This topic describes how to troubleshoot common FortiClient endpoint IP/MAC access control issues for the following topologies:

- [ZTNA access control on page 1149](#)
- [IP/MAC based access control on page 1150](#)

ZTNA access control

In this topology, FortiClient endpoints use an SSL encrypted connection to the FortiGate access proxy to access protected resources. FortiGate works with FortiClient EMS to use a combination of IP/MAC addresses and ZTNA tags to control FortiClient endpoint access to resources.

This section describes how to handle the following errors:

- [Invalid ZTNA certificate on page 1149](#)
- [ZTNA policy mismatch on page 1149](#)

Invalid ZTNA certificate

When FortiClient attempts to access a server protected by ZTNA, an *Invalid ZTNA certificate* error is shown. This error often appears when the serial number for the ZTNA certificate differs between the endpoint and the FortiGate.

1. Check the serial number for the ZTNA certificate on the endpoint and the FortiGate:
 - a. On the endpoint, check the serial number for the certificate.
 - b. On the FortiGate, check the serial number for the client certificate by running the following command:

```
# diagnose endpoint record list
```
2. If the serial number for the ZTNA certificate differs between the endpoint and the FortiGate, and the serial number on the FortiGate is comprised of zeros, check the following:
 - a. For FortiClient, make sure that the endpoint is running FortiClient 7.0 or later. FortiClient versions earlier than 7.0 do not support ZTNA.
 - b. For FortiClient EMS, make sure that ZTNA is enabled. Check the profile on EMS and the endpoint's summary information.
 - c. For licensing, make sure that you have a ZTNA agent license entitlement. Only some license types support ZTNA.
3. If the serial numbers still do not match, deregister FortiClient from EMS, and then connect FortiClient to EMS again to trigger a new certificate signing request.

ZTNA policy mismatch

In most cases, FortiGate denies incoming ZTNA requests because the endpoint FortiClient does not meet the tagging criteria configured in the ZTNA rule and is considered a policy mismatch.

1. On the FortiGate, look at the ZTNA event logs and the forwarded logs.
2. Run the following commands on the ZTNA server:

```
# diagnose wad debug enable category policy
# diagnose wad debug enable level verbose
# diagnose debug enable
```

The command output contains incoming ZTNA requests and the FortiGate process for matching the connection to a ZTNA rule.

3. Verify the zero trust tags for the endpoint:

- On FortiClient, verify the applied tags. Click the avatar to view the zero trust tags.
- On FortiClient EMS, verify the endpoint's tags. Go to the endpoint list and click the endpoint.
- On FortiGate, verify the tags using the following commands:

```
# diagnose test application fcnacd 7
```

- Display ZTNA cache data for an individual endpoint:

```
# diagnose wad dev query-by uid <UID> <EMS S/N> <tenant ID>
```

4. If the tagging information differs between FortiGate and EMS, examine the EMS tag exchange communication between FortiGate and EMS by looking at the cmNotify and python logs in the debug diagnostics for EMS.

For more information about FortiClient EMS diagnostics, see [Generate Diagnostic Log](#) in the FortiClient EMS Administration Guide.

IP/MAC based access control

In the following ZTNA topology, FortiClient endpoints use VPN to access resources. FortiGate works with FortiClient EMS to use a combination of IP/MAC addresses and ZTNA tags to control FortiClient endpoint access to resources.

For more information, see [ZTNA IP MAC based access control example on page 1083](#).

ZTNA tag information missing on the FortiGate

If the IP address for the FortiClient endpoint is not associated with a ZTNA tag on the FortiGate, a firewall policy mismatch occurs, and the FortiGate denies network access to the FortiClient endpoint.

The following workflow summarizes how FortiGate retrieves the IP address and tags for the FortiClient endpoint to help you better understand how to troubleshoot the situation:

1. FortiClient establishes a VPN connection to the FortiGate.
2. FortiGate uses the API to pass FortiClient's UUID and VPN IP address to FortiClient EMS.
3. FortiGate requests system information and tags from FortiClient based on the response from EMS.

Based on the workflow, start troubleshooting before the FortiClient endpoint attempts to establish a VPN connection to FortiGate. On FortiGate, run the following commands:

```
# diagnose debug application fcnacd -1
# diagnose debug console timestamp enable
# diagnose endpoint filter show-large-data yes
# diagnose debug enable
```

The following outputs illustrate how to examine the command output. The output can differ between environments. The outputs help illustrate how to understand the communication between FortiGate and FortiClient EMS.

In the following output, FortiGate's VPN daemon sends FortiClient's UUID and the VPN IP address to FortiClient EMS using the API. The NAC daemon makes the API call to send the details to FortiClient EMS:

```
2022-10-17 08:50:41 [fcems_call_vpn_client_gateway_call:1147] VPN act connect (UID:
3358095CFDCB414B9EDA49ADE79AF428, Interface: port1, IP: 10.212.134.200, VDom: root,

""
```

The following example from the fcmNotify.log file on FortiClient EMS shows how FortiClient EMS interprets the information sent from FortiGate:

```
2022-10-26 11:59:37,817 DEBUG ems_logger 6 7 [VPN Gateway Details]: Request made with
params: {'is_snapshot': False, 'sn_list': ['FG10E0TB20903081', 'FG10E0TB20903034'], 'uid_
list': [{'uid': 'D997B2A7A78E4E6F832309FF97FC2215', 'vdom': 'root', 'interface': 'EXT',
'sn': 'FG10E0TB20903081', 'ip': '10.1.18.61', 'is_delete': False}]}.
2022-10-26 11:59:38,281 DEBUG ems_logger 6 7 [Sysinfo c44cc74b1185431491f71c133c097f00
Certificate user: FG10E0TB20903081]: Request with SN [FG10E0TB20903034,FG10E0TB20903081]
success. Returned 1 endpoints. uid_offset: D997B2A7A78E4E6F832309FF97FC2215, updated_after:
2022-10-26 15:59:37.8237471, is_final: True
2022-10-26 11:59:38,543 DEBUG ems_logger 6 7 [UID-Tags e6ecc42c058e48b2b71cf7d65ecd432c
Certificate user: FG10E0TB20903081]: Request with SN [FG10E0TB20903034,FG10E0TB20903081]
success. uid_offset: D997B2A7A78E4E6F832309FF97FC2215, updated_after: 2022-10-26
15:59:37.8227461, is_final: True
```

FortiGate uses the information from FortiClient EMS to make a targeted API call to FortiClient EMS to retrieve both system information and tag information (with the means of uid_offset and updated_after parameters) for the endpoint. The following is the API call to retrieve the tags from FortiClient EMS:

```
https://172.31.200.182/api/v1/report/fct/uid_tags?sn_list[]=FGVM02TM22018374&updated_
after=2022-10-17 15:59:37.8227461&uid_offset=3358095CFDCB414B9EDA49ADE79AF428
```

The following is an example of the API call and subsequent communication between FortiGate and FortiClient EMS to retrieve tags for the FortiClient endpoint IP address:

```
2022-10-17 08:50:42 [ec_ez_worker_base_prep_resolver:373] Outgoing interface index 0 for 2
(FortiClientEMS).
```

```
2022-10-17 08:50:42 [ec_ez_worker_prep_data_url:98] request (26):

Other useful CLI commands

Output the JSON-formatted list of FortiGate interfaces (gateways) with IP and MAC addresses. This is the list that FortiGate sends to EMS so that EMS can identify the endpoints that are directly connected to the firewall:

```
# diagnose endpoint fctems json gateway-mac-request
```

Makes EMS execute API calls to the EMS API endpoints on demand:

```
# diagnose test application fcnacd 5
```

Send the gateway list to EMS on demand. It could be useful to execute `diagnose test application fcnacd 5` right after command during troubleshooting, as EMS will have an updated list of firewall interfaces:

```
# diagnose test application fcnacd 99
```

For more commands, see [ZTNA troubleshooting and debugging commands on page 1143](#).

Internet Service

The following topics provide instructions on configuring policies with Internet Service:

- [Using Internet Service in policy on page 1153](#)
- [Using custom Internet Service in policy on page 1155](#)
- [Using extension Internet Service in policy on page 1157](#)
- [Global IP address information database on page 1159](#)
- [IP reputation filtering on page 1161](#)
- [Internet service groups in policies on page 1163](#)
- [Allow creation of ISDB objects with regional information on page 1166](#)
- [Internet service customization on page 1168](#)

Using Internet Service in policy

This topic shows how to apply a predefined Internet Service entry into a policy.

The Internet Service Database is a comprehensive public IP address database that combines IP address range, IP owner, service port number, and IP security credibility. The data comes from the FortiGuard service system. Information is regularly added to this database, for example, geographic location, IP reputation, popularity & DNS, and so on. All this information helps users define Internet security more effectively. You can use the contents of the database as criteria for inclusion or exclusion in a policy.

From FortiOS version 5.6, Internet Service is included in the firewall policy. It can be applied to a policy only as a destination object. From version 6.0, Internet Service can be applied both as source and destination objects in a policy. You can also apply Internet Services to shaping policy.

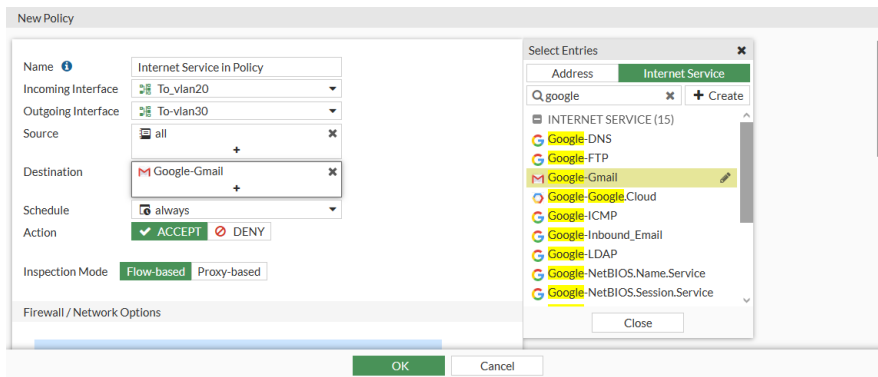

There are three types of Internet Services you can apply to a firewall policy:

- Predefined Internet Services
- Custom Internet Services
- Extension Internet Services

Sample configuration

To apply a predefined Internet Service entry to a policy using the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Click in the *Destination* field.
3. In the *Select Entries* pane, click *Internet Service* and select *Google-Gmail*.

4. Configure the remaining fields as needed.
5. Click **OK**.

To apply a predefined Internet Service entry to a policy in the CLI:

In the CLI, enable the `internet-service` first and then use its ID to apply the policy.

This example uses Google Gmail and its ID is 65646. Each Internet Service has a unique ID.

```
config firewall policy
  edit 9
    set name "Internet Service in Policy"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set internet-service enable
    set internet-service-id 65646
    set action accept
    set schedule "always"
    set utm-status enable
    set av-profile "g-default"
    set ssl-ssh-profile "certificate-inspection"
    set nat enable
  next
end
```

To diagnose an Internet Service entry in the CLI:

```
# diagnose internet-service id-summary 65646
Version: 0000600096
Timestamp: 201902111802
Total number of IP ranges: 444727
Number of Groups: 7
Group(0), Singularity(20), Number of IP ranges(142740)
Group(1), Singularity(19), Number of IP ranges(1210)
Group(2), Singularity(16), Number of IP ranges(241)
Group(3), Singularity(15), Number of IP ranges(38723)
Group(4), Singularity(10), Number of IP ranges(142586)
Group(5), Singularity(8), Number of IP ranges(5336)
Group(6), Singularity(6), Number of IP ranges(113891)
Internet Service: 65646(Google.Gmail)
Number of IP range: 60
Number of IP numbers: 322845
```

Singularity: 15
Reputation: 5 (Known and verified safe sites such as Gmail, Amazon, eBay, etc.)
Icon Id: 510
Second Level Domain: 53 (gmail.com)
Direction: dst
Data source: isdb

Result

Because the IP and services related to Google Gmail on the Internet are included in this Internet Service (65646), all traffic to Google Gmail is forwarded by this policy.

Using custom Internet Service in policy

Custom Internet Services can be created and used in firewall policies.

When creating a custom Internet Service, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges
- Reputation

You must use CLI to create a custom Internet Service, except for geographic based services (see [Allow creation of ISDB objects with regional information on page 1166](#)).

CLI syntax

```
config firewall internet-service-custom
  edit <name>
    set comment <comment>
    set reputation {1 | 2 | 3 | 4 | 5}
    config entry
      edit <ID>
        set protocol <protocol #>
        set dst <object_name>
        config port-range
          edit <ID>
            set start-port <port #>
            set end-port <port #>
          next
        end
      next
    end
  end
end
```

Sample configuration

To configure a custom Internet Service:

```
config firewall internet-service-custom
  edit "test-isdb-1"
    set comment "Test Custom Internet Service"
    set reputation 4
    config entry
      edit 1
        set protocol 6
        config port-range
          edit 1
            set start-port 80
            set end-port 443
          next
        end
        set dst "10-1-100-0"
      next
      edit 2
        set protocol 6
        config port-range
          edit 1
            set start-port 80
            set end-port 80
          next
        end
        set dst "172-16-200-0"
      next
    end
  next
end
```

To apply a custom Internet Service into a policy:

```
config firewall policy
  edit 1
    set name "Internet Service in Policy"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set internet-service enable
    set internet-service-id 65646
    set internet-service-custom "test-isdb-1"
    set action accept
    set schedule "always"
    set utm-status enable
    set av-profile "g-default"
    set ssl-ssh-profile "certificate-inspection"
    set nat enable
  next
end
```

Result

In addition to the IP address, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which access to 10.1.100.0/24 and TCP/80-443 and 172.16.200.0/24 and TCP/80.

Using extension Internet Service in policy

Extension Internet Service lets you add custom or remove existing IP address and port ranges to an existing predefined Internet Service entries. Using an extension type Internet Service is actually editing a predefined type Internet Service entry and adding IP address and port ranges to it.

When creating an extension Internet Service and adding custom ranges, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges

You must use CLI to add custom IP address and port entries into a predefined Internet Service.

You must use GUI to remove entries from a predefined Internet Service.

Custom extension Internet Service CLI syntax

```
config firewall internet-service-extension
  edit <ID #>
    set comment <comment>
    config entry
      edit <ID #>
        set protocol <number #>
        set dst <object_name>
        config port-range
          edit <ID #>
            set start-port <number #>
            set end-port <number #>
          next
        end
      next
    end
  end
end
```

Sample configuration

To configure an extension Internet Service in the CLI:

```
config firewall internet-service-extension
  edit 65646
    set comment "Test Extension Internet Service 65646"
    config entry
      edit 1
        set protocol 6
        config port-range
          edit 1
```

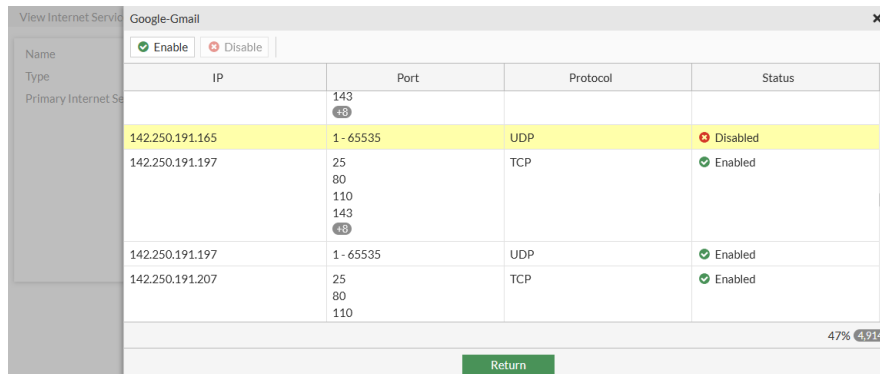

```

        set start-port 80
        set end-port 443
    next
end
set dst "172-16-200-0"
next
edit 2
set protocol 17
config port-range
edit 1
set start-port 53
set end-port 53
next
end
set dst "10-1-100-0"
next
end
next
end

```

To remove IP address and port entries from an existing Internet Service in the GUI:

1. Go to *Policy & Objects > Internet Service Database*.
2. Search for *Google-Gmail*.
3. Select *Google-Gmail* and click *Edit*.
4. In the gutter, click *View/Edit Entries*.
5. Select the *IP* entry that you need to remove and click *Disable*.

6. Click *Return* twice.

To remove IP address and port entries from an existing Internet Service in the CLI:

```

config firewall internet-service-extension
edit 65646
config disable-entry
edit 1
set protocol 17
config port-range
edit 1
next
end
config ip-range

```

```
        edit 1
          set start-ip 142.250.191.165
          set end-ip 142.250.191.165
        next
      end
    next
  end
next
end
```

To apply an extension Internet Service into policy in the CLI:

```
config firewall policy
  edit 9
    set name "Internet Service in Policy"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set internet-service enable
    set internet-service-id 65646
    set action accept
    set schedule "always"
    set utm-status enable
    set av-profile "g-default"
    set ssl-ssh-profile "certificate-inspection"
    set nat enable
  next
end
```

Result

In addition to the IP addresses, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which accesses 10.1.100.0/24 and UDP/53 and 172.16.200.0/24 and TCP/80-443. At the same time, the traffic that accesses 2.20.183.160 is dropped because this IP address and port is disabled from Google.Gmail.

Global IP address information database

The Internet Service and IP Reputation databases download details about public IP address, including: ownership, known services, geographic location, blocklisting information, and more. The details are available in drilldown information, tooltips, and other mechanisms in the FortiView and other pages.

The global IP address database is an integrated database containing all public IP addresses, and is implemented in the Internet Service Database.

To view the owner of the IP address:

```
(global) # get firewall internet-service-owner ?
id      Internet Service owner ID.
1      Google
2      Facebook
3      Apple
4      Yahoo
5      Microsoft
```

```
.....  
115 Cybozu  
116 VNC
```

To check for any known service running on an IP address:

```
(global) # diagnose internet-service info FG-traffic 6 80 8.8.8.8  
Internet Service: 65537(Google.Web)
```

To check GeolP location and blocklist information:

```
(global) # diagnose internet-service id 65537 | grep 8.8.8.8  
8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(6) port(80 443)  
8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(17) port(443)
```

To check a known malicious server:

```
(global) # diagnose internet-service id-summary 3080383  
Version: 0000600096  
Timestamp: 201902111802  
Total number of IP ranges: 444727  
Number of Groups: 7  
Group(0), Singularity(20), Number of IP ranges(142740)  
Group(1), Singularity(19), Number of IP ranges(1210)  
Group(2), Singularity(16), Number of IP ranges(241)  
Group(3), Singularity(15), Number of IP ranges(38723)  
Group(4), Singularity(10), Number of IP ranges(142586)  
Group(5), Singularity(8), Number of IP ranges(5336)  
Group(6), Singularity(6), Number of IP ranges(113891)  
Internet Service: 3080383(Botnet.C&C.Server)  
Number of IP range: 111486  
Number of IP numbers: 111486  
Singularity: 20  
Reputation: 1(Known malicious sites related to botnet servers, phishing sites, etc.)

IP reputation filtering

There are currently five reputation levels in the Internet Service Database (ISDB), and custom reputation levels can be defined in a custom internet service. You can configure firewall policies to filter traffic according to the desired reputation level. If the reputation level of either the source or destination IP address is equal to or greater than the level set in the policy, then the packet is forwarded, otherwise, the packet is dropped.

The five default reputation levels are:

- | | |
|----------|--|
| 1 | Known malicious sites, such as phishing sites or sites related to botnet servers |
| 2 | High risk services sites, such as TOR, proxy, and P2P |
| 3 | Unverified sites |
| 4 | Reputable social media sites, such as Facebook and Twitter |
| 5 | Known and verified safe sites, such as Gmail, Amazon, and eBay |

The default minimum reputation level in a policy is zero, meaning that the reputation filter is disabled.

For IP addresses that are not included in the ISDB, the default reputation level is three.

The default reputation direction is `destination`.

Example 1

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

To set the reputation level and direction in a policy using the CLI:

```
config firewall policy
  edit 1
    set srcintf "wan2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set reputation-minimum 3
    set reputation-direction source
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set auto-asic-offload disable
    set nat enable
  next
end
```

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

Example 2

This policy allows only outbound FTP traffic, if the destination server has a minimum reputation of 4.

To set the reputation level and direction in a policy using the CLI:

```
config firewall policy
  edit 1
    set srcintf "port1"
    set dstintf "wan2"
    set srcaddr "all"
    set dstaddr "all"
    set reputation-minimum 4
    set reputation-direction destination
    set action accept
    set schedule "always"
    set service "FTP"
    set logtraffic all
    set auto-asic-offload disable
    set nat enable
  next
end
```

Internet service groups in policies

This feature provides support for Internet Service Groups in traffic shaping and firewall policies. Service groups can be used as the source and destination of the policy. Internet Service Groups are used as criteria to match traffic; the shaper will be applied when the traffic matches.

To use a group as a destination, `internet-service` must be enabled. To use a group as a source, `internet-service-src` must be enabled.

The following CLI variables are available in the `firewall policy` and `firewall shaping-policy` commands:

Variable	Description
<code>internet-service-group <string></code>	Internet Service group name.
<code>internet-service-custom-group <string></code>	Custom Internet Service group name.
<code>internet-service-src-group <string></code>	Internet Service source group name.
<code>internet-service-src-custom-group <string></code>	Custom Internet Service source group name.

Examples

The following examples use the below topology.

Example 1

In this example, the PC is allowed to access Google, so all Google services are put into an Internet Service Group.

To configure access to Google services using an Internet Service Group using the CLI:

1. Create a Service Group:

```

config firewall internet-service-group
  edit "Google_Group"
    set direction destination
    set member Google-Other Google-Web Google-ICMP Google-DNS Google-Outbound_Email
    Google-SSH Google-FTP Google-NTP Google-Inbound_Email Google-LDAP Google-
    NetBIOS.Session.Service Google-RTMP Google-NetBIOS.Name.Service Google-Google.Cloud
    Google-Gmail
  next
end
  
```

2. Create a firewall policy to allow access to all Google Services from the PC:

```

config firewall policy
  edit 1
  
```

```

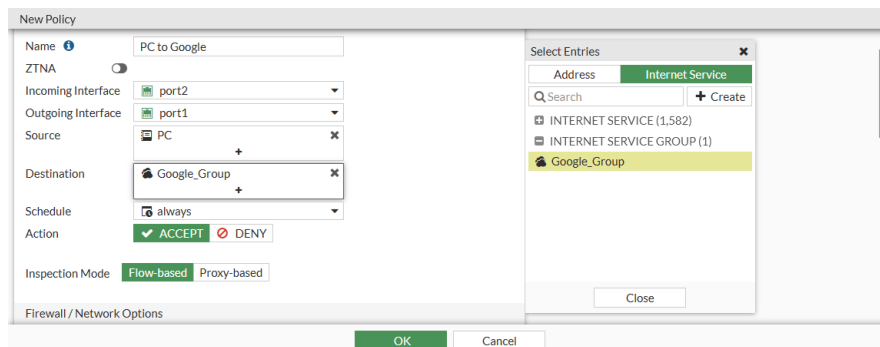

set name "PC to Google"
set srcintf "port2"
set dstintf "port1"
set srcaddr "all"
set internet-service enable
set internet-service-group "Google_Group"
set action accept
set schedule "always"
set fsso disable
set nat enable

next
end

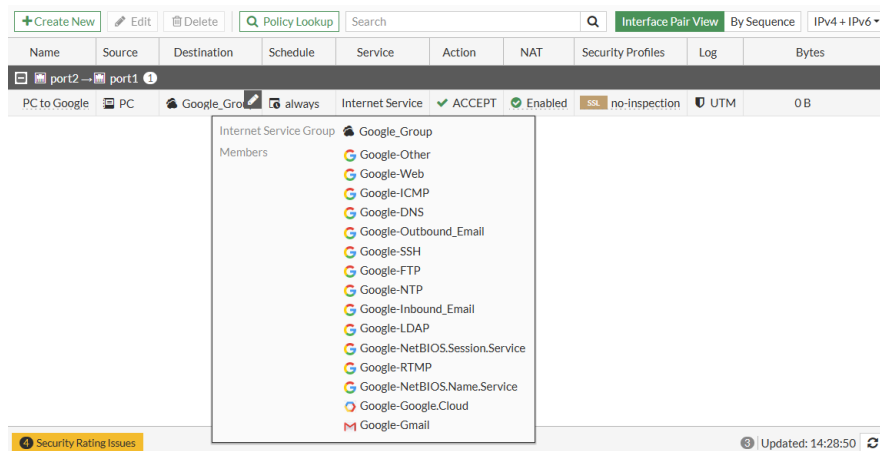

```

To configure access to Google services using an Internet Service Group in the GUI:

1. On the FortiGate, create a Service Group using the CLI.
2. Go to *Policy & Objects > Firewall Policy*, and create a new policy.
3. Set the *Destination* as the just created Internet Service Group.

4. Configure the remaining options, then click *OK*.
5. Go to *Policy & Objects > Firewall Policy* and hover over the group to view a list of its members.

Example 2

In this example, two office FTP servers are put into an Internet Custom Service Group, and the PC connection to the FTP servers is limited to 1Mbps.

To put two FTP servers into a custom service group and limit the PC connection speed to them in the CLI:**1. Create custom internet services for the internal FTP servers:**

```
config firewall internet-service-custom
  edit "FTP_PM"
    config entry
      edit 1
        config port-range
          edit 1
            set start-port 21
            set end-port 21
          next
        end
        set dst "PM_Server"
      next
    end
  next
edit "FTP_QA"
  config entry
    edit 1
      config port-range
        edit 1
          set start-port 21
          set end-port 21
        next
      end
      set dst "QA_Server"
    next
  end
next
end
```

2. Create a custom internet server group and add the just created custom internet services to it:

```
config firewall internet-service-custom-group
  edit "Internal_FTP"
    set member "FTP_QA" "FTP_PM"
  next
end
```

3. Create a traffic shaper to limit the maximum bandwidth:

```
config firewall shaper traffic-shaper
  edit "Internal_FTP_Limit_1Mbps"
    set guaranteed-bandwidth 500
    set maximum-bandwidth 1000
    set priority medium
  next
end
```

4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:

```
config firewall shaping-policy
  edit 1
    set name "For Internal FTP"
    set internet-service enable
```

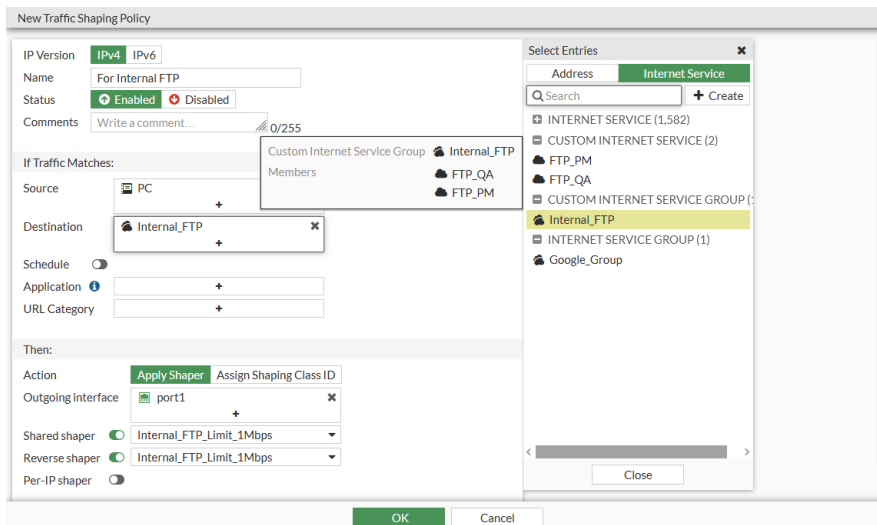

```

set internet-service-custom-group "Internal_FTP"
set dstintf "port1"
set traffic-shaper "Internal_FTP_Limit_1Mbps"
set traffic-shaper-reverse "Internal_FTP_Limit_1Mbps"
set srcaddr "PC"
next
end

```

To put two FTP servers into a custom service group and limit the PC connection speed to the in the GUI:

1. Create custom internet services for the internal FTP servers using the CLI.
2. Create a custom internet server group and add the just created custom internet services to it using the CLI.
3. Create a traffic shaper to limit the maximum bandwidth:
 - a. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shapers* tab, and click *Create New*.
 - b. Enter a *Name* for the shaper, such as *Internal_FTP_Limit_1Mbps*.
 - c. Set the *Traffic Priority* to *Medium*.
 - d. Enable *Max Bandwidth* and set it to *1000*.
 - e. Enable *Guaranteed Bandwidth* and set it to *500*.
 - f. Click *OK*.
4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:
 - a. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
 - b. Set the *Destination* to the just created custom internet service group, and apply the just create traffic shaper.

- c. Configure the remaining options as shown, then click *OK*.

Allow creation of ISDB objects with regional information

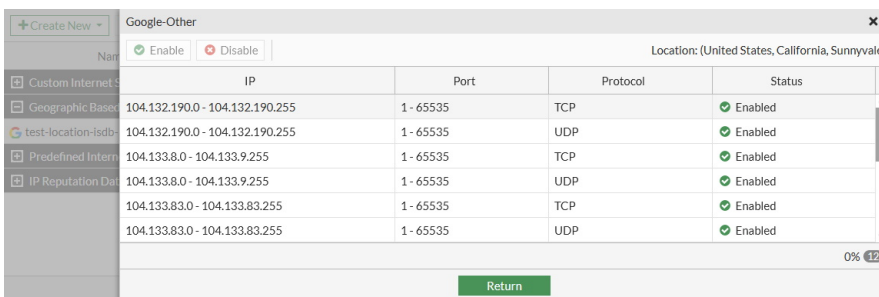

Geographic-based Internet Service Database (ISDB) objects allow users to define a country, region, and city. These objects can be used in firewall policies for more granular control over the location of the parent ISDB object. ISDB objects are now referenced in policies by name instead of ID.

To apply a location-based ISDB object to a policy in the GUI:

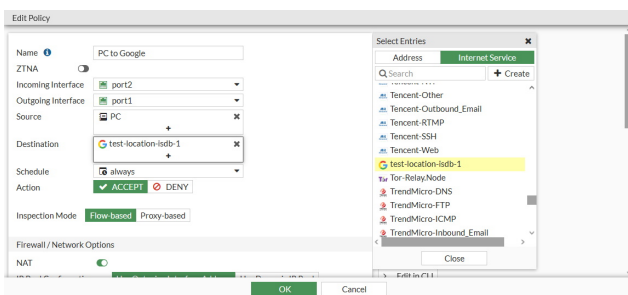

1. Create the ISDB object:
 - a. Go to *Policy & Objects > Internet Service Database* and click *Create New > Geographic Based Internet Service*.
 - b. Configure the settings as required.

- c. Click *OK*.
2. View the IP ranges in the location-based internet service:
 - a. Go to *Policy & Objects > Internet Service Database*.
 - b. In the table, hover over the object created in step 1 and click *View/Edit Entries*. The list of IPs is displayed:

- c. Click *Return*.
3. Add the ISDB object to a policy:
 - a. Go to *Policy & Objects > Firewall Policy* and create a new policy or edit an existing one.
 - b. For *Destination*, click *Internet Service* and select the ISDB object created in step 1.
 - c. Configure the other settings as needed.

- d. Click *OK*.

To apply a location-based ISDB object to a policy in the CLI:

1. Create the ISDB object:

```
config firewall internet-service-name
edit "test-location-isdb-1"
set type location
```

```

        set internet-service-id 65536
        set country-id 840
        set region-id 283
        set city-id 23352
    next
end

```

2. View the IP ranges in the location-based internet service:

```

# diagnose internet-service id 65536 | grep "country(840) region(283) city(23352)"
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation
(4), domain(5) popularity(0) botnet(0) proto(6) port(1-65535)
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation
(4), domain(5) popularity(0) botnet(0) proto(17) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0)
reputation(4), domain(5) popularity(4) botnet(0) proto(6) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0)
reputation(4), domain(5) popularity(4) botnet(0) proto(17) port(1-65535)

```

3. Add the ISDB object to a policy:

```

config firewall policy
    edit 3
        set name "PC to Google"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "PC"
        set internet-service enable
        set internet-service-name "test-location-isdb-1"
        set action accept
        set schedule "always"
        set logtraffic all
        set logtraffic-start enable
        set auto-asic-offload disable
        set nat enable
    next
end

```

Internet service customization

Internet Service Database (ISDB) entries can be tuned for their environments by adding custom ports and port ranges, as well as port mapping.

To add a custom port range:

```

config firewall internet-service-addition
    edit 65646
        set comment "Add custom port-range:tcp/8080-8090 into 65646"
        config entry
            edit 1
                set protocol 6
                config port-range
                    edit 1
                        set start-port 8080
                        set end-port 8090
                    next
            next
        next
    next
end

```

```
        end
      next
    end
  next
end
```

Warning: Configuration will only be applied after rebooting or using the 'execute internet-service refresh' command.

To verify that the change was applied:

```
# diagnose internet-service info FG-traffic 6 8080 2.20.183.160
Internet Service: 65646(Google.Gmail)
```

To configure additional port mapping:

```
config firewall internet-service-append
  set match-port 10
  set append-port 20
end
```

Warning: Configuration will only be applied after rebooting or using the 'execute internet-service refresh' command.

Security Profiles

This section contains information about configuring FortiGate security features, including:

- [Inspection modes on page 1170](#)
- [Antivirus on page 1174](#)
- [Web filter on page 1217](#)
- [Filtering based on YouTube channel on page 1255](#)
- [DNS filter on page 1260](#)
- [Application control on page 1289](#)
- [Intrusion prevention on page 1303](#)
- [File filter on page 1329](#)
- [Email filter on page 1337](#)
- [Data leak prevention on page 1352](#)
- [VoIP solutions on page 1360](#)
- [ICAP on page 1377](#)
- [Web application firewall on page 1383](#)
- [SSL & SSH Inspection on page 1386](#)
- [Custom signatures on page 1403](#)
- [Overrides on page 1414](#)
- [IP ban on page 1429](#)
- [Profile groups on page 1433](#)

If you are unable to view a security profile feature, go to *System > Feature Visibility* to enable it.

Inspection modes

FortiOS supports flow-based and proxy-based inspection in firewall policies. You can select the inspection mode when configuring a policy.

Flow-based inspection takes a snapshot of content packets and uses pattern matching to identify security threats in the content.

Proxy-based inspection reconstructs content that passes through the FortiGate and inspects the content for security threats.

Certain security profiles allows users to display flow-based or proxy-based feature sets.

The following topics provide information about inspection modes for various security profile features:

- [Flow mode inspection \(default mode\) on page 1171](#)
- [Proxy mode inspection on page 1171](#)

- [Inspection mode feature comparison on page 1172](#)

Flow mode inspection (default mode)

When a firewall policy's inspection mode is set to flow, traffic flowing through the policy will not be buffered by the FortiGate. Unlike proxy mode, the content payload passing through the policy will be inspected on a packet by packet basis with the very last packet held by the FortiGate until the scan returns a verdict. If a violation is detected in the traffic, a reset packet is issued to the receiver, which terminates the connection and prevents the payload from being sent successfully.

Flow-based inspection identifies and blocks security threats in real time as they are identified. All applicable flow-based security modules are applied simultaneously in one single pass, using Direct Filter Approach (DFA) pattern matching to identify possible attacks or threats. Pattern matching is offloaded and accelerated by CP8 or CP9 processors.

Flow-based inspection typically requires lower processing resources than proxy-based inspection and does not change packets, unless a threat is found and packets are blocked. Flow-based inspection is selected by default on new firewall policies. It is the recommended inspection mode, unless proxy-specific features are required. For more information, see [Inspection mode feature comparison on page 1172](#).

Proxy mode inspection

When a firewall policy's inspection mode is set to proxy, traffic flowing through the policy will be buffered by the FortiGate for inspection. This means that the packets for a file, email message, or web page will be held by the FortiGate until the entire payload is inspected for violations (virus, spam, or malicious web links). After FortiOS finishes the inspection, the payload is either released to the destination (if the traffic is clean) or dropped and replaced with a replacement message (if the traffic contains violations).

To optimize inspection, the policy can be configured to block or ignore files or messages that exceed a certain size. To prevent the receiving end user from timing out, you can apply client comforting. This allows small portions of the payload to be sent while it is undergoing inspection.

In proxy-based antivirus scanning, certain techniques are used to streamline scanning with either in-process or stream-based scanning. For more information, see [Proxy mode stream-based scanning on page 1191](#).

Proxy mode provides some security profile capabilities that are not available to flow-based scanning:

- Video Filter
- Web Application Firewall (WAF)
- Content Disarm and Reconstruction (CDR)
- Web quota

For a complete list, see [Inspection mode feature comparison on page 1172](#).

Some features are exclusively proxy-based:

- SSL Offloading
- Explicit Web Proxy
- ZTNA

Verify the capabilities that you need when deciding to use proxy-based or flow-based policy. Applying the same type of scan mode in all your policies also helps optimize your performance.

Inspection mode feature comparison

The following table shows which UTM profile can be configured on a flow mode or proxy mode inspection policy.

Some UTM profiles are hidden in the GUI and can only be configured using the CLI. To configure profiles in a firewall policy in CLI, enable the `utm-status` setting.

Some profiles might have feature differences between flow-based and proxy-based Inspection. From the GUI and CLI, you can set the *Feature set* option to be *Flow-based* or *Proxy-based* to display only the settings for that mode.

UTM Profile	Flow Mode Inspection Policy		Proxy Mode Inspection Policy		Feature set option
	GUI	CLI	GUI	CLI	
AntiVirus	Yes	Yes	Yes	Yes	GUI/CLI
Web Filter	Yes	Yes	Yes	Yes	GUI/CLI
Video Filter	No	No	Yes	Yes	N/A
DNS Filter	Yes	Yes	Yes	Yes	N/A
Application Control	Yes	Yes	Yes	Yes	N/A
Intrusion Prevention System	Yes	Yes	Yes	Yes	N/A
File Filter	Yes	Yes	Yes	Yes	GUI/CLI
Email Filter	Yes	Yes	Yes	Yes	GUI/CLI
Data Leak Prevention	No	Yes	No	Yes	CLI
VoIP	Yes	Yes	Yes	Yes	N/A
ICAP	No	No	Yes	Yes	N/A
Web Application Firewall	No	No	Yes	Yes	N/A
SSL/SSH Inspection	Yes	Yes	Yes	Yes	N/A
SSH Filter	No	No	No	Yes	N/A

The following sections outline differences between flow-based and proxy-based inspection for a security profile.

Feature comparison between Antivirus inspection modes

The following table indicates which Antivirus features are supported by their designated scan modes.

Part1	Replacement Message	Content Disarm	Mobile Malware	Virus Outbreak	Sandbox Inspection	NAC Quarantine
Proxy	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes*	No	Yes	Yes	Yes	Yes

*IPS Engine caches the URL and a replacement message is presented after the second attempt.

Part 2	Archive Blocking	Emulator	Client Comforting	Infection Quarantine	Heuristics	Treat EXE as Virus
Proxy	Yes	Yes	Yes	Yes (1)	Yes	Yes (2)
Flow	Yes	Yes	No	Yes	Yes	Yes (2)

1. Only available on FortiGate models with HDD or when FortiAnalyzer or FortiGate Cloud is connected and enabled.
2. Only applies to inspection on IMAP, POP3, SMTP, and MAPI protocols.

Part 3	External Blocklist	EMS Threat Feed	AI/ML Based Detection	FortiNDR Inline Detection
Proxy	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	No

Feature comparison between Web Filter inspection modes

The following table indicates which Web Filter features are supported by their designated inspection modes.

	FortiGuard Category-Based Filter	Category Usage Quota	Override Blocked Categories	Search Engines	Static URL Filter	Rating Option	Proxy Option	Web Profile Override
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes (1)	No	Yes (2)	No	Yes	Yes	Limited (3)	No

1. Local Category and Remote Category filters do not support the warning and authenticate actions.
2. Local Category and Remote Category filters cannot be overridden.
3. Only HTTP POST Action is supported.

Feature comparison between Email Filter inspection modes

The following tables indicate which Email Filters are supported by the specified inspection modes for local filtering and FortiGuard-assisted filtering.

Local Filtering	Banned Word Check	Block/Allow List	HELO/ EHLO DNS Check	Return Address DNS Check	DNSBL/ ORBL Check	MIME Header Check
Proxy	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	No	No	No	Yes

FortiGuard-Assisted Filtering	Phishing URL Check	Anti-Spam Block List Check	Submit Spam to FortiGuard	Spam Email Checksum Check	Spam URL Check
Proxy	Yes	Yes	Yes	Yes	Yes
Flow	No	No	No	No	No

Feature comparison between DLP inspection modes

The following table indicates which DLP filters are supported by their designated inspection modes.

	Credit Card Filter	SSN Filter	Regex Filter	File-Type Filter	File-Pattern Filter	Fingerprint Filter	Watermark Filter	Encrypted Filter	File-Size Filter
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	No	No	Yes	Yes*

*File-size filtering only works if file size is present in the protocol exchange.

Antivirus

An antivirus software's primary function is to detect and stop viruses that could cause harm to your system or compromise the security of your connected devices. It can be installed on individual endpoints or it can operate as an antivirus engine (AV engine) to perform traffic inspection inside a Next Generation Firewall (NGFW).

The FortiGate's AV engine operates by leveraging the information stored in signature databases that is updated in real-time by the [FortiGuard AV services](#). These databases are essentially vast repositories that contain detailed profiles of known and previously unknown viruses. The AV engine cross-references these profiles with the activities and files on your system to determine if any known or previously unknown viruses are active or attempting to infiltrate your network.

The scope of threats that the antivirus engine can neutralize extends beyond just viruses. It is equipped to deal with a wide array of malicious software, often called malware. This encompasses, but is not confined to, infected files that may carry harmful code, Trojans that disguise themselves as legitimate software, worms that can replicate themselves and spread across networks, and spyware that can collect and transmit your personal information without your consent. Furthermore, inline malware prevention powered by Sandboxing and AI extends protection to even new zero-day malware found in the wild.

This section includes information about antivirus techniques and configurations:

- [Antivirus introduction on page 1175](#)
- [Advanced configurations on page 1197](#)
- [Configuration examples on page 1210](#)

Antivirus introduction

FortiOS offers antivirus solutions in two modes: flow-based and proxy-based. Users can select the mode that best suits their needs. The default setting for a new antivirus profile is flow-based inspection, which is generally recommended unless there is a need for features specific to proxy. For more information, see [Protocol comparison between antivirus inspection modes on page 1175](#).

FortiOS includes two preloaded antivirus profiles:

- *default*
- *wifi-default*

You can customize these profiles, or you can create your own to inspect certain protocols, remove viruses, analyze suspicious files with FortiSandbox, and apply botnet protection to network traffic. Once configured, you can add the antivirus profile to a firewall policy.

This functionality requires a subscription to FortiGuard Antivirus.

Protocol comparison between antivirus inspection modes

The following table indicates which protocols can be inspected by the designated antivirus scan modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SSH
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes*	Yes
Flow	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No

* Proxy mode antivirus inspection on CIFS protocol has the following limitations:

- Cannot detect infections within some archive files.
- Cannot detect oversized files.

Other antivirus differences between inspection modes

Starting from 6.4.0, the scan mode option is no longer available for flow-based AV.

This means that AV no longer exclusively uses the default or legacy scan modes when handling traffic on flow-based firewall policies. Instead, AV in flow-based policies uses a hybrid of the two scan modes. Flow AV may use a pre-filtering database for malware detection in some circumstances as opposed to the full AV signature database in others. The scan method is determined by the IPS engine algorithm that is based on the type of file being scanned. When handling oversized files in flow-based AV, the action can either be pass (default) or block. When the action is pass, IPS appends to-be-scan data into the AV scan buffer. If the appended file size exceeds the oversize-limit that is defined in the protocol option profile, then the AV session is cleared and the file is bypassed from AV scanning.

In contrast, proxy mode maintains the scan mode option, which can be toggled between default or legacy mode. In default mode, the WAD daemon receives the file and then decides if it can do an in-process scan of the file in simple AV configuration scenarios. If the file is in an oversized archive that is supported by the stream-based decompressor, then it is sent to stream-based scan for best effort inspection. Stream-based scan decompresses and scans the entire archive

without archiving the file. If the file is not supported by stream-based scan, then it is buffered and then sent to the scanunit daemon for inspection on content that is under the oversize limit.

In legacy mode, stream-based scanning is disabled, so oversized archive files and files that cannot be handled by WAD in-process scan are buffered and sent to the scanunit daemon for processing.

Antivirus techniques

The security of digital systems is a top priority for organizations. A range of techniques and tools are employed to ensure the integrity and reliability of these systems.

The following table describes some of the industry standard techniques that are used for Antivirus protection, and if they can be configured in the GUI or CLI.

Technique	Description	GUI	CLI
Signature-based detection	Antivirus scan detects and compares malicious file against virus signatures database. The FortiGuard Antivirus Service uses content pattern recognition language (CPRL), which is more efficient and accurate than traditional signature-based detection methods.	✓	✓
Content Disarm and Reconstruction (CDR)	CDR sanitizes Office and PDF files by removing active content, preserving only the text. See Content disarm and reconstruction on page 1177 for more information.	✓	✓
Virus Outbreak Prevention (VOS)	VOS enhances FortiGate's antivirus database with third-party malware hashes. It checks file hashes against FortiGuard's database. See Virus outbreak prevention on page 1177 for more information.	✓	✓
External Malware Block List	Users can add their own malware signatures to an external list. See External malware block list on page 1177 for more information.	✓	✓
EMS Threat Feed	FortiGate receives malware feeds from FortiClient EMS, which itself gathers detected malware hashes from FortiClients. See EMS threat feed on page 1177 for more information.	✓	✓
Behavior-based detection	Submit suspected malicious files to FortiSandbox for inspection. See Using FortiSandbox with antivirus on page 1197 for more information.	✓	✓
CIFS Scanning	File filtering and antivirus scanning on Common Internet File System (CIFS) traffic is supported. See CIFS support on page 1205 for more information.	✓	✓
Heuristic Analysis	Identify malicious files such as Windows Portable Executables (PEs) to combat zero-day attacks. See AI-based malware detection on page 1178 for more information.		✓
AI/ML, behavioral, and human analysis	Helps identify, classify, and respond to threats. See Using FortiNDR inline scanning with antivirus on page 1199 for more information.	✓	✓

See [Configuring an antivirus profile on page 1178](#) and [Testing an antivirus profile on page 1182](#) for more information.

Content disarm and reconstruction

Content disarm and reconstruction (CDR) allows the FortiGate to sanitize Microsoft Office documents and PDF files (including those that are in ZIP archives) by removing active content, such as hyperlinks, embedded media, JavaScript, macros, and so on from the files (disarm) without affecting the integrity of its textual content (reconstruction).

CDR is supported on HTTP, SMTP, POP3, and IMAP.

HTTP GET is supported, but not HTTP POST.
SMTP splice and client-comfort mode are not supported.
CDR does not support flow-based inspection modes.

It allows network administrators to protect their users from malicious document files. See [Content disarm and reconstruction on page 1210](#) for a configuration example.

Virus outbreak prevention

FortiGuard VOS allows the FortiGate antivirus database to be supplemented with third-party malware hash signatures curated by FortiGuard. This allows VOS to manage zero-day threats effectively. The hash signatures are obtained from FortiGuard's Global Threat Intelligence database. Any signature that is added to FortiGuard becomes immediately active, eliminating the need to wait for AVDB (antivirus database) update. The AVDB queries FortiGuard with the hash of a scanned file. If FortiGuard returns a match, the scanned file is deemed to be malicious. Enabling the AV engine scan is not required to use this feature.

FortiGuard VOS can be used in both proxy-based and flow-based policy inspections across all supported protocols.

The FortiGate must be registered with a valid FortiGuard outbreak prevention license.

See [FortiGuard outbreak prevention on page 1212](#) for a configuration example.

External malware block list

The external malware block list allows users to add their own malware signatures in the form of MD5, SHA1, and SHA256 hashes. The FortiGate's antivirus database retrieves an external malware hash list from a remote server and polls the hash list every n minutes for updates. Enabling the AV engine scan is not required to use this feature.

The external malware block list can be used in both proxy-based and flow-based policy inspections, but it is not supported in AV quick scan mode.

Note that using different types of hashes simultaneously may slow down the performance of malware scanning. It is recommended to use one type of hash.

See [External malware block list on page 1214](#) and [Malware hash threat feed on page 2686](#) for more details and configuration examples.

EMS threat feed

A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor

actions. This feature is supported in proxy and flow mode.

If an external malware blocklist and the FortiGuard outbreak prevention database are also enabled in the antivirus profile, the checking order is: AV local database, EMS threat feed, external malware blocklist, FortiGuard outbreak prevention database. If the EMS threat feed and external malware blocklist contain the same hash value, then the EMS infection will be reported if both of them are blocked.

See [Malware threat feed from EMS on page 1202](#) for more details and configuration examples.

AI-based malware detection

The AV Engine AI malware detection model integrates into regular AV scanning to help detect potentially malicious Windows Portable Executables (PEs) in order to mitigate zero-day attacks. Previously, this type of detection was handled by heuristics that analyzed file behavior. With AV Engine AI, the module is trained by FortiGuard AV against many malware samples to identify file features that make up the malware. The AV Engine AI package can be downloaded by FortiOS via FortiGuard on devices with an active AV subscription. The machine-learning-detection setting is enabled by default at a per-VDOM level. Files detected by the AV Engine AI are identified with the W32/AI.Pallas.Suspicious virus signature.

To configure machine learning-based malware detection:

```
config antivirus settings
    set machine-learning-detection {enable| monitor | disable}
end
```

FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from <https://www.fortiguards.com/sample-files>. Test the AI-based malware detection feature by downloading *AI Sample* file. See [Example 2: AI sample file on page 1186](#).

Configuring an antivirus profile

In an antivirus profile, the FortiGate can be configured to apply antivirus protection to HTTP, FTP, IMAP, POP3, SMTP, CIFS, and NNTP sessions. Proxy-based profiles also support MAPI and SSH. Antivirus inspection prevents potentially unwanted and malicious files from entering the network. Antivirus profiles include multiple different functions, such as scanning files for virus signatures, scanning for advanced persistent threats, checking external malware hash lists and threat feeds, and others. Malicious files can be blocked or monitored, and can be quarantined. Some antivirus profile options require a license and/or other Fortinet products. Some antivirus profile options can only be configured in the CLI (refer to the [FortiOS CLI Reference](#)).

The feature set setting (proxy or flow) in the antivirus profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based antivirus profile must be used with a flow-based firewall policy.

To configure an antivirus profile:

1. Go to *Security Profiles > AntiVirus* and click *Create New*.
2. Configure the following settings:

<i>Name</i>	Enter a unique name for the profile.
<i>Comments</i>	Enter a comment (optional).
<i>AntiVirus scan</i>	<p>Enable one or more protocols for inspection, then enable <i>AntiVirus scan</i> for the selected protocols with a specified action.</p> <ul style="list-style-type: none"> • <i>Block</i>: block the malicious traffic. • <i>Monitor</i>: log malicious traffic and allow it to pass inspection.
<i>Feature set</i>	<p>Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy.</p> <ul style="list-style-type: none"> • <i>Flow-based</i> • <i>Proxy-based</i> <p>Additional options are available in proxy-based mode and are identified in the GUI with a <i>P</i> icon. See Inspection mode feature comparison on page 1172 for more details.</p>
<i>Inspected Protocols</i>	<p>Enable to inspect the protocol for session inspection: HTTP, SMTP, POP3, IMAP, FTP, and CIFS. Disabled protocols are not inspected.</p> <p>MAPI and SSH can be inspected in proxy-based mode.</p>
<i>APT Protection Options</i>	<p>This section includes options available with FortiGuard to mitigate advanced persistent threats (APT) in file-based attacks.</p>

<i>Content Disarm and Reconstruction</i>	<p>This option is available in proxy-based mode when at least one protocol is enabled for inspection and <i>AntiVirus scan</i> is enabled.</p> <p>See Content disarm and reconstruction on page 1177 for more details.</p>
<i>Allow transmission when an error occurs</i>	<p>Enable to allow traffic to pass when an inspection error occurs. Disable to block traffic when an inspection error occurs.</p>
<i>Original File Destination</i>	<p>Specify how to quarantine files processed by content disarm and reconstruction.</p> <ul style="list-style-type: none">• <i>FortiSandbox</i>: quarantine files on FortiSandbox. The FortiSandbox must be enabled. See Using FortiSandbox with antivirus on page 1197 for more details.• <i>File Quarantine</i>: quarantine files on FortiGate models with a hard disk.• <i>Discard</i>: discard suspicious files.
<i>Treat Windows executables in email attachments as viruses</i>	<p>Enable to deem all Windows executable files located in email traffic as viruses.</p>
<i>Send files to FortiNDR for inspection</i>	<p>This option is available in proxy-based mode when at least one protocol is enabled for inspection, <i>AntiVirus scan</i> is enabled, and FortiNDR is enabled. See Using FortiNDR inline scanning with antivirus on page 1199 for more details.</p>

<i>Include mobile malware protection</i>	Enable to use the mobile malware protection database from FortiGuard for content scanning.
<i>Quarantine</i>	This option is available when at least one protocol is enabled for inspection and <i>AntiVirus scan</i> is enabled. Enable to quarantine infected files.
<i>Virus Outbreak Prevention</i>	This section includes options available with the FortiGuard Virus Outbreak Protection Service. See Virus outbreak prevention on page 1177 for more details.
<i>Use FortiGuard outbreak prevention database</i>	Enable to use the outbreak prevention database that is available with Advanced Malware Protection on FortiGuard. A license is required. <ul style="list-style-type: none">• <i>Block</i>: block the malicious traffic.• <i>Monitor</i>: log malicious traffic and allow it to pass inspection.
<i>Use external malware block list</i>	Enable to use one or more external blocklist file hashes. <ul style="list-style-type: none">• <i>Block</i>: block the malicious traffic.• <i>Monitor</i>: log malicious traffic and allow it to pass inspection.• <i>All</i>: use all malware block lists.• <i>Specify</i>: select specific malware block lists. See External malware block list on page 1177 and Malware hash threat feed on page 2686 for more details.

Use EMS threat feed

This option is available when at least one protocol is enabled for inspection and *AntiVirus scan* is enabled.

Enable to use malware threat feeds from FortiClient EMS. A FortiClient EMS Fabric connector with EMS threat feed enabled is required. See [EMS threat feed on page 1177](#) for more details.

3. Click *OK*.

Protocol options

When applying an antivirus profile to a firewall policy, the protocol options profile defines parameters for handling protocol-specific traffic. These parameters affect functions such as the port mapping for inspecting each protocol, whether to log or block oversized files when performing AV scanning, enabling comfort client, and more. Protocol options profiles are configured by going to *Policy & Objects > Protocol Options*, or in the CLI under `config firewall profile-protocol-options`. See [Protocol options on page 982](#) for more information.

Scan mode

In proxy-based antivirus profiles, the scan mode can be set to either default or legacy. This setting can only be configured in the CLI. See [Proxy mode stream-based scanning on page 1191](#) for more information.

To configure the scan mode:

```
config antivirus profile
  edit <name>
    set feature-set proxy
    set scan-mode {default | legacy}
  next
end
```

Testing an antivirus profile

Antivirus (AV) profiles can be tested using various file samples to confirm whether AV is correctly configured. In this topic, an AV profile is configured, applied to a firewall policy, and a user attempts to download sample virus test files hosted on eicar.org and fortiguard.com.

Different sample files are used to verify different features on the AV profile. The expectation is these files must be blocked by the AV profile, and the user should be presented with a block page.

File	Test case
EICAR test file	A plain text EICAR test file (hosted on eicar.org over a HTTPS connection) to test basic AV scanning on the FortiGate using deep inspection.

File	Test case
AI sample file	A machine learning sample file to test AI-based malware detection on the FortiGate.
Virus outbreak (VO) sample file	A zero-day sample virus file to test the outbreak prevention feature of the AV profile.
Behavioral-based samples	Files that are detected by a sandbox. This requires FortiSandbox integration with the FortiGate.

For the following AV test cases, the test PC has an IP of 192.168.1.110/24 and is connected to the internal1 interface. It accesses the internet through the wan1 interface.

Configuring the AV profile

The *default* AV profile is used, and the *Use FortiGuard outbreak prevention database* setting is enabled with the action set to block.

To configure the AV profile:

1. Go to *Security Profiles > AntiVirus* and edit the *default* profile.
2. In the *Virus Outbreak Prevention* section, enable *Use FortiGuard outbreak prevention database* and select *Block*. See [FortiGuard outbreak prevention on page 1212](#) for more information about this setting.
3. Configure the other settings as needed (see [Configuring an antivirus profile on page 1178](#)).
4. Click *OK*.

By default, the FortiOS AV Engine has AI-based malware detection enabled (`set machine-learning-detection enable`). The AV Engine AI malware detection model integrates into regular AV scanning to help detect potentially malicious Windows Portable Executables (PEs) in order to mitigate zero-day attacks. See [AI-based malware detection on page 1178](#) for more information.

To verify the status of the AV Engine AI contract:

```
# diagnose autoupdate versions | grep AI -A6
AI/Machine Learning Malware Detection Model
-----
Version: 2.12588 signed
Contract Expiry Date: Tue Jul 9 2024
Last Updated using scheduled update on Tue Sep 5 08:23:15 2023
Last Update Attempt: Tue Sep 5 09:23:00 2023
Result: No Updates
```

Configuring the SSL SSH profile and firewall policy

The PC will be accessing and downloading the test files using HTTPS from the EICAR and the FortiGuard websites. Since HTTPS traffic is encrypted traffic, in order for the FortiGate to scan the encrypted traffic and inspect it for viruses

and malware, it should act as the machine-in-the-middle to decrypt this communication and then re-encrypt it to send it to the website. Deep inspection must be enabled in the SSL SSH profile that will be applied to the firewall policy (see [Deep inspection on page 1390](#)). The *custom-deep-inspection* profile is modified to remove the *fortinet* FQDN address from the exemption list.

To configure the SSL SSH profile:

1. Go to *Security Profiles > SSL/SSH Inspection* and edit the *custom-deep-inspection* profile.
2. In the *Exempt from SSL Inspection* section, locate the *fortinet* FQDN entry in the *Addresses* field, and click the *X* to delete it.
3. Click *OK*.

To configure the firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following settings:

<i>Name</i>	<i>To Internet</i>
<i>Incoming Interface</i>	<i>internal1</i>
<i>Outgoing Interface</i>	<i>wan1</i>
<i>AntiVirus</i>	Enable and select <i>default</i> .
<i>SSL Inspection</i>	Select <i>custom-deep-inspection</i> .

3. Configure the other settings as needed (see [Policies on page 848](#)).

The feature set setting (proxy or flow) in the antivirus profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based antivirus profile must be used with a flow-based firewall policy.

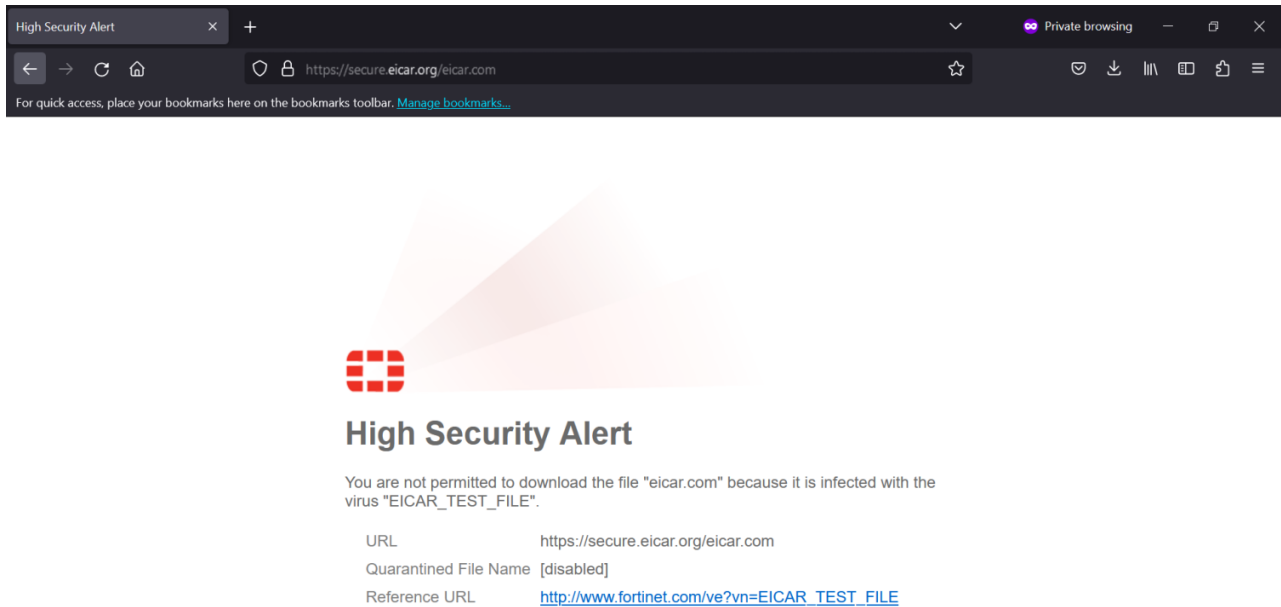

4. Click *OK*.

Example 1: EICAR test file

EICAR hosts anti-malware test files, which are available to download from <https://www.eicar.org/download-anti-malware-testfile>.

To test the AV profile with the EICAR test file:

1. On the PC, go to the [EICAR](#) website and download the *eicar.com* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.

3. Check the antivirus statistics on the FortiGate, HTTP virus detected increases by one:

```
# diagnose ips av stats show
AV stats:
HTTP virus detected: 1
HTTP virus blocked: 0
SMTP virus detected: 0
SMTP virus blocked: 0
POP3 virus detected: 0
POP3 virus blocked: 0
IMAP virus detected: 0
IMAP virus blocked: 0
NNTP virus detected: 0
NNTP virus blocked: 0
FTP virus detected: 0
FTP virus blocked: 0
SMB virus detected: 0
SMB virus blocked: 0
```

4. Check the antivirus statistics using an SNMP walk:

```
root:~# snmpwalk -c public -v 1 10.1.100.6 1.3.6.1.4.1.12356.101.8.2.1.1
iso.3.6.1.4.1.12356.101.8.2.1.1.1.1 = Counter32: 2 (fgAvVirusDetected)
iso.3.6.1.4.1.12356.101.8.2.1.1.2.1 = Counter32: 1 (fgAvVirusBlocked)
iso.3.6.1.4.1.12356.101.8.2.1.1.3.1 = Counter32: 1 (fgAvHTTPVirusDetected)
iso.3.6.1.4.1.12356.101.8.2.1.1.4.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.5.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.6.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.7.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.8.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.9.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.10.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.11.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.12.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.13.1 = Counter32: 0
```

```

iso.3.6.1.4.1.12356.101.8.2.1.1.14.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.15.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.16.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.17.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.18.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.19.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.20.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.21.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.22.1 = Counter32: 0

```

5. Verify the AV log.

- a. In the GUI, go to *Log & Report > AntiVirus*. Select the log entry and click *Details*.
- b. In the CLI, enter the following:

```

# execute log filter category 2
# execute log display
date=2023-08-30 time=14:51:26 eventtime=1693432286598227820 tz="-0700"
logid="0211008192" type="utm" subtype="virus" eventtype="infected" level="warning"
vd="root" policyid=1 poluid="c65fa590-4758-51ee-4d28-f2cc75f14979"
policytype="policy" msg="File is infected." action="blocked" service="HTTPS"
sessionid=15797 srcip=192.168.1.110 dstip=89.238.73.97 srcport=64641 dstport=443
srccountry="Reserved" dstcountry="Germany" srcintf="internal1"
srcintfrole="undefined" dstintf="wan1" dstintfrole="wan" srcuuid="ab8d1c24-30b1-51ee-
138a-f7be846c205d" dstuuid="ab8d1c24-30b1-51ee-138a-f7be846c205d" proto=6
direction="incoming" filename="eicar.com" quarskip="Quarantine-disabled"
virus="EICAR_TEST_FILE" viruscat="Virus" dtype="av-engine"
ref="http://www.fortinet.com/ve?vn=EICAR_TEST_FILE" virusid=2172
url="https://secure.eicar.org/eicar.com" profile="default" agent="Mozilla/5.0
(Windows NT 10.0; Win64; x64; rv:109.0) Gecko/20100101 Firefox/116.0"
httpmethod="GET" referralurl="https://www.eicar.org/"

analyticssubmit="false" crscore=50 craction=2 crlevel="critical"

```

6. Optionally, reset the antivirus statistics to zero:

```
# diagnose ips av stats clear
```

See [CLI troubleshooting cheat sheet](#) for log gathering, analysis, and troubleshooting.

Example 2: AI sample file

FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from <https://www.fortiguard.com/sample-files>.

To test the AV profile with the AI sample file:

1. On the PC, go to the [FortiGuard](#) website and download the *AI Sample* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.

High Security Alert

You are not permitted to download the file "ai_sample1" because it is infected with the virus "W32/AI.Pallas.Suspicious".

URL	https://filestore.fortinet.com/fortiguard/test-files/ml/ai_sample1
Quarantined File Name	[disabled]
Reference URL	http://www.fortinet.com/ve?vn=W32%2FAI.Pallas.Suspicious

The file is blocked due to AI-based malware detection and will be logged. Files detected by the AV Engine AI are identified with the W32/AI.Pallas.Suspicious virus signature in the AV logs.

3. Verify the AV log.

a. In the GUI, go to *Log & Report > AntiVirus*. Select the log entry and click *Details*.

b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-08-30 time=17:28:57 eventtime=1693441737721077640 tz="-0700"
logid="0211008192" type="utm" subtype="virus" eventtype="infected" level="warning"
vd="root" policyid=1 poluuid="c65fa590-4758-51ee-4d28-f2cc75f14979"
policytype="policy" msg="File is infected." action="blocked" service="HTTPS"

```

Example 3: VO sample file

To test the AV profile with the VO sample file:

1. On the PC, go to the [FortiGuard](#) website and download the *VO Sample* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.

High Security Alert

You are not permitted to transfer the file "zhvo_test.com" because its signature "503e99fe40ee120c45bc9a30835e7256fff3e46a" has been identified by the Virus Outbreak Prevention service.

URL https://filestore.fortinet.com/fortiguard/test-files/outbreak-prevention/zhvo_test.com
 Quarantined File Name [disabled]

The file is blocked due to the virus outbreak protection service and database that is enabled in the *default* AV profile.

3. Verify the AV log.

- a. In the GUI, go to *Log & Report* > *AntiVirus*. Select the log entry and click *Details*.
- b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-08-30 time=17:50:33 eventtime=1693443033509250120 tz="-0700"
logid="0204008202" type="utm" subtype="virus" eventtype="outbreak-prevention"

Example 4: behavioral-based samples detected by a sandbox

The FortiGate can be integrated with FortiSandbox appliance (used in this example), FortiSandbox Cloud, or FortiGate Cloud Sandbox. See [Configuring Sandboxing on page 2386](#) for more information about configuring the different FortiSandbox sandbox solutions.

In this example, when a client attempts to download a file, the AV profile is configured to send *All Supported Files* to the FortiSandbox appliance for scanning and allows the file to be downloaded by the client in the first attempt. After the FortiSandbox scans and presents a verdict, it updates its malware signature database and the FortiGate retrieves the malware signature database from FortiSandbox if the [FortiSandbox database on page 1196](#) is enabled.

If a user attempts to download the file again, the FortiGate will either block or allow the download depending on the FortiSandbox verdict. See [Using FortiSandbox with antivirus on page 1197](#) for more information.

This example assumes that the scan profile has already been configured in FortiSandbox. See [Verify the FortiSandbox Analysis](#) in the FortiSandbox Administration Guide for more information.

To test the AV profile with a Windows executable sample file:

1. Integrate the FortiGate with the FortiSandbox appliance using the Security Fabric (see [Configuring Sandboxing on page 2386](#)).
2. Update the AV profile to send *All Supported Files* to FortiSandbox for inspection (see [Using FortiSandbox with antivirus on page 1197](#)).

3. On the PC, go to the [FortiGuard](#) website, hover over the *Windows Executable* link, right-click, and select the browser's option to copy the link.
4. Open another browser tab, paste the URL, and append the URL with `&s=<string>`, such as `https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt*123`. Every file download attempt from the FortiGuard website downloads a new file. Downloading a file with same `<string>` ensures that the downloaded file is the same, and not a new file. A file named `windows.exe` is downloaded by the client, and a copy is sent to the FortiSandbox appliance for analysis.
5. Verify the AV log to confirm that the file was submitted to FortiSandbox:

```
# execute log filter category 2
# execute log display
date=2023-11-07 time=15:28:41 eventtime=1699399721812721581 tz="-0800"
logid="0201009233" type="utm" subtype="virus" eventtype="analytics" level="information"
vd="root" policyid=1 poluuid="6f2b2dee-478a-51ee-e9c3-b7218be554fe" policytype="policy"
msg="File submitted to Sandbox." action="analytics" service="HTTPS" sessionid=28695
srcip=192.168.1.110 dstip=209.52.38.145 srcport=52741 dstport=443 srccountry="Reserved"
dstcountry="Canada" srcintf="internal1" srcintfrole="undefined" dstintf="wan1"
dstintfrole="wan" srcuuid="a051eeb2-5284-51ee-99d0-d8b19cb7439d" dstuuid="6c43f8d6-478a-
51ee-95d8-31177232e869" proto=6 direction="incoming" filename="windows.exe"
filetype="exe" url="https://filegen.fortinet.com/v1/sandbox-file?file_
name=windows.exe&s=ftnt*123" profile="default" agent="Chrome/118.0.0.0"
analyticsscksum="8f6392d051fa38e79d66bafed67ce8a1f907b7a9d376b1e270cea2647c2aa3c5"
analyticsssubmit="true" rawdata="Method=GET|Response-Content-Type=application/octet-
stream|user-agent=Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML,
like Gecko) Chrome/118.0.0.0 Safari/537.36"
```

6. After FortiSandbox finishes scanning the file (typically between one to three minutes), attempt to re-download the file using the same URL and separator (`https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt*123`).
7. The file is now blocked by the FortiGate, and a *High Security Alert* block page appears in the PC's browser.

High Security Alert

You are not permitted to download the file "windows.exe" because it is infected with the virus "FSA/RISK_HIGH".

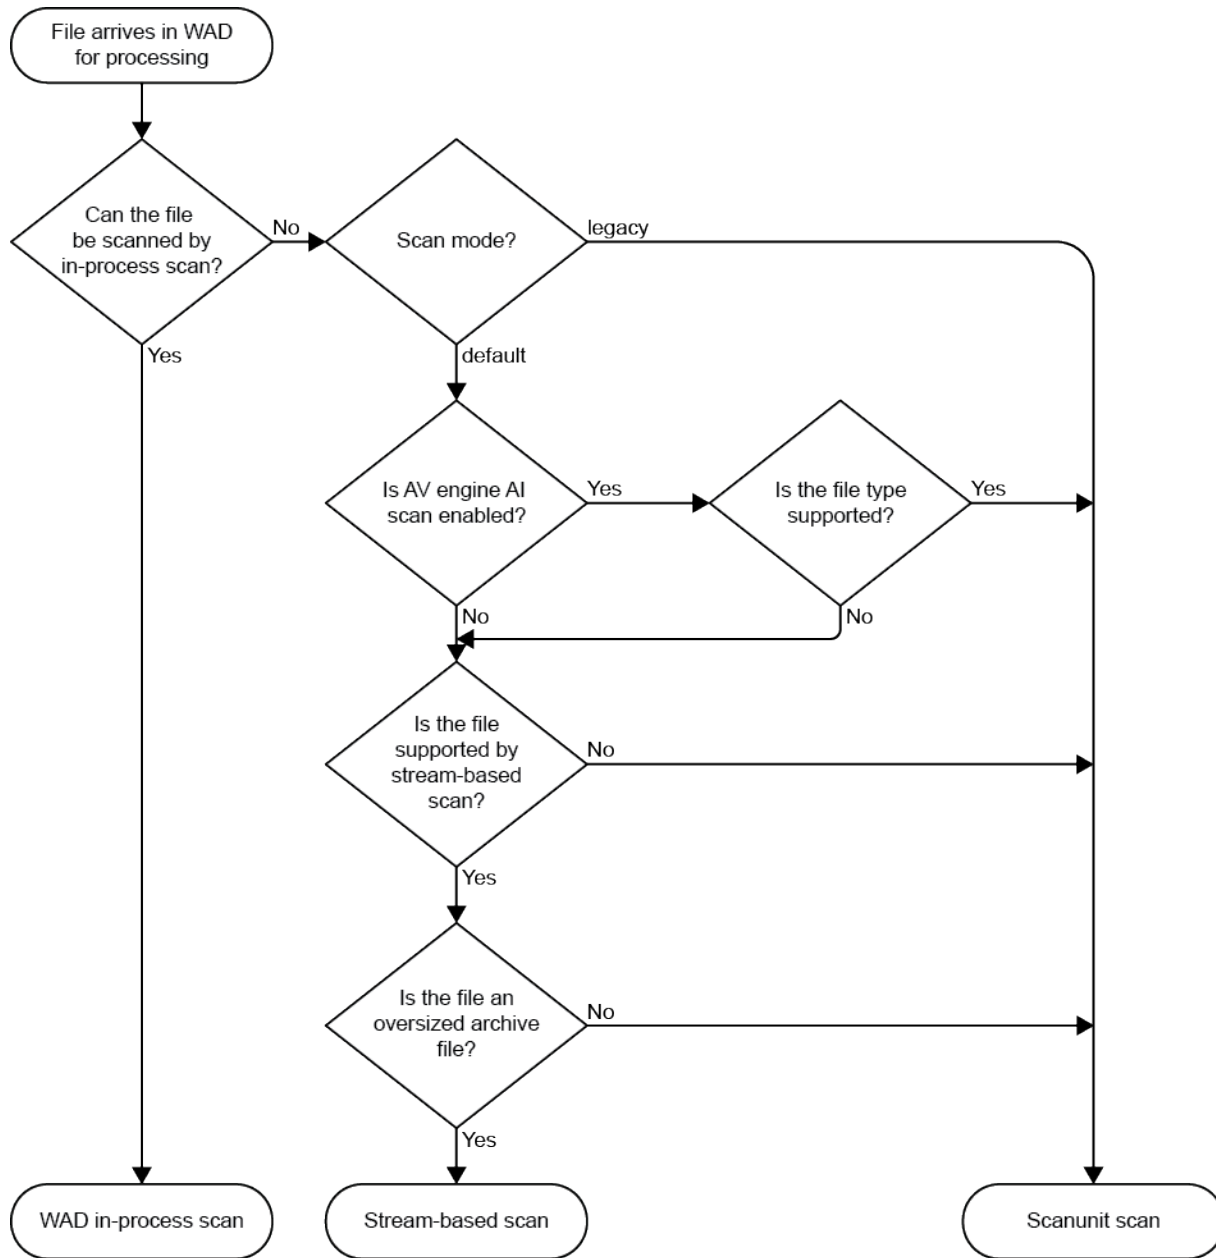

URL	https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt*123
Quarantined File Name	c1fa1de7.windows.exe
Reference URL	http://www.fortinet.com/ve?vn=FSA%2FRISK_HIGH

8. Verify the AV log again.
 - a. In the GUI, go to *Log & Report > AntiVirus*. Select the log entry and click *Details*.
 - b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-11-07 time=15:40:17 eventtime=1699400417588527201 tz="-0800"

```

Proxy mode stream-based scanning

In proxy mode, AV scanning is processed as follows:

Can the file be scanned by in-process scan?

- This is determined by the WAD daemon.
- In-process scan can be used for simple AV configurations to quickly scan a file without handing it off to another process.
- The following, more complex feature sets cannot be processed by in-process scan:
 - AV engine AI scan
 - DLP
 - Quarantine
 - FortiGuard outbreak prevention, external block list, and EMS threat feed
 - Content disarm

Scan mode?

- To configure the scan mode:

```
config antivirus profile
  edit <name>
    set feature-set proxy
    set scan-mode {default | legacy}
  next
end
```

default	Enable stream-based scanning (default).
legacy	Disable stream-based scanning.

Is AV engine AI scan enabled?

- When enabled, supported files (such as EXE, PDF, and MS Office) are forwarded to the scanunit scan.
- AV engine AI scan is enabled by default. To disable it:

```
config antivirus settings
  set machine-learning-detection disable
end
```

Is the file supported by stream-based scan?

- Stream-based scan supports the following archive file types: ZIP, GZIP, BZIP2, TAR, and ISO (ISO 9660).
- In FortiOS 7.0, stream-based scan is supported in HTTP(S), FTP(S), and SCP/SFTP.
- In FortiOS 6.4 and 6.2, stream-based scan is only supported in HTTP(S).
- Stream-based scan does not support HTTP POST.
- Stream-based scan is not supported when the following features are enabled:
 - DLP
 - Quarantine
 - FortiGuard outbreak prevention, external block list, and EMS threat feed
 - Content Disarm
- If a file is not supported, it is buffered and sent to scanunit for scanning.

Is the file an oversized archive file?

- An oversized archive file is a compressed file that is oversized according to the following setting:

```
config firewall profile-protocol-options
  edit <profile>
    config <protocol>
      set oversize-limit <size>
    end
  next
end
```

- If the file is not oversized, it is buffered and sent to scanunit for scanning.

Notes

Stream-based scans:

- Are performed with no oversize limits on a best effort basis.
- Can inspect the contents of large archive files without buffering the entire file.
- Decompress and scan the entire archive.
- Can cache infected scan results and clean the scan results (this is enabled by default):

```
config antivirus settings
    set cache-infection-result enable
    set cache-clean-result enable
end
```

Legacy scan mode:

- Used to disable stream-based scanning for troubleshooting purposes.
- Limited by the oversize and uncompressed-oversize limits:

```
config firewall profile-protocol-options
    edit <profile>
        config <protocol>
            set oversize-limit <size>
            set uncompressed-oversize-limit <size>
        end
    next
end
```

TCP windows

Some file transfer applications can negotiate large TCP windows. For example, WinSCP can negotiate an initial TCP window size of about 2 GB.

The TCP window options can be used to prevent overly large initial TCP window sizes, helping avoid channel flow control issues. It allows stream-based scan's flow control to limit peers from sending data that exceeds a policy's configured oversize limit.

To configure TCP window size options:

```
config firewall profile-protocol-options
    edit <string>
        config {http | ftp | ssh | cifs}
            set stream-based-uncompressed-limit <integer>
            set tcp-window-type {auto-tuning | system | static | dynamic}
            set tcp-window-size <integer>
            set tcp-window-minimum <integer>
            set tcp-window-maximum <integer>
        end
    next
end
```

- | | |
|--------------------------------------|---|
| <pre>{http ftp ssh cifs}</pre> | <ul style="list-style-type: none"> • http: Configure HTTP protocol options. • ftp: Configure FTP protocol options. • ssh: Configure SFTP and SCP protocol options. |
|--------------------------------------|---|

	<ul style="list-style-type: none"> <code>cifs</code>: Configure CIFS protocol options.
<code>stream-based-uncompressed-limit</code> <integer>	The maximum stream-based uncompressed data size that will be scanned, in MB (default = 0 (unlimited)). Stream-based uncompression used only under certain conditions.)
<code>tcp-window-type</code> { <code>auto-tuning</code> <code>system</code> <code>static</code> <code>dynamic</code> }	The TCP window type to use for this protocol. <ul style="list-style-type: none"> <code>auto-tuning</code>: Allow the system to auto-tune TCP window size (default). <code>system</code>: Use the system default TCP window size for this protocol. <code>static</code>: Manually specify the TCP window size. <code>dynamic</code>: Vary the TCP window size based on available memory within the limits configured in <code>tcp-window-minimum</code> and <code>tcp-window-maximum</code>.
<code>tcp-window-size</code> <integer>	The TCP static window size (65536 - 33554432, default = 262144). This option is only available when <code>tcp-window-type</code> is <code>static</code> .
<code>tcp-window-minimum</code> <integer>	The minimum TCP dynamic window size (65536 - 1048576, default = 131072). This option is only available when <code>tcp-window-type</code> is <code>dynamic</code> .
<code>tcp-window-maximum</code> <integer>	The maximum TCP dynamic window size (1048576 - 33554432, default = 8388608). This option is only available when <code>tcp-window-type</code> is <code>dynamic</code> .

Databases

The antivirus scanning engine uses a virus signatures database to record the unique attributes of each infection. The antivirus scan searches for these signatures and when one is discovered, the FortiGate determines if the file is infected and takes action.

All FortiGates have the normal antivirus signature database. Some models have additional databases that you can use. The database you use depends on your network and security needs, and on your FortiGate model.

The extended virus definitions database is the default setting and provides comprehensive antivirus protection. Entry-level and some mid-range FortiGates cannot support the extreme database. The FortiGate 300D is the lowest model that supports the extreme database. All VMs support the extreme database. The `use-extreme-db` setting is only available on models that support the extreme database.

Extended	This is the default setting. This database includes currently spreading viruses, as determined by the FortiGuard Global Security Research Team, plus recent viruses that are no longer active. These viruses may have been spreading within the last year but have since nearly or completely disappeared.
Extreme	This includes the extended database, plus a large collection of zoo viruses. These are viruses that have not spread in a long time and are largely dormant. Some zoo viruses might rely on operating systems and hardware that are no longer widely used.

To change the antivirus database:

```
config antivirus settings
  set use-extreme-db {enable | disable}
```

end

FortiSandbox database

The *Use FortiSandbox database* setting in the Antivirus profile enables the FortiGate's antivirus engine to receive the latest malware signatures discovered by FortiSandbox that is stored inside FortiSandbox's malware database. By enabling *Use FortiSandbox database*, FortiGate uses these signatures from the malware database along with its existing antivirus signature database for scanning. The antivirus engine scan searches for the malware signature database and antivirus signature database in tandem to check for a match. Once a signature match is discovered, the FortiGate determines if the file is infected and takes action.

The malware signature database supplements the existing antivirus signature database on the FortiGate. This setting is useful if a FortiSandbox solution (either FortiGate Sandbox Cloud, FortiSandbox Cloud, or the FortiSandbox appliance) is deployed.

If you have multiple FortiGates deployed and FortiSandbox is in use, if *Use FortiSandbox database* is enabled in the Antivirus profile, it will enable all FortiGates to download the malware signature database from your FortiSandbox. This can prevent zero-day attacks discovered by the FortiSandbox. FortiSandbox can also be configured to submit its malware signature database with Fortinet Inc. Community by enabling the required *Contribute* settings under your scan profile. See [Scan Profile Advanced Tab](#) in the FortiSandbox Administration Guide for information on the scan profile.

FortiGuard labs later release the required submitted signatures in the form of Antivirus updates which can be downloaded by the FortiGates worldwide through FortiGuard updates. See [Configuring FortiGuard updates on page 2275](#).

To enable using the FortiSandbox database in an antivirus profile in the GUI:

1. Go to *Security Profile > AntiVirus*.
2. Select the default profile and click *Edit*.
3. Under the *APT Protection Options*, enable *Use FortiSandbox database*.
4. Click *OK* to save the changes.
5. Apply this default profile to the respective firewall policy.

To enable using the FortiSandbox database in an antivirus profile in the CLI:

```
config antivirus profile
  edit "default"
    set analytics-db enable
  next
end
```

It is best practice to keep the `analytics-db` enabled.

To use the antivirus profile in a firewall policy:

```
config firewall policy
  edit 1
    set name "policyid-1"
    set srcintf "lan"
```

```

    set dstintf "wan"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set ssl-ssh-profile "certificate-inspection"
    set av-profile "default"
    set nat enable
  next
end

```

Once the Antivirus profile is configured to use the FortiSandbox database and submit files to FortiSandbox, and the antivirus profile is used in a firewall policy, the sharing of malware database from the FortiSandbox to the FortiGate needs to be configured. For information on submitting files to FortiSandbox, see [Using FortiSandbox with antivirus on page 1197](#).

The configuration depends on the type of FortiSandbox in use. The table below shows key differences in configuration:

Type of FortiSandbox	Malware database sharing with the FortiGate
FortiSandbox Appliance/FortiSandbox VM (On-Premise)	Enabled using the Global network. See Global Network in the FortiSandbox Administration Guide.
FortiSandbox Cloud (PaaS)	Enabled by default.
FortiGate Cloud Sandbox (SaaS)	Enabled by default.

Advanced configurations

This section includes the following:

- [Using FortiSandbox with antivirus on page 1197](#)
- [Using FortiNDR inline scanning with antivirus on page 1199](#)
- [Malware threat feed from EMS on page 1202](#)
- [CIFS support on page 1205](#)

Using FortiSandbox with antivirus

Antivirus profiles can submit potential zero-day viruses to FortiSandbox for inspection. Based on FortiSandbox's analysis, the FortiGate can supplement its own antivirus database with FortiSandbox's threat intelligence to detect files determined as malicious or suspicious. This augments the FortiGate antivirus with zero-day detection.

FortiSandbox can be used with antivirus in both proxy-based and flow-based inspection modes. The FortiGate first examines the file for any known viruses. When a match is found, the file is tagged as known malware. If no match is found, the files are forwarded to FortiSandbox using the following options:

- *All Supported Files*: all files matching the file types defined in the scan profile of the FortiSandbox are forwarded.
- *Suspicious Files Only*: files classified by the antivirus as having any possibility of active content are forwarded to FortiSandbox. When using FortiGate Cloud Sandbox, we recommend selecting this option due to its submission

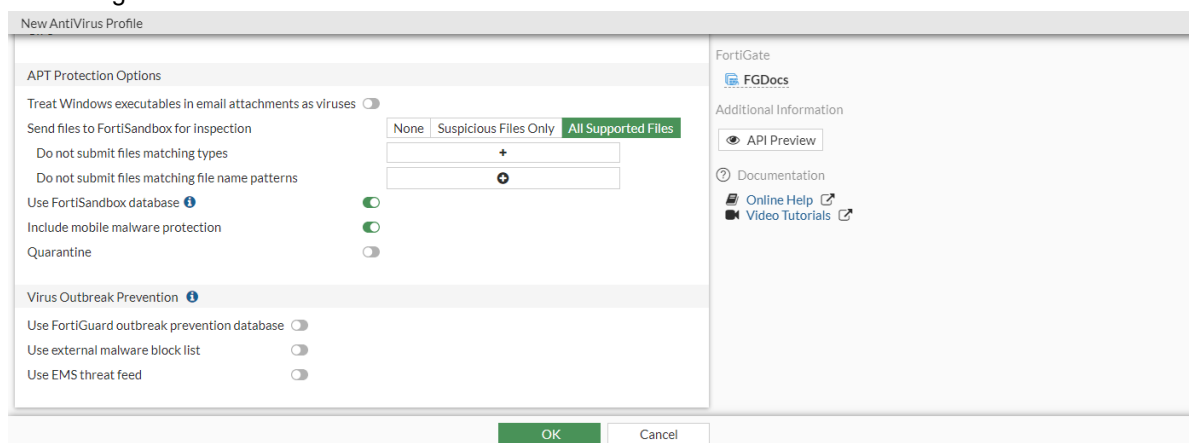

limits.

- *None*: files are not forwarded to FortiSandbox.

For more information, see [Configuring Sandboxing on page 2386](#).

To enable FortiSandbox inspection in an antivirus profile:

1. Go to *Security Profiles > AntiVirus*.
2. Create, edit, or clone an antivirus profile.
3. In the *APT Protection Options* section, set *Send Files to FortiSandbox for Inspection* to either *Suspicious Files Only* or *All Supported Files*.
4. Optionally, for *Do not submit files matching types*, click the + to exclude certain file types from being sent to FortiSandbox.
5. Optionally, for *Do not submit files matching file name patterns*, click the + to enter a wildcard pattern to exclude files from being sent to FortiSandbox.

6. Enable *Use FortiSandbox Database*.
7. Click *OK*.

FortiGate diagnostics

To view the detection count:

```
# diagnose test application quarantined 7
Total: 0
```

Statistics:

```
vfid: 0, detected: 2, clean: 1252, risk_low: 6, risk_med: 2, risk_high: 1, limit_reached:0
```

To verify the address is configured correctly:

```
# diagnose test application quarantined 1
...
fortisandbox-fsb1 is enabled: analytics, realtime=yes, taskfull=no
addr=172.18.52.154/514, source-ip=0.0.0.0, keep-alive=no. ssl_opt=3, hmac_alg=0
...
```

To run the diagnostics for real-time debugging:

```
# diagnose debug application quarantined -1
# diagnose debug enable
```

To check the FortiGate Cloud server status:

```
# diagnose test application forticldd 3
...
Active APTServer status: up
```

To view FortiGate Cloud Sandbox submission statistics for advanced debugging:

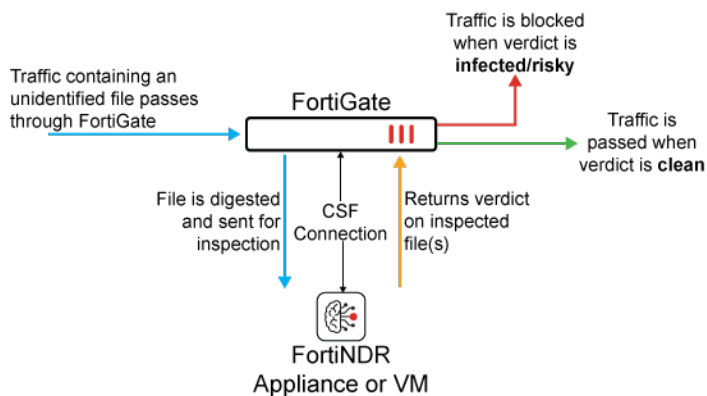

```
# diagnose test application quarantined 2
```

FortiSandbox diagnostics**To run the OFTP debug for advanced debugging:**

```
# diagnose-debug device <client serial number>
```

Using FortiNDR inline scanning with antivirus

FortiNDR can be used with antivirus profiles in proxy inspection mode (flow mode is currently not supported). FortiNDR inspects high-risk files and issues a verdict to the firewall based on how close the file features match those of malware. When enabled, FortiNDR can log, block, ignore, or monitor (allow) the file based on the verdict.

A licensed FortiNDR appliance with version 1.5.1 or later is required to use this feature.

To configure FortiNDR inline inspection with an AV profile:

1. Configure FortiNDR to join a Security Fabric in FortiOS (see [Configuring FortiNDR on page 2413](#)).
2. In the FortiNDR CLI, enable inline inspection:

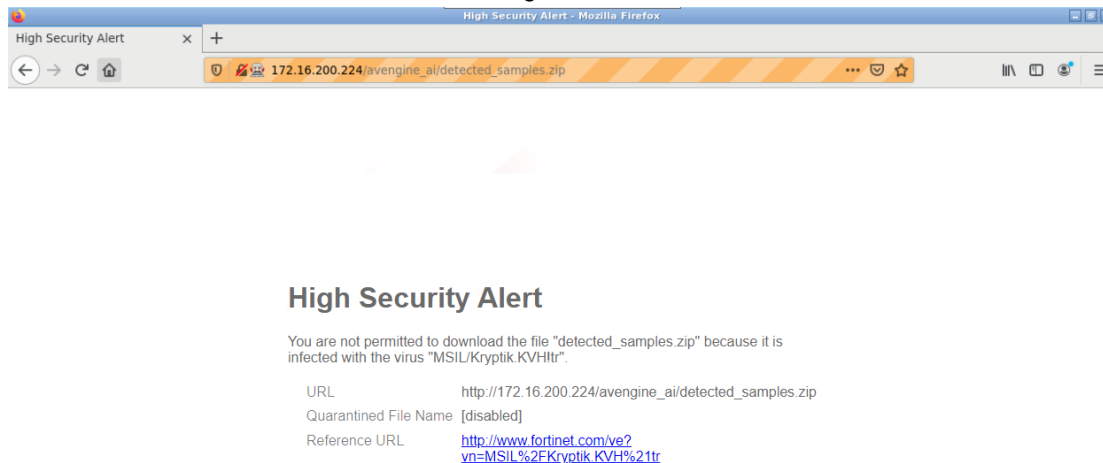

```
config system fortindr
    set status enable
end
```

3. Configure an AV profile in FortiOS to use inline inspection and block detected infections:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        config http
            set fortindr block
        end
        config ftp
            set fortindr block
        end
        config imap
            set fortindr block
        end
        config pop3
            set fortindr block
        end
        config smtp
            set fortindr block
        end
        config mapi
            set fortindr block
        end
        config nntp
            set fortindr block
        end
        config cifs
            set fortindr block
        end
        config ssh
            set fortindr block
        end
    end
next
end
```

4. Add the AV profile to a firewall policy. When potential infections are blocked by FortiNDR inline inspection, a replacement message appears (see [Replacement messages on page 2265](#) for more information). An infection

blocked over HTTP looks similar to the following:

High Security Alert

You are not permitted to download the file "detected_samples.zip" because it is infected with the virus "MSIL/Kryptik.KVH!tr".

URL http://172.16.200.224/avengine_ai/detected_samples.zip
 Quarantined File Name [disabled]
 Reference URL <http://www.fortinet.com/ve?vn=MSIL%2FKryptik.KVH%21tr>

```

FortiNDR inline inspection with other AV inspection methods

The following inspection logic applies when FortiNDR inline inspection is enabled simultaneously with other AV inspection methods. The AV engine inspection and its verdict always takes precedence because of performance. The actual behavior depends on which inspected protocol is used.

HTTP, FTP, SSH, and CIFS protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
 - a. FortiNDR inline inspection occurs simultaneously.
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
 - a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
 - a. FortiNDR inline inspection occurs simultaneously.

If any AV inspection method returns an infected verdict, the FortiNDR inspection is aborted.

POP3, IMAP, SMTP, NNTP, and MAPI protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
 - a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
 - a. FortiNDR inline inspection occurs simultaneously.

In an AV profile, use `set fortindr-error-action {log-only | block | ignore}` to configure the action to take if FortiNDR encounters an error.

Accepted file types

The following file types are sent to FortiNDR for inline inspection:

7Z	HTML	RTF
ARJ	JS	TAR
BZIP	LZH	VBA
BZIP2	LZW	VBS
CAB	MS Office documents (XML and non-	WinPE (EXE)
ELF	XML)	XZ
GZIP	PDF	ZIP
	RAR	

Malware threat feed from EMS

A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. This feature is supported in proxy and flow mode.

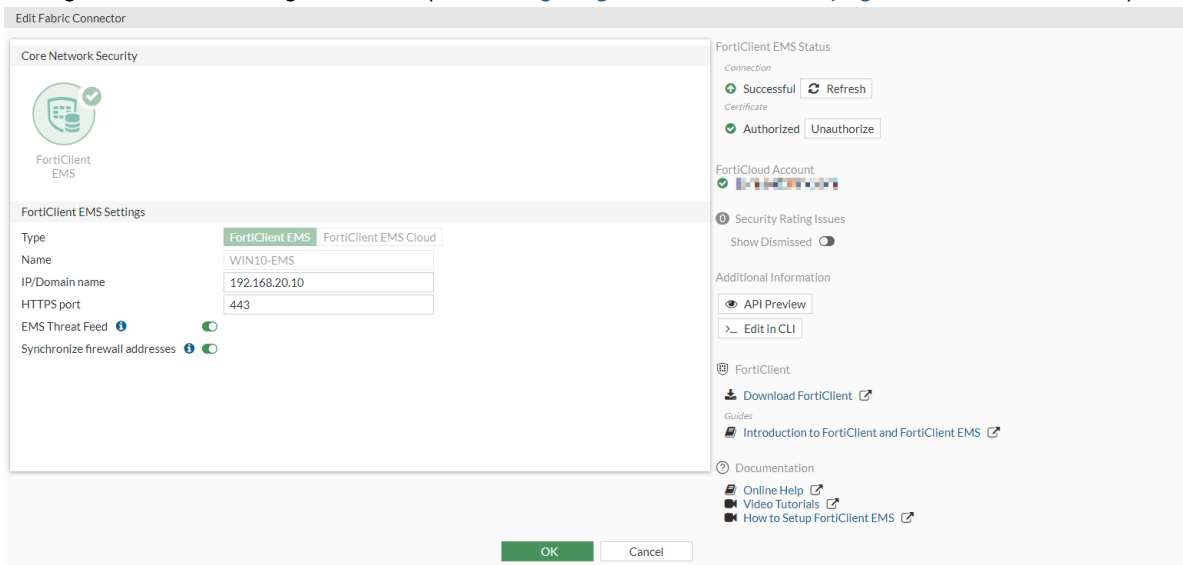

If an external malware blocklist and the FortiGuard outbreak prevention database are also enabled in the antivirus profile, the checking order is: AV local database, EMS threat feed, external malware blocklist, FortiGuard outbreak prevention database. If the EMS threat feed and external malware blocklist contain the same hash value, then the EMS infection will be reported if both of them are blocked.

To configure an EMS threat feed in an antivirus profile in the GUI:

1. Enable the EMS threat feed:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
 - b. Enable *EMS Threat Feed*.

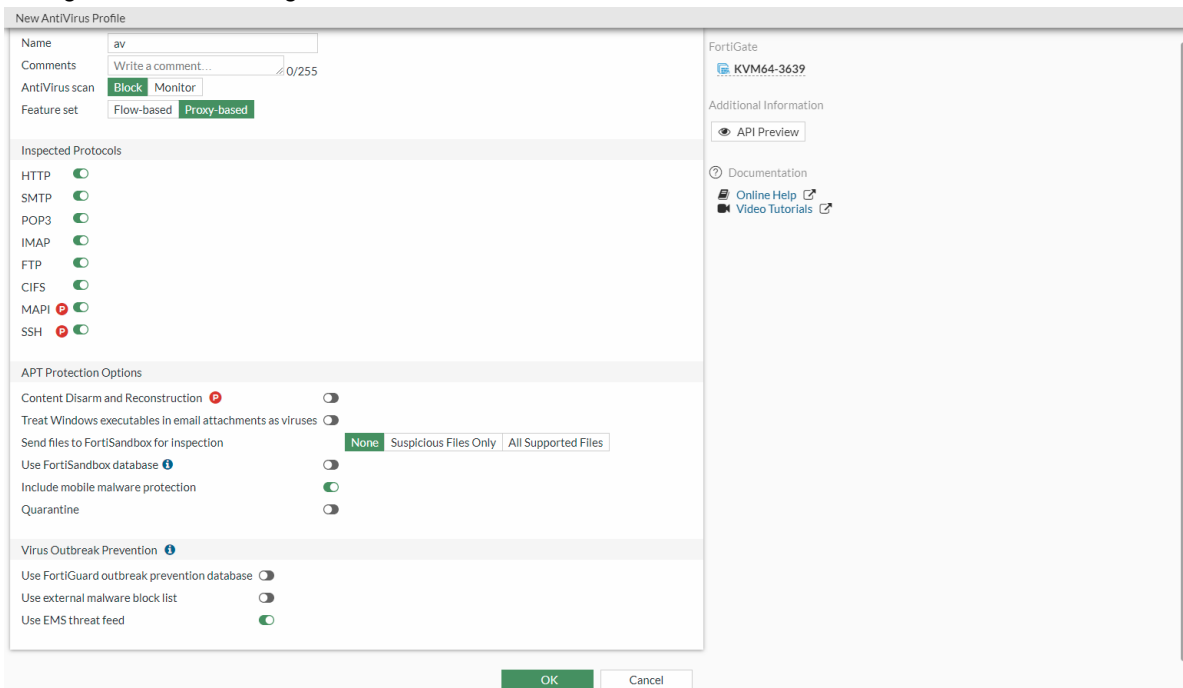

- c. Configure the other settings if needed (see [Configuring FortiClient EMS on page 2391](#) for more details).

- d. Click OK.

2. Create the antivirus profile:

- a. Go to *Security Profiles > AntiVirus* and click *Create New*.
- b. In the *Virus Outbreak Prevention* section, enable *Use EMS threat feed*.
- c. Configure the other settings as needed.

- d. Click OK.

To configure an EMS threat feed in an antivirus profile in the CLI:

1. Enable the EMS threat feed:

```
config endpoint-control fctems
  edit "WIN10-EMS"
    set fortinetone-cloud-authentication disable
    set server "192.168.20.10"
    set https-port 443
    set source-ip 0.0.0.0
    set pull-sysinfo enable
    set pull-vulnerabilities enable
    set pull-avatars enable
    set pull-tags enable
    set pull-malware-hash enable
    unset capabilities
    set call-timeout 30
    set websocket-override disable
  next
end
```

2. Create the antivirus profile:

```
config antivirus profile
  edit "av"
    config http
      set av-scan block
    end
    config ftp
      set av-scan block
    end
    config imap
      set av-scan block
    end
    config pop3
      set av-scan block
    end
    config smtp
      set av-scan block
    end
    config cifs
      set av-scan block
    end
    set external-blocklist-enable-all enable
    set ems-threat-feed enable
  next
end
```

Sample log

```
# execute log filter category utm-virus
# execute log display
```

```
1: date=2021-03-19 time=16:06:46 eventtime=1616195207055607417 tz="-0700" logid="0208008217"

```

CIFS support

Antivirus scanning on Common Internet File System (CIFS) traffic is supported in flow-based and proxy-based inspection. The file filter profile handles the configuration of file filtering on CIFS. The antivirus profile handles the antivirus configuration for CIFS scanning.

File filtering for CIFS is performed by inspecting the first 4 KB of the file to identify the file's magic number. If a match occurs, CIFS file filtering prevents the CIFS command that contains that file from running. The file filter functions differently for un-encrypted and encrypted CIFS traffic:

- For un-encrypted CIFS traffic, the standalone file filter works in flow and proxy mode.
- For encrypted CIFS traffic, the CIFS profile must be enabled in the firewall policy because the SMB server's credential settings are still be configured in CIFS profile. Using the standalone file filter only works in proxy mode.

For a CIFS profile to be available for assignment in a policy, the policy must use proxy inspection mode. See [Proxy mode inspection on page 1171](#) for details. Note that in proxy inspection mode, special condition archive files (encrypted, corrupted, mailbomb, and so on) marked by the antivirus engine are blocked automatically.

Messages that are compressed with LZNT1, LZ77, and LZ77+Huffman algorithms can be scanned in proxy mode.

To configure file-type filtering and antivirus scanning on CIFS traffic:

1. [Configure a CIFS domain controller on page 1205](#)
2. [Configure a CIFS profile on page 1206](#)
3. [Configure an antivirus profile on page 1208](#)

Configure a CIFS domain controller

The domain controller must be configured when CIFS traffic is encrypted. The configuration tells the FortiGate the network location of the domain controller and the superuser credentials.

For FortiGate to retrieve the domain information, the user needs to grant Replicating Directory Changes permissions in the Domain Controller (DC). See [How to grant the "Replicating Directory Changes" permission for the Microsoft Metadirectory Services ADMA service account](#) for more information.

To configure the CIFS domain controller:

```

config user domain-controller
  edit "SERVER_NAME"
    set hostname "host"
    set domain-name "EXAMPLE.COM"
    set username "admin-super"
    set password *****
    set ip 172.16.201.40
  next
end

```

Configure a CIFS profile

To create a CIFS profile, configure the server credential type and create a file filter profile.

Set the CIFS server credential type

The CIFS server credential type can be `none`, `credential-replication`, or `credential-keytab`.

none

The CIFS profile assumes the CIFS traffic is unencrypted. This is the default value.

```

config firewall profile-protocol-options
  edit "cifs"
    config cifs
      set server-credential-type none
    end
  next
end

```

credential-replication

To decrypt CIFS traffic, FortiOS obtains the session key from the domain controller by logging in to the superuser account. The domain controller must be configured.

```

config firewall profile-protocol-options
  edit "cifs"
    config cifs
      set server-credential-type credential-replication
      set domain-controller "SERVER_NAME"
    end
  next
end

```

Variable	Description
domain-controller <string>	The previously configured domain to decrypt CIFS traffic for.

credential-keytab

To decrypt CIFS traffic, FortiOS uses a series of keytab values. This method is used when the SMB connection is authenticated by Kerberos. Keytab entries must be configured, and are stored in FortiOS in plaintext.

```

config firewall profile-protocol-options
  edit "cifs"
    config cifs
      set server-credential-type credential-keytab
      config server-keytab
        edit "keytab1"
          set keytab
            "BQIAAABFAAEAC0VYQU1QTEUuQ09NAAadleGFtcGxlAAAAVUmAlwBABIAILdV5P6NXT8RrTvapcMJQxDYCjRQiD0Bzxh
            wS9h0VgyM"
        next
      end
    end
  next
end

```

Variable	Description
keytab <keytab>	Base64 encoded keytab file containing the credentials of the server.

Configure CIFS file filtering

Multiple rules can be added to a file filter profile. See [File filter on page 1329](#).

To configure a file filter for CIFS traffic:

```

config file-filter profile
  edit "cifs"
    set comment "block zip files on unencrypted cifs traffic"
    set feature-set flow
    set replacemsg-group ''
    set log enable
    config rules
      edit "rule1"
        set protocol cifs
        set action block
        set direction any
        set password-protected any
        set file-type zip
      next
    end
  next
end

```

Variable	Description
comment <string>	A brief comment describing the entry.
feature-set {flow proxy}	Flow or proxy mode feature set (default = flow).
replacemsg-group <string>	Replacement message group.
log {enable disable}	Enable/disable file filter logging (default = enable).
scan-archive-contents [enable disable]	Enable/disable scanning of archive contents (default = enable).

Variable	Description
protocol {http ftp smtp imap pop3 mapi cifs ssh}	Filter based on the specified protocol(s).
action {log-only block}	The action to take for matched files: <ul style="list-style-type: none"> log-only: Allow the content and write a log message (default). block: Block the content and write a log message.
direction {incoming outgoing any}	Match files transmitted in the session's originating (incoming) and/or reply (outgoing) direction (default = any).
password-protected [yes any]	Match only password-protected files (yes) or any file (default = any).
file-type <file_type>	The file types to be matched. See Supported file types on page 1335 for details.

Configure an antivirus profile

The antivirus profile handles the antivirus configuration for CIFS scanning.

To configure an antivirus profile:

```
config antivirus profile
  edit "av"
    ...
    config cifs
      set av-scan {disable | block | monitor}
      set outbreak-prevention {disable | block | monitor}
      set external-blocklist {disable | block | monitor}
      set quarantine {enable | disable}
      set archive-block {encrypted corrupted partiallycorrupted multipart nested
mailbomb fileslimit timeout unhandled}
      set archive-log {encrypted corrupted partiallycorrupted multipart nested
mailbomb fileslimit timeout unhandled}
      set emulator {enable | disable}
    end
  end
next
end
```

Variable	Description
av-scan	Enable antivirus scan service: <ul style="list-style-type: none"> disable: Disable (default). block: Block the virus infected files. monitor: Log the virus infected files.
outbreak-prevention {disable block monitor}	Enable the virus outbreak prevention service: <ul style="list-style-type: none"> disable: Disable (default). block: Block the matched files. monitor: Log the matched files.
external-blocklist {disable block monitor}	Enable the external blocklist: <ul style="list-style-type: none"> disable: Disable (default).

Variable	Description
	<ul style="list-style-type: none"> • block: Block the matched files. • monitor: Log the matched files.
quarantine {enable disable}	Enable/disable quarantine for infected files (default = <code>disable</code>).
archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to block: <ul style="list-style-type: none"> • encrypted: Block encrypted archives. • corrupted: Block corrupted archives. • partiallycorrupted: Block partially corrupted archives. • multipart: Block multipart archives. • nested: Block nested archives. • mailbomb: Block mail bomb archives. • fileslimit: Block exceeded archive files limit. • timeout: Block scan timeout. • unhandled: Block archives that FortiOS cannot open.
archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to log: <ul style="list-style-type: none"> • encrypted: Log encrypted archives. • corrupted: Log corrupted archives. • partiallycorrupted: Log partially corrupted archives. • multipart: Log multipart archives. • nested: Log nested archives. • mailbomb: Log mail bomb archives. • fileslimit: Log exceeded archive files limit. • timeout: Log scan timeout. • unhandled: Log archives that FortiOS cannot open.
emulator {enable disable}	Enable/disable the virus emulator (default = <code>enable</code>).

Log samples

File-type detection events generated by CIFS profiles are logged in the `utm-cifs` log category. Antivirus detection over the CIFS protocol generates logs in the `utm-virus` category. See the [FortiOS Log Message Reference](#) for more information.

Logs generated by CIFS profile file filter:

```

Configuration examples

This section includes the following examples:

- [Content disarm and reconstruction on page 1210](#)
- [FortiGuard outbreak prevention on page 1212](#)
- [External malware block list on page 1214](#)

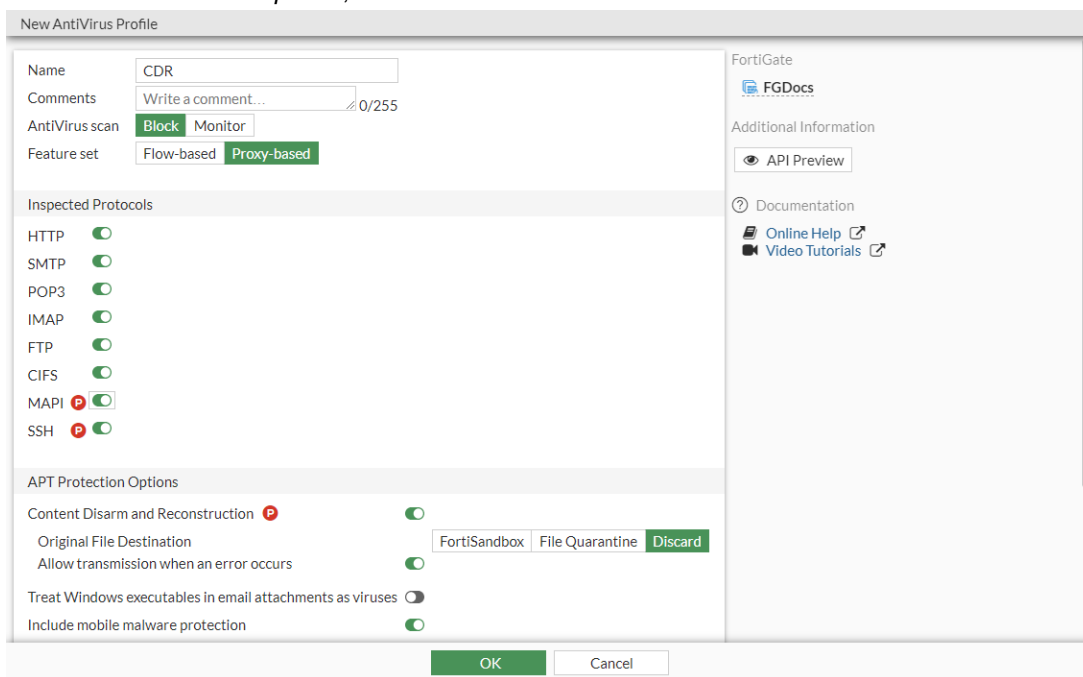

Content disarm and reconstruction

In this example, a Microsoft Office document with an embedded hyperlink (that redirects to an external website) is sent to the receiver. When the user receives the file, the hyperlink in the document is deactivated. See [Content disarm and reconstruction on page 1177](#) for more information.

To configure CDR:

1. Go to *Security Profiles > AntiVirus*.
2. Edit an antivirus profile, or create a new one.
3. Under *APT Protection Options*, enable *Content Disarm and Reconstruction*.

4. Select a quarantine location from the available options:

FortiSandbox	Saves the original document file to a connected FortiSandbox.
File Quarantine	Saves the original document file to disk (if possible) or a connected FortiAnalyzer based on the FortiGate log settings (<code>config log fortianalyzer setting</code>).
Discard	The default setting, which discards the original document file.

5. Click *OK*.

To edit the CDR detection parameters:

By default, stripping of all active Microsoft Office and PDF content types are enabled. In this example, stripping macros in Microsoft Office documents will be disabled.

```

config antivirus profile
  edit av
    config content-disarm
      set office-macro disable
      set detect-only {enable | disable}
      set cover-page {enable | disable}
    end
  next
end
  
```

Where:

detect-only	Only detect disarmable files, do not alter content. Disabled by default.
cover-page	Attach a cover page to the file's content when the file has been processed by CDR. Enabled by default.

FortiGuard outbreak prevention

This example demonstrates how to enable FortiGuard Virus Outbreak Protection Service (VOS). See [Virus outbreak prevention on page 1177](#) for more information.

To verify FortiGuard antivirus license information:

1. Go to *System > FortiGuard* and locate the *Outbreak Prevention* section in the table.

The screenshot displays the FortiGuard Distribution Network configuration interface. It is divided into several sections:

- License Information:** A table listing various services and their status.

Entitlement	Status	Actions
FortiCare Support	Registered	Actions
Virtual Machine	Valid (Expiration Date: 2022/01/28)	FortiGate VM License
Firmware & General Updates	Licensed (Expiration Date: 2022/01/29)	
Intrusion Prevention	Licensed (Expiration Date: 2022/01/29)	
AntiVirus	Licensed (Expiration Date: 2022/01/29)	
Web Filtering	Licensed (Expiration Date: 2022/01/29)	
Blocked Certificates	Version 1.00317	
Outbreak Prevention	Licensed (Expiration Date: 2022/01/29)	
SD-WAN Network Monitor	Licensed (Expiration Date: 2022/01/29)	
Security Rating	Licensed (Expiration Date: 2022/01/29)	
Industrial DB	Licensed (Expiration Date: 2022/01/29)	
FortiPAM	Licensed (Expiration Date: 2022/01/29)	
IoT Detection Service	Licensed (Expiration Date: 2022/01/29)	
FortiGate Cloud	Not Activated	Activate
- FortiGuard Updates:** Shows the next update scheduled for 2021/04/22 09:22:00 and a button to 'Update Licenses & Definitions Now'.
- Fortinet Service Communications:** A table showing traffic volume for various services over the last 24 hours.

Service	Traffic Volume (Last 24 hours)
FortiCare	0 B
FortiCloud Log	0 B
FortiGuard.com	1.69 MB
FortiGuard Download	55.79 MB
FortiGuard Query	144.79 kB
FortiGate Cloud Sandbox	0 B
OCVPN	0 B
SDNS	0 B
FortiToken Registration	0 B
SMS Service	0 B
- FortiGuard Filter Rating Servers:** A table showing the status of filter rating servers.

Service	Status
Web Filter	173.243.140.16 11 ms
Outbreak Prevention	173.243.140.16 11 ms
- Additional Information:** Includes buttons for 'API Preview', 'Edit in CLI', and 'Local Out Setting'.

At the bottom, there are settings for 'Scheduled updates' (set to Automatic), 'Improve IPS quality', 'Use extended IPS signature package', 'AntiVirus PUP/PUA', and 'Update server location' (set to US only, Lowest latency locations). An 'Apply' button is located at the bottom center.

2. See the instructions in the video, [How to Purchase or Renew FortiGuard Services](#), if required.

To enable FortiGuard outbreak prevention:

1. Go to *Security Profiles > AntiVirus*.
2. Edit an antivirus profile, or create a new one.
3. Under *Virus Outbreak Prevention*, enable *Use FortiGuard outbreak prevention database*.
4. Click *OK*.

To verify FortiGuard antivirus license information:

```
# diagnose debug rating

FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from <https://www.fortiguards.com/sample-files>. Test the *Virus Outbreak Prevention* feature by downloading *VO Sample* file. See [Example 3: VO sample file on page 1188](#).

External malware block list

This example demonstrates creating and implementing an external malware block list. See [External malware block list on page 1177](#) for more information.

To create the external block list:

1. Create the malware hash list.

The malware hash list follows a strict format in order for its contents to be valid. Malware hash signature entries must be separated into each line. A valid signature needs to follow this format:

```
# MD5 Entry with hash description
aa67243f746e5d76f68ec809355ec234 md5_sample1

# SHA1 Entry with hash description
a57983cb39e25ab80d7d3dc05695dd0ee0e49766 sha1_sample2

# SHA256 Entry with hash description
ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379 sha256_sample1

# Entry without hash description
0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521

# Invalid entries
7688499dc71b932feb126347289c0b8a_md5_sample2
7614e98badca10b5e2d08f8664c519b7a906fbd5180ea5d04a82f9796a4b87sha256_sample3
```

2. Configure the external malware block list source:

- a. Go to *Security Fabric > External Connectors* and click *Create New*.
- b. Click *Malware Hash*.
- c. Configure the settings as needed. The URI must point to the malware hash list on the remote server.
- d. Click *OK*.

3. To view entries inside the malware block list on the *External Connectors* page, hover over the malware hash card and click *View Entries*.

To configure antivirus to use an external block list in the GUI:

1. Go to *Security Profiles > AntiVirus* and edit the antivirus profile.
2. In the *Virus Outbreak Prevention* section, enable *Use external malware block list* and click *Specify*.
3. Click the + in the field and select a threat feed.
4. Optionally, enable *Quarantine*.

The screenshot shows the 'New AntiVirus Profile' configuration window. The 'Name' field is set to 'Demo'. Under 'Inspected Protocols', HTTP, SMTP, POP3, IMAP, FTP, CIFS, MAPI, and SSH are listed with status indicators. In the 'APT Protection Options' section, 'Quarantine' is enabled. The 'Virus Outbreak Prevention' section is expanded, showing 'Use external malware block list' enabled. A dropdown menu is open, showing 'malhash1' selected. The 'Use EMS threat feed' option is disabled. The 'OK' and 'Cancel' buttons are at the bottom.

5. Configure the other settings as needed.
6. Click *OK*.

To configure antivirus to use an external block list in the CLI:

```

config antivirus profile
  edit "Demo"
    set feature-set proxy
    set mobile-malware-db enable
    config http
      set av-scan disable
      set outbreak-prevention block
      set external-blocklist block
      set quarantine enable
      set emulator enable
      set content-disarm disable
    end
    config ftp
      set av-scan disable
      set outbreak-prevention block
      set external-blocklist block
      set quarantine enable
      set emulator enable
    end
    config imap

```

```
    set av-scan monitor
    set outbreak-prevention block
    set external-blocklist block
    set quarantine enable
    set emulator enable
    set executables default
    set content-disarm disable
end
config pop3
    set av-scan monitor
    set outbreak-prevention block
    set external-blocklist block
    set quarantine enable
    set emulator enable
    set executables default
    set content-disarm disable
end
config smtp
    set av-scan monitor
    set outbreak-prevention block
    set external-blocklist block
    set quarantine enable
    set emulator enable
    set executables default
    set content-disarm disable
end
config mapi
    set av-scan monitor
    set outbreak-prevention block
    set external-blocklist block
    set quarantine enable
    set emulator enable
    set executables default
end
config nntp
    set av-scan disable
    set outbreak-prevention disable
    set external-blocklist disable
    set quarantine disable
    set emulator enable
end
config cifs
    set av-scan monitor
    set outbreak-prevention block
    set external-blocklist block
    set quarantine enable
    set emulator enable
end
config ssh
    set av-scan disable
    set outbreak-prevention disable
    set external-blocklist disable
    set quarantine disable
    set emulator enable
end
set outbreak-prevention-archive-scan enable
set external-blocklist-enable-all disable
```

```
        set external-blocklist "malhash1"
        set av-virus-log enable
        set av-block-log enable
        set extended-log disable
        set scan-mode default
    next
end
```

The quarantine setting is configured in each protocol (`set quarantine`). The malware threat feed is also specified (`set external-blocklist-enable-all disable`) to the threat connector, `malhash1` (`set external-blocklist "malhash1"`).

To verify the scanunit daemon updated itself with the external hashes:

```
# diagnose sys scanunit malware-list list
md5 'aa67243f746e5d76f68ec809355ec234' profile 'malhash1' description 'md5_sample1'
sha1 'a57983cb39e25ab80d7d3dc05695dd0ee0e49766' profile 'malhash1' description 'sha1_
sample2'
sha256 '0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521' profile 'malhash1'
description ''

description 'sha256_sample1'
```

Web filter

Web filtering restricts or controls user access to web resources and can be applied to firewall policies using either policy-based or profile-based NGFW mode.

In FortiOS, there are three main components of web filtering:

- Web content filter: blocks web pages containing words or patterns that you specify.
- URL filter: uses URLs and URL patterns to block or exempt web pages from specific sources, or block malicious URLs discovered by FortiSandbox.
- FortiGuard Web Filtering service: provides many additional categories you can use to filter web traffic.

These components interact with each other to provide maximum control over what users on your network can view and protect your network from many internet content threats.

Web filters are applied in the following order:

1. URL filter
2. FortiGuard Web Filtering
3. Web content filter
4. Web script filter
5. Antivirus scanning

FortiOS includes three preloaded web filter profiles:

- *default*
- *monitor-all* (monitors and logs all URLs visited, flow-based)
- *wifi-default* (default configuration for offloading WiFi traffic)

You can customize these profiles, or you can create your own to manage network user access.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

The following topics provide information about web filters:

- [URL filter on page 1218](#)
- [FortiGuard filter on page 1223](#)
- [Credential phishing prevention on page 1231](#)
- [Additional antiphishing settings on page 1233](#)
- [Usage quota on page 1236](#)
- [Web content filter on page 1239](#)
- [Advanced filters 1 on page 1242](#)
- [Advanced filters 2 on page 1245](#)
- [Web filter statistics on page 1249](#)
- [URL certificate blocklist on page 1250](#)

URL filter

The URL filter uses specific URLs with patterns containing text and regular expressions so the FortiGate can process the traffic based on the filter action (exempt, block, allow, monitor) and web pages that match the criteria. Once a URL filter is configured, it can be applied to a firewall policy.

The following filter types are available:

URL filter type	Description
Simple	The FortiGate tries to strictly match the full context. For example, if you enter <i>www.facebook.com</i> in the <i>URL</i> field, it only matches traffic with <i>www.facebook.com</i> . It won't match <i>facebook.com</i> or <i>message.facebook.com</i> . When the FortiGate finds a match, it performs the selected URL action.
Regular expression/wildcard	The FortiGate tries to match the pattern based on the rules of regular expressions or wildcards. For example, if you enter <i>*fa*</i> in the <i>URL</i> field, it matches all the content that has <i>fa</i> such as <i>www.facebook.com</i> , <i>message.facebook.com</i> , <i>fast.com</i> , and so on. When the FortiGate finds a match, it performs the selected URL action.

For more information, see the [URL Filter expressions](#) technical tip in the Knowledge Base.

The following actions are available:

URL filter action	Description
Exempt	The traffic is allowed to bypass the remaining FortiGuard web filters, web content filters, web script filters, antivirus scanning, and DLP proxy operations.
Block	The FortiGate denies or blocks attempts to access any URL that matches the URL pattern. A replacement message is displayed.

URL filter action	Description
Allow	The traffic is passed to the remaining FortiGuard web filters, web content filters, web script filters, antivirus proxy operations, and DLP proxy operations. If the URL does not appear in the URL list, the traffic is permitted.
Monitor	The traffic is processed the same way as the <i>Allow</i> action. For the <i>Monitor</i> action, a log message is generated each time a matching traffic pattern is established.

The exempt URL filter action can be configured to bypass all or certain security profile operations. This setting can only be configured in the CLI.

If the action is set to `exempt`, use `set exempt` to select the security profile operations that exempt URLs skip.

```
config webfilter urlfilter
  edit <id>
    config entries
      edit <id>
        set action exempt
        set exempt {av web-content activex-java-cookie dlp fortiguard range-block
pass antiphish all}
      next
    end
  next
end
```

Option	Description
av	Antivirus scanning
web-content	Web filter content matching
activex-java-cookie	ActiveX, Java, and cookie filtering
dlp	DLP scanning
fortiguard	FortiGuard web filtering
range-block	Range block feature
pass	Pass single connection from all
antiphish	Antiphish credential checking
all	Exempt from all security profiles

These exempt options are not visible in the GUI. Setting the URL filter *Action* to *Exempt* will exempt URLs from all security profiles.

In the following example, a URL filter will be created to block the facebook.com URL using a wildcard.

Configuring a URL filter in the GUI

To create a URL filter for Facebook:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *URL Filter*.
3. Click *Create New*. The *New URL Filter* pane opens.
4. For *URL*, enter **facebook.com*, for *Type*, select *Wildcard*, and for *Action*, select *Block*.

5. Click *OK*. The entry appears in the table.

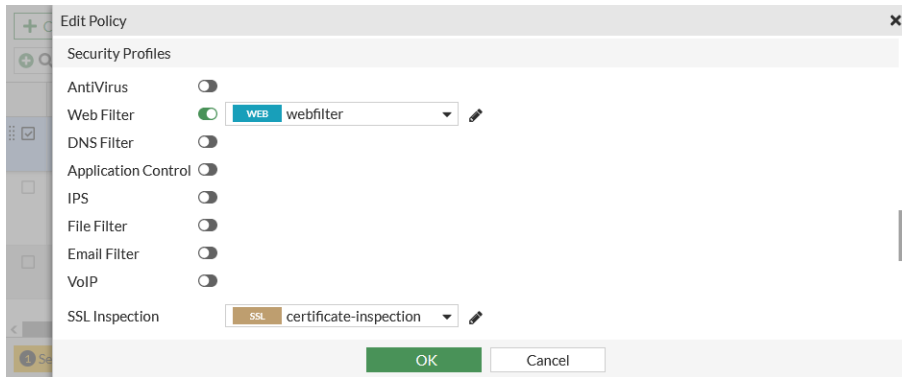

URL	Type	Action	Status
*facebook.com	Simple	Block	Enable

6. Configure the other settings as needed.
7. Click *OK*.

To apply the web filter profile to a firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Edit a policy, or create a new one.
3. In the *Security Profiles* section, enable *Web Filter* and select the profile you created.

4. Set SSL Inspection to *certificate-inspection*.

The *no-inspection* profile does not perform SSL inspection, so it should not be selected with other UTM profiles.

5. Configure the other settings as needed.

6. Click **OK**.

Configuring a URL filter in the CLI

To create a URL filter for Facebook:

```
config webfilter urlfilter
  edit 1
    set name "webfilter"
    config entries
      edit 1
        set url "*facebook.com"
        set type wildcard
        set action block
      next
    end
  next
end
```

To apply the URL filter to a web filter profile:

```
config webfilter profile
  edit "webfilter"
    config web
      set urlfilter-table 1
    end
    config ftgd-wf
      ...
    end
  next
end
```

To apply the web filter profile to a firewall policy:

```
config firewall policy
  edit 1
    set name "WF"
    set srcintf "wan2"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set logtraffic all
    set webfilter-profile "webfilter"
    set ssl-ssh-profile "certificate-inspection"
    set nat enable
  next
end
```

Verifying the URL filter results

Verify the URL filter results by going to a blocked website. For example, when you go to the Facebook website, the replacement message appears:

FortiGuard Intrusion Prevention - Access Blocked

Web Page Blocked

The page you have requested has been blocked because the URL is banned.

URL	https://www.facebook.com/facebook/
Description	
URL Source	Local URLfilter Block

To customize the URL web page blocked message:

1. Go to *System > Replacement Messages*.
2. In the *HTTP* section, select *URL Block Page* and click *Edit*.
3. Edit the HTML to customize the message. See [Replacement messages on page 2265](#) for more information.

To check web filter logs in the GUI:

1. Go to *Log & Report > Web Filter*.
2. If there are a lot of log entries, click *Add Filter* and select *Event Type > urlfilter* to display logs generated by the URL

filter.

Summary		Logs

```

FortiGuard filter

The FortiGuard filter enhances the web filter features by sorting billions of web pages into a wide range of categories that users can allow or block.

The FortiGuard Web Filtering service includes over 45 million individual website ratings that apply to more than two billion pages. When the FortiGuard filter is enabled in a web filter profile and applied to firewall policies, if a request for a web page appears in traffic controlled by one of the firewall policies, the URL is sent to the nearest FortiGuard server. The URL category or rating is returned. If the category is blocked, the FortiGate shows a replacement message in place of the requested page. If the category is not blocked, the page request is sent to the requested URL as normal.

To use this service, you must have a valid FortiGuard license.

The following actions are available:

FortiGuard web filter action	Description
Allow	Permit access to the sites in the category.
Monitor	Permit and log access to sites in the category. User quotas can be enabled for this option (see Usage quota on page 1236).
Block	Prevent access to the sites in the category. Users trying to access a blocked site see a replacement message indicating the site is blocked.
Warning	Display a message to the user allowing them to continue if they choose.
Authenticate	Require the user to authenticate with the FortiGate before allowing access to the category or category group.
Disable	Remove the category from the from the web filter profile. This option is only available for local or remote categories from the right-click menu.

FortiGuard web filter categories

FortiGuard has many web filter categories, including two local categories and a special remote category. Refer to the following table for more information:

FortiGuard web filter category	Where to find more information
All URL categories	See Web Filter Categories .
Local categories	See Web rating override on page 1414 .
Remote category	See Threat feeds on page 2673 .

The priority of categories is local category > external category > FortiGuard built-in category. If a URL is configured as a local category, it only follows the behavior of the local category and not the external or FortiGuard built-in category.

Blocking a web category

The following example shows how to block a website based on its category. The Information Technology category (category 52) will be blocked.

To block a category in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Block*.

49% 95

Allow users to override blocked categories

OK Cancel

3. Configure the remaining settings as needed.

4. Click **OK**.

To block a category in the CLI:

```
config webfilter profile
  edit "webfilter"
    config ftgd-wf
      unset options
      config filters
        edit 1
          set category 52
          set action block
        next
      end
    end
  next
end
```

You can use the `get webfilter categories` command to determine the web filtering category that corresponds to a given category ID.

To verify that the category is blocked:

1. Go to a website that belongs to the blocked category, such as www.fortinet.com.

The page should be blocked and display a replacement message.

FortiGuard Intrusion Prevention - Access Blocked

Web Page Blocked

You have tried to access a web page that is in violation of your Internet usage policy.

Category Information Technology
URL <https://www.fortinet.com/>

To have the rating of this web page re-evaluated [please click here](#).

To view the log of a blocked website in the GUI:

1. Go to *Log & Report > Web Filter*.
2. Select an entry with *blocked* in the *Action* column and click *Details*.

Date/Time	User	Source	Action	URL	Category Description	Log Details

direction="outgoing" msg="URL belongs to a denied category in policy" method="domain" cat=52
catdesc="Information Technology"
```

Allowing users to override blocked categories

There is an option to allow users with valid credentials to override blocked categories.

To allow users to override blocked categories in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. Enable *Allow users to override blocked categories*.
3. Enter information in the following fields:

<i>Groups that can override</i>	Add the user group that will be allowed to override.
<i>Profile Name</i>	Add the web filter profile the overridden group will use. This cannot be the same profile as its own.
<i>Switch applies to</i>	Select <i>User</i> , <i>User Groups</i> , <i>IP</i> , or <i>Ask</i> .
<i>Switch Duration</i>	Select either <i>Predefined</i> to specify a duration, or <i>Ask</i> for user input.

4. Configure the other settings as needed.

5. Click *OK*.

To allow users to override blocked categories in the CLI:

```

config webfilter profile
  edit "webfilter"
    set ovr-d-perm bannedword-override urlfilter-override fortiguard-wf-override
  contenttype-check-override
  config override
    set ovr-d-user-group "radius_group"
    set profile "webfilter"
  end
  config ftgd-wf
    unset options
  end
next
end

```

Issuing a warning on a web category

The following example shows how to issue a warning when a user visits a website in a specific category (Information Technology, category 52).

To configure a warning for a category in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Warning*.

3. Set the *Warning Interval*, then click *OK*.

The warning interval is the amount of time until the warning appears again after the user proceeds past it.

The screenshot shows a dialog box titled 'Edit Filter'. It contains a 'Warning Interval' section with three input fields: 'hour(s)' set to 0, 'minute(s)' set to 5, and 'second(s)' set to 0. At the bottom of the dialog are two buttons: 'OK' (green) and 'Cancel' (white).

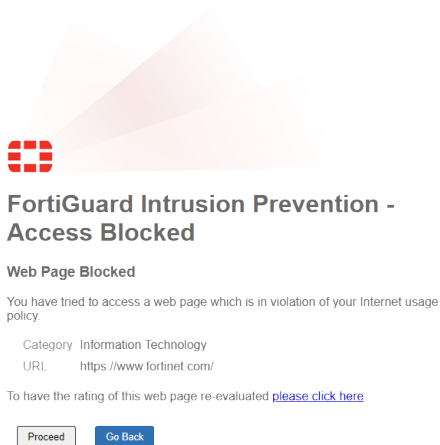

4. Configure the remaining settings as needed.
5. Click *OK*.

To configure a warning for a category in the CLI:

```
config webfilter profile
  edit "webfilter"
    config ftgd-wf
      unset options
      config filters
        edit 1
          set category 52
          set action warning
        next
      end
    end
  next
end
```

To verify that the warning works:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed* or *Go Back*.

Authenticating a web category

The following example shows how to authenticate a website based on its category (Information Technology, category 52).

To authenticate a category in the GUI:

1. Go to *Security Profiles > Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Authenticate*.
3. Set the *Warning Interval* and select one or more user groups, then click *OK*.
4. Configure the remaining settings as needed.
5. Click *OK*.

To authenticate a category in the CLI:

```
config webfilter profile
  edit "webfilter"
    config ftgd-wf
      unset options
      config filters
        edit 1
          set category 52
          set action authenticate
          set auth-usr-grp "local_group"
        next
      end
    end
  next
end
```

To verify that you have configured authentication:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed*.

FortiGuard Intrusion Prevention - Access Blocked

Customizing the replacement message page

When the category action is *Block*, *Warning*, or *Authenticate*, you can customize the replacement message page that a user sees.

To customize the replacement message page:

1. Go to *Security Profiles > Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, right-click on a category and select *Customize*.
3. Select a *Replacement Message Group*. See [Replacement message groups on page 2269](#) for details.
4. Optionally, click *Edit FortiGuard Block Page* or *Edit FortiGuard Warning Page* to make modifications.
5. Click *Save*.
6. Configure the remaining settings as needed.
7. Click *OK*.

Customizing the CA certificate

When accessing a HTTPS webpage, in order to intercept the connection and perform an override, warning, or authentication, the connection must be proxied and the warning and/or authentication page must be signed with FortiGate's CA certificate. The client accessing the page must trust the CA in order to avoid certificate errors while browsing.

When applying the web filter profile to a firewall policy, an SSL inspection profile must also be selected.

To apply a custom certificate to the SSL inspection profile in the GUI:

1. Go to *Security Profiles > SSL/SSH Inspection* and click *Create New*, or edit an existing profile.
2. Under *SSL Inspection Options*, set *CA certificate* to the desired custom CA certificate.
3. Click *OK*.
4. On the client endpoints, ensure this custom CA is trusted.

To apply a custom certificate to the SSL inspection profile in the CLI:

```
config firewall ssl-ssh-profile
  edit <name>
    set caname <custom_CA_certificate>
  next
end
```

Credential phishing prevention

When credential phishing prevention is enabled, the FortiGate scans for corporate credentials submitted to external websites and compares them to sensitive credentials stored in the corporate domain controller. Based on the configured antiphishing rules in proxy mode web filter profiles, the FortiGate will block the URL or alert the user if the credentials match ones that are stored on the corporate domain controller.

- The corporate domain controller must be configured in the `domain controller`.
- For FortiGate to retrieve the domain information, the user needs to grant Replicating Directory Changes permissions in the Domain Controller (DC). See [How to grant the "Replicating Directory Changes" permission for the Microsoft Metadirectory Services ADMA service account](#) for more information.
- Credentials can be matched based on sAMAccountName, user principal name (UPN), or down-level logon name.
- The antiphishing profile defines the corporate domain controller, antiphishing check option, default action if no rules match, antiphishing status, and so on.
- Inspection entries in the profile define what action occurs when the submission request matches the specified FortiGuard categories.
- The profile scans for pre-defined and custom username and password fields in the HTTP request, such as `username`, `auth`, and `password`. You can evaluate custom fields by configuring custom patterns.
- The URL filter defines individual URLs that the antiphish action (block or log) is applied to when the URL submission request matches.

Web-based URL filter actions and FortiGuard category-based filtering have higher priority than antiphishing URL filter actions and FortiGuard filtering:

- If a request is blocked by the web-based URL filter or FortiGuard filter, there is no further antiphishing scanning. Antiphishing scanning only happens after the web-based URL filter and FortiGuard filters allow the traffic.
 - If a submission matches an entry in the URL filter table that has an antiphishing action, the defined action is taken. No further FortiGuard category-based rules are applied.
 - Like firewall rules, the URL filter table and FortiGuard category-based antiphishing rules use a top-down priority. The rule that matches first is the one that is used.
-

In this example, URLs that match FortiGuard category 37 (social networking) will be blocked and other categories will be logged.

To configure credential phishing prevention:

1. Configure the corporate domain controller:

```
config user domain-controller
  edit "win2016"
    set hostname "win2016"
```

```

        set domain-name "corpserver.local"
        set username "Administrator"
        set password *****
        set ip <server_ip>
    next
end

```

The hostname and the domain-name are case sensitive.

2. Configure the antiphishing profile, which includes the FortiGuard category rule:

```

config webfilter profile
    edit <profile-name>
        set feature-set proxy
        ...
        config web
            ...
        end
        config antiphish
            set status enable
            set domain-controller "win2016"
            set default-action block
            set check-uri enable
            set check-basic-auth enable
            set max-body-len 65536
            config inspection-entries
                edit "inspect-37"
                    set fortiguard-category 37
                    set action block
                next
                edit "inspect-others"
                    set fortiguard-category all
                    set action log
                next
            end
        config custom-patterns
            edit "customer-name"
                set category username
            next
            edit "customer-passwd"
                set category password
            next
        end
    end
    ...
    set web-antiphishing-log enable
next
end

```

- `check-uri` enables support for scanning HTTP GET URI parameters.
- `check-basic-auth` enables support for scanning the HTTP basic authentication field.

3. Configure the URL filter to scan specific URLs.

The antiphish action is added to the URL filter table entry, and the URL filter is applied to the web filter profile:

```

config webfilter urlfilter
  edit 1
    set name "antiphish-table"
    config entries
      edit 1
        set url "www.example.com"
        set type simple
        set antiphish-action block
        set status enable
        set referrer-host ''
      next
    end
  next
end
config webfilter profile
  edit "<profile-name>"
    config web
      set urlfilter-table 1
    end
    ...
  next
end

```

4. Optionally, define custom patterns to scan fields other than the built-in username and password keywords:

```

config webfilter profile
  edit "<profile-name>"
    config custom-patterns
      edit "customer-name"
        set category username
      next
      edit "customer-passwd"
        set category password
      next
    end
  end
next
end

```

Additional antiphishing settings

The following settings are available for antiphishing:

- [Enable DNS service lookup in the domain controller](#) so that the domain controller IP does not need to be configured. The DNS server will resolve the domain controller IP.
- [Specify a source IP or port for the fetching domain controller.](#)
- [Use an LDAP server as a credential source](#) (only the OpenLDAP server is supported).
- [Block or log valid usernames regardless of password match.](#)
- [Use literal custom patterns type for username and password.](#)
- [Active Directory Lightweight Directory Services \(AD LDS\) support](#)

Configuration examples

To enable DNS service lookup:

```
config user domain-controller
  edit "win2016"
    set ad-mode ds
    set dns-srv-lookup enable
    set hostname "win2016"
    set username "replicate"
    set password *****
    set domain-name "SMB2016.LAB"
  next
end
```

To specify the source IP and port for the fetching domain controller:

```
config user domain-controller
  edit "win2016"
    set ad-mode ds
    set hostname "win2016"
    set username "replicate"
    set password *****
    set ip-address 172.18.52.188
    set source-ip-address 172.16.100.1
    set source-port 2000
    set domain-name "SMB2016.LAB"
  next
end
```

To use an LDAP server as a credential store:

1. Configure the LDAP server:

```
config user ldap
  edit "openldap"
    set server "172.18.60.214"
    set cnid "cn"
    set dn "dc=qafsso,dc=com"
    set type regular
    set username "cn=Manager,dc=qafsso,dc=com"
    set password *****
    set antiphish enable
    set password-attr "userPassword"
  next
end
```

2. Configure the web filter profile:

```
config webfilter profile
  edit "webfilter"
    set feature-set proxy
    config ftgd-wf
      unset options
      config filters
```

```
        edit 1
            set action block
        next
    end
end
config antiphish
    set status enable
    config inspection-entries
        edit "cat34"
            set fortiguard-category 34
            set action block
        next
    end
    set authentication ldap
    set ldap "openldap"
end
set log-all-url enable
next
end
```

To configure username-only credential matching:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            ...
        end
        config antiphish
            set status enable
            set check-username-only enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            set domain-controller "win2016"
        end
        set log-all-url enable
    next
end
```

To configure different custom pattern types for usernames and passwords:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            ...
        end
        config antiphish
            set status enable
            config inspection-entries
```

```

        edit "cat34"
            set fortiguard-category 34
            set action block
        next
    end
    config custom-patterns
        edit "qwer"
            set type literal
        next
        edit "[0-6]Dat*"
        next
        edit "dauw9"
            set category password
            set type literal
        next
        edit "[0-5]foo[1-4]"
            set category password
        next
    end
    set domain-controller "win2016"
end
set log-all-url enable
next
end

```

In this example, the `qwer` and `dauw9` entries use the literal type, while `[0-6]Dat*` and `[0-5]foo[1-4]` use the default regex type.

To configure Active Directory in LDS mode:

```

config user domain-controller
    edit "win2016adlds"
        set hostname "win2016adlds"
        set username "foo"
        set password *****
        set ip-address 192.168.10.9
        set domain-name "adlds.local"
        set ad-mode lds
        set adlds-dn "CN=adlds1part1,DC=ADLDS,DC=COM"
        set adlds-ip-address 192.168.10.9
        set adlds-port 3890
    next
end

```

Usage quota

In addition to using category and classification blocks and overrides to limit user access to URLs, you can set a daily quota by category, category group, or classification. Quotas allow access for a specified length of time or a specific bandwidth, and are calculated separately for each user. Quotas are reset daily at midnight.

Quotas can be set for the *Monitor*, *Warning*, or *Authenticate* actions. Once the quota is reached, the traffic is blocked and the replacement message page displays.

Quotas are only available in proxy-based inspection mode.

Configuring a quota

The following example shows how to set a time quota for the education category (category 30).

To configure a quota in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. For *Feature set*, select *Proxy-based*.
3. In the *FortiGuard category based filter* section, scroll to the *General Interest - Personal* and click the + to expand the section.
4. Select *Education*, then click *Monitor*.

20% 95

Name	Action
Brokerage and Trading	Allow
Games	Allow
Web-based Email	Allow
Entertainment	Allow
Arts and Culture	Allow
Education	Monitor
Health and Wellness	Allow
Job Search	Allow
Medicine	Allow
News and Media	Allow

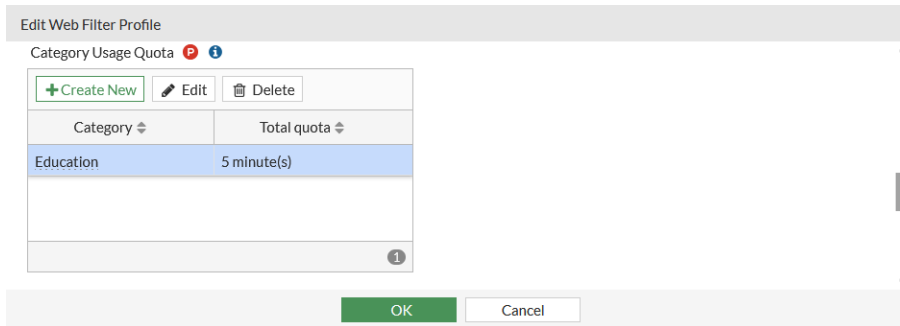

5. In the *Category Usage Quota* section, click *Create New*.
The *New/Edit Quota* pane opens.
6. In the *Category* field, select *Education*.
7. For the *Quota Type*, select *Time* and set the *Total quota* to 5 minutes.

Category: Education

Quota Type: Time Traffic

Total quota: 0 hour(s) 5 minute(s) 0 second(s)

8. Click *OK*. The entry appears in the table.

9. Configure the other settings as needed.
10. Click **OK**.

To configure a quota in the CLI:

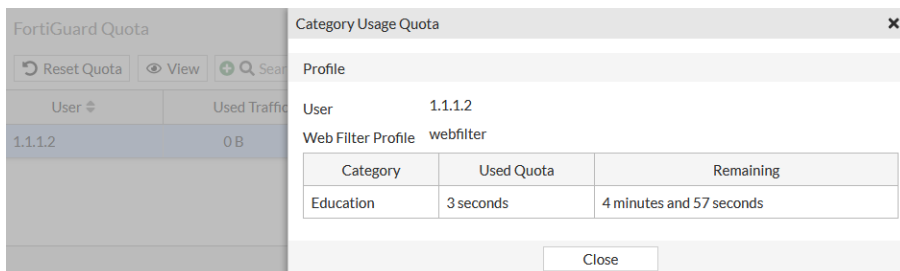

```

config webfilter profile
  edit "webfilter"
    config ftgd-wf
      unset options
      config filters
        edit 1
          set category 30
        next
      end
    config quota
      edit 1
        set category 30
        set type time
        set duration 5m
      next
    end
  end
next
end

```

To verify the quota usage:

1. Go to a website that belongs to the education category, such <https://www.harvard.edu/>. You can view websites in that category at the moment.
2. In FortiOS, go to *Dashboard > FortiGuard Quota Monitor* to check the used and remaining time.

- When the quota reaches its limit, traffic is blocked and the replacement page displays.

FortiGuard Intrusion Prevention - Access Blocked

Web Page Blocked

Your daily quota for this category of web page has expired.

Category Education

URL <https://www.harvard.edu/>

To have the rating of this web page re-evaluated [please click here](#).

Web content filter

You can control access to web content by blocking webpages containing specific words or patterns. This helps to prevent access to pages with questionable material. You can specify words, phrases, patterns, wildcards, and regular expressions to match content on webpages. You can use multiple web content filter lists and select the best one for each web filter profile.

The maximum number of web content patterns in a list depends on the model of the device. To find the maximum number of web content patterns allowed for a device, go to the Maximum Values Table (<https://docs.fortinet.com/max-value-table>). Select the software version and models, and click *Go*. Maximum values are displayed. In the *Search* box, enter *webfilter.content:entries* to find the maximum number.

When configuring a web content filter list, the following patterns are available:

Web content pattern type	Description
Wildcard	Use this setting to block or exempt one word or text strings of up to 80 characters. You can also use wildcard symbols such as ? or * to represent one or more characters. For example, a wildcard expression <i>forti*.com</i> matches <i>fortinet.com</i> and <i>fortiguard.com</i> . The * represents any character appearing any number of times.
Regular expression	Use this setting to block or exempt patterns of regular expressions that use some of the same symbols as wildcard expressions, but for different purposes. In regular expressions, * represents the character before the symbol. For example, <i>forti*.com</i> matches <i>fortiii.com</i> but not <i>fortinet.com</i> or <i>fortiice.com</i> . In this case, the symbol * represents <i>i</i> appearing any number of times.

Content evaluation

The web content filter scans the content of every webpage that is accepted by a firewall policy. The system administrator can specify banned words and phrases and attach a numerical value (or score) to the importance of those words and

phrases. When the web content filter scan detects banned content, it adds the scores of banned words and phrases found on that page. If the sum is higher than a threshold set in the web filter profile, the FortiGate blocks the page.

The default score for web content filter is 10 and the default threshold is 10. This means that by default, a webpage is blocked by a single match. These settings can only be configured in the CLI.

Banned words or phrases are evaluated according to the following rules:

- The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.
- The score for any word in a phrase without quotation marks is counted.
- The score for a phrase in quotation marks is counted only if it appears exactly as written.

The following table is an example of how rules are applied to the webpage contents . For example, a webpage contains only this sentence:

The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.

Banned pattern	Assigned score	Score added to the sum for the entire page	Threshold score	Comment
word	20	20	20	Appears twice but is only counted once. The webpage is blocked.
word phrase	20	40	20	Each word appears twice but is only counted once, giving a total score of 40. The webpage is blocked.
word sentence	20	20	20	<i>word</i> appears twice and <i>sentence</i> does not appear, but since any word in a phrase without quotation marks is counted, the score for this pattern is 20. The webpage is blocked.
"word sentence"	20	0	20	This phrase does not appear exactly as written. The webpage is allowed.
"word or phrase"	20	20	20	This phrase appears twice but is only counted once. The webpage is blocked.

To configure a web content filter in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Content Filter*.
3. Click *Create New*. The *New Web Content Filter* pane opens.
4. Configure the following settings:

- Configure the other settings as needed.
- Click OK.

To configure a web content filter in the CLI:

- Create the content (banned word) table:

```

config webfilter content
  edit 1
    set name "webfilter"
    config entries
      edit "fortinet"
        set pattern-type regexp
        set status enable
        set lang western
        set score 10
        set action block
      next
    end
  next
end

```

- Apply the content table to the web filter profile:

```

config webfilter profile
  edit "webfilter"
    config web

```

```
        set bword-threshold 10
        set bword-table 1
    end
    config ftgd-wf
        unset options
    end
next
end
```

To verify the content filter:

1. Go to a website with the word *fortinet*, such as www.fortinet.com. The website is blocked and a replacement page displays:

Advanced filters 1

This topic gives examples of the following advanced filter features:

- [Block malicious URLs discovered by FortiSandbox on page 1242](#)
- [Allow websites when a rating error occurs on page 1243](#)
- [Rate URLs by domain and IP address on page 1243](#)
- [Block invalid URLs on page 1244](#)

Block malicious URLs discovered by FortiSandbox

This setting blocks malicious URLs that FortiSandbox finds. Your FortiGate must be connected to a registered FortiSandbox.

For information on configuring FortiSandbox, see [Using FortiSandbox with antivirus on page 1197](#).

To block malicious URLs discovered by FortiSandbox in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block malicious URLs discovered by FortiSandbox*.

3. Click **OK**.

To block malicious URLs discovered by FortiSandbox in the CLI:

```
config webfilter profile
  edit "webfilter"
    config web
      set blocklist enable
    end
  next
end
```

Allow websites when a rating error occurs

If you do not have a FortiGuard license, but you have enabled services that need a FortiGuard license (such as FortiGuard filter), then you will get a rating error message.

Use this setting to allow access to websites that return a rating error from the FortiGuard Web Filter service.

To allow websites with rating errors in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Allow websites when a rating error occurs*.
3. Click **OK**.

To allow websites with rating errors in the CLI:

```
config webfilter profile
  edit "webfilter"
    config ftgd-wf
      set options error-allow
    end
  next
end
```

Rate URLs by domain and IP address

If you enable this setting, in addition to only sending domain information to FortiGuard for rating, the FortiGate always sends both the URL domain name and the TCP/IP packet's IP address (except for private IP addresses) to FortiGuard for the rating.

The FortiGuard server might return a different category of IP address and URL domain. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. This rating weight is hard-coded in FortiOS.

For example, if we use a spoof IP of Google as `www.irs.gov`, the FortiGate will send both the IP address and domain name to FortiGuard to get the rating. We get two different ratings: one is the search engine and portals that belong to the Google IP, the second is the government and legal organizations that belongs to `www.irs.gov`. Because the search engine and portals rating has a higher weight than government and legal organizations, the traffic is rated as search engine and portals.

To rate URLs by domain and IP address in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Rate URLs by domain and IP address*.
3. Click *OK*.

To rate URLs by domain and IP address in the CLI:

```
config webfilter profile
  edit "webfilter"
    config ftgd-wf
      set options rate-server-ip
    end
  next
end
```

Block invalid URLs

Use this setting to block websites when their SSL certificate CN field does not contain a valid domain name.

This option also blocks URLs that contains spaces. If there is a space in the URL, it must be written as `%20` in the URL path.

To block invalid URLs in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block invalid URLs*.

3. Click *OK*.

To block invalid URLs in the CLI:

```
config webfilter profile
  edit "webfilter"
    set options block-invalid-url
  next
end
```

Advanced filters 2

This topic gives examples of the following advanced filter features:

- [Safe search on page 1245](#)
- [Restrict YouTube access on page 1246](#)
- [Log all search keywords on page 1247](#)
- [Restrict Google account usage to specific domains on page 1247](#)
- [HTTP POST action on page 1248](#)
- [Remove Java applets, ActiveX, and cookies on page 1248](#)

These advanced filters are only available in proxy-based inspection mode.

Safe search

This setting applies to popular search sites and prevents explicit websites and images from appearing in search results.

The supported search sites are:

- Google
- Yahoo
- Bing
- Yandex

To enable safe search in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Enforce 'Safe Search' on Google, Yahoo!, Bing, Yandex*.

3. Click *OK*.

To enable safe search in the CLI:

```
config webfilter profile
  edit "webfilter"
    config web
      set safe-search url header
    end
  next
end
```

Restrict YouTube access

The *Restrict YouTube access* setting in the video filter profile adds the HTTP header `YouTube-Restrict: Strict` or `YouTube-Restrict: Moderate` into the HTTP request when enabled. When YouTube reads this header, it applies the appropriate content restriction based on the selected mode. YouTube Restricted Mode is an optional setting that filters out potentially mature videos while leaving a large number of videos still available (see [Restrict YouTube content available to users](#) and [Manage your organization's YouTube settings](#) for more information). Google defines the restricted YouTube access modes as follows:

- **Strict Restricted YouTube access:** this setting is the most restrictive. Strict Restricted Mode does not block all videos, but works as a filter to screen out many videos based on an automated system, while leaving some videos still available for viewing.
- **Moderate Restricted YouTube access:** this setting is similar to Strict Restricted Mode but makes a much larger collection of videos available.

To restrict YouTube access in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Restrict YouTube Access* and select either *Strict* or *Moderate*.

3. Click *OK*.

To restrict YouTube access in the CLI:

```
config webfilter profile
  edit <name>
    config web
      set set youtube-restrict {none | strict | moderate}
    end
  next
end
```

Vimeo access

The file filter profile includes a setting to restrict Vimeo access, which can only be configured in the CLI.

To restrict Vimeo access:

```
config webfilter profile
  edit <name>
    config web
      set vimeo-restrict {7 | 134}
    end
  next
end
```

```
vimeo-restrict {7 | 134}
```

Set the Vimeo restriction:

- 7: do not show mature content
- 134: do not show unrated and mature content

Log all search keywords

Use this setting to log all search phrases.

To enable logging search keywords in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Log all search keywords*.
3. Click *OK*.

To enable logging search keywords in the CLI:

```
config webfilter profile
  edit "webfilter"
    config web
      set log-search enable
    end
  next
end
```

Restrict Google account usage to specific domains

Use this setting to block access to certain Google accounts and services, while allowing access to accounts with domains in the exception list.

To enable Google account restriction:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, enable *Restrict Google account usage to specific domains*.
3. Click the + and enter the domains that Google can access, such as `www.fortinet.com`.

4. Click *OK*.

When you try to use Google services like Gmail, only traffic from the domain of `www.fortinet.com` can go through. Traffic from other domains is blocked.

HTTP POST action

Use this setting to select the action to take with HTTP POST traffic. HTTP POST is the command used by the browser when you send information, such as a completed form or a file you are uploading to a web server. The action options are allow or block. The default is allow.

To configure HTTP POST in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, for *HTTP POST Action*, select *Allow* or *Block*.
3. Click *OK*.

To configure HTTP POST in the CLI:

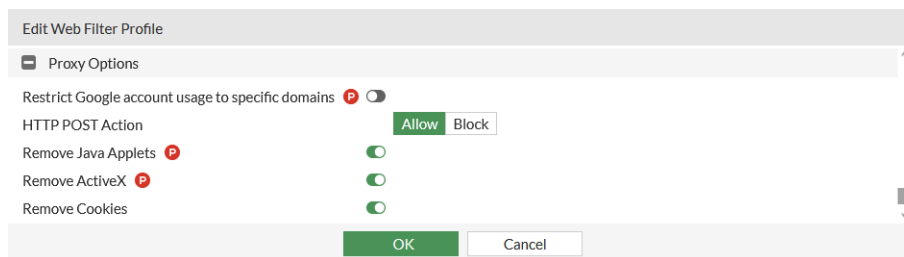

```
config webfilter profile
  edit "webfilter"
    set post-action {normal | block}
    config ftgd-wf
      unset options
    end
  next
end
```

Remove Java applets, ActiveX, and cookies

Web filter profiles have settings to filter Java applets, ActiveX, and cookies from web traffic. Note that if these filters are enabled, websites using Java applets, ActiveX, and cookies might not function properly.

To enable these filters in the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*, or edit an existing profile. and go to the *Proxy Options* section.
2. In the *Proxy Options* section, enabled the filters you want to use: *Remove Java Applets*, *Remove ActiveX*, or *Remove Cookies*.

To enable these filters in the CLI:

```
config webfilter profile
  edit "webfilter"
    set options {activexfilter cookiefilter javafilter}
    config ftgd-wf
      unset options
    end
  next
end
```

```
    end
  next
end
```

Web filter statistics

FortiOS provides diagnostics commands to view web filter statistics reports, which are either proxy-based or flow-based. The commands are available in both VDOM and global command lines.

Proxy-based web filter statistics report

Use the `diagnose wad filter vd {<VDOM> | global}` command to filter for per-VDOM or global statistics reports.

In the following example, there are two VDOMs (root and vdom1) using proxy-based policies that have web filter profiles enabled.

To view per-VDOM statistics reports:

```
(global) # diagnose wad filter vd root
Drop_unknown_session is enabled.

(global) # diagnose wad stats filter list
filtering of vdom root
  dlp          = 0
  content-type = 0
  urls:
    examined = 6
    allowed  = 3
    blocked  = 0
    logged   = 0
    overridden = 0

(global) # diagnose wad filter vd vdom1
(global) # diagnose wad stats filter list
filtering of vdom vdom1
  dlp          = 0
  content-type = 0
  urls:
    examined = 13
    allowed  = 2
    blocked  = 9
    logged   = 8
    overridden = 0

(global) # diagnose wad filter vd ALL
(global) # diagnose wad stats filter list
filtering of all accessible vdoms
  dlp          = 0
  content-type = 0
  urls:
    examined = 19
    allowed  = 5
    blocked  = 9
```

```
logged = 8
overridden = 0
```

Flow-based web filter statistics report

Use the `diagnose webfilter stats list {<VDOM> | global}` command to check the flow-based web filter statistics.

In the following example, the VDOM is using flow-based policies that have web filter profiles enabled.

To view web filter statistics:

```
# diagnose webfilter stats list root
Proxy/flow URL filter stats:
request: 9474
blocked: 8606
allowed: 868
overridden:0
logged: 8606
pending: 0
```

URL certificate blocklist

As increasing numbers of malware have started to use SSL to attempt to bypass IPS, maintaining a fingerprint-based certificate blocklist is useful to block botnet communication that relies on SSL.

This feature adds a dynamic package that is distributed by FortiGuard and is part of the Web Filtering service. It is enabled by default for SSL/SSH profiles, and can be configured using the following CLI commands:

```
config vdom
  edit <vdom>
    config firewall ssl-ssh-profile
      edit "certificate-inspection"
        set block-blocklisted-certificates enable
      next
      edit "deep-inspection"
        set block-blocklisted-certificates enable
      next
    end
  next
end
```

Video filter

The video filter profile can be used to filter YouTube videos based on FortiGuard categories or by channel ID for a more granular override of a single channel, user, or video. The video filter profile is currently supported in proxy-based policies and requires SSL deep inspection. The FortiGuard Video filtering service is based on a valid FortiGuard web filter license.

Configuring a video filter profile

In the GUI, there are two main sections on the *New Video Filter Profile* page (*Security Profiles > Video Filter*), *FortiGuard Category Based Filter* and *Channel override list*.

When *FortiGuard Category Based Filter* is enabled, the various FortiGuard categories can be set to allow, monitor, or block videos in those categories. See [Filtering based on FortiGuard categories on page 1251](#) for a detailed example and explanation of how the WAD daemon inspects videos.

The YouTube *Channel override list* can be used to filter specific YouTube channels. When a video matches a YouTube channel, the video filter will take the corresponding action of allow, monitor, or block. See [Filtering based on YouTube channel on page 1255](#) for a detailed example.

By default, when the FortiGuard category-based filter and YouTube channel override are used together, a video will be blocked if it matches either category or YouTube channel and the action is set to block.

Filtering based on FortiGuard categories

Video filtering is only proxy-based and uses the WAD daemon to inspect the video in four phases:

1. When the WAD receives a video query from a client, it extracts the video ID (`vid`) and tries to check the category and channel from the local cache.
2. If there is no match from the local cache, it connects to the FortiGuard video rating server to query the video category.
3. If the FortiGuard rating fails, it uses the `videofilter.youtube-key` to communicate with the Google API server to get its category and channel ID. This is the API query setting and it requires the user's own YouTube API key string. This configuration is optional.
4. If all steps fail to match the video, the WAD calls on the IPS engine to match the video ID and channel ID from the application signature database.

The FortiGuard anycast service must be enabled to use this feature.

In the following example, a new video filter profile is created to block the Knowledge category.

In the firewall policy settings, the default application control profile is recommended because it blocks QUIC traffic. Many Google services use the QUIC protocol on UDP/443. By blocking QUIC, YouTube will use standard HTTPS TCP/443 connections.

To configure a video filter based on FortiGuard categories in the GUI:

1. Create the video filter profile:
 - a. Go to *Security Profiles > Video Filter* and click *Create New*.
 - b. Enter a name (*category_filter*).
 - c. In the *FortiGuard Category Based Filter* section, set the *Knowledge* category *Action* to *Block*.
 - d. Click *OK*.
2. Create the firewall policy:
 - a. Enter the following:

Incoming Interface	port2
Outgoing Interface	port1
Source	All
Destination	All
Service	All
Inspection Mode	Proxy-based
NAT	Enable
Video Filter	Enable and select <i>category_filter</i>
Application Control	Enable and select <i>default</i>
SSL Inspection	deep-inspection
Log Allowed Traffic	All Sessions

- b. Configure the other settings as needed and click *OK*.

To configure a video filter based on FortiGuard categories in the CLI:

1. Create the video filter profile:

```
config videofilter profile
  edit "category_filter"
    config fortiguard-category
      edit 5
        set action block
        set category-id 4
        set log enable
      next
    end
  next
end
```

2. Create the firewall policy:

```
config firewall policy
  edit 10
    set name "client_yt_v4"
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
```

```

        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set application-list "default"
        set videofilter-profile "category_filter"
        set logtraffic all
        set nat enable
    next
end

```

To configure the YouTube API key (optional):

```

config videofilter youtube-key
    edit 1
        set key *****
        set status enable
    next
end

```

Verifying that the video is blocked

When a user browses to YouTube and selects a video based in the Knowledge category, a replacement message will appear. This replacement message says the URL is blocked, and displays the URL of the YouTube video. On the FortiGate, verify the forward traffic and web filter logs.

Sample forward traffic log

```

2: date=2021-04-27 time=15:27:13 eventtime=1619562433424944288 tz="-0700" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="vdom1" srcip=10.1.100.11 srcport=60628
srcintf="port2" srcintfrole="undefined" dstip=172.217.3.206 dstport=443 dstintf="port1"
dstintfrole="undefined" srccountry="Reserved" dstcountry="United States" sessionid=8230
proto=6 action="client-rst" policyid=10 policytype="policy" poluid="a5e991ba-a799-51eb-
4efe-ce32b9f70b75" policyname="client_yt_v4" service="HTTPS"trandisp="snat"
transip=172.16.200.1 transport=60628 duration=95 sentbyte=3546 rcvbyte=21653 sentpkt=24
rcvpkt=34 appcat="unscanned" wanin=2152 wanout=2290 lanin=2000 lanout=2000
utmaction="block" countweb=3 utmref=65532-0

```

Sample web filter log

```

1: date=2021-04-27 time=15:25:37 eventtime=1619562338128550236 tz="-0700" logid="0347013664"
type="utm" subtype="webfilter" eventtype="videofilter-category" level="warning" vd="vdom1"
msg="Video category is blocked." policyid=10 sessionid=8230 srcip=10.1.100.11
dstip=172.217.3.206 srcport=60628 dstport=443 srcintf="port2" srcintfrole="undefined"
dstintf="port1" dstintfrole="undefined" proto=6 service="HTTPS" action="blocked"
videoinfosource="Cache" profile="category_filter" videoid="EAyo3_zJj5c" videocategoryid=4
hostname="www.youtube.com" url="https://www.youtube.com/watch?v=EAyo3_zJj5c"

```

Troubleshooting and debugging

To verify if the FortiGuard video filtering license is valid:

```
# get system fortiguard

fortiguard-anycast : enable
fortiguard-anycast-source: debug
protocol           : https
port               : 443
...
webfilter-license  : Contract
webfilter-expiration: Fri Dec 13 2030
...
videofilter-license : Contract
videofilter-expiration: Fri Dec 13 2030
```

The videofilter license should be synchronized with the webfilter license.

To verify the WAD worker is running:

```
# diagnose test app wad 1000
Process [0]: WAD manager type=manager(0) pid=232 diagnosis=yes.
Process [1]: type=worker(2) index=0 pid=294 state=running
              diagnosis=no debug=enable valgrind=supported/disabled
...
Process [6]: type=YouTube-filter-cache-service(9) index=0 pid=290 state=running
              diagnosis=no debug=enable valgrind=unsupported/disabled
...
```

To display and debug video filter cache:

```
# diagnose test app wad ?
....
321: Display Video Filter Cache stats.
322: Reset Video Filter Cache stats.
323: Flush Video Filter Cache entries.
324: Display Video Filter module stats.
325: Request category list from Youtube API.
326: Display FTGD agent module stats.
327: Reset FTGD agent module stats.
328: Toggle Video Filter Cache Check.
329: Toggle Video Filter FTGD Query.
330: Toggle Video Filter API Check.
```

To enable real-time WAD debugs:

```
# diagnose wad debug enable level verbose
# diagnose wad debug enable category video
# diagnose debug enable
```

Sample output

```
[p:274][s:8754][r:186] wad_http_req_exec_video_filter_check(167): hreq=0x7f1184f288e0, check

```

Filtering based on YouTube channel

Video filtering can be configured to filter specific YouTube channels. When a video matches a YouTube channel, the video will take the corresponding action of allow, monitor, or block. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

By default, when the FortiGuard category-based filter and YouTube channel override are used together, a video will be blocked if it matches either category or YouTube channel and the action is set to block.

The `override-category` option allows the channel action to override the category action. A category can be blocked, but certain channels in that category can be allowed when the `override-category` option is enabled (see [Configuration with YouTube channel override](#)).

Identifying the YouTube channel ID

The following table lists how to identify the YouTube channel ID based on different YouTube video URLs formats:

Video URL	Channel ID
www.youtube.com/channel/<channel-id>	<channel-id> indicates the ID for the channel.
www.youtube.com/user/<user-id>	Open the page source and locate: <meta itemprop="channelId" content="<channel-id"> <channel-id> indicates the channel ID for the user page.
www.youtube.com/watch?v=<string>	Open the page source and locate: <meta itemprop="channelId" content="<channel-id"> <channel-id> indicates the channel ID for the video.

In a YouTube channel filter profile, the default action is set to monitor when there is no match. Logging is also disabled by default.

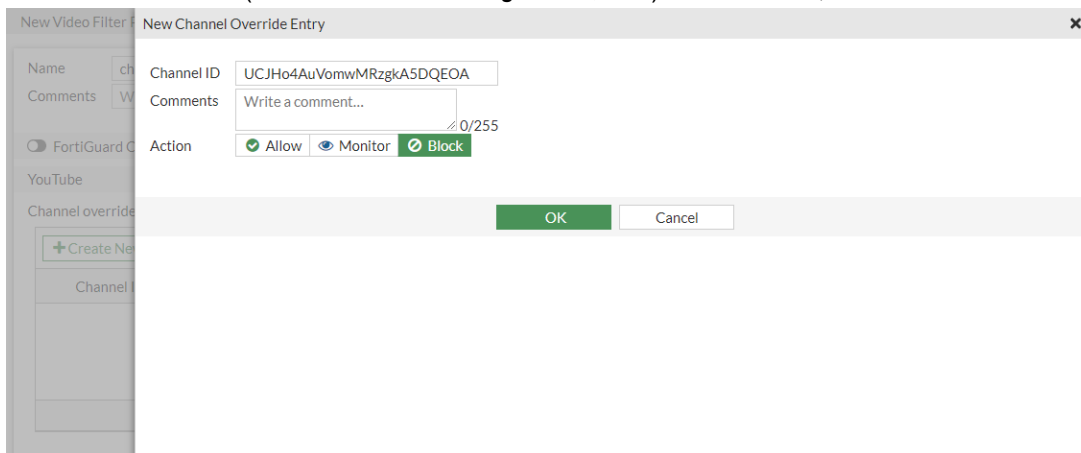

```
config videofilter youtube-channel-filter
  edit <id>
    set default-action {block | monitor | allow}
    set log {enable | disable}
  next
end
```

Basic configuration

In the following example, the Fortinet YouTube channel ID (UCJHo4AuVomwMRzgkA5DQEOA) is blocked, and the video filter is applied to a policy.

To configure a video filter based on a YouTube channel in the GUI:

1. Go to *Security Profiles > Video Filter* and click *Create New*.
2. In the *Channel override list* section, click *Create New*. The *New Channel Override Entry* pane opens.
 - a. Enter the *Channel ID* (UCJHo4AuVomwMRzgkA5DQEOA) and for *Action*, select *Block*.

- b. Click *OK*.
3. Click *OK*.

4. Configure the firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. For *Inspection Mode*, select *Proxy-based*.
 - c. Enable *Video Filter* and select the profile you created.
 - d. For *SSL Inspection*, select *deep-inspection*.

- e. Configure the other settings as needed and click *OK*.

To configure a video filter based on a YouTube channel in the CLI:

1. Configure the channel filter:

```
config videofilter youtube-channel-filter
  edit 1
    set name "channel_filter"
    set default-action monitor
    set log enable
    config entries
      edit 1
        set action block
        set channel-id "UCJHo4AuVomwMRzgkA5DQEOA"
      next
    end
  next
end
```

2. Configure the video filter profile:

```
config videofilter profile
  edit "channel_filter"
    set youtube-channel-filter 1
  next
end
```

3. Configure the firewall policy:

```
config firewall policy
  edit 1
    set name "video-filter"
    set srcintf "port2"
```

```

    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "deep-inspection"
    set videofilter-profile "channel_filter"
    set nat disable
  next
end

```

Configuration with YouTube channel override

In this example, all categories in the video filter are configured to be blocked. The YouTube channel filter list is configured with `override-category` enabled, which effectively creates an allowlist. The channel UCR6d0EiC3G4WA8-Rqji6a8g is allowed.

To configure YouTube channel override:

1. Configure the YouTube channel filter:

```

config videofilter youtube-channel-filter
  edit 1
    set name "vf1"
    set default-action monitor
    config entries
      edit 1
        set comment "https://www.youtube.com/watch_v=EAYo3_zJj5c"
        set action allow
        set channel-id "UCR6d0EiC3G4WA8-Rqji6a8g"
      next
    end
    set override-category enable
    set log enable
  next
end

```

2. Configure the video filter profile:

```

config videofilter profile
  edit "channel_filter_override"
    set youtube-channel-filter 1
    config fortiguard-category
      config filters
        edit 1
          set action block
          set log enable
        next
        edit 2
          set action block
          set category-id 1
          set log enable
        next
      next
    next
  next
end

```

```
        next
        edit 3
            set action block
            set category-id 2
            set log enable
        next
        edit 4
            set action block
            set category-id 3
            set log enable
        next
        edit 5
            set action block
            set category-id 4
            set log enable
        next
        edit 6
            set action block
            set category-id 5
            set log enable
        next
        edit 7
            set action block
            set category-id 6
            set log enable
        next
        edit 8
            set action block
            set category-id 7
            set log enable
        next
        edit 9
            set action block
            set category-id 8
            set log enable
        next
        edit 10
            set action block
            set category-id 9
            set log enable
        next
        edit 11
            set action block
            set category-id 10
            set log enable
        next
    end
end
next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 10
        set name "client_yt_v4"
        set srcintf "port2"
```

```

set dstintf "port1"
set action accept
set srcaddr "all"
set dstaddr "all"
set schedule "always"
set service "ALL"
set utm-status enable
set inspection-mode proxy
set profile-protocol-options "proxy"
set ssl-ssh-profile "custom-deep-inspection"
set videofilter-profile "channel_filter_override"
set logtraffic all
set nat enable
next
end

```

4. Verify the logs. The category action is set to `block` and the channel action is set to `allow`, so video access is allowed:

```

30: date=2022-05-27 time=13:40:13 eventtime=1653684013375716267 tz="-0700"
logid="0348013682" type="utm" subtype="webfilter" eventtype="videofilter-channel"
level="notice" vd="vdom1" msg="Video channel is allowed." policyid=10 sessionid=69958
srcip=10.1.100.11 dstip=142.251.33.78 srcport=42542 dstport=443 srcintf="port2"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6 service="HTTPS"
action="passthrough" videoinfosource="API" profile="channel_filter_override"
videoid="EAyo3_zJj5c" videochannelid="UCR6d0EiC3G4WA8-Rqji6a8g"
hostname="www.youtube.com" url="https://www.youtube.com/watch?v=EAyo3_zJj5c"

```

If the category action is changed to `allow` and the channel action is changed to `block`, the video access would be blocked.

DNS filter

You can apply DNS category filtering to control user access to web resources. You can customize the default profile, or create your own to manage network user access and apply it to a firewall policy, or you can add it to a DNS server on a FortiGate interface. For more information about configuring DNS, see [DNS on page 230](#).

When both a DNS and a web filter are configured on a firewall policy, the DNS filter takes precedence. If certificate inspection is also used, the web filter replacement message might be shown instead of the SDNS block page. If both filters are set to block, SSL inspection is set to certificate inspection, and the destination web traffic is HTTPS, then the client receives a redirect to the SDNS server, which is then blocked by the web filter because the redirect URL cannot pass the certificate inspection.

DNS filtering has the following features:

- FortiGuard Filtering: filters the DNS request based on the FortiGuard domain rating.
- Botnet C&C domain blocking: blocks the DNS request for the known botnet C&C domains.
- External dynamic category domain filtering: allows you to define your own domain category.
- DNS safe search: enforces Google, Bing, and YouTube safe addresses for parental controls.
- Local domain filter: allows you to define your own domain list to block or allow.

- External IP block list: allows you to define an IP block list to block resolved IPs that match this list.
 - DNS translation: maps the resolved result to another IP that you define.
-

Some DNS filter features require a subscription to FortiGuard Web Filtering.

DNS filtering connects to the FortiGuard secure DNS server over anycast by default. For more information about this configuration, see [DNS over TLS and HTTPS on page 245](#).

The IPS engine handles the DNS filter in flow mode policies and queries the FortiGuard web filter server for FortiGuard categories. In proxy mode, the DNS proxy daemon handles the DNS filter and queries the FortiGuard SDNS server for FortiGuard categories. When a DNS filter profile is enabled in `config system dns-server`, the DNS proxy daemon handles the traffic.

DNS filter profiles cannot be used in firewall policies when the FortiGate is in NGFW policy-based mode; see [Profile-based NGFW vs policy-based NGFW on page 850](#) for more information. They can be used in the DNS server; see [FortiGate DNS server on page 233](#) for more information.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1262](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1282](#)).

DNS filter behavior in proxy mode

In cases where the DNS proxy daemon handles the DNS filter (described in the preceding section) and if DNS caching is enabled (this is the default setting), then the FortiGate will respond to subsequent DNS queries using the result in the DNS cache and will not forward these queries to a real DNS server.

There are two options to disable this behavior:

- Disable DNS caching globally.
- Remove the DNS filter profile from the proxy mode firewall policy or from the DNS server configured on a FortiGate interface.

To disable DNS caching globally:

```
config system dns
    set dns-cache-limit 0
end
```

There will be a performance impact to DNS queries since each query will not be cached, and will be forwarded to a real DNS server.

FortiGuard DNS rating service

DNS over TLS connections to the FortiGuard secure DNS server is supported. The CLI options are only available when `fortiguard-anycast` is enabled. DNS filtering connects to the FortiGuard secure DNS server over anycast by default.

To configure DoT to the secure DNS server in the CLI:

```
config system fortiguard
    set fortiguard-anycast enable
    set fortiguard-anycast-source fortinet
    set anycast-sdns-server-ip 0.0.0.0
    set anycast-sdns-server-port 853
end
```

The following topics provide information about DNS filters:

- [Configuring a DNS filter profile on page 1262](#)
- [FortiGuard category-based DNS domain filtering on page 1266](#)
- [Botnet C&C domain blocking on page 1269](#)
- [DNS safe search on page 1273](#)
- [Local domain filter on page 1275](#)
- [DNS translation on page 1279](#)
- [Applying DNS filter to FortiGate DNS server on page 1282](#)
- [DNS inspection with DoT and DoH on page 1283](#)
- [Troubleshooting for DNS filter on page 1286](#)

Configuring a DNS filter profile

A DNS filter profile contains settings that enable or disable various forms of DNS filtering, including:

- FortiGuard filtering
- Botnet C&C domain blocking
- DNS safe search
- External dynamic category domain filtering
- Local domain filter
- External IP block list
- DNS translation

Once a DNS filter is configured, it can be applied to a firewall policy, or on a FortiGate DNS server if one is configured. In the following basic example, a DNS filter is created and applied to a firewall policy to scan DNS queries that pass through the FortiGate.

To configure a DNS filter profile in the GUI:

1. Go to *Security Profiles > DNS Filter* and click *Create New*, or edit an existing profile.
2. Configure the settings as needed.

<i>Name</i>	Enter a unique name for the profile.
<i>Comments</i>	Enter a comment (optional).
<i>Redirect botnet C&C requests to Block Portal</i>	Enable to block botnet website access at the DNS name resolution stage. See Botnet C&C domain blocking on page 1269 for more details.
<i>Enforce 'Safe Search' on Google, Bing, YouTube</i>	Enable to avoid explicit and inappropriate results in the Google, Bing, and YouTube search engines. See DNS safe search on page 1273 for more details.
<i>Restrict YouTube Access</i>	When <i>Enforce 'Safe Search' on Google, Bing, YouTube</i> is enabled, select either <i>Strict</i> or <i>Moderate</i> to restrict YouTube access by responding to DNS resolutions with CNAME <code>restrict.youtube.com</code> and <code>restrictmoderate.youtube.com</code> respectively.
<i>FortiGuard Category Based Filter</i>	<p>Enable to use the FortiGuard domain rating database to inspect DNS traffic. A FortiGuard Web Filter license is required to use this option.</p> <p>Expand the category groups in the table to view and edit the FortiGuard category settings to <i>Allow</i>, <i>Monitor</i>, or <i>Redirect to Block Portal</i>. See FortiGuard category-based DNS domain filtering on page 1266 for more details.</p>
<i>Static Domain Filter</i>	This section includes options related to the static domain filter.
<i>Domain Filter</i>	<p>Enable to define local static domain filters to allow or block specific domains. The local domain filter has a higher priority than the FortiGuard category-based domain filter.</p> <p>Click <i>Create New</i> in the table to add a domain filter and configure the following settings.</p> <ul style="list-style-type: none"> • <i>Domain</i>: enter a domain. • <i>Type</i>: select <i>Simple</i>, <i>Reg. Expression</i>, or <i>Wildcard</i>. • <i>Action</i>: select <i>Redirect to Block Portal</i>, <i>Allow</i>, or <i>Monitor</i>. • <i>Status</i>: select <i>Enable</i> or <i>Disable</i>. <p>See Local domain filter on page 1275 for more details.</p>
<i>External IP Block Lists</i>	Enable to add one or more external IP block lists. See IP address threat feed on page 2682 for more details.
<i>DNS Translation</i>	<p>Enable to translate a DNS resolved IP address to another IP address specified on a per-policy basis.</p> <p>Click <i>Create New</i> in the table to add a DNS translation and configure the following settings.</p> <ul style="list-style-type: none"> • <i>Type</i>: select <i>IPv4</i> or <i>IPv6</i>. • <i>Original Destination</i>: enter the address of a host or subnet that you want translated. When a resolved address in a DNS response matches this destination, the FortiGate will replace the address with the address in <i>Translated Destination</i>.

- **Translated Destination:** enter the address of a host or subnet that you want the resolved address to be translated to.
- **Network Mask:** enter the netmask for the original and translated destination. If a single host is used for the original and translated destination, set the netmask to `255.255.255.255`.
- **Status:** select *Enable* or *Disable*.

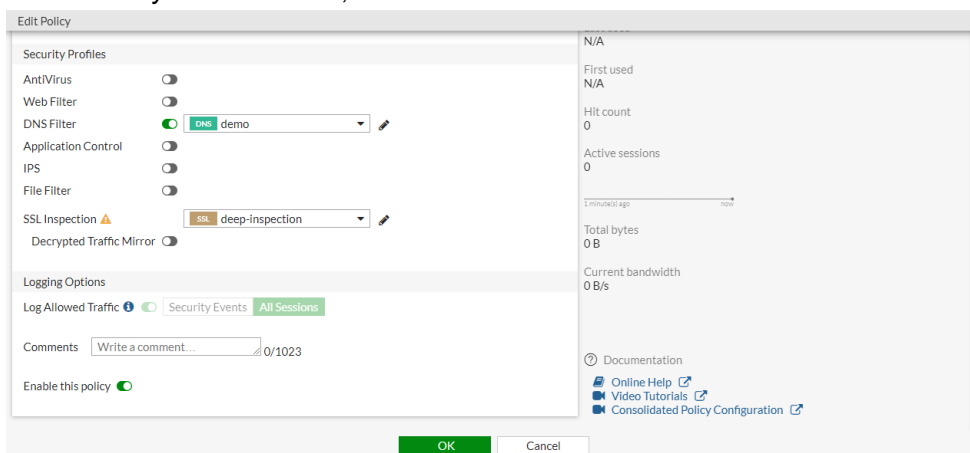

Enabling DNS translation will override matching DNS responses with translated IPs. See [DNS translation on page 1279](#) for more details.

Options	This section includes other options related to the DNS filter.
Redirect Portal IP	Set the IP address of the SDNS redirect portal. Select <i>Use FortiGuard Default</i> , or <i>Specify</i> and enter the IP address. When <i>FortiGuard Category Based Filter</i> categories are set to <i>Redirect to Block Portal</i> , the DNS response will use this IP address in its response to the client. If the client is accessing the domain on a web browser, they will be redirected to the block portal page on this address.
Allow DNS requests when a rating error occurs	Enable to allow all domains when FortiGuard DNS servers fail, or they are unreachable from the FortiGate. When this happens, a log message is recorded in the DNS logs by default.
Log all DNS queries and responses	Enable to log all domains visited (detailed DNS logging).

3. Click **OK**.

To apply a DNS filter profile to a policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*, or edit an existing policy.
2. In the *Security Profiles* section, enable *DNS Filter* and select the DNS filter.

3. Configure the other settings as needed.
4. Click **OK**.

CLI-only settings

The following DNS filter profile settings can only be configured in the CLI:

```

config dnsfilter profile
  edit <name>
    set block-action {block | redirect | block-servfail}
    set sdns-ftgd-err-log {enable | disable}
  next
end

```

```

block-action {block |
  redirect | block-
  servfail}

```

Set the action to take for blocked domains:

- **block:** return NXDOMAIN for blocked domains.
- **redirect:** redirect blocked domains to SDNS portal (default).
- **block-servfail:** return SERVFAIL for blocked domains.

When a FortiGuard or local domain filter category is set to *Redirect to Block Portal* in the GUI, the action is set to `block` in the CLI. By default, the `block-action` applied to a DNS profile is set to `redirect`.

```

sdns-ftgd-err-log {enable
  | disable}

```

Enable/disable FortiGuard SDNS rating error logging (default = enable).

To configure a DNS filter profile in the CLI:

```

config dnsfilter profile
  edit "demo"
    set comment ''
    config domain-filter
      unset domain-filter-table
    end
    config ftgd-dns
      set options error-allow
      config filters
        edit 2
          set category 2
          set action monitor
        next
        edit 7
          set category 7
          set action block
        next
        ...
        edit 22
          set category 0
          set action monitor
        next
      end
    end
    set log-all-domain enable
    set sdns-ftgd-err-log enable
    set sdns-domain-log enable
    set block-action redirect
    set block-botnet enable
    set safe-search enable
    set redirect-portal 93.184.216.34
    set youtube-restrict strict
  next
end

```

To apply a DNS filter profile to a policy in the CLI:

```
config firewall policy
  edit 1
    set name "Demo"
    set srcintf "port10"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set logtraffic all
    set fsso disable
    set dnsfilter-profile "demo"
    set profile-protocol-options "default"
    set ssl-ssh-profile "deep-inspection"
    set nat enable
  next
end
```

FortiGuard category-based DNS domain filtering

You can use the FortiGuard category-based DNS domain filter to inspect DNS traffic. This makes use of FortiGuard's continuously updated domain rating database for more reliable protection.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1262](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1282](#)).

The FortiGate must have a FortiGuard Web Filter license to use the FortiGuard category-based filter.

To configure FortiGuard category-based DNS domain filtering in the GUI:

1. Go to *Security Profiles > DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *FortiGuard Category Based Filter*.
3. Select the category and then select *Allow*, *Monitor*, or *Redirect to Block Portal* for that category.
4. In the *Options* section, select a setting for *Redirect Portal IP*. Select either *Use FortiGuard Default (208.91.112.55)* or click *Specify* and enter another portal IP. The FortiGate will use the portal IP to replace the resolved IP in the DNS response packet.

5. Click **OK**.

To configure FortiGuard category-based DNS domain filtering in the CLI:

```
config dnsfilter profile
  edit "demo"
    set comment ''
    config domain-filter
      unset domain-filter-table
    end
    config ftgd-dns
      set options error-allow
      config filters
        edit 2
          set category 2
          set action monitor
        next
        edit 7
          set category 7
          set action monitor
        next
        ...
        edit 22
          set category 0
          set action monitor
        next
      end
    end
    set log-all-domain enable
    set sdns-ftgd-err-log enable
    set sdns-domain-log enable
    set block-action {redirect | block}
    set block-botnet enable
    set safe-search enable
    set redirect-portal 93.184.216.34
```

```

    set youtube-restrict strict
  next
end

```

You can use the `get webfilter categories` command to determine the web filtering category that corresponds to a given category ID.

Verifying the logs

From your internal network PC, use a command line tool, such as `dig` or `nslookup`, to do a DNS query for some domains. For example:

```

#dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 61252
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 13; ADDITIONAL: 11

;; QUESTION SECTION:
;; www.example.com.                IN      A

;; ANSWER SECTION:
www.example.com.      17164   IN      A       93.184.216.34

;; AUTHORITY SECTION:

;; From 172.16.95.16@53(UDP) in 3.8 ms

```

To check the DNS filter log in the GUI:

1. Go to *Log & Report > DNS Query*. There are logs for the DNS traffic that just passed through the FortiGate with the FortiGuard rating for the domain name.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description	Domain Filter Index	#
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1	Domain is monitored		52	Information Technology		1
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1						2

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns
```

```
# execute log display
```

```
2 logs found.
```

```
2 logs returned.
```

```
1: date=2019-04-05 time=09:39:34 logid="1501054802" type="utm" subtype="dns" eventtype="dns-response" level="notice" vd="vdom1" eventtime=1554482373 policyid=1 sessionid=50868 srcip=10.1.100.18 srcport=34308 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16 dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=17647 qname="www.example.com" qtype="A" qtypeval=1 qclass="IN" ipaddr="93.184.216.34" msg="Domain is monitored" action="pass" cat=52 catdesc="Information Technology"

```

Botnet C&C domain blocking

FortiGuard Service continually updates the botnet C&C domain list. The botnet C&C domain blocking feature can block the botnet website access at the DNS name resolving stage. This provides additional protection for your network.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1262](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1282](#)).

To configure botnet C&C domain blocking in the GUI:

1. Go to *Security Profiles > DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *Redirect botnet C&C requests to Block Portal*.
3. Optionally, click the *botnet package* link. The *Botnet C&C Domain Definitions* pane opens, which displays the latest list.

The screenshot shows the 'Edit DNS Filter Profile' configuration page. On the left, the 'Name' is 'demo' and 'Comments' is 'Redirect botnet C&C requests to Block Portal'. The 'Enforce 'Safe Search' on Google, Bing, YouTube' and 'Restrict YouTube Access' options are checked. The 'FortiGuard Category Based Filter' is also checked. The 'Botnet C&C Domain Definitions' table is shown on the right, with a search bar and a list of domains and their actions.

Search	FQDN	Action

4. Configure the other settings as needed.
5. Click OK.

To configure botnet C&C domain blocking in the CLI:

```

config dnsfilter profile
  edit "demo"
    set comment ''
    config domain-filter
      unset domain-filter-table
    end
    config ftgd-dns
      set options error-allow
      config filters
        ...
      end
    end
    set log-all-domain enable
    set sdns-ftgd-err-log enable
    set sdns-domain-log enable
    set block-action block
    set block-botnet enable
    set safe-search enable
    set redirect-portal 208.91.112.55
    set youtube-restrict strict
  next
end

```

Verifying the logs

Select a botnet domain from that list. From your internal network PC, use a command line tool, such as dig or nslookup, to send a DNS query to traverse the FortiGate. For example:

```
#dig canind.co
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 997
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; canind.co.                IN      A

;; ANSWER SECTION:
canind.co.                60      IN      A      208.91.112.55

;; Received 43 B
;; Time 2019-04-05 09:55:21 PDT
;; From 172.16.95.16@53(UDP) in 0.3 ms
```

The botnet domain query was blocked and redirected to the portal IP (208.91.112.55) .

To check the DNS filter log in the GUI:

1. Go to *Log & Report > DNS Query* to view the DNS query blocked as a botnet domain.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1	Domain was blocked by dns botnet C&C			
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1				

To check the DNS filter log in the CLI:

```
(vdom1) # execute log filter category utm-dns
```

```
(vdom1) # execute log display
2 logs found.
2 logs returned.
```

```
1: date=2019-04-04 time=16:43:59 logid="1501054601" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1554421439 policyid=1 sessionid=14135

```

Botnet C&C IPDB blocking

FortiOS also maintains a botnet C&C IP address database (IPDB). If a DNS query response IP address (resolved IP address) matches an entry inside the botnet IPDB, this DNS query is blocked by the DNS filter botnet C&C.

To view the botnet IPDB list in the CLI:

```
(global) # diagnose sys botnet list 9000 10
9000. proto=TCP ip=103.228.28.166, port=80, rule_id=7630075, name_id=3, hits=0
9001. proto=TCP ip=5.9.32.166, port=481, rule_id=4146631, name_id=7, hits=0
```

```

9002. proto=TCP ip=91.89.44.166, port=80, rule_id=48, name_id=96, hits=0
9003. proto=TCP ip=46.211.46.166, port=80, rule_id=48, name_id=96, hits=0
9004. proto=TCP ip=77.52.52.166, port=80, rule_id=48, name_id=96, hits=0
9005. proto=TCP ip=98.25.53.166, port=80, rule_id=48, name_id=96, hits=0
9006. proto=TCP ip=70.120.67.166, port=80, rule_id=48, name_id=96, hits=0
9007. proto=TCP ip=85.253.77.166, port=80, rule_id=48, name_id=96, hits=0
9008. proto=TCP ip=193.106.81.166, port=80, rule_id=48, name_id=96, hits=0
9009. proto=TCP ip=58.13.84.166, port=80, rule_id=48, name_id=96, hits=0

```

Select an IP address from the IPDB list and use a reverse lookup service to find its corresponding domain name. From your internal network PC, use a command line tool, such as dig or nslookup, to query this domain and verify that it is blocked by the DNS filter botnet C&C. For example:

```

# dig cpe-98-25-53-166.sc.res.rr.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 35135
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; cpe-98-25-53-166.sc.res.rr.com.          IN      A

;; ANSWER SECTION:
cpe-98-25-53-166.sc.res.rr.com. 60      IN      A      208.91.112.55

;; Received 64 B
;; Time 2019-04-05 11:06:47 PDT
;; From 172.16.95.16@53(UDP) in 0.6 ms

```

Since the resolved IP address matches the botnet IPDB, the query was blocked and redirected to the portal IP (208.91.112.55).

To check the DNS filter log in the GUI:

1. Go to *Log & Report > DNS Query* to view the DNS query blocked by botnet C&C IPDB.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1	Domain was blocked by dns botnet C&C			
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1				

To check the DNS filter log in the CLI:

```
(global) # execute log filter category utm-dns
```

```
(global) # execute log display
```

```
2 logs found.
```

```
2 logs returned.
```

```

1: date=2019-04-05 time=11:06:48 logid="1501054600" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1554487606 policyid=1 sessionid=55232
srcip=10.1.100.18 srcport=60510 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16
dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=16265

ipaddr="93.184.216.34" msg="Domain was blocked by dns botnet C&C" action="redirect"
botnetip=98.25.53.166

```

```

2: date=2019-04-05 time=11:06:48 logid="1500054000" type="utm" subtype="dns" eventtype="dns-
query" level="information" vd="vdom1" eventtime=1554487606 policyid=1 sessionid=55232
srcip=10.1.100.18 srcport=60510 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16

```

```
dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=16265
qname="cpe-98-25-53-166.sc.res.rr.com" qtype="A" qtypeval=1 qclass="IN"
```

To check botnet activity:

1. Go to *Dashboard > Status* and locate the *Botnet Activity* widget.

2. If you do not see the widget, click *Add Widget*, and add the *Botnet Activity* widget.

DNS safe search

The DNS safe search option helps avoid explicit and inappropriate results in the Google, Bing, DuckDuckGo, Qwant, and YouTube search engines. The FortiGate responds with content filtered by the search engine.

For individual search engine safe search specifications, refer to the documentation for [Google](#), [Bing](#), [DuckDuckGo](#), [Qwant](#), and [YouTube](#).

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1262](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1282](#)).

To configure safe search in the GUI:

1. Go to *Security Profiles > DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *Enforce 'Safe search' on Google, Bing, YouTube* (this setting also applies safe search on DuckDuckGo and Qwant).
3. For *Restrict YouTube Access*, click *Strict* or *Moderate*.

4. Configure the other settings as needed.
5. Click *OK*.

To configure safe search in the CLI:

```
config dnsfilter profile
edit "demo"
```

```

config ftgd-dns
  set options error-allow
  config filters
    edit 2
      set category 2
    next
    ...
  end
end
set log-all-domain enable
set block-botnet enable
set safe-search enable
set youtube-restrict strict
next
end

```

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, and perform a DNS query on www.bing.com. For example:

```

# dig www.bing.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 46568
;; Flags: qr rd ra; QUERY: 1; ANSWER: 2; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.bing.com.                IN      A

;; ANSWER SECTION:
www.bing.com.          103    IN     CNAME  strict.bing.com
strict.bing.com.        103    IN      A       204.79.197.220

;; Received 67 B
;; Time 2019-04-05 14:34:52 PDT
;; From 172.16.95.16@53 (UDP) in 196.0 ms

```

The DNS query for www.bing.com returns with a CNAME strict.bing.com, and an A record for the CNAME. The user's web browser then connects to this address with the same search engine UI, but any explicit content search is filtered out.

To check the DNS filter log in the GUI:

1. Go to *Log & Report > DNS Query*.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1	DNS Safe Search enforced		41	Search Engines and Portals
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1				

The DNS filter log in FortiOS shows a message of *DNS Safe Search enforced*.

To check the DNS filter log in the CLI:

```

# execute log filter category utm-dns
# execute log display
2 logs found.
2 logs returned.

```

```

1: date=2019-04-05 time=14:34:53 logid="1501054804" type="utm" subtype="dns" eventtype="dns-

```

Local domain filter

In addition to the FortiGuard category-based domain filter, you can define a local static domain filter to allow or block specific domains.

In a DNS filter profile, the local domain filter has a higher priority than FortiGuard category-based domain filter. DNS queries are scanned and matched first with the local domain filter.

- If the local domain filter list has no match, then the FortiGuard category-based domain filter is used. If a DNS query domain name rating belongs to the block category, the query is blocked and redirected. If the FortiGuard category-based filter has no match, then the original resolved IP address is returned to the client DNS resolver.
- If the local domain filter action is set to block and an entry matches, then that DNS query is blocked and redirected.
- If the local domain filter action is set to allow and an entry matches, it will skip the FortiGuard category-based domain filter and directly return to the client DNS resolver.
- If the local domain filter action is set to monitor and an entry matches, it will skip the FortiGuard category-based domain filter, directly return to the client DNS resolver, and log the resolution.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1262](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1282](#)).

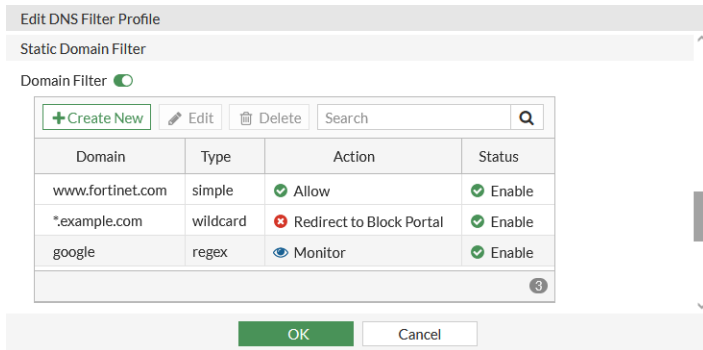

In this example, a DNS filter profile is configured and applied to a firewall policy running proxy-based inspection mode.

To configure the local domain filter in the GUI:

1. Go to *Security Profiles > DNS Filter* and click *Create New*, or edit an existing profile.
2. Set *Name* to *demo*.
3. In the *Static Domain Filter* section, enable *Domain Filter*.
4. Click *Create New*. The *Create Domain Filter* pane opens.
5. Enter a domain, and select a *Type* and *Action*. This example has three filters:

Domain	Type	Action
www.fortinet.com	Simple	Allow
*.example.com	Wildcard	Redirect to Block Portal
google	Reg. Expression	Monitor

6. Click *OK*. The entry appears in the table.

7. In the *FortiGuard Category Based Filter* table, set *General Interest - Business > Search Engines and Portals* to *Redirect to Block Portal*.
8. Configure the remaining settings as required.
9. Click *OK*.

To apply the DNS filter to a policy-mode policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*, or edit an existing policy.
2. Configure the *Incoming Interface*, *Outgoing Interface*, *Source*, *Destination*, and *Service* as required.
3. Set *Inspection Mode* to *Proxy-based*.
4. Enable *DNS Filter* and select the *demo* filter.
5. Set *SSL Inspection* to *certificate-inspection*.
6. Configure the remaining settings as required.
7. Click *OK*.

To configure the local domain filter in the CLI:

```
config dnsfilter domain-filter
  edit 1
    set name "demo"
    set comment ''
    config entries
      edit 1
        set domain "www.fortinet.com"
        set type simple
        set action allow
        set status enable
      next
      edit 2
        set domain "*.example.com"
        set type wildcard
        set action block
        set status enable
      next
      edit 3
        set domain "google"
        set type regex
        set action monitor
        set status enable
      next
    end
```

```

next
end

```

Wildcard entries are converted to regular expressions by FortiOS. As a result, wildcards will match any suffix, as long as there is a word boundary following the search term.

For example:

```

config entries
  edit 1
    set domain "*.host"
    set type wildcard
  next
end

```

will match `wp36.host` and `wp36.host.pressdns.com`, but not `wp36.host123.pressdnds.com`.

To avoid this, use an explicit regular expression search string:

```

config entries
  edit 1
    set domain "^.*\\.host$"
    set type regex
  next
end

```

To apply the DNS filter to a proxy-mode policy in the CLI:

```

config firewall policy
  edit 1
    set name "port3-port1"
    set srcintf "port3"
    set dstintf "port1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "certificate-inspection"
    set dnsfilter-profile "demo"
    set logtraffic all
    set nat enable
  next
end

```

Testing and Verification

On a client computer, perform DNS lookup on the three domains:

Domain	DNS query result	Log
www.fortinet.com	Allowed. Resolved to correct IP.	None
www.example.com	Blocked. Redirected to IP of block page.	Deny log
www.google.com	Allowed. Resolved to correct IP.	Allow log

To check the DNS filter log in the GUI:

1. Go to *Log & Report > Security Events*.
2. Click the *DNS Query* card name to show the logs.

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns
# execute log display
...
7: date=2019-04-05 time=15:37:06 logid="1501054803" type="utm" subtype="dns" eventtype="dns-

```

DNS translation

This setting allows you to translate a DNS resolved IP address to another IP address you specify on a per-policy basis.

For example, website A has a public address of 1.2.3.4. However, when your internal network users visit this website, you want them to connect to the internal host 192.168.3.4. You can use DNS translation to translate the DNS resolved address 1.2.3.4 to 192.168.3.4. Reverse use of DNS translation is also applicable. For example, if you want a public DNS query of your internal server to get a public IP address, then you can translate a DNS resolved private IP to a public IP address.

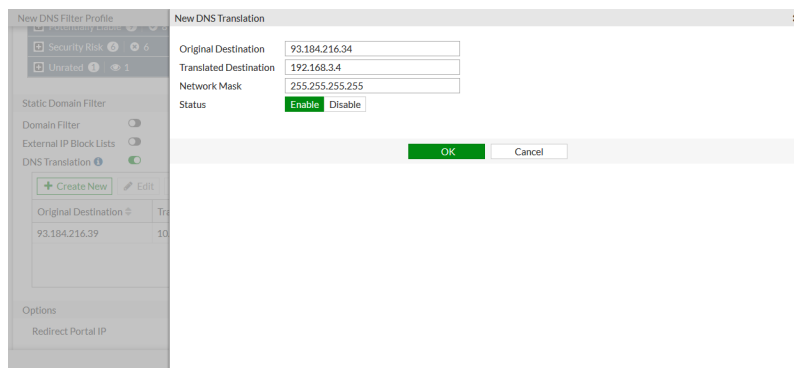

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see [Configuring a DNS filter profile on page 1262](#)), or applied on the DNS server interface (see [Applying DNS filter to FortiGate DNS server on page 1282](#)).

Sample configuration

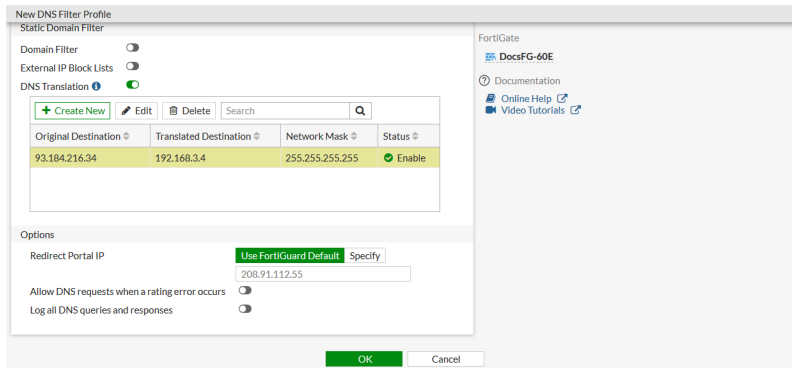

This configuration forces the DNS filter profile to translate 93.184.216.34 (www.example.com) to 192.168.3.4. When internal network users perform a DNS query for www.example.com, they do not get the original www.example.com IP address of 93.184.216.34. Instead, it is replaced with 192.168.3.4.

To configure DNS translation in the GUI:

1. Go to *Security Profiles > DNS Filter* and click *Create New*, or edit an existing profile.
2. In the *Static Domain Filter* section, enable *DNS Translation*.
3. Click *Create New*. The *New DNS Translation* pane opens.
4. Enter the *Original Destination* (the domain's original IP address), the *Translated Destination* IP address, and the *Network Mask*.

5. Click **OK**. The entry appears in the table.

6. Configure the other settings as needed.

7. Click **OK**.

To configure DNS translation in the CLI:

```
config dnsfilter profile
  edit "demo"
    set comment ''
    ...
    config dns-translation
      edit 1
        set src 93.184.216.34
        set dst 192.168.3.4
        set netmask 255.255.255.255
      next
    end
    set redirect-portal 0.0.0.0
    set redirect-portal6 ::
    set youtube-restrict strict
  next
end
```

To check DNS translation using a command line tool before DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 27030
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.                IN      A

;; ANSWER SECTION:
www.example.com.          33946   IN      A       93.184.216.34

;; AUTHORITY SECTION:
example.com.              18578   IN      NS      b.iana-servers.net.
example.com.              18578   IN      NS      a.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 10:47:26 PDT
;; From 172.16.95.16@53(UDP) in 0.5 ms
```

To check DNS translation using a command line tool after DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 62060
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.                IN      A

;; ANSWER SECTION:
www.example.com.          32491   IN      A       192.168.3.4

;; AUTHORITY SECTION:
example.com.              17123   IN      NS      b.iana-servers.net.
example.com.              17123   IN      NS      a.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 11:11:41 PDT
;; From 172.16.95.16@53(UDP) in 0.5 ms
```

DNS translation network mask

The following is an example of DNS translation that uses a network mask:

To configure DNS translation in the CLI:

```
config dns-translation
  edit 1
    set src 93.184.216.34
    set dst 1.2.3.4
    set netmask 255.255.224.0
  next
end
```

To check DNS translation using a command line tool after DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 6736
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.                IN      A

;; ANSWER SECTION:
www.example.com.          29322   IN      A       1.2.24.34

;; AUTHORITY SECTION:
example.com.              13954   IN      NS      a.iana-servers.net.
example.com.              13954   IN      NS      b.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 12:04:30 PDT
;; From 172.16.95.16@53(UDP) in 2.0 ms
```

The binary arithmetic to convert 93.184.216.34 to 1.2.3.4 with the subnet mask is as follows:

1. AND src(Original IP) with negative netmask (93.184.216.34 & ~255.255.224.0):

```
01011101.10111000.11011000.00100010 93.184.216.34
00000000.00000000.00011111.11111111 ~255.255.224.0
----- &
00000000.00000000.00011000.00100010 0.0.24.34
```

2. AND dst(Translated IP) with netmask:

```
00000001.00000010.00000011.00000100 1.2.3.4
11111111.11111111.11100000.00000000 255.255.224.0
----- &
00000001.00000010.00000000.00000000 1.2.0.0
```

3. Final step 2 bitwise-OR 3:

```
00000000.00000000.00011000.00100010 0.0.24.34
00000001.00000010.00000000.00000000 1.2.0.0
----- |
00000001.00000010.00011000.00100010 1.2.24.34
```

Applying DNS filter to FortiGate DNS server

You can configure a FortiGate as a DNS server in your network. When you enable DNS service on a specific interface, the FortiGate will listen for DNS service on that interface.

Depending on the configuration, DNS service works in three modes: *Recursive*, *Non-Recursive*, or *Forward to System DNS* (server). For details on how to configure the FortiGate as a DNS server and configure the DNS database, see [FortiGate DNS server on page 233](#).

You can apply a DNS filter profile to *Recursive* and *Forward to System DNS* mode. This is the same as the FortiGate working as a transparent DNS proxy for DNS relay traffic.

To configure DNS service in the GUI:

1. Go to *Network > DNS Servers* (if this option is not available, go to *System > Feature Visibility* and enable *DNS Database*).
2. In the *DNS Service on Interface* section, click *Create New* and select an *Interface* from the dropdown.
3. For *Mode*, select *Forward to System DNS*.
4. Enable *DNS Filter* and select a profile from the dropdown.

New DNS Service

Interface: port10

Mode: Recursive | Non-Recursive | **Forward to System DNS**

DNS Filter: **DNS** demo

DNS over HTTPS:

OK Cancel

5. Click **OK**.

To configure DNS service in the CLI:

```
config system dns-server
  edit "port10"
```

```

    set mode forward-only
    set dnsfilter-profile "demo"
  next
end

```

To check DNS service with a DNS filter profile using a command line tool:

In this example, port10 is enabled as a DNS service with the DNS filter profile demo. The IP address of port10 is 10.1.100.5, and the DNS filter profile is configured to block category 52 (information technology). From your internal network PC, use a command line tool, such as dig or nslookup, to perform a DNS query. For example:

```

# dig @10.1.100.5 www.fortinet.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 52809
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.fortinet.com.                IN      A

;; ANSWER SECTION:
www.fortinet.com.        60      IN      A      208.91.112.55

;; Received 50 B
;; Time 2019-04-08 14:36:34 PDT
;; From 10.1.100.5@53(UDP) in 13.6 ms

```

The relay DNS traffic was filtered based on the DNS filter profile configuration. It was blocked and redirected to the portal IP (208.91.112.55).

DNS inspection with DoT and DoH

DNS over TLS (DoT) and DNS over HTTPS (DoH) are supported in DNS inspection. Prior to 7.0, DoT and DoH traffic silently passes through the DNS proxy. In 7.0, the WAD is able to handle DoT and DoH, and redirect DNS queries to the DNS proxy for further inspection.

In the following examples, the FortiGate inspects DNS queries made over DoT and DoH to a Cloudflare DNS server. The DNS filter profile blocks the education category.

To configure DNS inspection of DoT and DoH queries in the GUI:

1. Configure the SSL-SSH profile:
 - a. Go to *Security Profiles > SSL/SSH Inspection* and click *Create New*.
 - b. Set *Inspection method* to *Full SSL Inspection*. DoT and DoH can only be inspected using doing deep inspection.
 - c. In the *Protocol Port Mapping* section, enable *DNS over TLS*.

The screenshot shows the 'New SSL/SSH Inspection Profile' configuration window. The 'Inspection method' is set to 'Full SSL Inspection'. Under the 'Protocol Port Mapping' section, 'DNS over TLS' is enabled with port 853. Other protocols listed include HTTPS (443), SMTPS (465), POP3S (995), IMAPS (993), and FTPS (990). The 'Server certificate SNI check' is set to 'Enable'. The 'Reputable websites' section is also visible.

- d. Configure the other settings as needed.
- e. Click *OK*.
2. Configure the DNS filter profile:
 - a. Go to *Security Profiles > DNS Filter* and click *Create New*.
 - b. Enable *Redirect botnet C&C requests to Block Portal*.
 - c. Enable *FortiGuard Category Based Filter* and set the *Action* for the *Education* category to *Redirect to Block Portal*.
 - d. Configure the other settings as needed.
 - e. Click *OK*.
3. Configure the firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Enable *DNS Filter* and select the profile you created.
 - c. For *SSL Inspection*, select the profile you created.
 - d. Configure the other settings as needed.
 - e. Click *OK*.

To configure DNS inspection of DoT and DoH queries in the CLI:**1. Configure the SSL-SSH profile:**

```
config firewall ssl-ssh-profile
  edit "ssl"
    config dot
      set status deep-inspection
      set client-certificate bypass
      set unsupported-ssl-cipher allow
      set unsupported-ssl-negotiation allow
      set expired-server-cert block
      set revoked-server-cert block
      set untrusted-server-cert allow
      set cert-validation-timeout allow
      set cert-validation-failure block
    end
  next
end
```

2. Configure the DNS filter profile:

```
config dnsfilter profile
  edit "dnsfilter"
    config ftgd-dns
      config filters
        edit 1
          set category 30
          set action block
        next
      end
    end
    set block-botnet enable
  next
end
```

3. Configure the firewall policy:

```
config firewall policy
  edit 1
    set srcintf "port1"
    set dstintf "port3"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set profile-protocol-options "protocol"
    set ssl-ssh-profile "ssl"
    set webfilter-profile "webfilter"
    set dnsfilter-profile "dnsfilter"
    set nat enable
  next
end
```

Testing the connection

To query DNS over TLS:

1. Send a DNS query over TLS to the Cloudflare server 1.1.1.1 (this example uses `kdig` on an Ubuntu client). The `www.ubc.ca` domain belongs to the education category:

```
~$ kdig -d @1.1.1.1 +tls-ca +tls-host=cloudflare-dns.com www.ubc.ca
;; DEBUG: Querying for owner(www.ubc.ca.), class(1), type(1), server(1.1.1.1), port
(853), protocol(TCP)
;; DEBUG: TLS, imported 128 system certificates
;; DEBUG: TLS, received certificate hierarchy:
;; DEBUG: #1, C=US,ST=California,L=San Francisco,O=Cloudflare\, Inc.,CN=cloudflare-
dns.com
;; DEBUG:      SHA-256 PIN: elpYcNcs9ZtkQBI4+cb2QtZcy015UI9jmKsvbTsTad0=
;; DEBUG: #2, C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=Certificate
Authority,CN=FG3H1E5818903681,EMAIL=support@fortinet.com
;; DEBUG:      SHA-256 PIN: s48VtdOD1NZfAG2g/92hMLhitU51qsP9pkHAUtTJ+f4=
;; DEBUG: TLS, skipping certificate PIN check
;; DEBUG: TLS, The certificate is trusted.
;; TLS session (TLS1.3)-(ECDHE-SECP256R1)-(ECDSA-SECP256R1-SHA256)-(AES-256-GCM)
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 56850
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.ubc.ca.                IN      A

;; ANSWER SECTION:
www.ubc.ca.                60      IN      A      208.91.112.55

;; Received 44 B
;; Time 2021-03-12 06:53:37 UTC
;; From 1.1.1.1@853(TCP) in 6.0 ms
```

In this query, the FortiGate inspects the DNS query to the Cloudflare DNS server. It replaces the result with the IP of the FortiGuard block page, which successfully blocks the query.

To query DNS over HTTPS:

1. In your browser, enable DNS over HTTPS.
2. Go to `www.ubc.ca`. The website is redirected to the block page.

Troubleshooting for DNS filter

If you have trouble with the DNS filter profile in your policy, start with the following troubleshooting steps:

- Check the connection between the FortiGate and FortiGuard DNS rating server (SDNS server).
- Check that the FortiGate has a valid FortiGuard web filter license.
- Check the FortiGate DNS filter configuration.

Checking the connection between the FortiGate and FortiGuard SDNS server

You need to ensure the FortiGate can connect to the FortiGuard SDNS server. By default, the FortiGate uses DNS over TLS (DoT, TCP port 853) to connect to the SDNS server. See [DNS over TLS and HTTPS on page 245](#) for more information.

To check the connection between the FortiGate and SDNS server:

1. Verify the FortiGuard SDNS server information:

```
# diagnose test application dnsproxy 3
...
SDNS servers:
173.243.140.53:853 vrf=0 tz=-480 encrypt=dot req=0 to=0 res=0 rt=34 ready=1 timer=0
probe=0 failure=0 last_failed=0
```

The SDNS server IP address might be different depending on location (in this example, it is 173.243.140.53:853).

2. In the management VDOM, check the communication between the FortiGate and the SDNS server:

```
# execute ping 173.243.140.53
```

3. If FortiGuard is not reachable using anycast, configure the default FortiGuard SDNS (unicast) server (208.91.112.220):

```
config system fortiguard
    set fortiguard-anycast disable
    set sdns-server-ip "208.91.112.220"
end
```

4. Verify the list of SDNS servers again:

```
# diagnose test application dnsproxy 3
FGD_DNS_SERVICE_LICENSE:
server=208.91.112.220:53, expiry=2023-10-28, expired=0, type=2
server=83.231.212.53:53, expiry=2023-10-28, expired=0, type=2
```

The default FortiGuard SDNS server should work in most cases; however, you can switch to another server to see if it improves latency.

By default, DNS filtering connects to the FortiGuard secure DNS server over anycast and uses DoT (TCP port 853) when the default settings of `fortiguard-anycast enable` and `fortiguard-anycast-source fortinet` are configured. Disabling `fortiguard-anycast` will force the FortiGate to use cleartext (UDP port 53) instead of DoT (TCP port 853) in addition to disabling FortiGuard secure DNS over anycast.

Checking the FortiGuard DNS rating service license

The FortiGuard DNS rating service shares the license with the FortiGuard web filter, so you must have a valid web filter license for the DNS rating service to work. While the license is shared, the DNS rating service uses a separate connection mechanism from the web filter rating.

To check the DNS rating service license in the CLI:

1. View the DNS settings:

```
# diagnose test application dnsproxy 3
```

2. Find the `FGD_DNS_SERVICE_LICENSE` line and check that the license has not expired:

```
FGD_DNS_SERVICE_LICENSE:
server=173.243.140.53:853, expiry=2023-10-28, expired=0, type=2
```

3. Find the `SDNS servers` line to view the functioning servers:

```
SDNS servers:
173.243.140.53:853 vrf=0 tz=-480 encrypt=dot req=0 to=0 res=0 rt=34 ready=1 timer=0
probe=0 failure=0 last_failed=0
```

Checking the FortiGate DNS filter profile configuration**To check the DNS filter profile configuration:**

1. In FortiOS, create a local domain filter and set the *Action* to *Redirect to Block Portal* (see [Local domain filter on page 1275](#)).
2. Apply this DNS filter profile to the policy.
3. From the client PC, perform a DNS query on this domain. If you get the profile's redirected portal address, this means that the DNS filter profile works as expected.

Additional troubleshooting

Use `diagnose test application dnsproxy <test level>` to troubleshoot further DNS proxy information, where:

Test level	Action
1	Clear DNS cache
2	Show statistics
3	Dump DNS setting
4	Reload FQDN
5	Requery FQDN
6	Dump FQDN
7	Dump DNS cache
8	Dump DNS database
9	Reload DNS database
10	Dump secure DNS policy/profile
11	Dump botnet domain

Test level	Action
12	Reload secure DNS setting
13	Show hostname cache
14	Clear hostname cache
15	Show SDNS rating cache
16	Clear SDNS rating cache
17	Show DNS debug bit mask
18	Show DNS debug object members
99	Restart the dnsproxy worker

To debug DNS proxy details:

```
# diagnose debug application dnsproxy -1
# diagnose debug {enable | disable}
```

Application control

FortiGates can recognize network traffic generated by a large number of applications. Application control sensors specify what action to take with the application traffic. Application control uses IPS protocol decoders that can analyze network traffic to detect application traffic, even if the traffic uses non-standard ports or protocols. Application control supports traffic detection using the HTTP protocol (versions 1.0, 1.1, and 2.0).

FortiOS includes three preloaded application sensors:

- *default* (monitors all applications)
- *wifi-default* (default configuration for offloading WiFi traffic)
- *block-high-risk*

You can customize these sensors, or you can create your own to log and manage the applications on your network.

Once configured, you can add the application sensor to a firewall policy.

This functionality requires a subscription to FortiGuard Application Control.

The following topics provide information about application control:

- [Configuring an application sensor on page 1290](#)
- [Basic category filters and overrides on page 1291](#)
- [Excluding signatures in application control profiles on page 1295](#)
- [Port enforcement check on page 1297](#)
- [Protocol enforcement on page 1297](#)
- [SSL-based application detection over decrypted traffic in a sandwich topology on page 1299](#)
- [Matching multiple parameters on application control signatures on page 1300](#)
- [Application signature dissector for DNP3 on page 1303](#)

Configuring an application sensor

FortiGates can recognize network traffic generated by a large number of applications using application control, which relies on IPS protocol decoders. Application sensors control what action is taken with application traffic.

To configure an application sensor:

1. Go to *Security Profiles > Application Control* and click *Create New*.
2. Configure the following settings:

<i>Name</i>	Enter a unique name for the sensor.
<i>Comments</i>	Enter a comment (optional).
<i>Categories</i>	Configure the action to take on groups of signatures based on their category type. Applications belonging to the category trigger the configured action: monitor, allow, block, or quarantine. See Basic category filters and overrides on page 1291 for more information.
<i>Network Protocol Enforcement</i>	Enable/disable the enforcement of protocols over selected ports. See Protocol enforcement on page 1297 for more information.
<i>Application and Filter Overrides</i>	Configure multiple applications signatures with a dedicated action for a single sensor. Filters can be added based on the application category, behavior, popularity, protocol, risk, technology, or vendor subtype. For more information, see <ul style="list-style-type: none"> • Configuring application and filter overrides on page 1292 • Matching multiple parameters on application control signatures on page 1300 • Blocking applications with custom signatures on page 1405
<i>Block applications detected on non-default ports</i>	When enabled: <ul style="list-style-type: none"> • For monitor and allow actions, applications will be blocked if detected on non-default ports (as defined in FortiGuard application signatures). • Block actions still block traffic for the application regardless of the port. See Port enforcement check on page 1297 for more information.

Allow and Log DNS Traffic

The intended behavior is to allow and log DNS traffic. However, to fully enable logging, configure the following:

1. Within the application sensor profile, create a new *Application and Filter Overrides* entry.
2. Set the *Action* to *Monitor*.
3. Search for the DNS application, select it, and click *Add Selected*.
4. Click *OK* to save the override, then click *OK* to save the application sensor profile.

QUIC

Allowing QUIC instructs the FortiGate to inspect Google Chrome packets for a QUIC header and logs as a QUIC message.

Blocking QUIC forces Google Chrome to use HTTP2/TLS1.2 and the FortiGate logs QUIC as blocked.

Replacement Messages for HTTP-based Applications

Enable/disable replacement messages for blocked applications.

See [Replacement messages on page 2265](#) for information about replacement messages.

3. Click *OK*.

Basic category filters and overrides

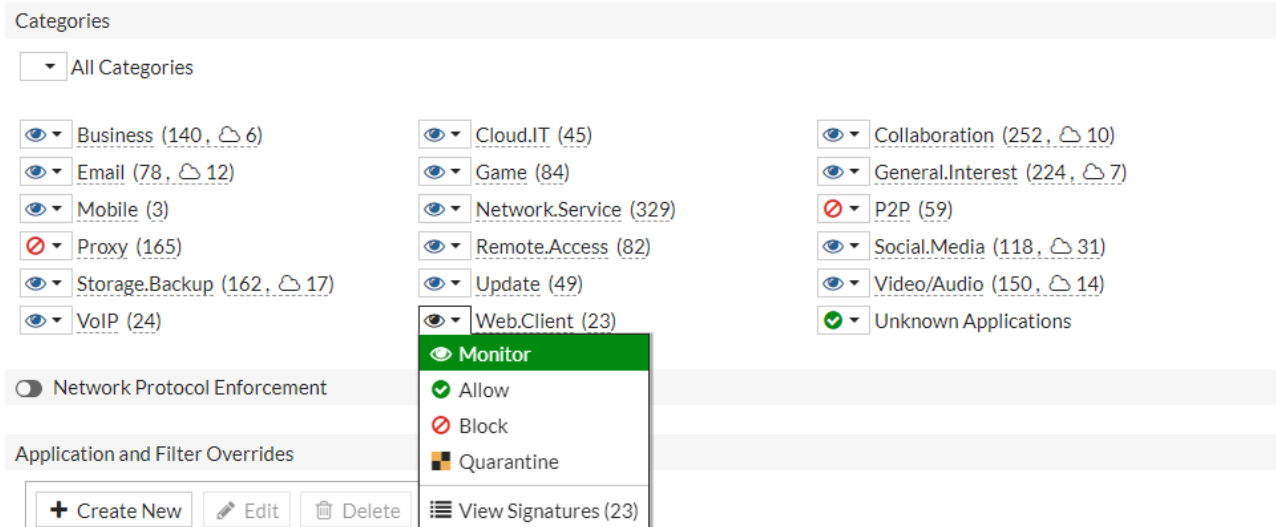

Once you have created an application sensor, you can define the applications that you want to control. You can add applications and filters using categories, application overrides, and/or filter overrides with designated actions (monitor, allow, block, or quarantine).

Action	Description
Monitor	Passes the traffic and generates a log message.
Allow	Passes the traffic but does not generate a log message.
Block	Drops the detected traffic and generates a log message.
Quarantine	Blocks the traffic from an attacker IP address until the expiration time is reached and generates a log message.

For more information about application control logs, see [Log and Report on page 2716](#).

To configure category filters in the GUI:

1. Go to *Security Profiles > Application Control* and click *Create New*, or edit an existing sensor.
2. Under *Categories*, click the icon next to the category name to set the action or view the application signatures.

3. If you select the *Quarantine* action, the *Quarantine Duration* pane will open. Enter the duration values and click *OK*.

Quarantine Duration

Days	<input type="text" value="0"/>
Hours	<input type="text" value="0"/>
Minutes	<input type="text" value="5"/>

4. Click *OK*.

To configure category filters in the CLI:

```

config application list
  edit <name>
    config entries
      edit <id>
        set category <id>
        set action {pass | block | reset}
        set quarantine {none | attacker}
        set quarantine-expiry <###d##h##m>
        set log {enable | disable}
      next
    end
  next
end

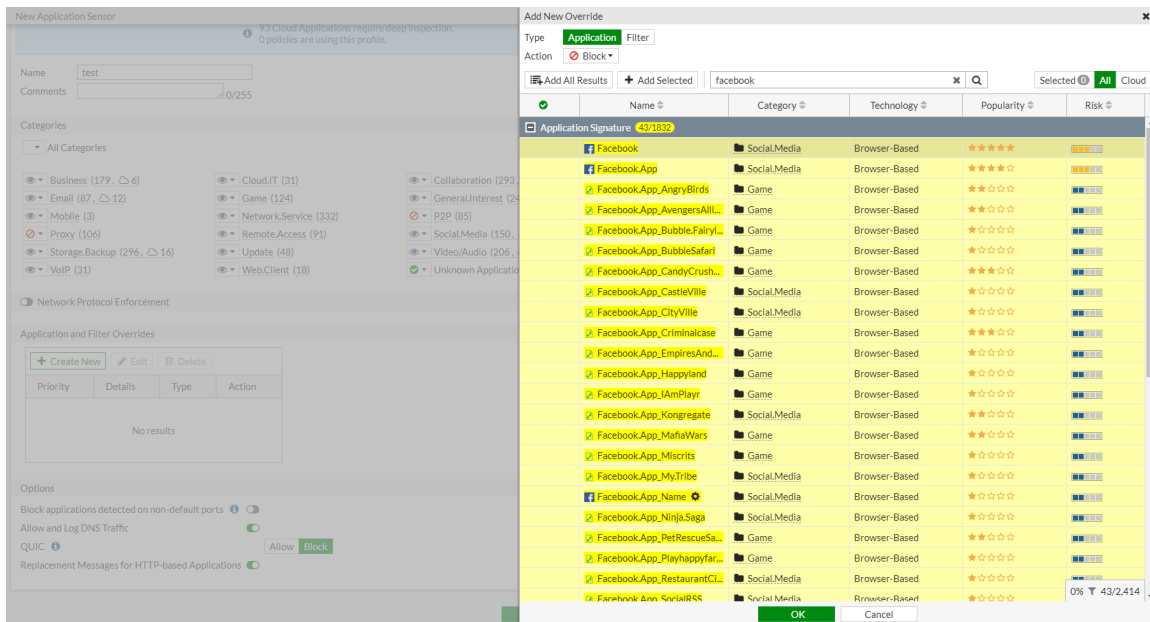

```

Configuring application and filter overrides

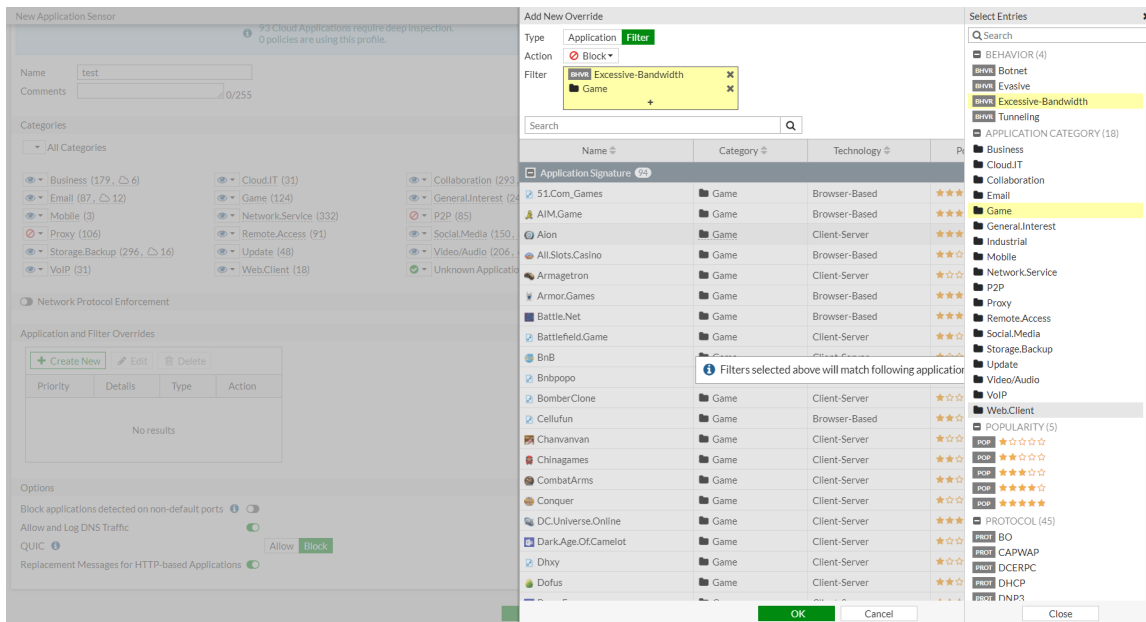

Multiple application signatures can be added for one sensor with a designated action. Filters can be added based on behavior, application category, popularity, protocol, risk, technology, or vendor subtypes.

To configure overrides in the GUI:

1. Go to *Security Profiles > Application Control* and click *Create New*, or edit an existing sensor.
2. In the *Application and Filter Overrides* table, click *Create New*.
3. Add an application:
 - a. For *Type*, select *Application*.
 - b. Select an *Action* from the dropdown.
 - c. In the *Search* box, enter an application name and press *Enter*.
 - d. In the search results, select desired the applications (you can select multiple applications) and click *Add Selected*.

- e. Click *OK*.
4. Add a filter:
 - a. In the *Application and Filter Overrides* table, click *Create New*.
 - b. For *Type*, select *Filter*.
 - c. Select an *Action* from the dropdown.
 - d. In the *Filter* field, click the *+*. The *Select Entries* pane opens, and you can search based on filter subtypes. This example has excessive bandwidth (under behavior) and game (under application category).

e. Click OK.

5. Click OK.

To configure overrides in the CLI:

```

config application list
  edit <name>
    config entries
      edit <id>
        set protocols <integer>
        set risk <integer>
        set vendor <id>
        set technology <id>
        set behavior <id>
        set popularity <integer>
        set action {pass | block | reset}
        set log {enable | disable}
      next
    end
  next
end
  
```

protocols <integer>	Application protocol filter (0 - 47, or all).
risk <integer>	Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).
vendor <id>	Application vendor filter (0 - 25, or all).
technology <id>	Application technology filter: <ul style="list-style-type: none"> • all • 0 (network-protocol) • 1 (browser-based)

	<ul style="list-style-type: none"> • 2 (client-server) • 4 (peer-to-peer)
behavior <id>	Application behavior filter: <ul style="list-style-type: none"> • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
popularity <integer>	Application popularity filter (1 - 5, from least to most popular).
action {pass block reset}	Pass/block traffic or reset the connection for traffic from this application (default = block).
log {enable disable}	Enable/disable logging for this application list (default = enable).

Excluding signatures in application control profiles

In an application control list, the exclusion option allows users to specify a list of applications they wish to exclude from an entry filtered by category, technology, or others. By excluding the signature, the application is no longer processed on the entry in which it is excluded, but may match subsequent entries that exist.

To configure signature exclusion:

```
config application list
  edit <name>
    config entries
      edit <id>
        set category <id>
        set exclusion <application id>
        set action {pass | block | reset}
      next
    end
  next
end
```

Sample configurations

In the following example, category 23 (social media) is blocked in the entries, and signature 34527 (Instagram) is excluded from this entry. Traffic to Instagram will pass because the signature is removed from entry 1 and the action of other-application-action is set to pass.

To configure signature exclusion:

```
config application list
  edit "test"
    set other-application-action pass
    set unknown-application-action pass
```

```
    set other-application-log enable
    set unknown-application-log enable
    config entries
        edit 1
            set category 23
            set exclusion 34527
            set action block
        next
    end
next
end
```

In the following example, entry 1 is configured so that category 23 (social media) is set to pass and signature 34527 (Instagram) is excluded. In entry 2, application 34527 (Instagram) is blocked, so the traffic to Instagram will be blocked, even though it is excluded in entry 1. Traffic to other signatures in category 23, such as Facebook, will still pass.

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
        config entries
            edit 1
                set category 23
                set exclusion 34527
                set action pass
            next
            edit 2
                set application 34527
                set action block
            next
        end
    next
end
```

In the following example, an explicit proxy is behind the FortiGate with an excluded signature for 107347980 (Proxy.HTTP) and category 6 (proxy) is set to block. The client will allow normal proxy traffic to pass, but it will discard all proxy application traffic (such as KProxy, Tor, and so on).

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
        config entries
            edit 1
                set category 6
                set exclusion 107347980
                set action block
            next
        end
    next
end
```

```
        end
    next
end
```

Port enforcement check

Most networking applications run on specific ports. For example, SSH runs on port 22, and Facebook runs on ports 80 and 443.

If the default network service is enabled in the application control profile, a port enforcement check is done at the application profile level, and any detected application signatures running on the non-standard TCP/IP port are blocked. This means that each allowed application runs on its default port.

To configure port enforcement check:

```
config application list
  edit <name>
    set enforce-default-app-port enable
    config entries
      edit 1
        set application 15896
        set action pass
      next
    end
  next
end
```

For example, when applying this application control sensor, FTP traffic (application 15896) with the standard port (port 21) is allowed, while the non-standard port (port 2121) is blocked.

Protocol enforcement

Protocol enforcement allows you to configure networking services (e.g. FTP, HTTP, HTTPS) on known ports (e.g. 21, 80, 443). For protocols that are not allowlisted under select ports, the IPS engine performs the violation action to block, allow, or monitor that traffic.

This feature can be used in the following scenarios:

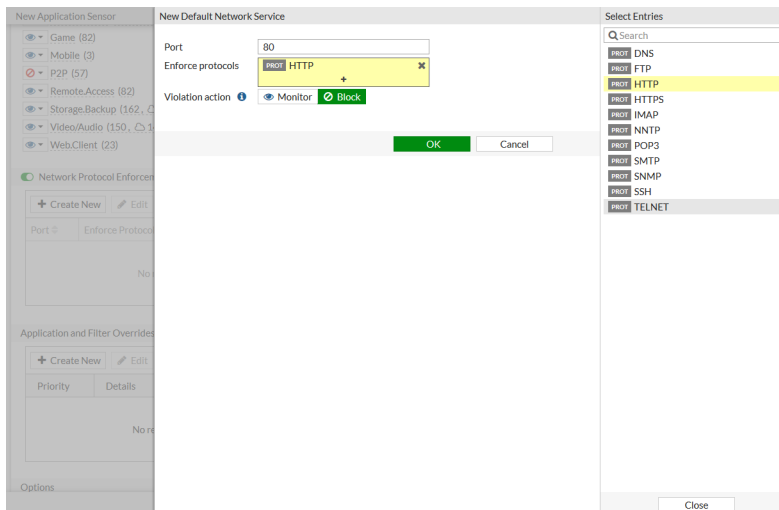

- When one protocol dissector confirms the service of network traffic, protocol enforcement can check whether the confirmed service is allowlisted under the server port. If it is not allowlisted, the traffic is considered a violation and IPS can take the action specified in the configuration (block or monitor it).
- When there is no confirmed service for the network traffic, the traffic is considered a service violation if IPS dissectors rule out all of the services enforced under its server port.

In an applicable profile, a default network service list can be created to associate well known ports with accepted services.

In the following example, an application sensor is configured to enforce HTTP on port 80 (block), and DNS on port 53 (monitor).

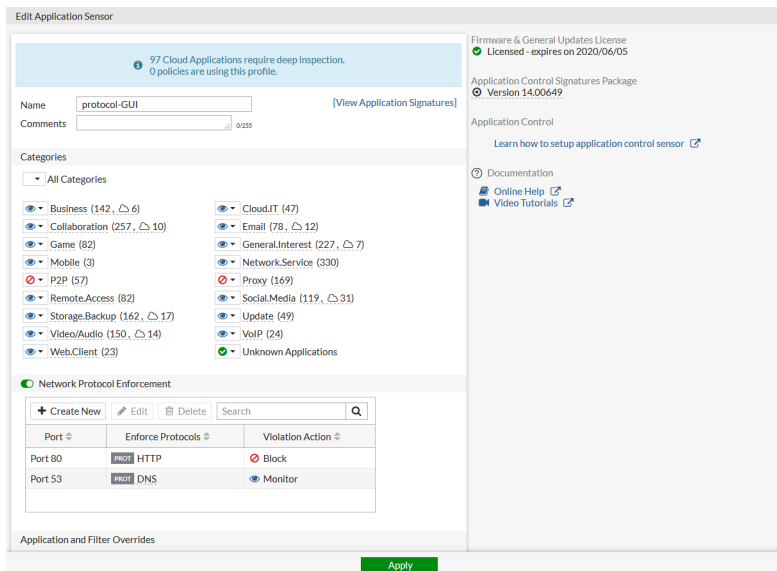

To configure protocol enforcement in the GUI:

1. Go to *Security Profiles > Application Control*.
2. Create a new application sensor or edit an existing one.
3. Enable *Network Protocol Enforcement*.
Enforcement entries can be created, edited, or deleted to configure network services on certain ports and determine the violation action.
4. In the *Network Protocol Enforcement* table, click *Create New*.
5. Configure the entry for HTTP:
 - a. For *Port*, enter 80.
 - b. For *Enforced protocols*, select *HTTP*.
 - c. For *Violation action*, select *Block*.
 - d. Click *OK*.

6. Configure the entry for DNS:
 - a. Click *Create New*, then for *Port*, enter 53.
 - b. For *Enforced protocols*, select *DNS*.
 - c. For *Violation action*, select *Monitor*.
 - d. Click *OK*.

The entries are displayed in the table.

7. Click OK.

To configure protocol enforcement in the CLI:

```
config application list
  edit "protocol-GUI"
    set other-application-log enable
    set control-default-network-services enable
    config default-network-services
      edit 1
        set port 80
        set services http
        set violation-action block
      next
      edit 2
        set port 53
        set services dns
        set violation-action monitor
      next
    end
  next
end
```

SSL-based application detection over decrypted traffic in a sandwich topology

When a FortiGate is sandwiched between SSL encryption and decryption devices, the FortiGate can process the decrypted traffic that passes between those devices. This feature adds support for decrypted traffic in application control. In some pre-defined signatures, the signature is pre-marked with the `require_ssl_di` tag. The `force-inclusion-ssl-di-sigs` option under `application list` allows users to control the inspection of dissected traffic. When this option is enabled, the IPS engine forces the pre-marked SSL-based signatures to be applied to the decrypted traffic of the respective applications. In the following topology, SSL Proxy 1 handles the client connection and SSL Proxy 2 handles the server connection, leaving the content unencrypted as traffic passes through the FortiGate.

To configure SSL-based application detection over decrypted traffic:

```

config application list
  edit "test"
    set force-inclusion-ssl-di-sigs {enable | disable}
  next
end
  
```

Example pre-marked SSL-based signature:

```

F-SBID( --vuln_id 15722; --attack_id 42985; --name "Facebook_Chat"; --group im; --protocol tcp; --default_action pass; -
-revision 4446; --app_cat 23; --vendor 3; --technology 1; --behavior 9; --pop 4; --risk 2; --language "Multiple"; --weight 20;
--depend-on 15832; --depend-on 38468; --require_ssl_di "Yes"; --casi 1; --casi 8; --parent 15832; --app_port
"TCP/443"; --severity info; --status hidden; --service http; --flow from_client; --pattern "/pull?"; --context uri; --no_case; --
pattern ".facebook.com"; --context host; --no_case; --tag set, Tag.Facebook.Pull; --tag quiet; --scan-range 10m,all; --date
20190301;)
  
```

All signatures that include the *require_ssl_di* tag are pre-defined and cannot be customized.

Matching multiple parameters on application control signatures

Application control signatures that support parameters (such as SCADA protocols) can have multiple parameters grouped together and matched at the same time. Multiple application parameter groups can be added to an override. Traffic will be flagged if it matches at least one parameter group.

This example uses the *Modbus_Func05.Write.Single.Coil.Validation* signature. This is an industrial signature, so ensure that no signatures are excluded:

```

config ips global
  set exclude-signatures none
end
  
```

To configure an application sensor with multiple parameters in the GUI:

1. Go to *Security Profiles > Application Control* and click *Create New*, or edit an existing sensor.
2. In the *Application and Filter Overrides* table, click *Create New*.
3. Search for *Modbus_Func05.Write.Single.Coil.Validation* and press *Enter*. A gear icon beside the signature name indicates it has configurable application parameters.

4. In the search results, select *Modbus_Func05.Write.Single.Coil.Validation* and click *Add Selected*.

The screenshot shows the 'Add New Override' dialog in FortiOS. The 'Type' is set to 'Application' and the 'Action' is 'Block'. The search term 'validation' is entered in the search bar. The results table is as follows:

Name	Category	Technology	Popularity
IEC.60870.5.104.Information.Transfer.In.Validation	Industrial	Client-Server	☆☆☆☆
IEC.60870.5.104.Information.Transfer.Out.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func01.Read.Coils.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func02.Read.Discrete.Inputs.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func03.Read.Holding.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func04.Read.Input.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func05.Write.Single.Coil.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func06.Write.Single.Reg.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func15.Write.Multi.Coils.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func16.Write.Multi.Reg.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func22.Mask.Write.Reg.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func23.Read.Write.Multi.Reg.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func24.Read.FIFO.Queue.Validation	Industrial	Client-Server	☆☆☆☆
Modbus_Func43.ME14.Read.Device.ID.Code.Validation	Industrial	Client-Server	☆☆☆☆

5. Click the *Selected* tab. In the *Application Parameters* section, click *Create New*.

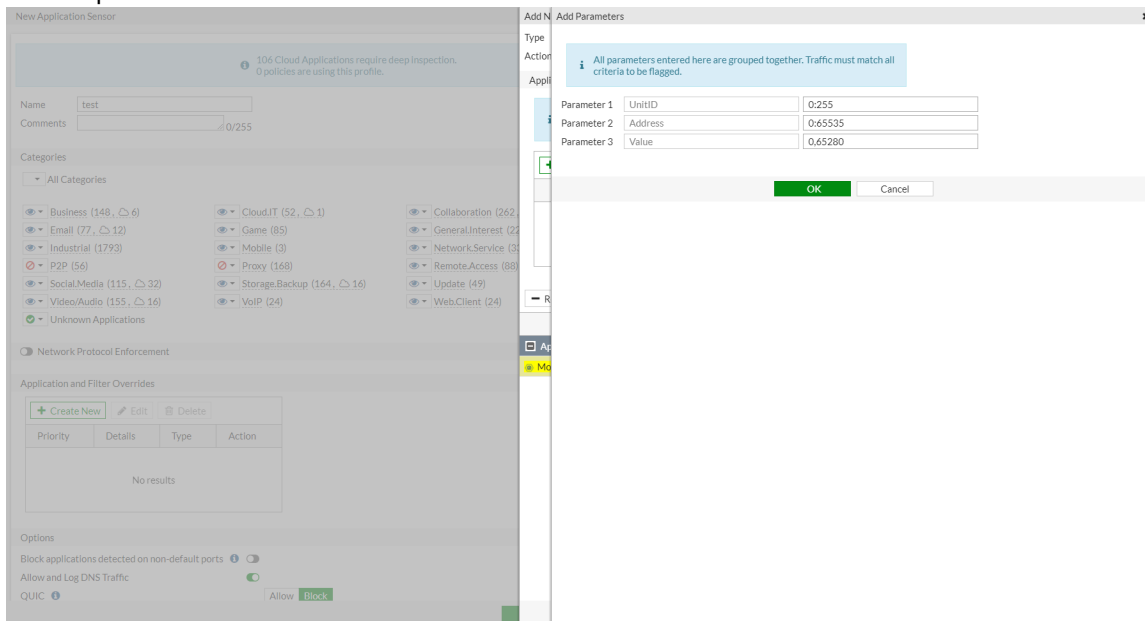

The screenshot shows the 'Add New Override' dialog with the 'Application Parameters' section open. A message states: 'Multiple application parameter groups can be added. Traffic will be flagged if it matches at least one parameter group.' Below this is a table for adding parameters:

ID	Parameter Group
No results	

At the bottom of the dialog, the search results are updated to show only the selected item:

Name	Category	Technology	Popularity	Risk
Modbus_Func05.Write.Single.Coil.Validation	Industrial	Client-Server	☆☆☆☆	Low

6. Edit the parameter values as needed.

7. Click **OK**.

8. Add more signatures if needed.

9. Click **OK**.**To configure an application sensor with multiple parameters in the CLI:**

```

config application list
  edit "test"
    set other-application-log enable
    config entries
      edit 1
        set application 48885
        config parameters
          edit 1
            config members
              edit 1
                set name "UnitID"
                set value "0:255"
              next
            edit 2
                set name "Address"
                set value "0:65535"
            next
          edit 3
                set name "Value"
                set value "0,65280"
            next
          next
        end
      next
    end
  next
end
edit 2

```

```

        set category 2 6
    next
end
next
end

```

Application signature dissector for DNP3

The DNP3 application signature dissector supports detecting DNP3 traffic that is encapsulated by the RealPort protocol (Net.CX). DNP3 is used in industrial solutions over serial ports, USB ports, printers, and so on. RealPort encapsulation allows transportation of the underlying protocols over TCP/IP. The FortiGate industrial signatures must be enabled to use RealPort.DNP3 signatures:

```

config ips global
    set exclude-signatures none
end

```

IPS engine version 7.0015 and later supports RealPort.DNP3 dissectors.

Intrusion prevention

Intrusion Prevention System (IPS) detects network attacks and prevents threats from compromising the network, including protected devices. IPS can be in the form of a standalone appliance, or part of the feature set of a Next Generation Firewall (NGFW), such as FortiGate. IPS utilizes signatures, protocol decoders, heuristics (or behavioral monitoring), threat intelligence (such as FortiGuard Labs), and advanced threat detection in order to prevent exploitation of known and unknown zero-day threats. FortiGate IPS is even capable of performing deep packet inspection to scan encrypted payloads in order to detect and prevent threats from attackers.

Networks and devices are often exploited through vulnerabilities. Software vulnerabilities are one such example where a bug or inherent weakness in the code provides attackers an opportunity to gain access to the software. More severe vulnerabilities allow unauthorized access, data leakage, and execution of malicious code. Exploitation of these vulnerabilities can cause damage to the machine and infect others. While the best solution is to patch vulnerabilities as

soon as patches are available, IPS signatures offer a solution to detect and block exploitation of many vulnerabilities before they enter the network.

IPS signatures

Fortinet's solution combines industry-leading threat intelligence from FortiGuard Labs with the FortiGate NGFW to identify the latest threats and prevent them from entering your network. IPS signatures are one such method for delivering the latest protection. FortiGuard Labs uses AI and Machine Learning (ML) to analyze billions of events every day. The FortiGuard Labs research team also proactively performs threat research to discover new vulnerabilities and exploitation, and produces signatures to identify such threats. These IPS signatures are delivered to each FortiGate daily, so that the IPS engine is armed with the latest databases to match the latest threats.

IPS sensors

A FortiGate IPS sensor is a collection of IPS signatures and filters that define the scope of what the IPS engine will scan when the IPS sensor is applied. An IPS sensor can have multiple sets of signatures and/or filters. A set of IPS signatures consists of manually selected signatures, while a set of IPS filters consists of filters based on signature attributes like target, severity, protocol, OS, and application. Each signature has predefined attributes and an action, such as block, allow, monitor (pass), quarantine, and reset. It is also possible to create custom IPS signatures to apply to an IPS sensor.

From the *Security Profiles > Intrusion Prevention* pane, you can create new IPS sensors and view a list of predefined sensors.

FortiOS includes the following predefined IPS sensors with associated predefined signatures:

Predefined IPS sensors	Description
all_default	Filters all predefined signatures, and sets action to the signature's default action.
all_default_pass	Filters all predefined signatures, and sets action to pass/monitor.
default	Filters all predefined signatures with severity of Critical/High/Medium. Sets action to signature's default action.
high_security	Filters all predefined signatures with severity of Critical/High/Medium, and sets action to Block. For Low severity signatures, sets action to signature's default action.
protect_client	Protects against client-side vulnerabilities by filtering on <code>Target=Client</code> . Sets action to signature's default action.
protect_email_server	Protects against email server-side vulnerabilities by filtering on <code>Target=Server</code> and <code>Protocol=IMAP, POP3 or SMTP</code> . Sets action to signature's default action.
protect_http_server	Protects against HTTP server-side vulnerabilities by filtering on <code>Target=Server</code> and <code>Protocol=HTTP</code> . Sets action to signature's default action.
wifi-default	Filters all predefined signatures with severity of Critical/High/Medium. Sets action to signature's default action. Used in profile for offloading WiFi traffic.

DDoS attacks

Besides protecting against threats and exploitation of vulnerabilities, the IPS engine is also responsible for mitigating Denial of Service (DoS) attacks where attackers attempt to bring a service down by flooding the target with traffic from

distributed systems. Using anomaly-based defense, FortiGate can detect a variety of L3 and L4 anomalies and take action against these attacks. This can be configured under IPv4 and IPv6 DoS Policies, which is discussed in detail under [DoS protection on page 900](#).

This section contains the following topics:

- [Signature-based defense on page 1305](#)
- [Configuring an IPS sensor on page 1308](#)
- [IPS configuration options on page 1311](#)
- [IPS signature filter options on page 1316](#)

This section also provides the following examples about IPS sensors:

- [IPS with botnet C&C IP blocking on page 1319](#)
- [IPS signatures for the industrial security service on page 1323](#)
- [IPS sensor for IEC 61850 MMS protocol on page 1324](#)
- [SCTP filtering capabilities on page 1326](#)

Signature-based defense

Signature-based defense is used against known attacks or vulnerability exploits. These often involve an attacker attempting to gain access to your network. The attacker must communicate with the host in an attempt to gain access, and this communication includes commands or sequences of commands and variables. The IPS signatures include these command sequences, allowing the FortiGate unit to detect and stop the attack.

This section describes the following components used in signature-based defense:

- [IPS signatures on page 1305](#)
- [Protocol decoders on page 1306](#)
- [IPS engine on page 1306](#)
- [IPS sensors on page 1306](#)
- [IPS filters on page 1307](#)
- [Custom and predefined signature entries on page 1307](#)
- [Policies on page 1308](#)

IPS signatures

IPS signatures are the basis of signature-based intrusion prevention. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. Signatures include this information, and FortiGate uses the information to detect and stop attacks.

Signatures also include characteristics about the attack they describe. These characteristics include the network protocol associated with the attack, the vulnerable operating system, and the vulnerable application.

To view the complete list of signatures, go to *Security Profiles > IPS Signatures*. The list of signatures includes predefined and custom signatures. You can hover over the name of the IPS signature to display a pop-up window that includes an ID number. You can click the ID number to display the FortiGuard page.

Protocol decoders

Before examining network traffic for attacks, the IPS engine uses protocol decoders to identify each protocol appearing in the traffic. Attacks are protocol-specific, so your FortiGate unit conserves resources by looking for attacks only in the protocols used to transmit them. For example, the FortiGate unit will only examine HTTP traffic for the presence of a signature describing an HTTP attack.

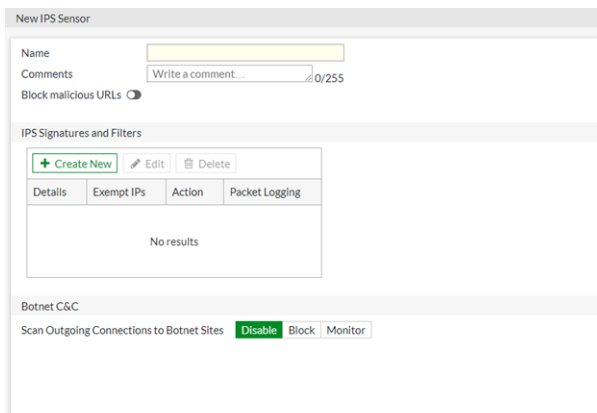

IPS engine

Once the protocol decoders separate the network traffic by protocol, the IPS engine examines the network traffic for the attack signatures by using IPS sensors.

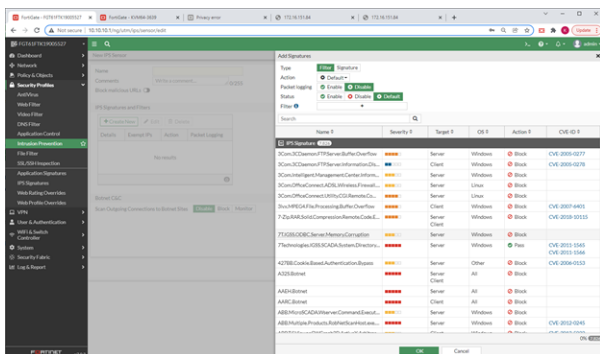

IPS sensors

The IPS engine does not examine network traffic for all signatures. The IPS engine examines network traffic for signatures specified in IPS sensors. You must first create an IPS sensor, and then you can specify what signatures the IPS sensor will use. You can add individual signatures to IPS sensors, or you can add filters to IPS sensors, and the filters automatically include the applicable signatures.

To view IPS sensors, go to *Security Profiles > Intrusion Prevention*. To create a new sensor, click *Create New*.

An IPS sensor is composed of IPS signatures and filters. Under *IPS Signatures and Filters*, click *Create New* to create a set of IPS signatures or a set of IPS filters.

You can create IPS sensors for specific types of traffic, and then select the IPS sensors in firewall policies designed to handle the same type of traffic. For example, you can specify all of the web-server related signatures in an IPS sensor,

and select the IPS sensor in a firewall policy that controls all traffic to and from a web server that is protected by the FortiGate unit.

The FortiGuard Service periodically adds new predefined signatures to counter new threats. New predefined signatures are automatically included in IPS sensors that are configured to use filters when the new signatures match existing filter specifications. For example, if you have an IPS sensor with a filter that includes all signatures for the Windows operating system, your filter will automatically incorporate new Windows signatures that the FortiGuard Service adds to the database.

IPS signature and filter entries are checked from top down. When a signature is found in a set of signatures or filters, the action defined for the signature is taken.

IPS filters

IPS sensors can contain one or more IPS filters. A filter is a collection of signature attributes that you specify. The signatures that have all of the attributes specified in a filter are included in the IPS filter.

Following are the attribute groups:

- Target
- Severity
- Protocol
- OS
- Application

Starting in FortiOS 6.4.2, you can also filter by CVE ID or CVE pattern by using the CLI. See [FortiOS 6.4 New Features > IPS signature filter options](#).

When selecting multiple attributes within the same group, the selections are combined by using a logical **OR**. When selecting multiple attributes between attribute groups, each attribute group is combined by using a logical **AND**.

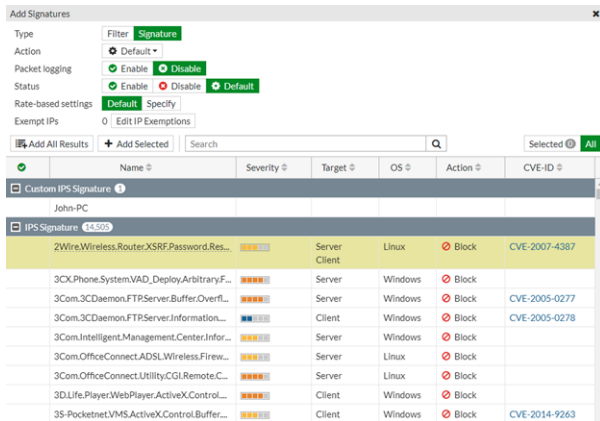

Once you select filters in the GUI, the filtered list of IPS signatures are displayed. Adjust your filters accordingly to construct a suitable list for your needs.

For example, if your FortiGate unit protects a Linux server running the Apache web server software, you could create a new filter to protect it. By setting *OS* filter attribute to *Linux*, and the filter attribute *Application* to *Apache*, the filter will include only the signatures that apply to both Linux and Apache. If you wanted to scan for all the Linux signatures and all the Apache signatures, you would create two filters, one for each.

To view the filters in an IPS sensor, go to *Security Profiles > Intrusion Prevention*, select the IPS sensor, and click *Edit*.

Custom and predefined signature entries

Signature entries allow you to add individual, custom or predefined IPS signatures to an IPS sensor. If you need only one signature, or you want to manually select multiple signatures that don't fall into the criteria for an IPS filter, adding a signature entry to an IPS sensor is the easiest way. Signature entries are also the only way to include custom signatures in an IPS sensor.

To select an individual signature, click a signature, and select *Add Selected*. The signature moves to the *Selected* list.

To select multiple signatures, use the *Search* bar to perform a keyword search, and then click *Add All Results* to move all entries to the *Selected* list.

Overriding the default action

Each IPS signature comes with a default action such as *Block* and *Pass*. In some scenarios, you may want to override this action. You can override a set of IPS filter or signatures. By default, a set of IPS filter or signatures has an action of *Default*, which applies a signature's default action when the signature is matched. By changing the action, you can override the setting for all signatures within the filter or signature set.

Policies

You must select an IPS sensor in a security policy or an interface policy to apply the IPS sensor to traffic. An IPS sensor that it not selected in a policy is not applied to network traffic.

Configuring an IPS sensor

You can configure IPS sensors to be used in policies in the GUI.

To configure an IPS sensor:

1. Go to *Security Profiles > Intrusion Prevention*.
2. Click *Create New*.

3. Configure the following settings:

<i>Name</i>	Enter a unique name for the sensor.
<i>Comments</i>	Enter a comment (optional).
<i>Block malicious URLs</i>	Enable to block malicious URLs based on a local malicious URL database on the FortiGate to assist in the detection of drive-by exploits. See Malicious URL database for drive-by exploits detection on page 1312 .
<i>IPS Signature and Filters</i>	Select a signature or filter to assign to the sensor. See Configuring signatures and filters on page 1309 .
<i>Botnet C&C</i>	
<i>Scan Outgoing Connections to Botnet Sites</i>	Define the botnet scanning across traffic that matches the policy: <ul style="list-style-type: none"> • <i>Disable</i>: Do not scan connections to botnet servers. • <i>Block</i>: Block connections to botnet servers. • <i>Monitor</i>: Log connections to botnet servers. See IPS with botnet C&C IP blocking on page 1319 .

4. Click OK.

For information on configuring IPS sensors in the CLI, see [IPS configuration options on page 1311](#).

Configuring signatures and filters

Signatures and filters can be configured and added to IPS sensors. A filter is a collection of signature attributes. Any signatures that meet all of the attributes specified in a filter are automatically included in the IPS sensor. See [IPS signature filter options on page 1316](#).

To configure a Signature entry of type Filter:

1. Go to *Security Profiles > Intrusion Prevention*.
2. Click *Create New*.
3. Configure the IPS sensor settings.
4. In *IPS Signatures and Filters*, click *Create New*. The *Add Signatures* pane is displayed.
5. Configure the settings as follows:

<i>Type</i>	Select <i>Filter</i> .
<i>Action</i>	Click the dropdown menu and select the action when a signature is triggered: <ul style="list-style-type: none"> • <i>Allow</i>: Allow traffic to continue to its destination. • <i>Monitor</i>: Allow traffic to continue to its destination and log the activity. • <i>Block</i>: Drop traffic that matches the signature. • <i>Reset</i>: Reset the session whenever the signature is triggered. • <i>Default</i>: Use the default action of the signature. Search for the signature

	<p>in the <i>IPS Signature</i> pane to view the default <i>Action</i>.</p> <ul style="list-style-type: none"> • <i>Quarantine</i>: Block the matching traffic. Enable packet logging. Quarantine the attacker.
<i>Packet logging</i>	<p>Enable packet logging to save a copy of the packets when they match the signature. Packet copies can be analyzed later.</p> <p>Packet logging is not supported on all FortiGate devices. FortiAnalyzer logging or a hard disk are required to support this feature; see the Feature Platform Matrix.</p>
<i>Status</i>	<p>Define the signature status:</p> <ul style="list-style-type: none"> • <i>Enable</i>: Enable the signature. • <i>Disable</i>: Disable the signature. • <i>Default</i>: Use the default status of the signature. Search for the signature in the <i>IPS Signature</i> pane to view the default <i>Status</i>.
<i>Filter</i>	<p>Select the + to open the <i>Select Entries</i> field and select filter entries. There are different entry categories:</p> <ul style="list-style-type: none"> • <i>Target</i>: Refers to the type of device targeted by the attack. • <i>Severity</i>: Refers to the level of the threat posed by the attack. • <i>Protocol</i>: Refers to the protocol that is the vector for the attack. • <i>OS</i>: Refers to the Operating System affected by the attack. • <i>Application</i>: Refers to the application affected by the attack.

6. Select one or more signatures from the *IPS Signatures* pane.
7. Click *OK*. The signature is added to the IPS sensor.
8. Click *OK*.

Individual signatures, custom or predefined IPS signatures can be selected for an IPS sensor. If you need only one signature, or you want to manually select multiple signatures that don't fall into the criteria for an IPS filter, adding a signature entry to an IPS sensor is the easiest way.

To configure a Signature entry of type Signature:

1. Go to *Security Profiles > Intrusion Prevention*.
2. Click *Create New*.
3. Configure the IPS sensor settings.
4. In *IPS Signatures and Filters*, click *Create New*. The *Add Signatures* pane is displayed.
5. Configure the settings as follows:

<i>Type</i>	Select <i>Signature</i> .
<i>Action</i>	<p>Click the dropdown menu and select the action when a signature is triggered:</p> <ul style="list-style-type: none"> • <i>Allow</i>: Allow traffic to continue to its destination. • <i>Monitor</i>: Allow traffic to continue to its destination and log the activity. • <i>Block</i>: Drop traffic that matches the signature. • <i>Reset</i>: Reset the session whenever the signature is triggered. • <i>Default</i>: Use the default action of the signature. Search for the signature

	<p>in the <i>IPS Signature</i> pane to view the default <i>Action</i>.</p> <ul style="list-style-type: none"> • <i>Quarantine</i>: Block the matching traffic. Enable packet logging. Quarantine the attacker.
<i>Packet Logging</i>	<p>Enable packet logging to save a copy of the packets when they match the signature. Packet copies can be analyzed later.</p> <p>Packet logging is not supported on all FortiGate devices. FortiAnalyzer logging or a hard disk are required to support this feature; see the Feature Platform Matrix.</p>
<i>Status</i>	<p>Define the signature status:</p> <ul style="list-style-type: none"> • <i>Enable</i>: Enable the signature. • <i>Disable</i>: Disable the signature. • <i>Default</i>: Use the default status of the signature. Search for the signature in the <i>IPS Signature</i> pane to view the default <i>Status</i>.
<i>Rate-based settings</i>	
<i>Default</i>	Use the default rate-based settings.
<i>Specify</i>	<p>Specify the rate-based settings:</p> <ul style="list-style-type: none"> • <i>Threshold</i>: Enter the threshold. See IPS signature rate count threshold on page 1312. • <i>Duration (seconds)</i>: Enter the duration in seconds. • <i>Track By</i>: Select the tracking method as <i>Any</i>, <i>Source IP</i>, or <i>Destination IP</i>.
<i>Exempt IPs</i>	<p>Add IP addresses that are exempt from the signature rules.</p> <p>Click <i>Edit IP Exemptions</i> and click <i>Create New</i>. Edit the <i>Source IP/Netmask</i> and the <i>Destination IP/Netmask</i> to define the IP address for exemption. Click <i>OK</i> to add it to <i>Exempt IPs</i>.</p>

6. Select one or more signatures from the *IPS Signatures* pane.
7. Click *OK*. The signature is added to the IPS sensor.
8. Click *OK*.

IPS configuration options

Besides configuring an IPS filter or selecting IPS signatures for an IPS sensor, you can configure additional IPS options for each sensor or globally for all sensors. This topic introduces the following available configuration options:

- [Malicious URL database for drive-by exploits detection on page 1312](#)
- [IPS signature rate count threshold on page 1312](#)
- [Botnet C&C on page 1313](#)
- [Hardware acceleration for flow-based security profiles \(NTurbo and IPSA\) on page 1313](#)
- [Extended IPS database on page 1314](#)
- [IPS engine-count on page 1314](#)
- [Industrial signature database on page 1315](#)
- [Fail-open on page 1315](#)
- [IPS buffer size on page 1315](#)

- [Session count accuracy on page 1316](#)
- [Protocol decoders on page 1316](#)

To configure IPS sensors, signatures, and filters in the GUI, see [Configuring an IPS sensor on page 1308](#).

Malicious URL database for drive-by exploits detection

This feature uses a local malicious URL database on the FortiGate to assist in detection of drive-by exploits, such as adware that allows automatic downloading of a malicious file when a page loads without the user's detection. The database contains all malicious URLs active in the last one month, and all drive-by exploit URLs active in the last three months. The number of URLs controlled are in the one million range.

This feature can be enabled from a IPS Sensor in the GUI by going to *Security Profiles > Intrusion Prevention* and editing or creating an IPS Sensor, then enabling *Block malicious URLs*. See [Configuring an IPS sensor on page 1308](#).

To enable the blocking of malicious URLs in the CLI:

```
config ips sensor
  edit <profile>
    set block-malicious-url {enable | disable}
  next
end
```

Blocking malicious URLs is not supported on some FortiGate models, such as FortiGate 51E, 50E, or 30E.

IPS signature rate count threshold

You can use the IPS signature rate-based settings to specify a rate count threshold that must be met before the signature is triggered. A rate count threshold provides a more controlled recording of attack activity. For example, if multiple login attempts produce a failed result over a short period of time, then an alert would be sent and traffic might be blocked, which is a more manageable response than sending an alert every time a login fails.

This can be configured from the GUI by going to *Security Profiles > Intrusion Prevention*. Create or edit an IPS sensor. Within the sensor, edit the IPS signatures and filters. Only IPS signatures have the rate-based settings option. IPS filters do not. See [Configuring an IPS sensor on page 1308](#).

Some settings are only available from CLI.

To configure the IPS signature rate-based settings in the CLI:

```
config ips sensor
  edit <sensor>
    config entries
      edit <filter ID number>
        set rule <ids>
```

```

        set rate-count <integer>
        set rate-duration <integer>
        set rate-mode {continuous | periodical}
        set rate-track {none | src-ip | dest-ip | dhcp-client-mac | dns-domain}
    next
end
next
end

```

<code>rule <ids></code>	The predefined or custom IPS signatures to add to the sensor.
<code>rate-count <integer></code>	The count of the rate (0 - 65535). The rate-count must be configured before the other rate settings can be set.
<code>rate-duration <integer></code>	Duration of the rate, in seconds (0 - 65535, default = 60)
<code>rate-mode {continuous periodical}</code>	How the count threshold is met. <ul style="list-style-type: none"> <code>continuous</code>: If the action is set to block, the action is engaged as soon as the rate-count is reached. For example, if the count is 10, the traffic would be blocked as soon as the signature is triggered 10 times. This is the default. <code>periodical</code>: The FortiGate allows up to the value of the rate-count incidents where the signature is triggered during the rate-duration. For example, if the rate count is 100 and the duration is 60, the signature would need to be triggered 100 times in 60 seconds for the action to be engaged.
<code>rate-track {none src-ip dest-ip dhcp-client-mac dns-domain}</code>	Track one of the protocol fields within the packet (default = none).

Botnet C&C

See [IPS with botnet C&C IP blocking on page 1319](#) for information on configuring settings in the CLI.

Hardware acceleration for flow-based security profiles (NTurbo and IPSA)

Some FortiGate models support a feature call NTurbo that can offload flow-based firewall sessions to network processors. See also [NTurbo offloads flow-based processing](#) in the Hardware Acceleration Guide. For IPSA enhanced pattern matching, see [IPSA offloads flow-based advanced pattern matching](#) in the Hardware Acceleration Guide.

Some FortiGate models also support offloading enhanced pattern matching for flow-based security profiles to CP8 or CP9 content processors.

To configure NTurbo and IPSA:

```

config ips global
    set np-accel-mode {none | basic}
    set cp-accel-mode {none | basic | advanced}
end

```

If the `np-accel-mode` option is available, your FortiGate supports NTurbo. The `none` option disables NTurbo, and `basic` (the default) enables NTurbo.

If the `cp-accel-mode` option is available, your FortiGate supports IPSA. The `none` option disables IPSA, and `basic` enables basic IPSA, and `advanced` enables enhanced IPSA, which can offload more types of pattern matching than basic IPSA. The `advanced` option is only available on FortiGate models with two or more CP8 processors, or one or more CP9 processors.

Extended IPS database

Some models have access to an extended IPS Database. Because the extended database may affect FortiGate performance, the extended database package may be disabled by default on some models, such as entry-level models.

You can only enable the extended IPS database by using the CLI.

To enable the extended IPS database:

```
config ips global
    set database extended
end
```

FortiGate models with the CP9 SPU receive the IPS full extended database, and the other physical FortiGate models receive a slim version of the extended database. The slim-extended database is a smaller version of the full extended database that contains top active IPS signatures. It is designed for customers who prefer performance.

Customers with non-CP9 SPU models need to upgrade to a CP9 SPU model (physical FortiGate) in order to get full IPS signature coverage. All FortiGate models 200 (E and F) and higher have a CP9 SPU.

See [Determining the content processor in your FortiGate unit](#) in the FortiOS Hardware Acceleration Guide to check if your device has a CP9 SPU.

FortiGate VMs with eight or more vCPUs can be configured to have a minimum of eight cores to be eligible to run the full extended database. Any FortiGate VM with less than eight cores will receive a slim version of the extended database.

IPS engine-count

FortiGate units with multiple processors can run one or more IPS engine concurrently. The `engine-count` CLI command allows you to specify how many IPS engines to use at the same time.

To specify the number of concurrent IPS engines running:

```
config ips global
    set engine-count <int>
end
```

The recommended and default setting is 0, which allows the FortiGate unit to determine the optimum number of IPS engines.

Industrial signature database

Industrial signatures are defined to protect Industrial Control Systems (ICS), Operational Technology (OT) and SCADA systems, which are critical infrastructure used by manufacturing industries. These signatures are enabled by default, but can be configured in the CLI.

Enabling the industrial signatures database may impact IPS performance, since this increases the number of signatures to scan. To optimize IPS performance, enable only IPS signature packages that are needed.

To configure industrial signatures:

```
config ips global
    set exclude-signatures {none* | industrial}
end
```

Fail-open

A fail-open scenario is triggered when IPS raw socket buffer is full. Therefore IPS engine has no space in memory to create more sessions and needs to decide whether to drop the sessions or bypass the sessions without inspection.

To enable fail-open mode:

```
config ips global
    set fail-open {enable | disable}
end
```

The default setting is `disable`, so sessions are dropped by IPS engine when the system enters fail-open mode.

When enabled, the IPS engine fails open, and it affects all protocols inspected by FortiOS IPS protocol decoders, including but not limited to HTTP, HTTPS, FTP, SMTP, POP3, IMAP, and so on. When the IPS engine fails open, traffic continues to flow without IPS scanning.

Sessions offloaded to Nturbo do not support fail-open. When Nturbo data path is overloaded, traffic is dropped regardless of fail-open setting.

IPS buffer size

If system enters fail-open mode frequently, it is possible to increase the IPS socket buffer size to allow more data buffering, which reduces the chances of overloading the IPS engine. You can set the size of the IPS buffer.

To set the socket buffer size:

```
config ips global
    set socket-size <int>
end
```

The default socket size and maximum configurable value varies by model. In short, socket-size determines how much data the kernel passes to the IPS engine each time the engine samples packets.

Take caution when modifying the default value. If the socket-size is too large, the higher memory used by the IPS engine may cause the system to enter conserve mode more frequently. If set too low, the system may enter IPS fail-open mode too frequently.

Session count accuracy

The IPS engine can track the number of open session in two ways. An accurate count uses more resources than a less accurate heuristic count.

To configure the IPS open session count mode:

```
config ips global
    set session-limit-mode {accurate | heuristic}
end
```

The default is `heuristic`.

Protocol decoders

The FortiGate Intrusion Prevention system uses protocol decoders to identify the abnormal traffic patterns that do not meet the protocol requirements and standards. For example, the HTTP decoder monitors traffic to identify any HTTP packets that do not meet the HTTP protocol standards.

To change the ports a decoder examines, you must use the CLI.

To configure protocol decoder ports:

```
config ips decoder dns_decoder
    config parameter "port_list"
        set value "100,200,300"
    end
end
```

In this example, the ports examined by the DNS decoder are changed from the default 53 to 100, 200, and 300.

You cannot assign specific ports to decoders that are set to `auto` by default. These decoders can detect their traffic on any port. Specifying individual ports is not necessary.

IPS signature filter options

IPS signature filter options include hold time and CVE pattern.

Hold time

The hold time option allows you to set the amount of time that signatures are held after a FortiGuard IPS signature update per VDOM. During the holding period, the signature's mode is monitor. The new signatures are enabled after the

hold time to avoid false positives.

The hold time can be from 0 days and 0 hours (default) up to 7 days, in the format ##d##h.

To configure the amount of time to hold and monitor IPS signatures:

```
config system ips
    set signature-hold-time 3d12h
    set override-signature-hold-by-id enable
end
```

When a signature that is on hold is matched, the log will include the message `signature is on hold:`

```
date=2010-07-06 time=00:00:57 logid="0419016384" type="utm" subtype="ips"
eventtype="signature" level="alert" vd="vd1" eventtime=1278399657778481842 tz="-0700"
severity="info" srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55 srcintf="port13"
srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" sessionid=3620
action="detected" proto=6 service="HTTP" policyid=1 attack="Eicar.Virus.Test.File"
srcport=52170 dstport=80 hostname="172.16.200.55" url="/virus/eicar" direction="incoming"
attackid=29844 profile="test" ref="http://www.fortinet.com/ids/VID29844"
incidentserialno=25165825 msg="file_transfer: Eicar.Virus.Test.File, (signature is on hold)"
```

To view signatures being held by rule ID 29844 on the VDOM:

```
# diagnose ips signature on-hold vd1 29844
Rule: 29844, attack_id: 58886, last updated: 20170411
Rule: 29844, attack_id: 59517, last updated: 20170411
Rule: 29844, attack_id: 60105, last updated: 20170411
...
```

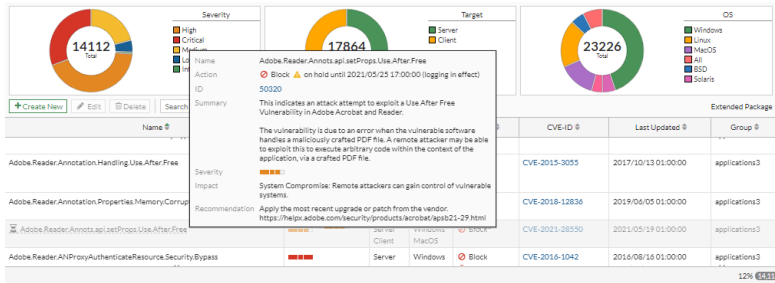

To view all help signatures on the VDOM:

```
# diagnose ips signature on-hold vd1
Rule: 17541, attack_id: 20899, last updated: 20140423
Rule: 17557, attack_id: 20934, last updated: 20140423
Rule: 17559, attack_id: 20932, last updated: 20140423
Rule: 17560, attack_id: 20933, last updated: 20140423
Rule: 17562, attack_id: 20928, last updated: 20170908
Rule: 17677, attack_id: 21187, last updated: 20171106
Rule: 17713, attack_id: 43756, last updated: 20140424
Rule: 17759, attack_id: 21298, last updated: 20140423
...
```

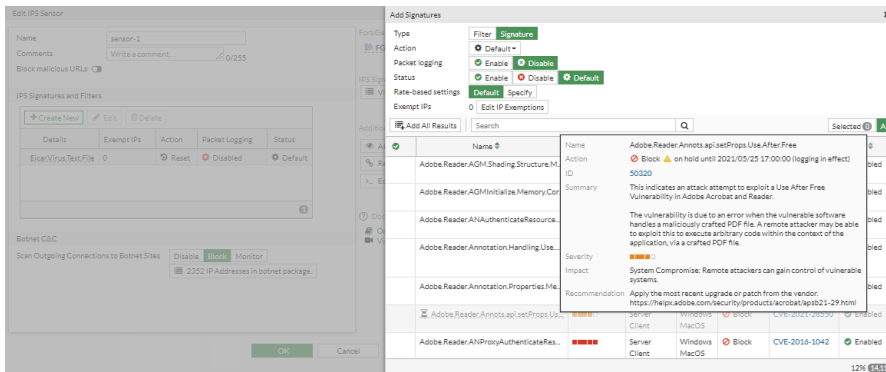

Viewing on hold information in the GUI

On hold signatures are grayed out in the GUI with an hourglass icon beside the signature name. A tooltip displays the on hold expiry time and other details.

On the *Security Profiles > IPS Signatures* page, for example, the *Adobe.Reader.Annotations.api.setProps.Use.After.Free* signature is on hold. Hover over the grayed-out entry to view the tooltip, which includes the action and hold time expiry. On this page, all on hold signatures are displayed as on hold regardless of whether `override-signature-hold-by-id` is enabled.

The same tooltip is available on the *Edit IPS Sensor (Security Profiles > Intrusion Prevention)* page when creating or editing the IPS signatures. In the *Add Signatures* pane when the *Type* is *Signature*, signatures on hold are only displayed as on hold if `override-signature-hold-by-id` is enabled.

You can still use on hold signatures in an IPS sensor profile; however, the profile will not block matching traffic. It will monitor it instead (logging in effect) until the on hold time expires.

CVE pattern

The CVE pattern option allows you to filter IPS signatures based on CVE IDs or with a CVE wildcard, ensuring that any signatures tagged with that CVE are automatically included.

To configure CVE patterns for CVE-2010-0177 and all CVE-2017 CVEs:

```
config ips sensor
  edit "cve"
    set comment "cve"
    config entries
      edit 1
        set cve "cve-2010-0177"
        set status enable
        set log-packet enable
        set action block
      next
    edit 2
      set cve "cve-2017"
```

```

        set action reset
    next
end
next
end

```

For example, the CVE of the IPS signature *Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution* is CVE-2010-0177. This matches the CVE filter in the IPS sensor, so traffic is blocked and logged:

```

date=2020-07-13 time=15:44:56 logid="0419016384" type="utm" subtype="ips"
eventtype="signature" level="alert" vd="vd1" eventtime=1594593896666145871 tz="-0700"
severity="critical" srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55
srcintf="port2" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined"
sessionid=1638 action="dropped" proto=6 service="HTTPS" policyid=1
attack="Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution" srcport=58298 dstport=443
hostname="172.16.200.55" url="/Mozilla" direction="incoming" attackid=20853 profile="sensor-1"
ref="http://www.fortinet.com/ids/VID20853" incidentserialno=124780667 msg="web_client: Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution," crscore=50 craction=4096
crlevel="critical"

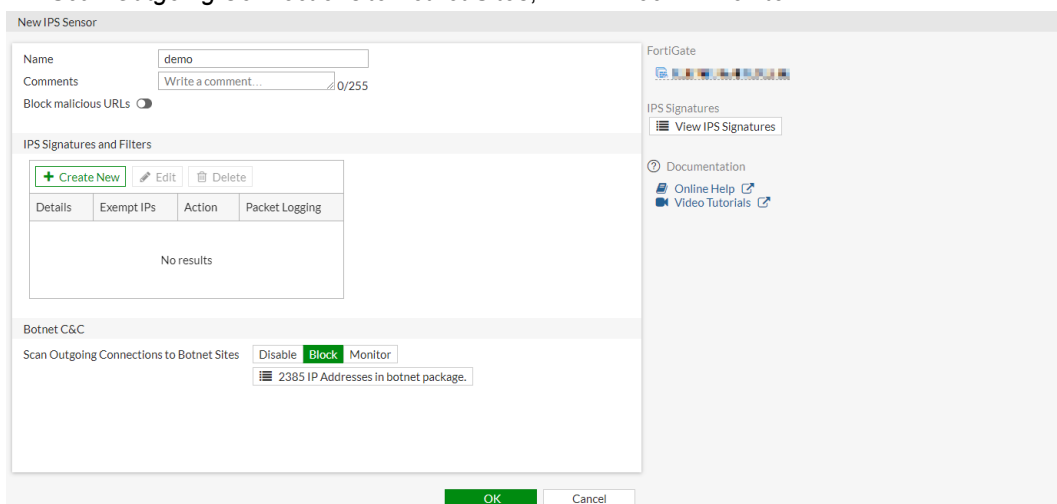

```

IPS with botnet C&C IP blocking

The *Botnet C&C* section consolidates multiple botnet options in the IPS profile. This allows you to enable botnet blocking across all traffic that matches the policy by configuring one setting in the GUI, or by the `scan-botnet-connections` option in the CLI.

To configure botnet C&C IP blocking in the GUI:

1. Go to *Security Profiles > Intrusion Prevention*, and click *Create New* to create a new IPS sensor, or double-click an existing IPS sensor to open it for editing.
2. Navigate to the *Botnet C&C* section.
3. For *Scan Outgoing Connections to Botnet Sites*, select *Block* or *Monitor*.

4. Configure the other settings as needed.
5. Click *OK* to save the IPS sensor.

6. Add the IPS sensor to a firewall policy.

The IPS engine will scan outgoing connections to botnet sites. If you access a botnet IP address, an IPS log is generated for this attack.

7. Go to *Log & Report > Intrusion Prevention* to view the log.**To configure botnet C&C IP blocking in the CLI:**

```
config ips sensor
  edit "Demo"
    set scan-botnet-connections {disable | block | monitor}
  next
end
```

The scan-botnet-connections option is no longer available in the following CLI commands:

- config firewall policy
- config firewall interface-policy
- config firewall proxy-policy
- config firewall sniffer

Sample log

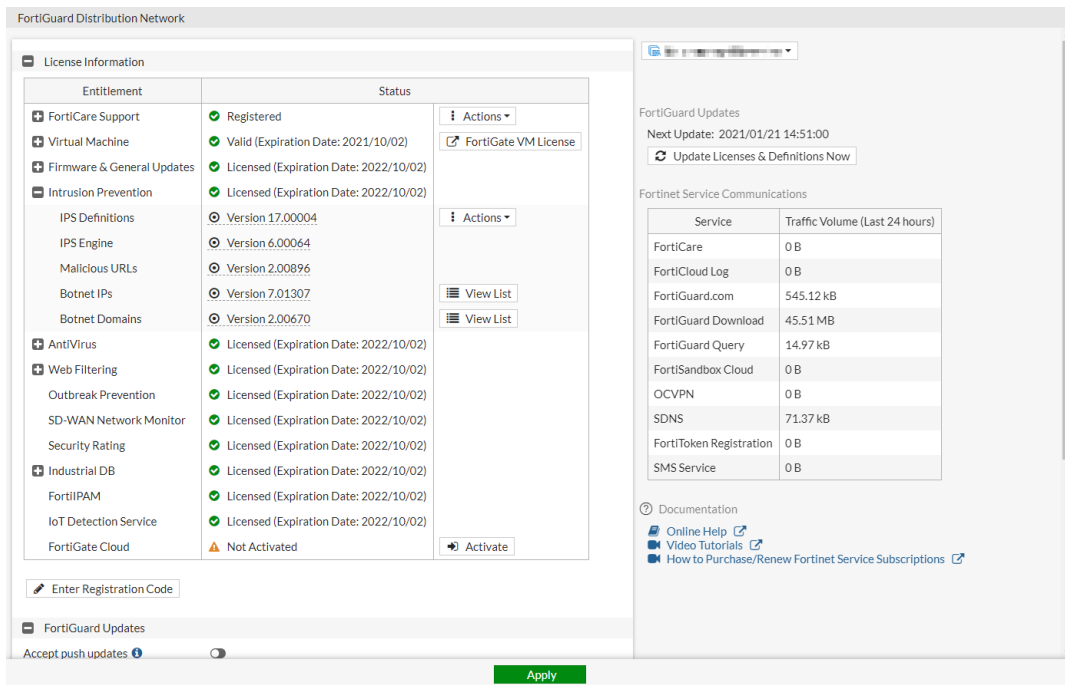

```
# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.
```

```
1: date=2022-04-28 time=16:18:34 eventtime=1651187914585406621 tz="-0700" logid="0422016400"
type="utm" subtype="ips" eventtype="botnet" level="warning" vd="vd1" msg="Botnet C&C
Communication." severity="critical" srcip=10.1.100.11 srccountry="Reserved"
dstip=2.58.149.169 srcintf="port13" srcintfrole="undefined" dstintf="port14"
dstintfrole="undefined" sessionid=894198 action="dropped" srcport=41798 dstport=80 proto=6
service="HTTP" policyid=1 profile="sensor-1" direction="outgoing" attack="Loki"
attackid=7630239 ref="http://www.fortinet.com/be?bid=7630239" crscore=50 craction=4
crlevel="critical"
```

Botnet IPs and domains lists**To view botnet IPs and domains lists:**

1. Go to *System > FortiGuard*.
2. Expand *License Information > Intrusion Prevention* to view *Botnet IPs* and *Botnet Domains* information.

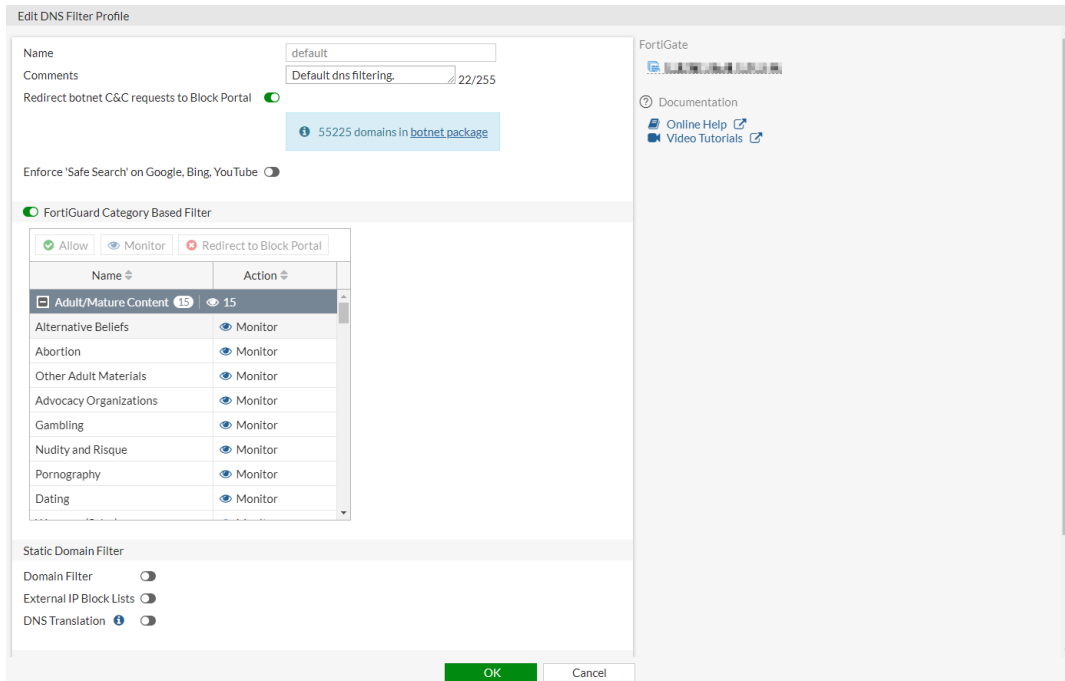

3. Click *View List* for more details.

Botnet C&C domain blocking

To block connections to botnet domains:

1. Go to *Security Profiles > DNS Filter*, and click *Create New*, or double-click an existing filter to open it for editing.
2. Enable *Redirect botnet C&C requests to Block Portal*.

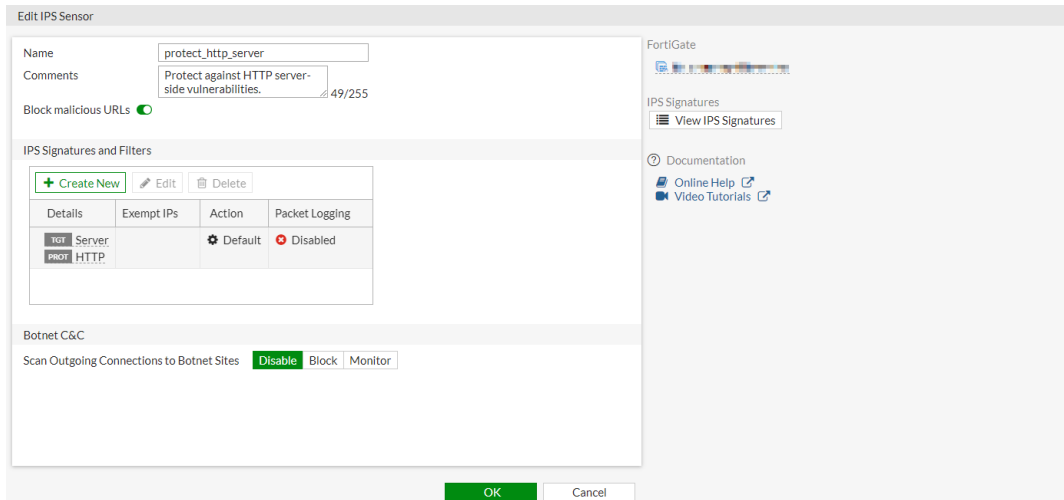

3. Configure the other settings as needed.

4. Click *OK*.
5. Add the filter profile to a firewall policy.

Botnet C&C URL blocking

To block malicious URLs:

1. Go to *Security Profiles > Intrusion Prevention*, and click *Create New*, or double-click an existing filter to open it for editing.
2. Enable *Block malicious URLs*.

3. Configure the other settings as needed.
4. Click *OK*.
5. Add the sensor to a firewall policy.

Botnet C&C signature blocking

To add IPS signatures to a sensor:

1. Go to *Security Profiles > Intrusion Prevention*, and click *Create New*, or double-click an existing sensor to open it for editing.
2. In the *IPS Signatures and Filters* section, click *Create New*. A list of available signatures appears.
3. For *Type*, select *Signature*. Select the signatures you want to include from the list.
4. Configure the other settings as needed.

5. Click *Add Selected*.

The screenshot shows the 'Add Signatures' dialog box in the FortiGate GUI. The dialog is open over the 'New IPS Sensor' configuration page. The 'Add Signatures' dialog has a table of signatures with columns for Name, Severity, Target, OS, Action, and CVE-ID. The 'A325.Botnet' signature is highlighted in yellow. The 'Add Selected' button is visible at the bottom of the dialog.

Name	Severity	Target	OS	Action	CVE-ID
427BB.Cookie.Based.Authentication.Bypass	■■■■■	Server	Other	Block	CVE-2006-0153
A325.Botnet	■■■■■	Server Client	All	Block	
AAEH.Botnet	■■■■■	Server	All	Block	
AARC.Botnet	■■■■■	Client	All	Block	
ABBS.Audio.Media.Player.LST.Buffer.Overfl...	■■■■■	Server Client	Windows	Block	
ABNR.Botnet	■■■■■	Server	All	Block	
ACDSee.FotoSlate.PLPFile.Overflow	■■■■■	Server Client	Windows	Block	CVE-2011-2595
ACDSee.TIFF.Buffer.Overflow	■■■■■	Client	Windows	Block	
ACME.mini_httpd.Arbitrary.File.Read	■■■■■	Server	Linux	Block	CVE-2018-18778
ACTI.ASOC.Web.Configurator.Remote.Co...	■■■■■	Server	Other	Block	
ACTI.Network.Video.Controller.ActiveX.Co...	■■■■■	Client	Windows	Block	CVE-2007-4583
ACTI.Network.Video.Controller.ActiveX.Set...	■■■■■	Client	Windows	Block	CVE-2007-4582
ACal.Arbitrary.Command.Execution	■■■■■	Server	Windows Linux BSD Solaris MacOS	Block	CVE-2006-2261

6. Click *OK* to add the IPS signatures to the IPS sensor.

7. Click *OK* to save the IPS sensor.

8. Add the sensor to a firewall policy to detect or block attacks that match the IPS signatures.

IPS signatures for the industrial security service

The FortiGuard Industrial Security Service (ISS) includes both application control and intrusion prevention signatures for industrial applications and protocols. The industrial database attack definitions are only updated if the FortiGate has a valid ISS license and an IPS security profile is used in a policy.

By default, industrial signatures are excluded from the signature lists in the GUI.

To verify that the FortiGate has a valid ISS license:

1. Go to *System > FortiGuard*.
2. In the *License Information* table, check the license status of *Industrial DB*.
3. Expand the *Industrial DB* entry to see the current *Industrial Attack Definitions* version.

To force the industrial DB attack definitions to update:

1. Optionally, create an IPS profile:
 - a. Go to *Security Profiles > Intrusion Prevention* and click *Create New*.
 - b. Enter a name for the profile.
 - c. In the *IPS Signatures and Filters* table click *Create New*.
 - d. Click *OK*.
 - e. Click *OK*.

See [Intrusion prevention on page 1303](#) for more information.

2. Use the IPS profile in a policy:
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Edit an existing policy, or click *Create New* to create a new policy.
 - c. Under *Security Profiles*, enable *IPS* and select an IPS profile.
 - d. Configure the remaining settings as needed, then click *OK*.
3. Go to *System > FortiGuard* and either click *Update Licenses & Definitions Now*, or wait for the next automatic update. The update could take a few minutes.
4. Refresh the page, then check the *Industrial Attack Definitions* version to confirm that they have been updated.

To make ISS IPS and application control signatures available in the GUI:

```
config ips global
    set exclude-signatures none
end
```

To view the signatures in the GUI:

1. Go to *Security Profiles > Application Signatures* and search for *industrial* to find signatures that identify industrial protocols.
2. Go to *Security Profiles > IPS Signatures* to find signatures that detect networks attacks that target industrial assets.

To see the entire list of OT IPS Rules and OT Application Control rules, go to the following links:

- <https://www.fortiguard.com/encyclopedia?type=otips>
- <https://www.fortiguard.com/encyclopedia?type=otapp>

To see the list of Industrial Application Control signatures, go to the following link:

- <https://www.fortiguard.com/appcontrol?category=Industrial>

IPS sensor for IEC 61850 MMS protocol

IEC 61850 is a SCADA protocol whose services are mapped to a number of protocols, including MMS services. MMS/ICCP detection is supported in IPS. The purpose of the MMS dissectors is to identify every IEC 61850 service to distinguish different MMS/ICCP messages. IPS engine 6.0.12 and later support MMS dissectors.

The following scenarios are also supported:

- Multiple MMS PDUs are transferred in one TCP payload, and the IPS engine identifies individuals.
- An MMS message is split over multiple TCP segments, where MMS runs over COTP segments.
- ICCP/TASE.2 that also uses MMS transport (ISO transport over TCP for ICCP) is detected.

Industrial signatures must be enabled in the global IPS settings to receive MMS/ICCP signatures. By default, industrial signatures are excluded.

```
config ips global
    set exclude-signatures none
end
```

Below are some industrial signatures for MMS/ICCP messages that can be detected by the IPS engine. This is not an exhaustive list.

- MMS_GetNameList.Request
- MMS_GetNamedVariableListAttributes.Request
- MMS_GetVariableAccessAttributes.Request
- MMS_Identify.Request
- MMS_Initiate.Request
- MMS_Read.Request
- MMS_Reset.Request
- ICCP_Transfer.Reporting
- ICCP_Create.Dataset
- ICCP_Abort
- ICCP_Start.Transfer.DSTransferSet
- ICCP_Get.Dataset.Element.Values
- ICCP_Get.Next.DSTransfer.Set.Value
- ICCP_Delete.Dataset
- ICCP_Start.Transfer.IMTransferSet

Diagnose command

The COTP dissector adds support for identifying every MMS PDU, and let the IPS engine separate them, like the Modbus and IEC-104 services for example.

```
# diagnose ips debug enable all
# diagnose debug enable
```

```
[284@78]ips_17_dsct_processor: serial=8142 create: cotp
[284@78]ips_17_dsct_processor: serial=8142 create: iec104
[284@78]ips_17_dsct_processor: serial=8142 create: modbus
```

Log samples

MMS dissectors can be triggered, and MMS/ICCP signatures can be monitored and logged.

Log samples:

```
date=2020-03-26 time=15:51:10 logid="1059028704" type="utm" subtype="app-ctrl"

```

SCTP filtering capabilities

A Stream Control Transmission Protocol (SCTP) dissector and Payload Protocol Identifier (PPID) filter can be used to either terminate the SCTP session, or replace the offending data chunk with zeros to keep the client and server sequence numbers synchronized. The SCTP filter action can also pass the data chunk.

To configure and test an SCTP filter:

1. Configure an SCTP filter profile that uses the reset action:

```
config sctp-filter profile
  edit "sctp"
    set comment "Demo profile"
    config ppid-filters
      edit 1
        set ppid 112233
        set action reset
        set comment "test chunk"
      next
    end
```

```

next
end

```

2. Use the SCTP filter profile in a firewall policy:

```

config firewall policy
edit 1
set name "1"
set srcintf "port38"
set dstintf "port37"
set srcaddr "all"
set dstaddr "all"
set action accept
set schedule "always"
set service "ALL"
set utm-status enable
set ssl-ssh-profile "new-deep-inspection"
set sctp-filter-profile "sctp"
set logtraffic all
next
end

```

3. On the SCTP client, confirm that the connection works and send a data chunk with PPID 112233.

The screenshot displays a Wireshark capture of Sctp traffic. The packet list pane shows the following packets:

No.	Time	Source	Destination	Protocol	Length	Info
5	1.496580	10.1.100.11	172.16.200.55	SCTP	186	INIT
6	1.496943	172.16.200.55	10.1.100.11	SCTP	354	INIT_ACK
7	1.497032	10.1.100.11	172.16.200.55	SCTP	310	COOKIE_ECHO
8	1.497140	172.16.200.55	10.1.100.11	SCTP	50	COOKIE_ACK
9	1.497239	10.1.100.11	172.16.200.55	SCTP	74	DATA
19	5.771852	10.1.100.11	172.16.200.55	SCTP	60	SHUTDOWN

The packet details pane for packet 9 shows the following information:

- Ethernet II, Src: 92:5c:92:08:40:51 (92:5c:92:08:40:51), Dst: Fortinet_44:8d:b3 (90:16:cac:44:8d:b3)
- Internet Protocol Version 4, Src: 10.1.100.11, Dst: 172.16.200.55
- Stream Control Transmission Protocol, Src Port: 35431 (35431), Dst Port: 5000 (5000)
 - Source port: 35431
 - Destination port: 5000
 - Verification tag: 0xcac37ecf
 - [Association index: 0]
 - Checksum: 0xa74bafb5 [unverified]
 - [Checksum Status: Unverified]
 - DATA chunk(ordered, complete segment, TSN: 2533261632, SID: 0, SSN: 0, PPID: 1773535488, payload length: 11 bytes)
- Data (11 bytes)
 - Data: 4b454c4c4f20574f524c44
 - [Length: 11]

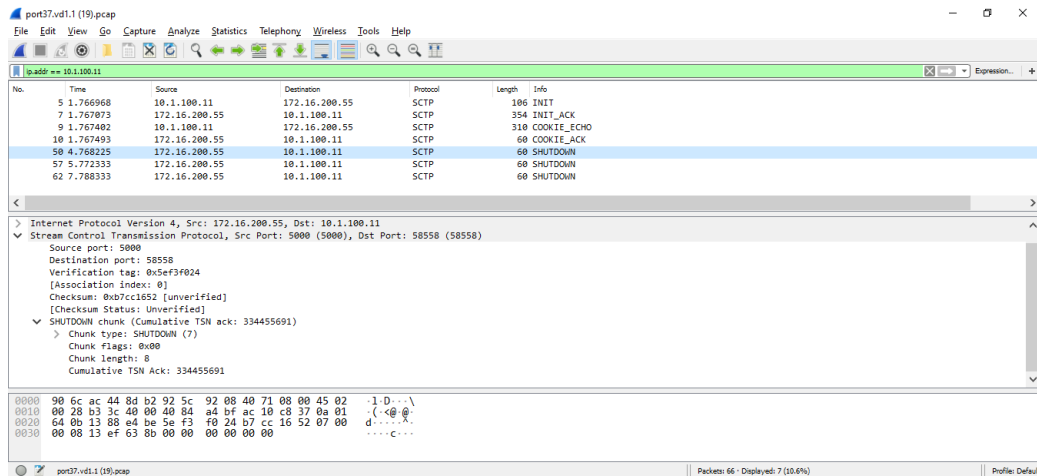

The packet bytes pane shows the raw data of the chunk:

```

0000  90 6c ac 44 8d b3 92 5c 92 08 40 51 08 00 45 02  -1.D...
0010  00 3c 00 01 40 00 40 84 57 e7 0a 01 64 0b ac 10  -<.@@
0020  c8 37 8a 67 13 88 ca c3 7e cf a7 4b af b5 00 03  -7.g...
0030  00 1b 96 fe 81 40 00 00 00 00 69 b6 01 00 48 45  -...@..
0040  4c 4c 4f 20 57 4f 52 4c 44 00                    LLO WORL

```

4. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is reset, so the data chunk is not received on the server, and the session is terminated.

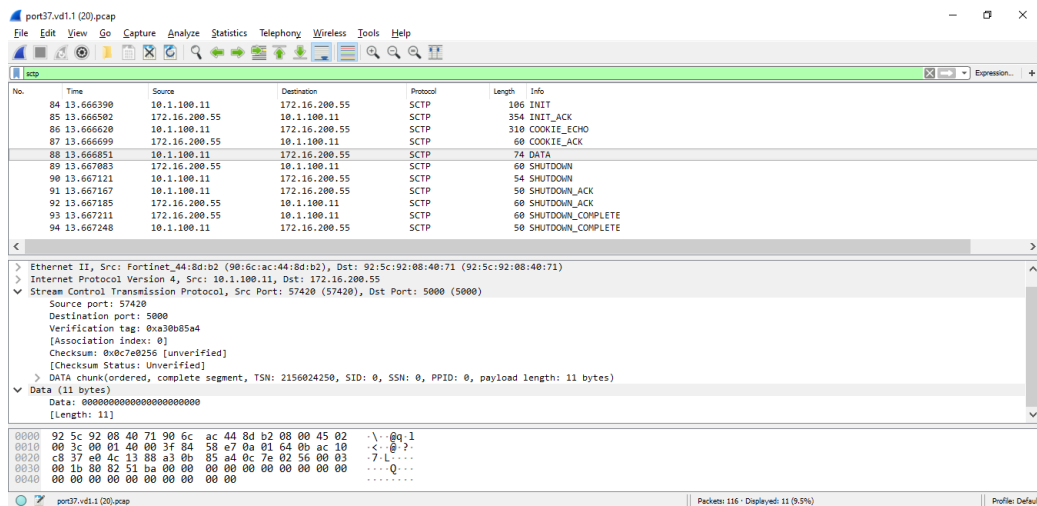

5. Change the filter action to replace:

```

config sctp-filter profile
edit "sctp"
    config ppid-filters
    edit 1
        set action replace
    next
end
next
end
    
```

6. Resend the data chunk.

7. The IPS engine detects the data chunk. The PPID matches the PPID filter, and the filter action is replace, so the data chunk is replaced with zeros.

File filter

A file filter can be configured to control the flow of different types of files passing through FortiGate. This is done by setting up rules that specify which file types are allowed or blocked. The file filter can be applied directly to firewall policies and supports various traffic protocols in proxy or flow mode. The feature set setting (proxy or flow) in the file filter profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based file filter profile must be used with a flow-based firewall policy.

Prior to FortiOS 6.4.1, file filter was embedded in the web filter, email filter, SSH inspection, and CIFS profiles.

Protocol	Proxy mode	Flow mode
CIFS	Yes	Yes
FTP	Yes	Yes
HTTP	Yes	Yes
IMAP	Yes	Yes
MAPI	Yes	No
POP3	Yes	Yes
SMTP	Yes	Yes
SSH	Yes	No

File filtering is based only on the file type (file meta data) and not on file size or content. A DLP sensor would need to be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regular expressions (see [Basic DLP filter types on page 1353](#) for more information).

The following options can be configured in a file filter profile:

GUI option	CLI option	Description
Basic profile settings		
<i>Name</i>	<code>name <string></code>	Enter a unique name for the profile.
<i>Comments</i>	<code>comment <var-string></code>	Enter a comment (optional).
<i>Scan archive contents</i>	<code>scan-archive-contents {enable disable}</code>	Enable to scan archive contents.
<i>Feature set</i>	<code>feature-set {flow proxy}</code>	Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy. <ul style="list-style-type: none"> • <i>Flow-based</i> • <i>Proxy-based</i>

GUI option	CLI option	Description
n/a	<code>log {enable disable}</code>	Enable to use file filter logging. This setting is enabled by default.
n/a	<code>extended-log {enable disable}</code>	Enable to use file filter extended logging. This setting is disabled by default.
n/a	<code>replacemsg-group <string></code>	Set a replacement message group.
File filter rule settings		
<i>Name</i>	<code>name <string></code>	Enter a unique name for the rule.
<i>Comments</i>	<code>comment <var-string></code>	Enter a comment (optional).
<i>Protocols</i>	<code>protocol {option1}, {option2}, ...</code>	Set the protocols to apply to the rule. By default, all protocols are configured: CIFS, FTP, HTTP, IMAP, POP3, and SMTP in flow mode. Additionally, MAPI and SSH are configured by default in proxy mode.
<i>Traffic</i>	<code>direction {incoming outgoing any}</code>	Set the traffic direction: <ul style="list-style-type: none"> <i>Incoming</i>/<code>incoming</code>: match files transmitted in the session's reply direction. <i>Outgoing</i>/<code>outgoing</code>: match files transmitted in the session's originating direction. <i>Both</i>/<code>any</code>: match files transmitted in the session's originating and reply directions.
<i>Password-protected only</i>	<code>password-protected {yes any}</code>	Enable (<code>yes</code>) to match password-protected files. If the setting is not enabled, any file is matched.
<i>File types</i>	<code>file-type <name1>, <name2>, ...</code>	Select the file type. See Supported file types on page 1335 for the list of available options.
<i>Action</i>	<code>action {log-only block}</code>	Set the action to take for a matched file: <ul style="list-style-type: none"> <i>Monitor</i>/<code>log-only</code>: allow the content and write a log message. <i>Block</i>/<code>block</code>: block the content and write a log message.

Configuring a file filter profile

In this example, a flow-based file filter is created that has two rules.

- Rule 1: applied to HTTP, FTP, SMTP, IMAP, POP3, and CIFS to monitor any matched .NET, 7-Zip, ActiveMime, ARJ, ASPack, AVI, Base64, Windows batch, BinHex, BMP, Bzip, and Bzip2 files transmitted in the session's originating and reply directions.

- Rule 2: applied to HTTP, FTP, SMTP, IMAP, POP3, and CIFS to block any matched SIS, TAR, TIFF, torrent, UPX, UUE, WAV, WMA, ZAR archive, XZ, and ZIP files transmitted in the session's originating direction.

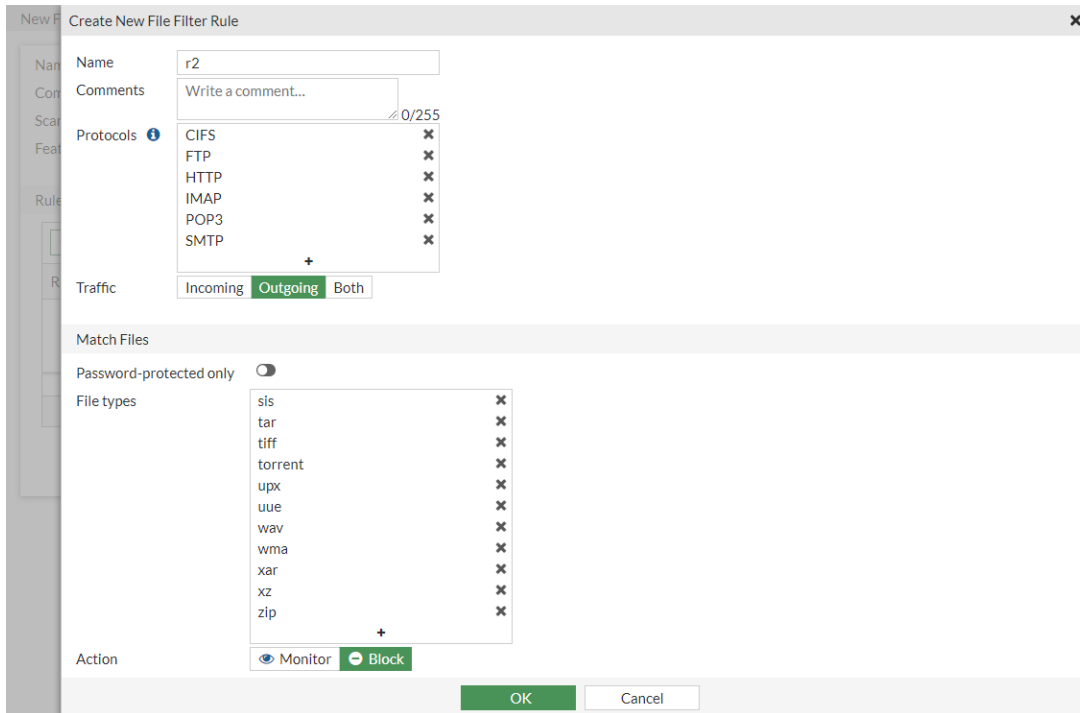

To configure a file filter in the GUI:

1. Configure the filter profile:
 - a. Go to *Security Profiles > File Filter* and click *Create New*.
 - b. Enter a name.
 - c. Set the *Feature set* to *Flow-based*.
 - d. In the *Rules* table, click *Create New*.
 - e. Configure rule 1 as follows:

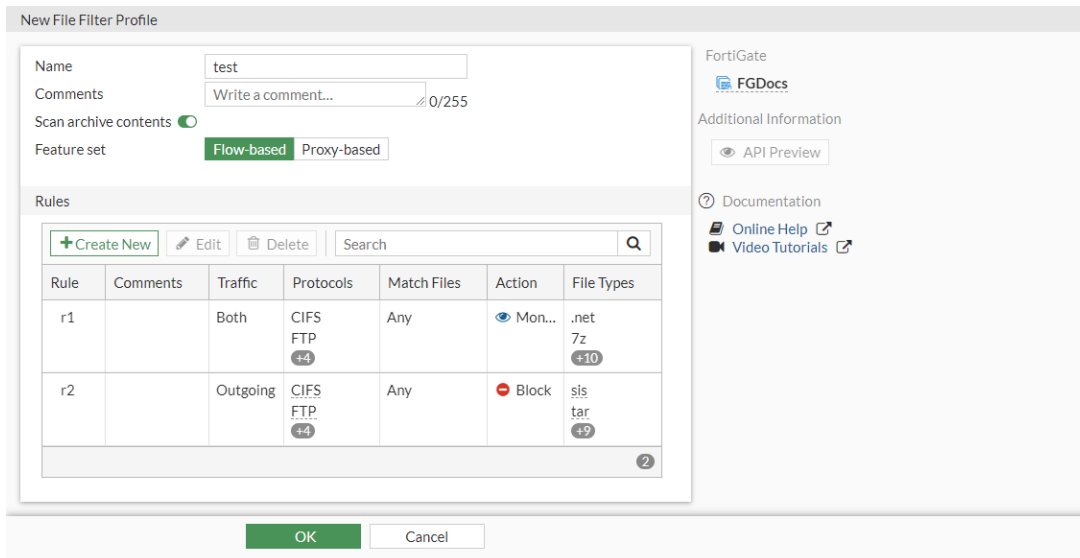

Name	r1
Protocols	HTTP, FTP, SMTP, IMAP, POP3, CIFS
Traffic	Both
Password-protected only	Deselect
File types	.net, 7z, activemime, arj, aspack, avi, base64, bat, binhex, bmp, bzip, bzip2
Action	Monitor

- f. Click *OK* to save the rule.
 - g. In the *Rules* table, click *Create New* and configure rule 2 as follows:

Name	r2
Protocols	HTTP, FTP, SMTP, IMAP, POP3, CIFS
Traffic	Outgoing
Password-protected only	Deselect
File types	sis, tar, tiff, torrent, upx, uue, wav, wma, xar, xz, zip
Action	Block

- h. Click **OK** to save the rule.
- i. Click **OK** to save the filter profile.

- 2. Apply the filter to a policy:
 - a. Go to *Policy & Objects > Firewall Policy* and edit an existing policy or create a new one.
 - b. In the *Security Profiles* section, enable *File Filter*.
 - c. Select the filter from the dropdown box (*test*).
 - d. Configure the other settings as needed.
 - e. Click **OK**.

To configure a file filter in the CLI:**1. Configure the file filter profile:**

```

config file-filter profile
  edit "test"
    set comment ''
    set feature-set flow
    set replacemsg-group ''
    set log enable
    set scan-archive-contents enable
  config rules
    edit "r1"
      set comment ''
      set protocol http ftp smtp imap pop3 cifs
      set action log-only
      set direction any
      set password-protected any
      set file-type ".net" "7z" "activemime" "arj" "aspack" "avi" "base64"
      "bat" "binhex" "bmp" "bzip" "bzip2"
    next
    edit "r2"
      set comment ''
      set protocol http ftp smtp imap pop3 cifs
      set action block
      set direction outgoing
      set password-protected any
      set file-type "sis" "tar" "tiff" "torrent" "upx" "uue" "wav" "wma" "xar"
      "xz" "zip"
    next
  end
next
end

```

2. Apply the filter to a policy:

```

config firewall policy
  edit 1
    set name "filefilter-policy"
    set srcintf "port10"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set profile-protocol-options "protocol"
    set ssl-ssh-profile "protocols"
    set file-filter-profile "test"
    set auto-asic-offload disable
    set np-acceleration disable
    set nat enable
  next
end

```

To view file filter logs in the GUI:

1. Go to *Log & Report > Security Events*.
2. Select the *File Filter* card.

To view file filter logs in the CLI:

```
# execute log filter category utm-file-filter
# execute log display
```

Supported file types

File filter allows the FortiGate to block files passing through based on file type based on the file's meta data only, and not on file size or file content. A DLP sensor must be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regexp.

The following file types are supported in file filter and DLP profiles:

Type	Description
.net	Match .NET files
7z	Match 7-Zip files
activemime	Match ActiveMime files
arj	Match ARJ compressed files
aspack	Match ASPack files
avi	Match AVI files
base64	Match Base64 files
bat	Match Windows batch files
binhex	Match BinHex files
bmp	Match BMP files
bzip	Match Bzip files
bzip2	Match Bzip2 files
cab	Match Windows CAB files
chm	Match Windows compiled HTML help files
class	Match CLASS files
cod	Match COD files
crx	Match Chrome extension files
dmg	Match Apple disk image files
elf	Match ELF files
exe	Match Windows executable files
flac	Match FLAC files

Type	Description
fsg	Match FSG files
gif	Match GIF files
gzip	Match Gzip files
hlp	Match Windows help files
hta	Match HTA files
html	Match HTML files
iso	Match ISO archive files
jad	Match JAD files
javascript	Match JavaScript files
jpeg	Match JPEG files
lzh	Match LZH compressed files
mach-o	Match Mach object files
mime	Match MIME files
mov	Match MOV files
mp3	Match MP3 files
mpeg	Match MPEG files
msi	Match Windows Installer MSI Bzip files
msoffice	Match MS-Office files. For example, DOC, XLS, PPT, and so on.
msofficex	Match MS-Office XML files. For example, DOCX, XLSX, PPTX, and so on.
pdf	Match PDF files
petite	Match Petite files
png	Match PNG files
rar	Match RAR archives
rm	Match RM files
sis	Match SIS files
tar	Match TAR files
tiff	Match TIFF files
torrent	Match torrent files
unknown*	Match unknown files
upx	Match UPX files

Type	Description
uue	Match UUE files
wav	Match WAV files
wma	Match WMA files
xar	Match XAR archive files
xz	Match XZ files
zip	Match ZIP files

* This file type is only available in DLP profiles.

Email filter

Email filters can be configured to perform spam detection and filtering. You can customize the default profile, or create your own and apply it to a firewall policy.

Two kinds of filtering can be defined in a single profile, and they will act independent of one another.

Filter options can be organized according to the source of the decision:

- Local options: the FortiGate qualifies the email based on local conditions, such as block/allowlists, banned words, or DNS checks using FortiGuard Antispam.
- FortiGuard-based options: the FortiGate qualifies the email based on the score or verdict returned from FortiGuard Antispam.
- Third-party options: the FortiGate qualifies the email based on information from a third-party source (like an ORB list).

Local and FortiGuard block/allowlists can be enabled and combined in a single profile. When combined, the local block/allowlist has a higher priority than the FortiGuard block list during a decision making process. For example, if a client IP address is blocklisted in the FortiGuard server, but you want to override this decision and allow the IP to pass through the filter, you can define the IP address or subnet in a local block/allowlist with the clear action. Because the information coming from the local list has a higher priority than the FortiGuard service, the email will be considered clean.

Some features of this functionality require a subscription to FortiGuard Antispam.

Protocol comparison between email filter inspection modes

The following table indicates which email filters are supported by their designated inspection modes.

	SMTP	POP3	IMAP	MAPI
Proxy	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	No

The following topics provide information about email filter profiles:

- [Configuring an email filter profile on page 1338](#)
- [Local-based filters on page 1339](#)
- [FortiGuard-based filters on page 1346](#)
- [Third-party-based filters on page 1348](#)
- [Filtering order on page 1348](#)
- [Protocols and actions on page 1350](#)
- [Configuring webmail filtering on page 1351](#)

Configuring an email filter profile

Email filters can be configured to perform spam detection and filtering.

To configure an email filter profile:

1. Go to *Security Profiles > Email filter* and click *Create New*.
2. Configure the following settings:

<i>Name</i>	Enter a unique name for the profile.
<i>Comments</i>	Enter a comment (optional).
<i>Enable spam detection and filtering</i>	Enable/disable spam detection and filtering.
<i>Spam Detection by Protocol</i>	Configure settings for SMTP, POP3, IMAP, and MAPI protocols. See Protocols and actions on page 1350 and Filtering order on page 1348 for more information.
<i>FortiGuard Spam Filtering</i>	The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing and spam URLs, known spam email checksums, and others. See FortiGuard-based filters on page 1346 for more information.
<i>Local Spam Filtering</i>	Enable and configure local spam filters. See Local-based filters on page 1339 for more information.

3. Click *OK*.

Local-based filters

There are six types of local spam filters:

- HELO DNS lookup
- Return email DNS check
- Block/allow list
- Banned words*
- Trusted IP addresses*
- MIME header*

* These filters can only be configured in the CLI.

By default, HELO DNS and return email DNS checks are done before the block/allow list check. In some situations, such as when configuring a block/allow list to clear an email from performing further filtering, configure the following to give precedence to the block/allow list:

```
config emailfilter profile
  edit <name>
    config smtp
      set local-override enable
    next
  end
end
```

HELO DNS lookup and return email DNS checking are not supported while in flow-based inspection mode. See [Inspection mode feature comparison on page 1172](#).

HELO DNS lookup

Whenever a client opens an SMTP session with a server, the client sends a HELO command with the client domain name. The FortiGate takes the domain name specified by the client in the HELO and performs a DNS lookup to determine if the domain exists. If the lookup fails, the FortiGate determines that any emails delivered during the SMTP session are spam. The HELO DNS lookup is only available for SMTP traffic.

Return email DNS check

The FortiGate performs a DNS lookup on the return field. If no such record exists, the email is treated as spam. When return email DNS checking is enabled, the FortiGate takes the domain in the reply-to email address and reply-to domain, and checks the DNS servers to see if there is an A or MX record for the domain. If the domain does not exist, the FortiGate treats the email as spam.

Block/allow list

Block/allow lists can be made from emails or IP subnets to forbid or allow them to send or receive emails. The following table summarizes the configurable options in a block/allow list.

Type	Description	Pattern	Action
<i>IP/Netmask and IPv6/Netmask</i>	<p>The FortiGate compares the IP address of the client delivering the email to the addresses in the IP address block/allow list specified in the email filter profile.</p> <p>If a match is found, the FortiGate takes the action configured for the matching block/allow list entry against all delivered email.</p> <p>By default the <code>hdrrip</code> setting under <code>config smtp</code> is disabled. If enabled, the FortiGate checks all the IP addresses in the header of SMTP email against the specified IP address block/allow list.</p>	The filter is an IP address with a subnet mask.	<ul style="list-style-type: none"> • <i>Mark as Reject:</i> the email is dropped before reaching its destination. • <i>Mark as Spam:</i> the email is allowed through, but it will be tagged with an indicator marking the email as spam. • <i>Mark as Clear:</i> the email is allowed to go through to its destination on the assumption that it is not spam.
<i>Email Regular Expression</i>	The FortiGate compares the sender email address, as shown in the email envelope MAIL FROM, to the pattern in the patterned field. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.	<p>The filter is a regular expression.</p> <p>For example, <code>^[a-z0-9]+(\.[a-z0-9-]+)*@(example xmp examp)(com org net)</code> can be used to filter based on a number of email domain name combinations.</p>	<ul style="list-style-type: none"> • <i>Mark as Spam:</i> the email is allowed through, but it will be tagged with an indicator marking the email as spam.
<i>Email Wildcard</i>	The FortiGate compares the sender email address, as shown in the email header and envelope MAIL FROM, to the pattern in the patterned field. If a match is found, the FortiGate takes the action configured for the matching block/allow list entry.	The filter is an email address with a wildcard symbol in place of the variable characters (such as <code>*.example.com</code> or <code>fred@*.com</code>).	<ul style="list-style-type: none"> • <i>Mark as Clear:</i> the email is allowed to go through to its destination on the assumption that it is not spam.

Banned words

When banned word checking is enabled, the FortiGate examines emails for words that appear in the banned word list specified in the email filter profile.

The banned word pattern can be either wildcard or Perl regular expression, which could include part of a word, a whole word, a phrase, multiple words, or multiple phrases.

Each time the banned word filter detects a pattern in an email, it adds the pattern score to the sum of scores for the message. The score is set when creating a new pattern to block content (`set score`). Higher scores indicate more offensive content. If the total score of the discovered banned words in the email exceeds the threshold value set in the email filter profile, then the FortiGate treats the email as spam. The score for each pattern is counted only once, even if that pattern appears many times in the email. The default score for banned word patterns is 10, and the default threshold in the email filter is 10. This means that by default, an email message is blocked by a single match.

For example, if the FortiGate scans an email containing only this sentence: “The score for each word or phrase is counted only once, even if that word or phrase appears many times in the email message.” and the banned word list contains the following patterns:

Banned word pattern	Pattern type	Assigned score	Score added to sum for entire page	Comments
word	Wildcard	20	20	The pattern appears twice, but it is counted once.
word phrase	Wildcard	20	0	Both words appear in the email, but they do not appear together as specified in the pattern. There are no matches.
word*phrase	Wildcard	20	20	A match occurs as long as “word” appears before “phrase” regardless of what is in between them. The pattern appears twice, but it is counted once.
mail*age	Wildcard	20	20	This pattern is a match because “email message” appears in the email.

The email would be treated as spam if the banned word threshold is set to 60 or less.

To apply a banned word filter to an email filter profile:

1. Configure the banned words list:

```
config emailfilter bword
  edit 1
    set name "banned"
    config entries
      edit 23
        set pattern-type {wildcard | regexp}
        set pattern <string>
        set score <1 - 99999>
      next
    end
```

```

    next
end

```

2. Configure the email filter profile:

```

config emailfilter profile
    edit "myBannedWordsProfile"
        set spam-filtering enable
        set options bannedword
        set spam-bword-threshold <0 - 2147483647>
        set spam-bword-table 23
    next
end

```

Once a banned word list is configured in the CLI and applied to an email filter profile, some settings can be edited in the GUI for that particular email filter profile. A banned word profile can be selected, and its *Threshold* (`spam-bword-threshold`) can be edited.

Trusted IP addresses

When the FortiGate creates a list of trusted IP addresses, any incoming email traffic from these IP address is exempt from having IP-based checks, such as DNSBL, RBL, FortiGuard Antispam service, or locally-defined IP block lists.

If the FortiGate sits behind a company's mail transfer units, it may be unnecessary to check email IP addresses because they are internal and trusted. In this case, only external IP addresses would be checked. In some cases, external IP addresses may be added to the list if they are known to not be spam sources.

To configure a trusted IP address list:

1. Define the IP address list:

```

config emailfilter iptrust
    edit 1
        set name "trustedIP"
        config entries
            edit 33
                set addr-type {ipv4 | ipv6}
                set ipv4-subnet <IPv4_classnet>
                set ipv6-subnet <IPv6_network>
            next
        end
    next
end

```

2. Add the list to the email filter profile:

```

config emailfilter profile
    edit "email_filter_profile"
        set spam-iptrust-table 1
    next
end

```

MIME header

This feature filters by the MIME header.

To configure a MIME header check:

1. Define the header content:

```
config emailfilter mheader
  edit 100
    set name "mheader"
    config entries
      edit 1
        set fieldname <string>
        set fieldbody <string>
        set pattern-type {wildcard | regexp}
        set action {spam | clear}
      next
    end
  next
end
```

2. Add the header to the email filter profile:

```
config emailfilter profile
  edit "email_filter_profile"
    set options spamhdrcheck
    set spam-mheader-table 100
  next
end
```

Configuring a local-based email filter

To configure a local-based email filter in the GUI:

1. Configure the email filter profile:

- a. Go to *Security Profiles > Email Filter* and click *Create New*, or edit an existing profile.
- b. Select a *Feature set* (*Proxy-based* is used in this example) and enable *Enable spam detection and filtering*.
- c. In the *Local Spam Filtering* section, enable the desired filters (*HELO DNS Lookup*, *Return Email DNS Check*, *Block/Allow List*).
- d. If *Block/Allow List* is enabled, click *Create New*. The *Create Anti-Spam Block/Allow List Entry* pane opens.

- e. Select a *Type*, enter a *Pattern*, and select an *Action*.

OK Cancel

- g. Click **OK** save the email filter profile.

2. Configure the firewall policy:

- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*, or edit an existing policy.
- b. Set the inspection-mode to *Proxy-based*.

- c. Enable the *Email Filter* option and select the previously created profile.

- d. Set *SSL Inspection* to a profile that has deep SSL inspection enabled. Deep inspection is required to filter SMTP, POP3, IMAP, or any SSL/TLS encapsulated protocol.
- e. Configure the other settings as needed.
- f. Click *OK*.

To configure a local-based email filter in the CLI:

1. Configure a block/allow list:

```
config emailfilter block-allow-list
  edit 1
    set name "myBAL"
    config entries
      edit 1
        set status enable
        set type ip
        set action spam
        set addr-type ipv4
        set ip4-subnet 10.1.100.0 255.255.255.0
      next
    end
  next
end
```

2. Configure an email filter profile:

```
config emailfilter profile
  edit "myLocalEmailFilter"
    set spam-filtering enable
    set options spambal spamhelodns spamraddrdns
    config smtp
      set action tag
    end
    set spam-bal-table 1
  next
end
```

3. Use the profile in a firewall policy:

```
config firewall policy
  edit 1
    set inspection-mode proxy
    set emailfilter-profile "myLocalEmailFilter"
  next
end
```

FortiGuard-based filters

The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing URLs, known spam URLs, known spam email checksums, and others. For more information, refer to the [FortiGuard website](#).

There are five FortiGuard spam filtering options:

- [IP address check](#)
- [URL check](#)
- [Detect phishing URLs in email](#) (requires URL check to be enabled)
- [Email checksum check](#)
- [Spam submission](#)

FortiGuard-based filters are not supported while in flow-based inspection mode. See [Inspection mode feature comparison on page 1172](#).

IP address check

The FortiGate queries the FortiGuard Antispam service to determine if the IP address of the client delivering the email is in the block list. If there is a match, the FortiGate treats delivered emails as spam.

URL check

The FortiGate submits all URLs that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL block list, the FortiGate treats the email as spam.

Detect phishing URLs in email

The FortiGate submits all URL hyperlinks that appear in the email body to the FortiGuard service for checking. If a URL exists in the FortiGuard URL phishing list, the FortiGate removes the hyperlink from the message. The URL remains in place, but it is no longer a clickable hyperlink.

Email checksum check

The FortiGate submits a checksum of each email to the FortiGuard service for checking. If a checksum exists in the FortiGuard checksum block list, the FortiGate treats the email as spam.

Spam submission

Spam submission is a way to inform the FortiGuard Antispam service of non-spam messages incorrectly marked as spam. When enabled, the FortiGate adds a link to the end of every email marked as spam. Click the link to notify the FortiGuard Antispam service if an email is marked incorrectly.

Configuring FortiGuard filters

To configure FortiGuard filters in the GUI:

1. Go to *Security Profiles > Email Filter* and click *Create New*.
2. Enable *Enable spam detection and filtering*.
3. In the *FortiGuard Spam Filtering Spam Filtering* section, enable the following as needed:
 - *IP Address Check*
 - *URL Check*
 - *Detect Phishing URLs in Email*
 - *Email Checksum Check*
 - *Spam Submission*

FortiGuard Spam Filtering

IP Address Check

URL Check

Detect Phishing URLs in Email

Email Checksum Check

Spam Submission

Local Spam Filtering

OK Cancel

4. Click *OK*.

To configure FortiGuard filters in the CLI:

```
config emailfilter profile
  edit <name>
    set spam-filtering enable
    set options spamfsip spamfsurl spamfsphish spamfschksun spamfssubmit
  next
end
```

Option	Description
spamfsip	Check email IP addresses
spamfurl	Check email content URLs
spamfsphish	Check email content phishing URLs
spamfschksum	Check email checksums
spamfssubmit	Add FortiGuard Antispam spam submission text

Third-party-based filters

In addition to local and FortiGuard filters, FortiOS can leverage third-party sources, which are known as DNS-based blackhole lists (DNSBL) or Open Relay Behavior-modification Systems (ORBS). These are maintained lists of IP addresses that have been identified as associated with spamming.

The following example demonstrates how to configure a DNSBL. The `config emailfilter dnsbl` command is used to configure either DNSBL or ORBS.

To configure a DNSBL:

1. Define the server to get the DNSBL list from:

```
config emailfilter dnsbl
  edit 100
    set name "dnsbl"
    config entries
      edit 1
        set status enable
        set server <IP address or server name>
        set action {reject | spam}
      next
    end
  next
end
```

2. Add the DNSBL list to an email filter profile:

```
config emailfilter profile
  edit "email_filter_profile"
    set options spamrbl
    set spam-rbl-table 100
  next
end
```

Filtering order

The FortiGate checks for spam using various filtering techniques. The filtering order used by the FortiGate depends on which mail protocol is used.

Filters requiring a query to a server and a reply (FortiGuard Antispam service and DNSBL/ORDBL) are run simultaneously. To avoid delays, queries are sent while other filters are running. The first reply to trigger a spam action takes effect as soon as the reply is received.

Each spam filter passes the email to the next if no matches or problems are found. If the action in the filter is *Mark as Spam*, the FortiGate tags the email as spam according to the settings in the email filter profile. If the action in the filter is *Mark as Reject*, the email session is dropped. If the action in the filter is *Mark as Clear*, the email is exempt from any remaining filters. For SMTP and SMTPS, if the action is *Discard*, the email is discarded or dropped.

SMTP and SMTPS spam filtering order

The FortiGate scans SMTP and SMTPS email for spam in a specific order, which depends on whether or not the local override feature is enabled. This feature is disabled by default, but enabling it gives priority to local spam filters.

You can enable local override (`set local-override`) in an email filter profile to override SMTP or SMTPS remote checks, which includes checks for IP RBL, IP FortiGuard AntiSpam, and HELO DNS with the locally defined antispam block and/or allow lists.

SMTPS spam filtering is available on FortiGates that support SSL content scanning and inspection.

To configure local override of an antispam filter:

```
config emailfilter profile
  edit <name>
    set spam-filtering enable
    set options spambal spamfsip spamfsurl spamhelodns spamfsphish
    config smtp
      set local-override {enable | disable}
    end
    set spam-bal-table 1
  next
end
```

Local override disabled	Local override enabled
<ol style="list-style-type: none"> 1. HELO DNS lookup, last hop IP check against ORDBL 2. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection 3. Last hop IP checks local block/allow list 4. Envelope address checks local block/allow list 5. Headers IPs local block/allow list 6. Headers email address local block/allow list, MIME header checks based on local list of patterns (<code>mheader</code>) 7. Banned words (subject first, then body) based on local block/allow list (<code>bword</code>) 	<ol style="list-style-type: none"> 1. Last hop IP checks local block/allow list 2. Envelope address checks local block/allow list 3. Headers IPs local block/allow list, MIME header checks based on local list of patterns (<code>mheader</code>) 4. Headers email address local block/allow list 5. Banned words (subject first, then body) based on local list of patterns (<code>bword</code>) 6. HELO DNS lookup, last hop IP check against ORDBL 7. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, FortiGuard IP address check, phishing URLs detection

IMAP, IMAPS, POP3, and POP3S spam filtering order

The FortiGate scans IMAP, IMAPS, POP3, and POP3S email for spam in the following order:

1. MIME headers check, email address block/allow list check
2. Banned word check on email subject
3. IP block/allow list check
4. Banned word check on email body
5. Return email DNS check, FortiGuard email checksum check, FortiGuard URL check, DNSBL and ORDBL checks

IMAPS and POP3S spam filtering are available on FortiGates that support SSL content scanning and inspection.

Protocols and actions

In an email filter profile, there are options to configure settings for SMTP, POP3, IMAP, and MAPI protocols. For each protocol, you can set an action to either discard (block), tag, or pass the log for that protocol. The action options vary per protocol. For the tag action, the spam email can be tagged with configured text in the subject or header.

MAPI is only configurable in the CLI and with the proxy feature set.

To configure protocols in an email filter:

```
config emailfilter profile
  edit <name>
    set feature-set {flow | proxy}
    set spam-filtering enable
    set options {bannedword spambal spamfsip spamfssubmit spamfschksum spamfsurl
spamhelodns spamaddrdns spamrbl spamhdrcheck spamfsphish}
    config smtp
      set log-all {enable | disable}
      set action {pass | tag | discard}
      set tag-type {subject | header | spaminfo}
      set tag-msg <string>
      set hdrip {enable | disable}
      set local-override {enable | disable}
    end
    config imap
      set log-all {enable | disable}
      set action {pass | tag}
      set tag-type {subject | header | spaminfo}
      set tag-msg <string>
    end
    config pop3
      set log-all {enable | disable}
      set action {pass | tag}
```

```

        set tag-type {subject | header | spaminfo}
        set tag-msg <string>
    end
    config mapi
        set log-all {enable | disable}
        set action {pass | discard}
    end
next
end

```

options ...

The following options are available:

- bannedword: content block.
- spambal: block/allow list.
- spamfsip: email IP address FortiGuard antispam block list check.
- spamfssubmit: add FortiGuard antispam spam submission text.
- spamfschksum: email checksum FortiGuard antispam check.
- spamfsurl: email content URL FortiGuard antispam check.
- spamhelodns: email HELO/EHLO domain DNS check.
- spamraddrdns: email return address DNS check.
- spamrbl: email DNSBL and ORBL check.
- spamhdrcheck: email MIME header check.
- spamfshish: email content phishing URL FortiGuard antispam check.

tag-type {subject |
header | spaminfo}

Set the tag type:

- subject: prepend text to the spam email subject.
- header: append a user-defined MIME header to the spam email.
- spaminfo: append spam information to the spam email header.

tag-msg <string>

Subject text or header added to the spam email.

hdrip {enable | disable}

Enable/disable SMTP email header IP checks for spamfsip, spamrbl, and spambal filters.

local-override {enable |
disable}

Enable/disable local filter to override SMTP remote check result.

For more information, see [config emailfilter profile](#) in the FortiOS CLI Reference.

Configuring webmail filtering

You can configure an email filter to detect and log emails sent by Gmail and Hotmail. These interfaces do not use standard email protocols (SMTP, POP3, or IMAP) and use HTTPS instead. However, you can still configure the email filter to detect emails that pass through the FortiGate.

The FortiGate only detects and logs the emails, it does not discard or tag them.

To configure webmail filtering:

```

config emailfilter profile
  edit <name>
    set spam-filtering enable
    config msn-hotmail
      set log-all enable
    end
    config gmail
      set log-all enable
    end
  next
end

```

Data leak prevention

The FortiGate data leak prevention (DLP) system prevents sensitive data from leaving or entering your network. You can customize the default sensor or create your own by adding individual filters based on file type, file size, a regular expression, an advanced rule, or a compound rule. Once configured, you can apply the DLP sensor to a firewall policy. Data matching defined sensitive data patterns is blocked, logged, or allowed when it passes through the FortiGate.

DLP can only be configured in the CLI.

The filters in a DLP sensor can examine traffic for the following:

- Known files using DLP fingerprinting
- Known files using DLP watermarking
- Particular file types
- Particular file names
- Files larger than a specified size
- Data matching a specified regular expression
- Credit card and Social Security numbers

Filters are ordered, but there is no precedence between the possible actions.

DLP is primarily used to stop sensitive data from leaving your network. DLP can also be used to prevent unwanted data from entering your network and to archive some or all of the content that passes through the FortiGate. DLP archiving is

configured per filter, which allows a single sensor to archive only the required data. You can configure the DLP archiving protocol in the CLI (see [Configure DLP sensors](#)).

There are two forms of DLP archiving:

- **Summary only:** a summary of all the activity detected by the sensor is recorded. For example, when an email message is detected, the sender, recipient, message subject, and total size are recorded. When a user accesses the web, every URL that they visit is recorded.
- **Full:** detailed records of all the activity detected by the sensor is recorded. For example, when an email message is detected, the message itself, including any attachments, is recorded. When a user accesses the web, every page that they visit is archived.

The following topics provide information about DLP:

- [Basic DLP filter types on page 1353](#)
- [DLP fingerprinting on page 1356](#)

Protocol comparison between DLP inspection modes

The following table indicates which protocols can be inspected by DLP based on the specified inspection modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SFTP/SCP
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	No	No	Yes	No

Logging and blocking files by file name

Sometimes, file names are not accurately recorded in DLP logs, even though the files are blocked correctly based on the DLP sensor. This is particularly apparent on cloud-based services, such as Google Drive or SharePoint.

For HTTP file uploads, some cloud services use proprietary encodings and APIs to transfer files and exchange metadata, instead of standard HTTP mechanisms, requiring custom handling of the proprietary API. If a cloud service changes the API without notice, the custom handling becomes outdated and file names might not be logged properly. Due to this, special consideration must be taken when using DLP to block files by file pattern. To block a specific file type, it is better to block by file type, and not by file name pattern.

Basic DLP filter types

The following basic filter types can be configured in the CLI:

- [File type and name](#)
- [File size](#)
- [Regular expression](#)
- [Credit card and SSN](#)

File type and name

A file type filter allows you to block, allow, log, or quarantine based on the file type specified in the file filter list (see [Supported file types on page 1335](#)).

```
config dlp filepattern
  edit <id>
    set name <string>
    config entries
      edit <pattern>
        set filter-type {type | pattern}
        set file-type <file_type>
      next
    end
  next
end
```

To configure file type and name filtering:

1. Create a file pattern to filter files based on the file name pattrer or file type.

For example, to filter for GIFs and PDFs:

```
config dlp filepattern
  edit 11
    set name "sample_config"
    config entries
      edit "*.gif"
        set filter-type pattern
      next
      edit "pdf"
        set filter-type type
        set file-type pdf
      next
    end
  next
end
```

2. Create the DLP sensor:

```
config dlp sensor
  edit <name>
    config filter
      edit <id>
        set name <string>
        set proto {smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs}
        set filter-by file-type
        set file-type 11
        set action {allow | log-only | block | quarantine-ip}
      next
    end
  next
end
```

File size

A file size filter checks for files that exceed the specific size, and performs the DLP sensor's configured action on them.

To configure file size filtering:

```

config dlp sensor
  edit <name>
    config filter
      edit <id>
        set name <string>
        set proto {smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs}
        set filter-by file-size
        set file-type 11
        set action {allow | log-only | block | quarantine-ip}
      next
    end
  next
end

```

Regular expression

A regular expression filter is used to filter files or messages based on the configured regular expression pattern.

To configure regular expression filtering:

```

config dlp sensor
  edit <name>
    config filter
      edit <id>
        set name <string>
        set type {file | message}
        set proto {smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs}
        set filter-by regexp
        set regexp <string>
        set action {allow | log-only | block | quarantine-ip}
      next
    end
  next
end

```

Credit card and SSN

The credit card sensor can match the credit card number formats used by American Express, Mastercard, and Visa. It can be used to filter files or messages.

The SSN sensor can be used to filter files or messages for Social Security numbers.

To configure credit card or SSN filtering:

```

config dlp sensor
  edit <name>
    config filter
      edit <id>
        set name <string>
        set type {file | message}
        set proto {smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs}

```

```

    set filter-by {credit-card | ssn}
    set action {allow | log-only | block | quarantine-ip}
  next
end
next
end

```

DLP fingerprinting

DLP fingerprinting employs Indexed Document Matching (IDM) to detect sensitive data. The file that the DLP profile filters is uploaded and the FortiGate generates and stores a checksum fingerprint. The FortiGate generates a fingerprint for all the files that are detected in network traffic, and compares all the checksums stored in its database. If a match is found, the configured action is taken. Any type of file can be detected by DLP fingerprinting, and fingerprints can be saved for each revision of a file as it is updated.

Using fingerprinting requires:

1. [Creating a DLP fingerprint database by allowing the FortiGate to access a file server containing files from which to create fingerprints.](#)
2. [Adding fingerprinting filters to DLP profiles.](#)
3. Adding the profiles to firewall policies that accept traffic that the fingerprinting will be applied on.

See [Fingerprinting example on page 1357](#) for a sample configuration.

The document fingerprint feature requires a FortiGate that has internal storage.

To configure a DLP fingerprint document:

```

config dlp fp-doc-source
  edit <name>
    set server <string>
    set username <string>
    set password <password>
    set file-path <string>
    set sensitivity <Critical | Private | Warning>
  next
end

```

Command	Description
server <string>	Enter the IPv4 or IPv6 address of the server.
username <string>	Enter the user name required to log into the file server.
password <password>	Enter the password required to log into the file server.
file-path <string>	Enter the path on the server to the fingerprint files.
sensitivity <Critical Private Warning>	Set the sensitivity or threat level for matches with this fingerprint database.

See [config dlp fp-doc-source](#) in the [FortiOS CLI Reference](#) for a comprehensive list of commands and supported FortiGate models.

A file server is required for the user to upload files. Each uploaded file will have a fingerprint generated by FortiGate, and will be stored locally as a checksum. Currently, only servers that are using the Samba (SMB) protocol are compatible.

To configure a DLP fingerprint profile:

```
config dlp profile
  edit <name>
    set feature-set proxy
    config rule
      edit <id>
        set proto {smtp | pop3 | imap | http-get | http-post | ftp | nntp | mapi |
ssh | cifs}
        set filter-by fingerprint
        set sensitivity {Critical | Private | Warning}
        set match-percentage <integer>
        set action {allow | log-only | block | ban | quarantine-ip}
      next
    end
  next
end
```

Command	Description
proto {smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs}	Set the protocol to inspect.
filter-by fingerprint	Set to match against a fingerprint sensitivity.
sensitivity {Critical Private Warning}	Set the DLP file pattern sensitivity to match.
match-percentage <integer>	Set the percentage of the checksum required to match before the profile is triggered.
action {allow log-only block ban quarantine-ip}	Set the action to take with content that matches the DLP profile.

Fingerprinting example

This configuration will block HTTPS download traffic that matches the checksums that are stored in the FortiGate fingerprint database.

When utilizing commonly-used SSL-encrypted protocols, such as HTTPS, SMTPS, POP3S, IMAPS, and FTPS, SSL inspection must be set to Deep Inspection. See [Deep inspection on page 1390](#) for more information.

The client machine must also have the corresponding deep inspection Certificate Authority (CA) certificate installed.

In this example, a text document with sensitive data is being downloaded by the client using the HTTP GET method. The term *Protected Server* refers to the Samba file server that stores the fingerprint files. It is assumed that you already have a configured Samba file server.

The FortiGate intercepts the traffic using deep inspection and blocks the traffic as it matches the DLP profile configured on this FortiGate. See [Sample log on page 1360](#) for a log sample.

To block network traffic that matches the checksums stored in the FortiGate fingerprint database:

1. Configure the DLP fingerprint database:

```
config dlp fp-doc-source
  edit "test"
    set server "172.16.200.55"
    set username "kiki"
    set password *****
    set file-path "/sambashare/upload/"
    set sensitivity "Critical"
  next
end
```

This step can only be configured in the CLI.

2. Configure the DLP profile:

```
config dlp profile
  edit "fingerprint"
    set feature-set proxy
    config rule
      edit 1
        set proto http-get
        set filter-by fingerprint
        set sensitivity "Critical"
        set action block
      next
    end
  next
end
```

DLP profiles that filter by fingerprint can only be configured in the CLI.

3. Add the DLP profile to a firewall policy:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
```

```

    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "deep-inspection"
    set dlp-profile "fingerprint"
    set nat enable
  next
end

```

This can also be configured in the GUI:

- a. Go to *Policy & Objects > Firewall Policy* and click *Create New* or edit an existing policy.
- b. Set the *Inspection Mode* to *Proxy-based*.
- c. In the *Security Profiles* section, enable *DLP Profile* and select *fingerprint*.
- d. Set *SSL Inspection* to *deep-inspection*.
- e. Configure the other settings as needed.
- f. Click *OK*.

To verify the results:

1. Verify that the DLP fingerprint database is present on the FortiGate:

```

# diagnose test application dlpfingerprint 3
File DB:
-----

```

2. Verify HTTP GET traffic that matches the checksums stored in the FortiGate fingerprint database is being blocked:
A download attempt of a text file from a Windows device was made using Chrome browser. This text file is located on the protected server and its fingerprint is saved in the FortiGate fingerprint database.

Attention

The transfer attempt has been blocked because it appears to contain a data leak.

URL <https://172.16.200.55/testdlp.txt>

The download was unsuccessful, leading to the creation of a sample log. See [Sample log on page 1360](#).

Sample log

To view the sample log:

1. Go to *Log & Report > Security Events* and select *AntiVirus*.
2. View the log details in the GUI, or download the log file:

```

VoIP solutions

You can configure VoIP profiles to allow SIP and SCCP traffic and to protect your network from SIP- and SCCP-based attacks.

FortiOS includes two preloaded VoIP profiles:

- *default*
- *strict*

You can customize these profiles, or you can create your own and add them to firewall policies that allow VoIP.

VoIP profiles cannot be used NGFW policy-based mode. See [Profile-based NGFW vs policy-based NGFW on page 850](#) for more information.

The following topics provide information about VoIP profiles:

- [General use cases on page 1361](#)
- [SIP message inspection and filtering on page 1365](#)
- [SIP pinholes on page 1368](#)
- [SIP over TLS on page 1370](#)
- [Voice VLAN auto-assignment on page 1371](#)
- [Scanning MSRP traffic on page 1373](#)

General use cases

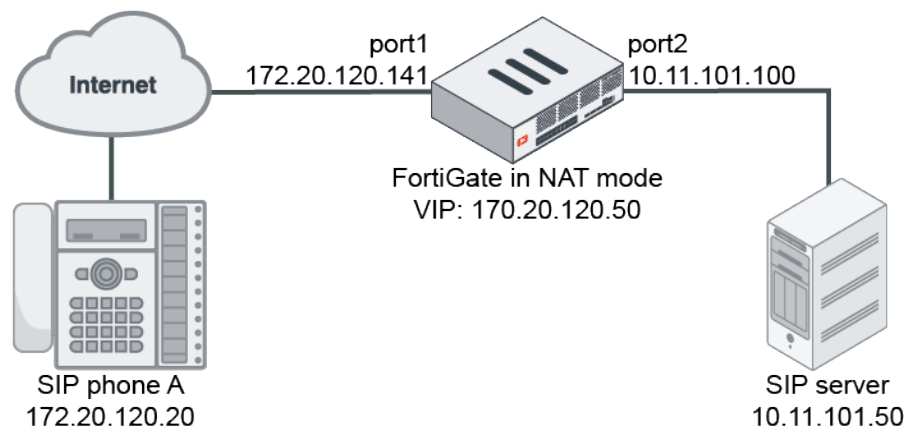

There are three scenarios in which the FortiOS session initiation protocol (SIP) solution is usually deployed:

1. The SIP server is in a private network that is protected from the internet by a FortiGate.
2. The SIP clients are in a private network that is protected from the internet by a FortiGate.
3. The SIP server is in a private network, such as a corporation's internal network or an ISP's network, that is protected from the internet by a FortiGate. The SIP clients are in a remote private network, such as a SOHO network, and behind a NAT device that is not aware of SIP applications.

The following VIP, NAT, and HNT examples show configurations for these common scenarios.

VIP

A FortiGate with SIP Application Layer Gateway (ALG) or SIP session helper protects the SIP server from the internet, while SIP phones from the internet need to register to the SIP server and establish calls through it.

A VIP needs to be configured for the SIP server, and the VIP must be applied in a firewall policy for the phones to send REGISTER messages through the FortiGate from port1 to port2.

Only one firewall policy needs to be configured for all SIP phones on both the internet and private network to register to the SIP server through port1 and set up SIP calls. This example assumes either SIP ALG or SIP session helper is enabled.

To configure the VIP for the SIP server:

```

config firewall vip
  edit "VIP_for_SIP_Server"
    set extip 172.20.120.50
    set extintf "port1"
    set mappedip "10.11.101.50"
  next
end

```

To configure the firewall policy:

```

config firewall policy
  edit 1
    set srcintf "port1"
    set dstintf "port2"
    set srcaddr "all"
    set dstaddr "VIP_for_SIP_Server"
    set action accept
    set schedule "always"
    set service "SIP"
  next
end

```

Setting `service` to `SIP` and not `all` in the firewall policy can improve protection by restricting the data traffic passing through the FortiGate to the SIP call traffic only.

NAT

A FortiGate with SIP ALG or SIP session helper protects the SIP phones and the internal network from the internet, while SIP phones in the internal network need to register to the SIP server installed on the internet and establish calls through it.

One firewall policy needs to be configured with NAT enabled for SIP phones to send REGISTER messages through the FortiGate from port2 to port1. This example assumes either SIP ALG or SIP session helper is enabled.

To configure the firewall policy:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "SIP"
    set nat enable
  next
end
```

HNT

A FortiGate with SIP ALG protects the SIP server from the internet, while SIP phones are in remote private networks behind NAT devices that are not aware of the SIP application. This is only supported in proxy mode.

In this example, the SIP server is located in an ISP's service cloud that is protected by the FortiGate SIP ALG, and the SIP phones are installed in the home networks of the ISP's customers.

The SIP messages traversing the remote NAT devices might have their IP addresses translated by the NAT device at the network layer, but untranslated at the SIP application layer because those NAT devices are not aware of the SIP applications. This causes problems in a SIP session initiated process. Special configurations for the hosted NAT traversal (HNT) are required to resolve this issue.

To configure the FortiGate with HNT support for SIP phones A and B to set up calls with each other:

1. Identify port1 as the external interface:

```
config system interface
  edit "port1"
    set external enable
  next
end
```

2. Configure the VIP for the SIP server:

```
config firewall vip
  edit "VIP_for_SIP_Server"
    set extip 10.21.101.10
```

```

        set extintf "port1"
        set mappedip "10.30.120.20"
    next
end

```

3. Configure a VoIP profile with HNT enabled:

```

config voip profile
    edit "hnt"
        config sip
            set hosted-nat-traversal enable
            set hnt-restrict-source-ip enable
        end
    next
end

```

`hosted-nat-traversal` must be enabled. `hnt-restrict-source-ip` does not have to be enabled, but can be enabled to restrict the RTP packets' source IP to be the same as the SIP packets' source IP.

4. Apply the VoIP profile and VIP in a firewall policy for phone A and B to register and set up SIP calls through the FortiGate and SIP server:

```

config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "VIP_for_SIP_Server"
        set action accept
        set schedule "always"
        set service "SIP"
        set utm-status enable
        set voip-profile "hnt"
        set nat enable
    next
end

```

`nat` must be enabled in the firewall policy.

SIP message inspection and filtering

SIP ALG provides users with security features to inspect and control SIP messages that are transported through the FortiGate, including:

- Verifying the SIP message syntax.
- Blocking particular types of SIP requests.
- Restricting the rate of particular SIP requests.

These can be performed in both proxy-based or flow-based firewall policies. In 7.0, flow-based SIP inspection is done by the IPS engine. This optimizes memory and CPU usage when VoIP profiles with SIP inspection are configured with other UTM profiles in a flow-based firewall policy because inspection is done entirely by the IPS engine.

These features are configured in the VoIP profile:

```
config voip profile
  edit <name>
    set feature-set {proxy | flow}
    config sip
      set ...
      ...
    end
  next
end
```

For more information, see [config voip profile](#) in the FortiOS CLI Reference.

The VoIP profile can then be applied to a firewall policy to process the SIP call traffic. The firewall policy's inspection mode decides whether inspection happens on the SIP ALG proxy or on the IPS engine.

```
config firewall policy
  edit <id>
    set inspection-mode {proxy | flow}
    set voip-profile <name>
  next
end
```

SIP message syntax inspection

For syntax verification, the following attributes are available for configuration in the VoIP profile to determine what action is taken when a specific syntax error or attack based on invalid syntax is detected. For example, the action can be set to pass or discard it.

```
malformed-request-line
malformed-header-via
malformed-header-from
malformed-header-to
malformed-header-call-id
malformed-header-cseq
malformed-header-rack
malformed-header-rseq
malformed-header-contact
malformed-header-record-route
malformed-header-route
malformed-header-expires
malformed-header-content-type
malformed-header-content-length
malformed-header-max-forwards
malformed-header-allow
malformed-header-p-asserted-identity
malformed-header-sdp-v
malformed-header-sdp-o
```

```
malformed-header-sdp-s
malformed-header-sdp-i
malformed-header-sdp-c
malformed-header-sdp-b
malformed-header-sdp-z
malformed-header-sdp-k
malformed-header-sdp-a
malformed-header-sdp-t
malformed-header-sdp-r
malformed-header-sdp-m
malformed-header-no-require*
malformed-header-no-proxy-require*
```

* = only available in flow mode

SIP message blocking

The following options are available in the VoIP profile to block SIP messages:

```
block-long-lines
block-unknown
block-ack
block-bye
block-cancel
block-info
block-invite
block-message
block-notify
block-options
block-prack
block-publish
block-refer
block-register
block-subscribe
block-update
block-geo-red-options**
```

** = only available in proxy mode

SIP message rate limiting

The rate of certain types of SIP requests that are passing through the SIP ALG can be restricted:

```
register-rate
invite-rate
subscribe-rate
message-rate
notify-rate
refer-rate
update-rate
options-rate
ack-rate
prack-rate
info-rate
publish-rate
```

```
bye-rate  
cancel-rate
```

Additionally, flow-based SIP supports the following rate tracking features:

```
register-rate-track none  
invite-rate-track none  
subscribe-rate-track none  
message-rate-track none  
notify-rate-track none  
refer-rate-track none  
update-rate-track none  
options-rate-track none  
ack-rate-track none  
prack-rate-track none  
info-rate-track none  
publish-rate-track none  
bye-rate-track none  
cancel-rate-track none
```

SIP pinholes

When SIP ALG processes a SIP call, it usually opens pinholes for SIP signaling and RTP/RTCP packets. NAT usually takes place during the process at both the network and SIP application layers. SIP ALG ensures that, with NAT happening, corresponding SIP and RTP/RTCP pinholes are created during the process when it is necessary for call sessions to be established through FortiOS devices.

By default, SIP ALG manages pinholes automatically, but some special configurations can be used to restrict the pinholes if required.

SIP pinhole restriction

The `strict-register` attribute is enabled by default. When enabled, after a SIP endpoint registers to the SIP server through a firewall policy on the FortiGate, only the SIP messages sent from the same IP address as the SIP server are allowed to pass through the SIP pinhole that is created in the FortiGate to reach the SIP endpoints. If the attribute is disabled, SIP messages from any IP addresses can pass through the pinhole created after the registration.

SIP pinhole restriction is only supported by SIP ALG and in proxy mode.

To configure registrar connection ability:

```
config voip profile  
  edit <name>  
    config sip  
      set strict-register {enable | disable}  
    end  
  next  
end
```

RTP/RTCP pinhole restriction

The `nat-port-range` setting is used to specify a port range in the VoIP profile to restrict the NAT port range for Real-time Transport Protocol/Real-time Transport Control Protocol (RTP/RTCP) packets in a Session Initiation Protocol (SIP) call session that is handled by the SIP application layer gateway (ALG) in a FortiGate.

When NAT is enabled, or VIP is used in a firewall policy for SIP ALG to handle a SIP call session established through a FortiGate, the SIP ALG can perform NAT to translate the ports used for the RTP/RTCP packets when they are flowing through the device between the external and internal networks.

To edit the translated port range for RTP/RTCP packets:

```
config voip profile
  edit <name>
    config sip
      set nat-port-range <start_port_number>--<end_port_number>
    end
  next
end
```

```
nat-port-range <start_
port_number>--<end_
port_number>
```

Enter the NAT port range (minimum port number = 5117, default = 5117-65535).

Example

In this example, Phone 1 is in Subnet 1, and the SIP server and Phone 2 are in Subnet 2. All SIP signaling messages and RTP/RTCP packets go through the SIP server. The RTP/RTCP ports on Phone 1 are configured as 17078/17079.

The FortiGate administrator wants to use NAT for the port 17078/17079 to 30000/30001. If Phone 1 and Phone 2 are registered to the SIP server, and they establish a call session between them through the FortiGate and the SIP server, then the RTP/RTCP ports 17078/17079 of Phone 1 will be translated to ports 30000/30001. All RTP/RTCP packets going out of port2 have source ports of 30000/30001, and all RTP/RTCP packets going into port2 also have destination ports of 30000/30001.

To configure the custom port range:

1. Edit the VoIP profile:

```
config voip profile
  edit "natPortRange"
    config sip
```

```
        set nat-port-range 30000-30001
    end
next
end
```

It is best practice to configure the starting port as an even number and the ending port as an odd number.

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf port1
        set dstintf port2
        set srcaddr all
        set dstaddr all
        set service SIP
        set action accept
        set schedule always
        set voip-profile natPortRange
        set nat enable
    next
end
```

SIP over TLS

Some SIP phones and servers can communicate using TLS to encrypt the SIP signaling traffic. To allow SIP over TLS calls to pass through the FortiGate, the encrypted signaling traffic must be unencrypted and inspected. The FortiGate SIP ALG intercepts, unencrypts, and inspects the SIP packets, which are then re-encrypted and forwarded to their destination.

The SIP ALG only supports full mode TLS. This means that the SIP traffic between SIP phones and the FortiGate, and between the FortiGate and the SIP server, is always encrypted. The highest TLS version supported by SIP ALG is TLS 1.3.

To enable SIP over TLS support, the SSL mode in the VoIP profile must be set to `full`. The SSL server and client certificates can be provisioned so that the FortiGate can use them to establish connections to SIP phones and servers, respectively.

This configuration is only supported in proxy mode.

To configure SIP over TLS:

1. Configure a VoIP profile with SSL enabled:

```
config voip profile
    edit "tls"
        config sip
            set ssl-mode full
```

```

        set ssl-client-certificate "ssl_client_cert"
        set ssl-server-certificate "ssl_server_cert"
    end
next
end

```

The `ssl_server_cert`, `ssl_client_cert`, and key files can be generated using a certification tool, such as OpenSSL, and imported to the local certificate store of the FortiGate from *System > Certificates* in the GUI. Existing local certificates in the certificate store can also be used. As always for TLS connections, the certificates used must be verified and trusted at the other end of the connection when required.

For example, the CA certificate of the SIP server's certificate should be imported to the FortiGate as an external CA certification, so that the FortiGate can use it to verify the SIP server's certificate when setting up the TLS connection. The CA certificate configured as the `ssl_server_cert` should be installed as the trusted certificate on the SIP phones. The deployment of the certificates across the network depends on the SIP client and server devices that are used in the system.

2. Apply the profile to the firewall policy:

```

config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "vip_sip_server"
        set action accept
        set schedule "always"
        set service "SIP"
        set utm-status enable
        set voip-profile "tls"
    next
end

```

Voice VLAN auto-assignment

You can leverage LLDP-MED to assign voice traffic to the desired voice VLAN. After detection and setup, the IP phone on the network is segmented to its own VLAN for policy, prioritization, and reporting. The LLDP reception capabilities in FortiOS include LLDP-MED assignment for voice, voice signaling, guest, guest voice signaling, softphone, video conferencing, streaming video, and video signaling.

You can configure VLAN auto-assignment using the following steps:

1. [Set up the VLAN for the voice device](#)
2. [Set up the DHCP server for the voice VLAN](#)
3. [Set up the LLDP network policy](#)
4. [Enable LLDP on the physical interface that the VLAN belongs to](#)
5. [Apply the LLDP network policy on the physical interface](#)
6. [Confirm that the VLAN was assigned](#)

To set up the VLAN for the voice device:

```

config system interface
    edit "vlan_100"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    end
end

```

```
        set alias "voice_vlan"
        set device-identification enable
        set role lan
        set snmp-index 25
        set interface "port10"
        set vlanid 100
    next
end
```

To set up the DHCP server for the voice VLAN:

```
config system dhcp server
    edit 1
        set dns-service default
        set default-gateway 192.168.1.99
        set netmask 255.255.255.0
        set interface "vlan_100"
        config ip-range
            edit 1
                set start-ip 192.168.1.110
                set end-ip 192.168.1.210
            next
        end
    next
end
```

To set up the LLDP network policy:

```
config system lldp network-policy
    edit "1"
        config voice
            set status enable
            set tag dot1q
            set vlan 100
        end
    next
end
```

To enable LLDP on the physical interface that the VLAN belongs to:

```
config system interface
    edit "port10"
        set vdom "root"
        set type physical
        set lldp-reception enable
        set lldp-transmission enable
        set snmp-index 14
    next
end
```

To apply the LLDP network policy on the physical interface:

```
config system interface
    edit "port10"
        set lldp-network-policy "1"
```

```

    next
end

```

To confirm that the VLAN was assigned as expected:

1. Connect an IP phone to the network.
2. Check the IP address on the phone.
The IP address should belong to the voice VLAN.
3. Sniff on the FortiGate incoming interface to see if traffic from the IP phone has the desired VLAN tag.
In this example, the voice traffic from the IP phone should be in VLAN 100.

Scanning MSRP traffic

An MSRP (Message Session Relay Protocol) decoder in the IPS engine scans for IPS signatures against the application data. Malicious payload in the text message can be blocked. A VoIP profile using flow inspection mode must be configured in the firewall policy. An IPS profile must be configured in the firewall policy to inspect the payload.

```

config voip profile
  edit <name>
    set feature-set flow
    config msrp
      set status {enable | disable}
      set log-violations {enable | disable}
      set max-msg-size <integer>
      set max-msg-size-action {pass | block | reset | monitor}
    end
  end
next
end

```

status {enable disable}	Enable/disable MSRP.
log-violations {enable disable}	Enable/disable logging of MSRP violations.
max-msg-size <integer>	Maximum allowable MSRP message size, in bytes (0 - 65535, default = 0).
max-msg-size-action {pass block reset monitor}	Action for violating maximum MSRP message size: <ul style="list-style-type: none"> • pass: pass or allow matching traffic (default) • block: block or drop matching traffic • reset: reset sessions for matching traffic • monitor: pass and log matching traffic

Examples

In this first example, MSRP messages larger than 10 bytes will be blocked. The client sends an oversized MSRP message to the server. Message Automation & Protocol Simulation (MAPS™) is used, and a client-server model was configured to use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with plain text placed in the message field. The software uses the content of the MsrpInputMessage.txt file located in the default folder, where anything in that file will be sent by MSRP. The following text is used:

GL's Message Automation & Protocol Simulation (MAPS™) is a protocol simulation and conformance test tool that supports a variety of protocols such as SIP, MEGACO, MGCP, SS7, ISDN, GSM, MAP, CAS, LTE, UMTS, SS7 SIGTRAN, ISDN SIGTRAN, SIP I, GSM AoIP, Diameter and others. This message automation tool covers solutions for both protocol simulation and protocol analysis. The application includes various test plans and test cases to support the testing of real-time entities. Along with automation capability, the application gives users the unlimited ability to edit messages and control scenarios (message sequences).

To configure MSRP traffic scanning:

1. Configure the VoIP profile:

```
config voip profile
  edit msrp_test
    set feature-set flow
    config msrp
      set status enable
      set log-violations enable
      set max-msg-size 10
      set max-msg-size-action block
    end
  next
end
```

2. Configure the firewall policy:

```
config firewall policy
  edit 1
    set name "vdom3"
    set srcintf "vlan843"
    set dstintf "vlan844"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
```

```

    set voip-profile "msrp_test"
    set logtraffic all
  next
end

```

3. Verify the log:

```

# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

```

```

1: date=2021-06-10 time=17:21:19 eventtime=1623370879840284165 tz="-0700"

```

4. In MAPS, verify that the call was terminated:

The screenshot shows the MAPS interface with a table of call logs and a detailed call flow view.

Sl No	Script Name	Profile	Call Info	Script Execution	Status	Events	Events Profile	Result	Total Iterations	Completed Iterations
1	SIPRegistrationControl.gls	Profile0001	CGPofScriptId:98493426403.2281.7216	Start		None		Unknown	1	1
2	SIPCallControl.gls	Profile0001	GL:MAPS-11.8.653431911.2277.98209192.168.12.212	Start	Call Terminated	None		Plan	1	1

The detailed call flow view shows the following sequence of events:

- 11:32:33.127000: INVITE (DUT to MAPS)
- 11:32:33.190000: 100 Trying (MAPS to DUT)
- 11:32:33.207000: 180 Ringing (MAPS to DUT)
- 11:32:33.340000: 200 OK (DUT to MAPS)
- 11:32:33.365000: ACK (DUT to MAPS)
- 11:32:38.201000: BYE (DUT to MAPS)
- 11:32:38.244000: 200 OK (MAPS to DUT)

In this second example, malicious files will be blocked. The client sends an EICAR test sample to the server in an MSRP message. Message Automation & Protocol Simulation (MAPS™) is used, and a client-server model was configured to use the software to send MSRP traffic from vlan843 (client) to vlan844 (server) with a plain text EICAR file containing a virus in the message field. The following text is used:

```
X5O!P%#@AP[4\PZX54(P^)7CC)7}$EICAR-STANDARD-ANTIVIRUS-TEST-FILE!$H+H*
```

To configure MSRP traffic scanning:

1. Configure the VoIP profile:

```

config voip profile
  edit msrp_test
    set feature-set flow
  config msrp
    set status enable

```

```

        set log-violations enable
        set max-msg-size 0
        set max-msg-size-action pass
    end
next
end

```

2. Configure the IPS profile:

```

config ips sensor
    edit "msrp"
        set extended-log enable
        config entries
            edit 1
                set rule 7470 29844
                set status enable
                set action block
            next
        end
    next
end

```

3. Configure the firewall policy:

```

config firewall policy
    edit 1
        set name "vdom3"
        set srcintf "vlan843"
        set dstintf "vlan844"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set ips-sensor "msrp"
        set voip-profile "msrp_test"
        set logtraffic all
    next
end

```

4. Verify the log:

```

# execute log filter category 4
# execute log display
1 logs found.
1 logs returned.

```

```

1: date=2021-09-16 time=11:29:48 eventtime=1631816988947762597 tz="-0700"

ICAP

Internet Content Adaptation Protocol (ICAP) is an application layer protocol that is used to offload tasks from the firewall to separate, specialized servers. For more information see [RFC 3507](#).

ICAP profiles can only be applied to policies that use proxy-based inspection. If you enable ICAP in a policy, HTTP and HTTPS (if HTTPS inspection is supported) traffic that is intercepted by the policy is transferred to the ICAP server specified by the selected ICAP profile. Responses from the ICAP server are returned to the FortiGate, and then forwarded to their destination.

By default, *ICAP* is not visible in the GUI. See [Feature visibility on page 2292](#) for instructions on making it visible.

ICAP filter profiles cannot be used in NGFW policy-based mode. See [Profile-based NGFW vs policy-based NGFW on page 850](#) for more information.

To configure ICAP:

1. Set up your ICAP server.
2. On the FortiGate, add an ICAP server.
3. Create an ICAP profile.
4. Use the ICAP profile in a firewall policy that covers the traffic that needs to be offloaded to the ICAP server.

The following topics provide information about ICAP:

- [ICAP configuration example on page 1378](#)
- [ICAP response filtering on page 1380](#)
- [Secure ICAP clients on page 1382](#)

TCP connection pool for connections to ICAP server

A TCP connection pool can maintain local-out TCP connections to the external ICAP server due to a backend update in FortiOS. TCP connections will not be terminated once data has been exchanged with the ICAP server, but instead are reused in the next ICAP session to maximize efficiency.

For example, consider a scenario where an ICAP profile is used as a UTM profile in an explicit web proxy policy, and a client visits web servers through this proxy policy.

Once the WAD is initialized, when a HTTP request is sent from the client to the server through the FortiGate with an ICAP profile applied to the matched proxy policy, a TCP connection is established between the FortiGate and the ICAP server to exchange data.

When an ICAP session is finished, the TCP connection is kept in the WAD connection pool. When another ICAP session needs to be established, the WAD will check if there are any idle connections available in the connection pool. If an idle connection is available, then it will be reused; otherwise, a new TCP connection is established for the ICAP session. This process can be checked in the WAD debug log.

ICAP configuration example

In this example, the ICAP server performs proprietary content filtering on HTTP and HTTPS requests. If the content filter is unable to process a request, then the request is blocked. Streaming media is not considered by the filter, so it is allowed through and is not processed.

To configure the ICAP setup in the GUI:

1. Add the ICAP server:

- a. Go to *Security Profiles > ICAP Servers* and click *Create New*.
- b. In the *Name* field, enter a name for the ICAP server, such as *content-filtration-server4*.
- c. Select the *IP Version*.
- d. In the *IP Address* field, enter the IP address of the ICAP server.
- e. In the *Port* field, enter a new port number if required. The default value is *1344*.

- f. Click *OK*.

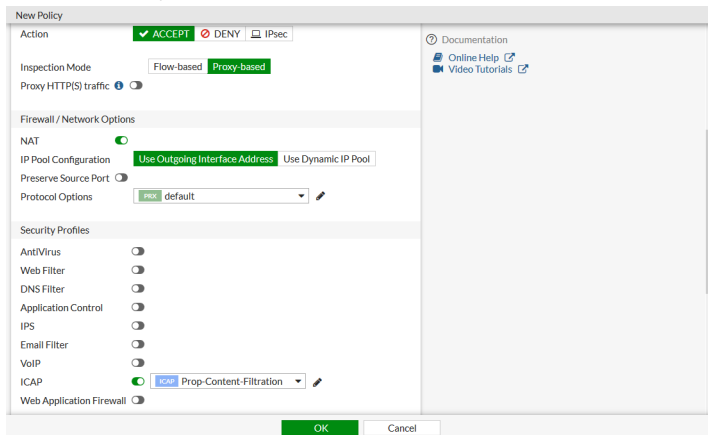

The maximum number of concurrent connections to ICAP server can be configured in the CLI (`set max-connections`). The default setting is 100 connections.

2. Create the ICAP profile:

- a. Go to *Security Profiles > ICAP* and click *Create New*.
- b. In the *Name* field, enter a name for the ICAP profile, such as *Prop-Content-Filtration*.
- c. Enable *Request Processing* and set the following:
 - *Server*: select the ICAP server (*content-filtration-server4*).
 - *Path*: enter the path to the processing component on the server, such as */proprietary_code/content-filter/*.
 - *On Failure*: select *Error* to block the request. If the message cannot be processed, it will not be blocked.
- d. Enable *Response Processing* and set the following:
 - *Server*: select the ICAP server (*content-filtration-server4*).
 - *Path*: enter the path to the processing component on the server, such as */proprietary_code/content-filter/*.
 - *On Failure*: select *Error* to block the request. If the message cannot be processed, it will not be blocked.
- e. Enable *Streaming Media Bypass* to not offload streaming media to the ICAP server.

- f. Click *OK*.

3. Add the ICAP profile to a policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Set *Inspection Mode* to *Proxy-based*.
 - c. Under *Security Profiles*, enable *ICAP* and select the ICAP server.

- d. Configure the other settings as needed.
- e. Click *OK*.

To configure the ICAP setup in the CLI:

1. Add the ICAP server:

```
config icap server
  edit "content-filtration-server4"
    set ip-version 4
    set ip-address 172.16.100.55
    set port 1344
    set max-connections 200
  next
end
```

2. Create the ICAP profile:

```
config icap profile
  edit "Prop-Content-Filtration"
    set request enable
    set response enable
    set streaming-content-bypass enable
    set request-server "content-filtration-server4"
    set response-server "content-filtration-server4"
    set request-failure error
    set response-failure error
    set request-path "/proprietary_code/content-filter/"
    set response-path "/proprietary_code/content-filter/"
    set methods delete get head options post put trace other
  next
end
```

3. Add the ICAP profile to a policy:

```
config firewall policy
  edit 5
```

```
    set name "icap_filter3"
    set srcintf "virtual-wan-link"
    set dstintf "virtual-wan-link"
    set srcaddr "FABRIC_DEVICE"
    set dstaddr "FABRIC_DEVICE"
    set dstaddr-negate enable
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "certificate-inspection"
    set icap-profile "Prop-Content-Filtration"
    set logtraffic disable
    set fsso disable
    set nat enable
  next
end
```

ICAP response filtering

ICAP HTTP responses can be forwarded or bypassed based on the HTTP header value and status code.

When configuring the ICAP profile, if `response` is enabled, the `respmod-default-action` option can be configured:

- If `respmod-default-action` is set to `forward`, FortiGate will treat every HTTP response and send ICAP requests to the ICAP server.
- If `respmod-default-action` is set to `bypass`, FortiGate will only send ICAP requests if the HTTP response matches the defined rules, and the rule's action is set to `forward`.

When configuring a response rule:

- The `http-resp-status-code` option is configured to specific HTTP response codes. If the HTTP response has any one of the configured values, then the rule takes effect.
- Multiple header value matching groups can be configured. If the header value matches one of the groups, then the rule takes effect.
- If both status codes and header values are specified in a rule, the response must match at least one of each.

The UTM ICAP log category is used for logging actions when FortiGate encounters errors with the ICAP server, such as no service, unreachable, error response code, or timeout. If an error occurs, a traffic log and an associated UTM ICAP log will be created.

Example

The FortiGate acts as a gateway for the client PC and connects to a reachable ICAP server. The ICAP server can be in NAT, transparent, or proxy mode.

In this example, client request HTTP responses will be forwarded to the ICAP server from all hosts if they have an HTTP status code of 200, 301, or 302, and have `content-type: image/jpeg` in their header.

To configure an ICAP profile with HTTP response rules:

```
config icap profile
  edit "icap_profile2"
    set request disable
    set response enable
    set streaming-content-bypass disable
    set preview disable
    set response-server "icap_server1"
    set response-failure error
    set response-path ''
    set methods delete get head options post put trace other
    set response-req-hdr disable
    set respmod-default-action bypass
    config respmod-forward-rules
      edit "rule2"
        set host "all"
        set action forward
        set http-resp-status-code 200 301 302
        config header-group
          edit 2
            set header-name "content-type"
            set header "image/jpeg"
          next
        end
      next
    end
  next
end
next
end
```

To view the logs if an error occurs:

1. View the traffic log:

```
# execute log filter category 0
# execute log display
1 logs found.
```

1 logs returned.

```
1: date=2019-10-25 time=17:43:47 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1572050627037314464 tz="-0700" srcip=10.1.100.145
srcport=47968 srcintf="port1" srcintfrole="undefined" dstip=172.16.200.46 dstport=80
dstintf="port2" dstintfrole="undefined" poluid="a4d5324e-f6c3-51e9-ce2d-f360994fb547"
sessionid=43549 proto=6 action="close" policyid=1 policytype="policy" service="HTTP"
dstcountry="Reserved" srccountry="Reserved"trandisp="snat" transip=172.16.200.1
transport=47968 duration=1 sentbyte=485 rcvbyte=398 sentpkt=6 rcvdpkt=5
appcat="unscanned" wanin=478 wanout=165 lanin=165 lanout=165 utmaction="block"
counticap=1 crscore=5 craction=262144 crlevel="low" utmref=65532-0
```

2. View the UTM ICAP log:

```
# execute log filter category 20
# execute log display
1 logs found.
1 logs returned.
```

```
1: date=2019-10-25 time=17:43:46 logid="2000060000" type="utm" subtype="icap"
eventtype="icap" level="warning" vd="vdom1" eventtime=1572050626010097145 tz="-0700"
msg="Request blocked due to ICAP server error" service="HTTP" srcip=10.1.100.145
dstip=172.16.200.46 srcport=47968 dstport=80 srcintf="port1" srcintfrole="undefined"
dstintf="port2" dstintfrole="undefined" policyid=1 sessionid=43549 proto=6
action="blocked" profile="icap_profile1" url="/icap_test/"
```

The logs show that the ICAP services stopped before the access. When the client tried to access HTTP and ICAP took effect, the FortiGate sent the ICAP request to the ICAP server and received an error. The client sees a *502 Bad Gateway* message, and FortiGate writes the two logs. In the GUI, the logged traffic is displayed as *Result: Deny: UTM Blocked*.

Secure ICAP clients

A secure SSL connection from the FortiGate to the ICAP server can be configured as follows:

```
config icap server
  edit <name>
    set secure {enable | disable}
    set ssl-cert <certificate>
  next
end
```

To configure a secure ICAP client:

1. Configure the ICAP server:

```
config icap server
  edit "icap_server1"
    set ip-version 4
    set ip-address 192.168.10.2
    set port 11344
    set max-connections 100
    set secure enable
    set ssl-cert "ACCVRAIZ1"
  next
end
```

Port 11344 is the standard port for secure ICAP. This must be configured manually if the secure connection is enabled.

2. Configure the ICAP profile:

```
config icap profile
  edit "icap_profile1"
    set request enable
    set response enable
    set streaming-content-bypass enable
    set request-server "icap_server1"
    set response-server "icap_server1"
  next
end
```

3. Configure the firewall policy:

```
config firewall policy
  edit 1
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "protocols"
    set icap-profile "icap_profile1"
  next
end
```

Web application firewall

Web application firewall (WAF) profiles can detect and block known web application attacks. You can configure WAF profiles to use signatures and constraints to examine web traffic. You can also enforce an HTTP method policy, which controls the HTTP method that matches the specified pattern.

You can customize the default profile, or you can create your own profile to apply access rules and HTTP protocol constraints to traffic. You can apply WAF profiles to firewall policies when the inspection mode is set to proxy-based.

Web application firewall profiles cannot be used NGFW policy-based mode. See [Profile-based NGFW vs policy-based NGFW on page 850](#) for more information.

The following topic provides information about WAF profiles:

- [Protecting a server running web applications on page 1383](#)

Protecting a server running web applications

You can use a web application firewall profile to protect a server that is running a web application, such as webmail.

Web application firewall profiles are created with a variety of options called signatures and constraints. Once these options are enabled, the action can be set to allow, monitor, or block. The severity can be set to high, medium, or low.

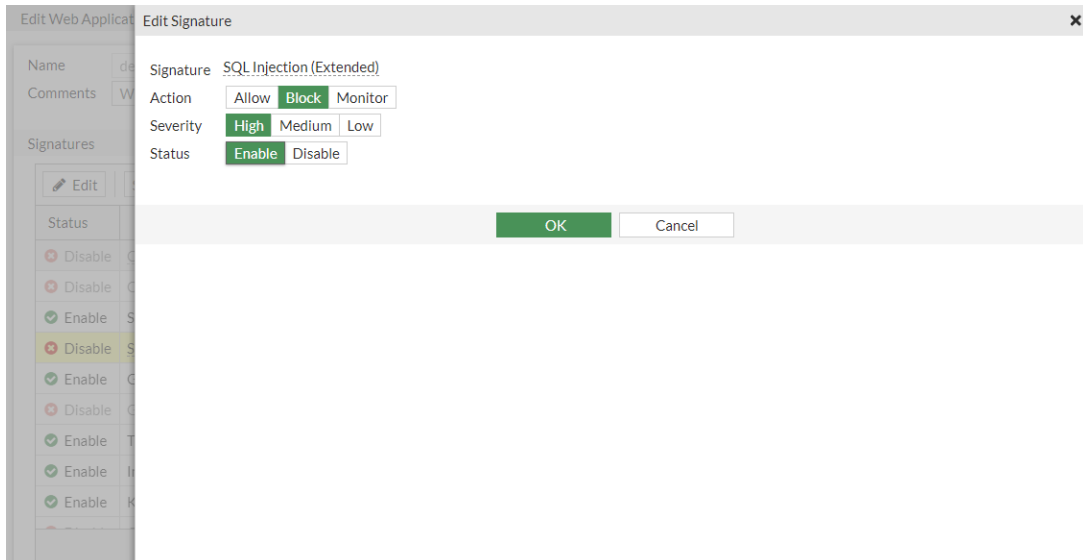

In the following example, the default profile will be targeted to block SQL injection attempts and generic attacks.

The web application firewall feature is only available when the policy inspection mode is proxy-based.

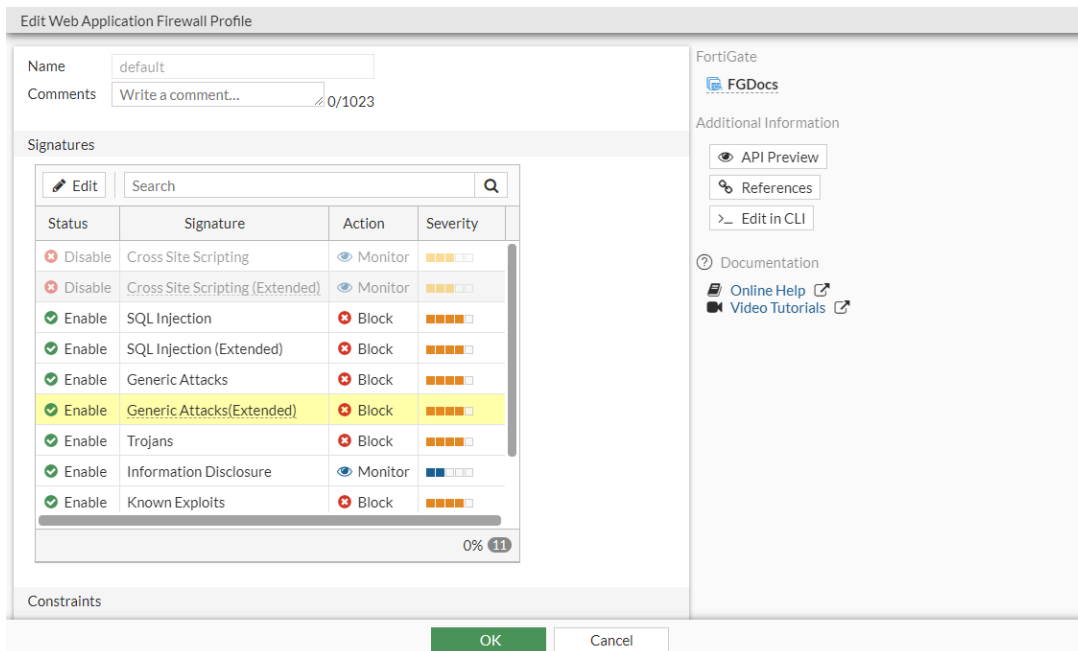

To protect a server running web applications:

1. Enable the web application firewall:
 - a. Go to *System > Feature Visibility*.
 - b. Under *Security Features*, enable *Web Application Firewall*.
 - c. Click *Apply*.
2. Edit the default web application firewall profile (*Trojans* and *Known Exploits* are blocked by default):
 - a. Go to *Security Profiles > Web Application Firewall* and edit the *default* profile signature.
 - b. Select *SQL Injection (Extended)* and edit it so that it is enabled, the *Action* is set to *Block*, and the *Severity* is set to *High*.
 - c. Click *OK*.

-
-
-
- d. Enable *Generic Attacks (Extended)* and edit it so that it is enabled, the *Action* is set to *Block*, and the *Severity* is set to *High*.

e. Click OK.

f. Click OK.

3. Apply the profile to a security policy:

- Go to *Policy & Objects > Firewall Policy* and edit the policy that allows access to the web server.
- For *Firewall / Network Options*, select the appropriate *Protocol Option*.
- For *Security Profiles*, enable *Web Application Firewall* and set it to use the *default* profile.
- Set the *SSL Inspection* to use the *deep-inspection* profile.
- Configure the other settings as needed.
- Click *OK*.

4. Verify that the web application firewall blocks traffic:

- Use the following URL to simulate an attack on your web server and substitute the IP address of your server:
`http://<server IP>/index.php?username=1'%20or%20'1'%20=%20'1&password=1'%20or%20'1'%20=%20'1`
 An error message appears, stating that the web application firewall has blocked the traffic:

Using FortiWeb for protection

Another way of protecting web applications is to forward HTTP traffic to a FortiWeb for scanning and inspection. A typical use case is to use a one-arm topology with FortiWeb running in reverse proxy mode to scan traffic before accessing the webpage on the web servers. See [Planning the network topology](#) in the FortiWeb Administration Guide for more information.

SSL & SSH Inspection

Secure Sockets Layer (SSL) content scanning and inspection allows you to apply antivirus scanning, web filtering, and email filtering to encrypted traffic. You can apply SSL inspection profiles to firewall policies.

FortiOS includes four preloaded SSL/SSH inspection profiles, three of which are read-only and can be cloned:

- *certificate-inspection*
- *deep-inspection*
- *no-inspection*

The *custom-deep-inspection* profile can be edited, or you can create your own SSL/SSH inspection profiles.

Deep inspection (also known as SSL/SSH inspection) is typically applied to outbound policies where destinations are unknown. Depending on your policy requirements, you can configure the following:

- Which CA certificate will be used to decrypt the SSL encrypted traffic
- Which SSL protocols will be inspected
- Which ports will be associated with which SSL protocols for inspection
- Whether or not to allow invalid SSL certificates
- Whether or not SSH traffic will be inspected
- Which addresses or web category allowlists can bypass SSL inspection

The following topics provide information about SSL & SSH Inspection:

- [Configuring an SSL/SSH inspection profile on page 1386](#)
- [Certificate inspection on page 1389](#)
- [Deep inspection on page 1390](#)
- [Protecting an SSL server on page 1393](#)
- [Handling SSL offloaded traffic from an external decryption device on page 1394](#)
- [SSH traffic file scanning on page 1396](#)
- [Redirect to WAD after handshake completion on page 1398](#)
- [HTTP/2 support in proxy mode SSL inspection on page 1399](#)
- [Define multiple certificates in an SSL profile in replace mode on page 1400](#)
- [Disabling the FortiGuard IP address rating on page 1402](#)

Configuring an SSL/SSH inspection profile

The *custom-deep-inspection* profile can be edited or new SSL/SSH inspection profiles can be configured to be used in firewall policies.

To configure an SSL/SSH inspection profile in the GUI:

1. Go to *Security Profiles > SSL/SSH Inspection* and click *Create New*.
2. Configure the following settings:

<i>Name</i>	Enter a unique name for the profile.
<i>Comments</i>	Enter a comment (optional).

SSL Inspection Options	
<i>Enable SSL Inspection of</i>	<p>Enable SSL inspection of:</p> <ul style="list-style-type: none"> • <i>Multiple Clients Connecting to Multiple Servers</i>: Use this option for generic policies where the destination is unknown. This is normally used when inspecting outbound internet traffic. Other <i>SSL Inspection Options</i> become available to configure if this option is selected. • <i>Protecting SSL Server</i>: Use this option when setting up a profile customized for a specific SSL server with a specific certificate. Define the certificate using the <i>Server certificate</i> field. See Protecting an SSL server on page 1393 for more information.
<i>Inspection method</i>	<p>Define the inspection method:</p> <ul style="list-style-type: none"> • <i>SSL Certificate Inspection</i>: Only inspects the certificate, by way of the headers up to the SSL/TLS layer, and not the contents of the traffic. See Certificate inspection on page 1389. • <i>Full SSL Inspection</i>: Inspects the SSL/TLS encrypted traffic payload. See Deep inspection on page 1390.
<i>CA certificate</i>	Use the dropdown menu to select one of the installed certificates for the inspection of the packets. Click <i>Download</i> to save the certificate.
<i>Blocked certificates</i>	Block or allow potentially malicious certificates. Select <i>View Blocked Certificates</i> for a detailed list of blocked certificates, including the listing reason and date.
<i>Untrusted SSL certificates</i>	<p>Configure the action to take when a server certificate is not issued by a trusted CA.</p> <ul style="list-style-type: none"> • <i>Allow</i>: Allow the untrusted server certificate. This is the default value. • <i>Block</i>: Block the session. • <i>Ignore</i>: This option is for <i>Full SSL inspection</i> only. It re-signs the server certificate as trusted. When configured in the GUI for certificate inspection it has no effect and the setting is not saved. <p>Click <i>View Trusted CAs List</i> to see a list of the factory bundled and user imported CAs that are trusted by the FortiGate.</p>
<i>Server certificate SNI check</i>	<p>Check the SNI in the hello message with the CN or SAN field in the returned server certificate:</p> <ul style="list-style-type: none"> • <i>Enable</i>: If it is mismatched, use the CN in the server certificate for URL filtering. • <i>Strict</i>: If it is mismatched, close the connection. • <i>Disable</i>: Server certificate SNI check is disabled.
<i>Enforce SSL cipher compliance</i>	Enable/disable SSL cipher compliance. This option is for <i>Full SSL inspection</i> only.
<i>Enforce SSL negotiation compliance</i>	Enable/disable SSL negotiation compliance. This option is for <i>Full SSL inspection</i> only.

<i>RPC over HTTPS</i>	Enable/disable inspection of Remote Procedure Calls (RPC) over HTTPS traffic. This option is for <i>Full SSL inspection</i> only.
<i>Protocol Port Mapping</i>	Inspect all ports with the IPS engine by enabling <i>Inspect all ports</i> . If <i>Inspect all ports</i> is disabled, specify the port through which traffic will be inspected in the field next to the listed protocols. Traffic of that protocol going through any other port will not be inspected.
<i>Exempt from SSL Inspection</i>	<p>These options are for <i>Full SSL inspection</i> only. Use the menus in this section to specify any reputable websites, FortiGuard Web Categories, or addresses that will be exempt from SSL inspection:</p> <ul style="list-style-type: none"> • <i>Reputable Websites</i>: Enable this option to exempt any websites identified by FortiGuard as reputable. • <i>Web Categories</i>: The categories of <i>Finance and Banking</i>, <i>Health and Wellness</i>, and <i>Personal Privacy</i> have been added by default. These categories are the most likely to have applications that will require a specific certificate. • <i>Addresses</i>: These can be any of the address objects that have an interface of <i>any</i>. • <i>Log SSL exemptions</i>: Enable this option to log all SSL exemptions. <p>See Exempt web sites from deep inspection on page 1392 for more information.</p>
<i>SSH Inspection Options</i>	
<i>SSH deep scan</i>	Enable/disable SSH protocol packet deep scanning capabilities. <i>SSH port</i> will become available if <i>SSH deep scan</i> is enabled.
<i>SSH port</i>	<p>Define what ports will search for SSH protocol packets:</p> <ul style="list-style-type: none"> • <i>Any</i>: Select this option to search all traffic regardless of service or TCP/IP port for packets that conform to the SSH protocol. • <i>Specify</i>: Select this option and enter the port number to restrict the search for SSH protocol packets to the TCP/IP port number specified. This is not as comprehensive but it is easier on the performance of the firewall.
<i>Common Options</i>	
<i>Invalid SSL certificates</i>	<p>Allow or block the passing of traffic in invalid certificates. Additional common options that provide more granularity with actions for different types of invalid SSL certificates will become available if <i>Invalid SSL certificates</i> is set to <i>Custom</i>:</p> <ul style="list-style-type: none"> • <i>Expired certificates</i>: Action to take when the server certificate is expired. The default action is block. • <i>Revoked certificates</i>: Action to take when the server certificate is revoked. The default action is block. • <i>Validation timed-out certificates</i>: Action to take when the server certificate validation times out. For certificate inspection, the default action is allow. For deep inspection, the default action is Keep Untrusted & Allow. • <i>Validation failed certificates</i>: Action to take when the server certificate validation fails. The default action is block.

For deep inspection, the above options have the following actions:

- *Keep Untrusted & Allow*: Allow the server certificate and keep it untrusted.
- *Block*: Block the certificate.
- *Trust & Allow*: Allow the server certificate and re-sign it as trusted.

Log SSL anomalies

Enable this feature to record and log traffic sessions containing invalid certificates.

By default, SSL anomalies logging is enabled. Logs are generated in the UTM log type under the SSL subtype when invalid certificates are detected.

3. Click *OK*.

Certificate inspection

FortiGate supports certificate inspection. The default configuration has a built-in *certificate-inspection* profile which you can use directly. When you use certificate inspection, the FortiGate only inspects the headers up to the SSL/TLS layer.

If you do not want to deep scan for privacy reasons but you want to control web site access, you can use *certificate-inspection*.

When a firewall policy is in flow-based inspection mode, *SSL Certificate Inspection* does not validate the certificate. *Untrusted SSL certificates* and *Server Certificate SNI* checks are not performed. If these features are needed, use proxy-based inspection mode.

Inspect non-standard HTTPS ports

The built-in *certificate-inspection* profile is read-only and only listens on port 443. If you want to make changes, you must create a new certificate inspection profile.

If you know the non-standard port that the web server uses, such as port 8443, you can add this port to the *HTTPS* field.

To add a port to the inspection profile in the GUI:

1. Go to *Security Profiles > SSL/SSH Inspection*.
2. Create a new profile, or clone the default profile.
3. If you do not know what port is used in the HTTPS web server, under *Protocol Port Mapping* enable *Inspect All Ports*. If you know the port, such as port 8443, then set *HTTPS* to *443,8443*.

4. Configure the remaining setting as needed.
5. Click **OK**.

Common options

Invalid SSL certificates can be blocked, allowed, or a different actions can be configured for the different invalid certificates types. See [Certificate inspection on page 1389](#).

When a firewall policy is in flow-based inspection mode, *SSL Certificate Inspection* does not validate the certificate. *Expired certificates* and *Revoked certificates* checks are not performed, and the *Validation timed-out certificates* and *Validation failed certificates* actions do not apply. If these features are needed, use proxy-based inspection mode.

Deep inspection

You can configure address and web category allowlists to bypass SSL deep inspection.

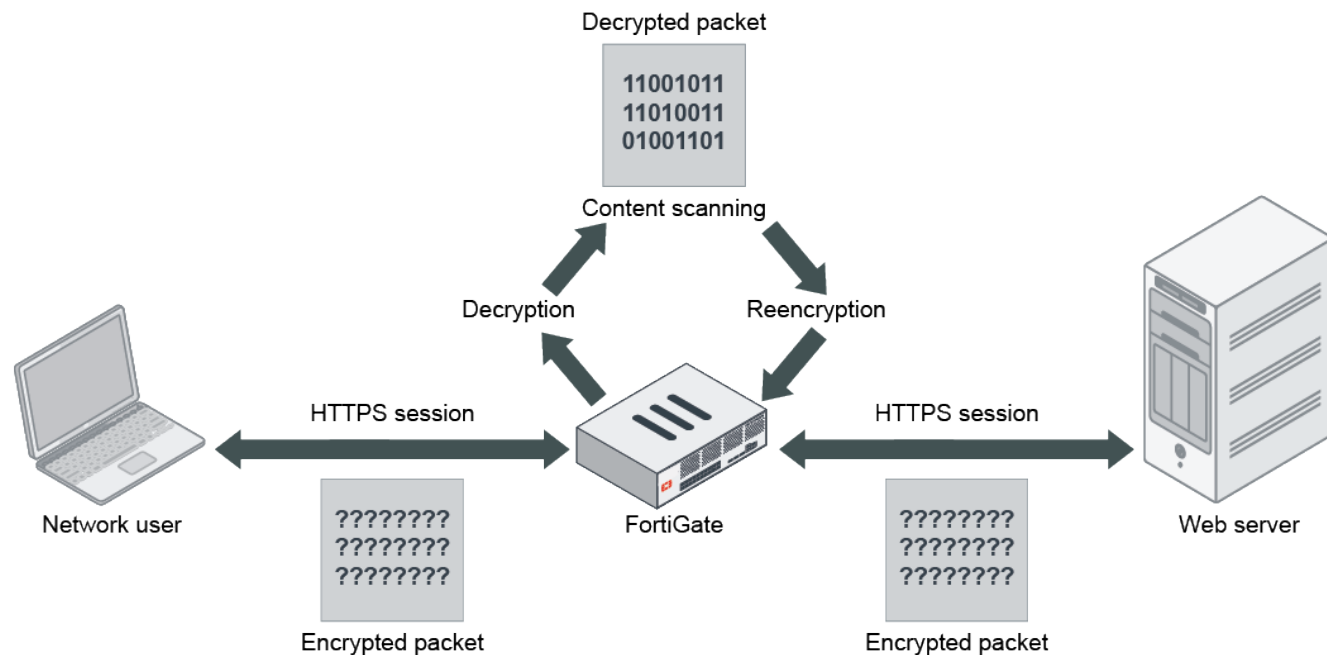

Reasons for using deep inspection

While Hypertext Transfer Protocol Secure (HTTPS) offers protection on the Internet by applying Secure Sockets Layer (SSL) encryption to web traffic, encrypted traffic can be used to get around your network's normal defenses.

For example, you might download a file containing a virus during an e-commerce session, or you might receive a phishing email containing a seemingly harmless download that, when launched, creates an encrypted session to a command and control (C&C) server and downloads malware onto your computer. Because the sessions in these attacks are encrypted, they might get past your network's security measures.

When you use deep inspection, the FortiGate impersonates the recipient of the originating SSL session, then decrypts and inspects the content to find threats and block them. It then re-encrypts the content and sends it to the real recipient.

Deep inspection not only protects you from attacks that use HTTPS, it also protects you from other commonly-used SSL-encrypted protocols such as SMTPS, POP3S, IMAPS, and FTPS.

Protocol port mapping

To optimize the FortiGate’s resources, the mapping and inspection of the following protocols can be enabled or disabled:

- HTTPS
- SMTPS
- POP3S
- IMAPS
- FTPS
- DNS over TLS

Each protocol has a default TCP port. The ports can be modified to inspect any port with flowing traffic. The packet headers indicate which protocol generated the packet.

Protocol port mapping only works with proxy-based inspection. Flow-based inspection inspects all ports regardless of the protocol port mapping configuration.

Browser messages when using deep inspection

When the FortiGate re-encrypts the content, it uses a stored certificate, such as *Fortinet_CA_SSL*, *Fortinet_CA_Untrusted*, or your own CA certificate that you uploaded.

Because there is no *Fortinet_CA_SSL* in the browser trusted CA list, the browser displays an untrusted certificate warning when it receives a FortiGate re-signed server certificate. To stop the warning messages, trust the FortiGate-trusted CA *Fortinet_CA_SSL* and import it into your browser.

If you still get messages about untrusted certificates after importing *Fortinet_CA_SSL* into your browser, it is due to *Fortinet_CA_Untrusted*. Never import the *Fortinet_CA_Untrusted* certificate into your browser.

To import *Fortinet_CA_SSL* into your browser:

1. On the FortiGate, go to *Security Profiles > SSL/SSH Inspection* and edit the *deep-inspection* profile.
The default *CA Certificate* is *Fortinet_CA_SSL*.
2. Click *Download* and save the certificate to the management computer.
3. On the client PC, use the *Certificate Import Wizard* to install the certificate into the *Trusted Root Certificate Authorities* store.
If a security warning appears, select *Yes* to install the certificate.

Exempt web sites from deep inspection

If you do not want to apply deep inspection for privacy or other reasons, you can exempt the session by address, category, or allowlist.

If you know the address of the server you want to exempt, you can exempt that address. You can exempt specific address type including IP address, IP address range, IP subnet, FQDN, wildcard-FQDN, and geography.

If you want to exempt all bank web sites, an easy way is to exempt the *Finance and Banking* category, which includes all finance and bank web sites identified in FortiGuard. For information about creating and using custom local and remote categories, see [Web rating override on page 1414](#) and [Threat feeds on page 2673](#).

If you want to exempt commonly trusted web sites, you can bypass the SSL allowlist in the SSL/SSH profile by enabling *Reputable websites*. The allowlist includes common web sites trusted by FortiGuard.

SSL version support

There are two ways to limit which SSL versions deep inspection is applied to.

- In the global attributes:

```
config system global
    set strong-crypto enable
end
```

- In the protocol configuration of a deep inspection profile:

```
config firewall ssl-ssh-profile
    edit <name>
        config {ssl | https | ftps}
            set min-allowed-ssl-version {ssl-3.0 | tls-1.0 | tls-1.1 | tls-1.2 | tls-
1.3}
        end
    next
end
```

Enabling `strong-crypto` in the global attributes sets the `min-allowed-ssl-version` to `tls-1.1` by default.

When a session is attempted using an SSL version below the minimum allowed version, the session can be blocked (default) or allowed.

To configure the action based on the SSL version used being unsupported:

```
config firewall ssl-ssh-profile
    edit <name>
        config {ssl | https | ftps | imaps | pop3s | smtps | dot}
            set unsupported-ssl-version {allow | block}
        end
    next
end
```

Flow-based inspection does not support SSL version control.

Protecting an SSL server

You typically use the FortiGate *Protecting SSL Server* profile as an inbound policy for clients on the internet that access the server through the internal side of the FortiGate.

Protecting SSL Server uses a server certificate to protect a single server.

You can use *Protecting SSL Server* if you do not want a client on the internet to directly access your internal server, and you want the FortiGate to simulate your real server.

To upload a server certificate into FortiGate and use that certificate in the SSL/SSH inspection profile:

1. Go to *System > Certificates*.
2. Select *Import > Local Certificate* and upload the certificate.
3. Go to *Security Profiles > SSL/SSH Inspection* and edit or create a new profile.
4. For *Enable SSL Inspection of*, select *Protecting SSL Server*.

5. For *Server Certificate*, click the + and select the local certificate you imported.

The screenshot shows the 'New SSL/SSH Inspection Profile' configuration window. The 'Name' field is 'Protecting server'. The 'Comments' field is 'Write a comment...' with a character count of 0/255. Under 'SSL Inspection Options', 'Enable SSL inspection of' is set to 'Multiple Clients Connecting to Multiple Servers'. The 'Server certificate' field has a dropdown menu showing 'Protecting SSL Server' and 'test'. A 'Select Entries' dialog box is open, showing a list of certificates with 'test' highlighted. The 'test' certificate is also visible in the 'Server certificate' dropdown. The 'Select Entries' dialog box has a search field, a '+ Create' button, and a 'Close' button. The main window has 'OK' and 'Cancel' buttons at the bottom.

6. Click **OK**.

When you apply the *Protecting SSL Server* profile in a policy, the FortiGate will send the server certificate to the client as your server does.

Handling SSL offloaded traffic from an external decryption device

In scenarios where the FortiGate is sandwiched between load-balancers and SSL processing is offloaded on the external load-balancers, the FortiGate can perform scanning on the unencrypted traffic by specifying the `ssl-offloaded` option in `firewall profile-protocol-options`. This option is supported in proxy and flow mode (previous versions only supported proxy mode).

If the FortiGate receives an AUTH TLS, PBSZ, or PROT command before receiving plain text traffic from a decrypted device, by default, it will expect encrypted traffic, determine that the traffic belongs to an abnormal protocol, and bypass the traffic.

When the `ssl-offloaded` command is enabled, the AUTH TLS command is ignored, and the traffic is treated as plain text rather than encrypted data. SSL decryption and encryption are performed by the external device.

Sample topology

In this example, the FortiGate is between two FortiADCs and in SSL offload sandwich mode. The FortiGate receives plain text from ADC1 and forwards plain text to ADC2. There is no encrypted traffic passing through the FortiGate.

The client sends HTTPS traffic to ADC1, which then decrypts the traffic and sends HTTP to the FortiGate. The FortiGate forwards HTTP to ADC2, and the ADC2 re-encrypts the traffic to HTTPS.

To configure SSL offloading:

```
config firewall profile-protocol-options
  edit "default-clone"
    config http
      set ports 80
      unset options
      unset post-lang
      set ssl-offloaded yes
    end
    config ftp
      set ports 21
      set options splice
      set ssl-offloaded yes
    end
    config imap
      set ports 143
      set options fragmail
      set ssl-offloaded yes
    end
    config pop3
      set ports 110
      set options fragmail
      set ssl-offloaded yes
    end
    config smtp
      set ports 25
      set options fragmail splice
      set ssl-offloaded yes
    end
  next
end
```

Verifying the packet captures

The ADC1 incoming port capture shows that ADC1 receives HTTPS traffic:

No.	Time	Source	Destination	Protocol	Length	Info
20	8.538335	10.1.100.66	172.16.200.99	TCP	74	49818 → 443 [SYN] Seq=0 Win=64240 Len=0 MSS=1460 SACK_PERM=1 TSval=2672317962 TSecr=0 WS=128
21	8.538408	172.16.200.99	10.1.100.66	TCP	74	443 → 49818 [SYN, ACK] Seq=0 Ack=1 Win=28960 Len=0 MSS=1460 SACK_PERM=1 TSval=880725085 TSecr=2672317962 WS=512
22	8.538538	10.1.100.66	172.16.200.99	TCP	66	49818 → 443 [ACK] Seq=1 Ack=1 Win=64256 Len=0 TSval=2672317962 TSecr=880725085
23	8.544564	10.1.100.66	172.16.200.99	TLSv1.2	583	Client Hello
24	8.546329	172.16.200.99	10.1.100.66	TLSv1.2	1740	Server Hello, Certificate, Server Key Exchange, Server Hello Done
25	8.546279	10.1.100.66	172.16.200.99	TCP	66	49818 → 443 [ACK] Seq=518 Ack=1675 Win=63488 Len=0 TSval=2672317970 TSecr=880725093
26	8.547757	10.1.100.66	172.16.200.99	TLSv1.2	159	Client Key Exchange, Change Cipher Spec, Encrypted Handshake Message
27	8.547968	172.16.200.99	10.1.100.66	TLSv1.2	117	Change Cipher Spec, Encrypted Handshake Message
28	8.549545	10.1.100.66	172.16.200.99	TLSv1.2	172	Application Data
29	8.557688	172.16.200.99	10.1.100.66	TLSv1.2	418	Application Data
30	8.559656	10.1.100.66	172.16.200.99	TLSv1.2	97	Encrypted Alert
31	8.559738	172.16.200.99	10.1.100.66	TLSv1.2	97	Encrypted Alert

The ADC1 outgoing port capture shows that ADC1 decrypts traffic and forwards HTTP traffic to the FortiGate:

No.	Time	Source	Destination	Protocol	Length	Info
9	9.499689	10.1.100.66	172.16.200.99	TCP	74	61516 → 80 [SYN] Seq=0 Win=29200 Len=0 MSS=1460 SACK_PERM=1 TSval=361768736 TSecr=0 WS=512
10	9.500095	172.16.200.99	10.1.100.66	TCP	74	80 → 61516 [SYN, ACK] Seq=0 Ack=1 Win=28960 Len=0 MSS=1460 SACK_PERM=1 TSval=2517238757 TSecr=361768736 WS=512
11	9.500048	10.1.100.66	172.16.200.99	HTTP	143	GET / HTTP/1.1

SSH traffic file scanning

FortiGates can buffer, scan, log, or block files sent over SSH traffic (SCP and SFTP) depending on the file size, type, or contents (such as viruses or sensitive content).

This feature is supported in proxy-based inspection mode. It is currently not supported in flow-based inspection mode.

You can configure the following SSH traffic settings in the CLI:

- Protocol options
- DLP sensor
- Antivirus (profile and quarantine options)

To configure SSH protocol options:

```
config firewall profile-protocol-options
  edit <name>
    config ssh
      set options {oversize clientcomfort servercomfort}
      set comfort-interval <1 - 900>
      set comfort-amount <1 - 65535>
      set oversize-limit <1 - 798>
      set uncompressed-oversize-limit <0 - 798>
      set uncompressed-nest-limit <2 - 100>
      set scan-bzip2 {enable | disable}
    end
  next
end
```

To configure SCP block and log options:

```
config ssh-filter profile
  edit <name>
    set block scp
    set log scp
  next
end
```

To configure the DLP sensor:

```
config dlp sensor
  edit <name>
    set full-archive-proto ssh
    set summary-proto ssh
    config filter
      edit 1
        set proto ssh
      next
    end
  next
end
```

To configure the antivirus profile options:

```
config antivirus profile
  edit <name>
    config ssh
      set av-scan {disable | block | monitor}
      set outbreak-prevention {disable | block | monitor}
      set external-blocklist {disable | block | monitor}
      set fortindr {disable | block | monitor}
      set quarantine {enable | disable}
    end
  next
end
```

```
        set archive-block {encrypted corrupted partiallycorrupted multipart nested
mailbomb timeout unhandled}
        set archive-log {encrypted corrupted partiallycorrupted multipart nested
mailbomb timeout unhandled}
        set emulator {enable | disable}
    end
next
end
```

To configure the antivirus quarantine options:

```
config antivirus quarantine
    set drop-infected ssh
    set store-infected ssh
    set drop-blocked ssh
    set store-blocked ssh
    set drop-machine-learning ssh
    set store-machine-learning ssh
end
```

To configure SCP block and log options:

```
config ssh-filter profile
    edit <name>
        set block scp
        set log scp
    next
end
```

To apply the ssh-filter to a policy:

```
config firewall policy
    edit <id>
        set utm-status enable
        set inspection-mode proxy
        set ssh-filter-profile <ssh-filter profile>
    next
end
```

Redirect to WAD after handshake completion

In a proxy-based policy, the TCP connection is proxied by the FortiGate. A TCP three-way handshake can be established with the client even though the server did not complete the handshake.

This option uses IPS to handle the initial TCP three-way handshake. It rebuilds the sockets and redirects the session back to proxy only when the handshake with the server is established.

To enable proxy after a TCP handshake in an SSL/SSH profile:

```
config firewall ssl-ssh-profile
    edit "test"
        config https
            set ports 443
            set status certificate-inspection
        end
    end
```

```

        set proxy-after-tcp-handshake enable
    end
next
end

```

To enable proxy after a TCP handshake in protocol options:

```

config firewall profile-protocol-options
  edit "test"
    config http
      set ports 80
      set proxy-after-tcp-handshake enable
      unset options
      unset post-lang
    end
  next
end

```

HTTP/2 support in proxy mode SSL inspection

Security profiles in proxy mode can perform SSL inspection on HTTP/2 traffic that is secured by TLS 1.2 or 1.3 using the Application-Layer Protocol Negotiation (ALPN) extension.

To set the ALPN support:

```

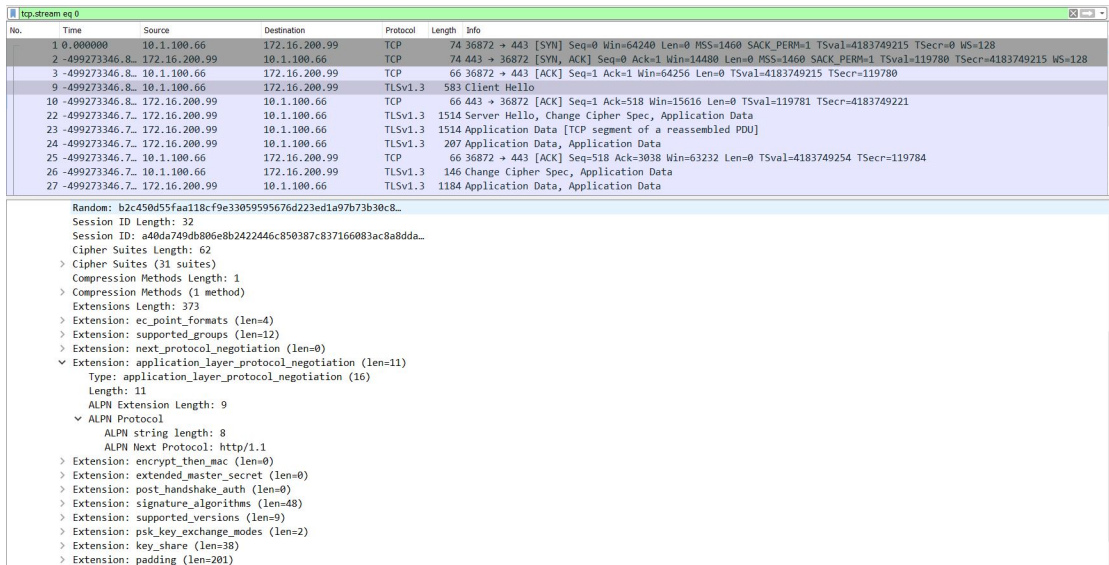

config firewall ssl-ssh-profile
  edit <profile>
    set supported-alpn {all | http1-1 | http2 | none}
  next
end

```

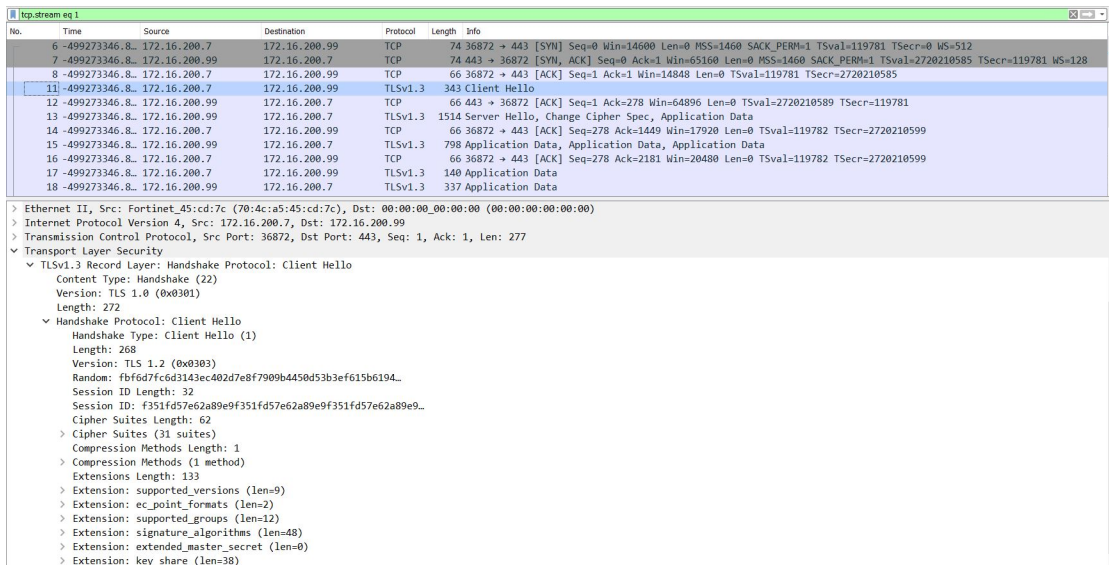

all	The FortiGate forwards ALPN extensions that use either HTTP/2 or HTTP/1.1. This is the default value.
http1-1	The FortiGate only forwards ALPN extensions that use HTTP/1.1. If the ALPN extension uses HTTP/2, then the FortiGate strips the ALPN header from the Client Hello.
http2	The FortiGate only forwards ALPN extensions that use HTTP/2. If the ALPN extension uses HTTP/1.1, then the FortiGate strips the ALPN header from the Client Hello.
none	The FortiGate always strips the ALPN header from the Client Hello when forwarding.

For example, if `supported-alpn` is set to `http2`, but the extension uses HTTP/1.1, the ALPN header is stripped from the Client Hello:

• Incoming packet capture:

• Outgoing packet capture:

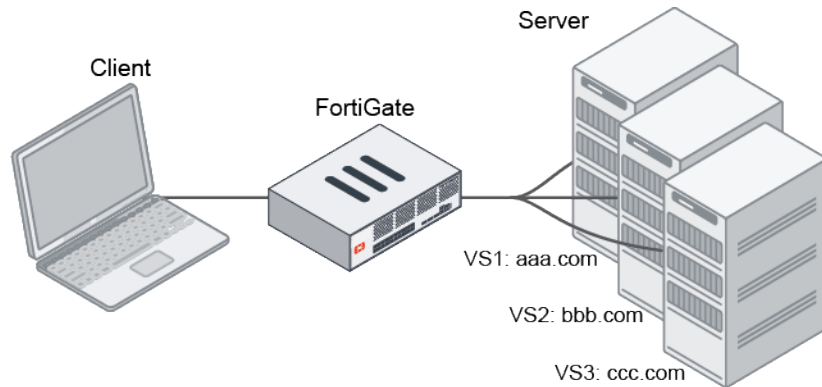

Define multiple certificates in an SSL profile in replace mode

Multiple certificates can be defined in an SSL inspection profile in replace mode (*Protecting SSL Server*). This allows multiple sites to be deployed on the same protected server IP address, and inspection based on matching the SNI in the certificate.

When the FortiGate receives the client and server hello messages, it will compare the server name identification (SNI) and the common name (CN) with the certificate list in the SSL profile, and use the matched certificate as a replacement. If there is no matched server certificate in the list, then the first server certificate in the list is used as a replacement.

Example

To configure an SSL profile in replace mode with multiple certificates:

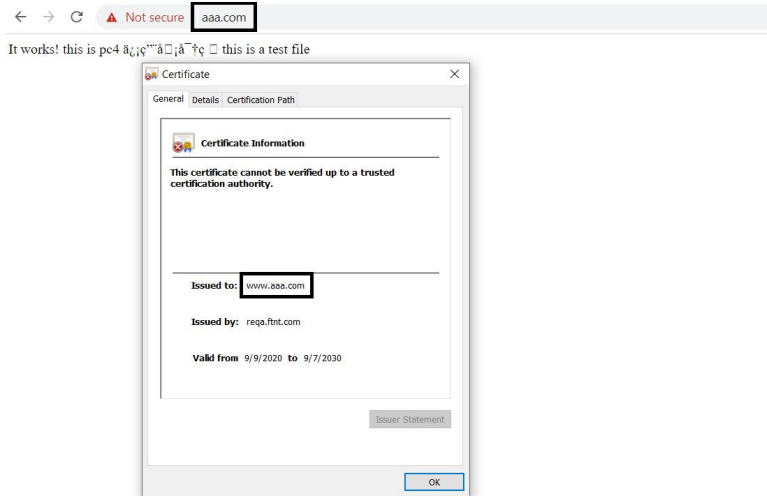

```
config firewall ssl-ssh-profile
  edit "multi-cert"
    set server-cert-mode replace
    set server-cert "bbb" "aaa"
  next
end
```

To configure a policy that uses the SSL profile:

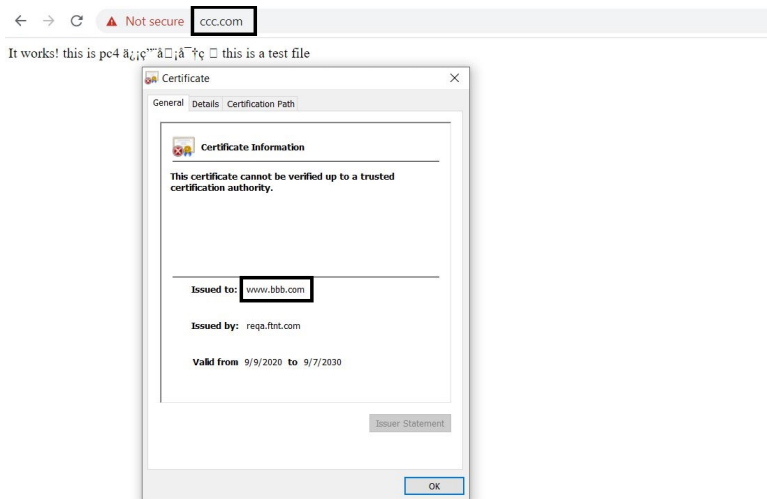

```
config firewall policy
  edit 1
    set name "multi-cert"
    set srcintf "port6"
    set dstintf "port11"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "multi-cert"
    set av-profile "default"
    set webfilter-profile "default"
    set logtraffic all
    set nat enable
  next
end
```

Results

If the SNI matches the CN in the certificate list in the SSL profile, then the FortiGate uses the matched server certificate. In this example, when the client accesses *www.aaa.com*, the FortiGate will use the *aaa* certificate as a replacement.

If the SNI does not match the CN in the certificate list in the SSL profile, then the FortiGate uses the first server certificate in the list. In this example, when the client accesses *www.ccc.com*, because there is no certificate for *www.ccc.com*, the FortiGate will use the *bbb* certificate as a replacement.

Disabling the FortiGuard IP address rating

The FortiGuard IP address rating for SSL exemptions and proxy addresses can be disabled using the `ssl-exemption-ip-rating` and `address-ip-rating` options.

To disable using the FortiGuard IP address rating for SSL exemptions:

```
config firewall ssl-ssh-profile
  edit <name>
    set ssl-exemption-ip-rating {enable | disable}
  next
end
```

To disable using the FortiGuard IP address rating for proxy addresses:

```
config firewall profile-protocol-options
  edit <name>
    config http
      set address-ip-rating {enable | disable}
    end
  next
end
```

The `ssl-exemption-ip-rating` and `address-ip-rating` options are enabled by default, so when both a website domain and its IP address return different categories after being rated by FortiGuard, the IP address category takes precedence when evaluating SSL exemptions associated with the SSL inspection profile and proxy addresses associated with the proxy protocol options profile. SSL exemptions and the `ssl-exemption-ip-rating` option work in both inspection modes (proxy and flow).

When the categories associated with the website domain and IP address are different, disabling the FortiGuard IP rating ensures that the FortiGuard domain category takes precedence when evaluating the preceding objects. For most websites, the domain category is valid when its IP address is unrated by FortiGuard. Since being unrated is considered as not having a category, the FortiGate uses the domain category as the website category.

A website might have an IP category that differs from its domain category. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. The rating weight is hard-coded in the FortiGate and depending on the relative category weights, the FortiGate may use the IP category instead of the website category. If the `ssl-exemption-ip-rating` option is disabled in the SSL inspection profile, then the FortiGate uses the domain category as the website category, which ensures SSL exemption operation as intended.

The `address-ip-rating` option in a proxy protocol options profile functions the same way as the `ssl-exemption-ip-rating` option. If the `address-ip-rating` option is disabled in a profile that is used in an explicit proxy policy that also uses a web filter profile, for HTTP or HTTPS traffic to a website that has different IP and domain categories and that matches the policy, the FortiGate will use the domain category when it evaluates categories for the web filter.

Custom signatures

You can create the following custom signatures and apply them to firewall policies:

- IPS signature
- Application signature
- Application group

The following topic provides information about custom signatures:

- [Configuring custom signatures on page 1404](#)
- [Blocking applications with custom signatures on page 1405](#)
- [Filters for application control groups on page 1408](#)
- [Application groups in traffic shaping policies on page 1410](#)

Configuring custom signatures

IPS signatures are the basis of signature-based intrusion prevention. Every attack can be reduced to a particular string of commands or a sequence of commands and variables. See [Intrusion prevention on page 1303](#) for more information.

An IPS signature identifies characteristics of a packet that are unique to an attack, such as the protocol type, an option/value pair within the payload, other special aspects of the payload, or specific application options. Custom IPS signatures can be created to block, monitor, or quarantine specific traffic that is not covered by the IPS definitions list. To view the IPS definitions list:

- Go to *Security Profiles > IPS Signatures*.
- Go to *Security Profiles > Intrusion Prevention*, edit an existing IPS sensor, and click *View IPS Signatures* in the right-hand pane.
- Go to *System > FortiGuard*, in the *License Information* table expand *Intrusion Prevention*, and in the *IPS Definitions* row click *Actions > View List*.

An application signature identifies characteristics of a packet that is unique to an application. Custom application signatures can be used in application control profiles to block traffic from specific applications that are not covered by the application control signatures list. To view the application control signatures list:

- Go to *Security Profiles > Application Signatures* and select the *Signature* view.
- Go to *Security Profiles > Application Control*, edit an existing application sensor, and click *View Application Signatures* in the right-hand pane.
- Go to *System > FortiGuard*, in the *License Information* table expand *Firmware & General Updates*, and in the *Application Control Signatures* row click *Actions > View List*.

Application groups can be created by selecting individual application, or by filtering by application category. The groups can then be used in firewall policies.

For information about the syntax for building IPS and application control signatures, see the [Custom IPS and Application Control Signature Syntax Guide](#)

To make the application signatures settings visible in the GUI:

1. Go to *System > Feature Visibility*
2. In the *Security Features* section, enable *Application Control*.
3. Click *Apply*.

To configure custom signatures:

1. Custom application and IPS signatures can be configured:
 - To configure custom application signatures, go to *Security Profiles > Application Signatures* and click *Create New > Custom Application Signature*. See [Blocking applications with custom signatures on page 1405](#) for an example.
 - To configure custom IPS signatures, go to *Security Profiles > IPS Signatures* and click *Create New*.

2. Configure the following settings:

<i>Name</i>	Enter a unique name for the signature.
<i>Comments</i>	Enter a comment (optional).
<i>Signature</i>	Enter the signature.

3. Click *OK*.

To configure application groups:

1. Go to *Security Profiles > Application Signatures* and click *Create New > Application Group*.
2. Configure the following settings:

<i>Group Name</i>	Enter a unique name for the signature group.
<i>Type</i>	Set the application group type, either application ID or application filter. See Filters for application control groups on page 1408 for information about the available filters.
<i>Members</i>	Select the applications or filter to include in the group.
<i>Comments</i>	Enter a comment (optional).

3. Click *OK*.

See [Application groups in traffic shaping policies on page 1410](#) for more information.

Blocking applications with custom signatures

Custom signatures can be used in application control profiles to block web traffic from specific applications, such as out of support operating systems.

In this example, a custom signature is created to detect PCs running Windows NT 6.1 operating systems, including Windows 7 and Windows Server 2008 R2. The signature is added to an application control profile and the action is set to block. The profile is then used in a firewall policy so that web traffic matching the signature is blocked. The logs generated by this example can be used to help identify other computers that need to be blocked.

To make the settings visible in the GUI:

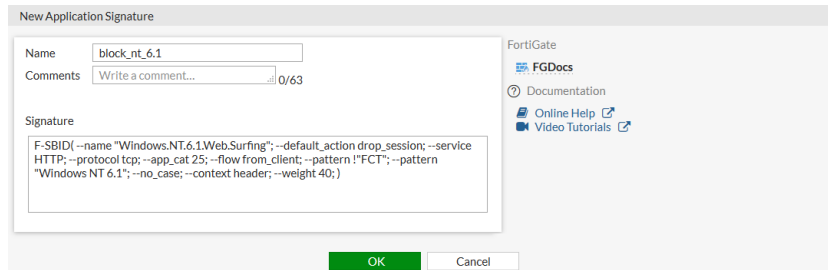

1. Go to *System > Feature Visibility*
2. In the *Security Features* section, enable *Application Control*.
3. Click *Apply*.

To create the custom application signature:

1. Go to *Security Profiles > Application Signatures* and click *Create New > Custom Application Signature*.
2. Enter a name for the custom signature, such as *block_nt_6.1*.
3. Enter the *Signature*. In this example:

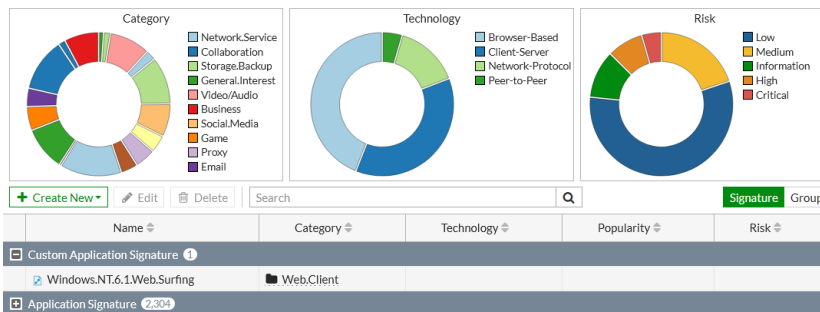

```
F-SBID( --attack_id 6483; --name "Windows.NT.6.1.Web.Surfing"; --default_action drop_session; --service HTTP; --protocol tcp; --app_cat 25; --flow from_client; --pattern !"FCT"; --pattern "Windows NT 6.1"; --no_case; --context header; --weight 40; )
```

This signature scans HTTP and HTTPS traffic that matches the pattern *Windows NT 6.1* in its header. For blocking older versions of Windows, such as Windows XP, you would use the pattern *Windows NT 5.1*. An attack ID is automatically generated when the signature is created.

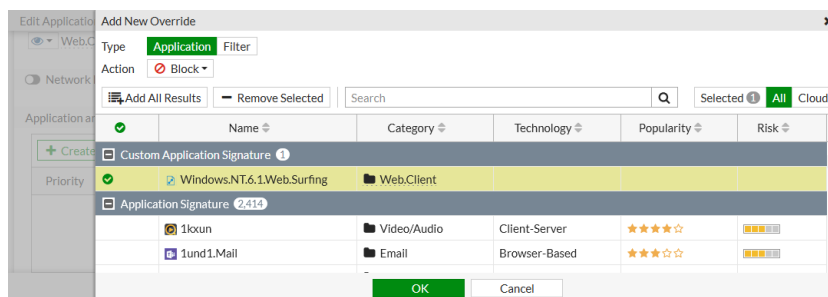

4. Click **OK**.

The signature is included in the *Custom Application Signature* section of the signature list.

To use the signature in an application control profile:

1. Go to *Security Profiles > Application Control*.
2. Create a new profile, or edit an existing one.
3. In the *Application and Filter Overrides* table, click *Create New*.
4. Set *Type* to *Application* and *Action* to *Block*.
5. Select the custom signature from the list, using the search feature if required, then click *Add Selected*.

6. Click **OK**.

The signature is added to the table.

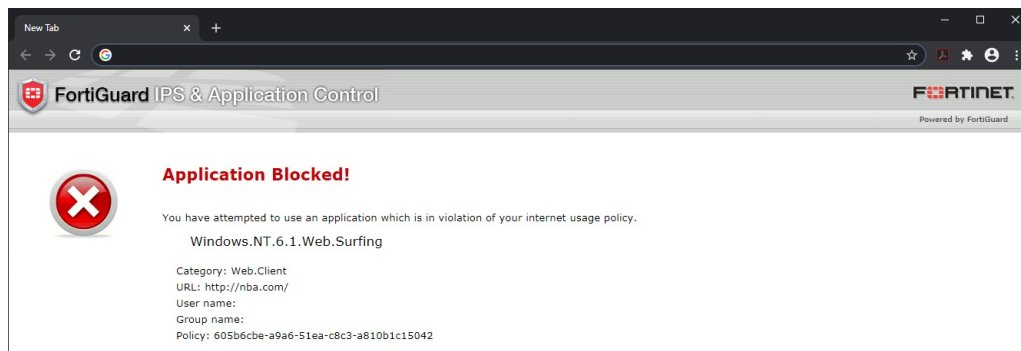

7. Click **OK**.

To add the application control profile to a firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Edit the policy that currently allows a connection from the internal network to the internet.
3. In the *Security Profiles* section, enable *Application Control* and select the profile.
If deep inspection is not enabled, then only HTTP traffic will be scanned. To scan HTTPS traffic, set SSL Inspection to a profile that includes deep inspection. See [SSL & SSH Inspection on page 1386](#) for more information.
4. Click *OK*.

Results

When a PC running one of the affected operating systems tries to connect to the internet using a web browser, a replacement message is shown. For information on customizing replacement messages, see [Replacement messages on page 2265](#).

Go to *Log & Report > Application Control* to view the web traffic that is logged for the PC that is blocked by the application signature.

Filters for application control groups

When defining application groups in NGFW policy or profile mode, the following group filters are available: protocols, risk, vendor, technology, behavior, popularity, and category.

```
config application group
  edit <name>
    set type filter
    set protocols <integer>
    set risk <integer>
    set vendor <id>
    set technology <id>
    set behavior <id>
    set popularity <integer>
    set category <id>
  next
end
```

protocols <integer>	Application protocol filter (0 - 47, or all).
risk <integer>	Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).
vendor <id>	Application vendor filter (0 - 25, or all).
technology <id>	Application technology filter: <ul style="list-style-type: none"> • all • 0 (network-protocol) • 1 (browser-based) • 2 (client-server) • 4 (peer-to-peer)
behavior <id>	Application behavior filter: <ul style="list-style-type: none"> • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
popularity <integer>	Application popularity filter (1 - 5, from least to most popular).
category <id>	Application category filter: <ul style="list-style-type: none"> • 2 (P2P) • 3 (VoIP) • 5 (video/audio) • 6 (proxy) • 7 (remote access) • 8 (game) • 12 (general interest) • 15 (network service) • 17 (update)

- 21 (email)
- 22 (storage backup)
- 23 (social media)
- 25 (web client)
- 26 (industrial)
- 28 (collaboration)
- 29 (business)
- 30 (cloud IT)
- 31 (mobile)
- 32 (unknown applications)

Sample configurations

In this example, a single filter (risk level 1) is configured in the application group in NGFW policy mode, so only signatures matching this filter will match the security policy.

To configure the application group:

```
config application group
  edit "risk_1"
    set type filter
    set risk 1
  next
end
```

To configure the security policy:

```
config firewall security-policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set status enable
    set schedule "always"
    set enforce-default-app-port disable
    set service "ALL"
    set app-group risk_1
    set logtraffic all
  next
end
```

In this example, the application group is configured so that only signatures matching both filters, category 5 (video/audio) and technology 1 (browser-based), will match the security policy. The application group can also be configured in a traffic shaping policy.

To configure the application group:

```
config application group
  edit "two"
```

```
        set type filter
        set category 5
        set technology 1
    next
end
```

To configure the security policy:

```
config firewall security-policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set status enable
        set schedule "always"
        set enforce-default-app-port disable
        set service "ALL"
        set app-group two
        set logtraffic all
    next
end
```

To configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 1
        set ip-version 4
        set service "ALL"
        set app-group two
        set dstintf port1
        set traffic-shaper "max-100"
        set traffic-shaper-reverse "max-100"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Application groups in traffic shaping policies

Application groups can be configured in traffic shaping policies. In this example, there are two traffic shaping policies:

- Policy 1 is for traffic related to cloud applications and has high priority.
- Policy 2 is for other traffic and has low priority.

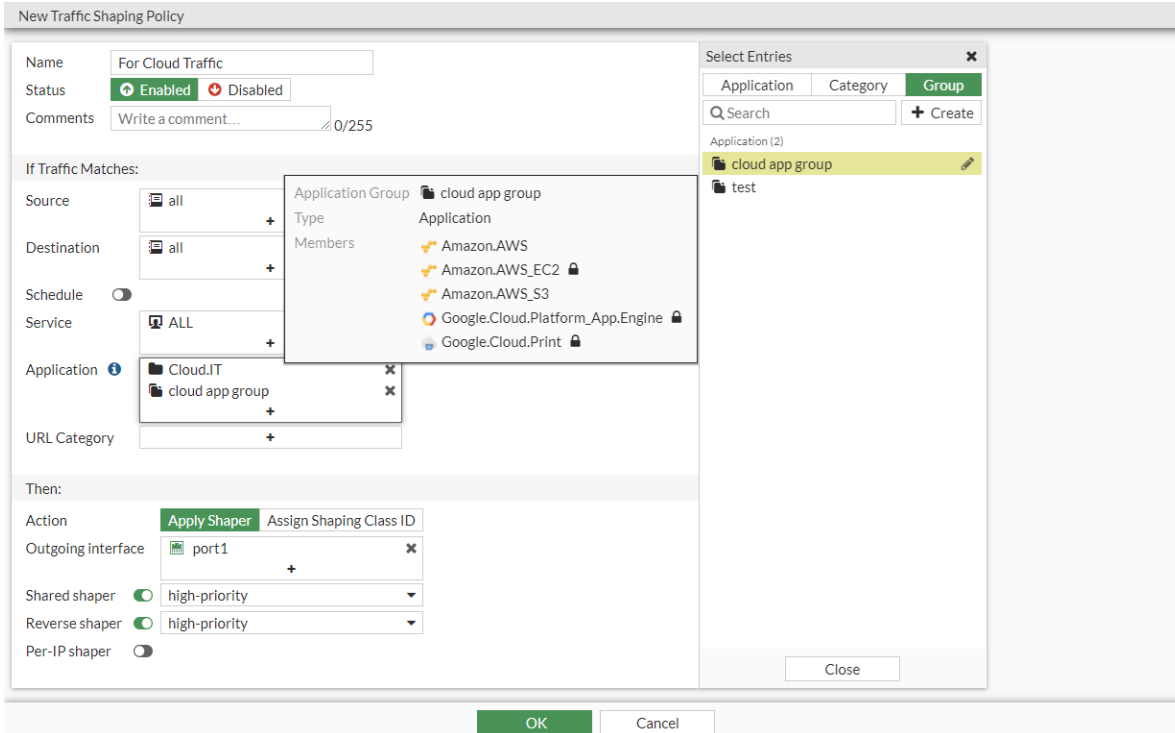

At least one firewall policy must have application control enabled for the applications to match any policy traffic.

To configure a traffic shaping policy to use an application group in the GUI:

1. Configure an application group for cloud applications:
 - a. Go to *Security Profiles > Application Signatures*.
 - b. Click *Create New > Application Group*. The *New Application Group* page opens.
 - c. Enter a name for the group, and for *Type*, select *Application*.
 - d. Click the **+** to add the group the members.

- e. Click **OK**.
2. Create the shaping policy for the high priority cloud application traffic:
 - a. Go to *Policy & Objects > Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
 - b. Enter the following:

Name	For Cloud Traffic
Source	All
Destination	All
Service	All
Application	Add the <i>Cloud.IT</i> category and the <i>cloud app group</i> application group.
Outgoing interface	port1
Shared shaper	high-priority
Reverse shaper	high-priority

c. Click **OK**.

3. Create the shaping policy for the low priority other traffic:

- a. Click *Create New* and enter the following:

Name	For Other Traffic
Source	All
Destination	All
Service	All
Outgoing interface	port1
Shared shaper	low-priority
Reverse shaper	low-priority

- b. Click *OK*.

To configure a traffic shaping policy to use an application group in the CLI:

1. Configure an application group for cloud applications:

```
config application group
  edit "cloud app group"
    set application 27210 36740 35944 43296 33048
  next
end
```

2. Create the shaping policies for the high priority cloud application traffic and low priority other traffic:

```
config firewall shaping-policy
  edit 1
    set name "For Cloud Traffic"
    set service "ALL"
    set app-category 30
```

```
        set app-group "cloud app group"
        set dstintf "port1"
        set traffic-shaper "high-priority"
        set traffic-shaper-reverse "high-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 2
        set name "For Other Traffic"
        set service "ALL"
        set dstintf "port1"
        set traffic-shaper "low-priority"
        set traffic-shaper-reverse "low-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Overrides

Web filter configuration can be separated into profile configuration and profile overrides.

You can also override web filter behavior based on the FortiGuard website categorization:

- Use alternate categories (web rating overrides): this method manually assigns a specific website to a different Fortinet category or a locally-created category.
- Use alternate profiles: configured users or IP addresses can use an alternative web filter profile when attempting to access blocked websites.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

The following topics provide information about web overrides:

- [Web rating override on page 1414](#)
- [Using local and remote categories on page 1423](#)
- [Web profile override on page 1425](#)

Web rating override

Web rating overrides allow you to apply a category override to a URL. This overrides the original FortiGuard category for the URL with either a different FortiGuard category, a custom local category, or a threat feed remote category.

If a URL is in multiple active categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

Web rating override requires a FortiGuard license.

This section includes information about override configurations and examples:

- [Configuring the category override rule on page 1415](#)
- [Sub-category actions on page 1417](#)
- [Category override examples on page 1418](#)

Configuring the category override rule

This topic includes information about configuring following category types:

- [FortiGuard category override](#)
- [Local category override](#)
- [Remote category override](#)

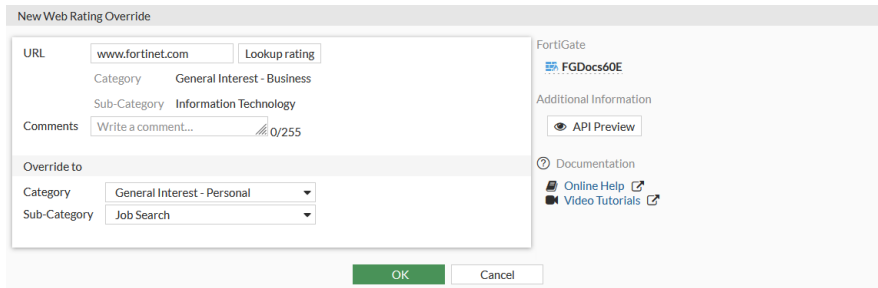

Once you have configured the category override rules, ensure that the override category is active in a web filter profile. See [Sub-category actions on page 1417](#) for more information.

To create a FortiGuard category override:

1. Go to *Security Profiles > Web Rating Overrides* and click *Create New*.
2. Configure the following settings:

<i>URL</i>	Enter the URL to override.
<i>Lookup rating</i>	Select to view any current <i>Category</i> and <i>Sub-Category</i> ratings.
<i>Comments</i>	Enter a comment (optional).
<i>Override to</i>	
<i>Category</i>	Select a FortiGuard category, threat feed remote category, or a <i>Custom Category</i> .
<i>Sub-Category</i>	Select a sub-category to further define the rating. If <i>Custom Category</i> was selected for the <i>Category</i> , you can select from a list of categories you created.

3. Click *OK*.

See [Example 1: Override a FortiGuard category with another FortiGuard category on page 1418](#) for a sample configuration.

To create a custom local category override:

1. Create a custom category :
 - a. Go to *Security Profiles > Web Rating Overrides*.
 - b. Click *Custom Categories*, then click *Create New*.
 - c. Configure the following settings:

<i>Name</i>	Enter a unique name for the category.
<i>Status</i>	Enable/disable the status of the category.

- d. Click *OK*.
2. Create a web rating override:
 - a. Go to *Security Profiles > Web Rating Overrides* and click *Create New*.
 - b. Configure the following settings:

<i>URL</i>	Enter the URL to override.
<i>Lookup rating</i>	Select to view any current <i>Category</i> and <i>Sub-Category</i> ratings.
<i>Comments</i>	Enter a comment (optional).
<i>Override to</i>	
<i>Category</i>	Select <i>Custom Category</i> .
<i>Sub-Category</i>	Select the custom category that was just created.

c. Click *OK*.

See [Example 3: Override a FortiGuard category with a custom local category on page 1421](#) for a sample configuration.

To create a threat feed remote category override:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name for the threat feed. This will also be the name of the remote category.
4. Enter the *URI of external resource* that contains the list of URLs that will be overridden in this remote category.
5. Configure the remaining settings as needed, then click *OK*.

See [Example 2: Override a FortiGuard category with a remote category on page 1420](#) for a sample configuration.

Sub-category actions

After [configuring category override rules](#), an override category must be active in a web filter profile for it to take effect. Whether a category is active or not depends on the override method and action:

Override method	Active category actions	Inactive category actions
FortiGuard categories	Monitor, Block, Warning, or Authenticate	Allow
Local categories	Allow, Monitor, Block, Warning, or Authenticate	Disable*
Remote categories	Allow, Monitor, Block, Warning, or Authenticate	Disable*

*The *Disable* action is only available for local and remote categories by right clicking on the sub-category.

The *Allow* action in the GUI is different for FortiGuard categories compared to local and remote categories.

For local and remote categories, the *Allow* action in the GUI corresponds to the monitor action with logging disabled in the CLI:

```
config webfilter profile
  edit <profile>
    config ftgd-wf
      config filters
        edit 142
          set category 142
          set action monitor
          set log disable
        next
      end
    end
  next
end
```

For FortiGuard categories, the *Allow* action in the GUI corresponds to no entry in the CLI:

The *Internet Radio and TV* sub-category has ID number 75.

```
config webfilter profile
  edit <profile>
    config ftgd-wf
      config filters
        end
      end
    end
  next
end
```

This means that a FortiGuard category with the *Allow* action applied is effectively inactive, as there is no actual action specified in the CLI.

See [Category override examples on page 1418](#) for sample configurations.

Category override examples

This topic includes examples that overrides the original FortiGuard category:

- [Example 1: Override a FortiGuard category with another FortiGuard category on page 1418](#)
- [Example 2: Override a FortiGuard category with a remote category on page 1420](#)
- [Example 3: Override a FortiGuard category with a custom local category on page 1421](#)

Example 1: Override a FortiGuard category with another FortiGuard category

In this example, `play.google.com` is overridden from its original category, *Freeware and Software Download* (19), to the *Advertising* category (17). In the web filter profile, the *Advertising* category is set to *Block* and the *Freeware and Software Download* category is set to *Allow*.

To configure a FortiGuard web rating override:

1. Go to *Security Profiles > Web Rating Overrides* and click *Create New*.
2. Enter the URL: `play.google.com`.
3. Optionally, click *Lookup rating* to see what its current rating is.
4. Set the *Category* and *Sub-Category* to an existing category that is different from the original category.

The screenshot shows the 'New Web Rating Override' dialog box. It contains the following fields and options:

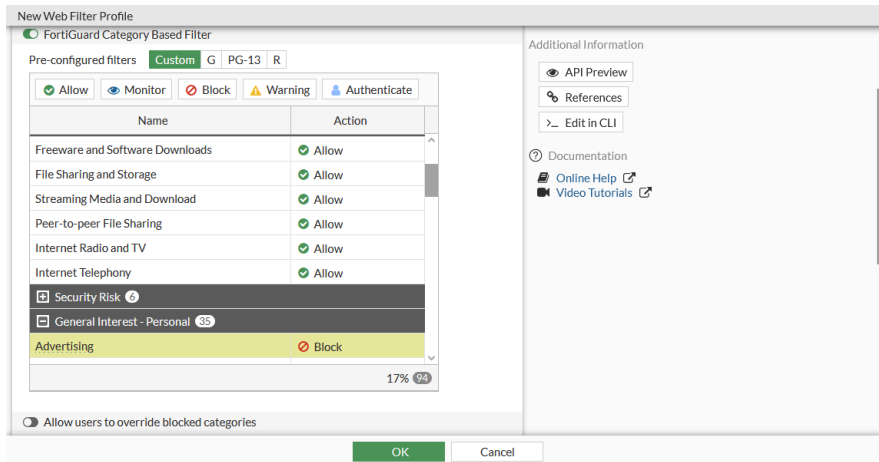

- URL:** play.google.com
- Lookup rating:** (button)
- Category:** Bandwidth Consuming
- Sub-Category:** Freeware and Software Downloads
- Comments:** Write a comment... (with a character count of 0/255)
- Override to:**
 - Category:** General Interest - Personal
 - Sub-Category:** Advertising
- Buttons:** OK, Cancel
- Additional Information:**
 - FortiGate: FGDocs60E
 - API Preview (button)
 - Documentation (link)
 - Online Help (link)
 - Video Tutorials (link)

5. Click *OK*.

To apply the category in a web filter profile:

1. Go to *Security Profiles > Web Filter* and create or edit a web filter profile. See [FortiGuard filter on page 1223](#) for more information.
2. Enable *FortiGuard category based filter*

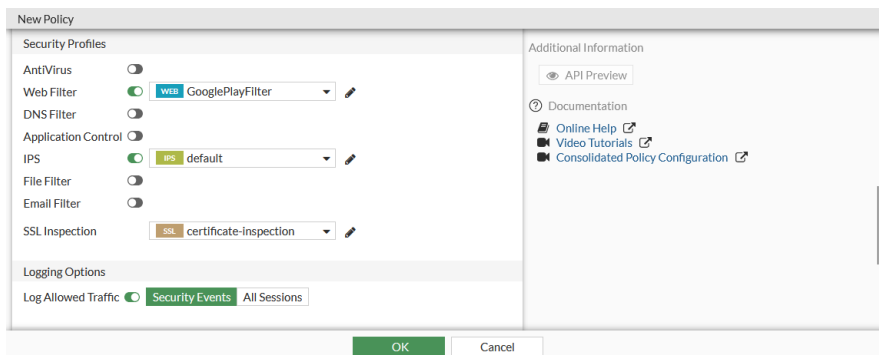

3. Set the action for the *Advertising* category in the *General Interest - Personal* group to *Block*.
4. Set the action for the *Freeware and Software Download* category in the *Bandwidth Consuming* group to *Allow*.

5. Configure the remaining settings are required, then click *OK*.

To apply the category in firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.

5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to *play.google.com*. The page will be blocked by the category override.

FortiGuard Intrusion Prevention - Access Blocked

Web Page Blocked

You have tried to access a web page that is in violation of your Internet usage policy.

Category Advertising
URL <https://play.google.com/>

To have the rating of this web page re-evaluated [please click here](#).

2. Go to *Log & Report > Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```
date=2022-09-21 time=16:43:31 eventtime=1663803811966781540 tz="-0700"
logid="0316013056" type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning"
vd="root" policyid=2 sessionid=891040 srcip=192.168.2.8 srcport=50318 srcintf="port2"
srcintfrole="undefined" dstip=142.251.211.238 dstport=443 dstintf="port1"
dstintfrole="undefined" proto=6 service="HTTPS" hostname="play.google.com" profile="FGD-
Override-FGD-Flow" action="blocked" reqtype="direct" url="https://play.google.com/"
sentbyte=517 rcvbyte=0 direction="outgoing" msg="URL belongs to a denied category in
policy" method="domain" cat=17 catdesc="Advertising"
```

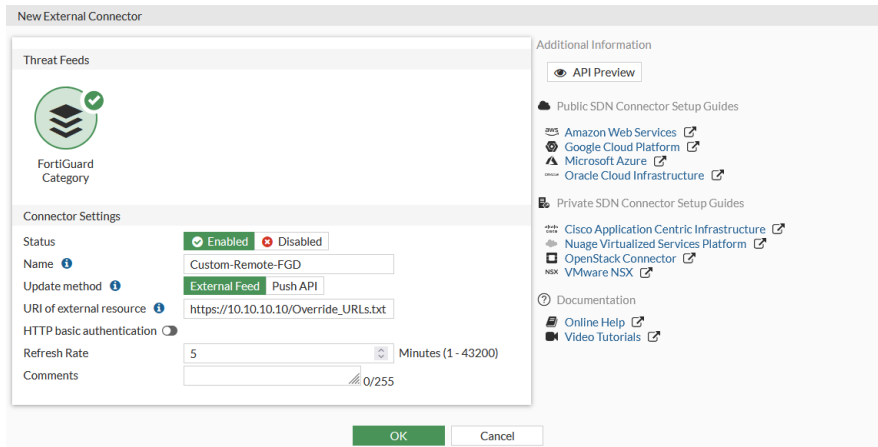

Example 2: Override a FortiGuard category with a remote category

In this example, play.google.com is added to an external URL category list and applied to a threat feed. In the web filter profile, the remote category is set to *Allow*, and the original FortiGuard category (Freeware and Software Download) is set to *Block*. Remote categories take precedence over FortiGuard categories, so the override action for the remote category will apply.

Delete the web rating override entry from example 1 for play.google.com before configuring this example.

To configure a FortiGuard threat feed for remote category override:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name for the threat feed, such as *Custom-Remote-FGD*. This will be the name of the remote category.
4. Enter the *URI of external resource* that contains the list of URLs that will be overridden to this remote category. This list will contain one entry for play.google.com.

5. Configure the remaining settings as needed, then click *OK*.

To apply the category in a web filter profile:

1. Go to *Security Profiles > Web Filter* and create or edit a web filter profile. See [FortiGuard filter on page 1223](#) for more information.
2. Enable *FortiGuard category based filter*
3. Set the action for the *Custom-Remote-FGD* category in the *Remote Categories* group to *Allow*.
4. Set the action for the *Freeware and Software Download* category in the *Bandwidth Consuming* group to *Block*.
5. Configure the remaining settings as required, then click *OK*.

To apply the category in firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to play.google.com. The page will be allowed by the remote category override.
2. No logs are recorded because the *Allow* action is selected.

Example 3: Override a FortiGuard category with a custom local category

In this example, play.google.com is added to a custom local category. that is set to *Monitor* in the web filter profile. Local custom categories take precedence over both remote and FortiGuard categories, so the override action for the local category will apply.

To create a custom local category override:

1. Go to *Security Profiles > Web Rating Overrides*.
2. Click *Custom Categories*, then click *Create New*.
3. Enter a name for the category, such as *myCustomCategory*, and ensure the *Status* is set to *Enable*.
4. Click *OK*.

To create a web rating override for the custom local category:

1. Go to *Security Profiles > Web Rating Overrides* and click *Create New*.
2. Enter the URL to override.
3. For *Category*, select *Custom Categories* and for *Sub-Category* select *myCustomCategory*.

The screenshot shows the 'New Web Rating Override' dialog box. It has a 'URL' field with 'play.google.com' and a 'Lookup rating' field with '0/255'. Below these is a 'Comments' field with the placeholder 'Write a comment...'. The 'Override to' section contains two dropdown menus: 'Category' set to 'Custom Categories' and 'Sub-Category' set to 'myCustomCategory'. On the right side, there is a 'FortiGate' section with 'FGDocs60E' and an 'API Preview' button. Below that is a 'Documentation' section with links for 'Online Help' and 'Video Tutorials'. At the bottom, there are 'OK' and 'Cancel' buttons.

4. Click *OK*.

To apply the category in a web filter profile:

1. Go to *Security Profiles > Web Filter* and create or edit a web filter profile. See [FortiGuard filter on page 1223](#) for more information.
2. Enable *FortiGuard category based filter*
3. Set the action for the *myCustomCategory* category in the *LocalCategories* group to *Monitor*.
4. The other actions can be left as they were at the end of example 2, *Custom-Remote-FGD* set to *Allow* and *Freeware and Software Download* set to *Block*.
5. Configure the remaining settings are required, then click *OK*.

To apply the category in firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create or edit a policy.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile that you just created.
4. Set *SSL Inspection* to *certificate-inspection* or *deep-inspection*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To test the filter:

1. From a Workstation behind the firewall, open a browser and browse to *play.google.com*. The page will be allowed by the local category override.
2. Go to *Log & Report > Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```
date=2022-09-21 time=17:17:00 eventtime=1663805820486294353 tz="-0700"
logid="0317013312" type="utm" subtype="webfilter" eventtype="ftgd_allow" level="notice"
vd="root" policyid=2 sessionid=893147 srcip=192.168.2.8 srcport=50417 srcintf="port2"
srcintfrole="undefined" dstip=142.251.211.238 dstport=443 dstintf="port1"
dstintfrole="undefined" proto=6 service="HTTPS" hostname="play.google.com" profile="FGD-
Override-FGD-Flow" action="passthrough" reqtype="direct" url="https://play.google.com/"
sentbyte=517 rcvbyte=0 direction="outgoing" msg="URL belongs to an allowed category in
policy" method="domain" cat=142 catdesc="myCustomCategory"
```

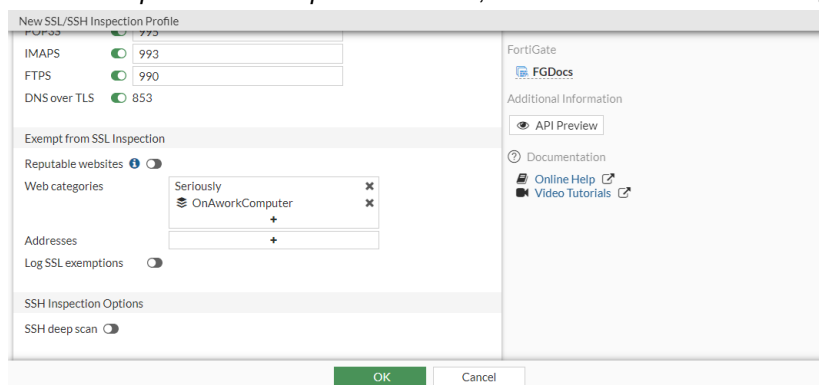

Using local and remote categories

For some functions, local and remote FortiGuard categories must be explicitly selected to apply. In [SSL/SSH inspection profiles](#), custom categories must be explicitly selected to be exempt from SSL inspection. In [Proxy addresses](#), custom categories must be explicitly selected as URL categories for them to apply. In both settings, if a URL is in multiple selected categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

SSL/SSH inspection profiles

To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the GUI:

1. Go to *Security Profiles > SSL/SSH Inspection*.
2. Create a new profile or edit an existing one.
3. Ensure that *Inspection method* is *Full SSL Inspection*.
4. In the *Exempt from SSL Inspection* section, add the local and remote categories to the *Web categories* list .

5. Configure the remaining settings as required, then click *OK*.

To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the CLI:

```
config vdom
  edit root
    config firewall ssl-ssh-profile
      edit "SSL_Inspection"
        config https
          set ports 443
          set status deep-inspection
```

```

end
...
config ssl-exempt
  edit 1
    set fortiguard-category 140
  next
  edit 2
    set fortiguard-category 192
  next
end
next
end
next
end

```

Proxy addresses

To use local and remote categories in a proxy address in the GUI:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*, or edit an existing proxy address.
2. Set *Category* to *Proxy Address*.
3. Set *Type* to *URL Category*.
4. In the *URL Category*, add the local and remote categories.

5. Configure the remaining settings as required, then click *OK*.

To use local and remote categories in a proxy address in the CLI:

```

config vdom
  edit root
    config firewall proxy-address
      edit "proxy_override"
        set type category
        set host "all"
        set category 140 192
        set color 23
      next
    end
  end
end

```

```
    next
end
```

Web profile override

The following profile override methods are available:

- Administrative override
- Allow users to override blocked categories

Administrative override

Administrators can grant temporary access to sites that are otherwise blocked by a web filter profile. You can grant temporary access to a user, user group, or source IP address. You can set the time limit by selecting a date and time. The default is 15 minutes.

When the administrative web profile override is enabled, a blocked access page or replacement message does not appear, and authentication is not required.

Scope range

You can choose one of the following scope ranges:

- User: authentication for permission to override is based on whether or not the user is using a specific user account.
- User group: authentication for permission to override is based on whether or not the user account supplied as a credential is a member of the specified user group.
- Source IP: authentication for permission to override is based on the IP address of the computer that was used to authenticate. This would be used for computers that have multiple users. For example, if a user logs on to the computer, engages the override by using their credentials, and then logs off, anyone who logs on with an account on that computer would be using the alternate override web filter profile.

When you enter an IP address in the administrative override method, only individual IP addresses are allowed.

Differences between IP and identity-based scope

Using the IP scope does not require using an identity-based policy.

When using the administrative override method and IP scope, you might not see a warning message when you change from using the original web filter profile to using the alternate profile. There is no requirement for credentials from the user so, if allowed, the page will just appear in the browser.

Configuring a web profile administrative override

This example describes how to override the *webfilter* profile with the *webfilter_new* profile.

To configure web profile administrative override using the GUI:

1. Go to *Security Profiles > Web Profile Overrides* and click *Create New*.
2. Configure the administrative override:
 - a. For *Scope Range*, click *Source IP*.
 - b. In the *Source IP* field, enter the IP address for the client computer (*10.1.100.11* in this example).
 - c. In the *Original profile* dropdown, select *webfilter*.
 - d. In the *New profile* dropdown, select *webfilter_new*.

In the *Expires* field, the default 15 minutes appears, which is the desired duration for this example.

3. Click *OK*.

To configure web profile administrative override using the CLI:

```
config webfilter override
  edit 1
    set status enable
    set scope ip
    set old-profile "webfilter"
    set new-profile "webfilter_new"
    set expires 2021/07/30 10:14:00
    set initiator "admin"
    set ip 10.1.100.11
  next
end
```

Allow users to override blocked categories

For both override methods, the scope ranges (for specified users, user groups, or IP addresses) allow sites blocked by web filtering profiles to be overridden for a specified length of time.

But there is a difference between the override methods when the users or user group scope ranges are selected. In both cases, you would need to apply the user or user group as source in the firewall policy. With administrative override, if you do not apply the source in the firewall policy, the traffic will not match the override and will be blocked by the original profile. With the *Allow users to override blocked categories* setting, the traffic will also be blocked, but instead of displaying a blocking page, the following message appears:

FortiGuard Intrusion Prevention - Access Blocked

Web Filter Block Override

If you have been granted creation privileged by your administrator, you can enter your username and password here to gain immediate access to the blocked webpage. If you do not have these privileges, please contact your administrator to gain access to the webpage.

Only user-based overrides are allowed and you do not appear to be authenticated with the system. Please contact your administrator.

When you choose the user group scope, once one user overrides, it will affect the other users in the group when they attempt to override. For example, user1 and user2 both belong to the local_user group. Once user1 successfully overrides, this will generate an override entry for the local_user group instead of one specific user. This means that if user2 logs in from another PC, they can override transparently.

Other features

Besides the scope, there are some other features in *Allow users to override blocked categories*.

Apply to user groups

Individual users can not be selected. You can select one or more of the user groups recognized by the FortiGate. They can be local to the system or from a third party authentication device, such as an AD server through FSSO.

Switch duration

Administrative override sets a specified time frame that is always used for that override. The available options are:

- *Predefined*: the value entered is the set duration (length of time in days, hours, or minutes) that the override will be in effect. If the duration variable is set to 15 minutes, the length of the override will always be 15 minutes. The option will be visible in the override message page, but the setting will be grayed out.
- *Ask*: the user has the option to set the override duration once it is engaged. The user can set the duration in terms of days, hours, or minutes.

Creating a web profile users override

This example describes how to allow users in the *local_group* to override the *webfilter_new* profile.

To allow users to override blocked categories using the GUI:

1. Go to *Security Profiles > Web Filter* and click *Create New*.
2. Enter a name for the profile.
3. Enable *Allow users to override blocked categories*.

4. Configure the web filter profile:
 - a. Click the *Groups that can override* field, and select a group (*local_group* in this example).
 - b. Click the *Profile Name* field, and select the *webfilter_new* profile.
 - c. For the *Switch applies to* field, click *IP*.
 - d. For the *Switch Duration* field, click *Predefined*. The default 15 minutes appears, which is the desired duration for this example.
 - e. Configure the rest of the profile as needed.

5. Click **OK**.

Using the ask feature

This option is only available in *Allow users to override blocked categories* is enabled. It configures the message page to have the user choose which scope they want to use. Normally on the message page, the scope options are grayed out and not editable. In the following example, the *Scope* is predefined with *IP*.

Web Filter Block Override

If you have been granted override creation privileges by your administrator, you can enter your username and password here to gain immediate access to the blocked web-page. If you do not have these privileges, please contact your administrator to gain access to the web-page.

Username:

Password:

Scope:

New Profile:

Duration: (Days) (Hours) (Minutes)

When the ask option is enabled (through the *Switch applies to* field in the GUI), the *Scope* dropdown is editable. Users can choose one of the following:

- User
- User group
- IP

Web Filter Block Override

If you have been granted override creation privileges by your administrator, you can enter your username and password here to gain immediate access to the blocked web-page. If you do not have these privileges, please contact your administrator to gain access to the web-page.

Username:

Password:

Scope: ▼

New Profile:

Duration: (Minutes)

User and *User Group* are only available when there is a user group in the firewall policy. You must specify a user group as a source in the firewall policy so the scope includes *User* and *User Group*; otherwise, only the IP option will be available.

IP ban

The FortiGate IP ban feature is a powerful tool for network security. It allows the system to block traffic originating from specific IP addresses that are deemed potentially harmful by the system administrator.

When an IP address is banned, any active connections originating from the banned IP address are immediately terminated. Any subsequent connection attempts are rejected by the Kernel's packet filter, further fortifying the network's security.

Checks for IP bans are carried out only if there is a corresponding firewall policy with an ACCEPT action. If a match is found, the action is then altered to DENY. In scenarios where there is no matching policy, the connection is refused due to the implicit deny rule that is in effect.

Several methods can be used to ban IP addresses:

- FortiView Source: This method allows you to ban an IP address directly from the *FortiView Sources* monitor. See [To ban an IP address](#) for more information.
- IP ban: Administrators can configure an automation stitch with the *IP Ban* action, using a trigger such as a *Compromised Host* or an *Incoming Webhook*. When the automation is triggered, the client PC is quarantined. See [Actions on page 2533](#) and [Incoming Webhook Quarantine stitch on page 2518](#) for more information. The Automation Stitch feature can also be used to configure IP bans from other fabric devices.
- Command line interface (CLI): For those who prefer using command line, IP ban can be added with the CLI. See [IP ban using the CLI on page 1430](#) for more information.
- Security profiles: Most security profiles include a mechanism to ban a source IP address. See [IP ban using security profiles on page 1431](#) for more information.
- DoS policy: A Denial of Service (DoS) policy can be used to block any further traffic from a source IP address that is considered a malicious actor. See [DoS protection on page 900](#) for more information.

IP ban using the CLI

Administrators can use the following command to manage the banned IP address list:

```
# diagnose user banned-ip {list | add | delete | clear | stat}
```

Option	Description
list	List banned IPs.
add	Add banned IP address.
delete	Delete banned IP address.
clear	Clear all banned IP addresses.
stat	Statistics

To add an IP address to the ban list:

```
# diagnose user banned-ip add <src4 | src6> <src-ipv4 | src-ipv6> <expiry> <admin | dlp | ips | av | dos | app>
```

Setting the expiry time to 0 results in an indefinite expiry time. If this is combined with the `banned-ip-persistence` (either `permanent-only` or `all`), the ban becomes permanent.

Example

In this example, a client PC is configured with the IP address 172.16.200.55, and an administrator adds the IP address to the IP ban list.

To add an IP address to the ban list:

```
# diagnose user banned-ip add src4 172.16.200.55 2 admin
```

To view the banned IP list:

```
# diagnose user banned-ip list
src-ip-addr      created          expires          cause
172.16.200.55   Tue Jan 16 14:46:00 2024 Tue Jan 16 14:56:00 2024 Administrative
```

To verify that the banned IP list is working:

1. From the client with the banned IP address of 172.16.200.55, send a DNS query for a domain that is configured on the Central DNS server.
2. Go to *Log & Report > Forward Traffic*, and search for IP address 172.16.200.55.
3. View the log details in the GUI, or download the log file.

In the following log file example, action is deny for source IP 172.16.200.55.

```
date=2024-01-16 time=14:48:43 eventtime=1705445143824107713 tz="+1200"
logid="0000000013" type="traffic" subtype="forward" level="notice" vd="root"
srcip=172.16.200.55 srcname="DESKTOP-644U0A1" srcport=55619 srcintf="port2"
srcintfrole="undefined" dstip=8.8.8.8 dstport=53 dstintf="port1" dstintfrole="undefined"
srccountry="United States" dstcountry="United States" sessionid=259700 proto=17
action="deny" policyid=1 policytype="policy" poluid="f4fe48a4-938c-51ee-8856-
3e84e3b24af4" policyname="client_yt_v4" service="DNS" trandisp="noop" duration=0
sentbyte=0 rcvdbyte=0 sentpkt=0 rcvdpkt=0 appcat="unscanned" crscore=30 craction=131072
crlevel="high" srchwvvendor="VMware" devtype="Server" srcfamily="Virtual Machine"
osname="Windows" srcswversion="10" mastersrcmac="00:0c:29:a6:5a:94"
srcmac="00:0c:29:a6:5a:94" srcserver=0
```

IP ban using security profiles

Configure one or all of the security profiles to quarantine all traffic originating from the infected host's IP address for a configurable duration. The IP address of the attacker is also incorporated into the list of banned users. The address of the target remains unaffected.

The following types of security profiles can be used to ban IP addresses:

- [Antivirus on page 1431](#)
- [Application control on page 1432](#)
- [DLP on page 1432](#)
- [IPS on page 1433](#)

Antivirus

To ban IP addresses using an antivirus profile:

1. Configure an antivirus profile:

```
config antivirus profile
  edit <name>
    config nac-quar
      set infected quar-src-ip
      set expiry <duration>
  end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr          created                expires                cause
172.16.200.55       Wed Jan 17 13:06:05 2024 Wed Jan 17 13:08:05 2024 AV
```

Application control

Quarantine is available as one of the action types when the application matches this application control profile. See [Basic category filters and overrides on page 1291](#) for more information.

To ban IP addresses using an application control profile:

1. Configure the application control profile:

```
config application list
  edit <name>
    config entries
      edit <id>
        set quarantine attacker
        set quarantine-expiry <duration>
      next
    end
  next
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr      created                expires                cause
172.16.200.55    Thu Jan 18 07:17:13 2024 Thu Jan 18 07:22:13 2024 APP
```

DLP

Quarantine is available as one of the action types when the content matches this DLP profile. See [Basic DLP filter types on page 1353](#) for more information

To ban IP addresses using a DLP profile:

1. Configure the DLP profile:

```
config dlp profile
  edit <name>
    config rule
      edit <id>
        set proto <protocols>
        set action quarantine-ip
        set expiry <duration>
      next
    end
  next
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr      created                expires                cause
172.16.200.55   Thu Jan 18 07:03:03 2024 Thu Jan 18 07:05:03 2024 DLP
```

IPS

Quarantine is available as one of the action types when the signature matches this IPS profile. A protocol must also be set. See [Configuring an IPS sensor on page 1308](#) for more information.

To ban IP addresses using an IPS profile:

1. Configure the IPS profile:

```
config ips sensor
  edit <name>
    config entries
      edit <id>
        set quarantine attacker
        set quarantine-expiry <duration>
      next
    end
  end
end
```

2. View the banned IP address:

```
# diagnose user banned-ip list
src-ip-addr      created                expires                cause

Profile groups

Security profiles can be organized into groups. They are useful when there are multiple policies that use the same security profiles, helping save time and preventing missing profiles when configuring policies. When changes need to be made, only the group has to be changed and not the individual policies.

By default, *Security Profiles > Profile Groups* is not visible in the GUI. It can only be enabled using the CLI.

To show profile groups in the GUI:

```
config system settings
  set gui-security-profile-group enable
end
```

To configure a profile group in the GUI:

1. Go to *Security Profiles > Profile Groups* and click *Create New*.

2. Enter a name for the group.
3. Enable the required profile types and select the profile that will be included in the group.
A *Protocol Option* must be selected.
4. Click *OK*.

To configure a profile group in the CLI:

```
config firewall profile-group
  edit <name>
    set application-list <string>
    set av-profile <string>
    set cifs-profile <string>
    set dlp-profile <string>
    set dnsfilter-profile <string>
    set emailfilter-profile <string>
    set file-filter-profile <string>
    set icap-profile <string>
    set ips-sensor <string>
    set profile-protocol-options <string>
    set sctp-filter-profile <string>
    set ssh-filter-profile <string>
    set ssl-ssh-profile <string>
    set videofilter-profile <string>
    set voip-profile <string>
    set waf-profile <string>
    set webfilter-profile <string>
  next
end
```

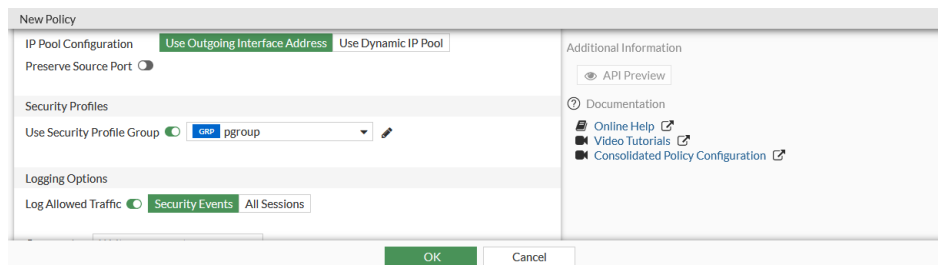

application-list <string>	Name of an existing application list.
av-profile <string>	Name of an existing antivirus profile.
cifs-profile <string>	Name of an existing CIFS profile.
dlp-profile <string>	Name of an existing DLP profile.
dnsfilter-profile <string>	Name of an existing DNS filter profile.
emailfilter-profile <string>	Name of an existing email filter profile.

<code>file-filter-profile</code> <string>	Name of an existing file-filter profile.
<code>icap-profile</code> <string>	Name of an existing ICAP profile.
<code>ips-sensor</code> <string>	Name of an existing IPS sensor profile.
<code>profile-protocol-options</code> <string>	Name of an existing protocol options profile (default = default).
<code>sctp-filter-profile</code> <string>	Name of an existing SCTP filter profile.
<code>ssh-filter-profile</code> <string>	Name of an existing SSH filter profile.
<code>ssl-ssh-profile</code> <string>	Name of an existing SSL SSH profile (default = certificate-inspection).
<code>videofilter-profile</code> <string>	Name of an existing video filter profile.
<code>voip-profile</code> <string>	Name of an existing VOIP profile.
<code>waf-profile</code> <string>	Name of an existing WAF profile.
<code>webfilter-profile</code> <string>	Name of an existing web filter profile.

To use the profile group in a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and edit an existing policy or create a new one.
2. In the *Security Profiles* section, enable *Use Security Profile Group* and select a group.

No individual profiles can be selected if using a profile group.

3. Click **OK**.

To use the profile group in a policy in the CLI:

```
config firewall policy
  edit <policyid>
    set name <string>
    set srcintf <interface(s)>
    set dstintf <interface(s)>
    set action {accept | deny | ipsec}
    set srcaddr <address(es)>
    set dstaddr <address(es)>
    set schedule <schedule>
    set service <service(s)>
    set utm-status enable
    set profile-type group
```

```
    set profile-group <group>
  next
end
```

VPN

Virtual Private Network (VPN) technology lets remote users connect to private computer networks to gain access to their resources in a secure way. For example, an employee traveling or working at home can use a VPN to securely access the office network through the Internet.

Instead of remotely logging into a private network using an unencrypted and unsecured Internet connection, using a VPN ensures that unauthorized parties cannot access the office network and cannot intercept information going between the employee and the office. Another common use of a VPN is to connect the private networks of multiple offices.

Fortinet offers VPN capabilities in the FortiGate Unified Threat Management (UTM) appliance and in the FortiClient Endpoint Security suite of applications. You can install a FortiGate unit on a private network and install FortiClient software on the user's computer. You can also use a FortiGate unit to connect to the private network instead of using FortiClient software.

The following sections provide information about VPN:

- [IPsec VPNs on page 1437](#)
- [SSL VPN on page 1718](#)

IPsec VPNs

The following sections provide instructions on configuring IPsec VPN connections in FortiOS 7.0.15.

- [General IPsec VPN configuration on page 1437](#)
- [Site-to-site VPN on page 1467](#)
- [Remote access on page 1520](#)
- [Aggregate and redundant VPN on page 1564](#)
- [Overlay Controller VPN \(OCVPN\) on page 1608](#)

- [Other VPN topics on page 1673](#)
- [VPN IPsec troubleshooting on page 1710](#)

General IPsec VPN configuration

The following sections provide instructions on general IPsec VPN configurations:

- [Network topologies on page 1438](#)
- [Phase 1 configuration on page 1438](#)
- [Phase 2 configuration on page 1452](#)
- [VPN security policies on page 1456](#)
- [Blocking unwanted IKE negotiations and ESP packets with a local-in policy on page 1460](#)
- [Configurable IKE port on page 1461](#)
- [IPsec VPN IP address assignments on page 1464](#)

Network topologies

The topology of your network will determine how remote peers and clients connect to the VPN and how VPN traffic is routed.

Topology	Description
Site-to-Site	Standard one-to-one VPN between two FortiGates. See Site-to-site VPN on page 1467 .
Hub and spoke/ADVPN	One central FortiGate (hub) has multiple VPNs to other remote FortiGates (spokes). In ADVPN, shortcuts can be created between spokes for direct communication. See ADVPN on page 1639 .
OCVPN	Fortinet's cloud based solution for automating VPN setup between devices registered to the same account. See Overlay Controller VPN (OCVPN) on page 1608 .
FortiClient dialup	Typically remote FortiClient dialup clients use dynamic IP addresses through NAT devices. The FortiGate acts as a dialup server allowing dialup VPN connections from multiple sources. See FortiClient as dialup client on page 1527 .
FortiGate dialup	Similar to site-to-site except one end is a dialup server and the other end is a dialup client. This facilitates scenarios in which the remote dialup end has a dynamic address, or does not have a public IP, possibly because it is behind NAT. See FortiGate as dialup client on page 1521 .
Aggregate VPN	Natively support aggregating multiple VPN tunnels to increase performance and provide redundancy over multiple links. See Packet distribution and redundancy for aggregate IPsec tunnels on page 1581 .
Redundant VPN	Options for supporting redundant and partially redundant IPsec VPNs, using route-based approaches. See Redundant hub and spoke VPN on page 1602 .
L2TP over IPsec	Configure VPN for Microsoft Windows dialup clients using the built in L2TP software. Users do not have to install any Fortinet software. See L2TP over IPsec on page 1545 .
GRE over IPsec	Legacy support for routers requiring point-to-point GRE over IPsec for tunneling. See GRE over IPsec on page 1483 .

Phase 1 configuration

Phase 1 configuration primarily defines the parameters used in IKE (Internet Key Exchange) negotiation between the ends of the IPsec tunnel. The local end is the FortiGate interface that initiates the IKE negotiations. The remote end is the remote gateway that responds and exchanges messages with the initiator. Hence, they are sometimes referred to as the initiator and responder. The purpose of phase 1 is to secure a tunnel with one bi-directional IKE SA (security association) for negotiating IKE phase 2 parameters.

The `auto-negotiate` and `negotiation-timeout` commands control how the IKE negotiation is processed when there is no traffic, and the length of time that the FortiGate waits for negotiations to occur.

IPsec tunnels can be configured in the GUI using the *VPN Creation Wizard*. Go to *VPN > IPsec Wizard*. The wizard includes several templates (site-to-site, hub and spoke, remote access), but a custom tunnel can be configured with the following settings:

For FortiOS 7.0.1 to 7.0.12, SSL VPN web mode, explicit web proxy, and interface mode IPsec VPN features will not work with the following configuration:

1. An IP pool with ARP reply enabled is configured.
2. This IP pool is configured as the source IP address in a firewall policy for SSL VPN web mode, in a proxy policy for explicit web proxy, or as the local gateway in the Phase 1 settings for an interface mode IPsec VPN.
3. A matching blackhole route is configured for IP pool reply traffic.

Configuring an IP pool as the source NAT IP address in a regular firewall policy works as before.

For details, see [Technical Tip: IP pool and virtual IP behaviour changes in FortiOS 6.4, 7.0, 7.2, and 7.4](#).

Name	Phase 1 definition name. The maximum length is 15 characters for an interface mode VPN and 35 characters for a policy-based VPN. For a policy-based VPN, the name normally reflects where the remote connection originates. For a route-based tunnel, the FortiGate also uses the name for the virtual IPsec interface that it creates automatically.
Network	
IP Version	Protocol, either IPv4 or IPv6.
Remote Gateway	Category of the remote connection: <ul style="list-style-type: none"> • <i>Static IP Address</i>: the remote peer has a static IP address. • <i>Dialup User</i>: one or more FortiClient or FortiGate dialup clients with dynamic IP addresses will connect to the FortiGate. • <i>Dynamic DNS</i>: a remote peer that has a domain name and subscribes to a dynamic DNS service will connect to the FortiGate.
IP Address	The IP address of the remote peer. This option is only available when the <i>Remote Gateway</i> is <i>Static IP Address</i> .
Dynamic DNS	The domain name of the remote peer. This option is only available when the <i>Remote Gateway</i> is <i>Dynamic DNS</i> .
Interface	The interface through which remote peers or dialup clients connect to the FortiGate. This option is only available in NAT mode. By default, the local VPN gateway IP address is the IP address of the interface that was selected (<i>Primary IP</i> in the <i>Local Gateway</i> field).
Local Gateway	IP address for the local end of the VPN tunnel (<i>Primary IP</i> is used by default): <ul style="list-style-type: none"> • <i>Secondary IP</i>: secondary address of the interface selected in the <i>Interface</i> field. • <i>Specify</i>: manually enter an address. Interface mode cannot be configured in a transparent mode VDOM.

Mode Config	<p>This option is only available when the <i>Remote Gateway</i> is <i>Dialup User</i>. Configure the client IP address range, subnet mask/prefix length, DNS server, and split tunnel capability to automate remote client addressing.</p>
NAT Traversal	<p>This option is only available when the <i>Remote Gateway</i> is <i>Static IP Address</i> or <i>Dynamic DNS</i>.</p> <p>ESP (encapsulating security payload), the protocol for encrypting data in the VPN session, uses IP protocol 50 by default. However, it does not use any port numbers so when traversing a NAT device, the packets cannot be demultiplexed. Enabling NAT traversal encapsulates the ESP packet inside a UDP packet, thereby adding a unique source port to the packet. This allows the NAT device to map the packets to the correct session.</p> <ul style="list-style-type: none"> • <i>Enable</i>: a NAT device exists between the local FortiGate and the VPN peer or client. Outbound encrypted packets are wrapped inside a UDP IP header that contains a port number. The local FortiGate and the VPN peer or client must have the same NAT traversal setting (both selected or both cleared) to connect reliably. When in doubt, enable NAT traversal. • <i>Disable</i>: disable the NAT traversal setting. • <i>Forced</i>: the FortiGate will use a port value of zero when constructing the NAT discovery hash for the peer. This causes the peer to think it is behind a NAT device, and it will use UDP encapsulation for IPsec, even if no NAT is present. This approach maintains interoperability with any IPsec implementation that supports the NAT-T RFC.
Keepalive Frequency	<p>Keepalive frequency setting. This option is only available when <i>NAT Traversal</i> is set to <i>Enable</i> or <i>Forced</i>. The NAT device between the VPN peers may remove the session when the VPN connection remains idle for too long.</p> <p>The value represents an interval in seconds where the connection will be maintained with periodic keepalive packets. The keepalive interval must be smaller than the session lifetime value used by the NAT device.</p> <p>The keepalive packet is a 138-byte ISAKMP exchange.</p>
Dead Peer Detection	<p>Reestablishes VPN tunnels on idle connections and cleans up dead IKE peers if required. This feature minimizes the traffic required to check if a VPN peer is available or unavailable (dead). The available options are:</p> <ul style="list-style-type: none"> • <i>Disable</i>: disable dead peer detection (DPD). • <i>On Idle</i>: triggers DPD when IPsec is idle. • <i>On Demand</i>: Passively sends DPD to reduce load on the firewall. Only triggers DPD when IPsec outbound packets are sent, but no reply is received from the peer. When there is no traffic and the last DPD-ACK has been received, IKE will not send DPDs periodically. <p>Notifications are received whenever a tunnel goes up or down, or to keep the tunnel connection open when no traffic is being generated inside the tunnel. For example, in scenarios where a dialup client or dynamic DNS peer connects from an IP address that changes periodically, traffic may be suspended while the IP address changes.</p>

When *Dead Peer Detection* is selected, optionally specify a retry count and a retry interval using `dpd-retrycount` and `dpd-retryinterval`. See [Dead peer detection on page 1445](#).

Forward Error Correction Enable on both ends of the tunnel to correct errors in data transmission by sending redundant data across the VPN.

Device creation Advanced option. When enabled, a dynamic interface (network device) is created for each dialup tunnel.

Aggregate member Advanced option. When enabled, the tunnel can be used as an aggregate member candidate.

Authentication

Method Either *Pre-shared Key* or *Signature*.

Pre-shared Key The pre-shared key that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. The same key must be defined at the remote peer or client. See [Pre-shared key](#).

Certificate Name The server certificate that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. See [Digital certificates](#).

IKE Version Either 1 or 2. See [Choosing IKE version 1 and 2 on page 1446](#).

Mode This option is only available when IKEv1 is selected. The two available options are:

- *Aggressive*: the phase 1 parameters are exchanged in a single message with unencrypted authentication information.
- *Main (ID protection)*: the phase 1 parameters are exchanged in multiple rounds with encrypted authentication information.

When the remote VPN peer has a dynamic IP address and is authenticated by a pre-shared key, you must select *Aggressive* mode if there is more than one dialup phase 1 configuration for the interface IP address.

When the remote VPN peer has a dynamic IP address and is authenticated by a certificate, you must select *Aggressive* mode if there is more than one phase 1 configuration for the interface IP address and these phase 1 configurations use different proposals.

Peer Options Options to authenticate VPN peers or clients depending on the *Remote Gateway* and *Authentication Method* settings.

Any peer ID Accepts the local ID of any remote VPN peer or client. The FortiGate does not check identifiers (local IDs). *Mode* can be set to *Aggressive* or *Main*. This option can be used with digital certificate authentication, but for higher security, use *Peer certificate*.

Specific peer ID This option is only available when *Aggressive Mode* is enabled. Enter the identifier that is used to authenticate the remote peer. The identifier must match the local ID configured by the remote peer's administrator.

If the remote peer is a FortiGate, the identifier is specified in the *Local ID* field of the *Phase 1 Proposal* settings.

If the remote peer is a FortiClient user, the identifier is specified in the *Local ID* field.

In circumstances where multiple remote dialup VPN tunnels exist, each tunnel must have a peer ID set.

Peer certificate

Define the CA certificate used to authenticate the remote peer when the authentication mode is *Signature*.

If the FortiGate will act as a VPN client, and you are using security certificates for authentication, set the *Local ID* to the distinguished name (DN) of the local server certificate that the FortiGate unit will use for authentication purposes.

Peer ID from dialup group

Authenticate multiple FortiGate or FortiClient dialup clients that use unique identifiers and unique pre-shared keys (or unique pre-shared keys only) through the same VPN tunnel.

You must create a dialup user group for authentication purposes. Select the group from the list next to the *Peer ID from dialup group* option.

You must set *Mode* to *Aggressive* when the dialup clients use unique identifiers and unique pre-shared keys. If the dialup clients use unique pre-shared keys only, you can set *Mode* to *Main* if there is only one dialup Phase 1 configuration for this interface IP address.

Phase 1 Proposal

The encryption and authentication algorithms used to generate keys for the IKE SA.

There must be a minimum of one combination. The remote peer or client must be configured to use at least one of the proposals that you define.

Encryption

The following symmetric-key encryption algorithms are available:

- *DES*: Digital Encryption Standard, a 64-bit block algorithm that uses a 56-bit key.
- *3DES*: triple-DES; plain text is encrypted three times by three keys.
- *AES128*: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key.
- *AES128GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2.
- *AES192*: a 128-bit block algorithm that uses a 192-bit key.
- *AES256*: a 128-bit block algorithm that uses a 256-bit key.
- *AES256GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2.
- *CHACHA20POLY1305*: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2. See also [HMAC settings](#).

Authentication

The following message digests that check the message authenticity during an encrypted session are available:

- *MD5*: message digest 5.
- *SHA1*: secure hash algorithm 1; a 160-bit message digest.

	<ul style="list-style-type: none"> • <i>SHA256</i>: a 256-bit message digest. • <i>SHA384</i>: a 384-bit message digest. • <i>SHA512</i>: a 512-bit message digest. <p>In IKEv2, encryption algorithms include authentication, but a PRF (pseudo random function) is still required (<i>PRFSHA1</i>, <i>PRFSHA256</i>, <i>PRFSHA384</i>, <i>PRFSHA512</i>). See also HMAC settings.</p>
Diffie-Hellman Groups	<p>Asymmetric key algorithms used for public key cryptography.</p> <p>Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the <i>Diffie-Hellman Groups</i> (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.</p>
Key Lifetime	<p>The time (in seconds) that must pass before the IKE encryption key expires. When the key expires, a new key is generated without interrupting service. The keylife can be from 120 to 172 800 seconds.</p>
Local ID	<p>Optional setting. This value must match the peer ID value given for the remote VPN peer's <i>Peer Options</i>.</p> <ul style="list-style-type: none"> • If the FortiGate will act as a VPN client and you are using peer IDs for authentication purposes, enter the identifier that the FortiGate will supply to the VPN server during the phase 1 exchange. • If the FortiGate will act as a VPN client and you are using security certificates for authentication, select the distinguished name (DN) of the local server certificate that the FortiGate will use for authentication purposes.
XAUTH	<p>This option supports the authentication of dialup clients. It is only available for IKE version 1.</p> <ul style="list-style-type: none"> • <i>Disable</i>: do not use XAuth. • <i>Client</i>: available only if the <i>Remote Gateway</i> is set to <i>Static IP Address</i> or <i>Dynamic DNS</i>. If the FortiGate is a dialup client, enter the user name and password for the FortiGate to authenticate itself to the remote XAuth server. • <i>PAP Server</i>, <i>CHAP Server</i>, <i>Auto Server</i>: available only if <i>Remote Gateway</i> is set to <i>Dialup User</i>. Dialup clients authenticate as members of a dialup user group. A user group must be created first for the dialup clients that need access to the network behind the FortiGate. <p>The FortiGate must be configured to forward authentication requests to an external RADIUS or LDAP authentication server.</p> <p>Select the server type based on the encryption method used between the FortiGate, the XAuth client, and the external authentication server. Then select the user group (<i>Inherit from policy</i> or <i>Choose</i>). See Using XAuth authentication on page 1450.</p>
Username	User name used for authentication.
Password	Password used for authentication.

Additional CLI configurations

The following phase 1 settings can be configured in the CLI:

VXLAN over IPsec

Packets with a VXLAN header are encapsulated within IPsec tunnel mode.

To configure VXLAN over IPsec:

```
config vpn ipsec phase1-interface/phase1
  edit ipsec
    set interface <name>
    set encapsulation vxlan/gre
    set encapsulation-address ike/ipv4/ipv6
    set encap-local-gw4 xxx.xxx.xxx.xxx
    set encap-remote-gw xxx.xxx.xxx.xxx
  next
end
```

IPsec tunnel idle timer

Define an idle timer for IPsec tunnels. When no traffic has passed through the tunnel for the configured `idle-timeout` value, the IPsec tunnel will be flushed.

To configure IPsec tunnel idle timeout:

```
config vpn ipsec phase1-interface
  edit p1
    set idle-timeout [enable | disable]
    set idle-timeoutinterval <integer> IPsec tunnel idle
timeout in minutes (10 - 43200).
  next
end
```

Monitor tunnel for failover

Monitor a site-to-site tunnel to guarantee operational continuity if the primary tunnel fails. Configure the secondary phase 1 interface to monitor the primary interface.

To configure the monitor:

```
config vpn ipsec phase1-interface
  edit <secondary phase1-interface>
    set monitor <primary phase1-interface>
  next
end
```

Passive mode

Passive mode turns one side of the tunnel to be a responder only. It does not initiate VPN tunnels either by auto-negotiation, rekey, or traffic initiated behind the FortiGate.

To configure passive mode:

```
config vpn ipsec phase1-interface
  edit <example>
```

```

        set rekey {enable | disable}
        set passive-mode {enable | disable}
        set passive-tunnel-interface {enable | disable}
    next
end

```

Network ID

The network ID is a Fortinet-proprietary attribute that is used to select the correct phase 1 between IPsec peers, so that multiple IKEv2 tunnels can be established between the same local/remote gateway pairs.

In a dial-up VPN, `network-id` is in the first initiator message of an IKEv2 phase 1 negotiation. The responder (Hub) uses the `network-id` to match a phase 1 configuration with a matching `network-id`. The Hub can then differentiate multiple dial-up phase 1s that are bound to the same underlay interface and IP address. Without a `network-id`, the Hub cannot have multiple phase 1 dialup tunnels on the same interface.

In static phase 1 configurations, `network-id` is used with the pair of gateway IPs to negotiate the correct tunnel with a matching `network-id`. This allows IPsec peers to use the same pair of underlay IPs to establish multiple IPsec tunnels. Without it, only a single tunnel can be established over the same pair of underlay IPs.

To configure the network ID:

```

config vpn ipsec phase1-interface
    edit <example>
        set ike-version 2
        set network-overlay enable
        set network-id <integer>
    next
end

```

Dead peer detection

By default, dead peer detection (DPD) sends probe messages every five seconds. If you are experiencing high network traffic, you can experiment with increasing the ping interval. However, longer intervals will require more traffic to detect dead peers, which will result in more traffic.

In a dynamic (dialup) connection, the *On Idle* option encourages dialup server configurations to more proactively delete tunnels if the peer is unavailable.

In the GUI, the dead peer detection option can be configured when defining phase 1 options. The following CLI commands support additional options for specifying a retry count and a retry interval.

For example, enter the following to configure DPD on the existing IPsec phase 1 configuration to use 15-second intervals and to wait for three missed attempts before declaring the peer dead and taking action.

To configure DPD:

```
config vpn ipsec phase1-interface
  edit <value>
    set dpd [disable | on-idle | on-demand]
    set dpd-retryinterval 15
    set dpd-retrycount 3
  next
end
```

DPD scalability

On a dialup server, if many VPN connections are idle, the increased DPD exchange could negatively impact the performance/load of the daemon. The `on-demand` option in the CLI triggers DPD when IPsec traffic is sent, but no reply is received from the peer.

When there is no traffic and the last DPD-ACK had been received, IKE will not send DPDs periodically. IKE will only send out DPDs if there are outgoing packets to send, but no inbound packets have since been received.

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as `3des-sha256`). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500
virtual-interface-addr: 172.31.0.2 -> 172.31.0.1
created: 1015820s ago
IKE SA: created 1/13 established 1/13 time 10/1626/21010 ms
IPsec SA: created 1/24 established 1/24 time 0/11/30 ms

  id/spi: 124 43b087dae99f7733/6a8473e58cd8990a
  direction: responder
  status: established 68693-68693s ago = 10ms
  proposal: 3des-sha256
  key: e0fa6ab8dc509b33-aa2cc549999b1823-c3cb9c337432646e
  lifetime/rekey: 86400/17436
  DPD sent/recvd: 000001e1/00000000
```

Choosing IKE version 1 and 2

If you create a route-based VPN, you have the option of selecting IKE version 2. Otherwise, IKE version 1 is used.

IKEv2, defined in [RFC 4306](#), simplifies the negotiation process that creates the security association (SA).

If you select IKEv2:

- There is no choice in phase 1 of aggressive or main mode.
- Extended authentication (XAUTH) is not available.
- You can utilize EAP and MOBIKE.

Repeated authentication in IKEv2

This feature provides the option to control whether a device requires its peer to re-authenticate or whether re-key is sufficient. It does not influence the re-authentication or re-key behavior of the device itself, which is controlled by the peer (the default being to re-key). This solution is in response to [RFC 4478](#). As described by the IETF, "the purpose of this is to limit the time that security associations (SAs) can be used by a third party who has gained control of the IPsec peer".

To configure IKE SA re-authentication:

```
config vpn ipsec phase1-interface
  edit p1
    set reauth [enable | disable]
  next
end
```

IKEv2 quick crash detection

There is support for IKEv2 quick crash detection (QCD) as described in [RFC 6290](#).

RFC 6290 describes a method in which an IKE peer can quickly detect that the gateway peer it has and established an IKE session with has rebooted, crashed, or otherwise lost IKE state. When the gateway receives IKE messages or ESP packets with unknown IKE or IPsec SPIs, the IKEv2 protocol allows the gateway to send the peer an unprotected IKE message containing INVALID_IKE_SPI or INVALID_SPI notification payloads.

RFC 6290 introduces the concept of a QCD token, which is generated from the IKE SPIs and a private QCD secret, and exchanged between peers during the protected IKE AUTH exchange.

To configure QCD:

```
config system settings
  set ike-quick-crash-detect [enable | disable]
end
```

IKEv1 quick crash detection

Based on the IKEv2 QCD feature previously described, IKEv1 QCD is implemented using a new IKE vendor ID (Fortinet Quick Crash Detection) so both endpoints must be FortiGates. The QCD token is sent in the phase 1 exchange and must be encrypted, so this is only implemented for IKEv1 in main mode (aggressive mode is not supported as there is no available AUTH message to include the token). Otherwise, the feature works the same as in IKEv2 (RFC 6290).

IKEv1 fragmentation

UDP fragmentation can cause issues in IPsec when either the ISP or perimeter firewall(s) cannot pass or fragment the oversized UDP packets that occur when using a very large public security key (PSK). The result is that IPsec tunnels do not come up. The solution is IKE fragmentation.

For most configurations, enabling IKE fragmentation allows connections to automatically establish when they otherwise might have failed due to intermediate nodes dropping IKE messages containing large certificates, which typically push the packet size over 1500 bytes.

FortiOS will fragment a packet on sending if only all the following are true:

- Phase 1 contains `set fragmentation enable`.
- The packet is larger than the minimum MTU (576 for IPv4, 1280 for IPv6).
- The packet is being re-transmitted.

By default, IKE fragmentation is enabled.

To configure IKEv1 fragmentation:

```
config vpn ipsec phase1-interface
    edit 1
        set fragmentation [enable | disable]
    next
end
```

IKEv2 fragmentation

[RFC 7383](#) requires each fragment to be individually encrypted and authenticated. With IKEv2, a copy of the unencrypted payloads around for each outgoing packet would need to be kept in case the original single packet was never answered and would retry with fragments. With the following implementation, if the IKE payloads are greater than a configured threshold, the IKE packets are preemptively fragmented and encrypted.

To configure IKEv2 fragmentation:

```
config vpn ipsec phase1-interface
    edit ike
        set ike-version 2
        set fragmentation [enable|disable]
        set fragmentation-mtu <500-16000>
    next
end
```

IPsec global IKE embryonic limit

When trying to establish thousands of tunnels simultaneously, a situation can arise where new negotiations starve other SAs from progressing to an established state in IKEv2. The IKE daemon can prioritize established SAs, offload groups 20 and 21 to CP9, and optimize the default embryonic limits for mid- and high-end platforms. The IKE embryonic limit can be configured in the CLI.

```
config system ike
    set embryonic-limit <integer>
end
```

```
embryonic-limit <integer> Set the maximum number of IPsec tunnels to negotiate simultaneously (50 - 20000, default = 1000).
```

To configure an IKE embryonic limit of 50:

```
config system ike
    set embryonic-limit 50
end
```

Pre-shared key vs digital certificates

A FortiGate can authenticate itself to remote peers or dialup clients using either a pre-shared key or a digital certificate.

Pre-shared key

Using a pre-shared key is less secure than using certificates, especially if it is used alone, without requiring peer IDs or extended authentication (XAuth). There also needs to be a secure way to distribute the pre-shared key to the peers.

If you use pre-shared key authentication alone, all remote peers and dialup clients must be configured with the same pre-shared key. Optionally, you can configure remote peers and dialup clients with unique pre-shared keys. On the FortiGate, these are configured in user accounts, not in the phase 1 settings.

The pre-shared key must contain at least six printable characters and should be known by network administrators. For optimum protection against currently known attacks, the key must consist of a minimum of 16 randomly chosen alphanumeric characters. The limit is 128 characters.

If you authenticate the FortiGate using a pre-shared key, you can require remote peers or dialup clients to authenticate using peer IDs, but not client certificates.

To authenticate the FortiGate using a pre-shared key:

1. Go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.
3. Configure or edit the *Authentication* settings as follows:

Method	<i>Pre-shared Key</i>
Pre-shared Key	<string>
IKE Version	1 or 2
Mode	<i>Aggressive</i> or <i>Main</i>
Peer Options	Select an <i>Accept Type</i> and the corresponding peer. Options vary based on the <i>Remote Gateway</i> and <i>Authentication Method</i> settings in the <i>Network</i> section. <i>Peer Options</i> are only available in <i>Aggressive</i> mode.

4. For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define *XAUTH* parameters.
6. Click *OK*.

Digital certificates

To authenticate the FortiGate using digital certificates, you must have the required certificates installed on the remote peer and on the FortiGate. The signed server certificate on one peer is validated by the presence of the root certificate installed on the other peer. If you use certificates to authenticate the FortiGate, you can also require the remote peers or dialup clients to authenticate using certificates. See [Site-to-site VPN with digital certificate on page 1472](#) for a detailed example.

To authenticate the FortiGate using a digital certificate:

1. Go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.

- Configure or edit the *Authentication* settings as follows:

Method	<i>Signature</i>
Certificate Name	Select the certificate used to identify this FortiGate. If there are no imported certificates, use <i>Fortinet_Factory</i> .
IKE Version	1 or 2
Mode	<i>Aggressive</i> is recommended.
Peer Options	For <i>Accept Type</i> , select <i>Peer certificate</i> and select the peer and the CA certificate used to authenticate the peer. If the other end is using the Fortinet_Factory certificate, then use the <i>Fortinet_CA</i> certificate here.

- For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
- Optionally, for authentication parameters for a dialup user group, define *XAUTH* parameters.
- Click *OK*.

Using XAuth authentication

Extended authentication (XAuth) increases security by requiring remote dialup client users to authenticate in a separate exchange at the end of phase 1. XAuth draws on existing FortiGate user group definitions and uses established authentication mechanisms such as PAP, CHAP, RADIUS, and LDAP to authenticate dialup clients. You can configure a FortiGate to function either as an XAuth server or client. If the server or client is attempting a connection using XAuth and the other end is not using XAuth, the failed connection attempts that are logged will not specify XAuth as the reason.

XAuth server

A FortiGate can act as an XAuth server for dialup clients. When the phase 1 negotiation completes, the FortiGate challenges the user for a user name and password. It then forwards the user's credentials to an external RADIUS or LDAP server for verification.

If the user records on the RADIUS server have suitably configured Framed-IP-Address fields, you can assign client virtual IP addresses by XAuth instead of from a DHCP address range.

The authentication protocol you use for XAuth depends on the capabilities of the authentication server and the XAuth client:

- Select *PAP Server* whenever possible.
- You must select *PAP Server* for all implementations of LDAP and some implementations of Microsoft RADIUS.
- Select *Auto Server* when the authentication server supports *CHAP Server* but the XAuth client does not. The FortiGate will use PAP to communicate with the XAuth client and CHAP to communicate with the authentication server. You can also use *Auto Server* to allow multiple source interfaces to be defined in an IPsec/IKE policy.

Before you begin, create user accounts and user groups to identify the dialup clients that need to access the network behind the FortiGate dialup server. If password protection will be provided through an external RADIUS or LDAP server, you must configure the FortiGate dialup server to forward authentication requests to the authentication server.

To configure XAuth to authenticate a dialup user group:

- On the FortiGate dialup server, go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
- Configure or edit the *Network*, *Authentication*, and *Phase 1 Proposal* sections as needed.

3. In the *XAUTH* section, select the encryption method *Type* to use between the XAuth client, the FortiGate, and the authentication server.
4. For *User Group*:
 - a. Click *Inherit from policy* for multiple user groups defined in the IPsec/IKE policy, or
 - b. Click *Choose* and in the dropdown, select the user group that needs to access the private network behind the FortiGate.

Only one user group may be defined for *Auto Server*.

5. Click *OK*.
6. Create as many policies as needed, specifying the source user(s) and destination address.

XAuth client

If the FortiGate acts as a dialup client, the remote peer, acting as an XAuth server, might require a username and password. You can configure the FortiGate as an XAuth client with its own username and password, which it provides when challenged.

To configure the FortiGate dialup client as an XAuth client:

1. On the FortiGate dialup client, go to *VPN > IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network*, *Authentication*, and *Phase 1 Proposal* sections as needed.
3. In the *XAUTH* section, for *Type*, select *Client*.
4. For *Username*, enter the FortiGate PAP, CHAP, RADIUS, or LDAP user name that the FortiGate XAuth server will compare to its records when the FortiGate XAuth client attempts to connect.
5. Enter the *Password* for the user name.
6. Click *OK*.

Dynamic IPsec route control

You can add a route to a peer destination selector by using the `add-route` option, which is available for all dynamic IPsec phases 1 and 2, for both policy-based and route-based IPsec VPNs.

The `add-route` option adds a route to the FortiGate routing information base when the dynamic tunnel is negotiated. You can use the `distance` and `priority` options to set the distance and priority of this route. If this results in a route with the lowest distance, it is added to the FortiGate forwarding information base.

You can also enable `add-route` in any policy-based or route-based phase 2 configuration that is associated with a dynamic (dialup) phase 1. In phase 2, `add-route` can be enabled, disabled, or set to use the same route as phase 1.

The `add-route` option is enabled by default.

To configure add-route in phase 1:

```
config vpn ipsec
  edit <name>
    set type dynamic
    set add-route {enable | disable}
```

```

    next
end

```

To configure add-route in phase 2:

```

config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end

```

Blocking IPsec SA negotiation

For interface-based IPsec, IPsec SA negotiation blocking can only be removed if the peer offers a wildcard selector. If a wildcard selector is offered, then the wildcard route will be added to the routing table with the distance/priority value configured in phase 1. If that is the route with the lowest distance, it will be installed into the forwarding information base.

In this scenario, it is important to ensure that the distance value configured for phase 1 is set appropriately.

Phase 2 configuration

After phase 1 negotiations end successfully, phase 2 begins. In Phase 2, the VPN peer or client and the FortiGate exchange keys again to establish a secure communication channel. The phase 2 proposal parameters select the encryption and authentication algorithms needed to generate keys for protecting the implementation details of security associations (SAs). The keys are generated automatically using a Diffie-Hellman algorithm.

The basic phase 2 settings associate IPsec phase 2 parameters with the phase 1 configuration that specifies the remote end point of the VPN tunnel. In most cases, you need to configure only basic Phase 2 settings.

Some settings can be configured in the CLI. The following options are available in the *VPN Creation Wizard* after the tunnel is created:

New Phase 2	
Name	Phase 2 definition name.
Local Address	A value of 0.0.0.0/0 means all IP addresses behind the local VPN peer. Add a specific address or range to allow traffic from and to only this local address. See Quick mode selectors on page 1454 .
Remote Address	Enter the destination IP address that corresponds to the recipients or network behind the remote VPN peer. A value of 0.0.0.0/0 means all IP addresses behind the remote VPN peer. See Quick mode selectors on page 1454 .
Advanced	Select the encryption and authentication algorithms that will be proposed to the remote VPN peer. To establish a VPN connection, at least one of the proposals specified must match the configuration on the remote peer.
Encryption	The following symmetric-key encryption algorithms are available: <ul style="list-style-type: none"> <i>NULL</i>: do not use an encryption algorithm. <i>DES</i>: Digital Encryption Standard, a 64-bit block algorithm that uses a

56-bit key.

- *3DES*: triple-DES; plain text is encrypted three times by three keys.
- *AES128*: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key.
- *AES128GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2.
- *AES192*: a 128-bit block algorithm that uses a 192-bit key.
- *AES256*: a 128-bit block algorithm that uses a 256-bit key.
- *AES256GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2.
- *CHACHA20POLY1305*: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2.

See [ChaCha20 and Poly1305 AEAD cipher on page 1456](#), [AES-GCM for IKEv2 phase 1 on page 1456](#), and [HMAC settings](#).

Authentication

The following message digests that check the message authenticity during an encrypted session are available:

- *NULL*: do not use a message digest.
- *MD5*: message digest 5.
- *SHA1*: secure hash algorithm 1; a 160-bit message digest.
- *SHA256*: a 256-bit message digest.
- *SHA384*: a 384-bit message digest.
- *SHA512*: a 512-bit message digest.

See also [HMAC settings](#).

Enable Replay Detection

Replay attacks occur when an unauthorized party intercepts a series of IPsec packets and replays them back into the tunnel.

Replay detection allows the FortiGate to check all IPsec packets to see if they have been received before. If any encrypted packets arrive out of order, the FortiGate discards them.

Note that 64-bit extended sequence numbers (as described in RFC 4303, RFC 4304 as an addition to IKEv1, and RFC 5996 for IKEv2) are supported for IPsec when replay detection is enabled.

Enable Perfect Forward Secrecy (PFS)

Perfect forward secrecy (PFS) improves security by forcing a new Diffie-Hellman exchange whenever keylife expires.

Diffie-Hellman Group

Asymmetric key algorithms used for public key cryptography.

Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the *Diffie-Hellman Groups* (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.

Local Port

Enter the port number that the local VPN peer uses to transport traffic related to the specified service (protocol number). The range is from 0 to 65535. To specify all ports, select *All*, or enter 0.

Remote Port	Enter the port number that the remote VPN peer uses to transport traffic related to the specified service (protocol number). To specify all ports, select <i>All</i> , or enter 0.
Protocol	Enter the IP protocol number of the service. To specify all services, select <i>All</i> , or enter 0.
Auto-negotiate	Select this option for the tunnel to be automatically renegotiated when the it expires. See Auto-negotiate on page 1455 .
Autokey Keep Alive	Select this option for the tunnel to remain active when no data is being processed.
Key Lifetime	Select the method for determining when the phase 2 key expires: <ul style="list-style-type: none"> • <i>Seconds</i> • <i>Kilobytes</i> • <i>Both</i> Enter a corresponding value for <i>Seconds</i> and/or <i>Kilobytes</i> in the text boxes. If <i>Both</i> is selected, the key expires when either the time has passed or the number of kilobytes have been processed.

Quick mode selectors

Quick mode selectors determine which IP addresses can perform IKE negotiations to establish a tunnel. By only allowing authorized IP addresses access to the VPN tunnel, the network is more secure.

The default settings are as broad as possible: any IP address or configured address object using any protocol on any port.

While the dropdown menus for specifying an address also show address groups, the use of address groups may not be supported on a remote endpoint device that is not a FortiGate.

When configuring a quick mode selector for *Local Address* and *Remote Address*, valid options include IPv4 and IPv6 single addresses, subnets, or ranges.

There are some configurations that require specific selectors:

- The VPN peer is a third-party device that uses specific phase2 selectors.
- The FortiGate connects as a dialup client to another FortiGate, in which case (usually) you must specify a local IP address, IP address range, or subnet. However, this is not required if you are using dynamic routing and `mode-cfg`.

With FortiOS VPNs, your network has multiple layers of security, with quick mode selectors being an important line of defense:

- Routes guide traffic from one IP address to another.
- Phase 1 and phase 2 connection settings ensure there is a valid remote end point for the VPN tunnel that agrees on the encryption and parameters.
- Quick mode selectors allow IKE negotiations only for allowed peers.
- Security policies control which IP addresses can connect to the VPN.
- Security policies also control what protocols are allowed over the VPN along with any bandwidth limiting.

If you are editing an existing phase 2 configuration, the local address and remote address fields are unavailable if the tunnel has been configured to use firewall addresses as selectors. This option exists only in the CLI.

Using the add-route option

Consider using the `add-route` option to add a route to a peer destination selector in phase 2 to automatically match the settings in phase 1.

To configure add-route:

```
config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end
```

Auto-negotiate

By default, the phase 2 security association (SA) is not negotiated until a peer attempts to send data. The triggering packet and some subsequent packets are dropped until the SA is established. Applications normally resend this data, so there is no loss, but there might be a noticeable delay in response to the user.

If the tunnel goes down, the auto-negotiate feature (when enabled) attempts to re-establish the tunnel. Auto-negotiate initiates the phase 2 SA negotiation automatically, repeating every five seconds until the SA is established.

Automatically establishing the SA can be important for a dialup peer. It ensures that the VPN tunnel is available for peers at the server end to initiate traffic to the dialup peer. Otherwise, the VPN tunnel does not exist until the dialup peer initiates traffic.

To configure auto-negotiate:

```
config vpn ipsec phase2
    edit <phase2_name>
        set auto-negotiate enable
    next
end
```

Installing dynamic selectors via auto-negotiate

The IPsec SA connect message generated is used to install dynamic selectors. These selectors can be installed via the auto-negotiate mechanism. When phase 2 has `auto-negotiate` enabled, and phase 1 has `mesh-selector-type` set to `subnet`, a new dynamic selector will be installed for each combination of source and destination subnets. Each dynamic selector will inherit the auto-negotiate option from the template selector and begin SA negotiation. Phase 2 selector sources from dialup clients will all establish SAs without traffic being initiated from the client subnets to the hub.

DHCP

The `dhcp-ipsec` option lets the FortiGate assign VIP addresses to FortiClient dialup clients through a DHCP server or relay. This option is only available if the remote gateway in the phase 1 configuration is set to dialup user, and it only works in policy-based VPNs.

With `dhcp-ipsec`, the FortiGate dialup server acts as a proxy for FortiClient dialup clients that have VIP addresses on the subnet of the private network behind the FortiGate. In this case, the FortiGate dialup server acts as a proxy on the

local private network for the FortiClient dialup client. A host on the network behind the dialup server issues an ARP request, corresponding to the device MAC address of the FortiClient host (when a remote server sends an ARP to the local FortiClient dialup client). The FortiGate then answers the ARP request on behalf of the FortiClient host, and then forwards the associated traffic to the FortiClient host through the tunnel.

Acting as a proxy prevents the VIP address assigned to the FortiClient dialup client from causing possible ARP broadcast problems—the normal and VIP addresses can confuse some network switches when two addresses have the same MAC address.

ChaCha20 and Poly1305 AEAD cipher

In IKEv2 to support [RFC 7634](#), the ChaCha20 and Poly1305 crypto algorithms can be used together as a combined mode AEAD cipher (like AES-GCM) in the `crypto_ftnt` cipher in `cipher_chacha20poly1305.c`:

```
config vpn ipsec phase2-interface
  edit <name>
    set phase1name <name>
    set proposal chacha20poly1305
  next
end
```

AES-GCM for IKEv2 phase 1

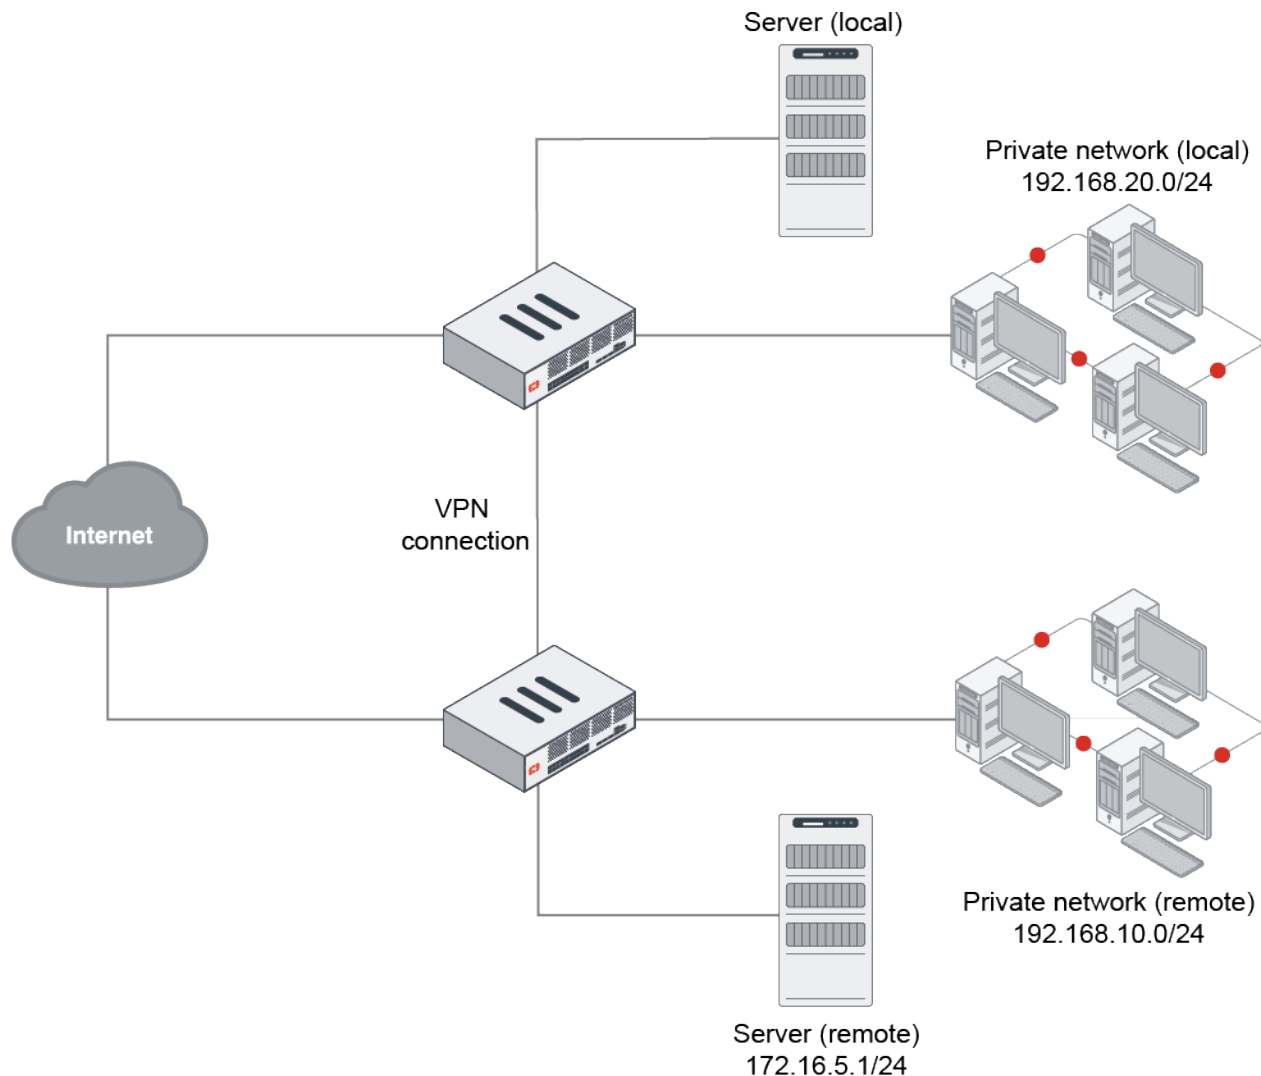

In IKEv2 to support [RFC 5282](#), the AEAD algorithm AES-GCM supports 128- and 256-bit variants:

```
config vpn ipsec phase2-interface
  edit <name>
    set phase1name <name>
    set proposal [aes128gcm | aes256gcm]
  next
end
```

VPN security policies

This section explains how to specify the source and destination IP addresses of traffic transmitted through an IPsec VPN, and how to define appropriate security policies.

Topology

Defining policy addresses

In a gateway-to-gateway, hub-and-spoke, dynamic DNS, redundant tunnel, or transparent configuration, you need to define a policy address for the private IP address of the network behind the remote VPN peer (for example, `192.168.10.0/255.255.255.0` or `192.168.10.0/24`).

In a peer-to-peer configuration, you need to define a policy address for the private IP address of a server or host behind the remote VPN peer (for example, `172.16.5.1/255.255.255.255`, `172.16.5.1/32`, or `172.16.5.1`).

For a FortiGate dialup server in a dialup-client or internet-browsing configuration, the source IP should reflect the IP addresses of the dialup clients:

Defining security policies

Policy-based and route-based VPNs require different security policies.

- A policy-based VPN requires an IPsec policy. You specify the interface to the private network, the interface to the remote peer and the VPN tunnel. A single policy can enable traffic inbound, outbound, or in both directions.
- A route-based VPN requires an accept policy for each direction. For the source and destination interfaces, you specify the interface to the private network and the virtual IPsec interface (phase 1 configuration) of the VPN. The IPsec interface is the destination interface for the outbound policy and the source interface for the inbound policy. One security policy must be configured for each direction of each VPN interface.

If the policy that grants the VPN connection is limited to certain services, DHCP must be included, otherwise the client will not be able to retrieve a lease from the FortiGate's (IPsec) DHCP server because the DHCP request (coming out of the tunnel) will be blocked.

Policy-based VPN

An IPsec policy enables the transmission and reception of encrypted packets, specifies the permitted direction of VPN traffic, and selects the VPN tunnel. In most cases, a single policy is needed to control both inbound and outbound IP traffic through a VPN tunnel. For a detailed example, see [Policy-based IPsec tunnel on page 1488](#). Be aware of the following before creating an IPsec policy.

Allow traffic to be initiated from the remote site

Policies specify which IP addresses can initiate a tunnel. By default, traffic from the local private network initiates the tunnel. When the *Allow traffic to be initiated from the remote site* option is selected, traffic from a dialup client, or a computer on a remote network, initiates the tunnel. Both can be enabled at the same time for bi-directional initiation of the tunnel.

Outbound and inbound NAT

When a FortiGate operates in NAT mode, you can enable inbound or outbound NAT. Outbound NAT may be performed on outbound encrypted packets or IP packets in order to change their source address before they are sent through the tunnel. Inbound NAT is performed to intercept and decrypt emerging IP packets from the tunnel.

By default, these options are not selected in security policies and can only be set through the CLI.

Defining multiple IPsec policies for the same tunnel

You must define at least one IPsec policy for each VPN tunnel. If the same remote server or client requires access to more than one network behind a local FortiGate, the FortiGate must be configured with an IPsec policy for each network. Multiple policies may be required to configure redundant connections to a remote destination or control access to different services at different times.

To ensure a secure connection, the FortiGate must evaluate policies with *Action* set to *IPsec* before *ACCEPT* and *DENY*. Because the FortiGate unit reads policies starting at the top of the list, you must move all IPsec policies to the top of the list, and be sure to reorder your multiple IPsec policies that apply to the tunnel so that specific constraints can be evaluated before general constraints. If you create two equivalent IPsec policies for two different tunnels, the system will select the correct policy based on the specified source and destination addresses.

Adding multiple IPsec policies for the same VPN tunnel can cause conflicts if the policies specify similar source and destination addresses, but have different settings for the same service. When policies overlap in this manner, the system may apply the wrong IPsec policy or the tunnel may fail.

Route-based VPN

When you define a route-based VPN, you create a virtual IPsec interface on the physical interface that connects to the remote peer. You create ordinary accept policies to enable traffic between the IPsec interface and the interface that connects to the private network. This makes configuration simpler than for policy-based VPNs.

To configure policies for a route-based VPN:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* and define an *ACCEPT* policy to permit communication between the local private network and the private network behind the remote peer and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the interface that connects to the private network behind this FortiGate.
Outgoing Interface	Select the IPsec interface you configured.
Source	Select the address name you defined for the private network behind this FortiGate.
Destination	Select the address name you defined for the private network behind the remote peer.
Action	Select <i>ACCEPT</i> .
NAT	Disable <i>NAT</i> .

3. Click *OK*.
To permit the remote client to initiate communication, you need to define a security policy for communication in that direction.
4. Click *Create New* and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the IPsec interface you configured.
Outgoing Interface	Select the interface that connects to the private network behind this FortiGate.
Source	Select the address name you defined for the private network behind the remote peer.
Destination	Select the address name you defined for the private network behind this FortiGate.
Action	Select <i>ACCEPT</i> .
NAT	Disable <i>NAT</i> .

5. Click *OK*.

Blocking unwanted IKE negotiations and ESP packets with a local-in policy

It is not unusual to receive IPsec connection attempts or malicious IKE packets from all over the internet. Malicious parties use these probes to try to establish an IPsec tunnel in order to gain access to your private network. A good way to prevent this is to use local-in policies to deny such traffic.

Sometimes there are malicious attempts using crafted invalid ESP packets. These invalid attempts are automatically blocked by the FOS IPsec local-in handler when it checks the SPI value against the SAs of existing tunnels. The IPsec local-in handler processes the packet instead of the firewall's local-in handler. So when these attempts are blocked, you will notice an `unknown SPI` message in your VPN logs instead of being silently blocked by your local-in policy. These log messages are rate limited.

Sample log and alert email

Message meets Alert condition

```
date=2020-08-11 time=09:28:40 devname=toSite1 devid=FGT60Fxxxxxxxxxx logid="0101037131"
type="event" subtype="vpn" level="error" vd="root" eventtime=1597163320747963100 tz="-0700"
logdesc="IPsec ESP" msg="IPsec ESP" action="error" remip=131.62.25.102 locip=192.157.116.88
remport=40601 locport=500 outintf="wan1" cookies="N/A" user="N/A" group="N/A"
xauthuser="N/A" xauthgroup="N/A" assignip=N/A vpntunnel="N/A" status="esp_error" error_
num="Received ESP packet with unknown SPI." spi="f6c9e2x1" seq="02000400"
```

Note that invalid SPIs may not always indicate malicious activity. For example, the SPI may not match during rekey, or when one unit flushes its tunnel SAs. Administrators should collect as much information as possible before making a conclusion.

To block undesirable IPsec connection attempts and IKE packets using a local-in policy:

1. Configure an address group that excludes legitimate IPs:

```
config firewall addrgrp
  edit "All_exceptions"
    set member "all"
    set exclude enable
    set exclude-member "remote-vpn"
  next
end
```

2. Create a local-in policy that blocks IKE traffic from the address group:

```
config firewall local-in-policy
  edit 1
    set intf "wan1"
    set srcaddr "All_exceptions"
    set dstaddr "all"
    set service "IKE"
    set schedule "always"
  next
end
```

The default action is deny.

3. Verify the traffic blocked by the local-in policy:

```
# diagnose debug flow filter dport 500
# diagnose debug flow trace start 10
# diagnose debug enable

id=20085 trace_id=290 func=print_pkt_detail line=5588 msg="vd-root:0 received a packet
(proto=17, 10.10.10.13:500->10.10.10.1:500) from wan1. "
id=20085 trace_id=290 func=init_ip_session_common line=5760 msg="allocate a new session-
003442e7"

failed on policy 1, drop"
```

Configurable IKE port

Some ISPs block UDP port 500 or UDP port 4500, preventing an IPsec VPN from being negotiated and established. To accommodate this, the IKE port can be changed.

To set the IKE port:

```
config system settings
    set ike-port <integer>
end
```

ike-port

UDP port for IKE/IPsec traffic (1024 - 65535, default = 500).

Example 1: site-to-site VPN without NAT

In this example, the IKE port is set to 6000 on the two site-to-site VPN gateways. There is no NAT between the VPN gateways, but the ISP has blocked UDP port 500. A site-to-site VPN is established using the defined IKE port.

To set the IKE port:

```
config system settings
    set ike-port 6000
end
```

To configure and check the site-to-site VPN:**1. Configure the phase1 and phase2 interfaces:**

```
config vpn ipsec phase1-interface
    edit "s2s"
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
        chacha20poly1305-prfsha256
        set wizard-type static-fortigate
        set remote-gw 11.101.1.1
```

```

        set psksecret *****
    next
end
config vpn ipsec phase2-interface
    edit "s2s"
        set phase1name "s2s"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "s2s_local"
        set dst-name "s2s_remote"
    next
end

```

2. Check the IKE gateway list and confirm that the specified port is used:

```

# diagnose vpn ike gateway list

vd: root/0
name: s2s
version: 2
interface: port27 17
addr: 173.1.1.1:6000 -> 11.101.1.1:6000
tun_id: 11.101.1.1
remote_location: 0.0.0.0
created: 194s ago
PPK: no
IKE SA: created 1/2 established 1/2 time 0/4500/9000 ms
IPsec SA: created 1/2 established 1/2 time 0/4500/9000 ms
...

```

3. Check the VPN tunnel list:

```

# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=s2s ver=2 serial=1 173.1.1.1:6000->11.101.1.1:6000 tun_id=11.101.1.1 dst_mtu=1500
dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=auto/1 encaps=none/520 options[0208]=npu
frag-rfc run_state=0 accept_traffic=1 overlay_id=0
...

```

Example 2: dialup VPN with NAT

In this example, the IKE port is set to 5000 on the VPN gateway and the dialup peer. The dialup peer is behind NAT, so NAT traversal (NAT-T) is used. The ISP blocks both UDP port 500 and UDP port 4500. The VPN connection is initiated on UDP port 5000 from the dialup VPN client and remains on port 5000 since NAT-T floating to 4500 is only required when the IKE port is 500.

To set the IKE port:

```

config system settings
    set ike-port 5000
end

```

To configure and check the dialup VPN with NAT:

1. Configure the phase1 and phase2 interfaces:

```

config vpn ipsec phase1-interface
  edit "server"
    set type dynamic
    set interface "port27"
    set ike-version 2
    set peertype any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
    set dpd on-idle
    set wizard-type static-fortigate
    set psksecret *****
    set dpd-retryinterval 60
  next
end
config vpn ipsec phase2-interface
  edit "server"
    set phaselname "server"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    set src-addr-type name
    set dst-addr-type name
    set src-name "server_local"
    set dst-name "server_remote"
  next
end

```

2. Check the IKE gateway list and confirm that the specified port is used:

```

# diagnose vpn ike gateway list

vd: root/0
name: server_0
version: 2
interface: port27 17
addr: 173.1.1.1:5000 -> 173.1.1.2:65416
tun_id: 173.1.1.2
remote_location: 0.0.0.0
created: 90s ago
nat: peer
PPK: no
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
...

```

3. Check the VPN tunnel list:

```

# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=server_0 ver=2 serial=a 173.1.1.1:5000->173.1.1.2:65416 tun_id=173.1.1.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=dial_inst/3 encap=none/904 options

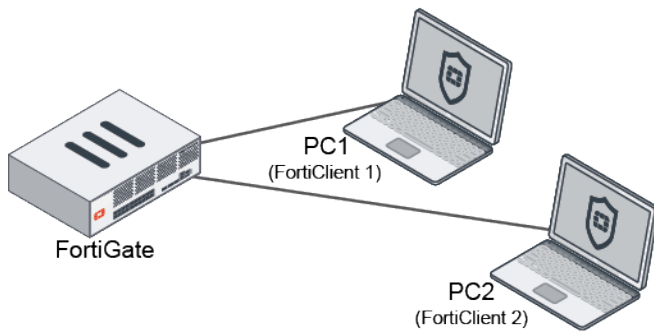

```

```
[0388]=npu rgwy-chg rport-chg frag-rfc run_state=0 accept_traffic=1 overlay_id=0
...
```

IPsec VPN IP address assignments

When a user disconnects from a VPN tunnel, it is not always desirable for the released IP address to be used immediately. In IPsec VPN, IP addresses can be held for the specified delay interval before being released back into the pool for assignment. The first-available address assignment method is still used.

Example

In this example, two PCs connect to the VPN. The IP address reuse delay interval is used to prevent a released address from being reused for at least four minutes. After the interval elapses, the IP address becomes available to clients again. Dual stack address assignment (both IPv4 and IPv6) is used.

To configure IPsec VPN with an IP address reuse delay interval:

1. Configure the IPsec phase1 interface, setting the IP address reuse delay interval to 240 seconds:

```
config vpn ipsec phase1-interface
  edit "FCT"
    set type dynamic
    set interface "port27"
    set mode aggressive
    set peertype any
    set net-device disable
    set mode-cfg enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set wizard-type dialup-forticlient
    set xauthtype auto
    set authusrgrp "local-group"
    set ipv4-start-ip 10.20.1.1
    set ipv4-end-ip 10.20.1.100
    set dns-mode auto
    set ipv4-split-include "FCT_split"
    set ipv6-start-ip 2001::1
    set ipv6-end-ip 2001::2
    set ip-delay-interval 240
    set save-password enable
    set psksecret *****
  next
end
```

2. Configure the IPsec phase2 interface:

```
config vpn ipsec phase2-interface
  edit "FCT"
    set phasename "FCT"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
  next
  edit "FCT6"
    set phasename "FCT"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    set src-addr-type subnet6
    set dst-addr-type subnet6
  next
end
```

To test the results:

1. Connect to the VPN with FortiClient 1 on PC1 then check the assigned IP address:

```
# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:60417
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 14s ago
xauth-user: userc
2FA: no
FortiClient UID: 7C0897D80C8E4B6DAC775DD6B0F93BAA
assigned IPv4 address: 10.20.1.1/255.255.255.255
assigned IPv6 address: 2001::1/128
nat: peer
IKE SA: created 1/1 established 1/1 time 100/100/100 ms
IPsec SA: created 2/2 established 2/2 time 0/5/10 ms

id/spi: 2 66140ba3e38b9b07/b64668f110ca4a48
direction: responder
status: established 14-14s ago = 100ms
proposal: aes256-sha256
key: 356637ee6e9a9cb5-fade432c09efb8aa-54be307fc1eeeab5-6e4b9ef19f98d5fa
lifetime/rekey: 86400/86115
DPD sent/recv: 00000000/00000394
```

2. Disconnect FortiClient 1 and connect with FortiClient 2. The IP address assigned to FortiClient 1 is not released to the pool, and a different IP address is assigned to FortiClient 2:

```
# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
```

```

interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:64916
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 6s ago
xauth-user: usera
2FA: no
FortiClient UID: EAF90E297393456AB546A041066C0720
assigned IPv4 address: 10.20.1.2/255.255.255.255
assigned IPv6 address: 2001::2/128
nat: peer
IKE SA: created 1/1 established 1/1 time 110/110/110 ms
IPsec SA: created 2/2 established 2/2 time 0/5/10 ms

id/spi: 3 b25141d5a915e67e/b32decdb8cf98318
direction: responder
status: established 6-6s ago = 110ms
proposal: aes256-sha256
key: 374ab753f3207ea0-83496b5cb24b5a8d-c51da1fd505cf3a4-727884839897808a
lifetime/rekey: 86400/86123
DPD sent/recv: 00000000/00000453

```

3. Wait for 240 seconds, then disconnect and reconnect FortiClient 2. The IP address previously assigned to FortiClient 1 has been released back to the pool, and is assigned to FortiClient 2:

```

# diagnose vpn ike gateway list

vd: root/0
name: FCT_0
version: 1
interface: port27 17
addr: 173.1.1.1:4500 -> 173.1.1.2:64916
tun_id: 173.1.1.2
remote_location: 0.0.0.0
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 20s ago
xauth-user: usera
2FA: no
FortiClient UID: EAF90E297393456AB546A041066C0720
assigned IPv4 address: 10.20.1.1/255.255.255.255
assigned IPv6 address: 2001::1/128
nat: peer
IKE SA: created 1/1 established 1/1 time 100/100/100 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms

id/spi: 4 fb1fbad0c12f5476/aa06a2de76964f63
direction: responder
status: established 20-20s ago = 100ms
proposal: aes256-sha256
key: af43f1bb876dc79c-16448592fe608dc3-f251746d71b2c35d-c848e8c03bf738e9
lifetime/rekey: 86400/86109
DPD sent/recv: 00000000/000000a9

```

Instead of waiting for 240 seconds, you can instead use the `diagnose vpn ike gateway flush` command to release the previously used IP addresses back into the pool.

Site-to-site VPN

A site-to-site VPN connection lets branch offices use the Internet to access the main office's intranet. A site-to-site VPN allows offices in multiple, fixed locations to establish secure connections with each other over a public network such as the Internet.

The following sections provide instructions for configuring site-to-site VPNs:

- [FortiGate-to-FortiGate on page 1467](#)
- [FortiGate-to-third-party on page 1495](#)

FortiGate-to-FortiGate

This section contains the following topics about FortiGate-to-FortiGate VPN configurations:

- [Basic site-to-site VPN with pre-shared key on page 1467](#)
- [Site-to-site VPN with digital certificate on page 1472](#)
- [Site-to-site VPN with overlapping subnets on page 1479](#)
- [GRE over IPsec on page 1483](#)
- [Policy-based IPsec tunnel on page 1488](#)

Basic site-to-site VPN with pre-shared key

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a pre-shared key.

To configure IPsec VPN authenticating a remote FortiGate peer with a pre-shared key in the GUI:

1. Configure the HQ1 FortiGate.
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *No NAT Between Sites*.
 - v. Click *Next*.

- b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. For the IP address, enter *172.16.202.1*.
 - iii. For *Outgoing interface*, enter *port1*.
 - iv. For *Authentication Method*, select *Pre-shared Key*.
 - v. In the *Pre-shared Key* field, enter *sample* as the key.
 - vi. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure the *Local Subnets* as *10.1.100.0*.
 - iii. Configure the *Remote Subnets* as *172.16.101.0*.
 - iv. Click *Create*.
2. Configure the HQ2 FortiGate.
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *No NAT Between Sites*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. For the IP address, enter *172.16.2001*.
 - iii. For *Outgoing interface*, enter *port25*.
 - iv. For *Authentication Method*, select *Pre-shared Key*.
 - v. In the *Pre-shared Key* field, enter *sample* as the key.
 - vi. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure *Local Subnets* as *172.16.101.0*.
 - iii. Configure the *Remote Subnets* as *10.1.100.0*.
 - iv. Click *Create*.

To configure IPsec VPN authenticating a remote FortiGate peer with a pre-shared key using the CLI:

1. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.
 - a. Configure HQ1.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 172.16.200.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.200.3
    set device "port1"
```

```
    next
end
```

b. Configure HQ2.

```
config system interface
    edit "port25"
        set vdom "root"
        set ip 172.16.202.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

2. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.**a. Configure HQ1.**

```
config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end
```

b. Configure HQ2.

```
config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
```

3. Configure the IPsec phase1-interface.**a. Configure HQ1.**

```
config vpn ipsec phase1-interface
    edit "to_HQ2"
        set interface "port1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
    next
end
```

b. Configure HQ2.

```
config vpn ipsec phase1-interface
    edit "to_HQ1"
        set interface "port25"
        set peertype any
        set net-device enable
```

```

        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample
    next
end

```

4. Configure the IPsec phase2-interface.

a. Configure HQ1.

```

config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

b. Configure HQ2.

```

config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

5. Configure the static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

a. Configure HQ1.

```

config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "to_HQ2"
    next
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end

```

b. Configure HQ2.

```

config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ1"
    next
    edit 3
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end

```

6. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.**a. Configure HQ1.**

```
config firewall policy
  edit 1
    set name "inbound"
    set srcintf "to_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "outbound"
    set srcintf "dmz"
    set dstintf "to_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

b. Configure HQ2.

```
config firewall policy
  edit 1
    set name "inbound"
    set srcintf "to_HQ1"
    set dstintf "port9"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "outbound"
    set srcintf "port9"
    set dstintf "to_HQ1"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

7. Run diagnose commands. The diagnose debug application ike -1 command is the key to troubleshoot why the IPsec tunnel failed to establish. If the PSK failed to match, the following error shows up in the debug output:

```
ike 0:to_HQ2:15037: parse error
ike 0:to_HQ2:15037: probable pre-shared secret mismatch'
```

The following commands are useful to check IPsec phase1/phase2 interface status.

- a. Run the `diagnose vpn ike gateway list` command on HQ1. The system should return the following:

```
vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 5s ago
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms
id/spi: 12 6e8d0532e7fe8d84/3694ac323138a024
direction: responder
status: established 5-5s ago = 0ms
proposal: aes128-sha256
key: b3efb46d0d385aff-7bb9ee241362ee8d
lifetime/rekey: 86400/86124
DPD sent/recv: 00000000/00000000
```

- b. Run the `diagnose vpn tunnel list` command on HQ1. The system should return the following:

```
list all ipsec tunnel in vd 0
name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1

Site-to-site VPN with digital certificate

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a certificate. The certificate on one peer is validated by the presence of the CA certificate installed on the other peer.

To configure IPsec VPN authenticating a remote FortiGate peer with a digital certificate in the GUI:

1. Import the certificate.
2. Configure user peers.
3. Configure the HQ1 FortiGate.
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *No NAT Between Sites*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. For the IP address, enter *172.16.202.1*.
 - iii. For *Outgoing interface*, enter *port1*.
 - iv. For *Authentication Method*, select *Signature*.
 - v. In the *Certificate name* field, select the imported certificate.
 - vi. From the *Peer Certificate CA* dropdown list, select the desired peer CA certificate.
 - vii. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure the *Local Subnets* as *10.1.100.0*.
 - iii. Configure the *Remote Subnets* as *172.16.101.0*.
 - iv. Click *Create*.
4. Configure the HQ2 FortiGate.
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *No NAT Between Sites*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. For the IP address, enter *172.16.2001*.
 - iii. For *Outgoing interface*, enter *port25*.
 - iv. For *Authentication Method*, select *Signature*.
 - v. In the *Certificate name* field, select the imported certificate.
 - vi. From the *Peer Certificate CA* dropdown list, select the peer CA certificate.
 - vii. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure *Local Subnets* as *172.16.101.0*.
 - iii. Configure the *Remote Subnets* as *10.1.100.0*.
 - iv. Click *Create*.

To configure IPsec VPN authenticating a remote FortiGate peer with a digital certificate using the CLI:

1. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.

- a. Configure HQ1.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 172.16.200.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.200.3
    set device "port1"
  next
end
```

- b. Configure HQ2.

```
config system interface
  edit "port25"
    set vdom "root"
    set ip 172.16.202.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.202.2
    set device "port25"
  next
end
```

2. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.

- a. Configure HQ1.

```
config system interface
  edit "dmz"
    set vdom "root"
    set ip 10.1.100.1 255.255.255.0
  next
end
```

- b. Configure HQ2.

```
config system interface
  edit "port9"
    set vdom "root"
    set ip 172.16.101.1 255.255.255.0
  next
end
```

3. Configure the import certificate and its CA certificate information. The certificate and its CA certificate must be imported on the remote peer FortiGate and on the primary FortiGate before configuring IPsec VPN tunnels. If the built-in Fortinet_Factory certificate and the Fortinet_CA CA certificate are used for authentication, you can skip this step.

a. Configure HQ1.

```
config vpn certificate local
  edit "test1"
    ...
    set range global
  next
end
config vpn certificate ca
  edit "CA_Cert_1"
    ...
    set range global
  next
end
```

b. Configure HQ2.

```
config vpn certificate local
  edit "test2"
    ...
    set range global
  next
end
config vpn certificate ca
  edit "CA_Cert_1"
    ...
    set range global
  next
end
```

4. Configure the peer user. The peer user is used in the IPsec VPN tunnel peer setting to authenticate the remote peer FortiGate.**a. If not using the built-in Fortinet_Factory certificate and Fortinet_CA CA certificate, do the following:****i. Configure HQ1.**

```
config user peer
  edit "peer1"
    set ca "CA_Cert_1"
  next
end
```

ii. Configure HQ2.

```
config user peer
  edit "peer2"
    set ca "CA_Cert_1"
  next
end
```

b. If the built-in Fortinet_Factory certificate and Fortinet_CA CA certificate are used for authentication, the peer user must be configured based on Fortinet_CA.**i. Configure HQ1.**

```
config user peer
  edit "peer1"
    set ca "Fortinet_CA"
  next
end
```

ii. Configure HQ2.

```
config user peer
  edit "peer2"
    set ca "Fortinet_CA"
  next
end
```

5. Configure the IPsec phase1-interface.**a. Configure HQ1.**

```
config vpn ipsec phase1-interface
  edit "to_HQ2"
    set interface "port1"
    set authmethod signature
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set certificate "test1"
    set peer "peer1"
  next
end
```

b. Configure HQ2.

```
config vpn ipsec phase1-interface
  edit "to_HQ1"
    set interface "port25"
    set authmethod signature
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.200.1
    set certificate "test2"
    set peer "peer2"
  next
end
```

6. Configure the IPsec phase2-interface.**a. Configure HQ1.**

```
config vpn ipsec phase2-interface
  edit "to_HQ2"
    set phase1name "to_HQ2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
end
```

b. Configure HQ2.

```
config vpn ipsec phase2-interface
  edit "to_HQ2"
    set phase1name "to_HQ1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
end
```

7. Configure the static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

a. Configure HQ1.

```
config router static
  edit 2
    set dst 172.16.101.0 255.255.255.0
    set device "to_HQ2"
  next
  edit 3
    set dst 172.16.101.0 255.255.255.0
    set blackhole enable
    set distance 254
  next
end
```

b. Configure HQ2.

```
config router static
  edit 2
    set dst 10.1.100.0 255.255.255.0
    set device "to_HQ1"
  next
  edit 3
    set dst 10.1.100.0 255.255.255.0
    set blackhole enable
    set distance 254
  next
end
```

8. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.

a. Configure HQ1.

```
config firewall policy
  edit 1
    set name "inbound"
    set srcintf "to_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "outbound"
    set srcintf "dmz"
    set dstintf "to_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

b. Configure HQ2.

```

config firewall policy
  edit 1
    set name "inbound"
    set srcintf "to_HQ1"
    set dstintf "port9"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "outbound"
    set srcintf "port9"
    set dstintf "to_HQ1"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end

```

- 9. Run diagnose commands.** The diagnose debug application ike -1 command is the key to troubleshoot why the IPsec tunnel failed to establish. If the remote FortiGate certificate cannot be validated, the following error shows up in the debug output:

```
ike 0: to_HQ2:15314: certificate validation failed
```

The following commands are useful to check IPsec phase1/phase2 interface status.

- a. Run the diagnose vpn ike gateway list command on HQ1.** The system should return the following:

```

vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 7s ago
peer-id: C = CA, ST = BC, L = Burnaby, O = Fortinet, OU = QA, CN = test2
peer-id-auth: yes
IKE SA: created 1/1 established 1/1 time 70/70/70 ms
IPsec SA: created 1/1 established 1/1 time 80/80/80 ms
id/spi: 15326 295be407fbddfc13/7a5a52afa56adf14 direction: initiator status:

Site-to-site VPN with overlapping subnets

This is a sample configuration of IPsec VPN to allow transparent communication between two overlapping networks that are located behind different FortiGates using a route-based tunnel with source and destination NAT.

In the following topology, both FortiGates (HQ and Branch) use 192.168.1.0/24 as their internal network, but both networks need to be able to communicate to each other through the IPsec tunnel.

New virtual subnets of equal size must be configured and used for all communication between the two overlapping subnets. The devices on both local networks do not need to change their IP addresses. However, the devices and users must use the new subnet range of the remote network to communicate across the tunnel.

Configuring the HQ FortiGate

To configure IPsec VPN:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. Enter the name *VPN-to-Branch* and click *Next*.
3. For the *IP Address*, enter the Branch public IP address (*172.25.177.46*), and for *Interface*, select the HQ WAN interface (*wan1*).
4. For *Pre-shared Key*, enter a secure key. You will use the same key when configuring IPsec VPN on the Branch FortiGate.

5. In the *Phase 2 Selectors* section, enter the subnets for the *Local Address* (10.1.1.0/24) and *Remote Address* (10.2.2.0/24).
6. Optionally, expand *Advanced* and enable *Auto-negotiate*.
7. Click *OK*.

To configure the static routes:

1. Go to *Network > Static Routes* and click *Create New*.
2. In the *Destination* field, enter the remote address subnet (10.2.2.0/24).
3. For *Interface*, select the VPN tunnel you just created, *VPN-to-Branch*.
4. Click *OK*.
5. Create another route with the same *Destination*, but change the *Administrative Distance* to 200 and for *Interface*, select *Blackhole*. This is a best practice for route-based IPsec VPN tunnels because it ensures traffic for the remote FortiGate's subnet is not sent using the default route in the event that the IPsec tunnel goes down.

To configure the address objects:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. For *Name*, enter *HQ-original*.
3. For *IP/Netmask*, enter the original LAN subnet of HQ (192.168.1.0/24).
4. For *Interface*, select the LAN-side interface (*internal*).
5. Click *OK*.
6. Create another address object named *Branch-new*, but for *IP/Netmask*, enter the new LAN subnet of Branch (10.2.2.0/24), and select the VPN interface (*VPN-to-Branch*).

To configure the IP pool:

1. Go to *Policy & Objects > IP Pools* and click *Create New*.
2. For *Name*, enter *HQ-new*.
3. For *Type*, select *Fixed Port Range*.
4. Enter the *External IP address/range* (10.1.1.1 – 10.1.1.254, the new HQ subnet) and *Internal IP Range* (192.168.1.1 – 192.168.1.254, the original HQ subnet).
5. Click *OK*.

To configure the VIP:

1. Go to *Policy & Objects > Virtual IPs* and click *Create New > Virtual IP*.
2. For *Name*, enter *HQ-new-to-original*.
3. For *Interface*, select the VPN interface (*VPN-to-Branch*).
4. Enter the *External IP address/range* (10.1.1.1 – 10.1.1.254, the new HQ subnet) and *Map to IPv4 address/range* (192.168.1.1 – 192.168.1.254, the original HQ subnet).
5. Click *OK*.

To configure the firewall policy for traffic from HQ to Branch:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. For *Name*, enter *From-HQ-to-Branch*.
3. For *Incoming Interface*, select the LAN-side interface (*internal*).
4. For *Outgoing Interface*, select the VPN tunnel interface (*VPN-to-Branch*).

5. For *Source*, select *HQ-original*.
6. For *Destination*, select *Branch-new*.
7. For *Service*, select *ALL*.
8. Enable *NAT*.
9. Select *Use Dynamic IP Pool* and select the *HQ-new* IP pool.
10. Click *OK*.

To configure the firewall policy for traffic from Branch to HQ:

1. Click *Create New* and for *Name*, enter *From-Branch-to HQ*.
2. For *Incoming Interface*, select the VPN tunnel interface (*VPN-to-Branch*).
3. For *Outgoing Interface*, select the LAN-side interface (*internal*).
4. For *Source*, select *Branch-new*.
5. For *Destination*, select the *HQ-new-to-original* VIP.
6. For *Service*, select *ALL*.
7. Disable *NAT*.
8. Click *OK*.

Configuring the Branch FortiGate

To configure IPsec VPN:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. Enter the name *VPN-to-HQ* and click *Next*.
3. For the *IP Address*, enter the HQ public IP address (*172.25.176.142*), and for *Interface*, select the Branch WAN interface (*wan1*).
4. For *Pre-shared Key*, enter the matching secure key used in the *VPN-to-Branch* tunnel.
5. In the *Phase 2 Selectors* section, enter the subnets for the *Local Address* (*10.2.2.0/24*) and *Remote Address* (*10.1.1.0/24*).
6. Optionally, expand *Advanced* and enable *Auto-negotiate*.
7. Click *OK*.

To configure the static routes:

1. Go to *Network > Static Routes* and click *Create New*.
2. In the *Destination* field, enter the remote address subnet (*10.1.1.0/24*).
3. For *Interface*, select the VPN tunnel you just created, *VPN-to-HQ*.
4. Click *OK*.
5. Create another route with the same *Destination*, but change the *Administrative Distance* to *200* and for *Interface*, select *Blackhole*.

To configure the address objects:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. For *Name*, enter *Branch-original*.
3. For *IP/Netmask*, enter the original LAN subnet of Branch (*192.168.1.0/24*).
4. For *Interface*, select the LAN-side interface (*lan*).
5. Click *OK*.

6. Create another address object named *HQ-new*, but for *IP/Netmask*, enter the new LAN subnet of HQ (*10.1.1.0/24*), and select the VPN interface (*VPN-to-HQ*).

To configure the IP pool:

1. Go to *Policy & Objects > IP Pools* and click *Create New*.
2. For *Name*, enter *Branch-new*.
3. For *Type*, select *Fixed Port Range*.
4. Enter the *External IP address/range* (*10.2.2.1 – 10.2.2.254*, the new Branch subnet) and *Internal IP Range* (*192.168.1.1 – 192.168.1.254*, the original Branch subnet).
5. Click *OK*.

To configure the VIP:

1. Go to *Policy & Objects > Virtual IPs* and click *Create New > Virtual IP*.
2. For *Name*, enter *Branch-new-to-original*.
3. For *Interface*, select the VPN interface (*VPN-to-HQ*).
4. Enter the *External IP address/range* (*10.2.2.1 – 10.2.2.254*, the new Branch subnet) and *Map to IPv4 address/range* (*192.168.1.1 – 192.168.1.254*, the original Branch subnet).
5. Click *OK*.

To configure the firewall policy for traffic from Branch to HQ:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. For *Name*, enter *From-Branch-to-HQ*.
3. For *Incoming Interface*, select the LAN-side interface (*lan*).
4. For *Outgoing Interface*, select the VPN tunnel interface (*VPN-to-HQ*).
5. For *Source*, select *Branch-original*.
6. For *Destination*, select *HQ-new*.
7. For *Service*, select *ALL*.
8. Enable *NAT*.
9. Select *Use Dynamic IP Pool* and select the *Branch-new* IP pool.
10. Click *OK*.

To configure the firewall policy for traffic from HQ to Branch:

1. Click *Create New* and for *Name*, enter *From-HQ-to-Branch*.
2. For *Incoming Interface*, select the VPN tunnel interface (*VPN-to-HQ*).
3. For *Outgoing Interface*, select the LAN-side interface (*lan*).
4. For *Source*, select *HQ-new*.
5. For *Destination*, select the *Branch-new-to-original* VIP.
6. For *Service*, select *ALL*.
7. Disable *NAT*.
8. Click *OK*.

To verify the communication across the tunnel:

1. Go to *Dashboard > Network* and click the *IPsec* widget to expand to full screen view. The tunnels should be up on both FortiGates. If you did not enable *Auto-negotiate* in the IPsec VPN settings, you may have to select the tunnel and click *Bring Up*.
2. From a PC on the HQ network, ping a PC on the Branch network using the new IP for the Branch PC. The ping should be successful.

```
C:\Users\jheadley>ping 10.2.2.98

Pinging 10.2.2.98 with 32 bytes of data:
Reply from 10.2.2.98: bytes=32 time=7ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62

```

GRE over IPsec

This is an example of GRE over an IPsec tunnel using a static route over GRE tunnel and `tunnel-mode` in the `phase2-interface` settings.

To configure GRE over an IPsec tunnel:**1. Enable subnet overlapping at both HQ1 and HQ2.**

```
config system settings
    set allow-subnet-overlap enable
end
```

2. Configure the WAN interface and static route.**a. HQ1.**

```
config system interface
    edit "port1"
        set ip 172.16.200.1 255.255.255.0
    next
    edit "dmz"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
end
```

b. HQ2.

```
config system interface
    edit "port25"
        set ip 172.16.202.1 255.255.255.0
    next
    edit "port9"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

3. Configure IPsec phase1-interface and phase2-interface.**a. HQ1.**

```
config vpn ipsec phase1-interface
    edit "greipsec"
        set interface "port1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
    next
end
config vpn ipsec phase2-interface
    edit "greipsec"
        set phasename "greipsec"
```

```
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set protocol 47
    next
end
```

b. HQ2.

```
config vpn ipsec phase1-interface
    edit "greipsec"
        set interface "port25"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample
    next
end
config vpn ipsec phase2-interface
    edit "greipsec"
        set phase1name "greipsec"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set protocol 47
    next
end
```

4. Configure IPsec tunnel interface IP address.**a. HQ1.**

```
config system interface
    edit "greipsec"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
end
```

b. HQ2.

```
config system interface
    edit "greipsec"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
    next
end
```

5. Configure the GRE tunnel.**a. HQ1.**

```
config system gre-tunnel
    edit "gre_to_HQ2"
        set interface "greipsec"
        set remote-gw 10.10.10.2
        set local-gw 10.10.10.1
    next
end
```

b. HQ2.

```
config system gre-tunnel
  edit "gre_to_HQ1"
    set interface "greipsec"
    set remote-gw 10.10.10.1
    set local-gw 10.10.10.2
  next
end
```

6. Configure the firewall policy.**a. HQ1.**

```
config firewall policy
  edit 1
    set srcintf "dmz"
    set dstintf "gre_to_HQ2"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set srcintf "gre_to_HQ2"
    set dstintf "dmz"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 3
    set srcintf "greipsec"
    set dstintf "greipsec"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

b. HQ2.

```
config firewall policy
  edit 1
    set srcintf "port9"
    set dstintf "gre_to_HQ1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set srcintf "gre_to_HQ1"
    set dstintf "port9"
```

```

        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set srcintf "greipsec"
        set dstintf "greipsec"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

7. Configure the static route.

a. HQ1.

```

config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "gre_to_HQ2"
    next
end

```

b. HQ2.

```

config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "gre_to_HQ1"
    next
end

```

To view the VPN tunnel list on HQ1:

```

diagnose vpn tunnel list

S     172.16.101.0/24 [10/0] is directly connected, gre_to_HQ2
```

Policy-based IPsec tunnel

This is an example of policy-based IPsec tunnel using site-to-site VPN between branch and HQ. HQ is the IPsec concentrator.

Sample topology

Sample configuration

To configure a policy-based IPsec tunnel using the GUI:

- Configure the IPsec VPN at HQ.
- Configure the IPsec concentrator at HQ.
- Configure the firewall policy at HQ.
- Configure IPsec VPN at branch 1.
- Configure the firewall policy at branch 1.
- Configure IPsec VPN at branch 2.
- Configure the firewall policy at branch 2.

To configure the IPsec VPN at HQ:

1. Go to *VPN > IPsec Wizard* to set up branch 1.
 - a. Enter a *VPN Name*. In this example, *to_branch1*.
 - b. For *Template Type*, click *Custom*. Click *Next*.
 - c. Uncheck *Enable IPsec Interface Mode*.
 - d. For *Remote Gateway*, select *Static IP Address*.

- e. Enter IP address, in this example, *15.1.1.2*.
 - f. For *Interface*, select *port9*.
 - g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
 - h. Click *OK*.
2. Go to *VPN > IPsec Wizard* to set up branch 2.
 - a. Enter a *VPN Name*. In this example, *to_branch2*.
 - b. For *Template Type*, click *Custom*. Click *Next*.
 - c. Uncheck *Enable IPsec Interface Mode*.
 - d. For *Remote Gateway*, select *Static IP Address*.
 - e. Enter IP address, in this example, *13.1.1.2*.
 - f. For *Interface*, select *port9*.
 - g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
 - h. Click *OK*.

To configure the IPsec concentrator at HQ:

1. Go to *VPN > IPsec Concentrator* and click *Create New*.
2. Enter a name. In this example, *branch*.
3. Add the *Members to_branch1* and *to_branch2*.
4. Click *OK*.

To configure the firewall policy at HQ:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. For *Incoming Interface*, select *port10*.
4. For *Outgoing Interface*, select *port9*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure IPsec VPN at branch 1:

1. Go to *VPN > IPsec Wizard* to set up branch 1.
2. Enter a *VPN name*. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click *OK*.

To configure the firewall policy at branch 1:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source, Destination, Schedule, Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure IPsec VPN at branch 2:

1. Go to *VPN > IPsec Wizard* to set up branch 1.
2. Enter a VPN name. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click *OK*.

To configure the firewall policy at branch 2:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source, Destination, Schedule, Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *to_HQ*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure a policy-based IPsec tunnel using the CLI:

1. Configure the HQ WAN interface and static route.

```
config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
  next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
  next
end
config router static
```

```
edit 1
    set gateway 22.1.1.2
    set device "port9"
next
end
```

2. Configure the HQ IPsec phase1 and phase2.

```
config vpn ipsec phase1
    edit "to_branch1"
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 15.1.1.2
        set psksecret sample
    next
    edit "to_branch2"
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 13.1.1.2
        set psksecret sample
    next
end
config vpn ipsec phase2
    edit "to_branch1"
        set phase1name "to_branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
    edit "to_branch2"
        set phase1name "to_branch2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
    edit 1
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "10.1.100.0"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_branch1"
    next
    edit 2
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "192.168.4.0"
        set action ipsec
```

```
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_branch2"
    next
end
```

4. Configure the IPsec concentrator at HQ.

```
config vpn ipsec concentrator
    edit "branch"
        set member "to_branch1" "to_branch2"
    next
end
```

5. Configure the branch WAN interface and static route.

a. For branch 1.

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

b. For branch 2.

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

6. Configure the branch IPsec phase1 and phase2.

a. For branch 1.

```
config vpn ipsec phase1
    edit "to_HQ"
        set interface "wan1"
```

```

        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 22.1.1.1
        set psksecret sample
        next
    end
    config vpn ipsec phase2
        edit "to_HQ"
            set phaselname "to_HQ"
            set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        next
    end

```

b. For branch 2.

```

config vpn ipsec phase1
    edit "to_HQ"
        set interface "wan1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 22.1.1.1
        set psksecret sample
        next
    end
    config vpn ipsec phase2
        edit "to_HQ"
            set phaselname "to_HQ"
            set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        next
    end

```

7. Configure the branch firewall policy.

a. For branch 1.

```

config firewall policy
    edit 1
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.1.100.0"
        set dstaddr "all"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_HQ"
    next
end

```

b. For branch 2.

```

config firewall policy
    edit 1
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "192.168.4.0"
        set dstaddr "all"
    next
end

```

```

        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_HQ"
    next
end

```

To view the IPsec VPN tunnel list at HQ:

```

# diagnose vpn tunnel list

FortiGate-to-third-party

This section contains the following topics about FortiGate-to-third-party VPN configurations:

- [IKEv2 IPsec site-to-site VPN to an AWS VPN gateway on page 1495](#)
- [IPsec VPN to Azure with virtual network gateway on page 1501](#)
- [IPsec VPN to an Azure with virtual WAN on page 1510](#)
- [IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets on page 1514](#)
- [Cisco GRE-over-IPsec VPN on page 1514](#)

IKEv2 IPsec site-to-site VPN to an AWS VPN gateway

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an AWS virtual private cloud (VPC).

AWS uses unique identifiers to manipulate a VPN connection's configuration. Each VPN connection is assigned an identifier and is associated with two other identifiers: the customer gateway ID for the FortiGate and virtual private gateway ID.

This example includes the following IDs:

- VPN connection ID: vpn-07e988ccc1d46f749
- Customer gateway ID: cgw-0440c1aebcd2f418a
- Virtual private gateway ID

This example assumes that you have configured VPC-related settings in the AWS management portal as described in [Create a Secure Connection using AWS VPC](#).

This example includes creating and configuring two tunnels. You must configure both tunnels on your FortiGate.

To configure IKEv2 IPsec site-to-site VPN to an AWS VPN gateway:

1. Configure the first VPN tunnel:
 - a. [Configure Internet Key Exchange \(IKE\)](#).
 - b. [Configure IPsec](#).
 - c. [Configure the tunnel interface](#).
 - d. [Configure border gateway protocol \(BGP\)](#).
 - e. [Configure firewall policies](#).
2. Configure the second VPN tunnel:
 - a. [Configure Internet Key Exchange \(IKE\)](#).
 - b. [Configure IPsec](#).
 - c. [Configure the tunnel interface](#).
 - d. [Configure BGP](#).
 - e. [Configure firewall policies](#).

To configure IKE for the first VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman (DH), lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec dead peer detection (DPD) causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
  edit vpn-07e988ccc1d46f749-0
    set interface "wan1"
    set dpd enable
    set local-gw 35.170.66.108
    set dhgrp 2
    set proposal aes128-sha1
    set keylife 28800
    set remote-gw 3.214.239.164
    set psksecret iCelks0UOob8z4SYMRM6zlx.rU2C3jth
    set dpd-retryinterval 10
  next
end
```

To configure IPsec for the first VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
  edit "vpn-07e988ccc1d46f749-0"
    set phase1name "vpn-07e988ccc1d46f749-0"
    set proposal aes128-sha1
    set dhgrp 2
    set pfs enable
    set keylifeseconds 3600
  next
end
```

To configure the tunnel interface for the first VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
  edit "vpn-07e988cccc1d46f749-0"
    set vdom "root"
    set ip 169.254.45.90 255.255.255.255
    set allowaccess ping
    set type tunnel
    set tcp-mss 1379
    set remote-ip 169.254.45.89
    set mtu 1427
    set interface "wan1"
  next
end
```

To configure BGP for the first VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP autonomous system number (ASN) (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
  set as 65000
  config neighbor
    edit 169.254.45.89
      set remote-as 64512
    end
  end
end
config router bgp
  config neighbor
    edit 169.254.45.89
      set capability-default-originate enable
    end
  end
end
config router prefix-list
  edit "default_route"
    config rule
      edit 1
        set prefix 0.0.0.0 0.0.0.0
      next
    end
  end
end
config router route-map
  edit "routemap1"
    config rule
      edit 1
        set match-ip-address "default_route"
      next
    end
  next
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
config network
  edit 1
    set prefix 192.168.0.0 255.255.0.0
  next
end
```

To configure firewall policies for the first VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, and 4, so you would proceed to create policy 5.

```
config firewall policy
  edit 5
    set srcintf "vpn-07e988cccl46f749-0"
    set dstintf internal
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
end
config firewall policy
  edit 5
    set srcintf internal
    set dstintf "vpn-07e988cccl46f749-0"
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
end
```

To configure IKE for the second VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, DH, lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec DPD causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
  edit vpn-07e988cccl1d46f749-1
    set interface "wan1"
    set dpd enable
    set local-gw 35.170.66.108
    set dhgrp 2
    set proposal aes128-sha1
    set keylife 28800
    set remote-gw 100.25.187.58
    set psksecret IjFzyDneUtDdAT4RNmQ85apUG3y4Akre
    set dpd-retryinterval 10
  next
end
```

To configure IPsec for the second VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
  edit "vpn-07e988cccl1d46f749-1"
    set phase1name "vpn-07e988cccl1d46f749-1"
    set proposal aes128-sha1
    set dhgrp 2
    set pfs enable
    set keylifeseconds 3600
  next
end
```

To configure the tunnel interface for the second VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
  edit "vpn-07e988cccl1d46f749-1"
    set vdom "root"
    set ip 169.254.44.162 255.255.255.255
    set allowaccess ping
    set type tunnel
    set tcp-mss 1379
    set remote-ip 169.254.44.161
    set mtu 1427
    set interface "wan1"
  next
end
```

To configure BGP for the second VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP ASN (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
  set as 65000
  config neighbor
    edit 169.254.44.161
      set remote-as 64512
    end
  config router bgp
  config neighbor
    edit 169.254.44.161
      set capability-default-originate enable
    end
  end
  config router prefix-list
    edit "default_route"
      config rule
        edit 1
          set prefix 0.0.0.0 0.0.0.0
        next
      end
    end
  end
  config router route-map
    edit "routemap1"
      config rule
        edit 1
          set match-ip-address "default_route"
        next
      end
    next
  end
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
config network
  edit 1
    set prefix 192.168.0.0 255.255.0.0
  next
end
```

To configure firewall policies for the second VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, 4, and 5, so you would proceed to create policy 6.

```
config firewall policy
  edit 6
    set srcintf "vpn-07e988cccl46f749-1"
    set dstintf internal
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
end
config firewall policy
  edit 6
    set srcintf internal
    set dstintf "vpn-07e988cccl46f749-1"
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ANY
  next
end
```

IPsec VPN to Azure with virtual network gateway

This example shows how to configure a site-to-site IPsec VPN tunnel to Microsoft Azure. It shows how to configure a tunnel between each site, avoiding overlapping subnets, so that a secure tunnel can be established.

Prerequisites

- A FortiGate with an Internet-facing IP address
- A valid Microsoft Azure account

Sample topology

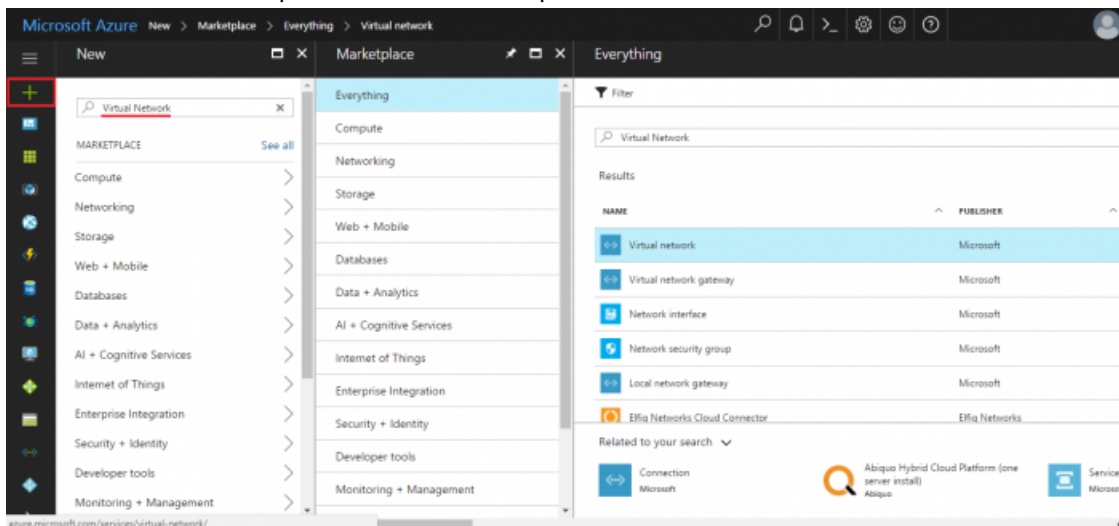

Sample configuration

This sample configuration shows how to:

1. [Configure an Azure virtual network](#)
2. [Specify the Azure DNS server](#)
3. [Configure the Azure virtual network gateway](#)
4. [Configure the Azure local network gateway](#)
5. [Configure the FortiGate tunnel](#)
6. [Create the Azure firewall object](#)
7. [Create the FortiGate firewall policies](#)
8. [Create the FortiGate static route](#)
9. [Create the Azure site-to-site VPN connection](#)
10. [Check the results](#)

To configure an Azure virtual network:

1. Log in to Azure and click *New*.
2. In *Search the Marketplace*, type *Virtual network*.
3. Click *Virtual network* to open the *Virtual network* pane.

4. At the bottom of the *Virtual network* pane, click the *Select a deployment model* dropdown list and select *Resource Manager*.

5. Click *Create*.

Virtual network
Microsoft

Create a logically isolated section in Microsoft Azure with this networking service. You can securely connect it to your on-premises datacenter or a single client machine using an IPsec connection. Virtual Networks make it easy for you to take advantage of the scalable, on-demand infrastructure of Azure while providing connectivity to data and applications on-premises, including systems running on Windows Server, mainframes, and UNIX.

Use Virtual Network to:

- Extend your datacenter
- Build distributed applications
- Remotely debug your applications

Create

To specify the Azure DNS server:

1. Open the virtual network you just created.
2. Click *DNS servers* to open the *DNS servers* pane.
3. Enter the IP address of the DNS server and click *Save*.

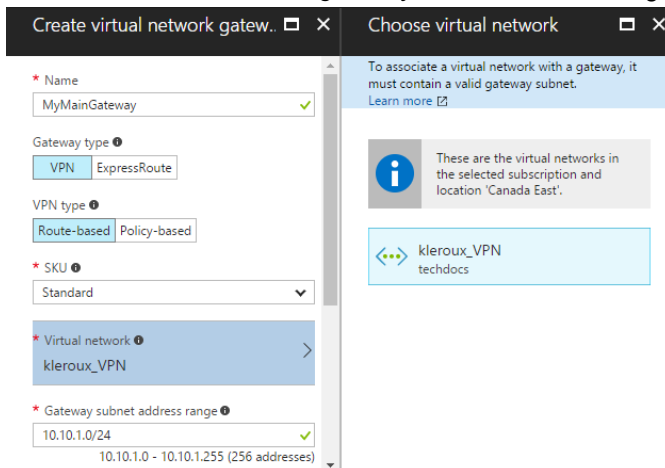

To configure the Azure virtual network gateway:

1. In the portal dashboard, go to *New*.
2. Search for *Virtual Network Gateway* and click it to open the *Virtual network gateway* pane.

3. Click *Create Virtual network gateways* and enter the settings for your virtual network gateway.

4. If needed, create a Public IP address.

* Public IP address

Create Automation options

Provisioning a virtual network gateway may take up to 45 minutes.

5. Click *Create*.

Creating the virtual network gateway might take some time. When the provisioning is done, you'll receive a notification.

Notifications 

Dismiss: **Informational** Completed All

■ ■ ■ Deployment in progress... 

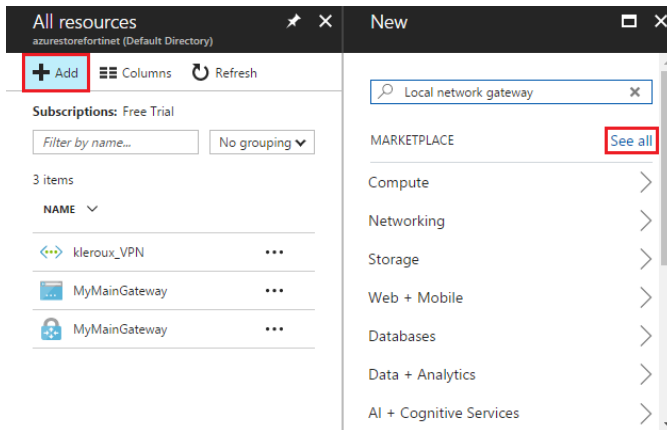

Deployment to resource group 'techdocs' is in progress.

✔ Saved virtual network 9:37 AM
Successfully saved DNS settings for virtual network 'kleroux_VPN'.

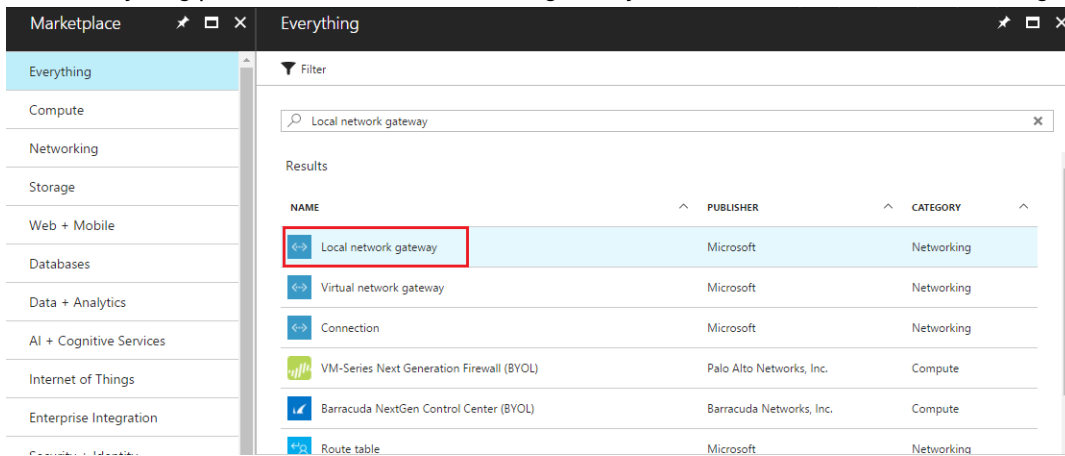

✔ Deployments succeeded 9:30 AM
Deployment to resource group 'techdocs' was successful.

To configure the Azure local network gateway:

1. In the portal dashboard, click *All resources*.
2. Click *Add* and then click *See all*.

3. In the *Everything* pane, search for *Local network gateway* and then click *Create local network gateway*.

- For the *IP address*, enter the local network gateway IP address, that is, the FortiGate's external IP address.

Create local network gateway [Close]

Create [Automation options](#)

- Set the remaining values for your local network gateway and click *Create*.

To configure the FortiGate tunnel:

- In the FortiGate, go to *VPN > IP Wizard*.
- Enter a *Name* for the tunnel, click *Custom*, and then click *Next*.
- Configure the *Network* settings.
 - For *Remote Gateway*, select *Static IP Address* and enter the IP address provided by Azure.
 - For *Interface*, select *wan1*.
 - For *NAT Traversal*, select *Disable*,
 - For *Dead Peer Detection*, select *On Idle*.
 - In the *Authentication* section, select
- Configure the *Authentication* settings.
 - For *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
 - For *IKE*, select *2*.
- Configure the *Phase 1 Proposal* settings.
 - Set the *Encryption* and *Authentication* combination to the three supported encryption algorithm combinations accepted by Azure.
 - AES256 and SHA1
 - 3DES and SHA1

- AES256 and SHA256
 - b. For *Diffie-Hellman Groups*, select 2.
 - c. Set *Key Lifetime (seconds)* to 28800.
6. In *Phase 2 Selectors*, expand the *Advanced* section to configure the *Phase 2 Proposal* settings.
 - a. Set the Encryption and Authentication combinations:
 - AES256 and SHA1
 - 3DES and SHA1
 - AES256 and SHA256
 - b. Uncheck *Enable Perfect Forward Secrecy (PFS)*.
 - c. Set *Key Lifetime (seconds)* to 27000.
 7. Click *OK*.

To create the Azure firewall object:

1. In the FortiGate, go to *Policy & Objects > Addresses*.
2. Create a firewall object for the Azure VPN tunnel.

To create the FortiGate firewall policies:

1. In the FortiGate, go to *Policy & Objects > Firewall Policy*.
2. Create a policy for the site-to-site connection that allows outgoing traffic.
 - a. Set the *Source* address and *Destination* address using the firewall objects you just created.
 - b. Disable *NAT*.
3. Create another policy that allows incoming traffic.
 - a. For this policy, reverse the *Source* address and *Destination* address.
4. We recommend limiting the TCP maximum segment size (MSS) being sent and received so as to avoid packet drops and fragmentation.
To do this, use the following CLI commands on both policies.

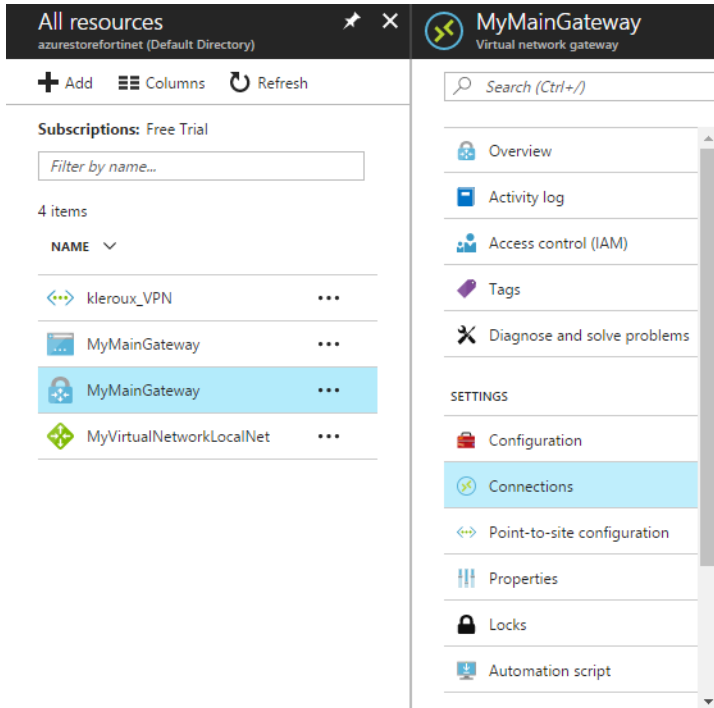

```
config firewall policy
  edit <policy-id>
    set tcp-mss-sender 1350
    set tcp-mss-receiver 1350
  next
end
```

To create the FortiGate static route:

1. In the FortiGate, go to *Network > Static Routes*.
2. Create an IPv4 Static Route that forces outgoing traffic going to Azure to go through the route-based tunnel.
3. Set the *Administrative Distance* to a value lower than the existing default route value.

To create the Azure site-to-site VPN connection:

1. In the Azure portal, locate and select your virtual network gateway.
2. In the *Settings* pane, click *Connections* and then click *Add*.

3. Enter the settings for your connection. Ensure the *Shared Key (PSK)* matches the *Pre-shared Key* for the FortiGate tunnel.

To check the results:

1. In the FortiGate, go to *Monitor > IPsec Monitor* and check that the tunnel is up. If the tunnel is down, right-click the tunnel and select *Bring Up*.
2. In the FortiGate, go to *Log & Report > Events*.
 - a. Select an event to view more information and verify the connection.

3. In the Azure portal dashboard, click *All resources* and locate your virtual network gateway.
 - a. In your virtual network gateway pane, click *Connections* to see the status of each connection.

The screenshot shows the Azure portal interface. On the left, the 'All resources' pane displays a list of resources under the 'Subscriptions: Free Trial' section. The resources listed are 'kleroux_VPN', 'MyMainGateway', 'MyMainGateway', and 'MyVirtualNetworkLocalNet'. The 'MyMainGateway' resource is highlighted. On the right, the 'MyMainGateway' page is open, showing a search bar and a list of settings. The 'Connections' setting is highlighted in blue.

- b. Click a connection to open the *Essentials* pane to view more information about that connection.
 - If the connection is successful, the *Status* shows *Connected*.
 - See the *ingress* and *egress* bytes to confirm traffic flowing through the tunnel.

IPsec VPN to an Azure with virtual WAN

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an Azure virtual network (VNet). This example uses Azure virtual WAN (vWAN) to establish the VPN connection.

- Azure must use IPsec v2 for this configuration.
- Azure uses overlapped subnet IP addresses for the IPsec interfaces.

To configure IKEv2 IPsec site-to-site VPN to an Azure VPN gateway:

1. In the Azure management portal, configure vWAN-related settings as described in [Tutorial: Create a Site-to-Site connection using Azure Virtual WAN](#).

If a custom BGP IP address is configured on Azure's vWAN, such as 169.254.21.6 and 169.254.21.7, you must configure the FortiGate `remote-IP` to the corresponding *Custom BGP IP Address* value. If a custom BGP IP address is not configured, FortiGate `remote-IPs` should point to the *Default BGP IP Address* value.

2. Download the VPN configuration. The following shows an example VPN configuration:

```
[ {"configurationVersion": {"LastUpdatedTime": "2019-07-16T22:16:28.0409002Z", "Version": "be5c5787-b903-43b1-a237-49eae1b373e4"}, "vpnSiteConfiguration": {"Name": "toaws", "IPAddress": "3.220.252.93", "BgpSetting":
```

```

{"Asn":7225,"BgpPeeringAddress":"169.254.24.25","PeerWeight":32768},"LinkName":"toa
ws"},"vpnSiteConnections":[{"hubConfiguration":
{"AddressSpace":"10.1.0.0/16","Region":"West US","ConnectedSubnets":
["10.2.0.0/16"]},"gatewayConfiguration":{"IpAddresses":
{"Instance0":"52.180.90.47","Instance1":"52.180.89.94"},"BgpSetting":
{"Asn":65515,"BgpPeeringAddresses":
{"Instance0":"10.1.0.7","Instance1":"10.1.0.6"},"PeerWeight":0}},"connectionConfigu
ration":{"IsBgpEnabled":true,"PSK":"Fortinet123#","IPsecParameters":
{"SADataSizeInKilobytes":102400000,"SALifeTimeInSeconds":3600}}}] ]

```

3. Configure the following on the FortiGate. Note for set proposal, you can select from several proposals.

```

config vpn ipsec phase1-interface
  edit "toazure1"
    set interface "port1"
    set ike-version 2
    set keylife 28800
    set peertype any
    set proposal aes256-shal
    set dhgrp 2
    set remote-gw 52.180.90.47
    set psksecret *****
  next
  edit "toazure2"
    set interface "port1"
    set ike-version 2
    set keylife 28800
    set peertype any
    set proposal aes256-shal
    set dhgrp 2
    set remote-gw 52.180.89.94
    set psksecret *****
  next
end
config vpn ipsec phase2-interface

    set dhgrp 2
    set keylifeseconds 3600
  next
end
config system settings
  set allow-subnet-overlap enable
end
config system interface
  edit "toazure1"
    set vdom "root"
    set ip 169.254.24.25 255.255.255.255
    set type tunnel
    set remote-ip 10.1.0.7 255.255.255.255
    set snmp-index 4
    set interface "port1"

```

```
next
edit "toazure2"
  set vdom "root"
  set ip 169.254.24.25 255.255.255.255
  set type tunnel
  set remote-ip 10.1.0.6 255.255.255.255
  set snmp-index 5
  set interface "port1"
next
end
config router bgp
  set as 7225
  set router-id 169.254.24.25
  config neighbor
    edit "10.1.0.7"
      set remote-as 65515
    next
    edit "10.1.0.6"
      set remote-as 65515
    next
  end
  config network
    edit 1
      set prefix 172.30.101.0 255.255.255.0
    next
  end
  config redistribute "connected"
    set status enable
  end
  config redistribute "rip"
  end
  config redistribute "ospf"
  end
  config redistribute "static"
  end
  config redistribute "isis"
  end
  config redistribute6 "connected"
  end
  config redistribute6 "rip"
  end
  config redistribute6 "ospf"
  end
  config redistribute6 "static"
  end
  config redistribute6 "isis"
  end
end
```

4. Run `diagnose vpn tunnel list`. If the configuration was successful, the output should resemble the following:

```
name=toazure1 ver=2 serial=3 172.30.1.83:4500->52.180.90.47:4500 tun_id=52.180.90.47

IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets

When a Cisco ASA unit has multiple subnets configured, multiple phase 2 tunnels must be created on the FortiGate to allocate to each subnet (rather than having multiple subnets on one phase 2 tunnel).

The FortiGate uses the same SPI value to bring up the phase 2 negotiation for all of the subnets, while the Cisco ASA expects different SPI values for each of its configured subnets. Using multiple phase 2 tunnels on the FortiGate creates different SPI values for each subnet.

To configure multiple phase 2 interfaces in route-based mode:

```
config vpn ipsec phase2-interface
  edit "First subnet"
    set phasename "VPN to Cisco"
    set src-subnet 192.168.227.253 255.255.255.255
    set dst-subnet 10.142.0.0 255.255.254.0
  next
  edit "Second subnet"
    set phasename "VPN to Cisco"
    set src-subnet 192.168.227.253 255.255.255.255
    set dst-subnet 10.143.0.0 255.255.254.0
  next
end
```

To configure multiple phase 2 interfaces in policy-based mode:

```
config vpn ipsec phase2
  edit "First subnet"
    set phasename "VPN to Cisco"
    set src-subnet 192.168.227.253 255.255.255.255
    set dst-subnet 10.142.0.0 255.255.254.0
  next
  edit "Second subnet"
    set phasename "VPN to Cisco"
    set src-subnet 192.168.227.253 255.255.255.255
    set dst-subnet 10.143.0.0 255.255.254.0
  next
end
```

Cisco GRE-over-IPsec VPN

This is a sample configuration of a FortiGate VPN that is compatible with Cisco-style VPNs that use GRE in an IPsec tunnel. Cisco products with VPN support often use the GRE protocol tunnel over IPsec encryption. Cisco VPNs can use either transport mode or tunnel mode IPsec.

Topology

In this example, LAN1 users are provided with access to LAN2.

Configuring the FortiGate

There are five steps to configure GRE-over-IPsec with a FortiGate and Cisco router:

1. [Enable overlapping subnets.](#)
2. [Configure a route-based IPsec VPN on the external interface.](#)
3. [Configure a GRE tunnel on the virtual IPsec interface.](#)
4. [Configure security policies.](#)
5. [Configure the static route.](#)

Enabling overlapping subnets

Overlapping subnets are required because the IPsec and GRE tunnels will use the same addresses. By default, each FortiGate network interface must be on a separate network. This configuration assigns an IPsec tunnel endpoint and the external interface to the same network.

To enable overlapping subnets:

```
config system settings
    set allow-subnet-overlap enable
    next
end
```

Configuring a route-based IPsec VPN

A route-based VPN that use encryption and authentication algorithms compatible with the Cisco router is required. Pre-shared key authentication is used in this configuration.

To configure route-based IPsec in the GUI:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name (*tocisco*) and click *Next*.
3. Enter the following:

Remote Gateway	Static IP Address
IP Address	Cisco router public interface (192.168.5.113)
Interface	FortiGate public interface (172.20.120.141)
Authentication Method	Pre-shared Key
Pre-shared Key	Entry must match the pre-shared key on the Cisco router
Mode	Main (ID Protection)
Phase 1 Proposal	3DES-SHA1, AES128-SHA1 (at least one proposal must match the settings on the Cisco router)
Local Address	GRE local tunnel endpoint IP address (172.20.120.141)
Remote Address	GRE remote tunnel endpoint IP address (192.168.5.113)
Phase 2 Proposal	3DES-MD5 (at least one proposal must match the settings on the Cisco router)
Local Port	0
Remote Port	0
Protocol	47

4. Click *OK*.
5. If the Cisco router is configured to use transport mode IPsec, configure transport mode on the FortiGate:

```
config vpn phase2-interface
  edit tocisco_p2
    set encapsulation transport-mode
  next
end
```

To configure route-based IPsec in the CLI:

```
config vpn ipsec phase1-interface
  edit tocisco
    set interface port1
    set proposal 3des-sha1 aes128-sha1
    set remote-gw 192.168.5.113
    set psksecret xxxxxxxxxxxxxxxxxxxx
  next
end
```

```
config vpn ipsec phase2-interface
  edit tocisco_p2
    set phasename tocisco
    set proposal 3des-md5
    set encapsulation [tunnel-mode | transport-mode]
    set protocol 47
    set src-addr-type ip
    set dst-start-ip 192.168.5.113
    set src-start-ip 172.20.120.141
  next
end
```

To add the IPsec tunnel end addresses:

```
config system interface
  edit tocisco
    set ip 172.20.120.141 255.255.255.255
    set remote-ip 192.168.5.113
  next
end
```

Configuring the GRE tunnel

The local gateway and remote gateway addresses must match the local and remote gateways of the IPsec tunnel. The GRE tunnel runs between the virtual IPsec public interface on the FortiGate unit and the Cisco router.

To configure the GRE tunnel:

```
config system gre-tunnel
  edit gre1
    set interface tocisco
    set local-gw 172.20.120.141
    set remote-gw 192.168.5.113
    set keepalive-interval <integer>
    set keepalive-failtimes <integer>
  next
end
```

The Cisco router configuration requires an address for its end of the GRE tunnel, so you need to add the tunnel end addresses.

To add the tunnel end addresses:

```
config system interface
  edit gre1
    set ip 10.0.1.1 255.255.255.255
    set remote-ip 10.0.1.2
  next
end
```

Configuring the security policies

Two sets of security policies are required:

- Policies to allow traffic to pass in both directions between the GRE virtual interface and the IPsec virtual interface.
- Policies to allow traffic to pass in both directions between the protected network interface and the GRE virtual interface.

To configure security policies in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter the following to allow traffic between the protected network and the GRE tunnel:

Name	LANtoGRE
Incoming Interface	Interface that connects to the private network behind the FortiGate (port2)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

3. Click *OK*.
4. Create a new policy and enter the following to allow traffic between the GRE tunnel and the protected network:

Name	GREtoLAN
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Interface that connects to the private network behind the FortiGate (port2)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

5. Click *OK*.
6. Create a new policy and enter the following to allow traffic between the GRE virtual interface and the IPsec virtual interface:

Name	GREtoIPsec
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Virtual IPsec interface (tocisco)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

7. Click *OK*.

8. Create a new policy and enter the following to allow traffic between the IPsec virtual interface and the GRE virtual interface:

Name	IPsectoGRE
Incoming Interface	Virtual IPsec interface (tocisco)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

9. Click *OK*.

To configure security policies in the CLI:

```
config firewall policy
  edit 1
    set name LANtoGRE
    set srcintf port2
    set dstintf gre1
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
  edit 2
    set name GREtoLAN
    set srcintf gre1
    set dstintf port2
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
  edit 3
    set name GREtoIPsec
    set srcintf gre1
    set dstintf tocisco
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
  edit 4
    set name IPsectoGRE
    set srcintf tocisco
    set dstintf gre1
    set srcaddr all
    set dstaddr all
```

```

        set action accept
        set schedule always
        set service ALL
    next
end

```

Configuring routing

to direct traffic destined for the network behind the Cisco router into the GRE-over-IPsec tunnel Traffic destined for the network behind the Cisco router must be routed to the GRE tunnel. To do this, create a static route

To create the static route in the GUI:

1. Go to *Network > Static Routes* and click *Create New*.
2. Enter the following:

Destination	IP and netmask for the network behind the Cisco router (10.21.101.0 255.255.255.0)
Interface	GRE tunnel virtual interface (gre1)
Administrative Distance	Leave the default setting

3. Click *OK*.

To create the static route in the CLI:

```

config router static
  edit 0
    set device gre1
    set dst 10.21.101.0 255.255.255.0
  next
end

```

Configuring the Cisco router

For more information, refer to [Configuring and verifying a GRE over IPsec tunnel](#) in the Fortinet Knowledge Base.

Remote access

Remote access lets users connect to the Internet using a dialup connection over traditional POTS or ISDN telephone lines. Virtual private network (VPN) protocols are used to secure these private connections.

The following topics provide instructions on configuring remote access:

- [FortiGate as dialup client on page 1521](#)
- [FortiClient as dialup client on page 1527](#)
- [Add FortiToken multi-factor authentication on page 1531](#)
- [Add LDAP user authentication on page 1532](#)
- [iOS device as dialup client on page 1533](#)
- [IKE Mode Config clients on page 1537](#)
- [IPsec VPN with external DHCP service on page 1542](#)

- [L2TP over IPsec on page 1545](#)
- [Tunneled Internet browsing on page 1549](#)
- [Dialup IPsec VPN with certificate authentication on page 1555](#)
- [Restricting VPN access to rogue/non-compliant devices with Security Fabric](#)

FortiGate as dialup client

This is a sample configuration of dialup IPsec VPN and the dialup client. In this example, a branch office FortiGate connects via dialup IPsec VPN to the HQ FortiGate.

You can configure dialup IPsec VPN with FortiGate as the dialup client using the [GUI](#) or [CLI](#).

To configure IPsec VPN with FortiGate as the dialup client in the GUI:

1. Configure the dialup VPN server FortiGate:
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *The remote site is behind NAT*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Incoming Interface*, select the incoming interface.
 - ii. For *Authentication Method*, select *Pre-shared Key*.
 - iii. In the *Pre-shared Key* field, enter *your-psk* as the key.
 - iv. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure the *Local Subnets* as *10.1.100.0/24*.
 - iii. Configure the *Remote Subnets* as *172.16.101.0/24*.
 - iv. Click *Create*.
2. Configure the dialup VPN client FortiGate:
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *This site is behind NAT*.
 - v. Click *Next*.

- b. Configure the following settings for *Authentication*:
 - i. For *IP Address*, enter *11.101.1.1*.
 - ii. For *Outgoing Interface*, select *port13*.
 - iii. For *Authentication Method*, select *Pre-shared Key*.
 - iv. In the *Pre-shared Key* field, enter *your-psk* as the key.
 - v. Click *Next*.
- c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface. In this example, it is *port9*.
 - ii. Configure the *Local Subnets* as *172.16.101.0*.
 - iii. Configure the *Remote Subnets* as *10.1.100.0*.
 - iv. Click *Create*.

To configure IPsec VPN with FortiGate as the dialup client in the CLI:

1. In the CLI, configure the user, user group, and firewall address. Only the HQ dialup server FortiGate needs this configuration. The address is an IP pool to assign an IP address for the dialup client FortiGate.

```
config user local
  edit "vpnuser1"
    set type password
    set passwd your-password
  next
end
config user group
  edit "vpngroup"
    set member "vpnuser1"
  next
end
config firewall address
  edit "client_range"
    set type iprange
    set start-ip 10.10.10.1
    set end-ip 10.10.10.200
  next
end
```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

- a. Configure the HQ FortiGate.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 11.101.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 11.101.1.2
    set device "wan1"
  next
end
```

b. Configure the branch office FortiGate.

```
config system interface
  edit "port13"
    set vdom "root"
    set ip 173.1.1.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 173.1.1.2
    set device "port13"
  next
end
```

3. Configure the internal interface and protected subnet. The internal interface connects to the internal network. Traffic from this interface will route out the IPsec VPN tunnel.**a. Configure the HQ FortiGate.**

```
config system interface
  edit "dmz"
    set vdom "root"
    set ip 10.1.100.1 255.255.255.0
  next
end
config firewall address
  edit "10.1.100.0"
    set subnet 10.1.100.0 255.255.255.0
  next
end
```

b. Configure the branch office FortiGate.

```
config system interface
  edit "port9"
    set vdom "root"
    set ip 172.16.101.1 255.255.255.0
  next
end
config firewall address
  edit "172.16.101.0"
    set subnet 172.16.101.0 255.255.255.0
  next
end
```

4. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.**a. Configure the HQ FortiGate.**

```
config vpn ipsec phase1-interface
  edit "for_Branch"
    set type dynamic
    set interface "wan1"
    set mode aggressive
    set peertype any
    set mode-cfg enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set add-route disable
```

```

        set dpd on-idle
        set xauthtype auto
        set authusrgrp "vpngroup"
        set net-device enable
        set assign-ip-from name
        set dns-mode auto
        set ipv4-split-include "10.1.100.0"
        set ipv4-name "client_range"
        set save-password enable
        set psksecret sample
        set dpd-retryinterval 60
    next
end

```

b. Configure the branch office FortiGate.

```

config vpn ipsec phase1-interface
    edit "to_HQ"
        set interface "port13"
        set mode aggressive
        set peertype any
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set xauthtype client
        set authusr "vpnuser1"
        set authpasswd vpnuser1-password
        set remote-gw 11.101.1.1
        set psksecret sample
    next
end

```

5. Configure the IPsec phase2-interface.

a. Configure the HQ FortiGate:

```

config vpn ipsec phase2-interface
    edit "for_Branch_p2"
        set phase1 name "for_Branch"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
    next
end

```

b. Configure the branch office FortiGate.

```

config vpn ipsec phase2-interface
    edit "to_HQ_p2"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
    next
end

```

6. Configure the static routes on the branch office FortiGate. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

```

config router static
    edit 2

```

```

        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ"
    next
edit 3
    set dst 10.1.100.0 255.255.255.0
    set blackhole enable
    set distance 254
next
end

```

7. Configure the firewall policy to allow the branch office to HQ network flow over the IPsec tunnel. This configuration only supports traffic from the branch office FortiGate to the HQ FortiGate. Traffic is dropped from the HQ FortiGate to the branch office FortiGate.

a. Configure the HQ FortiGate.

```

config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_Branch"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

b. Configure the branch office FortiGate.

```

config firewall policy
    edit 1
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

8. Run diagnose commands to check the IPsec phase1/phase2 interface status. The diagnose debug application ike -1 command is the key to troubleshoot why the IPsec tunnel failed to establish.

a. Run the diagnose vpn ike gateway list command on the HQ FortiGate. The system should return the following:

```

vd: root/0
name: for_Branch_0
version: 1
interface: wan1 5
addr: 11.101.1.1:500 -> 173.1.1.1:500
created: 1972s ago
xauth-user: vpnuser1
assigned IPv4 address: 10.10.10.1/255.255.255.252
IKE SA: created 1/1 established 1/1 time 10/10/10 ms

```

```

IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
id/spi: 184 5b1c59fab2029e43/bf517e686d3943d2
direction: responder
status: established 1972-1972s ago = 10ms
proposal: aes128-sha256
key: 8046488e92499247-fbbb4f6dfa4952d0
lifetime/rekey: 86400/84157
DPD sent/recvd: 00000020/00000000

```

- b. Run the diagnose vpn tunnel list command on the HQ FortiGate. The system should return the following:**

```

list all ipsec tunnel in vd 0
name=for_Branch_0 ver=1 serial=9 11.101.1.1:0->173.1.1.1:0 tun_id=173.1.1.1

FortiClient as dialup client

This is a sample configuration of dialup IPsec VPN with FortiClient as the dialup client.

You can configure dialup IPsec VPN with FortiClient as the dialup client using the GUI or CLI.

If multiple dialup IPsec VPNs are defined for the same dialup server interface, each phase1 configuration must define a unique peer ID to distinguish the tunnel that the remote client is connecting to. When a client connects, the first IKE message that is in aggressive mode contains the client's local ID. FortiGate matches the local ID to the dialup tunnel referencing the same Peer ID, and the connection continues with that tunnel.

To configure IPsec VPN with FortiClient as the dialup client on the GUI:

1. Configure a user and user group.
 - a. Go to *User & Authentication > User Definition* to create a local user *vpnuser1*.
 - b. Go to *User & Authentication > User Groups* to create a group *vpngroup* with the member *vpnuser1*.
2. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - a. Enter a VPN name.
 - b. For *Template Type*, select *Remote Access*.
 - c. For *Remote Device Type*, select *Client-based > FortiClient*.
 - d. Click *Next*.
3. Configure the following settings for *Authentication*:
 - a. For *Incoming Interface*, select *wan1*.
 - b. For *Authentication Method*, select *Pre-shared Key*.
 - c. In the *Pre-shared Key* field, enter *your-psk* as the key.
 - d. From the *User Group* dropdown list, select *vpngroup*.
 - e. Click *Next*.
4. Configure the following settings for *Policy & Routing*:
 - a. From the *Local Interface* dropdown menu, select *lan*.
 - b. Configure the *Local Address* as *local_network*.
 - c. Configure the *Client Address Range* as *10.10.2.1-10.10.2.200*.
 - d. Keep the default values for the *Subnet Mask*, *DNS Server*, *Enable IPv4 Split tunnel*, and *Allow Endpoint Registration*.
 - e. Click *Next*.
5. Adjust the *Client Options* as needed, then click *Create*.
6. Optionally, define a unique Peer ID in the phase1 configuration:
 - a. Go to *VPN > IPsec Tunnels* and edit the just created tunnel.
 - b. Click *Convert To Custom Tunnel*.
 - c. In the *Authentication* section, click *Edit*.
 - d. Under *Peer Options*, set *Accept Types* to *Specific peer ID*.
 - e. In the *Peer ID* field, enter a unique ID, such as *dialup1*.
 - f. Click *OK*.

To configure IPsec VPN with FortiClient as the dialup client using the CLI:

1. In the CLI, configure the user and group.

```
config user local
  edit "vpnuser1"
    set type password
    set passwd your-password
  next
end
config user group
  edit "vpngroup"
    set member "vpnuser1"
  next
end
```

2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this

FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
  edit "lan"
    set vdom "root"
    set ip 10.10.111.1 255.255.255.0
  next
end
config firewall address
  edit "local_subnet_1"
    set subnet 10.10.111.0 255.255.255.0
  next
  edit "local_subnet_2"
    set subnet 10.10.112.0 255.255.255.0
  next
end
config firewall addrgrp
  edit "local_network"
    set member "local_subnet_1" "local_subnet_2"
  next
end
```

3. Configure the WAN interface. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

4. Configure the client address pool. You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
  edit "client_range"
    set type iprange
    set comment "VPN client range"
    set start-ip 10.10.2.1
    set end-ip 10.10.2.200
  next
end
```

5. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
  edit "for_client"
    set type dynamic
    set interface "wan1"
    set mode aggressive
    set peertype one
    set peerid "dialup1"
    set net-device enable
    set mode-cfg enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set dpd on-idle
    set xauthtype auto
```

```

        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set save-password enable
        set psksecret your-psk
        set dpd-retryinterval 60
    next
end

```

6. Configure the IPsec phase2-interface.

```

config vpn ipsec phase2-interface
    edit "for_client"
        set phase1name "for_client"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end

```

7. Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.

```

config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_client"
        set dstintf "lan"
        set srcaddr "client_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

To configure FortiClient:

1. In FortiClient, go to *Remote Access* and click *Add a new connection*.
2. Set the *VPN to IPsec VPN* and the *Remote Gateway* to the FortiGate IP address.
3. Set the *Authentication Method to Pre-Shared Key* and enter the key.
4. Expand *Advanced Settings > Phase 1* and in the *Local ID* field, enter *dialup1*.
5. Configure remaining settings as needed, then click *Save*.
6. Select the VPN, enter the username and password, then select *Connect*.

Diagnose the connection

Run `diagnose` commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

1. Run the `diagnose vpn ike gateway list` command. The system should return the following:

```

vd: root/0
name: for_client_0
version: 1
interface: port1 15

```

```

addr: 172.20.120.123:4500 ->172.20.120.254:64916
created: 37s ago

Add FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the FortiClient dialup VPN configuration ([FortiClient as dialup client on page 1527](#)). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Edit the user:
 - a. Go to *User & Authentication > User Definition* and edit local user *vpnuser1*.
 - b. Enable *Two-factor Authentication*.
 - c. For *Authentication Type*, click *FortiToken* and select one mobile *Token* from the list.
 - d. Enter the user's *Email Address*.
 - e. Enable *Send Activation Code* and select *Email*.
 - f. Click *Next* and click *Submit*.
2. Activate the mobile token.
 - a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Edit the user and user group:

```
config user local
  edit "vpnuser1"
    set type password
    set two-factor fortitoken
    set fortitoken <select mobile token for the option list>
    set email-to <user's email address>
    set passwd <user's password>
  next
end
```

2. Activate the mobile token.
 - a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Add LDAP user authentication

This configuration adds LDAP user authentication to the FortiClient dialup VPN configuration ([FortiClient as dialup client on page 1527](#)). You must have already generated and exported a CA certificate from your AD server.

To configure LDAP user authentication using the GUI:

1. Import the CA certificate into FortiGate:
 - a. Go to *System > Certificates*.
If the *Certificates* option is not visible, enable it in *Feature Visibility*. See [Feature visibility on page 2292](#) for details.
 - b. Click *Import > CA Certificate*.
 - c. Set *Type* to *File*.
 - d. Click *Upload* then find and select the certificate file.
 - e. Click *OK*.
The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

- f. Optionally, rename the system generated `CA_Cert_1` to something more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

2. Configure the LDAP user:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Set *Name* to *ldaps-server* and specify *Server IP/Name*.
 - c. Specify *Common Name Identifier* and *Distinguished Name*.
 - d. Set *Bind Type* to *Regular*.
 - e. Specify *Username* and *Password*.
 - f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
 - g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
 - h. Click *OK*.
3. Add the LDAP user to the user group:
 - a. Go to *User & Authentication > User Groups* and edit the *vpngroup* group.
 - b. In *Remote Groups*, click *Add* to add the *ldaps-server* remote server.
 - c. Click *OK*.

To configure LDAP user authentication using the CLI:

1. Import the CA certificate using the GUI.
2. Configure the LDAP user:

```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password *****
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

3. Add the LDAP user to the user group:

```
config user group
    edit "vpngroup"
        append member "ldaps-server"
    next
end
```

iOS device as dialup client

This is a sample configuration of dialup IPsec VPN with an iPhone or iPad as the dialup client.

You can configure dialup IPsec VPN with an iOS device as the dialup client using the [GUI](#) or [CLI](#).

To configure IPsec VPN with an iOS device as the dialup client on the GUI:

1. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - a. Enter a VPN name.
 - b. For *Template Type*, select *Remote Access*.
 - c. For *Remote Device Type*, select *Native > iOS Native*.
 - d. For *NAT Configuration*, set *No NAT Between Sites*.
 - e. Click *Next*.
2. Configure the following settings for *Authentication*:
 - a. For *Incoming Interface*, select *wan1*.
 - b. For *Authentication Method*, select *Pre-shared Key*.
 - c. In the *Pre-shared Key* field, enter *your-psk* as the key.
 - d. From the *User Group* dropdown list, select *vpngroup*.
 - e. Deselect *Require 'Group Name' on VPN client*.
 - f. Click *Next*.
3. Configure the following settings for *Policy & Routing*:
 - a. From the *Local Interface* dropdown menu, select *lan*.
 - b. Configure the *Local Address* as *local_network*.
 - c. Configure the *Client Address Range* as *10.10.2.1-10.10.2.200*.
 - d. Keep the default values for the *Subnet Mask*, *DNS Server*, and *Enable IPv4 Split tunnel*.
 - e. Click *Create*.

To configure IPsec VPN with an iOS device as the dialup client using the CLI:

1. In the CLI, configure the user and group.

```
config user local
  edit "vpnuser1"
    set type password
    set passwd your-password
  next
end
```

```
config user group
  edit "vpngroup"
    set member "vpnuser1"
  next
end
```

2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
  edit "lan"
    set vdom "root"
    set ip 10.10.111.1 255.255.255.0
  next
end
```

```
config firewall address
  edit "local_subnet_1"
    set ip 10.10.111.0 255.255.255.0
  next
end
```

```
config firewall address
  edit "local_subnet_2"
    set ip 10.10.112.0 255.255.255.0
  next
end
```

```
config firewall addrgrp
  edit "local_network"
    set member "local_subnet_1" "local_subnet_2"
  next
end
```

3. Configure the WAN interface. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

4. Configure the client address pool. You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
  edit "client_range"
    set type iprange
    set comment "VPN client range"
    set start-ip 10.10.2.1
    set end-ip 10.10.2.200
  next
end
```

5. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

```

config vpn ipsec phase1-interface
  edit "for_ios_p1"
    set type dynamic
    set interface "wan1"
    set peertype any
    set net-device enable
    set mode-cfg enable
    set proposal aes256-sha256 aes256-md5 aes256-sha1
    set dpd on-idle
    set dhgrp 14 5 2
    set xauthtype auto
    set authusrgrp "vpngroup"
    set assign-ip-from name
    set ipv4-name "client_range"
    set dns-mode auto
    set ipv4-split-include "local_network"
    set psksecret your-psk
    set dpd-retryinterval 60
  next
end

```

6. Configure the IPsec phase2-interface.

```

config vpn ipsec phase2-interface
  edit "for_ios_p2"
    set phasename "for_ios_p1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    set pfs disable
    set keepalive enable
  next
end

```

7. Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.

```

config firewall policy
  edit 1
    set name "ios_vpn"
    set srcintf "for_ios_p1"
    set dstintf "lan"
    set srcaddr "ios_range"
    set dstaddr "local_network"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end

```

8. Configure the iOS device.

- a. In the iOS device, go to *Settings > General > VPN* and select *Add VPN Configuration*.
 - b. Set the *Type* to *IPsec* and enter a *Description*. Set the *Server* to the FortiGate's Internet-facing interface, and enter the username in *Account*. Enter the user password, the preshared IPsec VPN secret, then select *Done*.
 - c. Ensure that the IPsec VPN configuration is highlighted (indicated by a checkmark), and select the *Not Connected* button. The IPsec VPN connects with the user's credentials and secret. The status changes to *Connected*, and a VPN icon appears at the top of the screen.
- 9. Run diagnose commands to check the IPsec phase1/phase2 interface status. The diagnose debug application ike -1 command is the key to troubleshoot why the IPsec tunnel failed to establish.**

- a. Run the `diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: for_ios_pl_0
version: 1
interface: port1 15
addr: 172.20.120.123:4500 -> 172.20.120.254:64916

```

IKE Mode Config clients

IKE Mode Config is an alternative to DHCP over IPsec. It allows dialup VPN clients to obtain virtual IP address, network, and DNS configurations amongst others from the VPN server. A FortiGate can be configured as either an IKE Mode Config server or client.

IKE Mode Config can configure the host IP address, domain, DNS addresses, and WINS addresses. IPsec parameters such as gateway address, encryption, and authentication algorithms must be configured. Several network equipment vendors support IKE Mode Config.

An IKE Mode Config server or client is configured using `config vpn ipsec phase1-interface` and involves the following parameters:

Parameter	Description
ike-version {1 2}	IKE v1 is the default for FortiGate IPsec VPNs. IKE Mode Config is also compatible with IKE v2.
mode-cfg {enable disable}	Enable/disable IKE Mode Config.
type {static dynamic ddns}	If you set <code>type</code> to <code>dynamic</code> , an IKE Mode Config server is created. The other settings create an IKE Mode Config client.
assign-ip {enable disable}	Enable to request an IP address from the server. This configuration is for IKE Mode Config clients only.
interface <interface_name>	Specify the physical, aggregate, or VLAN interface to which the IPsec tunnel will be bound.
proposal <encryption_combination>	The encryption and authentication settings that the client will accept.
ip-version {4 6}	By default, IPsec VPNs use IPv4 addressing.
ipv4-split-include <string> ipv6-split-include <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the firewall address or address group that represents the subnets that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified subnets.
split-include-service <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the service or service group that represents the services that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified services.
ipv4-split-exclude <string> ipv6-split-exclude <string>	Specify the subnets that should not be accessed over the IPsec tunnel. This information is sent to the clients so that all default traffic should flow over the IPsec tunnel except for the specified subnets. See Split-exclude in IKEv1 .

Creating an IKE Mode Config client

In this example, the FortiGate connects to a VPN gateway with a static IP address that can be reached through port 1. Only the port, gateway, and proposal information needs to be configured. All other configuration information will come from the IKE Mode Config server.

To configure an IKE Mode Config client:

```
config vpn ipsec phase1-interface
  edit vpn1
    set ip-version 4
    set type static
    set remote-gw <gw_address>
    set interface port1
    set proposal 3des-sha1 aes128-sha1
    set mode-cfg enable
```

```

        set assign-ip enable
    next
end

```

Split-exclude in IKEv1

The `split-exclude` option specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of `split-include`, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The `split-include` and `split-exclude` options can be specified at the same time.

To configure split-exclude:

```

config vpn ipsec phase1-interface
    edit <name>
        set ike-version 1
        set type dynamic
        set mode-cfg enable
        set ipv4-split-exclude <string>
        set ipv6-split-exclude <string>
    next
end

```

Creating an IKE Mode Config server

To configure IKE Mode config settings, the following must be configured first :

```

config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
        set interface <interface_name>
        set ike-version < 1 | 2 >
        set mode-cfg enable
        set proposal <encryption_combination>
        set ip-version < 4 | 6 >
    next
end

```

In this example, the FortiGate assigns IKE Mode Config clients addresses in the range of 10.11.101.160 - 10.11.101.180. DNS and WINS server addresses are also provided. The public interface of the FortiGate unit is port1.

When IKE Mode-Configuration is enabled, multiple server IPs can be defined in IPsec phase 1.

The `ipv4-split-include` parameter specifies a firewall address (`OfficeLAN`), which represents the networks that the clients will have access to. This destination IP address information is sent to the clients.

To configure an IKE Mode Config server:

```

config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
        set interface "wan1"
        set xauthtype auto
        set mode aggressive
        set mode-cfg enable
    next
end

```

```
set proposal 3des-shal aes128-shal
set dpd disable
set dhgrp 2
set authusrgrp "FG-Group1"
set ipv4-start-ip 10.10.10.10
set ipv4-end-ip 10.10.10.20
set ipv4-dns-server1 1.1.1.1
set ipv4-dns-server2 2.2.2.2
set ipv4-dns-server3 3.3.3.3
set ipv4-wins-server1 4.4.4.4
set ipv4-wins-server2 5.5.5.5
set domain "fgt1c-domain"
set banner "fgt111C-banner"
set backup-gateway "100.100.100.1" "host1.com" "host2"
set ipv4-split-include OfficeLAN
next
end
```

Assigning IP addresses

Once the basic configuration is enabled, you can configure IP address assignment for clients, as well as DNS and WINS server assignments. Usually you will want to assign IP addresses to clients. The easiest way is to assign addresses from a specific range, similar to a DHCP server.

To assign an IP from an address range:

```
config vpn ipsec phase1-interface
edit vpn1
set ip-version 4
set assign-ip enable
set assign-ip-from range
set ipv4-start-ip <range_start>
set ipv4-end-ip <range_end>
set ipv4-netmask <netmask>
next
end
```

To assign an IP from a named firewall address or group:

```
config vpn ipsec phase1-interface
edit vpn1
set type dynamic
set assign-ip-from name
set ipv4-name <name>
set ipv6-name <name>
next
end
```

RADIUS server

If the client is authenticated by a RADIUS server, you can obtain the user's IP address assignment from the Framed-IP-Address attribute. The user must be authenticated using XAuth.

The users must be authenticated by a RADIUS server and assigned to the FortiGate user group `<grp_name>`. Since the IP address is not static, `type` is set to `dynamic` and `mode-cfg` is enabled. With IKE Mode Config, compatible clients can configure themselves with settings provided by the FortiGate.

To assign an IP from a RADIUS server:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set mode-cfg enable
        set assign-ip enable
        set assign-ip-from usrgrp
        set xauthtype auto
        set authusrgrp <grp_name>
    next
end
```

DHCP server

IKE Mode Config can use a remote DHCP server to assign the client IP addresses. Up to eight server addresses can be selected for either IPv4 or IPv6. The DHCP proxy must be enabled first.

To assign an IP from a DHCP server:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip <address>
    set dhcp6-server-ip <address>
end

config vpn ipsec phase1-interface
    edit vpn1
        set mode-cfg enable
        set assign-ip-from dhcp
    next
end
```

Certificate groups

IKE certificate groups consisting of up to four RSA certificates can be used in IKE phase 1. Since CA and local certificates are global, the IKE daemon loads them once for all VDOMs and indexes them into trees based on subject and public key hash (for CA certificates), or certificate name (for local certificates). Certificates are linked together based on the issuer, and certificate chains are built by traversing these links. This reduces the need to keep multiple copies of certificates that could exist in multiple chains.

To configure the IKE local ID:

```
config vpn certificate local
    edit <name>
        set ike-localid <string>
        set ike-localid-type {asn1dn | fqdn}
    next
end
```

Split-exclude in IKEv1

The `split-exclude` setting specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of `split-include`, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The `split-include` and `split-exclude` settings can be specified at the same time.

To configure `split-exclude`:

```
config vpn ipsec phase1-interface
  edit <name>
    set ike-version 1
    set type dynamic
    set mode-cfg enable
    set ipv4-split-exclude <string>
    set ipv6-split-exclude <string>
  next
end
```

IPsec VPN with external DHCP service

You can use an external DHCP server to assign IP addresses to your IPsec VPN clients. This is a common scenario found in enterprises where all DHCP leases need to be managed centrally.

In this example, the DHCP server assigns IP addresses in the range of 172.16.6.100 to 172.16.6.120. The server is attached to `internal2` on the FortiGate and has an IP address of 192.168.3.70.

To configure a DHCP server to assign IP addresses to IPsec VPN clients:

1. Create a user group for remote users:
 - a. Go to *User & Authentication > User Definition* and click *Create New*.
 - b. For *User Type*, select *Local User*.
 - c. Complete the wizard, and click *Submit*.
 - d. Go to *User & Authentication > User Groups* and click *Create New..*
 - e. Create a *Firewall* user group for your remote users.

- f. For *Members*, add the user you just created.
- g. Click *OK*.
2. Add a firewall address for the local network and IPsec VPN client range:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Create a new *Subnet* address for the LAN, including the IP mask and local interface (*internal2*).
 - c. Click *OK*.
 - d. Create a new *IP Range* address for the IPsec VPN client range (172.16.6.100–172.16.6.120).
 - e. Click *OK*.
3. Configure the IPsec VPN using a VPN tunnel in the CLI:

```

config vpn ipsec phase1-interface
  edit "dhcp_vpn"
    set type dynamic
    set interface "wan1"
    set mode aggressive
    set peertype any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set dpd on-idle
    set dhgrp 5
    set xauthtype auto
    set authusrgrp "ipsecvpn"
    set psksecret *****
    set dpd-retryinterval 60
  next
end

config vpn ipsec phase2-interface
  edit "toclient"
    set phase1name "dhcp_vpn"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    set dhgrp 5
    set dhcp-ipsec enable
  next
end

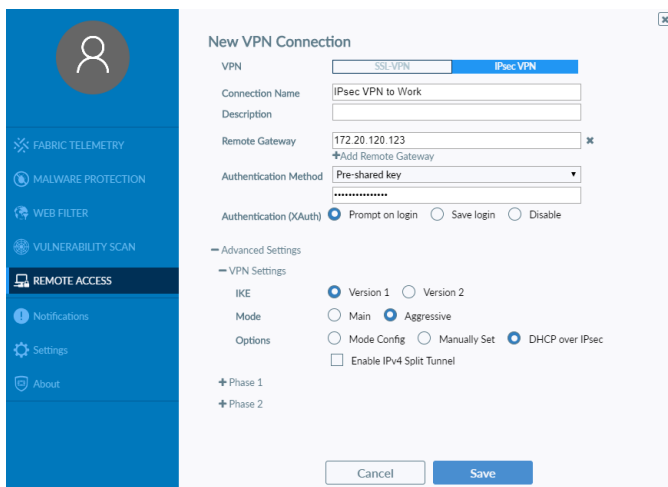

```

4. Configure the IPsec VPN interface:
 - a. Go to *Network > Interfaces* and edit the newly created IPsec VPN interface.
 - b. Enable the *DHCP Server*.
 - c. Expand *Advanced* and change the *Mode* to *Relay*.
 - d. Enter the external DHCP server IP address (192.168.3.70).
 - e. Change the *Type* to *IPsec*.
 - f. Click *OK*.
5. Create a security policy for access to the local network:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Configure the following parameters:
 - i. Set the *Incoming Interface* to the tunnel interface created in step 3 (*dhcp_vpn*).
 - ii. Set the *Outgoing Interface* (*internal2*).
 - iii. Set the *Source* to the IPsec VPN client range defined in step 2 (*ipsecvpn_range*).
 - iv. Set the *Destination* to the subnet address defined in step 2 (*Local LAN*).
 - v. Set the *Service* to *ALL*.

- c. Click *OK*.
6. Configure FortiClient:
 - a. In FortiClient, go to *REMOTE ACCESS > Add a new connection*.

- b. Configure the following parameters:
 - i. Set the *VPN* type to *IPsec VPN*.
 - ii. Enter a connection name.
 - iii. Set the *Remote Gateway* to the FortiGate external IP address.
 - iv. Set the *Authentication Method* to *Pre-shared key* and enter the key below.
 - v. Expand the *Advanced Settings > VPN Settings* and for *Options*, select *DHCP over IPsec*.
 - vi. Click *Save*.

- c. Select the new connection, and enter the user name and password.

d. Click *Connect*.

Once the connection is established, the external DHCP server assigns the user an IP address and FortiClient displays the connection status, including the IP address, connection duration, and bytes sent and received.

Verification

1. In FortiOS, go to *Monitor > IPsec Monitor* and verify that the tunnel *Status* is *Up*.
2. Go to *Log & Report > Forward Traffic* and verify the *Sent / Received* column displays the traffic flow through the tunnel.

L2TP over IPsec

This is an example of L2TP over IPsec.

This example uses a locally defined user for authentication, a Windows PC or Android tablet as the client, and `net-device` is set to `enable` in the `phase1-interface` settings. If `net-device` is set to `disable`, only one device can establish an L2TP over IPsec tunnel behind the same NAT device.

To configure L2TP over an IPsec tunnel using the GUI:

1. Go to *VPN > IPsec Wizard*.
2. Enter a *VPN Name*. In this example, *L2tpoIPsec*.

3. Configure the following settings for *VPN Setup*:
 - a. For *Template Type*, select *Remote Access*.
 - b. For *Remote Device Type*, select *Native* and *Windows Native*.
 - c. Click *Next*.
4. Configure the following settings for *Authentication*:
 - a. For *Incoming Interface*, select *port9*.
 - b. For *Authentication Method*, select *Pre-shared Key*.
 - c. In the *Pre-shared Key* field, enter *your-psk* as the key.
 - d. For *User Group*, select *L2tpusergroup*
 - e. Click *Next*.
5. Configure the following settings for *Policy & Routing*:
 - a. From the *Local Interface* dropdown menu, select *port10*.
 - b. Configure the *Local Address* as *172.16.101.0*.
 - c. Configure the *Client Address Range* as *10.10.10.1-10.10.10.100*.
 - d. Leave the *Subnet Mask* at its default value.
 - e. Click *Create*.

To configure L2TP over an IPsec tunnel using the CLI:

1. Configure the WAN interface and static route on HQ.

```

config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
  next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 22.1.1.2
    set device "port9"
  next
end

```

2. Configure IPsec phase1-interface and phase2-interface on HQ.

```

config vpn ipsec phase1-interface
  edit "L2tpoIPsec"
    set type dynamic
    set interface "port9"
    set peertype any
    set proposal aes256-md5 3des-sha1 aes192-sha1
    set dpd on-idle
    set dhgrp 2
    set net-device enable
    set psksecret sample
    set dpd-retryinterval 60
  next
end

```

```
config vpn ipsec phase2-interface
  edit "L2tpoIPsec"
    set phase1name "L2tpoIPsec"
    set proposal aes256-md5 3des-sha1 aes192-sha1
    set pfs disable
    set encapsulation transport-mode
    set l2tp enable
  next
end
```

3. Configure a user and user group on HQ.

```
config user local
  edit "usera"
    set type password
    set passwd usera
  next
end
config user group
  edit "L2tpusergroup"
    set member "usera"
  next
end
```

4. Configure L2TP on HQ.

```
config vpn l2tp
  set status enable
  set eip 10.10.10.100
  set sip 10.10.10.1
  set usrgrp "L2tpusergroup"
end
```

5. Configure a firewall address that is applied in L2TP settings to assign IP addresses to clients once the L2TP tunnel is established.

```
config firewall address
  edit "L2TPclients"
    set type iprange
    set start-ip 10.10.10.1
    set end-ip 10.10.10.100
  next
end
```

6. Configure a firewall policy.

```
config firewall policy
  edit 1
    set name "Bridge_IPsec_port9_for_l2tp negotiation"
    set srcintf "L2tpoIPsec"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "L2TP"
  next
  edit 2
    set srcintf "L2tpoIPsec"
```

```

        set dstintf "port10"
        set srcaddr "L2TPclients"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To view the VPN tunnel list on HQ:

```

# diagnose vpn tunnel list

list all ipsec tunnel in vd 0
----
name=L2tpoIPsec_0 ver=1 serial=8 22.1.1.1:0->10.1.100.15:0 tun_id=10.10.100.15

Tunneled Internet browsing

This is a sample configuration of tunneled internet browsing using a dialup VPN. To centralize network management and control, all branch office traffic is tunneled to HQ, including Internet browsing.

To configure a dialup VPN to tunnel Internet browsing using the GUI:

1. Configure the dialup VPN server FortiGate at HQ:
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name, in this example, *HQ*.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *The remote site is behind NAT*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Incoming Interface*, select *port9*.
 - ii. For *Authentication Method*, select *Pre-shared Key*.
 - iii. In the *Pre-shared Key* field, enter *sample* as the key.
 - iv. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select *port10*.
 - ii. Configure the *Local Subnets* as *172.16.101.0*.
 - iii. Configure the *Remote Subnets* as *0.0.0.0/0*.
 - iv. For *Internet Access*, select *Share Local*.
 - v. For *Shared WAN*, select *port9*.
 - vi. Click *Create*.
2. Configure the dialup VPN client FortiGate at a branch:
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name, in this example, *Branch1* or *Branch2*.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, select *The remote site is behind NAT*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *IP Address*, select *Remote Device* and enter *22.1.1.1*.
 - ii. For *Outgoing Interface*, select *wan1*.
 - iii. For *Authentication Method*, select *Pre-shared Key*.
 - iv. In the *Pre-shared Key* field, enter *sample* as the key.
 - v. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select *internal*.
 - ii. Configure the *Local Subnets* as *10.1.100.0/192.1684.0*.
 - iii. Configure the *Remote Subnets* as *0.0.0.0/0*.
 - iv. For *Internet Access*, select *Use Remote*.
 - v. Configure the *Local Gateway* to *15.1.1.1/13.1.1.1*.
 - vi. Click *Create*.

To configure a dialup VPN to tunnel Internet browsing using the CLI:**1. Configure the WAN interface and static route on the FortiGate at HQ.**

```
config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
  next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 22.1.1.2
    set device "port9"
  next
end
```

2. Configure IPsec phase1-interface and phase2-interface configuration at HQ.

```
config vpn ipsec phase1-interface
  edit "HQ"
    set type dynamic
    set interface "port9"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set dpd on-idle
    set psksecret sample
    set dpd-retryinterval 60
  next
end
config vpn ipsec phase2-interface
  edit "HQ"
    set phase1name "HQ"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
  next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
  edit 1
    set srcintf "HQ"
    set dstintf "port9" "port10"
    set srcaddr "10.1.100.0" "192.168.4.0"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end
```

4. Configure the WAN interface and static route on the FortiGate at the branches.**a. Branch1.**

```
config system interface
  edit "wan1"
    set ip 15.1.1.2 255.255.255.0
  next
  edit "internal"
    set ip 10.1.100.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 15.1.1.1
    set device "wan1"
  next
end
```

b. Branch2.

```
config system interface
  edit "wan1"
    set ip 13.1.1.2 255.255.255.0
  next
  edit "internal"
    set ip 192.168.4.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 13.1.1.1
    set device "wan1"
  next
end
```

5. Configure IPsec phase1-interface and phase2-interface configuration at the branches.**a. Branch1.**

```
config vpn ipsec phase1-interface
  edit "branch1"
    set interface "wan1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set dpd on-idle
    set remote-gw 22.1.1.1
    set psksecret sample
    set dpd-retryinterval 5
  next
end
config vpn ipsec phase2-interface
  edit "branch1"
    set phasename "branch1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
    set auto-negotiate enable
    set src-subnet 10.1.100.0 255.255.255.0
```

```
    next
end
```

b. Branch2.

```
config vpn ipsec phase1-interface
  edit "branch2"
    set interface "wan1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set dpd on-idle
    set remote-gw 22.1.1.1
    set psksecret sample
    set dpd-retryinterval 5
  next
end
config vpn ipsec phase2-interface
  edit "branch2"
    set phasename "branch2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    set auto-negotiate enable
    set src-subnet 192.168.4.0 255.255.255.0
  next
end
```

6. Configure the firewall policy at the branches.**a. Branch1.**

```
config firewall policy
  edit 1
    set name "outbound"
    set srcintf "internal"
    set dstintf "branch1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "inbound"
    set srcintf "branch1"
    set dstintf "internal"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

b. Branch2.

```
config firewall policy
  edit 1
    set name "outbound"
```

```

        set srcintf "internal"
        set dstintf "branch2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
edit 2
    set name "inbound"
    set srcintf "branch2"
    set dstintf "internal"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
next
end

```

7. Configure the static routes at the branches.

a. Branch1.

```

config router static
edit 2
    set dst 22.1.1.1/32
    set gateway 15.1.1.1
    set device "wan1"
    set distance 1
next
edit 3
    set device "branch1"
    set distance 5
next
end

```

b. Branch2.

```

config router static
edit 2
    set dst 22.1.1.1/32
    set gateway 13.1.1.1
    set device "wan1"
    set distance 1
next
edit 3
    set device "branch2"
    set distance 5
next
end

```

8. Optionally, view the VPN tunnel list on a branch with the `diagnose vpn tunnel list` command:

```

list all ipsec tunnel in vd 0
----
name=branch1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encaps=none/536 options[0218]=npu create_
dev frag-rfc accept_traffic=1

```

```

proxyid_num=1 child_num=1 refcnt=19 ilast=0 olast=0 ad=r/2
stat: rxp=1 txp=1661 rxb=65470 txb=167314
dpd: mode=on-idle on=1 idle=5000ms retry=3 count=0 seqno=2986
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=branch1 proto=0 sa=1 ref=5 serial=1 auto-negotiate adr
src: 0:0.0.0.0/0.0.0.0:0
dst: 0:0.0.0.0/0.0.0.0:0
SA: ref=6 options=1a227 type=00 soft=0 mtu=1438 expire=697/0B replaywin=1024
seqno=13a esn=0 replaywin_lastseq=00000000 itn=0
life: type=01 bytes=0/0 timeout=2368/2400

enc: spi=6e3636fe esp=aes key=16 fdaa20bcc96f74ae9885e824d3efa29d
ah=sha1 key=20 70c0891c769ad8007ea1f31a39978ffbc73242d0
dec:pkts/bytes=0/16348, enc:pkts/bytes=313/55962
npu_flag=03 npu_rgw=22.1.1.1 npu_lgw=15.1.1.2 npu_selid=1 dec_npuid=1 enc_npuid=1

```

9. Optionally, view static routing table on a branch with the `get router info routing-table static` command:

```

Routing table for VRF=0
S*      0.0.0.0/0 [5/0] is directly connected, branch1
S*      22.1.1.1/32 [1/0] via 15.1.1.1, wan1

```

Dialup IPsec VPN with certificate authentication

In a dialup IPsec VPN setup, a company may choose to use X.509 certificates as their authentication solution for remote users. This method includes the option to verify the remote user using a user certificate, instead of a username and password. This method can be simpler for end users.

Administrators need to issue unique user certificates to each user for remote access management. The user certificate can be verified by the subject field, common name, or the principal name in the Subject Alternative Name (SAN) field.

Subject field verification

This is the basic method that verifies the subject string defined in the PKI user setting matches a substring in the subject field of the user certificate. For example:

```

config user peer
  edit "tgerber"
    set ca "CA_Cert_2"
    set subject "CN=tgerber"
  next
end

```

Common name verification

In this method, administrators can define the CN string to match the common name (CN) in the subject field of the certificate. For example:

```

config user peer
  edit "tgerber"
    set ca "CA_Cert_2"
    set cn "tgerber"

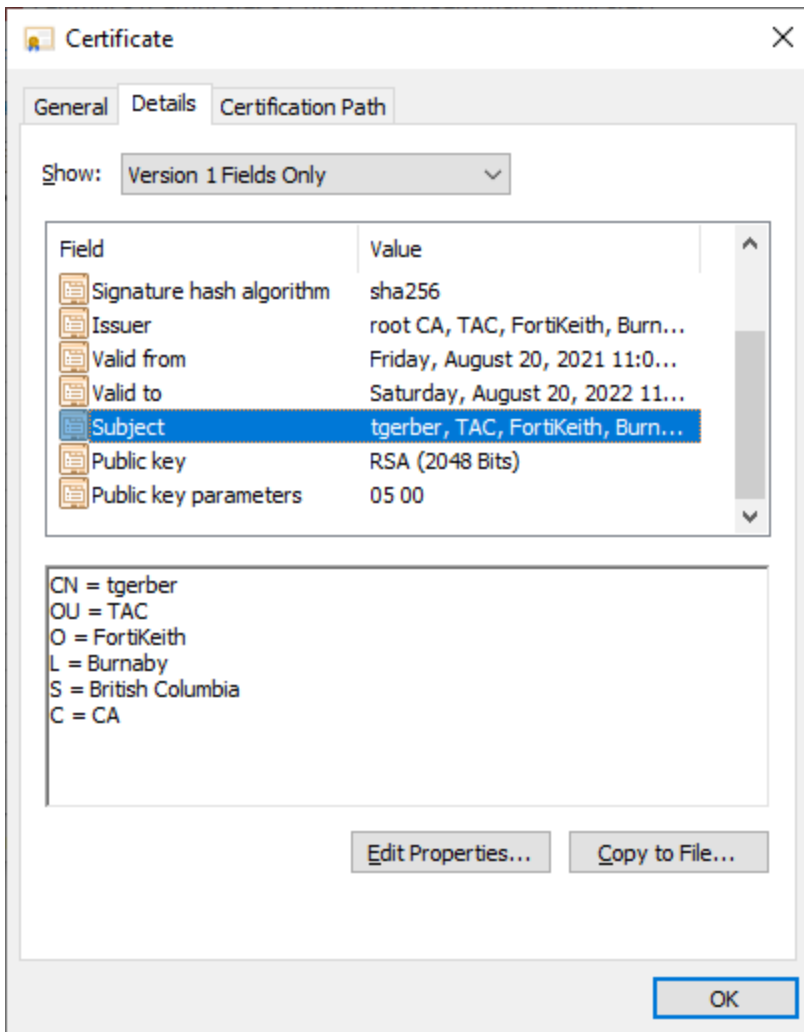

```

```

next
end

```

The matching certificate looks like the following:

A PKI user must be created on the FortiGate for each remote user that connects to the VPN with a unique user certificate.

Principal name with LDAP integration

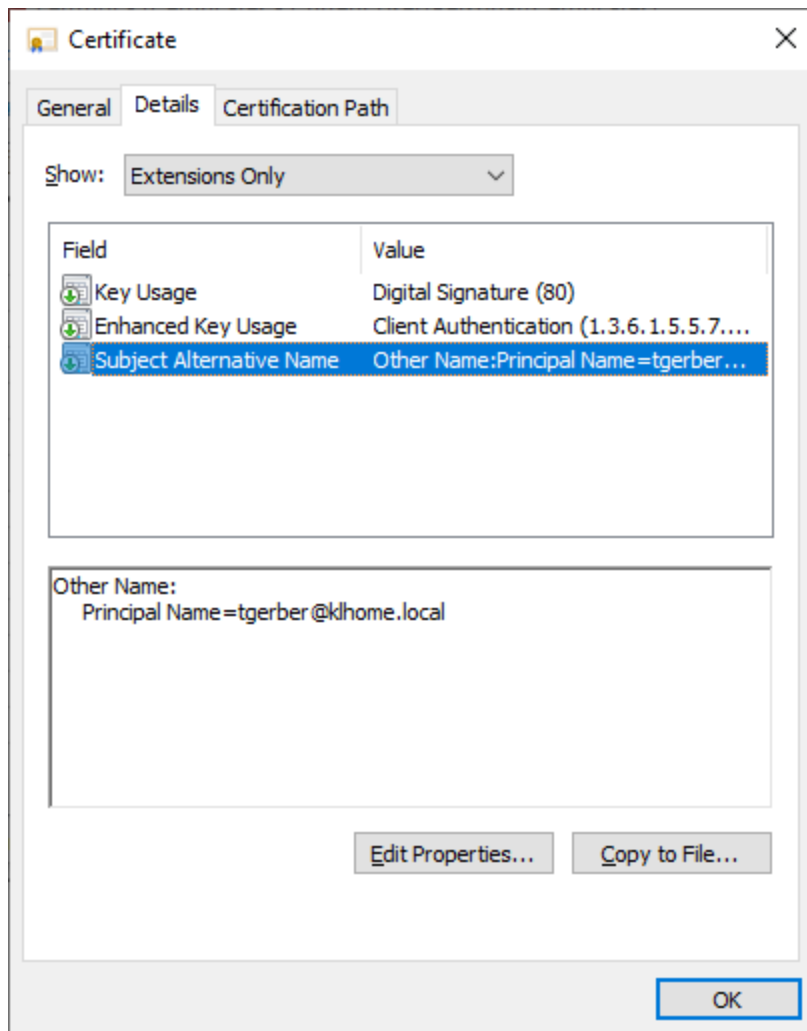

In this method, the PKI user setting references an LDAP server. When `ldap-mode` is set to `principal-name`, the UPN in the user certificate's SAN field is used to look up the user in the LDAP directory. If a match is found, then authentication succeeds. For example:

```

config user peer
  edit "ldap-peer"
    set ca "CA_Cert_2"
    set ldap-server "WIN2K16-KLHOME-LDAPS"
    set ldap-mode principal-name
  next
end

```

The matching certificate looks like the following:

This method is more scalable because only one PKI user needs to be created on the FortiGate. Remote users connect with their unique user certificate that are matched against users in the LDAP server.

Certificate management

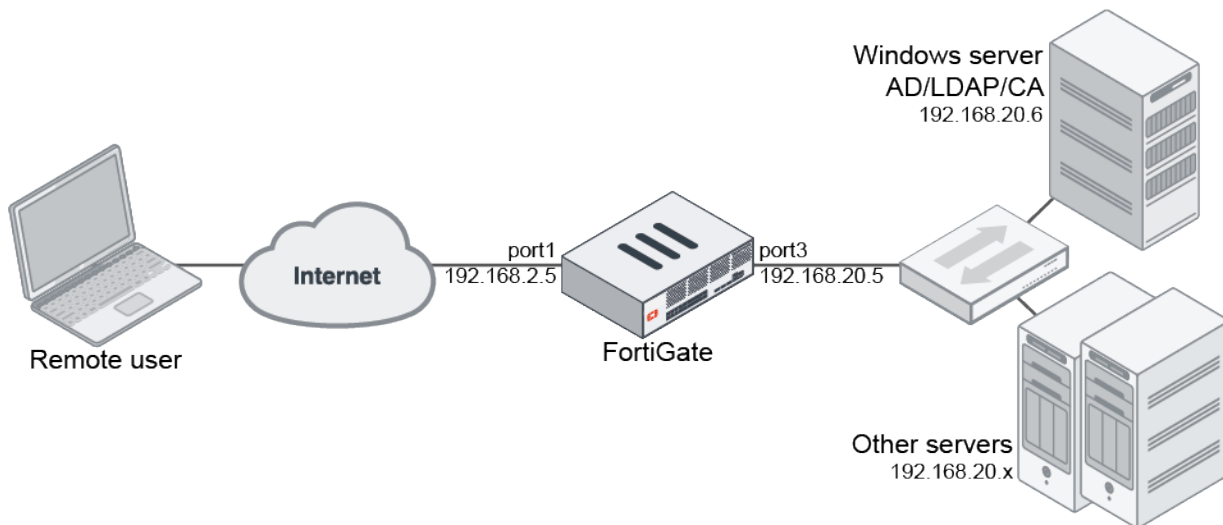

Dialup IPsec VPN with certificate authentication requires careful certificate management planning. Assuming that a company's private certificate authority (CA) is used to generate and sign all the certificates, the following certificates are needed:

Certificate type	Description
Server certificate	The server certificate is used to identify the FortiGate IPsec dialup gateway. A CSR can be generated on the FortiGate and signed by the CA, or the CA can generate the private and public keys and export the certificate package to the FortiGate.

Certificate type	Description
User certificate	The user certificate is generated and signed by the CA with unique CNs in the subject field and/or unique Principal Names in the SAN field. They are used to identify the user that is connecting to the VPN. User certificates must be installed on client machines.
CA certificate	The root CA certificate, and any subordinate CA that signed the actual user and server certificates, must be imported into the FortiGate and client machines. The CA certificate is used to verify the certificate chain of the server and user certificates.

Example

In this example, a dialup IPsec VPN tunnel is configured with certificate authentication using the subject field verification method and the LDAP integration method.

The company CA, named root CA, signs all the server and user certificates. The user, tgerber@klhome.local, has a user certificate signed by root CA installed on their endpoint. The corresponding user account is also present under the company's Active Directory.

There are five major steps to configure this example:

1. [Importing the certificates](#)
2. [Configuring user authentication](#)
3. [Configuring the VPN](#)
4. [Configuring FortiClient and the endpoints](#)
5. [Testing and verifying the certificate authentication](#)

Importing the certificates

The server certificate and CA certificate need to be imported into the FortiGate.

To import the server certificate:

1. Go to *System > Certificates* and select *Import > Local Certificate*.
2. For *Type*, select *PKCS #12 Certificate*.
3. Upload the key file exported from the CA and enter the password.
4. Click *OK*. The certificate now appears in the *Local Certificate* section.

To import the CA certificate:

1. Go to *System > Certificates* and select *Import > CA Certificate*.
2. For *Type*, select *File*.
3. Upload the CA certificate (usually a .CRT file). This certificate only contains the public key.
4. Click *OK*. The certificate now appears in the *Remote CA Certificate* section.

If any subordinate CA is involved in signing the certificates, you need to import its certificate.

Configuring user authentication

FortiGate PKI users do not appear in the GUI until at least one PKI user has been created in the CLI. The following instructions create the PKI users in the CLI.

To configure PKI users for subject field verification:

1. Create the PKI user and choose the CA certificate that was imported (if the certificate was signed by a subordinate CA, choose the subordinate CA's certificate):

```
config user peer
  edit "tgerber"
    set ca "CA_Cert_2"
    set subject "CN=tgerber"
  next
end
```

For an example of CN field matching, see [Common name verification](#).

2. Create additional users as needed.
3. Place the users into a peer group:

```
config user peergrp
  edit "pki-users"
    set member "tgerber" <user> ... <user>
  next
end
```

To configure PKI users for LDAP integration:

1. Configure the LDAP server that users connect to for authentication:

```
config user ldap
  edit "WIN2K16-KLHOME-LDAPS"
    set server "192.168.20.6"
```

```

        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password *****
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end

```

2. Configure the PKI user to reference the LDAP server using the CA certificate that was imported:

```

config user peer
    edit "ldap-peer"
        set ca "CA_Cert_2"
        set ldap-server "WIN2K16-KLHOME-LDAPS"
        set ldap-mode principal-name
    next
end

```

3. Place the user into a peer group:

```

config user peergrp
    edit "pki-ldap"
        set member "ldap-peer"
    next
end

```

Configuring the VPN

To configure the VPN, the address objects must be defined first so they can be used in the VPN and policy configurations. In this example, the VPN is configured in custom mode to define the authentication settings.

To configure the address objects:

1. Create the address range for the dialup clients:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. For *Name*, enter *remote-user-range*.
 - c. For *Type*, select *IP Range* and enter *172.18.200.10-172.18.200.99* in the *IP Range* field.
 - d. Click *OK*.
2. Create the address subnet for the destination 192.168.20.0/24:
 - a. Click *Create New > Address*.
 - b. For *Name*, enter *192.168.20.0*.
 - c. For *Type*, select *Subnet* and enter *192.168.20.0/24* in the *IP/Netmask* field.
 - d. Click *OK*.

To configure the IPsec dialup tunnel:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Tunnel*.
2. Enter a name for the tunnel, *Dialup-cert_0*.
3. For *Template type*, select *Custom* then click *Next*.

4. In the *Network* section, enter the following:

Remote Gateway	<i>Dialup User</i>
Interface	<i>port1</i>
Mode Config	Enable
Assign IP From	<i>Range</i>
IPv4 mode config > Client Address Range	<i>172.18.200.10-172.18.200.99</i>
Enable IPv4 Split Tunnel	Enable
Accessible Networks	<i>192.168.20.0</i>

5. In the *Authentication* section, enter the following:

Method	<i>Signature</i>
Certificate Name	Select the server certificate that was imported.
Mode	<i>Aggressive</i>
Peer Options > Accept Types	<i>Peer certificate group</i>
Peer Options > Peer certificate group	Select the group based on the preferred method: <ul style="list-style-type: none"> • For subject verification, select <i>pki-users</i>. • For LDAP integration, select <i>pki-ldap</i>.

When IKEv1 is used, aggressive mode should be selected so that the connecting endpoint will provide its peer ID in the first message of the IKE exchange. The peer identifier allows the FortiGate to match the correct tunnel when multiple dialup tunnels are defined.

6. For *Phase 2 Selectors*, leave the local and remote selectors as *0.0.0.0/0.0.0.0*.
7. Click *OK*.

To configure the firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following:

Name	Enter a policy name.
Incoming interface	<i>Dialup-cert_0</i>
Outgoing Interface	<i>port3</i>
Source	<i>remote-user-range</i>
Destination	<i>192.168.20.0</i>
Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>ACCEPT</i>

3. Configure the other settings as needed.
4. Click **OK**.

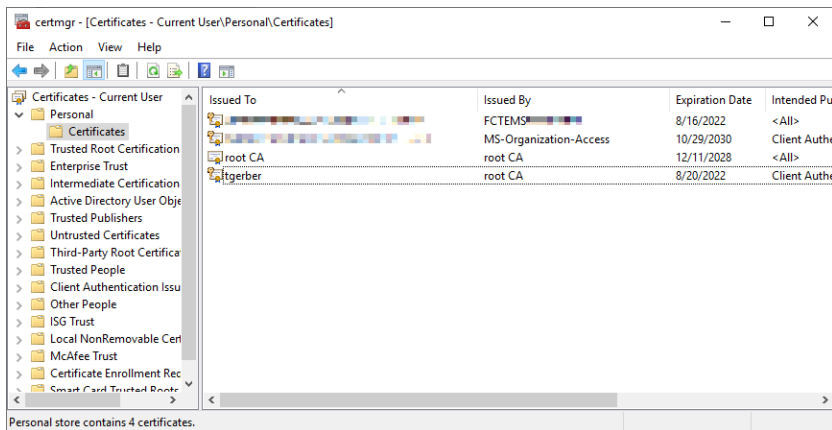

Configuring FortiClient and the endpoints

The following example is configured on a Windows PC with FortiClient 7.0.0. Other configurations may differ slightly.

The user certificate and CA certificate must be installed on the endpoint device. They may be pushed by the administrator through group policies or another method. This example assumes that the user certificate and CA certificate are already installed on the endpoint.

To verify the user and CA certificates:

1. Open the Windows certificate manager (certmgr):
 - a. In the Control Panel, type *Manage user certificate* in the search box.
 - b. Click the result, *Manage user certificates*.
2. Go to *Personal > Certificate*. The user certificate should be listed.

3. Go to *Trusted Root Certification Authorities > Certificates*. The company CA certificate should be listed.

To configure the FortiClient endpoint settings:

- In FortiClient, click the *Remote Access* tab and add a new connection:
 - If there are no existing connections, click *Configure VPN*.
 - If there are existing connections, click the menu icon and select *Add a new connection*.
- Configure the following:

VPN	<i>IPsec VPN</i>
Connection Name	<i>Dialup-cert_0</i>
Remote Gateway	<i>192.168.2.5</i>
Authentication Method	<i>X.509 Certificate</i> Select the user certificate, <i>tgerber/root CA</i> , from the dropdown.
Authentication (XAuth)	<i>Disable</i>

- Click *Save*.

Testing and verifying the certificate authentication

- On the client PC, open FortiClient and click the *Remote Access* tab.
- Select the VPN tunnel, *Dialup-cert_0*, and click *Connect*.
If the connection is successful, a FortiClient pop-up will appear briefly indicating that the IKE negotiation succeeded. The *Remote Access* window now displays *VPN Connected* and the associated VPN tunnel details.
- On the FortiGate, go to *Dashboard > Network* and locate the *IPsec* widget to view the VPN tunnel monitor. Click the widget to expand to full view.
The widget displays tunnel information, including the *Peer ID* containing the subject field of the user certificate.

Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selectors
Dialup-cert_0	192.168.2.1	C = CA, ST = British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN = tgerber	448 B	0 B	Dialup-cert_0	Dialup-cert
MPLS	10.10.10.1		4.28 GB	5.93 GB	MPLS	MPLS
vpn2Site1	192.168.2.1		0 B	0 B	vpn2Site1	vpn2Site1

- Go to *Log & Report > Events > VPN Events*. Several tunnel related logs are recorded.
- The same logs can be viewed in the CLI:

```
# execute log filter category 1
# execute log filter field subtype vpn
# execute log display
7: date=2021-08-23 time=15:53:08 eventtime=1629759188862005740 tz="-0700"
logid="0101037138" type="event" subtype="vpn" level="notice" vd="root" logdesc="IPsec
connection status changed" msg="IPsec connection status change" action="tunnel-up"
remip=192.168.2.1 locip=192.168.2.5 remport=64916 locport=4500 outintf="port1"
cookies="19f05ebc8c2f7a0d/7716190005538db5" user="C = CA, ST = British Columbia, L =
Burnaby, O = FortiKeith, OU = TAC, CN = tgerber" group="pki-ldap" useralt="C = CA, ST =
British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN = tgerber" xauthuser="N/A"
xauthgroup="N/A" assignip=172.18.200.10 vpntunnel="Dialup-cert_0" tunnelip=172.18.200.10
tunnelid=3418215253 tunneltype="ipsec" duration=0 sentbyte=0 rcvdbyte=0 nextstat=0
```

6. If any issues arise during the connection, run the following debug commands to troubleshoot the issue:

```
# diagnose debug application ike -1
# diagnose debug application fnbamd -1
# diagnose debug enable
```

Aggregate and redundant VPN

The following topics provide instructions on configuring aggregate and redundant VPNs:

- [Manual redundant VPN configuration on page 1564](#)
- [OSPF with IPsec VPN for network redundancy on page 1568](#)
- [IPsec VPN in an HA environment on page 1575](#)
- [Packet distribution and redundancy for aggregate IPsec tunnels on page 1581](#)
- [Packet distribution for aggregate dial-up IPsec tunnels using location ID on page 1592](#)
- [Packet distribution for aggregate static IPsec tunnels in SD-WAN on page 1596](#)
- [Packet distribution for aggregate IPsec tunnels using weighted round robin on page 1601](#)
- [Redundant hub and spoke VPN on page 1602](#)

Manual redundant VPN configuration

A FortiGate with two interfaces connected to the internet can be configured to support redundant VPNs to the same remote peer. Four distinct paths are possible for VPN traffic from end to end. If the primary connection fails, the FortiGate can establish a VPN using the other connection.

Topology

The redundant configuration in this example uses route-based VPNs. The FortiGates must operate in NAT mode and use auto-keying.

This example assumes the redundant VPNs are essentially equal in cost and capability. When the original VPN returns to service, traffic continues to use the replacement VPN until the replacement VPN fails. If the redundant VPN uses more expensive facilities, only use it as a backup while the main VPN is down.

A redundant configuration for each VPN peer includes:

- One phase 1 configuration for each path between the two peers with dead peer detection enabled
- One phase 2 definition for each phase 1 configuration
- One static route for each IPsec interface with different distance values to prioritize the routes
- Two firewall policies per IPsec interface, one for each direction of traffic

To configure the phase 1 and phase 2 VPN settings:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name and click *Next*.

3. Enter the following phase 1 settings for path 1:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

4. Configure the remaining phase 1 and phase 2 settings as needed.
5. Click *OK*.
6. Repeat these steps for the remaining paths.
 - a. Path 2:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

- b. Path 3:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

- c. Path 4:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

To configure the static routes:

1. Go to *Network > Static Routes* and click *Create New*.
2. In the *Destination* field, enter the subnet of the private network.
3. For *Interface*, select one of the IPsec interfaces on the local peer.
4. Enter a value for *Administrative Distance*.
5. Click *OK*.
6. Repeat these steps for the three remaining paths, and enter different values for *Administrative Distance* to prioritize the paths.

To configure the firewall policies:

1. Create the policies for the local primary interface:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Enter the following:

Name	Enter a name for the policy.
Incoming Interface	Select the local interface to the internal (private) network.
Outgoing Interface	Select one of the virtual IPsec interfaces.
Source	All
Destination	All
Schedule	Always
Service	All
Action	ACCEPT

- c. Click *OK*.
- d. Click *Create New* and configure the policy for the other direction of traffic:

Name	Enter a name for the policy.
Incoming Interface	Select one of the virtual IPsec interfaces.
Outgoing Interface	Select the local interface to the internal (private) network.
Source	All
Destination	All
Schedule	Always
Service	All
Action	ACCEPT

- e. In the policy list, drag the VPN policies above any other policies with similar source and destination addresses.
2. Repeat these steps to create the policies for the three remaining paths.

Creating a backup IPsec interface

A route-based VPN can be configured to act as a backup IPsec interface when the main VPN is out of service. This can only be configured in the CLI.

The backup feature works on interfaces with static addresses that have dead peer detection enabled. The `monitor` option creates a backup VPN for the specified phase 1 configuration.

To create a backup IPsec interface:

```
config vpn ipsec phase1-interface
edit main_vpn
set dpd on-demand
set interface port1
```

```

        set nattraversal enable
        set psksecret *****
        set remote-gw 192.168.10.8
        set type static
    next
    edit backup_vpn
        set dpd on-demand
        set interface port2
        set monitor main_vpn
        set nattraversal enable
        set psksecret *****
        set remote-gw 192.168.10.8
        set type static
    next
end

```

OSPF with IPsec VPN for network redundancy

This is a sample configuration of using OSPF with IPsec VPN to set up network redundancy. Route selection is based on OSPF cost calculation. You can configure ECMP or primary/secondary routes by adjusting OSPF path cost.

Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure OSPF with IPsec VPN to achieve network redundancy using the CLI:

1. Configure the WAN interface and static route.

Each FortiGate has two WAN interfaces connected to different ISPs. The ISP1 link is for the primary FortiGate and the IPS2 link is for the secondary FortiGate.

a. Configure HQ1.

```

config system interface
    edit "port1"
        set alias to_ISP1
        set ip 172.16.200.1 255.255.255.0
    next
    edit "port2"
        set alias to_ISP2
        set ip 172.17.200.1 255.255.255.0
    next
end
config router static
    edit 1

```

```

        set gateway 172.16.200.3
        set device "port1"
    next
    edit 2
        set gateway 172.17.200.3
        set device "port2"
        set priority 100
    next
end

```

b. Configure HQ2.

```

config system interface
    edit "port25"
        set alias to_ISP1
        set ip 172.16.202.1 255.255.255.0
    next
    edit "port26"
        set alias to_ISP2
        set ip 172.17.202.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
    edit 2
        set gateway 172.17.202.2
        set device "port26"
        set priority 100
    next
end

```

2. Configure the internal (protected subnet) interface.

a. Configure HQ1.

```

config system interface
    edit "dmz"
        set ip 10.1.100.1 255.255.255.0
    next
end

```

b. Configure HQ2.

```

config system interface
    edit "port9"
        set ip 172.16.101.1 255.255.255.0
    next
end

```

3. Configure IPsec phase1-interface and phase-2 interface. On each FortiGate, configure two IPsec tunnels: a primary and a secondary.

a. Configure HQ1.

```

config vpn ipsec phase1-interface
    edit "pri_HQ2"
        set interface "port1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample1
    next
end

```

```

next
edit "sec_HQ2"
  set interface "port2"
  set peertype any
  set net-device enable
  set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
  set remote-gw 172.17.202.1
  set psksecret sample2
next
end
config vpn ipsec phase2-interface
edit "pri_HQ2"
  set phaselname "pri_HQ2"
  set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
  set auto-negotiate enable
next
edit "sec_HQ2"
  set phaselname "sec_HQ2"
  set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
  set auto-negotiate enable
next
end

```

b. Configure HQ2.

```

config vpn ipsec phase1-interface
edit "pri_HQ1"
  set interface "port25"
  set peertype any
  set net-device enable
  set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
  set remote-gw 172.16.200.1
  set psksecret sample1
next
edit "sec_HQ1"
  set interface "port26"
  set peertype any
  set net-device enable
  set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
  set remote-gw 172.17.200.1
  set psksecret sample2
next
end
config vpn ipsec phase2-interface
edit "pri_HQ1"
  set phaselname "pri_HQ1"
  set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
  set auto-negotiate enable
next
edit "sec_HQ1"
  set phaselname "sec_HQ1"
  set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
    aes256gcm chacha20poly1305
  set auto-negotiate enable
next
end

```

4. Configure an inbound and outbound firewall policy for each IPsec tunnel.**a. Configure HQ1.**

```
config firewall policy
  edit 1
    set name "pri_inbound"
    set srcintf "pri_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "pri_outbound"
    set srcintf "dmz"
    set dstintf "pri_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 3
    set name "sec_inbound"
    set srcintf "sec_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 4
    set name "sec_outbound"
    set srcintf "dmz"
    set dstintf "sec_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

b. Configure HQ2.

```
config firewall policy
  edit 1
    set name "pri_inbound"
    set srcintf "pri_HQ1"
    set dstintf "port9"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
```

```
edit 2
    set name "pri_outbound"
    set srcintf "port9"
    set dstintf "pri_HQ1"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
edit 3
    set name "sec_inbound"
    set srcintf "sec_HQ1"
    set dstintf "port9"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
edit 4
    set name "sec_outbound"
    set srcintf "port9"
    set dstintf "sec_HQ1"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
end
```

5. Assign an IP address to the IPsec tunnel interface.

a. Configure HQ1.

```
config system interface
    edit "pri_HQ2"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
    edit "sec_HQ2"
        set ip 10.10.11.1 255.255.255.255
        set remote-ip 10.10.11.2 255.255.255.255
    next
end
```

b. Configure HQ2.

```
config system interface
    edit "pri_HQ1"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
    next
    edit "sec_HQ1"
        set ip 10.10.11.2 255.255.255.255
        set remote-ip 10.10.11.1 255.255.255.255
    next
end
```

6. Configure OSPF.**a. Configure HQ1.**

```
config router ospf
  set router-id 1.1.1.1
  config area
    edit 0.0.0.0
    next
  end
  config ospf-interface
    edit "pri_HQ2"
      set interface "pri_HQ2"
      set cost 10
      set network-type point-to-point
    next
    edit "sec_HQ2"
      set interface "sec_HQ2"
      set cost 20
      set network-type point-to-point
    next
  end
  config network
    edit 1
      set prefix 10.10.10.0 255.255.255.0
    next
    edit 2
      set prefix 10.10.11.0 255.255.255.0
    next
    edit 3
      set prefix 10.1.100.0 255.255.255.0
    next
  end
end
```

b. Configure HQ2.

```
config router ospf
  set router-id 2.2.2.2
  config area
    edit 0.0.0.0
    next
  end
  config ospf-interface
    edit "pri_HQ1"
      set interface "pri_HQ1"
      set cost 10
      set network-type point-to-point
    next
    edit "sec_HQ1"
      set interface "sec_HQ1"
      set cost 20
      set network-type point-to-point
    next
  end
  config network
    edit 1
      set prefix 10.10.10.0 255.255.255.0
    next
    edit 2
```

```

        set prefix 10.10.11.0 255.255.255.0
    next
    edit 3
        set prefix 172.16.101.0 255.255.255.0
    next
end
end

```

To check VPN and OSPF states using diagnose and get commands:

1. Run the HQ1 # diagnose vpn ike gateway list command. The system should return the following:

```

vd: root/0
name: pri_HQ2
version: 1
interface: port1 11

```

3. Run the HQ1 # get router info ospf neighbor command. The system should return the following:

```

OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:37 10.10.10.2 pri_HQ2
2.2.2.2 1. Full/ - 00:00:32 10.10.11.2 sec_HQ2

```

4. Run the HQ1 # get router info routing-table ospf command. The system should return the following:

```

Routing table for VRF=0
O 172.16.101.0/24 [110/20] via 10.10.10.2, pri_HQ2 , 00:03:21

```

In case the primary tunnel is down after route convergence.

5. Run the HQ1 # get router info routing-table ospf command. The system should return the following:

```

Routing table for VRF=0
O 172.16.101.0/24 [110/110] via 10.10.11.2, sec_HQ2 , 00:00:01

```

IPsec VPN in an HA environment

This is a sample configuration of site-to-site IPsec VPN in an HA environment.

For this example, set up HA as described in the HA topics. When setting up HA, enable the following options to ensure IPsec VPN traffic is not interrupted during an HA failover:

- session-pickup under HA settings.
- ha-sync-esp-seqno under IPsec phase1-interface settings.

You can configure IPsec VPN in an HA environment using the [GUI](#) or [CLI](#).

In this example, the VPN name for HQ1 is "to_HQ2", and the VPN name for HQ2 is "to_HQ1".

To configure IPsec VPN in an HA environment in the GUI:

1. Set up IPsec VPN on HQ1 (the HA cluster):
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, set *No NAT between sites*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. In the *IP address* field, enter *172.16.202.1*.
 - iii. For *Outgoing Interface*, select *port1*.
 - iv. For *Authentication Method*, select *Pre-shared Key*.
 - v. In the *Pre-shared Key* field, enter an example key.
 - vi. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the local interface.
 - ii. Configure the *Local Subnets* as *10.1.100.0/24*.
 - iii. Configure the *Remote Subnets* as *172.16.101.0/24*.
 - iv. Click *Create*.
2. Set up IPsec VPN on HQ2:
 - a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
 - i. Enter a VPN name.
 - ii. For *Template Type*, select *Site to Site*.
 - iii. For *Remote Device Type*, select *FortiGate*.
 - iv. For *NAT Configuration*, set *No NAT between sites*.
 - v. Click *Next*.
 - b. Configure the following settings for *Authentication*:
 - i. For *Remote Device*, select *IP Address*.
 - ii. In the *IP address* field, enter *172.16.200.1*.
 - iii. For *Outgoing Interface*, select *port13*.
 - iv. For *Authentication Method*, select *Pre-shared Key*.
 - v. In the *Pre-shared Key* field, enter an example key.
 - vi. Click *Next*.
 - c. Configure the following settings for *Policy & Routing*:
 - i. From the *Local Interface* dropdown menu, select the desired local interface. In this example, it is *port9*.
 - ii. Configure the *Local Subnets* as *172.16.101.0*.
 - iii. Configure the *Remote Subnets* as *10.1.100.0*
 - iv. Click *Create*.

To configure IPsec VPN in an HA environment using the CLI:

1. Configure HA. In this example, two FortiGates work in active-passive mode. The HA heartbeat interfaces are WAN1 and WAN2:

```
config system ha
```

```

set group-name "FGT-HA"
set mode a-p
set password sample
set hbdev "wan1" 50 "wan2" 50
set session-pickup enable
set priority 200
set override-wait-time 10
end

```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

- a. Configure HQ1:

```

config system interface
  edit "port1"
    set vdom "root"
    set ip 172.16.200.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.200.3
    set device "port1"
  next
end

```

- b. Configure HQ2:

```

config system interface
  edit "port25"
    set vdom "root"
    set ip 172.16.202.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.202.2
    set device "port25"
  next
end

```

3. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.

- a. Configure HQ1:

```

config system interface
  edit "dmz"
    set vdom "root"
    set ip 10.1.100.1 255.255.255.0
  next
end

```

- b. Configure HQ2:

```

config system interface
  edit "port9"
    set vdom "root"
    set ip 172.16.101.1 255.255.255.0
  next
end

```

4. Configure the IPsec phase1-interface. This example uses PSK as the authentication method. You can also use signature authentication.

a. Configure HQ1:

```

config vpn ipsec phase1-interface
  edit "to_HQ2"
    set interface "port1"
    set peertype any
    set net-device enable
    set ha-sync-esp-seqno enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set psksecret sample
  next
end

```

b. Configure HQ2:

```

config vpn ipsec phase1-interface
  edit "to_HQ1"
    set interface "port25"
    set peertype any
    set net-device enable
    set ha-sync-esp-seqno enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.200.1
    set psksecret sample
  next
end

```

5. Configure the IPsec phase2-interface:**a. Configure HQ1:**

```

config vpn ipsec phase2-interface
  edit "to_HQ2"
    set phaselname "to_HQ2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
      aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
end

```

b. Configure HQ2:

```

config vpn ipsec phase2-interface
  edit "to_HQ1"
    set phaselname "to_HQ1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
      aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
end

```

6. Configure static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure IPsec traffic does not match the default route when the IPsec tunnel is down.**a. Configure HQ1:**

```

config router static
  edit 2
    set dst 172.16.101.0 255.255.255.0
    set device "to_HQ2"
  next
  edit 3
    set dst 172.16.101.0 255.255.255.0
    set blackhole enable
    set distance 254
  next
end

```

```
end
```

b. Configure HQ2:

```
config router static
  edit 2
    set dst 10.1.100.0 255.255.255.0
    set device "to_HQ1"
  next
  edit 3
    set dst 10.1.100.0 255.255.255.0
    set blackhole enable
    set distance 254
  next
end
```

7. Configure two firewall policies to allow bi-directional IPsec traffic flow over the IPsec tunnel:**a. Configure HQ1:**

```
config firewall policy
  edit 1
    set name "inbound"
    set srcintf "to_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "outbound"
    set srcintf "dmz"
    set dstintf "to_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

b. Configure HQ2:

```
config firewall policy
  edit 1
    set name "inbound"
    set srcintf "to_HQ1"
    set dstintf "port9"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "outbound"
    set srcintf "port9"
    set dstintf "to_HQ1"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
```

```

    set schedule "always"
    set service "ALL"
  next
end

```

8. Use the following diagnose commands to check IPsec phase1/phase2 interface status including the sequence number on the secondary FortiGate. The diagnose debug application ike -1 command is the key to troubleshoot why the IPsec tunnel failed to establish.

- a. Run the HQ1 # diagnose vpn ike gateway list command. The system should return the following:

```

vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 5s ago
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms
  id/spi: 12 6e8d0532e7fe8d84/3694ac323138a024 direction: responder status:
    established 5-5s ago = 0ms proposal: aes128-sha256 key: b3efb46d0d385aff-
    7bb9ee241362ee8d lifetime/rekey: 86400/86124 DPD sent/recvd: 00000000/00000000

```

- b. Run the HQ1 # diagnose vpn tunnel list command. The system should return the following:

```

list all ipsec tunnel in vd 0

name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1

```

Packet distribution and redundancy for aggregate IPsec tunnels

This is a sample configuration of a multiple site-to-site IPsec VPN that uses an IPsec aggregate interface to set up redundancy and traffic load-balancing. The VPN tunnel interfaces must have `net-device` disabled in order to be members of the IPsec aggregate.

Each FortiGate has two WAN interfaces connected to different ISPs. OSPF runs over the IPsec aggregate in this configuration.

The supported load balancing algorithms are: L3, L4, round-robin (default), weighted round-robin, and redundant. The first four options allow traffic to be load-balanced, while the last option (redundant) uses the first tunnel that is up for all traffic.

Dynamic routing can run on the aggregate interface, and it can be a member interface in SD-WAN (not shown in this configuration).

Configuring the HQ1 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. [Create the IPsec tunnels.](#)
2. [Create the IPsec aggregate.](#)
3. [Configure the firewall policies.](#)
4. [Configure the aggregate VPN interface IPs.](#)
5. [Configure OSPF.](#)

To create the IPsec tunnels:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter `pri_HQ2` and click *Next*.
3. Enter the following:

Phase 1	
IP Address	172.16.202.1
Interface	port1
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named `sec_HQ2` with the following settings:

Phase 1	
IP Address	172.17.202.1
Interface	port2
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Aggregate*.
2. For *Name*, enter `agg_HQ2`.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (`pri_HQ2` and `sec_HQ2`). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ2
Outgoing Interface	dmz
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	dmz
Outgoing Interface	agg_HQ2
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network > Interfaces* and edit *agg_HQ2*.
2. For *IP*, enter 10.10.10.1.
3. For *Remote IP/Netmask*, enter 10.10.10.2 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network > OSPF*.
2. For *Router ID*, enter 1.1.1.1.
3. In the *Areas* table, click *Create New*.
 - a. For *Area ID*, enter 0.0.0.0.
 - b. Click *OK*.

4. In the *Networks* table, click *Create New*.
 - a. Set the *Area* to *0.0.0.0*.
 - b. For *IP/Netmask*, enter *10.1.100.0/24*.
 - c. Click *OK*.
 - d. Click *Create New*.
 - e. For *IP/Netmask*, enter *10.10.10.0/24*.
 - f. Click *OK*.
5. Click *Apply*.

Configuring the HQ2 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. [Create the IPsec tunnels.](#)
2. [Create the IPsec aggregate.](#)
3. [Configure the firewall policies.](#)
4. [Configure the aggregate VPN interface IPs.](#)
5. [Configure OSPF.](#)

To create the IPsec tunnels:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter *pri_HQ1* and click *Next*.
3. Enter the following:

Phase 1

IP Address	172.16.200.1
Interface	port25
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID

Phase 2

Auto-negotiate	Enable
----------------	--------

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named *sec_HQ1* with the following settings:

Phase 1

IP Address	172.17.200.1
Interface	port26
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Aggregate*.
2. For *Name*, enter *agg_HQ1*.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ1* and *sec_HQ1*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ1
Outgoing Interface	port9
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	port9

Outgoing Interface	agg_HQ1
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network > Interfaces* and edit *agg_HQ1*.
2. For *IP*, enter 10.10.10.2.
3. For *Remote IP/Netmask*, enter 10.10.10.1 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network > OSPF*.
2. For *Router ID*, enter 2.2.2.2.
3. In the *Areas* table, click *Create New*.
 - a. For *Area ID*, enter 0.0.0.0.
 - b. Click *OK*.
4. In the *Networks* table, click *Create New*.
 - a. Set the *Area* to 0.0.0.0.
 - b. For *IP/Netmask*, enter 172.16.101.0/24.
 - c. Click *OK*.
 - d. Click *Create New*.
 - e. For *IP/Netmask*, enter 10.10.10.0/24.
 - f. Click *OK*.
5. Click *Apply*.

Monitoring the traffic in the GUI

To monitor the traffic:

1. Go to *Dashboard > Network*, hover over the *IPsec* widget, then click *Expand to Full Screen*.
2. Expand the aggregate tunnel in the table to view statistics for each aggregate member.

Configuring the HQ1 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. [Configure the interfaces.](#)
2. [Configure two IPsec phase 1 and phase 2 interfaces.](#)
3. [Configure the IPsec aggregate.](#)
4. [Configure the firewall policies.](#)

5. [Configure the aggregate VPN interface IPs.](#)
6. [Configure OSPF.](#)

To configure the interfaces:

1. Configure port1, port2, and dmz as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
  edit "pri_HQ2"
    set interface "port1"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set psksecret sample1
  next
  edit "sec_HQ2"
    set interface "port2"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.17.202.1
    set psksecret sample2
  next
end
config vpn ipsec phase2-interface
  edit "pri_HQ2"
    set phaselname "pri_HQ2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
      chacha20poly1305
    set auto-negotiate enable
  next
  edit "sec_HQ2"
    set phaselname "sec_HQ2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
      chacha20poly1305
    set auto-negotiate enable
  next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
  edit "agg_HQ2"
    set member "pri_HQ2" "sec_HQ2"
  next
end
```

To configure the firewall policies:

```
config firewall policy
  edit 1
```

```
    set name "inbound"
    set srcintf "agg_HQ2"
    set dstintf "dmz"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
edit 2
    set name "outbound"
    set srcintf "dmz"
    set dstintf "agg_HQ2"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
    edit "agg_HQ2"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
end
```

To configure OSPF:

```
config router ospf
    set router-id 1.1.1.1
    config area
        edit 0.0.0.0
            next
        end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
            next
        edit 2
            set prefix 10.10.10.0 255.255.255.0
            next
        end
    end
end
```

Configuring the HQ2 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.

5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port25, port26, and port9 as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```

config vpn ipsec phase1-interface
  edit "pri_HQ1"
    set interface "port25"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.200.1
    set psksecret sample1
  next
  edit "sec_HQ1"
    set interface "port26"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.17.200.1
    set psksecret sample2
  next
end
config vpn ipsec phase2-interface
  edit "pri_HQ1"
    set phasename "pri_HQ1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
      chacha20poly1305
    set auto-negotiate enable
  next
  edit "sec_HQ1"
    set phasename "sec_HQ1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
      chacha20poly1305
    set auto-negotiate enable
  next
end

```

To configure the IPsec aggregate:

```

config system ipsec-aggregate
  edit "agg_HQ1"
    set member "pri_HQ1" "sec_HQ1"
  next
end

```

To configure the firewall policies:

```

config firewall policy
  edit 1

```

```
    set name "inbound"
    set srcintf "agg_HQ1"
    set dstintf "port9"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
edit 2
    set name "outbound"
    set srcintf "port9"
    set dstintf "agg_HQ1"
    set srcaddr "172.16.101.0"
    set dstaddr "10.1.100.0"
    set action accept
    set schedule "always"
    set service "ALL"
next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
    edit "agg_HQ1"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
    next
end
```

To configure OSPF:

```
config router ospf
    set router-id 2.2.2.2
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
        edit 2
            set prefix 10.10.10.0 255.255.255.0
        next
    end
end
```

Monitoring the traffic in the CLI

To view debugging information:

1. Verify the status of the phase 1 IKE SAs:

```
# diagnose vpn ike gateway list
vd: root/0
```

```

name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
tun_id: 172.16.202.1
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms
  id/spi: 173 dcdede154681579b/e32f4c48c4349fc0 direction: responder status: established
    1498-1498s ago = 10ms proposal: aes128-sha256 key: d7230a68d7b83def-
    588b94495cfa9d38 lifetime/rekey: 86400/84631 DPD sent/rcv: 0000000d/00000006
vd: root/0
name: sec_HQ2
version: 1
interface: port2 12
addr: 172.17.200.1:500 -> 172.17.202.1:500
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms

  src: 0:0.0.0.0/0.0.0.0:0 dst: 0:0.0.0.0/0.0.0.0:0 SA: ref=3 options=18227 type=00
    soft=0 mtu=1438 expire=41231/0B replaywin=2048
    seqno=28 esn=0 replaywin_lastseq=00000027 itn=0
  life: type=01 bytes=0/0 timeout=42900/43200 dec: spi=1071b4f8 esp=aes key=16
    142cce377b3432ba41e64128ade6848c
    ah=sha1 key=20 20e64947e2397123f561584321adc0e7aa0c342d
  enc: spi=ec89b7ed esp=aes key=16 2ec13622fd60dacce3d28ebe5fe7ab14

```

```

ah=sha1 key=20 c1787497508a87f40c73c0db0e835c70b3c3f42d
dec:pkts/bytes=38/2568, enc:pkts/bytes=39/5432

```

3. Debug the IPsec aggregation list:

```

# diagnose sys ipsec-aggregate list
agg_HQ2 algo=RR member=2 run_tally=2
members:
  pri_HQ2
  sec_HQ2

```

4. Verify the OSPF neighbor information:

```

# get router info ospf neighbor
OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:34 10.10.10.2 agg1_HQ2

```

5. Verify the OSPF routing table:

```

# get router info routing-table ospf
Routing table for VRF=0
O 172.16.101.0/24 [110/20] via 10.10.10.2, agg1_HQ2 , 00:18:43

```

Packet distribution for aggregate dial-up IPsec tunnels using location ID

To support per-packet load balancing on aggregate dial-up IPsec tunnels between sites, each spoke must be configured with a location ID. On the hub, per-packet load balancing is performed on the tunnels in the IPsec aggregate that have the same location ID.

Multiple dial-up VPN tunnels from the same location can be aggregated on the VPN hub and load balanced based on the configured load balance algorithm.

IPsec traffic cannot be offloaded to the NPU.

Example

In this example, an IPsec aggregate tunnel is formed between two dial-up IPsec tunnels in order to support per-packet load balancing.

To configure the client FortiGate (FGT-A):**1. Configure the IPsec tunnels:**

```
config vpn ipsec phase1-interface
  edit "client1"
    set interface "port1"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.200.4
    set psksecret *****
  next
  edit "client2"
    set interface "wan1"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 173.1.1.1
    set psksecret *****
  next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
  edit "aggl"
    set member "client1" "client2"
  next
end
```

3. Configure the location ID:

```
config system settings
  set location-id 1.1.1.1
end
```

To configure the server FortiGate (FGT-B):**1. Configure the IPsec tunnels:**

```
config vpn ipsec phase1-interface
  edit "server1"
    set type dynamic
    set interface "mgmt1"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set dpd on-idle
    set psksecret *****
    set dpd-retryinterval 60
  next
  edit "server2"
    set type dynamic
    set interface "port27"
```

```

        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret *****
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "server1"
        set phase1name "server1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
    edit "server2"
        set phase1name "server2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end

```

2. Configure an aggregate of the IPsec tunnels:

```

config system ipsec-aggregate
    edit "server"
        set member "server1" "server2"
    next
end

```

3. Configure a firewall policy:

```

config firewall policy
    edit 1
        set srcintf "server"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

To check the IPsec tunnel and aggregate state:

1. List all of the VPN tunnels:

```

FGDocs # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=server1 ver=1 serial=1 172.16.200.4:500->0.0.0.0:500 tun_id=1.0.0.0 dst_mtu=0 dpd-

```

2. List the IPsec aggregate members:

```

# diagnose sys ipsec-aggregate list
server
members(3):
    server1_1
    server1_0
    server2_0

```

3. In the GUI, go to *Dashboard > Network* and expand the *IPsec* widget to review the traffic distributed over the aggregate members:

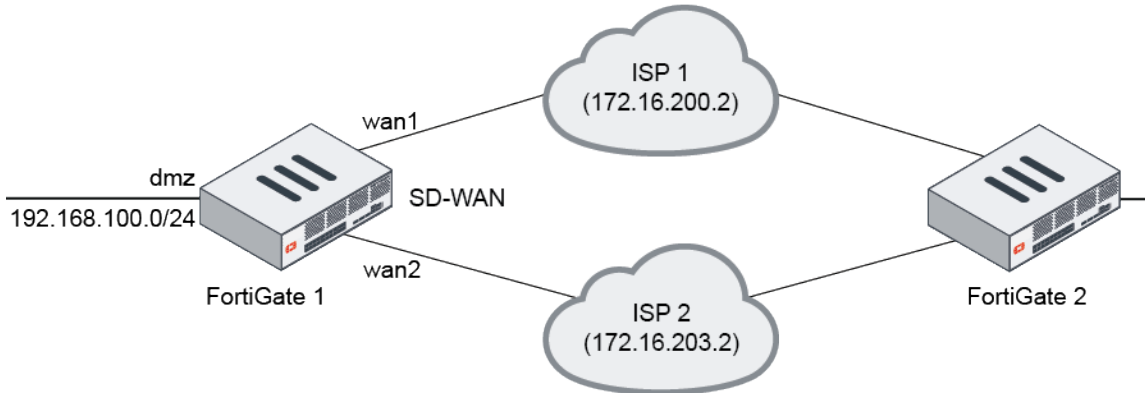

Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selectors
server2_0	11.101.1.1		2.11 MB	1.34 MB	server2_0	server2
server1_0	172.16.200.1		2.15 MB	1.19 MB	server1_0	server1
server1_1	172.16.200.3		0B	0B	server1_1	server1

Packet distribution for aggregate static IPsec tunnels in SD-WAN

This is a sample configuration of aggregating IPsec tunnels by using per-packet load-balancing.

For example, a customer has two ISP connections, wan1 and wan2. On each FortiGate, two IPsec VPN interfaces are created. Next, an ipsec-aggregate interface is created and added as an SD-WAN member.

Configuring FortiGate 1

To create two IPsec VPN interfaces:

```

config vpn ipsec phase1-interface
  edit "vd1-p1"
    set interface "wan1"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes256-sha256
    set dhgrp 14
    set remote-gw 172.16.201.2
    set psksecret ftnt1234
  next
  edit "vd1-p2"
    set interface "wan2"
    set peertype any
    set net-device disable
    set aggregate-member enable
    set proposal aes256-sha256
    set dhgrp 14
    set remote-gw 172.16.202.2
    set psksecret ftnt1234
  next
end

config vpn ipsec phase2-interface
  edit "vd1-p1"
    set phase1name "vd1-p1"
  next
  edit "vd1-p2"
    set phase1name "vd1-p2"
  next
end

```

To create an IPsec aggregate interface:

```

config system ipsec-aggregate
  edit "aggl1"
    set member "vd1-p1" "vd1-p2"
  next
end

```

```
        set algorithm L3
    next
end

config system interface
    edit "aggl"
        set vdom "root"
        set ip 172.16.11.1 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.2 255.255.255.255
    end
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "aggl"
            set gateway 172.16.11.2
        next
    end
end
```

Configuring FortiGate 2

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd2-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.200.1
        set psksecret ftnt1234
    next
    edit "vd2-p2"
```

```
        set interface "wan2"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.203.1
        set psksecret ftnt1234
    next
end

config vpn ipsec phase2-interface
    edit "vd2-p1"
        set phasename "vd2-p1"
    next
    edit "vd2-p2"
        set phasename "vd2-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg2"
        set member "vd2-p1" "vd2-p2"
        set algorithm L3
    next
end

config system interface
    edit "agg2"
        set vdom "root"
        set ip 172.16.11.2 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.1 255.255.255.255
    next
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```

config system sdwan
  set status enable
  config members
    edit 1
      set interface "agg2"
      set gateway 172.16.11.1
    next
  end
end

```

Related diagnose commands**To display aggregate IPsec members:**

```

# diagnose sys ipsec-aggregate list
agg1 algo=L3 member=2 run_tally=2
members:
  vd1-p1
  vd1-p2

```

To check the VPN status:

```

# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=vd1-p1 ver=1 serial=2 172.16.200.1:0->172.16.201.2:0 tun_id=172.16.201.2 dst_mtu=0

Packet distribution for aggregate IPsec tunnels using weighted round robin

A weighted round robin algorithm can be used for IPsec aggregate tunnels to distribute traffic by the weight of each member tunnel.

In this example, the FortiGate has two IPsec tunnels put into IPsec aggregate. Traffic is distributed among the members, with one third over *tunnel1*, and two thirds over *tunnel2*. To achieve this, the weighted round robin algorithm is selected, *tunnel1* is assigned a weight of 10, and *tunnel2* is assigned a weight of 20.

To create the IPsec aggregate in the GUI:

1. Go to **VPN > IPsec Tunnels** and click **Create New > IPsec Tunnel**.
2. Complete the wizard to create the *tunnel1* and *tunnel2* custom IPsec tunnels. Ensure that *Aggregate member* is *Enabled* for each tunnel under the **Network > Advanced** section.
3. Go to **VPN > IPsec Tunnels** and click **Create New > IPsec Aggregate**.
4. Enter a name for the aggregate, such as *agg1*, and ensure that *Algorithm* is *Weighted Round Robin*.
5. Add *tunnel1* as an aggregate members, and set *Weight* to *10*.
6. Add *tunnel2* as a second aggregate members, and set its *Weight* to *20*.

7. Click **OK**.

8. To view and monitor the aggregate tunnel statistics, go to the *IPsec* widget on the *Network* dashboard.

To create the IPsec aggregate in the CLI:

1. Create the *tunnel1* and *tunnel2* custom IPsec tunnels with *aggregate-member* enabled and *aggregate-weight* set for both tunnels:

```
config vpn ipsec phase1-interface
  edit "tunnel1"
    ...
    set aggregate-member enable
    set aggregate-weight 10
    ...
  next
  edit "tunnel2"
    ...
    set aggregate-member enable
    set aggregate-weight 20
    ...
  next
end
```

2. Create the IPsec aggregate:

```
config system ipsec-aggregate
  edit "agg1"
    set member "tunnel1" "tunnel2"
    set algorithm weighted-round-robin
  next
end
```

Redundant hub and spoke VPN

A redundant hub and spoke configuration allows VPN connections to radiate from a central FortiGate unit (the hub) to multiple remote peers (the spokes). Traffic can pass between private networks behind the hub and private networks behind the remote peers. Traffic can also pass between remote peer private networks through the hub.

This is a sample configuration of hub and spoke IPsec VPN. The following applies for this scenario:

- The spokes have two WAN interfaces and two IPsec VPN tunnels for redundancy.
- The secondary VPN tunnel is up only when the primary tunnel is down by dead peer detection.

Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure redundant hub and spoke VPN using the FortiOS CLI:

1. Configure the hub.

a. Configure the WAN, internal interface, and static route.

```
config system interface
  edit "port13"
    set alias "WAN"
    set ip 172.16.202.1 255.255.255.0
  next
  edit "port9"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.202.2
    set device "port13"
  next
end
```

b. Configure the IPsec phase1-interface and phase2-interface.

```
config vpn ipsec phase1-interface
  edit "hub"
    set type dynamic
    set interface "port13"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set dpd on-idle
    set psksecret sample
    set dpd-retryinterval 60
  next
end
config vpn ipsec phase2-interface
  edit "hub"
    set phase1name "hub"
```

```
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
          aes256gcm chacha20poly1305
    next
end
```

c. Configure the firewall policy.

```
config firewall policy
  edit 1
    set name "spoke-hub"
    set srcintf "hub"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "spoke-spoke"
    set srcintf "hub"
    set dstintf "hub"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

2. Configure the spokes.

a. Configure the WAN, internal interface, and static route.

i. Configure Spoke1.

```
config system interface
  edit "port1"
    set ip 172.16.200.1 255.255.255.0
  next
  edit "wan1"
    set mode dhcp
    set distance 10
    set priority 100
  next
  edit "dmz"
    set ip 10.1.100.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.200.2
    set device "port1"
  next
end
```

ii. Configure Spoke2.

```
config system interface
  edit "wan1"
    set ip 172.16.200.3 255.255.255.0
  next
  edit "wan2"
    set mode dhcp
```

```
        set distance 10
        set priority 100
    next
    edit "lan1"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.2
        set device "wan1"
    next
end
```

b. Configure IPsec phase1-interface and phase2-interface.

i. Configure Spoke1.

```
config vpn ipsec phase1-interface
    edit "primary"
        set interface "port1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
    next
    edit "secondary"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set monitor "primary"
        set psksecret sample
    next
end
config vpn ipsec phase2-interface
    edit "primary"
        set phasename "primary"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 10.1.100.0 255.255.255.0
    next
    edit "secondary"
        set phasename "secondary"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 10.1.100.0 255.255.255.0
    next
end
```

ii. Configure Spoke2.

```
config vpn ipsec phase1-interface
    edit "primary"
        set interface "wan1"
        set peertype any
        set net-device enable
```

```

    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set psksecret sample
    next
edit "secondary"
    set interface "wan2"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set monitor "primary"
    set psksecret sample
    next
end
config vpn ipsec phase2-interface
    edit "primary"
        set phasename "primary"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 192.168.4.0 255.255.255.0
    next
    edit "secondary"
        set phasename "secondary"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 192.168.4.0 255.255.255.0
    next
end

```

c. Configure the firewall policy.

i. Configure Spoke1.

```

config firewall policy
    edit 1
        set srcintf "dmz"
        set dstintf "primary" "secondary"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

ii. Configure Spoke2.

```

config firewall policy
    edit 1
        set srcintf "lan1"
        set dstintf "primary" "secondary"
        set srcaddr "192.168.4.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

d. Configure the static route.**i. Configure Spoke1.**

```

config router static
  edit 3
    set dst 172.16.101.0 255.255.255.0
    set distance 1
    set device "primary"
  next
  edit 4
    set dst 172.16.101.0 255.255.255.0
    set distance 3
    set device "secondary"
  next
end

```

ii. Configure Spoke2.

```

config router static
  edit 3
    set dst 172.16.101.0 255.255.255.0
    set distance 1
    set device "primary"
  next
  edit 4
    set dst 172.16.101.0 255.255.255.0
    set distance 3
    set device "secondary"
  next
end

```

3. Run diagnose and get commands.**a. Run the Spoke1 # diagnose vpn tunnel list command. The system should return the following:**

```

name=primary ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1

Overlay Controller VPN (OCVPN)

Overlay Controller VPN (OCVPN) is a cloud based solution to simplify IPsec VPN setup. When OCVPN is enabled, IPsec phase1-interfaces, phase2-interfaces, static routes, and firewall policies are generated automatically on all FortiGates that belong to the same community network. A community network is defined as all FortiGates registered to FortiCare using the same FortiCare account.

If the network topology changes on any FortiGates in the community (such as changing a public IP address in DHCP mode, adding or removing protected subnets, failing over in dual WAN), the IPsec-related configuration for all devices is updated with Cloud assistance in self-learning mode. No intervention is required.

The following topics provide instructions on configuring OCVPN:

- [Full mesh OCVPN on page 1608](#)
- [Hub-spoke OCVPN with ADVPN shortcut on page 1613](#)
- [Hub-spoke OCVPN with inter-overlay source NAT on page 1617](#)
- [OCVPN portal on page 1621](#)
- [SD-WAN integration with OCVPN on page 756](#)
- [Allow FortiClient to join OCVPN on page 1622](#)
- [Troubleshooting OCVPN on page 1626](#)

Full mesh OCVPN

This example shows how to configure a full mesh Overlay Controller VPN (OCVPN), establishing full mesh IPsec tunnels between all of the FortiGates.

License

- Free license: Three devices full mesh, 10 overlays, 16 subnets per overlay.
- Full License: Maximum of 16 devices, 10 overlays, 16 subnets per overlay.

Prerequisites

- All FortiGates must be running FortiOS 6.2.0 or later.
- All FortiGates must have Internet access.
- All FortiGates must be registered on FortiCare using the same FortiCare account.

Restrictions

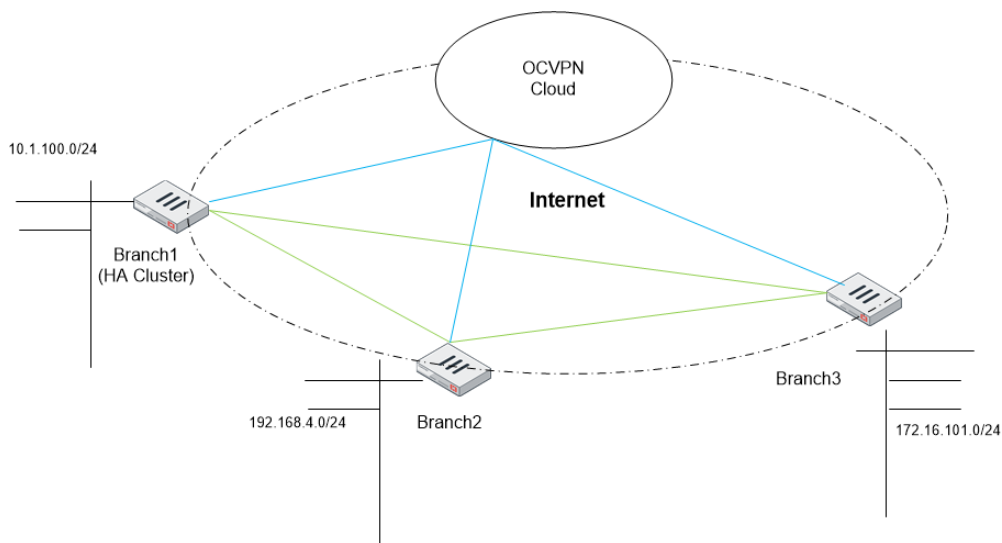

- Non-root VDOMs do not support OCVPN.
- FortiOS 6.2.x is not compatible with FortiOS 6.0.x.

Terminology

Poll-interval	How often FortiGate tries to fetch OCVPN-related data from OCVPN Cloud.
Role	The device OCVPN role of spoke, primary-hub, or secondary-hub.
Overlay	Defines network overlays and bind to subnets.
Subnet	Internal network subnet (IPsec protected subnet). Traffic to or from this subnet enters the IPsec tunnel encrypted by IPsec SA.

Sample topology

The following example shows three FortiGate units registered on FortiCare using the same FortiCare account. Each FortiGate unit has one internal subnet, and no NAT exists between the units.

Sample configuration

The following overlays and subnets are used:

- Branch1:
 - Overlay name: QA. Local subnets: 10.1.100.0/24
 - Overlay name: PM. Local subnets: 10.2.100.0/24
- Branch2:
 - Overlay name: QA. Local interfaces: lan1
 - Overlay name: PM. Local interfaces: lan2
- Branch3:
 - Overlay name: QA. Local subnets: 172.16.101.0/24
 - Overlay name: PM. Local subnets: 172.16.102.0/24

The overlay names on each device must be the same for local and remote selector pairs to be negotiated.

To register FortiGates on FortiCare:

1. Go to *System > FortiGuard*.
2. In the *License Information* section, click *Login to FortiCare*. The registration pane opens.
3. Enter the required information (email address, password, country/region, reseller).
4. Optionally, enable *Sign in to FortiGate Cloud using the same account*.
5. Click *OK*.

To enable OCVPN in the GUI:

1. Go to *VPN > Overlay Controller VPN*.
2. Create the first overlay by setting the following options:
 - a. For *Status*, click *Enabled*.
 - b. For *Role*, click *Spoke*.
 - c. In the *Overlays* section, click *Create New* to create a network overlay.

The screenshot displays the FortiGate GUI for configuring the Overlay Controller VPN. The left pane shows the 'Overlay Controller VPN' status, including FortiCare support (Registered), Status (Enabled), Registration status (Registered), Service status (Up), Topology (Dual-Hub-Spoke), Role (Spoke), and Auto-discovery shortcuts. The 'Overlays' section shows a table with columns for Overlay Name, Local Subnets, and Local Interfaces. The 'Cloud Members' section shows a table with columns for Overlay Name, Remote Gateway, Remote Subnets, and Assign IP. The right pane shows the 'New Overlay' form with fields for Name (HR), Local subnets (10.3.100.0/24), and Local Interfaces. The 'OK' button is highlighted in green.

Overlay Name	Local Subnets	Local Interfaces
QA	10.1.100.0/24	
PM	10.2.100.0/24	

Overlay Name	Remote Gateway	Remote Subnets	Assign IP
primary-hub (Primary Hub)			
secondary-hub (Secondary Hub)			
spoke1 (Spoke)			
QA	172.16.200.1	10.1.100.0/24	
PM	172.16.200.1	10.2.100.0/24	
spoke2 (Spoke)			

3. Specify the *Name*, *Local subnets*, and/or *Local interfaces*.
The local subnet must be routable and interfaces must have IP addresses.

4. Click **OK**.

PM	10.2.100.0/24	

Cloud Members

Overlay Name	Remote Gateway	Remote Subnets
branch2 (Spoke) 2		
branch1 (Spoke) 2		
branch3 (Spoke) 2		

Apply

- Click *Apply* to commit the configuration.
- Repeat this procedure to create all the overlays.

To enable OCVPN in the CLI:

1. Configure Branch1:

```

config vpn ocvpn
  set status enable
  set multipath disable
  config overlays
    edit 1
      set name "QA"
      config subnets
        edit 1
          set subnet 10.1.100.0 255.255.255.0
        next
      end
    next
  edit 2
    set name "PM"
    config subnets
      edit 1
        set subnet 10.2.100.0 255.255.255.0
      next
    end
  next
end

```

```
end
end
```

2. Configure Branch2:

```
config vpn ocvpn
  set status enable
  set multipath disable
  config overlays
    edit 1
      set name "QA"
      config subnets
        edit 1
          set type interface
          set interface "lan1"
        next
      end
    next
  edit 2
    set name "PM"
    config subnets
      edit 1
        set type interface
        set interface "lan2"
      next
    end
  next
end
end
```

3. Configure Branch3:

```
config vpn ocvpn
  set status enable
  set multipath disable
  config overlays
    edit 1
      set name "QA"
      config subnets
        edit 1
          set subnet 172.16.101.0 255.255.255.0
        next
      end
    next
  edit 1
    set name "PM"
    config subnets
      edit 1
        set subnet 172.16.102.0 255.255.255.0
      next
    end
  next
end
end
```

Hub-spoke OCVPN with ADVPN shortcut

This topic shows a sample configuration of a hub-spoke One-Click VPN (OCVPN) with an Auto Discovery VPN (ADVPN) shortcut. OCVPN automatically detects the network topology based on members' information. To form a hub-spoke OCVPN, at least one device must announce its role as the primary hub, another device can work as the secondary hub (for redundancy), while others function as spokes.

License

- Free license: Hub-spoke network topology not supported.
- Full license: Maximum of 2 hubs, 10 overlays, 64 subnets per overlay; 1024 spokes, 10 overlays, 16 subnets per overlay.

Prerequisites

- All FortiGates must be running FortiOS 6.2.0 or later.
- All FortiGates must have Internet access.
- All FortiGates must be registered on FortiCare using the same FortiCare account.

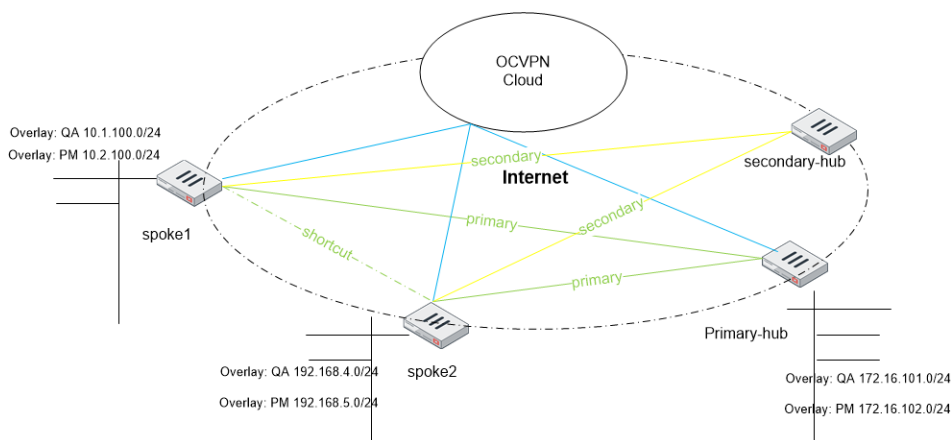

Restrictions

- Non-root VDOMs do not support OCVPN.
- FortiOS 6.2.x is not compatible with FortiOS 6.0.x.

OCVPN device roles

- Primary hub.
- Secondary hub.
- Spoke (OCVPN default role).

Sample topology

Sample configuration

The steps below use the following overlays and subnets for the sample configuration:

- Primary hub:
 - Overlay name: QA. Local subnets: 172.16.101.0/24
 - Overlay name: PM. Local subnets: 172.16.102.0/24
- Secondary hub:
 - Overlays are synced from primary hub.
- Spoke1:
 - Overlay name: QA. Local subnets: 10.1.100.0/24
 - Overlay name: PM. Local subnets: 10.2.100.0/24
- Spoke2:
 - Overlay name: QA. Local interfaces: lan1
 - Overlay name: PM. Local interfaces: lan2

The overlay names on each device must be the same for local and remote selector pairs to be negotiated.

To register FortiGates on FortiCare:

1. Go to *System > FortiGuard*.
2. In the *License Information* section, click *Login to FortiCare*. The registration pane opens.
3. Enter the required information (email address, password, country/region, reseller).
4. Optionally, enable *Sign in to FortiGate Cloud using the same account*.
5. Click *OK*.

To enable hub-spoke OCVPN in the GUI:

1. Go to *VPN > Overlay Controller VPN*.
2. Configure the OCVPN primary hub by setting the following options:
 - a. For *Status*, click *Enabled*.
 - b. For *Role*, click *Primary Hub*.
 - c. In the *Overlays* section, click *Create New* to create a network overlay.

- d. Specify the *Name*, *Local subnets*, and/or *Local interfaces*. Then click *OK*.
- e. Click *Apply* to commit the configuration.

Apply

To enable hub-spoke OCVPN in the CLI:

1. Configure the OCVPN primary hub:

```
config vpn ocvpn
  set status enable
  set role primary-hub
  config overlays
    edit 1
      set name "QA"
      config subnets
        edit 1
          set subnet 172.16.101.0 255.255.255.0
        next
      end
    next
    edit 2
      set name "PM"
      config subnets
        edit 1
          set subnet 172.16.102.0 255.255.255.0
        next
      end
    next
  end
end
```

2. Configure the OCVPN secondary hub:

```
config vpn ocvpn
  set status enable
  set role secondary-hub
end
```

3. Configure the OCVPN spoke1:

```
config vpn ocvpn
  set status enable
  config overlays
```

```
edit 1
  set name "QA"
  config subnets
    edit 1
      set subnet 10.1.100.0 255.255.255.0
    next
  end
next
edit 2
  set name "PM"
  config subnets
    edit 1
      set subnet 10.2.100.0 255.255.255.0
    next
  end
next
end
end
```

4. Configure the OCVPN spoke2:

```
config vpn ocvpn
  set status enable
  config overlays
    edit 1
      set name "QA"
      config subnets
        edit 1
          set subnet 192.168.4.0 255.255.255.0
        next
      end
    next
    edit 2
      set name "PM"
      config subnets
        edit 1
          set subnet 192.168.5.0 255.255.255.0
        next
      end
    next
  end
end
```

Hub-spoke OCVPN with inter-overlay source NAT

This topic shows a sample configuration of hub-spoke OCVPN with inter-overlay source NAT. OCVPN isolates traffic between overlays by default. With NAT enabled on spokes and `assign-ip` enabled on hub, you can have inter-overlay communication.

Inter-overlay communication means devices from any source addresses and any source interfaces can communicate with any devices in overlays' subnets when the overlay option `assign-ip` is enabled.

You must first disable `auto-discovery` before you can enable NAT.

License

- Free license: Hub-spoke network topology not supported.
- Full License: Maximum of 2 hubs, 10 overlays, 64 subnets per overlay; 1024 spokes, 10 overlays, 16 subnets per overlay.

Prerequisites

- All FortiGates must be running FortiOS 6.2.0 or later.
- All FortiGates must have Internet access.
- All FortiGates must be registered on FortiCare using the same FortiCare account.

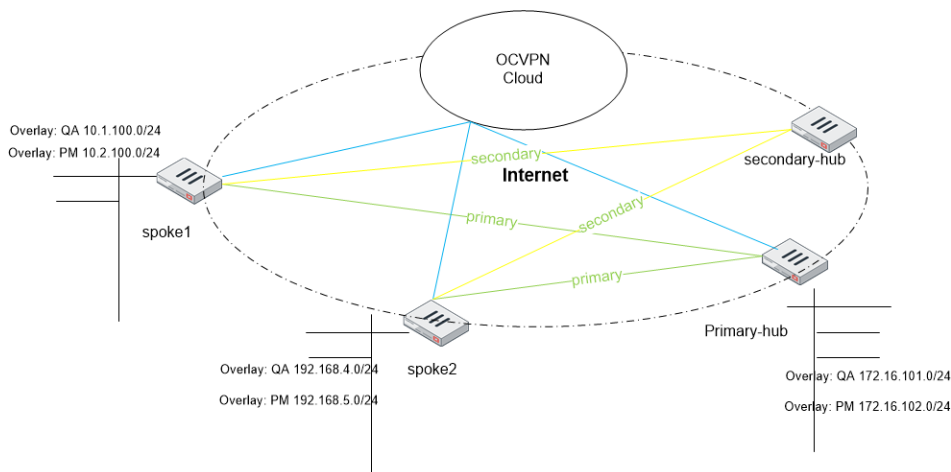

Restrictions

- Non-root VDOMs do not support OCVPN.
- FortiOS 6.2.x is not compatible with FortiOS 6.0.x.

OCVPN device roles

- Primary hub.
- Secondary hub.
- Spoke (OCVPN default role).

Sample topology

Sample configuration

You can only configure this feature using the CLI.

The overlay names on each device must be the same for local and remote selector pairs to be negotiated.

To enable inter-overlay source NAT in the CLI:

1. Configure the primary hub, enable overlay QA, and configure `assign-ip` and IP range:

```
config vpn ocvpn
  set status enable
  set role primary-hub
  config overlays
    edit 1
      set name "QA"
      set assign-ip enable
      set ipv4-start-ip 172.16.101.100
      set ipv4-end-ip 172.16.101.200
      config subnets
        edit 1
          set subnet 172.16.101.0 255.255.255.0
        next
      end
    next
  edit 2
    set name "PM"
    set assign-ip enable
    config subnets
      edit 1
        set subnet 172.16.102.0 255.255.255.0
      next
    end
  next
end
end
```

2. Configure the secondary hub:

```
config vpn ocvpn
  set status enable
  set role secondary-hub
end
```

3. Configure spoke1 and enable NAT on the spoke:

```
config vpn ocvpn
  set status enable
  set auto-discovery disable
  set nat enable
  config overlays
    edit 1
      set name "QA"
      config subnets
        edit 1
          set subnet 10.1.100.0 255.255.255.0
        next
      end
    next
  edit 2
    set name "PM"
    config subnets
      edit 1
        set subnet 10.2.100.0 255.255.255.0
```

```
        next
      end
    next
  end
end
```

4. Configure spoke2 and enable NAT on the spoke:

```
config vpn ocvpn
  set status enable
  set auto-discovery disable
  set nat enable
  config overlays
    edit 1
      set name "QA"
      config subnets
        edit 1
          set subnet 192.168.4.0 255.255.255.0
        next
      end
    next
    edit 2
      set name "PM"
      config subnets
        edit 1
          set subnet 192.168.5.0 255.255.255.0
        next
      end
    next
  end
end
```

A firewall policy with NAT is generated on the spoke:

```
edit 9
  set name "_OCVPN2-1.1_nat"
  set uuid 3f7a84b8-3d36-51e9-ee97-8f418c91e666
  set srcintf "any"
  set dstintf "_OCVPN2-1.1"
  set srcaddr "all"
  set dstaddr "_OCVPN2-1.1_remote_networks"
  set action accept
  set schedule "always"
  set service "ALL"
  set comments "Generated by OCVPN Cloud Service."
  set nat enable
next
```

OCVPN portal

When you log into the OCVPN portal, the OCVPN license type and device information display. The device information includes the device serial number, OCVPN role, hostname, public IP address, port number, and overlays.

Allow FortiClient to join OCVPN

Administrators can configure remote access for FortiClient within an OCVPN hub. This provides simple configurations to allow a user group access to an overlay network.

To configure remote FortiClient access to an OCVPN hub in the GUI:

1. On the primary hub, configure the users and user groups required for the FortiClient dialup user authentication and authorization. In this example, there are two user groups (*dev_grp* and *qa_grp*).
2. Go to *VPN > Overlay Controller VPN* and in the *Overlays* section, click *Create New*.
3. Enter a name and the local subnet (174.16.101.0/24 for *dev* and 22.202.2.0/24 for *qa*).
4. Enable *FortiClient Access*.
5. In the *Access Rules* section, click *Create New*.
6. Enter a name, and select the authentication groups and overlays. The authentication groups will be used by the IPsec phase 1 interface for authentication, and by firewall policies for authorization. The overlay allows access to the resource.
7. Click *OK*.
8. Create more rules if needed.
9. Click *Apply*.

To view the tunnel status and activity in the GUI:

1. Go to *Dashboard > Network*.
2. Click the *IPsec* widget to expand to full screen view.

To configure remote FortiClient access to an OCVPN hub in the CLI:

```
config vpn ocvpn
  set status enable
  set role primary-hub
  set wan-interface "mgmt1"
  set ip-allocation-block 10.254.0.0 255.255.0.0
  config overlays
    edit "dev"
      config subnets
        edit 1
          set subnet 174.16.101.0 255.255.255.0
        next
      end
    next
  next
```

```

    edit "qa"
        config subnets
            edit 1
                set subnet 22.202.2.0 255.255.255.0
            next
        end
    next
end
config forticlient-access
    set status enable
    set psksecret xxxxxxxxxxxxxx
    config auth-groups
        edit "dev"
            set auth-group "dev_grp"
            set overlays "dev"
        next
        edit "qa"
            set auth-group "qa_grp"
            set overlays "qa"
        next
    end
end
end

```

To view the tunnel status and activity in the CLI:

```
# diagnose vpn ike gateway list
```

```

vd: root/0
name: _OCVPN_FCT0_0

```

Troubleshooting OCVPN

This document includes troubleshooting steps for the following OCVPN network topologies:

- Full mesh OCVPN.
- Hub-spoke OCVPN with ADVPN shortcut.
- Hub-spoke OCVPN with inter-overlay source NAT.

For OCVPN configurations in other network topologies, see the other OCVPN topics.

Troubleshooting full mesh network topology

- **Branch_1#**diagnose vpn ocvpn status

```
Current State      : Registered
Topology          : Full-Mesh
Role              : Spoke
Server Status     : Up
Registration time  : Thu Feb 28 18:42:25 2019
Update time       : Thu Feb 28 15:57:18 2019
Poll time         : Fri Mar 1 15:02:28 2019
```

- **Branch_1#**diagnose vpn ocvpn show-meta

```
Topology :: auto
License  :: full
Members  :: 3
Max-free :: 3
```

- **Branch_1#**diagnose vpn ocvpn show-overlays

```
QA
PM
```

- **Branch_1#**diagnose vpn ocvpn show-members

```

ADVPN

Auto-Discovery VPN (ADVPN) allows the central hub to dynamically inform spokes about a better path for traffic between two spokes.

The following topics provide instructions on configuring ADVPN:

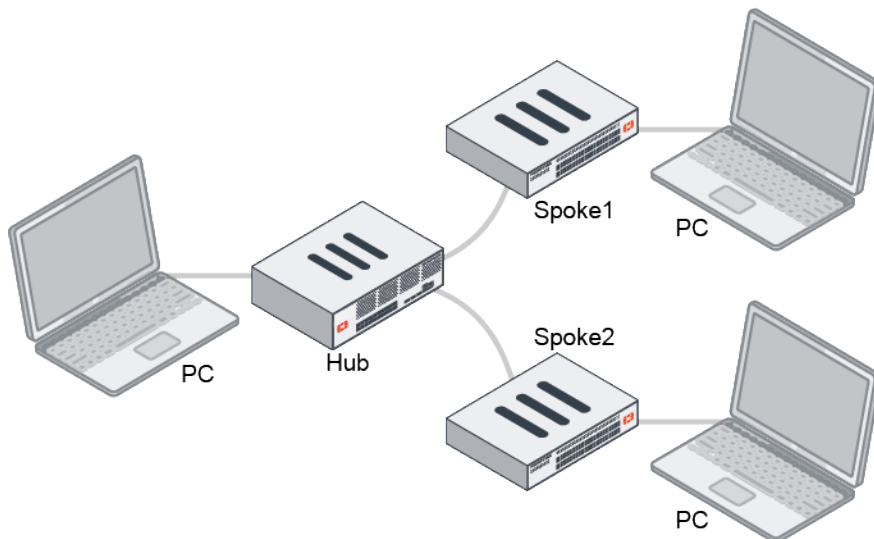

- [IPsec VPN wizard hub-and-spoke ADVPN support on page 1639](#)
- [ADVPN with BGP as the routing protocol on page 1643](#)
- [ADVPN with OSPF as the routing protocol on page 1652](#)
- [ADVPN with RIP as the routing protocol on page 1661](#)
- [UDP hole punching for spokes behind NAT on page 1670](#)

IPsec VPN wizard hub-and-spoke ADVPN support

When using the IPsec VPN wizard to create a hub and spoke VPN, multiple local interfaces can be selected. At the end of the wizard, changes can be reviewed, real-time updates can be made to the local address group and tunnel interface, and easy configuration keys can be copied for configuring the spokes.

When editing a VPN tunnel, the Hub & Spoke Topology section provides access to the easy configuration keys for the spokes, and allows you to add more spokes.

This example shows the configuration of a hub with two spokes.

To configure the hub:

1. Go to *VPN > IPsec Wizard*.
2. Go through the steps of the wizard:
 - a. *VPN Setup*:

Name	hub
Template Type	Hub-and-Spoke
Role	Hub

VPN Creation Wizard

1 VPN Setup > 2 Authentication > 3 Tunnel Interface > 4 Policy & Routing > 5 Review Settings

Name: hub

Template type: Site to Site | **Hub-and-Spoke** | Remote Access | Custom

Role: **Hub** | Spoke

The Hub-and-Spoke VPN will be set up using auto-discovery with BGP as the routing protocol.

< Back Next > Cancel

- b. *Authentication*:

Incoming Interface	port1
Authentication method	Pre-shared Key
Pre-shared key	<key>

- c. *Tunnel Interface*:

Tunnel IP	10.10.1.1
Remote IP/netmask	10.10.1.2/24

- d. *Policy & Routing*:

Multiple local interfaces and subnets can be configured.

Local AS	65400
Local interface	port3 port4
Local subnets	174.16.101.0/24 173.1.1.0/24
Spoke #1 tunnel IP	10.10.1.3
Spoke #2 tunnel IP	10.10.1.4

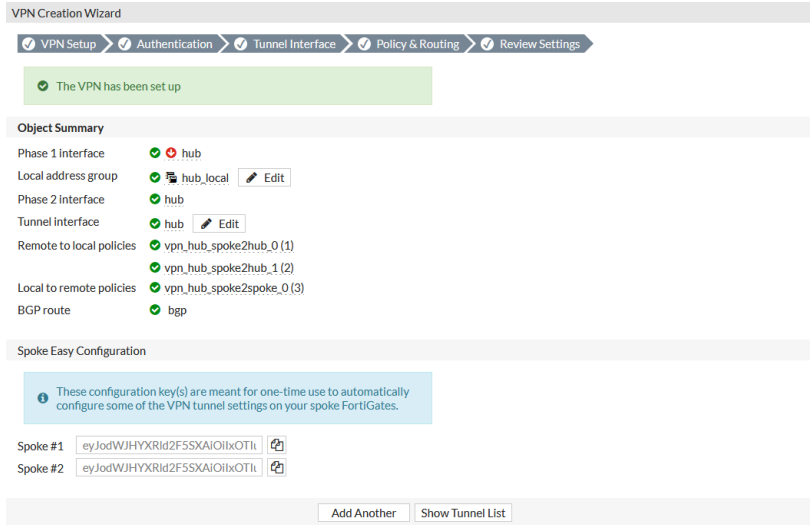

e. Review Settings:

Confirm that the settings look correct, then click *Create*.

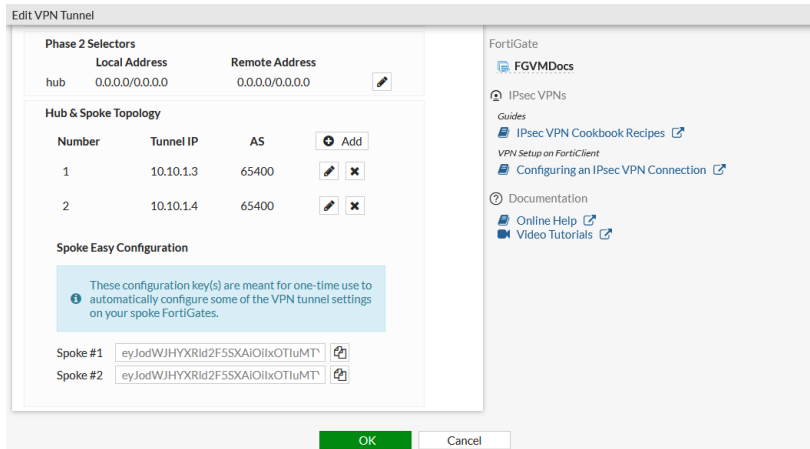

3. The summary shows details about the set up hub:

- The *Local address group* and *Tunnel interface* can be edited directly on this page.
- Spoke easy configuration keys can be used to quickly configure the spokes.

4. Click *Show Tunnel List* to go to *VPN > IPsec Tunnels*.

5. Edit the VPN tunnel to add more spokes and to copy the spokes' easy configuration keys.

To configure the spokes:

1. Go to *VPN > IPsec Wizard*.
2. On the *VPN Setup* page of the wizard, enter the following:

Name	spoke1
Template Type	Hub-and-Spoke
Role	Spoke

3. In the *Easy configuration key* field, paste the *Spoke #1* key from the hub FortiGate, click *Apply*, then click *Next*.

VPN Creation Wizard

1 VPN Setup 2 Authentication 3 Tunnel Interface 4 Policy & Routing 5 Review Settings

Name spoke1

Template type Site to Site **Hub-and-Spoke** Remote Access Custom

The Hub-and-Spoke VPN will be set up using auto-discovery with BGP as the routing protocol.

Role Hub **Spoke**

Easy configuration key XAiOlXMC4xMC4xLjMlJfQ== Apply

Hub Remote FortiGate Internet Spoke1 This FortiGate Spoke2 Remote FortiGate

< Back Next > Cancel

4. Adjust the *Authentication* settings as required, enter the *Pre-shared key*, then click *Next*.
5. Adjust the *Tunnel Interface* settings as required, then click *Next*.
6. Configure the *Policy & Routing* settings, then click *Next*:

Local interface	wan2
Local subnets	10.1.100.0/24

VPN Creation Wizard

1 VPN Setup 2 Authentication 3 Tunnel Interface 4 **Policy & Routing** 5 Review Settings

Local AS 65400

Local interface wan2

Local subnets 10.1.100.0/24

Hub #1 tunnel IP 10.10.1.1 Change

Hub Remote FortiGate Internet Spoke1 This FortiGate Spoke2 Remote FortiGate

< Back Next > Cancel

7. Review the settings, then click *Create*.
8. The summary shows details about the set up spoke. The *Local address group* and *Tunnel interface* can be edited directly on this page.
9. Follow the same steps to configure the second spoke.

To check that the tunnels are created and working:

1. On the hub FortiGate, go to *Dashboard > Network* and expand the IPsec widget. The tunnels to the spokes are established.

Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selectors
Hub-and-Spoke - FortiGate (Hub)						
hub_0	172.16.200.1		10.97 kB	5.34 kB	hub_0	hub
hub_1	172.16.200.3		3.51 kB	1.81 kB	hub_1	hub

- On a spoke, go to *Dashboard > Network* and expand the IPsec widget. The tunnel to the hub and the spoke to spoke shortcut are established.

Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selecto
Hub-and-Spoke - FortiGate (Spoke)						
spoke1	172.16.200.4		120 B	5.19 kB	spoke1	spoke1
spoke1_0	172.16.200.3		1.85 MB	1.07 MB	spoke1_0	spoke1

ADVPN with BGP as the routing protocol

This is a sample configuration of ADVPN with BGP as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- IBGP must be used between the hub and spoke FortiGates.
- `bgp neighbor-group/neighbor-range` must be reused.

To configure ADVPN with BGP as the routing protocol using the CLI:

- Configure hub FortiGate WAN interface, internal interface, and a static route:

```
config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
  next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
```

```

    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end

```

2. Configure the hub FortiGate:

a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```

config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phasename "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
3des-sha256
    next
end

```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```

config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"

```

```
        set dstintf "advpn-hub"  
        set srcaddr "all"  
        set dstaddr "all"  
        set action accept  
        set schedule "always"  
        set service "ALL"  
    next  
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface  
    edit "advpn-hub1"  
        set ip 10.10.10.254 255.255.255.255  
        set remote-ip 10.10.10.253 255.255.255.0  
    next  
end
```

d. Configure the hub FortiGate's BGP:

```
config router bgp  
    set as 65412  
    config neighbor-group  
        edit "advpn"  
            set link-down-failover enable  
            set remote-as 65412  
            set route-reflector-client enable  
        next  
    end  
    config neighbor-range  
        edit 1  
            set prefix 10.10.10.0 255.255.255.0  
            set neighbor-group "advpn"  
        next  
    end  
    config network  
        edit 1  
            set prefix 172.16.101.0 255.255.255.0  
        next  
    end  
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface  
    edit "wan1"  
        set alias "primary_WAN"  
        set ip 15.1.1.2 255.255.255.0  
    next  
    edit "wan2"  
        set alias "secondary_WAN"  
        set ip 12.1.1.2 255.255.255.0  
    next  
    edit "internal"  
        set ip 10.1.100.1 255.255.255.0
```

```
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
```

```
edit "spoke1_backup"
    set interface "wan2"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set add-route disable
    set dpd on-idle
    set auto-discovery-receiver enable
    set remote-gw 22.1.1.1
    set monitor "spoke1"
    set psksecret sample
    set dpd-retryinterval 5
next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phasename "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phasename "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
```

```
end
config vpn ipsec phase2-interface
  edit "spoke2"
    set phase1name "spoke2"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
  edit "spoke2_backup"
    set phase1name "spoke2_backup"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
  edit 1
    set name "outbound_advpn"
    set srcintf "internal"
    set dstintf "spoke1" "spoke1_backup"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "inbound_advpn"
    set srcintf "spoke1" "spoke1_backup"
    set dstintf "internal"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

ii. Configure Spoke2:

```
config firewall policy
  edit 1
    set name "outbound_advpn"
    set srcintf "internal"
    set dstintf "spoke2" "spoke2_backup"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "inbound_advpn"
```

```

        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```

config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end

```

ii. Configure Spoke2:

```

config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end

```

This example employs overlapping subnets for the primary and secondary tunnels. Prior to proceeding with this step of the configuration, please use the `set allow-subnet-overlap` command. It is important to note that configuring a failover VPN tunnel within the same subnet as the primary VPN tunnel is a unique use case and not widely implemented in practice.

e. Configure the spoke FortiGates' BGP:

i. Configure Spoke1:

```

config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
config network

```

```

        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end

```

ii. Configure Spoke2:

```

config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
config network
    edit 1
        set prefix 192.168.4.0 255.255.255.0
    next
end
end

```

4. Run diagnose and get commands on Spoke1 to check VPN and BGP states:

a. Run the diagnose vpn tunnel list command on Spoke1. The system should return the following:

```

list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu

bound_if=6 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
create_dev frag-rfc  accept_traffic=0

proxyid_num=1 child_num=0 refcnt=11 ilast=0 olast=0 ad=/0
stat: rxp=0 txp=0 rxb=0 txb=0
dpd: mode=on-idle on=0 idle=5000ms retry=3 count=0 seqno=0

```

```
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=spoke1_backup proto=0 sa=0 ref=2 serial=1 auto-negotiate adr
  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

- b. Run the `get router info bgp summary` command on Spoke1. The system should return the following:**

```
BGP router identifier 7.7.7.7, local AS number 65412
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor          V    AS [[QualityAssurance62/MsgRcvd]]
[[QualityAssurance62/MsgSent]]  [[QualityAssurance62/TblVer]]  InQ  OutQ  Up/Down
State/PfxRcd
10.10.10.254      1.    65412    143    142    1.    1.    1.
00:24:45                2

Total number of neighbors 1
```

- c. Run the `get router info routing-table bgp` command on Spoke1. The system should return the following:**

```
Routing table for VRF=0
B      172.16.101.0/24 [200/0] via 10.10.10.254, spoke1, 00:23:57
B      192.168.4.0/24 [200/0] via 10.10.10.254, spoke1, 00:22:03
```

- d. Generate traffic between the spokes and check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:**

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

- e. Run the `get router info routing-table bgp` command. The system should return the following:

```

Routing table for VRF=0
B      172.16.101.0/24 [200/0] via 10.10.10.254, spokel, 00:23:57
B      192.168.4.0/24 [200/0] via 10.10.10.3, spokel_0 , 00:22:03

```

ADVPN with OSPF as the routing protocol

This is a sample configuration of ADVPN with OSPF as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device enable` must be run.
- OSPF must be used between the hub and spoke FortiGates.

To configure ADVPN with OSPF as the routing protocol using the CLI:

1. Configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
  next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 22.1.1.2
    set device "port9"
  next
end
```

2. Configure the hub FortiGate:

- a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
  edit "advpn-hub"
    set type dynamic
    set interface "port9"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
    3des-sha1
    set add-route disable
    set dpd on-idle
    set auto-discovery-sender enable
    set psksecret sample
    set dpd-retryinterval 5
  next
end
```

```

config vpn ipsec phase2-interface
  edit "advpn-hub"
    set phasename "advpn-hub"
    set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
3des-sha256
    next
  end

```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```

config firewall policy
  edit 1
    set name "spoke2hub"
    set srcintf "advpn-hub"
    set dstintf "port10"
    set srcaddr "all"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "spoke2spoke"
    set srcintf "advpn-hub"
    set dstintf "advpn-hub"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end

```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```

config system interface
  edit "advpn-hub1"
    set ip 10.10.10.254 255.255.255.255
    set remote-ip 10.10.10.253 255.255.255.0
  next
end

```

d. Configure the hub FortiGate's OSPF:

```

config router ospf
  set router-id 1.1.1.1
  config area
    edit 0.0.0.0
  next
end
config network
  edit 1
    set prefix 10.10.10.0 255.255.255.0

```

```
        next
      edit 2
        set prefix 172.16.101.0 255.255.255.0
      next
    end
  end
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface
  edit "wan1"
    set alias "primary_WAN"
    set ip 15.1.1.2 255.255.255.0
  next
  edit "wan2"
    set alias "secondary_WAN"
    set ip 12.1.1.2 255.255.255.0
  next
  edit "internal"
    set ip 10.1.100.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 12.1.1.1
    set device "wan2"
    set distance 15
  next
  edit 2
    set gateway 15.1.1.1
    set device "wan1"
  next
end
```

ii. Configure the Spoke2:

```
config system interface
  edit "wan1"
    set alias "primary_WAN"
    set ip 13.1.1.2 255.255.255.0
  next
  edit "wan2"
    set alias "secondary_WAN"
    set ip 17.1.1.2 255.255.255.0
  next
  edit "internal"
    set ip 192.168.4.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 17.1.1.1
    set device "wan2"
    set distance 15
```

```

    next
  edit 2
    set gateway 13.1.1.1
    set device "wan1"
  next
end

```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```

config vpn ipsec phase1-interface
  edit "spoke1"
    set interface "wan1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set add-route disable
    set dpd on-idle
    set auto-discovery-receiver enable
    set remote-gw 22.1.1.1
    set psksecret sample
    set dpd-retryinterval 5
  next
  edit "spoke1_backup"
    set interface "wan2"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set add-route disable
    set dpd on-idle
    set auto-discovery-receiver enable
    set remote-gw 22.1.1.1
    set monitor "spoke1"
    set psksecret sample
    set dpd-retryinterval 5
  next
end
config vpn ipsec phase2-interface
  edit "spoke1"
    set phase1name "spoke1"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
  edit "spoke1_backup"
    set phase1name "spoke1_backup"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
    set auto-negotiate enable
  next
end

```

ii. Configure Spoke2:

```

config vpn ipsec phase1-interface
  edit "spoke2"
    set interface "wan1"

```

```

        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```

config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
    next
end

```

```
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
end
```

```

    next
end

```

e. Configure the spoke FortiGates' OSPF:

i. Configure Spoke1:

```

config router ospf
    set router-id 7.7.7.7
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end

```

ii. Configure Spoke2:

```

config router ospf
    set router-id 8.8.8.8
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end

```

4. Run diagnose and get commands on Spoke1 to check VPN and OSPF states:

a. Run the diagnose vpn tunnel list command on Spoke1. The system should return the following:

```

list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu

  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0

```

- b. Run the `get router info ospf neighbor` command on Spoke1. The system should return the following:**

```

OSPF process 0, VRF 0: Neighbor ID Pri State Dead Time Address Interface 8.8.8.8 1.
Full/ - 00:00:35 10.10.10.254 spoke1 1.1.1.1 1. Full/ - 00:00:35 10.10.10.254 spoke1

```

- c. Run the `get router info routing-table ospf` command on Spoke1. The system should return the following:**

```

Routing table for VRF=0
O      172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:23:23
O      192.168.4.0/24  [110/110] via 10.10.10.254, spoke1, 00:22:35

```

- d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:**

```

list all ipsec tunnel in vd 0
----
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

- e. Run the `get router info routing-table ospf` command. The system should return the following:

```

Routing table for VRF=0
O      172.16.101.0/24 [110/110] via 10.10.10.254, spokel, 00:27:14
O      192.168.4.0/24 [110/110] via 10.10.10.3, spokel_0, 00:26:26

```

ADVPN with RIP as the routing protocol

This is a sample configuration of ADVPN with RIP as routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- RIP must be used between the hub and spoke FortiGates.
- `split-horizon-status enable` must be run on the hub FortiGate.

To configure ADVPN with RIP as the routing protocol using the CLI:

1. In the CLI, configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
  edit "port9"
    set alias "WAN"
    set ip 22.1.1.1 255.255.255.0
  next
  edit "port10"
    set alias "Internal"
    set ip 172.16.101.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 22.1.1.2
    set device "port9"
  next
end
```

2. Configure the hub FortiGate:

- a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
  edit "advpn-hub"
    set type dynamic
    set interface "port9"
    set peertype any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
    3des-sha1
    set add-route disable
    set dpd on-idle
    set auto-discovery-sender enable
    set psksecret sample
    set dpd-retryinterval 5
  next
end
```

```

config vpn ipsec phase2-interface
  edit "advpn-hub"
    set phase1name "advpn-hub"
    set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
3des-sha256
  next
end

```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```

config firewall policy
  edit 1
    set name "spoke2hub"
    set srcintf "advpn-hub"
    set dstintf "port10"
    set srcaddr "all"
    set dstaddr "172.16.101.0"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "spoke2spoke"
    set srcintf "advpn-hub"
    set dstintf "advpn-hub"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end

```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```

config system interface
  edit "advpn-hub1"
    set ip 10.10.10.254 255.255.255.255
    set remote-ip 10.10.10.253 255.255.255.0
  next
end

```

d. Configure the hub FortiGate's RIP:

```

config router rip
  set default-information-originate enable
  config network
    edit 1
      set prefix 10.10.10.0 255.255.255.0
    next
    edit 2
      set prefix 172.16.101.0 255.255.255.0
    next
  next
end

```

```
end
config interface
  edit "advpn-hub"
    set split-horizon-status disable
  next
end
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface
  edit "wan1"
    set alias "primary_WAN"
    set ip 15.1.1.2 255.255.255.0
  next
  edit "wan2"
    set alias "secondary_WAN"
    set ip 12.1.1.2 255.255.255.0
  next
  edit "internal"
    set ip 10.1.100.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 12.1.1.1
    set device "wan2"
    set distance 15
  next
  edit 2
    set gateway 15.1.1.1
    set device "wan1"
  next
end
```

ii. Configure the Spoke2:

```
config system interface
  edit "wan1"
    set alias "primary_WAN"
    set ip 13.1.1.2 255.255.255.0
  next
  edit "wan2"
    set alias "secondary_WAN"
    set ip 17.1.1.2 255.255.255.0
  next
  edit "internal"
    set ip 192.168.4.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 17.1.1.1
    set device "wan2"
```

```

        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end

```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```

config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

ii. Configure Spoke2:

```

config vpn ipsec phase1-interface
    edit "spoke2"

```

```

        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end

```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```

config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
    next
end

```

```
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
```

```

    next
end

```

e. Configure the spoke FortiGates' RIP:

i. Configure Spoke1:

```

config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end

```

ii. Configure Spoke2:

```

config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end

```

4. Run diagnose and get commands on Spoke1:

a. Run the diagnose vpn tunnel list command on Spoke1. The system should return the following:

```

list all ipsec tunnel in vd 0
----
name=spokel ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

- b. Run the `get router info rip database` command on Spoke1. The system should return the following:**

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
       C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP
```

	Network	Next Hop	Metric	From	If	Time
Rc	10.1.100.0/24		1.		internal	
Rc	10.10.10.2/32		1.		spokel	
R	172.16.101.0/24	10.10.10.254	1.	10.10.10.254	spokel	02:28
R	192.168.4.0/24	10.10.10.254	1.	10.10.10.254	spokel	02:44

- c. Run the `get router info routing-table rip` command on Spoke1. The system should return the following:**

```
Routing table for VRF=0
R      172.16.101.0/24 [120/2] via 10.10.10.254, spokel, 00:08:38
R      192.168.4.0/24 [120/3] via 10.10.10.254, spokel, 00:08:38
```

- d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:**

```
list all ipsec tunnel in vd 0
----
name=spokel ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

- e. Run the `get router info routing-table rip` command. The system should return the following:

```

Routing table for VRF=0
R      172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:09:04
R      192.168.4.0/24 [120/2] via 10.10.10.3, spoke1_0, 00:00:02

```

UDP hole punching for spokes behind NAT

UDP hole punching allows ADVPN shortcuts to be established through a UDP hole on a NAT device. The NAT device must support RFC 4787 Endpoint-Independent Mapping.

In the following example, device 10.1.100.11 behind Spoke1 needs to reach device 192.168.4.33 behind Spoke2. Spoke1 and Spoke2 are behind NAT devices and have established IPsec tunnels to the Hub. The hole punching creates a shortcut between Spoke1 and Spoke2 that bypasses the Hub.

To verify the ADVPN shortcut is established between both spokes behind NAT:

```

# diagnose debug enable

VPN and ASIC offload

This topic provides a brief introduction to VPN traffic offloading.

IPsec traffic processed by NPU

1. Check the device ASIC information. For example, a FortiGate 900D has an NP6 and a CP8.

```
# get hardware status
Model name: [[QualityAssurance62/FortiGate]]-900D
ASIC version: CP8
ASIC SRAM: 64M
CPU: Intel(R) Xeon(R) CPU E3-1225 v3 @ 3.20GHz
Number of CPUs: 4
RAM: 16065 MB
Compact Flash: 1925 MB /dev/sda
Hard disk: 244198 MB /dev/sdb
USB Flash: not available
Network Card chipset: [[QualityAssurance62/FortiASIC]] NP6 Adapter (rev.)
```

2. Check port to NPU mapping.

```
# diagnose npu np6 port-list
Chip  XAUI Ports          Max  Cross-chip
      Speed offloading

----
np6_0  0
      1.  port17          1G   Yes

1.    port14         1G    Yes
1.    portA          10G   Yes
1.

```

```
----
```

3. Configure the option in IPsec phase1 settings to control NPU encrypt/decrypt IPsec packets (enabled by default).

```

config vpn ipsec phase1/phase1-interface
  edit "vpn_name"
    set npu-offload enable/disable
  next
end

```

4. Check NPU offloading. The NPU encrypted/decrypted counter should tick. The `npu_flag 03` flag means that the traffic processed by the NPU is bi-directional.

```

```

2. Two options are used to control if the CP processes packets. If disabled, packets are processed by the CPU.

```

config system global
  set ipsec-asic-offload disable
  set ipsec-hmac-offload disable
end

```

IPsec traffic processed by CPU

IPsec traffic might be processed by the CPU for the following reasons:

- Some entry-level models do not have NPUs.
- NPU offloading and CP IPsec traffic processing manually disabled.
- Some types of proposals - SEED, ARIA, chacha20poly1305 - are not supported by the NPU or CP.
- NPU flag set to 00 and software encrypt/decrypt counter ticked.

Encryption algorithms

This topic provides a brief introduction to IPsec phase 1 and phase 2 encryption algorithms and includes the following sections:

- [IKEv1 phase 1 encryption algorithm](#)
- [IKEv1 phase 2 encryption algorithm](#)
- [IKEv2 phase 1 encryption algorithm](#)
- [IKEv2 phase 2 encryption algorithm](#)
- [HMAC settings](#)

IKEv1 phase 1 encryption algorithm

The default encryption algorithm is:

```
aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
```

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports:

- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384

- aria192-sha512
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5
- seed128-sha1
- seed128-sha256
- seed128-sha384
- seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. IPsec traffic can be offloaded on NP6XLite and NP7 platforms. They cannot be offloaded on other NP6 processors and below. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

See [Network processors \(NP6, NP6XLite, NP6Lite, and NP4\)](#) and [CP9, CP9XLite, and CP9Lite capabilities](#) in the Hardware Acceleration guide for more information.

IKEv1 phase 2 encryption algorithm

The default encryption algorithm is:

aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:

- null-md5
- null-sha1
- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256

- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

With the AESGCM encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null
- aria256-md5
- aria256-sha1
- aria256-sha256

- aria256-sha384
- aria256-sha512

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256
- seed-sha384
- seed-sha512

IKEv2 phase 1 encryption algorithm

The default encryption algorithm is:

```
aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384 chacha20poly1305-  
prfsha256
```

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports:

- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes128gcm-prfsha1
- aes128gcm-prfsha256
- aes128gcm-prfsha384
- aes128gcm-prfsha512
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512

- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512
- aes256gcm-prfsha1
- aes256gcm-prfsha256
- aes256gcm-prfsha384
- aes256gcm-prfsha512

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the chacha20poly1305 encryption algorithm, FortiOS supports:

- chacha20poly1305-prfsha1
- chacha20poly1305-prfsha256
- chacha20poly1305-prfsha384
- chacha20poly1305-prfsha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5
- seed128-sha1
- seed128-sha256
- seed128-sha384
- seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. IPsec traffic can be offloaded on NP6XLite and NP7 platforms. They cannot be offloaded on other NP6 processors and below. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

See [Network processors \(NP6, NP6XLite, NP6Lite, and NP4\)](#) and [CP9, CP9XLite, and CP9Lite capabilities](#) in the Hardware Acceleration guide for more information.

IKEv2 phase 2 encryption algorithm

The default encryption algorithm is:

aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:

- null-md5
- null-sha1
- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null
- aes256-md5
- aes256-sha1

- aes256-sha256
- aes256-sha384
- aes256-sha512

With the AESGCM encryption algorithm, IPsec traffic **cannot** offload NPU. CP9 supports AESGCM offloading. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256
- seed-sha384
- seed-sha512

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as 3des-sha256). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500

  DPD sent/recv: 000001e1/00000000
```

Fragmenting IP packets before IPsec encapsulation

The `ip-fragmentation` command controls packet fragmentation before IPsec encapsulation, which can benefit packet loss in some environments.

The following options are available for the `ip-fragmentation` variable.

Option	Description
pre-encapsulation	Fragment before IPsec encapsulation.
post-encapsulation (default value)	Fragment after IPsec encapsulation (RFC compliant).

To configure packet fragmentation using the CLI:

```
config vpn ipsec phase1-interface
  edit "demo"
    set interface "port1"
    set authmethod signature
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set ip-fragmentation pre-encapsulation
    set remote-gw 172.16.200.4
    set certificate "Fortinet_Factory"
  next
end
```

Configure DSCP for IPsec tunnels

Configuring the differentiated services (DiffServ) code in phase2 of an IPsec tunnel allows the tag to be applied to the Encapsulating Security Payload (ESP) packet.

- If `diffserv` is disabled in the IPsec phase2 configuration, then the ESP packets' DSCP value is copied from the inner IP packet DSCP.
- If `diffserv` is enabled in the IPsec phase2 configuration, then ESP packets' DSCP value is set to the configured value.

Offloading traffic to the NPU must be disabled for the tunnel.

In this example, NPU offloading is disabled, `diffserv` is enabled, and the `diffserv` code is set to 000111 on FGT-A. Only one side of the tunnel needs to have `diffserv` enabled.

To configure IPsec on FGT-A:

1. Configure the phase1-interface:

```
config vpn ipsec phase1-interface
  edit "s2s"
    set interface "wan1"
    set peertype any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set npu-offload disable
    set dhgrp 14 5
    set wizard-type static-fortigate
    set remote-gw 173.1.1.1
    set psksecret *****
  next
end
```

2. Configure the phase2-interface:

```
config vpn ipsec phase2-interface
  edit "s2s"
    set phase1name "s2s"
```

```

set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
set dhgrp 14 5
set diffserv enable
set diffservcode 000111
set src-addr-type name
set dst-addr-type name
set src-name "s2s_local"
set dst-name "s2s_remote"
next
end

```

3. Check the state of the IPsec tunnel:

```

FGT-A # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=s2s ver=1 serial=1 11.101.1.1:0->173.1.1.1:0 tun_id=173.1.1.1 dst_mtu=1500
bound_if=17 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/512 options[0200]=frag-rfc
run_state=0 accept_traffic=1 overlay_id=0

proxyid_num=1 child_num=0 refcnt=11 ilast=12 olast=2978 ad=/0

```

Defining gateway IP addresses in IPsec with mode-config and DHCP

For an IPsec tunnel, the gateway IP address (giaddr) can be defined on a DHCP relay agent. Both IPv4 and IPv6 addresses are supported. An IPsec tunnel with mode-config and DHCP relay cannot specify a DHCP subnet range to the DHCP server.

The DHCP server assigns an IP address based on the giaddr set on the IPsec phase1 interface and sends an offer to this subnet. The DHCP server must have a route to the specified subnet giaddr.

Example

To define the gateway IP address on the DHCP relay server:

1. Configure the VPN IPsec phase1 interface:

```
config vpn ipsec phase1-interface
  edit "ipv4"
    set type dynamic
    set interface "port2"
    set peertype any
    set net-device disable
    set mode-cfg enable
    set proposal des-md5 des-shal
    set dpd on-idle
    set dhgrp 5
    set assign-ip-from dhcp
    set dhcp-ra-giaddr 11.11.11.1
    set psksecret *****
    set dpd-retryinterval 60
  next
end
```

IPv6 could also be configured:

```

config vpn ipsec phase1-interface
  edit "ipv6"
    set type dynamic
    set interface "port2"
    set peertype any
    set net-device disable
    set mode-cfg enable
    set proposal des-md5 des-sha1
    set dpd on-idle
    set dhgrp 5
    set assign-ip-from dhcp
    set dhcp6-ra-linkaddr 2000:11:11:11::1
    set psksecret *****
    set dpd-retryinterval 60
  next
end

```

2. Enable DHCP proxy and configure the DHCP server IP address:

```

config system settings
  set dhcp-proxy enable
  set dhcp-server-ip "10.1.1.1"
end

```

3. Repeat the above steps for FGT_C and subnet B.

FQDN support for remote gateways

FortiGate supports FQDN when defining an IPsec remote gateway with a dynamically assigned IPv6 address. When FortiGate attempts to connect to the IPv6 device, FQDN will resolve the IPv6 address even when the address changes.

Using FQDN to configure the remote gateway is useful when the remote end has a dynamic IPv6 address assigned by their ISP or DHCPv6 server.

To set the VPN to DDNS and configure FQDN:

```

config vpn ipsec phase1-interface
  edit "ddns6"
    set type ddns
    set interface "agg1"
    set ip-version 6
    set ike-version 2
    set peertype any
    set net-device disable
    set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
    chacha20poly1305-prfsha256
    set dpd on-idle
    set remotegw-ddns "rgwa61.vpnlab.org"
    set psksecret *****
  next
end

config vpn ipsec phase2-interface
  edit "ddns6"
    set phaselname "ddns6"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm

```

```

chacha20poly1305
    set src-addr-type subnet6
    set dst-addr-type subnet6
    set src-subnet6 2003:1:1:1::/64
next
end

```

FQDN resolves the IPv6 address

```

# diagnose test application dnsproxy 7

vfid=0, name=rgwa61.vpnlab.org, ttl=3600:3547:1747
    2003:33:1:1::22 (ttl=3600)

```

FortiGate uses FQDN to connect to the IPv6 device

```

# diagnose vpn tunnel list name ddns6
list ipsec tunnel by names in vd 0
-----

Windows IKEv2 native VPN with user certificate

In this example, IKEv2 with Extensible Authentication Protocol – Transport Layer Security (EAP-TLS) using mutual certificate authentication is configured. Mutual certificate authentication means that both the client and server use certificates to identify themselves. EAP uses RADIUS, which is handled by the Network Policy Server (NPS) on the Windows server. Certificates are generated and distributed through Active Directory Certificate Services (AD CS). An additional certificate is used to identify the IPsec gateway.

This example assumes that the following Windows server roles are installed and available:

- NPS (RADIUS)
- AD CS with a generated CA
- Group Policy Management
- DNS server

It is also assumed that a connection is established between the NPS and FortiGate, and a DNS entry exists for the NPS that the FortiGate can resolve.

Certificates

The following certificates are required:

- CA certificate for EAP-TLS to sign the client and server certificates.
The CA certificate must be able to sign other certificates. It is created after AD CSs CA role installation. It is named lab-local-CA, as lab.local is the domain that is used in this example. The CA certificate is automatically installed on the server that is hosting the AD CS role. In this example, that server is also hosting the NPS and DNS server.
The *Key Usage* specifies *Certificate Signing*.
- Client certificate for EAP-TLS used by the windows client.
The client certificate is stored in the personal user certificate store and is used to authenticate the user. The certificate has *Client Authentication* and a SAN of the user's FQDN, and is signed by the CA. The CA is stored in *Current User > Trusted Root Certification Authorities*.
- Server certificate for EAP-TLS used by the server providing RADIUS authentication.
The NPS certificate must be in the hosting server's certificate store so that the NPS can access it. It has *Server Authentication* and a SAN DNS name to match the server's IP address. The user must use the FQDN to connect to the VPN. If the IP address that the name resolves to is used, the certificate will not be considered valid.
- VPN certificate used to identify the FortiGate dialup gateway.
The VPN certificate and private key are installed to the FortiGate using a CSR generated by the FortiGate

Configure the Windows server

The Windows server includes AD-CS, a RADIUS server, and a DNS server.

After the AD CS role has been installed and configured, the CA is ready to sign certificates.

Users and groups are defined first. The groups are configured to automatically receive certificates and relay membership to the FortiGate for granular access control through group matching in policies.

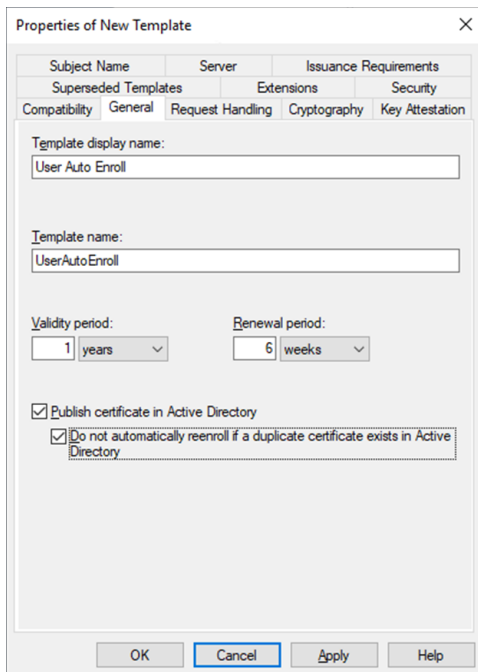

RADIUS is used to authorize connecting users. The RADIUS server returns users' groups with the access-accept response, to indicate to the FortiGate what groups the users belong to.

To create security groups and users:

1. Open *Active Directory Users and Computers*.
2. Create two groups, *Group1* and *Group2*.
3. Create two users, *User1* and *User2*.
 - a. To ensure that the automatic enrollment process succeeds in subsequent steps, ensure that each users has an email address configured in the *Email* field under *Properties > General*.
4. Add *User1* to *Group1* and *User2* to *Group2*.

To create a certificate template to enable automatic enrollment for the user groups:

1. Open *Certification Authority*.
2. In the navigation pane, expand the new CA, right-click *Certificate Template* and click *Manage*.
3. Configure a new certificate template:
 - a. Right-click the *User* template and click *Duplicate Template*.
 - b. On the *General* tab, enter a *Template display name*, such as *User Auto Enroll*.
 - c. Enable *Publish certificate in Active Directory* and *Do not automatically reenroll...*

- d. Configure the remaining settings as required, then go to the *Request Handling* tab.
 - e. Disable *Allow private key to be exported* and select *Enroll subject without requiring any user input*.
 - f. On the *Security* tab, in *Group or user name*, click *Add*.
 - g. Add *Group1* and *Group2*.
 - h. Select each group and, under *Permissions*, enable *Read*, *Enroll*, and *Autoenroll*.
 - i. On the *Extensions* tab, click *Application Policies* then click *Edit*.
 - j. Remove all of the policies expect for *Client Authentication*.
 - k. Click *OK* then close the *Certificate Templates* console.
4. In the navigation pane, right-click *Certificate Template* and click *New > Certificate Template to Issue*.
 5. Select the new certificate template, *User Auto Enroll*, then click *OK*.

To create a group policy to enable automatic enrollment:

1. Open the *Group Policy Management* console.
2. In the navigation pane, go to *Forest:lab.local > Domains > lab.local*, and then click *Group Policy Objects*.
3. Click *Action*, and then click *New*.
4. Set a *Name* for the new GPO then click *OK*.
5. Right-click the new GPO and click *Edit*.
6. In the *Group Policy Management Editor* navigation pane, go to *User configuration > Policies > Windows Settings > Security Settings > Public Key Policies*.
7. In the content pane, double-click *Certificate Services Client - Auto-Enrollment*.
8. Set *Configuration Model* to *Enabled*.
9. Enable *Renew expired certificates...* and *Update certificates....*

10. Click **OK**.

To verify that users are receiving certificates:

1. Log into an endpoint with a domain user.
2. On the server, open Certification Authority.
3. Expand the CA and select *Issued Certificates*.
4. Verify that the user logged into the endpoint is listed under *Requested Name*. You can also check the local user certificate store on the endpoint.

To generate and sign a CSR and import the signed certificate to the FortiGate:

1. On the FortiGate and go to *System > Certificates* and click *Create/Import > Generate CSR*.
2. Configure the CSR:

Certificate Name	vpn.lab.local
ID Type	Domain Name
Domain Name	vpn.lab.local
Subject Alternative Name	DNS:vpn.lab.local

3. Configure the remaining settings as required, then click **OK**.
4. Download the CSR to a location that is accessible to the CA server, in this example: `C:\CSR\`
5. Sign the CSR with the previously created CA:
 - a. Open the command prompt as an administrator and enter the following:

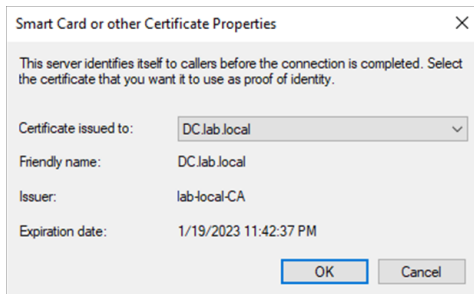

```
certreq -submit -attrib "CertificateTemplate:WebServer" C:\CSR\vpn.lab.local.csr
```

The *Certification Authority List* window opens.
 - b. Select the CA and click **OK**.
 - c. Save the signed certificate with a `.cer` file extension to a location that is accessible from the FortiGate.

6. Import the signed certificate to the FortiGate:
 - a. On the FortiGate, go to *System > Certificates* and click *Create/Import > Certificate*.
 - b. Click *Import Certificate*.
 - c. Set *Type* to *Local Certificate*.
 - d. Click *Upload* and locate and select the signed certificate
 - e. Click *Create* then click *OK*.

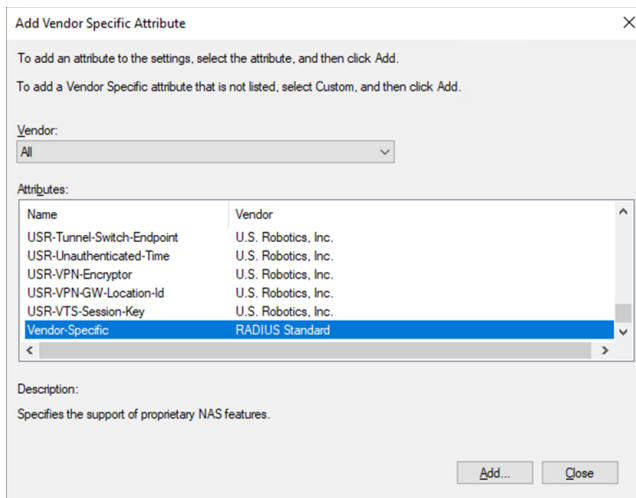

To configure network policies on the RADIUS server:

1. Open the *Network Policy Server* and, in the console tree, expand *Policies*.
2. Right-click on *Network Policies* and click *New*.
3. Enter a *Policy name*, such as *VPN-Group1*, then click *Next*.
4. Under *Condition description* click *Add*:
 - a. Select *User Groups*, then click *Add*.
 - b. Click *Add Groups*.
 - c. Enter the group name, *Group1*, click *Check Names* to confirm the group.
 - d. Click *OK* in both windows.
5. Click *Next*.
6. Make sure that *Access granted* is selected, then click *Next*.
7. On the *Configure Authentication Methods* page, click *Add* and add the EAP type *Microsoft: Smart Card or other certificate*.
8. Edit the EAP type, select the previously generated certificate, then click *OK*.

9. Deselect all of the *Less secure authentication methods* then click *Next*.
10. Configure constraints as needed, then click *Next*.
11. On the *Configure Settings* page, under *RADIUS Attributes*, select *Vendor Specific*, then click *Add*:

- a. In the *Attributes* list, select *Vendor-Specific*, then click *Add*.

- b. In the *Attribute Information* window, click *Add*.
- c. In the *Vendor-Specific Attribute Information* window, enter the *Vendor Code*, 12356, and select *Yes. It conforms*.
- d. Click *Configure Attribute* and configure the following:

Vendor-assigned attribute number	1
Attribute format	String
Attribute value	Group

- e. Click *OK* on all three windows and on the *Add Vendor Specific Attribute* window click *Close*.

12. Click *Next*.
13. On the *Completing New Network Policy* page, review the configuration, then click *Finish*.
14. Duplicate the policy for *Group2*, and call the new policy *VPN-Group2*.
15. Reorder the policies so that *VPN-Group1* and *VPN-Group2* are one and two in the processing order.

To add the FortiGate as a RADIUS client:

1. Open the *Network Policy Server* and, in the console tree, expand *RADIUS Clients and Servers*.
2. Right-click on *RADIUS Clients* and click *New*.
3. Add the FortiGate as a RADIUS client:

Friendly name	FGT1
---------------	------

Address 10.0.1.1

Shared Secret Manually enter the shared secret.

4. Click **OK**.

To create a DNS entry for the VPN connection:

1. Open the *DNS Manager*.
2. Go to *DC > Forward Lookup Zones* and select *lab.local*.
3. Right click in the content pane and select *New Host (A or AAAA)*.
4. Enter the VPN name. The FQDN should be auto-filled with *vpn.lab.local*.

5. Enter an IP address.
6. Click *Add Host*.

Configure the FortiGate

An IPsec VPN tunnel is configured to connect to the NPS (RADIUS) server for EAP authentication. For information about IPsec VPN, see [IPsec VPNs on page 1437](#).

A RADIUS server is added to relay VPN authentication requests to the NPS server. For information about RADIUS servers, see [RADIUS servers on page 1933](#).

Three groups are created that point to the RADIUS server for authentication: one group each for user group *Group1*, user group *Group2*, and the remote server. For information about groups, see [User groups on page 1910](#).

Three firewall policies are created to test the functionality of the three user groups (see [Policies on page 848](#)):

- Policy 1 allows VPN clients to communicate with each other.
- Policy 2 allows VPN clients in the *Group1* user group to communicate with *Server1* and *Server3*.
- Policy 3 allows VPN clients in the *Group2* user group to communicate with *Server1* and *Server2*.

To configure IPsec VPN in the GUI:

1. Go to *VPN > IPsec Wizard*.
2. Enter a name for the VPN, such as *VPN1*.
3. Set *Template type* to *Custom*, then click *Next*.
4. In the *Network* section, configure the following:

Remote Gateway	Dialup User
Interface	port1
Mode Config	Enable
Assign IP From	Range
Client Address Range	10.58.58.1-10.58.58.10
DNS Server	192.168.1.100
Enable IPv4 Split Tunnel	Enable
Accessible Networks	Select the networks that VPN users will have access to.

5. In the *Authentication* section, configure the following:

Method	Signature
Certificate Name	vpn.lab.local
Version	2
Accept Types	Any peer ID

6. In the *Phase 1 Proposal* section, configure the following:

Encryption / Authentication	AES128 / SHA256
Encryption / Authentication	AES256 / SHA256
Encryption / Authentication	AES128 / SHA1

Diffie-Hellman Groups	14, 5, 2
Local ID	vpn.lab.local

7. In the *Phase 2 Selectors* section, configure the following:

Local Address	Named Address - all
Remote Address	Named Address - all
Encryption / Authentication	AES128 / SHA256
Encryption / Authentication	AES256 / SHA256
Encryption / Authentication	AES128 / SHA1
Enable Perfect Forward Secrecy (PFS)	Disable
Autokey Keep Alive	Enable

8. Enable EAP settings in the CLI:

```
config vpn ipsec phase1-interface
  edit VPN1
    set eap enable
    set eap-identity send-request
  next
end
```

To configure IPsec VPN in the CLI:

```
config vpn ipsec phase1-interface
  edit "VPN1"
    set type dynamic
    set interface "port1"
    set ike-version 2
    set authmethod signature
    set peertype any
    set net-device disable
    set mode-cfg enable
    set ipv4-dns-server1 192.168.1.100
    set proposal aes128-sha256 aes256-sha256 aes128-sha1
    set localid "vpn.lab.local"
    set dpd on-idle
    set dhgrp 14 5 2
    set eap enable
    set eap-identity send-request
    set certificate "vpn.lab.local"
    set ipv4-start-ip 10.58.58.1
    set ipv4-end-ip 10.58.58.10
    set ipv4-split-include "10/8_net"
    set dpd-retryinterval 60
  next
end
config vpn ipsec phase2-interface
  edit "VPN1"
    set phase1name "VPN1"
```

```

        set proposal aes128-sha256 aes256-sha256 aes128-sha1
        set pfs disable
        set keepalive enable
        set src-addr-type name
        set dst-addr-type name
        set src-name "all"
        set dst-name "all"
    next
end

```

To add the RADIUS server in the GUI:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Enter a name for the server, such as *NPS*.
3. Enter the *Primary Server IP/Name* and *Secret*.
The *Test User Credentials* option will not work, as it does not use certificates for the test.
4. Click *OK*.

To add the RADIUS server in the CLI:

```

config user radius
    edit "NPS"
        set server <ip>
        set secret *****
    next
end

```

To configure the user groups in the GUI:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Enter a name for the group, such as *Group1*.
3. In the *Remote Groups* table, click *Add*:
 - a. Set *Remote Server* to the just created RADIUS server, *NPS*.
 - b. Set *Groups to Specify* and enter *Group1*.
 - c. Click *OK*.
4. Click *OK*.
5. Create a second group called *Group2* with the same *Remote Server* and *Group Name* set to *Group2*.
6. Create a third group called *RADIUS* with the same *Remote Server* but no *Group Name*.

To configure the user groups in the CLI:

```

config user group
    edit "Group1"
        set member "NPS"
        config match
            edit 1
                set server-name "NPS"
                set group-name "Group1"
            next
        end
    next
end

```

```

edit "Group2"
  set member "NPS"
  config match
    edit 1
      set server-name "NPS"
      set group-name "Group2"
    next
  end
next
edit "RADIUS"
  set member "NPS"
next
end

```

To configure the policies in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure policy 1:

Name	VPN-VPN
Incoming Interface	VPN1
Outgoing Interface	VPN1
Source	all, RADIUS
Destination	all
Schedule	always
Service	ALL
NAT	Disable

3. Click *OK*.
4. Click *Create New* again and configure policy 2:

Name	VPN Group1
Incoming Interface	VPN1
Outgoing Interface	Server1, Server3
Source	all, Group1
Destination	10.10.0.1, 10.10.0.3
Schedule	always
Service	ALL
NAT	Disable

5. Click *OK*.

6. Click *Create New* again and configure policy 3:

Name	VPN Group2
Incoming Interface	VPN1
Outgoing Interface	Server1, Server2
Source	all, Group2
Destination	10.10.0.1, 10.10.0.2
Schedule	always
Service	ALL
NAT	Disable

7. Click *OK*.

To configure the policies in the CLI:

```
config firewall policy
  edit 1
    set name "VPN-VPN"
    set srcintf "VPN1"
    set dstintf "VPN1"
    set action accept
    set srcaddr "all" "RADIUS"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set nat disable
  next
  edit 2
    set name "VPN Group1"
    set srcintf "VPN1"
    set dstintf "Server1" "Server3"
    set action accept
    set srcaddr "all" "Group1"
    set dstaddr "10.10.0.1" "10.10.0.3"
    set schedule "always"
    set service "ALL"
    set nat disable
  next
  edit 3
    set name "VPN Group2"
    set srcintf "VPN1"
    set dstintf "Server1" "Server2"
    set action accept
    set srcaddr "all" "Group2"
    set dstaddr "10.10.0.1" "10.10.0.2"
    set schedule "always"
    set service "ALL"
    set nat disable
  next
end
```

Configure the Windows client

The configuration is done on a Windows 10 Enterprise endpoint.

To add VPN connection and configure a VPN interface:

1. Open the *Settings* page and go to *Network & Internet > VPN*.
2. Click *Add a VPN connection*.
3. Configure the following:

VPN provider	Windows (built-in)
Connection name	vpn.lab.local
Server name or address	vpn.lab.local
VPN type	IKEv2
Type of sign-in info	Certificate

4. Click *Save*.
5. Go to *Network & Internet > Status* and, under *Advanced network settings*, click *Change adapter options*.
6. Select the VPN connection then click *Change settings of this connection*, or right-click on the connection and select *Properties*:
 - a. Go to the *Security* tab and, in the *Authentication* section, click *Properties*.
 - b. Select *Use a certificate on this computer* and enable *Use simple certification selection*.
 - c. Enable *Verify the server's identity by validating the certificate*.
 - d. Optionally, enable *Connect to these servers* and enter your NPS server's FQDN, in this case *DC.lab.local*.
 - e. In the *Trusted Root Certificate Authorities* list, select the CA *lab-local-CA*.

f. Click OK, then click OK again.

To test the connection:

1. Log in to the Windows endpoint as user1.
2. Open the network settings and connect to the *vpn.lab.local* VPN.
3. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server3 (10.10.0.3), but not server2 (10.10.0.2).
4. Log out of the Windows endpoint, then log back in as user2.
5. Open the network settings and connect to the *vpn.lab.local* VPN.
6. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server2 (10.10.0.2), but not server3 (10.10.0.3).

VPN IPsec troubleshooting

See the following IPsec troubleshooting examples:

- [Understanding VPN related logs](#)
- [IPsec related diagnose commands on page 1712](#)

Understanding VPN related logs

This section provides some IPsec log samples.

SSL VPN best practices

Securing remote access to network resources is a critical part of security operations. SSL VPN allows administrators to configure, administer, and deploy a remote access strategy for their remote workers. When not in use, SSL VPN can be disabled.

Choosing the correct mode of operation and applying the proper levels of security are integral to providing optimal performance and user experience, and keeping your user data safe.

The below guidelines outline selecting the correct SSL VPN mode for your deployment and employing best practices to ensure that your data are protected.

Information about SSL VPN throughput and maximum concurrent users is available on your device's datasheet; see [Next-Generation Firewalls Models and Specifications](#).

Ensure you always upgrade your FortiGate to the latest FortiOS firmware version. This ensures you are running the latest SSL VPN security enhancements to protect your VPN deployment.

Tunnel mode

In tunnel mode, the SSL VPN client encrypts all traffic from the remote client computer and sends it to the FortiGate through an SSL VPN tunnel over the HTTPS link between the user and the FortiGate.

The FortiGate establishes a tunnel with the client, and assigns a virtual IP (VIP) address to the client from a range reserved addresses. While the underlying protocols are different, the outcome is very similar to a IPsec VPN tunnel. All client traffic is encrypted, allowing the users and networks to exchange a wide range of traffic, regardless of the application or protocols.

Use this mode if you require:

- A wide range of applications and protocols to be accessed by the remote client.
- No proxying is done by the FortiGate.
- Straightforward configuration and administration, as traffic is controlled by firewall policies.
- A transparent experience for the end user. For example, a user that needs to RDP to their server only requires a tunnel connection; they can then use the usual client application, like Windows Remote Desktop, to connect.

Full tunneling forces all traffic to pass through the FortiGate (see [SSL VPN full tunnel for remote user on page 1735](#)). Split tunneling only routes traffic to the designated network through the FortiGate (see [SSL VPN split tunnel for remote user on page 1728](#)).

Limitations

Tunnel mode requires that the [FortiClient VPN](#) client be installed on the remote end. The standalone FortiClient VPN client is free to use, and can accommodate SSL VPN and IPsec VPN tunnels. For supported operating systems, see the [FortiClient Technical Specifications](#).

SSL VPN encrypts traffic using TLS and uses TCP as the transport layer. Therefore, SSL VPN is subject to retransmission issues that can occur with TCP-in-TCP that result in lower VPN throughput. For optimal SSL VPN throughput, consider enabling DTLS support. See [DTLS support on page 1866](#).

For the highest VPN throughput, consider configuring dialup IPsec VPN instead. See [FortiClient as dialup client on page 1527](#).

Web mode

Web-only mode provides clientless network access using a web browser with built-in SSL encryption. Users authenticate to FortiGate's SSL VPN Web Portal, which provides access to network services and resources, including HTTP/HTTPS, Telnet, FTP, SMB/CIFS, VNC, RDP, and SSH. When a user starts a connection to a server from the web portal, FortiOS proxies this communication with the server. All communication between the FortiGate and the user continues to be over HTTPS, regardless of the service that is being accessed.

The clipboard can be disabled for SSL VPN web mode RDP/VNC connections, see [Disable the clipboard in SSL VPN web mode RDP connections on page 1893](#).

Use this mode if you require:

- A clientless solution in which all remote services are access through a web portal.
- Tight control over the contents of the web portal.
- Limited services provided to the remote users.

Limitations

- Multiple applications and protocols are not supported.
- VNC and RDP access might have limitations, such as certain shortcut keys not being supported.
- In some configurations RDP can consume a significant amount of memory and CPU time.
- Firewall performance might decrease as remote usage increases.
- Highly customized web pages might not render correctly.

Security best practices

Integrate with authentication servers

For networks with many users, integrate your user configuration with existing authentication servers through LDAP, RADIUS, or FortiAuthenticator.

By integrating with existing authentication servers, such as Windows AD, there is a lower change of making mistakes when configuring local users and user groups. Your administration effort is also reduces.

See [SSL VPN with LDAP user authentication on page 1774](#) for more information.

Use a non-factory SSL certificate for the SSL VPN portal

Your certificate should identify your domain so that a remote user can recognize the identity of the server or portal that they are accessing through a trusted CA.

The default Fortinet factory self-signed certificates are provided to simplify initial installation and testing. If you use these certificates you are vulnerable to man-in-the-middle attacks, where an attacker spoofs your certificate, compromises your connection, and steals your personal information. It is highly recommended that you purchase a server certificate from a trusted CA to allow remote users to connect to SSL VPN with confidence. See [Procuring and importing a signed SSL certificate on page 2303](#) for more information.

Enabling the *Do not Warn Invalid Server Certificate* option on the client disables the certificate warning message, potentially allowing users to accidentally connect to untrusted servers. Disabling invalid server certificate warnings is not recommended.

Use multi-factor authentication

Multi-factor authentication (MFA) ensures that the end-user is who they claim to be by requiring at least two factors - a piece of information that the user knows (password), and an asset that the user has (OTP). A third factor, something a user is (fingerprint or face), may be enabled as well. [FortiToken Mobile](#) is typically used for MFA.

FortiGate comes with two free FortiTokens, and more can be purchased from the [FortiToken Mobile iOS app](#) or through Fortinet partners.

See [SSL VPN with FortiToken mobile push authentication on page 1803](#) for more information.

2FA, a subset of MFA, can also be set up with email tokens. See [Email Two-Factor Authentication on FortiGate](#) for information.

Deploy user certificates for remote SSL VPN users

This method of 2FA uses a user certificate as the second authentication factor. This is more secure, as it identifies the end user using a certificate. The configuration and administration of this solution is significantly more complicated, and requires administrators with advanced knowledge of the FortiGate and certificate deployment.

See [SSL VPN with certificate authentication on page 1785](#) for more information.

Define your minimum supported TLS version and cipher suites

Minimum and maximum supported TLS version can be configured in the FortiGate CLI. The cipher algorithm can also be customized.

See [How to control the SSL version and cipher suite for SSL VPN](#) for more information.

Properly administer firewall policies and profiles against only the access level required for the remote user

Users do not all require the same access. Access should only be granted after careful considerations. Typically, users are placed in groups, and each group is allowed access to limited resources.

Using SSL VPN realms simplifies defining the control structure for mapping users and groups to the appropriate resources.

See [SSL VPN multi-realm on page 1850](#) for more information.

Disable SSL VPN

After the SSL VPN settings have been configured, SSL VPN can be disabled when not in use.

To disable SSL VPN in the GUI:

1. Go to *VPN > SSL-VPN Settings*.
2. Disable *Enable SSL-VPN*.
3. Click *Apply*.

To disable SSL VPN in the CLI:

```
config vpn ssl settings
    set status disable
end
```

SSL VPN settings

Define your minimum supported TLS version and cipher suites

Minimum and maximum supported TLS version can be configured in the FortiGate CLI. The cipher algorithm can also be customized.

See [How to control the SSL version and cipher suite for SSL VPN](#) for more information.

Limit log in attempts and block duration

To prevent brute force attacks, limit log in attempts and configure the block duration:

```
config vpn ssl settings
  set login-attempt-limit 2
  set login-block-time 60
end
```

These values are the default values. The FortiGate will block attempts to connect to SSL VPN for 60 seconds after two unsuccessful log in attempts. These values can be configured as needed.

See [How to limit SSL VPN login attempts and block duration](#) for more information.

Limit users to one SSL VPN session at a time

To prevent attacks from a compromised user, you can limit a user to one SSL VPN session at a time by going to *VPN > SSL-VPN Portals*, editing a portal, and enabling *Limit Users to One SSL-VPN Connection at a Time*. This option can also be configured in the CLI:

```
config vpn ssl web portal
  edit < portal name >
    set limit-user-logins enable
  end
end
```

See [Multiple sessions of SSL VPN users](#) for more information.

Use a custom listening port for SSL VPN

To prevent external attacks targeting the default SSL VPN port 10443, use a custom listening port for SSL VPN other than port 10443.

The SSL VPN listening port can be configured from the GUI on the *VPN > SSL-VPN Settings* page by changing the *Listen on Port* field from the default 10443 to any other port. To change the listening port in the CLI:

```
config vpn ssl settings
  set port <port number>
end
```

After the SSL VPN listening port has been changed, the custom port must be communicated to end users that must use it for SSL VPN tunnel mode access using FortiClient, or for SSL VPN web portal access using a web browser, replacing 10443 in the web portal URL.

Disable SSL VPN

After the SSL VPN settings have been configured, SSL VPN can be disabled when not in use.

To disable SSL VPN in the GUI:

1. Go to *VPN > SSL-VPN Settings*.
2. Disable *Enable SSL-VPN*.
3. Click *Apply*.

If the FortiGate has VDOMs configured, then you can select the appropriate VDOM and repeat the steps to disable SSL VPN for that specific VDOM.

See [How to disable SSL VPN functionality on FortiGate](#) for more information.

Disable SSL VPN web login page

A best practice is to disable the SSL VPN web login page when SSL VPN is configured to only allow tunnel access and web access is disabled. This prevents the web login page from displaying in a browser when users access `https://<FortiGate-ip>:<ssl-vpn-port-number>`.

To disable SSL VPN web login page in the GUI:

1. Go to *System > Replacement Messages* and double-click *SSL-VPN Login Page* to open it for editing.
2. In the *Message Format: text/html* select from `<body>` to `</body>`, and press *Delete*.
3. Click *Save*.

To disable SSL VPN web login page in the CLI:

```
config system replacemsg sslvpn sslvpn-login
    set buffer ""
end
```

See [How to prevent the SSL-VPN web login portal from displaying when SSL-VPN web mode is disabled](#) for more information.

Authentication

Integrate with authentication servers

For networks with many users, integrate your user configuration with existing authentication servers through LDAP, RADIUS, or FortiAuthenticator. When integrating with existing authentication servers, these users are referred to as remote users.

By integrating with existing authentication servers, such as Windows AD, there is a lower chance of making mistakes when configuring remote users and remote user groups, reducing your administration effort. Also, credentials for remote users are kept on the authentication servers themselves and are not stored on the FortiGate, unlike credentials for local users.

See [SSL VPN with LDAP user authentication on page 1774](#) and [SSL VPN with RADIUS on Windows NPS on page 1822](#) for more information.

It is best practice to integrate with encrypted protocols on authentication servers such as LDAPS instead of LDAP.

Use a non-factory SSL certificate for the SSL VPN portal

Your certificate should identify your domain so that a remote user can recognize the identity of the server or portal that they are accessing through a trusted CA.

The default Fortinet factory self-signed certificates are provided to simplify initial installation and testing. If you use these certificates you are vulnerable to man-in-the-middle attacks, where an attacker spoofs your certificate, compromises your connection, and steals your personal information. It is highly recommended that you purchase a server certificate from a trusted CA to allow remote users to connect to SSL VPN with confidence. See [Procuring and importing a signed SSL certificate on page 2303](#) for more information.

Enabling the *Do not Warn Invalid Server Certificate* option on the client disables the certificate warning message, potentially allowing users to accidentally connect to untrusted servers. Disabling invalid server certificate warnings is not recommended.

Use multi-factor authentication

Multi-factor authentication (MFA) ensures that the end-user is who they claim to be by requiring at least two factors - a piece of information that the user knows (password), and an asset that the user has (OTP). A third factor, something a user is (fingerprint or face), may be enabled as well. [FortiToken Mobile](#) is typically used for MFA.

FortiGate comes with two free FortiTokens, and more can be purchased from the [FortiToken Mobile iOS app](#) or through Fortinet partners.

See [SSL VPN with FortiToken mobile push authentication on page 1803](#) for more information.

2FA, a subset of MFA, can also be set up with email tokens. See [Email Two-Factor Authentication on FortiGate](#) for information.

Use multi-factor authentication with authentication servers

Users configured with MFA, such as FortiToken Mobile tokens and email tokens on the FortiGate, are still essentially local users with user credentials stored on the FortiGate.

You should therefore consider using a combination of MFA and authentication servers for optimal security. See [SSL VPN with LDAP-integrated certificate authentication on page 1790](#) and [SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator on page 1813](#) for more information.

Disable case sensitivity for remote users using authentication servers and MFA

When using remote users with authentication servers and MFA, it is possible for MFA to be bypassed if the case of the entered username is not an exact match. To prevent this, ensure case sensitivity is disabled for each remote user that has been configured on the FortiGate with authentication server and MFA settings. See [SSL VPN for remote users with MFA and user sensitivity on page 1796](#) for more information.

Deploy user certificates for remote SSL VPN users

This method of 2FA uses a user certificate as the second authentication factor. This is more secure, as it identifies the end user using a certificate. The configuration and administration of this solution is significantly more complicated, and requires administrators with advanced knowledge of the FortiGate and certificate deployment.

See [SSL VPN with certificate authentication on page 1785](#) for more information.

Authorization

Properly administer firewall policies and profiles against only the access level required for the remote user

Users do not all require the same access. Access should only be granted after careful considerations. Typically, users are placed in groups, and each group is allowed access to limited resources.

Using SSL VPN realms simplifies defining the control structure for mapping users and groups to the appropriate resources.

See [SSL VPN multi-realm on page 1850](#) for more information.

Set the default portal to a custom SSL VPN with all modes disabled

In the SSL VPN settings, it is mandatory in the *Authentication/Portal Mapping* section to configure a portal for *All Other Users/Groups* or what can be considered a default portal for other users who are not specifically mapped to access SSL VPN portals.

When the *Authentication/Portal Mapping* does not match users or groups that you have specifically mapped to access SSL VPN portals, you can create a custom SSL VPN portal with both tunnel and web modes disabled, and then set the default portal to that custom portal. This configuration is analogous to the implicit deny policy in firewall policies, in that this custom portal can deny all other users and groups.

Even with a default portal with all modes disabled, users deemed to be part of *All Other Users/Groups* will still be able to access the web portal. Once these users try to log into the web portal, access will be denied. Users deemed to be part of *All Other Users/Groups* should not be able to successfully establish tunnel mode connections in this case.

See [How to disable SSL VPN Web Mode or Tunnel Mode in SSL VPN portal](#) for more information.

Limit incoming access to specific hosts or geography based addresses

The simplest method for limiting incoming access is specifying source addresses in the SSL VPN settings.

- If you require schedules and geography based addresses, and are comfortable using the CLI, then consider configuring local-in policies as described in [To limit incoming access to specific hosts based on their source IP addresses in the CLI](#).
- If you require Internet Services using ISDB or threat feeds, or schedules and geography based addresses, and are more comfortable using the GUI, then consider configuring a VIP, loopback, and firewall policy as described in [To limit incoming access to specific hosts based on their source IP addresses in the GUI](#).

In SSL VPN, IPv6 geography based addresses are not supported.

To limit incoming access to specific hosts based on their source IP addresses in the GUI:

1. Create address objects or groups with the source IP addresses you need to allow access to SSL VPN modes.
2. In *VPN > SSL-VPN Settings* under *Restrict Access*, select *Limit access to specific hosts* and in the *Hosts* field select address objects or groups corresponding to specific source IP addresses for hosts that you need to allow.

You can block incoming access for specific hosts by following the same configuration steps with the address objects or groups being of hosts to block and instead selecting *Negate Source*. See [How to block SSL VPN connection from a certain source IP Address](#) for more information.

To limit incoming access to specific hosts based on their source IP addresses in the CLI:

```
config vpn ssl settings
    set source-address <source address 1> ... <source address n>
    set source-address-negate {disable | enable}
end
```

With this CLI, you can limit incoming access to hosts from specific countries by specifying geography based addresses as the source addresses. See [Geography based addresses on page 957](#) and [Restricting SSL VPN connectivity from certain countries using firewall geography address](#) for more information.

Limit incoming access using local-in policies with specific hosts, geography based addresses, or schedules

As an alternative to configuring source addresses in the SSL VPN settings, you can configure local-in policies to allow and deny specific source addresses. Local-in policies must be defined in the CLI, so this approach requires familiarity with CLI commands.

The configuration workflow is:

1. Create a new custom service corresponding to the SSL VPN listening TCP port.
2. (Optional) Create new geography based addresses that can be specified as the source addresses for the allow and deny local-in policies that are created.
3. (Optional) Configure new schedules that can be specified as the schedule for the allow and deny local-in policies that are created.
4. Create a local-in policy using the SSL VPN custom service to allow specific source addresses.

5. Create a local-in policy using the SSL VPN custom service to deny specific source addresses. This is required since there is no implicit deny local-in policy defined by default.

Note that extra care should be taken when configuring a local-in policy, as an incorrect configuration could inadvertently deny traffic for IPsec VPN, dynamic routing protocols, HA, and other FortiGate features.

The source IP address objects that are used can be address objects or groups, or geography based address objects. New schedules can be created and applied to the local-in policies to impose schedule-based access restrictions.

You can also deny all access to SSL VPN by creating a deny local-in policy using source address `all` and SSL VPN custom service without creating a corresponding local-in policy to allow the SSL VPN custom service.

See [Local-in policies on page 896](#), [Restricting/Allowing access to the FortiGate SSL-VPN from specific countries or IP addresses with local-in-policy](#), and [Scheduled SSL-VPN connectivity via Local-in-Policy](#) for more information.

Limit incoming access using a virtual IP, loopback interface, and firewall policy with Internet Services or a threat feed or schedule

SSL VPN access can be moved to a secondary IP address or any other WAN IP address defined on a FortiGate interface by using a virtual IP (VIP), loopback interface, and WAN-to-loopback firewall policy. This method can be configured entirely in the GUI and is much easier to configure than local-in policies.

The configuration workflow is as follows:

1. Configure the SSL VPN firewall policy from the `ssl.<VDM>` interface to the internal interface or interfaces, ensuring that you specify the users and groups (required), and addresses or address groups (optional) in the policy's *Source* field. See [SSL VPN split tunnel for remote user on page 1728](#).
2. Create a new loopback interface and specify an IP address that is not being used by any other interface on the FortiGate. This IP address can be a private IP address within the RFC 1918 range.
3. Create a new VIP with the following settings:
 - *External IP address/range* configured as the secondary WAN IP address, or any other WAN IP address that is available for the WAN interface.
 - *IPv4 address/range* configured as the IP address assigned to the loopback interface.
 - *Port forwarding* enabled with *External service port* and *Map to IPv4 port* with the SSL VPN listening port.
4. Create a new WAN interface to loopback interface firewall policy with the VIP as the destination address.
5. In the SSL VPN settings set *Listen on Interface(s)* to the newly created loopback interface.
6. (Optional) Create a new deny firewall policy, configure Internet Services as source addresses in the new policy, and place it above the WAN-to-loopback firewall policy.
7. (Optional) Create a new deny firewall policy, configure an IP address threat feed, configure the threat feed as a source address in the new policy, and place it above the WAN-to-loopback firewall policy.
8. (Optional) Configure a new schedule and apply it to the WAN-to-loopback firewall policy.

This configuration gives you the option to deny access to SSL VPN from specified hosts. You can create a new deny firewall policy, apply Internet Services using the ISDB or threat feed objects as source addresses and place the deny policy above the WAN-to-loopback firewall policy.

You also have the option of creating a new schedule and applying it to the WAN-to-loopback firewall policy to allow SSL VPN access during a specified time or days of the week.

Finally, you can disable all SSL VPN access by disabling the WAN-to-loopback firewall policy.

See [Access SSL VPN from Secondary IP only, Using Internet Service in policy on page 1153](#), [IP address threat feed on page 2682](#), and [Firewall policy parameters on page 849](#) for more information.

See [Prevent TOR IP addresses from accessing SSL-VPN with brute-force attacks on FortiGate](#) and [How to use a Threat Feed with SSL VPN](#) for specific examples.

SSL VPN quick start

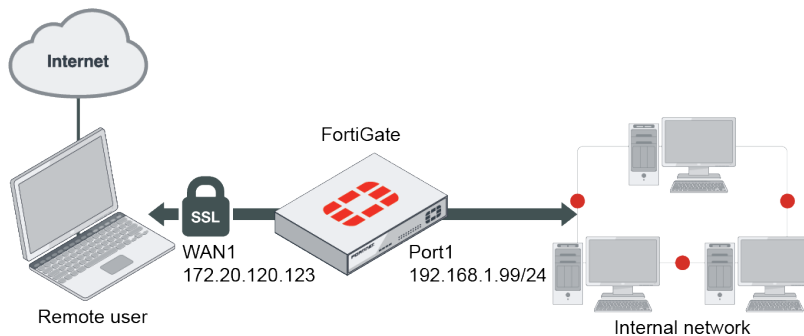

The following topics provide introductory instructions on configuring SSL VPN:

- [SSL VPN split tunnel for remote user on page 1728](#)
- [Connecting from FortiClient VPN client on page 1731](#)
- [Set up FortiToken multi-factor authentication on page 1733](#)
- [Connecting from FortiClient with FortiToken on page 1734](#)

SSL VPN split tunnel for remote user

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient but accessing the Internet without going through the SSL VPN tunnel.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internal subnet *192.168.1.0*.

2. Configure user and user group.
 - a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
 - b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to create a tunnel mode only portal *my-split-tunnel-portal*.
 - b. Enable *Tunnel Mode* and select one of the *Split tunneling* settings. See [Split tunneling settings on page 1744](#) for more information.
 - c. Select *Routing Address Override* to define the destination network (usually the corporate network) that will be routed through the tunnel.

Leave *Routing Address Override* undefined to use the destination in the respective firewall policies.

- d. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
4. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. For *Listen on Interface(s)*, select *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
 - e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-split-tunnel-portal*.
5. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn split tunnel access*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Choose an *Outgoing Interface*. In this example, *port1*.
 - e. Set the *Source* to *all* and group to *sslvpngroup*.
 - f. In this example, the *Destination* is *all*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
```

```
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end

config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "my-split-tunnel-portal"
        set tunnel-mode enable
        set split-tunneling enable
        set split-tunneling-routing-address "192.168.1.0"
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-split-tunnel-portal"
        next
    next
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn split tunnel access"
```

```
set srcintf "ssl.root"  
set dstintf "port1"  
set srcaddr "all"  
set dstaddr "192.168.1.0"  
set groups "sslvpngroup"  
set action accept  
set schedule "always"  
set service "ALL"  
next  
end
```

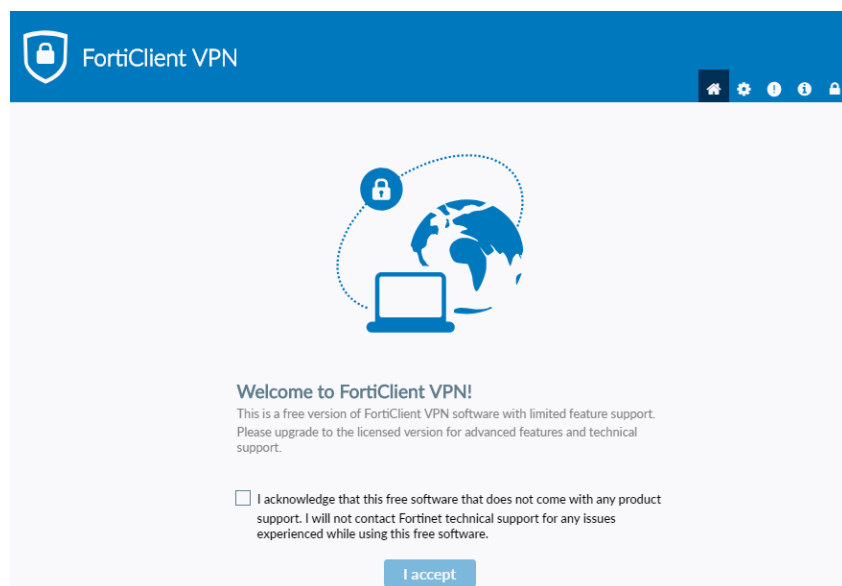

Connecting from FortiClient VPN client

For FortiGate administrators, a free version of FortiClient VPN is available which supports basic IPsec and SSL VPN and does not require registration with EMS. This version does not include central management, technical support, or some advanced features.

Downloading and installing the standalone FortiClient VPN client

You can download the free VPN client from [FNDN](#) or [FortiClient.com](#).

When the free VPN client is run for the first time, it displays a disclaimer. You cannot configure or create a VPN connection until you accept the disclaimer and click *I accept*:

Configuring an SSL VPN connection

To configure an SSL VPN connection:

1. On the *Remote Access* tab, click on the settings icon and then *Add a New Connection*.

The screenshot shows the 'New VPN Connection' configuration window. The left sidebar is the FortiOS navigation menu with 'REMOTE ACCESS' selected. The main window has the following settings:

- VPN: **SSL-VPN** (selected), IPsec VPN
- Connection Name: [Empty text box]
- Description: [Empty text box]
- Remote Gateway: [Empty text box] with a close icon (x)
- +Add Remote Gateway
- Customize port: Custom port: 443
- Client Certificate: None (dropdown menu)
- Authentication: Prompt on login, Save login
- Do not Warn Invalid Server Certificate
- Buttons: Cancel, Save

2. Select *SSL-VPN*, then configure the following settings:

Connection Name	SSLVPNtoHQ
Description	(Optional)
Remote Gateway	172.20.120.123
Customize port	10443
Client Certificate	Select <i>Prompt on connect</i> or the certificate from the dropdown list.
Authentication	Select <i>Prompt on login</i> for a prompt on the connection screen

3. Click *Save* to save the VPN connection.

Connecting to SSL VPN

To connect to SSL VPN:

1. On the *Remote Access* tab, select the VPN connection from the dropdown list. Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the *Connect* button.
4. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
5. Click the *Disconnect* button when you are ready to terminate the VPN session.

Checking the SSL VPN connection

To check the SSL VPN connection using the GUI:

1. On the FortiGate, go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
2. On the FortiGate, go to *Log & Report > Forward Traffic* to view the details of the SSL entry.

To check the tunnel log in using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
  Index  User           Auth Type  Timeout  From           HTTP in/out  HTTPS in/out
  0      sslvpuser1    1(1)      291      10.1.100.254  0/0          0/0

SSL VPN sessions:
  Index  User           Source IP  Duration  I/O Bytes      Tunnel/Dest IP
  0      sslvpuser1    10.1.100.254  9         22099/43228    10.212.134.200
```

Set up FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the split tunnel configuration ([SSL VPN split tunnel for remote user on page 1728](#)). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Configure a user and user group:
 - a. Go to *User & Authentication > User Definition* and edit local user *sslvpuser1*.
 - b. Enable *Two-factor Authentication*.
 - c. For *Authentication Type*, click *FortiToken* and select one mobile *Token* from the list.
 - d. Enter the user's *Email Address*.
 - e. Enable *Send Activation Code* and select *Email*.
 - f. Click *Next* and click *Submit*.
2. Activate the mobile token.
When a FortiToken is added to user *sslvpuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Configure a user and user group:

```
config user local
  edit "sslvpuser1"
    set type password
    set two-factor fortitoken
    set fortitoken <select mobile token for the option list>
    set email-to <user's email address>
    set passwd <user's password>
  next
end
config user group
  edit "sslvpngroup"
```

```

        set member "sslvpnuser1"
    next
end

```

2. Activate the mobile token.

When a FortiToken is added to user *sslvpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Connecting from FortiClient with FortiToken

To activate your FortiToken:

1. On your device, open FortiToken Mobile. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.

2. You should have received your notification via email, select + and use the device camera to scan the token QR code in your email.

3. FortiToken Mobile provisions and activates your token and generates token codes immediately. To view the OTP's digits, select the eye icon. After you open the application, FortiToken Mobile generates a new six-digit OTP every 30 seconds.

To connect to SSL VPN:

1. On the *Remote Access* tab, select the VPN connection from the dropdown list. Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the *Connect* button.
4. A Token field will appear, prompting you for the FortiToken code. Enter the FortiToken code from your Mobile device.
5. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
6. Click the *Disconnect* button when you are ready to terminate the VPN session.

SSL VPN tunnel mode

The following topics provide instructions on configuring SSL VPN tunnel mode:

- [SSL VPN full tunnel for remote user](#)
- [SSL VPN tunnel mode host check](#)
- [SSL VPN split DNS on page 1741](#)
- [Split tunneling settings on page 1744](#)
- [Augmenting VPN security with ZTNA tags on page 1745](#)
- [Enhancing VPN security using EMS SN verification on page 1758](#)

SSL VPN full tunnel for remote user

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address:
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
2. Configure user and user group:
 - a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
 - b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals* to create a tunnel mode only portal *my-full-tunnel-portal*.
 - b. Disable *Split Tunneling*.
4. Configure SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. For *Listen on Interface(s)*, select *wan1*.

- c. Set *Listen on Port* to 10443.
 - d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
 - e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-full-tunnel-portal*.
5. Configure SSL VPN firewall policies to allow remote user to access the internal network:
- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Set *Name* to *sslvpn tunnel mode access*.
 - c. Set *Incoming Interface* to *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set *Outgoing Interface* to *port1*.
 - e. Set the *Source Address* to *all* and *User* to *sslvpngroup*.
 - f. Set *Destination* to *all*, *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - g. Click *OK*.
 - h. Click *Create New*.
 - i. Set *Name* to *sslvpn tunnel mode outgoing*.
 - j. Configure the same settings as the previous policy, except set *Outgoing Interface* to *wan1*.
 - k. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end
```

3. Configure user and user group.

```
config user local
  edit "sslvpnuser1"
    set type password
    set passwd your-password
  next
end

config user group
  edit "sslvpngroup"
    set member "sslvpnuser1"
  next
end
```

4. Configure SSL VPN web portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
  edit "my-full-tunnel-portal"
    set tunnel-mode enable
    set split-tunneling disable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
  next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
  set servercert "Fortinet_Factory"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set source-address6 "all"
  set default-portal "full-access"
  config authentication-rule
    edit 1
      set groups "sslvpngroup"
      set portal "my-full-tunnel-portal"
    next
  end
end
```

6. Configure SSL VPN firewall policies to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
  edit 1
    set name "sslvpn tunnel mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set groups "sslvpngroup"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "sslvpn tunnel mode outgoing"
    set srcintf "ssl.root"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set groups "sslvpngroup"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

To see the results:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
 - Set *VPN Type* to *SSL VPN*.
 - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
7. After connection, all traffic except the local subnet will go through the tunnel *FGT*.
8. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
9. On the FortiGate, go to *Log & Report > Forward Traffic* and view the details for the SSL entry.

SSL VPN tunnel mode host check

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by tunnel mode using FortiClient with AV host check.

Sample topology**Sample configuration**

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.

- d. Click *OK*.
- e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
 - a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
 - b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to create a tunnel mode only portal *my-split-tunnel-portal*.
 - b. Enable *Tunnel Mode* and select one of the *Split tunneling* settings. See [Split tunneling settings on page 1744](#) for more information.
 - c. Select *Routing Address Override*.
 - d. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
4. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. For *Listen on Interface(s)*, select *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Choose a certificate for *Server Certificate*.

It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the [SSL VPN best practices on page 1718](#) and learn how to [Procuring and importing a signed SSL certificate on page 2303](#).

- e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
- f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-split-tunnel-portal*.
5. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn tunnel access with av check*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Choose an *Outgoing Interface*. In this example, *port1*.
 - e. Set the *Source* to *all* and group to *sslvpngroup*.
 - f. In this example, the *Destination* is *all*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Click *OK*.
6. Use CLI to configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user's computer.

```
config vpn ssl web portal
  edit my-split-tunnel-access
    set host-check av
  next
end
```

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
```

```
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end

config user group
    edit "sslvpngroup"
        set member "vpnuser1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "my-split-tunnel-portal"
        set tunnel-mode enable
        set split-tunneling enable
        set split-tunneling-routing-address "192.168.1.0"
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-split-tunnel-portal"
        next
    end
end
```

```

    end
end

```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```

config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

7. Configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user's computer:

```

config vpn ssl web portal
    edit my-split-tunnel-access
        set host-check av
    next
end

```

To see the results:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
 - Set *VPN Type* to *SSL VPN*.
 - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.

If the user's computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to *192.168.1.0* goes through the tunnel. Other traffic goes through local gateway.
8. On the FortiGate, go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
9. On the FortiGate, go to *Log & Report > Forward Traffic* and view the details for the SSL entry.

SSL VPN split DNS

SSL VPN clients in tunnel mode can enable the following settings to split DNS traffic:

- Resolve DNS requests for a specific domain, or suffix, using specific DNS servers.
- Resolve all other DNS requests using a DNS server configured in the SSL VPN settings. This DNS server can be the same as the client system DNS server, or another DNS server.

Administrators typically configure SSL VPN clients to use DNS servers that are behind the FortiGate on the internal network. This will require DNS traffic to traverse the SSL VPN tunnel.

Configuring SSL VPN DNS servers to use DNS suffixes

The `dns-suffix` setting under `config vpn ssl settings` is used to specify domains for SSL VPN DNS servers in the tunnel mode configuration. This setting can only be configured in the CLI.

The DNS servers and suffixes configured under `config vpn ssl settings` have a global scope, and apply only to SSL VPN portals that do not have their own DNS server configuration.

To configure DNS servers for all SSL VPN portals:

```
config vpn ssl settings
  set dns-suffix domain1.com
  set dns-server1 10.10.10.10
  set dns-server2 10.10.10.11
end
```

SSL VPN portals configured with their own DNS servers and suffixes under `config vpn ssl web portal` override the settings configured under `config vpn ssl settings`.

To configure DNS servers for a specific SSL VPN portal in split tunnel mode:

```
config vpn ssl web portal
  edit "full-access"
    set dns-suffix domain2.com
    set dns-server1 10.10.10.12
    set dns-server2 10.10.10.13
    set split-tunneling enable
  next
end
```

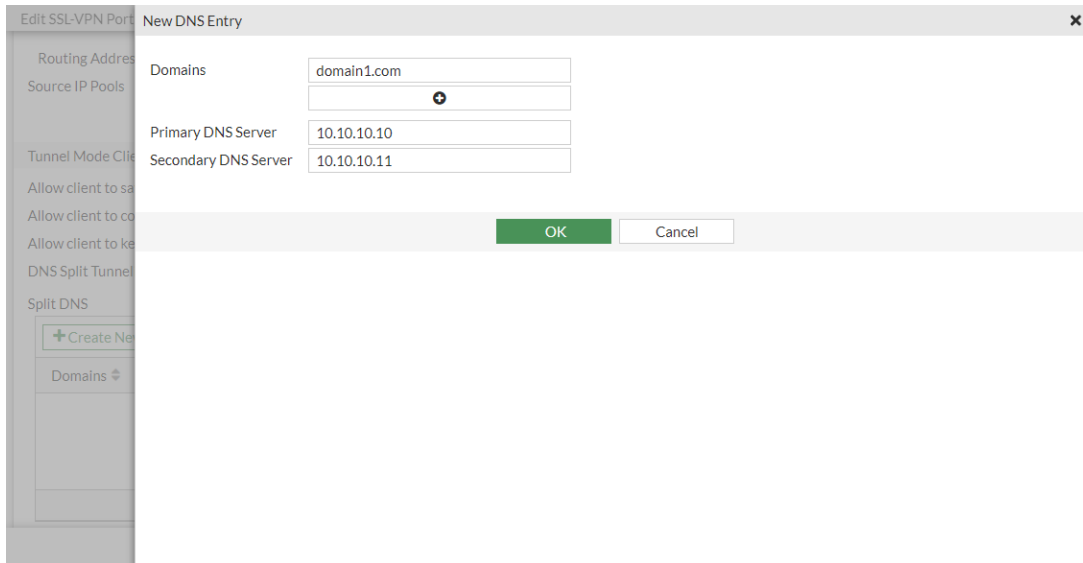

Only DNS requests that match DNS suffixes use the DNS servers configured in the VPN. Due to iOS limitations, the DNS suffixes are not used for searching as in Windows. Using short (non-FQDN) names may not be possible.

Configuring SSL VPN DNS servers for tunnel mode using DNS split tunneling

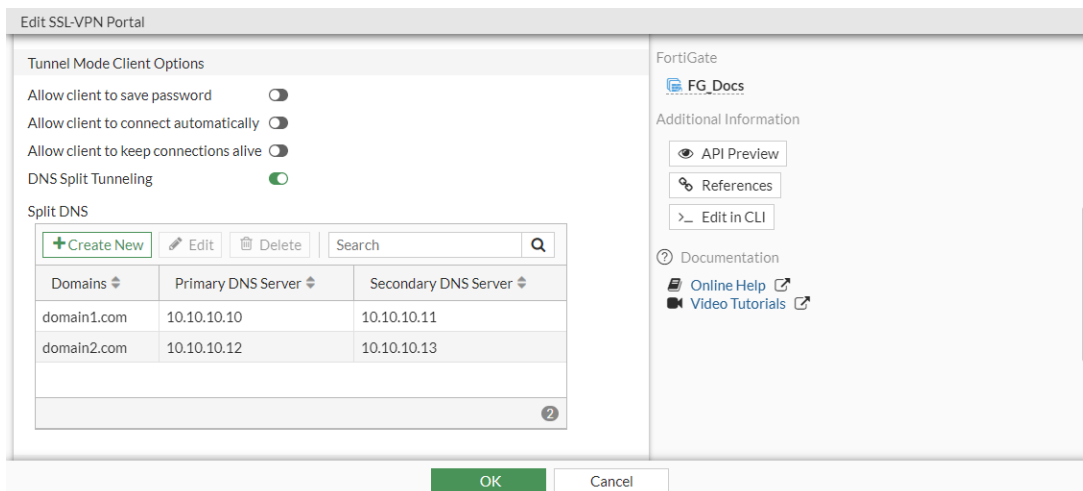

The DNS split tunneling setting can be used to configure domains that apply to a specific SSL VPN portal by specifying primary and secondary DNS servers to be used to resolve specific suffixes. This setting can be configured in the GUI and CLI. In the following example, DNS split tunneling is configured on the default tunnel-access portal with two DNS entries.

To configure DNS split tunneling in the GUI:

1. Go to *VPN > SSL-VPN Portals* and double-click *tunnel-access* to edit the portal.
2. In the *Tunnel Mode Client Options* section, enable *DNS Split Tunneling*.
3. In the *Split DNS* table, click *Create New*. The *New DNS Entry* pane opens.
4. Configure the first DNS entry:
 - a. For *Domains*, enter *domain1.com*.
 - b. Set the *Primary DNS Server* to *10.10.10.10*.
 - c. Set the *Secondary DNS Server* to *10.10.10.11*.

- d. Click **OK**.
5. Configure the second DNS entry:
 - a. Click *Create New*.
 - b. For *Domains*, enter *domain2.com*.
 - c. Set the *Primary DNS Server* to *10.10.10.12*.
 - d. Set the *Secondary DNS Server* to *10.10.10.13*.
 - e. Click **OK**.

6. Click **OK** to save the portal settings.

To configure DNS split tunneling in the CLI:

```
config vpn ssl web portal
  edit "tunnel-access"
    set dns-suffix "domain0.com"
    set dns-server1 10.10.10.8
    set dns-server2 10.10.10.9
    set split-tunneling enable
```

```

config split-dns
  edit 1
    set domains "domain1.com"
    set dns-server1 10.10.10.10
    set dns-server2 10.10.10.11
  next
  edit 2
    set domains "domain2.com"
    set dns-server1 10.10.10.12
    set dns-server2 10.10.10.13
  next
end
next
end

```

Split tunneling settings

SSL VPN clients in tunnel mode can choose between the following settings to split the traffic:

Option	Description
<i>Tunnel mode</i>	<ul style="list-style-type: none"> <i>Disabled</i>: All client traffic will be directed over the SSL-VPN tunnel. <i>Enabled Based on Policy Destination</i>: Only client traffic in which the destination matches the destination of the configured firewall policies will be directed over the SSL-VPN tunnel. <i>Enabled for Trusted Destinations</i>: Only client traffic which does not match explicitly trusted destination will be directed over the SSL-VPN tunnel.

To configure split tunneling in the GUI:

1. Go to *VPN > SSL-VPN Portals*.
2. Click *Create New* or *Edit* an existing portal.
3. Enable *Tunnel Mode* and select one of the *Split tunneling* settings.
4. Select *Routing Address Override* to define the destination network (usually the corporate network) that will be routed through the tunnel.

Leave *Routing Address Override* undefined to use the destination in the respective firewall policies.

5. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
6. Configure other necessary parameters as required.
7. Click *OK*.

To configure split tunneling in the CLI:

```

config vpn ssl web portal
  edit "tunnel-access"
    set tunnel-mode enable

```

```

set split-tunneling {enable | disable}
set split-tunneling-routing-negate {enable | disable}
set split-tunneling-routing-address <name1> <name2> ...
set ip-pools <name1> <name2> ...
next
end

```

The command `split-tunneling-routing-negate` is only available on the CLI after `split-tunneling` is enabled.

`split-tunneling-routing-negate` is disabled by default and corresponds to the *Enabled Based on Policy Destination* option on the GUI.

`split-tunneling-routing-negate enable` corresponds to the *Enabled for Trusted Destinations* option on the GUI.

Augmenting VPN security with ZTNA tags

FortiGate's integration of ZTNA tags into the VPN infrastructure offers a powerful solution to enhance VPN security. ZTNA tags are a feature exclusively offered with the licensed FortiClient versions (FortiClient EMS). ZTNA tags are objects that are assigned to the FortiClient endpoints in real-time. ZTNA tags are used in the firewall policies on the FortiGate to allow or deny access to the VPN and network resources based on the organization's security compliance regulations. These compliance regulations are enforced in real-time, thereby safeguarding the organization against constantly evolving security threats.

The following table compares features of the free VPN-only standalone FortiClient versus a licensed FortiClient managed by EMS for security compliance.

Feature	Free VPN-only standalone FortiClient	Licensed FortiClient
Basic VPN connection	Yes	Yes
Managed remote access profiles	No	Yes
Compliance using ZTNA tags: <ul style="list-style-type: none"> Allow or block VPN connections based on ZTNA security posture Per-firewall policy security posture checks using ZTNA tags 	No	Yes

For more detailed information, see [Feature comparison of FortiClient standalone and licensed versions](#) in the FortiClient Administration Guide.

This topic contains the following sections:

- [ZTNA tags on page 1746](#)
- [Security Fabric configuration on page 1746](#)
- [Creating ZTNA tags and ZTNA rules in FortiClient EMS](#)
- [Connecting FortiClient to FortiClient EMS using telemetry on page 1749](#)
- [Monitoring ZTNA tags on the FortiGate on page 1750](#)
- [Monitoring ZTNA tags in FortiClient and FortiClient EMS on page 1751](#)

- [Example: using ZTNA tags to augment VPN security on page 1752](#)
 - [Scenario 1: using ZTNA tags to restrict access to FortiClient endpoints connecting to the VPN on page 1753](#)
 - [Scenario 2: using ZTNA tags in firewall policies for role-based network access control on page 1755](#)

ZTNA tags

ZTNA tags (formerly FortiClient EMS tags in FortiOS 6.4 and earlier) are tags synchronized from FortiClient EMS as dynamic address objects on the FortiGate. FortiClient EMS uses zero-trust tagging rules to automatically tag managed endpoints based on various attributes detected by the FortiClient. When the FortiGate establishes a connection with the FortiClient EMS server through the EMS Fabric connector, it pulls zero-trust tags containing device IP and MAC addresses and converts them to read-only dynamic address objects. It also establishes a persistent WebSocket connection to monitor for changes in zero-trust tags, which keeps the device information current. These zero-trust tags can then be used in SSL VPN firewall rules to perform security posture checks to restrict or allow access to network resources, enabling role-based access control.

Security Fabric configuration

The FortiGate needs to be connected to FortiClient EMS in order to retrieve the ZTNA tags so they can be used in firewall policies. This is done by configuring a FortiClient EMS Security Fabric connector on the FortiGate to connect to FortiClient EMS. See [Configuring FortiClient EMS on page 2391](#) for more information.

Creating ZTNA tags and ZTNA rules in FortiClient EMS

You can create, edit, and delete zero-trust tagging rules for endpoints. You can also view and manage the tags used to dynamically group endpoints.

The following process occurs when using zero-trust tagging rules with EMS and FortiClient:

1. EMS sends zero-trust tagging rules to endpoints through telemetry communication.
2. FortiClient checks endpoints using the provided rules and sends the results to EMS.
3. EMS receives the results from FortiClient.
4. EMS dynamically groups endpoints together using the tag configured for each rule. The dynamic endpoint groups can be viewed on the *Zero Trust Tags > Zero Trust Tag Monitor* page. See [Zero Trust Tag Monitor](#) in the FortiClient EMS Administration Guide for more information.

In this topic, two zero-trust tagging rule sets are created:

ZTNA tag	ZTNA tagging rule
AD-Joined	Apply if a remote user has OS version Windows 8.1 or Windows 10 and is a part of the AD group, FORTI-ARBUTUS.LOCAL/IT/IT.
Vulnerable	Apply if critical vulnerabilities are detected on a remote user.

These tags will be applied in two scenario examples (see [Scenario 1](#) and [Scenario 2](#)). For more information about zero-trust tagging rule settings, see [Adding a Zero Trust tagging rule set](#) and [Zero Trust tagging rule types](#) in the FortiClient EMS Administration Guide.

To create a zero-trust tagging rule set in FortiClient EMS:

1. Go to *Zero Trust Tags > Zero Trust Tagging Rules*, and click *Add*.
2. Create the AD-Joined tagging rule set:

- a. In the *Name* field, enter *AD-Joined*.
- b. In the *Tag Endpoint As* dropdown list, enter *AD-Joined* and press **Enter**.

EMS uses this tag to dynamically group together endpoints that satisfy the rule, as well as any other rules that are configured to use this tag.
- c. Toggle *Enabled* on to enable the rule.
- d. Configure the user in AD group rule:
 - i. Click *Add Rule*.
 - ii. Set *OS* to *Windows*.
 - iii. Set the *Rule Type* to *User in AD Group*.
 - iv. Set the *AD Group* to *FORTI-ARBUTUS.LOCAL/IT/IT*.
 - v. Click *Save*.
- e. Configure the OS rule:
 - i. Click *Add Rule*.
 - ii. Set *OS* to *Windows*.
 - iii. Set the *Rule Type* to *OS Version* and select *Windows 8.1*.
 - iv. Click the **+** button and select *Windows 10*.
 - v. Click *Save*.
- f. By default, an endpoint must satisfy all configured rules to be eligible for the rule set. You may want to apply the tag to endpoints that satisfy some, but not all, of the configured rules. In this example, you need to modify the rule set logic to apply the same tag to endpoints that fulfill one of the following criteria:
 - Running Windows 8.1 or 10
 - Is part of an AD group called FORTI-ARBUTUS.LOCAL/IT/IT

With the default rule set logic, an endpoint would be eligible for the rule set if it is running Windows 8.1 or 10 and is part of an AD group called IT. To modify the rule set logic, do the following:

 - i. Click *Edit Logic*.
 - ii. Clicking *Edit Logic* assigns numerical values to each configured rule. You can use *and* and *or* to define the rule logic. You cannot use *not* when defining the rule logic. You can also use parentheses to group rules.

In the *Rule Logic* field, enter *1 and (2 or 3)* to indicate that endpoints that satisfy that they are part of the AD

IT group (rule 1) and Windows 8.1 (rule 2) or Windows 10 (rule 3) satisfy the rule set.

Zero Trust Tagging Rule Set

Name

Tag Endpoint As

Enabled

Comments

Type	Value
Windows (2)	
User in AD Group <input type="text" value="EMS"/>	1 FORTI-ARBUTUS.LOCAL/IT/IT
OS Version	2 Windows 8.1
	3 Windows 10

Rule Logic

- g. Click *Save*.
3. Create the Vulnerable tagging rule set:
 - a. Click *Add*.
 - b. In the *Name* field, enter *Vulnerable*.
 - c. In the *Tag Endpoint As* dropdown list, enter *Vulnerable* and press *Enter*.
 - d. Toggle *Enabled* on to enable the rule.
 - e. Configure the vulnerable devices rule:
 - i. Click *Add Rule*.
 - ii. Set *OS* to *Windows*.
 - iii. Set the *Rule Type* to *Vulnerable Devices*.
 - iv. Set the *Security Level* to *Critical*.
 - v. Click *Save*.

Zero Trust Tagging Rule Set

Type	Value
Vulnerable Devices Severity Level	Critical

f. Click Save.

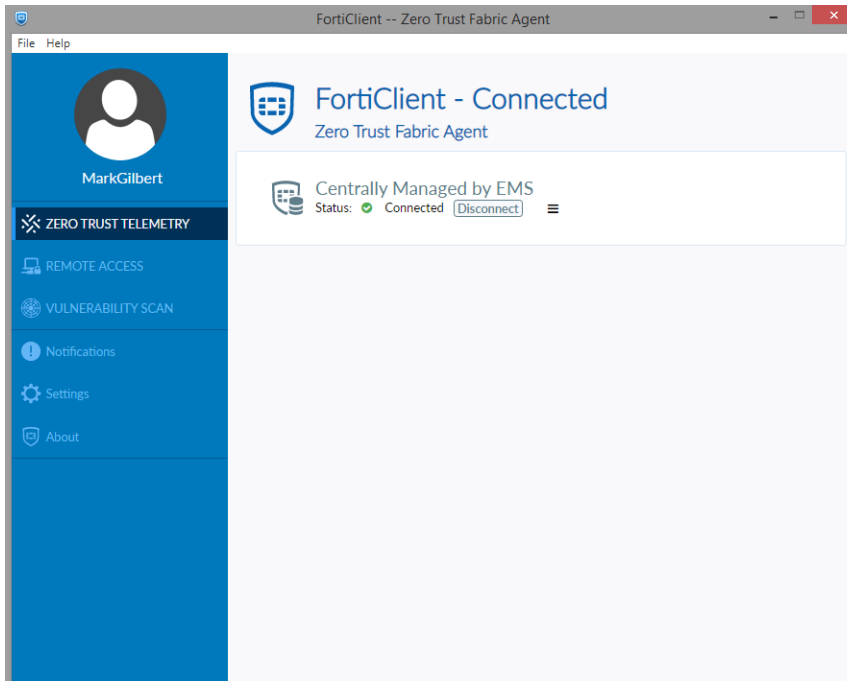

For more information about editing, deleting, and importing ZTNA rules, see [Zero Trust Tagging Rules](#) in the FortiClient EMS Administration Guide.

Connecting FortiClient to FortiClient EMS using telemetry

After FortiClient software installation is complete on an endpoint, you can connect FortiClient to FortiClient EMS. Depending on the way the FortiClient installation is performed, you can either manually or automatically connect to FortiClient EMS, see [Connecting FortiClient Telemetry after installation](#) in the FortiClient Administration Guide for more details.

Once FortiClient connects to the FortiClient EMS, the *Status* shows up as *Connected* in the *Zero Trust Telemetry* tab.

After FortiClient telemetry connects to EMS, FortiClient endpoints receive the ZTNA tags if they satisfy any of the required ZTNA rules configured on the FortiClient EMS.

Monitoring ZTNA tags on the FortiGate

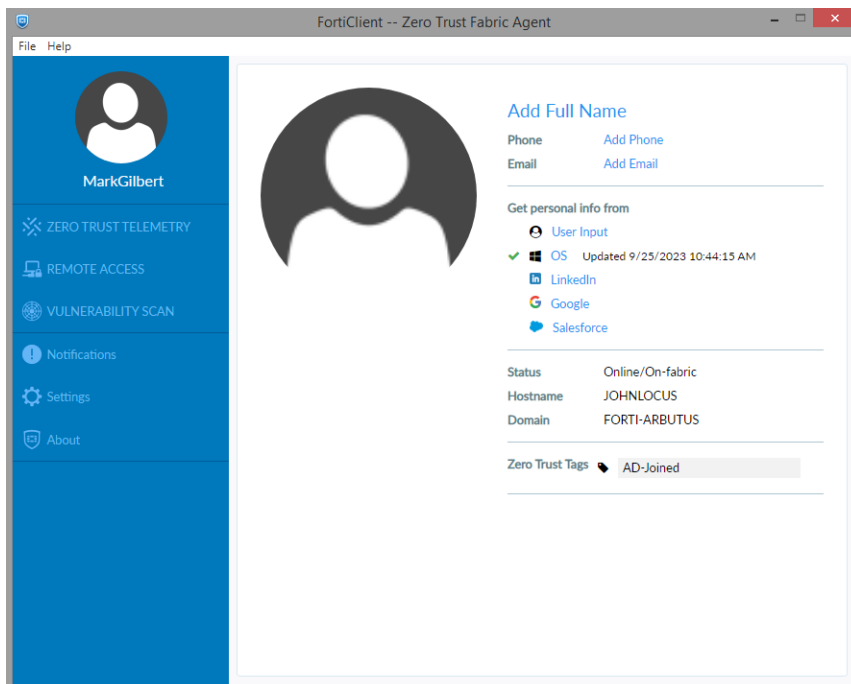

After the FortiGate is connected and authorized to and by FortiClient EMS, the ZTNA tags that were created in the zero-trust tagging rules are retrieved by the FortiGate. To view the tags on the FortiGate, go to *Policy & Objects > ZTNA* and select the *ZTNA Tags* tab.

ZTNA Servers		ZTNA Tags						
+ Create New Group		Edit	Delete	Search				
Name	Provided By	Details	Type	Category	Detection Level	Comments	Ref.	
ZTNA IP	AD-Joined	EMS	ZTNA IP Tag	Zero Trust			0	
ZTNA IP	Vulnerable	EMS	ZTNA IP Tag	Zero Trust			0	
ZTNA IP	all_registered_clients	EMS	ZTNA IP Tag	Zero Trust			0	
LOCAL TAG	EMS_ALL_UNKNOWN_CLI...		ZTNA IP Tag				0	
LOCAL TAG	EMS_ALL_UNMANAGEABLE...		ZTNA IP Tag				0	
LOCAL TAG	FCTEMS_ALL_FORTICLOUD...		ZTNA IP Tag				0	
ZTNA MAC	AD-Joined	EMS	ZTNA MAC Tag	Zero Trust			0	
ZTNA MAC	Vulnerable	EMS	ZTNA MAC Tag	Zero Trust			0	
ZTNA MAC	all_registered_clients	EMS	ZTNA MAC Tag	Zero Trust			0	

If the tags are not visible on the FortiGate, ensure that the FortiClient EMS is configured to share tagging information with the FortiGate. See [Configuring EMS to share tagging information with multiple FortiGates](#) in the FortiClient EMS Administration Guide for more details.

Monitoring ZTNA tags in FortiClient and FortiClient EMS

To view the ZTNA tags assigned to the FortiClient endpoints by FortiClient EMS, click the user avatar and locate the *Zero Trust Tags* section. The following FortiClient endpoint is assigned the *AD-Joined* tag.

Ensure that the *Show Zero Trust Tag on FortiClient GUI* is enabled on FortiClient EMS (*Endpoint Profiles > System Settings* in the profile's *Advanced* view) so the tags are visible in FortiClient. See [System Settings](#) in the FortiClient EMS Administration Guide for more details.

ZTNA tags can also be monitored on FortiClient EMS from the endpoint's details in the *Endpoints* pane.

To view ZTNA tag information in the endpoint details:

1. Go to *Endpoints*, and select *All Endpoints*, a domain, or workgroup. The list of endpoints for the selected domain or workgroup displays.
2. Click an endpoint to display details about it in the content pane.
3. In the *Summary* pane, you can see the *Zero Trust Tags* associated with the endpoint. For example, this user has the *AD-Joined* and *all_registered_clients* tags.

Example: using ZTNA tags to augment VPN security

ZTNA tags can be used to augment VPN security using the following methods:

- Restrict an endpoint to connect to the VPN tunnel based on the ZTNA tag (see [Scenario 1](#)).
- Control access to network resources by allowing or denying traffic passing through the FortiGate using the *IP/MAC Based Access Control* field in the firewall policy (also known as *ZTNA IP MAC based access control*, see [Scenario 2](#)).

Both methods are demonstrated in the following example.

In this example, Off-net-Client is the FortiClient endpoint connected to and managed by FortiClient EMS. The telemetry traffic passes through the FortiGate using a virtual IP. The two [ZTNA rule tagging sets](#) configured previously (AD-Joined and Vulnerable) are applied.

Enterprise Core is the FortiGate that acts as the SSL VPN server. To configure SSL VPN, refer to [SSL VPN on page 1718](#) and [SSL VPN security best practices on page 1721](#). Critical Assets are network resources that the off-net user tries to access after connecting to the VPN. SSL VPN is used in this example, but a similar configuration also applies to dialup IPsec VPN where the FortiGate acts as a dialup server.

Scenario 1: using ZTNA tags to restrict access to FortiClient endpoints connecting to the VPN

FortiClient endpoint profiles can be configured to allow or block an endpoint from connecting to a VPN tunnel based on its applied zero-trust tag. This feature is only available for Windows endpoints.

In this scenario, the endpoint profile is configured to prohibit the Off-net-Client (with a Windows OS) from connecting to the VPN if the endpoint has a Vulnerable ZTNA tag. The Vulnerable tag was configured previously (see [Creating ZTNA tags and ZTNA rules in FortiClient EMS](#)).

To configure the remote access profile in FortiClient EMS:

1. Go to *Endpoint Profiles > Remote Access*, and edit an existing profile or add a new one.
2. In the *General* section, enable *Enable Secure Remote Access*.
3. In the *VPN Tunnels* section, edit an existing VPN tunnel or add a new one.
4. Configure the following under *Advanced Settings*:
 - a. For the *Tag* field, select *Prohibit* from the first dropdown.
 - b. Select the *Vulnerable* tag from the second dropdown.
 - c. Enable *Customize Host Check Fail Warning*.
 - d. Enter a message to display to users when their connection to the VPN tunnel is prohibited due to critical vulnerabilities on their device.
 - e. Configure the other VPN tunnel settings as needed.

Editing VPN Tunnel: VPN

Changes to this VPN tunnel will not be saved until the profile is saved.

 Vulnerability Detected. Terminating VPN.

The following features need to also be configured on FortiGate to be enabled.

Show "Remember Password" Option
 Show "Always Up" Option
 Show "Auto Connect" Option

Save Cancel

f. Click **Save**.

5. Configure the other remote access profile settings as needed.

6. Click **Save**.

After the next communication between FortiClient EMS and FortiClient, endpoints with this profile applied are unable to connect to this VPN tunnel if they have critical vulnerabilities.

To verify the configuration using a vulnerable endpoint:

1. On the Off-net-Client endpoint, open FortiClient.

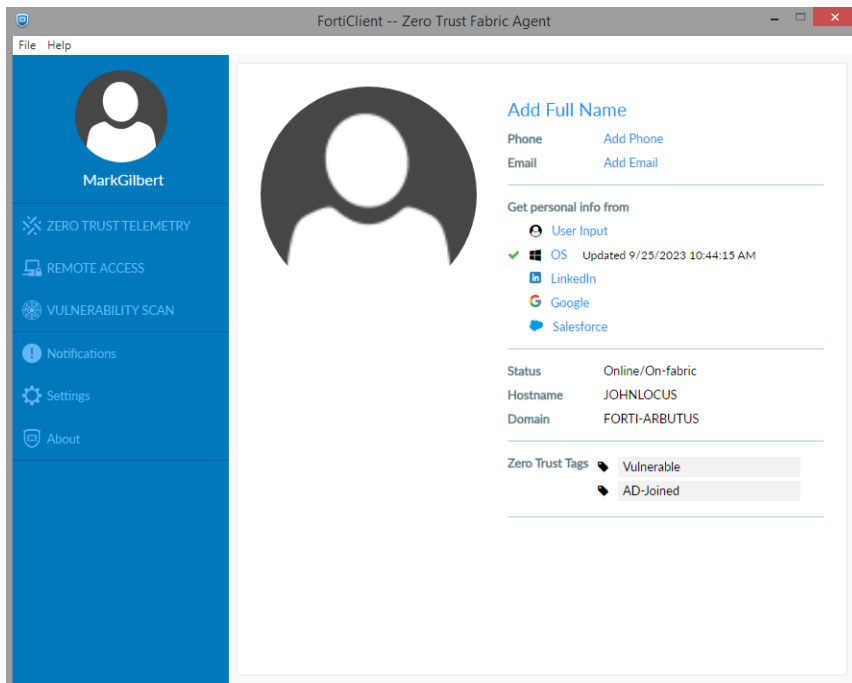

2. Click *Vulnerability Scan*, then click *Scan Now* to initiate a manual scan.

Vulnerability scans can also be scheduled. See [Vulnerability Scan](#) in the FortiClient EMS Administration Guide for more details.

3. Wait a few minutes for the scan to complete.

4. Click the user avatar and locate the *Zero Trust Tags* section.

FortiClient discovered the vulnerability and added a *Vulnerable* ZTNA tag in addition to the existing *AD-Joined* tag.

5. Click *Remote Access* to try to connect to the VPN:

- a. Enter the *Username* and *Password*.
- b. Click *Connect*.

Based on the remote access profile configuration, the endpoint's access is denied due to the assigned *Vulnerable* ZTNA tag. The message configured in the remote access profile appears as a notification above the FortiTray icon (in the Windows system tray).

See [FortiTray](#) in the FortiClient Administration Guide for more details about this icon.

Scenario 2: using ZTNA tags in firewall policies for role-based network access control

ZTNA tags are used in firewall policies to control access to network resources with the *IP/MAC Based Access Control* field.

In this scenario, if the Off-net Client is tagged with a *Vulnerable* tag, then it is not allowed to access Finance Server 1 (10.100.77.200). If the Off-net Client is tagged with an *AD-Joined* tag and no *Vulnerable* tag, then it is allowed to access Finance Server 1. Two firewall policies are configured as follows.

- Deny Vulnerable Endpoints: use IP/MAC based access control with the *Vulnerable* ZTNA IP tag to deny access.
- SSL VPN to DMZ: use IP/MAC based access control with the *AD-Joined* ZTNA IP tag to allow access.

These policies use a source address and group that have already be configured for SSL VPN users and authentication. See [User groups on page 1910](#) for more information.

To configure the Deny Vulnerable Endpoints policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following settings:

Name	<i>Deny Vulnerable Endpoints</i>
Incoming Interface	<i>ssl.root</i>
Outgoing Interface	<i>port2</i>
Source	<i>SSLVPN_TUNNEL_ADDR1, AD-Joined VPN Users</i>
IP/MAC Based Access Control	<i>Vulnerable</i>
Destination	<i>DMZ Subnet</i>
Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>DENY</i>
Log Violation Traffic	Enable this setting.
Enable this policy	Enable this setting.

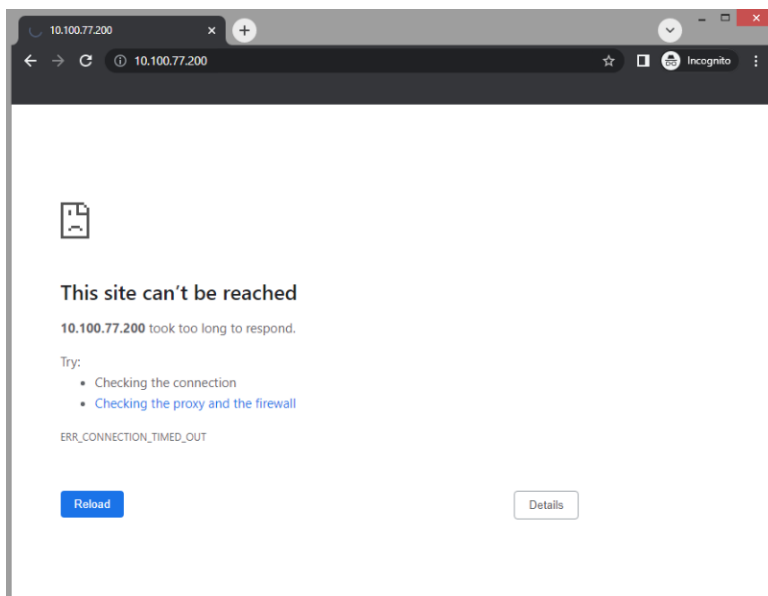

3. Click OK.

To verify the configuration using an off-net client with a Vulnerable tag:

This verification assumes that a vulnerability scan was performed, the endpoint has a critical vulnerability, and the Vulnerable zero-trust tag was added.

- On the endpoint, open FortiClient and click *Remote Access* to connect to the VPN:
 - Enter the *Username* and *Password*.
 - Click *Connect*.
- Once the FortiClient endpoint is connected to the VPN, try to access Finance Server 1 using the web server. The connection times out because the traffic is denied by the firewall policy.

3. Verify the forward traffic log:

- a. In the GUI, go to *Log & Report > Forward Traffic*.
- b. In the CLI, enter the following:

```
# execute log filter category 0
# execute log filter field policyname "Deny Vulnerable Endpoints"
# execute log display

date=2023-10-24 time=17:04:19 eventtime=1698192258985043569 tz="-0700"
logid="0000000013" type="traffic" subtype="forward" level="notice" vd="root"

```

To configure the SSL VPN to DMZ policy:

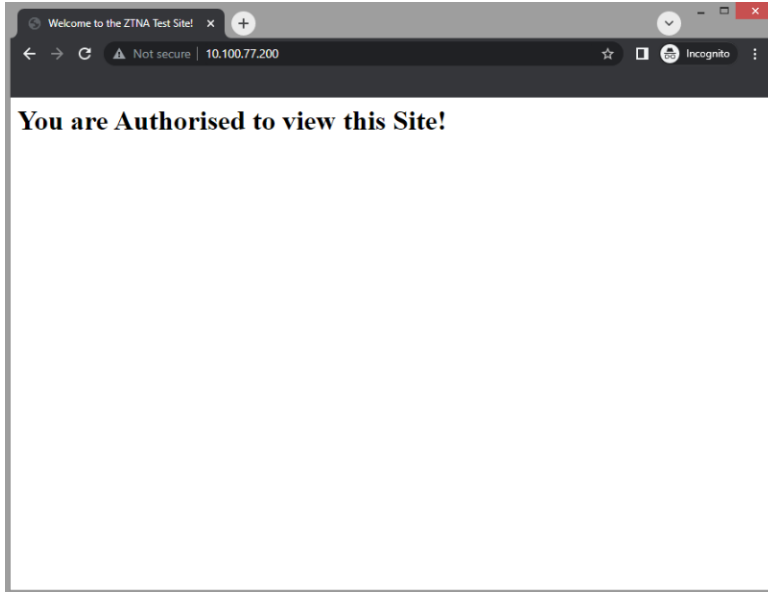

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following settings:

<i>Name</i>	<i>SSL VPN to DMZ</i>
<i>Incoming Interface</i>	<i>ssl.root</i>
<i>Outgoing Interface</i>	<i>port2</i>
<i>Source</i>	<i>SSLVPN_TUNNEL_ADDR1, AD-Joined VPN Users</i>
<i>IP/MAC Based Access Control</i>	<i>AD-Joined</i>
<i>Destination</i>	<i>DMZ Subnet</i>
<i>Schedule</i>	<i>always</i>
<i>Service</i>	<i>ALL</i>
<i>Action</i>	<i>ACCEPT</i>
<i>Log Allowed Traffic</i>	<i>Enable this setting and select All Sessions.</i>
<i>Enable this policy</i>	<i>Enable this setting.</i>

3. Configure the other settings as needed.
4. Click *OK*.

To verify the configuration using an off-net client with an AD-Joined tag:

1. On the endpoint, open FortiClient, click *Remote Access* to connect to the VPN:
 - a. Enter the *Username* and *Password*.
 - b. Click *Connect*.
2. Once the FortiClient endpoint is connected to the VPN, try to access Finance Server 1 using the web server. The traffic is allowed by the firewall policy, and the server is accessible.

3. Verify the forward traffic log:
 - a. In the GUI, go to *Log & Report > Forward Traffic*.
 - b. In the CLI, enter the following:

```
# execute log filter category 0
# execute log filter field policyname "SSL VPN to DMZ"
# execute log display

Enhancing VPN security using EMS SN verification

The EMS serial number (SN) verification feature restricts establishing a VPN connection to the FortiGate to only licensed FortiClient endpoints. The EMS SN verification is performed by the FortiGate and the feature requires that the FortiGate and FortiClient endpoints both must be connected to the same FortiClient EMS.

EMS SN verification is performed when a FortiClient user attempts to establish a VPN connection to FortiGate. During the VPN establishment process:

- FortiClient sends the SN of the FortiClient EMS that manages it to the FortiGate.
- The FortiGate performs a check to confirm whether the EMS SN sent by the FortiClient corresponds to same FortiClient EMS to which the FortiGate itself is connected to.
- The FortiGate allows the user to connect to the VPN only if the EMS SN match.

This feature prevents the free VPN-only standalone FortiClient users from connecting to VPN, thus enhancing VPN security. This setting can only be enabled from the CLI.

To enable the EMS SN verification in the CLI:

```
config system global
    set sslvpn-ems-sn-check {enable | disable}
end
```

Command	Description
set sslvpn-ems-sn-check {enable disable}	Enable or disable verification of the EMS serial number in the SSL-VPN connection.

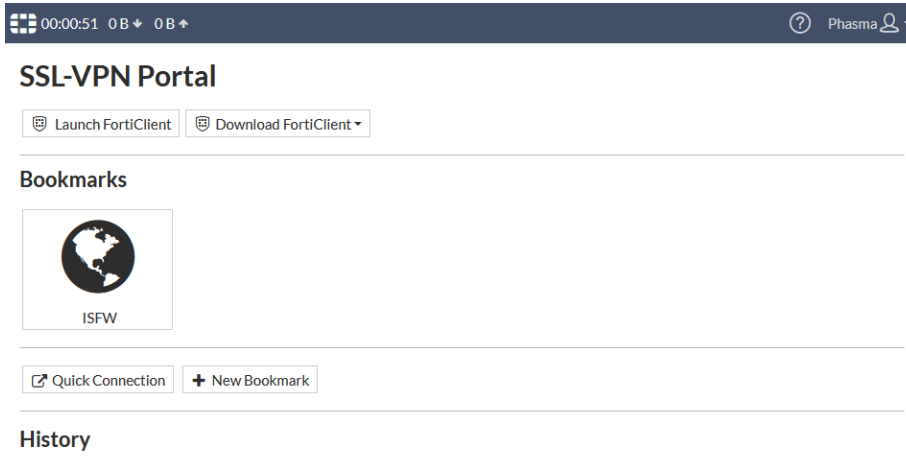

SSL VPN web mode

A user must have valid username and password credentials to log in to an SSL VPN web portal in addition to other multi-factor authentication components that may be configured, such as FortiTokens.

Web-only mode provides clientless network access using a web browser with built-in SSL encryption. Use this mode if you require:

- A clientless solution where all remote services are accessed through a web portal
- Tight control over the contents of the web portal
- Limited services provided to the remote users

After logging in, the web portal page appears:

A web portal includes the following features:

- The session information is displayed in the left corner of the top banner. This includes the elapsed time since logging in, and the volume of inbound and outbound HTTP and HTTPS traffic.
- The *Launch FortiClient* button appears if FortiClient is installed. Clicking the button opens the FortiClient *Remote Access* tab, but FortiClient does not automatically create a VPN connection based on the web mode connection information.
- The *Download FortiClient* button provides access to download the FortiClient application for various operating systems.

- The *Bookmarks* widget includes links to network resources (administrator-defined bookmarks), and users can create their own bookmarks.
- The *Quick Connection* button enables a connection to network resources without using or creating a bookmark.

The following topics provide information about SSL VPN web mode:

- [Web portal configurations on page 1760](#)
- [Quick Connection tool on page 1763](#)
- [SSL VPN bookmarks on page 1764](#)
- [SSL VPN web mode for remote user on page 1767](#)
- [Customizing the RDP display size on page 1770](#)

Web portal configurations

An SSL VPN web portal enables users to access network resources through a secure channel using a web browser. System administrators can configure log in privileges for users and which network resources are available to these users. The portal configuration determines what the user sees when they log in to the portal. Both system administrators and the users have the ability to customize the SSL VPN portal.

There are three predefined default web portal configurations available:

- **full-access:** connecting clients can either access protected resources through the SSL VPN web portal, or use FortiClient to connect through tunnel mode.
- **tunnel-access:** connecting clients can only access protected resources with FortiClient connecting through tunnel mode.
- **web-access:** connecting clients can only access protected resources through the SSL VPN web portal.

Custom web portals can also be configured.

To configure a custom web portal:

1. Go to *VPN > SSL-VPN Portals* and click *Create New*.
2. Configure the following settings as needed:

GUI option	Description
<i>Name</i>	Enter the portal name.
<i>Limit Users to One SSL-VPN Connection at a Time</i>	This option is disabled by default. When enabled, once a user logs in to the portal, they cannot go to another system and log in with the same credentials again.
<i>Tunnel Mode</i>	
<i>Split tunneling</i>	<p>There are three options:</p> <ul style="list-style-type: none"> • <i>Disabled:</i> all client traffic will be directed over the SSL VPN tunnel. • <i>Enabled Based on Policy Destination:</i> only client traffic where the destination matches the destination of the configured firewall policies will be directed over the SSL VPN tunnel. • <i>Enabled for Trusted Destinations:</i> only client traffic

GUI option	Description
	that does not match explicitly trusted destinations will be directed over the SSL VPN tunnel.
<i>Routing Address Override</i>	<p>When <i>Split tunneling</i> is set to <i>Enabled Based on Policy Destination</i>, the IPv4 firewall address selected overrides the firewall policy destination addresses to control split tunnel access.</p> <p>When <i>Split tunneling</i> is set to <i>Enabled for Trusted Destinations</i>, the IPv4 firewall address selected becomes a trusted destination that will not be tunneled through SSL VPN. All other destinations will be tunneled through SSL VPN.</p>
<i>Source IP Pools</i>	Select an IP pool for users to acquire an IP address when connecting to the portal.
<i>IPv6 Tunnel Mode</i>	When enabled, these settings determine how tunnel mode clients are assigned IPv6 addresses.
<i>IPv6 split tunneling</i>	The same three options are available as in <i>Tunnel Mode</i> .
<i>IPv6 Routing Address Override</i>	<p>When <i>Split tunneling</i> is set to <i>Enabled Based on Policy Destination</i>, the IPv6 firewall address selected overrides the firewall policy destination addresses to control split tunnel access.</p> <p>When <i>Split tunneling</i> is set to <i>Enabled for Trusted Destinations</i>, the IPv6 firewall address selected becomes a trusted destination that will not be tunneled through SSL VPN. All other destinations will be tunneled through SSL VPN.</p>
<i>Source IPv6 Pools</i>	Select an IP pool for users to acquire an IP address when connecting to the portal.
<i>Tunnel Mode Client Options</i>	The following options affect how FortiClient behaves when connected to the VPN tunnel.
<i>Allow client to save password</i>	When enabled and if the user selects this option, their password is stored on their computer and will automatically populate each time they connect to the VPN.
<i>Allow client to connect automatically</i>	When enabled and if the user selects this option, when FortiClient launches (such as after a reboot or system start up), FortiClient will automatically attempt to connect to the VPN.

GUI option	Description
<i>Allow client to keep connections alive</i>	When enabled and if the user selects this option, FortiClient will try to reconnect once it detects that the VPN connection is unexpectedly down (not manually disconnected by the user).
<i>DNS Split Tunneling</i>	When enabled, the <i>Split DNS</i> table is visible, where new DNS entries can be created. See SSL VPN split DNS on page 1741 for more details.
<i>Host Check</i>	When enabled, the type of host checking performed on endpoints can be configured (see Configuring OS and host check on page 1867).
<i>Type</i>	There are three options: <ul style="list-style-type: none"> • <i>Realtime AntiVirus</i>: check for antivirus software recognized by the Windows Security Center. • <i>Firewall</i>: check for firewall software recognized by the Windows Security Center. • <i>Enable both</i>: check for antivirus and firewall software recognized by the Windows Security Center.
<i>Restrict to Specific OS Versions</i>	When enabled, access to certain operating systems can be denied or forced to check for an update. By default, all operating systems in the table are allowed (see Configuring OS and host check on page 1867).
<i>Web Mode</i>	Enable this option to configure the web portal settings.
<i>Portal Message</i>	Enter a message that appears at the top of the web portal screen (default = <i>SSL-VPN Portal</i>).
<i>Theme</i>	Select a color theme from the dropdown.
<i>Show Session Information</i>	Enable to display session information in the top banner of the web portal (username, amount of time logged in, and traffic statistics).
<i>Show Connection Launcher</i>	Enable to display the <i>Quick Connection</i> button.
<i>Show Login History</i>	Enable to display the user's login history (<i>History</i>).
<i>User Bookmarks</i>	Enable to allow users to add their own bookmarks (<i>New Bookmark</i>).
<i>Rewrite Content IP/UI/</i>	Enable contents rewrite for URIs containing IP-address/ui/.
<i>RDP/VNC clipboard</i>	Enable to support RDP/VPC clipboard functionality.

GUI option	Description
<i>Predefined Bookmarks</i>	Use the table to create and edit predefined bookmarks. See To create a predefined administrator bookmark in FortiOS: on page 1766 for more details.
<i>FortiClient Download</i>	Enable this option to display the <i>Download FortiClient</i> button.
<i>Download Method</i>	Select either <i>Direct</i> or <i>SSL-VPN Proxy</i> as the method to download FortiClient.
<i>Customize Download Location</i>	Enable to configure a custom download location for <i>Windows</i> or <i>Mac</i> .

3. Click *OK*.

Quick Connection tool

The Quick Connection tool allows a user to connect to a resource when it is not a predefined bookmark. The tool allows the user to specify the type of server and the URL or IP address of the host.

To connect to a resource:

1. Select the connection type.
2. Enter the required information, such as the IP address or URL of the host.
3. Click *Launch*.

In a VNC session, to send Ctrl+Alt+Del, press *F8* then select *Send Ctrl-Alt-Delete*.

RDP sessions

Some Windows servers require that a specific security be set for RDP sessions, as opposed to the standard RDP encryption security. For example, Windows 10 requires that TLS be used.

You can specify a location option if the remote computer does not use the same keyboard layout as your computer by appending it to the *Host* field using the following format: <IP address> -m <locale>

The available options are:

ar	Arabic	fr-be	Belgian French	no	Norwegian
da	Danish	fr-ca	Canadian French	pl	Polish
de	German	fr-ch	Swiss French	pt	Portuguese
de-ch	Swiss German	hr	Croatian	pt-br	Brazilian Portuguese
en-gb	British English	hu	Hungarian	ru	Russian
en-uk	UK English	it	Italian	sl	Slovenian
en-us	US English	ja	Japanese	sv	Sudanese
es	Spanish	lt	Lithuanian	tk	Turkmen
fi	Finnish	lv	Latvian	tr	Turkish
fr	French	mk	Macedonian		

SSL VPN bookmarks

The *Bookmarks* widget displays bookmarks configured by administrators and users. Administrator bookmarks cannot be edited, and they are configured in FortiOS. Users can add, edit, and delete their own bookmarks within the web portal.

The FortiGate forwards client requests to servers on the internet or internal network. To use the web portal applications, add the URL, IP address, or name of the server application to the *Bookmarks* list. Once a bookmark is created, click the bookmark icon to initiate a session.

2022/08/12 13:30:42	192.168.2.1	5 minute(s) and 10 second(s)

To access a destination without adding a bookmark to the *Your Bookmarks* list, use the Quick Connection tool. See [Quick Connection tool on page 1763](#) for more details.

Configuring bookmarks

The following table summarizes which options can be configured based on the bookmark type in the SSL VPN web portal:

Setting	HTTP/ HTTPS	FTP	SMB	SFTP	RDP	VNC	SSH	Telnet
<i>URL</i>	✓							
<i>Folder</i>		✓	✓	✓				
<i>Host</i>					✓	✓	✓	✓
<i>Domain</i>			✓					
<i>Port</i>					✓	✓		
<i>Description</i>	✓	✓	✓	✓	✓	✓	✓	✓
<i>Password</i>						✓		
<i>SSO Credentials</i>	✓	✓	✓	✓				
<i>SSL-VPN Login</i>	✓	✓	✓	✓				
<i>SSO Form Data</i>	✓							
<i>Form Key</i>	✓							
<i>Form Value</i>	✓							
<i>Alternative</i>	✓	✓	✓	✓				
<i>Username</i>	✓	✓	✓	✓				
<i>Password</i>	✓	✓	✓	✓				
<i>Use SSL-VPN Credentials</i>					✓			
<i>Username</i>					✓			
<i>Password</i>					✓			
<i>Color Depth Per Pixel*</i>					✓			
<i>Screen Width*</i>					✓			
<i>Screen Height*</i>					✓			
<i>Keyboard Layout</i>					✓			
<i>Security</i>					✓			

Setting	HTTP/ HTTPS	FTP	SMB	SFTP	RDP	VNC	SSH	Telnet
<i>Preconnection ID</i>					✓			
<i>Preconnection Blob</i>					✓			
<i>Load Balancing Information</i>					✓			
<i>Restricted Admin Mode</i>					✓			

*= This setting can only be configured by an administrator.

To create a user bookmark in the web portal:

1. In the *Your Bookmarks* section, click *New Bookmark*.
2. Enter a *Name*.
3. Select a bookmark type and configure the type-based settings.
4. Click *Save*.

To create a predefined administrator bookmark in FortiOS:

1. Go to *VPN > SSL-VPN Portals* and double-click a portal to edit it.
2. In the *Predefined Bookmarks* table, click *Create New*. The *New Bookmark* pane appears.
3. Enter a *Name*.
4. Select a bookmark type and configure the type-based settings.
5. Click *OK* to save the bookmark settings.
6. Click *OK* to save the portal settings.

Configuring group-based SSL VPN bookmarks

Administrators can add bookmarks for users in the same user group. SSL VPN will only output the matched group name entry to the client. This setting can only be configured in the CLI.

To add bookmarks for users in the same user group:

1. Enable group bookmarks in the web portal settings:

```
config vpn ssl web portal
  edit <name>
    set user-group-bookmark enable
  next
end
```

2. Configure the user group bookmark:

```
config vpn ssl web user-group-bookmark
  edit <name>
    config bookmarks
      edit <name>
        ...
      next
    end
```

next
end

SSL VPN web mode for remote user

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by web mode using a web browser.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

For FortiOS 7.0.1 to 7.0.12, SSL VPN web mode, explicit web proxy, and interface mode IPsec VPN features will not work with the following configuration:

1. An IP pool with ARP reply enabled is configured.
2. This IP pool is configured as the source IP address in a firewall policy for SSL VPN web mode, in a proxy policy for explicit web proxy, or as the local gateway in the Phase 1 settings for an interface mode IPsec VPN.
3. A matching blackhole route is configured for IP pool reply traffic.

Configuring an IP pool as the source NAT IP address in a regular firewall policy works as before.

For details, see [Technical Tip: IP pool and virtual IP behaviour changes in FortiOS 6.4, 7.0, 7.2, and 7.4.](#)

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.

- c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
- d. Click OK.
- e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
 - a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
 - b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to create a web mode only portal *my-web-portal*.
 - b. Set *Predefined Bookmarks for Windows server* to type *RDP*.
4. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. For *Listen on Interface(s)*, select *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Choose a certificate for *Server Certificate*.

It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the [SSL VPN best practices on page 1718](#) and learn how to [Procuring and importing a signed SSL certificate on page 2303](#).

- e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *web-access*.
- f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-Web-portal*.
5. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn web mode access*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Choose an *Outgoing Interface*. In this example, *port1*.
 - e. Set the *Source* to *all* and group to *sslvpngroup*.
 - f. In this example, the *Destination* is the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end
```

```
config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Configure user and user group.

```
config user local
  edit "sslvpnuser1"
    set type password
    set passwd your-password
  next
end

config user group
  edit "sslvpngroup"
    set member "vpnuser1"
  next
end
```

4. Configure SSL VPN web portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
  edit "my-web-portal"
    set web-mode enable
    config bookmark-group
      edit "gui-bookmarks"
        config bookmarks
          edit "Windows Server"
            set apptype rdp
            set host "192.168.1.114"
            set port 3389
            set logon-user "your-windows-server-user-name"
            set logon-password your-windows-server-password
          next
        end
      next
    end
  next
end

next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
  set servercert "Fortinet_Factory"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set source-address6 "all"
  set default-portal "full-access"
  config authentication-rule
    edit 1
      set groups "sslvpngroup"
      set portal "my-web-portal"
    next
```

```

    end
end

```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client

```

config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end

```

To see the results:

1. In a web browser, log into the portal <https://172.20.120.123:10443> using the credentials you've set up.
2. In the portal with the predefined bookmark, select the bookmark to begin an RDP session. If there are no predefined bookmarks, the Quick Connection tool can be used; see [Quick Connection tool on page 1763](#) for more information.
3. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
4. Go to *Log & Report > Forward Traffic* to view the details for the SSL entry.

Customizing the RDP display size

The RDP display size (width and height settings) can be customized for SSL VPN web mode when creating a new connection or bookmark. Administrators can also specify the display size when preconfiguring bookmarks.

To configure the default window dimensions in an RDP web portal:

```

config vpn ssl web portal
    edit <name>
        set default-window-width <integer>
        set default-window-height <integer>
    next
end

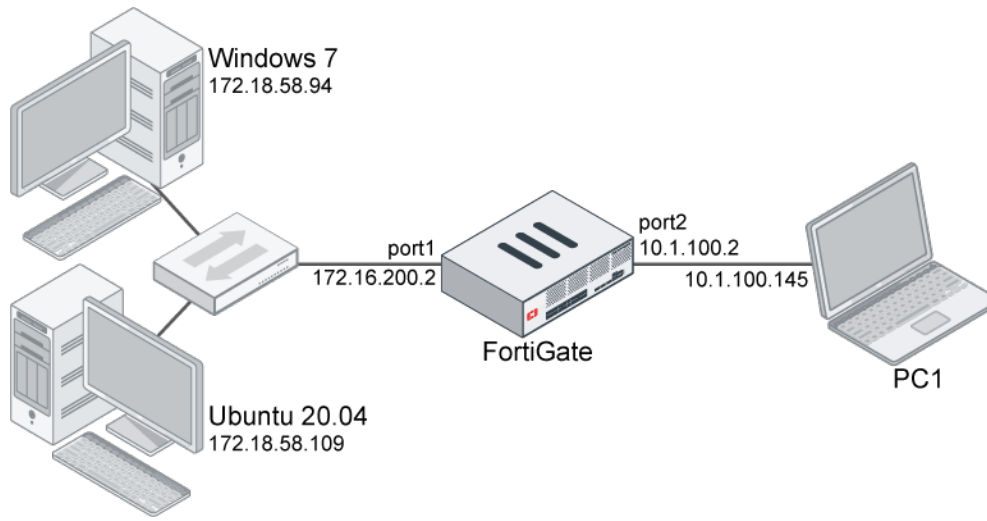

```

default-window-width <integer>	Set the default RDP screen width, in pixels (0 - 65535, default = 1024).
default-window-height <integer>	Set the default RDP screen height, in pixels (0 - 65535, default = 768).

Example

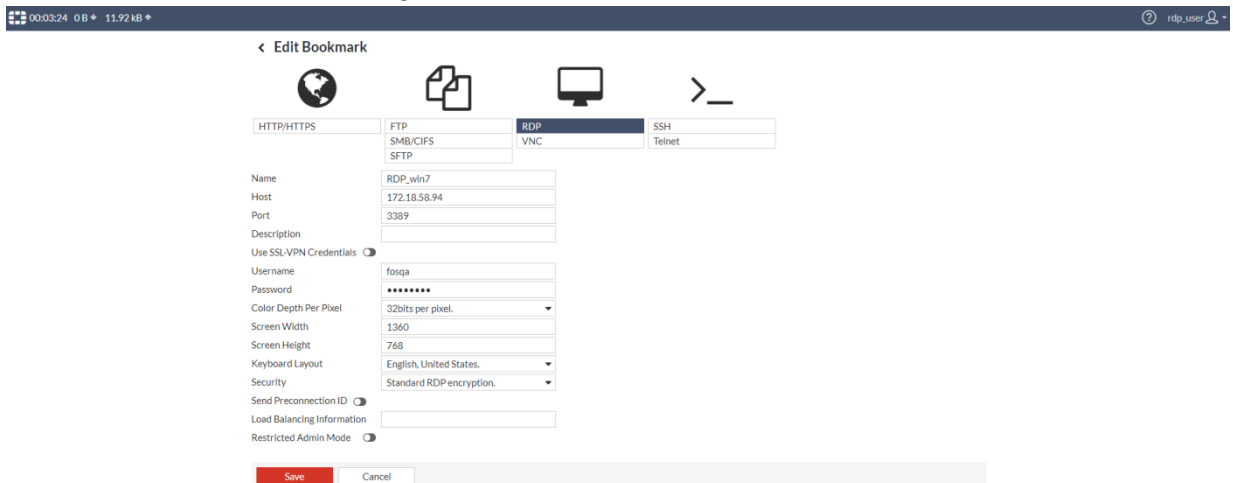

In this example, a user has a monitor with a resolution of 1920 × 1080. The user creates two bookmarks for RDP servers with different resolutions:

- Windows 7: 1360 × 768
- Ubuntu 20.04: 800 × 600

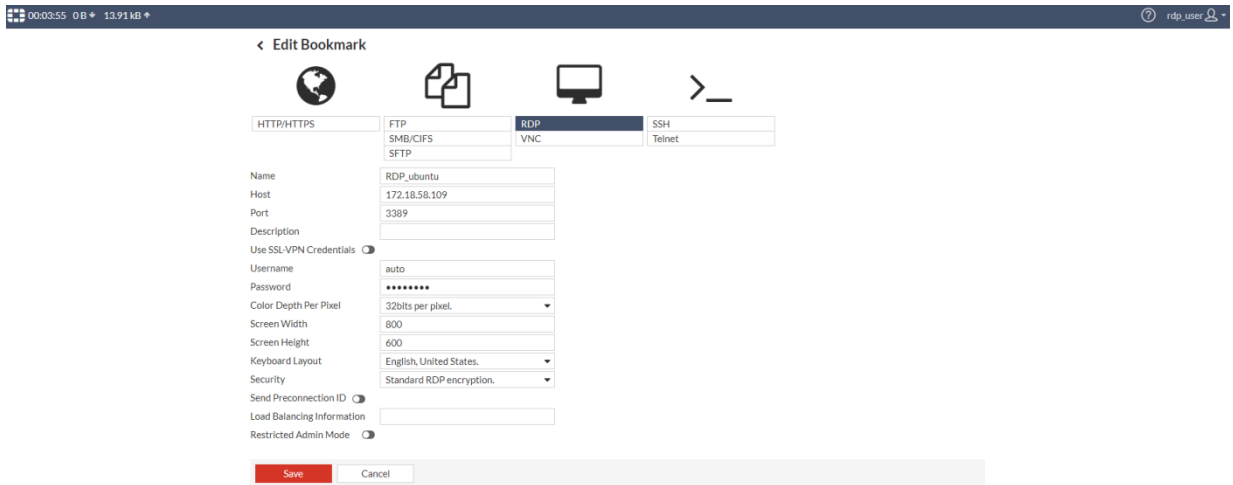

To customize the RDP bookmark display size:

1. Log in to the SSL VPN web portal.
2. Create a new RDP bookmark (+ *New Bookmark*), or hover over an existing bookmark and click the edit (pencil) icon.
3. Set the *Screen Width* and *Screen Height* fields as required.
 - a. Windows 7: 1360 width and 768 height.

b. Ubuntu 20.04: 800 width and 600 height.

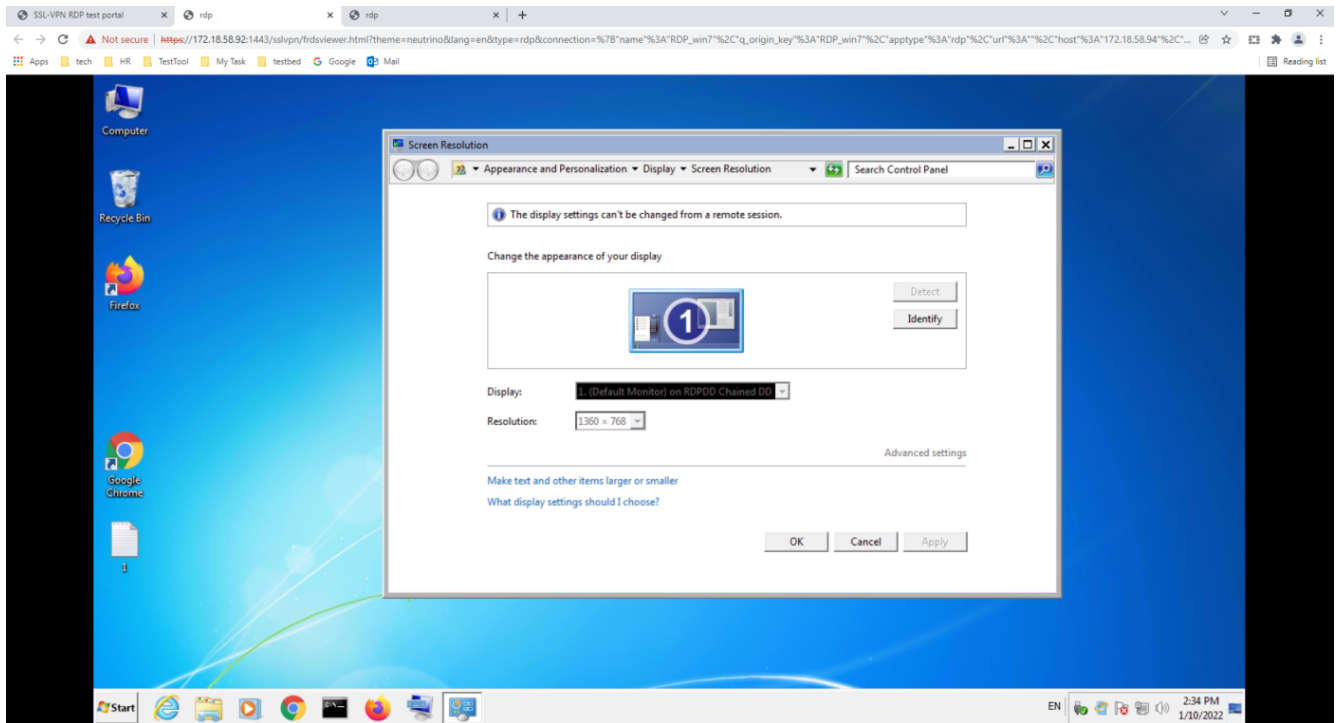

4. Click Save.

Verification:

When the user connects to the RDP servers using the bookmarks, the customized screen resolutions are applied regardless of the client PC's screen resolution (1920 × 1080).

Windows 7:

Ubuntu 20.04:

To view the bookmarks created by the user:

```

show vpn ssl web user-bookmark
config vpn ssl web user-bookmark
  edit "rdp_user#"
    config bookmarks
      edit "RDP_win7"
        set apptype rdp
        set host "172.18.58.94"
        set port 3389
        set logon-user "fosqa"
        set logon-password *****
        set color-depth 32
        set width 1360
        set height 768
      next
      edit "RDP_ubuntu"
        set apptype rdp
        set host "172.18.58.109"
        set port 3389
        set logon-user "auto"
        set logon-password *****
        set color-depth 32
        set width 800
        set height 600
      next
    end
  next
end

```

SSL VPN authentication

SSL VPN with LDAP user authentication

This is a sample configuration of SSL VPN for LDAP users. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network:
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
 - a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
 - b. Go to *System > Certificates* and select *Import > CA Certificate*.
 - c. Select *Local PC* and then select the certificate file.
The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
 - d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
  rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Specify *Name* and *Server IP/Name*.
 - c. Specify *Common Name Identifier* and *Distinguished Name*.
 - d. Set *Bind Type* to *Regular*.
 - e. Specify *Username* and *Password*.
 - f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
 - g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
4. Configure user group:
 - a. Go to *User & Authentication > User Groups* to create a user group.
 - b. Enter a *Name*.
 - c. In *Remote Groups*, click *Add* to add *ldaps-server*.
5. Configure SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *ldaps-group* mapping portal *full-access*.
7. Configure SSL VPN firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *ldaps-group*.
 - e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
 - f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.
 - i. Configure any remaining firewall and security options as desired.
 - j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```

config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end

```

3. Import CA certificate into FortiGate:

- a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
- b. Go to *System > Certificates* and select *Import > CA Certificate*.
- c. Select *Local PC* and then select the certificate file.
The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.
- d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```

config vpn certificate ca
  rename CA_Cert_1 to LDAPS-CA
end

```

4. Configure the LDAP server:

```

config user ldap
  edit "ldaps-server"
    set server "172.20.120.161"
    set cnid "cn"
    set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
    set type regular
    set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
    set password *****
    set group-member-check group-object
    set secure ldaps
    set ca-cert "LDAPS-CA"
    set port 636
  next
end

```

5. Configure user group:

```

config user group
  edit "ldaps-group"
    set member "ldaps-server"
  next
end

```

6. Configure SSL VPN web portal:

```

config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
  next
end

```

```
    next
end
```

7. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "ldaps-group"
            set portal "full-access"
        next
    end
end
```

8. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "ldaps-group"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal <http://172.20.120.123:10443>.
2. Enter the *Idu1* user credentials, then click *Login*.
3. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
 - c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *Idu1* credentials.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Events* and select *VPN Events* from the event type dropdown list to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
  0       ldu1    1(1)         229        10.1.100.254  0/0          0/0

SSL VPN sessions:
  Index   User    Source IP    Duration    I/O Bytes      Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
  0       ldu1    1(1)         291        10.1.100.254  0/0          0/0

SSL VPN sessions:
  Index   User    Source IP    Duration    I/O Bytes      Tunnel/Dest IP
  0       ldu1    10.1.100.254  9           22099/43228    10.212.134.200
```

SSL VPN with LDAP user password renew

This is a sample configuration of SSL VPN for LDAP users with *Force Password Change on next logon*. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server with *Force password change on next logon*.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
 - a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
 - b. Go to *System > Certificates* and select *Import > CA Certificate*.
 - c. Select *Local PC* and then select the certificate file.
The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
 - d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
  rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:

The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

- a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
- b. Specify *Name* and *Server IP/Name*.
- c. Specify *Common Name Identifier* and *Distinguished Name*.
- d. Set *Bind Type* to *Regular*.
- e. Specify *Username* and *Password*.
- f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
- g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
- h. To enable the `password-renew` option, use these CLI commands.

```
config user ldap
  edit "ldaps-server"
    set password-expiry-warning enable
    set password-renewal enable
  next
end
```

4. Configure user group:

- a. Go to *User & Authentication > User Groups* to create a user group.
- b. Enter a *Name*.
- c. In *Remote Groups*, click *Add* to add *ldaps-server*.

5. Configure SSL VPN web portal:

- a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
- b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.

6. Configure SSL VPN settings:

- a. Go to *VPN > SSL-VPN Settings*.
- b. Select the *Listen on Interface(s)*, in this example, *wan1*.
- c. Set *Listen on Port* to *10443*.
- d. Set *Server Certificate* to the authentication certificate.
- e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
- f. Create new *Authentication/Portal Mapping* for group *ldaps-group* mapping portal *full-access*.

7. Configure SSL VPN firewall policy:

- a. Go to *Policy & Objects > Firewall Policy*.
- b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
- c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
- d. Set the *Source Address* to *all* and *Source User* to *ldaps-group*.

- e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
- f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
- g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
- h. Enable *NAT*.
- i. Configure any remaining firewall and security options as desired.
- j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Import CA certificate into FortiGate:

- a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
- b. Go to *System > Certificates* and select *Import > CA Certificate*.
- c. Select *Local PC* and then select the certificate file.

The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.

- d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
  rename CA_Cert_1 to LDAPS-CA
end
```

4. Configure the LDAP server:

The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

```
config user ldap
  edit "ldaps-server"
    set server "172.20.120.161"
```

```
    set cnid "cn"
    set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
    set type regular
    set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
    set password *****
    set group-member-check group-object
    set secure ldaps
    set ca-cert "LDAPS-CA"
    set port 636
    set password-expiry-warning enable
    set password-renewal enable
  next
end
```

5. Configure user group:

```
config user group
  edit "ldaps-group"
    set member "ldaps-server"
  next
end
```

6. Configure SSL VPN web portal:

```
config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
  next
end
```

7. Configure SSL VPN settings:

```
config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set default-portal "web-access"
  config authentication-rule
    edit 1
      set groups "ldaps-group"
      set portal "full-access"
    next
  end
end
```

8. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "ldaps-group"
```

```

        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal `http://172.20.120.123:10443`.
2. Log in using the `ldu1` credentials.
Use a user that is configured on FortiAuthenticator with *Force password change on next logon*.
3. Click *Login*. You are prompted to enter a new password. The prompt will timeout after 90 seconds.
4. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, `172.20.120.123`.
 - c. Select *Customize Port* and set it to `10443`.
4. Save your settings.
5. Log in using the `ldu1` credentials.
You are prompted to enter a new password. The prompt will timeout after 90 seconds.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Events* and select *VPN Events* from the event type dropdown list to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```

# get vpn ssl monitor
SSL VPN Login Users:
  Index  User    Auth Type    Timeout  From           HTTP in/out  HTTPS in/out
  0      ldu1    1(1)         229     10.1.100.254  0/0          0/0

SSL VPN sessions:
  Index  User    Source IP    Duration    I/O Bytes    Tunnel/Dest IP

```

To check the tunnel login using the CLI:

```

# get vpn ssl monitor
SSL VPN Login Users:
  Index  User    Auth Type    Timeout  From           HTTP in/out  HTTPS in/out
  0      ldu1    1(1)         291     10.1.100.254  0/0          0/0

```

SSL VPN sessions:

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	ldu1	10.1.100.254	9	22099/43228	10.212.134.200

SSL VPN with certificate authentication

This is an example configuration of SSL VPN that requires users to authenticate using a client certificate. The client certificate is issued by the company Certificate Authority (CA). Each user is issued a certificate with their username in the subject.

There are two ways to configure certificate authentication:

1. [Using PKI users](#)
2. [Configuring the SSL VPN settings to require a client certificate](#)

In this example, the server and client certificates are signed by the same Certificate Authority (CA).

Self-signed certificates are provided by default to simplify initial installation and testing. It is **HIGHLY** recommended that you acquire a signed certificate for your installation.

Continuing to use these certificates can result in your connection being compromised, allowing attackers to steal your information, such as credit card details.

For more information, please review the [Use a non-factory SSL certificate for the SSL VPN portal on page 1720](#) and learn how to [Procuring and importing a signed SSL certificate on page 2303](#).

Using PKI users

When using PKI users, the FortiGate authenticates the user based on their identity in the subject or the common name on the certificate. The certificate must be signed by a CA that is known by the FortiGate, either through the default CA certificates or through importing a CA certificate.

The user can either match a static subject or common name defined in the PKI user settings, or match an LDAP user in the LDAP server defined in the PKI user settings. Multi-factor authentication can also be enabled with the password as the second factor.

Configuring the SSL VPN settings to require a client certificate

Using this method, the user is authenticated based on their regular username and password, but SSL VPN will still require an additional certificate check. The client certificate only needs to be signed by a known CA in order to pass authentication.

This method can be configured by enabling *Require Client Certificate* (`reqclientcert`) in the SSL-VPN settings.

Configuration

In the following example, SSL VPN users are authenticated using the first method. A PKI user is configured with multi-factor authentication

Pre-requisites:

- The CA has already issued a client certificate to the user.
- The CA has issued a server certificate for the FortiGate's SSL VPN portal.
- The CA certificate is available to be imported on the FortiGate.

To configure SSL VPN in the GUI:

1. Install the server certificate. The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic.

- a. Go to *System > Feature Visibility* and ensure *Certificates* is enabled.
- b. Go to *System > Certificates* and select *Import > Local Certificate*.
 - Set *Type* to *Certificate*.
 - Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
 - If required, you can change the *Certificate Name*.

The server certificate now appears in the list of *Certificates*.

2. Install the CA certificate.

The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.

- a. Go to *System > Certificates* and select *Import > CA Certificate*.
- b. Select *Local PC* and then select the certificate file.

The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

3. Configure PKI users and a user group.

To use certificate authentication, use the CLI to create PKI users.

```
config user peer
  edit pki01
    set ca CA_Cert_1
    set subject "CN=User01"
  next
end
```

Ensure that the subject matches the name of the user certificate. In this example, *User01*.

4. After you have create a PKI user, a new menu is added to the GUI:

- a. Go to *User & Authentication > PKI* to see the new user.
- b. Edit the user account.
- c. Enable *Two-factor authentication* and set a password for the account.
- d. Go to *User & Authentication > User Groups* and create a group called *sslvpgroup*.
- e. Add the PKI user *pki01* to the group.

5. Configure SSL VPN web portal.

- a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
- b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.

6. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings* and enable SSL-VPN.
 - b. Set the *Listen on Interface(s)* to *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the local certificate that was imported.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
7. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
 - e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
 - f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.
 - i. Configure any remaining firewall and security options as needed.
 - j. Click *OK*.

To configure SSL VPN in the CLI:

1. Configure the protected subnet:

```
config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

2. Install the server certificate:

The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic. While it is easier to install the server certificate in the GUI, the CLI can be used to import a p12 certificate from a TFTP server.

To import a p12 certificate, put the certificate *server_certificate.p12* on your TFTP server, then run following command on the FortiGate:

```
execute vpn certificate local import tftp server_certificate.p12 <your tftp_server> p12
<your password for PKCS12 file>
```

To check that the server certificate is installed:

```
show vpn certificate local server_certificate
```

3. Install the CA certificate:

The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users. While it is easier to install the CA certificate from GUI, the CLI can be used to import a CA certificates from a TFTP server.

To import a CA certificate, put the CA certificate on your TFTP server, then run following command on the FortiGate:

```
execute vpn certificate ca import tftp <your CA certificate name> <your tftp server>
```

To check that a new CA certificate is installed:

```
show vpn certificate ca
```

4. Configure PKI users and a user group:

```
config user peer
  edit pki01
    set ca CA_Cert_1
    set subject "CN=User01"
    set two-factor enable
    set passwd *****
  next
end

config user group
  edit "sslvpngroup"
    set member "pki01"
  next
end
```

5. Configure SSL VPN web portal:

```
config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
  next
end
```

6. Configure SSL VPN settings:

```
config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set default-portal "web-access"
  config authentication-rule
    edit 1
      set groups "sslvpngroup"
      set portal "full-access"
    next
  end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "sslvpngroup"
    set action accept
    set schedule "always"
```

```
        set service "ALL"  
        set nat enable  
    next  
end
```

Installation

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the user certificate on Windows 7, 8, and 10:

1. Double-click the certificate file to open the *Import Wizard*.
2. Use the *Import Wizard* to import the certificate into the *Personal store* of the current user.

To install the user certificate on Mac OS X:

1. Open the certificate file, to open *Keychain Access*.
2. Double-click the certificate.
3. Expand *Trust* and select *Always Trust*.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
 - Set *VPN Type* to *SSL VPN*.
 - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Enable *Client Certificate* and select the authentication certificate.
6. Save your settings.
7. Use the credentials you've set up to connect to the SSL VPN tunnel.
If the certificate is correct, you can connect.

To see the results of web portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.
A message requests a certificate for authentication.
2. Select the user certificate.
3. Enter your user credentials.
If the certificate is correct, you can connect to the SSL VPN web portal.

To check the SSL VPN connection using the GUI:

1. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
2. Go to *Log & Report > Events* and select *VPN Events* from the event type dropdown list to view the details for the SSL connection log.

To check the SSL VPN connection using the CLI:

```
get vpn ssl monitor
```

```
SSL VPN Login Users:
```

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	pki01,cn=User01		1(1)	229	10.1.100.254	0/0 0/0
1	pki01,cn=User01		1(1)	291	10.1.100.254	0/0 0/0

```
SSL VPN sessions:
```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	pki01,cn=User01	10.1.100.254		9	22099/43228 10.212.134.200

SSL VPN with LDAP-integrated certificate authentication

This is a sample configuration of SSL VPN that requires users to authenticate using a certificate with LDAP UserPrincipalName checking.

This sample uses Windows 2012R2 Active Directory acting as both the user certificate issuer, the certificate authority, and the LDAP server.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See [Configuring an LDAP server on page 1923](#).
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 1930](#).

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

In this sample, the *User Principal Name* is included in the subject name of the issued certificate. This is the user field we use to search LDAP in the connection attempt.

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the server certificate:

The server certificate is used for authentication and for encrypting SSL VPN traffic.

1. Go to *System > Feature Visibility* and ensure *Certificates* is enabled.
2. Go to *System > Certificates* and select *Import > Local Certificate*.
3. Set *Type* to *Certificate*.
4. Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
5. If required, change the *Certificate Name*.

The server certificate now appears in the list of *Certificates*.

To install the CA certificate:

The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.

1. Go to *System > Certificates* and select *Import > CA Certificate*.
2. Select *Local PC* and then select the certificate file.

The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Configure the LDAP server:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Specify *Name* and *Server IP/Name*.
 - c. Set *Distinguished Name* to *dc=fortinet-fsso,dc=com*.
 - d. Set *Bind Type* to *Regular*.
 - e. Set *Username* to *cn=admin,ou=testing,dc=fortinet-fsso,dc=com*.
 - f. Set *Password*.
 - g. Click *OK*.

3. Configure PKI users and a user group:

To use certificate authentication, use the CLI to create PKI users.

```
config user peer
  edit user1
    set ca CA_Cert_1
    set ldap-server "ldap-AD"
    set ldap-mode principal-name
  next
end
```

When you have create a PKI user, a new menu is added to the GUI:

- a. Go to *User & Authentication > PKI* to see the new user.
 - b. Go to *User & Authentication > User > User Groups* and create a group *sslvpn-group*.
 - c. Add the PKI peer object you created as a local member of the group.
 - d. Add a remote group on the LDAP server and select the group of interest.
You need these users to be members using the LDAP browser window.
4. Configure SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
 5. Configure SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.

- c. Set *Listen on Port* to 10443.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpn-group* mapping portal *full-access*.
6. Configure SSL VPN firewall policy:
- a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *sslvpn-group*.
 - e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
 - f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.
 - i. Configure any remaining firewall and security options as desired.
 - j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Configure the LDAP server:

```
config user ldap
  edit "ldap-AD"
    set server "172.18.60.206"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set username "cn=admin,ou=testing,dc=fortinet-fsso,dc=com"
    set password ldap-server-password
```

```
    next
end
```

4. Configure PKI users and a user group:

```
config user peer
    edit user1
        set ca CA_Cert_1
        set ldap-server "ldap-AD"
        set ldap-mode principal-name
    next
end

config user group
    edit "sslvpn-group"
        set member "ldap-AD" "user1"
        config match
            edit 1
                set server-name "ldap-AD"
                set group-name "CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            next
        end
    next
end
```

5. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

6. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpn-group"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
```

```
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpn-group"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
 - c. Select *Customize Port* and set it to *10443*.
 - d. Enable *Client Certificate* and select the authentication certificate.
4. Save your settings.

Connecting to the VPN only requires the user's certificate. It does not require username or password.

To see the results of web portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.

A message requests a certificate for authentication.
2. Select the user certificate.

You can connect to the SSL VPN web portal.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > VPN Events* to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the SSL VPN connection using the CLI:

Below is a sample output of `diagnose debug application fnbamd -1` while the user connects. This is a shortened output sample of a few locations to show the important parts. This sample shows lookups to find the group memberships (three groups total) of the user and that the correct group being found results in a match.

```
[1148] fnbamd_ldap_recv-Response len: 16, svr: 172.18.60.206
[829] fnbamd_ldap_parse_response-Got one MESSAGE. ID:4, type:search-result
[864] fnbamd_ldap_parse_response-ret=0
[1386] __fnbamd_ldap_primary_grp_next-Auth accepted
[910] __ldap_rxtx-Change state to 'Done'
[843] __ldap_rxtx-state 23(Done)

[2120] fnbamd_auth_cert_result-Result for ldap svr[0] 'ldap-AD' is SUCCESS
[2126] fnbamd_auth_cert_result-matched user 'test3', matched group 'sslvpn-group'
```

You can also use `diagnose firewall auth list` to validate that a firewall user entry exists for the SSL VPN user and is part of the right groups.

SSL VPN for remote users with MFA and user sensitivity

By default, remote LDAP and RADIUS user names are case sensitive. When a remote user object is applied to SSL VPN authentication, the user must type the exact case that is used in the user definition on the FortiGate.

Case sensitivity and accents can be ignored by disabling the `username-sensitivity` CLI command, allowing the remote user object to match any case or accents that the end user types in.

In this example, a remote user is configured with multi-factor authentication (MFA). The user group includes the LDAP user and server, and is applied to SSL VPN authentication and the policy.

Topology

Example configuration

To configure the LDAP server:

1. Generate and export a CA certificate from the AD server .
2. Import the CA certificate into FortiGate:
 - a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
 - b. Go to *System > Certificates* and select *Import > CA Certificate*.
 - c. Select *Local PC* and then select the certificate file.
The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
 - d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Configure the following options for this example:

Name	WIN2K16-KLHOME
Server IP/Name	192.168.20.6
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=KLHOME,dc=local
Bind Type	Regular
Username	KLHOME\Administrator
Password	*****
Secure Connection	Enable
Protocol	LDAPS
Certificate	CA_Cert_1 This is the CA certificate that you imported in step 2.

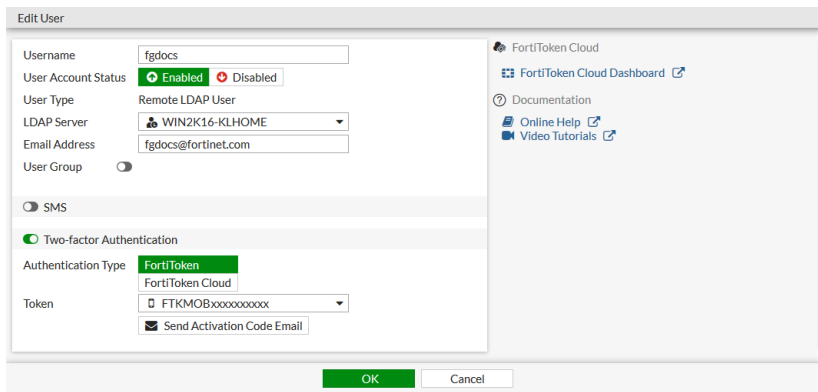

- c. Click **OK**.

To configure an LDAP user with MFA:

1. Go to *User & Authentication > User Definition* and click *Create New*.
2. Select *Remote LDAP User*, then click *Next*.
3. Select the just created LDAP server, then click *Next*.

4. Right click to add the selected user, then click *Submit*.
5. Edit the user that you just created.
The username will be pulled from the LDAP server with the same case as it has on the server.
6. Set the *Email Address* to the address that FortiGate will send the FortiToken to.
7. Enable *Two-factor Authentication*.
8. Set *Authentication Type* to *FortiToken*.
9. Set *Token* to a FortiToken device. See for more information.

10. Click **OK**.

To disable case and accent sensitivity on the remote user:

This can only be configured in the CLI.

```
config user local
  edit "fgdocs"
    set type ldap
    set two-factor fortitoken
    set fortitoken "FTKMOBxxxxxxxx"
    set email-to "fgdocs@fortinet.com"
    set username-sensitivity disable
    set ldap-server "WIN2K16-KLHOME"
  next
end
```

To configure a user group with the remote user and the LDAP server:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Set the *Name* to *LDAP-USERGRP*.

3. Set *Members* to the just created remote user.
4. In the *Remote Groups* table, click *Add*:
 - a. Set *Remote Server* to the LDAP server.
 - b. Set the group or groups that apply, and right click to add them.
 - c. Click *OK*.

New User Group

Name: LDAP-USERGRP

Type: Firewall

Members: fgdocs

Remote Groups

Remote Server	Group Name
WIN2K16-KLHOME	

OK Cancel

5. Click *OK*.

To apply the user group to the SSL VPN portal:

1. Go to *VPN > SSL-VPN Settings*.
2. In the *Authentication/Portal Mapping* table, click *Create New*.
 - a. Set *Users/Groups* to the just created user group.
 - b. Configure the remaining settings as required.
 - c. Click *OK*.

SSL-VPN Settings

Authentication/Portal Mapping

Users/Groups	Realm	Portal
LDAP-USERGRP	/	tunnel-access
All Other Users/Groups	/	full-access

Apply

3. Click *Apply*.

To apply the user group to a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following:

Name	SSLVPNtoInternal
Incoming Interface	SSL-VPN tunnel interface (ssl.root)
Outgoing Interface	port3
Source	Address - SSLVPN_TUNNEL_ADDR1 User - LDAP-USERGRP

Destination	The address of the internal network. In this case: 192.168.20.0.
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled

3. Configuring the remaining settings as required.
4. Click **OK**.

To configure this example in the CLI:

1. Configure the LDAP server:

```
config user ldap
  edit "WIN2K16-KLHOME"
    set server "192.168.20.6"
    set cnid "sAMAccountName"
    set dn "dc=KLHOME,dc=local"
    set type regular
    set username "KLHOME\\Administrator"
    set password *****
    set secure ldaps
    set ca-cert "CA_Cert_1"
    set port 636
  next
end
```

2. Configure an LDAP user with MFA and disable case and accent sensitivity on the remote user:

```
config user local
  edit "fgdocs"
    set type ldap
    set two-factor fortitoken
    set fortitoken "FTKMOBxxxxxxxxxx"
    set email-to "fgdocs@fortinet.com"
```

```
        set username-sensitivity disable
        set ldap-server "WIN2K16-KLHOME"
    next
end
```

3. Configure a user group with the remote user and the LDAP server:

```
config user group
    edit "LDAP-USERGRP"
        set member "fgdocs" "WIN2K16-KLHOME"
    next
end
```

4. Apply the user group to the SSL VPN portal:

```
config vpn ssl settings
    set servercert <server certificate>
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "LDAP-USERGRP"
            set portal "full-access"
        next
    end
end
```

5. Apply the user group to a firewall policy:

```
config firewall policy
    edit 5
        set name "SSLVPNtoInternal"
        set srcintf "ssl.root"
        set dstintf "port3"
        set srcaddr "SSLVPN_TUNNEL_ADDR1"
        set dstaddr "192.168.20.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set groups "LDAP-USERGRP"
        set nat enable
    next
end
```

Verification

To setup the VPN connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface.
 - c. If required, set the *Customize Port*.
4. Save your settings.

To test the connection with case sensitivity disabled:

1. Connect to the VPN:
 - a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
 - b. When prompted, enter your FortiToken code.
You should now be connected.

2. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index  User      Group   Auth Type      Timeout      From      HTTP in/out  HTTPS
in/out
  0      fgdocs    LDAP-USERGRP  16(1)         289         192.168.2.202 0/0
0/0

SSL VPN sessions:
  Index  User      Group   Source IP      Duration      I/O Bytes      Tunnel/Dest IP
  0      fgdocs    LDAP-USERGRP  192.168.2.202  45           99883/5572
10.212.134.200
```

3. Disconnect from the VPN connection.
4. Reconnect to the VPN:
 - a. Log in to the tunnel with the username, using a different case than on the FortiGate.
 - b. When prompted, enter your FortiToken code.
You should now be connected.
5. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index  User      Group   Auth Type      Timeout      From      HTTP in/out  HTTPS
in/out
  0      FGDOCS    LDAP-USERGRP  16(1)         289         192.168.2.202 0/0
0/0

SSL VPN sessions:
  Index  User      Group   Source IP      Duration      I/O Bytes      Tunnel/Dest IP
  0      FGDOCS    LDAP-USERGRP  192.168.2.202  45           99883/5572
10.212.134.200
```

In both cases, the remote user is matched against the remote LDAP user object and prompted for multi-factor authentication.

To test the connection with case and accent sensitivity enabled:

1. Enable case and accent sensitivity for the user:

```
config user local
  edit "fgdocs"
    set username-sensitivity enable
  next
end
```

2. Connect to the VPN

- a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
- b. When prompted, enter your FortiToken code.
You should now be connected.

3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index   User      Group   Auth Type   Timeout      From      HTTP in/out  HTTPS
in/out
  0       fgdocs    LDAP-USERGRP  16(1)      289         192.168.2.202 0/0
0/0

SSL VPN sessions:
  Index   User      Group   Source IP   Duration      I/O Bytes   Tunnel/Dest IP
0       fgdocs    LDAP-USERGRP  192.168.2.202  45          99883/5572
10.212.134.200
```

1. Disconnect from the VPN connection.**2. Reconnect to the VPN:**

- a. Log in to the tunnel with the username, using a different case than on the FortiGate.
You will not be prompted for your FortiToken code. You should now be connected.

3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index   User      Group   Auth Type   Timeout      From      HTTP in/out  HTTPS
in/out
  0       FGdocs    LDAP-USERGRP  16(1)      289         192.168.2.202 0/0
0/0

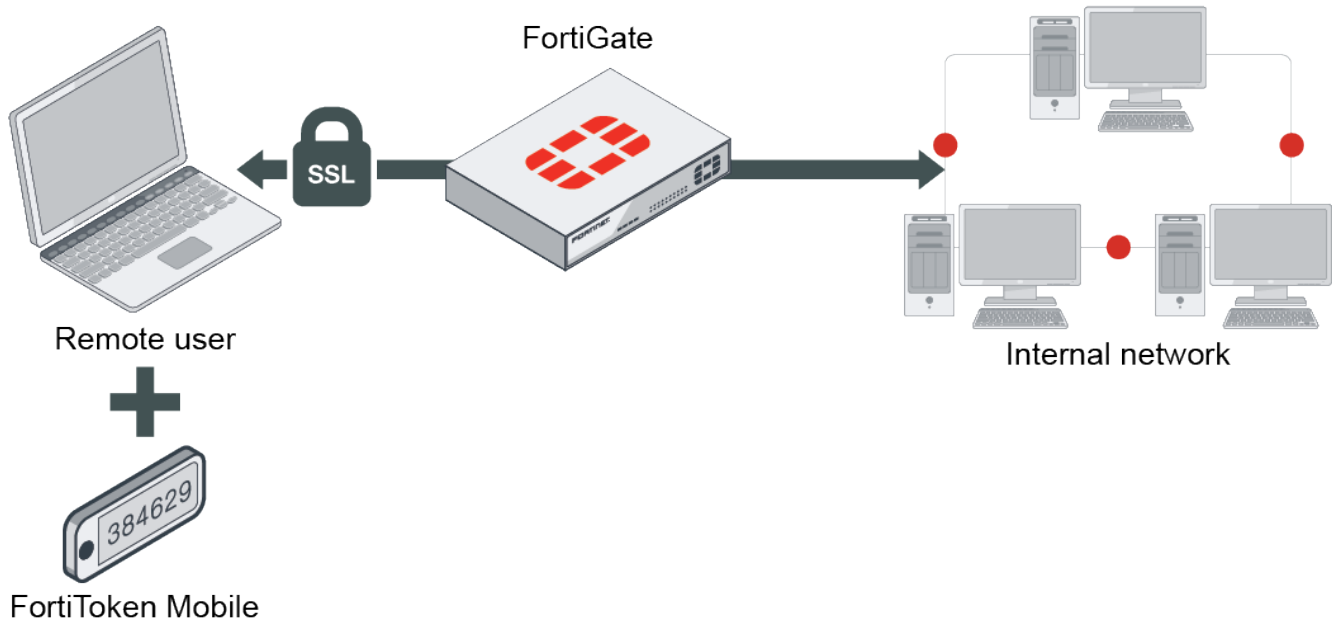

SSL VPN sessions:
  Index   User      Group   Source IP   Duration      I/O Bytes   Tunnel/Dest IP
0       FGdocs    LDAP-USERGRP  192.168.2.202  45          99883/5572
10.212.134.200
```

In this case, the user is allowed to log in without a FortiToken code because the entered user name did not match the name defined on the remote LDAP user object. Authentication continues to be evaluated against the LDAP server though, which is not case sensitive.

SSL VPN with FortiToken mobile push authentication

This is a sample configuration of SSL VPN that uses FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Register FortiGate for FortiCare Support:
To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.
 - a. Go to *Dashboard > Licenses*.
 - b. Hover the pointer on *FortiCare Support* to check if FortiCare registered. If not, click it and select *Register*.
3. Add FortiToken mobile to FortiGate:
If your FortiGate has FortiToken installed, skip this step.
 - a. Go to *User & Authentication > FortiTokens* and click *Create New*.
 - b. Select *Mobile Token* and type in *Activation Code*.
 - c. Every FortiGate has two free mobile tokens. Go to *User & Authentication > FortiTokens* and click *Import Free Trial Tokens*.
4. Enable FortiToken mobile push:
To use FTM-push authentication, use CLI to enable FTM-Push on the FortiGate.

- a. Ensure `server-ip` is reachable from the Internet and enter the following CLI commands:

```
config system ftm-push
    set server-ip 172.20.120.123
    set status enable
end
```

- b. Go to *Network > Interfaces*.
 - c. Edit the *wan1* interface.
 - d. Under *Administrative Access > IPv4*, select *FTM*.
 - e. Click *OK*.
5. Configure user and user group:
 - a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
 - b. Enter the user's *Email Address*.
 - c. Enable *Two-factor Authentication* and select one mobile *Token* from the list.
 - d. Enable *Send Activation Code* and select *Email*.
 - e. Click *Next* and click *Submit*.
 - f. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
 6. Activate the mobile token:
 - a. When the user *sslvpnuser1* is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.
 7. Configure SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
 8. Configure SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
 9. Configure SSL VPN firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
 - e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
 - f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.
 - i. Configure any remaining firewall and security options as desired.
 - j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Register FortiGate for FortiCare Support.

To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.

```
diagnose forticare direct-registration product-registration -a "your account@xxx.com" -p
"your password" -T "Your Country/Region" -R "Your Reseller" -e 1
```

4. Add FortiToken mobile to FortiGate:

```
execute fortitoken-mobile import <your FTM code>
```

If your FortiGate has FortiToken installed, skip this step.

Every FortiGate has two free mobile Tokens. You can download the free token.

```
execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

5. Enable FortiToken mobile push:

- a. To use FTM-push authentication, ensure `server-ip` is reachable from the Internet and enable FTM-push in the FortiGate:

```
config system ftm-push
  set server-ip 172.20.120.123
  set status enable
end
```

- b. Enable FTM service on WAN interface:

```
config system interface
  edit "wan1"
    append allowaccess ftm
  next
end
```

6. Configure user and user group:

```
config user local
  edit "sslvpnuser1"
    set type password
    set two-factor fortitoken
    set fortitoken <select mobile token for the option list>
    set email-to <user's email address>
    set passwd <user's password>
  next
end
config user group
  edit "sslvpngroup"
    set member "sslvpnuser1"
  next
end
```

7. Activate the mobile token.

When the user *sslvpnuser1* is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

8. Configure SSL VPN web portal:

```
config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
  next
end
```

9. Configure SSL VPN settings:

```
config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set default-portal "web-access"
  config authentication-rule
    edit 1
      set groups "sslvpngroup"
      set portal "full-access"
    next
  end
end
```

10. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "sslvpngroup"
    set action accept
```

```

        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal `http://172.20.120.123:10443`.
2. Log in using the `sslvpnuser1` credentials.
The FortiGate pushes a login request notification through the FortiToken mobile application.
3. Check your mobile device and select *Approve*.
When the authentication is approved, `sslvpnuser1` is logged into the SSL VPN portal.
4. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, `172.20.120.123`.
 - c. Select *Customize Port* and set it to `10443`.
4. Save your settings.
5. Log in using the `sslvpnuser1` credentials and click *FTM Push*.
The FortiGate pushes a login request notification through the FortiToken mobile application.
6. Check your mobile device and select *Approve*.
When the authentication is approved, `sslvpnuser1` is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```

get vpn ssl monitor
SSL VPN Login Users:
  Index   User           Auth Type   Timeout   From           HTTP in/out   HTTPS in/out
  0       sslvpnuser1    1(1)       229      10.1.100.254   0/0           0/0

```

```

SSL VPN sessions:
  Index   User           Source IP   Duration   I/O Bytes      Tunnel/Dest IP

```

To check the tunnel login using the CLI:

```

get vpn ssl monitor
SSL VPN Login Users:
  Index   User           Auth Type   Timeout   From           HTTP in/out   HTTPS in/out
  0       sslvpnuser1    1(1)       291      10.1.100.254   0/0           0/0

```

SSL VPN sessions:

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	sslvpnuser1	10.1.100.254	9	22099/43228	10.212.134.200

SSL VPN with RADIUS on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. Create a user on the FortiAuthenticator.
 - a. On the FortiAuthenticator, go to *Authentication > User Management > Local Users* to create a user *sslvpnuser1*.
 - b. Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
 - c. Go to *Authentication > User Management > User Groups* to create a group *sslvpngroup*.
 - d. Add *sslvpnuser1* to the group by moving the user from *Available users* to *Selected users*.
2. Create the RADIUS client (FortiGate) on the FortiAuthenticator.
 - a. On the FortiAuthenticator, go to *Authentication > RADIUS Service > Clients* to add the FortiGate as a RADIUS client (*OfficeServer*).
 - b. Enter the FortiGate IP address and set a *Secret*.
The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
 - c. Set *Realms* to *local | Local users*.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Addresses* and create an address for internal subnet *192.168.1.0*.
2. Create a RADIUS user and user group .
 - a. On the FortiGate, go to *User & Authentication > RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
 - b. For *Name*, use *FAC-RADIUS*.
 - c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.
 - d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
 - e. Select *Test User Credentials* and enter the credentials for *sslvpnuser1*.
The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
 - f. Go to *User & Authentication > User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
 - g. For *Name*, use *SSLVPNGroup*.
 - h. In *Remote Groups*, click *Add*.
 - i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
 - j. Leave the *Groups* field blank.
3. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
4. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
5. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
 - c. *Incoming Interface* must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example: *port1*.
 - e. Set the *Source > Address* to *all* and *Source > User* to *sslvpngroup*.
 - f. Set *Destination > Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.
 - i. Configure the remaining options as required.
 - j. Click *OK*.

To configure SSL VPN using the CLI:**1. Configure the interface and firewall address.**

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Create a RADIUS user and user group.

```
config user radius
  edit "FAC-RADIUS"
    set server "172.20.120.161"
    set secret <FAC client secret>
  next
end

config user group
  edit "sslvpngroup"
    set member "FAC-RADIUS"
  next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
  next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set default-portal "web-access"
```

```

config authentication-rule
  edit 1
    set groups "sslvpngroup"
    set portal "full-access"
  next
end
end

```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```

config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "sslvpngroup"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end

```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal <http://172.20.120.123:10443>.
2. Log in using the `sslvpnuser1` credentials.
3. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
 - Set the connection name.
 - Set *Remote Gateway* to `172.20.120.123`.
4. Select *Customize Port* and set it to `10443`.
5. Save your settings.
6. Log in using the `sslvpnuser1` credentials and check that you are logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```

get vpn ssl monitor
SSL VPN Login Users:
  Index   User           Auth Type   Timeout   From           HTTP in/out  HTTPS in/out
  0       sslvpnuser1   1(1)       229       10.1.100.254   0/0          0/0

```

SSL VPN sessions:

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
-------	------	-----------	----------	-----------	----------------

To check the tunnel login using the CLI:

```
get vpn ssl monitor
```

SSL VPN Login Users:

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	sslvpnuser1	1(1)	291	10.1.100.254	0/0	0/0

SSL VPN sessions:

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	sslvpnuser1	10.1.100.254	9	22099/43228	10.212.134.200

SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server and FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. On the FortiAuthenticator, go to *System > Administration > System Access* and configure a *Public IP/FQDN* for *FortiToken Mobile*. If the FortiAuthenticator is behind a firewall, the public IP/FQDN will be an IP/port forwarding rule directed to one of the FortiAuthenticator interfaces. The interface that receives the approve/deny FTM push responses must have the *FortiToken Mobile API* service enabled.
2. Add a FortiToken mobile license on the FortiAuthenticator:
 - a. Go to *Authentication > User Management > FortiTokens*.
 - b. Click *Create New*.
 - c. Set *Token type* to *FortiToken Mobile* and enter the *FortiToken Activation codes*.
3. Create the RADIUS client (FortiGate) on the FortiAuthenticator:
 - a. Go to *Authentication > RADIUS Service > Clients* to add the FortiGate as a RADIUS client (*OfficeServer*).
 - b. Enter the FortiGate IP address and set a *Secret*.
The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
 - c. Set *Authentication method* to *Enforce two-factor authentication*.
 - d. Select *Enable FortiToken Mobile push notifications authentication*.
 - e. Set *Realms* to *local | Local users*.
4. Create a user and assign FortiToken mobile to the user on the FortiAuthenticator:
 - a. Go to *Authentication > User Management > Local Users* to create a user *sslvpnuser1*.
 - b. Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
 - c. Enable *Token-based authentication* and select to deliver the token code by *FortiToken*.
 - d. Select the FortiToken added from the FortiToken Mobile dropdown menu.
 - e. Set *Delivery method* to *Email* and fill in the *User Information* section.
 - f. Go to *Authentication > User Management > User Groups* to create a group *sslvpngroup*.
 - g. Add *sslvpnuser1* to the group by moving the user from *Available users* to *Selected users*.
5. Install the FortiToken mobile application on your Android or iOS smartphone.
The FortiAuthenticator sends the FortiToken mobile activation to the user's email address.
6. Activate the FortiToken mobile through the FortiToken mobile application by entering the activation code or scanning the QR code.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Create a RADIUS user and user group:
 - a. On the FortiGate, go to *User & Authentication > RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
 - b. For *Name*, use *FAC-RADIUS*.
 - c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.
 - d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
 - e. Select *Test User Credentials* and enter the credentials for *sslvpnuser1*.
The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.

- f. Go to *User & Authentication > User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
 - g. For *Name*, use *SSLVPNGroup*.
 - h. In *Remote Groups*, click *Add*.
 - i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
 - j. Leave the *Groups* field blank.
3. Configure SSL VPN web portal:
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
4. Configure SSL VPN settings:
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
5. Configure SSL VPN firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
 - e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example: *port1*.
 - f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.
 - i. Configure any remaining firewall and security options as desired.
 - j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end
```

```
config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Create a RADIUS user and user group:

```
config user radius
  edit "FAC-RADIUS"
    set server "172.20.120.161"
    set secret <FAC client secret>
  next
end

config user group
  edit "sslvpngroup"
    set member "FAC-RADIUS"
  next
end
```

4. Configure SSL VPN web portal:

```
config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
  next
end
```

5. Configure SSL VPN settings:

```
config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set default-portal "web-access"
  config authentication-rule
    edit 1
      set groups "sslvpngroup"
      set portal "full-access"
    next
  end
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "sslvpngroup"
    set action accept
```

```

        set schedule "always"
        set service "ALL"
        set nat enable
    next
end

```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal `http://172.20.120.123:10443`.
2. Log in using the `sslvpnuser1` credentials.
The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
3. Check your mobile device and select *Approve*.
When the authentication is approved, `sslvpnuser1` is logged into the SSL VPN portal.
4. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example: `172.20.120.123`.
 - c. Select *Customize Port* and set it to `10443`.
4. Save your settings.
5. Log in using the `sslvpnuser1` credentials and click *FTM Push*.
The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
6. Check your mobile device and select *Approve*.
When the authentication is approved, `sslvpnuser1` is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```

get vpn ssl monitor
SSL VPN Login Users:
  Index   User           Auth Type   Timeout   From           HTTP in/out   HTTPS in/out
  0       sslvpnuser1    1(1)       229       10.1.100.254   0/0           0/0

```

```

SSL VPN sessions:
  Index   User           Source IP   Duration   I/O Bytes      Tunnel/Dest IP

```

To check the tunnel login on CLI:

```

get vpn ssl monitor
SSL VPN Login Users:
  Index   User           Auth Type   Timeout   From           HTTP in/out   HTTPS in/out
  0       sslvpnuser1    1(1)       291       10.1.100.254   0/0           0/0

```

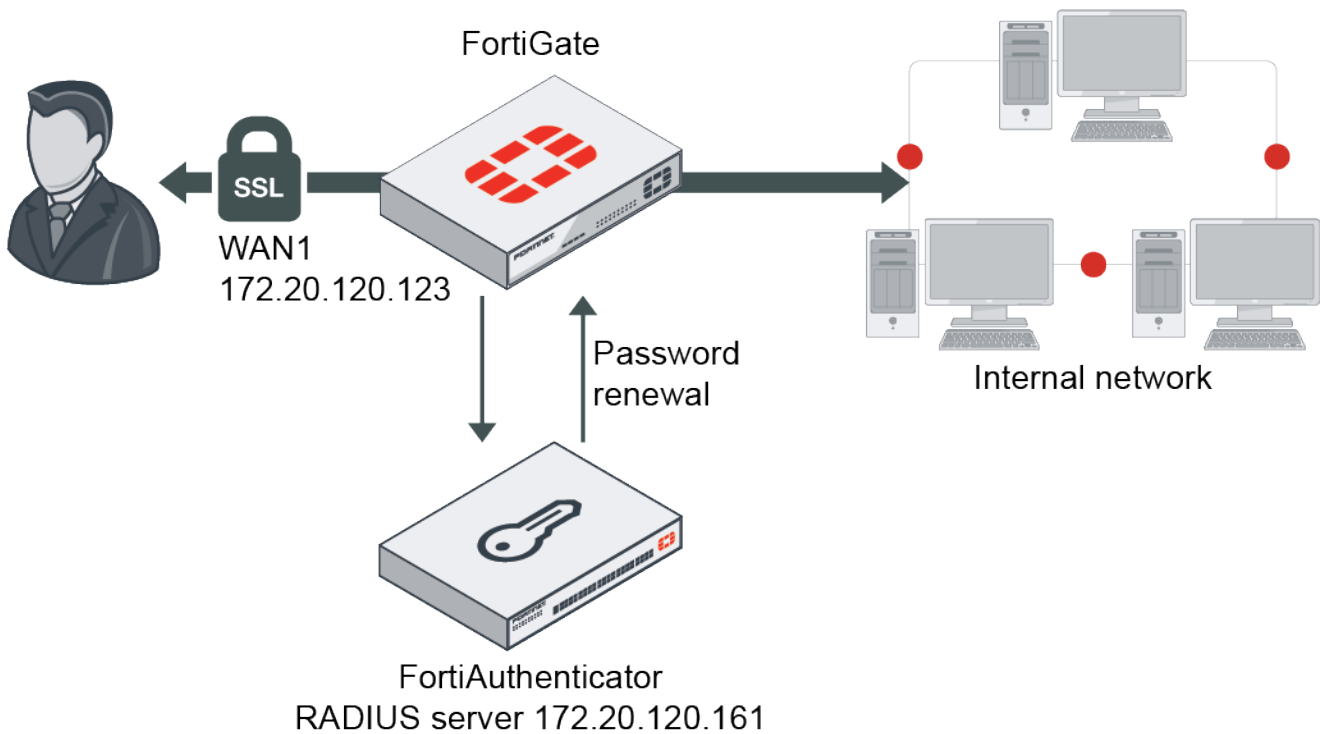

SSL VPN sessions:

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	sslvpnuser1	10.1.100.254	9	22099/43228	10.212.134.200

SSL VPN with RADIUS password renew on FortiAuthenticator

This is a sample configuration of SSL VPN for RADIUS users with *Force Password Change on next logon*. In this example, the RADIUS server is a FortiAuthenticator. A user *test1* is configured on FortiAuthenticator with *Force password change on next logon*.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.

2. Create a RADIUS user.
 - a. Go to *User & Authentication > RADIUS Servers* to create a user.
 - b. Set *Authentication method* to *MS-CHAP-v2*.
 - c. Enter the *IP/Name* and *Secret*.
 - d. Click *Create*.

Password renewal only works with the MS-CHAP-v2 authentication method.
 - e. To enable the `password-renew` option, use these CLI commands.

```
config user radius
  edit "fac"
    set server "172.20.120.161"
    set secret <fac radius password>
    set auth-type ms_chap_v2
    set password-renewal enable
  next
end
```

3. Configure user group.
 - a. Go to *User & Authentication > User Groups* to create a user group.
 - b. For the *Name*, enter *fac-group*.
 - c. In *Remote Groups*, click *Add* to add *Remote Server* you just created.
4. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.

This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *fac-group* mapping portal *full-access*.
6. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - d. Set the *Source Address* to *all* and *Source User* to *fac-group*.
 - e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
 - f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
 - g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - h. Enable *NAT*.
 - i. Configure any remaining firewall and security options as desired.
 - j. Click *OK*.

To configure SSL VPN using the CLI:**1. Configure the interface and firewall address.**

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Configure the RADIUS server.

```
config user radius
  edit "fac"
    set server "172.18.58.107"
    set secret <fac radius password>
    set auth-type ms_chap_v2
    set password-renewal enable
  next
end
```

4. Configure user group.

```
config user group
  edit "fac-group"
    set member "fac"
  next
end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
  next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
```

```

set source-interface "wan1"
set source-address "all"
set default-portal "web-access"
config authentication-rule
  edit 1
    set groups "fac-group"
    set portal "full-access"
  next
end
end

```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```

config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "fac-group"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end

```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal <http://172.20.120.123:10443>.
2. Log in using the *test1* credentials.
Use a user which is configured on FortiAuthenticator with *Force password change on next logon*.
3. Click *Login*. You are prompted to enter a new password.
4. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
 - Set the connection name.
 - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *test1* credentials.
You are prompted to enter a new password.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Events* and select *VPN Events* from the event type dropdown list to view the details of the SSL

VPN connection event log.

3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
  Index   User    Auth Type   Timeout   From           HTTP in/out   HTTPS in/out
  0       test1   1(1)        229       10.1.100.254  0/0           0/0
```

```
SSL VPN sessions:
  Index   User    Source IP   Duration   I/O Bytes      Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
  Index   User    Auth Type   Timeout   From           HTTP in/out   HTTPS in/out
  0       test1   1(1)        291       10.1.100.254  0/0           0/0
```

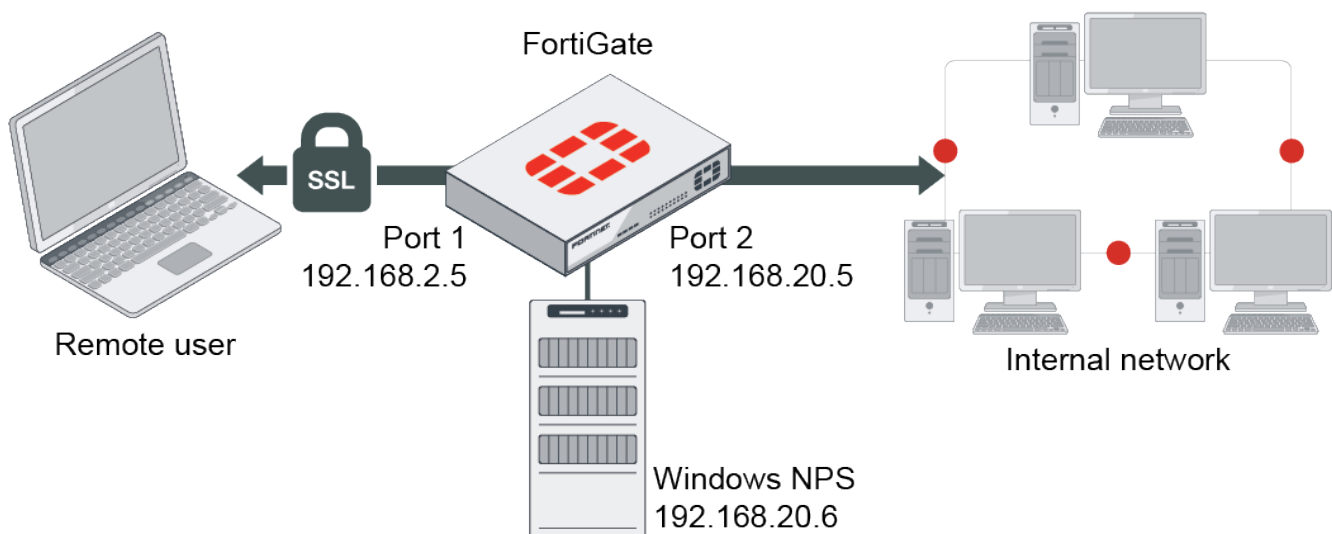

```
SSL VPN sessions:
  Index   User    Source IP   Duration   I/O Bytes      Tunnel/Dest IP
  0       test1   10.1.100.254  9         22099/43228    10.212.134.200
```

SSL VPN with RADIUS on Windows NPS

This is an example configuration of SSL VPN that uses Windows Network Policy Server (NPS) as a RADIUS authentication server.

The NPS must already be configured to accept the FortiGate as a RADIUS client and the choice of authentication method, such as MS-CHAPv2. A shared key must also have been created.

Example

The user is connecting from their PC to the FortiGate's port1 interface. RADIUS authentication occurs between the FortiGate and the Windows NPS, and the SSL-VPN connection is established once the authentication is successful.

Configure SSL-VPN with RADIUS on Windows NPS in the GUI

To configure the internal and external interfaces:

1. Go to *Network > Interfaces*
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. Set *Name* to *192.168.20.0*.
3. Leave *Type* as *Subnet*
4. Set *IP/Netmask* to *192.168.20.0/24*.
5. Click *OK*.

To add the RADIUS server:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *rad-server*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Optionally, click *Test User Credentials* to test user credentials. Testing from the GUI is limited to PAP.

New RADIUS Server

Name: rad-server

Authentication method: Default Specify

NAS IP:

Include in every user group:

Primary Server

IP/Name: 192.168.20.6

Secret:

Test Connectivity

Test User Credentials

Secondary Server

IP/Name:

Secret:

Test Connectivity

Test User Credentials

OK Cancel

7. Click *OK*.

To configure a user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Set *Name* to *rad-group*.

- Under *Remote Groups*, click *Add* and add the *rad-server*.

The screenshot shows the 'New User Group' configuration window. The 'Name' field contains 'rad-group'. The 'Type' dropdown menu is open, showing options: 'Firewall', 'Fortinet Single Sign-On (FSSO)', 'RADIUS Single Sign-On (RSSO)', and 'Guest'. The 'Members' field is empty. Below this, the 'Remote Groups' section has a table with columns 'Remote Server' and 'Group Name'. One entry is visible: 'rad-server'. At the bottom, there are 'OK' and 'Cancel' buttons.

- Click *OK*.

To configure SSL VPN settings:

- Go to *VPN > SSL-VPN Settings*.
- Select the *Listen on Interface(s)*, in this example, *port1*.
- Set *Listen on Port* to *10443*.
- If you have a server certificate, set *Server Certificate* to the authentication certificate.
- Under *Authentication/Portal Mapping*:
 - Edit *All Other Users/Groups* and set *Portal* to *web-access*.
 - Click *Create New* and create a mapping for the *rad-group* user group with *Portal* set to *full-access*.

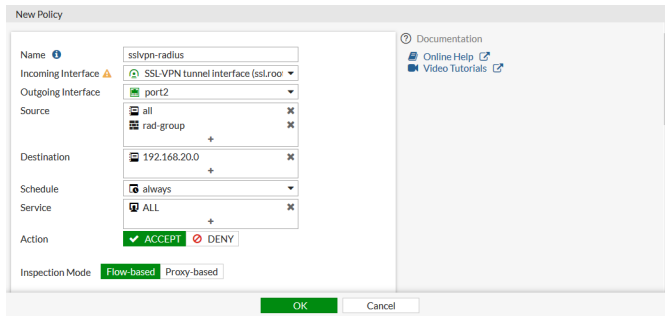

The screenshot shows the 'New Authentication/Portal Mapping' window. The 'Users/Groups' dropdown menu is set to 'rad-group'. The 'Portal' dropdown menu is set to 'full-access'. At the bottom, there are 'OK' and 'Cancel' buttons.

- Click *OK*.
- Click *Apply*.

To configure an SSL VPN firewall policy:

- Go to *Policy & Objects > Firewall Policy* and click *Create New*.
- Set the policy name, in this example, *sslvpn-radius*.
- Set *Incoming Interface* to *SSL-VPN tunnel interface(ssl.root)*.
- Set *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port2*.
- Set the *Source > Address* to *all* and *Source > User* to *rad-group*.
- Set *Destination > Address* to the internal protected subnet *192.168.20.0*.
- Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.

8. Enable NAT.

9. Configure the remaining options as required.

10. Click **OK**.

Configure SSL-VPN with RADIUS on Windows NPS in the CLI

To configure SSL VPN using the CLI:

1. Configure the internal and external interfaces:

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.2.5 255.255.255.0
    set alias internal
  next
  edit "port2"
    set vdom "root"
    set ip 192.168.20.5 255.255.255.0
    set alias external
  next
end
```

2. Configure the firewall address:

```
config firewall address
  edit "192.168.20.0"
    set subnet 192.168.20.0 255.255.255.0
  next
end
```

3. Add the RADIUS server:

```
config user radius
  edit "rad-server"
    set server "192.168.20.6"
    set secret *****
  next
end
```

4. Create a user group and add the RADIUS server to it:

```
config user group
  edit "rad-group"
    set member "rad-server"
  next
end
```

5. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "rad-group"
            set portal "full-access"
        next
    end
end
```

6. Configure an SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn-radius"
        set srcintf "ssl.root"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "192.168.20.0"
        set groups "rad-group"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Results

To connect with FortiClient in tunnel mode:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
 - a. Set the connection name.
 - b. Set *Remote Gateway* to *192.168.2.5*.
 - c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the RADIUS user credentials.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Events* and select *VPN Events* from the event type drop-down list to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
  Index  User      Group   Auth Type   Timeout      From      HTTP in/out  HTTPS in/out
  0      radkeith  rad-group  rad-group   2 (1)       295      192.168.2.202  0/0    0/0

SSL VPN sessions:
  Index  User      Group   Source IP   Duration      I/O Bytes   Tunnel/Dest IP
  0      radkeith  rad-group  192.168.2.202  18          28502/4966
10.212.134.200
```

SSL VPN with multiple RADIUS servers

When configuring two or more RADIUS servers, you can configure a Primary and Secondary server within the same RADIUS server configurations for backup purposes. You can also configure multiple RADIUS servers within the same User Group to service the access request at the same time.

A tertiary server can be configured in the CLI.

Sample topology

Sample configurations

- [Configure a Primary and Secondary server for backup on page 1827](#)
- [Authenticating to two RADIUS servers concurrently on page 1831](#)

Configure a Primary and Secondary server for backup

When you define a Primary and Secondary RADIUS server, the access request will always be sent to the Primary server first. If the request is denied with an Access-Reject, then the user authentication fails. However, if there is no response from the Primary server after another attempt, the access request will be sent to the Secondary server.

In this example, you will use a Windows NPS server as the Primary server and a FortiAuthenticator as the Secondary server. It is assumed that users are synchronized between the two servers.

To configure the internal and external interfaces:

1. Go to *Network > Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. Set *Name* to *192.168.20.0*.
3. Leave *Type* as *Subnet*.
4. Set *IP/Netmask* to *192.168.20.0/24*.
5. Click *OK*.

To add the RADIUS servers:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *PrimarySecondary*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Under *Secondary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
7. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
8. Click *OK*.

To configure the user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. In the *Name* field, enter *PrimarySecondaryGroup*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *PrimarySecondary*.
4. Click *OK*, and then click *OK* again.

To configure the SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. From the *Listen on Interface(s)* dropdown select *port1*.
3. In the *Listen on Port* field enter *10443*.
4. Optionally, from the *Server Certificate* dropdown, select the authentication certificate if you have one for this SSL VPN portal.
5. Under *Authentication/Portal Mapping*, set the default portal web-access.
 - a. Select *All Other Users/Groups* and click *Edit*.
 - b. From the *Portal* dropdown, select *web-access*.

- c. Click *OK*.
6. Create a web portal for *PrimarySecondaryGroup*.
 - a. Under *Authentication/Portal Mapping*, click *Create New*.
 - b. Click *Users/Groups* and select *PrimarySecondaryGroup*.
 - c. From the *Portal* dropdown, select *full-access*.
 - d. Click *OK*.

To configure SSL VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* to create a new policy, or double-click an existing policy to edit it and configure the following settings:

Name	Enter a name for the policy.
Incoming Interface	<i>SSL-VPN tunnel interface (ssl.root)</i>
Outgoing interface	Set to the local network interface so that the remote user can access the internal network. For this example, select <i>port3</i> .
Source	In the <i>Address</i> tab, select <i>SSLVPN_TUNNEL_ADDR1</i> In the <i>User</i> tab, select <i>PrimarySecondaryGroup</i>
Destination	Select the internal protected subnet <i>192.168.20.0</i> .
Schedule	<i>always</i>
Service	<i>All</i>
Action	<i>Accept</i>
NAT	<i>Enable</i>

3. Configure any remaining firewall and security options as required.
4. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the internal interface and firewall address:

```
config system interface
  edit "port3"
    set vdom "root"
    set ip 192.168.20.5 255.255.255.0
    set alias "internal"
  next
end
config firewall address
  edit "192.168.20.0"
    set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
    set subnet 192.168.20.0 255.255.255.0
  next
end
```

2. Configure the RADIUS server:

```
config user radius
```

```

edit "PrimarySecondary"
  set server "192.168.20.6"
  set secret <secret>
  set secondary-server "192.168.2.71"
  set secondary-secret <secret>
next
end

```

3. Add the RADIUS user to the user group:

```

config user group
  edit "PrimarySecondaryGroup"
    set member "PrimarySecondary "
  next
end

```

4. Configure SSL VPN settings:

```

config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "port1"
  set source-address "all"
  set default-portal "web-access"
  config authentication-rule
    edit 1
      set groups "PrimarySecondaryGroup "
      set portal "full-access"
    next
  end
end

```

5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:

```

config firewall policy
  edit 1
    set name "sslvpn-radius"
    set srcintf "ssl.root"
    set dstintf "port3"
    set srcaddr "all"
    set dstaddr "192.168.20.0"
    set groups "PrimarySecondaryGroup"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end

```

To verify the connection:

User *radkeith* is a member of both the NPS server and the FAC server.

When the Primary server is up, it will connect to the SSL VPN tunnel using FortiClient.

```

# diagnose sniffer packet any 'port 1812' 4 0 1
interfaces=[any]
filters=[port 1812]
2020-05-15 16:26:50.838453 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 118
2020-05-15 16:26:50.883166 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 20
2020-05-15 16:26:50.883374 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 182
2020-05-15 16:26:50.884683 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 228

```

The access request is sent to the Primary NPS server 192.168.20.6, and the connection is successful.

```
# get vpn ssl monitor
SSL VPN Login Users:
```

Index in/out	User HTTPS in/out	Group	Auth Type	Timeout	From	HTTP
0 0/0	radkeith 0/0	PrimarySecondaryGroup	2(1)	285	192.168.2.202	

```
SSL VPN sessions:
```

Index Tunnel/Dest IP	User	Group	Source IP	Duration	I/O Bytes
0 10.212.134.200	radkeith	PrimarySecondaryGroup	192.168.2.202	62	132477/4966

When the Primary server is down, and the Secondary server is up, the connection is made to the SSLVPN tunnel again:

```
# diagnose sniffer packet any 'port 1812' 4 0 1
interfaces=[any]
filters=[port 1812]
2020-05-15 16:31:23.016875 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:28.019470 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:30.011874 port1 out 192.168.2.5.23848 -> 192.168.2.71.1812: udp 118
2020-05-15 16:31:30.087564 port1 in 192.168.2.71.1812 -> 192.168.2.5.23848: udp 20
```

Access request is sent to the Primary NPS server 192.168.20.6, but there was no response. RADIUS authentication falls through to the Secondary FortiAuthenticator 192.168.2.71, and the authentication was accepted. The VPN connection is established.

```
# get vpn ssl monitor
SSL VPN Login Users:
```

Index in/out	User HTTPS in/out	Group	Auth Type	Timeout	From	HTTP
0 0/0	radkeith 0/0	PrimarySecondaryGroup	2(1)	287	192.168.2.202	

```
SSL VPN sessions:
```

Index Tunnel/Dest IP	User	Group	Source IP	Duration	I/O Bytes
0 10.212.134.200	radkeith	PrimarySecondaryGroup	192.168.2.202	48	53544/4966

Authenticating to two RADIUS servers concurrently

There are times where users are located on separate RADIUS servers. This may be the case when migrating from an old server to a new one for example. In this scenario, a Windows NPS server and a FortiAuthenticator are configured in the same User Group. The access-request is sent to both servers concurrently. If FortiGate receives an access-accept from either server, authentication is successful.

To configure the internal and external interfaces:

1. Go to *Network > Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.

3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. Set *Name* to *192.168.20.0*.
3. Leave *Type* as *Subnet*
4. Set *IP/Netmask* to *192.168.20.0/24*.
5. Click *OK*.

To configure the first RADIUS server:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *win2k16*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Click *OK*.

To configure the second RADIUS server:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *fac*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Click *OK*.

To configure the user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. In the *Name* field, enter *dualPrimaryGroup*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *fac*.
4. Click *Add* again. From the *Remote Server* dropdown select *win2k16* and click *OK*.
5. Click *OK*, and then click *OK* again.

To configure the SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. From the *Listen on Interface(s)* dropdown select *port1*.
3. In the *Listen on Port* field enter *10443*.
4. Optionally, from the *Server Certificate* dropdown, select the authentication certificate if you have one for this SSL VPN portal.

5. Under *Authentication/Portal Mapping*, set the default portal web-access.
 - a. Select *All Other Users/Groups* and click *Edit*.
 - b. From the *Portal* dropdown, select *web-access*.
 - c. Click *OK*.
6. Create a web portal for *PrimarySecondaryGroup*.
 - a. Under *Authentication/Portal Mapping*, click *Create New*.
 - b. Click *Users/Groups* and select *dualPrimaryGroup*.
 - c. From the *Portal* dropdown, select *full-access*.
 - d. Click *OK*.

To configure SSL VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* to create a new policy, or double-click an existing policy to edit it.

Name	Enter a name for the policy.
Incoming Interface	<i>SSL-VPN tunnel interface (ssl.root)</i>
Outgoing interface	Set to the local network interface so that the remote user can access the internal network. For this example, select <i>port3</i> .
Source	In the <i>Address</i> tab, select <i>SSLVPN_TUNNEL_ADDR1</i> In the <i>User</i> tab, select <i>dualPrimaryGroup</i>
Destination	Select the internal protected subnet <i>192.168.20.0</i> .
Schedule	<i>always</i>
Service	<i>All</i>
Action	<i>Accept</i>
NAT	<i>Enable</i>

3. Configure any remaining firewall and security options as required.
4. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the internal interface and firewall address:

```
config system interface
  edit "port3"
    set vdom "root"
    set ip 192.168.20.5 255.255.255.0
    set alias "internal"
  next
end
config firewall address
  edit "192.168.20.0"
    set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
    set subnet 192.168.20.0 255.255.255.0
  next
end
```

2. Configure the RADIUS server:

```
config user radius
  edit "win2k16"
    set server "192.168.20.6"
    set secret <secret>
  next
  edit "fac"
    set server "192.168.2.71"
    set secret <secret>
  next
end
```

3. Add the RADIUS user to the user group:

```
config user group
  edit "dualPrimaryGroup"
    set member "win2k16" "fac"
  next
end
```

4. Configure SSL VPN settings:

```
config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "port1"
  set source-address "all"
  set default-portal "web-access"
  config authentication-rule
    edit 1
      set groups "dualPrimaryGroup"
      set portal "full-access"
    next
  end
end
```

5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:

```
config firewall policy
  edit 1
    set name "sslvpn-radius"
    set srcintf "ssl.root"
    set dstintf "port3"
    set srcaddr "all"
    set dstaddr "192.168.20.0"
    set groups "dualPrimaryGroup"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end
```

To verify the connection:

User *fackeith* is a member of the FortiAuthenticator server only.

User *radkeith* is a member of both the NPS server and the FortiAuthenticator server, but has different passwords on each server.

Case 1: Connect to the SSLVPN tunnel using FortiClient with user FacAdmin:

```
# diagnose sniffer packet any 'port 1812' 4 0 1
interfaces=[any]
filters=[port 1812]
2020-05-15 17:21:31.217985 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 118
2020-05-15 17:21:31.218091 port1 out 192.168.2.5.11490 -> 192.168.2.71.1812: udp 118
2020-05-15 17:21:31.219314 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 20 <--
    access-reject
2020-05-15 17:21:31.219519 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 182
2020-05-15 17:21:31.220219 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 42
2020-05-15 17:21:31.220325 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 119
2020-05-15 17:21:31.220801 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 20
2020-05-15 17:21:31.236009 port1 in 192.168.2.71.1812 -> 192.168.2.5.11490: udp 20 <--
    access-accept
```

Access is denied by the NPS server because the user does not exist. However, access is accepted by FortiAuthenticator. The end result is the authentication is successful.

```
# get vpn ssl monitor
SSL VPN Login Users:
```

Index in/out	User HTTPS	Group in/out	Auth Type	Timeout	From	HTTP
0 0/0	fackeith	dualPrimaryGroup	2(1)	292	192.168.2.202	0/0

```
SSL VPN sessions:
```

Index Tunnel/Dest	User IP	Group	Source IP	Duration	I/O Bytes
0 10.212.134.200	fackeith	dualPrimaryGroup	192.168.2.202	149	70236/4966

Case 2: Connect to the SSLVPN tunnel using FortiClient with user radkeith:

```
# diagnose sniffer packet any 'port 1812' 4 0 1
interfaces=[any]
filters=[port 1812]
2020-05-15 17:26:07.335791 port1 out 192.168.2.5.17988 -> 192.168.2.71.1812: udp 118
2020-05-15 17:26:07.335911 port3 out 192.168.20.5.17988 -> 192.168.20.6.1812: udp 118
2020-05-15 17:26:07.337659 port3 in 192.168.20.6.1812 -> 192.168.20.5.17988: udp 20 <--
    access-accept
2020-05-15 17:26:07.337914 port3 out 192.168.20.5.17988 -> 192.168.20.6.1812: udp 182
2020-05-15 17:26:07.339451 port3 in 192.168.20.6.1812 -> 192.168.20.5.17988: udp 228
2020-05-15 17:26:08.352597 port1 in 192.168.2.71.1812 -> 192.168.2.5.17988: udp 20 <--
    access-reject
```

There is a password mismatch for this user on the Secondary RADIUS server. However, even though the authentication was rejected by FortiAuthenticator, it was accepted by Windows NPS. Therefore, the end result is authentication successful.

```
# get vpn ssl monitor
SSL VPN Login Users:

SSL VPN with local user password policy

This is a sample configuration of SSL VPN for users with passwords that expire after two days. Users are warned after one day about the password expiring. The password policy can be applied to any local user password. The password policy cannot be applied to a user group or a local remote user such as LDAP/RADIUS/TACACS+.

In FortiOS 6.2, users are warned after one day about the password expiring and have one day to renew it. If the password expires, the user cannot renew the password and must contact the administrator for assistance.

In FortiOS 6.0/5.6, users are warned after one day about the password expiring and have to renew it. If the password expires, the user can still renew the password.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
 - a. Go to *User & Authentication > User Definition* to create a local user.
 - b. Go to *User & Authentication > User Groups* to create a user group and add that local user to it.
3. Configure and assign the password policy using the CLI.
 - a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
  edit "pwpolicy1"
    set expire-days 2
    set warn-days 1
  next
end
```

- b. Assign the password policy to the user you just created.

```
config user local
  edit "sslvpnuser1"
    set type password
    set passwd-policy "pwpolicy1"
  next
end
```

4. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal. This portal supports both web and tunnel mode.
 - b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. Select the *Listen on Interface(s)*, in this example, *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Set *Server Certificate* to the authentication certificate.
 - e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
 - f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
6. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
 - c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.

- d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
- e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
- f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
- g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
- h. Enable *NAT*.
- i. Configure any remaining firewall and security options as desired.
- j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "192.168.1.0"
    set subnet 192.168.1.0 255.255.255.0
  next
end
```

3. Configure user and user group.

```
config user local
  edit "sslvpnuser1"
    set type password
    set passwd your-password
  next
end

config user group
  edit "sslvpngroup"
    set member "vpnuser1"
  next
end
```

4. Configure and assign the password policy.

- a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
  edit "pwpolicy1"
    set expire-days 2
    set warn-days 1
```

```
    next
end
```

b. Assign the password policy to the user you just created.

```
config user local
  edit "sslvpnuser1"
    set type password
    set passwd-policy "pwpolicy1"
  next
end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
  edit "full-access"
    set tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling disable
  next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
  set servercert "server_certificate"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set default-portal "web-access"
  config authentication-rule
    edit 1
      set groups "sslvpngroup"
      set portal "full-access"
    next
  end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
  edit 1
    set name "sslvpn web mode access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "192.168.1.0"
    set groups "sslvpngroup"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal <http://172.20.120.123:10443>.
2. Log in using the `sslvpnuser1` credentials.
When the warning time is reached, the user is prompted to enter a new password.
In FortiOS 6.2, when the password expires, the user cannot renew the password and must contact the administrator.
In FortiOS 6.0/5.6, when the password expires, the user can still renew the password.
3. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
 - Set the connection name.
 - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, `172.20.120.123`.
4. Select *Customize Port* and set it to `10443`.
5. Save your settings.
6. Log in using the `sslvpnuser1` credentials.
When the warning time is reached, the user is prompted to enter a new password.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check that login failed due to password expired on GUI:

1. Go to *Log & Report > Events* and select *VPN Events* from the event type dropdown list to see the SSL VPN alert labeled `ssl-login-fail`.
2. Click *Details* to see the log details about the *Reason* `sslvpn_login_password_expired`.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
  Index   User           Auth Type   Timeout   From           HTTP in/out   HTTPS in/out
  0       sslvpnuser1   1(1)       229      10.1.100.254  0/0           0/0
```

```
SSL VPN sessions:
  Index   User   Source IP   Duration   I/O Bytes   Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
  Index   User           Auth Type   Timeout   From           HTTP in/out   HTTPS in/out
  0       sslvpnuser1   1(1)       291      10.1.100.254  0/0           0/0
```

SSL VPN sessions:

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	sslvpnuser1	10.1.100.254	9	22099/43228	10.212.134.200

To check the FortiOS 6.2 login password expired event log:

```
FG201E4Q17901354 # execute log filter category event
```

```
FG201E4Q17901354 # execute log filter field subtype vpn
```

```
FG201E4Q17901354 # execute log filter field action ssl-login-fail
```

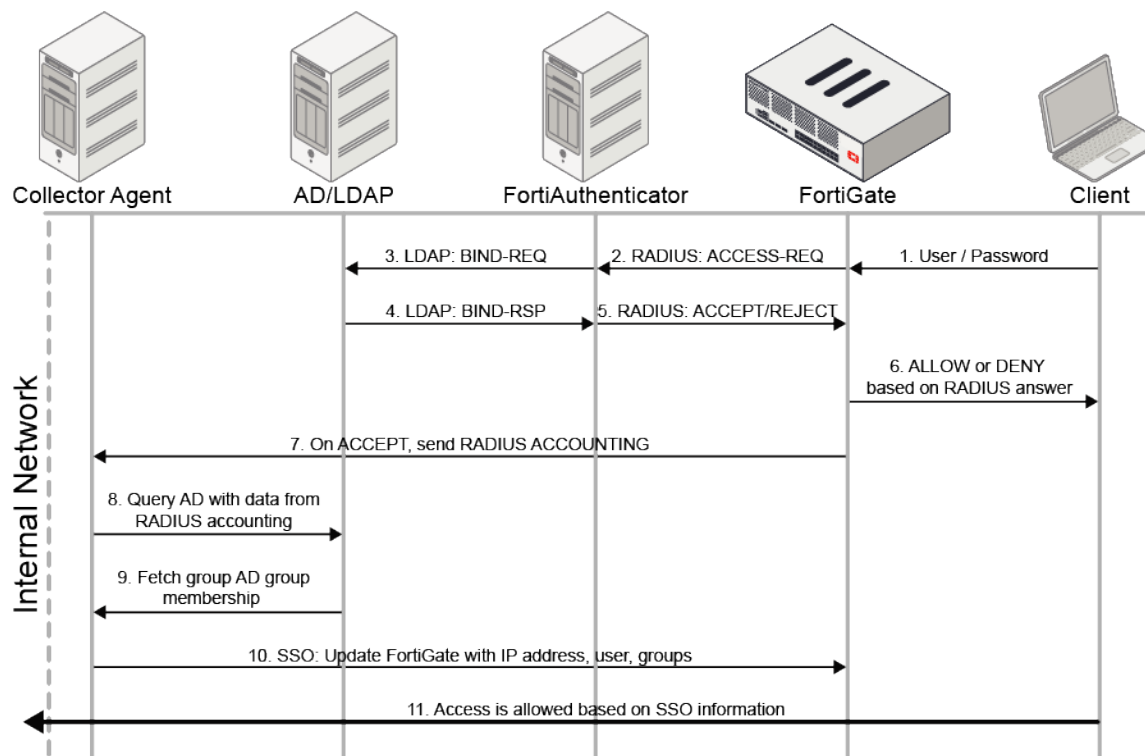

```
FG201E4Q17901354 # execute log display
```

```
1: date=2019-02-15 time=10:57:56 logid="0101039426" type="event" subtype="vpn" level="alert"
vd="root" eventtime=1550257076 logdesc="SSL VPN login fail" action="ssl-login-fail"
tunneltype="ssl-web" tunnelid=0 remip=10.1.100.254 user="u1" group="g1" dst_host="N/A"
reason="sslvpn_login_password_expired" msg="SSL user failed to logged in"
```

Dynamic address support for SSL VPN policies

Dynamic SSO user groups can be used in place of address objects when configuring SSL VPN policies. This allows dynamic IP addresses to be used in SSL VPN policies. A remote user group can be used for authentication while an FSSO group is separately used for authorization. Using a dummy policy for remote user authentication and a policy for FSSO group authorization, FSSO can be used with SSL VPN tunnels.

This image shows the authentication and authorization flow:

In this example, FortiAuthenticator is used as a RADIUS server. It uses a remote AD/LDAP server for authentication, then returns the authentication results to the FortiGate. This allows the client to have a dynamic IP address after successful authentication.

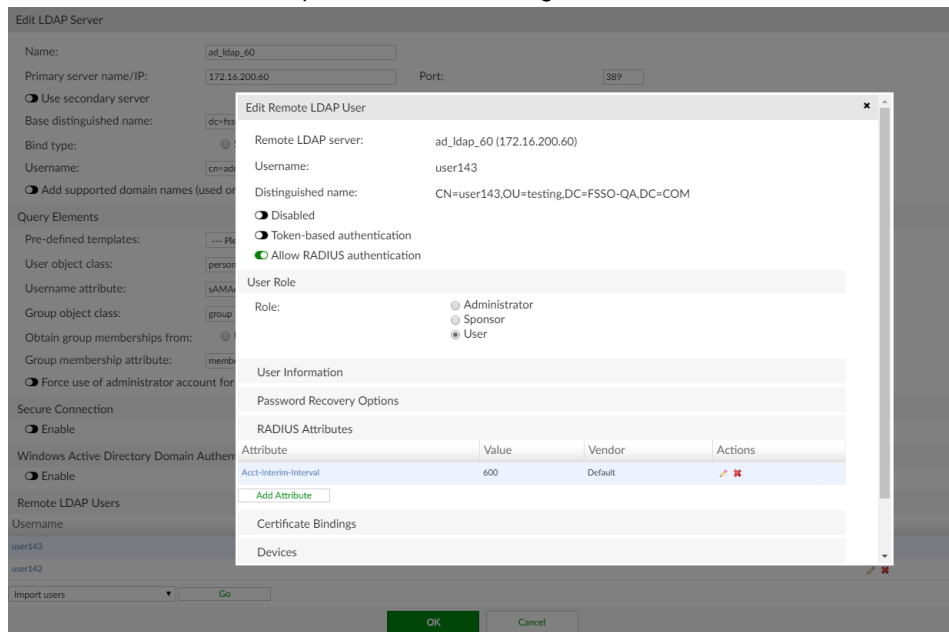

First, on the LDAP server, create two users each in their own group, *user142* in group *pc_group1*, and *user143* in group *pc_group2*.

Configure the FortiAuthenticator

To add a remote LDAP server and users on the FortiAuthenticator:

1. Go to *Authentication > Remote Auth. Servers > LDAP*.
2. Click *Create New*.
3. Set the following:
 - *Name*: *ad_ldap_60*
 - *Primary server name/IP*: *172.16.200.60*
 - *Base distinguished name*: *dc=fssso-qa,dc=com*
 - *Bind type*: *Regular*
 - *Username*: *cn=administrator,cn=User*
 - *Password*: <enter a password>
4. Click *OK*.
5. Edit the new LDAP server.
6. Import the remote LDAP users.
7. Edit each user to confirm that they have the RADIUS attribute *Acct-Interim-Interval*. This attribute is used by

FortiGate to send interim update account messages to the RADIUS server.

To create a RADIUS client for FortiGate as a remote authentication server:

1. Go to *Authentication > RADIUS Service > Clients*.
2. Click *Create New*.
3. Set the following:
 - *Name*: *fss0_ldap*
 - *Client address*: *Range 172.16.200.1~172.16.200.10*
 - *Secret*: *<enter a password>*
4. In the *Realms* table, set the realm to the LDAP server that was just added: *ad_ldap_60*.
5. Click *OK*.
FortiAuthenticator can now be used as a RADIUS server, and the authentication credentials all come from the DC/LDAP server.

Fortinet Single Sign-On Collector Agent

To configure the Fortinet Single Sign-On Collector Agent:

1. Select *Require authenticated connection from FortiGate* and enter a *Password*.
2. Click *Advanced Settings*.
3. Select the *RADIUS Accounting* tab.

4. Select *Enable RADIUS accounting server* and set the *Shared secret*.

5. Click *OK*, then click *Save&close*.

The collector agent can now accept accounting requests from FortiGate, and retrieve the IP addresses and usernames of SSL VPN client from the FortiGate with accounting request messages.

Configure the FortiGate

To configure the FortiGate in the CLI:

1. Create a Fortinet Single Sign-On Agent fabric connector:

```
config user fsso
  edit "AD_CollectAgent"
    set server "172.16.200.60"
    set password 123456
  next
end
```

2. Add the RADIUS server:

```
config user radius
  edit "rad150"
    set server "172.16.200.150"
    set secret 123456
    set acct-interim-interval 600
    config accounting-server
      edit 1
        set status enable
        set server "172.16.200.60"
        set secret 123456
      next
    end
  next
end
```

3. Create a user group for the RADIUS server:

```
config user group
  edit "rad_group"
    set member "rad150"
  next
end
```

4. Create user groups for each of the FSSO groups:

```
config user group
  edit "fsso_group1"
    set group-type fsso-service
    set member "CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM"
  next
  edit "fsso_group2"
    set group-type fsso-service
    set member "CN=PC_GROUP2,OU=TESTING,DC=FSSO-QA,DC=COM"
  next
end
```

5. Create an SSL VPN portal and assign the RADIUS user group to it:

```
config vpn ssl web portal
  edit "testportal"
    set tunnel-mode enable
    set ipv6-tunnel-mode enable
    set web-mode enable
    ...
  next
end
config vpn ssl settings
  ...
  set default-portal "full-access"
  config authentication-rule
    edit 1
      set groups "rad_group"
      set portal "testportal"
    next
  end
end
```

6. Create firewall addresses:

```
config firewall address
  edit "none"
    set subnet 0.0.0.0 255.255.255.255
  next
  edit "pc4"
    set subnet 172.16.200.44 255.255.255.255
  next
  edit "pc5"
    set subnet 172.16.200.55 255.255.255.255
  next
end
```

7. Create one dummy policy for authentication only, and two normal policies for authorization:

```
config firewall policy
  edit 1
    set name "sslvpn_authentication"
    set srcintf "ssl.vdom1"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "none"
    set action accept
    set schedule "always"
```

```
        set service "ALL"
        set logtraffic all
        set groups "rad_group"
        set nat enable
    next
    edit 3
        set name "sslvpn_authorization1"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "pc4"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "fsso_group1"
        set nat enable
    next
    edit 4
        set name "sslvpn_authorization2"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "pc5"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "fsso_group2"
        set nat enable
    next
end
```

To create an FSSO agent fabric connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. Click *FSSO Agent on Windows AD*.

4. Enter the name and *Primary FSSO agent* information.

5. Click *Apply & Refresh*.

The FSSO groups are retrieved from the collector agent.

To add the RADIUS server in the GUI:

1. Go to *User & Authentication > RADIUS Servers*.
2. Click *Create New*.
3. Enter a name for the server.
4. Enter the *IP/Name* and *Secret* for the primary server.
5. Click *Test Connectivity* to ensure that there is a successful connection.

6. Click *OK*.

7. Configure an accounting server with the following CLI command:

```
config user radius
  edit rad150
    set acct-interim-interval 600
    config accounting-server
      edit 1
        set status enable
        set server 172.16.200.60
        set secret *****
      next
    end
  next
end
```

To create a user group for the RADIUS server in the GUI:

1. Go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set the *Type* to *Firewall*.
4. Add the RADIUS server as a remote group.

The screenshot shows the 'New User Group' configuration window in the FortiGate GUI. The 'Name' field is set to 'rad_group'. The 'Type' dropdown menu is open, showing options: Firewall (selected), Fortinet Single Sign-On (FSSO), RADIUS Single Sign-On (RSSO), and Guest. The 'Members' field is empty with a '+' button. Below, the 'Remote Groups' section has a table with columns 'Remote Server' and 'Group Name'. The 'rad150' server is listed under 'Remote Server'. At the bottom, there are 'OK' and 'Cancel' buttons.

5. Click *OK*.

To create user groups for each of the FSSO groups in the GUI:

1. Go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set the *Type* to *Fortinet Single Sign-On (FSSO)*.
4. Add PC_GROUP1 as a member:
CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM
5. Click *OK*.
6. Add a second user group with PC_GROUP2 as a member:
CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM
7. Click *OK*.

To create an SSL VPN portal and assign the RADIUS user group to it in the GUI:

1. Go to *VPN > SSL VPN Portals*.
2. Click *Create New*.
3. Configure the portal, then click *OK*.
4. Go to *VPN > SSL VPN Settings*.
5. Configure the required settings.
6. Create an *Authentication/Portal Mapping* table entry:
 - a. Click *Create New*.
 - b. Set *User/Groups* to *rad_group*.
 - c. Set *Portal* to *testportal*.
 - d. Click *OK*.
7. Click *OK*.

To create policies for authentication and authorization in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Configure a dummy policy for authentication. Set the destination to *none* so that traffic is not allowed through the FortiGate, and add *rad_group* as a source.
3. Configure two authorization policies, with the FSSO groups as sources.

Confirmation

On *Client 1*, log in to FortiClient using *user142*. Traffic can go to *pc4* (172.16.200.44), but cannot go to *pc5* (172.16.200.55).

On *Client 2*, log in to FortiClient using *user143*. Traffic can go to *pc5* (172.16.200.55), but cannot go to *pc4* (172.16.200.44).

On the FortiGate, check the authenticated users list and the SSL VPN status:

```
# diagnose firewall auth list

10.212.134.200, USER142
  type: fssso, id: 0, duration: 173, idled: 173

SSL VPN Login Users:
```

Index	User	Auth Type	Timeout	From	HTTP in/out	HTTPS in/out
0	user142	2(1)	600	10.1.100.145	0/0	0/0
1	user143	2(1)	592	10.1.100.254	0/0	0/0

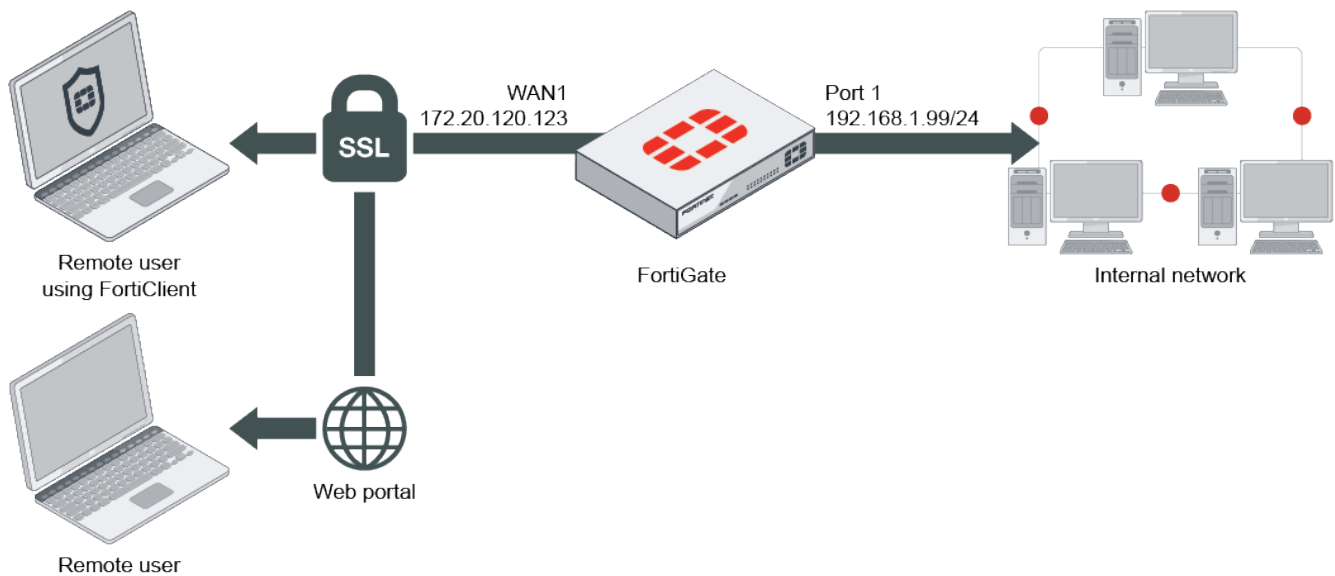

```
SSL VPN sessions:
```

Index	User	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	user142	10.1.100.145	104	32190/16480	10.212.134.200
1	user143	10.1.100.254	11	4007/4966	10.212.134.201

SSL VPN multi-realm

This sample shows how to create a multi-realm SSL VPN that provides different portals for different user groups.

Sample topology

Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
 - a. Go to *Network > Interfaces* and edit the *wan1* interface.
 - b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
 - c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
 - d. Click *OK*.
 - e. Go to *Policy & Objects > Address* and create an address for internet *QA_subnet* with subnet *192.168.1.0/24* and *HR_subnet* with subnet *10.1.100.0/24*.
2. Configure user and user group.
 - a. Go to *User & Authentication > User Definition* to create local users *qa-user1* and *hr-user1*.
 - b. Go to *User & Authentication > User Groups* to create separate user groups for web-only and full-access portals:
 - *QA_group* with member *qa-user1*.
 - *HR_group* with the member *hr-user1*.
3. Configure SSL VPN web portal.
 - a. Go to *VPN > SSL-VPN Portals* to create portal *qa-tunnel*.
 - b. Enable *Tunnel Mode*.
 - c. Create a portal *hr-web* with *Web Mode* enabled.
4. Configure SSL VPN realms.
 - a. Go to *System > Feature Visibility* to enable *SSL-VPN Realms*.
 - b. Go to *VPN > SSL-VPN Realms* to create realms for *qa* and *hr*.
 - c. (Optional) To access each realm with FQDN instead of the default URLs *https://172.20.120.123:10443/hr* and *https://172.20.120.123:10443/qa*, you can configure a virtual-host for the realm in the CLI.

```
config vpn ssl web realm
  edit hr
    set virtual-host hr.mydomain.com
  next
  edit qa
    set virtual-host qa.mydomain.com
  next
end
```

Where *mydomain.com* is the name of your domain. Ensure FQDN resolves to the FortiGate wan1 interface and that your certificate is a wildcard certificate.

5. Configure SSL VPN settings.
 - a. Go to *VPN > SSL-VPN Settings*.
 - b. For *Listen on Interface(s)*, select *wan1*.
 - c. Set *Listen on Port* to *10443*.
 - d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.

- e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *web-access*.
- f. Create new *Authentication/Portal Mapping* for group *QA_group* mapping portal *qa-tunnel*.
- g. Specify the realm *qa*.
- h. Add another entry for group *HR_group* mapping portal *hr-web*.
 - i. Specify the realm *hr*.
- 6. Configure SSL VPN firewall policy.
 - a. Go to *Policy & Objects > Firewall Policy*.
 - b. Create a firewall policy for QA access.
 - c. Fill in the firewall policy name. In this example, *QA sslvpn tunnel mode access*.
 - d. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - e. Choose an *Outgoing Interface*. In this example, *port1*.
 - f. Set the *Source* to *all* and group to *QA_group*.
 - g. In this example, the *Destination* is the internal protected subnet *QA_subnet*.
 - h. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - i. Click OK.
 - j. Create a firewall policy for HR access.
 - k. Fill in the firewall policy name. In this example, *HR sslvpn web mode access*.
 - l. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
 - m. Choose an *Outgoing Interface*. In this example, *port1*.
 - n. Set the *Source* to *all* and group to *HR_group*.
 - o. In this example, the *Destination* is the internal protected subnet *HR_subnet*.
 - p. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
 - q. Click OK.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
  edit "wan1"
    set vdom "root"
    set ip 172.20.120.123 255.255.255.0
  next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
  edit "port1"
    set vdom "root"
    set ip 192.168.1.99 255.255.255.0
  next
end

config firewall address
  edit "QA_subnet"
    set subnet 192.168.1.0 255.255.255.0
  next
  edit "HR_subnet"
    set subnet 10.1.100.0 255.255.255.0
```

```
    next
end
```

3. Configure user and user group.

```
config user local
    edit "qa_user1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "QA_group"
        set member "qa_user1"
    next
end

config user local
    edit "hr_user1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "HR_group"
        set member "hr_user1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "qa-tunnel"
        set tunnel-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling enable
        set split-tunneling-routing-address "QA_subnet"
    next
end

config vpn ssl web portal
    edit "hr-web"
        set web-mode enable
    next
end
```

5. Configure SSL VPN realms.

```
config vpn ssl web realm
    edit hr
        set virtual-host hr.mydomain.com
    next
    edit qa
        set virtual-host qa.mydomain.com
    next
end
```

The `set virtual-host` setting is optional. For example:

```
config vpn ssl web realm
    edit hr
    next
```

```
edit qa
next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
  set servercert "Fortinet_Factory"
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
  set source-interface "wan1"
  set source-address "all"
  set source-address6 "all"
  set default-portal "full-access"
  config authentication-rule
    edit 1
      set groups "QA_group"
      set portal "qa-tunnel"
      set realm qa
    next
    edit 2
      set groups "HR_group"
      set portal "hr-web"
      set realm hr
    next
  end
end
```

7. Configure two SSL VPN firewall policies to allow remote QA user to access internal QA network and HR user to access HR network.

```
config firewall policy
  edit 1
    set name "QA sslvpn tunnel access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "QA_subnet"
    set groups "QA_group"
    set action accept
    set schedule "always"
    set service "ALL"
  next
  edit 2
    set name "HR sslvpn web access"
    set srcintf "ssl.root"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "HR_subnet"
    set groups "HR_group"
    set action accept
    set schedule "always"
    set service "ALL"
  next
end
```

To see the results for QA user:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection.
 - Set *VPN Type* to *SSL VPN*.
 - Set *Remote Gateway* to `https://172.20.120.123:10443/qa.`
 - If a virtual-host is specified, use the FQDN defined for the realm (`qa.mydomain.com`).
4. Select *Customize Port* and set it to `10443`.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
If the user's computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to subnet `192.168.1.0` goes through the tunnel.
8. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the list of SSL users.
9. On the FortiGate, go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
10. On the FortiGate, go to *Log & Report > Forward Traffic* and view the details of the traffic.

To see the results for HR user:

1. In a web browser, log into the portal `https://172.20.120.123:10443/hr` using the credentials you've set up.
2. Alternatively, if a virtual-host is specified, use the FQDN defined for the realm (`hr.mydomain.com`).
3. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the list of SSL users.
4. Go to *Log & Report > Forward Traffic* and view the details of the traffic.

NAS-IP support per SSL-VPN realm

For RADIUS authentication and authorization, the RADIUS client (the FortiGate) passes the username, password, and NAS-IP to the RADIUS server in its access request. The RADIUS server authenticates and authorizes based on this information. Each RADIUS server can be configured with multiple NAS-IPs for authenticating different groups and NAS clients.

On the FortiGate, configuring the NAS-IP in the realm settings overrides the RADIUS server setting, allowing multiple NAS-IPs to be mapped to the same RADIUS server.

In this example, the user wants to present one FortiGate VDOM with different NAS-IPs to a single RADIUS server based on specific rules.

To configure the SSL-VPN to use the NAS-IP in the realm settings:**1. Configure a RADIUS user and add it to a group:**

```
config user radius
  edit "fac150"
    set server "172.16.200.150"
    set secret *****
    set nas-ip 172.16.200.2
  config accounting-server
    edit 1
      set status enable
      set server "172.16.200.150"
      set secret *****
    next
  end
next
end
config user group
  edit "radgrp"
    set member "fac150"
  next
end
```

2. Configure a realm for the user with a different NAS-IP:

```
config vpn ssl web realm
  edit "realm1"
    set login-page '.....'
    set radius-server "fac150"
    set nas-ip 10.1.100.2
  next
end
```

3. Configure SSL-VPN with an authentication rule that includes the user group and the realm:

```
config vpn ssl settings
  ...
  config authentication-rule
    edit 1
      set groupd "radgrp"
      set portal "testportal1"
      set realm "realm1"
    next
  end
end
```

4. Create a firewall policy:

```
config firewall policy
  edit 1
    set name "sslvpn1"
    ...
    set srcintf "ssl.vdom1"
    set groups "radgrp"
  next
end
```

Because the RADIUS server and NAS-IP are specified in realm1, its NAS-IP is used for authentication.

No.	Time	Source	Destination	Protocol	Length	Info
1	0.000000	172.16.200.2	172.16.200.150	RADIUS	244	Access-Request id=53

SSL VPN with Microsoft Entra SSO integration

You can use SAML single sign-on to authenticate against Microsoft Entra ID with SSL VPN SAML users who are using tunnel and web modes. See:

- [Configuring SAML SSO login for SSL VPN with Entra ID acting as SAML IdP](#)
- [Tutorial: Microsoft Entra SSO integration with FortiGate SSL VPN](#)

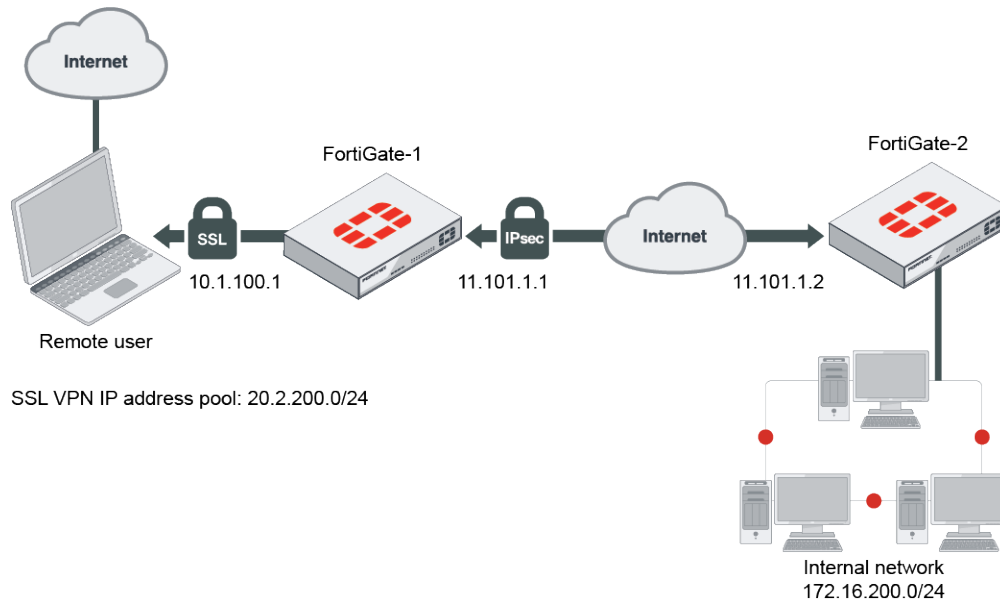

SSL VPN to IPsec VPN

This is a sample configuration of site-to-site IPsec VPN that allows access to the remote endpoint via SSL VPN.

This example uses a pre-existing user group, a tunnel mode SSL VPN with split tunneling, and a route-based IPsec VPN between two FortiGates. All sessions must start from the SSL VPN interface.

If you want sessions to start from the FGT_2 subnet, you need more policies. Also, if the remote subnet is beyond FGT_2 (if there are multiple hops), you need to include the SSL VPN subnet in those routers as well.

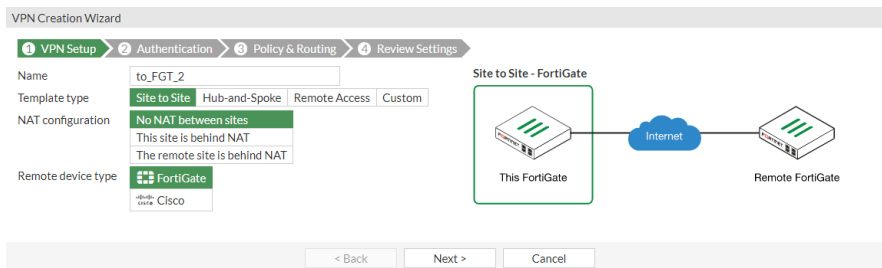

Sample topology

Sample configuration

To configure the site-to-site IPsec VPN on FGT_1:

1. Go to *VPN > IPsec Wizard*.
2. In the *VPN Setup* pane:
 - a. Specify the VPN connection *Name* as *to_FGT_2*.
 - b. Select *Site to Site*.

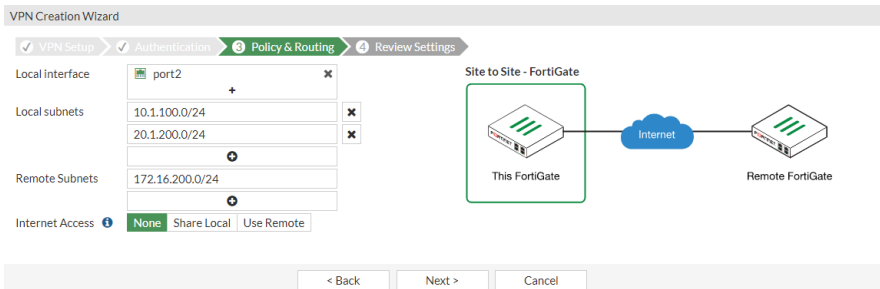

- c. Click *Next*.
3. In the *Authentication* pane:
 - a. Enter the *IP Address* to the Internet-facing interface.
 - b. For *Authentication Method*, click *Pre-shared Key* and enter the *Pre-shared Key*.

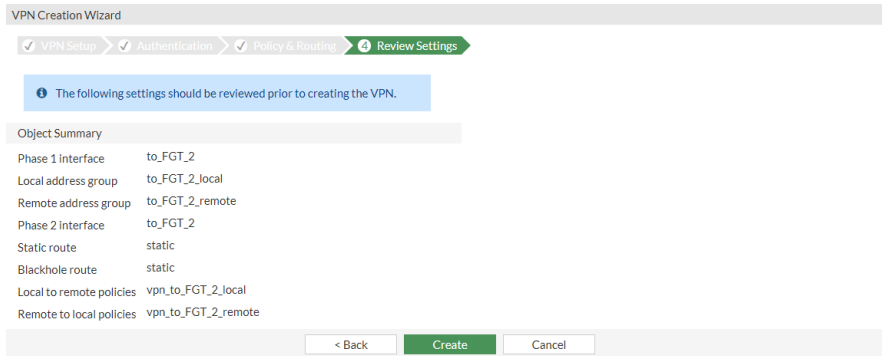

c. Click *Next*.

4. In the *Policy & Routing* pane:

- a. Set the *Local Interface* to the internal interface.
- b. Set the *Local Subnets* to include the internal and SSL VPN subnets for FGT_1.
- c. Set *Remote Subnets* to include the internal subnet for FGT_2.

d. Click *Next*.

5. Review the VPN settings and click *Create*.

A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.

VPN Creation Wizard

VPN Setup
 Authentication
 Policy & Routing
 Review Settings

The VPN has been set up

Object Summary

Phase 1 interface	<input checked="" type="checkbox"/> to_FGT_2	<input type="button" value="Edit"/>
Local address group	<input checked="" type="checkbox"/> to_FGT_2_local	<input type="button" value="Edit"/>
Remote address group	<input checked="" type="checkbox"/> to_FGT_2_remote	<input type="button" value="Edit"/>
Phase 2 interface	<input checked="" type="checkbox"/> to_FGT_2	
Static route	<input checked="" type="checkbox"/> 2	<input type="button" value="Edit"/>
Blackhole route	<input checked="" type="checkbox"/> 3	<input type="button" value="Edit"/>
Local to remote policies	<input checked="" type="checkbox"/> vpn_to_FGT_2_local_0 (2)	
Remote to local policies	<input checked="" type="checkbox"/> vpn_to_FGT_2_remote_0 (3)	

To configure SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Listen on Interface(s)* to *wan1*.
3. To avoid port conflicts, set *Listen on Port* to *10443*.
4. Set *Restrict Access* to *Allow access from any host*.
5. In the Tunnel Mode Client Settings section, select *Specify custom IP ranges* and include the SSL VPN subnet range created by the *IPsec Wizard*.
6. In the *Authentication/Portal Mapping* section, add the *VPN user group* to the *tunnel-access Portal*. Set *All Other Users/Groups* to the *web-access Portal*.

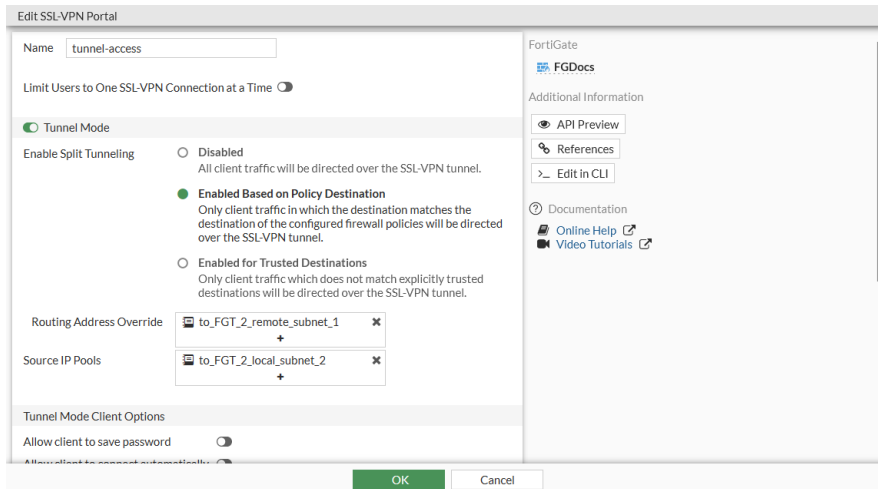

It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the [SSL VPN best practices on page 1718](#) and learn how to [Procuring and importing a signed SSL certificate on page 2303](#).

7. Click *Apply*.

To configure SSL VPN portal:

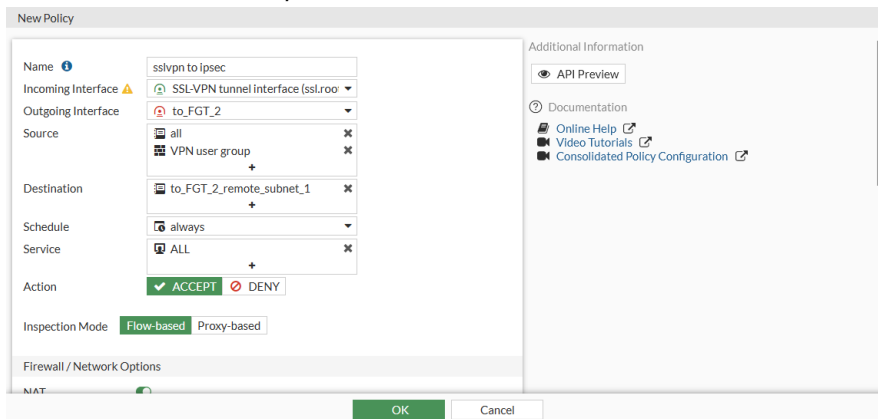

1. Go to *VPN > SSL-VPN Portals*.
2. Select *tunnel-access* and click *Edit*.
3. Turn on *Enable Split Tunneling* so that only traffic intended for the local or remote networks flow through FGT_1 and follows corporate security profiles.
4. For *Routing Address*, add the local and remote IPsec VPN subnets created by the *IPsec Wizard*.
5. For *Source IP Pools*, add the SSL VPN subnet range created by the *IPsec Wizard*.

6. Click **OK**.

To add policies to FGT_1:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* to create a policy that allows SSL VPN users access to the IPsec VPN tunnel.
3. For *Incoming Interface*, select *ssl.root*.
4. For *Outgoing Interface*, select the IPsec tunnel interface *to_FGT_2*.
5. Set the *Source* to *all* and the *VPN user group*.
6. Set *Destination* to the remote IPsec VPN subnet.
7. Specify the *Schedule*.
8. Set the *Service* to *ALL*.
9. In the *Firewall/Network Options* section, disable *NAT*.

10. Click **OK**.

To configure the site-to-site IPsec VPN on FGT_2:

1. Go to *VPN > IPsec Wizard*.
2. In the *VPN Setup* pane:
 - a. Specify the VPN connection *Name* as *to_FGT_1*.
 - b. Select *Site to Site*.

- c. Click *Next*.
3. In the *Authentication* pane:
 - a. Enter the *IP Address* to the Internet-facing interface.
 - b. For *Authentication Method*, click *Pre-shared Key* and enter the *Pre-shared Key* of the FGT_1.
 - c. Click *Next*.
4. In the *Policy & Routing* pane:
 - a. Set the *Local Interface* to the internal interface.
 - b. Set the *Local Subnets* to include the internal and SSL VPN subnets for FGT_2.
 - c. Set *Remote Subnets* to include the internal subnet for FGT_1.
 - d. Click *Create*.

A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.

To check the results:

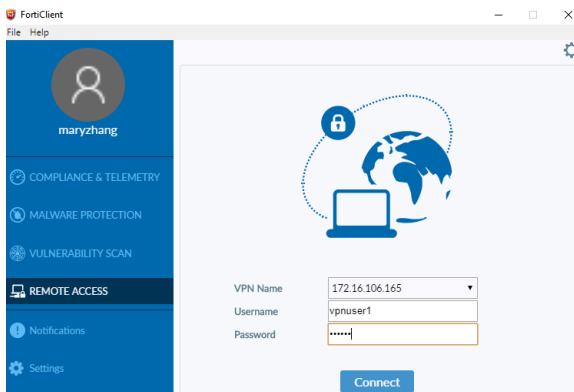

1. Go to *Dashboard > Network* and click the *IPsec* widget to expand to full screen view.
2. Select the tunnel and click *Bring Up*.

Name	Remote Gateway	Peer ID	Incoming Data	Outgoing Data	Phase 1	Phase 2 Selectors
to_FGT_2	11.101.1.2		0 B	0 B	to_FGT_2	to_FGT_2

Updated: 15:07:15

3. Verify that the *Status* changes to *Up*.
4. Configure the SSL VPN connection on the user's FortiClient and connect to the tunnel.

5. On the user's computer, send a ping through the tunnel to the remote endpoint to confirm access:

```
C:\>ping 172.16.200.55
```

```
Pinging 172.16.200.55 with 32 bytes of data:
Reply from 172.16.200.55: bytes=32 times=2ms TTL=62
Reply from 172.16.200.55: bytes=32 times=1ms TTL=62
Reply from 172.16.200.55: bytes=32 times=1ms TTL=62
Reply from 172.16.200.55: bytes=32 times=1ms TTL=62
```

```
Ping statistics for 172.16.200.55:
```

```
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),  
Approximate round trip time in milli-seconds:  
Minimum = 1ms, Maximum = 2ms, Average = 1ms
```

6. In FortiOS, go to the following pages for further verification:
 - a. Go to *Dashboard > Network* and click the *Routing* widget to verify the IPsec and SSL VPNs are added.
 - b. Go to *VPN > SSL-VPN Clients* to verify the connected users.
 - c. Go to *VPN > VPN Location Map* to view the connection activity.
 - d. Go to *Log & Report > Events > VPN Events* to view tunnel statistics.
 - e. Go to *Dashboard > FortiView Policies* to view the policy usage.

Troubleshooting

To troubleshoot on FGT_1, use the following CLI commands:

```
diagnose debug reset  
diagnose debug flow show function-name enable  
diagnose debug flow show iprope enable  
diagnose debug flow filter addr 172.16.200.55  
diagnose debug flow filter proto 1  
diagnose debug flow trace start 2  
diagnose debug enable
```

To troubleshoot using ping:

1. Send a ping through the SSL VPN tunnel to 172.16.200.55 and analyze the output of the debug.
2. Disable the debug output with: `diagnose debug disable`.

If traffic is entering the correct VPN tunnel on FGT_1, then run the same commands on FGT_2 to check whether the traffic is reaching the correct tunnel. If it is reaching the correct tunnel, confirm that the SSL VPN tunnel range is configured in the remote side quick mode selectors.

To troubleshoot using a sniffer command:

```
diagnose sniff packet any "host 172.16.200.44 and icmp" 4
```

To troubleshoot IPsec VPN issues, use the following commands on either FortiGate:

```
diagnose debug reset  
diagnose vpn ike gateway clear  
diagnose debug application ike -1  
diagnose debug enable
```

SSL VPN protocols

The following topics provide information about SSL VPN protocols:

- [TLS 1.3 support on page 1865](#)
- [SMBv2 support on page 1865](#)
- [DTLS support on page 1866](#)

TLS 1.3 support

FortiOS supports TLS 1.3 for SSL VPN.

TLS 1.3 support requires IPS engine 4.205 or later and endpoints running FortiClient 6.2.0 or later.

To establish a client SSL VPN connection with TLS 1.3 to the FortiGate:

1. Enable TLS 1.3 support using the CLI:

```
config vpn ssl setting
  set ssl-max-proto-ver tls1-3
  set ssl-min-proto-ver tls1-3
end
```

2. Configure the SSL VPN settings (see [SSL VPN full tunnel for remote user on page 1735](#)).
3. Configure the firewall policy (see [Policies on page 848](#)).
4. For Linux clients, ensure OpenSSL 1.1.1a is installed:

- a. Run the following commands in the Linux client terminal:

```
root@PC1:~/tools# openssl
OpenSSL> version
```

If OpenSSL 1.1.1a is installed, the system displays a response like the following:

```
OpenSSL 1.1.1a 20 Nov 2018
```

5. For Linux clients, use OpenSSL with the TLS 1.3 option to connect to SSL VPN:

- a. Run the following command in the Linux client terminal:

```
#openssl s_client -connect 10.1.100.10:10443 -tls1_3
```

6. Ensure the SSL VPN connection is established with TLS 1.3 using the CLI:

```
# diagnose debug application sslvpn -1
# diagnose debug enable
```

The system displays a response like the following:

```
[207:root:1d]SSL established: TLSv1.3 TLS_AES_256_GCM_SHA384
```

Deep inspection (flow-based)

FortiOS supports TLS 1.3 for policies that have the following security profiles applied:

- Web filter profile with flow-based inspection mode enabled.
- Deep inspection SSL/SSH inspection profile.

For example, when a client attempts to access a website that supports TLS 1.3, FortiOS sends the traffic to the IPS engine. The IPS engine then decodes TLS 1.3 and the client is able to access the website.

SMBv2 support

On all FortiGate models, SMBv2 is enabled by default for SSL VPN. Client PCs can access the SMBv2 server using SSL VPN web-only mode.

To configure SMBv2:

1. Set the minimum and maximum SMB versions.

```
config vpn ssl web portal
  edit portal-name
    set smb-min-version smbv2
    set smb-max-version smbv3
  next
end
```

2. Configure the SSL VPN settings (see [SSL VPN full tunnel for remote user on page 1735](#)).
3. Configure the firewall policy (see [Policies on page 848](#)).
4. Connect to the SSL VPN web portal and create an SMB bookmark for the SMBv2 server.
5. Click the bookmark to connect to the SMBv2 server.
6. On the FortiGate, use package capture to verify that SMBv2 works:

8	-440785802.3...	172.16.200.10	172.16.200.44	SMB2	252 Negotiate Protocol Request
9	-440785802.3...	172.16.200.44	172.16.200.10	SMB2	338 Negotiate Protocol Response

DTLS support

FortiOS Datagram Transport Layer Security (DTLS) allows SSL VPN to encrypt traffic using TLS and uses UDP as the transport layer instead of TCP. This avoids retransmission problems that can occur with TCP-in-TCP.

To establish a client SSL VPN connection with DTLS to the FortiGate:

1. Enable the DTLS tunnel in the CLI:

```
config vpn ssl setting
  set dtls-tunnel enable
end
```

2. Configure the SSL VPN settings (see [SSL VPN full tunnel for remote user on page 1735](#)).
3. Configure the firewall policy (see [Policies on page 848](#)).
4. In FortiClient, use the *Preferred DTLS Tunnel* option to connect to SSL VPN with DTLS:
 - a. Go to *Settings* and expand the *VPN Options* section.
 - b. Enable *Preferred DTLS Tunnel*.

FortiClient 5.4.0 to 5.4.3 uses DTLS by default. FortiClient 5.4.4 and later uses normal TLS, regardless of the DTLS setting on the FortiGate.

- c. Click *Save*.

5. In FortiOS, run diagnostics to ensure the SSL VPN connection is established with DTLS:

```
# diagnose debug application sslvpn -1
# diagnose debug enable
```

The system displays a response like the following:

```
[304:vdom1:7]DTLS established: DTLSv1 ECDHE-RSA-AES256-GCM-SHA384
```

Configuring OS and host check

Beyond the basics of setting up the SSL VPN, you can configure a number of other options that can help to ensure your internal network is secure and can limit the possibility of attacks and viruses entering the network from an outside source. These include verifying OS and performing host checks on software running on the remote device.

Verifying remote user OS

To verify that remote users are using devices with up-to-date Operating Systems to connect to your network, you can configure a host check for Windows and Mac OS. You can configure an OS host check for specific OS versions, such as Windows 7, 8, 8.1, 10, and 2000.

To configure an OS host check for specific OS versions:

1. Go to *VPN > SSL-VPN*.
2. Click *Create New*.
3. Enable *Restrict to Specific OS Versions*.
4. Select an OS version and click *Edit* to change the action.
5. Select the action:
 - *Allow*: The selected OS version is allowed to connect. This is the default action.
 - *Block*: The selected OS version is not allowed to connect.
 - *Check up to date*: Specify a *Tolerance* and *Latest patch level* that is allowed for the selected OS version.
6. Click *OK*.
7. Configure other parameters as needed.
8. Click *OK*.

Host check

Host check verifies whether the client device has AntiVirus, firewall, both, or other custom security software enabled on their Windows device. Admins may also define their own custom host check software, which supports Windows and Mac OS. See [Creating a custom host check list on page 1869](#).

Host Check is only available for SSL VPN tunnel mode.

To configure host checking:

1. Go to *VPN > SSL-VPN Portal*.
2. Click *Create New*.
3. Enable *Host Check*.
4. Set the *Type*:
 - *Realtime AntiVirus*: Checks that AntiVirus software recognized by Windows Security Center is enabled.
 - *Firewall*: Checks that firewall software recognized by Windows Security Center is enabled.

- *Enable both*: Checks that both *Realtime AntiVirus* and *Firewall* are enabled.
- *Custom*: Not configurable from the GUI. See CLI settings below.

5. Configure other parameters as needed.

6. Click **OK**.

You can configure the full-access portal to perform a custom host check for FortiClient Host Security AV and firewall software.

To configure custom host checking:

```
config vpn ssl web portal
  edit full-access
    set host-check custom
    set host-check-policy FortiClient-AV FortiClient-FW
  next
end
```

Many other security software can also be configured. Use `set host-check-policy ?` to see a list of software.

Replacing the host check error message

You can add your own host security check error message using either the GUI or the CLI. The default message reads:

```
Your PC does not meet the host checking requirements set by the firewall. Please try again
in a few minutes. If the issue persists check that your OS version meets the minimum
requirements, that your antivirus and firewall applications are installed and running
properly, and that you have the correct network interface.
```

To replace the host check error message in the GUI:

1. Go to *System > Replacement Messages*.
2. Select *Extended View* in the upper right corner.
3. Scroll down to *SSL-VPN* and select *Hostcheck Error Message*.
4. Click *Edit*. The *Hostcheck Error Message* pane opens.
5. Edit the text in the right-hand column.
6. Click *Save*.

If you are unhappy with the new message, you can restore the message to its default by selecting *Restore Defaults* instead of *Save*.

MAC address check

Aside from OS and Host check, FortiGate can also perform a MAC address check on the remote host.

To configure a MAC address check on the remote host in the CLI:

```

config vpn ssl web portal
  edit <portal_name>
    set mac-addr-check enable
    config mac-addr-check-rule
      edit <rule_name>
        set mac-addr-list <address> [address]
        set mac-addr-mask <mask between 1-48>
      next
    end
    set set mac-addr-action {allow | deny}
  next
end

```

Creating a custom host check list

You can add your own software requirements to the host check list using the CLI. Host integrity checking is only possible with client computers running Microsoft Windows platforms.

To add software requirements to the host check list:

```

config vpn ssl web host-check-software
  edit <software_name>
    set os-type {windows | macos}
    set type {av | fw}
    set version <version_number>
    set guid <guid_value>
    config check-item-list
      edit <ID>
        set action {require | deny}
        set type {file | registry | process}
        set target <target string>
        set version <version string>
        set md5s <hex string>
      next
    end
  next
end

```

If known, enter the Globally Unique Identifier (GUID) for the host check application. Windows uses GUIDs to identify applications in the Windows Registry. The GUID can be found in the Windows registry in the `HKEY_CLASSES_ROOT` section.

To obtain the exact versioning, in Windows, right-click on the .EXE file of the application and select *Properties*, then select the *Version* tab.

Example: Tunnel Mode Host Check - Registry Key Check

The following example configuration checks if a required registry key is present on a Windows device.

```

config vpn ssl web host-check-software
  edit <computer_name>
    config check-item-list
      edit 1

```

```

        set target "HKEY_LOCAL_
MACHINE\\SYSTEM\\CurrentControlSet\\Control\\ComputerName\\ActiveComputerName:ComputerName=W
INXP32SP3B62"
        set type registry
    next
end
next
end

```

Example: Tunnel Mode Host Check - Application Running Check

The following example configuration checks if a required application is installed and/or running:

```

config vpn ssl web host-check-software
    edit "calc"
        config check-item-list
            edit 1
                set target "calc.exe"
                set type process
            next
        end
    next
end

```

Example: Mac OS host check and process check

The `os-type` option is available under `vpn ssl web host-check-software`; if `os-type` is `macos`, then `type`, `version` and `guid` are hidden. Furthermore, `type` in `check-item-list` can only be set to `file` or `process`.

```

config vpn ssl web portal
    edit <portal_name>
        set os-check enable
        config os-check-list macos-bigsur-11
            set action {allow | deny | check-up-to-date}
            set tolerance <value>
            set latest-patch-level <value>
        end
    next
end
config vpn ssl web host-check-software
    edit <name>
        set os-type macos
        config check-item-list
            edit <name>
                set type process
                set target <target process>
            next
        end
    next
end

```

Example: Configuring Windows OS Check with patch version

The Windows patch check enables you to define the minimum Windows version and patch level allowed when connecting to the SSL VPN portal. When the user attempts to connect to the web portal, FortiOS performs a query on the

version of Windows the user has installed. If it does not match the minimum requirement, the connection is denied. The Windows patch check is configured in the CLI.

To specify the acceptable patch level, you set the `latest-patch-level` and the `tolerance`. The lowest acceptable patch level is `latest-patch-level` minus `tolerance`. In this case, `latest-patch-level` is three and `tolerance` is one, so two is the lowest acceptable patch level.

To configure OS check:

```
config vpn ssl web portal
  edit <portal_name>
    set os-check enable
    config os-check-list <windows OS version>
      set action {allow | check-up-to-date | deny}
      set latest-patch-level {disable | 0 - 65535}
      set tolerance <tolerance_num>
    end
  next
end
```

Example: Host check for Windows firewall

The Windows built-in firewall does not have a GUID in `root\securitycenter` or `root\securitycenter2`, but you can use a registry value to detect the firewall status.

If Windows firewall is on, the following registry value will be set to one:

- **KeyName:** HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\StandardProfile
- **ValueName:** EnableFirewall

In FortiOS, use the `registry-value-check` feature to define the Windows firewall software.

To define the Windows firewall software:

```
config vpn ssl web host-check-software
  edit "Microsoft-Windows-Firewall"
    set type fw
    config check-item-list
      edit 1
        set target
        "HKLM\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\StandardProfile:EnableFirewall==1"
        set type registry
      next
      edit 2
        set target
        "HKLM\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\PublicProfile:EnableFirewall==1"
        set type registry
      next
      edit 3
        set target
        "HKLM\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\DomainProfile:EnableFirewall==1"
        set type registry
    end
  next
end
```

```

        next
    end
next
end
config vpn ssl web portal
    edit <portal_name>
        set host-check custom
        set host-check-policy Microsoft-Windows-Firewall
    next
end

```

Troubleshooting

To troubleshoot OS and host check, enable the following real-time debugs from the CLI:

```

# diagnose debug app sslvpn -1
# diagnose debug enable

```

From the remote client, connect to SSL VPN. Look for debug output similar to the following:

```
[263:root:3cca1]host check result:4 0100,10.0.19042,74:78:27:4d:81:93|84:1b:77:3a:95:84
```

To interpret the above output:

Field	Description
host check result: 4	This is the hex number of portal's host check value: <ul style="list-style-type: none"> 0: None 1: Check antivirus 2: Check firewall 3: Check antivirus and firewall 4: Custom check
0100	The 4 bytes shows the result of host check checking in the FortiGate Settings. Position counts from left to right, zero to three: <ul style="list-style-type: none"> Position zero means result of third party firewall. Position one means result of third party antivirus. Position two means result of FortiClient firewall. Position three means result of FortiClient antivirus. 0 means not in use. 1 means in use.
10.0.19042	This is the OS version.
74:78:27:4d:81:93 84:1b:77:3a:95:84	The MAC address of the client machine's network interface, that is used for the mac address check. Multiple MAC address are separately by ' '

FortiGate as SSL VPN Client

The FortiGate can be configured as an SSL VPN client, using an *SSL-VPN Tunnel* interface type. When an SSL VPN client connection is established, the client dynamically adds a route to the subnets that are returned by the SSL VPN server. Policies can be defined to allow users that are behind the client to be tunneled through SSL VPN to destinations on the SSL VPN server.

FortiOS can be configured as an SSL VPN server that allows IP-level connectivity in tunnel mode, and can act as an SSL VPN client that uses the protocol used by the FortiOS SSL VPN server. This allows hub-and-spoke topologies to be configured with FortiGates as both the SSL VPN hub and spokes.

For an IP-level VPN between a device and a VPN server, this can be useful to avoid issues caused by intermediate devices, such as:

- ESP packets being blocked.
- UDP ports 500 or 4500 being blocked.
- Fragments being dropped, causing IKE negotiation that uses large certificates to fail if the peer does not support IKE fragmentation.

If the client specified destination is *all*, a default route is effectively dynamically created on the SSL VPN client, and the new default route is added to the existing default route in the form of ECMP. Some examples how to configure routing are:

- To make all traffic default to the SSL VPN server and still have a route to the server's listening interface, on the SSL VPN client set a lower distance for the default route that is learned from the server.
- To include both default routes in the routing table, with the route learned from the SSL VPN server taking priority, on the SSL VPN client set a lower distance for the route learned from the server. If the distance is already zero, then increase the priority on the default route.
- To avoid a default being learned on the SSL VPN client, on the SSL VPN server define a specific destination.

Example

In this example, the home FortiGate (FGT-A) is configured as an SSL VPN client, and the company FortiGate (FGT-B) is configured as an SSL VPN server. After FGT-A connects to FGT-B, the devices that are connected to FGT-A can access the resources behind FGT-B.

The SSL VPN server has a custom server certificate defined, and the SSL VPN client user uses PSK and a PKI client certificate to authenticate. The FortiGates must have the proper CA certificate installed to verify the certificate chain to the root CA that signed the certificate.

Split tunneling is used so that only the destination addresses defined in the server's firewall policies are routed to the server, and all other traffic is connected directly to the internet.

Configure the SSL VPN server

To create a local user in the GUI:

1. Go to *User & Authentication > User Definition* and click *Create New*.
2. Use the wizard to create a local user named *client2*.

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to *User & Authentication > PKI* and click *Create New*.
2. Set the *Name* to *pki*.
3. Set *CA* to the CA certificate that is used to verify the client certificate.

4. Click *OK*.
5. In the CLI, specify the CN that must be matched. If no CN is specified, then any certificate that is signed by the CA will be valid and matched.

```
config user peer
  edit "pki"
    set cn "/*.fos.automation.com"
```

```

    next
end

```

To create an SSL VPN portal in the GUI:

1. Go to *VPN > SSL-VPN Portals* and click *Create New*.
2. Set the *Name* to *testportal2*.
3. Set *Enable Split Tunneling* to *Enabled Based on Policy Destination*.
4. Set *Source IP Pools* to *SSLVPN_TUNNEL_ADDR1*.
5. Click *OK*.

To configure SSL VPN settings in the GUI:

1. Go to *VPN > SSL-VPN Settings* and enable *Enable SSL-VPN*.
2. Set *Listen on Interface(s)* to *port2*.
3. Set *Listen on Port* to *1443*.
4. Set *Server Certificate* to *fgt_gui_automation*.
5. In the *Authentication/Portal Mapping* table click *Create New*:
 - a. Set *Users/Groups* to *client2*.
 - b. Set *Portal* to *testportal2*.
 - c. Click *OK*.
6. Click *OK*.
7. In the CLI, enable SSL VPN client certificate restrictive and set the user peer to *pki*:

```

config vpn ssl settings
    config authentication-rule
        edit 1
            set client-cert enable
            set user-peer "pki"
        next
    end
end

```

To create a firewall address in the GUI:

1. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
2. Set the *Name* to *bing.com*.
3. Set *Type* to *FQDN*.
4. Set *FQDN* to *www.bing.com*.
5. Click *OK*.

To create a firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the policy:

Name	<i>sslvpn2</i>
-------------	----------------

Incoming Interface	<i>SSL-VPN tunnel interface (ssl.root)</i>
Outgoing Interface	<i>port1</i>
Source	<i>Address: all</i> <i>User: client2</i>
Destination	<i>bing.com: This FQDN resolves to 13.107.21.200 and 204.79.197.200. Traffic to these addresses is directed to the SSL VPN, while other traffic is routed to the remote devices' default adapters or interfaces.</i> <i>mantis</i>
Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>Accept</i>

3. Click *OK*.

To configure the SSL VPN server (FGT-B) in the CLI:

1. Create a local user:

```
config user local
  edit "client2"
    set passwd *****
  next
end
```

2. Create a PKI user:

```
config user peer
  edit "pki"
    set ca "CA_Cert_3"
    set cn "*.fos.automation.com"
  next
end
```

3. Create a new SSL VPN portal:

```
config vpn ssl web portal
  edit "testportal2"
    set tunnel-mode enable
    set ipv6-tunnel-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set split-tunneling enable
    set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set ipv6-split-tunneling enable
    ....
  next
end
```

4. Configure SSL VPN settings, including the authentication rule for user mapping:

```
config vpn ssl settings
  set ssl-min-proto-ver tls1-1
  set servercert "fgt_gui_automation"
```

```

set auth-timeout 0
set login-attempt-limit 10
set login-timeout 180
set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
set dns-suffix "sslvpn.com"
set port 1443
set source-interface "port2"
set source-address "all"
set source-address6 "all"
set default-portal "testportal1"
config authentication-rule
    edit 1
        set users "client2"
        set portal "testportal2"
        set client-cert enable
        set user-peer "pki"
    next
end
end

```

5. Create a firewall address and policy. The destination addresses used in the policy are routed to the SSL VPN server.

```

config firewall address
    edit "bing.com"
        set type fqdn
        set fqdn "www.bing.com"
    next
end

config firewall policy
    edit 2
        set name "sslvpn2"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "mantis" "bing.com"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "client2"
    next
end

```

Configure the SSL VPN client

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to *User & Authentication > PKI* and click *Create New*.
2. Set the *Name* to *fgt_gui_automation*.
3. Set *CA* to the CA certificate. The CA certificate allows the FortiGate to complete the certificate chain and verify the server's certificate, and is assumed to already be installed on the FortiGate.
4. Click *OK*.
5. In the CLI, specify the CN of the certificate on the SSL VPN server:

```
config user peer
  edit "fgt_gui_automation"
    set cn "*.fos.automation.com"
  next
end
```

To create an SSL VPN client and virtual interface in the GUI:

1. Go to *VPN > SSL-VPN Clients* and click *Create New*.
2. Expand the *Interface* drop down and click *Create* to create a new virtual interface:
 - a. Set the *Name* to *sslclient_port1*.
 - b. Set *Interface* to *port1*.
 - c. Under *Administrative Access*, select *HTTPS* and *PING*.

The screenshot shows the 'New SSL-VPN Client' configuration window with the 'New Interface' tab selected. The configuration is as follows:

- Name:** sslclient_port1
- Interface:** port1
- Role:** LAN
- Administrative Access:**
 - IPv4: HTTPS, HTTP, PING, SSH, SNMP
 - FMG-Access, FTM, RADIUS Accounting, Security Fabric Connection
- Traffic Shaping:** Outbound shaping profile:
- Miscellaneous:** Comments: 0/255, Status: Enabled, Disabled

- d. Click *OK*.

3. Configure the SSL VPN client:

Name	<i>sslclientTo9</i>
Interface	<i>sslclient_port1</i>
Server	<i>172.16.200.9</i>
Port	<i>1443</i>
Username	<i>client2</i>
Pre-shared Key	<i>*****</i>
Client Certificate	<i>fgtb_gui_automation</i> This is the local certificate that is used to identify this client, and is assumed to already be installed on the FortiGate. The SSL VPN server requires it for authentication.
Peer	<i>fgt_gui_automation</i>
Administrative Distance	Configure as needed.
Priority	Configure as needed.
Status	Enabled

4. Click *OK*.**To create a firewall policy in the GUI:**

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the policy:

Name	<i>policy_to_sslvpn_tunnel</i>
Incoming Interface	<i>port2</i>
Outgoing Interface	<i>sslclient_port1</i>
Source	<i>all</i>
Destination	<i>all</i>
Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>Accept</i>

3. Click *OK*.**To configure the SSL VPN client (FGT-A) in the CLI:**

1. Create the PKI user. Use the CA that signed the certificate *fgt_gui_automation*, and the CN of that certificate on the SSL VPN server.

```
config user peer
  edit "fgt_gui_automation"
```

```

    set ca "GUI_CA"
    set cn "*.fos.automation.com"
  next
end

```

2. Create the SSL interface that is used for the SSL VPN connection:

```

config system interface
  edit "sslclient_port1"
    set vdom "vdom1"
    set allowaccess ping https
    set type ssl
    set role lan
    set snmp-index 46
    set interface "port1"
  next
end

```

3. Create the SSL VPN client to use the PKI user and the client certificate *fgtb_gui_automation*:

```

config vpn ssl client
  edit "sslclientTo9"
    set interface "sslclient_port1"
    set user "client2"
    set psk 123456
    set peer "fgt_gui_automation"
    set server "172.16.200.9"
    set port 1443
    set certificate "fgtb_gui_automation"
  next
end

```

4. Create a firewall policy:

```

config firewall policy
  edit 1
    set name "policy_to_sslvpn_tunnel"
    set srcintf "port2"
    set dstintf "sslclient_port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end

```

Verification

After the tunnel is established, the route to 13.107.21.200 and 204.79.197.200 on FGT-A connects through the SSL VPN virtual interface *sslclient_port1*.

To check the routing table details:

```

(vdom1) # get router info routing-table details
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP

```

```

O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default

```

Routing table for VRF=0

```

S*  0.0.0.0/0 [10/0] via 172.16.200.254, port1
C   10.0.1.0/24 is directly connected, link_11
C   10.1.100.0/24 is directly connected, port2
      is directly connected, port2
C   10.212.134.200/32 is directly connected, sslclient_port1
S   13.107.21.200/32 [10/0] is directly connected, sslclient_port1
C   172.16.200.0/24 is directly connected, port1
S   192.168.100.126/32 [10/0] is directly connected, sslclient_port1
S   204.79.197.200/32 [10/0] is directly connected, sslclient_port1

```

To check the added routing for an IPv6 tunnel:

```

(vdom1) # get router info6 routing-table database
IPv6 Routing Table
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
      IA - OSPF inter area
      N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
      E1 - OSPF external type 1, E2 - OSPF external type 2
      i - IS-IS, B - BGP
      > - selected route, * - FIB route, p - stale info
Timers: Uptime

S   *> :::/0 [10/0] via 2000:172:16:200::254, port1, 00:00:01, [1024/0]
      *>      [10/0] via ::, sslclient_port1, 00:00:01, [1024/0]
C   *> ::1/128 via ::, vdom1, 03:26:35
C   *> 2000:10:0:1::/64 via ::, link_11, 03:26:35
C   *> 2000:10:1:100::/64 via ::, port2, 03:26:35
C   *> 2000:172:16:200::/64 via ::, port1, 03:26:35
C   *> 2001:1::1:100/128 via ::, sslclient_port1, 00:00:01
C   *> fe80::/64 via ::, port2, 03:26:35

```

To check the connection in the GUI:

1. On the SSL VPN server FortiGate (FGT-B), go to *Dashboard > Network* and expand the *SSL-VPN* widget.

2. On the SSL VPN client FortiGate (FGT-A), go to *VPN > SSL-VPN Clients* to see the tunnel list.

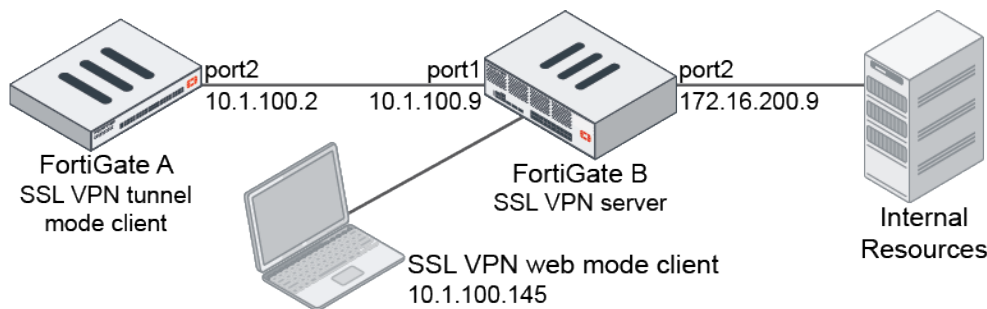

Dual stack IPv4 and IPv6 support for SSL VPN

Dual stack IPv4 and IPv6 support for SSL VPN servers and clients enables a client to establish a dual stack tunnel to allow both IPv4 and IPv6 traffic to pass through. FortiGate SSL VPN clients also support dual stack, which allows it to establish dual stack tunnels with other FortiGates.

Users connecting in web mode can connect to the web portal over IPv4 or IPv6. They can access bookmarks in either IPv4 or IPv6, depending on the preferred DNS setting of the web portal.

Example

In this example, FortiGate B works as an SSL VPN server with dual stack enabled. A test portal is configured to support tunnel mode and web mode SSL VPN.

FortiGate A is an SSL VPN client that connects to FortiGate B to establish an SSL VPN tunnel connection. It attempts to access `www.bing.com` and `www.apple.com` via separate IPv4 and IPv6 connections. Two addresses are configured on FortiGate B:

- `bing.com` uses IPv4 FQDN and resolves to 13.107.21.200 and 204.79.197.200.
- `apple_v6` uses IPv6 FQDN and resolves to 2600:140a:c000:385::1aca and 2600:140a:c000:398::1aca.

The server certificate used is `fgt_gui_automation`, and the CN is `*.fos.automation.com`.

A PC serves as a client to connect to FortiGate B in SSL VPN web mode. The PC can connect to the SSL VPN server over IPv4 or IPv6. Based on the preferred DNS setting, it will access the destination website over IPv4 or IPv6.

Dual stack tunnel mode support requires a supported client. In 7.0.0, a FortiGate in SSL VPN client mode can support dual stack tunnels. FortiClient 7.0.1 and later releases support dual stack.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the GUI:

1. Create a local user:
 - a. Go to *User & Authentication > User Definition* and click *Create New*. The *Users/Groups Creation Wizard* opens.
 - b. Set the *User Type* to *Local User* and click *Next*.
 - c. Enter the *Username* (`client2`) and password, then click *Next*.
 - d. Optionally, configure the contact information and click *Next*.
 - e. Click *Submit*.
2. Configure the addresses:

- a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
- b. Enter the following for the IPv4 address:

Category	Address
Name	bing.com
Type	FQDN
FQDN	www.bing.com

- c. Click *OK*.
- d. Click *Create New > Address* and enter the following for the IPv6 address:

Category	IPv6 Address
Name	apple_v6
Type	FQDN
FQDN	www.apple.com

- e. Click *OK*.
3. Configure the SSL VPN portal:
 - a. Go to *VPN > SSL-VPN Portals* and click *Create New*.
 - b. Enter a name (*testportal1*).
 - c. Enable *Tunnel Mode* and for *Enable Split Tunneling*, select *Enable Based on Policy Destination*.
 - d. For *Source IP Pools*, add *SSLVPN_TUNNEL_ADDR1*.
 - e. Enable *IPv6 Tunnel Mode* and for *Enable Split Tunneling*, select *Enable Based on Policy Destination*.
 - f. For *Source IP Pools*, add *SSLVPN_TUNNEL_IPv6_ADDR1*.
 - g. Enable *Enable Web Mode*.

New SSL-VPN Portal

Name:

Limit Users to One SSL-VPN Connection at a Time:

Tunnel Mode

Enable Split Tunneling

Disabled
All client traffic will be directed over the SSL-VPN tunnel.

Enabled Based on Policy Destination
Only client traffic in which the destination matches the destination of the configured firewall policies will be directed over the SSL-VPN tunnel.

Enabled for Trusted Destinations
Only client traffic which does not match explicitly trusted destinations will be directed over the SSL-VPN tunnel.

Routing Address Override:
Source IP Pools:

IPv6 Tunnel Mode

Enable IPv6 Split Tunneling

Disabled
All client traffic will be directed over the SSL-VPN tunnel.

Enabled Based on Policy Destination
Only client traffic in which the destination matches the destination of the configured firewall policies will be directed over the SSL-VPN tunnel.

Enabled for Trusted Destinations
Only client traffic which does not match explicitly trusted destinations will be directed over the SSL-VPN tunnel.

IPv6 Routing Address Override:
Source IPv6 Pools:

FortiGate

Additional Information
API Preview
Documentation
Online Help
Video Tutorials

OK Cancel

h. Click **OK**.

4. Configure the SSL VPN settings:

- a. Go to *VPN > SSL-VPN Settings* and configure the following:

Listen on Interface(s)	port1
Listen on Port	1443
Restrict Access	Allow access from any host
Server Certificate	fgt_gui_automation
Address Range	Automatically assign addresses
DNS Server	Same as client system DNS
Authentication/Portal Mapping	Edit the <i>All Other Users/Groups</i> entry to use <i>testportal1</i> .

- b. Click *Apply*.
 c. Enable dual stack in the CLI:

```
config vpn ssl settings
    set dual-stack-mode enable
end
```

5. Configure the firewall policy:

- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 b. Enter the following:

Name	sslvpn
Incoming Interface	ssl.root

Outgoing Interface	port2
Source	all (IPv4), all (IPv6), client2
Destination	bing.com, apple_v6
Schedule	Always
Service	All
NAT	Enabled

- c. Click *OK*.

To configure FortiGate A as an SSL VPN client in the GUI:

1. Create a peer to verify the server certificate:

The PKI menu is only available in the GUI (*User & Authentication > PKI*) after a PKI user has been created using the CLI, and a CN can only be configured in the CLI. If the CA is not known or is public, import the CA that signed the server certificate.

- a. Go to *User & Authentication > PKI* and click *Create New*.
- b. Set the *Name* to *fgt_gui_automation*.
- c. Set *CA* to the CA certificate that is used to verify the server certificate.
- d. Click *OK*.
- e. In the CLI, specify the CN that must be matched:

```
config user peer
  edit "fgt_gui_automation"
    set ca "GUI_CA"
    set cn "*.fos.automation.com"
  next
end
```

2. Configure the SSL VPN client:
 - a. Go to *VPN > SSL-VPN Clients* and click *Create New*.
 - b. In the *Interface* dropdown, click *Create*.
 - i. Enter a Name (*sslclient_port2*).
 - ii. Set *Interface* to *port2*.
 - iii. Set *Role* to *LAN*.

The screenshot shows the 'New Interface' configuration window for an SSL-VPN Tunnel. The configuration is as follows:

- Name: sslclient_port2
- Interface: port1 (wan1)
- Role: LAN
- Administrative Access:
 - IPv4:
 - Speed Test
 - PING
 - SNMP
 - Security Fabric Connection
 - HTTPS:
 - FMG-Access:
 - FTM:
 - HTTP: (selected)
 - SSH:
 - RADIUS Accounting:
- Traffic Shaping:
 - Outbound shaping profile: Off

iv. Click OK.

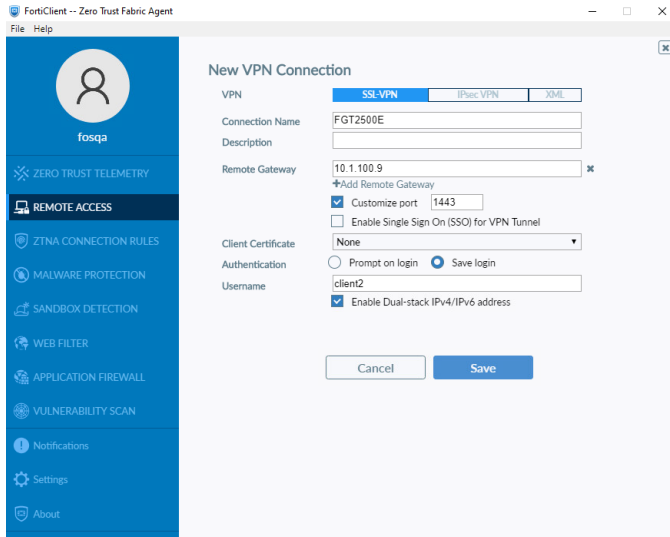

c. Configure the SSL VPN client:

Name	sslclientTo9
Interface	sslclient_port2
Server	Either IPv4 address <i>10.1.100.9</i> or IPv6 address <i>2000:10:1:100::9</i> can be used and will have the same results.
Port	1443
Username	client2
Pre-shared Key	*****
Peer	fgt_gui_automation
Status	Enabled

d. Click OK.

To configure FortiClient and connect to the VPN:

1. On the *Remote Access* tab and click *Configure VPN*, or if other connections have already been configured, click the sandwich icon and select *Add a new connection*.
2. Set *Connection Name* to *FGT2500E*, and *Remote Gateway* to *10.1.100.9*.
3. Enable *Customize port* and enter the port number *1443*.
4. Set *Username* to *client2*.
5. Enable *Enable Dual-stack IPv6/IPv6 address*.

6. Click **Save**.
7. Enter the password, then click **Connect**.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the CLI:

1. Create a local user:

```
config user local
  edit "client1"
    set type password
    set passwd "*****"
  next
end
```

2. Configure the addresses:

```
config firewall address
  edit "bing.com"
    set type fqdn
    set fqdn "www.bing.com"
  next
end

config firewall address6
  edit "apple_v6"
    set type fqdn
    set fqdn "www.apple.com"
  next
end
```

3. Configure the SSL VPN portal:

```
config vpn ssl web portal
  edit "testportal1"
    set tunnel-mode enable
    set ipv6-tunnel-mode enable
    set web-mode enable
    set ip-pools "SSLVPN_TUNNEL_ADDR1"
    set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
```

```
        set split-tunneling enable
        set ipv6-split-tunneling enable
    next
end
```

4. Configure the SSL VPN settings:

```
config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set port 1443
    set source-interface "port1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "testportal1"
    set dual-stack-mode enable
end
```

5. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "sslvpn"
        set srcintf "ssl.root"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "bing.com"
        set srcaddr6 "all"
        set dstaddr6 "apple_v6"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "client2"
    next
end
```

To configure FortiGate A as an SSL VPN client in the CLI:

1. Create a peer to verify the server certificate:

```
config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Configure the interface:

```
config system interface
    edit "sslclient_port2"
        set vdom "vdom1"
        set type ssl
        set role lan
        set snmp-index 46
        set interface "port2"
```

```

next
end

```

- Configure the SSL VPN client. Either IPv4 address 10.1.100.9 or IPv6 address 2000:10:1:100::9 can be used and will have the same results:

```

config vpn ssl client
  edit "sslclientTo9"
    set interface "sslclient_port2"
    set user "client2"
    set psk "*****"
    set peer "fgt_gui_automation"
    set server {10.1.100.9 | 2000:10:1:100::9}
    set port 1443
  next
end

```

Testing dual stack with tunnel mode

To verify the SSL VPN tunnel connection in the GUI:

- On FortiGate B, go to *Dashboard > Network*.
- Expand the *SSL-VPN* widget.

To verify the SSL VPN tunnel connection in the CLI:

- On FortiGate B, verify that the client is assigned with both IPv4 and IPv6 addresses:

```

(root) # get vpn ssl monitor
SSL VPN Login Users:
  Index  User   Group  Auth Type      Timeout      Auth-Timeout  From      HTTP
in/out  HTTPS in/out  Two-factor Auth
0       client2  1 (1)  292           2147483647   10.1.100.2
0/0    0/0    0

SSL VPN sessions:
  Index  User   Group  Source IP      Duration      I/O Bytes      Tunnel/Dest IP
0       client2  10.1.100.2  5427          1756/1772
10.212.134.200,fdff:ffff::1

```

- On FortiGate A, verify the routing tables.
 - IPv4 with resolved addresses for www.bing.com:

```

(vdom1) # get router info routing-table database
...
Routing table for VRF=0

```

```

S   *> 0.0.0.0/0 [10/0] via 172.16.200.254, port1
C   *> 10.0.1.0/24 is directly connected, link_11
C   *> 10.1.100.0/24 is directly connected, port2
C   *> 10.212.134.200/32 is directly connected, sslclient_port2
S   *> 13.107.21.200/32 [10/0] is directly connected, sslclient_port2
C   *> 172.16.200.0/24 is directly connected, port1
S   *> 204.79.197.200/32 [10/0] is directly connected, sslclient_port2

```

b. IPv6 with resolved addresses for www.apple.com:

```

(vdom1) # get router info6 routing-table database
...
S   *> ::/0 [10/0] via 2000:172:16:200::254, port1, 01:57:23, [1024/0]
C   *> ::1/128 via ::, vdom1, 06:12:54
C   *> 2000:10:0:1::/64 via ::, link_11, 06:12:54
C   *> 2000:10:1:100::/64 via ::, port2, 06:12:54
C   *> 2000:172:16:200::/64 via ::, port1, 06:12:54
S   *> 2600:140a:c000:385::1aca/128 [10/0] via ::, sslclient_port2, 01:33:08,
[1024/0]
S   *> 2600:140a:c000:398::1aca/128 [10/0] via ::, sslclient_port2, 01:33:08,
[1024/0]
C   *> fdff:ffff::/120 via ::, sslclient_port2, 01:33:08
C   *> fe80::/64 via ::, port2, 06:12:54

```

To test the address connections using ping:

1. On FortiGate A, ping www.bing.com using IPv4 ping:

```

# execute ping www.bing.com
PING www-bing-com.dual-a-0001.a-msedge.net (13.107.21.200): 56 data bytes
64 bytes from 13.107.21.200: icmp_seq=0 ttl=117 time=1.8 ms
...

```

2. On FortiGate B, sniff for IPv4 ICMP packets and observe the results:

```

# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
9.675101 ssl.root in 10.212.134.200 -> 13.107.21.200: icmp: echo request
9.675219 port2 out 172.16.200.9 -> 13.107.21.200: icmp: echo request
9.676698 port2 in 13.107.21.200 -> 172.16.200.9: icmp: echo reply
9.676708 ssl.root out 13.107.21.200 -> 10.212.134.200: icmp: echo reply
...

```

3. On FortiGate A, ping www.apple.com using IPv6 ping:

```

# execute ping6 www.apple.com
PING www.apple.com (2600:140a:c000:385::1aca): 56 data bytes
64 bytes from 2600:140a:c000:385::1aca: icmp_seq=1 ttl=52 time=1.88 ms
...

```

4. On FortiGate B, sniff for IPv6 ICMP packets and observe the results:

```

# diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
3.564296 ssl.root in fdff:fff::1 -> 2600:140a:c000:385::1aca: icmp6: echo request seq 1
3.564435 port2 out 2000:172:16:200::9 -> 2600:140a:c000:385::1aca: icmp6: echo request
seq 1

```

```

3.565929 port2 in 2600:140a:c000:385::1aca -> 2000:172:16:200::9: icmp6: echo reply seq
1 [flowlabel 0x1fdfff]
3.565953 ssl.root out 2600:140a:c000:385::1aca -> fdff:fff::1: icmp6: echo reply seq 1
[flowlabel 0x1fdfff]
...

```

Testing dual stack with web mode

In SSL VPN web mode, users can access both IPv4 and IPv6 bookmarks in the portal. The attribute, `prefer-ipv6-dns` can be enabled to prefer querying IPv6 DNS first, or disabled to prefer querying IPv4.

To test an IPv4 connection to the web portal and access www.bing.com over IPv6:

1. On FortiGate B, prioritize resolving IPv6 addresses:

```

config vpn ssl web portal
  edit "testportall"
    set prefer-ipv6-dns enable
  next
end

```

2. Log in to the web portal in the browser over the IPv4 address 10.1.100.9.
3. Create a new HTTP/HTTPS bookmark named *bing* for the URL www.bing.com.
4. Click the *bing* bookmark. The bing page will open over IPv6.

To test an IPv6 connection to the web portal and access www.apple.com over IPv4:

1. On FortiGate B, prioritize resolving IPv4 addresses:

```

config vpn ssl web portal
  edit "testportall"
    set prefer-ipv6-dns disable
  next
end

```

2. Log in to the web portal in the browser over the IPv6 address [2000:10:1:100::9].
3. Create a new HTTP/HTTPS bookmark named *apple* for the URL www.apple.com.

- Click the *apple* bookmark. The apple page will open over IPv4.

Disable the clipboard in SSL VPN web mode RDP connections

In web portal profiles, the clipboard can be disabled for SSL VPN web mode RDP/VNC connections. User will not be able to copy and paste content to or from the internal server.

Example

In this example, two groups of users are using SSL VPN web mode to access internal servers with RDP/VNC. One group is allowed to copy and paste content to and from the internal server using the clipboard, while the other is not.

To configure the SSL VPN portals in the GUI:

- Go to *VPN > SSL-VPN Portals* and click *Create New*.
- Enter a name for the portal, such as *testportal1*.
- Enable *Enable Web Mode* and enable *RDP/VNC clipboard* to allow copying and pasting.
- Configure the remaining settings as needed.

- Click *OK*.

6. Click *Create New* again.
7. Enter a name for the portal, such as *testportal2*.
8. Enable *Enable Web Mode* and disable *RDP/VNC clipboard* to prevent copying and pasting.
9. Configure the remaining settings as needed.

10. Click *OK*.

To configure the SSL VPN settings in the GUI:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Listen on Interface* to *port2*.
3. In the *Authentication/Portal Mapping* table, add the users to each of the portals:
 - a. Click *Create New*.
 - b. Set *Users/Groups* to *u1* and *Portal* to *testportal1*.
 - c. Click *OK*, then click *Create New* again.
 - d. Set *Users/Groups* to *u2* and *Portal* to *testportal2*.
 - e. Click *OK*.
4. Configure the remaining settings as needed.

Users/Groups	Portal
u1	testportal1
u2	testportal2
All Other Users/Groups	tunnel-access

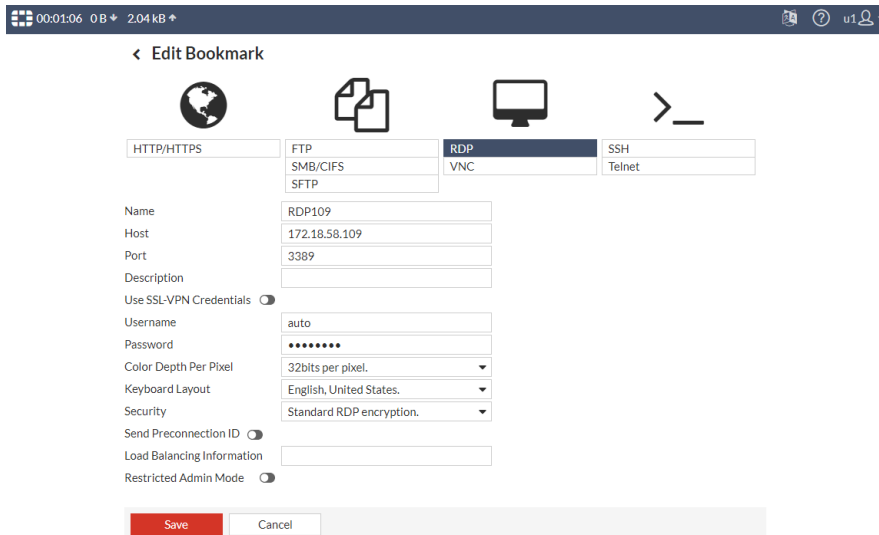

5. Click *Apply*.

To configure a firewall policy for SSL VPN in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Set a name for the policy, such as *policy_to_sslvpn_tunnel*.
3. Set *Incoming Interface* to the SSL VPN tunnel interface and *Outgoing Interface* to port1.
4. Set *Source* to the users, *u1* and *u2*, and all addresses.
5. Set *Destination* to all addresses.
6. Set *Schedule* to *always*, *Service* to *All*, and *Action* to *Accept*.
7. Configure the remaining settings as needed.
8. Click *OK*.

To test the if the users can use the clipboard:

1. On the PC, open a web browser and log in to the web portal as user *u1*.
2. Access the internal server using RDP/VNC.

3. The clipboard is available and you can copy and paste content to and from the remote server.

4. Log out of the web portal, then log back in as user *u2* and access the internal server using RDP/VNC. The clipboard is disabled.

To configure the SSL-VPN portals and settings in the CLI:

1. Configure the SSL VPN portals:

```
config vpn ssl web portal
  edit "testportal1"
    set web-mode enable
    set clipboard enable
    ...
  next
  edit "testportal2"
    set web-mode enable
    set clipboard disable
    ...
  next
end
```

2. Configure the SSL VPN settings:

```
config vpn ssl settings
  set port 1443
  set source-interface "port2"
  set source-address "all"
  set source-address6 "all"
  set default-portal "tunnel-access"
  config authentication-rule
    edit 1
```

```

        set users "u1"
        set portal "testportal1"
    next
    edit 2
        set users "u2"
        set portal "testportal2"
    next
end
end
end

```

3. Configure a firewall policy for SSL VPN:

```

config firewall policy
    edit 1
        set name "policy_to_sslvpn_tunnel"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "u1" "u2"
    next
end

```

4. On the PC, open a web browser, log in to the web portal as user *u1*, access the internal server using RDP/VNC, and use the clipboard.

5. Check the SSL VPN session monitor:

```

# get vpn ssl monitor
SSL-VPN Login Users:

```

Index	User	Group	Auth Type	Timeout	Auth-Timeout	From	HTTP
in/out	HTTPS	in/out	Two-factor Auth				
0	u1		1(1)	N/A	10.1.100.146	0/0	0/364 0

```

SSL-VPN sessions:

```

Index	User	Group	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	u1		10.1.100.146	64	0/700	RDP 172.18.58.109

6. On the PC, open a web browser, log in to the web portal as user *u2*, access the internal server using RDP/VNC, and note that the clipboard is not available.

7. Check the SSL VPN session monitor:

```

# get vpn ssl monitor
SSL-VPN Login Users:

```

Index	User	Group	Auth Type	Timeout	Auth-Timeout	From	HTTP
in/out	HTTPS	in/out	Two-factor Auth				
0	u2		1(1)	N/A	10.1.100.146	0/0	0/2681 0

```

SSL-VPN sessions:

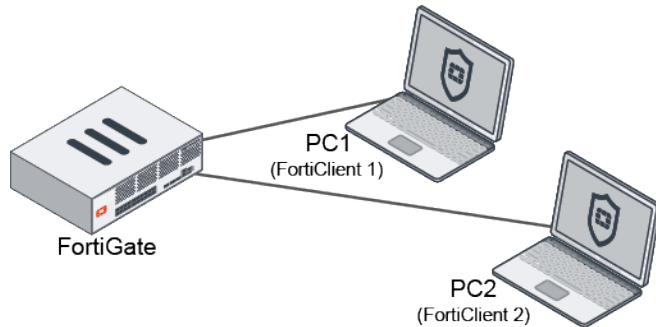

```

Index	User	Group	Source IP	Duration	I/O Bytes	Tunnel/Dest IP
0	u2		10.1.100.146	7	0/553	RDP 172.18.58.109

SSL VPN IP address assignments

When a user disconnects from a VPN tunnel, it is not always desirable for the released IP address to be used immediately. In SSL VPN, IP addresses can be assigned from the pool in a round robin fashion, instead of the default first-available address method.

Example

In this example, two PCs connect to the VPN. SSL VPN is configured to use round robin IP address assignment. Dual stack address assignment (both IPv4 and IPv6) is used.

After a tunnel is disconnected, freeing a low IP address, the next client that connects gets the next address in the round robin instead of the lowest address.

To configure SSL VPN with round robin and dual stack:

1. Create IPv4 and IPv6 address ranges:

```
config firewall address
  edit "sslvpn_ipv4_pool"
    set type iprange
    set start-ip 173.10.1.1
    set end-ip 173.10.1.3
  next
end

config firewall address6
  edit "sslvpn_ipv6_pool"
    set type iprange
    set start-ip 2000::ad0a:101
    set end-ip 2000::ad0a:103
  next
end
```

2. Set the address ranges as IP pools in the SSL VPN settings:

```
config vpn ssl settings
  set tunnel-ip-pools "sslvpn_ipv4_pool"
  set tunnel-ipv6-pools "sslvpn_ipv6_pool"
end
```

When round-robin is used, any address pools defined in the web portal are ignored and the tunnel IPv4 and IPv6 pool addresses in the SSL VPN settings are used. Only one set of IP pool addresses can be applied.

3. Enable round-robin and dual stack in the SSL VPN settings:

```
config vpn ssl settings
    set dual-stack-mode enable
    set tunnel-addr-assigned-method round-robin
end
```

By default, the IP pool assignment follows the first available rule.

4. Create two users and assign them to an SSL VPN policy:

```
config user local
    edit "u1"
        set type password
        set passwd *****
    next
    edit "u2"
        set type password
        set passwd *****
    next
end

config firewall policy
    edit 1
        set name "sslvpn"
        set srcintf "ssl.vdom1"
        set dstintf "link_11" "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "u1" "u2"
    next
end
```

To test the results:

1. Log in to the SSL VPN on PC1 using user u1 and then check its assigned IP address:

```
# get vpn ssl monitor
SSL-VPN Login Users:
  Index  User  Group  Auth Type  Timeout  Auth-Timeout  From  HTTP
in/out  HTTPS in/out  Two-factor Auth
  0      u1      1(1)      N/A      10.1.100.145  0/0  0/0  0

SSL-VPN sessions:
  Index  User  Group  Source IP  Duration  I/O Bytes  Tunnel/Dest IP
  0      u1      10.1.100.145  13  49935/35251
173.10.1.1,2000::ad0a:101
```

2. Log in to the SSL VPN on PC1 using user u2 and then check its assigned IP address:

```
# get vpn ssl monitor
SSL-VPN Login Users:
  Index  User  Group  Auth Type  Timeout  Auth-Timeout  From  HTTP
in/out  HTTPS in/out  Two-factor Auth
  0      u1    Group  1 (1)      N/A      10.1.100.145  0/0   0/0   0
  1      u2    Group  1 (1)      N/A      10.1.100.254  0/0   0/0   0

SSL-VPN sessions:
  Index  User  Group  Source IP  Duration  I/O Bytes  Tunnel/Dest IP
  0      u1    Group  10.1.100.145  44      90126/70405  173.10.1.1,2000::ad0a:101
  1      u2    Group  10.1.100.254  10      10563/8158   173.10.1.2,2000::ad0a:102
```

3. Log user u1 off of PC1, then log them back in and check that the assigned IP address is not the same as was previously assigned:

```
# get vpn ssl monitor
SSL-VPN Login Users:
  Index  User  Group  Auth Type  Timeout  Auth-Timeout  From  HTTP
in/out  HTTPS in/out  Two-factor Auth
  0      u1    Group  1 (1)      N/A      10.1.100.145  0/0   0/0   0
  1      u2    Group  1 (1)      N/A      10.1.100.254  0/0   0/0   0

SSL-VPN sessions:
  Index  User  Group  Source IP  Duration  I/O Bytes  Tunnel/Dest IP
  0      u1    Group  10.1.100.145  10      50992/41159  173.10.1.3,2000::ad0a:103
  1      u2    Group  10.1.100.254  43      30374/21860  173.10.1.2,2000::ad0a:102
```

Using SSL VPN interfaces in zones

SSL VPN interfaces can be used in zones, simplifying firewall policy configuration in some scenarios.

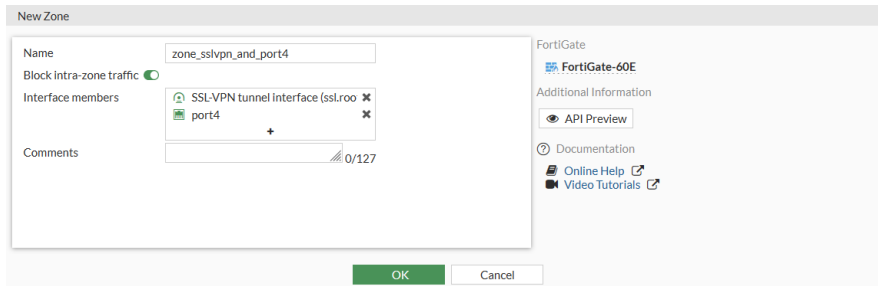

Example

In this example, a zone is created that includes a physical interface (port4) and an SSL VPN interface. The zone is used as the source interface in a firewall policy. PC1 is used for regular access with a firewall policy, and PC2 uses the SSL VPN for access.

To create a zone that includes the port4 and ssl.root interfaces in the GUI:

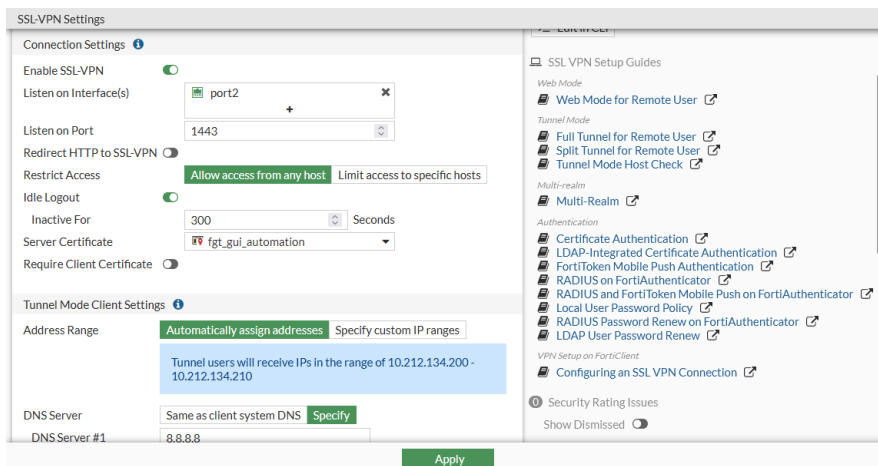

1. Go to *Network > Interfaces* and click *Create New > Zone*.
2. Set the name of the zone, such as *zone_sslvpn_and_port4*.
3. Add *port4* and *ssl.root* to the *Interface members*.

4. Click *OK*.

To configure SSL VPN settings in the GUI:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Listen on Interface(s)* to *port2*.
3. Set *Listen on Port* to *1443*.
4. Select a *Server Certificate* (*fgt_gui_automation* is used in this example).
5. Configure the remaining settings as required.

6. Click *Apply*.

To configure a firewall policy with the zone as the source interface in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Set the policy name, such as *policy_to_sslvpn_tunnel*.
3. Set *Incoming Interface* to *zone_sslvpn_and_port4*.
4. Set *Outgoing Interface* to *port1*.
5. Configure the remaining settings as required.

The screenshot shows the 'New Policy' configuration window in FortiGate. The configuration is as follows:

- Name:** policy_to_sslvpn_tunnel
- Incoming Interface:** zone_sslvpn_and_port4
- Outgoing Interface:** port1
- Source:** all
- Destination:** all
- Schedule:** always
- Service:** ALL
- Action:** ACCEPT (checked), DENY (unchecked)
- Inspection Mode:** Flow-based (selected), Proxy-based (unselected)
- Firewall / Network Options:**
 - NAT:** Disabled
 - IP Pool Configuration:** Use Outgoing Interface Address (selected), Use Dynamic IP Pool (unselected)

Additional Information on the right includes API Preview, Documentation, Online Help, Video Tutorials, and Consolidated Policy Configuration.

6. Click **OK**.

To configure the zone, SSL VPN, and policy in the CLI:

1. Create a zone that includes the port4 and ssl.root interfaces:

```
config system zone
    edit "zone_sslvpn_and_port4"
        set interface "port4" "ssl.root"
    next
end
```

2. Configure SSL VPN settings with port2 as the source interface:

```
config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set dns-server1 8.8.8.8
    set dns-server2 8.8.4.4
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "web-access"
end
```

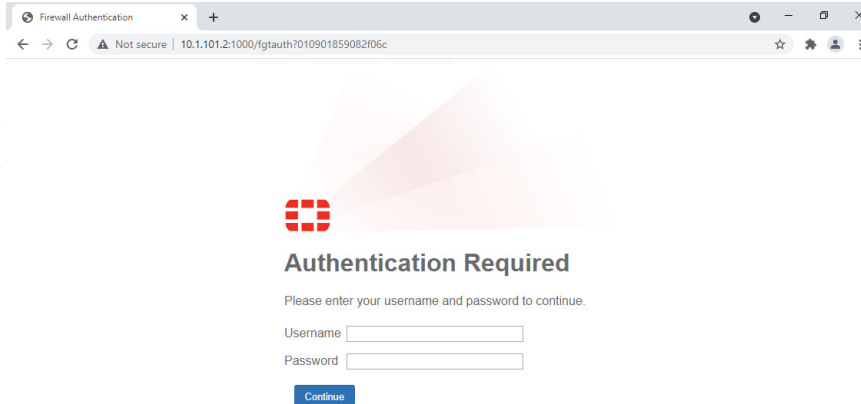

3. Configure a firewall policy with the zone as the source interface:

```
config firewall policy
    edit 2
        set name "policy_to_sslvpn_tunnel"
        set srcintf "zone_sslvpn_and_port4"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set users "u1"
    end
```

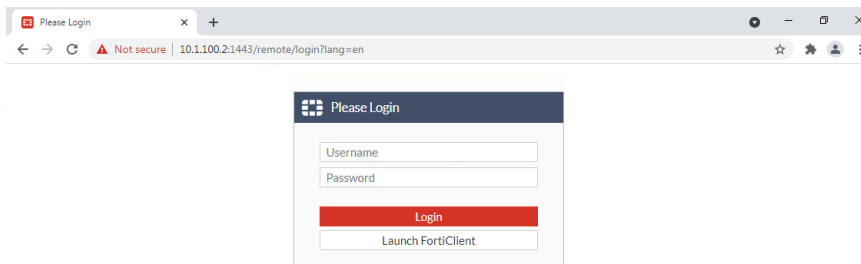

next
end

To test the configuration:

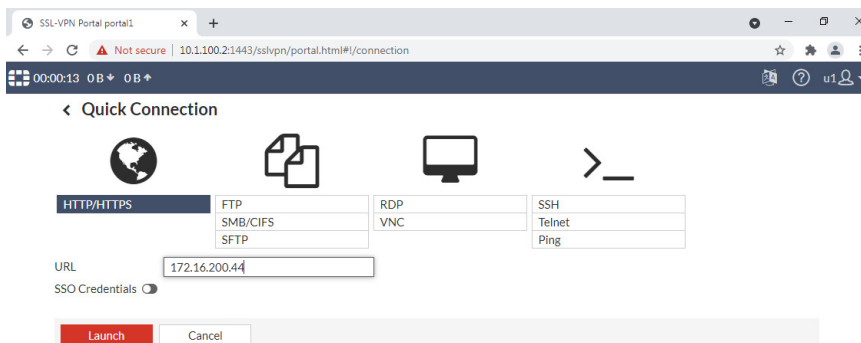

1. On PC1, open a browser and try to access the server at 172.16.200.44.
You are redirected to the authentication page.

2. Enter the *Username* and *Password*, then click *Continue*.
You are redirected back to the server.
3. On PC2, access the SSL VPN web portal.

4. Enter the *Username* and *Password*, then click *Login*.
5. Access the server using the bookmark.

SSL VPN troubleshooting

The following topics provide information about SSL VPN troubleshooting:

- [Debug commands on page 1904](#)
- [Troubleshooting common issues on page 1904](#)

Debug commands

SSL VPN debug command

Use the following diagnose commands to identify SSL VPN issues. These commands enable debugging of SSL VPN with a debug level of -1 for detailed results.

```
diagnose debug application sslvpn -1
diagnose debug enable
```

The CLI displays debug output similar to the following:

```
FGT60C3G10002814 # [282:root]SSL state:before/accept initialization (172.20.120.12)
[282:root]SSL state:SSLv3 read client hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write server hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write change cipher spec A (172.20.120.12)
[282:root]SSL state:SSLv3 write finished B (172.20.120.12)
[282:root]SSL state:SSLv3 flush data (172.20.120.12)
[282:root]SSL state:SSLv3 read finished A:system lib(172.20.120.12)
[282:root]SSL state:SSLv3 read finished A (172.20.120.12)
[282:root]SSL state:SSL negotiation finished successfully (172.20.120.12)
[282:root]SSL established: DHE-RSA-AES256-SHA SSLv3 Kx=DH Au=RSA Enc=AES(256) Mac=SHA1
```

To disable the debug:

```
diagnose debug disable
diagnose debug reset
```

Remote user authentication debug command

Use the following diagnose commands to identify remote user authentication issues.

```
diagnose debug application fnbamd -1
diagnose debug reset
```

Troubleshooting common issues

To troubleshoot getting no response from the SSL VPN URL:

1. Go to *VPN > SSL-VPN Settings*.
 - a. Confirm that SSL VPN is enabled.
 - b. Check the SSL VPN port assignment.
 - c. Check the *Restrict Access* setting to ensure the host you are connecting from is allowed.
2. Go to *Policy > Firewall Policy*.
 - a. Check that the policy for SSL VPN traffic is configured correctly.
 - b. Check the URL you are attempting to connect to. It should follow this pattern:

```
https://<FortiGate IP>:<Port>
```

- c. Check that you are using the correct port number in the URL. Ensure FortiGate is reachable from the computer.

```
ping <FortiGate IP>
```

- d. Check the browser has *TLS 1.1*, *TLS 1.2*, and *TLS 1.3* enabled.

To troubleshoot FortiGate connection issues:

1. Check the Release Notes to ensure that the FortiClient version is compatible with your version of FortiOS.
2. FortiClient uses IE security setting, In IE *Internet options* > *Advanced* > *Security*, check that *Use TLS 1.1* and *Use TLS 1.2* are enabled.
3. Check that SSL VPN *ip-pools* has free IPs to sign out. The default *ip-poolsSSLVPN_TUNNEL_ADDR1* has 10 IP addresses.
4. Export and check FortiClient debug logs.
 - a. Go to *File* > *Settings*.
 - b. In the *Logging* section, enable *Export logs*.
 - c. Set the *Log Level* to *Debug* and select *Clear logs*.
 - d. Try to connect to the VPN.
 - e. When you get a connection error, select *Export logs*.

To troubleshoot SSL VPN hanging or disconnecting at 98%:

1. A new SSL VPN driver was added to FortiClient 5.6.0 and later to resolve SSL VPN connection issues. If your FortiOS version is compatible, upgrade to use one of these versions.
2. Latency or poor network connectivity can cause the login timeout on the FortiGate. In FortiOS 5.6.0 and later, use the following commands to allow a user to increase the SSL VPN login timeout setting.

```
config vpn ssl settings
  set login-timeout 180 (default is 30)
  set dtls-hello-timeout 60 (default is 10)
end
```

To troubleshoot tunnel mode connections shutting down after a few seconds:

This might occur if there are multiple interfaces connected to the Internet, for example, SD-WAN. This can cause the session to become “dirty”. To allow multiple interfaces to connect, use the following CLI commands.

If you are using a FortiOS 6.0.1 or later:

```
config system interface
  edit <name>
    set preserve-session-route enable
  next
end
```

If you are using a FortiOS 6.0.0 or earlier:

```
config vpn ssl settings
  set route-source-interface enable
end
```

To troubleshoot users being assigned to the wrong IP range:

1. Go to *VPN* > *SSL-VPN Portals* and *VPN* > *SSL-VPN Settings* and ensure the same *IP Pool* is used in both places. Using the same *IP Pool* prevents conflicts. If there is a conflict, the portal settings are used.

To troubleshoot slow SSL VPN throughput:

Many factors can contribute to slow throughput.

This recommendation tries to improve throughput by using the FortiOS Datagram Transport Layer Security (DTLS) tunnel option, available in FortiOS 5.4 and above.

DTLS allows SSL VPN to encrypt traffic using TLS and uses UDP as the transport layer instead of TCP. This avoids retransmission problems that can occur with TCP-in-TCP.

FortiClient 5.4.0 to 5.4.3 uses DTLS by default. FortiClient 5.4.4 and later uses normal TLS, regardless of the DTLS setting on the FortiGate.

To use DTLS with FortiClient:

1. Go to *File > Settings* and enable *Preferred DTLS Tunnel*.

To enable DTLS tunnel on FortiGate, use the following CLI commands:

```
config vpn ssl settings
  set dtls-tunnel enable
end
```

User & Authentication

In *User & Authentication*, you can control network access for different users and devices in your network. FortiGate authentication controls system access by user group. By assigning individual users to the appropriate user groups you can control each user's access to network resources. You can define local users and peer users on the FortiGate unit. You can also define user accounts on remote authentication servers and connect them to FortiOS.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See [Configuring an LDAP server on page 1923](#).
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 1930](#).

You can control network access for different device types in your network by doing the following:

- Identifying and monitoring the types of devices connecting to your network
- Using MAC address based access control to allow or deny individual devices
- Using Telemetry data received from FortiClient endpoints to construct a policy to deny access to endpoints with known vulnerabilities or to quarantine compromised endpoints

The following sections provide information about users and devices:

- [User definition, groups, and settings on page 1907](#)
- [LDAP servers on page 1923](#)
- [RADIUS servers on page 1933](#)
- [SAML on page 1961](#)
- [TACACS+ servers on page 1990](#)
- [FortiTokens on page 1992](#)
- [PKI on page 2015](#)
- [FSSO on page 2019](#)
- [Include usernames in logs on page 2035](#)

User definition, groups, and settings

FortiGate authentication controls system access by user groups. By assigning individual users to the appropriate user groups, this controls each user's access to network resources. The user groups members are user accounts, of which there are several types. Local and peer users are defined in FortiOS. User accounts can also be defined on remote authentication servers.

This section contains information about configuring the following:

- [Users on page 1908](#)
- [User groups on page 1910](#)
- [Authentication settings on page 1917](#)
- [Retail environment guest access on page 1920](#)

For information about configuring authentication servers, see the [LDAP servers on page 1923](#), [RADIUS servers on page 1933](#), [TACACS+ servers on page 1990](#), and [SAML on page 1961](#) sections.

Users

A user is a user account consisting of a username, password, and sometimes other information, that is configured in FortiOS or on an external authentication server. There are several types of user accounts with slightly different methods of authentication.

User type	Authentication method
Local	The username and password must match a user account stored in FortiOS. Authentication is done by a firewall policy.
Remote	Remote users consist of usernames defined in FortiOS that are authenticated by a remote server. For example, RADIUS, TACACS+, LDAP, or FortiNAC. The server must be configured in FortiOS before creating a user.
FSSO	Users on a Microsoft Windows, Citrix, or Novell network can use their network authentication to access resources through the FortiGate. Access is controlled through FSSO user groups, which contain Windows, Citrix, or Novell user groups as members. The FSSO agent must be configured in FortiOS before creating a user (see FSSO on page 2019).
PKI or peer	A PKI or peer user is a digital certificate holder that authenticates using a client certificate. No password is required, unless two-factor authentication is enabled. In the GUI, the <i>User & Authentication > PKI</i> menu is only available after a PKI user is configured in the CLI (see Configuring a PKI user on page 2015).

Some user types have an option to enable multi-factor authentication using FortiToken or FortiToken Cloud. In some cases, the user must be defined first, and then can be edited to add multi-factor authentication. See [FortiTokens on page 1992](#) for more information.

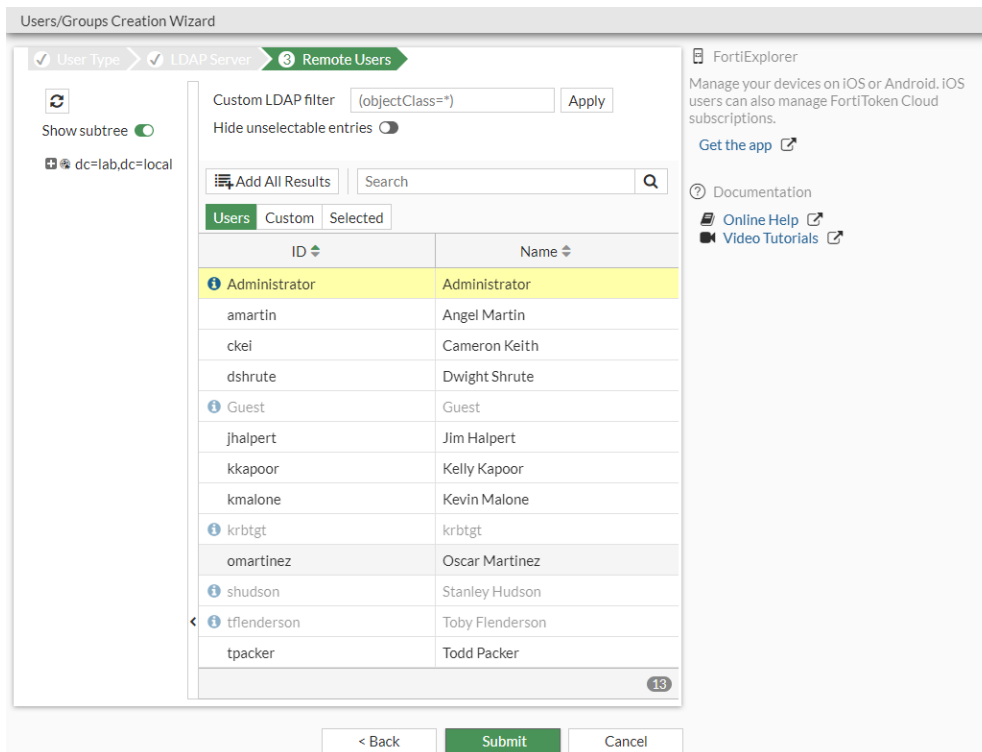

To create a user:

1. Go to User Authentication > User Definition and click Create New. The *Users/Groups Creation Wizard* appears.
2. Select a *User Type* and click *Next*.
3. The remaining wizard steps depend on the user type:
 - *Local User*:
 - i. Enter a *Username* and *Password*, then click *Next*.
 - ii. Optionally, enable *Two-factor Authentication* and configure the following:

Authentication Type	Select <i>FortiToken Cloud</i> or <i>FortiToken</i> .
Token	If using FortiToken to authenticate, select a token.

Email Address	Enter an email address.
SMS	Enable to send an SMS message to activate the token.
Country Dial Code	Select the country code.
Phone Number	Enter a phone number.

- iii. Click *Next*, then click *Submit*.
- *Remote LDAP User*:
 - i. Select an *LDAP Server*, then click *Next*.
 - ii. Select the users to add from the LDAP server. If the user ID matches an existing configured username, it cannot be added.

- iii. Click *Submit*.
- *Remote RADIUS User and Remote TACACS+ User*:
 - i. Enter a *Username* and select the server.
 - ii. Click *Next*.
 - iii. Optionally, enable *Two-factor Authentication* and configure the settings as needed.
 - iv. Click *Next*, then click *Submit*.
- *FSSO*:
 - i. Select an *FSSO Agent*, click the + to add *AD Groups*, then click *Next*.
 - ii. Select an FSSO group to add the *AD Groups* to. If an FSSO group already exists (see [Configuring FSSO user groups on page 1914](#)), click *Choose Existing* and select the group. Otherwise, click *Create New*, enter a name, and click *OK*.
 - iii. Click *Submit*.

User groups

A user group is a list of user identities. A user identity can be a:

- Local user account (username/password) stored on the FortiGate
- Remote user account (password stored on a RADIUS, LDAP, or TACACS+ server)
- PKI user account with a digital client authentication certificate stored on the FortiGate
- RADIUS, LDAP, or TACACS+ server, optionally specifying particular user groups on that server
- User group defined on an FSSO server

User groups provide the ability to combine users that require the same permissions so they can be referenced at once, which enables consistency in configurations. User groups allow for remote servers to be referenced by leveraging the pre-existing user accounts, instead of redefining them on the FortiGate.

For example, when a new employee joins a department, they can be added to their respective group, whether in the remote authentication server or local group, and be subject to the same access as their colleagues in the same department. In FortiOS, user groups can be used when configuring firewall policies, traffic shaping policies, proxy policies, SSL VPN portals, IPsec VPN XAUTH, ZTNA, wireless networks (SSIDs), web filtering profiles, identity-based routing, and system administrators with remote authentication.

In most cases, the FortiGate authenticates users by requesting their username and password. The FortiGate checks local user accounts first. If a match is not found, the FortiGate checks the RADIUS, LDAP, or TACACS+ servers that belong to the user group. Authentication succeeds when a matching username and password are found. If the user belongs to multiple groups on a server, those groups will also be matched.

Four types of user groups can be configured:

- Firewall
- FSSO
- RSSO
- Guest

Configuring firewall user groups

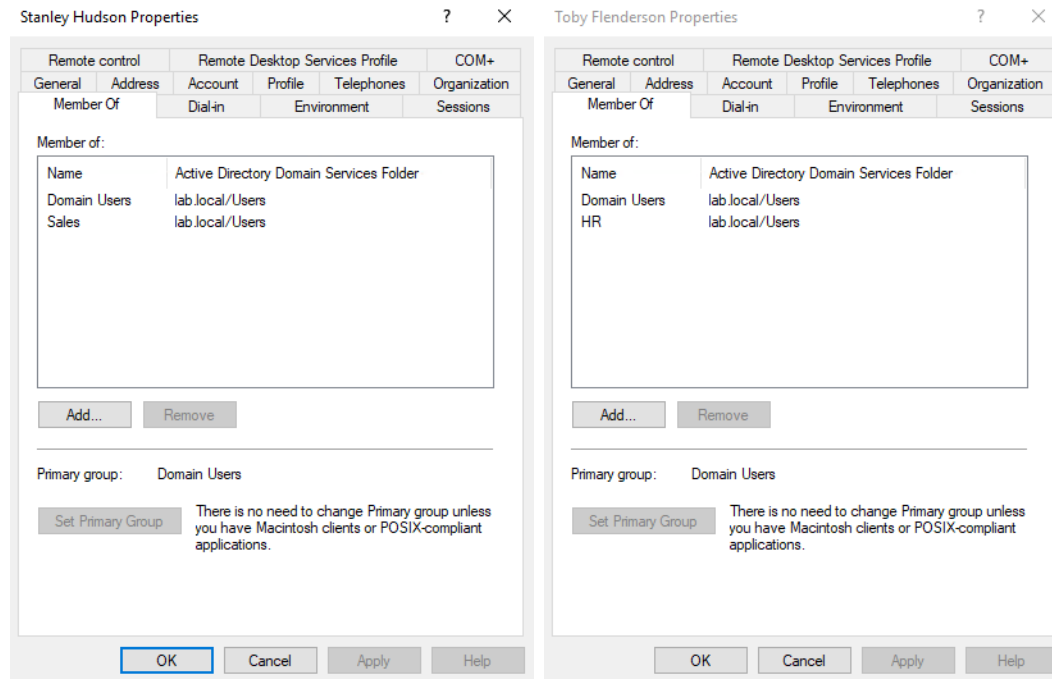

Firewall user groups are used locally as part of authentication. For example, when a firewall policy allows access only to specified user groups, users must authenticate before matching the policy. If the user authenticates successfully and is a member of one of the permitted groups, the policy is applied to the user. A firewall user group may contain local users (defined locally or authenticated remotely), PKI users, or authentication servers.

There are two options to add users in a firewall group configuration: members or remote groups. Members are the individual users who have been defined in FortiOS. Remote groups are remote server that users may authenticate to. One or more user groups can be specified within that server to limit which users can authenticate to the firewall user group. Both options may be used at the same time. The FortiGate attempts to authenticate users in the members list first, and then the remote groups if the initial authentication does not succeed.

When adding remote groups to user groups, FortiTokens cannot be applied to the users. To use remote authentication servers and FortiToken for multi-factor authentication, a remote user type must be created and then added as a user group member.

The following user group configuration examples have local members and a remote authentication server user group. There are two LDAP users, but the principle applies to other remote authentication server types.

Both LDAP users (shudson and tflenderson) belong to the primary group, Domain Users. The user, shudson belongs to the Sales group; tflenderson belongs to the HR group.

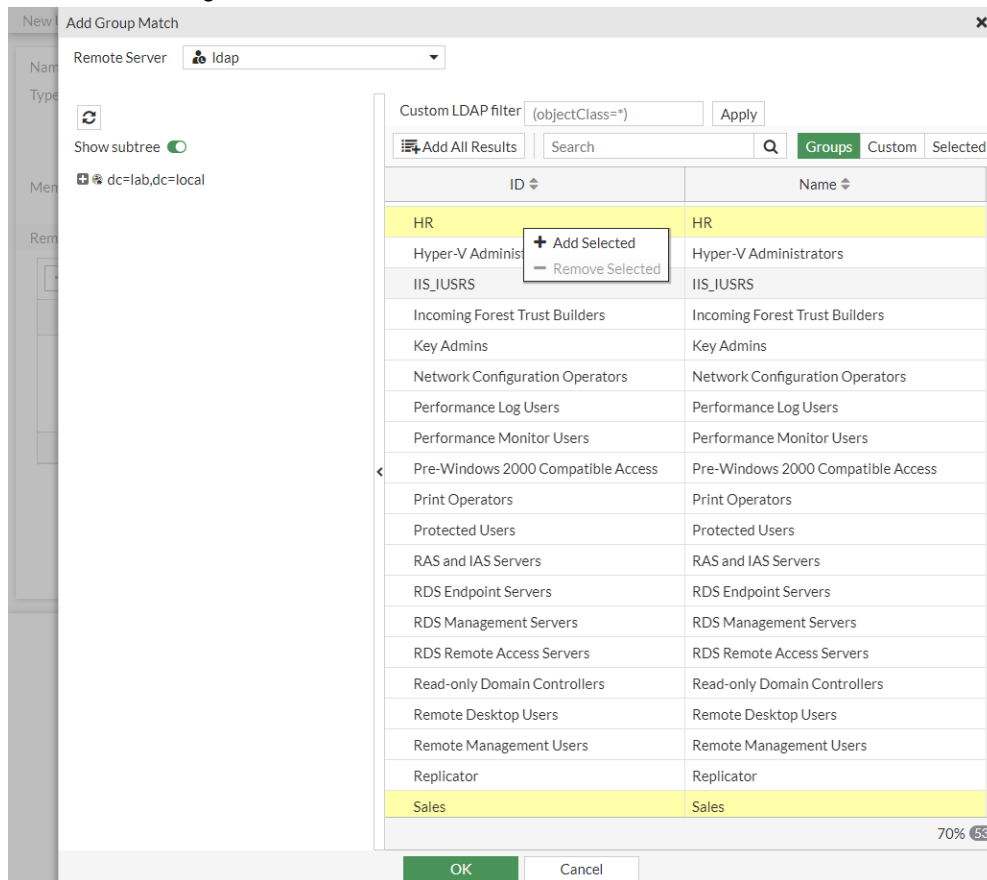

Example 1: Adding multiple remote groups to a user group

In this example, two remote groups (HR and Sales) are added to a firewall group called SSL_VPN_ACCESS.

To add multiple remote groups to a user group:

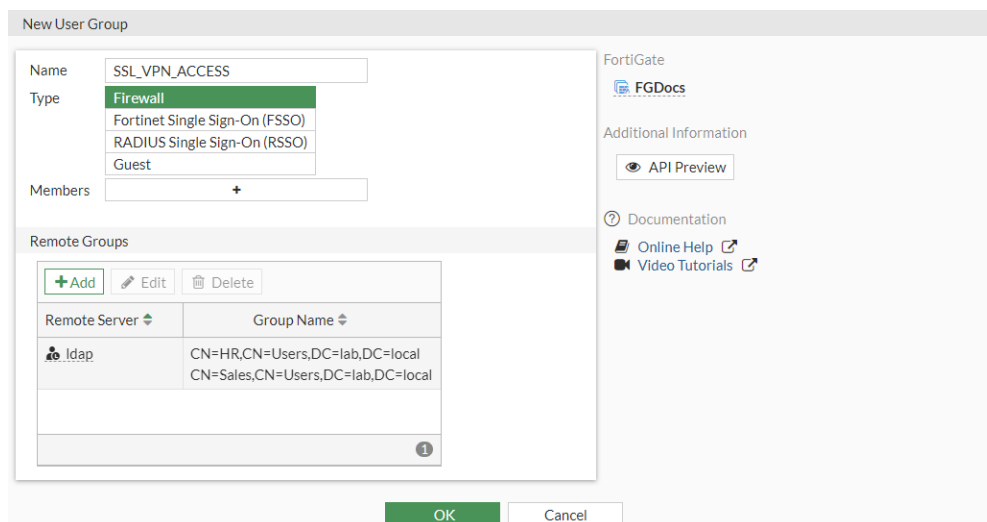

1. Go to *User & Authentication > User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, *SSL_VPN_ACCESS*.
3. In the *Remote Groups Section*, click *Add*.
4. Set *Remote Server* to the LDAP server (*ldap*).
5. In the *Groups* table, select *Sales*, then right-click and select *Add Selected*.

6. Select *HR*, then right-click and select *Add Selected*.

7. Click *OK*.

Both user group paths are specified under the *Group Name*.

8. Click *OK*.

In this configuration, shudson and tflenderson would be able to authenticate to this group.

Example 2: combining remote groups and local users in a user group

In this example, the firewall group (SSL_VPN_ACCESS) is configured to contain the HR remote group and a local LDAP user (shudson) with multi-factor authentication.

Name	Type	Two-factor Authentication	Groups	Status	Ref.
shudson	LDAP	FTKMOB		Enabled	0
Administrator	LDAP			Enabled	0
Guest	LDAP			Enabled	1
Mandrews	LDAP			Enabled	0

To combine remote groups and local users in a user group:

1. Go to *User & Authentication > User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, *SSL_VPN_ACCESS*.
3. In the *Remote Groups Section*, click *Add*.
4. Set *Remote Server* to the LDAP server (*ldap*).
5. In the *Groups* table, select *HR*, then right-click and select *Add Selected*.
6. Click *OK*.
7. In the *Members* field, click the + and add *shudson*.

8. Click *OK*.

In this configuration, shudson, tflenderson, and any members of the HR LDAP group would be able to authenticate to the user group. Other users in the Sales group are not allowed.

Example 3: adding a user as a member and their group as a remote groups

This example uses a combination of the previous examples. The HR and Sales groups are added as remote groups similar to example 1. The local LDAP user, shudson (using a FortiToken), from example 2 is added as a group member.

This example is for demonstration only. It may cause unwanted results, so this configuration is not advised.

To add a user as a member and their group as a remote groups:

1. Refer to [example 1](#) to configure the two remote groups.
2. In the *Members* field, click the + and add *shudson*.

The screenshot shows the 'New User Group' configuration interface. The 'Name' field is set to 'SSL_VPN_ACCESS' and the 'Type' is 'Firewall'. In the 'Members' field, 'shudson' is listed with a '+' button to add more members. Below this is the 'Remote Groups' section, which includes a table with columns for 'Remote Server' and 'Group Name'. Two entries are shown for the 'ldap' server, with group names 'CN=HR,CN=Users,DC=lab,DC=local' and 'CN=Sales,CN=Users,DC=lab,DC=local'. The right sidebar contains links for 'FortiGate', 'FGDocs', 'API Preview', 'Documentation', 'Online Help', and 'Video Tutorials'. At the bottom, there are 'OK' and 'Cancel' buttons.

3. Click *OK*.

One unwanted scenario from this configuration is that a user might be able to bypass multi-factor authentication on LDAP by changing the username case (see the related [PSIRT](#) advisory). By default, the username of the remote LDAP user is case sensitive. This means the username has to match what is configured (*shudson*). If a user types *sHudson*, for example, this will not match the user *shudson*, so it falls through to remote group authentication. It will match the Sales group in this example. To prevent this, disable username case sensitivity (see [SSL VPN for remote users with MFA and user sensitivity on page 1796](#) for more details).

To disable case sensitivity on the remote user:

```
config user local
  edit <name>
    set type ldap
    set two-factor fortitoken
    set fortitoken "FTKMOBxxxxxxxxxxxx"
    set email-to <email_address>
    set username-sensitivity disable
    set ldap-server <server_name>
  next
end
```

There is another unwanted scenario from this configuration than can occur to bypass multi-factor authentication. The LDAP server, *ldap*, has a user named *shudson*. Another LDAP server, *ldap2*, also has a user named *shudson*, but with a different password. If the *ldap* and *ldap2* servers are added to the user group in addition to the remote *shudson* user, if a user tries to log in using *shudson* and the password on the *ldap2* server, they would be able to bypass multi-factor authentication.

Configuring FSSO user groups

FSSO user groups contain only Windows, Citrix, and Novell network users. Information about these user groups and their member logon activities are provided by the corresponding FSSO connector. See the [FSSO on page 2019](#) section for more information.

Configuring RSSO user groups

RADIUS single sign-on user groups leverage a RADIUS server to authenticate connecting users. This requires users to log in to their computer using their RADIUS account. The FortiGate does not interact with the remote RADIUS server. It only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. See [RADIUS single sign-on agent on page 2665](#) for more information.

Configuring guest user groups

In some scenarios, an administrator might need to create temporary user accounts with a defined expiry time to access network resources. For example, if there is a large conference and many attendees require temporary network access for a few days. *Guest Management* can be used to combine many guest users into a group. Many guest accounts can be created at once using randomly-generated user IDs and passwords.

A guest group must be configured first. The guest user account user ID can be an email address, a randomly generated string, or an ID that the assigned by the administrator. The password can be assigned by the administrator or randomly generated. The guest group configuration determines the fields that are provided when creating guest user accounts in *Guest Management*.

To create a guest user group:

1. Go to *User & User & Authentication > User Groups* and click *Create New*.
2. Enter a name, and set the *Type* to *Guest*.

3. Configure the following:

Batch Guest Account Creation	Create multiple accounts automatically. When enabled: <ul style="list-style-type: none"> The user ID and password are automatically generated. The accounts only have user ID, password, and expiration fields. The expiration field is editable in the GUI in the <i>Start Countdown</i> and <i>Time</i> settings. An administrator can print the account information. Users do not receive an email or SMS notification.
User ID	Select one of the following: <ul style="list-style-type: none"> <i>Email</i>: use the user's email address <i>Auto Generate</i>: FortiOS creates a random user ID <i>Specify</i>: the administrator assigns a user ID
Maximum Accounts	Enable to set a maximum number of guest accounts that can be created for this group (disabled = unlimited).
Guest Details	
Enable Name	If enabled, the user form has a field to enter a name.
Enable Email	If enabled, the user is notified by email.
Enable SMS	If enabled, the user is notified by SMS.
Password	Select one of the following: <ul style="list-style-type: none"> <i>Auto Generate</i>: FortiOS creates a random password <i>Specify</i>: the administrator assigns a password If the setting is disabled, no password is used.
Sponsor	If enabled, the user form has a field to enter a sponsor (<i>Optional</i>). Select <i>Required</i> if the sponsor field is mandatory.
Company	If enabled, the user form has a field to enter a company (<i>Optional</i>). Select <i>Required</i> if the company field is mandatory.
Expiration	
Start Countdown	Select one of the following: <ul style="list-style-type: none"> <i>On Account Creation</i>: the countdown starts from the time the account is created <i>After First Login</i>: the countdown starts from the time the first time the user logs in
Time	Set the expiry time. There are fields to enter values for <i>Days</i> , <i>Hours</i> , <i>Minutes</i> , and <i>Seconds</i> .

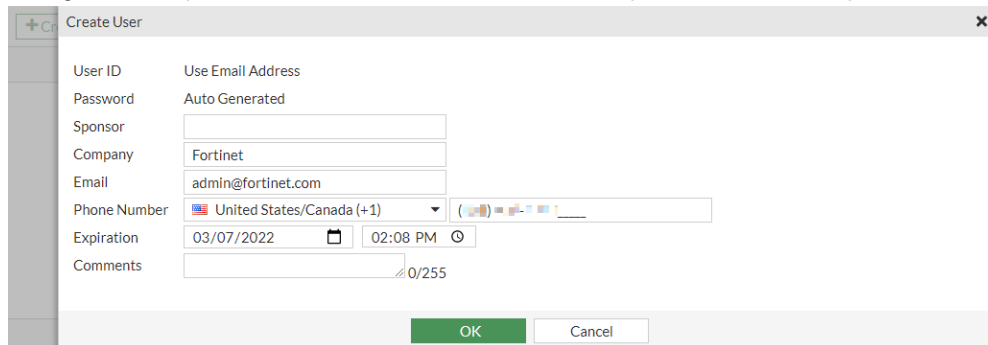

4. Click *OK*.

To manually create a guest user account:

1. Go to *User & User & Authentication > Guest Management*.
2. If more than one guest user group is configured, select the group from the dropdown beside the search box.

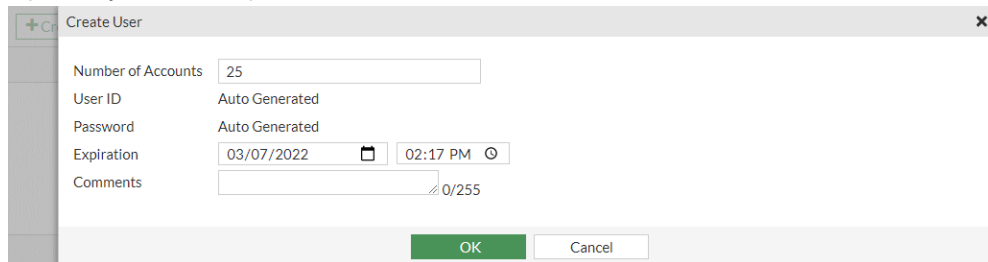

3. Click *Create New* and enter the information in the *Create User* pane. The fields are based on the guest group configuration. Optional fields can be left blank, such as *Sponsor* in this example.

4. Click *OK*.

To automatically create multiple guest user accounts:

1. Go to *User & User & Authentication > Guest Management*.
2. If more than one guest user group is configured, select the group from the dropdown beside the search box. The group must have *Batch Guest Account Creation* enabled.
3. Click *Create New > Multiple Users* and enter the *Number of Accounts*.
4. Optionally, edit the *Expiration* date and time.

5. Click *OK*.

Authentication settings

General authentication settings include:

- [Timeout on page 1918](#)
- [Protocols on page 1919](#)
- [Certificates on page 1920](#)
- [Lockouts on page 1920](#)

Only some of the settings can be configured in the GUI.

To configure authentication settings in the GUI:

1. Go to *User & Authentication > Authentication Settings*.
2. Configure the following settings:

Setting	Description
Authentication Timeout	Enter the desired timeout, in minutes, from 1 to 1440 (24 hours). The default time is 5 minutes. Only idle timeout can be configured in the GUI.
Protocol support	Select the protocols to challenge during firewall user authentication.
HTTP redirect	Redirect HTTP challenge to a secure channel (HTTPS). This option is only available if <i>HTTP</i> is selected in the <i>Protocol Support</i> options.
Certificate	Select the local certificate to use for authentication.

3. Click *OK*.

Timeout

Authenticated users and user groups can have timeout values per user or group, in addition to FortiGate-wide timeouts. Three types of user timeouts can be configured:

Timeout type	Description
Idle	<p>The idle timer starts when a user initiates a session. As long as data are transferred in this session, the timer continually resets. If the data flow stops, the timer is allowed to advance until it reaches its limit. When the user has been idle for too long, they must re-authenticate before traffic is allowed to continue in that session.</p> <p>This is the default setting. It can be configured in the GUI and CLI.</p>
Hard	<p>The hard timer starts when a user initiates a session. When the timeout is reached, all the sessions for that user must be re-authenticated. This timeout is not affected by any events.</p> <p>This setting can be configured in the CLI.</p>
Session	<p>The session timer starts when a user initiates a session. When the timeout is reached, existing sessions may continue. New sessions are not allowed until the user re-authenticates. This timeout is not affected by any events.</p> <p>This setting can be configured in the CLI.</p>

The authentication timeout time is configured in minutes. The default is five minutes. If VDOMs are enabled, the global level `auth-timeout` user setting is the default that all VDOMs inherit. If the timeout time is set to zero,

To configure timeout for authenticated users:

```
config user setting
  set auth-timeout-type {idle-timeout | hard-timeout | new-session}
```

```
    set auth-timeout <integer>
end
```

To configure the authentication timeout for a user group:

```
config user group
    edit <name>
        set authtimeout <integer>
    next
end
```

If the group timeout time is zero (the default) or the user belongs to multiple RADIUS groups, then the user group timeout values are ignored and the global user timeout value is used.

Protocols

When you enable user authentication within a security policy, the authentication challenge is normally issued for any of four protocols, depending on the connection protocol:

- HTTP (you can set this to redirect to HTTPS)
- HTTPS
- FTP
- Telnet

The selected protocols control which protocols support the authentication challenge. Users must connect with a supported protocol first so that they can subsequently connect with other protocols. If HTTPS is selected as a protocol support method, it allows the user to authenticate with a customized local certificate.

When you enable user authentication within a security policy, FortiOS challenges the security policy user to authenticate. For user ID and password authentication, the user must provide their username and password. For certificate authentication (HTTPS, or HTTP redirected to HTTPS only), you can install customized certificates on the unit and the user can also install customized certificates on their browser. Otherwise, users see a warning message and must accept a default Fortinet certificate. The network user's web browser may deem the default certificate invalid.

Enable `auth-secure-http` to redirect HTTP challenges to a secure channel. Enable `auth-ssl-allow-renegotiation` to allow SSL re-negotiation for HTTPS authentication.

Enable `auth-http-basic` to use HTTP basic authentication for identity-based firewall policies. HTTP basic authentication usually causes a browser to display a pop-up authentication window instead of an authentication web page. Some basic web browsers, such as those on older mobile devices, may only support HTTP basic authentication.

FTP and Telnet authentication replacement messages cannot be customized.

To configure the protocols to challenge during firewall user authentication:

```
config user setting
    set auth-type {http https ftp telnet}
    set auth-secure-http {enable | disable}
    set auth-http-basic {enable | disable}
    set auth-ssl-allow-renegotiation {enable | disable}
end
```

Certificates

Configure the HTTPS certificate and CA certificate to use for policy authentication.

To configure certificates for policy authentication:

```
config user setting
    set auth-cert <certificate>
    set auth-ca-cert <CA certificate>
end
```

Lockouts

Failed log in attempts can indicate malicious attempts to gain access to your network. To prevent this security risk, you can limit the number of failed log in attempts. After the configured maximum number of failed log in attempts is reached (1 - 10, default = 3), access to the account is blocked for the configured lockout duration (0 - 4294967295 seconds, default = 0)

To configure the maximum failed log in attempts and the lockout duration:

```
config user setting
    set auth-lockout-threshold <integer>
    set auth-lockout-duration <integer>
end
```

Retail environment guest access

Businesses such as coffee shops provide free Internet access for customers. In this scenario, you do not need to configure guest management, as customers can access the WiFi access point without logon credentials.

However, consider that the business wants to contact customers with promotional offers to encourage future patronage. You can configure an email collection portal to collect customer email addresses for this purpose. You can configure a firewall policy to grant network access only to users who provide a valid email address. The first time a customer's device attempts WiFi connection, FortiOS requests an email address, which it validates. The customers' subsequent connections go directly to the Internet without interruption.

This configuration consists of the following steps:

1. [Creating an email collection portal on page 1920](#)
2. [Creating a firewall policy on page 1921](#)
3. [Checking for collected emails on page 1921](#)

Creating an email collection portal

The customer's first contact with your network is a captive portal that presents a webpage requesting an email address. When FortiOS has validated the email address, the customer's device MAC address is added to the collected emails device group.

This example modifies the freewifi WiFi interface to present an email collection captive portal.

To configure the freewifi SSID to use an email collection portal in the GUI:

1. Enable email collection:
 - a. Go to *System > Feature Visibility*.
 - b. In the *Additional Features* section, enable *Email Collection*.
 - c. Click *Apply*.
2. Edit the freewifi SSID:
 - a. Go to *WiFi & Switch Controller > SSIDs* and edit the *freewifi* SSID.
 - b. In the *Security Mode Settings* section, set the *Security mode* to *Captive Portal*.
 - c. Set the *Portal type* to *Email Collection*.
 - d. Click *OK*.

To configure the freewifi SSID to use an email collection portal in the CLI:

```
config wireless-controller vap
  edit freewifi
    set security captive-portal
    set portal-type email-collect
  next
end
```

Creating a firewall policy

You must configure a firewall policy that allows traffic to flow from the WiFi SSID to the internet interface only for members of the collected emails device group. This policy must be listed first. Unknown devices are not members of the collected emails device group, so they do not match the policy.

To create a firewall policy:

```
config firewall policy
  edit 3
    set srcintf "freewifi"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
    set email-collect enable
  next
end
```

Checking for collected emails

When a WiFi user connects to the freewifi SSID, they are presented with a captive portal to enter their email address.

Terms and Disclaimer Agreement

You are about to access Internet content that is not under the control of the network access provider. The network access provider is therefore not responsible for any of these sites, their content or their privacy policies. The network access provider and its staff do not endorse nor make any representations about these sites, or any information, software

I accept the Terms and Disclaimer Agreement

Please enter your Email address to continue.

Email

Once the user enters their email and clicks *Continue*, they will have access to the Internet. The collected emails can be verified in FortiOS.

To check for collected emails in the GUI:

1. Go to *Dashboard > Users & Devices* and click *Add Widget*.
2. In the *User & Authentication* section, select *Collected Email* and click *Add Widget*.
3. Click *Close*.
4. Click the *Collected Email* to expand to full view. The list of emails is displayed.

Collected Email	Duration	IP Address	Traffic Volume	Time Left
admin@fortinet.com	14m 30s		5.12 MB	9d 23h

5. Optionally, click *Export* to export the data as a CSV or JSON file.

To check for collected emails in the CLI:

```
# diagnose firewall auth mac list

72:4d:e1:**:**:**, admin@fortinet.com
    type: email, id: 0, duration: 937, idled: 19
    expire: 863980, allow-idle: 864000
    flag(1000): src_idle
    packets: in 4753 out 4592, bytes: in 2662403 out 2458644

----- 1 listed, 0 filtered -----
```

LDAP servers

The following topics provide information about LDAP servers:

- [Configuring an LDAP server on page 1923](#)
- [Enabling Active Directory recursive search on page 1926](#)
- [Configuring LDAP dial-in using a member attribute on page 1927](#)
- [Configuring wildcard admin accounts on page 1928](#)
- [Configuring least privileges for LDAP admin account authentication in Active Directory on page 1930](#)
- [Tracking users in each Active Directory LDAP group on page 1930](#)

Configuring an LDAP server

FortiOS can be configured to use an LDAP server for authentication.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See relevant LDAPS information in this topic.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 1930](#).

To configure an LDAP server on the FortiGate:

1. Go to *User & Authentication > LDAP Servers*.
2. Click *Create New*.
3. Configure the following:

Name	This connection name is for reference within the FortiGate only.
Server IP/Name	LDAP server IP address or FQDN resolvable by the FortiGate.
Server Port	By default, LDAP uses port 389 and LDAPS uses 636. Use this field to specify a custom port if necessary.
Common Name Identifier	Attribute field of the object in LDAP that the FortiGate uses to identify the connecting user. The identifier is case sensitive. Common attributes are: <ul style="list-style-type: none"> • <i>cn</i> (Common Name) • <i>sAMAccountName</i> (SAMAccountName) • <i>uid</i> (User ID)
Distinguished Name	Used to look up user account entries on the LDAP server. It reflects the hierarchy of LDAP database object classes above the CN identifier in which you are doing the lookup. Enter <i>dc=COMPANY,dc=com</i> to specify the root of the domain to include all objects.

	Enter <code>ou=VPN-Users,dc=COMPANY,dc=com</code> to look up users under a specific organization unit.
Exchange server	Enable to specify the exchange server connector to collect information about authenticated users from a corporate exchange server. See Exchange Server connector on page 2668 for more details.
Bind Type	Select one of the following options: <ul style="list-style-type: none"> • <i>Simple</i>: bind using simple password authentication using the client name. The LDAP server only looks up against the distinguished name (DN), but does not search on the subtree. • <i>Anonymous</i>: bind using an anonymous user, and search starting from the DN and recurse over the subtrees. Many LDAP servers do not allow this. • <i>Regular</i>: bind using the username and password provided, and search starting from the DN and recurse over the subtrees.
Username	If using regular bind, enter a username with sufficient privileges to access the LDAP server. The following formats are supported: <ul style="list-style-type: none"> • <code>username\administrator</code> • <code>administrator@domain</code> • <code>cn=administrator,cn=users,dc=domain,dc=com</code>
Password	If using regular bind, enter the password associated with the username.
Secure Connection	Enable to apply security to the LDAP connection through STARTTLS or LDAPS.
Protocol	If <i>Secure Connection</i> is enabled, select <i>STARTTLS</i> or <i>LDAPS</i> . Selecting <i>STARTTLS</i> changes the port to 389 and selecting <i>LDAPS</i> changes the port to 636.
Certificate	Enable and select the certificate so the FortiGate will only accept a certificate from the LDAP server that is signed by this CA.
Server identity check	Enable to verify the server domain or IP address against the server certificate. This option is enabled by default and it is recommended to leave it enabled for a secure configuration.

When specifying a secure connection, there are some considerations for the certificate used by LDAP to secure the connection. The FortiGate checks the certificate presented by the LDAP server for the IP address or FQDN as specified in the *Server IP/Name* field with the following logic:

- If there is a Subject Alternative Name (SAN), it will ignore any Common Name (CN) value and look for a match in any of the SAN fields.
- If there is no SAN, it will check the CN for a match.

4. Optionally, click *Test User Credentials* to ensure that the account has sufficient access rights.
5. Click *OK*.

The FortiGate checks the connection and updates the *Connection Status*.

To configure a secure connection to the LDAP server in the GUI:

1. Go to *User & Authentication > LDAP Servers*.
2. Click *Create New*.
3. Configure the following:

Name	LDAP-fortiad
Server IP/Name	10.88.0.1
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=fortiad,dc=info
Exchange server	Disabled
Bind Type	Regular Enter the <i>Username</i> and <i>Password</i> for LDAP binding and lookup.
Secure Connection	Enabled <ul style="list-style-type: none"> • Set <i>Protocol</i> to <i>LDAPS</i>. • Enable <i>Certificate</i> and select the CA certificate to validate the server certificate.
Server identity check	Optionally, enable to verify the domain name or IP address against the server certificate.

4. Click *Test Connectivity* to verify the connection to the server.
5. Click *OK*.

To configure a secure connection to the LDAP server in the CLI:

```
config user ldap
  edit "LDAP-fortiad"
    set server "10.88.0.1"
    set cnid "sAMAccountName"
    set dn "dc=fortiad,dc=info"
    set type regular
    set username "fortiad\\Administrator"
```

```

    set password <password>
    set secure ldaps
    set ca-cert "CA_Cert_1"
    set port 636
  next
end

```

Enabling Active Directory recursive search

By default, nested groups (groups that are members of other groups) are not searched in Windows Active Directory (AD) LDAP servers because this can slow down the group membership search. There is an option in FortiOS to enable the searching of nested groups for user group memberships on AD LDAP servers.

This option is not available for other LDAP servers, such as OpenLDAP-based servers.

The default behavior does not include nested groups:

```

config user ldap
  edit "ldap-ad"
    set server "10.1.100.131"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
    set password XXXXXXXXXXXXXXXXXXXXXXXXXXXX
  next
end

```

The default search results only show groups that have the user as member, and no groups that have groups as members:

```

diagnose test authserver ldap ldap-ad nuser nuser
  authenticate 'nuser' against 'ldap-ad' succeeded!
  Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                      CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM

```

To enable recursive search to include nested groups in the results:

```

config user ldap
  edit "ldap-ad"
    set server "10.1.100.131"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
    set password XXXXXXXXXXXXXXXXXXXXXXXXXXXX
    set search-type recursive
  next
end

```

The search results now include groups that have other groups as members:

```

diagnose test authserver ldap ldap-ad nuser nuser
  authenticate 'nuser' against 'ldap-ad' succeeded!
  Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                       CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
                       CN=nested2,OU=Testing,DC=Fortinet-FSSO,DC=COM
                       CN=nested1,OU=Testing,DC=Fortinet-FSSO,DC=COM

```

The group nested3 is a member of the group nested2, which is a member of the group nested1.

Configuring LDAP dial-in using a member attribute

In this configuration, users defined in Microsoft AD can set up a VPN connection based on an attribute that is set to `TRUE`, instead of their user group. You can activate the *Allow Dialin* property in AD user properties, which sets the `msNPAllowDialin` attribute to `TRUE`. You can use this procedure for other member attributes as your system requires.

This configuration consists of the following steps:

1. Ensure that the AD server has the `msNPAllowDialin` attribute set to `TRUE` for the desired users.
2. [Configure user LDAP member attribute settings.](#)
3. [Configure LDAP group settings.](#)
4. [Ensure that you configured the settings correctly.](#)

To configure user LDAP member attribute settings:

```

config user ldap
  edit "ldap_server"
    set server "192.168.201.3"
    set cnid "sAMAccountName"
    set dn "DC=fortilabanz,DC=com,DC=au"
    set type regular
    set username "fortigate@sample.com"
    set password *****
    set member-attr "msNPAllowDialin"
  next
end

```

To configure LDAP group settings:

```

config user group
  edit "ldap_grp"
    set member "ldap_server"
    config match
      edit 1
        set server-name "ldap_server"
        set group-name "TRUE"
      next
    end
  next
end

```

To ensure that you configured the settings correctly:

Users that are members of the `ldap_grp` user group should be able to authenticate. The following shows sample `diagnose debug` output when the `Allow Dial-in` attribute is set to `TRUE`:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='TRUE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Passed group matching
```

If the attribute is not set to TRUE but is expected, you may see the following output:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='FALSE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Failed group matching
```

The difference between the two outputs is the last line, which shows passed or failed depending on whether the member attribute is set to the expected value.

Configuring wildcard admin accounts

To avoid setting up individual admin accounts in FortiOS, you can configure an admin account with the wildcard option enabled, allowing multiple remote admin accounts to match one local admin account. This way, multiple LDAP admin accounts can use one FortiOS admin account.

Benefits include:

- Fast configuration of the FortiOS admin account to work with your LDAP network, saving effort and avoiding potential errors incurred when setting up multiple admin accounts
- Reduced ongoing maintenance. As long as LDAP users belong to the same group and you do not modify the wildcard admin account in FortiOS, you do not need to configure changes on the LDAP accounts. If you add or remove a user from the LDAP group, you do not need to perform changes in FortiOS.

Potential issues include:

- Multiple users may be logged in to the same account simultaneously. This may cause issues if both users make changes simultaneously.
- Security is reduced since multiple users have login access to the same account, as opposed to an account for each user.

Wildcard admin configuration also applies to RADIUS. If configuring for RADIUS, configure the RADIUS server and RADIUS user group instead of LDAP. When using the GUI, wildcard admin is the only remote admin account that does not require you to enter a password on account creation. That password is normally used when the remote authentication server is unavailable during authentication.

This example uses default values where possible. If a specific value is not mentioned, the example sets it to its default value.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials. To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See [Configuring an LDAP server on page 1923](#).

You can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 1930](#).

To configure the LDAP server:

The important parts of this configuration are the username and group lines. The username is the domain administrator account. The group binding allows only the GRP group access.

This example uses an example domain name. Configure as appropriate for your own network.

```
config user ldap
  edit "ldap_server"
    set server "192.168.201.3"
    set cnid "sAMAccountName"
    set dn "DC=example,DC=com,DC=au"
    set type regular
    set username "CN=Administrator,CN=Users,DC=example,DC=COM"
    set password *
    set group-member-check group-object
    set group-object-filter (&
      (objectcategory=group)member="CN=GRP,OU=training,DC=example,DC=COM")
  next
end
```

To configure the user group and add the LDAP server:

```
config user group
  edit "ldap_grp"
    set member "ldap_server"
    config match
      edit 1
        set server-name "ldap_server"
        set group-name "CN=GRP,OU=training,DC=example,DC=COM"
      next
    end
  next
end
end
end
end
```

To configure the wildcard admin account:

```
config system admin
  edit "test"
    set remote-auth enable
    set accprofile "super_admin"
    set wildcard enable
    set remote-group "ldap_grp"
  next
end
```

Configuring least privileges for LDAP admin account authentication in Active Directory

An administrator should only have sufficient privileges for their role. In the case of LDAP admin bind, you can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups.

For information about Active Directory, see the [product documentation](#).

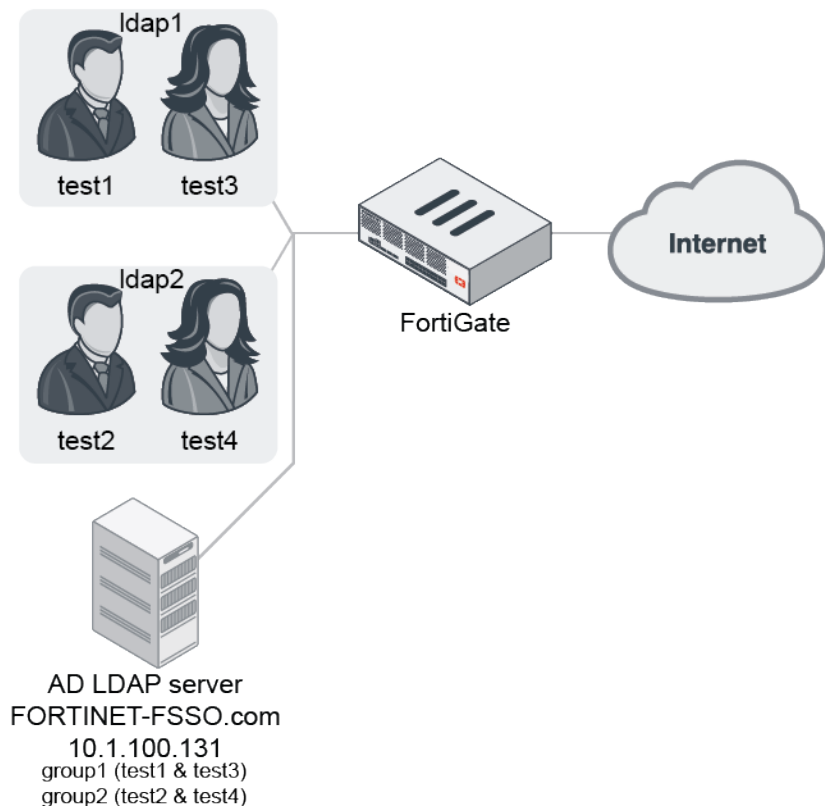

To configure account privileges for LDAP authentication in Active Directory:

1. In the *Active Directory Users and Computers* administrative console, right-click the Organizational Unit (OU) or the top-level domain you want to configure and select *Delegate Control*.
2. In the *Delegation of Control Wizard* dialog, click *Next*.
3. In the *Users or Groups* dialog, click *Add...* and search Active Directory for the users or groups.
4. Click *OK* and then click *Next*.
5. In the *Tasks to Delegate* dialog, select *Create a custom task to delegate* and click *Next*.
6. Select *Only the following objects in the folder* and scroll to the bottom of the list. Select *User objects* and click *Next*.
7. In the *Permissions* dialog, select *General*.
8. From the *Permissions* list, select the following:
 - *Change password*
 - *Reset password*
9. Clear the *General* checkbox and select *Property-specific*.
10. From the *Permissions* list, select the following:
 - *Write lockoutTime*
 - *Read lockoutTime*
 - *Write pwdLastSet*
 - *Read pwdLastSet*
 - *Write UserAccountControl*
 - *Read UserAccountControl*
11. Click *Next* and click *Finish*.

Tracking users in each Active Directory LDAP group

When LDAP users log on through firewall authentication, the active users per Active Directory LDAP group is counted and displayed in the *Firewall Users* widget and the CLI.

Example

The Active Directory LDAP server, FORTINET-FSSO.com, is configured with two groups that contain two users each: group1 consists of users test1 and test3; group2 consists of users test2 and test4.

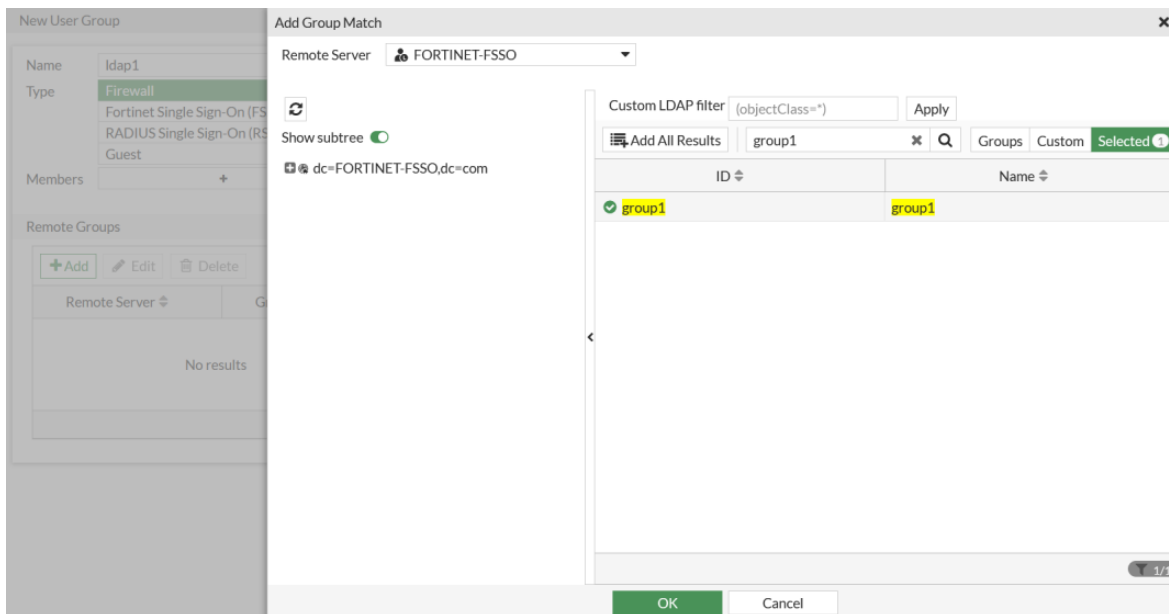

To configure AD LDAP user groups in the GUI:

1. Configure the Active Directory LDAP server, FORTINET-FSSO:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Enter the following:

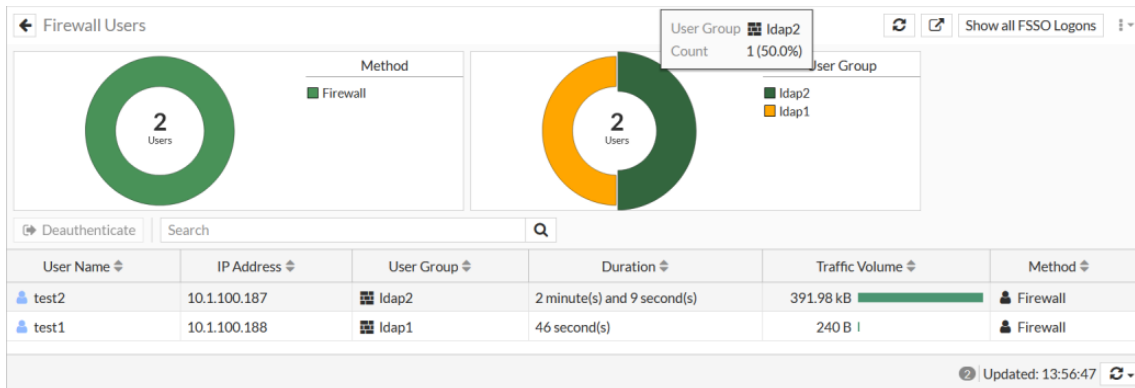

Name	<i>FORTINET-FSSO</i>
Server IP/Name	<i>10.1.100.131</i>
Distinguished Name	<i>dc=FORTINET-FSSO,dc=com</i>
Bind Type	<i>Regular</i>
Username	<i>cn=administrator,cn=users,dc=FORTINET-FSSO,dc=com</i>
Password	Enter the password.

- c. Click *OK*.
2. Configure the LDAP user groups:
 - a. Go to *User & Authentication > User Groups* and click *Create New*.
 - b. Enter the name, *ldap1*.

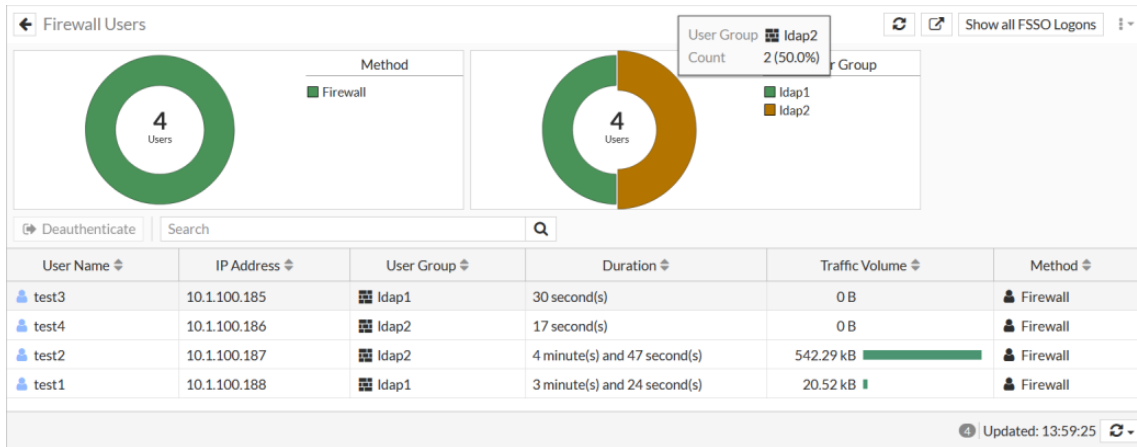

- c. In the *Remote Groups* table, click *Add*. The *Add Group Match* pane opens.
- d. For *Remote Server*, select *FORTINET-FSSO*.
- e. In the search box, enter *group1*, and select the result in the table.
- f. Click *OK*.

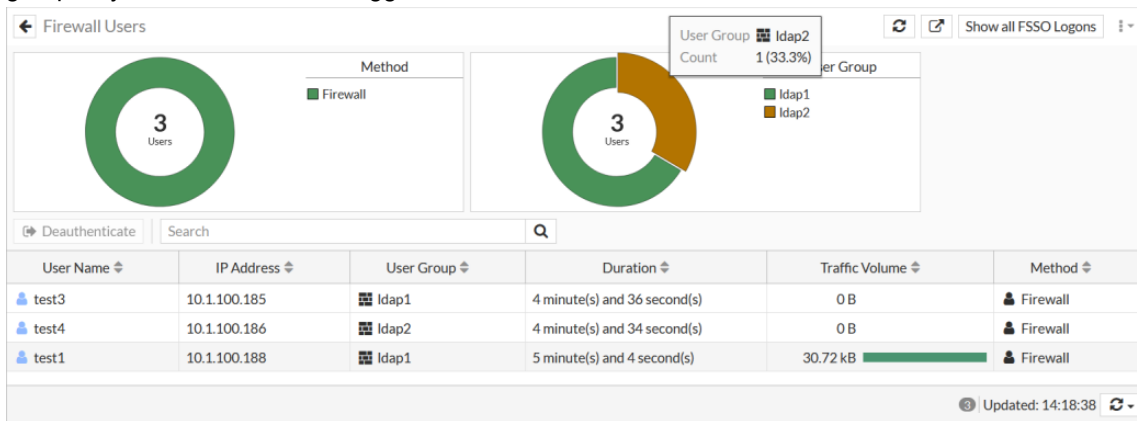

- g. Repeat these steps to configure *ldap2* with the *FORTINET-FSSO group2*.
 - h. Click *OK*.
3. Configure a firewall policy with both LDAP groups:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. For *Source*, select *ldap1* and *ldap2*.
 - c. Configure the other settings as needed.
 - d. Click *OK*.
 4. Get users *test1* and *test2* to log in.
 5. In FortiOS, go to *Dashboard > Users & Devices* and click the *Firewall Users* widget to expand to full screen view. Hover over a group in the *User Group* donut chart to view how many users are logged on from that group, and the number of users as a percentage of all logged on users. The chart shows that two users are logged in.

6. Get users *test3* and *test4* to log in, and refresh the *Firewall Users* widget. Each LDAP group has two users logged in, with a total of four active users.

- Get user test2 to log out, and refresh the *Firewall Users* widget. There is a total of three active users, and the Idap2 group only has one user that is logged in.

To verify the user group count in the CLI:

```
# diagnose user-device-store user-count list <integer>
# diagnose user-device-store user-count query <FQDN of AD group>
```

RADIUS servers

Remote Authentication and Dial-In User Service (RADIUS) is a broadly supported client-server protocol that provides centralized authentication, authorization, and accounting functions. RADIUS clients are built into gateways that allow access to networks such a VPN server, network access server (NAS), and a network switch or firewall that uses authentication.

RADIUS servers use UDP packets to communicate with the RADIUS clients on the network to authenticate users before allowing them access to the network, authorize access to resources by appropriate users, and account or bill for those resources that are used. RADIUS servers are currently defined by [RFC 2865](#) (RADIUS) and [RFC 2866](#) (RADIUS Accounting), and listen on either UDP ports 1812 (authentication) and 1813 (accounting), or ports 1645 (authentication) and 1646 (accounting) requests. RADIUS servers exist for all major operating systems.

The RADIUS server must be configured to accept the FortiGate as a client so it can use the authentication and accounting functions of the RADIUS server.

RADIUS authentication with a FortiGate requires the following:

- Configuring one or more RADIUS server profiles on the FortiGate.
- Assigning the RADIUS server profile to a user or user group.
- Applying the user or user group to a firewall policy.

RADIUS authentication can be applied to many FortiGate functions, such as firewall authentication, SSL and IPsec VPNs, administrator profiles, ZTNA, explicit proxy, wireless, 802.1X, and more.

The RADIUS server uses a shared secret key with MD5 hashing to encrypt information passed between RADIUS servers and clients. Typically, only user credentials are encrypted. Additional security can be configured through IPsec tunnels by placing the RADIUS server behind another VPN gateway.

The following topics provide more information about RADIUS servers:

- [Configuring a RADIUS server on page 1934](#)
- [Using multiple RADIUS servers on page 1935](#)
- [RADIUS AVPs and VSAs on page 1938](#)
- [Restricting RADIUS user groups to match selective users on the RADIUS server on page 1940](#)
- [Configuring RADIUS SSO authentication on page 1942](#)
- [RSA ACE \(SecurID\) servers on page 1948](#)
- [Support for Okta RADIUS attributes filter-Id and class on page 1952](#)
- [Sending multiple RADIUS attribute values in a single RADIUS Access-Request on page 1954](#)
- [Traffic shaping based on dynamic RADIUS VSAs on page 1954](#)

Configuring a RADIUS server

A RADIUS server can be configured in the GUI by going to *User & Authentication > RADIUS Servers*, or in the CLI under `config user radius`.

Basic configuration

The following table summarizes the common RADIUS settings that can be configured in the GUI and CLI.

GUI field	CLI setting	Description
<i>Name</i>	<code>edit <name></code>	Define the RADIUS server object within FortiOS.
<i>Authentication method</i>	<code>set auth-type {auto ms_chap_v2 ms_chap chap pap}</code>	Specify the authentication method, or select <i>Default/auto</i> to negotiate PAP, MSCHAP_v2, and CHAP in that order.
<i>NAS IP</i>	<code>set nas-ip <IPv4_address></code>	Optional setting, also known as Calling-Station-Id. Specify the IP address the FortiGate uses to communicate with the RADIUS server. If left unconfigured, the FortiGate will use the IP address of the interface that communicates with the RADIUS server.

GUI field	CLI setting	Description
<i>Include in every user group</i>	<code>set all-usergroup {enable disable}</code>	Optional setting to add the RADIUS server to each user group. This allows each user group to try and authenticate users against the RADIUS server if local authentication fails.
<i>Primary Server</i>		
<i>IP/Name</i>	<code>set server <string></code>	Enter the IP address or resolvable FQDN of the RADIUS server.
<i>Secret</i>	<code>set secret <password></code>	Enter the password used to connect to the RADIUS server.

There is an option in the GUI to configure a second server, and a third server can be configured in the CLI (see [Using multiple RADIUS servers on page 1935](#)).

Advanced settings

Advanced settings for RADIUS servers can be configured in the CLI. The following are some commonly used settings.

To edit the port used to connect with the RADIUS server:

```
config system global
    set radius-port <integer>
end
```

To edit the default setting for password encoding and username case sensitivity:

```
config user radius
    edit <name>
        set password-encoding {auto | ISO-8859-1}
        set username-case-sensitive {enable | disable}
    next
end
```

<code>password-encoding {auto ISO-8859-1}</code>	Set the password encoding to use the original encoding or ISO-8859-1 (default = auto). The <code>auth-type</code> must be <code>auto</code> or <code>pap</code> to change this setting.
<code>username-case-sensitive {enable disable}</code>	Enable/disable case sensitive usernames (default = disable).

Using multiple RADIUS servers

There are several ways to implement multiple RADIUS servers, and each has a different effect on user authentication. The three main options available are:

- Add a second (or third) RADIUS server in the same profile.
- Add a second RADIUS server profile, and add both to the same user group.
- Use two RADIUS server profiles for two user groups (one for each).

Adding a second server in a RADIUS profile

A second RADIUS server can be configured in the same RADIUS profile so in the event the first RADIUS server does not respond, the second server can be checked. If the first RADIUS server responds with an Access-Reject, no further servers are queried.

To add a second server in a RADIUS profile:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Enter the following:

Name	<i>RADIUS_with_2ndary</i>
Authentication method	<i>Default</i>
Primary Server	
IP/Name	<i>1.1.1.1</i>
Secret	Enter the password used to connect to the RADIUS server.
Secondary Server	
IP/Name	<i>2.2.2.2</i>
Secret	Enter the password used to connect to the RADIUS server.

3. Click *OK*.

Adding two RADIUS server profiles in the same user group

When two separate RADIUS profiles are added to a user group, the FortiGate sends an Access-Request simultaneously to both RADIUS servers, and authentication succeeds if either server sends back an Access-Accept. This example includes the settings from the previous example where one or more of the RADIUS server profiles has a secondary

server configured. In this case, the secondary server in the *RADIUS_with_2ndary* profile, 2.2.2.2, is only checked if the primary server of this profile times out and the *fac_radius_server* profile does not return an Access-Accept.

To add two RADIUS server profiles in the same user group:

1. Go to *User & Authentication > RADIUS Servers*, click *Create New*, and configure the RADIUS servers as needed (refer to the [previous example](#)).
2. Go to *User & Authentication > User Groups* and click *Create New*.
3. Enter the following:

Name	<i>RADIUS_GROUP</i>
Type	<i>Firewall</i>

4. In the *Remote Groups* table, click *Add*.
5. Select *RADIUS_with_2ndary* and click *OK*.
6. Click *Add*, select *fac_radius_server*, then click *OK*.

The screenshot shows the 'New User Group' configuration window. The 'Name' field contains 'RADIUS_GROUP' and the 'Type' is set to 'Firewall'. Below these fields, there are options for 'Fortinet Single Sign-On (FSSO)', 'RADIUS Single Sign-On (RSSO)', and 'Guest'. The 'Members' field has a plus sign. The 'Remote Groups' section contains a table with two rows: 'RADIUS_with_2ndary' and 'fac_radius_server'. The 'OK' button is highlighted in green.

7. Click *OK*.

Using separate RADIUS server profiles for separate user groups

In this example, the FortiGate first evaluates if the user belongs to the first listed group (*radius_group*) in the policy. If the user fails to authenticate to this group, then the FortiGate checks if the user can successfully authenticate to the second user group (*radius_group_2*). Refer to the first and second examples for detailed instructions.

To use separate RADIUS server profiles for separate user groups:

1. Configure the RADIUS server profiles:
 - a. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
 - b. Configure two RADIUS servers, *fac_radius_server* and *RADIUS_with_2ndary*, as needed (refer to the [previous example](#)).

2. Configure the firewall groups:

- a. Go to *User & Authentication > User Groups* and click *Create New*.
- b. Configure two firewall groups, one named *radius_group* with remote server member *fac_radius_server*, and one named *radius_group_2* with remote server member *RADIUS_with_2ndary* (refer to the [previous example](#)).

Group Name ↕	Group Type ↕	Members ↕	Ref. ↕
radius_group	Firewall	fac_radius_server	1
radius_group_2	Firewall	RADIUS_with_2ndary	1

3. Configure the firewall policy:

- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
- b. For *Source*, click *User* then select *radius_group* and *radius_group_2*. Click *Address* and select *LAN address*.
- c. Configure the other settings as needed.
- d. Click *OK*.

Name	From	To	Source	Destination	Schedule	Service	Action	NAT
LAN to WAN	LAN (LAN)	WAN	radius_group radius_group_2 LAN address	all	always	ALL	ACCEPT	Enabled

RADIUS AVPs and VSAs

This topic describes RADIUS Attribute Value Pairs (AVPs) and Vendor-Specific Attributes (VSAs).

AVPs

RADIUS packets include a set of AVPs to identify information about the user, their location, and other information. The IETF defined a set of 255 standard attributes, which are well known and come in the form of Type, Length, Value (for more details, refer to [RFC 2865](#)). Of the standard 255, the FortiGate sends the following RADIUS attributes:

RADIUS attribute number	Name	Description
1	User-Name	Name of the user being authenticated by the RADIUS server.
4	NAS-IP-Address	IP address of the network access server (NAS) that is requesting authentication. The NAS is the FortiGate.
8	Framed-IP-Address	IP address to be configured for the user, by sending the IP address of a user to the RADIUS server in the Access-Request packet.
25	Class	Used in accounting packets and requests for firewall, WiFi, and proxy authentication. The attribute is returned in the Access-Accept message and is added to all accounting packets.
26	Fortinet-VSA	See VSAs .
32	NAS-Identifier	Identifier or IP address of the NAS that is requesting authentication. The NAS is the FortiGate.
42	Acct-Input-Octets	Number of octets received from the port over the course of this service being provided. Used to charge the user for the amount of traffic they used.

RADIUS attribute number	Name	Description
43	Acct-Output-Octets	Number of octets sent to the port while delivering this service. Used to charge the user for the amount of traffic they used.
44	Acct-Session-Id	Unique number assigned to each start and stop record to make it easy to match them, and to eliminate duplicate records.
55	Event-Timestamp	Records the time that the event occurred on the NAS. The timestamp is measured in seconds since January 1, 1970 00:00 UTC. Before the Event-Timestamp attribute can be sent in a packet, make sure that the correct time is set on the FortiGate.

VSA's

Some vendors want or need to send attributes that do not match any of the defined IETF attributes. This can be accomplished by using RADIUS attribute type 26, which allows a vendor to encapsulate their own specific attributes in this standard AVP.

In order to support VSAs, the RADIUS server requires a dictionary to define the VSAs. This dictionary is typically supplied by the client or server vendor.

The Fortinet RADIUS vendor ID is 12356 and contains the following attributes:

Attribute name	Attribute number	Attribute value format
Fortinet-Group-Name	1	String
Fortinet-Client-IP-Address	2	IP address
Fortinet-Vdom-Name*	3	String
Fortinet-Client-IPv6-Address	4	Octets
Fortinet-Interface-Name	5	String
Fortinet-Access-Profile	6	String
Fortinet-SSID	7	String
Fortinet-AP-Name	8	String
Fortinet-FAC-Auth-Status	11	String
Fortinet-FAC-Token-ID	12	String
Fortinet-FAC-Challenge-Code	15	String
Fortinet-Webfilter-Category-Allow	16	String
Fortinet-Webfilter-Category-Block	17	Octets
Fortinet-Webfilter-Category-Monitor	18	Octets
Fortinet-AppCtrl-Category-Allow	19	Octets

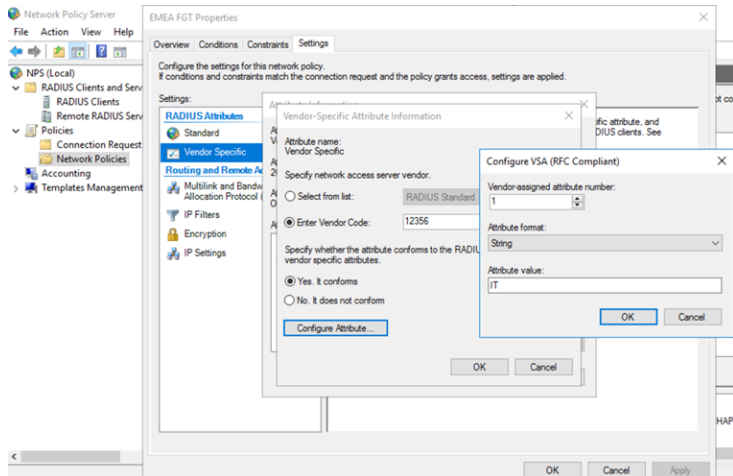

Attribute name	Attribute number	Attribute value format
Fortinet-AppCtrl-Category-Block	20	Octets
Fortinet-AppCtrl-Risk-Allow	21	Octets
Fortinet-AppCtrl-Risk-Block	22	Octets
Fortinet-WirelessController-Device-MAC	23	Ether
Fortinet-WirelessController-WTP-ID	24	String
Fortinet-WirelessController-Assoc-Time	25	Date
Fortinet-FortiWAN-AVPair	26	String
Fortinet-FDD-Access-Profile	30	String
Fortinet-FDD-Trusted-Hosts	31	String
Fortinet-FDD-SPP-Name	32	String
Fortinet-FDD-Is-System-Admin	33	String
Fortinet-FDD-Is-SPP-Admin	34	String
Fortinet-FDD-SPP-Policy-Group	35	String
Fortinet-FDD-Allow-API-Access	36	String
Fortinet-Fpc-User-Role	40	String
Fortinet-Tenant-Identification	41	String
Fortinet-Host-Port-AVPair	42	String

* For Fortinet-Vdom-Name, users can be tied to a specific VDOM on the FortiGate. Refer to the documentation provided by your RADIUS server for configuration details.

Restricting RADIUS user groups to match selective users on the RADIUS server

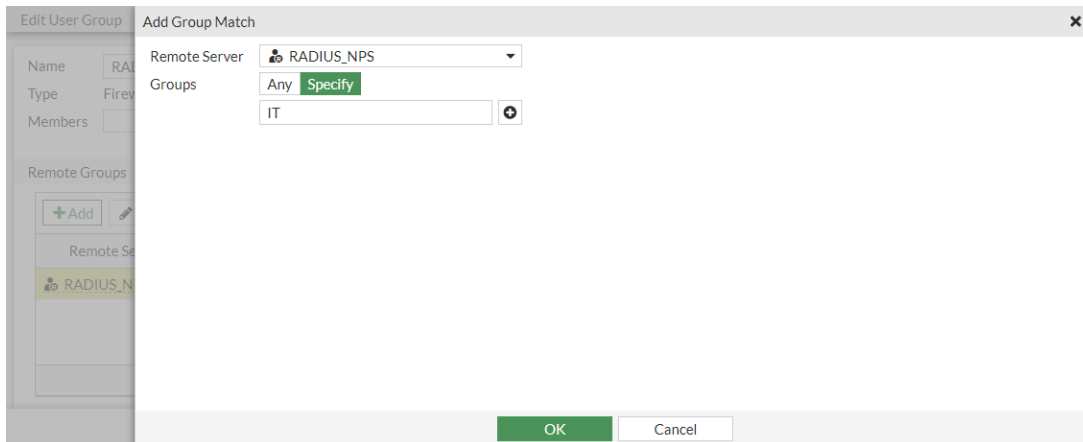

When a user group is configured in FortiOS to authenticate against a RADIUS server, it will allow any valid user account on the RADIUS server to match that user group. Sometimes you might want to specify which users on the RADIUS server should match a particular user group on the FortiGate. This can be accomplished using the RADIUS attribute value pair (AVP) 26, known as a Vendor-Specific Attribute (VSA). This attribute allows the Fortinet-Group-Name VSA to be included in the RADIUS response. In FortiOS, the user group must be configured to specifically match this group.

In the following example, a RADIUS [Network Policy Server \(NPS\)](#) has been configured to have the Fortinet-Group-Name be *IT*, and assumes that the user group, *RADIUS_IT* has been created, which authenticates to the *RADIUS_NPS* server.

To configure specific group matching in the GUI:

1. Go to *User & Authentication > User Groups* and edit the *RADIUS_IT* group.
2. In the *Remote Groups* table, select the *RADIUS_NPS* server and click *Edit*. The *Add Group Match* pane opens.
3. For *Groups*, select *Specify* and enter the group name configured on the RADIUS server (*IT*).
4. Click *OK*.

5. Click *OK*.

To configure specific group matching in the CLI:

```

config user group
  edit "RADIUS_IT"
    set member "RADIUS_NPS"
    config match
      edit 1
        set server-name "RADIUS_NPS"
        set group-name "IT"
      next
    end
  next
end
    
```

To change the matching back to any group, under `config match`, enter `delete 1`. Changing the `group-name` to "Any" will cause the FortiGate to match the Fortinet-Group-Name with the literal string, Any.

Configuring RADIUS SSO authentication

A common RADIUS SSO (RSSO) topology involves a medium-sized company network of users connecting to the Internet through the FortiGate and authenticating with a RADIUS server. The following describes how to configure FortiOS for this scenario. The example makes the following assumptions:

- VDOMs are not enabled.
- The `super_admin` account is used for all FortiGate configuration.
- A RADIUS server is installed on a server or FortiAuthenticator and uses default attributes.
- BGP is used for any dynamic routing.
- You have configured authentication event logging under *Log & Report*.

Example.com has an office with 20 users on the internal network who need access to the Internet. The office network is protected by a FortiGate-60C with access to the Internet through the wan1 interface, the user network on the internal interface, and all servers are on the DMZ interface. This includes an Ubuntu sever running FreeRADIUS. This example configures two users:

User	Account
Pat Lee	plee@example.com
Kelly Green	kgreen@example.com

Configuring this example consists of the following steps:

1. [Configure RADIUS.](#)
2. [Configure FortiGate interfaces.](#)
3. [Configure a RSSO agent.](#)
4. [Create a RSSO user group.](#)
5. [Configure security policies.](#)
6. [Test the configuration.](#)

To configure RADIUS:

Configuring RADIUS includes configuring a RADIUS server such as FreeRADIUS on user's computers and configuring users in the system. In this example, Pat and Kelly belong to the `example.com_employees` group. After completing the configuration, you must start the RADIUS daemon. The users have a RADIUS client installed on their PCs that allow them to authenticate through the RADIUS server.

For any problems installing FreeRADIUS, see the [FreeRADIUS documentation](#).

To configure FortiGate interfaces:

You must define a DHCP server for the internal network, as this network type typically uses DHCP. The `wan1` and `dmz` interfaces are assigned static IP addresses and do not need a DHCP server. The following table shows the FortiGate interfaces used in this example:

Interface	Subnet	Act as DHCP server	Devices
wan1	172.20.120.141	No	Internet service provider
dmz	10.11.101.100	No	Servers including RADIUS server
internal	10.11.102.100	Yes: x.x.x.110-250	Internal user network

1. Go to *Network > Interfaces*.
2. Edit wan1:

Alias	Internet
Addressing Mode	Manual
IP/Network Mask	172.20.120.141/255.255.255.0
Administrative Access	HTTPS, SSH
Enable DHCP Server	Not selected
Comments	Internet
Administrative Status	Up

3. Click *OK*.
4. Edit dmz:

Alias	Servers
Addressing Mode	Manual
IP/Network Mask	10.11.101.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING, SNMP
Enable DHCP Server	Not selected
Listen for RADIUS Accounting Messages	Select

Comments	Servers
Administrative Status	Up

- Click *OK*.
- Edit internal:

Alias	Internal network
Addressing Mode	Manual
IP/Network Mask	10.11.102.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING
Enable DHCP Server	Select
Address Range	10.11.102.110 - 10.11.102.250
Netmask	255.255.255.0
Default Gateway	Same as Interface IP
Comments	Internal network
Administrative Status	Up

To create a RADIUS SSO agent:

- Go to *Security Fabric > External Connectors*.
- Click *Create New*.
- Under *Endpoint/Identity*, select *RADIUS Single Sign-On Agent*.
- Enable *Use RADIUS Shared Secret*. Enter the RADIUS server's shared secret.
- Enable *Send RADIUS Responses*. Click *OK*.

To create a RADIUS SSO user group:

- Go to *User & Authentication > User Groups*.
- Click *Create New*.
- For *Type*, select *RADIUS Single Sign-On (RSSO)*.
- In *RADIUS Attribute Value*, enter the name of the RADIUS user group that this local user group represents.
- Click *OK*.

Configuring security policies

The following security policies are required for RADIUS SSO:

Sequence Number	From	To	Type	Schedule	Description
1	internal	wan1	RADIUS SSO	Business hours	Authenticate outgoing user traffic

Sequence Number	From	To	Type	Schedule	Description
2	internal	wan1	Regular	Always	Allow essential network services and VoIP
3	dmz	wan1	Regular	Always	Allow servers to access the Internet
4	internal	dmz	Regular	Always	Allow users to access servers
5	any	any	Deny	Always	Implicit policy denying all traffic that has not been matched

You must place the RADIUS SSO policy at the top of the policy list so that it is matched first. The only exception to this is if you have a policy to deny access to a list of banned users. In this case, you must put that policy at the top so that the RADIUS SSO does not mistakenly match a banned user or IP address.

You must configure lists before creating security policies.

Schedule

You must configure a business_hours schedule. You can configure a standard Monday to Friday 8 AM to 5 PM schedule, or whatever days and hours covers standard work hours at the company.

Address groups

You must configure the following address groups:

Name	Interface	Address range included
internal_network	internal	10.11.102.110 to 10.11.102.250
company_servers	dmz	10.11.101.110 to 10.11.101.250

Service groups

You must configure the service groups. The services listed are suggestions and you may include more or less as required:

Name	Interface	Description of services to be included
essential_network_services	internal	Any network protocols required for normal network operation such as DNS, NTP, BGP
essential_server_services	dmz	All the protocols required by the company servers such as BGP, HTTP, HTTPS, FTP, IMAP, POP3, SMTP, IKE, SQL, MYSQL, NTP, TRACEROUTE, SOCKs, and SNMP

Name	Interface	Description of services to be included
user_services	internal	Any protocols required by users such as HTTP, HTTPS, FTP

The following security policy configurations are basic and only include logging and default AV and IPS. These policies allow or deny access to non-RADIUS SSO traffic. These are essential as network services including DNS, NTP, and FortiGuard require access to the Internet.

To configure security policies:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Configure the policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_network_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	ON
Comments	Essential network services

4. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	dmz
Source Address	company_servers
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_server_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS

Log Allowed Traffic	enable
Comments	Company servers accessing the Internet

5. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	dmz
Destination Address	company_servers
Schedule	always
Service	all
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Access company servers

6. Click *Create New*, and configure the RADIUS SSO policy as follows, then click *OK*. This policy allows access for members of specific RADIUS groups.

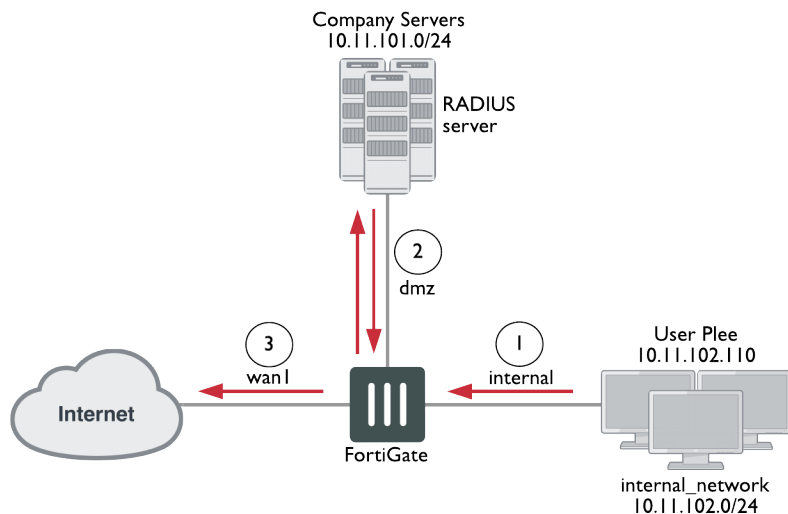

Incoming Interface	Internal
Source Address	internal_network
Source User(s)	Select the user groups that you created for RSSO.
Outgoing Interface	wan1
Destination Address	all
Schedule	business_hours
Service	ALL
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, Web Filter, IPS, and Email Filter. In each case, select the default profile.

7. Place the RSSO policy higher in the security policy list than more general policies for the same interfaces. Click *OK*.

To test the configuration:

Once configured, a user only needs to log in to their PC using their RADIUS account. After that, when they attempt to access the Internet, the FortiGate uses their session information to get their RADIUS information. Once the user is verified, they can access the website.

1. The user logs on to their PC and tries to access the Internet.
2. The FortiGate contacts the RADIUS server for the user's information. Once confirmed, the user can access the Internet. Each step generates logs that enable you to verify that each step succeeded.
3. If a step does not succeed, confirm that your configuration is correct.

RSA ACE (SecurID) servers

SecurID is a two-factor system produced by the company RSA that uses one-time password (OTP) authentication. This system consists of the following:

- Portable tokens that users carry
- RSA ACE/Server
- Agent host (the FortiGate)

When using SecurID, users carry a small device or "token" that generates and displays a pseudo-random password. According to RSA, each SecurID authenticator token has a unique 64-bit symmetric key that is combined with a powerful algorithm to generate a new code every 60 seconds. The token is time-synchronized with the SecurID RSA ACE/Server.

The RSA ACE/Server is the SecurID system's management component. It stores and validates the information about the SecurID tokens allowed on your network. Alternately, the server can be an RSA SecurID 130 appliance.

The agent host is the server on your network. In this case, this is the FortiGate, which intercepts user logon attempts. The agent host gathers the user ID and password entered from the SecurID token and sends the information to the RSA ACE/Server for validation. If valid, the RSA ACE/Server returns a reply indicating that it is a valid logon and FortiOS allows the user access to the network resources specified in the associated security policy.

Configuring SecurID with FortiOS consists of the following:

1. Configure the RSA and RADIUS servers to work with each other. See RSA server documentation.
2. Do one of the following:
 - a. [Configure the RSA SecurID 130 appliance.](#)
 - b. [Configure the FortiGate as an agent host on the RSA ACE/Server.](#)
3. [Configure the RADIUS server in FortiOS.](#)
4. [Create a SecurID user group.](#)

5. [Create a SecurID user.](#)
6. [Configure authentication with SecurID.](#)

The following instructions are based on RSA ACE/Server 5.1 and RSA SecurID 130 appliance. They assume that you have successfully completed all external RSA and RADIUS server configuration.

In this example, the RSA server is on the internal network and has an IP address of 192.128.100.000. The FortiOS internal interface address is 192.168.100.3. The RADIUS shared secret is fortinet123, and the RADIUS server is at IP address 192.168.100.202.

To configure the RSA SecurID 130 appliance:

1. Log on to the SecurID IMS console.
2. Go to *RADIUS > RADIUS clients*, then select *Add New*.

RADIUS Client Basics	
Client Name	FortiGate
Associated RSA Agent	FortiGate
RADIUS Client Settings	
IP Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
Make / Model	Select <i>Standard Radius</i> .
Shared Secret	Enter the RADIUS shared secret. In this example, it is fortinet123.
Accounting	Leave unselected.
Client Status	Leave unselected.

3. Configure your FortiGate as a SecurID client:
4. Click *Save*.

To configure the FortiGate as an agent host on the RSA ACE/Server:

1. On the RSA ACE/Server, go to *Start > Programs > RSA ACE/Server*, then *Database Administration - Host Mode*.
2. From the *Agent Host* menu, select *Add Agent Host*.
3. Configure the following:

Name	FortiGate
Network Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
Secondary Nodes	You can optionally enter other IP addresses that resolve to the FortiGate.

For more information, see the RSA ACE/Server documentation.

To configure the RADIUS server in FortiOS:

1. Go to *User & Authentication > RADIUS Servers*, then click *Create New*.
2. Configure the following:

Name	RSA
Authentication method	Select <i>Default</i> .
Primary Server	
IP/Name	192.168.100.102. You can click <i>Test</i> to ensure the IP address is correct and that FortiOS can contact the RADIUS server.
Secret	fortinet123

3. Click *OK*.

To create a SecurID user group:

1. Go to *User & Authentication > User Groups*. Click *Create New*.
2. Configure the following:

Name	RSA_group
Type	Firewall

3. In *Remote Groups*, click *Add*, then select the RSA server.
4. Click *OK*.

To create a SecurID user:

1. Go to *User & Authentication > User Definition*. Click *Create New*.
2. Configure the following:

User Type	Remote RADIUS User
Type	wloman
RADIUS Server	RSA
Contact Info	(Optional) Enter email or SMS information.
User Group	RSA_group

3. Click *Create*.

You can test the configuration by entering the `diagnose test authserver radius RSA auto wloman 1111111111` command. The series of 1s is the OTP that your RSA SecurID token generates that you enter for access.

Configuring authentication with SecurID

You can use the SecurID user group in several FortiOS features that authenticate by user group:

- [Security policy on page 1951](#)
- [IPsec VPN XAuth on page 1951](#)
- [PPTP VPN on page 1951](#)
- [SSL VPN](#)

Unless stated otherwise, the following examples use default values.

Security policy

The example creates a security policy that allows HTTP, FTP, and POP3 traffic from the internal interface to WAN1. If these interfaces are not available in FortiOS, substitute other similar interfaces.

To configure a security policy with SecurID authentication:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Configure the following:

Incoming Interface	internal
Source Address	all
Source User(s)	RSA_group
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	HTTP, FTP, POP3
Action	ACCEPT
NAT	On
Shared Shaper	If you want to limit traffic or guarantee minimum bandwidth for traffic that uses the SecurID security policy, enable and use the default shaper, guarantee-100kbps.
Log Allowed Traffic	Enable if you want to generate usage reports on traffic that this policy has authenticated.

4. Click *OK*.

IPsec VPN XAuth

In *VPN > IPsec Wizard*, select the SecurID user group on the *Authentication* page. The SecurID user group members must enter their SecurID code to authenticate.

PPTP VPN

When configuring PPTP in the CLI, set `usrgrp` to the SecurID user group.

SSL VPN

You must map the SecurID user group to the portal that will serve SecurID users and include the SecurID user group in the security policy's *Source User(s)* field.

To map the SecurID group to an SSL VPN portal:

1. Go to *VPN > SSL-VPN Settings*.
2. Under *Authentication/Portal Mapping*, click *Create New*.
3. Configure the following:

Users/Groups	RSA_group
Portal	Select the desired portal.

4. Click *OK*.

Support for Okta RADIUS attributes filter-Id and class

RADIUS user group membership information can be returned in the filter-Id (11) and class (25) attributes in RADIUS Access-Accept messages. The group membership information can be used for group matching in FortiGate user groups in firewall policies and for FortiGate wildcard administrators with remote RADIUS authentication.

In this example, a FortiAuthenticator is used as the RADIUS server. A local RADIUS user on the FortiAuthenticator is configured with two groups in the filter-Id attribute: *okta-group1* and *okta-group2*.

To create the RADIUS user and set the attribute type to override group information:

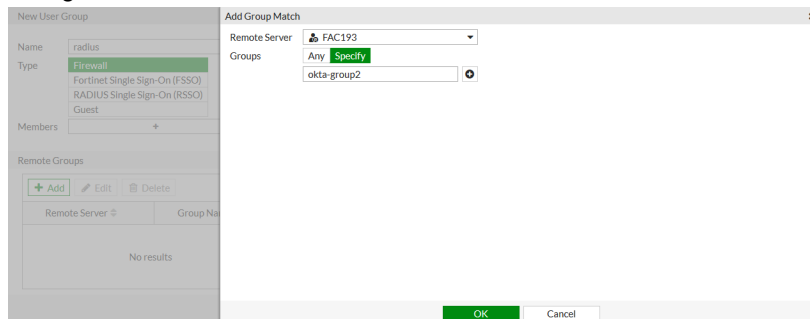

```
config user radius
  edit "FAC193"
    set server "10.1.100.189"
    set secret *****
    set group-override-attr-type filter-Id
  next
end
```

FortiOS will only use the configured filter-Id attribute, even if the RADIUS server sends group names in both class and filter-id attributes. To return group membership information from the class attribute instead, set `group-override-attr-type` to `class`.

To configure group match in the user group:

1. Go to *User & Authentication > User Groups*.
2. Click *Create New*.

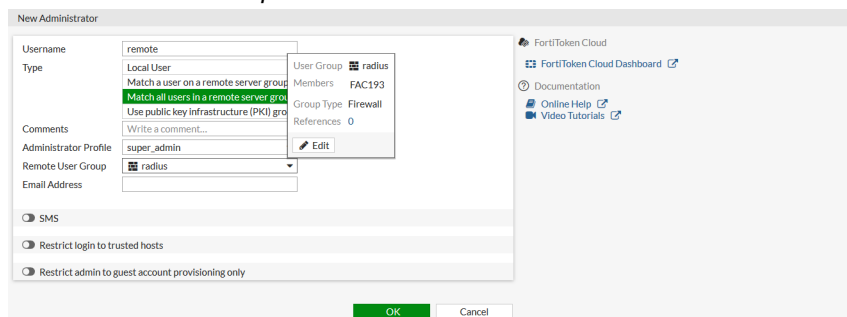

3. Enter a name for the group, and set *Type* to *Firewall*.
4. In the *Remote Groups* table, click *Add*.
5. Set *Remote Server* to the just created RADIUS server, *FAC193*.
6. Set *Groups* to *Specify*, and enter the group name, *okta-group2*. The string must match the group name configured on the RADIUS server for the filter-Id attribute.

7. Click *OK*.
The remote server is added to the *Remote Groups* table.
8. Click *OK*.
9. Add the new user group to a firewall policy and generate traffic on the client PC that requires firewall authentication, such as connecting to an external web server.
10. After authentication, on the FortiGate, verify that traffic is authorized in the traffic log:
 - a. Go to *Log & Report > Forward Traffic*.
 - b. Verify that the traffic was authorized.

To use the remote users user group with group match in a system wildcard administrator configuration:

1. Go to *System > Administrators*.
2. Edit an existing administrator, or create a new one.
3. Set *Type* to *Match all users in a remote server group*.
4. Set *Remote User Group* to the remote server.

5. Configure the remaining settings as required.
6. Click *OK*.
7. Log in to the FortiGate using the remote user credentials on the RADIUS server.
If the correct group name is returned in the filter-Id attribute, administrative access is allowed.

Sending multiple RADIUS attribute values in a single RADIUS Access-Request

A managed FortiSwitch can be configured to send multiple RADIUS attribute values in a single RADIUS Access-Request. This option is configured per RADIUS user, and is set to `none` by default.

The available service type options are:

login	User should be connected to a host.
framed	User use Framed Protocol.
callback-login	User disconnected and called back.
callback-framed	User disconnected and called back, then a Framed Protocol.
outbound	User granted access to outgoing devices.
administrative	User granted access to the administrative unsigned interface.
nas-prompt	User provided a command prompt on the NAS.
authenticate-only	Authentication requested, and no authentication information needs to be returned.
callback-nas-prompt	User disconnected and called back, then provided a command prompt.
call-check	Used by the NAS in an Access-Request packet, Access-Accept to answer the call.
callback-administrative	User disconnected and called back, granted access to the admin unsigned interface.

To configure a managed FortiSwitch to the RADIUS attributes login, framed, and authenticate-only all at the same time:

```
config user radius
  edit "Radius_Server"
    set switch-controller-service-type login framed authenticate-only
    ....
  next
end
```

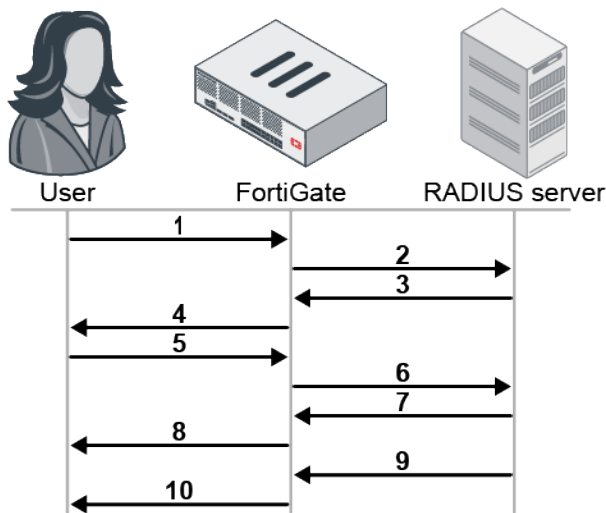

Traffic shaping based on dynamic RADIUS VSAs

A FortiGate can use the WISPr-Bandwidth-Max-Down and WISPr-Bandwidth-Max-Up dynamic RADIUS VSAs (vendor-specific attributes) to control the traffic rates permitted for a certain device. The FortiGate can apply different traffic shaping to different users who authenticate with RADIUS based on the returned RADIUS VSA values. When the same user logs in from an additional device, the RADIUS server will send a CoA (change of authorization) message to update the bandwidth values to $1/N$ of the total values, where N is the number of logged in devices from the same user.

This feature is not supported on NP hardware. NP offloading is automatically disabled on the policy if this feature is enabled.

When a user logs in to two devices through RADIUS authentication. The authentication and authorization flow is as follows:

1. The user logs in to a device and the authentication is sent to the FortiGate.
2. The FortiGate sends the Access-Request message to the RADIUS server.
3. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs.
4. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds based on its IP.
5. The user logs in to a second device and the authentication is sent to the FortiGate.
6. The FortiGate sends the Access-Request message to the RADIUS server.
7. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs at half the value from the first device.
8. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds on the second device based on its IP.
9. The RADIUS server sends a CoA message and returns WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs for the first device at half the value.
10. Based on the VSA values, the FortiGate updates traffic shaping for the upload and download speeds on the first device based on its IP.

Example

In this example, the FortiGate is configured to dynamically shape user traffic based on the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs returned by the RADIUS server when the user logs in through firewall authentication.

To configure traffic shaping based on dynamic RADIUS VSAs:

1. Configure the RADIUS server users file to identify WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down:

The WISPr-Bandwidth is measured in bps, and the FortiOS dynamic shaper is measured in Bps.

```
WISPr-Bandwidth-Max-Up = 1004857,
WISPr-Bandwidth-Max-Down = 504857,
```

2. In FortiOS, configure the RADIUS server:

```
config user radius
  edit "rad1"
    set server "172.16.200.44"
    set secret *****
    set radius-coa enable
    set acct-all-servers enable
    config accounting-server
      edit 1
        set status enable
        set server "172.16.200.44"
        set secret *****
      next
    end
  next
end
```

3. Configure the RADIUS user group:

```
config user group
  edit "group_radius"
    set member "rad1"
  next
end
```

4. Configure the firewall policy with dynamic shaping and the RADIUS group:

```
config firewall policy
  edit 2
    set srcintf "port2"
    set dstintf "wan1"
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all6"
    set dstaddr6 "all6"
    set action accept
    set schedule "always"
    set service "ALL"
    set dynamic-shaping enable
    set groups "group_radius"
    set nat enable
  next
end
```

Verification

After a client PC is authenticated by the RADIUS server, dynamic shaping is applied to the client based on the IP address.

Use the following commands to monitor the dynamic shaper:

```
# diagnose firewall shaper dynamic-shaper stats
# diagnose firewall shaper dynamic-shaper list {ip | ipv6 | user} <address or username>
```

Use case 1

User1 is paying for rate plan A that limits their maximum bandwidth to 10 Mbps download and 5 Mbps upload. User2 is paying for rate plan B that limits their maximum bandwidth to 5 Mbps download and 5 Mbps upload. The speeds in both plans are provided by best effort, so there is no guaranteed minimum bandwidth.

User1 logs in to pc1 with RADIUS authentication and IP-based dynamic shaping is applied. User2 logs in to pc2 with RADIUS authentication and IP-based dynamic shaping is applied.

To verify the dynamic shaping:

1. On pc1, verify the bandwidth and transfer speed:

```
root@pc1:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
-----
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size: 208 KByte (default)
-----
[ 3] local 10.1.100.11 port 50510 connected with 172.16.200.44 port 5001
[ ID] Interval      Transfer      Bandwidth
[ 3] 0.0-25.0 sec  59.6 MBytes  20.0 Mbits/sec
[ 3] Sent 42518 datagrams
[ 3] Server Report:
[ 3] 0.0-25.3 sec  30.1 MBytes  9.99 Mbits/sec  15.651 ms 21058/42518 (50%)
```

2. On pc2, verify the bandwidth and transfer speed:

```
root@pc2:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
-----
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size: 208 KByte (default)
-----
[ 3] local 10.1.100.22 port 52814 connected with 172.16.200.44 port 5001
[ ID] Interval      Transfer      Bandwidth
[ 3] 0.0-25.0 sec  59.6 MBytes  20.0 Mbits/sec
[ 3] Sent 42518 datagrams
[ 3] Server Report:
[ 3] 0.0-25.3 sec  15.1 MBytes  5.03 Mbits/sec  15.652 ms 31710/42514 (75%)
```

3. In FortiOS, check the authentication list:

```
# diagnose firewall auth list
10.1.100.11, test-shaper1
    src_mac: **:***:***:***:***:***
```

```

    type: fw, id: 0, duration: 38, idled: 16
    expire: 562
    flag(814): hard radius no_idle
    server: rad1
    packets: in 8207 out 3999, bytes: in 12306164 out 226963
    group_id: 3
    group_name: group_radius
10.1.100.22, test-shaper2
    src_mac: **:***:***:***:***:***
    type: fw, id: 0, duration: 24, idled: 24
    expire: 156, max-life: 35976
    flag(814): hard radius no_idle
    server: rad1
    packets: in 0 out 5, bytes: in 0 out 300
    group_id: 3
    group_name: group_radius
----- 2 listed, 0 filtered -----

```

4. Check the dynamic shaper list:

```

# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply) : 1250000 Bps/625000 Bps
current bandwidth(original/reply): 1237072 Bps/0 Bps
allow packets(original/reply): 38524/14
allow bytes(original/reply): 55270378/11285
drop packets(original/reply): 10136/0
drop bytes(original/reply): 13516198/0
life: 441
idle: 0/40
idle time limit: 600 s

addr: 10.1.100.22
bandwidth(original/reply) : 625000 Bps/625000 Bps
current bandwidth(original/reply): 622909 Bps/0 Bps
allow packets(original/reply): 3232/3
allow bytes(original/reply): 4841536/243
drop packets(original/reply): 2753/0
drop bytes(original/reply): 4123994/0
life: 10
idle: 0/10
idle time limit: 36000 s

```

5. Check the session list:

```

# diagnose sys session list
session info: proto=6 proto_state=05 duration=3 expire=116 timeout=3600 flags=00000004
socktype=4 sockport=10001 av_idx=0 use=4

```

Use case 2

A user logs in to a device (pc1, 10.1.100.11) and has a maximum bandwidth of 10 Mbps download and 5 Mbps upload. The same user logs in to a second device (pc2, 10.1.100.22) and the RADIUS server sends a CoA request with the

WISPr-Bandwidth-Max to pc1. The maximum bandwidth on pc1 changes to 5 Mbps download and 2.5Mbps upload. On pc2, the maximum bandwidth is also 5 Mbps download and 2.5Mbps upload.

When the user logs out from pc1, the RADIUS server sends CoA request with the new WISPr-Bandwidth-Max for pc2. The FortiGate updates the authentication user list and dynamic shaper for pc2. The maximum bandwidth on pc2 changes to 10 Mbps download and 5 Mbps upload.

To verify the dynamic shaping:

1. Check the dynamic shaper list after the user logs in to pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply) : 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 491
idle: 4/4
idle time limit: 86400 s
```

2. Check the dynamic shaper list after the user logs in to pc2:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply) : 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 652
idle: 5/5
idle time limit: 600 s
```

```
addr: 10.1.100.22
bandwidth(original/reply) : 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 3
idle: 3/3
idle time limit: 86400 s
```

3. Check the authentication list:

```
# diagnose firewall auth list
10.1.100.11, test
  src_mac: **:**:**:**:**:**
  type: fw, id: 0, duration: 171, idled: 11
  expire: 589, max-life: 589
  flag(814): hard radius no_idle
  server: rad1
  packets: in 0 out 0, bytes: in 0 out 0
```

```

    group_id: 15
    group_name: group_radius
10.1.100.22, test
    src_mac: **:***:***:***:***:***
    type: fw, id: 0, duration: 9, idled: 9
    expire: 86391
    flag(814): hard radius no_idle
    server: radl
    packets: in 0 out 0, bytes: in 0 out 0
    group_id: 15
    group_name: group_radius
----- 2 listed, 0 filtered -----

```

4. Check the dynamic shaper list after the user logs out from pc1:

```

# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.22
bandwidth(original/reply) : 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 414
idle: 9/9
idle time limit: 600 s

```

5. Check the authentication list again:

```

# diagnose firewall auth list
10.1.100.22, test
    src_mac: **:***:***:***:***:***
    type: fw, id: 0, duration: 453, idled: 49
    expire: 551, max-life: 551
    flag(814): hard radius no_idle
    server: radl
    packets: in 0 out 0, bytes: in 0 out 0
    group_id: 15
    group_name: group_radius
----- 1 listed, 0 filtered -----

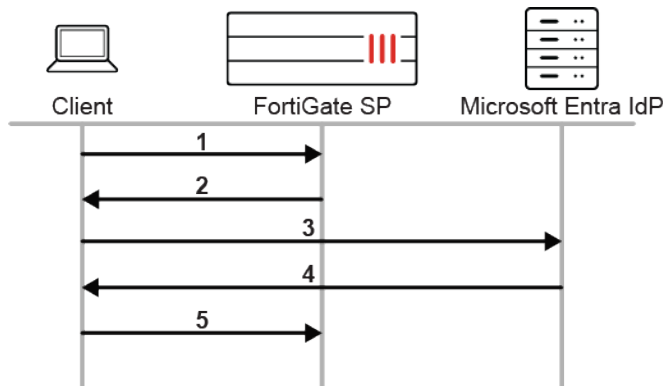

```

SAML

SAML authentication allows a user to complete authentication and authorization between a Service Provider (SP) and an Identity Provider (IdP). It enables Single Sign-On (SSO) by allowing users who have been authenticated against an IdP to be allowed access to different applications (the SPs providing a service such as a web application).

A FortiGate (SP) can provide a web service, such as an SSL VPN connection, that requires users to be authenticated through SAML. The user identities for the company can be stored remotely in an IdP, such as Microsoft Entra ID. Other applications might also require authentication from the same IdP, so after a user is authenticated once, the same SAML assertion carrying user and group information can be used to authorize the user access to the FortiGate SSL VPN, as well as other applications.

To illustrate the communication between the user or browser, SP, and IdP:

1. The user initiates an SSL VPN connection to the FortiGate.
2. The FortiGate SP redirects the user to the SAML IdP.
3. The user connects to the Microsoft log in page for the SAML authentication request.
4. The SAML IdP authenticates the user and sends the SAML assertion containing the user and group.
5. The browser forwards the SAML assertion to the FortiGate SP. If the user and group are allowed by the FortiGate, the user is allowed to access the application, in this case, connecting to SSL VPN.

Usage

There are many practical uses and applications for SAML authentication on the FortiGate. For example:

- Authentication for SSL VPN
- Firewall authentication for firewall policy access
- Authentication for ZTNA
- Authentication for Explicit Proxy
- Authentication for Administrative Access

Identity providers

FortiGate's SAML SSO configurations can be integrated with any common Identity providers, such as Microsoft Entra ID, Okta, Google Workspace, Onelogin, and others. You can also use FortiAuthenticator as an identity provider with local or remote user integration, or as an IdP Proxy to other IdP providers.

For more information on using FortiAuthenticator, see the [FortiAuthenticator Administration Guide](#) and [FortiAuthenticator Examples Guide](#).

Configuring SAML SSO

SAML Single Sign-On (SSO) can be configured from the GUI or CLI. The configurations allow administrators to set up the FortiGate as a SAML Service Provider (SP) while inputting the necessary settings for the Identity Provider (IdP).

There are many use cases for applying SAML authentication, as explained in the [SAML introduction](#). For each use case, the configuration steps vary slightly. In general, to successfully configure SAML authentication for an application, you will need to perform the following:

1. Obtain IdP configurations from the Identity Provider. This is outside the scope of the FortiGate.
2. Create a Single Sign-On object in *User & Authentication > Single Sign-On*.
3. Apply the FortiGate SP URLs to the IdP.
4. Install appropriate IdP and SP certificates.
5. Configure user group with the SSO object as member.

After these steps are completed, the user group object can be applied to whatever type of policy is applicable to the use case.

Common SAML SSO settings

Configuring the IdP is outside the scope of this topic, but to successfully configure SAML on the FortiGate the following information must be obtained from the Identity Provider:

From IdP	Description
Entity ID	The identifier URL for the IdP used to identify the issuer of the SAML response or assertion.
Assertion consumer service (ACS) URL	The ACS URL, sometimes called the Login URL, informs the SP and end user where to send the Login request to the IdP.
Single logout service URL	The Single logout service URL, sometimes called the Logout URL, informs the SP and end user where to send the Logout request to the IdP.
SAML Signing Certificate	The certificate used to sign the SAML response originating from the IdP. This must be trusted by the SP in order to verify the identity of the messages from the IdP. To upload a remote certificate from the IdP, follow the instructions in Uploading a certificate using the GUI on page 2293 .

At the same time, to complete the configurations on the IdP, it will require information about the SP from the FortiGate. The following describes the settings configured on the FortiGate, including the information needed for the IdP configuration.

To configure the FortiGate SP settings for SSO in the GUI:

1. Go to *User & Authentication > Single Sign-On* and click *Create new*.
2. Configure the SP settings:

Setting	Description
Name	Name of the SSO object.
Address	FQDN or IP address that clients will be connecting to. If this requires a non-standard port (eg. 443), specify the port in this format <code><address>:<port></code> .
Entity ID	The identifier URL for the SP used to identify the issuer of the SAML request. This URL must be provided to the IdP. Modifying the URL must be done in CLI.

Setting	Description
Assertion consumer service URL	The ACS URL, sometimes referred to as the reply URL or the single sign-on URL, informs the IdP and end user the URL to send the SAML Assertion for login to. This URL must be provided to the IdP. Modifying the URL must be done in CLI.
Single logout service URL	The logout URL informs the IdP and end user the URL to send the request to logout to. This URL must be provided to the IdP. Modifying the URL must be done in CLI.
Certificate	The certificate used to sign the SAML messages originating from the SP to the IdP. This is typically an optional configuration.

3. Click *Next*.

4. Configure the IdP settings:

Setting	Description
Type	<ul style="list-style-type: none"> Fortinet Product: If the IdP is a FortiAuthenticator or FortiTrust-ID, IdP configurations are simplified. See FortiAuthenticator Admin Guide > Authentication > SAML IdP for more information Custom: If the IdP is any other vendor, or you want to configure each field manually, select this option.
Fortinet Product setup	
Address	Enter the address of the FortiAuthenticator or FortiTrust-ID that users will access to authenticate to the IdP.
Prefix	Enter the prefix specified by the FortiAuthenticator or FortiTrust-ID.
Certificate	Select the SAML Signing certificate from the IdP. If this is not yet uploaded, use the <i>Import</i> option to import the remote certificate.
Custom setup	
Entity ID	Input the Entity ID URL from the IdP. See Entity ID on page 1963 .
Assertion consumer service URL	Input the ACS URL from the IdP. See Assertion consumer service (ACS) URL on page 1963 .
Single logout service URL	Input the Single logout service URL from the IdP. See Single logout service URL on page 1963 .
Certificate	Select the SAML Signing certificate from the IdP. If this is not yet uploaded, use the <i>Import</i> option to import the remote certificate. See SAML Signing Certificate on page 1963 .
Additional SAML Attributes	
AD FS claim	This setting is only available after the initial SSO object has been configured. Enable this setting to select the attribute names based on Active Directory Federated Services (AD FS) claim types.

Setting	Description
User claim type	Select the AD FS claim type that will be used to match the user within the SAML assertion statement.
Group claim type	Select the AD FS claim type that will be used to match the group within the SAML assertion statement.
Attribute used to identify users	Specify the name of the attribute for a user within the SAML assertion statement. This value is case sensitive. If AD FS claim is enabled, this field will be auto-populated to reflect the claim type.
Attribute used to identify groups	Specify the name of the attribute for a group within the SAML assertion statement. This value is case-sensitive. If AD FS claim is enabled, this field will be auto-populated to reflect the claim type.

5. Click *Submit*.

To configure the FortiGate SP settings for SSO in the CLI:

```
config user saml
  edit <name>
    set adfs-claim [enable|disable]
    set cert {string}
    set clock-tolerance {integer}
    set digest-method [sha1|sha256]
    set entity-id {string}
    set group-claim-type [email|given-name|...]
    set group-name {string}
    set idp-cert {string}
    set idp-entity-id {string}
    set idp-single-logout-url {string}
    set idp-single-sign-on-url {string}
    set limit-relaystate [enable|disable]
    set reauth [enable|disable]
    set single-logout-url {string}
    set single-sign-on-url {string}
    set user-claim-type [email|given-name|...]
    set user-name {string}
  next
end
```

Setting	Description
adfs-claim	See AD FS claim on page 1964 .
cert	The SP certificate used to sign SAML messages.
clock-tolerance	A SAML assertion is only valid for a specific duration. When the FortiGate SP and the SAML IdP clocks are not in synchronization, use clock-tolerance to define the number of seconds that the skew in time is tolerated. The setting is only available in the CLI.

Setting	Description
digest-method	The type of hash used to compute the hash value of the content of the SAML assertion. The setting is only available in the CLI.
entity-id	The SP Entity ID.
group-claim-type	Specify the group claim type when <code>adfs-claim</code> is enabled.
group-name	The attribute used to identify a group within the SAML assertion statement.
idp-cert	The SAML Signing certificate from the IdP.
idp-entity-id	The Entity ID from the IdP.
idp-single-logout-url	The Single logout service URL from the IdP.
idp-single-sign-on-url	The ACS URL, sometimes called the Login URL, from the IdP.
limit-relaystate	Enable/disable limiting the relay-state parameter when it exceeds SAML 2.0 specification limits (80 bytes). The setting is only available in the CLI.
reauth	Enable/disable signaling the IdP to force user re-authentication. The SAML AuthnRequest is set to ForceAuthn="true". The setting is only available in the CLI.
single-logout-url	The Single logout service URL from the SP.
single-sign-on-url	The ACS URL, sometimes referred to as the reply URL or the single sign-on URL, from the SP.
user-claim-type	Specify the user claim type when <code>adfs-claim</code> is enabled.
user-name	The attribute used to identify a user within the SAML assertion statement.

Other SAML related global settings

Authentication port

By default, the FortiGate listens on port 1003 for incoming authentication requests when traffic matches an identity based firewall policy. As a SAML SP with an identity based firewall policy configured for the SAML user group, the FortiGate will use the same port to listen for SAML authentication requests and redirect them to the IdP.

To change the default port:

```
config system global
    set auth-https-port <port>
end
```

Configuring the user authentication setting

When the FortiGate receives an authentication request in an identity based firewall policy, the authentication daemon uses a local server certificate to secure the connection. The client making the authentication request must trust the

certificate presented by the FortiGate that is acting as the TLS server.

In SAML authentication, when a user initiates traffic to the SP, the traffic matches the identity based firewall policy which triggers the authentication request to hit the authentication daemon. The server certificate used by the authentication daemon must be trusted by the user, otherwise they will receive a certificate warning. To avoid a certificate warning, use a custom certificate that the user trusts.

To configure a custom certificate in the GUI:

1. Go to *User & Authentication > Authentication Settings*.
2. Set *Certificate* to the custom certificate.

If the certificate is not available, click *Create* to create or import a new custom certificate.

The custom certificate's SAN field should have the FQDN or IP address from the SP URL.

To configure a custom certificate in the CLI:

```
config user setting
    set auth-cert <custom certificate name>
end
```

Alternatively, assigning a CA certificate allows the FortiGate to automatically generate and sign a certificate for the authentication daemon. This will override any assigned server certificate.

To assign a CA certificate:

1. Edit the user setting :

```
config user setting
    set auth-ca-cert <CA certificate name>
end
```

2. Go to *System > Certificates* and download the certificate.
3. Install the certificate into the client's certificate store.

SSL VPN with FortiAuthenticator as a SAML IdP

A FortiGate can act as a SAML service provider (SP) for SSL VPN that requests authentication from a SAML identity provider (IdP), such as Entra ID, Okta, Fortinet's FortiAuthenticator, or others. The following example shows the use of FortiAuthenticator as the IdP.

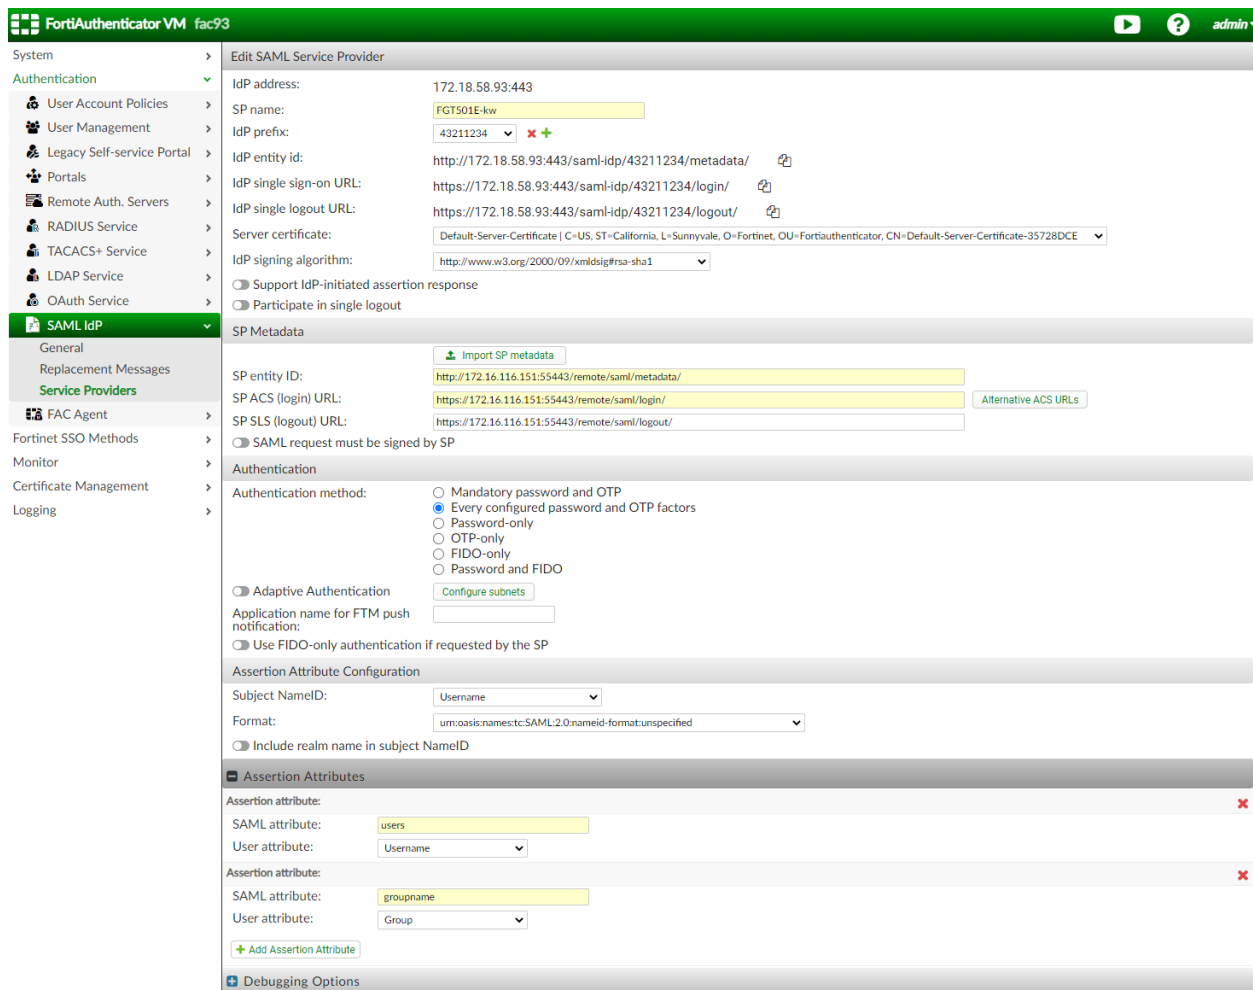

Using FortiAuthenticator as an IdP

In this example, FortiGate AA is the inside firewall (172.16.200.101). The other FortiGate is the outside firewall that only does port forwarding from 172.16.116.151:55443 to 172.16.200.101:443. FortiGate AA is configured to allow full SSL VPN access to the network in port2.

This SSL VPN portal allows users from the user group *saml_grp* and SAML server *saml_test* to log in. The FortiAuthenticator acts as the SAML identity provider (IdP), while the FortiGate is the SAML SP. External users are directed to the FortiAuthenticator IdP login URL to authenticate.

The FortiAuthenticator in this example has the following configuration:

For a deep-dive into how to configure FortiAuthenticator as an IdP, including integration with Windows AD via LDAP for user authentication, see the [FortiGate SSL VPN with FortiAuthenticator as SAML IdP](#) section in the [FortiAuthenticator Examples Guide](#).

This example also demonstrates using FortiAuthenticator to act as a root CA to sign certificates for the SP, IdP, and SSL VPN portal.

To configure FortiGate AA as an SP:

1. Create a new SAML server entry:
 - a. Go to *User & Authentication > Single Sign-On* and click *Create New*. The single-sign on wizard opens.
 - b. Enter a name (*saml_test*). The other fields will automatically populate based on the FortiGate's WAN IP and port.

New Single Sign-On

1
2

Name

SP address

SP entity ID

SP single sign-on URL

SP single logout URL

SP certificate

Click the icon beside the *SP entity ID*, *SP single sign-on URL*, and *SP single logout URL* fields to copy the text.

- c. Click *Next*.
- d. Enter the FortiAuthenticator IdP details:

IdP address	172.18.58.93:443
Prefix	43211234
IdP certificate	REMOTE_Cert_1

- e. Enter the additional SAML attributes that will be used to verify authentication attempts:

Attribute used to identify users	users
Attribute used to identify groups	groupname

The IdP must be configured to include these attributes in the SAML attribute statement. In FortiAuthenticator, this is configured in the *Assertion Attributes* section.

New Single Sign-On

✓ ————— 2

IdP Details

i Log into your Identity Provider platform to find the following information.

IdP type: Fortinet Product Custom

IdP address:

Prefix:

IdP certificate: REMOTE_Cert_1

Additional SAML Attributes

i The FortiGate will look for these attributes to verify authentication attempts. Configure your Identity Provider to include them in the SAML Attribute Statement.

Attribute used to identify users:

Attribute used to identify groups:

f. Click *Submit*.

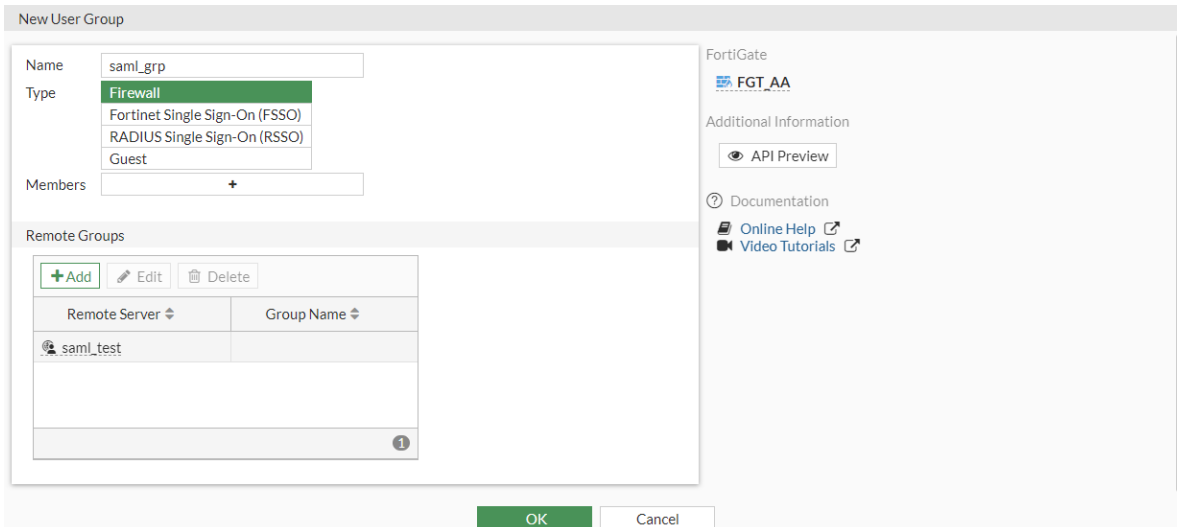

The following is created in the backend:

```

config user saml
  edit "saml_test"
    set cert "fgt_gui_automation"
    set entity-id "http://172.16.116.151:55443/remote/saml/metadata/"
    set single-sign-on-url "https://172.16.116.151:55443/remote/saml/login/"
    set single-logout-url "https://172.16.116.151:55443/remote/saml/logout/"
    set idp-entity-id "http://172.18.58.93:443/saml-idp/43211234/metadata/"
    set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/43211234/login/"
    set idp-single-logout-url "https://172.18.58.93:443/saml-idp/43211234/logout/"
    set idp-cert "REMOTE_Cert_1"
    set user-name "users"
    set group-name "groupname"
    set digest-method sha1
  next
end
    
```

2. Create the SAML group:

- a. Go to *User & Authentication > User Groups* and click *Create New*.
- b. Enter a name, *saml_grp*.
- c. In the *Remote Groups* table, click *Add*.
- d. In the *Remote Server* dropdown, select *saml_test* and click *OK*.

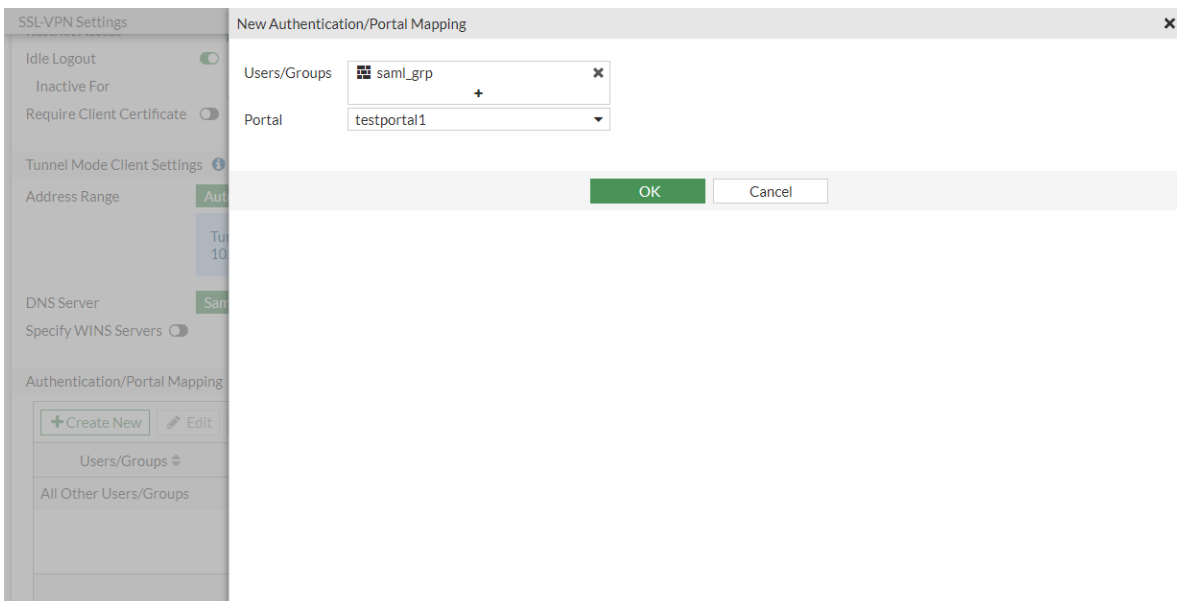

e. Click **OK**.

The following is created in the backend:

```
config user group
  edit "saml_grp"
    set member "saml_test"
  next
end
```

3. Add the SAML group in the SSL VPN settings:

- a. Go to *VPN > SSL-VPN Settings*.
- b. In the *Authentication/Portal Mapping* table, click *Create New*.
- c. For *Users/Groups*, click the + and select *saml_grp*.
- d. Select the *Portal (testportal1)*.
- e. Click **OK**.

f. Click **Apply**.

4. Configure the firewall policy:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Enter the following:

Incoming Interface	ssl.root
Outgoing Interface	port2
Source	all, saml_grp, saml_test

- c. Configure the other settings as needed.
 - d. Click *OK*.
5. On the client, log in with SAML using the SSL VPN web portal.

If you are using FortiClient for tunnel mode access, enable *Enable Single Sign On (SSO) for VPN Tunnel* in the *SSL-VPN* connection settings to use the SAML log in. See [Configuring an SSL VPN](#) connection for more information.

6. In FortiOS, go to *Dashboard > Network* and click the *SSL-VPN* widget to expand to full view and verify the connection information.

Using a browser as an external user-agent for SAML authentication in an SSL VPN connection

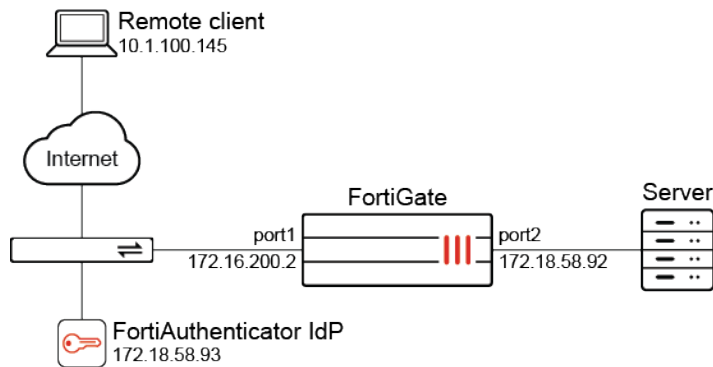

FortiClient can use a browser as an external user-agent to perform SAML authentication for SSL VPN tunnel mode, instead of the FortiClient embedded log in window. If a user has already done SAML authentication in the default browser, they do not need to authenticate again in the FortiClient built-in browser. FortiClient 7.0.1 and later is required.

The following CLI is used to set the SAML local redirect port on the FortiClient endpoint after successful SAML authentication:

```
config vpn ssl settings
  set saml-redirect-port <port>
end
```

Example

In this example, a user wants to use their default browser to connect to IdP for SAML authentication, without needing to separately authenticate in the FortiClient built-in browser. After authenticating in the browser, FortiClient obtains the authentication cookie directly from the browser.

The authentication process proceeds as follows:

1. The remote client uses FortiClient to connect to the FortiGate SSL VPN on 172.16.58.92:1443 with the *Use external browser as user-agent for saml user authentication* option enabled.
2. The SSL VPN redirects FortiClient to complete SAML authentication using the Identity Provider (IdP).
3. FortiClient opens the default browser to authenticate the IdP server.
4. After a successful authentication, the browser redirects to localhost:<port>, where the port is defined by the `saml-redirect-port` variable on the FortiGate.
5. FortiClient reads the authentication ID passed by the successful authentication, then requests that the SAML authentication process continues on the FortiGate with this ID.
6. The FortiGate continues with the remaining SSL-VPN host-check and other steps until it receives the authentication cookie. It then allow the SSL VPN user to connect using tunnel mode.

To configure the VPN:

1. Configure a SAML user:

```
config user saml
  edit "sml"
    set cert "fgt_gui_automation"
    set entity-id "http://172.18.58.92:1443/remote/saml/metadata/"
    set single-sign-on-url "https://172.18.58.92:1443/remote/saml/login/"
    set single-logout-url "https://172.18.58.92:1443/remote/saml/logout/"
    set idp-entity-id "http://172.18.58.93:443/saml-idp/222222/metadata/"
    set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/222222/login/"
    set idp-single-logout-url "https://172.18.58.93:443/saml-idp/222222/logout/"
    set idp-cert "REMOTE_Cert_1"
    set user-name "Username"
    set group-name "Groupname"
    set digest-method sha1
  next
end
```

2. Add the SAML user to a user group:

```
config user group
  edit "saml_grp"
    set member "sml"
  next
end
```

3. Create an SSL VPN web portal:

```
config vpn ssl web portal
  edit "testportall"
    set tunnel-mode enable
    set ipv6-tunnel-mode enable
    set web-mode enable
    ...
  next
end
```

4. Configure the SSL VPN:

```
config vpn ssl settings
  set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
  set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
  set port 1443
  set source-interface "port2"
  set source-address "all"
  set source-address6 "all"
  set default-portal "testportall"
  ...
end
```

5. Configure a firewall policy for the SSL VPN and assign the SAML group and a local user to it:

```
config firewall policy
  edit 1
    set name "policy_to_sslvpn_tunnel"
    set srcintf "ssl.root"
    set dstintf "port1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set srcaddr6 "all"
    set dstaddr6 "all"
    set schedule "always"
    set service "ALL"
    set nat enable
    set groups "saml_grp"
    set users "u1"
  next
end
```

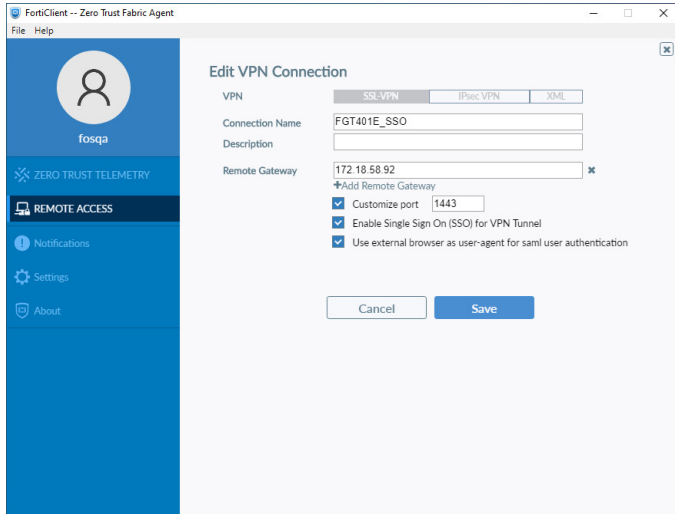

6. Enable the SAML redirect port:

```
config vpn ssl settings
  set saml-redirect-port 8020
end
```

To connect to the VPN using FortiClient:

1. Configure the SSL VPN connection:
 - a. Open FortiClient and go to the *Remote Access* tab and click *Configure VPN*.
 - b. Enter a name for the connection.
 - c. Set the *Remote Gateway* to the FortiGate port 172.18.58.92.
 - d. Enable *Customize port* and set the port to 1443.

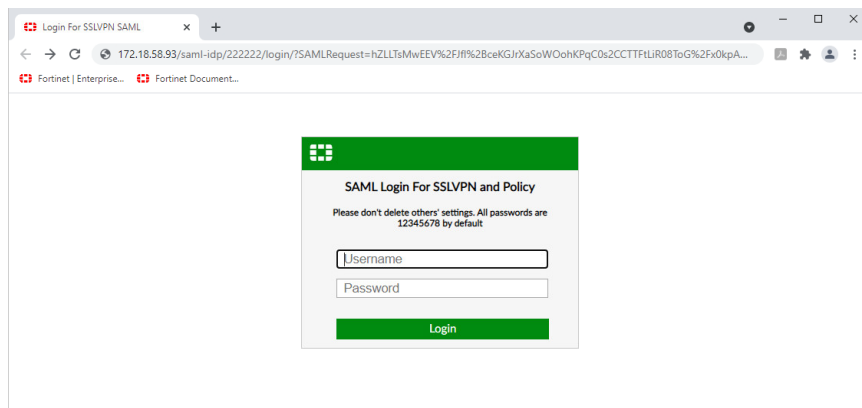

- e. Enable *Enable Single Sign On (SSO) for VPN Tunnel* and *Use external browser as user-agent for saml user authentication*.

- f. Click *Save*.

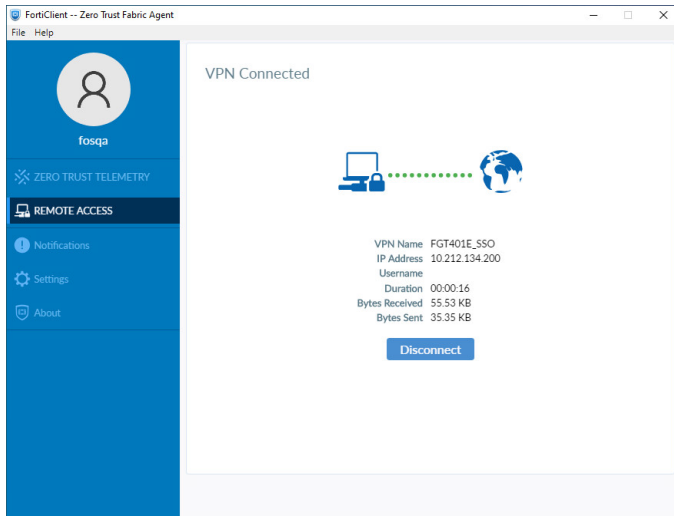

2. On the *Remote Access* tab select the *FGT401E_SSO* VPN connection from the dropdown list.
3. Click *SAML Login*.

The default browser opens to the IdP authentication page.

4. Enter the username and password, then click *Login*.

The authenticated result is sent back to FortiClient and the connection is established.

To check the connection on the FortiGate:

```
# get vpn ssl monitor
SSL-VPN Login Users:
  Index  User      Group   Auth Type      Timeout      Auth-Timeout  From      HTTP in/out
  HTTPS in/out   Two-factor Auth
  1      fac3     saml_grp 256(1)      N/A         10.1.100.254 0/0      0/0      0

SSL-VPN sessions:
  Index  User      Group   Source IP      Duration      I/O Bytes      Tunnel/Dest IP
  0      fac3     saml_grp 10.1.100.254  5             9990/8449
10.212.134.200,fdff:ffff::1

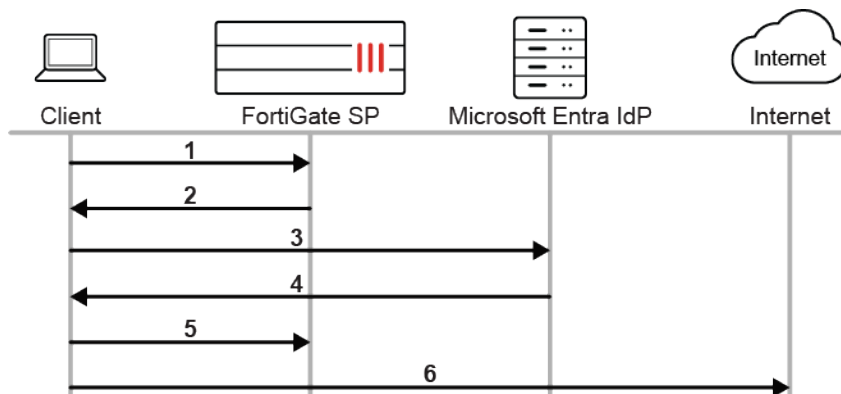

# diagnose firewall auth list

10.212.134.200, fac3
  type: fw, id: 0, duration: 6, idled: 0
  expire: 259199, allow-idle: 259200
  flag(80): sslvpn
  server: sul
  packets: in 28 out 28, bytes: in 23042 out 8561
  group_id: 5
  group_name: saml_grp
```

Outbound firewall authentication with Microsoft Entra ID as a SAML IdP

In this example, users are managed through Microsoft Entra ID (formerly Azure Active Directory). The FortiGate is configured for SSO firewall authentication for outbound traffic, with authentication performed by the Microsoft Entra ID as a SAML identity provider (IdP).

The SAML interaction occurs as follows:

1. The user initiates web traffic to the internet.
2. The FortiGate redirects to the local captive portal port (default is 1003), then redirects the user to the SAML IdP.
3. The user connects to the Microsoft log in page for the SAML authentication request.
4. The SAML IdP sends the SAML assertion containing the user and group.
5. The browser forwards the SAML assertion to the SAML SP.
6. If the user and group are allowed by the FortiGate, the user is allowed to access the internet.

In this example environment, a user is added in the Microsoft Entra ID belonging to the security group called Firewall.

- Username: John Locus
- User login: jlocus@azure.kldocs.com
- Group: Firewall (ID 62b699ce-4f80-48c0-846e-c1dfde2dc667)

The goal is to allow users in the Firewall group to access the internet after passing firewall authentication.

Configuring the Microsoft Entra ID

The following Microsoft Entra ID configuration demonstrates how to add the FortiGate as an enterprise non-gallery application. This application provides SAML SSO connectivity to the Microsoft Entra IdP. Some steps are performed concurrently on the FortiGate.

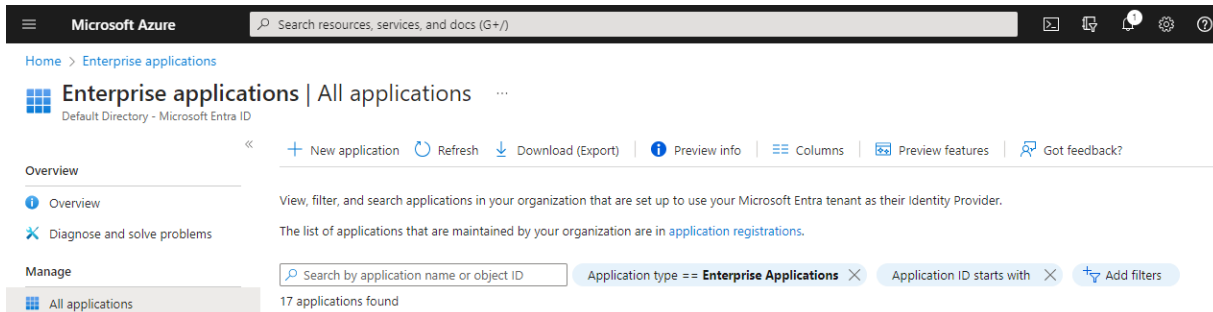

This example is configured with an Microsoft Entra ID free-tier directory. There may be limitations to managing users in Azure in this tier that are not limited in other tiers. Consult the [Microsoft Entra ID](#) documentation for more information.

There are three steps to configure the Microsoft Entra ID:

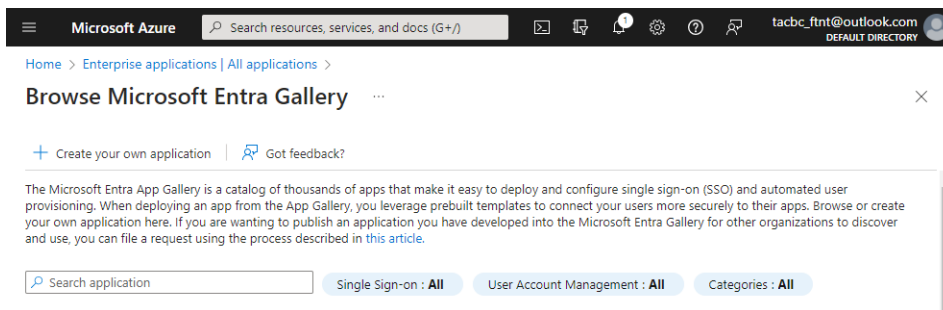

1. [Create a new enterprise application.](#)
2. [Configure the SAML SSO settings on the application and FortiGate.](#)
3. [Assign Microsoft Entra ID users and groups to the application.](#)

To create a new enterprise application:

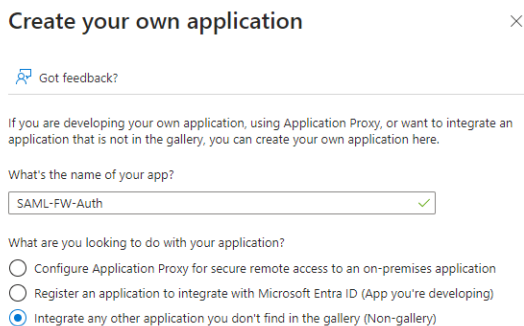

1. Log in to the Azure portal.
2. In the Azure portal menu, click *Microsoft Entra ID*.
3. In the left-side menu go *Manage > Enterprise applications*.
4. Click *New application*.

5. Click *Create your own application*.

6. Enter a name for the application (*SAML-FW-Auth*) and select *Integrate any other application you don't find in the gallery (Non-gallery)*.

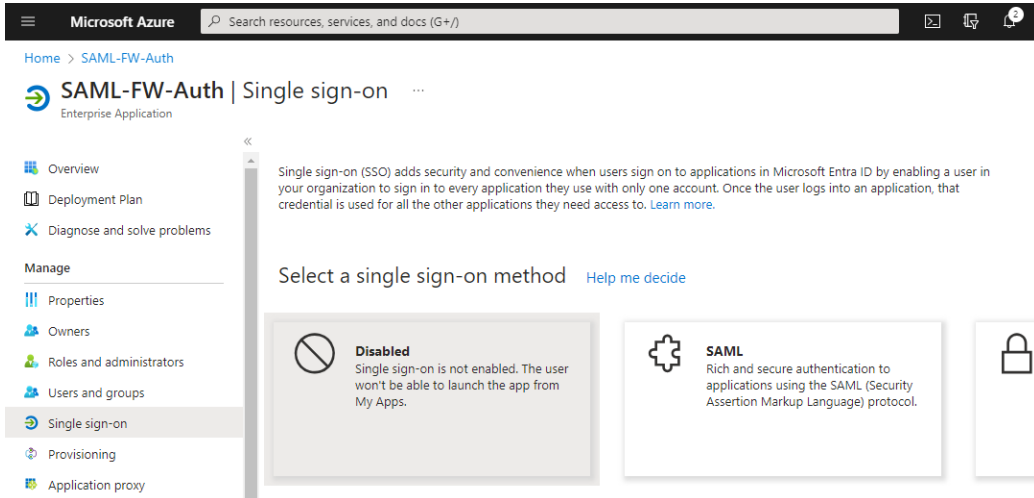

7. Click *Create*.

To configure the SAML SSO settings on the application and FortiGate:

This procedure requires going back and forth between Azure and the FortiGate GUI. Leave the FortiGate GUI open for the entire procedure.

1. On the *Overview* page for your new application, go to *Manage > Single sign-on* and select *SAML* as the single sign-on method.

2. The *Basic SAML Configuration* section in Azure describes the SAML SP entity and links that Azure will reference. Configure these settings on the FortiGate by creating a new SAML server object and defining the SP address. The SP (IP or FQDN) address should be accessible by the user who is authenticating against the firewall. The port used should match the port used by the FortiGate firewall authentication captive portal. By default, this is port 1003 for HTTPS. A captive portal does not need to be configured separately.
 - a. Go to *User & Authentication > Single Sign-On* and click *Create New*.
 - b. Enter a *Name* for the SAML object, *Entra-ID-SAML*.
 - c. Enter the *SP address*, *10.1.0.1:1003*. The three SP URLs are automatically populated.

3. In Azure on the *Set up Single Sign-On with SAML* page, copy the following URLs from the FortiGate to the *Basic SAML Configuration* section:

From FortiGate	To Azure field
<i>Entity ID</i> (http://10.1.0.1:1003/remote/saml/metadata/)	<i>Identifier (Entity ID)</i> , set to <i>Default</i>
<i>Assertion consumer service URL</i> (https://10.1.0.1:1003/remote/saml/login/)	<i>Reply URL</i> and <i>Sign on URL</i>
<i>Single logout service URL</i> (https://10.1.0.1:1003/remote/saml/logout/)	<i>Logout URL</i>

4. Click **Save**.

5. Under the **SAML Signing Certificate** section, download the Base64 certificate.

6. Import the certificate from Azure on the FortiGate as the IdP certificate:

- a. Go to **System > Certificates** and click **Create/Import > Remote Certificate**.
- b. Upload the certificate from Azure and click **OK**. The new certificate appears under the **Remote Certificate** section with the name **REMOTE_Cert_(N)**.
- c. Optionally, rename the certificate in the CLI to give it a more recognizable name:

```
config vpn certificate remote
    rename REMOTE_Cert_3 to ENTRA_ID_SAML_FW
end
```

7. In the **Set up <application name>** section, copy the URLs from Azure to the FortiGate in the **IdP Details** section:

- a. On the FortiGate, click **Next**.
- b. For **IdP type**, select **Custom** and copy the following from Azure to the corresponding field:

From Azure	To FortiGate field
Microsoft Entra Identifier	Entity ID
Login URL	Assertion consumer service URL
Logout URL	Single logout service URL

- c. For **Certificate**, select the remote certificate imported earlier.
8. In Azure, edit the **User Attributes & Claims** section. The attributes are returned in the SAML assertion, which the FortiGate uses to verify the user and group. Configuring group matching is optional.
- a. Click **Add new claim**, name it **username**, and set the **Source attribute** to **user.displayname**. The source attribute can be any of the related username fields. The value of the username returned to the FortiGate will be used in logs and monitors to identify the user.
 - b. Click **Save**.
 - c. Click **Add a group claim** and in the **Group Claims** pane, select **All groups**.
 - d. In **Advanced Options**, select **Customize the name of the group claim**. Set the name to **group**.

Group Claims ×

Manage the group claims used by Azure AD to populate SAML tokens issued to your app

Which groups associated with the user should be returned in the claim?

None
 All groups
 Security groups
 Directory roles
 Groups assigned to the application

Source attribute *

Group ID ▼

Advanced options

Customize the name of the group claim

Name (required)

group

Namespace (optional)

Emit groups as role claims ⓘ

e. Click **Save**. The *User Attributes & Claims* section displays the update settings.

User Attributes & Claims ✎ Edit

givenname	user.givenname
surname	user.surname
emailaddress	user.mail
name	user.userprincipalname
username	user.displayname
group	user.groups
Unique User Identifier	user.userprincipalname

9. On the FortiGate, update the *Additional SAML Attributes* section with the username and group created in Azure:

- a. For *Attribute used to identify users*, enter *username*.
- b. For *Attribute used to identify groups*, enter *group*.

New Single Sign-On

✓ ————— 2

Identity Provider Details

i Log into your Identity Provider platform to find the following information.

Type Fortinet Product Custom

Entity ID

Assertion consumer service URL

Single logout service URL

Certificate

Additional SAML Attributes

i The FortiGate will look for these attributes to verify authentication attempts. Configure your Identity Provider to include them in the SAML Attribute Statement.

Attribute used to identify users 🗑️

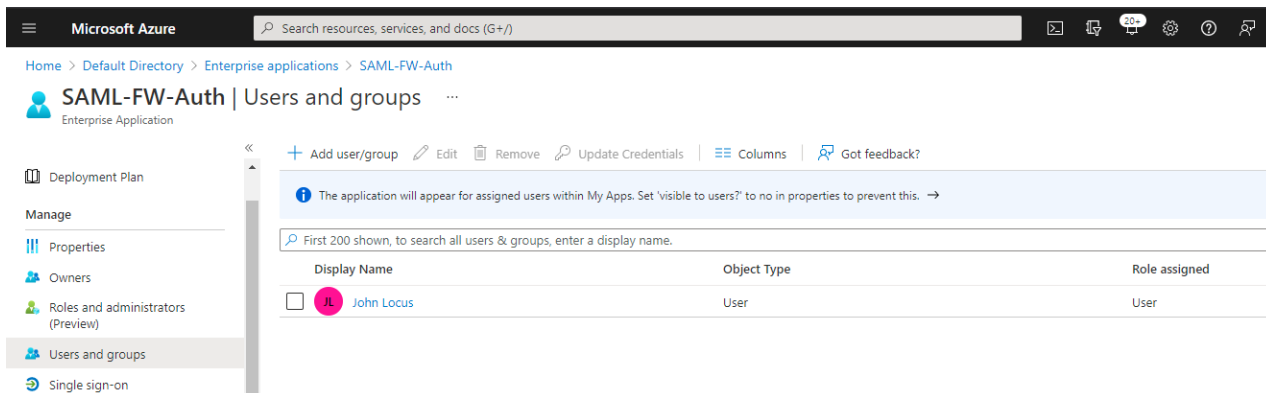

Attribute used to identify groups 🗑️

Back
Submit
Cancel

c. Click **Submit**.

To assign Microsoft Entra users and groups to the application:

1. In Azure, go to the application's *Overview* page.
2. Go to *Manage > Users and groups* and click *Add user/group*.
3. Click *Users* to select the users or groups (*John Locus* is selected in this example).
4. Click *Assign* to add the assignment.

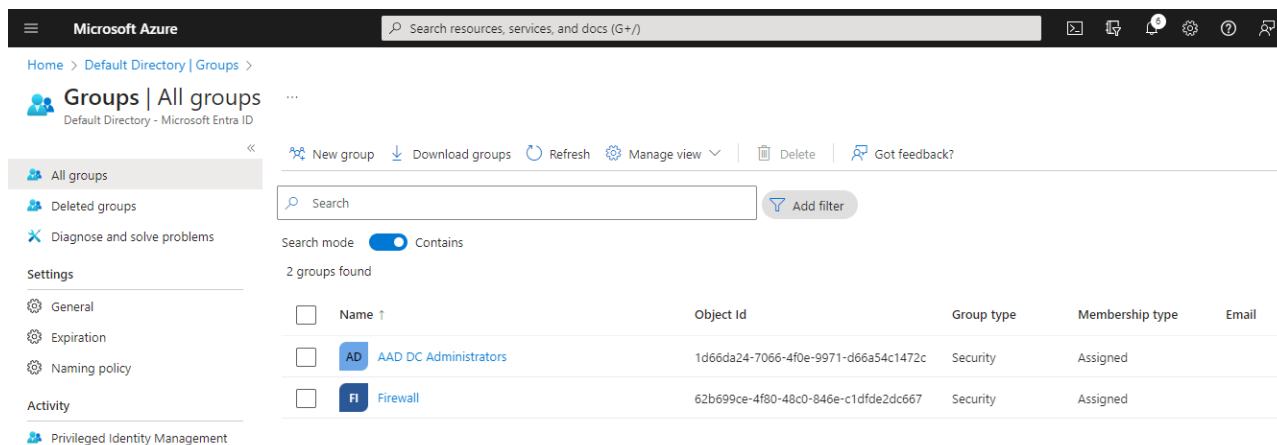

Configuring the FortiGate

The user group, user authentication settings, and firewall policies must be configured on the FortiGate.

Configuring the user group

A user group named *Azure-FW-Auth* is created with the member *Entra-ID-SAML*.

Configuring group matching is optional, and the *Object ID* from Azure is needed for the `config match` settings. In the Azure default directory, go to *Manage > Groups* and locate the *Object ID* for the *Firewall* group.

To configure the user group:

```
config user group
  edit "Azure-FW-Auth"
    set member "Entra-ID-SAML"
  config match
```

```

edit 1
    set server-name "Entra-ID-SAML"
    set group-name "62b699ce-4f80-48c0-846e-c1dfde2dc667"
next
end
next
end

```

Configuring the user authentication setting

When a user initiates traffic, the FortiGate will redirect the user to the firewall authentication captive portal before redirecting them to the SAML IdP portal. After the SAML IdP responds with the SAML assertion, the user is again redirected to the firewall authentication captive portal. If the firewall portal's certificate is not trusted by the user, they will receive a certificate warning. Use a custom certificate that the user trusts to avoid the certificate warning.

To configure a custom certificate:

1. Go to *User & Authentication > Authentication Settings*.
2. For *Certificate*, select the custom certificate. The custom certificate's SAN field should have the FQDN or IP from the SP URL.

Alternatively, assigning a CA certificate allows the FortiGate to automatically generate and sign a certificate for the portal page. This will override any assigned server certificate. In this example, the built-in Fortinet_CA_SSL is used.

To assign a CA certificate:

1. Edit the user setting:

```

config user setting
    set auth-ca-cert "Fortinet_CA_SSL"
end

```

2. Go to *System > Certificates* and download the certificate.
3. Install the certificate into the client's certificate store.

Configuring the firewall policies

Firewall policies must be configured to apply user authentication and still allow users behind the FortiGate to access the Microsoft log in portal without authentication.

To configure the firewall policies:

1. Configure a policy to allow traffic to the Microsoft Azure internet service:
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. Enter the following:

Name	<i>LAN-to-AuthPortal</i>
Incoming Interface	<i>port3</i>
Outgoing Interface	<i>Underlay</i>

Source	<i>all</i>
Destination	<i>Microsoft-Azure (under Internet Service)</i>
Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>ACCEPT</i>
NAT	Enable and select <i>NAT</i> .
Log Allowed Traffic	Enable and select <i>All Sessions</i> .

- c. Configure the other settings as needed.
 - d. Click *OK*.
2. Configure a policy to apply user authentication:
- a. Click *Create New* and enter the following:

Name	<i>LAN-auth-policy</i>
Incoming Interface	<i>port3</i>
Outgoing Interface	<i>Underlay</i>
Source	<i>all, Azure-FW-Auth</i>
Destination	<i>all</i>
Schedule	<i>always</i>
Service	<i>ALL</i>
Action	<i>ACCEPT</i>
NAT	Enable and select <i>NAT</i> .
Log Allowed Traffic	Enable and select <i>All Sessions</i> .

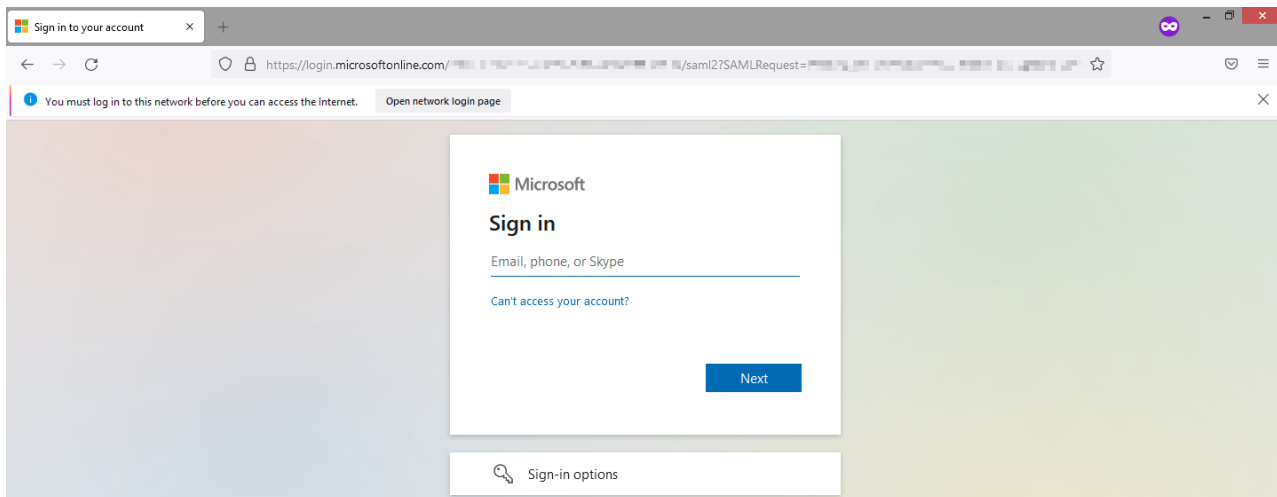

- b. Configure the other settings as needed.
- c. Click *OK*.

Connecting from the client

When the client connects to the internet from a browser, they will be redirected to the Microsoft log in page to authenticate against the Microsoft Entra ID. The FortiGate's authentication portal certificate should be installed on the client.

To connect from the client:

1. On the client, open a browser (such as Firefox) and go to a website. The user is redirected to the Microsoft log in page.
2. Enter the user credentials.

3. If the log in attempt is successful, the user is allowed to access the internet

Viewing logs and diagnostics

To verify user logins, go to the *Dashboard > Users & Devices > Firewall Users* widget, or enter the following in the CLI:

```
# diagnose firewall auth list
10.1.0.100, John Locus
  src_mac: 02:09:0f:00:03:03
  type: fw, id: 0, duration: 152, idled: 7
  expire: 292, allow-idle: 300
  server: Entra-ID-SAML
  packets: in 2097 out 932, bytes: in 2208241 out 143741
  group_id: 2
  group_name: Azure-FW-Auth
----- 1 listed, 0 filtered -----
```

To verify user login logs, go to *Log & Report > Events > User Events*, or enter the following in the CLI:

```
# execute log filter category event
# execute log filter field subtype user
# execute log display
17 logs found.
10 logs returned.
7: date=2021-09-30 time=09:49:25 eventtime=1633020565577584390 tz="-0700" logid="0102043039"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication logon"
srcip=10.1.0.100 user="John Locus" authserver="Entra-ID-SAML" action="auth-logon"
status="logon" msg="User John Locus added to auth logon"

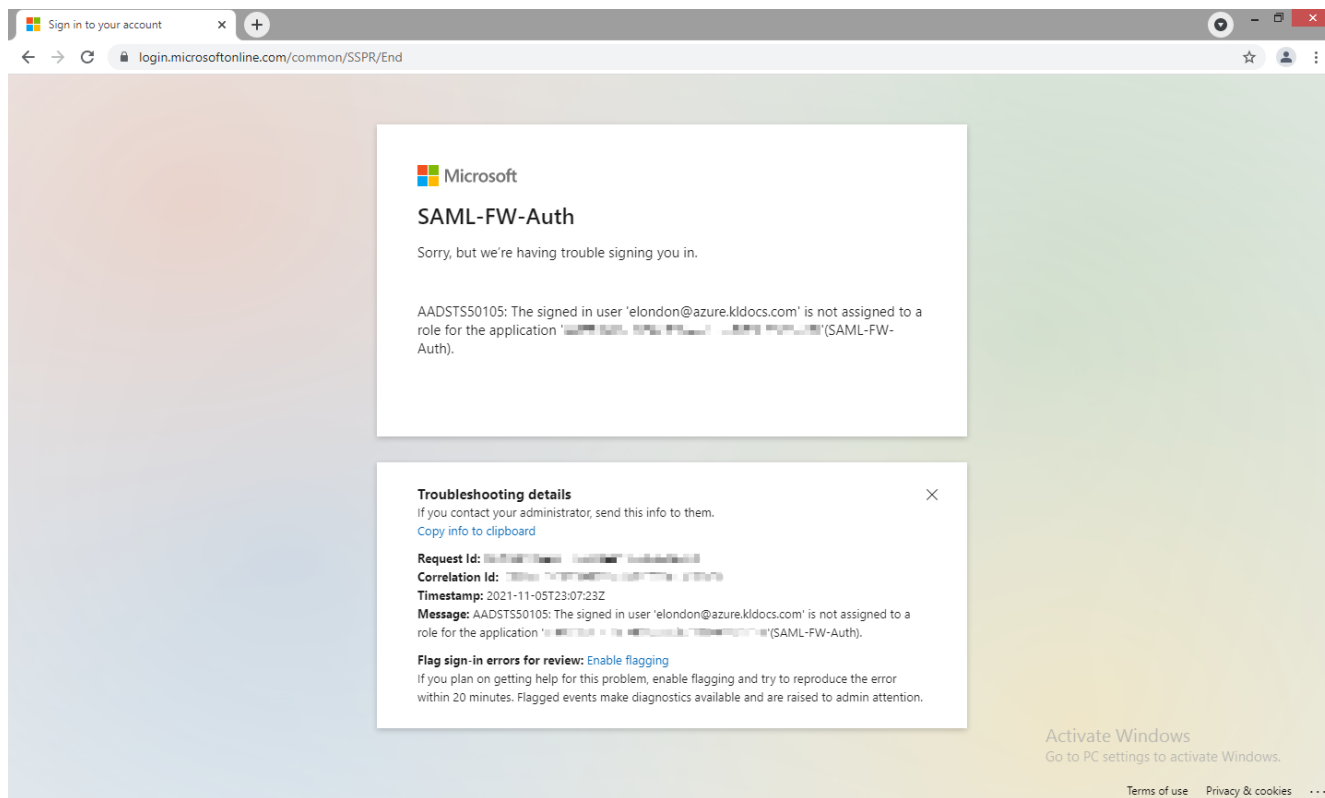

8: date=2021-09-30 time=09:49:25 eventtime=1633020565577075629 tz="-0700" logid="0102043008"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication success"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="John Locus"
group="Azure-FW-Auth" authproto="HTTPS(10.1.0.100)" action="authentication" status="success"
reason="N/A" msg="User John Locus succeeded in authentication"
```

If user authentication is successful in Microsoft Entra ID, but their group does not match the one defined in the FortiGate user group, the user will receive a *Firewall Authentication Failed* message in the browser. A log is also recorded:

```
# execute log filter category event
# execute log filter field subtype user
```

```
# execute log display
1: date=2021-09-30 time=10:39:35 eventtime=1633023575381139214 tz="-0700" logid="0102043009"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication failed"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="Adam Thompson"
group="N/A" authproto="HTTPS (10.1.0.100)" action="authentication" status="failure"
reason="No matched SAML user or group name in auth resp" msg="User Adam Thompson failed in
authentication"
```

If a user receives the following error message, this means the user is not assigned to the enterprise application *SAML-FW-Auth* in Azure.

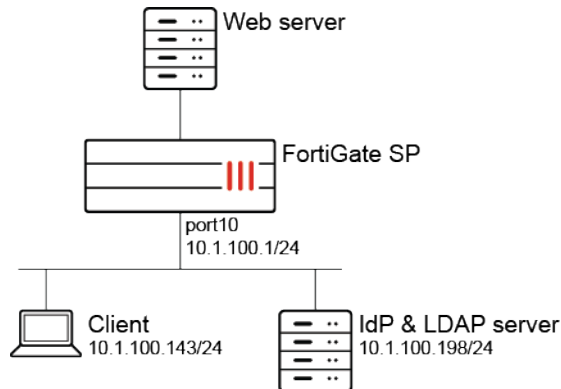

To troubleshoot SAML issues:

```
# diagnose debug application samld -1
# diagnose debug enable
```

SAML authentication in a proxy policy

SAML user authentication can be used in explicit web proxies and transparent web proxies with the FortiGate acting as a SAML SP. SAML can be used as an authentication method for an authentication scheme that requires using a captive portal.

Topology

In this configuration, SAML authentication is used with an explicit web proxy. The IdP is a Windows 2016 server configured with ADFS. The LDAP and IdP servers are on the same server. The LDAP server is used as the user backend for the IdP to perform authentication; however, they are not required to be on the same server.

The authentication and authorization flow is as follows:

1. The client opens a browser and visits <https://www.google.com>.
2. The browser is redirected by the web proxy to the captive portal.
3. The request is redirected to the IdP's sign-in page.
4. If the user signs in, the IdP authenticates the user and sends back a SAML assertion message to the user's browser with the user group information.
5. The browser forwards the SAML assertion response as a HTTP POST to the FortiGate SAML assertion consumer service URL (<https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/>).
6. If the FortiGate authentication scheme has a user database configured, the FortiGate will query the LDAP server for the user group information and ignore the user group information from the SAML message.
7. The user group information is returned. The FortiGate matches the user group information against the LDAP group in the proxy policy group settings. If there is a match, the request is authorized and the proxy policy is matched.
8. If all policy criteria match successfully, then the webpage is returned to the client.

To configure SAML authentication with an explicit web proxy:**1. Enable the web proxy:**

```
config web-proxy explicit
    set status enable
    set http-incoming-port 8080
end
```

2. Enable the proxy captive portal:

```
config system interface
    edit "port10"
        set vdom "vdom1"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
        set type physical
        set explicit-web-proxy enable
        set explicit-ftp-proxy enable
        set proxy-captive-portal enable
        set snmp-index 12
    next
end
```

3. Configure the LDAP server:

```
config user ldap
    edit "ldap-10.1.100.198"
        set server "10.1.100.198"
        set cnid "cn"
        set dn "dc=myqalab,dc=local"
        set type regular
        set username "cn=fosqal,cn=users,dc=myqalab,dc=local"
        set password *****
        set group-search-base "dc=myqalab,dc=local"
    next
end
```

4. Configure the user group:

```
config user group
    edit "ldap-group-saml"
        set member "ldap-10.1.100.198"
    next
end
```

5. Configure SAML:

```
config user saml
    edit "saml_user"
        set cert "Fortinet_CA_SSL"
        set entity-id "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/metadata/"
        set single-sign-on-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/"
        set single-logout-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/logout/"
        set idp-entity-id "http://MYQALAB.LOCAL/adfs/services/trust"
        set idp-single-sign-on-url "https://myqalab.local/adfs/ls"
        set idp-single-logout-url "https://myqalab.local/adfs/ls"
        set idp-cert "REMOTE_Cert_4"
        set digest-method sha256
```

```
        set adfs-claim enable
        set user-claim-type name
        set group-claim-type group
    next
end
```

6. Configure the authentication scheme, rule, and setting:

```
config authentication scheme
    edit "saml"
        set method saml
        set saml-server "saml_user"
        set user-database "ldap-10.1.100.198"
    next
end

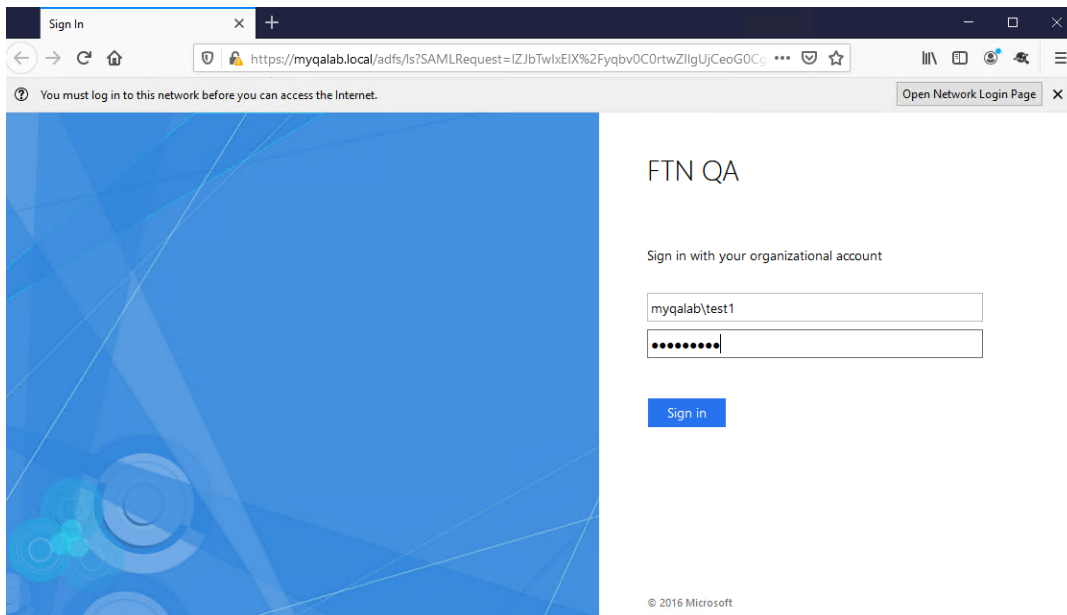

config authentication rule
    edit "saml"
        set srcaddr "all"
        set active-auth-method "saml"
    next
end

config authentication setting
    set captive-portal "fgt9.myqalab.local"
end
```

7. Configure the proxy policy:

```
config firewall proxy-policy
    edit 3
        set proxy explicit-web
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set groups "ldap-group-saml"
        set utm-status enable
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "deep-custom"
        set av-profile "av"
    next
end
```

When a user goes to www.google.com in a browser that is configured to use the FortiGate as a proxy, the IdP sign-in page appears.

Sample log

```

```

TACACS+ servers

TACACS+ is a remote authentication protocol that provides access control for routers, network access servers, and other network devices through one or more centralized servers.

FortiOS sends the following proprietary TACACS+ attributes to the TACACS+ server during authorization requests:

Attribute	Description
service=<name>	User must be authorized to access the specified service.
memberof	Group that the user belongs to.
admin_prof	Administrator profile (admin access only).

Only `memberof` and `admin_prof` attributes are parsed in authentication replies.

You can configure up to ten remote TACACS+ servers in FortiOS. You must configure at least one server before you can configure remote users.

A TACACS+ server must first be added in the CLI to make the option visible in the GUI.

To configure TACACS+ authentication in the CLI:

1. Configure the TACACS+ server entry:

```
config user tacacs+
  edit "TACACS-SERVER"
    set server <IP address>
    set key <string>
    set authen-type ascii
    set source-ip <IP address>
  next
end
```

2. Configure the remote user group:

```
config user group
  edit "TACACS-GROUP"
    set group-type firewall
    set member "TACACS-SERVER"
  next
end
```

3. Configure the remote user:

```
config system admin
  edit TACACS-USER
    set remote-auth enable
    set accprofile "super_admin"
    set vdom "root"
    set wildcard enable
    set remote-group "TACACS-GROUP"
  next
end
```

To configure a TACACS+ server in the GUI:

1. Go to *User & Authentication > TACACS+ Servers*.
2. Click *Create New*.

3. Configure the following settings:

Name	Enter the TACACS+ server name.
Authentication Type	Select the authentication type used for the TACACS+ server. Selecting <i>Auto</i> tries PAP, MSCHAP, and CHAP, in that order.
Server IP/Name	Enter the domain name or IP address for the primary server.
Server Secret	Enter the key to access the primary server.

4. Click *OK*.

FortiTokens

FortiTokens are security tokens used as part of a multi-factor authentication (MFA) system on FortiGate and FortiAuthenticator. A security token is a 6-digit or 8-digit (configurable) one-time password (OTP) that is used to authenticate one's identity electronically as a prerequisite for accessing network resources. FortiToken is available as either a mobile or a physical (hard) token. Mobile tokens can be purchased as a license, or consumed with points as part of the FortiToken Cloud service.

FortiToken Mobile and physical FortiTokens store their encryption seeds on the cloud. FortiToken Mobile seeds are generated dynamically when the token is provisioned. They are always encrypted whether in motion or at rest.

You can only register FortiTokens to a single FortiGate or FortiAuthenticator for security purposes. This prevents malicious third parties from making fraudulent requests to hijack your FortiTokens by registering them on another FortiGate or FortiAuthenticator. If re-registering a FortiToken Mobile or Hard Token on another FortiGate is required, you must contact [Fortinet Customer Support](#).

Common usage for FortiTokens includes:

- Applying MFA to a VPN dialup user connecting to the corporate network
- Applying MFA to FortiGate administrators
- Applying MFA to firewall authentication and captive portal authentication

The MFA process commonly involves:

- **Something you know:** User password
- **Something you have:** The FortiToken OTP

A third factor of authentication is added to the authentication process:

- **Something you are:** Your fingerprint or face

To enable the third factor, refer to the [Activating FortiToken Mobile on a mobile phone on page 1996](#) section.

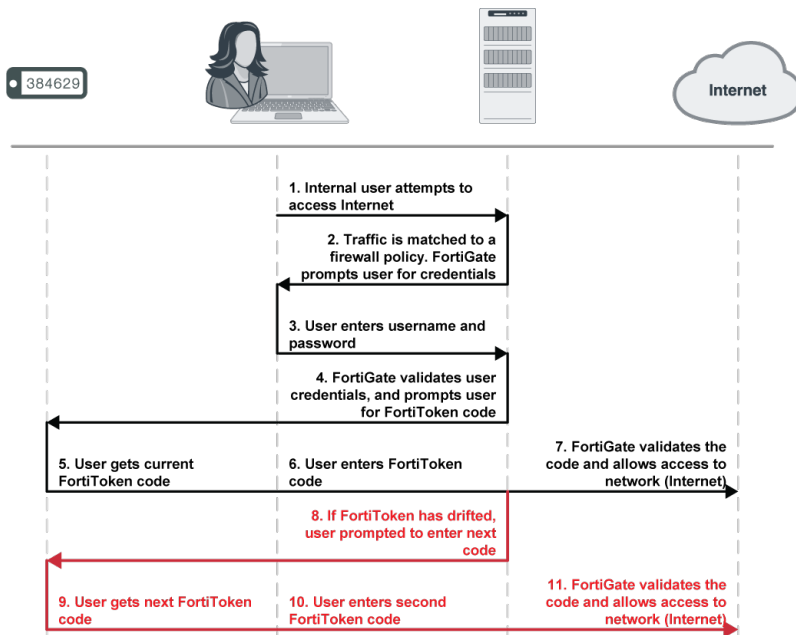

The following illustrates the FortiToken MFA process:

1. The user attempts to access a network resource.
2. FortiOS matches the traffic to an authentication security policy and prompts the user for their username and password.
3. The user enters their username and password.
4. FortiOS verifies their credentials. If valid, it prompts the user for the FortiToken code.

5. The user views the current code on their FortiToken. They enter the code at the prompt.
6. FortiOS verifies the FortiToken code. If valid, it allows the user access to network resources.

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.

This section includes the following topics to quickly get started with FortiTokens:

- [FortiToken Mobile quick start on page 1993](#)
- [FortiToken Cloud on page 2001](#)
- [Registering hard tokens on page 2001](#)
- [Managing FortiTokens on page 2004](#)
- [FortiToken Mobile Push on page 2006](#)
- [Synchronizing LDAP Active Directory users to FortiToken Cloud using the group filter on page 2007](#)
- [FortiGuard distribution of updated Apple certificates for push notifications on page 2011](#)
- [Troubleshooting and diagnosis on page 2012](#)

FortiToken Mobile quick start

FortiToken Mobile is an OATH compliant, event- and time-based one-time password (OTP) generator for mobile devices. It provides an easy and flexible way to deploy and provision FortiTokens to your end users through mobile devices. FortiToken Mobile produces its OTP codes in an application that you can download onto your Android or iOS mobile device without the need for a physical token.

You can download the free FortiToken Mobile application for Android from the [Google Play Store](#), and for iOS from the [Apple App Store](#).

This section focuses on quickly getting started and setting up FortiToken Mobile for use on a FortiGate:

- [Registering FortiToken Mobile on page 1994](#)
- [Provisioning FortiToken Mobile on page 1995](#)
- [Activating FortiToken Mobile on a mobile phone on page 1996](#)
- [Applying multi-factor authentication on page 2001](#)

Registering FortiToken Mobile

To deploy FortiToken Mobile for your end users, you must first register the tokens on your FortiGate. After registering the tokens, you can assign them to your end users.

Each FortiGate comes with two free FortiToken Mobile tokens. These tokens should appear under *User & Authentication > FortiTokens*. If no tokens appear, you may import them. Ensure that your FortiGate is registered and has internet access to connect to the FortiToken servers to import the tokens.

To import FortiTokens from the FortiGate GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click the *Import Free Trial Tokens* icon at the top. The two free tokens are imported.

To import FortiTokens from the FortiGate CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
# show user fortitoken
```

If only one free token appears, you can first delete that token and then follow the procedure to import the two free tokens from either the GUI or the CLI.

If you have the FortiToken Mobile redemption certificate, you can register FortiToken Mobile on a FortiGate.

To register FortiToken Mobile from the FortiGate GUI:

1. Go to *User & Authentication > FortiTokens* and click *Create New*. The *New FortiToken* dialog appears.
2. For the *Type* field, select *Mobile Token*.
3. Locate the 20-digit code on the redemption certificate and type it in the *Activation Code* field.
4. Click *OK*. The token is successfully registered.

If you attempt to add invalid FortiToken serial numbers, there is no error message. FortiOS does not add invalid serial numbers to the list.

To register FortiToken Mobile from the FortiGate CLI:

```
# execute fortitoken-mobile import <20-digit activation code>
# show user fortitoken
```

FortiToken Mobile stores its encryption seeds on the cloud. You can only register it to a single FortiGate or FortiAuthenticator.

Provisioning FortiToken Mobile

Once registered, FortiTokens need to be provisioned for users before they can be activated. In this example, you will provision a mobile token for a local user. Similar steps can be taken to assign FortiTokens to other types of users.

To create a local user and assign a FortiToken in the FortiGate GUI:

1. Go to *User & Authentication > User Definition*, and click *Create New*. The *Users/Groups Creation Wizard* appears.
2. In the *User Type* tab, select *Local User*, and click *Next*.

Users/Groups Creation Wizard

① User Type > ② Login Credentials > ③ Contact Info > ④ Extra Info

- Local User
- Remote RADIUS User
- Remote TACACS+ User
- Remote LDAP User
- FSSO
- FortiClient EMS User
- FortiNAC User

< Back Next Cancel

3. In the *Login Credentials* tab, enter a *Username* and *Password* for the user, and click *Next*.

Users/Groups Creation Wizard

① User Type > ② Login Credentials > ③ Contact Info > ④ Extra Info

Username

Password

< Back Next Cancel

4. In the *Contact Info* tab:
 - a. Enable the *Two-factor Authentication* toggle.
 - b. Select *FortiToken* for *Authentication Type*.
 - c. Select a *Token* to assign to the user from the drop-down list.
 - d. Enter the user's email address in the *Email Address* field. This is the email where the user will receive the QR code for activation of the FortiToken.
 - e. Click *Next*.

Users/Groups Creation Wizard

User Type
 Login Credentials
 3 Contact Info
 4 Extra Info

Two-factor Authentication

Authentication Type: FortiToken Cloud
 FortiToken

Token: FTKMOB [REDACTED]

Email Address:

SMS:

- In the *Extra Info* tab, make sure the *User Account Status* field is set to Enabled. You can also optionally assign the user to a user group by enabling the *User Group* toggle.

Users/Groups Creation Wizard

User Type
 Login Credentials
 3 Contact Info
 4 Extra Info

User Account Status: Enabled Disabled

User Group:

- Click *Submit*. An activation code should be sent to the created user by email or SMS, depending upon the delivery method configured above.

FortiGate has the *Email Service* setting configured using the server *notifications.fortinet.net* by default. To see configuration, go to *System > Settings > Email Service*.

The activation code expires if not activated within the 3-day time period by default. However, the expiry time period is configurable.

To configure the time period (in hours) for FortiToken Mobile, using the CLI:

```
config system global
  set two-factor-ftm-expiry <1-168>
end
```

To resend the email or SMS with the activation code, refer to the [Managing FortiTokens on page 2004](#) section.

Activating FortiToken Mobile on a mobile phone

After your system administrator provisions your token, you receive a notification with an activation code and expiry date via SMS or email. If you do not activate your token by the expiry date, you must contact your system administrator so that they can reassign your token for activation.

Platforms that support FortiToken Mobile:

Platform	Device and firmware support
iOS	iPhone, iPad, and iPod Touch with iOS 6.0 and later.
Android	Phones and tablets with Android Jellybean 4.1 and later.
Windows	Windows 10 (desktop and mobile), Windows Phone 8.1, and Windows Phone 8.

FortiToken is a Windows Universal Platform (UWP) application. To download FortiToken for Windows 10 desktop and mobile platforms, see [FortiToken for Windows on the Microsoft Store](#).

The following instructions describe procedures when using FortiToken Mobile for iOS on an iPhone. Procedures may vary depending on your device and firmware.

To activate FortiToken Mobile on iOS:

1. On your iOS device, tap on the FortiToken application icon to open the application. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.

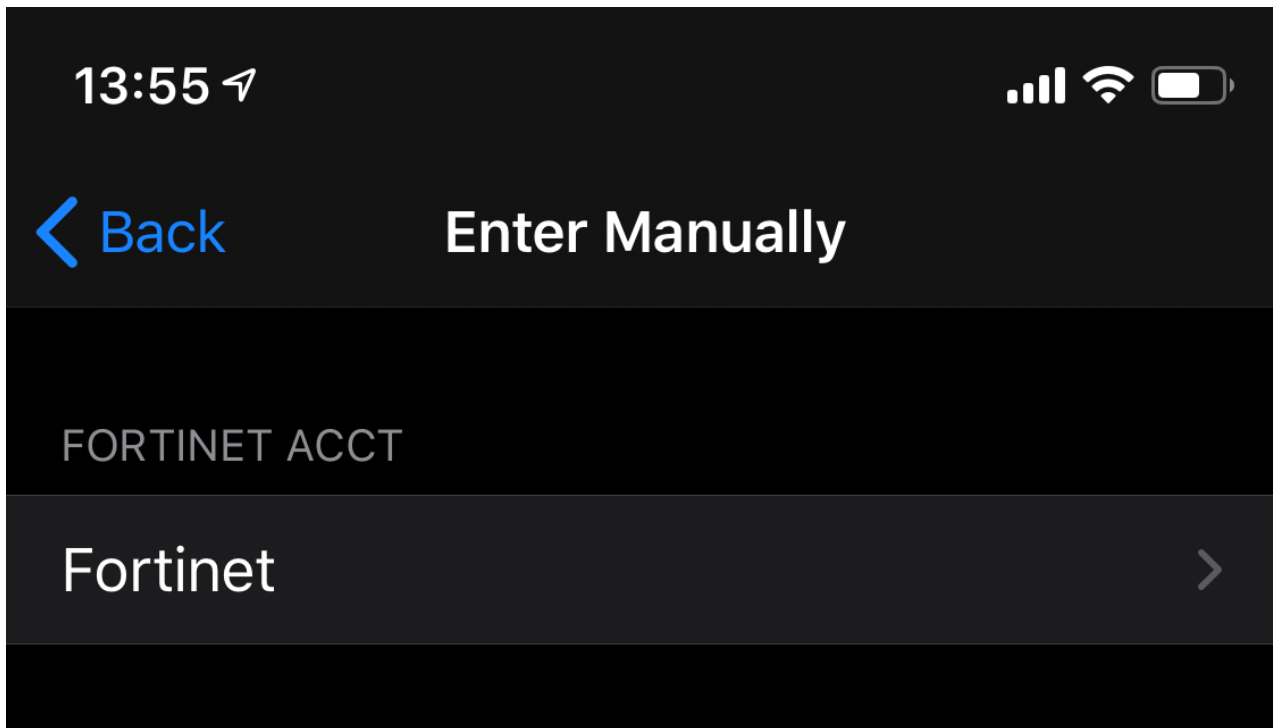

2. Tap on the + icon. The *Scan Barcode* screen appears.

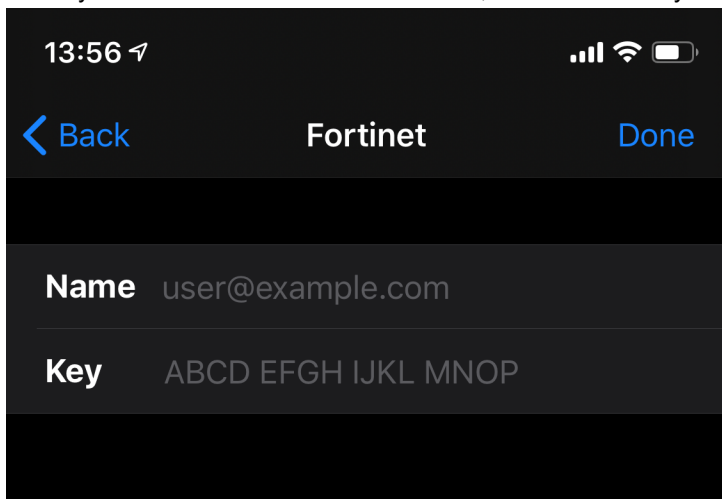

3. If you received the QR code via email, locate and scan the QR code in your email.

OR

If you received the activation key via SMS, tap on *Enter Manually* at the bottom of the screen, and tap on *Fortinet*.

Enter your email address in the *Name* field, the activation key in the *Key* field, and tap *Done*.

4. FortiToken Mobile activates your token, and starts generating OTP digits immediately. To view or hide the OTP digits, tap the eye icon.

After you open the application, FortiToken Mobile generates a new 6-digit OTP every 30 seconds. All configured tokens display on the application homescreen.

The FortiToken Mobile activation process described above caters to the MFA process that involves two factors (password and OTP) of the authentication process. A third factor (fingerprint or face) can be enabled as well.

To enable *Touch/Face ID* on iOS for FortiToken Mobile:

1. Open the FortiToken application and tap on *Info*.

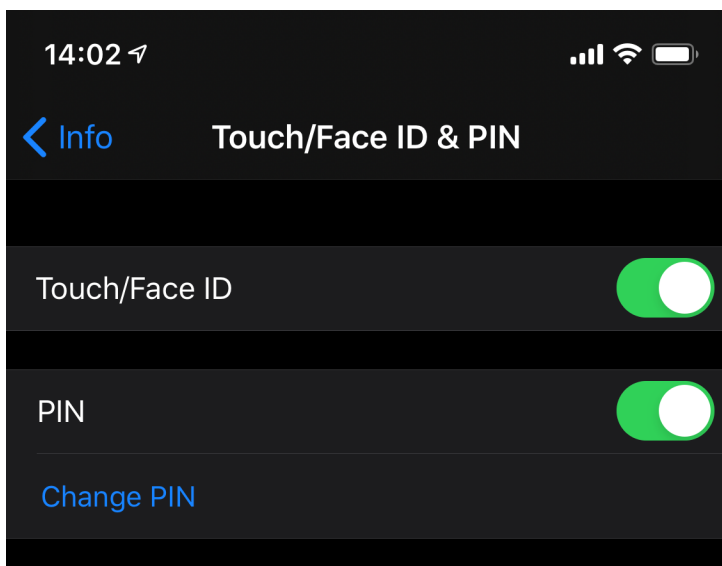

2. Tap on *Touch/Face ID & PIN*.

3. Enable and set up a 4-digit *PIN* for the application. The *PIN* is required to be enabled before you can enable *Touch/Face ID*.

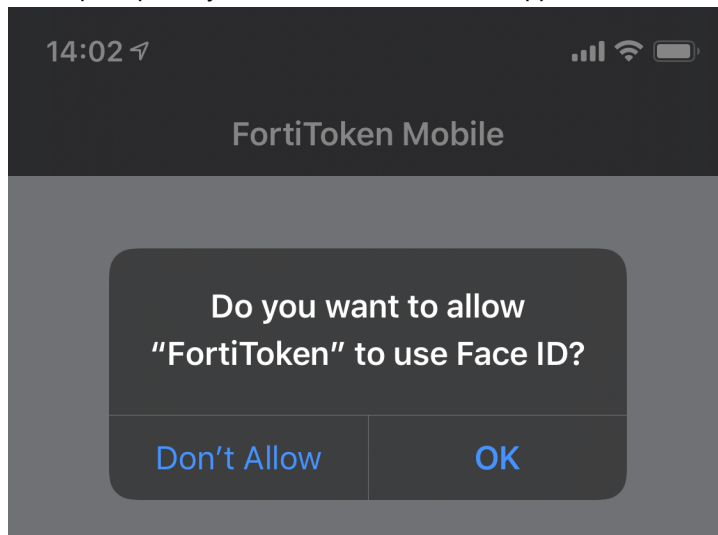

4. Enable *Touch/Face ID*.

You cannot enable *Touch/Face ID* for FortiToken if *Touch/Face ID* is not set up and enabled for device unlock (*iPhone Unlock* in this case) on iOS. You must first set up and enable *Touch/Face ID* from *Settings* on your iOS device.

5. When prompted by iOS, allow the FortiToken application to use *Touch/Face ID* by tapping on *OK* in the prompt.

Applying multi-factor authentication

Multi-factor authentication (MFA) may also be set up for SSL VPN users, administrators, firewall policy, wireless users, and so on. The following topics explain more about how you may use the newly created user in such scenarios:

- MFA for SSL VPN: [Set up FortiToken multi-factor authentication on page 1733](#)
- MFA for IPsec VPN: [Add FortiToken multi-factor authentication on page 1531](#)
- MFA for Administrators: [Associating a FortiToken to an administrator account on page 2057](#)
- [MFA with Captive Portal](#)
- [MFA for wireless users via Captive Portal](#)
- [Configuring FSSO firewall authentication on page 2029](#)

FortiToken Cloud

FortiToken Cloud is an Identity and Access Management as a Service (IDaaS) cloud service offering by Fortinet. It enables FortiGate and FortiAuthenticator customers to add MFA for their respective users, through the use of Mobile tokens or Hard tokens. It protects local and remote administrators as well as firewall and VPN users.

For information, see [Getting started—FGT-FTC users](#) in the [FortiToken Cloud Administration Guide](#).

Registering hard tokens

Registering FortiTokens consists of the following steps:

1. [Adding FortiTokens to FortiOS.](#)
2. [Activating FortiTokens.](#)
3. [Associating FortiTokens with user accounts.](#)

Adding FortiTokens to FortiOS

You can add FortiTokens to FortiOS in the following ways:

- [Add FortiToken serial numbers using the GUI](#)
- [Add FortiToken serial numbers using the CLI](#)
- [Import FortiTokens using a serial number or seed file using the GUI](#)

To manually add single hard token to FortiOS using the GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. In the *Serial Number* field, enter one or more FortiToken serial numbers.
5. Click *OK*.

To add multiple FortiTokens to FortiOS using the CLI:

```
config user fortitoken
  edit <serial_number>
  next
  edit <serial_number2>
  next
end
```

To import multiple FortiTokens to FortiOS using the GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. Click *Import*. The *Import Tokens* section slides in on the screen.

5. Select *Serial Number File*.

Seed files are only used with FortiToken-200CD. These are special hardware tokens that come with FortiToken seeds on a CD. See the [FortiToken Comprehensive Guide](#) for details.

6. Click *Upload*.

7. Browse to the file's location on your local machine, select the file, then click *OK*.

8. Click *OK*.

Activating FortiTokens

You must activate the FortiTokens before starting to use them. FortiOS requires connection to FortiGuard servers for FortiToken activation. During activation, FortiOS queries FortiGuard servers about each token's validity. Each token can only be used on a single FortiGate or FortiAuthenticator. If tokens are already registered, they are deemed invalid for re-activation on another device. FortiOS encrypts the serial number and information before sending for added security.

To activate a FortiToken using the GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Select the desired FortiTokens that have an *Available* status.
3. Click *Activate* from the menu above.
4. Click *Refresh*. The selected FortiTokens are activated.

To activate a FortiToken using the CLI:

```
config user fortitoken
  edit <token_serial_num>
    set status activate
  next
end
```

Associating FortiTokens with user accounts

You can associate FortiTokens with local user or administrator accounts.

To associate a FortiToken to a local user account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.
2. Go to *User & Authentication > User Definition*. Edit the desired user account.
3. Enable *Two-factor Authentication*.
4. From the *Token* dropdown list, select the desired FortiToken serial number.
5. In the *Email Address* field, enter the user's email address.
6. Click *OK*.

To associate a FortiToken to a local user account using the CLI:

```
config user local
  edit <username>
    set type password
    set passwd "myPassword"
```

```
set two-factor fortitoken
set fortitoken <serial_number>
set email-to "username@example.com"
set status enable
next
end
```

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

To associate a FortiToken to an administrator account, refer to the [Associating a FortiToken to an administrator account on page 2057](#) section.

Managing FortiTokens

This section focuses on the following:

- [Resending an activation email on page 2004](#)
- [Locking/unlocking FortiTokens on page 2004](#)
- [Managing FortiTokens drift on page 2004](#)
- [Deactivating FortiTokens on page 2005](#)
- [Moving FortiTokens to another device on page 2005](#)

Resending an activation email

To resend an activation email/SMS for a mobile token on a FortiGate:

1. Go to *User & Authentication > User Definition* and edit the user.
2. Click *Send Activation Code Email* from the *Two-factor Authentication* section.

Locking/unlocking FortiTokens

To change FortiToken status to active or to lock:

```
config user fortitoken
  edit <token_serial_num>
    set status <active | lock>
  next
end
```

A user attempting to log in using a locked FortiToken cannot successfully authenticate.

Managing FortiTokens drift

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.

3. FortiOS uses both codes to update its clock to match the FortiToken.

If you still experience clock drift, it may be the result of incorrect time settings on your mobile device. If so, make sure that the mobile device clock is accurate by confirming the network time and the correct timezone.

If the device clock is set correctly, the issue could be the result of the FortiGate and FortiTokens being initialized prior to setting an NTP server. This will result in a time difference that is too large to correct with the synchronize function. To avoid this, selected Tokens can be manually drift adjusted.

To show current drift and status for each FortiToken:

```
diagnose fortitoken info
FORTITOKEN DRIFT STATUS
FTK200XXXXXXXXXC 0 token already activated, and seed won't be returned
FTK200XXXXXXXXXE 0 token already activated, and seed won't be returned
FTKMOBXXXXXXXXXA 0 provisioned
FTKMOBXXXXXXXXX4 0 new
Total activated token: 0
Total global activated token: 0
Token server status: reachable
```

This command lists the serial number and drift for each configured FortiToken. You can check if it is necessary to synchronize the FortiGate and any particular FortiTokens.

To adjust Mobile FortiToken for drift:

```
# execute fortitoken sync <FortiToken_ID> <token_code1> <next_token_code2>
```

Deactivating FortiTokens

To deactivate FortiToken on a FortiGate:

1. Go to *User & Authentication > User Definition*.
2. Select and edit the user for which you want to deactivate the token.
3. Disable the *Two-factor Authentication* toggle.
4. Click *OK*. The token will be removed from the user's *Two-factor Authentication* column. The user will also be removed from the token's *User* column under *User & Authentication > FortiTokens*.

Moving FortiTokens to another device

FortiTokens can only be activated on a single FortiGate or FortiAuthenticator. To move FortiTokens to another device, you would first have to reset the registered FortiTokens on a device and then reactivate them on another device.

To reset Hard tokens registered to a FortiGate appliance (non-VM model), you can reset all hardware FTK200 tokens from the [Support Portal](#), or during RMA transfer. See the [Migrating users and FortiTokens to another FortiGate](#) KB article, for more information.

The above process will reset all Hard tokens and you cannot select individual tokens to reset.

To reset FortiToken Mobile, a single Hard token, a Hard token registered to a VM, and so on, an administrator must contact Customer Support and/or open a ticket on the [Support Portal](#).

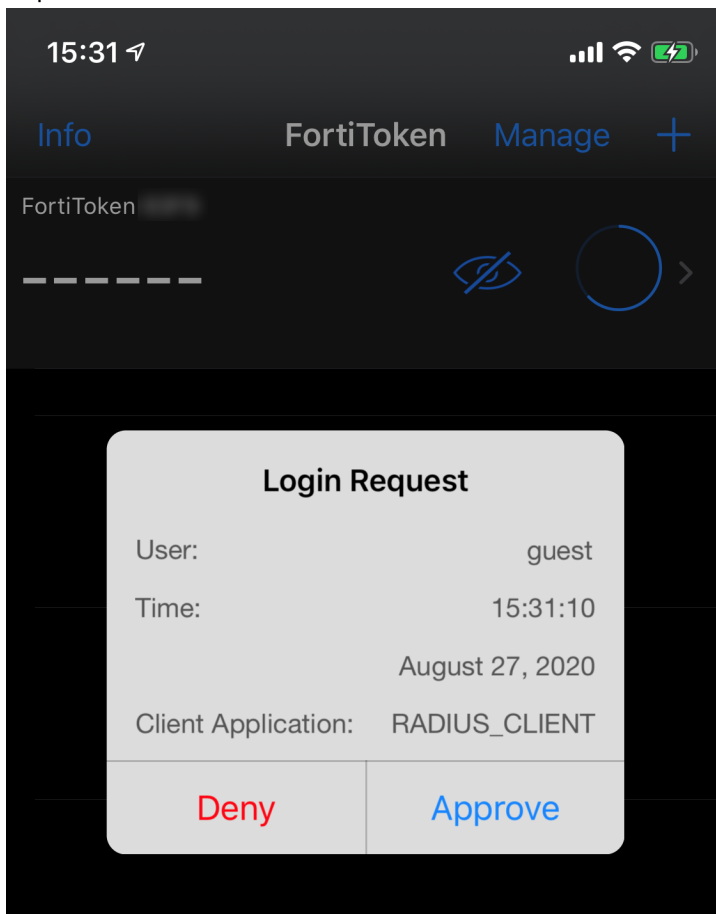

Once reset, the FortiTokens can be activated on another FortiGate or FortiAuthenticator.

FortiToken Mobile Push

FortiToken Mobile Push allows authentication requests to be sent as push notifications to the end user's FortiToken Mobile application.

The FortiToken Mobile push service operates as follows:

1. FortiGate sends a DNS query to the FortiToken Mobile Push proxy server (*push.fortinet.com*).
2. FortiGate connects to the proxy server via an encrypted connection over TCP/443.
3. The proxy server handles the notification request by making a TLS connection with either Apple (for iOS) or Google (for Android) notification servers. Notification data may include the recipient, session, FortiGate callback IP and port, and so on.
4. The notification service from either Apple or Google notifies the user's mobile device of the push request.
5. The FortiToken Mobile application on the user's mobile displays a prompt for the user to either *Approve* or *Deny* the request.

To configure FortiToken Mobile push services using the CLI:

```
config system ftm-push
```

```

set status enable
set server-ip <ip-address>
set server-port [1-65535]
end

```

The default server port is 4433.

The server IP address is the public IP address of the FortiOS interface that FortiToken Mobile calls back to. FortiOS uses this IP address for incoming FortiToken Mobile calls.

If an SSL VPN user authenticates with their token, then logs out and attempts to reauthenticate within a minute, a *Please wait x seconds to login again* message displays. This replaces a previous error/permission denied message. The *x* value depends on the calculation of how much time is left in the current time step.

```

config system interface
edit "guest"
set allowaccess ftm
next
end

```

FortiOS supports FortiAuthenticator-initiated FortiToken Mobile Push notifications for users attempting to authenticate through an SSL VPN and/or RADIUS server (with FortiAuthenticator as the RADIUS server).

Synchronizing LDAP Active Directory users to FortiToken Cloud using the group filter

To synchronize Active Directory users and apply two-factor authentication using FortiToken Cloud, two-factor authentication can be enabled in the `user ldap` object definition in FortiOS. By default, FortiOS retrieves all Active Directory users in the LDAP server with a valid email or mobile number (`mail` and `mobile` attributes), and synchronizes the users to FortiToken Cloud. Users are then created on FortiToken Cloud and activation is sent out using email or SMS.

Group filters can be used to reduce the number of the Active Directory users returned, and only synchronize the users who meet the group filter criteria.

Two-factor authentication for LDAP group filtering can only be configured in the CLI:

```

config user ldap
edit <name>
set dn <string>
set two-factor {disable | fortitoken-cloud}
set group-filter <string>
next
end

```

<code>dn <string></code>	Set the distinguished name used to look up entries on the LDAP server. The search for users and groups starts here based on what is defined.
<code>two-factor {disable fortitoken-cloud}</code>	Enable/disable two-factor authentication: <ul style="list-style-type: none"> <code>disable</code>: disable two-factor authentication <code>fortitoken-cloud</code>: use the FortiToken Cloud service
<code>group-filter <string></code>	Set the filter used for group matching.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See [Configuring an LDAP server on page 1923](#).
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See [Configuring least privileges for LDAP admin account authentication in Active Directory on page 1930](#).

Group filter examples

In the following examples, a user `ldap` object is defined to connect to an Active Directory on a Windows server. The search will begin in the root of the `fortinet-fsso.com` directory.

To configure a default LDAP server configuration without a group filter:

```
config user ldap
  edit "ad-ldap-auth"
    set server <ip_address>
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set two-factor fortitoken-cloud
    set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
    set password *****
  next
end
```

When a group filter is not used, all users in the Active Directory with a valid email or mobile number will be retrieved.

Example 1: specific users and email address with wildcard

With this `group-filter`, users under `fortinet-fsso.com` that have `oliver*` in their username and `*fortinet*` in their email will be matched.

```
config user ldap
  edit "ad-ldap-auth"
    set group-filter "(&(SAMAccountName=oliver*)(mail=*fortinet*))"
  next
end
```

Example 2: all users with matching email

With this `group-filter`, all users under `fortinet-fsso.com` with `*fortinet*` in their email will be matched.

```
config user ldap
  edit "ad-ldap-auth"
    set group-filter "(&(SAMAccountName=*)(mail=*fortinet*))"
  next
end
```

Example 3: all users in a group

With this `group-filter`, all users within the group `fortinet-fsso.com > Testing > ftc-users` will be matched.

```
config user ldap
  edit "ad-ldap-auth"
    set group-filter "(&(objectCategory=Person)(sAMAccountName=*)(memberOf=cn=ftc-
users,ou=Testing,dc=fortinet-fsso,DC=com))"
  next
end
```

Example configuration

In this example, Active Directory users are configured to be synchronized to FortiToken Cloud. The same group filter is used from [example 1](#) and searches the Active Directory for users named `oliver*` with email `*fortinet*`.

Before configuring the FortiGate:

1. Gather the information to connect to the Active Directory server through LDAP. Include all necessary fields, such as the server IP, port, CN name identifier, DN for the start of the search, bind type, and username associated with a regular bind.
2. Consider the users or groups that require two-factor authentication and should be synchronized. If necessary, group the users under the same group in the Active Directory.
3. If using a group filter, formulate the `group-filter` string to limit the match. For this example, `(&(sAMAccountName=oliver*)(mail=*fortinet*))`.
4. Test the filter by using the FortiOS CLI to perform a quick LDAP search:

```
# diagnose test authserver ldap-search <server_ip> 389 "ou=Testing,dc=fortinet-
fsso,DC=com" cn Administrator@fortinet-fsso.com PASSWORD 0 '(&(sAMAccountName=oliver*)
(mail=*fortinet*))' 2
```

```
searching 'ou=Testing,dc=fortinet-fsso,DC=com, cn=cn' on 10.1.100.131:389 for
(Administrator@fortinet-fsso.com, PASSWORD), secure(0), filter((&
(sAMAccountName=oliver*)(mail=*fortinet*)), flag(0x2), page_no(0)...
CN=oliver2022,OU=Testing,DC=Fortinet-FSSO,DC=COM (oliver2022, 0 entries)
```

The user, `oliver2022`, was found.

5. Estimate how many users will be retrieved, and ensure that the FortiToken Cloud account has enough user licenses to support the number of users.

To configure Active Directory users to be synchronized to FortiToken Cloud:

1. Configure the user LDAP settings:

```
config user ldap
  edit "ad-ldap-auth"
    set server "10.1.100.131"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set two-factor fortitoken-cloud
    set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
    set password *****
    set group-filter "(&(sAMAccountName=oliver*)(mail=*fortinet*))"
```

```

next
end

```

- In the background, the FortiGate FAS daemon scans the LDAP server for users to be synchronized based on the group filter pattern, but will not send them to the FortiToken Cloud server yet. Optionally, verify the users that are retrieved from the Active Directory based on the filter:

```

# diagnose fortitoken-cloud debug enable
# diagnose debug enable
# diagnose fortitoken-cloud sync
...
fas_sync_ftc[2788]: Sending packet to FTC server: "IP-of-FTC-server" Port: 8686
(length:444)
fas_sync_ftc[2792]: FTC User Sync Packet(length:444):
POST /api/v1/user_sync HTTP/1.1
Host: ftc.fortinet.com
Connection: keep-alive
User-Agent: FortiGate-401E v7.0.6,build****
Content-Type: application/json
Content-Length: 246
{"users": [{"username": "oliver2022", "vdom": "vdom1", "email": "o****@fortinet.com", "mobile_
number": "XXXXXXXXXXXX", "user_
data": 1, "action": "create"}], "sn": "FG4H1E5819900000", "cluster_members": [
"FG4H1E5819900000" ], "group_name": "FGT400D", "group_id": "0"}
Reminder: User sync packet not actually sent out because of diagnose purpose!

```

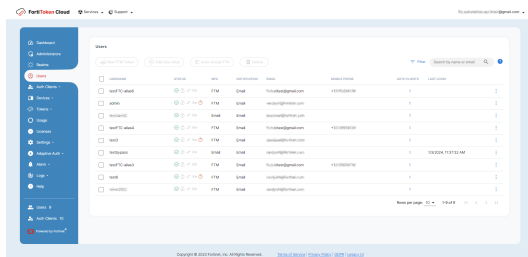

As expected, only the user that matches the current filter is returned.

- Manually trigger the synchronization process with FortiToken Cloud:

```
# execute fortitoken-cloud sync
```

The user is added to FortiToken Cloud, and an activation email or SMS message is sent to the user.

- In FortiToken Cloud, go to *Users* to verify that the user was added.

If the activation email was sent, but user has not downloaded and activated the mobile token yet, a pending symbol appears in the *Status* column (such as for the *admin*, *test6*, and *test3* users).

- In FortiOS, add the `ad-ldap-auth` object in a user group. The user group can be used for VPN, firewall authentication, and so on.

The `ldap` user object should not be used in remote LDAP user groups that require group matching because it is not supported.

FortiGuard distribution of updated Apple certificates for push notifications

Push notifications for iPhone (for the purpose of two-factor authentication) require a TLS server certificate to authenticate to Apple. As this certificate is only valid for one year, a service extension allows FortiGuard to distribute updated TLS server certificates to FortiGate when needed.

FortiGuard update service updates local Apple push notification TLS server certificates when the local certificate is expired. FortiGuard update service also reinstalls certificates when the certificates are lost.

You can verify that the feature is working on the FortiGate by using the CLI shell.

To verify certificate updates:

1. Using FortiOS CLI shell, verify that all certificates are installed:

```
/data/etc/apns # ls -al
drwxr-xr-x  2 0      0      Tue Jan 15 08:42:39 2019      1024 .
drwxr-xr-x 12 0      0      Tue Jan 15 08:45:00 2019      2048 ..
-rw-r--r--  1 0      0      Sat Jan 12 00:06:30 2019      2377 apn-dev-cert.pem
-rw-r--r--  1 0      0      Sat Jan 12 00:06:30 2019      1859 apn-dev-key.pem
-rw-r--r--  1 0      0      Sat Jan 12 00:06:30 2019      8964 apn-dis-cert.pem
-rw-r--r--  1 0      0      Sat Jan 12 00:06:30 2019      4482 apn-dis-key.pem
```

2. Rename all current Apple certificates.

Apple push notification no longer works after you rename the certificates.

```
/data/etc/apns # mv apn-dis-cert.pem apn-dis-cert.pem.save
/data/etc/apns # mv apn-dev-key.pem apn-dev-key.pem.save
/data/etc/apns # mv apn-dev-cert.pem apn-dev-cert.pem.save
/data/etc/apns # mv apn-dis-key.pem apn-dis-key.pem.save
/data/etc/apns # ls -al
drwxr-xr-x  2 0 0  Tue Jan 15 08:51:15 2019  1024 .
drwxr-xr-x 12 0 0  Tue Jan 15 08:45:00 2019  2048 ..
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  2377 apn-dev-cert.pem.save
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  1859 apn-dev-key.pem.save
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  8964 apn-dis-cert.pem.save
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  4482 apn-dis-key.pem.save
```

3. Run a FortiGuard update, and verify that all certificates are installed again:

```
/data/etc/apns # ls -al
drwxr-xr-x  2 0 0  Tue Jan 15 08:56:20 2019  1024 .
drwxr-xr-x 12 0 0  Tue Jan 15 08:56:15 2019  2048 ..
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  2377 apn-dev-cert.pem.save
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  1859 apn-dev-key.pem.save
-rw-r--r--  1 0 0  Tue Jan 15 08:56:20 2019  2167 apn-dis-cert.pem <-- downloaded
from FortiGuard
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  8964 apn-dis-cert.pem.save
-rw-r--r--  1 0 0  Tue Jan 15 08:56:20 2019  1704 apn-dis-key.pem <-- downloaded
from FortiGuard
-rw-r--r--  1 0 0  Sat Jan 12 00:06:30 2019  4482 apn-dis-key.pem.save
-rw-r--r--  1 0 0  Tue Jan 15 08:56:20 2019    41 apn-version.dat <-- downloaded
from FortiGuard
/data/etc/apns #
```

Troubleshooting and diagnosis

This section contains some common scenarios for FortiTokens troubleshooting and diagnosis:

- [FortiToken Statuses on page 2012](#)
- [Recovering trial FortiTokens on page 2013](#)
- [Recovering lost Administrator FortiTokens on page 2013](#)
- [SSL VPN with multi-factor authentication expiry timers on page 2014](#)

FortiToken Statuses

When troubleshooting FortiToken issues, it is important to understand different FortiToken statuses. FortiToken status may be retrieved either from the CLI or the GUI, with a slightly different naming convention.

Before you begin, verify that the FortiGate has Internet connectivity and is also connected to both the FortiGuard and registration servers:

```
# execute ping fds1.fortinet.com
# execute ping directregistration.fortinet.com
# execute ping globalftm.fortinet.net
```

The `globalftm.fortinet.net` server is the Fortinet Anycast server added in FortiOS 6.4.2.

If there are connectivity issues, retrieving FortiToken statuses or performing FortiToken activation could fail. Therefore, troubleshoot connectivity issues before continuing.

To retrieve FortiToken statuses:

- In the CLI:
`diagnose fortitoken info`
- In the GUI:
Go to *User & Authentication > FortiTokens*.

Various FortiToken statuses in either the CLI or the GUI may be described as follows:

CLI	GUI	Description
new	<i>Available</i>	Newly added, not pending, not activated, not yet assigned.
active	<i>Assigned</i>	Assigned to a user, hardware token.
provisioning	<i>Pending</i>	Assigned to a user and waiting for activation on the FortiToken Mobile app.
provisioned	<i>Assigned</i>	Assigned to user and activated on the FortiToken Mobile app.
provision timeout		Token provided to user but not activated on the FortiToken Mobile app. To fix, the token needs to be re-provisioned and activated in time.

CLI	GUI	Description
token already activated, and seed won't be returned	<i>Error</i>	Token is locked by FortiGuard FDS. The hardware token was already activated on another device and locked by FDS.
locked		Either manually locked by an Administrator (<code>set status lock</code>), or locked automatically, for example, when the token is unassigned and the FortiCare FTM provisioning server was unreachable to process that change.

Recovering trial FortiTokens

You can recover trial FortiTokens if deleted from a FortiGate, or if stuck in a state where it is not possible to provision to a user.

When a token is stuck in an unusual state or with errors, delete the FortiTokens from the unit and proceed to recover trial FortiTokens.

To recover trial tokens via the GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click the *Import Free Trial Tokens* button at the top. The two free trial tokens are recovered.

To recover trial tokens via the CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

- Before attempting to recover the trial tokens, both the tokens should be deleted from the unit first.
- If VDOMs are enabled, trial tokens are in the management VDOM (`root` by default).

Following error codes might come up in the CLI:

- If the device is not registered:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
import fortitoken license error:-7571
```
- If the serial number format is incorrect:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-00
import fortitoken license error: -7566
```

Recovering lost Administrator FortiTokens

If an Administrator loses their FortiToken or the FortiToken is not working, they will not be able to log into the admin console through the GUI or the CLI. If there is another Administrator that can log into the device, they may be able to reset the two-factor settings configured for the first Administrator, or create a new Admin user for them. Note that a *super_admin* user will be able to edit other admin user settings, but a *prof_admin* user will not be able to edit *super_admin* settings.

In the case where there are no other administrators configured, the only option is to flash format the device and reload a backup config file. You must have console access to the device in order to format and flash the device. It is recommended to be physically on site to perform this operation.

The process of resetting an Admin user password using the maintainer account cannot be used to reset or disable two-factor authentication.

Before formatting the device, verify that you have a backup config file. You may or may not have the latest config file backed up, though you should consider using a backed up config file, and reconfigure the rest of the recent changes manually. Otherwise, you may need to configure your device starting from the default factory settings.

To recover lost Administrator FortiTokens:

1. If you have a backed up config file:

- a. Open the config file and search for the specific admin user. For representational purposes we will use `Test` in our example.

```
# edit "Test"
  set accprofile "super_admin"
  set vdom "root"
  set two-factor fortitoken
  set fortitoken "FTKXXXXXXXXXX"
  set email-to "admin@email.com"
  set password *****
  next
end
```

- b. Once you find the settings for the `Test` user, delete the `fortitoken`-related settings:

```
# edit "Test"
  set accprofile "super_admin"
  set vdom "root"
  set password *****
  next
end
```

2. Format the boot device during a maintenance window and reload the firmware image using instructions in the [Formatting and loading FortiGate firmware image using TFTP](#) KB article.
3. Once the reload is complete, log into the admin console from the GUI using the default admin user credentials, and go to *Configuration > Restore* from the top right corner to reload your config file created in Step 1 above.
4. Once the FortiGate reboots and your configuration is restored, you can log in with your admin user credentials.

SSL VPN with multi-factor authentication expiry timers

When SSL VPN is configured with multi-factor authentication (MFA), sometimes you may require a longer token expiry time than the default 60 seconds.

To configure token expiry timers using the CLI:

```
config system global
  set two-factor-ftk-expiry <number of seconds>
  set two-factor-ftm-expiry <number of seconds>
  set two-factor-sms-expiry <number of seconds>
  set two-factor-fac-expiry <number of seconds>
```

```
set two-factor-email-expiry <number of seconds>
end
```

These timers apply to the tokens themselves and remain valid for as long as configured above. However, SSL VPN does not necessarily accept tokens for the entire duration they are valid. To ensure SSLVPN accepts the token for longer durations, you need to configure the remote authentication timeout setting accordingly.

To configure the remote authentication timeout:

```
config system global
set remoteauthtimeout <1-300 seconds>
end
```

SSL VPN waits for a maximum of five minutes for a valid token code to be provided before closing down the connection, even if the token code is valid for longer.

The `remoteauthtimeout` setting shows how long SSL VPN waits not only for a valid token to be provided before closing down the connection, but also for other remote authentication like LDAP, RADIUS, and so on.

PKI

The following topics include information about public key infrastructure (PKI):

- [Configuring a PKI user on page 2015](#)
- [SSL VPN with certificate authentication on page 1785](#)
- [SSL VPN with LDAP-integrated certificate authentication on page 1790](#)

Configuring a PKI user

PKI users are users who are identified by a digital certificate they hold. Defining a PKI user in FortiOS specifies:

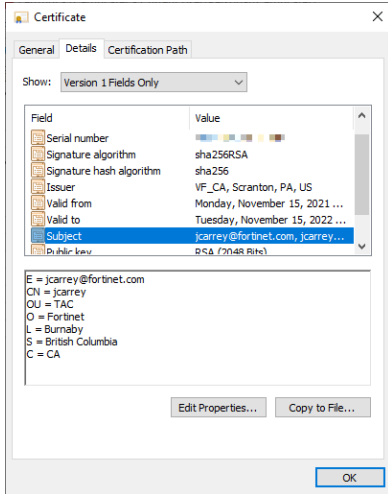

- Which CA certificate to use to validate the user's certificate
- The field and value of the user's certificate that FortiOS will check to verify a user

These peer users can then be used in a FortiGate user group, or as a peer certificate group used for IPsec VPN configurations that accept RSA certificate authentication.

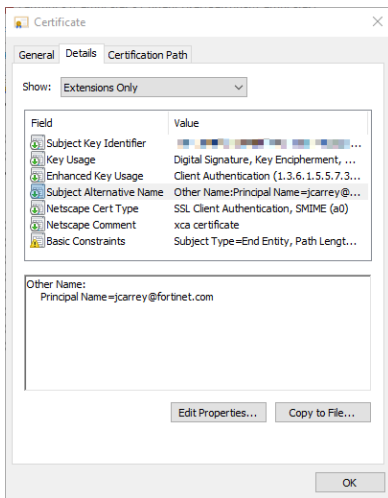

Example X.509 certificate

The following certificate demonstrates which FortiGate settings can be used to match on different fields.

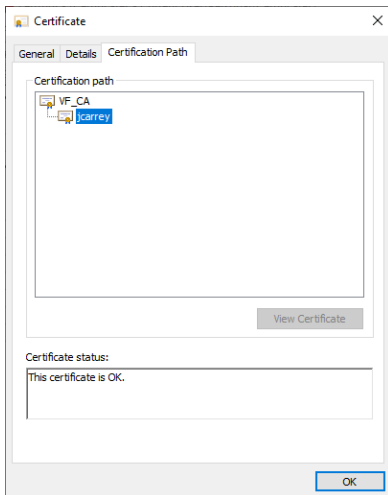

Subject:

Subject Alternative Name:

Certification path:

To configure a PKI user:

```

config user peer
  edit <name>
    set ca <string>
    set mandatory-ca-verify {enable | disable}
    set subject <string>
    set cn <string>
    set cn-type {string | email | FQDN | ipv4 | ipv6}
    set ldap-server <string>
    set ldap-username <string>
    set ldap-password <string>
    set ldap-mode {password | principal-name}
  next
end

```

ca <string>	Specify which certificate on the FortiGate is used to validate the client's certificate. This can be any CA in the client's certificate chain. You may need to upload a CA certificate to the FortiGate specifically to identify PKI peer users (see Uploading a certificate using the GUI on page 2293).
mandatory-ca-verify {enable disable}	Control the action if the CA certificate used to sign the client's certificate is not installed on the FortiGate (default = enable). Disabling this setting makes the FortiGate consider any certificate presented by the peer as valid. In the example certificate, the certification path shows that VF_CA signed jcarrey's certificate.
subject <string>	Enter the peer certificate name constraints.
cn <string>	Enter the peer certificate common name.
cn-type {string email FQDN ipv4 ipv6}	Set the peer certificate common name type: string, email, FQDN, IPv4 address, or IPv6 address. See CN on page 2018 for more details.
ldap-server <string>	Enter the name of an LDAP server defined under <code>config user ldap</code> for performing client access rights checks. See LDAP servers on page 1923 for more details.
ldap-mode {password principal-name}	Set the mode for LDAP peer authentication, either by password or principal name (default = password). See LDAP on page 2019 for more details.
ldap-username <string>	Enter the username for the LDAP server bind when the LDAP mode is password.
ldap-password <string>	Enter the password for the LDAP server bind when the LDAP mode is password.

Identifying users based on their client certificate

When the client's certificate is valid, or `mandatory-ca-verify` is disabled, the FortiGate can then inspect the certificate to check specific fields for matching values. There are three ways of specifying which certificate field to verify: by subject, CN, or LDAP. All string comparisons are case sensitive.

Subject

This basic method verifies that the subject string defined in the PKI user setting matches a value or substring in the subject field of the user certificate. Further matching is controlled in the following VPN certificate settings.

```
config vpn certificate setting
    set subject-match {substring | value}
    set subject-set {superset | subset}
    set cn-match {substring | value}
    set cn-allow-multi {enable | disable}
end
```

<pre>subject-match {substring value}</pre>	<p>Control how to do relative distinguished name (RDN) value matching with the certificate subject name:</p> <ul style="list-style-type: none"> • substring: find a match if any string in the certificate subject name matches the name being searched for (such as <code>set subject jcarrey</code>). • value: find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for (such as <code>set subject "OU=TAC"</code> or <code>set subject "C=CA, CN=jcarrey, OU=TAC"</code>).
<pre>set subject-set {superset subset}</pre>	<p>Control how to do RDN value matching with the certificate subject name:</p> <ul style="list-style-type: none"> • superset: a certificate only passes verification if it contains all the RDNs defined in the subject settings (such as <code>set subject "E = jcarrey@fortinet.com, CN = jcarrey, OU = TAC, O = Fortinet, L = Burnaby, S = British Columbia, C = CA"</code>). • subset: a certificate passes verification if the RDN is a subset of the certificate subject (such as <code>set subject "CN = jcarrey, OU = TAC"</code>).
<pre>cn-match {substring value}</pre>	<p>Control how to do CN value matching with the certificate subject name:</p> <ul style="list-style-type: none"> • substring: find a match if any string in the certificate subject name matches the name being searched for. • value: find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for.
<pre>cn-allow-multi {enable disable}</pre>	<p>Enable/disable allowing multiple CN entries with the certificate subject name (default = enable).</p>

CN

Common name (CN) certificate verification compares the CN in the subject field with the configured string (such as `set cn "jcarrey"`). The following logic is used when configuring different CN types:

Type	Action
string	Based on the <code>cn-match</code> setting, perform a substring or exact match in the certificate subject.
email	Look for a match in the certificate subject.
FQDN	Look for a match in the certificate subject, then compare the mapped IP and client IP. The FQDN is only retrieved from the CN.

Type	Action
ipv4	Look for a match in the certificate subject, then compare the IP.
ipv6	Look for a match in the certificate subject, then compare the IP.

The CN type also controls the format checking of the CN string. In this example, if the CN type is set to email, the CN must be in email format (`set cn "jcarrey@fortinet.com"`).

LDAP

LDAP-integrated user authentication allows the FortiGate to check the connecting user against an LDAP server in two ways: through a username and password, or the certificate's principal name. The `password` method requires the username and password of each authenticating user to be entered, so it is not recommended when configuring PKI users. The `principal-name` method is recommended.

The UPN in the user certificate's Subject Alternative Name field is used to look up the user in the LDAP directory. If a match is found, then authentication succeeds. This type of configuration scales well since only one PKI user needs to be created on the FortiGate. Connecting clients use their unique user certificate to match within the configured LDAP server.

FSSO

FortiOS can provide single sign-on capabilities to Windows AD, Citrix, VMware Horizon, Novell eDirectory, and Microsoft Exchange users with the help of agent software installed on these networks. The agent software sends information about user logons to the FortiGate unit. With user information such as IP address and user group memberships from the network, FortiGate security policies can allow authenticated network access to users who belong to the appropriate user groups without requesting their credentials again.

Fortinet Single Sign-On (FSSO), through agents installed on the network, monitors user logons and passes that information to the FortiGate unit. When a user logs on at a workstation in a monitored domain, FSSO:

- Detects the logon event and records the workstation name, domain, and user,
- Resolves the workstation name to an IP address,
- Determines which user groups the user belongs to,
- Sends the user logon information, including IP address and groups list, to the FortiGate unit, and
- Creates one or more log entries on the FortiGate unit for this logon event as appropriate.

When the user tries to access network resources, the FortiGate unit selects the appropriate security policy for the destination. If the user belongs to one of the permitted user groups associated with that policy then the connection is allowed, otherwise the connection is denied.

Agent-based FSSO

Several different FSSO agents can be used in an FSSO implementation:

- Domain Controller (DC) agent
- eDirectory agent

- Citrix/Terminal Server (TS) agent
- Collector Agent

Consult the latest [FortiOS Release Notes](#) for operating system compatibility information.

Domain Controller agent

The Domain Controller (DC) agent must be installed on every domain controller when you use DC Agent mode. The DC agents monitor user logon events and pass the information to the Collector agent, which stores the information and sends it to the FortiGate unit.

eDirectory agent

The eDirectory agent is installed on a Novell network to monitor user logons and send the required information to the FortiGate unit. It functions much like the Collector agent on a Windows AD domain controller. The agent can obtain information from the Novell eDirectory using either the Novell API or LDAP.

Terminal Server agent

The Terminal Server (TS) agent can be installed on a Citrix, VMware Horizon 7.4, or Windows Terminal Server to monitor user logons in real time. It functions much like the DC Agent on a Windows AD domain controller.

Collector agent

The Collector Agent (CA) is installed as a service on a server in the Windows AD network to monitor user logons and send the required information to the FortiGate unit. The Collector agent can collect information from a DC agent (Windows AD) and TS agent (Citrix or VMware Horizon Terminal Server).

In a Windows AD network, the Collector agent can optionally obtain logon information by polling the AD domain controllers. In this case, DC agents are not needed.

The CA is responsible for DNS lookups, group verification, workstation checks, and updating FortiGates on logon records. The FSSO CA sends Domain Local Security Group and Global Security Group information to FortiGate units. The CA communicates with the FortiGate over TCP port 8000 and it listens on UDP port 8002 for updates from the DC agents.

The FortiGate device can have up to five CAs configured for redundancy. If the first CA on the list is unreachable, the next is attempted, and so on down the list until one is contacted.

All DC agents must point to the correct CA port number and IP address on domains with multiple DCs.

A FortiAuthenticator device can act much like a CA, collecting Windows AD user logon information and sending it to the FortiGate device. It is particularly useful in large installations with several FortiGate units. For more information, see the [FortiAuthenticator Administration Guide](#).

Agentless FSSO

For Windows AD networks, FortiGate devices can also provide SSO capability by directly polling Windows Security Event log entries on Windows DC for user log in information. This configuration does not require a CA or DC agent.

FortiGate configuration

To configure FSSO on a FortiGate, go to *Security Fabric > External Connectors*.

When creating a new connector, several options for connectors are available under Endpoint/Identity:

- [Fortinet single sign-on agent on page 2657](#)

For most FSSO Agent-based deployments, this connector option will be used. Specify either Collector Agent or Local as User Group Source to collect user groups from the Collector Agent, or to match users to user groups from a LDAP server.

- [Poll Active Directory server on page 2658](#)

This connection option directly polls Windows Security Event log entries on Windows DC for user log in information.

- [RADIUS single sign-on agent on page 2665](#)

FortiGate can authenticate users who have authenticated on a remote RADIUS server by monitoring the RADIUS accounting records forwarded by the RADIUS server to the FortiGate.

- [Exchange Server connector on page 2668](#)

FortiGate collects information about authenticated users from corporate Microsoft Exchange Servers.

- [Symantec endpoint connector on page 2659](#)

This connector uses client IP information from Symantec Endpoint Protection Manager (SEPM) to assign dynamic IP addresses on FortiOS.

Since FSSO is commonly associated with Agent-based FSSO and Agentless FSSO, this chapter will primarily focus on the first two Security Fabric External Connector options.

FSSO polling connector agent installation

This topic gives an example of configuring a local FSSO agent on the FortiGate. The agent actively pools Windows Security Event log entries on Windows Domain Controller (DC) for user log in information. The FSSO user groups can then be used in a firewall policy.

This method does not require any additional software components, and all the configuration can be done on the FortiGate.

To configure a local FSSO agent on the FortiGate:

1. [Configure an LDAP server on the FortiGate on page 2021](#)
2. [Configure a local FSSO polling connector on page 2022](#)
3. [Add the FSSO groups to a policy on page 2022](#)

Configure an LDAP server on the FortiGate

Refer to [Configuring an LDAP server on page 1923](#). The connection must be successful before configuring the FSSO polling connector.

Configure a local FSSO polling connector

To configure a local FSSO polling connector:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Endpoint/Identity* section, select *Poll Active Directory Server*.
3. Fill in the required information.
4. For *LDAP Server*, select the server you just created.
5. Configure the group settings:
 - a. For *Users/Groups*, click *Edit*. The structure of the LDAP tree is shown in the *Users/Groups* window.
 - b. Click the *Groups* tab.
 - c. Select the required groups, right-click on them, and select *Add Selected*. Multiple groups can be selected at one time by holding the CTRL or SHIFT keys. The groups list can be filtered or searched to limit the number of groups that are displayed.
 - d. Click the *Selected* tab and verify that the required groups are listed. To remove a group, right-click and select *Remove Selected*.
 - e. Click *OK* to save the group settings.
6. Click *OK* to save the connector settings.
7. Go back to *Security Fabric > External Connectors*.
8. There should be two new connectors:

- The *Local FSSO Agent* is the backend process that is automatically created when the first FSSO polling connector is created.
- The *Active Directory Connector* is the front end connector that can be configured by FortiGate administrators.

To verify the configuration, hover the cursor over the top right corner of the connector; a popup window will show the currently selected groups. A successful connection is also shown by a green up arrow in the lower right corner of the connector.

If you need to get log in information from multiple DCs, then you must configure other Active Directory connectors for each additional DC to be monitored.

Add the FSSO groups to a policy

FSSO groups can be used in a policy by either adding them to the policy directly, or by adding them to a local user group and then adding the group to a policy.

To add the FSSO groups to a local user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Enter a name for the group in the *Name* field.
3. Set the *Type* to *Fortinet Single Sign-On (FSSO)*.

4. In the *Members* field, click the + and add the FSSO groups.

5. Click *OK*.

6. Add the local FSSO group to a policy.

To add the FSSO groups directly to a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. In the *Source* field, click the +. In the *Select Entries* pane, select the *User* tab.
3. Select the FSSO groups.
4. Configure the remaining settings as required.
5. Click *OK*.

Troubleshooting

If an authenticated AD user cannot access the internet or pass the firewall policy, verify the local FSSO user list:

```
# diagnose debug authd fssso list
----FSSO logons----
IP: 10.1.100.188 User: test2 Groups: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM
Workstation: MemberOf: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM
Total number of logons listed: 1, filtered: 0
----end of FSSO logons----
```

1. Check that the group in *MemberOf* is allowed by the policy.
2. If the expected AD user is not in list, but other users are, it means that either:
 - The FortiGate missed the log in event, which can happen if many users log in at the same time, or
 - The user's workstation is unable to connect to the DC, and is currently logged in with cached credentials, so there is no entry in the DC security event log.
3. If there are no users in the local FSSO user list:
 - a. Ensure that the local FSSO agent is working correctly:

```
# diagnose debug enable
# diagnose debug authd fssso server-status
```

Server Name	Connection Status	Version	Address
FGT_A (vdom1) # Local FSSO Agent	connected	FSAE server 1.1	127.0.0.1

The connection status must be *connected*.

b. Verify the Active Directory connection status:

```
# diagnose debug fssso-polling detail 1
AD Server Status (connected):
ID=1, name(10.1.100.131), ip=10.1.100.131, source(security), users(0)
```

```
port=auto username=Administrator
read log eof=1, latest logon timestamp: Fri Jul 26 10:36:20 2019
```

```
polling frequency: every 10 second(s) success(274), fail(0)
LDAP query: success(0), fail(0)
LDAP max group query period(seconds): 0
LDAP status: connected
```

```
Group Filter: CN=group2,OU=Testing,DC=Fortinet-
FSSO,DC=com+CN=group21,OU=Testing,DC=Fortinet-FSSO,DC=COM
```

If the polling frequency shows successes and failures, that indicates sporadic network problems or a very busy DC. If it indicates no successes or failures, then incorrect credentials could be the issue.

If the LDAP status is connected, then the FortiGate can access the configured LDAP server. This is required for AD group membership lookup of authenticated users because the Windows Security Event log does not include group membership information. The FortiGate sends an LDAP search for group membership of authenticated users to the configured LDAP server.

FortiGate adds authenticated users to the local FSSO user list only if the group membership is one of the groups in `Group Filter`.

4. If necessary, capture the output of the local FortiGate daemon that polls Windows Security Event logs:

```
# diagnose debug application fssod -1
```

This output contains a lot of detailed information which can be captured to a text file.

Limitations

- NTLM based authentication is not supported.
- If there are a large number of user log ins at the same time, the FSSO daemon may miss some. Consider using FSSO agent mode if this will be an issue. See [Public and private SDN connectors on page 2593](#) for information.
- The FSSO daemon does not support all of the security log events that are supported by other FSSO scenarios. For example, only Kerberos log in events 4768 and 4769 are supported.

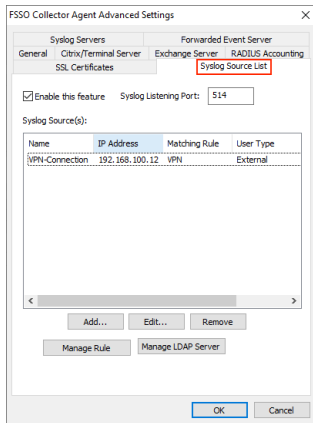

FSSO using Syslog as source

This example describes how to configure Fortinet Single Sign-On (FSSO) agent on Windows using syslog as the source and a custom syslog matching rule.

The FSSO collector agent must be build 0291 or later, and in advanced mode (see [How to switch FSSO operation mode from Standard Mode to Advanced Mode](#)).

To configure the FSSO agent on Windows:

1. Open the FSSO agent on Windows.
2. Click *Advanced Settings*.
3. Go to the *Syslog Source List* tab.
4. Select *Enable this feature*.
5. Set *Syslog Listening Port*, or use the default port.

6. Click *Manage Rule*.
7. Create a new syslog rule:
 - a. Click *Add*.
 - b. Configure the rule:

Trigger	722051
Logon	assigned to session
Username Field	User <{{:username}}>
Client IPv4 Field	IPv4 Address <{{:client_ip}}>
Client IPv6 Field	IPv6 Address <{{:client_ipv6}}>
Group Field	Group <{{:group}}>
Groups List Separator	,

- c. To test the rule, enter a sample log line, then click *Test*.
 - d. Click *OK*.
8. Create a new syslog source:
 - a. On the *Advanced Settings* window, click *Add*.
 - b. Configure the source:

Name	<i>VPN-Connection</i>
IP Address	<i>192.168.100.12</i>
Matching Rule	<i>VPN</i>
User Type	<p><i>External:</i> Users are not defined on the CA and user groups come from the source.</p> <p><i>Remote User:</i> Users are defined on a remote LDAP server and user groups are retrieved from the specified LDAP server. Any group from the syslog messages are ignored. See Connect to a remote LDAP server on page 2026.</p>

c. Click *OK*.

9. Click *OK*.

Connect to a remote LDAP server

This section describes how to connect to a remote LDAP server to match the user identity from the syslog server with an LDAP server.

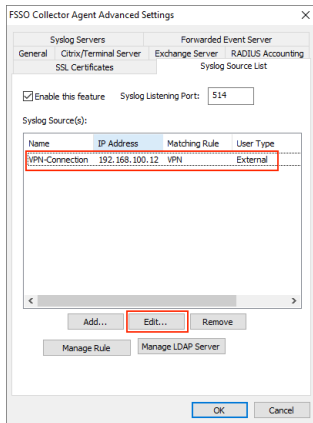

To connect to a remote LDAP server:

1. Open the FSSO agent on Windows.
2. Click *Advanced Settings*.
3. Go to the *Syslog Source List* tab.
4. Click *Manage LDAP Server*.
5. Click *Add* and configure the LDAP server settings:

6. Click *OK*.

7. Select the syslog source and click *Edit*.

8. Set *User Type* to *Remote User*, and select the LDAP server from the drop-down list.

9. Click *OK*.

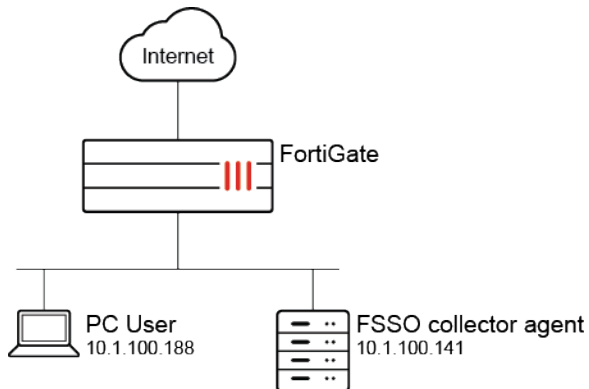

Configuring the FSSO timeout when the collector agent connection fails

The `logon-timeout` option is used to manage how long authenticated FSSO users on the FortiGate will remain on the list of authenticated FSSO users when a network connection to the collector agent is lost.

```
config user fssu
  edit <name>
    set server <string>
    set password <string>
    set logon-timeout <integer>
  next
end
```

`logon-timeout <integer>` Enter the interval to keep logons after the FSSO server is down, in minutes (1 - 2880, default = 5).

Example

In this example, the logon timeout is set for four minutes.

To configure the FSSO logon timeout:

1. Set the timeout value:

```
config user fsso
  edit "ad"
    set server "10.1.100.141"
    set password *****
    set logon-timeout 4
  next
end
```

2. Log on to a PC with a valid FSSO user account.

3. Enable real-time debugging and check for authd polling collector agent information. During this time, the connection to the collector agent is lost:

```
# diagnose debug enable
# diagnose debug application authd -1
# diagnose debug application fssod -1
2021-06-10 16:20:41 authd_timer_run: 2 expired
2021-06-10 16:20:41 authd_epoll_work: timeout 39970
2021-06-10 16:20:46 fsae_io_ctx_process_msg[ad]: received heartbeat 100031
2021-06-10 16:20:46 authd_epoll_work: timeout 1690
2021-06-10 16:20:47 authd_timer_run: 1 expired
2021-06-10 16:20:47 authd_epoll_work: timeout 39990
2021-06-10 16:20:56 fsae_io_ctx_process_msg[ad]: received heartbeat 100032
2021-06-10 16:20:56 authd_epoll_work: timeout 31550
2021-06-10 16:21:00 _event_error[ad]: error occurred in epoll_in: Success
2021-06-10 16:21:00 disconnect_server_only[ad]: disconnecting
2021-06-10 16:21:00 authd_timer_run: 1 expired
2021-06-10 16:21:00 authd_epoll_work: timeout 9620
```

4. After about three minutes, check that the FSSO user is still in the list of authenticated users and can connect to the internet:

```
# diagnose firewall auth l
10.1.100.188, TEST1
  type: fsso, id: 0, duration: 229, idled: 229
  server: ad
```

```

packets: in 0 out 0, bytes: in 0 out 0
user_id: 16777219
group_id: 3 33554433
group_name: ad CN=GROUP1,OU=TESTING,DC=FORTINET-FSSO,DC=COM

```

```
----- 1 listed, 0 filtered -----
```

5. After four minutes, check the debugs again. Note that the FSSO users are cleared:

```

...
2021-06-10 16:24:57 authd_timer_run: 3 expired
2021-06-10 16:24:57 authd_epoll_work: timeout 60000
2021-06-10 16:24:59 [fsae_db_logoff:248]: vfid 0, ip 10.1.100.188, id(0), port_range_sz
(0)
2021-06-10 16:24:59 [authd_fp_notify_logoff:444]: vfid 0, ip 10.1.100.188, id 0

2021-06-10 16:24:59 [authd_fp_on_user_logoff:412]: vfid 0, ip 10.1.100.188
2021-06-10 16:24:59 authd_epoll_work: timeout 21990

# diagnose firewall auth 1

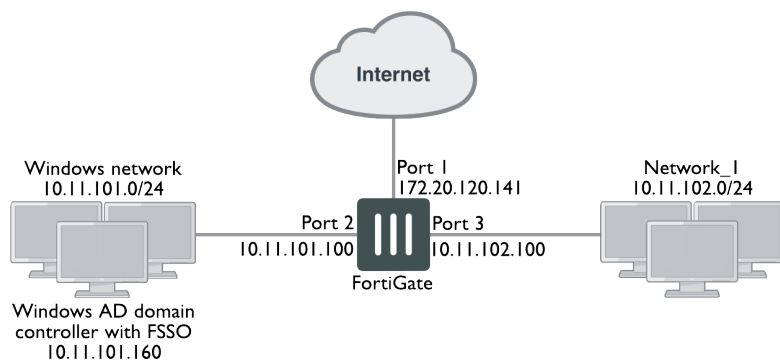

----- 0 listed, 0 filtered -----

```

After the connection to the collector agent is restored, all users remain in the list of authenticated users and are synchronized to the FortiGate. The users do not need to log in again for authentication.

Configuring FSSO firewall authentication

In this example, a Windows network is connected to the FortiGate on port 2, and another LAN, Network_1, is connected on port 3.

All Windows network users authenticate when they log on to their network. Engineering and Sales groups members can access the Internet without reentering their authentication credentials. The example assumes that you have already installed and configured FSSO on the domain controller.

LAN users who belong to the Internet_users group can access the Internet after entering their username and password. The example shows two users: User1, authenticated by a password stored in FortiOS; and User 2, authenticated on an external authentication server. Both users are local users since you create the user accounts in FortiOS.

1. [Create a locally authenticated user account.](#)
2. [Create a RADIUS-authenticated user account.](#)

3. [Create an FSSO user group.](#)
4. [Create a firewall user group.](#)
5. [Define policy addresses.](#)
6. [Create security policies.](#)

Creating a locally authenticated user account

User1 is authenticated by a password stored in FortiOS.

To create a locally authenticated user account in the GUI:

1. Go to *User & Authentication > User Definition* and click *Create New*.
2. Configure the following settings:

User Type	Local User
User Name	User1
Password	hardtoguess1@@1
User Account Status	Enabled

3. Click *Submit*.

To create a locally authenticated user account in the CLI:

```
config user local
  edit user1
    set type password
    set passwd hardtoguess1@@1
  next
end
```

Creating a RADIUS-authenticated user account

You must first configure FortiOS to access the external authentication server, then create the user account.

To create a RADIUS-authenticated user account in the GUI:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Configure the following settings:

Name	OurRADIUSsrv
Authentication method	Default
Primary Server	
IP/Name	10.11.101.15
Secret	OurSecret

3. Click *OK*.

4. Go to *User & Authentication > User Definition* and click *Create New*.
5. Configure the following settings:

User Type	Remote RADIUS User
User Name	User2
RADIUS Server	OurRADIUSsrv
User Account Status	Enabled

6. Click *Submit*.

To create a RADIUS-authenticated user account in the CLI:

```

config user radius
edit OurRADIUSsrv
    set server 10.11.102.15
    set secret OurSecret
    set auth-type auto
next
end
config user local
edit User2
    set name User2
    set type radius
    set radius-server OurRADIUSsrv
next
end

```

Creating an FSSO user group

This example assumes that you have already set up FSSO on the Windows network and that it used advanced mode, meaning that it uses LDAP to access user group information. You must do the following:

- Configure LDAP access to the Windows AD global catalog
- Specify the collector agent that sends user log in information to FortiOS
- Select Windows user groups to monitor
- Select and add the Engineering and Sales groups to an FSSO user group

To create an FSSO user group in the GUI:

1. Configure LDAP for FSSO:
 - a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
 - b. Configure the following settings:

Name	ADserver
Server Name / IP	10.11.101.160
Distinguished Name	dc=office,dc=example,dc=com
Bind Type	Regular

Username	cn=FSSO_Admin,cn=users,dc=office,dc=example,dc=com
Password	Enter a secure password.

- c. Leave other fields as-is. Click *OK*.
2. Specify the collector agent for FSSO;
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. Under *Endpoint/Identity*, select *FSSO Agent on Windows AD*.
 - c. Configure the following settings:

Name	Enter the Windows AD server name. This name appears in the Windows AD server list when you create user groups. In this example, the name is WinGroups.
Server IP/Name	Enter the IP address or name of the server where the agent is installed. The maximum name length is 63 characters. In this example, the IP address is 10.11.101.160.
Password	Enter the password of the server where the agent is installed. You only need to enter a password for the collector agent if you configured the agent to require authenticated access. If the TCP port used for FSSO is not the default, 8000, you can run the <code>config user fssso</code> command to change the setting in the CLI.
Collector Agent AD access mode	Advanced
LDAP Server	Select the previously configured LDAP server. In this example, it is ADserver.
User/Groups/Organization Units	Select the users, groups, and OUs to monitor.

- d. Click *OK*.
3. Create the FSSO_Internet_users user group:
 - a. Go to *User & Authentication > User Groups* and click *Create New*.
 - b. Configure the following settings:

Name	FSSO_Internet_users
Type	Fortinet Single Sign-On (FSSO)
Members	Engineering, Sales

- c. Click *OK*.

To create an FSSO user group in the CLI:

```
config user ldap
edit "ADserver"
  set server "10.11.101.160"
  set dn "cn=users,dc=office,dc=example,dc=com"
  set type regular
  set username "cn=administrator,cn=users,dc=office,dc=example,dc=com"
  set password set_a_secure_password
```

```
next
end
config user fsso
edit "WinGroups"
set ldap-server "ADserver"
set password *****
set server "10.11.101.160"
next
end
config user group
edit FSSO_Internet_users
set group-type fsso-service
set member CN=Engineering,cn=users,dc=office,dc=example,dc=com
CN=Sales,cn=users,dc=office,dc=example,dc=com
next
end
```

Creating a firewall user group

This example shows a firewall user group with only two users. You can add additional members.

To create a firewall user group in the GUI:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Configure the following settings:

Name	Internet_users
Type	Firewall
Members	User1, User2

3. Click *OK*.

To create a firewall user group in the CLI:

```
config user group
edit Internet_users
set group-type firewall
set member User1 User2
next
end
```

Defining policy addresses

To define policy addresses:

1. Go to *Policy & Objects > Addresses*.
2. Click *Create New > Address*.
3. Configure the following settings:

Name	Internal_net
Type	Subnet
IP/Netmask	10.11.102.0/24
Interface	Port 3

- Click *OK*.
- Create another new address by repeating steps 2-4 using the following settings:

Name	Windows_net
Type	Subnet
IP/Netmask	10.11.101.0/24
Interface	Port 2

Creating security policies

You must create two security policies: one for the firewall group connecting through port 3, and one for the FSSO group connecting through port 2.

To create security policies using the GUI:

- Go to *Policy & Objects > Firewall Policy*.
- Click *Create New*.
- Configure the following settings:

Incoming Interface	Port2
Source Address	Windows_net
Source User(s)	FSSO_Internet_users
Outgoing Interface	Port1
Destination Address	all
Schedule	always
Service	ALL
NAT	Enabled.
Security Profiles	You can enable security profiles as desired.

- Click *OK*.

5. Create another new policy by repeating steps 2-4 using the following settings:

Incoming Interface	Port3
Source Address	Internal_net
Source User(s)	Internet_users
Outgoing Interface	Port1
Destination Address	all
Schedule	always
Service	ALL
NAT	Enabled.
Security Profiles	You can enable security profiles as desired.

6. Click *OK*.

To create security policies using the CLI:

```
config firewall policy
  edit 0
    set srcintf port2
    set dstintf port1
    set srcaddr Windows_net
    set dstaddr all
    set action accept
    set groups FSSO_Internet_users
    set schedule always
    set service ANY
    set nat enable
  next
end
config firewall policy
  edit 0
    set srcintf port3
    set dstintf port1
    set srcaddr internal_net
    set dstaddr all
    set action accept
    set schedule always
    set groups Internet_users
    set service ANY
    set nat enable
  next
end
```

Include usernames in logs

Usernames can be included in logs, instead of just IP addresses. The benefits of doing this include:

- FortiOS monitors and FortiAnalyzer reports display usernames instead of IP addresses, allowing you to quickly determine who the information pertains to. Without the usernames, it is difficult to correlate the IP addresses with specific users.
- User activity can be correlated across multiple IP addresses.
For example, if DHCP is used a user might receive different IP addresses every day, making it difficult to track a specific user by specifying an IP address as the match criterion.

In this example, a collector agent (CA) is installed on a Windows machine to poll a domain controller (DC) agent (see [FSSO on page 2019](#) for more information). On the FortiGate, an external connector to the CA is configured to receives user groups from the DC agent. The received group or groups are used in a policy, and some examples of the usernames in logs, monitors, and reports are shown.

Install and configure FSSO Agent

To download the FSSO agent:

1. Sign in to your [FortiCloud account](#).
2. Go to *Support > Firmware Download* and select the *Download* tab.
3. Browse to the appropriate directory for the version of the FSSO agent that you need to download.

Welcome to the Firmware Images download center for Fortinet's extensive line of security solutions.

4. Click *HTTPS* to download the appropriate *FSSO_Setup* file.

To install the FSSO agent:

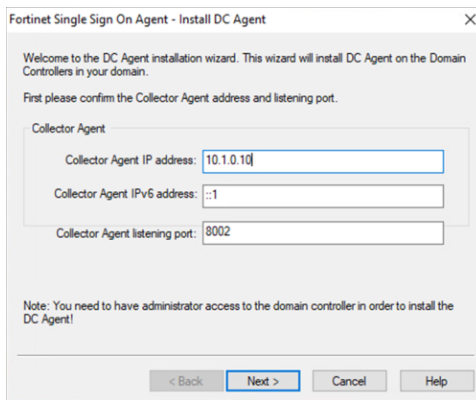

1. Run the *FSSO_Setup* file with administrator privileges.
2. Click *Next*, accept the terms of the license agreement, and click *Next* again.
3. Select the installation directory, or use the default location, then click *Next*.
4. Enter the User Name and Password, then click *Next*.

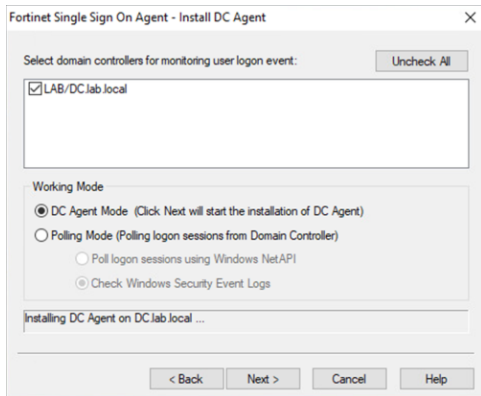

5. On the *Install Options*, select *Advanced*, then click *Next*.

6. Click *Install*.
7. After the FSSO Agent installs, run *Install DC Agent*.
8. Update the Collector Agent IP address and listening port as needed, then click *Next*.

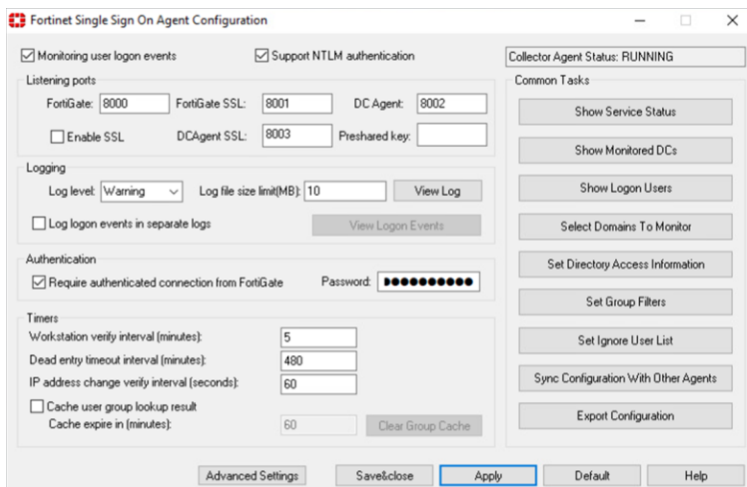

9. Select the domain, in this example *LAB:lab.local*, then click *Next*.
10. Set the *Working Mode* to *DC Agent Mode*, then click *Next* to install the agent.

11. After the DC agent mode installation finishes, Reboot the DC to complete the setup.

To configure the FSSO agent:

1. Open the FSSO agent.
2. Enable *Require authentication from FortiGate* and enter a password for FortiGate authentication.

3. Click *Set Group Filters*, and create a default group filter to limit the groups that are sent to the FortiGate.
4. Click *Save&close*.

Configure the FortiGate

Create an external connector to the FSSO agent to receive the AD user groups. Add the user group or groups as the source in a firewall policy to include usernames in traffic logs. Enable security profiles, such as web filter or antivirus, in the policy to include the usernames in UTM logs.

Event logs include usernames when the log is created for a user action or interaction, such as logging in or an SSL VPN connection.

To create an external connector:

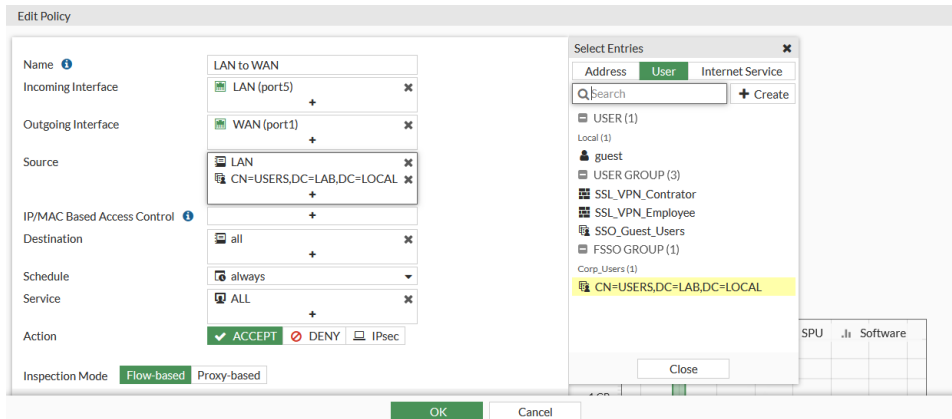

1. On the FortiGate, go to *Security Fabric > External Connectors*.
2. Click *Create New* and select *FSSO Agent on Windows AD*.
3. Set the *Primary FSSO agent* to the previously configured *Collector Agent IP address* and authentication password.

4. Click *OK*

The connector shows a green arrow when the connection is established, and a number in the top right indicating the number of AD groups received from the DC agent. Edit the connector to view the user groups.

**To configure a policy with an imported user group and web filter in the GUI:**

1. Go to *Policy & Objects > Firewall Policy*.
2. Edit an existing policy, or create a new one. See [Policies on page 848](#) for information.
3. Add the FSSO groups or groups as sources:
 - a. Click in the *Source* field.
 - b. Select the *User* tab.
 - c. Select the group or groups.

d. Click *Close*.

4. Under *Security Profiles*, enable *Web Filter* and select a profile that monitors or blocks traffic, such as the *monitor-all* profile. See [Web filter on page 1217](#) for information.
5. Click *OK*.

To configure a policy with an imported user group and web filter in the CLI:

```
config firewall policy
  edit 0
    set name "LAN to WAN"
    set srcintf "port5"
    set dstintf "port1"
    set action accept
    set srcaddr "LAN"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set webfilter-profile "monitor-all"
    set logtraffic all
    set nat enable
    set fssso-groups "CN=USERS,DC=LAB,DC=LOCAL"
  next
end
```

Log, monitor, and report examples

FortiOS monitors:

The *FortiView Web Sites by Bytes* monitor shows a list of visited websites. Double click a specific domain (or manually create a filter), such as *microsoft.com*, to see a breakdown of the usernames and IP addresses that visited that domain. See [Monitors on page 113](#) for more information.

FortiAnalyzer reports:

The *User Detailed Browsing Log* report requires a username or IP address to run. If a username is used, the report includes logs related to that user regardless of their IP address. For example, the following report shows two source IP addresses:

User: USER2
Source IP: 10.1.0.11, 10.1.0.222
Hostname (MAC): 00:0c:29:5e:f5:25, LAB, PC1
Source Interface: port5
Devices: FGVM01TM22000459

See [Reports](#) in the [FortiAnalyzer Administration guide](#) for more information.

Wireless configuration

See the [FortiWiFi and FortiAP Configuration Guide](#).

Switch Controller

Use the Switch Controller function, also known as FortiLink, to remotely manage FortiSwitch units. In the commonly-used layer 2 scenario, the FortiGate that is acting as a switch controller is connected to distribution FortiSwitch units. The distribution FortiSwitch units are in the top tier of stacks of FortiSwitch units and connected downwards with Convergent or Access layer FortiSwitch units. To leverage CAPWAP and the Fortinet proprietary FortiLink protocol, set up data and control planes between the FortiGate and FortiSwitch units.

FortiLink allows administrators to create and manage different VLANs, and apply the full-fledged security functions of FortiOS to them, such as 802.1X authentication and firewall policies. Most of the security control capabilities on the FortiGate are extended to the edge of the entire network, combining FortiGate, FortiSwitch, and FortiAP devices, and providing secure, seamless, and unified access control to users.

See [FortiSwitch devices managed by FortiOS](#).

System

This topic contains information about FortiGate administration and system configuration that you can do after installing the FortiGate in your network.

Basic system settings

Administrators

By default, FortiGate has an administrator account with the username *admin* and no password. See [Administrators on page 2049](#) for more information.

Administrator profiles

An administrator profile defines what the administrator can see and do on the FortiGate. See [Administrator profiles on page 2049](#) for more information.

Password policy

Set up a password policy to enforce password criteria and change frequency. See [Password policy on page 2055](#) for more information.

Interfaces

Physical and virtual interface allow traffic to flow between internal networks, and between the internet and internal networks. See [Interfaces on page 142](#) for more information.

Advanced system settings

SNMP

The simple network management protocol (SNMP) allows you to monitor hardware on your network. See [SNMP on page 2255](#) for more information.

DHCP server

You can configure one or more DHCP servers on any FortiGate interface. See [DHCP servers and relays on page 323](#) for more information.

VDOM

You can use virtual domains (VDMs) to divide a FortiGate into multiple virtual devices that function independently. See [Virtual Domains on page 2092](#) for more information.

High availability

You can configure multiple FortiGate devices, including private and public cloud VMs, in HA mode. See [High Availability on page 2117](#) for more information.

Certificates

You can manage certificates on the FortiGate. See [Certificates on page 2292](#) for more information.

Operating modes

A FortiGate or VDOM (in multi-vdom mode) can operate in either NAT/route mode or transparent mode.

NAT/route mode

The FortiGate or VDOM is installed as a gateway or router between multiple networks, such as a private network and the internet. One function of NAT/route mode is to allow the FortiGate to hide the IP addresses on the private network using NAT. NAT/route mode can also be used to connect to multiple ISPs in an SD-WAN setup, and to route traffic between different networks. .

By default, new VDOMs are set to NAT/route operation mode.

See [NAT mode on page 2100](#) for more information.

Transparent mode

The FortiGate or VDOM operates in layer 2 to forward traffic between network devices such as routers, firewalls, and switches. For example, it can be installed inline between a router and a switch to perform security scanning without changing the network topology or modifying the IP addresses. When you add a FortiGate that is in transparent mode to a network, it only needs to be provided with a management IP address in order to access the device. It is recommended that a dedicated interface is used to connect to the management network in transparent mode.

The following topology is an example of a transparent mode FortiGate inserted inline between a router and a switch:

Using transparent mode VDOMs is recommended when multiple VLANs pass through the FortiGate. Otherwise, they must be separated into different forwarding domains within the same VDOM.

See [NAT and transparent mode on page 2109](#) for more information.

Changing modes

The following is a sample configuration for changing from NAT/route operation mode to transparent operation mode in the CLI:

```
config system settings
  set opmode transparent
  set manageip <IP_address>
  set gateway <gateway_address>
end
```

The gateway setting is optional. However, once the operation mode is changed from NAT/route to transparent, the gateway configuration is found under the static router settings:

```
config router static
  edit <seq-num>
    set gateway <IP_address>
  next
end
```

The following is a sample configuration for changing from transparent operation to NAT/route operation mode in the CLI:

```
config system settings
  set opmode nat
  set ip <IP_address>
  set device <interface>
  set gateway <gateway_address>
end
```

The IP and device settings are mandatory. Once the operation mode is changed from transparent to NAT/route, the IP address configuration is found under the corresponding interface settings:

```
config system interface
    edit <interface>
        set ip <IP_address>
    next
end
```

The gateway setting is optional. However, once the operation mode is changed, the gateway configuration is found under the static router settings:

```
config router static
    edit <seq-num>
        set gateway <IP_address>
        device <interface>
    next
end
```

Administrators

By default, FortiGate has an administrator account with the username *admin* and no password. To prevent unauthorized access to the FortiGate, this account must be protected with a password. Additional administrators can be added for various functions, each with a unique username, password, and set of access privileges.

The following topics provide information about administrators:

- [Administrator profiles on page 2049](#)
- [Add a local administrator on page 2052](#)
- [Remote authentication for administrators on page 2053](#)
- [Password policy on page 2055](#)
- [Associating a FortiToken to an administrator account on page 2057](#)
- [REST API administrator on page 2058](#)
- [SSO administrators on page 2059](#)
- [FortiGate administrator log in using FortiCloud single sign-on on page 2060](#)

Administrator profiles

Administrator profiles define what the administrator can do when logged into the FortiGate. When you set up an administrator account, you also assign an administrator profile which dictates what the administrator sees. Depending on the nature of the administrator's work, access level or seniority, you can allow them to view and configure as much or as little as is required. Access to CLI diagnose commands can also be disabled for global and VDOM level administrators.

By default, the FortiGate has an *admin* administrator account that uses the *super_admin* profile.

super_admin profile

This profile has access to all components of FortiOS, including the ability to add and remove other system administrators. For certain administrative functions, such as backing up and restoring the configuration, super_admin access is required. To ensure that there is always a method to administer the FortiGate, the super_admin profile cannot be deleted or modified.

Lower level administrator profiles cannot backup or restore the FortiOS configuration.

The super_admin profile is used by the default admin account. It is recommended that you add a password and rename this account once you have set up your FortiGate. In order to rename the default account, a second admin account is required.

Creating customized profiles

To create a profile in the GUI:

1. Go to *System > Admin Profiles* and click *Create New*.
2. Configure the following settings:
 - Name
 - Access permissions
 - Usage of CLI diagnose commands
 - Override idle timeout
3. Click *OK*.

To create a profile in the CLI:

```
config system accprofile
  edit <name>
    set secfabgrp {none | read | read-write}
    set ftviewgrp {none | read | read-write}
    set authgrp {none | read | read-write}
    set sysgrp {none | read | read-write | custom}
    set netgrp {none | read | read-write | custom}
    set loggrp {none | read | read-write | custom}
    set fwgrp {none | read | read-write | custom}
    set vpnggrp {none | read | read-write}
    set utmgrp {none | read | read-write | custom}
    set wanoptgrp {none | read | read-write}
    set wifi {none | read | read-write}
    set admintimeout-override {enable | disable}
    set system-diagnostics {enable | disable}
  next
end
```

Displaying execute commands for custom system permissions

A custom access profile can have customized system permissions. In this example, a profile is created for maintenance read access, and the profile is applied to a new system administrator account. Once the administrator logs in, they can view the available execute commands by entering `execute ?` in the CLI.

To create the profile:

1. Configure the access profile:

```
config system accprofile
  edit "mnt test"
    set sysgrp custom
    config sysgrp-permission
      set mnt read
    end
  next
end
```

2. Configure the system administrator account:

```
config system admin
  edit "mnt"
    set accprofile "mnt test"
    set vdom "root"
    set password *****
  next
end
```

To display the list of the execute commands:

```
$ execute ?
backup                backup
fctems                fctems
ping                  PING command.
ping-options          ping-options
ping6                 PINGv6 command. [Take 0-100 arg(s)]
ping6-options         ping6-options
ssh-options           SSH options.
ssh6-options          IPv6 SSH options.
telnet-options        telnet-options
traceroute            Traceroute {IP|hostname}.
traceroute-options    traceroute-options
tracert6              Traceroute for IPv6. [Take 0-32 arg(s)]
usb-device            usb-device
usb-disk              usb-disk
vm-license-options    VM license options.
```

The output will vary based on the FortiGate model. A FortiGate VM is used in this example. For more information about using the CLI, see [CLI basics on page 44](#).

Editing profiles

To edit a profile in the GUI:

1. Go to *System > Admin Profiles*.
2. Select the profile to be edited and click *Edit*.
3. Make the required changes.
4. Click *OK* to save any changes.

To edit a profile in the CLI:

```
config system accprofile
  edit "sample"
    set secfabgrp read
  next
end
```

Deleting profiles

To delete a profile in the GUI:

1. Go to *System > Admin Profiles*.
2. Select the profile to be deleted and click *Delete*.
3. Click *OK*.

To delete a profile in the CLI:

```
config system accprofile
  delete "sample"
end
```

Add a local administrator

By default, FortiGate has one super admin named `admin`. You can create more administrator accounts with different privileges.

To create an administrator account in the GUI:

1. Go to *System > Administrators*.
2. Select *Create New > Administrator*.
3. Specify the *Username*.

Do not use the characters `<` `>` `(` `)` `#` `"` `'` in the administrator username.

Using these characters in an administrator username might have a cross site scripting (XSS) vulnerability.

4. Set *Type* to *Local User*.

5. Set the password and other fields.
6. Click *OK*.

To create an administrator account in the CLI:

```
config system admin
  edit <admin_name>
    set accprofile <profile_name>
    set vdom <vdom_name>
    set password <password for this admin>
  next
end
```

Remote authentication for administrators

Administrators can use remote authentication, such as LDAP, RADIUS, and TACACS+ to connect to the FortiGate.

Local logins can also be restricted when remote authentication servers are available, see [Restricting logins from local administrator accounts when remote servers are available on page 2055](#).

Setting up remote authentication for administrators includes the following steps:

1. [Configuring the LDAP server on page 2053](#)
2. [Adding the LDAP server to a user group on page 2054](#)
3. [Configuring the administrator account on page 2054](#)

Configuring the LDAP server

To configure the LDAP server in the GUI:

1. Go to *User & Authentication > LDAP Servers* and click *Create New*.
2. Enter the server *Name* and *Server IP/Name*.
3. Enter the *Common Name Identifier* and *Distinguished Name*.
4. Set the *Bind Type* to *Regular* and enter the *Username* and *Password*.
5. Click *OK*.

To configure the LDAP server in the CLI:

```
config user ldap
  edit <name>
    set server <server_ip>
    set cnid "cn"
    set dn "dc=XYZ,dc=fortinet,dc=COM"
    set type regular
    set username "cn=Administrator,dc=XYA, dc=COM"
    set password <password>
  next
end
```

Adding the LDAP server to a user group

After configuring the LDAP server, create a user group that includes that LDAP server.

To create a user group in the GUI:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Enter a *Name* for the group.
3. In the *Remote groups* section, select *Create New*.
4. Select the *Remote Server* from the dropdown list.
5. Click *OK*.

To create a user group in the CLI:

```
config user group
  edit <name>
    set member <ldap_server_name>
  next
end
```

Configuring the administrator account

After configuring the LDAP server and adding it to a user group, create a new administrator. For this administrator, instead of entering a password, use the new user group for authentication.

To create an administrator in the GUI:

1. Go to *System > Administrators* and click *Create New > Administrator*.
2. Specify the *Username*.
3. Set *Type* to *Match all users in a remote server group*.
4. In *Remote User Group*, select the user group you created.
5. Select an *Administrator Profile*.
6. Click *OK*.

To create an administrator in the CLI:

```
config system admin
  edit <name>
    set remote-auth enable
    set accprofile super_admin
    set wildcard enable
    set remote-group <ldap_group_name>
  next
end
```

The *Match all users in a remote server group* option acts as a wildcard for matching any users against the remote server group. The *Match a user on a remote server group* option only matches the username defined to match against the remote server group, which is the equivalent of using `set wildcard disable`.

Other methods of administrator authentication

Administrator accounts can use different methods for authentication, including RADIUS, TACACS+, and PKI.

RADIUS authentication for administrators

To use a RADIUS server to authenticate administrators, you must:

1. Configure the FortiGate to access the RADIUS server.
2. Create the RADIUS user group.
3. Configure an administrator to authenticate with a RADIUS server.

TACACS+ authentication for administrators

To use a TACACS+ server to authenticate administrators, you must:

1. Configure the FortiGate to access the TACACS+ server.
2. Create a TACACS+ user group.
3. Configure an administrator to authenticate with a TACACS+ server.

PKI certificate authentication for administrators

To use PKI authentication for an administrator, you must:

1. Configure a PKI user.
2. Create a PKI user group.
3. Configure an administrator to authenticate with a PKI certificate.

Restricting logins from local administrator accounts when remote servers are available

Logins from local administrator accounts can be restricted when remote servers are available. When enabled, FortiOS will check if all of the remote servers used by administrators are down before allowing a local administrator to log in. This option is applied globally, and is disabled by default.

To restrict local administrator authentication when a remote authentication server available:

```
config system global
    set admin-restrict-local enable
end
```

Password policy

Brute force password software can launch more than just dictionary attacks. It can discover common passwords where a letter is replaced by a number. For example, if `p4ssw0rd` is used as a password, it can be cracked.

Using secure passwords is vital for preventing unauthorized access to your FortiGate. When changing the password, consider the following to ensure better security:

- Do not use passwords that are obvious, such as the company name, administrator names, or other obvious words or phrases.
- Use numbers in place of letters, for example: `passw0rd`.

- Administrator passwords can be up to 64 characters.
- Include a mixture of numbers, symbols, and upper and lower case letters.
- Use multiple words together, or possibly even a sentence, for example: `correcthorsebatterystaple`.
- Use a password generator.
- Change the password regularly and always make the new password unique and not a variation of the existing password. For example, do not change from `password` to `password1`.
- Make note of the password and store it in a safe place away from the management computer, in case you forget it; or ensure at least two people know the password in the event one person becomes unavailable. Alternatively, have two different admin logins.

FortiGate allows you to create a password policy for administrators and IPsec pre-shared keys. With this policy, you can enforce regular changes and specific criteria for a password policy, including:

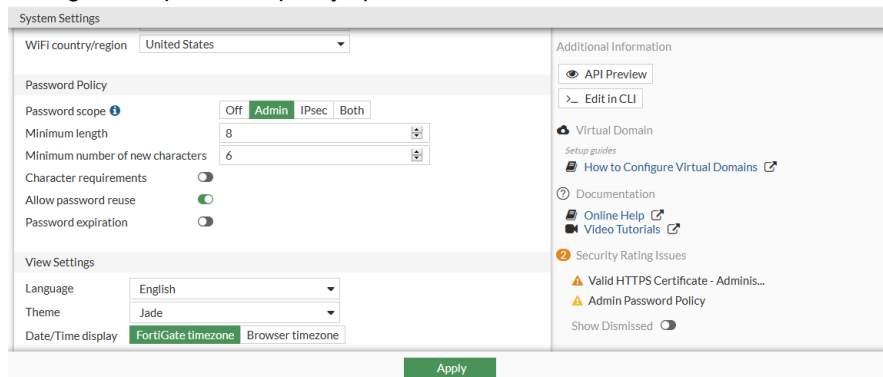

- The minimum length, between 8 and 64 characters.
- If the password must contain uppercase (A, B, C) and/or lowercase (a, b, c) characters.
- If the password must contain numbers (1, 2, 3).
- If the password must contain special or non-alphanumeric characters: `!, @, #, $, %, ^, &, *, (, and)`
- Where the password applies (admin or IPsec or both).
- The duration of the password before a new one must be specified.
- The minimum number of unique characters that a new password must include.

If you add a password policy or change the requirements on an existing policy, the next time that administrator logs into the FortiGate, the administrator is prompted to update the password to meet the new requirements before proceeding to log in.

For information about setting passwords, see [Default administrator password on page 2071](#).

To create a system password policy the GUI:

1. Go to *System > Settings*.
2. In the *Password Policy* section, change the *Password scope* to *Admin*, *IPsec*, or *Both*.
3. Configure the password policy options.

4. Click *Apply*.

To create a system password policy the CLI:

```
config system password-policy
  set status {enable | disable}
  set apply-to {admin-password | ipsec-preshared-key}
  set minimum-length <8-128>
```

```
set min-lower-case-letter <0-128>
set min-upper-case-letter <0-128>
set min-non-alphanumeric <0-128>
set min-number <0-128>
set min-change-characters <0-128>
set expire-status {enable | disable}
set expire-day <1-999>
set reuse-password {enable | disable}
end
```

Associating a FortiToken to an administrator account

You can also associate FortiTokens with administrator accounts.

To associate a FortiToken to an administrator account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.
2. Go to *System > Administrators*. Edit the admin account. This example assumes that the account is fully configured except for two-factor authentication.
3. Enable *Two-factor Authentication* and for *Authentication Type*, select *FortiToken*.
4. From the *Token* dropdown list, select the desired FortiToken serial number.
5. In the *Email Address* field, enter the administrator's email address.
6. Click *OK*.

For a mobile token, click *Send Activation Code* to send the activation code to the configured email address. The admin uses this code to activate their mobile token. You must have configured an email service in *System > Settings* to send the activation code.

To associate a FortiToken to an administrator account using the CLI:

```
config system admin
edit <username>
set password "myPassword"
set two-factor fortitoken
set fortitoken <serial_number>
set email-to "username@example.com"
next
end
```

The `fortitoken` keyword is not visible until you select `fortitoken` for the `two-factor` option.

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

REST API administrator

REST API administrator accounts are used for automated configuration, backup creation, and monitoring of the FortiGate.

For more information about the REST API, see the [Fortinet Development Network \(FNDN\)](#). Note that an account is required to access the FNDN.

Only an administrator with the *super_admin* profile can create a REST API administrator by using the GUI or CLI.

To create a REST API administrator in the GUI:

1. Go to *System > Administrators*.
2. Select *Create New > REST API Admin*.
3. Configure the administrator:

<i>Username</i>	The username of the administrator. Do not use the characters < > () # " ' in the administrator username. Using these characters in an administrator username might have a cross site scripting (XSS) vulnerability.
<i>Administrator Profile</i>	Where permissions for the REST API administrator are defined. A REST API administrator should have the minimum permissions required to complete the request.
<i>PKI Group</i>	Certificate matching is supported as an extra layer of security. Both the client certificate and token must match to be granted access to the API.
<i>CORS Allow Origin</i>	Cross Origin Resource Sharing (CORS) allows third-party web apps to make API requests to the FortiGate using the token.
<i>Trusted Hosts</i>	The following can be used to restrict access to FortiGate API: <ul style="list-style-type: none"> • Multiple trusted hosts/subnets can be configured • IPv6 hosts are supported • Allow all (0.0.0.0/0) is not allowed You need your <i>Source Address</i> to create the trusted host.

4. Click *OK*.
An API token is generated. Make note of the token, as it is only shown once.

To create a REST API administrator in the CLI:

1. Create the REST API administrator:

```
config system api-user
  edit "api-admin"
    set comments <string>
    set api-key *****
    set accprofile "API profile"
```

```

    set vdom "root"
    config trusthost
        edit 1
            set ipv4-trusthost <class_ip&net_netmask>
        next
        ...
    end
next
end

```

2. Generate the API token:

```
# execute api-user generate-key <API username>
```

Make note of the token, as it is only shown once.

By default, The SSO administrator account can only be assigned the *admin_no_access* or *super_admin_readonly* profile. You can define a new administrator profile with the required permissions for the account. For example, you could use a specific API user to query the FortiGate for just their own status. In that case, the profile would be configured as read-only.

SSO administrators

SSO administrators are automatically created when the FortiGate acts as a SAML service provider (SP) with *SAML Single Sign-On* enabled in the Security Fabric settings.

On the system login page, an administrator can log in with their username and password against the root FortiGate acting as the identity provider (IdP) in the Security Fabric. After the first successful log in, this user is added to the administrators table (*System > Administrators* under *Single Sign-On Administrator*). The default profile selected is based on the SP settings (*Default admin profile*). See [Configuring a downstream FortiGate as an SP on page 2483](#) for more information.

SSO administrators can be manually configured in FortiOS.

To manually configure an SSO administrator in the GUI:

1. Go to *System > Administrators* and click *Create New > SSO Admin*.
2. Enter the username.
3. Select an administrator profile.
4. Click *OK*.

To manually configure an SSO administrator in the CLI:

```

config system sso-admin
    edit <name>
        set accprofile <profile>
        set vdom <vdom>
    next
end

```

FortiGate administrator log in using FortiCloud single sign-on

By default, the FortiGate is configured to allow administrators to log in using FortiCloud single sign-on. Both IAM and non-IAM users on the FortiCloud support portal are supported. Non-IAM users must be the FortiCloud account that the FortiGate is registered to.

To configure an IAM user in FortiCloud:

1. Log in to your FortiCloud account at support.fortinet.com.
2. Select *Services > IAM*.
3. See the [FortiCloud Identity & Access Management \(IAM\)](#) guide for more information.

To manually enable FortiCloud single sign-on in the GUI:

1. Log in to the FortiGate and go to *System > Settings*.
2. In the *Administration Settings* section, enable *Allow administrative login using FortiCloud SSO*.
3. Click *Apply*.

To manually enable FortiCloud single sign-on in the CLI:

```
config system global
    set admin-forticloud-ss0-login {enable | disable}
end
```

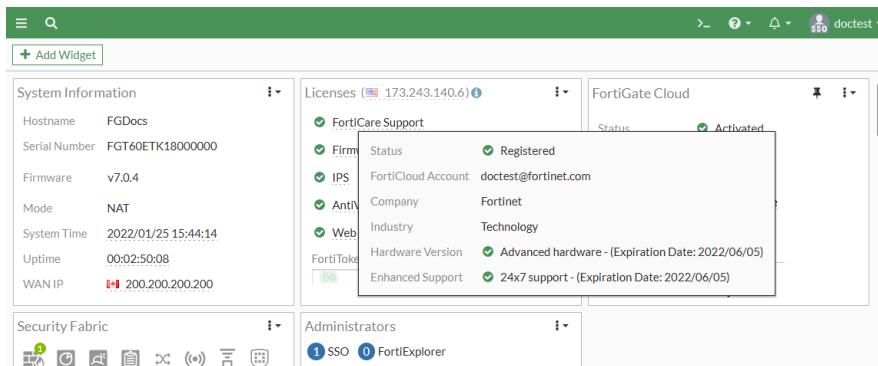

To log in to the FortiGate with the FortiCloud user:

1. Go to the FortiGate log in screen.

2. Click *Sign in with FortiCloud*. The FortiCloud log in page opens.
3. Enter the FortiCloud account credentials and click *Login*.

You are logged in to the FortiOS GUI. The SSO username is shown in the top right corner of the GUI.

Firmware

Fortinet periodically updates the FortiGate firmware to include new features and resolve important issues. After you have registered your FortiGate unit, firmware updates can be downloaded from the [Fortinet Customer Service & Support website](#).

Always back up the current configuration before installing new firmware. See [Configuration backups and reset on page 2355](#).

Before you install any new firmware, follow the below steps:

1. Understand the maturity level of the current and target firmware releases to help you determine whether to upgrade. See [Firmware maturity levels on page 2061](#).
2. Review the [Release Notes](#) for a new firmware release.
3. Review the [Supported Upgrade Paths](#).
4. Download a copy of the currently installed firmware, in case you need to revert to it. See [Downloading a firmware image on page 2064](#) and [Downgrading to a previous firmware version on page 2067](#) for details.
5. Have a plan in place in case there is a critical failure, such as the FortiGate not coming back online after the update. This could include having console access to the device ([Connecting to the CLI on page 41](#)), ensuring that you TFTP server is working ([Installing firmware from system reboot on page 2068](#)), and preparing a USB drive ([Restoring from a USB drive on page 2070](#)).
6. Backup the current configuration, including local certificates. The upgrade process prompts you to back up the current configuration. See also [Configuration backups and reset on page 2355](#) for details.
7. Test the new firmware until you are satisfied that it applies to your configuration. See [Testing a firmware version on page 2065](#) and [Controlled upgrade on page 2070](#) for details.

Installing new firmware without reviewing release notes or testing the firmware may result in changes to settings and unexpected issues.

Only FortiGate admin users and administrators whose access profiles contain system read and write privileges can change the FortiGate firmware.

Firmware maturity levels

Released FortiOS 7.0.6 and later firmware images use tags to indicate the following maturity levels:

- The *Feature* tag indicates that the firmware release includes new features.
- The *Mature* tag indicates that the firmware release includes no new, major features. Mature firmware contains bug fixes and vulnerability patches where applicable.

Administrators can use the tags to identify the maturity level of the current firmware in the GUI or CLI.

Administrators can view the maturity level of each firmware image that is available for upgrade on the *Firmware* page and the *Fabric Management* page. When upgrading FortiGates from mature firmware to feature firmware, a warning message is displayed. See also [Upgrading the firmware on page 2066](#) and [Fabric Management page on page 2443](#).

To demonstrate the functionality of this feature, this example uses FortiGates that are running fictitious build numbers.

To view maturity levels for firmware in the GUI:

1. Check the maturity level of the current firmware:

- Go to *Dashboard > Status*. The *Firmware* field in the *System Information* widget displays the version with build number and either (*Mature*) or (*Feature*).

The following is an example of firmware with the (*Feature*) tag:

System Information	
Hostname	sf70-jun13
Serial Number	[REDACTED]
Firmware	v7.0.6 build0366 (Feature)
Mode	NAT
System Time	2022/06/13 16:10:09
Uptime	00:00:48:09
WAN IP	[REDACTED]

- Go to *System > Fabric Management*. The *Firmware Version* column displays the version with build number and either (*Mature*) or (*Feature*) for FortiOS 7.0.6 or later.

The following is an example of firmware with the (*Feature*) tag:

Device Type

8 Total

- FortiGate
- FortiAP

Upgrade Status

5 Total

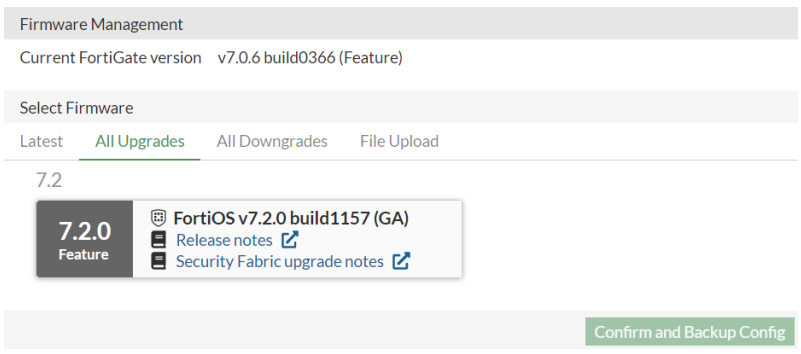

- Upgrade available
- Up to date

Device	Status	Registration Status	Firmware Version	Upgrade Status
sf70-jun13	Online	Registered	v7.0.6 build0366 (Feature)	Up to date
Enterprise_Second_Floor	Online	Registered	v7.0.5 build0304	v7.0.6 available
Enterprise_First_Floor	Online	Registered	v7.0.5 build0304	v7.0.6 available
Branch_Office_02	Online	Registered	v7.0.5 build0304	v7.0.6 available
Branch_Office_01	Online	Registered	v7.0.5 build0304	v7.0.6 available

2. Check the maturity level of firmware images that are available for upgrade:

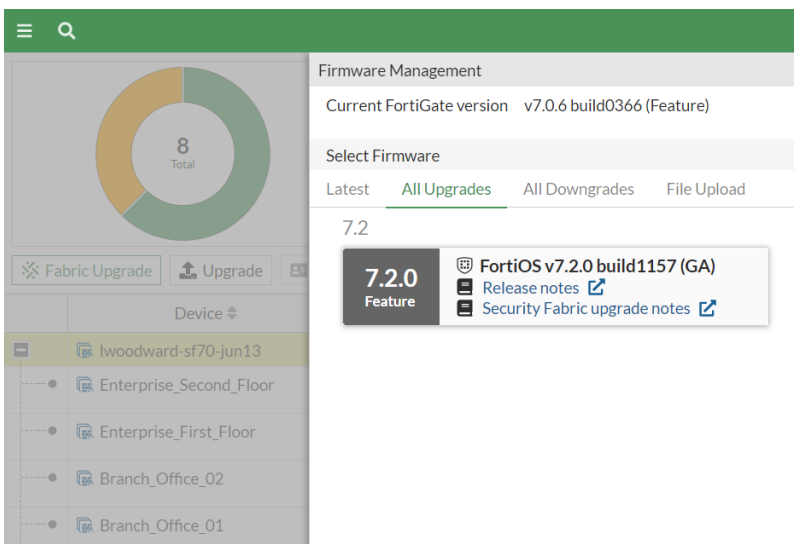

- Go to *System > Firmware*, and click *Latest* or *All Upgrades*. The *Firmware Management* pane is displayed. A gray box around the version number and the label *Feature* identifies feature firmware version. A green box around the version with the label *Mature* identifies a mature firmware version.

The following is an example of firmware with the *Feature* tag:

- Go to *System > Fabric Management*, select a device, and click *Upgrade*. The *Firmware Management* pane is displayed.

The following is an example of firmware with the *Feature* tag on the *All Upgrades* tab:

To view maturity levels for firmware in the CLI:

```
# get system status
Version: FortiGate-301E v7.0.6,build00366,220606 (GA.F)
...
```

In this example, the `Version` field includes `.F` to indicate that the maturity level is feature.

```
# get system status
Version: FortiGate-301E v7.0.7,build0391,220929 (GA.M)
...
```

In this example, the `Version` field includes `.M` to indicate that the maturity level is mature.

Firmware upgrade notifications

FortiGates with a firmware upgrade license that are connected to FortiGuard display upgrade notifications in the setup window, banner, and FortiGuard menu. The firmware notifications are enabled by default.

To configure firmware notifications in the CLI:

```
config system global
  set gui-firmware-upgrade-warning {enable | disable}
end
```

To use the firmware upgrade notifications in the GUI:

1. When you log in to FortiGate, the *FortiGate Setup* window includes an *Upgrade firmware* step. Click *Begin*.

2. Follow the steps in the *Setup Progress*, then click *Review Firmware Upgrade*.

The *System > Firmware* page opens.

3. Notifications appear below the *Notification* icon in the banner, and beside *Firmware* in the tree menu.

Downloading a firmware image

Firmware images for all FortiGate units are available on the [Fortinet Customer Service & Support](#) website.

To download firmware:

1. Log into the support site with your user name and password.
2. Go to *Support > Firmware Download*.
A list of Release Notes is shown. If you have not already done so, download and review the Release Notes for the firmware version that you are upgrading your FortiGate unit to.
3. Select the *Download* tab.
4. Navigate to the folder for the firmware version that you are upgrading to.
5. Find your device model on the list. FortiWiFi devices have file names that start with *FWF*.
6. Click *HTTPS* in the far right column to download the firmware image to your computer.

Firmware can also be downloaded using FTP, but as FTP is not an encrypted file transferring protocol, HTTPS downloading is recommended.

Security levels are pre-configured on the BIOS. See [BIOS-level signature and file integrity checking on page 2323](#) and [Real-time file system integrity checking on page 2327](#) for more information.

Testing a firmware version

The integrity of firmware images downloaded from Fortinet's support portal can be verified using a file checksum. A file checksum that does not match the expected value indicates a corrupt file. The corruption could be caused by errors in transfer or by file modification. A list of expected checksum values for each build of released code is available on Fortinet's support portal.

Image integrity is also verified when the FortiGate is booting up. This integrity check is done through a cyclic redundancy check (CRC). If the CRC fails, the FortiGate unit will encounter an error during the boot process.

Firmware images are signed and the signature is attached to the code as it is built. When upgrading an image, the running OS will generate a signature and compare it with the signature attached to the image. If the signatures do not match, the new OS will not load.

Testing before installation

FortiOS lets you test a new firmware image by installing the firmware image from a system reboot and saving it to system memory. After completing this procedure, the FortiGate unit operates using the new firmware image with the current configuration. The new firmware image is not permanently installed. The next time the FortiGate unit restarts, it operates with the originally installed firmware image using the current configuration. If the new firmware image operates successfully, you can install it permanently using the procedure explained in [Upgrading the firmware](#).

For this procedure, you must install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

To test the new firmware version:

1. Connect to the CLI using an RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory on the TFTP server.
4. Ensure that the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Restart the FortiGate unit: `execute reboot`. The following message is shown:
This operation will reboot the system!
Do you want to continue? (y/n)
6. Type `y`. As the FortiGate unit starts, a series of system startup messages appears.
7. When the following messages appears:
Press any key to display configuration menu.....

Immediately press any key to interrupt the system startup.

You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `execute reboot` command.

If you successfully interrupt the startup process, the following messages appears:

```
[G]: Get firmware image from TFTP server.  
[F]: Format boot device.  
[B]: Boot with backup firmware and set as default  
[C]: Configuration and information  
[Q]: Quit menu and continue to boot with default firmware.  
[H]: Display this list of options.  
Enter G, F, Q, or H:
```

8. Type `G` to get the new firmware image from the TFTP server. The following message appears: Enter TFTP server address [192.168.1.168]:

- Type the address of the TFTP server, then press *Enter*. The following message appears: `Enter Local Address [192.168.1.188]:`
- Type the IP address of the FortiGate unit to connect to the TFTP server.

The IP address must be on the same network as the TFTP server.
Make sure that you do not enter the IP address of another device on this network.

The following message appears:

```
Enter File Name [image.out]:
```

- Enter the firmware image file name then press *Enter*. The TFTP server uploads the firmware image file to the FortiGate unit and the following message appears:

```
Save as Default firmware/Backup firmware/Run image without saving: [D/B/R]
```
- Type *R*. The FortiGate image is installed to system memory and the FortiGate unit starts running the new firmware image, but with its current configuration.

Test the new firmware image as required. When done testing, reboot the FortiGate unit, and the it will resume using the firmware that was running before you installed the test firmware.

Upgrading the firmware

Installing a new firmware image replaces the current antivirus and attack definitions, along with the definitions included with the firmware release that is being installing. After you install new firmware, make sure that the antivirus and attack definitions are up to date.

Back up your configuration before making any firmware changes.

To upgrade the firmware in the GUI:

- Log into the FortiGate GUI as the admin administrative user.
- Go to *System > Firmware*.
- Under *Latest* or *All Upgrades*, select a firmware version, and click *Confirm and Backup config*.
If you are upgrading from a mature to a feature firmware version, the *Confirm* pane opens with a warning message.
- Review the warning, and click *Confirm* to continue. A warning message is displayed.
- Click *Continue* to initiate the upgrade.
The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.

To upgrade the firmware in the CLI:

- Make sure that the TFTP server is running.
- Copy the new firmware image file to the root directory of the TFTP server.
- Log into the CLI.
- Ping the TFTP server to ensure that the FortiGate can connect to it:

```
execute ping <tftp_ipv4>
```

5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

```
execute restore image tftp <filename> <tftp_ipv4>
```

The FortiGate unit responds with the message:

```
This operation will replace the current firmware version!
Do you want to continue? (y/n)
```

6. Type `y`.

The FortiGate unit uploads the firmware image file, verifies the signature of the firmware image, and determines the firmware maturity level.

When you are upgrading to a feature firmware image, you are asked to confirm whether to continue with the upgrade.

When you proceed with the upgrade, the upgrade image is installed and FortiGate restarts. This process takes a few minutes.

```
Please wait...
Connect to tftp server 172.16.200.55 ...
#####
Get image from tftp server OK.
Verifying the signature of the firmware image.
```

```
Warning: Upgrading to an image with Feature maturity notation.
Image file uploaded is marked as a Feature image, are you sure you want to upgrade?
Do you want to continue? (y/n)y
Please confirm again. Are you sure you want to upgrade using uploaded file?
Do you want to continue? (y/n)y
Checking new firmware integrity ... pass
Please wait for system to restart.
Firmware upgrade in progress ...
Done.
The system is going down NOW !!
```

7. Reconnect to the CLI.

8. Update the antivirus and attack definitions:

```
execute update-now
```

Downgrading to a previous firmware version

Downgrading the firmware is not recommended.

Downgrading FortiGates in an HA cluster causes all cluster members to be downgraded simultaneously. This process, also known as an interrupted downgrade, leads to a temporary interruption in the cluster's communication.

This procedure downgrades the FortiGate to a previous firmware version. The backup configuration might not be able to be restored after downgrading.

To downgrade to a previous firmware version in the GUI:

1. Log into the FortiGate GUI as the admin administrative user.
2. Go to *System > Firmware*.

- Click one of the following tabs to select a downgrade method:

<i>All Downgrades</i>	Click the <i>All Downgrades</i> tab to view and select all firmware versions that are available from FortiGuard for downgrade.
<i>File Upload</i>	Click the <i>File Upload</i> tab to upload a firmware file that you previously downloaded from the Fortinet Customer Service & Support website. <ol style="list-style-type: none"> See Downloading a firmware image on page 2064.

- Select a firmware image, and click *Confirm and Backup Config*. A warning message is displayed.
- Click *Continue* to continue with the downgrade.

The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, downgrades to the firmware version, and restarts. This process takes a few minutes.

To downgrade to a previous firmware version in the CLI:

- Make sure that the TFTP server is running.
- Copy the new firmware image file to the root directory of the TFTP server.
- Log into the CLI.
- Ping the TFTP server to ensure that the FortiGate can connect to it:

```
execute ping <tftp_ipv4>
```
- Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

```
execute restore image tftp <filename> <tftp_ipv4>
```

The FortiGate unit responds with the message:

```
This operation will replace the current firmware version!
Do you want to continue? (y/n)
```
- Type `y`. The FortiGate unit uploads the firmware image file, then a message similar to the following is shown:

```
Get image from tftp server OK.
Check image OK.
This operation will downgrade the current firmware version!
Do you want to continue? (y/n)
```
- Type `y`. The FortiGate unit downgrades to the old firmware version and restarts. This process takes a few minutes.
- Reconnect to the CLI.
- Update the antivirus and attack definitions:

```
execute update-now
```

Installing firmware from system reboot

In the event that the firmware upgrade does not load properly and the FortiGate unit will not boot, or continuously reboots, it is best to perform a fresh install of the firmware from a reboot using the CLI. If configured, the firmware can also be automatically installed from a USB drive; see [Restoring from a USB drive on page 2070](#) for details.

This procedure installs a firmware image and resets the FortiGate unit to factory default settings. You can use this procedure to upgrade to a new firmware version, revert to an older firmware version, or re-install the current firmware.

To use this procedure, you must connect to the CLI using the FortiGate console port and a RJ-45 to USB (or DB-9), or null modem cable. You must also install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

Before beginning this procedure, ensure that you backup the FortiGate unit configuration. See [Configuration backups and reset on page 2355](#) for details. If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

To install firmware from a system reboot:

1. Connect to the CLI using the RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory of the TFTP server.
4. Ensure that the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Restart the FortiGate unit: `execute reboot`. The following message is shown:
This operation will reboot the system!
Do you want to continue? (y/n)
6. Type `y`. As the FortiGate unit starts, a series of system startup messages appears.
7. When the following messages appears:

```
Press any key to display configuration menu.....
```

Immediately press any key to interrupt the system startup.

You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `execute reboot` command.

If you successfully interrupt the startup process, the following messages appears:

```
[C]: Configure TFTP parameters.  
[R]: Review TFTP parameters.  
[T]: Initiate TFTP firmware transfer.  
[F]: Format boot device.  
[I]: System information.  
[B]: Boot with backup firmware and set as default.  
[Q]: Quit menu and continue to boot.  
[H]: Display this list of options.
```

```
Enter C,R,T,F,I,B,Q, or H:
```

8. If necessary, type `C` to configure the TFTP parameters, then type `Q` to return to the previous menu:

```
[P]: Set firmware download port.  
[D]: Set DHCP mode.  
[I]: Set local IP address.  
[S]: Set local subnet mask.  
[G]: Set local gateway.  
[V]: Set local VLAN ID.  
[T]: Set remote TFTP server IP address.  
[F]: Set firmware file name.  
[E]: Reset TFTP parameters to factory defaults.  
[R]: Review TFTP parameters.  
[N]: Diagnose networking(ping).  
[Q]: Quit this menu.  
[H]: Display this list of options.
```

```
Enter P,D,I,S,G,V,T,F,E,R,N,Q, or H:
```

The IP address must be on the same network as the TFTP server.
Make sure that you do not enter the IP address of another device on this network.

9. Type **T** get the new firmware image from the TFTP server.
The FortiGate unit loads the firmware.
10. Save the firmware as the default (**D**) or backup (**B**) firmware image, or run the image without saving it (**R**).
The FortiGate unit installs the new firmware image and restarts. The installation might take a few minutes to complete.

Restoring from a USB drive

The FortiGate firmware can be manually restored from a USB drive, or installed automatically from a USB drive after a reboot.

To restore the firmware from a USB drive:

1. Copy the firmware file to the root directory on the USB drive.
2. Connect the USB drive to the USB port of the FortiGate device.
3. Connect to the FortiGate CLI using the RJ-45 to USB (or DB-9) or null modem cable.
4. Enter the following command:

```
execute restore image usb <filename>
```

The FortiGate unit responds with the following message:

```
This operation will replace the current firmware version! Do you want to continue?
(y/n)
```

5. Type **y**. The FortiGate unit restores the firmware and restarts. This process takes a few minutes.
6. Update the antivirus and attack definitions:

```
execute update-now
```

To install firmware automatically from a USB drive:

1. Go to *System > Settings*.
2. In the *Start Up Settings* section, enable *Detect firmware* and enter the name of the firmware file.
3. Copy the firmware file to the root directory on the USB drive.
4. Connect the USB drive to the USB port of the FortiGate device.
5. Reboot the FortiGate device.

Controlled upgrade

Using a controlled upgrade, you can upload a new version of the FortiOS firmware to a separate partition in the FortiGate memory for later upgrade. The FortiGate unit can be configured so that when it is rebooted, it will automatically load the new firmware. Using this option, you can stage multiple FortiGate units to upgrade simultaneously using FortiManager or a script.

To load the firmware for later installation:

```
execute restore secondary-image {ftp | tftp | usb} <filename_str>
```

To set the FortiGate unit so that when it reboots, the new firmware is loaded:

```
execute set-next-reboot {primary | secondary}
```

where {primary | secondary} is the partition with the preloaded firmware.

Settings

The default administrator password should be configured immediately after the FortiGate is installed, see [Default administrator password on page 2071](#).

After that, there are several system settings that should also be configured in *System > Settings*:

- [Changing the host name on page 2073](#)
- [Setting the system time on page 2073](#)
- [Configuring ports on page 2077](#)
- [Setting the idle timeout time on page 2078](#)
- [Setting the password policy on page 2078](#)
- [Changing the view settings on page 2078](#)
- [Setting the administrator password retries and lockout time on page 2079](#)
- [TLS configuration on page 2080](#)
- [Controlling return path with auxiliary session on page 2080](#)
- [Email alerts on page 2084](#)
- [Using configuration save mode on page 2089](#)
- [Trusted platform module support on page 2090](#)

Default administrator password

By default, your FortiGate has an administrator account set up with the username `admin` and no password. In order to prevent unauthorized access to the FortiGate, it is highly recommended that you add a password to this account.

Adding a password to the `admin` administrator is mandatory. You will be prompted to configure it the first time you log in to the FortiGate using that account, after a factory reset, and after a new image installation.

To change the default password in the GUI:

1. Go to *System > Administrators*.
2. Edit the `admin` account.
3. Click *Change Password*.
4. If applicable, enter the current password in the *Old Password* field.
5. Enter a password in the *New Password* field, then enter it again in the *Confirm Password* field.
If the password does not conform to the password policy, an error is shown:

Changing the password of the current administrator account will require you to login again.

Username: admin

Old Password: [masked]

New Password: [masked] **The password must conform to the system password policy.**

Confirm Password: [masked]

Password must conform to the following rules:

- Minimum length
- Minimum number of new characters

OK Cancel

If the password conforms to the password policy, no error message is shown:

Changing the password of the current administrator account will require you to login again.

Username: admin

Old Password: [masked]

New Password: [masked]

Confirm Password: [masked]

Password must conform to the following rules:

- Minimum length
- Minimum number of new characters

OK Cancel

6. Click **OK**.

To change the default password in the CLI:

```
config system admin
  edit admin
    set password <old password> <old password>
  
```

New password must conform to the password policy enforced on this device:
 minimum-length=8; the new password must have at least 1 unique character(s) which don't
 exist in the old password.; must not be same as last two passwords

```
node_check_object fail! for password *

value parse error before '*'
Command fail. Return code -49

    set password <new password> <old password>
  next
end
```

It is also recommended that you change the user name of this account; however, since you cannot change the user name of an account that is currently in use, a second administrator account must be created in order to do this.

Changing the host name

The FortiGate host name is shown in the *Hostname* field in the *System Information* widget on a dashboard, as the command prompt in the CLI, as the SNMP system name, as the device name on FortiGate Cloud, and other places. If the FortiGate is in an HA cluster, use a unique host name to distinguish it from the other devices in the cluster.

An administrator requires *System > Configuration* read/write access to edit the host name. See [Administrator profiles on page 2049](#) for details.

To change the host name in the GUI:

1. Go to *System > Settings*.
2. In the *Host name* field, enter a new name.
3. Click *Apply*.

To change the host name in the CLI:

```
config system global
    set hostname <hostname>
end
```

Setting the system time

You can either manually set the FortiOS system time, or configure the device to automatically keep its system time correct by synchronizing with a Network Time Protocol (NTP) or Precision Time Protocol (PTP) server.

Daylight savings time is enabled by default, and can only be configured in the CLI.

For many features to work, including scheduling, logging, and SSL-dependent features, the FortiOS system time must be accurate.

To configure the date and time in the GUI:

1. Go to *System > Settings*.
2. In the *System Time* section, configure the following settings to either manually set the time or use an NTP server:

Time Zone	Select a time zone from the list. This should be the time zone that the FortiGate is in.
Set Time	Select either <i>NTP</i> , <i>PTP</i> , or <i>Manual settings</i> .
NTP	To use an NTP server other than FortiGuard, the CLI must be used. In the <i>Sync interval</i> field, enter how often, in minutes, that the device synchronizes its time with the NTP server.
PTP	<ul style="list-style-type: none"> • Set the <i>Mode</i> to <i>Multicast</i> or <i>Hybrid</i>. • Select the <i>Delay mechanism: E2E</i> or <i>P2P</i>. • Set the <i>Request interval</i>, in seconds.

	<ul style="list-style-type: none"> • Select the <i>Interface</i>.
Manual settings	Manually enter the <i>Date</i> , and <i>Time</i> .
Setup device as local NTP server	<p>Enable to configure the FortiGate as a local NTP server. This option is not available if <i>Set Time</i> is <i>PTP</i>.</p> <p>In the <i>Listen on Interfaces</i> field, set the interface or interfaces that the FortiGate will listen for NTP requests on.</p>

3. Click *Apply*.

To configure the date and time in the CLI:

1. Configure the timezone and daylight savings time:

```
config system global
    set timezone <integer>
    set dst {enable | disable}
end
```

2. Either manually configure the date and time, or configure an NTP or PTP server:

- Manual:

```
execute date <yyyy-mm-dd>
execute time <hh:mm:ss>
```

- NTP server:

```
config system ntp
    set ntpsync enable
    set type {fortiguard | custom}
    set syncinterval <integer>
    set source-ip <ip_address>
    set source-ip6 <ip6_address>
    set server-mode {enable | disable}
    set interface <interface>
    set authentication {enable | disable}
    set key-type {MD5 | SHA1}
    set key <password>
    set key-id <integer>
    config ntpserver
        edit <server_id>
            set server <ip_address or hostname>
            set ntpv3 {enable | disable}
            set authentication {enable | disable}
            set interface-select-method {auto | sdwan | specify}
            set key <password>
            set key-id <integer>
        next
    end
end
```

- PTP server:

```
config system ptp
    set status enable
    set mode {multicast | hybrid}
```

```

    set delay-mechanism {E2E | P2P}
    set request-interval <integer>
    set interface <string>
end

```

SHA-1 authentication support (for NTPv4)

SHA-1 authentication support allows the NTP client to verify that servers are known and trusted and not intruders masquerading (accidentally or intentionally) as legitimate servers. In cryptography, SHA-1 is a cryptographic hash algorithmic function.

SHA-1 authentication support is only available for NTP clients, not NTP servers.

To configure authentication on a FortiGate NTP client:

```

config system ntp
  set ntpsync enable
  set type custom
  set syncinterval 1
  config ntpserver
    edit "883502"
      set server "10.1.100.11"
      set authentication enable
      set key *****
      set key-id 1
    next
  end
end
end

```

Command	Description
authentication <enable disable>	Enable/disable MD5/SHA1 authentication (default = disable).
key <passwd>	Key for MD5/SHA1 authentication. Enter a password value.
key-id <integer>	Key ID for authentication. Enter an integer value from 0 to 4294967295.

To confirm that NTP authentication is set up correctly:

```

# diagnose sys ntp status
synchronized: yes, ntpsync: enabled, server-mode: disabled
ipv4 server(10.1.100.11) 10.1.100.11 -- reachable(0xff) S:4 T:6 selected
server-version=4, stratum=3

```

If NTP authentication is set up correctly, the server version is equal to 4.

PTPv2

The Precision Time Protocol (PTP) is used to synchronize network clocks. It is best suited to situations where time accuracy is of the utmost importance, as it supports accuracy in the sub-microsecond range. Conversely, NTP accuracy is in the range of milliseconds or tens of milliseconds.

Before configuring the PTP settings, ensure that NTP synchronization is disabled. Otherwise, the `config system ptp` command is not available.

```
config system ntp
  set ntpsync disable
end
```

The following CLI commands are available:

```
config system ptp
  set status {enable | disable}
  set mode {multicast | hybrid}
  set delay-mechanism {E2E | P2P}
  set request-interval <integer>
  set interface <interface>
end
```

Command	Description
<code>status {enable disable}</code>	Enable or disable the FortiGate system time by synchronizing with a PTP server (default = disable).
<code>mode {multicast hybrid}</code>	Use multicast or hybrid transmission (default = multicast).
<code>delay-mechanism {E2E P2P}</code>	Use end-to-end (E2E) or peer-to-peer (P2P) delay detection (default = E2E).
<code>request-interval <integer></code>	The logarithmic mean interval between the delay request messages sent by the client to the server in seconds (default = 1).
<code>interface <interface></code>	The interface that the PTP client will reply through.

Sample configuration

This example uses the following topology:

To configure a FortiGate to act as a PTP client that synchronizes itself with a Linux PTP server:

1. Enable debug messages:

```
# diagnose debug application ptpd -1
```

This command will provide details to debug the PTP communication with the server.

2. Check the system date:

```
# execute date
current date is: 2021-04-01
```

3. Configure PTP in global mode:

```
config system ptp
    set status enable
    set interface wan2
end
```

4. Check the system date again after synchronization with the PTP server:

```
# execute date
current date is: 2021-04-27
```

Configuring ports

To improve security, the default ports for administrative connections to the FortiGate can be changed. Port numbers must be unique. If a conflict exists with a particular port, a warning message is shown.

When connecting to the FortiGate after a port has been changed, the port number be included, for example:

```
https://192.168.1.99:100.
```

To configure the ports in the GUI:

1. Go to *System > Settings*.
2. In the *Administration Settings* section, set the HTTP, HTTPS, SSH, and Telnet ports.
3. Enable *Redirect to HTTPS* to prevent HTTP from being used by administrators.
4. Click *Apply*.

To configure the ports in the CLI:

```
config system global
    set admin-port <port>
    set admin-sport <port>
    set admin-https-redirect {enable | disable}
    set admin-ssh-port <port>
    set admin-telnet-port <port>
end
```

Custom default service port range

The default service port range can be customized using the following CLI command:

```
config system global
    set default-service-source-port <port range>
end
```

Where `<port range>` is the new default service port range, that can have a minimum value of 0 and a maximum value up to 65535. The default value is 1 to 65535.

This change effects the TCP/UDP protocol.

Setting the idle timeout time

The idle timeout period is the amount of time that an administrator will stay logged in to the GUI without any activity. This is to prevent someone from accessing the FortiGate if the management PC is left unattended. By default, it is set to five minutes.

A setting of higher than 15 minutes will have a negative effect on a security rating score. See [Security rating on page 2499](#) for more information.

To change the idle timeout in the GUI:

1. Go to *System > Settings*.
2. In the *Administration Settings* section, set the *Idle timeout* to up to 480 minutes.
3. Click *Apply*.

To change the idle timeout in the CLI:

```
config system global
    set admintimeout <1-480>
end
```

Setting the password policy

A password policy can be created for administrators and IPsec pre-shared keys. See [Password policy on page 2055](#) for information.

Changing the view settings

The view settings change the look and language of the FortiOS GUI.

To change the view settings in the GUI:

1. Go to *System > Settings*.
2. In the *View Settings* section, configure the following settings:

Language	Set the GUI language: <i>English, French, Spanish, Portuguese, Japanese, Traditional Chinese, Simplified Chinese, Korean.</i>
-----------------	---

Theme	Set the theme color: <i>Jade, Neutrino, Mariner, Graphite, Melongene, Retro, Dark Matter, Onyx, or Eclipse.</i>
Date/Time Display	Set the date and time to display using the FortiGate's or the browser's timezone.
NGFW Mode	Set the NGFW mode to either <i>Profile-based</i> (default) or <i>Policy-based</i> .
Central SNAT	Optionally, enable central SNAT. This option is only available in <i>Profile-based</i> mode.

3. Click *Apply*.

To change the view settings in the CLI:

```
config system global
    set language {english | french | spanish | portuguese | japanese | trach | simch |
korean}
    set gui-theme {jade | neutrino | mariner | graphite | melongene | retro | dark-matter |
onyx | eclipse}
    set gui-date-time-source {system | browser}
end

config system settings
    set ngfw-mode {profile-based | policy-based}
    set central-nat {enable | disable}
end
```

Setting the administrator password retries and lockout time

By default, the number password retry attempts is set to three, allowing the administrator a maximum of three attempts at logging in to their account before they are locked out for a set amount of time (by default, 60 seconds).

The number of attempts and the default wait time before the administrator can try to enter a password again can be configured using the CLI.

A maximum of ten retry attempts can be configured, and the lockout period can be 1 to 2147483647 seconds (over 68 years). The higher the retry attempts, the higher the risk that someone might be able to guess the password.

To configure the lockout options:

```
config system global
    set admin-lockout-threshold <failed_attempts>
    set admin-lockout-duration <seconds>
end
```

For example, to set the number of retry attempts to 1, and the lockout time to 5 minutes:

```
config system global
    set admin-lockout-threshold 1
    set admin-lockout-duration 300
end
```

If the time span between the first failed log in attempt and the lockout threshold failed attempt is less than lockout time, the lockout will be triggered.

TLS configuration

The minimum TLS version that is used for local out connections from the FortiGate can be configured in the CLI:

```
config system global
    set ssl-min-proto-version {SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
```

By default, the minimum version is TLSv1.2. The FortiGate will try to negotiate a connection using the configured version or higher. If the server that FortiGate is connecting to does not support the version, then the connection will not be made. Some FortiCloud and FortiGuard services do not support TLSv1.3.

Minimum SSL/TLS versions can also be configured individually for the following settings, not all of which support TLSv1.3:

Setting	CLI
Email server	<code>config system email-server</code>
Certificate	<code>config vpn certificate setting</code>
FortiSandbox	<code>config system fortisandbox</code>
FortiGuard	<code>config log fortiguard setting</code>
FortiAnalyzer	<code>config log fortianalyzer setting</code>
Syslog	<code>config log syslogd setting</code>
User Authentication	<code>config user setting</code>
LDAP server	<code>config user ldap</code>
POP3 server	<code>config user pop3</code>
Exchange server	<code>config user exchange</code>

A minimum (`ssl-min-proto-ver`) and a maximum (`ssl-max-proto-ver`) version can be configured for SSL VPN. See [TLS 1.3 support on page 1865](#)

Controlling return path with auxiliary session

When multiple incoming or outgoing interfaces are used in ECMP or for load balancing, changes to routing, incoming, or return traffic interfaces impacts how an existing sessions handles the traffic. Auxiliary sessions can be used to handle these changes to traffic patterns.

- In FortiOS 6.0 and earlier, the auxiliary session feature is not supported.
- In FortiOS 6.2.0 to 6.2.2, the auxiliary session feature is permanently enabled.
- In FortiOS 6.2.3 and later, the auxiliary session feature is disabled by default, and can be enabled if required.

To enable or disable the auxiliary session feature:

```
config system settings
  set auxiliary-session {enable | disable*}
end
```

When enabling auxiliary sessions, consider the impact of routing in both traffic directions. In topologies such as SD-WAN hub and spoke or ADVPN deployments, the symmetry of the return traffic is important for maintaining the stability of the session. It is expected that the spoke selects the outbound interface and path, and the other nodes obey and reply symmetrically. It is recommended to disable auxiliary in these scenarios, and others where incoming and return traffic symmetry is expected.

Scenarios

Incoming traffic is from the client to the server. Return traffic is from the server to the client.

Scenario 1 - Return traffic returns on the original outgoing interface

In this scenario, a session is established between port1 and port3. When the return traffic hits port3:

Auxiliary sessions disabled:

The reply to the client egresses on the original incoming interface, port1. If policy routes or SD-WAN rules are configured, the next hop gateway is applied if the output device is the same as the original incoming interface.

Auxiliary sessions enabled:

The reply to the client egresses on the best route in the routing table:

- If the best route is port1, then it will egress on port1.
- If the best route is port2, then it will egress on port2.

If policy routes or SD-WAN rules are configured, they must be matched to determine the egress interface. If both are configured, policy routes have higher priority.

Scenario 2 - Return traffic returns on an interfaces other than the original outgoing interfaces

In this scenario, a session is established between port1 and port3. When the return traffic hits port4:

Auxiliary sessions disabled:

- The session is dirtied and then gets refreshed, and interfaces on the session are updated.
- If there is a high traffic volume or flapping between the interfaces, the CPU usage increases.

Auxiliary sessions enabled:

An auxiliary session is created for the existing session, and traffic returns to the client as normal on the auxiliary session.

Scenario 3 - Incoming traffic enters on an interfaces other than the original incoming interfaces

In this scenario, a session is established between port1 and port3. When the incoming traffic hits port2:

Auxiliary sessions disabled:

The session is dirtied and then gets refreshed, and interfaces on the session are updated.

Auxiliary sessions enabled:

An auxiliary session is created for the existing session, and traffic is forwarded to the server as normal on the auxiliary session.

Scenario 4 - the routing table is changed

In this scenario, a session has been established between port1 and port3, when a new route on port4 is updated as the route to the server.

Auxiliary sessions disabled:

As long as there is a route to the destination, the session will not be dirtied or refreshed. Even though there is a better route, traffic continues on the original path between port1 and port3.

Auxiliary sessions enabled:

The session is dirtied and then gets refreshed, and interfaces on the session are updated.

Effect on NPU offloading sessions

When the auxiliary session feature is disabled, there is always one session. If the incoming or return interface changes, the FortiGate marks the session as dirty and updates the session's interfaces. This cannot be done by the NPU, so the session is not offloaded to the NPU, and is processed by the CPU instead. If Equal-Cost Multi-Path (ECMP) causes the interface to keep changing, then it will use significant CPU resources.

When the auxiliary session feature is enabled and the incoming or return interface changes, it creates an auxiliary session, and all traffic can continue to be processed by the NPU.

Verification

When an auxiliary, or reflect, session is created, it will appear as a reflect session below the existing session:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=111 expire=175 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=4

total reflect session num: 1
total session 1
```

When a session is dirtied, a dirty flag is added to it:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=28 expire=152 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=dirty may_dirty npu
statistic(bytes/packets/allow_err): org=68/2/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 2/0 rx speed(Bps/kbps): 0/0
origin->sink: org pre->post, reply pre->post dev=0->0/0->0 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 10.1.100.22:51926->172.16.204.44:5001(0.0.0.0:0)
hook=post dir=reply act=noop 172.16.204.44:5001->10.1.100.22:51926(0.0.0.0:0)
src_mac=90:6c:ac:19:19:58 dst_mac=02:6c:ac:5c:c6:f9
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=2
serial=00002b2c tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x000400
```

```
npu info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0,

total reflect session num: 1
total session 1
```

Email alerts

Alert emails are used to notify administrators about events on the FortiGate device, allowing a quick response to any issues.

There are two methods that can be used to configure email alerts:

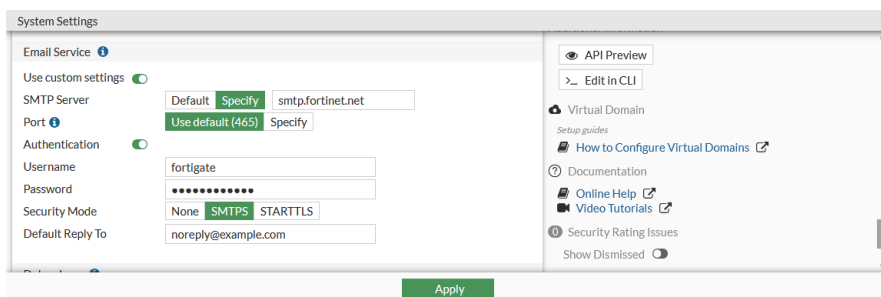

- [Automation stitches on page 2086](#)
- [Alert emails on page 2088](#)

The FortiGate has a default SMTP server, notification.fortinet.net, that provides secure mail service with SMTPS. It is used for all emails that are sent by the FortiGate, including alert emails, automation stitch emails, and FortiToken Mobile activations. You can also configure a custom email service.

To configure a custom email service in the GUI:

1. Go to *System > Settings*.
2. In the *Email Service* section, enable *Use custom settings*.
3. Configure the following settings:

SMTP Server	If required, select <i>Specify</i> and enter the address or name of the SMTP server, such as <i>smtp.example.com</i> .
Port	If required, select <i>Specify</i> and enter a specific port number. The default is port 465.
Authentication	If required by the email server, enable authentication. If enabled, enter the <i>Username</i> and <i>Password</i> .
Security Mode	Set the security mode: <i>None</i> , <i>SMTPS</i> , or <i>STARTTLS</i> .
Default Reply To	Optionally, enter the reply to email address, such as <i>noreply@example.com</i> . This address will override the from address that is configured for an alert email. If <i>SMTP Server</i> is set to <i>Default</i> , the <i>Default Reply To</i> field is hidden and cannot be configured, and the default address is set to <i>DoNotReply@notification.fortinet.net</i> . This ensures that default SMTP server can work correctly.

4. Click *Apply*.

To configure a custom email service in the CLI:

```
config system email-server
  set server "smtp.fortinet.net"
  set reply-to "noreply@example.com"
  set port 465
  set authenticate enable
  set username "fortigate"
  set password *****
  set security smtps
end
```

If server is set to `notification.fortinet.net`, the `reply-to` command is hidden and cannot be configured, and the default reply to address is set to `DoNotReply@notification.fortinet.net`. This ensures that default SMTP server can work correctly.

Automation stitches

Automation stitches can be configured to send emails based on a variety of triggers, giving you control over the events that cause an alert, and who gets alerted. For more information, see [Automation stitches on page 2506](#).

In this example, the default mail service sends an email to two recipients when an Admin login failed event occurs or there is a configuration change.

To configure the automation stitch in the GUI:

1. On the root FortiGate, go to *Security Fabric > Automation* and click *Create New*.
2. Enter a name for the stitch, such as *Admin Fail*.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *FortiOS Event Log*.
 - c. Enter a name for the trigger, such as *Admin Fail*.
 - d. Click in the *Event* field, and in the slide out pane, search for and select *Admin login failed*.

The screenshot shows the 'Create New Automation Trigger' dialog box. The title bar reads 'Create New Automation Trigger'. The main area is titled 'FortiOS Event Log' with a subtitle 'A specified FortiOS event log ID has occurred.' and a 'CHANGE TYPE' button. The 'Name' field contains 'Admin Fail'. The 'Description' field is empty with a character count of '0/255'. Under the 'FortiOS Event Log' section, the 'Event' field has a dropdown menu showing 'Admin login failed' with a close button. Below it is a 'Field filter(s)' section with an information icon and a plus button. At the bottom, there are 'OK' and 'Cancel' buttons.

- e. Click *OK*.
- f. Select the trigger in the list and click *Apply*.
4. Configure the action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Email*.
 - c. Configure the following settings:

Name	Enter a name for the action, such as <i>Admin Fail_email</i> .
To	Enter the two email recipients' addresses, such as <i>admin@example.com</i> and <i>manager@example.com</i> .
Subject	Enter a subject, such as <i>Admin log in failed</i> .
Body	Edit as required. By default, the email body will include all the fields from the log event that triggered the stitch.

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
5. Click **OK**.
 6. Create a second stitch with *Configuration Change* as the trigger, and an email action with a different subject line (such as *Configuration Change Detected*).

To configure the automation stitch in the CLI:

1. Create the automation triggers:

```
config system automation-trigger
  edit "Admin Fail"
    set event-type event-log
    set logid 32002
  next
  edit "Config Change"
    set event-type config-change
  next
end
```

2. Create automation actions to send the email messages:

```
config system automation-action
  edit "Admin Fail_email"
    set action-type email
    set email-to "admin@example.com" "manager@example.com"
    set email-subject "Admin log in failed"
  next
  edit "Config Change_email"
    set action-type email
    set email-to "admin@example.com" "manager@example.com"
    set email-subject "Configuration Change Detected"
  next
end
```

3. Create the automation stitches:

```
config system automation-stitch
  edit "Admin Fail"
    set trigger "Admin Fail"
```

```
    config actions
      edit 1
        set action "Admin Fail_email"
        set required enable
      next
    end
  next
edit "Config Change"
  set trigger "Config Change"
  config actions
    edit 1
      set action "Config Change_email"
      set required enable
    next
  end
next
end
```

Alert emails

When configuring an alert email, you can define the threshold when an issue becomes critical and requires attention. When the threshold is reached, an email is sent to up to three recipients on the configured schedule to notify them of the issue.

Alert email messages can be configured in the CLI. For more information on the available CLI commands, see [Configure alert email settings](#).

Alert email messages (under `config alertemail setting`) cannot monitor and notify users of the current logging status or the status of the `miglogd` daemon. In the event that the `miglogd` daemon is unresponsive, alert email messages cannot be triggered.

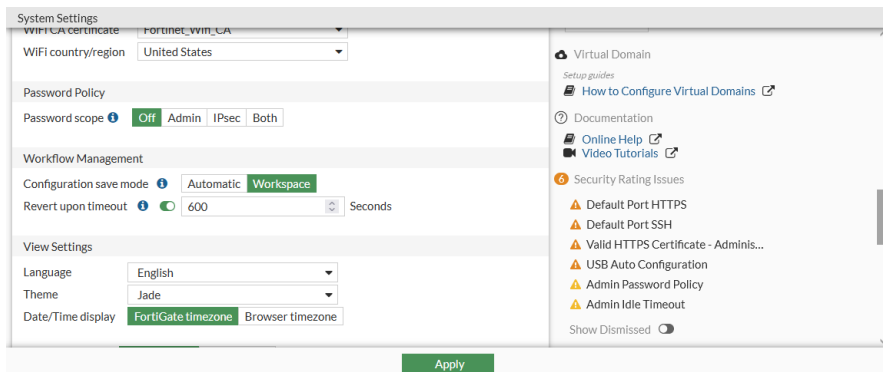

In this example, the FortiGate is configured to send email messages to two addresses, `admin@example.com` and `manager@example.com`, every two minutes when multiple intrusions, administrator log in or out events, or configuration changes occur.

To configure an alert email:

```
config alertemail setting
  set username fortigate@example.com
  set mailto1 admin@example.com
  set mailto2 manager@example.com
  set filter-mode category
  set email-interval 2
  set IPS-logs enable
  set configuration-changes-logs enable
  set admin-login-logs enable
end
```

Using configuration save mode

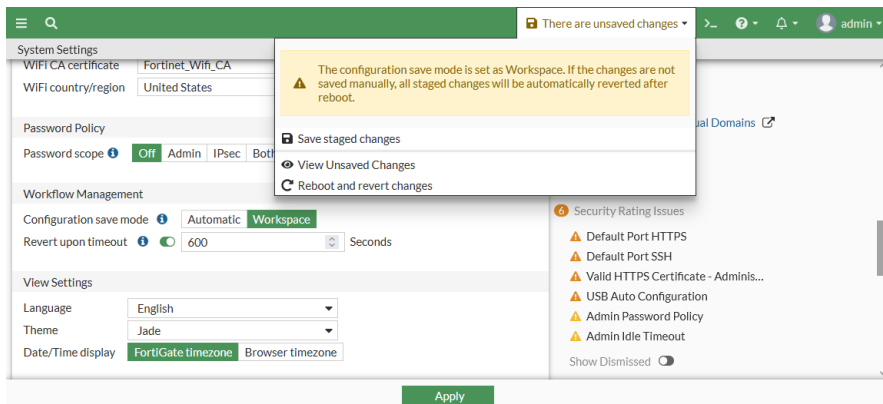

Administrators can use configuration save mode set to *Workplace* to implement strict change control by requiring changes to be manually committed to the flash. To configure the setting in the GUI, go to *System > Settings*.

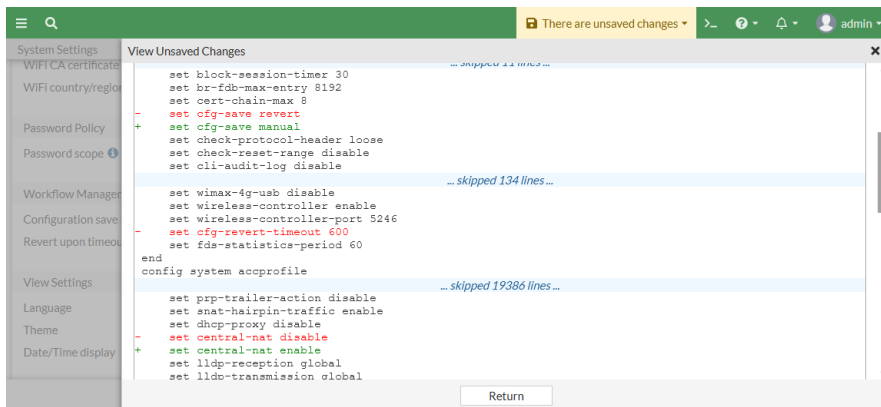

When *Configuration save mode* is set to *Automatic* (default), configuration changes are automatically saved to both memory and flash.

When *Configuration save mode* is set to *Workspace*, configuration changes are saved to memory but not to flash. The changes take effect immediately, but must be manually saved to flash. Unsaved changes are reverted when the device is rebooted. If *Revert upon timeout* is enabled, the system might be unresponsive for a short time after the configured timeout while it reverts the changes back to the previous save point. Prior to the timeout expiring, a pop-up warning gives you the option to postpone the reboot by one minute, revert the configuration immediately, or save the configuration changes.

In workspace mode, a warning is shown in the banner when there are unsaved changes. Click the warning to save, view, or revert the changes. When you click *Reboot and revert changes*, the system might be unresponsive for a short time while it reverts the changes back to the previous save point.

Clicking *View Unsaved Changes* opens a pane highlighting the changes that have not been committed.

This feature is also available in the CLI:

```
config system global
    set cfg-save {automatic | manual | revert}
    set cfg-revert-timeout <integer>
end

# execute cfg {reload | save}
```

Trusted platform module support

On supported FortiGate hardware devices, the Trusted Platform Module (TPM) can be used to protect your password and key against malicious software and phishing attacks. The dedicated module hardens the FortiGate by generating, storing, and authenticating cryptographic keys. To help prevent tampering, the chip is soldered on the motherboard to reduce the risk of data transaction interceptions from attackers.

By default, the TPM is disabled. To enable it, you must set the 32 hexadecimal digit master-encryption-password which encrypts sensitive data on the FortiGate using AES128-CBC. With the password, TPM generates a 2048-bit primary key to secure the master-encryption-password through RSA-2048 encryption. The master-encryption-password protects the data. The primary key protects the master-encryption-password.

The TPM module does not encrypt the disk drive of eligible FortiGates.

The primary key binds the encrypted configuration file to a specific FortiGate unit and never leaves the TPM. When backing up the configuration, the TPM uses the primary key to encrypt the master-encryption-password in the configuration file. When restoring a configuration that includes a TPM protected master-encryption-password:

- If TPM is disabled, then the configuration cannot be restored.
- If TPM is enabled but has a different master-encryption-password than the configuration file, then the configuration cannot be restored.
- If TPM is enabled and the master-encryption-password is the same in the configuration file, then the configuration can be restored.

For information on backing up and restoring the configuration, see [Configuration backups and reset on page 2355](#).

Passwords and keys that can be encrypted by the master-encryption-key include:

- Alert email user's password
- BGP and other routing related configurations
- External resource
- FortiGuard proxy password
- FortiToken/FortiToken Mobile's seed
- HA password
- IPsec pre-shared key
- Link Monitor, server side password
- Local certificate's private key
- Local, LDAP, RADIUS, FSSO, and other user category related passwords
- Modem/PPPoE
- NST password
- NTP Password
- SDN connector, server side password
- SNMP
- Wireless Security related password

In HA configurations, each cluster member must use the same master-encryption-key so that the HA cluster can form and its members can synchronize their configurations.

To check if your FortiGate device has a TPM:

Verify all the following commands exist. Otherwise, the platform does not support it.

```
# diagnose hardware test info
List of test cases:
  bios: sysid
  bios: checksum
  bios: license
  bios: detect

# diagnose hardware deviceinfo tpm
TPM capability information of fixed properties:
=====
TPM_PT_FAMILY_INDICATOR: 2.0
TPM_PT_LEVEL: 0
TPM_PT_REVISION: 138
TPM_PT_DAY_OF_YEAR: 8
TPM_PT_YEAR: 2018
TPM_PT_MANUFACTURER: NTC
# diagnose hardware test tpm
===== Fortinet Hardware Test Report =====
TPM
TPM Device Detection..... PASS
===== Fortinet Hardware Test PASSED =====
# diagnose tpm
get-property Get TPM properties. [Take 0-1 arg(s)]
get-var-property Get TPM var properties.
read-clock Read TPM internal clock.
```

```
shutdown-prepare Prepare for TPM power cycle.
selftest Perform self tests.
generate-random-number Generate a 4-byte random number
SHA-1 HASH a sequence of num with SHA-1 algo
SHA-256 HASH a sequence of num with SHA-256 algo
```

To enable TPM and input the master-encryption-password:

```
config system global
    set private-data-encryption enable
end
Please type your private data encryption key (32 hexadecimal numbers):
*****
Please re-enter your private data encryption key (32 hexadecimal numbers) again:
*****
Your private data encryption key is accepted.
```

Virtual Domains

Virtual Domains (VDOMs) are used to divide a FortiGate into two or more virtual units that function independently. VDOMs can provide separate security policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network.

There are two VDOM modes:

- Split-task VDOM mode: One VDOM is used only for management, and the other is used to manage traffic. See [Split-task VDOM mode on page 2094](#).
- Multi VDOM mode: Multiple VDOMs can be created and managed as independent units. See [Multi VDOM mode on page 2097](#) and [Backing up and restoring configurations in multi VDOM mode on page 2114](#).

By default, most FortiGate units support 10 VDOMs, and many FortiGate models support purchasing a license key to increase the maximum number.

FortiGate-VM V-series, S-series, and FortiFlex instances support split-task VDOMs without any additional VDOM licenses.

Global settings are configured outside of a VDOM. They effect the entire FortiGate, and include settings such as interfaces, firmware, DNS, some logging and sandboxing options, and others. Global settings should only be changed by top level administrators.

Enable the following to prevent accidentally creating VDOMs in the CLI:

```
config system global
    set edit-vdom-prompt enable
end
```

The FortiGate displays a prompt to confirm before the VDOM is created.

Switching VDOM modes

Switching between VDOM modes is allowed, except to switch from multi VDOM to split-task VDOM mode you must first disable VDOMs.

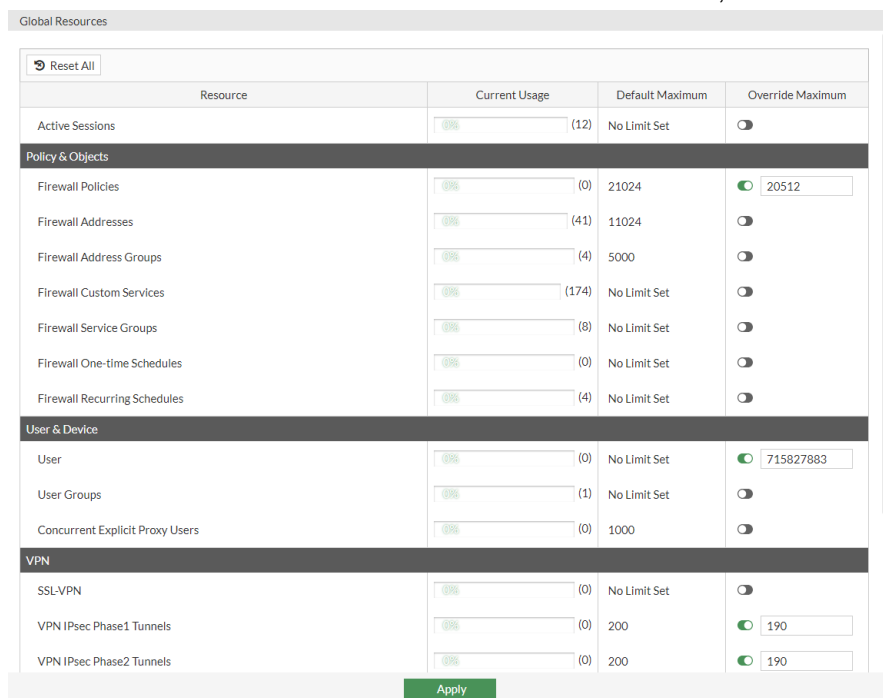

Global and per-VDOM resources

Global and per-VDOM resources can be configured when the FortiGate is in Split-Task or Multi VDOM mode. Global resources apply to resources that are shared by the whole FortiGate, while per-VDOM resources are specific to each VDOM.

By default, all per-VDOM resource settings are set to have no limits. This means that any single VDOM can use all of the FortiGate device's resources. This could deprive other VDOMs of the resources that they require, to the point that could be unable to function. We recommend settings maximum values on the resources that are vital to you.

To configure global resources:

1. In the Global VDOM, go to *System > Global Resources*.
2. Enable the resource's override in the *Override Maximum* column, then enter the override value.

3. Click *Apply*.
To reset the all of the override values, click *Reset All*.

To configure per-VDOM resources:

1. In the Global VDOM, go to *System > VDOM*.
2. Edit the VDOM whose resources need to be configured.
3. Enable the resource's override in the *Override Maximum* column, then enter the override value.

4. Optionally, enter a value in the *Guaranteed* column.

Additional Information

- API Preview
- References
- Edit in CLI
- Documentation
 - Online Help
 - Video Tutorials
 - How to Purchase and Renew VDOM Licenses

Resource	Current Usage	Global Maximum	Override Maximum	Guaranteed
Active Sessions	23	No Limit Set	No Limit Set	
Log & Report				
Log Disk Quota (MiB)	0	No Limit Set (MiB)	5039	2520

5. Click *OK*.

To reset the all of the override values, click *Reset All*.

Split-task VDOM mode

In split-task VDOM mode, the FortiGate has two VDOMs: the management VDOM (*root*) and the traffic VDOM (*FG-traffic*).

The management VDOM is used to manage the FortiGate, and cannot be used to process traffic.

The following GUI sections are available when in the management VDOM:

- The Status dashboard
- Security Fabric topology and settings (read-only, except for *HTTP Service* settings)
- Interface and static route configuration
- FortiClient configuration
- Replacement messages
- Certificates
- System events
- Log and email alert settings
- Threat weight definitions

The traffic VDOM provides separate security policies, and is used to process all network traffic.

The following GUI sections are available when in the traffic VDOM:

- The Status, Top Usage LAN/DMZ, and Security dashboards
- Security Fabric topology, settings (read-only, except for *HTTP Service* settings), and External Connectors (*Endpoint/Identity* connectors only)
- FortiView
- Interface configuration
- Packet capture

- SD-WAN, SD-WAN Rules, and Performance SLA
- Static and policy routes
- RIP, OSPF, BGP, and Multicast
- Replacement messages
- Feature visibility
- Tags
- Certificates
- Policies and objects
- Security profiles
- VPNs
- User and device authentication
- Wifi and switch controller
- Logging
- Monitoring

Split-task VDOM mode is not available on all FortiGate models. The Fortinet Security Fabric supports split-task VDOM mode.

Enable split-task VDOM mode

Split-task VDOM mode can be enabled in the GUI or CLI. Enabling it does not require a reboot, but does log you out of the FortiGate.

When split-task VDOM mode is enabled, all current management configuration is assigned to the *root* VDOM, and all non-management settings, such as firewall policies and security profiles, are deleted.

On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

To enable split-task VDOM mode in the GUI:

1. On the FortiGate, go to *System > Settings*.
2. In the *System Operation Settings* section, enable *Virtual Domains*.

3. Select *Split-Task VDOM* for the VDOM mode.
4. Select a *Dedicated Management Interface* from the *Interface* list. This interface is used to access the management VDOM, and cannot be used in firewall policies.
5. Click *OK*.

To enable split-task VDOM mode with the CLI:

```
config system global
    set vdom-mode split-vdom
end
```

Assign interfaces to a VDOM

An interface can only be assigned to one of the VDOMs. When split-task VDOM mode is enabled, all interfaces are assigned to the *root* VDOM. To use an interface in a policy, it must first be assigned to the traffic VDOM.

An interface cannot be moved if it is referenced in an existing configuration.

In the GUI, the interface list *Ref.* column shows if the interface is referenced in an existing configuration, and allows you to quickly access and edit those references.

To assign an interface to a VDOM in the GUI:

1. On the FortiGate, go to *Global > Network > Interfaces*.
2. Edit the interface that will be assigned to a VDOM.
3. Select the VDOM that the interface will be assigned to from the *Virtual Domain* list.

4. Click **OK**.

To assign an interface to a VDOM using the CLI:

```
config global
    config system interface
        edit <interface>
            set vdom <VDOM_name>
        next
    end
end
```

Create per-VDOM administrators

Per-VDOM administrators can be created that can access only the management or traffic VDOM. These administrators must use either the *prof_admin* administrator profile, or a custom profile.

A per-VDOM administrator can only access the FortiGate through a network interface that is assigned to the VDOM that they are assigned to. The interface must also be configured to allow management access. They can also connect to the FortiGate using the console port.

To assign an administrator to multiple VDOMs, they must be created at the global level. When creating an administrator at the VDOM level, the *super_admin* administrator profile cannot be used.

To create a per-VDOM administrator in the GUI:

1. On the FortiGate, connect to the global VDOM.
2. Go to *System > Administrators* and click *Create New > Administrator*.
3. Fill in the required information, setting the *Type* as *Local User*.
4. In the *Virtual Domains* field, add the VDOM that the administrator will be assigned to, and if necessary, remove the other VDOM from the list.

5. Click *OK*.

To create a per-VDOM administrator using the CLI:

```
config global
  config system admin
    edit <name>
      set vdom <VDOM_name>
      set password <password>
      set accprofile <admin_profile>
      ...
    next
  end
end
```

Multi VDOM mode

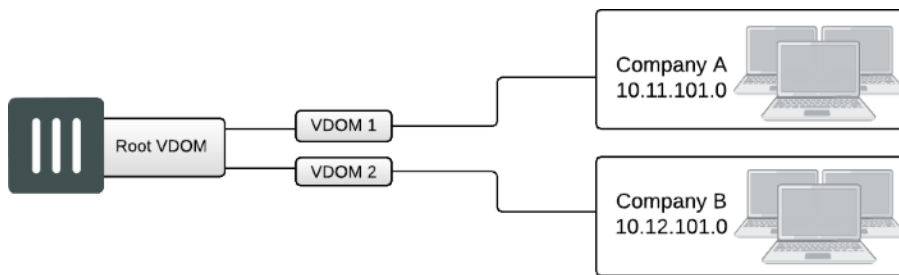

In multi VDOM mode, the FortiGate can have multiple VDOMs that function as independent units. One VDOM is used to manage global settings. The root VDOM cannot be deleted, and remains in the configuration even if it is not processing any traffic.

Multi VDOM mode is not available on all FortiGate models.

There are three main configuration types in multi VDOM mode:

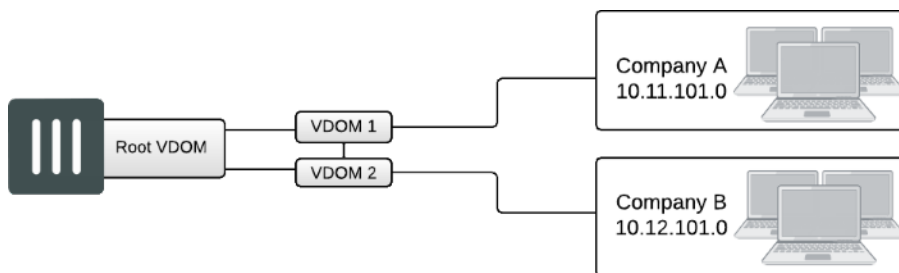

Independent VDOMs:

Multiple, completely separate VDOMs are created. Any VDOM can be the management VDOM, as long as it has Internet access. There are no inter-VDOM links, and each VDOM is independently managed.

Management VDOM:

A management VDOM is located between the other VDOMs and the Internet, and the other VDOMs connect to the management VDOM with inter-VDOM links. The management VDOM has complete control over Internet access, including the types of traffic that are allowed in both directions. This can improve security, as there is only one point of ingress and egress.

There is no communication between the other VDOMs.

Meshed VDOMs:

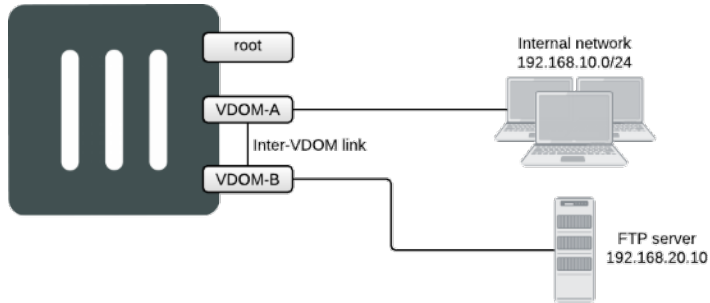

VDOMs can communicate with inter-VDOM links. In full-mesh configurations, all the VDOMs are interconnected. In partial-mesh configurations, only some of the VDOMs are interconnected.

In this configuration, proper security must be achieved by using firewall policies and ensuring secure account access for administrators and users.

Multi VDOM configuration examples

The following examples show how to configure per-VDOM settings, such as operation mode, routing, and security policies, in a network that includes the following VDOMs:

- VDOM-A: allows the internal network to access the Internet.
- VDOM-B: allows external connections to an FTP server.
- root: the management VDOM.

You can use VDOMs in either NAT or transparent mode on the same FortiGate. By default, VDOMs operate in NAT mode.

For both examples, multi VDOM mode must be enabled, and VDOM-A and VDOM-B must be created.

Enable multi VDOM mode

Multi VDOM mode can be enabled in the GUI or CLI. Enabling it does not require a reboot, but does log you out of the device. The current configuration is assigned to the *root* VDOM.

On VMs and FortiGate 60 series models and lower, VDOMs can only be enabled using the CLI.

To enable multi VDOM mode in the GUI:

1. On the FortiGate, go to *System > Settings*.
2. In the *System Operation Settings* section, enable *Virtual Domains*.
3. Select *Multi VDOM* for the VDOM mode.
4. Click *OK*.

To enable multi VDOM mode with the CLI:

```
config system global
  set vdom-mode multi-vdom
end
```

Create the VDOMs

To create the VDOMs in the GUI:

1. In the *Global VDOM*, go to *System > VDOM* and click *Create New*.
2. In the *Virtual Domain* field, enter *VDOM-A*.

3. If required, set the *NGFW Mode*. If the *NGFW Mode* is *Profile-based*, *Central SNAT* can be enabled.
4. Click *OK* to create the VDOM.
5. Repeat the above steps for *VDOM-B*.

To create the VDOMs with the CLI:

```
config vdom
  edit VDOM-A
  next
  edit VDOM-B
  next
end
```

NAT mode

In this example, both VDOM-A and VDOM-B use NAT mode. A VDOM link is created that allows users on the internal network to access the FTP server.

This configuration requires the following steps:

1. [Configure VDOM-A on page 2100](#)
2. [Configure VDOM-B on page 2102](#)
3. [Configure the VDOM link on page 2105](#)

Configure VDOM-A

VDOM-A allows connections from devices on the internal network to the Internet. WAN 1 and port 1 are assigned to this VDOM.

The per-VDOM configuration for VDOM-A includes the following:

- A firewall address for the internal network
- A static route to the ISP gateway
- A security policy allowing the internal network to access the Internet

All procedures in this section require you to connect to VDOM-A, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects > Addresses* and create a new address.
2. Enter the following information:

Name	internal-network
Type	Subnet
Subnet / IP Range	192.168.10.0/255.255.255.0
Interface	port1

3. Click *OK*.

To add the firewall addresses with the CLI:

```
config vdom
  edit VDOM-A
    config firewall address
      edit internal-network
        set associated-interface port1
        set subnet 192.168.10.0 255.255.255.0
      next
    end
  next
end
```

To add a default route in the GUI:

1. Go to *Network > Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.201.7
Interface	wan1
Distance	10

3. Click *OK*.

To add a default route with the CLI:

```
config vdom
  edit VDOM-A
    config router static
      edit 0
        set gateway 172.20.201.7
        set device wan1
      next
    end
  next
end
```

To add the security policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy.
2. Enter the following information:

Name	VDOM-A-Internet
Incoming Interface	port1
Outgoing Interface	wan1
Source	internal-network
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

3. Click *OK*.

To add the security policy with the CLI:

```
config vdom
  edit VDOM-A
    config firewall policy
      edit 1
        set name "VDOM-A-Internet"
        set srcintf "port1"
        set dstintf "wan1"
        set srcaddr "internal-network"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
      next
    end
  next
end
```

Configure VDOM-B

VDOM-B allows external connections to reach an internal FTP server. WAN 2 and port 2 are assigned to this VDOM.

The per-VDOM configuration for VDOM-B includes the following:

- A firewall address for the FTP server
- A virtual IP address for the FTP server
- A static route to the ISP gateway
- A security policy allowing external traffic to reach the FTP server

All procedures in this section require you to connect to VDOM-B, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects > Addresses* and create a new address.
2. Enter the following information:

Address Name	FTP-server
Type	Subnet
Subnet / IP Range	192.168.20.10/32
Interface	port2
Show in Address List	enabled

3. Click *OK*.

To add the firewall addresses with the CLI:

```
config vdom
  edit VDOM-B
    config firewall address
      edit FTP-server
        set associated-interface port2
        set subnet 192.168.20.10 255.255.255.255
      next
    end
  next
end
```

To add the virtual IP address in the GUI:

1. Go to *Policy & Objects > Virtual IPs* and create a new virtual IP address.
2. Enter the following information:

Name	FTP-server-VIP
Interface	wan2
External IP Address/Range	172.25.177.42
Internal IP Address/Range	192.168.20.10

3. Click *OK*.

To add the virtual IP address with the CLI:

```
config vdom
  edit VDOM-B
    config firewall vip
      edit FTP-server-VIP
        set extip 172.25.177.42
        set extintf wan2
        set mappedip 192.168.20.10
      next
    end
```

```

    next
end

```

To add a default route in the GUI:

1. Go to *Network > Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.10.10
Interface	wan2
Distance	10

3. Click *OK*.

To add a default route with the CLI:

```

config vdom
  edit VDOM-B
    config router static
      edit 0
        set gateway 172.20.10.10
        set device wan2
      next
    end
  next
end

```

To add the security policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy.
2. Enter the following information:

Name	Access-server
Incoming Interface	wan2
Outgoing Interface	port2
Source	all
Destination	FTP-server-VIP
Schedule	always
Service	FTP
Action	ACCEPT
NAT	enabled

3. Click *OK*.

To add the security policy with the CLI:

```

config vdom
  edit VDOM-B
    config firewall policy
      edit 1
        set name "Access-server"
        set srcintf "wan2"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "FTP-server-VIP"
        set action accept
        set schedule "always"
        set service "FTP"
        set nat enable
      next
    end
  next
end

```

Configure the VDOM link

The VDOM link allows connections from VDOM-A to VDOM-B. This allows users on the internal network to access the FTP server through the FortiGate.

The configuration for the VDOM link includes the following:

- The VDOM link interface
- Firewall addresses for the FTP server on VDOM-A and for the internal network on VDOM-B
- Static routes for the FTP server on VDOM-A and for the internal network on VDOM-B
- Policies allowing traffic using the VDOM link

All procedures in this section require you to connect to the global VDOM using a global administrator account.

To add the VDOM link in the GUI:

1. In the Global VDOM, go to *Network > Interfaces* and select *Create New > VDOM link*.
2. Enter the following information:

Name	VDOM-link
Interface 0	
Virtual Domain	VDOM-A
IP/Netmask	0.0.0.0/0.0.0.0
Interface 1	
Virtual Domain	VDOM-B
IP/Netmask	0.0.0.0/0.0.0.0

3. Click *OK*.

To add the VDOM link with the CLI:

```
config global
  config system vdom-link
    edit "VDOM-link"
    next
  end
end
```

To add the firewall address on VDOM-A in the GUI:

1. In the VDOM-A VDOM, go to *Policy & Objects > Addresses* and create a new address.
2. Enter the following information:

Address Name	FTP-server
Type	Subnet
Subnet / IP Range	192.168.20.10/32
Interface	VDOM-link0
Show in Address List	enabled
Static Route Configuration	enabled

To add the firewall addresses on VDOM-A with the CLI:

```
config vdom
  edit VDOM-A
    config firewall address
      edit "FTP-server"
        set associated-interface "VDOM-link0"
        set allow-routing enable
        set subnet 192.168.20.10 255.255.255.255
      next
    end
  next
end
```

To add the static route on VDOM-A in the GUI:

1. Connect to VDOM-A.
2. Go to *Network > Static Routes* and create a new route.
3. Enter the following information:

Destination	Named Address
Named Address	FTP-server
Gateway	0.0.0.0
Interface	VDOM-link0

To add the static route on VDOM-A with the CLI:

```

config vdom
  edit VDOM-A
    config router static
      edit 0
        set device VDOM-link0
        set dstaddr FTP-server
      next
    end
  next
end

```

To add the security policy on VDOM-A in the GUI:

1. In the VDOM-A VDOM, go to *Policy & Objects > Firewall Policy* and create a new policy.
2. Enter the following information:

Name	Access-FTP-server
Incoming Interface	port1
Outgoing Interface	VDOM-link0
Source	internal-network
Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT
NAT	disabled

3. Click **OK**.

To add the security policy on VDOM-A with the CLI:

```

config vdom
  edit VDOM-A
    config firewall policy
      edit 0
        set name Access-FTP-server
        set srcintf port1
        set dstintf VDOM-link0
        set srcaddr internal-network
        set dstaddr FTP-server
        set action accept
        set schedule always
        set service FTP
      next
    end
  next
end

```

To add the firewall address on VDOM-B in the GUI:

1. In the VDOM-B VDOM, go to *Policy & Objects > Addresses* and create a new address.
2. Enter the following information:

Address Name	internal-network
Type	Subnet
Subnet / IP Range	192.168.10.0/24
Interface	VDOM-link1
Show in Address List	enabled
Static Route Configuration	enabled

3. Click *OK*.

To add the firewall addresses on VDOM-B with the CLI:

```
config vdom
  edit VDOM-B
    config firewall address
      edit internal-network
        set associated-interface VDOM-link1
        set allow-routing enable
        set subnet 192.168.10.0 255.255.255.0
      next
    end
  next
end
```

To add the static route on VDOM-B in the GUI:

1. In the VDOM-B VDOM, go to *Network > Static Routes* and create a new route.
2. Enter the following information:

Destination	Named Address
Named Address	internal-network
Gateway	0.0.0.0
Interface	VDOM-link1

3. Click *OK*.

To add the static route on VDOM-B with the CLI:

```
config vdom
  edit VDOM-B
    config router static
      edit 0
        set device VDOM-link1
        set dstaddr internal-network
      next
    end
  next
end
```

```

        end
    next
end

```

To add the security policy on VDOM-B in the GUI:

1. In the VDOM-B VDOM, go to *Policy & Objects > Firewall Policy* and create a new policy.
2. Enter the following information:

Name	Internal-server-access
Incoming Interface	VDOM-link1
Outgoing Interface	port2
Source	internal-network
Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT
NAT	disabled

3. Click *OK*.

To add the security policy on VDOM-B with the CLI:

```

config vdom
  edit VDOM-B
    config firewall policy
      edit 0
        set name Internal-server-access
        set srcintf VDOM-link1
        set dstintf port2
        set srcaddr internal-network
        set dstaddr FTP-server
        set action accept
        set schedule always
        set service FTP
      next
    end
  next
end

```

NAT and transparent mode

In this example, VDOM-A uses NAT mode and VDOM-B uses transparent mode.

This configuration requires the following steps:

1. [Configure VDOM-A on page 2110](#)
2. [Configure VDOM-B on page 2112](#)

Configure VDOM-A

VDOM-A allows connections from devices on the internal network to the Internet. WAN 1 and port 1 are assigned to this VDOM.

The per-VDOM configuration for VDOM-A includes the following:

- A firewall address for the internal network
- A static route to the ISP gateway
- A security policy allowing the internal network to access the Internet

All procedures in this section require you to connect to VDOM-A, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects > Addresses* and create a new address.
2. Enter the following information:

Name	internal-network
Type	Subnet
Subnet / IP Range	192.168.10.0/24
Interface	port1
Show in Address List	enabled

3. Click *OK*.

To add the firewall addresses with the CLI:

```
config vdom
  edit VDOM-A
    config firewall address
      edit internal-network
        set associated-interface port1
        set subnet 192.168.10.0 255.255.255.0
      next
    end
  next
end
```

To add a default route in the GUI:

1. Go to *Network > Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.201.7
Interface	wan1

Distance	10
-----------------	----

3. Click *OK*.

To add a default route with the CLI:

```
config vdom
  edit VDOM-A
    config firewall address
      edit 0
        set gateway 172.20.201.7
        set device wan1
      next
    end
  next
end
```

To add the security policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy.
2. Enter the following information:

Name	VDOM-A-Internet
Incoming Interface	port1
Outgoing Interface	wan1
Source	internal-network
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

3. Click *OK*.

To add the security policy with the CLI:

```
config vdom
  edit VDOM-A
    config firewall policy
      edit 0
        set name VDOM-A-Internet
        set srcintf port1
        set dstintf wan1
        set srcaddr internal-network
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
        set nat enable
      next
    end
  next
end
```

```

        next
    end
next
end

```

Configure VDOM-B

VDOM-B allows external connections to reach an internal FTP server. WAN 2 and port 2 are assigned to this VDOM.

The per-VDOM configuration for VDOM-B includes the following:

- A firewall address for the FTP server
- A static route to the ISP gateway
- A security policy allowing external traffic to reach the FTP server

All procedures in this section require you to connect to VDOM-B, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects > Addresses* and create a new address.
2. Enter the following information:

Address Name	FTP-server
Type	Subnet
Subnet / IP Range	172.25.177.42/32
Interface	port2
Show in Address List	enabled

3. Click *OK*.

To add the firewall addresses with the CLI:

```

config vdom
  edit VDOM-B
    config firewall address
      edit FTP-server
        set associated-interface port2
        set subnet 172.25.177.42 255.255.255.255
      next
    end
  next
end

```

To add a default route in the GUI:

1. Go to *Network > Routing Table* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0

Gateway	172.20.10.10
----------------	--------------

3. Click *OK*.

To add a default route with the CLI:

```
config vdom
  edit VDOM-B
    config router static
      edit 0
        set gateway 172.20.10.10
      next
    end
  next
end
```

To add the security policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy.
2. Enter the following information:

Name	Access-server
Incoming Interface	wan2
Outgoing Interface	port2
Source	all
Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT

3. Click *OK*.

To add the security policy with the CLI:

```
config vdom
  edit VDOM-B
    config firewall policy
      edit 0
        set name Access-server
        set srcintf wan2
        set dstintf port2
        set srcaddr all
        set dstaddr FTP-server-VIP
        set action accept
        set schedule always
        set service FTP
      next
    end
  next
end
```

Backing up and restoring configurations in multi VDOM mode

When a FortiGate is in multi VDOM mode, the configuration can be backed up or restored using the GUI or the CLI. Back up and restoration permissions depend on the VDOM administrator when in multi VDOM mode:

- A global *super_admin* can back up and restore the global configuration or the configuration of a specific VDOM.
- A VDOM administrator of one VDOM can only back up and restore the configuration of the current VDOM.
- A VDOM administrator of multiple VDOMs can back up and restore the configuration of multiple VDOMs.

To back up the configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration > Backup*.
2. Select *VDOM* for the *Scope*. The *VDOM* dropdown menu is displayed.
3. Select the VDOM you want to back up.
4. Direct the backup to your *Local PC* or to a *USB Disk*.
5. Enable *Encryption*.

This is recommended to secure your backup configurations and prevent unauthorized parties from reloading your configuration.

6. Enter a password, and enter it again to confirm it. This password will be required to restore the configuration.
7. Click *OK*.
8. When prompted, select a location on the PC or USB disk to save the configuration file. The configuration file will have a *.conf* extension.

To restore the FortiGate configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration > Restore*.
2. Select *VDOM* for the *Scope*. The *VDOM* dropdown menu is displayed.
3. Select the VDOM that you want to restore the configuration for.
4. Identify the source of the configuration file to be restored: your *Local PC* or a *USB Disk*.
The *USB Disk* option will not be available if no USB drive is inserted in the USB port. You can restore from the FortiManager using the CLI.
5. Click *Upload*, locate the configuration file, and click *Open*.

Confirm that the configuration file you are uploading is for the same VDOM selected from the dropdown menu.

6. Enter the password if required.
7. Click *OK*.

Backing up configurations in the CLI

Configuration backups can be performed in the CLI using the `execute backup` commands. If you are backing up a VDOM configuration instead of the global configuration, first enter the commands:

```
config vdom
  edit <vdom_name>
```

Configurations can be backed up in FortiOS format.

Configuration files can be backed up to various locations depending on the command:

- `flash`: Backup the configuration file to the flash drive.
- `ftp`: Backup the configuration file to an FTP server.
- `sftp`: Backup the configuration file to a SFTP server.
- `tftp`: Backup the configuration file to a TFTP server.
- `usb`: Backup the configuration file to an external USB drive.

Command	Description
<code># execute backup config</code>	<p>Back up the configuration in FortiOS format.</p> <p>Backup your configuration file to:</p> <ul style="list-style-type: none"> • <code>flash</code> • <code>ftp</code> • <code>sftp</code> • <code>tftp</code> • <code>usb</code>
<code># execute backup full-config</code>	<p>Backup the configuration, including backups of default configuration settings.</p> <p>Backup your configuration file to:</p> <ul style="list-style-type: none"> • <code>ftp</code> • <code>sftp</code> • <code>tftp</code> • <code>usb</code>

To back up the configuration in FortiOS format using the CLI:

For FTP, note that port number and username are optional depending on the FTP site:

```
config vdom
  edit <vdom_name>
    execute backup config ftp <backup_filename> <ftp_server>[:<ftp_port>] [<password>]
    [<backup_password>]
```

or for TFTP:

```
config vdom
  edit <vdom_name>
    execute backup config tftp <backup_filename> <tftp_servers> [<backup_password>]
```

or for SFTP:

```
config vdom
  edit <vdom_name>
    execute backup config sftp <backup_filename> <sftp_server>[:<sftp_port>] <password>
    [<backup_password>]
```

or for an external USB:

```
config vdom
  edit <vdom_name>
    execute backup config usb <backup_filename> [<backup_password>]
```

Restoring configurations in the CLI

Restoring configurations can be performed in the CLI using the `execute restore` commands. If you are restoring a VDOM configuration instead of the global configuration, first enter the commands:

```
config vdom
  edit <vdom_name>
```

When restoring a VDOM configuration, ensure that the configuration file is for the correct VDOM specified.

Command	Description
# <code>execute restore config</code>	<p>Restore a configuration that is in FortiOS format.</p> <p>Configurations can be loaded from:</p> <ul style="list-style-type: none"> • <code>dhcp</code>: Load the configuration through DHCP. • <code>flash</code>: Load the configuration file from flash to firewall. • <code>ftp</code>: Load the configuration file from an FTP server. • <code>tftp</code>: Load the configuration from a TFTP server. • <code>usb</code>: Load the configuration file from an external USB disk to firewall.

To restore the FortiGate configuration in FortiOS format using the CLI:

For FTP, note that port number and username are optional depending on the FTP site:

```
config vdom
  edit <vdom_name>
    execute restore config ftp <file_path> <ftp_server>[:<port>] [<FTP password>]
    [<password>]
```

or for TFTP:

```
config vdom
  edit <vdom_name>
    execute restore config tftp <file_name> <tftp_server> [<password>]
```

or for DHCP:

```
config vdom
  edit <vdom_name>
    execute restore config dhcp <port> [<VLAN_ID>]
```

or for flash:

```
config vdom
  edit <vdom_name>
    execute restore config flash <revision_ID>
```

or for an external USB:

```
config vdom
  edit <vdom_name>
    execute restore config usb <file_name> [<password>]
```

High Availability

Whether your FortiGate is used as a security gateway, an internal segmentation firewall, in the cloud, or in an MSSP environment, as long as there is critical traffic passing through it, there is risk of it being a single point of failure. Physical outages can occur due to power failures, physical link failures, transceiver failures, or power supply failures. Non-physical outages can be caused by routing, resource issues, or kernel panic.

Network outages cause disruptions to business operations, downtime, and frustration for users and in some situations may have financial setbacks. In designing your network and architecture, it is important to weigh the risks and consequences associated with unexpected outages.

There are many ways to build redundancy and resiliency. In a switching network, you can accomplish this by adding redundant links and switches in partial or full mesh topologies. Using redundant and aggregate links, you can avoid a single link failure causing a network to go down. Using SD-WAN, you can build redundant and intelligent WAN load balancing and failover architectures.

FortiGate HA offers several solutions for adding redundancy in the case where a failure occurs on the FortiGate, or is detected by the FortiGate through monitored links, routes, and other health checks. These solutions support fast failover to avoid lengthy network outages and disruptions to your traffic.

FortiGate Clustering Protocol (FGCP)

FGCP provides a solution for two key requirements of critical enterprise networking components: enhanced reliability and increased performance. Enhanced reliability is achieved through device failover protection, link failover protection, and remote link failover protection. Session failover protection for most IPv4 and IPv6 sessions also contributes to enhanced reliability. Increased performance is achieved through active-active HA load balancing.

FortiGate Session Life Support Protocol (FGSP)

In a network that already includes load balancing (either with load balancers or routers) for traffic redundancy, two entities (either standalone FortiGates or FGCP clusters) can be integrated into the load balancing configuration using the FortiGate Session Life Support Protocol (FGSP). The external load balancers or routers can distribute sessions among the FortiGates and the FGSP performs session synchronization of IPv4 and IPv6 TCP, SCTP, UDP, ICMP, expectation, and NAT sessions to keep the session tables of both entities synchronized. In the event of a failure, the load balancer can detect the failed unit and failover the sessions to other active members to continue processing the traffic.

VRRP

FortiGates can function as primary or backup Virtual Router Redundancy Protocol (VRRP) routers. The FortiGates can quickly and easily integrate into a network that has already deployed VRRP. A FortiGate can be integrated into a VRRP group with any third-party VRRP devices, and VRRP can provide redundancy between multiple FortiGates. FortiOS supports VRRP version 2 and 3.

The following topics provide more information about each HA solution and other HA related topics:

- [FGCP on page 2118](#)
- [FGSP on page 2179](#)
- [Standalone configuration synchronization on page 2233](#)

- [VRRP on page 2238](#)
- [Session failover on page 2249](#)

FGCP

High availability (HA) is usually required in a system where there is high demand for little downtime. There are usually hot-swaps, backup routes, or standby backup units and as soon as the active entity fails, backup entities will start functioning. This results in minimal interruption for the users.

The FortiGate Clustering Protocol (FGCP) is a proprietary HA solution whereby FortiGates can find other member FortiGates to negotiate and create a cluster. A FortiGate HA cluster consists of at least two FortiGates (members) configured for HA operation. All FortiGates in the cluster must be the same model and have the same firmware installed. Cluster members must also have the same hardware configuration (such as the same number of hard disks). All cluster members share the same configurations except for their host name and priority in the HA settings. The cluster works like a device but always has a hot backup device.

Critical cluster components

The following are critical components in an HA cluster:

- Identical heartbeat connections and interfaces: members will use this to communicate with each other. In general, a two-member cluster is most common. We recommend double back-to-back heartbeat connections (as demonstrated in the topology).
- Identical connections for internal and external interfaces: we recommend similar connections from each member to the switches for the cluster to function properly (as demonstrated in the topology).

The HA heartbeat interface communicates with each unit in the cluster using the same heartbeat interface for each member.

For example, if port1 and port2 are the heartbeat interfaces for the HA cluster, then in a cluster consisting of two members:

- port1 of the primary FortiGate should be connected to port1 of the secondary FortiGate.
- port2 of the primary FortiGate should be connected to port2 of the secondary FortiGate.

General operation

The following are best practices for general cluster operation:

- Ensure that heartbeat communication is present (see [HA heartbeat interface on page 2122](#)).
- Enable the session synchronization option in daily operation (see [FGSP basic peer setup on page 2182](#)).
- Monitor traffic flowing in and out of the interfaces.

Failover

FGCP provides failover protection in the following scenarios:

- The active device loses power.
- A monitored interface loses a connection.

After failover occurs, the user will not notice any difference, except that the active device has changed. See [Failover protection on page 2120](#) for more information.

Synchronizing the configuration

FGCP uses a combination of incremental and periodic synchronization to make sure that the configuration of all cluster units is synchronized to that of the primary unit.

The following settings are not synchronized between cluster units:

- The FortiGate host name
- GUI Dashboard widgets
- HA override
- HA device priority
- The virtual cluster priority
- The HA priority setting for a ping server (or dead gateway detection) configuration
- The system interface settings of the HA reserved management interface
- The HA default route for the reserved management interface, set using the `ha-mgmt-interface-gateway` option of the `config system ha` command

Most subscriptions and licenses are not synchronized, as each FortiGate must be licensed individually. FortiToken Mobile is an exception; they are registered to the primary unit and synchronized to the secondary units.

The primary unit synchronizes all other configuration settings, including the other HA configuration settings.

All synchronization activity takes place over the HA heartbeat link using TCP/703 and UDP/703 packets.

The following topics provide more information about FGCP:

Failover protection

The FortiGate Clustering Protocol (FGCP) provides failover protection, meaning that a cluster can provide FortiGate services even when one of the devices in the cluster encounters a problem that would result in the complete loss of connectivity for a stand-alone FortiGate unit. Failover protection provides a backup mechanism that can be used to reduce the risk of unexpected downtime, especially in mission-critical environments.

FGCP supports failover protection in four ways:

1. If a link fails.
2. If a device loses power.
3. If an SSD fails.
4. If memory utilization exceeds the threshold for a specified amount of time.

When session-pickup is enabled in the HA settings, existing TCP sessions are kept, and users on the network are not impacted by downtime as the traffic can be passed without reestablishing the sessions.

When and how the failover happens

1. Link fails

Before triggering a failover when a link fails, the administrator must ensure that monitor interfaces are configured. Normally, the internal interface that connects to the internal network, and an outgoing interface for traffic to the internet or outside the network, should be monitored. Any of those links going down will trigger a failover.

2. Loss of power for active unit

When an active (primary) unit loses power, a backup (secondary) unit automatically becomes the active, and the impact on traffic is minimal. There are no settings for this kind of fail over.

3. SSD failure

An HA failover can be triggered by an SSD failure.

To enable an SSD failure triggering HA fail over:

```
config system ha
    set ssd-failover enable
end
```

4. Memory utilization

An HA failover can be triggered when memory utilization exceeds the threshold for a specific amount of time.

Memory utilization is checked at the configured sample rate (`memory-failover-sample-rate`). If the utilization is above the threshold (`memory-failover-threshold`) every time that it is sampled for the entire monitor period (`memory-failover-monitor-period`), then a failover is triggered.

If the FortiGate meets the memory utilization conditions to cause failover, but the last memory triggered failover happened within the timeout period (`memory-failover-flip-timeout`), then the failover does not occur. Other HA cluster members can still trigger memory based failovers if they meet the criteria and have not already failed within the timeout period.

After a memory based failover from FortiGate A to FortiGate B, if the memory usage on FortiGate A goes down below the threshold but the memory usage on FortiGate B is still below the threshold, then a failover is not triggered, as the cluster is working normally using FortiGate B as the primary device.

When you disable memory based failover, a new HA primary selection occurs to determine the primary device.

To configure memory based HA failover:

```
config system ha
    set memory-based-failover {enable | disable}
    set memory-failover-threshold <integer>
    set memory-failover-monitor-period <integer>
    set memory-failover-sample-rate <integer>
    set memory-failover-flip-timeout <integer>
end
```

<code>memory-based-failover</code> {enable disable}	Enable/disable memory based failover (default = disable).
<code>memory-failover-threshold</code> <integer>	The memory usage threshold to trigger a memory based failover, in percentage (0 - 95, 0 = use the conserve mode threshold, default = 0).
<code>memory-failover-monitor-period</code> <integer>	The duration of the high memory usage before a memory based failover is triggered, in seconds (1 - 300, default = 60).
<code>memory-failover-sample-rate</code> <integer>	The rate at which memory usage is sampled in order to measure memory usage, in seconds (1 - 60, default = 1).
<code>memory-failover-flip-timeout</code> <integer>	The time to wait between subsequent memory based failovers, in minutes (6 - 2147483647, default = 6).

Configuring HA failover time

On supported models, the HA heartbeat interval unit can be changed from the 100ms default to 10ms. This allows for a failover time of less than 50ms, depending on the configuration and the network.

```
config system ha
  set hb-interval-in-milliseconds {100ms | 10ms}
end
```

In this example, the HA heartbeat interval unit is changed from 100ms to 10ms. As the default heartbeat interval is two, this means that a heartbeat is sent every 20ms. The number of lost heartbeats that signal a failure is also changed to two. So, after two consecutive heartbeats are lost, a failover will be detected in 40ms.

To configure the HA failover time:

```
config system ha
  set group-id 240
  set group-name "300D"
  set mode a-p
  set hbdev "port3" 50 "port5" 100
  set hb-interval 2
  set hb-interval-in-milliseconds 10ms
  set hb-lost-threshold 2
  set override enable
  set priority 200
end
```

HA heartbeat interface

The HA heartbeat allows cluster units to communicate with each other. The heartbeat consists of hello packets that are sent at regular intervals by the heartbeat interface of all cluster units. The hello packets describe the state of the cluster unit (including communication sessions) and are used by other cluster units to keep the cluster synchronized. While the cluster is operating, the HA heartbeat confirms that all cluster units are functioning normally.

HA heartbeat packets are Layer 2 Ethernet frames that use EtherType values of 0x8890 and 0x8891 rather than 0x0800 for normal 802.3 IP packets. The default time interval between HA heartbeats is 200 ms.

As a best practice, it is recommended to isolate the heartbeat devices from the user networks by connecting the heartbeat devices to a dedicated switch that is not connected to any network. The heartbeat packets contain sensitive information about the cluster configuration and may use a considerable amount of network bandwidth. If the cluster consists of two FortiGates, connect the heartbeat device interfaces back-to-back using a crossover cable. If there are

more than two FortiGates, each heartbeat interface should be connected to a dedicated switch. For example, in a four-member HA cluster with two heartbeat interfaces, there would be two switches (one switch dedicated to each interface).

Upon starting up, a FortiGate configured for HA broadcasts HA heartbeat hello packets from its HA heartbeat interface to find other FortiGates configured to operate in HA mode. If two or more FortiGates operating in HA mode connect with each other, they compare HA configurations (mode, password, and group ID). If the HA configurations match, then the units negotiate to form a cluster.

The HA heartbeat interface communicates with each unit in the cluster using the same heartbeat interface for each member.

For example, if port1 and port2 are the heartbeat interfaces for the HA cluster, then in a cluster consisting of two members:

- port1 of the primary FortiGate should be connected to port1 of the secondary FortiGate.
- port2 of the primary FortiGate should be connected to port2 of the secondary FortiGate.

Configuring an HA heartbeat interface

A heartbeat interface is an Ethernet network interface in a cluster that is used by the FGCP for HA heartbeat communications between cluster units.

By default, two interfaces are configured to be heartbeat interfaces on most FortiGate models. The heartbeat interface configuration can be changed to select an additional or different heartbeat interface. It is possible to select only one heartbeat interface; however, this is not a recommended configuration (see [Split brain scenario on page 2124](#)).

Another important setting in the HA configuration is the heartbeat interface priority. In all cases, the heartbeat interface with the highest priority is used for all HA heartbeat communication. If the interface fails or becomes disconnected, then the selected heartbeat interface with the next highest priority handles all HA heartbeat communication.

If more than one heartbeat interface has the same priority, the heartbeat interface with the highest priority that is also highest in the heartbeat interface list is used for all HA heartbeat communication. If this interface fails or becomes disconnected, then the selected heartbeat interface with the highest priority that is next highest in the list handles all heartbeat communication (see [Selecting heartbeat packets and interfaces on page 2124](#)).

The default heartbeat interface configuration sets the priority of both heartbeat interfaces to 50, and the range is 0 to 512. When selecting a new heartbeat interface, the default priority is 0. The higher the number, the higher the priority.

In most cases, the default heartbeat interface configuration can be maintained as long the heartbeat interfaces are connected. Configuring HA heartbeat interfaces is the same for virtual clustering and for standard HA clustering. Up to eight heartbeat interface can be selected. This limit only applies to FortiGates with more than eight physical interfaces.

Heartbeat communications can be enabled on physical interfaces, but not on switch ports, VLAN subinterfaces, IPsec VPN interfaces, redundant interfaces, or 802.3ad aggregate interfaces.

To change the heartbeat interfaces in the GUI:

1. Go to *System > HA* and select a *Mode*.
2. Click the + in the *Heartbeat interfaces* field to select an interface.
3. Click *OK*.

To configure two interfaces as heartbeat interfaces with the same priority in the CLI:

```
config system ha
    set hbdev port4 150 port5 150
end
```

In this example, port4 and port5 are configured as the HA heartbeat interfaces and they both have a priority of 150.

To configure two interfaces as heartbeat interfaces with different priorities in the CLI:

```
config system ha
    set hbdev port4 100 port1 50
end
```

In this example, port4 and port1 are configured as the HA heartbeat interfaces. The priority for port4 is higher (100) than port1 (50), so port4 is the preferred HA heartbeat interface.

Split brain scenario

At least one heartbeat interface must be selected for the HA cluster to function correctly. This interface must be connected to all the units in the cluster. If heartbeat communication is interrupted and cannot fail over to a second heartbeat interface, then the cluster units will not be able to communicate with each other and more than one cluster unit may become a primary unit. As a result, the cluster stops functioning normally because multiple devices on the network may be operating as primary units with the same IP and MAC addresses creating a split brain scenario. See [Split brain scenario: on page 2178](#) for more information.

Sharing heartbeat interfaces with traffic ports

HA heartbeat and data traffic is supported on the same cluster interface. In NAT mode, if the heartbeat interfaces are used for processing network traffic, then the interface can be assigned any IP address. The IP address does not affect HA heartbeat traffic.

In transparent mode, the heartbeat interface can be connected to the network with management access enabled on the same interface. A management connection would then be established to the interface using the transparent mode management IP address. This configuration does not affect HA heartbeat traffic.

While these configurations are allowable, they are not recommended. When possible, use dedicated interfaces for heartbeat traffic.

Selecting heartbeat packets and interfaces

HA heartbeat hello packets are sent constantly by all of the enabled heartbeat interfaces. Using these hello packets, each cluster unit confirms that the other cluster units are still operating. The FGCP selects one of the heartbeat interfaces to be used for communication between the cluster units. This interface is used for heartbeat communication and is based on the linkfail states of the heartbeat interfaces, the heartbeat interface priority, and the interface index. The connected heartbeat interface with the highest priority is selected for heartbeat communication.

If more than one connected heartbeat interface has the highest priority, then the FGCP selects the heartbeat interface with the lowest interface index. The interface index order is visible in the CLI by running the `diagnose netlink interface list` command.

If the interface that is processing heartbeat traffic fails or becomes disconnected, the FGCP uses the same criteria to select another heartbeat interface for heartbeat communication. If the original heartbeat interface is fixed or reconnected, the FGCP selects this interface again for heartbeat communication.

The HA heartbeat interface communicates cluster session information, synchronizes the cluster configuration, synchronizes the cluster kernel routing table, and reports individual cluster member statuses. The HA heartbeat constantly communicates HA status information to make sure that the cluster is operating properly.

Modifying heartbeat timing

The heartbeat interval and heartbeat lost threshold are two variables that dictate the length of time one cluster unit will wait before determining a peer is dead.

```
config system ha
    set hb-interval <integer>
    set hb-interval-in-milliseconds {100 | 10}
    set hb-lost-threshold <integer>
end
```

hb-interval <integer>	Set the time between sending heartbeat packets; increase to reduce false positives (1 - 20, default = 2).
hb-interval-in-milliseconds {100 10}	Set the number of milliseconds for each heartbeat interval (100 or 10, default = 100).
hb-lost-threshold <integer>	Set the number of lost heartbeats to signal a failure; increase to reduce false positives (1 - 60, default = 20).

Heartbeats are sent out every 2×100 ms, and it takes 20 consecutive lost heartbeats for a cluster member to be detected as dead. Therefore, it takes by default 2×100 ms \times 20 = 4000 ms, or 4 seconds, for a failure to be detected.

Sub-second heartbeat failure detection can be achieved by lowering the interval and threshold or lowering the heartbeat interval unit of measurement from 100 ms to 10 ms.

If the primary unit does not receive a heartbeat packet from a subordinate unit before the heartbeat threshold expires, the primary unit assumes that the subordinate unit has failed.

If a subordinate unit does not receive a heartbeat packet from the primary unit before the heartbeat threshold expires, the subordinate unit assumes that the primary unit has failed. The subordinate unit then begins negotiating to become the new primary unit.

The HA heartbeat packets consume more bandwidth if the heartbeat interval is short. But if the heartbeat interval is very long, the cluster is not as sensitive to topology and other network changes. Therefore, gauge your settings based on the amount of traffic and CPU usage sustainable by the cluster units versus the tolerance for an outage when the primary unit fails. Avoid using the heartbeat interfaces as traffic ports to prevent congesting the interfaces.

Changing the time to wait in the hello state

The hello state hold down time is the number of seconds that a cluster unit waits before changing from hello state to work state. After a failure or when starting up, cluster units operate in the hello state to send and receive heartbeat packets so that all the cluster units can find each other and form a cluster. A cluster unit should change from the hello state to work state after it finds all the other FortiGates to form a cluster with.

If all cluster units cannot find each other during the hello state, then some cluster units may join the cluster after it has formed. This can cause disruptions to the cluster and affect how it operates. A delay could occur if the cluster units are located at different sites or if communication is delayed between the heartbeat interfaces. If delays occur, increase the cluster units wait time in the hello state.

```
config system ha
    set hello-holddown <integer>
end
```

`hello-holddown <integer>` Set the time to wait before changing from hello to work state, in seconds (5 - 300, default = 20).

Configuring HA heartbeat encryption and authentication

HA heartbeat encryption and authentication to encrypt and authenticate HA heartbeat packets can be enabled. HA heartbeat packets should be encrypted and authenticated if the cluster interfaces that send HA heartbeat packets are also connected to the networks. HA heartbeat encryption and authentication are disabled by default. Note that enabling these settings could reduce cluster performance.

```
config system ha
    set authentication {enable | disable}
    set encryption {enable | disable}
end
```

If HA heartbeat packets are not encrypted, the cluster password and changes to the cluster configuration could be exposed. An attacker may be able to sniff HA packets to get cluster information. Enabling HA heartbeat message authentication prevents an attacker from creating false HA heartbeat messages. False HA heartbeat messages could affect the stability of the cluster.

HA authentication and encryption uses AES-128 for encryption and SHA1 for authentication. Heartbeat messages are encrypted and encapsulated in ESP packets for transfer in an IPsec tunnel between the cluster members.

Heartbeat bandwidth requirements

The majority of the traffic processed by the HA heartbeat interface is session synchronization traffic. Other heartbeat interface traffic required to synchronize IPsec states, IPsec keys, routing tables, configuration changes, and so on is usually negligible.

The amount of traffic required for session synchronization depends on the connections per second (CPS) that the cluster is processing, since only new sessions (and session table updates) need to be synchronized.

Another factor to consider is that if session pickup is enabled, the traffic on the heartbeat interface surges during a failover or when a unit joins or re-joins the cluster. When one of these events occurs, the entire session table needs to be synchronized. Lower throughput HA heartbeat interfaces may increase failover time if they cannot handle the higher demand during these events.

The amount of heartbeat traffic can also be reduced by:

- Turning off session pickup if it is not needed
- Enabling `session-pickup-delay` to reduce the number of sessions that are synchronized
- Using the `session-sync-dev` option to move session synchronization traffic off of the heartbeat link

Heartbeat packet EtherTypes

Normal 802.3 IP packets have an EtherType field value of 0x0800. EtherType values other than 0x0800 are understood as Layer 2 frames rather than IP packets.

HA heartbeat packets use the following EtherTypes:

Field value	Function	Description
0x8890	Heartbeat	Heartbeat packets are used by cluster units to find other cluster units, and to verify the status of other cluster units while the cluster is operating. Use the <code>ha-eth-type</code> option to change the EtherType.
0x8891	Traffic redistribution from primary to subordinate	These are used when the HA primary needs to redistribute traffic packets and the corresponding session information to the subordinate units in A-A mode. Use the <code>hc-eth-type</code> option to change the EtherType.
0x8892	Session synchronization	Session synchronization uses the heartbeat interfaces for communication, unless session synchronization devices are specified. See Session synchronization on page 2127 for more information.
0x8893	HA Telnet sessions (configuration synchronization)	The Telnet sessions are used to synchronize the cluster configurations, and to connect from one cluster unit's CLI to another when an administrator uses the <code>execute ha manage</code> command. Use the <code>l2ep-eth-type</code> option to change the EtherType.

Session synchronization

Since large amounts of session synchronization traffic can increase network congestion, it is recommended to keep this traffic off of the network and separate from the HA heartbeat interfaces by using dedicated connections for it. The interfaces are configured in the `session-sync-dev` setting.

The session synchronization device interfaces must be connected together by directly using the appropriate cable or using switches. If one of the interfaces becomes disconnected, then the cluster uses the remaining interfaces for session synchronization. If all the session synchronization interfaces become disconnected, then session synchronization reverts to using the HA heartbeat link.

All session synchronization traffic is between the primary unit and each subordinate unit. Session synchronization always uses UDP/708, but this will be encapsulated differently depending on the `session-sync-dev` setting. If `session-sync-dev` is specified, the packets will use 0x8892 and will exit over the mentioned port. If `session-sync-dev` is not specified, the packets will use 0x8893 and will exit the heartbeat port.

Session synchronization packets are typically processed by a single CPU core because all source and destination MAC addresses of the L2 frames are the same. Hashing based on the L2 addresses maps the processing of the frames to the same core. When large amounts of session synchronization traffic must be processed, enable the `sync-packet-balance` setting to distribute the processing to more cores. This effectively uses a larger set of MAC addresses for the hashing to map to multiple cores.

Troubleshooting heartbeat packets

Understanding the different types of heartbeat packets will ease troubleshooting. Heartbeat packets are recognized as Layer 2 frames. The switches and routers on the heartbeat network that connect to heartbeat interfaces must be configured to allow them to pass through. If Layer 2 frames are dropped by these network devices, then the heartbeat traffic will not be allowed between the cluster units.

For example, some third-party network equipment may not allow EtherType 0x8893. The unit can still be found in the HA cluster, but you would be unable to run `execute ha manage` to manage the other unit. Use the following settings to change the EtherTypes of the HA heartbeat packets, if they require changing them for the traffic to be forwarded on the connected switch.

```
config system ha
  set ha-eth-type <hex_value>
  set hc-eth-type <hex_value>
  set l2ep-eth-type <hex_value>
end
```

To change the EtherType values of the heartbeat and HA Telnet session packets:

```
config system ha
  set ha-eth-type 8895
  set l2ep-eth-type 889f
end
```

For troubleshooting issues with packets sent or received on the HA heartbeat ports, use the following diagnostic command to sniff the traffic by EtherType.

```
# diagnose sniffer packet any 'ether proto <EtherType_in_hex>' 6 0 1
```

To sniff the traffic on EtherType 0x8890:

```
# diagnose sniffer packet any 'ether proto 0x8890' 6 0 1
Using Original Sniffing Mode
interfaces=[any]
filters=[ether proto 0x8890]
2022-10-19 16:22:26.512813 port5 out Ether type 0x8890 printer hasn't been added to sniffer.

Interface IP addresses

An FGCP cluster communicates heartbeat packets using Layer 2 frames over the physical heartbeat interface, but it also communicates other synchronization traffic, logs, and locally generated traffic from subordinate devices over Layer 3 IP packets. Additional virtual interfaces are created in the hidden vsys_ha VDOM, which need to be addressed with IPv4 addresses.

The FGCP uses link-local IPv4 addresses (see RFC 3927) in the 169.254.0.x range for the virtual HA heartbeat interface (port_ha) and for the inter-VDOM link interfaces between the vsys_ha and management VDOM. When members join an HA cluster, each member's heartbeat interface (port_ha) is assigned an IP address from the range of 169.254.0.1 to

169.254.0.63/26. HA inter-VDOM link interfaces (havdlink0 and havdlink1) are assigned IP address from the range of 169.254.0.65 to 169.254.0.66/26.

The IP address that is assigned to a virtual heartbeat interface depends on the serial number priority of the member. Higher serial numbers have a higher priority, and therefore a lower `serialno_prio` number, for example:

```
# diagnose sys ha status
...
FGVM08TM20002002:    Secondary, serialno_prio=0, usr_priority=128, hostname=FGVM08TM20002002
FGVM08TM19003001:    Primary, serialno_prio=1, usr_priority=128, hostname=FGVM08TM19003001
```

The member with `serialno_prio=0` is assigned IP address 169.254.0.1, `serialno_prio=1` is assigned 169.254.0.2, and so forth.

To view the HA heartbeat interface IP address of the primary unit:

```
# get system ha status
...
vcluster 1: work 169.254.0.2
...
```

To view all the assigned IP addresses of a device:

```
# diagnose ip address list
IP=172.16.151.84->172.16.151.84/255.255.255.0 index=3 devname=port1
IP=192.168.2.204->192.168.2.204/255.255.255.0 index=6 devname=port2
IP=10.10.10.1->10.10.10.1/255.255.255.0 index=9 devname=port3
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=root
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=16 devname=vsys_ha
IP=169.254.0.2->169.254.0.2/255.255.255.192 index=17 devname=port_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=18 devname=vsys_fgfm
IP=169.254.0.65->169.254.0.65/255.255.255.192 index=19 devname=havdlink0
IP=169.254.0.66->169.254.0.66/255.255.255.192 index=20 devname=havdlink1
```

When generating traffic from a subordinate unit, traffic will be routed to the primary unit's `port_ha` virtual heartbeat interface. From there, if traffic is destined to another network, the traffic is routed from the `vsys_ha` VDOM to the management VDOM by the `havdlink` interfaces.

Use the `execute traceroute` command on the subordinate unit to display HA heartbeat IP addresses and the HA inter-VDOM link IP addresses.

To trace the route to an IP address on a subordinate unit:

```
# execute ha manage 1
# execute traceroute 172.20.20.10
traceroute to 172.20.20.10 (172.20.20.10), 32 hops max, 72 byte packets
1 169.254.0.1 0 ms 0 ms 0 ms
2 169.254.0.66 0 ms 0 ms 0 ms
3 172.20.20.10 0 ms 0 ms 0 ms
```

To run a sniffer trace on the primary unit to view the traffic flow:

```
# diagnose sniffer packet any 'net 169.254.0.0/24' 4 0 1
```

Unicast HA heartbeat

In virtual machine (VM) and cloud environments that do not support heartbeat communication with Layer 2 Ethernet frames (see [HA heartbeat interface on page 2122](#)), you can set up a Layer 3 unicast HA heartbeat when configuring HA. This consists of enabling the feature and adding a peer IP address. The peer IP address is the IP address of the HA heartbeat interface of the other FortiGate VM in the HA cluster.

Unicast HA is only supported between two FortiGate VMs in active-passive (A-P) mode. The heartbeat interfaces must be connected to the same network, and the IP addresses must be added to these interfaces.

In the following example, unicast HA heartbeat is enabled over the port3 interface.

To enable unicast HA heartbeat in the GUI:

1. Go to *System > HA*.
2. Enable *Unicast Heartbeat* and enter the *Peer IP*, such as *172.30.3.12*.
3. Click *OK*.

To enable unicast HA heartbeat in the CLI:

```
config system ha
  set hbdev port3 50
  set unicast-hb enable
  set unicast-hb-peerip 172.30.3.12
end
```

HA active-passive cluster setup

An HA Active-Passive (A-P) cluster can be set up using the GUI or CLI.

This example uses the following network topology:

To set up an HA A-P cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.

3. Go to *System > HA* and set the following options:

Mode	Active-Passive
Device priority	128 or higher
Group name	Example_cluster
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.

The group ID can be configured in the CLI and must be the same in all HA members in order to form a cluster. The group ID can impact the definition of the virtual MAC addresses of interfaces. See [Determining VMAC addresses](#) for more details.

4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click **OK**.
The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.
6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.

To set up an HA A-P cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Change the hostname of the FortiGate:

```
config system global
    set hostname Example1_host
end
```

Changing the host name makes it easier to identify individual cluster units in the cluster operations.

4. Enable HA:

```
config system ha
    set mode a-p
    set group-name Example_cluster
```

```

set hbdev ha1 10 ha2 20
end

```

5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster, giving each device a unique hostname.

HA active-active cluster setup

An HA Active-Active (A-A) cluster can be set up using the GUI or CLI.

An A-A cluster supports interfaces in DHCP mode, but not interfaces in PPPoE mode. FGCP in Active-Active mode cannot load balance any sessions that traverse NPU VDOM links or regular VDOM links. If Active-Active session load balancing between VDOMs is required, use an external router to handle the inter-VDOM routing.

This example uses the following network topology:

To set up an HA A-A cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to *System > HA* and set the following options:

Mode	Active-Active
Device priority	128 or higher
Group name	Example_cluster
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.

The group ID can be configured in the CLI and must be the same in all HA members in order to form a cluster. The group ID can impact the definition of the virtual MAC addresses of interfaces. See [Determining VMAC addresses](#) for more details.

4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click **OK**.
The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.
6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.

To set up an HA A-A cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Change the hostname of the FortiGate:

```
config system global
    set hostname Example1_host
end
```

Changing the host name makes it easier to identify individual cluster units in the cluster operations.

4. Enable HA:

```
config system ha
    set mode a-a
    set group-name Example_cluster
    set hbdev ha1 10 ha2 20
end
```

5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster.

HA and load balancing

FGCP active-active HA uses a technique similar to unicast load balancing where the primary unit is associated with the cluster HA virtual MAC addresses and cluster IP addresses. The primary unit is the only cluster unit that receives packets sent to the cluster. The primary unit uses a load balancing schedule to distribute sessions to all cluster units

(including the primary unit). Subordinate unit interfaces retain their actual MAC addresses, and the primary unit communicates with the subordinate units using these MAC addresses. Packets exiting the subordinate units proceed directly to their destination and do not pass through the primary unit.

By default, active-active HA load balancing distributes proxy-based security profile processing to all cluster units. Proxy-based security profile processing is CPU and memory-intensive, so FGCP load balancing may result in higher throughput because resource-intensive processing is distributed among all cluster units.

The following proxy-based security profile processing is load balanced:

- Virus scanning
- Web filtering
- Email filtering
- Data leak prevention (DLP) of HTTP, FTP, IMAP, IMAPS, POP3, POP3S, SMTP, SMTPS, IM, and NNTP sessions accepted by firewall policies

Other features enabled in firewall policies such as endpoint security, traffic shaping, and authentication have no effect on active-active load balancing.

Active-active HA load balancing does not support software switches. See [Software switch on page 167](#).

The `load-balance-all` option can be enabled to have the primary unit load balance all TCP sessions. Load balancing TCP sessions increases overhead and may actually reduce performance. This setting is disabled by default.

To configure TCP session load balancing:

```
config system ha
    set load-balance-all {enable | disable}
end
```

NP6 and NP7 processors can offload and accelerate load balancing. See [NP session offloading in HA active-active configuration](#) for more information.

During active-active HA load balancing, the primary unit uses the configured load balancing schedule to determine which cluster unit will process a session. The primary unit stores the load balancing information for each load balanced session in the cluster load balancing session table. Using the information in this table, the primary unit can then forward all of the remaining packets in each session to the appropriate cluster unit. The load balancing session table is synchronized among all cluster units.

ICMP, multicast, and broadcast sessions are never load balanced and are always processed by the primary unit. The following sessions are only processed by the primary unit:

- IPS
- Application control
- Flow-based virus scanning
- Flow-based web filtering
- Flow-based DLP
- Flow-based email filtering
- VoIP

- IM
- P2P
- IPsec VPN
- SSL VPN
- HTTP multiplexing
- SSL offloading
- WAN optimization
- Explicit web proxy
- WCCP

In addition to load balancing, active-active HA provides the same session, device, and link failover protection as active-passive HA. If the primary unit fails, a subordinate unit becomes the primary unit and resumes operating the cluster. Active-active HA maintains as many load balanced sessions as possible after a failover by continuing to process the load balanced sessions that were being processed by the cluster units that are still operating.

Load balancing schedules

The load balancing schedule controls how the primary unit distributes packets to all cluster units.

To configure the load balancing schedule:

```
config system ha
    set schedule {none | hub | leastconnection | round-robin | weight-round-robin | random |
ip | ipport}
end
```

The following table outlines the load balancing schedule options.

Schedule	Description
None	Use no load balancing. Select this option when the cluster interfaces are connected to load balancing switches. The primary unit does not load balance traffic, and the subordinate units process incoming traffic that does not come from the primary unit. For all other load balancing schedules, all traffic is received first by the primary unit and then forwarded to the subordinate units. The subordinate units only receive and process packets sent from the primary unit.
Hub	Perform load balancing if the cluster interfaces are connected to a hub. Traffic is distributed to cluster units based on the source and destination IP of the packet.
Least connection	Distribute network traffic to the cluster unit currently processing the fewest connections.
Round robin	Distribute network traffic to the next available cluster unit.
Weighted round robin	This is similar to round robin, but weighted values are assigned to each cluster unit based on their capacity and how many connections they are currently processing.

Schedule	Description
	For example, the primary unit should have a lower weighted value because it handles scheduling and forwards traffic. Weighted round robin distributes traffic more evenly because units that are not processing traffic will be more likely to receive new connections than units that are very busy.
Random	Randomly distribute traffic to cluster units.
IP	Distribute traffic to cluster units based on the source and destination IP of the packet.
IP port	Distribute traffic to cluster units based on based on the source IP, source port, destination IP, and destination port of the packet.

Once a packet has been propagated to a subordinate unit, all packets are part of that same communication session are propagated to that same subordinate unit. Traffic is distributed according to the communication session, not just an individual packet.

Any subordinate unit that receives a forwarded packet processes it without applying load balancing. Note that subordinate units are still considered to be active because they perform routing, virus scanning, and other tasks on their share of the traffic. Active subordinate units share their session and link status information with all cluster units. Active subordinate units do not make load balancing decisions.

The primary unit is responsible for the load balancing process, and still performs other FortiGate tasks. Depending on the load balancing schedule used, the primary unit may assign itself a smaller share of the total load.

Active-active failover

If a subordinate unit fails, the primary unit redistributes the sessions that the subordinate was processing among the remaining active cluster members. If the primary unit fails, the subordinate units negotiate to select a new primary unit. The new primary unit continues to distribute packets among the remaining active cluster units.

Failover works in a similar way if the cluster consists of only two units. If the primary unit fails, the subordinate unit negotiates and becomes the new primary unit. If the subordinate unit fails, the primary unit processes all traffic. In both cases, the single remaining unit continues to function as a primary unit, maintaining the HA virtual MAC address for all of its interfaces.

HTTPS sessions and active-active load balancing

Active-active HA does not load balance HTTPS sessions that have SSL deep packet scanning enabled. This is to prevent HTTPS web filtering problems. The FortiGate identifies HTTPS sessions as all sessions received on the HTTPS TCP port. The default HTTPS port is 443. If the HTTPS port is changed in the SSL/SSH inspection profile applied in the firewall policy, FGCP stops load balancing all sessions that use the custom HTTPS port.

HTTPS traffic passing through a firewall policy that does not have UTM enabled, or has UTM enabled without deep inspection, can still be load balanced when `load-balance-all` is enabled.

HA virtual cluster setup

Virtual clustering is an extension of FGCP HA that provides failover protection between two instances of one or more VDOMs operating on two FortiGates that are in a virtual cluster. A standard virtual cluster consists of FortiGates that are operating in active-passive HA mode with multiple VDOMs enabled.

Active-passive virtual clustering uses VDOM partitioning to send traffic for some VDOMs to the primary FortiGate and traffic for other VDOMs to the secondary FortiGates. Traffic distribution between FortiGates can potentially improve throughput. If a failure occurs and only one FortiGate continues to operate, all traffic fails over to that FortiGate, similar to normal HA. If the failed FortiGates rejoin the cluster, the configured traffic distribution is restored.

In an active-passive virtual cluster of two FortiGates, the primary and secondary FortiGates share traffic processing according to the VDOM partitioning configuration. If you add a third or fourth FortiGate, the primary and first secondary FortiGate process all traffic and the other one or two FortiGates operate in standby mode. If the primary or first secondary FortiGate fails, one of the other FortiGates becomes the new primary or secondary FortiGate and begins processing traffic.

Separation of VDOM traffic

Virtual clustering creates a cluster between instances of each VDOM on the two FortiGates in the virtual cluster. All traffic to and from a given VDOM is sent to one of the FortiGates where it stays within its VDOM and is only processed by that VDOM. One FortiGate is the primary FortiGate for each VDOM and one FortiGate is the secondary FortiGate for each VDOM. The primary FortiGate processes all traffic for its VDOMs; the secondary FortiGate processes all traffic for its VDOMs.

Virtual clustering and heartbeat interfaces

The HA heartbeat provides the same HA services in a virtual clustering configuration as in a standard HA configuration. One set of HA heartbeat interfaces provides HA heartbeat services for all of the VDOMs in the cluster. You do not have to add a heartbeat interface for each VDOM.

Special considerations for NPU-based VLANs in a Virtual Cluster

In an FGCP cluster, the primary FortiGate uses virtual MAC addresses when forwarding traffic, and the secondary uses the physical MAC addresses when forwarding traffic. In a virtual cluster, packets are sent with the cluster's virtual MAC addresses. However, in the case of NPU offloading on a non-root VDOM, traffic that leaves an NPU-based VLAN will use the physical MAC address of its parent interface rather than the virtual MAC address. If this behavior is not desired, disable *auto-asic-offload* in the firewall policy where the VLAN interface is used.

Example

This example shows a virtual cluster configuration consisting of two FortiGates. The virtual cluster has two VDOMs, Root and End_vdm.

The root VDOM can only be associated with virtual cluster 1.

The VDOM that is assigned as the management VDOM can also only be associated with virtual cluster 1.

To set up an HA virtual cluster using the GUI:

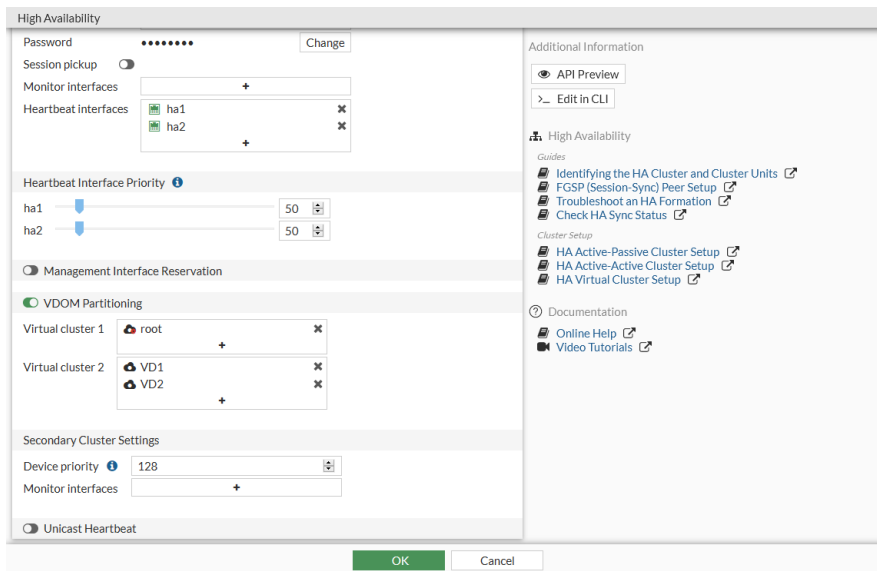

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to *System > HA* and set the following options:

Mode	Active-Passive
Device priority	128 or higher
Group name	Example_cluster
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.

4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click *OK*.
The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.
6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.
7. Go to *System > Settings* and enable *Virtual Domains*.
8. Click *Apply*. You will be logged out of the FortiGate.
9. Log back into the FortiGate, ensure that you are in the global VDOM, and go to *System > VDOM*.

10. Create two new VDOMs, such as VD1 and VD2:
 - a. Click *Create New*. The *New Virtual Domain* page opens.
 - b. Enter a name for the VDOM in the *Virtual Domain* field, then click *OK* to create the VDOM.
 - c. Repeat these steps to create a second new VDOM.
11. Implement a virtual cluster by moving the new VDOMs to *Virtual cluster 2*:
 - a. Go to *System > HA*.
 - b. Enable *VDOM Partitioning*.
 - c. Click on the *Virtual cluster 2* field and select the new VDOMs.

- d. Click *OK*.

To set up an HA virtual cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Set up a regular A-P cluster. See [HA active-passive cluster setup on page 2131](#).
3. Enable VDOMs:

```
config system global
  set vdom-mode multi-vdom
end
```

You will be logged out of the FortiGate.

4. Create two VDOMs:

```
config vdom
  edit VD1
  next
  edit VD2
  next
end
```

5. Reconfigure the HA settings to be a virtual cluster:

```
config global
  config system ha
    set vcluster2 enable
```

```

config secondary-vcluster
    set vdom "VD1" "VD2"
end
end
end
end
    
```

Check HA synchronization status

The HA synchronization status can be viewed in the GUI through either a widget on the *Dashboard* or on the *System > HA* page. It can also be confirmed through the CLI. When a cluster is out of synchronization, administrators should correct the issue as soon as possible as it affects the configuration integrity and can cause issues to occur.

When units are out of synchronization in an HA cluster, the GUI will compare the HA checksums and display the tables that caused HA to be out of synchronization. This can be visualized on the HA monitor page and in the HA status widget.

HA synchronization status in the GUI

Following HA setup, the *HA Status* widget can be added to the *Dashboard* that shows the HA synchronization statuses of the members.

A green checkmark is shown next to each member that is in synchronization.

A member that is out of synchronization is highlighted in red. Hover the cursor over the unsynchronized device to see the tables that are out of synchronization and the checksum values.

You can also go to *System > HA* to see the synchronization statuses of the members. A member that is out of synchronization will have a red icon next to its name. Hover the cursor over the unsynchronized device to see the tables that are out of synchronization and the checksum values.

Synchronized:

Status	Priority	Hostname	Serial No.	Role	Uptime	Sessions	Throughput
Synchronized	128	FGDocs-P	FGVMEV...	Primary	48m 40s	19	48.00 kbps
Synchronized	128	FGDocs-S	FGVMEV...	Secondary	48m 39s	10	35.00 kbps

Unsynchronized:

HA synchronization status in the CLI

In the CLI, run the `get system ha status` command to see if the cluster is in synchronization. The synchronization status is reported under *Configuration Status*.

When both members are in synchronization:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: HA A-P
Group: 0
Debug: 0
Cluster Uptime: 0 days 0:52:39
Cluster state change time: 2021-04-29 13:17:03
Primary selected using:
  <2021/04/29 13:17:03> FGVMEV0000000002 is selected as the primary because its uptime is
  larger than peer member FGVMEV7000000005.
  <2021/04/29 12:37:17> FGVMEV0000000002 is selected as the primary because it's the only
  member in the cluster.

```

Out-of-band management with reserved management interfaces

As part of an HA configuration, you can reserve up to four management interfaces to provide direct management access to all cluster units. For each reserved management interface, you can configure a different IP address, administrative access, and other interface settings, for each cluster unit. By connecting these interfaces to your network, you can separately manage each cluster unit from different IP addresses.

- Reserved management interfaces provide direct management access to each cluster unit, and give each cluster unit a different identity on your network. This simplifies using external services, such as SNMP, to monitor separate cluster units.
- Reserved management interfaces are not assigned HA virtual MAC addresses. They retain the permanent hardware address of the physical interface, unless you manually change it using the `config system interface` command.
- Reserved management interfaces and their IP addresses should not be used for managing a cluster using FortiManager. To manage a FortiGate HA cluster with FortiManager, use the IP address of one of the cluster unit interfaces.
- Configuration changes to a reserved management interface are not synchronized to other cluster units. Other configuration changes are automatically synchronized to all cluster units.

You can configure an in-band management interface for a cluster unit. See [In-band management on page 2150](#) for information. In-band management does not reserve the interface exclusively for HA management.

Management interface

Enable HTTPS or HTTP administrative access on the reserved management interfaces to connect to the GUI of each cluster unit. On secondary units, the GUI has the same features as the primary unit, except for unit specific information, for example:

- The System Information widget on the Status dashboard shows the secondary unit's serial number.
- In the cluster members list at `System > HA`, you can change the HA configuration of the unit that you are logged into. You can only change the host name and device priority of the primary and other secondary units.
- The system events logs show logs for the device that you are logged into. Use the HA device drop down to view the log messages for other cluster units, including the primary unit.

Enable SSH administrative access on the reserved management interfaces to connect to the CLI of each cluster unit. The CLI prompt includes the host of the cluster unit that you are connected to. Use the `execute ha manage` command to connect to other cluster unit CLIs.

Enable SNMP administrative access on a reserved management interface to use SNMP to monitor each cluster unit using the interface's IP address. Direct management of cluster members must also be enabled, see [Configuration examples on page 2145](#).

Reserved management interfaces are available in both NAT and transparent mode, and when the cluster is operating with multiple VDOMs.

FortiCloud, FortiSandbox, and other management services

By default, management services such as FortiCloud, FortiSandbox, SNMP, remote logging, and remote authentication, use a cluster interface. This means that communication from each cluster unit will come from a cluster interface of the

primary unit, and not from the individual cluster unit's interface.

You can configure HA reserved management interfaces to be used for communication with management services by enabling the `ha-direct` option. This separates management traffic for each cluster unit, and allows each unit to be individually managed. This is especially useful when cluster units are in different physical locations.

The following management features will then use the HA reserved management interface:

- Remote logging, including syslog, FortiAnalyzer, and FortiCloud
- Remote authentication and certificate verification
- Communication with FortiSandbox
- Netflow and sflow, see [Routing NetFlow data over the HA management interface on page 2165](#) for information.
- SNMP queries and traps

Syntax for HA reserved management interfaces is as follows:

```
config system ha
  set ha-direct enable
  set ha-mgmt-status enable
  config ha-mgmt-interfaces
    edit 1
      set interface <interface>
      set dst <destination IP>
      set gateway <IPv4 gateway>
      set gateway6 <IPv6 gateway>
    next
  end
end
```

The `ha-direct` option is a pre-requisite for allowing communication on each HA reserved management interface for various management services listed above. Once enabled, all `source-ip` settings will be unset from log related, netflow and sflow management services. SNMP requires `ha-direct` to be configured under SNMP settings only. See below for more configuration options.

Configuration examples

The configuration examples below will use the following topology:

Two FortiGate units are already operating in a cluster. On each unit, port8 is connected to the internal network through a switch and configured as an out-of-band reserved management interface.

Configuration changes to the reserved management interface are not synchronized to other cluster units.

Administrative access and default route for HA management interface

To configure the primary unit's reserved management interface, configure an IP address and management access on port8. Then, configure the necessary HA settings to enable the HA reserved management interface and its route. To configure the secondary unit's reserved management interface, access the unit's CLI through the primary unit, and configure an IP address, management access on port8, and the necessary HA settings. Configuration changes to the reserved management interface are not synchronized to other cluster units.

To configure the primary unit reserved management interface to allow HTTPS, SSH, and ICMP access:

1. From a computer on the internal network, connect to the CLI at 10.11.101.100 on port2.
2. Change the port8 IP address and management access:

```
config system interface
  edit port8
    set ip 10.11.101.101/24
    set allowaccess https ping ssh
  next
end
```

3. Configure the HA settings for the HA reserved management interface by defining a default route to route to the gateway 10.11.101.2:

```
config system ha
  set ha-mgmt-status enable
  config ha-mgmt-interfaces
    edit 1
      set interface port8
      set gateway 10.11.101.2
    next
  end
end
```

You can now log into the primary unit's GUI by browsing to <https://10.11.101.101>. You can also log into the primary unit's CLI by using an SSH client to connect to 10.11.101.101.

To configure secondary unit reserved management interfaces to allow HTTPS, SSH, and ICMP access:

1. From a computer on the internal network, connect to the primary unit's CLI.
2. Connect to the secondary unit with the following command:

```
execute ha manage <unit id> <username> <password>
```

3. Change the port8 IP address and management access:

```
config system interface
  edit port8
```

```
        set ip 10.11.101.102/24
        set allowaccess https ping ssh
    next
end
exit
```

4. Configure the HA settings for the HA reserved management interface by defining a default route to route to the gateway 10.11.101.2:

```
config system ha
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface port8
            set gateway 10.11.101.2
        next
    end
end
```

You can now log into the secondary unit's GUI by browsing to <https://10.11.101.102>. You can also log into the secondary unit's CLI by using an SSH client to connect to 10.11.101.102.

SNMP monitoring

The SNMP server can get status information from the cluster members. To use the reserved management interfaces, you must add at least one HA direct management host to an SNMP community. If the SNMP configuration includes SNMP users with user names and passwords, HA direct management must be enabled for the users.

To configure the cluster for SNMP management using the reserved management interfaces in the CLI:

1. Allow SNMP on port8 on both primary and secondary units:

```
config system interface
  edit port8
    append allowaccess snmp
  next
end
```

2. Add an SNMP community with a host for the reserved management interface of each cluster member. The host includes the IP address of the SNMP server.

```
config system snmp community
  edit 1
    set name "Community"
    config hosts
      edit 1
        set ip 10.11.101.20 255.255.255.255
        set ha-direct enable
      next
    end
  next
end
```

Enabling `ha-direct` in a non-HA environment will make SNMP unusable.

3. Add an SNMP user for the reserved management interface:

```
config system snmp user
  edit "1"
    set notify-hosts 10.11.101.20
    set ha-direct enable
  next
end
```

The SNMP configuration is synchronized to all cluster units.

To get CPU, memory, and network usage information from the SNMP manager for each cluster unit using the reserved management IP addresses:

1. Connect to the SNMP manager CLI.
2. Get resource usage information for the primary unit using the MIB fields:

```
snmpget -v2c -c Community 10.11.101.101 fgHaStatsCpuUsage
snmpget -v2c -c Community 10.11.101.101 fgHaStatsMemUsage
snmpget -v2c -c Community 10.11.101.101 fgHaStatsNetUsage
```

3. Get resource usage information for the primary unit using the OIDs:

```
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.3.1
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.4.1
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.5.1
```

4. Get resource usage information for the secondary unit using the MIB fields:

```
snmpget -v2c -c Community 10.11.101.102 fgHaStatsCpuUsage
snmpget -v2c -c Community 10.11.101.102 fgHaStatsMemUsage
snmpget -v2c -c Community 10.11.101.102 fgHaStatsNetUsage
```

5. Get resource usage information for the primary unit using the OIDs:

```
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.3.1
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.4.1
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.5.1
```

Firewall local-in policies for the reserved management interface

Enabling `ha-mgmt-intf-only` applies the local-in policy only to the VDOM that contains the reserved management interface. The incoming interface is set to match any interface in the VDOM.

To add local-in policies for the reserved management interface:

```
config firewall local-in-policy
  edit 0
    set ha-mgmt-intf-only enable
    set intf any
    set srcaddr internal-net
    set dstaddr mgmt-int
    set action accept
    set service HTTPS
    set schedule weekdays
  next
end
```

NTP over reserved management interfaces

When NTP is enabled in an HA cluster, the primary unit will always be the unit to contact the NTP server and synchronize system time to the secondary units over the HA heartbeat interface. However, in the event that the primary should contact the NTP server over the HA reserved management interface, then the `ha-direct` option should be enabled under the `config system ha` settings.

```
config system interface
  edit port5
    set ip 172.16.79.46 255.255.255.0
  next
end

config system ha
  set group-name FGT-HA
  set mode a-p
  set ha-mgmt-status enable
  config ha-mgmt-interfaces
    edit 1
      set interface port5
      set gateway 172.16.79.1
    next
```

```

end
  set ha-direct enable
end

config system ntp
  set ntpsync enable
  set syncinterval 5
end

```

In-band management

In-band management IP addresses are an alternative to reserved HA management interfaces, and do not require reserving an interface exclusively for management access. They can be added to multiple interfaces on each cluster unit.

The in-band management IP address is accessible from the network that the cluster interface is connected to. It should be in the same subnet as the interface that you are adding it to. It cannot be in the same subnet as other interface IP addresses.

In-band management interfaces support ping, HTTP, HTTPS, and SNMP administrative access options.

Primary and secondary units can respond on the management IP to traffic from different networks by using the routing table. The secondary unit uses the kernel routing table synchronized from the primary to route the traffic.

In-band management IP address configuration is not synchronized to other cluster units.

To add an in-band management IP address to port23 with HTTPS, SSH, and SNMP access:

```

config system interface
  edit port23
    set management-ip 172.25.12.5/24
    set allowaccess https ssh snmp
  next
end

```

Upgrading FortiGates in an HA cluster

You can upgrade the firmware on an HA cluster in the same way as on a standalone FortiGate. During a firmware upgrade, the cluster upgrades the primary unit and all of the subordinate units to the new firmware image.

Before upgrading a cluster, back up your configuration ([Configuration backups and reset on page 2355](#)), schedule a maintenance window, and make sure that you are using a supported upgrade path (<https://docs.fortinet.com/upgrade-tool>).

Uninterrupted upgrade

An uninterrupted upgrade occurs without interrupting communication in the physical or virtual cluster.

To upgrade the cluster firmware without interrupting communication, use the following steps. These steps are transparent to the user and the network, and might result in the cluster selecting a new primary unit.

1. The administrator uploads a new firmware image using the GUI or CLI. See [Firmware on page 2061](#) for details.
2. The firmware is upgraded on all of the subordinate units.
3. A new primary unit is selected from the upgraded subordinates.
4. The firmware is upgraded on the former primary unit.
5. Primary unit selection occurs, according to the standard primary unit selection process.

If all of the subordinate units crash or otherwise stop responding during the upgrade process, the primary unit will continue to operate normally, and will not be upgraded until at least one subordinate rejoins the cluster.

Interrupted upgrade

An interrupted upgrade upgrades all cluster members at the same time. This takes less time than an uninterrupted upgrade, but it interrupts communication in the cluster. Interrupted upgrade is disabled by default.

To enable interrupted upgrade:

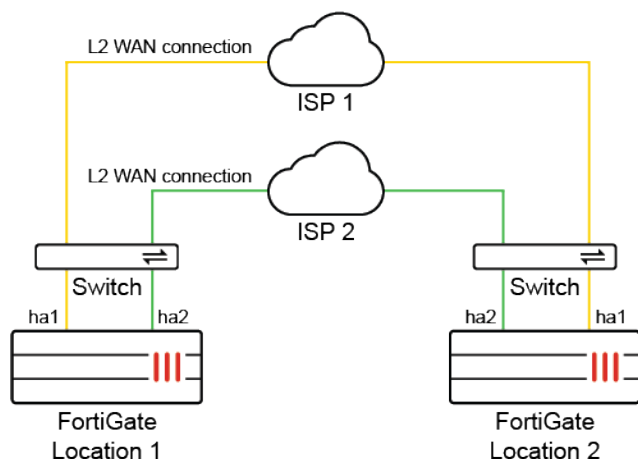

```
config system ha
    set uninterruptible-upgrade disable
end
```

Distributed HA clusters

FGCP HA supports cluster units installed in different physical locations to achieve geo-redundancy. This may be desirable in large enterprises that deploy multiple data centers and network infrastructure to prevent interruptions caused by downtime in one location or region. Distributed clusters (or geographically distributed clusters) can have cluster units in different rooms in the same building, different buildings in the same location, or different geographical regions (cities, countries, or continents). When disruption is detected in one location, traffic can be routed to another location and failed over to the HA unit in the same cluster to prevent major downtime.

Just like any FGCP HA cluster, distributed clusters require heartbeat communication between cluster units over a Layer 2 network. In a distributed cluster, this heartbeat communication can take place over a dedicated lease-line, MPLS, or other L2 WAN solutions. Most Data Center Interconnect (DCI) or MPLS-based solutions that support Layer 2 extensions between the remote data centers should also support HA heartbeat communication between the FortiGates in the distributed locations.

For more information about FGCP HA heartbeats, see [HA heartbeat interface on page 2122](#).

Because of the possible distance between the cluster members, it may take longer for heartbeat packets to be transmitted between cluster units. If the time it takes and the possible latency and packet losses cause the configured heartbeat lost threshold to be exceeded, then a split brain scenario can occur (see [Split brain scenario](#)).

To avoid this, you can increase the heartbeat interval (the time between the sending of heartbeat packets) so that the cluster expects extra time between heartbeat packets. A general rule is to configure the failover time to be longer than the maximum latency. You could also increase the `hb-lost-threshold`, which is the number of lost heartbeats to signal a failure, in order to tolerate losing more heartbeat packets if the network connection is less reliable.

To configure the heartbeat interval and lost threshold:

```
config system ha
    set hb-interval <integer>
    set hb-lost-threshold <integer>
end
```

A longer interval and threshold can lead to slower failover time, and a shorter interval and threshold may lead to false positives. Therefore, these settings should be fine-tuned based on individual network scenarios. Additional options include:

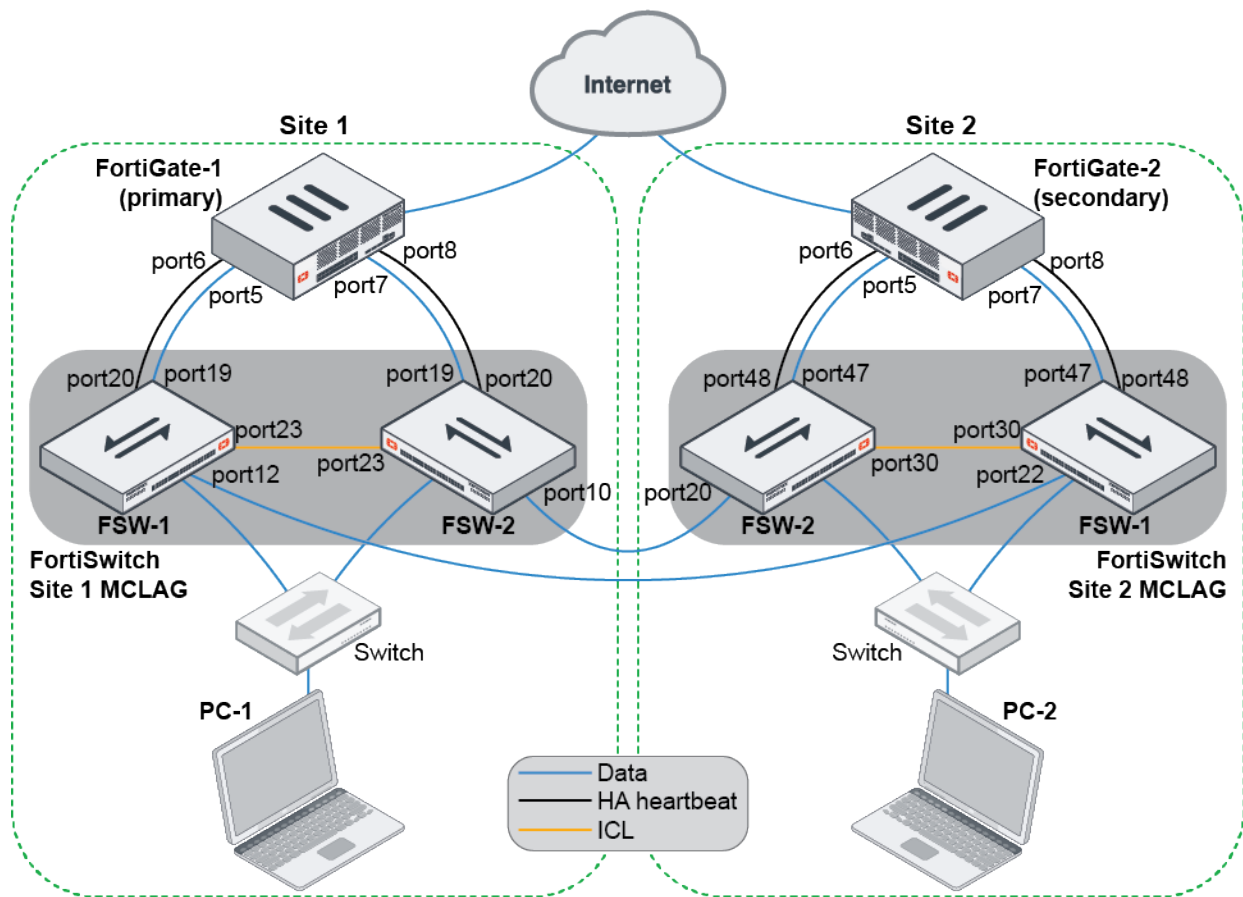

- Using multiple heartbeat interfaces and different link paths for heartbeat packets to optimize HA heartbeat communication.
- Configuring QoS on the links used for HA heartbeat traffic to make sure heartbeat communication has the highest priority.

For information about changing the heartbeat interval and other heartbeat related settings, see [Modifying heartbeat timing](#).

HA between remote sites over managed FortiSwitches

In a multi-site FortiGate HA topology that uses managed FortiSwitches in a multi-chassis link aggregation group (MCLAG) to connect between sites, HA heartbeat signals can be sent through the switch layer of the FortiSwitches, instead of through back-to-back links between the heartbeat interfaces. This means that two fiber connections can be used, instead of four (two back-to-back heartbeat fiber connections and two connections for the FortiSwitches). The FortiSwitches can be different models, but must all support MCLAG and be running version 6.4.2 or later.

This example shows how to configure heartbeat VLANs to assign to the access ports that the heartbeat interfaces connect to, passing over the trunk between the FortiSwitches on the two sites.

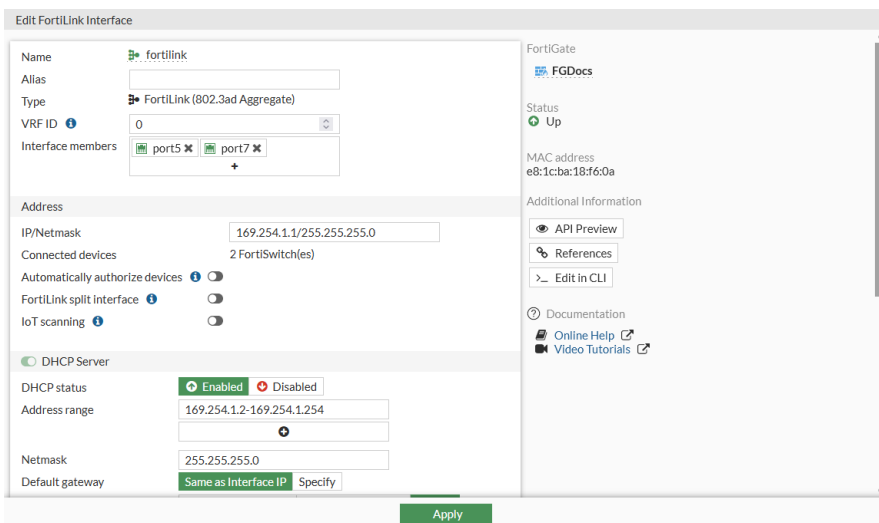

FortiGate HA is with two FortiGates in separate locations and the switch layer connection between the FortiSwitches is used for the heartbeat signal.

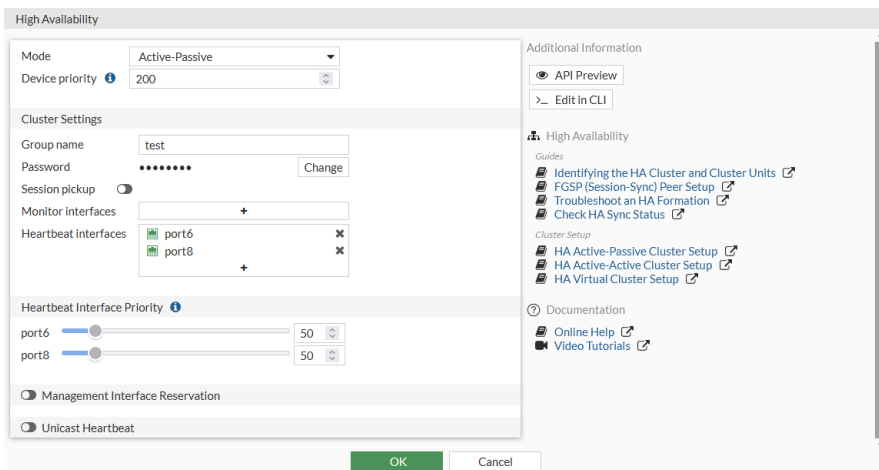

To configure the example:

1. Disconnect the physical connections between Site 1 and Site 2:
 - Disconnect the cable on Site 1 FWS-1 port 12.
 - Disconnect the cable on Site 1 FWS-2 port 10.
2. Configure Site 1:

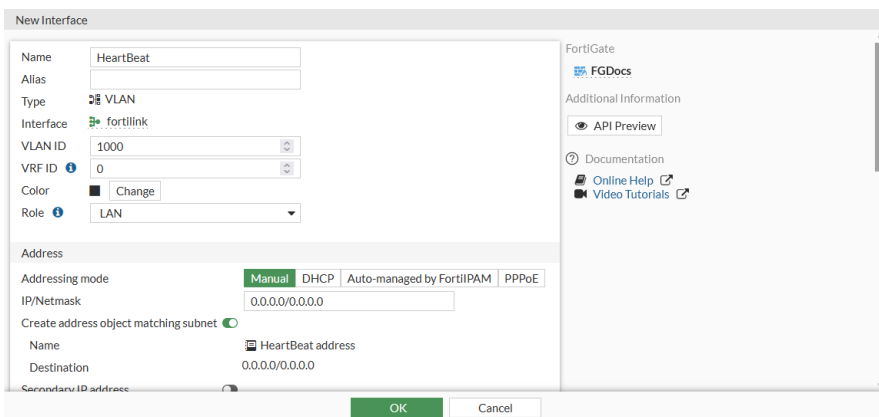

- a. On the FortiGate, go to *WiFi & Switch Controller > FortiLink Interface* and configure FortiLink:

- b. Go to *System > HA* and configure HA:
- i. Set the heartbeat ports to the ports that are connected to FortiSwitch.
 - ii. Adjust the priority and enable override so that this FortiGate becomes the primary.

- c. Go to *WiFi & Switch Controller > FortiSwitch VLANs* and create switch VLANs that are dedicated to each FortiGate HA heartbeat interface between the two FortiGates: Heartbeat VLAN 1000 and Heartbeat VLAN 1100.

- d. Assign the native VLAN of the switch ports that are connected to the heartbeat ports to the created VLAN. Each HA heartbeat should be in its own VLAN.
- Go to *WiFi & Switch Controller > FortiSwitch Ports*.
 - In the *Native VLAN* column for the heartbeat port that is connected to FSW-1, click the edit icon and select the *Heartbeat VLAN*.

Port	Trunk	Access Mode	Enabled Features	Native VLAN	Allowed VLANs	PoE	Device Information
S248DN3X17000000							
port10		Normal	Edge Port Spanning Tree Protocol	default	quarantine		
port11		Normal	Edge Port Spanning Tree Protocol	default	quarantine		
port12		Normal	Edge Port Spanning Tree Protocol	FS0000000000000000			
port13		Normal	Edge Port Spanning Tree Protocol	default	quarantine		
port14		Normal	Edge Port Spanning Tree Protocol	default	quarantine		
port15		Normal	Edge Port Spanning Tree Protocol	default	quarantine		
port16		Normal	Edge Port Spanning Tree Protocol	default	quarantine		
port17		Normal	Edge Port Spanning Tree Protocol	S248EPTF18000000			
port18		Normal	Edge Port Spanning Tree Protocol	default	quarantine		
port19		Normal	Edge Port Spanning Tree Protocol	FGT3HD9999000000			
port20		Normal	Edge Port Spanning Tree Protocol	Heartbeat	quarantine		

- In the *Native VLAN* column for the heartbeat port that is connected to FSW-2, click the edit icon and select the *Heartbeat2 VLAN*.
- e. On each FortiSwitch, enable MCLAG-ICL on the trunk port:

```
config switch trunk
  edit D243Z17000032-0
    set mclag-icl enable
  next
end
```

- Configure Site 2 the same as Site 1, except set the HA priority so that the FortiGate becomes the secondary.
- Disconnect the physical connections for FortiGate HA and FortiLink interfaces on Site 2:
 - Disconnect the cable on Site 2 FSW-1 ports 47 and 48.
 - Disconnect the cable on Site 2 FSW-2 ports 47 and 48.
- Connect cables between the FortiSwitch MCLAG in Site 1 and Site 2:
 - Connect a cable from Site 1 FSW-1 port 12 to Site 2 FSW-1 port 22.
 - Connect a cable from Site 1 FSW-2 port 10 to Site 2 FSW-2 port 20.
- On all of the FortiSwitches, configure the `auto-isl-port-group`. The group must match on both sides.

- a. Site 1 FSW-1:

Set `members` to the port that is connected to Site 2 FSW-1:

```
config switch auto-isl-port-group
  edit 1
    set members port12
  next
end
```

- b. Site 1 FSW-2:

Set `members` to the port that is connected to Site 1 FSW-1:

```

config switch auto-isl-port-group
  edit 1
    set members port22
  next
end

```

c. Site 2 FSW-1:

Set `members` to the port that is connected to Site 2 FSW-2:

```

config switch auto-isl-port-group
  edit 1
    set members port10
  next
end

```

d. Site 2 FSW-2:

Set `members` to the port that is connected to Site 1 FSW-2:

```

config switch auto-isl-port-group
  edit 1
    set members port20
  next
end

```

7. Connect the FortiGate HA and FortiLink interface connections on Site 2.

8. Configure a firewall policy and route for traffic so that the client can reach the internet.

9. Wait for HA to finish synchronizing and for all of the FortiSwitches to come online, then on FortiGate-1, go to *WiFi & Switch Controller > Managed FortiSwitches* and select the Topology view from the drop-down on the right.

The page should look similar to the following:

To test the configuration to confirm what happens when there is a failover:

1. On both PC-1 and PC-2, access the internet and monitor traffic. The traffic should be going through the primary FortiGate.
2. Perform a continuous ping to an outside IP address, then reboot any one of the FortiSwitches. Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.
3. Perform a continuous ping to an outside IP address, then force an HA failover (see [Force HA failover for testing and demonstrations on page 2167](#)). Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.
4. After an HA failover, on the new primary FortiGate, go to *WiFi & Switch Controller > Managed FortiSwitch*. The switch layer tiering will be changed so that the directly connected FortiSwitches are at the top of the topology.

HA using a hardware switch to replace a physical switch

An HA cluster can be deployed without physical switches connecting the traffic interfaces on the primary and secondary members. This setup may be desirable in certain environments where the network infrastructure must be kept to a bare minimum.

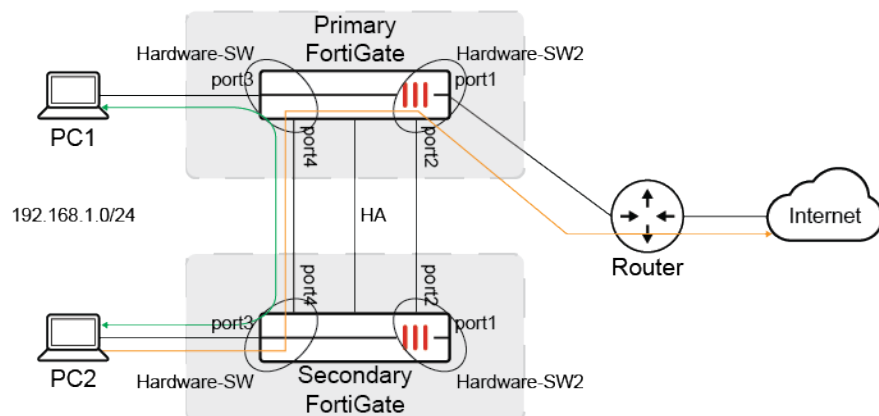

Generally, using a hardware switch to replace a physical switch is not recommended, as it offers no redundancy or interface monitoring.

- If one FortiGate loses power, all of the clients connected to that FortiGate device cannot go to another device until that FortiGate recovers.
- A hardware switch cannot be used as a monitor interface in HA. Any incoming or outgoing link failures on hardware member interfaces will not trigger failover; this can affect traffic.

Therefore, assess your environment thoroughly before applying this solution.

Examples

The examples use the following topology:

Traffic between hardware switches

When using Hardware switch in HA environment, a client device connected to the hardware switch on the primary FortiGate can communicate with client devices connected to the hardware switch on secondary FortiGates as long as

there is a direct connection between the two switches.

To configure the FortiGate devices:

1. Connect the LAN side of the FortiGate cluster as shown in the topology diagram.
2. On each FortiGate, configure HA:

```
config system ha
  set mode a-a
  set group-name Example_cluster
  set hbdev ha1 10 ha2 20
end
```

3. On the primary FortiGate, configure the hardware switch:

```
config system virtual-switch
  edit Hardware-SW
    set physical-switch sw0
    config port
      edit port3
      next
      edit port4
      next
    end
  next
end
```

4. On each FortiGate, configure the IP addresses on the hardware switches:

```
config system interface
  edit Hardware-SW
    set ip 192.168.10.1 255.255.255.0
    set allowaccess ping ssh http https
  next
end
```

After configuring the hardware switches, PC1 and PC2 can now communicate with each other.

Traffic passes through FortiGate

If client device needs to send traffic through the FortiGate, additional firewall configuration on the FortiGate is required.

All traffic from the hardware switches on either the primary or secondary FortiGate reaches the primary FortiGate first. The traffic is then directed according to the HA mode and firewall configuration.

On the WAN side, in order for both HA members to reach the upstream router without connecting to a switch, a hardware switch must be configured with a direct connection between the cluster members.

To configure the FortiGate devices:

1. Connect the WAN side of the FortiGate cluster as shown in the topology diagram.
2. On the primary FortiGate, configure another hardware switch for the WAN connection:

```
config system virtual-switch
  edit Hardware-SW2
    set physical-switch sw0
  config port
```

```
        edit port1
        next
        edit port2
        next
    end
next
end
```

3. On each FortiGate, configure the IP addresses on the hardware switch:

```
config system interface
    edit Hardware-SW2
        set ip 172.16.200.1 255.255.255.0
        set allowaccess ping ssh http https
    next
end
```

4. On each FortiGate, configure a firewall policy:

```
config firewall policy
    edit 1
        set srcintf Hardware-SW
        set dstintf Hardware-SW2
        set srcaddr all
        set dstaddr all
        set service ALL
        set action accept
        set schedule always
        set nat enable
    next
end
```

5. On each FortiGate, configure a static route:

```
config router static
    edit 1
        set device Hardware-SW2
        set gateway 172.16.200.254
    next
end
```

Traffic from PC1 and PC2 can now reach destinations outside of the FortiGate cluster.

VDOM exceptions

VDOM exceptions are settings that can be selected for specific VDOMs or all VDOMs that are not synchronized to other HA members. This can be required when cluster members are not in the same physical location, subnets, or availability zones in a cloud environment.

Some examples of possible use cases include:

- You use different source IP addresses for FortiAnalyzer logging from each cluster member. See [Override FortiAnalyzer and syslog server settings on page 2161](#) for more information.
- You need to keep management interfaces that have specific VIPs or local subnets that cannot transfer from being synchronized.
- In a unicast HA cluster in the cloud, you use NAT with different IP pools in different subnets, so IP pools must be exempt.

- In a unicast HA cluster in the cloud, when HA members have different interface IPs, the local gateway (`local-gw`) used to define the local end of the VPN tunnel may need to be specified individually for IPsec tunnel failover to occur.

When a VDOM exception is configured, the object will not be synchronized between the primary and secondary devices when the HA forms. Different options can be configured for every object.

When VDOM mode is disabled, the configured object is excluded for the entire device. To define a scope, VDOM mode must be enabled and the object must be configurable in a VDOM.

VDOM exceptions are synchronized to other HA cluster members.

To configure VDOM exceptions:

```
config global
  config system vdom-exception
    edit 1
      set object <object name>
      set scope {all* | inclusive | exclusive}
      set vdom <vdom name>
    next
  end
end
```

object	The name of the configuration object that can be configured independently for some or all of the VDOMs. See Objects on page 2160 for a list of available settings and resources.
scope	Determine if the specified object is configured independently for all VDOMs or a subset of VDOMs. <ul style="list-style-type: none"> • <code>all</code>: Configure the object independently on all VDOMs. • <code>inclusive</code>: Configure the object independently only on the specified VDOMs. • <code>exclusive</code>: Configure the object independently on all of the VDOMs that are not specified.
vdom	The names of the VDOMs that are included or excluded.

Objects

The following settings and resources can be exempt from synchronization in an HA cluster:

log.fortianalyzer.setting	user.radius
log.fortianalyzer.override-setting	system.interface*
log.fortianalyzer2.setting	vpn.ipsec.phase1-interface*
log.fortianalyzer2.override-setting	vpn.ipsec.phase2-interface*
log.fortianalyzer3.setting	router.bgp*
log.fortianalyzer3.override-setting	router.route-map*
log.fortianalyzer-cloud.setting	router.prefix-list*
log.fortianalyzer-cloud.override-setting	firewall.ippool*
log.syslogd.setting	firewall.ippool6*

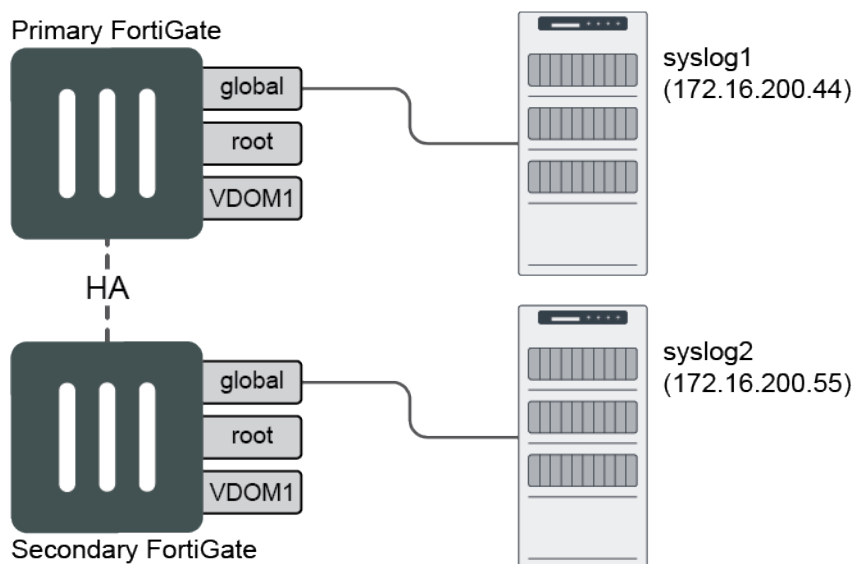

log.syslogd.override-setting	router.static*
log.syslogd2.setting	router.static6*
log.syslogd2.override-setting	firewall.vip*
log.syslogd3.setting	firewall.vip6*
log.syslogd3.override-setting	system.sdwan*
log.syslogd4.setting	system.saml*
log.syslogd4.override-setting	router.policy*
system.central-management	router.policy6*
system.csf	

* This setting can only be configured on cloud VMs.

Override FortiAnalyzer and syslog server settings

In an HA cluster, secondary devices can be configured to use different FortiAnalyzer devices and syslog servers than the primary device. VDOMs can also override global syslog server settings.

Configure a different syslog server on a secondary HA device

To configure the primary HA device:

1. Configure a global syslog server:

```
config global
  config log syslog setting
    set status enable
    set server 172.16.200.44
    set facility local6
    set format default
  end
end
```

2. Set up a VDOM exception to enable setting the global syslog server on the secondary HA device:

```
config global
  config system vdom-exception
    edit 1
      set object log.syslogd.setting
    next
  end
end
```

To configure the secondary HA device:

1. Configure a global syslog server:

```
config global
  config log syslogd setting
    set status enable
    set server 172.16.200.55
    set facility local5
  end
end
```

2. After the primary and secondary device synchronize, generate logs on the secondary device.

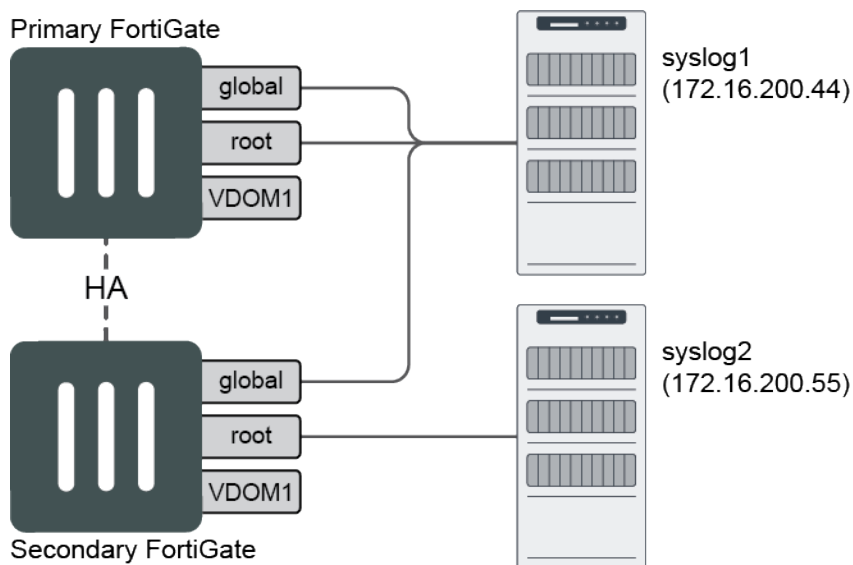

To confirm that logs are been sent to the syslog server configured on the secondary device:

1. On the primary device, retrieve the following packet capture from the secondary device's syslog server:

```
# diagnose sniffer packet any "host 172.16.200.55" 6
interfaces=[any]
filters=[host 172.16.200.55]

266.859494 port2 out 172.16.200.2.7434 -> 172.16.200.55.514: udp 278
0x0000  0000 0000 0000 0009 0f09 0004 0800 4500      .....E.

```

Configure a different syslog server in the root VDOM on a secondary HA device

To configure the primary HA device:

1. Configure a global syslog server:

```
config global
    config log syslog setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

2. Set up a VDOM exception to enable `syslog-override` in the secondary HA device root VDOM:

```
config global
    config system vdom-exception
        edit 1
            set object log.syslogd.override-setting
            set scope inclusive
            set vdom root
        next
    end
end
```

3. In the VDOM, enable `syslog-override` in the log settings, and set up the override syslog server:

```
config root
    config log setting
        set syslog-override enable
    end
    config log syslog override-setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

```

    end
end

```

After `syslog-override` is enabled, an override syslog server must be configured, as logs will not be sent to the global syslog server.

To configure the secondary HA device:

1. Configure an override syslog server in the root VDOM:

```

config root
    config log syslogd override-setting
        set status enable
        set server 172.16.200.55
        set facility local5
        set format default
    end
end

```

2. After the primary and secondary device synchronize, generate logs in the root VDOM on the secondary device.

To confirm that logs are been sent to the syslog server configured for the root VDOM on the secondary device:

1. On the primary device, retrieve the following packet capture from the syslog server configured in the root VDOM on the secondary device:

```

# diagnose sniffer packet any "host 172.16.200.55" 6
interfaces=[any]
filters=[host 172.16.200.55]

156.759696 port2 out 172.16.200.2.1165 -> 172.16.200.55.514: udp 277

```

Routing NetFlow data over the HA management interface

In an HA environment, the `ha-direct` option allows data from services such as syslog, FortiAnalyzer, SNMP, and NetFlow to be routed over the outgoing interface.

The following example shows how NetFlow data can be routed over the HA management interface `mgmt1`.

To route NetFlow data over the HA management interface:

1. On the primary unit (FortiGate A), configure the HA and `mgmt1` interface settings:

```
(global) # config system ha
  set group-name "test-ha"
  set mode a-p
  set password *****
  set hbdev "port6" 50
  set hb-interval 4
  set hb-lost-threshold 10
  set session-pickup enable
  set ha-mgmt-status enable
  config ha-mgmt-interfaces
    edit 1
      set interface "mgmt1"
    next
  end
  set override enable
  set priority 200
  set ha-direct enable
end

(global) # config system interface
  edit "mgmt1"
    set ip 10.6.30.111 255.255.255.0
    set allowaccess ping https ssh http telnet fgfm
    set type physical
    set dedicated-to management
    set role lan
    set snmp-index 1
  next
end
```

2. On the secondary unit (FortiGate B), configure the HA and `mgmt1` interface settings:

```
(global) # config system ha
  set group-name "test-ha"
  set mode a-p
  set password *****
  set hbdev "port6" 50
  set hb-interval 4
  set hb-lost-threshold 10
  set session-pickup enable
  set ha-mgmt-status enable
  config ha-mgmt-interfaces
    edit 1
      set interface "mgmt1"
    next
  end
```

```
    set override enable
    set priority 100
    set ha-direct enable
end

(global) # config system interface
edit "mgmt1"
    set ip 10.6.30.112 255.255.255.0
    set allowaccess ping https ssh http telnet fgfm
    set type physical
    set dedicated-to management
    set role lan
    set snmp-index 1
next
end
```

3. On the primary unit (FortiGate A), configure the NetFlow setting:

```
(global) # config system netflow
    set collector-ip 10.6.30.59
end
```

4. Verify that NetFlow uses the mgmt1 IP:

```
(global) # diagnose test application sflowd 3
```

5. Verify that the NetFlow packets are being sent by the mgmt1 IP:

```
(vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
interfaces=[any]
filters=[udp and port 2055]
8.397265 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
23.392175 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 188
23.392189 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
...
3 packets received by filter
0 packets dropped by kernel
```

6. On the secondary device (FortiGate B), change the priority so that it becomes the primary:

```
(global) # config system ha
    set priority 250
end
```

7. Verify the NetFlow status on FortiGate A, which is using the new primary's mgmt1 IP:

```
(global) # diagnose test application sflowd 3
```

8. Verify that the NetFlow packets use the new source IP on FortiGate B:

```
(vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
interfaces=[any]
filters=[udp and port 2055]
7.579574 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
22.581830 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
29.038336 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 1140
^C
3 packets received by filter
0 packets dropped by kernel
```

Force HA failover for testing and demonstrations

This command should only be used for testing, troubleshooting, maintenance, and demonstrations.

Do not use it in a live production environment outside of an active maintenance window.

HA failover can be forced on an HA primary device. The device will stay in a failover state (secondary) regardless of the conditions. The only way to remove the failover status is by manually turning it off.

Syntax

```
execute ha failover set <cluster_id>
execute ha failover unset <cluster_id>
```

Variable	Description
<cluster_id>	The cluster ID is 1 for any cluster that is not in virtual cluster mode, and can be 1 or 2 if virtual cluster mode is enabled.

Example

To manually force an HA failover:

```
# execute ha failover set 1
Caution: This command will trigger an HA failover.
It is intended for testing purposes.
Do you want to continue? (y/n)y
```

To view the failover status:

```
# execute ha failover status
failover status: set
```

To view the system status of a device in forced HA failover:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-300D
Mode: HA A-P
Group: 240
Debug: 0
Cluster Uptime: 0 days 2:11:46
Cluster state change time: 2020-03-12 17:38:04
Primary selected using:
<2020/03/12 17:38:04> FGT3HD3914800153 is selected as the primary because EXE_FAIL_OVER
flag is set on peer member FGT3HD3914800069.
<2020/03/12 15:27:26> FGT3HD3914800069 is selected as the primary because it has the
largest value of override priority.
ses_pickup: disable
override: enable
Configuration Status:

```

Disabling stateful SCTP inspection

There is an option in FortiOS to disable stateful SCTP inspection. This option is useful when FortiGates are deployed in a high availability (HA) cluster that uses the FortiGate Clustering Protocol (FGCP) and virtual clustering in a multihoming topology. In this configuration, the primary stream control transmission protocol (SCTP) path traverses the primary FortiGate node by using its active VDOM (for example, VDOM1), and the backup SCTP path traverses the other passive FortiGate node by using its active VDOM (for example, VDOM2).

When stateful SCTP inspection is enabled, SCTP heartbeat traffic fails by means of the backup path because the primary path goes through a different platform and VDOM. Since there is no state sharing between VDOMs, the passive FortiGate is unaware of the original SCTP session and drops the heartbeats because of no associated sessions. When stateful SCTP inspection is disabled, the passive node permits the SCTP heartbeats to pass.

When set to `enable`, SCTP session creation without SCTP INIT is enabled. When set to `disable`, SCTP session creation without SCTP INIT is disabled (this is the default setting):

```

config system settings
  set sctp-session-without-init {enable | disable}
end

```

The following is an example topology and scenario:

In this example, FGT_A and FGT_B are in HA a-p mode with two virtual clusters. Two primaries exist on different FortiGate units. PC1 eth1 can access PC5 eth1 through VDOM1, and PC1 eth2 can access PC5 eth2 through VDOM2.

On PC5, to listen for an SCTP connection:

```
sctp_darn -H 172.16.200.55 -B 172.17.200.55 -P 2500 -l
```

On PC1, to start an SCTP connection:

```
sctp_darn -H 10.1.100.11 -B 20.1.100.11 -P 2600 -c 172.16.200.55 -c 172.17.200.55 -p 2500 -s
```

An SCTP four-way handshake is on one VDOM, and a session is created on that VDOM. With the default configuration, there is no session on any other VDOM, and the heartbeat on another path (another VDOM) is dropped. After enabling `sctp-session-without-init`, the other VDOM creates the session when it receives the heartbeat, and the heartbeat is forwarded:

```
config system settings
  set sctp-session-without-init enable
end
```

Resume IPS scanning of ICCP traffic after HA failover

After HA failover occurs, the IPS engine will resume processing ICCP sessions and keep the traffic going on the new primary unit. `session-pickup` must be enabled in an active-passive cluster to pick up the ICCP sessions.

Example

The following example uses an active-passive cluster. See [HA active-passive cluster setup on page 2131](#) for more information.

To configure HA:

```
config system ha
  set group-name "HA-APP"
  set mode a-p
  set password *****
  set hbdev "port3" 100
  set session-pickup enable
  set override enable
end
```

Session states before failover

When HA is working, the ICCP session information is stored in the HA session cache on the secondary FortiGate.

To verify the HA session cache on the secondary FortiGate:

```
# diagnose ips share list
HA Session Cache
client=10.1.100.178:57218 server=172.16.200.177:102
service=39, ignore_app_after=0, last_app=76919, buffer_len=32
stock tags: nr=981, hash=e68dc8120970448
custom tags: nr=0, hash=1a49b996b6a42aa2
tags [count=2]: s-737, s-828,
```

The ICCP session information can be found in the IPS session list and the session table on the primary FortiGate.

To verify the IPS session information on the primary FortiGate:

```
# diagnose ips session list
SESSION id:1 serial:35487 proto:6 group:6 age:134 idle:1 flag:0x800012a6

```

Session states after failover

After HA failover, the IPS engine on the new primary picks up the related ICCP sessions and continues passing the traffic. The HA session cache disappears on the new primary. The ICCP session now appears on the IPS session list and session table on the new primary.

To verify the IPS session information on the new primary FortiGate:

```
# diagnose ips session list
SESSION id:1 serial:35487 proto:6 group:6 age:90 idle:2 flag:0x820012a3
      feature:0x4 encap:0 ignore:1,0 ignore_after:204800,0
      tunnel:0 children:0 flag:....-....-..i.
      C-10.1.100.178:57218, S-172.16.200.177:102
      state: C-ESTABLISHED/9114/0/0/0/0, S-ESTABLISHED/0/0/0/0/0 pause:0, paws:0
      expire: 28
      app: unknown:0 last:44684 unknown-size:0
```

The server and client IPs, ports, and protocols remain the same.

To verify the system information on the primary FortiGate:

```
# diagnose sys session list
session info: proto=6 proto_state=11 duration=569 expire=3577 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=5
origin-shaper=

Querying autoscale clusters for FortiGate VM

When a FortiGate VM secondary device is added to a cluster, the new secondary member can query the cluster about its autoscale environment. FortiManager can then run this query on the new secondary member to update its autoscale record.

To view cluster information from a secondary member:

```
# diagnose sys ha checksum autoscale-cluster
```

Cluster information sample

Sample cloud topology:

```
FGT_BYOL; primary; 10.0.0.6; FGVM04TM000000066
FGT_BYOL; secondary; 10.0.0.7; FGVM000000000056
FGT_PAYG; secondary; 10.0.0.4; FGTAZ0000000000CD
FGT_PAYG; secondary; 10.0.0.5; FGTAZ00000000003D
```

From the secondary device, you can see cluster checksums and the primary device:

```
# diagnose sys ha checksum autoscale-cluster

  10.0.0.5, timeo=31430, serial_no=FGTAZR7UZRKKNR3D

```

Cluster virtual MAC addresses

In a cluster, the FGCP assigns virtual MAC addresses (VMACs) to each primary device interface. HA uses VMAC addresses so that if a failover occurs, the new primary device interfaces will have the same VMAC addresses and IP addresses as the failed primary device. As a result, most network equipment will identify the new primary device as the same device as the failed primary device and still be able to communicate with the cluster.

If a cluster is operating in NAT mode, the FGCP assigns a different VMAC address to each primary device interface. VLAN subinterfaces are assigned the same VMAC address as the physical interface that the VLAN subinterface is added to. Redundant or 802.3ad aggregate interfaces are assigned the VMAC address of the first interface in the redundant or aggregate list.

If a cluster is operating in transparent mode, the FGCP assigns a VMAC address to the primary device's management IP address. Since you can connect to the management IP address from any interface, all FortiGate interfaces appear to have the same VMAC address.

The MAC address of a reserved management interface does not change to a VMAC address; it keeps its original MAC address.

Subordinate device MAC addresses do not change. Use `diagnose hardware deviceinfo nic <interface>` on the subordinate device to display the MAC addresses of each interface.

A MAC address conflict can occur when two clusters are operating on the same network using the same group ID (see [Diagnosing packet loss](#)). It is recommended that each cluster in the same network and broadcast domain uses a unique group ID.

Failover

When the new primary device is selected after a failover, the primary device sends gratuitous ARP packets to update the devices connected to the cluster interfaces (usually layer 2 switches) with the VMAC addresses. This is sometimes called using gratuitous ARP packets (or GARP packets) to train the network. The gratuitous ARP packets sent from the primary unit are intended to make sure that the layer 2 switch forwarding databases (FDBs) are updated as quickly as possible.

Sending gratuitous ARP packets is not a requirement because connected devices will eventually learn of the new ports to forward the packets to. However, many network switches will update their FDBs more quickly after a failover if the new primary device sends gratuitous ARP packets.

Configuring ARP packet settings

The following settings can be configured.

```
config system ha
  set arps <integer>
  set arps-interval <integer>
  set gratuitous-arps {enable | disable}
  set link-failed-signal {enable | disable}
end
```

<code>arps <integer></code>	Set the number of gratuitous ARPs; lower the value to reduce traffic, and increase the value to reduce failover time (1 - 60, default = 5).
<code>arps-interval <integer></code>	Set the time between gratuitous ARPs; lower the value to reduce failover time, and increase the value to reduce traffic, in seconds (1 - 20, default = 8).
<code>gratuitous-arps {enable disable}</code>	Enable/disable gratuitous ARPs (default = enable).
<code>link-failed-signal {enable disable}</code>	Enable/disable shutting down all interfaces for one second after a failover. Use if gratuitous ARPs do not update the network (default = disable).

If you disable sending gratuitous ARP packets, it is recommended to enable the `link-failed-signal` setting. The `link-failed-signal` alerts the connected switches of a failed link, which triggers them to react immediately to the changes.

For more information about gratuitous ARP packets see [RFC 826](#) and [RFC 3927](#).

Determining VMAC addresses

A VMAC address is determined based on following formula:

```
<group-prefix>:<group-id_hex>:(<vcluster_integer> + <idx>)
```

The `<group-prefix>` is determined by the following set of group IDs:

- Set 1: group IDs 0 - 255: group prefix 00:09:0f:09
- Set 2: group IDs 256 - 511: group prefix e0:23:ff:fc
- Set 3: group IDs 512 - 767: group prefix e0:23:ff:fd
- Set 4: group IDs 768 - 1023: group prefix e0:23:ff:fe

The `<group-id_hex>` is determined by the group ID % 256, converted to hexadecimal. For example:

Group ID	Hexadecimal ID
0: 0 % 256 = 0	00
255: 255 % 256 = 255	ff
256: 256 % 256 = 0	00
511: 511 % 256 = 255	ff
512: 512 % 256 = 0	00
...	...

The `<vcluster_integer>` is 00 for virtual cluster 1, and 20 for virtual cluster 2. If VDOMs are not enabled, HA sets the virtual cluster to 1 and by default all interfaces are in the root VDOM. Including virtual cluster and VDOM factors in the VMAC address formula means that the same formula can be used whether or not VDOMs and virtual clustering are enabled.

The `<idx>` is the index number of the interface. Interfaces are numbered from 0 to x (where x is the number of interfaces). Interfaces are numbered according to their map order. The first interface has an index of 0. The second interface in the list has an index of 1, and so on.

The following table compares the VMAC addresses for interfaces with an unchanged HA group ID (0) with VDOMs not enabled and interfaces when the group ID is changed to 34:

Interface	VMAC address with unchanged group ID (0)	VMAC address with changed group ID (34)
port5	00-09-0f-09-00-0a	00-09-0f-09-22-0a
port6	00-09-0f-09-00-0b	00-09-0f-09-22-0b
port7	00-09-0f-09-00-0c	00-09-0f-09-22-0c
port8	00-09-0f-09-00-0d	00-09-0f-09-22-0d

Using the same interfaces, a cluster with VDOMs is enabled and the group ID changes to 35. The root VDOM contains port5 and port6 (virtual cluster 1), and vdom_1 contains port7 and port8 (virtual cluster 2). The interfaces have the following VMAC addresses:

Interface	VMAC address with group ID 35
port5	00-09-0f-09-23-0a
port6	00-09-0f-09-23-0b
port7	00-09-0f-09-23-2c
port8	00-09-0f-09-23-2d

Displaying VMAC addresses

Each FortiGate physical interface has two MAC addresses: the permanent and current hardware addresses. The permanent hardware address cannot be changed, as it is the actual MAC address of the interface hardware. The current hardware address can be changed, as it is the address seen by the network.

To change the current hardware address on a FortiGate not operating in HA:

```
config system interface
  edit <name>
    set macaddr <address>
  next
end
```

In an operating cluster, the current hardware address of each cluster device interface is changed to the HA virtual MAC address by the FGCP. The `macaddr` option is not available for a functioning cluster.

To display MAC addresses on a FortiGate operating in HA:

```
# diagnose hardware deviceinfo nic port1
...
Current_HWaddr 00:09:0f:09:ff:02
Permanent_HWaddr 08:5b:0e:72:3b:b2
```

Diagnosing packet loss

A network can experience packet loss when two FortiGate HA clusters are deployed in the same broadcast domain due to MAC address conflicts. You can resolve the MAC address conflict by changing the HA group ID (or cluster ID) configuration of the two clusters.

You can diagnose packet loss by pinging from one cluster to the other, or by pinging both of the clusters from a device within the broadcast domain.

To check for a MAC address conflict in a HA cluster:

1. On Cluster_1 and Cluster_2, check the VMAC address (`Current_HWaddr`) used in an interface on the primary device:

```
# diagnose hardware deviceinfo nic <interface>
```

If the group prefix and group hexadecimal ID are identical, there will be MAC address conflicts.

2. Change one of the clusters to use a different group ID:

```
config system ha
    set group-id <integer>
end
```

Troubleshoot an HA formation

The following are requirements for setting up an HA cluster or FGSP peers.

Cluster members must have:

- The same model.
- The same hardware configuration.
- The same connections.
- The same generation.

The requirement to have the same generation is done as a best practice as it avoids issues that can occur later on. If you are unsure if the FortiGates are from the same generation, please contact customer service.

Troubleshooting common HA formation errors

One member keeps shutting down during HA setup (hard drive failure):

If one member has a hard drive failure but the other does not, the one with the hard drive failure will be shut down during HA setup. In this case, RMA the member to resolve the issue.

Split brain scenario:

A split brain scenario occurs when two or more members of a cluster cannot communicate with each other on the heartbeat interface, causing each member to think it is the primary. As a result, each member assumes the primary HA role and applies the same IP and virtual MAC addresses on its interfaces. This causes IP and MAC conflicts on the network, and causes flapping on L2 devices when they learn the same MAC address on ports connected to different FortiGates.

A split brain scenario is usually caused by a complete lost of the heartbeat link or links. This can be a physical connectivity issue, or less commonly, something blocking the heartbeat packets between the HA members. Another cause is congestion and latency in the heartbeat links that exceeds the heartbeat lost intervals and thresholds.

The following are common symptoms of a split brain scenario:

- The connections to the FortiGates in the cluster work intermittently when trying to connect with administrative access.
- Sessions cannot be established through the FortiGate, and the traffic drops.
- When logging in to the FortiGates using the console, `get system ha status` shows each FortiGate as the primary.

To resolve a split brain scenario:

- Be physically on-site with the FortiGates (recommended). If this is not possible, connect to the FortiGates using console access.

- Identify the heartbeat ports, and verify that they are physically connected and up.
- Verify that heartbeat packets are being sent and received on the heartbeat ports.
- Verify that the HA configurations match between the HA members. The `HA mode`, `group-name`, `group-id`, and `password` settings should be the same. Different `group-id` values will result in different virtual MAC addresses, which might not cause a MAC conflict. However, an IP conflict can still occur.
- If everything seems to be in working order, run `get system ha status` to verify that HA has formed successfully.

To avoid a split brain scenario:

- In a two-member HA configuration, use back-to-back links for heartbeat interface instead of connecting through a switch.
- Use redundant HA heartbeat interfaces.
- In a configuration where members are in different locations, ensure the heartbeat lost intervals and thresholds are longer than the possible latency in the links.

FGSP

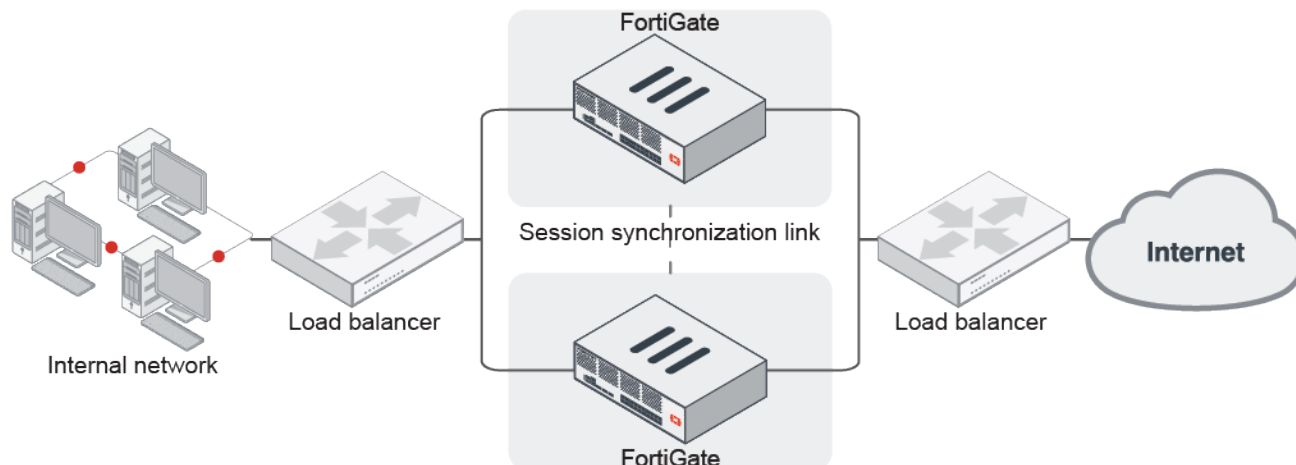

Standalone FortiGates or FGCP clusters can be integrated into the load balancing configuration using the FortiGate Session Life Support Protocol (FGSP) in a network where traffic is load balanced by an upstream load balancer and scanned by downstream FortiGates. FGSP can perform session synchronization of IPv4 and IPv6 TCP, SCTP, UDP, ICMP, expectation, and NAT sessions to keep the session tables synchronized on all entities. If one of the FortiGates fails, the upstream load balancer should detect the failed member and stop distributing sessions to it. Session failover occurs and active sessions fail over to the peers that are still operating. Traffic continues to flow on the new peer without data loss because the sessions are synchronized.

The FortiGates in FGSP operate as peers that process traffic and synchronize sessions. An FGSP deployment can include two to 16 standalone FortiGates, or two to 16 FortiGate FGCP clusters of two members each. Adding more FortiGates increases the CPU and memory required to keep all of the FortiGates synchronized, and it increases network synchronization traffic. Exceeding the numbers of members is not recommended and may reduce overall performance. By default, FGSP synchronizes all IPv4 and IPv6 TCP sessions, and IPsec tunnels. You can optionally add filters to control which sessions are synchronized, such as synchronizing packets from specific source and destination addresses, source and destination interfaces, or services.

FGSP is also compatible with FortiGate VRRP.

FGSP is primarily used instead of FGCP when external load balancers are part of the topology, and they are responsible for distributing traffic amongst the downstream FortiGates. FGSP provides the means to synchronize sessions between the FortiGate peers without needing a primary member to distribute the sessions like in FGCP active-active mode. If the external load balancers direct all sessions to one peer, the effect is similar to active-passive FGCP HA. If external load balancers balance traffic to both peers, the effect is similar to active-active FGCP HA. The load balancers should be configured so that all packets for any given session are processed by the same peer, including return packets whenever possible.

Session pickup

Session pickup is an optional setting that can be enabled to synchronize connectionless (UDP and ICMP) sessions, expectation sessions, and NAT sessions. If session pickup is not enabled, the FGSP does not share session tables for the particular session type, and sessions do not resume after a failover. All sessions are interrupted by the failover and must be re-established at the application level. Many protocols can successfully restart sessions with little, or no, loss of data. Others may not recover as easily. Enable session pickup for sessions that may be difficult to reestablish. Since session pickup requires FortiGate memory and CPU resources, only enable this feature for sessions that need to synchronize.

Session synchronization link

The session synchronization link is an optional configuration that allows peers to synchronize sessions over a dedicated interface instead of the interface in which the peer IP is routed. In this configuration, communications occur over L2 instead of L3. Configuring session synchronization links is recommended when you want to minimize traffic over the peering interface when there are many sessions that need to be synchronized.

Expectation sessions

FortiOS session helpers keep track of the communication of layer 7 protocols, such as FTP and SIP, that have control sessions and expectation sessions. The control sessions establish the link between the server and client, and negotiate the ports and protocols that will be used for data communications. The session helpers then create expectation sessions through the FortiGate for the ports and protocols negotiated by the control session.

The expectation sessions are the sessions that actually communicate data. For FTP, the expectation sessions transmit files being uploaded or downloaded. For SIP, the expectation sessions transmit voice and video data. Expectation sessions usually have a timeout value of 30 seconds. If the communication from the server is not initiated within 30 seconds, the expectation session times out and traffic will be denied.

By default, FGSP does not synchronize expectation sessions; if a failover occurs, the sessions will have to be restarted.

To synchronize expectation sessions so they continue after a failover:

```
config system ha
    set session-pickup enable
    set session-pickup-expectation enable
end
```

NAT session synchronization

NAT sessions are not synchronized by default. You can enable NAT session synchronization by entering the following command:

```
config system ha
    set session-pickup enable
    set session-pickup-nat enable
end
```

When deploying FGCP over FGSP, the `session-pickup-nat` setting is hidden and enabled by default. It cannot be modified. See [FGCP over FGSP per-tunnel failover for IPsec on page 2218](#) for more information.

After a failover with this configuration, all sessions that include the IP addresses of interfaces on the failed FortiGate unit will have nowhere to go since the IP addresses of the failed FortiGate unit will no longer be on the network. If you want NAT sessions to resume after a failover you should not configure NAT to use the destination interface IP address, since the FGSP FortiGate units have different IP addresses. To avoid this issue, you should use IP pools with the type set to overload (which is the default IP pool type), as shown in this example:

```
config firewall ippool
    edit FGSP-pool
        set type overload
        set startip 172.20.120.10
        set endip 172.20.120.20
    next
end
```

In NAT mode, only sessions for route mode security policies are synchronized. FGSP is also available for FortiGate units or virtual domains operating in transparent mode. Only sessions for normal transparent mode policies are synchronized.

The following topics provide more information about FGSP:

FGSP basic peer setup

The FortiGate Session Life Support Protocol (FGSP) is a proprietary HA solution for only sharing sessions between entities based on peer-to-peer communications. The entities could be standalone FortiGates or an FGCP cluster. Sessions are load balanced by an upstream load balancer. Each peer will synchronize its sessions with the other peers so that if a failure occurs, sessions will continue to flow as the load balancer redirects the traffic to the other peers.

Basic requirements and limitations

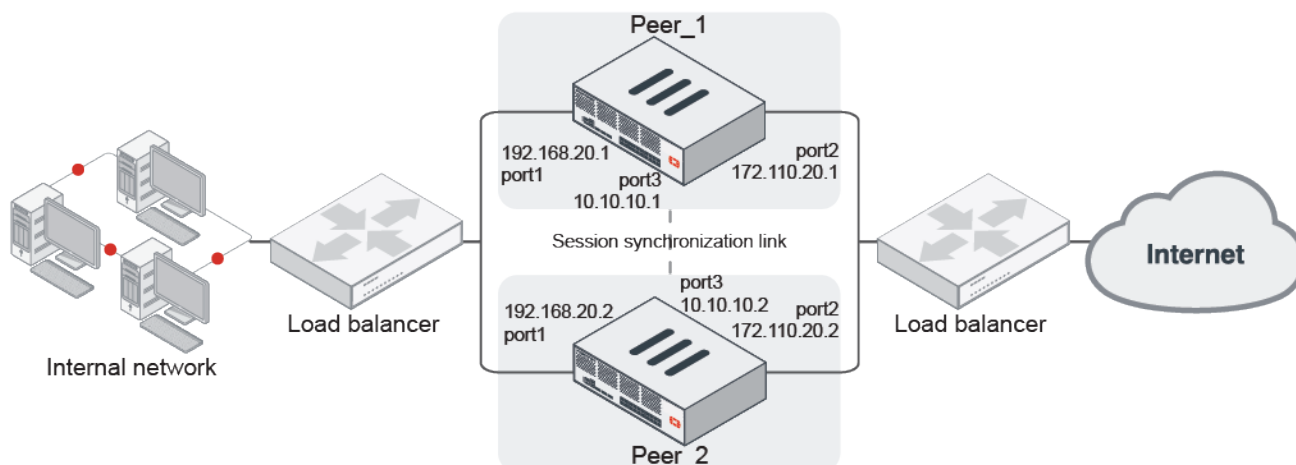

In most production environments, the following requirements should be met:

- The peers are FortiGates of the same model.
- The peers are running the same firmware version.
- There are 2 to 16 standalone FortiGates, or 2 to 16 FortiGate FGCP clusters of two members each.
- The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

Two FortiGates must have similar capabilities so that data structures used in session synchronization will match, and are capable of delivering similar performance. Therefore, the same model and firmware version is highly recommended for most production deployments. The limitation on the number of FortiGates in FGSP also ensures that session synchronization will occur smoothly.

Example

This example uses two peer FortiGates. The load balancer is configured to send all sessions to Peer_1, and if Peer_1 fails, all traffic is sent to Peer_2.

To configure a basic FGSP peer setup:

These instructions assume that all FortiGates have been factory reset.

1. Make all the necessary connections as shown in the topology diagram.
2. On Peer_1, configure the peer IP in which this device will peer with:

```
config system cluster-sync
  edit 1
    set peerip 10.10.10.2
  next
end
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 1
end
```

If there are multiple peer IPs from the same peer, enter them as separate entries. If there are multiple peers, enter the IP of each peer in separate entries. See [Optimizing FGSP session synchronization and redundancy on page 2195](#) for an example.

Sessions by default will be synchronized over layer 3 on the interface in which the current unit connects to the peer's IP.

3. On Peer_2, configure session synchronization:

```
config system cluster-sync
  edit 1
    set peerip 10.10.10.1
  next
end
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 2
end
```

4. Configure identical firewall policies on each peer, such as for traffic going from the same incoming interface (port1) to the outgoing interface (port2).

To test the FGSP peer setup:

1. Initiate TCP traffic (like HTTP access) to go through Peer_1.
2. Check the session information:

```
# diagnose sys session filter src <IP_address>
# diagnose sys session list
```

3. Enter the same commands on Peer_2 to verify if the same session information appears.

Optional filters

Filters can be added to synchronize certain types of sessions that meet the filter criteria.

To add filters for session synchronization:

```
config system cluster-sync
  edit <id>
    config session-sync-filter
      set srcintf <interface>
      set dstintf <interface>
      set srcaddr <IPv4_address>
```

```
        set dstaddr <IPv4_address>
        set srcaddr6 <IPv6_address>
        set dstaddr6 <IPv6_address>
    end
next
end
```

Filter examples

To synchronize only sessions with a particular source subnet:

```
config system cluster-sync
    edit 1
        config session-sync-filter
            set srcaddr 192.168.20.0/24
        end
    next
end
```

To synchronize only sessions with a particular source address range:

```
config system cluster-sync
    edit 1
        config session-sync-filter
            set srcaddr 192.168.20.10 192.168.20.20
        end
    next
end
```

To synchronize only sessions with a particular destination address range:

```
config system cluster-sync
    edit 1
        config session-sync-filter
            set dstaddr6 2001:db8:0:2::/64
        end
    next
end
```

Session pickup

You can enable this setting to synchronize connectionless (UDP and ICMP) sessions, expectation sessions, and NAT sessions. If session pickup is not enabled, the FGSP does not share session tables for the particular session type, and sessions do not resume after a failover.

To enable UDP and ICMP session synchronization:

```
config system ha
    set session-pickup enable
    set session-pickup-connectionless enable
end
```

Session synchronization

You can specify interfaces used to synchronize sessions in L2 instead of L3 using the `session-sync-dev` setting. For more information about using session synchronization, see [Session synchronization interfaces in FGSP on page 2188](#).

To configure session synchronization over redundant L2 connections:

```
config system standalone-cluster
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
end
```

VDOM synchronization

When multi-VDOM mode is enabled, you can specify the peer VDOM and the synchronized VDOMs. The peer VDOM contains the session synchronization link interface on the peer unit. The synchronized VDOMs' sessions are synchronized using this session synchronization configuration.

To synchronize between VDOMs:

```
config system cluster-sync
    edit 1
        set peerip <IP address>
        set peervd <vdom>
        set syncvd <vdom 1> [<vdom 2>] ... [<vdom n>]
    next
end
```

Configuring unique group and member ID

FGSP can function between standalone FortiGates or between FGCP clusters. In either case, peers should use different group ID and member ID to uniquely identify each member. This allows each member to actively process traffic without any conflict.

To configure FGSP peering between standalone FortiGates, follow the steps under [To configure a basic FGSP peer setup](#).

To configure FGSP peering between different FGCP clusters:

These instructions assume Peer_1 and Peer_2 are in cluster 1, and Peer_3 and Peer_4 are in cluster 2.

1. On Peer_1, configure the first group ID:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
end
```

2. On Peer_2, configure the same group ID but a different member ID:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 2
end
```

3. On Peer_3, configure the second group ID:

```
config system standalone-cluster
  set standalone-group-id 2
  set group-member-id 1
end
```

4. On Peer_4, configure the same group ID but a different member ID:

```
config system standalone-cluster
  set standalone-group-id 2
  set group-member-id 2
end
```

Synchronizing sessions between FGCP clusters

Synchronizing sessions between FGCP clusters is useful when data centers in different locations are used for load balancing, and traffic must be shared and flow freely based on demand.

There are some limitations when synchronizing sessions between FGCP clusters:

- All FortiGates must have the same model and generation, hardware configuration, and FortiOS version.
- A total of 16 clusters can share sessions.
- The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

To configure session synchronization between two clusters:

1. Configure the two clusters (see [HA active-passive cluster setup on page 2131](#) or [HA active-active cluster setup on page 2133](#)).
2. On cluster A, configure the peer IP for the interface:

```
config system interface
  edit "port5"
    set vdom "root"
    set ip 10.10.10.1 255.255.255.0
    set allowaccess ping https ssh snmp http telnet
  next
end
```

In this example, cluster A uses port5 and its IP address, 10.10.10.1, is reachable from another cluster.

3. On cluster A, configure cluster and session synchronization:

```
config system cluster-sync
  edit 1
    set peerip 10.10.10.2
  next
end
```

4. On cluster A, configure additional FGSP attributes as needed:

```
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 0
  set session-sync-dev <interface>
end
```

The `standalone-group-id` must match between FGSP members. The `group-member-id` is unique for each FGSP cluster. `session-sync-dev` is an optional command to specify the interfaces to sync sessions.

5. On cluster B, configure the peer IP for the interface:

```
config system interface
  edit "port5"
    set vdom "root"
    set ip 10.10.10.2 255.255.255.0
    set allowaccess ping https ssh snmp http telnet
  next
end
```

In this example, cluster B uses port5 and its IP address, 10.10.10.2, is reachable from another cluster.

6. On cluster B, configure cluster and session synchronization:

```
config system cluster-sync
  edit 1
    set peerip 10.10.10.1
  next
end
```

7. On cluster B, configure additional FGSP attributes as needed:

```
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 1
  set session-sync-dev <interface>
end
```

Session synchronization interfaces in FGSP

When peering over FGSP, by default, the FortiGates or FGCP clusters share information over L3 between the interfaces that are configured with Peer IP addresses. When a session synchronization interface is configured and FGSP peers are directly connected on this interface, then session synchronization is done over L2, only falling back to L3 if the session synchronization interface becomes unavailable.

When FGSP peers are formed between standalone FortiGates, the session synchronization process is performed by the kernel with UDP encapsulation. When using a FGSP session synchronization interface, the synchronization process is also offloaded to the kernel, albeit more efficiently without the UDP encapsulation. Therefore, a fast, dedicated, and stable L2 connection is recommended for the session synchronization interface between the FGSP peers. For redundancy, multiple synchronization interfaces can be configured. The session synchronization interface or interfaces should always be the same on each FGSP peer.

The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

To configure session-sync interfaces:

```
config system standalone-cluster
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
    set layer2-connection {available | unavailable}
    set encryption {enable | disable}
end
```

The `layer2-connection` setting is for forwarded traffic between FGSP peers. Set it to `available` if the peer interface user for traffic forwarding is directly connected and supports L2 forwarding. See [UTM inspection on asymmetric traffic in FGSP on page 2190](#) for more information.

Session synchronization in FGCP over FGSP

To provide full redundancy, FGCP clusters can be used in FGSP peering. This is called FGCP over FGSP. In these complex environments, as well as in high performance, low latency data centers, using the FGCP session synchronization interface is recommended, as it offloads the session synchronization process to the kernel.

To offload the session synchronization process to the kernel and synchronize sessions using connected interfaces directly:

```
config system ha
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
end
```

This is optimal when any of the following conditions apply:

- The session rate is high.
- Low network latency is required.
- There is a complex environment with FGCP clusters synchronizing over FGSP using L3 only in the presence of asymmetric traffic.

Configuring the FGCP `session-sync-dev` effectively offloads the session synchronization from the `sessionsync` daemon into the kernel and reduces the session synchronization latency.

When configuring both `system.standalone-cluster.session-sync-dev` and `system.ha.session-sync-dev` in FGCP over FGSP mode, the interfaces configured should be the same.

The following topology uses multiple session synchronization interfaces with a full mesh backbone to prevent any single point of failure.

The state diagram summarizes the session synchronization of a TCP session. It assumes that the session is connected over FGCP Cluster 1 and processed entirely by the primary unit, Cluster-1A.

1. The session starts with the Client SYN packet.
2. As the session is established, Cluster-1A synchronizes the session with Cluster-1B over the heartbeat interface, and with Cluster-2A over the session synchronization interface.
3. Cluster-2A then synchronizes the session with Cluster-2B over its heartbeat interface.
4. The process then repeats as it transitions to different states.

Session synchronization if links fail

In the previous topology, if any single session synchronization link fails on the primary member of each cluster, session synchronization will continue on the second link from the pair of session synchronization interfaces.

If the second link on the primary member of the same cluster then fails, L2 session synchronization over the session synchronization interface stops, and synchronization fails over to L3 between the peer IP links.

If the Peer IP link then fails, the FGSP peers are effectively disconnected, and no session synchronization will occur.

UTM inspection on asymmetric traffic in FGSP

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the session.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, traffic bounces from FGT_2 port1 to FGT_1 port1 using FGT_1's MAC address. Traffic is then inspected by FGT_1.

This example requires the following settings:

- The internal and outgoing interfaces of both FortiGates in the FGSP pair are in the same subnet.
- Both peers have layer 2 access with each other.

To configure FTG_1:

1. Configure the cluster, setting the peer IP to the IP address of FGT_2:

```
config system cluster-sync
  edit 1
    set peerip 10.2.2.2
  next
end
```

2. Configure FGSP cluster attributes:

```
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 0
  set layer2-connection available
  unset session-sync-dev
end
```

3. Configure the firewall policy:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set av-profile "default"
    set logtraffic all
    set nat enable
```

```
    next
end
```

To configure FTG_2:

1. Configure the cluster, setting the peer IP to the IP address of FGT_1:

```
config system cluster-sync
    edit 1
        set peerip 10.2.2.1
    next
end
```

2. Configure FGSP cluster attributes:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set layer2-connection available
    unset session-sync-dev
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

Results

Capture packets on FGT_2 to see that traffic bounced from FGT_2 to FGT_1 over the traffic interface.

```

```

UTM inspection on asymmetric traffic on L3

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the

session.

For networks where L2 connectivity is not available, such as cloud environments, traffic bound for the session owner are forwarded through the peer interface using a UDP connection.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, return traffic is packed and sent from FGT_2 to FGT_1 using UDP encapsulation between two peer interfaces (port 3). Traffic is then inspected by FGT_1.

Both of the FortiGates in this example are peering on interfaces in the same subnet, but the solution does not require the FortiGate peers to be on the same subnet or connected back-to-back.

To configure FTG_1:

1. Configure the cluster, setting the peer IP to the IP address of FGT_2:

```
config system cluster-sync
  edit 1
    set peerip 10.2.2.2
  next
end
```

2. Configure FGSP cluster attributes:

```
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 0
  set layer2-connection unavailable
  unset session-sync-dev
end
```

3. Configure the firewall policy:

```
config firewall policy
  edit 1
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
```

```
        set service "ALL"  
        set utm-status enable  
        set av-profile "default"  
        set logtraffic all  
        set nat enable  
    next  
end
```

To configure FTG_2:

1. Configure the cluster, setting the peer IP to the IP address of FGT_1:

```
config system cluster-sync  
    edit 1  
        set peerip 10.2.2.1  
    next  
end
```

2. Configure FGSP cluster attributes:

```
config system standalone-cluster  
    set standalone-group-id 1  
    set group-member-id 1  
    set layer2-connection unavailable  
    unset session-sync-dev  
end
```

3. Configure the firewall policy:

```
config firewall policy  
    edit 1  
        set srcintf "port2"  
        set dstintf "port1"  
        set srcaddr "all"  
        set dstaddr "all"  
        set action accept  
        set schedule "always"  
        set service "ALL"  
        set utm-status enable  
        set av-profile "default"  
        set logtraffic all  
        set nat enable  
    next  
end
```

Encryption for L3 on asymmetric traffic in FGSP

In scenarios where asymmetric routing between FGSP members occurs, the return traffic can be encrypted and routed back to the session owner on Layer 3 (L3).

To encrypt L3 traffic in FGSP:

1. Run the following on both FortiGates:

```
config system standalone-cluster  
    set encryption enable
```

```

set psksecret xxxxxxxxxx
end

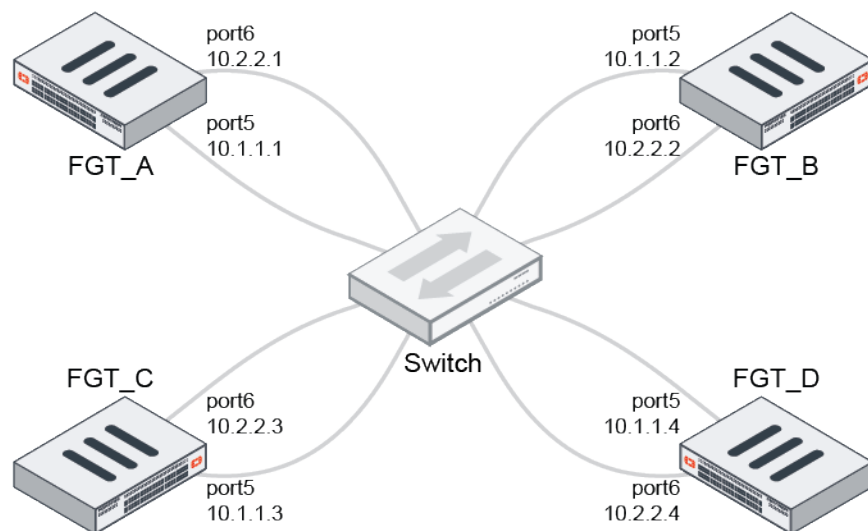

```

Optimizing FGSP session synchronization and redundancy

In this example where standalone FortiGates are peered in FGSP, using `session-sync-dev` optimizes session synchronization as it eliminates UDP encapsulation and offloads session synchronization processing to the kernel. FGSP session synchronization can be supported to handle heavy loads.

For more information about session synchronization, see [Session synchronization interfaces in FGSP on page 2188](#).

Topology

In this topology, there are three FGSP peer groups for each FortiGate. Sessions are synchronized between each FortiGate and its peer groups. Redundancy is achieved by using two dedicated session sync device links for each peer setup. There are a total of six peer IPs for each session synchronization device link in each FGSP peer. When one link is fails, session synchronization is not affected.

For optimization, `sync-packet-balance` is enabled to distribute synchronization packets processing to multiple CPUs. The session synchronization process is offloaded to the kernel, and sessions are synchronized over layer 2 over the connected interfaces (`set session-sync-dev "port5" "port6"`). Jumbo frame MTU 9216 is configured on each session synchronization device link to reduce the number of packets; however, setting MTU to 9216 is entirely optional.

To configure FGT_A:

1. Configure HA:

```

config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end

```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.1/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.1/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system cluster-sync
    edit 1
        set peerip 10.1.1.2
    next
    edit 2
        set peerip 10.2.2.2
    next
    edit 3
        set peerip 10.1.1.3
    next
    edit 4
        set peerip 10.2.2.3
    next
    edit 5
        set peerip 10.1.1.4
    next
    edit 6
        set peerip 10.2.2.4
    next
end
```

To configure FGT_B:**1. Configure HA:**

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
```

```
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.2/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.2/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system cluster-sync
    edit 1
        set peerip 10.1.1.1
    next
    edit 2
        set peerip 10.2.2.1
    next
    edit 3
        set peerip 10.1.1.3
    next
    edit 4
        set peerip 10.2.2.3
    next
    edit 5
        set peerip 10.1.1.4
    next
    edit 6
        set peerip 10.2.2.4
    next
end
```

To configure FGT_C:**1. Configure HA:**

```
config system ha
    set sync-packet-balance enable
```

```
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.3/24
        set mtu-override enable
    set mtu 9216
    next
    edit port6
        set ip 10.2.2.3/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system cluster-sync
    edit 1
        set peerip 10.1.1.1
    next
    edit 2
        set peerip 10.2.2.1
    next
    edit 3
        set peerip 10.1.1.2
    next
    edit 4
        set peerip 10.2.2.2
    next
    edit 5
        set peerip 10.1.1.4
    next
    edit 6
        set peerip 10.2.2.4
    next
end
```

To configure FGT_D:**1. Configure HA:**

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.4/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.4/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system cluster-sync
    edit 1
        set peerip 10.1.1.1
    next
    edit 2
        set peerip 10.2.2.1
    next
    edit 3
        set peerip 10.1.1.2
    next
    edit 4
        set peerip 10.2.2.2
    next
    edit 5
        set peerip 10.1.1.3
    next
    edit 6
        set peerip 10.2.2.3
```

```

    next
end

```

IKE monitor for FGSP

Split-brain situations occur in a scenario where session synchronization is down between two FGSP peers. This can have an effect if IKE fails over from one unit to another, causing the tunnel to be invalid due to the IKE session and role being out of sync, and ESP anti-replay detection. In split-brain situations, the IKE monitor provides a mechanism to maintain the integrity of the state tables and primary/secondary roles for each VPN gateway. It continues to provide fault tolerance by keeping track of the timestamp of the latest received traffic, and it uses the ESP sequence number jump ahead value to preserve the sequence number per gateway. Once the link is up, the cluster resolves the role and synchronizes the session and IKE data. During this process, if the IKE fails over from one unit to another, the tunnel will remain valid and traffic continues to flow.

The IKE monitor only works with 2 peers in FGSP.

To configure the IKE monitor:

```

config system cluster-sync
    edit <id>
        set peerip <address>
        set ike-monitor {enable | disable}
        set ike-monitor-interval <integer>
        set ike-heartbeat-interval <integer>
        set ike-seqjump-speed <integer>
    next
end

```

ike-monitor {enable disable}	Enable/disable IKE HA monitor (default = disable).
ike-monitor-interval <integer>	Set the monitoring interval for determining how fast the cluster members detect split-brain mode, in seconds (10 - 300, default = 15).
ike-heartbeat-interval <integer>	Set the heartbeat message interval for sending the heartbeat per gateway to the other peers, in seconds (1 - 60, default = 3).
ike-seqjump-speed <integer>	Set the ESP jump ahead factor, in packets per second equivalent (1 - 10, default = 10). A value of 10 means it is the factor for a 10G interface.

Example

In this example, FortiGate A and FortiGate B are FGSP peers with port3 as the session synchronization link. The FortiGates act as IPsec dial-up servers and PCs on the 10.1.100.0 subnet are the IPsec dial-up clients. Router A acts as the external load balancer for IKE sessions between the FortiGates. Dynamic routing OSPF is configured for the FortiGates and routers.

When PC2 and other clients form IPsec dial-up tunnels to the FGSP peers, these tunnels terminate on either FortiGate A or FortiGate B, not both. For each tunnel, one FortiGate is the primary and the other is the secondary.

When the session synchronization link goes down, the FGSP split-brain scenario occurs. Without using the IKE monitor mechanism, the IKE and ESP information becomes out of sync between the two FortiGates. The secondary FortiGate for a tunnel does not receive any information about updated tunnel status. If there is a failover and tunnel traffic begins to flow to the secondary FortiGate, the tunnel will be invalidated because its state tables for that session are out of sync.

By using the IKE monitor when a split-brain scenario occurs, each unit starts periodically monitoring traffic flows and managing the sequence number jump ahead on standby units. Using a combination of timers with ESP sequence number jump ahead lets the units maintain integrity of the shared SA runtime state table, including ESP anti-replay sequence numbers.

Once the session synchronization link is up, the FGSP peers synchronize the state tables and resume regular operations.

To configure the IKE monitor:

```
config system cluster-sync
  edit 1
    set peerip 10.10.10.2
    set ike-monitor enable
    set ike-monitor-interval 12
    set ike-heartbeat-interval 2
    set ike-seqjump-speed 2
  next
end
```

Firmware upgrades in FGSP

The following steps are recommended to upgrade the firmware of FortiGates in an FGSP deployment. Follow these steps whether or not you have enabled standalone configuration synchronization.

This example FGSP deployment has two FortiGates, FGT-1 and FGT-2.

To upgrade the firmware in an FGSP deployment:

1. Switch all traffic to FGT-1:
 - a. Configure the load balancer or router that distributes traffic between the FortiGates to send all traffic to FGT-1.
2. Disconnect FGT-2 from the network.

Make sure to also disconnect the interfaces that allow heartbeat and synchronization communication with FGT-1. This is to prevent FGT-2 from communicating with FGT-1.
3. Upgrade the firmware on FGT-2.
4. Reconnect the traffic interfaces on FGT-2, but not the interfaces used for heartbeat and synchronization communication with FGT-1.
5. Switch all traffic to the newly upgraded FGT-2:
 - a. Configure the load balancer or router that distributes traffic between the FortiGates to send all traffic to FGT-2.
6. Upgrade the firmware on FGT-1 (while heartbeat and synchronization communication with FGT-2 remains disconnected).
7. Reconnect the FGT-2 interfaces that allow heartbeat and synchronization communication between FGT-1 and FGT-2.
8. Restore the original traffic distribution between FGT-1 and FGT-2:
 - a. Configure the load balancer or router to distribute traffic to both FortiGates in the FGSP deployment.

FGSP session synchronization between different FortiGate models or firmware versions

FGSP HA deployments are generally meant for interoperating between FortiGates with the same model and firmware version. However, situations may arise where individual members or FGCP clusters running over FGSP use different models or firmware versions. For example, to avoid downtime while upgrading the members, some FGSP members or clusters may be upgraded first and then re-join the FGSP peers after a successful upgrade. Or while performing maintenance, sessions may need to be offloaded to a temporary member or FGCP cluster of a different model.

Being able to perform FGSP session synchronization between members of different models or firmware versions is helpful to transition the traffic smoothly and causes minimal disruptions. This topic outlines requirements to be aware of before assessing whether FGSP session synchronization may work between members with different models or firmware versions.

Different FortiGate models

The general guideline is to only use FortiGate models in a similar tier and family. Vastly different models have different performance and capabilities, which may not be compatible. The goal is for two models to have similar capabilities so that data structures used in session synchronization will match, and are capable of delivering similar performance.

When considering FGSP session synchronization between two FortiGates, ensure that:

- The FortiGates use the same 32-bit kernel or 64-bit kernel.
- The FortiGates use the same type of CPU (such as ARM or x86).

- For network interfaces:
 - The same type of physical interface should be used on each member.
 - The physical interfaces should be capable of the same speeds.
- The device memory should be similar in size. If the FortiGates have vastly different memory sizes, their performance may be different if one device supports more sessions than the other.
- The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

Virtual clusters and asymmetric routing are not supported.

Different firmware versions

When operating in FGSP, the firmware needs to have compatible data structures and session synchronization packet headers. The firmware is generally able to handle different data structures between old and new FortiOS sessions. Session synchronization packets are typically the same between versions.

Note the following exceptions and guidelines when assessing FGSP session synchronization compatibility between different firmware versions:

- FortiOS 7.0.2 added support for widening the HA virtual MAC address range. This change updated the session synchronization packet header structure.
 - FortiGates running 7.0.2 or later, and FortiGates running 7.0.1 or earlier will not accept session synchronization packets from each other.
- If the traffic uses a new feature only available in a newer FortiOS version, it may not work when synchronized to an older FortiOS version.
 - For example, PFCP (Packet Forwarding Control Protocol) support was added in 7.0.1, and a PFCP profile name was added to the sessions. When the sessions are synchronized to an older firmware version, the PFCP profile name will be lost and the sessions will not be able to handle the traffic as they would in 7.0.1.
- FortiOS 7.0.8 added `group-id` into the protocol header. This means that FortiGates running 7.0.8 and later cannot perform session synchronization with FortiGates running 7.0.7 or earlier.

To identify that session-sync is failing due to the receiver not being able to recognize a packet that it receives:

1. Run the following CLI command:

```
# diagnose sys session sync
sync_ctx: sync_started=1, sync_tcp=1, sync_others=1,
sync_expectation=1, sync_nat=1, stdalone_sesync=1.
sync: create=323:0, update=84662, delete=0:0, query=960
recv: create=39544:0, update=133665, delete=0:0, query=38775
ses pkts: send=248714, alloc_fail=0, recv=751196, recv_err=1 sz_err=0
udp pkts: send=8, recv=85
nCfg_sess_sync_num=5, mtu=1500, ipsec_tun_sync=0
sync_filter:
```

2. Check if the `recv_err` counter continues to increase.

Session synchronization interfaces

Session synchronization between FGSP members uses an L3 connection over the peer IP by default.

Session synchronization between FGSP members uses an L2 connection when a session synchronization interface (`session-sync-dev`) is used. The synchronization process is also offloaded to the kernel.

FGSP is also compatible with FortiGate VRRP.

Applying the session synchronization filter only between FGSP peers in an FGCP over FGSP topology

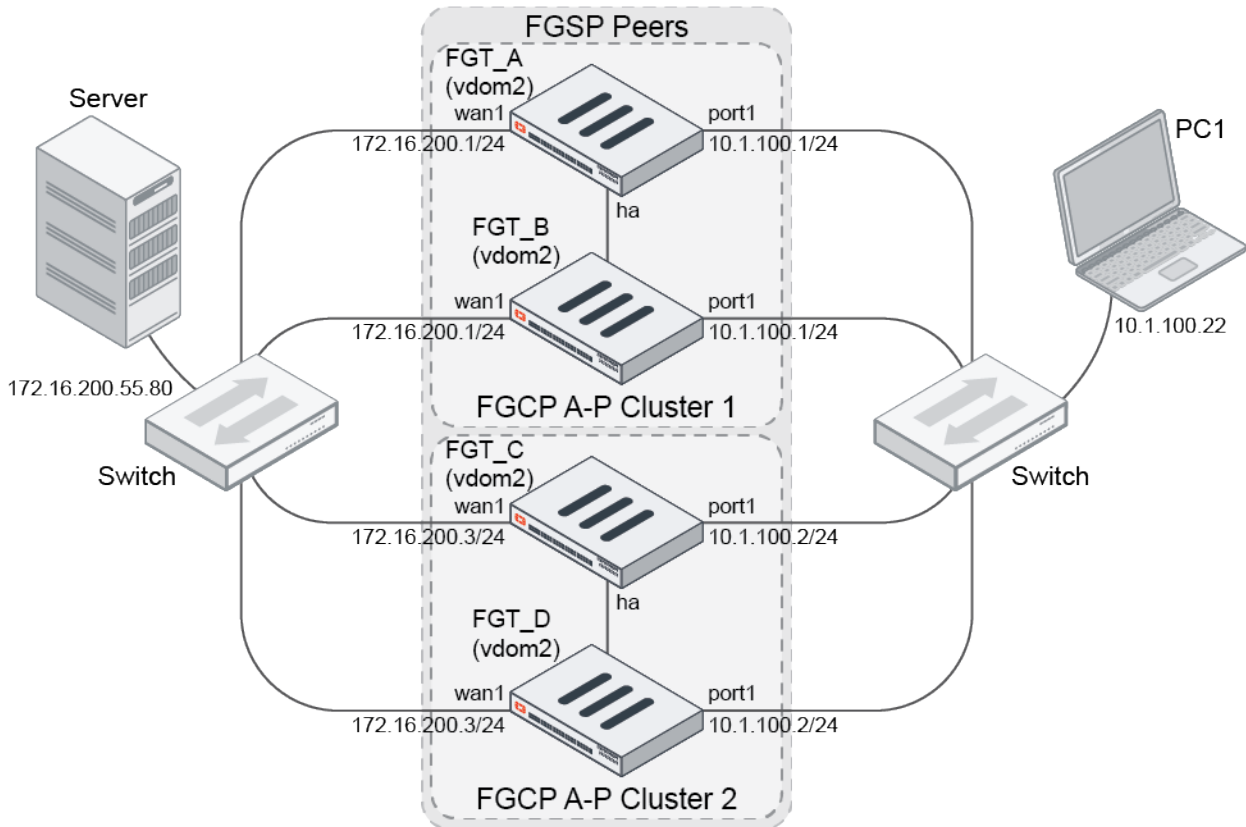

When the session synchronization filter is applied on FGSP, the filter will only affect sessions synchronized between the FGSP peers. When virtual clustering is used, sessions synchronized between each virtual cluster can also be synchronized to FGSP peers. All peers' `syncvd` must be in the same HA virtual cluster.

Example

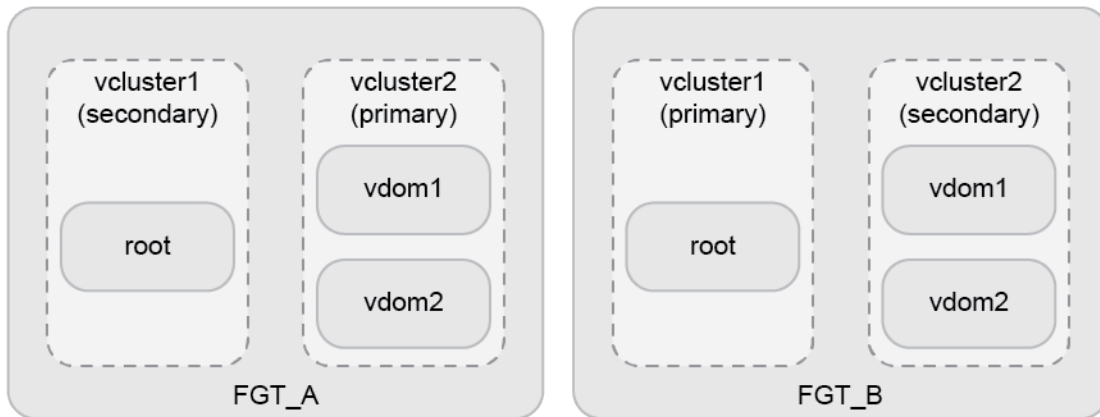

In this example, there is a simplified configuration where there is no router or load balancer performing balancing between the FGSP peers, but it demonstrates the following:

- When sessions pass through FGCP A-P Cluster 1, all sessions are synchronized between the FGT_A and FGT_B regardless of the session synchronization filter.
- Session synchronization between the FGSP peers (FGCP A-P Cluster 1 and 2) only occurs for the service specified in the filter, which is HTTP/80.
- The preceding behavior is applicable when virtual clustering is configured. This example focuses on vdom2, which belongs to vcluster2. FGT_A is the primary for vcluster2.

Each FGSP A-P cluster is connected on ha as the FGCP cluster heartbeat device. The FGSP peers are connected on mgmt over 10.1.1.1-2/24.

Virtual clustering between FGT_A and FGT_B:

Interface	FGT_A	FGT_B	FGT_C	FGT_D
wan1	172.16.200.1/24	172.16.200.1/24	172.16.200.3/24	172.16.200.3/24
port1	10.1.100.1/24	10.1.100.1/24	10.1.100.2/24	10.1.100.2/24
mgmt	10.1.1.1/24	10.1.1.1/24	10.1.1.2/24	10.1.1.2/24
ha	FGCP cluster heartbeat device		FGCP cluster heartbeat device	

To configure the HA clusters:**1. Configure FGCP A-P Cluster 1 (use the same configuration for FGT_A and FGT_B):**

```
config system ha
  set group-id 146
  set group-name "FGT_HA1"
  set mode a-p
  set hbdev "wan2" 100 "ha" 50
  set session-pickup enable
  set session-pickup-nat enable
  set vcluster-status enable
  config vcluster
    edit 1
      set override enable
      set priority 25
      set monitor "wan1" "port1"
      set vdom "root"
    next
    edit 2
      set override disable
      set priority 150
      set monitor "wan1"
      set vdom "vdom2" "vdom1"
    next
  end
end
```

2. Configure FGCP A-P Cluster 2 (use the same configuration for FGT_C and FGT_D):

```
config system ha
  set group-id 200
  set group-name "FGT_HA2"
  set mode a-p
  set hbdev "wan2" 100 "ha" 50
  set session-pickup enable
  set session-pickup-nat enable
  set vcluster-status enable
  config vcluster
    edit 1
      set override enable
      set priority 120
      set monitor "wan1" "port1"
      set vdom "root"
    next
    edit 2
      set override disable
      set priority 150
      set monitor "wan1"
      set vdom "vdom2" "vdom1"
    next
  end
end
```

To configure the FGSP peers:**1. Configure FGT_A.****a. Configure the FGSP cluster attributes:**

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
end
```

b. Configure the FGSP session synchronization:

```
config system cluster-sync
    edit 1
        set peervd "vdom2"
        set peerip 10.1.1.2
        set syncvd "vdom2"
        config session-sync-filter
            config custom-service
                edit 1
                    set dst-port-range 80-80
                next
            end
        end
    end
next
end
```

The configuration is automatically synchronized to FGT_B.

2. Configure FGT_C.**a. Configure the FGSP cluster attributes:**

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 2
end
```

b. Configure the FGSP session synchronization:

```
config system cluster-sync
    edit 1
        set peervd "vdom2"
        set peerip 10.1.1.1
        set syncvd "vdom2"
        config session-sync-filter
            config custom-service
                edit 1
                    set dst-port-range 80-80
                next
            end
        end
    end
next
end
```

The configuration is automatically synchronized to FGT_D.

To verify the configuration:**1. Verify the FGSP peer information on Cluster 1:**

```
FGT_A (global) # diagnose sys ha fgsp-zone
Local standalone-member-id: 1
FGSP peer_num = 1
    peer[1]: standalone-member-id=2, IP=10.1.1.2, vd=vdom2, prio=1
```

2. Verify the FGSP peer information on Cluster 2:

```
FGT_C (global) # diagnose sys ha fgsp-zone
Local standalone-member-id: 1
FGSP peer_num = 1
    peer[1]: standalone-member-id=1, IP=10.1.1.1, vd=vdom2, prio=1
```

3. Initiate two sessions, HTTP and SSH.**4. Verify that the HTTP session is synchronized from Cluster 1 to Cluster 2.****a. Verify the session list of vdom2 on FGT_A:**

```
FGT_A (vdom2) # diagnose sys session list

```

```
no_ofld_reason:
total session 1
```

Session synchronization filters are designed to be configured symmetrically on all of the FGSP peers. In cases where the filters are configured asymmetrically, note the following differences:

- In an FGCP over FGSP topology, session filtering will be applied on the FGSP peer that has the filtering configured and is receiving the session synchronization.
- In an FGSP topology between standalone peers, the filtering will be applied on the FGSP peer that has the filtering configured and is sending out the session synchronization.

FGSP static site-to-site IPsec VPN setup

When configuring static site-to-site IPsec VPN between FGSP FortiGates and a remote gateway, the FGSP peers must have the `passive-mode` setting enabled in the `vpn ipsec phase1-interface` configuration to function as an IPsec responder. This is a required configuration in this setup. If the FGSP peers act as initiators for tunnel setup when `passive-mode` is disabled and both FGSP peers initiate the tunnel with the same gateway IP, the remote IPsec gateway will be unable to process this, and the tunnel negotiation will fail. Likewise, when a failover occurs in FGSP and a new peer begins to initiate tunnel traffic, the remote IPsec gateway will be unable to handle the traffic initiated from the new peer.

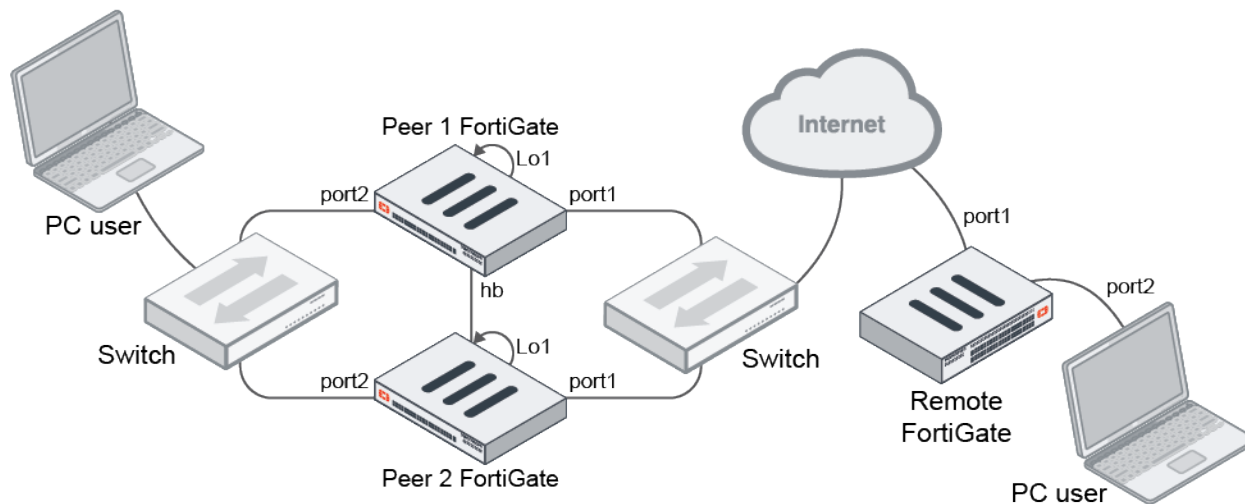

Enabling `passive-mode` ensures the FGSP peers only respond to tunnel initiations from the remote IPsec gateway and do not initiate tunnel negotiations. This way, the preceding situations will not occur.

For dynamic tunnel configuration examples on FGSP peers, see the following topics:

- [FGSP per-tunnel failover for IPsec on page 2213](#)
- [FGCP over FGSP per-tunnel failover for IPsec on page 2218](#)
- [Allow IPsec DPD in FGSP members to support failovers on page 2228](#)

Example

In this example, the FGSP peer has a loopback interface (Lo1) configured with the same IP address (192.168.202.31/32). All other interface IP addresses are different between the peers.

To configure IPsec on the FGSP peer FortiGates:**1. Configure the phase 1 settings:**

```
config vpn ipsec phase1-interface
  edit "IPsec"
    set type static
    set set interface "port1"
    set ike-version 2
    set local-gw 192.168.202.31
    set net-device disable
    set proposal aes256-sha256
    set dhgrp 14
    set passive-mode enable
    set remote-gw 10.10.100.100
  next
end
```

2. Configure the phase 2 settings:

```
config vpn ipsec phase2-interface
  edit "IPSec"
    set phasename "IPsec"
    set proposal aes256-sha256
    set dhgrp 14
  next
end
```

To configure IPsec on the remote FortiGate:**1. Configure the phase 1 settings:**

```
config vpn ipsec phase1-interface
  edit "IPsec"
    set type static
    set set interface "port1"
    set ike-version 2
    set net-device disable
    set proposal aes256-sha256
    set dhgrp 14
    set remote-gw 192.168.202.31
  next
end
```

2. Configure the phase 2 settings:

```
config vpn ipsec phase2-interface
  edit "IPSec"
    set phasename "IPsec"
    set proposal aes256-sha256
    set dhgrp 14
  next
end
```

FGSP per-tunnel failover for IPsec

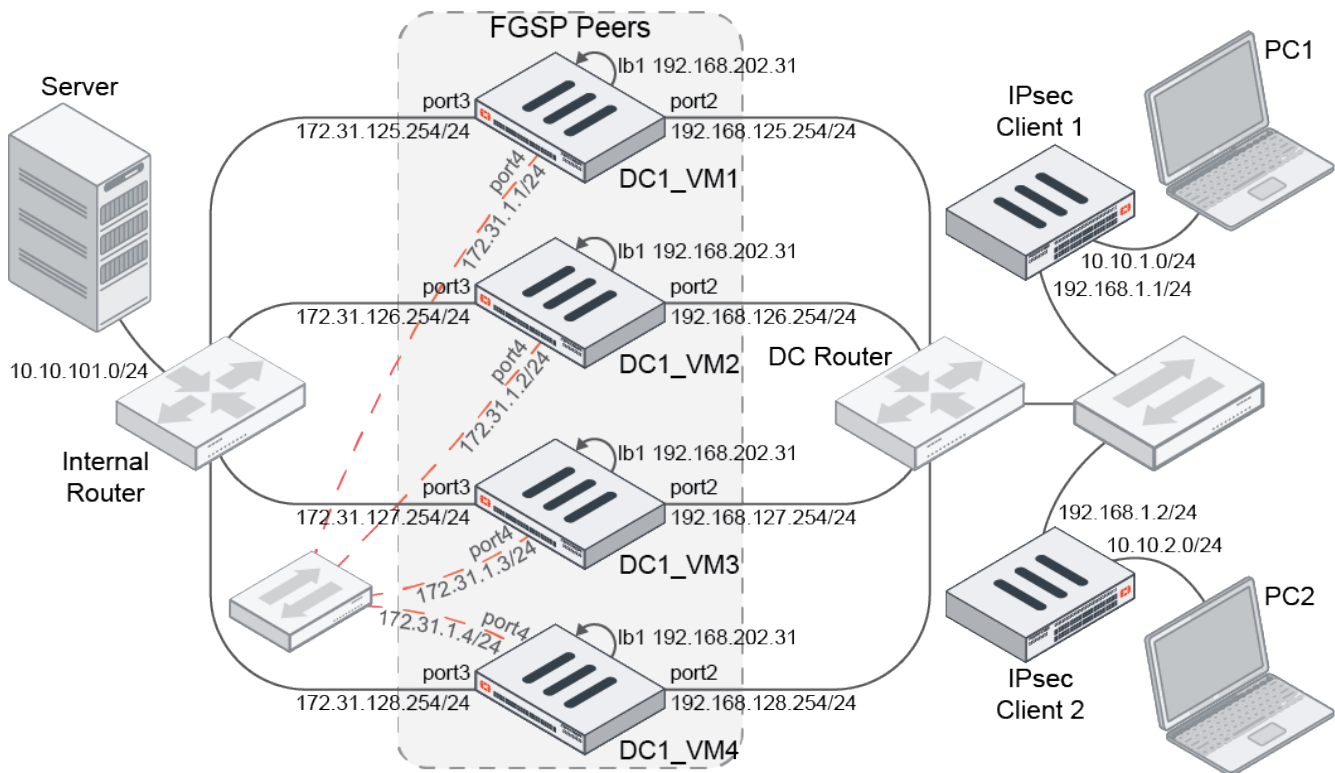

During FGSP per-tunnel failover for IPsec, the same IPsec dialup server configured on each FGSP member may establish tunnels with dialup clients as the primary gateway. The IPsec SAs are synchronized to all other FGSP peers that have FGSP synchronization for IPsec enabled. Other FGSP members may establish a tunnel with other clients on the same dialup server and synchronize their SAs to other peers.

Upon the failure of the FGSP member that is the primary gateway for a tunnel, the upstream router will fail over the tunnel traffic to another FGSP member. The other FGSP member will move from standby to the primary gateway for that tunnel and continue to forward traffic.

```
config vpn ipsec phase1-interface
  edit <name>
    set fgsp-sync {enable | disable}
  next
end
```

Example

In this example, the FGSP peers are connected on port4 over 172.31.1.1-4/24. Each peer has a loopback interface, lb1, with the same IP address. This loopback interface is used as the local gateway on each of the phase 1 connections to avoid each FGSP member having different IPs on port2. The DC Router uses ECMP to distribute traffic to each FGSP peer. It is assumed that the networking addresses are already configured properly.

Interface/setting	DC1_VM1	DC1_VM2	DC1_VM3	DC1_VM4
port2	192.168.125.254/24	192.168.126.254/24	192.168.127.254/24	192.168.128.254/24

Interface/setting	DC1_VM1	DC1_VM2	DC1_VM3	DC1_VM4
port3	172.31.125.254/24	172.31.126.254/24	172.31.127.254/24	172.31.128.254/24
port4	172.31.1.1/24	172.31.1.2/24	172.31.1.3/24	172.31.1.4/24
lb1	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32
fgsp-sync	Enabled	Enabled	Enabled	Disabled

Out of the four FGSP peers, DC1_VM1, DC1_VM2, and DC1_VM3 have `fgsp-sync` enabled in their IPsec phase 1 configurations. This allows the three FGSP members to synchronize IPsec SAs as clients establish dialup tunnels to them individually. DC1_VM4, which does not have `fgsp-sync` configured, will not participate in synchronizing IPsec SAs or establishing tunnels. The DC Router uses ECMP to route traffic to the destination 192.168.202.31 through each of the participating FGSP peers.

In a larger scale there may be many more IPsec dialup clients connecting, with each eligible FGSP peer being the primary gateway for a set of dialup tunnels, and is in standby for the rest of the tunnels. If an FGSP peer fails, traffic will fail over to other peers, and these peers will become primary gateways for the respective dialup tunnels.

To configure the FGSP peers (DC1_VM1):

The following steps are to configure DC1_VM1. The other peers have similar configurations based on the preceding table. In the `config vpn ipsec phase1-interface` settings, all peers should have the same local gateway external interface (192.168.202.31).

1. Configure the FGSP cluster and session synchronization:

```
config system cluster-sync
  edit 1
    set peerip 172.31.1.2
  next
  edit 2
    set peerip 172.31.1.3
  next
  edit 3
    set peerip 172.31.1.4
  next
end
```

2. Configure the additional FGSP attributes:

```
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 1
end
```

3. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
  edit "vpn1"
    set type dynamic
    set interface "port2"
    set ike-version 2
    set local-gw 192.168.202.31
    set keylife 90000
```

```

    set peertype one
    set net-device disable
    set proposal aes128-sha1
    set dpd on-idle
    set dhgrp 2
    set fgsp-sync enable
    set nattraversal disable
    set peerid "Nokia_Peer"
    set psksecret xxxxx
    set dpd-retryinterval 60
  next
end

```

4. Configure the VPN tunnel phase 2 settings:

```

config vpn ipsec phase2-interface
  edit "vpn1"
    set phasename "vpn1"
    set proposal aes128-sha1
    set keylifeseconds 10800
  next
end

```

To verify the configuration:

1. Once the FGSP members establish peering with each other, verify the standalone peers on DC1_VM1:

```

DC1_VM1 # diagnose sys ha standalone-peers
Group=1, ID=1
Detected-peers=3
Kernel standalone-peers: num=3.
peer0: vfid=0, peerip:port = 172.31.1.2:708, standalone_id=2

standalone_id=15:

```

2. Initiate a dialup tunnel connection from the IPsec Client 2 FortiGate (192.168.1.2).
3. Verify the tunnel list for vpn1_1 on each peer. The output shows the bi-directional SAs for that particular tunnel are synchronized to all participating FGSP peers.

```

d. DC1_VM4:

```

DC1_VM4 # diagnose vpn tunnel list name vpn1_1
list ipsec tunnel by names in vd 0

```

The IPsec tunnel `role=sync-primary` on DC1_VM1 indicates that the IPsec tunnel was established on the FortiGate and traffic is being forwarded. On DC1_VM2 and DC1_VM3, the IPsec tunnel `role=standby` indicates that they are synchronized from the FGSP peer and are in standby for traffic forwarding.

The IPsec SAs do not synchronize to DC1_VM4 because `fgsp-sync` is disabled.

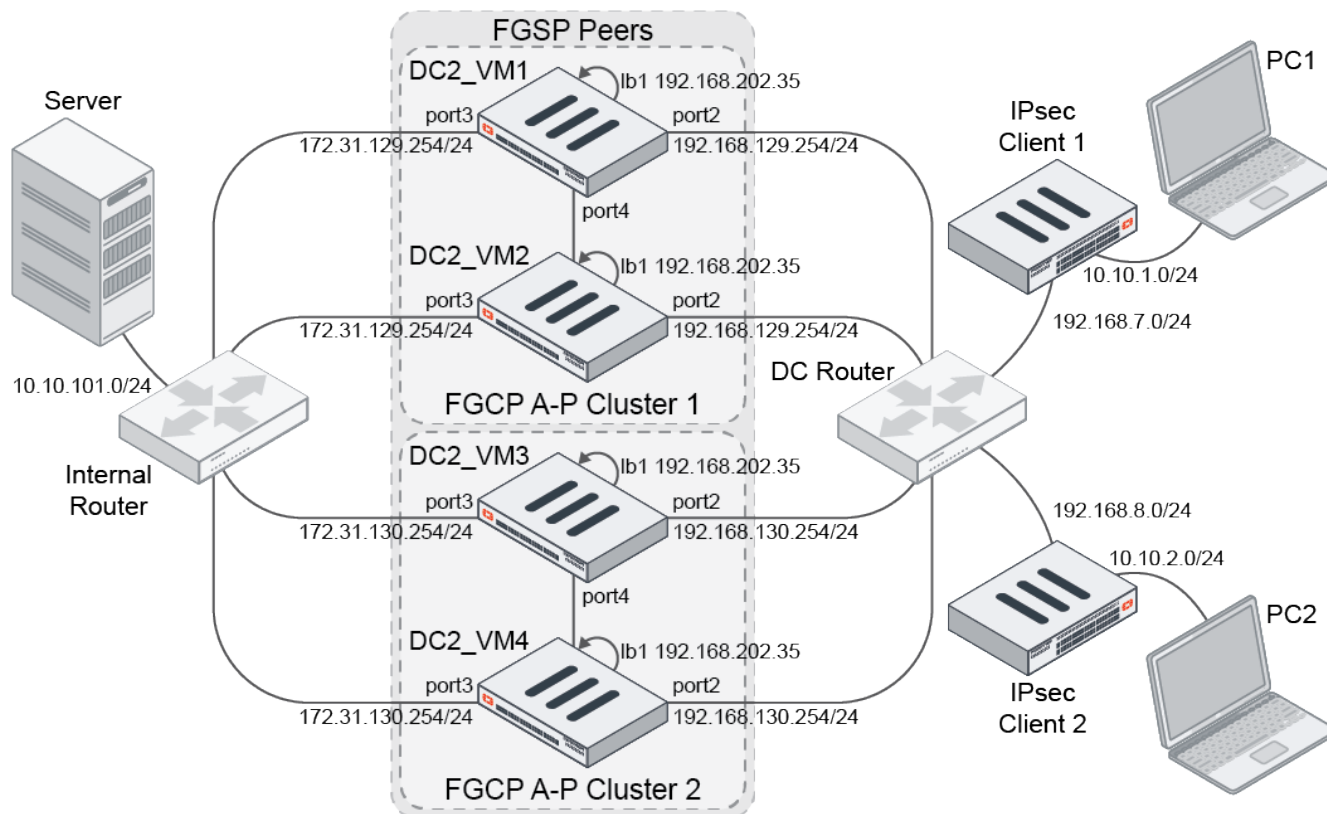

- When a failure occurs on DC1_VM1, the tunnel traffic will fail over to either DC1_VM2 or DC1_VM3. Its tunnel role will become `role=sync-primary`.

FGCP over FGSP per-tunnel failover for IPsec

For additional redundancy, an FGCP cluster on one site may form FGSP peering with FGCP clusters on other sites. The FGCP over FGSP peers can still synchronize IPsec SAs and act as the primary gateway for individual tunnels for the same dialup servers. When failover happens within an FGCP cluster, tunnel traffic will failover to the other FGCP cluster member. When an FGCP cluster fails, tunnel traffic will failover to the other FGSP peer.

Example

In this example, each FGCP A-P cluster is connected on port4 as the heartbeat interface. The FGSP peers are connected on port5 over 172.31.2.1-2/24. Each FGSP peer and FGCP cluster has a loopback interface, lb1, with the same IP address. This loopback interface is used as the local gateway on each of the phase 1 connections to avoid each FGSP member having different IPs on port2. The DC Router uses ECMP to distribute traffic to each FGSP peer. It is assumed that the networking addresses are already configured properly.

Interface/setting	DC2_VM1	DC2_VM2	DC2_VM3	DC2_VM4
port2	192.168.129.254/24	192.168.129.254/24	192.168.130.254/24	192.168.130.254/24
port3	172.31.129.254/24	172.31.129.254/24	172.31.130.254/24	172.31.130.254/24
port4	FGCP HA heartbeat interface	FGCP HA heartbeat interface	FGCP HA heartbeat interface	FGCP HA heartbeat interface
port5	172.31.2.1/24	172.31.2.1/24	172.31.2.2/24	172.31.2.2/24
lb1	192.168.202.35/32	192.168.202.35/32	192.168.202.35/32	192.168.205.35/32
fgsp-sync	Enabled	Enabled	Enabled	Enabled

There are two pairs of FGCP A-P HA clusters that form FGSP peering with each other. This is a typical FGCP over FGSP configuration used in large enterprises and service provider environments where high redundancy is needed. Each cluster uses the same loopback address for the local gateway. The DC Router uses ECMP to route traffic to the destination 192.168.202.31 through each of the participating FGSP peers.

In a larger scale there may be many more members in the FGCP clusters, more FGSP peers, and more IPsec dialup clients connecting. Each eligible FGSP peer will be the primary gateway for a set of dialup tunnels, and is in standby for the rest of the tunnels. When the FGCP cluster is configured in A-P mode, the tunnels will be established on the primary unit and synchronized to the standby unit.

The following configurations and example demonstrates PC1 initiating traffic to the Server. First, a dialup tunnel is formed between FortiGate IPsec Client 1 and DC2_VM1, which allows traffic to go through. IPsec SAs are synchronized to the FGCP standby unit, and to the FGSP peer. Upon failure of DC2_VM1, DC2_VM2 takes over as the primary of the HA cluster, and assumes the primary role for the failover tunnels.

If both DC2_VM1 and DC2_VM2 fail, the tunnels that were formed on this FGSP peer will now be re-routed to the other FGSP peer. The primary FGCP cluster member, DC2_VM3, will now pick up the tunnel traffic and assume the primary role for the failover tunnels.

To configure the HA clusters:

1. Configure FGCP A-P Cluster 1 (use the same configuration for DC2_VM1 and DC2_VM2):

```
config system ha
  set group-id 1
  set group-name "DC2_VM12"
  set mode a-p
  set password *****
  set hbdev "port4" 50
  set session-pickup enable
  set uninterruptible-upgrade disable
  set override disable
  set priority 100
end
```

2. Configure FGCP A-P Cluster 2 (use the same configuration for DC2_VM3 and DC2_VM4):

```
config system ha
  set group-id 2
  set group-name "DC2_VM34"
  set mode a-p
  set password *****
  set hbdev "port4" 50
  set session-pickup enable
  set uninterruptible-upgrade disable
  set override disable
  set priority 100
end
```

To configure the FGSP peers:

1. Configure DC2_VM1.

- a. Configure the FGSP cluster and session synchronization:

```
config system cluster-sync
  edit 1
    set peerip 172.31.2.2
  next
end
```

- b. Configure the additional FGSP attributes:

```
config system standalone-cluster
  set standalone-group-id 2
  set group-member-id 1
end
```

The configuration is automatically synchronized to DC2_VM2.

2. Configure DC2_VM3.

a. Configure the FGSP cluster and session synchronization:

```
config system cluster-sync
  edit 1
    set peerip 172.31.2.1
  next
end
```

b. Configure the additional FGSP attributes:

```
config system standalone-cluster
  set standalone-group-id 2
  set group-member-id 2
end
```

The configuration is automatically synchronized to DC2_VM4.

3. To configure the IPsec VPN settings (use the same configuration for DC2_VM1 and DC2_VM3).**a. Configure the VPN tunnel phase 1 settings:**

```
config vpn ipsec phase1-interface
  edit "vpn1"
    set type dynamic
    set interface "port2"
    set ike-version 2
    set local-gw 192.168.202.35
    set keylife 90000
    set peertype one
    set net-device disable
    set proposal aes128-sha1
    set add-route disable
    set dpd on-idle
    set dhgrp 2
    set fgsp-sync enable
    set nattraversal disable
    set peerid "Nokia_Peer"
    set psksecret *****
    set dpd-retryinterval 60
  next
end
```

b. Configure the VPN tunnel phase 2 settings:

```
config vpn ipsec phase2-interface
  edit "vpn1"
    set phase1name "vpn1"
    set proposal aes128-sha1
    set keylifeseconds 10800
  next
end
```

To verify the configuration:**1. The FGCP HA cluster and the FGSP peering have formed. Verify the respective HA statuses.****a. Verify the FGCP cluster status on DC2_VM1:**

```
DC2_VM1 # diagnose sys ha status
```

```

HA information
Statistics
    traffic.local = s:0 p:439253 b:89121494
    traffic.total = s:0 p:440309 b:89242174

enc_npuid=0

```

The IPsec tunnel `role=sync-primary` on DC2_VM1 indicates that it is being used to carry IPsec traffic. On DC2_VM2, DC2_VM3, and DC2_VM4, the IPsec tunnel `role=standby` indicates that they are in standby for traffic forwarding.

To test failover scenarios:

1. Verify the sniffer trace on DC2_VM1 before FGCP HA failover:

```

DC2_VM1 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.171753 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.171763 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.171941 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.171947 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply

```

Traffic passes through DC2_VM1.

2. Reboot the primary FortiGate, DC2_VM1.

3. Verify the sniffer trace on DC2_VM2 after FGCP HA failover:

```

DC2_VM2 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.111107 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.111118 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.111293 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.111298 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
^C
16 packets received by filter
0 packets dropped by kernel

```

Traffic passes through DC2_VM2.

4. Verify the tunnel list for vpn1_1 on DC2_VM2:

```

DC2_VM2 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=vpn1_1 ver=2 serial=4 192.168.202.35:0->192.168.7.2:0 tun_id=192.168.7.2 tun_
id6=::10.0.0.4 dst_mtu=1500 dpd-link=on weight=1
bound_if=6 lgwy=static/1 tun=intf/0 mode=dial_inst/3 encap=none/8840 options[2288]=npu
rgwy-chg frag-rfc run_state=0 role=sync-primary accept_traffic=1 overlay_id=0

```

```

  npuid=0

```

The role has changed to role=sync-primary.

5. Shut down DC2_VM1 and the DC2_VM2 IPsec uplink interface.
6. Verify the sniffer trace on DC2_VM3. As expected, traffic now passes through DC2_VM3:

```

DC2_VM3 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.165088 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.165102 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.165294 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.165301 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
^C
14 packets received by filter
0 packets dropped by kernel

```

7. Verify the tunnel list for vpn1_1 on DC2_VM3:

```

DC2_VM3 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
-----
name=vpn1_1 ver=2 serial=4 192.168.202.35:0->192.168.7.2:0 tun_id=192.168.7.2 tun_

npuid=0

```

The role has changed to `role=sync-primary`.

Allow IPsec DPD in FGSP members to support failovers

In conjunction with support for [FGSP per-tunnel failover for IPsec on page 2213](#), configuring DPD (dead peer detection) on an FGSP member is permitted. This allows a failed FGSP member to send out DPD probes during failover to detect unreachable remote peers and to flush the corresponding tunnels.

Example

In this example, using the same configuration as in [FGCP over FGSP per-tunnel failover for IPsec on page 2218](#), a tunnel can be established from one of the remote IPsec clients to one of the FGSP members (DC1_VM1). DPD can be set to `on-idle`, with a configured `dpd-retryinterval` of 60 seconds. When a client disappears, whether it is due to remote client failures or server-side routing failures, the FGSP member or gateway (DC1_VM1) will send out DPD probes for detection. Once the three iterations are complete and no responses are detected, the FGSP member will flush the tunnel and remove any routing to that peer.

Interface/setting	DC1_VM1	DC1_VM2	DC1_VM3	DC1_VM4
port2	192.168.125.254/24	192.168.126.254/24	192.168.127.254/24	192.168.128.254/24
port3	172.31.125.254/24	172.31.126.254/24	172.31.127.254/24	172.31.128.254/24
port4	172.31.1.1/24	172.31.1.2/24	172.31.1.3/24	172.31.1.4/24
lb1	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32
fgsp-sync	Enabled	Enabled	Enabled	Disabled

To configure the FGSP peers (DC1_VM1):

The following steps are to configure DC1_VM1. The other peers have similar configurations based on the preceding table. In the `config vpn ipsec phase1-interface` settings, all peers should have the same local gateway external interface (192.168.202.31). For DC1_VM4, `fgsp-sync` is disabled in the VPN tunnel phase 1 settings.

1. Configure the FGSP cluster and session synchronization:

```
config system cluster-sync
  edit 1
    set peerip 172.31.1.2
  next
  edit 2
    set peerip 172.31.1.3
  next
  edit 3
    set peerip 172.31.1.4
  next
end
```

2. Configure the additional FGSP attributes:

```
config system standalone-cluster
  set standalone-group-id 1
  set group-member-id 1
end
```

3. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
  edit "vpn1"
    set type dynamic
    set interface "port2"
    set ike-version 2
    set local-gw 192.168.202.31
    set keylife 90000
    set peertype one
    set net-device disable
    set proposal aes128-sha1
    set dpd on-idle
    set dhgrp 2
    set fgsp-sync enable
    set nattraversal disable
```

```

        set peerid "Nokia_Peer"
        set psksecret xxxxx
        set dpd-retryinterval 60
    next
end

```

4. Configure the VPN tunnel phase 2 settings:

```

config vpn ipsec phase2-interface
    edit "vpn1"
        set phasename "vpn1"
        set proposal aes128-sha1
        set keylifeseconds 10800
    next
end

```

To verify the configuration:

1. Once the FGSP members establish peering with each other, verify the standalone peers on DC1_VM1:

```

DC1_VM1 # diagnose sys ha standalone-peers
Group=1, ID=1
Detected-peers=3
Kernel standalone-peers: num=3.
peer0: vfid=0, peerip:port = 172.31.1.2:708, standalone_id=2

```

Standalone configuration synchronization

You can configure synchronization from one standalone FortiGate to another standalone FortiGate (standalone-config-sync). With the exception of some configurations that do not sync (settings that identify the FortiGate to the network), the rest of the configurations are synced, such as firewall policies, firewall addresses, and UTM profiles.

This option is useful in situations when you need to set up FGSP peers, or when you want to quickly deploy several FortiGates with the same configurations. You can set up `standalone-config-sync` for multiple members.

`standalone-config-sync` is an independent feature and should be used with caution as there are some limitations. We recommend disabling it once the configurations have been synced over.

Limitations

When standalone configuration synchronization is enabled, there are some limitations, including but not limited to the following:

- Network interruptions occur during firmware upgrades: when upgrading the firmware, all members in the `standalone-config-sync` group are upgraded simultaneously. This creates downtime if the FortiGates are the only outgoing gateway in the network. We recommend disabling the option before upgrading firmware.
- Some unwanted configurations might be synced: the current design and implementation of `standalone-config-sync` is based on requirements from specific customers. Thus, some users may find that unwanted parts of the configurations are synced. Should this occur, we recommend disabling the option and modifying those configurations manually.
- The wrong primary device might be selected accidentally: `standalone-config-sync` is derived from the HA primary unit selection mechanism. All members in the group will join the selection process in the same way as a the HA cluster selection process. It is important to select the correct device as the primary, otherwise the wrong device could be selected and existing configurations could be overwritten.

Setting up standalone configuration synchronization

Two or more standalone FortiGates should be connected to each other with one or more heartbeat interfaces, either back-to-back or via a switch. In the following example, the device supplying the configurations is called "conf-prim," and the devices receiving the configurations are called "conf-secos."

To set up standalone configuration synchronization:

1. Configure the conf-prim device for the group:

```
config system ha
  set hbdev ha1 50 ha2 100
  set priority 255
  set override enable
  set standalone-config-sync enable
end
```

2. Configure the conf-prim device as needed to be functional.
3. Configure the other group members as conf-secos:

```
config system ha
  set standalone-config-sync enable
end
```

4. Wait 10–15 minutes for the configurations to sync over.
5. Verify the synchronization status:

```
# get system ha status
path=system, objname=ha, tablename=(null), size=5912
HA Health Status:

```

If all members are `in-sync`, this means all members share the same configurations, except those that should not be synced. If any members are `out-of-sync`, this means the member failed to sync with the primary device.

Debugging is similar when a cluster is out of sync.

The following topic provides more information about standalone configuration synchronization:

- [Layer 3 unicast standalone configuration synchronization on page 2236](#)

Layer 3 unicast standalone configuration synchronization

Unicast standalone configuration synchronization is supported on layer 3, allowing peers to be synchronized in cloud environments that do not support layer 2 networking. Configuring a unicast gateway allows peers to be in different subnets.

Example

In this example, two FortiGates in different subnets are connected through a unicast gateway. Both cluster members use the same port for the heartbeat interface.

To configure unicast synchronization between peers:

1. Configure FortiGate A:

```

config system ha
    set group-name "testcs"
    set hbdev "port3" 50
    set standalone-config-sync enable
    config unicast-peers
        edit 1
            set peer-ip 10.1.100.72
        next
    end
    set override enable
    set priority 200
    set unicast-status enable
    set unicast-gateway 172.16.200.74
end
  
```

2. Configure FortiGate B:

```

config system ha
    set group-name "testcs"
    set hbdev "port3" 50
    set standalone-config-sync enable
    config unicast-peers
        edit 1
            set peer-ip 172.16.200.71
        next
    end
    set override enable
    set priority 100
    set unicast-status enable
    set unicast-gateway 10.1.100.74
end
  
```

3. Check the HA status on FortiGate A:

```

# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: ConfigSync
Group: 0
Debug: 0
Cluster Uptime: 2 days 3:40:25
Cluster state change time: 2021-03-08 12:00:38
Primary selected using:
    <2021/03/08 12:00:38> FGVMSLTM00000001 is selected as the primary because its
    override priority is larger than peer member FGVMSLTM00000002.
    <2021/03/06 11:50:35> FGVMSLTM00000001 is selected as the primary because it's the
    only member in the cluster.
ses_pickup: disable
override: enable
Configuration Status:
    FGVMSLTM21000151(updated 5 seconds ago): in-sync
    FGVMSLTM21000152(updated 5 seconds ago): in-sync
System Usage stats:
    FGVMSLTM21000151(updated 5 seconds ago):
        sessions=7, average-cpu-user/nice/system/idle=0%/0%/0%/100%, memory=24%
    FGVMSLTM21000152(updated 5 seconds ago):
        sessions=5, average-cpu-user/nice/system/idle=0%/0%/0%/100%, memory=23%
HBDEV stats:
    FGVMSLTM21000151(updated 5 seconds ago):
        port3: physical/1000auto, up, rx-
bytes/packets/dropped/errors=466060007/1049137/0/0, tx=429538329/953028/0/0
    FGVMSLTM21000152(updated 5 seconds ago):
        port3: physical/1000auto, up, rx-
bytes/packets/dropped/errors=48805199/85441/0/0, tx=33470286/81425/0/0
Primary      : FGT-71          , FGVMSLTM00000001, HA cluster index = 1
Secondary    : FGT-72          , FGVMSLTM00000002, HA cluster index = 0
number of vcluster: 1
vcluster 1: work 0.0.0.0
Primary: FGVMSLTM00000001, HA operating index = 0
Secondary: FGVMSLTM00000002, HA operating index = 1

```

4. Check the HA checksums on FortiGate A:

```

# diagnose sys ha checksum cluster

===== FGVMSLTM00000001 =====

is_manage_primary()=1, is_root_primary()=1
debugzone
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee

all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd
```

5. Verify that configuration changes on the primary FortiGate are synchronized to the secondary FortiGate:

a. Adjust the administrator timeout value on FortiGate A:

```
config system global
    set admintimeout 100
end
```

b. Check the debug messages on FortiGate B:

```
# diagnose debug cli 7
Debug messages will be on for 30 minutes.

# diagnose debug enable

create pid=15639, clictyno=0, last=1615246288
0: conf sys global
0: set admintimeout 100
0: end
```

VRRP

A Virtual Router Redundancy Protocol (VRRP) configuration can be used as a high availability solution to ensure that a network maintains connectivity with the internet (or with other networks) even if the default router for the network fails. If a router or a FortiGate fails, all traffic to this device transparently fails over to another router or FortiGate that takes over the role of the failed device. If the failed device is restored, it will take over processing the network traffic.

FortiOS supports VRRP versions 2 and 3. VRRP domains can be created, which can include multiple FortiGates and other VRRP-compatible routers. Different FortiGate models can be added to the same VRRP domain.

FortiOS supports IPv4 and IPv6 VRRP, so IPv4 and IPv6 VRRP virtual routers can be added to the same interface. FortiGates can quickly and easily integrate into a network that has already deployed VRRP.

Basic VRRP configuration

The most common VRRP application is to provide redundant default routers between an internal network and the internet. The default routers can be FortiGates or any routers that support VRRP.

Two or more FortiGate interfaces or routers must be configured with the same virtual router ID and IP address so they can automatically join the same VRRP domain. Priorities must be assigned to each FortiGate interface or router in the VRRP domain. All of the routers in the VRRP domain should have different priorities. One FortiGate interface or router must have the highest priority to become the primary router. The other FortiGates or routers in the domain are assigned lower priorities and become backups. If the primary router fails, VRRP automatically fails over to the router in the domain with the next highest priority.

To configure VRRP:

1. Add a virtual VRRP router to the internal interface of each FortiGate and/or router. This adds the FortiGates and routers to the same VRRP domain.
2. Set the VRRP IP address of the domain to the internal network default gateway IP address.
3. Set the priorities.

See [Adding IPv4 and IPv6 virtual routers to an interface on page 2239](#) [Single-domain VRRP example on page 2246](#), and [Multi-domain VRRP example on page 2247](#) for configuration examples.

During normal operations, all traffic from the internal network to the internet passes through the primary VRRP router. The primary router also sends VRRP advertisement messages to the backup routers. A backup router will not attempt to become a primary router while receiving these messages. If the primary router fails, the backup router with the highest priority becomes the new primary router after a short delay. All packets sent to the default route are now sent to the new primary router. If the new primary router is a FortiGate, the network continues to benefit from FortiOS security features. If the new primary router is just a router, traffic continues to flow, but FortiOS security features are unavailable until the FortiGate is back online.

If the backup router is a FortiGate, during a VRRP failover as the FortiGate begins operating as the new primary router, it will not have session information for all of the failed over in-progress sessions. So, it would normally not be able to forward in-progress session traffic.

Adding IPv4 and IPv6 virtual routers to an interface

This topic describes to how to add IPv4 and IPv6 virtual routers to an interface. VRRP can only be configured on physical or VLAN interfaces. VRRP cannot be configured on hardware switch interfaces where multiple physical interfaces are combined into a hardware switch interface.

IPv4 virtual router

In this example, an IPv4 VRRP router is added to port10 on the FortiGate. The VRRP virtual router has a virtual router ID of 200, uses IP address 10.31.101.200, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.

To configure the interface settings:

```
config system interface
  edit port10
    config vrrp
      edit 200
        set vrip 10.31.101.200
        set priority 255
      next
    end
  next
end
```

IPv6 virtual router

In this example, an IPv6 VRRP router is added to port20 on the FortiGate. The VRRP virtual router has a virtual router ID of 220, uses IP address 2001:db8:1::12, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.

To configure the interface settings:

```
config system interface
  edit port20
    config ipv6
      set vrip6_link_local <IPv6_address>
    config vrrp6
      edit 220
        set vrip 2001:db8:1::12
        set priority 255
      next
    end
  end
next
end
```

VRRP failover

VRRP routers in a VRRP domain periodically send VRRP advertisement messages to all routers in the domain to maintain one router as the primary router and the others as backup routers. The primary router has the highest priority. If the backup routers stop receiving these packets from the primary router, the backup router with the highest priority becomes the new primary router.

The primary router stops sending VRRP advertisement messages if it fails or becomes disconnected. Up to two VRRP destination addresses can be configured to be monitored by the primary router. As a best practice, the destination addresses should be remote addresses. If the primary router is unable to connect to these destination addresses, it stops sending VRRP advertisement messages, and the backup router with the highest priority becomes the primary router.

To configure IPv4 VRRP with two destination addresses for monitoring:

```
config system interface
  edit port14
    config vrrp
```

```
        edit 12
          set vrdst 10.10.10.20 10.20.20.10
        next
      end
    next
  end
```

To configure IPv6 VRRP with one destination address for monitoring:

```
config system interface
  edit port23
    config ipv6
      config vrrp6
        edit 223
          set vrdst 2001:db8:1::12
        next
      end
    end
  next
end
```

IPv4 VRRP active failover

The `vrdst-priority` option can be used to reduce IPv4 VRRP failover times. This option causes the primary router to actively signal to the backup routers when the primary router cannot reach its configured destination addresses. The primary router sends a lower priority for itself in the VRRP advertisement messages. The backup router with the highest priority becomes the new primary router and takes over traffic processing.

In this example, the primary router is configured to have a priority of 255, so it should always become the primary router. The `vrdst-priority` is set to 10. If the primary router cannot connect to the 10.10.10.1 destination address, then the primary router informs the VRRP group that its priority is now 10.

To set the priority of the virtual router when the destination address is unreachable:

```
config system interface
  edit port10
    config vrrp
      edit 12
        set vrip 10.31.101.200
        set priority 255
        set vrdst 10.10.10.1
        set vrdst-priority 10
      next
    end
  next
end
```

IPv4 VIP and IP pool failover

The `proxy-arp` option can be used to map VIPs and IP pool address ranges to each router's VMAC (virtual MAC). After failover, the IP or ranges configured in the VRRP settings are routed to the new primary router's VMAC. In this example, a single IP and an address range are added for proxy ARP.

To configure the IP addresses for proxy ARP:

```
config system interface
  edit port5
    set vrrp-virtual-mac enable
    config vrrp
      edit 1
        config proxy-arp
          edit 1
            set ip 192.168.62.100-192.168.62.200
          next
          edit 2
            set ip 192.168.62.225
          next
        end
      next
    end
  next
end
```

Changing the advertisement message interval

By default, VRRP advertisement messages are sent once every second. The frequency can be changed with the `adv-interval` option to change the frequency of sending these messages (1 - 255 seconds).

The `adv-interval` also affects the period of time that a backup VRRP router waits before assuming the primary router has failed. The waiting period is three times the `adv-interval`. For example, if the `adv-interval` is set to 5, then the backup router waits for up to 15 seconds to receive a VRRP advertisement from the current primary router before taking over the role as the primary router.

To configure IPv4 VRRP to send advertisement messages every 10 seconds:

```
config system interface
  edit port14
    config vrrp
      edit 12
        set adv-interval 10
      next
    end
  next
end
```

To configure IPv6 VRRP to send advertisement messages every 20 seconds:

```
config system interface
  edit port23
    config ipv6
      config vrrp6
        edit 223
          set adv-interval 20
        next
      end
    next
  end
end
```

Changing the VRRP startup time

The VRRP startup time is the time a backup or primary VRRP router waits before sending or receiving VRRP advertisements before potentially changing state (`start-time` in seconds, 1 - 255, default = 3). This timer is mainly visible when VRRP-monitored interfaces become up after previously been down. When this occurs, the device will wait for the time period before considering, and potentially changing its status.

There are some instances when the advertisement messages might be delayed. For example, some switches with spanning tree enabled may delay some of the advertisement message packets. If backup routers are attempting to become primary routers even though the primary router has not failed, extend the start time to ensure that the backup routers wait long enough for the advertisement messages.

To configure the IPv4 VRRP startup time to 10 seconds:

```
config system interface
  edit port14
    config vrrp
      edit 12
        set start-time 10
      next
    end
  next
end
```

To configure the IPv6 VRRP startup time to 15 seconds:

```
config system interface
  edit port23
    config ipv6
      config vrrp6
        edit 223
          set start-time 15
        next
      end
    next
  end
end
```

VRRP groups

If VRRP routers are added to multiple interfaces of the same FortiGate, each router will be in a different VRRP domain. If one of the VRRP routers fails, it is useful if all of the VRRP routers added to the FortiGate also fail.

VRRP can only check the routers' status in a single VRRP domain and cannot track the status of routers in other domains. For multiple VRRP domains on a single FortiGate, only one can switch to being a backup, and the others remain operating normally. Using VRRP groups resolves this issue.

All the VRRP virtual routers on the FortiGate can be added to a VRRP group. If one of the virtual routers in a VRRP group switches to the backup, the VRRP group forces all members to switch to backups. All VRRP traffic being processed by the FortiGate fails over to other devices in the network.

The status of the virtual routers in a VRRP group only changes when one or more of the virtual routers in the group changes status. A VRRP group should not be used to manually change the status of the virtual routers in the group.

To configure two IPv4 VRRP routers in a VRRP group:

```
config system interface
  edit port10
    config vrrp
      edit 200
        set vrip 10.31.101.200
        set priority 255
        set vrgrp 10
      next
    end
  next
  edit port20
    config vrrp
      edit 100
        set vrip 10.23.1.223
        set priority 20
        set vrgrp 10
      next
    end
  next
end
```

To configure two IPv6 VRRP routers in a VRRP group:

```
config system interface
  edit port11
    config ipv6
      set vrip6_link_local <IPv6_address>
      config vrrp6
        edit 220
          set vrip 2001:db8:1::12
          set priority 255
          set vrgrp 90
        next
      end
    end
  next
  edit port12
    config ipv6
      set vrip6_link_local <IPv6_address>
      config vrrp6
        edit 220
          set vrip 2001:db8:1::14
          set priority 100
          set vrgrp 90
        next
      end
    end
  next
end
```

VRRP virtual MACs

The VRRP virtual MAC address (or virtual router MAC address) is a shared MAC address adopted by the primary router. If the primary router fails, the same virtual MAC address is picked up by the new primary router, allowing all devices on the network to transparently connect to the default route using the same virtual MAC address. This feature must be enabled on all members in a VRRP domain.

Each VRRP router has its own virtual MAC address. The last part octet is based on the VRRP router ID using the following format:

```
00-00-5E-00-01-<VRID_hex>
```

Where <VRID_hex> is the VRRP router ID in hexadecimal format in internet standard bit-order. For more information about virtual MAC formatting, see [RFC 3768](#).

For example:

- If the VRRP router ID is 10, then the virtual MAC is 00-00-5E-00-01-0a.
- If the VRRP router ID is 200, then the virtual MAC is 00-00-5E-00-01-c8.

If the VRRP virtual MAC address feature is disabled (the default setting), the VRRP domain uses the MAC address of the primary router. On a FortiGate VRRP virtual router, this is the MAC address of the FortiGate interface that the VRRP router is added to. If the primary fails, when the new primary takes over, it sends gratuitous ARPs to associate the VRRP router IP address with the MAC address of the new primary (or the FortiGate interface that became the new primary).

When a VRRP virtual MAC address is enabled, the new primary uses the same MAC address as the old primary.

Since devices on the LAN do not have to learn a new MAC address for a new VRRP router in the event of a failover, this feature can improve network efficiency, especially in large and complex networks.

To enable virtual MAC addresses in IPv4 VRRP:

```
config system interface
  edit <name>
    set vrrp-virtual-mac enable
  next
end
```

To enable virtual MAC addresses in IPv6 VRRP:

```
config system interface
  edit <name>
    config ipv6
      set vrrp-virtual-mac6 enable
    end
  next
end
```

Preempt mode

When preempt mode is enabled (the default setting), a higher priority backup router can preempt a lower priority primary router. This can happen if the primary router fails, the backup router becomes the primary router, and the failed primary router restarts. Since the restarted router has a higher priority, if preempt mode is enabled, the restarted router replaces the current primary router becoming the new primary router. If preempt mode is disabled, a restarted router that has a higher priority would not take over as the primary router.

Based on [RFC 3768 Section 5.3.4](#), "The priority value for the VRRP router that owns the IP address(es) associated with the virtual router MUST be 255 (decimal). VRRP routers backing up a virtual router MUST use priority values between 1-254 (decimal)."

Therefore, in cases where preempt mode is disabled, but the priority is set to 255, the restarted unit will take over as the primary router.

To configure preempt mode in IPv4 VRRP:

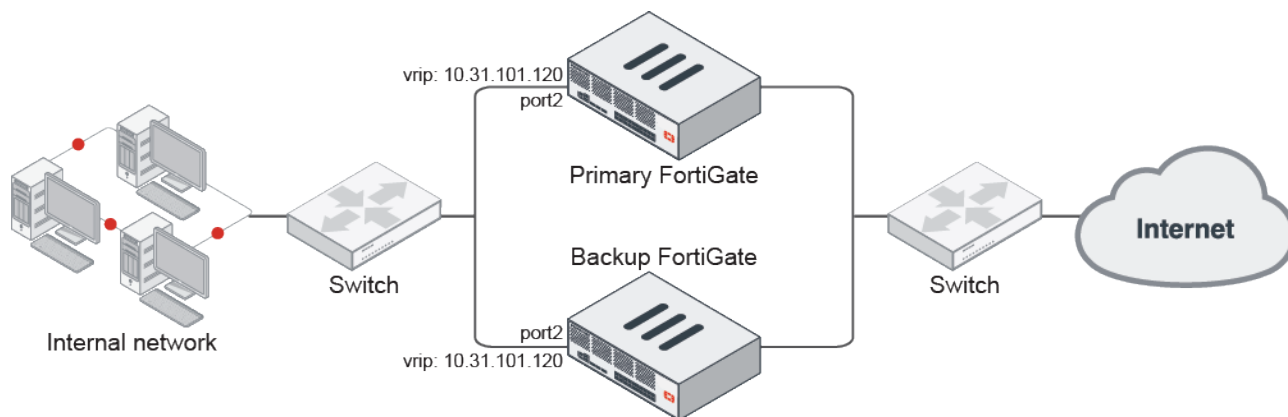

```
config system interface
  edit <name>
    config vrrp
      edit <vrid>
        set preempt {enable | disable}
      next
    end
  next
end
```

To configure preempt mode in IPv6 VRRP:

```
config system interface
  edit <name>
    config ipv6
      config vrrp6
        edit <vrid>
          set preempt {enable | disable}
        next
      end
    end
  next
end
```

Single-domain VRRP example

This example consists of a VRRP domain with two FortiGates that connect an internal network to the internet. The FortiGate port2 interfaces connect to the internal network, and a VRRP virtual router is added to each port2 interface with VRRP virtual MAC addresses enabled. The internal network default route is 10.31.101.120. Each FortiGate port2 interface has an IP address that is different from the virtual router IP address. Since `vrrp-virtual-mac` is enabled, upon failover, the new primary VRRP router will use the same VMAC as the previous router.

To configure the primary FortiGate:

```
config system interface
  edit port2
    set vrrp-virtual-mac enable
    config vrrp
      edit 5
        set vrip 10.31.101.120
        set priority 255
      next
    end
  next
end
```

To configure the backup FortiGate:

```
config system interface
  edit port2
    set vrrp-virtual-mac enable
    config vrrp
      edit 5
        set vrip 10.31.101.120
        set priority 50
      next
    end
  next
end
```

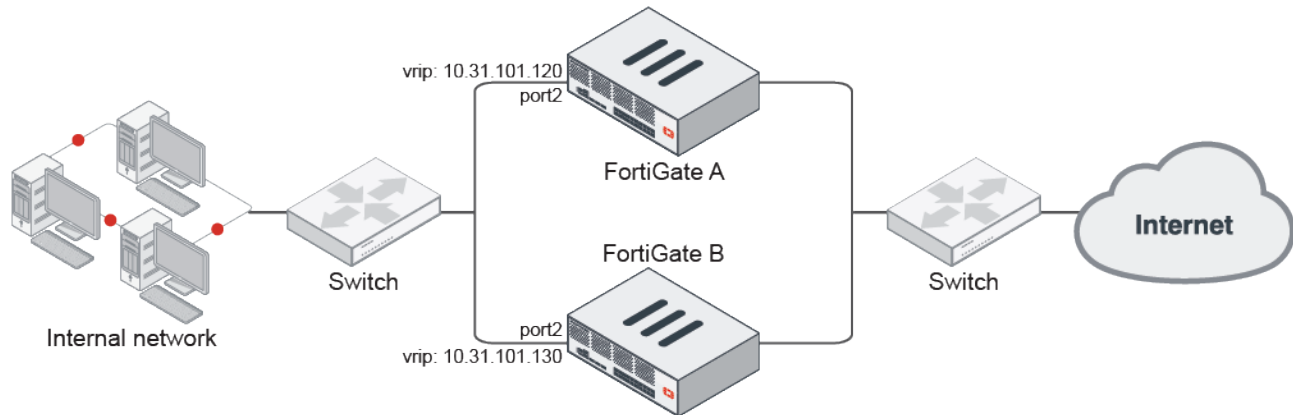

Multi-domain VRRP example

This example consists of two VRRP domains, and both FortiGates participate in the domains that connect an internal network to the internet. One FortiGate is the primary router of one domain and the other FortiGate is the primary router of the other domain. The network distributes traffic between two different default routes (10.31.101.120 and 10.31.101.130). One VRRP domain is configured with one of the default route IP addresses and the other VRRP domain gets the other default route IP address. During normal operation, both FortiGates process traffic, and the VRRP domains are used to load balance the traffic between the two FortiGates.

If one of the FortiGates fails, the remaining FortiGate becomes the primary router of both VRRP domains. The network sends all traffic for both default routes to this FortiGate. The result is a configuration that (under normal operational load)

balances traffic between two FortiGates, but if one of the FortiGates fails, all traffic fails over to the FortiGate that is still operating.

VRRP virtual MAC address are enabled on both FortiGates' port2 interfaces so that the VRRP domains use their VRRP virtual MAC addresses.

Device	VRRP primary			VRRP backup		
	Virtual router IP	ID	Priority	Virtual router IP	ID	Priority
FortiGate A	10.31.101.120	50	255	10.31.101.130	100	50
FortiGate B	10.31.101.130	100	255	10.31.101.120	50	50

To configure FortiGate A:

```
config system interface
  edit port2
    set vrrp-virtual-mac enable
    config vrrp
      edit 50
        set vrip 10.31.101.120
        set priority 255
      next
      edit 100
        set vrip 10.31.101.130
        set priority 50
      next
    end
  next
end
```

To configure FortiGate B:

```
config system interface
  edit port2
    set vrrp-virtual-mac enable
    config vrrp
      edit 50
        set vrip 10.31.101.120
        set priority 50
      next
    end
  next
end
```

```
    next
  edit 100
    set vrip 10.31.101.130
    set priority 255
  next
end
next
end
```

Session failover

Session failover means that after the primary unit fails, communications sessions resume on the new primary unit with minimal or no interruption. Two categories of sessions need to be resumed after a failover:

- Sessions passing through the cluster
- Sessions terminated by the cluster

Session failover (also called session-pickup) is not enabled by default for FortiGate. See [Session pickup on page 2249](#) for more information

Using the `session-sync-dev` option, you can select one or more FortiGate interfaces to use for synchronizing sessions as required for session pickup. See [Improving session sync performance on page 2254](#) for more information.

After a failover the new primary unit recognizes open sessions that were being handled by the cluster. The sessions continue to be processed by the new primary unit and are handled according to their last known state.

Session-pickup has some limitations. For example, session failover is not supported for sessions being scanned by proxy-based security profiles. Session failover is supported for sessions being scanned by flow-based security profiles; however, flow-based sessions that fail over are not inspected after they fail over. For more limitations, see [Pass-through sessions on page 2251](#).

Sessions terminated by the cluster do not failover and have to be restarted. There are some exceptions though, particularly for IPsec and SSL VPN. For more information, see [Terminated sessions on page 2253](#).

Session pickup

When session-pickup is enabled, the FGCP synchronizes the primary unit's TCP session table to all cluster units. As soon as a new TCP session is added to the primary unit's session table, that session is synchronized to all cluster units. This synchronization happens as quickly as possible to ensure the session tables remain synchronized.

If the primary unit fails, the new primary unit uses its synchronized session table to resume all TCP sessions that were being processed by the former primary unit, resulting in only minimal interruption. Under ideal conditions, all TCP sessions should be resumed. However, this is not guaranteed, and under less than ideal conditions, some TCP sessions may need to be restarted.

To enable session pickup in the GUI:

1. Go to *System > HA*.
2. Select the Primary FortiGate and click *Edit*.

3. Under *Cluster Settings*, enable *Session pickup*.
4. Click *OK* to save the setting.

To enable session pickup in the CLI:

```
config system ha
    set session-pickup enable
end
```

Enabling UDP, ICMP and broadcast packet session failover

By default, the FGCP does not maintain a session table for UDP, ICMP, or broadcast packets, even when session pickup is enabled. This means that the cluster does not specifically support the failover of these types of packets. However, it is possible to enable session pickup for UDP and ICMP packets. To do this, you must first enable session pickup for TCP sessions. After that, you can enable session pickup for connectionless sessions:

```
config system ha
    set session-pickup enable
    set session-pickup-connectionless enable
end
```

This configuration causes the cluster units to synchronize UDP and ICMP session tables and if a failover occurs UDP and ICMP sessions are maintained.

Enabling multicast session failover

To configure multicast session failover, use the following command to change the multicast TTL timer to a smaller value than the default. The recommended setting to support multicast session failover is 120 seconds (2 minutes). The default setting is 600 seconds (10 minutes).

```
config system ha
    set multicast-ttl 120
end
```

The multicast TTL timer controls how long to keep synchronized multicast routes on the backup unit, ensuring they are present on the backup unit when it becomes the new primary unit after a failover. If you set the multicast TTL lower, the multicast routes on the backup unit are refreshed more often, and are therefore more likely to be accurate. However reducing this time causes route synchronization to happen more often, which could affect performance.

Disabling session pickup

If you leave session pickup disabled, the cluster doesn't track sessions, and active sessions must be restarted or resumed after a failover. This is usually handled by TCP/IP communications.

The `session-pickup` setting does not affect session failover for sessions terminated by the cluster.

Disabling session pickup can reduce CPU and network bandwidth usage, especially if your cluster is mainly used for unsynchronized traffic. However, if session pickup is not enabled, sessions won't resume after a failover, causing a brief interruption. Most protocols can restart sessions with minimal data loss. For instance, web users can refresh their

browsers to resume browsing, but large file downloads may need to be restarted. Some protocols may require manual session restarts, like FTP file downloads.

Pass-through sessions

This section contains information about session failover for communication sessions passing through the cluster. In general, if session pickup is enabled, session failover is supported for most TCP traffic.

Protocol	Session failover
Most TCP sessions	Supported if session-pickup is enabled. See TCP session failover on page 2251 for more information.
Multicast sessions	Supported if multicast session-pickup is enabled. See Enabling multicast session failover on page 2250 for more information.
IPv6, NAT64, and NAT66	Supported if session-pickup is enabled.
Proxy-based security profile sessions	Not Supported; sessions have to be restarted. Proxy-based features require the FortiGate to maintain very large amounts of internal state information for each session. The FGCP does not synchronize this internal state information. As a result, proxy-based sessions are not failed over. Active-active clusters can resume some of these sessions after a failover. See Resume active-active HA subordinate units sessions after failover on page 2252 for more information.
Flow-based security profile sessions	Supported if session-pickup is enabled; however, internal state information is not synchronized so flow-based sessions that fail over are not inspected after they fail over. If both flow-based and proxy-based security profile features are applied to a TCP session, that session will not resume after a failover.
UDP, ICMP, or broadcast sessions	Supported if connectionless session-pickup is enabled. See Enabling UDP, ICMP and broadcast packet session failover on page 2250 for more information.
GPRS Tunneling Protocol (GTP)	Supported with limitations. See FortiOS Carrier GTP session failover on page 2252 for more information.
SIP	Supported for active-passive HA only. See SIP session failover on page 2252 for more information.
SIMPLE or SCCP signal session	Not supported; sessions have to be restarted.
SSL offloading and HTTP multiplexing	Not supported; sessions have to be restarted. See SSL offloading and HTTP multiplexing session failover on page 2252 for more information.

TCP session failover

TCP sessions that are not being processed by security profile features resume after a failover even if these sessions are accepted by security policies with security profiles. Only TCP sessions that are actually being processed by these security profile features do not resume after a failover.

- TCP sessions that are not virus scanned, web filtered, spam filtered, content archived, or are not SIP, SIMPLE, or SCCP signal traffic resume after a failover, even if they are accepted by a security policy with security profile options enabled. For example, SNMP TCP sessions through the FortiGate resume after a failover because FortiOS does not apply any security profile options to SNMP sessions.
- TCP sessions for a protocol for which security profile features have not been enabled resume after a failover even if they are accepted by a security policy with security profile features enabled. For example, if you have not enabled any antivirus or content archiving settings for FTP, FTP sessions resume after a failover.

SIP session failover

If session pickup is enabled, the FGCP supports SIP session failover (also called stateful failover) for active passive HA.

SIP session failover replicates SIP states to all cluster units. If an HA failover occurs, all in-progress SIP calls (setup complete) and their RTP flows are maintained and the calls will continue after the failover with minimal or no interruption.

SIP calls being set up at the time of a failover may lose signaling messages. In most cases the SIP clients and servers should use message retransmission to complete the call setup after the failover has completed. As a result, SIP users may experience a delay if their calls are being set up when an HA failover occurs. But in most cases the call setup should be able to continue after the failover.

FortiOS Carrier GTP session failover

FortiOS Carrier HA supports GTP session failover. Once the GTP tunnel setup is completed, the primary unit synchronizes the GTP tunnel state across all cluster units. Although HA does not synchronize UDP sessions used by GTP, the new primary unit retains the GTP tunnel state information after a failover. This allows GTP UDP sessions using the same tunnel to continue to flow, albeit with certain limitations.

The limitation on packets continuing to flow is that there has to be a security policy to accept the packets. For example, if the FortiOS Carrier unit has an internal to external security policy, GTP UDP sessions using an established tunnel that are received by the internal interface are accepted by the security policy and can continue to flow. However, GTP UDP packets for an established tunnel that are received at the external interface cannot flow until packets from the same tunnel are received at the internal interface.

If you have bi-directional policies that accept GTP UDP sessions then traffic in either direction that uses an established tunnel can continue to flow after a failover without interruption.

SSL offloading and HTTP multiplexing session failover

SSL offloading and HTTP multiplexing requires the FortiGate to maintain very large amounts of internal state information for each session. Sessions accepted by security policies containing virtual IPs or virtual servers with SSL offloading or HTTP multiplexing enabled do not resume after a failover.

Resume active-active HA subordinate units sessions after failover

In an active-active cluster, subordinate units process sessions. After a failover, all cluster units that are still operating may be able to continue processing the sessions that they were processing before the failover. These sessions are maintained because after the failover the new primary unit uses the HA session table to continue to send session packets to the cluster units that were processing the sessions before the failover. Cluster units maintain their own information about the sessions that they are processing and this information is not affected by the failover. In this way, the cluster units that are still operating can continue processing their own sessions without loss of data.

The cluster keeps processing as many sessions as it can. But some sessions can be lost. Depending on what caused the failover, sessions can be lost in the following ways:

- A cluster unit (subordinate unit) fails. All sessions that were being processed by that cluster unit are lost.
- A link failure occurs. All sessions that were being processed through the network interface that failed are lost.

Terminated sessions

This section contains information about session failover for communication sessions terminated by the cluster. Sessions terminated by the cluster include management sessions as well as IPsec and SSL VPN, WAN Optimization and so on between the cluster and a client.

In general, most sessions terminated by the cluster have to be restarted after a failover. There are some exceptions though. For example, the FGCP provides failover for IPsec and SSL VPN sessions terminated by the cluster.

The session pickup setting does not affect session failover for sessions terminated by the cluster. Also other cluster settings such as active-active or active-passive mode do not affect session failover for sessions terminated by the cluster.

Protocol	Session failover
Administrative or management connections such as connecting to the GUI or CLI, SNMP, syslog, communication with FortiManager, FortiAnalyzer and so on	Not supported, sessions have to be restarted.
Explicit web proxy, WCCP, WAN Optimization and Web Caching	Not supported, sessions have to be restarted. See Explicit web proxy, explicit FTP proxy, WCCP, WAN optimization and Web Caching session failover on page 2253 for more information.
IPsec VPN tunnels terminating at the FortiGate	Supported. Security associations (SAs) and related IPsec VPN tunnel data is synchronized to cluster members. See IPsec VPN SA sync on page 2254 for more information.
SSL VPN tunnels terminating at the FortiGate	Partially supported. Sessions are not synchronized and have to be restarted. Authentication failover and cookie failover is supported for SSL VPN web mode sessions. Authentication failover is not supported for FortiClient SSL VPN sessions. See SSL VPN session failover and SSL VPN authentication failover on page 2254 for more information.
PPTP and L2TP VPN terminating at the FortiGate	Not supported; sessions have to be restarted. See PPTP and L2TP VPN sessions on page 2254 for more information.

Explicit web proxy, explicit FTP proxy, WCCP, WAN optimization and Web Caching session failover

Explicit web proxy, explicit FTP proxy, WCCP, WAN optimization and web caching sessions all require the FortiGate to maintain very large amounts of internal state information for each session. This information is not maintained and these

sessions do not resume after a failover.

The active-passive HA clustering is recommended for WAN optimization. All WAN optimization sessions are processed by the primary unit only. Even if the cluster is operating in active-active mode, HA does not load-balance WAN optimization sessions.

Web cache and byte cache databases are only stored on the primary unit. These databases are not synchronized to the cluster. So, after a failover, the new primary unit must rebuild its web and byte caches. The new primary unit cannot connect to a SAS partition that the failed primary unit used.

Rebuilding the byte caches can happen relatively quickly because the new primary unit gets byte cache data from the other FortiGates that it is participating with in WAN optimization tunnels.

IPsec VPN SA sync

The FGCP synchronizes IPsec SAs between cluster members so that if a failover occurs, the cluster can resume IPsec sessions without having to establish new SAs. The result is improved failover performance because IPsec sessions are not interrupted to establish new SAs. Also, establishing a large number of SAs can reduce cluster performance.

SSL VPN session failover and SSL VPN authentication failover

Session failover is not supported for SSL VPN tunnels. However, authentication failover is supported for SSL VPN web mode sessions. This means that after a failover, SSL VPN web mode sessions can re-establish the SSL VPN session between the SSL VPN client and the FortiGate without having to authenticate again.

Authentication failover is not supported for FortiClient SSL VPN sessions.

All sessions inside the SSL VPN tunnel that were running before the failover are stopped and have to be restarted. For example, file transfers that were in progress would have to be restarted. As well, any communication sessions with resources behind the FortiGate that are started by an SSL VPN session have to be restarted.

To support SSL VPN cookie failover, when an SSL VPN session starts, the FGCP distributes the cookie created to identify the SSL VPN session to all cluster units.

PPTP and L2TP VPN sessions

PPTP and L2TP VPNs are supported in HA mode. For a cluster you can configure PPTP and L2TP settings and you can also add security policies to allow PPTP and L2TP pass through. However, the FGCP does not provide session failover for PPTP or L2TP. After a failover, all active PPTP and L2TP sessions are lost and must be restarted.

Improving session sync performance

Two HA configuration options are available to reduce the performance impact of enabling session-pickup:

- Reducing the number of sessions that are synchronized.
- Using more FortiGate interfaces for session synchronization.

Reducing the number of sessions that are synchronized

When session pickup is enabled, new sessions are synced across cluster units. To reduce the number of synced sessions, enable the `session-pickup-delay` option, which only syncs sessions active for more than 30 seconds. This can reduce syncs for clusters with many short sessions, like HTTP traffic.

Use the following commands to enable a 30-second delay:

```
config system ha
    set session-pickup-delay enable
end
```

This may result in more sessions not resuming after a failover, but most short sessions can restart with minor interruption.

Using multiple FortiGate interfaces for session synchronization

The `session-sync-dev` option allows you to choose one or more FortiGate interfaces for session synchronization, which is necessary for session pickup. Typically, session synchronization takes place over the HA heartbeat link. However, with this HA option, only the chosen interfaces are used for session synchronization, not the HA heartbeat link. If multiple interfaces are selected, the session synchronization traffic is load balanced among the selected interfaces.

Shifting session synchronization away from the HA heartbeat interface can reduce the bandwidth needed for HA heartbeat traffic, potentially enhancing the cluster's efficiency and performance. This is particularly true if the cluster is synchronizing a large volume of sessions. Load balancing session synchronization across multiple interfaces can further boost performance and efficiency when dealing with a large number of sessions.

To perform cluster session synchronization using the port10 and port12 interfaces:

```
config system ha
    set session-sync-dev port10 port12
end
```

The interfaces chosen for session synchronization must be interconnected, either directly with the appropriate cable (if the cluster only contains two units) or through switches. If one of the interfaces becomes disconnected the cluster uses the remaining interfaces for session synchronization. If all of the session synchronization interfaces become disconnected, session synchronization reverts back to using the HA heartbeat link. All session synchronization traffic is between the primary unit and each subordinate unit.

Since large amounts of session synchronization traffic can increase network congestion, it is recommended to isolate this traffic from your network by using dedicated connections.

SNMP

SNMP enables you to monitor hardware on your network. You can configure the hardware, such as the FortiGate SNMP agent, to report system information and send traps (alarms or event messages) to SNMP managers. SNMP traps alert you to events that happen, such as when a log disk is full or a virus is detected.

The FortiGate SNMP implementation is read-only. SNMP v1/v2c, and v3 compliant SNMP managers have read-only access to FortiGate system information through queries, and can receive trap messages from the FortiGate unit.

- [Basic configuration on page 2256](#)
- [MIB files on page 2259](#)
- [Important SNMP traps on page 2259](#)
- [SNMP examples on page 2261](#)

Basic configuration

SNMP configuration has four steps that should be configured in order:

1. Configure interface access

Before a remote SNMP manager can connect to the FortiGate SNMP agent, you must configure one or more FortiGate interfaces to accept SNMP connections.

2. Configure the SNMP agent

The SNMP agent sends SNMP traps originating on the FortiGate to an external monitoring SNMP manager defined in an SNMP community. The SNMP manager can monitor the FortiGate system to determine if it is operating properly or if any critical events are occurring.

The description, location, and contact information for this FortiGate system will be part of the information that the SNMP manager receives. This information is useful if the SNMP manager is monitoring many devices, and enables faster responses when the FortiGate system requires attention.

3. Configure SNMP v1/v2c communities

An SNMP community is a grouping of equipment for network administration purposes. A single device can belong to multiple communities. It is not mandatory if SNMP v3 is configured.

You must add an SNMP community to the FortiGate so that the SNMP manager can receive traps and system information. Up to three communities can be added.

4. Configure SNMP v3 users

Authentication is used to ensure the identity of users. Privacy allows for the encryption of SNMP v3 messages to ensure the confidentiality of data. These protocols provide a higher level of security than is available in SNMP v1/v2c, which use community strings for security. Both authentication and privacy are optional.

To configure SNMP in the GUI:

1. Configure interface access:

- a. Go to *Network > Interfaces* and edit an interface.
- b. In the *Administrative Access* options, enable *SNMP*.
- c. Click *OK*.

2. Configure the SNMP agent:

- a. Go to *System > SNMP*.
- b. Enable *SNMP Agent* and configure the following:

Description	A description of the agent.
Location	The location of the FortiGate.
Contact Info	A contact or administrator for the SNMP agent or FortiGate.

- c. Click *Apply*.

3. Configure an SNMP v1/v2c community:

- a. Go to *System > SNMP*.
- b. In the *SNMP v1/v2c* table, click *Create New*.

- c. Configure the following:

Community Name	The name of the community.
Hosts	Enter the <i>IP Address</i> and select the <i>Host Type</i> for each SNMP manager.
Queries	Enable or disable v1 and v2c queries, then enter the port numbers that the SNMP managers in this community use for them.
Traps	Enable or disable v1 and v2c traps, then enter the local and remote port numbers that the SNMP managers in this community use for them.
SNMP Events	Enable or disable the events that activate traps in this community.

- d. Click *OK*.

4. Configure an SNMP v3 user:

- a. Go to *System > SNMP*.
 b. In the *SNMP v3* table, click *Create New*.
 c. Configure the following:

User Name	The name of the user.
Security Level	Configure the security level: <ul style="list-style-type: none"> • <i>No Authentication</i>: No authentication or encryption. • <i>Authentication</i>: Select the authentication algorithm and password. • <i>Authentication and Private</i>: Select both the authentication and encryption algorithms and password.
Hosts	The <i>IP Address</i> for each SNMP manager.
Queries	Enable or disable queries, then enter the port number that the SNMP managers use for them.
Traps	Enable or disable traps, then enter the local and remote port numbers that the SNMP managers use for them
SNMP Events	Enable or disable the events that activate traps.

- d. Click *OK*.

To configure SNMP in the CLI:

1. Configure the Interface access:

```
config system interface
  edit <interface>
    append allowaccess snmp
    config ipv6
      append ip6-allowaccess snmp
    end
  next
end
```

2. Configure the SNMP agent:

```
config system snmp sysinfo
  set status enable
```

```
    set description <string>
    set contact-info <string>
    set location <string>
end
```

3. Configure an SNMP v1/v2c community:

```
config system snmp community
  edit <id>
    set name <string>
    set status {enable | disable}
    config hosts
      edit <host_id>
        set ip <ip/mask>
        set source-ip <class_ip>
        set ha-direct {enable | disable}
        set host-type {any | query | trap}
      next
    end
    set query-v1-port <port_number>
    set query-v1-status {enable | disable}
    set query-v2c-port <port_number>
    set query-v2c-status {enable | disable}
    set trap-v1-lport <port_number>
    set trap-v1-rport <port_number>
    set trap-v1-status {enable | disable}
    set trap-v2c-lport <port_number>
    set trap-v2c-rport <port_number>
    set trap-v2c-status {enable | disable}
    set events <events>
  next
end
```

4. Configure an SNMP v3 user:

```
config system snmp user
  edit <user>
    set status {enable | disable}
    set trap-status {enable | disable}
    set trap-lport <port_number>
    set trap-rport <port_number>
    set queries {enable | disable}
    set query-port <port_number>
    set notify-hosts <class_ip> ... <class_ip>
    set source-ip <class_ip>
    set ha-direct {enable | disable}
    set events <events>
    set security-level {no-auth-no-priv | auth-no-priv | auth-priv}
    set auth-proto {md5 | sha | sha224 | sha256 | sha384 | sha512}
    set auth-pwd <password>
    set priv-proto {aes | des | aes256 | aes256cisco}
    set priv-pwd <password>
  next
end
```

See [SNMP examples on page 2261](#) for sample configurations.

MIB files

The FortiGate SNMP agent supports Fortinet proprietary MIBs, as well as the parts of RFC 2665 and RFC 1213 that apply to FortiGate unit configuration.

Your SNMP manager may already include standard and private MIBs in a compiled database that is ready to use. You must add the Fortinet proprietary MIBs to this database to have access to Fortinet specific information.

MIB file or RFC	Description
FORTINET-CORE-MIB.mib	The Fortinet core MIB includes all system configuration and trap information that is common to all Fortinet products. Your SNMP manager requires this information to monitor Fortinet device settings and receive traps from the FortiGate SNMP agent.
FORTINET-FORTIGATE-MIB.mib	The FortiGate MIB includes all system configuration information and trap information that is specific to FortiGate units. Your SNMP manager requires this information to monitor FortiGate settings and receive traps from the FortiGate SNMP agent.
RFC-1213 (MIB II)	The FortiGate SNMP agent supports MIB II groups with the following exceptions: <ul style="list-style-type: none"> No support for the EGP group from MIB II (RFC 1213, section 3.11 and 6.10). Protocol statistics returned for MIB II groups (IP/ICMP/TCP/UDP/etc.) do not accurately capture all Fortinet traffic activity. More accurate information can be obtained from the information reported by the Fortinet MIB.
RFC-2665 (Ethernet-like MIB)	The FortiGate SNMP agent supports Ethernet-like MIB information. FortiGate SNMP does not support for the dot3Tests and dot3Errors groups.

To download the MIB files:

1. Go to *System > SNMP*.
2. Click *Download FortiGate MIB File* and save the file to the management computer.
3. Click *Download Fortinet Core MIB File* and save the file to the management computer.

Important SNMP traps

Link Down and Link Up traps

This trap is sent when a FortiGate port either goes down or is brought up.

For example, the following traps are generated when the state of port34 is set to down using `set status down`, and then brought up using `set status up`:

```
NET-SNMP version 5.7.3 2019-01-31 14:11:48 10.1.100.1(via UDP: [10.1.100.1]:162->
[10.1.100.1]:162) TRAP, SNMP v1, community REGR-SYS SNMPv2-MIB::snmpTraps Link Down Trap

```

fgFmTrapIfChange trap

This trap is sent when any changes are detected on the interface. The change can be very simple, such as giving an IPV4 address.

For example, the user has given the IP address of 1.2.3.4/24 to port 1 and the EMS Manager has detected the following trap:

```
DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (7975058) 22:09:10.58 SNMPv2-
MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgFmTrapIfChange FORTINET-CORE-
MIB::fnSysSerial.0 = STRING: FG140P3G15800330 IF-MIB::ifName.45 = STRING: port1 FORTINET-
FORTIGATE-MIB::fgManIfIp.0 = IpAddress: 1.2.3.4 FORTINET-FORTIGATE-MIB::fgManIfMask.0 =
IpAddress: 255.255.255.0 FORTINET-FORTIGATE-MIB::fgManIfIp6.0 = STRING: 0:0:0:0:0:0:0:0
```

entConfigChange trap

The change to the interface in the previous example has also triggered the *ConfChange Trap* which is sent along with the *fgFmTrapIfChange* trap:

```
2018-11-15 09:30:23 FGT_A [UDP: [172.16.200.1]:162->[172.16.200.55]:162]: DISMAN-EXPRESSION-
MIB::sysUpTimeInstance = Timeticks: (8035097) 22:19:10.97 SNMPv2-MIB::snmpTrapOID.0 = OID:
ENTITY-MIB::entConfigChange
```

fgTrapDeviceNew trap

This trap is triggered when a new device, like a FortiSwitch, is connected to the FortiGate.

For example, the following scenario has given the device a new trap for adding FortiAP on a PoE interface a FortiGate 140D-POE. The trap has important information about the device name, device MAC address, and when it was last seen.

```
2018-11-15 11:17:43 UDP/IPv6: [2000:172:16:200::1]:162 [UDP/IPv6: [2000:172:16:200::1]:162]:
DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (520817) 1:26:48.17 SNMPv2-
MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgTrapDeviceNew FORTINET-CORE-
MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT_A IF-
MIB::ifIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgVdEntIndex.0 = INTEGER: 0 FORTINET-
FORTIGATE-MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 =
Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0
```

```
2018-11-15 11:17:43 FGT_A [UDP: [172.16.200.1]:162->[172.16.200.55]:162]: DISMAN-EXPRESSION-
MIB::sysUpTimeInstance = Timeticks: (520817) 1:26:48.17 SNMPv2-MIB::snmpTrapOID.0 = OID:
FORTINET-FORTIGATE-MIB::fgTrapDeviceNew FORTINET-CORE-MIB::fnSysSerial.0 = STRING:
FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT_A IF-MIB::ifIndex.0 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fgVdEntIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-
MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 = Gauge32: 5
FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0
```

fgTrapAvOversize trap

The `fgTrapAvOversize` trap is generated when the antivirus scanner detects an oversized file:

```
019-01-31 13:22:04 10.1.100.1(via UDP: [10.1.100.1]:162->[10.1.100.11]:162) TRAP, SNMP v1,
community REGR-SYS FORTINET-FORTIGATE-MIB::fgt140P Enterprise Specific Trap (602) Uptime: 1
day, 3:41:10.31 FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-

[10.1.100.1]:162->[10.1.100.11]:162]: DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks:
(9967031) 1 day, 3:41:10.31 SNMPv2-MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-
MIB::fgTrapAvOversize FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-
MIB::sysName.0 = STRING: FortiGate-140D-POE
```

SNMP examples

This topic includes examples that incorporate several SNMP settings:

- [Example 1: SNMP traps for monitoring interface status using SNMP v3 user on page 2261](#)
- [Example 2: SNMP traps and query for monitoring DHCP pool using SNMP v3 user on page 2263](#)

Example 1: SNMP traps for monitoring interface status using SNMP v3 user

This configuration enables the SNMP manager (172.16.200.55) to receive notifications when a FortiGate port either goes down or is brought up. The SNMP manager can also query the current status of the FortiGate port.

To configure SNMP for monitoring interface status in the GUI:

1. Configure interface access:
 - a. Go to *Network > Interfaces* and edit *port1*.
 - b. In the *Administrative Access* options, enable *SNMP*.
 - c. Click *OK*.
2. Configure the SNMP agent:
 - a. Go to *System > SNMP*.
 - b. Enable *SNMP Agent* and enter the following:

Description	Branch
Location	Burnaby
Contact Info	Jane Doe

- c. Click *Apply*.

3. Configure an SNMP v3 user:
 - a. Go to *System > SNMP*.
 - b. In the *SNMP v3* table, click *Create New*.
 - c. Configure the following:

User Name	Interface_Status
Security Level	Authentication
Authentication Algorithm	SHA1
Password	*****
Hosts IP Address	172.16.200.55

- d. Click *OK*.

To configure SNMP for monitoring interface status in the CLI:

1. Configure interface access:

```
config system interface
  edit port1
    append allowaccess snmp
  next
end
```

2. Configure the SNMP agent:

```
config system snmp sysinfo
  set status enable
  set description Branch
  set contact-info Jane Doe
  set location Burnaby
end
```

3. Configure an SNMP v3 user:

```
config system snmp user
  edit "Interface_Status"
    set notify-hosts 172.16.200.55
    set security-level auth-no-priv
    set auth-proto sha
    set auth-pwd *****
  next
end
```

Verification

1. Start the packet capture on interface port1 with the filter set to port 162. See [Performing a sniffer trace or packet capture on page 2872](#) for more information.
2. Turn off one of the FortiGate interface statuses to down, in this case, port2.
3. Save the packet capture.

```

    error-index: 0
  > variable-bindings: 9 items
  > 1.3.6.1.2.1.1.3.0: 17457123
  > 1.3.6.1.6.3.1.1.4.1.0: 1.3.6.1.6.3.1.1.5.3 (iso.3.6.1.6.3.1.1.5.3)
  > 1.3.6.1.2.1.2.2.1.1.2: 2
  > 1.3.6.1.2.1.2.2.1.7.2: 1
  > 1.3.6.1.2.1.2.2.1.8.2: 2
  > 1.3.6.1.4.1.12356.100.3.1.1.0: "FGVM08TM22004645"
  > 1.3.6.1.2.1.1.5.0: "Root"
  > 1.3.6.1.2.1.31.1.1.1.2: "port2"
  > 1.3.6.1.2.1.2.2.1.2.2: <MISSING>

```

The SNMP v3 trap is transmitted from port1 to the SNMP manager. Note that `msgAuthenticationParameters` is configured, indicating that authentication is active. The absence of `msgPrivacyParameters` suggests that encryption is not configured. This is further confirmed by `plaintext` in `msgData`.

4. Verify that the SNMP manager has received the trap. See [Important SNMP traps on page 2259](#) for an example of a trap.
5. Verify that the SNMP manager can successfully query and receive a response on the current status of the FortiGate ports:

```

# snmpwalk -v3 -u Interface_Status -l authNoPriv -a SHA -A xxxxxxxx 172.16.200.1
1.3.6.1.2.1.2.2.1.8
iso.3.6.1.2.1.2.2.1.8.1 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.2 = INTEGER: 2
iso.3.6.1.2.1.2.2.1.8.3 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.4 = INTEGER: 1

iso.3.6.1.2.1.2.2.1.8.7 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.8 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.9 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.10 = INTEGER: 1

```

Example 2: SNMP traps and query for monitoring DHCP pool using SNMP v3 user

This configuration enables the SNMP manager (172.16.200.55) to receive DHCP-related notifications from FortiGate.

The SNMP DHCP event contains three traps and one query.

Traps are sent when:

- DHCP server IP pool usage reaches 90%
- DHCP server detect an IP address that is already in use
- DHCP client receives DHCP NAK

SNMP queries are accepted for DHCP lease usage information (OID = 1.3.6.1.4.1.12356.101.23). The query result is based on the leased out percentage.

To configure SNMP for monitoring DHCP pool in the GUI:

1. Configure interface access:
 - a. Go to *Network > Interfaces* and edit *port1*.
 - b. In the *Administrative Access* options, enable *SNMP*.
 - c. Click *OK*.
2. Configure the SNMP agent:
 - a. Go to *System > SNMP*.
 - b. Enable *SNMP Agent* and enter the following:

Description	Branch
Location	Burnaby
Contact Info	Jane Doe

- c. Click *Apply*.
3. Configure an SNMP v3 user:
 - a. Go to *System > SNMP*.
 - b. In the *SNMP v3* table, click *Create New*.
 - c. Configure the following:

User Name	DHCP_Status
Security Level	Authentication
Authentication Algorithm	SHA384
Password	*****
Private	Enabled
Encryption Algorithm	AES256
Password	*****
Hosts IP Address	172.16.200.55

- d. Click *OK*.

To configure SNMP for monitoring the DHCP pool in the CLI:

1. Configure interface access:

```
config system interface
  edit port1
    append allowaccess snmp
  next
end
```
2. Configure the SNMP agent:

```
config system snmp sysinfo
  set status enable
  set description Branch
  set contact-info Jane Doe
```

```

    set location Burnaby
end

```

3. Configure an SNMP v3 user:

```

config system snmp user
    edit "DHCP_Status"
        set notify-hosts 172.16.200.55
        set security-level auth-priv
        set auth-proto sha384
        set auth-pwd *****
        set priv-proto aes256
        set priv-pwd *****
    next
end

```

Verification

1. Start the packet capture on interface port1 with the filter set to port 162. See [Performing a sniffer trace or packet capture on page 2872](#) for more information.
2. Overload the DHCP server IP pool.
3. Save the packet capture.

```

> Internet Protocol Version 4, Src: 172.16.200.1, Dst: 172.16.200.55
> User Datagram Protocol, Src Port: 162, Dst Port: 162
▼ Simple Network Management Protocol
  msgVersion: snmpv3 (3)
  msgGlobalData
  > msgAuthoritativeEngineID: 80003044058000304404085b0e9f05f0
  msgAuthoritativeEngineRoots: 1695743618
  msgAuthoritativeEngineTime: 177918
  msgUserName: DHCP_Status
  msgAuthenticationParameters: 518d94b4d9d81644cfbd0a7854048e6f73ed77c54a265363cbb5d66a6be6b
  msgPrivacyParameters: 00001b660000difa
  ▼ msgData: encryptedPDU (1)
    encryptedPDU: 6f61e1a52974893b6ef505e2ecc9dc1457f7921fccba97081d36a776b99f6c257dd4aa5...

```

The SNMP v3 trap is transmitted from port1 to the SNMP manager. Note that both `msgAuthenticationParameters` and `msgPrivacyParameters` are set up, indicating that authentication and encryption are active. This is further confirmed by `encryptedPDU` in `msgData`.

4. Verify that the SNMP manager has received the trap. See [Important SNMP traps on page 2259](#) for an example of a trap.
5. Verify that the SNMP manager can successfully query and receive DHCP lease usage information for FortiGate:

```

# snmpwalk -v3 -u DHCP_Status -l authPriv -a SHA384 -A xxxxxxxx -x AES256 -X xxxxxxxx
172.16.200.1 1.3.6.1.4.1.12356.101.23

iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.1 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.2 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.3 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.4 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.5 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.6 = INTEGER: 100

```

Replacement messages

FortiOS has replacement messages that are HTML and text files. These messages can be customized to meet user requirements. The content can be modified, and images can be added.

Modifying replacement messages

The *Replacement Messages* page has two views. *Simple View* (the default view) shows the most commonly used replacement messages. *Extended View* shows the entire list and all replacement message categories.

To modify a replacement message in the GUI:

1. Go to *System > Replacement Messages*.
2. Select a replacement message and click *Edit*.

If the message you want to edit is not visible, click *Extended View* in the upper right-hand corner of the top menu.

Name	Description	Modified
Sender Address Block Message	Replacement text for emails block due to blocked sender address	
SSL-VPN		
Hostcheck Error Message	Replacement text for hostcheck error message	
SSL-VPN Limit Page	Replacement HTML for SSL-VPN connection limit exceeded page	
SSL-VPN Login Page	Replacement HTML for SSL-VPN login page	
SSL-VPN Portal Header	Replacement HTML for SSL-VPN portal page header	
SSL-VPN Provision User Email	Replacement HTML for SSL-VPN provision user email template	
SSL-VPN Provision User SMS	Replacement text for SSL-VPN provision user SMS template	
Traffic Quota		
Traffic Quota Limit Exceeded Page	Replacement HTML for traffic quota limit exceeded block page	
Web-proxy		
Web-proxy Authentication Failed Page	Replacement HTML for web-proxy authentication failed page	
Web-proxy Authorization Group Query Failed Page	Replacement HTML for web-proxy authorization group query fail...	
Web-proxy Block Page	Replacement HTML for web-proxy block page	
Web-proxy Challenge Page	Replacement HTML for web-proxy authentication required block ...	
Web-proxy HTTP Error Page	Replacement HTML for web-proxy HTTP error page	
Web-proxy IP Blackout Page	Replacement HTML for web-proxy IP Blackout page	
Web-proxy User Limit Page	Replacement HTML for web-proxy user limit block page	

3. Edit the HTML code.

The message is visible on the left alongside the HTML code on the right. The message view updates in real-time as you edit the content.

When adding a variable to the code, right-click and select *Insert Tag* or type `%%` to view a list of the available variables, or start typing the variable name then press *Enter* or *TAB* to auto-complete the variable name.

Message Format: text/html Message Size: 3.7 kB/32.8 kB

```

<code>.text-scrollable {
  overflow: auto;
  height: 150px;
  border: 1px solid rgb(200, 200, 200);
  padding: 5px;
  font-size: 1em;
}
.text-centered {
  text-align: center;
}
.text-container {
  margin: 1em 1.5em;
}
.flex-container {
  display: flex;
}
.flex-container.column {
  flex-direction: column;
}
</code>
</style>
<title>
Traffic Quota Control
</title>
</head>
<body>
<div class="message">
<div class="logo">
<img alt="Fortinet logo" />
</div>
Traffic blocked because of exceeded session quota.
<p>
Traffic has been blocked because the per IP shaper session quota has been exceeded. Please contact the system administrator.
Quota: 2097000
</p>
</div>
</body>
</html>

```

Available variables:

- FGT_HOSTNAME: Displays the FortiGate hostname.
- FILE: The name of a file removed from a content system because of antivirus file blocking.
- FORTIGUARD_WF: Displays the following text: FORTIGUARD Web Files.
- FORTINRT: Displays the following text: FORTINRT.
- FVCL_VPN_NAME: The name of the VPN.
- GROUPNAME: Displays the following text: GROUPNAME.

4. Click *Save*.

Click *Restore Defaults* to return to the original message and code base.

To modify a replacement message in the CLI:

For example, to modify the *Traffic Quota Limit Exceeded Page* message:

```
config system replacemsg traffic-quota "per-ip-shaper-block"
  set buffer "<html>
<head>
  <title>
    Traffic Quota Control
  </title>
</head>
<body>
  <font size=2>
    <table width=\"100%\">
      <tr>
        <td bgcolor=#3300cc align=\"center\" colspan=2>
          <font color=#ffffff>
            <b>
              Traffic blocked because exceeded session quota
            </b>
          </font>
        </td>
      </tr>
    </table>
    <br>
    <br>
    Traffic blocked because it exceeded the per IP shaper session quota. Please contact
the system administrator.
    <br>
    %%QUOTA_INFO%%
    <br>
    <br>
    <hr>
  </font>
</body>
</html>"
  set header http
  set format html
end
```

Replacement message images

Images can be added to replacement messages on:

- Disclaimer pages
- Login pages
- Declined disclaimer pages
- Login failed pages

- Login challenge pages
- Keepalive pages

The supported image formats are GIF, JPEG, TIFF, and PNG. The maximum file size supported is 24 KB.

Adding images to replacement messages

To add images to replacement messages in the GUI:

1. Go to *System > Replacement Messages*.
2. In the top menu, click *Manage Images*.
3. Click *Create New*.
4. Enter a name for the image.
5. Click *Upload Image* and locate the file.

6. Click *OK*.

The file is now visible in the list.

Name	Image
Bulb	
Caution	
Fortinet Logo	
Fortinet Logo Grey	
Fortinet Logo White	
Tools	

7. Return to the replacement message list and edit a message.
8. Right-click in the message code where you want to add the image, and select *Insert Image*.
9. Select the image from the list then press *Enter*, or double-click on the image to add it to the message.
10. Click *Save*.

To add images to replacement messages in the CLI:**1. Add the image to the FortiGate:**

```
config system replacemsg-image
  edit <image_name>
    set image-type {gif | jpg | tiff | png}
    set image-base64 <string>
  next
end
```

2. Edit the replacement message, and include %%IMAGE:<image name>%% in the code to add the image.

Replacement message groups

Replacement message groups allow users to customize replacement messages for individual policies and profiles.

There are two types of replacement message groups:

Type	Usage	Customizable categories
utm	Used with UTM settings in firewall policies.	<ul style="list-style-type: none"> admin alertmail custom-message fortiguard-wf ftp http icap mail nac-quar spam sslvpn traffic-quota utm webproxy
auth	Used with authentication pages in firewall policies.	<ul style="list-style-type: none"> auth webproxy

The messages added to a group do not need to be customized. The message body content, header type, and format will use the default values if not customized.

To make replacement message groups visible in the GUI:

```
config system global
  set gui-replacement-message-groups enable
end
```

In the following example, two replacement message groups are created. The UTM message group includes custom mail-related messages and is assigned to an email filter profile. The authentication message group has a custom authentication success message that is applied to a proxy-based firewall policy that has an assigned email filter profile.

To create replacement message groups in the GUI:

1. Create the *Security* replacement message group:
 - a. Go to *System > Replacement Message Groups*.
 - b. Click *Create New*.
 - c. For *Name*, enter *newutm*.
 - d. In the *Comments* field, enter *UTM message group*.
 - e. For *Group Type*, select *Security*.
 - f. Click *OK*.

2. Customize the replacement messages in the *newutm* group:
 - a. Go to *System > Replacement Message Groups*.
 - b. Edit the *newutm* group.
 - c. Select the *Partial Email Block Message*.

- d. Edit the message and click *Save*.
 - e. Select the *ASE Block Message*.
 - f. Edit the message and click *Save*.
3. Create the *Authentication* replacement message group:
 - a. Go to *System > Replacement Message Groups*.
 - b. Click *Create New*.
 - c. For *Name*, enter *newauth*.
 - d. In the *Comments* field, enter *Authentication message group*.
 - e. For *Group Type*, select *Authentication*.
 - f. Click *OK*.

4. Apply the *newutm* replacement message group to an email filter profile in the CLI:

```
config emailfilter profile
  edit "newmsgs"
    set replacemsg-group "newutm"
  next
end
```

5. Apply the *newauth* replacement message group and the email filter profile to a firewall policy in the CLI:

```
config firewall policy
  edit 1
    ...
    set replacemsg-override-group "newauth"
    set inspection-mode proxy
    set emailfilter-profile "newmsgs"
    ...
  next
end
```

To create replacement message groups in the CLI:**1. Create the replacement message groups:**

```
config system replacemsg-group
  edit "newutm"
    set comment "UTM message group"
    set group-type utm
    config mail
      edit "partial"
        set buffer "Fragmented emails are blocked, sorry."
      next
    end
    config spam
      edit "smtp-spam-ase"
        set buffer "This message has been blocked because ASE reports it as
spam. You\'re welcome."
      next
    end
  next
  edit "newauth"
    set comment 'Authentication message group'
    set group-type auth
    config auth
      edit "auth-success-msg"
        set buffer "Welcome to the firewall. Your authentication has been
accepted, please reconnect."
      next
    end
  next
end
```

2. Apply the message group to the email filter:

```
config emailfilter profile
  edit "newmsgs"
    set replacemsg-group "newutm"
```

```
    next
end
```

3. Apply the email filter and message group to the policy:

```
config firewall policy
  edit 1
    ...
    set replacemsg-override-group "newauth"
    set inspection-mode proxy
    set emailfilter-profile "newmsgs"
    ...
  next
end
```

FortiGuard

FortiGuard services comprise of signature packages and querying services that provide content, web and device security. It is delivered via various types of FortiGuard servers that are part of the FortiGuard Distribution Network (FDN).

FortiGuard service subscriptions can be purchased and registered to your FortiGate unit. The FortiGate must be connected to the Internet in order to automatically connect to the FDN to validate the license and download FDN updates or perform real-time queries.

To view FDN support contract information, go to *System > FortiGuard*. The *License Information* table shows the status of your FortiGate's entitlements and breaks down the status of each service.

Anycast

FortiGuard servers use Anycast addresses in order to optimize and distribute traffic across many servers. Anycast is the default access mode for FortiGates when connecting to FortiGuard which by default utilizes HTTPS and port 443.

Each type of FortiGuard servers and services have a FortiGuard domain name that resolves to a single Anycast IP address. Regardless of where the FortiGate is located, the resolution is still the same. Fortinet maintains the network in the background to ensure routes to the FortiGuard servers are optimized. In the below diagram, several servers have the same Anycast IP, but the FortiGate will connect to the one with the least hops.

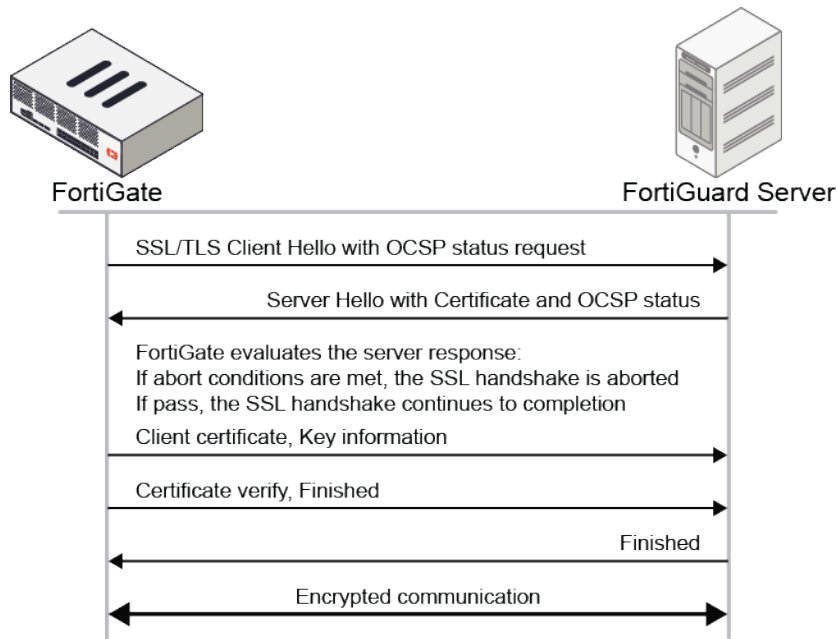

Connection and OCSP stapling

When the FortiGate connects to a FortiGuard server, it is important for it to validate the server is indeed a real FortiGuard server. Hence, FortiGuard servers provide the following security:

- The domain name of each FortiGuard service is the common name in that service's certificate, which is signed by a third-party intermediate CA.
- The FortiGuard server also applies Online Certificate Status Protocol (OCSP) stapling check, in which it attaches a time-stamped OCSP status of the server certificate from the OCSP server to the TLS response.

This ensures FortiGate can validate the FortiGuard server certificate efficiently during the TLS handshake.

The following illustrates the connection process:

FortiGate will only complete the TLS handshake with an anycast server when abort conditions are not met. Abort conditions include:

- The CN in the server's certificate does not match the domain name resolved from the DNS.
- The OCSP status is revoked or unknown.
- The issuer-CA is revoked by the root-CA.

To configure the anycast FortiGuard access mode:

```

config system fortiguard
    set fortiguard-anycast enable
end
  
```

If FortiGuard is not reachable via Anycast, choose between the following options to work around this issue:

1. Switch to other Anycast servers:

```

config system fortiguard
    set fortiguard-anycast enable
    set fortiguard-anycast-source aws
end
  
```

2. Disable Anycast and use HTTPS:

```

config system fortiguard
    set fortiguard-anycast disable
    set protocol https
    set port 8888
end
  
```

3. Disable Anycast and use UDP:

```

config system fortiguard
    set fortiguard-anycast disable
    set protocol udp
    set port 53
end
  
```

Configuring FortiGuard updates

To configure FortiGuard updates:

1. Go to *System > FortiGuard*
2. Scroll down to the *FortiGuard Updates* section.
3. Configure the options for connecting and downloading definition files:

Immediately download updates

The option can be enabled on 2U and larger hardware models when the FortiGuard servers are connected in anycast mode.

The FortiGate forms a secure, persistent connection with FortiGuard to get notifications of new updates through an HTTPS connection. The FortiGate uses the `fds_notify` daemon to wait for the notification, then makes another connection to the FortiGuard server to download the updates.

Scheduled Updates

Enable to schedule updates to be sent to the FortiGate at the specified time or automatically. See [Scheduled updates on page 2278](#) and [Automatic updates on page 2277](#).

Improve IPS quality

Enable to send information to the FortiGuard servers when an attack occurs. This can help keep the FortiGuard database current as attacks evolve, and improve IPS signatures.

Use extended IPS signature package
