Enable to use the extended IPS database, that includes protection from legacy attacks, along with the regular IPS database that protects against the latest common and in-the-wild attacks.

AntiVirus PUP/PUA

Enable antivirus grayware checks for potentially unwanted applications.

Update server location

The FortiGuard update server location. See [Update server location on page 2280](#) for details.

The screenshot displays the FortiGuard Distribution Network configuration interface. On the left, there are several toggle and dropdown settings:

- FortiGuard Updates** (expanded):
 - Immediately download updates:
 - Scheduled updates: Frequency: **Weekly**, Day: **Monday**, Interval: **1**, Time: **PM**
 - Improve IPS quality:
 - Use extended IPS signature package:
 - AntiVirus PUP/PUA:
 - Update server location: **Lowest latency locations** (selected), Restrict to:
- Filtering:
- Override FortiGuard Servers:

On the right, the **Fortinet Service Communications** table shows traffic volume for various services over the last 24 hours:

Service	Traffic Volume (Last 24 hours)
FortiCare	0 B
FortiCloud Log	715.61 kB
FortiGuard.com	3.10 MB
FortiGuard Download	57.22 MB
FortiGuard Query	51.16 kB
FortiGate Cloud Sandbox	0 B
OCVPN	0 B
SDNS	0 B
FortiToken Registration	0 B
SMS Service	0 B

At the bottom of the configuration area, there is an **Apply** button.

4. Click *Apply*.

Configuring a proxy server for FortiGuard updates

You can configure FortiOS to use a proxy server to connect to the FortiGuard Distribution Network (FDN).

Proxy tunneling is supported only for registration, AV, and IPS updates. For FortiGate virtual machines, proxy tunneling can also be used for license validation. For web filtering or spam filtering, UDP protocol is used on ports 53 or 8888. UDP protocol traffic cannot be directed over a proxy server, even if you are using versions of FortiOS that support web filtering over port 443.

Consider the following before configuring FortiOS to use a proxy server to connect to FDN:

- FortiOS connects to the proxy server using the HTTP CONNECT method. For information about the HTTP CONNECT method, see [RFC 2616](#).
- The proxy server must not inspect the HTTPS traffic used for FortiOS communication.
- FortiOS sends to the proxy server an HTTP CONNECT request that specifies the IP address and port required for the FDN connection. Authentication information is optional for the request.
- FortiOS or the proxy server must be configured to use DNS servers that resolve the addresses of FDN servers to support AV and IPS updates.
- The proxy server establishes the connection to FDN and passes information between FortiOS and FDN.

Use the following syntax to configure a proxy server in the CLI:

```
config system autoupdate tunneling
  set address <proxy_address>
  set port <proxy_port>
  set username <username>
  set password <password>
  set status {enable | disable}
end
```

In the following example, a proxy server with IP address 10.1.1.1 is configured to listen on port TCP/3128 without authentication.

To configure a proxy server:

```
config system autoupdate tunneling
  set address 10.1.1.1
  set port 3128
  set status enable
end
```

In a closed network without direct internet connection for web filtering or spam filtering, you can use FortiManager as a FortiGuard server. FortiManager supports proxy for both updates and rating, and FortiOS retrieves its updates and ratings through FortiManager. See [Using FortiManager as a local FortiGuard server on page 2283](#).

Manual updates

When needed, FortiGuard Distribution Network (FDN) updates can be manually uploaded.

To manually update the signature definitions files:

1. Log in to the [Fortinet Support](#) website.
2. Go to *Support > Service Updates*.
3. Select your *OS Version* from the dropdown list.

4. Locate your device in the table, and download the signature definitions files.
5. On the FortiGate, go to *System > FortiGuard*.
6. In the *License Information* table, locate and expand the definitions that you are updating, and click *Upgrade Database* in the rightmost column.
7. In the pane that opens, click *Upload*, locate the downloaded definitions file on your computer, then click *Open*. The download may take a few minutes to complete.

8. Click *OK*.

AV and IPS manual updates

To execute the update:

```
# execute restore ips tftp nids-720-19.261.pkg 172.16.200.55
```

To verify the manual AV and IPS package updates:

```
# diagnose debug app updated -1
# diagnose debug enable
```

Security levels are pre-configured on the BIOS. See [BIOS-level signature and file integrity checking on page 2323](#) and [Real-time file system integrity checking on page 2327](#) for more information.

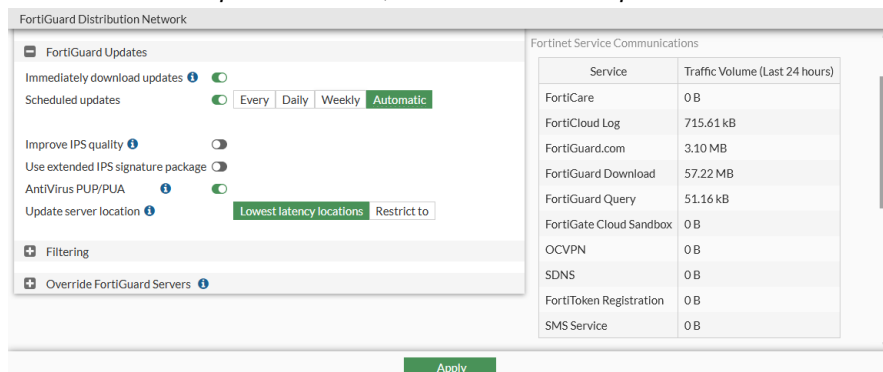

Automatic updates

The default auto-update schedule for FortiGuard packages is automatic. The update interval is calculated based on the model and percentage of valid subscriptions, within one hour.

For example, if a FortiGate 501E has 78% valid contracts, then based on this device model, the update schedule is calculated to be every 10 minutes. If you verify the system event logs (ID 0100041000), they are generated approximately every 10 minutes.

To configure automatic updates in the GUI:

1. Go to *System > FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates* and select *Automatic*.

3. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency automatic
end
```

Scheduled updates

Scheduling updates ensures that the virus and IPS definitions are downloaded to your FortiGate on a regular basis.

Updating definitions can cause a brief disruption in traffic that is currently being scanned while the FortiGate unit applies the new signature database. Updates should be scheduled during off-peak hours when network usage is at a minimum to ensure that network activity will not be affected by downloading the definitions files.

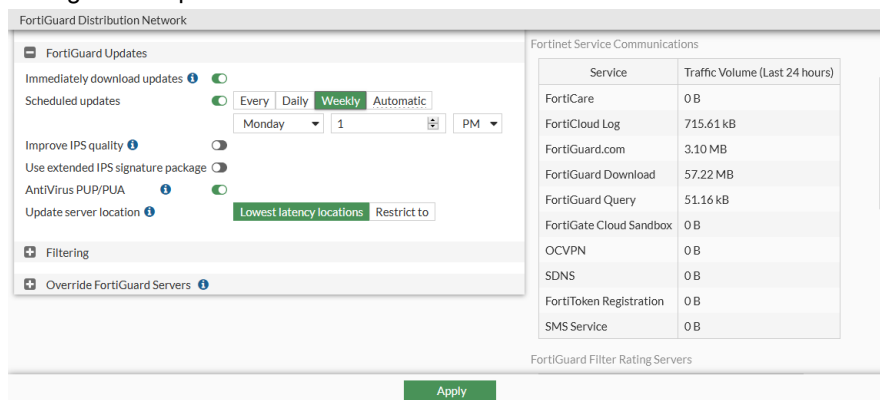

A schedule of once a week means any urgent updates will not be pushed until the scheduled time. If an urgent update is required, click the *Update Licenses & Definitions Now* button to manually update the definitions.

To configure scheduled updates in the GUI:

1. Go to *System > FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates*.

3. Configure the update schedule:

4. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency {every | daily | weekly}
    set time <hh:mm>
    set day <day_of_week>
end
```

Sending malware statistics to FortiGuard

FortiGate devices periodically send encrypted antivirus, IPS, botnet IP list, and application control statistics to FortiGuard. Included with these data is the IP address and serial number of the FortiGate, and the country that it is in. This information is never shared with external parties, [Fortinet Privacy Policy](#).

The malware statistics are used to improve various aspects of FortiGate malware protection. For example, antivirus data allow FortiGuard to determine what viruses are currently active. Signatures for those viruses are kept in the Active AV Signature Database that is used by multiple Fortinet products. Inactive virus signatures are moved to the Extended AV Signature Database (see [Configuring FortiGuard updates on page 2275](#)). When events for inactive viruses start appearing in the malware data, the signatures are moved back into the AV Signature Database.

The FortiGate and FortiGuard servers go through a 2-way SSL/TLS 1.2 authentication before any data is transmitted. The certificates used in this process must be trusted by each other and signed by the Fortinet CA server.

The FortiGate only accepts data from authorized FortiGuard servers. Fortinet products use DNS to find FortiGuard servers and periodically update their FortiGate server list. All other servers are provided by a list that is updated through the encrypted channel.

Malware statistics are accumulated and sent every 60 minutes by default.

To configure sharing this information, use the following CLI command:

```
config system global
    set fds-statistics {enable | disable}
    set fds-statistics-period <minutes>
end
```

The submission of malware data is in accordance with the [Fortinet Privacy Policy](#).

There is no sensitive or personal information included in these submissions. Only malware statistics are sent.

Fortinet uses the malware statistics collected in this manner to improve the performance of the FortiGate services and to display statistics on the [Fortinet Support](#) website for customers registered FortiGate devices.

Fortinet may also publish or share statistics or results derived from this malware data with various audiences. The malware statistics shared in this way do not include any customer data.

Update server location

The location of the FortiGuard update server that the FortiGate connects to can be set to only servers in the USA, only servers in the European Union (EU), or to the servers with the lowest latency.

In EU locations, it can be required that certain traffic is only handled by servers located in the EU. By setting the update server location to EU only, the FortiGate will use EU domains to resolve to EU servers for FortiGuard traffic to update, URL rating, and IoT servers.

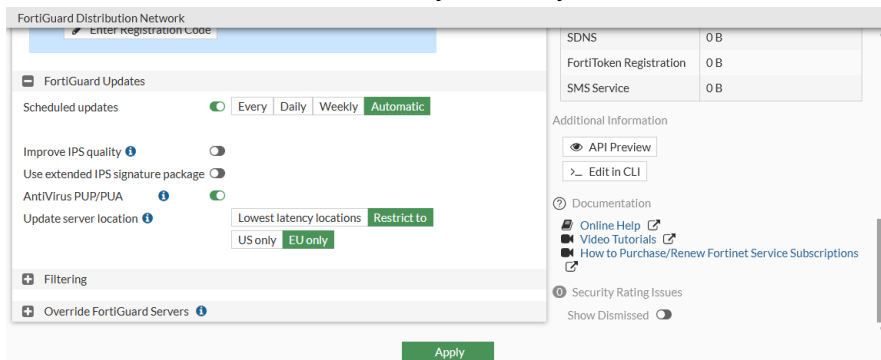

Server location	Anycast domain name	Non-Anycast FQDN addresses
EU only	euupdate.fortinet.net euguardservice.fortinet.net	
US only	usupdate.fortinet.net usguardservice.fortinet.net	usupdate.fortiguard.net UDP: usservice.fortiguard.net HTTPS: ussecurewf.fortiguard.net
Lowest latency (automatic)	globalupdate.fortinet.net globalguardservice.fortinet.net	update.fortiguard.net UDP: service.fortiguard.net HTTPS: securewf.fortiguard.net

On hardware FortiGate devices, the default is *Lowest latency locations*. On VM devices, the default is *US only*.

To configure the update server location in the GUI:

1. Go to *System > FortiGuard*
2. In the *FortiGuard Updates* section, set *Update server location* to *Lowest latency locations* or *Restrict to*.

3. If *Restrict to* is selected, choose *US only* or *EU only*.

4. Click *Apply*.

To configure the update server location in the CLI:

```
config system fortiguard
    set update-server-location {automatic | usa | eu}
end
```

Filtering

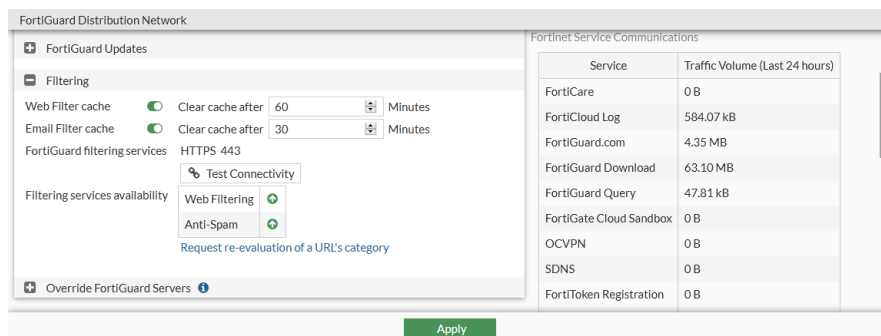

Web filtering is used to block access to harmful, inappropriate, and dangerous web sites (see [FortiGuard filter on page 1223](#)).

Email filtering is used to detect and block spam messages (see [FortiGuard-based filters on page 1346](#)).

To configure filtering in the GUI:

1. Go to *System > FortiGuard*
2. Scroll down to the *Filtering* section.
3. Configure the settings as needed:

Web Filter Cache	Enable/disable web filter cache, and set the amount of time that the FortiGate will store a blocked IP address or URL locally. After the time expires, the FortiGate contacts the FDN to verify the address.
Email Filter Cache	Enable/disable email filter cache, and set the amount of time that the FortiGate will store an email address locally.
FortiGuard filtering services	The protocol and port used to contact the FortiGuard servers. These options can be changed in the CLI.
Filtering service availability	The status of the filtering service. Click <i>Test Connectivity</i> if the filtering service is not available.
Request re-evaluation of a URL's category	Click to re-evaluate a URL category rating on the FortiGuard web filter service.

4. Click *Apply*.

To configure filtering in the CLI:

```
config system fortiguard
    set protocol {https | udp}
    set port {443 | 53 | 8888}
    set antispam-force-off {enable | disable}
    set antispam-cache {enable | disable}
    set antispam-cache-ttl <integer>
    set antispam-cache-mpercent <percent>
    set antispam-timeout <integer>
    set webfilter-force-off {enable | disable}
    set webfilter-cache {enable | disable}
    set webfilter-cache-ttl <integer>
    set webfilter-timeout <integer>
end
```

When anycast is enabled (by default) the protocol is HTTPS and the port is 443.

Online security tools

FortiGuard Labs provides a number of online security tools, including but not limited to:

- **URL lookup**
Enter a website address to see if it has been rated and what category and classification it is filed as. If you find a site that has been wrongly categorized, use this page to request that the site be re-evaluated:
<https://www.fortiguard.com/webfilter>
- **Threat Encyclopedia**
Browse FortiGuard Labs extensive encyclopedia of threats. Search for viruses, botnet C&C, IPS, endpoint vulnerabilities, and mobile malware: <https://www.fortiguard.com/encyclopedia>
- **Application Control**
Browse FortiGuard Labs extensive encyclopedia of applications: <https://www.fortiguard.com/appcontrol>

Anycast and unicast services

The following services are accessed by FortiGate:

Service	Non-Anycast FQDN addresses	Anycast Domain name
FortiGuard Object download	update.fortiguard.net	globalupdate.fortinet.net
Querying service (web-filtering, anti-spam ratings) over HTTPS	securewf.fortiguard.net	globalguardservice.fortinet.net
Querying service (web-filtering, anti-spam ratings) over UDP	service.fortiguard.net	Service only in Unicast
Device info Collection	Service only in Anycast	globaldevcollect.fortinet.net
Device info Query	Service only in Anycast	globaldevquery.fortinet.net
FortiGate Cloud logging	logctrl1.fortinet.com	globallogctrl.fortinet.net
FortiGate Cloud management	mgrctrl1.fortinet.com	globalmgrctrl.fortinet.net
FortiGate Cloud messaging	msgctrl1.fortinet.com	globalmsgctrl.fortinet.net
FortiGate Cloud sandbox	aptctrl1.fortinet.com	globalaptctrl.fortinet.net
Product API used by OCVPN registration and GUI icon download	productapi.fortinet.net	globalproductapi.fortinet.net
FortiCare registration	directregistration.fortinet.com	globalregistration.fortinet.net
Secure DNS	sdns.fortinet.net	globalsdns.fortinet.net
FortiCloud FortiClient	forticlient.fortinet.net	globalfctupdate.fortinet.net
FortiMobile Tokens	directregistration.fortinet.com	globalftm.fortinet.net
EMS cloud	forticlient-emsproxy.forticloud.com	Service only in Unicast
DDNS	ddns.fortinet.net	globalddns.fortinet.net
GeoIP	gip.fortinet.net	globalgip.fortinet.net
IP blocklist	ipbl.fortinet.net	N/A

Using FortiManager as a local FortiGuard server

FortiManager can provide a local FortiGuard server with port 443 access.

Anycast FortiGuard settings force the rating process to use port 443, even with an override server. Using a unique address in the same subnet as the FortiManager access IP address, the FortiManager can provide local FortiGuard updates and rating access with a dedicated IP address and port 443.

To use a FortiManager as a local FortiGuard server in the GUI:

1. Go to *System > FortiGuard*
2. In the *Override FortiGuard Servers* table, click *Create New*. The *Create New Override FortiGuard Server* pane opens.
3. Select the server address type: *IPv4*, *IPv6*, or *FQDN*.
4. Enter the FortiManager address in the *Address* field.
5. Select the type of server: *AntiVirus & IPS Updates*, *Filtering*, or *Both*.

6. Click **OK**.
7. Click **Create New** again to add a second override FortiManager for filtering.

8. Click **OK**, then click **Apply**.

To use a FortiManager as a local FortiGuard server in the CLI:

```
config system central-management
  set type fortimanager
  set fmg "172.18.37.148"
  config server-list
    edit 1
      set server-type update
      set server-address 172.18.37.150
    next
    edit 2
      set server-type rating
      set server-address 172.18.37.149
    next
  end
  set fmg-update-port 443
  set include-default-servers enable
end
```

When `fmg-update-port` is set to 443, the update process will use port 443 to connect to the override update server, which is the local FortiGuard server in the FortiManager. If this is not set, the update process will use port 8890, and the server address setting has to be the FortiManager access IP address. Override FortiGuard services come from the server list that is the local FortiGuard server in the FortiManager, and use the traditional, non-OCSP TLS handshake. If override servers in the FortiManager are not available, the default FortiGuard servers are connected, and the anycast OCSP TLS handshake is used.

Cloud service communication statistics

Fortinet service communications statistics are displayed on the *FortiGuard* page. The statistics correspond with the output from `diagnose sys service-communication`. The traffic volume values in the GUI are the sums of data from the last 24 hours.

To view Fortinet service communications statistics:

1. Go to *System > FortiGuard*.

The *Fortinet Service Communications* statistics are displayed on the right side of the screen:

The screenshot displays the FortiGuard Distribution Network interface. On the left, the 'License Information' section lists various services and their status:

Entitlement	Status	Actions
FortiCare Support	Registered	Actions
Firmware & General Updates	Licensed (Expiration Date: 2022/06/05)	
AntiVirus	Licensed (Expiration Date: 2022/06/05)	
Web Filtering	Licensed (Expiration Date: 2022/06/05)	
Outbreak Prevention	Licensed (Expiration Date: 2022/06/05)	
SD-WAN Network Monitor	Not Licensed	Purchase
Security Rating	Expired (Expiration Date: 2020/06/18)	Renew
Industrial DB	Not Licensed	Purchase
FortiPAM	Not Licensed	Purchase
IoT Detection Service	Licensed (Expiration Date: 2021/06/05)	
FortiGate Cloud	Activated	Logout
FortiGate Cloud Log Retention	Free License	Upgrade

On the right, the 'Fortinet Service Communications' section shows a table of traffic volume for various services over the last 24 hours:

Service	Traffic Volume (Last 24 hours)
FortiCare	0 B
FortiCloud Log	710.72 kB
FortiGuard.com	4.74 MB
FortiGuard Download	76.87 MB
FortiGuard Query	51.69 kB
FortiGate Cloud Sandbox	0 B
OCVPN	0 B
SDNS	0 B
FortiToken Registration	0 B
SMS Service	0 B

2. Enter the following CLI command:

```
# diagnose sys service-communication
FortiCare:

The last 7 days(in bytes): 0 0 0 0 0 0 0
```

IoT detection service

Internet of Things (IoT) detection is a subscription service that allows FortiGate to detect unknown devices in FortiGuard that are not detected by the local Device Database (CIDB). When the service is activated, FortiGate can send device information to the FortiGuard collection server. When a new device is detected, FortiGate queries the results from the FortiGuard query for more information about the device.

This feature requires an IoT Detection Service license.

FortiGate device requirements:

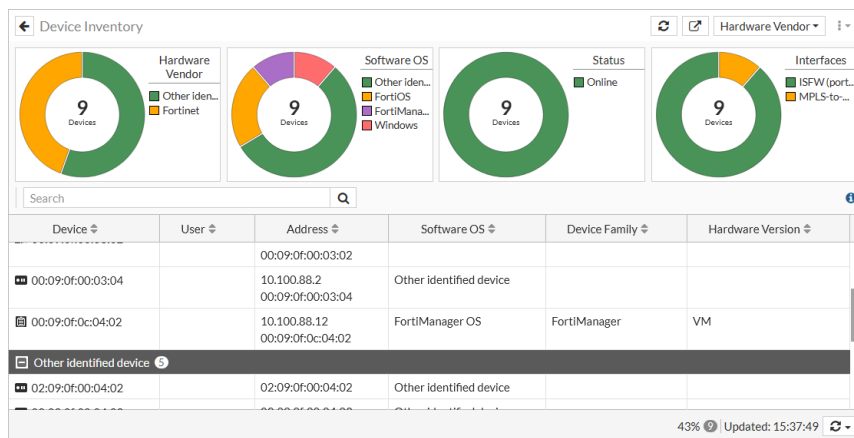

The FortiGate device must be:

- Registered with FortiCare
- Connected to an anycast FortiGuard server

How the service works:

1. Enable Device Detection on an interface..
2. FortiGate uses the interface to detect device traffic flow.
3. Upon detecting traffic from an unknown device, FortiGate sends the device data to the FortiGuard collection server.
4. The collection server returns data about the new device to the FortiGuard query server.
5. If the device signature does not appear in the local Device Database (CIDB) or some fields are not complete, FortiGate queries FortiGuard for more information about the device.

To view the latest device information in the GUI, go to *Dashboard > Users & Devices* and expand the *Device Inventory* widget.

To debug the daemon in the CLI:

1. Disable the local device database in order to force all queries to go to FortiGuard.

```
# diagnose src-vis local-sig disable
```

2. Enable iotd debugs:

```
# diagnose debug application iotd -1
# diagnose debug enable
```

FortiGate sends the device data to the FortiGuard collection server:

```
# [iotd] rcv request from caller size:61
[iotd] service:collect hostname: ip: fd:-1 request tlv_len:41
[iotd] txt(.....y...w.....Jasons-iPhone6....579=23..)
[iotd] hex
(02010007017903060f77fc0203000e4a61736f6e732d6950686f6e6536020400083537393d32330cff)
[iotd] service:collect hostname:globaldevcollect.fortinet.net ip: fd:-1 got server

FortiAP query to FortiGuard IoT service to determine device details

A FortiAP collects packets from devices and queries FortiGuard with the help of the FortiGate. Device detection results are reported back to the FortiGate where this information is displayed. Querying the FortiGuard service requires an IoT Detection Service license.

The following attributes can be configured in `wireless-controller` setting:

Attribute	Description
device-weight <integer>	Set the device upper limit of confidence (0 - 255, default = 1, 0 = disable).
device-holdoff <integer>	Set the device lower limit of creation time, in minutes (0 - 60, default = 5).
device-idle <integer>	Set the device upper limit of idle time, in minutes (0 - 14400, default = 1440).

To query the FortiGuard IoT service:

```

config wireless-controller setting
    ...
    set device-weight 1
    set device-holdoff 5
    set device-idle 1440
    ...
end

# diagnose user device list
vd root/0 54:27:1e:e6:26:3d gen 89 req OUA/34
created 70s gen 86 seen 2s port29 gen 28
ip 10.29.1.214 src mac
hardware vendor 'Asustek compute' src fortiguard id 0 weight 21
type 'Home & Office' src fortiguard id 0 weight 21

os 'Linux' src dhcp id 822 weight 128
host 'test-wifi' src dhcp

```

FDS-only ISDB package in firmware images

FortiOS firmware images include Fortinet objects in the built-in Internet Service Database (ISDB).

```

# diagnose firewall internet-service list
List internet service in kernel(global):
Internet Service Database Kernel Table: size 14974 bytes, Entry size 5844 bytes, number of
index entries 165 number of IP range entries 0

Group(0): Weight(15), number of entries(162)
.....

```

This lightweight ISDB package allows firewall rules and policy routes that use ISDB to access FortiGuard servers to continue working after upgrading FortiOS. For example, the following policy will work after an upgrade:

```

config firewall policy
    edit 440
        set name "Fortinet Updates"
        set srcintf "port25"
        set dstintf "port1"
        set srcaddr "FortiAnalyzer" "FortiAuthenticator" "Tesla Management Interface"
        "BackupFortinet" "SipFW" "ConnectVPNMgmt"
        set internet-service enable
        set internet-service-id 1245187 1245326 1245324 1245325 1245193 1245192 1245190
        1245185
        set action accept
        set schedule "always"
        set logtraffic all
        set fsso disable
    next
end

```

After the FortiGate reboots after a firmware update, an automatic update will run in five minutes so that the FortiGate can get the ISDB, whether or not scheduled update is enabled.

```
# diagnose autoupdate versions | grep Internet -A 6
```

Internet-service Full Database

Version: 7.02217 signed

Contract Expiry Date: n/a

Last Updated using manual update on Thu Mar 10 12:06:58 2022

Last Update Attempt: Thu Mar 10 12:07:27 2022

License expiration

The FortiGate will still function as a firewall if any or all of the FortiGuard licenses are expired. Valid FortiGuard licenses are required to receive database and signature updates, and to perform real-time or near-real-time security lookups to detect and quickly adjust your security posture for newly discovered attacks.

FortiGuard services are designed to be continuous. Any lapses in the service will require coverage back to the contract expiration date. For more information, see [FortiCare/FortiGuard Renewal Continuous Service Policy](#).

License type	Expiration impact
Firmware & General Update	<p>Application Control, Device & OS Identification, and Internet Service Database Definitions continue to work, but the databases are not updated and no new signatures are added.</p> <p>For example, if application control is used in a firewall policy that has an internet service applied to the source or destination addresses, then the policy will continue to inspect matching traffic using the FortiGate's existing application control signatures and ISDB definitions.</p> <p>Application control, device and OS detection, and internet service database are included in the base services that are included with all FortiCare support contracts. See FortiGuard Security Services for details.</p>
Intrusion Prevention	<p>IPS scanning continues to work, but the IPS databases are not updated and no new signatures are added.</p> <p>For example, if an IPS sensor with <i>Block malicious URLs</i> enabled is used in a firewall policy, then the policy will continue to inspect matching traffic using the FortiGate's existing IPS signatures and malicious URLs database.</p> <p>An active IPS license is critical for stopping sophisticated and zero-day attacks, as FortiGuard IPS provides near-real-time intelligence with thousands of intrusion prevention rules to detect and block known and zero-day threats.</p> <p>For more information, see Intrusion prevention on page 1303.</p>
Botnet IPs/Domains	<p>IPS sensors and DNS Filter profiles with Botnet C&C configured continue to work, but the Botnet IPs and Botnet Domain databases are not updated and no new signatures are added.</p> <p>While Botnet IPs and Domain are listed in the Intrusion Prevention category, they are actually part of the Firmware & General Updates contract.</p> <p>For more information, see Botnet C&C domain blocking on page 1269 and IPS with botnet C&C IP blocking on page 1319.</p>

License type	Expiration impact
AntiVirus	<p>Antivirus scanning continues to work, but the antivirus database is not updated and no new signatures are added.</p> <p>For more information, see Antivirus on page 1174.</p>
Web and DNS Filtering	<p>Category-based Web and DNS filtering stops working, as URLs and domains are sent to FortiGuard in real-time to determine the category.</p> <p>By default, all web and DNS traffic is dropped. If allowing website or DNS requests when a rating error occurs is enabled, then all web and DNS traffic passes through without filtering.</p> <p>If static URL or domain filtering is applied in a filter profile, those filters continue to work.</p> <p>Configurations where only specific URLs and domains are allowed and all others are blocked continue to work, but this is not a scalable solution blocking websites or performing category filtering.</p> <p>For more information, see FortiGuard filter on page 1223 and FortiGuard category-based DNS domain filtering on page 1266.</p>
Email Filtering	<p>Spam filtering stops working, as it queries the FortiGuard spam filtering server in real-time to check spammer IP addresses and emails (except those that are locally configured), phishing URLs, spam URLs, spam email checksums, and spam submissions. Anti-spam signatures are not updated.</p> <p>Profile options based on local spam filtering continue to work.</p> <p>For more information, see Email filter on page 1337.</p>
Outbreak Prevention	<p>Outbreak prevention stops working, as it uses real-time lookups to the FortiGuard Global Threat Intelligence database.</p> <p>For more information, see FortiGuard outbreak prevention on page 1212.</p>
Security Rating	<p>The security rating check stops working.</p> <p>Security Rating licenses are required to run security rating checks across all of the devices in the Security Fabric. They allow rating scores to be submitted to and received from FortiGuard for network ranking. Without security rating checks, critical vulnerabilities and configuration weaknesses in the Security Fabric cannot be identified, and best practice recommendations cannot be implemented.</p> <p>For more information, see Security rating on page 2499.</p>
Industrial DB	<p>Industry Security Service (ISS) signatures continue to work, but the database attack definitions are not updated and no new signatures are added.</p> <p>ISS includes application control and IPS signatures for industrial applications and protocols.</p> <p>For example, if an IPS sensor enabled with ISS signatures is used in a firewall policy, then the policy will continue to inspect matching traffic using the FortiGate's existing industrial database IPS signatures.</p> <p>For more information, see Industrial signature database on page 1315.</p>

Feature visibility

Feature visibility is used to control which features are visible in the GUI. This allows features that are not in use to be hidden. Some features are also invisible by default and must be made visible before they can be configured in the GUI.

The visibility of a feature does not affect its functionality or configuration. Invisible features can still be configured using the CLI.

To change the visibility of features:

1. Go to *System > Feature Visibility*.
2. Change the visibility of the features as required.
For information about what settings each option affects, click on the + icon to the right of the feature name.
Changes are listed on the right side of the content pane.
3. Click *Apply*.

Certificates

FortiOS leverages certificates in multiple areas, such as VPNs, administrative access, and deep packet inspection. This section contains topics about uploading certificates and provides examples of how certificates may be used to encrypt and decrypt communications, and represent the identity of the FortiGate. This section assumes the reader has a high level understanding of the public key infrastructure (PKI) system, particularly how entities leverage trusted certificate authorities (CAs) to verify the authenticating party, and how public and private certificate keys work to secure communications.

The certificates feature is hidden by default in FortiOS. In the GUI, go to *System > Feature Visibility* and enable *Certificates*.

For additional capabilities and enhanced certificate management, please review the FortiAuthenticator [Administration Guide](#) and [Cookbook](#).

The following topics provide an overview of how to add certificates to the FortiGate:

- [Uploading a certificate using the GUI on page 2293](#)
- [Uploading a certificate using the CLI on page 2296](#)
- [Uploading a certificate using an API on page 2297](#)

The following topics provide examples of how to use certificates:

- [Generate a new certificate on page 2302](#)
- [Site-to-site VPN with digital certificate on page 1472](#)
- [Procuring and importing a signed SSL certificate on page 2303](#)
- [Microsoft CA deep packet inspection on page 2306](#)
- [Automatically provision a certificate on page 2310](#)
- [ECDSA in SSH administrative access on page 2314](#)
- [Creating certificates with XCA on page 2316](#)
- [Configuring FortiClient EMS on page 2391](#)
- [SSL VPN with certificate authentication on page 1785](#)

- [SSL VPN with LDAP-integrated certificate authentication on page 1790](#)
- [Configuring certificates for SAML SSO on page 2485](#)
- [Protecting an SSL server on page 1393](#)

Uploading a certificate using the GUI

On the *System > Certificates* page, there are two options to add a certificate: *Generate* (use a certificate signing request) and *Import*.

Generate certificate signing request

Certificate signing requests (CSRs) are used to generate a certificate which is then signed by a CA to create a chain of trust. The CSR includes details of the FortiGate (see table below) and its public key. A CSR is not strictly necessary; some CAs allow you to provide the details of the FortiGate manually, but a CSR helps streamline the process. Selecting *Generate* takes you the *Generate Certificate Signing Request* page to enter the following information:

Certificate Name	Enter the certificate name; this is how it will appear in the <i>Local Certificates</i> list.
Subject Information	Specify an ID type: host IP address, domain name (FQDN), or email address.
Optional Information	Although listed as optional, we recommended entering the information for each field in this section. If you are generating a CSR for a third-party CA, you need to insure that these values reflect those listed for your company or organization at said certificate authority. If you are generating a certificate for a Microsoft CA, you need to check with the administrator regarding these values.
Organization Unit	Enter the name of the organizational unit under which the certificate will be issued.
Organization	Enter the overall name of the organization.
Locality(City)	Enter the city where the SSL certificate is located.
State / Province	Some issuers will reject a CSR that has an abbreviated state or province, so enter the full name of the state or province.
Country / Region	Enable the option and select the country from the dropdown.
E-Mail	Enter the email address of the technical contact for the SSL certificate that is being requested.
Subject Alternative Name	This field allows multiple domains to be used in an SSL certificate. Select from email addresses, IP addresses, URIs, DNS names, and so on.
Password for private key	If supplied, this is used as an encryption password for the private key file.
Key Type	Select <i>RSA</i> or <i>Elliptic Curve</i> .

Key Size	When <i>Key Type</i> is <i>RSA</i> , select 1024, 1536, 2048, or 4096 for bit-size/strength. We recommend using at least 2048 if your CA can issue certificates of that size.
Curve Name	When <i>Key Type</i> is <i>Elliptic Curve</i> , select the elliptic curve type: secp256r1, secp384r1, or secp521r1.
Enrollment Method	<p>Select one of the following methods that determines how the CSR will be signed.</p> <ul style="list-style-type: none"> File Based: this will generate a certificate in the certificate menu under <i>Local Certificate</i>, which differs from the existing ones because it has no <i>Subject</i>, <i>Comments</i>, <i>Issuer</i>, or <i>Expires</i> values in the table. It will also show a <i>Pending</i> status because it is only a CSR at the moment and cannot function as a certificate just yet. You can download the CSR to provide to a CA for signing. If you open the CSR file, it should look similar to this: <pre>-----BEGIN CERTIFICATE REQUEST----- MIIC7jCCAdYCAQAwgZUxCzAJBgNVBAYT (...)HEKjDX+Hg== -----END CERTIFICATE REQUEST-----</pre> <p>Next, the CSR file is supplied to a CA for signing and the returned file from the CA should be in .CER format. This file is then uploaded to the FortiGate by going to <i>System > Certificates > Import > Local Certificate</i> and uploading the CER file.</p> Online SCEP: the Simple Certificate Enrollment Protocol (SCEP) allows devices to enroll for a certificate by using a URL and a password. The SCEP server works as a proxy to forward the FortiGate's request to the CA and returns the result to the FortiGate (setting up an SCEP server is beyond the scope of this topic). Once the request is approved by the SCEP server, the FortiGate will have a signed certificate containing the details provided in the CSR.

Import

Although *Import* is often used in conjunction with a CSR, you may upload a certificate to the FortiGate that was generated on its own. This is typical of wildcard certificates (*.domain.tld) where the same certificate is used across multiple devices (FGT.domain.tld, FAZ.domain.tld, and so on), but may be used for individual certificates so long as the information provided to the signing CA matches that of the FortiGate.

When selecting *Import*, there are four options: *Local Certificate*, *CA Certificate*, *Remote Certificate*, and *CRL*.

Local certificate

Local certificates are used by the FortiGate to identify itself, or a service it provides, such as HTTPS administrative access, SSL VPN user portal, or virtual server load balancing where the FortiGate masquerades as the destination server. When selecting *Local Certificate*, four certificate type options appear in the *Import Certificate* pane:

Local Certificate	There is no field to upload a key with this option.
--------------------------	---

	Use this option when you have created a CSR on the FortiGate, as the key is generated as part of the CSR process and remains on the FortiGate. You will need to upload a .CER file.
PKCS #12 Certificate	This option takes a specific certificate file type that contains the private key. The certificate will be encrypted and a password must be supplied with the certificate file.
Certificate	This option is intended for certificates that were generated without using the FortiGate's CSR. Since the certificate private key is being uploaded, a password is required. This can be done two ways: <ul style="list-style-type: none"> • Certificate file and key file (typically .CER and .PEM) • Certificate and key bundle file (typically .PFX)
Automated	This option allows you to configure the Automated Certificate Management Environment (ACME), which allows you to request and use trusted certificates signed by Let's Encrypt (see Automatically provision a certificate on page 2310 for configuration details).

CA certificate

FortiGates come with many CA certificates from well-known certificate authorities pre-installed, just as most modern operating systems like Windows and MacOS. Use this option to add private CA certificates to the FortiGate so that certificates signed by this private CA are trusted by the FortiGate.

For example, a private CA can be used when two FortiGates are establishing a site-to-site VPN tunnel using a certificate not signed by a public or trustworthy CA, or for your LDAPS connection to your corporate AD server that also uses a certificate signed with a private CA in your domain. It is very common to upload a private CA when using PKI user authentication, since most PKI user certificates will be signed by an internal CA.

When selecting *CA Certificate*, two type options appear in the *Import CA Certificate* pane:

Online SCEP	The FortiGate contacts an SCEP server to request the CA certificate.
File	The CA certificate is uploaded directly to the FortiGate.

Remote certificate

Remote certificates are public certificates and contain only the public key. They are used to identify a remote device. For example, when configuring your FortiGate for SAML authentication with the FortiGate as an identity provider (IdP), you can optionally specify the service provider (SP) certificate. However, when configuring your FortiGate as a SP, you must specify the certificate used by the IdP. Both these certificates can be uploaded to the FortiGate as a remote certificate, since the private key is not necessary for its implementation.

CRL

Since it is not possible to recall a certificate, the CRL (certificate revocation list) list details certificates signed by valid CAs that should no longer be trusted. Certificates may be revoked for many reasons, such as if the certificate was issued erroneously, or if the private key of a valid certificate has been compromised. When selecting *CRL*, two import methods are available:

File Based	CAs publish a file containing the list of certificates that should no longer be trusted.
Online Updating	This is the preferred way to keep the list of revoked certificates up to date. Three protocols are offered: HTTP, LDAP, and SCEP.

Uploading a certificate using the CLI

Generate certificate signing request

The generated CSR must be signed by a CA then loaded to the FortiGate. See [Generate certificate signing request on page 2293](#) for more details.

To generate a CSR:

```
# execute vpn certificate local generate cmp <certificate_name> <key_size> <server> <path>
<server_certificate> <auth_certificate> <user> <password> <subject> [SANs] [options]

# execute vpn certificate local generate default-ssl-ca

# execute vpn certificate local generate default-ssl-key-certs

# execute vpn certificate local generate default-ssl-serv-key

# execute vpn certificate local generate ec <certificate_name> <curve_name> <subject>
<country> <state/province> <city> <organization> <OU> <email> [SANs] [options]

# execute vpn certificate local generate rsa <certificate_name> <key_size> <subject>
<country> <state/province> <city> <organization> <OU> <email> [SANs] [options]
```

cmp	Generate a certificate request over CMPv2.
default-ssl-ca	Generate the default CA certificate used by SSL Inspection.
default-ssl-ca-untrusted	Generate the default untrusted CA certificate used by SSL Inspection.
default-ssl-key-certs	Generate the default RSA, DSA and ECDSA key certs for ssl resign.
default-ssl-serv-key	Generate the default server key used by SSL Inspection.
ec	Generate an elliptic curve certificate request.
rsa	Generate a RSA certificate request.

Import

Any certificate uploaded to a VDOM is only accessible to that VDOM. Any certificate uploaded to the Global VDOM is globally accessible by all VDOMs.

A signed certificate that is created using a CSR that was generated by the FortiGate does not include a private key, and can be imported to the FortiGate from a TFTP file server.

To import a certificate that does not require a private key:

```
# execute vpn certificate local import tftp <file_name> <server_address> <cert_type>
[password]
```

To import a certificate that requires a private key to a VDOM, or when VDOMs are disabled:

```
config vpn certificate {local | ca | remote | ocsp-server | crl}
```

Refer to the FortiOS CLI Reference for detailed options for each certificate type ([local](#), [CA](#), [remote](#), [OSCP server](#), [CRL](#)).

To import a global certificate that requires a private key when VDOMs are enabled:

```
config certificate {local | ca | remote | crl}
```

This command is only available when VDOMs are enabled. For details, see the [FortiOS CLI Reference](#).

Uploading a certificate using an API

There are several API methods to upload a certificate based on the type and purpose of the certificate. The parameters of each method are available options, and some methods do not require all parameters to upload the certificate.

When uploading a certificate to the FortiGate using API, the certificate must be provided to the FortiGate in Base64 encoding. You must create a REST API user to authenticate to the FortiGate and use the generated API token in the request.

}

```

Example

In this example, a PKCS 12 certificate is uploaded as a local certificate using Postman as the API client. PowerShell is used for the Base64 encoding.

To upload a PKCS 12 certificate using an API:

1. In PowerShell , encode the PKCS 12 certificate to Base64:

```

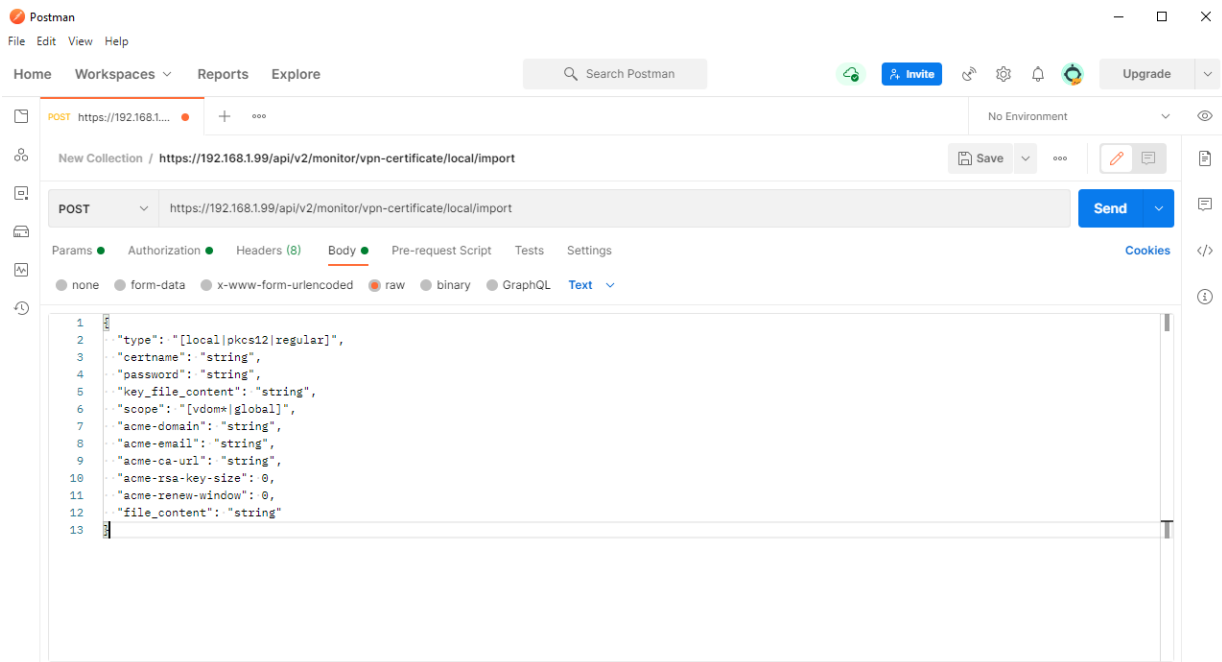

cd C:\users\username\desktop
$pkcs12cert = get-content 'C:\users\path\to\certificate\certificatename.p12' -Encoding
Byte
[System.Convert]::ToBase64String($pkcs12cert) | Out-File 'base12encodedcert.txt'

```

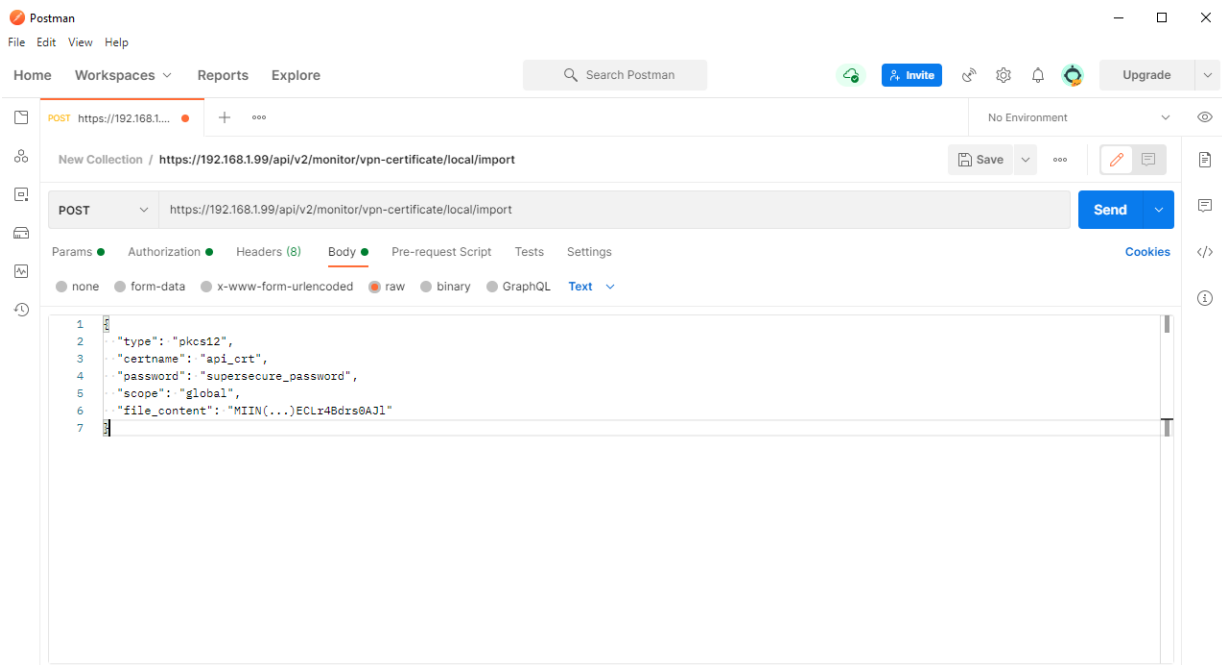

These three lines of code do the following:

- a. Changes to working directory to the location where the encoded certificate will be created. In this example, it is the desktop.

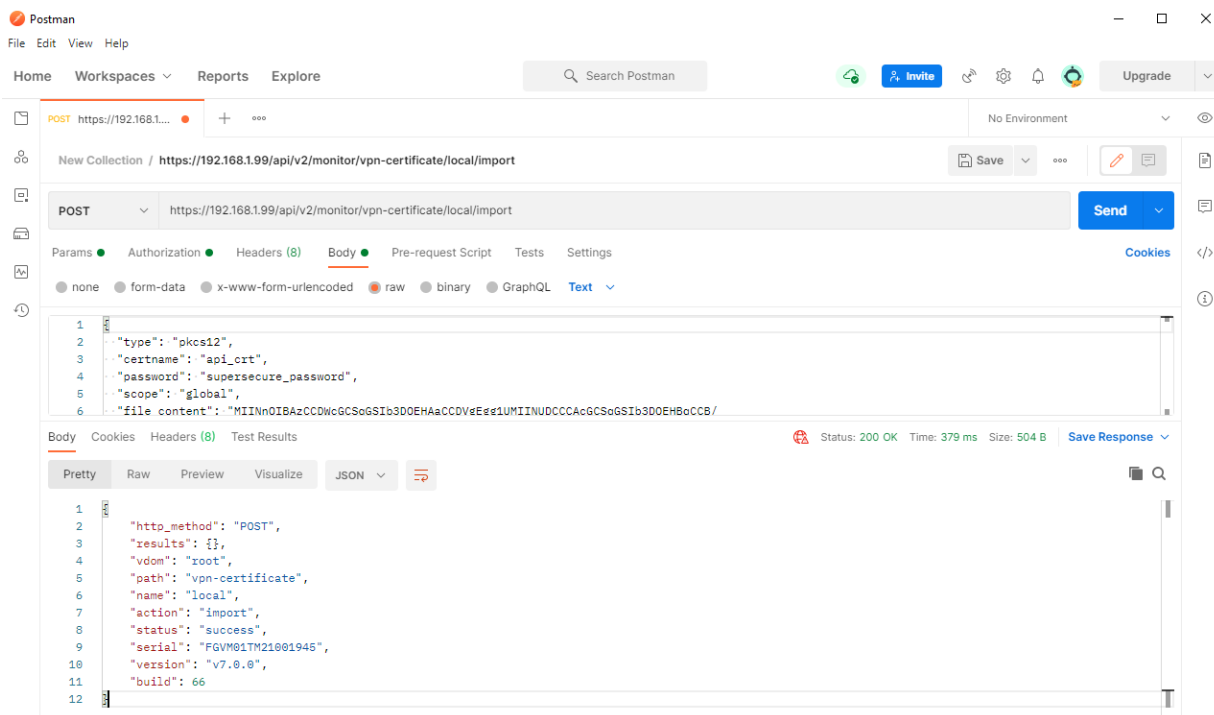

5. Click the *Body* tab, and copy and paste the API parameters.

6. Remove unnecessary parameters (ACME related parameters and `key_file_content`) and enter the correct settings for your certificate. Copy and paste the contents of the file generated by PowerShell earlier into `file_content`.

7. Click **Send**. The lower window will return the results.

8. In FortiOS, go to **System > Certificates** and verify that the uploaded certificate is shown in the table (*api_crt*).

To debug using the HTTPS daemon:

```

# diagnose debug reset
# diagnose debug enable
# diagnose debug application httpsd -1
<output>
# diagnose debug disable
  
```

Generate a new certificate

The FortiGate can generate a certificate using a pre-loaded, self-signed CA certificate: *Fortinet_CA_SSL*, instead of generating a CSR and providing it to a CA for signing. It is recommended that a server certificate from a well-known and trusted CA is used.

To generate a new certificate:

1. Go to *System > Certificates* and select *Create/Import > Certificate*.
2. Click *Generate Certificate*.
3. Set *Certificate name* to the name of the certificate. This is what is referenced when using the certificate in FortiGate configurations.
4. Set the *Common name* (CN) for the certificate. The common name should match the FQDN or IP of the primary SSL-VPN interface.
5. Optionally, set the *Subject alternative name*.
6. Click *Download CA Certificate* to download the CA certificate so that it can be installed or imported to all the machines that need to trust this certificate.

7. Click *Create*.
8. After the certificate is created, click *Download Certificate* to download the certificate. Click *View Details* to review the certificate details.

9. Click *OK*.

Procuring and importing a signed SSL certificate

A signed SSL certificate can be used when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

Before creating a certificate, you must have a registered domain. With a valid FortiGuard subscription, FortiDDNS can be used to register a domain; see [DDNS on page 239](#) for more information.

Follow these instructions to purchase, import, and use a signed SSL certificate:

- [Obtain, setup, and download an SSL certificate package from a certificate authority](#)
- [Generate a CSR](#)
- [Import the signed certificate into your FortiGate](#)
- [Configure your FortiGate to use the signed certificate](#)

Obtain, setup, and download an SSL certificate package from a certificate authority

SSL certificate packages can be purchased from any Certificate Authority (CA), such as [DigiCert](#), [GoDaddy](#), or [GlobalSign](#).

[Let's Encrypt](#) can be used to generate a free, trusted SSL certificate.

A third party CA might not sign a certificate with an intranet name or IP address. For details, see [Can I request a certificate for an intranet name or IP address?](#)

The process for purchasing, setting up, and downloading a certificate will vary depending on the CA that is used, and if a CSR must be generated on the FortiGate.

To purchase a certificate package:

1. Create an account with your chosen vendor, or use the account that you used to purchase your domain.
2. Locate the SSL Certificates page.
3. Purchase a basic SSL certificate for domain validation only. If required, a more secure SSL certificate can be purchased.
4. If required, load the CSR, either by uploading the text file or copying and pasting the contents into the requisite text box. See [Generate a CSR on page 2304](#) for information on generating the CSR on the FortiGate.
5. If required, set the server type to *Other*.
6. Verify the certificate per the requirements of the CA.
7. Download the signed certificate to your computer.
8. Import the signed certificate into your FortiGate; see [Import the signed certificate into your FortiGate on page 2305](#).

Generate a CSR

Some CAs can auto-generate the CSR during the signing process, or provide tools for creating CSRs. If necessary, a CSR can be created in your FortiGate device's GUI.

To generate a CSR on your FortiGate:

1. Go to *System > Certificates*. By default, the *Certificates* option is not visible, see [Feature visibility on page 2292](#) for information.
2. Click *Generate*. The *Generate Certificate Signing Request* page opens.

3. Configure the CSR request:
 - Ensure that the certificate has a unique name.
 - Set the *ID Type* to *Domain Name* and enter a *Domain Name*.
 - An email address is required.
 - Ensure that the *Key Size* is set to *2048 Bit*.
 - Set the *Enrollment Method* to *File Based*.
4. Click *OK*.
The CSR will be added to the certificate list with a status of *PENDING*.
5. In the certificate list, select the new CSR then click *Download* to save the CSR to your computer.
The CSR file can be opened in any text editor, and will resemble the following:

```
-----BEGIN CERTIFICATE REQUEST-----
MIICuTCCAaECAQAwSzEcmBoGA1UEAxMTZm9ydG1zc2x2cG5kZW1vLmNvbTErMCKG

-----END CERTIFICATE REQUEST-----
```

Import the signed certificate into your FortiGate

To import the signed certificate into your FortiGate:

1. Unzip the file downloaded from the CA.
There should be two CRT files: a CA certificate with *bundle* in the file name, and a local certificate.
2. Log in to your FortiGate unit and go to *System > Certificates*.
3. Click *Import > Local Certificate*.
4. Upload the local certificate file, then click *OK*.
5. The status of the certificate will change from *PENDING* to *OK*.
6. Click *Import > CA Certificate*.
7. Set the *Type* to *File*, upload the CA certificate file, then click *OK*.
The CA certificate will be listed in the *CA Certificates* section of the certificates list.

Configure your FortiGate to use the signed certificate

After the signed certificates have been imported, you can use it when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

To configure your FortiGate to use the signed certificate for SSL VPN:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Server Certificate* to the new certificate.
3. Configure other settings as needed.
4. Click *Apply*.

For more information on configuring SSL VPN, see [SSL VPN on page 1718](#) and the [Setup SSL VPN](#) video in the Fortinet Video Library.

To configure using the certificate for administrator GUI access in the CLI:

```
config system global
    set admin-server-cert fortisslvpndemo
end
```

To change the certificate that is used for administrator GUI access in the GUI:

1. Go to *System > Settings*.
2. In the *Administration Settings* section, change *HTTPS server certificate* as needed.
3. Click *Apply*. You will be logged out of FortiOS.

Microsoft CA deep packet inspection

In most production environments, you want to use a certificate issued by your own PKI for deep packet inspection (DPI).

An existing Microsoft root CA can be used to issue a subordinate CA (sub CA) certificate that is installed as a DPI certificate on the FortiGate.

Complete the following steps to create your own sub CA certificate and use it for DPI:

1. [Create a Microsoft sub CA certificate](#)
2. [Export the certificate and private key](#)
3. [Import the certificate and private key into the FortiGate](#)
4. [Configure a firewall policy for DPI](#)
5. [Verify that the sub CA certificate is being used for DPI](#)

The FortiGate firewall uses information in the original web server certificate, then issues a new certificate signed by the Microsoft DPI certificate. The FortiGate then sends this certificate with the issuing DPI certificate to the client's web browser when the SSL session is being established.

The browser verifies that the certificate was issued by a valid CA, then looks for the issuing CA of the Microsoft DPI certificate in its local trusted root CA store to complete the path to trusted root CA.

The Microsoft CA root certificate is normally deployed to all client PCs in the Windows domain, so the client can complete the certificate path up to a trusted root CA. The FortiGate now controls and can inspect the two HTTPS sessions: one with the external web server, and one with the client PC.

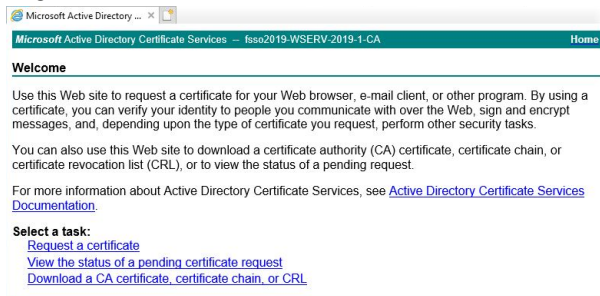

Create a Microsoft sub CA certificate

A Microsoft sub CA certificate can be created on a Microsoft CA server, or remotely using a web browser.

Creating a certificate remotely requires that the web enrollment option is configured on the Microsoft CA server. Remote certificate requests require HTTPS; requests are not allowed with HTTP.

To create a Microsoft sub CA certificate remotely:

1. Open a web browser and go to one of the following URLs:
 - <https://<FQDN-CA-server>/CertSrv>
 - <https://<IP-CA-server>/CertSrv>.
2. Log in to a domain administrator account that has web enrollment rights.

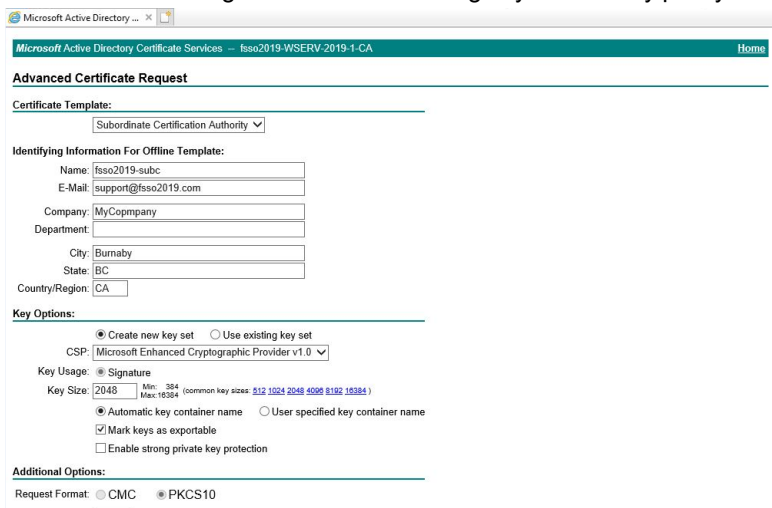

3. Click *Request a certificate*.

4. Click *advanced certificate request*.

- 5. Click *Create and submit a request to this CA*, then click *Yes* in the *Web Access Confirmation* warning.
- 6. For the *Certificate Template*, select *Subordinate Certification Authority*.
- 7. Enable *Mark keys as exportable*.
- 8. Fill out the remaining information according to your security policy.

- 9. Submit the request.
- 10. Click *Yes* in the *Web Access Confirmation* warning.
- 11. Click *Install this certificate*.
The certificate and private key are located in the current user's certificate store.

Export the certificate and private key

To export the certificate and private key:

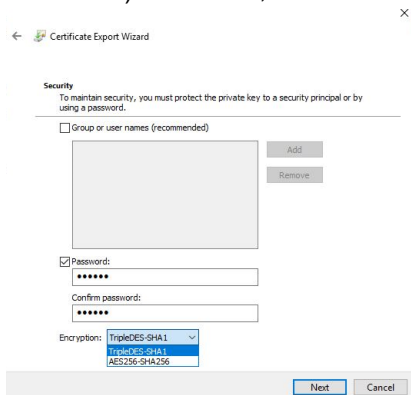

- 1. Open the Microsoft Management Console (MMC) and add the *Certificate Snap-in*.
- 2. Go to the user's certificate store to locate the sub CA certificate that you just installed.

- 3. Right-click the certificate and select *All Tasks > Export*.
- 4. Click *Next* to start the *Microsoft Certificate Export Wizard*.

5. Follow the steps in the wizard:

- When asked, select *Yes, export the private key*.
- Only the PKCS #12 (.PFX) format is available, and it requires a password.
- When selecting the encryption type, select *TripleDES-SHA1* if you are using an older version of FortiOS (5.6.9 and earlier). Otherwise, select *AES256-SHA256*.

6. Complete the wizard, and save the DPI certificate to a local folder.

Import the certificate and private key into the FortiGate

The certificate can be imported from the local computer using the GUI, or from a TFTP server using the CLI. After importing the certificate, you can view it in the GUI to verify that it was successfully imported.

To import the certificate and private key into the FortiGate in the GUI:

1. Go to *System > Certificates*.
2. Select *Import > Local Certificate*.
3. Set *Type* to *PKCS #12 Certificate*.
4. Click *Upload* and locate the certificate file.
5. Enter the *Password*.
6. Optionally, modify the *Certificate Name*.

7. Click *OK*.

To import the certificate and private key into the FortiGate in the CLI:

```
execute vpn certificate local import <certificate file name> <tftp ip address> <password>
```

To verify that the certificate was imported:

1. Go to *System > Certificates*. By default, the *Certificate* option is not visible, see [Feature visibility on page 2292](#) for information.

2. Locate the newly imported certificate in the table.
3. Select the certificate and click *View Details* to view the certificate details.

Configure a firewall policy for DPI

The certificate is used in an SSL/SSH inspection profile that is then used in a firewall policy.

To configure a firewall policy for DPI:

1. Go to *Security Profiles > SSL/SSH Inspection* and click *Create New*.
2. Configure the inspection profile, selecting the new certificate

The screenshot shows the 'New SSL/SSH Inspection Profile' configuration window. The 'Name' field is 'custom-deep-inspection' and the 'Comments' field is 'Customizable deep inspection profile.' The 'SSL Inspection Options' section is highlighted with green boxes, showing 'Enable SSL Inspection of' set to 'Multiple Clients Connecting to Multiple Servers', 'Inspection method' set to 'Full SSL Inspection', and 'CA certificate' set to 'fso2019subca-AES256'. Other options like 'Blocked certificates', 'Untrusted SSL certificates', and 'Server certificate SNI check' are also visible.

3. Click *Apply*.
4. Go to *Policy & Objects > Firewall Policy*.
5. Create a new policy, or edit an existing policy.
6. In the *SSL Inspection* field, select the new SSL inspection profile.

The screenshot shows the 'New Policy' configuration window. The 'SSL Inspection' field is highlighted with a green box, showing it is set to 'custom-deep-inspection'. Other options like 'AntiVirus', 'Web Filter', 'DNS Filter', 'Application Control', 'IPS', and 'File Filter' are also visible.

7. Configure the remaining settings as needed.
8. Click *OK*.

Verify that the sub CA certificate is being used for DPI

You can verify that the certificate is being used for resigning web server certificates when a user connects to an external HTTPS website.

To verify that the certificate is being used:

1. On a client PC that is behind the FortiGate, go to an external HTTPS website.
When connecting to the website, no certificate warning should be shown.
2. In your web browser, view the certificate and certificate path.
The methods for doing this vary depending on the browser. See your browsers documentation for information.

Automatically provision a certificate

The Automated Certificate Management Environment (ACME), as defined in [RFC 8555](#), is used by the public Let's Encrypt certificate authority (<https://letsencrypt.org>) to provide free SSL server certificates. The FortiGate can be configured to use certificates that are managed by Let's Encrypt, and other certificate management services, that use the ACME protocol. The server certificates can be used for secure administrator log in to the FortiGate.

- The FortiGate must have a public IP address and a hostname in DNS (FQDN) that resolves to the public IP address.
- The configured ACME interface must be public facing so that the FortiGate can listen for ACME update requests. It must not have any VIPs, or port forwarding on port 80 (HTTP) or 443 (HTTPS).
- The Subject Alternative Name (SAN) field is automatically filled with the FortiGate DNS hostname. It cannot be edited, wildcards cannot be used, and multiple SANs cannot be added.

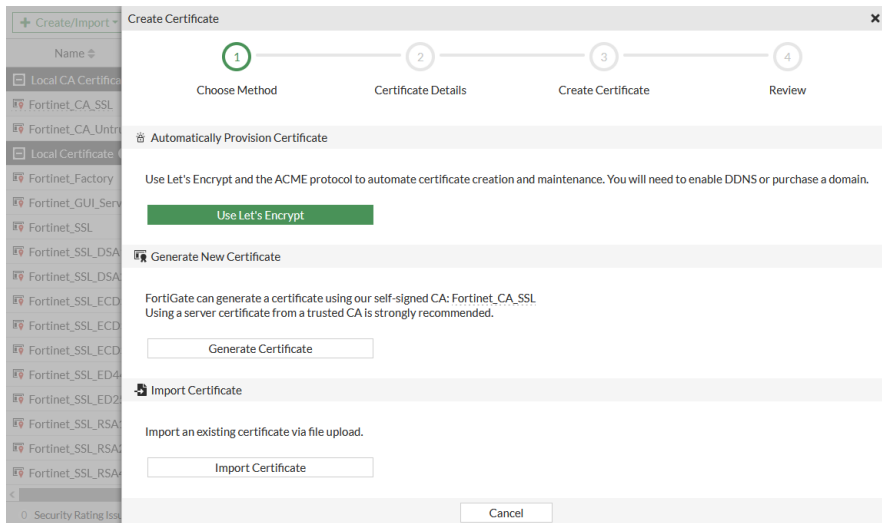

ACME certificates do not support loopback interfaces.

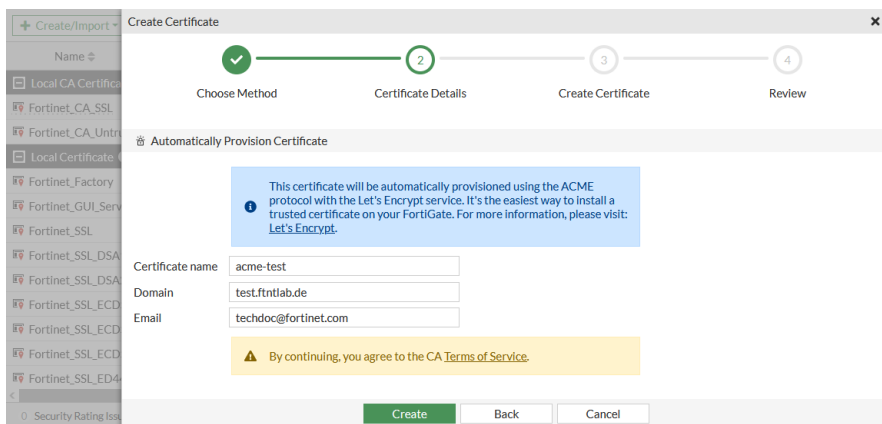

This example shows how to import an ACME certificate from Let's Encrypt, and use it for secured remote administrator access to the FortiGate.

To generate a certificate using ACME and Let's Encrypt:

1. Go to *System > Certificates* and click *Create/Import > Certificate*.

2. Click *Use Let's Encrypt*.
3. Set *Certificate name* to an appropriate name for the certificate. This is what is referenced when using the certificate in FortiGate configurations.
4. Set *Domain* to the public FQDN of the FortiGate.
5. Set *Email* to a valid email address. The email is not used during the enrollment process.

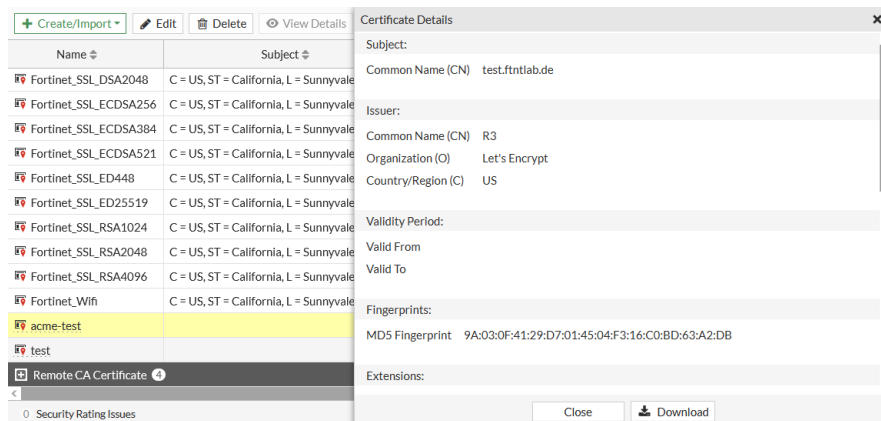

6. Click *Create*.
7. Set the *ACME interface*, on which the ACME client will listen for challenges in order to provision and renew certificates. The challenge is how the certificate signing request is validated by Let's Encrypt.

8. Click *OK*. Let's Encrypt provisions the certificate and the certificate is added to the certificate list in the *Local Certificates* section.

9. Click **View Details** to verify that the FortiGate's FQDN is in the certificate's *Subject: Common Name (CN)*.

To import an ACME certificate in the CLI:

1. Set the interface that the FortiGate communicates with Let's Encrypt on:

```
config system acme
    set interface "port1"
end
```

2. Make sure that the FortiGate can contact the Let's Encrypt enrollment server:

```
# execute ping acme-v02.api.letsencrypt.org
PING ca80aladb12a4fbdac5ffcbc944e9a61.pacloudflare.com (172.65.32.248): 56 data bytes
64 bytes from 172.65.32.248: icmp_seq=0 ttl=60 time=2.0 ms
64 bytes from 172.65.32.248: icmp_seq=1 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=2 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=3 ttl=60 time=2.1 ms
64 bytes from 172.65.32.248: icmp_seq=4 ttl=60 time=2.0 ms

--- ca80aladb12a4fbdac5ffcbc944e9a61.pacloudflare.com ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 1.7/1.9/2.1 ms
```

3. Configure the local certificate request:

```
config vpn certificate local
    edit "acme-test"
        set enroll-protocol acme2
        set acme-domain "test.ftntlab.de"
        set acme-email "techdoc@fortinet.com"
    next
```

```
By enabling this feature you declare that you agree to the Terms of Service at
https://acme-v02.api.letsencrypt.org/directory
Do you want to continue? (y/n)y
end
```

4. Verify that the enrollment was successful:

```
# get vpn certificate local details acme-test
path=vpn.certificate, objname=local, tablename=(null), size=2632
== [ acme-test ]
    Name:          acme-test
```

```

Subject:      CN = test.ftntlab.de
Issuer:       C = US, O = Let's Encrypt, CN = R3
Valid from:   2021-03-11 17:43:04 GMT
Valid to:     2021-06-09 17:43:04 GMT
Fingerprint: 9A:03:0F:41:29:D7:01:45:04:F3:16:C0:BD:63:A2:DB
Serial Num:   03:d3:55:80:d2:e9:01:b4:ca:80:3f:2e:fc:24:65:ad:7c:0c

```

ACME details:

Status: The certificate for the managed domain has been renewed successfully and can be used (valid since Thu, 11 Mar 2021 17:43:04 GMT).

Staging status: Nothing in staging

5. Check the ACME client full status log for the CN domain:

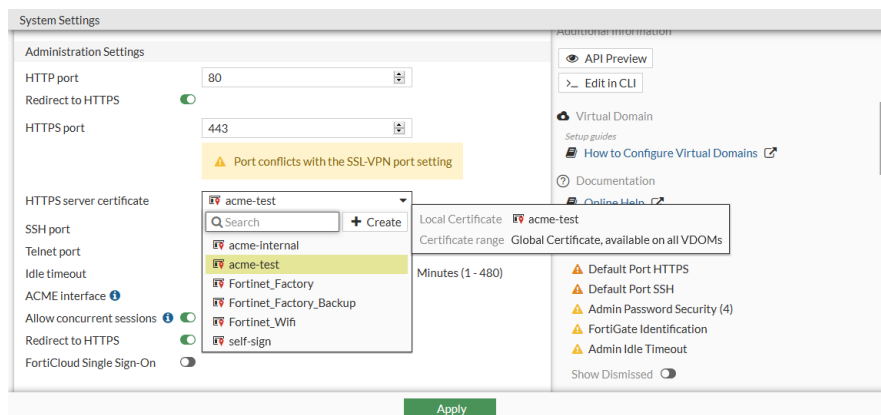

```

# diagnose sys acme status-full test.ftntlab.de
{
  "name": "test.ftntlab.de",
  "finished": true,
  "notified": false,
  "last-run": "Thu, 11 Mar 2021 18:43:02 GMT",
  "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT",
  "errors": 0,
  "last": {
    "status": 0,
    "detail": "The certificate for the managed domain has been renewed successfully and
can be used (valid since Thu, 11 Mar 2021 17:43:04 GMT). A graceful server restart now
is recommended.",
    "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT"
  },
  "log": {
    "entries": [
      {
        "when": "Thu, 11 Mar 2021 18:43:05 GMT",
        "type": "message-renewed"
      },
      ...
      {
        "when": "Thu, 11 Mar 2021 18:43:02 GMT",
        "type": "starting"
      }
    ]
  }
}

```

To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the GUI:

1. Go to *System > Settings*.
2. Set *HTTPS server certificate* to the new certificate.

3. Click *Apply*.
4. Log in to the FortiGate using an administrator account from any internet browser. There should be no warnings related to non-trusted certificates, and the certificate path should be valid.

To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the CLI:

```
config system global
    set admin-server-cert "acme-test"
end
```

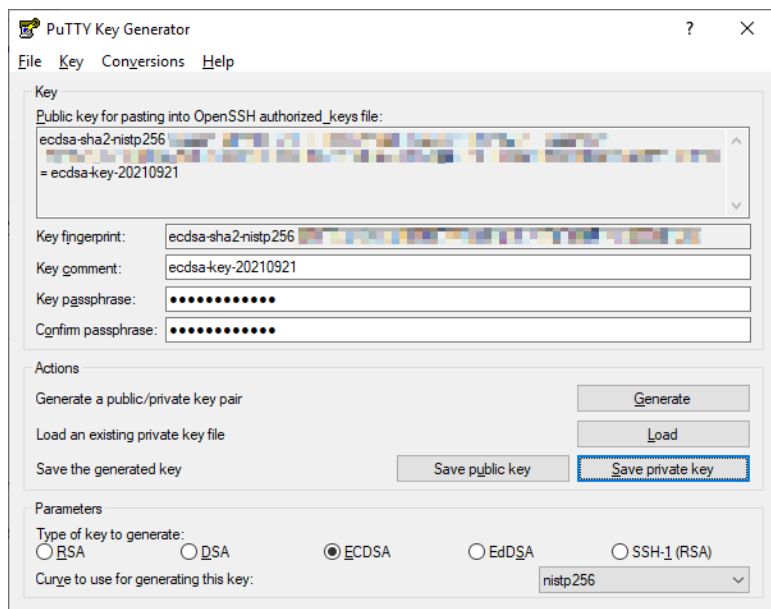

When you log in to the FortiGate using an administrator account there should be no warnings related to non-trusted certificates, and the certificate path should be valid.

ECDSA in SSH administrative access

ECDSA (Elliptic Curve Digital Signature Algorithm) is supported in SSH administrative access. Administrative users can connect using an ECDSA key pair or an ECDSA-based certificate.

To log in to the FortiGate with an ECDSA public key:

1. On the PC, use a key generator (such as PuTTY) to generate an SSH public/private key pair using ECDSA encryption.

2. In FortiOS, configure the key for ssh-public-key1:

```
config system admin
  edit "admin1"
    set accprofile "prof_admin"
    set vdom "root"
    set ssh-public-key1 "ecdsa-sha2-nistp256 *****/*****=
root@PC05.qa.fortinet.com"
    set password *****
  next
end
```

3. On the PC, verify that the administrator can log in to the FortiGate with the private key:

```
# ssh -o StrictHostKeyChecking=no admin1@172.16.200.1 -i ./ssh/id_ecdsa
FortiGate-101F $ get system status
Version: FortiGate-101F v7.0.2,build0234,211019 (GA)
```

To log in to the FortiGate with a certificate private key:

1. On the PC, generate a certificate with keys encrypted by ECDSA.

2. In FortiOS, import the PEM file for the remote certificate:

```
# execute vpn certificate remote import tftp certificate.pem 172.16.200.55
```

3. Display the imported remote certificate:

```
config certificate remote
  edit "REMOTE_Cert_1"
  next
end
```

4. Apply the remote certificate to the administrative user:

```
config system admin
  edit "admin1"
    set accprofile "prof_admin"
    set vdom "root"
```

```
set ssh-certificate "REMOTE_Cert_1"  
set password *****  
next  
end
```

5. On the PC, verify that the administrator can log in to the FortiGate with the SSH certificate:

```
root@PC05:~# ssh -i certificate-private.pem admin1@172.16.200.1  
FortiGate-101F $ get system status  
Version: FortiGate-101F v7.0.2,build0234,211019 (GA)
```

Creating certificates with XCA

This topic explains how to generate various certificates to be used in conjunction with a FortiGate, including:

- CA certificate
 - Signing server and client certificates
 - Issuing subordinate CAs for deep inspection
- Server certificate
 - SSL/TLS web administration authentication
 - VPN authentication
 - Internal SSL server protection
- Client certificate
 - End user authentication for SSL or IPsec VPN

XCA is an x509 certificate generation tool that handles RSA, DSA, and EC keys, as well as certificate signing requests (PKCS #10) and CRLs.

There are several options for generating and managing certificates. This topic covers basic certificate generation for XCA. It is not a comprehensive guide to its application and does not explore all options available when generating a certificate.

Creating the XCA database

Before creating any certificates, you must create an XCA database to group the certificates in. You should use a different database for each PKI you create.

To create the database:

1. Go to *File > New Database*.
2. Select a directory to store the created certificates and keys.
3. Enter a name. The provided password encrypts the private keys and is used to access the XCA database in the future.

The remaining procedures in this topic assume you are using this XCA database.

Creating a CA certificate

A CA certificate marks the root of a certificate chain. If this CA certificate is trusted by an end entity, any certificates signed by the CA certificate are also trusted.

To create a CA certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
 - a. Set *Template for the new certificate* to *[default] CA*.
 - b. Click *Apply extensions*.

The screenshot shows the 'Create x509 Certificate' dialog box with the 'Source' tab selected. The 'Signing request' section has three checkboxes: 'Sign this Certificate signing request' (unchecked), 'Copy extensions from the request' (checked), and 'Modify subject of the request' (unchecked). The 'Signing' section has two radio buttons: 'Create a self signed certificate' (selected) and 'Use this Certificate for signing' (unchecked). The 'Signature algorithm' dropdown is set to 'SHA 256'. The 'Template for the new certificate' dropdown is set to '[default] CA'. Below the dropdown are three buttons: 'Apply extensions' (highlighted), 'Apply subject', and 'Apply all'. At the bottom are 'OK', 'Cancel', and 'Help' buttons.

3. Edit the *Subject* tab:
 - a. Enter an *Internal Name* to reference this certificate within XCA.
 - b. Enter a *commonName*.
 - c. Optionally, click *Add* to add other distinguished name fields.
 - d. Since this XCA database does not contain any keys yet, click *Generate a new key*. The *Private key* field is now

populated.

4. Optionally, edit the *Extensions* tab:
 - a. Adjust the *Time range* if needed.
 - b. Click *Apply*.
5. Click *OK*.

Issuing a subordinate CA certificate for deep inspection

Subordinate CA certificates are similar to CA certificates because they are used to sign other certificates to establish trust of the signed certificate's content. This trust of the signed certificate is only valid if the subordinate CA is also trusted by the client.

When performing deep inspection on a FortiGate, the FortiGate proxies the connection between the endpoint and the server. This is done transparently so that the end user believes they are communicating with the server, and the server with the client. To do this, when the webpage is requested by a client, the FortiGate must present a certificate that matches the requested website and is trusted by the client.

The certificate presented by the FortiGate is generated on-demand to match the requested website and is signed by this subordinate CA to establish trust with the requesting endpoint. The subordinate CA must be installed on the FortiGate (with the private key) and on the client device (without the private key).

A subordinate CA is used in place of a CA so that it may be revoked as necessary. This is critical since the subordinate CA's private key is exported and becomes susceptible of being compromised. If the CA private key becomes compromised, you would be forced to re-create your entire PKI with a new root CA because root CAs cannot be revoked. See [Microsoft CA deep packet inspection on page 2306](#) for more information about using subordinate CA certificates.

To issue a subordinate CA certificate for deep inspection:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
 - a. Set *Use this Certificate for signing* to the CA created previously.
 - b. Set *Template for the new certificate* to *[default] CA*.
 - c. Click *Apply extensions*.
3. Edit the *Subject* tab:
 - a. Enter an *Internal Name* to reference this certificate within XCA.
 - b. Enter a *commonName*.
 - c. Optionally, click *Add* to add other distinguished name fields.
 - d. Click *Generate a new key* to create a new private key for the subordinate CA.

The screenshot shows the 'Create x509 Certificate' dialog box with the 'Subject' tab selected. The 'Internal Name' field contains 'VF_sub_CA'. Under 'Distinguished name', the following fields are filled: 'countryName' (US), 'stateOrProvinceName' (PA), 'localityName' (Scranton), and 'commonName' (VF_sub_CA). The 'Private key' dropdown is set to 'VF_sub_CA (RSA:2048 bit)' and the 'Generate a new key' checkbox is checked. At the bottom, there are 'Add' and 'Delete' buttons for the distinguished name fields, and 'OK', 'Cancel', and 'Help' buttons.

4. Optionally, edit the *Extensions* tab:
 - a. Adjust the *Time range* if needed.
 - b. Click *Apply*.
5. Click *OK*.

Creating a server host certificate

When a CA signs a host certificate, that CA is vouching for the credentials in the certificate. These credentials are what identifies the host.

Some endpoints can generate a certificate signing request (CSR). A CSR is a certificate outline that specifies the details of the endpoint, including its public key. This allows the CA to review the details and sign the request if they are true. This request is then returned or uploaded to the generating endpoint to be used.

Since some endpoints cannot generate their own CSR, you can create the certificate manually in XCA. If you already have a CSR, use the *Certificate signing requests* tab to import and then sign it.

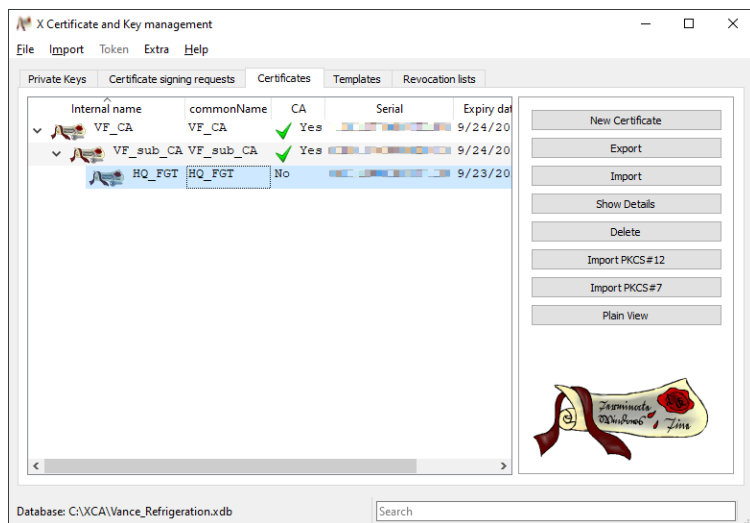

To create a server host certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
 - a. Set *Template for the new certificate* to *[default] TLS_server*.
 - b. Click *Apply extensions*.
 - c. In the *Signing* section, select *Use this Certificate for signing* and select the subordinate CA certificate.
3. Edit the *Subject* tab:
 - a. Enter an *Internal Name* to reference this certificate within XCA.
 - b. Enter the distinguished name fields as needed.
 - c. Click *Generate a new key*.

The screenshot shows the 'Create x509 Certificate' dialog box with the 'Subject' tab selected. The 'Internal Name' field contains 'HQ_FGT'. Under 'Distinguished name', the following fields are filled: 'countryName' is 'US', 'stateOrProvinceName' is 'PA', 'commonName' is 'HQ_FGT', and 'localityName' is 'Scranton'. The 'Private key' dropdown is set to 'HQ_FGT (RSA:2048 bit)'. There is a checkbox for 'Used keys too' which is unchecked, and a 'Generate a new key' button next to it. At the bottom, there are 'OK', 'Cancel', and 'Help' buttons.

4. Edit the *Extensions* tab:
 - a. For *X509v3 Subject Alternative Name*, enter *email:user@domain.tld*.
5. Click *OK*.

6. Click the *Certificates* tab to view the certificate.

This certificate may be used to identify an SSL or TLS server by uploading the certificate and key pair to the server, such as when the FortiGate presents the administrative webpage or for SSL VPN authentication (see [Configure your FortiGate to use the signed certificate on page 2305](#)). Another use case for a server host certificate is to enable SSL server protection so the FortiGate simulates the real server and brokers the connection (see [Protecting an SSL server on page 1393](#)).

Creating a client host certificate

A client host certificate is used to identify an end entity in a more secure way than a username and password. Once the client host certificate is generated, see [SSL VPN with certificate authentication on page 1785](#) for more information about using the certificate.

To create a client host certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
 - a. In the *Signing* section, select *Use this Certificate for signing* and select the CA or subordinate CA.
 - b. Set *Template for the new certificate* to *[default] TLS_client*.
 - c. Click *Apply extensions*.
3. Edit the *Subject* tab:
 - a. Enter an *Internal Name* to reference this certificate within XCA.
 - b. Enter the distinguished name fields as needed.

- c. Click *Generate a new key*.

4. Click *OK*.
5. Click the *Certificates* tab. The FortiGate and client certificates are listed under the signing CA certificate and are ready to be exported.

Internal name	commonName	CA	Serial	Expiry date	CRL Expiration
VF_CA	VF_CA	Yes		9/24/2031	
VF_sub_CA	VF_sub_CA	Yes		9/24/2022	
BobVance	BVance	No		9/24/2022	

6. Select a certificate and click *Export*.
7. Enter the file name and select an export format.
8. Click *OK*.

Certificate formats

Certificate file formats indicate what is contained in the file, how it is formatted, and how it is encoded. See [Uploading a certificate using the GUI on page 2293](#) for more information about which formats the FortiGate expects for a given certificate type.

Security

The following topics provide information about security:

- [BIOS-level signature and file integrity checking on page 2323](#)
- [Real-time file system integrity checking on page 2327](#)
- [Running a file system check automatically on page 2329](#)
- [FortiGate VM unique certificate on page 2330](#)

BIOS-level signature and file integrity checking

The BIOS-level signature and integrity checking has been enhanced by enforcing each FortiOS GA firmware image, AV engine file, and IPS engine file to be dually-signed by the Fortinet CA and a third-party CA. The BIOS verifies that each file matches their secure hash as indicated by their certificates. Users are warned when there is a failed integrity check, and the system may be prevented from booting depending on the severity and the BIOS security level.

Signature checking occurs when the FortiOS firmware, AV, and IPS engine files are uploaded. This allows the FortiGate to warn users of potential risks involved with uploading an unauthenticated file.

The outcome of the signature and integrity check depends on the security level configured in BIOS and the certificate authority that signed the file.

The following table summarizes the use cases and the potential outcome based on the security level.

Use case	Certificate signed by		Outcome based on security level		
	Fortinet CA	Third-party CA	Level 2	Level 1	Level 0
GA-Certified (GA firmware, Beta firmware, Top3 final builds)	Yes	Yes	Accept	Accept	Accept
Non-GA certified (Special builds: Top3 and NPI quick builds)	Yes	No	Warning	Accept	Accept
Interim and Dev builds, or unknown build	No	Yes or No	Reject	Warning	Accept

The security levels on the BIOS are:

- Level 2: in order to operate normally, FortiOS requires all file signatures to match their secure checksums as indicated on both Fortinet and third-party CA signed certificates.
 - If a file has a Fortinet CA signed certificate but no third-party signed certificates, then FortiOS can still run but displays a warning in the GUI and CLI.
 - If a file has no valid certificate signed by the Fortinet CA, then FortiOS is not allowed to run.
- Level 1: in order to operate normally, FortiOS only requires all file signatures to match their secure checksums as indicated on the Fortinet CA signed certificate.

- If a file has no valid certificate signed by the Fortinet CA, then FortiOS can still run but displays a warning in the GUI and CLI.
- Level 0 (not recommended): FortiOS does not perform code verification.

On FortiGates without supported BIOS security levels, the device acts like security level 1. For example, on a FortiGate-VM that does not have BIOS, the security level is defaulted to level 1.

To verify the BIOS security level:

```
# get system status
Version: FortiGate-101F v7.0.12,build0523,230606 (GA.M)
Security Level: 2
Firmware Signature: certified
```

The following examples outline the different use cases when upgrading firmware and AV files on a FortiGate model that supports BIOS security levels, and a FortiGate model that does not support BIOS security levels.

For more information, see the [Firmware on page 2061](#) section and [Manual updates on page 2276](#).

Upgrading on a device with BIOS security levels

The following use cases are applicable when upgrading firmware on a FortiGate with BIOS security levels. Firmware is upgraded using the *System > Fabric Management* or *System > Firmware* page. In the following examples, the FortiOS version is upgraded from 7.0.11 to 7.0.12 and interim build numbers are used to demonstrate the functionality of this feature on a FortiGate 101F.

Level 2

When upgrading with a dually-signed firmware image, FortiOS verifies the certificates and accepts the image. The following CLI output shows the messages displayed when a FortiGate is upgraded.

```
FortiGate_101F (global) # get system status
Version: FortiGate-101F v7.0.11,build0489,230314 (GA.M)
Firmware Signature: certified
Virus-DB: 1.00000(2018-04-09 18:07)
...
FortiGate_101F (global) # Image verification OK!
Firmware upgrade in progress ...
```

Done.

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.

...

System is starting...

The config file may contain errors.
Please see details by the command 'diagnose debug config-error-log read'.

```
FortiGate_101F login: admin
Password:
```

Welcome!

```
FortiGate_101F (global) # get system status
Version: FortiGate-101F v7.0.12,build0523,230606 (GA.M)
Security Level: 2
Firmware Signature: certified
```

When upgrading with an unsigned firmware image in the GUI, FortiOS is unable to verify the certificates and rejects the image. A notification is displayed that *This firmware image didn't pass the signature verification*.

When uploading a dually-signed IPS engine file on the *System > FortiGuard* page, FortiOS verifies the certificates and accepts the file. A notification is displayed (*Successfully upgraded database*).

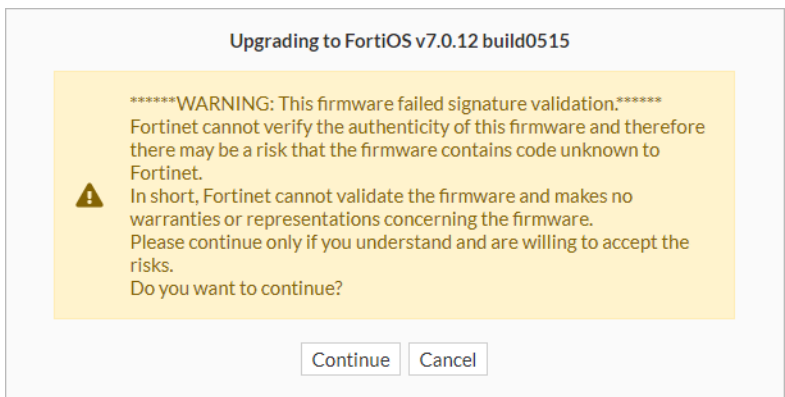

When uploading an unsigned IPS engine file on the *System > FortiGuard* page, FortiOS is unable to verify the certificates and rejects the file. A notification is displayed that the device *Failed to upgrade database*.

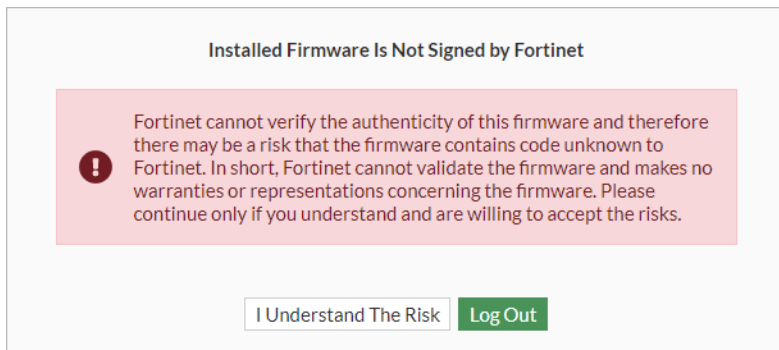

Level 1

When upgrading with a dually-signed firmware image, FortiOS verifies the certificates and accepts the image. No warning is displayed during the upgrade, or while the system is running in 7.0.12.

When upgrading with an unsigned firmware image in the GUI, FortiOS is unable to verify the certificates and the image fails verification. The upgrade will still occur. However, during the upgrade process, a warning dialog is displayed indicating that *This firmware failed signature validation*. The user can click *Continue* to upgrade the firmware.

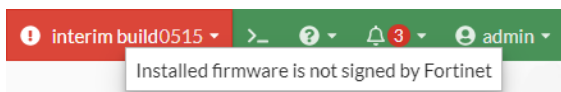

When the user logs in to the FortiGate running 7.0.12, a warning dialog is displayed indicating that the *Installed Firmware is Not Signed by Fortinet*. The user can click *I Understand The Risk* to log in.

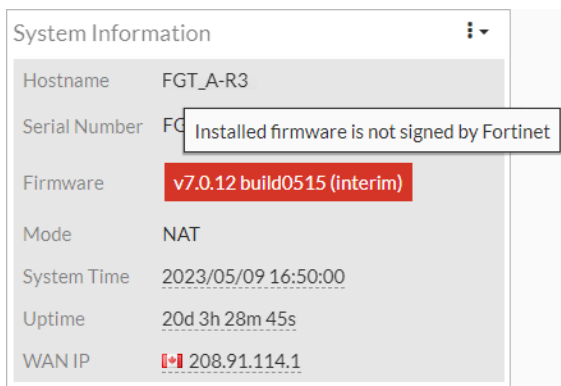

When the FortiGate is running unsigned firmware, warnings appear in the GUI and CLI.

- Top banner: the unsigned firmware version is highlighted in red. Hovering over the unsigned firmware version displays a tooltip that the *Installed firmware is not signed by Fortinet*.

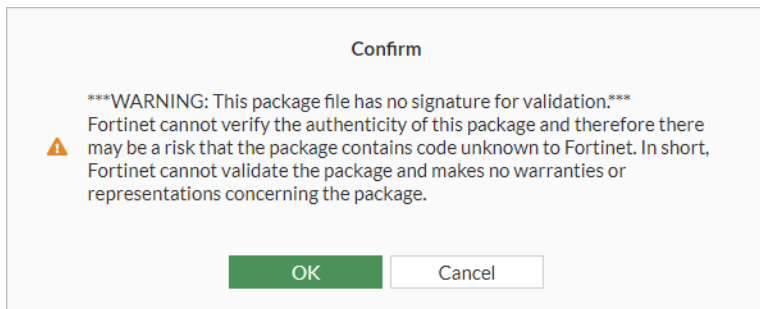

- *Dashboard > Status > System Information* widget: the unsigned firmware version is highlighted in red. Hovering over the unsigned firmware version displays a tooltip that the *Installed firmware is not signed by Fortinet*.

- Enter the following in the CLI to verify the firmware status:

```
# get system status
Version: FortiGate-VM64 v7.0.12,build0515,230509 (interim)
Security Level: 1
Firmware Signature: un-certified
Virus-DB: 91.03113 (2023-05-09 15:26)
```

When running uploading an unsigned IPS engine file on the *System > FortiGuard* page, FortiOS is unable to verify the certificates and the file fails verification. A warning dialog is displayed indicating that *This package file has no signature for validation*, but the user can click *OK* to use the file.

Level 0

When upgrading with a dually-signed firmware image, FortiOS verifies the certificates and accepts the image. No verification is performed.

When upgrading with an unsigned firmware image in the GUI, FortiOS does not verify the certificates. No warnings are displayed that the firmware is unverified.

Upgrading on a device without BIOS security levels

The following use cases are applicable when upgrading firmware and AV files on a FortiGate without BIOS security levels. Firmware is upgraded using the *System > Fabric Management* or *System > Firmware* page, and AV files are upgraded using the *System > FortiGuard* page. A FortiGate 60E is used in these examples and acts like it has security level 1.

When upgrading from 7.0.11 to 7.0.12 with a dually-signed firmware image, FortiOS verifies the certificates and accepts the image.

When upgrading from 7.0.11 to 7.0.12 with an unsigned firmware image in the GUI, FortiOS is unable to verify the certificates and the image fails verification. A warning dialog is displayed indicating that *This firmware failed signature validation*, but the user can click *Continue* to use the firmware.

When running 7.0.12 and uploading an unsigned AV engine file on the *System > FortiGuard* page, FortiOS is unable to verify the certificates and the file fails verification. A warning dialog is displayed indicating that *This package file has no signature for validation*, but the user can click *OK* to use the file.

Real-time file system integrity checking

Real-time file system integrity checking has two main purposes:

- Prevent unauthorized modification of important binaries.
- Detect unauthorized binaries and prevent them from running.

How it works

When the FortiGate boots, the system performs a BIOS level integrity check on important internal files, the AV engine file, and the IPS engine file. These files are signed by the process described in [BIOS-level signature and file integrity checking on page 2323](#), and the BIOS verifies their signature against their certificates.

Once these files are verified to be authentic, the BIOS can boot the root filesystem and other executables and libraries. Once loaded, real-time protection begins. The important executables and binaries are protected from write access and

any modifications. It also blocks the kernel from loading any modules. Any unauthorized loading of modules is blocked. If violations are found, logs are triggered.

A hash of all executable binaries and libraries is taken and stored in memory. If there is a hash mismatch when attempting to run a binary, that binary is blocked from running, and the system is rebooted. A log will be generated with ID 20234.

If there is a missing hash when attempting to run a binary, then the system is rebooted. A log will be generated with ID 20223.

The system also runs a periodic check to verify the integrity of important binaries and AV and IPS engines.

Log summary

The following logs are recorded when specific actions take place.

Log	Description
20230 - LOG_ID_SYS_SECURITY_WRITE_VIOLATION 432	The root filesystem is read only. Any modification triggers this log.
20231 - LOG_ID_SYS_SECURITY_HARDLINK_VIOLATION 432	An attacker trying to replace symlink triggers this log.
20232 - LOG_ID_SYS_SECURITY_LOAD_MODULE_VIOLATION 433	Only the kernel can load modules. Any unusual loading of modules triggers this log.
20233 - LOG_ID_SYS_SECURITY_FILE_HASH_MISSING 434	File hashes are generated for legitimate files during bootup. If a hash cannot be found, the file may be suspicious as it could be a new routine inserted by an attacker. The binary is blocked.
20234 - LOG_ID_SYS_SECURITY_FILE_HASH_MISMATCH 434	File hashes are generated for legitimate files during bootup. If a hash does not match when the file is exercised, it is an indication that it could have been modified by an attacker. The system is rebooted.

Detection examples

Example 1: system reboots due to mismatched hash

```
fos_ima: fos_process_appraise 110: Executable File(/bin/node) doesn't match previous hash,
it has been changed
Restarting system.
```

...

```
fos_ima: fos_process_appraise 110: Executable File(/lib/libc.so.6) doesn't match previous
hash, it has been changed
Restarting system.
```

...

Logs similar to the following are captured:

```
date="2023-06-16" time="12:01:44" id=7245222014288399309 bid=471609558 dvid=6533
itime=1686909705 euid=3 epid=3 dsteuid=3 dstepid=3 logver=604132092 logid="0100020234"
type="event" subtype="system" level="alert" msg="Hash of executable file(/bin/init) doesn't
match the previous." logdesc="Integrity check of Run/loading Executable File failed without
Integrity measure" severity="alert" eventtime=1686909705825483706 tz="+0200"
devid="xxxxxxxx" vd="root" devname="xxxxxxxx"
```

```
date="2023-06-15" time="09:57:54" id=7244819017507013700 bid=470303007 dvid=1431
itime=1686815875 euid=3 epid=3 dsteuid=3 dstepid=3 logver=604132092 logid="0100020234"
type="event" subtype="system" level="alert" msg="Hash of executable file(/lib/libc.so.6)
doesn't match the previous." logdesc="Integrity check of Run/loading Executable File failed
without Integrity measure" severity="alert" eventtime=1686815874936267770 tz="+0200" devid="
xxxxxxxx " vd="root" devname=" xxxxxxxxxxx"
```

Example 2: suspected compromise due to an observed indicator of compromise (IoC)

```
fos_ima: fos_process_appraise 99: Suspicious Executable File(/data2/libcrashpad.so) is
missing hash
```

...

```
fos_ima: fos_process_appraise 99: Suspicious Executable File(/data2/flatkc_info) is missing
hash
```

...

No logs are found.

Corrective action

In the previous examples where a mismatched or missing hash occurs, alert technical support straight away so that they may gather information to start a forensic analysis with our internal PSIRT team. There are two possible outcomes:

1. The firewall is reporting a false positive, in which a bug causes a mismatched or missing hash.
Once verified by technical support, the corrective action may be upgrade to a newer build where the bug is fixed
2. An actual compromise has occurred, or is occurring.
The system could be blocking an offending binary that causes the system to malfunction, or the system could reboot to protect itself from compromise.

In either case, contact technical support for further forensic analysis. If an IoC is detected and it is determined that the persistent threat resides on the FortiGate, a reflash and reload of the firmware may be recommended.

Running a file system check automatically

There is an option in FortiOS to enable automatic file system checks if the FortiGate shuts down ungracefully.

By default, the automatic file system check is disabled. When an administrator logs in after an ungraceful shutdown, a warning message appears advising them to manually run a file system check. A warning also appears in the CLI:

```
WARNING: File System Check Recommended! Unsafe reboot may have caused inconsistency in disk
drive.
```

```
It is strongly recommended that you check file system consistency before proceeding.
Please run 'execute disk scan 17'
```

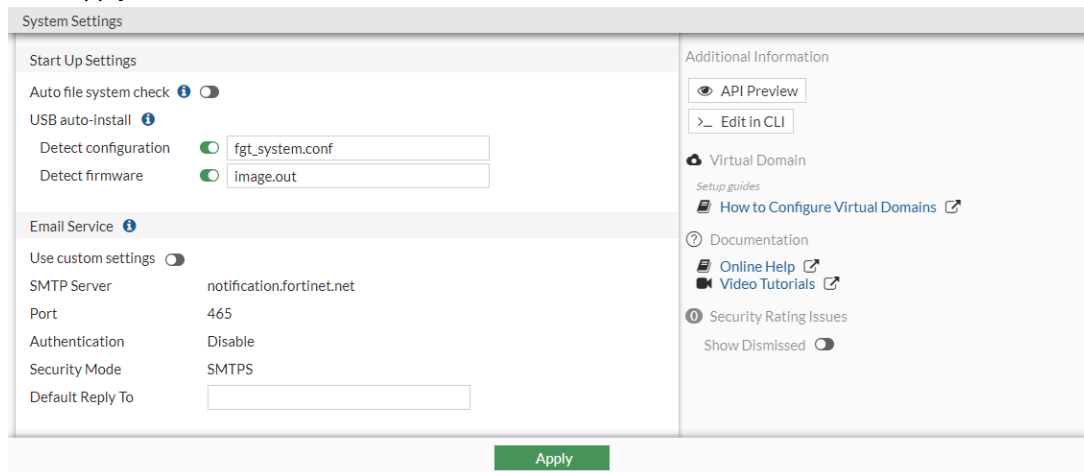

```
Note: The device will reboot and scan during startup. This may take up to an hour
```

Enabling automatic file system checks

You can enable automatic file system checks in both the GUI and CLI.

To enable automatic file system checks in the GUI:

1. Go to *System > Settings*.
2. In the *Start Up Settings* section, enable *Auto file system check*.
3. Click *Apply*.

To enable automatic file system checks using the CLI:

```
config system global
  set autorun-log-fsck enable
end
```

FortiGate VM unique certificate

To safeguard against certificate compromise, FortiGate VM and FortiAnalyzer VM use the same deployment model as FortiManager VM where the license file contains a unique certificate tied to the serial number of the virtual device.

A hardware appliance usually comes with a BIOS certificate with a unique serial number that identifies the hardware appliance. This built-in BIOS certificate is different from a firmware certificate. A firmware certificate is distributed in all appliances with the same firmware version.

Using a BIOS certificate with a built-in serial number provides a high trust level for the other side in X.509 authentication.

Since a VM appliance has no BIOS certificate, a signed VM license can provide an equivalent of a BIOS certificate. The VM license assigns a serial number in the BIOS equivalent certificate. This gives the certificate an abstract access ability, which is similar to a BIOS certificate with the same high trust level.

This feature is only supported in new, registered VM licenses.

Sample configurations

Depending on the firmware version and VM license, the common name (CN) on the certificate will be configured differently.

License	Firmware			
	6.0	6.2	6.4	7.0
6.0	CN = FortiGate	CN = FortiGate	CN = FortiGate	CN = FortiGate
6.2	CN = FortiGate	CN = serial number	CN = serial number	CN = serial number
6.4	CN = FortiGate	CN = serial number	CN = serial number	CN = serial number
7.0	CN = FortiGate	CN = serial number	CN = serial number	CN = serial number

To view validated certificates:

1. Go to *System > Certificates*.
2. Double-click on a VM certificate. There are two VM certificates:
 - *Fortinet_Factory*
 - *Fortinet_Factory_Backup*
 The *Certificate Detail Information* window displays.

Configuration scripts

Configuration scripts are text files that contain CLI command sequences. They can be created using a text editor or copied from a CLI console, either manually or using the *Record CLI Script* function.

Scripts can be used to run the same task on multiple devices. For example, if your devices use the same security policies, you can enter or record the commands to create those policies in a script, and then run the script on each device. You could also create the policies in the GUI, and then copy and paste the CLI commands from the *CLI Console* using the *show* command.

If the FortiGate is managed by FortiManager, scripts can be uploaded to FortiManager and then run on any other FortiGates that are managed by that FortiManager. See [Scripts](#) in the [FortiManager Administration Guide](#).

A comment line in a script starts with the number sign (#). Comments are not executed.

To run a script using the GUI:

1. Click on your username and select *Configuration > Scripts*.
2. Click *Run Script*.
3. Select the text file containing the script on your management computer, then click *OK*.
The script runs immediately, and the *Script Execution History* table is updated, showing if the script ran successfully.

Name	Result	Time
Local		
Retro.txt	Success	2021/05/04 15:33:21
ReplmntMsgGroups.txt	Success	2021/05/04 15:33:08
GetSystemStatus.txt	Success	2021/05/04 15:32:57

Workspace mode

Workspace mode allows administrators to make a batch of changes that are not implemented until the transaction is committed. Prior to committing, the changes can be reverted or edited as needed without impacting current operations.

When an object is edited in workspace mode it is locked, preventing other administrators from editing that object. A warning message will be shown to let the administrator know that the object is currently being configured in another transaction.

All administrators can use workspace mode; their permissions in workspace mode are the same as defined in their account profile.

A workspace mode transaction times out after five minutes if there is no activity. When a transaction times out, all changes are discarded. A warning message will be shown to let the administrator know that a timeout is imminent, or has already happened:

```
config transaction id=1 will expire in 30 seconds
config transaction id=1 will expire in 20 seconds
config transaction id=1 will expire in 10 seconds
config transaction id=1 has expired
```

The following commands are not changeable in a workspace transaction:

```
config system console
config system resource-limits
config system elbc
config system global
    set split-port
    set vdom-admin
    set management-vdom
    set wireless-mode
    set internal-switch-mode
end
config system settings
    set opmode
end
config system npu
config system np6
config system wireless
    set mode
end
config system vdom-property
config system storage
```

The `execute batch` command cannot be used in or to start workspace mode.

To use workspace mode:**1. Start workspace mode:**

```
execute config-transaction
```

Once in workspace mode, the administrator can make configuration changes, all of which are made in a local CLI process that is not viewable by other processes.

2. Commit configuration changes:

```
execute config-transaction commit
```

After performing the commit, the changes are available for all other processes, and are also made in the kernel.

3. Abort configuration changes:

```
execute config-transaction abort
```

If changes are aborted, no changes are made to the current configuration or the kernel.

Diagnose commands

```
diagnose sys config-transaction show txn-meta
```

Show config transaction meta information. For example:

```
# diagnose sys config-transaction show txn-meta
txn_next_id=8, txn_nr=2
```

```
diagnose sys config-transaction show txn-info
```

Show config transaction information. For example:

```
# diagnose sys config-transaction show txn-info
current_jiffies=680372
```

```
txn_id=6, expire_jiffies=706104, clicmd_fpath='/dev/cmdb/txn/6_EiLl9G.conf'
txn_id=7, expire_jiffies=707427, clicmd_fpath='/dev/cmdb/txn/7_UXK6wY.conf'
```

```
diagnose sys config-transaction show txn-entity
```

Show config transaction entity. For example:

```
# diagnose sys config-transaction show txn-entity
vd='global', cli-node-oid=37(system.vdom), txn_id=7. location: fileid=0, storeid=0,
pgnr=0, pgidx=0
vd='global', cli-node-oid=46(system.interface), txn_id=7. location: fileid=3,
storeid=0, pgnr=0, pgidx=0
```

```
diagnose sys config-transaction show txn-lock
```

Show transaction lock status. For example:

```
# diagnose sys config-transaction show txn-lock
type=-1, refcnt=0, value=256, pid=128
```

```
diagnose sys config-transaction status
```

Show the transaction status in the current CLI.

Custom languages

Custom languages can be uploaded and used for SSL VPN web portals. Custom languages must be enabled before they can be added in the GUI.

To enable custom languages:

```
config system global
    set gui-custom-language enable
end
```

To configure a custom language in the GUI:

1. Go to *System > Custom Languages* and click *Create New*.
2. Enter the name of the language.
3. Optionally, enter a comment.
4. Click *Upload* and upload the language JSON file from your management computer.

5. Click *OK*.

To configure a language in an SSL VPN web portal in the GUI:

1. Go to *VPN > SSL-VPN Portals*.
2. Edit an existing portal, or click *Create New* to create a new one.
3. Enable *Enable Web Mode*, then select the language from the *Language* field.

4. Click *OK*.

To configure a custom language in the CLI:

```
config system custom-language
    edit <language>
        set filename <file>
    end
end
```

```

    next
end

```

To configure a language in an SSL VPN web portal in the GUI:

```

config vpn ssl web portal
    edit <portal>
        set web-mode enable
        set custom-lang <language>
    next
end

```

RAID

Most FortiGate devices with multiple disk drives (SSD or HDD) can be configured to use RAID.

Enabling or disabling RAID, and changing the RAID level, erases all data on the log disk and reboots the device.

To verify that the FortiGate has multiple disks:

- List disk devices and partitions:

```

# execute disk list

Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
  partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev:
/dev/sda1 start: 2048

Disk SSD2 ref: 16 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sdb
  partition ref: 17 62.7GiB, 62.4GiB free mounted: Y label: WANOPTXX1FEBBFA1 dev:
/dev/sdb1 start: 2048
  partition ref: 18 63.7GiB, 63.7GiB free mounted: N label: dev: /dev/sdb2 start:
133625856
  partition ref: 19 85.0GiB, 85.0GiB free mounted: N label: dev: /dev/sdb3 start:
267249664

```

- Display information about all of the disks:

```

# diagnose hardware deviceinfo disk

Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
  partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev:
/dev/sda1 start: 2048

Disk SSD2 ref: 16 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sdb
  partition ref: 17 62.7GiB, 62.4GiB free mounted: Y label: WANOPTXX1FEBBFA1 dev:
/dev/sdb1 start: 2048
  partition ref: 18 63.7GiB, 63.7GiB free mounted: N label: dev: /dev/sdb2 start:
133625856
  partition ref: 19 85.0GiB, 85.0GiB free mounted: N label: dev: /dev/sdb3 start:

```

267249664

```
Disk SYSTEM(boot) 14.9GiB type: SSD [ATA 16GB SATA Flash] dev: /dev/sdc
  partition 247.0MiB, 155.0MiB free mounted: N label: dev: /dev/sdc1(boot) start: 1
  partition 247.0MiB, 154.0MiB free mounted: Y label: dev: /dev/sdc2(boot) start: 524289
  partition ref: 35 14.2GiB, 14.0GiB free mounted: Y label: dev: /dev/sdc3 start:
1048577
```

```
Disk USB-6(user-usb) ref: 48 28.6GiB type: USB [SanDisk Ultra] dev: /dev/sdd
<<<<<<===this info for usb disk because i have usb disk on FGT301E
  partition ref: 49 28.6GiB, 28.6GiB free mounted: Y label: dev: /dev/sdd1 start: 0
```

```
Total available disks: 4
Max SSD disks: 2 Available storage disks: 2
```

To check the RAID status:

- RAID enabled:

```
# execute disk raid status
RAID Level: Raid-1
RAID Status: OK (Background-Synchronizing) (9%)
RAID Size: 239GB
```

```
Disk 1: OK Used 228GB
Disk 2: OK Used 228GB
```

- RAID disabled:

```
# execute disk raid status
RAID Level: Unavailable
RAID Status: Unavailable
RAID Size: 0GB
```

```
Disk 1: OK Not-Used 228GB
Disk 2: OK Not-Used 228GB
```

To enable RAID:

```
# execute disk raid enable
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y
```

```
Dependent storage SSD2 removed.
Dependent storage SSD1 removed.
Raid-0 created with 2 disks.
```

```
Performing raid on the requested disk(s) and rebooting, please wait.. .
```

```
Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
- unmounting /usb : ok
- unmounting /var/storage/SSD2-WANOPTXX0EA0EF17 : ok
```

```

- unmounting /usb : ok
```

Formatting /dev/md0 ... done

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.

To rebuild the RAID:

```
# execute disk raid rebuild
```

To rebuild the RAID to another level:

1. Check the supported RAID levels:

```
# execute disk raid rebuild-level  
<RAID level> supported: Raid-0, Raid-1
```

2. Rebuild the RAID to the required level:

```
# execute disk raid rebuild-level Raid-1  
This will erase all data on the log disk, and system will reboot!  
Do you want to continue? (y/n)y
```

```
Dependent storage RAID removed.  
Raid-1 created with 2 disks.
```

Performing raid on the requested disk(s) and rebooting, please wait...

```
Configuring raid...  
- unmounting /data2 : ok

FortiGate encryption algorithm cipher suites

FortiGates use SSL/TLS encryption for HTTPS and SSH administrative access, and SSL VPN remote access. When establishing an SSL/TLS or SSH connection, you can control the encryption level and the ciphers that are used in order to control the security level.

HTTPS access

HTTP administrative access encryption is controlled using the following commands:

```
config system global
    set strong-crypto {enable | disable}
    set admin-https-ssl-versions {tls1-1 tls1-2 tls1-3}
    set admin-https-ssl-ciphersuites {<cipher_1> ... <cipher_n>}
    set admin-https-ssl-banned-ciphers {<cipher_1> ... <cipher_n>}
end
```

When strong encryption is enabled, only TLS 1.2 and TLS 1.3 are allowed. If strong encryption is then disabled, TLS 1.1 has to be manually enabled.

Setting `admin-https-ssl-ciphersuites` controls which cipher suites are offered in TLS 1.3. TLS 1.2 and lower are not affected by this command. To disable all TLS 1.3 cipher suites, remove TLS1-3 from `admin-https-ssl-versions`.

Setting `admin-https-ssl-banned-ciphers` controls which cipher technologies will not be offered for TLS 1.2 and lower.

Specific cipher suites are supported by each TLS version:

TLS version	Supported cipher suites	
TLS 1.1 ¹	ECDHE-RSA-AES256-SHA ¹	AES256-SHA ¹
	ECDHE-RSA-AES128-SHA ¹	AES128-SHA ¹
TLS 1.2	ECDHE-RSA-AES256-GCM-SHA384	AES256-GCM-SHA384 ¹
	ECDHE-RSA-AES128-GCM-SHA256	AES128-GCM-SHA256 ¹
	ECDHE-RSA-CHACHA20-POLY1305	AES256-SHA256
	ECDHE-RSA-AES256-SHA384	AES128-SHA256
	ECDHE-RSA-AES128-SHA256	AES256-SHA ¹
	ECDHE-RSA-AES256-SHA ¹	AES128-SHA ¹
	ECDHE-RSA-AES128-SHA ¹	
TLS 1.3	TLS-AES-128-GCM-SHA256	TLS-AES-128-CCM-8-SHA256
	TLS-AES-256-GCM-SHA384	TLS-CHACHA20-POLY1305-SHA256
	TLS-AES-128-CCM-SHA256	

¹ Disabled if strong encryption (`strong-crypto`) is enabled.

SSH access

SSH access encryption is controlled using the following command:

```
config system global
  set admin-ssh-v1 {enable | disable}
  set strong-crypto {enable | disable}
  set ssh-enc-algo <algo_1> [<algo_2> ... <algo_n>]
  set ssh-kex-algo <algo_1> [<algo_2> ... <algo_n>]
  set ssh-mac-algo <algo_1> [<algo_2> ... <algo_n>]
end
```

The algorithms available when configuring `set ssh-enc-algo` are affected by `set strong-crypto` as follows:

Strong encryption setting	Supported ciphers	
Enabled	chacha20-poly1305@openssh.com	aes256-ctr
	aes256-gcm@openssh.com	

Strong encryption setting	Supported ciphers	
Disabled	chacha20-poly1305@openssh.com	aes128-ctr
	aes192-ctr	aes256-ctr
	arcfour256	arcfour128
	aes128-cbc	3des-cbc
	blowfish-cbc	cast128-cbc
	aes192-cbc	aes256-cbc
	arcfour	rijndael-cbc@lysator.liu.se
	aes128-gcm@openssh.com	aes256-gcm@openssh.com

The following options are available for the `ssh-kex-algo` algorithm based on the strong encryption setting:

Strong encryption setting	Supported ciphers	
Enabled	diffie-hellman-group-exchange-sha256	curve25519-sha256@libssh.org
	ecdh-sha2-nistp256	ecdh-sha2-nistp384
	ecdh-sha2-nistp521	
Disabled	diffie-hellman-group14-sha1	diffie-hellman-group-exchange-sha1
	diffie-hellman-group-exchange-sha256	curve25519-sha256@libssh.org
	ecdh-sha2-nistp256	ecdh-sha2-nistp384
	ecdh-sha2-nistp521	

The following options are available for the `ssh-mac-algo` algorithm based on the strong encryption setting:

Strong encryption setting	Supported ciphers	
Enabled	hmac-sha2-256	hmac-sha2-256-etm@openssh.com
	hmac-sha2-512	hmac-sha2-512-etm@openssh.com

Strong encryption setting	Supported ciphers	
Disabled	hmac-md5	hmac-md5-etm@openssh.com
	hmac-md5-96	hmac-md5-96-etm@openssh.com
	hmac-sha1	hmac-sha1-etm@openssh.com
	hmac-sha2-256	hmac-sha2-256-etm@openssh.com
	hmac-sha2-512	hmac-sha2-512-etm@openssh.com
	hmac-ripemd160	hmac-ripemd160@openssh.com
	hmac-ripemd160-etm@openssh.com	umac-64@openssh.com
	umac-128@openssh.com	umac-64-etm@openssh.com
	umac-128-etm@openssh.com	

SSL VPN

For SSL VPN connections, the TLS versions and cipher suites are controlled using the following commands:

```
config vpn ssl setting
  set algorithm {high | medium | low}
  set ssl-max-proto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
  set ssl-min-proto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
  set ciphersuite {TLS-AES-128-GCM-SHA256 TLS-AES-256-GCM-SHA384 TLS-CHACHA20-POLY1305-
  SHA256 TLS-AES-128-CCM-SHA256 TLS-AES-128-CCM-8-SHA256}
end
```

Only cipher suites supported by TLS 1.3 can be set using the `set ciphersuite` command.

When the SSL VPN security level (`algorithm`) is set to high, only high levels are allowed. When it is set to medium, high and medium levels are allowed. When it is set to low, any level is allowed.

The strong encryption (`strong-crypto`) command has no effect on the SSL VPN encryption level or ciphers.

Specific cipher suites are supported by each TLS version:

TLS version	Supported cipher suites	
TLS 1.0	ECDHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-AES256-SHA	AES128-SHA
	DHE-RSA-CAMELLIA256-SHA	SEED-SHA ¹
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA	ECDHE-RSA-DES-CBC3-SHA ^{1*}
	ECDHE-RSA-AES128-SHA	EDH-RSA-DES-CBC3-SHA ^{1*}
	DHE-RSA-AES128-SHA ¹	DES-CBC3-SHA ^{1*}
	DHE-RSA-SEED-SHA	
TLS 1.1	ECDHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-AES256-SHA	AES128-SHA
	DHE-RSA-CAMELLIA256-SHA	SEED-SHA ¹
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA	ECDHE-RSA-DES-CBC3-SHA ^{1*}
	ECDHE-RSA-AES128-SHA	EDH-RSA-DES-CBC3-SHA ^{1*}
	DHE-RSA-AES128-SHA	DES-CBC3-SHA ^{1*}
	DHE-RSA-SEED-SHA ¹	

TLS version	Supported cipher suites	
TLS 1.2	ECDHE-RSA-AES256-GCM-SHA384	ECDHE-RSA-AES128-SHA
	ECDHE-RSA-AES256-SHA384	DHE-RSA-AES128-GCM-SHA256
	ECDHE-RSA-AES256-SHA	DHE-RSA-AES128-CCM8
	DHE-RSA-AES256-GCM-SHA384	DHE-RSA-AES128-CCM
	ECDHE-RSA-CHACHA20-POLY1305	AES128-CCM8
	DHE-RSA-CHACHA20-POLY1305	AES128-CCM
	DHE-RSA-AES256-CCM8	DHE-RSA-AES128-SHA256
	DHE-RSA-AES256-CCM	DHE-RSA-AES128-SHA
	DHE-RSA-AES256-SHA256	ECDHE-RSA-CAMELLIA128-SHA256
	DHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA256
	ECDHE-RSA-CAMELLIA256-SHA384	DHE-RSA-SEED-SHA ¹
	DHE-RSA-CAMELLIA256-SHA256	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-CAMELLIA256-SHA	AES128-GCM-SHA256
	AES256-GCM-SHA384	AES128-SHA256
	AES256-CCM8	AES128-SHA
	AES256-CCM	CAMELLIA128-SHA256
	AES256-SHA256	SEED-SHA ¹
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA256	ARIA128-GCM-SHA256
	CAMELLIA256-SHA	DHE-RSA-ARIA128-GCM-SHA256
	ARIA256-GCM-SHA384	ECDHE-ARIA128-GCM-SHA256
	DHE-RSA-ARIA256-GCM-SHA384	ECDHE-RSA-AES256-GCM-SHA384
ECDHE-ARIA256-GCM-SHA384	ECDHE-RSA-DES-CBC3-SHA ^{1*}	
ECDHE-RSA-AES128-GCM-SHA256	EDH-RSA-DES-CBC3-SHA ^{1*}	
ECDHE-RSA-AES128-SHA256	DES-CBC3-SHA ^{1*}	
TLS 1.3	TLS_AES_256_GCM_SHA384	TLS_AES_128_CCM_SHA256
	TLS_CHACHA20_POLY1305_SHA256	TLS_AES_128_CCM_8_SHA256
	TLS_AES_128_GCM_SHA256	

¹ This cipher is not available when the SSL VPN security level (`algorithm`) is set to high.

* This cipher is not available when the SSL VPN security level (`algorithm`) is set to medium.

Additional features

Security hardening for other FortiOS features can also be achieved by managing the encryption level or ciphers. See [SSL algorithm security level on page 2345](#) for more information about different levels of security.

An asterisk (*) represents the default values for each feature.

Some of these features are described next.

WAN optimization

For WAN optimization tunnel connections, the encryption algorithm is controlled using the following commands:

```
config wanopt settings
    set tunnel-ssl-algorithm {high* | medium | low}
end
```

Explicit FTP proxy

For explicit FTP proxy, the encryption algorithm is controlled using the following commands:

```
config ftp-proxy explicit
    set ssl-algorithm { high* | medium | low}
end
```

Explicit web proxy

For explicit web proxy, the encryption algorithm is controlled using the following commands:

```
config web-proxy explicit
    set ssl-algorithm {high | medium | low*}
end
```

SSL Server

For SSL server, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config firewall ssl-server
    edit <name>
        set ssl-algorithm {high* |medium | low}
        set ssl-max-version {tls-1.0* |tls-1.1 | tls-1.2 | tls-1.3}
        set ssl-min-version {tls-1.0 |tls-1.1 | tls-1.2 | tls-1.3*}
    next
end
```

VIP

For VIP, the TLS versions and the encryption algorithm are controlled using the following commands:

```

config firewall vip
  set ssl-max-version {ssl-3.0|tls-1.1 | tls1-2 | tls-1.3* | client}
  set ssl-min-version {ssl-3.0|tls-1.1* | tls1-2 | tls-1.3 | client}
  set ssl-algorithm {high* | medium | low | custom}
  config ssl-cipher-suites
    edit <priority>
      set cipher {TLS-AES-128-GCM-SHA256 | TLS-AES-256-GCM-SHA384|...}
      set versions {option1}, {option2}, ...
    next
  end
  set ssl-server-max-version [ssl-3.0|tls-1.1 | tls1-2 | tls-1.3 | client*]
  set ssl-server-min-version [ssl-3.0|tls-1.1 | tls1-2 | tls-1.3 | client*]

  set ssl-server-algorithm {high | medium | low | custom | client* }
  config ssl-server-cipher-suites
    edit <priority>
      set cipher {TLS-AES-128-GCM-SHA256 | TLS-AES-256-GCM-SHA384|...}
      set versions {option1}, {option2}, ...
    next
  end
next
end

```

The commands `config ssl-server-cipher-suites` and `config ssl-cipher-suites` are only available when `set ssl-algorithm` and `set ssl-server-algorithm` are set to `custom`. It is recommended to exercise caution when manually configuring cipher suites, as selecting a cipher with an incompatible version may result in unexpected issues.

VoIP

For VoIP, the TLS versions and the encryption algorithm are controlled using the following commands:

```

config voip profile
  edit <name>
    config sip
      set ssl-algorithm {high* |medium | low}
      set ssl-max-version {ssl-3.0 | tls-1.0* |tls-1.1 | tls-1.2 | tls-1.3}
      set ssl-min-version {ssl-3.0 | tls-1.0 |tls-1.1 | tls-1.2 | tls-1.3*}
    next
  end
end

```

SSL algorithm security level

Option	Description
high	High encryption. Allow only AES and ChaCha.
medium	Medium encryption. Allow AES, ChaCha, 3DES, and RC4.
low	Low encryption. Allow AES, ChaCha, 3DES, RC4, and DES.

Option	Description
*custom	Custom encryption. Use <code>ssl-server-cipher-suites</code> to select the cipher suites that are allowed.
*client	Use the same encryption algorithms for both client and server sessions.

The SSL algorithm security levels marked with an asterisk (*) are not supported across different FortiOS features.

Other Products

The security level of communication to and from FortiOS can be managed by controlling the encryption level and ciphers used. See [Encryption algorithm security level on page 2347](#) for more information about different levels of security.

An asterisk (*) represents the default value for each product.

Some products that commonly interact with the FortiGate device are listed next.

syslog server

For syslog server, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log syslogd setting
  set enc-algorithm {high-medium | high | low | disable*}
  set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
config log syslogd override-setting
  set enc-algorithm {high-medium | high | low | disable*}
  set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
```

The command `ssl-min-proto-version set to default` means that the system global setting will be followed.

FortiCloud

For logging to FortiCloud, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log fortiguard setting
  set enc-algorithm {high-medium | high* | low}
  set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
```

FortiAnalyzer Cloud

For FortiAnalyzer Cloud, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log fortianalyzer-cloud setting
    set enc-algorithm {high-medium | high* | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
```

FortiAnalyzer

For FortiAnalyzer, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config log fortianalyzer setting
    set enc-algorithm {high-medium | high* | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
config log fortianalyzer override-setting
    set enc-algorithm {high-medium | high* | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
```

FortiSandbox

For FortiSandbox, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config system fortisandbox
    set enc-algorithm {default* | high | low}
    set ssl-min-proto-version {default* | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
end
```

FortiManager

For central management, the TLS versions and the encryption algorithm are controlled using the following commands:

```
config system central-management
    set enc-algorithm {default | high* | low}
end
```

Encryption algorithm security level

Option	Description
*high-medium/ default	SSL communication with high and medium encryption algorithms.
high	SSL communication with high encryption algorithm
low	SSL communication with low encryption algorithms.
*disable	Disable SSL communication.

Encryption algorithm security levels marked with an asterisk (*) are not supported across different products.

Conserve mode

Each FortiGate model has a specific amount of memory that is shared by all operations. If most or all of that memory is in use, system operations can be affected in unexpected ways. To control how FortiOS functions when the available memory is very low, FortiOS enters conserve mode. This causes functions, such as antivirus scanning, to change how they operate to reduce the functionality and conserve memory without compromising security.

Three memory thresholds can be configured:

```
config system global
    set memory-use-threshold-extreme <integer>
    set memory-use-threshold-green <integer>
    set memory-use-threshold-red <integer>
end
```

memory-use-threshold-extreme <integer>	The threshold at which memory usage is considered extreme and new sessions are dropped, in percent of total RAM (70 - 97, default = 95).
memory-use-threshold-green <integer>	The threshold at which memory usage forces the FortiGate to leave conserve mode, in percent of total RAM (70 - 97, default = 82).
memory-use-threshold-red <integer>	The threshold at which memory usage forces the FortiGate to enter conserve mode, in percent of total RAM (70 - 97, default = 88).

Proxy inspection in conserve mode

The FortiGate's proxy-based inspection behavior while in conserve mode is configured with the antivirus failopen command.

```
config system global
    set av-failopen {pass | off | one-shot}
end
```

pass	<p>This is the default settings.</p> <p>Bypass the antivirus proxy and allow traffic to continue to its destination. Because traffic bypasses the proxy, security profiles that require the antivirus proxy are also bypassed. Security profiles that do not use the antivirus proxy continue to function normally.</p> <p>Use this setting when access is more important than security while the issue is resolved.</p>
off	<p>Force the FortiGate to stop all traffic that uses the antivirus proxy. New sessions are blocked, but active sessions continue to be processed normally unless they request more memory and are then terminated.</p>

If a security policy is configured to use antivirus scanning, then the traffic that it permits is blocked while in conserve mode. So, a policy with only IPS scanning enabled will continue normally, but a policy with both IPS and antivirus scanning is blocked because antivirus scanning requires the antivirus proxy.

Use this setting when security is more important than access while the issue is resolved.

one-shot

Continue to bypass the antivirus proxy after the FortiGate is out of conserve mode, until the failopen setting is changed or the FortiGate is restarted.

Flow inspection in conserve mode

The FortiGate's flow-based inspection behavior while in conserve mode is configured with the IPS failopen command.

```
config ips global
    set fail-open {enable | disable}
end
```

- When disabled (default), the IPS engine drops all new sessions that require flow-based inspection.
- When enabled, the IPS engine does not perform any scans and allows new packets.

Diagnostics

When in conserve mode, FortiOS generates conserve mode log messages and SNMP traps, and a conserve mode banner is shown in the GUI.

To view current information about memory conservation status:

```
# diagnose hardware sysinfo conserve
memory conserve mode:                on
total RAM:                            997 MB
memory used:                          735 MB    73% of total RAM
memory freeable:                      173 MB    17% of total RAM
memory used + freeable threshold extreme: 947 MB    95% of total RAM
memory used threshold red:            877 MB    88% of total RAM
memory used threshold green:         817 MB    82% of total RAM
```

To view logs:

1. Go to *Log & Report > System Events* in the GUI.
2. If historical FortiView is enabled, select the *Logs* tab.
3. If the GUI is unresponsive due to high memory usage, making the logs inaccessible, they can be viewed in the CLI:

```
# execute log filter category 1
# execute log display

1: date=2022-11-02 time=16:58:37 eventtime=1667433517502192693 tz="-0700"
logid="0100022011" type="event" subtype="system" level="critical" vd="root"
```

```
logdesc="Memory conserve mode entered" service="kernel" conserve="on" total=997 MB  
used=707 MB red="877 MB" green="698 MB" msg="Kernel enters memory conserve mode"
```

To view the crash log in the CLI:

```
# diagnose debug crashlog read  
  
1: 2022-10-27 14:22:36 service=kernel conserve=on total="997 MB" used="720 MB" red="877 MB"  
2: 2022-10-27 14:22:36 green="817 MB" msg="Kernel enters memory conserve mode"
```

Using APIs

Administrators can use API calls to a FortiGate to:

- Retrieve, create, update, and delete configuration settings
- Retrieve system logs and statistics
- Perform basic administrative actions, such as a reboot or shut down through programming scripts.

Token-based authentication

FortiGate supports only token-based authentication for API calls. Token-based authentication requires the administrator to generate a token, which is then included in each API request for authentication. A token is automatically generated when a new API administrator is created in FortiOS.

Once the API administrator is created and the token displays, there is no way for the FortiGate to provide this token again. Ensure you record the token, and store it in a safe location; otherwise, you will have to generate a new token.

Creating the API administrator and generating the API token

When creating an API administrator, it is best practice to provide this account (and the associated token) with the minimum permissions required to complete the function. For example, if you only plan to use API calls to retrieve statistics or information from the FortiGate, the account should have read permissions.

The API administrator account used in this topic's examples has full permissions strictly to illustrate various call types and does not adhere to the preceding recommendation.

See [REST API administrator on page 2058](#) for detailed steps to create a REST API administrator.

Best Practices

Using API tokens with a request header

The API token can be included in any REST API request in either the request header or URL parameter. For added security, it is strongly recommended to use API tokens in the request header or transition your applications to include the API token in the request header instead of the URL parameter.

To pass the API token in the request header, the user needs to explicitly add the following field to the request header:

```
Authorization: Bearer <YOUR-API-TOKEN>
```

Configuring security options when creating a REST API administrator

In addition to using API tokens in the request header, for added security when creating a new REST API administrator, one or more of the following fields should be configured, listed in order of configuration difficulty from easy to difficult:

- **Trusted Hosts**

To ensure that only trusted hosts/subnets can access the FortiGate REST API, you should configure the *Trusted Hosts* field when creating a new REST API administrator. You need your *Source Address* to create the trusted host.

- **CORS Allow Origin**

Cross Origin Resource Sharing (CORS) allows third-party web apps to make API requests to the FortiGate using the token. For this field, specify the `Access-Control-Allow-Origin` on API responses. If possible, avoid using '*'.

- **PKI Group**

Configure a PKI group to enable peer authentication using certificate matching, which provides an extra layer of security. Both the client certificate and token must match to be granted access to the API. The PKI group is typically specified as the name of a peer group defined under `config user group` which has PKI members. See [Configuring a PKI user on page 2015](#) for details.

Making an API call to retrieve information from the FortiGate

The newly created API token is used to query the FortiGate for all firewall addresses. Many applications can be used for this query; this example uses the curl and Postman clients to demonstrate the functionality.

To ensure maximum security when using API tokens, HTTPS is enforced. HTTP cannot be used.

Replace the placeholders below with values for your FortiGate:

- `<FortiGate_address>` is the IP address or hostname of your FortiGate as well as the HTTPS port number (default = 443 and does not need to be explicitly specified).
- `<API-TOKEN>` is the token you generated.

General API call

One of the simplest API calls is `api/v2/cmdb/firewall/address`, which returns all information about all firewall addresses.

To make a general API call using curl:

```
curl --insecure \  
-H "Accept: application/json" \  
-H "Authorization: Bearer <API-TOKEN>" https://<FortiGate_  
address>/api/v2/cmdb/firewall/address
```

The backslash (\) allows for multiline commands in curl. You can choose to enter the backslashes or enter the commands into a single wrapping line.

To make a general API call using Postman:

1. Open the Postman client.
2. Go to *Settings > General* and turn off *SSL certificate verification*.
3. Click on *New* and select *HTTP*
4. In the new request, click on the *Authorization* tab, select *Type* as *Bearer Token* and enter `<YOUR-API-TOKEN>` in the *Token* field.
5. Enter a URL like the one below:

```
https://<YOUR-FORTIGATE-ADDRESS>/api/v2/cmdb/firewall/address
```

6. Click *Send*.

Results of the general API call:

curl and Postman display the output similar to the following (output shortened for brevity):

```
{  
  "http_method": "GET",  
  "size": 17,  
  "limit_reached": false,  
  "matched_count": 17,  
  "next_idx": 16,  
  "revision": "bd002ee1735120907182831e7528dc8b",  
  "results": [  
    {  
      "name": "EMS_ALL_UNKNOWN_CLIENTS",  
      "q_origin_key": "EMS_ALL_UNKNOWN_CLIENTS",  
      "uuid": "*****-****-****-****-*****"  
      "type": "dynamic",  
      "route-tag": 0,  
      "sub-type": "ems-tag",  
      "clearpass-spt": "unknown",  
      "macaddr": [],  
      "country": "",  
      "cache-ttl": 0,  
      "sdn": "",  
      "fsso-group": [],  
      "interface": "",
```

```

    "obj-tag": "",
    "obj-type": "ip",
    "tag-detection-level": "",
    "tag-type": "",
    "dirty": "clean",
    "hw-vendor": "",
    "hw-model": "",
    "os": "",
    "sw-version": "",
    "comment": "",
    "associated-interface": "",
    "color": 0,
    "filter": "",
    "sdn-addr-type": "private",
    "node-ip-only": "disable",
    "obj-id": "",
    "list": [],
    "tagging": [],
    "allow-routing": "disable",
    "fabric-object": "disable"
  },
  {
    "name": "EMS_ALL_UNMANAGEABLE_CLIENTS",
    "q_origin_key": "EMS_ALL_UNMANAGEABLE_CLIENTS",
    "uuid": "*****-****-****-****-*****",

```

Formatting an API call

Since a general API call for address objects returns a large amount of information, it may be beneficial to format the API call to display certain information using the `format` parameter. In this example, the `format` parameter is used to display the name and comment for each firewall address.

To use the format parameter in an API call using curl:

```

curl --insecure \
-H "Accept: application/json" \
-H "Authorization: Bearer <API-TOKEN>" https://<FortiGate_
address>/api/v2/cmdb/firewall/address?format="name|comment"

```

The backslash (\) allows for multiline commands in curl. You can choose to enter the backslashes or enter the commands into a single wrapping line.

To use the format parameter in an API call using Postman:

1. Open the Postman client.
2. Go to *Settings > General* and turn off *SSL certificate verification*.
3. Click on *New* and select *HTTP*
4. In the new request, click on the *Authorization* tab, select *Type* as *Bearer Token* and enter `<YOUR-API-TOKEN>` in the *Token* field.
5. Enter a URL like the one below:

```
https://<FortiGate_address>/api/v2/cmdb/firewall/address/? format=name|comment.
```

6. Click *Send*.

Results of the formatted API call:

curl and Postman display the output similar to the following (output shortened for brevity):

```
{
  "http_method": "GET",
  "size": 17,
  "limit_reached": false,
  "matched_count": 17,
  "next_idx": 16,
  "revision": "bd002ee1735120907182831e7528dc8b",
  "results": [
    {
      "name": "EMS_ALL_UNKNOWN_CLIENTS",
      "q_origin_key": "EMS_ALL_UNKNOWN_CLIENTS",
      "comment": ""
    },
    {
      "name": "EMS_ALL_UNMANAGEABLE_CLIENTS",
      "q_origin_key": "EMS_ALL_UNMANAGEABLE_CLIENTS",
      "comment": ""
    },
    {
      "name": "FABRIC_DEVICE",
      "q_origin_key": "FABRIC_DEVICE",
      "comment": "IPv4 addresses of Fabric Devices."
    }
  ],
}
```

Filtering an API call

The filter parameter can be used to specify a field and a keyword to limit what results match and are returned by a call. In this example, the preceding call is used with a filter to return only names and comments for address objects with the word `Sales` in the name.

To use the filter parameter in an API call using curl:

```
curl --insecure \
-H "Accept: application/json" \
-H "Authorization: Bearer <API-TOKEN>" https://<FortiGate_
address>/api/v2/cmdb/firewall/address?format="name|comment&filter=name=@SSLVPN"
```

The backslash (\) allows for multiline commands in curl. You can choose to enter the backslashes or enter the commands into a single wrapping line.

To use the filter parameter in an API call using Postman:

1. Open the Postman client.
2. Go to *Settings > General* and turn off *SSL certificate verification*.
3. Click on *New* and select *HTTP*
4. In the new request, click on the *Authorization* tab, select *Type* as *Bearer Token* and enter `<YOUR-API-TOKEN>` in the *Token* field.
5. Enter a URL like the one below:

```
https://<FortiGate_address>/api/v2/cmdb/firewall/address/?  
format=name|comment&filter=name=@SSLVPN.
```

6. Click *Send*.

Results of the formatted API call:

curl and Postman display the output similar to the following (output shortened for brevity):

```
{  
  "http_method": "GET",  
  "size": 17,  
  "limit_reached": false,  
  "matched_count": 1,  
  "next_idx": 5,  
  "revision": "bd002ee1735120907182831e7528dc8b",  
  "results": [  
    {  
      "name": "SSLVPN_TUNNEL_ADDR1",  
      "q_origin_key": "SSLVPN_TUNNEL_ADDR1",  
      "comment": ""  
    }  
  ],  
  "vdom": "root",  
  "path": "firewall",  
  "name": "address",  
  "status": "success",  
  "http_status": 200,  
  "serial": "*****",  
  "version": "*****",  
  "build": ****}
```

For a complete list of API calls, see the [Fortinet Development Network \(FNDN\)](#). A [subscription](#) is required to access the FNDN.

Configuration backups and reset

Once you successfully configure the FortiGate, it is extremely important that you back up the configuration. In some cases, you may need to reset the FortiGate to factory defaults or perform a TFTP upload of the firmware, which will erase the existing configuration. In these instances, the configuration on the device must be recreated, unless a backup can be used to restore it.

You should also backup the local certificates, as the unique SSL inspection CA and server certificates that are generated by your FortiGate by default are not saved in a system backup.

We also recommend that you backup the configuration after *any* changes are made, to ensure you have the most current configuration available. Also, backup the configuration before any upgrades of the FortiGate's firmware. Should anything happen to the configuration during the upgrade, you can easily restore the saved configuration.

Always backup the configuration and store it on the management computer or off-site. You have the option to save the configuration file to various locations including the local PC, USB key, FTP, and TFTP server. FTP and TFTP are only configurable through the CLI.

If you have VDOMs, you can back up the configuration of the entire FortiGate or only a specific VDOM. Note that if you are using FortiManager or FortiGate Cloud, full backups are performed and the option to backup individual VDOMs will not appear.

You can also backup and restore your configuration using Secure File Copy (SCP). See [How to download/upload a FortiGate configuration file using secure file copy \(SCP\)](#).

You enable SCP support using the following command:

```
config system global
    set admin-scp enable
end
```

For more information about this command and about SCP support, see [config system global](#).

Backing up the configuration

To back up the configuration in FortiOS format using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration > Backup*.
2. Direct the backup to your *Local PC* or to a *USB Disk*.
The *USB Disk* option will not be available if no USB drive is inserted in the USB port. You can also backup to the FortiManager using the CLI.
3. If VDOMs are enabled, indicate whether the scope of the backup is the entire FortiGate configuration (*Global*) or only a specific VDOM configuration (*VDOM*).
If backing up a VDOM configuration, select the VDOM name from the list.
4. Enable *Encryption*.

This is recommended to secure your backup configurations and prevent unauthorized parties from reloading your configuration.

5. Enter a password, and enter it again to confirm it. This password will be required to restore the configuration.
6. Click *OK*.
7. When prompted, select a location on the PC or USB disk to save the configuration file. The configuration file will have a *.conf* extension.

To backup the configuration using the CLI:

Use one of the following commands:

```
execute backup config management-station <comment>
```

or:

```
execute backup config usb <backup_filename> [<backup_password>]
```

or for FTP, note that port number, username are optional depending on the FTP site:

```
execute backup config ftp <backup_filename> <ftp_server>[:ftp_port] [<user_name>]
[<password>] [<backup_password>]
```

or for TFTP:

```
execute backup config tftp <backup_filename> <tftp_servers> [<backup_password>]
```

or for SFTP:

```
execute backup config sftp <backup_filename> <sftp_server>[:sftp_port] <user> <password>
[<backup_password>]
```

Use the same commands to backup a VDOM configuration by first entering the commands:

```
config vdom
  edit <vdom_name>
```

See [Backing up and restoring configurations in multi VDOM mode on page 2114](#) for more information.

The configuration can be backed up to IPv4 and IPv6 FTP, TFTP, and SFTP servers.
The configuration can be restored from IPv4 and IPv6 FTP and TFTP servers.

Restoring a configuration

To restore the FortiGate configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration > Restore*.
2. Identify the source of the configuration file to be restored: your *Local PC* or a *USB Disk*.
The *USB Disk* option will not be available if no USB drive is inserted in the USB port. You can restore from the FortiManager using the CLI.
3. Click Upload, locate the configuration file, and click *Open*.
4. Enter the password if required.
5. Click *OK*.

To restore the FortiGate configuration using the CLI:

```
execute restore config management-station normal 0
```

or:

```
execute restore config usb <backup_filename> [<backup_password>]
```

or for FTP, note that port number, username are optional depending on the FTP site:

```
execute restore config ftp <backup_filename> <ftp_server>[:port] [<user_name>]
[<password>] [<backup_password>]
```

or for TFTP:

```
execute restore config tftp <backup_filename> <tftp_server> [<backup_password>]
```

The FortiGate will load the configuration file and restart. Once the restart has completed, verify that the configuration has been restored.

Troubleshooting

When restoring a configuration, errors may occur, but the solutions are usually straightforward.

Error message	Reason and Solution
Configuration file error	This error occurs when attempting to upload a configuration file that is incompatible with the device. This may be due to the configuration file being for a different model or being saved from a different version of firmware. Solution: Upload a configuration file that is for the correct model of FortiGate device and the correct version of the firmware.
Invalid password	When the configuration file is saved, it can be protected by a password. The password entered during the upload process is not matching the one associated with the configuration file. Solution: Use the correct password if the file is password protected.

Configuration revision

You can manage multiple versions of configuration files on models that have a 512MB flash memory and higher. Revision control requires either a configured central management server or the local hard drive, if your FortiGate has this feature. Typically, configuration backup to local drive is not available on lower-end models.

The central management server can either be a FortiManager unit or FortiGate Cloud.

If central management is not configured on your FortiGate unit, a message appears instructing you to either

- Enable central management, or
- Obtain a valid license.

When revision control is enabled on your FortiGate unit, and configuration backups have been made, a list of saved revisions of those backed-up configurations appears.

Configuration revisions are viewed by clicking on the user name in the upper right-hand corner of the screen and selecting *Configuration > Revisions*.

Backup and restore the local certificates

This procedure exports a server (local) certificate and private key together as a password protected PKCS12 file. The export file is created through a customer-supplied TFTP server. Ensure that your TFTP server is running and accessible to the FortiGate before you enter the command.

To back up the local certificates:

Connect to the CLI and use the following command:

```
execute vpn certificate local export tftp <cert_name> <filename> <tftp_ip>
```

where:

- <cert_name> is the name of the server certificate.
- <filename> is a name for the output file.
- <tftp_ip> is the IP address assigned to the TFTP server host interface.

To restore the local certificates using the GUI:

1. Move the output file from the TFTP server location to the management computer.
2. Go to *System > Certificates* and click *Import > Local*.
3. Select the certificate type, then click *Upload* in the *Certificate file* field.
4. On the management computer, browse to the file location, select it, and click *Open*.
5. If the *Type* is *Certificate*, upload the *Key file* as well.
6. If required, enter the *Password* that is required to upload the file or files.
7. Click *OK*.

To restore the local certificates using the CLI:

Connect to the CLI and use the following command:

```
execute vpn certificate local import tftp <filename> <tftp_ip>
```

Restore factory defaults

There may be a need to reset the FortiGate to its original defaults; for example, to begin with a fresh configuration. There are two options when restoring factory defaults:

# execute factoryreset	Reset the device to factory default configuration. The firmware version and antivirus and IPS attack definitions are not changed.
# execute factoryreset2	Reset to factory default configuration without losing management access to the FortiGate. Interface and VDOM configurations, as well as the firmware version and antivirus and IPS attack definitions, are not changed.

Fortinet Security Fabric

The Fortinet Security Fabric provides an intelligent architecture that interconnects discrete security solutions into an integrated whole to detect, monitor, block, and remediate attacks across the entire attack surface. It delivers broad protection and visibility into every network segment and device, be they hardware, virtual, or cloud based.

- The physical topology view shows all connected devices, including access layer devices. The logical topology view shows information about the interfaces that each device is connected to.
- Security rating checks analyze the Security Fabric deployment to identify potential vulnerabilities and highlight best practices to improve the network configuration, deploy new hardware and software, and increase visibility and control of the network.
- Fabric connectors provide integration with multiple SDN, cloud, and partner technology platforms to automate the process of managing dynamic security updates without manual intervention.
- Automation pairs an event trigger with one or more actions to monitor the network and take the designated actions automatically when the Security Fabric detects a threat.

Security Fabric settings and usage

This section contains information about how to configure the following devices as part of the Fortinet Security Fabric:

- [Components on page 2361](#)
- [Configuring the root FortiGate and downstream FortiGates](#)
- [Configuring FortiAnalyzer](#)
- [Configuring FortiGate Cloud on page 2373](#)
- [Configuring FortiAnalyzer Cloud service on page 2377](#)
- [Configuring FortiManager on page 2381](#)
- [Configuring FortiManager Cloud service on page 2384](#)
- [Configuring Sandboxing on page 2386](#)
- [Configuring FortiClient EMS on page 2391](#)
- [Synchronizing FortiClient ZTNA tags on page 2405](#)
- [Configuring FortiNAC on page 2408](#)

- [Integrate user information from EMS and Exchange connectors in the user store on page 2479](#)

System requirements

To set up the Security Fabric, the devices that you want to include must meet the Product Integration and Support requirements in the [FortiOS Release Notes](#).

Some features of the Security Fabric are only available in certain firmware versions and models. Not all FortiGate models can run the FortiGuard Security Rating Service if they are the root FortiGate in a Security Fabric. For more information, see the Special Notices in the [FortiOS Release Notes](#).

Prerequisites

- If devices are not already installed in your network, complete basic installation and configuration tasks by following the instructions in the device documentation.
- FortiGate devices must be operating in NAT mode.

Components

The Fortinet Security Fabric consists of different components that work together to secure you network.

The following devices are required to create a Security Fabric:

Device	Description
FortiGate	<p>FortiGate devices are the core of the Security Fabric and can have one of the following roles:</p> <ul style="list-style-type: none"> • Root: The root FortiGate is the main component in the Security Fabric. It is typically located on the edge of the network and connects the internal devices and networks to the Internet through your ISP. From the root FortiGate, you can see information about the entire Security Fabric on the Physical and Logical Topology pages in the GUI. • Downstream: After a root FortiGate is installed, all other FortiGate devices in the Security Fabric act as Internal Segmentation Firewalls (ISFWs), located at strategic points in your internal network, rather than on the network edge. This allows extra security measures to be taken around key network components, such as servers that contain valuable intellectual property. ISFW FortiGate devices create network visibility by sending traffic and information about the devices that are connected to them to the root FortiGate. <p>See Configuring the root FortiGate and downstream FortiGates on page 2364 for more information about adding FortiGate devices in the Security Fabric.</p> <p>FortiGate documentation: https://docs.fortinet.com/product/fortigate</p>

Device	Description
FortiAnalyzer*	<p>FortiAnalyzer gives you increased visibility into your network, centralized monitoring, and awareness of threats, events, and network activity by collecting and correlating logs from all Security Fabric devices. This gives you a deeper and more comprehensive view across the entire Security Fabric.</p> <p>See Configuring FortiAnalyzer on page 2371 for more information about adding FortiAnalyzer devices in the Security Fabric.</p> <p>FortiAnalyzer documentation: https://docs.fortinet.com/product/fortianalyzer</p>
Cloud Logging*	<p>There are two options for cloud logging: FortiAnalyzer Cloud and FortiGate Cloud. Either can be used to enable the Security Fabric root device; however, if using FortiGate Cloud, all downstream devices must belong to the same FortiCloud account.</p> <p>See Configuring FortiGate Cloud on page 2373 for more information about configuring a Security Fabric with FortiGate Cloud.</p> <p>FortiGate Cloud documentation: https://docs.fortinet.com/product/fortigate-cloud</p>

* FortiAnalyzer or Cloud Logging is a required component for the Security Fabric. Either FortiAnalyzer, FortiAnalyzer Cloud, or FortiGate Cloud can be used to meet this requirement.

The following devices are recommended:

Device	Description
FortiNDR	<p>FortiNDR (formerly FortiAI) uses artificial neural networks (ANN) that can deliver sub-second malware detection and a verdict. Add FortiNDR to your Security Fabric to automatically quarantine attacks.</p> <p>See Configuring FortiNDR on page 2413 for more information about adding FortiNDR devices in the Security Fabric.</p> <p>FortiNDR documentation: https://docs.fortinet.com/product/fortindr</p>
FortiAP	<p>Add FortiAP devices to extend the Security Fabric to your wireless devices. Devices connected to a FortiAP appear in the Physical and Logical Topology pages in the Security Fabric menu.</p> <p>See Configuring FortiAP and FortiSwitch on page 2410 for more information about adding FortiAP devices in the Security Fabric.</p> <p>FortiAP documentation: https://docs.fortinet.com/product/fortiap</p>
FortiClient	<p>FortiClient adds endpoint control to devices that are located in the Security Fabric, allowing only traffic from compliant devices to flow through the FortiGate. FortiClient compliance profiles are applied by the first FortiGate that a device's traffic flows through. Device registration and on-net status information for a device that is running FortiClient appears only on the FortiGate that applies the FortiClient profile to that device.</p> <p>FortiClient documentation: https://docs.fortinet.com/product/forticlient</p>
FortiDeceptor	<p>FortiDeceptor automatically lays out a layer of decoys and lures, which helps conceal sensitive and critical assets behind a fabricated deception surface to confuse and redirect attackers while revealing their presence on your network.</p> <p>See Configuring FortiDeceptor on page 2417 for more information about adding FortiDeceptor devices in the Security Fabric.</p>

Device	Description
	FortiDeceptor documentation: https://docs.fortinet.com/product/fortideceptor
FortiClient EMS	<p>FortiClient EMS is used in the Security Fabric to provide visibility across your network, securely share information, and assign security profiles to endpoints.</p> <p>See Configuring FortiClient EMS on page 2391 for more information about adding FortiClient EMS devices in the Security Fabric.</p> <p>FortiClient EMS documentation: https://docs.fortinet.com/product/forticlient</p>
FortiMail	<p>FortiMail antispam processing helps offload from other devices in the Security Fabric that would typically carry out this process.</p> <p>See Configuring FortiMail on page 2411 for more information about adding FortiMail devices in the Security Fabric.</p> <p>FortiMail documentation: https://docs.fortinet.com/product/fortimail</p>
FortiManager	<p>Add FortiManager to simplify the network management of devices in the Security Fabric by centralizing management access in a single device. This allows you to easily control the deployment of security policies, FortiGuard content security updates, firmware revisions, and individual configurations for devices in the Security Fabric.</p> <p>See Configuring FortiManager on page 2381 for more information about adding FortiManager devices in the Security Fabric.</p> <p>FortiManager documentation: https://docs.fortinet.com/product/fortimanager</p>
FortiSandbox	<p>Add FortiSandbox to your Security Fabric to improve security with sandbox inspection. Sandbox integration allows FortiGate devices in the Security Fabric to automatically receive signature updates from FortiSandbox and add the originating URL of any malicious file to a blocked URL list.</p> <p>See Configuring Sandboxing on page 2386 for more information about adding FortiSandbox devices in the Security Fabric.</p> <p>FortiSandbox documentation: https://docs.fortinet.com/product/fortisandbox</p>
FortiSwitch	<p>A FortiSwitch can be added to the Security Fabric when it is managed by a FortiGate that is in the Security Fabric with the FortiLink protocol, and connected to an interface with <i>Security Fabric Connection</i> enabled. FortiSwitch ports to become logical extensions of the FortiGate. Devices connected to the FortiSwitch appear in the Physical and Logical Topology pages in the Security Fabric menu, and security features, such as FortiClient compliance profiles, are applied to them.</p> <p>See Configuring FortiAP and FortiSwitch on page 2410 for more information about adding FortiSwitch devices in the Security Fabric.</p> <p>FortiSwitch documentation: https://docs.fortinet.com/product/fortiswitch</p>
FortiWeb	<p>Add FortiWeb to defend the application attack surface from attacks that target application exploits. You can also configure FortiWeb to apply web application firewall features, virus scanning, and web filtering to HTTP traffic to help offload from other devices in the Security Fabric that would typically carry out these processes.</p> <p>See Configuring FortiWeb on page 2420 for more information about adding FortiWeb devices in the Security Fabric.</p> <p>FortiWeb documentation: https://docs.fortinet.com/product/fortiweb</p>

The following devices are optional:

Device	Description
FortiADC	<p>FortiADC devices optimize the availability, user experience, and scalability of enterprise application delivery. They enable fast, secure, and intelligent acceleration and distribution of even the most demanding enterprise applications.</p> <p>See Configuring additional devices on page 2431 for more information about adding FortiADC devices in the Security Fabric.</p> <p>FortiADC documentation: https://docs.fortinet.com/product/fortiadc</p>
FortiDDoS	<p>FortiDDoS is a Network Behavior Anomaly (NBA) prevention system that detects and blocks attacks that intend to disrupt network service by overutilizing server resources.</p> <p>See Configuring additional devices on page 2431 for more information about adding FortiDDoS devices in the Security Fabric.</p> <p>FortiDDoS documentation: https://docs.fortinet.com/product/fortiddos</p>
FortiWLC	<p>FortiWLC delivers seamless mobility and superior reliability with optimized client distribution and channel utilization. Both single and multi channel deployment options are supported, maximizing efficiency to make the most of available wireless spectrum.</p> <p>See Configuring additional devices on page 2431 for more information about adding FortiWLC devices in the Security Fabric.</p> <p>FortiWLC documentation: https://docs.fortinet.com/product/wireless-controller</p>
Other Fortinet products	<p>Many other Fortinet products can be added to the Security Fabric, including FortiAuthenticator, FortiToken, FortiCache, and FortiSIEM.</p> <p>Documentation: https://docs.fortinet.com/</p>
Third-party products	<p>Third-party products that belong to the Fortinet Fabric-Ready Partner Program can be added to the Security Fabric.</p>

Configuring the root FortiGate and downstream FortiGates

The following procedures include configuration steps for a typical Security Fabric implementation, where the edge FortiGate is the root FortiGate with other FortiGates that are downstream from the root FortiGate.

For information about the recommended number of downstream FortiGates, see the [FortiOS Best Practices](#).

Prerequisite

- The FortiGates must be operating in NAT mode.

Configuring the root FortiGate

The edge FortiGate is typically configured as the root FortiGate, as this allows you to view the full topology of the Security Fabric from the top down.

The following steps describe how to add the FortiGate to serve as the root device, and how to configure FortiAnalyzer logging.

To configure the root FortiGate:

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, click *Enable*.
3. Set the *Security Fabric* role to *Serve as Fabric Root*. FortiAnalyzer logging is automatically enabled and the settings can be configured in the slide-out pane.

When neither *FortiAnalyzer Logging* nor *Cloud Logging* are enabled, if the FortiGate detects that a FortiAnalyzer Cloud entitlement is available on this FortiGate, the slide-out pane will display *Cloud Logging* configurations. Otherwise, if *Cloud Logging* is enabled, the slide-out pane will display the *Cloud Logging* page. If *Cloud Logging* is disabled but FortiAnalyzer is enabled, then it will display the *FortiAnalyzer Logging* page.

In the *Cloud Logging* card, there are two options available, *FortiGate Cloud* and *FortiAnalyzer Cloud*. If there are multiple services enrolled on the FortiGate, the preference is: *Cloud Logging (FortiAnalyzer Cloud)*, *FortiAnalyzer Logging*, then *Cloud Logging (FortiGate Cloud)*.

4. Enter the FortiAnalyzer IP and select the *Upload option*.
5. In the *FortiAnalyzer Logging* section, in the *IP address* field, enter the IP address of the FortiAnalyzer.
6. If required, enable *Allow access to FortiGate REST API* and, optionally, *Verify FortiAnalyzer certificate*. The REST API accesses the FortiGate topology and shares data and results. The FortiGate will verify the FortiAnalyzer by retrieving its serial number and checking it against the FortiAnalyzer certificate. When verified, the FortiAnalyzer serial number is stored in the FortiGate configuration. When authorizing the FortiGate on the FortiAnalyzer, the FortiGate admin credentials do not need to be entered.
7. Click *Test Connectivity*.
If you select *Test Connectivity* and this is the first time that you are connecting the FortiGate to the FortiAnalyzer, you will receive a warning message because the FortiGate has not yet been authorized on the FortiAnalyzer. You can configure this authorization when you configure the FortiAnalyzer. See [Configuring FortiAnalyzer on page 2371](#).
8. Click *OK*. The FortiAnalyzer serial number is verified.

9. Enter a *Fabric name*.
10. Ensure *Allow other Security Fabric devices to join* is enabled.
11. Select the interfaces that will be listening for device join requests. Enabling an interface here has the same effect as going to *Network > Interfaces*, editing an interface, and enabling *Security Fabric Connection* under *Administrative Access*.
12. Click *OK*.

Using the root FortiGate with disk to store historic user and device information

This backend implementation allows the root FortiGate in a Security Fabric to store historic user and device information in a database on its disk. This will allow administrators to visualize users and devices over a period of time.

The daemon, `user_info_history`, stores this data on the disk. The information source for the historical data will be the `user_info` daemon, which would be recorded on the disk when `user_info` notifies `user_info_history` that a user has logged out or the device is no longer connected.

Adding downstream devices

Downstream device serial numbers can be pre-authorized from the root FortiGate, or allowed to join by request. New authorization requests include the device serial number, IP address, and HA members. HA members can include up to four serial numbers and is used to ensure that, in the event of a fail over, the secondary FortiGate is still authorized.

A downstream device's certificate can also be used to authorize the device by uploading the certificate to the root FortiGate.

Pre-authorizing the downstream FortiGate

When a downstream Fortinet device's serial number or certificate is added to the trusted list on the root FortiGate, the device can join the Security Fabric as soon as it connects. After the new device is authorized, connected FortiAP and FortiSwitch devices are automatically included in the topology, where they can be authorized with one click.

The interface that connects to the downstream FortiGate must have *Security Fabric Connection* enabled.

To pre-authorize a FortiGate:

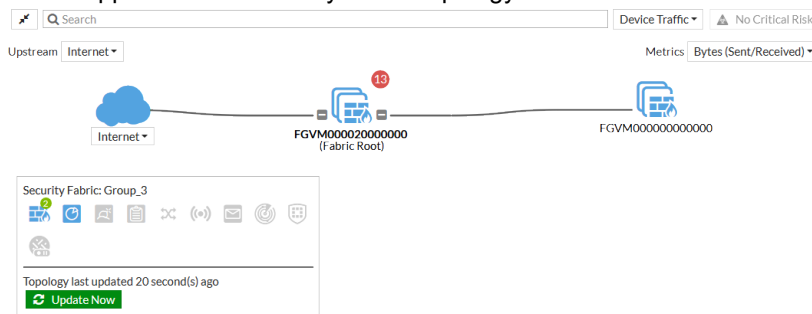

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Device authorization* field click *Edit*. The *Device Authorization* window opens.
3. Click *Create New* to add a new device for pre-authorization.
4. Enter the device name in the *Name* field.
5. Select the *Authorization type*, either *Serial Number* or *Certificate*.
6. If *Certificate* is selected, click *Browse* to upload the downstream device's certificate from the management computer.

7. Select the *Action*, either *Accept* or *Deny*.

8. Click *OK* and add more devices as required.
9. Click *OK*.

To configure a downstream FortiGate to connect to an upstream FortiGate:

1. Configure the downstream FortiGate:
 - a. On the downstream FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. Set *Status* to *Enable*.
 - c. Set *Security Fabric role* to *Join Existing Fabric*.
 - d. Enter the IP address of the root FortiGate in the *Upstream FortiGate IP* field.
 - e. Click *OK*.
2. On the root FortiGate, go to *Security Fabric > Physical Topology* and verify that the downstream FortiGate that you added appears in the Security Fabric topology.

Authorizing a downstream FortiGate

When you log in to an unauthorized downstream FortiGate, the log in prompt includes the option to authorize the device on the root FortiGate.

To authorize a downstream FortiGate:

1. Log in to the unauthorized, downstream device.

2. In the *Fabric Setup* step, click *Review authorization on root FortiGate*. A pop-up window opens to a log in screen for the root FortiGate.

3. Enter the log in credentials for the root FortiGate, then click *Login*. A list of pending authorizations is shown.

4. Select *Allow* and then click *OK* to authorize the downstream FortiGate. You can also select *Deny* to reject the authorization, or *Later* to postpone the decision to the next time that you log in. When authorization is allowed, the pop-up window closes, and the log in prompt shows that the downstream FortiGate has been authorized.

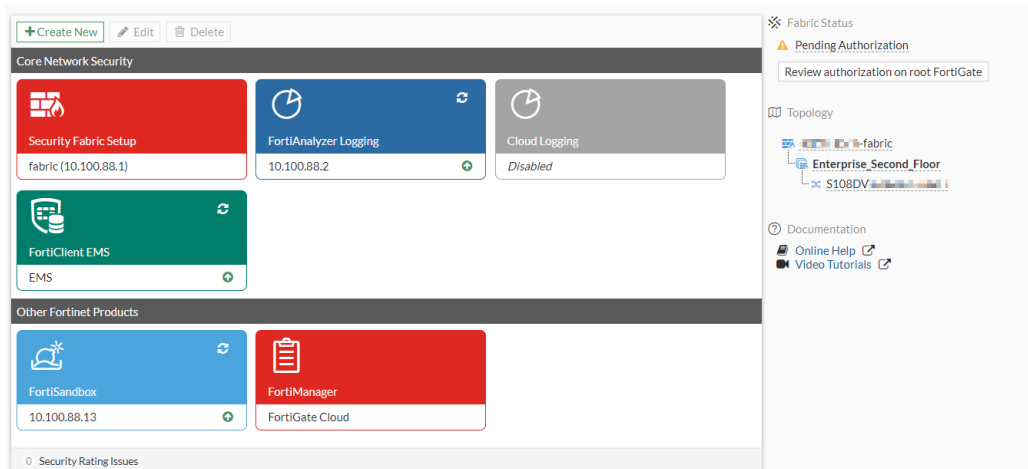

5. Click *Done* to log in to the downstream FortiGate.

Triggering authorization from the Fabric Connectors page

To authorize a downstream device from the Fabric Connectors page:

1. Go to *Security Fabric > Fabric Connectors*.
2. In the gutter on the right side of the screen, click *Review authorization on root FortiGate*.

The root FortiGate pop-up window shows the state of the device authorization.

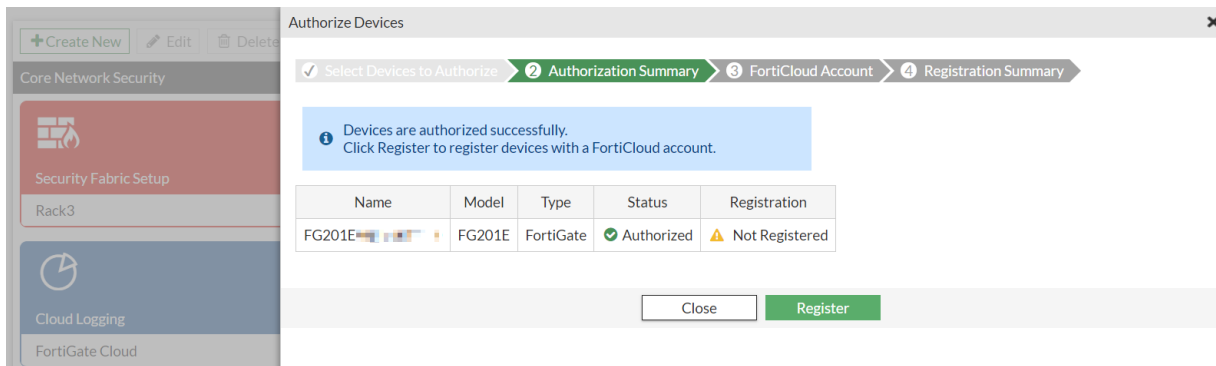

Authorizing the downstream FortiGate from the root

In this example, a downstream FortiGate is unauthorized and it is not registered to a FortiCloud account.

To authorize the downstream FortiGate from the root:

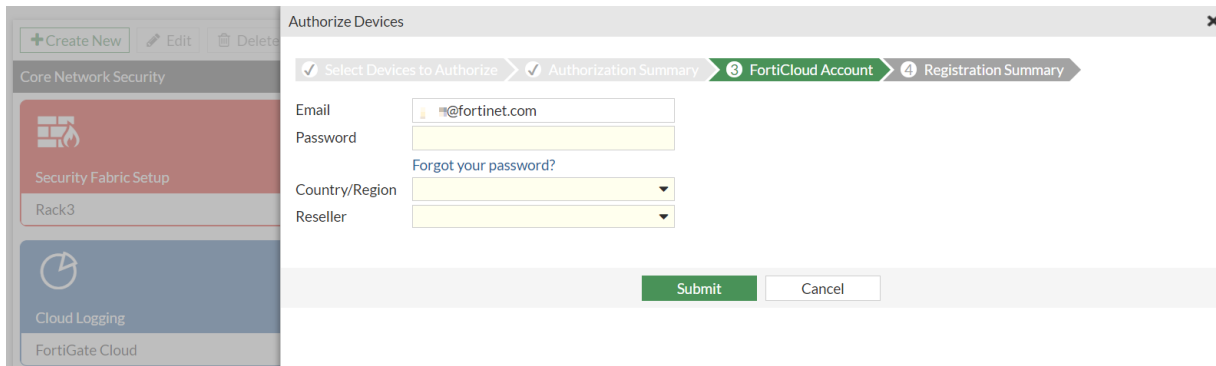

1. Log in to the root FortiGate and go to *Security Fabric > Fabric Connectors*. Devices requiring authorization are highlighted in the *Topology* tree (right-side gutter).

2. Click on a highlighted device and select *Authorize*. The *Authorize Devices* pane opens.
3. Click *Authorize*. The *Authorization Summary* pane opens.
4. The FortiGate is now authorized, so click *Register* to register the device to a FortiCloud account.

The *FortiCloud Account* pane opens.

5. Enter the required information (password, country/region, reseller). On the *Fabric Connectors* page, the same account name is implied for registration.

6. Click *Submit*. The *Registration Summary* pane opens.
7. Click *Close*.

You can use IPAM to automatically assign subnets to downstream FortiGates to prevent duplicate IP addresses from overlapping within the same Security Fabric. See [Configure IPAM locally on the FortiGate on page 212](#).

CLI commands

Use the following commands to view, accept, and deny authorization requests, to view upstream and downstream devices, and to list or test Fabric devices:

Command	Description
<pre>diagnose sys csf authorization pending-list</pre>	View pending authorization requests on the root FortiGate.

Command	Description
<code>diagnose sys csf authorization accept <serial number></code>	Authorize a device to join the Security Fabric.
<code>diagnose sys csf authorization deny <serial number></code>	Deny a device from joining the Security Fabric.
<code>diagnose sys csf downstream</code>	Show connected downstream devices.
<code>diagnose sys csf upstream</code>	Show connected upstream devices.
<code>diagnose sys csf fabric-device list</code>	List all known Fabric devices.
<code>diagnose sys csf fabric-device test</code>	Test connections to locally configured Fabric devices.

Desynchronizing settings

By default, the settings for FortiAnalyzer logging, central management, sandbox inspection, and FortiClient EMS are synchronized between all FortiGates in the Security Fabric.

To disable automatic synchronization:

```
config system csf
  set configuration-sync local
end
```

Deauthorizing a device

A device can be deauthorized to remove it from the Security Fabric.

To deauthorize a device:

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors*.
2. In the topology tree, click the device and select *Deauthorize*.

After a device is deauthorized, the serial number is saved in a trusted list that can be viewed in the CLI using the `show system csf` command. For example, this result shows a deauthorized FortiSwitch:

```
show system csf
config system csf
  set status enable
  set group-name "Office-Security-Fabric"
  set group-password *****
config trusted-list
  edit "FGT6HD391800000"
next
  edit "S248DF3X1700000"
  set action deny
next
```

end
end

Configuring FortiAnalyzer

FortiAnalyzer or Cloud Logging is a required component for the Security Fabric. Either FortiAnalyzer, FortiAnalyzer Cloud, or FortiGate Cloud can be used to meet this requirement.

FortiAnalyzer allows the Security Fabric to show historical data for the Security Fabric topology and logs for the entire Security Fabric. For more information about using FortiAnalyzer, see the [FortiAnalyzer Administration Guide](#).

FortiAnalyzer 7.0.1 is used for this configuration example.

To authorize a FortiAnalyzer in the Security Fabric:

1. In FortiAnalyzer, configure the authorization address and port:
 - a. Go to *System Settings > Admin > Admin Settings*.
 - b. In the *Fabric Authorization* section, enter an *Authorization Address* and *Authorization Port*. This is used to access the FortiAnalyzer login screen.

- c. Click *Apply*.
2. In FortiOS, go to *Security Fabric > Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
3. Enter the FortiAnalyzer IP.
4. Click *OK*. The *FortiAnalyzer Status* (in the right-side gutter) is *Unauthorized*.

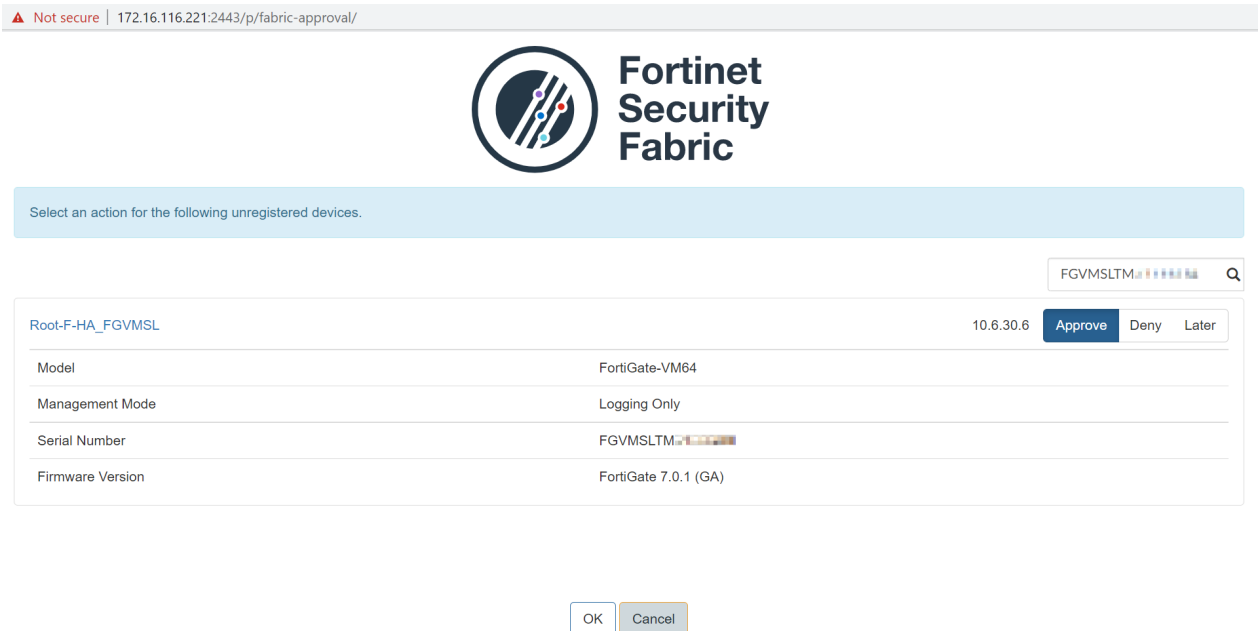

5. Click *Authorize*. You are redirected to a login screen.

- Enter the username and password, then click *Login*.

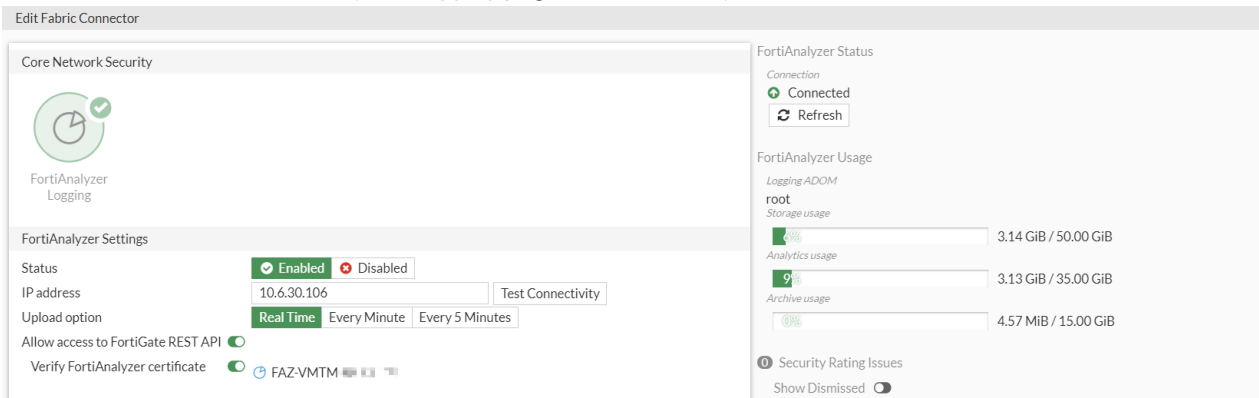

The authorization dialog opens.

- Select *Approve* and click *OK* to authorize the FortiGate.

- In FortiOS, refresh the *FortiAnalyzer Logging* page. The *FortiAnalyzer Status* is *Authorized*.

Sending traffic logs to FortiAnalyzer Cloud

FortiGates with a FortiCloud Premium subscription (AFAC) for Cloud-based Central Logging & Analytics, can send traffic logs to FortiAnalyzer Cloud in addition to UTM logs and event logs. After the Premium subscription is registered through FortiCare, FortiGuard will verify the purchase and authorize the AFAC contract. Once the contract is verified, FortiGuard will deliver the contract to FortiGate.

FortiGates with a Standard FortiAnalyzer Cloud subscription (FAZC) can only send UTM and event logs. FortiGates with a Premium subscription will send the UTM and event logs even if the Standard subscription has expired.

For information about cloud logging, see [Configuring FortiAnalyzer Cloud service on page 2377](#)

FortiAnalyzer Cloud does not support DLP/IPS archives at this time.

To verify the status a FortiCloud subscription with the CLI:

```
# diagnose test update info
```

The `FAZC` and `AFAC` fields display the subscription expiration date. The `Support contract` field displays the FortiCare account information. The `User ID` field displays the ID for FortiAnalyzer-Cloud instance.

```
...
FAZC,Tue Sep 24 16:00:00 2030
AFAC,Mon Nov 29 16:00:00 2021
...
Support contract: pending_registration=255 got_contract_info=1
account_id=[****@fortinet.com] company=[Fortinet] industry=[Technology]
User ID: 979090
```

Configuring FortiGate Cloud

FortiGate Cloud is a hosted security management and log retention service for FortiGate devices. It provides centralized reporting, traffic analysis, configuration management, and log retention without the need for additional hardware or software.

FortiGate Cloud offers a wide range of features:

- **Simplified central management**

FortiGate Cloud provides a central GUI to manage individual or aggregated FortiGate and FortiWiFi devices. Adding a device to the FortiGate Cloud management subscription is straightforward. FortiGate Cloud has detailed traffic and application visibility across the whole network.

- **Hosted log retention with large default storage allocated**

Log retention is an integral part of any security and compliance program, but administering a separate storage system is onerous. FortiGate Cloud takes care of this automatically and stores the valuable log information in the cloud. Different types of logs can be stored, including Traffic, System Events, Web, Applications, and Security Events.

- **Monitoring and alerting in real time**

Network availability is critical to a good end-user experience. FortiGate Cloud enables you to monitor your FortiGate network in real time with different alerting mechanisms to pinpoint potential issues. Alerting mechanisms can be delivered via email.

- **Customized or pre-configured reporting and analysis tools**

Reporting and analysis are your eyes and ears into your network's health and security. Pre-configured reports are available, as well as custom reports that can be tailored to your specific reporting and compliance requirements. The reports can be emailed as PDFs, and can cover different time periods.

- **Maintain important configuration information uniformly**

The correct configuration of the devices within your network is essential for maintaining optimum performance and security posture. In addition, maintaining the correct firmware (operating system) level allows you to take advantage of the latest features.

- **Service security**

All communication (including log information) between the devices and the cloud is encrypted. Redundant data centers are always used to give the service high availability. Operational security measures have been put in place to make sure your data is secure — only you can view or retrieve it.

For more information about FortiGate Cloud, see the [FortiGate Cloud documentation](#).

Registration and activation

Before you can activate a FortiGate Cloud account, you must first register your device.

FortiGate Cloud accounts can be registered manually through the FortiGate Cloud website, <https://www.forticloud.com>, or you can easily register and activate your account directly from your FortiGate.

To activate your FortiGate Cloud account:

1. On your device, go to *Dashboard > Status*.
2. In the *FortiGate Cloud* widget, click the *Not Activated > Activate* button in the *Status* field.
3. A pane will open asking you to register your FortiGate Cloud account. Click *Create Account*, enter your information, view and accept the terms and conditions, and then click *OK*.
4. A second dialogue window open, asking you to enter your information to confirm your account. This sends a confirmation email to your registered email. The dashboard widget then updates to show that confirmation is required.
5. Open your email, and follow the confirmation link it contains.
A FortiGate Cloud page will open, stating that your account has been confirmed. The *Activation Pending* message on the dashboard will change to state the type of account you have, and will provide a link to the FortiGate Cloud portal.

Enabling logging to FortiGate Cloud

To enable logging to FortiGate Cloud:

1. Go to *Security Fabric > Fabric Connectors > Cloud Logging or Log & Report > Log Settings*.
2. Enable *Cloud Logging*.
3. Select an upload option: *Realtime*, *Every Minute*, or *Every 5 Minutes* (default).
4. Click *Apply*.

Logging into the FortiGate Cloud portal

Once logging has been configured and you have registered your account, you can log into the FortiGate Cloud portal and begin viewing your logging results. There are two methods to reach the FortiGate Cloud portal:

- If you have direct network access to the FortiGate:
 - a. Go to *Dashboard > Status*.
 - b. In the *FortiGate Cloud* widget, in the *Status* field, click *Activated > Launch Portal*, or, in the *Licenses* widget, click *FortiCare Support > Launch Portal*.
- If you do not have access to the FortiGate's interface, visit the FortiGate Cloud website (<https://www.forticloud.com>) and log in remotely, using your email and password. It will ask you to confirm the FortiGate Cloud account you are connecting to and then you will be granted access.

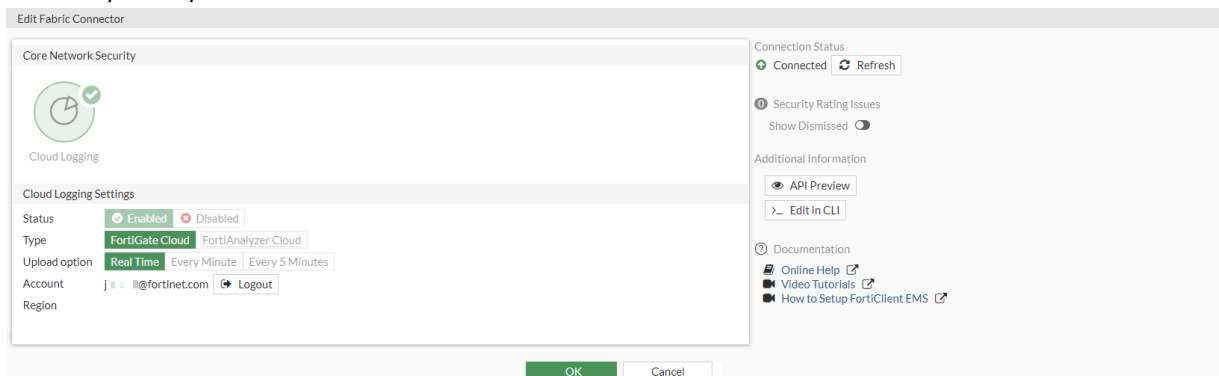

Configuring a Security Fabric with FortiGate Cloud logging

A Security Fabric can be created on the root device using FortiGate Cloud for cloud logging. When the FortiCloud account enforcement is enabled (by default), members joining the Fabric must be registered to the same FortiCloud account. Devices that are not activated with FortiCloud are also allowed.

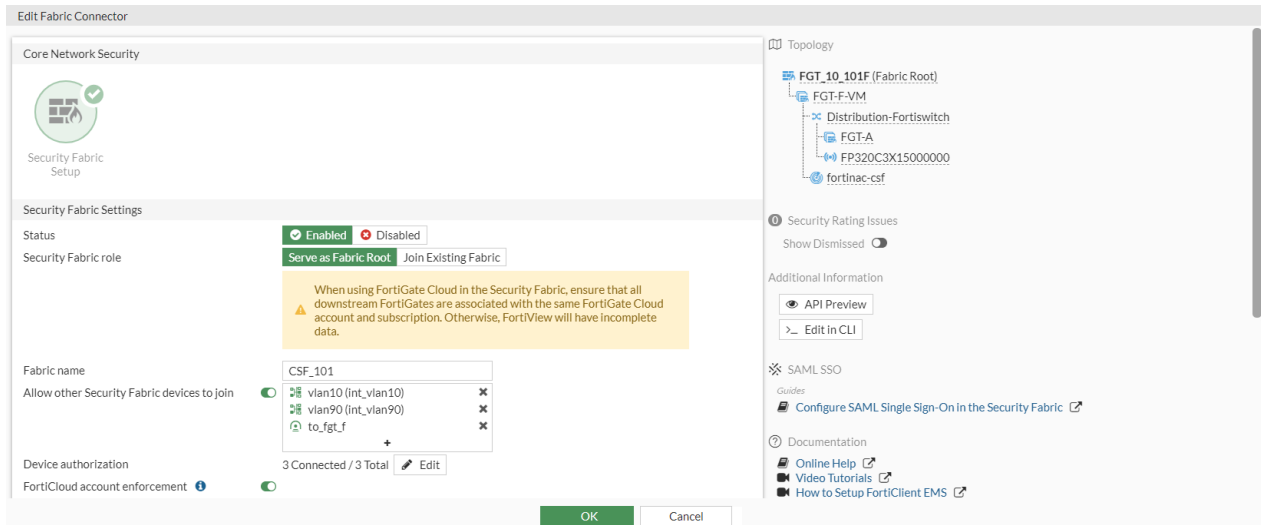

For example, the root FortiGate (FGT_10_101F) is configured with FortiGate Cloud logging. In the Security Fabric settings, the *FortiCloud account enforcement* option is enabled by default. The downstream FortiGate, FGT-F-VM, with the same FortiCloud account ID is able to join the Fabric.

To configure a Security Fabric with FortiCloud logging in the GUI:

1. On the root FortiGate, configure FortiCloud logging:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *Cloud Logging* card.
 - b. Set the *Type* to *FortiGate Cloud*.
 - c. Set the *Upload option* to *Real Time*.

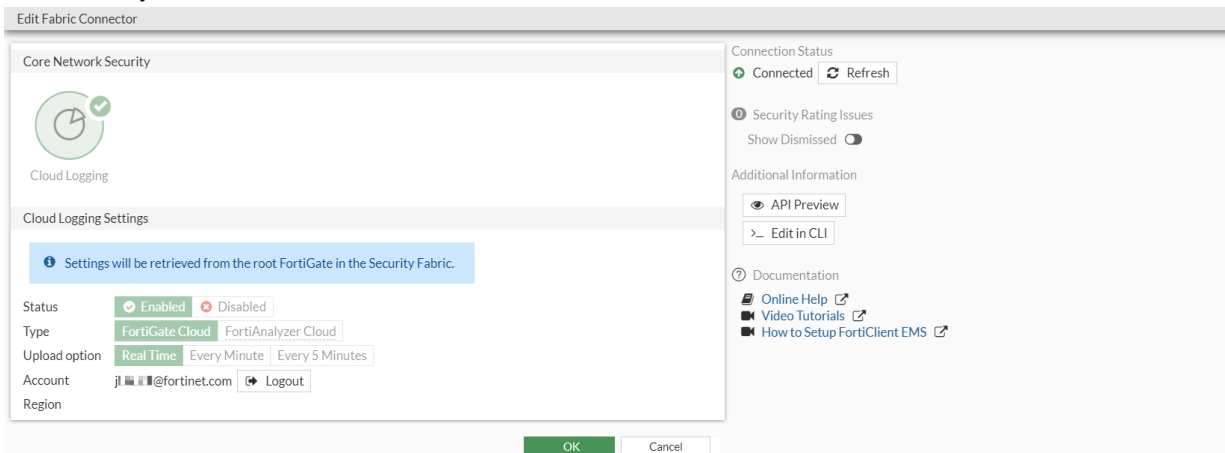

- d. Click *OK*.
2. Configure the Security Fabric settings (see [Configuring the root FortiGate and downstream FortiGates on page 2364](#)). The *FortiCloud account enforcement* setting is enabled by default.

3. On the FGT-F-VM, check the FortiCloud logging settings:

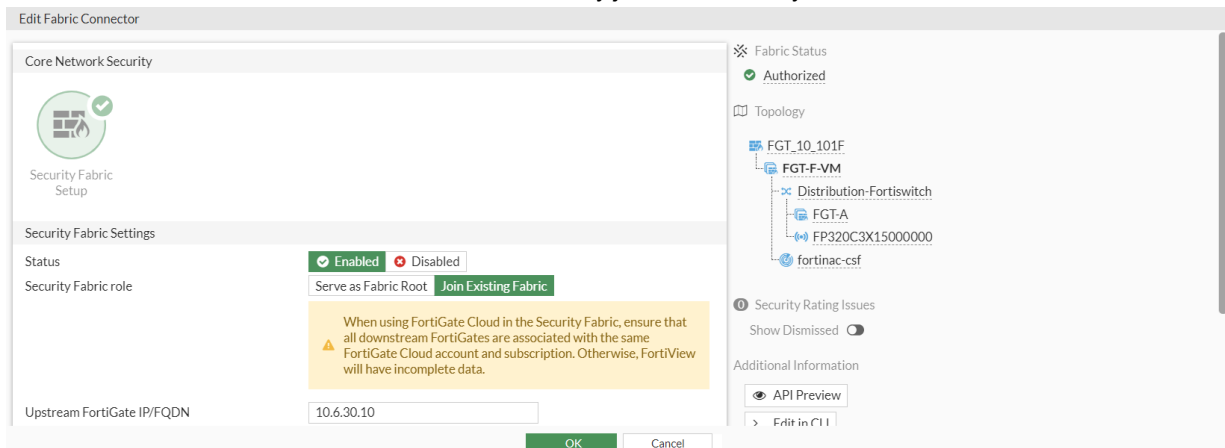

- a. Go to *Security Fabric > Fabric Connectors* and double-click the *Cloud Logging* card. The settings are automatically retrieved from the root and the *Account* is the same.

4. Configure the FGT-F-VM to join the Security Fabric:

- a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
- b. Set the *Security Fabric* role to *Join Existing Fabric*.

- c. Click **OK**. The FortiGate is authorized and successfully joins the Security Fabric.

To configure a Security Fabric with FortiCloud logging in the CLI:

```
config log fortiguard setting
    set status enable
    set upload-option realtime
end
```

The FortiCloud account enforcement setting is enabled by default in the Security Fabric settings:

```
show system csf
config system csf
    set status enable
    set group-name "CSF_101"
    set forticloud-account-enforcement enable
end
```

Cloud sandboxing

FortiGate Cloud can be used for automated sample tracking, or sandboxing, for files from a FortiGate. This allows suspicious files to be sent to be inspected without risking network security. If the file exhibits risky behavior, or is found to contain a virus, a new virus signature is created and added to the FortiGuard antivirus signature database.

See [Configuring Sandboxing on page 2386](#) for instructions to configure FortiGate Cloud Sandbox. Sandboxing results are shown on the *Sandbox* tab in the FortiGate Cloud portal.

Configuring FortiAnalyzer Cloud service

The FortiAnalyzer Cloud service can be used for event logging.

Traffic logs are not currently supported by FortiAnalyzer Cloud without a FortiCloud Premium subscription (AFAC). For information, see [Configuring FortiAnalyzer on page 2371](#).

When FortiAnalyzer Cloud is licensed and enabled (see [Deploying FortiAnalyzer Cloud](#) for more information), all event logs are sent to FortiAnalyzer Cloud by default. All traffic logs, security logs, and archive files are not sent to FortiAnalyzer Cloud.

FortiAnalyzer Cloud differs from FortiAnalyzer in the following ways:

- You cannot enable FortiAnalyzer Cloud in `vdom override-setting` when global FortiAnalyzer Cloud is disabled.
- You must use the CLI to retrieve and display logs sent to FortiAnalyzer Cloud. The FortiOS GUI is not supported.
- You cannot enable FortiAnalyzer Cloud and FortiGate Cloud at the same time.

In the *Security Fabric > Fabric Connectors > Cloud Logging* card settings, *FortiAnalyzer Cloud* is grayed out when you do not have a FortiAnalyzer Cloud entitlement. When you have a FortiAnalyzer Cloud entitlement, *FortiAnalyzer Cloud* is available and you can authenticate by the certificate.

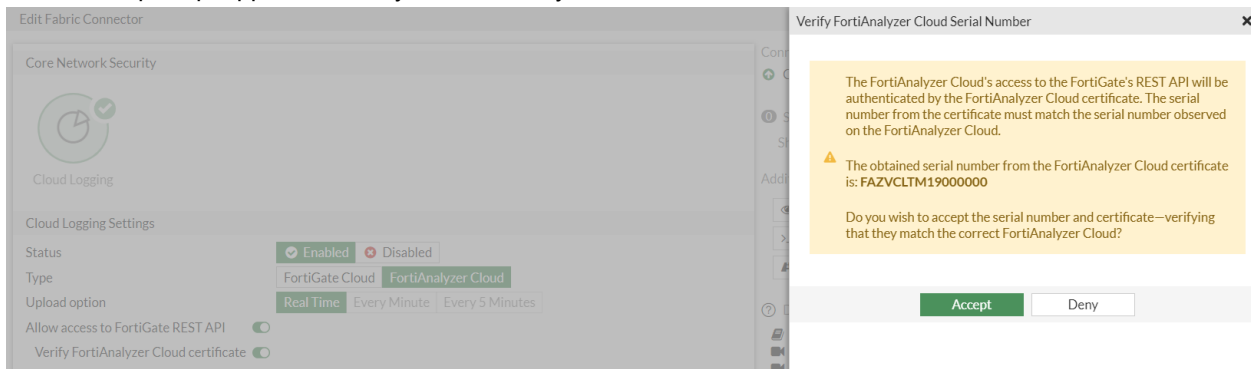

You can also view the FortiAnalyzer Cloud settings in the *Log & Report > Log Settings* page.

In FortiAnalyzer Cloud, you can view logs from FortiOS in the *Event > All Types* page.

#	Date/Time	Level	Device ID	Action	Message	User	User Interface

To configure FortiAnalyzer Cloud logging in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Cloud Logging* card.
2. Set the *Type* to *FortiAnalyzer Cloud*.
3. Click *OK*. A prompt appears to verify the FortiAnalyzer Cloud serial number.

4. Click *Accept*.

5. The verified FortiAnalyzer Cloud certificate appears in the settings.

To enable FortiAnalyzer Cloud logging in the CLI:

1. Configure the FortiAnalyzer Cloud settings:

```
config log fortianalyzer-cloud setting
  set status enable
  set ips-archive disable
  set certificate-verification enable
  set serial "FAZVCLTM19000000"
  set access-config enable
  set enc-algorithm high
  set ssl-min-proto-version default
  set conn-timeout 10
  set monitor-keepalive-period 5
  set monitor-failure-retry-period 5
  set upload-option realtime
end
```

2. Configure the FortiAnalyzer Cloud filters:

```
config log fortianalyzer-cloud filter
  set severity information
  set forward-traffic disable
  set local-traffic disable
  set multicast-traffic disable
  set sniffer-traffic disable
  set anomaly disable
  set voip disable
  set dlp-archive disable
end
```

To disable FortiAnalyzer Cloud logging for a specific VDOM in the CLI:

1. Enable override FortiAnalyzer in the general log settings:

```
config log setting
  set faz-override enable
end
```

2. Disable the override FortiAnalyzer Cloud setting:

```
config log fortianalyzer-cloud override-setting
    set status disable
end
```

To set FortiAnalyzer Cloud logging to filter for a specific VDOM in the CLI:**1. Enable override FortiAnalyzer in the general log settings:**

```
config log setting
    set faz-override enable
end
```

2. Enable the override FortiAnalyzer Cloud setting:

```
config log fortianalyzer-cloud override-setting
    set status enable
end
```

3. Configure the override filters for FortiAnalyzer Cloud:

```
config log fortianalyzer-cloud override-filter
    set severity information
    set forward-traffic disable
    set local-traffic disable
    set multicast-traffic disable
    set sniffer-traffic disable
    set anomaly disable
    set voip disable
    set dlp-archive disable
end
```

To display FortiAnalyzer Cloud logs in the CLI:

```
# execute log filter device fortianalyzer-cloud
# execute log filter category event
# execute log display
```

Sample log

```

```

Configuring FortiManager

When a FortiManager device is added to the Security Fabric, it automatically synchronizes with any connected downstream devices.

To add a FortiManager to the Security Fabric, configure it on the root FortiGate. The root FortiGate then pushes this configuration to downstream FortiGate devices. The FortiManager provides remote management of FortiGate devices over TCP port 541. The FortiManager must have internet access for it to join the Security Fabric.

Once configured, the FortiGate can receive antivirus and IPS updates, and allows remote management through FortiManager or the FortiGate Cloud service. The FortiGate management option must be enabled so that the FortiGate can accept management updates to its firmware and FortiGuard services.

Adding a FortiManager device to the Security Fabric requires the following steps in FortiOS:

- Specify the FortiManager IP address or domain name.
- Approve the FortiManager serial number returned by the FortiManager server certificate. This ensures that the administrator is connecting the FortiGate to the desired FortiManager.

You can complete the steps in FortiOS by using the GUI or CLI.

After you complete the steps in FortiOS, go to FortiManager to complete the process by authorizing the FortiGate.

To add a FortiManager to the Security Fabric using the CLI:

1. Provide FortiManager connection information:

```
config system central-management
  set type fortimanager
  set fmg {<IP_address> | <Domain name>}
  set serial-number <FMG serial number>
end
```

2. Approve the returned FortiManager serial number:

When configuring the FortiManager connection from the CLI, no prompt is available to approve the returned FortiManager serial number. Therefore you must provide the following command:

```
execute central-mgmt <fmg-serial-no> <PSK>
```

If you have not previously configured a model device in FortiManager and leveraged a pre-shared key for registration, you can enter any character for the PSK field in the `execute central-mgmt` command.

3. Go to FortiManager and authorize the FortiGate. See [Authorizing the FortiGate in FortiManager on page 2384](#).
4. If necessary on FortiGate, use the `diagnose fdsm central-mgmt-status` command to diagnose the connection.

- If the connection is not yet successful because the FortiManager serial number is not verified, the following information is displayed:

```
# diagnose fdsm central-mgmt-status
Connection status: Handshake
Registration status: Unknown
Serial: FMGVMSTM2300xxxx
```

- If the connection is up, but the FortiGate has not been authorized by FortiManager, the following information is displayed:

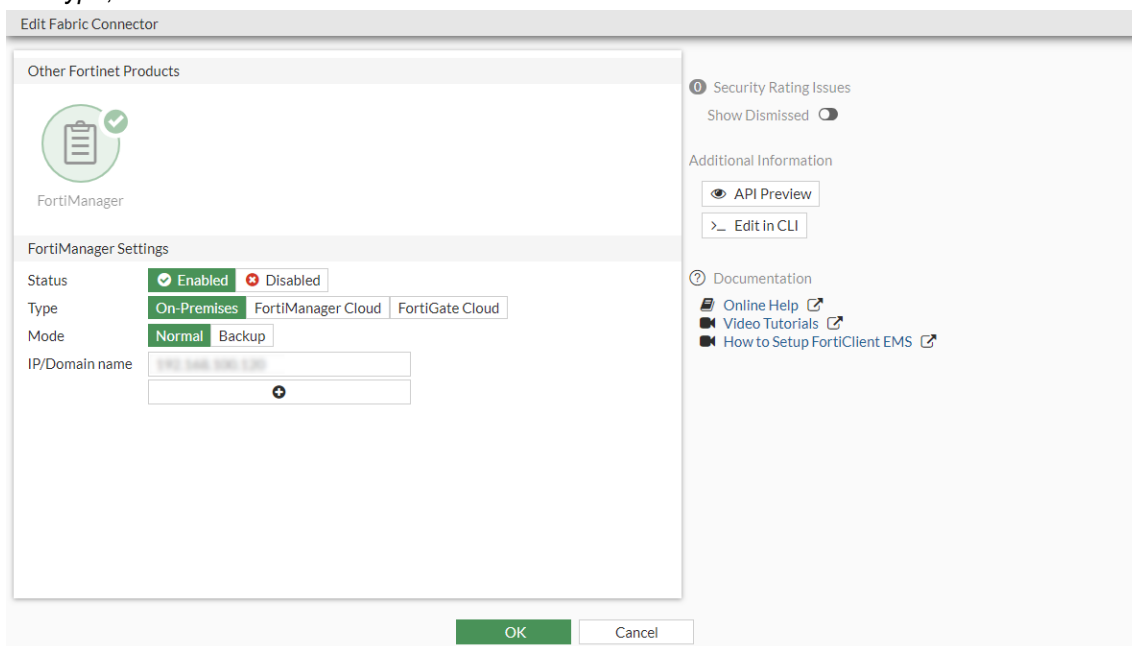

```
# diagnose fdsm central-mgmt-status
Connection status: Up
Registration status: Unregistered
Serial: FMGVMSTM2300xxxx
```

- If the connection is up, and the FortiGate has been authorized, the following information is displayed:

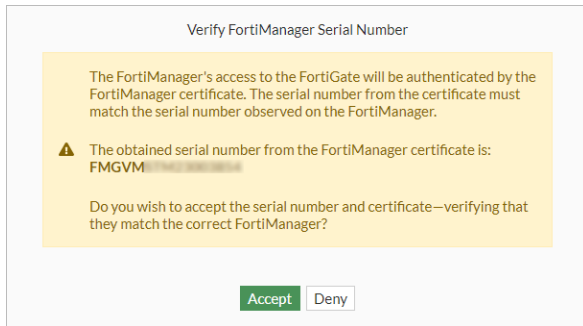

```
# diagnose fdsm central-mgmt-status
Connection status: Up
Registration status: Registered
Serial: FMGVMSTM2300xxxx
```

To add a FortiManager to the Security Fabric using the GUI:

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *FortiManager* card. The FortiManager card is used to configure the FortiManager connection information.
2. For *Status*, click *Enable*.
3. For *Type*, click *On-Premise*.

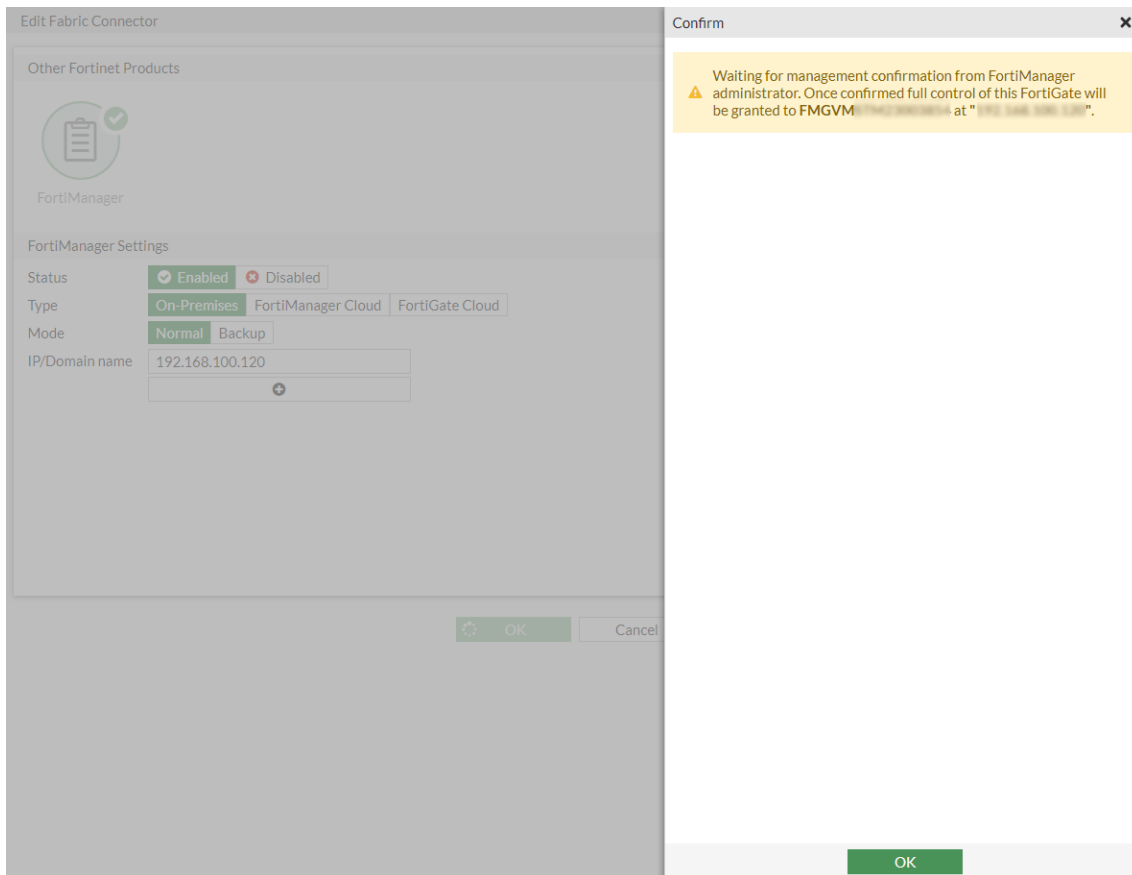

4. Enter the *IP/Domain Name* of the FortiManager.
5. Click *OK*.
The *Verify FortiManager Serial Number* pane appears.

6. Review the serial number, and click *Accept*.

The *Confirm* pane appears, indicating the FortiGate must be authorized on FortiManager.

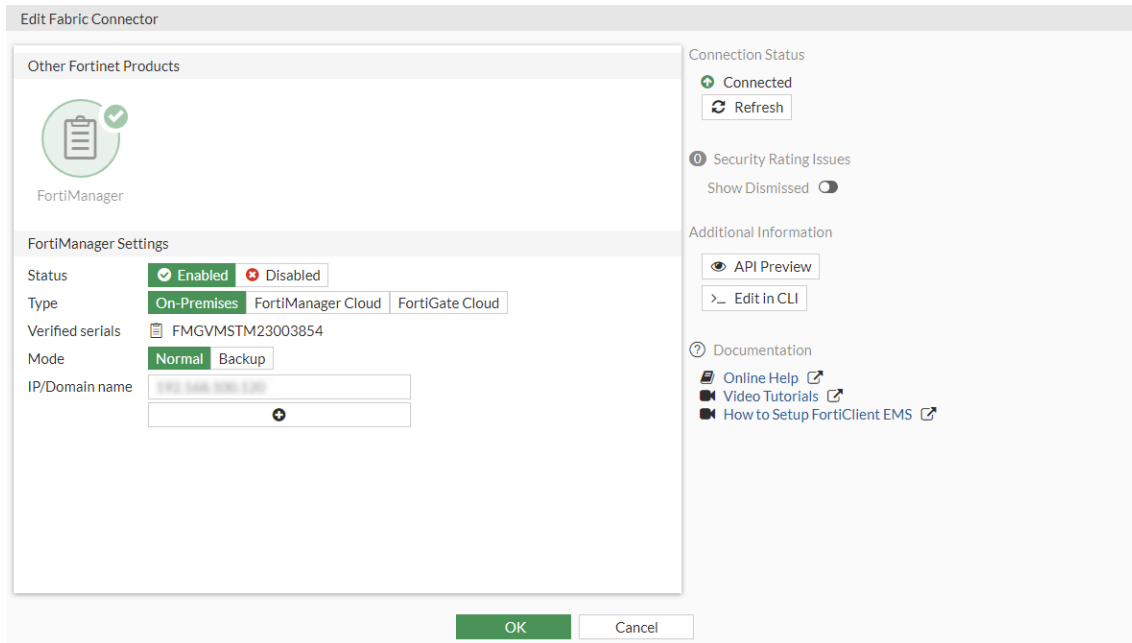

7. Click *OK*.

8. Go to FortiManager and authorize the FortiGate. See [Authorizing the FortiGate in FortiManager on page 2384](#).

9. After the FortiGate is registered, log in to FortiGate again as either read-only or read/write.

10. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiManager* card. The *Status* is updated to *Enabled*.

Authorizing the FortiGate in FortiManager

After completing the GUI or CLI steps in FortiOS, go to FortiManager to authorize the FortiGate, which completes the process.

To authorize the FortiGate in FortiManager:

1. On FortiManager, go to *Device Manager* and find the FortiGate in the *Unauthorized Devices* list. The unauthorized device list is located in the root ADOM, regardless of the firmware version of the root ADOM or FortiOS.
2. Select the FortiGate device or devices, and click *Authorize* in the toolbar.
3. In the *Authorize Device* pop-up, adjust the device names as needed, select the appropriate ADOM (if applicable), and click *OK*.

For more information about using FortiManager, see the [FortiManager Administration Guide](#).

Configuring FortiManager Cloud service

This cloud-based SaaS management service is available through FortiManager. This service is included in FortiCloud accounts with a FortiManager Cloud account level subscription (ALCI).

Configuring a per-device license

Once the FortiGate has acquired a contract named *FortiManager Cloud*, FortiCloud creates a cloud-based FortiManager instance under the user account. You can launch the portal for the cloud-based FortiManager from FortiCloud, and its URL starts with the User ID.

You can use a FortiGate with a contract for *FortiManager Cloud* to configure central management by using the FQDN of *fortimanager.forticloud.com*. A FortiGate-FortiManager tunnel is established between FortiGate and the FortiManager instance.

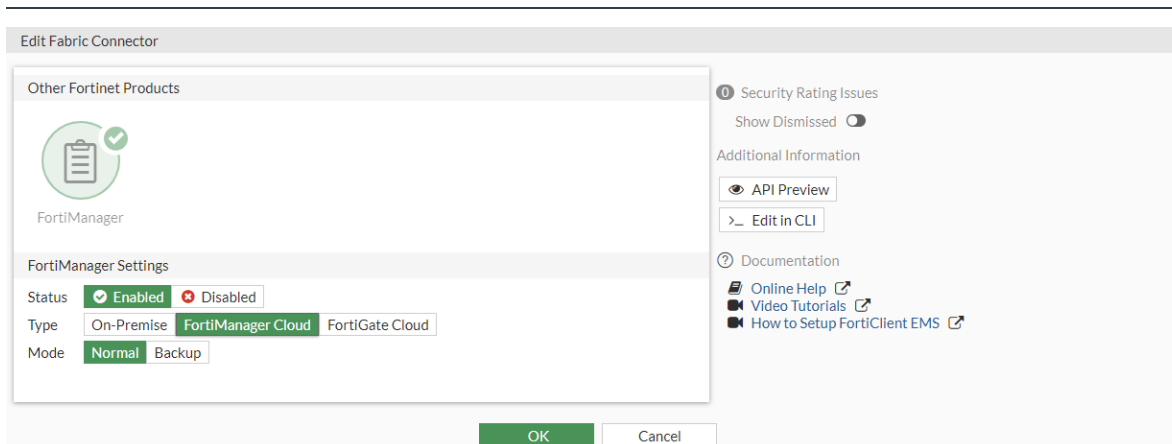

After the tunnel is established, you can execute FortiManager functions from the cloud-based FortiManager portal.

To configure FortiManager Cloud central management:

1. Enable FortiManager Cloud.
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiManager* card.
 - b. For *Status*, click *Enable*.
 - c. For *Type*, click *FortiManager Cloud*.
 - d. Click *OK*.

The *FortiManager Cloud* button can only be selected if you have a FortiManager Cloud product entitlement.

2. In the FortiManager Cloud instance, go to *Device Manager* and authorize the FortiGate. See [Authorizing devices](#) for more information.

When using the FortiGate to enable FortiManager Cloud, the FortiGate appears as an unauthorized device. After authorizing the FortiGate, it becomes a managed device.

Device Name	Config Status	Policy Package Status	CLI Template Status	Firmware Version
FG101E4Q17004236	✓ Synchronized	⚠ Never installed		FortiGate 7.0.0.build0066 (GA)

In FortiOS, the *Security Fabric > Fabric Connectors* page now displays green arrow in the *FortiManager* card because FortiManager Cloud is registered.

Diagnostics

To verify the contract information:

```
# diagnose test update info contract
...
System contracts:
```

```

...
Account contracts:
  FMGC,Thu Dec  2 16:00:00 2021
...

```

To verify the FortiManager Cloud instance has launched and the FortiGate is registered:

```

# diagnose fdsm central-mgmt-status
Connection status: Up
Registration status: Registered

```

Configuring Sandboxing

The Security Fabric supports the following FortiSandbox deployments.

Type	Description	Requirements	Next steps
FortiGate Cloud Sandbox (FortiSandbox SaaS)	Files are sent to Fortinet's Cloud Sandbox cluster for post-processing.	<ul style="list-style-type: none"> The FortiGate must be subscribed to the Advanced Malware Protection (AMP) license, which includes the AV license. 	<ul style="list-style-type: none"> Activate and configure your FortiGate Cloud Sandbox. Use post-transfer scan with Antivirus.
FortiSandbox Cloud (FortiSandbox PaaS)	Files are sent to a dedicated FortiCloud hosted instance of FortiSandbox for processing.	<ul style="list-style-type: none"> FortiCloud premium license. FortiSandbox Cloud entitlement. The FortiGate and FortiCloud licenses are registered to the same account. 	<ul style="list-style-type: none"> Provision your dedicated instance. Configure your FortiGate for post-transfer scan. Verify Sandbox detection.
FortiSandbox Appliance	Files are sent to a physical or VM appliance, typically residing on premise, for processing.	<ul style="list-style-type: none"> None 	<ul style="list-style-type: none"> Configure your FortiSandbox. Configure your FortiGate for post-transfer scan. Verify Sandbox detection.

To apply sandboxing in a Security Fabric, connect one of the FortiSandbox deployments, then configure an antivirus profile to submit files for dynamic analysis. The submission results supplement the AV signatures on the FortiGate. FortiSandbox inspection can also be used in web filter profiles.

In a Security Fabric environment, sandbox settings are configured on the root FortiGate. Once configured, the root FortiGate pushes the settings to other FortiGates in the Security Fabric.

FortiGate Cloud Sandbox (FortiSandbox SaaS)

FortiGate Cloud Sandbox allows users to take advantage of FortiSandbox features without having to purchase, operate, and maintain a physical appliance. It also allows you to control the region where your traffic is sent to for analysis. This allows you to meet your country's compliance needs regarding data storage locations.

Users are not required to have a FortiCloud account to use FortiGate Sandbox Cloud.

The submission to the cloud with a valid FortiGuard Antivirus (AVDB) license is rate limited per FortiGate model. Refer to the Service Description for details. For those without any AVDB license, the submission is limited to only 100 per day.

To configure FortiGate Cloud Sandbox, you must first activate the connection from the CLI. Note that FortiGate Cloud Sandbox is decoupled from FortiGate Cloud logging, so you do not need to have a FortiCloud account or have cloud logging enabled.

To activate the FortiGate Cloud Sandbox connection:

```
# execute forticloud-sandbox region
0 Europe
1 Global
2 Japan
3 US
Please select cloud sandbox region[0-3]:3
```

After a region is selected, the following configuration is added:

```
config system fortiguard
    set sandbox-region {0 | 1 | 2 | 3}
end
```

Alternatively, using the `execute forticloud-sandbox update` command also works.

To obtain or renew a FortiGuard antivirus license:

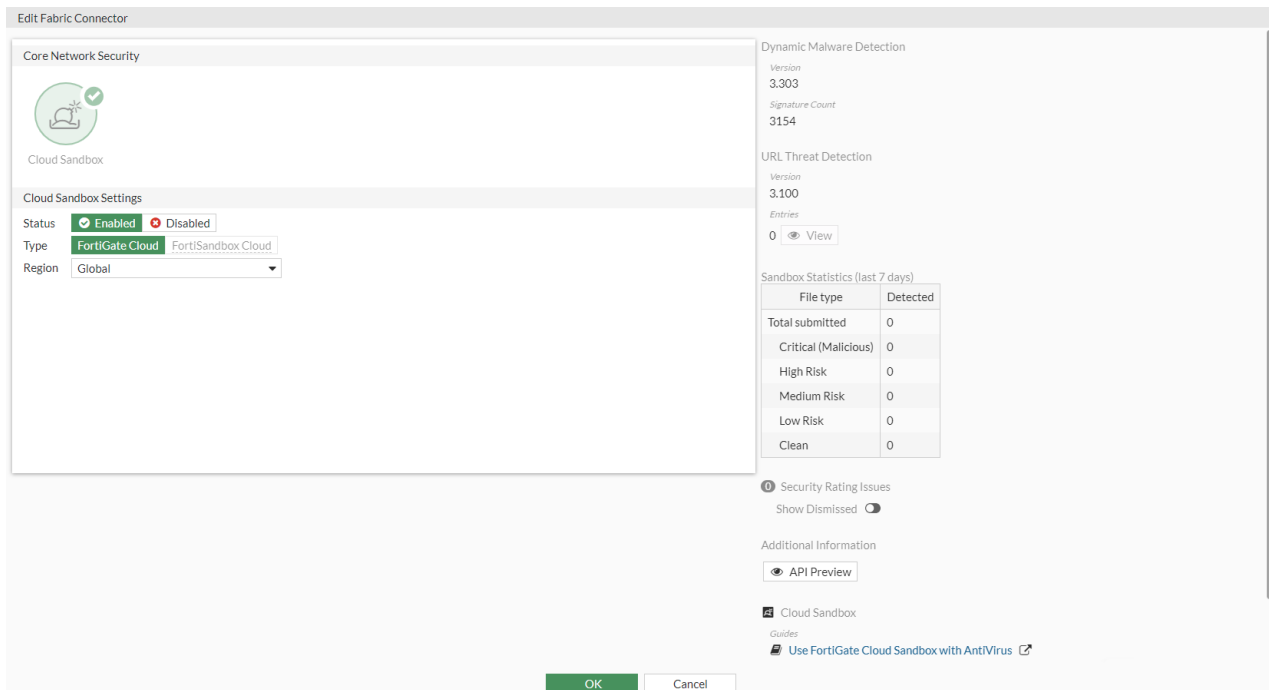

1. See the [How to Purchase or Renew FortiGuard Services](#) video for FortiGuard antivirus license purchase instructions.
2. Once a FortiGuard license is purchased and activated, users are provided with a paid FortiSandbox Cloud license.
 - a. Go to *Dashboard > Status* to view the FortiSandbox Cloud license indicator.

- b. Alternatively, go to *System > FortiGuard* to view the FortiSandbox Cloud license indicator.

To enable FortiGate Cloud Sandbox in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Cloud Sandbox* card.
2. Set *Status* to *Enable*.
3. For *Type*, select *FortiGate Cloud*.
4. Select a *Region* from the dropdown.

5. Click *OK*.

FortiSandbox Cloud (FortiSandbox PaaS)

FortiSandbox Cloud offers more features and better detection capability. Connecting to FortiSandbox Cloud will automatically use the cloud user ID of the FortiGate to connect to the dedicated FortiSandbox Cloud instance. The FortiGate automatically detects if there is a valid entitlement.

The following items are required to initialize FortiSandbox Cloud:

- A FortiCloud premium account.
- A valid FortiSandbox Cloud contract on the FortiGate. To view contract information in the CLI, enter `diagnose test update info`. The `User ID` at the end of the output shows FortiCloud which FortiSandbox Cloud account the FortiGate is connected to.
- A provisioned FortiSandbox Cloud. See [Deploying FortiSandbox Cloud](#) for information.

To configure FortiSandbox Cloud in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Cloud Sandbox* card.
2. Set *Status* to *Enable*.
3. For *Type*, select *FortiSandbox Cloud*.

If the *FortiSandbox Cloud* option is grayed out or not visible, enter the following in the CLI:

```
config system global
    set gui-fortigate-cloud-sandbox enable
end
```

4. Click *OK*.

To configure FortiSandbox Cloud in the CLI:

```
config system fortisandbox
    set status enable
    set forticloud enable
end
```

If the FortiGate does not detect the proper entitlement, a warning is displayed and the CLI configuration will not save.

FortiSandbox appliance

FortiSandbox appliance is the on-premise option for a full featured FortiSandbox. Connecting to a FortiSandbox appliance requires that Cloud Sandbox is disabled.

To switch from Cloud Sandbox to FortiSandbox in the Security Fabric:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Cloud Sandbox* card.
2. Set *Status* to *Disabled*.
3. Click *OK*.

To enable FortiSandbox appliance in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiSandbox* card.
2. Set *Status* to *Enable*.
3. In the *Server* field, enter the FortiSandbox device's IP address.
4. Optionally, enter a *Notifier email*.
5. Click *OK*.

To enable FortiSandbox appliance in the CLI:

```
config system fortisandbox
  set status enable
  set forticloud disable
  set server <address>
end
```

Authorizing the FortiGate from FortiSandbox Cloud and a FortiSandbox appliance

Once the FortiGate makes a connection to the FortiSandbox Cloud or appliance, the FortiGate must be authorized.

To authorize a FortiGate from FortiSandbox:

1. In the FortiSandbox GUI, go to *Scan Input > Device* in 3.2 or *Security Fabric > Device* in 4.0.
2. Search using the FortiGate serial number to locate the FortiGate. In the *Auth* column, click the link icon to authorize the FortiGate.
3. Repeat this step to authorize the VDOMs if required.

Device Name	Serial	Malicious	High	Medium	Low	Clean	Others	Mal Pkg	URL Pkg	Auth	Limit	Status	
FGT_PROXY	FG101E4Q17000000	0	0	0	0	0	0	3.1821	3.606		<input type="checkbox"/>		
FGT_PROXYvdom1	FG101E4Q17000000	0	0	0	0	0	0	3.1821	3.606		<input type="checkbox"/>		

The link icon changes from an open to a closed link, which indicates that the FortiGate is authorized.

Device Name	Serial	Malicious	High	Medium	Low	Clean	Others	Mal Pkg	URL Pkg	Auth	Limit	Status	
FGT_PROXY	FG101E4Q17000000	0	0	0	0	0	0	3.1821	3.606		<input type="checkbox"/>		
FGT_PROXYvdom1	FG101E4Q17000000	0	0	0	0	0	0	3.1821	3.606		<input type="checkbox"/>		

4. In the FortiGate GUI, go to *Security Fabric > Fabric Connectors* and double-click the *FortiSandbox* card.
5. Click *Test connectivity*. The FortiGate is now authorized and the status displays as *Connected*.

Antivirus profiles

An antivirus profile must be configured to send files to the sandbox. Once submitted, sandbox inspection is performed on the file to detect malicious activities. The FortiGate can use the dynamic malware detection database from the sandbox to supplement the AV signature database. See [Using FortiSandbox with antivirus on page 1197](#) for more information.

Web filter profiles

Sandbox inspection can be used in web filter profiles. The FortiGate uses URL threat detection database from the sandbox to block malicious URLs. See [Block malicious URLs discovered by FortiSandbox on page 1242](#) for more information.

Configuring FortiClient EMS

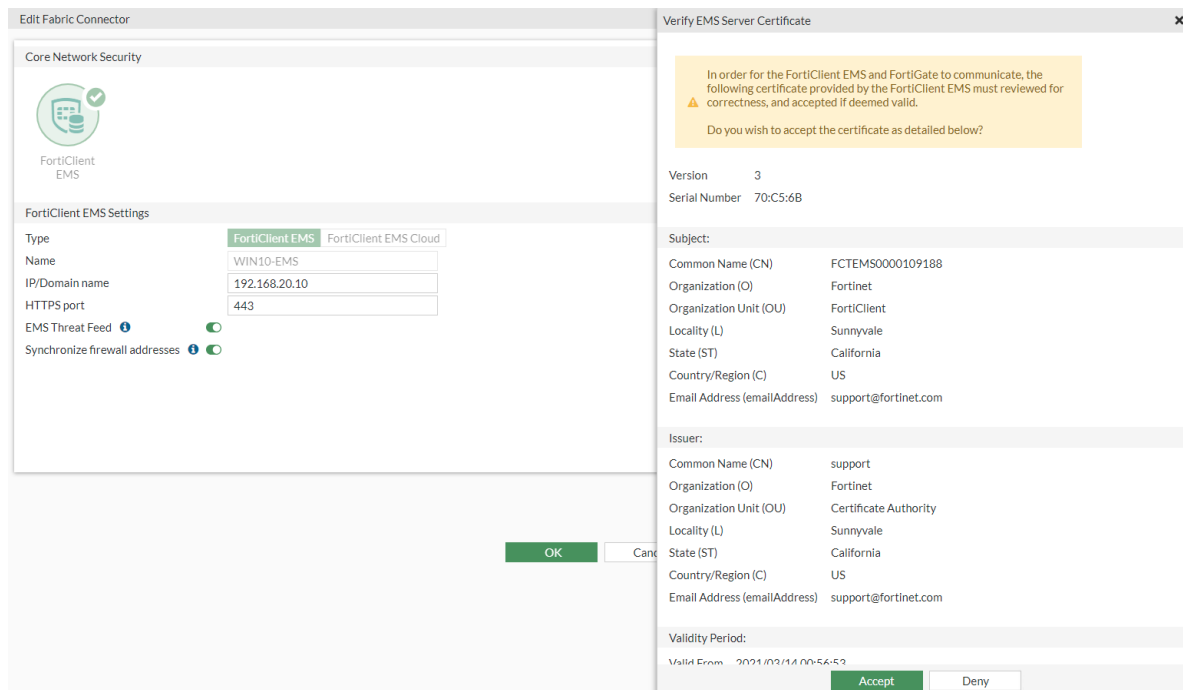

The FortiGate Security Fabric root device can link to FortiClient Endpoint Management System (EMS) and FortiClient EMS Cloud (a cloud-based EMS solution) for endpoint connectors and automation. Up to five EMS servers can be added to the Security Fabric, including a FortiClient EMS Cloud server. EMS settings are synchronized between all fabric members.

To enable cloud-based EMS services, the FortiGate must be registered to FortiCloud with an appropriate user account. The following examples presume that the EMS certificate has already been configured.

To add an on-premise FortiClient EMS server to the Security Fabric in the GUI:

1. On the root FortiGate, go to *System > Feature Visibility* and enable *Endpoint Control*.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
3. For *Type*, click *FortiClient EMS*.
4. Optionally, enable *EMS Threat Feed*. See [Malware threat feed from EMS on page 1202](#) for more information about using this setting in an AV profile.
5. Enter a name and IP address or FQDN. When connecting to a multitenancy-enabled EMS, Fabric connectors must use an FQDN to connect to EMS, where the FQDN hostname matches a site name in EMS (including "Default"). The following are examples of FQDNs to provide when configuring the connector to connect to the default site and to a site named SiteA, respectively: `default.ems.yourcompany.com`, `sitea.ems.yourcompany.com`. See [Multitenancy](#).
6. Click *OK*.

A window appears to verify the EMS server certificate:

7. Click *Accept*.

The *FortiClient EMS Status* section displays a *Successful* connection and an *Authorized* certificate:

- If the device is not authorized, log in to the FortiClient EMS to authorize the FortiGate under *Administration > Fabric Devices*.

To add a FortiClient EMS Cloud server to the Security Fabric in the GUI:

FortiClient EMS Cloud can only be configured when the FortiGate is registered to FortiCloud and the EMS Cloud entitlement is verified.

If the FortiCloud account does not pass the FortiClient EMS Cloud entitlement check, the option is not selectable in the FortiClient EMS connector settings.

- Go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
- Set *Type* to *FortiClient EMS Cloud*.
- Enter a name.
- Click *OK*.
A window appears to verify the EMS server certificate.
- Click *Accept*.
The *FortiClient EMS Status* section displays a *Successful* connection and an *Authorized* certificate.

To test connectivity with the EMS server:

- Go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* or *FortiClient EMS Cloud* card.
- In the *FortiClient EMS Status* section under *Connection*, click *Refresh*.

To add an on-premise FortiClient EMS server to the Security Fabric in the CLI:

```
config endpoint-control fctems
  edit {1 | 2 | 3 | 4 | 5}
    set status {enable | disable}
    set name <string>
    set server <ip_address>
    set certificate <string>
    set https-port <integer>
    set source-ip <ip_address>
```

```

    next
end

```

The `https-port` is the EMS HTTPS access port number, and the `source-ip` is the REST API call source IP address.

To add a FortiClient EMS Cloud server to the Security Fabric in the CLI:

```

config endpoint-control fctems
  edit {1 | 2 | 3 | 4 | 5}
    set status {enable | disable}
    set name <string>
    set fortinetone-cloud-authentication enable
    set certificate <string>
  next
end

```

To verify the EMS Cloud entitlement in the CLI:

```
# diagnose test update info
```

To verify an EMS certificate in the CLI:

```
# execute fctems verify ems137
```

```

EMS configuration needs user to confirm server certificate.
Do you wish to add the above certificate to trusted remote certificates? (y/n)y

Troubleshooting

Certificate not trusted

When configuring a new connection to an EMS server, the certificate might not be trusted.

When you click *Authorize*, a warning displays: *The server certificate cannot be authenticated with installed CA certificates. Please install its CA certificates on this FortiGate.*

In the CLI, an error message displays when you try to verify the certificate:

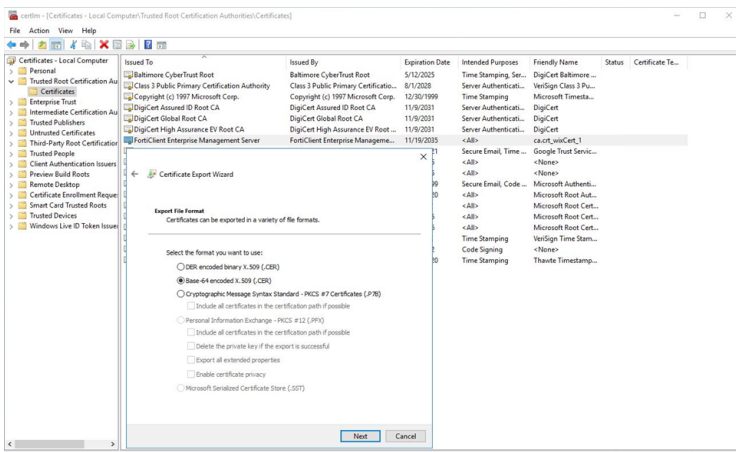

```
# execute fctems verify Win2K16-EMS
certificate not configured/verified: 2
Could not verify server certificate based on current certificate authorities.
Error 1--92-60-0 in get SN call: EMS Certificate is not signed by a known CA.
```

The default FortiClient EMS certificate that is used for the SDN connection is signed by the CA certificate that is saved on the Windows server when FortiClient EMS is first installed. You can manually export and install it on the FortiGate.

To manually export and install the certificate on to the FortiGate:

1. Export the EMS certificate on the server that EMS is installed on:
 - a. On the Windows server that EMS is installed on, go to *Settings > Manage computer certificates*.
 - b. In the certificate management module, go to *Trusted Root Certification Authorities > Certificates*.
 - c. Right click on the certificate issued by FortiClient Enterprise Management Server and select *All Tasks > Export*.
 - d. The *Certificate Export Wizard* opens. Click *Next*.

- e. Select *Base-64 encoded X.509*, then click *Next*.

- f. Enter a file name for the certificate and click *Browse* to select the folder where it will be located, then click *Next*.
 - g. Review the settings, then click *Finish*. The certificate is downloaded to the specified folder.
2. On the FortiGate, import the certificate:
 - a. Go to *System > Certificate*. By default, the *Certificate* option is not visible, see [Feature visibility on page 2292](#) for information.
 - b. Click *Import > CA Certificate*.
 - c. Set *Type* to *File*, and click *Upload* to import the certificate from the management computer.
 - d. Click *OK*. The imported certificate is shown in the *Remote CA Certificate* section of the certificate table.

3. Try to authorize the certificate on the FortiGate:

- a. Go to *Security Fabric > Fabric Connectors* and edit the FortiClient EMS connector. The connection status should now say that the certificate is not authorized.
- b. Click *Authorize*. The following warning is shown:

The warning can also be seen in the CLI:

```
# execute fctems verify Win2K16-EMS
failure in certificate configuration/verification: -4
Could not verify EMS. Error 1--94-0-401 in get SN call: Authentication denied.
```

4. Authorize the FortiGate on EMS:
 - a. Log in to the EMS server console and go to *Administration > Fabric Devices*.
 - b. Select the serial number of the FortiGate device, then click *Authorize*.
5. Try to authorize the certificate on the FortiGate again:
 - a. On the FortiGate, go to *Security Fabric > Fabric Connectors* and edit the FortiClient EMS connector.
 - b. Click *Authorize*.
 - c. When presented with the EMS server certificate, click *Accept* to accept the certificate. Your connection should now be successful and authorized.

- d. Click OK.

Using EMS silent approval in the Security Fabric

FortiClient EMS with Fabric authorization and silent approval capabilities can approve the root FortiGate in a Security Fabric once, and then silently approve remaining downstream FortiGates in the Fabric. Similarly in an HA scenario, an approval only needs to be made once to the HA primary unit. The remaining cluster members are approved silently.

To use EMS silent approval:

1. Configure the EMS entry on the root FortiGate or HA primary:

```
config endpoint-control fctems
  edit "ems139"
    set fortinetone-cloud-authentication disable
    set server "172.16.200.139"
    set https-port 443
    set source-ip 0.0.0.0
    set pull-sysinfo enable
    set pull-vulnerabilities enable
    set pull-avatars enable
    set pull-tags enable
    set pull-malware-hash enable
    unset capabilities
    set call-timeout 30
    set websocket-override disable
  next
end
```

When the entry is created, the capabilities are unset by default.

2. Authenticate the FortiGate with EMS:

```
# execute fctems verify ems_139
...
```

The FortiGate will enable the Fabric authorization and silent approval based on the EMS supported capabilities.

```
config endpoint-control fctems
  edit "ems139"
    set server "172.18.62.12"
    set capabilities fabric-auth silent-approval websocket
  next
end
```

3. Configure a downstream device in the Security Fabric (see [Configuring the root FortiGate and downstream FortiGates on page 2364](#) for more details). The downstream device will be silently approved.
4. Configure a secondary device in an HA system (see [HA active-passive cluster setup on page 2131](#) and [HA active-active cluster setup on page 2133](#) for more details). The secondary device will be silently approved.

Allowing deep inspection certificates to be synchronized to EMS and distributed to FortiClient

On FortiClient EMS versions that support `push CA certs` capability, the FortiGate will push CA certificates used in SSL deep inspection (see [Deep inspection on page 1390](#) for more details) to the EMS server. On the EMS server, the

CA certificates can be selected in the managed endpoint profiles so they can be installed on managed endpoints. FortiClient EMS 7.0.1 and later is required to use this feature.

To configure deep inspection certificate synchronization to EMS:

1. Configure the EMS Fabric connector:

```
config endpoint-control fctems
  edit "ems138"
    set fortinetone-cloud-authentication disable
    set server "172.16.200.138"
    set https-port 443
    set source-ip 0.0.0.0
    set pull-sysinfo enable
    set pull-vulnerabilities enable
    set pull-avatars enable
    set pull-tags enable
    set pull-malware-hash enable
    set capabilities fabric-auth silent-approval websocket websocket-malware push-
ca-certs
    set call-timeout 30
    set websocket-override disable
    set preserve-ssl-session disable
  next
end
```

2. Apply the certificate to an SSL/SSH profile for deep inspection:

```
config firewall ssl-ssh-profile
  edit "deep-inspection"
    set comment "Read-only deep inspection profile."
    config https
      set ports 443
      set status deep-inspection
    end
    ...
    set server-cert-mode re-sign
    set caname "Fortinet_CA_SSL"
    set untrusted-caname "Fortinet_CA_Untrusted"
  next
end
```

The default deep inspection profile, CA certificate, and untrusted CA certificates are used in this example.

3. Configure the firewall policy:

```
config firewall policy
  edit 1
    set name "deep-inspection"
    set srcintf "port14"
    set dstintf "port13"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
```

```

set ssl-ssh-profile "deep-inspection"
set av-profile "default"
set nat enable

next
end

```

4. In EMS, verify that the CA certificate was pushed to EMS:

a. Go to *Endpoint Policy & Components > CA Certificates*.

Name	Subject	Expiry
FGT31D3Z [root]		
Fortinet_CA_SSL	/C=US/ST=California/L=Sunnyvale/O=Fortinet/OU=Certificate Authority/CN=FGT31D3Z15800010/emailAddress=support@fortinet.com	2031-06-11 16:38:29

b. Verify the certificate table to see that the EMS server received the CA certification from the different FortiGates.

5. Select the CA certificate in the endpoint profile:

a. Go to *Endpoint Profiles > Manage Profiles* and edit a profile. The default profile is used in this example.

b. Click *Advanced* in the top right corner and click the *System Settings* tab.

c. In the *Other* section, enable *Install CA Certificate on Client* and select the *Fortinet_CA_SSL* certificate for the desired endpoint.

d. Click *Save*.

Once the FortiClient endpoint is registered, it receives the CA certificate. When the FortiClient endpoint tries to access the internet through the FortiGate with the firewall policy that has deep inspection, no warning message is displayed. The server certificate is trusted with the installed CA certificate to complete the certificate chain.

Verification

Before configuring deep inspection certificate synchronization, a warning message is displayed when a FortiClient endpoint accesses the internet through the FortiGate with the firewall policy that has deep inspection. The FortiClient certificate store does not have the FortiGate's CA that is used in the deep inspection SSL/SSH profile.

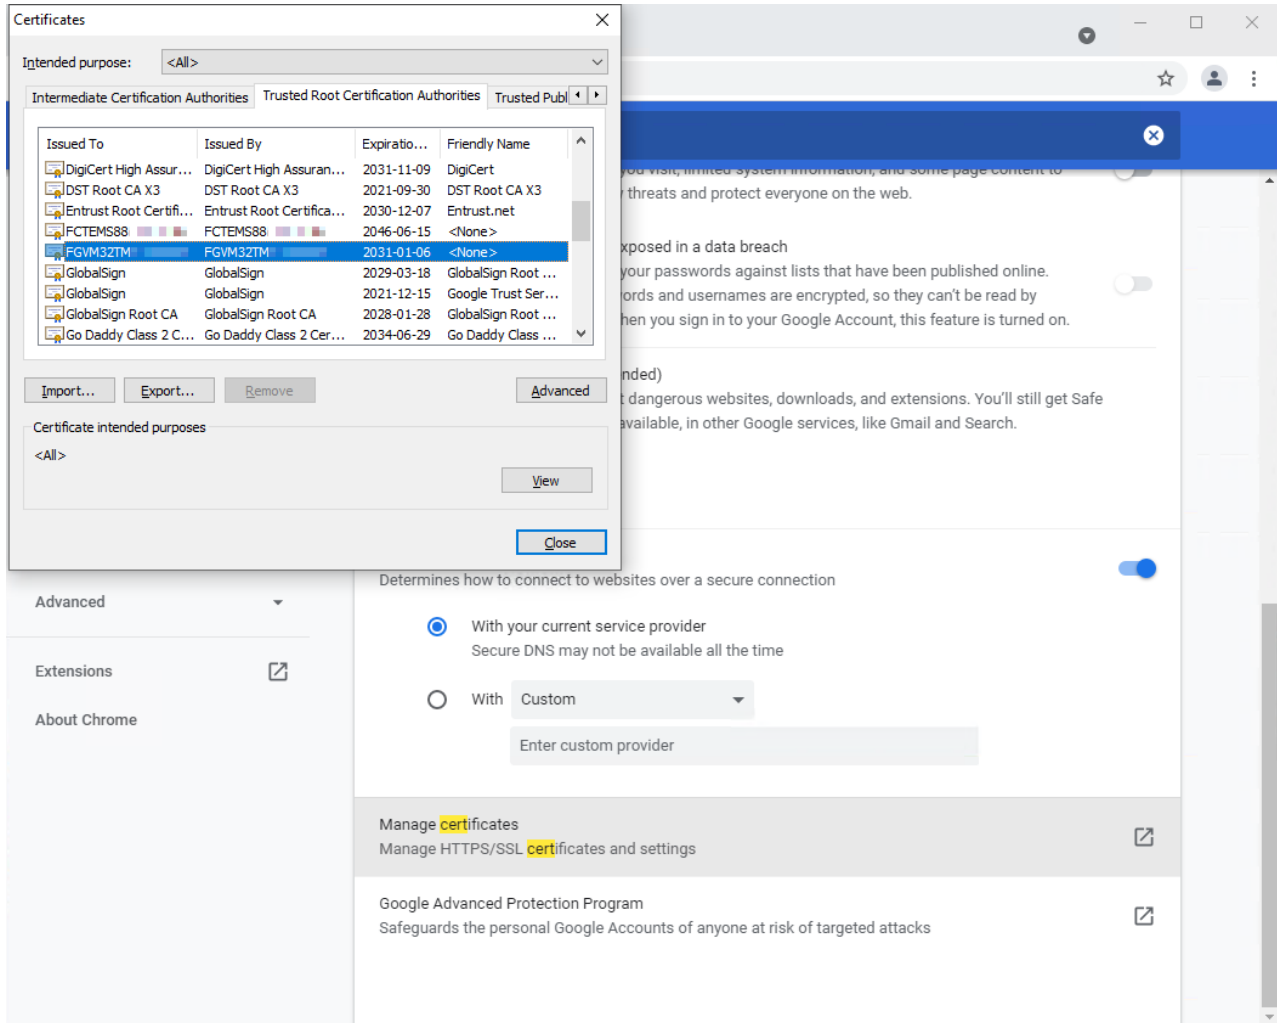

For example, accessing <https://www.facebook.com> in Chrome shows a warning. In the address bar, clicking *Not secure* > *Certificate* opens the *Certificate* dialog, which indicates that *Windows does not have enough information to verify the certificate*.

After the EMS profile is pushed to FortiClient endpoint, the expected FortiGate's certificate is shown in its certificate store.

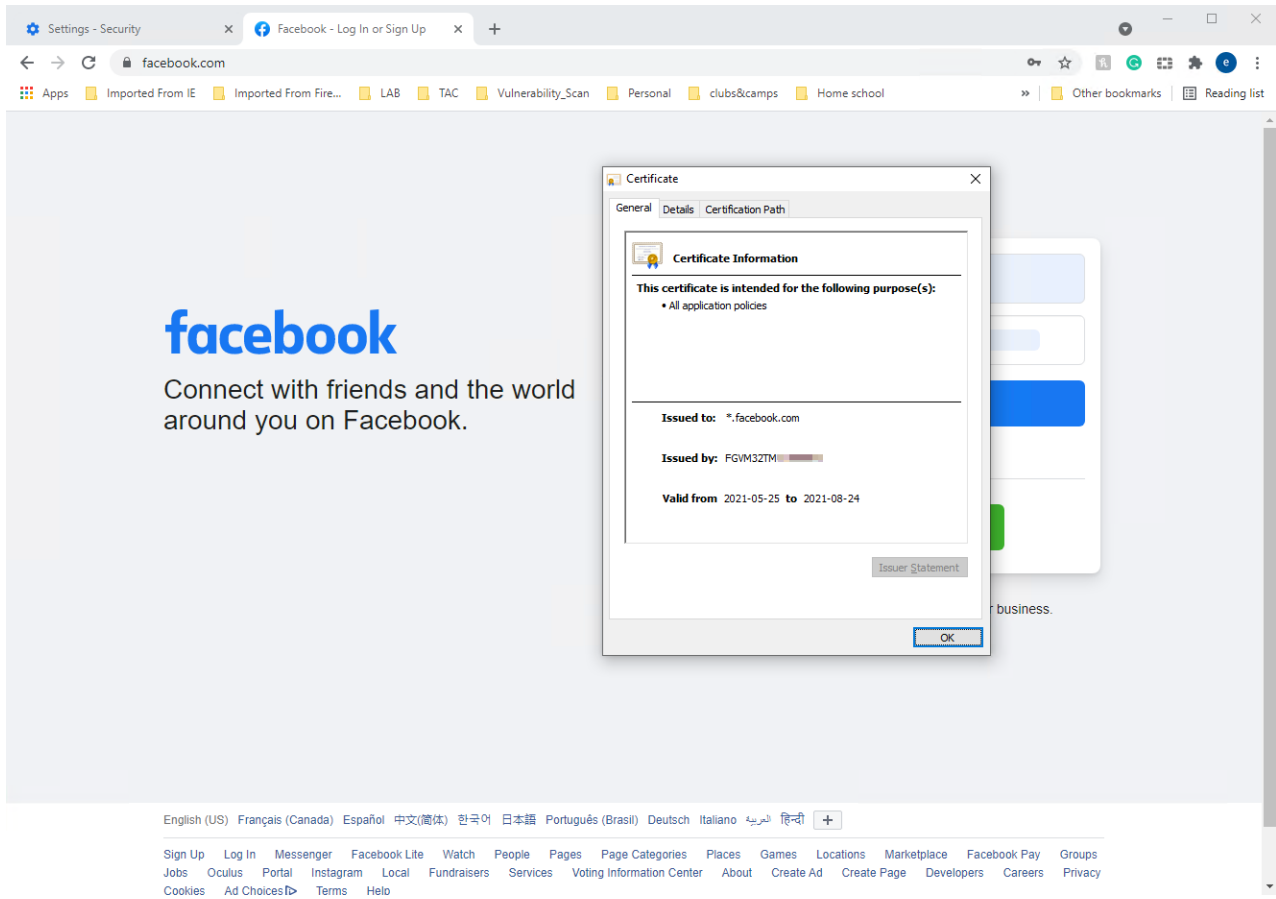

To verify the deep inspection certificate synchronization:

1. In Chrome, go to *Settings > Privacy and security* and open *Manage certificates*.
2. Click the *Trusted Root Certification Authorities* tab. The FortiGate's certificate appears in the list.

3. On the FortiClient endpoint using Chrome, go to <https://www.facebook.com>. The website is displayed.

4. In the address bar, click the padlock, then click *Certificate*. The dialog displays the valid certificate information.

Diagnostics

Use the diagnose endpoint `fctems json deep-inspect-cert-sync` command in FortiOS to verify the certificate information. In the following example, there are multiple VDOMs with FortiGates in HA mode.

To verify the primary FortiGate:

```
FGT_EC_Primary (global) # diagnose endpoint fctems json deep-inspect-cert-sync
JSON:
"""
{
  "fortigates": [
    "FG2K5E39169*****",
    "FG2K5E39169*****"
  ],
  "vdoms": [
    {
      "vdom": "root",
      "certs": [
        {
          "name": "Fortinet_CA_SSL",
          "cert": "-----BEGIN CERTIFICATE-----\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\ /bv+q\n\n---
--END CERTIFICATE-----\n"
```

```

    },
    {
      "name": "Fortinet_CA_Untrusted",
      "cert": "-----BEGIN CERTIFICATE-----\nMIID8DCCAtig...3zBbfzP+nVUpC\nZDPRZA==\n---
---END CERTIFICATE-----"
    }
  ]
},
{
  "vdom": "vdom1",
  "certs": [
    {
      "name": "Fortinet_CA_SSL",
      "cert": "-----BEGIN CERTIFICATE-----\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\nbv+q\n---
--END CERTIFICATE-----\n"
    },
    {
      "name": "Fortinet_CA_Untrusted",
      "cert": "-----BEGIN CERTIFICATE-----\nMIID8DCCAtig...3zBbfzP+nVUpC\nZDPRZA==\n---
---END CERTIFICATE-----"
    }
  ]
}
]
}
}
""

```

To verify the secondary FortiGate:

```

FGT_EC_Secondary(global) # diagnose endpoint fctems json deep-inspect-cert-sync
JSON:
""
{
  "fortigates": [
    "FG2K5E39169*****",
    "FG2K5E39169*****"
  ],
  "vdoms": [
    {
      "vdom": "root",
      "certs": [
        {
          "name": "Fortinet_CA_SSL",
          "cert": "-----BEGIN CERTIFICATE-----\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\nbv+q\n---
--END CERTIFICATE-----\n"
        },
        {
          "name": "Fortinet_CA_Untrusted",
          "cert": "-----BEGIN CERTIFICATE-----\nMIID8DCCAtig...3zBbfzP+nVUpC\nZDPRZA==\n---
---END CERTIFICATE-----"
        }
      ]
    },
    {
      "vdom": "vdom1",
      "certs": [

```

```

    {
        "name": "Fortinet_CA_SSL",
        "cert": "-----BEGIN CERTIFICATE-----\nMIID5jCCAs6g...Sfu+Q8zE8Crmt6L1X\ /bv+q\n---
--END CERTIFICATE-----\n"
    },
    {
        "name": "Fortinet_CA_Untrusted",
        "cert": "-----BEGIN CERTIFICATE-----\nMIID8DCCAtig...3zBbfzP+nVUpC\nZDPRZA==\n---
---END CERTIFICATE-----"
    }
]
}
]
}
}
"""

```

Allowing FortiClient EMS connectors to trust EMS server certificate renewals based on the CN field

When a FortiGate establishes a Fabric connection with FortiClient EMS, the FortiGate must trust the CA that signed the server certificate. Upon the approval of the EMS certificate, the FortiGate saves the CN field and will trust future certificates that are signed by the same CA and have the same CN field. This allows EMS servers to update their certificates at regular intervals without requiring re-authorization on the FortiGate side, as long as the CN field matches. This prevents interruptions to the EMS Fabric connection when a certificate is updated. Previously, upon the user's approval of the certificate, the certificate fingerprint was saved on the FortiGate, and this required the FortiGate to re-authorize the EMS connection each time the server certificate is updated.

```

config endpoint-control fctems
    edit <id>
        set trust-ca-cn {enable | disable}
    next
end

```

This feature is supported for EMS on-premise and cloud connections, and is the default setting. To authorize based on the certificate fingerprint, disable the `trust-ca-cn` setting. If the setting is changed back to be enabled at a later time, the user will have to re-approve the EMS certificate.

To configure the EMS Fabric connector to trust EMS server certificate renewals based on the CN field:

```

config endpoint-control fctems
    edit 1
        set status enable
        set name "ems133"
        set dirty-reason none
        set fortinetone-cloud-authentication disable
        set server "172.18.62.35"
        set https-port 443
        set serial-number "FCTEMS8822000000"
        set tenant-id "00000000000000000000000000000000"
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-avatars enable
        set pull-tags enable
    
```

```

        set pull-malware-hash enable
        set capabilities fabric-auth silent-approval websocket websocket-malware push-ca-
certs common-tags-api tenant-id
        set call-timeout 30
        set out-of-sync-threshold 180
        set websocket-override disable
        set preserve-ssl-session disable
        set interface-select-method auto
        set trust-ca-cn enable
    next
end

```

To verify the configuration:

1. Download the FortiGate configuration file.
2. Verify the `ca-cn-info` entry, which lists the trusted CA certificate information. In this example, `ems133` connector has `trust-ca-cn` enabled and `ems138` connector has `trust-ca-cn` disabled. For `ems138`, the `ca-cn-info` entry does not appear, and there is a `certificate-fingerprint` field instead:

```

config endpoint-control fctems
    edit 1
        set status enable
        set name "ems133"
        set server "172.18.62.35"
        set serial-number "FCTEMS8822000000"
        set tenant-id "00000000000000000000000000000000"
        set capabilities fabric-auth silent-approval websocket websocket-malware push-
ca-certs common-tags-api tenant-id
        set ca-cn-info "C = CA, ST = BC, L = VANCOUVER, O = FTNT, OU = ReleaseQA, CN =
Release_QA, emailAddress = *****@fortinet.comRelease_QA"
    next
    edit 2
        set status enable
        set name "ems138"
        set server "172.18.62.18"
        set serial-number "FCTEMS8821000000"
        set tenant-id "00000000000000000000000000000000"
        set capabilities fabric-auth silent-approval websocket websocket-malware push-
ca-certs common-tags-api tenant-id
        set certificate-fingerprint
"18:51:76:67:EB:4C:31:A1:51:3F:74:F7:8E:1D:47:5C:18:0F:FE:45:DF:52:91:52:37:0B:27:E7:F1:
85:5B:01:8C:7D:FB:2D:C7:D2:CC:FE:4A:E3:0E:A9:2A:1C:27:4D:D2:A6:C5:87:B8:97:98:57:75:10:1
5:28:EF:A2:23:7C"
        set trust-ca-cn disable
    next
    ...
end

```

3. Run diagnostics to view the certificate information:

```

# diagnose test application fcnacd 96
ems_id 1, certificate authority and common name: C = CA, ST = BC, L = VANCOUVER, O =
FTNT, OU = ReleaseQA, CN = Release_QA, emailAddress = *****@fortinet.comRelease_QA
ems_id 1, fingerprint_sha512:
ems_id 2, certificate authority and common name:
ems_id 2, fingerprint_sha512:

```

```
18:51:76:67:EB:4C:31:A1:51:3F:74:F7:8E:1D:47:5C:18:0F:FE:45:DF:52:91:52:37:0B:27:E7:F1:8
5:5B:01:8C:7D:FB:2D:C7:D2:CC:FE:4A:E3:0E:A9:2A:1C:27:4D:D2:A6:C5:87:B8:97:98:57:75:10:15
:28:EF:A2:23:7C
```

Synchronizing FortiClient ZTNA tags

ZTNA tags (formerly FortiClient EMS tags in FortiOS 6.4 and earlier) are tags synchronized from FortiClient EMS as dynamic address objects on the FortiGate. FortiClient EMS uses zero-trust tagging rules to automatically tag managed endpoints based on various attributes detected by the FortiClient. When the FortiGate establishes a connection with the FortiClient EMS server through the EMS Fabric connector, it pulls zero-trust tags containing device IP and MAC addresses and converts them to read-only dynamic address objects. It also establishes a persistent WebSocket connection to monitor for changes in zero-trust tags, which keeps the device information current. These ZTNA tags can then be used in ZTNA rules, firewall rules, and NAC policies to perform security posture checks. ZTNA tags are displayed in the *Device Inventory* widget, *FortiClient* widget, and *Asset Identity Center* page.

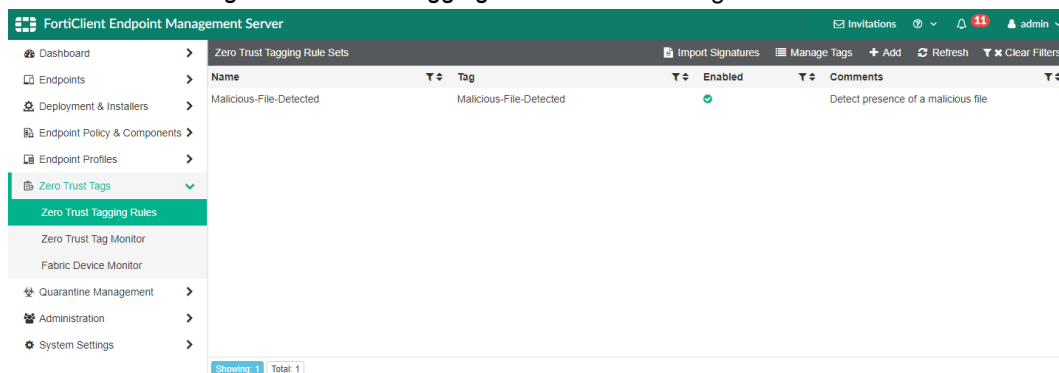

When using WebSocket, EMS pushes notifications to the corresponding FortiGate when there are updates to tags or other monitored attributes. The FortiGate then fetches the updated information using the REST API over TCP/8013. When WebSocket is not used (due to an override or unsupported EMS version), updates are triggered on demand from the FortiGate side over the REST API.

If the WebSocket capability is detected, the capabilities setting will automatically display the WebSocket option. You can use the `diagnose test application fcnacd 2` command to view the status of the WebSocket connection.

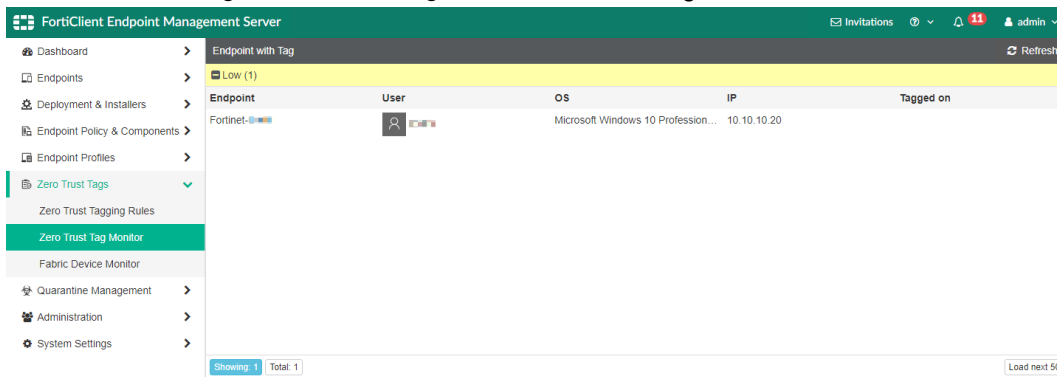

In the following example, the FortiGate connects to and retrieves ZTNA tags from a FortiClient EMS configured with tagging rules. It is assumed that zero-trust tags and rules are already created on the FortiClient EMS. For more information, see the [Zero Trust Tags](#) section of the EMS Administration Guide.

To verify zero-trust tags in FortiClient EMS:

1. Go to *Zero Trust Tags > Zero Trust Tagging Rules* to view the tags.

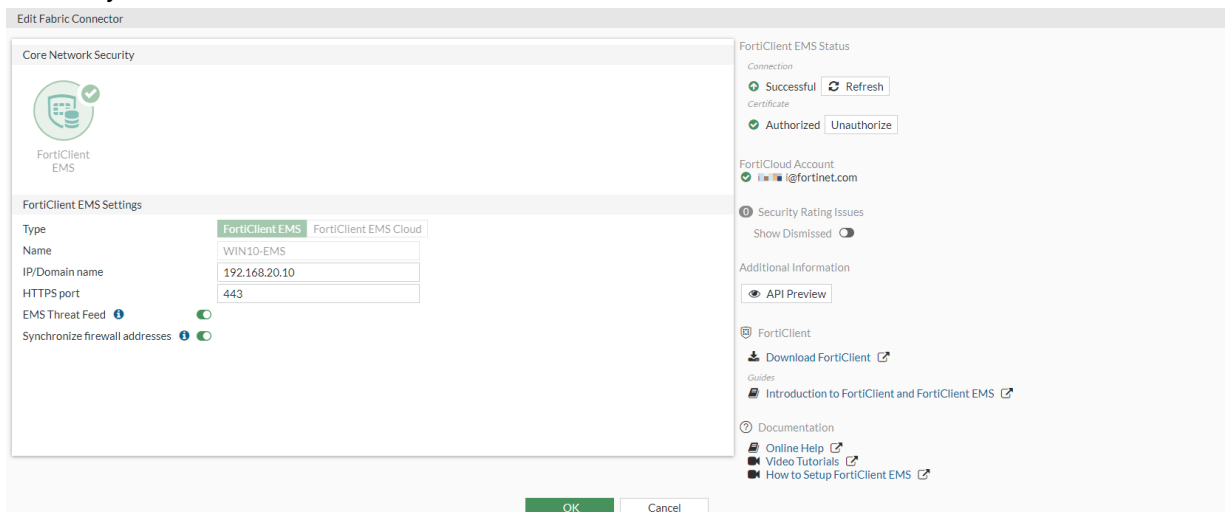

- Go to *Zero Trust Tags > Zero Trust Tag Monitor* to view the registered users who match the defined tag.

To configure the EMS Fabric connector to synchronize ZTNA tags in the GUI:

- Configure the EMS Fabric connector:
 - On the root FortiGate, go to *Security Fabric > Fabric Connectors*.
 - Click *Create New* and click *FortiClient EMS*.
 - Enable *Synchronize firewall addresses*.

- Configure the other settings as needed and validate the certificate.
 - Click *OK*.
- Enable ZTNA:
 - Go to *System > Feature Visibility* and enable *Zero Trust Network Access*.
 - Click *Apply*.
 - Go to *Policy & Objects > ZTNA* and select the *ZTNA Tags* tab. You will see the ZTNA IP and ZTNA MAC tags

synchronized from the FortiClient EMS.

ZTNA Rules ZTNA Servers ZTNA Tags			
+ Create New Group Edit Delete Search			
Name	Details	Comments	Ref.
ZTNA IP Tag			
Zero-day Detections			0
Medium			0
Malicious-File-Detected			2
Low			4
IOC Suspicious			0
High			0
FCTEMS_ALL_FORTICLOUD_SERVERS			0
Critical			1
all_registered_clients			1
ZTNA MAC Tag			
Zero-day Detections			0
Medium			0
Malicious-File-Detected			0
Low			0
IOC Suspicious			0
High			0
Critical			0
all_registered_clients			0
ZTNA Tag Group			
grp_ems138	all_registered_clients Critical		0

To configure the EMS Fabric connector to synchronize ZTNA tags in the CLI:

1. Configure the EMS Fabric connector on the root FortiGate:

```
config endpoint-control fctems
  edit 1
    set status enable
    set name "WIN10-EMS"
    set server "192.168.20.10"
    set https-port 443
    set pull-sysinfo enable
    set pull-vulnerabilities enable
    set pull-avatars enable
    set pull-tags enable
    set pull-malware-hash enable
    set capabilities fabric-auth silent-approval websocket
  next
end
```

2. Verify which IPs the dynamic firewall address resolves to:

```
# diagnose firewall dynamic list
List all dynamic addresses:
FCTEMS0000100000_all_registered_clients: ID(51)
  ADDR(172.17.194.209)
  ADDR(10.10.10.20)
...

FCTEMS0000100000_Low: ID(78)
  ADDR(172.17.194.209)
  ADDR(10.10.10.20)
...

FCTEMS0000100000_Malicious-File-Detected: ID(190)
```

ADDR (172.17.194.209)
ADDR (10.10.10.20)

...

When running the FortiGate in multi VDOM mode, by default, EMS is configured in the global VDOM. All ZTNA tags synchronized with the globally configured EMS are shared by all VDOMs.

Configuring FortiNAC

A FortiNAC device can be added to the Security Fabric on the root FortiGate. After the device has been added and authorized, you can log in to the FortiNAC from the FortiGate topology views.

Adding a FortiNAC to the Security Fabric requires a FortiNAC with a license issued in the year 2020 or later that includes an additional certificate. The device cannot be added if it has an older license. Use the `licensetool` in the FortiNAC CLI to determine if your license includes the additional certificate.

The FortiNAC tags connector under *Security Fabric > Fabric Connectors* has been deprecated. It was replaced with a REST API (in FortiNAC and FortiOS) that is used by FortiNAC to send user logon and logoff information to the FortiGate. The FortiNAC tag dynamic firewall address type is used to store the device IP, FortiNAC firewall tags, and FortiNAC group information sent from FortiNAC by the REST API when user logon and logoff events are registered (see [FortiNAC tag dynamic address on page 974](#) for more information).

For upgrade support, the FSSO FortiNAC user type can still be configured in the CLI.

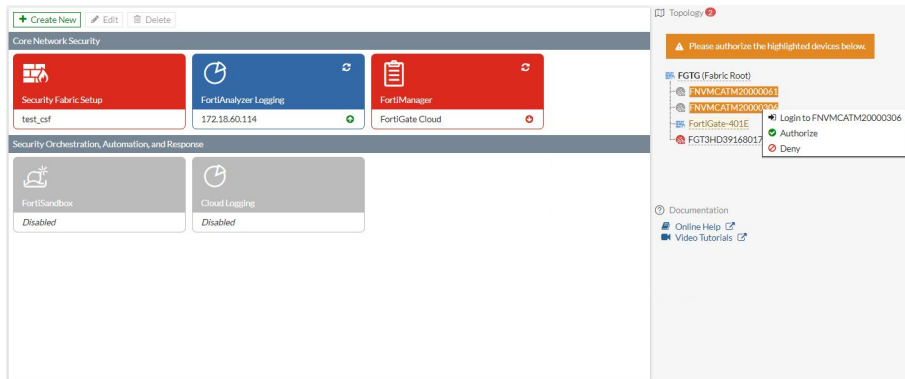

To add a FortiNAC to the Security Fabric:

1. On the FortiNAC, configure telemetry and input the IP address of the root FortiGate. See [Security Fabric Connection](#) in the *FortiNAC Administration Guide* for more information.
2. On the root FortiGate, authorize the FortiNAC.
3. Verify the connection status in the topology views.

To authorize the FortiNAC on the root FortiGate in the GUI:

1. Go to *Security Fabric > Fabric Connectors*.
2. The FortiNAC device will be highlighted in the topology list in the right panel with the status *Waiting for Authorization*.

3. Click on the highlighted FortiNAC and select *Authorize*.

Optionally, you can also deny authorization to the FortiNAC to remove it from the list.

To authorize the FortiNAC on the root FortiGate in the CLI:

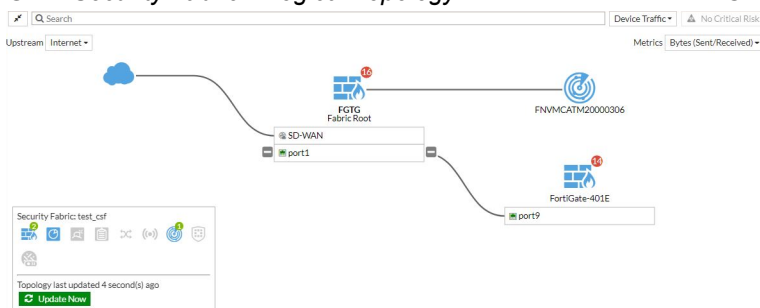

```
config system csf
  config trusted-list
    edit "FNVMCATM20000306"
      set action accept
    next
  end
end
```

To verify the connection status:

1. After the FortiNAC is authorized, go to *Security Fabric > Physical Topology* and confirm that it is included in the topology.

2. Go to *Security Fabric > Logical Topology* and confirm the FortiNAC is also displayed there.

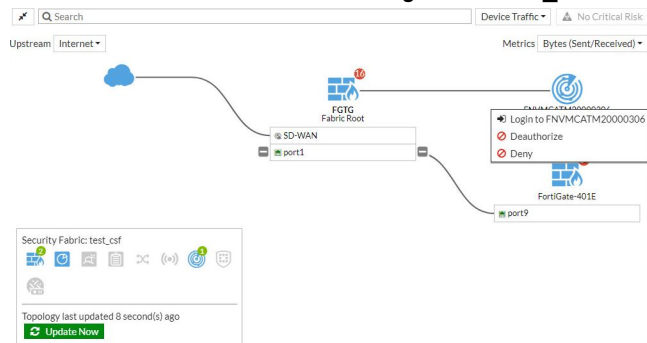

- Run the following command in the CLI to view information about the FortiNAC device's status:

```
# diagnose sys csf downstream-devices fortinac
{
  "path": "FG5H1E5818900126:FNVMCATM20000306",
  "mgmt_ip_str": "10.1.100.197",
  "mgmt_port": 0,
  "admin_port": 8443,
  "serial": "FNVMCATM20000306",
  "host_name": "adnac",
  "device_type": "fortinac",
  "upstream_intf": "port2",
  "upstream_serial": "FG5H1E5818900126",
  "is_discovered": true,
  "ip_str": "10.1.100.197",
  "downstream_intf": "eth0",
  "authorizer": "FG5H1E5818900126",
  "idx": 1
}
```

To log in to the FortiNAC from the FortiGate:

- On the FortiGate, go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology*.
- Click on the FortiNAC and select *Login to <serial_number>*.

A new tab will open to the FortiNAC log in page.

- Enter the username and password to log in to the FortiNAC.

Configuring FortiAP and FortiSwitch

FortiAP and FortiSwitch devices can be authorized in the Security Fabric with one click. After connecting a FortiAP or FortiSwitch device to an authorized FortiGate, it will automatically be listed in the topology tree.

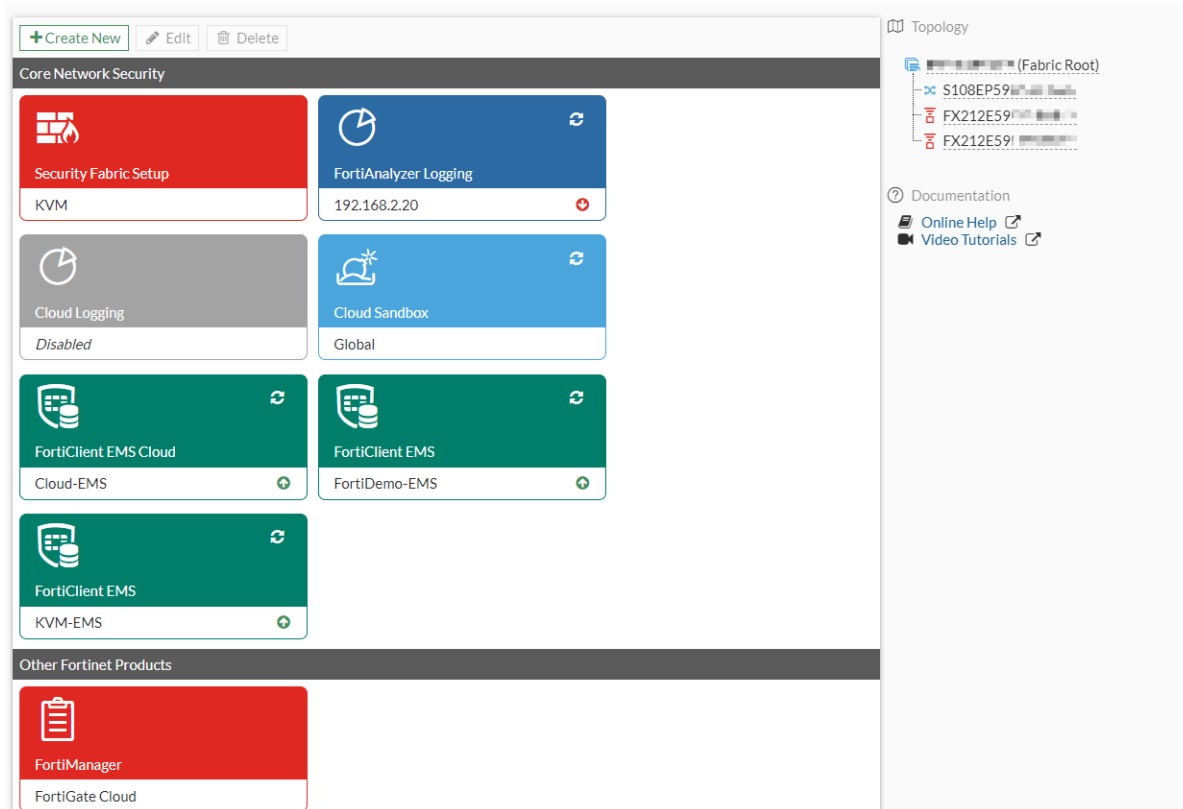

If the default `auto-auth-extension-device` settings on the FortiAP or FortiSwitch have been modified, manual authorization in the Security Fabric may not be required.

For more information about configuring FortiAPs, see [Configuring the FortiGate interface to manage FortiAP units and Discovering, authorizing, and deauthorizing FortiAP units](#).

For more information about configuring FortiSwitches, see [Using the FortiGate GUI](#).

To authorize FortiAP and FortiSwitch devices:

1. Connect the FortiAP or FortiSwitch device to a FortiGate.
2. On the root FortiGate, go to *Security Fabric > Fabric Connectors*. The new device is shown in the *Topology* tree.
3. Click the device and select *Authorize*.

Configuring FortiMail

FortiMail can be authorized into the Security Fabric using either the gutter on the *Fabric Connectors* page, or by pre-authorizing using the FortiMail serial number or certificate.

To join the Security Fabric from FortiMail:

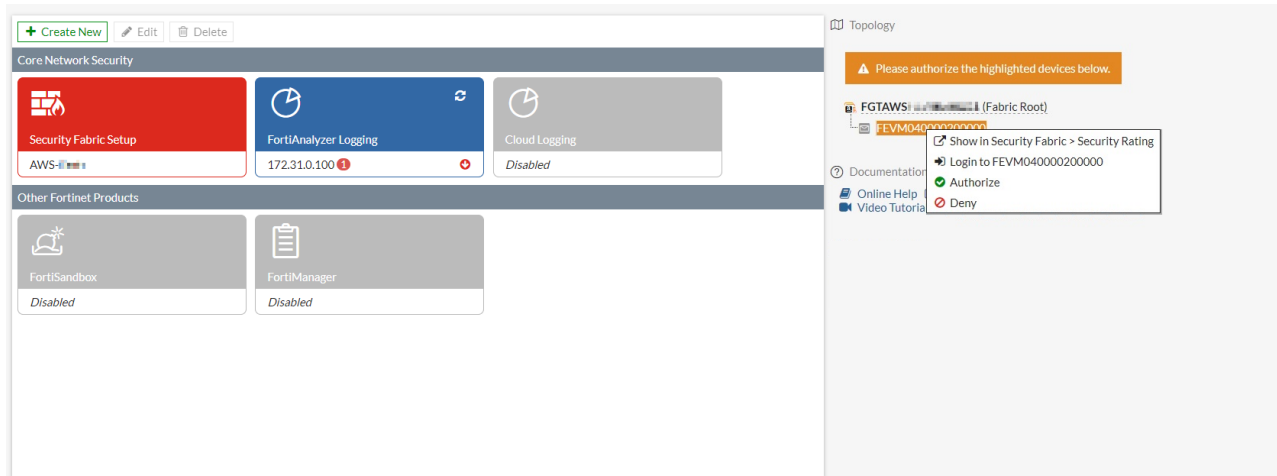

1. Go to *System > Customization* and click the *Corporate Security Fabric* tab (or the *Corporate Security Fabric* tab in FortiMail 6.4.2 and earlier).
2. Click the toggle to enable the Fabric.
3. Enter the *Upstream IP Address* (root FortiGate) and the *Management IP* of the FortiMail.
4. Click *Apply*.

Authorizing using FortiOS

If the FortiMail was added to the Security Fabric but not pre-authorized, you can authorize it in FortiOS on the *Fabric Connectors* page.

To authorize FortiMail:

1. Go to *Security Fabric > Fabric Connectors*.
2. In the topology tree, hover over the FortiMail and click *Authorize*.

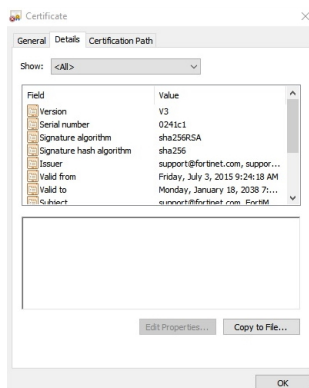

3. Verify the certificate is correct, then click *Accept*.

Pre-authorizing using the FortiMail certificate

FortiMail can be pre-authorized using its serial number or certificate. When you pre-authorize, the FortiMail can join at any time, and you will not need to authorize it FortiOS. In this example, FortiMail is pre-authorized using a certificate.

To pre-authorize FortiMail using a third-party or default certificate:

1. Log in to FortiMail.
2. Download the certificate. For example, in Chrome:
 - a. In the left side of the address bar, click the icon to view the site information.
 - b. Click *Certificate*.
 - c. Click the *Details* tab, then click *Copy to File*.

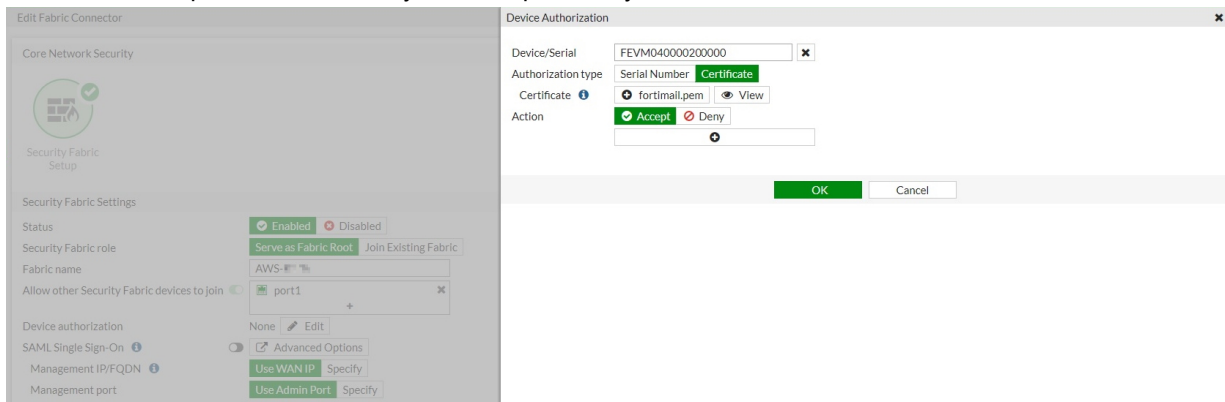

- d. The *Certificate Export Wizard* opens. Click *Next* to continue.

- e. For the file format, select *Base-64 encoded X.509 (.CER)*, then click *Next*.

- f. Browse to the folder location and enter a file name, then click *Next*.
- g. Click *Finish*, then click *OK* to close the dialog box.
3. In FortiOS, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
4. Beside *Device authorization*, click *Edit* and configure the following:
- Enter the FortiMail serial number.
 - For *Authorization type*, select *Serial Number*.
 - For *Certificate*, upload the .CER file you saved previously.

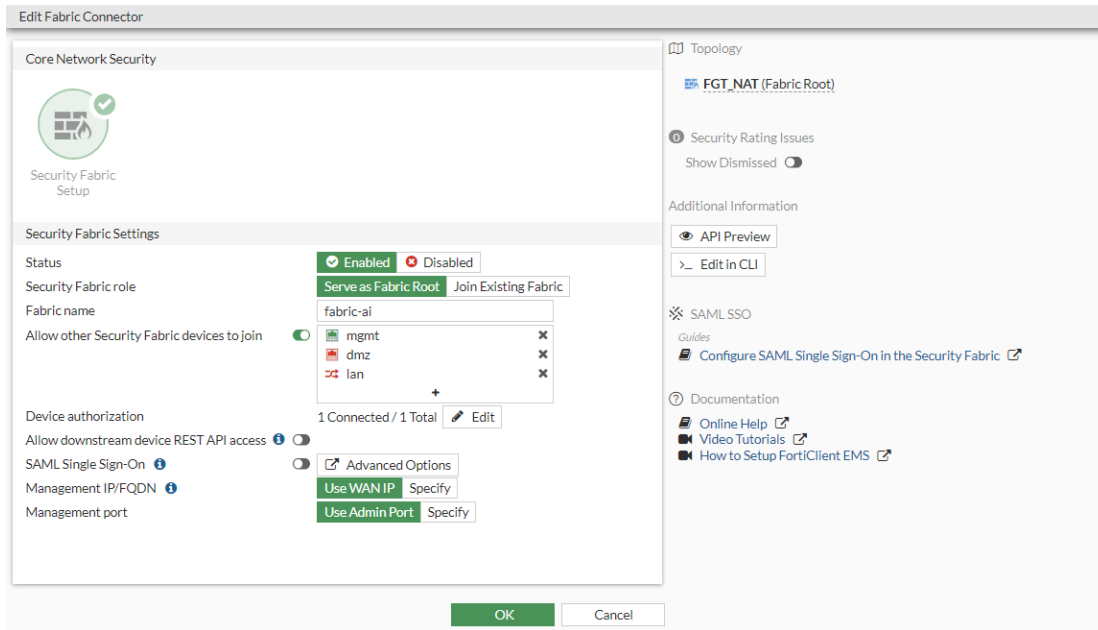

- d. Click *OK*.

Configuring FortiNDR

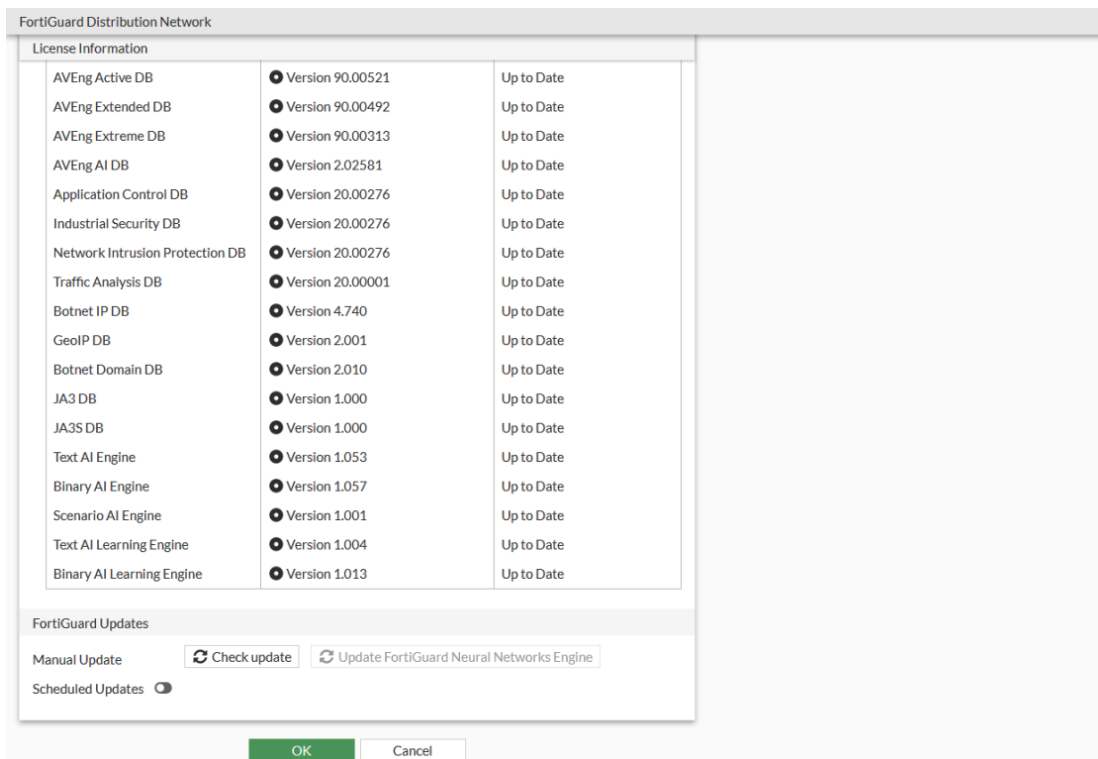

FortiNDR can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

To add FortiNDR to the Security Fabric in the GUI:

1. Enable the Security Fabric and configure the interface to allow other Security Fabric devices to join (see [Configuring the root FortiGate and downstream FortiGates on page 2364](#)).

2. Install the FortiNDR appliance and activate the product with a valid license (see [Registering products](#) in the Asset Management Guide). A license file is provided after the product is registered.
3. In FortiNDR, go to *System > FortiGuard* and verify that the pre-trained models (engines) are up to date. Refer to the [FortiGuard website](#) for the latest FortiNDR ANN versions.

4. Configure and authorize the FortiGate in the FortiNDR GUI to join the Security Fabric:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the connector card.
 - b. Click the toggle to *Enable Security Fabric*.

- c. Enter the IP addresses for the root FortiGate and the FortiNDR.

- d. Click OK. The FortiNDR is now authorized.

5. Authorize the FortiNDR in FortiOS:

- a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
- b. In the topology tree, click the highlighted FortiNDR serial number and select *Authorize*.

c. Click **Accept** to verify the device certificate.

The *Security Fabric* widget on the dashboard also updates when the FortiNDR is authorized.

6. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.**To add FortiNDR to the Security Fabric in the CLI:**

1. Configure the interface to allow other Security Fabric devices to join:

```
config system interface
  edit "port1"
    ...
    set allowaccess ping https ssh http fgfm fabric
    ...
  next
end
```

2. Enable the Security Fabric:

```
config system csf
  set status enable
  set group-name "fabric-ai"
end
```

3. In FortiNDR, configure the device to join the Security Fabric:

```
config system csf
  set status enable
  set upstream-ip 10.6.30.14
```

```

    set management-ip 10.6.30.251
end

```

4. Authorize the FortiNDR in FortiOS:

```

config system csf
    set status enable
    set group-name "fabric-ai"
    config trusted-list
        edit "FAIVMSTM21000000"
            set authorization-type certificate
            set certificate "*****"
        next
    end
end
end

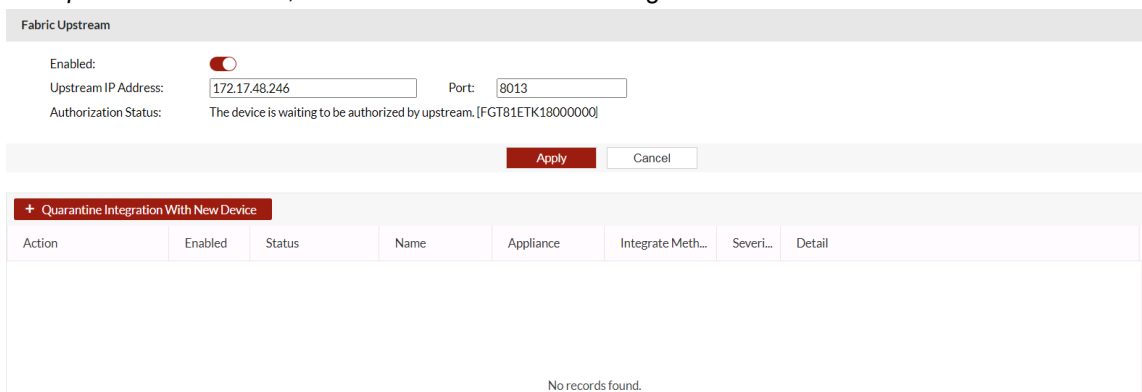

```

Configuring FortiDeceptor

FortiDeceptor can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

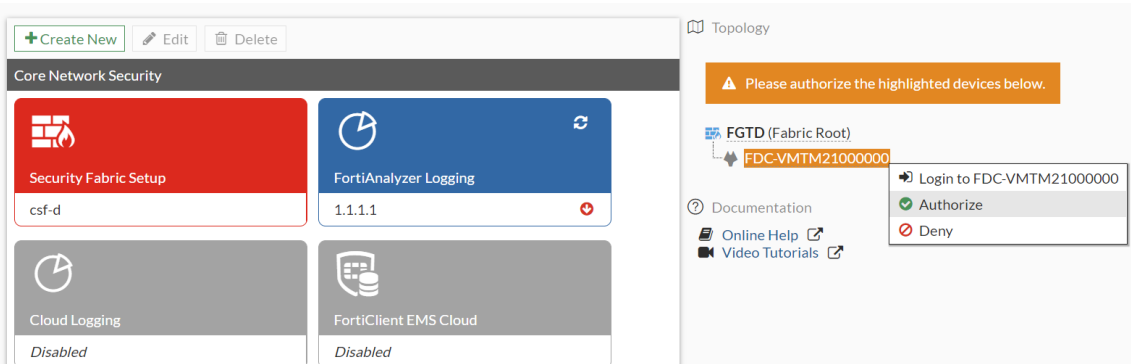

To add FortiDeceptor to the Security Fabric in the GUI:

1. Enable the Security Fabric (see [Configuring the root FortiGate and downstream FortiGates on page 2364](#) for more details) with the following settings:
 - a. Configure the interface to allow other Security Fabric devices to join.
 - b. Enable *Allow downstream device REST API access* so the FortiDeceptor can communicate with the FortiGate, and select an *Administrator profile*. The minimum permission required for the selected *Administrator profile* is *Read/Write for User & Device* (set authgrp read-write).
2. In FortiDeceptor, integrate the device:
 - a. Go to *Fabric > Integration Devices*.
 - b. Click *Quarantine Integration With New Device*.
 - c. Click the toggle to enable the device.
 - d. For *Upstream IP Address*, enter the root FortiGate's management IP address.

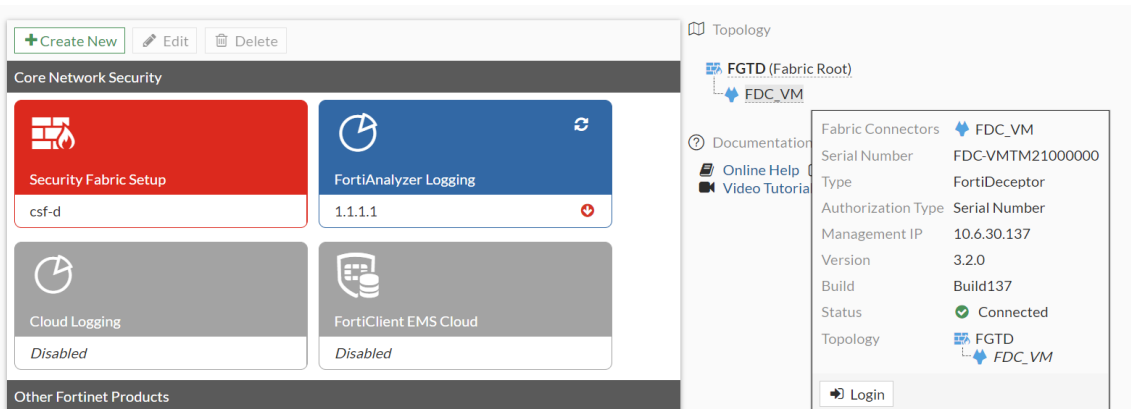

- e. Click *Apply*.

3. Authorize the FortiDeceptor in FortiOS:
 - a. Go to *Security Fabric > Fabric Connectors*.
 - b. In the topology tree, click the highlighted FortiDeceptor serial number and select *Authorize*.

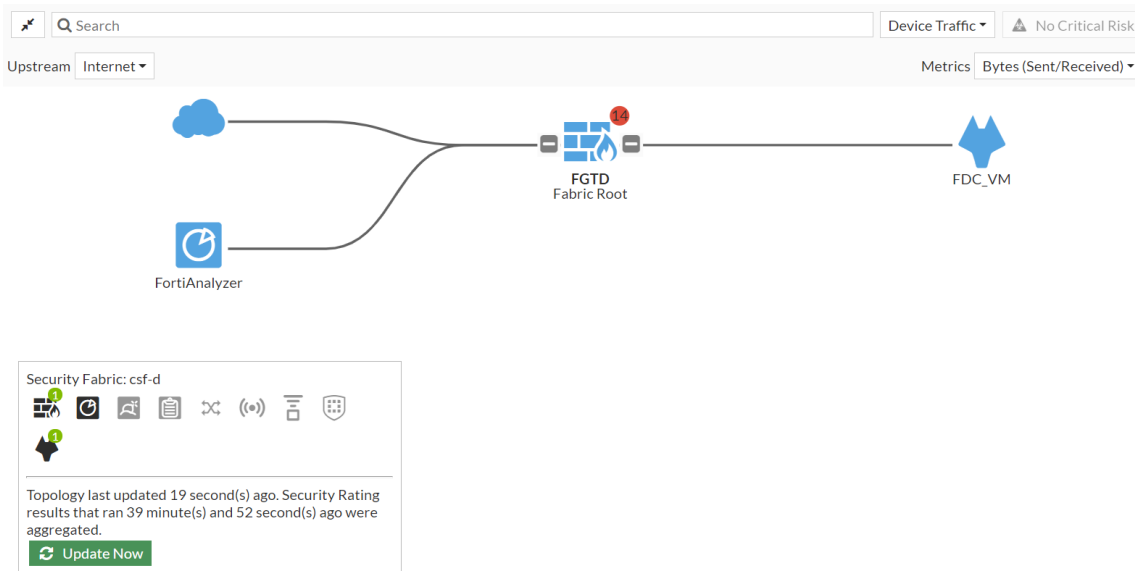

The authorized device appears in the topology tree. Hover over the device name to view the tooltip.

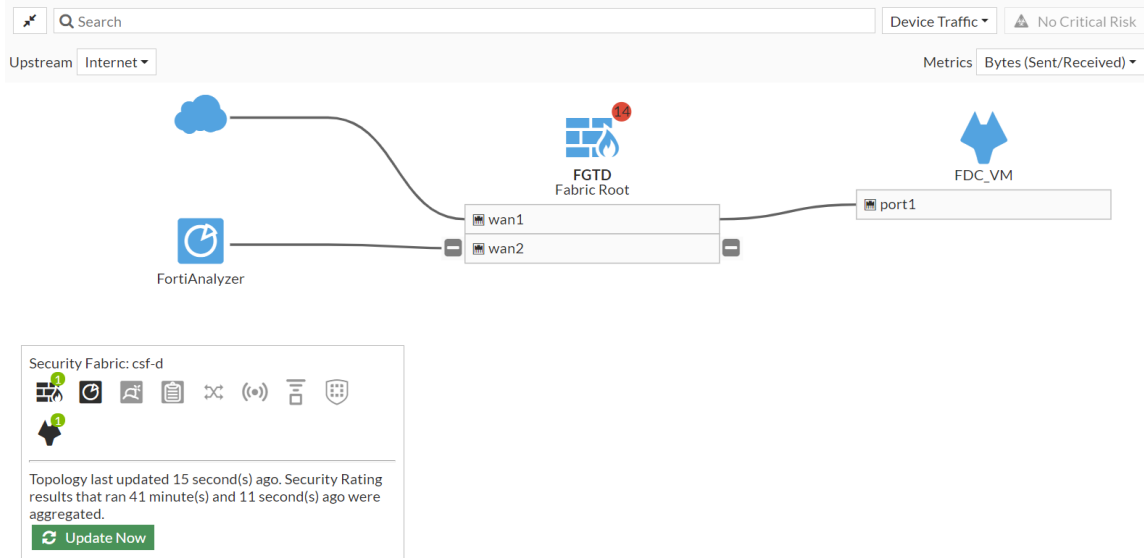

The *Security Fabric* widget on the dashboard also updates when the FortiDeceptor is authorized.

4. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information. Physical topology view:

Logical topology view:

To add FortiDeceptor to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:

```
config system interface
  edit "wan1"
    ...
    set allowaccess ping https ssh snmp http fabric
    ...
  next
end
```

2. Enable the Security Fabric:

```
config system csf
  set status enable
  set group-name "csf-d"
  set downstream-access enable
  set downstream-accprofile "super_admin"
end
```

3. In FortiDeceptor, integrate the device:

- a. Go to *Fabric > Integration Devices*.
- b. Click *Quarantine Integration With New Device*.
- c. Click the toggle to enable the device.
- d. For *Upstream IP Address*, enter the root FortiGate's management IP address.
- e. Click *Apply*.

4. Authorize the FortiDeceptor in FortiOS:

```
config system csf
  set status enable
  set group-name "csf-d"
  config trusted-list
    edit "FDC-VMTM21000000"
      set serial "FDC-VMTM21000000"
    next
  next
```

```
    end
end
```

Configuring FortiWeb

A FortiWeb can be configured to join a Security Fabric through the root or downstream FortiGate. There are two methods to add a FortiWeb to the Security Fabric:

- Trigger the authorization on the FortiWeb side and authorize from the FortiOS side.
- Pre-authorize the FortiWeb from the FortiOS side.

Once the FortiWeb joins the Fabric, the following features are available:

- View the FortiWeb on topology pages.
- Create a dashboard Fabric Device widget to view FortiWeb data.
- Configure single sign-on using SAML.

Triggering the authorization in FortiWeb

In this example, a FortiWeb triggers the authorization process, and then the device is approved in FortiOS. This example assumes the Security Fabric has already been configured.

To trigger the Security Fabric authorization in FortiWeb:

1. Edit the FortiGate *Fabric Connector* settings in FortiWeb (see [Fabric Connector: Single Sign On with FortiGate](#)). The *Connection Status* is currently *Authorize pending*.
2. In FortiOS, go to *Security Fabric > Fabric Connectors*.
3. In the topology tree, select the FortiWeb and click *Authorize*.
4. Verify that the certificate is correct, then click *Accept*.
5. In FortiWeb, verify that the FortiGate *Connection Status* is now *Authorized*.

Pre-authorizing the FortiWeb in FortiOS

In this example, a FortiWeb is pre-authorized on the root FortiGate using certificate authorization. This example assumes the Security Fabric has already been configured.

To authorize a FortiWeb to join the Security Fabric in FortiOS:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Beside *Device authorization*, click *Edit*. The *Device authorization* pane opens.
3. Add the FortiWeb:
 - a. Click *Create New* and enter a device name.
 - b. For *Authorization type*, select *Certificate*.
 - c. Click *Browse* to upload the certificate.
 - d. For *Action*, select *Accept*.

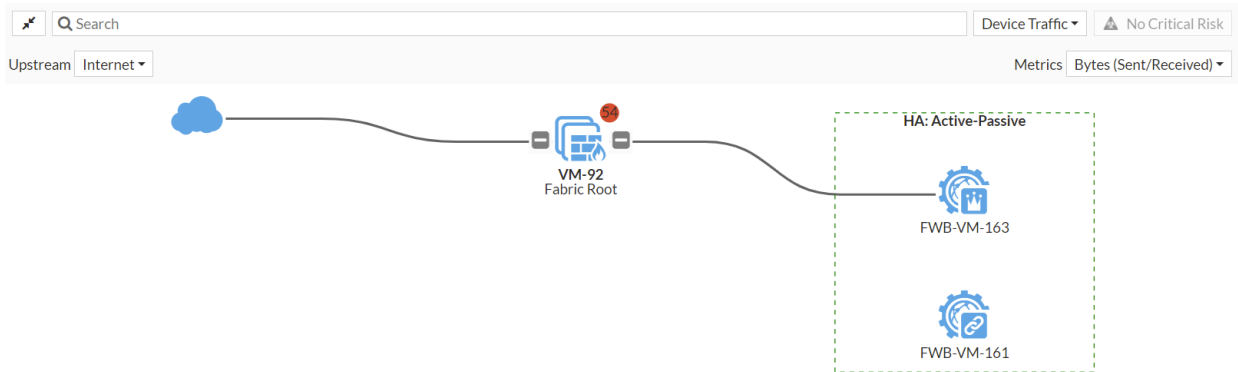

e. Click OK. The FortiWeb appears in the table.

The screenshot shows the 'Device Authorization' window in the FortiWeb interface. On the left is a sidebar with navigation options like 'Core Network Security', 'Security Fabric Setup', and 'Device authorization'. The main area displays a table with the following data:

Device	Type	Status	Authorization Type	Serial Number
FWB-VM-163	FortiWeb	Connected	Certificate	

At the bottom right of the window, there is a status bar indicating 'Updated: 16:42:47'.

4. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information. Physical topology view:

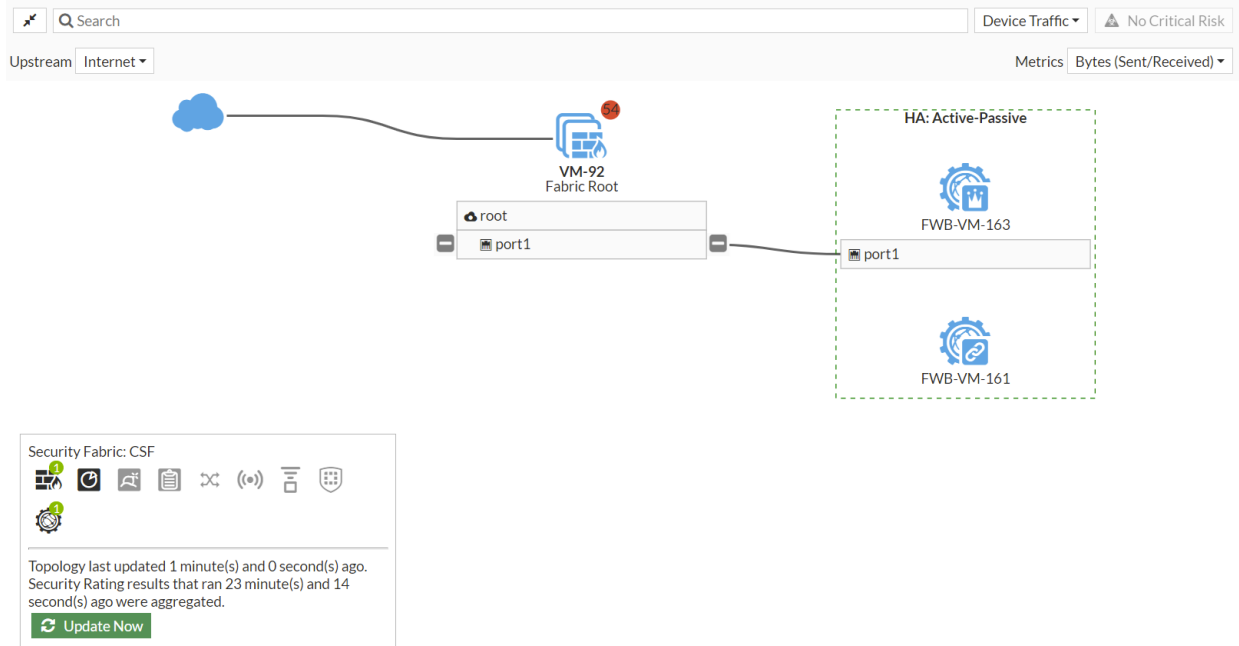

The 'Security Fabric: CSF' status panel includes several icons representing different security components. Below the icons, it provides the following information:

Topology last updated 30 second(s) ago. Security Rating results that ran 23 minute(s) and 40 second(s) ago were aggregated.

Update Now

Logical topology view:

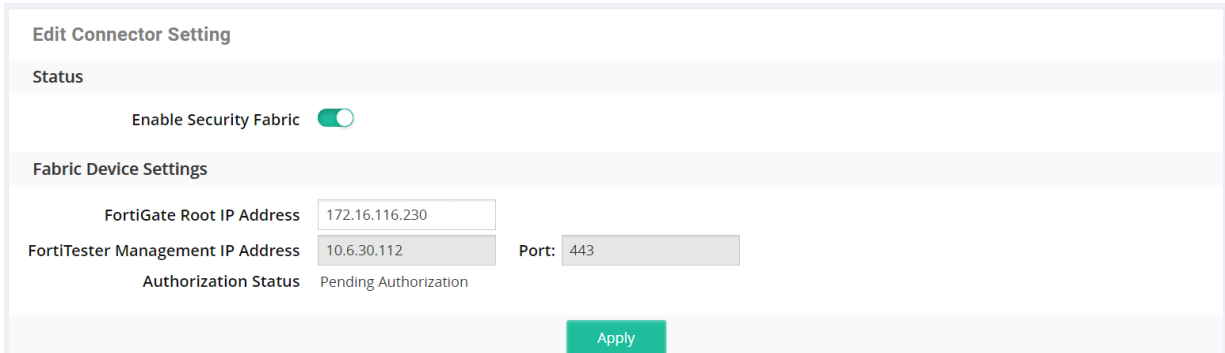

Configuring FortiTester

FortiTester can be added to the Security Fabric and authorized from the Security Fabric topology views. Once added, the FortiTester will appear in the *Security Fabric* widget on the dashboard. A FortiTester can be added to the dashboard as a Fabric device widget.

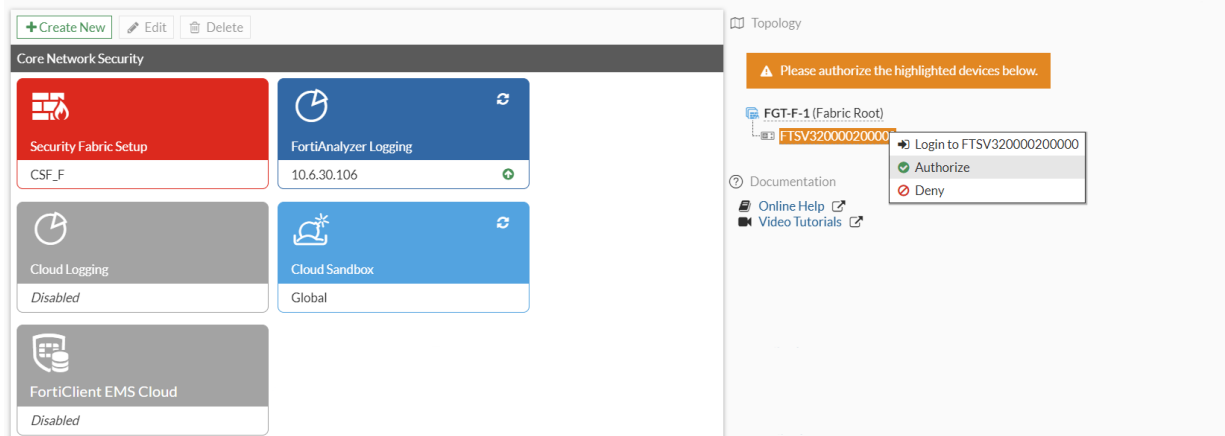

To add FortiTester to the Security Fabric in the GUI:

1. Enable the Security Fabric and configure the interface to allow other Security Fabric devices to join (see [Configuring the root FortiGate and downstream FortiGates on page 2364](#)).

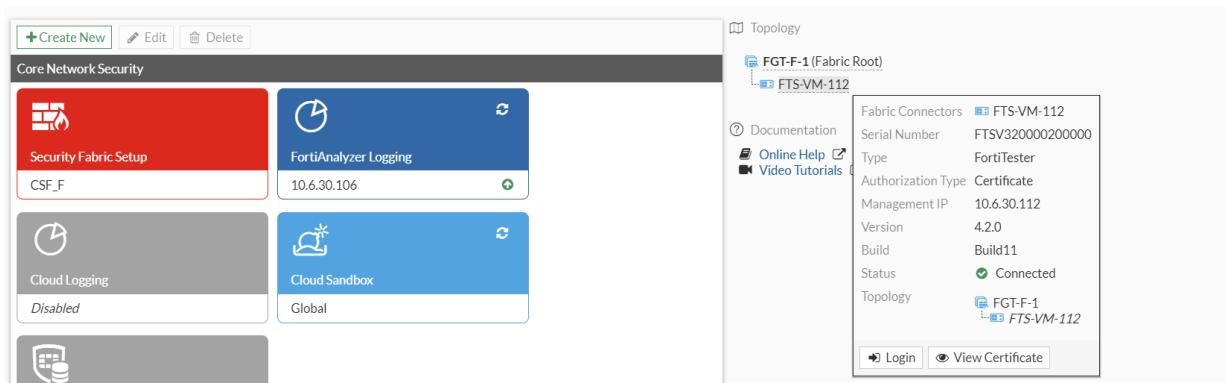

2. In FortiTester, enable the Security Fabric:
 - a. Go to *System Settings > Security Fabric > Settings*.
 - b. Click the toggle to enable the device (*Enable Security Fabric*).
 - c. Enter the *FortiGate Root IP Address*.

- d. Click *Apply*.
3. Authorize the FortiTester in FortiOS:
 - a. Go to *Security Fabric > Fabric Connectors*.
 - b. In the topology tree, click the highlighted FortiTester serial number and select *Authorize*.

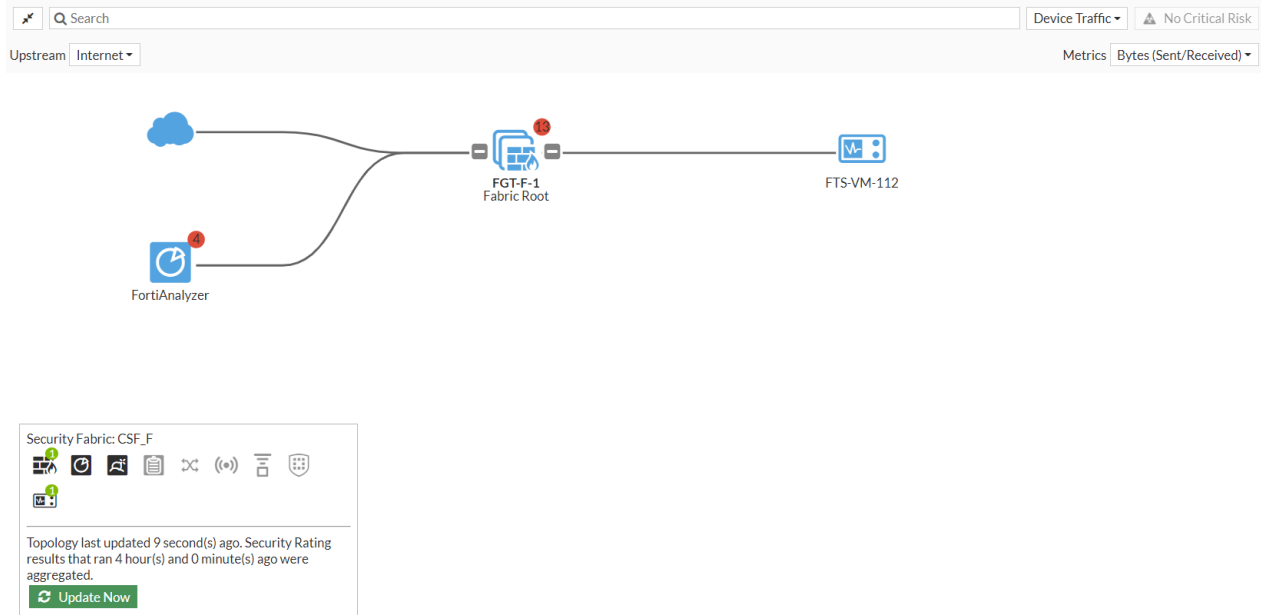

The authorized device appears in the topology tree. Hover over the device name to view the tooltip.

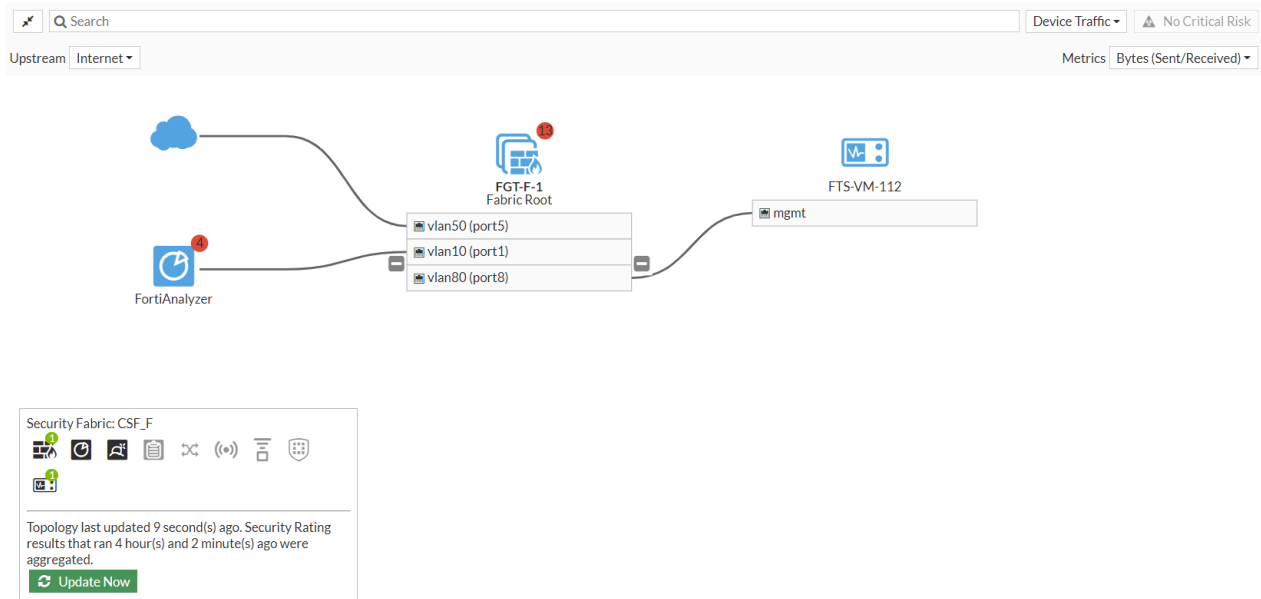

The *Security Fabric* widget on the dashboard also updates when the FortiTester is authorized.

4. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information.
Physical topology view:

Logical topology view:

To add FortiTester to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:

```
config system interface
    edit "port8"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
end
```

2. Enable the Security Fabric:

```
config system csf
    set status enable
    set group-name "CSF_F"
end
```

3. In FortiTester, enable the Security Fabric:

```
config system csf
    set ip 172.16.116.230
    set port 8013
    set status enable
end
```

4. Authorize the FortiTester in FortiOS:

```
config system csf
    set status enable
    set group-name "CSF_F"
    config trusted-list
        edit "FTSV320000200000"
            set authorization-type certificate
            set certificate "*****"
        next
    end
end
```

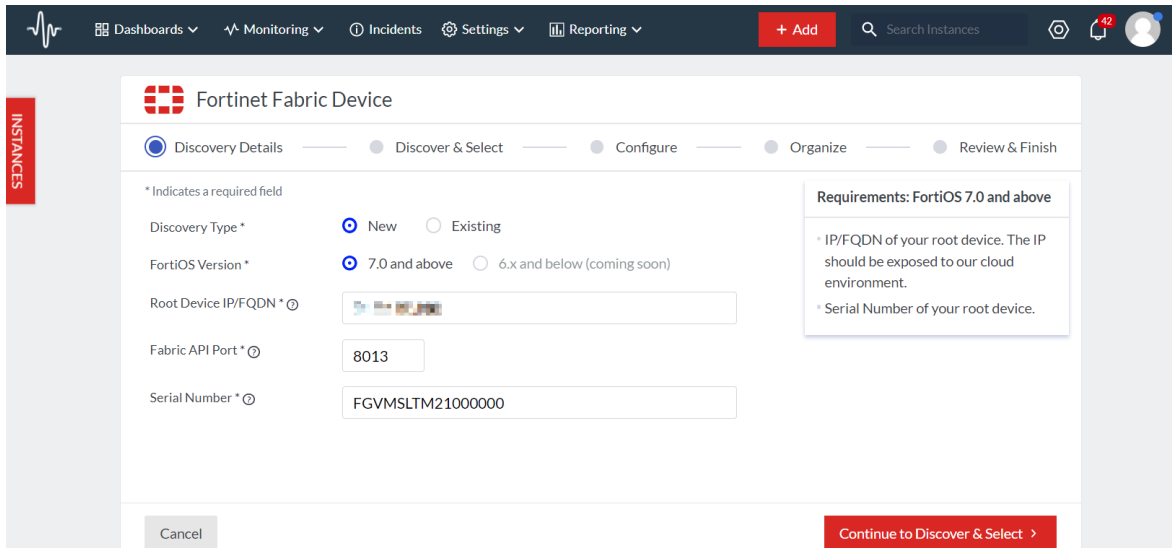

Configuring FortiMonitor

FortiMonitor can be added to the Security Fabric. When a FortiMonitor joins the Security Fabric and is authorized, it appears in the Fabric topology pages.

To add FortiMonitor to the Security Fabric:

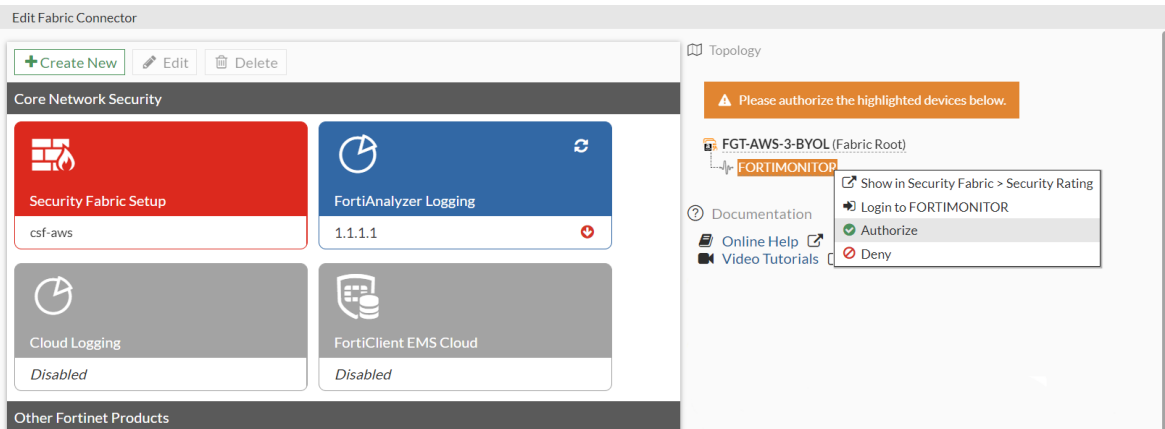

1. Enable the Security Fabric (see [Configuring the root FortiGate and downstream FortiGates on page 2364](#)) with the following settings:
 - a. Configure the interface to allow other Security Fabric devices to join.
 - b. Enable *Allow downstream device REST API access* and select an *Administrator profile*.
2. In FortiMonitor, start configuring the device to join the Security Fabric (see [Enable Security Fabric monitoring for detailed instructions](#)):

a. Complete the *Discovery Details* page.

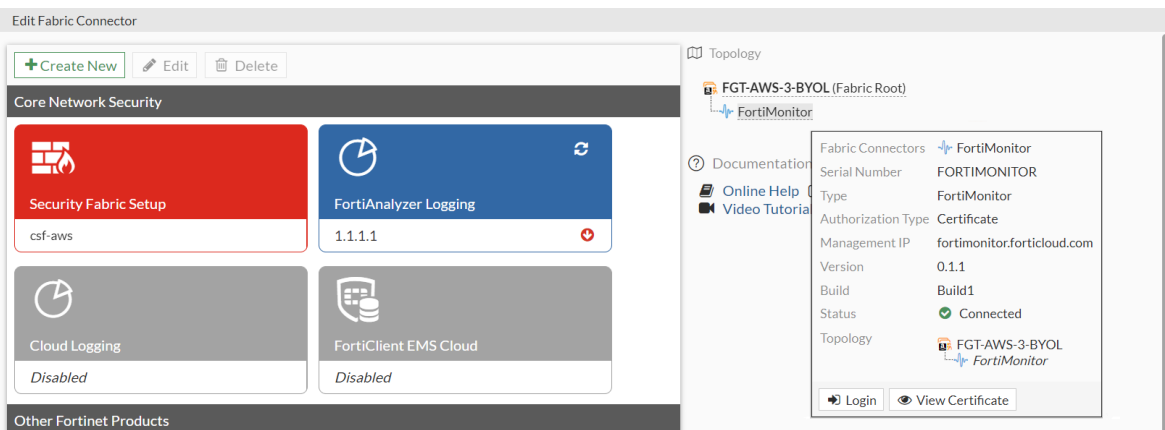

3. Authorize the FortiMonitor in FortiOS:

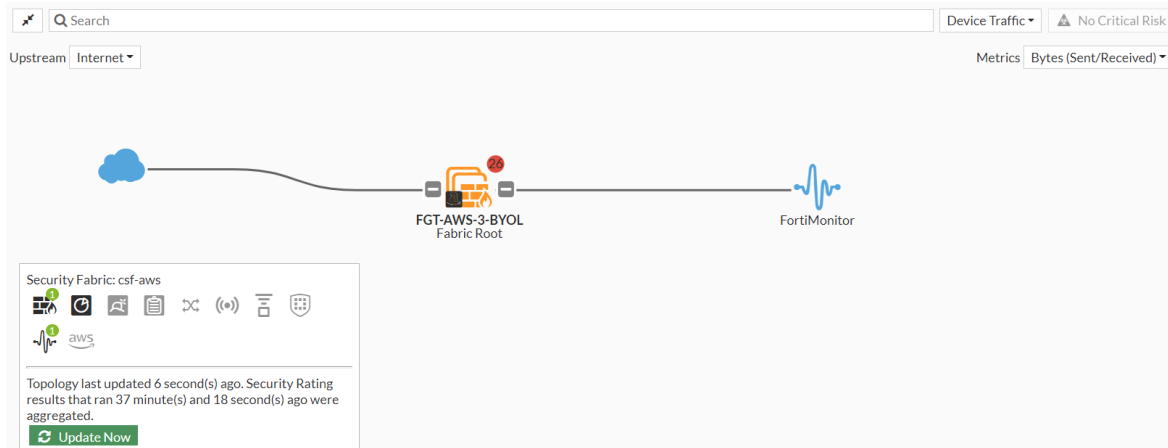

- a. Go to *Security Fabric > Fabric Connectors*.
- b. In the topology tree, click the highlighted FortiMonitor and select *Authorize*.

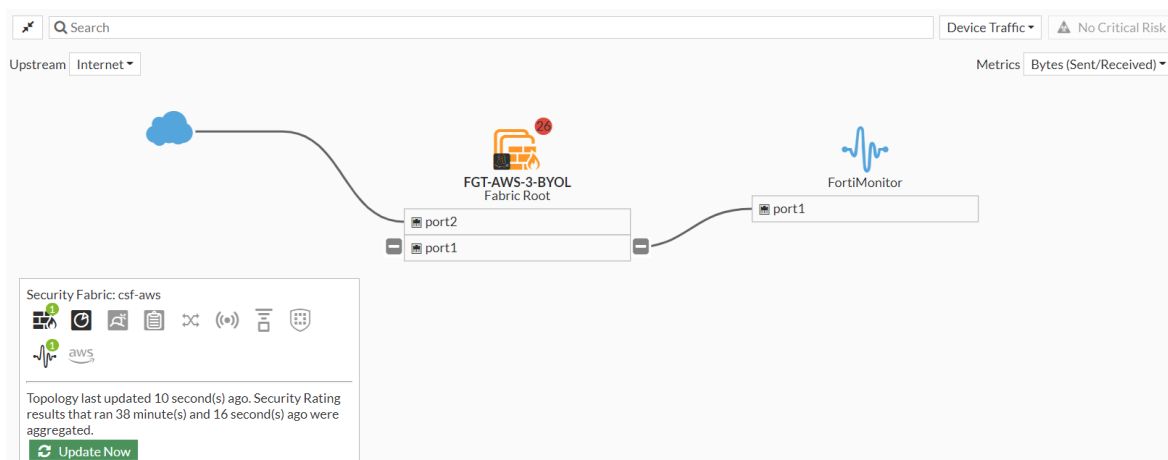

The authorized device appears in the topology tree. Hover over the device name to view the tooltip.

- 4. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology* to view more information. Physical topology view:

Logical topology view:

5. In FortiMonitor, complete the device configuration (see [Enable Security Fabric monitoring](#) for detailed instructions).

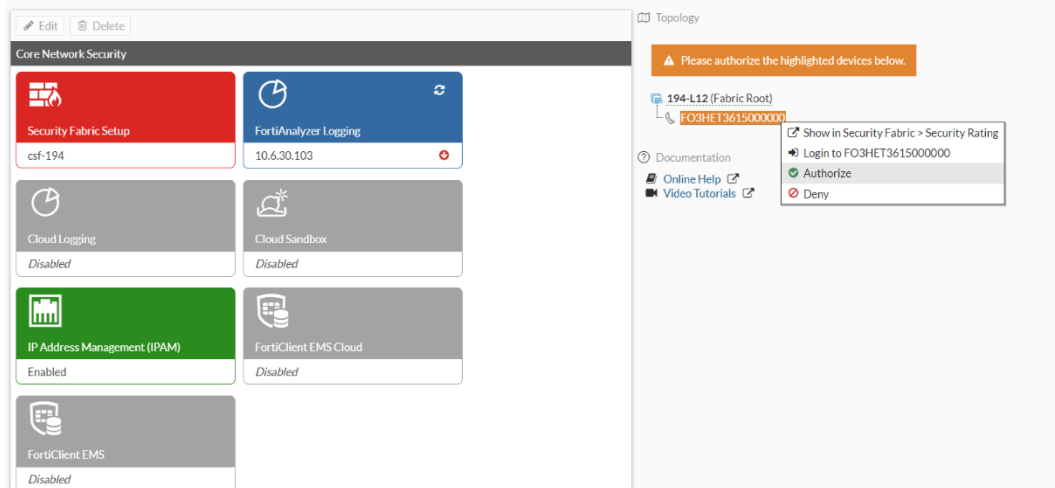

Configuring FortiVoice

A FortiVoice can be added to the Security Fabric on the root FortiGate. Once the FortiVoice is added and authorized, you can log in to the device from the Security Fabric topology pages or the topology tree. A FortiVoice can be authorized in FortiOS, or can be pre-authorized with its serial number or certificate. A FortiVoice can be added to the dashboard as a Fabric device widget.

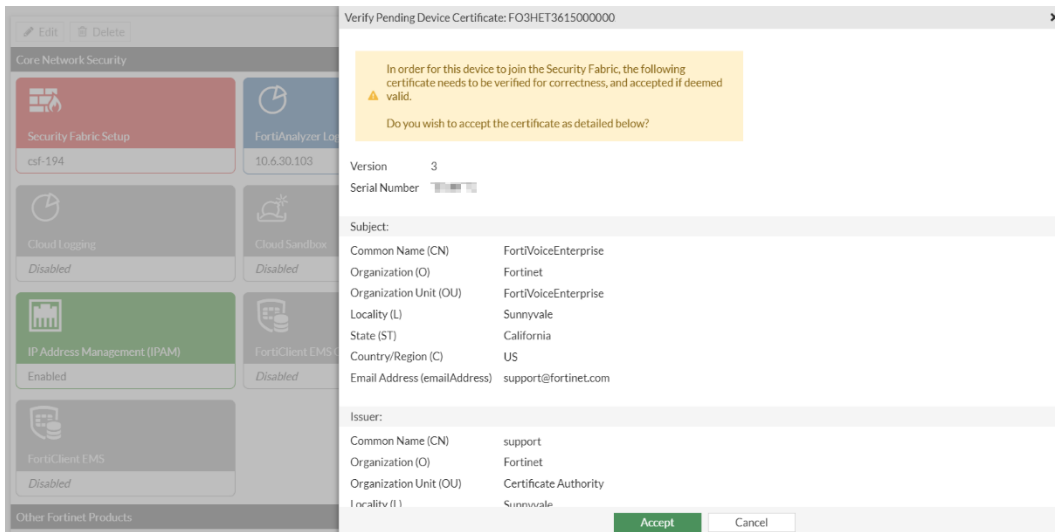

Authorizing using the FortiOS GUI

To authorize a FortiVoice to join the Security Fabric:

1. On the FortiVoice, enable the Security Fabric. See [Enabling Security Fabric](#) in the FortiVoice Phone System Administration Guide.
2. On the root FortiGate, go to *Security Fabric > Fabric Connectors*. The FortiVoice is highlighted in the topology list in the right panel with the status *Waiting for Authorization*.
3. Click the highlighted FortiVoice and select *Authorize*.

4. Verify that the certificate is correct, then click **Accept**.

Pre-authorizing using the FortiVoice certificate

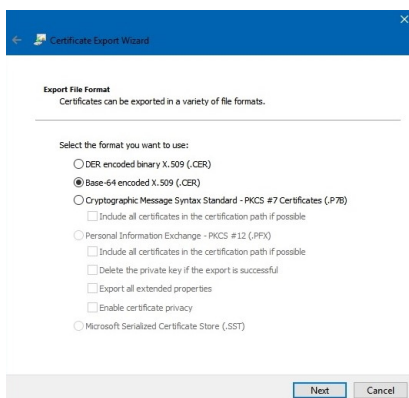

A FortiVoice can be pre-authorized using its serial number or certificate. When pre-authorizing, the FortiVoice can join at any time, and it will not need to be authorized in FortiOS. In the following example, the FortiVoice is pre-authorized using a certificate.

To pre-authorize a FortiVoice using a third-party or default certificate in the GUI:

1. Log in to the FortiVoice.
2. Download the certificate. For example, in Chrome:
 - a. In the left side of the address bar, click the icon to view the site information.
 - b. Click *Certificate*.
 - c. In the *Certificate* window, click the *Details* tab, then click *Copy to File*.

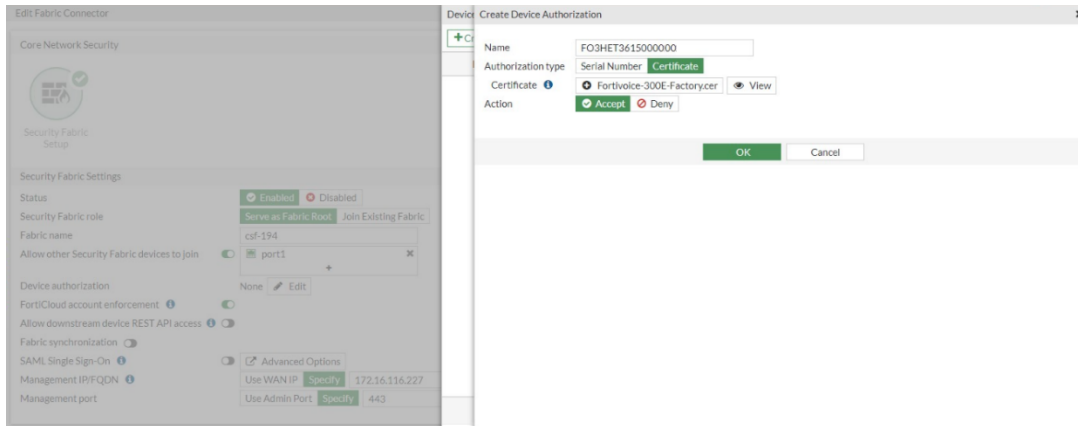

- d. The *Certificate Export Wizard* opens. Click *Next*.
- e. Set the format to *Base-64 encoded X.509 (.CER)*, then click *Next*.

- f. Browse to the folder location, enter a file name, then click *Next*.
- g. Click *Finish*, then click *OK* to close the wizard.

3. In FortiOS, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
4. Beside *Device authorization*, click *Edit*.

5. Click *Create New* and enter the following:
 - a. In the *Name* field, enter the FortiVoice serial number.
 - b. Set the *Authorization type* to *Certificate*.
 - c. Upload the .CER file.

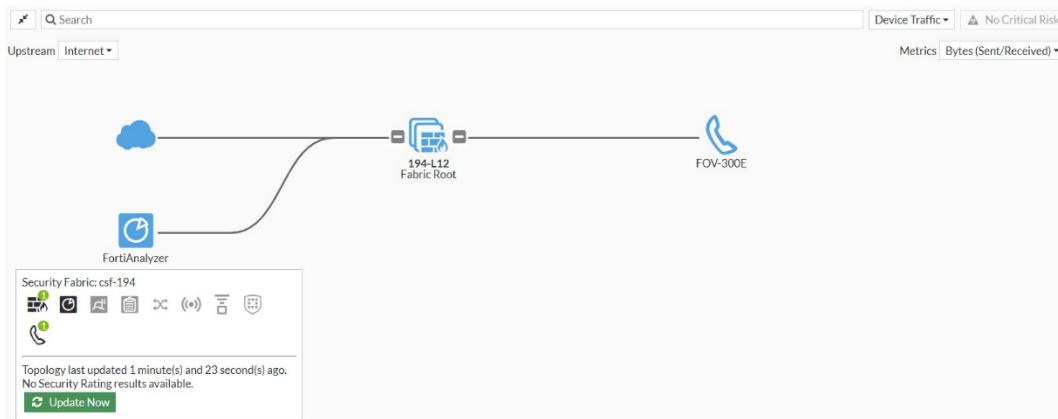

- d. Click *OK*, then close the *Device authorization* pane.

To pre-authorize a FortiVoice using a third-party or default certificate in the CLI:

```
config system csf
  config trusted-list
    edit "FOV-300E"
      set action accept
      set authorization-type certificate
      set certificate "-----BEGIN CERTIFICATE-----
...
<encrypted_certificate_data>
...
-----END CERTIFICATE-----"
    next
  end
end
```

To verify the connection status:

1. After the FortiVoice is authorized, go to *Security Fabric > Physical Topology* and confirm that it is included in the topology.

2. Go to *Security Fabric > Logical Topology* and confirm the FortiVoice is also displayed there.

Logging in to the FortiVoice using the Security Fabric

To log in using a topology page:

1. Go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology*.
2. Click on the FortiVoice and select *Login to <serial_number>*.

To log in using the Fabric Connectors page:

1. Go to *Security Fabric > Fabric Connectors*.
2. In the topology tree, click the FortiVoice and select *Login to <serial_number>*.

Configuring additional devices

The following Fortinet devices are supported by the Security Fabric and can be configured in the CLI:

- FortiADC
- FortiDDoS
- FortiWLC

In FortiOS, the device details are shown in the *Security Fabric* and *Fabric Device* dashboard widgets, the *Fabric Connectors* page, and the physical and logical topologies. See [config system csf](#) in the FortiOS CLI Reference for more information.

```
config system csf
...
config fabric-device
  edit <name>
    set device-ip <IP address>
    set https-port <integer>
    set access-token <token>
  next
end
end
```

To configure a FortiADC:

```
config system csf
...
config fabric-device
  edit "FortiADC"
    set device-ip 172.18.64.36
    set https-port 443
    set access-token xxxxxxxxxxxxxxxxxxxx
  next
end
end
```

Using the Security Fabric

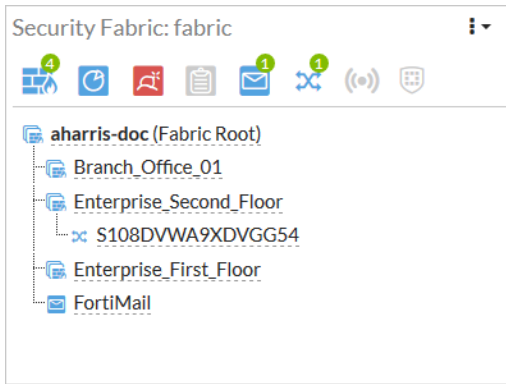

Dashboard widgets

Security Fabric widgets can be added to FortiGate dashboards, including:

- [Security Fabric status on page 2432](#)
- [Fabric Device on page 2433](#)
- [FortiGate Cloud on page 2434](#)

Security Fabric status

The Security Fabric status widget shows a summary of the devices in the Security Fabric.

Hover the cursor over the top icons to view pop-ups showing the statuses of the devices in the fabric.

The device tree shows devices that are connected, or could be connected, to your Security Fabric, according to the following color scheme:

- Blue: connected to the network
- Gray: not configured or not detected
- Red: no longer connected or not authorized

Hover over a device in the tree to view details about the device, such as its serial number, operation mode, IP address, CPU and memory usage, and others, depending on the device type.

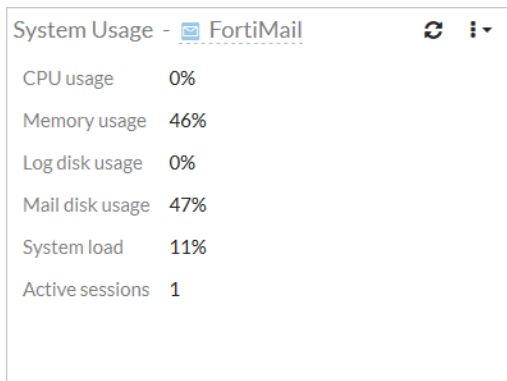

Unauthorized FortiAP and FortiSwitch devices are highlighted in the list, and can be authorized by clicking on the device name.

Fabric Device

A Fabric Device widget shows statistics and system information about the selected fabric device. Widgets can be added for various Fabric devices including FortiMail, FortiNDR, and FortiDeceptor.

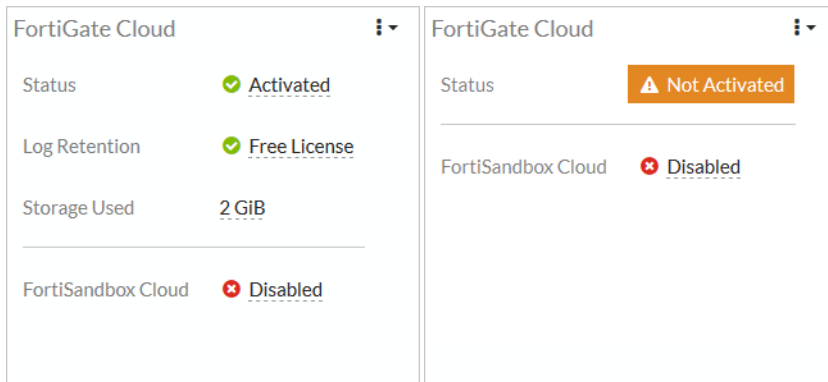

For a FortiMail device, the widget can show:

- Mail Statistics: a chart of the total messages and total spam messages over time.
- Statistics Summary: a pie chart summarizes mail statistics.
- System Information: The FortiMail System Information widget
- System Usage: System usage information, such as CPU, memory, and disk usage, as well as the number of active sessions.

FortiGate Cloud

The FortiGate Cloud widget shows the FortiGate Cloud status and information. If your account is not activated, you can activate it from the widget.

To activate your FortiGate Cloud account:

1. Click on the *Not Activated* button and select *Activate*. The *Activate FortiGate Cloud* pane opens.
2. If you already have an account:
 - a. Fill in your email address, password, country or region, and reseller.
 - b. Click *OK*.
3. If you are creating an account:
 - a. In the *FortiCloud* field select *Create Account*.
 - b. Fill in all of the required information.
 - c. Click *OK*.

Topology

The full Security Fabric topology can be viewed on the root FortiGate. Downstream FortiGate devices' topology views do not include upstream devices.

The *Physical Topology* page shows the physical structure of your network, including all connected devices and the connections between them. The *Logical Topology* page shows information about the interfaces that connect devices to the Security Fabric.

In both topology pages, you can use filtering and sorting options to control the information that is shown. Hover the cursor over a device icon, port number, or endpoint to open a tooltip that shows information about that specific device, port, or endpoint. Right-click on a device to log into, configure, or deauthorize it. Right-click on an endpoint to perform various tasks, such as drilling down for more details in FortiView, quarantining the host, and banning the IP address.

The small number that might be shown in the top right corner of a device icon is the number of security ratings recommendations or warnings for that device. The circle color indicates the severity of the highest security rating check that failed. Clicking it opens the *Security Rating* page. See [Security rating on page 2499](#) for more information.

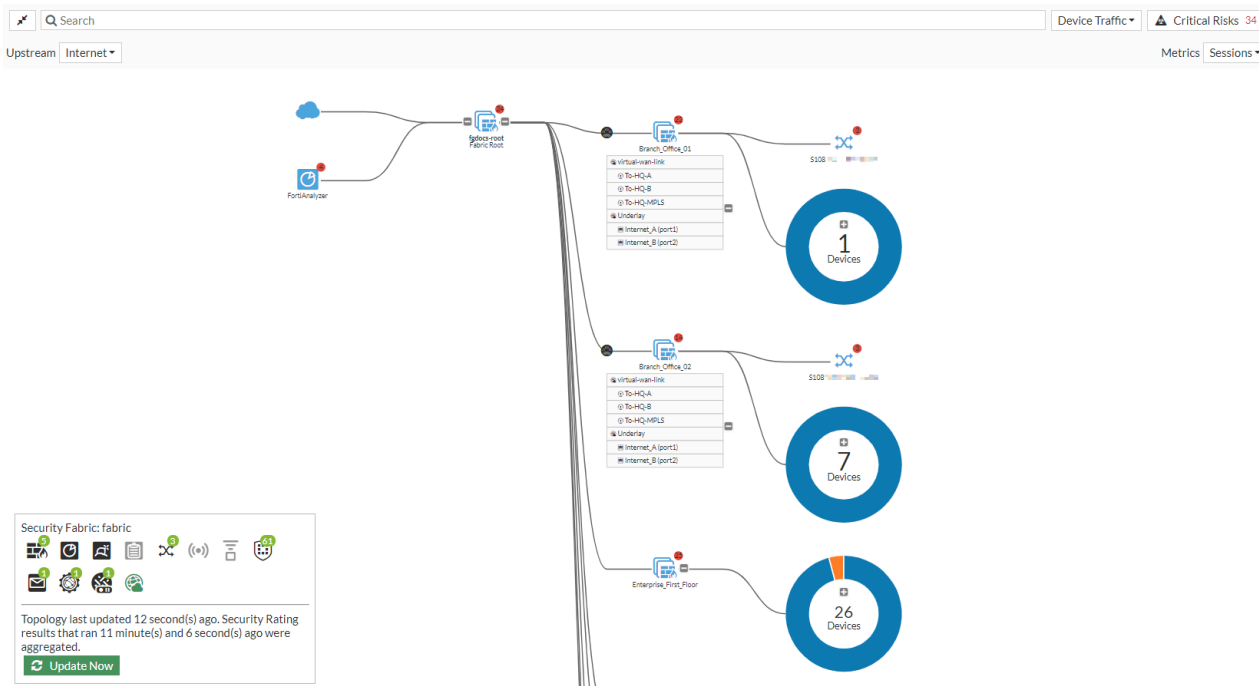

Views

From the dropdown list beside the search bar, select one of the following views:

- *Device Traffic*: organize devices by traffic.
- *Device Count*: organize devices by the number of devices connected to it.
- *Device Operating System*: organize devices by operating system.
- *Device Hardware Vendor*: organize devices by hardware vendor.
- *Risk*: only include devices that have endpoints with medium, high, or critical risk values of the specified type: *All*, *Compromised Host*, *Vulnerability*, or *Threat Score*.
- *No Devices*: do not show endpoints.

Endpoint groups

The *Device Traffic* and *Device Count* views display endpoint groups as donut charts, with the total number of endpoints in the group in the center of the chart. Each sector of the donut chart represents a different endpoint operating system.

To zoom in on a donut chart, click any chart sector. Each sector represents a different endpoint OS. Hovering over each sector allows you to see the OS that the sector represents and the number of endpoints that have that OS installed.

In this example, the endpoint group contains a total of nine endpoints, with the following OSes installed:

Donut sector color	OS	Number of endpoints
Orange	Linux	2
Green	FortiMail	1
Red	FortiManager	1
Blue	Other	5

To view the endpoint group in a bubble pack display, click the + button in the center of the donut chart. You can view each individual endpoint in the bubble pack view.

FortiAP and FortiSwitch devices

Newly discovered FortiAP and FortiSwitch devices are initially shown in the topologies with gray icons to indicate that they have not been authorized. To authorize a device, click on the device icon or name and select *Authorize*. Once authorized, the device icon will turn blue.

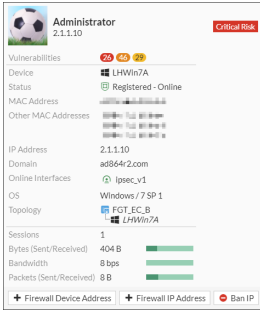

Right-click on an authorized FortiAP device to *Deauthorize* or *Restart* the device. Right-click on a FortiSwitch device to *Deauthorize*, *Restart*, or *Upgrade* the device, or to *Connect to the CLI*.

FortiAP and FortiSwitch links are enhanced to show link aggregation groups for the inter-switch link (ISL-LAG). To differentiate them from physical links, ISL-LAG links are shown with a thicker line. The endpoint circles can also be used as a reference to identify ISL-LAG groups that have more than two links.

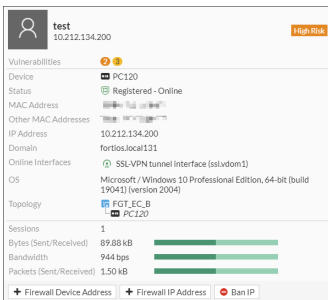

Managed clients connected over a VPN

When managed clients are connected over a VPN, EMS collects user information about these registered clients, such as the VPN connection information. The FortiGate can synchronize this user information from EMS and display it in the logical topology view to provide a detailed picture of clients and their associated VPN interfaces.

Client using an IPsec VPN interface:

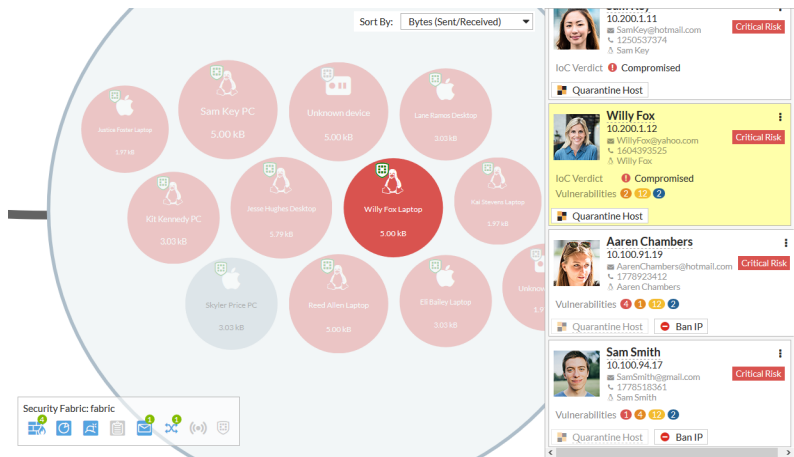

Client using an SSL VPN interface:

Critical risks

Click the *Critical Risks* button to see a list of endpoints that are deemed critical risks, organized by threat severity. These are the red endpoints in the current topology view.

For each endpoint, the user's photo, name, IP address, email address, and phone number are shown. The number of vulnerabilities of each severity is shown, and if the IoC verdict is that the endpoint is compromised.

If applicable, the endpoint's host can be quarantined (click *Quarantine Host*) or their IP address can be banned (click *Ban IP*).

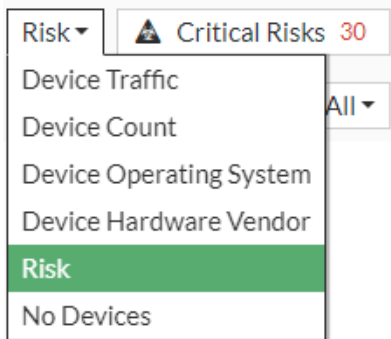

The dropdown menu also provides options to drill down to more information on compromised hosts or endpoint vulnerabilities.

Consolidated risk view

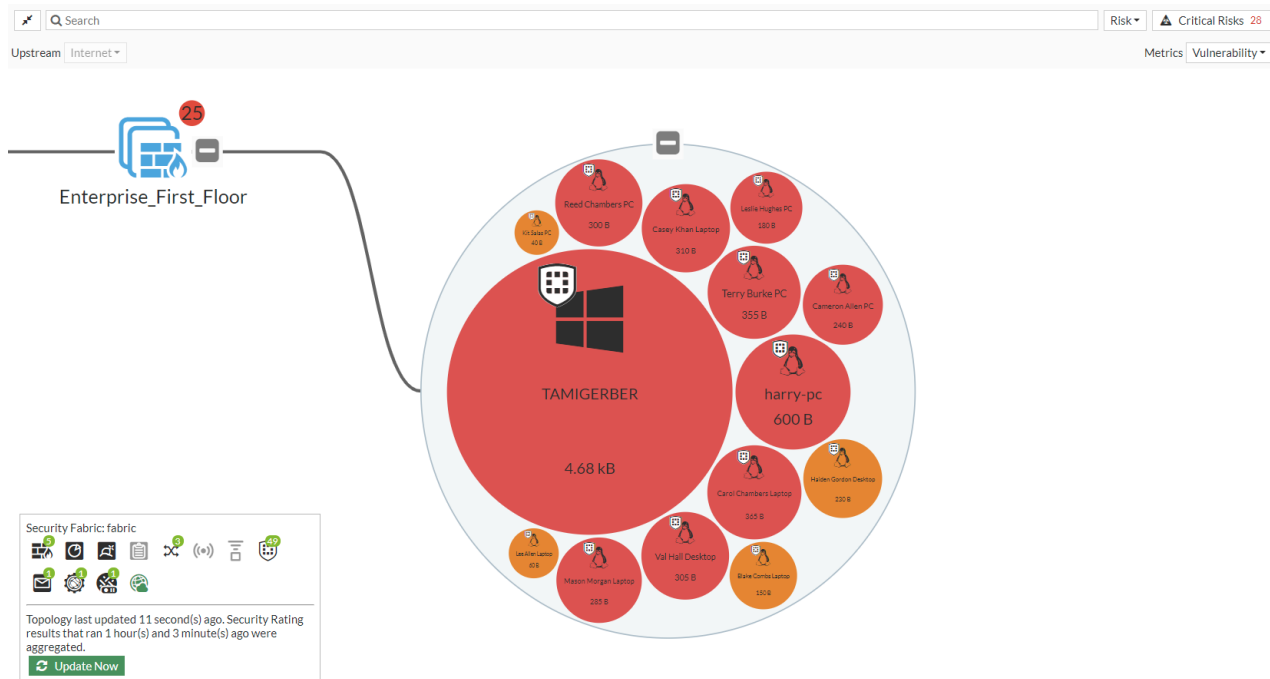

The consolidated *Risk* view mode displays different risks within the Security Fabric topology. You can use the *Risk* view mode to filter threats by *Compromised Hosts*, *Vulnerability*, and *Threat Score*.

To access the consolidated risk view mode:

1. On one of the topology pages, in the view option dropdown list beside the search bar, select *Risk*.

2. Select one of the following options from the *Risk Type* dropdown menu:
 - a. *All*
 - b. *Compromised Hosts*
 - c. *Vulnerability*
 - d. *Threat Score*
3. When devices fit into the risk metric, they will appear in the endpoint groups. Click the + in the endpoint group to display the devices in a bubble chart.

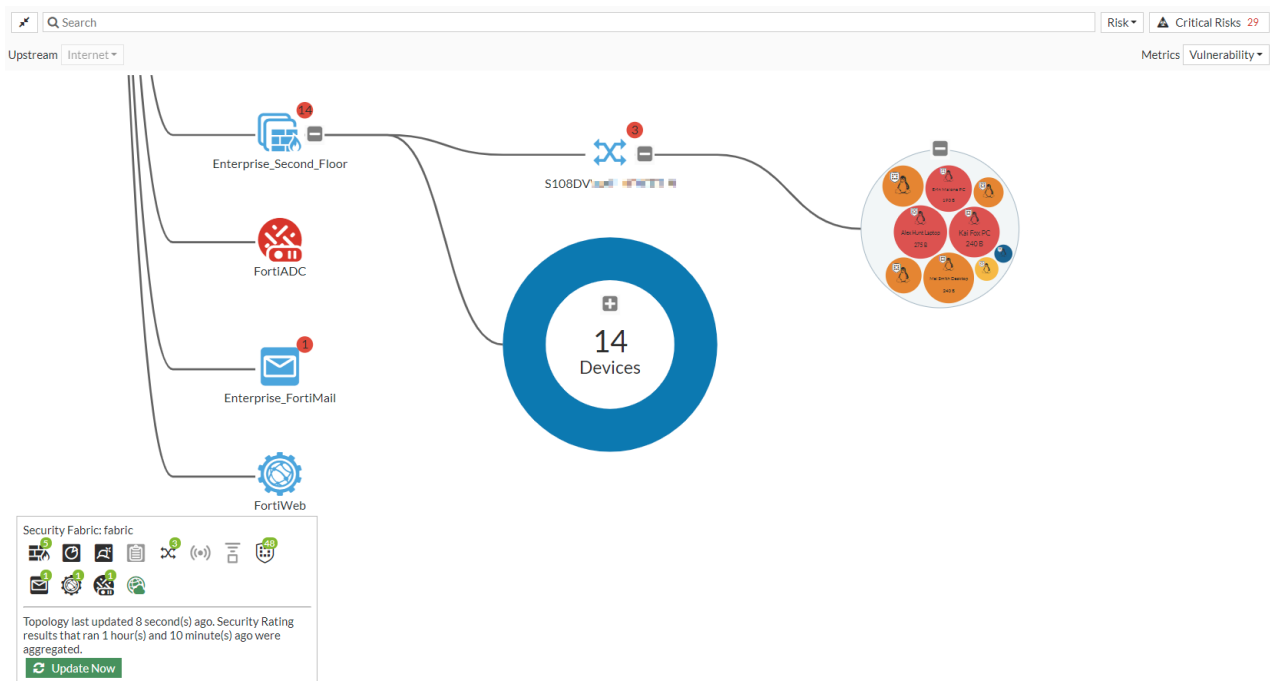

Viewing and controlling network risks in topology view

On the physical and logical topology pages, you can view and control compromised hosts. Compromised hosts behind a FortiSwitch or FortiAP can be quarantined.

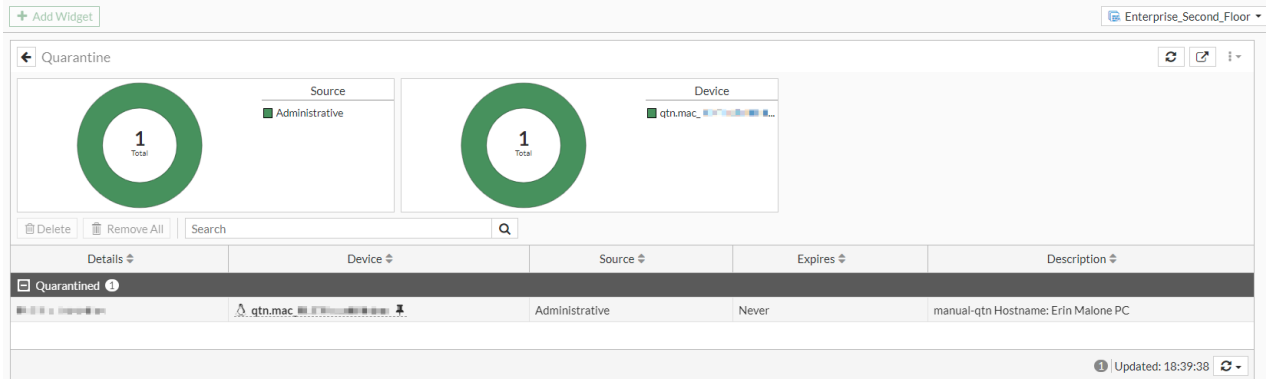

To view a compromised endpoint host:

1. Test that FortiGate detects a compromised endpoint host by opening a browser on the endpoint host and entering a malicious website URL. The browser displays a *Web Page Blocked!* warning and does not allow access to the website.
2. On the root FortiGate, go to *Security Fabric > Physical Topology* or *Security Fabric > Logical Topology*. Expand the endpoint group connected to a FortiSwitch or FortiAP. The endpoint host connected to the switch is highlighted in red. Mouse over the endpoint host to view a tooltip that shows the IoC verdict. The endpoint host is compromised.

To quarantine a compromised endpoint host:

1. On the *Physical Topology* or *Logical Topology* page, right-click the endpoint host and select *Quarantine Host*. A dialog displays the FortiGate, host MAC address, and description of the host to be quarantined. Quarantine entries for each MAC address will be created on the FortiGate that the FortiSwitch or FortiAP is connected to.
2. Click *OK*.
3. Go to *Dashboard > User & Devices* and click the *Quarantine* widget to expand it.
4. In the top-right corner, use the dropdown to select the FortiGate in which this host was quarantined. In this example, it is the *Enterprise_Second_Floor* FortiGate.

5. On the endpoint host, open a browser and visit a website such as <https://www.fortinet.com/>. If the website cannot be accessed, this confirms that the endpoint host is quarantined.

To show the quarantined device from the CLI:

1. Log in to the downstream device where the host was quarantined (Enterprise_Second_Floor).
2. Enter the following show command:

```
Enterprise_Second_Floor # show user quarantine
config user quarantine
  set firewall-groups "QuarantinedDevices"
config targets
  edit "Erin Malone PC"
    set description "Manually quarantined"
  config macs
    edit **:**:**:**:**:**
      set description "manual-qtn Hostname: Erin Malone PC"
    next
  end
next
end
end
end
```

Asset Identity Center page

The *Asset Identity Center* page unifies information from detected addresses, devices, and users into a single page, while building a data structure to store the user and device information in the backend. *Asset* view groups information by *Device*, while *Identity* view groups information by *User*. Hover over a device or a user in the GUI to perform different actions relevant to the object, such as adding a firewall device address, adding an IP address, banning the IP, quarantining the host, and more.

To view the Asset Identity Center page:

1. Go to *Security Fabric > Asset Identity Center*.
2. Click *Asset* to view information by device. The default columns are *Device*, *Software OS*, *Hardware*, *FortiClient User*, *User*, *Status*, *Vulnerabilities*, *Endpoint Tags*, and *Last Seen*. The optional columns are *Address*, *Firewall Address*, *Hostname*, *IP Address*, and *Server*.

Device	Software OS	Hardware	FortiClient User	User	Status	Vulnerabilities	Endpoint Tags
Skylar Khan PC	Linux	Other identi...	Skylar Khan 10.2.0.10 SkylarKhan@... Skylar Khan		Registered - Online	8 7	Low all_registered_clients
Haiden Bryant ...	Linux	Other identi...	Haiden Bryant 10.2.0.14 HaidenBryant@... Haiden Bryant		Registered - Online	1 2	Low all_registered_clients

Diagnostics for the unified user device store

The following options are available for `diagnose user-device-store unified <option>`:

Option	Description
<code>device-memory-query</code>	Get device records and associated user records from memory.
<code>device-query</code>	Get device records and associated user records from memory and disk.
<code>user-memory-query</code>	Get user records and associated device records from memory.
<code>user-query</code>	Get user records and associated device records from memory and disk.
<code>re-query</code>	Retrieve query by <code><query-id></code> <code><iteration-start></code> <code><iteration-count></code> (takes 0-3 arguments).
<code>list</code>	List unified queries.
<code>clear</code>	Delete all unified queries.
<code>dump</code>	Dump unified query stats by <code><query-id></code> (takes 0-1 arguments).
<code>delete</code>	Delete unified query by <code><query-id></code> (takes 0-1 arguments).
<code>stats</code>	Get statistics for unified queries.
<code>debug</code>	Enable/disable debug logs for unified queries.

Fabric Management page

The *Fabric Management* page allows administrators to manage the firmware running on each FortiGate, FortiAP, and FortiSwitch in the Security Fabric, and to authorize and register these Fabric devices.

Administrators can also use the *Fabric Management* page to view the maturity level of FortiOS 7.0.6 and later firmware images. See [Firmware maturity levels on page 2061](#).

Upgrading firmware

A *Fabric Upgrade* can be performed immediately or during a scheduled time. Administrators can choose a firmware from FortiGuard for the Fabric member to download directly to upgrade.

When upgrading FortiGates from mature firmware to feature firmware, a warning message is displayed.

To demonstrate the functionality of this feature, the examples use FortiGates that are running interim builds.

To upgrade individual device firmware:

1. Go to *System > Fabric Management*. The devices are displayed in the table with their firmware version, maturity level (either *Feature*) or (*Mature*)), and status.

Device	Status	Registration Status	Firmware Version	Upgrade Status
sf70-jun13	Online	Registered	v7.0.6 build0366 (Feature)	Up to date
Enterprise_Second_Floor	Online	Registered	v7.0.6 build0366 (Feature)	Up to date
Branch_Office_01	Online	Registered	v7.0.6 build0366 (Feature)	Up to date

2. Upgrade the root FortiGate to the latest firmware:
 - a. Select the root device (*sf70-jun13*) and click *Upgrade*. The *Firmware Management* pane opens.
 - b. Select *All Upgrades* (other options available are *Latest*, *All Downgrades*, and *File Upload*) and select an option.

- c. Click *Confirm and Backup Config*.
If you are upgrading from a mature to a feature firmware version, the *Confirm* pane opens with a warning message.
- d. Review the warning, and click *Confirm* to continue. A warning message is displayed.
- e. Click *Continue* to initiate the upgrade.

3. After the root FortiGate reboots, upgrade the FortiSwitch using FortiGuard:
 - a. Go to *System > Fabric Management* and select the device, then click *Upgrade*. The *Upgrade FortiSwitches* pane opens.
 - b. Select *FortiGuard*, ensure the device you want to upgrade is enabled, then click *Upgrade*.
4. Upgrade the FortiAP using local firmware:
 - a. Select the device and click *Upgrade Device*. The *Upgrade FortiAPs* pane opens.
 - b. Select *Upload* and click *Browse* to select the file.
 - c. Ensure the device you want to upgrade is enabled, then click *Upgrade*.

To upgrade all Fabric device firmware:

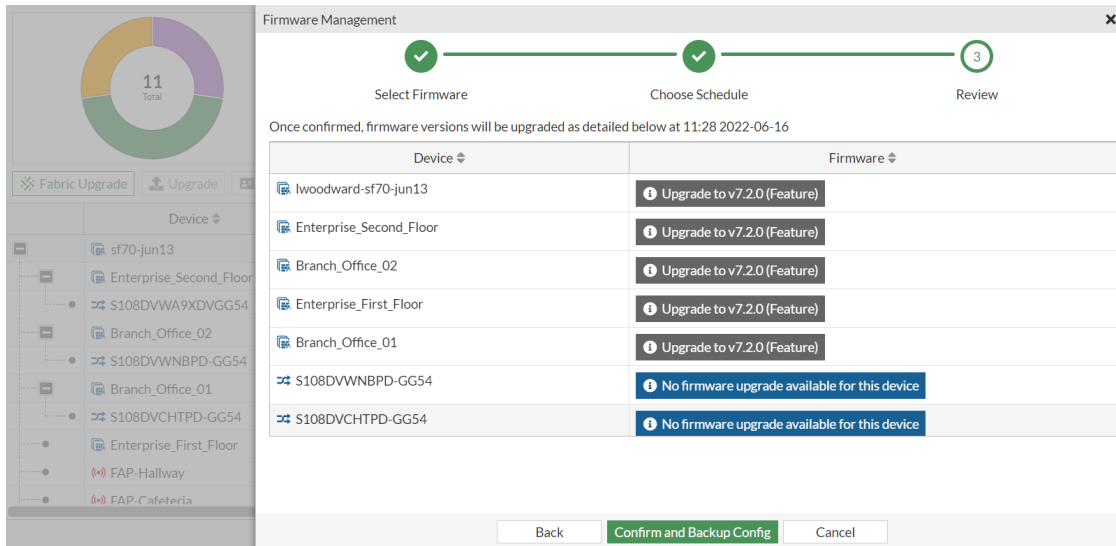

1. Go to *System > Fabric Management* and click *Fabric Upgrade*. The *Firmware Management* pane opens.
2. Select *Latest* or *All Upgrades* and select the option that is displayed, then click *Next*.

3. Select an upgrade schedule, either *Immediate* or *Custom*. If using *Custom*, enter an upgrade date and time (*Custom* is used in this example).

In a custom upgrade, the configuration backups are saved when the administrator schedules the upgrade. If the scheduled upgrade occurs after further configuration changes are made, the latest changes will not be saved in a new backup configuration file.

4. Click *Next* and review the update schedule. For the FortiSwitch units, a message appears because no firmware upgrade is currently available.

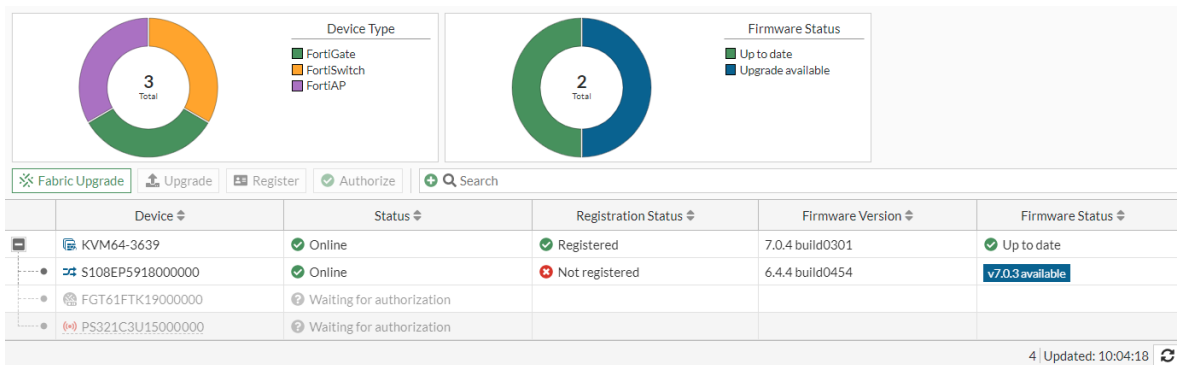

- Click *Confirm and Backup Config*. The pane goes into a loading state to wait for all FortiGate configurations to save. Once completed, the pane closes and the device list refreshes to reflect the latest changes.

Authorizing devices

If there are any notifications in the top banner dropdown for unauthorized devices or devices that require authorization, clicking the notification redirects the user to the *System > Fabric Management* page. In this example, two devices require authorization.

On the *Fabric Management* page, the unauthorized devices (a downstream FortiGate and a FortiAP) are grayed out, and their status is *Waiting for authorization*.

To authorize a Security Fabric device from the Fabric Management page:

1. Select an unauthorized device.
2. Click *Authorize* (below the donut charts), or right-click and select *Authorize*.

The screenshot shows the Fabric Management interface with two donut charts: 'Device Type' (3 total) and 'Firmware Status' (2 total). A table lists devices with their status and registration details. The device FGT61FTK19000000 is highlighted in yellow and has a status of 'Waiting for authorization'. A context menu is open over this device, showing options: Upgrade, Register, Authorize, and Deauthorize. The 'Authorize' option is selected.

Device	Status	Registration Status	Firmware Version	Firmware Status
KVM64-3639	Online	Registered	7.0.4 build0301	Up to date
S108EP5918000000	Online	Not registered	6.4.4 build0454	v7.0.3 available
FGT61FTK19000000	Waiting for authorization			
PS321C3U15000000	Waiting for authorization			

A notification appears in the bottom-right corner once the device is authorized.

The screenshot is identical to the previous one, but now a green notification box is visible in the bottom right corner with the text 'Successfully authorized Fabric Device' and a close button.

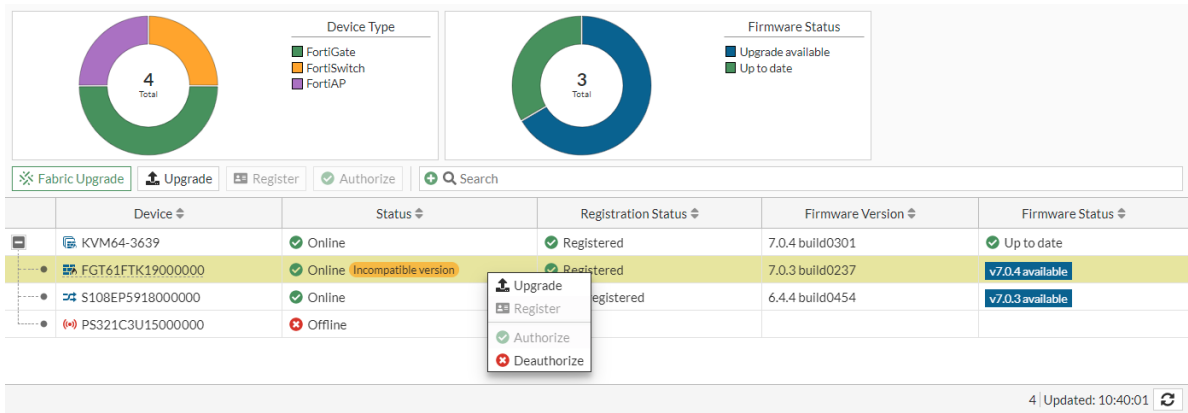

3. Click the subsequent notification to refresh the page. The device's status is now *Online*.

The screenshot shows the Fabric Management interface after a page refresh. The device FGT61FTK19000000 is now in 'Online' status. The 'Device Type' chart shows 4 total devices, and the 'Firmware Status' chart shows 3 total devices. The device's registration status is now 'Registered' and its firmware version is '7.0.3 build0237'. A yellow banner indicates 'Incompatible version'. The notification from the previous step is no longer visible.

Device	Status	Registration Status	Firmware Version	Firmware Status
KVM64-3639	Online	Registered	7.0.4 build0301	Up to date
FGT61FTK19000000	Online Incompatible version	Registered	7.0.3 build0237	v7.0.4 available
S108EP5918000000	Online	Not registered	6.4.4 build0454	v7.0.3 available
PS321C3U15000000	Offline			

To deauthorize a Security Fabric device from the Fabric Management page:

1. Select a device.
2. Right-click and select *Deauthorize*.

3. Click the subsequent notification to refresh the page.

CLI commands

The following options are available in `execute federated-upgrade <option>`:

Option	Description
cancel	Cancel the currently configured upgrade.
initialize	Set up a federated upgrade.
status	Show the current status of a federated upgrade.

The `config system federated-upgrade` command is read-only. Attempting to configure federated upgrade using the `config` command will show the following error message:

```
Federated upgrade cannot be configured directly.
Please use 'execute federated-upgrade ...' to configure.
```

WebSocket for Security Fabric events

With the WebSocket for Security Fabric events, subscribers to the WebSocket (such as the *Fabric Management* page) are updated upon new Fabric events and alert users to reload the page.

Example

To deauthorize a downstream FortiGate:

1. Go to *System > Fabric Management* and select a downstream FortiGate in the table.
2. Right-click on the device and select *Deauthorize*.

The screenshot shows the Fortinet Security Fabric management interface. At the top, there are two summary cards: 'Device Type' showing 2 total FortiGate devices, and 'Firmware Status' showing 2 total devices that are up to date. Below these are navigation buttons: 'Fabric Upgrade', 'Upgrade', 'Register', 'Authorize', and a search icon. A table lists the devices:

Device	Status	Registration Status	Firmware Version	Firmware Status	Device Type
FGT_10_101F	Online	Registered	7.0.4 build0301	Up to date	FortiGate
FGT-A	Online	Registered	7.0.4 build0301	Up to date	FortiGate

A context menu is open over the 'FGT-A' device, showing options: 'Upgrade', 'Register', 'Authorize', and 'Deauthorize' (highlighted in red).

3. An alert appears in the bottom-right corner of the page. Click *Reload Now* to refresh the page.

This screenshot is identical to the previous one, but with an orange alert box in the bottom right corner. The alert box contains the text: 'Entries have changed since last load' and a 'Reload Now' button with a refresh icon.

The deauthorized FortiGate is removed from the table.

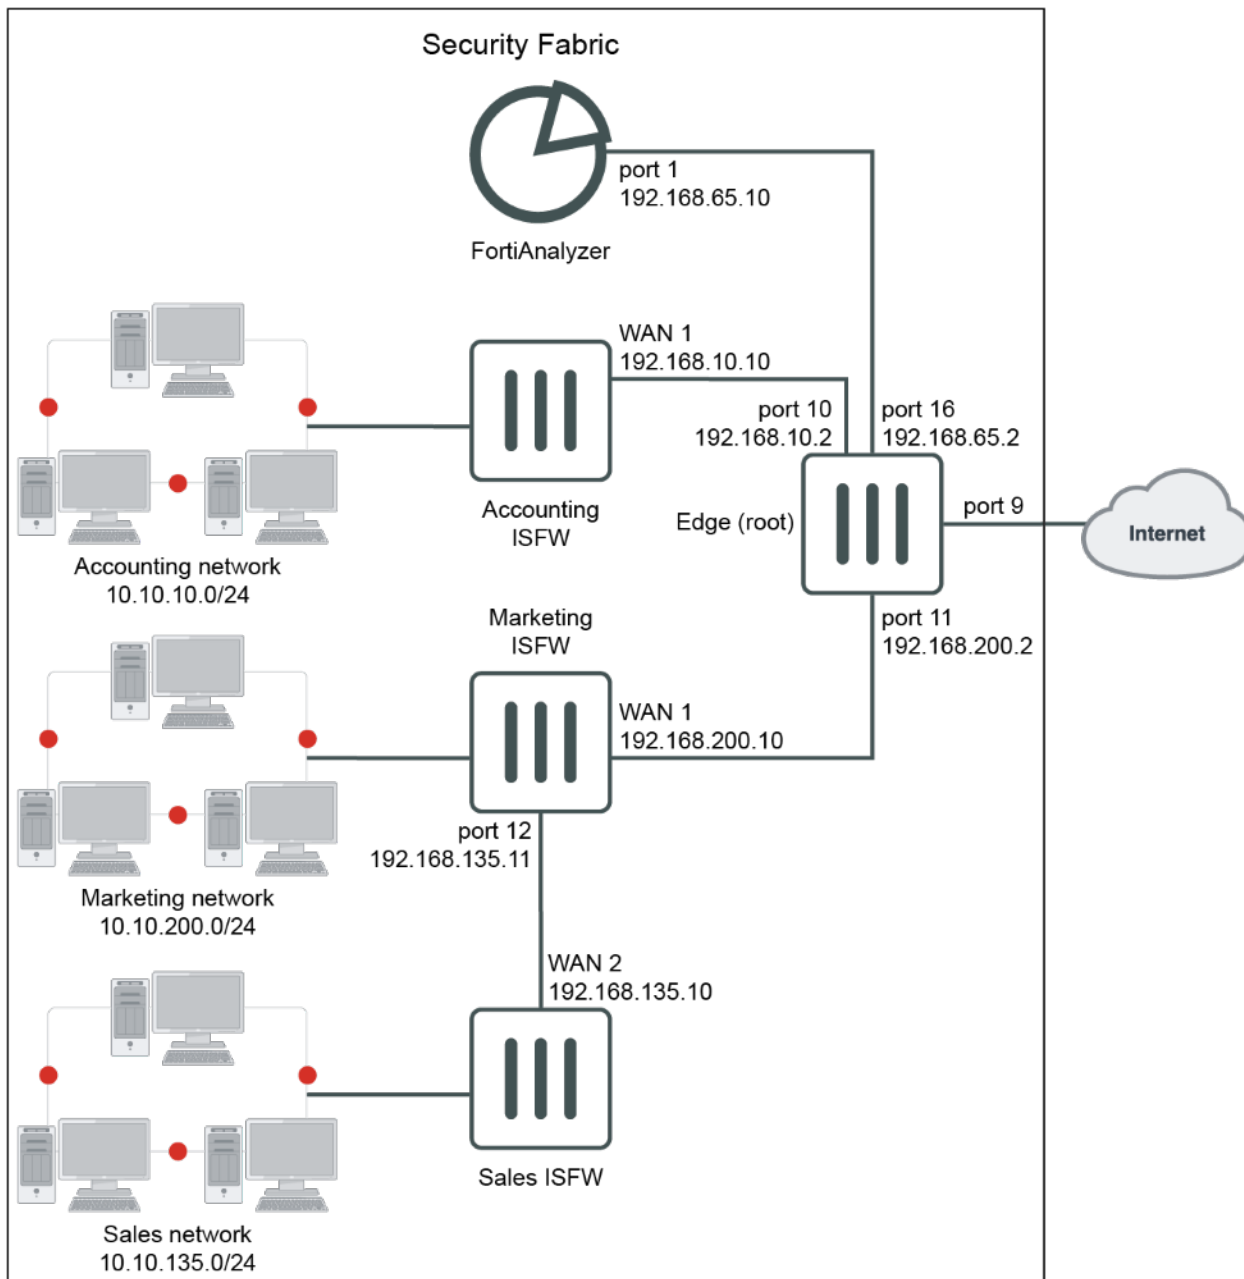

The screenshot shows the Fortinet Security Fabric management interface after the deauthorization. The summary cards now show 1 total FortiGate device and 1 total device that is up to date. The table now only contains one device:

Device	Status	Registration Status	Firmware Version	Firmware Status	Device Type
FGT_10_101F	Online	Registered	7.0.4 build0301	Up to date	FortiGate

Deploying the Security Fabric

This topic provides an example of deploying Security Fabric with three downstream FortiGates connecting to one root FortiGate. To deploy Security Fabric, you need a FortiAnalyzer running firmware version 6.2 or later.

The following shows a sample network topology with three downstream FortiGates (Accounting, Marketing, and Sales) connected to the root FortiGate (Edge).

To configure the root FortiGate (Edge):

1. Configure interfaces:

- a. In the root FortiGate (Edge), go to *Network > Interfaces*.
- b. Edit *port16*:
 - Set *Role* to *DMZ*.
 - For the interface connected to FortiAnalyzer, set the *IP/Network Mask* to *192.168.65.2/255.255.255.0*

- c. Edit *port10*:
 - Set *Role* to *LAN*.
 - For the interface connected to the downstream FortiGate (Accounting), set the *IP/Network Mask* to *192.168.10.2/255.255.255.0*
 - d. Edit *port11*:
 - Set *Role* to *LAN*.
 - For the interface connected to the downstream FortiGate (Marketing), set the *IP/Network Mask* to *192.168.200.2/255.255.255.0*
2. Configure Security Fabric:
- a. In the root FortiGate (Edge), go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. For *Status*, click *Enable*.
 - c. Set the *Security Fabric role* to *Serve as Fabric Root*. The FortiAnalyzer settings can be configured.
 - d. Enter the FortiAnalyzer IP (*192.168.65.10*) and select and *Upload option* (the default is *Real Time*).
 - e. Click *Test Connectivity*.

A warning message indicates that the FortiGate is not authorized on the FortiAnalyzer. The authorization is configured in a later step on the FortiAnalyzer.
 - f. Click *OK*. The FortiAnalyzer serial number is verified.
 - g. Enter a *Fabric name*, such as *Office-Security-Fabric*.
 - h. Ensure *Allow other Security Fabric devices to join* is enabled and add *port10* and *port11*.
 - i. Click *OK*.
3. Create a policy to allow the downstream FortiGate (Accounting) to access the FortiAnalyzer:
- a. In the root FortiGate (Edge), go to *Policy & Objects > Addresses*.
 - b. Click *Create New*.
 - Set *Name* to *FAZ-addr*.
 - Set *Type* to *Subnet*.
 - Set *Subnet/IP Range* to *192.168.65.10/32*.
 - Set *Interface* to *any*.
 - c. Click *OK*.
 - d. Click *Create New*.
 - Set *Name* to *Accounting*.
 - Set *Type* to *Subnet*.
 - Set *Subnet/IP Range* to *192.168.10.10/32*.
 - Set *Interface* to *any*.
 - e. Click *OK*.
 - f. In the root FortiGate (Edge), go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - Set *Name* to *Accounting-to-FAZ*.
 - Set *srcintf* to *port10*.
 - Set *dstintf* to *port16*.
 - Set *srcaddr* to *Accounting-addr*.
 - Set *dstaddr* to *FAZ-addr*.
 - Set *Action* to *Accept*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Enable *NAT*.
 - Set *IP Pool Configuration* to *Use Outgoing Interface Address*.

- g. Click *OK*.
4. Create a policy to allow the two downstream FortiGates (Marketing and Sales) to access the FortiAnalyzer:
- a. In the root FortiGate (Edge), go to *Policy & Objects > Addresses* and click *Create New*.
 - Set *Name* to *Marketing-addr*.
 - Set *Type* to *Subnet*.
 - Set *Subnet/IP Range* to *192.168.200.10/32*.
 - Set *Interface* to *any*.
 - b. Click *OK*.
 - c. In the root FortiGate (Edge), go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - Set *Name* to *Marketing-to-FAZ*.
 - Set *srcintf* to *port11*.
 - Set *dstintf* to *port16*.
 - Set *srcaddr* to *Marketing-addr*.
 - Set *dstaddr* to *FAZ-addr*.
 - Set *Action* to *Accept*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Enable *NAT*.
 - Set *IP Pool Configuration* to *Use Outgoing Interface Address*.
 - d. Click *OK*.

To configure the downstream FortiGate (Accounting):

1. Configure interface:
 - a. In the downstream FortiGate (Accounting), go to *Network > Interfaces*.
 - b. Edit interface *wan1*:
 - Set *Role* to *WAN*.
 - For the interface connected to root, set the *IP/Network Mask* to *192.168.10.10/255.255.255.0*
2. Configure the default static route to connect to the root FortiGate (Edge):
 - a. In the downstream FortiGate (Accounting), go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *wan1*.
 - Set *Gateway Address* to *192.168.10.2*.
 - b. Click *OK*.
3. Configure Security Fabric:
 - a. In the downstream FortiGate (Accounting), go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. For *Status*, click *Enable*.
FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).
 - c. Set the *Security Fabric* role to *Join Existing Fabric*.
 - d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.10.2* set in the previous step.
 - e. Disable *Allow other FortiGates to join*, because there is no downstream FortiGate connecting to it.
 - f. Click *OK*.

To configure the downstream FortiGate (Marketing):

1. Configure interface:
 - a. In the downstream FortiGate (Marketing), go to *Network > Interfaces*.
 - b. Edit *port12*:
 - Set *Role* to *LAN*.
 - For the interface connected to the downstream FortiGate (Sales), set the *IP/Network Mask* to *192.168.135.11/255.255.255.0*.
 - c. Edit *wan1*:
 - Set *Role* to *WAN*.
 - For the interface connected to the root FortiGate (Edge), set the *IP/Network Mask* to *192.168.200.10/255.255.255.0*.
2. Configure the default static route to connect to the root FortiGate (Edge):
 - a. In the downstream FortiGate (Marketing), go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *wan1*.
 - Set *Gateway Address* to *192.168.200.2*.
 - b. Click *OK*.
3. Configure Security Fabric:
 - a. In the downstream FortiGate (Marketing), go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. For *Status*, click *Enable*.
FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Marketing) connects to the root FortiGate (Edge).
 - c. Set the *Security Fabric role* to *Join Existing Fabric*.
 - d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.200.2* set in the previous step.
 - e. Enable *Allow other FortiGates to join* and add *port12*.
 - f. Click *OK*.
4. Create a policy to allow another downstream FortiGate (Sales) going through FortiGate (Marketing) to access the FortiAnalyzer:
 - a. In the downstream FortiGate (Marketing), go to *Policy & Objects > Addresses* and click *Create New*.
 - Set *Name* to *FAZ-addr*.
 - Set *Type* to *Subnet*.
 - Set *Subnet/IP Range* to *192.168.65.10/32*.
 - Set *Interface* to *any*.
 - b. Click *OK*.
 - c. Click *Create New*.
 - Set *Name* to *Sales-addr*.
 - Set *Type* to *Subnet*.
 - Set *Subnet/IP Range* to *192.168.135.10/32*.
 - Set *Interface* to *any*.
 - d. Click *OK*.

- e. In the downstream FortiGate (Marketing), go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - Set *Name* to *Sales-to-FAZ*.
 - Set *srcintf* to *port12*.
 - Set *dstintf* to *wan1*.
 - Set *srcaddr* to *Sales-addr*.
 - Set *dstaddr* to *FAZ-addr*.
 - Set *Action* to *Accept*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Enable *NAT*.
 - Set *IP Pool Configuration* to *Use Outgoing Interface Address*.
- f. Click *OK*.

To configure the downstream FortiGate (Accounting):

1. Configure interface:
 - a. In the downstream FortiGate (Accounting), go to *Network > Interfaces*.
 - b. Edit interface *wan1*:
 - Set *Role* to *WAN*.
 - For the interface connected to root, set the *IP/Network Mask* to *192.168.10.10/255.255.255.0*
2. Configure the default static route to connect to the root FortiGate (Edge):
 - a. In the downstream FortiGate (Accounting), go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *wan1*.
 - Set *Gateway Address* to *192.168.10.2*.
 - b. Click *OK*.
3. Configure Security Fabric:
 - a. In the downstream FortiGate (Accounting), go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. For *Status*, click *Enable*.

FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).
 - c. Set the *Security Fabric role* to *Join Existing Fabric*.
 - d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.10.2* set in the previous step.
 - e. Disable *Allow other FortiGates to join*, because there is no downstream FortiGate connecting to it.
 - f. Click *OK*.

To configure the downstream FortiGate (Sales):

1. Configure interface:
 - a. In the downstream FortiGate (Sales), go to *Network > Interfaces*.
 - b. Edit *wan2*:
 - Set *Role* to *WAN*.
 - For the interface connected to the upstream FortiGate (Marketing), set the *IP/Network Mask* to *192.168.135.10/255.255.255.0*.

2. Configure the default static route to connect to the upstream FortiGate (Marketing):
 - a. In the downstream FortiGate (Sales), go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *wan2*.
 - Set *Gateway Address* to *192.168.135.11*.
 - b. Click *OK*.
3. Configure Security Fabric:
 - a. In the downstream FortiGate (Sales), go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. For *Status*, click *Enable*.

FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Sales) connects to the root FortiGate (Edge).
 - c. Set the *Security Fabric role* to *Join Existing Fabric*.
 - d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.135.11* set in the previous step.
 - e. Disable *Allow other FortiGates to join*, because there is no downstream FortiGate connecting to it.
 - f. Click *OK*.

To authorize downstream FortiGates (Accounting, Marketing, and Sales) on the root FortiGate (Edge):

1. In the root FortiGate (Edge), go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.

The *Topology* tree highlights two connected FortiGates with their serial numbers and asks you to authorize the highlighted devices.
2. Select the highlighted FortiGates and select *Authorize*.

After they are authorized, the two downstream FortiGates (Accounting and Marketing) appear in the *Topology* tree in the *Security Fabric > Fabric Connectors > Security Fabric Setup* page. This means that the two downstream FortiGates (Accounting and Marketing) have successfully joined the Security Fabric.
3. The *Topology* tree now highlights the FortiGate with the serial number that is connected to the downstream FortiGate (Marketing) and asks you to authorize the highlighted device.
4. Select the highlighted FortiGates and select *Authorize*.

After it is authorized, the downstream FortiGate (Sales) appears in the *Topology* tree in the *Security Fabric > Fabric Connectors > Security Fabric Setup* page. This means that the downstream FortiGates (Sales) has successfully joined the Security Fabric.

To use FortiAnalyzer to authorize all the Security Fabric FortiGates:

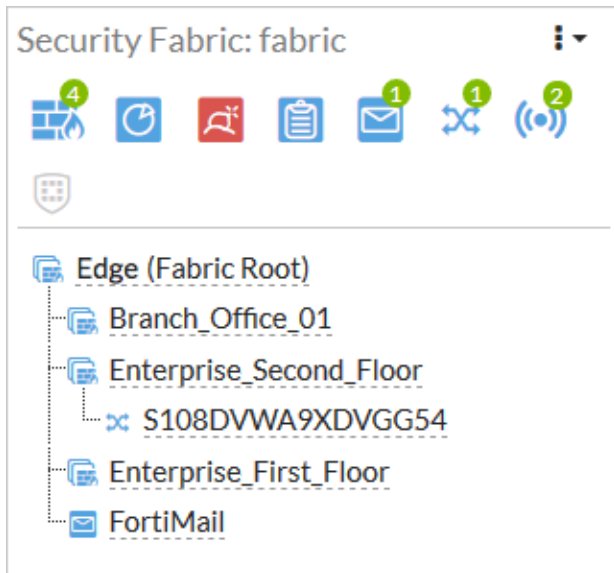

1. Authorize all the Security Fabric FortiGates on the FortiAnalyzer side:
 - a. On the FortiAnalyzer, go to *System Settings > Network > All Interfaces*.
 - b. Edit *port1* and set *IP Address/Netmask* to *192.168.65.10/255.255.255.0*.
 - c. Go to *Device Manager > Unauthorized*. All of the FortiGates are listed as unauthorized.
 - i. Select all the FortiGates and select *Authorize*. The FortiGates are now listed as authorized.

After a moment, a warning icon appears beside the root FortiGate (Edge) because the FortiAnalyzer needs administrative access to the root FortiGate (Edge) in the Security Fabric.
 - ii. Click the warning icon and enter the admin username and password of the root FortiGate (Edge).

2. Check FortiAnalyzer status on all the Security Fabric FortiGates:
 - a. On each FortiGate, go to *Security Fabric > Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
 - b. Check that *Storage usage* information is shown.

To check Security Fabric deployment result:

1. On FortiGate (Edge), go to *Dashboard > Status*.
The *Security Fabric* widget displays all the FortiGates in the Security Fabric.

2. On FortiGate (Edge), go to *Security Fabric > Physical Topology*.
This page shows a visualization of access layer devices in the Security Fabric.

3. On FortiGate (Edge), go to *Security Fabric > Physical Topology*.
This dashboard shows information about the interfaces of each device in the Security Fabric.

To run diagnose commands:

1. Run the `diagnose sys csf authorization pending-list` command in the root FortiGate to show the downstream FortiGate pending for root FortiGate authorization:

```
Edge # diagnose sys csf authorization pending-list
Serial                IP Address          HA-Members          Path
-----
FG201ETK18902514     0.0.0.0              FG3H1E5818900718:FG201ETK18902514
```

2. Run the `diagnose sys csf downstream` command in the root or middle FortiGate to show the downstream FortiGates after they join Security Fabric:

```
Edge # diagnose sys csf downstream
1:      FG201ETK18902514 (192.168.200.10) Management-IP: 0.0.0.0 Management-port:0
parent: FG3H1E5818900718
        path:FG3H1E5818900718:FG201ETK18902514
        data received: Y downstream intf:wan1 upstream intf:port11 admin-port:443
        authorizer:FG3H1E5818900718
2:      FGT81ETK18002246 (192.168.10.10) Management-IP: 0.0.0.0 Management-port:0 parent:
FG3H1E5818900718
        path:FG3H1E5818900718:FGT81ETK18002246
        data received: Y downstream intf:wan1 upstream intf:port10 admin-port:443
        authorizer:FG3H1E5818900718
3:      FG101ETK18002187 (192.168.135.10) Management-IP: 0.0.0.0 Management-port:0
parent: FG201ETK18902514
        path:FG3H1E5818900718:FG201ETK18902514:FG101ETK18002187
        data received: Y downstream intf:wan2 upstream intf:port12 admin-port:443
        authorizer:FG3H1E5818900718
```

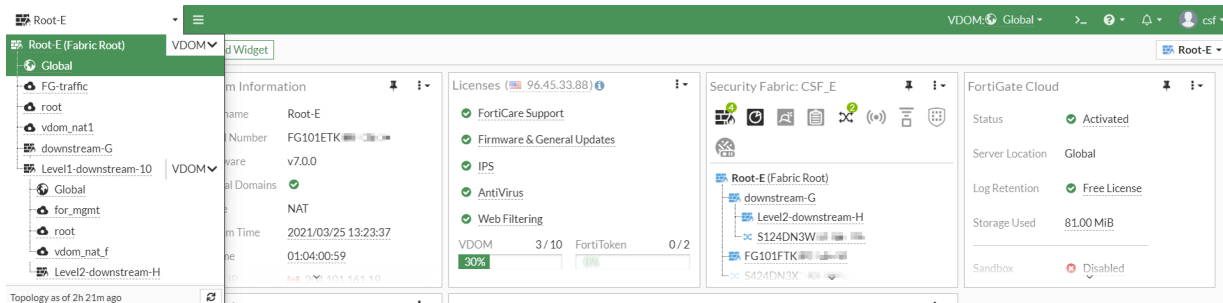

3. Run the `diagnose sys csf upstream` command in any downstream FortiGate to show the upstream FortiGate after downstream FortiGate joins Security Fabric:

```
Marketing # diagnose sys csf upstream
Upstream Information:
Serial Number:FG3H1E5818900718
IP:192.168.200.2
Connecting interface:wan1
Connection status:Authorized
```

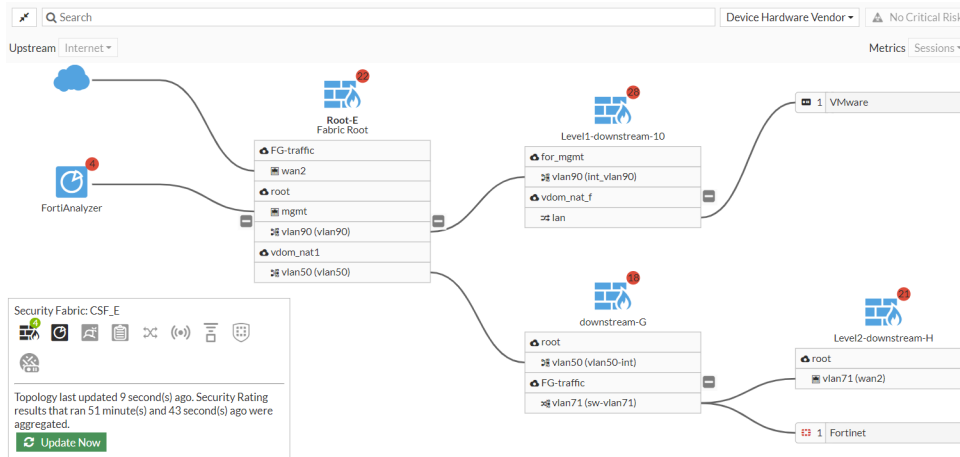

Deploying the Security Fabric in a multi-VDOM environment

A Security Fabric can be enabled in multi-VDOM environments. This allows access to all of the Security Fabric features, including automation, security rating, and topologies, across the VDOM deployment.

- Users can navigate to downstream FortiGate devices and VDOMs directly from the root FortiGate using the Fabric selection menu.

- The logical topology shows all of the configured VDOMs.

- Security rating reports include results for all of the configured VDOMs as well the entire Fabric.

Downstream FortiGate devices must connect to the upstream FortiGate from its management VDOM.

Topology

In this topology, there is a root FortiGate with three FortiGates connected through two different VDOMs. The root FortiGate is able to manage all devices running in multi-VDOM mode.

This example assumes multi-VDOM mode is already configured on each FortiGate, and that FortiAnalyzer logging is configured on the root FortiGate (see [Configuring FortiAnalyzer on page 2371](#) and [Configuring the root FortiGate and downstream FortiGates on page 2364](#) for more details).

To enable multi-VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```

Device configurations

Root FortiGate (Root-E)

The Security Fabric is enabled, and configured so that downstream interfaces from all VDOMs can allow other Security Fabric devices to join.

To configure Root-E in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Ensure that the *Status* is *Enabled* and the *Security Fabric role* is set to *Serve as Fabric Root*.
3. Enable *Allow other Security Fabric devices to join* and click the + to add the interfaces (vlan50 and vlan90) from the vdom_nat1 and root VDOMs.

4. Configure the other settings as needed.
5. Click **OK**.

To configure Root-E in the CLI:

1. Enable the Security Fabric:

```
config system csf
    set status enable
    set group-name "CSF_E"
end
```

2. Configure the interfaces:

```

config system interface
  edit "vlan50"
    set vdom "vdom_nat1"
    ...
    set allowaccess ping https ssh http fgfm fabric
    ...
  next
  edit "vlan90"
    set vdom "root"
    ...
    set allowaccess ping https ssh http fgfm fabric
    ...
  next
end

```

Downstream FortiGate 1 (Downstream-G)

To configure Downstream-G in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, select *Enabled* and set the role to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root FortiGate vdom_nat1 interface (192.168.5.5). Downstream-G must use the interface from the management VDOM to connect to the upstream FortiGate IP.
4. Enable *Allow other Security Fabric devices to join* and click the + to add the downstream interface (sw-vlan71) from the FG-traffic VDOM.

The screenshot displays the 'Edit Fabric Connector' configuration window. On the left, the 'Security Fabric Settings' are configured as follows:

- Status:** Enabled (with a red 'x' icon for Disabled).
- Security Fabric role:** Join Existing Fabric (with a 'Serve as Fabric Root' option).
- Upstream FortiGate IP:** 192.168.5.5
- Allow other Security Fabric devices to join:** Enabled (toggle on), with 'vlan71 (sw-vlan71)' listed and a '+' icon to add more.
- Allow downstream device REST API access:** Disabled (toggle off).
- SAML Single Sign-On:** Mode set to 'Manual' (with 'Auto' and 'Advanced Options' options).
- Management IP/FQDN:** 172.16.116.217 (with 'Use WAN IP' and 'Specify' options).
- Management port:** Use Admin Port (with 'Specify' option).

On the right side of the window, the 'Fabric Status' is 'Pending Authorization' with a 'Review authorization on root FortiGate' button. Below that is a 'Topology' diagram showing a tree structure: 'Root-E' containing 'downstream-G', which in turn contains 'S124DN3W'. There are also links for 'API Preview', 'Edit in CLI', 'SAML SSO Guides', and 'Documentation'.

5. Configure the other settings as needed.
6. Click **OK**.

To configure Downstream-G in the CLI:

1. Enable the Security Fabric:

```
config system csf
    set status enable
    set upstream-ip 192.168.5.5
end
```

2. Configure the interfaces:

```
config system interface
    edit "sw-vlan71"
        set vdom "FG-traffic"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
end
```

Downstream FortiGate 2 (Level2-downstream-H)

To configure Level2-downstream-H in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, select *Enabled* and set the role to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Downstream-G (192.168.71.7).

4. Configure the other settings as needed.
5. Click **OK**.

To configure Level2-downstream-H in the CLI:

```
config system csf
    set status enable
    set upstream-ip 192.168.71.7
end
```

Downstream FortiGate 3 (Level1-downstream-10)

To configure Level1-downstream-10 in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, select *Enabled* and set the role to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Root-E (192.168.9.5).

4. Configure the other settings as needed.
5. Click **OK**.

To configure Level1-downstream-10 in the CLI:

```
config system csf
    set status enable
    set upstream-ip 192.168.9.5
end
```

Device authorization and verification

To authorize the downstream devices on the root FortiGate:

1. On Root-E, go to *Security Fabric > Fabric Connectors*.
2. In the topology tree, click the highlighted serial number and select *Authorize* for each downstream FortiGate. Once all the devices are authorized, the physical topology page shows the root and downstream FortiGates. The logical topology page shows the root and downstream FortiGates connected to interfaces in their corresponding VDOMs.

Synchronizing objects across the Security Fabric

When the Security Fabric is enabled, various objects such as addresses, services, and schedules are synced from the upstream FortiGate to all downstream devices by default. FortiOS has the following settings for object synchronization across the Security Fabric:

- Set object synchronization (`fabric-object-unification`) to `default` or `local` on the root FortiGate.
- Set a per object option to toggle whether the specific Fabric object will be synchronized or not. After upgrading from 6.4.3, this option is disabled for supported Fabric objects. The synchronized Fabric objects are kept as locally created objects on downstream FortiGates.
- Define the number of task workers to handle synchronizations.

The firewall object synchronization wizard helps identify objects that are not synchronized and resolves any conflicts. A warning message appears in the topology tree if there is a conflict.

Summary of CLI commands

Object synchronization can be configured as follows:

```
config system csf
  set fabric-object-unification {default | local}
  set configuration-sync {default | local}
  set fabric-workers <integer>
  ...
next
end
```

Parameter	Description
<code>fabric-object-unification</code>	<i>default:</i> Global CMDB objects will be synchronized in the Security Fabric. <i>local:</i> Global CMDB objects will not be synchronized to and from this device. This command is available on the root FortiGate. If set to <code>local</code> , the device does not synchronize objects from the root, but will send the synchronized objects downstream.
<code>configuration-sync</code>	<i>default:</i> Synchronize configuration for FortiAnalyzer, FortiSandbox, and Central Management to root node. <i>local:</i> Do not synchronize configuration with root node. If downstream FortiGates are set to <code>local</code> , the synchronized objects from the root to downstream are not applied locally. However, the downstream FortiGate will send the configuration to lower FortiGates.
<code>fabric-workers</code>	Define how many task worker process are created to handle synchronizations (1-4, default = 2). The worker processes dies if there is no task to perform after 60 seconds.

The per object setting can be configured on the root FortiGate as follows:

```
config firewall <object>
  edit <name>
    set fabric-object {enable | disable}
    ...
  next
end
```

Where:

- `<object>` is one of the following: `address`, `address6`, `addrgrp`, `addrgrp6`, `service category`, `service custom`, `service group`, `schedule group`, `schedule onetime`, or `schedule recurring`.

- Enabling `fabric-object` sets the object as a Security Fabric-wide global object that is synchronized to downstream FortiGates.
- Disabling `fabric-object` sets the object as local to this Security Fabric member.
- If a device in the Fabric is in multi-VDOM mode, the GUI will not display the Fabric synchronization option. Even if this is enabled in the CLI, the object will not be synchronized to any downstream devices.

Sample topology

In this Security Fabric, the root FortiGate (FGTA-1) has `fabric-object-unification` set to default so the Fabric objects can be synchronized to the downstream FortiGate. The level 1 downstream FortiGate (FGTB-1) has `configuration-sync` set to local, so it will not apply the synchronized objects locally. The level 2 downstream FortiGate (FGTC) has `configuration-sync` set to default, so it will apply the synchronized objects locally.

In this example, firewall addresses and address groups are used. Other supported Fabric objects have the same behaviors. The following use cases illustrate common synchronization scenarios:

- If no conflicts exist, firewall addresses and address groups can be synchronized to downstream FortiGates ([see example below](#)).
- If a conflict exists between the root and downstream FortiGates, it can be resolved with the conflict resolution wizard. After the conflict is resolved, the firewall addresses and address groups can be synchronized to downstream FortiGates ([see example below](#)).
- If `set fabric-object` (*Fabric synchronization* option in the GUI) is disabled for firewall addresses and address groups on the root FortiGate, they will not be synchronized to downstream FortiGates ([see example below](#)).

To configure the FortiGates used in this example:

```
FGTA-1 # config system csf
    set status enable
    set group-name "fabric"
    set fabric-object-unification default
    ...
end

FGTB-1 # config system csf
    set status enable
    set upstream-ip 10.2.200.1
    set configuration-sync local
    ...
end

FGTC # config system csf
    set status enable
    set upstream-ip 192.168.7.2
    set configuration-sync default
    ...
end
```

To synchronize a firewall address and address group in the Security Fabric:**1. Configure the firewall address on the root FortiGate:**

```
FGTA-1 # config firewall address
      edit "add_subnet_1"
        set fabric-object enable
        set subnet 22.22.22.0 255.255.255.0
      next
end
```

2. Configure the address group on the root FortiGate:

```
FGTA-1 # config firewall addrgrp
      edit "group_subnet_1"
        set member "add_subnet_1"
        set fabric-object enable
      next
end
```

3. Check the firewall address and address group on the downstream FortiGates:

```
FGTB-1 # show firewall address add_subnet_1
entry is not found in table

FGTB-1 # show firewall addrgrp group_subnet_1
entry is not found in table
```

The synchronized objects are not applied locally on this FortiGate because `configuration-sync` is set to `local`.

```
FGTC # show firewall address add_subnet_1
config firewall address
      edit "add_subnet_1"
        set uuid 378a8094-34cb-51eb-ce40-097f298fcfdc
        set fabric-object enable
        set subnet 22.22.22.0 255.255.255.0
      next
end

FGTC # show firewall addrgrp group_subnet_1
config firewall addrgrp
      edit "group_subnet_1"
        set uuid 4d7a8a52-34cb-51eb-fce7-d93f76915319
        set member "add_subnet_1"
        set color 19
        set fabric-object enable
      next
end
```

The objects are synchronized on this FortiGate because `configuration-sync` is set to `default`.

To resolve a firewall address and address group conflict in the Security Fabric:

1. On FGTC, create a firewall address:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Configure the following:

Name	sync_add_1
IP/Netmask	33.33.33.0 255.255.255.0

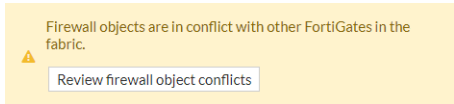

- c. Click *OK*.
2. On FGTA-1 (Fabric root), create the firewall address with same name but a different subnet:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Configure the following:

Name	sync_add_1
IP/Netmask	11.11.11.0 255.255.255.0
Fabric synchronization	Enable

- c. Click *OK*.
3. Add the address to a different address group than what is configured on FGTC:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address Group*.
 - b. Configure the following:

Name	sync_group4
Members	sync_add_1
Fabric synchronization	Enable

- c. Click *OK*.
4. Go to *Security Fabric > Fabric Connectors*. In the topology tree, there is a message that *Firewall objects are in conflict with other FortiGates in the fabric*.

5. Resolve the conflict:

- a. Click *Review firewall object conflicts*. The *Firewall Object Synchronization* pane opens.
- b. Click *Rename All Objects*. The conflicted object will be renamed on the downstream FortiGate.

The screenshot shows the Firewall Object Synchronization pane. A blue warning box at the top states: "The following objects require manual intervention in order to synchronize them with the fabric. Click 'Rename All Objects' to automatically resolve all conflicts by renaming them." Below this, the Strategy is set to 'Automatic' and 'Automatically rename on' is set to 'Downstream FortiGates'. A table lists the objects with their status and conflicting FortiGate:

Fabric Object	Status	Conflicting FortiGate
Address 1		
sync_add_1	Content mismatch	FGTC

The 'Rename All Objects' button is highlighted in green. A 'Close' button is at the bottom right.

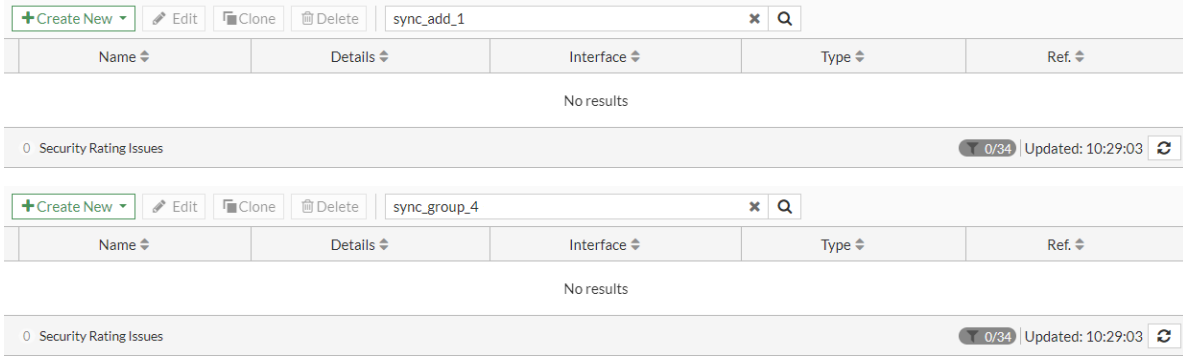

- c. The conflict is resolved. Click *Close* to exit the *Firewall Object Synchronization* pane.

The screenshot shows the Firewall Object Synchronization pane after the conflict has been resolved. The warning box is still present. The table now shows the object as resolved:

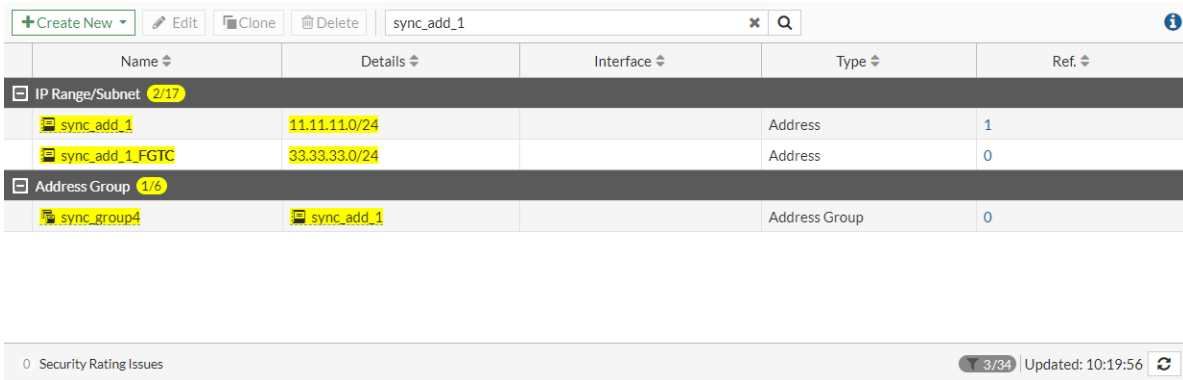

Fabric Object	Status	Conflicting FortiGate
Address 1		
sync_add_1_FGTC	Resolved	FGTC

The 'Close' button is highlighted in green at the bottom right.

- d. The topology tree no longer indicates there is a conflict.
6. Verify the results on the downstream FortiGates:
- a. On FGTB-1, go to *Policy & Objects > Addresses*.
 - b. Search for *sync_add_1* and *sync_group4*. No results are found. The synchronized objects are not applied locally on this FortiGate because `configuration-sync` is set to `local`.

- c. On FGTC, go to *Policy & Objects > Addresses*.
- d. Search for *sync_add_1*. The original firewall address *sync_add_1* was renamed to *sync_add_1_FGTC* by resolving the conflict on FGTA-1. The address *sync_add_1* and address group *sync_group4* are synchronized from FGTA-1.

To disable Fabric synchronization on the root FortiGate in the GUI:

- 1. On FGTA-1, create a firewall address:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Configure the following:

Name	add_subnet_3
IP/Netmask	33.33.33.0 255.255.255.0
Fabric synchronization	Disable

- c. Click *OK*.
- 2. Create the firewall address group and add the address:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address Group*.
 - b. Configure the following:

Name	group_subnet_3
Members	add_subnet_3
Fabric synchronization	Disable

- c. Click *OK*.

3. On FGTA-1, go to *Policy & Objects > Addresses* and search for *subnet_3*. No results are found because Fabric synchronization is disabled on the root FortiGate (FGTA-1).

4. On FGTC, go to *Policy & Objects > Addresses* and search for *subnet_3*. No results are found because Fabric synchronization is disabled on the root FortiGate (FGTA-1).

To disable Fabric synchronization on the root FortiGate in the CLI:

1. Configure the firewall address on the root FortiGate:

```
FGTA-1 # config firewall address
      edit "add_subnet_3"
        set subnet 33.33.33.0 255.255.255.0
        set fabric-object disable
      next
end
```

2. Configure the address group on the root FortiGate:

```
FGTA-1 # config firewall addrgrp
      edit "group_subnet_3"
        set member "add_subnet_3"
        set fabric-object disable
      next
end
```

3. Check the firewall address and address group on the downstream FortiGates:

```
FGTB-1 # show firewall address add_subnet_3
entry is not found in table

FGTB-1 # show firewall addrgrp group_subnet_3
entry is not found in table

FGTC # show firewall address add_subnet_3
entry is not found in table

FGTC # show firewall addrgrp group_subnet_3
entry is not found in table
```

The objects are not synchronized from the root FortiGate (FGTA-1) because the `fabric-object` setting is disabled.

Group address objects synchronized from FortiManager

Address objects from external connectors that are learned by FortiManager are synchronized to FortiGate. These objects can be grouped together with the FortiGate CLI to simplify selecting connector objects in the FortiGate GUI. Multiple groups can be created.

This option is only available for objects that are synchronized from FortiManager.

To add an object to a connector group:

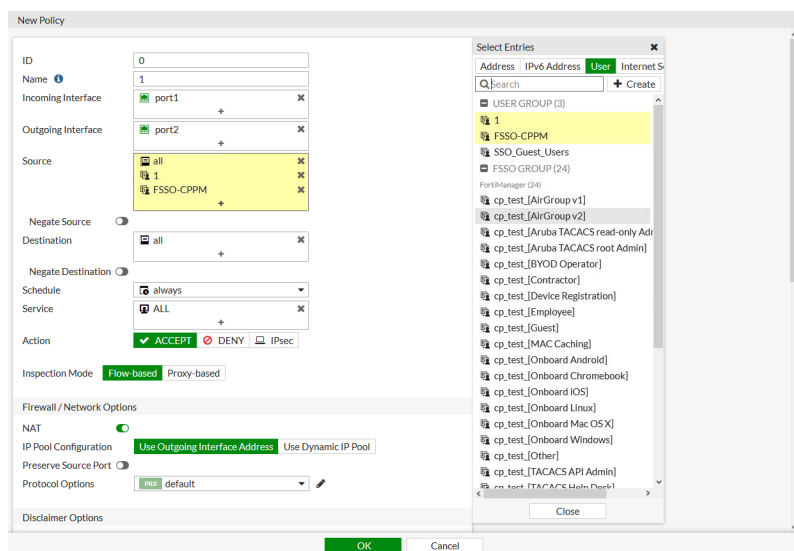

```
config user adgrp
    edit <object_name>
        set server-name "FortiManager"
        set connector-source <group_name>
    next
end
```

Example

In this example, objects learned by the FortiManager from an Aruba ClearPass device are synchronized to the FortiGate. Some of the objects are then added to a group called *ClearPass* to make them easier to find in the object list when creating a firewall policy.

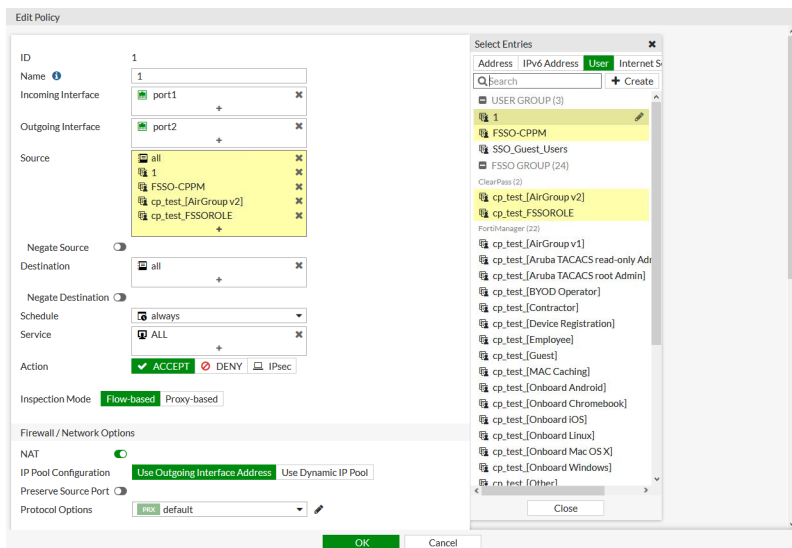

Prior to being grouped, the synchronized objects are listed under the FortiManager heading in the object lists.

To add some of the objects to a group:

```
config user adgrp
  edit "cp_test_FSSOROLE"
    set server-name "FortiManager"
    set connector-source "ClearPass"
  next
  edit "cp_test_[AirGroup v2]"
    set server-name "FortiManager"
    set connector-source "ClearPass"
  next
end
```

The objects are now listed under the *ClearPass* heading.

Security Fabric over IPsec VPN

This is an example of configuring Security Fabric over IPsec VPN.

Sample topology

This sample topology shows a downstream FortiGate (HQ2) connected to the root FortiGate (HQ1) over IPsec VPN to join Security Fabric.

Sample configuration

To configure the root FortiGate (HQ1):

1. Configure interface:
 - a. In the root FortiGate (HQ1), go to *Network > Interfaces*.
 - b. Edit *port2*:
 - Set *Role* to *WAN*.
 - For the interface connected to the Internet, set the *IP/Network Mask* to *10.2.200.1/255.255.255.0*
 - c. Edit *port6*:
 - Set *Role* to *DMZ*.
 - For the interface connected to FortiAnalyzer, set the *IP/Network Mask* to *192.168.8.250/255.255.255.0*
2. Configure the static route to connect to the Internet:
 - a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *port2*.
 - Set *Gateway Address* to *10.2.200.2*.
 - b. Click *OK*.
3. Configure IPsec VPN:
 - a. Go to *VPN > IPsec Wizard*.
 - Set *Name* to *To-HQ2*.
 - Set *Template Type* to *Custom*.
 - Click *Next*.
 - Set *Authentication* to *Method*.
 - Set *Pre-shared Key* to *123456*.
 - b. Leave all other fields in their default values and click *OK*.
4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
 - a. Go to *Network > Interfaces*.
 - b. Edit *To-HQ2*:
 - Set *Role* to *LAN*.
 - Set the *IP/Network Mask* to *10.10.10.1/255.255.255.255*.
 - Set *Remote IP/Network Mask* to *10.10.10.3/255.255.255.0*.
5. Configure IPsec VPN local and remote subnet:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*
 - Set *Name* to *To-HQ2_remote_subnet_2*.
 - Set *Type* to *Subnet*.
 - Set *IP/Network Mask* to *10.10.10.3/32*.
 - c. Click *OK*.
 - d. Click *Create New*
 - Set *Name* to *To-HQ2_local_subnet_1*.
 - Set *Type* to *Subnet*.
 - Set *IP/Network Mask* to *192.168.8.0/24*.
 - e. Click *OK*.

- f. Click *Create New*
 - Set *Name* to *To-HQ2_remote_subnet_1*.
 - Set *Type* to *Subnet*.
 - Set *IP/Network Mask* to *10.1.100.0/24*.
- g. Click *OK*.
6. Configure IPsec VPN static routes:
 - a. Go to *Network > Static Routes*
 - b. Click *Create New* or *Create New > IPv4 Static Route*.
 - For *Named Address*, select *Type* and select *To-HQ2_remote_subnet_1*.
 - Set *Interface* to *To-HQ2*.Click *OK*.
 - c. Click *Create New* or *Create New > IPv4 Static Route*.
 - For *Named Address*, select *Type* and select *To-HQ2_remote_subnet_1*.
 - Set *Interface* to *Blackhole*.
 - Set *Administrative Distance* to *254*.
 - d. Click *OK*.
7. Configure IPsec VPN policies:
 - a. Go to *Policy & Objects > Firewall Policy*
 - b. Click *Create New*.
 - Set *Name* to *vpn_To-HQ2_local*.
 - Set *Incoming Interface* to *port6*.
 - Set *Outgoing Interface* to *To-HQ2*.
 - Set *Source* to *To-HQ2_local_subnet_1*.
 - Set *Destination* to *To-HQ2_remote_subnet_1*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Disable *NAT*.
 - c. Click *OK*.
 - d. Click *Create New*.
 - Set *Name* to *vpn_To-HQ2_remote*.
 - Set *Incoming Interface* to *To-HQ2*.
 - Set *Outgoing Interface* to *port6*.
 - Set *Source* to *To-HQ2_remote_subnet_1, To-HQ2_remote_subnet_2*.
 - Set *Destination* to *To-HQ2_local_subnet_1*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Enable *NAT*.
 - Set *IP Pool Configuration* to *Use Outgoing Interface Address*.
 - e. Click *OK*.
8. Configure Security Fabric:
 - a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. For *Status*, click *Enable*.

After *FortiGate Telemetry* is enabled, FortiAnalyzer automatically enables *Logging* and *Upload* is set to *Real Time*.
 - c. Set the *Security Fabric* role to *Serve as Fabric Root*. The FortiAnalyzer settings can be configured.

- d. Enter the FortiAnalyzer IP (192.168.8.250).
- e. Click OK. The FortiAnalyzer serial number is verified.
- f. Enter a *Fabric name*, such as *Office-Security-Fabric*.
- g. Ensure *Allow other Security Fabric devices to join* is enabled and add VPN interface *To-HQ2*.
- h. Click OK.

To configure the downstream FortiGate (HQ2):

1. Configure interface:
 - a. Go to *Network > Interfaces*.
 - b. Edit interface *wan1*:
 - Set *Role* to *WAN*.
 - For the interface connected to the Internet, set the *IP/Network Mask* to *192.168.7.3/255.255.255.0*.
 - c. Edit interface *vlan20*:
 - Set *Role* to *LAN*.
 - For the interface connected to local endpoint clients, set the *IP/Network Mask* to *10.1.100.3/255.255.255.0*.
2. Configure the static route to connect to the Internet:
 - a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - Set *Destination* to *0.0.0.0/0.0.0.0*.
 - Set *Interface* to *wan1*.
 - Set *Gateway Address* to *192.168.7.2*.
 - b. Click OK.
3. Configure IPsec VPN:
 - a. Go to *VPN > IPsec Wizard*.
 - Set *VPN Name* to *To-HQ1*.
 - Set *Template Type* to *Custom*.
 - Click *Next*.
 - In the *Network IP Address*, enter *10.2.200.1*.
 - Set *Interface* to *wan1*.
 - Set *Authentication* to *Method*.
 - Set *Pre-shared Key* to *123456*.
 - b. Leave all other fields in their default values and click OK.
4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
 - a. Go to *Network > Interfaces*.
 - b. Edit *To-HQ1*:
 - Set *Role* to *WAN*.
 - Set the *IP/Network Mask* to *10.10.10.3/255.255.255.255*.
 - Set *Remote IP/Network Mask* to *10.10.10.1/255.255.255.0.0*.
5. Configure IPsec VPN local and remote subnet:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*
 - Set *Name* to *To-HQ1_local_subnet_1*.
 - Set *Type* to *Subnet*.
 - Set *IP/Network Mask* to *10.1.100.0/24*.
 - c. Click OK.

- d. Click *Create New*
 - Set *Name* to *To-HQ1_remote_subnet_1*.
 - Set *Type* to *Subnet*.
 - Set *IP/Network Mask* to *192.168.8.0/24*.
 - e. Click *OK*.
6. Configure IPsec VPN static routes:
- a. Go to *Network > Static Routes* and click *Create New* or *Create New > IPv4 Static Route*.
 - For *Named Address*, select *Type* and select *To-HQ1_remote_subnet_1*.
 - Set *Interface* to *To-HQ1*.
 - b. Click *OK*.
 - c. Click *Create New* or *Create New > IPv4 Static Route*.
 - For *Named Address*, select *Type* and select *To-HQ1_remote_subnet_1*.
 - Set *Interface* to *Blackhole*.
 - Set *Administrative Distance* to *254*.
 - d. Click *OK*.
7. Configure IPsec VPN policies:
- a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - Set *Name* to *vpn_To-HQ1_local*.
 - Set *Incoming Interface* to *vlan20*.
 - Set *Outgoing Interface* to *To-HQ1*.
 - Set *Source* to *To-HQ1_local_subnet_1*.
 - Set *Destination* to *To-HQ1_remote_subnet_1*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Disable *NAT*.
 - b. Click *OK*.
 - c. Click *Create New*.
 - Set *Name* to *vpn_To-HQ1_remote*.
 - Set *Incoming Interface* to *To-HQ1*.
 - Set *Outgoing Interface* to *vlan20*.
 - Set *Source* to *To-HQ1_remote_subnet_1*.
 - Set *Destination* to *-HQ1_local_subnet_1*.
 - Set *Schedule* to *Always*.
 - Set *Service* to *All*.
 - Disable *NAT*.
 - d. Click *OK*.
8. Configure Security Fabric:
- a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. For *Status*, click *Enable*.
FortiAnalyzer automatically enables logging. FortiAnalyzer settings will be retrieved when the downstream FortiGate connects to the root FortiGate.
 - c. Set the *Security Fabric role* to *Join Existing Fabric*.
 - d. Set the *Upstream FortiGate IP* to *10.10.10.1*.
 - e. Click *OK*.

To authorize the downstream FortiGate (HQ2) on the root FortiGate (HQ1):

- In the root FortiGate (HQ1), go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
The *Topology* tree highlights the connected FortiGate (HQ2) with the serial number and asks you to authorize the highlighted device.
- Select the highlighted FortiGates and select *Authorize*.
After authorization, the downstream FortiGate (HQ2) appears in the *Topology* tree in the *Security Fabric > Fabric Connectors > Security Fabric Setup* page. This means the downstream FortiGate (HQ2) has successfully joined the Security Fabric.

To check Security Fabric over IPsec VPN:

- On the root FortiGate (HQ1), go to *Security Fabric > Physical Topology*.
The root FortiGate (HQ1) is connected by the downstream FortiGate (HQ2) with VPN icon in the middle.

- On the root FortiGate (HQ1), go to *Security Fabric > Logical Topology*.
The root FortiGate (HQ1) VPN interface *To-HQ2* is connected by downstream FortiGate (HQ2) VPN interface *To-HQ1* with VPN icon in the middle.

To run diagnose commands:

- Run the `diagnose sys csf authorization pending-list` command in the root FortiGate (HQ1) to show the downstream FortiGate pending for root FortiGate authorization:

```
HQ1 # diagnose sys csf authorization pending-list
Serial          IP Address      HA-Members
Path
-----
FG101ETK18002187      0.0.0.0
FG3H1E5818900718:FG101ETK18002187
```

- Run the `diagnose sys csf downstream` command in the root FortiGate (HQ1) to show the downstream FortiGate (HQ2) after it joins Security Fabric:

```
HQ1 # diagnose sys csf downstream
1:      FG101ETK18002187 (10.10.10.3) Management-IP: 0.0.0.0 Management-port:0 parent:
FG3H1E5818900718
      path:FG3H1E5818900718:FG101ETK18002187
      data received: Y downstream intf:To-HQ1 upstream intf:To-HQ2 admin-port:443
      authorizer:FG3H1E5818900718
```

3. Run the `diagnose sys csf upstream` command in the downstream FortiGate (HQ2) to show the root FortiGate (HQ1) after the downstream FortiGate joins Security Fabric:

```
HQ2 # diagnose sys csf upstream
Upstream Information:
Serial Number:FG3H1E5818900718
IP:10.10.10.1
Connecting interface:To-HQ1
Connection status:Authorized
```

Leveraging LLDP to simplify Security Fabric negotiation

LLDP reception is enabled on WAN interfaces, which prompts FortiGates that are joining the Security Fabric if the upstream FortiGate asks.

- If the interface role is undefined, LLDP reception and transmission inherit settings from the VDOM.
- If the interface role is WAN, LLDP reception is enabled.
- If the interface role is LAN, LLDP transmission is enabled.

When a FortiGate B's WAN interface detects that FortiGate A's LAN interface is immediately upstream (through the default gateway), and FortiGate A has Security Fabric enabled, FortiGate B will show a notification on the GUI asking to join the Security Fabric.

To configure LLDP reception and join a Security Fabric in the GUI:

1. On FortiGate A, go to *Network > Interfaces*.
2. Configure an interface:
 - If the interface's role is undefined, under *Administrative Access*, set *Receive LLDP* and *Transmit LLDP* to *Use VDOM Setting*.

Edit Interface

Name: port3
 Alias:
 Type: Physical Interface
 VRF ID: 0
 Role: Undefined

Address

Addressing mode: Manual | DHCP | Auto-managed by FortiIPAM

FortiGate

FGDocs
 Status: Up
 MAC address: 00:09:0F:00:02:02
 Additional Information: [API Preview](#), [References](#), [Edit in CLI](#)
 Documentation: [Online Help](#), [Video Tutorials](#)

- Click OK. A notification is shown on FortiGate B, *You can connect to a Security Fabric via an upstream FortiGate at 10.2.200.1.*

- Click the notification. The *Core Network Security* page with the Security Fabric settings opens. All the required settings automatically configured.
- Click OK to apply the settings.

To configure LLDP reception and join a Security Fabric in the CLI:

- Configure the interface on FortiGate A:
 - Undefined role

```
config system interface
  edit "port3"
    set lldp-reception vdom
    set lldp-transmission vdom
    set role undefined
    ...
```

```
    next
end
```

- WAN role

```
config system interface
  edit "wan1"
    set lldp-reception enable
    set lldp-transmission vdom
    set role wan
    ...
  next
end
```

- LAN role

```
config system interface
  edit "port2"
    set lldp-reception vdom
    set lldp-transmission enable
    set role lan
    ...
  next
end
```

2. Edit the Security Fabric settings on FortiGate B:

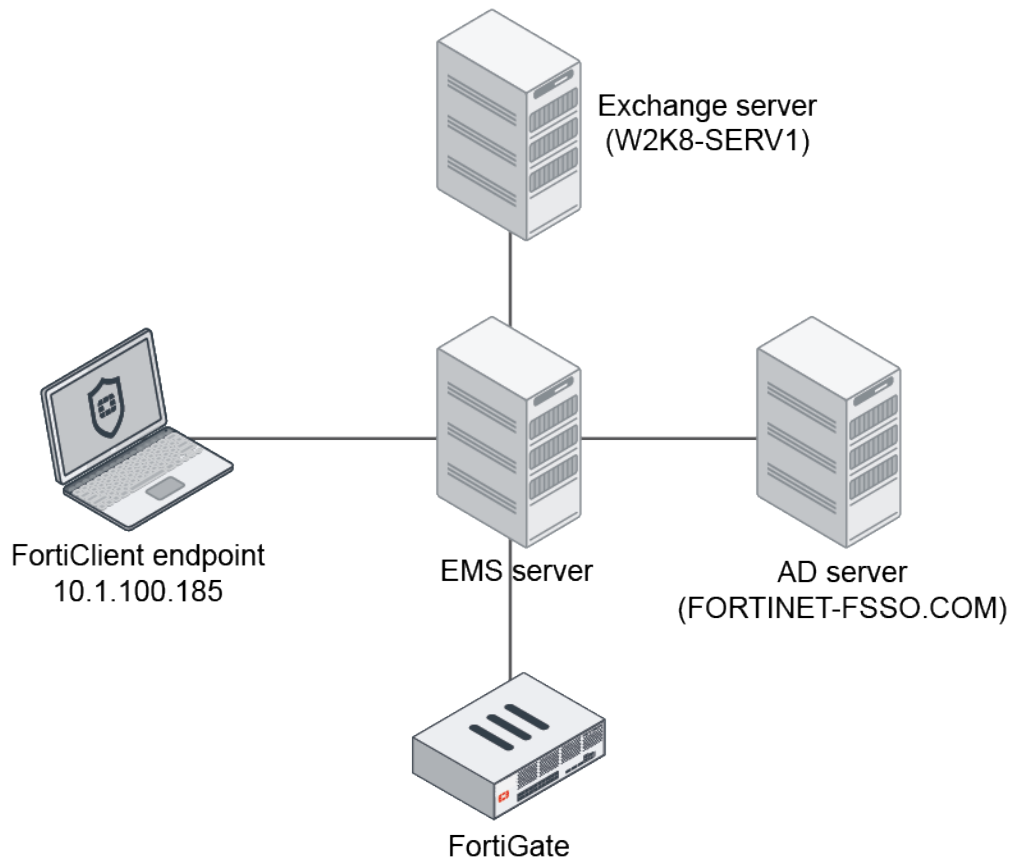

```
config system csf
  set status enable
  set upstream-ip 10.2.200.1
end
```

Integrate user information from EMS and Exchange connectors in the user store

When a FortiClient endpoint is managed by EMS, logged in user and domain information is shared with FortiOS through the EMS connector. This information can be joined with the Exchange connector to produce more complete user information in the user store.

The `diagnose user-device-store device memory list` command displays detailed device information.

Sample topology

In this example, the FortiClient PC user (test1) logs on to the AD domain (FORTINET-FSSO.COM), which is also the same domain as the Exchange server. The user information is pushed to the EMS server that the user is registered to. The FortiGate synchronizes the information from EMS, and at the same time looks up the user on the Exchange server under the Exchange connector. If the user exists on the Exchange server, additional information is fetched. These details are combined in the user store, which is visible in the *FortiClient* widget in the *Status* dashboard.

To configure the Exchange server:

```
config user exchange
  edit "exchange-140"
    set server-name "W2K8-SERV1"
    set domain-name "FORTINET-FSSO.COM"
    set username "Administrator"
    set password *****
  next
end
```

To configure the EMS server:

```
config endpoint-control fctems
  edit "ems133"
    set server "172.18.62.12"
    set certificate-fingerprint "4F:A6:76:E2:00:4F:A6:76:E2:00:4F:A6:76:E2:00:E0"
```

```
    next
end
```

To view the user information in the GUI:

1. Go to *Dashboard > Status*.
2. In the *FortiClient* widget, hover over a device or user name to view the information.

To view the user information in the CLI:

```
# diagnose user-device-store device memory list
...
Record #13:
    device_info
        'ipv4_address' = '10.1.100.185'

        'forticlient_gateway_interface' = 'port10'
        'on_net' = 'true'
        'is_online' = 'true'
```

Configuring the Security Fabric with SAML

Security Assertion Markup Language (SAML) is an open standard for exchanging authentication and authorization data between one Identity Provider (IdP) and one or more Service Providers (SP). Both parties exchange messages using the XML protocol as transport. FortiGate firewall devices can be configured as IdPs or SPs.

When the Security Fabric is enabled, you can configure the root FortiGate as the IdP. You can also configure downstream FortiGates to be automatically configured as SPs, with all links required for SAML communication, when added to the Security Fabric. Administrators must still be authorized on each device. Credentials are verified by the root FortiGate, and login credentials are shared between devices. Once authorized, an administrator can move between fabric devices without logging in again.

Optionally, the downstream FortiGate can also be manually configured as an SP, and then linked to the root FortiGate.

The authentication service is provided by the root FortiGate using local system admin accounts for authentication. Any of the administrator account types can be used for SAML log in. After successful authentication, the administrator logs in to the first downstream FortiGate SP, and can then connect to other downstream FortiGates that have the SSO account properly configured, without needing to provide credentials again, as long as admins use the same browser session. In summary, the root FortiGate IdP performs SAML SSO authentication, and individual device administrators define authorization on FortiGate SPs by using security profiles.

Configuring single-sign-on in the Security Fabric

SAML SSO enables a single FortiGate device to act as the identify provider (IdP), while other FortiGate devices act as service providers (SP) and redirect logins to the IdP.

Only the root FortiGate can be the identity provider (IdP). The downstream FortiGates can be configured as service providers (SP).

The process is as follows:

1. [Configuring the root FortiGate as the IdP on page 2482](#)
2. [Configuring a downstream FortiGate as an SP on page 2483](#)
3. [Configuring certificates for SAML SSO on page 2485](#)
4. [Verifying the single-sign-on configuration on page 2487](#)

You can also use the CLI. See [CLI commands for SAML SSO on page 2488](#).

Configuring the root FortiGate as the IdP

To configure the root FortiGate as the IdP:

1. Log in to the root FortiGate.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Enable *SAML Single Sign-On*. The *Mode* field is automatically populated as *Identity Provider (IdP)*.
4. Enter an IP address in the *Management IP/FQDN* box.

5. Enter a management port in the *Management port* box.
The *Management IP/FQDN* will be used by the SPs to redirect the login request. The *Management IP/FQDN* and *Management port* must be reachable from the user's device.
6. Select the *IdP certificate*.
7. Click **OK**.

Configuring a downstream FortiGate as an SP

There are two ways to configure the downstream FortiGate:

- From the root FortiGate
- From within the downstream device

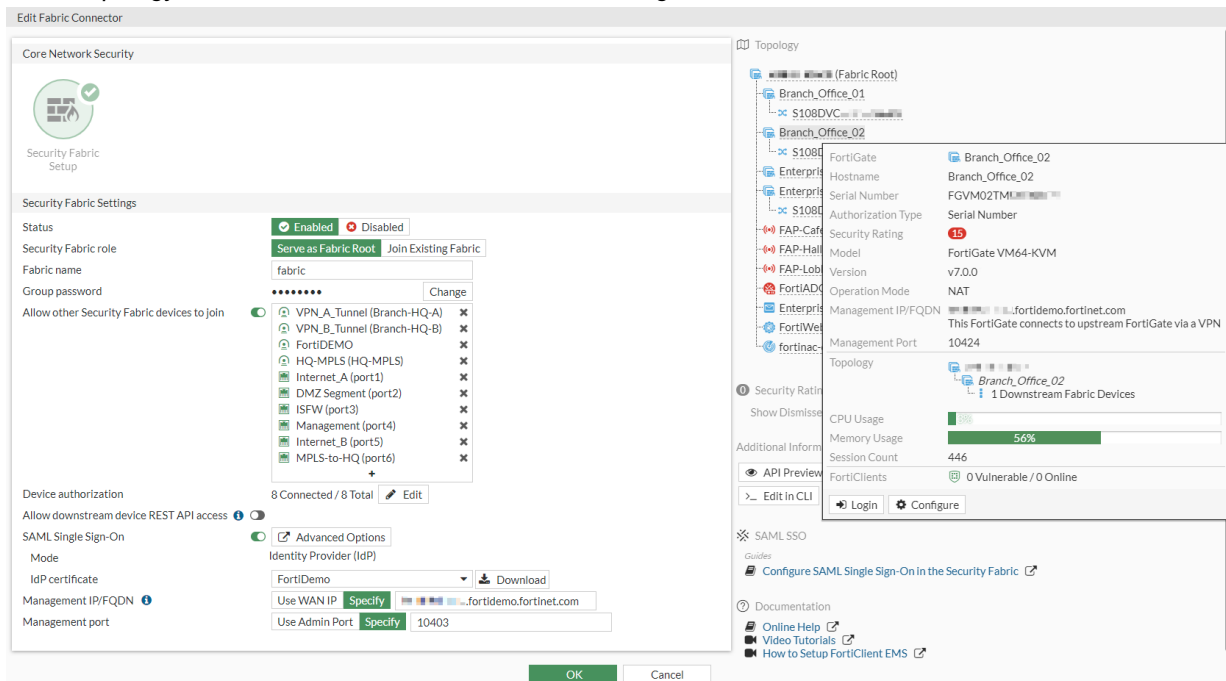

An SP must be a member of the Security Fabric before you configure it.

To configure the downstream FortiGate from the root FortiGate:

1. Log in to the root FortiGate.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.

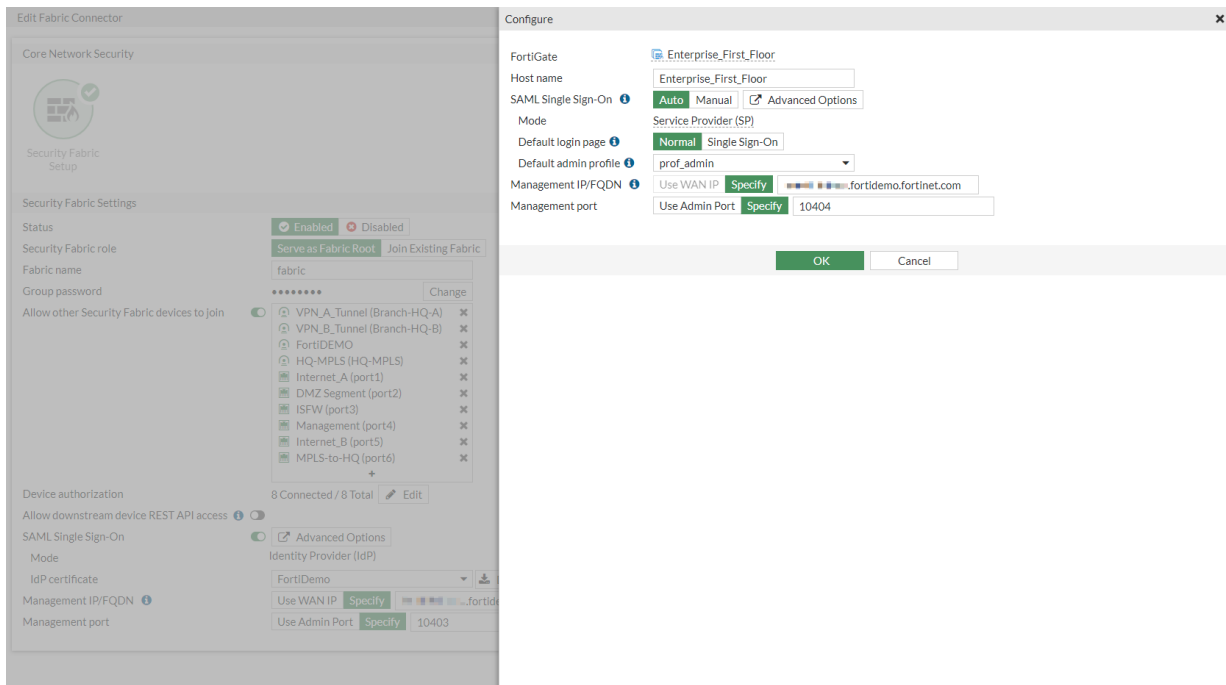

3. In the *Topology* tree, hover over a FortiGate and click *Configure*.

The *Configure* pane opens.

4. Select a *SAML Single Sign-On* option. *Auto* sets the device to SP mode. *Manual* allows you to configure the SSO settings by clicking *Advanced Options*.
5. Select a *Default login page* option.
6. Select one of the following *Default admin profile* types: *prof_admin*, *super_admin*, or *super_admin_readonly*.
7. Enter an IP address in the *Management IP/FQDN* box.
8. Enter a management port in the *Management port* box.

The *Management IP/FQDN* will be used by the IdP and so other SPs can redirect to each other. The *Management port* must be reachable from the user's device.

9. Click **OK**.**To configure the downstream FortiGate within the device:**

1. Log in to the downstream FortiGate.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Select a *SAML Single Sign-On* option. *Auto* sets the device to SP mode. *Manual* allows you to configure the SSO settings by clicking *Advanced Options*.
4. Select a *Default login page* option.
5. Select one of the following *Default admin profile* types: *prof_admin*, *super_admin*, or *super_admin_readonly*.
6. Enter an IP address in the *Management IP/FQDN* box.
7. Enter a management port in the *Management port* box.
The *Management IP/FQDN* will be used by the IdP and so other SPs can redirect to each other. The *Management port* must be reachable from the user's device.
8. Click **OK**.

Configuring certificates for SAML SSO

Because communication between the root FortiGate IdP and FortiGate SPs is secured, you must select a local server certificate in the *IdP certificate* option on the root FortiGate. When downstream SPs join the IdP (root FortiGate), the SP automatically obtains the certificate.

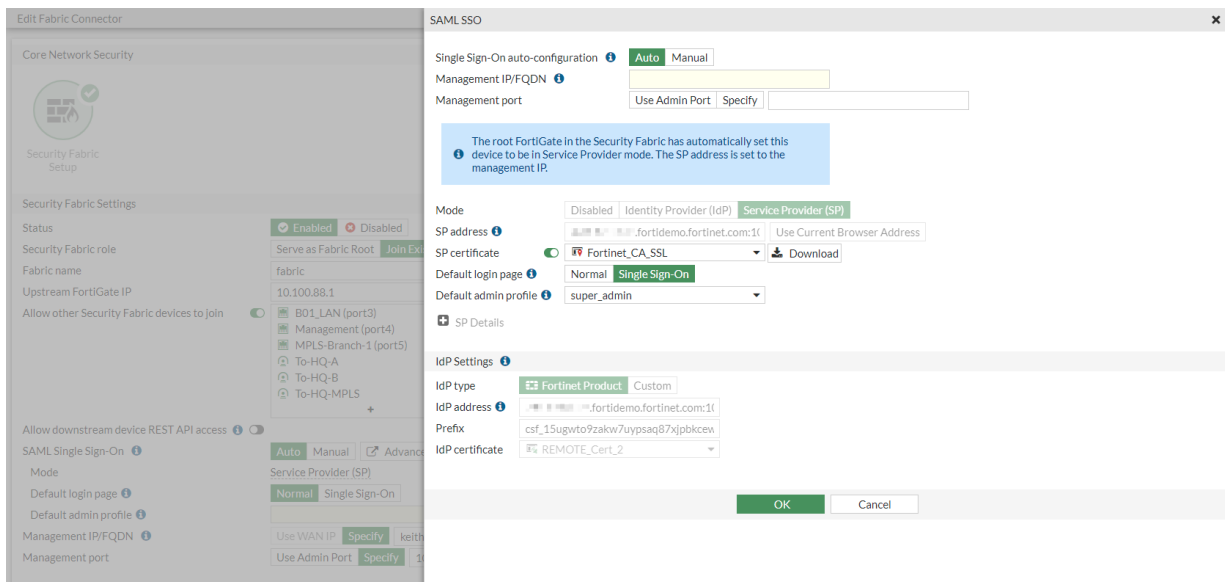

In the following SP example, the *IdP certificate* displays *REMOTE_Cert_2*, which is the root server certificate for the IdP:

It is possible to manually import a certificate from an SP to the IdP so it can be used for authentication.

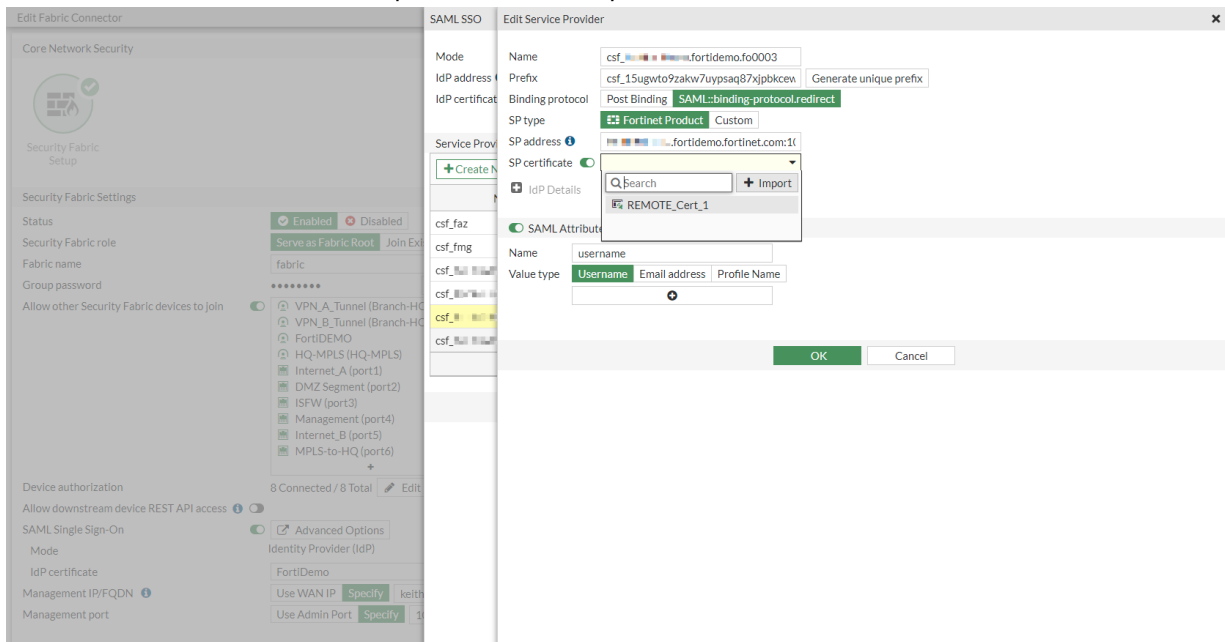

To manually import an SP certificate to an IdP:

1. Add the certificate:
 - a. On the SP, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. Click *Advanced Options*. The *SAML SSO* pane opens.
 - c. Enable *SP certificate* and select a certificate from the dropdown box.
 - d. Click *Download*. The certificate is downloaded on the local file system.
 - e. Click *OK*.

2. Import the certificate:
 - a. On the IdP, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. Click *Advanced Options*. The *SAML SSO* pane opens.
 - c. In the *Service Providers* table, select the SP from step 1 and click *Edit*.

- d. Enable *SP certificate* and in the dropdown box, click *Import*.

The *Upload Remote Certificate* window opens.

- e. Click *Upload* and select the certificate downloaded in step 1.
- f. Click *OK*. The certificate is imported.
- g. Click *OK*.
- h. In the *IdP certificate* list, select the certificate that you imported.
- i. Click *OK*.

Verifying the single-sign-on configuration

After you have logged in to a Security Fabric member using SSO, you can navigate between any Security Fabric member with SSO configured.

To navigate between Security Fabric members:

1. Log in to a Security Fabric member that is using SSO.
2. In the top banner, click the name of the device you are logged in to. A list of Security Fabric members displays.

3. Click a Security Fabric member. The login page appears. Click *Sign in with Security Fabric*.

4. A prompt appears that an SSO administrator account has been created. Click *Continue*.

You are now logged in to the Security Fabric member with SSO. The letters "SSO" also display beside the user name in the top banner.

5. Go to *System > Administrators > Single-Sign-On Administrator* to view the list of SSO admins created.

Name	Trusted Hosts	IPv6 Trusted Host	Profile	Type	Two-factor Authentication
System Administrator					
REST API Administrator					
Single Sign-On Administrator			super_admin	SSO Admin	

CLI commands for SAML SSO

To enter a question mark (?) or a tab, Ctrl + V must be entered first. Question marks and tabs cannot be typed or copied into the CLI Console or some SSH clients.

To configure the IdP:

```
config system saml
  set status enable
  set role identity-provider
  set cert "Fortinet_Factory"
  set server-address "172.16.106.74"
  config service-providers
    edit "csf_172.16.106.74:12443"
      set prefix "csf_ngczjwqxujfsbhgr9ivhehwu37fml20"
      set sp-entity-id "http://172.16.106.74/metadata/"
      set sp-single-sign-on-url "https://172.16.106.74/saml/?acs"
      set sp-single-logout-url "https://172.16.106.74/saml/?sls"
      set sp-portal-url "https://172.16.106.74/saml/login/"
      config assertion-attributes
        edit "username"
          next
        edit "tdoc@fortinet.com"
          set type email
        next
      end
    next
  end
end
```

To configure an SP:

```
config system saml
  set status enable
  set cert "Fortinet_Factory"
  set idp-entity-id "http://172.16.106.74/saml-idp/csf_
```

```
ngczjwqxujfsbhgr9ivhehwu37fml20/metadata/"
  set idp-single-sign-on-url "https://172.16.106.74/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/login/"
  set idp-single-logout-url "https://172.16.106.74/saml-idp/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/logout/"
  set idp-cert "REMOTE_Cert_1"
  set server-address "172.16.106.74:12443"
end
```

To configure an SSO administrator:

```
config system sso-admin
  edit "SSO-admin-name"
    set accprofile <SSO admin user access profile>
    set vdom <Virtual domain(s) that the administrator can access>
  next
end
```

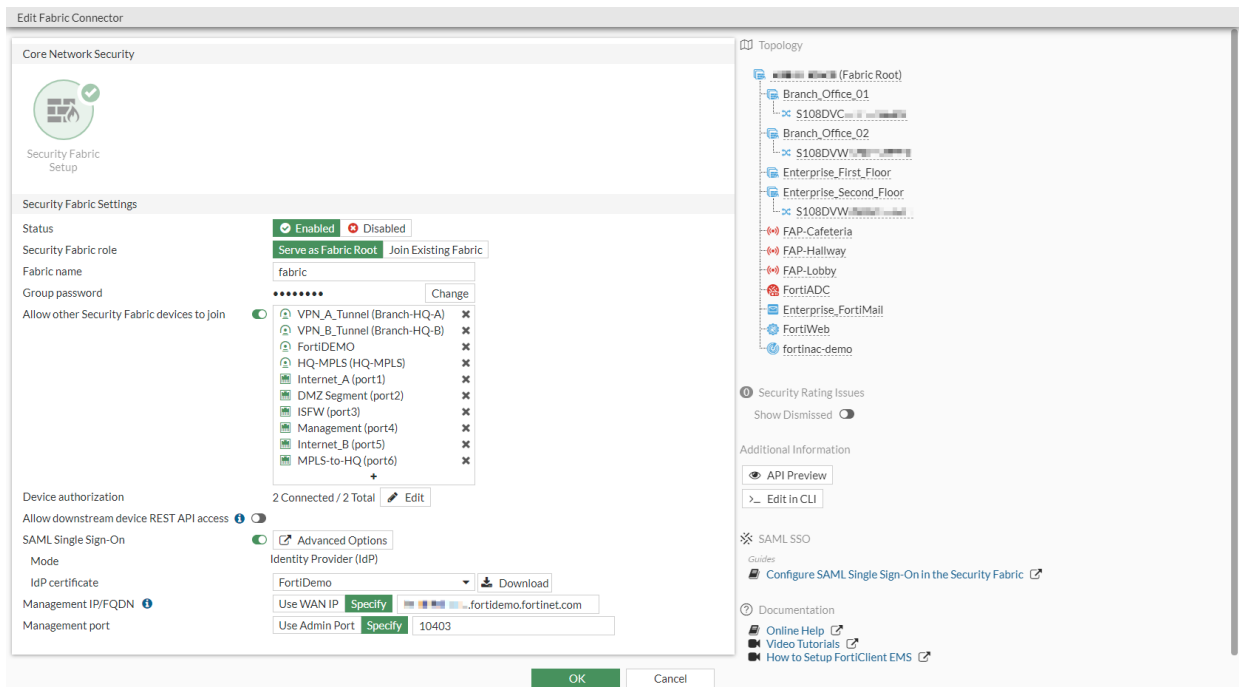

SAML SSO with pre-authorized FortiGates

You can set up SAML SSO authentication in a Security Fabric environment by starting with a root FortiGate that has one or more pre-authorized FortiGates.

After the initial configuration, you can add more downstream FortiGates to the Security Fabric, and they are automatically configured with default values for a service provider.

To set up basic SAML SSO for the Security Fabric:

1. Log in to the root FortiGate of the Security Fabric.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Join two pre-authorized FortiGates to the root FortiGate (see [Configuring the root FortiGate and downstream FortiGates on page 2364](#)).

4. Configure the IdP (see [Configuring the root FortiGate as the IdP on page 2482](#)).
5. Configure the SPs (see [Configuring a downstream FortiGate as an SP on page 2483](#)).

Navigating between Security Fabric members with SSO

After you have logged in to a Security Fabric member by using SSO, you can navigate between any Security Fabric member with SSO configured. This can be done using the Security Fabric members dropdown menu or by logging in to a FortiGate SP from the root FortiGate IdP.

Security Fabric members dropdown

The Security Fabric members dropdown menu allows you to easily switch between all FortiGate devices that are connected to the Security Fabric. You can also use this menu to customize a FortiGate in the Security Fabric.

To navigate between Security Fabric members:

1. Log in to a Security Fabric member by using SSO.
2. In the top banner, click the name of the device you are logged into with SSO.
A list of Security Fabric members is displayed.

3. Click the Security Fabric member.
You are logged in to the Security Fabric member without further authentication.

To customize a FortiGate in the Security Fabric:

1. In the Security Fabric members dropdown menu, hover the cursor over a FortiGate so the tooltip is shown.
2. Click *Configure*. The *Configure* pane opens.
3. Edit the settings as required.
4. Click *OK*.

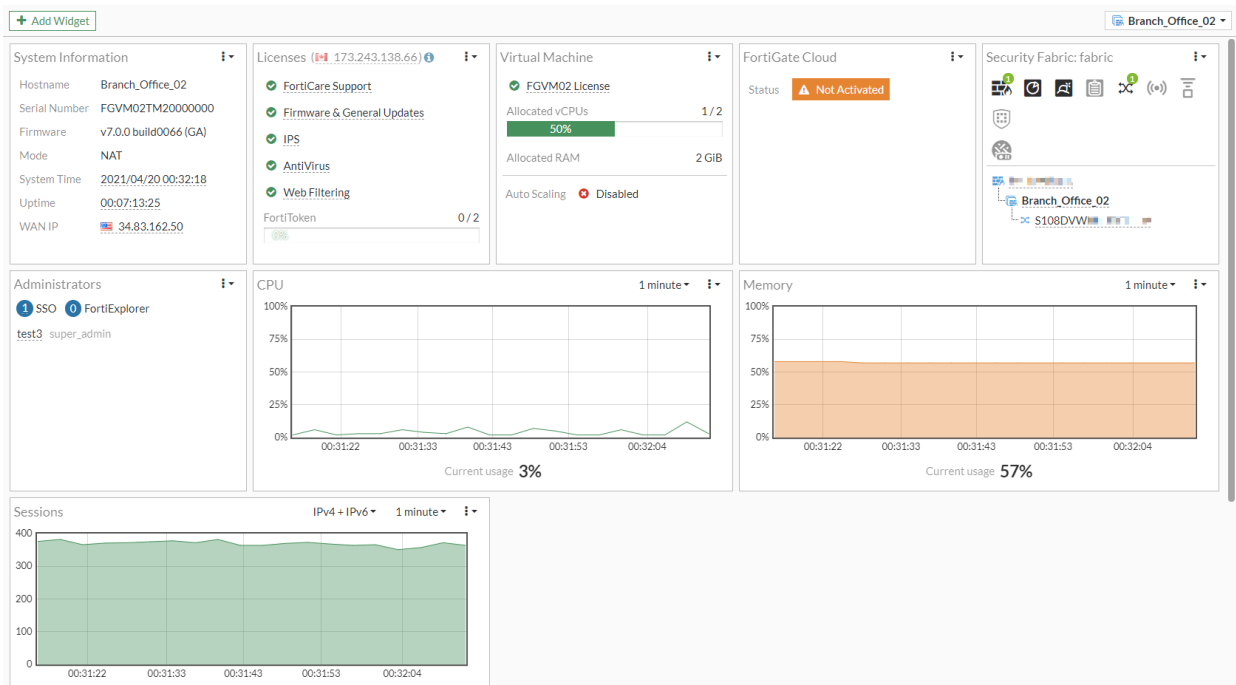

Logging in to an SP from the root IdP

The following example describes how to log in to a root FortiGate IdP, and navigate to other FortiGate SPs in the Security Fabric without further authentication. The local administrator account is named *test3*. The local administrator account must also be available as an SSO administrator account on all downstream FortiGate SPs. Different tabs of the same browser are used to log in to the various FortiGates.

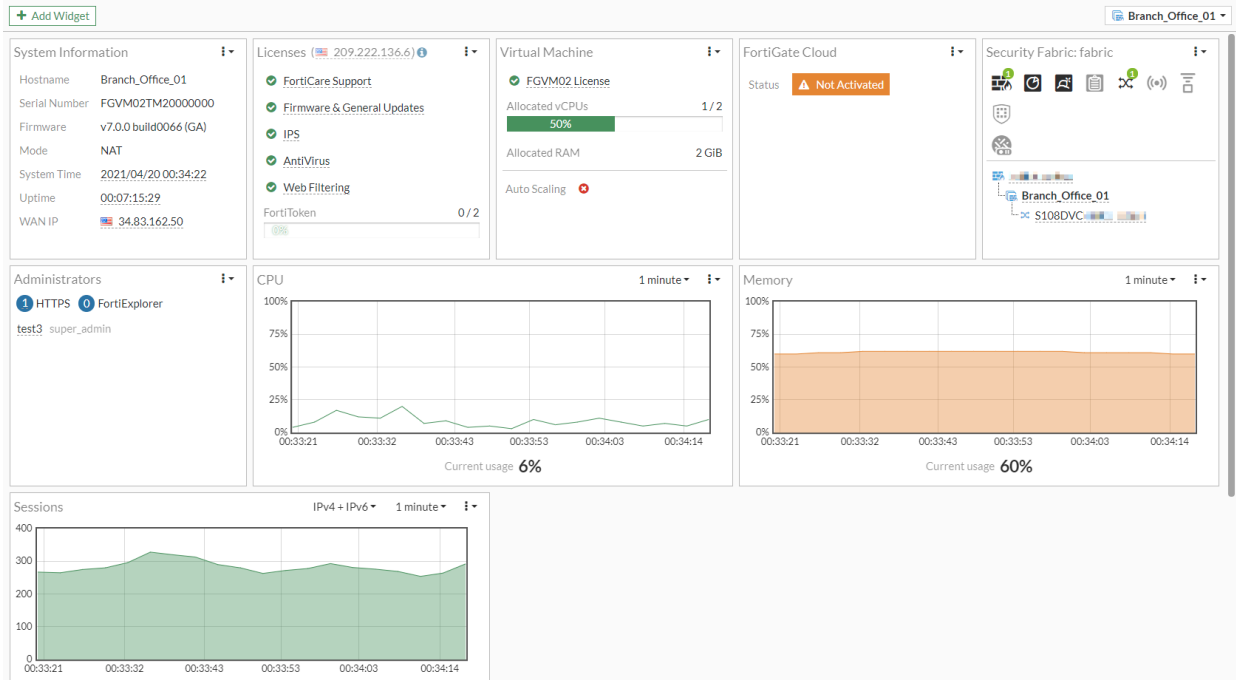

To log in to a FortiGate SP from a root FortiGate IdP:

1. Log in to the root FortiGate IdP by using the local administrator account. In this example, the local administrator account is named *test3*.
2. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. In the *Topology* tree, click one of the downstream FortiGate SPs, and select *Login to <name of FortiGate>*. The login screen is displayed.
4. In the login screen, select *Single Sign-On*.

By using cookies in your local browser for the already-authenticated SSO administrator, FortiGate logs you in to the downstream FortiGate SP as the SSO administrator. In this example, the SSO administrator name is *test3*.

5. While still logged into the root FortiGate IdP in your browser, go to the browser tab for the root FortiGate IdP, and log in to another FortiGate SP that is displayed on the *Security Fabric* widget in the GUI.

SAML SSO login uses *SAML_IDP* session cookies of already authenticated admin users in your local browser cache to send to the root FortiGate IdP for authentication. If your browser cache is manually cleared, or you close your browser, you must authenticate again.

It is possible to log in to one downstream FortiGate SP in a Security Fabric, and then open another tab in your browser to connect to another FortiGate SP that is not a member of the Security Fabric.

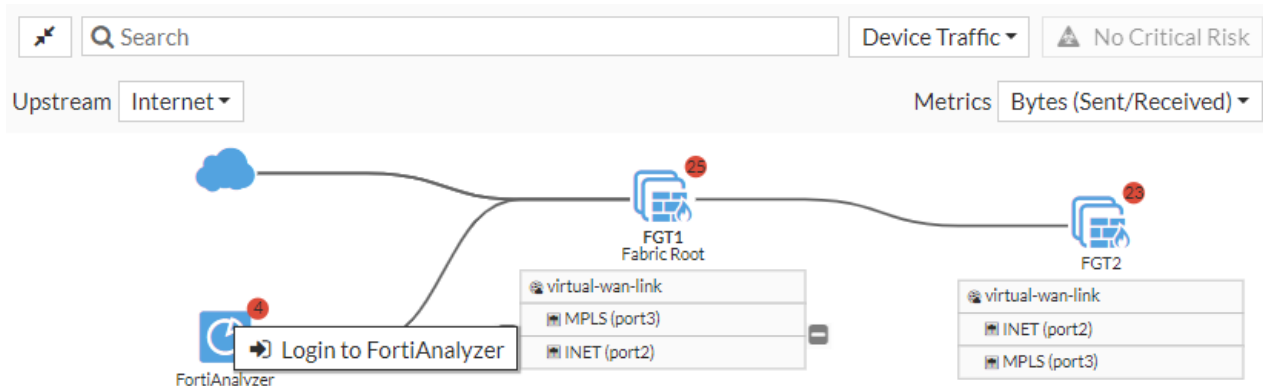

This is useful in cases where the SSO administrator and the local system administrator on the FortiGate SP both have the same login name, but are two different entities.

Integrating FortiAnalyzer management using SAML SSO

When a FortiGate acting as a Security Fabric root is configured as a SAML SSO identity provider (IdP), the FortiAnalyzer of the Security Fabric can register itself as a service provider (SP). This simplifies the configuration by enabling the setting in FortiAnalyzer to facilitate Fabric SSO access to the FortiAnalyzer once authenticated to the root FortiGate. When signed in using SSO, the FortiAnalyzer includes a Security Fabric navigation dropdown, which allows easy navigation to FortiGates in the Fabric.

To enable FortiAnalyzer as a Fabric SP in the GUI:

1. On the root FortiGate, go to *Security Fabric > Physical Topology* or *Logical Topology*.
2. In the topology, click the *FortiAnalyzer* icon and select *Login to FortiAnalyzer*.

3. Enter the credentials to log in. A Security Fabric must be configured with the Fabric devices listed under the Fabric name.
 - a. Go to *Device Manager* to verify the Fabric setup. There is an asterisk beside the root FortiGate.

Device Name	IP Address	Platform	Logs	Average Log Rate(Logs/Sec)
fabric				
FGT1*	192.168.1.99	FortiGate-VM64	Real Time	0
FGT2	192.168.1.100	FortiGate-VM64	Real Time	0

4. Edit the FortiAnalyzer SAML SSO settings:

- a. Go to *System Settings > Admin > SAML SSO*.
- b. For *Single Sign-On Mode*, select *Fabric SP* and enter the address to access the FortiAnalyzer in *Server Address*.

Single Sign-On Settings

Server Address i

Allow admins to login with FortiCloud i

Single Sign-On Mode: Disabled | Identity Provider (IdP) | Service Provider (SP) | **Fabric SP**

i In Fabric SP mode, an SSO administrator is created for each Security Fabric. When a user logs in via Fabric SSO, the Fabric IdP provides the user's profile name. If this system has a profile with the matching name, the profile is assigned to the user. Otherwise, the profile of the SSO administrator is assigned to the user by default.

Default Admin Profile i

Fabric IdPs

Root Device	ADOM Name	Status	IdP Settings
FGVM01TM	70	Enabled	Entity ID: http://192.168.1.99/saml-idp/csf_ubhqs18oq2i2u8C Login URL: https://192.168.1.99/saml-idp/csf_ubhqs18oq2i2u Logout URL: https://192.168.1.99/saml-idp/csf_ubhqs18oq2i2

- c. Click *Apply* and log out of the FortiAnalyzer. The FortiAnalyzer will automatically register itself on the FortiGate and is a visible appliance in the list of SPs.

5. Verify that the FortiAnalyzer registration was successful:
 - a. In FortiOS, go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
 - b. In the *SAML Single Sign-On* section click *Advanced Options*. There should be an entry for the FortiAnalyzer in the *Service Providers* table (*appliance_192.168.1.103*).

Mode: Disabled | Identity Provider (IdP) | Service Provider (SP)

IdP address: 192.168.1.99 | Use Current Browser Address

IdP certificate: Fortinet_Factory | Download

Login with Fabric Single Sign-On

7. Click *Login with Fabric Single Sign-On*. A dialog appears to select a Fabric IdP.

8. Select a FortiGate. The ADOM containing that FortiGate opens.

To enable FortiAnalyzer as a Fabric SP in the CLI:

1. In FortiAnalyzer, enable the device as a Fabric SP:

```
config system saml
  set status enable
  set role FAB-SP
  set server-address "192.168.1.99"
end
```

FortiAnalyzer will register itself on the FortiGate as an appliance.

2. Verify the configuration in FortiOS:

```
show system saml
config system saml
  set status enable
  set role identity-provider
  set cert "fortigate.domain.tld"
  set server-address "192.168.1.99"
config service-providers
  edit "appliance_192.168.1.103"
    set prefix "csf_76sh0bm4e7hf1ty54w42yrrv88tk8uj"
    set sp-entity-id "http://192.168.1.103/metadata/"
    set sp-single-sign-on-url "https://192.168.1.103/saml/?acs"
    set sp-single-logout-url "https://192.168.1.103/saml/?sls"
    set sp-portal-url "https://192.168.1.103/saml/login/"
  config assertion-attributes
    edit "username"
    next
    edit "profilename"
      set type profile-name
    next
```

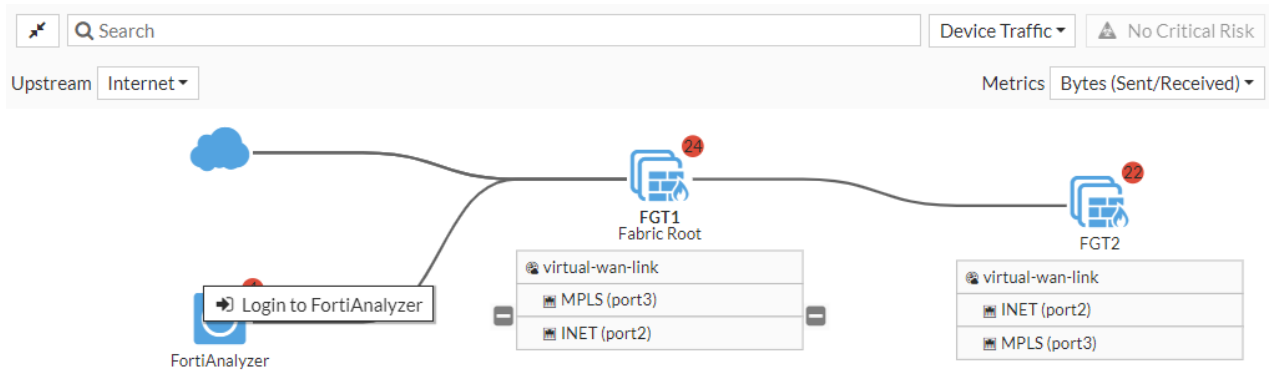

```

end
next
end
end

```

To navigate between devices using SAML SSO in FortiOS:

1. Log in to the root FortiGate.
2. Go to *Security Fabric > Physical Topology* or *Logical Topology*.
3. In the topology, click the *FortiAnalyzer* icon and select *Login to FortiAnalyzer*.

To navigate between devices using SAML SSO in FortiAnalyzer:

1. Log in to the FortiAnalyzer using SSO.
2. Navigate to the ADOM that contains the root FortiGate of the Security Fabric.
3. In the toolbar, click the Security Fabric name to display a dropdown a list of the Fabric FortiGates.

Integrating FortiManager management using SAML SSO

When a FortiGate is configured as the SAML SSO IdP, FortiManager can be added as an SP.

To configure FortiManager as a Fabric SP:

1. On the root FortiGate, go to *Security Fabric > Fabric Connectors*, and edit the *Security Fabric Setup* connector.
2. In the *Security Fabric Settings* section, click *Advanced Options*.
3. In the *Service Providers* section, click *Create New*.
4. Enter a name and a prefix for the SP. FortiOS generates a unique prefix, but you can enter your own.

5. In *SP address*, enter the FortiManager address including the port number.

6. Click *OK*.
7. In FortiManager, go to *System Settings > Admin > SAML SSO* and in the *Single Sign-On Mode* section, click *Service Provider (SP)*.
8. Configure the *IdP Settings*:
- a. For *IdP Type*, click *Fortinet*.
 - b. For *IdP Address*, enter the root FortiGate address including the port number.
 - c. Enter the *Prefix* of the SP.
 - d. For *IdP Certificate*, import the same certificate used on the root FortiGate.
 - e. Click *Apply*.

Single Sign-On Settings

Single Sign-On Mode Disabled Identity Provider (IdP) Service Provider (SP)

i In SP mode, an SSO administrator is created for each user who logs in via SSO. The SSO administrators have restricted profiles by default. You can edit their profiles on the Administrators page.

- To verify that the configuration works, log out of FortiManager and log in using the *Login via Single-Sign-On* link.

FortiManager-VM64-KVM

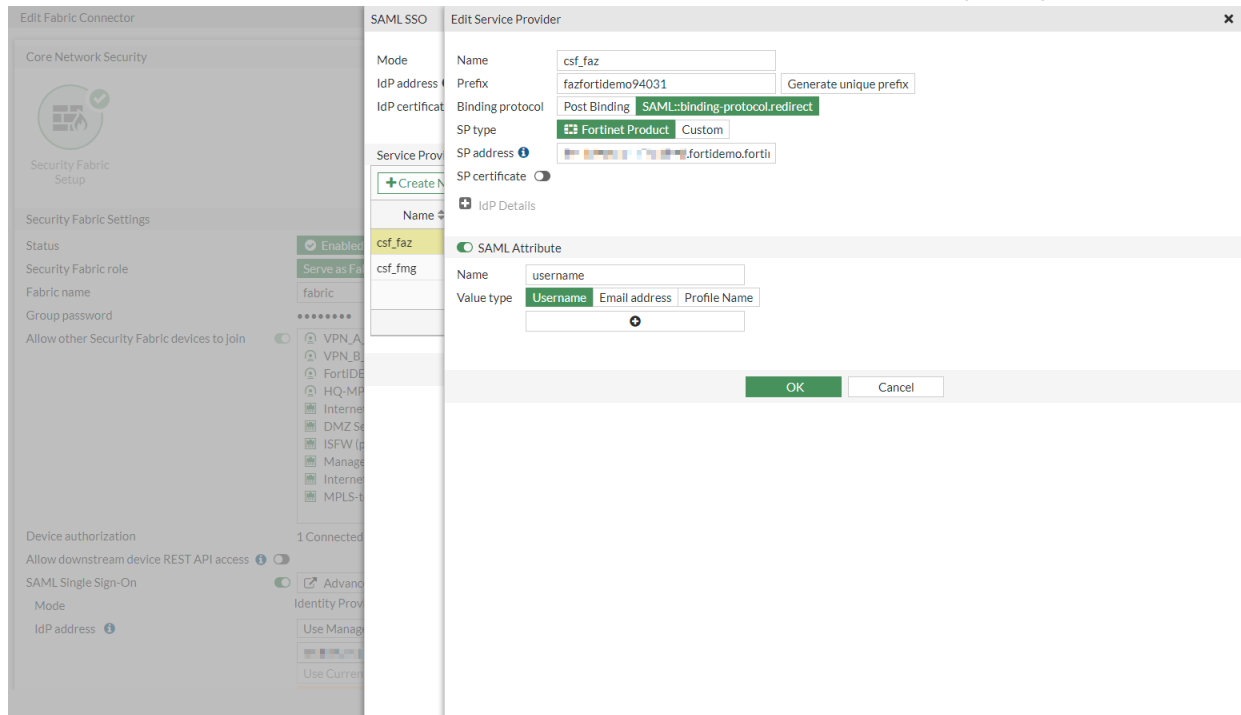

Advanced option - FortiGate SP changes

From a root FortiGate IdP, you can edit each of the FortiGate SPs. For example, you can edit a FortiGate SP to generate a new prefix, or you can add or modify SAML attributes. When you generate a new prefix value, it is propagated to the respective downstream FortiGates.

To edit an SP from the root FortiGate (IdP):

- Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
- Click *Advanced Options*. The *SAML SSO* pane opens.
- In the *Service Providers* table, select a device and click *Edit*. The *Edit Service Provider* pane opens.

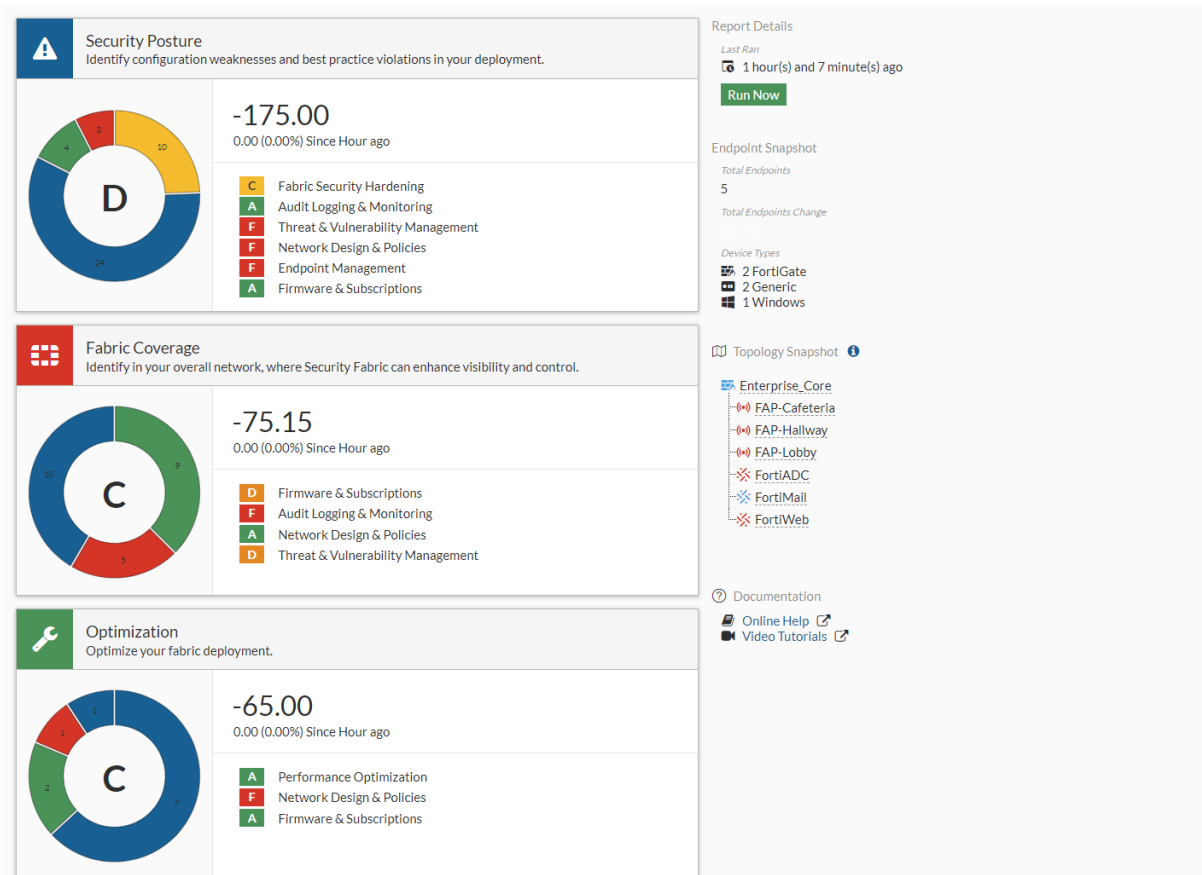

- Edit the settings as needed.
- Click *OK*.

Security rating

The security rating uses real-time monitoring to analyze your Security Fabric deployment, identify potential vulnerabilities, highlight best practices that can be used to improve the security and performance of your network, and calculate Security Fabric scores.

To view the security rating, go to *Security Fabric > Security Rating* on the root FortiGate.

The *Security Rating* page is separated into three major scorecards: *Security Posture*, *Fabric Coverage*, and *Optimization*, which provide an executive summary of the three largest areas of security focus in the Security Fabric.

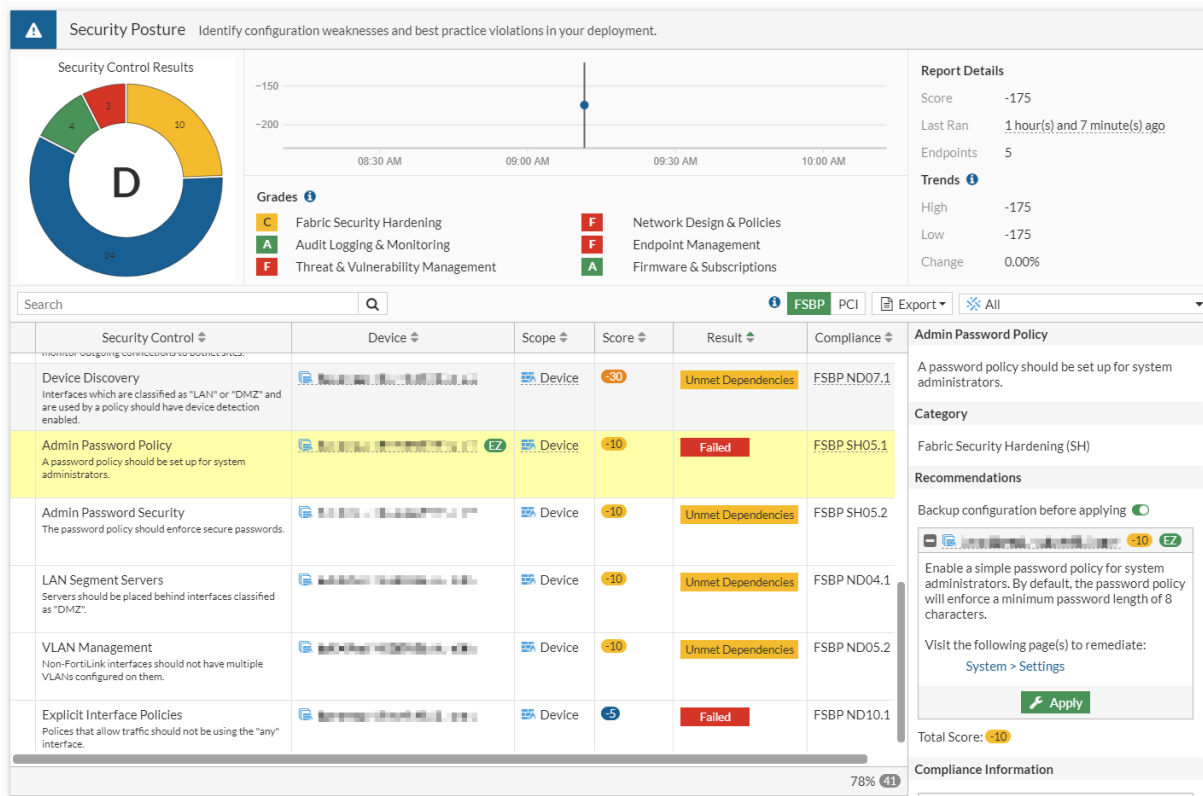

The scorecards show an overall letter grade and breakdown of the performance in sub-categories. The letter grade is calculated based on the percent of tests in a category that passed:

- A = 90% and above
- B = 77% to <90%
- C = 60% to <77%
- D = 50% to <60%
- F = Less than 50%

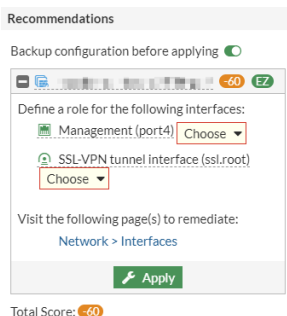

For example, if eight out of ten tests in a category passed, then 80% of the tests passed, and the category would be given a B grade.

Clicking a scorecard drills down to a detailed report of itemized results and compliance recommendations. The point score represents the net score for all passed and failed items in that area. In the drill down report, hover the cursor over a score to view the calculation breakdown.

The report includes the security controls that were tested against, linking to specific FSBP or PCI compliance policies. Click the *FSBP* and *PCI* buttons to reference the corresponding standard. Users can search or filter the report results. If there is a failed check on the scorecard, there is a link in the *Recommendations* section that takes you to the page to resolve the problem.

Certain remediations marked with an *EZ* symbol represent configuration recommendations that support *Easy Apply*. In the panel on the right, in the *Recommendations* section, click *Apply* to apply the changes to resolve the failed security control.

The report table can be customized by adding more columns, such as *Category*, to view, filter, or sort the results based on scorecard categories. Click the gear icon to customize the table.

Security Control	Device	Scope	Score	Result	Compliance
Best Fit All Columns	Device	Device	-30	Unmet Dependencies	FSBP ND07.1
Security Control	Device	Device	-10	Failed	FSBP SH05.1
Device	Device	Device	-10	Unmet Dependencies	FSBP SH05.2
Scope	Device	Device	-10	Unmet Dependencies	FSBP ND04.1
Score	Device	Device	-10	Unmet Dependencies	FSBP ND05.2
Result	Device	Device	-5	Failed	FSBP ND10.1
Compliance					
Category					
Severity					

Users can also export the reports as CSV or JSON files by clicking the *Export* dropdown.

Security Control	Device	Scope	Score	Result	Compliance
Device Discovery	Device	Device	-30	Unmet Dependencies	FSBP ND07.1

To exit the current view, click the icon beside the scorecard title to return to the summary view.

For more information about security ratings, and details about each of the checks that are performed, go to [Security Best Practices & Security Rating Feature](#).

The following licensing options are available for security rating checks:

- A base set of free checks
- A licensed set that requires a FortiGuard Security Rating Service subscription

The base set can be run locally on any FortiGate and on all other devices in the Security Fabric. On licensed FortiGates, ratings scores can be submitted to and received from FortiGuard for ranking networks by percentile.

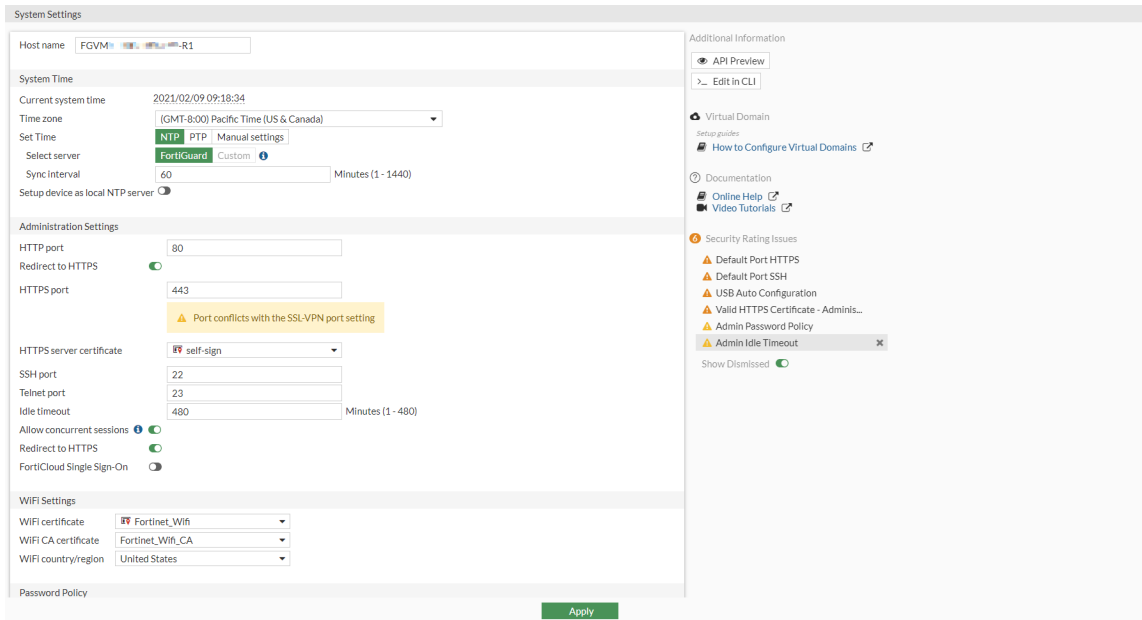

For a list of base and licensed security rating checks, see [FortiGuard Security Rating Service](#).

Security rating notifications

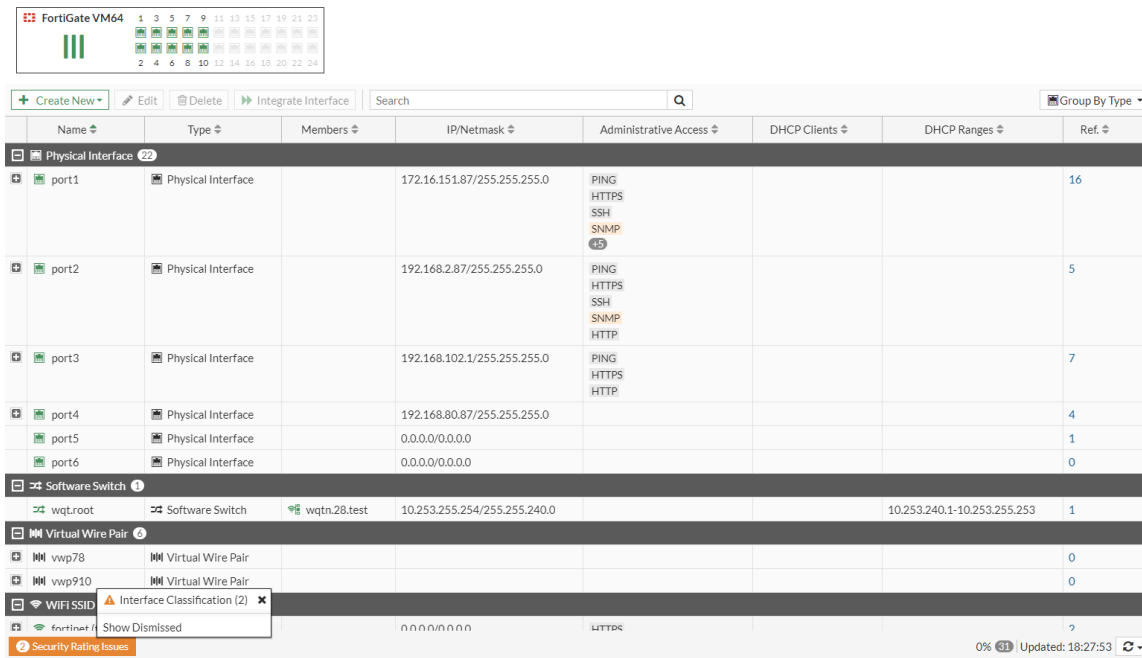

Security rating notifications are shown on settings pages, which list configuration issues determined by the security rating report. You can open the recommendations to see which items need to be fixed. Notifications can be dismissed in the GUI. Dismissed issues are unique for each administrator. Hashes for dismissed notifications are saved in local storage. If a user clears the local storage, all issues will show up again as not dismissed.

Notification locations

On the *System > Settings* page, there is a *Security Rating Issues* section in the right-side gutter. To dismiss a notification, hover over the issue and click the X beside it. To view dismissed notifications, enable *Show Dismissed*.

On the **Network > Interfaces** page, there is a **Security Rating Issues** section in the table footer. Click **Security Rating Issues** to view the list of issues. To dismiss a notification, click the X beside it. To view dismissed notifications, click **Show Dismissed**.

Notification pop-ups

When you click a security rating notification, a pop-up appears and the related setting is highlighted in the GUI. The pop-up contains a description of the problem and a timestamp of when the issue was found.

The screenshot shows the FortiGate VM64 interface configuration page. At the top, there is a status bar for FortiGate VM64 with a grid of 24 status indicators. Below it is a navigation bar with options: Create New, Edit, Delete, Integrate Interface, and a search field. The main content is a table of interfaces, grouped by type. The table has columns: Name, Type, Members, IP/Netmask, Administrative Access, DHCP Clients, DHCP Ranges, and Ref. The 'Physical Interface' group is expanded, showing several entries. An 'Interface Classification' modal window is open, showing a list of roles for the interface 'face'.

Name	Type	Members	IP/Netmask	Administrative Access	DHCP Clients	DHCP Ranges	Ref.
Physical Interface (22)							
port1	Physical Interface		172.16.151.87/255.255.255.0	PING HTTPS SSH SNMP 15			16
port2	Physical Interface		192.168.2.87/255.255.255.0	PING HTTPS SSH SNMP HTTP			5
face	Physical Interface		192.168.102.1/255.255.255.0	PING HTTPS HTTP			7
face	Physical Interface		192.168.80.87/255.255.255.0				4
face	Physical Interface		0.0.0.0/0.0.0.0				1
port6	Physical Interface		0.0.0.0/0.0.0.0				0
Software Switch (1)							
wqt.root	Software Switch	wqtn.28.test	10.253.255.254/255.255.255.0			10.253.240.1-10.253.255.253	1
Virtual Wire Pair (2)							
vwp78	Virtual Wire Pair						0
vwp910	Virtual Wire Pair						0
WiFi SSID (2)							
fortinet (face)	WiFi SSID		0.0.0.0/0.0.0.0	HTTPS			?

Once an issue is resolved, the notification disappears after the next security rating report runs.

Security rating check scheduling

Security rating checks by default are scheduled to run automatically every four hours.

To disable automatic security checks using the CLI:

```
config system global
    security-rating-run-on-schedule disable
end
```

To manually run a report using the CLI:

```
# diagnose report-runner trigger
```

Opt out of ranking

Security rating scores can be submitted to FortiGuard for comparison with other organizations' scores, allowing a percentile score to be calculated. If you opt out of submitting your score, only an absolute score will be available.

To opt out of submitting the score using the CLI:

```
config system global
    set security-rating-result-submission {enable | disable}
end
```

Logging the security rating

The results of past security checks are available on the *Log & Report > Events > Security Rating Events* page.

Date/Time	Level	Log Description	Result	Security Score	Report
24 minutes ago	High	Security Rating summary	1 1 0 12	+240	Fabric Coverage

Security Rating
 Security Ranking ID: 1618418249152
 Security Rating Time: 1618418269000
 Report: Fabric Coverage
 Security Score: +240
 Critical Count: 1
 High Count: 1
 Medium Count: 1
 Low Count: 0
 Passed Count: 12

Other
 Log event original timestamp: 1618418269614653000
 Timezone: -0700
 Log ID: 0110052000
 Type: event
 Sub Type: security-rating

An event filter subtype can be created for the Security Fabric rating so event logs are created on the root FortiGate that summarize the results and show detailed information for the individual tests.

To configure security rating logging using the CLI:

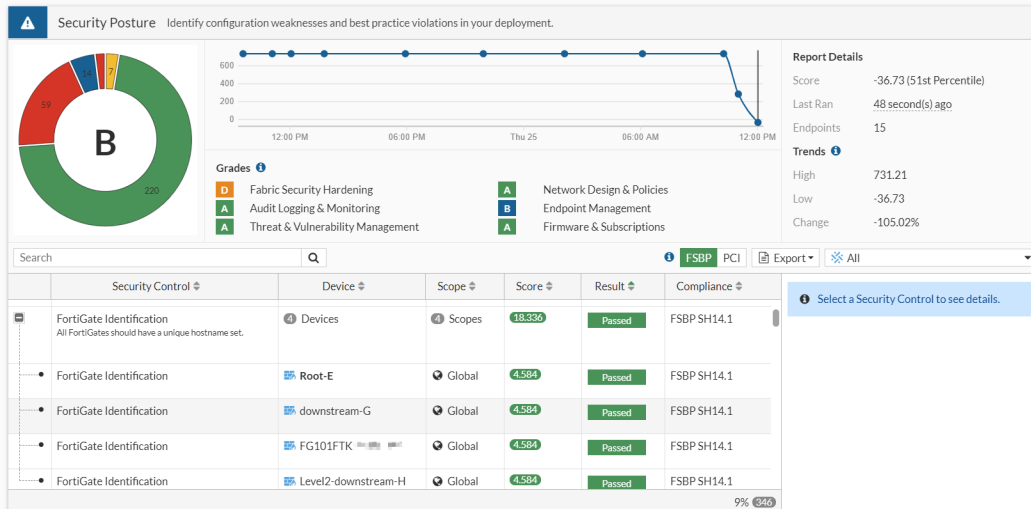

```
config log eventfilter
    set security-rating enable
end
```

Multi VDOM mode

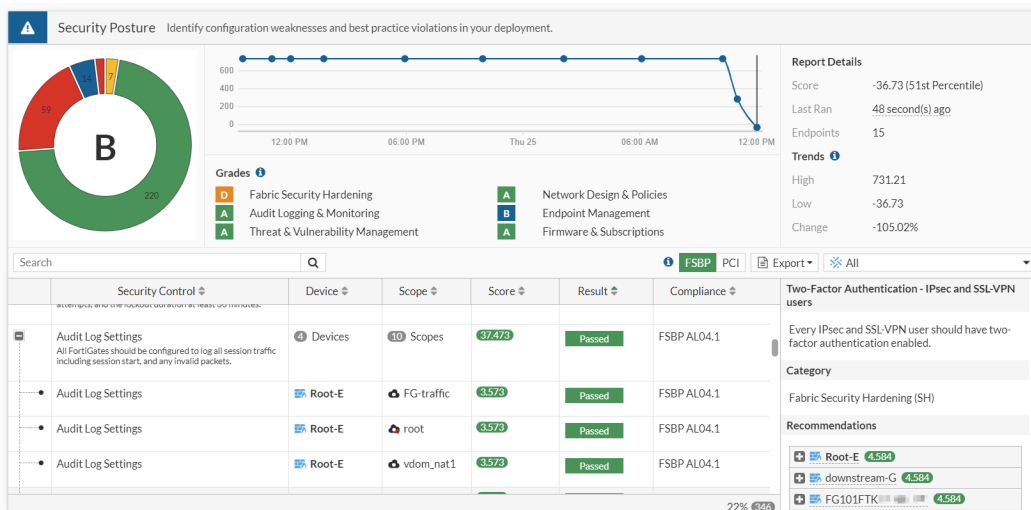

In multi VDOM mode, security rating reports can be generated in the Global VDOM for all of the VDOMs on the device. Administrators with read/write access can run the security rating report in the Global VDOM. Administrators with read-only access can only view the report.

On the report scorecards, the *Scope* column shows the VDOMs that the check was run on. On checks that support *Easy Apply*, the remediation can be run on all of the associated VDOMs.

Global scope:

VDOM scope:

The security rating event log is available on the root VDOM.

Security Fabric score

The Security Fabric score is calculated when a security rating check is run, based on the severity level of the checks that are passed or failed. A higher scores represents a more secure network. Points are added for passed checks and removed for failed checks.

Severity level	Weight (points)
Critical	50
High	25
Medium	10
Low	5

To calculate the number of points awarded to a device for a passed check, the following equation is used:

$$\text{score} = \frac{\text{<severity level weight>}}{\text{<\# of FortiGates>}} \times \text{<secure FortiGate multiplier>}$$

The secure FortiGate multiplier is determined using logarithms and the number of FortiGate devices in the Security Fabric.

For example, if there are four FortiGate devices in the Security Fabric that all pass the compatible firmware check, the score for each FortiGate device is calculated with the following equation:

$$\frac{50}{4} \times 1.292 = 16.15 \text{ points}$$

All of the FortiGate devices in the Security Fabric must pass the check in order to receive the points. If any one of the FortiGate devices fails a check, the devices that passed are not awarded any points. For the device that failed the check, the following equation is used to calculate the number of points that are lost:

$$\text{score} = \text{<severity level weight>} \times \text{<secure FortiGate multiplier>}$$

For example, if the check finds two critical FortiClient vulnerabilities, the score is calculated with the following equation:

$$-50 \times 2 = -100 \text{ points}$$

Scores are not affected by checks that do not apply to your network. For example, if there are no FortiAP devices in the Security Fabric, no points will be added or subtracted for the FortiAP firmware version check.

Automation stitches

Automation stitches automate the activities between the different components in the Security Fabric, which decreases the response times to security events. Events from any source in the Security Fabric can be monitored, and action responses can be set up to any destination.

Automation stitches can also be used on FortiGate devices that are not part of a Security Fabric.

An automation stitch consists of two parts: the trigger and the actions. The trigger is the condition or event on the FortiGate that activates the action, for example, a specific log, or a failed log in attempt. The action is what the FortiGate does in response to the trigger.

Automation stitches that use cloud-based actions (AWS Lambda, Azure Function, Google Cloud Function, and AliCloud Function) have the option to delay an action after the previous action is completed.

Diagnose commands are available in the CLI to test, log, and display the stitch history and settings.

Automation stitches can only be created on the root FortiGate in a Security Fabric.

Creating automation stitches

To create an automation stitch, a trigger event and a response action or actions are selected. Automation stitches can be tested after they are created.

In the GUI, go to *Security Fabric > Automation* and click *Create New*. Automation stitches, actions, and triggers are configured in separate dialogs.

The stitch *Action execution* can be set to either *Sequential* or *Parallel*. In sequential execution, actions will execute one after another with a delay (if specified). If one action fails, then the action chain stops. This is the default setting. In parallel execution, all actions will execute immediately when the stitch is triggered.

When creating a stitch, clicking *Add Trigger* and *Add Action* displays a list of available triggers and actions, and the option to create a new one.

The screenshot shows the 'Create New Automation Stitch' dialog box. It includes fields for Name, Status (Enable/Disable), FortiGate(s) (All FortiGates), Action execution (Sequential/Parallel), and Description (0/255). The 'Stitch' section contains 'Add Trigger' and 'Add Action' buttons. The 'Additional Information' section on the right provides links for API Preview, Guides (Chaining and delaying actions, Execute a CLI script based on CPU and memory thresholds, Default automation stitches), and Documentation (Online Help, Video Tutorials). The dialog has OK and Cancel buttons at the bottom.

Once the stitch is configured, a process diagram of the trigger, actions, and delays is displayed. A delay can be added before an action if *Sequential* action execution is used. Executing the next action can be delayed by up to 3600 seconds (one hour).

Triggers and actions can be configured separately, and then added to an automation stitch.

Tabs on the Automation page

On the *Security Fabric > Automation* page, there are tabs for *Stitch*, *Trigger*, and *Action*. The *Stitch* tab is the default view that lists the trigger and actions used in each stitch. Individual triggers and actions can be created or edited in the corresponding tabs.

Stitch

Sample configuration

The following example shows how to configure a Security Rating Summary automation stitch with AWS Lambda and Email actions. There is a 60-second delay before the Email action.

To configure the automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name and description.

3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Security Rating Summary*.
 - c. Enter the following:

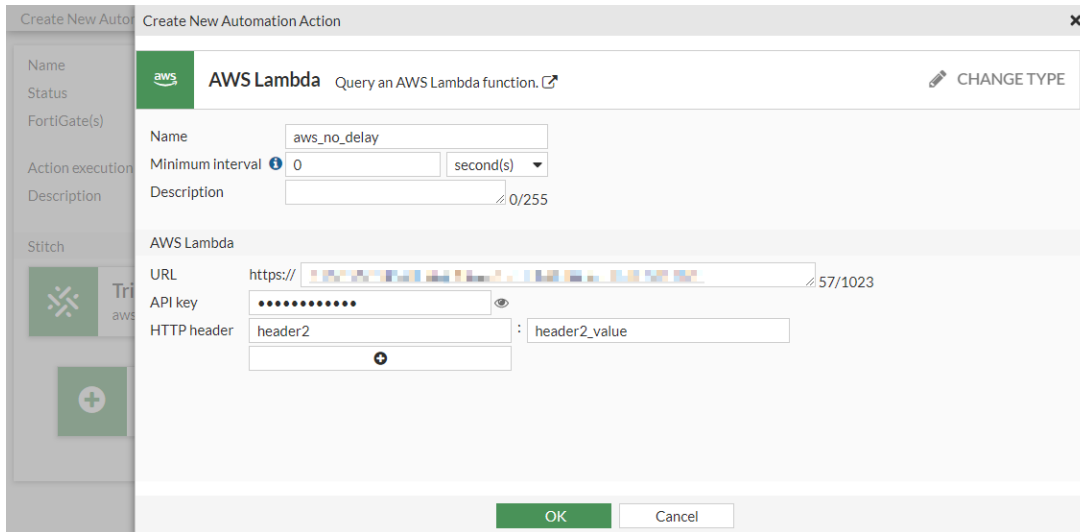

Name	<i>aws_no_delay</i>
Report	<i>Security Posture</i>

The screenshot shows a 'Create New Automation Trigger' dialog box. The title bar reads 'Create New Automation Trigger'. On the left is a sidebar with a search icon and a list of categories: Name, Status, FortiGate(s), Action execution, Description, and Stitch. The main area displays a configuration for a 'Security Rating Summary' trigger. The name is 'aws_no_delay', the description is empty, and the report is set to 'Security Posture'. There are 'OK' and 'Cancel' buttons at the bottom.

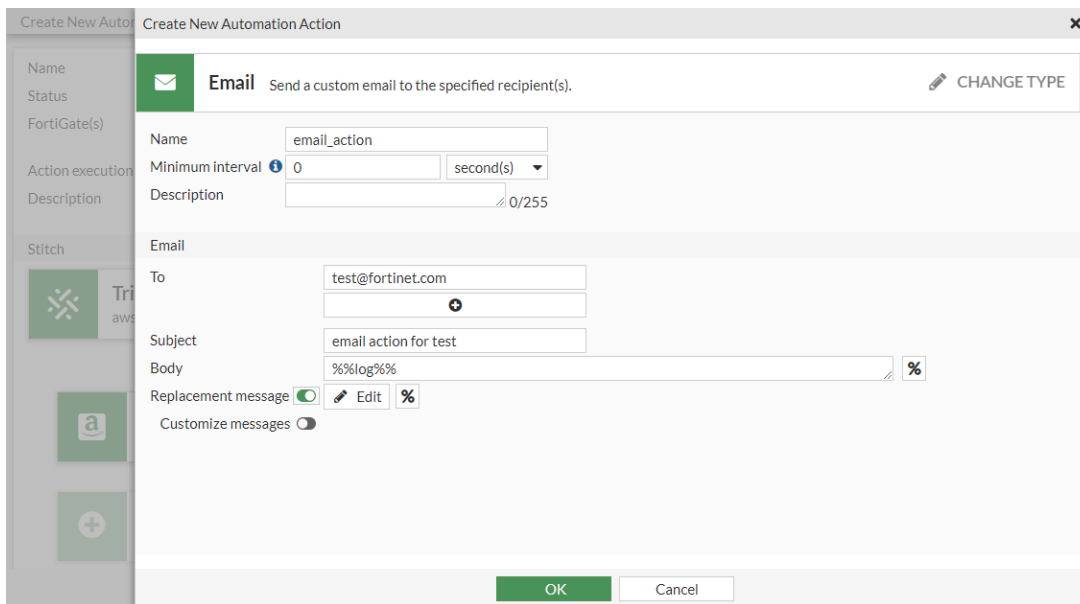

- d. Click *OK*.
 - e. Select the trigger in the list and click *Apply*.
4. Configure the AWS Lambda function action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *AWS Lambda*.
 - c. Enter the following:

Name	<i>aws_no_delay</i>
URL	Enter the request API URI
API key	Enter the API key
HTTP header	<i>header2 : header2_value</i>

- d. Click **OK**.
 - e. Select the action in the list and click *Apply*.
5. Configure the Email notification action:
- a. Click *Add Action*.
 - b. Click *Create* and select *Email*.
 - c. Enter the following:

Name	<i>email_action</i>
To	Enter an email address
Subject	<i>email action for test</i>
Replacement message	Enable

- d. Click **OK**.
- e. Select the action in the list and click *Apply*.

6. Click the *Add delay* located between both actions. Enter *60* and click *OK*.
7. Click *OK*.

To configure the automation stitch in the CLI:

1. Configure the trigger:

```
config system automation-trigger
  edit "aws_no_delay"
    set event-type security-rating-summary
  next
end
```

2. Configure the actions:

```
config system automation-action
  edit "aws_no_delay"
    set action-type aws-lambda
    set aws-api-key xxxxxxxxxxxx
    set uri "xxxxxxxxxx.execute-api.us-east-1.amazonaws.com/xxxxxxxxxx"
  config http-headers
    edit 1
      set key "header2"
      set value "header2_value"
    next
  end
next
edit "email_action"
  set action-type email
  set email-to "test@fortinet.com"
  set email-subject "email action for test"
  set replacement-message enable
next
end
```

3. Configure the stitch:

```
config system automation-stitch
  edit "aws_no_delay"
    set description "aws action test"
    set trigger "aws_no_delay"
  config actions
    edit 1
      set action "aws_no_delay"
      set required enable
    next
    edit 2
      set action "email_action"
      set delay 60
      set required enable
    next
  end
next
end
```

Testing automation stitches

In the GUI, go to *Security Fabric > Automation*, right-click on the automation stitch and select *Test Automation Stitch*.

In the CLI, enter `diagnose automation test <automation-stitch name>`.

Default automation stitches

The following default automation stitches are included in FortiOS:

- Compromised Host Quarantine
- [Incoming Webhook Quarantine](#)
- HA Failover
- Network Down
- Reboot
- FortiAnalyzer Connection Down
- License Expired Notification
- Security Rating Notification

To view and edit the automation stitches in the GUI, go to *Security Fabric > Automation*.

Stitch	Trigger	Action	FortiGate(s)	Trigger Count	Last Triggered

CLI configurations

Compromised Host Quarantine

```
config system automation-action
  edit "Quarantine on FortiSwitch + FortiAP"
    set description "Default automation action configuration for quarantining a MAC
address on FortiSwitches and FortiAPs."
    set action-type quarantine
  next
  edit "Quarantine FortiClient EMS Endpoint"
    set description "Default automation action configuration for quarantining a
FortiClient EMS endpoint device."
    set action-type quarantine-forticlient
```

```
    next
end

config system automation-trigger
    edit "Compromised Host - High"
        set description "Default automation trigger configuration for when a high severity
compromised host is detected."
    next
end

config system automation-stitch
    edit "Compromised Host Quarantine"
        set description "Default automation stitch to quarantine a high severity compromised
host on FortiAPs, FortiSwitches, and FortiClient EMS."
        set status disable
        set trigger "Compromised Host - High"

        config actions
            edit 1
                set action "FortiExplorer Notification"
            next
        end
    next
end

```

Incoming Webhook Quarantine stitch

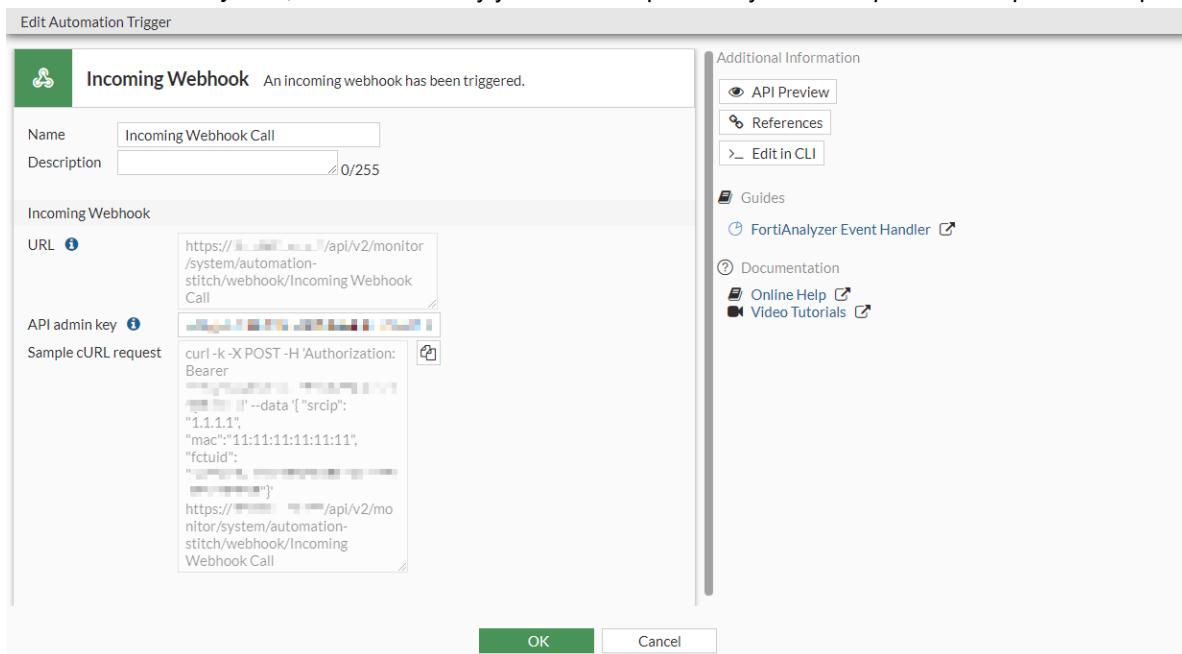

The Incoming Webhook Quarantine stitch for API calls to the FortiGate accepts multiple parameters (MAC address and FortiClient UUID) from an Incoming Webhook trigger, which enacts either the Access Layer Quarantine action (MAC address) or the FortiClient Quarantine action (FortiClient UUID). This is a default automation stitch included in FortiOS.

To trigger the Incoming Webhook Quarantine stitch in the GUI:

1. Create a new API user:
 - a. Go to *System > Administrators*.
 - b. Click *Create New > REST API Admin*.
 - c. Configure the *New REST API Admin* settings, and copy the API key to the clipboard.

2. Enable the stitch:
 - a. Go to *Security Fabric > Automation*.
 - b. Under *Incoming Webhook*, right-click *Incoming Webhook Quarantine*, and select *Select Status > Enable*.
3. Get the sample cURL request:
 - a. Click the *Trigger* trigger tab.
 - b. Under *Incoming Webhook*, right-click *Incoming Webhook Call*, and select *Edit*.
 - c. In the *API admin key* field, enter the API key you recorded previously. The *Sample cURL request* field updates.

- d. Copy the *Sample cURL request* to the clipboard.
 - e. Click *OK*.
4. Execute the request:
 - a. Edit the sample cURL request you just copied.
 - b. Add parameters to the data field ("mac" and "fctuid"), and then execute the request.

```
root@pc:~# curl -k -X POST -H 'Authorization: Bearer
cfgtctlmmx3fQxr4kxb994p7swdfmk' --data '{ "mac": "0c:0a:00:0c:ce:b0", "fctuid":
"0000BB0B0ABD0D00B0D0A0B0E0F0B00B" }'
https://172.16.116.226/api/v2/monitor/system/automation-
stitch/webhook/Incoming%20Webhook%20Quarantine
{
  "http_method": "POST",
  "status": "success",
  "http_status": 200,
  "serial": "FGT00E0Q00000000",
  "version": "v6.4.0",
```

```
"build":1545
```

Encode spaces in the automation stitch name with %20. For example, Incoming%20Webhook%20Quarantine

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

To trigger the Incoming Webhook Quarantine stitch in the CLI:

1. Create a new API user and note the API key:

```
config system api-user
```

2. Enable the automation stitch:

```
config system api-user
  edit "api"
    set api-key *****
    set accprofile "api_profile"
    set vdom "root"
    config trusthost
      edit 1
        set ipv4-trusthost 10.6.30.0 200.200.200.0
      next
    end
  next
end
```

3. Edit the cURL request to include parameters in the data field ("mac" and "fctuid"), then execute the request:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer
cftgctlmmx0fQxr4kxb000p70wdfmk' --data '{ "mac": "0c:0a:00:0c:ce:b0", "fctuid":
"3000BB0B0ABD0D00B0D0A0B0E0F0B00B" }'
https://100.10.100.200/api/v2/monitor/system/automation-
stitch/webhook/Incoming%20Webhook%20Quarantine
{
  "http_method": "POST",
  "status": "success",
  "http_status": 200,
  "serial": "FGT80E0Q00000000",
  "version": "v6.4.0",
  "build": 1545
```

Encode spaces in the automation stitch name with %20. For example, Incoming%20Webhook%20Quarantine.

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

Sample log

```
date=2020-02-14 time=15:37:48 logid="0100046600" type="event" subtype="system"
level="notice" vd="root" eventtime=1581723468644200712 tz="-0800" logdesc="Automation
stitch triggered" stitch="Incoming Webhook Quarantine" trigger="Incoming Webhook
Quarantine" stitchaction="Compromised Host Quarantine_quarantine,Compromised Host
Quarantine_quarantine-forticlient" from="log" msg="stitch:Incoming Webhook Quarantine is
triggered."
```

Triggers

The following table outlines the available triggers.

Category	Trigger	Description
Security Fabric		
	Compromised Host	An indicator of compromise (IoC) is detected on a host endpoint. Additional actions are available only for <i>Compromised Host</i> triggers: <ul style="list-style-type: none"> • Access Layer Quarantine • FortiClient Quarantine • VMware NSX Security Tag • IP Ban
	Security Rating Summary	A summary is available for a recently run Security Rating report. Options include: <ul style="list-style-type: none"> • Security Posture • Fabric Coverage • Optimization • Any
	FortiAnalyzer Event Handler	The specified FortiAnalyzer event handler has occurred. See FortiAnalyzer event handler trigger on page 2522 for details.
	FortiGate Cloud Event Handler	The specified FortiGate Cloud event handler has occurred. This option requires a FortiGate Cloud log retention license.
	Fabric Connector Event	An event has occurred on a specific Fabric connector. See Fabric connector event trigger on page 2527 for details.
	FortiGate Cloud-Based IOC	IOC detection from the FortiGate Cloud IOC service. This option requires an IOC license, a web filter license, and FortiCloud logging must be enabled.
System		
	Reboot	A FortiGate is rebooting.
	HA Failover	An HA failover is occurring.
	Conserve Mode	A FortiGate entered conserve mode due to low memory. See Execute a CLI script based on memory and CPU thresholds on page 2570 for an example.

Category	Trigger	Description
	Configuration Change	A FortiGate configuration change has occurred.
	License Expiry	A FortiGuard license is expiring. The license type must be selected. Options include: <ul style="list-style-type: none"> • FortiCare Support • FortiGuard Web Filter • FortiGuard AntiSpam • FortiGuard AntiVirus • FortiGuard IPS • FortiGuard Management Service • FortiGate Cloud • Any
	AV & IPS DB Update	The antivirus and IPS database is updating.
	High CPU	A FortiGate has high CPU usage. See Execute a CLI script based on memory and CPU thresholds on page 2570 for an example.
Miscellaneous		
	FortiOS Event Log	The specified FortiOS log has occurred. Multiple event log IDs can be selected, and log field filters can be applied. See FortiOS event log trigger on page 2532 for an example.
	Incoming Webhook	An incoming webhook is triggered.
	Schedule	A scheduled monthly, weekly, daily, or hourly trigger. Set to occur on a specific minute of an specific hour on a specific day.

FortiAnalyzer event handler trigger

You can trigger automation stitches based on FortiAnalyzer event handlers. This allows you to define rules based on complex correlations across devices, log types, frequencies, and other criteria.

To set up a FortiAnalyzer event handler trigger:

1. [Configure a FortiGate event handler on the FortiAnalyzer](#)
2. [Configure FortiAnalyzer logging on the FortiGate on page 2523](#)
3. [Configure an automation stitch that is triggered by a FortiAnalyzer event handler on page 2524](#)

Configure a FortiGate event handler on the FortiAnalyzer

On the FortiAnalyzer, configure an event handler for the automation stitch. In this example, the event handler is triggered when an administrator logs in to the FortiGate. See [Creating a custom event handler](#) in the FortiAnalyzer Administration Guide for more information.

To configure an event handler on the FortiAnalyzer:

1. Go to *FortiSoC > Handlers > FortiGate Event Handlers*, and click *Create New*.
2. Configure an event handler with two conditions for the automation stitch:

Log Type	Event Log
Log Subtype	System
Group By	Device ID
Logs match	Any of the following conditions
Log Field	Level
Match Criteria	Equal To
Value	Information
Log Field	Action
Match Criteria	Equal To
Value	login

3. Configure the other settings as needed.

Create New Handler

Status: ON

Name: system-log-handler2

Description:

Devices: All Devices Specify

Subnets: All Subnets Specify

Filters: +

Filter 1 ON

Log Device Type: FortiGate

Log Type: Event Log (event)

Log Subtype: System (system)

Group By: Device ID (devid) +

Logs match: All Any of the following conditions

Log Field	Match Criteria	Value
<input checked="" type="checkbox"/> Level (pri)	Equal To	Information
<input checked="" type="checkbox"/> Action (action)	Equal To	login

Generic Text Filter: 0/1023

Generate Alert When: At least 1 Exact matches occurred over a period of 30 minutes

Event Message:

OK Cancel

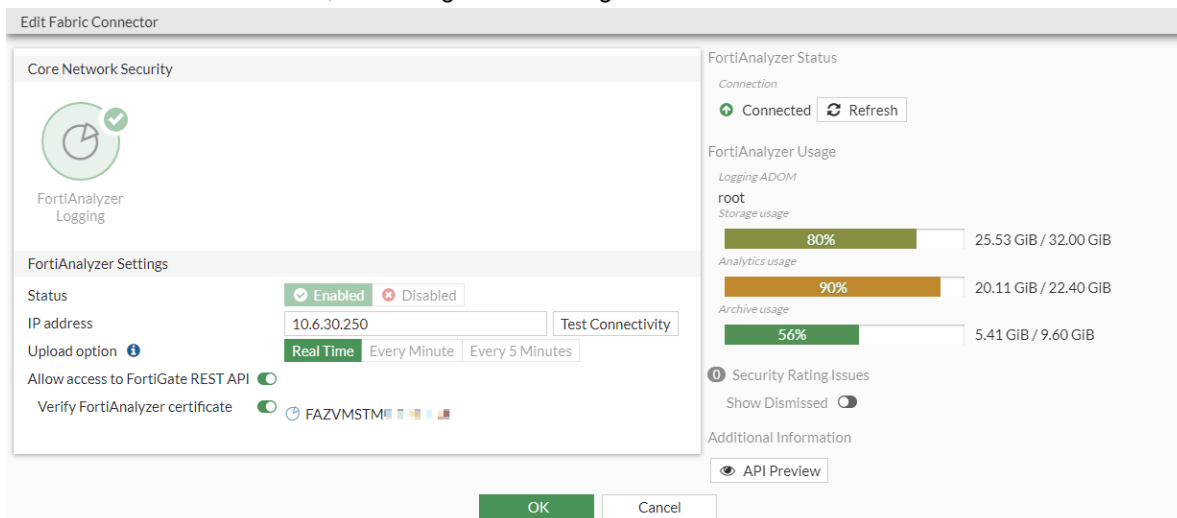

4. Click *OK*.

Configure FortiAnalyzer logging on the FortiGate

See [Configuring FortiAnalyzer](#) on page 2371 for more information.

To configure FortiAnalyzer logging in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
2. Ensure the *Status* is *Enabled*, and configure the settings as needed.

3. Click *OK*.

To configure FortiAnalyzer logging in the CLI:

```
config log fortianalyzer setting
  set status enable
  set server "10.6.30.250"
  set serial "FL-4HET000000000"
  set upload-option realtime
  set reliable enable
end
```

Configure an automation stitch that is triggered by a FortiAnalyzer event handler

When a FortiAnalyzer event handler is triggered, it sends a notification to the FortiGate automation framework, which generates a log and triggers the automation stitch.

To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name, *auto-faz-1*.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *FortiAnalyzer Event Handler*.
 - c. Enter the following:

Name	auto-faz-1
Event handler name	system-log-handler2
Event severity	Medium

Event tag User login successful

Create New Automation Trigger

Name: auto-faz-1

Status: Enabled

FortiGate(s): All FortiGate(s)

Action execution: Sequence

Description:

+ **FortiAnalyzer Event Handler** A specified FortiAnalyzer event handler was triggered. CHANGE TYPE

Name:

Description: 0/255

FortiAnalyzer Event Handler

Event handler name:

Event severity: Medium

Event tag: User login successful

- d. Click **OK**.
- e. Select the trigger in the list and click **Apply**.
4. Configure the Email notification action:
 - a. Click **Add Action**.
 - b. Click **Create** and select **Email**.
 - c. Enter the following:

Name	auto-faz-1_email
To	Enter an email address
Subject	CSF stitch alert
Body	User login FortiGate successfully.

Create New Automation Action

Name: auto-faz-1_email

Status: Enabled

FortiGate(s): All FortiGate(s)

Action execution: Sequence

Description:

+ **Email** Send a custom email to the specified recipient(s). CHANGE TYPE

Name:

Minimum interval: second(s)

Description: 0/255

Email

To:

Subject:

Body:

Replacement message:

- d. Click **OK**.
- e. Select the action in the list and click **Apply**.
5. Click **OK**.

To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the CLI:**1. Create an automation trigger:**

```
config system automation-trigger
  edit "auto-faz-1"
    set event-type faz-event
    set faz-event-name "system-log-handler2"
    set faz-event-severity "medium"
    set faz-event-tags "User log in successful"
  next
end
```

2. Create an automation action:

```
config system automation-action
  edit "auto-faz-1_email"
    set action-type email
    set email-to "admin@fortinet.com"
    set email-subject "CSF stitch alert"
    set message "User login FortiGate successfully."
  next
end
```

3. Create the automation stitch:

```
config system automation-stitch
  edit "auto-faz-1"
    set trigger "auto-faz-1"
    config actions
      edit 1
        set action "auto-faz-1_email"
        set required enable
      next
    end
  next
end
```

View the trigger event log**To view the trigger event log in the GUI:****1. Log in to the FortiGate.**

The FortiAnalyzer sends a notification to the FortiGate automation framework, generates an event log on the FortiGate, and triggers the automation stitch.

2. Go to *Log & Report > Events* and select *System Events*. From the log location dropdown, select *FortiAnalyzer*.**To view the trigger event log in the CLI:**

```
# execute log display
...
date=2019-02-05 time=14:16:17 logid="0100046600" type="event" subtype="system"
level="notice" vd="root" eventtime=1549404977 logdesc="Automation stitch triggered"
stitch="auto-faz-1" trigger="auto-faz-1" from="log" msg="stitch:auto-faz-1 is triggered."
...
```

Sample email

The email sent by the action will look similar to the following:

Fabric connector event trigger

With the *Fabric Connector Event* trigger, any supported Fabric connector is able to trigger an automation stitch on the FortiGate based on a specific event defined on the Fabric connector. Currently, only FortiDeceptor 4.1 supports this trigger for the *Insider Threat*, *Notify Ban*, and *Notify Unban* events.

In the following example, an authorized FortiDeceptor in the Security Fabric deploys a decoy called ubuntu16 configured with SSH, SAMBA, HTTP, and HTTPS services.

This example assumes the Security Fabric is already configured. Refer to [Configuring the root FortiGate and downstream FortiGates](#) and [FortiDeceptor](#) for detailed configuration steps. On the root FortiGate, the *Allow downstream device REST API access* option must be enabled (`set downstream-access enable`). The minimum permission required for the selected *Administrator profile* is *Read/Write for User & Device* (`set authgrp read-write`).

Three stitches are configured, one for each FortiDeceptor trigger type:

Stitch name	Fabric connector event trigger	Actions
fortideceptor_threat	Insider threat	Email and IP ban
fortideceptor_ban	Notify ban	Email and IP ban
fortideceptor_unban	Notify unban	Email and CLI script

To configure stitches with the Fabric connector event trigger in the GUI:

1. Configure the triggers:
 - a. Go to *Security Fabric > Automation*, select the *Trigger* tab, and click *Create New*.
 - b. In the *Security Fabric* section, click *Fabric Connector Event* and enter the following:

Name	<i>fdc_Insider_Threat</i>
Description	<i>Insider_Threat</i>
Connector	Select the FortiDeceptor connector
Event Name	<i>Insider Threat</i>

- c. Click *OK*.
- d. Repeat these steps to create two more triggers with the following settings:

Name	<i>fdc_Notify_Ban</i>
Description	<i>Notify_Ban</i>

Connector	Select the FortiDeceptor connector
Event Name	<i>Notify Ban</i>
Name	<i>fdc_Notify_Unban</i>
Description	<i>Notify_Unban</i>
Connector	Select the FortiDeceptor connector
Event Name	<i>Notify Unban</i>

2. Configure the actions:

- a. Go to *Security Fabric > Automation*, select the *Action* tab, and click *Create New*.
- b. In the *Security Response* section, click *IP Ban* and enter the name, *fdc_ban-ip*.
- c. Click *OK*.
- d. Repeat these steps to create an *Email* (in the *Notifications* section) and a *CLI Script* (in the *General* section) action with the following settings:

Email	
Name	<i>email_log</i>
To	Enter an email address
Subject	<i>CSF stitch alert</i>
CLI Script	
Name	<i>fdc_unban</i>
Script	<i>diagnose user quarantine delete src4 %%log.srcip%%</i>
Administrator profile	<i>super_admin</i>

3. Configure the *fortideceptor_threat* stitch:

- a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
- b. Enter the name, *fortideceptor_threat*.
- c. Click *Add Trigger*. Select *fdc_Insider_Threat* and click *Apply*.
- d. Click *Add Action*. Select *email_log* and click *Apply*.
- e. Click *Add Action*. Select *fdc_ban-ip* and click *Apply*.
- f. Click the *Add delay* located between both actions. Enter 5 and click *OK*.
- g. Click *OK*.

4. Configure the *fortideceptor_ban* stitch:

- a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
- b. Enter the name, *fortideceptor_ban*.
- c. Click *Add Trigger*. Select *fdc_Notify_Ban* and click *Apply*.
- d. Click *Add Action*. Select *email_log* and click *Apply*.
- e. Click *Add Action*. Select *fdc_ban-ip* and click *Apply*.
- f. Click the *Add delay* located between both actions. Enter 5 and click *OK*.
- g. Click *OK*.

5. Configure the *fortideceptor_unban* stitch:
 - a. Go to *Security Fabric > Automation*, select the *Stitch* tab, and click *Create New*.
 - b. Enter the name, *fortideceptor_unban*.
 - c. Click *Add Trigger*. Select *fdc_Notify_Unban* and click *Apply*.
 - d. Click *Add Action*. Select *email_log* and click *Apply*.
 - e. Click *Add Action*. Select *fdc_unban* and click *Apply*.
 - f. Click the *Add delay* located between both actions. Enter *5* and click *OK*.
 - g. Click *OK*.

To configure stitches with the Fabric connector event trigger in the CLI:

1. Configure the triggers:

```
config system automation-trigger
  edit "fdc_Insider_Threat"
    set description "Insider_Threat"
    set event-type fabric-event
    set serial "FDC-VMTM210000**"
    set fabric-event-name "insider_threat"
  next
  edit "fdc_Notify_Ban"
    set description "Notify_Ban"
    set event-type fabric-event
    set serial "FDC-VMTM210000**"
    set fabric-event-name "notify_ban"
  next
  edit "fdc_Notify_Unban"
    set description "Notify_Unban"
    set event-type fabric-event
    set serial "FDC-VMTM210000**"
    set fabric-event-name "notify_unban"
  next
end
```

2. Configure the actions:

```
config system automation-action
  edit "fdc_ban-ip"
    set action-type ban-ip
  next
  edit "fdc_unban"
    set action-type cli-script
    set script "diagnose user quarantine delete src4 %%log.srcip%"
    set accprofile "super_admin"
  next
  edit "email_log"
    set action-type email
    set email-to "*****@fortinet.com"
    set email-subject "CSF stitch alert"
  next
end
```

3. Configure the stitches:

```
config system automation-stitch
  edit "fortideceptor_threat"
    set trigger "fdc_Insider_Threat"
    config actions
      edit 1
        set action "email_log"
        set required enable
      next
      edit 2
        set action "fdc_ban-ip"
        set delay 5
        set required enable
      next
    end
  next
  edit "fortideceptor_ban"
    set trigger "fdc_Notify_Ban"
    config actions
      edit 1
        set action "email_log"
        set required enable
      next
      edit 2
        set action "fdc_ban-ip"
        set delay 5
        set required enable
      next
    end
  next
  edit "fortideceptor_unban"
    set trigger "fdc_Notify_Unban"
    config actions

        set action "email_log"
        set required enable
      next
      edit 2
        set action "fdc_unban"
        set delay 5
        set required enable
      next
    end
  next
end
```

Verification

A device with IP 172.16.200.33 uses SSH to access the decoy (ubuntu16) deployed in the FortiDeceptor. The FortiDeceptor will detect the attacker IP 172.16.200.33, automatically quarantine it, and send the insider threat notification to the FortiGate. This notification will trigger the *fortideceptor_threat* stitch due to the insider threat event trigger, so an email alert is sent and the attacker IP (172.16.200.33) is banned.

In FortiDeceptor, if the attacker IP (172.16.200.33) is manually blocked or unblocked, the FortiDeceptor will send out the internal block or unblock notification to FortiGate (see [Quarantine Status](#) for more details). This notification will trigger

the `fortideceptor_ban` or `fortideceptor_unban` stitch due the notify ban or unban event trigger. An email alert is sent, and based on the event, the IP is banned or the CLI script runs to unban the IP.

To view the quarantine details in FortiDeceptor:

1. Go to *Fabric > Quarantine Status*.

a. Automatic quarantine:

Refresh Block Unblock

<input type="checkbox"/>	Attacker IP	Start	End	Type	Integrated Device	Time Remaining	Status	Message
<input checked="" type="checkbox"/>	172.16.200.33	2022-01-05 15:5...	2022-01-05 15:5...	Auto quarantine	fabricupstream	0	Quarantine stopp...	
<input type="checkbox"/>	172.16.200.33	2022-01-05 15:3...	2022-01-05 15:3...	Manual quarantine	fabricupstream	0	Quarantine stopp...	Manual block by a...
<input type="checkbox"/>	172.16.200.33	2021-10-13 10:1...	2021-10-13 10:1...	Manual quarantine	fabricupstream	0	Quarantine failed	Manual block by a...

b. Manual block or unblock:

Refresh Block Unblock

<input type="checkbox"/>	Attacker IP	Start	End	Type	Integrated Device	Time Remaining	Status	Message
<input checked="" type="checkbox"/>	172.16.200.33	2022-01-05 17:3...	2022-01-05 17:3...	Manual quarantine	fabricupstream	1m 57s	Quarantined	Manual block by a...
<input type="checkbox"/>	172.16.200.33	2022-01-05 15:5...	2022-01-05 15:5...	Auto quarantine	fabricupstream	0	Quarantine stopp...	
<input type="checkbox"/>	172.16.200.33	2022-01-05 15:3...	2022-01-05 15:3...	Manual quarantine	fabricupstream	0	Quarantine stopp...	Manual block by a...

To confirm that the stitch was triggered in the FortiOS GUI:

1. Go to *Security Fabric > Automation* and select the *Stitch* tab.

a. Triggered insider threat:

Stitch Trigger Action

+ Create New Edit Delete Clone Search

Name	Status	Trigger	Actions	FortiGate(s)	Trigger Count	Last Triggered
fortideceptor_threat	Enabled	fdc_Insider_Threat	email_log fdc_ban-ip	All FortiGates	3	Hour ago

b. Triggered notify ban or unban:

Stitch Trigger Action

+ Create New View Delete Clone Search

Name	Status	Trigger	Actions	FortiGate(s)	Trigger Count	Last Triggered
fortideceptor_ban	Enabled	fdc_Notify_Ban	email_log fdc_ban-ip	All FortiGates	1	Hour ago
fortideceptor_unban	Enabled	fdc_Notify_Unban	email_log >... fdc_unban	All FortiGates	2	Hour ago

To view the quarantined IP details in the FortiOS CLI:

```
# diagnose user quarantine list
src-ip-addr      created          expires          cause
172.16.200.33   Wed Jan  5 15:57:41 2022 indefinite    Administrative
```

If the IP is unbanned by the stitch, the list will be empty:

```
# diagnose user quarantine list
src-ip-addr      created          expires          cause
```

FortiOS event log trigger

You can configure a FortiOS event log trigger for when a specific event log ID occurs. You can select multiple event log IDs, and apply log field filters.

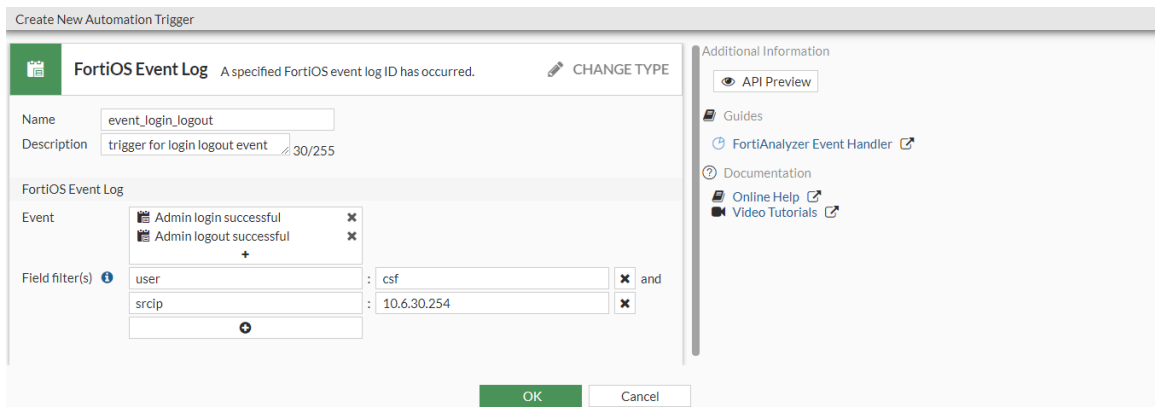

A maximum of 16 log IDs can be set as triggers for the event log.

To configure a FortiOS event log trigger in the GUI:

1. Go to *Security Fabric > Automation*, select the *Trigger* tab, and click *Create New*.
2. In the *Miscellaneous* section, click *FortiOS Event Log*.
3. Enter a name and description.
4. In the *Event* field, click the + to select multiple event log IDs.

The *Event* options correspond to the *Message Meaning* listed in the FortiOS Log Message Reference. Hover over an entry to view the tooltip that includes the event ID and log name. In this example, the *Admin login successful* event in the GUI corresponds to log ID *32001*, which is *LOG_ID_ADMIN_LOGIN_SUCC*.

5. In the *Field filter(s)* field, click the + to add multiple field filters. The configured filters much match in order for the stitch to be triggered.
 - a. To view the list of available fields for a log, refer to the FortiOS Log Message Reference by appending the log ID to the document URL (https://docs.fortinet.com/document/fortigate/7.0.15/fortios-log-message-reference/<log_ID>).

6. Click **OK**.

To configure a FortiOS event log trigger in the CLI:

```
config system automation-trigger
  edit "event_login_logout"
    set description "trigger for login logout event"
    set event-type event-log
    set logid 32001 32003
    config fields
      edit 1
        set name "user"
        set value "csf"
      next
      edit 2
        set name "srcip"
        set value "10.6.30.254"
      next
    end
  next
end
```

Actions

The following table outlines the available actions. Multiple actions can be added to an automation stitch. Actions can be reorganized in the *Edit Automation Stitch* page by dragging and dropping the actions in the diagram.

Category	Action	Description
Security Response		
	Access Layer Quarantine	This option is only available for Compromised Host triggers. Quarantine the MAC address on access layer devices (FortiSwitch and FortiAP).
	FortiClient Quarantine	This option is only available for Compromised Host triggers. Use FortiClient EMS to block all traffic from the source addresses that are flagged as compromised hosts.

Category	Action	Description
		Quarantined devices are flagged on the Security Fabric topology views. Go to the <i>Dashboard > Users & Devices > Quarantine</i> widget to view and manage quarantined IP addresses.
	FortiNAC Quarantine	This option is only available for Compromised Host and Incoming Webhook triggers. Use FortiNAC to quarantine a client PC and disable its MAC address. See FortiNAC Quarantine action on page 2535 for details.
	VMware NSX Security Tag	This option is only available for Compromised Host triggers. If an endpoint instance in a VMware NSX environment is compromised, the configured security tag is assigned to the compromised endpoint. See VMware NSX security tag action on page 2538 and VMware NSX-T security tag action on page 2542 for details.
	IP Ban	This option is only available for Compromised Host triggers. Block all traffic from the source addresses flagged by the IoC. Go to the <i>Dashboard > Users & Devices > Quarantine</i> widget to view and manage quarantined IP addresses.
Notifications		
	Email	Send a custom email message to the selected recipients. At least one recipient and an email subject must be specified. The email body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: <i>%%results.source%%</i> is the source property from the previous action. Replacement messages can be enabled in the email body to create branded email alerts. See Replacement messages for email alerts on page 2546 for details.
	FortiExplorer Notification	Send push notifications to FortiExplorer. The FortiGate must be registered to FortiCare on the mobile app that will receive the notification.
	Slack Notification	Send a notification to a Slack channel. See Slack Notification action on page 2550 for details.
	Microsoft Teams Notification	Send a notification to channels in Microsoft Teams. See Microsoft Teams Notification action on page 2555 for details.
Cloud Compute		
	AWS Lambda	Send log data to an integrated AWS service. See AWS Lambda action on page 2560 for details.

Category	Action	Description
	Azure Function	Send log data to an Azure function. See Azure Function action on page 2562 for details.
	Google Cloud Function	Send log data to a Google Cloud function. See Google Cloud Function action on page 2563 for details.
	AliCloud Function	Send log data to an AliCloud function. See AliCloud Function action on page 2565 for details.
General		
	CLI Script	Run one or more CLI scripts. See CLI script action on page 2567 for details. See Execute a CLI script based on memory and CPU thresholds on page 2570 for an example.
	Webhook	Send an HTTP request using a REST callback. See Webhook action on page 2576 for details, and Slack integration webhook on page 2589 and Microsoft Teams integration webhook on page 2591 for examples.
	Alert	Generate a FortiOS dashboard alert. This option is only available in the CLI.
	Disable SSID	Disable the SSID interface. This option is only available in the CLI.

FortiNAC Quarantine action

Users can configure an automation stitch with the FortiNAC Quarantine action with a Compromised Host or Incoming Webhook trigger. When the automation is triggered, the client PC will be quarantined and its MAC address is disabled in the configured FortiNAC.

In this example, the FortiNAC has been configured to join an enabled Security Fabric. See [FortiNAC](#) for more information.

The FortiNAC must also be configured to isolate disabled hosts:

- Endpoints connecting to FortiWiFi or wired ports on FortiGate:
 - See the requisite *Configure FortiNAC* section in the [FortiGate Endpoint Management Integration Guide](#).
- Endpoints connecting to FortiAP:
 - Set the *Dead End VLAN*. See [Model configuration](#).
- Endpoints connecting to FortiSwitch:
 - Set the *Dead End VLAN*. See [Model configuration](#).
 - Add the switch to the physical address filtering group. See [Systems groups](#) and [Modify a group](#).

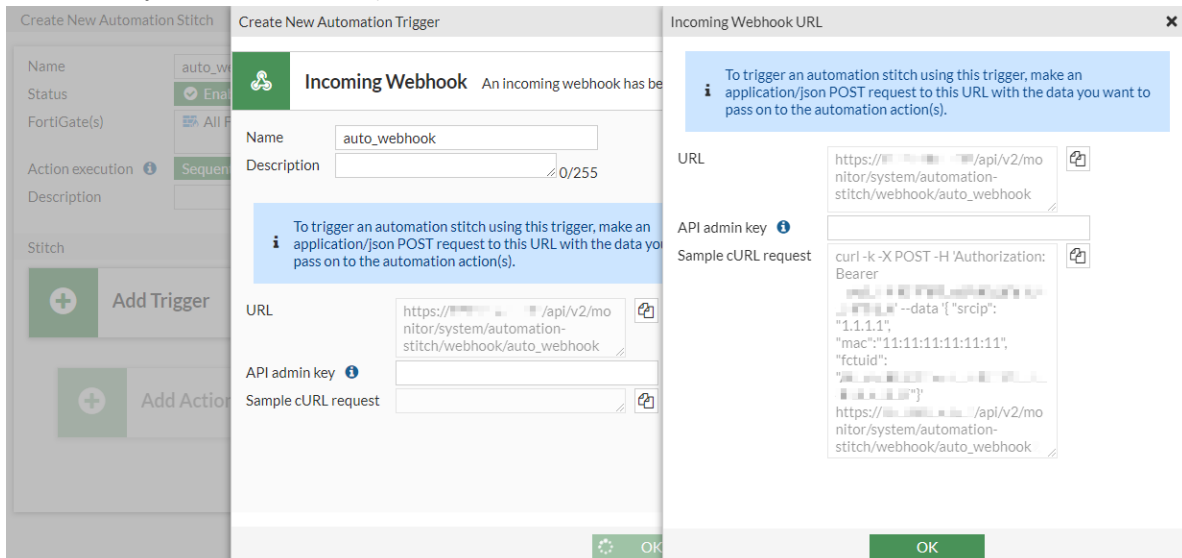

To configure an automation stitch with a FortiNAC quarantine action in the GUI:

1. Create a new API user and generate the API key:
 - a. Go to *System > Administrators* and click *Create New > REST API Admin*.
 - b. Configure the settings as needed.

- c. Click **OK**. The *New API key* window opens.
- d. Copy the key to the clipboard and click **Close**.

- e. Click **OK**.
2. Configure the automation stitch trigger:
 - a. Go to *Security Fabric > Automation* and click *Create New*.
 - b. Enter the stitch name (*auto_webhook*).
 - c. Click *Add Trigger*.
 - d. Click *Create* and select *Incoming Webhook*.
 - e. Enter a name (*auto_webhook*).
 - f. Click **OK**.
 - g. Paste the key in the *API admin key* field.

- h. Click **OK**.
- i. Select the trigger in the list and click *Apply*.
3. Configure the automation stitch action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *FortiNAC Quarantine*.
 - c. Enter an action name (*auto_webhook_quarantine-fortinac*) and click **OK**.
 - d. Select the action in the list and click *Apply*.
 - e. Click **OK**.
4. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer cxx7d9xdzxx14Nztd1Ncr701dpwwy9' --data '{"srcip": "1.1.1.1", "mac": "00:0C:29:0B:A6:16", "fctuid": "A8BA0B12DA694E47BA4ADF24F8358E2F"}' https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
```

5. In FortiOS, verify the automation stitch is triggered and the action is executed:
 - a. Go to *Log & Report > Events* and select *System Events* to confirm that the stitch was activated.
 - b. Go to *Security Fabric > Automation* to see the last time that the stitch was triggered.
 In FortiNAC, the *Host View* shows the status of the client PC. It is quarantined and its MAC address is disabled.

Hosts - Displayed: 1 Total: 7

Options Add Modify Delete Enable Disable

To configure an automation stitch with a FortiNAC quarantine action in the CLI:

1. Create a new API user and generate the API key:

```
config system api-user
  edit "g-api-rw-user"
    set api-key *****
    set accprofile "super_admin"
    set vdom "root"
    config trusthost
      edit 1
        set ipv4-trusthost 10.6.30.0 255.255.255.0
      next
    end
  next
end
```

2. Configure the automation trigger:

```
config system automation-trigger
  edit "auto_webhook"
    set event-type incoming-webhook
  next
end
```

3. Configure the automation action:

```
config system automation-action
  edit "auto_webhook_quarantine-fortinac"
    set action-type quarantine-fortinac
  next
end
```

4. Configure the automation stitch:

```
config system automation-stitch
  edit "auto_webhook"
    set trigger "auto_webhook"
```

```

config actions
  edit 1
    set action "auto_webhook_quarantine-fortinac"
    set required enable
  next
end
next
end

```

5. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

```

root@pc56:~# curl -k -X POST -H 'Authorization: Bearer cKx7d9xdzxx14Nztd1Ncr701dpwpy9' -
-data '{ "srcip": "1.1.1.1", "mac": "00:0C:29:0B:A6:16", "fctuid":
"A8BA0B12DA694E47BA4ADF24F8358E2F"}'
https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook

```

6. In FortiOS, verify that the automation stitch is triggered and the action is executed:

```

# diagnose test application autod 2
csf: enabled    root:yes
version:1592949233 sync time:Tue Jun 23 15:03:15 2020

total stitches activated: 1

webhook_quarantine-fortinac" from="log" msg="stitch:auto_webhook is triggered."

```

VMware NSX security tag action

If an endpoint instance in a VMware NSX environment is compromised, this action will assign the configured security tag to the compromised endpoint.

This action is only available when the automation trigger is set to compromised host.

To set up the NSX quarantine action, you need to:

1. [Configure a VMware NSX SDN connector](#)
2. [Configure an NSX security tag automation stitch](#)
3. [Configure FortiAnalyzer logging on the FortiGate](#)

Configure a VMware NSX SDN connector

The FortiGate retrieves security tags from the VMware NSX server through the connector.

To configure a VMware NSX SDN connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. Select *VMware NSX*.
4. Configure the settings as needed.

The screenshot shows the 'New External Connector' configuration page in the FortiGate GUI. The page is divided into several sections:

- Private SDN:** A VMware logo with a green checkmark and the text 'VMware NSX'.
- Connector Settings:**
 - Name: nsx
 - Status: Enabled (with a green checkmark icon) and Disabled (with a red X icon).
 - Update interval: Use Default (selected) and Specify.
- NSX Connector:**
 - IP / Hostname: 172.18.64.32
 - Username: admin
 - Password: masked with dots.
- vCenter Settings:** A toggle switch is turned off.

On the right side, there is an 'Additional Information' panel with links to 'API Preview', 'Public SDN Connector Setup Guides' (for Amazon Web Services, Google Cloud Platform, Microsoft Azure, and Oracle Cloud Infrastructure), 'Private SDN Connector Setup Guides' (for Cisco Application Centric Infrastructure, Nuage Virtualized Services Platform, and OpenStack Connector), and 'Documentation' (for Online Help and Video Tutorials).

At the bottom of the configuration area, there are 'OK' and 'Cancel' buttons.

5. Click *OK*.

To configure a VMware NSX SDN connector in the CLI:

```
config system sdn-connector
  edit "nsx"
    set type nsx
    set server "172.18.64.32"
    set username "admin"
    set password xxxxxxxxxxxx
  next
end
```

Configure an NSX security tag automation stitch

Security tags are retrieved from the VMware NSX server through the NSX SDN connector.

To configure an automation stitch with an NSX security tag in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*pcui-test*).
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Compromised Host*.
 - c. Enter the trigger name (*pcui-test*).
 - d. Click *OK*.
 - e. Select the trigger in the list and click *Apply*.
4. Configure the VMware NSX Security Tag action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *VMware NSX Security Tag*.
 - c. Enter the following:

Name	pcui-test_quarantine-nsx
Specify NSX server(s)	Enable and select the SDN connector
Security tag	Select an existing tag, or create a new one

- d. Click *OK*.
 - e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an automation stitch with an NSX security tag in the CLI:

1. Create the automation trigger:

```

config system automation-trigger
    edit "pcui-test"
        next
    end
            
```

2. Create the automation action:

```

config system automation-action
  edit "pcui-test_quarantine-nsx"
    set action-type quarantine-nsx
    set security-tag "pcui-tag2"
    set sdn-connector "nsx"
  next
end

```

3. Create the automation stitch:

```

config system automation-stitch
  edit "pcui-test"
    set trigger "pcui-test"
    config actions
      edit 1
        set action "pcui-test_quarantine-nsx"
        set required enable
      next
    end
  next
end

```

Configure FortiAnalyzer logging on the FortiGate

The FortiAnalyzer is used to send endpoint compromise notification to the FortiGate.

See [Configuring FortiAnalyzer on page 2371](#) for more information.

To configure FortiAnalyzer logging in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
2. Ensure the *Status* is *Enabled*, and configure the settings as needed.

The screenshot displays the 'Edit Fabric Connector' window for 'FortiAnalyzer Logging'. The 'FortiAnalyzer Settings' section includes:

- Status: Enabled (with a green checkmark icon)
- IP address: 172.18.64.234 (with a 'Test Connectivity' button)
- Upload option: Real Time (with 'Every Minute' and 'Every 5 Minutes' options)
- Allow access to FortiGate REST API: Enabled (with a green checkmark icon)
- Verify FortiAnalyzer certificate: Enabled (with a green checkmark icon and a certificate icon)

The 'FortiAnalyzer Status' section shows:

- Connection: Connected (with a green checkmark icon and a 'Refresh' button)
- FortiAnalyzer Usage:
 - Logging ADOM: 80% (25.53 GIB / 32.00 GIB)
 - Analytics usage: 90% (20.11 GIB / 22.40 GIB)
 - Archive usage: 56% (5.41 GIB / 9.60 GIB)
- Security Rating Issues: Show Dismissed (with a toggle switch)
- Additional Information: API Preview (with an eye icon)

At the bottom of the window are 'OK' and 'Cancel' buttons.

3. Click *Apply*.

To configure FortiAnalyzer logging in the CLI:

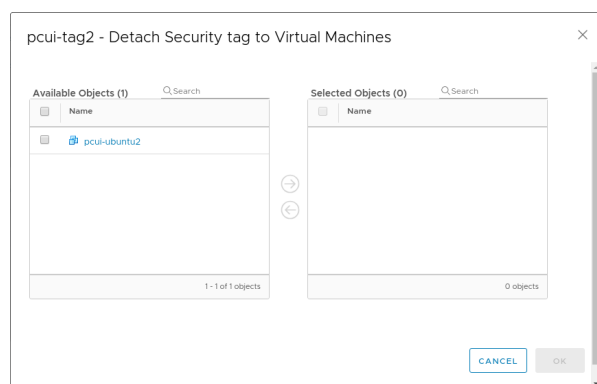

```

config log fortianalyzer setting
  set status enable
  set server "172.18.64.234"
  set serial "FL-8HFT000000000"
  set upload-option realtime
  set reliable enable
end

```

When an endpoint instance is compromised

When an endpoint instance, such as *pcui-ubuntu2*, in the VMware NSX environment is compromised, the automation stitch is triggered. The FortiGate then assigns the configured security tag, *pcui-tag2* in this example, to the compromised NSX endpoint instance.

**VMware NSX-T security tag action**

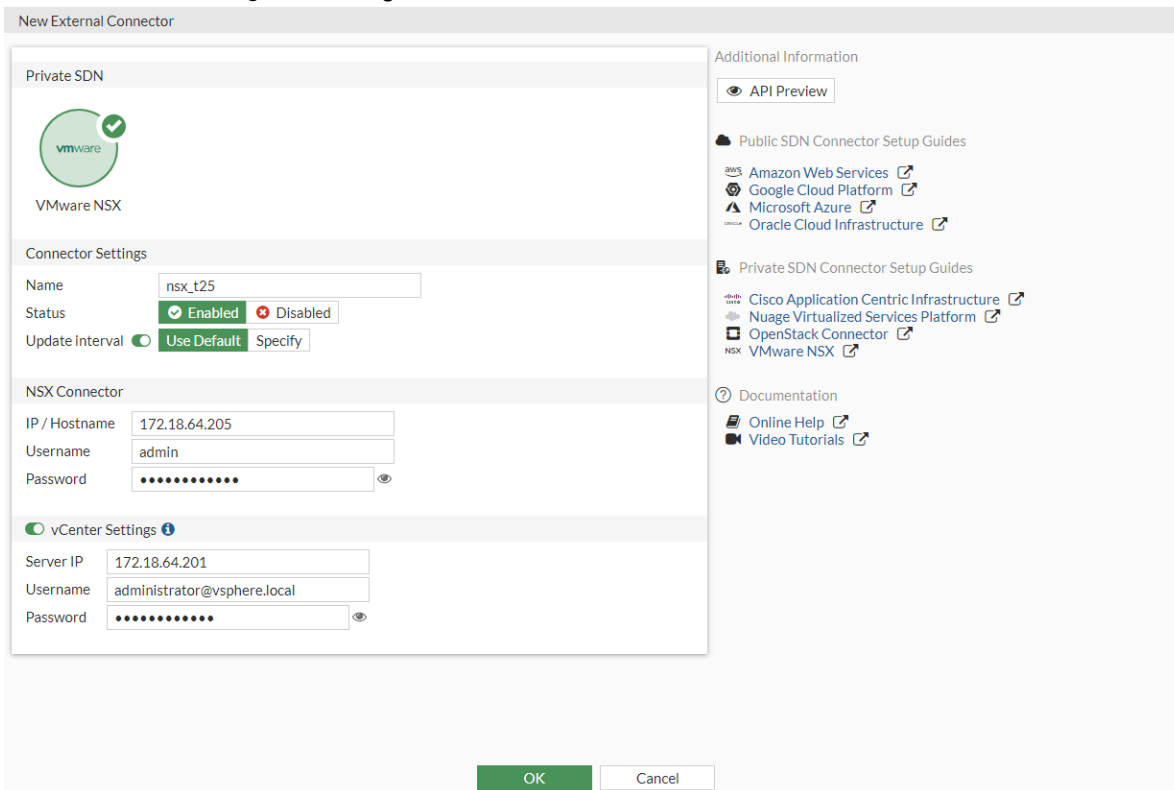

VMware NSX SDN connectors' vCenter server and credentials can be configured so the FortiGate resolves NSX-T VMs. The FortiGate uses the VMWare NSX Security Tag automation action to assign a tag to the VM through an automation stitch.

The FortiGate is notified of a compromised host on the NSX-T network by an incoming webhook or other means, such as FortiGuard IOC. An automation stitch can be configured to process this trigger and action it by assigning a VMware NSX security tag on the VM instance.

To configure an automation stitch to assign a security tag to NSX-T VMs in the GUI:

1. Configure the NSX SDN connector:
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. Select *VMware NSX*.
 - c. Configure the connector settings.

d. Enable *vCenter Settings* and configure as needed.

e. Click **OK**.

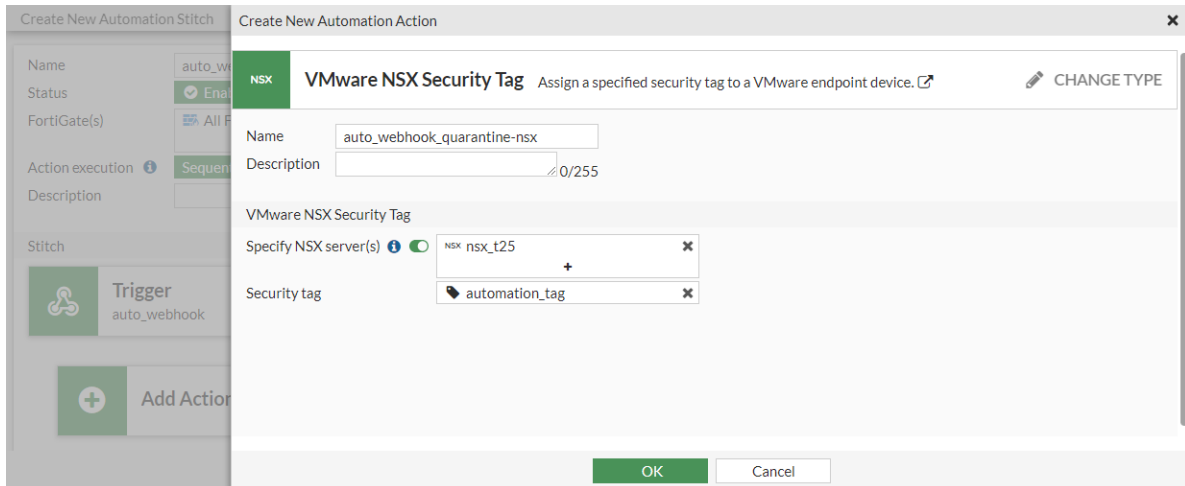

2. Configure the automation stitch trigger:

- a. Go to *Security Fabric > Automation* and click *Create New*.
- b. Enter the stitch name (*auto_webhook*).
- c. Click *Add Trigger*.
- d. Click *Create* and select *Incoming Webhook*.
- e. Enter a name (*auto_webhook*).
- f. Click **OK** to close the *Incoming Webhook URL* prompt.
- g. Select the trigger in the list and click *Apply*.

3. Configure the automation stitch action:

- a. Click *Add Action*.
- b. Click *Create* and select *VMware NSX Security Tag*.
- c. Enter the following:

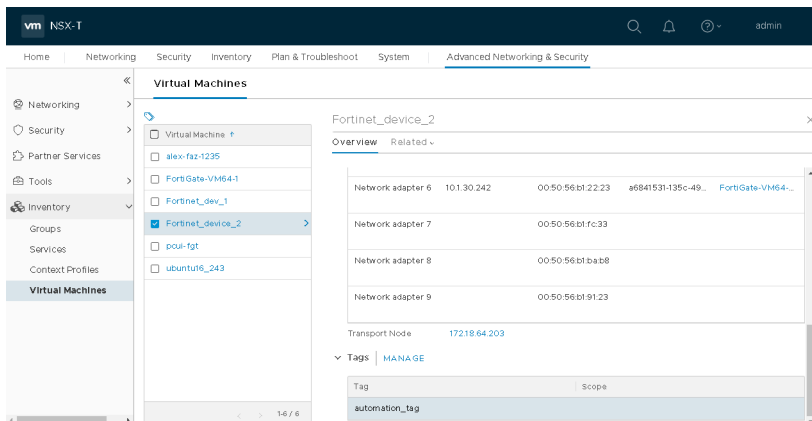

Name	auto_webhook_quarantine-nsx
Specify NSX server(s)	Enable and select the SDN connector
Security tag	Select an existing tag, or create a new one

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
4. Click **OK**.
 5. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

```
root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer
3fdxNG08mgNg0fh4NQ51g1NQ1QHcxx' --data '{ "srcip": "10.1.30.242"}'
https://172.16.116.230/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
{
  "http_method": "POST",
  "status": "success",
  "http_status": 200,
  "serial": "FGVM08TM20000000",
  "version": "v6.4.0",
  "build": 1608
}
```

The automation stitch is triggered and the configured tag is added to the NSX-T VM.

In FortiOS, the *Security Fabric > Automation* page shows the last trigger time.

Name	Status	Trigger	Actions	FortiGate(s)	Trigger Count	Last Triggered
Incoming Webhook						
Incoming Webhook Quarantine	Enabled	Incoming Webhook Call	Compromised Host Quarantine_quarantine Compromised Host Quarantine_quarantine-forticlient	All FortiGates	0	
auto_webhook	Enabled	auto_webhook	NSX auto_webhook_quarantine-nsx	All FortiGates	1	6 minutes ago

100% Updated: 15:38:21

To configure an automation stitch to assign a security tag to NSX-T VMs in the CLI:

1. Configure the NSX SDN connector:

```
config system sdn-connector
  edit "nsx_t25"
    set type nsx
    set server "172.18.64.205"
    set username "admin"
    set password xxxxxxxxxxxx
    set vcenter-server "172.18.64.201"
    set vcenter-username "administrator@vsphere.local"
    set vcenter-password xxxxxxxxxxxx
  next
end
```

2. Configure the automation stitch:

```
config system automation-trigger
  edit "auto_webhook"
    set trigger-type event-based
    set event-type incoming-webhook
  next
end

config system automation-action
  edit "auto_webhook_quarantine-nsx"
    set action-type quarantine-nsx
    set security-tag "automation_tag"
    set sdn-connector "nsx_t25"
  next
end

config system automation-stitch
  edit "auto_webhook"
    set trigger "auto_webhook"
    config actions
      edit 1
        set action "auto_webhook_quarantine-nsx"
        set required enable
      next
    end
  next
end
```

3. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

```
root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer
3fdxNG08mgNg0fh4NQ51g1NQ1QHcxx' --data '{"srcip": "10.1.30.242"}'
https://172.16.116.230/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
```

```
{
  "http_method":"POST",
  "status":"success",
  "http_status":200,
  "serial":"FGVM08TM20000000",
  "version":"v6.4.0",
  "build":1608
}
```

To verify the automation stitch is triggered and the action is executed:

```
# diagnose test application autod 2

csf: enabled root:yes
version:1586883541 sync time:Tue Apr 14 11:04:05 2020

total stitches activated: 1

stitch: auto_webhook
destinations: all
trigger: auto_webhook

(id:15)service=auto_webhook

local hit: 1 relayed to: 0 relayed from: 0
actions:
auto_webhook_quarantine-nsx type:quarantine-nsx interval:0
security tag:automation_tag
sdn connector:
nsx_t25;
```

Replacement messages for email alerts

Automation stitches with an Email action can leverage the formatting options provided by replacement messages to create branded email alerts.

You can enable a replacement message and edit the message body or select a customized replacement message group when you configure the automation action. When the automation stitch is triggered, the FortiGate will send the email with the defined replacement message.

In this example, a Security Rating report triggers an Email notification action. The email uses a customized replacement message group.

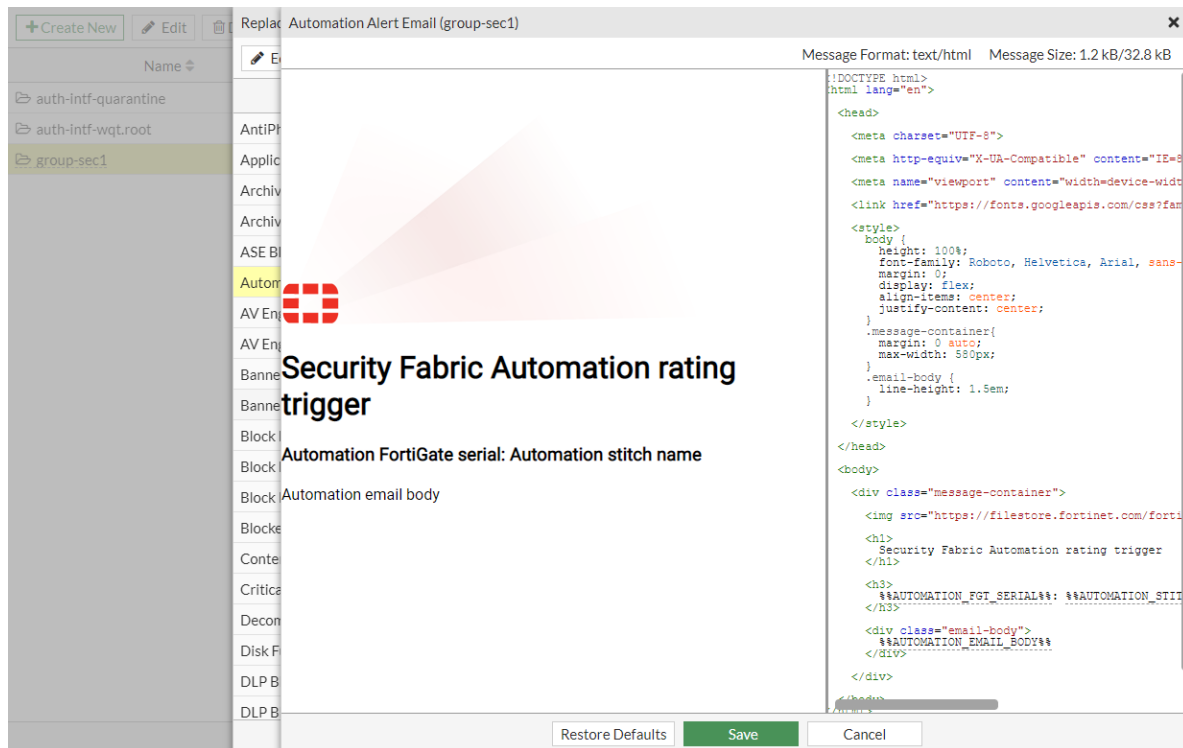

To configure the replacement message group in the GUI:

1. Go to *System > Replacement Message Groups* and click *Create New*.
2. Enter the following:

Name	group-sec1
Group Type	Security

3. Click *OK*.
4. Select the group in the list and click *Edit*.

5. Select *Automation Alert Email* and click *Edit*.

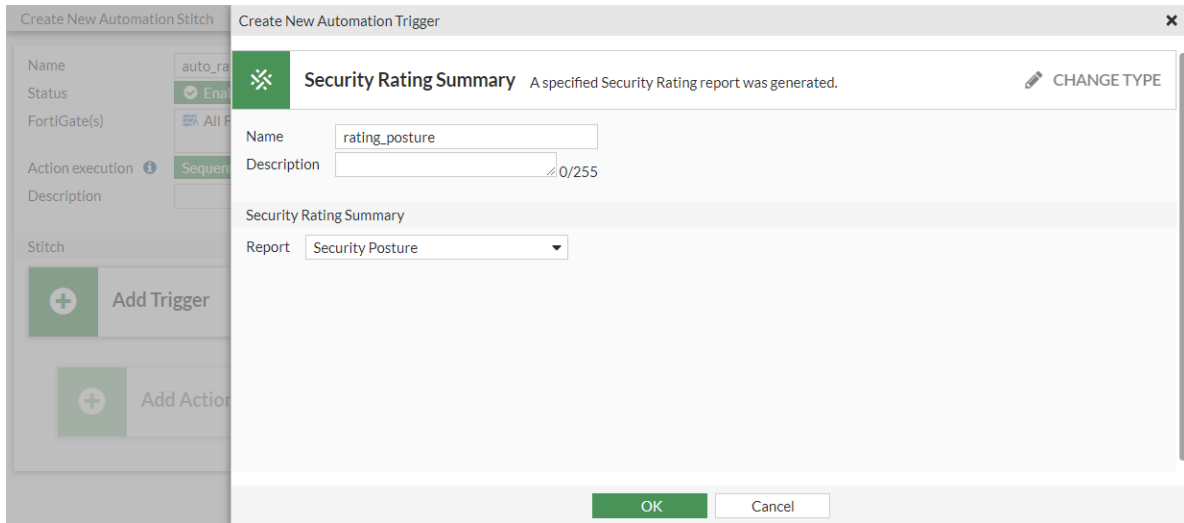

6. Edit the HTML code as needed, then click *Save*.

To configure the email action in the GUI:

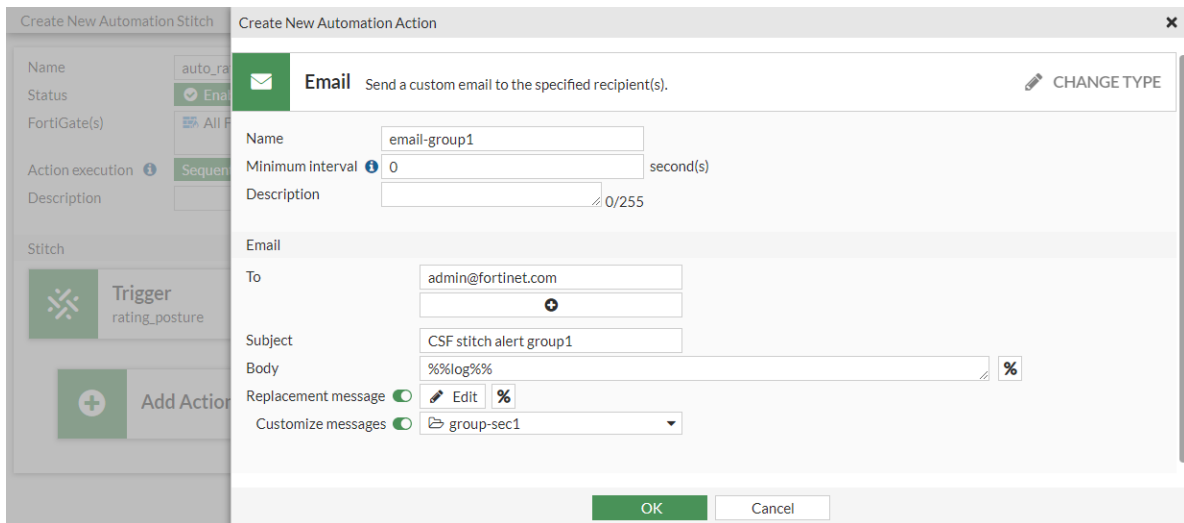

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Security Rating Summary*.
 - c. Enter the following:

Name	rating_posture
Description	rating test
Report	Security Posture

- d. Click **OK**.
 - e. Select the trigger in the list and click **Apply**.
4. Configure the Email notification action:
- a. Click **Add Action**.
 - b. Click **Create** and select **Email**.
 - c. Enter the following:

Name	email-group1
To	Enter an email address
Subject	CSF stitch alert group1
Replacement message	Enable
Customize messages	Enable and select group-sec1 from the dropdown

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
5. Click **OK**.

6. Right-click the automation stitch, and click *Test Automation Stitch*.

After the Security Rating report is finished, the automation is triggered, and the email is delivered with the customized replacement message in the email body.

To configure the replacement message group in the CLI:

```
config system replacemsg-group
  edit "group-secl"
    set comment ""
    set group-type utm
    config automation
      edit "automation-email"
        set buffer "...<h1> Security Fabric Automation rating trigger </h1>..."
        ...
      next
    end
  next
end
```

To configure the email action in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
  edit "rating_posture"
    set description "rating test"
    set event-type security-rating-summary
  next
end
```

2. Configure the automation action:

```
config system automation-action
  edit "email-group1"
    set action-type email
    set email-to "admin@fortinet.com"
    set email-subject "CSF stitch alert group1"
    set replacement-message enable
```

```
        set replacemsg-group "group-sec1"
    next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
    edit "auto_rating"
        set trigger "rating_posture"
        config actions
            edit 1
                set action "email-group1"
                set required enable
            next
        end
    next
end
```

4. To view the automation stitch information after it is triggered:

```
# diagnose test application autod 3
stitch: auto_rating
    local hit: 1 relayed to: 0 relayed from: 0
    last trigger:Tue Mar 16 15:11:29 2021
    last relay:
    actions:
        email-group1:
            done: 1 relayed to: 0 relayed from: 0
            last trigger:Tue Mar 16 15:11:29 2021
            last relay:

logid2stitch mapping:
id:52000 local hit: 1 relayed hits: 0
    auto_rating
```

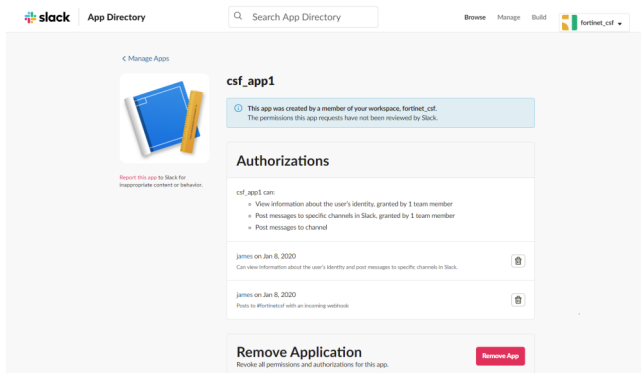

Slack Notification action

To configure an automation stitch with a Slack Notification action, you first need to configure an incoming webhook in Slack. Then you can enter the webhook URL when you configure the Slack Notification action.

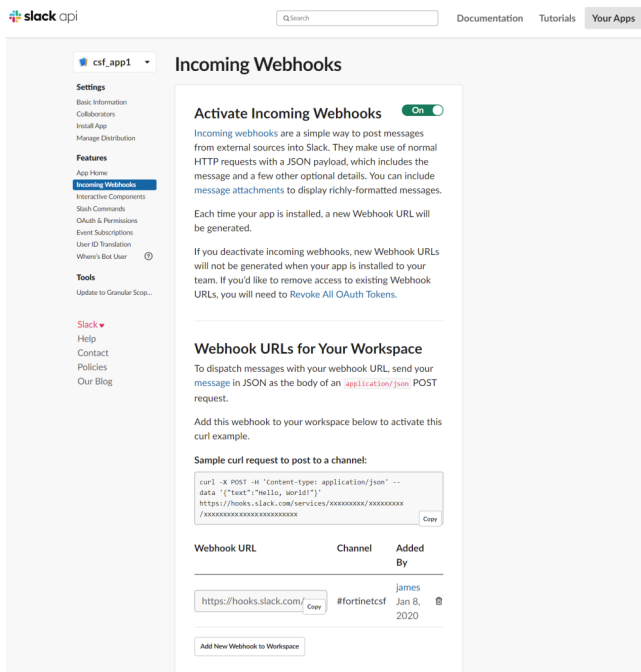

This example uses a Security Rating Summary trigger in the automation stitch with two Slack Notification actions with different notification messages. One message is a custom message, and the other is for the Security Rating Summary log with a 90 second delay.

To create an Incoming Webhook in Slack:

1. Go to the Slack website, and create a workspace.
2. Create a Slack application for the workspace.

3. Add an Incoming Webhook to a channel in the workspace (see [Sending messages using Incoming Webhooks](#) for more details).
4. Activate the Incoming Webhook, and copy the *Webhook URL* to the clipboard.

To configure an automation stitch with Slack Notification actions in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the Security Rating Summary trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Security Rating Summary*.

c. Enter the following:

Name	auto-rating
Report	Security Posture

d. Click *OK*.

e. Select the trigger in the list and click *Apply*.

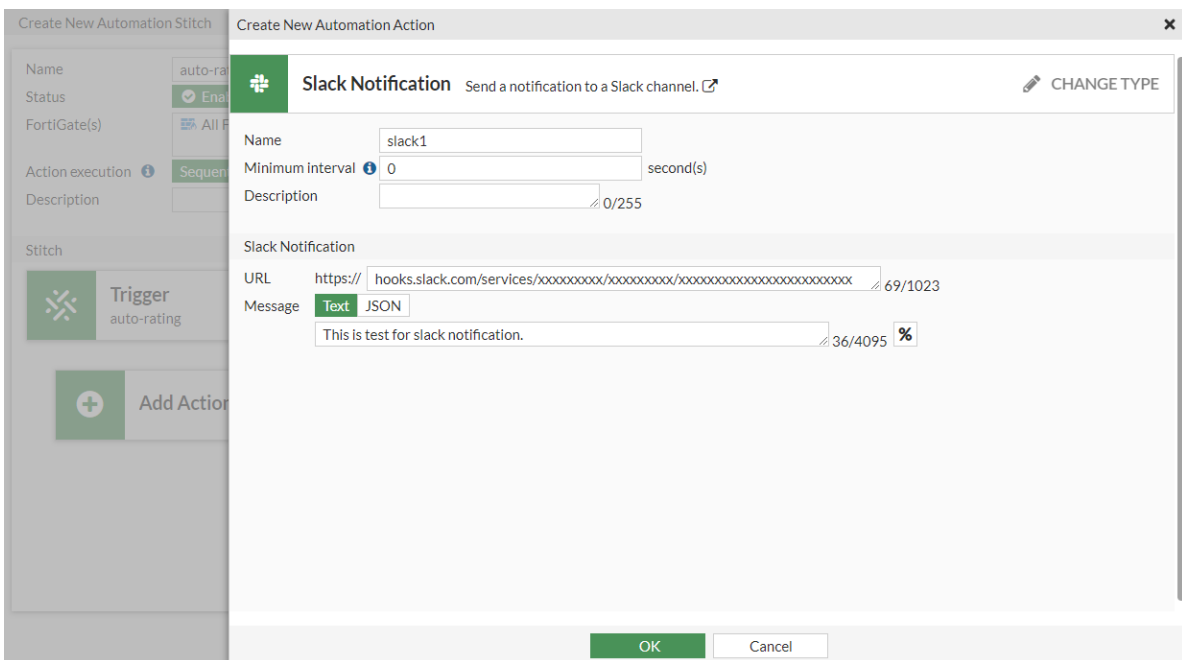

4. Configure the first Slack Notification action:

a. Click *Add Action*.

b. Click *Create* and select *Slack Notification*.

c. Enter the following:

Name	slack1
URL	Paste the webhook URL from the clipboard
Message	Text
Message text	This is test for slack notification.

d. Click *OK*.

e. Select the action in the list and click *Apply*.

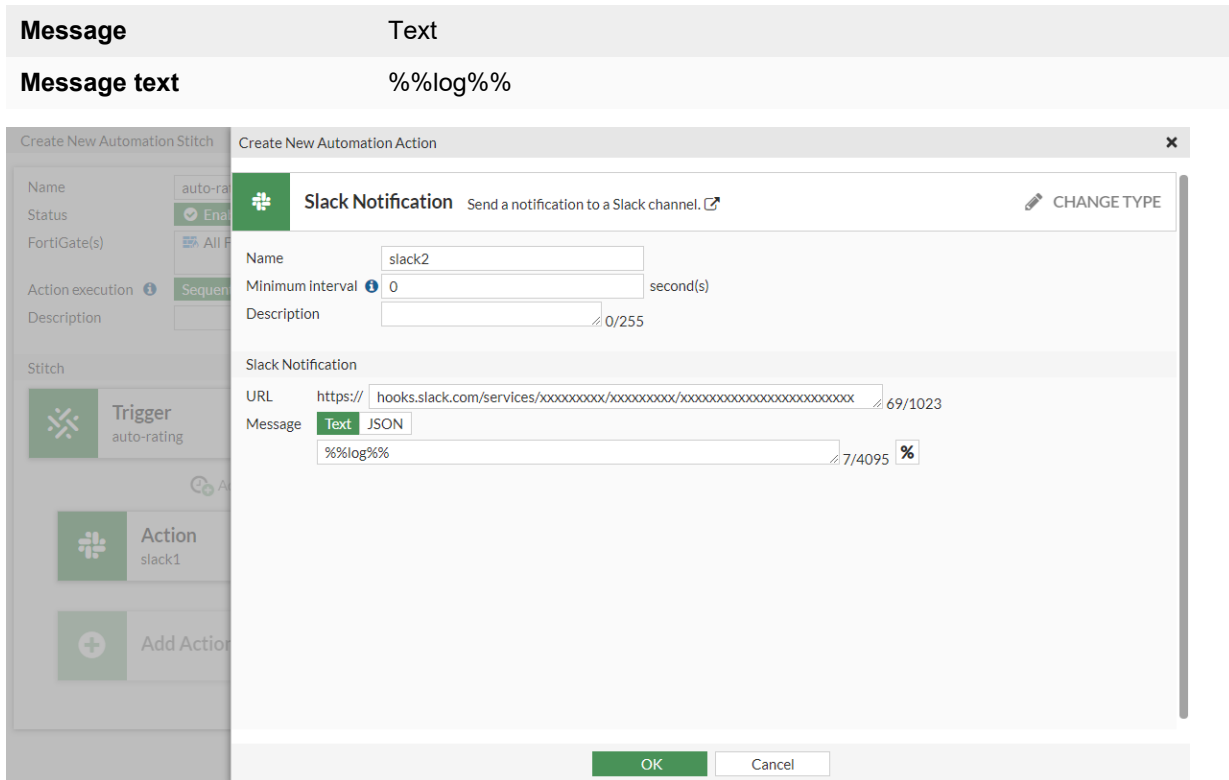

5. Configure the second Slack Notification action:

a. Click *Add Action*.

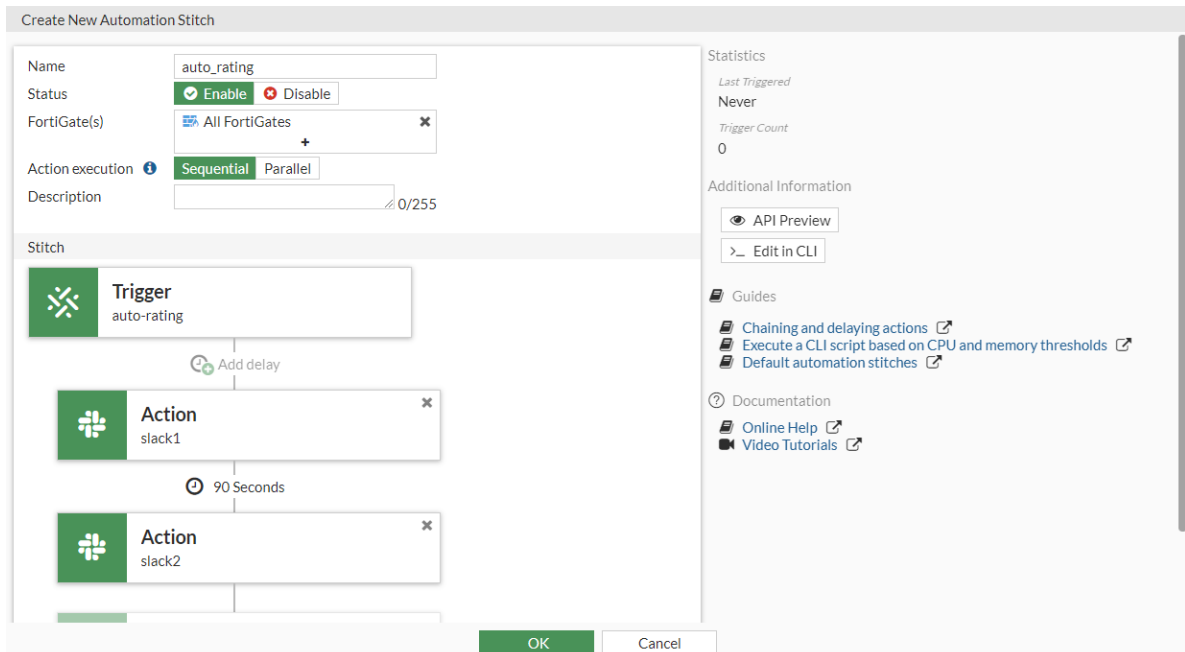

b. Click *Create* and select *Slack Notification*.

c. Enter the following:

Name	slack2
URL	Paste the webhook URL from the clipboard

- d. Click **OK**.
- e. Select the action in the list and click **Apply**.
- f. Click the **Add delay** located between both actions. Enter **90** and click **OK**.

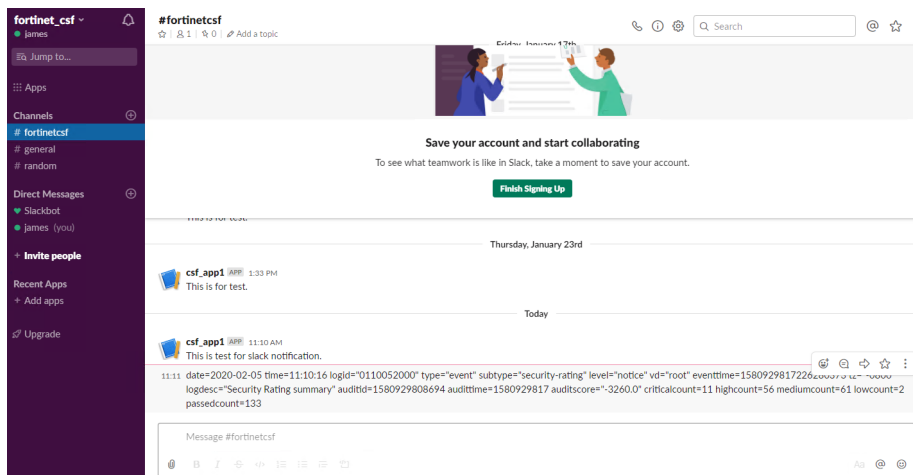

- 6. Click **OK**.

7. Trigger the automation stitch:

- a. Right-click the automation stitch and select *Test Automation Stitch*.

After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Slack channel.

To configure an automation stitch with Slack Notification actions in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
  edit "auto-rating"
    set event-type security-rating-summary
  next
end
```

2. Configure the automation actions:

```
config system automation-action
  edit "slack1"
    set action-type slack-notification
    set message "This is test for slack notification."
    set uri "hooks.slack.com/services/xxxxxxxx/xxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxxx"
  next
  edit "slack2"
    set action-type slack-notification
    set uri "hooks.slack.com/services/xxxxxxxx/xxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxxx"
  next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
  edit "auto_rating"
    set trigger "auto-rating"
    config actions
      edit 1
        set action "slack1"
        set required enable
      next
      edit 2
        set action "slack2"
```

```

        set delay 90
        set required enable
    next
end
next
end

```

4. Verify that the automation action was triggered:

```

# diagnose test application autod 3
stitch: auto-rating
  local hit: 1 relayed to: 0 relayed from: 0
  last trigger:Wed Feb 05 11:10:23 2020
  last relay:
  actions:
    slack1:
      done: 1 relayed to: 0 relayed from: 0
      last trigger:Wed Feb 11:10:23 2020
      last relay:
    slack2:
      done: 1 relayed to: 0 relayed from: 0
      last trigger:Wed Feb 05 11:10:23 2020
      last relay:

```

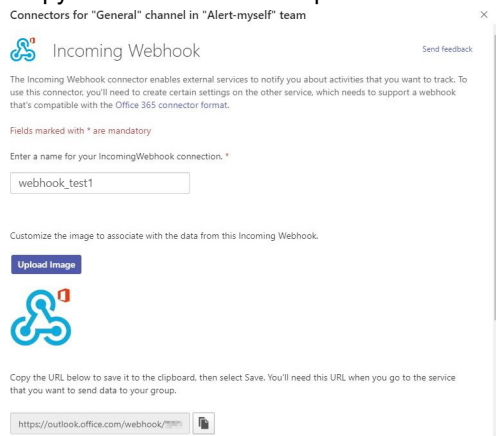

Microsoft Teams Notification action

Microsoft Teams Notification actions can be configured to send notifications to channels in Microsoft Teams. To trigger the notifications, you need to add an Incoming Webhook connector to a channel in Microsoft Teams, then you can configure the automation stitch with the webhook URL.

In the following example, you will configure an automation stitch with a Security Rating Summary trigger and two Microsoft Teams Notification actions with different notification messages. One message is for the Security Rating Summary log, and the other is a custom message with a ten second delay.

To add the Incoming Webhook connector in a Microsoft Teams channel:

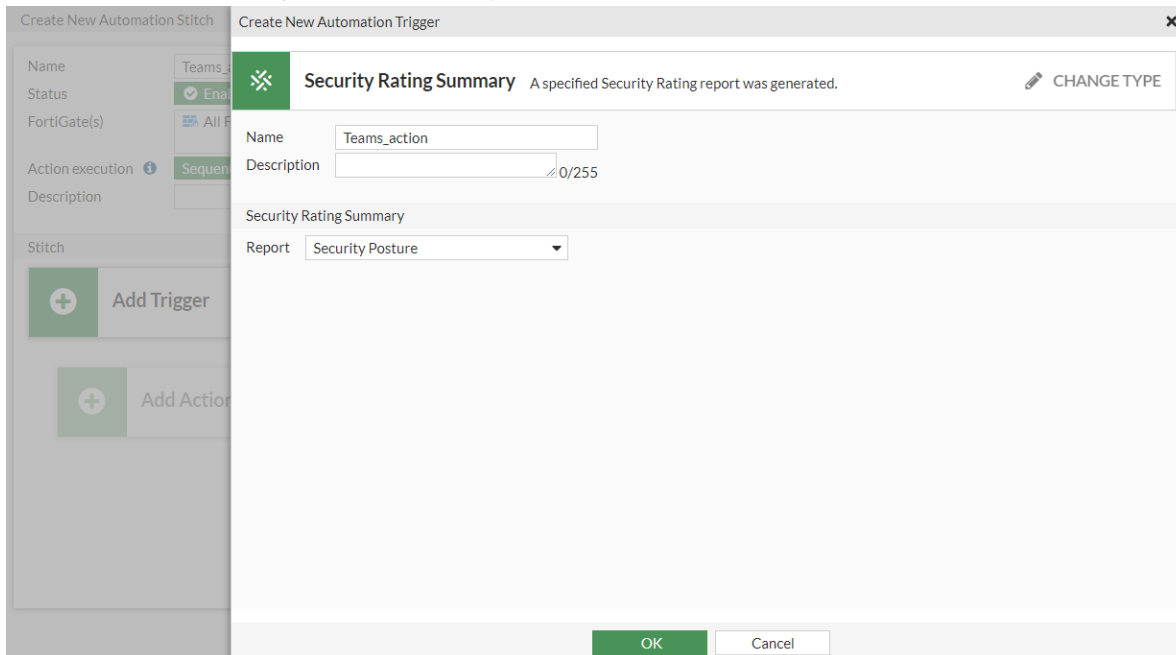

1. In Microsoft Teams, click the ... (*More options*) beside the channel name, and select *Connectors*.
2. Search for *Incoming Webhook* and click *Configure*.
3. Enter a name for the webhook, upload an image for the webhook, and click *Create*.
4. Copy the webhook to the clipboard and save it.

5. Click *Done*.

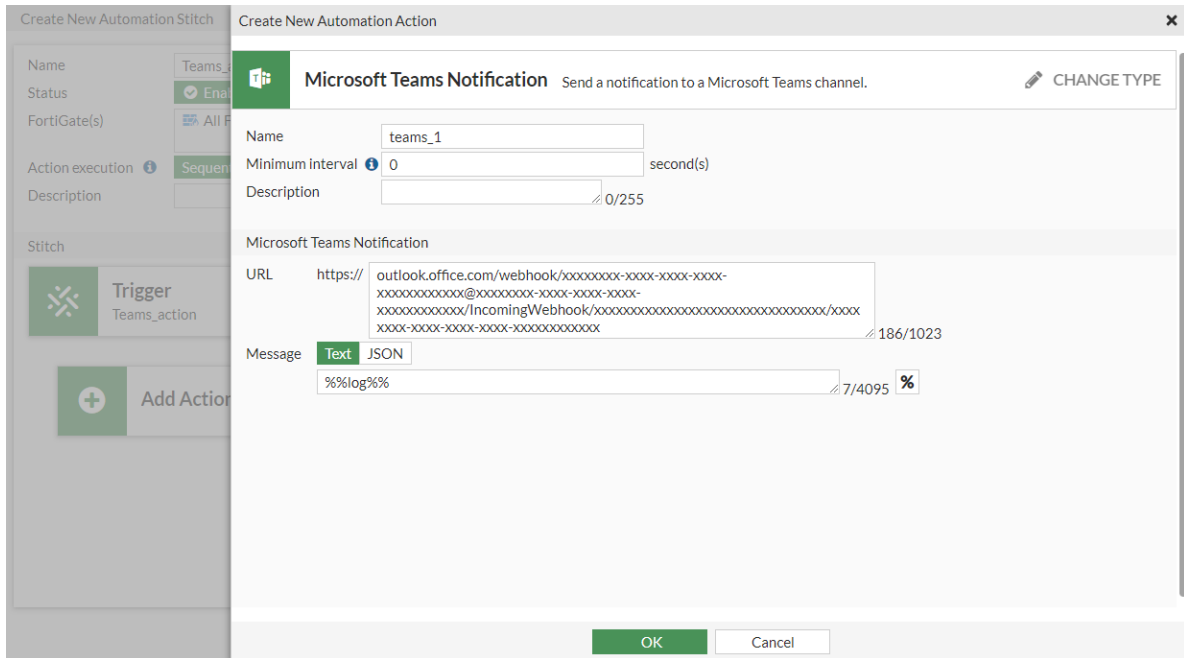

To configure an automation stitch with Microsoft Teams Notification actions in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the Security Rating Summary trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Security Rating Summary*.
 - c. Enter a name, and for *Report*, select *Security Posture*.

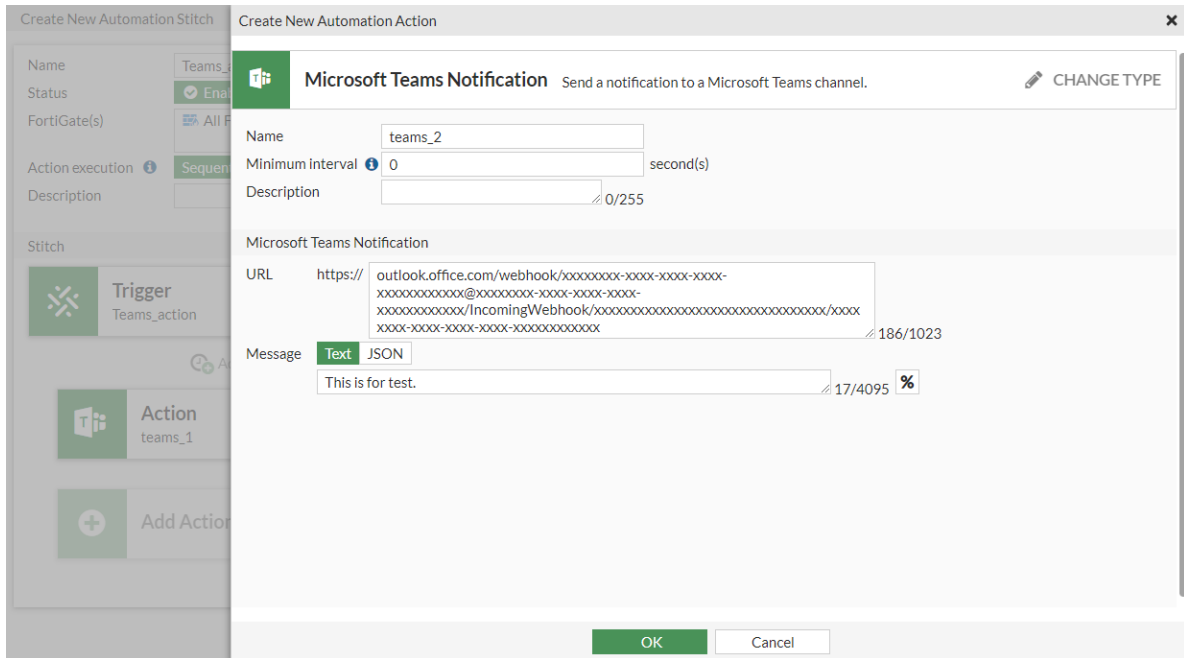

- d. Click *OK*.
- e. Select the trigger in the list and click *Apply*.
4. Configure the first Microsoft Teams Notification action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Microsoft Teams Notification*.
 - c. Enter the following:

Name	teams_1
URL	Paste the webhook URI from the clipboard
Message	Text
Message text	%%log%%

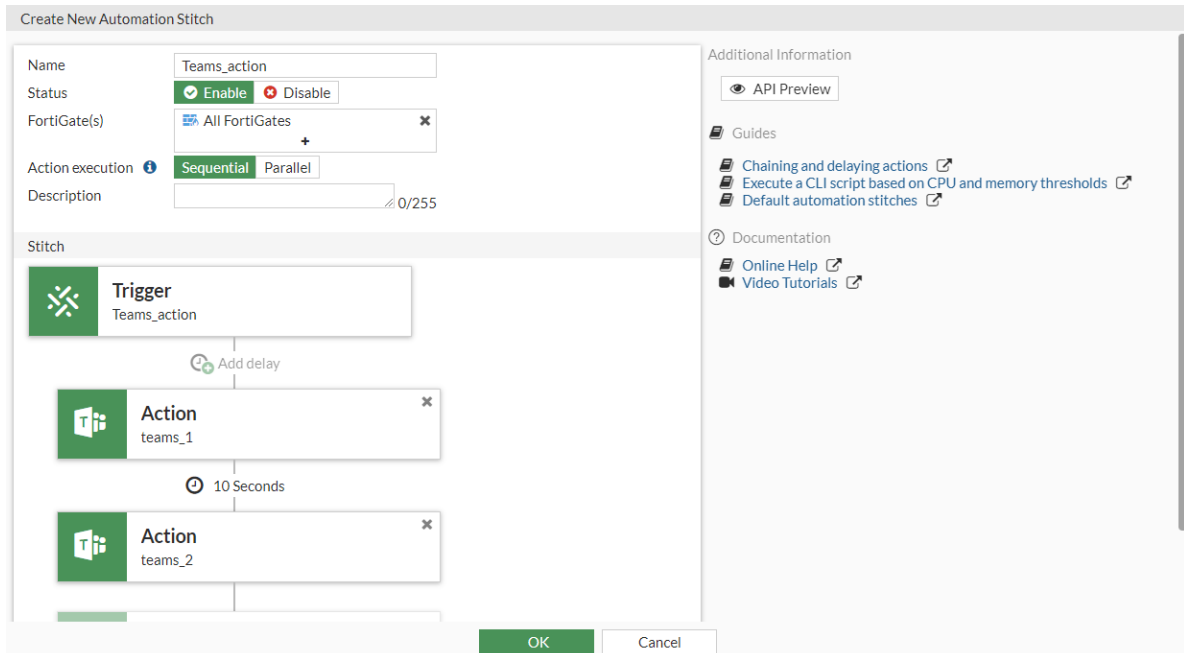

- d. Click *OK*.
- e. Select the action in the list and click *Apply*.
- 5. Configure the second Microsoft Teams Notification action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Microsoft Teams Notification*.
 - c. Enter the following:

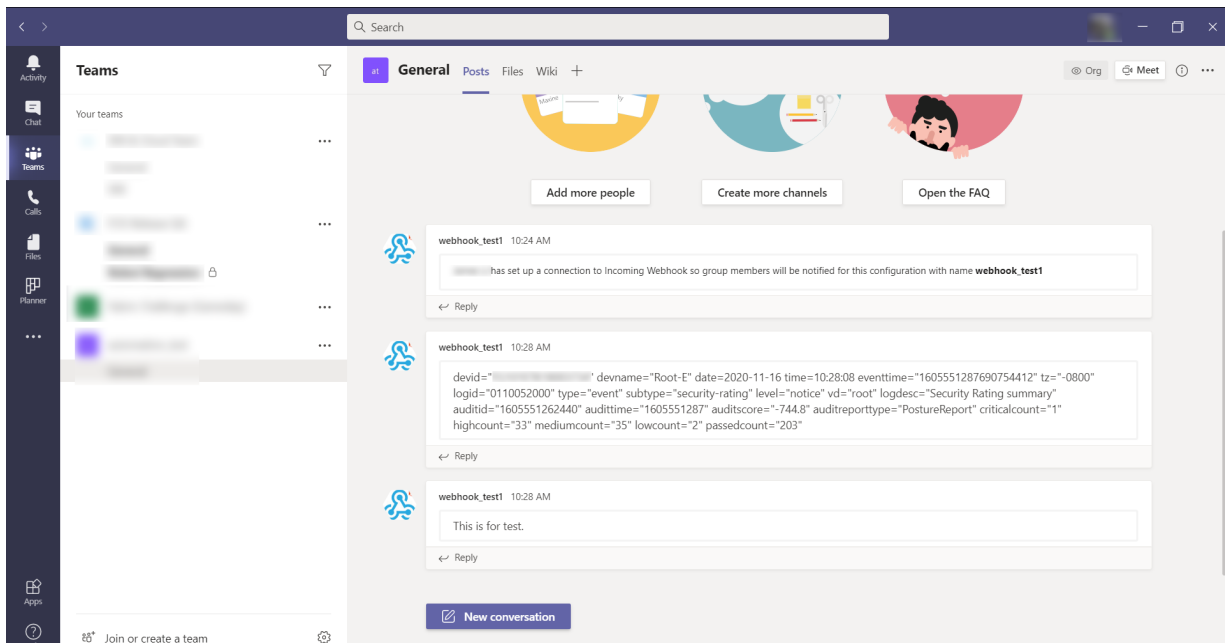

Name	teams_2
URL	Paste the webhook URI from the clipboard
Message	Text
Message text	This is for test.

- d. Click **OK**.
- e. Select the action in the list and click **Apply**.
- f. Click the **Add delay** located between both actions. Enter **10** and click **OK**.

- 6. Click **OK**.
- 7. Trigger the automation stitch:
 - a. Right-click the automation stitch and select **Test Automation Stitch**.
After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Microsoft Teams channel.

To configure an automation stitch with Microsoft Teams Notification actions in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
  edit "Teams_action"
    set event-type security-rating-summary
  next
end
```

2. Configure the automation actions:

```
config system automation-action
  edit "teams_1"
    set action-type microsoft-teams-notification
    set uri "outlook.office.com/webhook/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxxxxx@xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxxxxx"
  next
  edit "teams_2"
    set action-type microsoft-teams-notification
    set message "This is for test."
    set uri "outlook.office.com/webhook/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxxxxx@xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxx-xxxx-xxxx-xxxx-
xxxxxxxxxxxxxxxx"
  next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
  edit "Teams_action"
    set trigger "Teams_action"
```

```

    config actions
      edit 1
        set action "teams_1"
        set required enable
      next
      edit 2
        set action "teams_2"
        set delay 10
        set required enable
      next
    end
  next
end

```

4. Verify that the automation action was triggered:

```

# diagnose test application autod 3
stitch: Teams_action
  local hit: 2 relayed to: 0 relayed from: 0
  last trigger: Mon Nov 16 10:28:08 2020
  last relay:
  actions:
    teams_1:
      done: 2 relayed to: 0 relayed from: 0
      last trigger: Mon Nov 16 10:28:08 2020
      last relay:
    teams_2:
      done: 2 relayed to: 0 relayed from: 0
      last trigger: Mon Nov 16 10:28:08 2020
      last relay:
logid2stitch mapping:
id:52000 local hit: 22 relayed hits: 0
Teams_action

```

AWS Lambda action

AWS Lambda functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure an AWS Lambda function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Security Rating Summary*.
 - c. Enter the following:

Name	auto-aws
Report	Security Posture

- d. Click *OK*.
- e. Select the trigger in the list and click *Apply*.

4. Configure the AWS Lambda function action:

- a. Click *Add Action*.
- b. Click *Create* and select *AWS Lambda*.
- c. Enter the following:

Name	aws-action-1
URL	Enter the request API URI
API key	Enter the API key
HTTP header	header2 : header2_value

- d. Click *OK*.
 - e. Select the action in the list and click *Apply*.
- 5. Click *OK*.**

To configure an AWS Lambda function automation stitch in the CLI:**1. Create the automation trigger:**

```
config system automation-trigger
  edit "auto-aws"
    set event-type security-rating-summary
  next
end
```

2. Create the automation action:

```
config system automation-action
  edit "aws-action-1"
    set action-type aws-lambda
    set aws-api-key *****
    set uri "0100000000.execute-api.us-east-2.amazonaws.com/default/xxxxx-
autobatoon-XXX-lambdaXXX"
    config http-headers
      edit 1
        set key "header2"
        set value "header2_value"
      next
    end
  next
end
```

3. Create the automation stitch:

```
config system automation-stitch
  edit "auto-aws"
    set trigger "auto-aws"
    config actions
      edit 1
        set action "aws-action-1"
        set required enable
      next
    end
  next
end
```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In AWS, the log shows that the function was called, executed, and finished.

Azure Function action

Azure functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure an Azure function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Security Rating Summary*.
 - c. Enter the following:

Name	auto-azure
Report	Security Posture

- d. Click *OK*.
- e. Select the trigger in the list and click *Apply*.
4. Configure the Azure Function action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Azure Function*.
 - c. Enter the following:

Name	azure_function
URL	Enter the request API URI
Authorization	Function
API key	Enter the API key
HTTP header	header1 : value1

- d. Click *OK*.
- e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an Azure function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
  edit "auto-azure"
    set event-type security-rating-summary
  next
end
```

2. Create an automation action:

```
config system automation-action
    edit "azure_function"
        set action-type azure-function
        set azure-function-authorization function
        set azure-api-key *****
        set uri "xxxxx00-no-delete-xxxx.azurewebsites.net/api/headersResponse"
    config http-headers
        edit 1
            set key "header1"
            set value "value1"
        next
    end
next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-azure"
        set trigger "auto-azure"
    config actions
        edit 1
            set action "azure_function"
            set required enable
        next
    end
next
end
```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In Azure, the function log shows that the function was called, executed, and finished:

Google Cloud Function action

Google Cloud functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure a Google Cloud function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Security Rating Summary*.
 - c. Enter the following:

Name	auto-google1
Report	Security Posture

- d. Click *OK*.
- e. Select the trigger in the list and click *Apply*.
4. Configure the Google Cloud Function action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Google Cloud Function*.
 - c. Enter the following:

Name	google-echo
URL	Enter the request API URI
HTTP header	echo-header : echo-value

- d. Click *OK*.
- e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure a Google Cloud function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
  edit "auto-google1"
    set event-type security-rating-summary
  next
end
```

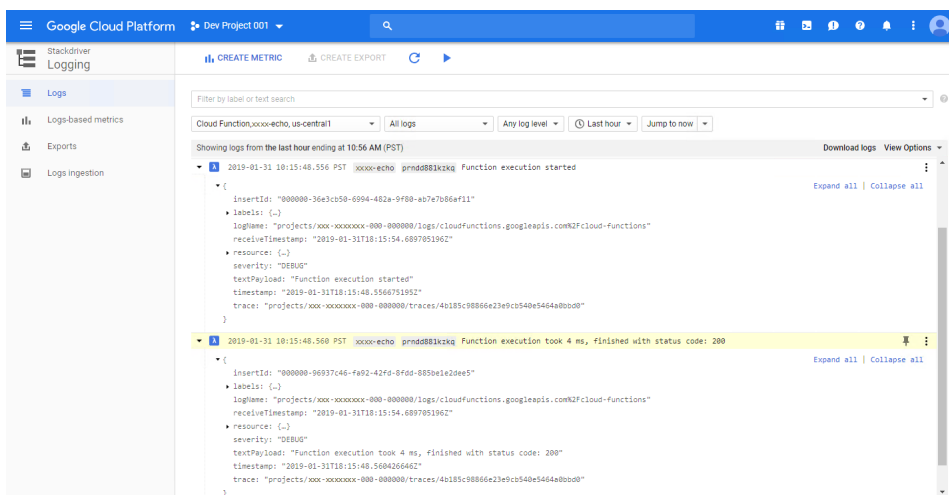

2. Create an automation action:

```
config system automation-action
  edit "google-echo"
    set action-type google-cloud-function
    set uri "us-central1-xxx-xxxxxxx-000-000000.cloudfunctions.net/xxxx-echo"
    config http-headers
      edit 1
        set key "echo-header"
        set value "echo-value"
      next
    end
  next
end
```

3. Create the automation stitch:

```
config system automation-stitch
  edit "auto-google1"
    set trigger "auto-google1"
    config actions
      edit 1
        set action "google-echo"
        set required enable
      next
    end
  next
end
```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In Google Cloud, go to *Logs* to see the function log showing that the configured function was called, executed, and finished:

AliCloud Function action

AliCloud functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure an AliCloud function automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Security Rating Summary*.
 - c. Enter the following:

Name	auto-ali
Report	Security Posture

- d. Click *OK*.
- e. Select the trigger in the list and click *Apply*.

4. Configure the AliCloud Function action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *AliCloud Function*.
 - c. Enter the following:

Name	Ali-Action-1
URL	Enter the request API URI
Authorization	Function
AccessKey ID	Enter the access key ID
AccessKey Secret	Enter the access key secret

- d. Click *OK*.
 - e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an AliCloud function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
  edit "auto-ali"
    set event-type security-rating-summary
  next
end
```

2. Create an automation action:

```
config system automation-action
  edit "Ali-Action-1"
    set action-type alicloud-function
    set alicloud-function-authorization function
    set alicloud-access-key-id "XXXXXXXXXXXXXXXXXXXX"
    set alicloud-access-key-secret xxxxxx
    set uri "0000000000000000.us-east-1.fc.aliyuncs.com/2099-99-99/proxy/test-
function/echoBodyAuth/"
  next
end
```

3. Create the automation stitch:

```
config system automation-stitch
  edit "auto-ali"
    set trigger "auto-ali"
    config actions
      edit 1
        set action "Ali-Action-1"
        set required enable
      next
    end
  next
end
```

When the automation stitch is triggered, the *Security Fabric > Automation* page shows the stitch trigger time. In AliCloud, the function log shows that the function was called, executed, and finished:

The screenshot displays the 'Log' tab for the 'echoBodyAuth' function. It shows three log entries with the following details:

- Entry 7:** timestamp 03-19 09:58:01, versionId: 1553014685. Message: "message: 2019-03-19T16:58:01.2202.2d36db6-3773-c108-7c56-2644a780f80 [verbose] [\"data\": {\"stitch\": \"auto-all\", \"actions\": [{\"name\": \"All-Action-1\", \"type\": \"allcloud-function\"}], \"triggertype\": \"event\", \"eventtype\": \"security rating summary\", \"sn\": \"FG3HIE500000000\", \"time\": 1553014677, \"rawlog\": [\"date\": \"2019-03-19\", \"time\": \"09:57:56\", \"logid\": \"0110062000\", \"type\": \"event\", \"subtype\": \"security-rating\", \"level\": \"notice\", \"vd\": \"root\", \"eventtime\": \"1550000000\", \"logdesc\": \"Security Rating summary\", \"auditid\": \"1550000000\", \"audittime\": \"1553014677\", \"auditcore\": \"615.0\", \"criticalcount\": \"0\", \"highcount\": \"0\", \"mediumcount\": \"13\", \"lowcount\": \"1\", \"passedcount\": \"29\"]}]\". Qualifier: LATEST.
- Entry 8:** timestamp 03-19 09:58:01, versionId: 1553014685. Message: "message: FC Invoke Start RequestId: 2d36db6-3773-c108-7c56-2644a780f80". Qualifier: LATEST.
- Entry 9:** timestamp 03-19 09:52:41, versionId: 1553014365. Message: "message: FC Invoke End RequestId: 8f687292-5d63-a7b8-8cbe-e43c8d4de9ec". Qualifier: I ATFST.

CLI script action

CLI scripts can run when an automation stitch is triggered. The scripts can be entered manually, uploaded as a file, or recorded in the CLI console. The output of the script can be sent as an email action.

The maximum size of the CLI script action output is 16K characters.

Certain diagnostic commands may not function as expected with CLI scripts and result in no output. For example, when used in a CLI script, the diagnostic command `dia test application dnsproxy 6` fails to produce any output because the cli-script feature does not support `daemon message()` prints.

In this example, the script sets the idle timeout value to 479 minutes, and sends an email with the script output.

To configure a stitch with a CLI script action in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*auto-cli-1*).
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Security Rating Summary*.
 - c. Enter the following:

Name	auto-cli-1
Report	Security Posture

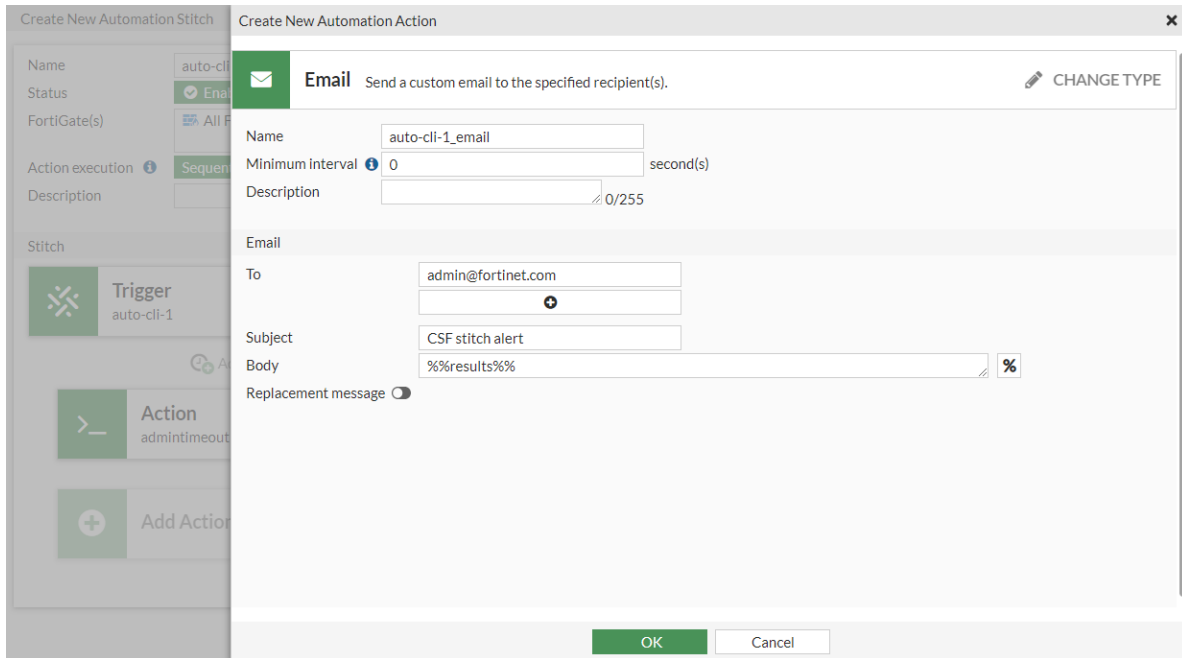

- d. Click *OK*.
 - e. Select the trigger in the list and click *Apply*.
4. Configure the CLI Script action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *CLI Script*.

- c. Enter the following:

Name	admintimeout
Script	<pre>config system global set admintimeout 479 end</pre> <p>Alternatively, click <i>Upload</i> to upload a file, or click <i>>_Record in CLI console</i> and enter the CLI commands.</p>
Administrator profile	Select a profile

- d. Click *OK*.
- e. Select the action in the list and click *Apply*.
5. Configure the Email notification action:
- Click *Add Action*.
 - Click *Create* and select *Email*.
 - Enter the following:

Name	auto-cli-1_email
To	Enter an email address
Subject	CSF stitch alert
Body	%%results%%

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
6. Click **OK**.

To configure a stitch with a CLI script action in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
  edit "auto-cli-1"
    set event-type security-rating-summary
  next
end
```

2. Create the automation actions:

```
config system automation-action
  edit "admintimeout"
    set action-type cli-script
    set script "config system global
      set admintimeout 479
    end"
    set accprofile "super_admin"
  next
  edit "auto-cli-1_email"
    set action-type email
    set email-to "admin@fortinet.com"
    set email-subject "CSF stitch alert"
    set message "%%results%%"
  next
end
```

3. Create the automation stitch:

```

config system automation-stitch
  edit "auto-cli-1"
    set trigger "auto-cli-1"
    config actions
      edit 1
        set action "admintimeout"
        set required enable
      next
      edit 2
        set action "auto-cli-1_email"
        set required enable
      next
    end
  next
end

```

Sample email

The email sent by the action will look similar to the following:

Execute a CLI script based on memory and CPU thresholds

Automation stitches can be created to run a CLI script and send an email message when memory or CPU usage exceeds specified thresholds.

The maximum size of the CLI script action output is 16K characters. In cases where the output exceeds 16K, the email received will contain truncated output. To avoid this, it is recommended to limit the number of commands per script.

To define memory and CPU usage thresholds:

```

config system global
  set cpu-use-threshold <percent>
  set memory-use-threshold-extreme <percent>
  set memory-use-threshold-green <percent>
  set memory-use-threshold-red <percent>
end

```

Where:

cpu-use-threshold	Threshold at which CPU usage is reported, in percent of total possible CPU utilization (default = 90).
memory-use-threshold-extreme	Threshold at which memory usage is considered extreme, and new sessions are dropped, in percent of total RAM (default = 95).

memory-use-threshold-green	Threshold at which memory usage forces the FortiGate to exit conserve mode, in percent of total RAM (default = 82).
memory-use-threshold-red	Threshold at which memory usage forces the FortiGate to enter conserve mode, in percent of total RAM (default = 88).

Configuring a high memory usage stitch

In this example, an automation stitch is created that runs two CLI scripts to collect debug information, and then two email messages will be received with CLI output to a specified email address when the memory usage causes the FortiGate to enter conserve mode.

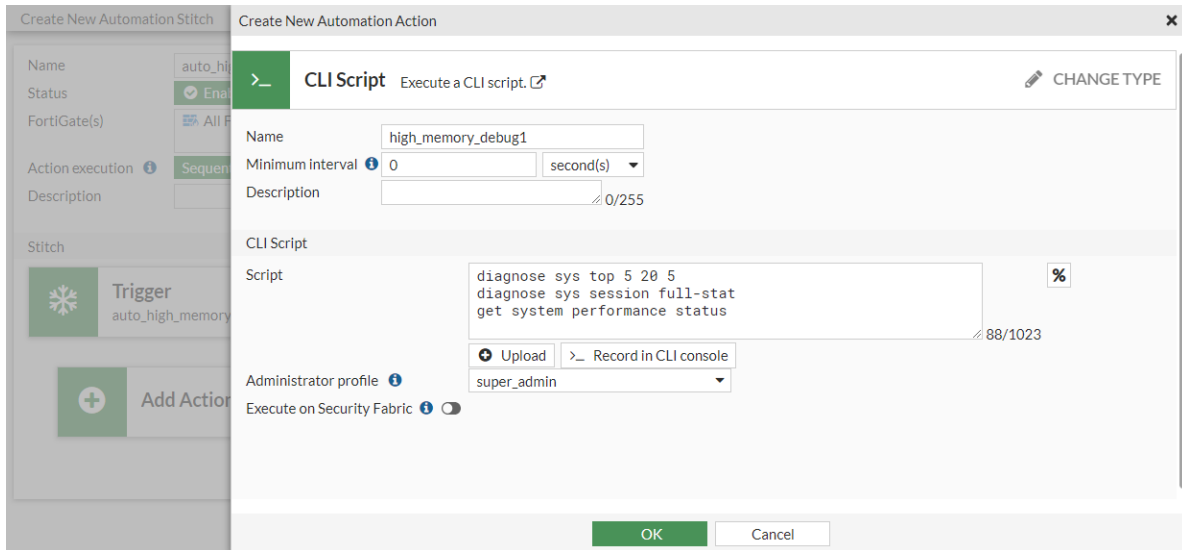

Since the output in this example will exceed 16K, two scripts are used. The CLI scripts are run sequentially, and an email is sent out each time a script runs.

To create an automation stitch for high memory usage in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*auto_high_memory*).
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Conserve Mode*.
 - c. Enter the name, *auto_high_memory*.
 - d. Click *OK*.
 - e. Select the trigger in the list and click *Apply*.
4. Configure the first CLI Script action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *CLI Script*.
 - c. Enter the following:

Name	high_memory_debug1
Script	diagnose sys top 5 20 5 diagnose sys session full-stat get system performance status
Administrator profile	Select a profile

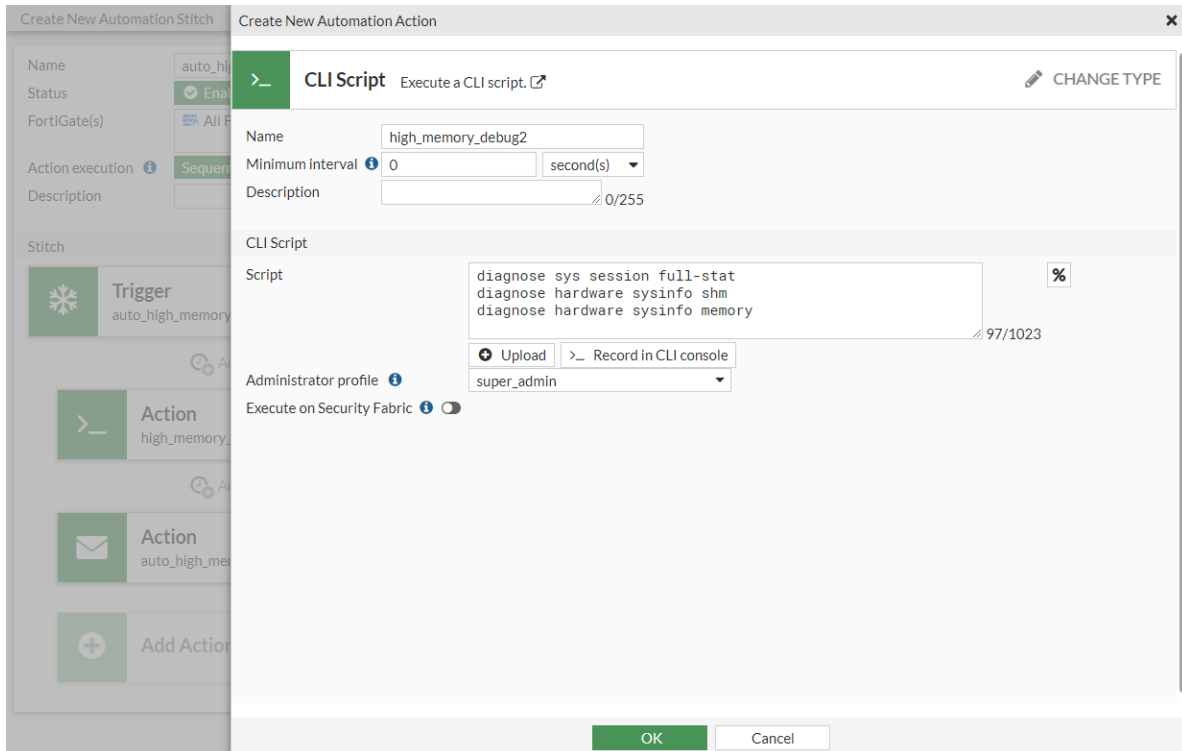

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
5. Configure the first Email notification action:
- a. Click **Add Action**.
 - b. Click **Create** and select **Email**.
 - c. Enter the following:

Name	auto_high_memory_email1
To	Enter an email address
Subject	CSF stitch alert: high_memory1
Body	%%results%%

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
6. Configure the second CLI Script action:
- a. Click **Add Action**.
 - b. Click **Create** and select **CLI Script**.
 - c. Enter the following:

Name	high_memory_debug2
Script	diagnose sys session full-stat diagnose hardware sysinfo shm diagnose hardware sysinfo memory
Administrator profile	Select a profile

- d. Click *OK*.
 - e. Select the action in the list and click *Apply*.
7. Configure the second Email notification action:
- a. Click *Add Action*.
 - b. Click *Create* and select *Email*.
 - c. Enter the following:

Name	auto_high_memory_email2
To	Enter an email address
Subject	CSF stitch alert: high_memory2
Body	%%results%%

- d. Click *OK*.
 - e. Select the action in the list and click *Apply*.
8. Click *OK*.

To create an automation stitch for high memory usage in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
  edit "auto_high_memory"
    set event-type low-memory
  next
end
```

2. Create the automation actions:

```

config system automation-action
  edit "high_memory_debug1"
    set action-type cli-script
    set script "diagnose sys top 5 20 5
diagnose sys session full-stat
get system performance status"
    set output-size 10
    set timeout 0
    set accprofile "super_admin"
  next
  edit "auto_high_memory_email1"
    set action-type email
    set email-to "person@fortinet.com"
    set email-subject "CSF stitch alert: high_memory1"
    set message "%results%"
  next
  edit "high_memory_debug2"
    set action-type cli-script
    set script "diagnose sys session full-stat
diagnose hardware sysinfo shm
diagnose hardware sysinfo memory"
    set accprofile "super_admin"
  next
  edit "auto_high_memory_email2"
    set action-type email
    set email-to "person@fortinet.com"
    set email-subject "CSF stitch alert: high_memory2"
    set message "%results%"
  next
end

```

3. Create the automation stitch:

```

config system automation-stitch
  edit "auto_high_memory"
    set trigger "auto_high_memory"
    config actions
      edit 1
        set action "high_memory_debug1"
        set required enable
      next
      edit 2
        set action "auto_high_memory_email1"
        set required enable
      next
      edit 3
        set action "high_memory_debug2"
        set required enable
      next
      edit 4
        set action "auto_high_memory_email2"
        set required enable
      next
    end
end

```

```

next
end

```

Results

When the FortiGate enters conserve mode due to the `memory-use-threshold-red` being exceeded, the GUI displays a notice, and the `auto_high_memory` automation stitch is triggered. This causes the CLI scripts to run and the scripts' results are emailed to the specified address.

Configuring a high CPU usage stitch

Similar to the previous example, an automation stitch can be created that runs a CLI script to collect debug information, and then email the results of the script to a specified email address when CPU usage threshold is exceeded (High CPU trigger type).

The following commands are recommended for collecting debug information, but they are not the only options. Other commands can be used.

```

diagnose sys cmdb info
diagnose sys vd list | grep fib
diagnose sys top 5 20 2
diagnose sys session full-stat
diagnose sys session list | grep "\<dirty\>" -c
get system performance status
diagnose sys session full-stat
diagnose hardware sysinfo memory
diagnose sys cmdb info
diagnose sys vd list | grep fib

```

Webhook action

The webhook automation stitch action makes HTTP and HTTPS requests to a specified server, with custom headers, bodies, ports, and methods. It can be used to leverage the ubiquity of HTML requests and APIs to integrate with other tools.

The URI and HTTP body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: %%results.source%% is the source property from the previous action.

In this example, a specific log message (failed administrator log in attempt) triggers the FortiGate to send the contents of the log to a server. The server responds with a generic reply. This example assumes that the server is already configured and able to communicate with the FortiGate.

To configure the webhook automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*badLogin*).
3. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *FortiOS Event Log*.
 - c. Enter the following:

Name	badLogin
Event	Admin login failed

- d. Click *OK*.
 - e. Select the trigger in the list and click *Apply*.
4. Configure the automation stitch action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Webhook*.
 - c. Enter the following:

Name	Send Log To Server
Protocol	HTTP
URL	172.16.200.44

Custom port	Enable and enter 80
Method	POST
HTTP body	%%log%%
HTTP header	Header : 1st Action

The screenshot shows the 'Create New Automation Action' window for a Webhook. The configuration is as follows:

- Name:** Send Log To Server
- Minimum interval:** 0 second(s)
- Description:** (empty)
- Webhook Protocol:** HTTP
- URL:** https://172.16.200.44
- Custom port:** 80
- Method:** POST
- HTTP body:** %%log%%
- HTTP header:** Header : 1st Action

- d. Click **OK**.
 - e. Select the action in the list and click **Apply**.
5. Click **OK**.

To configure the webhook automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
  edit "badLogin"
    set event-type event-log
    set logid 32002
  next
end
```

2. Create the automation action:

```
config system automation-action
  edit "Send Log To Server"
    set action-type webhook
    set uri "172.16.200.44"
    set http-body "%%log%%"
    set port 80
    config http-headers
      edit 1
        set key "Header"
        set value "1st Action"
      next
    end
```

```

    next
end

```

3. Create the automation stitch:

```

config system automation-stitch
  edit "badLogin"
    set trigger "badLogin"
  config actions
    edit 1
      set action "Send Log To Server"
      set required enable
    next
  end
next
end

```

To test the automation stitch:

1. Attempt to log in to the FortiGate with an incorrect username or password.
2. On the server, check the log to see that its contents were sent by the FortiGate.

```

{
  "userId": 1,
  "id": 1,
  "title": "Test Response",
  "body": "ABCDEFGHIJKLMNQRSTUWXYZ"
}

```

The body content is replaced with the log from the trigger.

3. On the FortiGate, go to *Log & Report > Events* and select *System Events* to confirm that the stitch was activated.
4. Go to *Security Fabric > Automation* to see the last time that the stitch was triggered.

Diagnose commands

To enable log dumping:

```

# diagnose test application autod 1
autod dumped total:1 logs, num of logids:1
autod log dumping is enabled

```

```

vdom:root(0) logid:32002 len:408 log:
date=2019-05-30 time=17:41:03 logid="0100032002" type="event" subtype="system" level="alert"
vd="root" eventtime=1559263263858888451 tz="-0700" logdesc="Admin login failed" sn="0"
user="admin" ui="http(10.6.30.254)" method="http" srcip=10.6.30.254 dstip=10.6.30.5
action="login" status="failed" reason="passwd_invalid" msg="Administrator admin login failed
from http(10.6.30.254) because of invalid password"
autod log dumping is disabled

```

```

autod logs dumping summary:
  logid:32002 count:1

```

```

autod dumped total:1 logs, num of logids:1

```

To show the automation settings:

```

}

```

Webhook action with Twilio for SMS text messages

The FortiGate automation stitch framework can be used to interact with third-party services with webhooks to perform various tasks. A webhook action to Twilio can be used to automate tasks that send alerts and information to administrators by SMS text messages.

This topic includes two examples where the FortiGate uses webhooks to trigger Twilio to send SMS text messages to an administrator.

- [Example 1: using an SD-WAN health check to trigger a Twilio webhook action](#)
- [Example 2: using an incoming webhook to trigger a Twilio webhook action](#)

Prerequisites

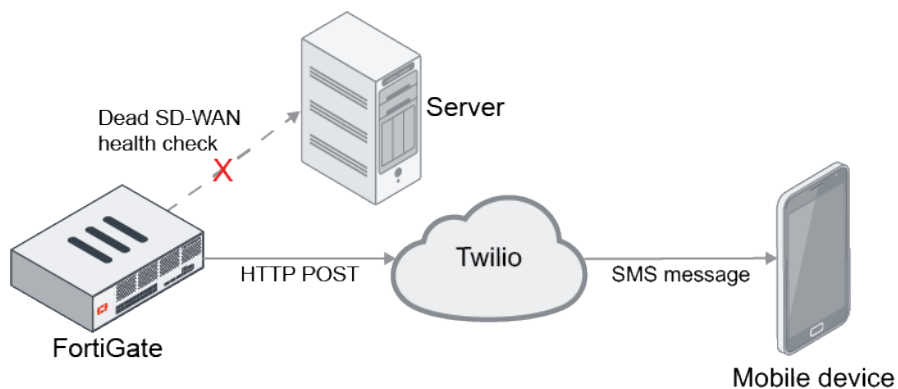

- An active Twilio account with a virtual phone number that is able to send SMS text messages to the receiver in the desired region
- A valid Twilio Account SID and Auth token for sending SMS text messages

These examples assume that the Twilio account is already configured. For more information, see [Creating or Updating Resources with the POST Method](#) in the Twilio documentation.

Example 1: using an SD-WAN health check to trigger a Twilio webhook action

In this example, an administrator wants to monitor the FortiGate's SD-WAN health, particularly when a dead health check is reported. An automation stitch will trigger the alert based on an SD-WAN log event (log ID 0113022931, SD-WAN SLA information warning) and perform a webhook action to inform Twilio to send an SMS message.

Sample SD-WAN log event

```

date=2023-01-13 time=10:39:26 eventtime=1673635167489361827 tz="-0800" logid="0113022931"
type="event" subtype="sdwan" level="warning" vd="root" logdesc="SDWAN SLA information
warning" eventtype="Health Check" healthcheck="Google" interface="VLAN1101"
probepproto="ping" oldvalue="alive" newvalue="dead" msg="SD-WAN health-check member
changed state."
  
```

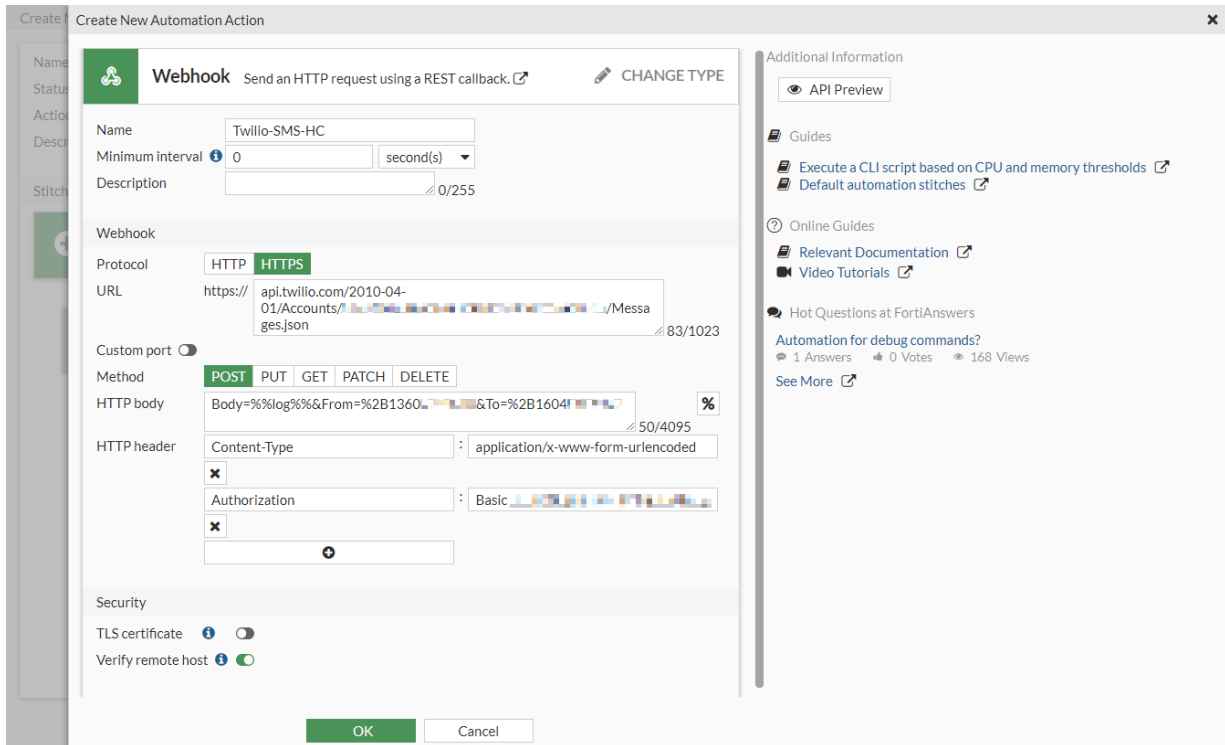

To configure the automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*SD-WAN-HC-Down-SMS*).
3. Configure the FortiOS event log trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *FortiOS Event Log*.
 - c. Enter the following:

Name	<i>SD-WAN-HC-Down</i>
Event	<i>SDWAN SLA information warning</i>
Field filter(s)	<i>Set Field name to newvalue. Set Value to dead.</i>

- d. Click *OK*.
- e. Select the trigger in the list and click *Apply*.
4. Configure the webhook action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Webhook*.
 - c. Enter the following:

Name	<i>Twilio-SMS-HC</i>
Protocol	<i>HTTPS</i>
URL	Enter the URL provided by Twilio for sending SMS messages using the POST method. The URL can be found in the cURL code sample in the following format: <i>https://api.twilio.com/2010-04-01/Accounts/<Twilio_Account_SID>/Messages.json</i> .
Method	<i>POST</i>
HTTP body	<i>Body=%%log%%&From=%2B1360x*****&To=%2B1604*****</i> This string for the body text includes the SD-WAN log message, and the Twilio from and to phone numbers.
HTTP header	<i>Content-Type : application/x-www-form-urlencoded Authorization : Basic <Base64_encoded_authentication_code></i>

d. Click **OK**.

e. Select the action in the list and click **Apply**.

5. Click **OK** to save the stitch.

To configure the automation stitch in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
  edit "SD-WAN-HC-Down"
    set event-type event-log
    set logid 22931
    config fields
      edit 1
        set name "newvalue"
        set value "dead"
      next
    end
  next
end
```

2. Configure the automation action:

```
config system automation-action
  edit "Twilio-SMS-HC"
    set action-type webhook
    set protocol https
    set uri "api.twilio.com/2010-04-01/Accounts/*****/Messages.json"
    set http-body "Body=%log%&From=%2B1360*****&To=%2B1604*****"
    set port 443
```

```

config http-headers
  edit 1
    set key "Content-Type"
    set value "application/x-www-form-urlencoded"
  next
  edit 2
    set key "Authorization"
    set value "Basic *****"
  next
end
next
end

```

3. Configure the automation stitch:

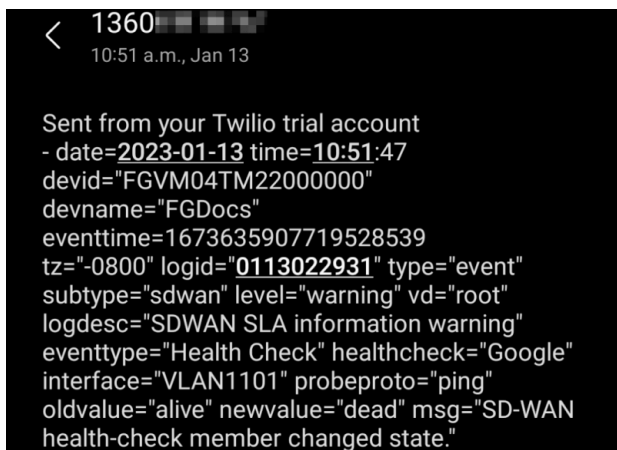

```

config system automation-stitch
  edit "SD-WAN-HC-Down-SMS"
    set trigger "SD-WAN-HC-Down"
    config actions
      edit 1
        set action "Twilio-SMS-HC"
        set required enable
      next
    end
  next
end

```

Verification:

1. Simulate an SD-WAN health check failure to trigger the automation stitch.
2. Twilio sends an SMS message to the administrator.

3. Go to *Security Fabric > Automation* and locate the *SD-WAN-HC-Down-SMS* stitch. The *Trigger Count* value has increased by one.

System log after the stitch was triggered:

```

date=2023-01-13 time=10:51:47 eventtime=1673635907720476287 tz="-0800" logid="0100046600"
type="event" subtype="system" level="notice" vd="root" logdesc="Automation stitch triggered"
stitch="SD-WAN-HC-Down-SMS" trigger="SD-WAN-HC-Down" stitchaction="Twilio-SMS-HC" from="log"
msg="stitch:SD-WAN-HC-Down-SMS is triggered."

```

Example 2: using an incoming webhook to trigger a Twilio webhook action

In this example, an administrator wants to trigger an automation stitch remotely to retrieve the device uptime with an SMS text message. An incoming webhook will be used to send an HTTP POST request to trigger the event to occur. Subsequently, the FortiGate performs a CLI action followed by a webhook action to inform Twilio to send an SMS text message.

A REST API administrator with write privileges must be configured to apply an API key to this incoming webhook. See [REST API administrator on page 2058](#) for more information.

To configure the automation stitch in the GUI:

1. Go to *Security Fabric > Automation* and click *Create New*.
2. Enter the stitch name (*Check-Uptime*).
3. Configure the incoming webhook trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Incoming Webhook*.
 - c. Enter the trigger name (*Check-Uptime-Webhook*).
 - d. Click *OK*.
 - e. Select the trigger in the list and click *Apply*.
4. Configure the CLI script action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *CLI Script*.
 - c. Enter the following:

Name	<i>Uptime</i>
Script	<code>get system performance status grep Uptime</code>
Administrator profile	Select a profile with REST API write privileges (<i>prof_admin</i>)

- d. Click *OK*.
- e. Select the action in the list and click *Apply*.
5. Configure the webhook action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Webhook*.
 - c. Enter the following:

Name	<i>Twilio-SMS-Uptime</i>
Protocol	<i>HTTPS</i>
URL	Enter the URL provided by Twilio for sending SMS messages using the POST method. The URL can be found in the cURL code sample in the following format: <i>https://api.twilio.com/2010-04-01/Accounts/<Twilio_Account_SID>/Messages.json</i> .
Method	<i>POST</i>
HTTP body	<i>Body=%%results%%&From=%2B1360*****&To=%2B1604*****</i> This string for the body text includes the results from the preceding CLI script action.
HTTP header	<i>Content-Type : application/x-www-form-urlencoded</i> <i>Authorization : Basic <Base64_encoded_authentication_code></i>

- d. Click *OK*.
- e. Select the action in the list and click *Apply*.

6. Click *OK* to save the stitch.

To configure the automation stitch in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
  edit "Check-Uptime-Webhook"
    set event-type incoming-webhook
  next
end
```

2. Configure the automation actions:

```
config system automation-action
  edit "Uptime"
    set action-type cli-script
    set script "get system performance status | grep Uptime"
    set accprofile "prof_admin"
  next
  edit "Twilio-SMS-Uptime"
    set action-type webhook
    set protocol https
    set uri "api.twilio.com/2010-04-01/Accounts/01/Accounts/*****/Messages.json"
    set http-body "Body=%%results%%&From=%2B1360*****&To=%2B1604*****"
    set port 443
    config http-headers
      edit 1
        set key "Content-Type"
        set value "application/x-www-form-urlencoded"
      next
      edit 2
        set key "Authorization"
        set value "Basic *****"
    next
```

```
        end
    next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
    edit "Check-Uptime"
        set trigger "Check-Uptime-Webhook"
        config actions
            edit 1
                set action "Uptime"
                set required enable
            next
            edit 2
                set action "Twilio-SMS-Uptime"
                set required enable
            next
        end
    next
end
```

Verification:

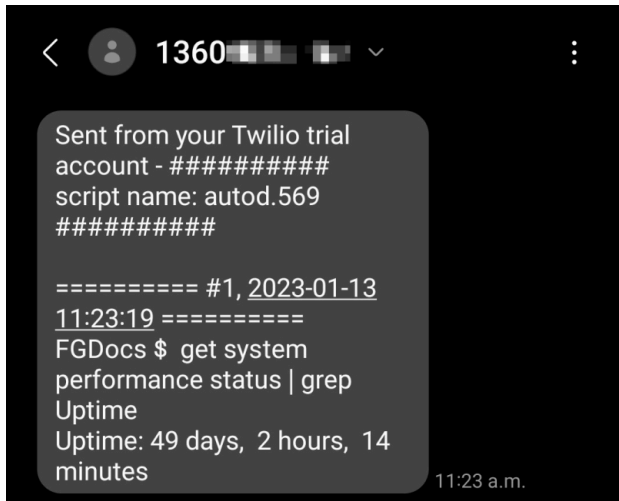

1. From a command prompt, issue the sample cURL command as recommended by the Check-Uptime-Webhook incoming webhook:

```
>curl -k -X POST -H "Authorization: Bearer <API_token>" --data "{ 'srcip': '1.1.1.1',
'mac':'11:11:11:11:11:11', 'fctuid': '*****'}"
https://x.x.x.x/api/v2/monitor/system/automation-stitch/webhook/Check-Uptime-Webhook
```

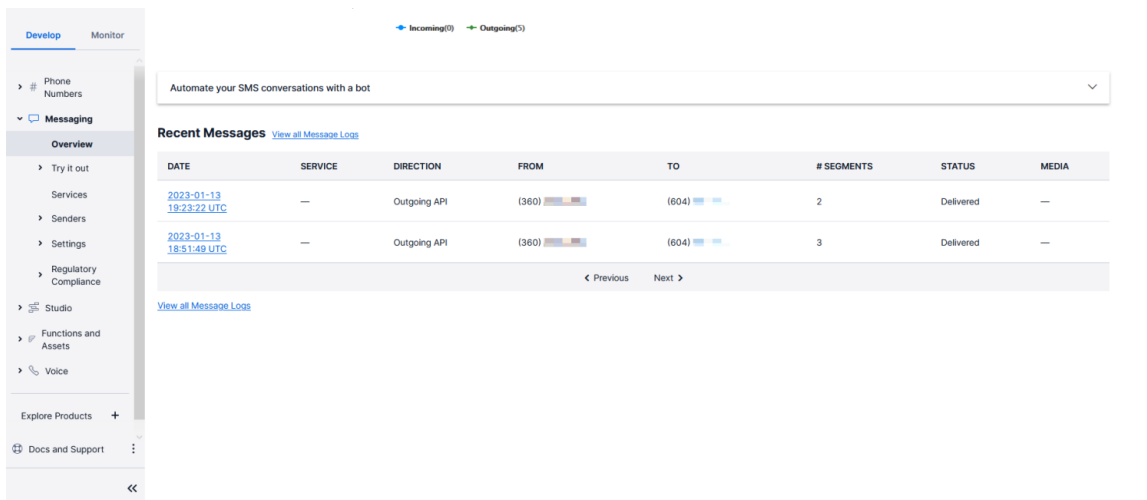

Response:

```
{
  "http_method": "POST",
  "status": "success",
  "http_status": 200,
  "serial": "FGVM04TM20000000",
  "version": "v7.0.10",
  "build": 0450
}
```

2. This triggers the automation stitch on the FortiGate to send a HTTP POST request to Twilio. In response, Twilio sends an SMS text message to the recipient.

- From the Twilio dashboard, go to *Messaging > Overview* and verify the *Recent Messages* section to confirm that the SMS text message was delivered.

To view automation stitch diagnostics:

```
# diagnose debug enable
# diagnose debug application autod -1

2023-01-13 11:23:19 __action_cli_script_open()-180: cli script action:Uptime is called. svc

2023-01-13 11:23:23 auto_curl_perform()-114: Failed to send curl request. http status code:
201
```

Although the final line in this debug output shows Failed to send curl request. http status code: 201, the HTTP status code 201 indicates that the request was successful and a response code was created.

Slack integration webhook

A webhook can be created to post messages and notifications to Slack.

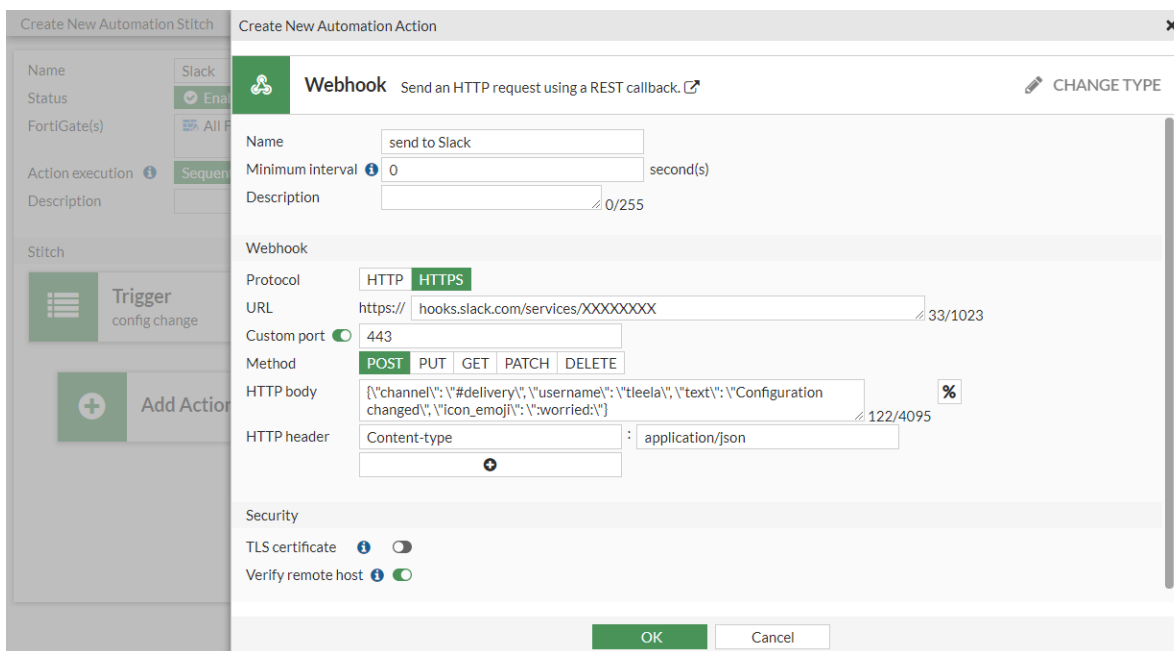

In this example, a configuration change triggers the FortiGate to post a message to Slack.

To create a webhook automation stitch for Slack integration in the GUI:

1. Create an incoming webhook in Slack. See [Sending messages using Incoming Webhooks](#) for more information.
2. Go to *Security Fabric > Automation* and click *Create New*.
3. Enter the stitch name.
4. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Configuration Change*.
 - c. Enter a name (*config change*).
 - d. Click *OK*.
 - e. Select the trigger in the list and click *Apply*.

5. Configure the action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Webhook*.
 - c. Enter the following:

Name	send to Slack
Protocol	HTTPS
URL	Enter the incoming webhook URL created in Slack
Custom port	Enable and enter 443
Method	POST
HTTP body	{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\": \"Configuration changed\", \"icon_emoji\": \":worried:\"}
HTTP header	Content-type : application/json

- d. Click *OK*.
 - e. Select the action in the list and click *Apply*.
6. Click *OK*.

To create a webhook automation stitch for Slack integration in the CLI:

1. Create an incoming webhook in Slack. See [Sending messages using Incoming Webhooks](#) for more information.
2. Create the automation trigger:

```
config system automation-trigger
  edit "config change"
    set event-type config-change
  next
end
```

3. Create the automation action:

```

config system automation-action
  edit "send to Slack"
    set action-type webhook
    set protocol https
    set uri "hooks.slack.com/services/XXXXXXXX"
    set http-body "{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\":
  \\\"Configuration changed\\\", \"icon_emoji\": \":worried:\"}"
    set port 443
    config http-headers
      edit 1
        set key "Content-type"
        set value "application/json"
      next
    end
  next
end

```

4. Create the automation stitch:

```

config system automation-stitch
  edit "Slack"
    set trigger "config change"
    config actions
      edit 1
        set action "send to Slack"
        set required enable
      next
    end
  next
end

```

Microsoft Teams integration webhook

A webhook can be created to post messages and notifications to Microsoft Teams.

In this example, a configuration change triggers the FortiGate to post a message to Teams.

To create a webhook automation stitch for Teams integration in the GUI:

1. Create an incoming webhook in Teams. See [Create an incoming webhook](#) for information.
2. Go to *Security Fabric > Automation* and click *Create New*.
3. Enter the stitch name.
4. Configure the trigger:
 - a. Click *Add Trigger*.
 - b. Click *Create* and select *Configuration Change*.
 - c. Enter a name (*Teams*).
 - d. Click *OK*.
 - e. Select the trigger in the list and click *Apply*.
5. Configure the action:
 - a. Click *Add Action*.
 - b. Click *Create* and select *Webhook*.

c. Enter the following:

Name	send to Teams
Protocol	HTTPS
URL	Enter the incoming webhook URL created in Teams
Custom port	Enable and enter 443
Method	POST
HTTP body	{\"text\": \"<message to send>\" }
HTTP header	Content-type : application/json

The screenshot shows the 'Create New Automation Action' dialog for a 'Webhook' action. The 'Name' field is 'send to Teams'. The 'Minimum interval' is '0' seconds. The 'Description' field is empty. The 'Webhook' section shows 'Protocol' set to 'HTTPS', 'URL' as 'https://outlook.office.com/webhook/XXXXXXXXXXXX/IncomingWebhook/XXXXXXXXXXXXXXXXXXXX', 'Custom port' checked and set to '443', 'Method' set to 'POST', 'HTTP body' as '{\"text\": \"<message to send>\" }', and 'HTTP header' as 'Content-type : application/json'. The 'Security' section shows 'TLS certificate' and 'Verify remote host' both checked.

d. Click *OK*.

e. Select the action in the list and click *Apply*.

6. Click *OK*.

To create a webhook automation stitch for Teams integration in the CLI:

1. Create an incoming webhook in Teams. See [Create an incoming webhook](#) for information.
2. Create the automation trigger:

```
config system automation-trigger
  edit "Teams"
    set event-type config-change
  next
end
```

3. Create the automation action:

```
config system automation-action
  edit "send to Teams"
    set action-type webhook
```

```

        set protocol https
        set uri
"outlook.office.com/webhook/XXXXXXXXXXXX/IncomingWebhook/XXXXXXXXXXXX/XXXXXXXXXXXX"
        set http-body "{ \"text\": \"<message to send>\" }"
        set port 443
        config http-headers
            edit 1
                set key "Content-type"
                set value "application/json"
            next
        end
    next
end

```

4. Create the automation stitch:

```

config system automation-stitch
    edit "Teams"
        set trigger "Teams"
        config actions
            edit 1
                set action "send to Teams"
                set required enable
            next
        end
    next
end

```

For information about more advanced messages that can be configured and sent to the Teams incoming webhook, see [Sending messages to connectors and webhooks](#).

Public and private SDN connectors

Cloud SDN connectors provide integration and orchestration of Fortinet products with public and private cloud solutions. In a typical cloud environment, resources are dynamic and often provisioned and scaled on-demand. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric.

To protect the East-West or North-South traffic in these environments, the FortiGate uses the SDN connector to sync the dynamic addresses that these volatile environments use. You can then configure the dynamic address objects as sources or destinations for firewall policies. When you make changes to cloud environment resources, such as moving them to a new location or assigning different IP addresses to them, you do not need to modify the policy in FortiOS, as the SDN connector syncs changes to the cloud address objects.

These configurations consist of three primary steps:

1. Configure the cloud SDN connector to connect your FortiGate and public or private cloud account.
2. Create dynamic address objects to use the SDN connector. Use filters to sync only cloud address objects that you require.
3. Apply the dynamic address objects to your firewall policy to protect your traffic.

This chapter explores the steps in detail and describes how to connect to each currently supported cloud platform. This chapter does not discuss cloud account role-based or permission requirements. The respective cloud documents contain this information.

The following external connector categories are available in the Security Fabric: Public SDN, Private SDN, Endpoint/Identity, and Threat Feeds.

Public SDN

Private SDN

Endpoint/Identity

Threat Feeds

If VDOMs are enabled, SDN and Threat Feeds connectors are in the global settings, and Endpoint/Identity connectors are per VDOM.

Getting started with public and private SDN connectors

You can use SDN connectors to connect your FortiGate to public and private cloud solutions. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric. You can use SDN connector address objects to create policies that provide dynamic access control based on cloud environment attribute changes. There is no need to manually reconfigure addresses and policies whenever changes to the cloud environment occur.

There are four steps to creating and using an SDN connector:

1. Gather the required information. The required information depends on which public or private cloud solution SDN connector you are configuring.
2. [Creating the SDN connector on page 2595](#)

3. [Creating an SDN connector address on page 2595](#)
4. [Adding the address to a firewall policy on page 2597](#)

The following provides general instructions for creating an SDN connector and using the dynamic address object in a firewall policy. For instructions for specific public and private cloud solutions, see the relevant topic in this guide. For advanced scenarios regarding SDN connectors, see the appropriate [FortiOS 7.0 cloud platform guide](#).

Creating the SDN connector

To create an SDN connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. Click the desired public or private cloud.
4. Enter the *Name*, *Status*, and *Update Interval* for the connector.
5. Enter previously collected information for the connector as needed.
6. Click *OK*.

To create an SDN connector in the CLI:

```
config system sdn-connector
  edit <name>
    set status {enable | disable}
    set type {connector type}
    ...
    set update-interval <integer>
  next
end
```

The available CLI commands vary depending on the selected SDN connector type.

Creating an SDN connector address

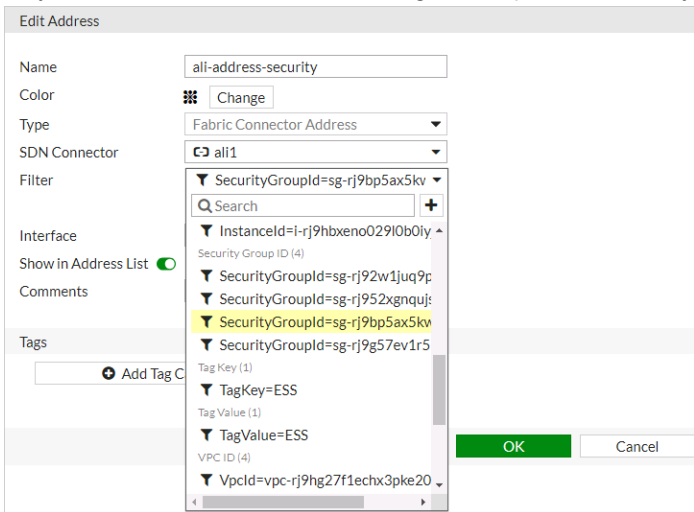

You can use an SDN connector address in the following ways:

- As the source or destination address for firewall policies.
- To automatically update changes to addresses in the public or private cloud environment, based on specified filters.
- To automatically apply changes to firewall policies that use the address, based on specified filters.

To create an SDN connector address in the GUI:

1. Go to *Policy & Objects > Addresses*.
2. Click *Create New > Address*.
3. Configure the address:
 - a. Set the *Type* to *Dynamic*.
 - b. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
 - c. From the *SDN Connector* dropdown list, select the desired SDN connector.

- d. From the *Filter* dropdown list, configure the desired filter. The filters available depend on the selected SDN connector type. The SDN connector automatically populates and updates IP addresses only for instances that satisfy the filter requirements. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the specified security group:

You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

- e. Configure other settings as desired.
 - f. Click *OK*.
4. Ensure that the SDN connector resolves dynamic firewall IP addresses as configured:
- a. Go to *Policy & Objects > Addresses*.
 - b. Hover over the address that you created to see a list of IP addresses for instances that satisfy the filter that you configured. In this case, the IP addresses of instances that belong to the specified security group display:

To create an SDN connector address in the CLI:

1. Create the address:

```
config firewall address
edit <name>
set type dynamic
set sdn <sdn_connector>
set visibility enable
set associated-interface <interface_name>
set color <integer>
...
set comment <comment>
config tagging
edit <name>
set category <string>
set tags <strings>
```

```

        next
    end
    next
end

```

2. Ensure that the SDN connector resolves dynamic firewall IP addresses as configured by running `show`. The following shows example output:

```

config firewall address
  edit "ali-address-security"
    set type dynamic
    config list
      edit "10.0.0.16"
        next
      edit "10.0.0.17"
        next
      edit "10.0.20.20"
        next
    end
  ...
next
end

```

The available CLI commands vary depending on the selected SDN connector type.

Adding the address to a firewall policy

You can use an SDN connector address as the source or destination address in a policy.

To add the address to a firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Use the SDN connector address as the source or destination address.
4. Configure the remaining settings as needed.
5. Click *OK*.

To add the address to a firewall policy in the CLI:

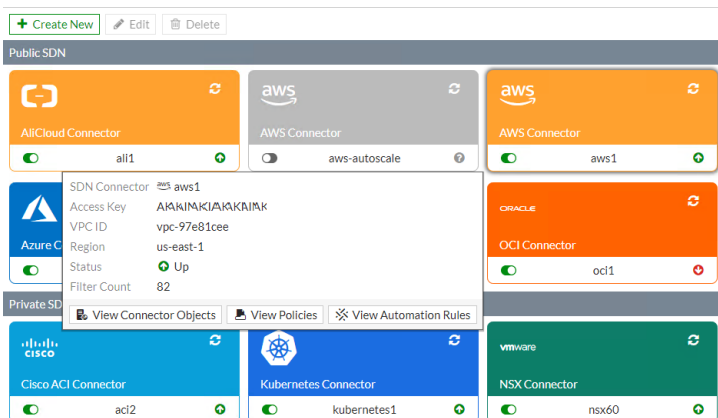

```

config firewall policy
  edit 0
    set name <name>
    set srcintf <port_name>
    set dstintf <port_name>
    set srcaddr <firewall_address>
    set dstaddr <firewall_address>
    set action accept
    set schedule <schedule>
    set service <service>
  next
end

```

Connector tooltips

In *Security Fabric > External Connectors*, hover over an SDN connector to view a tooltip that shows basic configuration information.

Three buttons provide additional information:

Button	Information
View Connector Objects	Connector's dynamic objects, such as filters and instances.
View Policies	List of policies that use the dynamic addresses from the connector.
View Automation Rules	List of automation actions that use the connector.

AliCloud SDN connector using access key

FortiOS automatically updates dynamic addresses for AliCloud using an AliCloud SDN connector, including mapping the following attributes from AliCloud instances to dynamic address groups in FortiOS:

- ImageId
- InstanceId
- SecurityGroupId
- VpcId
- VSwitchId
- TagKey
- TagValue

To configure AliCloud SDN connector using the GUI:

1. Configure the AliCloud SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, and select *AliCloud*.
 - c. Configure as shown, substituting the access key, secret, and region ID for your deployment. The update

interval is in seconds.

2. Create a dynamic firewall address for the configured AliCloud SDN connector:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.
 - c. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the specified security group:

3. Ensure that the AliCloud SDN connector resolves dynamic firewall IP addresses:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the security group configured in step 2:

Name	Type
Address (31)	
FIREWALL_AUTH	all-address-security resolves to:
SSLVPN_TUNNEL	<ul style="list-style-type: none"> • 10.0.0.16 • 10.0.0.17 • 10.0.0.20
ali-address-OR	ector Address (ACS)
ali-address-security	Fabric Connector Address (ACS)

To configure AliCloud SDN connector using CLI commands:**1. Configure the AliCloud SDN connector:**

```
config system sdn-connector
  edit "ali1"
    set type acs
    set access-key "LTAIKmERWEuEOChg"
    set secret-key xxxxx
    set region "us-west-1"
    set update-interval 30
  next
end
```

2. Create a dynamic firewall address for the configured AliCloud SDN connector with the supported AliCloud filter. In this example, the AliCloud SDN Connector will automatically populate and update IP addresses only for instances that belong to the specified security group:

```
config firewall address
  edit "ali-address-security"
    set type dynamic
    set sdn "ali1"
    set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdizqb"
  next
end
```

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
  edit "ali-address-security"
    set type dynamic
    set sdn "ali1"
    set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdizqb"
    config list
      edit "10.0.0.16"
      next
      edit "10.0.0.17"
      next
      edit "10.0.0.20"
      next
    end
  next
end
```

AWS SDN connector using certificates

FortiOS automatically updates dynamic addresses for AWS using an AWS SDN connector, including mapping attributes from AWS instances to dynamic address groups in FortiOS.

Configuring the SDN connector using the GUI, then checking the configuration using the CLI is recommended.

To configure an AWS SDN connector using the GUI:**1. Configure the AWS SDN connector:**

- a. Go to *Security Fabric > External Connectors*.
- b. Click *Create New*, and select *Amazon Web Services (AWS)*.
- c. In the *Access key ID* field, enter the key created in the AWS management portal.

- d. In the *Secret access key* field, enter the secret access key accompanying the above access key.
- e. In the *Region name* field, enter the region name. Refer to [AWS Regions and Endpoints](#) for the desired region name.
- f. In the *VPC ID* field, enter the VPC ID within the specified region you desire to cover with the SDN connector.
- g. Click **OK**.

2. Check the configuration using the CLI:

```
config system sdn-connector
  edit "<connector-name>"
  show
```

The output resembles the following:

```
config system sdn-connector
  edit "<connector-name>"
    set access-key "<example-access-key>"
    set secret-key ENC <example-secret-key>
    set region "us-west-2"
    set vpc-id "vpc-e1e4b587"
    set update-interval 1
  next
end
```

If you see that the SDN connector is not enabled in *Security Fabric > External Connectors* in the GUI, run the following commands to enable the SDN connector:

```
diagnose deb application awsd -1
diagnose debug enable
```

The output may display an error like the following:

```
FGT # awsd sdn connector AWS_SDN prepare to update
awsd sdn connector AWS_SDN start updating
aws curl response err, 403
<?xml version="1.0" encoding="UTF-8"?>
<Response><Errors><Error><Code>UnauthorizedOperation</Code><Message>You are not
  authorized to perform this
  operation.</Message></Error></Errors><RequestID>8403cc11-b185-41da-ad6d-
  23bb4db7d00a</RequestID></Response>
awsd curl failed 403
awsd sdn connector AWS_SDN failed to get instance list
aws curl response err, 403
{"Message": "User: arn:aws:iam::956224459807:user/jcarcavallo is not authorized to
  perform: eks:ListClusters on resource: arn:aws:eks:us-east-
  1:956224459807:cluster/*"}
awsd sdn connector AWS_SDN get EKS cluster list failed
awsd sdn connector AWS_SDN list EKS cluster failed
awsd sdn connector AWS_SDN start updating IP addresses
awsd sdn connector AWS_SDN finish updating IP addresses
awsd reap child pid: 569
```

In this case, you must configure power user access for the current administrator in the AWS management console:

After configuring power user access, run the following commands:

```
diagnose deb application awsd -1
diagnose debug enable
```

The output should display without error, as follows:

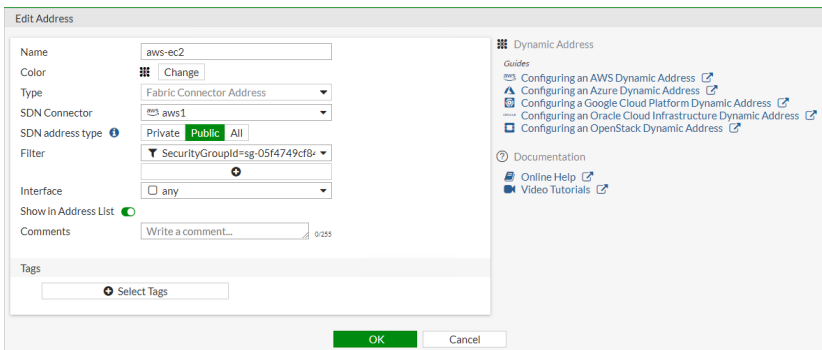

```
FGT # AWSD: update sdn connector AWS_SDN status to enabled
awsd sdn connector AWS_SDN prepare to update
awsd sdn connector AWS_SDN start updating
awsd get ec2 instance info successfully
awsd sdn connector AWS_SDN start updating IP addresses
awsd sdn connector AWS_SDN finish updating IP addresses
awsd reap child pid: 893
```

The AWS connector is now enabled.

3. Create a dynamic firewall address for the configured AWS SDN connector:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.
 - c. From the *Type* dropdown list, select *Dynamic*.
 - d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.

- e. In the *Filter* field, add the desired filters. The following filters are supported:

Description	Key	Example value
Architecture	architecture	x86
Autoscaling group	AutoScaleGroup	10703c-4f731e90-fortigate-payg-auto-scaling-group
AZ	placement.availabilityzone	us-east-1a
Group name	placement.groupname	
Image ID	imageId	ami-123456
Instance ID	instanceId	i-12345678
Instance type	instanceType	t2.micro
Key name	keyName	
Kubernetes cluster	k8s_cluster	
Kubernetes label and its name	k8s_label.Name	
Kubernetes namespace	k8s_namespace	
Kubernetes node name	k8s_nodename	
Kubernetes pod name	k8s_podname	
Kubernetes region	k8s_region	
Kubernetes service name	k8s_servicename	
Kubernetes zone	k8s_zone	
Private DNS name	privateDnsName	ip-172-31-10-211.us-west-2.compute.internal
Public DNS name	publicDnsName	ec2-54-202-168-254.us-west-2.compute.amazonaws.com
Security group ID	SecurityGroupId	
Subnet ID	subnetId	sub-123456
Tag and its name. This key supports a maximum of eight tags.	tag.Name	
Tenancy placement	placement.tenancy	
VPC ID	VpcId	

4. Ensure that the AWS SDN connector resolves dynamic firewall IP addresses:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the security group configured in step 2.

The following is an example for a public SDN address type:

Name	Type	Details	Interface	Visibility	Ref.
FABRIC_DEVICE	Subnet	0.0.0.0/0		Visible	0
FIREWALL	Subnet	0.0.0.0/0		Hidden	0
SSLVPN	IP Range	10.212.134.200 - 10.212.134.210	SSL-VPN tunnel interface (sslroot)	Visible	2
all	Subnet	0.0.0.0/0		Visible	0
aws-ec2	Fabric Connector Address (AWS)			Visible	1

The following is an example for a private SDN address type:

Name	Type	Details	Interface	Visibility	Ref.
FABRIC_DEVICE	Subnet	0.0.0.0/0		Visible	0
FIREWALL	Subnet	0.0.0.0/0		Hidden	0
SSLVPN	IP Range	10.212.134.200 - 10.212.134.210	SSL-VPN tunnel interface (sslroot)	Visible	2
all	Subnet	0.0.0.0/0		Visible	0
aws-ec2	Fabric Connector Address (AWS)			Visible	1
aws-eks1	Fabric Connector Address (AWS)			Visible	1

To configure AWS SDN connector using CLI commands:

1. Configure the AWS connector:

```
config system sdn-connector
edit "<connector-name>"
set access-key "<example-access-key>"
set secret-key ENC <example-secret-key>
set region "us-west-2"
set vpc-id "vpc-e1e4b587"
set update-interval 1
next
end
```

2. Create a dynamic firewall address for the configured AWS SDN connector with the supported filter:

```
config firewall address
edit "aws-ec2"
set type dynamic
set sdn "<connector-name>"
set filter "SecurityGroupId=sg-05f4749cf84267548"
set sdn-addr-type public
```

```

next
edit "aws-eks1"
  set type dynamic
  set sdn "<connector-name>"
  set filter "K8S_Region=us-west-2"
next
end

```

3. Confirm that the AWS SDN connector resolves dynamic firewall IP addresses using the configured filter:

```

config firewall address
  edit "aws-ec2"
    set type dynamic
    set sdn "<connector-name>"
    set filter "SecurityGroupId=sg-05f4749cf84267548"
    set sdn-addr-type public
    config list
      edit "34.222.246.198"
      next
      edit "54.188.139.177"
      next
      edit "54.218.229.229"
      next
    end
  next
  edit "aws-eks1"
    set type dynamic
    set sdn "<connector-name>"
    set filter "K8S_Region=us-west-2"
    config list
      edit "192.168.114.197"
      next
      edit "192.168.167.20"
      next
      edit "192.168.180.72"
      next
      edit "192.168.181.186"
      next
      edit "192.168.210.107"
      next
    end
  next
end

```

To add an EC2 instance to test automatic address population:

1. Assume that you want to boot up another instance with an IP address of 34.222.246.178, which is currently stopped. This instance belongs to the security group that the aws-ec2 address is filtering for. In the AWS management portal, start the instance.
2. Verify that the instance is running.
3. At this point, running `show` again shows the SDN connector has automatically populated and added the 34.222.246.178 instance.

```

config firewall address
  edit "aws-ec2"
    set type dynamic
    set sdn "<connector-name>"
    set filter "SecurityGroupId=sg-05f4749cf84267548"

```

```

set sdn-addr-type public
config list
  edit "34.222.246.198"
  next
  edit "54.188.139.177"
  next
  edit "54.218.229.229"
  next
  edit "34.222.246.178"
  next
end
next
end

```

Therefore, administrators do not need to add this instance to the address manually. When a firewall policy is applied to this address, 34.222.246.178 is automatically covered.

Azure SDN connector using service principal

FortiOS automatically updates dynamic addresses for Azure using Azure SDN connector, including mapping attributes from Azure instances to dynamic address groups in FortiOS.

To configure the Azure SDN connector using service principal:

1. Create an Azure SDN connector:
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. Select *Microsoft Azure*.
 - c. Configure the connector. See [Azure SDN connector service principal configuration requirements](#):

The screenshot shows the 'New External Connector' configuration page. The connector is named 'azure1' and is currently 'Enabled'. The 'Update interval' is set to 'Use Default'. Under the 'Azure Connector' section, the 'Server region' is 'Global', the 'Directory ID' is '942b80cd-1b14-42a1-8dcf-4b21dececf', the 'Application ID' is '14dbd5c5-307e-4ea4-8133-68738141', and the 'Client secret' is masked with dots. The 'Resource path' is currently disabled.

- d. Click *OK*.
2. Create a dynamic firewall address for the Azure connector.
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. From the *Type* dropdown list, select *Dynamic*.
 - c. From the *Sub Type* dropdown list, select *Fabric Connector Address*.

- d. From the *SDN Connector* dropdown list, select the Azure SDN connector.
- e. In the *Filter* field, add filters as desired. The Azure SDN connector supports the following filters:
 - `vm=<VM name>`
 - `securitygroup=<nsg id>`
 - `vnet=<VNet id>`
 - `subnet=<subnet id>`
 - `vmss=<VM scale set>`
 - `tag.<key>=<value>`
 - `servicetag=<value>`
 - `tag.<key>=<value>`
- f. Click *OK*.
- g. Hover the cursor over the address name to see the dynamic IP addresses that the connector resolves.

Cisco ACI SDN connector using a standalone connector

Cisco ACI (Application Centric Infrastructure) SDN connectors can be used in dynamic firewall addresses.

The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.

To configure a Cisco ACI connector in the GUI:

1. Create the Cisco ACI SDN connector:
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. In the *Private SDN* section, click *Application Centric Infrastructure (ACI)*.
 - c. In the *Cisco ACI Connector* section, for *Type*, select *Fortinet SDN Connector* and configure the remaining settings as needed.
 - d. Click *OK*.

The screenshot shows the 'New External Connector' dialog box in the Fortinet GUI. The dialog is titled 'New External Connector' and is divided into several sections:

- Private SDN:** Features the Cisco logo and the text 'Application Centric Infrastructure (ACI)'.
- Connector Settings:** Includes a 'Name' field with the value 'aci1', a 'Status' section with 'Enabled' selected and 'Disabled' unselected, and a 'Cisco ACI Connector' section.
- Cisco ACI Connector:** Includes a 'Type' dropdown set to 'FortiSDN Connector' (with 'Direct Connection' also visible), an 'IP' field with '172.18.64.31', a 'Port' dropdown set to 'Use Default' (with 'Specify' also visible), a 'Username' field with 'admin', and a 'Password' field with masked characters.

On the right side of the dialog, there are links for 'Public SDN Connector Setup Guides' (Amazon Web Services, Google Cloud Platform, Microsoft Azure, Oracle Cloud Infrastructure) and 'Private SDN Connector Setup Guides' (Cisco Application Centric Infrastructure, Nuage Virtualized Services Platform, OpenStack Connector, VMware NSX). There are also links for 'Documentation' (Online Help, Video Tutorials).

At the bottom of the dialog, there are 'OK' and 'Cancel' buttons.

2. Create the dynamic firewall address for the connector:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Configure the following settings:
 - i. For *Type*, select *Dynamic*.
 - ii. For *Sub Type*, select *Fabric Connector Address*.
 - iii. For *SDN Connector*, select the first ACI connector.
 - iv. Configure the remaining settings as needed.
 - c. Click *OK*.

The screenshot shows the 'Edit Address' configuration window. The main form contains the following fields and values:

- Name: aci-address1
- Color: Change (button)
- Type: Dynamic (dropdown)
- Sub Type: Fabric Connector Address (dropdown)
- SDN Connector: aci1 (dropdown)
- Tenant: wqdai-ten
- Endpoint Group Name: EPG-in
- SDN Tag: ffff
- Interface: any (dropdown)
- Show in address list:
- Comments: Write a comment... (text area)

On the right side, there is a 'Dynamic Address' section with 'Guides' and 'Documentation' links. The guides include links for configuring dynamic addresses on AWS, Azure, Google Cloud Platform, Oracle Cloud Infrastructure, and OpenStack.

To verify the dynamic firewall IPs are resolved by the SDN connector in the GUI:

1. Go to *Policy & Objects > Addresses*.
2. In the address table, hover over the address to view which IPs it resolves to.

To configure a Cisco ACI connector in the CLI:

1. Create the SDN connector:

```
config system sdn-connector
  edit "aci1"
    set type aci
    set server "172.18.64.31"
    set username "admin"
    set password xxxxxxxx
  next
end
```

2. Create the dynamic firewall address for the connector:

```
config firewall address
  edit "aci-address1"
    set type dynamic
    set sdn "aci1"
    set color 17
    set tenant "wqdai-ten"
```

```

    set epg-name "EPG-in"
    set sdn-tag "fffff"
  next
end

```

To verify the dynamic firewall IPs are resolved by the SDN connector in the CLI:

```

# diagnose firewall dynamic list

List all dynamic addresses:
aci1.aci.wqdai-ten.EPG-in.fffff: ID(171)
  ADDR(192.168.100.20)

```

ClearPass endpoint connector via FortiManager

ClearPass Policy Manager (CPPM) is a network access system that can send information about authenticated users to third party systems, such as a FortiGate or FortiManager.

In this example, communications are established between CPPM and FortiManager, and then the FortiManager forwards information to a managed FortiGate. On the FortiGate, the user information can be used in firewall policies and added to FSSO dynamic addresses.

Configure the FortiManager

Establish communications between FortiManager and CPPM so that FortiManager can synchronize CPPM user groups. See [Creating a ClearPass connector](#) in the FortiManager Administration Guide.

Edit ClearPass Connector

Name: test

Status: ON

Server: 10.1.100.139

Client: test

User: admin

Password: *****

Connector Users: Search...

- cp_test_FSSOROLE (0/2)
- cp_test_AirGroup v1 (0/0)
- cp_test_AirGroup v2 (0/0)
- cp_test_Aruba TACACS read-only Admin (0/0)
- cp_test_Aruba TACACS root Admin (0/0)
- cp_test_BYOD Operator (0/0)
- cp_test_Contractor (0/0)
- cp_test_Device Registration (0/0)
- cp_test_Employee (0/0)
- cp_test_Guest (0/0)
- cp_test_MAC Caching (0/0)
- cp_test_Onboard Android (0/0)
- cp_test_Onboard Chromebook (0/0)

Apply & Refresh OK Cancel

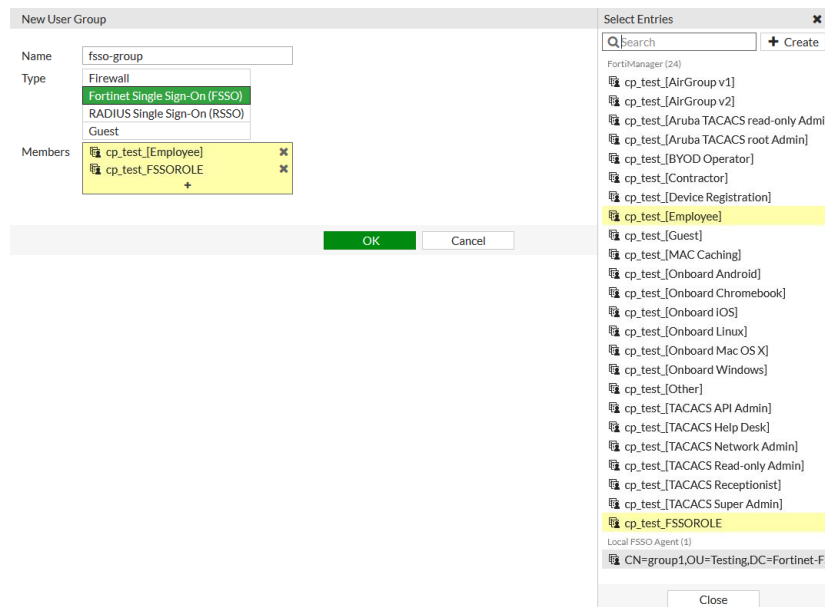

FortiManager forwards the group information to managed FortiGates.

Adding CPPM FSSO user groups to a local user group

To add CPPM user groups to a local user group in the GUI:

1. On the FortiGate, go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set *Type* to *Fortinet Single Sign-On (FSSO)*.
4. Click the *Members* field, and add one or more FSSO groups.

FSSO groups can come from multiple sources; CPPM FSSO groups are prefixed with *cp_* and are listed under the *FortiManager* heading.

5. Click *OK*.

To add CPPM user groups to a local user group in the CLI:

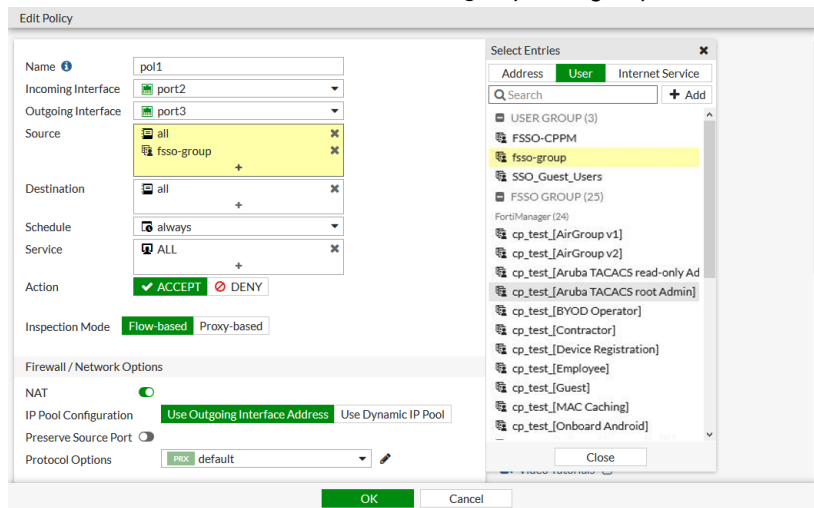

```
config user group
  edit fssso-group
    set group-type fssso-service
    set member "cp_test_[Employee]" "cp_test_FSSOROLE"
  next
end
```

Using the local FSSO user group in a firewall policy

To add the local FSSO user group to a firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create a new policy, or edit an existing one.

- Click in the *Source* field and add the *fssso-group* user group.

CPPM user groups can also be added directly to the policy.

- Click **OK**.

To add the local FSSO user group to a firewall policy in the CLI:

```
config firewall policy
  edit 1
    set name "poll"
    set srcintf "port2"
    set dstintf "port3"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set groups "fssso-group"
    set nat enable
  next
end
```

Verification

To verify that a user was added to the FSSO list on the FortiGate:

- Log on to the client and authenticate with CPPM.
After successful authentication, the user is added to the FSSO list on the FortiGate.
- On the FortiGate, go to *Dashboard > Users & Devices* and look at the *Firewall Users* widget to verify that the user was added.

User Name	User Group	Duration	IP Address	Traffic Volume	Method
fssso2	fssso-group cp_test_FSSOROLE	9 second(s)	10.1.100.188	0 B	Fortinet Single Sign-On

The user group *cp_test_FSSOROLE* is listed separately because the user is a member of that group on the CPPM.

To verify that traffic can pass the firewall:

1. Log on to the client and browse to an external website.
2. On the FortiGate, go to *Dashboard > FortiView Sources*.
3. Double-click on the user and select the *Destinations* tab to verify that traffic is being passed by the firewall.

To verify the user address groups:

```
show user adgrp
  config user adgrp
    edit "cp_test_FSSOROLE"
      set server-name "FortiManager"
    next
    edit "cp_test_[AirGroup v1]"
      set server-name "FortiManager"
    next
    edit "cp_test_[AirGroup v2]"
      set server-name "FortiManager"
    next
    edit "cp_test_[Aruba TACACS read-only Admin]"
      set server-name "FortiManager"
    next
    edit "cp_test_[Aruba TACACS root Admin]"
      set server-name "FortiManager"
    next
    edit "cp_test_[BYOD Operator]"
      set server-name "FortiManager"
    next
    edit "cp_test_[Contractor]"
      set server-name "FortiManager"
    next
    edit "cp_test_[Device Registration]"
      set server-name "FortiManager"
    next
    ...
    edit "CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM"
      set server-name "Local FSSO Agent" <----- !!!
    next
  end
```

GCP SDN connector using service account

FortiOS automatically updates dynamic addresses for GCP using a GCP SDN connector, including mapping attributes from GCP instances to dynamic address groups in FortiOS.

To configure GCP connector using the GUI:

1. In FortiOS, go to *Security Fabric > External Connectors*.
2. Click *Create New*, and select *Google Cloud Platform (GCP)*.
Note you can create only one SDN Connector per connector type. For example, you can create one entry for GCP.

3. Configure the connector as follows:

- a. **Project name:** Enter the name of the GCP project. The VMs whose IP addresses you want to populate should be running within this project.
- b. **Service account email:** Enter the email address associated with the service account that will call APIs to the GCP project specified above.
- c. **Private key:** Enter the private key statement as shown in the text box. For details, see [Creating a GCP service account](#).

The screenshot shows the 'New External Connector' configuration window. It is titled 'Public SDN' and features the Google Cloud Platform (GCP) logo with a green checkmark. The 'Connector Settings' section includes:

- Name: gcp-connector
- Status: Enabled (with a green checkmark icon) and Disabled (with a red X icon)
- Update interval: Use Default (selected) and Specify

 The 'GCP Connector' section includes:

- Project name: devproject01
- Service account email: jbanks@devproject.
- Private key: -----BEGIN PRIVATE KEY-----

 At the bottom right, there are 'OK' and 'Cancel' buttons.

Once the connector is successfully configured, a green indicator appears at the bottom right corner. If the indicator is red, the connector is not working. See [Troubleshooting GCP SDN Connector](#).

4. Create a dynamic firewall address for the configured GCP SDN connector:

- a. Go to *Policy & Objects > Addresses*. Click *Create New*, then select *Address*.
- b. Configure the address:
 - i. **Name:** Enter the desired name.
 - ii. **Type:** Select *Dynamic*.
 - iii. **Fabric Connector Type:** Select *Google Cloud Platform (GCP)*.
 - iv. **Filter:** The SDN connector automatically populates and updates only instances that match this filtering condition. Currently GCP supports the following filters:
 - `id=<instance id>`: This matches an VM instance ID.
 - `name=<instance name>`: This matches a VM instance name.
 - `zone=<gcp zones>`: This matches a zone name.
 - `network=<gcp network name>`: This matches a network name.
 - `subnet=<gcp subnet name>`: This matches a subnet name.
 - `tag=<gcp network tags>`: This matches a network tag.
 - `label.<gcp label key>=<gcp label value>`: This matches a free form GCP label key and its value.

In the example, the filter is set as `'network=default & zone=us-central-1f'`. This configuration populates all IP addresses that belong to the default network in the zone us-central-1f.

You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

Note that wildcards (such as the asterisk) are not allowed in filter values.

v. Click **OK**.

The address has been created. Wait for a few minutes before the setting takes effect. You will know that the address is in effect when the exclamation mark disappears from the address entry. When you hover over the address, you can see the list of populated IP addresses.

Name	Type	Details
ESS	Subnet	0.0.0.0/0
	IP Range	10.212.134.200 - 10.212
	Subnet	0.0.0.0/0
	FQDN	autoupdate.opera.com
	FQDN	play.google.com
jkatogcp001	Fabric Connector Address (GCP)	

If the exclamation mark does not disappear, check the address settings.

IBM Cloud SDN connector using API keys

FortiOS can automatically update dynamic addresses for IBM Cloud using an SDN connector. For information on creating and managing the API key, see the [IBM Cloud](#) documentation.

To configure IBM Cloud SDN connectors using the GUI:

1. Create SDN connectors for compute generation 1 and 2:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, then select *IBM Cloud*.

c. Configure the connector for computer generation 1:

d. Click **OK**.e. Click **Create New**, then select **IBM Cloud**.

f. Configure the connector for computer generation 2:

g. Click **OK**.

2. Create dynamic firewall addresses for the configured connectors:

- a. Go to **Policy & Objects > Addresses**.
- b. Click **Create New > Address**.
- c. From the **Type** dropdown list, select **Dynamic**.
- d. From the **Sub Type** dropdown list, select **Fabric Connector Address**.
- e. From the **SDN Connector** dropdown list, select the **IBM SDN** connector.
- f. In the **Filter** field, add the desired filters. The following filters are supported:
 - <InstanceId>
 - <InstanceName>
 - <ImageId>
 - <ImageName>
 - <Architecture>
 - <Profile>
 - <Vpc>
 - <Zone>
 - <Subnet>
 - <ResourceGroup>

- g. Click **OK**.
- h. Click **Create New > Address**.
- i. Repeat the process for computer generation 2:

- j. Click **OK**.

3. Ensure that the connectors resolve dynamic firewall IP addresses:

- a. Go to **Policy & Objects > Addresses**.
- b. Hover over the addresses created in step 2 to see a list of IP addresses that the connector has resolved:

Name	Type	Details	Interface
gmail.com	FQDN	gmail.com	
ibm_gen1_add1	Dynamic (IBM)	ibm_gen1_add1	
ibm_gen2_add1	Address	ibm_gen1_add1	h2_add1
login.microsoft.com	Type	Dynamic	soft.com
login.microsoft.com	Sub Type	Fabric Connector Address	softonline.com
login.windows.net	SDN Connector	ibm_gen1	aws.net
none	Interface	any	
onboarding.address	Resolved To	10.240.0.49 10.240.0.75 169.61.227.88	onboarding
vlan_Linux.address	References	0	vlan_Linux
wildcard.dropbox.com			
wildcard.google.com	FQDN	google.com	

To configure IBM Cloud SDN connectors using the CLI:

1. Create SDN connectors for compute generation 1 and 2:

```
config system sdn-connector
edit "ibm_gen1"
set status enable
set type ibm
set api-key xxxxxx
set compute-generation 1
set ibm-region us-south
set update-interval 60
next
edit "ibm_gen2"
set status enable
set type ibm
```

```
        set api-key xxxxxx
        set compute-generation 2
        set ibm-region us-east
        set update-interval 60
    next
end
```

2. Create dynamic firewall addresses for the configured connectors:

```
config firewall address
    edit "ibm_gen1_add1"
        set type dynamic
        set sdn "ibm_gen1"
        set color 19
        set filter "Vpc=alex-vpc1"
    next
    edit "ibm_gen2_add1"
        set type dynamic
        set sdn "ibm_gen2"
        set color 19
        set filter "ResourceGroup=alex-grp2"
    next
end
```

3. Ensure that the connectors resolve dynamic firewall IP addresses:

```
# show firewall address ibm_gen1_add1
config firewall address
    edit "ibm_gen1_add1"
        set uuid 586841c4-7f46-51ea-dc66-dbf840af03d3
        set type dynamic
        set sdn "ibm_gen1"
        set color 19
        set filter "Vpc=alex-vpc1"
        config list
            edit "10.240.0.49"
            next
            edit "10.240.0.75"
            next
            edit "169.61.227.88"
            next
            edit "52.117.170.31"
            next
        end
    next
end

# show firewall address ibm_gen2_add1
config firewall address
    edit "ibm_gen2_add1"
        set uuid 5868c4f0-7f46-51ea-2b79-b5170fbfd4a8
        set type dynamic
        set sdn "ibm_gen2"
        set color 19
        set filter "ResourceGroup=alex-grp2"
        config list
            edit "10.241.128.4"
            next
        end
    end
```

```
        edit "10.241.128.5"  
        next  
        edit "10.241.129.4"  
        next  
        edit "52.117.126.69"  
        next  
    end  
next  
end
```

Kubernetes (K8s) SDN connectors

The following topics provide information about configuring Kubernetes SDN connectors:

- [AliCloud Kubernetes SDN connector using access key on page 2618](#)
- [AWS Kubernetes \(EKS\) SDN connector using access key on page 2620](#)
- [Azure Kubernetes \(AKS\) SDN connector using client secret on page 2623](#)
- [GCP Kubernetes \(GKE\) SDN connector using service account on page 2625](#)
- [Oracle Kubernetes \(OKE\) SDN connector using certificates on page 2628](#)
- [Private cloud K8s SDN connector using secret token on page 2630](#)

AliCloud Kubernetes SDN connector using access key

When an AliCloud SDN connector is configured, dynamic address objects can support Kubernetes filters based on cluster, service, node, pod, and more.

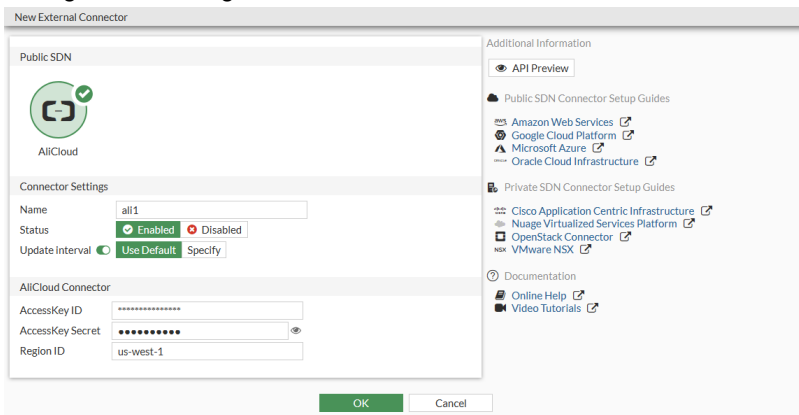

The following address filters can be applied:

- K8S_Cluster
- K8S_Namespace
- K8S_ServiceName
- K8S_NodeName
- K8S_PodName
- K8S_Region
- K8S_Zone
- K8S_Label

To configure an AliCloud SDN connector with a Kubernetes filter in the GUI:

1. Configure the AliCloud SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, and select *AliCloud*.

c. Configure the settings as needed and click OK.

2. Create a dynamic firewall address with the supported Kubernetes filter:

- a. Go to *Policy & Objects > Addresses*.
- b. Click *Create New > Address* and enter a name.
- c. Configure the following settings:
 - i. For *Type*, select *Dynamic*.
 - ii. For *Sub Type*, select *Fabric Connector Address*.
 - iii. For *SDN Connector*, select the connector created in step 1.
 - iv. For *SDN address type*, select *Private*.
 - v. For *Filter*, select *K8S_Cluster=zhmcluster*.
- d. Click *OK*.

The corresponding IP addresses are dynamically updated and resolved after applying the Kubernetes filter.

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:

- a. Go to *Policy & Objects > Addresses*.
- b. In the address table, hover over the address created in step 2 to view which IPs it resolves to:

Interface	Type	Ref.
10	Address	0
10	Address	0
10	Address	2
10	Address	2
10	Address	0
10	Address	0
10	Address	0
10	Address	0

To configure an AliCloud SDN connector with a Kubernetes filter in the CLI:**1. Configure the AliCloud SDN connector:**

```
config system sdn-connector
  edit "ali1"
    set type alicloud
    set access-key "*****"
    set secret-key xxxxxxxx
    set region "us-west-1"
  next
end
```

2. Create a dynamic firewall address with the supported Kubernetes filter:

```
config firewall address
  edit "ali_add1"
    set type dynamic
    set sdn "ali1"
    set color 10
    set filter "K8S_Cluster=zhmcluster1"
  next
end
```

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
  edit "ali_add1"
    show
    config firewall address
      edit "ali_add1"
        set uuid c48e4f00-5435-51eb-0547-aced5cf80f1f
        set type dynamic
        set sdn "ali1"
        set color 10
        set filter "K8S_Cluster=zhmcluster1"
      config list
        edit "10.0.0.28"
        next
        edit "10.0.0.29"
        next
        edit "10.0.0.30"
        next
        ...
      end
    next
  end
end
```

AWS Kubernetes (EKS) SDN connector using access key

AWS SDN connectors support dynamic address groups based on AWS Kubernetes (EKS) filters.

To enable an AWS SDN connector to fetch IP addresses from AWS Kubernetes:

1. Go to *Security Fabric > External Connectors*. Click *Create New*, then select *Amazon Web Services (AWS)*. Configure the SDN connector as desired. See [AWS SDN connector using certificates on page 2600](#)

2. Go to *Policies & Objects > Addresses*. Click *Create New > Address* to create a dynamic firewall address for the configured SDN connector using the supported Kubernetes filter.
3. From the *Type* dropdown list, select *Dynamic*.
4. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
5. From the *SDN Connector* dropdown list, select the desired SDN connector.
6. In the *Filter* field, add the desired filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/pod).

- Configure the rest of the settings, then click **OK**.
- Ensure that the SDN connector resolves the dynamic firewall address IP addresses by going to *Policy & Objects > Addresses* and hovering over the newly created address.

Name	Type
aws-k8s-and	Fabric Connector Address (AWS)
aws-k8s-or	Fabric Connector Address (AWS)
aws-label	Fabric Connector Address (AWS)
aws-nam	Fabric Connector Address (AWS)
aws-nod	Fabric Connector Address (AWS)
aws-pod	Fabric Connector Address (AWS)

aws-pod resolves to:

- 192.168.114.197

To configure an AWS Kubernetes SDN connector through the CLI:

- Configure the SDN connector:

```
config system sdn-connector
  edit "aws1"
    set type aws
    set access-key "AKIAIJNKE75ANVN5AEQA"
    set secret-key xxxxx
    set region "us-west-2"
    set update-interval 30
  next
end
```

- Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:

```
config firewall address
  edit "aws-pod"
    set type dynamic
    set sdn "aws1"
    set filter "K8S_PodName=aws-node-g6zhx"
  next
end
```

The SDN connector resolves the dynamic firewall address IP address:

```
config firewall address
  edit "aws-pod"
    set type dynamic
    set sdn "aws1"
```

```

set filter "K8S_PodName=aws-node-g6zhx"
config list
  edit "192.168.114.197"
  next
end
next
end

```

Azure Kubernetes (AKS) SDN connector using client secret

Azure SDN connectors support dynamic address groups based on Azure Kubernetes (AKS) filters.

To enable an Azure SDN connector to fetch IP addresses from Azure Kubernetes:

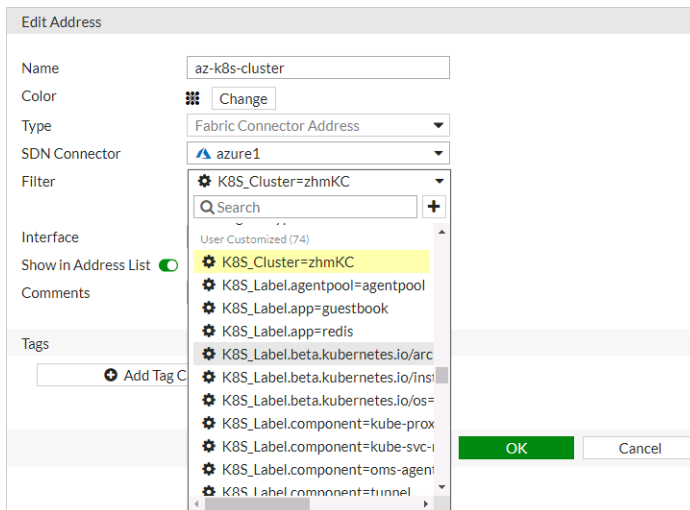

1. Configure the Azure SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, and select *Azure*.
 - c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. See [Azure SDN connector service principal configuration requirements](#).

2. Create a dynamic firewall address for the configured K8s SDN connector:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.
 - c. From the *Type* dropdown list, select *Dynamic*.
 - d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
 - e. From the *SDN Connector* dropdown list, select the desired SDN connector.
 - f. In the *Filter* field, add the desired filter. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.

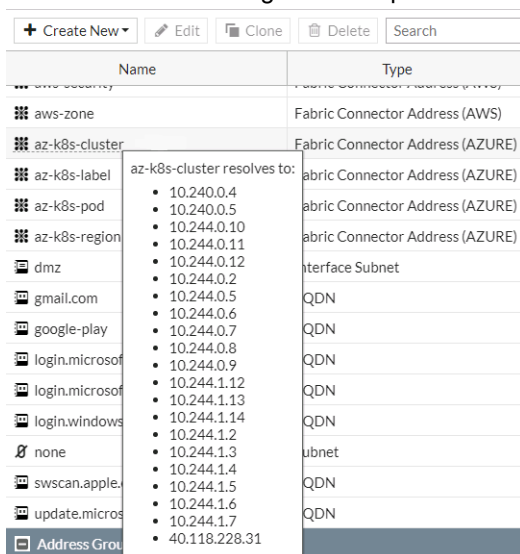

Filter	Description
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/pod).

In this example, the address is configured to automatically populate and update IP addresses only for instances that belong to the zhmKC cluster:

3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:

- a. Go to *Policy & Objects > Addresses*.
- b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the zhmKC cluster as configured in step 2:

To configure an Azure Kubernetes SDN connector through the CLI:

1. Configure the SDN connector:

```
config system sdn-connector
  edit "azure1"
    set type azure
    set tenant-id "942b80cd-1b14-42a1-8dcf-4b21dece61ba"
    set client-id "14dbd5c5-307e-4ea4-8133-68738141feb1"
    set client-secret xxxxx
    set update-interval 30
  next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter. In this example, the address will automatically populate and update IP addresses only for instances that belong to the zhmkC cluster:

```
config firewall address
  edit "az-k8s-cluster"
    set type dynamic
    set sdn "azure1"
    set filter "K8S_Cluster=zhmkC"
  next
end
```

3. Confirm that the Azure SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
  edit "az-k8s-cluster"
    set type dynamic
    set sdn "azure1"
    set filter "K8S_Cluster=zhmkC"
    config list
      edit "10.240.0.4"
      next
      edit "10.240.0.5"
      next
      edit "10.244.0.10"
      next
    end
  next
end
```

GCP Kubernetes (GKE) SDN connector using service account

Google Cloud Platform (GCP) SDN connectors support dynamic address groups based on GCP Kubernetes Engine (GKE) filters.

To enable a GCP SDN connector to fetch IP addresses from GKE:

1. Go to *Security Fabric > External Connectors*, and configure an SDN connector for GCP.

The screenshot shows the 'Edit External Connector' configuration page. It is titled 'Public SDN' and features the Google Cloud Platform (GCP) logo. The 'Connector Settings' section includes:

- Name: gcp1
- Status: Enabled (with a green checkmark icon) and Disabled (with a red X icon)
- Update Interval: Use Default (with an info icon) and Specify (with a green checkmark icon) 30

 The 'GCP Connector' section includes:

- Project name: dev-project-001-166400
- Service account email: 966517025500-compute@developer.g
- Private key: -----BEGIN PRIVATE KEY-----

2. Go to *Policies & Objects > Addresses* and create a dynamic firewall address for the configured SDN connector using the supported Kubernetes filter.
3. To filter out the Kubernetes IP addresses, select the address filter or filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/Pod).

In this example, the GCP SDN connector will automatically populate and update IP addresses only for instances that belong to the zhm-kc3 cluster:

4. Configure the rest of the settings, then click **OK**.
The dynamic firewall address IP is resolved by the SDN connector.

Name	Type
Address 13	
FIREWALL_AUTH_PORTAL_ADDRESS	Subnet
SSLVPN_TUNNEL_ADDR1	IP Range
all	Subnet
gcp-k8s-cluster	Fabric Connector Address (GCP)
gcp-k8s-label	gcp-k8s-cluster resolves to:
gcp-k8s-pod	<ul style="list-style-type: none"> • 10.0.2.4 • 10.0.2.7
gcp-k8s-pool	<ul style="list-style-type: none"> • 10.28.0.13 • 10.28.0.14
gmail.com	IP Range
login.microsoft.com	IP Range
login.microsoft.com	IP Range
login.windows.net	IP Range
none	Subnet
vmware-network	Fabric Connector Address (VMWARE)
Address Group	<ul style="list-style-type: none"> • 35.235.101.176 • 35.236.43.119 • 35.236.60.13 • 50.13.123.45
Wildcard FQDN	

To configure a GCP Kubernetes SDN connector through the CLI:

1. Configure an SDN connector for Kubernetes:

```
config system sdn-connector
edit "gcp1"
set type gcp
set gcp-project "dev-project-001-166400"
set service-account "966517025500-compute@developer.gserviceaccount.com"
set update-interval 30
next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:

```
config firewall address
edit "gcp-k8s-cluster"
set type dynamic
set sdn "gcp1"
```

```

    set filter "K8S_Cluster=zhm-kc3"
  next
end

```

The dynamic firewall address IP is resolved by the SDN connector:

```

config firewall address
  edit "gcp-k8s-cluster"
    set type dynamic
    set sdn "gcp1"
    set filter "K8S_Cluster=zhm-kc3"
  config list
    edit "10.0.2.4"
    next
    edit "10.0.2.7"
    next
    edit "10.28.0.13"
    next
  end
next
end

```

Oracle Kubernetes (OKE) SDN connector using certificates

OCI SDN connectors support dynamic address groups based on Oracle Kubernetes (OKE) filters.

To enable an OCI SDN connector to fetch IP addresses from Oracle Kubernetes:

1. Configure the OCI SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, and select *Oracle Cloud Infrastructure (OCI)*.
 - c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. The update interval is in seconds.

The screenshot shows the 'Edit External Connector' configuration window. The 'Public SDN' section is active, showing the Oracle Cloud Infrastructure (OCI) logo. The 'Connector Settings' section includes the following fields:

- Name: oci1
- Status: Enabled (with a red 'X' icon next to 'Disabled')
- Update Interval: Use Default (with a 'Specify' button) | 30

The 'OCI Connector' section includes the following fields:

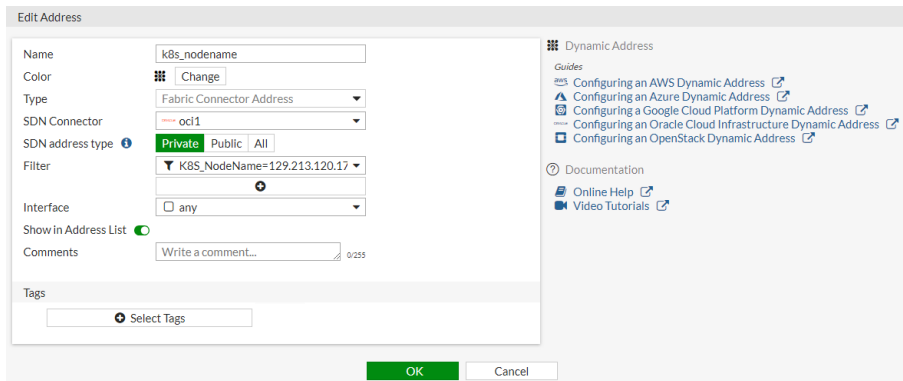

- Server region: US Ashburn
- User ID: ocid1.user.oc1.aaaaaaq2lfspeo3uetz
- Tenant ID: ocid1.tenancy.oc1.aaaaaaambr3uztzo
- Compartment ID: ocid1.compartment.oc1.aaaaaaaebxod
- Certificate: cert-sha2

On the right side, there are links for 'Public SDN Connector Setup Guides' (Amazon Web Services, Google Cloud Platform, Microsoft Azure) and 'Private SDN Connector Setup Guides' (Cisco Application Centric Infrastructure, Nuage Virtualized Services Platform, OpenStack Connector, Oracle Cloud Infrastructure, VMware NSX). There are also links for 'Documentation', 'Online Help', and 'Video Tutorials'. A 'Feedback' button is visible on the right edge.

2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.

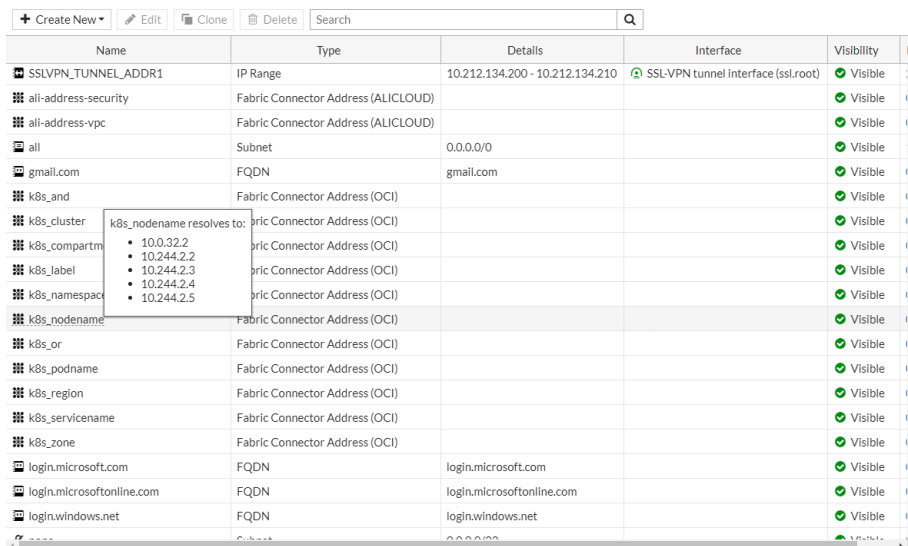

c. In the *Filter* field, select the desired filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/Pod).

3. Confirm that the SDN connector resolves dynamic firewall IP addresses:

- a. Go to *Policy & Objects > Addresses*.
- b. Hover over the address created in step 2 to see a list of IP addresses for instances:

To configure an SDN connector through the CLI:

1. Configure the OCI SDN connector:

```
config system sdn-connector
  edit "oci1"
    set type oci
    set tenant-id
      "ocid1.tenancy.oc1..aaaaaaaambr3uzztoyhweohbzqqdo775h7d3t54zpmz4b2cf35vs55cxxx"
    set user-id
      "ocid1.user.oc1..aaaaaaaq21fspeo3uetzbpzpv2pqvzzevozccnys347stwssvizqlatfxxx"
    set compartment-id
      "ocid1.compartment.oc1..aaaaaaaaelxxdjazqo7nzcpgypiyiqcgkmytjry6nfg5345vw7eavpwnmxxx"
    set oci-region ashburn
    set oci-cert "cert-sha2"
    set update-interval 30
  next
end
```

2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:

```
config firewall address
  edit "k8s_nodename"
    set type dynamic
    set sdn "oci1"
    set filter "K8S_NodeName=129.213.120.172"
  next
end
```

3. Confirm that the SDN connector resolves dynamic firewall IP addresses:

```
config firewall address
  edit "k8s_nodename"
    set type dynamic
    set sdn "oci1"
    set filter "K8S_NodeName=129.213.120.172"
  config list
    edit "10.0.32.2"
    next
    edit "10.244.2.2"
    next
    edit "10.244.2.3"
    next
    edit "10.244.2.4"
    next
    edit "10.244.2.5"
    next
  end
next
end
```

Private cloud K8s SDN connector using secret token

FortiOS automatically updates dynamic and cluster IP addresses for Kubernetes (K8s) by using a K8s SDN connector, enabling FortiOS to manage K8s pods as global address objects, as with other connectors. This includes mapping the following attributes from K8s instances to dynamic address groups in FortiOS:

Filter	Description
Namespace	Filter service IP addresses in a given namespace.
ServiceName	Filter service IP addresses by the given service name.
NodeName	Filter node IP addresses by the given node name.
PodName	Filter IP addresses by the pod name.
Label.XXX	Filter service or node IP addresses with the given label XXX. For example: <code>K8S_Label.app=nginx</code> .

FortiOS 6.2.3 and later collect cluster IP addresses in addition to external IP addresses for exposed K8s services.

There is no maximum limit for the number of IP addresses populated with the filters.

To configure K8s SDN connector using the GUI:

1. Configure the K8s SDN connector:
 - a. Go to *Security Fabric > External Connectors > Create New Connector*.
 - b. Select *Kubernetes*.
 - c. In the *IP* field, enter the IP address that you obtained in [Obtaining the IP address, port, and secret token in Kubernetes](#).
 - d. In the *Port* field, select *Specify*, then enter the port that you obtained in [Obtaining the IP address, port, and secret token in Kubernetes](#).
 - e. In the *Secret token* field, enter the token that you obtained in [Obtaining the IP address, port, and secret token in Kubernetes](#).
 - f. Configure the other fields as desired.
2. Create a dynamic firewall address for the configured K8S SDN connector:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.
 - c. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match

the specified node name:

3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Hover over the address created in step 2 to see a list of IP addresses for node instances that match the node name configured in step 2:

Name	Type
aws-security	Fabric Connector Address (AWS)
aws-zone	Fabric Connector Address (AWS)
az-k8s-cluster	Fabric Connector Address (AZURE)
az-k8s-label	Fabric Connector Address (AZURE)
az-k8s-pod	Fabric Connector Address (AZURE)
az-k8s-region	Fabric Connector Address (AZURE)
dmz	Interface Subnet
gmail.com	FQDN
google-play	FQDN
k8s_label	Fabric Connector Address (KUBERNETES)
k8s_nodename	Fabric Connector Address (KUBERNETES)

Hover tooltip for k8s_nodename:

```
k8s_nodename resolves to:
• 172.16.65.227
```

To configure K8s SDN connector using CLI commands:

1. Configure the K8s SDN connector:

```
config system sdn-connector
edit "kubernetes1"
set type kubernetes
set server "<IP address obtained in Obtaining the IP address, port, and secret token in Kubernetes>"
set server-port <Port obtained in Obtaining the IP address, port, and secret token in Kubernetes>
set secret-token <Secret token obtained in Obtaining the IP address, port, and secret token in Kubernetes>
set update-interval 30
next
end
```

2. Create a dynamic firewall address for the configured K8s SDN connector with the supported K8s filter. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match the specified node name:

```

config firewall address
  edit "k8s_nodename"
    set type dynamic
    set sdn "kubernetes1"
    set filter "K8S_NodeName=van-201669-pc1"
  next
end

```

3. Confirm that the K8s SDN connector resolves dynamic firewall IP addresses using the configured filter:

```

config firewall address
  edit "k8s_nodename"
    set type dynamic
    set sdn "kubernetes1"
    set filter "K8S_NodeName=van-201669-pc1"
  config list
    edit "172.16.65.227"
      next
    end
  next
end

```

To troubleshoot the connection:

1. In FortiOS, run the following commands:

```

diagnose deb application kubed -1
diagnose debug enable

```
2. Reset the connection on the web UI to generate logs and troubleshoot the issue. The following shows the output in the case of a failure:

```

fortigate # diagnose deb application kubed -1
Debug messages will be on for 30 minutes.

fortigate # diagnose debug enable

fortigate # k8s: update sdn connector kubernetes1 status to enabled
k8s: update sdn connector kubernetes2 status to disabled

kubed reap child pid: 1252

```

Nuage SDN connector using server credentials

You can use Nuage SDN connectors in dynamic firewall addresses.

The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.

To configure a Nuage connector in the GUI:

1. Create the Nuage SDN connector:
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. In the *Private SDN* section, click *Nuage Virtualized Services Platform*.
 - c. Configure the settings as needed.
 - d. Click *OK*.

The screenshot shows the 'New External Connector' dialog box in the Fortinet GUI. The 'Private SDN' section is selected, and the 'Nuage Virtualized Services Platform' connector is chosen. The 'Connector Settings' section shows the name 'nuage1' and the status 'Enabled'. The 'Nuage Connector' section shows the IP address '172.18.64.27', the port '5671', the username 'admin', and a masked password. The 'OK' button is highlighted in green.

2. Create the dynamic firewall address for the connector:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Configure the following settings:
 - i. For *Type*, select *Dynamic*.
 - ii. For *Sub Type*, select *Fabric Connector Address*.
 - iii. For *SDN Connector*, select the Nuage connector.
 - iv. Configure the remaining settings as needed.

c. Click OK.

The screenshot shows the 'Edit Address' configuration window in the FortiGate GUI. The configuration is as follows:

- Name: nuage-address1
- Color: 19 (Change button)
- Type: Dynamic
- Sub Type: Fabric Connector Address
- SDN Connector: nuage1
- Organization: nuage/L3
- Subnet Name: Subnet20
- Policy Group: (empty)
- Interface: any
- Show in address list:
- Comments: Write a comment... (0/255)

On the right side, there is a 'Dynamic Address' section with a 'Guides' list containing links for configuring dynamic addresses on AWS, Azure, Google Cloud Platform, Oracle Cloud Infrastructure, and OpenStack. Below that is a 'Documentation' section with links for 'Online Help' and 'Video Tutorials'. At the bottom of the window, the 'OK' button is highlighted in green, and the 'Cancel' button is visible to its right.

To verify the SDN connector resolves the dynamic firewall IP addresses in the GUI:

1. Go to *Policy & Objects > Addresses*.
2. In the address table, hover over an address to view which IP addresses it resolves to.

To configure a Nuage connector in the CLI:

1. Create the SDN connector:

```
config system sdn-connector
  edit "nuage1"
    set type nuage
    set server "172.18.64.27"
    set server-port 5671
    set username "admin"
    set password xxxxxxxx
  next
end
```

2. Create the dynamic firewall address for the connector:

```
config firewall address
  edit "nuage-address1"
    set type dynamic
    set sdn "nuage1"
    set color 19
    set organization "nuage/L3"
    set subnet-name "Subnet20"
  next
end
```

To verify the SDN connector resolves the dynamic firewall IP addresses in the CLI:

```
# diagnose firewall dynamic list
```

```
List all dynamic addresses:
```

```
nuage1.nuage.nuage/L3.Subnet20.*: ID(196)
  ADDR(192.168.20.92)
  ADDR(192.168.20.240)
```

Nutanix SDN connector using server credentials

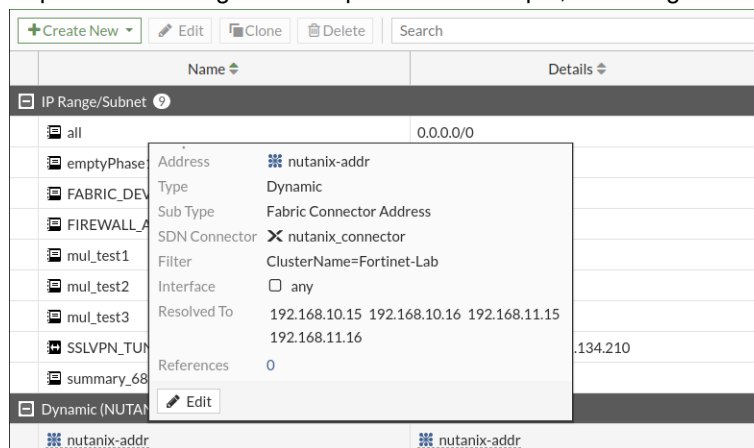

FortiOS automatically updates dynamic addresses for Nutanix using an Nutanix SDN connector, including mapping the following attributes from Nutanix instances to dynamic address groups in FortiOS:

- Cluster name
- Cluster UUID
- Description
- Host name
- Host UUID
- Hypervisor type
- Image name
- Image UUID
- Subnet name
- Subnet UUID
- VM name
- VM UUID

To configure a Nutanix connector using the GUI:

1. Configure the Nutanix SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Select *Nutanix*.
 - c. In the *IP address* field, enter the IP address for your Nutanix environment.
 - d. In the *Port* field, enter the desired port.
 - e. In the *Username* and *Password* fields, enter the credentials for your Nutanix environment.
 - f. Click *OK*.
2. Create a dynamic firewall address for the configured Nutanix SDN connector:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New*, then select *Address*.
 - c. From the *Type* dropdown list, select *Dynamic*.
 - d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
 - e. From the *SDN Connector* dropdown list, select the Nutanix connector.
 - f. From the *Filter* dropdown list, select the desired filters.
 - g. Click *OK*.
3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Hover over the address created in step 2 to see a list of IP addresses for instances that satisfy the filter

requirements configured in step 2. In this example, the configured filter is "ClusterName=Fortinet-Lab":

To configure a Nutanix connector using the CLI:

1. Configure the Nutanix SDN connector:

```
config system sdn-connector
  edit "nutanix_connector"
    set status disable
    set type nutanix set server "172.18.33.59"
    set server-port 9440
    set username "admin"
    set password *****
    set update-interval 60
  next
end
```

2. Create a dynamic firewall address for the configured Nutanix SDN connector:

```
config firewall address
  edit "nutanix-addr"
    set uuid 382ceafe-8e72-51eb-7300-0807ee907946
    set type dynamic
    set sdn "nutanix_connector"
    set color 2
    set filter "ClusterName=Fortinet-Lab"
  next
end
```

3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:

```
config firewall address
  edit "nutanix-addr"
    set uuid 382ceafe-8e72-51eb-7300-0807ee907946
    set type dynamic
    set sdn "nutanix_connector"
    set color 2
    set filter "ClusterName=Fortinet-Lab"
  config list
    edit "192.168.10.15"
    next
    edit "192.168.10.16"
    next
    edit "192.168.11.15"
    next
    edit "192.168.11.16"
```

```

next
end
next
end

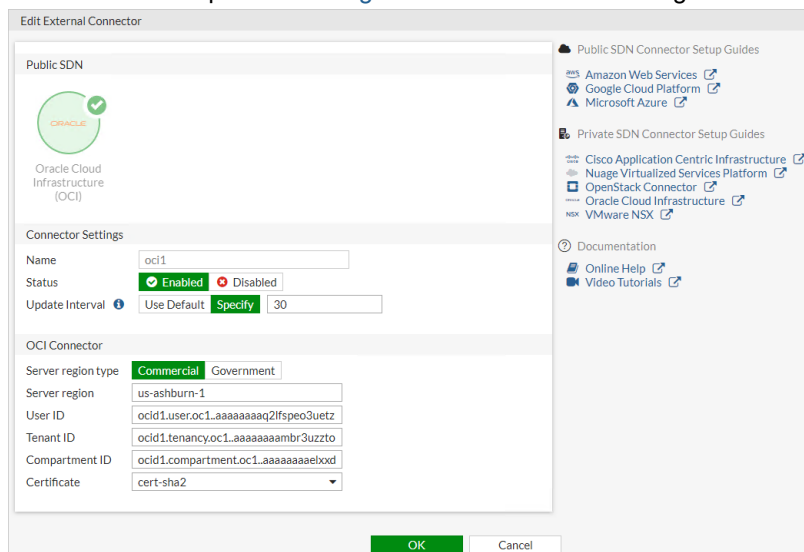

```

OCI SDN connector using certificates

You can configure SDN connector integration with Oracle Cloud Infrastructure (OCI).

To configure an OCI SDN connector in the GUI:

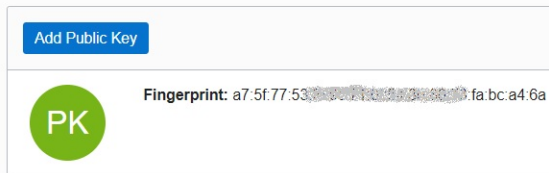

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Public SDN* section, select *Oracle Cloud Infrastructure (OCI)*.
3. Configure the connector as desired:
 - a. *User ID*: Enter the OCID of the OCI user who belongs to the administrator group. See [Certificate-based SDN connector requirements](#).
 - b. For the *OCI Certificate* field, you must select a certificate that satisfies OCI key size limits. The minimum size is 2048 bits. Do one of the following:
 - i. Select the built-in default certificate called *Fortinet_Factory*.
 - ii. Follow steps 1-2 in [Using custom certificates](#) to configure a custom certificate.

4. Click *OK*.
5. At this stage, you must register the certificate's fingerprint to the specified OCI user.
 - a. Go to the OCI user, then *API Keys > Add Public Key*.
 - b. If you selected the *Fortinet_Factory* certificate in step 2f, do the following:
 - i. In FortiOS, go to *System > Certificate*. Select *Fortinet_Factory*, then click *Download*.
 - ii. You now have the *Fortinet_Factory.cer* file. Create a public key file in PEM format from it, using a freely available tool of your choice such as *OpenSSL*.
 - c. Copy and paste the content of the certificate PEM key file in the *Add Public Key* window in OCI. Click *Add*.

d. You now see the fingerprint.

API Keys

You can configure the following for the fingerprint:

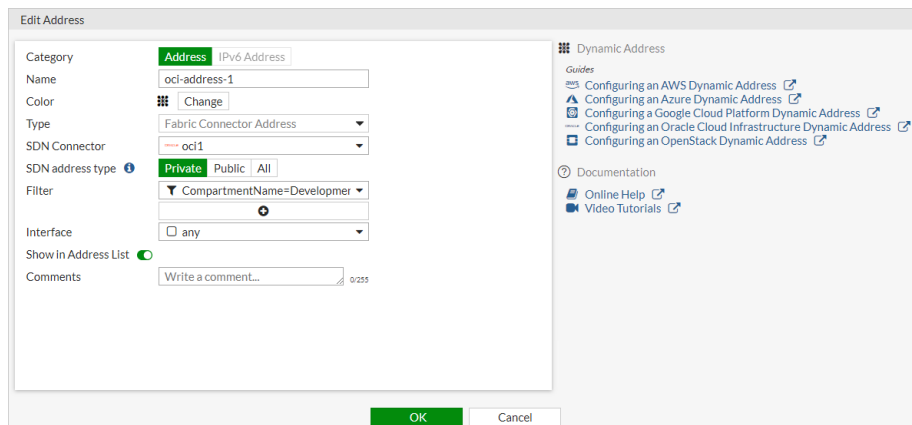

1. **Update Interval:** The default value is 60 seconds. You can change the value to between 1 and 3600 seconds.
2. **Status:** Green means that the connector is enabled. You can disable it at any time by toggling the switch.

e. Click OK.

6. Go to *Policy & Objects > Addresses* and click *Create New > Address*.

7. Configure the address as needed, selecting the OCI connector in the *SDN Connector* field. The following filters are supported:

- 'vm_name=<vm name>': matches VM instance name.
- 'instance_id=<instance id>': matches instance OCID.
- 'tag.<key>=<value>': matches freeform tag key and its value.
- 'definedtag.<namespace>.<key>=<value>': matches a tag namespace, tag key, and its value.

8. Click OK.

To configure an OCI SDN connector in the CLI:

1. Configure an SDN connector:

```
config system sdn-connector
  edit "oci1"
    set status enable
    set type oci
    set tenant-id
"ocid1.tenancy.oc1..aaaaaaaa3aaaaaaaaaaaaaaaaa77xxxxx54bbbbbb4xxxx35xx55xxxx"
    set user-id
"ocid1.user.oc1..aaaaaaaa2laaaaa3aaaaaaaaabbbbbbbbbbcccc3cccccccccccccccccccc"
    set compartment-id
"ocid1.compartment.oc1..aaaaaaaaaaaaaaaa7bbbbbbbbbcccccccccc6xxx53xxxx7xxxxxxxxxxx"
    set oci-region "us-ashburn-1"
```

```

        set oci-region-type commercial
        set oci-cert "cert-sha2"
        set update-interval 30
    next
end

```

2. Create a dynamic firewall address for the SDN connector with a supported filter:

```

config firewall address
    edit "oci-address-1"
        set type dynamic
        set sdn "ocil"
        set filter "CompartmentName=DevelopmentEngineering"
    next
end

```

To confirm that dynamic firewall addresses are resolved by the SDN connector:

1. In the CLI, check that the addresses are listed:

```

config firewall address
    edit "oci-address-1"
        set type dynamic
        set sdn "ocil"
        set filter "CompartmentName=DevelopmentEngineering"
    config list
        edit "10.0.0.11"
        next
        edit "10.0.0.118"
        next
        ...
        next
    end
next
end

```

2. In the GUI, go to *Policy & Objects > Addresses* and hover the cursor over the address name.

Type	Details	Interface	Visibility	Ref
abric Connector Address (VMWARE)			Visible	0
abric Connector Address (VMWARE)			Visible	0

abric Connector Address (GCP)			Visible	0
QDN	gmail.com		Visible	1
QDN	login.microsoft.com		Visible	1
QDN	login.microsoftonline.com		Visible	1
QDN	login.windows.net		Visible	1
lbnet	0.0.0.0/32		Visible	0
abric Connector Address (OCI)			Visible	0

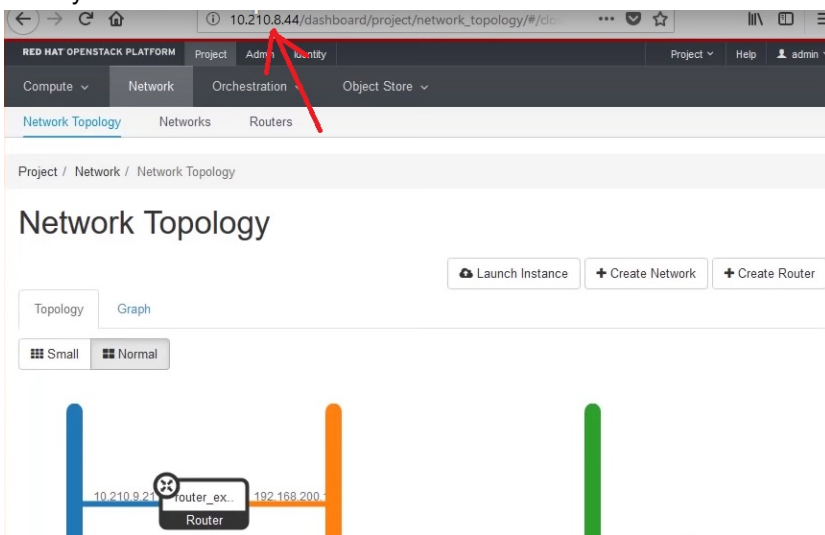

OpenStack SDN connector using node credentials

To configure OpenStack SDN connector using node credentials:

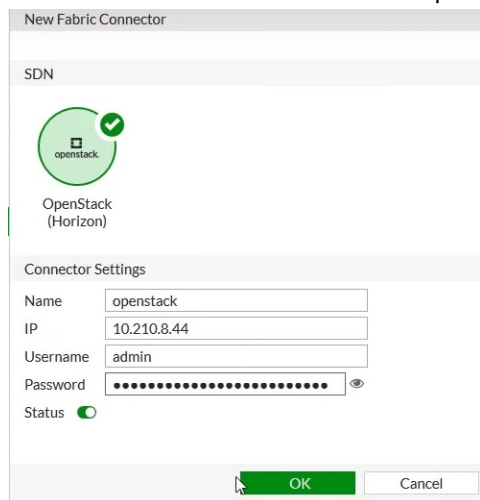

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*, then select *OpenStack (Horizon)*.

3. Configure the fields as follows:

- a. **Name:** Name the connector as desired.
- b. **IP:** Enter the OpenStack management component's IP address. Generally you can find it in the OpenStack identity.

- c. **User name:** Enter the specified node's administrator name.
- d. **Password:** Enter the administrator password.

4. Click OK. The SDN connector is now configured.

To configure a dynamic firewall address:

The next step is to create an address that will be used as an address group or single address that acts as the source/destination for firewall policies. The address is based on IP addresses and contains VM instances' IP addresses.

No matter what changes occur to the instances, the SDN connector populates and updates the changes automatically based on the specified filtering condition so that administrators do not need to reconfigure the address content manually. Appropriate firewall policies using the address are applied to instances that are members of the address.

1. Go to *Policy & Objects > Address*. Click *Create New*, then select *Address*.
2. Configure the address as follows:
 - a. *Name*: Name the address as desired.
 - b. *Type*: Select *Dynamic*.
 - c. *Sub Type*: Select *Fabric Connector Address*.
 - d. *SDN Connector*: Select *openstack*.
 - e. *Filter*: The SDN connector automatically populates and updates only IP addresses belonging to the specified filter that matches the condition. OpenStack Horizon connectors support the following filters:
 - i. `id=<instance id>`: This matches a VM instance ID.
 - ii. `name=<instance name>`: This matches a VM instance name.
 - iii. `flavor=<instance flavor name>`: This matches an instance flavor name.
 - iv. `keypair=<key pair name>`: This matches a key pair name.
 - v. `network=<net name>`: This matches a network name.
 - vi. `project=<project name>`: This matches a project name.
 - vii. `availabilityzone=<zone name>`: This matches an availability zone name.
 - viii. `servergroup=<group name>`: This matches a server group name.
 - ix. `securitygroup=<security group name>`: This matches a security group name.
 - x. `metadata.<key>=<value>`: This matches metadata with its key and value pair.

You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

For example, you could enter `flavor=m1.nano&project=admin`. In this case, IP addresses of instances that match both the flavor name and project name are populated. Wildcards (asterisks) are not allowed in values.

The screenshot shows the 'New Address' configuration form in the Fortinet Security Fabric interface. The form is titled 'New Address' and contains the following fields and values:

- Name:** flavor and project
- Color:** Change
- Type:** Fabric Connector Address
- SDN Connector:** openstack
- Filter:** flavor=m1.nano & project=admin
- Interface:** any
- Show in Address List:**
- Comments:** 0/255

Below the form is a 'Tags' section with an 'Add Tag Category' button. At the bottom of the form, there are 'OK' and 'Cancel' buttons.

In this example, let's use `project=admin`, assuming the project name is admin.

project resolves to:

- 10.210.9.11
- 192.0.50.3
- 192.168.200.3
- 192.168.200.6

VMware ESXi SDN connector using server credentials

Dynamic addresses for VMware ESXi and vCenter servers can be automatically updated by using a VMware ESXi SDN connector, including mapping the following attributes from VMware ESXi and vCenter objects to dynamic address groups in FortiOS:

- vmid
- host
- name
- uuid
- vmuuid
- vmnetwork
- guestid
- guestname
- annotation

To configure VMware ESXi SDN connector using the GUI:

1. Configure the VMware ESXi SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*, and select *VMware ESXi*.
 - c. Configure as shown, substituting the server IP address, username, and password for your deployment. The update interval is in seconds. The password cannot contain single or double quotes.

2. Create a dynamic firewall address for the configured VMware ESXi SDN connector:
 - a. Go to *Policy & Objects > Addresses* and click *Create New > Address*.
 - b. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the VMware ESXi fabric connector will automatically populate and update IP addresses only for instances that

belong to VLAN80:

The screenshot shows the 'New Address' configuration window in FortiGate. The 'Name' field is 'vmware-network'. The 'Type' is 'Dynamic', and the 'Sub Type' is 'Fabric Connector Address'. The 'SDN Connector' is set to 'ESX vmware1', and the 'Filter' is 'VMNetwork=VLAN80'. The 'Interface' is set to 'any'. The right sidebar shows 'Dynamic Address' guides and documentation links.

3. Ensure that the VMware ESXi SDN connector resolves dynamic firewall IP addresses:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to VLAN80 as configured in step 2:

To configure VMware ESXi SDN connector using CLI commands:

1. Configure the VMware ESXi SDN connector:

```
config system sdn-connector
  edit "vmware1"
    set type vmware
    set server "172.17.48.222"
    set username "example_username"
    set password xxxxx
    set update-interval 30
  next
end
```

2. Create a dynamic firewall address for the configured VMware ESXi SDN connector with the supported VMware ESXi filter. In this example, the VMware ESXi SDN connector will automatically populate and update IP addresses only for instances that belong to the specified VLAN:

```
config firewall address
  edit "vmware-network"
    set type dynamic
    set sdn "vmware1"
    set filter "vmnetwork=VLAN80"
  next
end
```

3. Confirm that the VMware ESXi SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
  edit "vmware-network"
    set type dynamic
    set sdn "vmware1"
    set filter "vmnetwork=VLAN80"
  config list
    edit "192.168.8.240"
    next
  end
next
end
```

VMware NSX-T Manager SDN connector using NSX-T Manager credentials

This feature provides SDN connector configuration for VMware NSX-T manager. You can import specific groups, or all groups from the NSX-T Manager.

To configure SDN connector for NSX-T Manager in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Private SDN* section, click *VMware NSX*.

3. Configure the settings and click *OK*.

To configure SDN connector for NSX-T Manager in the CLI:

```
config system sdn-connector
  edit "nsx_t24"
    set type nsx
    set server "172.18.64.205"
    set username "admin"
    set password xxxxxx
  next
end
```

To import a specific group from the NSX-T Manager:

```
# execute nsx group import nsx_t24 root csf_ns_group
[1] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
  Name:csf_ns_group
  Address:1.1.1.0
  Address:1.1.1.1
  Address:172.16.10.104
  Address:172.16.20.104
  Address:172.16.30.104
  Address:2.2.2.0
  Address:2.2.2.2
  Address:4.4.4.0
  Address:5.5.5.0
```

Address:6.6.6.6
Address:7.7.7.7

To import all groups from NSX-T Manager:

```
# execute nsx group import nsx_t24 root
[1] 663a7686-b9a3-4659-b06f-b45c908349a0 ServiceInsertion_NSGroup:
  Name:ServiceInsertion_NSGroup
  Address:10.0.0.2
[2] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
  Name:csf_ns_group
  Address:1.1.1.0
  Address:1.1.1.1
  Address:172.16.10.104
  Address:172.16.20.104
  Address:172.16.30.104
  Address:2.2.2.0
  Address:2.2.2.2
  Address:4.4.4.0
  Address:5.5.5.0
  Address:6.6.6.6
  Address:7.7.7.7
[3] c462ec4d-d526-4ceb-aeb5-3f168cecd89d charlie_test:
  Name:charlie_test
  Address:1.1.1.1
  Address:2.2.2.2
  Address:6.6.6.6
  Address:7.7.7.7
[4] ff4dcb08-53cf-46bd-bef4-f7aeda9c0ad9 fgt:
  Name:fgt
  Address:172.16.10.101
  Address:172.16.10.102
  Address:172.16.20.102
  Address:172.16.30.103
[5] 3dd7df0d-2baa-44e0-b88f-bd21a92eb2e5 yongyu_test:
  Name:yongyu_test
  Address:1.1.1.0
  Address:2.2.2.0
  Address:4.4.4.0
  Address:5.5.5.0
```

To view the dynamic firewall IP addresses that are resolved by the SDN connector in the GUI:

1. Go to *Policy & Objects > Addresses* to view the IP addresses resolved by an SDN connector.

+ Create New Edit Clone Delete Search Q

```

Multiple concurrent SDN connectors

This guide shows how to configure SDN connectors and resolve dynamic firewall addresses through the configured SDN connector in FortiOS.

FortiOS supports multiple SDN connectors including public connectors (AWS, Azure, GCP, OCI, AliCloud) and private connectors (Kubernetes, VMware ESXi, VMware NSX, OpenStack, Cisco ACI, Nuage). FortiOS also supports multiple instances for each type of SDN connector.

This guide uses an Azure SDN connector as an example. The configuration procedure for all supported SDN connectors is the same. In the following topology, the FortiGate accesses the Azure public cloud through the Internet:

This process consists of the following:

1. [Configure the interface.](#)
2. [Configure a static route to connect to the Internet.](#)
3. [Configure two Azure SDN connectors with different client IDs.](#)
4. [Check the configured SDN connectors.](#)
5. [Create two firewall addresses.](#)
6. [Check the resolved firewall addresses after the update interval.](#)
7. [Run diagnose commands.](#)

To configure the interface:

1. In FortiOS, go to *Network > Interfaces*.
2. Edit port1:
 - a. From the *Role* dropdown list, select *WAN*.
 - b. In the *IP/Network Mask* field, enter 10.6.30.4/255.255.255.0 for the interface connected to the Internet.

To configure a static route to connect to the Internet:

1. Go to *Network > Static Routes*. Click *Create New*.
2. In the *Destination* field, enter 0.0.0.0/0.0.0.0.
3. From the *Interface* dropdown list, select *port1*.
4. In the *Gateway Address* field, enter 10.60.30.254.

To configure two Azure SDN connectors with different client IDs:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*. Configure the first SDN connector:
 - a. Select *Microsoft Azure*.
 - b. In the *Name* field, enter *azure1*.
 - c. In the *Status* field, select *Enabled*.
 - d. From the *Server region* dropdown list, select *Global*.
 - e. In the *Directory ID* field, enter the directory ID. In this example, it is *942b80cd-1b14-42a1-8dcf-4b21dece61ba*.
 - f. In the *Application ID* field, enter the application ID. In this example, it is *14dbd5c5-307e-4ea4-8133-68738141feb1*.
 - g. In the *Client secret* field, enter the client secret.
 - h. Leave the *Resource path* disabled.
 - i. Click *OK*.

The screenshot shows the 'New External Connector' configuration form. The 'Public SDN' section is selected, showing the Microsoft Azure logo. The 'Connector Settings' section includes the following fields:

- Name: azure1
- Status: Enabled (radio button selected)
- Update interval: Use Default (radio button selected)

The 'Azure Connector' section includes the following fields:

- Server region: Global (dropdown menu)
- Directory ID: 942b80cd-1b14-42a1-8dcf-4b21dece61ba
- Application ID: 14dbd5c5-307e-4ea4-8133-68738141
- Client secret: [masked]
- Resource path: Disabled (radio button selected)

3. Click *Create New*. Configure the second SDN connector:
 - a. Select *Microsoft Azure*.
 - b. In the *Name* field, enter *azure2*.
 - c. In the *Status* field, select *Enabled*.
 - d. From the *Server region* dropdown list, select *Global*.
 - e. In the *Directory ID* field, enter the directory ID. In this example, it is *942b80cd-1b14-42a1-8dcf-4b21dece61ba*.
 - f. In the *Application ID* field, enter the application ID. In this example, it is *3baf0a6c-44ff-4f94-b292-07f7a2c36be6*.
 - g. In the *Client secret* field, enter the client secret.
 - h. Leave the *Resource path* disabled.

i. Click **OK**.

New External Connector

Public SDN

Microsoft Azure

Connector Settings

Name: azure2

Status: Enabled Disabled

Update interval: Use Default Specify

Azure Connector

Server region: Global

Directory ID: 942b80cd-1b14-42a1-8dcf-4b21dece...

Application ID: 3baf0a6c-44ff-4f94-b292-07f7a2c36b

Client secret:

Resource path:

To check the configured SDN connectors:

1. Go to *Security Fabric > External Connectors*.
2. Click the *Refresh* icon in the upper right corner of each configured SDN connector. A green up arrow appears in the lower right corner, meaning that both SDN connectors are connected to the Azure cloud using different client IDs.

**To create two firewall addresses:**

This process creates two SDN connector firewall addresses to associate with the configured SDN connectors.

1. Go to *Policy & Objects > Addresses*.
2. Click *Create New > Address*. Configure the first SDN connector firewall address:
 - a. In the *Name* field, enter *azure-address-1*.
 - b. From the *Type* dropdown list, select *Dynamic*.
 - c. From the *Sub Type* dropdown list, select *Fabric Connector address*.
 - d. From the *SDN Connector* dropdown list, select *azure1*.
 - e. For *SDN address type*, select *Private*.
 - f. From the *Filter* dropdown list, select the desired filter.
 - g. For *Interface*, select *any*.

h. Click *OK*.

3. Click *Create New > Address*. Configure the second SDN connector firewall address:

- a. In the *Name* field, enter *azure-address-1*.
- b. From the *Type* dropdown list, select *Dynamic*.
- c. From the *Sub Type* dropdown list, select *Fabric Connector address*.
- d. From the *SDN Connector* dropdown list, select *azure2*.
- e. For *SDN address type*, select *Private*.
- f. From the *Filter* dropdown list, select the desired filter.
- g. For *Interface*, select *any*.
- h. Click *OK*.

To check the resolved firewall addresses after the update interval:

By default, the update interval is 60 seconds.

1. Go to *Policy & Objects > Addresses*.
2. Hover over the created addresses. The firewall address that the configured SDN connectors resolved display.

Name	Type
azure-address-1	Fabric Connector Address (AZURE)
azure-address-2	Fabric Connector Address (AZURE)

To run diagnose commands:

Run the `show sdn connector status` command. Both SDN connectors should appear with a status of `connected`.

Run the `diagnose debug application azd -1` command. The output should look like the following:

```
Level2-downstream-D # diagnose debug application azd -1
...
azd sdn connector azure1 start updating IP addresses
azd checking firewall address object azure-address-1, vd 0
IP address change, new list:
10.18.0.4
...
```

To restart the Azure SDN connector daemon, run the `diagnose test application azd 99` command.

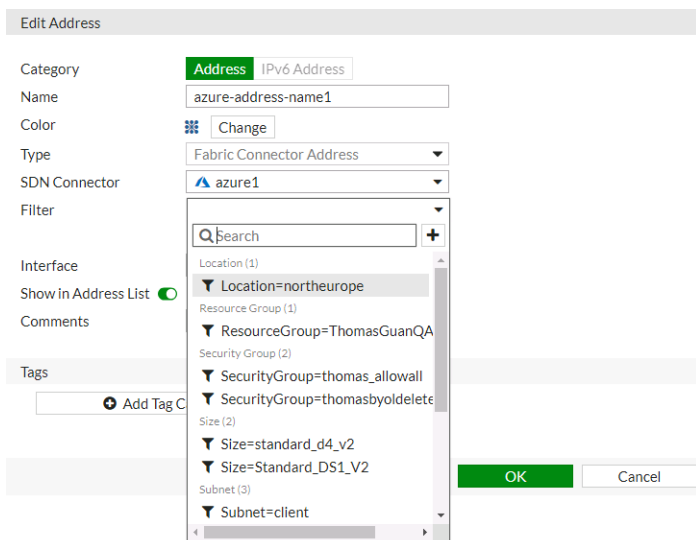

Filter lookup in SDN connectors

When configuring dynamic address mappings for filters in SDN connectors for Azure, GCP, OpenStack, Kubernetes, and AliCloud, FortiGate can query the filters automatically.

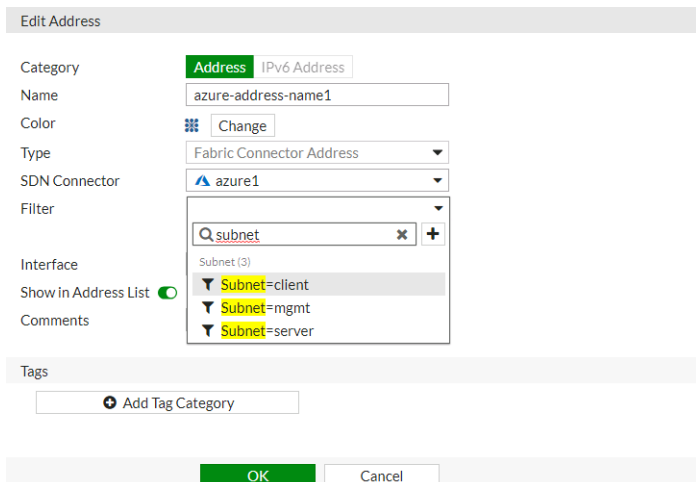

To use the filter lookup:

1. Navigate to *Policy & Objects > Addresses*.
2. Create or edit an SDN connector type dynamic IP address.
Supported SDN connector types include: AWS, Azure, GCP, OpenStack, Kubernetes, and AliCloud. The example below is for an Azure SDN connector.
3. In the address *Filter* field, you can perform the following actions:

- List all available filters.

- Search the available filters.

- Create custom filters.

The image displays three sequential screenshots of the Fortinet GUI's 'Edit Address' configuration page, illustrating the steps to create a custom filter.

Top Screenshot: The 'Edit Address' page is shown with the 'Filter' dropdown menu open. The address object is named 'azure-address-name1' and is of type 'Fabric Connector Address'. The filter dropdown shows a search bar and a list of resource categories including Location, Resource Group, Security Group, Size, Subnet, and Virtual Machine. The 'Subnet=client' option is currently selected.

Middle Screenshot: A 'New Filter' dialog box is displayed. The 'Filter' field contains the text 'Vm=webserver'. An 'OK' button is visible at the bottom right of the dialog.

Bottom Screenshot: The 'Edit Address' page is shown again, with the 'Filter' dropdown menu open. The 'Vm=webserver' option is now highlighted in orange, indicating it has been selected as the filter for the address object. The 'OK' button is visible at the bottom right.

- Set filter logic [and|or].

The screenshot shows the 'Edit Address' configuration window. The 'Filter' section is expanded to show three filter rules: 'Location=northeurope', 'ResourceGroup=ThomasGuanQA', and 'Subnet=server'. The logic between these filters is set to 'and' and 'or'.

Support for wildcard SDN connectors in filter configurations

Wildcards are supported for SDN connectors when configuring dynamic address filters.

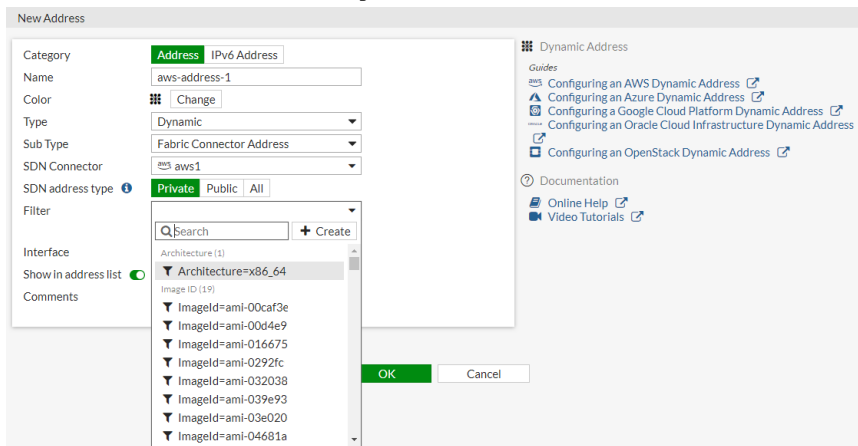

The following SDN connector types are currently supported:

- AWS
- Azure
- Google Cloud Platform
- Kubernetes
- OpenStack
- Oracle Cloud Infrastructure
- VMware ESXi

To configure a dynamic address filter for AWS in the GUI:

1. Create the SDN connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*.
 - c. In the *Public SDN* section, click *Amazon Web Services (AWS)*.
 - d. Configure the settings as needed.
 - e. Click *OK*.
2. Create the dynamic firewall address:
 - a. Go to *Policy & Objects > Addresses*.
 - b. Click *Create New > Address*
 - c. Enter a name for the address, then configure the following settings:
 - Set *Type* to *Dynamic*.
 - Set *Sub Type* to *Fabric Connector Address*.
 - Set *SDN Connector* to *aws1*.
 - Set *SDN address type* to *Private*.

- For *Filter*, click *Create*, enter `Tag.Name=aws*`, then click *OK*.

d. Click *OK*.

3. In the address table, hover over the address to view what IPs it resolves to.

Name	Type	Details	Interface	Visibility
FIREWALL_A	aws-address-1 resolves to:	0.0.0.0/0		Hidden
SSLVPN_TUN	<ul style="list-style-type: none"> 18.234.167.123 3.81.41.167 52.87.157.127 	Range 10.212.134.200 - 10.212.134.210	SSL-VPN tunnel interface (ssl.FG-traffic)	Visible
all		0.0.0.0/0		Visible
aws-address-1	Dynamic (AWS)			Visible

4. In AWS, verify to confirm the IP addresses match.

To configure a dynamic address filter for AWS in the CLI:

1. Configure the SDN connector:

```
config firewall address
edit "aws-address-1"
set type dynamic
set sdn "aws1"
set filter "Tag.Name=aws*"
set sdn-addr-type public
next
end
```

2. Create the dynamic firewall address and verify where the IP addresses resolve to:

```
config firewall address
edit "aws-address-1"
set type dynamic
set sdn "aws1"
set filter "Tag.Name=aws*"
set sdn-addr-type public
config list
edit "18.234.167.123"
```

```
        next
        edit "3.81.41.167"
        next
        edit "52.87.157.127"
        next
    end
next
end
```

3. In AWS, verify that the IP addresses match.

Endpoint/Identity connectors

SSO fabric connectors integrate SSO authentication into the network. This allows users to enter their credentials only once, and have those credentials reused when accessing other network resources through the FortiGate.

The following fabric connectors are available:

- [Fortinet single sign-on agent on page 2657](#)
- [Poll Active Directory server on page 2658](#)
- [Symantec endpoint connector on page 2659](#)
- [RADIUS single sign-on agent on page 2665](#)
- [Exchange Server connector on page 2668](#)

Fortinet single sign-on agent

To create an FSSO agent connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.

3. In the *Endpoint/Identity* section, click *FSSO Agent on Windows AD*.

4. Fill in the *Name*, and *Primary FSSO Agent* server IP address or name and *Password*.
5. Optionally, add more FSSO agents by clicking the plus icon.
6. Optionally, enable *Trusted SSL certificate* and select or import a certificate.
7. Select the *User group source*:
 - *Collector Agent*: User groups will be pushed to the FortiGate from the collector agent. Click *Apply & Refresh* to fetch group filters from the collector agent.
 - *Local*: User groups will be specified in the FortiGate unit's configuration. Select the LDAP server from the list, then click *Edit* to select the *Users*, *Groups*, and *Organizational Units*. Optionally, enable *Proactively retrieve from LDAP server* and configure the *Search filter* and *Interval*.
8. Click *OK*.

Poll Active Directory server

The FortiGate unit can authenticate users and allow them network access based on groups membership in Windows Active Directory (AD).

To create an AD server connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.

3. In the *Endpoint/Identity* section, click *Poll Active Directory Server*.

4. Fill in the *Server IP/Name*, *User*, and *Password* for the AD server.
5. Select the LDAP server from the list.
6. If necessary, disable *Enable Polling*. This can be used to temporarily stop the FortiGate from polling security event logs on the Windows logon server, for troubleshooting purposes.
7. Click *OK*.

Symantec endpoint connector

With the Fabric connector for Symantec Endpoint Protection Manager (SEPM), you can use the client IP information from SEPM to assign to dynamic IP addresses on FortiOS.

When communication between FortiGate and SEPM is established, FortiGate polls every minute for updates via TLS over port 8446. You can use the CLI to change the default one minute polling interval.

For example, you can create a dynamic Fabric Connector IP address subtype and use it in firewall policies as the source address. The dynamic IP address contains all IP addresses sent by SEPM.

This example shows a dynamic IP address with SEPM and one client PC managed by SEPM using FortiGate as the default gateway.

To configure SEPM on a managed client PC:

1. In SEPM, create client packages for client hosts and group them into SEPM groups. You can install packages locally on clients or download them directly from SEPM.

Package Name	Type	Version	Start Time	Available
Symantec Endpoint Protection version 14.2.3332.1000 for VMN64BIT	Symantec Endpoint Protection Client	14.2.3332.1000	September 6, 2019 4:43:14 PM PDT	✓
Symantec Endpoint Protection version 14.2.3332.1000 for VMN32BIT	Symantec Endpoint Protection Client	14.2.3332.1000	September 6, 2019 4:43:35 PM PDT	✓

2. When a package is installed on the client host, the host is considered managed by SEPM. Even if the host has multiple interfaces, only one IP per host is displayed.

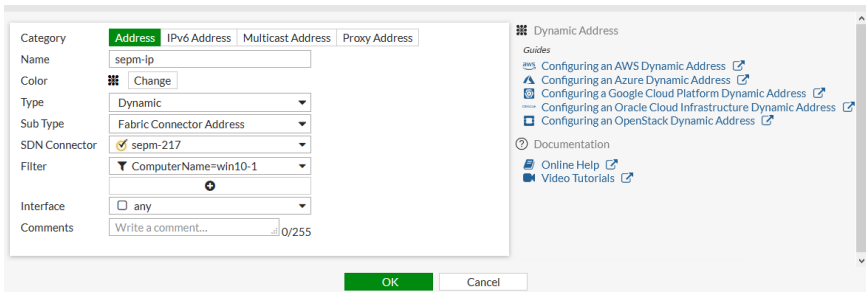

To configure Symantec endpoint connector on FortiGate in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*:
 - a. In the *Endpoint/Identity* section, click *Symantec Endpoint Protection*.
 - b. Fill in the *Name*, and set the *Status* and *Update Interval*.
 - c. Set *Server* to the SEPM IP address.
 - d. Enter the *Username* and *Password* for the server.
 - e. To limit the domain or group that is monitored, enter them in the requisite fields.

- f. Click *OK*.
When the connection is established, you can see a green up arrow in the bottom right of the card. You might need to refresh your browser to see the established connection.
2. Go to *Policy & Objects > Addresses* and click *Create New > Address*:
 - a. Fill in the address *Name*.
 - b. Set *Type* to *Dynamic*.
 - c. Set *Sub Type* to *Fabric Connector Address*.
 - d. Set *SDN Connector* to the fabric connector that you just created.

e. Add *Filters* as needed.

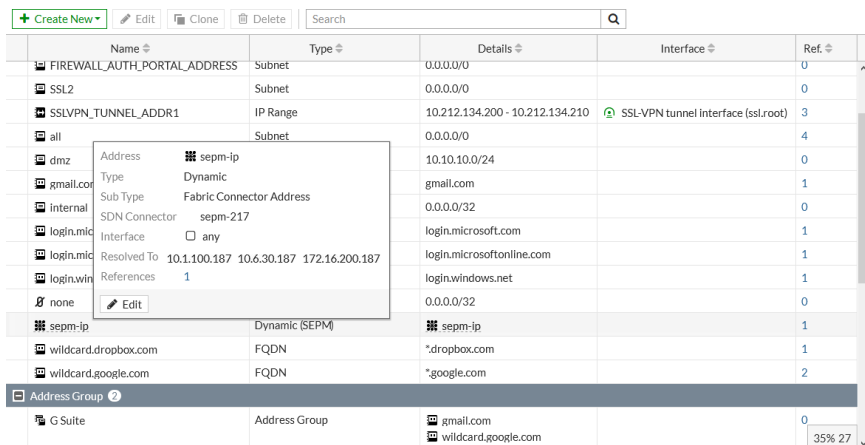

f. Click **OK**.

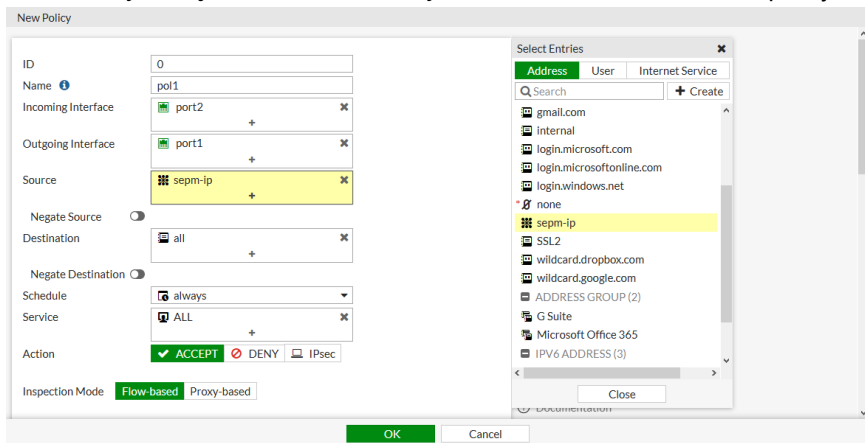

Filter options are only available for active computers that are configured and registered in SEPM. Free-form filters can be created manually by clicking *Create* and entering the filter, in the format: `filter_type=value`. Possible manual filter types are: `GroupName`, `GroupID`, `ComputerName`, `ComputerUUID`, and `OSName`. For example: `GroupName=MyGroup`.

3. Go to *Policy & Objects > Addresses* and hover the cursor over the name of the new address to see the resolved IP addresses of the host.

4. Go to *Policy & Objects > Firewall Policy*, click *Create New*, and add a policy that uses the dynamic IP address.

To verify the configuration:

1. On the client PC, check that it is managed by SEPM to access the Internet.

The screenshot shows the Symantec Endpoint Protection (SEP) status window on the left, indicating that the computer is protected. The status window lists several security components: Virus and Spyware Protection, Proactive Threat Protection, and Network and Host Exploit Mitigation. On the right, a Command Prompt window displays the network configuration for three Ethernet adapters (Ethernet 2, 3, and 4), including their IP addresses, subnet masks, and default gateways. Below the network configuration, the Command Prompt shows the execution of a ping command to 8.8.8.8, with successful results and ping statistics.

2. On the FortiGate, you can check in *Dashboard > FortiView Sources* and *Log & Report > Forward Traffic*.

2019/09/09 11:06:20	10.1.100.187	WIN10-1	173.194.152.58		

Because this traffic is not authenticated traffic but is based on source IP address only, it is not shown in the GUI firewall monitor or in the diagnose firewall auth list CLI command.

To configure Symantec endpoint connector on FortiGate in the CLI:**1. Create the fabric connector:**

```
config system sdn-connector
  edit "sepm-217"
    set type sepm
    set server "172.18.60.217"
    set username "admin"
    set password "*****"
    set status enable
  next
end
```

2. Create the dynamic IP address:

```
config firewall address
  edit "sepm-ip"
    set type dynamic
    set sdn "sepm-217"
    set filter "ComputerName=win10-1"
    config list
      edit "10.1.100.187"
      next
      edit "10.6.30.187"
      next
      edit "172.16.200.187"
      next
    end
  next
end
```

3. Add the dynamic IP address to the firewall policy:

```
config firewall policy
  edit 1
    set name "poll"
    set srcintf "port2"
    set dstintf "port1"
    set srcaddr "sepm-ip"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "certificate-inspection"
    set av-profile "default"
    set logtraffic all
    set fssso disable
    set nat enable
  next
end
```

To troubleshoot Symantec SD connector in the CLI:

```
# diagnose debug application sepm -1
```

Output is sent every minute (default). All IPv4 learned from SEPM. IPv6 also sent but not

yet supported.

```

```

To list the SEPM daemon SDN connectors:

```
# diagnose test application sepm 1
sepm SDN connector list:
  name: sepm-217, status: enabled, updater_interval: 60
```

To list the SEPM daemon SDN filters:

```
# diagnose test application sepm 2
sepm SDN connector sepm-217 filter list:
  name: sepm-ip, vd 0, filter 'ComputerName=win10-1'
```

RADIUS single sign-on agent

With RADIUS single sign-on (RSSO), a FortiGate can authenticate users who have authenticated on a remote RADIUS server. Based on which user group the user belongs to, the security policy applies the appropriate UTM profiles.

The FortiGate does not interact with the remote RADIUS server; it only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. The remote RADIUS server sends the following accounting messages to the FortiGate:

Message	Action
Start	If the information in the start message matches the RSSO configuration on the FortiGate, the user is added to the local list of authenticated firewall users.
Stop	The user is removed from the local list of authenticated firewall users because the user session no longer exists on the RADIUS server.

You can configure an RSSO agent connector using the FortiOS GUI; however, in most cases, you will need to use the CLI. There are some default options you may need to modify, which can only be done in the CLI.

To configure an RSSO agent connector:

1. Create the new connector:
 - a. Go to *Security Fabric > External Connectors*.
 - b. Click *Create New*.
 - c. In the *Endpoint/Identity* section, click *RADIUS Single Sign-On Agent*. The *New Fabric Connector* pane opens.
 - d. Enter the connector name.
 - e. Enable *Use RADIUS Shared Secret*.

The value entered in *Use RADIUS Shared Secret* must be identical to what the remote RADIUS server uses to authenticate when it sends RADIUS accounting messages to the FortiGate.

f. Enable *Send RADIUS Responses*.

You should enable *Send RADIUS Responses* because some RADIUS servers continue to send the same RADIUS accounting message several times if there is no response.

- g. Click **OK**.
2. Edit the network interface:
 - a. Go to *Network > Interfaces*.
 - b. Double-click the interface that will receive the RADIUS accounting messages. The *Edit Interface* pane opens.
 - c. In the *Administrative Access* section, select the *RADIUS Accounting* checkbox. This will open listening for port 1813 on this interface. The FortiGate will then be ready to receive RADIUS accounting messages.
 - d. Click **OK**.
3. Create a local RSSO user group:
 - a. Go to *User & Authentication > User Groups*.
 - b. Click *Create New*.
 - c. Enter the group name.
 - d. For the *Type* field, click *RADIUS Single-Sign-ON (RSSO)*.
 - e. Enter a value for *RADIUS Attribute Value*.

This value by default is the class attribute. The FortiGate uses the content of this attribute in RADIUS accounting start messages to map a user to a FortiGate group, which then can be used in firewall policies.

In this example configuration, the FortiGate will only add a remote RADIUS user to the local firewall user list if the class attribute in the RADIUS accounting START message contains the value group1.

If your users are in multiple groups, you will need to add multiple local RSSO user group.

If the RADIUS attribute value used to map users to a local RSSO group is different than the RADIUS attribute in the RADIUS accounting messages forwarded by the server, you must change it in the CLI.

f. Click *OK*.

4. Edit the local RSSO agent to modify default options using the CLI.

For example, the default value for `radius-endpoint-attribute` might work in common remote access scenarios where users are identified by their unique `Calling-Station-Id`, but in other scenarios the user name might be in a different attribute.

```
config user radius
  edit "Local RSSO Agent"
    set radius-endpoint-attribute <attribute>
    set sso-attribute <attribute>
  next
end
```

5. Add the local RSSO user group to a firewall policy.

Verifying the RSSO configuration

Verification requires a working remote RADIUS server configured for RADIUS accounting forwarding and wireless or wired clients that use RADIUS for user authentication.

For a quick test, you can use one of the publicly available RADIUS test tools to send RADIUS accounting start and stop messages to the FortiGate. You can also use [radclient](#).

To verify the RSSO configuration:

1. In `radclient`, enter the RADIUS attributes. These attributes are then executed with the FortiGate IP parameters (sends accounting messages to port 1813) and shared password you configured. `-x` is used for verbose output:

```
root@ControlPC:~# echo "Acct-Status-Type =Start,Framed-IP-Address=10.1.100.185,User-
Name=test2,Acct-Session-Id=0211a4ef,Class=group1,Calling-Station-Id=00-0c-29-44-BE-B8" |
radclient -x 10.1.100.1 acct 123456
Sending Accounting-Request of id 180 to 10.1.100.1 port 1813
  Acct-Status-Type = Start
  Framed-IP-Address = 10.1.100.185
  User-Name = "test2"
  Acct-Session-Id = "0211a4ef"
  Class = 0x67726f757031
  Calling-Station-Id = "00-0c-29-44-BE-B8"
rad_recv: Accounting-Response packet from host 10.1.100.1 port 1813, id=180, length=20
root@ControlPC:~#
```

2. Verify that the user is in the local firewall user list with the correct type (`radius`) and local firewall group (`radius-group1`):

```
# diagnose firewall auth 1

10.1.100.185, test2
  type: radius, id: 0, duration: 5, idled: 5
  flag(10): radius
  server: vdom1
  packets: in 0 out 0, bytes: in 0 out 0
  group_id: 3
  group_name: radius-group-1

----- 1 listed, 0 filtered -----
```

Exchange Server connector

FortiGate can collect additional information about authenticated users from corporate Microsoft Exchange Servers. After a user logs in, the additional information can be viewed in various parts of the GUI.

The Exchange connector must be mapped to the LDAP server that is used for authentication.

The following attributes are retrieved:

USER_INFO_FULL_NAME	USER_INFO_COMPANY	USER_INFO_CITY
USER_INFO_FIRST_NAME	USER_INFO_DEPARTMENT	USER_INFO_STATE
USER_INFO_LAST_NAME	USER_INFO_GROUP	USER_INFO_POSTAL_CODE
USER_INFO_LOGON_NAME	USER_INFO_TITLE	USER_INFO_COUNTRY
USER_INFO_TELEPHONE	USER_INFO_MANAGER	USER_INFO_ACCOUNT_EXPIRES
USER_INFO_EMAIL	USER_INFO_STREET	
USER_INFO_USER_PHOTO	USER_INFO_POST_OFFICE_BOX	

Kerberos Key Distribution Center (KDC) automatic discovery is enabled by default. The FortiGate must be able to use DNS to resolve the KDC IP addresses, otherwise the FortiGate will be unable to retrieve additional user information from the Exchange Server.

KDC automatic discovery can be disabled, and one or more internal IP addresses that the FortiGate can reach can be configured for KDC.

The Override server IP address is enabled when the IP address of the Exchange server cannot be resolved by DNS and must be entered manually.

To configure an Exchange connector in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Endpoint/Identity* section, click *Exchange Server*.
3. Set *Name* to *exchange140*.
4. Set *Exchange account* to *Administrator@W2K8-SERV1.FORTINET-FSSO.COM*.
Administrator is the username, *W2K8-SERV1* is the exchange server name, and *FORTINET-FSSO.COM* is the domain name.
5. Set *Password* to the password.
6. Enable *Override server IP address* and set it to *10.1.100.140*.

7. Ensure that *Auto-discover KDC* is enabled.

If *Auto-discover KDC* is disabled, one or more KDC IP addresses can be manually entered.

8. Click *OK*.

To link the connector to the LDAP server in the GUI:

1. Go to *User & Authentication > LDAP Servers*.
2. Edit an existing LDAP server, or click *Create New* to create a new one.
3. Enable *Exchange server*, and select the connector from the list.
4. Configure the remaining settings as required.

5. Click *OK*.

To configure an Exchange connector with automatic KDC discovery in the CLI:

```
config user exchange
  edit "exchange140"
    set server-name "W2K8-SERV1"
    set domain-name "FORTINET-FSSO.COM"
    set username "Administrator"
    set password *****
    set ip 10.1.100.140
    set auto-discover-kdc enable
  next
end
```

To link the connector to the LDAP server in the CLI:

```

config user ldap
  edit "openldap"
    set server "172.18.60.213"
    set cnid "cn"
    set dn "dc=fortinet-fsso,dc=com"
    set type regular
    set username "cn=Manager,dc=fortinet-fsso,dc=com"
    set password *****
    set group-member-check group-object
    set group-object-filter "(&(objectclass=groupofnames)(member=*))"
    set member-attr "member"
    set user-info-exchange-server "exchange140"
  next
end

```

Verification**To verify that KDC auto-discovery is working:**

```

# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable
# diagnose wad user exchange test-auto-discover

wad_diag_session_acceptor(3115): diag socket 20 accepted.
__wad_fmем_open(557): fmem=0x12490bd8, fmem_name='cmem 9188 bucket', elm_sz=9188, block_
sz=73728, overhead=0, type=advanced
Starting auto-discover test for all configured user-exchanges.
[NOTE]: If any errors are returned, try manually configuring IPs for the reported errors.

wad_rpc_nspi_test_autodiscover_kdc(1835): Starting DNS SRV request for srv(0x7f938e052050)

    addr[2]: 10.6.30.131
    addr[3]: 2001::131
    addr[4]: 2003::131
wad_rpc_nspi_dns_on_discover_kdc_done(1787): Received response for DNS autodiscover req
(0x7f938dfe8050) query(_kerberos._udp.FORTINET-FSSO.COM) n_rsp(3)

```

Completed auto-discover test for all configured user-exchanges.

To check the collected information after the user has been authenticated:

1. In the GUI, go to *Dashboard > Users & Devices*, expand the *Firewall Users* widget, and hover over the user name.
2. In the CLI, run the following diagnose command:

```
# diagnose wad user info 20 test1
'username' = 'test1'
'sourceip' = '10.1.100.185'
'vdom' = 'root'
'cn' = 'test1'
'givenName' = 'test1'
'sn' = 'test101'
'userPrincipalName' = 'test1@Fortinet-FSSO.COM'
'telephoneNumber' = '604-123456'
'mail' = 'test1@fortinet-fsso.com'
'thumbnailPhoto' = '/tmp/wad/user_info/76665fff62ffffffffffffffffffff75ff68ffffffffffa'
'company' = 'Fortinet'
'department' = 'Release QA'
'memberOf' = 'CN=group321,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=g1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=group21,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'manager' = 'CN=test6,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'streetAddress' = 'One Backend Street 1901'
'l' = 'Burnaby'
'st' = 'BC'
'postalCode' = '4711'
'co' = 'Canada'
'accountExpires' = '9223372036854'
```

If the results are not as expected, verify what information FortiGate can collect from the Exchanger Server:

```
# diagnose test application wad 2500
# diagnose test application wad 162
```

Threat feeds

The FortiGate dynamically imports an external list from an HTTP/HTTPS server in the form of a plain text file. The imported list is then available as a threat feed, which can be used to enforce special security requirements, such as long-term policies to always allow or block access to certain websites, or short-term requirements to block access to known compromised locations. The threat feeds are dynamically synchronized and are updated periodically so that any changes are immediately imported by FortiOS.

If the FortiGate loses connectivity with the external server, the threat feed will continue to function despite the *Connection Status* error or reboot. However, the threat feed will not be updated and no new entries will be added until the connection is re-established.

FortiOS also supports STIX/TAXII format. See [STIX format for external threat feeds on page 2692](#) for more information.

There are four types of threat feeds:

FortiGuard Category	The FortiGate dynamically imports a text file from an external server, which contains one URL per line. See FortiGuard category threat feed on page 2678 for more information.
IP Address	The FortiGate dynamically imports a text file from an external server, which contains one IP/IP range/subnet per line. See IP address threat feed on page 2682 for more information.
Domain Name	The FortiGate dynamically imports a text file from an external server, which contains one domain per line. Simple wildcards are supported. See Domain name threat feed on page 2684 for more information.
Malware Hash	The FortiGate dynamically imports a text file from an external server, which contains one hash per line in the format <code><hex hash> [optional hash description]</code> . Each line supports MD5, SHA1, and SHA256 hex hashes. See Malware hash threat feed on page 2686 for more information.

Additionally, the EMS threat feed is integrated with FortiClient EMS, but it is not configured in the same way as the preceding feeds:

EMS Threat Feed	A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. See Malware threat feed from EMS on page 1202 for an example.
------------------------	---

External resources file format

File format requirements for a HTTP/HTTPS external resources file:

- The file is in plain text format with each URL list, IP address, domain name, or malware hash occupying one line. Comments can be added by using the number sign, for example: `# This is a test.`
- The file is limited to a maximum size of 10 MB and can hold up to 131072 entries, whichever limit is hit first.
- The entry limit also follows the table size limitation defined by CMDB per model.
- The external resources update period can be set to 1 minute, hourly, daily, weekly, or monthly (43200 min, 30 days).
- The external resources type as category (URL list) and domain (domain name list) share the category number range 192 to 221 (total of 30 categories).
- There is no duplicated entry validation for the external resources file (entry inside each file or inside different files).
- If the number of entries exceed the limit, a warning is displayed. Additional entries beyond the threshold will not be loaded.

For domain name list (type = domain):

- Simple wildcards are allowed in the domain name list, for example: `*.test.com`.
- IDN (international domain name) is supported.

For IP address list (type = address):

- The IP address can be a single IP address, subnet address, or address range. For example, `192.168.1.1`, `192.168.10.0/24`, or `192.168.100.1-192.168.100.254`.
- The address can be an IPv4 or IPv6 address. An IPv6 address does not need to be in `[]` format.

For URL list (type = category):

- The scheme is optional, and will be truncated if found; https:// and http:// are not required.
- Wildcards are allowed at the beginning or end of the URL, for example: *.domain.com or domain.com.*.
- IDN and UTF encoding URL are supported .
- The URL can be an IPv4 or IPv6 address. An IPv6 URL must be in [] format.

For malware hash list (type = malware):

- The malware hash list follows a strict format in order for its contents to be valid. Malware hash signature entries must be separated into each line. A valid signature must follow this format:

```
# MD5 Entry with hash description
aa67243f746e5d76f68ec809355ec234 md5_sample1

# SHA1 Entry with hash description
a57983cb39e25ab80d7d3dc05695dd0ee0e49766 sha1_sample2

# SHA256 Entry with hash description
ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379 sha256_sample1

# Entry without hash description
0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521

# Invalid entries
7688499dc71b932feb126347289c0b8a_md5_sample2
7614e98badca10b5e2d08f8664c519b7a906fbd5180ea5d04a82fce9796a4b87sha256_sample3
```

To determine the external resource table size limit for your device:

```
# print tablesize
...
system.external-resource: 0 256 512
...
```

In this example, a FortiGate 60E has a global limit of 512 and a per-VDOM limit of 256. A FortiGate 60E can configure up to 512 feeds. Each feed is limited to a maximum size of 10 MB or 131072 entries, whichever is reached first. The total number of feeds is limited by the available memory on the device.

Threat feeds

The FortiGate dynamically imports an external list from an HTTP/HTTPS server in the form of a plain text file. The imported list is then available as a threat feed, which can be used to enforce special security requirements, such as long-term policies to always allow or block access to certain websites, or short-term requirements to block access to known compromised locations. The threat feeds are dynamically synchronized and are updated periodically so that any changes are immediately imported by FortiOS.

If the FortiGate loses connectivity with the external server, the threat feed will continue to function despite the *Connection Status* error or reboot. However, the threat feed will not be updated and no new entries will be added until the connection is re-established.

FortiOS also supports STIX/TAXII format. See [STIX format for external threat feeds on page 2692](#) for more information.

There are four types of threat feeds:

FortiGuard Category	The FortiGate dynamically imports a text file from an external server, which contains one URL per line. See FortiGuard category threat feed on page 2678 for more information.
IP Address	The FortiGate dynamically imports a text file from an external server, which contains one IP/IP range/subnet per line. See IP address threat feed on page 2682 for more information.
Domain Name	The FortiGate dynamically imports a text file from an external server, which contains one domain per line. Simple wildcards are supported. See Domain name threat feed on page 2684 for more information.
Malware Hash	The FortiGate dynamically imports a text file from an external server, which contains one hash per line in the format <code><hex hash> [optional hash description]</code> . Each line supports MD5, SHA1, and SHA256 hex hashes. See Malware hash threat feed on page 2686 for more information.

Additionally, the EMS threat feed is integrated with FortiClient EMS, but it is not configured in the same way as the preceding feeds:

EMS Threat Feed	A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. See Malware threat feed from EMS on page 1202 for an example.
------------------------	---

External resources file format

File format requirements for a HTTP/HTTPS external resources file:

- The file is in plain text format with each URL list, IP address, domain name, or malware hash occupying one line. Comments can be added by using the number sign, for example: `# This is a test.`
- The file is limited to a maximum size of 10 MB and can hold up to 131072 entries, whichever limit is hit first.
- The entry limit also follows the table size limitation defined by CMDB per model.
- The external resources update period can be set to 1 minute, hourly, daily, weekly, or monthly (43200 min, 30 days).
- The external resources type as category (URL list) and domain (domain name list) share the category number range 192 to 221 (total of 30 categories).
- There is no duplicated entry validation for the external resources file (entry inside each file or inside different files).
- If the number of entries exceed the limit, a warning is displayed. Additional entries beyond the threshold will not be loaded.

For domain name list (type = domain):

- Simple wildcards are allowed in the domain name list, for example: `*.test.com`.
- IDN (international domain name) is supported.

For IP address list (type = address):

- The IP address can be a single IP address, subnet address, or address range. For example, `192.168.1.1`, `192.168.10.0/24`, or `192.168.100.1-192.168.100.254`.
- The address can be an IPv4 or IPv6 address. An IPv6 address does not need to be in `[]` format.

For URL list (type = category):

- The scheme is optional, and will be truncated if found; https:// and http:// are not required.
- Wildcards are allowed at the beginning or end of the URL, for example: *.domain.com or domain.com.*.
- IDN and UTF encoding URL are supported .
- The URL can be an IPv4 or IPv6 address. An IPv6 URL must be in [] format.

For malware hash list (type = malware):

- The malware hash list follows a strict format in order for its contents to be valid. Malware hash signature entries must be separated into each line. A valid signature must follow this format:

```
# MD5 Entry with hash description
aa67243f746e5d76f68ec809355ec234 md5_sample1

# SHA1 Entry with hash description
a57983cb39e25ab80d7d3dc05695dd0ee0e49766 sha1_sample2

# SHA256 Entry with hash description
ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379 sha256_sample1

# Entry without hash description
0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521

# Invalid entries
7688499dc71b932feb126347289c0b8a_md5_sample2
7614e98badca10b5e2d08f8664c519b7a906fbd5180ea5d04a82fce9796a4b87sha256_sample3
```

To determine the external resource table size limit for your device:

```
# print tablesize
...
system.external-resource: 0 256 512
...
```

In this example, a FortiGate 60E has a global limit of 512 and a per-VDOM limit of 256. A FortiGate 60E can configure up to 512 feeds. Each feed is limited to a maximum size of 10 MB or 131072 entries, whichever is reached first. The total number of feeds is limited by the available memory on the device.

Configuring a threat feed

A threat feed can be configured on the *Security Fabric > External Connectors* page. After clicking *Create New*, there are four threat feed options available: *FortiGuard Category*, *IP Address*, *Domain Name*, and *Malware Hash*.

This topic includes two example threat feed configurations:

- [Configuring a basic threat feed](#)
- [Configuring threat feed authentication](#)

When multi VDOM mode is enabled, threat feed external connectors can be defined in the global VDOM or within a VDOM. See [Threat feed connectors per VDOM on page 2688](#) for example configurations.

Configuring a basic threat feed

The threat feed will periodically fetch entries from the URI using HTTP or HTTPS.

To create a threat feed in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. In the *Threat Feeds* section, click on the required feed type.
4. Configure the connector settings:

Name	Enter a name for the threat feed connector.
URI of external resource	Enter the link to the external resource file. HTTP, HTTPS, and STIX protocols are supported.
HTTP basic authentication	Enable/disable basic HTTP authentication. When enabled, enter the username and password in the requisite fields. See Configuring threat feed authentication for more information.
Refresh Rate	The time interval to refresh the external resource, in minutes (1 - 43200, default = 5). The applicable threat feed will be triggered to refresh between 0 minutes and the configured value. When the refresh is triggered, if another task is being processed by the schedule worker, the refresh task will be added to the queue.
Comments	Optionally, enter a description of the connector.
Status	Enable/disable the connector.

5. Click *OK*.

To create a threat feed in the CLI:

```
config system external-resource
  edit <name>
    set status {enable | disable}
    set type {category | address | domain | malware}
    set category <integer, 192-221>
    set username <string>
    set password <string>
    set comments <string>
    *set resource <resource-uri>
    set user-agent <string>
    set server-identity-check {none | basic | full}
    set refresh-rate <integer>
    set source-ip <ip address>
    set interface-select-method {auto | sdwan | specify}
  next
end
```

The parameter marked with an asterisk (*) is mandatory and must be filled in. The `category` parameter must be set when the `type` is either `category` or `domain`. Other parameters have either default values or are optional.

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode.

Configuring threat feed authentication

Threat feed external connectors support username and password authentication.

To enable username and password authentication in a threat feed connector:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*, or edit an existing threat feed connector.
3. Enable *HTTP basic authentication*
4. Enter the *Username* and *Password*.

5. Click *OK*.

HTTP header

Additional headers can be included in the `user-agent` field. Use `\r\n` to separate the URL headers, for example:

```
# set user-agent "Firefox\r\nheader1: test1\r\nheader2: test2"
```

Sample request:

```
HTTP request: http
GET /filetypes/test.tar.gz HTTP/1.1
Host: 172.17.219.10
User-Agent: Firefox
header1: test1
header2: test2
Accept: */*
Connection: close
```

Threat feed external connectors use this functionality to support authentication using an API key. The API key authentication can only be configured in the CLI with the `set user-agent` command. The API key must be appended with `user-agent` in the following format: `"user-agent\r\nAPI-Key:SecretAPIkey"`. API keys are typically used for programmatic access to the resource by an authorized requester. See [What Is an API Key](#) in the Fortinet Cyber Glossary for more information.

To enable API key authentication in a threat feed connector:

1. Configure the threat feed. See [Configuring a basic threat feed on page 2676](#).
2. Configure the user-agent with an API key:

```
config system external resources
  edit <name>
    set user-agent "Firefox\r\nAPI-Key:abcdef12345"
  next
end
```

See [Using the AusCERT malicious URL feed with an API key on page 2694](#) for an example.

Viewing the update history

To review the update history of a threat feed, go to *Security Fabric > External Connectors*, select a feed, and click *Edit*. The *Last Update* field shows the date and time that the feed was last updated.

Click *View Entries* to view the current entries in the list.

Entry	Validity
209.212.233.26	Valid
46.17.46.54	Valid

FortiGuard category threat feed

A FortiGuard category threat feed is a dynamic list that contains URLs and is periodically updated from an external server. The list is stored in text file format on an external server. After the FortiGate imports this list, it becomes available as a category in the *Remote Categories* group of web filter profiles that can be used to block or monitor URLs matching this category. A category threat feed can also be used solely or grouped with other categories to be used for exemptions within an SSL/SSH profile that performs full SSL inspection.

Multiple custom categories can be defined by creating a FortiGuard Category threat feed for each category.

Text file example:

```
http://example.com.url
https://example.com/url
http://example.com:8080/url
```

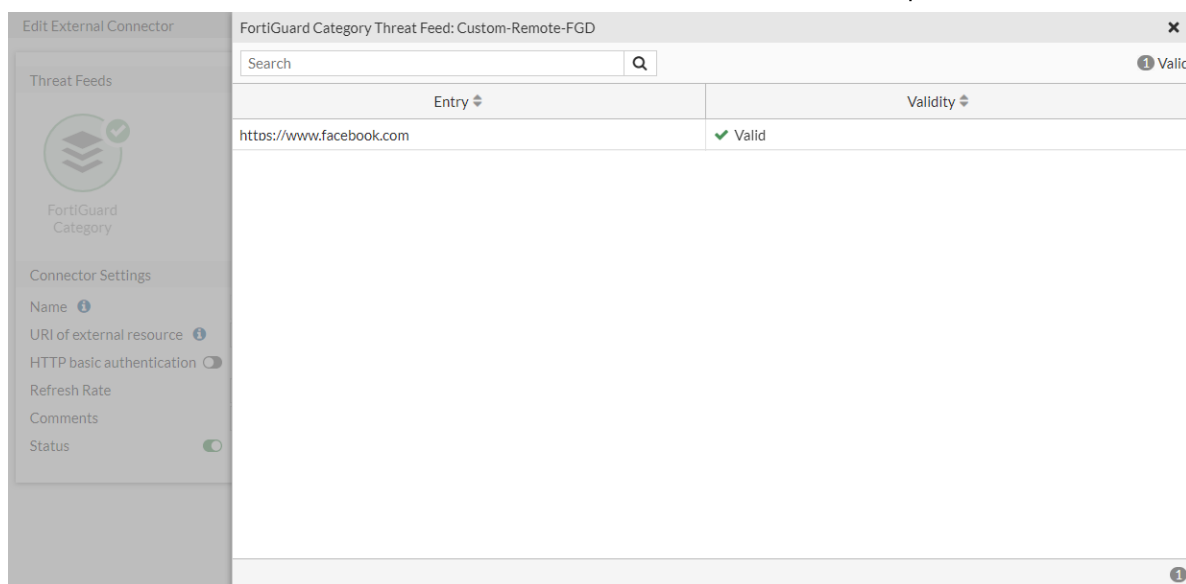

The file contains one URL per line. See [External resources file format](#) for more information about the URL list formatting style.

Example configuration

In this example, a list of URLs is imported using the FortiGuard category threat feed. The newly created threat feed is set to block in the web filter profile, and the web filter profile is applied to a firewall policy. Any traffic that passes through the FortiGate and matches the URLs in the threat feed list will be dropped.

To configure a FortiGuard category threat feed in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Set the *Name* to *Custom-Remote-FGD*.
4. Set the *URI of external resource* to *https://192.168.10.13/Override_URLs.txt*.
5. Configure the remaining settings as needed, then click *OK*.
6. Edit the connector, then click *View Entries* to view the URL in the feed, which is *https://www.facebook.com*.

To configure a FortiGuard category threat feed in the CLI:

```
config system external-resource
  edit "Custom-Remote-FGD"
    set type category
    set category 192
    set resource "https://192.168.10.13/Override_URLs.txt"
    set server-identity-check {none | basic | full}
  next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, it is set to none.

To apply a FortiGuard category threat feed in a web filter profile:

1. Go to *Security Profiles > Web Filter* and create a new web filter profile, or edit an existing one.
2. Enable *FortiGuard Category Based Filter*.
3. In the *Remote Categories* group, set the action for the *Custom-Remote-FGD* category to *Block*.
4. Configure the remaining settings as needed, then click *OK*.

Selecting the *Allow* action for the *FortiGuard Category Based Filter* does not actually allow the category. It merely implies that no filter has been applied.

We recommend avoid using the *Allow* action for remote categories, as it will not override the original action specified in the *FortiGuard Category Based Filter*.

The *Monitor* and *Block* actions for remote categories can override the original action specified in the *FortiGuard Category Based Filter*.

To apply the web filter profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

URLs that match the FortiGuard category threat feed list are rated as the FortiGuard category threat feed, overriding their original domain rating. Use the [FortiGuard Web Filter Lookup](#) to check the original category of a URL.

To view the web filter logs:

1. Go to *Log & Report > Web Filter*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-06 time=09:31:04 eventtime=1675704664795395841 tz="-0800"
logid="0316013056" type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning"
vd="root" policyid=1 poluid="e8b310ba-914f-51ed-9014-7b2a116f29ad" policytype="policy"
sessionid=509983 srcip=172.20.120.13 srcport=54645 srccountry="Reserved" srcintf="port2"
srcintfrole="undefined" srcuid="3342cb44-9140-51ed-5dbe-8e0787bedec"
dstip=157.240.3.35 dstport=443 dstcountry="United States" dstintf="port3"
dstintfrole="wan" dstuid="3342cb44-9140-51ed-5dbe-8e0787bedec" proto=6
httpmethod="GET" service="HTTPS" hostname="www.facebook.com" agent="Mozilla/5.0 (Windows
NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML, like Gecko) Chrome/64.0.3282.140
Safari/537.36 Edge/18.17763" profile="default" action="blocked" reftype="referral"
url="https://www.facebook.com/"
referralurl="https://www.google.com/url?url=https://www.facebook.com/&q=facebook&rct=j&s
a=X&source=suggest&ct=res&oi=suggest_nav&usg=AOvVaw3XzIKieZE-
CH5KqZaBe775&oq=facebook&gs_l=heirloom-
hp..0.5j0i512i433i131i1013j0i512i433i1013j0i512i433i131i1012j0i512i433i10.1716.3397.0.58
24.8.8.0.0.0.85.609.8.8.0...0...1ac.1.34.heirloom-hp..0.8.608.798UueJkbN0"
sentbyte=527 rcvbyte=0 direction="outgoing" msg="URL belongs to a denied category in
policy" ratemethod="domain" cat=192 catdesc="Custom-Remote-FGD"
```

Note that facebook.com, which was originally in the Social Networking category with a default action set to allow in the *FortiGuard Category Based Filter*, has been overridden by the block action of the remote category.

Applying a FortiGuard category threat feed in an SSL/SSH profile

A FortiGuard category threat feed can be applied in an SSL/SSH profile where full SSL inspection mode is used. The threat feed category can be selected in the exempt category list. HTTPS requests that match the URLs in the threat feed list will be exempted from SSL deep inspection. This example uses the *Custom-Remote-FGD* threat feed configured in the previous example.

To configure the SSL/SSH profile:

1. Go to *Security Profiles > SSL/SSH Inspection* and create a new profile, or edit an existing one.
2. Set the *Inspection method* to *Full SSL Inspection*.
3. In the *Exempt from SSL Inspection* section, locate *Web categories*. Click the + and add *Custom-Remote-FGD* in the *FORTIGUARD CATEGORY THREAT FEED* section.
4. Enable *Log SSL exemptions*.
5. Click *OK*.

To apply the SSL/SSH inspection profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, set *SSL Inspection* to the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

URLs that match the FortiGuard category threat feed list are rated as the FortiGuard category threat feed, overriding their original domain rating. Use the [FortiGuard Web Filter Lookup](#) to check the original category of a URL.

To view the SSL logs:

1. Go to *Log & Report > SSL*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-06 time=11:23:54 eventtime=1675711434094550877 tz="-0800"
logid="1701062009" type="utm" subtype="ssl" eventtype="ssl-exempt" level="notice"
vd="root" action="exempt" policyid=1 poluid="e8b310ba-914f-51ed-9014-7b2a116f29ad"
policytype="policy" sessionid=531331 service="SSL" profile="custom-deep-inspection"
srcip=172.20.120.13 srcport=52805 srccountry="Reserved" dstip=157.240.3.35 dstport=443
dstcountry="United States" srcintf="port2" srcintfrole="undefined" dstintf="port3"
dstintfrole="wan" srcuuid="3342cb44-9140-51ed-5dbe-8e0787bedeec" dstuuid="3342cb44-9140-

authalgo="ecdsa" kxproto="ecdhe" eventsubtype="user-category" cat=192 catdesc="Custom-
Remote-FGD" hostname="www.facebook.com" msg="SSL connection is exempted based on user
category rating."
```

IP address threat feed

An IP address threat feed is a dynamic list that contains IPv4 and IPv6 addresses, address ranges, and subnets. The list is periodically updated from an external server and stored in text file format on an external server. After the FortiGate imports this list, it can be used as a source or destination in firewall policies, proxy policies, and ZTNA rules. It can also be used as an external IP block list in DNS filter profiles.

Text file example:

```
192.168.2.100
172.200.1.4/16
172.16.1.2/24
172.16.8.1-172.16.8.100
2001:0db8::eade:27ff:fe04:9a01/120
2001:0db8::eade:27ff:fe04:aa01-2001:0db8::eade:27ff:fe04:ab01
```

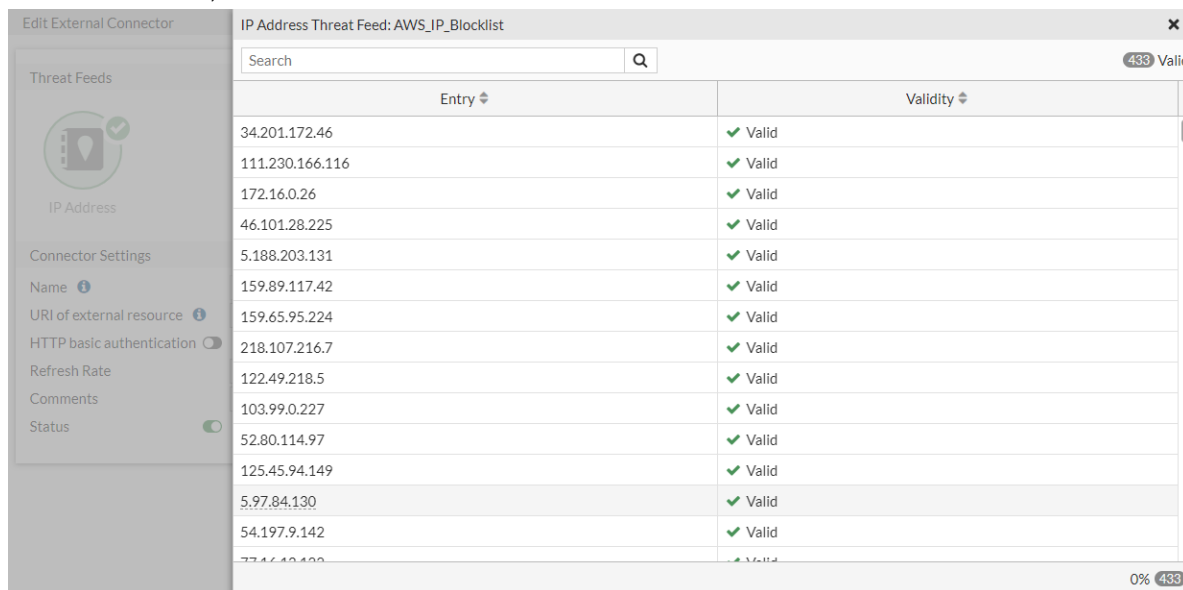

The file contains one IPv4 or IPv6 address, address range, or subnet per line. See [External resources file format](#) for more information about the IP list formatting style.

Example configuration

In this example, a list of destination IP addresses is imported using the IP address threat feed. The newly created threat feed is then used as a destination in a firewall policy with the action set to deny. Any traffic that passes through the FortiGate and matches the defined firewall policy will be dropped.

To configure an IP address threat feed in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *IP Address*.
3. Set the *Name* to *AWS_IP_Blocklist*.
4. Set the *URI of external resource* to *https://s3.us-east-2.amazonaws.com/ip-blocklist/ip.txt*.
5. Configure the remaining settings as required, then click *OK*.
6. Edit the connector, then click *View Entries* to view the IP addresses in the feed.

To configure an IP address threat feed in the CLI:

```
config system external-resource
  edit "AWS_IP_Blocklist"
    set type address
    set resource "https://s3.us-east-2.amazonaws.com/ip-blocklist/ip.txt"
    set server-identity-check {none | basic | full}
  next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, it is set to none.

To apply an IP address threat feed in a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. In the *Destination* field, click the + and select *AWS_IP_Blocklist* from the list (in the *IP ADDRESS FEED* section).
4. Set *Action* to *DENY*.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

Applying an IP address threat feed as an external IP block list in a DNS filter profile

An IP address threat feed can be applied by enabling *External IP Block Lists* in a DNS filter profile. Any DNS query that passes through the FortiGate and resolves to any of the IP addresses in the threat feed list will be dropped.

To configure the DNS filter profile:

1. Go to *Security Profiles* > *DNS Filter* and create a new profile, or edit an existing one.
2. Enable *External IP Block Lists*.
3. Click the + and select *AWS_IP_Blocklist* from the list.
4. Click *OK*.

To apply the DNS filter profile in a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *DNS Filter* and select the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

IP addresses that match the IP address threat feed list will be blocked.

To view the DNS query logs:

1. Go to *Log & Report > DNS Query*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-06 time=15:06:50 eventtime=1675724810452621179 tz="-0800"
logid="1501054400" type="utm" subtype="dns" eventtype="dns-response" level="warning"
vd="root" policyid=0 sessionid=555999 srcip=172.20.120.13 srcport=59602
srccountry="Reserved" srcintf="port2" srcintfrole="undefined" dstip=172.20.120.12
dstport=53 dstcountry="Reserved" dstintf="root" dstintfrole="undefined" proto=17
profile="default" xid=24532 qname="dns.google" qtype="A" qtypeval=1 qclass="IN"
ipaddr="208.91.112.55" msg="Domain was blocked because it is in the domain-filter list"
action="redirect" domainfilteridx=0 domainfilterlist="AWS_IP_Block_list"
```

Domain name threat feed

A domain name threat feed is a dynamic list that contains domains and periodically updates from an external server. The list is stored in a text file format on an external server. After the FortiGate imports this list, it becomes available as a category in the *Remote Categories* group of DNS filter profiles that can be used to block or monitor domains matching this category. Multiple custom categories can be defined by creating a domain name threat feed for each category.

Text file example:

```
mail.*.example.com
*-special.example.com
www.*example.com
example.com
```

The file contains one domain name per line. See [External resources file format](#) for more information about the domain list formatting style.

Example configuration

In this example, a list of domain names is imported using the domain name threat feed. The newly created threat feed is set to monitor in the DNS filter profile, and the DNS filter profile is applied to a firewall policy. Any traffic that passes through the FortiGate and matches any of the domain names in the threat feed list will be monitored.

To configure a domain name threat feed in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *Domain Name*.
3. Set the *Name* to *Domain_monitor_list*.
4. Set the *URI of external resource* to *https://192.168.10.13/external_domain_list.txt*.
5. Configure the remaining settings as required, then click *OK*.

6. Edit the connector, then click *View Entries* to view the domain names in the feed (fortinet.com and example.com).

Entry	Validity
www.fortinet.com	✓ Valid
www.example.com	✓ Valid

To configure a domain name threat feed in the CLI:

```
config system external-resource
  edit "Domain_monitor_list"
    set type domain
    set category 194
    set resource "http://192.168.10.13/external_domain_list.txt"
    set server-identity-check {none | basic | full}
  next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, it is set to none.

To apply a domain name threat feed in a DNS filter profile:

1. Go to *Security Profiles > DNS Filter* and create a new web filter profile, or edit an existing one.
2. Enable *FortiGuard Category Based Filter*.
3. In the *Remote Categories* group, set the action for the *Domain_monitor_list* category to *Monitor*.
4. Configure the remaining settings as needed, then click *OK*.

Selecting the *Allow* action for the *FortiGuard Category Based Filter* does not actually allow the category. It merely implies that no filter has been applied.

We recommend avoid using the *Allow* action for remote categories, as it will not override the original action specified in the *FortiGuard Category Based Filter*.

The *Monitor* and *Block* actions for remote categories can override the original action specified in the *FortiGuard Category Based Filter*.

To apply the DNS filter profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *DNS Filter* and select the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

Domains that match the domain threat feed list are rated as domain threat feed, overriding their original domain rating. Use the FortiGuard [Secure DNS Service](#) to check the original category of a domain name.

To view the DNS query logs:

1. Go to *Log & Report > DNS Query*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-03 time=10:44:16 eventtime=1675449856658521042 tz="-0800"
logid="1501054802" type="utm" subtype="dns" eventtype="dns-response" level="notice"
vd="root" policyid=0 sessionid=265870 srcip=172.20.120.13 srcport=59662
srccountry="Reserved" srcintf="port2" srcintfrole="undefined" dstip=172.20.120.12
dstport=53 dstcountry="Reserved" dstintf="root" dstintfrole="undefined" proto=17
profile="default" xid=35624 qname="example.com" qtype="A" qtypeval=1 qclass="IN"
ipaddr="93.184.216.34" msg="Domain is monitored" action="pass" cat=194 catdesc="Domain_
monitor_list"
```

```
2: date=2023-02-03 time=10:44:08 eventtime=1675449848683418535 tz="-0800"
logid="1501054802" type="utm" subtype="dns" eventtype="dns-response" level="notice"
vd="root" policyid=0 sessionid=265537 srcip=172.20.120.13 srcport=57434
srccountry="Reserved" srcintf="port2" srcintfrole="undefined" dstip=172.20.120.12
dstport=53 dstcountry="Reserved" dstintf="root" dstintfrole="undefined" proto=17
profile="default" xid=31194 qname="fortinet.com" qtype="A" qtypeval=1 qclass="IN"
ipaddr="3.1.92.70, 52.220.222.172" msg="Domain is monitored" action="pass" cat=194
catdesc="Domain_monitor_list"
```

Note that `fortinet.com`, which was originally in the Information Technology category with a default action set to allow in the *FortiGuard Category Based Filter*, has been overridden by the monitor action of the remote category.

Malware hash threat feed

A malware hash threat feed is a dynamic list that contains malware hashes and periodically updates from an external server. The list is stored in text file format on an external server. After the FortiGate imports this list, it is automatically used for virus outbreak prevention on antivirus profiles when *Use external malware block list* is enabled. Similar to FortiGuard outbreak prevention, the malware hash threat feed is not supported in AV quick scan mode.

Text file example:

```
292b2e6bb027cd4ff4d24e338f5c48de
dda37961870ce079defbf185eeef905 Trojan-Ransom.Win32.Locky.abf1
3fa86717650a17d075d856a41b3874265f8e9eab Trojan-Ransom.Win32.Locky.abf1
c35f705df9e475305c0984b05991d444450809c35dd1d96106bb8e7128b9082f Trojan-
Ransom.Win32.Locky.abf1
```

The file contains one malware hash per line. See [External resources file format](#) for more information about the malware hash list formatting style.

For optimal performance, do not mix different hashes in the list. Only use one MD5, SHA1, or SHA256.

Example configuration

In this example, a list of malware hashes is imported using the malware threat feed. The newly created threat feed is applied to an antivirus profile, and the antivirus profile is applied to a firewall policy. Any traffic that passes through the FortiGate and matches the malware hashes in the threat feed list will be dropped.

To configure a malware hash threat feed in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *Malware Hash*.
3. Set the *Name* to *AWS_Malware_Hash*.
4. Set the *URI of external resource* to *https://s3.us-west-2.amazonaws.com/malware.txt*.
5. Configure the remaining settings as required, then click *OK*.
6. Edit the connector, then click *View Entries* to view the hash list.

Entry	Validity
037c69bqbbb001f7cae8b8ecf0be000	Valid

dade9d2aq30ce9eb7e2765cb93659d00	Valid
d59149c1f7247c3q89d2e01ecd630500	Valid

To configure a malware hash threat feed in the CLI:

```
config system external-resource
  edit "AWS_Malware_Hash"
    set type malware
    set resource "https://s3.us-west-2.amazonaws.com/malware.txt"
    set server-identity-check {none | basic | full}
  next
end
```

To improve the security of the connection, it is recommended to enable server certificate validation (*server-identity-check*) either in basic or full mode. By default, it is set to none.

To apply a malware hash threat feed in an antivirus profile:

1. Go to *Security Profiles > AntiVirus* and create a new web filter profile, or edit an existing one.
2. Enable *Use external malware block list*.
3. Click the + and select *AWS_Malware_Hash* from the list.
4. Configure the remaining settings as needed, then click *OK*.

To apply the antivirus profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *AntiVirus* and select the profile used in the previous procedure.
4. Set *SSL Inspection* to *deep-inspection* to inspect HTTPS traffic.
5. Enable *Log Allowed Traffic*.
6. Click *OK*.

To view the antivirus logs:

1. Go to *Log & Report > AntiVirus*.
2. View the log details in the GUI, or download the log file:

```
1: date=2023-02-03 time=15:42:41 eventtime=1675467761491047388 tz="-0800"
logid="0207008212" type="utm" subtype="virus" eventtype="malware-list" level="warning"
vd="root" policyid=1 poluuid="e8b310ba-914f-51ed-9014-7b2a116f29ad" policytype="policy"

agent="curl/7.55.1" httpmethod="GET" analyticssubmit="false" crscore=10 craction=2
crlevel="medium"
```

To verify the scanunit daemon:

```
# diagnose sys scanunit file-hash list

```

The list of external hashes has been updated.

Threat feed connectors per VDOM

When multi-VDOM mode is enabled, a threat feed external connector can be defined in global or within a VDOM. Global threat feeds can be used in any VDOM, but cannot be edited within the VDOM. FortiGuard category and domain name-based external feeds have an added category number field to identify the threat feed. The threat feed name in global must start with *g-*. Threat feed names in VDOMs cannot start with *g-*.

FortiGuard category and domain name-based external feed entries must have a number assigned to them that ranges from 192 to 221. This number can be assigned to both external feed types. However, when a category number is used under a global entry, such as 192 with the name `g-cat-192`, this category number cannot be used in any other global or VDOM entries. If a category is used under a VDOM entry, such as 192 under VDOM1 with the name `cat-192`, the category 192 can be used in another VDOM or root with the name `cat-192`.

A threat feed connector can only be used in profiles in the VDOM that it was created in. Global connectors can be used in all VDOMs.

Each VDOM can have a maximum of 256 threat feed entries. But in total, a FortiGate can only have 511 threat feed entries.

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode.

To configure a FortiGuard threat feed connector under global in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name that begins with `g-`.
4. Configure the other settings as needed.
5. Click *OK*.

To configure a FortiGuard threat feed connector under global in the CLI:

```
config global
  config system external-resource
    edit "g-category"
      set status enable
      set type category
      set category 192
      set comments ''
      set resource "http://172.16.200.55/external-resource-test/513-FDGCategory.txt"
      set server-identity-check {none | basic | full}
      set refresh-rate 5
    next
  end
end
```

To configure a domain name threat feed connector under a VDOM in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *Domain Name*.
3. Enter a name that does not begin with `g-`.
4. Configure the other settings as needed.
5. Click *OK*. The threat feed connector created under global also appears, but it is not editable.

To configure a domain name threat feed connector under a VDOM in the CLI:

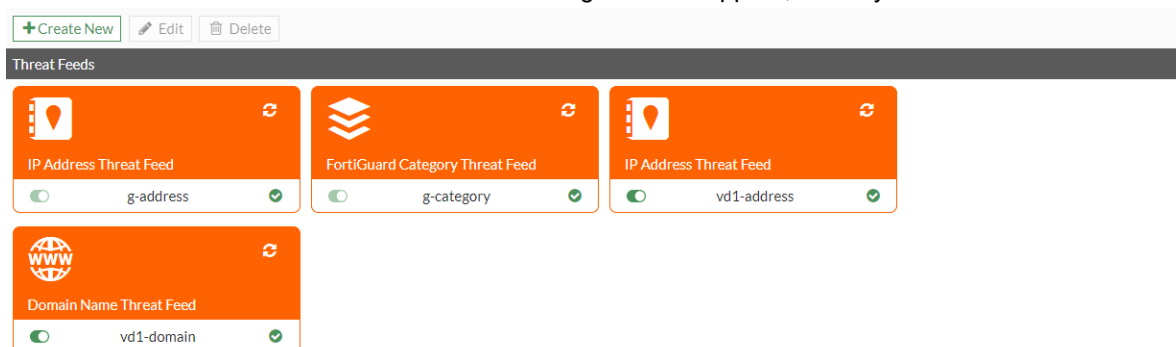

```

config vdom
  edit vd1
    config system external-resource
      edit "vd1-domain"
        set status enable
        set type domain
        set category 193
        set comments ''
        set resource "http://172.16.200.55/external-resource-test/513-Domain.txt"
        set server-identity-check {none | basic | full}
        set refresh-rate 5
      next
    end
  next
end

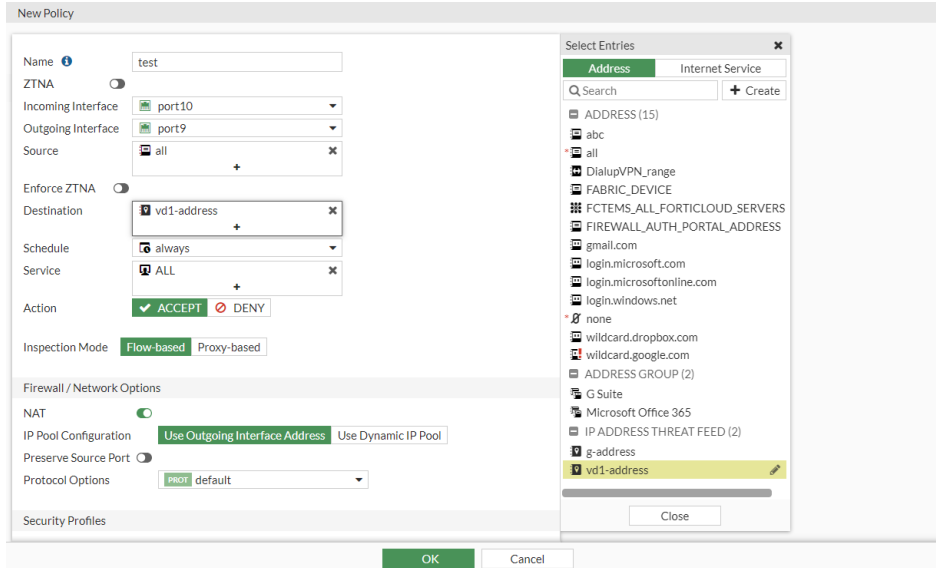

```

To use an IP address threat feed in a policy in the GUI:

1. Configure an IP address connector in global:
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. In the *Threat Feeds* section, click *IP Address*.
 - c. Enter a name that begins with *g-*.
 - d. Configure the other settings as needed.
 - e. Click *OK*.
2. Configure an IP address connector in the VDOM (vd1):
 - a. Go to *Security Fabric > External Connectors* and click *Create New*.
 - b. In the *Threat Feeds* section, click *IP Address*.
 - c. Enter a name that does not begin with *g-*.
 - d. Configure the other settings as needed.
 - e. Click *OK*. The threat feed connectors created under global also appear, but they are not editable.

3. Configure the firewall policy in the VDOM (vd1):
 - a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
 - b. For *Destination*, select *vd1-address*. Since this policy is configured under *vd1*, *g-address* can also be set as the destination.

- c. Configure the other settings as needed.
- d. Click OK.

To use an IP address threat feed in a policy in the CLI:

1. Configure the IP address connectors:

```

config global
  config system external-resource
    edit "g-address"
      set status enable
      set type address
      set username ''
      set comments ''
      set resource "http://172.16.200.55/external-resource-test/513-IP.txt"
      set server-identity-check {none | basic | full}
      set refresh-rate 5
    next
  end
end

config vdom
  edit vd1
    config system external-resource
      edit "vd1-address"
        set status enable
        set type address
        set comments ''
        set resource "http://172.16.200.55/external-resource-test/513-IP.txt"
        set user-agent "curl/7.58.0"
        set server-identity-check {none | basic | full}
        set refresh-rate 5
      next
    end
  next
end

```

2. In the VDOM, configure a firewall policy with the external address as the destination address:

```
config vdom
  edit vdl
    config firewall policy
      edit 1
        set name "test"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "vdl-address"
        set action accept
        set schedule "always"
        set service "ALL"
        set profile-protocol-options "protocol"
        set nat enable
      next
    end
  next
end
```

Since this firewall policy is configured under `vdl`, `g-address` can also be set as the `dstaddr`.

STIX format for external threat feeds

The FortiGate's external threat feeds support feeds that are in the STIX/TAXII format. Use the `stix://` prefix in the URI to denote the protocol.

All external threat feeds support the STIX format. In this example, a FortiGuard Category threat feed in the STIX format is configured.

To configure a FortiGuard Category threat feed in the STIX format in the GUI:

1. Go to *Security Fabric > External Connectors* and click *Create New*.
2. Select *FortiGuard Category* from the *Threat Feeds* section.
3. Configure the connector:
 - *Name*: `category-taxii`
 - *URI of external resource*: `stix://limo.anomali.com/api/v1/taxii2/feeds/collections/200/objects/`
 - *HTTP basic authentication*: Enable and enter the username and password, such as `guest` and `guest`.

4. Click **OK**.
5. Edit the connector, and click **View Entries** in the right side bar to view the retrieved entries.

Entry	Validity
www.assculturaleincontri.it	Valid
dancecourt.com	Valid
strangeduckfilms.com	Valid
ukonline.hc0.me	Valid
boschetto-hotel.gr	Valid
tecslide.com	Valid
dl.microsword.net	Valid
axisbuild.com	Valid
romvarimarton.hu	Valid
rsluk.co.uk	Valid
www.catgallery.com	Valid

To configure a FortiGuard Category threat feed in the STIX format in the CLI:

```

config system external-resource
  edit "category-taxii"
    set category 194
    set username "guest"
    set password guest
    set resource "stix://limo.anomali.com/api/v1/taxii2/feeds/collections/200/objects/"
    set server-identity-check {none | basic | full}
  next
end

```

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) either in basic or full mode. By default, `server-identity-check` is set to none.

If the connector is used in webfilter that blocks category 194, the traffic that matches the retrieved URLs, such as `rsluk.co.uk`, is blocked:

```
1: date=2021-10-06 time=18:07:46 eventtime=1633568867163763708 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vd1" policyid=1
sessionid=174974 srcip=10.1.100.12 srcport=48284 srcintf="port2" srcintfrole="undefined"
srcuuiid="c6753ba2-231b-51ec-1675-090f2b5f1384" dstip=78.129.255.151 dstport=443
dstintf="port1" dstintfrole="undefined" dstuuiid="c6753ba2-231b-51ec-1675-090f2b5f1384"
proto=6 service="HTTPS" hostname="rsiuk.co.uk" profile="test" action="blocked"
reqtype="direct" url="https://rsiuk.co.uk/" sentbyte=75 rcvbyte=0 direction="outgoing"
msg="URL belongs to a denied category in policy" method="domain" cat=194 catdesc="category-
taxii"
```

Using the AusCERT malicious URL feed with an API key

In this example, a list of malicious URLs is imported from AUSCERT, an Australian not for profit organization. See [AUSCERT](#) for more information.

The FortiGuard threat feed is used to import the malicious URL feed by appending the API key to the user-agent. See [HTTP header on page 2677](#) for more information. The newly created threat feed is set to block in the web filter profile, and the web filter profile is applied to a firewall policy. Any traffic that passes through the FortiGate and matches the URLs in the threat feed list will be dropped, and a replacement message will be shown.

To configure the FortiGuard category threat feed in the GUI:

1. Go *Security Fabric > External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, select *FortiGuard Category*.
3. Configure the following settings:

Status	Enabled
Name	AusCERT_Feed
Update method	External Feed
URI of external resource	https://www.auscert.org.au/api/v1/malurl/combo-7-txt/

4. Click *OK*.
5. In the CLI, enter the following:

```
config system external-resource
  edit "AusCERT_Feed"
    set user-agent "Firefox\r\nAPI-Key:SECRETAPIKEY"
  next
end
```
6. In the GUI, edit the connector and configure the remaining settings as needed, then click *OK*.
7. Edit the connector again, and click *View Entries* in the right pane to view the URL list.

To configure the FortiGuard category threat feed in the CLI:

```
config system external-resource
  edit "AusCERT_Feed"
    set category 194
    set resource "https://www.auscert.org.au/api/v1/malurl/combo-7-txt/"
    set user-agent "Firefox\r\nAPI-Key:SECRETAPIKEY"
```

next
end

When configuring a FortiGuard category threat feed in the GUI, the category is set automatically. When configuring a the threat feed in the CLI, the category must be set manually. The category must be unique and in the range of 192 - 221.

To improve the security of the connection, it is recommended to enable server certificate validation (`server-identity-check`) in either `basic` or `full` mode. By default, it is set to `none`.

To apply the FortiGuard category threat feed to a web filter profile:

1. Go to *Security Profiles > Web Filter* and create a new web filter profile, or edit an existing one.
2. Enable *FortiGuard category based filter*.
3. In the *Remote Categories* group, set the action for the *AusCERT_Feed* category to *Block*.
4. Configure the remaining settings as needed, then click *OK*.

To apply the web filter profile in a firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and create a new policy, or edit an existing one.
2. Configure the policy fields as required.
3. Under *Security Profiles*, enable *Web Filter* and select the profile used in the previous procedure.
4. Enable *Log Allowed Traffic*.
5. Click *OK*.

URLs that match the FortiGuard category threat feed list are rated as the category matching the corresponding FortiGuard category threat feed, overriding their original domain rating.

To verify that FortiGate is blocking URLs from the AusCERT feed list:

1. Visit one of the URLs from the AusCERT_Feed list.
A replacement message should be shown.

FortiGuard Intrusion Prevention - Access Blocked

Web Page Blocked

You have tried to access a web page that is in violation of your Internet usage policy.

Category AusCERT_Feed
URL <http://pcmach.co.nz/>

To have the rating of this web page re-evaluated [please click here](#).

2. Go to *Log & Report > Security Events* and select *Web Filter*.
3. View the log details in the GUI, or download the log file:

```

1: date=2023-04-11 time=14:18:02 eventtime=1681247882561766251 tz="-0700"
logid="0316013056" type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning"
vd="root" policyid=1 poluuid="26540ed0-ae54-51ed-80eb-89af8af4d53f" policytype="policy"
sessionid=3275 srcip=172.20.120.13 srcport=64151 srccountry="Reserved" srcintf="port2"
srcintfrole="undefined" srcuuid="3342cb44-9140-51ed-5dbe-8e0787bedeec"
dstip=114.142.162.65 dstport=80 dstcountry="Australia" dstintf="port3" dstintfrole="wan"
dstuuid="3342cb44-9140-51ed-5dbe-8e0787bedeec" proto=6 httpmethod="GET" service="HTTP"
hostname="pcmach.co.nz" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/112.0.0.0 Safari/537.36" profile="default"
action="blocked" reqtype="direct" url="http://pcmach.co.nz/" sentbyte=427 rcvbyte=0
direction="outgoing" msg="URL belongs to a denied category in policy"
ratemethod="domain" cat=194 catdesc="AusCERT_Feed"

```

Troubleshooting a threat feed

In this example, the user entered the URL of external resource without the trailing slash. The following commands can be used to troubleshoot connectivity issues between a FortiGate and external resource:

```

diagnose debug app dnsproxy -1
diagnose debug app forticron -1
diagnose debug enable

```

This output shows that the DNS resolution is successful, indicating that the FortiGate has connectivity to the external server:

```

#diagnose debug app dnsproxy -1
[worker 0] dns_local_lookup()-2476: vfid=0, real_vfid=0, qname=www.auscert.org.au, qtype=1,
qclass=1, offset=36, map#=4 max_sz=512
[worker 0] dns_lookup_aa_zone()-608: vfid=0, fqdn=www.auscert.org.au
[worker 0] dns_send_request()-1398
[worker 0] dns_send_resol_request()-1234: orig id: 0xa002 local id: 0xa002
domain=www.auscert.org.au
[worker 0] dns_find_best_server()-595: found server: 96.45.46.46
...
id:0xa002 domain=www.auscert.org.au active

```

This output shows that the requested resource was missing a trailing slash:

```

#diagnose debug app forticron -1
fcron_timer_func()-23: Timer ext_upd fired
6745-before-init: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.body info=0-
DNS fail chunk=0 content-0=0 etag=0 csum=0 done=0 closed=0
    sync-0(len=0 note=0 err=0) buf-1(sz=8192 data=179 free=8013 pos=0 end=179 max=10485760)
6745-init-as: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.body info=0-None
chunk=0 content-0=0 etag=0 csum=0 done=0 closed=0
    sync-0(len=0 note=0 err=0) buf-1(sz=8192 data=0 free=8192 pos=0 end=0 max=10485760)
http_request_make()-2066: HTTP request: https

GET /api/v1/malurl/combo-7-txt HTTP/1.1
Host: www.auscert.org.au
User-Agent: Firefox
API-Key: <obfuscated>
Accept: */*
Connection: close
http_request_make()-2101: fcron_get_addr(www.auscert.org.au)
__update_ext()-187: Updating EXT 'AusCERT_Feed' with HTTP
fcron_update_ext_func()-611: update ver: 0

```

```
fcron_timer_func()-32: Timer ext_upd done
fcron_epoll_before_handle()-297: BEFORE READ fd 11 handle event 0x01 read 0xc55a40 epoll
events 0x01
dns_parse_resp()-102: DNS www.auscert.org.au -> 54.253.78.74
dns_parse_resp()-102: DNS www.auscert.org.au -> 13.54.251.23
...
HTTP/1.1 301 Moved Permanently
...
Location: /api/v1/malurl/combo-7-txt/
```

After adding a trailing slash to the external resource URL, the connection is now working:

```
#diagnose debug app forticron -1
fcron_timer_func()-23: Timer ext_upd fired
2832-before-init: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.header
info=0-None chunk=0 content-0=0 etag=0 csum=0 done=0 closed=0
    sync-0(len=0 note=0 err=0) buf-0(sz=0 data=0 free=0 pos=0 end=0 max=10485760)
2832-init-as: fd=-1 name='ext-root.AusCERT_Feed' http_1=0 loc=0 state=send.header info=0-
None chunk=0 content-0=0 etag=0 csum=0 done=0 closed=0
    sync-0(len=0 note=0 err=0) buf-1(sz=8192 data=0 free=8192 pos=0 end=0 max=10485760)
http_request_make()-2066: HTTP request: https

GET /api/v1/malurl/combo-7-txt/ HTTP/1.1
Host: www.auscert.org.au
User-Agent: Firefox
API-Key: <obfuscated>
Accept: */*
Connection: close
...
HTTP/1.1 200 OK
```

These troubleshooting commands can be used to resolve a variety of issues. They are not limited to this specific use case.

Monitoring the Security Fabric using FortiExplorer for Apple TV

FortiExplorer for Apple TV allows you to use a TV screen to monitor your entire Security Fabric.

FortiExplorer for Apple TV is an analysis tool that provides easy to use NOC and SOC monitoring capabilities. The app features real-time data traffic, visual alerts, as well as a general overview of hardware devices, operating systems, and interfaces. The monitor also provides a wireless health summary of your entire network across multiple buildings. If an access point goes offline, you will be notified about the network's health. After the issues are resolved, you will immediately see the health update on your screen.

Getting started with FortiExplorer for Apple TV

Download FortiExplorer for Apple TV from the app store on Apple TV. After the app is installed, add devices using the Apple TV remote or by sharing a login profile with FortiExplorer. Once the devices are added, you can use FortiExplorer for Apple TV to view real-time data in the Network Operations Center, Security Operations Center, and Software-Defined Branch.

To get started with FortiExplorer for Apple TV:

1. [Download the app and add devices to FortiExplorer for Apple TV.](#)
You can add devices by sharing a login profile with FortiExplorer or logging into the device directly on FortiExplorer for Apple TV.
2. [View the physical topology of the Fabric to identify risks](#)
3. [View the Fabric components as seen on the root FortiGate.](#)
4. [View an executive summary of the three largest areas of security focus in the Security Fabric.](#)
5. [View data collected by FortiAnalyzer on the endpoints on your network.](#)
6. [View vulnerability data collected by FortiClient EMS.](#)
7. [Use the Software-Defined Branch module to monitor interface SD-WAN usage and associated service level agreements.](#)

NOC and SOC example

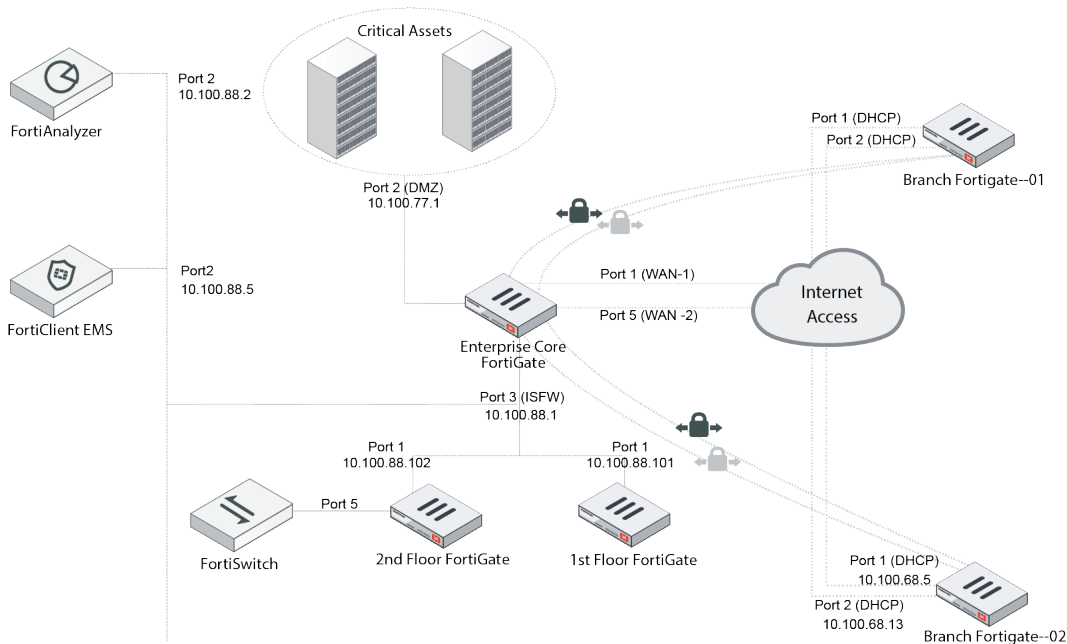

In this example, you have configured your FortiGates, FortiAnalyzer and other devices in your Security Fabric. Now you want to use FortiExplorer for Apple TV to display the status of the devices on a TV in your Network Operation Center or Security Operation Center.

Topology

This topology has a Headquarter and two Branches. Within the Headquarter is the Enterprise Core and two FortiGates acting as ISFWs. In addition, an on-premise FortiAnalyzer collects all logging information from the fabric devices. The FortiClient EMS manages all the endpoints within the topology.

The two branches are configured with SD-WAN with VPN overlays to the Enterprise Core. Traffic is steered towards the overlays and underlays based on SD-WAN Rules.

Using FortiExplorer for Apple TV, you will be able to monitor the different components in this topology.

To take advantage of the views in the FortiExplorer for Apple TV, you should configure:

- Security Fabric on all FortiGates. See [Configuring the root FortiGate and downstream FortiGates on page 2364](#).
- FortiAnalyzer Logging. See [Configuring FortiAnalyzer on page 2371](#).
- FortiClient EMS. See [Configuring FortiClient EMS on page 2391](#)

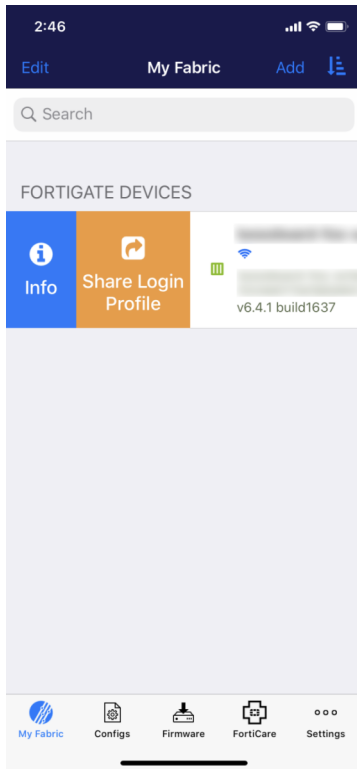

Adding the root FortiGate to FortiExplorer for Apple TV

By adding the root FortiGate, you can view the entire topology and navigate to branch FortiGates in the SD-WAN view. If you are already using FortiExplorer on a mobile device, you can connect the same FortiGate device to Apple TV by sharing the login credentials on both devices. Alternatively, you can manually connect to your root FortiGate directly from the app.

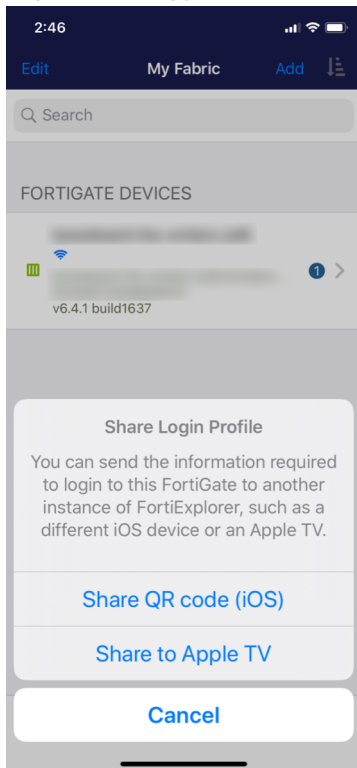

To share login credentials between FortiExplorer and FortiExplorer for Apple TV:

1. Connect the FortiExplorer and FortiExplorer for Apple TV devices to the same network.
2. On FortiExplorer for Apple TV, click *New FortiGate*.
3. In FortiExplorer, go to *My Fabric*.

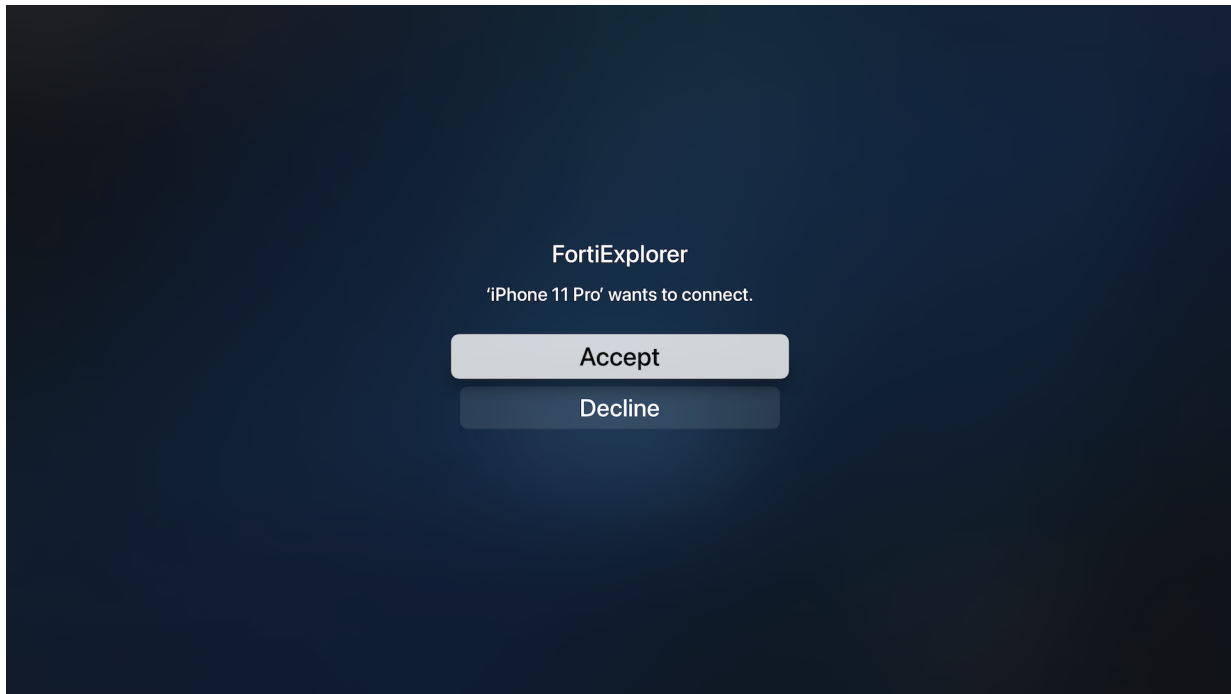

4. Swipe right on the device you want to share, and tap *Share Login Profile*.

5. Tap *Share to Apple TV*.

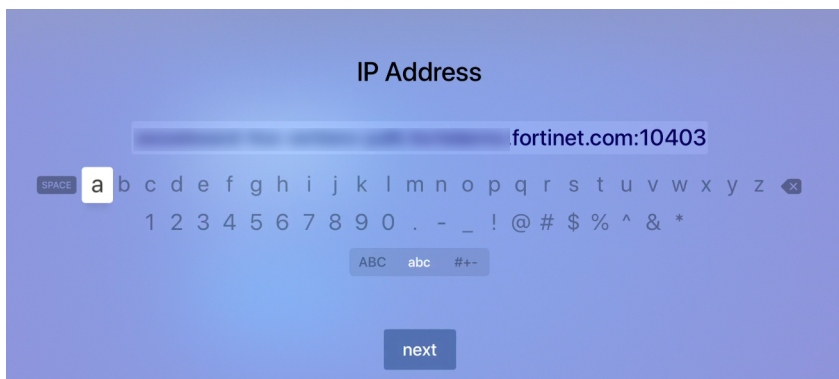

6. On Apple TV, click *Accept*. FortiExplorer for Apple TV confirms the request and proceeds to the device main menu.

To add devices to FortiExplorer for Apple TV:

1. In the *Devices* menu, click *New FortiGate*. The *Login to FortiGate* dialog box is displayed.
2. In the *IP Address/Host Name* field, take one of the following actions:
 - Enter the device IP address and port, if not using the default admin port 443
 - Enter the full host name including the domain. Enter port if not using the default admin port 443.

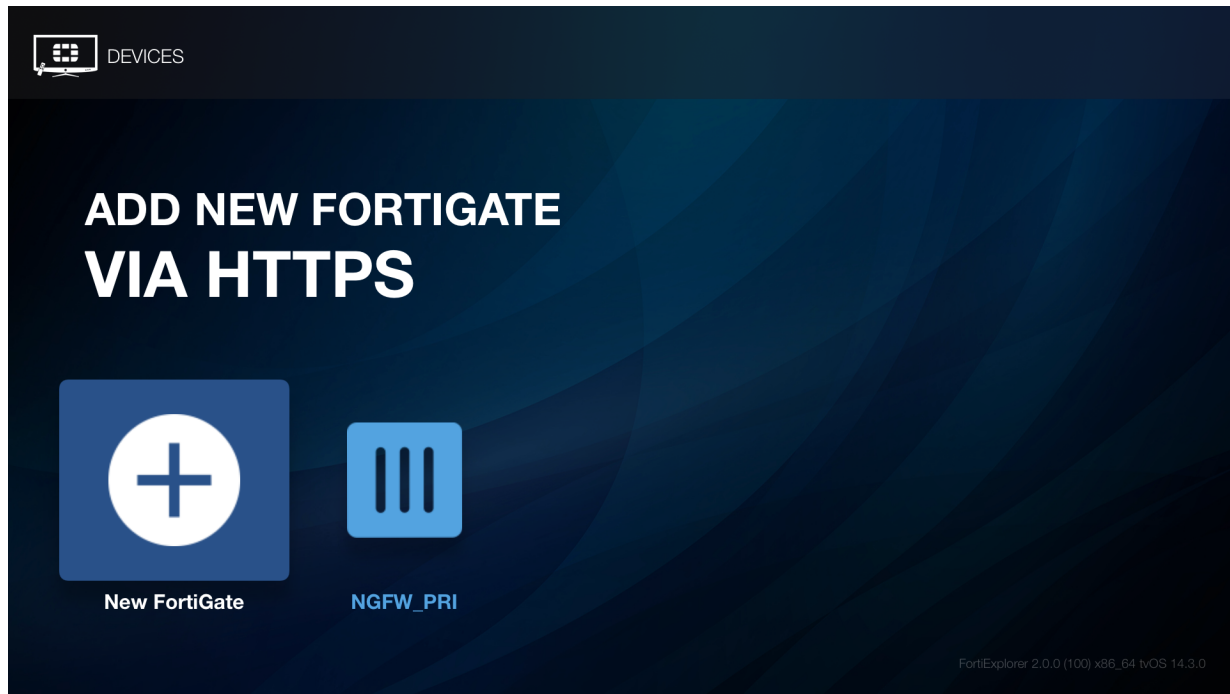

3. Enter the *Username* and *Password* for the FortiGate device.
4. Click *Remember* to save time entering the login credentials later.

5. Click *Login*. The device is added to FortiExplorer for Apple TV.

If the IP or hostname is not defined in the CN or SAN field of your certificate, you will receive a prompt that "Your connection is not private". You may choose to continue with your connection.

Viewing the Fabric Topology monitor

Use the Fabric Topology monitor to view the physical topology of the Fabric to identify risks. FortiGate devices with version 6.4. and above can drilldown further to see additional information for devices such as FortiGates, FortiAPs, and FortiSwitches.

To view the Fabric Topology monitor, go to *Network Operations Center > Fabric Topology*. This monitor displays the same information as the *Physical Topology* on the FortiGate

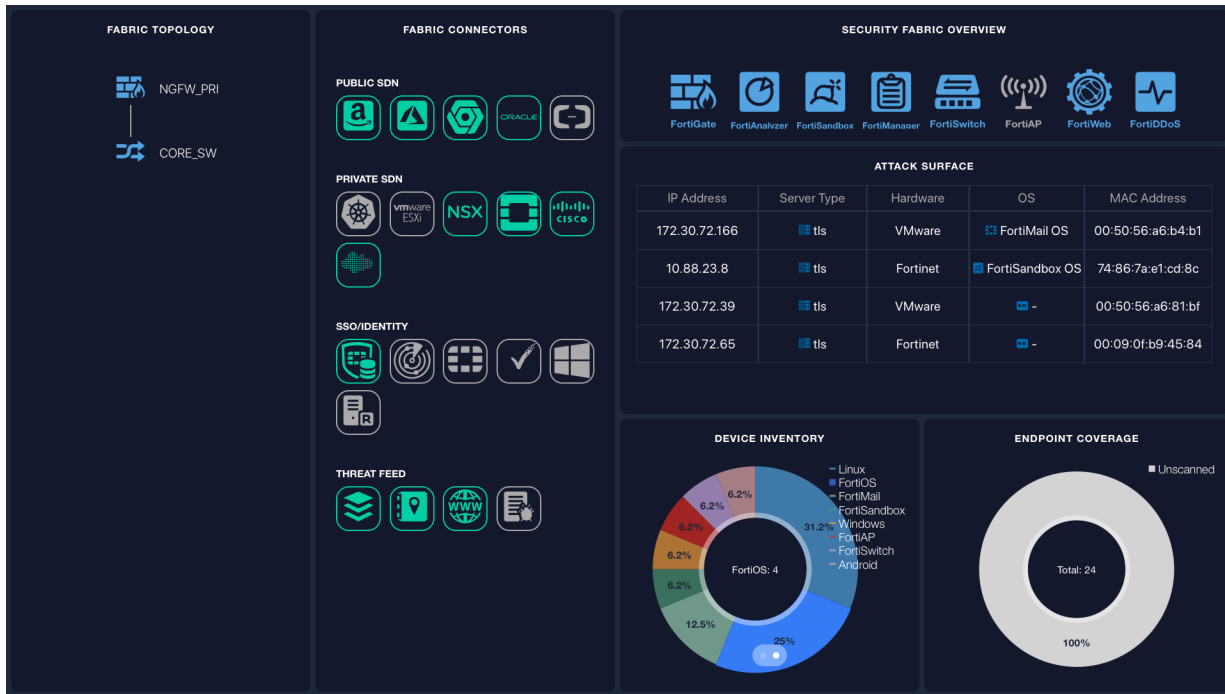

Use your remote to navigate through the devices in the Fabric topology. Click a device to view the drilldown information. To return to the default view, click the *Menu* button.

Viewing the Fabric Overview monitor

Use the Fabric Overview monitor to view the Fabric components as seen on the Dashboard of the Fabric Root FortiGate in the example topology. Each device must be authorized and be part of the Fabric.

For information about configuring the Security Fabric, see [Fortinet Security Fabric on page 2360](#)

To view the Fabric Overview monitor, go to *Network Operations Center > Fabric Overview*.

The Security Fabric monitor has multiple panes. To see data populated on the panes, ensure that proper configurations are applied on the Fabric devices:

Pane	Description	Configuration
Fabric Connectors	Displays external SDN connectors that are enabled.	Configure <i>Security Fabric > External Connectors</i> .
Security Fabric Overview	Displays the number of devices in the topology.	Configure <i>Security Fabric > Fabric Connectors</i> .
Attack Surface	Displays devices detected by the FortiGate with a server tag.	Ensure Device Detection is configured on the interface(s). Go to <i>Network > Interfaces</i> .
Device Inventory	Displays devices based on Hardware Vendor and detected OS	Ensure Device Detection is configured on the interface(s). Go to <i>Network > Interfaces</i> .
Endpoint Coverage	Displays the number of online devices and the percentage of Unscanned, Vulnerable, and Secured devices.	Ensure Device Detection is configured on the interface(s). Vulnerability scan results come from FortiClient EMS. Go to <i>Network > Interfaces</i> .

Device related information only corresponds to devices local to the FortiGate. Device information from downstream FortiGates do not propagate to the Upstream FortiGate.

Viewing the Security Rating monitor

The Security Rating monitor is separated into three major scorecards: *Security Posture*, *Fabric Coverage*, and *Optimization*, which provide an executive summary of the three largest areas of security focus in the Security Fabric.

To see the Security Rating summary, the root FortiGate and all FortiGates within the Fabric should have the proper FortiGuard Security Rating license. Security rating is performed on the root FortiGate. Its reports are generated periodically.

To view the Security Rating monitor, go to *Network Operations Center > Security Rating*.

The scorecards show an overall score of the performance and sub-categories. The point score represents the net score for all passed and failed items in that area.

For more information about the Security Rating score, see [Security Fabric score on page 2505](#).

Viewing the Compromised Hosts monitor

The Compromised Hosts monitor leverages the data collected by FortiAnalyzer on the endpoints on your network. To see compromised hosts, the FortiAnalyzer must have a FortiGuard Indicators of Compromise license. The IOC service helps identify compromised hosts based on infected websites that it may have visited.

This monitor captures the same information as seen on the *Compromised Hosts* monitor on the FortiGate.

The screenshot displays the Fortinet Security Fabric interface for the 'Compromised Hosts' monitor. On the left, a list of users is shown, with 'Jesse Hughes' selected. The main area is divided into three panes:

- USER INFORMATION:** Shows details for Jesse Hughes, including 'Not Registered', phone number 1778160275, IP address 10.200.1.18, email JesseHughes@hotmail.com, OS Linux LUBUNTU 16.0.4, and login time 14:03:04:69:1b:20.
- TOPOLOGY VIEW:** Shows the user's location in the network topology, specifically 'Enterprise_Second_Floor' under the device 'jko-testappletv'.
- VERDICT VIEW:** Displays two detected threats:
 - Malware Sinkhole- 176.31.62.76:** Detected Method: infected-ip, Security Action: close.
 - Malware Sinkhole- 23.253.46.64:** Detected Method: infected-ip, Security Action: close.

A red warning icon with a robot head and the text '1 Threat Detected' is also visible in the Verdict View pane.

To view the Compromised Hosts monitor:

1. Go to *Security Operations Center > Compromised Hosts*.
2. In the left-hand pane, scroll through the user list. The monitor displays three panes:
 - The *User Information* pane displays the user's contact information and IP address.
 - The *Topology View* pane displays the user's location in the topology.
 - The *Verdict View* pane displays the *Malware*, *Detected Method*, and *Security Action*.

Viewing the Vulnerability Monitor

The Vulnerability Monitor obtains data from FortiClient EMS. It displays vulnerabilities detected by the FortiClient endpoint, categorized into Critical, High, Medium and Low risk. In this example, an on-premise FortiClient EMS is connected on the root FortiGate's Fabric Connector.

This monitor captures the same information as seen on the *Top Vulnerable Endpoint Devices* monitor on the FortiGate.

VULNERABILITY SUMMARY

1 Critical, 4 High, 12 Medium, 2 Low

TOPOLOGY VIEW

jko-testappletv
 Enterprise_First_Floor
 Sam Smith

TOP VULNERABILITIES

Severity	Vulnerability Name	Vulnerability Category	CVE-IDs
critical	Ubuntu Security Notice USN-2936-3	Web Client	CVE-2016-2804 CVE-2016-2806 (+8)
high	Ubuntu Security Notice USN-3076-1	Web Client	CVE-2016-2827 CVE-2016-5256 (+14)
high	Ubuntu Security Notice USN-3023-1	Applications	CVE-2016-1951 CVE-2016-2818
high	Clients that receive a KoD should validate the origin timestamp field.	Applications	CVE-2015-7704 CVE-2015-7705

To view the Vulnerability Monitor:

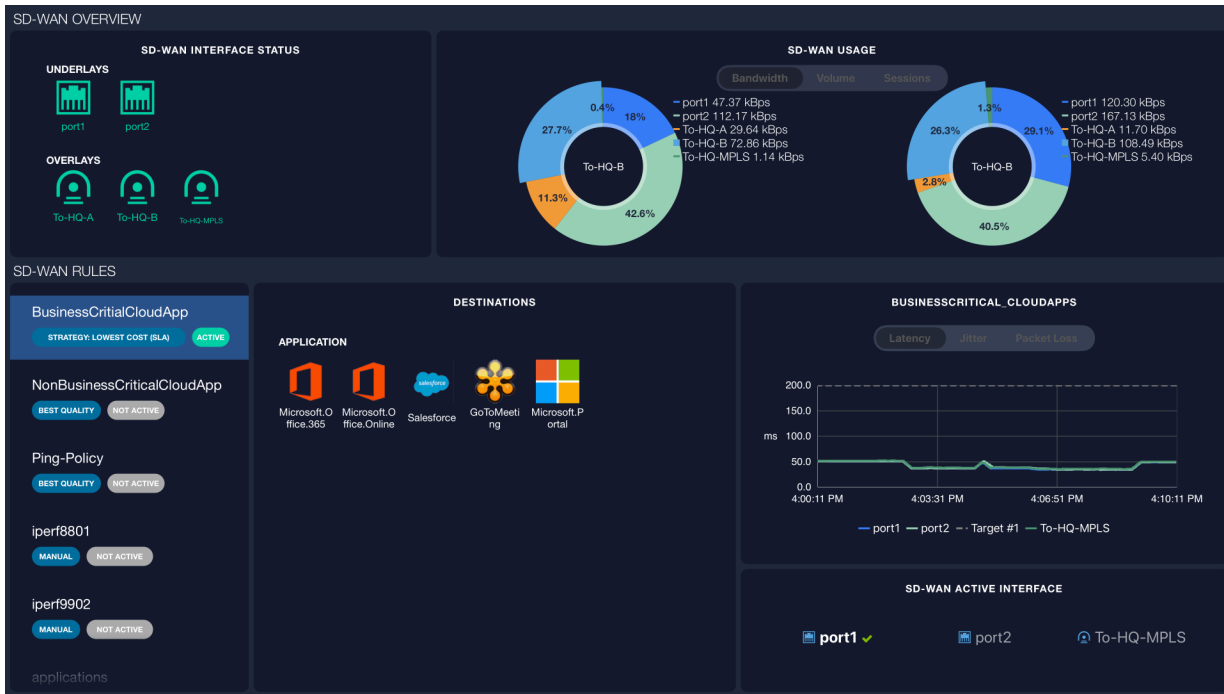

1. Go to *Security Operations Center > Vulnerability Monitor*. The monitor displays a user list and their vulnerabilities.
2. Use your remote to scroll through the user list. The vulnerability details are displayed on the right side of the monitor.
 - The *User Information* pane displays the user's contact details and IP address.
 - The *Vulnerability Summary* pane displays the number of vulnerabilities categorized into *Critical*, *High*, *Medium* and *Low* risk.
 - The *Topology View* pane displays the user's location in the topology.
 - The *Top Vulnerabilities* pane displays the top vulnerabilities by severity.

Using the SD-WAN monitor

In the example topology, the branches are configured to use SD-WAN. You can use the top-right navigation menu in the SD-WAN monitor to navigate to the Branch FortiGate to display information about the SD-WAN.

To view the SD-WAN monitor, go to *Software-Defined Branch > SD-WAN Monitor*.

The SD-WAN monitor summarizes the SD-WAN members, Zones, SD-WAN Rules and health checks deployed on the FortiGate. It shows the interface member's SD-WAN usage and its associated service level agreements. The monitor contains a chart that shows if the ports are meeting the SLA target for bandwidth, jitter and latency per the health check in use in each SD-WAN Rule.

Some of the SD-WAN statistics are only available in FOS 6.4.1 and higher.

To view SD-WAN usage charts:

1. In the *SD-WAN Overview* area, Use your remote to select the *SD-WAN Usage* pane.
2. Scroll left and right to view *Bandwidth*, *Volume* and *Sessions* charts for the *VIRTUAL-WAN-LINK* and *Underlay* interfaces in the *SD-WAN Zones* pane.

To view SLA targets:

1. In the *SD-WAN Rules* area, use your remote to scroll the rules pane at the left-side of the monitor.
 - The *Destinations* pane displays the destination details.
 - The *Performance SLA* pane displays the SLA targets for the rule.
 - The *SD-WAN Active Interface* pane displays a checkmark next to the active interface.

- Use your remote to navigate between the *Latency*, *Jitter*, and *Packet Loss* charts.

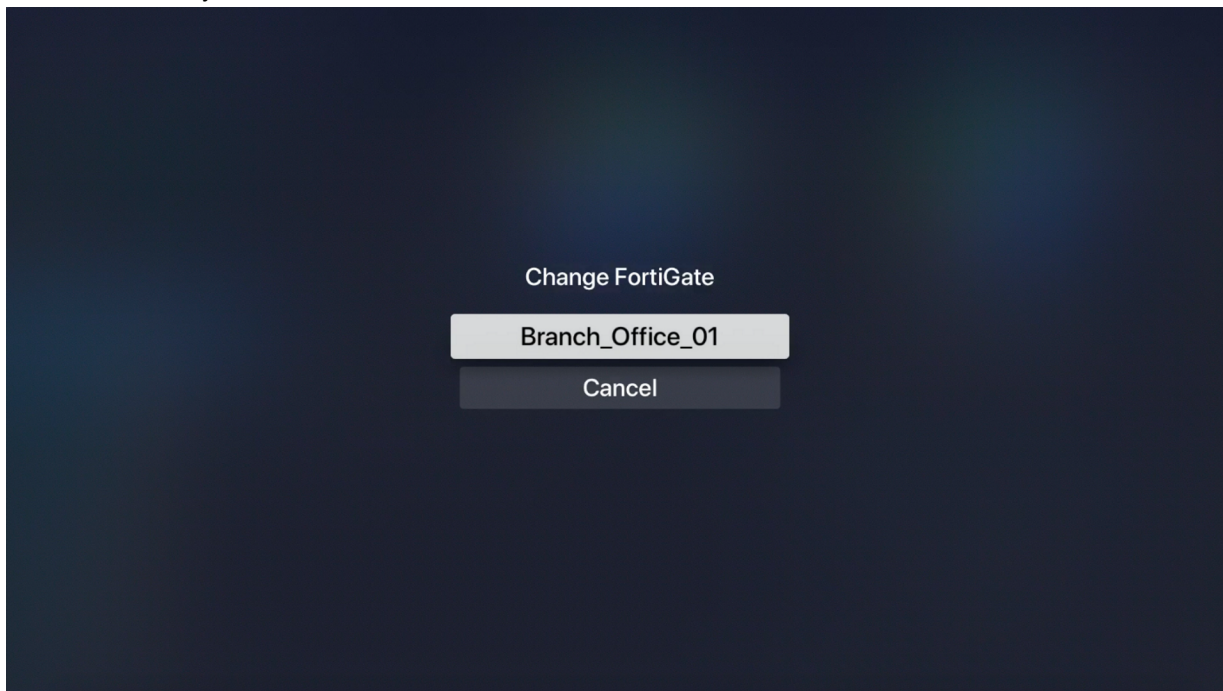

To view a branch in the topology:

- Use your remote to swipe to the top navigation in the monitor. Wait for the topology to load.
- At the top-right of the monitor, select the current device.

- Select the device you want to view.

Troubleshooting

The following topics provide troubleshooting information for the Fortinet Security Fabric:

- [Viewing a summary of all connected FortiGates in a Security Fabric on page 2710](#)
- [Diagnosing automation stitches on page 2712](#)

Viewing a summary of all connected FortiGates in a Security Fabric

In downstream FortiGates, the `diagnose sys csf global` command shows a summary of all of the connected FortiGates in the Security Fabric.

To view a Security Fabric summary on a downstream FortiGate:

```
# diagnose sys csf global
Current vision:

Diagnosing automation stitches

Diagnose commands are available to:

- Test an automation stitch
- Enable or disable log dumping for automation stitches
- Display the settings of every automation stitch
- Display statistics on every automation stitch

To test an automation stitch:

```
diagnose automation test <automation-stitch-name>
```

Example:

```
# diagnose automation test HA-failover
automation test is done. stitch:HA-failover
```

To toggle log dumping:

```
diagnose test application autod 1
```

Examples:

```
# diagnose test application autod 1
autod log dumping is enabled
```

```
# diagnose test application autod 1
autod log dumping is disabled
```

```
autod logs dumping summary:
autod dumped total:7 logs, num of logids:4
```

To display the settings for all of the automation stitches:

```
diagnose test application autod 2
```

Example:

```
# diagnose test application autod 2
csf: enabled root:yes
total stitches activated: 3
```

```
stitch: Compromised-IP-Banned
destinations: all
trigger: Compromised-IP-Banned
```

```
local hit: 0 relayed to: 0 relayed from: 0
actions:
    Compromised-IP-Banned_ban-ip type:ban-ip interval:0
```

```
stitch: HA-failover

Log and Report

Logging and reporting are useful components to help you understand what is happening on your network, and to inform you about certain network activities, such as the detection of a virus, a visit to an invalid website, an intrusion, a failed log in attempt, and myriad others.

Logging records the traffic that passes through, starts from, or ends on the FortiGate, and records the actions the FortiGate took during the traffic scanning process. After this information is recorded in a log message, it is stored in a log file that is stored on a log device (a central storage location for log messages). FortiGate supports sending all log types to several log devices, including FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, and syslog servers. Approximately 5% of memory is used for buffering logs sent to FortiAnalyzer. The FortiGate system memory and local disk can also be configured to store logs, so it is also considered a log device.

Reports show the recorded activity in a more readable format. A report gathers all the log information that it needs, then presents it in a graphical format with a customizable design and automatically generated charts showing what is happening on the network. Reports can be generated on FortiGate devices with disk logging and on FortiAnalyzer devices.

FortiView is a more comprehensive network reporting and monitoring tool. It integrates real-time and historical data into a single view in FortiOS. For more information, see [FortiView monitors and widgets on page 114](#).

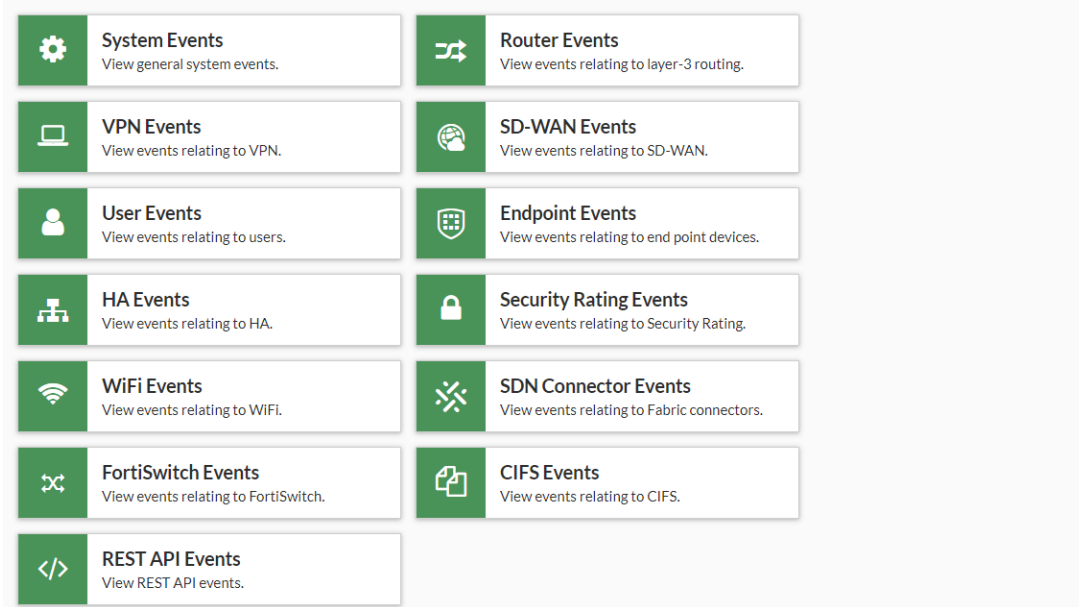

Performance statistics are not logged to disk. Performance statistics can be received by a syslog server or by FortiAnalyzer.

The following topics provide information about logging and reporting:

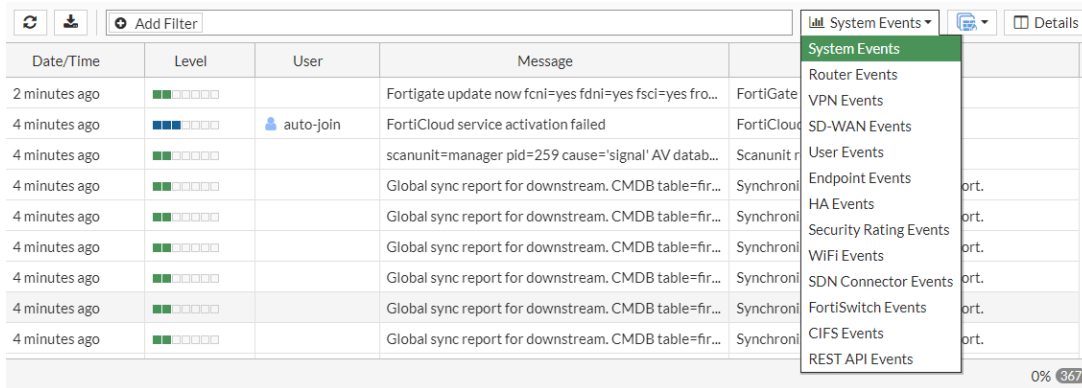

- [Viewing event logs on page 2717](#)
- [Log settings and targets on page 2718](#)
- [Sample logs by log type on page 2723](#)
- [Log buffer on FortiGates with an SSD disk on page 2744](#)
- [Checking the email filter log on page 2747](#)
- [Supported log types to FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, and syslog on page 2747](#)
- [Sending traffic logs to FortiAnalyzer Cloud on page 2747](#)
- [Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode on page 2750](#)
- [Configuring multiple FortiAnalyzers \(or syslog servers\) per VDOM on page 2753](#)
- [Source and destination UUID logging on page 2754](#)
- [Logging the signal-to-noise ratio and signal strength per client on page 2756](#)
- [RSSO information for authenticated destination users in logs on page 2759](#)
- [Destination user information in UTM logs on page 2762](#)
- [Threat weight on page 2766](#)
- [Logs for the execution of CLI commands on page 2767](#)
- [Configuring and debugging the free-style filter on page 2769](#)
- [Troubleshooting on page 2770](#)

Viewing event logs

Event log subtypes are available on the *Log & Report > Events* page. Not all of the event log subtypes are available by default.

When viewing event logs, use the event log subtype dropdown list on the to navigate between event log types.

System Events	Always available.
Router Events	Always available.
VPN Events	Available when <i>VPN</i> is enabled in <i>System > Feature Visibility</i> .
SD-WAN Events	Always available.
User Events	Always available.
Endpoint Events	Available when <i>Endpoint Control</i> is enabled in <i>System > Feature Visibility</i> .
HA Events	Always available.

Security Rating Events	Always available, but logs are only generated when a Security Rating License is registered.
WAN Opt. & Cache Events	Available on devices with two hard disks by default. On devices with one hard disk, the disk usage must be set to <code>wanopt</code> and then <i>WAN Opt. & Cache</i> must be enabled in <i>System > Feature Visibility</i> .
WiFi Events	Available on hardware devices when <i>WiFi Controller</i> is enabled in <i>System > Feature Visibility</i> .
FortiExtender Events	Available when <i>FortiExtender</i> is enabled in <i>System > Feature Visibility</i> .
SDN Connector Events	Always available.
FortiSwitch Events	Available when <i>Switch Controller</i> is enabled in <i>System > Feature Visibility</i> .
CIFS Events	Always available.
REST API Events	Always available.

Log settings and targets

Log settings determine what information is recorded in logs, where the logs are stored, and how often storage occurs. Log settings can be configured in the GUI and CLI. In the GUI, *Log & Report > Log Settings* provides the settings for local and remote logging.

Local Log	
Disk	<p>Define local log storage on the FortiGate:</p> <ul style="list-style-type: none"> <i>Enable</i>: Logs will be stored on a local disk. Local disk logging is not available in the GUI if the Security Fabric is enabled. When the Security Fabric is enabled, disk logging can still be configured on the root FortiGate in the CLI but is not available for downstream FortiGates. <i>Disable</i>: Logs will be stored remotely to FortiAnalyzer/FortiManager or to a Cloud logging device.
Enable Local Reports	<p>Define log reporting on the FortiGate:</p> <ul style="list-style-type: none"> <i>Enable</i>: Local reports will be available on the FortiGate. Reports can be reviewed in <i>Log & Report > Local Reports</i>. If the Security Fabric is enabled, <i>Local Reports</i> can be enabled in <i>System > Feature Visibility</i>. <i>Disable</i>: Local reports will not be available on the FortiGate.
Enable Historical FortiView	<p>Define the presentation of log information on FortiView:</p> <ul style="list-style-type: none"> <i>Enable</i>: Historical log data will be available on a FortiView monitor. By default, logs older than seven days are deleted. Disk logging must be enabled. <i>Disable</i>: Historical log data will not be available on FortiView.

Remote Logging and Archiving	
Send logs to FortiAnalyzer/FortiManager	<p>Define the status of remote logging to FortiAnalyzer and FortiManager:</p> <ul style="list-style-type: none"> <i>Enable</i>: Logs are sent to FortiAnalyzer or FortiManager for remote logging. HTTP transaction logs are also sent to a FortiAnalyzer unit to generate additional details in reports. <i>Disable</i>: Logs are stored to system memory, a local disk, or a Cloud logging device.
Server	Set the server IP address for the FortiAnalyzer or FortiManager. Use <i>Test Connectivity</i> to test the connection status to the server.
Connection status	<p>Displays authorization status on FortiAnalyzer:</p> <ul style="list-style-type: none"> <i>Successful</i>: The FortiGate is connected to the FortiAnalyzer. Remote logging to the FortiAnalyzer can be configured. <i>Unauthorized</i>: The FortiGate is not connected to the FortiAnalyzer. Click <i>Authorize</i> to review the approval status on FortiAnalyzer or see Configuring FortiAnalyzer on page 2371 for more information.
Storage usage	Presents the storage used and the total storage available on the remote logging device.
Analytics usage	Presents the analytics space used and the total analytics space available on the remote logging device.
Archives usage	Presents the archive space used and the total archive space available on the remote logging device.
Upload option	<p>Select the frequency of log uploads to the remote device:</p> <ul style="list-style-type: none"> <i>Real Time</i>: Logs are sent to the remote device in real time. <i>Every Minute</i>: Logs are sent to the remote device once every minute. This option is unavailable if the Security Fabric Connections is enabled. <i>Every 5 Minutes</i>: Logs are sent to the remote device once every five minutes. This is the default option. This option is unavailable if the Security Fabric Connection is enabled. <i>store-and-upload</i>: Store logs to a local disk before uploading to FortiAnalyzer or FortiManager at a scheduled time. This option is only available for CLI configuration.
Allow access to FortiGate REST API	<p>Define access to FortiGate REST API:</p> <ul style="list-style-type: none"> <i>Enable</i>: The REST API accesses the FortiGate topology and shares data and results. <i>Disable</i>: The REST API does not share data and results.
Verify FortiAnalyzer certificate	<p>Define the FortiAnalyzer certificate verification process:</p> <ul style="list-style-type: none"> <i>Enable</i>: The FortiGate will verify the FortiAnalyzer serial number against the FortiAnalyzer certificate. When verified, the serial number is stored in the FortiGate configuration. <i>Disable</i>: The FortiGate will not verify the FortiAnalyzer certificate against the serial number.

Cloud Logging Settings	
Type	Specify remote logging to the FortiGate Cloud or FortiAnalyzer Cloud device. If multiple devices are enabled, the default preference is FortiAnalyzer Cloud.
Connection status	Displays the current connection status to the selected <i>Type</i> . Use <i>Test Connectivity</i> to test the connection status to the Cloud logging device.
Upload option	Select the frequency of log uploads to the Cloud device: <ul style="list-style-type: none"> • <i>Real Time</i>: Logs are sent to the Cloud device in real time. • <i>Every Minute</i>: Logs are sent to the Cloud device once every minute. This option is unavailable if the Security Fabric Connection is enabled. • <i>Every 5 Minutes</i>: Logs are sent to the Cloud device once every five minutes. This is the default option. This option is unavailable if the Security Fabric Connection is enabled.
Allow access to FortiGate REST API	Define access to FortiGate REST API: <ul style="list-style-type: none"> • <i>Enable</i>: The REST API accesses the FortiGate topology and shares data and results. • <i>Disable</i>: The REST API does not share data and results.
Verify FortiAnalyzer Cloud certificate	Define the FortiAnalyzer Cloud certificate verification process: <ul style="list-style-type: none"> • <i>Enable</i>: The FortiGate will verify the FortiAnalyzer serial number against the FortiAnalyzer certificate. When verified, the serial number is stored in the FortiGate configuration. • <i>Disable</i>: The FortiGate will not verify the FortiAnalyzer certificate against the serial number.
UUIDs in Traffic Log	
Policy	Define the use of policy UUIDs in traffic logs: <ul style="list-style-type: none"> • <i>Enable</i>: Policy UUIDs are stored in traffic logs. UUIDs can be matched for each source and destination that match a policy in the traffic log. See Source and destination UUID logging on page 2754 for more information. • <i>Disable</i>: Policy UUIDs are excluded from the traffic logs.
Address	Define the use of address UUIDs in traffic logs: <ul style="list-style-type: none"> • <i>Enable</i>: Address UUIDs are stored in traffic logs. When viewing <i>Forward Traffic</i> logs, a filter is automatically set based on UUID. • <i>Disable</i>: Address UUIDs are excluded from traffic logs.
Log Settings	
Event Logging	Define the allowed set of event logs to be recorded: <ul style="list-style-type: none"> • <i>All</i>: All event logs will be recorded. • <i>Customize</i>: Select specific event log types to be recorded. Deselect all options to disable event logging.
Local Traffic Log	Define the allowed set of traffic logs to be recorded:

- *All*: All traffic logs to and from the FortiGate will be recorded.
- *Customize*: Select specific traffic logs to be recorded. Deselect all options to disable traffic logging. Local traffic logging is disabled by default due to the high volume of logs generated.

GUI Preferences

Resolve Hostnames

Define the translation of IP addresses to host names:

- *Enable*: IP addresses are translated to host names using reverse DNS lookup. If the DNS server is not available or is slow to reply, requests may time out.
- *Disable*: IP addresses are not translated to host names.

Resolve Unknown Applications

Define the resolution of unknown applications:

- *Enable*: Unknown applications are resolved using the Internet Service Database.
- *Disable*: Unknown applications are not resolved.

Configuring logs in the CLI

The FortiGate can store logs locally to its system memory or a local disk. Logs can also be stored externally on a storage device, such as FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, or a syslog server.

Disk logging

Disk logging must be enabled for logs to be stored locally on the FortiGate. By default, logs older than seven days are deleted from the disk. Log age can be configured in the CLI. Approximately 75% of disk space is available for log storage. Log storage space can be determined using the `diagnose sys logdisk usage` command.

To configure local disk logging:

```
config log disk setting
    set status enable
    set maximum-log-age <integer>
    set max-log-file-size <integer>
end
```

Remote logging

The process to configure FortiGate to send logs to FortiAnalyzer or FortiManager is identical. Remote logging to FortiAnalyzer and FortiManager can be configured using both the GUI and CLI. When using the CLI, use the `config log fortianalyzer setting` command for both FortiAnalyzer and FortiManager.

If VDOMs are configured on the FortiGate, multiple FortiAnalyzers and syslog servers can be added globally. See [Configuring multiple FortiAnalyzers \(or syslog servers\) per VDOM on page 2753](#) and [Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode on page 2750](#) for more information.

To configure remote logging to FortiAnalyzer:

```
config log fortianalyzer setting
    set status enable
    set server <server_IP>
    set upload option {store-and-upload | realtime | 1-minute | 5-minute}
end
```

Remote logging can also be configured to FortiCloud, FortiSIEM, and syslog servers. Up to four syslog servers or FortiSIEM devices can be configured using the `config log syslogd` command and can send logs to syslog in CSV and CEF formats.

To configure remote logging to FortiCloud:

```
config log fortiguard setting
    set status enable
    set source-ip <source IP used to connect FortiCloud>
end
```

To configure remote logging to a syslog server:

```
config log syslogd setting
    set status enable
    set server <syslog_IP>
    set format {default | cev | cef}
end
```

Log filters

Log filter settings can be configured to determine which logs are recorded to the FortiAnalyzer, FortiManager, and syslog servers. This allows certain logging levels and types of logs to be directed to specific log devices.

To configure log filters for FortiAnalyzer:

```
config log fortianalyzer filter
    set severity <level>
    set forward-traffic {enable | disable}
    set local-traffic {enable | disable}
    set multicast-traffic {enable | disable}
    set sniffer-traffic {enable | disable}
end
```

To configure log filters for a syslog server:

```
config log syslogd filter
    set severity <level>
    set forward-traffic {enable | disable}
    set local-traffic {enable | disable}
    set multicast-traffic {enable | disable}
    set sniffer-traffic {enable | disable}
end
```

Email alerts

FortiGate events can be monitored at all times using email alerts. Email alerts send notifications to up to three recipients and can be triggered based on log event and severity level. Email alerts will be sent every five minutes by default but this can be configured in the CLI.

To configure email alerts:

```
config alertemail setting
  set username <name>
  set mailto1 <email>
  set filter-mode {category | threshold}
  set email-interval <integer>
  set IPS-logs {enable | disable}
  set HA-logs {enable | disable}
  set antivirus-logs {enable | disable}
  set webfilter-logs {enable | disable}
  set log-disk-usage-warning {enable | disable}
end
```

Sample logs by log type

This topic provides a sample raw log for each subtype and the configuration requirements.

Traffic Logs > Forward Traffic

Log configuration requirements

```
config firewall policy
  edit 1
    set srcintf "port12"
    set dstintf "port11"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set logtraffic all
    set application-list "g-default"
    set ssl-ssh-profile "certificate-inspection"
    set nat enable
  next
end
```

Sample log

```

Log buffer on FortiGates with an SSD disk

FortiGates with an SSD disk have a configurable log buffer. When the connection to FortiAnalyzer is unreachable, the FortiGate is able to buffer logs on disk if the memory log buffer is full. The logs queued on the disk buffer can be sent successfully once the connection to FortiAnalyzer is restored.

The number of logs queued on the disk buffer is visible in the *Log & Report > Log Settings* page:

The queued logs are buffered to the memory first and then disk. Main `miglogd` handles the disk buffering job, while `miglogd-children` handles the memory buffering. Disk buffer statistics only appear under Main `miglogd`, and memory buffer statistics only appears under `miglogd-children`. If the total buffer is full, new logs will overwrite the old logs.

To configure the log buffer:

1. Allocate disk space (MB) to temporarily store logs to FortiAnalyzer:

```
config system global
    set faz-disk-buffer-size 200
end
```

2. Check the Main `miglogd` and `miglogd-children` statistics. The 200 MB disk buffer has been set, and there are currently no logs buffered in memory or on disk when FortiAnalyzer is reachable:

```
# diagnose test application miglogd 41 0
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
```

```
VDOM:root
Queue for: global-faz
```

```
memory queue:
  num:0 size:0(0MB) max:101906636(97MB) logs:0
```

```
disk max queue size:200MB total:0MB
total items:0
disk queue agents:
  devid:-1-10-0-1
  buffer path:/var/log/qbuf/10.0/1
  saved size:0MB cached size:0
  save roll:0 restore roll:0
  restore id:0 space:0MB
```

```
# diagnose test application miglogd 41 1
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz
```

```
memory queue:
  num:0 size:0(0MB) max:101906636(97MB) logs:0
```

```
disk queue client:
  devid:-1-10-0-1 status:buffering
  Total in cache:0 size:0(0MB) max:4MB logs:0
```

3. Disable the connection between the FortiGate and FortiAnalyzer. For example, delete the FortiGate from the FortiAnalyzer authorized device list.

Assuming a massive number of logs (~ 300000) are recorded during this downtime, the logs will be queued in the memory buffer first. If the memory buffer is full, then the remaining logs will be queued on the disk buffer.

4. Check the Main miglogd and miglogd-children statistics again. All 97 MB of the memory buffer is occupied, and 76 of the 200 MB has been taken from the disk buffer:

```
# diagnose test application miglogd 41 0
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz
```

```
memory queue:
  num:0 size:0(0MB) max:101906636(97MB) logs:0
```

```
disk max queue size:200MB total:76MB
total items:128917
disk queue agents:
  devid:-1-10-0-1
  buffer path:/var/log/qbuf/10.0/1
  saved size:76MB cached size:3324984
  save roll:19 restore roll:0
  restore id:0 space:0MB
```

```
# diagnose test application miglogd 41 1
cache maximum: 106100940(101MB) objects: 165721 used: 101908358(97MB) allocated:
106449280(101MB)
VDOM:root
Queue for: global-faz
```

```
memory queue:
  num:165718 size:101906500(97MB) max:101906636(97MB) logs:165718
```

```
disk queue client:
  devid:-1-10-0-1 status:restoring
  restore id:1267 space:0MB
  Total in cache:3 size:1858(0MB) max:4MB logs:3
```

The overall miglogd statistics shows the total cached logs is the sum of the logs buffered in memory and on disk:

```
# diagnose test application miglogd 6
mem=0, disk=11, alert=0, alarm=0, sys=0, faz=300053, faz-cloud=0, webt=0, fds=0
interface-missed=44
Queues in all miglogds: cur:165718 total-so-far:165718
global log dev statistics:
faz 0: sent=0, failed=0, cached=300053, dropped=0 , relayed=0
Num of REST URLs: 0
```

5. Enable the connection between FortiAnalyzer and the FortiGate.

6. After a while, check the miglogd statistics to confirm that all buffered logs are being sent to FortiAnalyzer successfully:

```
# diagnose test application miglogd 6
mem=0, disk=11, alert=0, alarm=0, sys=0, faz=300058, faz-cloud=0, webt=0, fds=0
interface-missed=44

Checking the email filter log

To check the email filter log in the GUI:

1. Go to *Log & Report > Anti-Spam*.

To check the email filter log in the CLI:

```
# execute log filter category 5

# execute log display
1 logs found.
1 logs returned.

1: date=2019-04-09 time=03:41:18 logid="0510020491" type="utm" subtype="emailfilter"
eventtype="imap" level="notice" vd="vdom1" eventtime=1554806478647415130 policyid=1
sessionid=439 srcip=10.1.100.22 srcport=39937 srcintf="port21" srcintfrole="undefined"
dstip=172.16.200.45 dstport=143 dstintf="port17" dstintfrole="undefined" proto=6
service="IMAPS" profile="822881" action="blocked" from="testpc3@qa.fortinet.com"

```

Supported log types to FortiAnalyzer, FortiAnalyzer Cloud, FortiGate Cloud, and syslog

FortiGate supports sending logs of all log types to FortiAnalyzer, FortiGate Cloud, and Syslog. For FortiGates with a standard FortiAnalyzer Cloud subscription (FAZC contract), traffic logs are not sent to FortiAnalyzer Cloud; for FortiGates with a Premium subscription (AFAC contract), all logs are sent.

Sending traffic logs to FortiAnalyzer Cloud

FortiGates with a FortiCloud Premium subscription (AFAC) for Cloud-based Central Logging & Analytics, can send traffic logs to FortiAnalyzer Cloud in addition to UTM logs and event logs. After the Premium subscription is registered through FortiCare, FortiGuard will verify the purchase and authorize the AFAC contract. Once the contract is verified, FortiGuard will deliver the contract to FortiGate.

FortiGates with a Standard FortiAnalyzer Cloud subscription (FAZC) can only send UTM and event logs. FortiGates with a Premium subscription will send the UTM and event logs even if the Standard subscription has expired.

FortiAnalyzer Cloud does not support DLP/IPS archives at this time.

Example

In the following example, you will configure a FortiGate with a valid Premium subscription (AFAC) and expired Standard subscription (FAZC) to send traffic logs to FortiAnalyzer Cloud.

1. Configure the log delivery.

```
config log fortianalyzer-cloud setting
  set status enable
  set ips-archive disable
  set access-config enable
  set enc-algorithm high
  set ssl-min-proto-version default
  set conn-timeout 10
  set monitor-keepalive-period 5
  set monitor-failure-retry-period 5
  set certificate ''
  set source-ip ''
  set interface-select-method auto
  set upload-option realtime
  set priority default
  set max-log-rate 0
end
```

2. Verify the status of the FortiCloud Premium subscription (AFAC) and standard FortiAnalyzer Cloud subscription (FAZC).

The **FAZC** and **AFAC** fields display the subscription expiration date. The **Support contract** field displays the FortiCare account information. The **User ID** field displays the ID for FortiAnalyzer-Cloud instance.

```
# diagnose test update info
...
FAZC, Tue Sep 24 16:00:00 2030
AFAC, Mon Nov 29 16:00:00 2021
...
Support contract: pending_registration=255 got_contract_info=1
account_id=[****@fortinet.com] company=[Fortinet] industry=[Technology]
User ID: 979090
```

The **FAZC** and **AFAC** subscriptions are valid (date of verification is November 29, 2020).

3. Check the status of FortiAnalyzer Cloud.

```
# execute log fortianalyzer-cloud test-connectivity
FortiAnalyzer Host Name: FAZVM64-VIO-CLOUD
FortiAnalyzer Adom Name: root
FortiGate Device ID: FG101FTK19000000
Registration: registered
Connection: allow
Adom Disk Space (Used/Allocated): 50351453B/53687091200B
Analytics Usage (Used/Allocated): 41368925B/37580963840B
Analytics Usage (Data Policy Days Actual/Configured): 60/60 Days
Archive Usage (Used/Allocated): 8982528B/16106127360B
Archive Usage (Data Policy Days Actual/Configured): 235/365 Days
Log: Tx & Rx (log not received)
IPS Packet Log: Tx & Rx
Content Archive: Tx & Rx
Quarantine: Tx & Rx
Certificate of Fortianalyzer valid and serial number is:FAZVCLTM20000000
```

4. When the FortiCloud Premium (AFAC) and standard FortiAnalyzer Cloud (FAZC) subscriptions are valid, the FortiGate sends the traffic, event, and UTM logs to the remote FortiAnalyzer Cloud.

5. When the FortiGate has a valid Premium FortiCloud subscription (AFAC) and an expired Standard FortiCloud subscription (FAZC), the FortiGate still sends the logs to the remote FortiAnalyzer Cloud.

Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode

This topic shows a sample configuration of multiple FortiAnalyzers on a FortiGate in multi-VDOM mode.

In this example:

- The FortiGate has three VDOMs:
 - Root (management VDOM)
 - VDOM1
 - VDOM2
- There are four FortiAnalyzers.
These IP addresses are used as examples in the instructions below.
 - FAZ1: 172.16.200.55
 - FAZ2: 172.18.60.25
 - FAZ3: 192.168.1.253
 - FAZ4: 192.168.1.254
- Set up FAZ1 and FAZ2 under global.
 - These two collect logs from the root VDOM and VDOM2.
 - FAZ1 and FAZ2 must be accessible from management VDOM root.
- Set up FAZ3 and FAZ4 under VDOM1.
 - These two collect logs from VDOM1.
 - FAZ3 and FAZ4 must be accessible from VDOM1.

To set up FAZ1 as global FortiAnalyzer 1 from the GUI:

Prerequisite: FAZ1 must be reachable from the management root VDOM.

1. Go to *Global > Log & Report > Log Settings*.
2. Enable *Send logs to FortiAnalyzer/FortiManager*.

3. Enter the FortiAnalyzer IP.
In this example: 172.16.200.55.
4. For *Upload option*, select *Real Time*.
5. Click *Apply*.

To set up FAZ2 as global FortiAnalyzer 2 from the CLI:

Prerequisite: FAZ2 must be reachable from the management root VDOM.

```
config log fortianalyzer2 setting
    set status enable
    set server "172.18.60.25"
    set upload-option realtime
end
```

To set up FAZ3 and FAZ4 as VDOM1 FortiAnalyzer 1 and FortiAnalyzer 2:

Prerequisite: FAZ3 and FAZ4 must be reachable from VDOM1.

```
config log setting
    set faz-override enable
end

config log fortianalyzer override-setting
    set status enable
    set server "192.168.1.253"
    set upload-option realtime
end

config log fortianalyzer2 override-setting
    set status enable
    set server "192.168.1.254"
    set upload-option realtime
end
```

Checking FortiAnalyzer connectivity

To use the diagnose command to check FortiAnalyzer connectivity:

1. Check the global FortiAnalyzer status:

```
FGTA(global) # diagnose test application miglogd 1
faz: global , enabled
    server=172.16.200.55, realtime=3, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_172.16.200.55, reliable=1
    status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
    SNs: last sn update:1369 seconds ago.
        Sn list:

    queue: qlen=0.
filter: severity=6, sz_exclude_list=0
    voip dns ssh ssl
subcategory:
```

```

traffic: forward local multicast sniffer
anomaly: anomaly

server: global, id=0, fd=90, ready=1, ipv6=0, 172.16.200.55/514
oftp-state=5
faz2: global , enabled
server=172.18.60.25, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_172.18.60.25, reliable=0
status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
SNs: last sn update:1369 seconds ago.
Sn list:

queue: qlen=0.
filter: severity=6, sz_exclude_list=0
voip dns ssh ssl
subcategory:
traffic: forward local multicast sniffer
anomaly: anomaly

server: global, id=1, fd=95, ready=1, ipv6=0, 172.18.60.25/514
oftp-state=5

```

2. Check the VDOM1 override FortiAnalyzer status:

```

FGTA(global) # diagnose test application miglogd 3101
faz: vdom, enabled, override
server=192.168.1.253, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_192.168.1.253, reliable=1
status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
SNs: last sn update:1369 seconds ago.
Sn list:
(FAZ-VM0000000001,age=17s)
queue: qlen=0.
filter: severity=6, sz_exclude_list=0
voip dns ssh ssl
subcategory:
traffic: forward local multicast sniffer
anomaly: anomaly

server: vdom, id=0, fd=72, ready=1, ipv6=0, 192.168.1.253/514
oftp-state=5
faz2: vdom, enabled, override
server=192.168.1.254, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_192.168.1.254, reliable=0
status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
SNs: last sn update:1369 seconds ago.
Sn list:
(FL-1KET3180000008,age=17s)
queue: qlen=0.
filter: severity=6, sz_exclude_list=0
voip dns ssh ssl
subcategory:
traffic: forward local multicast sniffer
anomaly: anomaly

```

```
server: vdom, id=1, fd=97, ready=1, ipv6=0, 192.168.1.254/514
offtp-state=5
faz3: vdom, disabled, override
```

Configuring multiple FortiAnalyzers (or syslog servers) per VDOM

In a VDOM, multiple FortiAnalyzer and syslog servers can be configured as follows:

- Up to three override FortiAnalyzer servers
- Up to four override syslog servers

If the VDOM `faz-override` and/or `syslog-override` setting is enabled or disabled (default) before upgrading, the setting remains the same after upgrading.

If the override setting is disabled, the GUI displays the global FortiAnalyzer1 or syslog1 setting. If the override setting is enabled, the GUI displays the VDOM override FortiAnalyzer1 or syslog1 setting.

You can only use CLI to enable the override to support multiple log servers.

To enable FortiAnalyzer and syslog server override under VDOM:

```
config log setting
  set faz-override enable
  set syslog-override enable
end
```

When `faz-override` and/or `syslog-override` is enabled, the following CLI commands are available for configuring VDOM override:

To configure VDOM override for FortiAnalyzer:

1. Configure the FortiAnalyzer override settings:

```
config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-setting
  set status enable
  set server "123.12.123.123"
  set reliable enable
end
```

2. Configure the override filters:

```
config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-filter
  set severity information
  set forward-traffic enable
  set local-traffic enable
  set multicast-traffic enable
  set sniffer-traffic enable
  set anomaly enable
  set voip enable
  set dlp-archive enable
  set dns enable
  set ssh enable
```

```
    set ssl enable
end
```

To configure VDOM override for a syslog server:

1. Configure the syslog override settings:

```
config log syslogd/syslogd2/syslogd3/syslogd4 override-setting
    set status enable
    set server "123.12.123.12"
    set facility local1
end
```

2. Configure the override filters:

```
config log syslogd/syslogd2/syslogd3/syslogd4 override-filter
    set severity information
    set forward-traffic enable
    set local-traffic enable
    set multicast-traffic enable
    set sniffer-traffic enable
    set anomaly enable
    set voip enable
    set dns enable
    set ssh enable
    set ssl enable
end
```

Source and destination UUID logging

The traffic log setting includes three UUID fields: Source UUID (srcuuid), Destination UUID (dstuuid), and Policy UUID (poluuid). It also includes two `internet-service` name fields: *Source Internet Service* (srcinetsvc) and *Destination Internet Service* (dstinetsvc).

Log UUIDs

All policy types have a UUID field that is auto-generated by FortiOS when the policy is created, and can be viewed in the CLI using the show command. For example:

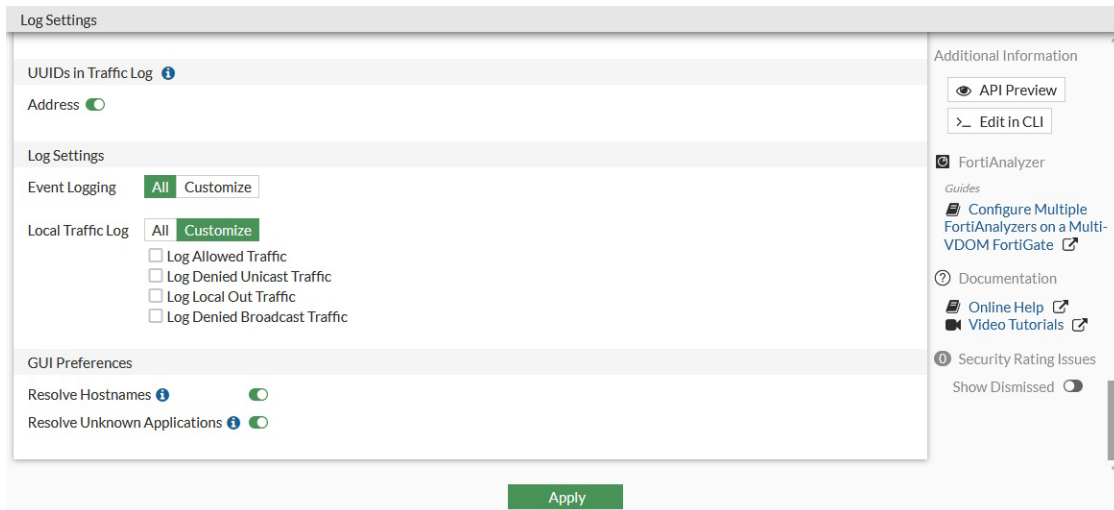

```
# show firewall policy 1
config firewall policy
    edit 1
        set name "client_yt_v4"
        set uuid f4fe48a4-938c-51ee-8856-3e84e3b24af4
        ...
    next
end
```

UUIDs can be matched for each source and destination that match a policy that is added to the traffic log. This allows the address objects to be referenced in log analysis and reporting.

As this may consume a significant amount of storage space, this feature is optional. By default, address UUID insertion is disabled.

To enable address and policy UUID insertion in traffic logs using the GUI:

1. Go to *Log & Report > Log Settings*.
2. Under *UUIDs in Traffic Log*, enable *Address*.

3. Click *Apply*.

To enable address and policy UUID insertion in traffic logs using the CLI:

```
config system global
    set log-uuid-address enable
end
```

Sample log

```
date=2019-01-25 time=11:32:55 logid="0000000013" type="traffic" subtype="forward"

```

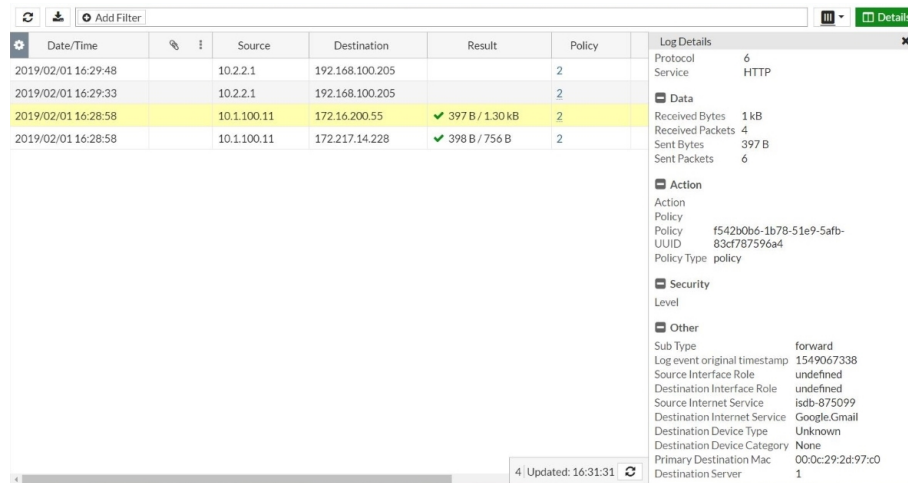

Internet service name fields

Traffic logs for `internet-service` include two fields: *Source Internet Service* and *Destination Internet Service*.

To view the internet service fields using the GUI:

1. Go to *Log & Report > Forward Traffic*.
2. Double-click on an entry to view the *Log Details*. The *Source Internet Service* and *Destination Internet Service* fields

are visible in the *Log Details* pane.

Logging the signal-to-noise ratio and signal strength per client

The signal-to-noise ratio (*snr*) and signal strength (*signal*) are logged per client in the WiFi event and traffic logs.

When a WiFi client connects to a tunnel or local-bridge mode SSID on an FortiAP that is managed by a FortiGate, signal-to-noise ratio and signal strength details are included in WiFi event logs for local-bridge traffic statistics and authentication, and in forward traffic logs for tunnel traffic. This allows you to store and view clients' historical signal strength and signal-to-noise ratio information.

To verify when a client is connecting to an SSID:

1. Go to *Log & Report > Events* and select *WiFi Events* from the events drop-down list.

The *Signal* and *Signal/Noise* columns show the signal strength and signal-to-noise ratio for each applicable client.

Date/Time	Level	Action	Message	SSID	Channel	Signal	Signal/Noise

```

To verify tunnel traffic when a client is connecting to a tunnel mode SSID:

1. Go to *Log & Report > Forward Traffic*.

The *Signal* and *Signal/Noise* columns show the signal strength and signal-to-noise ratio for each applicable client.

stamac="00:1e:e5:df:b1:63" signal=-53 snr=52 sentbyte=8970016 rcvdbyte=985910
nextstat=300 action="sta-wl-bridge-traffic-stats" msg="Traffic stats for bridge ssid
client 00:1e:e5:df:b1:63"
```

RSSO information for authenticated destination users in logs

FortiGate can use RSSO accounting information from authenticated RSSO users to populate destination users and groups, along with source users and groups.

RSSO user login information can be forwarded by the RADIUS server to the FortiGate that is listening for incoming RADIUS accounting start messages on the RADIUS accounting port. Accounting start messages usually contain the IP address, user name, and user group information. FortiGate uses this information in traffic logs, which include *dstuser* and *dstgroup* fields for user and group destination information .

For instructions on configuring RSSO, see [RADIUS single sign-on agent on page 2665](#).

The three following scenarios show traffic between pc1 and the internet, and pc1 and pc2.

Scenario 1

In this scenario, RSSO user *test2* in group *rsso-grp1* is authenticated on pc1. Traffic flows from pc1 to the internet.

Expected result:

In the logs, user *test2* is shown as the source user in the *rsso-grp1* group.

To verify the results:

1. In the GUI, go to *Log & Report > Forward Traffic* and view the details of an entry with *test2* as the source.
2. In the *Source* section, *User* is *test2* and *Group* is the *rsso-grp1*.

```

Scenario 2

In this scenario, RSSO user *test2* is authenticated on pc1. Traffic is initialized on pc2 (172.16.200.185) going to pc1 (10.1.100.188).

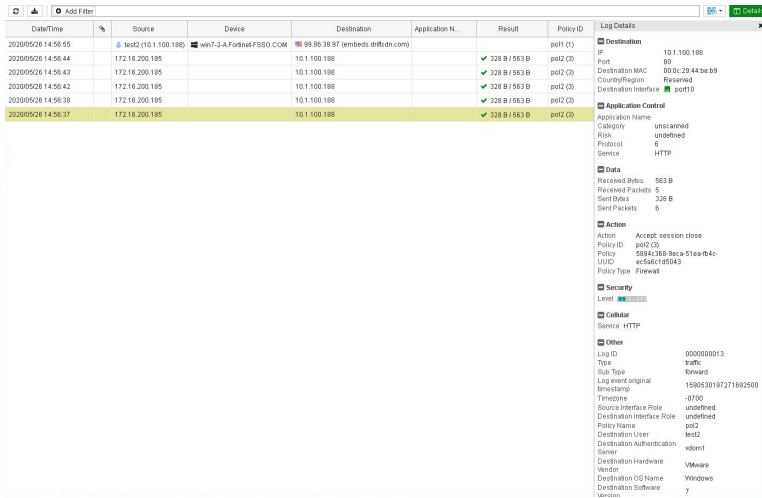

Expected result:

In the logs, user *test2* is shown as the destination user (*dstuser*). No destination group (*dstgroup*) is logged because no RSSO user is logged in on pc2, so the traffic from pc2 is unauthenticated.

To verify the results:

1. In the GUI, go to *Log & Report > Forward Traffic* and view the details of an entry with 172.16.200.185 (pc2) as the source.

2. In the *Other* section, *Destination User* is *test2* and no destination group is shown.

3. The log message shows the destination user:

```
1: date=2020-05-22 time=07:38:06 logid="000000020" type="traffic" subtype="forward"
level="notice" vd="root" eventtime=1590158286585506922 tz="-0700" srcip=172.16.200.185
identifier=1 srcintf="port9" srcintfrole="undefined" dstip=10.1.100.188 dstintf="port10"

proto=1 action="accept" policyid=3 policytype="policy" poluuid="d4f18e1e-9c36-51ea-6ec0-
3a354d5910ee" policyname="pol2" dstuser="test2" dstauthserver="root" service="PING"
trandisp="snat" transip=10.1.100.1 transport=0 duration=128 sentbyte=7620 rcvdbyte=5220
sentpkt=127 rcvdpkt=87 appcat="unscanned" sentdelta=7620 rcvddelta=5220
```

Scenario 3

In this scenario, RSSO user *test2* in group *rsso-grp1* is authenticated on pc1, and user *test3* in group *rsso-grp2* is authenticated on pc2. Traffic flows from pc2 to pc1.

Expected result:

In the logs, user *test3* is shown as the source user in the *rsso-grp1* group. User *test2* is shown as destination user (*dstuser*) in the *rsso-grp1* destination group (*dstgroup*). The destination group is logged because an RSSO user is logged in to pc2.

To verify the results:

1. In the GUI, go to *Log & Report > Forward Traffic* and view the details of an entry with 172.16.200.185 (pc2) as the source.
2. In the *Source* section, *User* is *test3* and *Group* is the *rsso-grp2*. In the *Other* section, *Destination User* is *test2* and *Destination Group* is *rsso-grp1*.

```

Destination user information in UTM logs

The `dstuser` field in UTM logs records the username of a destination device when that user has been authenticated on the FortiGate.

Examples

In the following topology, the user, bob, is authenticated on a client computer. The user, guest, is authenticated on the server. Log are collected for AV and IPS in flow inspection mode. Logs are collected for application control and web filter in proxy mode.

To configure the RADIUS user and user groups:

1. Configure the RADIUS server:

```
config user radius
  edit "Ubuntu_docker"
    set server "172.16.200.240"
    set secret *****
  next
end
```

2. Configure the local user:

```
config user local
  edit "guest"
    set type password
    set passwd *****
  next
end
```

3. Configure the RADIUS user groups:

```
config user group
  edit "RADIUS_User_Group"
    set member "Ubuntu_docker"
  next
  edit "Local_User"
    set member "guest"
  next
end
```

Flow inspection mode

To verify AV and IPS logs in flow mode:

1. Configure the firewall policies:

```
config firewall policy
  edit 1
    set name "WAN_out"
    set srcintf "dmz"
    set dstintf "wan1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set ssl-ssh-profile "deep-inspection"
    set av-profile "g-default"
    set ips-sensor "sensor-11"
    set nat enable
    set groups "RADIUS_User_Group" "Local_User"
  next
  edit 3
    set name "WAN_in"
    set srcintf "wan1"
    set dstintf "dmz"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set logtraffic all
    set nat enable
    set groups "RADIUS_User_Group" "Local_User"
  next
end
```

2. Verify the AV log:

```
date=2021-09-14 time=16:37:25 eventtime=1631662646131356720 tz="-0700"
logid="0211008192" type="utm" subtype="virus" eventtype="infected" level="warning"
vd="vdom1" policyid=1 msg="File is infected." action="blocked" service="HTTP"

C9QQUNLRVQ+"

```

Proxy inspection mode

To verify application control and web filter logs in proxy mode:

1. Configure the firewall policies:

```

config firewall policy
  edit 1
    set name "WAN_out"
    set srcintf "dmz"
    set dstintf "wan1"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set inspection-mode proxy
    set ssl-ssh-profile "deep-inspection"
    set av-profile "g-default"
    set application-list "g-default"
    set webfilter-profile "1"
    set nat enable
    set groups "RADIUS_User_Group" "Local_User"
  next
  edit 3
    set name "WAN_in"
    set srcintf "wan1"
    set dstintf "dmz"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
    set service "ALL"
    set inspection-mode proxy
    set logtraffic all
    set nat enable
    set groups "RADIUS_User_Group" "Local_User"
  next
end

```

2. Verify the application control log:

```
date=2021-09-14 time=17:05:45 eventtime=1631664345570951500 tz="-0700"  
logid="1059028704" type="utm" subtype="app-ctrl" eventtype="signature"  
level="information" vd="vdom1" appid=38783 user="bob" group="RADIUS_User_Group"  
authserver="Ubuntu_docker" dstuser="guest" srcip=10.1.100.72 dstip=172.16.200.75  
srcport=60098 dstport=80 srcintf="dmz" srcintfrole="undefined" dstintf="wan1"  
dstintfrole="undefined" proto=6 service="HTTP" direction="outgoing" policyid=1  
sessionid=10871 applist="g-default" action="pass" appcat="General.Interest" app="Wget"  
hostname="172.16.200.75" incidentserialno=17825796 url="/eicar.com"  
msg="General.Interest: Wget," apprisk="low"
```

3. Verify the web filter log:

```
date=2021-09-14 time=17:14:46 eventtime=1631664886585770420 tz="-0700"  
logid="0315012546" type="utm" subtype="webfilter" eventtype="urlfilter"  
level="information" vd="vdom1" urlfilteridx=1 urlfilterlist="Auto-webfilter-urlfilter_  
caex0oj15" policyid=1 sessionid=15251 user="bob" group="RADIUS_User_Group"  
authserver="Ubuntu_docker" dstuser="guest" srcip=10.1.100.72 srcport=60106 srcintf="dmz"

rcvdbyte=0 direction="outgoing" msg="URL was allowed because it is in the URL filter  
list"
```

Threat weight

Threat weight helps aggregate and score threats based on user-defined severity levels. It adds several fields such as threat level (`crlevel`), threat score (`crscore`), and threat type (`craction`) to traffic logs. Threat weight logging is enabled by default and the settings can be customized. Threats can be viewed from the *Top Threats* FortiView dashboard.

To configure threat weight settings:

1. Go to *Log & Report > Threat Weight*.
2. Adjust the settings as needed, such as individual weights per threat type and risk level values.
3. Click *Apply*.

To add the Top Threats monitor to the dashboard:

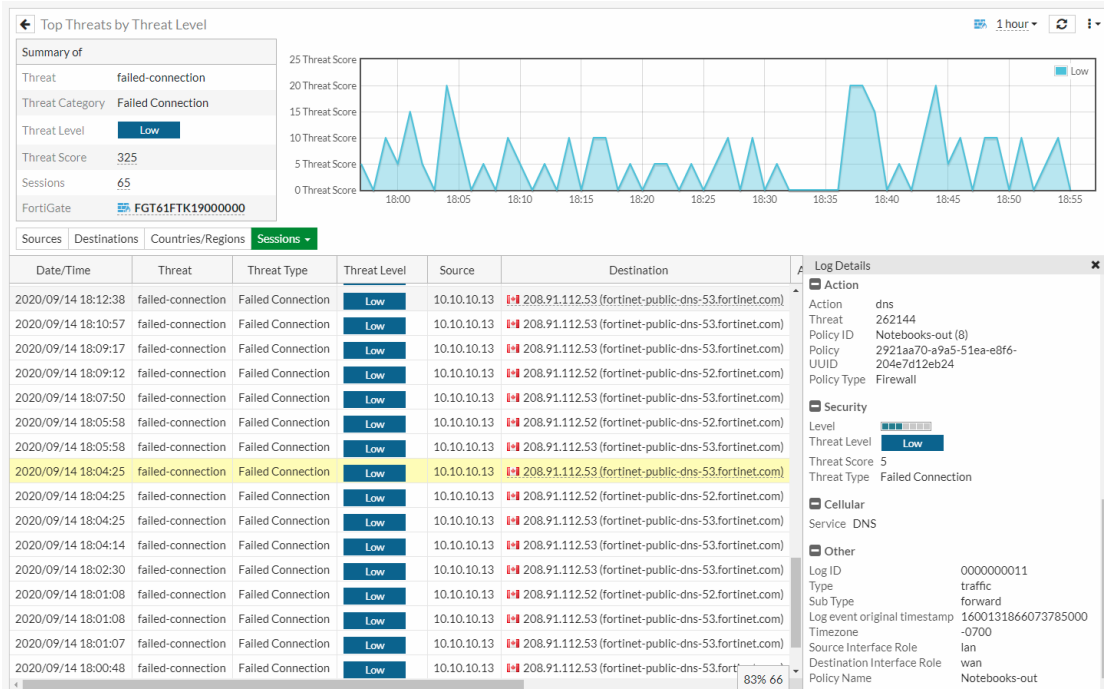

1. In the tree menu, click *Dashboard* and in the FortiView section, click the + sign (*Add Monitor*).
2. In the *Security* section, enable *Show More* and click *Top Threats*.
3. Configure the settings as needed.
4. Click *Add Monitor*.

5. Go to *Dashboard > Top Threats*. The *Top Threats* monitor displays threats based on the scores in the traffic logs.

6. Double-click a threat to view the summary.

7. Click *Sources*, *Destinations*, *Countries/Regions*, or *Sessions* to view more information. Double-click an entry to view the log details.

Logs for the execution of CLI commands

The `cli-audit-log` option records the execution of CLI commands in system event logs (log ID 44548). In addition to `execute` and `config` commands, `show`, `get`, and `diagnose` commands are recorded in the system event logs.

The `cli-audit-log` data can be recorded on memory or disk, and can be uploaded to FortiAnalyzer, FortiGate Cloud, or a syslog server.

To enable the CLI audit log option:

```
config system global
    set cli-audit-log enable
end
```

To view system event logs in the GUI:

1. Run the command in the CLI (# show log fortianalyzer setting).
2. Go to *Log & Report > Events > System Events*.
3. In the log location dropdown, select *Memory*.
4. Select the log entry and click *Details*.

```

Configuring and debugging the free-style filter

Free-style filters allow users to define a filter for logs that are captured to each individual logging device type. Filters can include log categories and specific log fields. The filters can be created as an inclusive list or exclusive list.

Free-style filters can also be used to filter logs that have been captured on logging devices already to narrow down the list of logs to view.

```
config log syslogd filter
  config free-style
    edit <id>
      set category <option>
      set filter <string>
      set filter-type {include | exclude}
    next
  end
end
```

category <option>	Set the log category. The following options are available: traffic, event, virus, webfilter, attack, spam, anomaly, voip, dlp, app-ctrl, waf, dns, ssh, ssl, file-filter, icap, and ztna.
filter <string>	Enter the filter criteria. Multiple values can be added, for example: set filter "logid <id> <id>"
filter-type {include exclude}	Include/exclude logs that match the filter.

Use the following commands to view the results when multiple fields are used:

```
# execute log filter free-style "logid <id> <id>"
# execute log filter free-style "srcip <IP_address> <IP_address>"
# execute log filter free-style "(logid <id>) or (srcip <IP_address> <IP_address>)"
# execute log filter free-style "(srcip <IP_address>) and (dstip <IP_address>)"
```

In this example, the free-style filter is set to filter log IDs 0102043039 and 0102043040. The source IPs, 192.168.2.5 and 192.168.2.205, are also checked.

To configure the syslogd free-style filter with multiple values:

```
config log syslogd filter
  config free-style
    edit 1
      set category event
      set filter "logid 0102043039 0102043040"
    next
  end
end
```

To view the syslogd free-style filter results:

```
# execute log filter free-style "logid 0102043039 0102043040"
# execute log filter dump
```

```
category: event
device: disk
start-line: 1
view-lines: 10
max-checklines: 0
HA member:
log search mode: on-demand
pre-fetch-pages: 2
Filter: logid 0102043039 0102043040
Oftp search string: (and (or logid=="0102043039" not-exact logid=="0102043040" not-exact))

# execute log filter free-style "(logid 0102043039) or (srcip 192.168.2.5 192.168.2.205)"
# execute log filter dump
category: event
device: disk
start-line: 1
view-lines: 10
max-checklines: 0
HA member:
log search mode: on-demand
pre-fetch-pages: 2
Filter: (logid 0102043039) or (srcip 192.168.2.5 192.168.2.205)
Oftp search string: (or (or (or srcip==192.168.2.5) (or srcip==192.168.2.205)) (or
logid=="0102043039" not-exact))
```

Troubleshooting

The following topics provide information about troubleshooting logging and reporting:

- [Log-related diagnose commands on page 2770](#)
- [Backing up log files or dumping log messages on page 2776](#)
- [SNMP OID for logs that failed to send on page 2778](#)

Log-related diagnose commands

This topic shows commonly used examples of log-related diagnose commands.

Use the following diagnose commands to identify log issues:

- The following commands enable debugging log daemon (`miglogd`) at the proper debug level:

```
diagnose debug application miglogd x
diagnose debug enable
```

- The following commands display different status/statistics of `miglogd` at the proper level:

```
diagnose test application miglogd x
diagnose debug enable
```

To get the list of available levels, press `Enter` after `diagnose test/debug application miglogd`. The following are some examples of commonly use levels.

If the debug log display does not return correct entries when log filter is set:

```
diagnose debug application miglogd 0x1000
```

For example, use the following command to display all login system event logs:

```
execute log filter device disk
execute log filter category event
execute log filter field action login
```

```
execute log display
```

Files to be searched:

```
file_no=65523, start_line=0, end_line=237
file_no=65524, start_line=0, end_line=429
file_no=65525, start_line=0, end_line=411
file_no=65526, start_line=0, end_line=381
file_no=65527, start_line=0, end_line=395
file_no=65528, start_line=0, end_line=458
file_no=65529, start_line=0, end_line=604

ID=1, total=3697, checked=3697, found=114
```

You can check and/or debug the FortiGate to FortiAnalyzer connection status.

To show connect status with detailed information:

```
diagnose test application miglogd 1
```

```
faz: global , enabled
server=172.18.64.234, realtime=3, ssl=1, state=connected, src=, mgmt_name=FGh_Log_
vdom1_172.18.64.234, reliable=0, sni_prefix_type=none, required_entitlement=none
status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
SNs: last sn update:107 seconds ago.
Sn list:
(FL-8HFT718900132,age=107s)
queue: qlen=0.
filter: severity=6, sz_exclude_list=0
voip dns ssh ssl cifs
subcategory:
traffic: forward local multicast sniffer
anomaly: anomaly

server: global, id=0, fd=132, ready=1, ipv6=0, 172.18.64.234/514
oftp-state=5
```

To collect debug information when FortiAnalyzer is enabled:

```
diagnose debug application miglogd 0x100
```

```

To check log statistics to the local/remote log device since the miglogd daemon start:

```
diagnose test application miglogd 6 1 <<< 1 means the first child daemon
diagnose test application miglogd 6 2 <<< 2 means the second child daemon
```

```
FGT-B-LOG (global) # diagnose test application miglogd 6 1
mem=4288, disk=4070, alert=0, alarm=0, sys=5513, faz=4307, webt=0, fds=0
interface-missed=208
Queues in all miglogds: cur:0 total-so-far:36974
global log dev statistics:
syslog 0: sent=6585, failed=152, relayed=0
faz 0: sent=13, failed=0, cached=0, dropped=0, relayed=0
```

To check the miglogd daemon number and increase/decrease miglogd daemon:

```
diagnose test application miglogd 15 <<< Show miglog ID
diagnose test application miglogd 13 <<< Increase one miglogd child
diagnose test application miglogd 14 <<< Decrease one miglogd child
```

```
FGT-B-LOG (global) # diagnose test application miglogd 15
Main miglogd: ID=0, children=2, active-children=2
ID=1, duration=70465.
ID=2, duration=70465.
```

```
FGT-B-LOG (global) # diagnose test application miglogd 13
```

```
FGT-B-LOG (global) # diagnose test application miglogd 15
Main miglogd: ID=0, children=3, active-children=3
ID=1, duration=70486.
```

```
ID=2, duration=70486.  
ID=3, duration=1.
```

```
FGT-B-LOG (global) # diagnose test application miglogd 14
```

```
FGT-B-LOG (global) # diagnose test application miglogd 15
```

```

```

```
ID=1, duration=70604.
```

```
ID=2, duration=70604.
```

To check the remote queue and see the maximum buffered memory size:

```
diagnose test application miglogd 41
```

```
cache maximum: 105405644(100MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
```

```
VDOM:root
```

```
Queue for: global-faz
```

```
memory queue:
```

```
num:0 size:0(0MB) max:105405644(100MB) logs:0
```

```
Queue for: fds
```

```
memory queue:
```

```
num:0 size:0(0MB) max:97852620(93MB) logs:0
```

Backing up log files or dumping log messages

When a log issue is caused by a particular log message, it is very help to get logs from that FortiGate. This topic provides steps for using `execute log backup` or dumping log messages to a USB drive.

Backing up full logs using `execute log backup`

This command backs up all disk log files and is only available on FortiGates with an SSD disk.

Before running `execute log backup`, we recommend temporarily stopping `miglogd` and `reportd`.

To stop and kill `miglogd` and `reportd`:

```
diagnose sys process daemon-auto-restart disable miglogd
```

```
diagnose sys process daemon-auto-restart disable reportd
```

Or

1. Determine the process, or thread, ID (PID) of `miglogd` and `reportd`:

```
# diagnose sys top 10 99
```

2. Kill each process:

```
# diagnose sys kill 9 <PID>
```

To store the log file on a USB drive:

1. Plug in a USB drive into the FortiGate.
2. Run this command:

```
execute log backup /usb/log.tar
```

To restart miglogd and reportd:

```
diagnose sys process daemon-auto-restart enable miglogd  
diagnose sys process daemon-auto-restart enable reportd
```

Dumping log messages**To dump log messages:**

1. Enable log dumping for miglogd daemon:

```
(global) # diagnose test application miglogd 26 1  
miglogd(1) log dumping is enabled
```

2. Display all miglogd dumping status:

```
global) # diagnose test application miglogd 26 0 255  
miglogd(0) log dumping is disabled  
miglogd(1) log dumping is enabled  
miglogd(2) log dumping is disabled
```

```
(global) # diagnose test application miglogd 26 2  
miglogd(2) log dumping is enabled
```

```
(global) # diagnose test application miglogd 26 0  
miglogd(0) log dumping is enabled
```

```
(global) # diagnose test application miglogd 26 0 255  
miglogd(0) log dumping is enabled  
miglogd(1) log dumping is enabled  
miglogd(2) log dumping is enabled
```

3. Let the FortiGate run and collect log messages.
4. List the log dump files:

```
(global) # diagnose test application miglogd 33  
2019-04-17 15:50:02          20828      log-1-0.dat  
2019-04-17 15:48:31          4892      log-2-0.dat
```

5. Back up log dump files to the USB drive:

```
(global) # diagnose test application miglogd 34
```

```
Dumping file miglog1_index0.dat copied to USB disk OK.
```

```
Dumping file miglog2_index0.dat copied to USB disk OK.
```

6. Disable log dumping for miglogd daemon:

```
(global) # diagnose test application miglogd 26 0  
miglogd(0) log dumping is disabled
```

```
(global) # diagnose test application miglogd 26 1
miglogd(1) log dumping is disabled

(global) # diagnose test application miglogd 26 2

miglogd(0) log dumping is disabled
miglogd(1) log dumping is disabled
miglogd(2) log dumping is disabled
```

SNMP OID for logs that failed to send

When a syslog server encounters low-performance conditions and slows down to respond, the buffered syslog messages in the kernel might overflow after a certain number of retransmissions, causing the overflowed messages to be lost. OIDs track the lost messages or failed logs.

SNMP query OIDs include log statistics for global log devices:

- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDeviceNumber 1.3.6.1.4.1.12356.101.21.1.1
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEntryIndex 1.3.6.1.4.1.12356.101.21.2.1.1.1
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEnabled 1.3.6.1.4.1.12356.101.21.2.1.1.2
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceName 1.3.6.1.4.1.12356.101.21.2.1.1.3
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceSentCount 1.3.6.1.4.1.12356.101.21.2.1.1.4
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceRelayedCount 1.3.6.1.4.1.12356.101.21.2.1.1.5
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceCachedCount 1.3.6.1.4.1.12356.101.21.2.1.1.6
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceFailedCount 1.3.6.1.4.1.12356.101.21.2.1.1.7
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceDroppedCount 1.3.6.1.4.1.12356.101.21.2.1.1.8

Where:

- fgLogDeviceNumber is the number of devices in the table.
- fgLogDeviceEnabled is either 1 or 0, indicating whether the device is enabled.
- fgLogDeviceName is the name of the device.

A FortiGate connected to a syslog server or FortiAnalyzer generates statistics that can be seen using the `diagnose test application syslogd` command:

```
(global) # diagnose test application syslogd 4
syslog=437, nulldev=0, webtrends=0, localout_ioc=258, alarms=0
global log dev statistics:
syslog 0: sent=222, failed=0, cached=0, dropped=0
syslog 1: sent=215, failed=0, cached=0, dropped=0
syslog 2: sent=95, failed=0, cached=0, dropped=0
```

The same statistics are also available in snmpwalk/snmpget on the OID 1.3.6.1.4.1.12356.101.21.

```

FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.8 = Counter32: 0

```

To get the type of logging device that is attached to the FortiGate:

```

root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.3
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.0 = STRING: "syslog"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.1 = STRING: "syslog2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.2 = STRING: "syslog3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.3 = STRING: "syslog4"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.4 = STRING: "faz"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.5 = STRING: "faz2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.6 = STRING: "faz3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.7 = STRING: "webtrends"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.8 = STRING: "fds"

```

To get the present state of the logging device that is attached to the FortiGate:

```

root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.2
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.0 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.1 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.2 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.3 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.4 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.5 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.6 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.7 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.8 = INTEGER: 0

```

To get the failed log count value:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.7
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.0 = Counter32: 139
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.1 = Counter32: 139
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.2 = Counter32: 73
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.3 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.4 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.5 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.6 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.7 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.8 = Counter32: 0
```

WAN optimization

Many multi-location enterprise environments reduce costs and consolidate resources by centralizing applications or providing applications in the cloud. Applications that work fine on a local LAN, such as Windows File Sharing (CIFS), email exchange (MAPI), and many others, suffer from bandwidth limitations and latency issues when accessed over a WAN. This results in a loss of productivity and a perceived need for expensive network upgrades. WAN optimization reduces your network overhead and removes unnecessary traffic for a better overall performance experience and eliminates the need for costly WAN link upgrades between data centers and other expensive solutions for your network traffic growth.

FortiOS WAN optimization provides an inexpensive and comprehensive solution that maximizes your WAN performance and provides intelligent bandwidth management and unmatched consolidated security performance.

FortiOS includes license-free WAN optimization on most current FortiGate devices with internal storage that also support SSL offloading.

Features

The following features are available through WAN optimization:

Protocol optimization

Protocol optimization is effective for applications designed for the LAN that do not function well on low bandwidth, high latency networks. See [Protocol optimization on page 2790](#) for more information.

Byte caching

Byte caching improves caching by accelerating the transfer of similar, but not identical content. See [Byte caching on page 2790](#) for more information.

SSL offloading

SSL is used by many organizations to keep WAN communications private. WAN optimization utilizes the SSL offloading capabilities of the FortiGate FortiASIC hardware to accelerate SSL traffic across the WAN. The FortiGate unit handles SSL encryption and decryption for corporate servers providing SSL encrypted connections over the WAN. See [SSL Offloading on page 2786](#) for more information.

WAN optimization and HA

You can configure WAN optimization on a FortiGate HA cluster. See [HA on page 2794](#) for more information.

Secure tunneling

FortiOS WAN optimization supports secure SSL-encrypted tunnels between FortiGate units on the WAN. See [Secure tunneling on page 2788](#) for more information.

Prerequisites

FortiGate WAN optimization is proprietary to Fortinet Inc.. It will not work with other vendors' WAN optimization or offloading features.

Before you begin to configure WAN optimization, please go through the following steps:

1. To use WAN optimization, your FortiGate unit must support it and not all FortiGate units do. In general, your FortiGate unit must include a hard disk to support these features. See [Feature Platform Matrix](#).
2. If the physical FortiGate has only one hard disk, make sure it is selected for WAN optimization. See [Disk usage on page 2783](#) for more information.
3. For FortiGate-VM, ensure you create two virtual disks besides the boot disk for WAN optimization to work.
4. To be able to configure WAN optimization from the GUI you should begin by going to *System > Feature Visibility* and turning on *WAN Opt. & Cache*.
5. If you enable virtual domains (VDOMs) on the FortiGate unit, WAN optimization is available separately for each VDOM.

At this stage, the following installation and configuration conditions are assumed:

- For WAN optimization you have already successfully installed two or more FortiGate units at various locations across your WAN.
- You have administrative access to the GUI or CLI.
- The FortiGate units are integrated into your WAN or other networks.
- The system time, DNS settings, administrator password, and network interfaces have been configured.
- Firmware, FortiGuard Antivirus, and FortiGuard Antispam updates are completed.
- Your Fortinet products have been registered. Register your Fortinet Inc. products at the Fortinet Technical Support website, <https://support.fortinet.com>.

Disk usage

Both logging and WAN optimization use hard disk space to save data. In FortiOS, you cannot use the same hard disk for both WAN optimization and logging.

- If the FortiGate has one hard disk, then it can be used for either disk logging or WAN optimization, but not both. By default, the hard disk is used for disk logging.

Only physical FortiGate devices can switch between disk logging and WAN optimization in the case of a single hard disk. FortiGate-VM must have two virtual disks apart from the boot disk for WAN optimization to work.

- If the FortiGate has two hard disks, then one disk is always used for disk logging and the other disk is always used for WAN optimization.

On the FortiGate, go to *System > Settings > Disk Settings* to switch between *Local Log* and *WAN Optimization*.

You can also change disk usage from the CLI using the following command:

```
config system storage
  edit <name>
    set usage {log | wanopt}
    set wanopt-mode {mix | wanopt | webcache}
  next
end
```

Option	Description
wanopt-mode	<p>WAN optimization mode:</p> <ul style="list-style-type: none"> • <code>mix</code>: This is the default mode. • <code>wanopt</code>: Recommended if only the WANopt feature is enabled. • <code>webcache</code>: Recommended if only the webcache feature is enabled. <p>If only one of the two features is being used, using the applicable recommended mode will give a higher cache capacity and improve performance.</p>

Enabling WAN optimization affects more than just disk logging. The following table shows other features affected by the FortiGate disk configuration.

Feature	1 hard disk	2 hard disks
Logging	Not supported	Supported
Report/Historical FortiView	Not supported	Supported
Firewall Packet Capture (Policy Capture and Interface Capture)	Not supported	Supported
AV Quarantine	Not supported	Supported
IPS Packet Capture	Not supported	Supported
DLP Archive	Not supported	Supported
Sandbox DB & Results	FortiSandbox database and results are also stored on disk, but will not be affected by this feature.	
Remote Logging	Remote logging (including logging to FortiAnalyzer and Syslog servers) is not affected by this features.	

Changing the disk setting formats the disk, erases current data stored on the disk, and disables either disk logging or WAN optimization.

The following sections provide information about WAN optimization:

- [Overview on page 2785](#)
- [Example topologies on page 2796](#)

- [Configuration examples on page 2798](#)

Overview

The following topics provide an overview on WAN optimization:

- [Peers and authentication groups on page 2786](#)
- [Tunnels on page 2787](#)
- [Transparent mode on page 2789](#)
- [Protocol optimization on page 2790](#)
- [Cache service and video caching on page 2791](#)
- [Manual and active-passive on page 2792](#)
- [Monitoring performance on page 2793](#)
- [System and feature operation with WAN optimization on page 2793](#)
- [Best practices on page 2796](#)

Client/server architecture

Traffic across a WAN typically consists of clients on a client network communicating across a WAN with a remote server network. The clients do this by starting communication sessions from the client network across a WAN to the server network. When you have FortiGates on each end, you can optimize these sessions by adding a WAN optimization profile.

To use WAN optimization, the FortiGate units can operate in either NAT or transparent mode. The client-side and server-side FortiGate units do not have to be operating in the same mode. The client-side FortiGate unit is located between the client network and the WAN. The server-side FortiGate unit is located between the server network and the WAN.

WAN optimization profiles are only added to the client-side. The server-side FortiGate unit employs the WAN optimization settings set in the WAN optimization profile on the client-side FortiGate unit.

Profiles

Use WAN optimization profiles to apply WAN optimization techniques to traffic to be optimized. In a WAN optimization profile you can select the protocols to be optimized and for HTTP protocol. You can also enable SSL offloading (if supported), secure tunneling, byte caching, transparent mode, and optionally select an authentication group. You can edit the default WAN optimization profile or create new ones. See [Configuration examples on page 2798](#) for sample configuration.

Transparent mode

Servers receiving packets after WAN optimization see different source addresses depending on whether or not you select *Transparent Mode*. See [Transparent mode on page 2789](#) for more information.

Authentication group

Select this option and select an authentication group so that the client and server-

	side FortiGate units must authenticate with each other before starting the WAN optimization tunnel. See Peers and authentication groups on page 2786 for more information.
Protocol	Select CIFS, FTP, HTTP, MAPI or TCP to apply protocol optimization for the selected protocols. See Protocol optimization on page 2790 for more information.
SSL Offloading	Select to apply SSL offloading for HTTPS traffic. You can use SSL offloading to offload SSL encryption and decryption from one or more HTTP servers to the FortiGate unit. If you enable this option, you must also use one of the following option to achieve SSL offloading: <ul style="list-style-type: none"> • Enable ssl profile with <i>ssl deep-inspection</i> in the WAN optimization firewall policy on the client-side and use the CLI command <code>config firewall ssl-server</code> to add an SSL server on the server-side for each HTTP server that you want to offload SSL encryption and decryption for. • Enable ssl profile with <i>ssl deep-inspection</i> in the WAN optimization firewall policy on client-side and WAN optimization proxy policy on server-side to accept SSL encrypted traffic.
SSL Secure Tunneling	The WAN optimization tunnel is encrypted using SSL encryption. You must also add an authentication group to the profile. See Secure tunneling on page 2788 for more information.
Byte Caching	Select to apply WAN optimization byte caching to the sessions accepted by this rule. See Byte caching on page 2790 for more information.

Peers and authentication groups

The client-side and server-side FortiGate units are called WAN optimization peers. The client and server roles relate to how a session is started. Any FortiGate unit configured for WAN optimization can be a client-side and a server-side FortiGate unit at the same time, depending on the direction of the traffic. Client-side FortiGate units initiate WAN optimization sessions and server-side FortiGate units respond to the session requests.

During this process, the WAN optimization peers identify and optionally authenticate each other. The authentication group is optional unless the tunnel is a secure tunnel. You need to add authentication groups to support secure tunneling between WAN optimization peers.

Peer requirements

WAN optimization requires the following configuration on each peer:

- The peer must have a unique host ID.
- Unless authentication groups are used, peers authenticate each other using host ID values. Do not leave the local host ID at its default value.
- The peer must know the host IDs and IP addresses of all of the other peers that it can start WAN optimization tunnels with. This does not apply if you use authentication groups that accept all peers.
- If a FortiGate unit or VDOM is operating in transparent mode, WAN optimization uses the management IP address as the peer IP address of the FortiGate unit instead of the address of an interface.

- All peers must have the same local certificate installed on their FortiGate units if the units authenticate by local certificate. Furthermore, system time must be enabled to ensure that SSL/TLS certificate expiry can be validated. Similarly, if the units authenticate by pre-shared key (password), administrators must know the password. The type of authentication is selected in the authentication group. This applies only if you use authentication groups.

Tunnel requests for peer authentication

When a client-side FortiGate unit attempts to start a WAN optimization tunnel with a peer server-side FortiGate unit, the tunnel request includes the following information:

- The client-side host ID.
- The name of an authentication group, if included in the rule that initiates the tunnel.
- The authentication method it specifies (pre-shared key or certificate), if an authentication group is used.
- The type of tunnel (secure or not).

If the tunnel request does not include an authentication group, authentication will be based on the client-side host ID in the tunnel request.

If the tunnel request includes an authentication group, the authentication will be based on the settings of this group as follows:

- The server-side FortiGate unit searches its own configuration for the name of the authentication group in the tunnel request. If no match is found, the authentication fails.
- If a match is found, the server-side FortiGate unit compares the authentication method in the client and server authentication groups. If the methods do not match, the authentication fails.
- If the authentication methods match, the server-side FortiGate unit tests the peer acceptance settings in its copy of the authentication group.
 - If the *Accept peer(s)* setting is *Any*, the authentication is successful.
 - If the *Accept peer(s)* setting is *One*, the server-side FortiGate unit compares the client-side host ID in the tunnel request with the peer name in the server-side authentication group. If the names match, authentication is successful. If a match is not found, authentication fails.
 - If the *Accept peer(s)* setting is *Defined Peers Only*, the server-side FortiGate unit compares the client-side host ID in the tunnel request with the server-side peer list. If a match is found, authentication is successful. If a match is not found, authentication fails.

After a tunnel is established, multiple WAN optimization sessions can start and stop between peers without restarting the tunnel.

Tunnels

All optimized traffic passes between the FortiGate units over a WAN optimization tunnel. Traffic in the tunnel can be sent in plain text or encrypted. Both plain text and the encrypted tunnels use TCP destination port 7810.

Secure tunneling

You can configure a WAN optimization profile to use SSL secure tunneling to encrypt the traffic in the WAN optimization tunnel using AES-128bit-CBC SSL. WAN optimization uses FortiASIC acceleration to accelerate SSL decryption and encryption of the secure tunnel. Secure tunneling can be enabled in both manual and active-passive WAN optimization configuration. See [Manual and active-passive on page 2792](#) for more information.

To use secure tunneling, you must add an authentication group and enable *SSL Secure Tunneling* in a WAN optimization profile. The *Accept peers(s)* setting of the authentication group does not affect secure tunneling. See [Secure tunneling configuration example on page 2809](#) for sample configuration.

Tunnel sharing

Tunnel sharing means multiple WAN optimization sessions share the same tunnel. It can improve performance by reducing the number of WAN optimization tunnels between FortiGate units. Having fewer tunnels means less data to manage. Also, tunnel setup requires more than one exchange of information between the ends of the tunnel. Once the tunnel is set up, each new session that shares the tunnel avoids tunnel setup delays.

Tunnel sharing also uses bandwidth more efficiently by reducing the chances that small packets will be sent down the tunnel. For example, suppose a FortiGate unit is processing five WAN optimization sessions and each session has 100 bytes to send. If these sessions use a shared tunnel, WAN optimization combines the packets from all five sessions into one 500-byte packet. If each session uses its own private tunnel, five 100-byte packets will be sent instead. Each packet also requires a TCP ACK reply. The combined packet in the shared tunnel requires one TCP ACK packet. The separate packets in the private tunnels require five.

Tunnel sharing is not always recommended and may not always be the best practice. For instance, aggressive and non-aggressive protocols should not share the same tunnel. An aggressive protocol can be defined as a protocol that is able to get more bandwidth than a non-aggressive protocol, for example, HTTP and FTP. If aggressive and non-aggressive protocols share the same tunnel, the aggressive protocols may take all of the available bandwidth. As a result, the performance of less aggressive protocols could be reduced.

To avoid this problem, rules for HTTP and FTP traffic should have their own tunnel. To do this, set `tunnel-sharing` to `private` for WAN optimization rules that accept HTTP or FTP traffic.

It is also useful to set `tunnel-sharing` to `express-shared` for applications, such as Telnet, that are very interactive but not aggressive.

Set `tunnel-sharing` to `shared` for applications that are not aggressive and are not sensitive to latency or delays.

Example configuration

To configure tunnel sharing for HTTP traffic in a WAN optimization profile:

```
config wanopt profile
  edit default
    config http
      set tunnel-sharing {express-shared | private | shared}
    end
  next
end
```

Transparent mode

WAN optimization is transparent to users. This means that with WAN optimization in place, clients connect to servers in the same way as they would without WAN optimization. However, servers receiving packets after WAN optimization see different source addresses depending on whether or not transparent mode is selected for WAN optimization. If transparent mode is selected, WAN optimization keeps the original source address of the packets, so servers appear to receive traffic directly from clients. Routing on the server network should be configured to route the traffic back to the client network.

Some protocols, for example CIFS, may not function as expected if transparent mode is not selected. In most cases, for CIFS WAN optimization you should select transparent mode and confirm the server network can route traffic as described to support transparent mode.

If transparent mode is not selected, the source address of the packets received by servers is changed to the address of the server-side FortiGate unit interface that sends the packets to the servers. So servers appear to receive packets from the server-side FortiGate unit. Routing on the server network is simpler in this case because client addresses are not involved. All traffic appears to come from the server-side FortiGate unit and not from individual clients.

Do not confuse WAN optimization transparent mode with FortiGate transparent mode. WAN optimization transparent mode is similar to source NAT. FortiGate's transparent mode is a system setting that controls how the FortiGate unit (or a VDOM) processes traffic.

Configuring transparent mode

You can configure transparent mode by selecting *Transparent* in a WAN optimization profile. The profile is added to an active WAN optimization policy.

When you configure a passive WAN optimization policy you can accept or override the active policy transparent setting. From the GUI you can do this by setting the *Passive* option as follows:

- *Default*: Use the transparent setting in the WAN optimization profile added to the active policy (client-side configuration).
- *Transparent*: Override the active policy transparent mode setting and impose transparent mode. Packets exiting the FortiGate keep their original source addresses.
- *Non-transparent*: Override the active policy transparent mode setting and impose non-transparent mode. Packets exiting the FortiGate have their source address changed to the address of the server-side FortiGate unit interface that sends the packets to the servers.

To configure a passive wan optimization policy in the CLI:

```
config firewall policy
  edit <policy ID>
    set srcintf <Incoming interface>
    set wanopt-passive-opt {default | transparent | non-transparent}
  next
end
```

Protocol optimization

Protocol optimization techniques optimize bandwidth use across the WAN. These techniques can improve the efficiency of communication across the WAN optimization tunnel by reducing the amount of traffic required by communication protocols. You can apply protocol optimization to CIFS, FTP, HTTP, MAPI, and general TCP sessions. You can apply general TCP optimization to MAPI sessions.

For example, CIFS provides file access, record locking, read/write privileges, change notification, server name resolution, request batching, and server authentication. CIFS requires many background transactions to successfully transfer a single file. This is usually not a problem across a LAN. However, across a WAN, latency and bandwidth reduction can slow down CIFS performance.

When you select the CIFS protocol in a WAN optimization profile, the FortiGate units at both ends of the WAN optimization tunnel use a number of techniques to reduce the number of background transactions that occur over the WAN for CIFS traffic.

If a policy accepts a range of different types of traffic, you can set *Protocol* to *TCP* to apply general optimization techniques to TCP traffic. However, applying this TCP optimization is not as effective as applying more protocol-specific optimization to specific types of traffic. TCP protocol optimization uses techniques such as TCP SACK support, TCP window scaling and window size adjustment, and TCP connection pooling to remove TCP bottlenecks.

Byte caching

Byte caching breaks large units of application data (for example, a file being downloaded from a web page) into small chunks of data, labeling each chunk of data with a hash of the chunk and storing those chunks and their hashes in a database. The database is stored on a WAN optimization storage device. Then, instead of sending the actual data over the WAN tunnel, the FortiGate unit sends the hashes. The FortiGate unit at the other end of the tunnel receives the hashes and compares them with the hashes in its local byte caching database. If any hashes match, that data does not have to be transmitted over the WAN optimization tunnel. The data for any hashes that does not match is transferred over the tunnel and added to that byte caching database. Then the unit of application data (the file being downloaded) is reassembled and sent to its destination.

The stored byte caches are not application specific. Byte caches from a file in an email can be used to optimize downloading that same file or a similar file from a web page.

The result is less data transmitted over the WAN. Initially, byte caching may reduce performance until a large enough byte caching database is built up.

To enable byte caching, select *Byte Caching* in a WAN optimization profile.

Byte caching cannot determine whether or not a file is compressed (for example a zip file), and caches compressed and non-compressed versions of the same file separately.

Dynamic data chunking for byte caching

Dynamic data chunking can improve byte caching by improving detection of data chunks that are already cached in changed files or in data embedded in traffic using an unknown protocol. Dynamic data chunking can only be enabled from the CLI and is available for HTTP, CIFS and FTP.

Dynamic data chunking is disabled by default and `prefer-chunking` is set to `fix`.

To enable dynamic data chunking for HTTP in the default WAN optimization profile:

```
config wanopt profile
  edit default
    config http
      set prefer-chunking dynamic
    end
  next
end
```

Cache service and video caching

Two features that can only be configured in the CLI include cache service and video caching.

Cache service

The `config wanopt cache-service` command is used to configure cache-service clusters between multiple FortiGates. The result is that the cache-service daemons of the different FortiGates can collaborate for serving web cache entries.

See [config wanopt cache-service](#) in the CLI Reference guide for more configuration information.

Video caching

The `config wanopt content-delivery-network-rule` command configures web-caching, including the video-cache matching rules.

See [config wanopt content-delivery-network-rule](#) in the CLI Reference guide for more configuration information.

Manual and active-passive

You can create manual (peer-to-peer) and active-passive WAN optimization configurations.

There are a few key differences between manual and active-passive mode:

- For manual mode, the tunnels are always up which makes it more resource extensive as compared to active-passive.
- The performance of active-passive mode is lower than manual mode for the new connection.
- The active-passive mode can be used to deploy tunnel dynamically using *Authentication groups* set to accept *Any* peers which eliminates the need of defining peers manually. This is not possible with manual mode.

This setting is only recommended when you do not know the peer host IDs or IP addresses of the peers that will use this authentication group. This setting is most often used with FortiGate units that do not have static IP addresses, for example units that use DHCP.

-
- For manual mode, traffic shaping cannot be applied to traffic on the server-side. See [Traffic shaping on page 2795](#) for more information.

Manual (peer to peer) configurations

Manual configurations allow for WAN optimization between one client-side FortiGate unit and one server-side FortiGate unit. Manual WAN optimization requires a manual WAN optimization firewall policy on the client-side FortiGate unit and a WAN optimization proxy policy on the server-side FortiGate unit.

In a manual mode configuration, the client-side peer can only connect to the named server side peer. When the client-side peer initiates a tunnel with the server-side peer, the packets that initiate the tunnel include extra information so that the server-side peer can determine that it is a peer-to-peer tunnel request. This extra information is required because the server-side peer does not require a WAN optimization firewall policy; however, you need to add the client peer host ID and IP address to the server-side FortiGate unit peer list. See [Manual \(peer-to-peer\) WAN optimization configuration example on page 2800](#) for a sample configuration.

Active-passive configurations

Active-passive WAN optimization requires an active WAN optimization firewall policy on the client-side FortiGate unit and a passive WAN optimization firewall policy on the server-side FortiGate unit. The server-side FortiGate unit also requires a WAN optimization proxy policy.

You can use the passive policy to control WAN optimization address translation by specifying transparent mode or non-transparent mode. You can also use the passive policy to apply security profiles, web caching, and other FortiGate features at the server-side FortiGate unit. For example, if a server-side FortiGate unit is protecting a web server, the passive policy could enable web caching.

A single passive policy can accept tunnel requests from multiple FortiGate units as long as the server-side FortiGate unit includes their peer IDs and all of the client-side FortiGate units include the server-side peer ID. See [Active-passive WAN optimization configuration example on page 2804](#) for a sample configuration.

The WAN optimization proxy policy can only be added from the CLI and policies with `proxy` set to `wanopt` do not appear on the GUI.

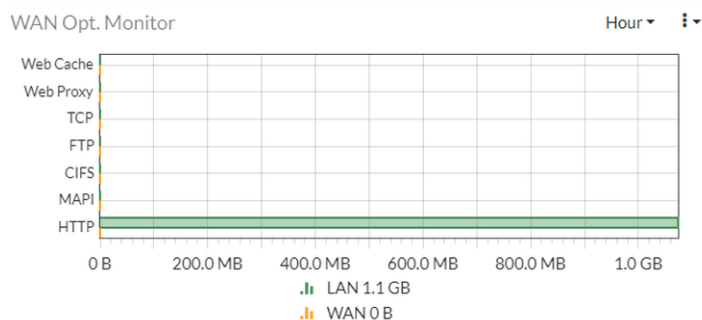

Monitoring performance

Using *WAN Opt. & Cache* widgets, you can confirm that a FortiGate unit is optimizing traffic and view estimates of the amount of bandwidth saved. These include peers manually added to the configuration as well as discovered peers.

To add *WAN Opt. & Cache* widgets go to *Dashboard > Status > Add Widget > WAN Opt. & Cache* and add *WAN Opt. Monitor* and *Peer Monitor*.

Wan Opt. Monitor

The *Wan Opt. Monitor* shows how WAN optimization is reducing the amount of traffic on the WAN for each WAN optimization protocol by showing the amount of WAN and LAN traffic. If WAN optimization is being effective, the amount of WAN traffic should be lower than the amount of LAN traffic.

Peer Monitor

The *Peer Monitor* lists all of the WAN optimization peers that a FortiGate unit can perform WAN optimization with.

Peer Host ID	Peer IP Address	Peer Type
Server-Fgt	192.168.30.12	Manual Configured Peer

System and feature operation with WAN optimization

This section contains the following information:

- [HA on page 2794](#)
- [Memory usage on page 2794](#)
- [Distributing WAN optimization processing on page 2794](#)
- [Distributing WAN optimization to multiple CPU cores on page 2795](#)
- [Identity policies and load balancing on page 2795](#)
- [Traffic shaping on page 2795](#)

HA

You can configure WAN optimization on a FortiGate HA cluster. The recommended best practice HA configuration for WAN optimization is active-passive mode. When the cluster is operating, all WAN optimization sessions are processed by the primary unit only. Even if the cluster is operating in active-active mode, HA does not load-balance WAN optimization sessions.

You can also form a WAN optimization tunnel between a cluster and a standalone FortiGate unit or between two clusters.

In a cluster, only the primary unit stores the byte cache database. This database is not synchronized to the subordinate units. So, after a failover, the new primary unit must rebuild its byte cache. Rebuilding the byte cache can happen relatively quickly because the new primary unit gets byte cache data from the other FortiGate unit that it is participating with in WAN optimization tunnels.

Memory usage

To accelerate and optimize disk access and to provide better throughput and less latency, FortiOS WAN optimization uses provisioned memory to reduce disk I/O and increase disk I/O efficiency. In addition, WAN optimization requires a small amount of additional memory per session for comprehensive flow control logic and efficient traffic forwarding.

When WAN optimization is enabled you will see a reduction in available memory. The reduction increases when more WAN optimization sessions are being processed. If you are thinking of enabling WAN optimization on an operating FortiGate unit, make sure its memory usage is not maxed out during high traffic periods.

In addition to using the system dashboard to see the current memory usage you can use the `get test wad 2` command to see how much memory is currently being used by WAN optimization.

Distributing WAN optimization processing

The `wad-worker` balancing algorithm supports a more balanced dispersal of traffic to the wad processes even if the bulk of the traffic is coming from a small set of sources or single source.

By default, dispatching traffic to WAD workers is based on source affinity. This may negatively affect performance when users have another explicit proxy in front of the FortiGate. Source affinity causes the FortiGate to process the traffic as if it originated from the single (or small set of) IP address of the outside proxy. This results in the use of one, or a small number, of WAD processes.

By disabling `wad-source-affinity` the traffic is balanced over all of the WAD processes. The WAD dispatcher will not assign the traffic based on the source IP address, but will assign the traffic to available workers in a round-robin fashion.

To configure WAD source affinity:

```
config system global
    set wad-source-affinity {enable | disable}
end
```

Handling the traffic by different WAD workers results in losing cached related benefits of using source affinity, as there is the memory cache on the current wad worker and if a new connection is handled by another worker, the cache will not be hit.

This is explained by the warning message that appears when it is disabled:

```
WARNING: Disabling this option results in some features to be
unsupported. IP-based user authentication, disclaimer messages, security
profile override, authentication cookies, MAPI scanning, and some video
caches such as YouTube are not supported.
```

```
Do you want to continue? (y/n)
```

Distributing WAN optimization to multiple CPU cores

By default WAN optimization is handled by half of the CPU cores in a FortiGate unit. For example, if your FortiGate unit has 4 CPU cores, by default two will be used for WAN optimization. You can use the following command to change the number of CPU cores that are used.

```
config system global
    set wad-worker-count <number>
end
```

The `wad-worker-count` can be between 1 and the total number of CPU cores in your FortiGate unit. Adding more cores may enhance WAN optimization but reduce the performance of other FortiGate systems.

Identity policies and load balancing

WAN optimization and firewall policies compatibility varies depending on the type of policy:

- WAN optimization is not compatible with firewall load balancing.
- WAN optimization is compatible with source and destination NAT options in firewall policies (including firewall virtual IPs). If a virtual IP is added to a policy, the traffic that exits the WAN optimization tunnel has its destination address changed to the virtual IP mapped to IP address and port.
- WAN optimization is compatible with user identity-based and device identity security policies. If a session is allowed after authentication or device identification the session can be optimized.

Traffic shaping

Traffic shaping works for WAN optimization traffic that is not in a WAN optimization tunnel. So traffic accepted by a WAN optimization policy on a client-side FortiGate unit can be shaped on ingress. However, when the traffic enters the WAN optimization tunnel, traffic shaping is not applied.

In manual mode:

- Traffic shaping works as expected on the client-side FortiGate unit.
- Traffic shaping cannot be applied to traffic on the server-side FortiGate unit.

In active-passive mode:

- Traffic shaping works as expected on the client-side FortiGate unit.
- If transparent mode is enabled in the WAN optimization profile, traffic shaping also works as expected on the server-side FortiGate unit.
- If transparent mode is not enabled, traffic shaping works partially on the server-side FortiGate unit.

Best practices

WAN optimization and explicit proxy best practices include:

- WAN optimization tunnel sharing is recommended for similar types of WAN optimization traffic. However, tunnel sharing for different types of traffic is not recommended. For example, aggressive and non-aggressive protocols should not share the same tunnel.
- Active-passive HA is the recommended HA configuration for WAN optimization.
- Configure WAN optimization authentication with specific peers. Accepting any peer is not recommended as this can be less secure.

Example topologies

All FortiGate WAN optimization topologies consist of two FortiGate units operating as WAN optimization peers intercepting and optimizing traffic crossing the WAN between the private networks.

The following topics cover a few of the example topologies:

- [In-path WAN optimization topology on page 2796](#)
- [Out-of-path WAN optimization topology on page 2797](#)
- [Topology for multiple networks on page 2797](#)

In-path WAN optimization topology

FortiGate units can be deployed as typical security devices that protect private networks connected to the WAN and also perform WAN optimization. The WAN optimization configuration intercepts traffic to be optimized as it passes through the FortiGate unit and uses a WAN optimization tunnel with another FortiGate unit to optimize the traffic that crosses the WAN.

You can add web caching to any WAN optimization topology when users on a private network communicate with web servers located across the WAN on another private network.

Out-of-path WAN optimization topology

In an out-of-path topology, one or both of the FortiGate units configured for WAN optimization are not directly in the main data path. Instead, the out-of-path FortiGate unit is connected to FortiGate units in the data path, and the device is configured to redirect sessions to be optimized to the out-of-path FortiGate unit. The FortiGate units in the data path use a method such as policy routing to redirect traffic to be optimized to the out-of-path FortiGate units. The out-of-path FortiGate units establish a WAN optimization tunnel between each other and optimize the redirected traffic.

One of the benefits of out-of-path WAN optimization is that out-of-path FortiGate units only perform WAN optimization and do not have to process other traffic. An in-path FortiGate unit configured for WAN optimization also has to process other non-optimized traffic on the data path.

Topology for multiple networks

As shown below, you can create multiple WAN optimization configurations between many private networks. Whenever WAN optimization occurs, it is always between two FortiGate units, but you can configure any FortiGate unit to perform WAN optimization with any of the other FortiGate units that are part of your WAN.

You can also configure WAN optimization between FortiGate units with different roles on the WAN. FortiGate units configured as security devices and for WAN optimization can perform WAN optimization as if they are single-purpose FortiGate units just configured for WAN optimization. The WAN optimization configuration is the same for FortiGate units deployed as security devices and for single-purpose WAN optimization FortiGate units. The only differences would result from the different network topologies.

Configuration examples

The following pages are used in the WAN optimization configuration examples demonstrated in the subsequent sections:

- **WAN Opt. & Cache > Profiles:** Configure the default WAN optimization profile to optimize HTTP traffic on client side.

Name	Protocol/Port	Transparent	Authentication Group	Comments	Ref.
default	HTTP	Enabled		Default WANopt.profile.	1

- **WAN Opt. & Cache > Peers:** Change the *Host ID* and add *Peer Host ID* and *IP address* on both client and server side.

Peer Host ID	IP	Ref.
Server_Fgt	192.168.30.12	1

- **WAN Opt. & Cache > Authentication Groups:** Add an authentication group for the authentication purpose on both client and server side. (Optional)

Name	Authentication Method	Peers	Ref
Auth-Secure-Tunnel	Pre-shared Key	any	0

- **Policy & Objects > Firewall Policy:** Add a WAN optimization firewall policy on the client side or on both client and server side depending on the WAN optimization configuration. See the examples for more information.

[Consolidated Policy Configuration](#)

A WAN optimization firewall policy is a firewall policy running in *Proxy-based* inspection mode with *WAN Optimization* enabled. A WAN optimization firewall policy cannot be configured with inspection mode set to *Flow-based*.

The following topics provide instructions on different WAN optimization configuration examples:

- [Manual \(peer-to-peer\) WAN optimization configuration example on page 2800](#)
- [Active-passive WAN optimization configuration example on page 2804](#)
- [Secure tunneling configuration example on page 2809](#)
- [Testing and troubleshooting the configuration on page 2815](#)

Manual (peer-to-peer) WAN optimization configuration example

Please ensure that the [Prerequisites on page 2783](#) are met before proceeding with the configuration example.

See [Manual \(peer to peer\) configurations on page 2792](#) for conceptual information.

This example configuration includes a client-side FortiGate unit called Client-Fgt with a WAN IP address of 172.20.34.12. This unit is in front of a network with IP address 172.20.120.0. The server-side FortiGate unit is called Server-Fgt with a WAN IP address of 192.168.30.12. This unit is in front of a web server network with IP address 192.168.10.0.

This example customizes the default WAN optimization profile on the client-side FortiGate unit and adds it to the WAN optimization firewall policy. You can also create a new WAN optimization profile.

General configuration steps

This section breaks down the configuration for this example into smaller procedures:

1. Configure the client-side FortiGate unit:
 - Add peers.
 - Configure the default WAN optimization profile to optimize HTTP traffic.
 - Add a manual WAN optimization firewall policy.
2. Configure the server-side FortiGate unit:
 - Add peers.
 - Add a WAN optimization proxy policy.

Configuring manual WAN optimization from the GUI

Use the following steps to configure the example configuration from the GUI:

To configure the client-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the client-side FortiGate unit:
 - a. Click *Change*. The *Host ID* pane opens.
 - b. Enter a new *Host ID*:

Host ID	Client-Fgt
----------------	------------

- c. Click *OK*.
2. Create the server-side FortiGate unit peer:
 - a. Select *Create New*. The *New WAN Optimization Peer* opens.
 - b. Configure the following settings:

Peer Host ID	Server-Fgt
IP address	192.168.30.12

- c. Click *OK*.
3. Go to *WAN Opt. & Cache > Profiles* and edit the default profile:
 - a. Select the default profile and click *Edit*.
 - b. Under *Protocol Options*, edit *HTTP*.
 - c. Set *Status* to *Enable* and click *Apply*.
 - d. Click *OK*.
4. Go to *Policy & Objects > Firewall Policy* to add a manual WAN optimization firewall policy to the client-side FortiGate unit that accepts traffic to be optimized:
 - a. Click *Create New*.
 - b. Enter a *Name* and configure the following settings:

Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

- c. Set *Inspection Mode* to *Proxy-based*.
 - d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Manual
Profiles	default
Peers	Server-Fgt

- e. Click *OK* to save the policy.

To configure the server-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the server-side FortiGate unit:
 - a. Click *Change*. The *Host ID* pane opens.
 - b. Enter a new *Host ID*:

Host ID	Server-Fgt
----------------	------------

- c. Click *OK*.
2. Create the client-side FortiGate unit peer:
 - a. Select *Create New*. The *New WAN Optimization Peer* opens.
 - b. Configure the following settings:

Peer Host ID	Client-Fgt
IP address	172.20.34.12

- c. Click *OK*.
3. Enter the following CLI command to add a WAN optimization proxy policy to accept WAN optimization tunnel connections:

```
config firewall proxy-policy
  edit 0
    set proxy wanopt
    set dstintf port5
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
end
```

Configuring basic WAN optimization from the CLI

Use the following steps to configure the example configuration from the CLI.

To configure the client-side FortiGate unit:

1. Change the Host ID of the client-side FortiGate:

```
config wanopt settings
  set host-id Client-Fgt
end
```

2. Add the Host ID of the server-side FortiGate:

```
config wanopt peer
  edit Server-Fgt
    set ip 192.168.30.12
  next
end
```

3. Edit the *default* WAN optimization profile and enable HTTP WAN optimization:

```
config wanopt profile
  edit default
    config http
      set status enable
    end
  next
end
```

4. Add a WAN optimization firewall policy to accept the traffic to be optimized:

```
config firewall policy
  edit 0
    set srcintf port2
    set dstintf port3
    set srcaddr all
    set dstaddr all
    set action accept
    set service ALL
    set schedule always
    set inspection-mode proxy
    set wanopt enable
    set wanopt-profile default
    set wanopt-detection off
    set wanopt-peer Server-Fgt
  next
end
```

When you set the detection mode to off, the policy becomes a manual mode WAN optimization firewall, which is reflected on the GUI.

To configure the server-side FortiGate unit:

1. Change the Host ID of the server-side FortiGate:

```
config wanopt settings
  set host-id Server-Fgt
end
```

2. Add the Host ID of the client-side FortiGate:

```
config wanopt peer
  edit Client-Fgt
    set ip 172.20.34.12
  next
end
```

3. Add a WAN optimization proxy policy:

```
config firewall proxy-policy
  edit 0
    set proxy wanopt
    set dstintf port5
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
```

next
end

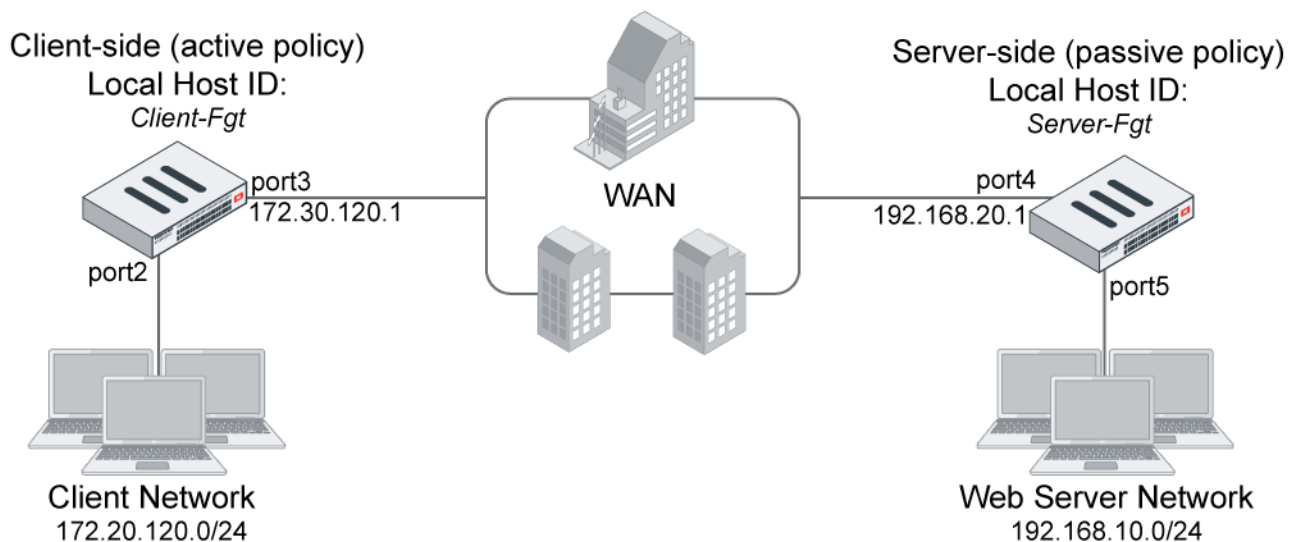

Active-passive WAN optimization configuration example

Please ensure that the [Prerequisites on page 2783](#) are met before proceeding with the configuration example.

See [Active-passive configurations on page 2792](#) for conceptual information.

This example configuration includes a client-side FortiGate unit called Client-Fgt with a WAN IP address of 172.30.120.1. This unit is in front of a network with IP address 172.20.120.0. The server-side FortiGate unit is called Server-Fgt and has a WAN IP address of 192.168.20.1. This unit is in front of a web server network with IP address 192.168.10.0.

General configuration steps

This section breaks down the configuration for this example into smaller procedures:

1. Configure the client-side FortiGate unit:
 - Add peers.
 - Add a WAN optimization profile to optimize CIFS, FTP, and HTTP traffic.
 - Add an active WAN optimization firewall policy.
2. Configure the server-side FortiGate unit:
 - Add peers.
 - Add a passive WAN optimization firewall policy.
 - Add a WAN optimization proxy policy.

Configuring active-passive WAN optimization from the GUI

Use the following steps to configure the example configuration from the GUI.

To configure the client-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the client-side FortiGate unit:
 - a. Click *Change*. The *Host ID* pane opens.
 - b. Enter a new *Host ID*:

Host ID	Client-Fgt
----------------	------------

- c. Click *OK*.
2. Create the server-side FortiGate unit peer:
 - a. Select *Create New*. The *New WAN Optimization Peer* opens.
 - b. Configure the following settings:

Peer Host ID	Server-Fgt
IP address	192.168.20.1

- c. Click *OK*.
3. Go to *WAN Opt & Cache > Profiles* to add a WAN optimization profile to optimize CIFS, HTTP, and FTP traffic:
 - a. Select *Create New*.
 - b. Enter the profile name:

Name	Custom-wan-opt-pro
-------------	--------------------

- c. In the *Protocol Options* section:
 - i. Edit *CIFS*.
 - ii. Set *Status* to *Enable*.
 - iii. Click *Apply*.
 - iv. Repeat these steps to edit and enable *FTP* and *HTTP*.
 - d. Click *OK*.
4. Go to *Policy & Objects > Firewall Policy* to add an active WAN optimization firewall policy:
 - a. Click *Create New*.
 - b. Enter a *Name* and configure the following settings:

Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	all
Schedule	always
Service	HTTP FTP

	SMB
Action	ACCEPT

- c. Set *Inspection Mode* to *Proxy-based*.
- d. Enable WAN optimization and configure the following settings:

WAN Optimization	Active
Profile	Custom-wan-opt-pro

- e. Click *OK*.

To configure the server-side FortiGate unit:

- 1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the server-side FortiGate unit:
 - a. Click *Change*. The *Host ID* pane opens.
 - b. Enter a new *Host ID*:

Host ID	Server-Fgt
----------------	------------

- c. Click *OK*.

- 2. Create the client-side FortiGate unit peer:
 - a. Select *Create New*. The *New WAN Optimization Peer* opens.
 - b. Configure the following settings:

Peer Host ID	Client-Fgt
IP address	172.30.120.1

- c. Click *OK*.

- 3. Go to *Policy & Objects > Firewall Policy* to add a passive WAN optimization firewall policy:
 - a. Click *Create New*.
 - b. Enter a *Name* and configure the following settings:

Incoming Interface	port4
Outgoing Interface	port5
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

- c. Set *Inspection Mode* to *Proxy-based*.

- d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Passive
Passive Option	Default

- e. Click *OK*.

4. Add a WAN optimization proxy policy from the CLI:

```
config firewall proxy-policy
  edit 0
    set proxy wanopt
    set dstintf port5
    set srcaddr all
    set dstaddr all
    set action accept
    set schedule always
    set service ALL
  next
end
```

Configuring basic active-passive WAN optimization from the CLI

Use the following steps to configure the example configuration from the CLI.

To configure the client-side FortiGate unit:

1. Change the Host ID of the client-side FortiGate:

```
config wanopt settings
  set host-id Client-Fgt
end
```

2. Add the Host ID of the server-side FortiGate:

```
config wanopt peer
  edit Server-Fgt
    set ip 192.168.20.1
  next
end
```

3. Add a WAN optimization profile to optimize CIFS, HTTP, and FTP traffic:

```
config wanopt profile
  edit Custom-wan-opt-pro
    config cifs
      set status enable
    end
    config http
      set status enable
    end
    config ftp
      set status enable
    end
  next
end
```

4. Add an active WAN optimization firewall policy:

```
config firewall policy
  edit 0
    set srcintf port2
    set dstintf port3
    set srcaddr all
    set dstaddr all
    set action accept
    set service HTTP FTP SMB
    set schedule always
    set inspection-mode proxy
    set wanopt enable
    set wanopt-detection active
    set wanopt-profile Custom-wan-opt-pro
  next
end
```

To configure the server-side FortiGate unit:**1. Change the Host ID of the server-side FortiGate:**

```
config wanopt settings
  set host-id Server-Fgt
end
```

2. Add the Host ID of the client-side FortiGate:

```
config wanopt peer
  edit Client-Fgt
    set ip 172.30.120.1
  next
end
```

3. Add a passive WAN optimization firewall policy:

```
config firewall policy
  edit 0
    set srcintf port4
    set dstintf port5
    set srcaddr all
    set dstaddr all
    set action accept
    set service ALL
    set schedule always
    set inspection-mode proxy
    set wanopt enable
    set wanopt-detection passive
    set wanopt-passive-opt default
  next
end
```

4. Add a WAN optimization proxy policy:

```
config firewall proxy-policy
  edit 0
    set proxy wanopt
    set dstintf port5
```

```

set srcaddr all
set dstaddr all
set action accept
set schedule always
set service ALL
next
end

```

Secure tunneling configuration example

Please ensure that the [Prerequisites on page 2783](#) are met before proceeding with the configuration example.

See [Secure tunneling on page 2788](#) for conceptual information.

This example configuration includes a client-side FortiGate unit called Client-Fgt with a WAN IP address of 172.30.120.1. This unit is in front of a network with IP address 172.20.120.0. The server-side FortiGate unit is called Server-Fgt and has a WAN IP address of 192.168.20.1. This unit is in front of a web server network with IP address 192.168.10.0.

General configuration steps

This section breaks down the configuration for this example into smaller procedures:

1. Configure the client-side FortiGate unit:
 - Add peers.
 - Add an authentication group.
 - Add an active WAN optimization firewall policy.
2. Configure the server-side FortiGate unit:

- Add peers.
- Add the same authentication group.
- Add a passive WAN optimization firewall policy.
- Add a WAN optimization proxy policy.

Configuring WAN optimization with secure tunneling from the GUI

Use the following steps to configure the example configuration from the GUI.

To configure the client-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the client-side FortiGate unit:
 - a. Click *Change*. The *Host ID* pane opens.
 - b. Enter a new *Host ID*:

Host ID	Client-Fgt
----------------	------------

- c. Click *OK*.
2. Create the server-side FortiGate unit peer:
 - a. Select *Create New*. The *New WAN Optimization Peer* opens.
 - b. Configure the following settings:

Peer Host ID	Server-Fgt
IP address	192.168.20.1

- c. Click *OK*.
3. Go to *WAN Opt. & Cache > Authentication Groups* to add the authentication group to be used for secure tunneling:
 - a. Click *Create New* and configure the following settings:

Name	Auth-Secure-Tunnel
Authentication Method	Pre-shared key
Pre-shared key	*****
Accept peer(s)	Defined Peers Only

- b. Click *OK*.
4. Go to *WAN Opt. & Cache > Profiles* to add a WAN optimization profile that enables secure tunneling and includes the authentication group:
 - a. Click *Create New*.
 - b. Enter a *Name*:

Name	Secure-wan-opt-pro
-------------	--------------------

- c. Enable *Authentication group*:

Authentication group	Auth-Secure-Tunnel
-----------------------------	--------------------

- d. In the *Protocol Options* section, edit *HTTP*:

- i. Set *Status* to *Enable*.
 - ii. Click *Apply*.
 - iii. Set *SSL Secure Tunneling* to *Enable*.
 - iv. Click *Apply*.
 - e. Click *OK*.
5. Go to *Policy & Objects > Firewall Policy* to add an active WAN optimization firewall policy:
- a. Click *Create New*.
 - b. Enter a *Name* and configure the following settings:

Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	all
Schedule	always
Service	HTTP
Action	ACCEPT

- c. Set *Inspection Mode* to *Proxy-based*.
- d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Active
Profile	Secure-wan-opt-pro

- e. Click *OK*.

To configure the server-side FortiGate unit:

1. Go to *WAN Opt. & Cache > Peers* and change the *Host ID* of the server-side FortiGate unit:
 - a. Click *Change*. The *Host ID* pane opens.
 - b. Enter a new *Host ID*:

Host ID	Server-Fgt
----------------	------------

- c. Click *OK*.

2. Create the client-side FortiGate unit peer:
 - a. Select *Create New*. The *New WAN Optimization Peer* opens.
 - b. Configure the following settings:

Peer Host ID	Client-Fgt
IP address	172.30.120.1

- c. Click *OK*.

3. Go to *WAN Opt. & Cache > Authentication Groups* to add the authentication group to be used for secure tunneling:

- a. Click *Create New* and configure the following settings:

Name	Auth-Secure-Tunnel
Authentication Method	Pre-shared key
Pre-shared key	*****
Accept peer(s)	Defined Peers Only

- b. Click *OK*.

4. Go to *Policy & Objects > Firewall Policy* to add an passive WAN optimization firewall policy:

- a. Click *Create New*.

- b. Enter a *Name* and configure the following settings:

Incoming Interface	port4
Outgoing Interface	port5
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

- c. Set *Inspection Mode* to *Proxy-based*.

- d. Enable *WAN Optimization* and configure the following settings:

WAN Optimization	Passive
Passive Option	Default

- e. Click *OK*.

5. Add a WAN optimization proxy policy from the CLI:

```
config firewall proxy-policy
edit 0
set proxy wanopt
set dstintf port5
set srcaddr all
set dstaddr all
set action accept
set schedule always
set service ALL
next
end
```

Configuring WAN optimization with secure tunneling from the CLI

Use the following steps to configure the example configuration from the CLI.

To configure the client-side FortiGate unit:**1. Change the Host ID of the client-side FortiGate:**

```
config wanopt settings
    set host-id Client-Fgt
end
```

2. Add the Host ID of the server-side FortiGate:

```
config wanopt peer
    edit Server-Fgt
        set ip 192.168.20.1
    next
end
```

3. Add a new authentication group to be used for secure tunneling:

```
config wanopt auth-group
    edit Auth-Secure-Tunnel
        set auth-method psk
        set peer-accept defined
        set psk *****
    next
end
```

4. Add a WAN optimization profile that enabled secure tunneling and includes the authentication group, enables HTTP protocol optimization, and enables secure tunneling for HTTP traffic:

```
config wanopt profile
    edit Secure-wan-opt-pro
        set auth-group Auth-Secure-Tunnel
        config http
            set status enable
            set secure-tunnel enable
        end
    next
end
```

5. Add an active WAN optimization firewall policy that enables secure tunneling:

```
config firewall policy
    edit 0
        set srcintf port2
        set dstintf port3
        set srcaddr all
        set dstaddr all
        set action accept
        set service HTTP
        set schedule always
        set inspection-mode proxy
        set wanopt enable
        set wanopt-detection active
        set wanopt-profile Secure-wan-opt-pro
    next
end
```

To configure the server-side FortiGate unit:**1. Change the Host ID of the server-side FortiGate:**

```
config wanopt settings
    set host-id Server-Fgt
end
```

2. Add the Host ID of the client-side FortiGate:

```
config wanopt peer
    edit Client-Fgt
        set ip 172.30.120.1
    next
end
```

3. Add an authentication group to be used for secure tunneling:

```
config wanopt auth-group
    edit Auth-Secure-Tunnel
        set auth-method psk
        set peer-accept defined
        set psk *****
    next
end
```

4. Add a passive WAN optimization firewall policy:

```
config firewall policy
    edit 0
        set srcintf port4
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
        set service ALL
        set schedule always
        set inspection-mode proxy
        set wanopt enable
        set wanopt-detection passive
        set wanopt-passive-opt default
    next
end
```

5. Add a WAN optimization proxy policy:

```
config firewall proxy-policy
    edit 0
        set proxy wanopt
        set dstintf port5
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
end
```

Testing and troubleshooting the configuration

To test the configuration attempt, start a web browsing session between the client network and the web server network. For example, from a PC on the client network browse to the IP address of a web server on the web server network, for example `http://192.168.10.13`. Even though this address is not on the client network, you should be able to connect to this web server over the WAN optimization tunnel.

If you can connect, the *WAN Opt. Monitor* widget should show the protocol that has been optimized (in this case HTTP) and the *Peer Monitor* widget displays the *Peer* information. To add the *WAN Opt. Monitor* and the *Peer Monitor*, go to *Dashboard > Status > Add Widget > WAN Opt. & Cache* and add *WAN Opt. Monitor* and *Peer Monitor*. See [Monitoring performance on page 2793](#) for more information.

If you cannot connect, try the following to diagnose the problem:

- Review your configuration and make sure all details such as address ranges, peer names, and IP addresses are correct.
- Check routing on the FortiGate units and on the client and web server networks to make sure packets can be forwarded as required. The FortiGate units must be able to communicate with each other, routing on the client network must allow packets destined for the web server network to be received by the client-side FortiGate unit, and packets from the server-side FortiGate unit must be able to reach the web servers. See [Routing concepts on page 339](#) for more information.

You can use `get` and `diagnose` commands to display information about how WAN optimization is operating.

Example output

The command output for the client-side FortiGate unit shows 10 tunnels all created by the manual WAN optimization configuration:

```
# diagnose wad tunnel list

Tunnel: id=100 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=100 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=348 bytes_out=384

Tunnel: id=99 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=99 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=348 bytes_out=384

Tunnel: id=98 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=98 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=348 bytes_out=384

Tunnel: id=39 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=39 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1068 bytes_out=1104
```

```
Tunnel: id=7 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=7 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264
```

```
Tunnel: id=8 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=8 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264
```

```
Tunnel: id=5 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=5 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264
```

```
Tunnel: id=4 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=4 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264
```

```
Tunnel: id=1 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=1 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264
```

```
Tunnel: id=2 type=manual
vd=0 shared=no uses=0 state=2
peer name=Server-Fgt id=2 ip=192.168.30.12
SSL-secured-tunnel=no auth-grp=
bytes_in=1228 bytes_out=1264
```

```
Tunnels total=10 manual=10 auto=0
```

The command output shows three tunnels all created by the active-passive WAN optimization configuration:

```
# diagnose wad tunnel list
```

```
Tunnel: id=22 type=auto
  vd=0 shared=no uses=1 state=2
  peer name=Server-Fgt id=42 ip=192.168.20.1 (best guess)
  SSL-secured-tunnel=no auth-grp=
  bytes_in=56693 bytes_out=10831
```

```
Tunnel: id=24 type=auto
  vd=0 shared=no uses=1 state=2
  peer name=Server-Fgt id=44 ip=192.168.20.1 (best guess)
  SSL-secured-tunnel=no auth-grp=
  bytes_in=14833 bytes_out=3896
```

```
Tunnel: id=26 type=auto
  vd=0 shared=no uses=1 state=2
```

```
peer name=Server-Fgt id=46 ip=192.168.20.1 (best guess)
SSL-secured-tunnel=no auth-grp=
bytes_in=481 bytes_out=176
```

Tunnels total=3 manual=0 **auto=3**

The command output shows a tunnel created by active passive WAN optimization configuration with secure tunneling:

```
# diagnose wad tunnel list
```

```
Tunnel: id=3 type=auto
vd=0 shared=no uses=1 state=2
peer name=Server-Fgt id=49 ip=192.168.20.1 (best guess)
SSL-secured-tunnel=yes auth-grp=Auth-Secure-Tunnel
bytes_in=95810 bytes_out=39597
```

Tunnels total=1 manual=0 **auto=1**

Unlike manual mode, for active-passive configurations, each session will negotiate an active-passive tunnel so an open session is required to display the corresponding output above. For example, continuous data transfer such as uploading or downloading will display tunnel output in the active-passive configuration, which is in contrast to manual mode where tunnels are always open and ready to use.

VM

This section contains topics on deploying FortiGate-VM:

Private cloud

See [FortiGate Private Cloud](#) in the document library.

VM license

You can access the *FortiGate VM License* page from the *Dashboard > Status* page in the *Virtual Machine* widget. Click the device license and select *FortiGate VM License*.

The *FortiGate VM License* page displays the following information:

Field	Description
License status	<p>Displays one of the following statuses:</p> <ul style="list-style-type: none"> Valid: VM can connect and validate the license against a FortiManager or FortiGuard server. All features are available. Warning: VM cannot connect and validate against a FortiManager or FortiGuard server. FortiOS makes a check against how many days the warning status is continuous. If the number is less than 30 days, the status does not change. Invalid: VM cannot connect and validate against a FortiManager or FortiGuard server. FortiOS makes a check against how many days the warning status is continuous. If the number is 30 days or more, the status changes to invalid. FortiOS restricts GUI access until you upload a valid license. Firewall policies do not work. FortiGuard downloads are unavailable. Pending: temporary state where the VM attempts to validate its license. <p>Reasons for having a warning or invalid status include:</p> <ul style="list-style-type: none"> The network environment does not allow FortiGate-VM to connect to the FortiGuard server. The license might be expired. Check the expiration date for evaluation or term-based licenses. Another VM has been already validated with FortiGuard using the same license. See Technical Note: VM License activation for details about duplicated VM instances.
Allocated vCPUs	Number of allocated and total allowable vCPUs
Allocated RAM	Amount of allocated RAM. There is no RAM restriction.
Expires on	Expiry date. The value depends on the license type.

This information is visible in the CLI by running `get system status` (see [CLI troubleshooting](#)).

Uploading a license file

After you submit an order for a FortiGate-VM, Fortinet sends a license registration code to the email address that you entered in the order form. Use this code on the FortiCloud portal to register the FortiGate-VM.

Once the VM is registered, you can download the license file in .LIC format. On the *FortiGate VM License* page, click *Upload*. The system prompts you to reboot and validate the license with the FortiGuard server. Once validated, your FortiGate-VM is fully functional.

The VM license window may also appear immediately after logging in if you are running a VM with an evaluation license that has expired.

In cases where the GUI is not accessible, you can upload the license using secure copy (SCP).

For information about injecting FortiFlex license tokens, see *Injecting tokens into FortiGate-VM* in the [Flex VM Deployment Guide](#).

To upload the license using SCP:

1. Enable SCP:

```
config system global
    set admin-scp enable
end
```

2. Enable SSH in the administrative access for the interface where the transfer will take place:

```
config system interface
    edit <interface>
        append allowaccess ssh
    next
end
```

3. On your computer, upload the VM license. This example is for Linux:

```
scp <filename> <admin-user>@<FortiGate_IP>:vmlicense
```

Types of VM licenses

FortiGate-VM offers perpetual licensing (normal series and V-series) and annual subscription licensing (S-series). SKUs are based on the number of vCPUs (1, 2, 4, 8, 16, 32, or unlimited).

The FortiFlex program allows qualified enterprise and MSSP customers to create as many VM entitlements as required. Resource consumption is based upon predefined points that are calculated on a daily basis. For information, see the *FortiFlex Program Guide* in the [Fortinet document library](#).

Feature	Normal series	V-series	S-series	FortiFlex
Licensing and support	The VM base is perpetual. You must separately contract support services on an annual basis. See the price list for details.		Single annually contracted SKU that contains a VM base and a FortiCare service bundle. Four support service bundle types are available: <ul style="list-style-type: none"> • Only FortiCare • UTM • Enterprise • ATP 	An annually contracted program to create multiple sets of a single entitlement per VM. Entitlements contain a VM base and FortiCare bundle. Four support service bundle types are available: <ul style="list-style-type: none"> • Only FortiCare • UTM • Enterprise • ATP
vCPU number upgrade during contracted term	Not supported.		Supported. You can also upgrade the support service bundle. Contact a Fortinet sales representative to upgrade.	Supported. You can apply different VM entitlement configurations in the FortiFlex portal. API is not supported at this time.
vCPU number downgrade during contracted term	Not supported.			
VDOM support	By default, each CPU level supports up to a certain number of VDOMs. Refer to the FortiGate-VM data sheet for default limits.	By default, all CPU levels do not support adding VDOMs. V-series VM instances support split-task VDOMs without any additional VDOM licenses.	By default, all CPU levels do not support adding VDOMs. S-series VM instances support split-task VDOMs without any additional VDOM licenses. S-series VM instances support the subscription VDOM license.	FortiFlex instances support split-task VDOMs without any additional VDOM licenses.

Consuming a new vCPU

In a scenario where you have not allocated all the vCPUs allotted by your VM entitlement, you can add additional vCPUs to your FortiGate VM. The vCPU allocation can be verified in the GUI and CLI.

To confirm the vCPU allocation in the GUI:

1. Go to *Dashboard > Status*, and locate the *Virtual Machine* widget.
2. Verify the *Allocate vCPUs* field, which displays the number and percentage of allocated vCPUs.

To confirm the vCPU allocation in the CLI:

```
# get system status | grep "VM Resources"  
VM Resources: 1 CPU/4 allowed, 2006 MB RAM
```

You can increase the number of vCPUs on running FortiGate VM models that support hot-adding. Once the hot-adding is complete, perform one of the following for FortiOS to recognize the new CPUs:

- Enter `execute cpu add <number_of_new_vCPUs>`.
- Reboot the FortiGate.

CLI troubleshooting

In some cases, you can view more information from the CLI to diagnose issues with VM licensing. This is also useful when the GUI is inaccessible due to an invalid contract.

Before you begin, ensure that your FortiGate has the proper routes to connect to the Internet. Run all following debug commands for a full picture of the issue.

To view the license status, expiration date, and VM resources:

```
# get system status  
Version: FortiGate-VM64-KVM v6.4.2,build1723,200730 (GA)  
...  
Serial-Number: FGVM08*****  
....  
License Status: Valid  
License Expiration Date: 2020-12-10  
VM Resources: 1 CPU/8 allowed, 2010 MB RAM  
...
```

To display license details:

```
# diagnose debug vm-print-license  
SerialNumber: FGVM08*****  
CreateDate: Tue Dec 10 00:57:32 2019  
License expires: Thu Dec 10 00:00:00 2020  
Expiry: 366  
Key: yes  
Cert: yes  
Key2: yes  
Cert2: yes  
Model: 08 (11)  
CPU: 8  
MEM: 2147483647
```

To display license information from FortiGuard:

```
# diagnose hardware sysinfo vm full
UUID:      abbe*****
valid:     1
status:    1
code:      200
warn:      0
copy:      0
received:  4604955037
warning:   4600905081
recv:      202009152207
dup:
```

Field	Value and description
Valid	0 – Invalid 1 – Valid
Status	0 – Startup 1 – Success 2 – Warning 3 – Error 4 – Invalid Copy 5 – Eval Expired 6 - Grace Period. For FortiFlex, there is a two-hour grace period to begin passing traffic upon retrieving the license from FortiCare.
Code	2xx, 3xx – Success 200 – Valid 202 – Accepted (treated as correct response code) 4xx - Error 400 – Expired 401 – Duplicate 5xx – Warning 500 - Warning 502 – Invalid. Cannot connect to FDS 6xx – Evaluation license expired Other codes - Error

The following are examples of common combinations:

This combination indicates the license is valid and functioning normally:

```
valid: 1
status: 1
code: 200
```

This combination indicates the license itself is valid, but is running on a duplicate instance:

```
valid: 1
status: 4
code: 401
```

This combination indicates the system cannot connect to FortiGuard:

```
valid: 0
status: 2
code: 502
```

This combination indicates the license is expired and invalid:

```
valid: 0
status: 3
code: 400
```

This combination indicates the VM is unlicensed:

```
valid: 0
status: 3
code: 0
```

For FortiFlex licenses, the following command allows you to enter the license token and proxy information:

```
# execute vm-license <token> https://<username>:<password>@<proxy IP address>:<proxy port>
```

The following error codes can be received from the FortiCare server:

```
1 - Runtime error (server unhandled error on FortiCare sever)
57 - License Token is invalid
58 - License Token is already used and cannot be used again to retrieve license key
```

The following error code can be generated on the FortiGate itself:

```
60 - Failed to request forticare license. Failed to download VM license.
```

Contact [Fortinet Support](#) for assistance if your licensing issue persists.

Adding VDOMs with FortiGate v-series

Each FortiGate-VM base license type allows a default number of virtual domains (VDOM). This topic provides sample procedures to add VDOMs beyond the default number using separately purchased VDOM licenses.

This topic consists of the following steps:

1. [Activate the FortiGate-VM with the base license.](#)
2. [Add more VDOMs to the FortiGate-VM.](#)

To activate the FortiGate-VM with the base license:

1. Purchase and register the FortiGate-VM base license in FortiCare:
 - a. Purchase the FortiGate-VM base license from Fortinet or a Fortinet reseller.
 - b. You receive a license certification with a registration code. Open the certification.
 - c. Log in to [Fortinet Customer Service & Support](#).
 - d. Go to *Asset > Register/Activate* and enter the provided registration code.
 - e. Follow the registration process. The serial number generates and displays on the *Registration Completion*

page.

- f. Go to *Asset > Manage/View Products*. Click the serial number to download the license file.
2. Upload the FortiGate-VM base license file to FortiOS:
 - a. Log in to the FortiGate-VM GUI.
 - b. In *Dashboard > Status*, in the *Virtual Machine* widget, click *FortiGate VM License*.
 - c. Click the *Upload* button.
 - d. Select the FortiGate-VM base license file, then click *OK*. The FortiGate-VM reboots after applying the base license.
3. Verify the FortiGate-VM base license status and VDOM information:
 - a. Log in to the FortiGate-VM GUI.
 - b. In *Dashboard > Status*, in the *Virtual Machine* widget, ensure that there is a checkmark in front of the FortiGate-VM base license name. The checkmark indicates that the base license is valid.
 - c. You can check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently one. This is correct since the FortiGate-VM base license only supports the default root VDOM that the system uses.

To add more VDOMs to the FortiGate-VM:

You can repeat this procedure multiple times to stack multiple VDOM licenses on the same FortiGate-VM.

1. Purchase and register the FortiGate-VM upgrade license in FortiCare. This example adds 15 VDOMs:
 - a. Purchase the FortiGate-VM upgrade license from Fortinet or a Fortinet reseller.
 - b. You receive a license certification with a registration code. Open the certification.
 - c. Log in to [Fortinet Customer Service & Support](#).
 - d. Go to *Asset > Register/Activate* and enter the provided registration code.
 - e. On the *Specify License Confirmation Information* screen, enter the FortiGate-VM serial number to apply the VDOM upgrade license to the FortiGate-VM. In this example, the FortiGate-VM serial number is *FGVM4VTM19000476*.

- f. Follow the registration process.
- g. Go to *Asset > Manage/View Products >* . Select the desired product, then click *License & Key*. The VDOM upgrade license displays under *Registered License(s)*, and a key for adding 15 VDOMs (in this example

M6JSD-8EE32-VHIJB-N) displays under Available Key(s).

Registered License(s)

License Type	License Number	Registration Date
VDOM Upgrade	VDOM4713241427	2018-04-13
Virtual Domain License Add 15		
FortiGateVM	FGVM4713410408	2019-04-29
FortiGate-VM for all supported platforms. 4 x vCPU core and up to 6GB RAM		

Available Key(s)

Key	License Number	Description
Get The License File	FGVM4713410408	FortiGate-VM for all supported platforms. 4 x vCPU core and up to 6GB RAM
M6JSD-8EE32-VHIJB-N	VDOM4713241427	Virtual Domain License for 15

- Apply the FortiGate-VM upgrade license key to FortiOS:
 - Log in to the FortiGate-VM CLI in the local console or using SSH.
 - Apply the VDOM upgrade license key:

```
FGVM4V/TM19000476 # execute upd-vd-license M6JSD-8EE32-VHIJB-N
update vdom license succeeded
```
- Verify the FortiGate-VM VDOM information:
 - Log in to the FortiGate-VM CLI in the local console or using SSH.
 - Check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently 15. When you add VDOMs for the first time on a FortiGate-VM v-series instance, FortiOS does not count the default VDOM, as the default VDOM is the so-called root VDOM that the system uses and FortiOS does not treat it as a countable VDOM in terms of VDOM addition. Therefore, as in this example, if your FortiGate-VM had the default VDOM configuration, then you add 15 VDOMs, FortiOS displays the maximum VDOM number as 15, not 16.

```

PF and VF SR-IOV driver and virtual SPU support

Physical Function (PF) and Virtual Function (VF) PCI Passthrough and SR-IOV drivers in FortiGate guest VM are supported.

PF provides the ability for PCI Passthrough, but requires an entire Network Interface Card (NIC) for a VM. It can usually achieve greater performance than a Virtual Function (VF) based SR-IOV. PF is also expensive. While VF allows one NIC to be shared among multiple guests VMs, PF is allocated to one port on a VM.

The supported driver versions are:

Driver	Version	Hypervisor	PCI-Passthrough/SR-IOV	vSPU (In-guest DPDK)	Note
ixgbe	5.6.5	ESXi, KVM	Yes	Yes	
ixgbev	4.6.3	ESXi, KVM	Yes		
i40e	2.15.9	ESXi, KVM	Yes	Yes	
i40evf	3.6.15	ESXi, KVM	Yes	Yes	Available in FortiOS 6.4.0 and earlier versions.
lavf	4.1.1	ESXi, KVM	Yes	Yes	Replaces i40evf in FortiOS 6.4.1 and later versions. Supports Intel E810-C 100G adapters.
Mlx5	4.6-1.0.1	ESXi, KVM	Yes	Yes	Supports Nvidia ConnectX-5 and ConnectX-6 100G adapters.
Bnxt_en	1.10.1-216.0.416.1	ESXi, KVM	Yes	Yes	Available in FortiOS 6.4.3 and later versions. Supports Broadcom P2100G 100G adapters.
Vmxnet3	1.4.a.0-k-NAPI	ESXi		Yes	The combination of VMware ESXi and NSX-T does not support virtual SPU (vSPU).

Other hypervisors, such as Xen or Microsoft Hyper-V, may work with vSPU, although they are unverified.

All tools and software utilities for UEFI 1.X have been removed from 6.2.0 and later releases. Update to UEFI 2.x to use the UEFI tools or software utilities.

You perform the configuration to use PF or VF on the hypervisor, and do not configure it on the FortiGate.

To check what driver is being used on the FortiGate:

```
# diagnose hardware deviceinfo nic port2
Name:          port2
Driver:        i40e
Version:       2.4.10
Bus:           0000:03:00.0
Hwaddr:        3c:fd:fe:1e:98:02
Permanent Hwaddr:3c:fd:fe:1e:98:02
State:         up
Link:          up
Mtu:           1500
Supported:     auto 1000full 10000full
Advertised:    auto 1000full 10000full
Auto:          disabled
Rx packets:    0
Rx bytes:      0
Rx compressed: 0
...
```

Using OCI IMDSv2

OCI IMDSv2 offers increased security for accessing instance metadata compared to IMDSv1. IMDSv2 is used in OCI SDN connectors and on instance deployments with bootstrap metadata. When upgrading from previous FortiOS builds with legacy IMDSv1 endpoints, the endpoints will be updated to IMDSv2, and the same calls can be made.

The following use cases illustrate IMDSv2 support on the FortiGate-VM.

To configure the Oracle OCI instance to use IMDSv2:

1. In OCI, deploy an instance using IMDSv2 with bootstrap metadata. There are two methods to enable IMDSv2 :
 - Use the OCI command line to deploy an instance using `user-data`. This example uses a MIME file that contains the license and configuration, as well as a JSON file that specifies to disable V1 metadata.

```
oci compute instance launch
--availability-domain ww1:US-ASHBURN-AD-1
--compartment-id
ocidl.tenancy.oc1..aaaaaaaaaaaa3aaaaaaaaaaaaaaaaa7xxxxxx54aaaaaa4xxxxxxxx55xxxa
--display-name fos-byol-v6.4.6-b2290-emulated
```

```
--image-id
ocidl.image.oc1.iad.aaaaaaa6xxx43xxxxxxxx7aaaaaaaaaaaaaaaaaaaaa3xxxxxxxxxxxxxxxx
--subnet-id
ocidl.subnet.oc1.iad.aaaaaaaaxxxxxxxxx2xxxxxxxxxxxxxxxxxxxxxxxx5aaa4xxxxxxxxxxxx42aaa
--shape VM.Standard1.4
--assign-public-ip true
--user-data-file /home/oci/userdata/mime.txt
--ssh-authorized-keys-file /home/oci/userdata/myfirstkeypair.pub
--instance-options file://home/oci/scripts/metadatav2.json

root@mail:/home/oci/scripts# cat metadatav2.json
{
  "areLegacyImsEndpointsDisabled": true
}
```

- While the instance is running, edit the instance metadata service version in the GUI ,and change the allowed IMDS version to *VERSION 2 ONLY* (see [Getting Instance Metadata](#) in the OCI documentation).

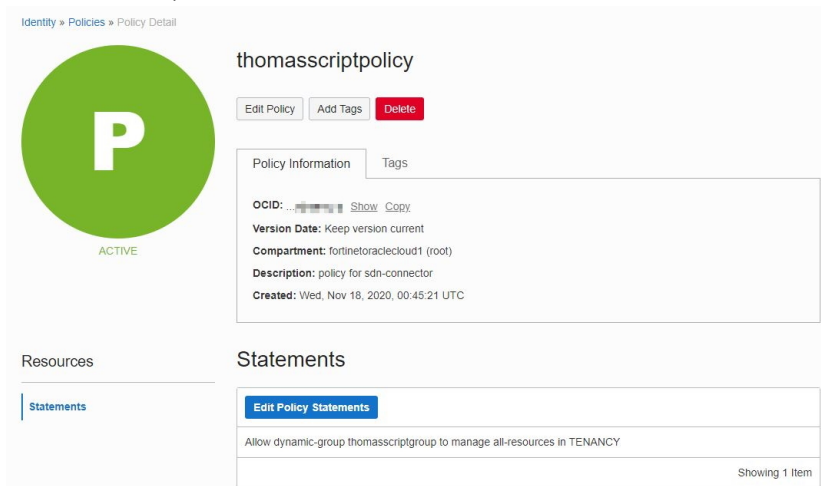

2. The FortiGate will use the metadata v2 endpoints to get the metadata bootstrap information. In FortiOS, verify this by running the following after bootup:

```
# diagnose debug cloudinit show
```

To configure an SDN connector with meta-IAM enabled and firewall addresses to obtain dynamic addresses:

1. Configure an IAM policy and dynamic group (see [How Policies Work](#) and [Managing Dynamic Groups](#) in the OCI documentation).

Identity » Dynamic Groups » Dynamic Group Details

thomasscriptgroup

ACTIVE

Edit Dynamic Group Add Tags Delete

Dynamic Group Information Tags

OCID: [redacted] Description: dynamic group for sdn-connector
 Created: Wed, Nov 18, 2020, 00:56:17 UTC

Resources

Matching Rules

Edit All Matching Rules

Instances that meet the criteria defined by all of these rules will be included in the dynamic group.

ANY (Instance.id = 'ocid1.instance.oc1.iad.[redacted]')

Showing 1 Matching Rule < 1 of 1 >

2. In FortiOS, configure the OCI Fabric connector (see [OCI SDN connector using certificates on page 2638](#) for detailed instructions):
 - a. Create the SDN connector.
 - b. Verify that the OCI connector comes up (*Security Fabric > External Connectors* page indicates the status is up).
 - c. Configure a dynamic firewall address with a filter.
 - d. Verify the dynamic firewall address is resolved by the SDN connector.

To manually update the external IP:

```
# execute update-eip
instance: fos-byol-v6.4.6-b2290-emulated
  vnic0: fos-byol-v6.4.6-b2290-emulated
    10.0.0.58 (129.213.138.192)
port1: 10.0.0.58, eip: 129.213.138.192
EIP is updated successfully
```

To verify the OCI daemon debugs related to metadata:

```
# diagnose test application ocid 4
instance: fos-byol-v6.4.6-b2290-emulated
  vnic0: fos-byol-v6.4.6-b2290-emulated
    10.0.0.58

# diagnose test application ocid 5
Compartment
Id:ocid1.tenancy.oc1..aaaaaaaa3aaaaaaaaaaaaaaaa7xxxxxxx54aaaaaa4xxxxxxxxx55xxxa
Instance Id:ocid1.instance.oc1.iad.aaaaaaaaaaaaaaaaaaaa4aaaaa5aaaaaaaa4xxxxxxxx2aaaaaaaa
Instance Name:fos-byol-v6.4.6-b2290-emulated
OCI Regarxiehlion:us-ashburn-1

# diagnose test application ocid 6
Instance Principal Token has been refreshed
```

FIPS cipher mode for AWS, Azure, OCI, and GCP FortiGate-VMs

AWS, Azure, OCI, and GCP FortiGate-VMs support FIPS cipher mode. You must remove all VPN configurations before you can enable FIPS CC mode.

FIPS cipher mode only allows a restricted set of ciphers for features that require encryption, such as SSH, IPsec and SSL VPN, and HTTPS. You cannot use insecure protocols such as Telnet, TFTP, and HTTP to access the FortiGate-VM.

You must perform a factory reset to disable `fips-ciphers` mode.

To enable fips-cipher mode:

```
config system fips-cc
    set status fips-ciphers
end
Warning: entering fips-ciphers mode. To exit this mode, factory reset is required.
Do you want to continue? (y/n) y
```

The following behavior occurs when you enable FIPS cipher mode:

- You can restore a license, image, configuration, and so on from an FTP server.
- The following options are available:

SSH algorithms	<ul style="list-style-type: none"> • aes128-gcm@openssh.com • aes256-gcm@openssh.com • hmac-sha2-256 • hmac-sha2-512
IKE/IPsec phase1 proposals	<ul style="list-style-type: none"> • aes128-sha256 • aes128-sha256 • aes128-sha384 • aes128-sha384 • aes128-sha512 • aes128-sha512 • aes128gcm-prfsha256 • aes128gcm-prfsha256 • aes128gcm-prfsha384 • aes128gcm-prfsha384 • aes128gcm-prfsha512 • aes128gcm-prfsha512 • aes256-sha256 • aes256-sha256 • aes256-sha384 • aes256-sha384 • aes256-sha512 • aes256-sha512 • aes256gcm-prfsha256 • aes256gcm-prfsha256

- The FortiCare license is validated.
- FortiGuard databases and engines are updated.
- The DH-RSA-AES128-GCM-SHA256 and DH-RSA-AES256-GCM-SHA384 ciphers are not supported.

TPM support for FortiGate-VM

Using the TPM module, the FortiGate can generate, store, and authenticate cryptographic keys. When TPM is enabled on a FortiGate, the admin must set a 32-digit hexadecimal master-encryption-password to encrypt sensitive data on the FortiGate such as admin passwords, IPsec VPN preshared keys (PSK), and other passwords and keys as this document lists. In turn, a TPM-generated primary key, which is stored on the TPM, encrypts this master-encryption-password.

When the FortiGate backs up configurations to a configuration file, the master-encryption-password encrypts passwords and keys. The primary key also encrypts the master-encryption-password. Therefore, when restoring a config file, if the FortiGate unit does not have TPM enabled, or does not have the same master-encryption-key, you cannot upload the configuration file.

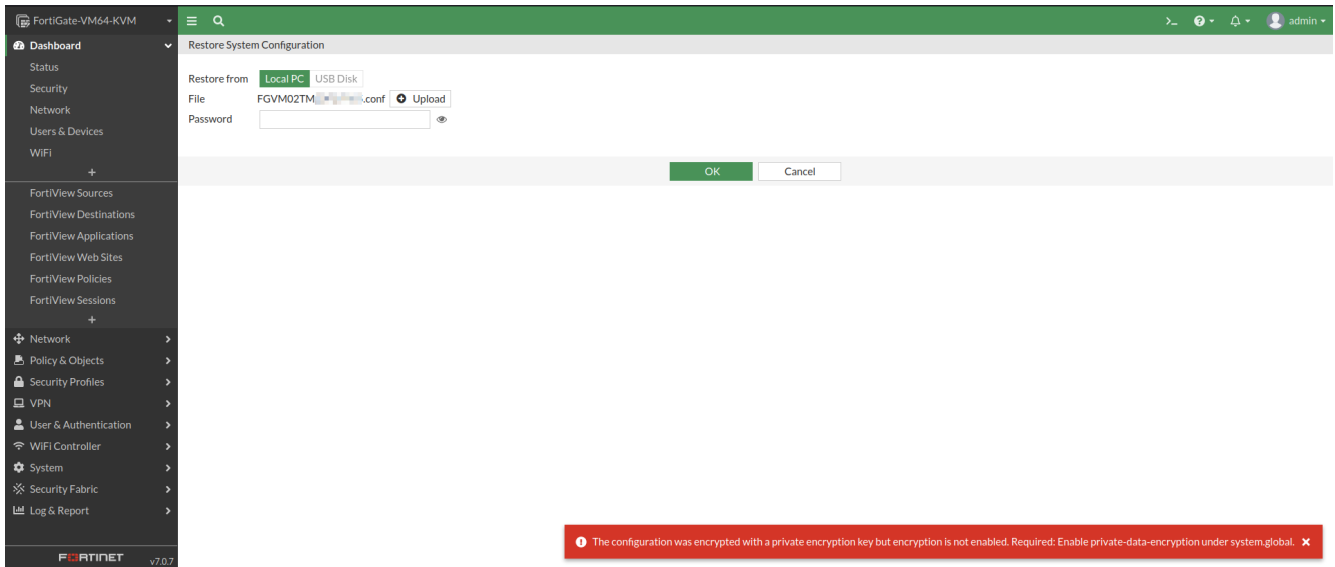

This enhancement adds TPM support to FGT-VM64 platforms. Hypervisors with software TPM emulator packages installed can support the TPM feature in FortiOS. This feature supports KVM/QEMU.

For information about TPM, see [Trusted platform module support on page 2090](#).

Passwords and keys that the masterencryptionkey can encrypt include:

- Alert email user password
- BGP and other routing-related configurations
- External resource
- FortiGuard proxy password
- FortiToken/FortiToken Mobile seed
- High availability password
- Link Monitor server-side password
- IPsec VPN PSK
- Local certificate private key
- SDN connector server-side password
- Local, LDAP, RADIUS, FSSO, and other user category-related passwords
- Modem/PPPoE
- NST password
- NTP Password
- SNMP
- Wireless security-related password

You cannot restore a private key-encrypted configuration via the FortiOS GUI if `private-data-encryption` is disabled. The following shows the GUI in this scenario:

To check if your FortiGate has a TPM:

1. Verify that the required packages are installed on the Linux KVM host:

```
packet@kvm-s01:~$ lsb_release -a
No LSB modules are available.
Distributor ID:      Ubuntu
Description:        Ubuntu 22.04.1 LTS
Release:            22.04
Codename:           jammy
packet@kvm-s01:~$
packet@kvm-s01:~$ apt list swtpm swtpm-tools qemu libvirt0 virtinst
Listing... Done
libvirt0/jammy-updates,jammy-updates,now 8.0.0-1ubuntu7.1 amd64
[installed,automatic]
qemu/jammy-updates,jammy-updates,now 1:6.2+dfsg-2ubuntu6.3 amd64 [installed]
swtpm-tools/jammy,jammy,now 0.6.3-0ubuntu3 amd64 [installed]
swtpm/jammy,jammy,now 0.6.3-0ubuntu3 amd64 [installed]
virtinst/jammy,jammy,jammy,jammy,now 1:4.0.0-1 all [installed]
```

2. Import a FGT_VM64_KVM VM to the host. You may want to change the following script to fit your setup:

```
UUID="$(uuid)"
SKU="FGT_VM64_KVM"
VER=7
NUM=0418
CPU=2
RAM=2048
CONTROLLER="type=ide,index=0"
BUS="ide"
MODEL="virtio"
RND_MAC() { printf '90:6C:AC:%02X:%02X\n' $((RANDOM%256)) $((RANDOM%256)) ;}
MACADDR=$(RND_MAC)
```

```
DOMAIN=$SKU-v$VER-b$NUM
```

```
qemu-img create -f qcow2 $DOMAIN-log.qcow2 1024M
qemu-img create -f qcow2 $DOMAIN-wanopt.qcow2 1024M
```

```
virt-install --connect qemu:///system \
    --name $DOMAIN \
    --uuid $UUID \
    --virt-type kvm \
    --arch=x86_64 \
    --hvm \
    --osinfo linux \
    --os-variant=generic \
    --graphics vnc,listen=0.0.0.0 --noautoconsole \
    --cpu host-passthrough \
    --vcpus=$CPU \
    --ram $RAM \
    --sysinfo host \
    --controller $CONTROLLER \
    --boot hd,menu=on \
    --disk fortios.qcow2,device=disk,bus=$BUS,format=qcow2,cache=none,io=native \
    --disk $DOMAIN-log.qcow2,device=disk,bus=$BUS,format=qcow2,cache=none,io=native \
    --disk $DOMAIN-wanopt.qcow2,device=disk,bus=$BUS,format=qcow2,cache=none,io=native \
    \
    --features kvm_hidden=on,smm=on \
    --tpm backend.type=emulator,backend.version=2.0,model=tpm-tis \
    --network bridge=br1,model=$MODEL,mac=$MACADDR:01 \
    --network bridge=br2,model=$MODEL,mac=$MACADDR:02 \
    --network bridge=br3,model=$MODEL,mac=$MACADDR:03 \
    --network bridge=br4,model=$MODEL,mac=$MACADDR:04 \
    --import
```

Key pairs are created on the host when the VM with TPM is imported:

```
packet@kvm-s01:~$ sudo ls -al /var/lib/swtpm-localca/
total 56
drwxr-x---  2 swtpm root  4096 Sep 21 08:09 .

FGT_VM64_KVM # diagnose tpm SHA-256 1234567890abcdef1234567890abcdef
1234567890abcdef1234567890abcdef
```

TPM2_Hash of '1234567890abcdef1234567890abcdef' with SHA-256:

```
0x00000000:  C5  12  D9  2E  35  45  B2  F1
0x00000008:  22  2E  4B  4C  6A  F6  D3  30
0x00000010:  EC  30  02  A0  4B  CA  A4  1D
0x00000018:  F9  CC  2C  49  62  84  96  D6
```

4. Enable TPM and input the master encryption password. This is an example. Using 0123456789abcdef0123456789abcdef as your private key is not recommended:

```
FGT_VM64_KVM # exec private-encryption-key sample
Private encryption is not enabled.
Command fail. Return code 7
```

```
FGT_VM64_KVM #
FGT_VM64_KVM # config system global
```

```
FGT_VM64_KVM (global) # set private-data-encryption enable
```

```
FGT_VM64_KVM (global) # end
```

Please type your private data encryption key (32 hexadecimal numbers):

```
1234567890abcdef1234567890abcdef
```

Please re-enter your private data encryption key (32 hexadecimal numbers) again:

```
1234567890abcdef1234567890abcdef
```

Your private data encryption key is accepted.

The following shows an example of a successful activation:

```
FGT_VM64_KVM # exec private-encryption-key sample
B64TEXT: u7oOx1iBjPFu4XLZVq5/RpoZrDJ9htRo6Jjhfts4BaI=
B64HMAC: FHmUhzSyT0IEfyoRnfdTFbY2l0o=
```

Note the B64TEXT and B64HMAC sample keys. Run the following to verify the feature:

```
FGT_VM64_KVM # exec private-encryption-key verify
u7oOx1iBjPFu4XLZVq5/RpoZrDJ9htRo6Jjhfts4BaI= FHmUhzSyT0IEfyoRnfdTFbY2l0o=
Verification passed.
```

5. Back up the config:

```
FGT_VM64_KVM # execute backup config tftp FGVM02TM12345678.conf 172.18.70.161
Please wait...
Connect to tftp server 172.18.70.161 ...
#
Send config file to tftp server OK.
```

6. Verify that the backup config has private-encryption-key:

```
packet@1804:/mnt/incoming$ less FGVM02TM12345678.conf
#config-version=FGVMK6-7.0.8-FW-build0418-220920:opmode=0:vdom=0:user=admin
#conf_file_ver=2079893748141389
#buildno=0418
#global_vdom=1
```

```
#private-encryption-key=oY5GhQK3w0Ddn0EX+8hp6UYpjB4=
config system global
    set admin-server-cert "Fortinet_Factory"
    set alias "FortiGate-VM64-KVM"
    set hostname "FGT_VM64_KVM"
    set private-data-encryption enable
    set timezone 04
end
```

7. Factory reset the FortiGate and restore the backup config. If private-data-encryption is disabled, the restore fails:

```
FGT_VM64_KVM # execute factoryreset keepvmlicense
This operation will reset the system to factory default except VM license!
Do you want to continue? (y/n)y
```

System is resetting to factory default...

The system is going down NOW !!

```
FGT_VM64_KVM #
```

After reboot:

```
FGT_VM64_KVM # execute restore config tftp FGVM02TM12345678.conf 172.18.70.161
This operation will overwrite the current setting and could possibly reboot the
system!
Do you want to continue? (y/n)y
```

Please wait...

Connect to TFTP server 172.18.70.161 ...

Get file from TFTP server OK.

The configuration was encrypted with a private encryption key but encryption is not enabled. Required: Enable private-data-encryption under system.global.
Command fail. Return code -910

The backup config restore fails if private-data-encryption is enabled with a incorrect master key:

```
FGT_VM64_KVM # config system global
```

```
FGT_VM64_KVM (global) # set private-data-encryption enable
```

```
FGT_VM64_KVM (global) # end
```

Please type your private data encryption key (32 hexadecimal numbers):

```
ac6bdcdee2701aledc6d594898e34f50
```

Please re-enter your private data encryption key (32 hexadecimal numbers) again:

```
ac6bdcdee2701aledc6d594898e34f50
```

Your private data encryption key is accepted.

```
FGT_VM64_KVM #
FGT_VM64_KVM # execute restore config tftp FGVM02TM12345678.conf 172.18.70.161
This operation will overwrite the current setting and could possibly reboot the
system!
Do you want to continue? (y/n)y

Please wait...
Connect to TFTP server 172.18.70.161 ...

Get file from TFTP server OK.
The configuration was encrypted with a private encryption key that does not match
the current in-use private encryption key.
Command fail. Return code -911

You can only restore the backup config when private-data-encryption is enabled with the correct master
key.

FGT_VM64_KVM # config system global

FGT_VM64_KVM (global) # set private-data-encryption disable

FGT_VM64_KVM (global) # end

FGT_VM64_KVM #
FGT_VM64_KVM # config system global

FGT_VM64_KVM (global) # set private-data-encryption enable

FGT_VM64_KVM (global) # end
Please type your private data encryption key (32 hexadecimal numbers):
1234567890abcdef1234567890abcdef
Please re-enter your private data encryption key (32 hexadecimal numbers) again:
1234567890abcdef1234567890abcdef
Your private data encryption key is accepted.

FGT_VM64_KVM # execute restore config tftp FGVM02TM12345678.conf 172.18.70.161
This operation will overwrite the current setting and could possibly reboot the
system!
Do you want to continue? (y/n)y

Please wait...
Connect to TFTP server 172.18.70.161 ...

Get file from TFTP server OK.
File check OK.

FGT_VM64_KVM #

The system is going down NOW !!
```

Please stand by while rebooting the system.

Troubleshooting

This section is intended for administrators with super_admin permissions who require assistance with basic and advanced troubleshooting. Administrators with other types of permissions may not be able to perform all of the tasks in this section.

This section contains the following troubleshooting topics:

- [Troubleshooting methodologies on page 2847](#)
- [Troubleshooting scenarios on page 2850](#)
 - [Checking the system date and time on page 2851](#)
 - [Checking the hardware connections on page 2852](#)
 - [Checking FortiOS network settings on page 2853](#)
 - [Troubleshooting CPU and network resources on page 2856](#)
 - [FortiGuard server settings on page 2899](#)
 - [Troubleshooting high CPU usage on page 2858](#)
 - [Checking the modem status on page 2862](#)
 - [Running ping and traceroute on page 2863](#)
 - [Checking the logs on page 2868](#)
 - [Verifying routing table contents in NAT mode on page 2869](#)
 - [Verifying the correct route is being used on page 2869](#)
 - [Verifying the correct firewall policy is being used on page 2870](#)
 - [Checking the bridging information in transparent mode on page 2870](#)
 - [Checking wireless information on page 2872](#)
 - [Performing a sniffer trace or packet capture on page 2872](#)
 - [Debugging the packet flow on page 2876](#)
 - [Testing a proxy operation on page 2879](#)
 - [Displaying detail Hardware NIC information on page 2880](#)
 - [Performing a traffic trace on page 2883](#)
 - [Using a session table on page 2884](#)
 - [Finding object dependencies on page 2887](#)
 - [Diagnosing NPU-based interfaces on page 2888](#)
 - [Identifying the XAUI link used for a specific traffic stream on page 2889](#)

 - [FortiGuard troubleshooting on page 2898](#)
 - [View open and in use ports on page 2901](#)
- [Additional resources on page 2902](#)

Troubleshooting methodologies

The sections in this topic provide an overview of how to prepare to troubleshoot problems in FortiGate. They include verifying your user permissions, establishing a baseline, defining the problem, and creating a plan.

Verify user permissions

Before you begin troubleshooting, verify the following:

- You have administrator privileges for the FortiGate.
- The FortiGate is integrated into your network.
- The operation mode is configured.
- The system time, DNS settings, administrator password, and network interfaces are configured.
- Firmware, FortiGuard AntiVirus, FortiGuard Application Control, and FortiGuard IPS are up to date.

If you are using a FortiGate that has virtual domains (VDOMs) enabled, you can often troubleshoot within your own VDOM. However, you should inform the super_admin for the FortiGate that you will be performing troubleshooting tasks.

You may also need access to other networking equipment, such as switches, routers, and servers to carry out tests. If you do not have access to this equipment, contact your network administrator for assistance.

Establish a baseline

FortiGate operates at all layers of the OSI model. For this reason, troubleshooting can be complex. Establishing baseline parameters for your system before a problem occurs helps to reduce the complexity when you need to troubleshoot.

A best practice is to establish and record the normal operating status. Regular operation data shows trends, and allows you to see where changes occur when problems arise. You can gather this data by using logs and SNMP tools to monitor the system performance or by regularly running information gathering commands and saving the output.

You should back up your FortiOS configuration on a regular basis even when you are not troubleshooting. You can restore the backed up configuration as needed to save time recreating it from the factory default settings.

Use the following CLI commands to obtain normal operating data for a FortiGate:

<code>get system status</code>	Displays firmware versions and FortiGuard engine versions, and other system information.
<code>get system performance status</code>	Displays CPU and memory states, average network usage, average sessions and session setup rate, viruses caught, IPS attacks blocked, and uptime.
<code>get hardware memory</code>	Displays information about memory.

<code>get system session status</code>	Displays total number of sessions.
<code>get router info routing-table all</code>	Displays all the routes in the routing table, including their type, source, and other useful data.
<code>get ips session</code>	Displays memory used and maximum amount available to IPS as well as counts
<code>get webfilter ftgd-statistics</code>	Displays a list of FortiGuard related counts of status, errors, and other data.
<code>diagnose sys session list</code>	Displays the list of current detailed sessions.
<code>show sys dns</code>	Displays the configured DNS servers.
<code>diagnose sys ntp status</code>	Displays information about NTP servers.

You can run any commands that apply to your system for information gathering. For example, if you have active VPN connections, use the `get vpn` series of commands to get more information about them.

Use `execute tac report` to get an extensive snapshot of your system. This command runs many diagnostic commands for specific configurations. It also records the current state of each feature regardless of the features deployed on your FortiGate. If you need to troubleshoot later, you can run the same command again and compare the differences to identify any suspicious output.

Define the problem

The following questions are intended to compare the current behavior of the FortiGate with normal operations to help you define the problem. Be specific with your answers. After you define the problem, search for a solution in the troubleshooting scenarios section, and then create a plan to resolve it.

What is the problem?	The problem being observed may not be the actual problem. You should determine where the problem lies before starting to troubleshoot the FortiGate.
Was the device working before?	If the device never worked, it might be defective. For more information, see Troubleshooting your installation on page 33 .
Can the problem be reproduced?	If the problem is intermittent, it may be dependent on system load. Intermittent problems are challenging to troubleshoot because they are difficult to reproduce.
What has changed?	Use the FortiGate event log to identify possible configuration changes. There may be changes in the operating environment. For example, there might be a gradual increase in load as more sites are forwarded through the firewall. If something has changed, roll back the change and assess the impact.
What is the scope of the problem?	After you isolate the problem, determine what applications, users, devices, and operating systems the problem affects. The following questions are intended to narrow the scope of the problem and identify what to check during troubleshooting. The more factors you can eliminate, the less you need to check. For this reason, be as specific and accurate as possible when gathering information. <ul style="list-style-type: none"> • What is not working?

- Is more than one thing not working?
- Is it partly working? If so, what parts are working?
- Is it a connectivity issue for the entire device, or is there an application that isn't reaching the Internet?
- Where did the problem occur?
- When did the problem occur and to which users or groups of users?
- What components are involved?
- What applications are affected?
- Can you use a packet sniffer to trace the problem?
- Can you use system debugging or look in the session table to trace the problem?
- Do any of the log files indicate a failure has occurred?

Create a troubleshooting plan

After you define the problem and its scope, develop a troubleshooting plan.

Create checklist

Make a list all the possible causes of the problem and how you can test for each cause.

Create a checklist to keep track of what has been tried and what is left to test. Checklists are useful when more than one person is performing troubleshooting tasks.

Obtain the required equipment

Testing your solution may require additional networking equipment, computers, or other devices.

Network administrators usually have additional networking equipment available to loan you, or a lab where you can bring the FortiGate unit to test.

If you do not have access to equipment, check for shareware applications that can perform the same tasks. Often, there are software solutions you can use when hardware is too expensive.

Consult Fortinet troubleshooting resources

After the checklist is created, refer to the troubleshooting scenarios sections to assist with implementing your plan. See [Troubleshooting scenarios on page 2850](#).

Gather information for technical support

If you still require technical assistance after the plan is implemented, be prepared to provide Fortinet technical support with following information:

- Firmware build version (use the `get system status` command)
- Network topology diagram
- Recent configuration file
- Recent debug log (optional)
- Summary of troubleshooting steps you have taken and the results.

Do not provide the output from the `execute tac` report unless the support team requests it. The output from this command is very large and is not required in many cases.

Contact technical support

Before contacting technical support, ensure you have login access (preferably with full read/write privileges) to all networking devices that could be relevant to troubleshooting.

If you are using VMs, be prepared to have someone who can log in to the virtual hosting platform in case it is necessary to check and possibly modify resource allocation.

For information about contacting technical support, go to [FortiCare Support Service](#) page.

Troubleshooting scenarios

The following table is intended to help you diagnose common problems and provides links to the corresponding troubleshooting topics:

Problem	Probable cause	Recommended action
Hardware connections	<ul style="list-style-type: none"> Are all of the cables and interfaces connected properly? Is the LED for the interface green? 	Checking the hardware connections on page 2852
FortiOS network settings	<ul style="list-style-type: none"> If you are having problems connecting to the management interface, is your protocol enabled on the interface for administrative access? Does the interface have an IP address? 	Checking FortiOS network settings on page 2853
CPU and memory resources	<ul style="list-style-type: none"> Is the CPU running at almost 100 percent usage? Is your FortiGate running low on memory? 	Troubleshooting CPU and network resources on page 2856
Modem status	<ul style="list-style-type: none"> Is the modem connected? Are there PPP issues? 	Checking the modem status on page 2862
Ping and traceroute	Is the FortiGate experiencing complete packet loss?	Running ping and traceroute on page 2863
Logs	Do you need to identify a problem?	Checking the logs on page 2868
Contents of the routing table (in NAT mode)	<ul style="list-style-type: none"> Are there routes in the routing table for default and static routes? Do all connected subnets have a route in the routing table? Does a route have a higher priority than it should? 	Verifying routing table contents in NAT mode on page 2869
Traffic routes	Is the traffic routed correctly?	Verifying the correct route is being used on page 2869

Problem	Probable cause	Recommended action
Firewall policies	Is the correct firewall policy applied to the expected traffic?	Verifying the correct firewall policy is being used on page 2870
Bridging information in transparent mode	Are you having problems in transparent mode?	Checking the bridging information in transparent mode on page 2870
Firewall session list	Are there active firewall sessions?	Using a session table on page 2884
Wireless Network	Is the wireless network working properly?	Checking wireless information on page 2872
FortiGuard connectivity	Is the FortiGate communicating properly with FortiGuard?	Verifying connectivity to FortiGuard on page 2898
Sniffer trace	<ul style="list-style-type: none"> Is traffic entering the FortiGate? Does the traffic arrive on the expected interface? Is the ARP resolution correct for the next-hop destination? Is the traffic exiting the FortiGate to the destination as expected? Is the FortiGate sending traffic back to the originator? 	Performing a sniffer trace or packet capture on page 2872
Packet flow	Is traffic entering or leaving the FortiGate as expected?	Debugging the packet flow on page 2876
FortiGate is frozen or halted	The FortiGate may have experienced a kernel issue.	On supported models, use the NMI button to troubleshoot kernel issues.

Checking the system date and time

The system date and time are important for FortiGuard services, logging events, and sending alerts. The wrong time makes the log entries confusing and difficult to use.

When possible, use Network Time Protocol (NTP) to set the date and time. This is an automatic method that does not require manual intervention. However, you must ensure that the port is allowed through the firewalls on your network. FortiToken synchronization requires NTP in many situations.

For information about setting the system date and time, see [Setting the system time on page 2073](#).

To view and configure the date and time in the GUI:

1. Go to *Dashboard > Status*. The date and time are displayed in the *System Information* widget, next to *System Time*.
2. Go to *System > Settings*.
3. In the *System Time* section, select *NTP*, and then configure the *Time Zone*, and *Set Time* settings as required.

To view the date and time in the CLI:

```
execute date
```

```
execute time
```

To configure the date and time in the CLI:

Use the `set timezone ?` command to display a list of timezones and the integers that represent them.

```
config system global
  set timezone <integer>
end
config system ntp
  set type custom
  config ntpserver
    edit 1
      set server "ntp1.fortinet.net"
    next
    edit 2
      set server "ntp2.fortinet.net"
    next
  end
  set ntpsync enable
  set syncinterval 60
end
```

Checking the hardware connections

If traffic is not flowing from the FortiGate, there may be a problem with the hardware connection.

To check hardware connections:

1. Ensure the network cables are plugged into the interfaces.
2. Verify the LED connection lights for the network cables indicate there is a connection. The lights are typically green when there is a connection.
3. Change the cable when:
 - The cable or its connector are damaged.
 - You are unsure of the type or quality of the cable, such as straight through or crossover.
 - You see exposed wires at the connector.
4. Connect the FortiGate to different hardware.
5. Go to *Network > Interfaces* to ensure the link status for the interface is set to *Up*. The link status is based on the physical connection and cannot be set in FortiOS.

To enable an interface in the GUI:

You should still perform basic software connectivity tests to ensure complete connectivity even if there was a problem with the hardware connection. The interface might also be disabled, or its *Status* might be set to *Down*. See [Interfaces on page 142](#).

1. Go to *Network > Interfaces*.
2. Select an interface, such as *Port1*, and click *Edit*.
3. In the *Miscellaneous* area, next to *Status*, click *Enabled*.
4. Click *OK*.

To enable an interface in the CLI:

```
config system interface
  edit port1
    set status up
  next
end
```

Checking FortiOS network settings

Check the FortiOS network settings if you have problems connecting to the management interface. FortiOS network settings include, interface settings, DNS Settings, and DHCP settings.

Interface settings

If you can access the FortiGate with the management cable only, you can view the interface settings in the GUI.

To view the interface settings in the GUI:

1. Go to *Network > Interfaces*.
2. Select an interface and click *Edit*.
3. Check the following interfaces to ensure they are not blocking traffic.

Setting	Description
Link Status	The status is <i>Up</i> when a valid cable is plugged in. The status is <i>Down</i> when an invalid cable is plugged in. The Link Status is shown physically by the connection LED for the interface. If the LED is green, the connection is good. If Link Status is <i>Down</i> , the interface does not work. Link status also appears in the <i>Network > Interfaces</i> page by default.
Addressing mode	Do not use <i>DHCP</i> if you do not have a DHCP server. You will not be able to log into an interface in DHCP mode as it will not have an IP address.
IP/Network Mask	An interface requires an IP address to connect to other devices. Ensure there is a valid IP address in this field. The one exception is when <i>DHCP</i> is enabled for this interface to get its IP address from an external DHCP server.
IPv6 address	The same protocol must be used by both ends to complete the connection. Ensure this interface and the remote connection are both using IPv4 or both are using IPv6 addresses.
Administrative access	If no protocols are selected, you will have to use the local management cable to connect to the unit. If you are using IPv6, configure the IPv6 administrative access protocols.
Status	Ensure the status is set to <i>Up</i> or the interface will not work.

To display the internal interface settings in the CLI:

```
FGT# show system interface <interface_name>
```

To view the list of possible interface settings:

```
config system interface
  edit <interface_name>
    get
end
```

DNS settings

To view DNS settings in the GUI:

Go to *Network > DNS*.

You can trace many networking problems back to DNS issues. Check the following items:

1. Are there values for both the *Primary DNS server* and *Secondary DNS server* fields.
2. Is the *Local Domain Name* correct?
3. Are you using IPv6 addressing? If so, are the IPv6 DNS settings correct?
4. Are you using Dynamic DNS (DDNS)? If so, is it using the correct server, credentials, and interface?
5. Can you contact both DNS servers to verify the servers are operational?
6. If an interface addressing mode is set to DHCP and is set to override the internal DNS, is that interface receiving a valid DNS entry from the DHCP server? Is it a reasonable address and can it be contacted to verify it is operational?
7. Are there any DENY security policies that need to allow DNS?
8. Can any internal device perform a successful traceroute to a location using the FQDN?

DHCP server settings

DHCP servers are common on internal and wireless networks. The DHCP server will cause problems if it is not configured correctly.

To view DHCP server settings in the GUI:

1. Go to *Network > Interfaces*.
2. Select an interface, and click *Edit*.

Check the following items:

1. Is the DHCP server enabled?
2. Is the DHCP server entry set to *Relay*? If so, verify there is another DHCP server to which requests can be relayed. Otherwise, set it to *Server*.
3. Does the DHCP server use a valid IP address range? Are other devices using the addresses? If one or more devices are using IP addresses in this range, you can use the IP reservation feature to ensure the DHCP server does not use these addresses. See [DHCP servers and relays on page 323](#)
4. Is there a gateway entry? If not, add a gateway entry to ensure that the server's clients have a default route.
5. Is the system DNS setting being used? A best practice is to avoid confusion by using the system DNS whenever possible. However, you can specify up to three custom DNS servers, and you should use all three entries for redundancy.

There are some situations, such as a new wireless interface, or during the initial FortiGate configuration, where interfaces override the system DNS entries. When this happens, it often shows up as intermittent Internet connectivity.

To fix the problem, go to *Network > DNS*, and enable *Use FortiGuard Servers*.

Checking CPU and memory resources

Check the CPU and memory resources when the FortiGate is not working, the network is slow, or there is a reduced firewall session setup rate. All processes share the system resources in FortiOS, including CPU and memory.

To view system resources in the GUI:

Go to *Dashboard > Status*. The resource information is located in the *CPU* and *Memory* widgets. For information, see [Dashboards and Monitors on page 83](#).

To view system resources in the CLI:

```
# get system performance status
```

Sample output:

```
# get system performance status
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU0 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU1 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU2 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU3 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
Memory: 2039608k total, 1154872k used (56.6%), 571856k free (28.0%), 312880k freeable
(15.4%)
Average network usage: 0 / 0 kbps in 1 minute, 1 / 9 kbps in 10 minutes, 2 / 45 kbps in 30
minutes
Maximal network usage: 1 / 0 kbps in 1 minute, 36 / 1630 kbps in 10 minutes, 655 / 6758 kbps
in 30 minutes
Average sessions: 7 sessions in 1 minute, 7 sessions in 10 minutes, 6 sessions in 30 minutes
Maximal sessions: 9 sessions in 1 minute, 13 sessions in 10 minutes, 36 sessions in 30
minutes
Average session setup rate: 0 sessions per second in last 1 minute, 0 sessions per second in
last 10 minutes, 0 sessions per second in last 30 minutes
Maximal session setup rate: 0 sessions per second in last 1 minute, 5 sessions per second in
last 10 minutes, 14 sessions per second in last 30 minutes
Average NPU sessions: 0 sessions in last 1 minute, 0 sessions in last 10 minutes, 0 sessions
in last 30 minutes
Maximal NPU sessions: 0 sessions in last 1 minute, 0 sessions in last 10 minutes, 0 sessions
in last 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 9 days, 0 hours, 38 minutes
```

- The first lines of the output show the CPU usage by category for each CPU core:

```
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU0 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
```

```
CPU1 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU2 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU3 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
```

- The next line of the output shows the memory usage:

```
Memory: 2039608k total, 1154872k used (56.6%), 571856k free (28.0%), 312880k freeable
(15.4%)
```

Memory usage should not exceed 90%. Using too much memory prevents some processes from functioning properly. For example, if the system is running low on memory, antivirus scanning enters into *failopen* mode where it drops connections or bypasses the antivirus system.

- Network usage, sessions, session setup rate, and NPU sessions are shown next, summarizing the network and session usage. Samples are taken every three seconds. The `Average` values are the average of all of the samples taken during the sample period (1, 10, 30 minutes, and so on). The `Maximal` values are the maximum values recorded during the sample period.
- For example, a high average network usage may indicate high traffic processing on the FortiGate, while a very low or zero average session setup rate may indicate the proxy is overloaded and unable to function.
- The `viruses caught` and `IPS attacks blocked` lines help determine why system resource usage is high.

Troubleshooting CPU and network resources

FortiGate has stopped working

If the FortiGate has stopped working, the first line of the output will look similar to this:

```
CPU states: 0% user 0% system 0% nice 100% idle
```

Network is slow

If your network is running slow, the first line of the output will look similar to this:

```
CPU states: 1% user 98% system 0% nice 1% idle
```

This example shows that all of the CPU is being used by system processes, and the FortiGate is overloaded. When overloading occurs, it is possible a process such as `scanunitid` is using all the resources to scan traffic. In this case you need to reduce the amount of traffic being scanned by blocking unwanted protocols, configuring more security policies to limit scanning to certain protocols, or similar actions.

It is also possible a hacker has accessed your network and is overloading it with malicious activity, such as running a spam server or using zombie PCs to attack other networks on the Internet.

You can use the following commands to investigate the problem with the CPU:

```
# get system performance top <delay> <lines>
# diagnose sys top <delay> <lines> <repeat>
```

These commands show all of the top processes that are running on the FortiGate and their CPU usage; the process names are on the left. If a process is using most of the CPU cycles, investigate it to determine whether that activity is normal.

Reduced firewall session setup rate

A reduced firewall session setup rate can be caused by a lack of system resources on the FortiGate, or reaching the session count limit for a VDOM.

As a best practice, administrators should record the session setup rate during normal operation to establish a baseline to help define a problem when your are troubleshooting.

The session setup rate appears in the `average sessions` section of the output.

A reduced firewall session setup rate will look similar to this:

```
Average sessions: 80 sessions in 1 minute, 30 sessions in 10 minutes, 42 sessions in 30
minutes
```

```
Average session setup rate: 3 sessions per second in last 1 minute, 0 sessions per second in
last 10 minutes, 0 sessions per second in last 30 minutes
```

In the example above, there were 80 sessions in 1 minute, or an average of 3 sessions per second.

The values for `10 minutes` and `30 minutes` allow you to take a longer average for a more reliable value if your FortiGate is working at maximum capacity. The smallest FortiGate can have 1,000 sessions established per second across the unit.

The session setup rate is a global command. If you have multiple VDOMs configured with many sessions in each VDOM, the session setup rate per VDOM will be slower than if there are no VDOMs configured.

High memory usage

As with any system, a FortiGate has limited hardware resources, such as memory, and all processes running on the FortiGate share the memory. Each process uses more or less memory, depending on its workload. For example, a process usually uses more memory in high traffic situations. If some processes use all of the available memory, other processes will not be able to run.

When high memory usage occurs, the services may freeze up, connections may be lost, or new connections may be refused.

If you see high memory usage in the *Memory* widget, the FortiGate may be handling high traffic volumes. Alternatively, the FortiGate may have problems with connection pool limits that are affecting a single proxy. If the FortiGate receives large volumes of traffic on a specific proxy, the unit may exceed the connection pool limit. If the number of free connections within a proxy connection pool reaches zero, issues may occur.

To view current memory usage information in the CLI:

```
# diagnose hardware sysinfo memory
```

Sample output:

```
# diagnose hardware sysinfo memory
MemTotal:      3075676 kB
MemFree:       1067428 kB
MemAvailable:  1490772 kB
```

Troubleshooting high CPU usage

Connection-related problems may occur when FortiGate's CPU resources are over extended. This occurs when you deploy too many FortiOS features at the same time.

Examples of CPU intensive features:

- VPN high-level encryption
- Intensive scanning of all traffic
- Logging all traffic and packets
- Dashboard widgets that frequently perform data updates

For information on customizing the CPU use threshold, see [Execute a CLI script based on memory and CPU thresholds on page 2570](#).

Determining the current level of CPU usage

You can view CPU usage levels in the GUI or CLI. For precise usage values for both overall usage and specific processes, use the CLI.

To view CPU usage in the GUI:

Go to *Dashboard > Status*. Real-time CPU usage information is located in the *CPU* widget.

To view CPU usage in the CLI:

- Show top processes information:
`diagnose sys top`
- Show top threads information:
`diagnose sys top-all`

Sample output:

```
Run Time: 86 days, 0 hours and 10 minutes
OU, ON, OS, 100I, OWA, OHI, OSI, OST; 3040T, 2437F
bcm.user 93 S < 3.1 0.4
httpsd 18922 S 1.5 0.5
httpsd 19150 S 0.3 0.5
newcli 20195 R 0.1 0.1
cmdbsvr 115 S 0.0 0.8
pyfcgid 20107 S 0.0 0.6
forticron 146 S 0.0 0.5
httpsd 139 S 0.0 0.5
cw_acd 166 S 0.0 0.5
miglogd 136 S 0.0 0.5
pyfcgid 20110 S 0.0 0.4
pyfcgid 20111 S 0.0 0.4
pyfcgid 20109 S 0.0 0.4
httpsd 20192 S 0.0 0.4
miglogd 174 S 0.0 0.4
miglogd 175 S 0.0 0.4
fgfmd 165 S 0.0 0.3
newcli 20191 S 0.0 0.3
initXXXXXXXXXXXX 1 S 0.0 0.3
httpsd 184 s 0.0 0.3
```

The following table explains the codes in the second line of the output:

Code	Description
U	Percentage of user space applications that are currently using the CPU
N	Percentage of time that the CPU spent on low priority processes since the last shutdown
S	Percentage of system processes (or kernel processes) that are using the CPU
I	Percentage of idle CPU resources
WA	Percentage of time that the CPU spent waiting on IO peripherals since the last shutdown
HI	Percentage of time that the CPU spent handling hardware interrupt routines since the last shutdown
SI	Percentage of time that the CPU spent handling software interrupt routines since the last shutdown
ST	Steal time: Percentage of time a virtual CPU waits for the physical CPU when the hypervisor is servicing another virtual processor
T	Total FortiOS system memory in MB
F	Free memory in MB

Each additional line of the command output displays information specific to processes or threads that are running on the FortiGate unit. For example, the sixth line of the output is: `newcli 20195 R 0.1 0.1`

The following table describes the data in the sixth line of the output:

Item	Description
<code>newcli</code>	The process (or thread) name. Duplicate process or thread names indicate that separate instances of that process or thread are running.
<code>20195</code>	The process or thread ID, which can be any number.
<code>R</code>	Current state of the process or thread. The process or thread state can be: <ul style="list-style-type: none"> • R - running • S - sleep • Z - zombie • D- disk sleep
<code>0.1</code>	The percentage of CPU capacity that the process or thread is using. CPU usage can range from 0.0 for a process or thread that is sleeping to higher values for a process or thread that's taking a lot of CPU time.
<code>0.1</code>	The amount of memory that the process or thread is using. Memory usage can range from 0.1 to 5.5 and higher.

You can use the following single-key commands when running `diagnose sys top` or `diagnose sys top-all`:

- `q` to quit and return to the normal CLI prompt.
- `p` to sort the processes by the amount of CPU that the processes are using.
- `m` to sort the processes by the amount of memory that the processes are using.

The output only displays the top processes or threads that are running. For example, if 20 are listed, they are the top 20 currently running, sorted by either CPU or memory usage. You can configure the number of processes or threads displayed, using the following CLI commands:

```
diagnose sys top <integer_seconds> <integer_maximum_lines>
diagnose sys top-all <integer_seconds> <integer_maximum_lines>
```

Where:

- <integer_seconds> is the delay in seconds (default is 5)
- <integer_maximum_lines> is the maximum number of lines (or processes) to list (default is 20)

Determining which features are using the most CPU resources

You can use the CLI to view the top few processes that are currently running and using the most CPU resources.

To view processes using the most CPU resources:

```
get system performance top
```

The entries at the top are using the most CPU resources. The second column from the right shows CPU usage by percentage. Note which processes are using the most resources and try to reduce their CPU load.

Processes you will see include:

- `ipsengine`: the IPS engine that scans traffic for intrusions
- `scanunitd`: antivirus scanner
- `httpsd`: secure HTTP
- `iked`: internet key exchange (IKE) in use with IPsec VPN tunnels
- `newcli`: active whenever you're accessing the CLI
- `sshd`: there are active secure socket connections
- `cmdbsrv`: the command database server application

Go to the features that are at the top of the list and look for evidence of CPU overuse. Generally, the monitor for a feature is a good place to start.

Checking for unnecessary CPU “wasters”

These are some best practices that will reduce your CPU usage, even if the FortiGate is not experiencing high CPU usage. Note that if the following information instructs you to turn off a feature that you require, disregard that part of the instructions.

- Use hardware acceleration wherever possible to offload tasks from the CPU. Offloading tasks, such as encryption, frees up the CPU for other tasks.
- Schedule antivirus, IPS, and firmware updates during off-peak hours. These updates do not usually consume CPU resources but they can disrupt normal operation.
- Check the log levels and which events are being logged. This is the severity of the messages that are recorded. Consider going up one level to reduce the amount of logging. Also, if there are events you do not need to monitor, remove them from the list.
- Log to FortiCloud instead of logging to memory or disk. Logging to memory quickly uses up resources and logging to local disk impacts overall performance and reduces the lifetime of the unit. Fortinet recommends logging to FortiCloud to avoid using too much CPU.

- If the disk is almost full, transfer the logs or data off the disk to free up space. When a disk is almost full it consumes a lot of resources to find free space and organize the files.
- If packet logging is enabled on the FortiGate, consider disabling it. When packet logging is enabled, it records every packet that comes through that policy.
- Halt all sniffers and traces.
- Ensure the FortiGate isn't scanning traffic twice. Traffic does not need to be rescanned if it enters the FortiGate on one interface, goes out another, and then comes back in again. Doing so is a waste of resources. However, ensure that traffic truly is being scanned once.
- Reduce the session timers to close unused sessions faster. Enter the following CLI commands, which reduce the default values. Note that, by default, the system adds 10 seconds to `tcp-timewait`.

```
config system global
    set tcp-halfclose-timer 30
    set tcp-halfopen-timer 30
    set tcp-timewait-timer 0
    set udp-idle-timer 60
end
```

- Go to *System > Feature Visibility*, and enable only features that you need.

SNMP monitoring

When CPU usage is under control, use SNMP to monitor CPU usage. Alternatively, use logging to record CPU and memory usage every 5 minutes.

Once the system is back to normal, you should set up a warning system that sends alerts when CPU resources are used excessively. A common method to do this is using SNMP. SNMP monitors many values in FortiOS and allows you to set high water marks that generate events. You can run an application on your computer to watch for and record these events.

To enable SNMP:

1. Go to *System > SNMP*.
2. Configure an SNMP community.

See [SNMP on page 2255](#).

You can use the *System Resources* widget to record CPU usage if SNMP is too complicated. However, the widget only records problems as they happen and will not send you alerts for problems.

Checking the modem status

You can use the CLI to troubleshoot a modem that is not working properly, or troubleshoot a FortiGate that does not detect the modem.

To diagnose modem issues in the CLI:

```
diagnose sys modem {cmd | com | detect | history | external-modem | query| reset}
```

You should always run the following command after you connect a USB modem to FortiGate:

```
diagnose sys modem detect
```

Use the following command to view the modem's configuration, vendor and custom product identification number:

```
get system modem
```

Use the following commands to resolve connectivity issues:

- `diagnose debug enable`: Activates the debug on the console
- `diagnose debug application modemd`: Dumps communication between the modem and the unit.
- `diagnose debug application ppp`: Dumps the PPP negotiating messages.
- `execute modem dial`: Displays modem debug output.

The modem diagnose output should not contain errors when initializing. You should also verify the number used to dial into your ISP.

Running ping and traceroute

Ping and traceroute are useful tools in network troubleshooting. Alone, either tool can determine network connectivity between two points. However, ping can be used to generate simple network traffic that you can view using `diagnose` commands in FortiGate. This combination can be very powerful when you are trying to locate network problems.

Ping and traceroute can also tell you if your computer or network device has access to a domain name server (DNS). Both tools can use IP addresses or device domain names to determine why particular services, such as email or web browsing, may not work properly.

If ping does not work, it may be disabled on at least one of the interface settings and security policies for that interface.

Both ping and traceroute require particular ports to be open on firewalls to function. Since you typically use these tools to troubleshoot, you can allow them in the security policies and on interfaces only when you need them. Otherwise, keep the ports disabled for added security.

Ping

The ping command sends a very small packet to a destination, and waits for a response. The response has a timer that expires when the destination is unreachable.

Ping is part of layer 3 on the OSI Networking Model. Ping sends Internet Control Message Protocol (ICMP) “echo request” packets to the destination, and listens for “echo response” packets in reply. However, many public networks block ICMP packets because ping can be used in a denial of service (DoS) attack (such as Ping of Death or a smurf attack), or by an attacker to find active locations on the network. By default, FortiGate units have ping enabled while broadcast-forward is disabled on the external interface.

What ping can tell you

Beyond the basic connectivity information, ping can tell you the amount of packet loss (if any), how long it takes the packet to make the round trip, and the variation in that time from packet to packet.

If packet loss is detected, you should investigate the following:

- Possible ECMP, split horizon, or network loops.
- Cabling, to ensure there are no loose connections.

- Verify which security policy was used. To do this:
Go to *Policy & Objects > Firewall Policy* and view the packet count column.

If there is total packet loss, you should investigate the following:

1. Ensure cabling is correct, and all equipment between the two locations is accounted for.
2. Ensure all IP addresses and routing information along the route is configured as expected.
3. Ensure all firewalls, including FortiGate security policies allow PING to pass through.

FortiGate ping options

Use the following CLI to view all the FortiGate ping options:

```
execute ping-options ?
adaptive-ping      Adaptive ping <enable|disable>.
data-size          Integer value to specify datagram size in bytes.
df-bit             Set DF bit in IP header <yes | no>.
interface          Auto | <outgoing interface>.
interval           Integer value to specify seconds between two pings.
pattern            Hex format of pattern, e.g. 00ffaabb.
repeat-count       Integer value to specify how many times to repeat PING.
reset              Reset settings.
source             Auto | <source interface IP>.
timeout            Integer value to specify timeout in seconds.
tos                IP type-of-service option.
ttl                Integer value to specify time-to-live.
use-sdwan          Use SD-WAN rules to get output interface <yes | no>.
validate-reply     Validate reply data <yes | no>.
view-settings      View the current settings for PING option.
```

<code>adaptive-ping {enable disable}</code>	Enable or disable adaptive ping. FortiGate sends the next packet after the last response is received.
<code>data-size <integer></code>	Specify the size of data in bytes. The size excludes ICMP header information. The data size allows you to control the ICMP datagram size to test the effects of different packet sizes on the connection. Enter an integer value from <0> to <65507>.
<code>df-bit {yes no}</code>	Don't fragment bit. Prevent or allow the ICMP packet to fragment: <ul style="list-style-type: none"> • <code>yes</code>: Prevent the ICMP packet from being fragmented. • <code>no</code>: Allow the ICMP packet to be fragmented.
<code>interface {auto <outgoing interface>}</code>	Specify the outgoing interface: <ul style="list-style-type: none"> • <code>auto</code>: Automatically select the interface based on the destination and routing table. • <code><outgoing interface></code>: Manually specify the interface to be used for ping. When <code>source</code> is specified, the IP address will be used as the ping source IP.
<code>interval <integer></code>	Specify the time between pings in seconds. Enter an integer value from <1> to <2147483647>.
<code>pattern <string></code>	Specify a pattern in hex format, for example, 00ffaabb, to be used in the data section of the ICMP packet.

<code>repeat-count <integer></code>	Specify how many times to repeat the ping attempt. Enter an integer value from <1> to <2147483647>.
<code>reset</code>	Reset ping options to default values.
<code>source {auto <source interface IP>}</code>	Specify the source IP address to use for sending out ping: <ul style="list-style-type: none"> <code>auto</code>: Selects the primary IP address of the source interface. <code><source interface ip></code>: Specify a source IP address for the interface used.
<code>timeout <integer></code>	Specify in seconds how long to wait until the ping times out. Enter an integer value from <0> to <2147483647>.
<code>tos</code>	Set the type of service (ToS) field in the packet header to indicate the desired quality of service: <ul style="list-style-type: none"> <code>default</code>: Defaults to 0. <code>lowcost</code>: Minimize the cost. <code>lowdelay</code>: Minimize the delay. <code>reliability</code>: Maximize reliability. <code>throughput</code>: Maximize throughput.
<code>ttl <integer></code>	Specify the time to live. Time to live is the number of hops the ping packet should be allowed to make before being discarded or returned. Enter an integer value from <1> to <1255>.
<code>use-sdwan {yes no}</code>	Specify whether to use SD-WAN rules and policy routes. <ul style="list-style-type: none"> <code>yes</code>: The ping follows SD-WAN rules and policy routes. Usually used with other options, such as <code>source</code>, to match a specific SD-WAN rule that is based on a specific source address. <code>no</code>: Do not follow SD-WAN rules and policy routes.
<code>validate-reply {yes no}</code>	Specify whether to validate reply data: <ul style="list-style-type: none"> <code>yes</code>: Validate reply data. <code>no</code>: Do not validate reply data.
<code>view-settings</code>	Display the current ping option settings.

How to use ping

Ping syntax is the same for nearly every type of system on a network.

To ping from a FortiGate unit:

1. Go to *Dashboard*, and connect to the CLI through either telnet or the CLI widget.
2. Enter `execute ping 10.11.101.101` to send 5 ping packets to the destination IP address.
To modify ping options, first apply your changes using the command `execute ping-options <option> <setting>`.

```
# execute ping 10.11.101.101
PING 10.11.101.101 (10.11.101.101): 56 data bytes
64 bytes from 10.11.101.101: icmp_seq=0 ttl=255 time=0.3 ms
64 bytes from 10.11.101.101: icmp_seq=1 ttl=255 time=0.2 ms
```

```
64 bytes from 10.11.101.101: icmp_seq=2 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=3 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=4 ttl=255 time=0.2 ms

--- 10.11.101.101 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.2/0.2/0.3 ms
```

3. Enter the domain name to test name resolution.

```
# execute ping google.com
PING google.com (142.250.179.78): 56 data bytes
```

To ping from a Microsoft Windows PC:

1. Open a command window.
2. Enter `ping 10.11.101.100` to ping the default internal interface of the FortiGate with four packets.

Other options include:

- `-t` to send packets until you press `Ctrl+C`
- `-a` to resolve addresses to domain names where possible
- `-n X` to send `X` ping packets and stop

```
C:\>ping 10.11.101.101
```

```
Pinging 10.11.101.101 with 32 bytes of data:
Reply from 10.11.101.101: bytes=32 time=10ms TTL=255
Reply from 10.11.101.101: bytes=32 time<1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
```

```
Ping statistics for 10.11.101.101:
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 0ms, Maximum = 10ms, Average = 3ms
```

To ping from a Linux PC:

1. Go to a shell prompt.
2. Enter `"ping 10.11.101.101"`.

Traceroute

Where ping will only tell you if it reached its destination and returned successfully, traceroute shows each step of the journey to its destination and how long each step takes. If ping finds an outage between two points, you can use traceroute to locate exactly where the problem is.

Traceroute works by sending ICMP packets to test each hop along the route. It sends three packets, and then increases the time to live (TTL) setting by one each time. This effectively allows the packets to go one hop farther along the route. This is why most traceroute commands display their maximum hop count before they start tracing the route, which is the maximum number of steps it takes before it declares the destination unreachable. Also, the TTL setting may result in steps along the route timing out due to slow responses. There are many possible reasons for this to occur.

By default, traceroute uses UDP datagrams with destination ports numbered from 33434 to 33534. The traceroute utility may also offer the option to select use of ICMP echo request (type 8) instead, which the Windows `tracert` utility uses. If

you must, allow both protocols inbound through the FortiGate security policies (UDP with ports from 33434 to 33534 and ICMP type 8).

To track traceroute packets in the GUI:

Go to *Policy & Objects > Firewall Policy* and view the packet count column.

This allows you to verify the connection and confirm which security policy the traceroute packets are using.

What traceroute can tell you

Both ping and traceroute verify connectivity between two points. However, only traceroute shows you each step in the connection path. Also, ping and traceroute use different protocols and ports, so one may succeed where the other fails.

You can verify your DNS connection using traceroute. If you enter an FQDN instead of an IP address for the traceroute, DNS tries to resolve that domain name. If the name isn't resolved, you have DNS issues.

Using traceroute

The traceroute command varies slightly between operating systems. In Microsoft Windows, the command name is shortened to "tracert". Also, your output lists different domain names and IP addresses along your route.

To use traceroute on a Microsoft Windows PC:

1. Open a command window.
2. Enter `tracert fortinet.com` to trace the route from the PC to the Fortinet web site.

```
C:\>tracert fortinet.com
Tracing route to fortinet.com [208.70.202.225]
over a maximum of 30 hops:
 1 <1 ms <1 ms <1 ms 172.20.120.2
 2 66 ms 24 ms 31 ms 209-87-254-xxx.storm.ca [209.87.254.221]
 3 52 ms 22 ms 18 ms core-2-g0-0-1104.storm.ca [209.87.239.129]
 4 43 ms 36 ms 27 ms core-3-g0-0-1185.storm.ca [209.87.239.222]
 5 46 ms 21 ms 16 ms te3-x.1156.mpd01.cogentco.com [38.104.158.69]
 6 25 ms 45 ms 53 ms te8-7.mpd01.cogentco.com [154.54.27.249]
 7 89 ms 70 ms 36 ms te3-x.mpd01.cogentco.com [154.54.6.206]
 8 55 ms 77 ms 58 ms sl-st30-chi-.sprintlink.net [144.232.9.69]
 9 53 ms 58 ms 46 ms sl-0-3-3-x.sprintlink.net [144.232.19.181]
10 82 ms 90 ms 75 ms sl-x-12-0-1.sprintlink.net [144.232.20.61]
11 122 ms 123 ms 132 ms sl-0-x-0-3.sprintlink.net [144.232.18.150]
12 129 ms 119 ms 139 ms 144.232.20.7
13 172 ms 164 ms 243 ms sl-321313-0.sprintlink.net [144.223.243.58]
14 99 ms 94 ms 93 ms 203.78.181.18
15 108 ms 102 ms 89 ms 203.78.176.2
16 98 ms 95 ms 97 ms 208.70.202.225
```

The first column on the left is the hop count, which cannot exceed 30 hops. When that number is reached, the traceroute ends.

The second, third, and fourth columns display how much time each of the three packets takes to reach this stage of the route. These values are in milliseconds and normally vary quite a bit. Typically a value of <1ms indicates a local connection.

The fifth column (farthest to the right) shows the domain name of the device and its IP address, or possibly only the IP address.

To perform a traceroute on a Linux PC:

1. Go to a command line prompt.
2. Enter `tracert fortinet.com`.

The Linux traceroute output is very similar to the Windows `tracert` output.

To trace a route from a FortiGate to a destination IP address in the CLI:

```
# execute traceroute www.fortinet.com

traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
 1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms
 2 209.87.254.221 <static-209-87-254-221.storm.ca> 2.448 ms 2.519 ms 2.458 ms
 3 209.87.239.129 <core-2-g0-2.storm.ca> 2.917 ms 2.828 ms 9.324 ms

```

Checking the logs

A log message records the traffic passing through FortiGate to your network and the action FortiGate takes when it scans the traffic. You should log as much information as possible when you first configure FortiOS. If FortiGate logs are too large, you can turn off or scale back the logging for features that are not in use.

It is difficult to troubleshoot logs without a baseline. Before you can determine if the logs indicate a problem, you need to know what logs result from normal operation.

When troubleshooting with log files

- Compare current logs to a recorded baseline of normal operation.
- If you need to, increase the level of logging (such as from Warning to Information) to obtain more information. When increasing logging levels, ensure that you configure email alerts and select both disk usage and log quota. This ensures that you will be notified if the increase in logging causes problems.

To configure the log settings in the GUI:

Go to *Log & Report > Log Settings*.

Determine the activities that generate the most log entries:

- Check all logs to ensure important information is not overlooked.
- Filter or order log entries based on different fields, such as level, service, or IP address, to look for patterns that may indicate a specific problem, such as frequent blocked connections on a specific port for all IP addresses.

Logs can help identify and locate any problems, but they do not solve them. The purpose of logs is to speed up your problem solving and save you time and effort.

For more information about logging and log reports, see [Log and Report on page 2716](#).

Verifying routing table contents in NAT mode

Verify the contents of the routing table when a FortiGate has limited or no connectivity.

The routing table stores the routes currently in use for both static and dynamic protocols. Storing a route in the routing table saves time and resources performing a lookup. To ensure the most recently used routes remain in the table, old routes are bumped to make room for new ones. You cannot perform this task when FortiGate is in transparent mode.

If FortiGate is running in NAT mode, verify that all desired routes are in the routing table, including local subnets, default routes, specific static routes, and dynamic routing protocols.

To view the routing table in the CLI:

```
get router info routing-table all
```

Sample output:

```
FGT# get router info routing-table all
Codes:
  K - kernel, C - connected, S - static, R - RIP, B - BGP
  O - OSPF, IA - OSPF inter area
  N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
  E1 - OSPF external type 1, E2 - OSPF external type 2
  i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
  * - candidate default
S* 0.0.0.0/0 [10/0] via 172.20.120.2, wan1
C 10.31.101.0/24 is directly connected, internal
C 172.20.120.0/24 is directly connected, wan1
```

Verifying the correct route is being used

Run a trace route from a machine in the local area network (LAN) to ensure traffic is flowing as expected through the correct route when there is more than one default route.

In the following example output:

- The first hop contains the IP address 10.10.1.99, which is the internal interface of the FortiGate.
- The second hop contains the IP address 172.20.120.2, to which the wan1 interface of the FortiGate is connected.

This means the route through the wan1 interface is being used for this traffic.

```
C:\>tracert www.fortinet.com
Tracing route to www.fortinet.com [66.171.121.34]
over a maximum of 30 hops:
 1 <1 ms <1 ms <1 ms 10.10.1.99
 2 1 ms <1 ms <1 ms 172.20.120.2
 3 3 ms 3 ms 3 ms static-209-87-254-221.storm.ca [209.87.254.221]
 4 3 ms 3 ms 3 ms core-2-g0-2.storm.ca [209.87.239.129]
 5 13 ms 13 ms 13 ms core-3-bdi1739.storm.ca [209.87.239.199]
```

```
6 12 ms 19 ms 11 ms v502.core1.tor1.he.net [216.66.41.113]
7 22 ms 22 ms 21 ms 100ge1-2.core1.nyc4.he.net [184.105.80.9]
8 84 ms 84 ms 84 ms ny-paix-gni.twgate.net [198.32.118.41]
9 82 ms 84 ms 82 ms 217-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.217]
10 82 ms 81 ms 82 ms 229-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.229]
11 82 ms 82 ms 82 ms 203.78.181.2
12 84 ms 83 ms 83 ms 203.78.186.70
13 84 ms * 85 ms 66.171.127.177
14 84 ms 84 ms 84 ms fortinet.com [66.171.121.34]
15 84 ms 84 ms 83 ms fortinet.com [66.171.121.34]
```

You can also see the route taken for each session by debugging the packet flow in the CLI. For more information, see [Debugging the packet flow on page 2876](#).

Verifying the correct firewall policy is being used

If you have more than one firewall policy, you can check which policy is being used in the *Policy & Objects* module in the GUI.

To verify the firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Look in the *Count* column to see which policy is being used. The count must show traffic increasing.

Debugging the packet flow in the CLI shows the policy ID that's allowing the traffic. For information, see [Debugging the packet flow on page 2876](#).

Checking the bridging information in transparent mode

Checking the bridging information is useful when you are experiencing connectivity problems. When FortiGate is set to transparent mode, it acts like a bridge and sends all incoming traffic out on the other interfaces. Each bridge is a link between interfaces.

When traffic is flowing between the interfaces, you can see the bridges listed in the CLI. If no bridges are listed, this is the likely cause of the connectivity issue. When investigating bridging information, check for the MAC address of the interface or device in question.

How to check the bridging information

To view the list of bridge instances in the CLI:

```
diagnose netlink brctl list
```

Sample output:

```
#diagnose netlink brctl list
list bridge information
1. root.b fdb: size=256 used=6 num=7 depth=2 simple=no
Total 1 bridges
```

How to display forwarding domain information

You can use forwarding domains, or collision domains, in routing to limit where packets are forwarded on the network. Layer 2 broadcasts are limited to the same group. By default, all interfaces are in group 0. For example, if the FortiGate has 12 interfaces, only two may be in the same forwarding domain, which limits packets that are broadcast to those two interfaces. This reduces traffic on the rest of the network.

Collision domains prevent the forwarding of ARP packets to all VLANs on an interface. Without collision domains, duplicate MAC addresses on VLANs may cause ARP packets to be duplicated. Duplicate ARP packets can cause some switches to reset. It's important to know what interfaces are part of which forwarding domains because this determines which interfaces can communicate with each other.

To manually configure forwarding domains in transparent mode in the CLI:

```
config system interface
  edit <interface_name>
    set forward-domain <integer>
  end
```

To display the forward domains information in the CLI:

```
diagnose netlink brctl domain <name> <id>
```

Where <name> is the name of the forwarding domain to display and <id> is the domain ID.

Sample output:

```
diagnose netlink brctl domain ione 101
show bridge root.b ione forward domain.
id=101 dev=trunk_1 6
```

To list the existing bridge MAC table in the CLI:

```
diagnose netlink brctl name host <name>
```

Sample output:

```
show bridge control interface root.b host.
fdb: size=256, used=6, num=7, depth=2, simple=no
Bridge root.b host table
```

port no	device	devname	mac addr	tvl	attributes
2	7	wan2	02:09:0f:78:69:00	0	Local Static
5	6	vlan_1	02:09:0f:78:69:01	0	Local Static
3	8	dmz	02:09:0f:78:69:01	0	Local Static
4	9	internal	02:09:0f:78:69:02	0	Local Static
3	8	dmz	00:80:c8:39:87:5a	194	
4	9	internal	02:09:0f:78:67:68	8	
1	3	wan1	00:09:0f:78:69:fe	0	Local Static

To list the existing bridge port list in the CLI:

```
diagnose netlink brctl name port <name>
```

Sample output:

```
show bridge root.b data port.
trunk_1 peer_dev=0
internal peer_dev=0
dmz peer_dev=0
wan2 peer_dev=0
wan1 peer_dev=0
```

Checking wireless information

Check wireless connections, stations, and interfaces when the problem is not caused by a physical interface.

Troubleshooting station connection issues

To check if a station entry is created on access control in the CLI:

```
FG600B3909600253 # diagnose wireless-controller wlac -d sta
* vf=0 wtp=70 rId=2 wlan=open ip=0.0.0.0 mac=00:09:0f:db:c4:03 rssi=0 idle=148 bw=0 use=2
vf=0 wtp=70 rId=2 wlan=open ip=172.30.32.122 mac=00:25:9c:e0:47:88 rssi=-40 idle=0 bw=9
use=2
```

Enabling diagnostics for a specific station

This example uses the station MAC address to find where it is failing:

```
FG600B3909600253 # diagnose wireless-controller wlac sta_filter 00:25:9c:e0:47:88 1
Set filter sta 00:25:9c:e0:47:88 level 1
FG600B3909600253 # 71419.245 <ih> IEEE 802.11 mgmt::disassoc <== 00:25:9c:e0:47:88 vap open
rId 1 wId 0 00:09:0f:db:c4:03
71419.246 <dc> STA del 00:25:9c:e0:47:88 vap open rId 1 wId 0
71419.246 <cc> STA_CFG_REQ(34) sta 00:25:9c:e0:47:88 del ==> ws (0-192.168.35.1:5246) rId 1
wId 0
71419.246 <cc> STA del 00:25:9c:e0:47:88 vap open ws (0-192.168.35.1:5246) rId 1 wId 0
00:09:0f:db:c4:03 sec open reason I2C_STA_DEL
71419.247 <cc> STA_CFG_RESP(34) 00:25:9c:e0:47:88 <== ws (0-192.168.35.1:5246) rc 0
(Success).
```

Performing a sniffer trace or packet capture

When you troubleshoot networks and routing in particular, it helps to look inside the headers of packets to determine if they are traveling the route that you expect them to take. Packet sniffing is also known as network tap, packet capture, or logic analyzing.

For FortiGates with NP2, NP4, or NP6 interfaces that are offloading traffic, disable offloading on these interfaces before you perform a trace or it will change the sniffer trace.

Sniffing packets

To perform a sniffer trace in the CLI:

Before you start sniffing packets, you should prepare to capture the output to a file. A large amount of data may scroll by and you will not be able to see it without saving it first. One method is to use a terminal program like puTTY to connect to the FortiGate CLI. Once the packet sniffing count is reached, you can end the session and analyze the output in the file.

The general form of the internal FortiOS packet sniffer command is:

```
# diagnose sniffer packet <interface_name> <'filter'> <verbose> <count> <tsformat>
```

To stop the sniffer, type CTRL+C.

<interface_name>	The name of the interface to sniff, such as <code>port1</code> or <code>internal</code> . This can also be <code>any</code> to sniff all interfaces.
<'filter'>	What to look for in the information the sniffer reads. <code>none</code> indicates no filtering, and all packets are displayed as the other arguments indicate. The filter must be inside single quotes (').
<verbose>	The level of verbosity as one of: <ul style="list-style-type: none"> • 1 - print header of packets • 2 - print header and data from IP of packets • 3 - print header and data from Ethernet of packets • 4 - print header of packets with interface name • 5 - print header and data from IP of packets with interface name • 6 - print header and data from Ethernet of packets with interface name
<count>	The number of packets the sniffer reads before stopping. If you don't put a number here, the sniffer will run until you stop it with <CTRL+C>.
<tsformat>	The timestamp format. <ul style="list-style-type: none"> • <code>a</code>: absolute UTC time, <code>yyyy-mm-dd hh:mm:ss.ms</code> • <code>l</code>: absolute LOCAL time, <code>yyyy-mm-dd hh:mm:ss.ms</code> • <code>otherwise</code>: relative to the start of sniffing, <code>ss.ms</code>

Simple sniffing example:

```
# diagnose sniffer packet port1 none 1 3.
```

This displays the next three packets on the `port1` interface using no filtering, and verbose level 1. At this verbosity level, you can see the source IP and port, the destination IP and port, action (such as `ack`), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets and that 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diagnose sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]
0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757
0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808
0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

Advanced sniffing example:

The following commands will report packets on any interface that are traveling between a computer with the host name of "PC1" and a computer with the host name of "PC2". With verbosity 4 and above, the sniffer trace displays the interface names where traffic enters or leaves the FortiGate unit. To stop the sniffer, type CTRL+C.

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2>" 4
or
FGT# diagnose sniffer packet any "(host <PC1> or host <PC2>) and icmp" 4
```

The following CLI command for a sniffer includes the ARP protocol in the filter which may be useful to troubleshoot a failure in the ARP resolution. For example, PC2 may be down and not responding to the FortiGate ARP requests.

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2> or arp" 4
```

Using packet capture in a firewall policy

FortiGate can capture packets matching a firewall policy. You can enable `capture-packet` in the firewall policy.

To use packet capture, the FortiGate must have a disk and logging must be enabled in the firewall policy.

To enable packet capture in a policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Enter a name for the policy and configure the required settings.
3. Enable *Log Allowed Traffic* and select *Security Events* or *All Sessions*.
4. Enable *Capture Packets*.
5. Click *OK*.

To enable packet capture in a policy in the CLI:

```
config firewall policy
  edit <id>
    set action accept
    set logtraffic {all | utm}
    set capture-packet enable
  next
end
```

To view the packet capture:

1. Go to *Log & Report > Forward Traffic* and select the log that matches the firewall policy.
2. Select *Details > Archived Data* and click on the download button.

3. Open the downloaded PCAP file in a packet analyzer tool, such as Wireshark.

Packet capture filters

To configure packet capture filters in the GUI:

1. Go to *Network > Packet Capture* and click *Create New*.
2. Enter the following information:

Interface	Select the interface to sniff from the drop-down menu. You must select one interface. You cannot change the interface without deleting the filter and creating a new one, unlike the other fields.
Max Packets to Save	Enter the number of packets to capture before the filter stops. This number cannot be zero. You can halt the capturing before this number is reached.
Enable Filters	Select this option to specify filter fields.
Host(s)	Enter the IP address of one or more hosts. Separate multiple hosts with commas. To enter a range, use a dash without spaces. For example, 172.16.1.5-172.16.1.15, or enter a subnet.
Port(s)	Enter one or more ports to capture on the selected interface. Separate multiple ports with commas. To enter a range, use a dash without spaces, for example 88-90.
VLAN(s)	Enter one or more VLANs (if any). Separate multiple VLANs with commas.
Protocol	Enter one or more protocols. Separate multiple protocols with commas. To enter a range, use a dash without spaces. For example, 1-6, 17, 21-25.
Include IPv6 Packets	Select this option if you are troubleshooting IPv6 networking, or if your network uses IPv6. Otherwise, leave it disabled.
Include Non-IP Packets	The protocols in the list are all IP based except for ICMP (ping). Use this feature to capture non-IP based packets. Examples of non-IP packets include IPsec, IGMP, ARP, and ICMP.

3. Click *OK*.

Managing filters

If you select a filter, you have the option to start and stop packet capture in the edit window, or download the captured packets. You can also see the filter status and the number of packets captured.

You can select the filter and start capturing packets. When the filter is running, the number of captured packets increases until it reaches the *Max Packet Count* or you stop it. You cannot download the output file while the filter is running.

Packet capture controls

To start, stop, or resume packet capture, use the symbols on the screen. These symbols are the same as those used for audio or video playback. Hover over the symbol to reveal explanatory text. Similarly, to download the *.pcap file, use the download symbol on the screen.

Downloading the file

You can download the *.pcap file when the packet capture is complete. You must use a third party application, such as Wireshark, to read *.pcap files. This tool provides you with extensive analytics and the full contents of the packets that were captured.

Debugging the packet flow

Debug the packet flow when network traffic is not entering and leaving the FortiGate as expected. Debugging the packet flow can only be done in the CLI. Each command configures a part of the debug action. The final commands starts the debug.

To trace the packet flow in the CLI:

```
# diagnose debug flow trace start
```

To follow packet flow by setting a flow filter:

```
# diagnose debug flow {filter | filter6} <option>
```

- Enter `filter` if your network uses IPv4.
- Enter `filter6` if your network uses IPv6.

Replace `<option>` with one of the following variables:

Variable	Description
<code>addr</code>	IPv4 or IPv6 address
<code>clear</code>	clear filter
<code>daddr</code>	destination IPv4 or IPv6 address
<code>dport</code>	destination port
<code>negate</code>	inverse IPv4 or IPv6 filter
<code>port</code>	port

Variable	Description
proto	protocol number
saddr	source address
sport	source port
vd	index of virtual domain; -1 matches all

If FortiGate is connected to FortiAnalyzer or FortiCloud, the diagnose debug flow output will be recorded as event log messages and then sent to the devices. Do not run this command longer than necessary, as it generates a significant amount of data.

Flow monitoring does not work for traffic offloaded to NP6 or NP7 processors. To use the diagnose debug flow commands with sessions offloaded to NP6 or NP7 processors you can test the traffic flow using ICMP (ICMP traffic is not offloaded) or you can disable NP6 or NP7 offloading.

You can use the following command to temporarily disable NP6 offloading of all traffic:

```
diagnose npu {np6 | np6xlite | np6lite} fastpath disable
```

You must disable NP7 offloading in the firewall policy that accepts the traffic that you are tracing, see [Tracing packet flow on FortiGates with NP7 processors](#).

You can also use the NP7 packet sniffer to sniff NP7 offloaded traffic without disabling NP7 offloading, see [NP7 packet sniffer](#).

To start flow monitoring with a specific number of packets:

```
# diagnose debug flow trace start <N>
```

To stop flow tracing at any time:

```
# diagnose debug flow trace stop
```

The following example shows the flow trace for a device with an IP address of 203.160.224.97:

```
# diagnose debug enable
# diagnose debug flow filter addr 203.160.224.97
# diagnose debug flow show function-name enable
# diagnose debug flow trace start 100
```

Sample output: HTTP

To observe the debug flow trace, connect to the website at the following address:

```
https://www.fortinet.com
```

Comment: SYN packet received:

```
id=20085 trace_id=209 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."

msg="Find an existing session, id-00000e90, reply direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=210 func=__ip_session_run_tuple
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

Lookup for next-hop gateway address for reply traffic:

```
id=20085 trace_id=210 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.3.221 via port5"
```

ACK received:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, original
direction"
```

Apply source NAT:

```
id=20085 trace_id=211 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from client:

```
id=20085 trace_id=212 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
id=20085 trace_id=212 func=resolve_ip_tuple_fast
line=2727 msg="Find an existing session, id-00000e90,
original direction"
```

Apply source NAT:

```
id=20085 trace_id=212 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from server:

```
id=20085 trace_id=213 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
203.160.224.97:80->192.168.11.59:31925) from port6."
```

Match existing session in reply direction:

```
id=20085 trace_id=213 func=resolve_ip_tuple_fast
line=2727 msg="Find an existing session, id-00000e90,
reply direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=213 func=__ip_session_run_tuple
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

Sample output: IPsec (policy-based)

```
id=20085 trace_id=1 msg="vd-root received a packet(proto=1, 10.72.55.240:1->10.71.55.10:8)
from internal."
id=20085 trace_id=1 msg="allocate a new session-00001cd3"

```

Testing a proxy operation

To monitor proxy operations in the CLI:

```
diagnose test application <application> <option>
```

To display a list of available application values:

```
diagnose test application ?
```

To display a list of available option values:

```
diagnose test application <application> ?
```

The <option> value will depend on the application value used in the command.

For example, if the application is http, the CLI command that displays the <option> values is:

```
diagnose test application http ?
```

Displaying detail Hardware NIC information

Monitoring the hardware NIC is important because interface errors indicate data link or physical layer issues which may impact the performance of the FortiGate.

To monitor hardware network operations in the CLI:

```
diagnose hardware deviceinfo nic <interface>
```

or

```
diagnose netlink interface list <interface>
```

Sample output:

The following is sample output when the <interface> is set to port1:

```
# diagnose hardware deviceinfo nic port1
Name:                port1
...

Field descriptions

The `diagnose hardware deviceinfo nic` and `diagnose netlink interface list` commands display lists of error names and values that are related to hardware.

The following table describes possible hardware errors:

Field	Description
Rx packets (rxp)	Number of received packets.
Tx packets (txp)	Number of transmitted packets.
Rx bytes (rxb)	Number of received bytes.
Tx bytes (txb)	Number of transmitted bytes.
Rx errors (rx) = rx error count	Bad frame was marked as error by PHY.
Tx errors (txe) = Tx aborted errors	ECOL (Excessive Collisions Count); only valid in half-duplex mode.
Rx CRC errors + Rx length errors - Rx align errors	This error is only valid in 10/100M mode.
Rx dropped (rxd) or Rx no buffer count	Running out of buffer space.
Tx dropped (txd)	Number of dropped packet.
Multicast (mc)	Number of multicast packets received.
Collisions	Total number of collisions experienced by the transmitter; valid in half-duplex mode.

Field	Description
Rx length errors (rxl)	Number of packets dropped due to invalid length.
Rx over errors (rxo)	Receive FIFO overflow event counter.
Rx CRC errors (rxc)	Number of received packets with Frame CRC error.
Rx frame errors (rxf)	Same as Rx_Align_Errors. This error is only valid in 10/100M mode.
Rx FIFO errors (rxfi)	Same as Rx_Missed_Errors - a missed packet count
Rx missed errors (rxm)	Equals Rx_FIFO_Errors + CEXTERR (Carrier Extension Error Count). Only valid in 1000M mode, which is marked by PHY.
Tx aborted errors (txa)	See Tx_Errors.
Tx carrier errors (txc)	The PHY should assert the internal carrier sense signal during every transmission. Failure to do so may indicate that the link has failed or the PHY has an incorrect link configuration. This register only increments if transmits are enabled. This register isn't valid in internal SerDes 1 mode (TBI mode for the 82544GC/EI) and is valid only when the Ethernet controller is operating at full duplex.
Tx FIFO errors (txfi)	Number of Frame transmission error due to underflow.
Tx heartbeat errors (txh)	Number of heartbeat error.
Tx window errors (txw)	Late Collisions (LATECOL) Count Late collisions are collisions that occur after 64-byte time into the transmission of the packet while working in 10 to 100 Mb/s data rate and 512-byte time into the transmission of the packet while working in the 1,000 Mb/s data rate. This register only increments if transmits are enabled and the device is in half-duplex mode.
Rx compressed (misc rxc)	Number of received compressed packets.
Tx compressed (misc txc)	Number of transmitted compressed packets.
Tx single collision frames	Counts the number of times that a successfully transmitted packet encountered a single collision. The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx multiple collision frames	A Multiple Collision Count which indicates the number of times that a transmit encountered more than one collision, but less than 16. The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx deferred	Counts defer events. A deferred event occurs when the transmitter cannot immediately send a packet due to: <ul style="list-style-type: none"> • The medium being busy because another device is transmitting. • The IPG timer has not expired. • Half-duplex deferral events are occurring.

Field	Description
	<ul style="list-style-type: none"> XOFF frames are being received . The link is not up. <p>This register only increments if transmits are enabled. This counter does not increment for streaming transmits that are deferred due to TX IPG.</p>
Rx frame too longs	The Rx frame is oversized.
Rx frame too shorts	The Rx frame is too short.
Rx align errors	This error is only valid in 10/100M mode.
Symbol error count	<p>Counts the number of symbol errors (SYMERRS) between reads.</p> <p>The count increases for every bad symbol that's received, whether or not a packet is currently being received and whether or not the link is up. This register increments only in internal SerDes mode.</p>

Performing a traffic trace

Traffic tracing allows you to follow a specific packet stream. This is useful when you want to confirm that packets are using the route you expect them to take on your network.

To view traffic sessions:

Use this command to view the characteristics of a traffic session though specific security policies.

```
diagnose sys session
```

To trace per-packet operations for flow tracing:

```
diagnose debug flow
```

To trace per-Ethernet frame:

```
diagnose sniffer packet
```

To trace a route from a FortiGate to a destination IP address:

```
# execute traceroute www.fortinet.com
traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
 1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms
 2 209.87.254.221 <static-209-87-254-221.storm.ca> 2.448 ms 2.519 ms 2.458 ms
 3 209.87.239.129 <core-2-g0-2.storm.ca> 2.917 ms 2.828 ms 9.324 ms
 4 209.87.239.199 <core-3-bdi1739.storm.ca> 13.248 ms 12.401 ms 13.009 ms

```

```
14 66.171.121.34 <www.fortinet.com> 83.874 ms 84.084 ms 83.810 ms
```

Using a session table

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all at once instead of inspecting each packet individually. Each session has an entry in the session table that includes important information about the session.

You can view FortiGate session tables from the FortiGate GUI or CLI. The most useful troubleshooting data comes from the CLI. The session table in the GUI also provides useful summary information, particularly the current policy number that the session is using.

When to use a session table

Session tables are useful when verifying open connections. For example, if you have a web browser open to browse the Fortinet website, you would expect a session entry from your computer on port 80 to the IP address for the Fortinet website.

You can also use a session table to investigate why there are too many sessions for FortiOS to process.

GUI

To view session information in the GUI:

1. Go to *Security Fabric > Physical Topology*.
2. From the *Metrics* dropdown, select *Sessions*.

Finding the security policy for a specific connection

Every program and device on your network must have an open communication channel or session to pass information. FortiGate manages these sessions with features such as traffic shaping, antivirus scanning, and blocking known bad websites. Each session will have an entry in the session table.

If a secure web browser session is not working properly, you can check the session table to ensure the session is still active and going to the proper address. The session table can also tell you the security policy number it matches, so you can check what is happening in that policy.

1. Get the connection information.

You need to be able to identify the session you want. To do this, you will need:

- The source IP address (usually your computer)
- The destination IP address (if you have it)
- The port number which is determined by the program you are using. Common ports are:
 - Port 80 (HTTP for web browsing)
 - Port 443 (HTTPS for SSL encrypted web browsing)
 - Port 22 (SSH for Secure Shell)
 - Port 25 (SMTP for Mail Transfer)

2. Find the session and policy ID

Go to *Security Fabric > Physical Topology*. From the *Metrics* dropdown, select *Sessions*.

To find your session, search for your source IP address, destination IP address (if you have it), and port number. The policy ID is listed after the destination information.

3. Use filters to find a session

If there are multiple pages of sessions, you can use a filter to hide the sessions you do not need. To filter the sessions in the table, click *Add Filter*, and select an option from the list. You can filter the table by *Destination IP*, *Source IP*, or *Source Port*.

CLI

The session table output in the CLI is very large. The CLI command supports filters to show only the data you need.

To view session data in the CLI:

```
diagnose sys session list
```

An entry is placed in the session table for each traffic session passing through a security policy

To filter session data:

```
diagnose sys session filter <option>
```

The values for <option> include the following:

Value	Definition
clear	Clear session filter
dintf	Destination interface
dport	Destination port
dst	Destination IP address
duration	Duration of the session
expire	Expire
negate	Inverse filter
nport	NAT'd source port
nsrc	NAT'd source ip address
policy	Policy ID
proto	Protocol number
proto-state	Protocol state
session-state1	Session state 1

Value	Definition
session-state2	Session state2
sintf	Source interface
sport	Source port
src	Source IP address
vd	Index of virtual domain, -1 matches all

Even though UDP is a sessionless protocol, FortiGate keeps track of the following states:

- When UDP reply does not have a value of 0
- When UDP reply has a value of 1

The following table displays firewall session states from the session table:

State	Description
log	Session is being logged
local	Session is originated from or destined for local stack
ext	Session is created by a firewall session helper
may_dirty	Session is created by a policy For example, the session for <code>ftp control channel</code> will have this state but <code>ftp data channel</code> won't. This is also seen when NAT is enabled.
ndr	Session will be checked by IPS signature
nds	Session will be checked by IPS anomaly
br	Session is being bridged (TP) mode

Examining the firewall session list

The firewall session list displays all open sessions in FortiGate. Examine the list for strange patterns, such as no sessions apart from the internal network, or all sessions are only to one IP address.

When you examine the firewall session list in the CLI, you can use filters to reduce the output.

To examine the firewall session list in the CLI:

You can use a filter to limit the sessions displayed by source, destination address, port, or NAT'd address. To use more than one filter, enter a separate line for each value.

The following example filters the session list based on a source address of 10.11.101.112:

```
FGT# diagnose sys session filter src 10.11.101.112
FGT# diagnose sys session list
```

The following example filters the session list based on a destination address of 172.20.120.222.

```
FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session list
```

To clear all sessions corresponding to a filter:

```
FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session clear
```

Checking source NAT information

Checking source NAT is important when you are troubleshooting from the remote end of the connection outside the firewall.

To check the source NAT information in the CLI:

When you display the session list in the CLI, you can match the NAT'd source address (`nsrc`) and port (`nport`). This is useful when multiple internal IP addresses are NAT'd to a common external-facing source IP address.

```
FGT# diagnose sys session filter nsrc 172.20.120.122
FGT# diagnose sys session filter nport 8888
FGT# diagnose sys session list
```

Finding object dependencies

You may be prevented from deleting a configuration object when other configuration objects depend on it. You can use the GUI or CLI to identify objects which depend on, or make reference to the configuration you are trying to delete. Additionally, if you have a virtual interface with dependent objects, you will need to find and remove those dependencies before deleting the interface.

To remove interface object dependencies in the GUI:

1. Go to *Network > Interfaces*. The *Ref.* column displays the number of objects that reference this interface.
2. Select the number in the *Ref.* column for the interface. A window listing the dependencies appears.
3. Use these detailed entries to locate and remove object references to this interface. The trash can icon is enabled after all the object dependencies are removed.
4. Remove the interface by selecting the check box for the interface, and select *Delete*.

To find object dependencies in the CLI:

When running multiple VDOMs, use the following command in the global configuration only.

```
diagnose sys cmdb refcnt show <path.object.mkey>
```

The command searches for the named object in both the most recently used global and VDOM configurations.

Examples

To verify which objects a security policy with an ID of 1 refers to:

```
diagnose sys cmdb refcnt show firewall.policy.policyid 1
```

To check what is referred to by interface `port1`:

```
diagnose sys cmdb refcnt show system.interface.name port1
```

To show all dependencies for an interface:

```
diagnose sys cmdb refcnt show system.interface.name <interface name>
```

Sample output:

In this example, the interface has dependent objects, including four address objects, one VIP, and three security policies.

```
entry used by table firewall.address:name '10.98.23.23_host'
entry used by table firewall.address:name 'NAS'
entry used by table firewall.address:name 'all'
entry used by table firewall.address:name 'fortinet.com'
entry used by table firewall.vip:name 'TORRENT_10.0.0.70:6883'
entry used by table firewall.policy:policyid '21'
entry used by table firewall.policy:policyid '14'
entry used by table firewall.policy:policyid '19'
```

Diagnosing NPU-based interfaces

Some Fortinet products contain network processors, such as NP4, NP6Lite, or NP6. Offloading requirements will vary depending on the model.

To view the initial session setup for NPU-based interfaces:

```
diagnose debug flow
```

- If the session is programmed into the ASIC (fastpath) correctly, the command will not detect the packets that arrive at the CPU.
- If the NPU functionality is disabled, the CPU detects all the packets. However, you should only disable the NPU functionality for troubleshooting purposes.

To diagnose NPU-based interfaces:

1. Get the NPx or NPU ID and port numbers.

```
diagnose npu <processor> list
```

The output will look like this:

```
ID Model Slot Interface
0 On-board port1 fabric1 fabric3 fabric5
1 On-board fabric2 port2 base2 fabric4
```

2. Disable the NPU functionality.

```
diagnose npu <processor> fastpath disable <dev_id>
```

The `dev_id` is the NPx ID number.

3. Analyze the packets.

```
diagnose npu <processor> fastpath-sniffer enable port1
```

These commands only apply to NP4 and NP6 interfaces.

The output will look similar to:

```
NP4 Fast Path Sniffer on port1 enabled
```

This causes traffic on `port1` of the network processor to be sent to the CPU. This means you can perform a standard sniffer trace and use other diagnostic commands, if it is a standard CPU-driven port.

Identifying the XAUI link used for a specific traffic stream

The `diagnose npu np6 xaui-hash` command takes a 6-tuple input of the traffic stream to identify the NP6 XAUI link that the traffic passes through.

This command is only available on the 38xxD, 39xxD, 34xxE, 36xxE, and 5001E series devices.

Syntax

```
diagnose npu np6 xaui-hash <interface> <proto> <src_ip> <dst_ip> <src_port> <dst_port>
```

Variable	Description
<interface>	The network interface that the packets are coming from.
<proto>	The proto number, 6 for TCP or 17 for UDP.
<src_ip>	The source IP address.
<dst_ip>	The destination IP address.
<src_port>	The source port.
<dst_port>	The destination port.

Examples

```
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 80
NP6_ID: 0, XAUI_LINK: 2

# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 200
NP6_ID: 6, XAUI_LINK: 2

# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 20
NP6_ID: 1, XAUI_LINK: 2

# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 23
NP6_ID: 1, XAUI_LINK: 1
```

The `NP6_ID` is the NP index of the model that is being used. It can be found with the `diagnose npu np6 port-list` command.

Date and time settings

Fortinet support may ask you to check the date and time settings for log message timestamp synchronization and for certificates that have a time requirement to check for validity.

To check time settings:

```
execute time
```

To check date settings:

```
execute date
```

If all devices have the same time, it helps to correlate log entries from different devices.

```
execute time
current time is: 12:40:48
last ntp sync:Thu Mar 16 12:00:21 2006
execute date
current date is: 2006-03-16
```

To force synchronization with an NTP server:

```
config system ntp
    set ntpsync {enable | disable}
end
```

If all devices have the same time, it helps to correlate log entries from different devices.

Running the TAC report

The Technical Assistance Center (TAC) report runs an exhaustive series of diagnostic commands. Some of the commands are only needed if you are using features, such as HA, VPN tunnels, or a modem. Fortinet support may ask you to use the report output to provide information about the current state of your FortiGate.

Due to the amount of output generated, the report may take a few minutes to run. If you are logging CLI output to a file, you can run this command to familiarize yourself with the diagnostic commands.

To run the TAC report in the CLI:

```
execute tac report
```

Using the process monitor

The *Process Monitor* displays running processes with their CPU and memory usage levels. Administrators can sort, filter, and terminate processes within the *Process Monitor* pane.

To access the process monitor:

1. Go to *Dashboard > Status*:
 - Left-click in the *CPU* or *Memory* widget and select *Process Monitor*.
 - Click the user name in the upper right-hand corner of the screen, then go to *System > Process Monitor*.

The *Process Monitor* appears, which includes a line graph, donut chart, and process list.

2. Click the + beside the search bar to view which columns can be filtered.

The screenshot shows the Process Monitor interface with three widgets on the left: CPU usage (3%), Sessions (19), and a search bar. The main area displays a process list table. A dropdown menu titled 'Filterable Columns' is open, showing the following options: PID, Command, CPU, Memory, State, PSS, and a Close button.

PID	Command	CPU	Memory	State	PSS
1474	httpsd	13.8%	0.3%	R	6.45 MIB

To kill a process within the process monitor:

1. Select a process.
2. Click the *Kill Process* dropdown.

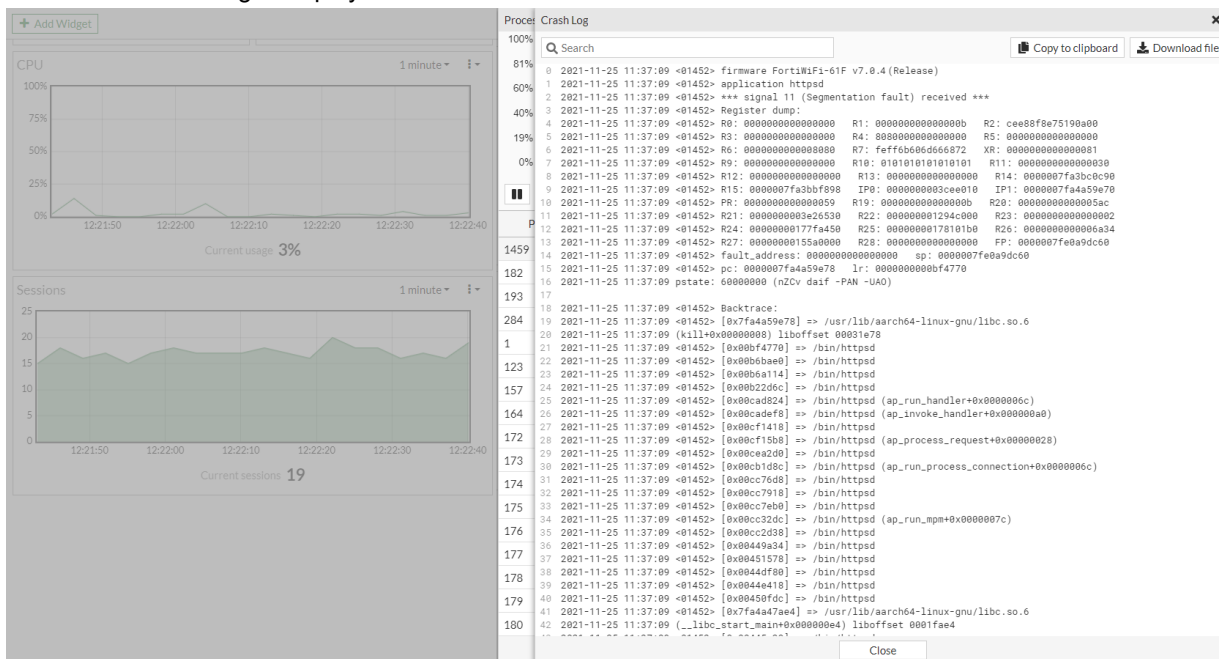

The screenshot shows the Process Monitor interface with the same widgets as before. The process list table is visible, and the 'Kill Process' dropdown menu is open for the process with PID 1452. The dropdown menu shows three options: Kill, Force Kill, and Kill & Trace. The process row for PID 1452 is highlighted in yellow.

PID	Command	CPU	Memory	State	PSS

3. Select one of the following options:

- *Kill*: the standard kill option that produces one line in the crash log (diagnose debug crashlog read).
- *Force Kill*: the equivalent to `diagnose sys kill 9 <pid>`. This can be viewed in the crash log.

- **Kill & Trace:** the equivalent to `diagnose sys kill ll <pid>`. This generates a longer crash log and backtrace. A crash log is displayed afterwards.

Computing file hashes

The following command computes the SHA256 file hashes for all of the files in a directory or directories:

```
# diagnose sys filesystem hash <paths> -d [depth]
```

<paths>	Add up to 25 paths to show only the hash for the files at those paths.
-d [depth]	Specify the maximum depth of the traversal.

This command can be used for troubleshooting and debugging the system. The file hashes of system files can be compared against known good system files to help identify any compromises made on the system files.

To hash all filesystems:

```
# diagnose sys filesystem hash
Hash contents: /bin
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/syslogd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/acd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/httpsnifferd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/merged_daemons
-> /bin/init
...
/bin/init
6e2e07782dc17b8693268989f8ba1a8858a73d5291fb521e315011731cfe412 /bin/setpci
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/wad_csvc_cs ->
```

```

/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/fds_notify ->
/bin/init
...
Hash contents: /lib
3dae8f9c15da465ffda24cebc1328725e98ee7c94a20e54af6ead7eaada45d9d /lib/libusb-1.0.so.0

...

```

To hash specific filesystem, add the name of the filesystem:

```

# diagnose sys filesystem hash /sbin
Hash contents: /sbin
c1f81e67a53bcf70720748fe31c2380e95b4c3dfdb96957fd116fcf702bd797b /sbin/init
Filesystem hash complete. Hashed 1 files.

```

To hash multiple filesystems, add the names of the filesystems:

Up to 25 file systems can be added.

```

# diagnose sys filesystem hash /sbin /bin
Hash contents: /sbin
c1f81e67a53bcf70720748fe31c2380e95b4c3dfdb96957fd116fcf702bd797b /sbin/init
Hash contents: /bin
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/syslogd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/acd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/httpssnifferd ->
/bin/init
5132b40a66fd4cf062adb42e2af43cb9aea0672cf885f12978e8de2f3137834b /bin/merged_daemons
-> /bin/init

```

To specify the maximum depth of the traversal:

```

# diagnose sys filesystem hash /data2 -d 1
Hash contents: /data2

Filesystem hash complete. Hashed 25 files.

```

An error message is shown if an incorrect value is entered:

```

# diagnose sys filesystem hash /test-path
ERROR: Could not fetch info for path /test-path (No such file or directory)
Filesystem hash complete. Hashed 0 files.

# diagnose sys filesystem hash /bin -d 0
ERROR: depth must be greater than zero. (0)
Command fail. Return code -651

```

Other commands

You may be asked to provide the following information when you contact Fortinet support.

- [ARP table on page 2895](#)
- [IP address on page 2897](#)

ARP table

The ARP table is used to determine the destination MAC addresses of the network nodes, as well as the VLANs and ports from where the nodes are reached.

To view the ARP table:

```
# get system arp
```

Address	Age (min)	Hardware Addr	Interface
10.10.1.3	1	50:b7:c3:75:ea:dd	internal7
192.168.0.190	0	28:f1:0e:03:2a:97	wan1
192.168.0.97	0	f4:f2:6d:37:b0:99	wan1

To view the ARP cache in the system:

```
# diagnose ip arp list
```

```
index=14 ifname=internal7 10.10.1.3 50:b7:c3:75:ea:dd state=00000004 use=2494 confirm=1995
update=374 ref=3
index=5 ifname=wlan1 192.168.0.190 28:f1:0e:03:2a:97 state=00000002 use=88 confirm=86
update=977639 ref=2
index=22 ifname=internal 192.168.1.111 00:0c:29:c6:79:3d state=00000004 use=3724
confirm=9724 update=3724 ref=0
index=5 ifname=wlan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202 confirm=930202
update=924202 ref=1
index=5 ifname=wlan1 192.168.0.97 f4:f2:6d:37:b0:99 state=00000002 use=78 confirm=486
update=614 ref=26
index=14 ifname=internal7 10.10.1.11 state=00000020 use=172 confirm=1037790 update=78 ref=2
```

ARP request and cache

The FortiGate must make an ARP request when it tries to reach a new destination. The base ARP reachable value determines how often an ARP request it sent; the default is 30 seconds. The actual ARP reachable time is a random number between half and three halves of the base reachable time, or 15 to 45 seconds. The random number is updated every five minutes.

ARP entries in the ARP cache are updated based on the state of the ARP entry and the objects that are using it, as highlighted in the following output sample:

```
index=5 ifname=wlan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202
confirm=930202 update=924202 ref=1
```

There are multiple possible states for an ARP entry, and the state-transition mechanism can be complex. Common states include the following:

State	Meaning	Description
00000002 or 0x02	REACHABLE	An ARP response was received
00000004 or 0x04	STALE	No ARP response within the expected time
00000008 or 0x08	DELAY	A transition state between STALE and REACHABLE before Probes are sent out
00000020 or 0x20	FAILED	Did not manage to resolve within the maximum configured number of probes
00000040 or 0x40	NOARP	Device does not support ARP, e.g. IPsec interface
00000080 or 0x80	PERMANENT	A statically defined ARP entry

An entry that is in the STALE (0x04) or FAILED (0x20) states with no references to it (ref=0) can be deleted. Many factors affect the state-transmit mechanism and if an entry is used by other subsystems. For example, ARP creation, ARP request/reply, neighbor lookup, routing, and others can cause an ARP entry to be in use or referenced.

The garbage collection mechanism runs every 30 seconds, and checks and removes stale and unreferenced entries if they have been stale for longer than 60 seconds. Garbage collection will also be triggered when the number of ARP entries exceeds the configured threshold. If the threshold is exceeded, no entries can be added to the ARP table.

To set the maximum number of ARP entries threshold:

```
config system global
    set arp-max-entry <integer>
end
```

arp-max-entry <integer>	The maximum number of dynamically learned MAC addresses that can be added to the ARP table (131072 to 2147483647, default = 131072).
-------------------------	--

To set the ARP reachable time on an interface:

```
config system interface
    edit port1
        set reachable-time <integer>
    next
end
```

reachable-time <integer>	The reachable time (30000 to 3600000, default = 30000).
--------------------------	---

To clear all of the entries in the ARP table:

```
execute clear system arp table
```

To delete a single ARP entry from the ARP table:

```
diagnose ip arp delete <interface name> <IP address>
```

To add static ARP entries:

```
config system arp-table
  edit 1
    set interface "internal"
    set ip 192.168.50.8
    set mac bc:14:01:e9:77:02
  next
end
```

To view a summary of the ARP table:

```
# diagnose sys device list root

list virtual firewall root info:
ip4 route_cache: table_size=65536 max_depth=2 used=31 total=34
arp: table_size=16 max_depth=2 used=5 total=6
proxy_arp: table_size=256 max_depth=0 used=0 total=0
arp6: table_size=32 max_depth=1 used=3 total=3
proxy_arp6: table_size=256 max_depth=0 used=0 total=0
local table version=00000000 main table version=0000002b
vf=root dev=root vrf=0
vf=root dev=ssl.root vrf=0
...
vf=root dev=internal5 vrf=0
ses=0/0 ses6=0/0 rt=0/0 rt6=0/0
```

IP address

You may want to verify the IP addresses assigned to the FortiGate interfaces are what you expect them to be.

To verify IP addresses:

```
diagnose ip address list
```

The output lists the:

- IP address and mask (if available)
- index of the interface (a type of ID number)
- devname (the interface name)

While physical interface names are set, virtual interface names can vary. A good way to use this command is to list all of the virtual interface names. For `vsys_ha` and `vsys_fgfm`, the IP addresses are the local host, which are virtual interfaces that are used internally.

Sample output:

```
# diagnose ip address list
IP=10.31.101.100->10.31.101.100/255.255.255.0 index=3 devname=internal
IP=172.20.120.122->172.20.120.122/255.255.255.0 index=5 devname=wan1
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=8 devname=root
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=11 devname=vsys_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=vsys_fgfm
```

FortiGuard troubleshooting

The FortiGuard service provides updates to AntiVirus (AV), Antispam (AS), Intrusion Protection Services (IPS), Webfiltering (WF), and more. The FortiGuard Distribution System (FDS) consists of a number of servers across the world that provide updates to your FortiGate unit. Problems can occur with the connection to FDS and its configuration on your local FortiGate unit.

Some of the more common troubleshooting methods are listed here, including:

- [Verifying connectivity to FortiGuard on page 2898](#)
- [Troubleshooting process for FortiGuard updates on page 2899](#)
- [FortiGuard server settings on page 2899](#)

Verifying connectivity to FortiGuard

You can verify FortiGuard connectivity in the GUI and CLI.

To verify FortiGuard connectivity in the GUI:

1. Got to *Dashboard > Status*.
2. Check the *Licenses* widget. When FortiGate is connected to FortiGuard, a green check mark appears next to the available FortiGuard services.

To verify FortiGuard connectivity in the CLI:

```
execute ping service.fortiguard.net
```

```
execute ping update.fortiguard.net
```

Sample output:

```
FG100D# execute ping service.fortiguard.net
PING guard.fortinet.net (208.91.112.196): 56 data bytes
64 bytes from 208.91.112.196: icmp_seq=0 ttl=51 time=61.0 ms
64 bytes from 208.91.112.196: icmp_seq=1 ttl=51 time=60.0 ms
64 bytes from 208.91.112.196: icmp_seq=2 ttl=51 time=59.6 ms
64 bytes from 208.91.112.196: icmp_seq=3 ttl=51 time=58.9 ms
64 bytes from 208.91.112.196: icmp_seq=4 ttl=51 time=59.2 ms
```

```
--- guard.fortinet.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 58.9/59.7/61.0 ms
```

```
FG100D# execute ping update.fortiguard.net
PING fds1.fortinet.com (208.91.112.68): 56 data bytes
64 bytes from 208.91.112.68: icmp_seq=0 ttl=53 time=62.0 ms
64 bytes from 208.91.112.68: icmp_seq=1 ttl=53 time=61.8 ms
64 bytes from 208.91.112.68: icmp_seq=2 ttl=53 time=61.3 ms
64 bytes from 208.91.112.68: icmp_seq=3 ttl=53 time=61.9 ms
64 bytes from 208.91.112.68: icmp_seq=4 ttl=53 time=61.8 ms
```

Troubleshooting process for FortiGuard updates

The following process shows the logical steps you should take when troubleshooting problems with FortiGuard updates:

- 1. Does the device have a valid license that includes these services?**

Each device requires a valid FortiGuard license to access updates for some or all of these services. You can verify the status of the support contract for your devices at the [Fortinet Support](#) website.
- 2. If the device is part of a high availability (HA) cluster, do all members of the cluster have the same level of support?**

You can verify the status of the support contract for all of the devices in your HA cluster at the [Fortinet Support](#) website.
- 3. Are services enabled on the device?**

To see the FortiGuard information and status for a device in the GUI, go to *System > FortiGuard*.
Use this page to verify the status of each component, and enable each service.
- 4. Can the device communicate with FortiGuard servers?**

Go to *System > FortiGuard* in the GUI, and try to update AntiVirus and IPS, or test the availability of Web Filtering and AS default and alternate ports.
- 5. Is there proper routing to reach the FortiGuard servers?**

Ensure there is a static or dynamic route that allows your FortiGate to reach the FortiGuard servers. Usually a generic default route to the internet is enough, but you may need to verify this if your network is complex.
- 6. Are there issues with DNS?**

An easy way to test this is to attempt a traceroute from behind the FortiGate to an external network using the Fully Qualified Domain Name (FQDN) for a location. If the traceroute FQDN name doesn't resolve, you have general DNS problems.
- 7. Is there anything upstream that might be blocking FortiGuard traffic, either on the network or ISP side?**

Many firewalls block all ports, by default, and ISPs often block ports that are low. There may be a firewall between the FortiGate and the FortiGuard servers that's blocking the traffic. By default, FortiGuard uses port 53. If that port is blocked you need to either open a hole for it or change the port it is using.
- 8. Is there an issue with source ports?**

It is possible that ports that FortiGate uses to contact FortiGuard are being changed before they reach FortiGuard or on the return trip before they reach FortiGate. A possible solution for this is to use a fixed-port at NAT'd firewalls to ensure the port remains the same. You can use packet sniffing to find more information about what's happening with ports.
- 9. Are there security policies that include antivirus?**

If none of the security policies include antivirus, the antivirus database will not be updated. If antivirus is included, only the database type that's used will be updated.

FortiGuard server settings

Your local FortiGate connects to remote FortiGuard servers to get updates to FortiGuard information, such as new viruses that may have been found or other new threats.

The default setting to reach FortiGuard is anycast. However, FortiGate can be configured to use unicast server. See [FortiGuard on page 2272](#) for more information.

This section provides methods to display FortiGuard server information on your FortiGate, and how to use that information and update it to fix potential problems.

Displaying the server list

To get a list of FDS servers FortiGate uses to send web filtering requests:

```
get webfilter status
```

or

```
diagnose debug rating
```

Rating requests are only sent to the server at the top of the list in normal operation. Each server is probed for Round Trip Time (RTT) every two minutes. Rating may not be enabled on your FortiGate.

Optionally, you can add a refresh rate to the end of the command to determine how often the server list is refreshed.

Sample output:

```
Locale      : English

Service     : Web-filter
Status      : Enable
License     : Contract

Service     : Antispam
Status      : Disable

Service     : Virus Outbreak Prevention
Status      : Disable

Num. of servers : 2
Protocol     : https
Port        : 443
Anycast     : Disable
Default servers : Included

--- Server List (Wed Nov 16 14:42:08 2022) ---
IP          Weight  RTT  Flags  TZ  FortiGuard-requests
Curr Lost Total Lost          Updated Time
140.174.22.68 30    866   -5
13           0      0    Wed Nov 16 14:41:35 2022
12.34.97.18 30    878  DI    -5
12           0      0    Wed Nov 16 14:41:35 2022
```

Output details

The server list includes the IP addresses of alternate servers if the first entry cannot be reached. In this example, the IP addresses are not public addresses.

The following flags in `get webfilter status` indicate the server status:

Flag	Description
D	The server was found through the DNS lookup of the hostname. If the hostname returns more than one IP address, all of them are flagged with D and are used first for INIT requests before falling back to the other servers.

Flag	Description
I	The server to which the last INIT request was sent
F	The server hasn't responded to requests and is considered to have failed
T	The server is currently being timed
S	Rating requests can be sent to the server. The flag is set for a server only in two cases: <ul style="list-style-type: none"> The server exists in the servers list received from the FortiManager or any other INIT server. The server list received from the FortiManager is empty so the FortiManager is the only server that the FortiGate knows and it should be used as the rating server.

Please note that the example output displays `Anycast` as `Disable` because the CLI commands above work with the FortiGuard unicast server case and not with the FortiGuard anycast servers case.

Also, in the example output above, the server 12.34.97.18 was found through a DNS lookup (D flag) and was sent the last INIT request (I flag).

Sorting the server list

The server list is sorted first by weight. The server with the smallest RTT appears at the top of the list, regardless of weight. When a packet is lost (there has been no response in 2 seconds), it is re-sent to the next server in the list. Therefore, the top position in the list is selected based on RTT, while the other positions are based on weight.

Calculating weight

The weight for each server increases with failed packets and decreases with successful packets. To lower the possibility of using a remote server, the weight isn't allowed to dip below a base weight. The base weight is calculated as the difference in hours between the FortiGate and the server multiplied by 10. The farther away the server is, the higher its base weight is and the lower it appears in the list.

View open and in use ports

Traffic destined for the FortiGate itself, and not being passed through or dropped, is called local-in traffic. It can be from a variety of services, such as HTTPS for administrative access, or BGP for inter-router communication.

Local-in traffic is controlled by local-in policies. To enable viewing local-in policies in the GUI, go to *System > Feature Visibility* and enable *Local In Policy*.

The *Policy & Objects > Local In Policy* page shows a read-only list of the local policies, populated with default values, and values that are automatically enabled when the related service is enabled, for example, enabling BGP opens TCP port 179. For more information, see [Local-in policies on page 896](#).

To view ports that are being listened on, and active connections and the services or processes using them:

```
# diagnose sys tcpsock | grep 0.0.0.0
0.0.0.0:10400->0.0.0.0:0->state=listen err=0 socktype=4 rma=0 wma=0 fma=0 tma=0 inode=10621
process=142/authd
...
```

```
0.0.0.0:53->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=8067
process=177/dnsproxy
0.0.0.0:22->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=13390
process=225/ssh
0.0.0.0:541->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=13155
process=215/fgfmd
...
0.0.0.0:9980->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=5063
process=129/httpsd
0.0.0.0:179->0.0.0.0:0->state=listen err=0 socktype=1 rma=0 wma=0 fma=0 tma=0 inode=10583
process=148/bgpd
...
```

For more information on incoming and outgoing ports, see the [FortiOS Ports](#) guide.

IPS and AV engine version

The IPS engine is an important module that processes traffic in policies configured with flow-based inspection, next generation firewall policies, as well as any policies that have IPS and application control defined. Just like its counterpart, the WAD daemon in proxy-based inspection, the IPS engine can invoke other daemons to perform additional processing such as certificate inspection, authentication, and other functions.

For each FortiOS release, an IPS engine is built into the firmware. You can find information about the IPS engine in its corresponding [Release Notes](#).

When a FortiGate is configured for automatic FortiGuard updates and has policies configured to use the IPS engine, it downloads new releases of the IPS engine that are available through the FortiGuard Distribution Network. The IPS Engine package released to FortiGuard is unavailable for manual download.

The FortiGate supports manual upgrade/downgrade of the IPS engine in special cases, such as for troubleshooting or resolving a temporary issue that Technical Support deems necessary. In these cases, Technical Support distributes the IPS engine package.

Likewise, the AV engine is also built into the FortiOS firmware and available as an automatic update through FortiGuard. You can find information about the AV engine in its corresponding [Release Notes](#).

Finally, for compatibility information between IPS and AV engines with FortiOS, see [IPS Engine and AV Engine Support for FortiOS and FortiAPS](#)

CLI troubleshooting cheat sheet

See [CLI troubleshooting cheat sheet](#).

Additional resources

To learn more about FortiGate and FortiOS, and for information about technical issues, refer to the following resources.

Fortinet Document Library

Installation Guides, Administration Guides, Quick Start Guides, and other technical documents are available online at the [Fortinet Document Library](#).

Release notes

Issues that arise after the technical documentation has been published are often listed in the release notes. The release notes are available in the [Fortinet Document Library](#).

Fortinet Video Library

The [Fortinet Video Library](#) hosts a collection of videos that provide valuable information about Fortinet products.

Fortinet Community

The [Fortinet Community](#) provides a place to collaborate, share insights and experiences, and get answers to questions. It incorporates the Fortinet Knowledge Base and technical discussion forums. You can access the Fortinet Community at <https://community.fortinet.com>.

Knowledge Base

The [Fortinet Knowledge Base](#) provides access to a variety of articles, white papers, and other documentation that provides technical insight into a range of Fortinet products. You can access the Knowledge Base at <https://community.fortinet.com/t5/Knowledge-Base/ct-p/knowledgebase>.

Fortinet technical discussion forums

The [online technical forum](#) allows administrators to contribute to discussions about issues related to their Fortinet products. Searching the forum can help an administrator identify if an issue has been experienced by another user. You can access the support forum at <https://community.fortinet.com/t5/Fortinet-Forum/bd-p/fortinet-discussion>.

Fortinet Training Institute

The [Fortinet Training Institute](#) hosts a collection of tutorials and training materials that you can use to increase your knowledge of Fortinet products. You can access these training resources at <https://www.fortinet.com/training.html>.

Fortinet Support

You defined your problem, researched a solution, put together a plan to find the solution, and executed that plan. At this point, if the problem has not been solved, contact [Fortinet Support](#) for assistance.
