Change Log

Date	Change Description
2020-06-08	Initial release of the FortiVoice 6.0.5 Cookbook.
2020-06-09	Updated references in Gateway management on page 67 and FortiVoice units as survivable branches on page 67 .
2020-07-07	Added and updated recipes in High availability on page 56 .

Auto dialer

This section contains information about establishing and maintaining automatic dialer features.

Auto dialing

The FortiVoice auto dialing system provides a significant time and resource savings for your organization by assisting you when you need to reach multiple contacts quickly and efficiently.

This recipe guides you through the quick and easy process of setting up an auto dialer campaign and establishing your contact list. A campaign allows you to set up an auto dialer task to broadcast a recorded message to the dialed phone numbers.

Enabling the auto dialer service

1. Go to **Auto Dialer > Setting > Setting**.
2. Click **Enable service**.
3. Set **Maximum channel** to the maximum number of contacts that can be dialed at the same time.
4. Click **Apply**.

Adding contacts

1. Go to **Auto Dialer > Contact > Contact** and click **New**.
2. Enter the contact's **Name** and their **Main number**, and any other family, business, and emergency settings as required.
3. Click **Create**.
4. You can also **Import** (and **Export**) multiple contacts at once via **CSV** or **vCard**.

Configuring an audio message

An audio message can either be uploaded or recorded.

To upload an audio message:

1. Go to **Auto Dialer > Campaign > Audio** and click **New**.
2. Enter a **File name** for the audio message, and click **Upload** to upload an audio file, if a pre-recorded message is to be sent.

Note that only WAVE compression format files are supported.

To record a new phone message:

1. Click **Record** to record a new message by phone.
2. Set **Send record call** to your extension. Answer the call and record your message, then click **OK**. Follow the audio prompts to complete the recording.
3. Click **Download** once the file is recorded (if you would like to retain a copy in WAVE compression format), and click **Create**.

Configuring the campaign

1. Go to **Auto Dialer > Campaign > Campaign** and click **New**.
2. Enter a **Name** and a **Caller ID** for the campaign to be displayed on called phones.
3. Set **Sound file** to the audio message you uploaded/created earlier.
4. Set **Retry** to the number of times you want the auto dialer to retry calling the client if the call is missed.
5. Under **External Numbers**, select the external phone numbers and click the right-arrow to add them to the campaign.
6. Under **Internal Numbers**, add any internal extensions from your local network to be added to the campaign.
7. Click **Create**.

Call center

This section contains information about establishing and maintaining call centers.

Call center setup

Callers may outnumber available agents, often forcing a caller to call back repeatedly to reach an available agent. Thankfully, FortiVoice queues multiple incoming calls and can prioritize them.

This recipe guides you through the process of creating a call queue to handle large volumes of incoming calls and then set up the appropriate department to handle the calls.

Creating a call queue

Call queues establish the order in which incoming calls are placed when an agent is unavailable.

1. Go to **Call Center > Call Queue > Call Queue** and click **New**.
2. Enter a **Queue ID** for the queue.
3. Enter an available extension **Number** for callers to dial and enter into a call queue following the extension number pattern.
4. Enable **Status**.
5. Enter a **Display name** and brief **Description**.
6. Leave **Department** set to **None**, as you will configure one and add it to the queue later. See [Configuring departments on page 11](#).

Queue setting

1. Under **Queue Setting**, set **Maximum queue capacity** to the maximum number of callers the queue can handle.
2. Set a **Maximum queuing time** in minutes and **Ring duration** in seconds. Once these time durations have elapsed, the caller will be dealt with according to the **Timeout Call Handling** action selected.
3. Select the **Music on hold** audio file you want for the call queue.

Queue Setting

Maximum queue capacity:	<input type="text" value="7"/>		[Overflow Call Handling...]
Maximum queuing time:	<input type="text" value="30"/>		(Minutes) [Timeout Call Handling...]
Ring duration:	<input type="text" value="20"/>		(Seconds)
Music on hold:	<input type="text" value="ott"/>		

Call distribution

1. Under **Call distribution**, determine whether calls in the call queue will be subjected to **Skill Based Routing**, whereby calls are routed depending on the operator's skill. For more information, see [Skill-based routing on page 12](#).

Note that skill based routing can be configured along with a distribution policy, in which case the distribution policy will only take effect when you have more than one agent with the same skill level in a queue.

2. Set **Distribution policy** to one of the following:

- **Ring all**: Dials all available agents.
- **Round Robin**: Dials all agents in order from top to bottom and then bottom to top.
- **Sequential**: Dials each agent in a sequential manner.
- **Random**: Dials an agent at random.
- **Least Recent**: Dials the agent that least recently received a call.
- **Fewest Calls**: Dials the agent that has completed the fewest calls in this queue.
- **Weight Random**: Dials a random agent, but uses the agent's penalties as a weight.
- **Priority Based**: Dials agents based on the agents' rated ability to handle calls in that call center.

 **Call Distribution**

Skill Based Routing: Disabled ▼

Distribution policy: Round Robin ▼

Additional setting

Under **Additional Setting**, you can configure a variety of options, including the following:

- **Distinctive Setting for Agent**: In some cases, one agent may need to handle calls from multiple queues, and needs to be able to distinguish between queues when they receive the calls. Use this setting to define an audio message that announces the queue name, and control how the caller's ID is displayed.
- **Business Schedule**: Determine when agents are available to answer calls.
- **Announcement to Caller**: Determine whether callers will be told where they are in a queue, and control how often those announcements are made.
- **Service Level**: Determine how often the FortiVoice unit checks to see whether the queue service level threshold is reached.
- **Alert**: Determine what events will trigger an alert, such as queue overflow and agent unavailability, and control how alert notifications will be sent to the appropriate contact.
- **Callback Setting**: Allow callers waiting in a queue to request a callback. The system can callback automatically when an agent becomes available.
- **Survey Settings**: Define how the system collects customer feedback.

Agent

1. Under **Agent**, set **Agent type** to either **Dynamic** or **Static**. Dynamic agents are required to log in to the queue, while static agents are always connected to the queue.

2. If you have selected the **Dynamic** agent type, set **Auto-logout time** to the duration of time agents have before they are logged out of the queue. Additionally, enable or disable **Logout all agents after scheduled business hour** for dynamic agents.
3. Set **Wrap up time** to the duration of time in seconds needed by agents to complete a queue call. Similarly, enable **Wrap up outgoing call** to apply the same time constraint for agents to make and finish any outgoing customer calls.
4. Enable **Call waiting** to display caller information on the agent's phone when a queue call comes in while the agent is already on the phone. The agent can choose to answer the call or not. If the agent does not answer the call, after the ring duration is due, the call is transferred to the next agent.

 **Agent**

Agent type: Dynamic Static

Auto-logout time:  Hours(0 means disable)

☒ Logout all agents after scheduled business hour

Wrap up time:  Seconds

☒ Wrap up outgoing call

☒ Call waiting

[\[Agent Members...\]](#)

Call handling

1. Under **Call handling**, set **When no logged-in agent** to either **Queue Caller** or **Do Not Queue**. For example, if there are no agents available, you may set this option to **Do Not Queue**, in which case any incoming calls will be handled by your general call handling configuration, such as the auto attendant.
2. Optionally configure additional scheduled and non-scheduled business hour call handling options.
3. Click **Create**.

Configuring departments

Once the call queue is created, the department that the client will contact can be configured and assigned to the appropriate managers, members, and the call queue itself. The department can be helpful for management and reporting purposes.

1. Go to **Extension > Group > Department** and click **New**.
2. Enter a **Name** for the department.
3. Under **Call Center**, move the **Member** extensions you want to be members of the department to the **Selected** column.
4. Similarly, move **Manager** extensions you want to be managers of the department to the **Selected** column.
5. Move the newly created call **Queue** to the **Selected** column.
6. Click **Create**.

Skill-based routing

When a customer dials an organization's support line they are commonly greeted with an automated attendant that transfers the customer's call to a specific department based on the number the customer selects.

This recipe guides you through the process of configuring FortiVoice to transfer customer calls to the most qualified agent.

Skill-based routing requires configuring the call center, extension, and virtual number features.

Creating skill sets

Varying skill sets must first be established for each department. For example, a skill set is created for the Sales department.

1. On FortiVoice, go to **Call Center > Configuration > Skill Set** and click **New**.
2. Enter a **Name** and **Description** for the Sales department, and click **Create**.

Configuring skill levels

Once skill sets have been created, individual skill levels must be defined.

1. Go to **Call Center > Configuration > Skill Level**. The FortiVoice already has a pre-defined list of skill levels, showing varying degrees of skill-progression from junior through intermediate to senior.
2. Either create your own levels by clicking **New**, edit, or use the default levels.

For the purpose of this recipe, default levels will be used.

Skill Set	Skill Level	Reason Code	Data Service	Global Setting
<div> <div>+ New...</div> <div>Edit...</div> <div>Delete</div> </div> <div> <div>1</div> / 1 <div>Page size: 50</div> <div>Total: 9</div> </div>				
Level	Description			
10	level 10, junior			
20	level 20, junior			
30	level 30, junior			
40	level 40, intermediate			
50	level 50, intermediate			
60	level 60, intermediate			
70	level 70, senior			
80	level 80, senior			
90	level 90, senior			

Assigning a skill level to an extension

Assign a skill level to each agent.

1. Go to **Extension > Extension > IP Extension**.
2. Select an agent's extension and click **Edit** (in the example, **Donna**).

IP Extension									
Managed Extension Remote Extension Fax Extension Preference									
+ New... Edit... Delete Actions <input type="text"/> <input type="button" value="Q"/> Filter: --None-- Option: --All--									
<div> <input type="button" value="Refresh"/> <input type="button" value="Previous"/> <input type="button" value="Next"/> <input type="button" value="1"/> / 1 </div> <div> Page size: 50 </div> <div> Selected: 1 / 7 </div>

Create Cancel

9. To complete the call center settings, click **OK**.
10. To finish configuring the agent IP extension, click **OK**.
11. Repeat the same steps for your other agents, assigning the appropriate skill level where applicable.

Configuring the call queue

Calls are routed to different call queues depending on the set skills.

1. Go to **Call Center > Call Queue > Call Queue** and click **New**.
2. Under **Call Distribution**, set **Skill Based Routing** to one of the following:
 - **Lowest Level First**: The call transfers to the agent with the lowest skill level score first and then moves up the ranks to the first available agent.
 - **Highest Level First**: The call transfers to the agent with the highest skill level score first and then moves down in rank to the first available agent.
3. Set **Default skill** to the defined skill set (Sales), meaning only agents from the Sales department will pick up calls from the queue.
4. Select a **Distribution policy** from the drop-down menu. In this example, **Round Robin** is selected, whereby all agents in the queue will be equally called from the top to the bottom of the list and so on.

Distribution policy:

Round robin

5. Under **Agent**, click **Agent Members**.
6. Select all agents that you want to be assigned to the call queue and click **OK**.
7. Click **Create**.

Configuring call handling

After establishing skill-based routing, configure call handling for virtual numbers. Skill-based call handling helps to associate (tag) an incoming call with a specific skill set to distributed a call among agents with that specific skill set. Two actions need to be defined: one to tag the call with a skill to process the call as a skill-based call, and a second to route the call to the queue where the agents with configured skill levels are assigned the appropriate calls.

1. Go to **Extension > Virtual Number > Virtual Number** and click **New**.
2. Enter a **Name** and an unassigned **Number**.
3. Under **Call Handling**, click **New**.
4. Set an appropriate **Schedule**, and set **Action** to **Call Queue Skill Tag**.

5. Click **OK**.
6. Click **New** again.
7. Set the **Schedule**, and set **Action** to **Call Queue**.
8. Assign the newly created **Call queue** from the drop-down menu.
9. Click **OK**. Your virtual number call handling should look similar to the example below.
10. Click **Create**.

Call features

This section contains information about configuring various call features.

Auto attendant configuration

What if you need FortiVoice to answer calls and direct users to various departments within your office? An auto attendant can answer calls with a prerecorded message and then guide the user to the department they desire with a simple press of a button.

This recipe guides you through the process of configuring auto attendants, exploring the user options, and establishing how a caller navigates through the auto attendant.

Configuring the auto attendant

1. Go to **Call Feature > Auto Attendant > Auto Attendant** and click **New**.
2. Enter a **Name** and set the **Default language**.
3. Select a **Greeting mode**, and select the desired sound file for the **Greeting**.
4. Enter the amount of time that the phone will ring before being answered, and the time out and invalid input settings.

5. Before you click **Create**, configure the dial pad key action settings in [Configuring key actions on page 18](#).

Configuring key actions

Configure the auto attendant keys for caller to use when navigating through the auto attendant hierarchy.

1. Under **Dial Pad Key Action**, click **New**.
2. Map keys with the appropriate **Language** and **Action**, and any additional settings according to the action selected. In this example, the **Dial Pad Key Action** section shows number 2 assigned to the technical support call queue.

Dial Pad Key Action

+ New...

 Edit...

 Delete

Key	Action	Target
0	Dial Operator	--
#	Lookup Name Directory	--
2	Call Queue	technical-support

Additional advanced settings can be optionally configured in [\(Optional\) Configuring advanced settings on page 19](#).

(Optional) Configuring advanced settings

1. Expand the **Advanced** tab.
2. Enable **Access voicemail**, if required, to allow external callers to reach their voicemail boxes by dialing their voicemail prompt code. Dial local number should already be enabled by default, allowing external callers to dial local extensions.
3. Disable **Dial local number** if you do not want callers to be able to dial extensions directly. This forces users to use the Dial Pad Key Actions only – used in many call centers.
4. Enable **Override schedule**, if required, to allow an administrator with the privilege to dial a code followed by the administrator PIN to replace the original schedule with a system schedule.
5. Enable **Call bridge (DISA)**, if required, and select an account. This allows external users to dial into the FortiVoice device and use the FortiVoice service like a local extension.
6. If **Call bridge (DISA)** is enabled, select the outbound dial plan for users to make outbound calls using FortiVoice.
7. Click **Create**.

The screenshot shows the 'Advanced' configuration tab in the FortiVoice interface. The settings are as follows:

- Access voicemail:** Disabled (toggle switch).
- Dial local number:** Enabled (toggle switch).
- Override schedule:** Disabled (toggle switch).
- Allow recording of prompt sound file:** Disabled (toggle switch).
- Call bridge(DISA):** Enabled (toggle switch). The **Account code:** is set to '--None--' with '+' and 'x' icons.
- Outbound dialplans allowed for access:**
 - Available (2):** A list containing 'emergency (Outbound)' and 'outgoing_default (Outbound)'.
 - Selected (0):** An empty list.
 - Arrows indicate the ability to move items between the available and selected lists.
- Business group:** Set to '--None--' with '+' and 'x' icons.

At the bottom right, there are **Create** and **Cancel** buttons.

Call parking – best practices

Sometimes active calls at extensions are put on hold within the FortiVoice for other extensions to pick up. This process is called “parking”. FortiVoice features the ability to easily park calls, unpark calls, and monitor parking slots on FortiFone devices with programmable keys. Monitored parking slots can easily unpark calls by simply pressing the programmable key. Calls can also be parked by using the call park feature code, which is useful for FortiFone devices without programmable keys.

The following best practices recipe covers specific tips to program and use call parking on FortiVoice and FortiFone devices.

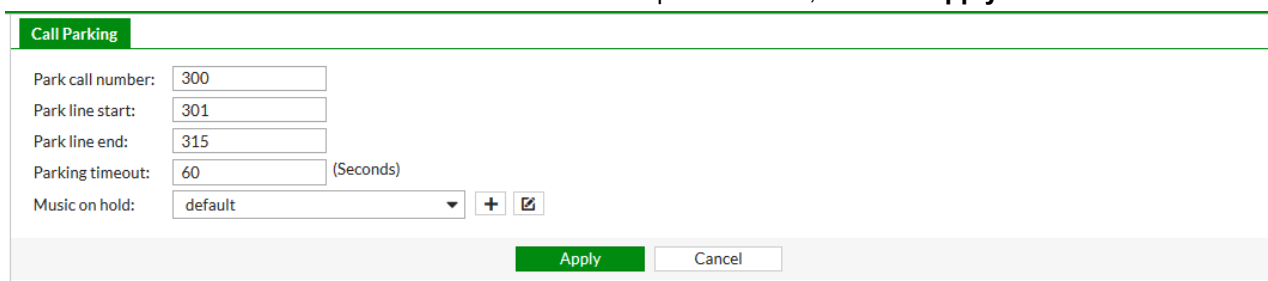

Configuring call parking settings

First, call parking must be configured on FortiVoice. It is recommended to keep the numbering scheme separate from the extension number scheme, keeping it unique to call parking. By default, the FortiVoice reserves 300 to 320 for call parking. This can be broken down as follows:

- **300:** Number reserved to park a call in the first available slot.
- **301-320:** Numbers reserved as call park slots.

For more information on how to use these number schemes, see [Using call parking on page 22](#).

1. Go to **Call Feature > Call Parking > Call Parking**.
2. Set **Park call number** to the number used to park calls automatically to the first available call park slot.
3. Set **Park line start** and **Park line end** to define the total range of call park slots.
4. Set **Parking timeout** to the amount of time in seconds that the call will remain parked. Once this timeout is reached, the parked call is returned to the extension that had parked it.
5. Select the desired hold music from the **Music on hold** drop-down menu, and click **Apply**.

Configuring call parking on programmable phone keys

FortiFone devices that support programmable phone keys can be configured with one touch call parking. There are two types of call park programmable phone keys:

- **Park:** Places the call into the first available call park slot.
- **Park appearance:** Monitors the selected call park slots, informing the user if there is a call parked. It may also be used to park a call in the specified call park slot if it is not already in use.

Configuring automatic parking

1. Go to **Phone System > Profile > Programmable Keys**.
2. Select a FortiFone profile and click **Edit**.
3. In **Provisioning lines**, select **1**.
4. Under **Page 1**, set the **Function** for line 2 to **Park**.

- Click **OK**. For changes to take effect, the FortiFone device must reboot.

Programmable Keys

Name:

Phone model:

Description: Default programmable keys for FortiFone-175 ☒

Provisioning lines:

Page 1

Option	Mode	Function	Resource	Label

2.	User Admin	<input type="text" value="Park"/>	<input type="text"/>	<input type="text"/>

Configuring park appearance

- Go to **Phone System > Profile > Programmable Keys**.
- Select a FortiFone profile and click **Edit**.
- In **Provisioning lines**, select **1**.
- Under **Page 1**, set the **Function** for line 2 to **Park appearance**.
- Set **Resource** to the call park slot you would like to monitor. The **Label** will automatically propagate.
- Click **OK**. For changes to take effect, the FortiFone device must reboot. Repeat this for as many call park slots that

you would like to monitor.

Using call parking

You can park a call in the following ways:

- Call park feature code
- Programmable phone key with park
- Programmable phone key with park appearance

All FortiFone models support the feature code method.

Feature code

1. While on a call, dial ***40**.
The call is now parked. The extension will be notified of the call park slot number.
2. To retrieve the parked call from any extension, dial the call park slot number.

Programmable key with park

1. While on a call, press the **Park** programmable phone key on the FortiFone device.
FortiVoice will indicate the call park slot the call has been placed in (for example, 301).
2. To retrieve the parked call from any extension, dial the call park slot number.

Programmable key with park appearance

1. While on a call, press the **Park appearance** programmable phone key on the FortiFone device.
The call is now parked.
2. To retrieve the parked call, press the **Park appearance** programmable phone key again or dial the call park slot number.

When using call park, keep in mind the following:

- The feature code and programmable phone key park methods will place the call in the first available call park slot.
- Programmable phone keys with park appearance will indicate if a call is parked. Press the key to retrieve the call.
- Programmable phone keys with park appearance may be used to park calls, only if the key is not already in use.

Call recording

FortiVoice allows you to monitor and supervise incoming and outgoing calls, but you can also record calls, allowing you to have a permanent record of particularly important phone calls.

This recipe shows how to configure and archive recorded calls.

Configuring call recording

1. Go to **Call Feature > Call Recording > Policy** and click **New**.
2. Enter a **Name** and click **Enable**.
3. Set **Description** to the category of calls you want to record from the drop-down menu. Call recordings are initiated by phone number (either phone calls from or to a number matching the pattern specified), department, group, trunk, or queue.
Note that if you select either **By Phone Number** or **By Queue**, calls can be recorded bidirectionally (both incoming and outgoing). A recording policy that is set to record by either department, group, or trunk will record all calls associated with that department, group, or trunk.
4. Set **Record ratio** to the amount of calls that you want to be recorded, represented as a percentage.
5. Set **Retention duration** to the number of days you want the FortiVoice unit to keep the recordings.
6. Set **File name format** to a predefined format that you want recorded call files to be generated as.
7. Click **Create**.
Note that all recorded calls can be found on the FortiVoice unit under **Monitor > Storage > Recorded Call**.
8. Go to **Call Feature > Call Recording > Setting** and select a compression recording bit rate. For higher quality calls, click **Standard** (128 Kbps), or for when audio quality is not so important, click **Low Rate** (13 Kbps).
9. Click **Apply**.

Archiving recorded calls

1. Go to **Call Feature > Call Recording > Archive**.
2. Under **Rotation Setting**, set the **Recording rotation size** in MB and **Recording rotation time** in seconds. The FortiVoice unit starts generating a new archive file when either one of these parameters (size or time) is reached first.

3. Set **Archiving options when disk quota is full** to determine what the FortiVoice unit should do if it runs out of disk space. Click **Overwrite** to remove the oldest archived folder in order to make space for new archives, or click **Do Not Overwrite** to stop archiving.
4. Under **Destination Setting**, set **Destination** to either **local** to use the FortiVoice unit's local hard drive or a NAS server, or **remote** to use a remote FTP or SFTP storage server.
5. If **Destination** is set to **local**, set the **Local disk quota** limit. This value cannot exceed 50% of the total disk size available on the FortiVoice unit. The FortiVoice unit will remove the oldest archived call if this limit is exceeded.
6. If **Destination** is set to **remote**, configure the remote server options as necessary.
7. Set a **Schedule** for archiving to take place. Archiving will not take place outside of the selected schedule times. Note that a **Schedule** can only be set if **Destination** is set to **remote**.
8. Click **Apply**.

Conference calls

FortiVoice features conference calling, allowing multiple clients to join a live group discussion.

This recipe details how to create three kinds of call conferencing instances:

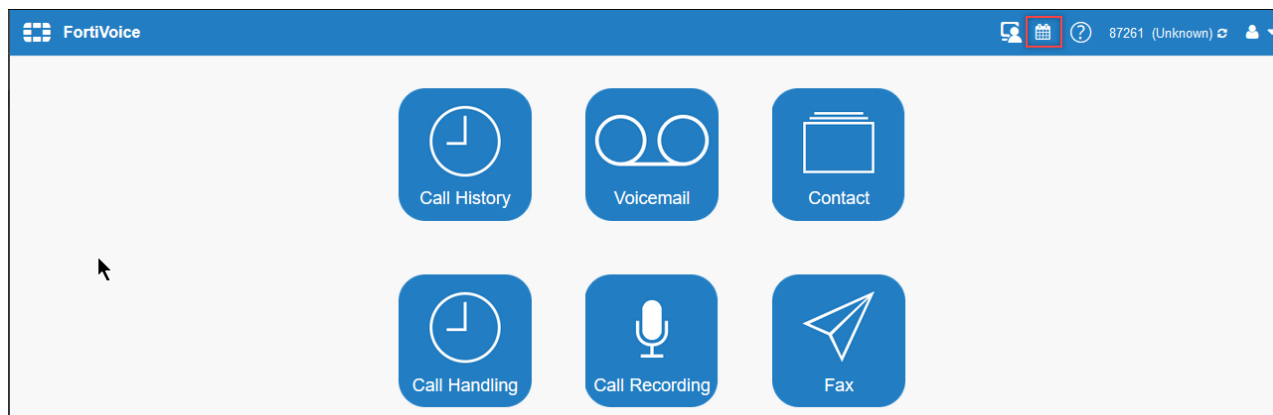

- **User Conferencing:** Administrators provide the ability for users to create and schedule conferences through the FortiVoice user portal. Users can add attendees to the conference in order to get an email invite with the information regarding the conference.
- **Static Conference:** Administrators create rooms for conference that can be used based upon schedule profile (office hours, anytime, and so on) or only available for a specific date and time. These conferences are the most restrictive. To avoid conflicts administrators would need to create multiple rooms.
- **Dynamic Conference:** Administrators create a room, and then can create unique conference events based upon time and dates required. These events will have unique conference IDs limiting conflicts in participants. Similar to user conferencing attendees can receive email invites with the call details for the conferences.

Configuring user conferencing

1. Go to **Call Feature > Conferencing > User Conferencing** and click **Enabled**.
2. Set **Number** to the extension number that is mapped to the external number that callers can use to dial to join the conference call.
3. Under **Extensions**, click **New** to add extensions users who have the privilege to organize conference calls.

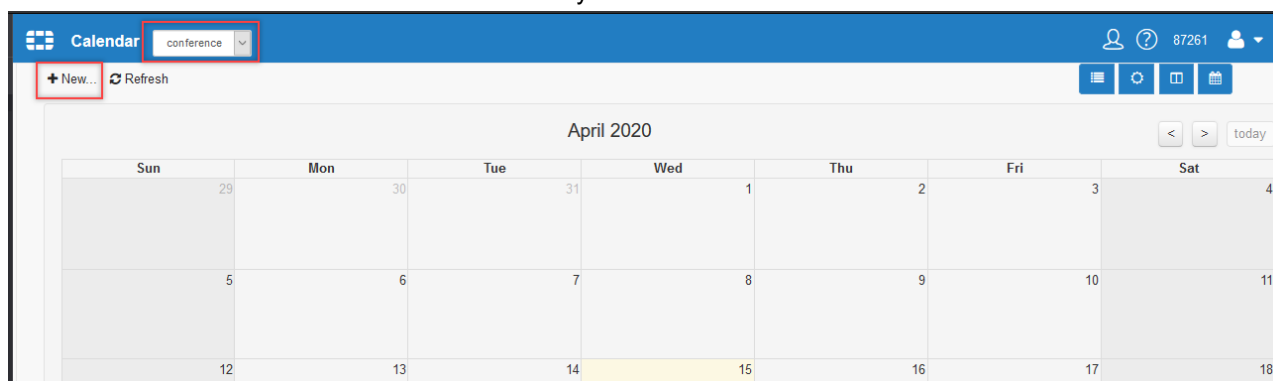

4. Select the **Extension** from the drop-down list.
5. For **Conference ID**, enter a code or generate one by clicking **Generate**.
6. Select **OK**, and select **Apply** to finish the **User Conferencing** configuration.
7. Open a web browser and go to `https://<IP_address_or_FQDN>/voice`.
 where <IP_address_or_FQDN> is the IP address or the FQDN of the FortiVoice phone system.
 If the FortiVoice system administrator has changed the access port, then you must also include the port, for example:
`https://<IP_address_or_FQDN>:446/voice`
8. Log in as the user that has been added to the list of extensions.

9. After you are logged in, click on the calendar.
 The **Conference** option is available to extensions that have been added to the extension list that allows conference scheduling.

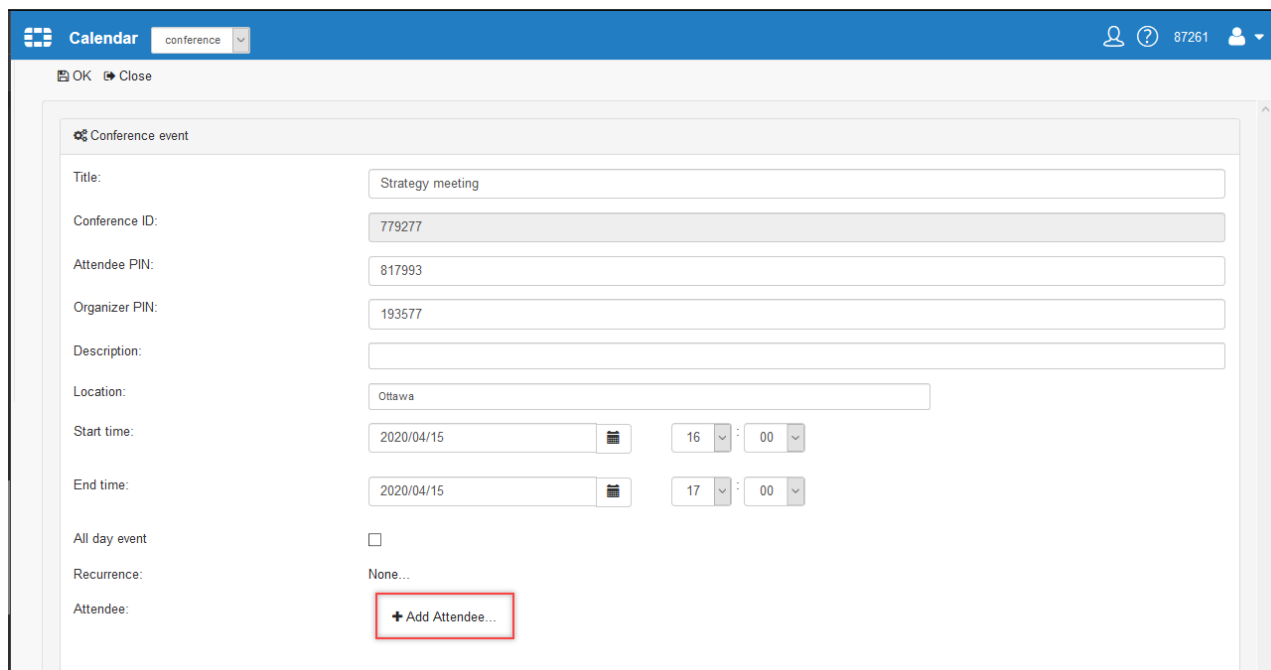

A new window opens to a calendar view, where the user can schedule upcoming conference calls.

10. Select **Conference** and then click **New** or the date you wish to schedule the conference for.

11. Fill in details for this meeting.
12. Make note of the **Attendee PIN**. Attendees invited to the conference call will need this PIN.
13. Make note of the **Organizer PIN**. You will need this PIN to start the meeting.
14. In **Attendee**, click **Add Attendee**.

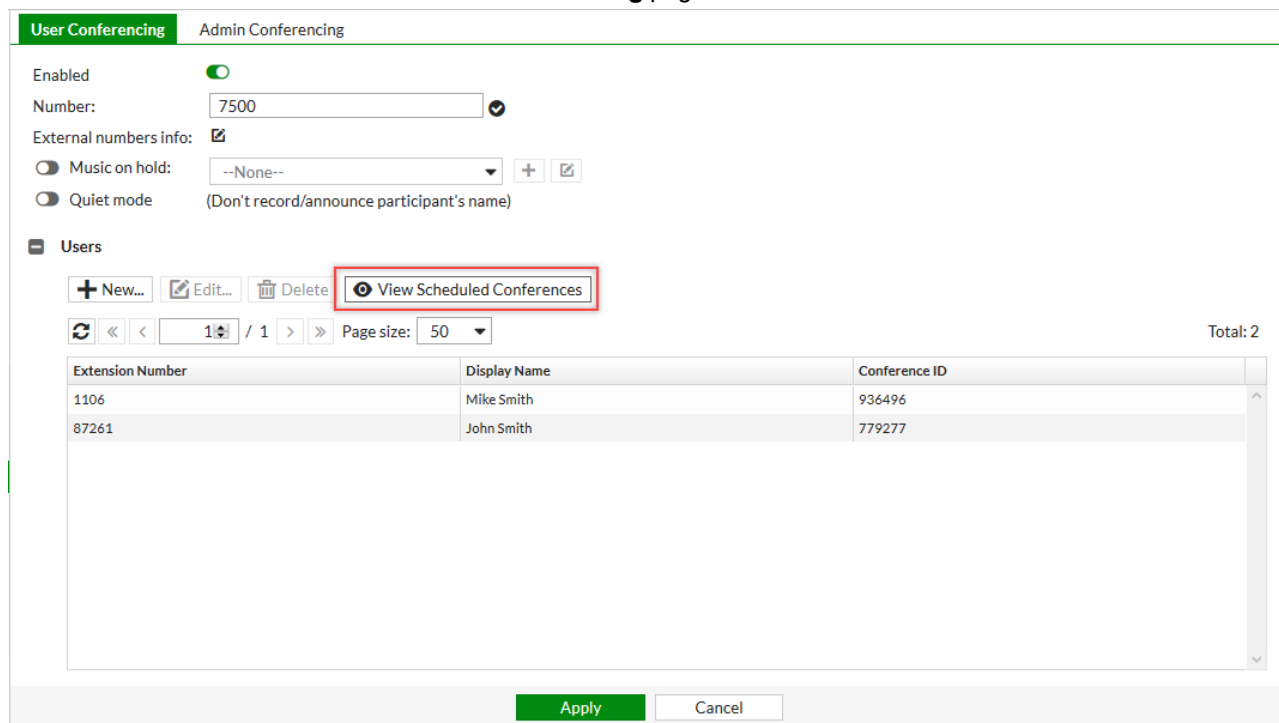

The screenshot shows the 'Calendar' application window with a 'conference' dropdown menu. The main form is titled 'Conference event' and contains the following fields:

- Title:** Strategy meeting
- Conference ID:** 779277
- Attendee PIN:** 817993
- Organizer PIN:** 193577
- Description:** (empty text area)
- Location:** Ottawa
- Start time:** 2020/04/15, 16:00
- End time:** 2020/04/15, 17:00
- All day event:** ☐
- Recurrence:** None...
- Attendee:** + Add Attendee... (highlighted with a red box)

- 15.** Enter the **Email** address of the attendee you wish to invite to the conference call, with an optional **Display name**. Click **Create**.
- 16.** Add any additional attendees you wish to invite.
- 17.** To finish the scheduling of the conference call, click **OK**.
Upon clicking **OK**, all invited attendees will receive an email invitation to the conference call, with all the relevant information they need to attend the conference call.

18. Return to the FortiVoice UI. Administrators can view upcoming conferences for themselves by clicking **View Scheduled Conferences** from the **User Conferencing** page.

Configuring administrator conferencing

Both **Static** and **Dynamic** administrator conferences can be configured.

Configuring a static conference call

1. Go to **Call Feature > Conferencing > Admin Conferencing** and click **New**.
2. Set **Mode** to **Static**, enter a **Name**, and set to **Enabled** (if not already activated).
3. Enter an extension **Number** that callers can dial to join the conference call.
4. Under **Setting**, enter a **Display name** for the conference call, and an optional **Description**.
5. Enter a **User PIN**, which is the password users must enter to join the conference call.
Callers need to dial the conference number and then enter their PIN.
6. Enter an **Admin PIN**, which is the password an administrator must use to begin the conference call.
7. To configure a recurring frequency for this static conference call, enable **Recursive Schedules** and click **New**.

Conference

Mode: **Static** Dynamic

Name:

Enabled ☒

Number: ✓

Setting

Display name:

Attendee PIN:

Organizer PIN: (Organizer's PIN to start/manage conference)

Description: ☒

☐ Music on hold: --None--

☐ Quiet mode (Don't record/announce participant's name)

Recursive Schedules ☒

Schedule

One Time Schedules ☐

8. Assign an appropriate **Schedule** from the drop-down list, and enter a **Password**. Then click **Create**. This recursive schedule will make sure that users can only join the conference call during the scheduled time period by entering the configured password.
9. Alternatively, enable **One Time Schedules** and click **New** to schedule a single conference call.
10. Click **Create**.

Configuring a dynamic conference call

1. Go to **Call Feature > Conferencing > Admin Conferencing** and click **New**.
2. Set **Mode** to **Dynamic**, enter a **Name**, and set to **Enabled** (if not already activated).
3. Enter an extension **Number** that callers can dial to join the conference call.
4. Under **Setting**, enter a **Display name** for the conference call, and an optional **Description**.
5. Click **Create**.
6. Select your newly created conference call and click **Edit**.
7. Click **View Scheduled Conferences** to show the calendar view.

View Scheduled Conferences

OK Cancel

8. To schedule conference calls, click the desired date.

Faxes

FortiVoice can send and receive faxes to the FortiVoice user portal, email, and physical fax machines. This recipe guides you through the process of configuring the FortiVoice unit to send and receive faxes.

Configuring FortiVoice to receive faxes

1. Go to **Call Feature > Fax > eFax Account** and click **New**.
2. Under **Incoming Fax Setting**, enter a **Name** and extension **Number**.
3. Enter a **Display name** of the extension, and click **Enable**.
4. Under **External Numbers**, click **New**.
5. Map the direct inward dialing (DID) numbers to the extension of the fax. Select the **Incoming trunk** used for dialing the DID numbers, and enter the **DID Numbers** that you want to map to an extension.
All DID numbers assigned here will reach this extension for incoming faxes.
6. Under **Select Fax Monitors**, assign the extensions that can monitor the faxes received on this fax extension in their FortiVoice user portal. From their FortiVoice user portal, users can choose to view, delete, resend, forward, or download the faxes. These users, who have email addresses linked to their extensions, will receive an email notification when a fax is received.
7. Set **Fax to Email** to the email addresses you want to receive the faxes sent to this fax extension. These email addresses will receive the faxes in a PDF file.

8. If required, under **Relay to Fax Machine**, assign the fax machines connected to the FortiVoice unit using T.38 adapters. Faxes will be relayed to the selected machines.
9. Under **Archive**, enable **Fax archive** to activate fax archiving and enter the **File name format** to archive, according to the formats available from the drop-down menu.
10. Click **Create**.

Fax archive settings

If you have enabled **Fax archive** in an **eFax Account**, you should specify rotation and destination settings to archive recorded calls.

1. Go to **Call Feature > Fax > Archive**.
2. Under **Rotation Setting**, set the **Fax rotation size** in MB and **Fax rotation time** in seconds. The FortiVoice unit starts generating a new archive file when either one of these parameters (size or time) is reached first.
3. Set **Archiving options when disk quota is full** to determine what the FortiVoice unit should do if it runs out of disk space. Click **Overwrite** to remove the oldest archived folder to make space for new archives, or click **Do Not Overwrite** to stop archiving.
4. Set a **Schedule** for archiving to take place. Archiving will not take place outside of the selected schedule.
5. Under **Destination Setting**, set **Destination** to either **Local** to use the hard drive of the FortiVoice unit or a NAS server, or **Remote** to use a remote FTP or SFTP storage server.
6. If **Destination** is set to **Remote**, configure the remote server options as necessary.
7. Click **Apply**.

Configuring FortiVoice to send faxes

1. Go to **Call Feature > Fax > Sending Rule** and click **New**.
2. Enter a **Name** and click **Enable**.
3. Under **Dialed Number Match**, click **New**.
4. Enter a **Match Pattern** number. This is the extension number pattern in your dial plan that can match many different numbers for sending faxes.

The following pattern matching syntax is supported, in order to match a wide range of potential numbers:

Syntax	Description
X	Matches any single digit from 0 to 9.
Z	Matches any single digit from 1 to 9.
N	Matches any single digit from 2 to 9.
[15-7]	Matches a single character from the range of digits specified. In this case, the pattern matches a single 1, as well as any number in the range 5, 6, 7.
.	Wildcard match; matches one or more characters, no matter what they are.
!	Wildcard match; matches zero or more characters, no matter what they are.

5. Enter any required **Modification** settings, such as stripping or appending prefixes or postfixes to the number pattern, and click **Create**.
6. Under **Call Handling**, click **New**.

7. Set the appropriate **Schedule**, **Action**, and **Outgoing trunk** and/or **Caller ID modification** for your dial plan requirements, to determine the call handling action for the numbers matching the configured number pattern.
8. Click **Create**, and **Create** again to finish configuring the **Sending Rule**.

General fax settings

1. Go to **Call Feature > Fax > Setting**.
2. Enter a **System station ID** and **System fax header** that shows on each fax sent from the FortiVoice unit.
3. Under **T.38 Fax**, determine whether the FortiVoice unit will resend a T.38 invite if the remote end is unresponsive, and whether the FortiVoice will fallback to G.711 mode if T.38 communication fails.
A T.38 fax requires significantly less bandwidth, and helps mitigate packet loss.
4. T.38 uses UDP Transport Layer (UDPTL) as its transport protocol. Enter the start and end ports.
5. Under **Send Queue**, set **Max retry times** to the maximum number of times the FortiVoice unit will attempt to resend a fax if the fax is unable to be sent due to busy lines.
6. Set a **Retry interval** and **Wait time for an answer** to the duration of time in seconds that the FortiVoice unit will wait between retries and the wait time for a "go-ahead" signal from the fax receiving terminal.
7. Click **Apply**.

Extensions

This section contains information about establishing and maintaining extensions.

Auto provisioning for FortiFone devices on different subnets

When configuring FortiFone IP extensions on your FortiVoice system on a single LAN deployment, they will auto discover utilizing SIP PnP, in which a multicast is sent out on the network.

For FortiFone devices on networks that use a different subnet than FortiVoice, the multicast will not make it across the various subnets. In deployments using different subnets it is best to use HTTP or HTTPS with Option 66 configured on your DHCP server.

The HTTP and HTTPS protocols increase the reliability of the FortiFone devices being able to auto provision across the network. Option 66 set on the DHCP server creates an easy way to have all phones directed towards the FortiVoice in order to auto provision.

This recipe covers the best practices for a large deployment of FortiFone devices with the FortiVoice system.

This recipe recommends using firmware v6.0.1 or later.

Downloading and editing the CSV file

1. On FortiVoice, go to **Extension > Extension > IP Extension**.
2. Under the **Actions** drop-down, select **Export > Table Template (csv) > With User ID**.

A sample file will be downloaded entitled **extensions.csv**.

The screenshot shows the FortiVoice IP Extension management interface. At the top, there are tabs for 'IP Extension', 'Managed Extension', 'Remote Extension', 'Fax Extension', and 'Preference'. Below the tabs, there are buttons for '+ New...', 'Edit...', and 'Delete'. A search bar with 'Filter: --None--' and an 'Option: --All--' dropdown are also present. The 'Actions' dropdown menu is open, showing options like 'Export', 'Import', 'View Phone Configuration', 'Apply Configuration (Main Phone)', 'Password Auditor', 'Number Auditor', 'Send Softclient QR Code by Email', and 'Maintenance'. The 'Export' option is selected, and a sub-menu is open showing 'All Extensions', 'Table Template (csv)', and 'Profile'. The 'Table Template (csv)' option is selected, and a sub-menu is open showing 'With User ID' and 'Without User ID'. The 'With User ID' option is selected. Below the menu, a table of extensions is visible. The table has columns for 'Enabled', 'Number', 'Display Name', 'Phone Info', 'Emergency Zone', and 'Status'. The 'Status' column shows red dots for each row. The total number of extensions is 9.

Enabled	Number	Display Name	Phone Info	Emergency Zone	Status
<input checked="" type="checkbox"/>	101	Donna		default	●
<input checked="" type="checkbox"/>	102	Stanley		default	●
<input checked="" type="checkbox"/>	1106	Mike Smith		default	●
<input checked="" type="checkbox"/>	200	test200		default	●
<input checked="" type="checkbox"/>	201	user 201	Linphone Desk...	default	●
<input checked="" type="checkbox"/>	7701	Operator	Linphone Desk...	default	●

3. Open the newly downloaded sample CSV file.
4. Replace the sample's content with the information for your extensions. Make sure to configure the following sections: **User ID**, **Extension**, **Display Name**, **Phone Type**, and **MAC Address**.

User ID	Extension	SIP password	voicemail PIN	User Password Email	Display name	Phone type	Mac address	Phone profile	Survival branch	Device ID
1	811	811	voice#321	123123	password321# ky@some.com Kathy Ainsworth	FortiFone-350i	00:1a:7e:ac:c2:8d	{}		1
3	811	812	voice#321	123123	password321# aa@test.com, I Jack Wong	FortiFone-350i	00:1a:7e:ac:c2:8d	{}		1
4	811	813	voice#321	123123	password321# john@777.com John Green	FortiFone-350i	00:1a:7e:ac:c2:8d	{}		1

The **Phone Type** must be entered as “FortiFone-XXX”, where “XXX” is your model type (for example, **FortiFone-570**). To see a current list of FortiFone models, go to **Phone System > Profile > Phone**.

The **MAC Address** sections can be populated as “XX:XX:XX:XX:XX:XX” or “XXXXXXXXXXXX”. FortiVoice will automatically format the MAC address once the CSV file is imported.

If a custom phone profile using the default settings is in use, the **Phone profile** section will also need to be configured.

Importing the CSV file

1. Go to **Extension > Extension > IP Extension**.
2. Under the **Actions** drop-down, select **Import**.
3. Navigate to and select the configured CSV file and select **OK**.
A window will appear stating that large imports can take a while, with **Update existing extensions** enabled.
4. Select **Import**.

Import Extensions Options

Please note that for large imports it can take a while. Please wait for the page to reload after choosing import.

Update existing extensions ☒

Import Cancel

5. Review your list of pre-existing and newly imported extensions.

Configuring HTTP or HTTPS protocol support

For successful auto provisioning to occur across multiple subnets, the HTTP and HTTPS protocols must be enabled on the FortiVoice network interface.

1. Go to **System > Network > Network**.
2. Select the network interface in use (in this example, **port1**) and select **Edit**.
3. Expand **Advanced Setting**.
4. Under **Access**, make sure **HTTP** and/or **HTTPS** is enabled, then select **OK**.

Interface

Interface name: port1 (00:0c:29:8b:00:44)

OK Cancel

5. Go to **System > Advanced > Auto Provisioning**.

6. Under **Auto Provisioning**, select **Enabled** (and optionally enable **Unassigned phone**).
7. Set **Provisioning protocol** to either **HTTPS** or **HTTP**, and select **Apply**.

DHCP server

1. On your DHCP server, set:
 - a. Option 66 to the protocol in use
 - b. IP address of FortiVoice
 - c. Protocol port number
 - d. Provisioning folder (for example, *http://192.168.1.99:80/provisioning/*, or *https://192.168.1.99:443/provisioning/*)
2. The protocol ports can be changed from their default values on FortiVoice by going to **System > Configuration > Option**. Make note of any changes made on FortiVoice.
3. Once DHCP settings are verified, connect the FortiFone devices to the network, or reboot them if already connected.

Caller ID modification – best practices

For outbound calls from the FortiVoice unit, you can customize the caller ID to be any name, number, or both. As there are multiple areas where you can modify the caller ID within the FortiVoice UI, there is a hierarchy to which the caller ID modification takes precedence. This recipe details the caller ID modification hierarchy to help you decide how to configure your FortiVoice caller IDs.

The hierarchy of caller ID modification options is different for a normal call or an emergency call.

This section includes the following topics:

- [Caller ID modification hierarchy for normal calls on page 37](#)
- [Caller ID modification hierarchy for emergency calls on page 41](#)

Caller ID modification hierarchy for normal calls

A normal call is any outbound call that is not an emergency call, as defined by the regional emergency number settings.

The following table displays the caller ID modification options available on normal calls from the highest priority (1) to the lowest priority (6).

For example, if you configure the caller ID settings using the direct inward dialing (DID) number mapping (priority 2) and the Caller ID modification (priority 4), the FortiVoice unit displays the caller ID configured using the DID number mapping because this setting has a higher priority.

Priority	Setting	Steps
1	External caller ID	<ol style="list-style-type: none"> 1. Go to Extension > Extension > IP Extension. 2. Edit an extension or create a new one. 3. Go to Display name and click  to expand.

Caller ID modification hierarchy for emergency calls

When you place an emergency call, the hierarchy for caller ID modification changes to alert emergency services about the correct location of the caller.

The following table displays the caller ID modification options available on emergency calls from the highest priority (1) to the lowest (8).

For example, if you configure the caller ID settings using the Extension emergency caller ID (priority 1) and the Extension external caller ID (priority 3), the FortiVoice unit displays the caller ID configured using the Extension emergency caller ID because this setting has a higher priority.

Priority	Setting	Steps
1	Extension emergency caller ID	<div><div>1. Go to Extension > Extension > IP Extension.</div><div>2. Edit an extension or create a new one.</div><div>3. FortiVoice Click-to-dial configuration on Google Chrome

FortiVoice Click-to-dial is a Google Chrome extension that allows you to click on a phone number on a website and call them from your desk phone. This recipe details the steps required to install and set up the extension from the Chrome Web Store.

Installing FortiVoice Click-to-dial

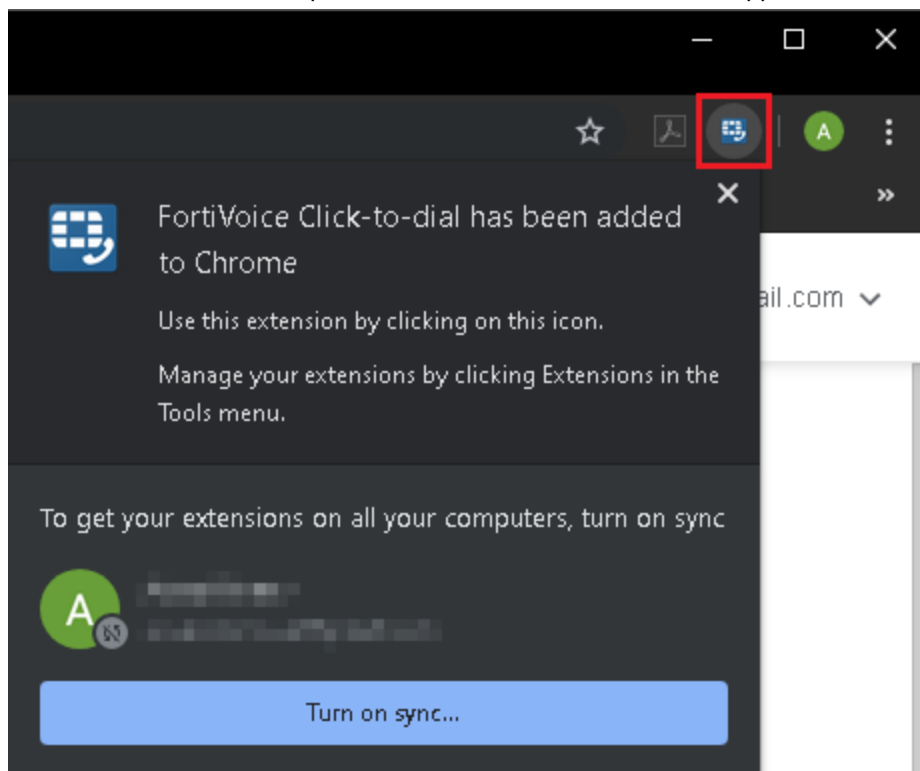

1. Start the Google Chrome web browser and go to the [Chrome Web Store](#).
2. Search for **FortiVoice**.
Google Chrome displays **FortiVoice Click-to-dial**.
3. Select **Add to Chrome**.

4. In the confirmation window select **Add extension**.

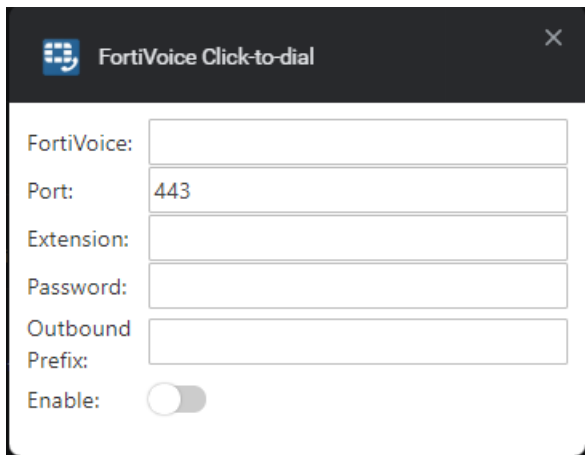

5. After the installation is complete, the FortiVoice Click-to-dial icon appears in the search bar.

Configuring FortiVoice Click-to-dial

1. Right-click on the Click-to-dial icon and select **Options**.
2. Complete the following fields:
 - **FortiVoice:** The IP address or FQDN of the FortiVoice device. If on the same network as the FortiVoice, enter the private IP address.
 - **Port:** The HTTPS port used by FortiVoice (443 by default).
 - **Extension:** The extension number of the user.
 - **Password:** The PIN code or password for that extension (the same as the voicemail PIN).
 - **Outbound Prefix:** (Optional) If required to dial an outbound code before the number, such as 9.
 - **Enable:** Turn on the extension.

The screenshot shows a configuration window titled "FortiVoice Click-to-dial". It contains several input fields: "FortiVoice:" (empty), "Port:" (443), "Extension:" (empty), "Password:" (empty), "Outbound Prefix:" (empty), and an "Enable:" toggle switch which is currently turned on.

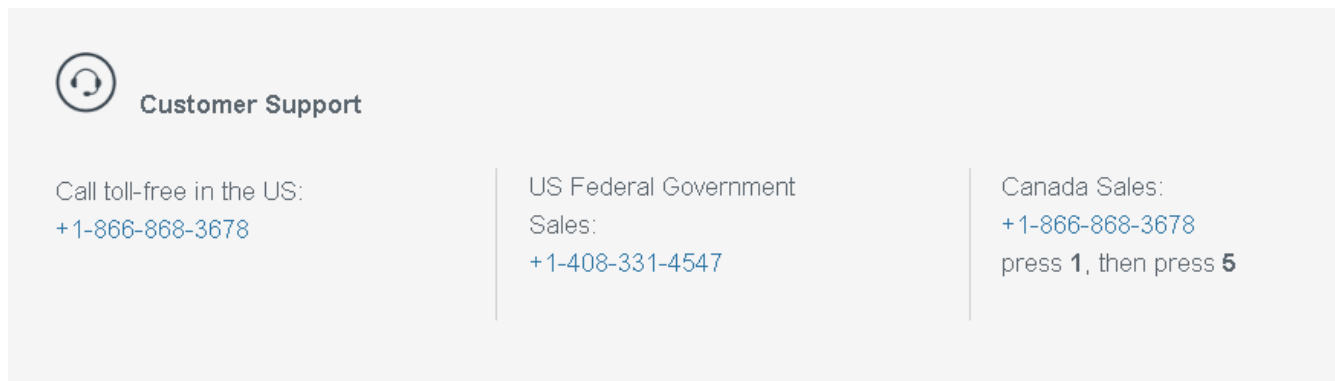

Note that the following errors can appear when you attempt to enable the extension:

- **Connection error:** Indicates that the **IP/FQDN** or **Port** is incorrect, or if the firewall is not routing the traffic correctly if attempting to use externally.
- **Invalid credentials:** Indicates that the wrong **Password** has been entered.

If the **Enable** toggle remains on, the configuration is correct.

Using FortiVoice Click-to-dial

After the configuration is complete, any web page that contains a phone number will be highlighted; click on the number to initiate the call from your extension.

Alternatively, you can select the Click-to-dial icon to open the phone dialer and manually enter the phone number.

Hot desking

Hot desking enables a user to log in to an unassigned phone and take total control of that phone by applying all of their own phone settings until logging out.

Hot desking is particularly useful in a call center or sales office environment where users need to be able to sit at any desk and use their phone extension.

The hot-desking configuration requires two phones:

- Registered phone: This phone has an extension and is used to log in to a hot-desking host. This extension requires a user privilege with the hot-desking login enabled.
- Unassigned phone: This phone is the hot-desking host which users log in to. The unassigned phone has no extension and does not require a user privilege.

Configuring hot desking

1. Log in to the FortiVoice web-based manager.
2. Create a user privilege to enable hot-desking login:
 - a. Go to **Phone System > Profile > User Privilege**.
 - b. Click **New**.
 - c. In the **Name** field, add a name for this user privilege.
Note: The **Name** field does not support the following characters: space, quotation mark, and backward slash.
 - d. Select **Enable hot-desking login** to allow phones associated with this user privilege to log in to other phones.
 - e. In the **Automatic logout hours** field, enter the time in hours after which the phone automatically logs out of hot desking.

User Privilege

Name:

Basic Setting

Using hot desking on FortiFone

1. On the FortiFone unit that you want to log in to, dial *11.
2. Enter your extension number (example, 1001#) and user PIN.
Depending of the phone model, the FortiFone unit may reboot.
The new extension and name display on the FortiFone screen.
3. To place a call, dial an extension (example, 3004).
The screen of the receiving FortiFone unit displays the extension number (example, 1001).
4. To log out of the FortiFone unit, dial *12.
Depending of the phone model, the FortiFone unit may reboot.

Viewing activity details of hot-desking extensions

1. Go to **Monitor > Extension & Device > Hot Desking**.
When an extension is used for logging in or logging out of a hot-desking host, FortiVoice populates the table. The table includes one row for each extension, not multiple rows. If the table is empty, then none of the extensions have used hot desking.

2. For the extension that is logged in to a phone or has logged out, you can view the following hot-desking details:
 - **Status:** The status of the hot-desking extension as logged in or logged out.
 - **Number:** The number of the hot-desking extension.
 - **Display Name:** The name displayed on the phone that is hosting hot desking.
 - **Host Device:** The MAC address of the unassigned phone. This is the phone that a hot-desking user logs into. When the status of the hot-desking extension is "Logged out", then the host device is blank.
 - **Last Login:** The last login performed on the hosting phone.
 - **Expiry:** The expiry time (in the yyyy-mm-dd hh:mm:ss format) of the hot-desking login. The value is set in the **Automatic logout hours** field of the user privilege for the hot-desking login. When the status of the hot-desking extension is "Logged out", the expiry time is all zeros.

Local IP extensions

FortiVoice Enterprise allows you to configure IP phone extensions, edit analog extensions, and determine extension preferences.

This recipe shows how to configure an internal IP extension, a phone connected on the same LAN as the system. An external IP extension is a phone connected outside the LAN.

Note that this recipe requires a Call Center license.

Configuring extension settings

1. Go to **Extension > Extension > IP Extension** and click **New** (or select and **Edit** an existing extension).
2. Enter an extension **Number**. A green check mark will appear to indicate that the number entered is **Available**. FortiVoice auto-populates the **User ID** field.
3. Enter a **Display name** for the user. This is the name that appears on the phone screen when receiving a call from this extension.

Configuring device settings

1. In the **Device Setting** section, you can determine whether the IP extension is assigned as either a **Desktop Phone**, **Soft Phone**, or an **Auxiliary Device**. For this example, stay on the **Desktop Phone** tab, and set the **Type** to **FortiFone** from the drop-down menu.
2. For **Device**, click **New**, where you can enter the extension's device **MAC address**, **Phone model**, and assign a **Phone profile**.
3. Assign an appropriate SIP profile from the **SIP settings** drop-down, and assign an **Emergency zone**.
4. Then click **Advanced** to open the desktop phone advanced settings.

5. Enter or **Generate** a **SIP password**, and set **Location** to **Internal**.
Note that IP extensions that are designated as **Internal** are those extensions that do not traverse through NAT to connect to the FortiVoice unit. Select **External** if the extension does require NAT.
6. Optionally, enable message waiting indication (**MWI**), **Auto answer**, and **Direct call**. Then click **Create**.

Configuring user settings

1. In the **User Setting** section, under the **Management** tab, assign a **User privilege**, the **Department** the extension belongs to, and a **Survival branch** profile.
See [Configuring voicemail on page 53](#) for information on configuring the **Voicemail** settings.
2. Under the **Web Access** tab, set **Authentication type** to **Local** and enter or **Generate** a **User password**.
3. A warning may appear indicating that the system password policy is disabled. If this is the case, click **Password policy is disabled** to enable **Password/PIN Policy**, and configure the minimum requirements for passwords as appropriate.
4. Under the **Phone Access** tab, enter or **Generate** a **Voicemail PIN** and **Personal code**. These are used by the extension user to access their voicemail and the FortiVoice user portal, and to make restricted calls, respectively.

[Member of Queues...]

6. Set **Main/Outgoing queue** to the primary queue for collecting the outgoing calls from all queues by this agent.
7. From the **Queues** table, assign the queues you want the extension to be a member of.
8. Click **OK** when finished.
9. Under **Skill Sets**, click **New**.
10. Assign the appropriate skill and skill level for the agent from the drop-down menu. For more information on agent skill and skill-based routing, see [Skill-Based Routing in FortiVoice Enterprise](#).

Create New Record

Skills: support

Level: 80

Create Cancel

11. Click **Create**, and **OK** to complete configuring the **Call Center**, and **OK** again to complete configuring the **IP Extension**.

Remote extension configuration

Callers can connect to remote extensions through auto attendants or through call cascade transfers. A remote extension reaches an external phone by automatically selecting a line from a trunk and dialing the phone number. For example, a remote extension could reach an employee's cell phone or home phone, or a phone at a branch office.

This recipe guides you through the process of configuring a remote extension. It is assumed that an auto attendant is already established.

Remote extensions are designed to operate with most major telephone service providers. Unfortunately, phone numbers and mobile phones roaming internationally may not support remote extensions.

Adding a remote extension

1. Go to **Extension > Extension > Remote Extension** and click **New**.
2. Set **Number** to the local extension number from which calls are transferred to a remote extension.
3. Enter the **Remote number**. Calls to the local extension are transferred to this remote number.
4. Click **Enable**.
5. Enter a **Display name**, and expand to modify the caller ID.
6. Under **User Setting**, in the **Management** tab, apply a **User privilege** rule and a **Department**, if required.
7. Click **Voicemail** to assign a voice mailbox, and optionally allow other users and/or groups to access the same voice mailbox. For example, you may want others to access the mailbox when you are away.
8. In the **Web Access** tab, select the appropriate **Authentication type**.
9. Enter the **User password**, for local authentication extensions.
10. In the **Phone Access** tab, set **Voicemail PIN** to the PIN for the user to access voicemail.
11. Click **Create**.

Testing a remote extension

1. Call the auto attendant associated with the FortiVoice unit, which dials the local extension.
2. When the extension's user is not available to answer the call, the call is transferred to the configured remote extension. For example, the user's cell phone number.
3. The user will receive the call through their remote extension.

High availability

With FortiVoice HA, you set up redundancy between two FortiVoice units in case of a system failure. FortiVoice HA uses an active-passive mode which means that you have a master (active) unit and a slave (passive) unit. These two units make up an HA group. The slave unit is not used until a failure occurs on the master unit and triggers the slave unit to assume the responsibilities of the master unit.

FortiVoice HA units use a heartbeat link to communicate. This heartbeat link lets the slave unit know that the master unit is up and running, and allows the master unit to copy configuration and data information to the slave unit whenever the master configuration changes. If a failure occurs on the master unit, the loss of the heartbeat triggers the slave unit to take over as the master and be a copy of that master unit.

This section includes the following recipes:

- [Planning high availability on page 56](#)
- [Configuring HA mode and group](#)
- [Configuring service-based failover on page 59](#)
- [Synchronizing configuration and data in a FortiVoice HA group on page 60](#)
- [Installing licenses on a FortiVoice HA group on page 61](#)
- [Enabling HA activity logging on page 61](#)
- [Displaying the HA status on page 61](#)

Planning high availability

For FortiVoice HA, apply the following planning guidelines:

- Make sure that both FortiVoice units in the HA group are the same model and have the same firmware version. If you are using VM instances, you require two VM licenses.
- For *both* the master and slave FortiVoice units:
 - Connect port 1 to the network switch.
 - Connect port 2 or a secondary port (3, 4, or 5, depending on the model) to the network switch. This port takes on the role of the primary heartbeat interface.
- Plan which interface ports to use for your voice traffic and heartbeat links:
 - Decide which port you want to use for your voice traffic, for example port 1.
 - Make sure to assign the secondary heartbeat status to port 1.
 - Make sure to assign the primary heartbeat status to port 2 (3, 4, or 5, depending on the model).
- FortiVoice HA uses a secondary IP address on the interface ports. This secondary IP address is called a virtual IP address. You configure the master and slave units to use this virtual IP address but only the acting master unit will use it to communicate. Any network traffic that is to be forwarded to the FortiVoice unit can be forwarded to this virtual IP address. If a failover occurs, the slave unit assumes the role of master and starts to use the virtual IP address. Your system is then able to continue operating as normal without having to change your port forwarding. For example, the master unit has an IP address of 192.168.1.200 and the slave unit has an IP address of 192.168.1.202. The virtual IP address is 192.168.1.210. Both master and slave units share this virtual IP address which is also used to receive all port forwarding to the FortiVoice unit.

- Take note of the IP address of each interface port on both FortiVoice units. You will need this information to set up the heartbeat link.

When you are ready to configure HA, go to [Configuring high availability on FortiVoice units on page 57](#).

If a failover occurs and you are using FortiVoice 200F8 or FortiVoice 300E-T, remember to swap the physical FXO and PRI connections to the slave unit.

Configuring high availability on FortiVoice units

Perform this procedure on both the primary (master) FortiVoice unit and secondary (slave) FortiVoice unit.

1. Go to **System > High Availability > Configuration**.
2. In **HA configuration**, configure the following settings:
 - a. Set **Mode of operation**.
If the FortiVoice unit is the primary unit, set the **Mode of operation** to **Master**.
If the FortiVoice unit is the secondary unit, set the **Mode of operation** to **Slave**.
 - b. Set the **On failure** behavior to one of the following choices:
 - i. **Switch Off**: As part of the HA group, the failed unit will not become a master again until you manually restore the configured operating mode on the **Status** tab.
 - ii. **Wait for Recovery then Restore Original Role**: After the unit recovers from failure, it will go back to its programmed **Mode of operation**. For example, if unit 1 (master) encounters a failure and unit 2 (slave) effectively becomes the master, then when unit 1 recovers from failure, unit 1 will be restored as the master and unit 2 will return to operating as the slave unit.
 - iii. **Wait for Recovery then Restore Slave Role**: After the unit recovers from failure, this unit will operate in slave mode. For example, if unit 1 (master) encounters a failure and unit 2 (slave) effectively becomes the master, then when unit 1 recovers from failure, it will then assume the slave mode and unit 2 will continue to operate in master mode.
 - c. Set **Shared password**. Make sure to use the same password for both master and slave units.

Example of HA Configuration settings for primary (master) unit

HA Configuration	
Mode of operation:	Master
On failure:	Switch Off
Shared password:	GR@T7859!

3. In **Advanced Options**, configure the following port and heartbeat settings:
 - a. The **HA base port** is used for the heartbeat signal as well as data and configuration synchronization. The default and recommended port is 20000.
 - b. The **Heartbeat lost threshold** setting is the amount of time that must pass with no heartbeat link between the master and slave units before the system triggers a failover. The heartbeat signal is sent once per second to ensure that the unit is responding. In order to prevent a premature failover due to the system being under a heavy load, it is recommended to set this setting at 3 seconds or higher.

- c. As an added fail-safe, you can enable **Remote services as heartbeat**. After you enable this setting, you can configure the HTTP and SIP UDP settings in the **Service Monitor** section to act as an additional HA heartbeat (details are included in [Configuring service-based failover on page 59](#)). If both primary and secondary heartbeat links fail but the remote service detects that the master is still available, no failover will occur. Note that this feature is only an additional heartbeat and does not provide any synchronization of files from master to slave units. Therefore, Fortinet does not recommend relying on remote services alone. Configure at least one HA heartbeat on an interface port.
- d. With **Call recording sync**, you enable or disable the synchronization of recorded calls from the master to the slave units. This setting is optional because there can be many recorded calls on the system that can take up quite a bit of memory. Copying these files during synchronization can take a long time and use up network bandwidth.
- e. **Survivability service interface** is planned to be functional in a future release.
- f. Click **Apply**.

Example of Advanced Options settings

 **Advanced Options**

HA base port:

Heartbeat lost threshold: seconds

Remote services as heartbeat ☒

Call recording sync ☒

Survivability service interface:

4. In **Interface**, you configure the port behavior. When setting up the ports, make sure that you mirror the master unit settings on the slave unit, except for the **Peer IP address** and **Peer IPv6 address** settings.

Make sure to apply the following settings:

- Set port 1 with the secondary heartbeat status.
- Set port 2 (or 3 or 4) with the primary heartbeat status.

Select a port and click **Edit**.

- a. **Enable port monitor**: When you enable this setting, the unit performs an internal port check to make sure that this port is responsive. If the port becomes unresponsive, the system triggers a failover. This setting has its timing intervals configured by using the **Service monitor**, **Interface monitor** section which you can set later in [Configuring service-based failover on page 59](#).
- b. **Heartbeat status**: Configure the heartbeat link and system synchronization. The following three choices are available:
 - i. **Disable**: There is no heartbeat link or synchronization on this port.
 - ii. **Primary**: Make sure to set port 2 (or 3 or 4) as primary. This port provides a heartbeat link and system synchronization from the master to the slave.
 - iii. **Secondary**: Make sure to set port 1 as secondary. A secondary heartbeat link is used as a backup in case the primary one fails. A failover does not occur unless both primary and secondary heartbeat links are down.
- c. **Peer IP address and Peer IPv6 address**: Specify the IP address of the port at the opposite side for the heartbeat link to communicate on. For example, if you are configuring the master unit, then enter the IP address for port 2 of the slave unit here. If you are configuring the slave unit, then enter the IP address of port 2 of the master unit here.
- d. **Virtual IP action**: When configuring the virtual IP address, set the **Virtual IP action** to **Use**.

- e. **Virtual IP address and IPv6 address:** Make sure that the master and slave units share the same virtual IP address on each port. Also, make sure that all port forwarding for voice traffic on your router is forwarded to the virtual IP address.
- f. Click **OK**.

Example of Interface settings

 View...

Port	Heartbeat Sta...	Peer IP Address	Virtual IP Act...	Virtual IP Address	Port Monitor
port1	Secondary	[IPv4]  [IPv6] ::	Use	[IPv4]  [IPv6] ::/0	
port2	Disable	[IPv4] 0.0.0.0 [IPv6] ::	Use	[IPv4]  [IPv6] ::/0	
port3	Disable	[IPv4] 0.0.0.0 [IPv6] ::	Use	[IPv4]  [IPv6] ::/0	
port4	Primary	[IPv4]  [IPv6] ::	Ignore	[IPv4] 0.0.0.0/0 [IPv6] ::/0	

5. **Service Monitor** offers another way of detecting whether or not there is a system failure. For configuration details, see [Configuring service-based failover on page 59](#).
6. When you have completed the configuration on both FortiVoice units in the HA group, go to [Synchronizing configuration and data in a FortiVoice HA group on page 60](#).

Configuring service-based failover

The **Service Monitor** section offers another way of detecting whether or not there is a system failure.

The system uses **Remote HTTP** and **SIP UDP** settings as a heartbeat link to confirm that the slave unit can connect to the master unit using HTTP or SIP. If the slave unit cannot connect to the master unit, then the system triggers a failover and the slave unit becomes the master. In addition to enabling the **Remote HTTP** and **SIP UDP** settings here, make sure that you have enabled **Remote services as heartbeat** in the **Advanced Options** section of [Configuring high availability on FortiVoice units on page 57](#).

The **Interface monitor** and **Local hard drives** settings are locally monitored. If the system detects a failure on one of its interface ports or hard drives, then the system triggers a failover. To enable which ports the unit will monitor for failure, select **Enable port monitor** in the **Interface** section of [Configuring high availability on FortiVoice units on page 57](#).

Perform the following steps on both the primary (master) FortiVoice unit and secondary (slave) FortiVoice unit.

1. Go to **System > High Availability > Configuration**.
2. In **Service Monitor**, click one of the following services:
 - **Remote HTTP**
 - **SIP UDP**
 - **Interface monitor**
 - **Local hard drives**
3. Click **Edit**.

4. For **Remote HTTP** and **SIP UDP**, click **Enable**, and configure the following settings:

- **Remote IP:** Enter the peer IP address.
- **Port:** Enter the port number of the peer service.
- **Timeout:** Enter the timeout period (in seconds) for one connection test.
- **Interval:** Enter the frequency (in seconds) of the tests.
- **Retries:** Enter the number of consecutive tests that are allowed before the primary unit is deemed unresponsive and a failover occurs.

For **Interface monitor** and **Local hard drives**, configure the following settings:

- **Enable:** Select to enable local hard drive monitoring.
For interface monitoring, select **Enable port monitor** in the **Interface** section of [Configuring high availability on FortiVoice units on page 57](#).
- **Interval:** Enter the frequency (in seconds) of the test.
- **Retries:** Enter the number of consecutive tests that are allowed before the local interface or local hard drive is deemed unresponsive and a failover occurs.

5. Click **OK**.

Example of Service Monitor settings

Service Monitor						
 Edit...						
Name	Remote IP	Port	Timeout	Interval	Retries	Enabled
Remote HTTP	0.0.0.0	80	30	120	3	✓
SIP UDP	0.0.0.0	5060	30	120	3	✗
Interface monitor				120	3	
Local hard drives				120	3	✗

6. Go to [Synchronizing configuration and data in a FortiVoice HA group on page 60](#).

Synchronizing configuration and data in a FortiVoice HA group

Use this procedure to synchronize configuration and data from the master FortiVoice unit to the slave FortiVoice unit.

The synchronization does not copy the following data:

- Host name
- Static routes
- Interface configuration
- Main HA configuration
- HA service monitoring settings
- System appearance

Procedure steps

1. Go to **System > High Availability > Status**.
2. Click the link **Click HERE to Start a Configuration/Data Sync**.
3. To confirm, click **OK**.

Installing licenses on a FortiVoice HA group

For the Call Center and Hotel Management features, the master and slave FortiVoice units share the license file. However, you must install the license file separately on both master and slave FortiVoice units.

Prerequisite

Download the license (.lic) file from your [Fortinet Support](#) account and know where you save the file on your computer.

Install the license on the master FortiVoice unit

1. Log in to the master FortiVoice unit.
2. Go to **Dashboard > Status**.
3. In the **License Information** widget, click **Update License**.
4. Locate the license file that you previously downloaded to your computer and click **Open**.
5. To confirm the upload, click **Yes**.

Install the license on the slave FortiVoice unit

1. Log in to the slave FortiVoice unit.
2. Go to **System > High Availability > Status**.
3. Check the **Effective Operation Mode** and wait until it displays **out of sync**.
You can install the license file on the slave unit only when the file is out of synchronization with the license file on the master unit.
4. When the **Effective Operation Mode** on the slave unit displays **out of sync**, then go to **Dashboard > Status**.
5. In the **License Information** widget, click **Update License**.
6. Locate the license file that you previously downloaded to your computer and click **Open**.
7. To confirm the upload, click **Yes**.
8. After successfully uploading the license file, go to **System > High Availability > Status**.
9. Click the link **Click HERE to restart the HA system**.

Enabling HA activity logging

Use this procedure to enable the high availability activity logging. This logging is disabled by default.

1. Go to **Log & Report > Log Setting > Local**.
2. Under **Logging Policy Configuration**, expand **System** and enable **HA**.
3. Click **Apply**.

Displaying the HA status

Use this procedure to display the high availability status of a FortiVoice unit.

1. Go to **System > High Availability > Status**.

2. You can review the following settings:

- **Refresh** section lets you set a timer for how often you want this page to check for a status update automatically. To manually refresh this page, click **Refresh**.
- **Mode Status** lets you know what the configured mode is and the mode that it is currently using.
 - **Configured Operating Mode** is the mode that you have programmed the unit to act as with the **Configuration** tab (either as master or slave).
 - **Effective Operating Mode** can display one of the following modes:
 - **Master** shows that the unit is acting as the master.
 - **Slave** shows that the unit is acting as the slave.
 - **Failed** shows that the service or network interface monitoring has detected a failure and the diagnostic connection is currently determining whether the problem has been corrected or a failover is required.
 - **Off** is a mode used by both units. For a master unit, this mode indicates that the service or interface monitoring has detected a failure, taken the master unit offline, and triggered a failover. For a slave unit, this mode indicates that the synchronization has failed once; a subsequent failure will trigger a failover.
 - **Daemon status** is only available on the slave unit. The following updates are available:
 - **Monitor** shows when the slave unit will check the master unit to make sure that it is still active. If the system detects any errors, this section will show how many errors were detected.
 - **Configuration** shows the last time the configuration was updated from the master unit to the slave unit.
 - **Data** shows the last time the data was synchronized between the master and slave units. The **Configuration** and **Data** section may display different times. This is normal. Synchronizing data can take longer to complete.
 - **Database** shows the database status such as Checking Status, Stopped, Running (in sync), and Syncing Data.
 - **Actions**
 - **Click HERE to Start a Configuration/Data Sync:** For details about this action, see [Synchronizing configuration and data in a FortiVoice HA group on page 60](#).
 - **Click HERE to Restore Configured Operating Mode:** If a failover is triggered and the issue has been resolved, you can click this link to tell the unit that it can resume the mode it was originally configured to be.
 - **Click HERE to Switch to SLAVE Mode:** This action is available on the master unit only. If you want to change the mode of operation of the master unit to slave, click the link.
 - **Click HERE to Switch to MASTER Mode:** This action is available on the slave unit only. If you want to change the mode of operation of the slave unit to master, click the link.

Hotel management

This section contains information about configuring and maintaining hotel management settings in FortiVoice.

Hotel management configuration

This recipe shows how to configure hotel management settings, such as establishing wake-up calls and configuring hotel room status.

After configuring FortiVoice, you will need to configure your own property management software (PMS) and ensure it is properly connected to FortiVoice. FortiVoice, in this manner, acts as a supplement. Consult your property management software manual for more details.

A Hotel management license is required for this configuration.

Configuring PMS settings

Configure settings for connecting to the PMS on the FortiVoice.

The connection between FortiVoice and the PMS requires the use of an adapter. The Precedia iPocket 232 is recommended.

1. Go to **Hotel Management > Setting > PMS** and click **Enabled**.
2. Set **Protocol** to **FortiVoice**, and enter the port number used to connect to the PMS (by default, 15374).
3. Under **Network Setting**, enter the IP address and netmask of the PMS.
You can enter multiple trusted hosts if you have multiple property management systems.

4. Click **Apply**.

Apply Cancel

Configuring hotel management options

Check in and check out actions can be configured.

1. Go to **Hotel Management > Setting > Option**.
2. Under **Check In Action**, select the appropriate guest information to make a room check-in ready:
 - **Privilege**: Enable phone call restrictions and user privileges for the room extension.
 - **Guest name**: Display either the room number or guest name on the extension in the room. This is configured in the **Name** field as %%NUMBER%% to display the room number or %%NAME%% to display the guest name.
 - **Room condition**: Clear any condition set for the room.
3. Under **Check Out Action**, select the appropriate guest information to make a room check-out ready. In addition to the options available for check-in, check-out options also include the following:
 - **Voicemail**: Clear all voicemails for the room extension.
 - **Wake-up call**: Clear all wake-up call setups for the room extension.
4. Under **Advanced**, set **First dial minibar item** to either **Code** or **Number**, to determine how guests place an order from the front desk. For example, if **Code** is selected, and the guest wants two waters (code 1), the guest would enter **1*2**. If **Number** is selected, and the guest wants the same order, they would instead enter **2*1**.

5. Click **Apply**.

PMS **Option** Minibar Code

Privilege:

Room condition:

Advanced

First dial minibar item:

Apply **Cancel**

Defining minibar codes

In the previous step, an example was given of the guest entering a number code of 1 for water. The **Minibar Code** tab is where codes are associated with minibar items. Codes assigned to minibar items must be configured to allow guests to place minibar orders using the key pad.

1. Go to **Hotel Management > Setting > Minibar Code** and click **New**.
2. To create the water code used in the previous step, set **Name** to **water** and **Code** to **1**, and click **OK**.
3. Create other minibar codes for other minibar items as necessary.

PMS **Option** **Minibar Code**

+ New... **Edit...** **Delete** Total: 3

Name	Code
water	1
beer	2
chips	3

In this example, water, beer, and chips have been assigned codes 1, 2, and 3 respectively. If the guest wants two waters, two beers, and one order of chips, and assuming **First dial minibar item** under **Hotel Management > Setting > Option** is set to **Code**, the guest would enter **1*2*2*3*1**.

Configuring room status

Once the PMS and FortiVoice device are properly connected, hotel room statuses can be configured.

1. Go to **Hotel Management > Room Status > Room Status** and click **Server Info**.

A green dot indicates that the FortiVoice device is connected with the PMS.

Server Info

Status: 

Protocol:

Close

2. Select the **Room** you wish to edit and click **Edit**.
3. Enable **Guest phone** to make the room a guest room. **Guest Setting** will appear.
4. If the guest is checked-out, set the appropriate **Room condition** from the drop-down menu. If the guest is checked-in, enable **Checked-in**, set the appropriate **Room condition**, **Guest name**, and **Privilege** option.
5. Additionally, enable **VIP setting** if the guest should receive special treatment, and enable **DND** if the guest does not want to be disturbed.

Managed system

This section contains information about configuring system management settings including gateways, survivability, and FortiVoice and FortiFone firmware.

Gateway management

FortiVoice can manage the following three types of gateways:

- **FortiVoice foreign exchange office (FXO) gateway** - This gateway works in conjunction with the FortiVoice phone system, an IP private branch exchange (IP PBX), to expand resources and support additional analog phone lines. With the FortiVoice FXO gateway, you connect your analog phone lines to your FortiVoice phone system. For details about deploying an FXO gateway, see the [FortiVoice FXO Gateway Deployment Guide](#).
- **FortiVoice foreign exchange subscriber (FXS) gateway** - This gateway works in conjunction with the FortiVoice phone system to expand resources and support additional analog phone extensions. With the FXS gateway, you can connect your traditional analog phones and fax machines to a FortiVoice phone system. For details about deploying an FXS gateway, see the [FortiVoice FXS Gateway Deployment Guide](#).
- **FortiVoice primary rate interface (PRI) gateway** - This gateway works in conjunction with your FortiVoice phone system to expand resources and support additional phone lines. With a PRI gateway, you connect your legacy telephony infrastructure composed of PRI (T1 or E1) digital lines to a FortiVoice phone system. For details about deploying a PRI gateway, see the [FortiVoice PRI Gateway Deployment Guide](#).

FortiVoice units as survivable branches

In a centralized multi-site network deployment, a FortiVoice local survivability solution provides resiliency with survivability branches. A survivability branch is a FortiVoice local survivable gateway (LSG) unit with local extensions. A FortiVoice LSG unit is located in a branch office. A FortiVoice phone system in a main office manages one or more FortiVoice LSG units (survivability branches).

Local survivability provides centralized management and branch office resiliency.

For details about deploying a FortiVoice LSG unit, see the [FortiVoice Local Survivable Gateway Deployment Guide](#).

FortiFone firmware upgrades

This cookbook recipe guides you through the process of upgrading FortiFone firmware using FortiVoice 6.0. It details how to review current FortiFone firmware, upload new firmware files, schedule firmware upgrade jobs, and confirm firmware upgrades.

Prior to deploying FortiFone firmware upgrades, make sure to meet the following requirements:

- The network connectivity is available between the target FortiFone devices and the FortiVoice unit.
- You have downloaded the latest FortiFone firmware files from the [Fortinet Support](#) website.

Reviewing the current FortiFone firmware

Before updating FortiFone firmware, you can review the firmware currently installed on all FortiFone devices connected to the network.

1. From the FortiVoice UI, navigate to **Managed System > Firmware > FortiFone Firmware** and click **Statistics**. The **Firmware Upgrade Status** window opens listing the phone model and firmware version details of phones currently connected to the network. The **Phone Number** column provides the number of phones in each particular grouping.
2. When you are finished reviewing the status of the phones, click **Close**.

Uploading the FortiFone firmware to FortiVoice

1. In the **FortiFone Firmware** tab, click **Upload**. The **FortiFone Firmware Upload** window opens.
2. For **Phone model**, select the phone type that will be the target of the firmware upgrade.
3. For **Firmware file**, click **Select**. Select the firmware file for the selected FortiFone model and click **Open**. The firmware file uploads to FortiVoice.
4. In the **Firmware version** field, type the firmware version number.
5. In the **Comments** field, provide a comment if necessary.
6. Click **OK**.

The uploaded firmware file appears in the list of **FortiFone Firmware** files.

FortiFone Firmware		FortiVoice Firmware			
		<div> Upload Delete Download Action ▼ Statistics Upgrade schedule: business_hour ▼ Total: 2 </div>			
Name	Firmware Version	Size	Date	Status	
FortiFone-375					
FON375-2.10.0.6742.z	2.10.0.6742	4 MB	2019-09-12 16:0...	Upgrade disabled	

Scheduling the firmware upgrade

1. From the **Upgrade schedule** drop-down list, select a time period for the firmware upgrade to take place.

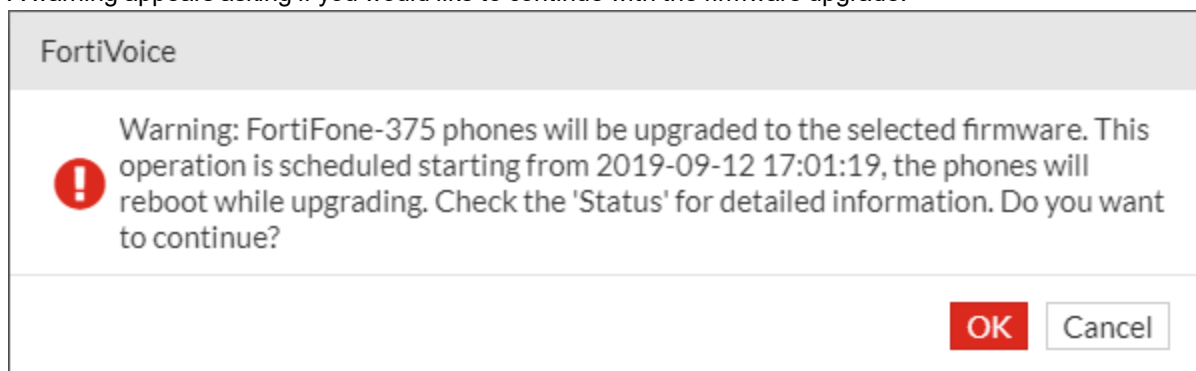

You can edit the phone firmware upgrade schedule options or create your own. To do this, go to **System > Advanced > Auto Provisioning**.

2. From the list of FortiFone firmware files, select the firmware file to schedule for upgrade.

3. Click **Action**, then click **Schedule Upgrade**.

A warning appears asking if you would like to continue with the firmware upgrade.

4. Click **OK**.

The firmware upgrade is scheduled to run.

Confirming the firmware upgrade

1. To confirm that the firmware has been successfully installed on targeted FortiFone devices, from the **FortiFone Firmware** tab, click **Statistics**.

The Firmware Upgrade Status window opens. Review the firmware version of applicable phone models to confirm that the new firmware is installed.

2. If necessary, click **Refresh** to view updates.

3. Click **Close**.

4. The scheduled firmware upgrade can be disabled after the firmware upgrade process is complete. From the list of FortiFone firmware files, select the firmware file that you want to disable scheduling for.

5. Click **Action**, then click **Disable Upgrade**.

The firmware upgrade is disabled.

Phone system

This section contains information about configuring various phone system features.

Emergency numbers

This recipe guides you through the process of establishing an emergency contact number for your office.

An emergency call, such as 911 in North America, is first routed to a Public Safety Answering Point (PSAP). The PSAP will look up the Automatic Number Identification (ANI), or calling number, from Automatic Location Information Database (ALI database) to determine the caller's physical address. The ALI database is updated by the PSTN service provider when a customer subscribes to its trunk service. A record in the ALI database is a mapping between a phone number (or trunk) and its physical address.

For each emergency call, the PBX is responsible for setting the correct ANI for the PSAP.

Configuring the emergency number

1. Go to **Phone System > Setting > Location**.
2. Select the appropriate **Country/Region** (in this example, **Canada**).
3. Configure the **Emergency number** and **Outside line prefix**. Check with your PSTN service provider for the appropriate area code. Configure the remaining settings as required.
It is especially important to note the **Outside line prefix**, as internal callers will need to append this to the configured emergency number (in this example, **9 911**).
4. Under **Emergency Setting**, select **Send Alert Email** and enter **Emergency contact emails** as necessary. The email addresses specified here will receive an alert email any time an emergency call is made, including the location of the caller and the time of the call.

5. Click **Apply** when finished.

Location	Option	Custom Message	Miscellaneous

Configuring an outbound dialplan for emergency calls

1. Go to **Call Routing > Outbound > Outbound** and click **New**.
2. Enter a **Name** for the dialplan, and enable **Emergency Call**. This dialplan ensures that the FortiVoice unit bypasses privilege checks and grants the highest priority to all emergency calls.
3. Leave **Caller ID Match** and **Dialed Number Match** as you do not want to impose any kind of restrictions to who can make an emergency call.
4. Under **Call Handling**, click **New**.
5. For an outbound dialplan as important as facilitating emergency calls, set **Schedule** to **any_time** and **Action** to **Allow**.
6. Select an **Outgoing trunk** or **Caller ID modification** profile from the drop-down menus provided.

LDAP authentication configuration for extension users

The FortiVoice unit works with LDAP servers to authenticate extension users accessing the unit. This recipe guides you through the process of configuring LDAP authentication on the FortiVoice unit for extension users.

This recipe uses MS Server 2012 Active Directory as an example LDAP server.

Creating an LDAP profile

1. Go to **Phone System > Profile > LDAP** and click **New**, or edit an existing profile.
2. Enter a **Profile name**.
3. Set **Server name/IP** to the FQDN or IP address of the LDAP server.
4. Set **Port** to the port that the LDAP server will use to communicate with the FortiVoice unit.
Note that the default port number depends on whether the LDAP server uses an encrypted connection (see the next step).
5. Set **Use secure connection** to **None** or **SSL**. Port 389 is typically used for non-secure connections, and port 636 is typically used for SSL-secured (LDAPS) connections.
6. Set **Base DN** to the distinguished name (DN) of the LDAP directory tree within which the FortiVoice unit will search for user objects, such as `ou=People,dc=example,dc=com`.
7. Set the **Bind DN** of an LDAP user account who has permissions to query the base DN, such as `cn=FortiVoice,dc=example,dc=com`.
Note that this is only necessary if your LDAP server requires the FortiVoice unit to authenticate when performing queries.
8. Enter the **Bind password**, if applicable.
9. Under **User Authentication Options**, enable one of the following:
 - **Try Common Name with Base DN as Bind DN**: Enable to form the user's bind DN by prepending a common name to the base DN. Also enter the name of the user objects' common name attribute, such as `cn` or `uid` into the field.
 - **Search User and Try Bind DN**: Select to form the user's bind DN by using the DN retrieved for that user.
For more information about configuring the LDAP query filter and schema required for this option, see the [FortiVoice Phone System Administration Guide](#).
10. Under **Advanced Options**, enter a **Timeout** in seconds that the FortiVoice unit will wait for query responses from the LDAP server.
11. Set **Protocol version** to the protocol used by the LDAP server.
12. Click **Enable cache** to cache LDAP query results.
13. Set **TTL** to the number of minutes that the FortiVoice unit will cache query results. After the TTL has elapsed, cached results expire, and any subsequent request for that information causes the FortiVoice unit to query the LDAP server, refreshing the cache.
Note that if caching is enabled, but queries are not being cached, review the value entered for **TTL**. Setting a **TTL** of **0** effectively disables caching.
14. Click **Enable user password change** to allow users of the FortiVoice user portal to change their password.
15. Set **Password schema** to your LDAP server's user schema style, either **OpenLDAP** or **Active Directory**.

16. Click **Create** or **OK**.

Applying the LDAP profile to an extension

1. Go to **Extension > Extension > IP Extension** and click **New**, or edit an existing extension.
2. Under **User Setting**, in the **Web Access** tab, set **Authentication type** to **LDAP**.
3. Set **LDAP profile** to the newly created profile.
4. Leave the **Authentication ID** field empty, and click **Create** or **OK**.

Schedules – best practices

Each schedule you create can be used within the call handling of the FortiVoice to direct calls during various times of the day, such as your business hours, after hours and holidays. Schedules can easily be edited to change hours, include specific days with modified hours, or even add new holidays.

Schedules are used for handling calls in the following features:

- Inbound call handling
- Outbound call handling
- Extension call handling
- Ring groups call handling
- Virtual number call handling

As schedules for these features are all added in the same way, this best practice covers an efficient way to create three schedules and how to edit them that works for most businesses.

Creating schedules

FortiVoice has two methods for creating a schedule, **Calendar** and **Standard**, both of which are used to create the schedules outlined within this recipe. FortiVoice contains three example schedules (**business_hours**, **after_hours**, and **holiday**) and a schedule called **any_time** which can be used to handle calls for any time that is not configured within a separate schedule. As a best practice, the following is recommended:

- Create a **Standard** schedule to handle your holidays.
- Create a **Calendar** based schedule for your business hours.
- Use the **any_time** schedule to handle time outside of business hours.

A holiday schedule should use the **Standard** based schedule, which allows for the quick addition of holidays. The holiday schedule will run for the entire day so no time ranges are required.

By default, FortiVoice uses a schedule called **any_time** to handle hours that have not already been configured within a schedule. For example, if you have a business hours schedule for 10 AM to 6 PM but no other schedule created, the hours outside that schedule (6 PM to 9 AM the next day) will be handled by the **any_time** schedule.

To add holiday dates in a Standard based schedule:

1. Go to **Phone System > Profile > Schedule** and click **New**.
2. Enter a **Name** (in this example, **Custom_holiday**), set **Mode** to **Standard**, and click **Create**.

Schedule

Name: Custom_holiday

Mode: **Standard** Calendar**Create**

Cancel

3. Once created, select the schedule from the list and click **Edit**.

4. Expand **Holiday** and click **New**.

Schedule

Name: custom_holiday

Recurring end:	Never Until

[OK](#)[Cancel](#)

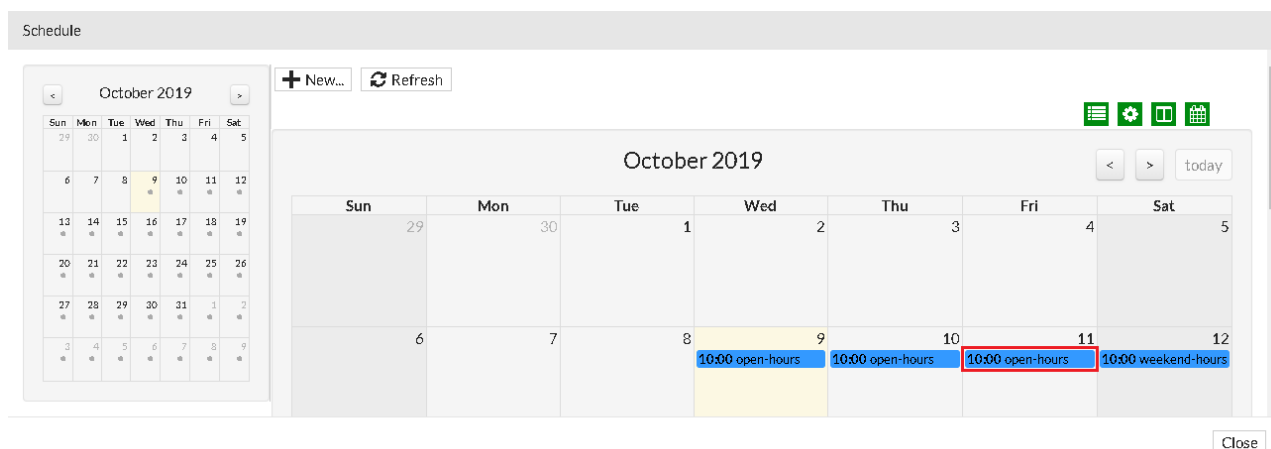

The calendar view shows the newly created weekend hours automatically populated alongside the regular business hours.

To define unique hours for a specific date:

The benefit to using calendar-based schedules is that they are perpetual schedules that can be easily edited. For example, you may want to edit your business hours for one specific date.

1. Go to **Phone System > Profile > Schedule** and edit your existing calendar-based business schedule.
2. Click the calendar event on the date that you would like to edit (for example, this coming Friday, October 11th). Be sure to click the event itself and not the area surrounding the event, otherwise a new event will be created instead.

3. Change the hours as necessary, and click **OK**. In this example, the **End time** has been reduced from 6 PM to 2 PM.

Calendar Event

Title:

Start time:  :

Configuring call handling with schedules

When you have schedules ready to use, they can be added to the call handling of any of the FortiVoice features. As the configuration for adding a schedule is the same for all features, one call handling example will be used for inbound calls.

In this example the schedules will be put in a specific order as the FortiVoice checks schedules in the list from first to last. The order of the schedules will be:

- **Custom_holiday**: Checked first to see if the calls are coming in during a scheduled holiday.
- **Custom_business**: Checked second to ensure the call is coming in during scheduled business hours.
- **Any_time**: Checked last to handle any calls that fall outside of the business hours.

To configure inbound call handling with a schedule:

1. Go to **Call Routing > Inbound > Inbound**.
2. Select your inbound call routing rule and click **Edit**.
3. Under **Call Handling** click **New**.

Inbound Dialplan

Name:

Security

This section contains information about establishing and maintaining a secure phone system.

Securing your phone system – best practices

The following recipe provides an extensive list of best practices to maximize the safety of your phone system.

As with network security, your phone system should always be managed by FortiGate.

Before your begin, make sure you have the latest software running on your FortiVoice phone system to take advantage of the latest features and enhancements that are available to you.

Changing the default external access ports

SIP communication commonly uses TCP or UDP port 5060 and/or 5061. Port 5060 is used for nonencrypted SIP signaling sessions and port 5061 is typically used for SIP sessions encrypted with Transport Layer Security (TLS).

Avoid changing any of the protocol ports to four digit numbers, such as 5065 or 5070, as those are used by other brands and are commonly scanned port numbers.

1. Go to **System > Advanced > External Access**.
2. You have the option to change the following SIP transport protocol ports:
 - **UDP**: This is the default signaling port used for external extensions, VoIP trunking, and office peers. Choose a five digit number.
 - **TCP**: This is the default signaling port used for the FortiFone softclient. Choose a five digit number.
 - **TLS**: This is the default port for SIP sessions encrypted with Transport Layer Security (TLS). Choose a five digit number.
 - **WSS**: WebSocket Secure is used to support the FortiFone desktop application. Choose a five digit number.
3. Additionally, you can configure the service external ports. Click **Apply** when finished.

SIP	Service	External Access	Auto Provisioning
-----	---------	-----------------	-------------------

SIP server external hostname/IP address:

SIP Transport	Internal Ports	External Ports
UDP:	5060	: <input type="text" value="5060"/>
TCP:	5060	: <input type="text" value="5060"/>
TLS:	5061	: <input type="text" value="5061"/>
WSS:	8089	: <input type="text" value="8089"/>

Other service external hostname/IP address:

Service	Internal Ports	External Ports
HTTP:	80	: <input type="text" value="80"/>
HTTPS:	443	: <input type="text" value="443"/>
NTP:	123	: <input type="text" value="123"/>
TFTP:	69	: <input type="text" value="69"/>
LDAP:	389	: <input type="text" value="389"/>
LDAPS:	636	: <input type="text" value="636"/>
<i>(LDAP contact service)</i>		

Changing the default passwords

Many of the default passwords are too simple and are therefore more susceptible to compromise. It is recommended to take the time to change the default passwords to more secure passwords.

Administrator password

Establish a more secure administrator password on the system.

1. Go to **System > Administrator > Administrator**.
2. Select the **admin** account and click **Edit**.

- Click **Change Password**, enter and confirm a new password, and click **OK**.

Administrator

Enable	<input checked="" type="checkbox"/>		
Administrator:	<input type="text" value="admin"/>

Department only	<input type="checkbox"/>		
Description:	<input type="button" value="✎"/>		

Administrator PIN

The administrator PIN allows the owner of the PIN to change extension assignments and modes from any phone or auto attendant.

- Go to **Phone System > Setting > Miscellaneous**.
- Under **PBX Setting**, enter a new **Administrator PIN**, and click **Apply**.

PBX Setting

Administrator PIN:	<input type="text"/>

Call Bridge (DISA) account code

The Call Bridge Direct Inward System Access (DISA) feature allows callers to make outgoing calls from the auto attendant. If enabled, configure this feature to use an account code.

- Go to **Call Feature > Auto Attendant > Auto Attendant**.
- Select an auto attendant and click **Edit**.
- Under **Advanced**, enable **Call bridge (DISA)** and select the appropriate **Account code**, or create a new one.

4. Click **OK**.

Password and PIN policy

Set a secure password policy that requires upper and lower case characters and alpha numerical characters for administrator passwords and SIP passwords.

1. Go to **Security > Password Policy > Password/PIN Policy**.
2. Enable **Password/PIN Policy** and configure the settings as required. Make sure to apply the password policy to the appropriate users.
3. Enabling **PIN special** allows the use of the * and # special characters.
4. Click **Apply**.

Office peers

Authentication can be configured for inbound and outbound calls on office peer trunks.

1. Go to **Trunk > Office Peer > Office Peer**.
2. Select an existing office peer or create a new one.
3. Under **Peer Configuration**, expand **Authentication** and select one of the following options from the drop-down menu:
 - **Symmetric**: Both PBX devices will use the following information to form the office peer trunk and authenticate each other. The defined **User name** and **Password** must be the same on both PBX devices forming the office peer trunk.
 - **Asymmetric**: Used to authenticate incoming and outgoing calls. Enter the **Inbound user name**, **Outbound user name**, and **Password**. These settings must be the same on both PBX devices forming the office peer trunk.

4. Define an **Outgoing digit pattern** (set to **XXXXXX** by default, or a six-digit code), and click **OK** or **Create**.

Disabling recommended features

Many features are enabled by default to assist with the initial setup. After setup, however, we recommend disabling any features that you feel are unnecessary.

Generate default configuration

After the initial setup, disable the **Unassigned phone** option. When you disable this feature, FortiVoice does not automatically create a default configuration file when it receives a request from an unassigned phone.

1. Go to **System > Advanced > Auto Provisioning**.
2. Under **Auto Provisioning**, disable **Unassigned phone**. Automatic default configurations for unassigned phones will no longer be generated.

3. Click **Apply**.

SIP	Service	External Access	Auto Provisioning

Configuring additional settings

In order to provide another level of protection beyond external abuse, there are a number of settings that you can enable to protect the FortiVoice phone system from internal abuse.

Call restrictions and common phones

Restrictions can be put in place based on call types, such as blocking international or toll calls.

1. Go to **Security > User Privilege > User Privilege**.
2. Select a user privilege and click **Edit**.
3. Expand **Call Restriction** and configure the settings accordingly.

User Privilege

Call Restriction

Allow international call:	Forbidden ▼
Allow long distance call:	Allowed ▼
Local:	Allowed ▼
Internal:	Allowed ▼

Other Restricted Area Code

Miscellaneous

Extensions that are placed in common areas, such as store floors and kitchens, should have the highest restriction levels, which include a PIN code to make calls.

4. Set the appropriate call type to **Allowed with Account Code**, **Allowed with Personal Code**, or **Allowed with Account and Personal Code**.

Interface access

Any access methods that are not being used on the FortiVoice device should be disabled.

1. Go to **System > Network > Network**.
2. Select an interface and click **Edit**.

- Under **Advanced Setting**, disable any unused **Access** protocols.

Prohibited prefixes

You may want to outright block certain phone number prefixes, such as 900 (blocked by default) which is commonly used for premium-rate calls, or phone calls with area codes originating from certain regions.

1. Go to **Phone System > Setting > Option**.
2. Under **Number Management**, add all undesirable prefixes to the **System prohibited prefix** section.

Location	Option	Custom Message	Miscellaneous
Number Management			
Extension number pattern:	<input type="text" value="X."/>		
Speed dial pattern:	<input type="text" value="*3XX"/>		+ -
System prohibited prefix:	<input type="text" value="900"/>		+ -
System unrestricted prefix:	<input type="text" value="800"/>		+ -
	<input type="text" value="866"/>		-
	<input type="text" value="877"/>		-
	<input type="text" value="888"/>		-
Operator extension:	<input type="text"/>		
Supporting extension:	<input type="text"/>		

Trusted hosts for administrators

Certain IP subnets can be designated as allowed or trusted for administrators to log into FortiVoice. This configuration can allow local networks to access the system but restrict remote access to the system and restrict remote access to the system.

1. Go to **System > Administrator > Administrator**.
2. Select the administrator and click **Edit**.

- Set **Trusted hosts** to the local trusted IP subnet (define as many as required).

Administrator

Verify SIP user agent

Restrict phone registration so only phone requests that match the system configured phone type are allowed.

1. Go to **Dashboard > Console** and click inside the window to connect to the CLI console.
2. Enter the following commands:

```
config system sip-setting
  set verify-user-agent enable
end
```

Monitoring and reporting

There are many tools within FortiVoice to help manage your security settings and help protect your system.

Administrator alerts

Administrators can be notified by email of system alerts when FortiVoice detects suspicious activity, such as a SIP attack.

1. Go to **Log & Report > Alert > Configuration** and click **New**.
2. Enter the administrator's email address and click **Create**.

Alert Email

Email to:

Create

Cancel

3. Go to **Log & Report > Alert > Category**.
4. Under **Alert Email Setting**, enable **Massive SIP authentication failure**, and click **Apply**.

SIP password auditor

Frequently review the SIP password audits to make sure that SIP passwords for extensions are secure. Make sure that **Password/PIN Policy** is enabled under **Security > Password Policy > Password/PIN Policy**, and that the password policy is applied to SIP users.

1. Go to **Security > Password Policy > Password Auditor**.
2. Review the list of extensions to see whether their password and PIN strengths meet the password policy requirements.

Intrusion detection

Intrusion detection lets you manually add IPs to be exempted from being blocked, remove system added exempt IPs if you find them suspicious, and configure intrusion detection settings.

1. Go to **Security > Intrusion Detection > Setting** and set **Status** to **Enable**.

Exempt IP **Setting**

Softclient

With the FortiFone softclient, you stay connected to the office, never missing an important call. You transform your mobile device into an extension connected to the FortiVoice phone system. The Fortinet business communications solution enables you to manage calls, check voicemail messages, and quickly view the company directory.

This section includes the following sections about the FortiFone softclient for mobile:

- [FortiFone softclient for mobile – best practices on page 98](#)
 - [Configuring FortiFone softclient settings on FortiVoice on page 100](#)
 - [Configuring FortiGate for SIP over TLS on page 106](#)
 - [Configuring FortiGate for SIP over TCP or UDP on page 114](#)
 - [Installing and configuring the FortiFone softclient for mobile on page 121](#)

FortiFone softclient for mobile – best practices

Topics in this section apply to the FortiFone softclient for mobile, not for desktop.

In a typical deployment scenario, the FortiVoice phone system is located behind an internet facing firewall. If a customer has deployed a FortiFone softclient, this softclient is usually behind another firewall when the customer's cell phone is using the data service of a cellular network or the Wi-Fi of a home network. Signaling and two-way audio through a firewall requires the network address translation (NAT) traversal for the session initiation protocol (SIP). When the deployment is using either SIP over the transmission control protocol (TCP) or the user datagram protocol (UDP), the SIP application layer gateway (ALG) with hosted NAT traversal enabled on FortiGate can translate the internal IP address of a session description protocol (SDP) payload properly to allow media flow. If the deployment is using SIP over transport layer security (TLS), the SIP traffic is encrypted end-to-end. With this encryption, FortiGate is unable to translate the internal IP address in the SDP payload, which then causes a one-way audio or no audio at all. Fortunately, FortiGate supports SSL inspection and is able to decrypt the encrypted SIP traffic and translate the SDP address to resolve the NAT-traversal issue.

This section describes how to configure the FortiVoice phone system and FortiGate to use the FortiFone softclient as a remote SIP client, and install and configure the FortiFone softclient.

Protocols

The communication between the FortiFone softclient and FortiVoice uses the following protocols and server:

- HTTPS for softclient login, auto-provisioning, download of contacts, call logs, and voicemails
- SIP for signaling
- RTP or secure RTP (SRTP) for audio
- Android and iOS push server for outbound calls

Call flows

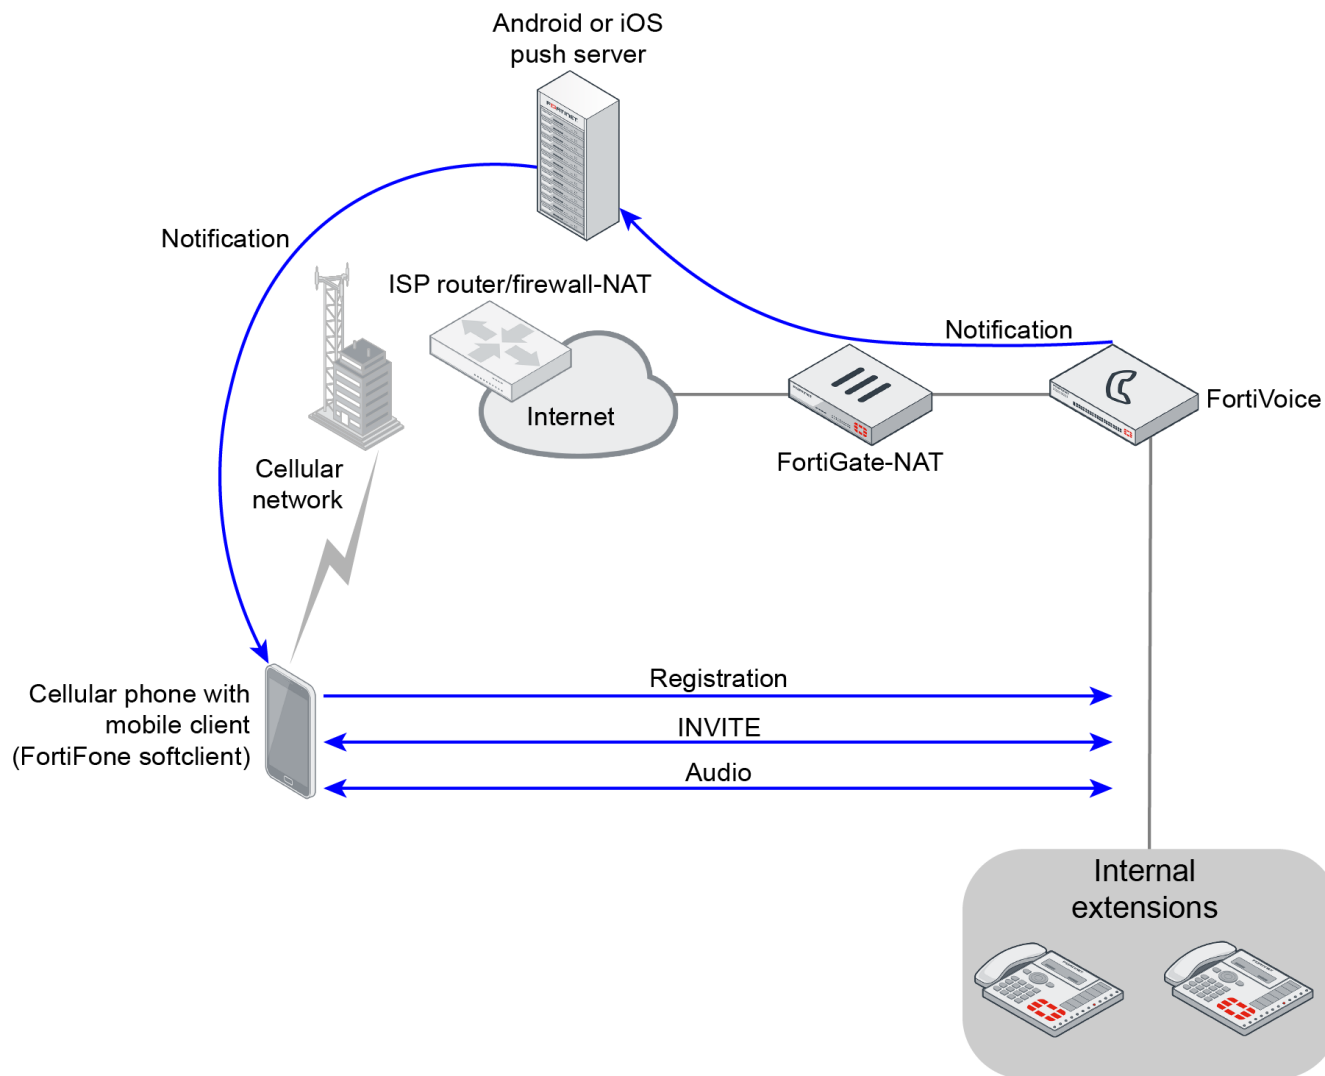

The inbound call flow includes the following steps:

1. A caller dials an extension to connect to the FortiFone softclient.
2. FortiVoice sends the push request to the Android or iOS push server which relays the request to the mobile client (cellular phone).
3. If the mobile client is in sleep mode, the request wakes up the mobile client.
4. The FortiFone softclient registers with FortiVoice and then receives the inbound call.
5. After the signaling is complete, FortiVoice sends the audio to the mobile client using RTP or SRTP.

The outbound call flow includes the following steps:

1. The user initiates an outbound call using the mobile client.
2. The FortiFone softclient sends a SIP invite directly to FortiVoice.
3. After the signaling is complete, FortiVoice sends the audio to the destination phone using RTP or SRTP.

Topology

Configuring FortiFone softclient settings on FortiVoice

Perform the following procedures to configure FortiFone softclient settings on the FortiVoice phone system:

- [Load the FortiFone softclient license on FortiVoice on page 101](#)
- [Configure external access settings on page 101](#)
- [Configure a SIP profile on page 102](#)
- [Assign the FortiFone softclient to a FortiVoice extension on page 103](#)
- [Export the FortiVoice server certificate for SIP over TLS on page 105](#)

Unless otherwise specified, steps in this FortiFone softclient section apply to SIP over TCP, UDP, and TLS.

Load the FortiFone softclient license on FortiVoice

1. On FortiVoice, go to **Dashboard > Status**.
2. In the **License Information** widget, load the FortiVoice softclient license file to allow activation and registration of softclients on the system.

License Information			
[Update License...]			
Hotel management	Full License		✓
	4 rooms / 500 allowed		
Call center	Full License		✓
	29 agent / 500 allowed		
Softclient	Full License		✓ i
	1005 users / 2000 allowed		

Configure external access settings

1. On FortiVoice, go to **System > Advanced > External Access**.
2. Set **SIP server external hostname/IP address** to the IP address or FQDN of the FortiVoice device and configure the following external access ports.

SIP	Service	External Access	Auto Provisioning
SIP server external hostname/IP address: <input type="text" value="domain.company.com"/>			
SIP Transport	Internal Ports	External Ports	
UDP:	5060	domain.company.com:	56000
TCP:	5060	domain.company.com:	56002
TLS:	5061	domain.company.com:	56004
WSS:	8089	domain.company.com:	8089
Other service external hostname/IP address: <input type="text"/>			
Service	Internal Ports	External Ports	
HTTP:	80	:	80
HTTPS:	443	:	10443

Apply Cancel

Configure a SIP profile

Perform this procedure to create a new SIP profile.

The default SIP profile (sip_mobile_default) is set for SIP over TCP. If you want, you can update this profile to set it to the protocol used by your deployment.

1. On FortiVoice, go to **Phone System > Profile > SIP**.
2. Click **New**.
3. In **Name**, enter a name for this SIP profile.
4. In **DTMF**, select **Auto**.
5. Enable **NAT**.
6. In **Transport**, select the protocol. If you set **Transport** to **TLS**, enable **Secure RTP**.
7. Click **Create**.

Example for configuring a SIP profile for UDP:

6. Click **Create**.
7. If your deployment uses SIP over TLS, go to [Export the FortiVoice server certificate for SIP over TLS on page 105](#).
If your deployment uses SIP over TCP or UDP, go to [Configuring FortiGate for SIP over TCP or UDP on page 114](#).

Export the FortiVoice server certificate for SIP over TLS

1. On FortiVoice, go to **System > Certificate > Local Certificate**.
2. In the list, select **FortiVoiceSIPServer**. This is the default certificate for the SIP service. If you are using a custom certificate, select that one instead of the default.

Name	Subject	Status	Service
Factory	/C=US/ST=California/L=Sunnyvale/O=Fortinet/OU=FortiVoiceEnterprise/CN=FortiVoiceEnterprise/...	OK	HTTPS,LDAP,SIP WSS
FortiVoiceSIPServer	/C=US/ST=California/O=Fortinet/OU=Certificate Authority/CN=FortiVoice/emailAddress=support...	OK	SIP TLS
Self	/CN=Fortinet/O=Fortinet Ltd.	OK	

3. Click **Download** and select **Download PKCS12 File**.

The PKCS12 Certificate Download dialog opens.

4. In **Password** and **Confirm password**, enter a password to encrypt the key.
5. To download the file, click **OK**.
6. To save the file locally, click **OK**.
7. Take note of the location where you save the file.
8. Go to [Configuring FortiGate for SIP over TLS on page 106](#).

Configuring FortiGate for SIP over TLS

After [Configuring FortiFone softclient settings on FortiVoice on page 100](#), perform the following procedures to configure a FortiGate device for SIP over TLS:

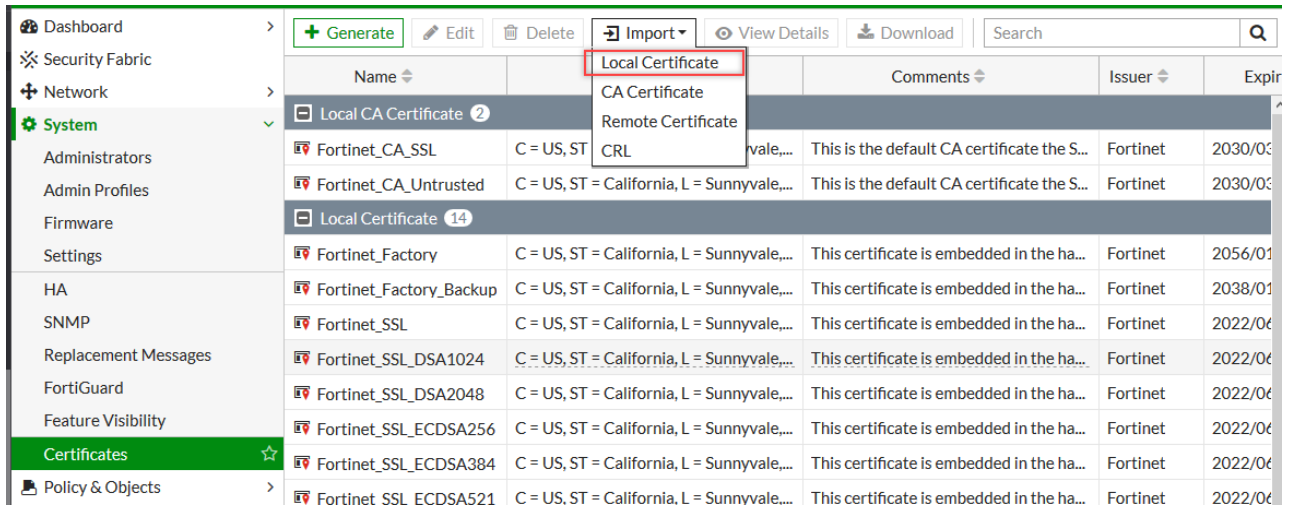

- [Import the downloaded FortiVoice server certificate for SIP over TLS on page 106](#)
- [Configure system settings for SIP over TLS on page 108](#)
- [Create virtual IP addresses for SIP over TLS on page 108](#)
- [Configure VoIP profile and NAT traversal settings for SIP over TLS on page 111](#)
- [Create an inbound firewall policy for SIP over TLS on page 112](#)
- [Create an outbound firewall policy for FortiVoice to access the Android or iOS push server on page 113](#)

If your FortiVoice deployment is using SIP over TCP or UDP instead, go to [Configuring FortiGate for SIP over TCP or UDP on page 114](#).

Import the downloaded FortiVoice server certificate for SIP over TLS

Perform the following steps to import the downloaded FortiVoice server certificate. The downloaded certificate is from [Export the FortiVoice server certificate for SIP over TLS on page 105](#).

1. On FortiGate, go to **System > Certificates**.
2. Click **Import** and select **Local Certificate**.

3. Update the following fields in the Import Certificate dialog:
 - a. In **Type**, click **PKCS #12 Certificate**.
 - b. In **Certificate with key file**, click **Upload**.
 - c. Locate the FortiVoice server certificate. This is the file from [Export the FortiVoice server certificate for SIP over TLS on page 105](#).
 - d. Click **Open**.
 - e. In **Password**, enter the password associated with the FortiVoice server certificate.
 - f. Click **OK**.

Create virtual IP addresses for SIP over TLS

- On FortiGate, go to **Policy & Objects > Virtual IPs**.
- Click **Create New** and select **Virtual IP**.
- Create virtual IPs for the following services that map to the IP address of the FortiVoice:
 - External SIP TLS port of FortiVoice
 - External HTTPS port of FortiVoice. The HTTPS port is used for the softclient login, call logs, and contacts download from the FortiVoice phone system.

Configure VoIP profile and NAT traversal settings for SIP over TLS

1. On FortiGate, open the **CLI Console** from the GUI banner.
2. Create a VoIP protection profile and enable hosted NAT traversal (HNT) and restricted HNT source address. If the FortiVoice softclient is behind a non-SIP-aware firewall, HNT addresses the SDP local address problem. Enable SSL full inspection and refer to the imported FortiVoice server certificate for example, FortiVoiceSIPServer. This VoIP protection policy with hosted NAT traversal enabled will be added to the inbound firewall policy to prevent potential one way audio issues caused by NAT.

VoIP profile command example for SIP over TLS

```
config voip profile
  edit "SIP_IN"
    config sip
      set hosted-nat-traversal enable
      set hnt-restrict-source-ip enable
      set ssl-mode full
      set ssl-server-certificate "FortiVoiceSIPServer"
    end
  next
end
```

3. For SIP over TLS, the recommendation is to use the default SSL port for SIP (TCP 5061). Enter the following commands:

```
config system settings
  set sip-tcp-port 5061
end
```

4. Edit the FortiGate interface connecting to the internet and set it to external. The SIP application layer gateway (ALG) with hosted NAT traversal requires an external port to work. Enter the following commands:

```
config system interface
  edit wan1
    set external enable
```

next
end

Create an inbound firewall policy for SIP over TLS

1. On FortiGate, go to **Policy & Objects > Firewall Policy** and click **Create New**.
2. Set **Incoming Interface** to the internet-facing interface.
3. Set **Outgoing Interface** to the internal/LAN interface.
4. Set **Source** to **all**.
5. Set **Destination** to the virtual IP group created in [Create virtual IP addresses for SIP over TLS on page 108](#).
6. Set **Schedule** to **always**.
7. Set **Service** to **ALL**.
8. Disable **NAT**.
9. Enable **VoIP** and select the VoIP profile created in [Configure VoIP profile and NAT traversal settings for SIP over TLS on page 111](#).

Create an outbound firewall policy for FortiVoice to access the Android or iOS push server

FortiVoice requires outbound access to the Android and iOS push servers.

If FortiGate has an outbound firewall policy that allows FortiVoice to access everything on the internet, then you do not need to create an additional firewall policy. You have completed the FortiGate configuration for SIP over TLS. Go to [Installing and configuring the FortiFone softclient for mobile on page 121](#).

If FortiGate does not have an outbound firewall policy that allows FortiVoice to access everything on the internet, perform the steps to create the FQDN addresses and the specific outbound firewall policies to allow FortiVoice to access the Android and iOS push servers.

To create FQDN addresses for Android and iOS push servers

1. On FortiGate, go to **Policy & Objects > Addresses** and click **Create New**.
2. In **Name**, enter a name for the Android push server address.
3. In **Type**, select **FQDN**.
4. In **FQDN**, enter **fcm.googleapis.com**.
5. Click **OK**.
6. Click **Create New**.
7. In **Name**, enter a name for the iOS push server address.
8. In **Type**, select **FQDN**.
9. In **FQDN**, enter **gateway.push.apple.com**.
10. Click **OK**.

To use the Android and iOS push server addresses in an outbound firewall policy

1. On FortiGate, go to **Policy & Objects > Firewall Policy** and click **Create New**.
2. In **Incoming interface**, enter the port connected to FortiVoice.
3. In **Outgoing interface**, enter the WAN port.
4. In **Source**, select **all**.
5. In **Destination**, select the FQDN addresses that you created for the Android and iOS push servers.
6. Configure the rest of the policy, as needed.
7. Click **OK**.

You have completed the configuration of FortiGate for SIP over TLS.

8. Go to [Installing and configuring the FortiFone softclient for mobile on page 121](#).

Configuring FortiGate for SIP over TCP or UDP

After [Configuring FortiFone softclient settings on FortiVoice on page 100](#), perform the following procedures to configure a FortiGate device for SIP over TCP or UDP:

- [Configure system settings for SIP over TCP or UDP on page 115](#)
- [Create virtual IP addresses for SIP over TCP or UDP on page 115](#)
- [Configure VoIP profile and NAT traversal settings for SIP over TCP or UDP on page 118](#)
- [Create an inbound firewall policy for SIP over TCP or UDP on page 119](#)
- [Create an outbound firewall policy for FortiVoice to access the Android or iOS push server on page 120](#)

If your FortiVoice deployment is using SIP over TLS instead, go to [Configuring FortiGate for SIP over TLS on page 106](#).

Configure system settings for SIP over TCP or UDP

1. On FortiGate, go to **System > Feature Visibility**.
2. Under **Additional Features**, enable **Multiple Security Profiles** and **VoIP**.
3. Click **Apply**.

Create virtual IP addresses for SIP over TCP or UDP

1. On FortiGate, go to **Policy & Objects > Virtual IPs**.
2. Click **Create New** and select **Virtual IP**.
3. Create virtual IPs for the following services that map to the IP address of the FortiVoice:
 - External SIP TCP port of FortiVoice. If the **sip_mobile_default** profile has been modified to use UDP instead, configure the VIP for the external SIP UDP port.
 - External HTTPS port of FortiVoice. The HTTPS port is used for the softclient login, call logs, and contacts download from the FortiVoice phone system.

Configure VoIP profile and NAT traversal settings for SIP over TCP or UDP

1. On FortiGate, open the **CLI Console** from the GUI banner.
2. Create a VoIP protection profile and enable hosted NAT traversal (HNT) and restricted HNT source address. If the FortiVoice softclient is behind a non-SIP-aware firewall, HNT addresses the SDP local address problem. This VoIP protection profile will be added to the inbound firewall policy to prevent potential one-way audio issues caused by NAT.

VoIP profile command example for SIP over TCP or UDP

```
config voip profile
  edit "SIP_IN"
    config sip
      set hosted-nat-traversal enable
      set hnt-restrict-source-ip enable
    end
  next
end
```

3. If you are using a non-standard external port, update the system settings by entering the following commands. Both command examples use port 5566.

External port setting example for TCP

```
config system settings
  set sip-tcp-port 5566
end
```

External port setting example for UDP

```
config system settings
  set sip-udp-port 5566
end
```

4. Set the internet facing interface as external. HNT requires an external port to work. The command example uses port2 as the internet facing interface.

```
config system interface
  edit "wan1"
    set external enable
```

```
next
end
```

Create an inbound firewall policy for SIP over TCP or UDP

1. On FortiGate, go to **Policy & Objects > Firewall Policy**.
2. Click **Create New**.
3. Set **Incoming Interface** to the internet-facing interface and **Outgoing Interface** to the internal/LAN interface.
4. Set **Source** to **all**.
5. Set **Destination** to the virtual IP group created in [Create virtual IP addresses for SIP over TCP or UDP on page 115](#).
6. Set **Schedule** to **always**.
7. Set **Service** to **ALL**.
8. Disable **NAT**.
9. Enable **VoIP** and select the VoIP profile created in [Configure VoIP profile and NAT traversal settings for SIP over TCP or UDP on page 118](#).

Create an outbound firewall policy for FortiVoice to access the Android or iOS push server

FortiVoice requires outbound access to the Android and iOS push servers.

If FortiGate has an outbound firewall policy that allows FortiVoice to access everything on the internet, then you do not need to create an additional firewall policy. You have completed the FortiGate configuration for SIP over TLS. Go to [Installing and configuring the FortiFone softclient for mobile on page 121](#).

If FortiGate does not have an outbound firewall policy that allows FortiVoice to access everything on the internet, perform the steps to create the FQDN addresses and the specific outbound firewall policies to allow FortiVoice to access the Android and iOS push servers.

To create FQDN addresses for Android and iOS push servers

1. On FortiGate, go to **Policy & Objects > Addresses** and click **Create New**.
2. In **Name**, enter a name for the Android push server address.
3. In **Type**, select **FQDN**.
4. In **FQDN**, enter **fcm.googleapis.com**.
5. Click **OK**.
6. Click **Create New**.
7. In **Name**, enter a name for the iOS push server address.
8. In **Type**, select **FQDN**.
9. In **FQDN**, enter **gateway.push.apple.com**.
10. Click **OK**.

To use the Android and iOS push server addresses in an outbound firewall policy

1. On FortiGate, go to **Policy & Objects > Firewall Policy** and click **Create New**.
2. In **Incoming interface**, enter the port connected to FortiVoice.
3. In **Outgoing interface**, enter the WAN port.
4. In **Source**, select **all**.
5. In **Destination**, select the FQDN addresses that you created for the Android and iOS push servers.
6. Configure the rest of the policy, as needed.
7. Click **OK**.

You have completed the configuration of FortiGate for SIP over TCP or UDP.

8. Go to [Installing and configuring the FortiFone softclient for mobile on page 121](#).

Installing and configuring the FortiFone softclient for mobile

With the FortiFone softclient for mobile, you stay connected to the office, never missing an important call. You transform your mobile device into an extension connected to the FortiVoice phone system. Fortinet's business communications solution enables you to manage calls, check voicemail messages and quickly view the company directory.

For details about installing, configuring, and using the FortiFone softclient for Android or iOS, see the [FortiFone Softclient User Guide \(Android or iOS\)](#).
