Installing FortiSIEM in OpenStack

This document provides instructions for installing FortiSIEM on OpenStack.

Installing a Supervisor, Worker, or All-In-One Node

Follow these steps for installing a FortiSIEM Supervisor, Worker, or All-In-One node on OpenStack

Step 1: Download the KVM Image

1. Download the KVM Image from the Fortinet Support website <https://support.fortinet.com>. See "Downloading FortiSIEM Products" for more information on downloading products from the support website.
2. Unzip the Images.
3. Verify that there are three disks: `system`, `svn`, and `cmdb`.

Step 2: Create a Volume

1. Log in to the OpenStack dashboard.
2. Select the appropriate project from the drop-down menu at the top left.
3. On the **Project** tab, open the **Volumes** tab and click the **Volumes** category.
4. Click **Create Volume**.

In the dialog box that opens, enter or select the following values.

- **Volume Name:** Specify a name for the volume.
- **Description:** Optionally, provide a brief description for the volume.
- **Type:** Leave this field blank.
- **Size (GB):** Specify the size of the volume in gigabytes (GiB).
- **Availability Zone:** Select the Availability Zone from the list. By default, this value is set to the availability zone given by the cloud provider (for example, `us-west` or `apac-south`). For some cases, it could be `nova`.

5. Click **Create Volume**.
6. Repeat Steps 1 through 5 for the `svn` and `cmdb` disks.

Step 3: Create an Instance

Create an instance from the volume created with the `system` disk (see substeps 1 to 5 in [Step 2: Create a Volume](#)), but **do not** boot the instance.

Step 4: Attach the Volume to the Instance

1. Attach the CMDB volume you created in substeps 1 to 5 in [Step 2: Create a Volume](#), then attach it to the instance created in [Step 3: Create an Instance](#).
2. Attach the SVN volume you created in substeps 1 to 5 in [Step 2: Create a Volume](#), then attach it to the instance created in [Step 3: Create an Instance](#).
3. Boot the instance.

Installing a Collector

Follow these steps to install a FortiSIEM collector on OpenStack.

Step 1: Download the KVM Image

1. Download the KVM Image from the Fortinet Support website <https://support.fortinet.com>. See "[Downloading FortiSIEM Products](#)" for more information on downloading products from the support website.
2. Unzip the Images.
3. Verify the presence of the `system` disk.

Step 2: Create a Volume

1. Log in to the OpenStack dashboard.
2. Select the appropriate project from the drop-down menu at the top left.
3. On the **Project** tab, open the **Volumes** tab and click the **Volumes** category.
4. Click **Create Volume**.

In the dialog box that opens, enter or select the following values.

- **Volume Name:** Specify a name for the volume.
- **Description:** Optionally, provide a brief description for the volume.
- **Type:** Leave this field blank.
- **Size (GB):** Specify the size of the volume in gigabytes (GiB).
- **Availability Zone:** Select the Availability Zone from the list. By default, this value is set to the availability zone given by the cloud provider (for example, `us-west` or `apac-south`). For some cases, it could be `nova`.

5. Click **Create Volume**.

Step 3: Create an Instance

Create an instance from the volume created with the `system` disk (see substeps 1 to 5 in [Step 2: Create a Volume](#)), but **do not** boot the instance.
