

Allowing a Secure Email Account to Bypass Scanning in FortiMail

What if you know that a certain email address is always safe? Perhaps you know that someone from another department isn't going to accidentally have his computer infected by a virus and so you would like to receive his email quickly, without having to scan it for threats. Perhaps you routinely receive server notifications or alert emails that you know are not harmful.

Thankfully, FortiMail supports customizable access controls that can automatically deliver emails from secure sources, bypassing all anti-spam profile processing.

Configuring Access Controls

1. Navigate to **Policy > Access Control > Receiving**.
2. Select **New** to add an access control rule or double-click an existing access control rule to modify the rule.
3. Select the **Enabled** checkbox.

4. For Sender Pattern, enter the trusted email address.
5. For the Recipient Pattern, enter * to represent all recipients.

6. Select the **BYPASS** from the **Action** dropdown menu.
7. Select the **Create** button.
