FortiOS 7.0.0 Administration Guide
01-700-700620-20210827

TABLE OF CONTENTS

Change Log **18**
Getting started **19**
Differences between models 19
Using the GUI 19
Connecting using a web browser 19
Menus 20
Tables 21
Entering values 23
Using the CLI 24
Connecting to the CLI 25
CLI basics 27
Command syntax 33
Subcommands 36
Permissions 38
FortiExplorer for iOS 38
Getting started with FortiExplorer 39
Connecting FortiExplorer to a FortiGate via WiFi 42
Running a security rating 43
Upgrading to FortiExplorer Pro 44
Basic administration 44
Basic configuration 45
Registration 47
FortiCare and FortiGate Cloud login 50
Transfer a device to another FortiCloud account 53
Configuration backups 55
Troubleshooting your installation 59
Dashboards and Monitors **62**
Using dashboards 62
Using widgets 63
Widgets 65
Viewing device dashboards in the Security Fabric 67
Creating a fabric system and license dashboard 68
Example 68
Dashboards 69
Resetting the default dashboard template 70
Status dashboard 70
Security dashboard 72
Network dashboard 74
Users & Devices 82
WiFi dashboard 86
Monitors 92
Non-FortiView monitors 92
FortiView monitors 92
FortiView monitors and widgets 93

Adding FortiView monitors ... 94
Using the FortiView interface ... 97
Enabling FortiView from devices ... 100
FortiView sources ... 102
FortiView Sessions ... 103
FortiView Top Source and Top Destination Firewall Objects monitors ... 105
Viewing top websites and sources by category ... 107
Cloud application view ... 110
Network ... 121
Interfaces ... 121
Interface settings ... 122
Aggregation and redundancy ... 126
VLANs ... 128
Enhanced MAC VLANs ... 134
Inter-VDOM routing ... 137
Software switch ... 142
Hardware switch ... 144
Zone ... 146
Virtual wire pair ... 148
PRP handling in NAT mode with virtual wire pair ... 151
Virtual switch support for FortiGate 300E series ... 152
Failure detection for aggregate and redundant interfaces ... 154
VLAN inside VXLAN ... 155
Virtual wire pair with VXLAN ... 157
QinQ ... 159
Assign a subnet with the FortiIPAM service ... 160
Configure a VRF ID on an interface ... 165
Interface MTU packet size ... 167
One-arm sniffer ... 169
Interface migration wizard ... 173
DNS ... 177
Important DNS CLI commands ... 177
DNS domain list ... 179
FortiGate DNS server ... 180
DDNS ... 182
DNS latency information ... 186
DNS over TLS and HTTPS ... 188
DNS troubleshooting ... 192
Explicit and transparent proxies ... 194
Explicit web proxy ... 194
FTP proxy ... 197
Transparent proxy ... 198
Proxy policy addresses ... 200
Proxy policy security profiles ... 207
Explicit proxy authentication ... 211
Transparent web proxy forwarding ... 217
Upstream proxy authentication in transparent proxy mode ... 221
Multiple dynamic header count ... 223
Restricted SaaS access ... 225

Explicit proxy and FortiSandbox Cloud 227
Proxy chaining 230
Agentless NTLM authentication for web proxy 235
Multiple LDAP servers in Kerberos keytabs and agentless NTLM domain controllers 238
Learn client IP addresses 239
Explicit proxy authentication over HTTPS 240
DHCP server 243
Configure a DHCP server on an interface 243
Configure a DHCP relay on an interface 244
Configure a DHCP server and relay on an interface 245
DHCP options 246
IP address assignment with relay agent information option 247
DHCP client options 249
Static routing 250
Routing concepts 250
Policy routes 260
Equal cost multi-path 263
Dual internet connections 268
RIP 273
OSPF 273
BGP 273
Multicast 274
Multicast routing and PIM support 274
Configuring multicast forwarding 275
FortiExtender 278
Adding a FortiExtender 278
Data plan profiles 280
Direct IP support for LTE/4G 282
Sample LTE interface 283
Limitations 284
LLDP reception 285
Route leaking between VRFs 287
Route leaking between multiple VRFs 289
NetFlow 300
Verification and troubleshooting 301
NetFlow templates 302
NetFlow on FortiExtender and tunnel interfaces 314
SD-WAN 319
SD-WAN quick start 319
Configuring the SD-WAN interface 320
Adding a static route 321
Selecting the implicit SD-WAN algorithm 322
Configuring firewall policies for SD-WAN 322
Link monitoring and failover 323
Results 324
Configuring SD-WAN in the CLI 327
SD-WAN zones 329

Performance SLA 334
Link health monitor 334
Factory default health checks 337
Health check options 339
Link monitoring example 342
SLA targets example 343
Passive WAN health measurement 344
Health check packet DSCP marker support 348
Manual interface speedtest 348
Scheduled interface speedtest 349
Monitor performance SLA 351
SLA monitoring using the REST API 354
SD-WAN rules 358
Implicit rule 358
Best quality strategy 362
Lowest cost (SLA) strategy 365
Maximize bandwidth (SLA) strategy 368
Minimum number of links for a rule to take effect 371
Use MAC addresses in SD-WAN rules and policy routes 372
SD-WAN traffic shaping and QoS 373
SDN dynamic connector addresses in SD-WAN rules 378
Application steering using SD-WAN rules 380
DSCP tag-based traffic steering in SD-WAN 392
Advanced routing 402
Local out traffic 402
Using BGP tags with SD-WAN rules 407
BGP multiple path support 410
Controlling traffic with BGP route mapping and service rules 413
Applying BGP route-map to multiple BGP neighbors 419
IBGP and EBGP support in VRF 425
VPN overlay 428
ADVPN and shortcut paths 428
SD-WAN monitor on ADVPN shortcuts 441
Hold down time to support SD-WAN service strategies 442
SD-WAN integration with OCVPN 444
Forward error correction on VPN overlay networks 451
Dual VPN tunnel wizard 454
Duplicate packets based on SD-WAN rules 455
Duplicate packets on other zone members 457
Advanced configuration 459
SD-WAN with FGCP HA 459
Configuring SD-WAN in an HA cluster that uses the internal hardware switches 466
SD-WAN configuration portability 469
SD-WAN cloud on-ramp 475
Configuring the VPN overlay between the HQ FortiGate and cloud FortiGate-VM 476
Configuring the VPN overlay between the HQ FortiGate and AWS native VPN gateway 481
Configuring the VIP to access the remote servers 484
Configuring the SD-WAN to steer traffic between the overlays 487

Verifying the traffic ... 491
Hub and spoke SD-WAN deployment example ... 498
Datacenter configuration ... 498
Branch configuration ... 503
Validation ... 507
Dynamic definition of SD-WAN routes ... 508
Adding another datacenter ... 509
Troubleshooting SD-WAN ... 510
Tracking SD-WAN sessions ... 510
Understanding SD-WAN related logs ... 510
SD-WAN related diagnose commands ... 513
SD-WAN bandwidth monitoring service ... 518
Using SNMP to monitor health check ... 520
Policy and Objects ... 524
Policies ... 524
Firewall policy parameters ... 525
Profile-based NGFW vs policy-based NGFW ... 526
NGFW policy mode application default service ... 530
Application logging in NGFW policy mode ... 532
Policy views and policy lookup ... 533
Policy with source NAT ... 535
Policy with destination NAT ... 548
Policy with Internet Service ... 562
NAT64 policy and DNS64 (DNS proxy) ... 578
NAT46 policy ... 581
Local-in policies ... 584
DoS protection ... 586
Access control lists ... 593
Mirroring SSL traffic in policies ... 594
Inspection mode per policy ... 597
OSPFv3 neighbor authentication ... 599
Firewall anti-replay option per policy ... 601
Enabling advanced policy options in the GUI ... 601
Recognize anycast addresses in geo-IP blocking ... 602
Matching GeoIP by registered and physical location ... 603
Authentication policy extensions ... 604
HTTP to HTTPS redirect for load balancing ... 605
Use Active Directory objects directly in policies ... 607
FortiGate Cloud / FDN communication through an explicit proxy ... 610
No session timeout ... 612
MAP-E support ... 613
Seven-day rolling counter for policy hit counters ... 617
Objects ... 618
Address group exclusions ... 619
MAC addressed-based policies ... 620
ISDB well-known MAC address list ... 622
Dynamic policy — fabric devices ... 623
FSSO dynamic address subtype ... 625

ClearPass integration for dynamic address objects 629
Group address objects synchronized from FortiManager 632
Using wildcard FQDN addresses in firewall policies 634
Configure FQDN-based VIPs 636
IPv6 geography-based addresses 637
Array structure for address objects 639
IPv6 MAC addresses and usage in firewall policies 641
Traffic shaping 643
Determining your QoS requirements 644
Packet rates 645
Changing traffic shaper bandwidth unit of measurement 647
Shared traffic shaper 647
Per-IP traffic shaper 651
Type of Service-based prioritization and policy-based traffic shaping 654
Interface-based traffic shaping profile 657
Interface-based traffic shaping with NP acceleration 666
Classifying traffic by source interface 667
Configuring traffic class IDs 668
Traffic shaping schedules 671
DSCP matching (shaping) 674
QoS assignment and rate limiting for quarantined VLANs 678
Weighted random early detection queuing 679
Zero Trust Network Access 685
Zero Trust Network Access introduction 685
Basic ZTNA configuration 687
Establish device identity and trust context with FortiClient EMS 695
SSL certificate based authentication 700
ZTNA configuration examples 702
Migrating from SSL VPN to ZTNA HTTPS access proxy 731
ZTNA troubleshooting and debugging 734
Security Profiles 740
Inspection modes 740
Flow mode inspection (default mode) 741
Proxy mode inspection 741
Inspection mode feature comparison 743
Antivirus 745
Protocol comparison between antivirus inspection modes 745
Other antivirus differences between inspection modes 746
AI-based malware detection 746
Proxy mode stream-based scanning 747
Databases 748
Content disarm and reconstruction 749
FortiGuard outbreak prevention 751
External malware block list 753
Malware threat feed from EMS 756
Checking flow antivirus statistics 759
CIFS support 761
Using FortiSandbox with antivirus 766

Web filter 768
URL filter 769
FortiGuard filter 774
Credential phishing prevention 780
Additional antiphishing settings 783
Usage quota 786
Web content filter 788
Advanced filters 1 791
Advanced filters 2 794
Web filter statistics 797
URL certificate blocklist 798
Video filter 799
Filtering based on FortiGuard categories 799
Filtering based on YouTube channel 803
DNS filter 806
FortiGuard DNS rating service 807
Configuring a DNS filter profile 807
FortiGuard category-based DNS domain filtering 810
Botnet C&C domain blocking 812
DNS safe search 816
Local domain filter 818
DNS translation 821
Applying DNS filter to FortiGate DNS server 824
DNS inspection with DoT and DoH 825
Troubleshooting for DNS filter 829
Application control 831
Basic category filters and overrides 832
Excluding signatures in application control profiles 835
Port enforcement check 837
Protocol enforcement 838
SSL-based application detection over decrypted traffic in a sandwich topology 839
Matching multiple parameters on application control signatures 840
Application signature dissector for DNP3 843
Intrusion prevention 843
Botnet C&C IP blocking 844
Detecting IEC 61850 MMS protocol in IPS 848
IPS signature filter options 850
File filter 853
Logs 855
Supported file types 856
Email filter 859
Protocol comparison between email filter inspection modes 859
Local-based filters 860
FortiGuard-based filters 863
Protocols and actions 864
Configuring webmail filtering 866
Data leak prevention 866
Protocol comparison between DLP inspection modes 867

Logging and blocking files by file name 868
Basic DLP filter types 868
DLP fingerprinting 870
VoIP solutions 874
General use cases 875
SIP message inspection and filtering 879
SIP pinholes 881
SIP over TLS 882
Custom SIP RTP port range support 883
Voice VLAN auto-assignment 885
ICAP 887
ICAP configuration example 888
ICAP response filtering 890
Secure ICAP clients 892
Web application firewall 893
Protecting a server running web applications 893
SSL & SSH Inspection 896
Certificate inspection 897
Deep inspection 899
Protecting an SSL server 901
Handling SSL offloaded traffic from an external decryption device 901
SSH traffic file scanning 904
Redirect to WAD after handshake completion 905
HTTP/2 support in proxy mode SSL inspection 906
Define multiple certificates in an SSL profile in replace mode 907
Custom signatures 909
Application groups in traffic shaping policies 910
Blocking applications with custom signatures 913
Filters for application control groups 915
Overrides 918
Web rating override 919
Web profile override 924
VPN 929
IPsec VPNs 929
General IPsec VPN configuration 929
Site-to-site VPN 955
Remote access 1008
Aggregate and redundant VPN 1042
Overlay Controller VPN (OCVPN) 1086
ADVPN 1116
Other VPN topics 1151
VPN IPsec troubleshooting 1183
SSL VPN 1190
SSL VPN best practices 1191
SSL VPN quick start 1193
SSL VPN tunnel mode 1200
SSL VPN web mode for remote user 1207
SSL VPN authentication 1211

SSL VPN to IPsec VPN 1294
SSL VPN protocols 1304
FortiGate as SSL VPN Client 1305
Dual stack IPv4 and IPv6 support for SSL VPN 1314
SSL VPN troubleshooting 1324
User & Authentication 1328
Endpoint control and compliance 1328
Per-policy disclaimer messages 1328
Compliance 1331
FortiGuard distribution of updated Apple certificates 1333
Integrate user information from EMS and Exchange connectors in the user store 1334
User Definition 1337
User types 1337
Removing a user 1337
User Groups 1338
Configuring POP3 authentication 1338
Guest Management 1339
Configuring guest access 1339
Retail environment guest access 1341
LDAP Servers 1342
Configuring an LDAP server 1342
FSSO polling connector agent installation 1344
Enabling Active Directory recursive search 1347
Configuring LDAP dial-in using a member attribute 1348
Configuring wildcard admin accounts 1349
Configuring least privileges for LDAP admin account authentication in Active Directory 1351
RADIUS Servers 1352
Configuring RADIUS SSO authentication 1352
RSA ACE (SecurID) servers 1358
Support for Okta RADIUS attributes filter-Id and class 1363
Send multiple RADIUS attribute values in a single RADIUS Access-Request 1364
Traffic shaping based on dynamic RADIUS VSAs 1365
TACACS+ servers 1372
SAML 1374
Outbound firewall authentication for a SAML user 1374
SAML SP for VPN authentication 1376
SAML authentication in a proxy policy 1378
Authentication Settings 1382
FortiTokens 1383
FortiToken Mobile quick start 1384
FortiToken Cloud 1392
Registering hard tokens 1392
Managing FortiTokens 1394
FortiToken Mobile Push 1396
Troubleshooting and diagnosis 1398
Configuring the maximum log in attempts and lockout period 1401

PKI 1401
Creating a PKI/peer user 1402
Configuring firewall authentication 1402
Creating a locally authenticated user account 1403
Creating a RADIUS-authenticated user account 1403
Creating an FSSO user group 1404
Creating a firewall user group 1406
Defining policy addresses 1407
Creating security policies 1407
Wireless configuration 1409
Switch Controller 1410
System 1411
Basic system settings 1411
Advanced system settings 1411
Operating modes 1412
Administrators 1413
Administrator profiles 1413
Add a local administrator 1415
Remote authentication for administrators 1415
Password policy 1418
Associating a FortiToken to an administrator account 1419
SSO administrators 1420
FortiGate administrator log in using FortiCloud single sign-on 1421
Firmware 1422
Firmware upgrade notifications 1423
Downloading a firmware image 1423
Testing a firmware version 1425
Upgrading the firmware 1426
Downgrading to a previous firmware version 1427
Installing firmware from system reboot 1428
Restoring from a USB drive 1429
Controlled upgrade 1430
Settings 1430
Default administrator password 1431
Changing the host name 1432
Setting the system time 1433
Configuring ports 1436
Setting the idle timeout time 1437
Setting the password policy 1438
Changing the view settings 1438
Setting the administrator password retries and lockout time 1439
TLS configuration 1439
Controlling return path with auxiliary session 1440
Email alerts 1443
Virtual Domains 1447
Global and per-VDOM resources 1448
Split-task VDOM mode 1449

Multi VDOM mode 1453
Configure VDOM-A 1456
Configure VDOM-B 1458
Configure the VDOM link 1461
Configure VDOM-A 1466
Configure VDOM-B 1468
High Availability 1470
Introduction to the FGCP cluster 1470
Failover protection 1472
Link monitoring and HA failover time 1474
FGSP (session synchronization) peer setup 1476
UTM inspection on asymmetric traffic in FGSP 1477
UTM inspection on asymmetric traffic on L3 1479
Encryption for L3 on asymmetric traffic in FGSP 1481
Synchronizing sessions between FGCP clusters 1481
FGSP four-member session synchronization and redundancy 1483
Session synchronization interfaces in FGSP 1488
Standalone configuration synchronization 1490
Layer 3 unicast standalone configuration synchronization 1493
Out-of-band management with reserved management interfaces 1495
In-band management 1501
Troubleshoot an HA formation 1501
Check HA synchronization status 1502
Disabling stateful SCTP inspection 1505
Upgrading FortiGates in an HA cluster 1506
HA cluster setup examples 1507
HA between remote sites over managed FortiSwitches 1516
Routing NetFlow data over the HA management interface 1520
Override FortiAnalyzer and syslog server settings 1522
Force HA failover for testing and demonstrations 1526
Querying autoscale clusters for FortiGate VM 1529
VDOM exceptions 1530
IKE monitor for FGSP 1531
SNMP 1533
Interface access 1533
MIB files 1534
SNMP agent 1535
SNMP v1/v2c communities 1535
SNMP v3 users 1537
Important SNMP traps 1538
SNMP traps and query for monitoring DHCP pool 1540
Replacement messages 1541
Modifying replacement messages 1541
Replacement message images 1543
Replacement message groups 1544
FortiGuard 1548
Configuring FortiGuard updates 1548
Manual updates 1549
Automatic updates 1550

Scheduled updates 1550
Sending malware statistics to FortiGuard 1551
Update server location 1552
Filtering 1552
Online security tools 1554
FortiGuard anycast and third-party SSL validation 1554
Using FortiManager as a local FortiGuard server 1557
Cloud service communication statistics 1558
IoT detection service 1559
FortiAP query to FortiGuard IoT service to determine device details 1561
Feature visibility 1562
Certificates 1563
Microsoft CA deep packet inspection 1563
Procure and import a signed SSL certificate 1567
ACME certificate support 1570
Configuration scripts 1575
Workspace mode 1575
Custom languages 1577
RAID 1578
FortiGate encryption algorithm cipher suites 1581
HTTPS access 1582
SSH access 1582
SSL VPN 1583
Fortinet Security Fabric 1586
Security Fabric settings and usage 1586
Components 1587
Configuring the root FortiGate and downstream FortiGates 1590
Configuring FortiAnalyzer 1596
Configuring other Security Fabric devices 1598
Using the Security Fabric 1634
Deploying the Security Fabric 1642
Deploying the Security Fabric in a multi-VDOM environment 1650
Synchronizing objects across the Security Fabric 1655
Security Fabric over IPsec VPN 1662
Leveraging LLDP to simplify Security Fabric negotiation 1668
Configuring the Security Fabric with SAML 1671
Configuring single-sign-on in the Security Fabric 1672
CLI commands for SAML SSO 1678
SAML SSO with pre-authorized FortiGates 1679
Navigating between Security Fabric members with SSO 1680
Integrating FortiAnalyzer management using SAML SSO 1682
Integrating FortiManager management using SAML SSO 1686
Advanced option - FortiGate SP changes 1688
Security rating 1688
Security Fabric score 1695
Automation stitches 1696
Creating automation stitches 1697
Triggers 1710

Actions 1723
Public and private SDN connectors 1774
Getting started with public and private SDN connectors 1775
AliCloud SDN connector using access key 1779
AWS SDN connector using certificates 1781
Azure SDN connector using service principal 1787
Cisco ACI SDN connector using a standalone connector 1788
ClearPass endpoint connector via FortiManager 1790
GCP SDN connector using service account 1793
IBM Cloud SDN connector using API keys 1795
Kubernetes (K8s) SDN connectors 1799
Nuage SDN connector using server credentials 1815
Nutanix SDN connector using server credentials 1817
OCI SDN connector using certificates 1819
OpenStack SDN connector using node credentials 1821
VMware ESXi SDN connector using server credentials 1825
VMware NSX-T Manager SDN connector using NSX-T Manager credentials 1827
Multiple concurrent SDN connectors 1831
Filter lookup in SDN connectors 1833
Support for wildcard SDN connectors in filter configurations 1836
Endpoint/Identity connectors 1838
Fortinet single sign-on agent 1838
Poll Active Directory server 1839
Symantec endpoint connector 1840
RADIUS single sign-on agent 1846
Exchange Server connector 1849
Threat feeds 1852
External resources file format 1853
Create a threat feed 1854
Update history 1855
EMS threat feed 1855
External blocklist policy 1856
External blocklist authentication 1857
External blocklist file hashes 1858
External resources for DNS filter 1859
Threat feed connectors per VDOM 1863
Monitoring the Security Fabric using FortiExplorer for Apple TV 1867
NOC and SOC example 1868
Troubleshooting 1879
Viewing a summary of all connected FortiGates in a Security Fabric 1880
Diagnosing automation stitches 1882
Log and Report 1886
Viewing event logs 1887
Sample logs by log type 1888
Log buffer on FortiGates with an SSD disk 1908
Checking the email filter log 1911
Supported log types to FortiAnalyzer, syslog, and FortiAnalyzer Cloud 1911
Sending traffic logs to FortiAnalyzer Cloud 1912

Example 1912
Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode 1915
Checking FortiAnalyzer connectivity 1916
Configuring multiple FortiAnalyzers (or syslog servers) per VDOM 1917
Source and destination UUID logging 1919
Logging the signal-to-noise ratio and signal strength per client 1920
RSSO information for authenticated destination users in logs 1923
Scenario 1 1923
Scenario 2 1924
Scenario 3 1925
Threat weight 1926
Logs for the execution of CLI commands 1927
Troubleshooting 1929
Log-related diagnose commands 1929
Backing up log files or dumping log messages 1935
SNMP OID for logs that failed to send 1936
VM 1940
Amazon Web Services 1940
Microsoft Azure 1940
Google Cloud Platform 1940
Oracle OCI 1940
AliCloud 1940
Private cloud 1940
VM license 1940
Uploading a license file 1941
Types of VM licenses 1942
CLI troubleshooting 1943
FortiGate multiple connector support 1944
Adding VDOMs with FortiGate v-series 1947
Terraform: FortiOS as a provider 1949
Troubleshooting 1953
PF and VF SR-IOV driver and virtual SPU support 1954
Using OCI IMDSv2 1955
Troubleshooting 1958
Troubleshooting methodologies 1958
Verify user permissions 1959
Establish a baseline 1959
Create a troubleshooting plan 1961
Troubleshooting scenarios 1962
Checking the system date and time 1963
Checking the hardware connections 1964
Checking FortiOS network settings 1965
Troubleshooting CPU and network resources 1968
Troubleshooting high CPU usage 1969
Checking the modem status 1973
Running ping and traceroute 1974

Checking the logs 1977
Verifying routing table contents in NAT mode 1978
Verifying the correct route is being used 1979
Verifying the correct firewall policy is being used 1979
Checking the bridging information in transparent mode 1980
Checking wireless information 1981
Performing a sniffer trace (CLI and packet capture) 1982
Debugging the packet flow 1985
Testing a proxy operation 1988
Displaying detail Hardware NIC information 1988
Performing a traffic trace 1990
Using a session table 1991
Finding object dependencies 1995
Diagnosing NPU-based interfaces 1996
Identifying the XAUI link used for a specific traffic stream 1996
Date and time settings 1997
Running the TAC report 1998
Other commands 1998
FortiGuard troubleshooting 2001
Additional resources 2004
Technical documentation 2004
Fortinet video library 2004
Release notes 2004
Knowledge base 2004

Fortinet Support 2005

Change Log

Date	Change Description
2021-03-30	Initial release.
2021-04-15	Added Passive WAN health measurement on page 344 and Hold down time to support SD-WAN service strategies on page 442.
2021-04-16	Updated Configuring multicast forwarding on page 275.
2021-05-07	Added Learn client IP addresses on page 239, FGSP four-member session synchronization and redundancy on page 1483, Layer 3 unicast standalone configuration synchronization on page 1493, and Scheduled updates on page 1550. Updated Automatic updates on page 1550 and Certificate inspection on page 897.
2021-05-17	Updated FortiMail on page 1622.
2021-05-20	Added Route leaking between multiple VRFs on page 289.
2021-06-01	Added Traffic shaping based on dynamic RADIUS VSAs on page 1365. Updated Filtering based on YouTube channel on page 803.
2021-06-04	Updated Assign a subnet with the FortiIPAM service on page 160.
2021-06-14	Added Zero Trust Network Access on page 685.
2021-06-21	Updated Configuring the root FortiGate and downstream FortiGates on page 1590, Topology on page 1635, and Synchronizing objects across the Security Fabric on page 1655.
2021-06-25	Added RAID on page 1578.
2021-06-29	Updated Integrating FortiAnalyzer management using SAML SSO on page 1682.
2021-07-19	Updated Filtering based on YouTube channel on page 803.
2021-07-23	Added FortiGate encryption algorithm cipher suites on page 1581.
2021-07-30	Updated SSL VPN with certificate authentication on page 1222 and Local out traffic on page 402.
2021-08-06	Updated Registration on page 47. Added Basic configuration on page 45.
2021-08-27	Added QinQ on page 159. Updated Adding a FortiExtender on page 278.

Getting started

This section explains how to get started with a FortiGate.

Differences between models

Not all FortiGates have the same features, particularly entry-level models (models 30 to 90). A number of features on these models are only available in the CLI.

Consult your model's QuickStart Guide, hardware manual, or the Feature / Platform Matrix for further information about features that vary by model.

FortiGate models differ principally by the names used and the features available:

- Naming conventions may vary between FortiGate models. For example, on some models the hardware switch interface used for the local area network is called *lan*, while on other units it is called *internal*.
- Certain features are not available on all models. Additionally, a particular feature may be available only through the CLI on some models, while that same feature may be viewed in the GUI on other models.
  If you believe your FortiGate model supports a feature that does not appear in the GUI, go to *System* > *Feature Visibility* and confirm that the feature is enabled. For more information, see Feature visibility on page 1562.

Using the GUI

This section presents an introduction to the graphical user interface (GUI) on your FortiGate.

The following topics are included in this section:

- Connecting using a web browser
- Menus
- Tables
- Entering values

For information about using the dashboards, see Dashboards and Monitors on page 62.

Connecting using a web browser

In order to connect to the GUI using a web browser, an interface must be configured to allow administrative access over HTTPS or over both HTTPS and HTTP. By default, an interface has already been set up that allows HTTPS access with the IP address 192.168.1.99.

Browse to https://192.168.1.99 and enter your username and password. If you have not changed the admin account's password, use the default user name, `admin`, and leave the password field blank.

The GUI will now display in your browser, and you will be required to provide a password for the administrator account.

To use a different interface to access the GUI:

1. Go to *Network* > *Interfaces* and edit the interface you wish to use for access. Take note of its assigned IP address.
2. In *Administrative Access*, select *HTTPS*, and any other protocol you require. You can also select *HTTP*, although this is not recommended as the connection will be less secure.
3. Click *OK*.
4. Browse to the IP address using your chosen protocol.
   The GUI will now be displayed in your browser.

Menus

If you believe your FortiGate model supports a menu that does not appear in the GUI, go to *System* > *Feature Visibility* and ensure the feature is enabled. For more information, see Feature visibility on page 1562.

The GUI contains the following main menus, which provide access to configuration options for most FortiOS features:

Dashboard	The dashboard displays various widgets that display important system information and allow you to configure some system options. For more information, see Dashboards and Monitors on page 62.
Network	Options for networking, including configuring system interfaces and routing options. For more information, see Network on page 121.
Policy & Objects	Configure firewall policies, protocol options, and supporting content for policies, including schedules, firewall addresses, and traffic shapers. For more information, see Policy and Objects on page 524.
Security Profiles	Configure your FortiGate's security features, including Antivirus, Web Filter, and Application Control. For more information, see Security Profiles on page 740.
VPN	Configure options for IPsec and SSL virtual private networks (VPNs). For more information, see IPsec VPNs on page 929 and SSL VPN on page 1190.
User & Authentication	Configure user accounts, groups, and authentication methods, including external authentication and single sign-on (SSO).
WiFi & Switch Controller	Configure the unit to act as a wireless network controller, managing the wireless Access Point (AP) functionality of FortiWiFi and FortiAP units. On certain FortiGate models, this menu has additional features allowing for FortiSwitch units to be managed by the FortiGate. For more information, see Wireless configuration on page 1409 and Switch Controller on page 1410.

System	Configure system settings, such as administrators, HA, FortiGuard, and certificates. For more information, see System on page 1411.
Security Fabric	Access the physical topology, logical topology, automation, and settings of the Fortinet Security Fabric. For more information, see Fortinet Security Fabric on page 1586.
Log & Report	Configure logging and alert email as well as reports. For more information, see Log and Report on page 1886.

Tables

Many GUI pages contain tables of information that can be filtered and customized to display specific information in a specific way. Some tables allow content to be edited directly on that table, or rows to be copied and pasted.

Navigation

Some tables contain information and lists that span multiple pages. Navigation controls will be available at the bottom of the page.

Filters

Filters are used to locate a specific set of information or content in a table. They can be particularly useful for locating specific log entries. The filtering options vary, depending on the type of information in the log.

Depending on the table content, filters can be applied using the filter bar, using a column filter, or based on a cell's content. Some tables allow filtering based on regular expressions.

Administrators with read and write access can define filters. Multiple filters can be applied at one time.

To manually create a filter:

1. Click *Add Filter* at the top of the table. A list of the fields available for filtering is shown.
2. Select the field to filter by.
3. Enter the value to filter by, adding modifiers as needed.
4. Press *Enter* to apply the filter.

To create a column filter:

1. Click the filter icon on the right side of the column header
2. Choose a filter type from the available options.
3. Enter the filter text, or select from the available values.
4. Click *Apply*.

To create a filter based on a cell's content:

1. Right click on a cell in the table.
2. Select a filtering option from the menu.

Column settings

Columns can be rearranged, resized, and added or removed from tables.

To add or remove columns:

1. Right a column header, or click the gear icon on the left side of the header row that appears when hovering the cursor over the headers.
2. Select columns to add or remove.
3. Click *Apply*.

To rearrange the columns in a table:

1. Click and drag the column header.

To resize a column:

1. Click and drag the right border of the column header.

To resize a column to fit its contents:

1. Click the dots or filter icon on the right side of the column header and select *Resize to Contents*.

To resize all of the columns in a table to fit their content:

1. Right a column header, or click the gear icon on the left side of the header row that appears when hovering the cursor over the headers.
2. Click *Best Fit All Columns*.

To reset a table to its default view:

1. Right a column header, or click the gear icon on the left side of the header row that appears when hovering the cursor over the headers.
2. Click *Reset Table*.
   Resetting a table does not remove filters.

Editing objects

In some tables, parts of a configuration can be edited directly in the table. For example, security profiles can be added to an existing firewall policy by clicking the edit icon in a cell in the *Security Profiles* column.

Copying rows

In some tables, rows can be copied and pasted using the right-click menu. For example, a policy can be duplicated by copying and pasting it.

Entering values

Numerous fields in the GUI and CLI require text strings or numbers to be entered when configuring the FortiGate. When entering values in the GUI, you will be prevented from entering invalid characters, and a warning message will be shown explaining what values are not allowed. If invalid values are entered in a CLI command, the setting will be rejected when you apply it.

- Text strings on page 23
- Numbers on page 24

Text strings

Text strings are used to name entities in the FortiGate configuration. For example, the name of a firewall address, administrator, or interface are all text strings.

The following characters cannot be used in text strings, as they present cross-site scripting (XSS) vulnerabilities:

- " - double quotes
- ' - single quote
- > - greater than
- < - less than

Most GUI text fields prevent XSS vulnerable characters from being added.

VDOM names and hostnames can only use numbers (0-9), letters (a-z and A-Z), dashes, and underscores.

The `tree` CLI command can be used to view the number of characters allowed in a name field. For example, entering the following commands show that a firewall address name can contain up to 80 characters, while its FQDN can contain 256 characters:

```
config fire address
(address) # tree
    -- [address] --*name     (80)
              |- uuid
              |- subnet
              |- type
              |- start-mac
              |- end-mac
              |- start-ip
              |- end-ip
              |- fqdn     (256)
              |- country     (3)
              |- wildcard-fqdn     (256)
              |- cache-ttl     (0,86400)
```

```
|- wildcard
|- sdn    (36)
|- interface    (36)
|- tenant    (36)
|- organization    (36)
|- epg-name    (256)
|- subnet-name    (256)
|- sdn-tag    (16)
|- policy-group    (16)
|- comment
|- visibility
|- associated-interface    (36)
|- color    (0,32)
|- filter
|- sdn-addr-type
|- obj-id
|- [list] --*ip    (36)
          |- obj-id    (128)
          +- net-id    (128)
|- [tagging] --*name    (64)
             |- category    (64)
             +- [tags] --*name    (80)
+- allow-routing
```

Numbers

Numbers are used to set sizes, rated, addresses, port numbers, priorities, and other such numeric values. They can be entered as a series of digits (without commas or spaces), in a dotted decimal format (such as IP addresses), or separated by colons (such as MAC addresses). Most numeric values use base 10 numbers, while some use hexadecimal values.

Most GUI and CLI fields prevent invalid numbers from being entered. The CLI help text includes information about the range of values allowed for applicable settings.

Using the CLI

The Command Line Interface (CLI) can be used in lieu of the GUI to configure the FortiGate. Some settings are not available in the GUI, and can only be accessed using the CLI.

This section briefly explains basic CLI usage. For more information about the CLI, see the FortiOS CLI Reference.

- Connecting to the CLI on page 25
- CLI basics on page 27
- Command syntax on page 33
- Subcommands on page 36
- Permissions on page 38

Connecting to the CLI

You can connect to the CLI using a direct console connection, SSH, the FortiExplorer app on your iOS device, or the CLI console in the GUI.

You can access the CLI outside of the GUI in three ways:

- Console connection: Connect your computer directly to the console port of your FortiGate.
- SSH access: Connect your computer through any network interface attached to one of the network ports on your FortiGate.
- FortiExplorer: Connect your device to the FortiExplorer app on your iOS device to configure, manage, and monitor your FortiGate. See FortiExplorer for iOS on page 38 for details.

To open a CLI console,click the _> icon in the top right corner of the GUI. The console opens on top of the GUI. It can be minimized and multiple consoles can be opened.

To edit policies and objects directly in the CLI, right-click on the element and select *Edit in CLI*.

Console connection

A direct console connection to the CLI is created by directly connecting your management computer or console to the FortiGate using its DB-9 or RJ-45 console port.

Direct console access to the FortiGate may be required if:

- You are installing the FortiGate for the first time and it is not configured to connect to your network.
- You are restoring the firmware using a boot interrupt. Network access to the CLI will not be available until after the boot process has completed, making direct console access the only option.

To connect to the FortiGate console, you need:

- A console cable to connect the console port on the FortiGate to a communications port on the computer. Depending on your device, this is one of:
  - null modem cable (DB-9 to DB-9)
  - DB-9 to RJ-45 cable (a DB-9-to-USB adapter can be used)
  - USB to RJ-45 cable
- A computer with an available communications port
- Terminal emulation software

To connect to the CLI using a direct console connection:

1. Using the console cable, connect the FortiGate unit's console port to the serial communications (COM) port on your management computer.
2. Start a terminal emulation program on the management computer, select the COM port, and use the following settings:

Bits per second	9600
Data bits	8
Parity	None
Stop bits	1
Flow control	None

3. Press *Enter* on the keyboard to connect to the CLI.
4. Log in to the CLI using your username and password (default: *admin* and no password).
   You can now enter CLI commands, including configuring access to the CLI through SSH.

SSH access

SSH access to the CLI is accomplished by connecting your computer to the FortiGate using one of its network ports. You can either connect directly, using a peer connection between the two, or through any intermediary network.

If you do not want to use an SSH client and you have access to the GUI, you can access the CLI through the network using the CLI console in the GUI.

SSH must be enabled on the network interface that is associated with the physical network port that is used.

If your computer is not connected either directly or through a switch to the FortiGate, you must also configure the FortiGate with a static route to a router that can forward packets from the FortiGate to the computer. This can be done using a local console connection, or in the GUI.

To connect to the FortiGate CLI using SSH, you need:

- A computer with an available serial communications (COM) port and RJ-45 port
- An appropriate console cable
- Terminal emulation software
- A network cable
- Prior configuration of the operating mode, network interface, and static route.

To enable SSH access to the CLI using a local console connection:

1. Using the network cable, connect the FortiGate unit's port either directly to your computer's network port, or to a network through which your computer can reach the FortiGate.
2. Note the number of the physical network port.
3. Using direct console connection, connect and log into the CLI.
4. Enter the following command:

```
config system interface
    edit <interface_str>
        append allowaccess ssh
    next
end
```

   Where `<interface_str>` is the name of the network interface associated with the physical network port, such as `port1`.
5. Confirm the configuration using the following command to show the interface's settings:

```
show system interface <interface_str>
```

   For example:

```
show system interface port1
    config system interface
        edit "port1"
            set vdom "root"
```

```
            set ip 192.168.1.99 255.255.255.0
            set allowaccess ping https ssh
            set type hard-switch
            set stp enable
            set role lan
            set snmp-index 6
        next
    end
```

Connecting using SSH

Once the FortiGate is configured to accept SSH connections, use an SSH client on your management computer to connect to the CLI.

The following instructions use PuTTy. The steps may vary in other terminal emulators.

To connect to the CLI using SSH:

1. On your management computer, start PuTTy.
2. In the *Host Name (or IP address)* field, enter the IP address of the network interface that you are connected to and that has SSH access enabled.
3. Set the port number to 22, if it is not set automatically.
4. Select *SSH* for the *Connection type*.
5. Click *Open*. The SSH client connect to the FortiGate.
   The SSH client may display a warning if this is the first time that you are connecting to the FortiGate and its SSH key is not yet recognized by the SSH client, or if you previously connected to the FortiGate using a different IP address or SSH key. This is normal if the management computer is connected directly to the FortiGate with no network hosts in between.
6. Click *Yes* to accept the FortiGate's SSH key.
   The CLI displays the log in prompt.
7. Enter a valid administrator account name, such as `admin`, then press *Enter*.
8. Enter the administrator account password, then press *Enter*.
   The CLI console shows the command prompt (FortiGate hostname followed by a `#`). You can now enter CLI commands.

If three incorrect log in or password attempts occur in a row, you will be disconnected. If this occurs, wait for one minute, then reconnect and attempt to log in again.

CLI basics

Basic features and characteristics of the CLI environment provide support and ease of use for many CLI tasks.

Help

Press the question mark (?) key to display command help and complete commands.

- Press the question mark (?) key at the command prompt to display a list of the commands available and a description of each command.

- Enter a command followed by a space and press the question mark (?) key to display a list of the options available for that command and a description of each option.
- Enter a command followed by an option and press the question mark (?) key to display a list of additional options available for that command option combination and a description of each option.
- Enter a question mark after entering a portion of a command to see a list of valid complete commands and their descriptions. If there is only one valid command, it will be automatically filled in.

Shortcuts and key commands

Shortcut key	Action
?	List valid complete or subsequent commands. If multiple commands can complete the command, they are listed with their descriptions.
Tab	Complete the word with the next available match. Press multiple times to cycle through available matches.
Up arrow or Ctrl + P	Recall the previous command. Command memory is limited to the current session.
Down arrow, or Ctrl + N	Recall the next command.
Left or Right arrow	Move the cursor left or right within the command line.
Ctrl + A	Move the cursor to the beginning of the command line.
Ctrl + E	Move the cursor to the end of the command line.
Ctrl + B	Move the cursor backwards one word.
Ctrl + F	Move the cursor forwards one word.
Ctrl + D	Delete the current character.
Ctrl + C	Abort current interactive commands, such as when entering multiple lines. If you are not currently within an interactive command such as `config` or `edit`, this closes the CLI connection.
\ then Enter	Continue typing a command on the next line for a multiline command. For each line that you want to continue, terminate it with a backslash (\ ). To complete the command, enter a space instead of a backslash, and then press *Enter*.

Command tree

Enter `tree` to display the CLI command tree. To capture the full output, connect to your device using a terminal emulation program and capture the output to a log file. For some commands, use the `tree` command to view all available variables and subcommands.

Command abbreviation

You can abbreviate words in the command line to their smallest number of non-ambiguous characters.

For example, the command `get system status` could be abbreviated to `g sy stat`.

Adding and removing options from lists

When configuring a list, the `set` command will remove the previous configuration.

For example, if a user group currently includes members A, B, and C, the command `set member D` will remove members A, B, and C. To avoid removing the existing members from the group, the command `set members A B C D` must be used.

To avoid this issue, the following commands are available:

append	Add an option to an existing list. For example, `append member D` adds user D to the user group without removing any of the existing members.
select	Clear all of the options except for those specified. For example, `select member B` removes all member from the group except for member B.
unselect	Remove an option from an existing list. For example, `unselect member C` removes only member C from the group, without affecting the other members.

Environment variables

The following environment variables are support by the CLI. Variable names are case-sensitive.

$USERFROM	The management access type (`ssh`, `jsconsole`, and so on) and the IPv4 address of the administrator that configured the item.
$USERNAME	The account name of the administrator that configured the item.
$SerialNum	The serial number of the FortiGate.

For example, to set a FortiGate device's host name to its serial number, use the following CLI command:

```
config system global
   set hostname $SerialNum
end
```

Special characters

The following characters cannot be used in most CLI commands: `<`, `>`, `(`, `)`, `#`, `'`, and `"`

If one of those characters, or a space, needs to be entered as part of a string, it can be entered by using a special command, enclosing the entire string in quotes, or preceding it with an escape character (backslash, \).

To enter a question mark (`?`) or a tab, *Ctrl* + *V* or *Ctrl* + *Shift* + - must be entered first.

Question marks and tabs cannot be copied into the CLI Console or some SSH clients. They must be typed in.

Character	Keys
?	Ctrl + V or Ctrl + Shift + - then ?
Tab	Ctrl + V then Tab
Space (as part of a string value, not to end the string)	Enclose the string in single or double quotation marks: "`Security Administrator`" or '`Security Administrator`'. Precede the space with a backslash: `Security\ Administrator`.
' (as part of a string value, not to begin or end the string)	\'
" (as part of a string value, not to begin or end the string)	\"
\	\\

Using grep to filter command output

The `get`, `show`, and `diagnose` commands can produce large amounts of output. The `grep` command can be used to filter the output so that it only shows the required information.

The grep command is based on the standard UNIX grep, used for searching text output based on regular expressions.

For example, the following command displays the MAC address of the internal interface:

```
get hardware nic internal | grep Current_HWaddr
    Current_HWaddr        00:09:0f:cb:c2:75
```

The following command will display all TCP sessions that are in the session list, including the session list line number in the output:

```
get system session list | grep -n tcp
```

The following command will display all of the lines in the HTTP replacement message that contain `URL` or `url`:

```
show system replacemsg http | grep -i url
```

The following options can also be used:

```
-A <num> After
-B <num> Before
-C <num> Context
```

The `-f` option is available to support contextual output, in order to show the complete configuration. The following example shows the difference in the output when `-f` is used versus when it is not used:

Without `-f`:

```
show | grep ldap-group1
```

With `-f`:

```
    edit "ldap-group1"
        set groups "ldap-group1"
```

```
show | grep -f ldap-group1
    config user group
        edit "ldap-group1"
            set member "pc40-LDAP"
        next
    end
    config firewall policy
        edit 2
            set srcintf "port31"
            set dstintf "port32"
            set srcaddr "all"
            set action accept
            set identity-based enable
            set nat enable
            config identity-based-policy
                edit 1
                    set schedule "always"
                    set groups "ldap-group1"
                    set dstaddr "all"
                    set service "ALL"
                next
            end
        next
    end
```

Language support and regular expressions

Characters such as ñ and é, symbols, and ideographs are sometimes acceptable input. Support varies depending on the type of item that is being configured. CLI commands, objects, field names, and options must use their exact ASCII characters, but some items with arbitrary names or values can be input using your language of choice. To use other languages in those cases, the correct encoding must be used.

Input is stored using Unicode UTF-8 encoding, but is not normalized from other encodings into UTF-8 before it is stored. If your input method encodes some characters differently than in UTF-8, configured items may not display or operate as expected.

Regular expressions are especially impacted. Matching uses the UTF-8 character values. If you enter a regular expression using a different encoding, or if an HTTP client sends a request in a different encoding, matches may not be what is expected.

For example, with Shift-JIS, backslashes could be inadvertently interpreted as the symbol for the Japanese yen (¥), and vice versa. A regular expression intended to match HTTP requests containing monetary values with a yen symbol may not work it if the symbol is entered using the wrong encoding.

For best results:

- use UTF-8 encoding, or
- use only characters whose numerically encoded values are the same in UTF-8, such as the US-ASCII characters that are encoded using the same values in ISO 8859-1, Windows code page 1252, Shift-JIS, and other encoding methods, or
- for regular expressions that must match HTTP requests, use the same encoding as your HTTP clients.

HTTP clients may send requests in encodings other than UTF-8. Encodings usually vary based on the client's operating system or input language. If the client's encoding method cannot be predicted, you might only be able to match the parts of the request that are in English, as the values for English characters tend to be encoded identically, regardless of the encoding method.

If the FortiGate is configured to use an encoding method other than UTF-8, the management computer's language may need to be changed, including the web browse and terminal emulator. If the FortiGate is configured using non-ASCII characters, all the systems that interact with the FortiGate must also support the same encoding method. If possible, the same encoding method should be used throughout the configuration to avoid needing to change the language settings on the management computer.

The GUI and CLI client normally interpret output as encoded using UTF-8. If they do not, configured items may not display correctly. Exceptions include items such as regular expression that may be configured using other encodings to match the encoding of HTTP requests that the FortiGate receives.

To enter non-ASCII characters in a terminal emulator:

1. On the management computer, start the terminal client.
2. Configure the client to send and receive characters using UTF-8 encoding.
   Support for sending and receiving international characters varies by terminal client.
3. Log in to the FortiGate.
4. At the command prompt, type your command and press *Enter*.
   Words that use encoded characters may need to be enclosed in single quotes (').
   Depending on your terminal client's language support, you may need to interpret the characters into character codes before pressing *Enter*. For example, you might need to enter: `edit '\743\601\613\743\601\652'`
5. The CLI displays the command and its output.

Screen paging

By default, the CLI will pause after displaying each page worth of text when a command has multiple pages of output. this can be useful when viewing lengthy outputs that might exceed the buffer of terminal emulator.

When the display pauses and shows `--More--`, you can:

- Press *Enter* to show the next line,
- Press *Q* to stop showing results and return to the command prompt,
- Press an arrow key, *Insert*, *Home*, *Delete*, *End*, *Page Up*, or *Page Down* to show the next few pages,
- Press any other key to show the next page, or
- Wait for about 30 seconds for the console to truncate the output and return to the command prompt.

When pausing the screen is disabled, press *Ctrl* + *C* to stop the output and log out of the FortiGate.

To disable pausing the CLI output:

```
config system console
   set output standard
end
```

To enable pausing the CLI output:

```
config system console
   set output more
end
```

Changing the baud rate

The baud rate of the local console connection can be changed from its default value of 9600.

To change the baud rate:

```
config system console
   set baudrate {9600 | 19200 | 38400 | 57600 | 115200}
end
```

Editing the configuration file

The FortiGate configuration file can be edited on an external host by backing up the configuration, editing the configuration file, and then restoring the configuration to the FortiGate.

Editing the configuration file can save time is many changes need to be made, particularly if the plain text editor that you are using provides features such as batch changes.

To edit the configuration file:

1. Backup the configuration. See Configuration backups on page 55 for details.
2. Open the configuration file in a plain text editor that supports UNIX-style line endings.
3. Edit the file as needed.

Do not edit the first line of the configuration file.

This line contains information about the firmware version and FortiGate model. If you change the model number, the FortiGate will reject the configuration when you attempt to restore it.

4. Restore the modified configuration to the FortiGate. See Configuration backups on page 55 for details.
The FortiGate downloads the configuration file and checks that the model information is correct. If it is correct, the configuration file is loaded and each line is checked for errors. If a command is invalid, that command is ignored. If the configuration file is valid, the FortiGate restarts and loads the downloaded configuration.

Command syntax

When entering a command, the CLI console requires that you use valid syntax and conform to expected input constraints. It rejects invalid commands. Indentation is used to indicate the levels of nested commands.

Each command line consists of a command word, usually followed by configuration data or a specific item that the command uses or affects.

Notation

Brackets, vertical bars, and spaces are used to denote valid syntax. Constraint notations, such as `<address_ipv4>`, indicate which data types or string patterns are acceptable value input.

All syntax uses the following conventions:

Angle brackets < >	Indicate a variable of the specified data type.
Curly brackets { }	Indicate that a variable or variables are mandatory.
Square brackets [ ]	Indicate that the variable or variables are optional. For example: `show system interface [<name_str>]` To show the settings for all interfaces, you can enter `show system interface` To show the settings for the Port1 interface, you can enter `show system interface port1`.
Vertical bar |	A vertical bar separates alternative, mutually exclusive options. For example: `set protocol {ftp | sftp}` You can enter either `set protocol ftp` or `set protocol sftp`.

Space	A space separates non-mutually exclusive options.
	For example:
	`set allowaccess {ping https ssh snmp http fgfm radius-acct probe-response capwap ftm}`
	You can enter any of the following:
	`set allowaccess ping`
	`set allowaccess https ping ssh`
	`set allowaccess http https snmp ssh ping`
	In most cases, to make changes to lists that contain options separated by spaces, you need to retype the entire list, including all the options that you want to apply and excluding all the options that you want to remove.

Optional values and ranges

Any field that is optional will use square-brackets. The overall config command will still be valid whether or not the option is configured.

Square-brackets can be used is to show that multiple options can be set, even intermixed with ranges. The following example shows a field that can be set to either a specific value or range, or multiple instances:

```
config firewall service custom
   set iprange <range1> [<range2> <range3> ...]
end
```

next

The `next` command is used to maintain a hierarchy and flow to CLI commands. It is at the same indentation level as the preceding `edit` command, to mark where a table entry finishes.

The following example shows the next command used in the subcommand `entries`:

```
config dlp filepattern
    edit <1>
        set name <name>
        set comment [comment]
        config entries
            edit <2>
                set filter-type {pattern | type}
            next
```

After configuring table entry `<2>` then entering `next`, the `<2>` table entry is saved and the console returns to the `entries` prompt:

```
FGT60E1Q23456789 (entries) #
```

You can now create more table entries as needed, or enter `end` to save the table and return to the `filepattern` table element prompt.

end

The `end` command is used to maintain a hierarchy and flow to CLI commands.

The following example shows the same command and subcommand as the `next` command example, except `end` has been entered instead of `next` after the subcommand:

```
config dlp filepattern
    edit <1>
        set name <name>
        set comment [comment]
        config entries
            edit <2>
                set filter-type {pattern | type}
    end
```

Entering `end` will save the `<2>` table entry and the table, and exit the `entries` subcommand entirely. The console returns to the filepattern table element prompt:

```
FGT60E1Q23456789 (1) #
```

Subcommands

Subcommands are available from within the scope of some commands. When you enter a subcommand level, the command prompt changes to indicate the name of the current command scope. For example, after entering:

```
config system admin
```

the command prompt becomes:

```
(admin)#
```

Applicable subcommands are available until you exit the command, or descend an additional level into another subcommand. Subcommand scope is indicated by indentation.

For example, the `edit` subcommand is only available in commands that affects tables, and the `next` subcommand is available only in the `edit` subcommand:

```
config system interface
   edit port1
      set status up
   next
end
```

The available subcommands vary by command. From a command prompt under the `config` command, subcommands that affect tables and fields could be available.

Table subcommands

edit <table_row>	Create or edit a table value.
	In objects such as security policies, `<table_row>` is a sequence number. To create a new table entry without accidentally editing an existing entry, enter `edit 0`. The CLI will confirm that creation of entry 0, but will assign the next unused number when the entry is saved after entering `end` or `next`.
	For example, to create a new firewall policy, enter the following commands:
	`config firewall policy`
	`edit 0`
	`....`
	`next`
	`end`
	To edit an existing policy, enter the following commands:
	`config firewall policy`
	`edit 27`
	`....`
	`next`
	`end`
	The `edit` subcommand changes the command prompt to the name of the table value that is being edited.

delete <table_row>	Delete a table value.
	For example, to delete firewall policy 30, enter the following commands:
	`config firewall policy`
	`delete 30`
	`end`

purge	Clear all table values. The `purge` command cannot be undone. To restore purged table values, the configuration must be restored from a backup.

move	Move an ordered table value.
	In the firewall policy table, this equivalent to dragging a policy into a new position. It does not change the policy's ID number.
	For example, to move policy 27 to policy 30, enter the following commands:
	`config firewall policy`
	`move 27 to 30`
	`end`
	The `move` subcommand is only available in tables where the order of the table entries matters.

clone <table_row> to <table_row>	Make a clone of a table entry.
	For example, to create firewall policy 30 as a clone of policy 27, enter the following commands:
	`config firewall policy`
	`clone 27 to 30`
	`end`
	The `clone` subcommand may not be available for all tables.

rename <table_row> to <table_row>	Rename a table entry.
	For example to rename an administrator from Flank to Frank, enter the following commands:
	`config system admin`
	`rename Flank to Frank`
	`end`
	The `rename` subcommand is only available in tables where the entries can be renamed.

get	List the current table entries.
	For example, to view the existing firewall policy table entries, enter the following commands:
	`config firewall policy`
	`get`

show	Show the configuration. Only table entries that are not set to default values are shown.
end	Save the configuration and exit the current `config` command.

Purging the `system interface` or `system admin` tables does not reset default table values. This can result in being unable to connect to or log in to the FortiGate, requiring the FortiGate to be formatted and restored.

Field subcommands

set <field> <value>	Modify the value of a field.

	For example, the command `set fsso enable` sets the `fsso` field to the value `enable`.
unset	Set the field to its default value.
select	Clear all of the options except for those specified. For example, if a group contains members A, B, C, and D, to remove all members except for B, use the command `select member B`.
unselect	Remove an option from an existing list. For example, if a group contains members A, B, C, and D, to remove only member B, use the command `unselect member B`.
append	Add an option to an existing multi-option table value.
clear	Clear all the options from a multi-option table value.
get	List the configuration of the current table entry, including default and customized values.
show	Show the configuration. Only values that are not set to default values are shown.
next	Save changes to the table entry and exit the `edit` command so that you can configure the next table entry.
abort	Exit the command without saving.
end	Save the configuration and exit the current `config` command.

Permissions

Administrator (or access) profiles control what CLI commands an administrator can access by assigning read, write, or no access to each area of FortiOS. For information, see Administrator profiles on page 1413.

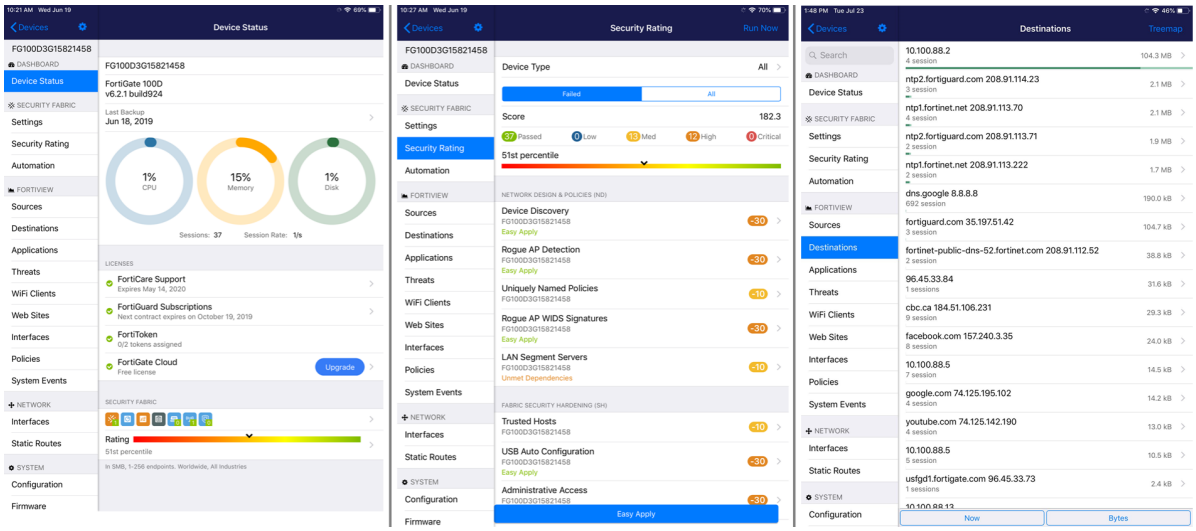
Read access is required to view configurations. Write access is required to make configuration changes. Depending on your account's profile, you may not have access to all CLI commands. To have access to all CLI commands, an administrator account with the *super_admin* profile must be used, such as the *admin* account.

Accounts assigned the *super_admin* profile are similar to the root administrator account. They have full permission to view and change all FortiGate configuration options, including viewing and changing other administrator accounts.

To increase account security, set strong passwords for all administrator accounts, and change the passwords regularly.

FortiExplorer for iOS

FortiExplorer for iOS is a user-friendly application that helps you to rapidly provision, deploy, and monitor Security Fabric components from your iOS device.



FortiExplorer for iOS requires iOS 10.0 or later and is compatible with iPhone, iPad, and Apple TV. It is supported by FortiOS 5.6 and later, and is only available on the App Store for iOS devices.

Advanced features are available with the purchase of FortiExplorer Pro. Paid features include the ability to add more than two devices, and firmware upgrades for devices with active licenses.

Up to six members can use this app with 'Family Sharing' enabled in the App Store.

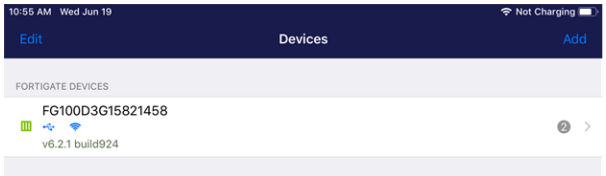
Firmware upload requires a valid firmware license. Users can download firmware for models with a valid support contract.

Getting started with FortiExplorer

If your FortiGate is accessible on a wireless network, you can connect to it using FortiExplorer provided that your iOS device is on the same network (see Connecting FortiExplorer to a FortiGate via WiFi). Otherwise, you will need to physically connect your iOS device to the FortiGate using a USB cable.

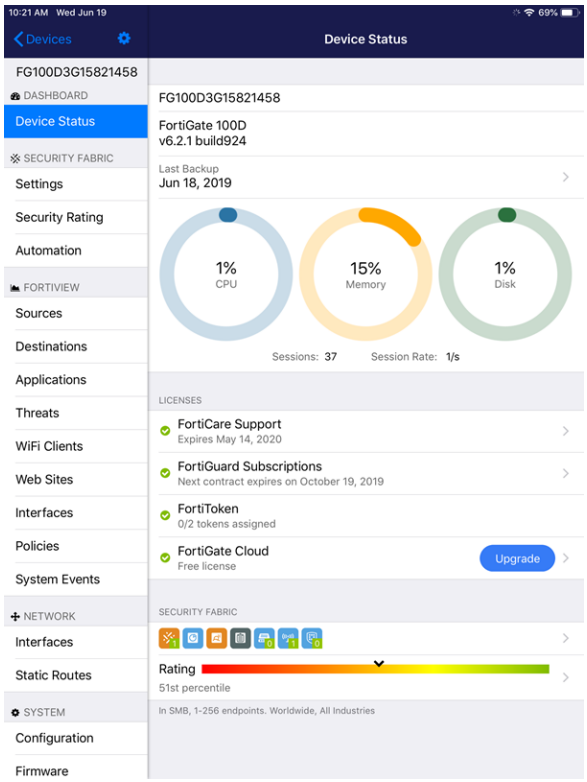
To connect and configure a FortiGate with FortiExplorer using a USB connection:

1. Connect your iOS device to your FortiGate USB A port. If prompted on your iOS device, *Trust* this computer.
2. Open FortiExplorer and select your FortiGate from the *FortiGate Devices* list . A blue USB icon will indicate that you are connected over a USB connection.

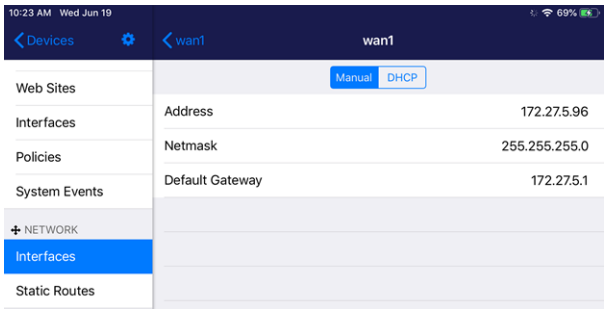


3. On the *Login* screen, select *USB*.
4. Enter the default *Username* (`admin`) and leave the *Password* field blank.
5. Optionally, select *Remember Password*.

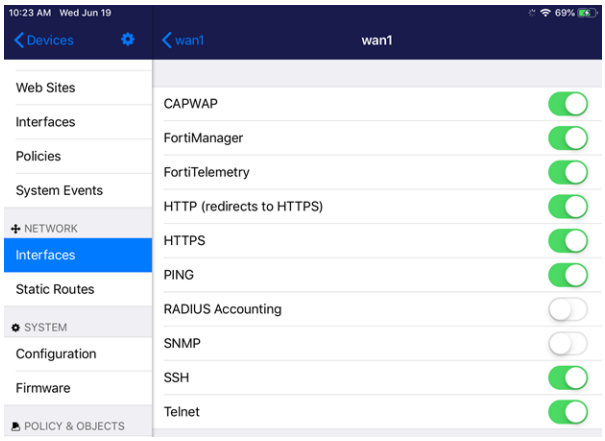
6. Tap *Done* when you are ready.
   FortiExplorer opens the FortiGate management interface to the *Device Status* page:



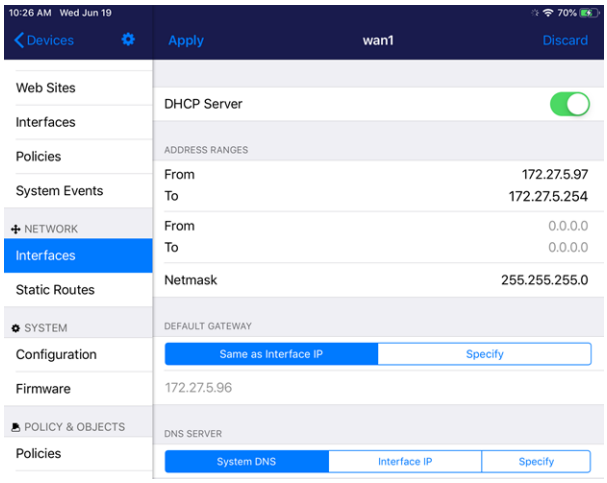
7. Go to *Network* > *Interfaces* and configure the WAN interface or interfaces.
8. The *wan1* interface *Address* mode is set to *DHCP* by default. Set it to *Manual* and enter its *Address*, *Netmask*, and *Default Gateway*, and then *Apply* your changes.



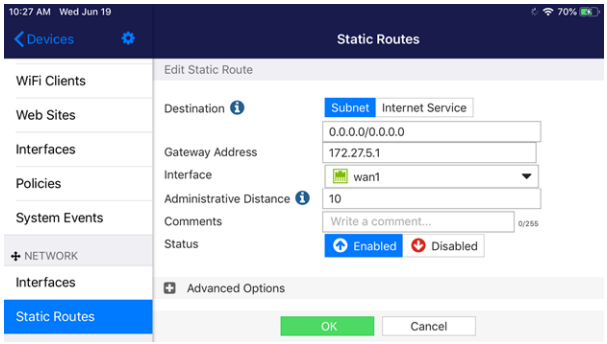
9. Optionally, configure *Administrative Access* to allow *HTTPS* access. This will allow administrators to access the FortiGate GUI using a web browser.



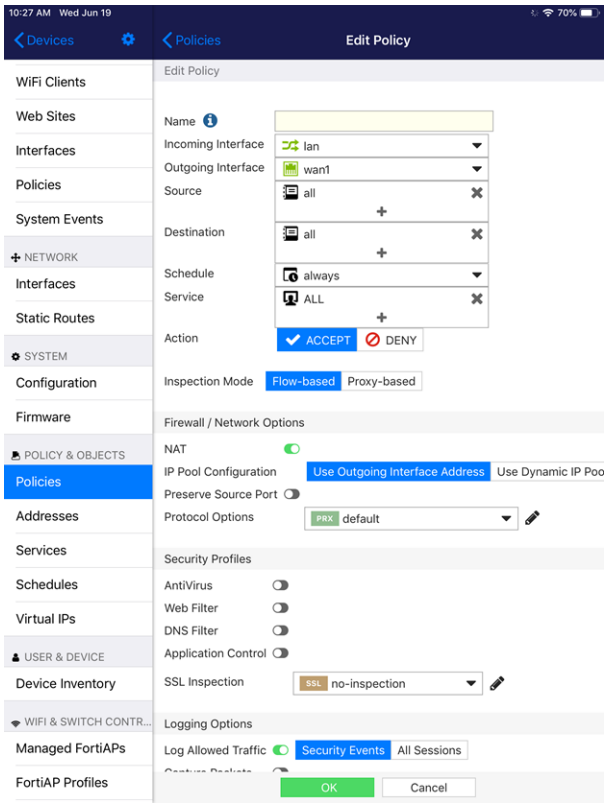
10. Go to *Network* > *Interfaces* and configure the local network (internal) interface.
11. Set the *Address* mode as before and configure *Administrative Access* if required.
12. Configure a *DHCP Server* for the internal network subnet.



13. Return to the internal interface using the < button at the top of the screen.
14. Go to *Network* > *Static Routes* and configure the static route to the gateway.



15. Go to *Policy & Objects* > *Firewall Policy* and edit the Internet access policy. Enter a *Name* for the policy, enable the required *Security Profiles*, configure *Logging Options*, then tap *OK*.

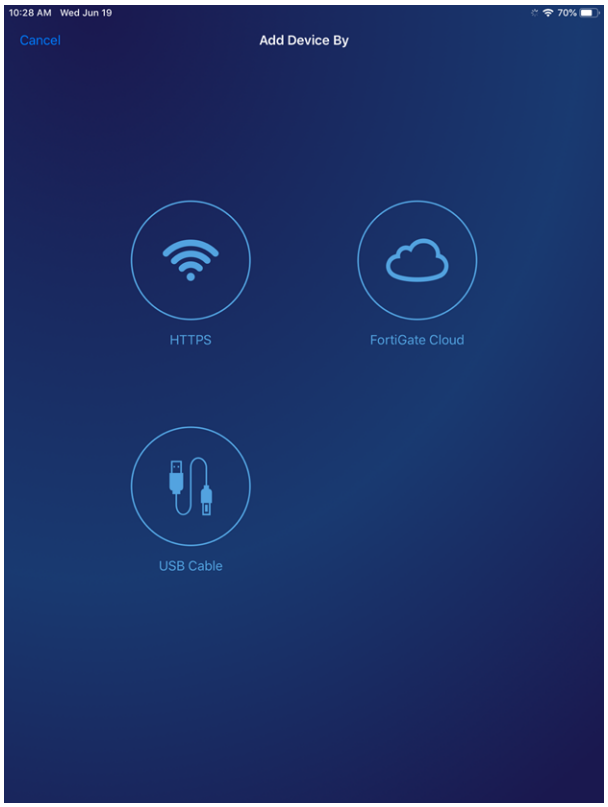


Connecting FortiExplorer to a FortiGate via WiFi

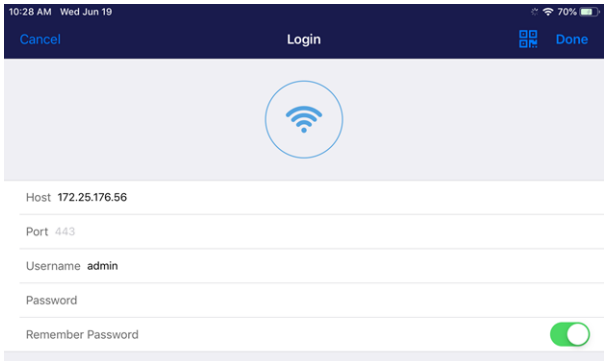
You can wirelessly connect to the FortiGate if your iOS device and the FortiGate are both connected to the same wireless network.

To connect and configure a FortiGate with FortiExplorer wirelessly:

1. Open the FortiExplorer app and tap *Add* on the *Devices* page.
2. On the *Add Device By* page, tap *HTTPS*.



3. Enter the *Host* information, *Username*, and *Password*.
4. If required, change the default *Port* number, and optionally enable *Remember Password*.

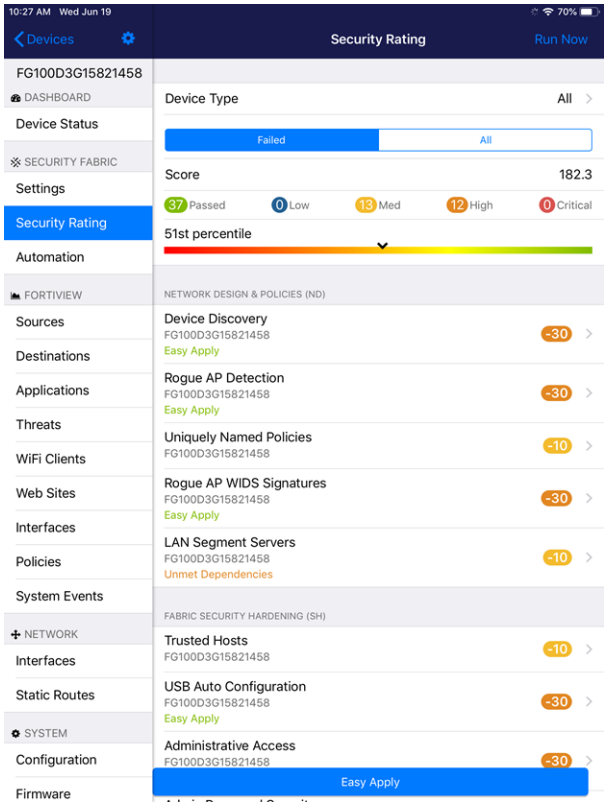


5. Tap *Done*.
6. If the FortiGate device identity cannot be verified, tap *Connect* at the prompt.
   FortiExplorer opens the FortiGate management interface to the *Device Status* page.

Running a security rating

After configuring your network, run a security rating check to identify vulnerabilities and highlight best practices that could improve your network's security and performance.

Go to *Security Fabric* > *Security Rating* and follow the steps to determine the score. See Security rating on page 1688 for more information.



Upgrading to FortiExplorer Pro

FortiExplorer Pro allows you to add unlimited devices, and download firmware images for devices with active licenses.

To upgrade to FortiExplorer Pro:

1. In FortiExplorer, go to *Settings*.
2. Tap *Manage Subscription*.
3. Follow the on-screen prompts.

Basic administration

This section contains information about basic FortiGate administration that you can do after you installing the unit in your network.

- Basic configuration on page 45
- Registration on page 47
- FortiCare and FortiGate Cloud login on page 50

- Transfer a device to another FortiCloud account on page 53
- Configuration backups on page 55

Basic configuration

This topic will help you configure a few basic settings on the FortiGate as described in the Using the GUI on page 19 and Using the CLI on page 24 sections, including:

- Configuring an interface to be part of your existing network for further configuration
- Configuring the hostname
- Configuring the default route
- Ensuring internet/FortiGuard connectivity

Configuring an interface

It is unlikely the default interface configuration will be appropriate for your environment and typically requires some effort of the administrator to use these settings, such as being physically near the FortiGate to establish a serial connection. Therefore, the first step is to configure an interface that can be used to complete the FortiGate configuration.

To configure an interface in the GUI:

1. Go to *Network* > *Interfaces*. Select an interface and click *Edit*.
2. Enter an *Alias*.
3. In the *Address* section, enter the *IP/Netmask*.
4. In *Administrative Access* section, select the access options as needed (such as *PING*, *HTTPS*, and *SSH*).
5. Optionally, enable *DHCP Server* and configure as needed.
6. Click *OK*.

To configure an interface in the CLI:

```
config system interface
    edit "port2"
        set ip 203.0.113.99 255.255.255.0
        set allowaccess ping https ssh
        set alias "Management"
    next
end
```

Configuring the hostname

Setting the FortiGate's hostname assists with identifying the device, and it is especially useful when managing multiple FortiGates. Choose a meaningful hostname as it is used in the CLI console, SNMP system name, device name for FortiGate Cloud, and to identify a member of an HA cluster.

To configure the hostname in the GUI:

1. Go to *System* > *Settings*.
2. Enter a name in the *Host name* field.

3. Click *Apply*.

To configure the hostname in the CLI:

```
config system global
    set hostname 200F_YVR
end
```

Configuring the default route

Setting the default route enables basic routing to allow the FortiGate to return traffic to sources that are not directly connected. The gateway address should be your existing router or L3 switch that the FortiGate is connected to. If you are directly connecting to the FortiGate, you may choose your endpoint's IP address as the gateway address. Set the interface to be the interface the gateway is connected to.

To configure the default route in the GUI:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Leave the destination subnet as *0.0.0.0/0.0.0.0*. This is known as a default route, since it would match any IPv4 address.
3. Enter the *Gateway Address*.
4. Select an *Interface*.
5. Click *OK*.

To configure the default route in the CLI:

```
config router static
    edit 0
        set gateway 192.168.1.254
        set device port1
    next
end
```

Ensuring internet and FortiGuard connectivity

This step is not necessary for the configuration; however, it is necessary in order to keep your FortiGate up to date against the latest threats. Updates are provided to FortiGates that are registered and make a request to the FortiGuard network to verify if there are any more recent definitions.

Use `execute ping <domain.tld>` to ensure the DNS resolution is able to resolve the following FortiGuard servers:

- fds1.fortinet.com
- service.fortiguard.net
- update.fortiguard.net

You also need to ensure the necessary ports are permitted outbound in the event your FortiGate is behind a filtering device. Refer to the Ports and Protocols document for more information.

Registration

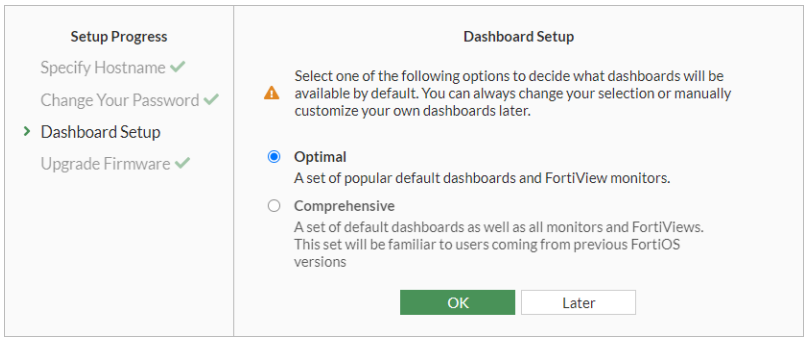
The FortiGate, and then its service contract, must be registered to have full access to Fortinet Customer Service and Support, and FortiGuard services. The FortiGate can be registered in either the FortiGate GUI or the FortiCloud support portal. The service contract can be registered from the FortiCloud support portal.

The service contract number is needed to complete registrations on the FortiCloud support portal. You can find this 12-digit number in the email that contains your service registration document (sent from do-not-reply-contract@fortinet.com) in the service entitlement summary.

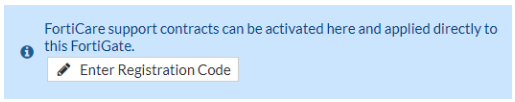
To register your FortiGate in the GUI:

1. Connect to the FortiGate GUI. A dialog box appears, which indicates the steps you should take to complete the setup of your FortiGate. These steps include:
   a. *Specify Hostname*
   b. *Change Your Password*
   c. *Dashboard Setup*
   d. *Upgrade Firmware*

   If you completed the Basic configuration on page 45, the hostname and password steps are already marked as complete (checkmark). If you chose to deploy the latest firmware, the *Upgrade Firmware* step is marked as complete.
2. Click *Begin* to complete the dashboard setup. Two options appear (*Optimal* and *Comprehensive*).



3. Select the desired setting and click *OK*. The *Dashboard* > *Status* page opens. Note that the licenses are grayed out because the device or virtual machine is not registered.
4. Go to *System* > *FortiGuard* and click *Enter Registration Code*.

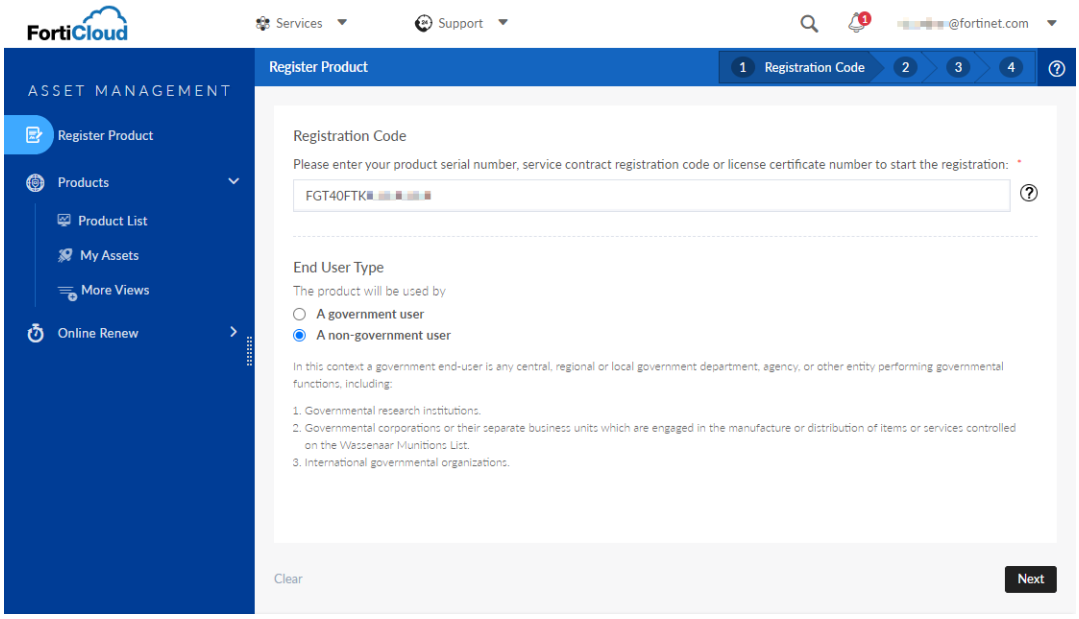


5. Enter the contract registration code from your service registration document.
6. Click *OK*.

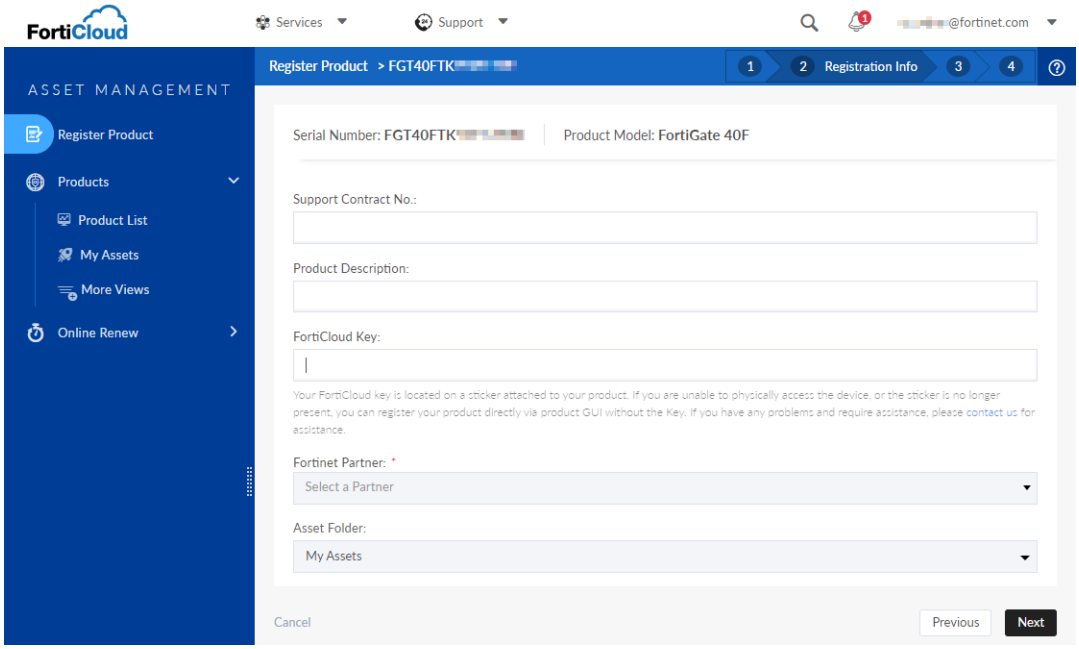
To register the FortiGate on the FortiCloud support portal:

1. Go to support.fortinet.com and log in using your FortiCloud account credentials. If you do not have an account, click *Register* to create one.
2. In the left-side menu, click *Register Product*.

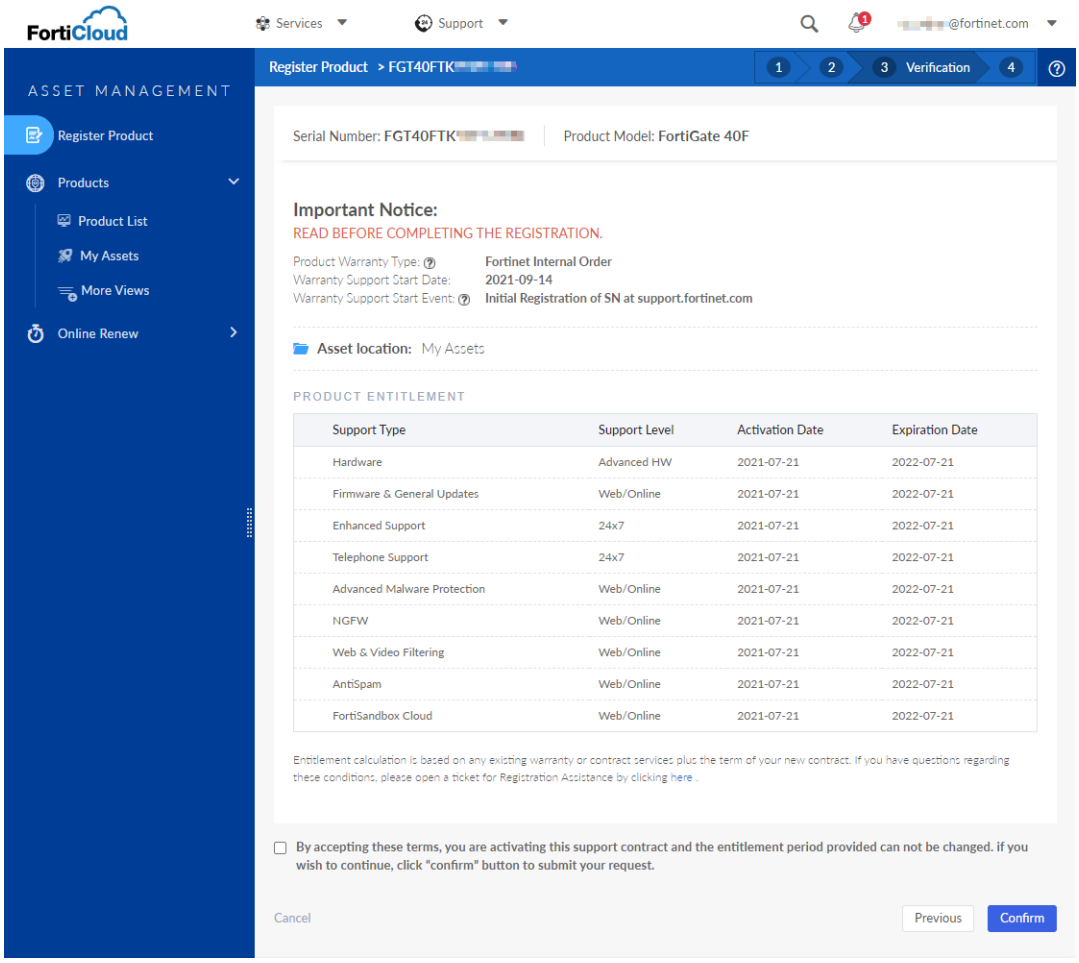
3. Enter the product serial number or license certificate number for a VM, select an end user type, then click *Next*.



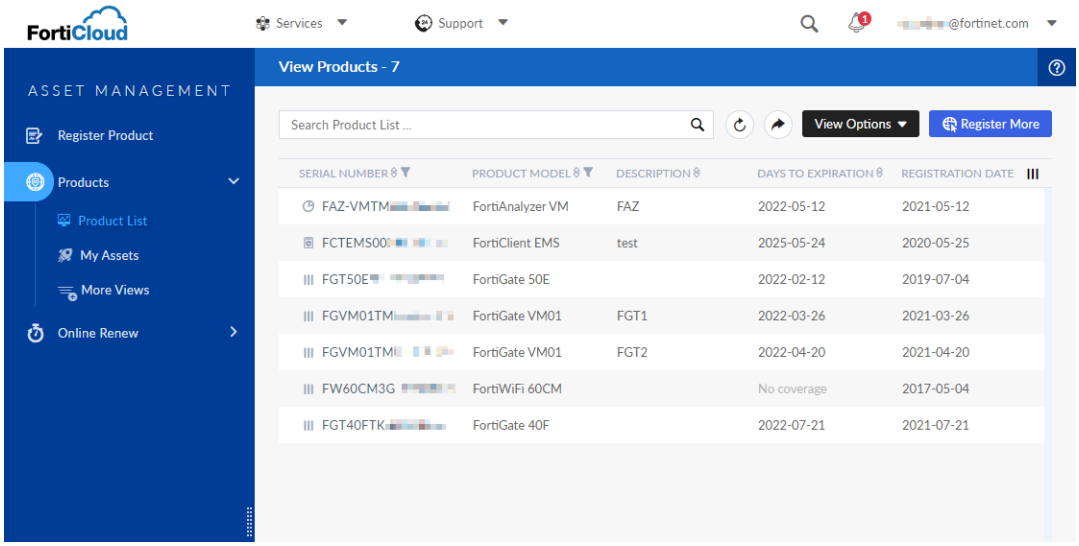
4. Enter the *Support Contract* number and *FortiCloud Key* (optionally, enter a product description), then click *Next*.



5. Review the product entitlement information, select the checkbox to accept the terms, then click *Confirm*.



6. Go to *Products* > *Product List*. The FortiGate is now visible in the product list.



FortiCare and FortiGate Cloud login

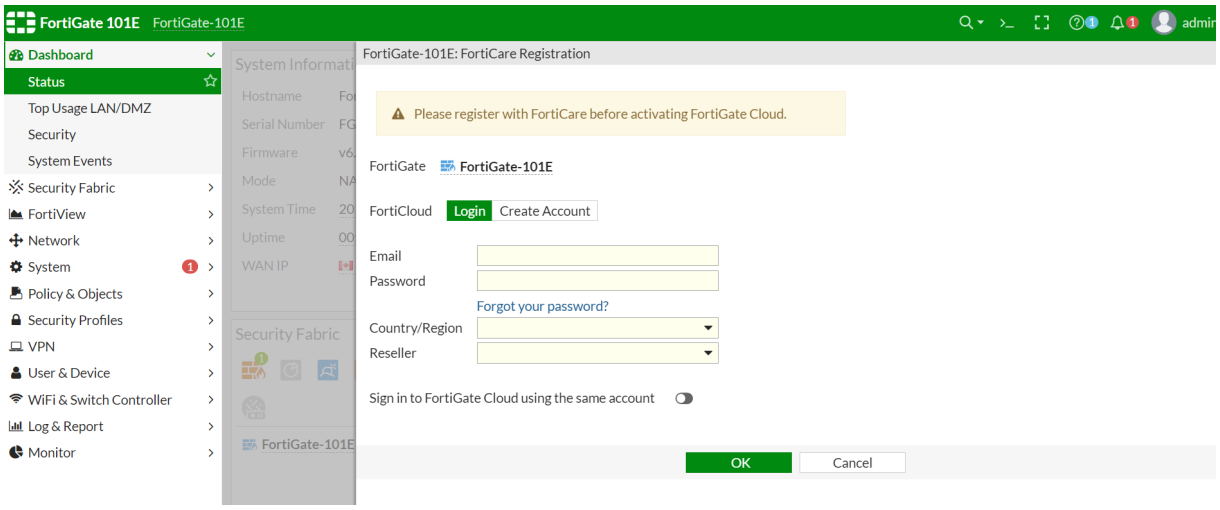
With FortiCloud, FortiGate supports a unified login to FortiCare and FortiGate Cloud. The FortiGate Cloud setup is a subset of the FortiCare setup.

- If the FortiGate is not registered, activating FortiGate Cloud will force you to register with FortiCare.
- If a FortiGate is registered in FortiCare using a FortiCloud account, then only that FortiCloud account can be used to activate FortiGate Cloud.
- If a different FortiCloud account was already used to activate FortiGate Cloud, then a notification asking you to migrate to FortiCloud is shown in the GUI after upgrading FortiOS.

The CLI can be used to activate FortiGate Cloud without registration, or with a different FortiCloud account.

To activate FortiGate Cloud and register with FortiCare at the same time:

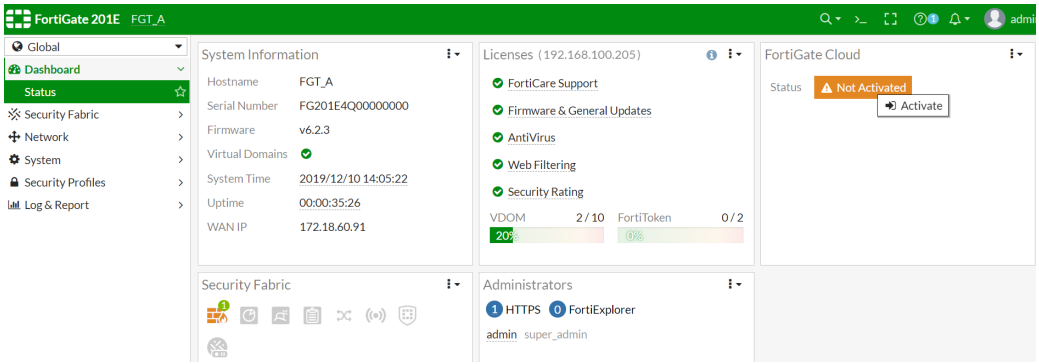
1. Go to *Dashboard* > *Status*.
2. In the FortiGate Cloud widget, click *Not Activated* > *Activate*.
   You must register with FortiCare before activating FortiGate Cloud.



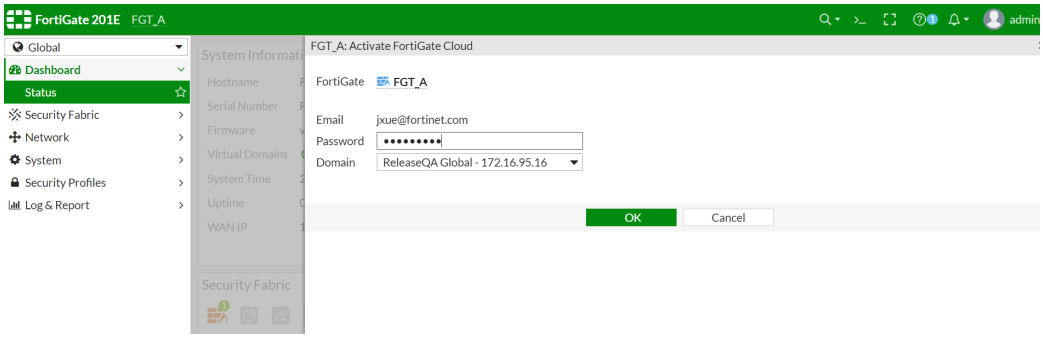
3. Enter your FortiCare *Email* address and *Password*.
4. Select your *Country/Region* and *Reseller*.
5. Enable *Sign in to FortiGate Cloud using the same account*.
6. Click *OK*.

To activate FortiGate Cloud on an already registered FortiGate:

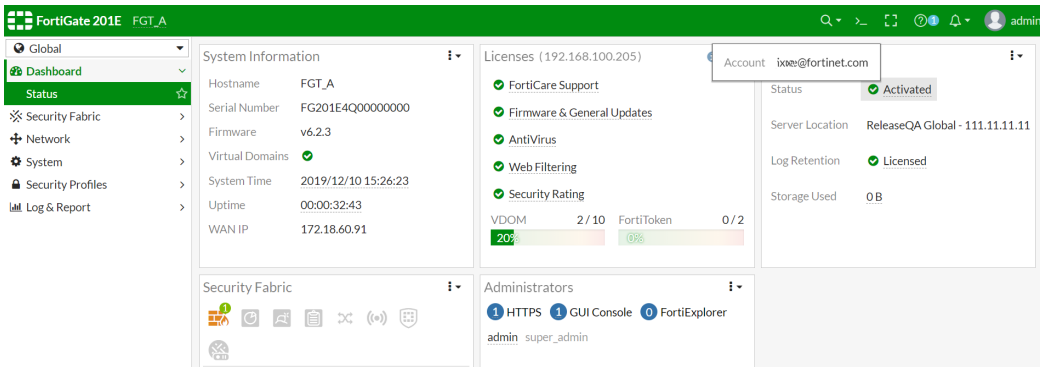
1. Go to *Dashboard* > *Status*.
2. In the FortiGate Cloud widget, click *Not Activated* > *Activate*.



3. Enter the password for the account that was used to register the FortiGate.

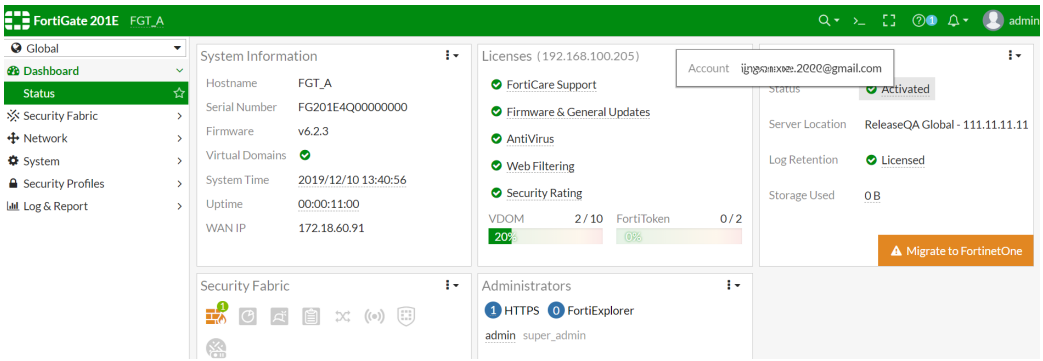


4. Click *OK*.
   The FortiGate Cloud widget now shows the FortiCloud account.

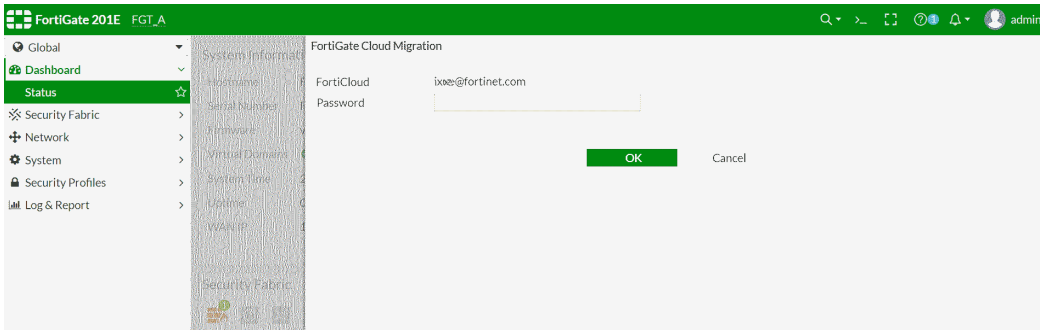


To migrate from the activated FortiGate Cloud account to the registered FortiCloud account:

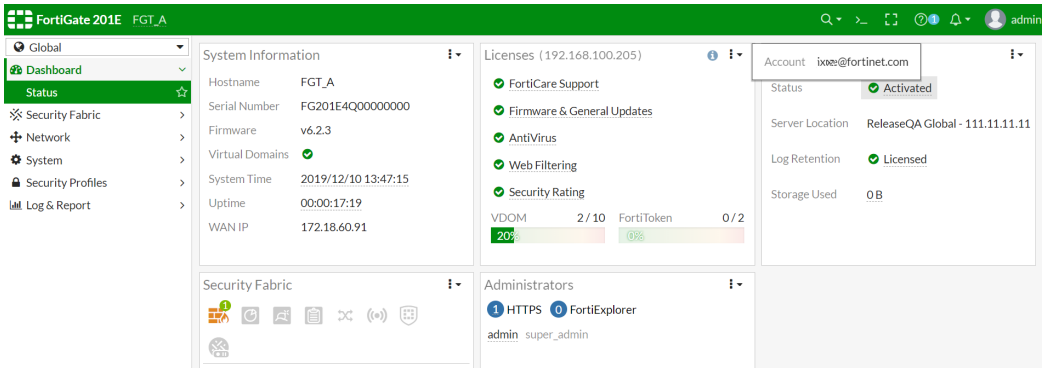
1. Go to *Dashboard* > *Status*.



2. In the FortiGate Cloud widget, click *Migrate to FortiCloud*.



3. Enter the password for the account that was used to register the FortiGate, then click *OK*.
The FortiGate Cloud widget now shows the FortiCloud account.



To activate FortiGate Cloud using an account that is not used for registration:

1. In the CLI, enter the following command:

```
execute fortiguard-log login <account_id> <password>
```

Where the <account_id> and <password> are the credentials for the account that you are using to activate FortiGate Cloud.

2. Check the account type with following command:

```
# diagnose fdsm contract-controller-update
Protocol=2.0|Response=202|Firmware=FAZ-4K-FW-2.50-
```

```
100|SerialNumber=FAMS000000000000|Persistent=false|ResponseItem=HomeServer:172.16.95.151
:443*AlterServer:172.16.95.151:443*Contract:20200408*NextRequest:86400*UploadConfig:Fals
e*ManagementMode:Local*ManagementID:737941253*AccountType:multitenancy

Result=Success
```

A FortiCloud account that is not used for the support portal account cannot be used to register FortiGate. Attempting to activate FortiGate Cloud with this type of account will fail.

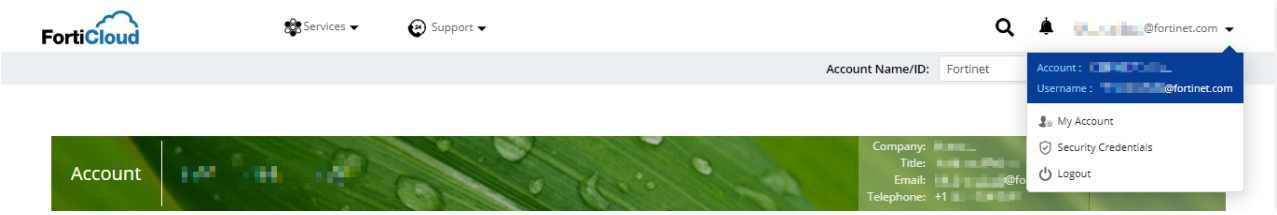
Transfer a device to another FortiCloud account

Master account users can transfer a device from one FortiCloud/FortiCare account to another. Users can transfer a device up to three times within a twelve-month time period. If more transfers are required within the twelve-month time period, contact Technical Support to request the transfer.

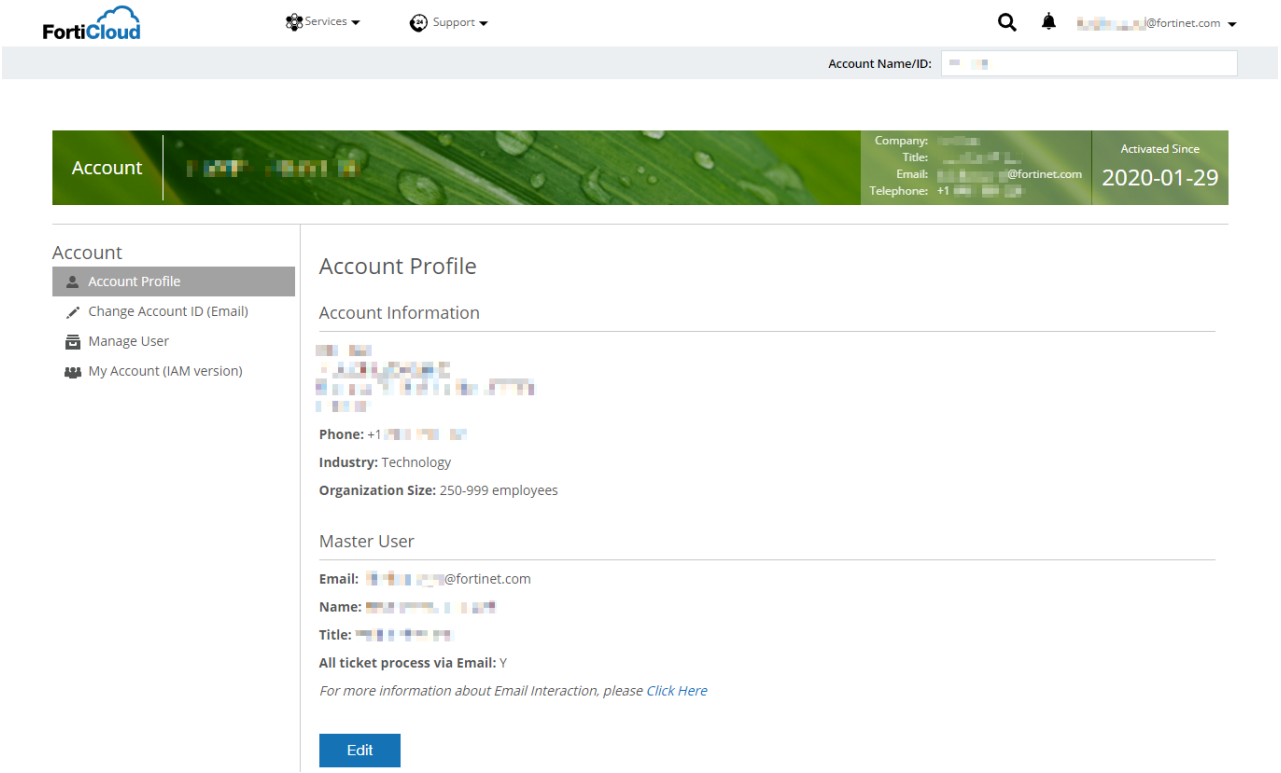
Requirements:

To transfer an account, you must:

- Have access to the FortiGate, as well as both the FortiCloud and FortiCare accounts.
- Be a master account user.
  To verify if you are the master account user, log in to support.fortinet.com. Click the username, then select *My Account*.



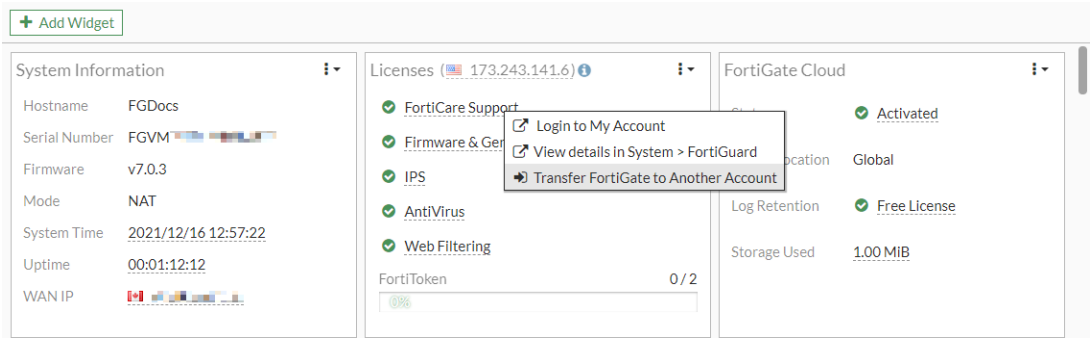
The *Account Profile* page opens.



To transfer an account in the GUI:

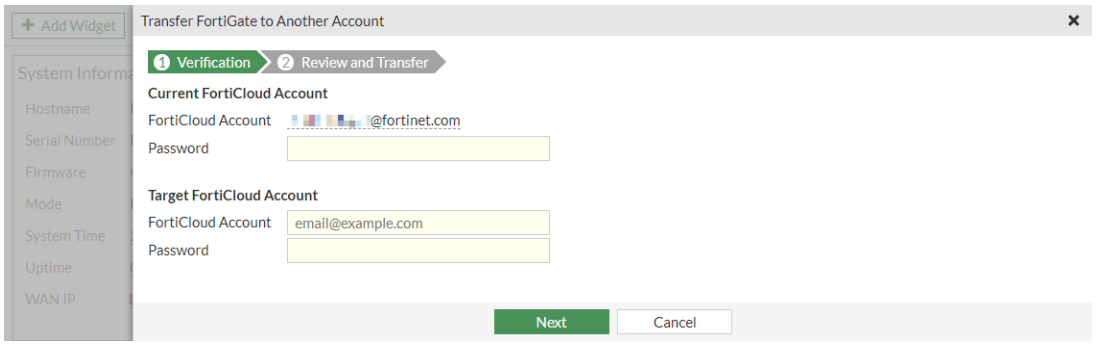
1. Go to *Dashboard* > *Status*.
2. In the *Licenses* widget, click the *FortiCare Support* link, then click *Transfer FortiGate to Another Account*.

You can also transfer an account from *System* > *FortiGuard*.

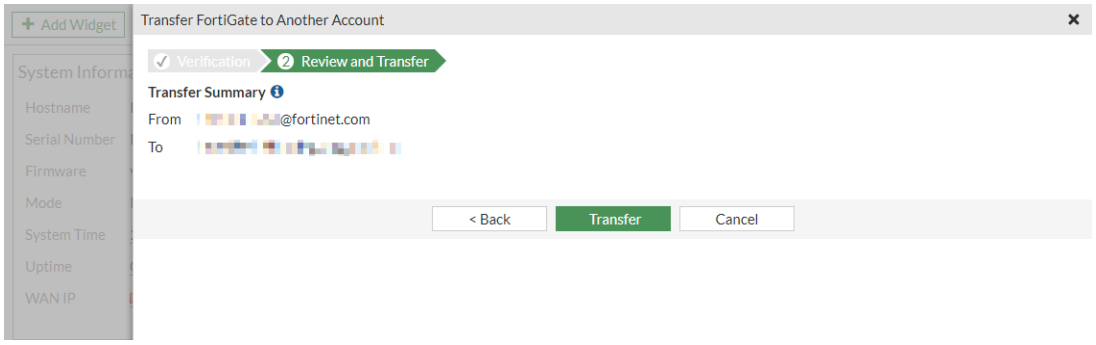


3. In the *Current FortiCloud Account* fields, enter the username and password for the current account. In the *Target FortiCloud Account* fields, enter the new username and password.

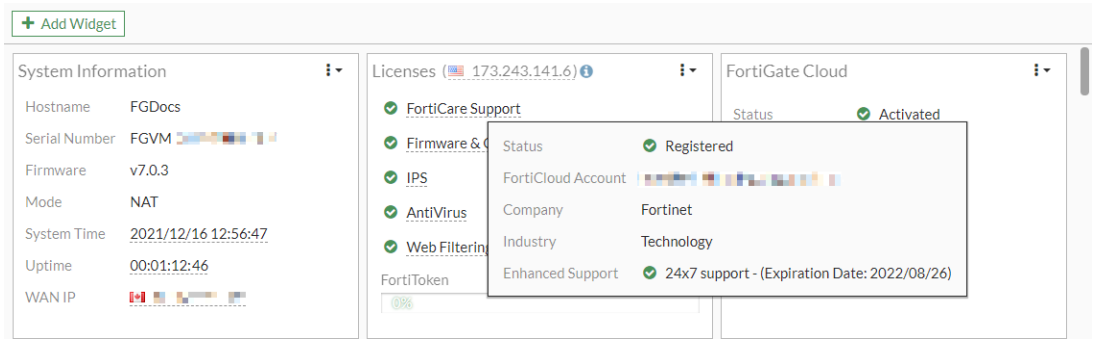
4. Click *Next*.



5. Review the information, then click *Transfer*.



After the transfer is complete, the new the FortiCloud account is displayed in the *Licenses* widget.



Configuration backups

Once you successfully configure the FortiGate, it is extremely important that you backup the configuration. In some cases, you may need to reset the FortiGate to factory defaults or perform a TFTP upload of the firmware, which will erase the existing configuration. In these instances, the configuration on the device will have to be recreated, unless a backup can be used to restore it. You should also backup the local certificates, as the unique SSL inspection CA and server certificates that are generated by your FortiGate by default are not saved in a system backup.

We also recommend that you backup the configuration after *any* changes are made, to ensure you have the most current configuration available. Also, backup the configuration before any upgrades of the FortiGate's firmware. Should anything happen to the configuration during the upgrade, you can easily restore the saved configuration.

Always backup the configuration and store it on the management computer or off-site. You have the option to save the configuration file to various locations including the local PC, USB key, FTP, and TFTP server. FTP and TFTP are only configurable through the CLI.

If you have VDOMs, you can back up the configuration of the entire FortiGate or only a specific VDOM. Note that if you are using FortiManager or FortiGate Cloud, full backups are performed and the option to backup individual VDOMs will not appear.

You can also backup and restore your configuration using Secure File Copy (SCP). See How to download/upload a FortiGate configuration file using secure file copy (SCP).

You enable SCP support using the following command:

```
config system global
   set admin-scp enable
end
```

For more information about this command and about SCP support, see config system global.

Backing up the configuration

To backup the configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration* > *Backup*.
2. Direct the backup to your *Local PC* or to a *USB Disk*.
   The *USB Disk* option will not be available if no USB drive is inserted in the USB port. You can also backup to the FortiManager using the CLI.
3. If VDOMs are enabled, indicate whether the scope of the backup is the entire FortiGate configuration (*Global*) or only a specific VDOM configuration (*VDOM*).
   If backing up a VDOM configuration, select the VDOM name from the list.
4. Enable *Encryption*. Encryption must be enabled on the backup file to back up VPN certificates.
5. Enter a password, and enter it again to confirm it. This password will be required to restore the configuration.
6. Click *OK*.
7. When prompted, select a location on the PC or USB disk to save the configuration file. The configuration file will have a .conf extension.

To backup the configuration using the CLI:

Use one of the following commands:

```
execute backup config management-station <comment>
```

or:

```
execute backup config usb <backup_filename> [<backup_password>]
```

or for FTP, note that port number, username are optional depending on the FTP site:

```
execute backup config ftp <backup_filename> <ftp_server> [<port>] [<user_name>]
     [<password>]
```

or for TFTP:

```
execute backup config tftp <backup_filename> <tftp_servers> <password>
```

Use the same commands to backup a VDOM configuration by first entering the commands:

```
config vdom
  edit <vdom_name>
```

The configuration can be backed up to and restored from both IPv4 and IPv6 FTP and TFTP servers.

Restoring a configuration

To restore the FortiGate configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration* > *Restore*.
2. Identify the source of the configuration file to be restored: your *Local PC* or a *USB Disk*.
   The *USB Disk* option will not be available if no USB drive is inserted in the USB port. You can restore from the FortiManager using the CLI.
3. Click Upload, locate the configuration file, and click *Open*.
4. Enter the password if required.
5. Click *OK*.

To restore the FortiGate configuration using the CLI:

```
execute restore config management-station normal 0
```

or:

```
execute restore config usb <filename> [<password>]
```

or for FTP, note that port number, username are optional depending on the FTP site:

```
execute restore config ftp <backup_filename> <ftp_server> [<port>] [<user_name>]
     [<password>]
```

or for TFTP:

```
execute restore config tftp <backup_filename> <tftp_server> <password>
```

The FortiGate will load the configuration file and restart. Once the restart has completed, verify that the configuration has been restored.

Troubleshooting

When restoring a configuration, errors may occur, but the solutions are usually straightforward.

Error message	Reason and Solution
Configuration file error	This error occurs when attempting to upload a configuration file that is incompatible with the device. This may be due to the configuration file being for a different model or being saved from a different version of firmware. **Solution**: Upload a configuration file that is for the correct model of FortiGate device and the correct version of the firmware.
Invalid password	When the configuration file is saved, it can be protected by a password. The password entered during the upload process is not matching the one associated with the configuration file. **Solution**: Use the correct password if the file is password protected.

Configuration revision

You can manage multiple versions of configuration files on models that have a 512MB flash memory and higher. Revision control requires either a configured central management server or the local hard drive, if your FortiGate has this feature. Typically, configuration backup to local drive is not available on lower-end models.

The central management server can either be a FortiManager unit or FortiGate Cloud.

If central management is not configured on your FortiGate unit, a message appears instructing you to either

- Enable central management, or
- Obtain a valid license.

When revision control is enabled on your FortiGate unit, and configuration backups have been made, a list of saved revisions of those backed-up configurations appears.

Configuration revisions are viewed by clicking on the user name in the upper right-hand corner of the screen and selecting *Configuration* > *Revisions*.

Backup and restore the local certificates

This procedure exports a server (local) certificate and private key together as a password protected PKCS12 file. The export file is created through a customer-supplied TFTP server. Ensure that your TFTP server is running and accessible to the FortiGate before you enter the command.

To back up the local certificates:

Connect to the CLI and use the following command:

```
execute vpn certificate local export tftp <cert_name> <filename> <tftp_ip>
```

where:

- `<cert_name>` is the name of the server certificate.
- `<filename>` is a name for the output file.
- `<tftp_ip>` is the IP address assigned to the TFTP server host interface.

To restore the local certificates using the GUI:

1. Move the output file from the TFTP server location to the management computer.
2. Go to *System* > *Certificates* and click *Import* > *Local*.
3. Select the certificate type, then click *Upload* in the *Certificate file* field.
4. On the management computer, browse to the file location, select it, and click *Open*.
5. If the *Type* is *Certificate*, upload the *Key file* as well.
6. If required, enter the *Password* that is required to upload the file or files.
7. Click *OK*.

To restore the local certificates using the CLI:

Connect to the CLI and use the following command:

```
execute vpn certificate local import tftp <filename> <tftp_ip>
```

Restore factory defaults

There may be a need to reset the FortiGate to its original defaults; for example, to begin with a fresh configuration. There are two options when restoring factory defaults. The first resets the entire device to the original out-of-the-box configuration.

You can reset the device with the following CLI command:

```
execute factoryreset
```

When prompted, type `y` to confirm the reset.

Alternatively, in the CLI you can reset the factory defaults but retain the interface and VDOM configuration with the following command:

```
execute factoryreset2
```

Troubleshooting your installation

If your FortiGate does not function as desired after installation, try the following troubleshooting tips:

1. **Check for equipment issues**
   Verify that all network equipment is powered on and operating as expected. Refer to the QuickStart Guide for information about connecting your FortiGate to the network.
2. **Check the physical network connections**
   Check the cables used for all physical connections to ensure that they are fully connected and do not appear damaged, and make sure that each cable connects to the correct device and the correct Ethernet port on that device.
3. **Verify that you can connect to the internal IP address of the FortiGate**
   Connect to the GUI from the FortiGate's internal interface by browsing to its IP address. From the PC, try to ping the internal interface IP address; for example, `ping 192.168.1.99`. If you cannot connect to the internal interface, verify the IP configuration of the PC. If you can ping the interface but can't connect to the GUI, check the settings for administrative access on that interface. Alternatively, use SSH to connect to the CLI, and then confirm that HTTPS has been enabled for Administrative Access on the interface.
4. **Check the FortiGate interface configurations**
   Check the configuration of the FortiGate interface connected to the internal network (under *Network* > *Interfaces*) and check that *Addressing mode* is set to the correct mode.
5. **Verify the security policy configuration**
   Go to *Policy & Objects* > *Firewall Policy* and verify that the internal interface to Internet-facing interface security policy has been added and is located near the top of the policy list. Check the *Active Sessions* column to ensure that traffic has been processed (if this column does not appear, right-click on the table header and select *Active Sessions*). If you are using NAT mode, check the configuration of the policy to make sure that *NAT* is enabled and that *Use Outgoing Interface Address* is selected.
6. **Verify the static routing configuration**
   Go to *Network* > *Static Routes* and verify that the default route is correct. Go to *Monitor* > *Routing Monitor* and verify that the default route appears in the list as a static route. Along with the default route, you should see two routes shown as *Connected*, one for each connected FortiGate interface.
7. **Verify that you can connect to the Internet-facing interface's IP address**
   Ping the IP address of the Internet-facing interface of your FortiGate. If you cannot connect to the interface, the FortiGate is not allowing sessions from the internal interface to Internet-facing interface. Verify that PING has been

enabled for *Administrative Access* on the interface.

8. **Verify that you can connect to the gateway provided by your ISP**
   Ping the default gateway IP address from a PC on the internal network. If you cannot reach the gateway, contact your ISP to verify that you are using the correct gateway.
9. **Verify that you can communicate from the FortiGate to the Internet**
   Access the FortiGate CLI and use the command `execute ping 8.8.8.8`. You can also use the `execute traceroute 8.8.8.8` command to troubleshoot connectivity to the Internet.
10. **Verify the DNS configurations of the FortiGate and the PCs**
    Check for DNS errors by pinging or using traceroute to connect to a domain name; for example: `ping www.fortinet.com`.

    If the name cannot be resolved, the FortiGate or PC cannot connect to a DNS server and you should confirm that the DNS server IP addresses are present and correct.
11. **Confirm that the FortiGate can connect to the FortiGuard network**
    Once the FortiGate is on your network, you should confirm that it can reach the FortiGuard network. First, check the *License Information* widget to make sure that the status of all FortiGuard services matches the services that you have purchased. Go to *System* > *FortiGuard*, and, in the Filtering section, click *Test Connectivity*. After a minute, the GUI should indicate a successful connection. Verify that your FortiGate can resolve and reach FortiGuard at `service.fortiguard.net` by pinging the domain name. If you can reach this service, you can then verify the connection to FortiGuard servers by running the command `diagnose debug rating`. This displays a list of FortiGuard IP gateways you can connect to, as well as the following information:
    - `Weight`: Based on the difference in time zone between the FortiGate and this server
    - `RTT`: Return trip time
    - `Flags`: D (IP returned from DNS), I (Contract server contacted), T (being timed), F (failed)
    - `TZ`: Server time zone
    - `Curr Lost`: Current number of consecutive lost packets
    - `Total Lost`: Total number of lost packets
12. **Consider changing the MAC address of your external interface**
    Some ISPs do not want the MAC address of the device connecting to their network cable to change. If you have added a FortiGate to your network, you may have to change the MAC address of the Internet-facing interface using the following CLI command:

```
config system interface
   edit <interface>
      set macaddr <xx:xx:xx:xx:xx:xx>
   end
end
```

13. **Check the FortiGate bridge table (transparent mode)**
    When a FortiGate is in transparent mode, the unit acts like a bridge sending all incoming traffic out on the other interfaces. The bridge is between interfaces on the FortiGate unit. Each bridge listed is a link between interfaces. Where traffic is flowing between interfaces, you expect to find bridges listed. If you are having connectivity issues and there are no bridges listed, that is a likely cause. Check for the MAC address of the interface or device in question. To list the existing bridge instances on the FortiGate, use the following CLI command:

```
diagnose netlink brctl name host root.b
show bridge control interface root.b host.
fdb: size=2048, used=25, num=25, depth=1
Bridge root.b host table
port no device devname mac addr ttl attributes
3 4 wan1 00:09:0f:cb:c2:77 88
3 4 wan1 00:26:2d:24:b7:d3 0
3 4 wan1 00:13:72:38:72:21 98
4 3 internal 00:1a:a0:2f:bc:c6 6
```

```
1 6 dmz 00:09:0f:dc:90:69 0 Local Static
3 4 wan1 c4:2c:03:0d:3a:38 81
3 4 wan1 00:09:0f:15:05:46 89
3 4 wan1 c4:2c:03:1d:1b:10 0
2 5 wan2 00:09:0f:dc:90:68 0 Local Static
```

14. **Use FortiExplorer if you can't connect to the FortiGate over Ethernet**
    If you can't connect to the FortiGate GUI or CLI, you may be able to connect using FortiExplorer. Refer to the QuickStart Guide or see the section on FortiExplorer for more details.
15. **Either reset the FortiGate to factory defaults or contact Fortinet Support for assistance**
    To reset the FortiGate to factory defaults, use the CLI command `execute factoryreset`. When prompted, type `y` to confirm the reset.

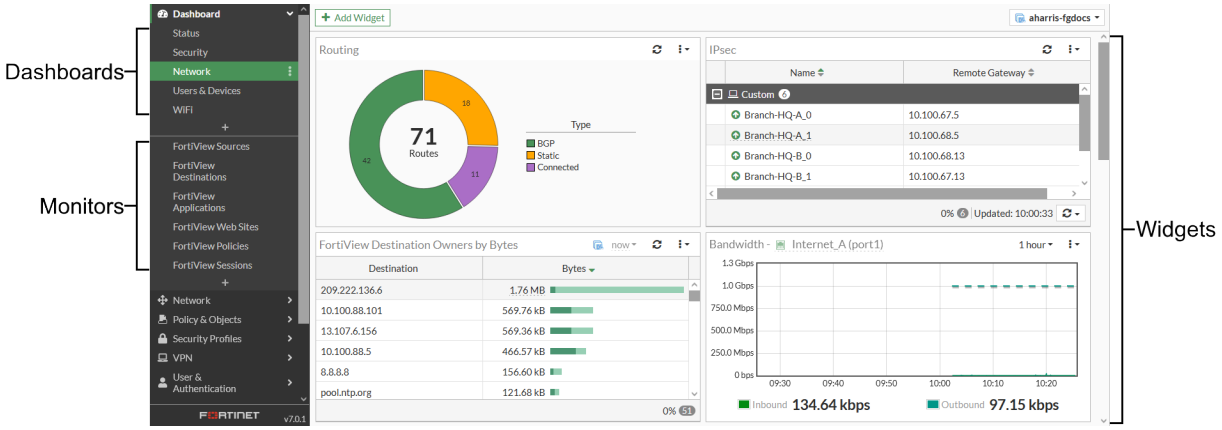
If you require further assistance, visit the Fortinet Support website.

Dashboards and Monitors

FortiOS includes predefined dashboards so administrators can easily monitor device inventory, security threats, traffic, and network health. You can customize the appearance of a default dashboard to display data pertinent to your Security Fabric or combine widgets to create custom dashboards. Many dashboards also allow you to switch views between fabric devices.

Each dashboard contains a set of widgets that allow you to view drilldown data and take actions to prevent threats. Use widgets to perform tasks such as viewing device inventory, creating and deleting DHCP reservations, and disconnecting dial-up users. You can add or remove widgets in a dashboard or save a widget as a standalone monitor.

Monitors display information in both text and visual format. Use monitors to change views, search for items, view drilldown information, or perform actions such as quarantining an IP address. FortiView monitors for the top categories are located below the dashboards. All of the available widgets can be added to the tree menu as a monitor.

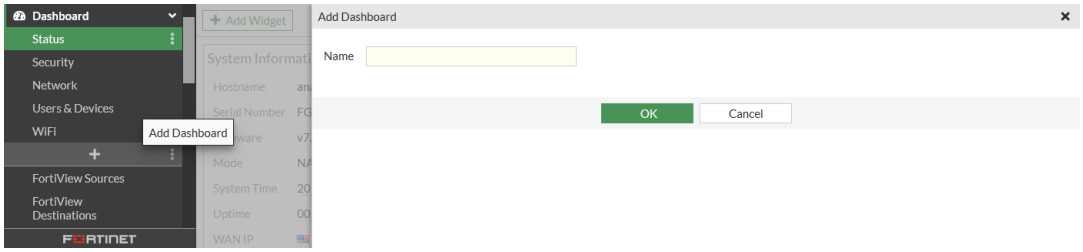


Using dashboards

You can combine widgets to create custom dashboards. You can also use the dropdown in the tree menu to switch to another device in the Security Fabric.

To create a new dashboard:

1. Under *Dashboard*, click the *Add Dashboard* button. The *Add Dashboard* window opens.



2. Enter a name in the *Name* field and click *OK*. The new dashboard opens.

To add a widget to a dashboard:

1. In the tree menu, select a dashboard.
2. In the banner, click *Add Widget*. The *Add Dashboard Widget* pane opens.
3. Click the *Add* button next to the widget. You can use the *Search* field to search for a widget. Enable *Show More* to view more widgets in a category.
4. Configure the widget settings, then click *Add Widget*.
5. Click *Close*.
6. (Optional) Click and drag the widget to the desired location in the dashboard.

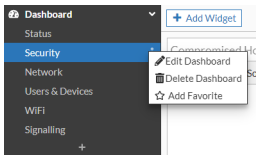
To edit a dashboard:

1. Click the *Actions* menu next to the dashboard and select*Edit Dashboard*.

2. Edit the dashboard and click *OK*.

To delete a dashboard:

1. Click the *Actions* menu next to the dashboard and select *Delete Dashboard*.

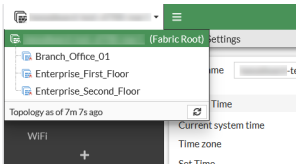


2. Click *Delete Dashboard* . The *Confirm* dialog opens.
3. *Click OK.*

You cannot delete the *Status* dashboard.

To switch to another device in the Security Fabric:

1. In the tree menu, click the device name and select a fabric device from dropdown.

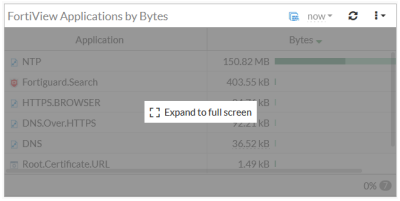


Using widgets

You can convert a widget to a standalone monitor, change the view type, configure tables, and filter data.

To save a dashboard widget as a monitor:

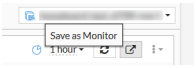
1. Hover over the widget and click *Expand to full screen*.



Full screen mode is not supported in all widgets.

---

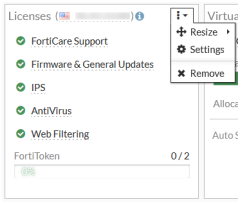
2. In the widget, click *Save as Monitor*. The *Add Monitor* window opens.



3. (Optional) Enter a new name for the monitor in the *Name* field.
4. Click *OK*.

To view the widget settings:

1. Click the menu dropdown at the right side of the widget and select *Settings*.



2. Configure the widget settings and click *OK*.

The settings will vary depending on the widget.

To configure a table in the widget:

1. Hover over the left side of the table header and click *Configure Table*.

2. Configure the table options:

Option	Description
Best Fit All Columns	Resizes all of the columns in a table to fit their content.
Reset Table	Resets the table to the default view.
Select Columns	Adds or removes columns from the view.

3. Click *Apply*.

To filter or configure a column in a table:

1. Hover over a column heading, and click *Filter/Configure Column*.

2. Configure the column options.

Option	Description
Resize to Contents	Resizes the column to fit the content.
Group by this Column	Groups the table rows by the contents in the selected column.

3. Click *Apply*.
4. To filter a column, enter a value in the *Filter* field, and click *Apply*.

Filtering is not supported in all widgets.

Widgets

Dashboards are created per VDOM when VDOM mode is enabled.For information about VDOM mode, see Virtual Domains on page 1447.

Some dashboards and widgets are not available in Multi-VDOM mode.

The following table lists the available widgets in VDOM mode:

Category	Widgets
FortiView	• FortiView Application Bandwidth FortiView

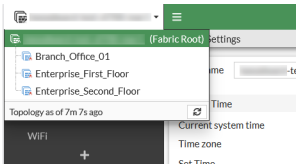
Category	Widgets
	• Applications FortiView Cloud Applications • FortiView Destination Interfaces FortiView • Destination Owners FortiView Destinations • FortiView Policies FortiView Sessions • FortiView Source Interfaces FortiView • Sources FortiView VPN FortiView Web • Categories FortiView Countries/Regions • FortiView Destination Firewall Objects • FortiView Interface Pairs FortiView Search • Phrases FortiView Servers FortiView Source • Firewall Objects FortiView Sources - WAN • FortiView Traffic Shaping
Security Fabric	• Fabric Device • FortiGate Cloud • Security Fabric Status
Network	• DHCP • Interface Bandwidth • IP Pool Utilization • IPsec • Routing • SD-WAN • SSL-VPN • Top IP Pools by Assigned IPs  The *Interface Bandwidth* widget can monitor a maximum of 25 interfaces.
System	• Administrators • Botnet Activity • HA Status • License Status • System Information • Top System Events • Virtual Machine
Resource Usage	• CPU Usage • Disk Usage • Log Rate Memory Usage • Session Rate • Sessions
Security	• Advanced Threat Protection Statistics • Compromised Hosts

Category	Widgets
	• FortiClient Detected Vulnerabilities • GTP Tunnel Rate • GTP Tunnels • Host Scan Summary • Quarantine • Top Endpoint Vulnerabilities • Top Failed Authentication • Top FortiSandbox Files • Top Threats • Top Threats - WAN
User & Authentication	• Device Inventory • Firewall Users • FortiClient • FortiGuard Quota • FortiSwitch NAC VLANs • Top Admin Logins • Top Vulnerable Endpoint Devices • Top Cloud Users
WiFi	• Channel Utilization • Clients By FortiAP • FortiAP Status • Historical Clients • Interfering SSIDs • Login Failures • Rogue APs • Signal Strength • Top WiFi Clients

Viewing device dashboards in the Security Fabric

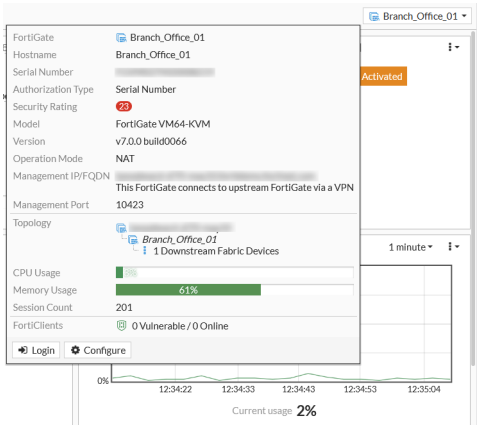
Use the device dropdown to view the dashboards in downstream fabric devices. You can also create dedicated device dashboards or log in and configure fabric devices.

To view the dashboards in fabric devices, click the device dropdown at the left side of the page, and select a device from the list.



The device dropdown is available in the *Status*, *Security*, *Network*, *Users & Devices*, and *WiFi* dashboards. You can also enable the dropdown when you create a dashboard.

To log in to or configure a fabric device, hover over the device name until the device dialog opens and then select *Login* or *Configure*.

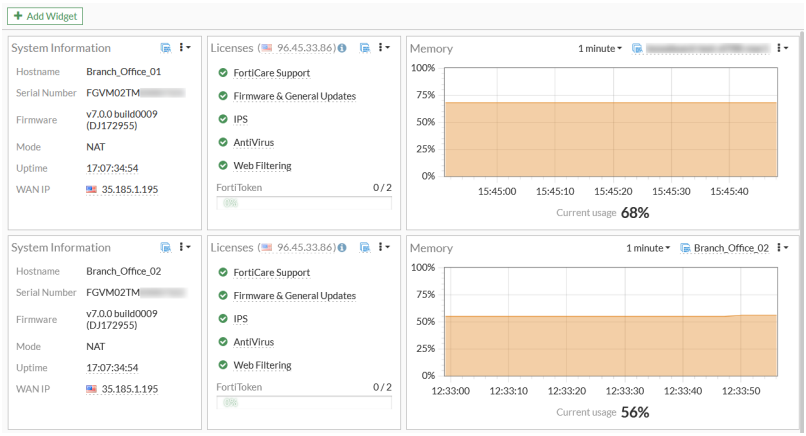


Creating a fabric system and license dashboard

Create a dashboard summary page to monitor all the fabric devices in a single view. You can use this dashboard to monitor aspects of the devices such as system information, VPN and routing.

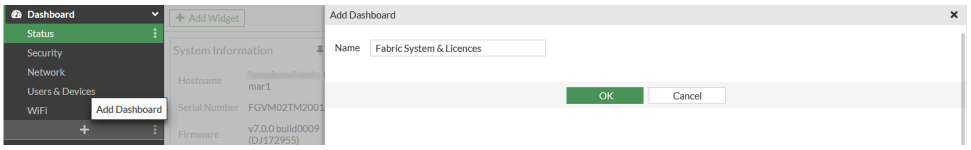
Example

The following image is an example of a *Fabric System & License* dashboard to monitor the *System Information*, *Licenses*, and *Memory* usage for *Branch_Office_01* and *Branch_Office_02*.

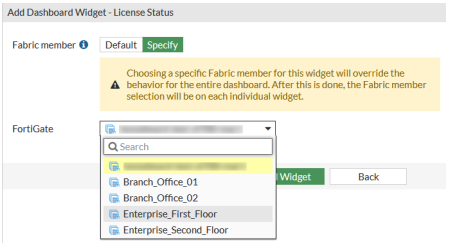


To create a system dashboard:

1. Click the *Add Dashboard* button. The *Add Dashboard* window opens.



2. In the *Name* field, enter a name such as *Fabric System & Licenses*, and click *OK*. The new dashboard appears.
3. In the banner, click *Add Widget*. The *Add Dashboard Widget* window opens. You can use the *Search* field to search for a specific widget (for example, *License Status*, *System Information*, and *Memory Usage*).
4. Click the *Add* button next to widget. The *Add Dashboard Widget* window opens.
5. In the *Fabric member* area, select *Specify* and select a device in the Security Fabric.



6. Click *Add Widget*. The widget is added to the dashboard.
   Repeat this step for all the devices you want to view in the dashboard.
7. (Optional) Arrange the widgets in the dashboard by fabric device.

Dashboards

A dashboard is a collection of widgets that show the status of your devices, network, and Security Fabric at a glance. Widgets are condensed monitors that display a summary of the key details about your FortiGate pertaining to routing, VPN, DHCP, devices, users, quarantine, and wireless connections.

The following dashboards are included in the dashboard templates:

Dashboard	Default Template	Use these widgets to:
Status	• Comprehensive • Optimal	• View the device serial number, licenses, and administrators • View the status of devices in the security fabric • Monitor CPU and Memory usage • Monitor IPv4 and IPv6 sessions • View VMs and Cloud devices
Security	• Optimal	• View compromised hosts and host scan summary • View top threats and vulnerabilities
Network	• Optimal	• Monitor DHCP clients • Monitor IPsec VPN connections • Monitor current routing table • Monitor SD-WAN status • Monitor SSL-VPN connections

Dashboard	Default Template	Use these widgets to:
Users & Devices	• Optimal	• View users and devices connected to the network • Identify threats from individual users and devices • View FortiGuard and FortiClient data • Monitor traffic bandwidth over time
WiFi	• Comprehensive • Optimal	• View FortiAP status, channel utilization, and clients • View login failures and signal strength • View the number of WiFi clients

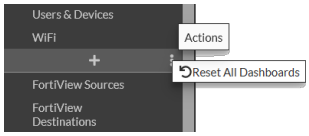
Resetting the default dashboard template

You can use the GUI to change the default dashboard template. The *Optimal* template contains a set of popular default dashboards and FortiView monitors. The *Comprehensive* template contains a set of default dashboards as well as all of the FortiView monitors.

Resetting the default template will delete any custom dashboards and monitors, and reset the widget settings.

To reset all dashboards:

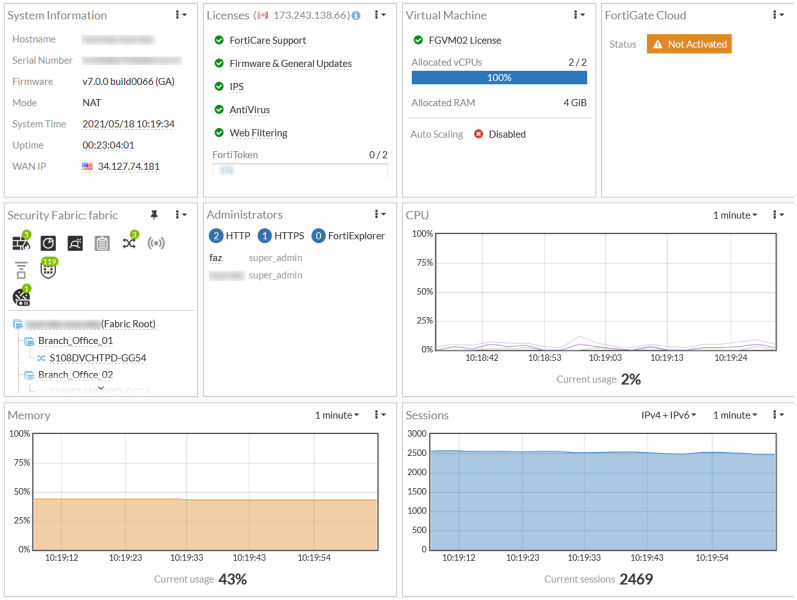
1. Click the *Actions* menu next to *Add Dashboard* or *Add Monitor* and click *Reset All Dashboards*. The *Dashboard Setup* window opens.



2. Select *Optimal* or *Comprehensive* and click *OK*.

Status dashboard

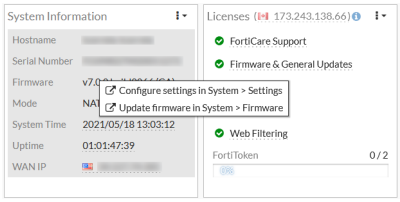
The *Status* dashboard provides an overview of your FortiGate device and the devices in your Security Fabric. If your FortiGate is a Virtual Machine, information about the Virtual Machine is also displayed in the dashboard.



Updating system information

The *System Information* widget contains links to the *Settings* module where you can update the *System Time*, *Uptime*, *and WAN IP*.

A notification will appear in the *Firmware* field when a new version of FortiOS is released. Click *Update firmware in System > Firmware* to view the available versions and update FortiOS.



Viewing fabric devices

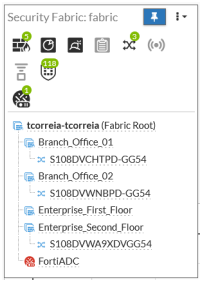
The *Security Fabric* widget provides a visual overview of the devices connected to the fabric and their connection status. Hover of a device icon to view more information about the device.

Click a device in the fabric to:

- View the device in the physical or logical topology
- Register, configure, deauthorize, or log in to the device
- Open *Diagnostics and Tools*
- View the *FortiClient Monitor*

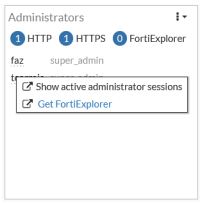
These options will vary depending on the device.

Click *Expand & Pin hidden content* to view all the devices in the fabric at once.



Viewing administrators

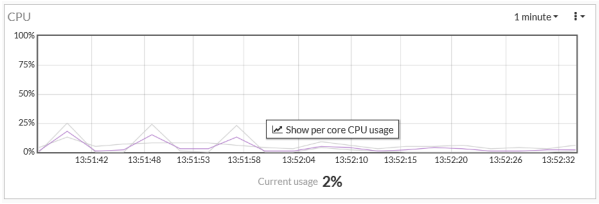
The *Administrators* widget displays the active administrators and their access interface. Click the username to view the *Active Administrator Sessions* monitor. You can use the monitor to end an administrator's session.



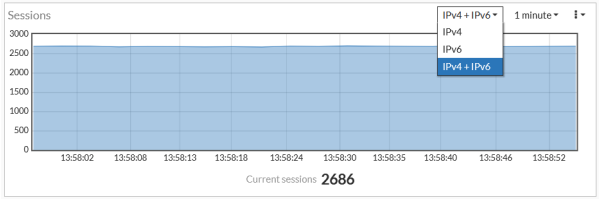
Resource widgets

The resource widgets show the current usage statistics for *CPU*, *Memory*, and *Sessions*.

Click the *CPU* monitor to show the per core CPU usage.



You can switch between *IPv4*, *IPv6*, or *IPv4+IPv6* in the *Sessions* monitor.



Security dashboard

The widgets in the *Security* dashboard provide a snapshot of the current threats and vulnerabilities targeting your Security Fabric.

The *Security* dashboard contains the following widgets:

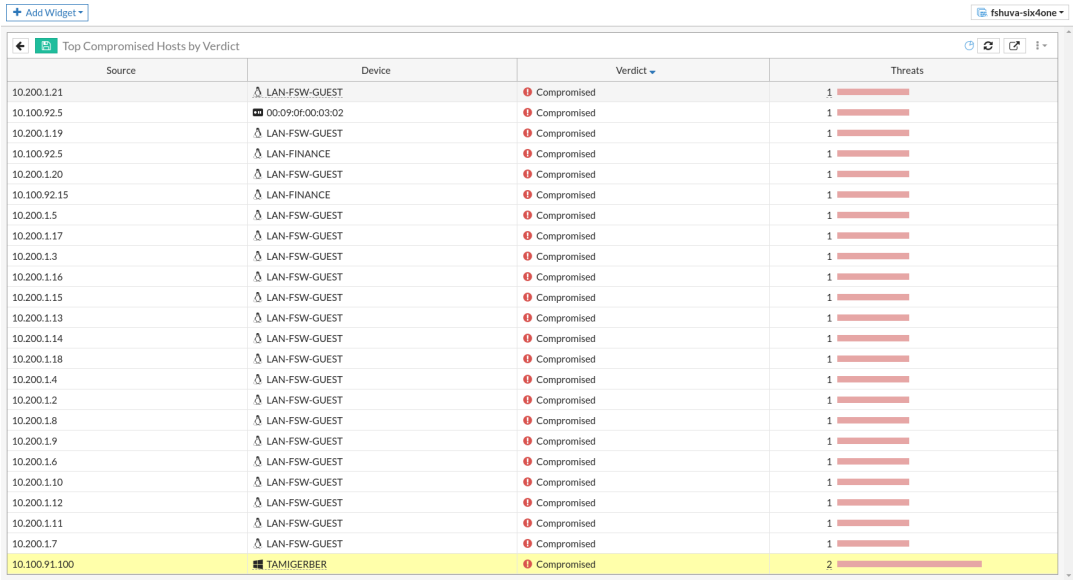
Widget	Description
Compromised Hosts by Verdict	Shows the session information for a compromised host. See Viewing session information for a compromised host on page 73.
Top Threats by Threat Level	Shows the top traffic sessions aggregated by threat. You can expand the widget to view drilldown information about the *Threat*, *Threat Category*, *Threat Level*, *Threat Score* and *Sessions*.
FortiClient Detected Vulnerablities	Shows a summary of vulnerabilities detected by FortiClient. FortiClient must be enabled.
Host Scan Summary	Shows a summary of hosts scanned. Hover over a color in the chart to view the number of hosts by category. Click the chart to view the *FortiClient Monitor* or *Device Inventory* monitor.
Top Vulnerable Endpoint Devices by Detected Vulnerabilities	Shows a summary devices aggregated by vulnerabilities. Expand the widget to view drilldown information about the *Device*, *Source* and *Detected Vulnerablities*.

Viewing session information for a compromised host

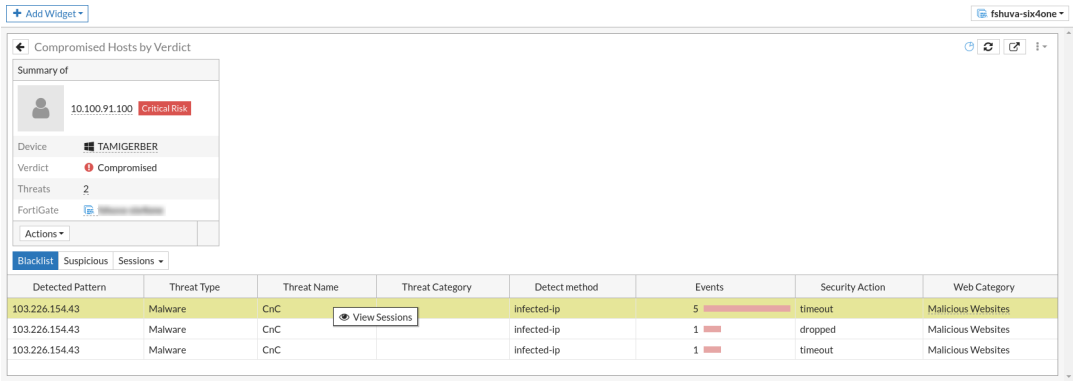
You can use the *Compromised Hosts by Verdict* widget to view the session information for a compromised host.

To view session information for a compromised host in the GUI:

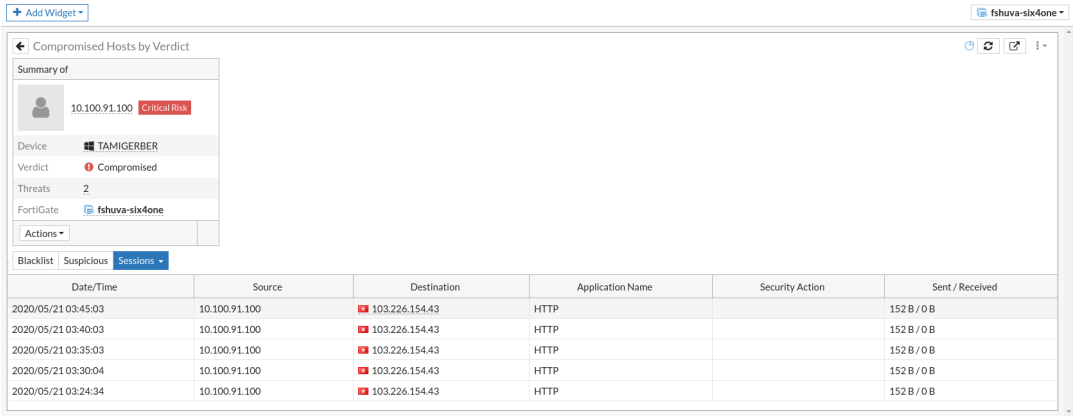
1. Go to *Dashboard* > *Security* and expand the *Compromised Hosts by Verdict* widget.



2. Double-click a compromised host to view the session information. You can also right-click a compromised host, and select *View Sessions*.



3. Double-click a session, or right-click the session and select *View Sessions* to view the information.



Network dashboard

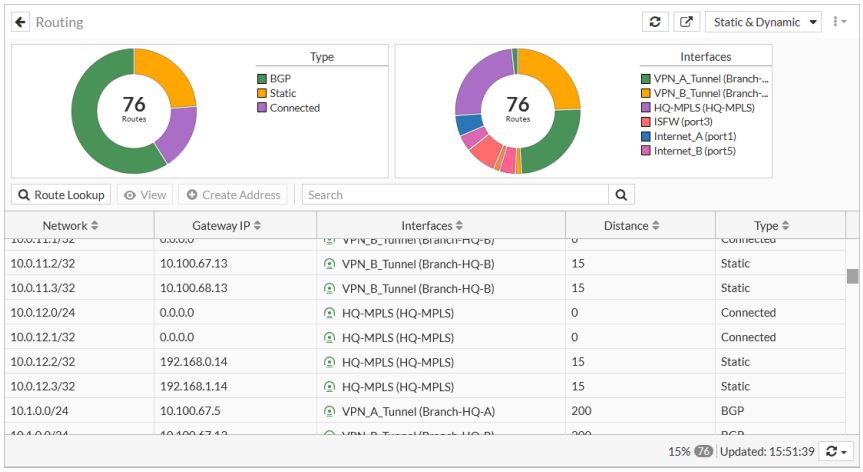
The widgets in the Network dashboard show information related to networking for this FortiGate and other devices connected to your Security Fabric. Use this dashboard to monitor the status of Routing, DHCP, SD-WAN, IPsec and SSL VPN tunnels. All of the widgets in the *Network* dashboard can be expanded to full screen and saved as a monitor.

The *Network* dashboard contains the following widgets:

Widget	Description
Static & Dynamic Routing	Shows the static and dynamic routes currently active in your routing table. The widget also includes policy routes, BGP neighbors and paths, and OSPF neighbors. See Static & Dynamic Routing monitor on page 75.
DHCP	Shows the addresses leased out by FortiGate's DHCP servers. See DHCP monitor on page 78.
SD-WAN	Shows a summary of the SD-WAN status.
IPsec	Shows the connection statuses of your IPsec VPN site to site and dial-up tunnels. See IPsec monitor on page 79.
SSL-VPN	Shows a summary of remote active users and the connection mode. See SSL-VPN monitor on page 81.

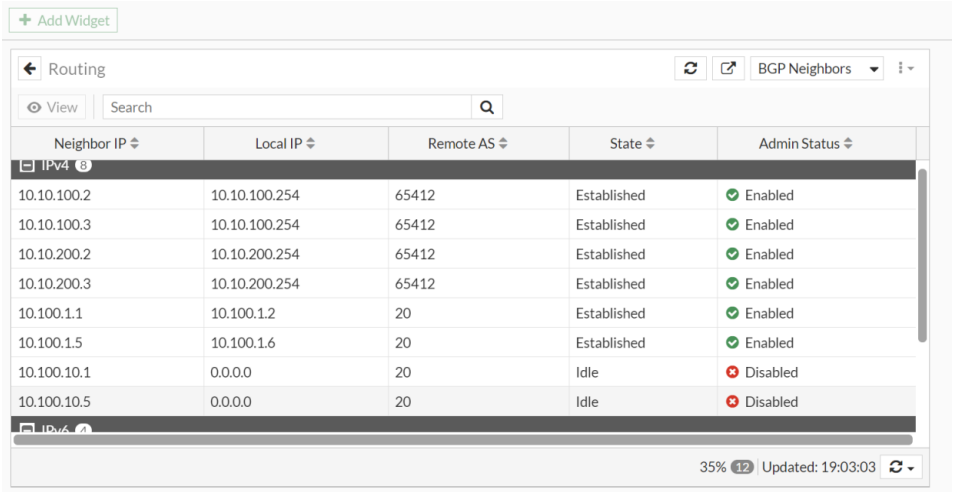
Static & Dynamic Routing monitor

The *Static & Dynamic Routing Monitor* displays the routing table on the FortiGate, including all static and dynamic routing protocols in IPv4 and IPv6. You can also use this monitor to view policy routes, BGP neighbors and paths, and OSPF neighbors..

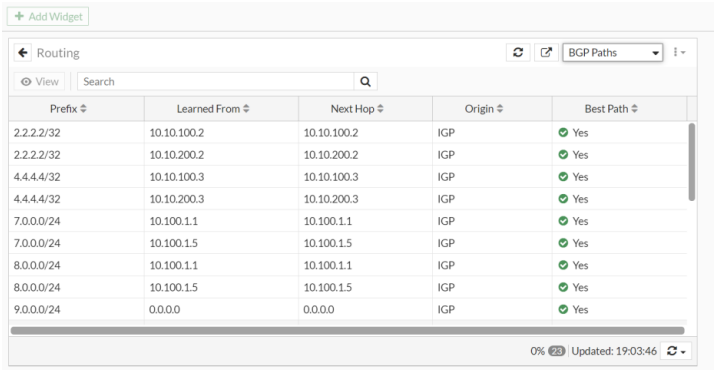


To view the routing monitor in the GUI:

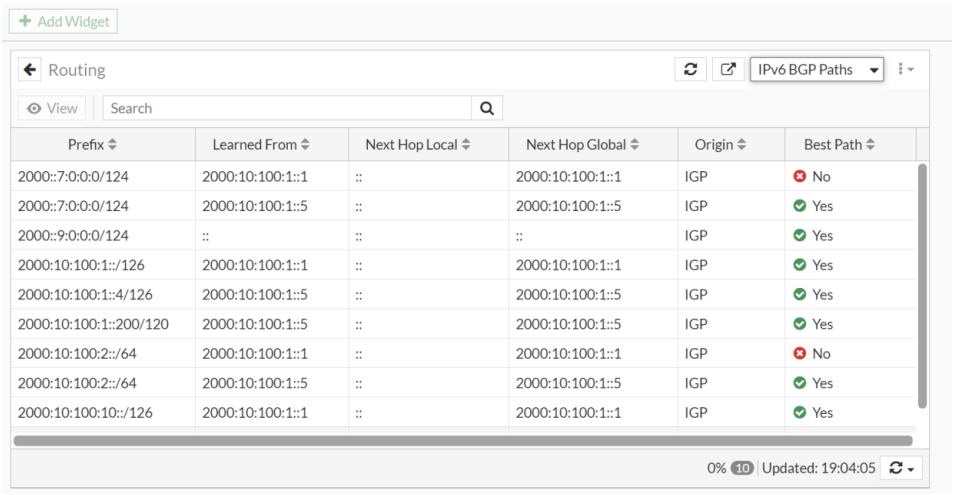
1. Go to *Dashboard* > *Network*.
2. Hover over the *Routing* widget, and click *Expand to Full Screen*. The *Routing* monitor is displayed.
3. To view neighbors and paths, click the monitors dropdown at the top of the page.
   BGP Neighbors



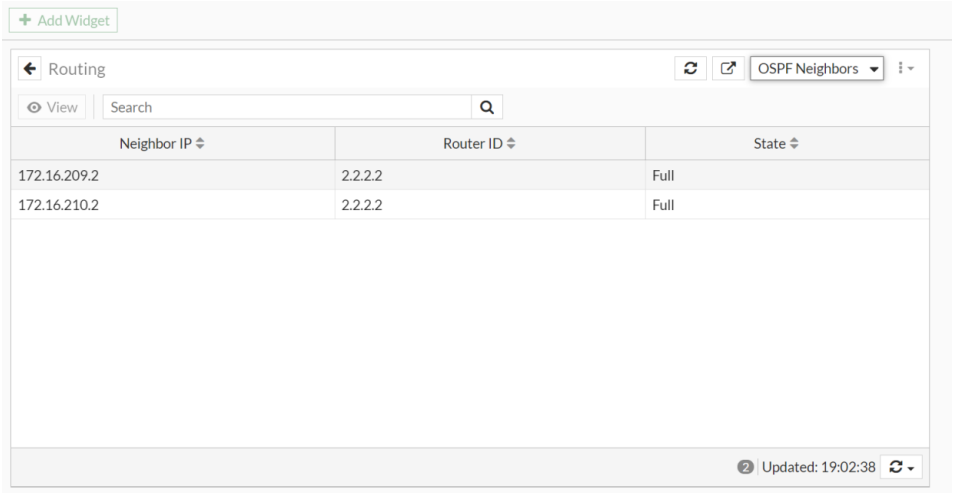
BGP Paths



IPv6 BGP Paths



OSPF Neighbors



4. To filter the *Interfaces* and *Type* columns:
   a. Click the *Static & Dynamic* tab.
   b. Hover over the column heading, and click the *Filter/Configure Column* icon.

   c. Click *Group By This Column*, then click *Apply*.

5. (Optional) Click *Save as Monitor* to save the widget as monitor.

To look up a route in the GUI:

1. Click *Route Lookup*.
2. Enter an IP address in the *Destination* field, then click *Search*. The matching route is highlighted on the *Routing* monitor.

To view the routing table in the CLI:

```
# get route info routing-table all
```

Sample output:

```
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default

Routing table for VRF=0
S* 0.0.0.0/0 [1/0] via 10.0.10.1, To-HQ-A
[1/0] via 10.0.12.1, To-HQ-MPLS
[1/0] via 10.10.11.1, To-HQ-B
[1/0] via 10.100.67.1, port1
[1/0] via 10.100.67.9, port2
C 10.0.10.0/24 is directly connected, To-HQ-A
C 10.0.10.2/32 is directly connected, To-HQ-A
C 10.0.11.0/24 is directly connected, To-HQ-B
C 10.0.11.2/32 is directly connected, To-HQ-B
C 10.0.12.0/24 is directly connected, To-HQ-MPLS

C 10.1.0.2/32 is directly connected, port3
C 10.1.0.3/32 is directly connected, port3
C 10.1.100.0/24 is directly connected, vsw.port6
```

To look up a firewall route in the CLI:

```
# diagnose firewall proute list
```

Sample output:

```
list route policy info(vf=root):

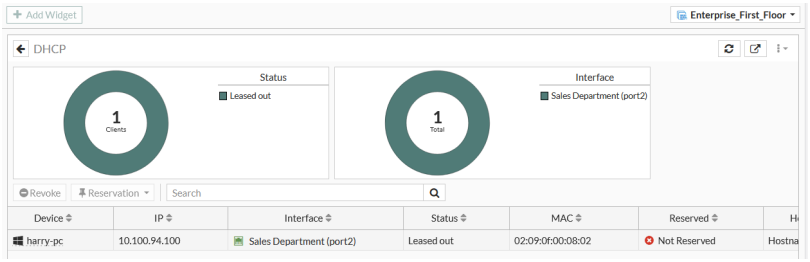
To view neighbors and paths
```

DHCP monitor

The DHCP monitor shows all the addresses leased out by FortiGate's DHCP servers. You can use the monitor to revoke an address for a device, or create, edit, and delete address reservations.



To view the DHCP monitor:

1. Go to *Dashboard* > *Network*.
2. Hover over the *DHCP* widget, and click *Expand to Full Screen*.

To filter or configure a column in the table, hover over the column heading and click *Filter/Configure Column*.

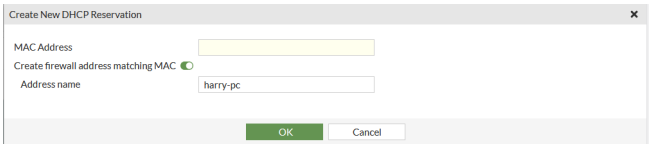
To revoke a lease:

1. Select a device in the table.
2. In the toolbar, click *Revoke*, or right-click the device, and click *Revoke Lease(s)*. The *Confirm* page is displayed.
3. Click *OK*.

A confirmation window opens only if there is an associated address reservation. If there is no address, the lease will be removed immediately upon clicking *Revoke*.

To create a DHCP reservation:

1. Select a server in the table.
2. In the toolbar, click *Reservation*, or right-click the device and click *Create DHCP Reservation*. The *Create New DHCP Reservation* page is displayed.
3. Configure the DHCP reservation settings.



4. Click *OK*.

To view top sources by bytes:

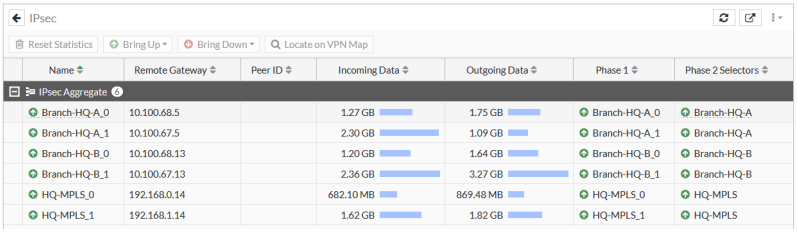
1. Right-click a device in the table and click *Show in FortiView*. The *FortiView Sources by Bytes* widget is displayed.

To view the DHCP lease list in the CLI:

```
# execute dhcp lease-list
```

IPsec monitor

The IPsec monitor displays all connected Site to Site VPN and Dial-up VPNs. You can use the monitor to bring a phase 2 tunnel up or down or disconnect dial-up users. A notification appears in the monitor when users have not enabled two-factor authentication.



To view the IPsec monitor in the GUI:

1. Go to *Dashboard* > *Network*.
2. Hover over the *IPsec* widget, and click *Expand to Full Screen*. A warning appears when an unauthenticated user is detected.

To filter or configure a column in the table, hover over the column heading and click *Filter/Configure Column*.

3. Hover over a record in the table. A tooltip displays the *Phase 1* and *Phase 2* interfaces. A warning appears next to a user who has not enabled two-factor authentication.

To reset statistics:

1. Select a tunnel in the table.
2. In the toolbar, click *Reset Statistics* or right-click the tunnel, and click *Reset Statistics*. The *Confirm* dialog is displayed.
3. Click *OK*.

To bring a tunnel up:

1. Select a tunnel in the table.
2. Click *Bring Up*, or right-click the tunnel, and click *Bring Up*. The *Confirm* dialog is displayed.
3. Click *OK*.

To bring a tunnel down:

1. Select a tunnel in the table.
2. Click *Bring Down*, or right-click the tunnel, and click *Bring Down*. The *Confirm* dialog is displayed.
3. Click *OK*.

To locate a tunnel on the VPN Map:

1. Select a tunnel in the table.
2. Click *Locate on VPN Map*, or right-click the tunnel, and click *Locate on VPN Map*. The *VPN Location Map* is displayed.

To view the IPsec monitor in the CLI:

```
# diagnose vpn tunnel list
```

Sample output:

```
list all ipsec tunnel in vd 0
------------------------------------------------------
name=fct-dialup ver=1 serial=4 10.100.67.5:0->0.0.0.0:0 dst_mtu=0

```

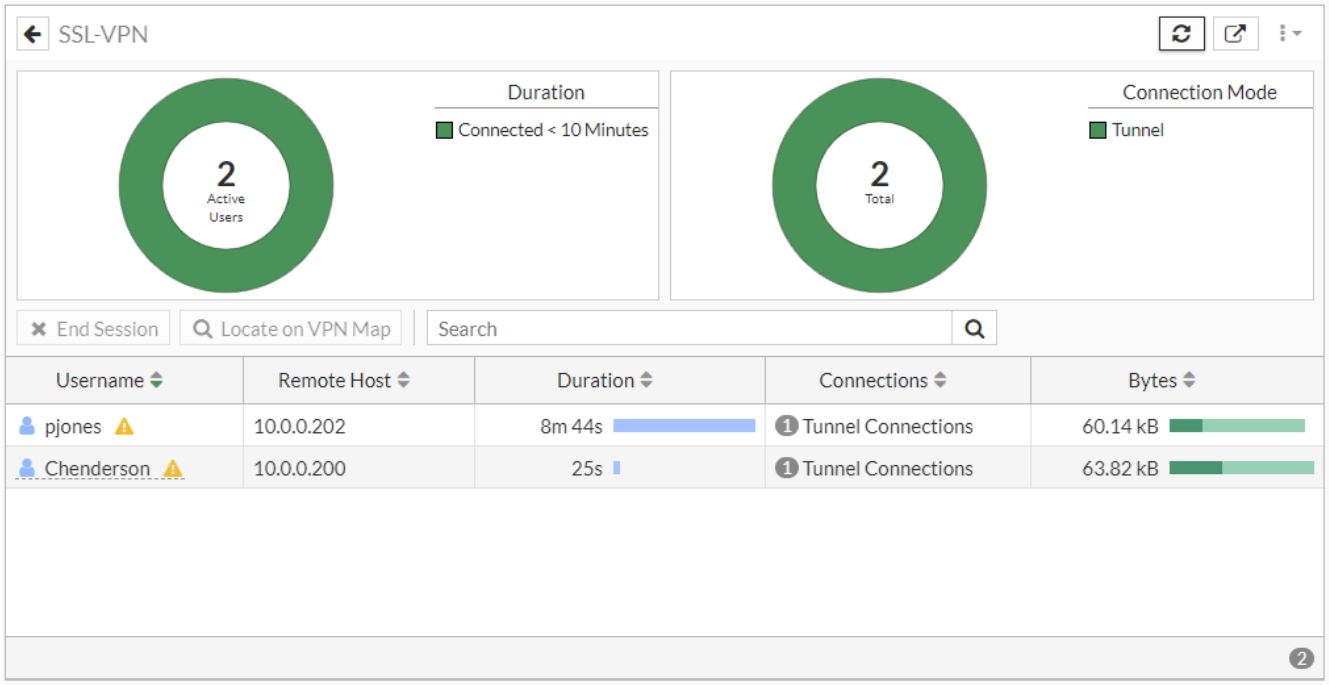
SSL-VPN monitor

The SSL-VPN monitor displays remote user logins and active connections. You can use the monitor to disconnect a specific connection. The monitor will notify you when VPN users have not enabled two-factor authentication.



To view the SSL-VPN monitor in the GUI:

1. Go *Dashboard* > *Network*.
2. Hover over the *SSL-VPN* widget, and click *Expand to Full Screen*.The *Duration* and *Connection Summary* charts are displayed at the top of the monitor.

To filter or configure a column in the table, hover over the column heading and click *Filter/Configure Column*.

To disconnect a user:

1. Select a user in the table.
2. In the table, right-click the user, and click *End Session*. The Confirm window opens.
3. Click *OK*.

To monitor SSL-VPN users in the CLI:

```
# get vpn ssl monitor
```

Sample output

```
SSL VPN Login Users:
Index User Group Auth Type Timeout From HTTP in/out HTTPS in/out
0 amitchell TAC 1(1) 296 10.100.64.101 3838502/11077721 0/0
1 mmiles Dev 1(1) 292 10.100.64.101 4302506/11167442 0/0

SSL VPN sessions:
Index User Group Source IP Duration I/O Bytes Tunnel/Dest IP
```

Users & Devices

The *Users & Devices* dashboard shows the current status of users and devices connected to your network. All of the widgets can be expanded to view as monitor. In monitor view, you can create firewall addresses, deauthenticate a user, or remove a device from the network.

The *User & Devices* dashboard contains the following widgets:

Widget	Description
Device Inventory	Shows a summary of the hardware and software that is connected to the network. See Device inventory on page 82.
FortiClient	Shows a summary of the FortiClient endpoints.
Firewall Users	Shows a summary of the users logged into the network.
Quarantine	Shows a summary of quarantined devices.
FortiSwitch NAC VLANs	Shows a summary of VLANs assigned to devices by FortiSwitch NAC policies.

Device inventory

You can enable device detection to allow FortiOS to monitor your networks and gather information about devices operating on those networks, including:

- MAC address
- IP address
- Operating system
- Hostname
- Username
- When FortiOS detected the device and on which interface

You can enable device detection separately on each interface in *Network* > *Interfaces*.

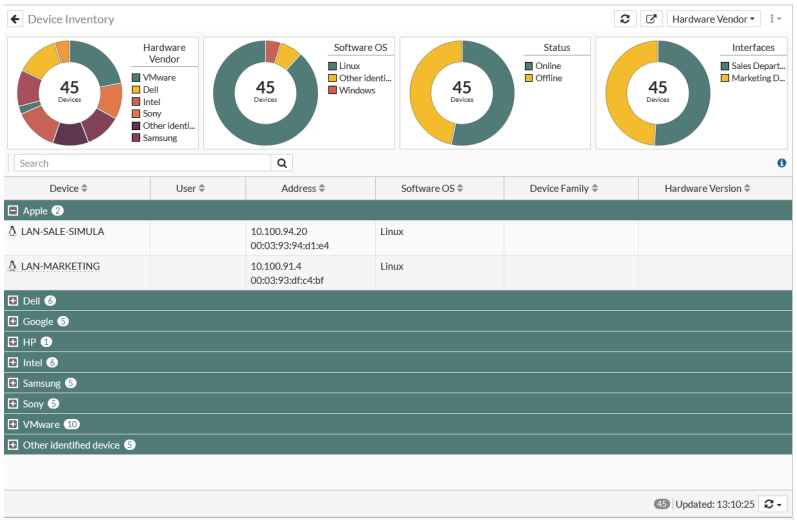
Device detection is intended for devices directly connected to your LAN and DMZ ports. The widget is only available when your *Interface Role* is *LAN*, *DMZ* or *Undefined*. It is not available when the role is WAN.

You can also manually add devices to Device Inventory to ensure that a device with multiple interfaces displays as a single device.

To view the device inventory monitor:

1. Go to *Dashboard* > *Users & Devices*.
   If you are using the Comprehensive dashboard template, go to *Dashboard* > *Device Inventory Monitor*. See .
2. Hover over the *Device Inventory* widget, and click *Expand to Full Screen*. The *Device Inventory* monitor is displayed.

To filter or configure a column in the table, hover over the column heading, and click *Filter/Configure Column*. See Device inventory and filtering on page 83.



Device inventory and filtering

The *Device Inventory* widget contains a series of summary charts that provide an overview of the hardware, operating system, status, and interfaces. You can use these clickable charts to simplify filtering among your devices.

To view the device inventory and apply a filter:

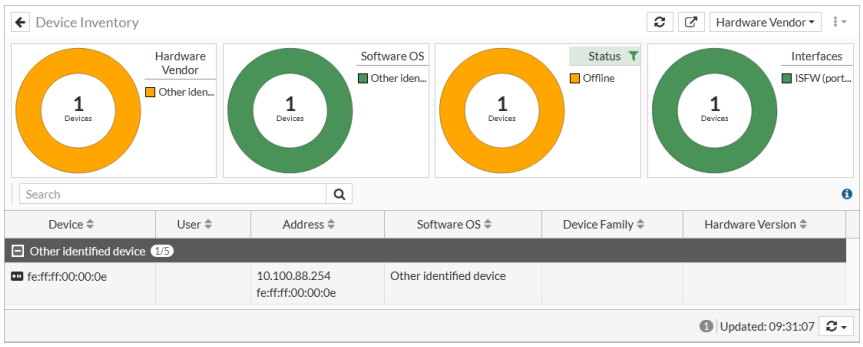
1. Go to *Dashboard* > *Users & Devices*.
   If you are using the Comprehensive dashboard template, go to *Dashboard* > *Device Inventory Monitor*. See .
2. Hover over the *Device Inventory* widget, and click *Expand to Full Screen*. The *Device Inventory* monitor is displayed.
3. To filter the order of the charts by operating system, click the dropdown in the top menu bar and select *Software OS*.
4. To filter a chart, click an item in the legend or chart area. The table displays the filter results.
5. To combine filters, hover over a column heading and click *Filter/Configure Column*.

6. Click the filter icon in the top-right corner of the chart to remove the filter.

Filter examples

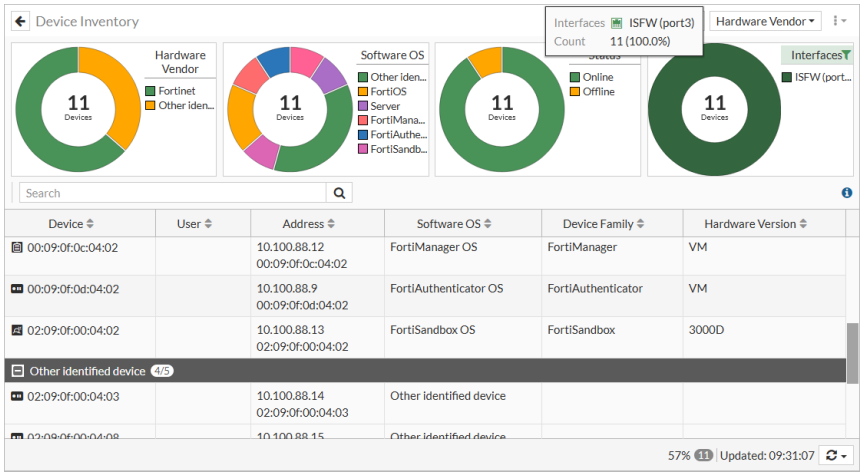
To filter all offline devices:

1. In the *Status* chart, click *Offline* in the legend or on the chart itself.



To filter all devices discovered on port3:

1. In the *Interfaces* chart, click *port3*.



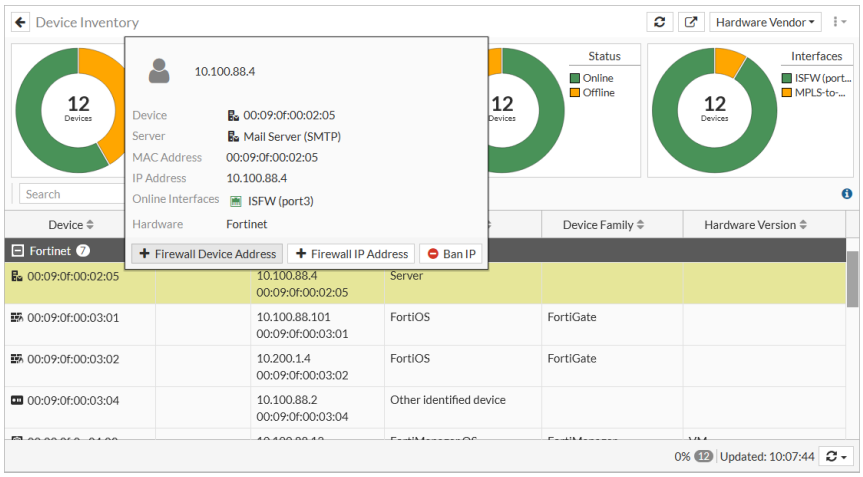
Adding MAC-based addresses to devices

Assets detected by device detection appear in the *Device Inventory* widget. You can manage policies around devices by adding a new device object (MAC-based address) to a device. Once you add the MAC-based address, the device can be used in address groups or directly in policies.

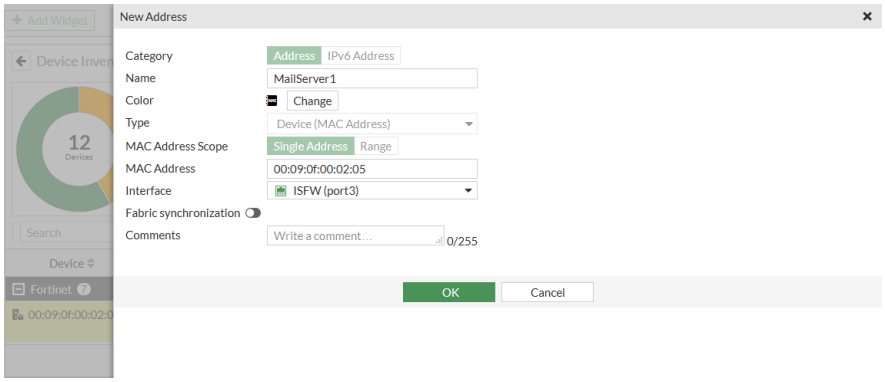
To add a MAC-based address to a device:

1. Go to *Dashboard* > *Users & Devices*.
   If you are using the Comprehensive dashboard template, go to *Dashboard* > *Device Inventory Monitor*. See .
2. Hover over the *Device Inventory* widget, and click *Expand to Full Screen*. The *Device Inventory* monitor is displayed.

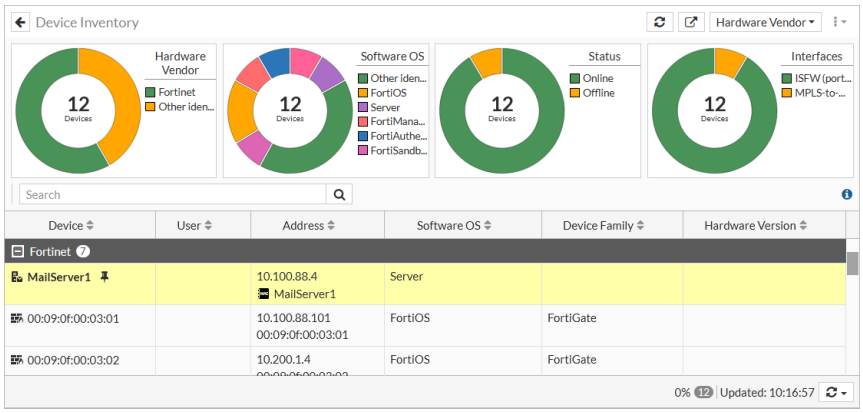
3. Click a device, then click *Firewall Device Address*. The *New Address* dialog is displayed.



4. In the *Name* field, give the device a descriptive name so that it is easy to in the *Device* column.
5. Configure the *MAC Address*.

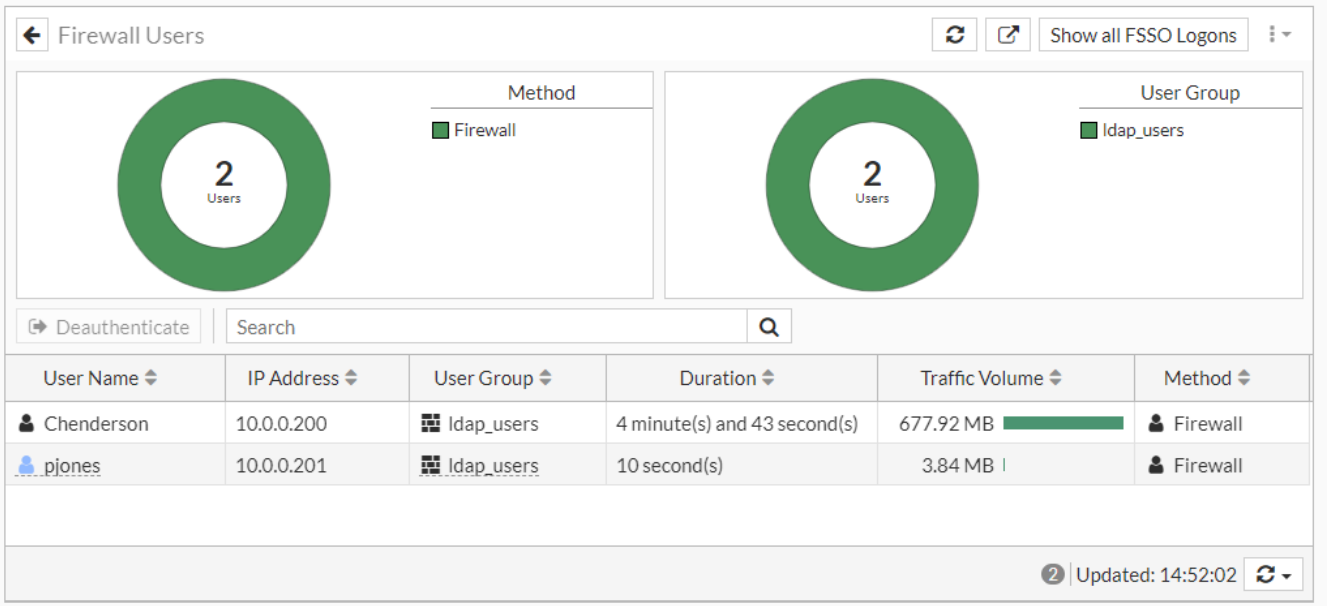


6. Click *OK*, then refresh the page. The MAC address icon appears in the *Address* column next to the device name.



Firewall Users monitor

The Firewall Users monitor displays all firewall users currently logged in. You can use the monitor to diagnose user-related logons or to highlight and deauthenticate a user.



To view the firewall monitor:

1. Go to *Dashboard* > *Users & Devices*.
   If you are using the Comprehensive dashboard template, go to *Dashboard* > *Firewall User Monitor*. See .
2. Hover over the *Firewall Users* widget, and click *Expand to Full Screen*.
3. To show FSSO logons, click *Show all FSSO Logons* at the top right of the page.

To filter or configure a column in the table, hover over the column heading and click *Filter/Configure Column*.

To deauthenticate a user:

1. Go to *Dashboard* > *Users & Devices*.
2. Hover over the *Firewall Users* widget, and click *Expand to Full Screen*.
3. (Optional) Use the *Search* field to search for a specific user.
4. In the toolbar, click *Deauthenticate*, or right-click the user, and click *Deauthenticate*. The *Confirm* dialog is displayed.
5. Click *OK*.

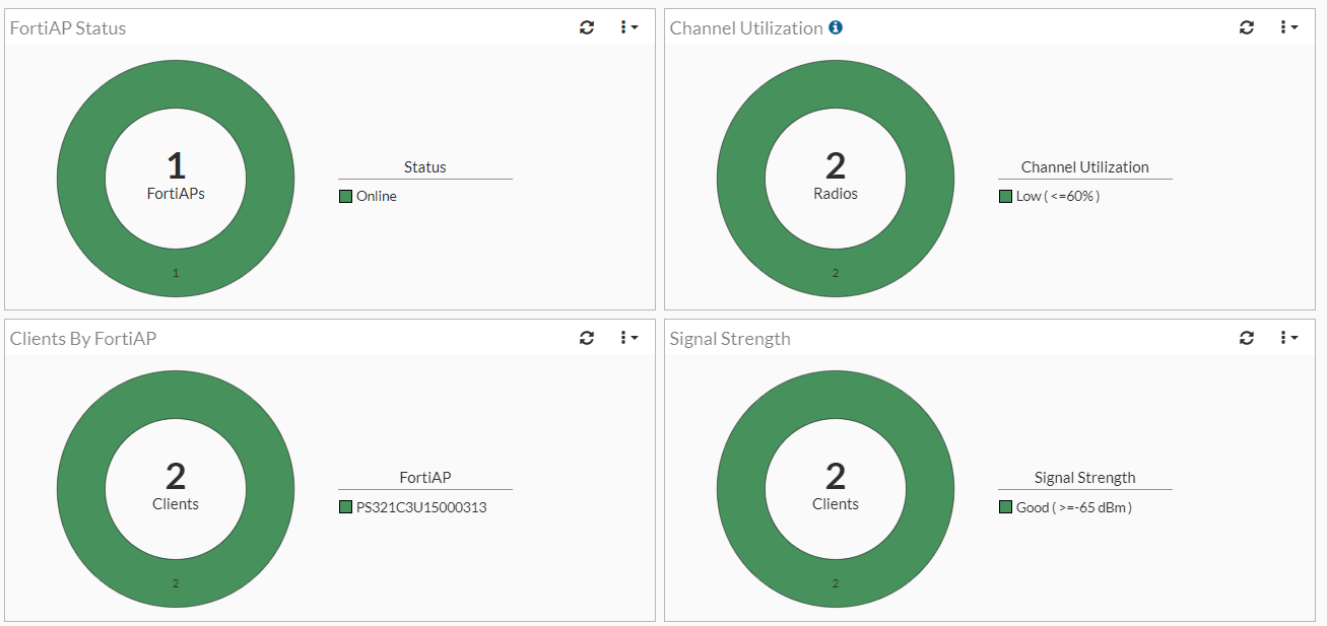
To view firewall users in the CLI:

```
# diagnose firewall auth list
```

WiFi dashboard

The *WiFi* dashboard provides an overview of your WiFi network's performance, including FortiAP status, channel utilization, WiFi clients and associated information, login failures, and signal strength.

To access the WiFi dashboard, go to *Dashboard* > *WiFi*.



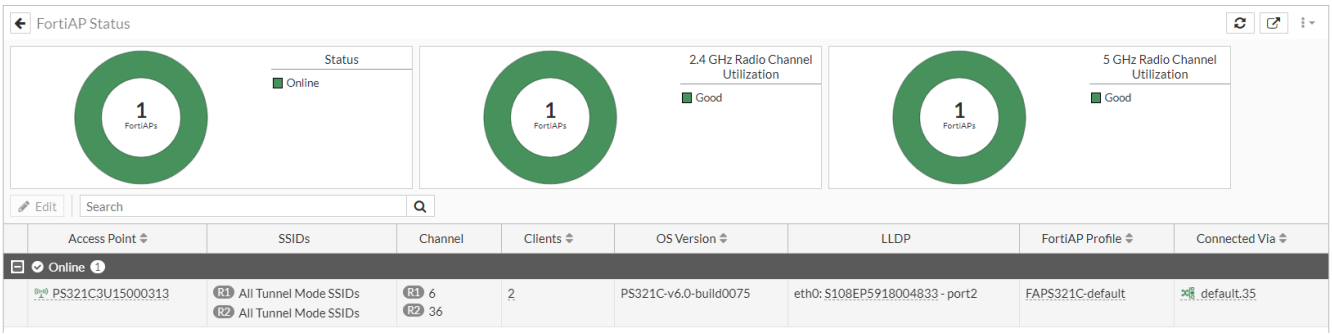
The WiFi dashboard can be customized per your requirements. To learn more about using and modifying dashboards and widgets, see Dashboards and Monitors on page 62.

This section describes the following monitors available for the WiFi Dashboard:

- FortiAP Status monitor on page 87
- Clients by FortiAP monitor on page 89

FortiAP Status monitor

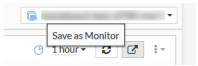
The *FortiAP Status* monitor displays the status and the channel utilization of the radios of FortiAP devices connected to a FortiGate. It also provides access to tools to diagnose and analyze connected APs.



To view the *FortiAP Status* monitor:

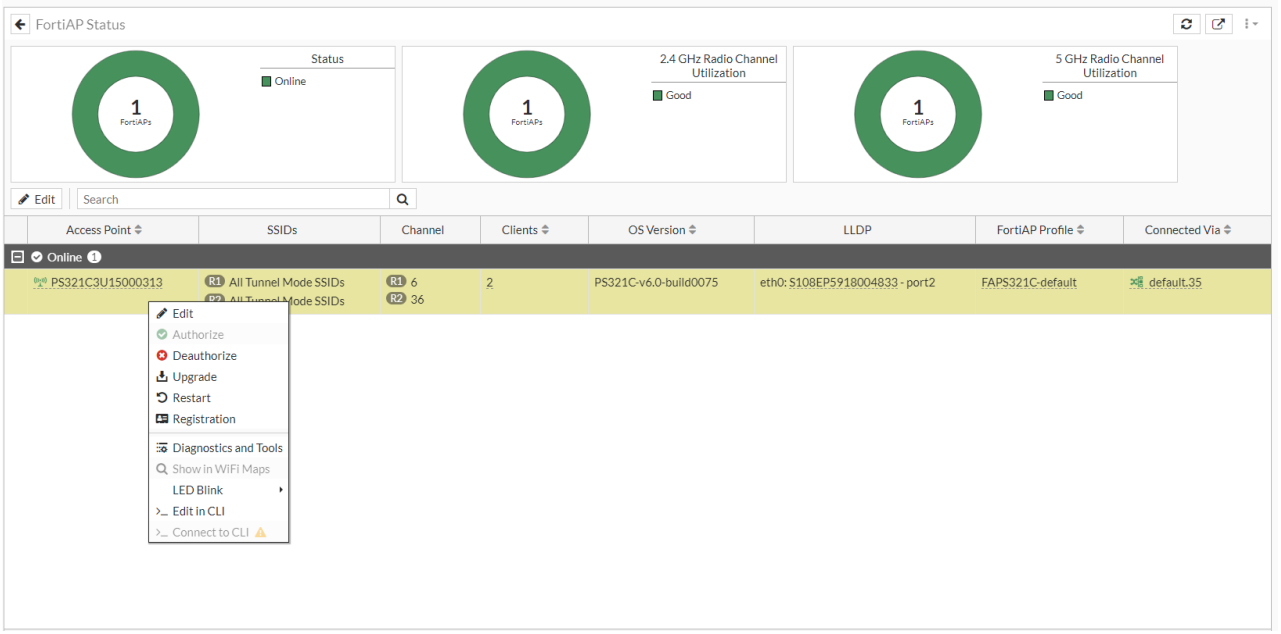
1. Go to *Dashboard* > *WiFi*.
2. Hover over the *FortiAP Status* widget, and click *Expand to Full Screen*. The *FortiAP Status* monitor opens.

3. (Optional) Click *Save as Monitor* to save the widget as monitor.

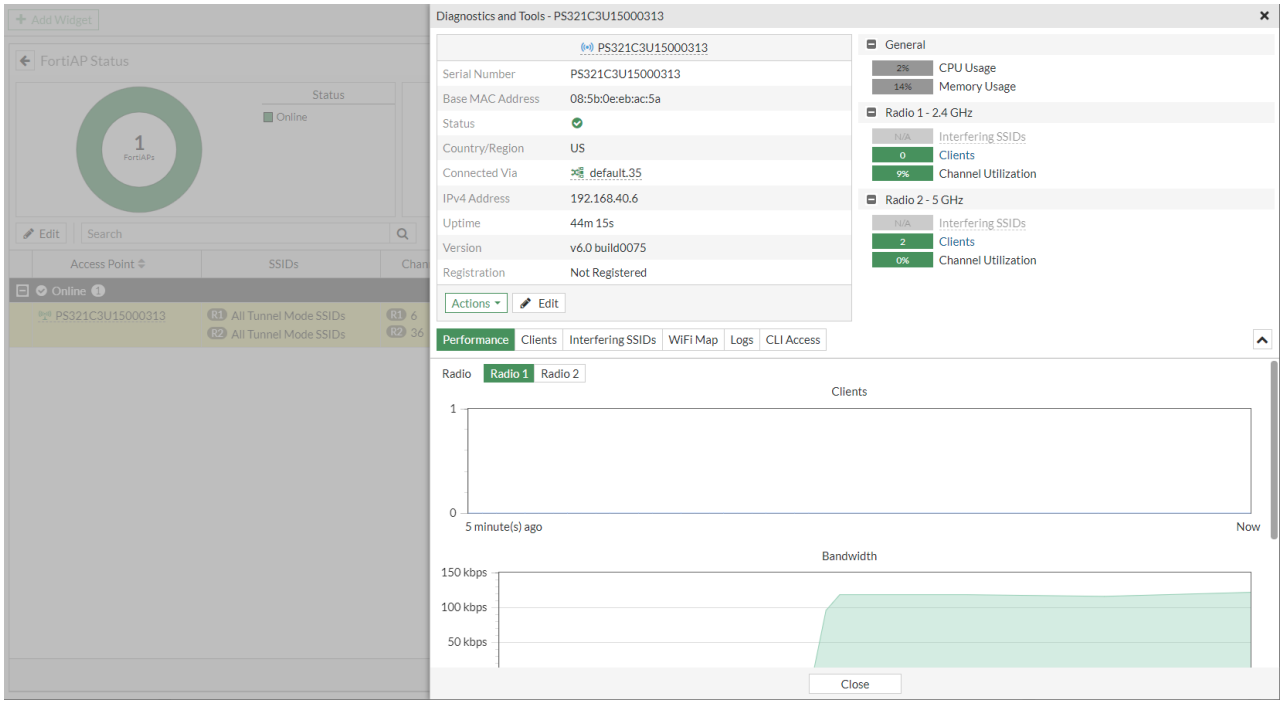


To view the Diagnostics and Tools menu:

1. Right-click an *Access Point* in the table, and click *Diagnostics and Tools*. The *Diagnostics and Tools* dialog opens.



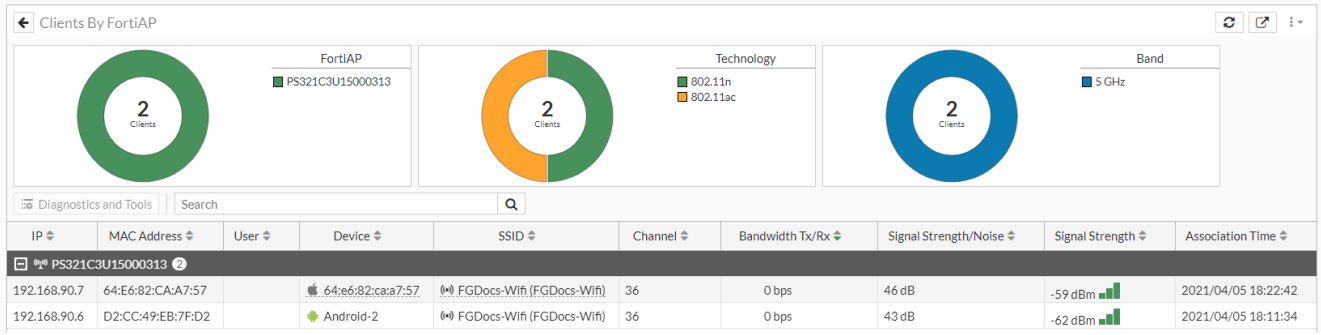
2. To monitor and analyze the FortiAP device, click on the tabs in the *Diagnostics and Tools* dialog, such as *Clients*, *Spectrum Analysis*, *VLAN Probe*, and so on.



The *Diagnostics and Tools* dialog is similar to the device dialog from *WiFi & Switch Controller* > *Managed FortiAPs*. To learn more about the various tabs and their functions, see Spectrum analysis of FortiAP E models, VLAN probe report, and Standardize wireless health metrics.

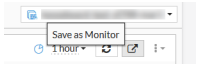
Clients by FortiAP monitor

The *Clients by FortiAP* monitor allows you to view detailed information about the health of individual WiFi connections in the network. It also provides access to tools to diagnose and analyze connected wireless devices.



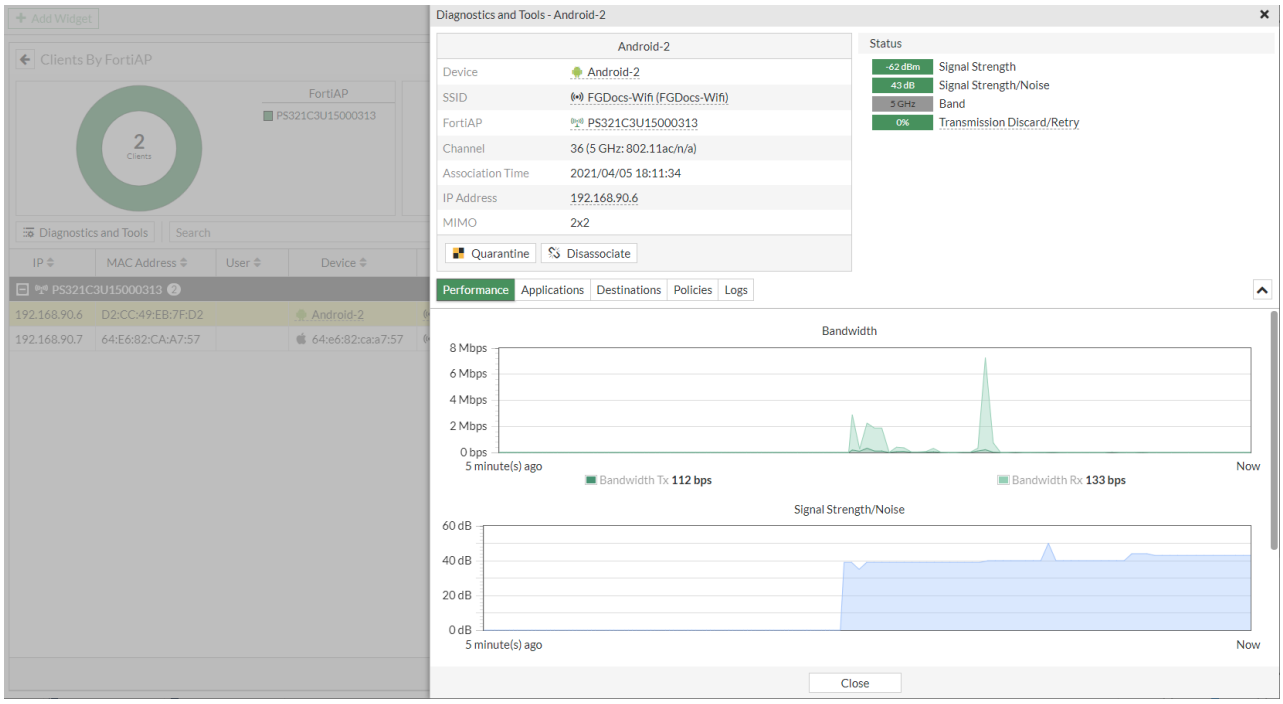
To view the *Clients by FortiAP* monitor:

1. Go to *Dashboard* > *WiFi*.
2. Hover over the *Clients by FortiAP* widget, and click *Expand to Full Screen*. The *Clients by FortiAP* monitor opens.
3. (Optional) Click *Save as Monitor* to save the widget as monitor.



To view the summary page for a wireless client:

1. Right-click a client in the table and select *Diagnostics and Tools*. The *Diagnostics and Tools - <device>* page is displayed.



2. (Optional) Click *Quarantine* to quarantine the client,
3. (Optional) Click *Disassociate* to disassociate the client.

Health status

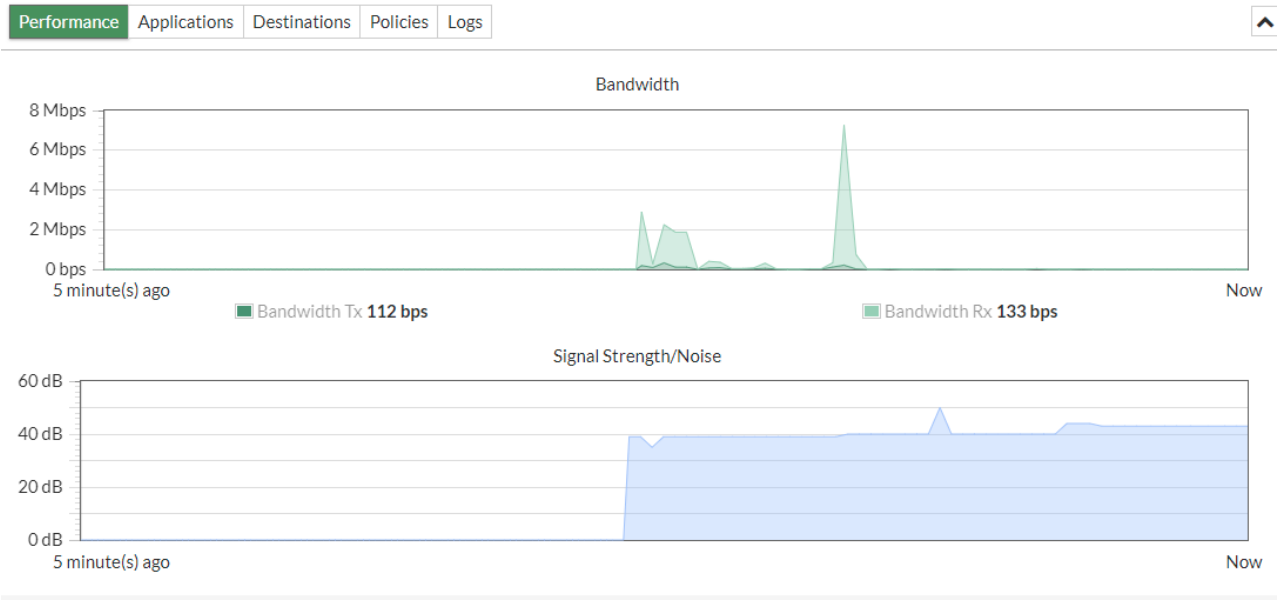
The *Status* section displays the overall health for the wireless connection. The overall health of the connection is:

- Good if the value range for all three conditions are *Good*
- Fair or poor if one of the three conditions is *Fair* or *Poor* respectively.

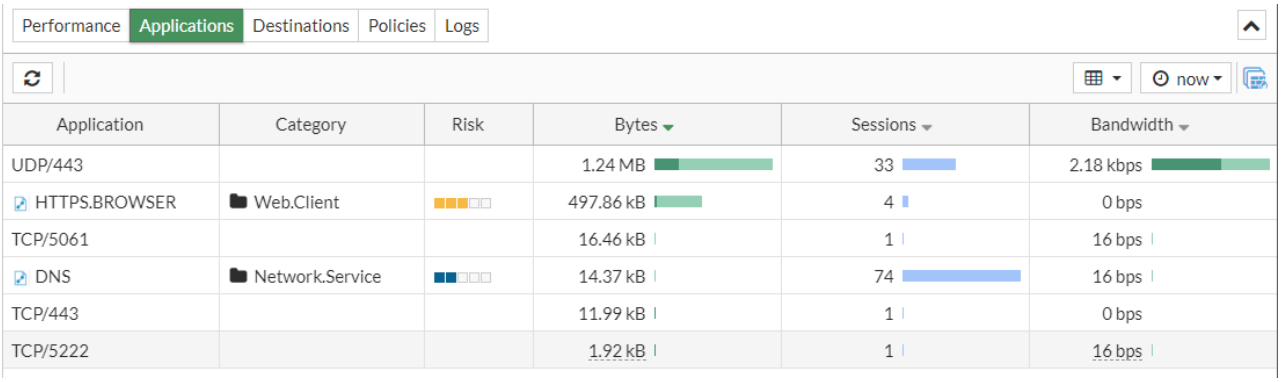
Condition	Value Range
Signal Strength	• *Good > -56dBm* • *-56dBm > Fair > -75dBm* • *Poor < -75dBm*
Signal Strength/Noise	• *Good > 39dBm* • *20dBm < Fair < 39dBm* • *Poor < 20dBm*
Band	• *Good = 5G band* • *Fair = 2.4G band*

The summary page also has the following FortiView tabs:

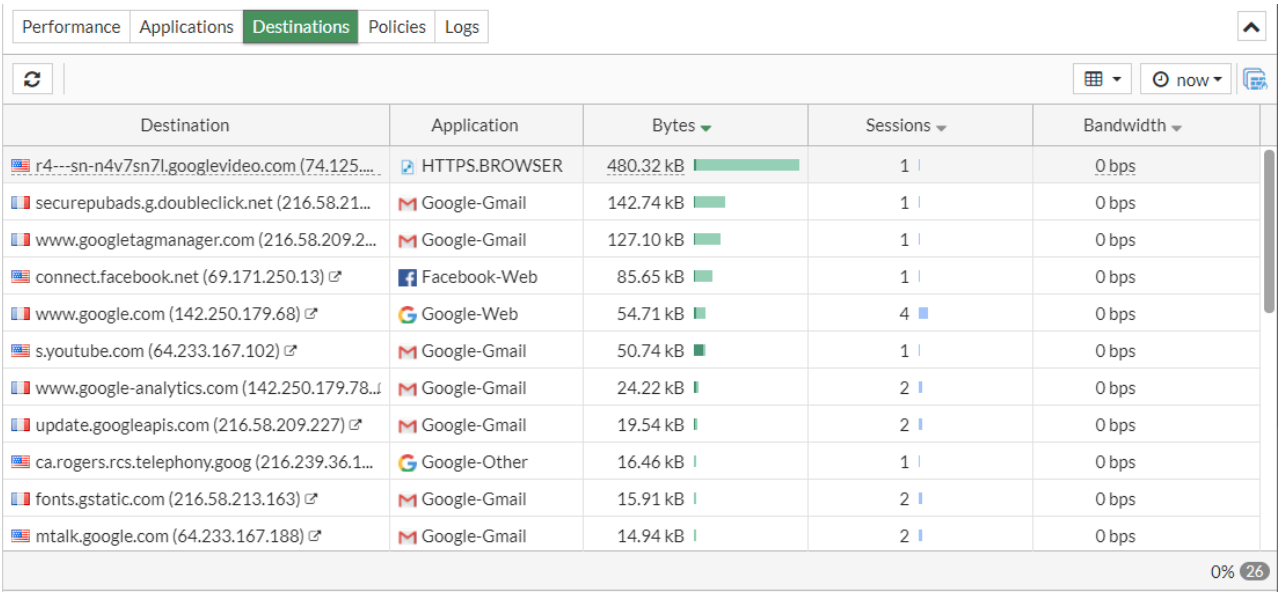
- *Performance*



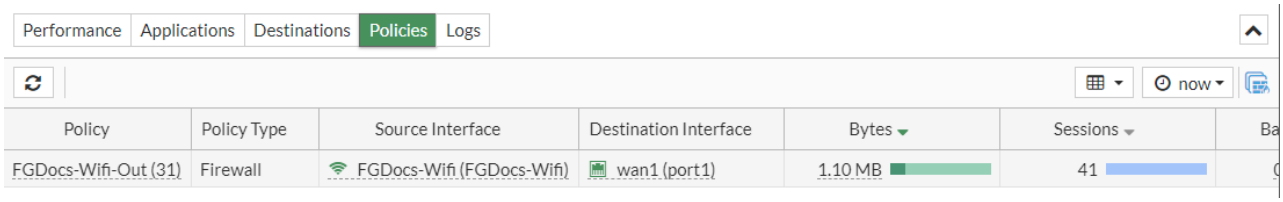
- *Applications*



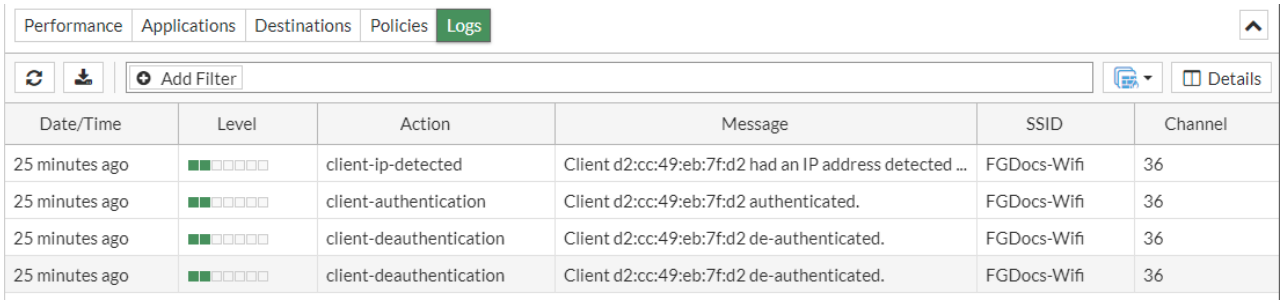
- *Destinations*



- *Policies*



- *Logs*



Monitors

FortiGate supports both FortiView and Non-FortiView monitors. FortiView monitors are driven by traffic information captured from logs and real-time data. Non-FortiView monitors capture information from various real-time state tables on the FortiGate.

Non-FortiView monitors

Non-FortiView monitors capture information on various state tables, such as the routes in the routing table, devices in the device inventory, DHCP leases in the DHCP lease table, connected VPNs, clients logged into the wireless network, and much more. These monitors are useful when troubleshooting the current state of the FortiGate, and to identify whether certain objects are in the state table or not. For more information, see Dashboards on page 69.

FortiView monitors

FortiView is the FortiOS log view tool and comprehensive monitoring system for your network. FortiView integrates real-time and historical data into a single view on your FortiGate. It can log and monitor network threats, keep track of administration activities, and more.

Use FortiView monitors to investigate traffic activity such as user uploads and downloads, or videos watched on YouTube. You can view the traffic on the whole network by user group or by individual. FortiView displays the information in both text and visual format, giving you an overall picture of your network traffic activity so that you can quickly decide on actionable items.

FortiView is integrated with many UTM functions. For example, you can quarantine an IP address directly in FortiView or create custom devices and addresses from a FortiView entry.

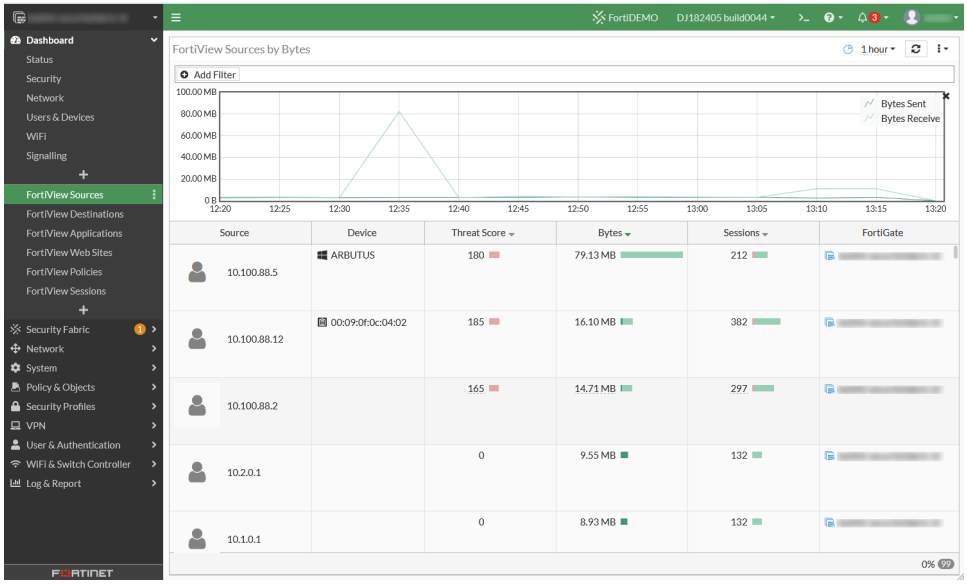
The logging range and depth will depend on the FortiGate model.

The *Optimal* template contains a set of popular default dashboards and FortiView monitors. The *Comprehensive* template contains a set of default dashboards as well as all of the FortiView monitors. See Dashboards on page 69.

Template	Monitors
Optimal	• FortiView Sources • FortiView Destinations • FortiView Applications • FortiView Web Sites • FortiView Policies • FortiView Sessions
Comprehensive	• FortiView Sources • FortiView Destinations • FortiView Applications • FortiView Web Sites • FortiView Threats • FortiView Compromised Hosts • FortiView Policies • FortiView Sessions • Device Inventory Monitor • Routing Monitor • DHCP Monitor • SD-WAN Monitor • FortiGuard Quota Monitor • IPsec Monitor • SSL-VPN Monitor • Firewall User Monitor • Quarantine Monitor • FortiClient Monitor • FortiAP Clients Monitor • Rogue APs Monitor

FortiView monitors and widgets

FortiView monitors are available in the tree menu under *Dashboards*. The menu contains several default monitors for the top categories. Additional FortiView monitors are available as widgets that can be added to the dashboards. You can also add FortiView monitors directly to the tree menu with the Add (**+**) button.



Core FortiView monitors

The following default monitors are available in the tree menu:

Dashboard	Usage
FortiView Sources	Displays Top Sources by traffic volume and drilldown by Source.
FortiView Destinations	Displays Top Destinations by traffic volume and drilldown by Destination.
FortiView Applications	Displays Top Applications by traffic volume and drilldown by Application.
FortiView Web Sites	Displays Top Websites by session count and drilldown by Domain.
FortiView Policies	Displays Top Policies by traffic volume and drilldown by Policy number
FortiView Sessions	Displays Top Sessions by traffic source and can be used to end sessions.

Usage is based on default settings. The pages may be customized further and sorted by other fields.

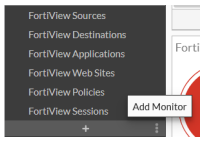
You can quarantine a host and ban an IP from all of the core FortiView monitors.

Adding FortiView monitors

Non-core FortiView monitors are available in the *Add monitor* pane. You can add a FortiView widget to a dashboard or the tree menu as a monitor.

To add a monitor to the tree menu:

1. In the tree menu, under the monitors section, click *Add Monitor* (+). The *Add Monitor* window opens.



2. Click *Add* next to a monitor. You can use the *Search* field to search for a specific monitor.
3. In the *FortiGate* area, select *All FortiGates* or *Specify* to select a FortiGate device in the security fabric.
4. (Optional) In the *Data Source* area, select *Specify* and select a source device.
5. From the *Time Period* dropdown, select the time period. This option is not available in all monitors.
6. In the *Visualization* area, select *Table View* or *Bubble Chart*.
7. From the *Sort By* dropdown, select the sorting method.
8. Click *Add Monitor*. The monitor is added to the tree menu.

Monitors by category

Usage is based on the default settings. The monitors may be customized further and sorted by other fields.

LANDMARK

Widget	Sort by	Usage
Applications	Bytes/Sessions/Bandwidth/Packets	Displays top applications and drilldown by application.
Application Bandwidth	Bytes/Bandwidth	Displays bandwidth for top applications and drilldown by application.
Cloud Applications	Bytes/Sessions/Files(Up/Down)	Displays top cloud applications and drilldown by application.
Cloud Users	Bytes/Sessions/Files(Up/Down)	Displays top cloud users and drilldown by cloud user.
Compromised Hosts	Verdict	Displays compromised hosts and drilldown by source.
Countries/Regions	Bytes/Sessions/Bandwidth/Packets	Displays top countries/regions and drilldown by countries/regions.
Destination Firewall Objects	Bytes/Sessions/Bandwidth/Packets	Displays top destination firewall objects and drilldown by destination objects.
Destination Owners	Bytes/Sessions/Bandwidth/Packets	Displays top destination owners and drilldown by destination.
Destinations	Bytes/Sessions/Bandwidth/Packets	Displays top destinations and drilldown by destination.

Widget	Sort by	Usage
Search Phrases	Count	Displays top search phrases and drilldown by search phrase.
Source Firewall Objects	Bytes/Sessions/Bandwidth/Packets	Displays top search phrases and drilldown by source object.
Sources	Bytes/Sessions/Bandwidth/Packets	Displays top sources and drilldown by source.
Threats	Threat level/Threat Score/Sessions	Displays top threats and drilldown by threat.
Traffic Shaping	Dropped Bytes/Bytes/Sessions/Bandwidth/Packets	Displays top traffic shaping and drilldown by shaper.
Web Categories	Bytes/Sessions/Bandwidth/Packets	Displays top web categories and drilldown by category.
Web Sites	Bytes/Sessions/Bandwidth/Packets	Displays top web sites and drilldown by domain.
WiFi Clients	Bytes/Sessions	Displays top WiFi clients and drilldown by source.

WAN

Widget	Sort by	Usage
Servers	Bytes/Sessions/Bandwidth/Packets	Displays top servers and drilldown by server address.
Sources	Bytes/Sessions/Bandwidth/Packets	Displays top sources and drilldown by device.
Threats	Threat Level/Threat Score/Sessions	Displays top threats and drilldown by threat.

All Segments

Widget	Sort by	Usage
Admin Logins	Configuration Changes/Logins/Failed Logins	Displays top admin logins by username.
Destination Interfaces	Bytes/Sessions/Bandwidth/Packets	Displays top destination interfaces by destination interface.
Endpoint Vulnerabilities	Severity	Displays top endpoint vulnerabilities by vulnerability name.
Failed Authentication	Failed Attempts	Displays top failed authentications by failed authentication source.
FortiSandbox Files	Submitted	Displays top FortiSandbox files by file name.

Widget	Sort by	Usage
Interface Pairs	Bytes/Sessions/Bandwidth/Packets	Displays top interface pairs by source interface.
Policies	Bytes/Sessions/Bandwidth/Packets	Displays top policies by policy.
Source Interfaces	Bytes/Sessions/Bandwidth/Packets	Displays top source interfaces by source interface.
System Events	Level/Events	Displays top system events by event name.
VPN	Connections/Bytes	Displays top VPN connections by user.
Vulnerable Endpoint Devices	Detected Vulnerabilities	Displays top vulnerable endpoint devices by device.

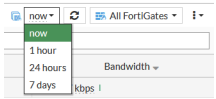
A maximum of 25 interfaces can be monitored at one time on a device.

Using the FortiView interface

Use the FortiView interface to customize the view and visualizations within a monitor to find the information you are looking for. The tools in the top menu bar allow you to change the time display, refresh or customize the data source, and filter the results. You can also right-click a table in the monitor to view drilldown information for an item.

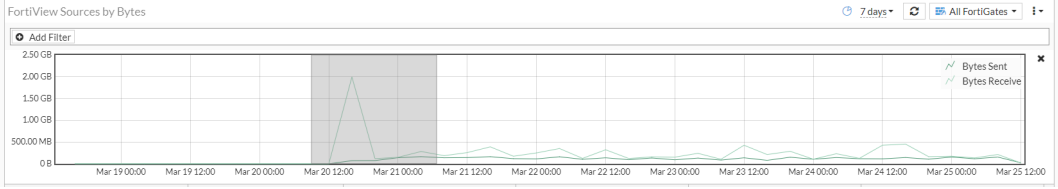
Real-time and historical charts

Use the *Time Display* dropdown to select the time period to display on the current monitor. Time display options vary depending on the monitor and can include real-time information (*now*) and historical information (*1 hour*, *24 hours*, and *7 days*).

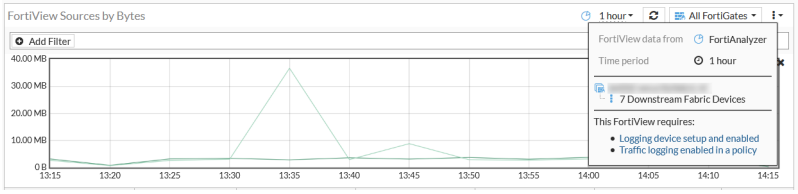


Disk logging or remote logging must be enabled to view historical information.

You can create a custom time range by selecting an area in table with your cursor.

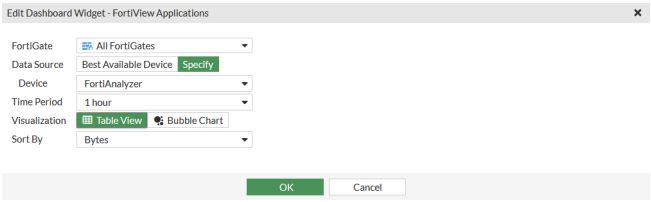


The icon next to the time period identifies the data source (FortiGate Disk, FortiAnalyzer, or FortiGate Cloud). You can hover over the icon to see a description of the device.



Data source

FortiView gathers information from a variety of data sources. If there are no log disk or remote logging configured, the data will be drawn from the FortiGate's session table, and the *Time Period* is set to *Now*.



Other data sources that can be configured are:

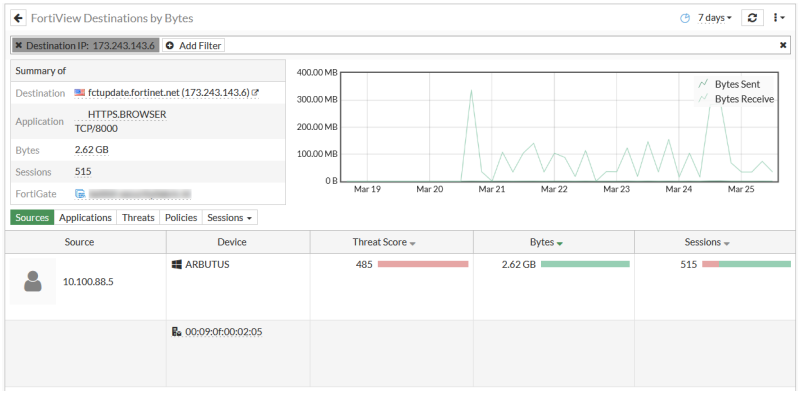
- FortiGates (disk)
- FortiAnalyzer
- FortiGate Cloud

When *Data Source* is set to *Best Available Device*, FortiAnalyzer is selected when available, then FortiGate Cloud, and then FortiGate Disk.

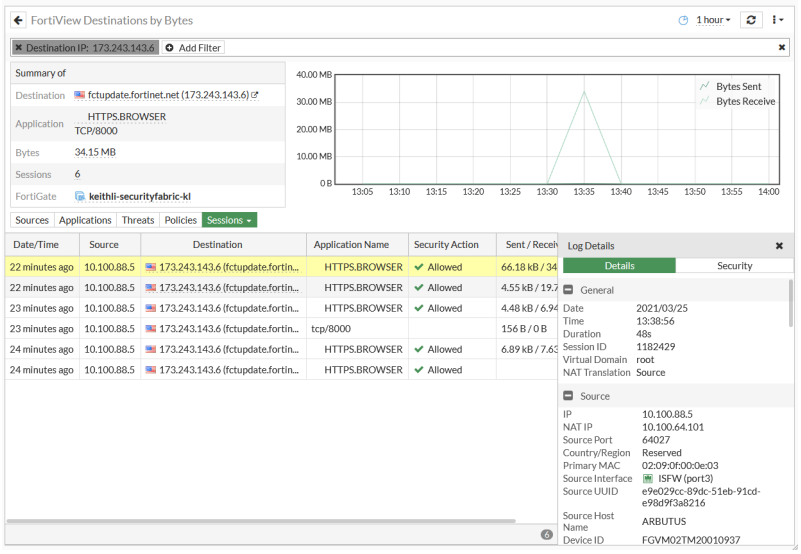
Drilldown information

Double-click or right-click an entry in a FortiView monitor and select *Drill Down to Details* to view additional details about the selected traffic activity. Click the *Back* icon in the toolbar to return to the previous view.

You can group drilldown information into different drilldown views. For example, you can group the drilldown information in the *FortiView Destinations* monitor by *Sources*, *Applications*, *Threats*, *Policies*, and *Sessions*.



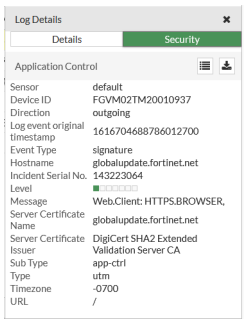
Double-click an entry to view the logs in *Sessions* view. Double-click a session to view the logs.



Graph	• The graph shows the bytes sent/received in the time frame. real time does not include a chart. • Users can customize the time frame by selecting a time period within the graph.
Summary of	• Shows information such as the user/avatar, avatar/source IP, bytes, and sessions total for the time period. • Can quarantine host (access layer quarantine) if they are behind a FortiSwitch or FortiAP. • Can ban IP addresses, adds the source IP address into the quarantine list.

Tabs	• Drilling down entries in any of these tabs (except sessions tab) will take you to the underlying traffic log in the sessions tab.
	• *Applications* shows a list of the applications attributed to the source IP. This can include scanned applications (using Application Control in a firewall policy or unscanned applications.
	`config log gui-display`
	`set fortiview-unscanned-apps enable`
	`end`
	• *Destinations* shows destinations grouped by IP address/FQDN.
	• *Threats* lists the threats caught by UTM profiles. This can be from antivirus, IPS, Web Filter, Application Control, etc.
	• *Web Sites* contains the websites which were detected either with webfilter, or through FQDN in traffic logs.
	• *Web Categories* groups entries into their categories as dictated by the Web Filter Database.
	• *Policies* groups the entries into which polices they passed through or were blocked by.
	• *Sessions* shows the underlying logs (historical) or sessions (real time). Drilldowns from other tabs end up showing the underlying log located in this tab.
	• *Search Phrases* shows entries of search phrases on search engines captured by a Web Filter UTM profile, with deep inspection enabled in firewall policy.
	• More information can be shown in a tooltip while hovering over these entries.

To view matching logs or download a log, click the *Security* tab in the *Log Details* .



Enabling FortiView from devices

You can enable FortiView from SSD disk, FortiAnalyzer and FortiGate Cloud.

FortiView from disk

FortiView from disk is available on all FortiGates with an SSD disk.

Restrictions

Model	Supported view
Desktop models (100 series) with SSD	Five minutes and one hour
Medium models with SSD	Up to 24 hours

Large models (1500D and above) with SSD	Up to seven days
	To enable seven days view:
	`config log setting`
	`set fortiview-weekly-data enable`
	`end`

Configuration

A firewall policy needs to be in place with traffic logging enabled. For optimal operation with FortiView, internal interface roles should be clearly defined as LAN. DMZ and internet facing or external interface roles should be defined as WAN.

To configure logging to disk:

```
config log disk setting
   set status enable
end
```

To include sniffer traffic and local-deny traffic when FortiView from Disk:

```
config report setting
   set report-source forward-traffic sniffer-traffic local-deny-traffic
end
```

This feature is only supported through the CLI.

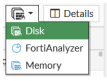
Troubleshooting

Use `execute report flush-cache` and `execute report recreate-db` to clear up any irregularities that may be caused by upgrading or cache issues.

Traffic logs

To view traffic logs from disk:

1. Go to *Log & Report*, and select either the *Forward Traffic*, *Local Traffic*, or *Sniffer Traffic* views.
2. In the top menu bar, click *Log location* and select *Disk*.



FortiView from FortiAnalyzer

Connect FortiGate to a FortiAnalyzer to increase the functionality of FortiView. Adding a FortiAnalyzer is useful when adding monitors such as the *Compromised Hosts*. FortiAnalyzer also allows you to view historical information for up to seven days.

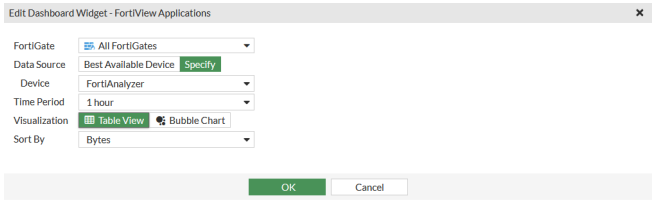
Requirements

- A FortiGate or FortiOS
- A compatible FortiAnalyzer (see Compatibility with FortiOS)

To configure logging to the FortiAnalyzer, see Configuring FortiAnalyzer on page 1596

To enable FortiView from FortiAnalyzer:

1. Go to *Dashboard* > *FortiView Sources*.
2. Select a time range other than *Now* from the dropdown list to view historical data.
3. In top menu, click the dropdown, and select *Settings*. The *Edit Dashboard Widget* dialog is displayed.
   a. In the *Data Source* area, click *Specify*.
   b. From the dropdown, select *FortiAnalyzer*, and click *OK*.



All the historical information now comes from the FortiAnalyzer.

When *Data Source* is set to *Best Available Device*, FortiAnalyzer is selected when available, then FortiGate Cloud, and then FortiGate Disk.

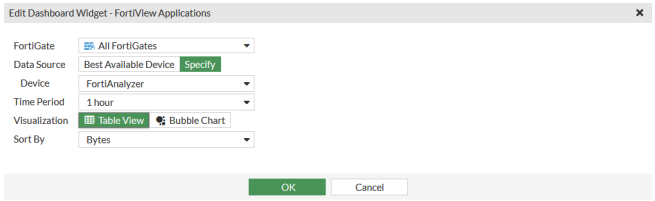
FortiView from FortiGate Cloud

This function requires a FortiGate that is registered and logged into a compatible FortiGate Cloud. When using FortiGate Cloud, the *Time Period* can be set to up to 24 hours.

To configure logging to FortiGate Cloud, see FortiGate Cloud on page 1598.

To enable FortiView with log source as FortiGate Cloud:

1. Go to *Dashboard* > *FortiView Sources*.
2. In the top menu, click the dropdown, and select *Settings*. The *Edit Dashboard Widget* window opens.
   a. In the *Data Source* area, click *Specify*.
   b. From the dropdown, select *FortiGate Cloud*, then click *OK*.



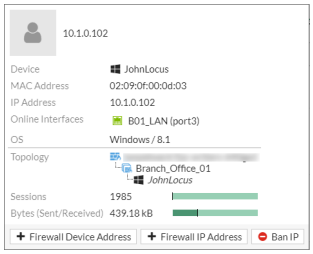
You can select FortiGate Cloud as the data source for all available FortiView pages and widgets.

FortiView sources

The *FortiView Sources* monitor displays top sources sorted by Bytes, Sessions or Threat Score. The information can be displayed in real time or historical views. You can use the monitor to create or edit a firewall device address or IP address definitions, and temporarily or permanently ban IPs.

To add a firewall device address:

1. In the *Device* column, hover over the device MAC address. An information window opens.

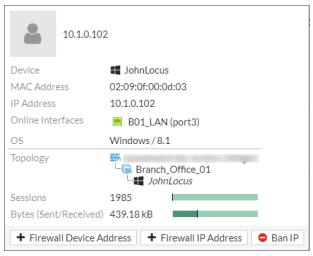


2. Click *Firewall Device Address*. The *New Address* dialog opens.
3. Configure the address settings, and click *Return*.

Use the *Name* field to assign a descriptive name to a device so it is easier to find it in the *Device* column. After you finish configuring the device, refresh the page to see the new name in the monitor.

To add a firewall IP address:

1. In the *Device* column, hover over the device MAC address. An information window opens.

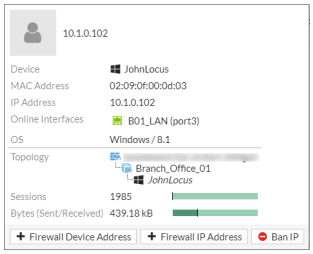


2. Click *Firewall IP Address*. The *New Address* window opens.
3. Configure the address settings, and click *Return*.

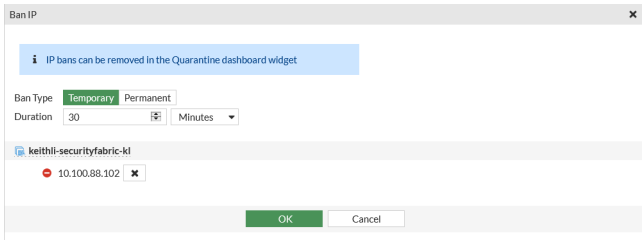
Use the *Name* field to assign a descriptive name to a device so it is easier to find it in the *Device* column. After you finish configuring the device, refresh the page to see the new name in the monitor.

To ban an IP address:

1. In the *Device* column, hover over the device MAC address. An information window opens.



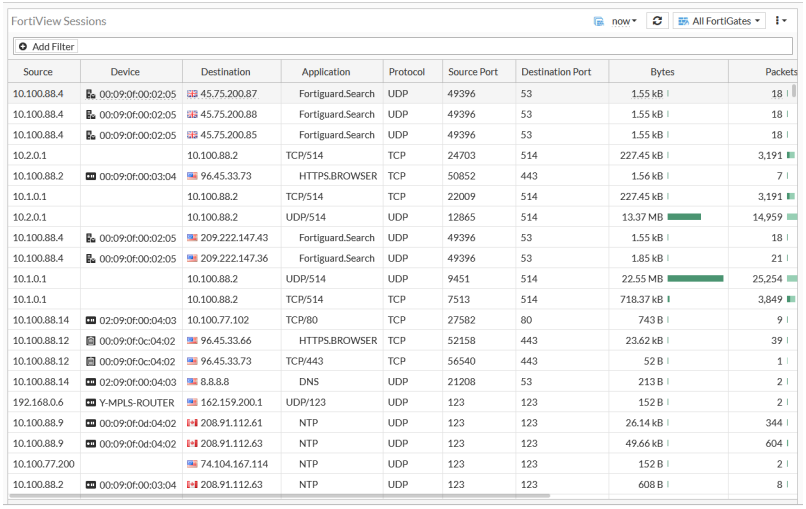
2. Click *Ban IP* . The *Ban IP* dialog is displayed.
3. Configure the ban IP settings, and click *OK*.



FortiView Sessions

The *FortiView Sessions* monitor displays *Top Sessions* by traffic source and can be used to end sessions.

To view the *FortiView Sessions* dashboard, go to *Dashboard* > *FortiView Sessions*.

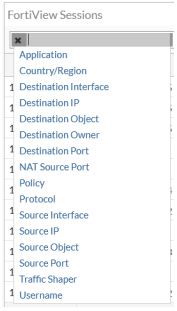


The session table displayed on the *FortiView Sessions* monitor is useful when verifying open connections. For example, if you have a web browser open to browse the Fortinet website, you would expect a session entry from your computer on port 80 to the IP address for the Fortinet website. You can also use a session table to investigate why there are too many sessions for FortiOS to process.

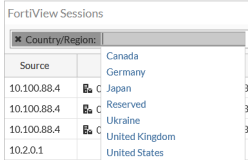
You can filter the sessions displayed in the session table by setting up the available filtering options.

To filter sessions in the session table:

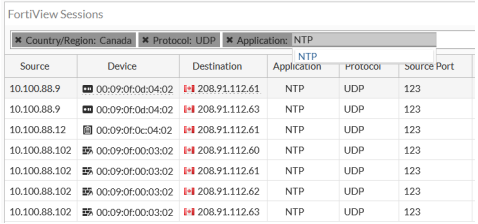
1. Click on the *Add Filter* button at the top of the session table.



2. Select the required filtering option. The session table updates to the filter selection.



3. You may add one or more filters depending upon your requirements. To add more filters, repeat the above steps for a different set of filters.



You can be very specific with how you use filters and target sessions based on different filter combinations. For example, you may want to view all sessions from a device with a particular IP by adding the *Source IP* filter. Similarly, you may need to target all the sessions having a particular *Destination IP* and *Destination Port*, and so on.

You may also view the session data in the CLI.

To view session data using the CLI:

```
# diagnose sys session list
```

The session table output in the CLI is very large. You can use the supported filters in the CLI to show only the data you need.

To view session data with filters using the CLI:

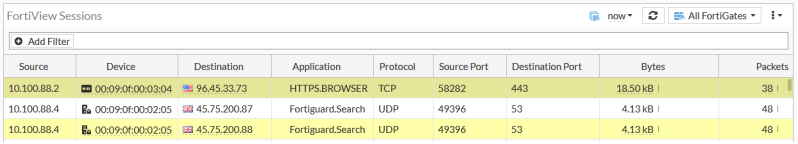
```
# diagnose sys session filter <option>
```

See Using a session table on page 1991 to learn more about using the supported filters in the CLI.

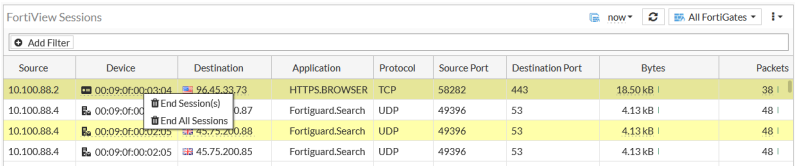
You may also decide to end a particular session or all sessions for administrative purposes.

To end sessions from the GUI:

1. Select the session you want to end. To select multiple sessions, hold the *Ctrl* or *Shift* key on your keyboard while clicking the sessions.



2. Right-click on the selected sessions, click on *End Session(s)* or *End All Sessions*.



3. Click *OK* in the confirmation dialog.

FortiView Top Source and Top Destination Firewall Objects monitors

The *FortiView Source Firewall Objects* and *FortiView Destination Firewall Objects* monitors leverage UUID to resolve firewall object address names for improved usability.

Requirements

To have a historical *Firewall Objects*-based view, address objects' UUIDs need to be logged.

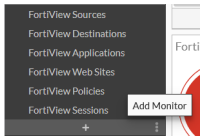
To enable address object UUID logging in the CLI:

```
config system global
   set log-uuid-address enable
```

```
end
```

To add a firewall object monitor in the GUI:

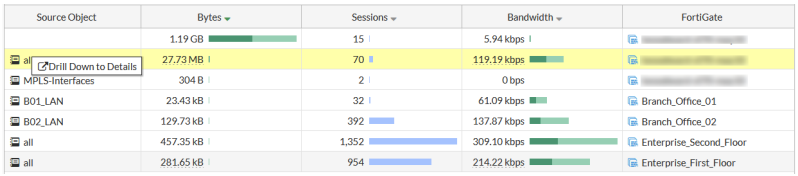
1. Click *Add Monitor*. The *Add Monitor* window opens.



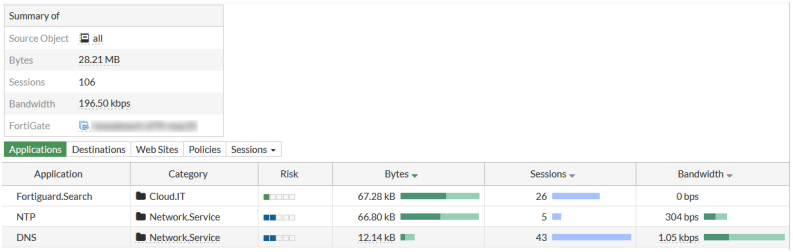
2. In the *Search* field, type *Destination Firewall Objects* and click the *Add* button next to the dashboard name.
3. In the *FortiGate* area, select the FortiGate(s) from the dropdown.
4. In the *Data Source* area, select *Best Available Device* or *Specify*. For information, see Using the FortiView interface on page 97.
5. From the *Time Period* dropdown, select the time period. Select *now* for real-time information, or (*1 hour*, *24 hours*, and *7 days*) for historical information.
6. In the *Visualization* area, select *Table View* or *Bubble Chart*.
7. From the *Sort By* dropdown, select *Bytes*, *Sessions*, *Bandwidth*, or *Packets*.
8. Click *Add Monitor*. The monitor is added to the tree menu.

To drill down Firewall Objects:

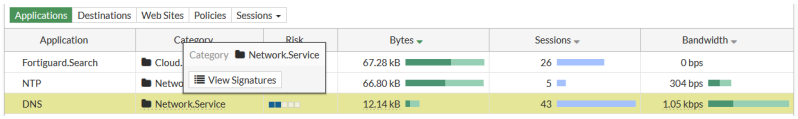
1. Open the *FortiView Source Firewall Objects* or *FortiView Destination Firewall Objects* monitor.
2. Right-click on any *Source* or *Destination Object* and click *Drill Down to Details*.



3. Click the tabs to sort the sessions by *Application*, *Destinations*, *Web Sites*, or *Policies*.



4. To view signatures, click the entry in the *Category* column.



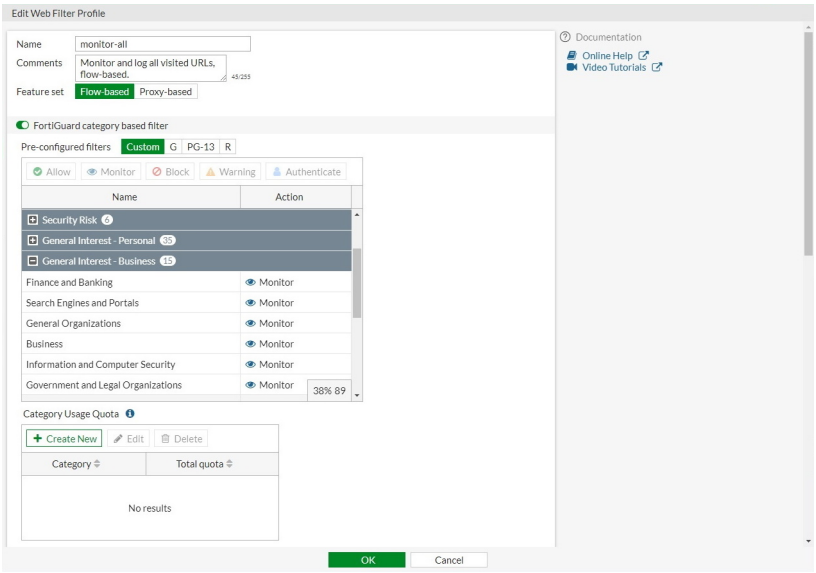
5. To views sessions, right-click an entry and click *View Sessions*, or click the *Sessions* tab.
6. To end a session, right-click an entry in the Sessions tab and select *End Sessions* or *End All Sessions*.

Viewing top websites and sources by category

You can use FortiGuard web categories to populate the category fields in various FortiView monitors such as *FortiView Web Categories*, *FortiView Websites* or *FortiView Sources*. To view the categories in a monitor, the web filter profile must be configured to at least monitor for a FortiGuard category based on a web filter and applied to a firewall policy for outbound traffic.

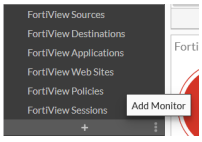
To verify the web filter profile is monitor-only:

1. Go to *Security Profiles* > *Web Filter*.
2. Double-click a web filter that is applied to an outbound traffic firewall policy. The *Edit Web Filter Profile* window opens.
3. Ensure *FortiGuard category based filter* is enabled.
   In the image below, the *General Interest - Business* categories are monitor-only.



To create a Web categories monitor:

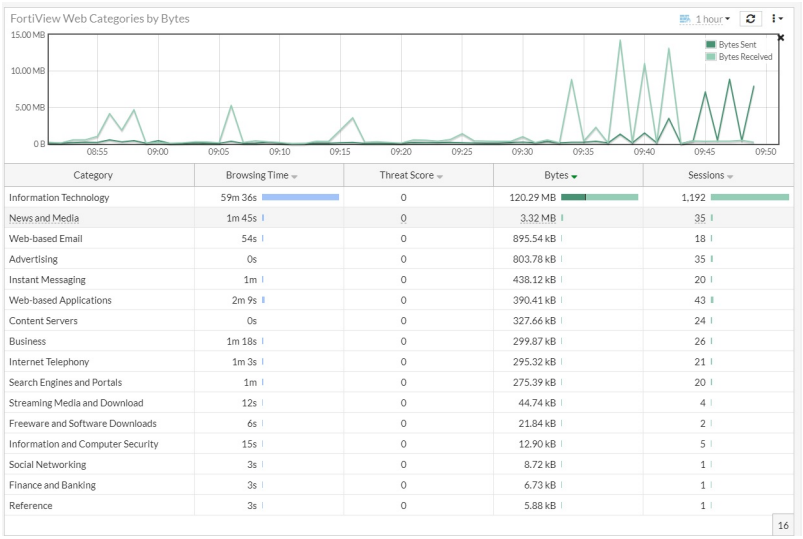
1. Click *Add Monitor*. The *Add Monitor* window opens.



2. In the *Search* field, type *FortiView Web Categories* and click the *Add* button next to the monitor name.
3. In the *FortiGate* area, select the FortiGate(s) from the dropdown.
4. In the *Data Source* area, click *Best Available Device* or *Specify* to select a device in the security fabric.
5. From the *Time Period* dropdown, select a time period greater than *Now*.
6. From the *Sort By* dropdown, select *Bytes*, *Sessions*, *Bandwidth*, or *Packets*.
7. Click *Add Monitor*. The widget is added to the tree menu.

Viewing the web filter category

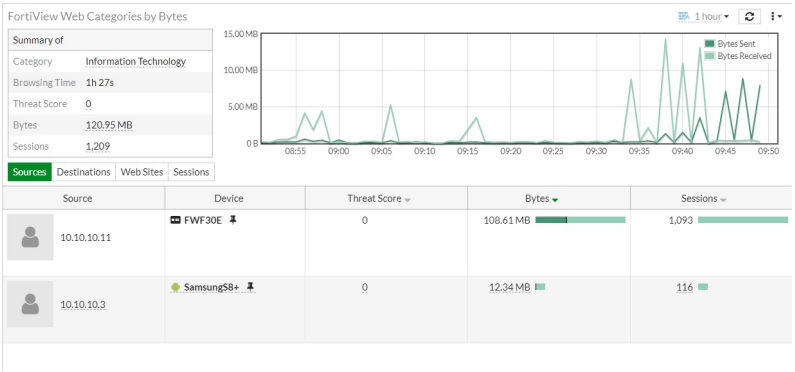
The web filter category name appears in the *Category* column of the dashboard.



Category	Browsing Time	Threat Score	Bytes	Sessions
Information Technology	59m 36s	0	120.29 MB	1,192
News and Media	1m 45s	0	3.32 MB	35
Web-based Email	54s	0	895.54 kB	18
Advertising	0s	0	803.78 kB	35
Instant Messaging	1m	0	438.12 kB	20
Web-based Applications	2m 9s	0	390.41 kB	43
Content Servers	0s	0	327.66 kB	24
Business	1m 18s	0	299.87 kB	26
Internet Telephony	1m 3s	0	295.32 kB	21
Search Engines and Portals	1m	0	275.39 kB	20
Streaming Media and Download	12s	0	44.74 kB	4
Freeware and Software Downloads	6s	0	21.84 kB	2
Information and Computer Security	15s	0	12.90 kB	5
Social Networking	3s	0	8.72 kB	1
Finance and Banking	3s	0	6.73 kB	1
Reference	3s	0	5.88 kB	1

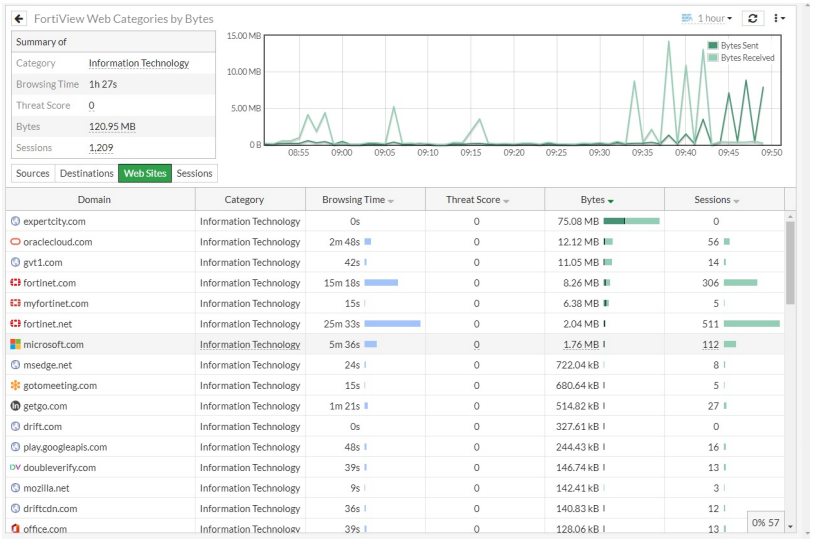
16

Click an entry in the table. The category name appears at the top of the *Summary of* box.

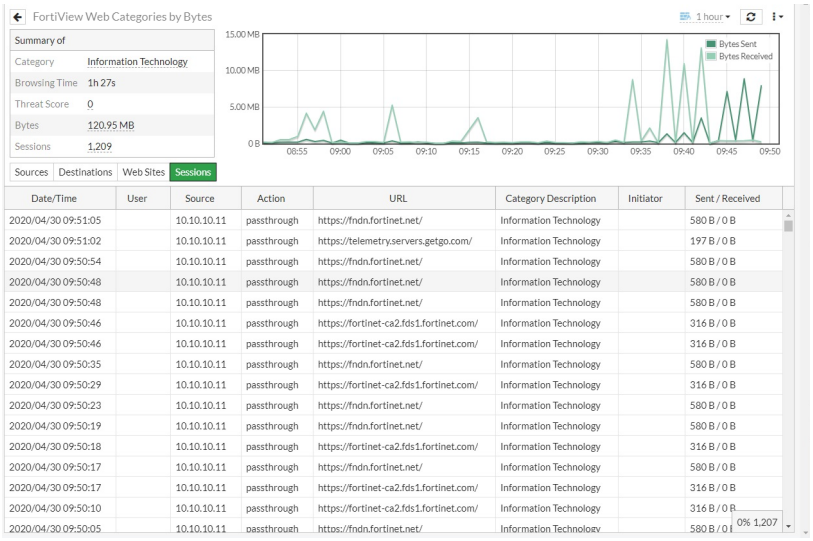


Source	Device	Threat Score	Bytes	Sessions
10.10.10.11	FWF30E	0	108.61 MB	1,093
10.10.10.3	SamsungS8+	0	12.34 MB	116

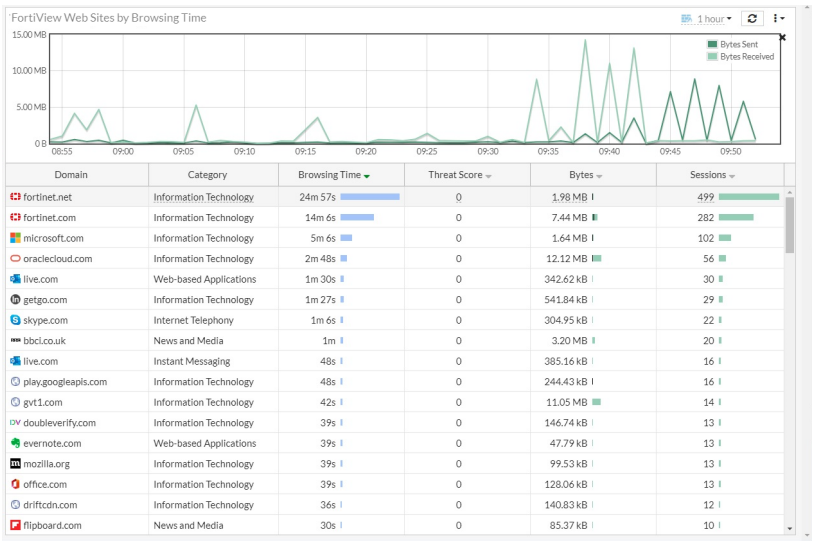
Click the *Web Sites* tab. The category name appears in the *Category* column.



Click the *Sessions* tab. The category name appears in the *Category Description* column.



The category name also appears in the *Category* column in the *FortiView Websites* and *FortiView Sources* monitors.



Cloud application view

To see different cloud application views, set up the following:

- A FortiGate having a relative firewall policy with the *Application Control* security profile.
- A FortiGate with log data from the local disk or FortiAnalyzer.
- Optional but highly recommended: *SSL Inspection* set to *deep-inspection* on relative firewall policies.

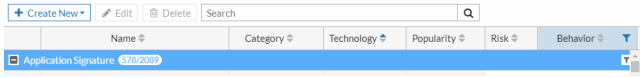
Viewing cloud applications

Cloud applications

All cloud applications require *SSL Inspection* set to *deep-inspection* on the firewall policy. For example, `Facebook_File.Download` can monitor Facebook download behavior which requires *SSL deep-inspection* to parse the deep information in the network packets.

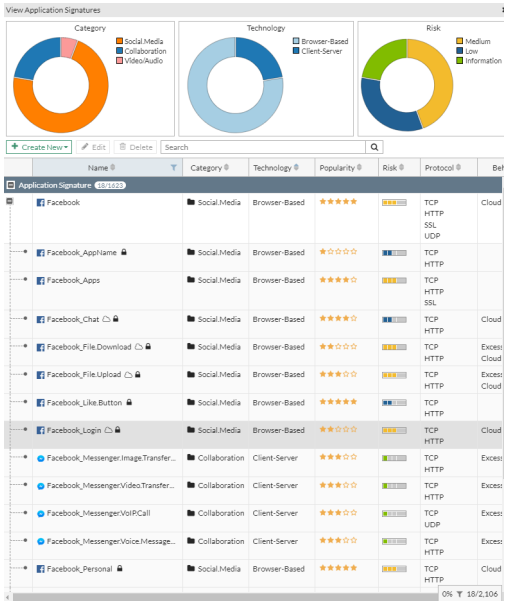
To view cloud applications:

1. Go to *Security Profiles* > *Application Control*.
2. Select a relative Application Control profile used by the firewall policy and click *Edit*.
3. On the *Edit Application Sensor* page, click *View Application Signatures*.
4. Hover over a column heading or the *Application Signature* bar. In the right gutter area, click the filter icon to filter the applications.

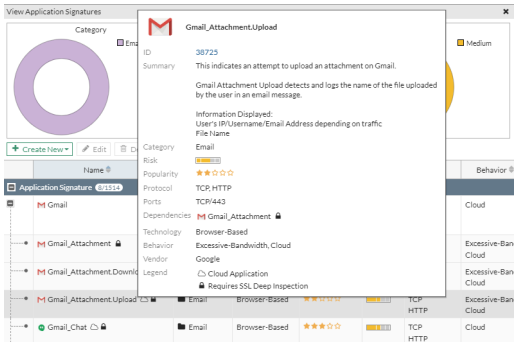


Cloud applications have a cloud icon beside them.

The lock icon indicates that the application requires SSL deep inspection.



5. Hover over an item to see its details.
   This example shows *Gmail_Attachment.Download*, a cloud application signature based sensor which requires SSL deep inspection. If any local network user behind the firewall logs into Gmail and downloads a Gmail attachment, that activity is logged.



Applications with cloud behavior

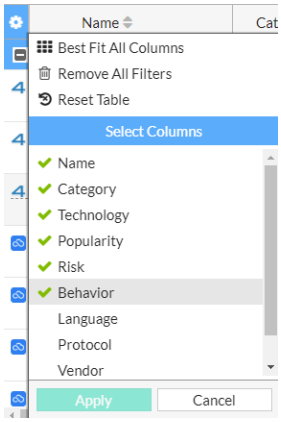
Applications with cloud behavior is a superset of cloud applications.

Some applications do not require SSL deep inspection, such as Facebook, Gmail, and YouTube. This means that if any traffic trigger application sensors for these applications, there is a FortiView cloud application view for that traffic.

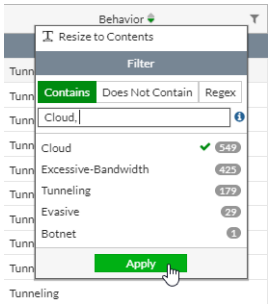
Other applications require SSL deep inspection, such as Gmail attachment, Facebook_Workplace, and so on.

To view applications with cloud behavior:

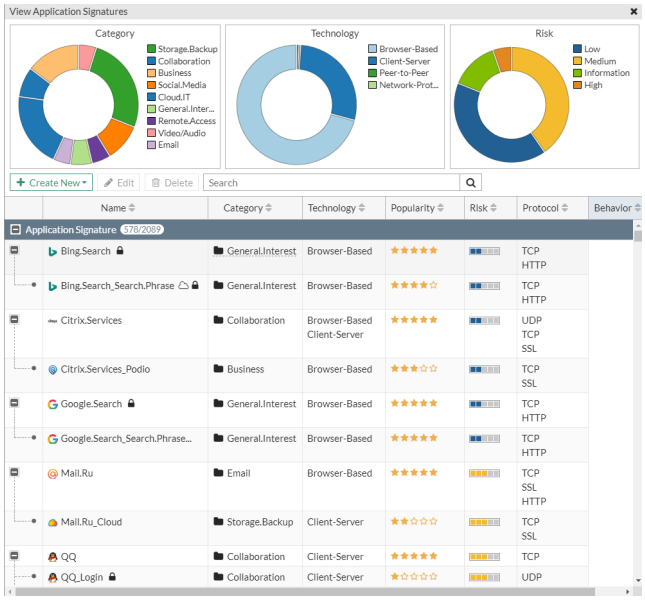
1. In the *Application Signature* page, ensure the *Behavior* column is displayed. If necessary, add the *Behavior* column.
   a. Hover over the left side of the table column headings to display the *Configure Table* icon.
   b. Click *Configure Table* and select *Behavior*.
   c. Click *Apply*.



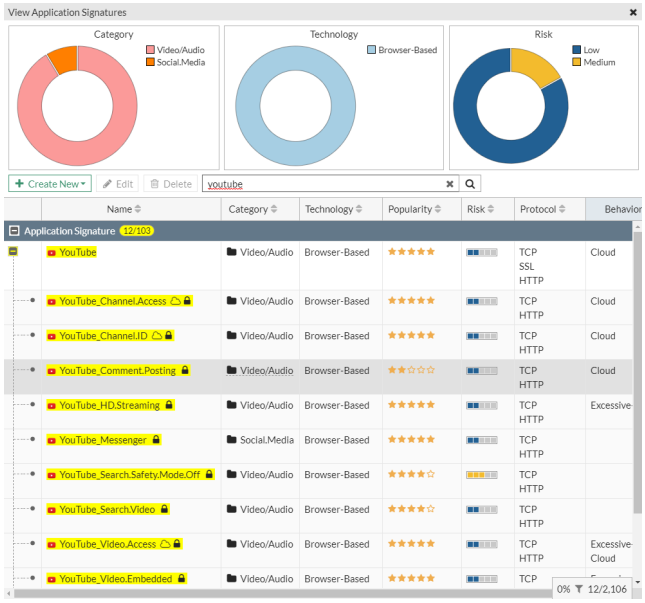
2. Click the filter icon in the *Behavior* column and select *Cloud* to filter by Cloud. Then click *Apply*.



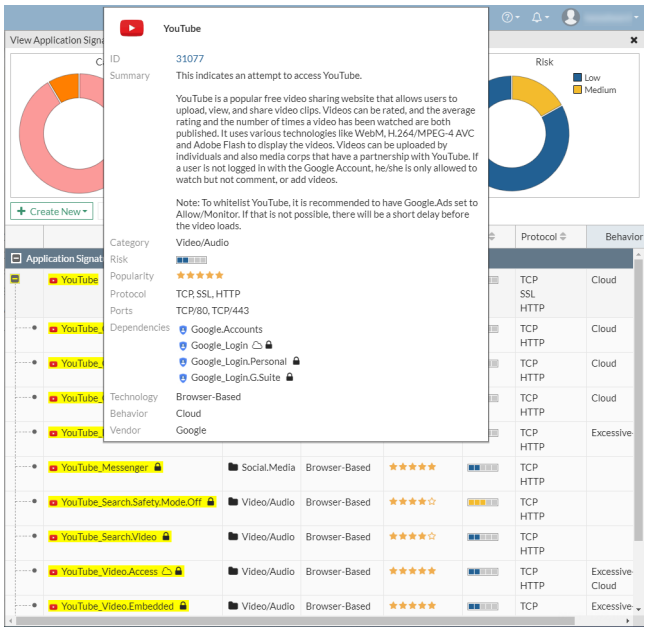
3. The *Application Signature* page displays all applications with cloud behavior.



4. Use the *Search* box to search for applications. For example, you can search for *youtube*.

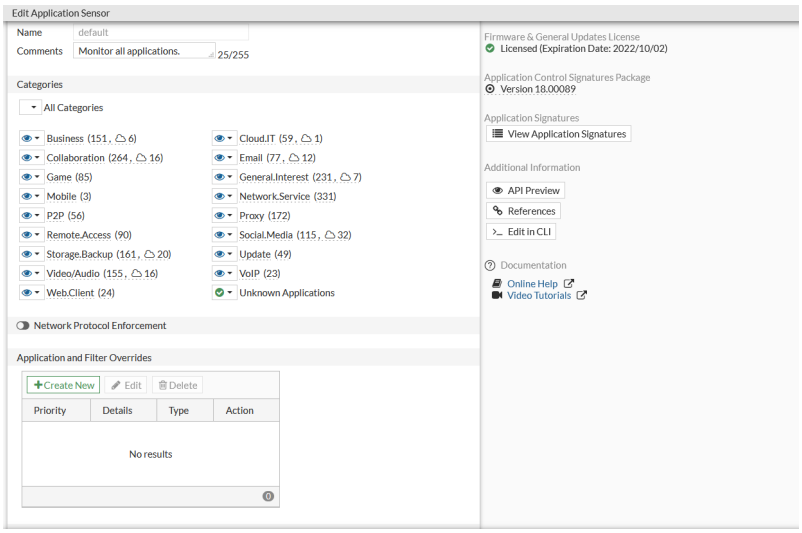


5. Hover over an item to see its details.
This example shows an application sensor with no lock icon which means that this application sensor does not require SSL deep inspection. If any local network user behind the firewall tries to navigate to the YouTube website, that activity is logged.



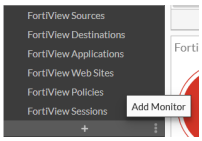
Configuring the Cloud Applications monitor

On the *Edit Application Sensor* page in the *Categories* section, the eye icon next to a category means that category is monitored and logged.

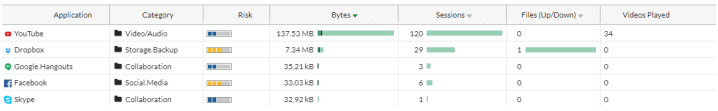


To add the Cloud Applications monitor in the GUI:

1. Click *Add Monitor*. The *Add monitor* window opens.



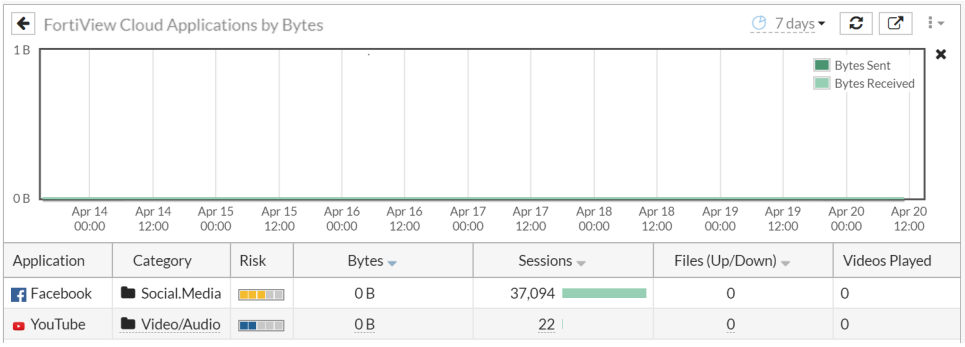
2. In the *Search* field, enter *FortiView Cloud Applications* and click the *Add* button next to the monitor.
3. In the *FortiGate* area, select the FortiGate(s) from the dropdown.
4. In the *Data Source* area, click *Best Available Device* or *Specify* to select a device in the security fabric.
5. From the *Time Period* dropdown, select a time period greater than *Now*.
6. From the *Sort By* dropdown, select *Bytes*, *Sessions*, or *Files (Up/Down)*.
7. Click *Add Monitor*. The monitor is added to the tree menu.
8. Open the monitor. If SSL deep inspection is enabled on the relative firewall, then the monitor shows the additional details that are logged, such as *Files (Up/Down)* and *Videos Played*.
   - For YouTube, the *Videos Played* column is triggered by the *YouTube_Video.Play* cloud application sensor. This shows the number of local network users who logged into YouTube and played YouTube videos.
   - For Dropbox, the *Files (Up/Down)* column is triggered by *Dropbox_File.Download* and *Dropbox_File.Upload* cloud application sensors. This shows the number of local network users who logged into Dropbox and uploaded or downloaded files.



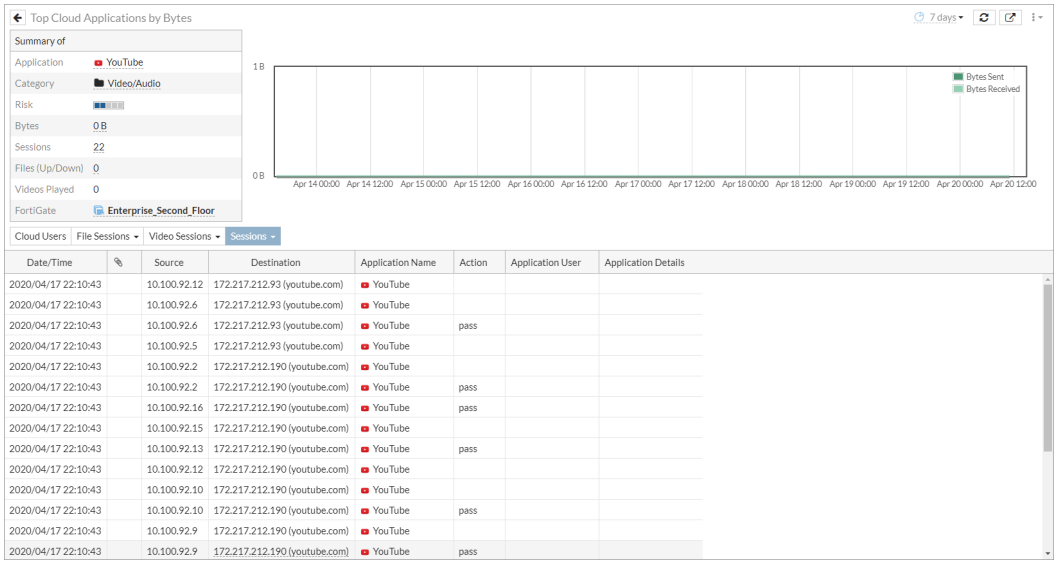
Using the Cloud Applications monitor

To see additional information in the Cloud Applications monitor:

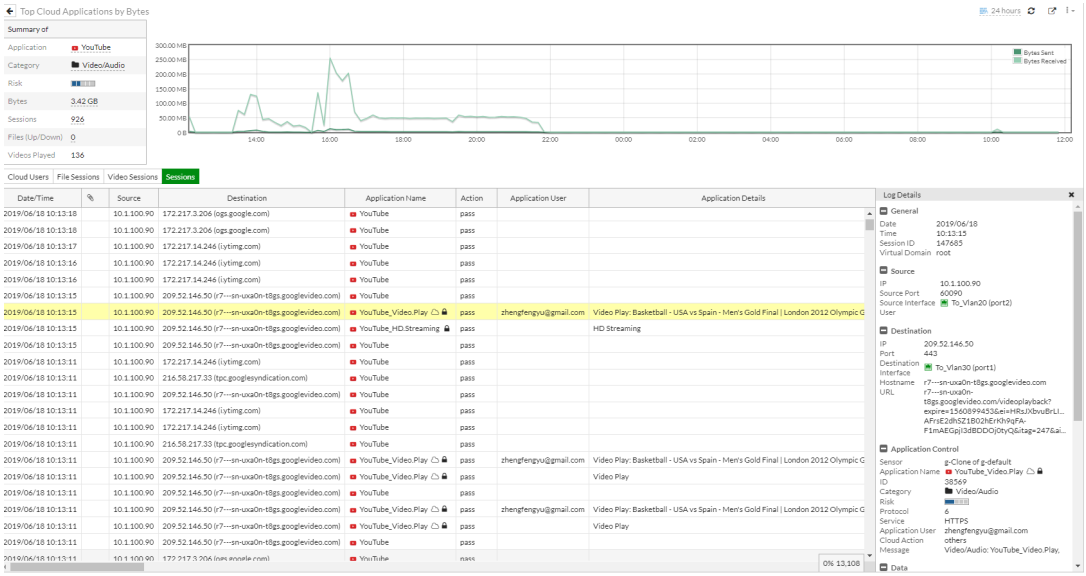
1. In the tree menu, click the *FortiView Cloud Applications* monitor to open it.



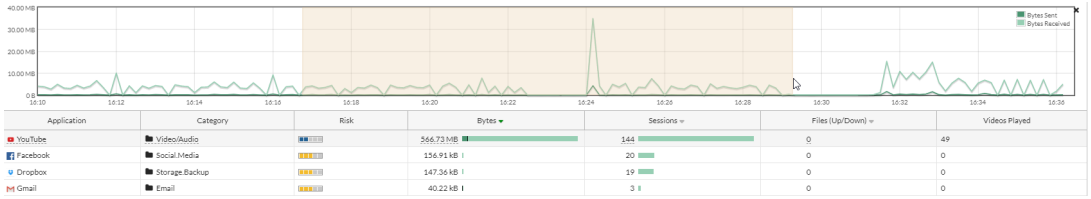
2. For details about a specific entry, double-click the entry or right-click the entry and select *Drill Down to Details*.
3. To see all the sessions for an application, click *Sessions*.
   In this example, the *Application Name* column shows all applications related to YouTube.



4. To view log details, double-click a session to display the *Log Details* pane.
   Sessions monitored by SSL deep inspection (in this example, Youtube_Video.Play) captured deep information such as *Application User*, *Application Details*, and so on. The *Log Details* pane also shows additional deep information such as application *ID*, *Message*, and so on.
   Sessions not monitored by SSL deep inspection (YouTube) did not capture the deep information.



5. To display a specific time period, select and drag in the timeline graph to display only the data for that time period.



Top application: YouTube example

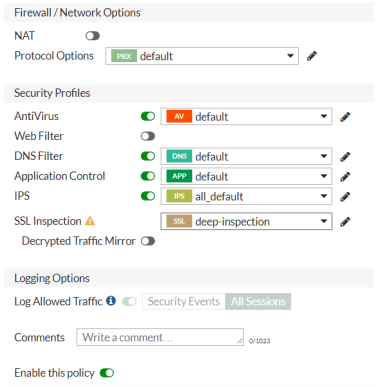
Monitoring network traffic with SSL deep inspection

This example describes how to monitor network traffic for YouTube using *FortiView Applications* view with SSL deep inspection.

To monitor network traffic with SSL deep inspection:

1. Create a firewall policy with the following settings:
   - *Application Control* is enabled.
   - *SSL Inspection* is set to *deep-inspection*.

- *Log Allowed Traffic* is set to *All Sessions*.



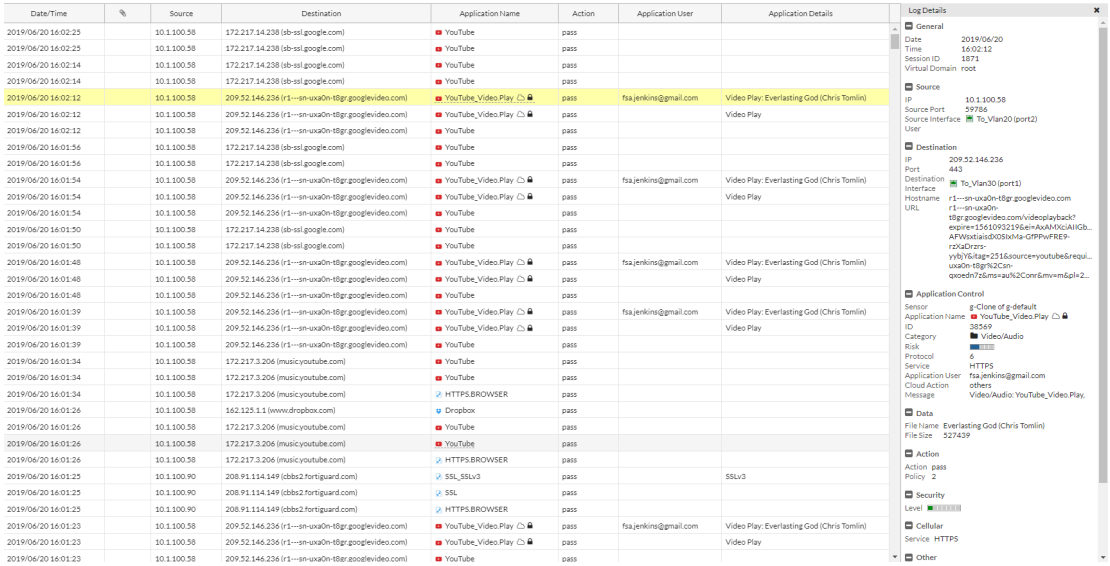
2. Go to *Security Profiles* > *Application Control*.
3. Select a relative Application Control profile used by the firewall policy and click *Edit*.
4. Because YouTube cloud applications are categorized into *Video/Audio*, ensure the *Video/Audio* category is monitored. Monitored categories are indicate by an eye icon.
5. Click *View Application Signatures* and hover over YouTube cloud applications to view detailed information about YouTube application sensors.
6. Expand *YouTube* to view the Application Signatures associated with the application.

Application Signature	Description	Application ID
YouTube_Video.Access	An attempt to access a video on YouTube.	16420
YouTube_Channel.ID	An attempt to access a video on a specific channel on YouTube.	44956
YouTube_Comment.Posting	An attempt to post comments on YouTube.	31076
YouTube_HD.Streaming	An attempt to watch HD videos on YouTube.	33104
YouTube_Messenger	An attempt to access messenger on YouTube.	47858
YouTube_Video.Play	An attempt to download and play a video from YouTube.	38569
YouTube_Video.Upload	An attempt to upload a video to YouTube.	22564
YouTube	An attempt to access YouTube. This application sensor does not depend on SSL deep inspection so it does not have a cloud or lock icon.	31077
YouTube_Channel.Access	An attempt to access a video on a specific channel on YouTube.	41598

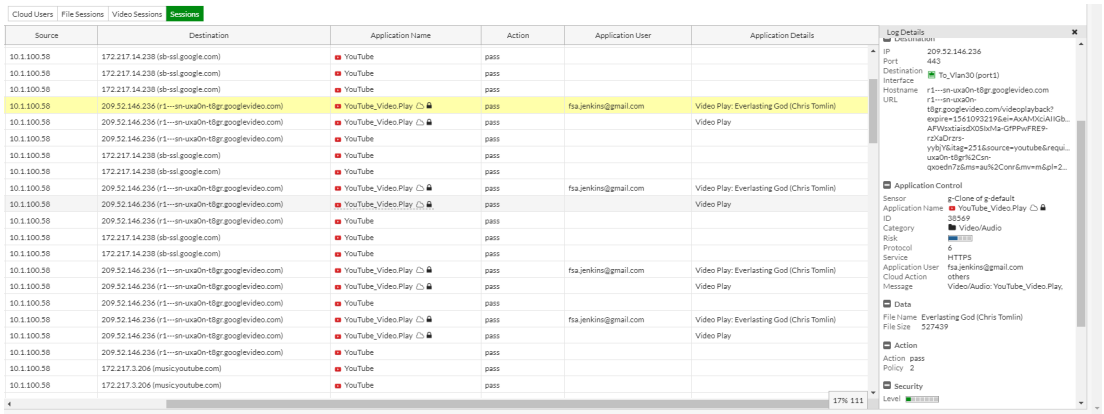
To view the application signature description, click the ID link in the information window.

7. On the test PC, log into YouTube and play some videos.
8. On the FortiGate, go to *Log & Report* > *Application Control* and look for log entries for browsing and playing YouTube videos.

In this example, note the *Application User* and *Application Details*. Also note that the *Application Control ID* is *38569* showing that this entry was triggered by the application sensor *YouTube_Video.Play*.



9. Go to *Dashboard* > *FortiView Applications*.
10. In the *FortiView Applications* monitor, double-click *YouTube* to view the drilldown information.
11. Select the *Sessions* tab to see all the entries for the videos played. Check the sessions for *YouTube_Video.Play* with the ID *38569*.



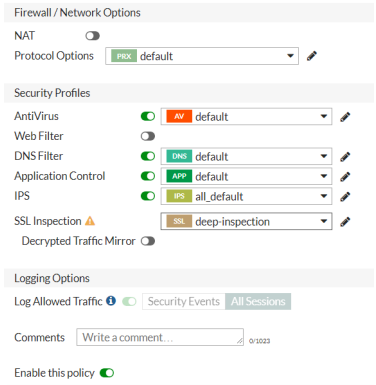
Monitoring network traffic without SSL deep inspection

This example describes how to monitor network traffic for YouTube using FortiView cloud application view without SSL deep inspection.

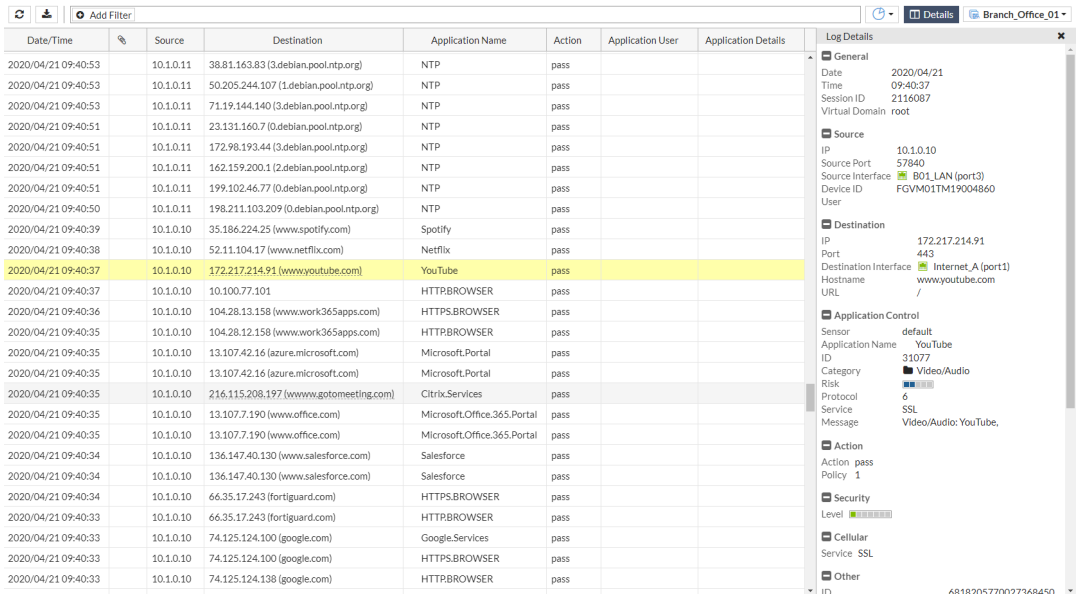
To monitor network traffic without SSL deep inspection:

1. Create a firewall policy with the following settings.
   - *Application Control* is enabled.
   - *SSL Inspection* is set to *certificate-inspection*.

- *Log Allowed Traffic* is set to *All Sessions*.

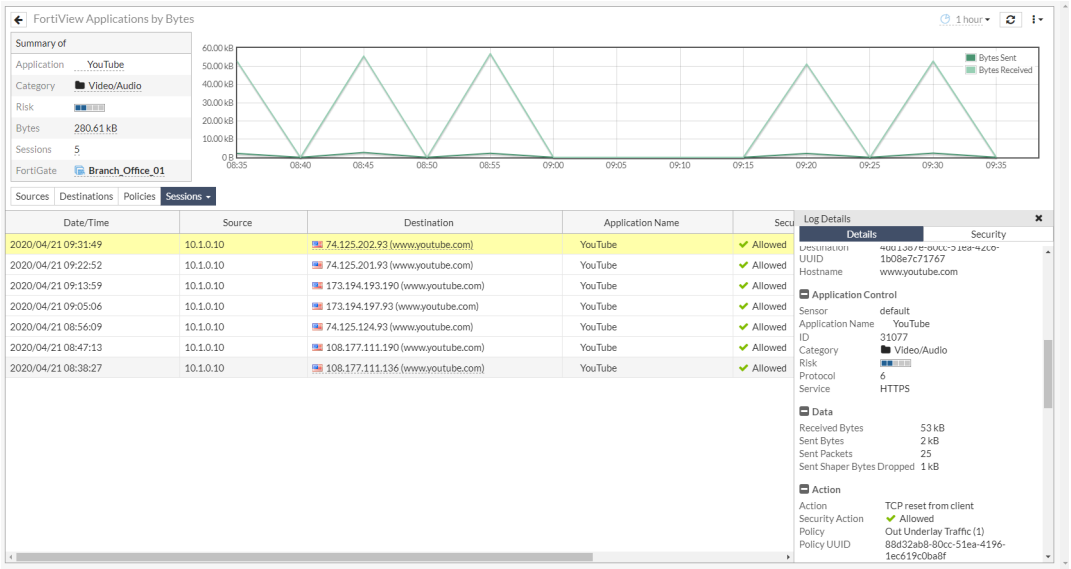


2. On the test PC, log into YouTube and play some videos.
3. On the FortiGate, go to *Log & Report* > *Application Control* and look for log entries for browsing and playing YouTube videos.
   In this example, the log shows only applications with the name YouTube. The log cannot show YouTube application sensors which rely on SSL deep inspection.



4. Go to *Dashboard* > *FortiView Applications*.
   The *FortiView Application by Bytes* monitor shows the YouTube cloud application without the video played information that requires SSL deep inspection.

5. Double-click *YouTube* and click the *Sessions* tab.
   These sessions were triggered by the application sensor *YouTube* with the ID *31077*. This is the application sensor with cloud behavior which does not rely on SSL deep inspection.



Network

The following topics provide information about network settings:

- Interfaces on page 121
- DNS on page 177
- Explicit and transparent proxies on page 194
- SD-WAN on page 319
- DHCP server on page 243
- Static routing on page 250
- RIP on page 273
- OSPF on page 273
- BGP on page 273
- Multicast on page 274
- FortiExtender on page 278
- Direct IP support for LTE/4G on page 282
- LLDP reception on page 285
- Route leaking between VRFs on page 287
- Route leaking between multiple VRFs on page 289
- NetFlow on page 300

Interfaces

Physical and virtual interfaces allow traffic to flow between internal networks, and between the internet and internal networks. FortiGate has options for setting up interfaces and groups of subnetworks that can scale as your organization grows. You can create and edit VLAN, EMAC-VLAN, switch interface, zones, and so on.

The following topics provide information about interfaces:

- Interface settings on page 122
- Aggregation and redundancy on page 126
- VLANs on page 128
- Enhanced MAC VLANs on page 134
- Inter-VDOM routing on page 137
- Software switch on page 142
- Hardware switch on page 144
- Zone on page 146
- Virtual wire pair on page 148
- PRP handling in NAT mode with virtual wire pair on page 151
- Virtual switch support for FortiGate 300E series on page 152
- Failure detection for aggregate and redundant interfaces on page 154
- VLAN inside VXLAN on page 155
- Virtual wire pair with VXLAN on page 157

- QinQ on page 159
- Assign a subnet with the FortiIPAM service on page 160
- Configure a VRF ID on an interface on page 165
- Interface MTU packet size on page 167
- One-arm sniffer on page 169
- Interface migration wizard on page 173

Interface settings

Administrators can configure both physical and virtual FortiGate interfaces in *Network* > *Interfaces*. There are different options for configuring interfaces when FortiGate is in NAT mode or transparent mode.

The available options will vary depending on feature visibility, licensing, device model, and other factors. The following list is not comprehensive.

To configure an interface in the GUI:

1. Go to *Network* > *Interfaces*.
2. Click *Create New* > *Interface*.
3. Configure the interface fields:

Interface Name	Physical interface names cannot be changed.
Alias	Enter an alternate name for a physical interface on the FortiGate unit. This field appears when you edit an existing physical interface. The alias does not appear in logs. The maximum length of the alias is 25 characters.
Type	The configuration type for the interface, such as VLAN, Software Switch. 802.3ad Aggregate, and others.
Interface	This field is available when *Type* is set to *VLAN*. Select the name of the physical interface that you want to add a VLAN interface to. Once created, the VLAN interface is listed below its physical interface in the *Interface* list. You cannot change the physical interface of a VLAN interface.
VLAN ID	This field is available when *Type* is set to *VLAN*. Enter the VLAN ID. The VLAN ID can be any number between 1 and 4094 and must match the VLAN ID added by the IEEE 802.1Q-compliant router or switch that is connected to the VLAN subinterface. The VLAN ID can be edited after the interface is added.
VRF ID	Virtual Routing and Forwarding (VRF) allows multiple routing table instances to coexist on the same router. One or more interface can have a VRF, and packets are only forwarded between interfaces with the dame VRF.
Virtual Domain	Select the virtual domain to add the interface to. Only administrator accounts with the *super_admin* profile can change the *Virtual Domain*.

Interface Members	This section can have different formats depending on the *Type*. Members can be selected for some interface types: • *Software Switch* or *Hardware Switch*: Specify the physical and wireless interfaces joined into the switch. • *802.3ad Aggregate* or *Redundant Interface*: This field includes the available and selected interface lists.
Role	Set the role setting for the interface. Different settings will be shown or hidden when editing an interface depending on the role: • *LAN*: Used to connected to a local network of endpoints. It is default role for new interfaces. • *WAN*: Used to connected to the internet. When WAN is selected, the *Estimated bandwidth* setting is available, and the following settings are not: *DHCP server*, *Create address object matching subnet*, *Device detection*, *Security mode*, *One-arm sniffer*, *Dedicate to extension/fortiap modes*, and *Admission Control*.and will show Estimated Bandwidth settings. • *DMZ*: Used to connected to the DMZ. When selected, *DHCP server* and *Security mode* are not available. • *Undefined*: The interface has no specific role. When selected, *Create address object matching subnet* is not available.
Estimated bandwidth	The estimated WAN bandwidth. The values can be entered manually, or saved from a speed test executed on the interface. The values can be used in SD-WAN rules that use the Maximize Bandwidth or Best Quality strategy.
Traffic mode	This option is only available when *Type* is *WiFi SSD*. • *Tunnel*: Tunnel to wireless controller • *Bridge*: Local bridge with FortiAP's interface • *Mesh*: Mesh downlink
Address	
Addressing mode	Select the addressing mode for the interface. • *Manual*: Add an IP address and netmask for the interface. If IPv6 configuration is enabled, you can add both an IPv4 and an IPv6 address. • *DHCP*: Get the interface IP address and other network settings from a DHCP server. • *Auto-managed by FortiIPAM*: Assign subnets to prevent duplicate IP addresses from overlapping within the same Security Fabric. See Assign a subnet with the FortiIPAM service on page 160. • *PPPoE*: Get the interface IP address and other network settings from a PPPoE server. This option is only available on the low-end FortiGate models. • *One-Arm Sniffer*: Set the interface as a sniffer port so it can be used to detect attacks. See One-arm sniffer on page 169.

IP/Netmask	If *Addressing Mode* is set to *Manual*, enter an IPv4 address and subnet mask for the interface. FortiGate interfaces cannot have multiple IP addresses on the same subnet.
IPv6 addressing mode	Select the addressing mode for the interface: • *Manual*: Add an IP address and netmask for the interface. • *DHCP*: Get the interface IP address and other network settings from a DHCP server. • *Delegated*: Select an *IPv6 upstream interface* that has DHCPv6 prefix delegation enabled, and enter an *IPv6 subnet* if needed. The interface will get the IPv6 prefix from the upstream DHCPv6 server that is connected to the IPv6 upstream interface, and form the IPv6 address with the subnet configured on the interface.
IPv6 Address/Prefix	If *Addressing Mode* is set to *Manual* and IPv6 support is enabled, enter an IPv6 address and subnet mask for the interface. A single interface can have an IPv4 address, IPv6 address, or both.
Auto configure IPv6 address	Automatically configure an IPv6 address using Stateless Address Auto-configuration (SLAAC). This option is available when *IPv6 addressing mode* is set to *Manual*.
DHCPv6 prefix delegation	Enable/disable DHCPv6 prefix delegation, which can be used to delegate IPv6 prefixes from an upstream DHCPv6 server to another interface or downstream device. When enabled, there is an option to enable a *DHCPv6 prefix hint* that helps the DHCPv6 server provide the desired prefix.
Create address object matching subnet	This option is available when *Role* is set to *LAN* or *DMZ*. Enable this option to automatically create an address object that matches the interface subnet.
Secondary IP Address	Add additional IPv4 addresses to this interface.
Administrative Access	
IPv4 Administrative Access	Select the types of administrative access permitted for IPv4 connections to this interface. See Configure administrative access to interfaces on page 126.
IPv6 Administrative Access	Select the types of administrative access permitted for IPv6 connections to this interface. See Configure administrative access to interfaces on page 126.
DHCP Server	Enable a DHCP server for the interface. See DHCP server on page 243.
Stateless Address Auto-configuration (SLAAC)	Enable to provide IPv6 addresses to connected devices using SLAAC.
DHCPv6 Server	Select to enable a DHCPv6 server for the interface. When enabled, you can configure *DNS service* settings: *Delegated* (delegate the DNS received from the upstream server), *Same as System DNS*, or *Specify* (up to four servers).

	You can also enable *Stateful server*to configure the DHCPv6 server to be stateful. Manually enter the IP range, or use Delegated mode to delegate IP prefixes from an upstream DHCPv6 server connected to the upstream interface.
Network	
Device Detection	Enable/disable passively gathering device identity information about the devices on the network that are connected to this interface.
Security Mode	Enable/disable captive portal authentication for this interface. After enabling captive portal authentication, you can configure the authentication portal, user and group access, custom portal messages, exempt sources and destinations/services, and redirect after captive portal.
Traffic Shaping	
Outbound shaping profile	Enable/disable traffic shaping on the interface. This allows you to enforce bandwidth limits on individual interfaces. See Interface-based traffic shaping profile on page 657 for more information.
Miscellaneous	
Comments	Enter a description of the interface of up to 255 characters.
Status	Enable/disable the interface. • *Enabled*: The interface is active and can accept network traffic. • *Disabled*: The interface is not active and cannot accept traffic.

4. Click *OK*.

To configure an interface in the CLI:

```
config system interface
    edit <name>
        set vdom <VDOM_name>
        set mode {static | dhcp | pppoe}
        set ip <IP_address/netmask>
        set security-mode {none | captive-portal | 802.1X}
        set egress-shaping-profile <profile>
        set device-identification {enable | disable}
        set allowaccess {ping https ssh http snmp telnet fgfm radius-acct probe-response
fabric ftm}
        set secondary-IP enable
        config secondaryip
            edit 1
                set ip 9.1.1.2 255.255.255.0
                set allowaccess ping https ssh snmp http
            next
        end
    next
end
```

Configure administrative access to interfaces

You can configure the protocols that administrators can use to access interfaces on the FortiGate. This helps secure access to the FortiGate by restricting access to a limited number of protocols. It helps prevent users from accessing interfaces that you don't want them to access, such as public-facing ports.

As a best practice, you should configure administrative access when you're setting the IP address for a port.

To configure administrative access to interfaces in the GUI:

1. Go to *Network* > *Interfaces*.
2. Create or edit an interface.
3. In the *Administrative Access* section, select which protocols to enable for *IPv4* and *IPv6 Administrative Access*.

HTTPS	Allow secure HTTPS connections to the FortiGate GUI through this interface. If configured, this option is enabled automatically.
HTTP	Allow HTTP connections to the FortiGate GUI through this interface. This option can only be enabled if HTTPS is already enabled.
PING	The interface responds to pings. Use this setting to verify your installation and for testing.
FMG-Access	Allow FortiManager authorization automatically during the communication exchanges between FortiManager and FortiGate devices.
SSH	Allow SSH connections to the CLI through this interface.
SNMP	Allow a remote SNMP manager to request SNMP information by connecting to this interface.
FTM	Allow FortiToken Mobile Push (FTM) access.
RADIUS Accounting	Allow RADIUS accounting information on this interface.
Security Fabric Connection	Allow Security Fabric access. This enables FortiTelemetry and CAPWAP.

Aggregation and redundancy

Link aggregation (IEEE 802.3ad) enables you to bind two or more physical interfaces together to form an aggregated (combined) link. This new link has the bandwidth of all the links combined. If a link in the group fails, traffic is transferred automatically to the remaining interfaces. The only noticeable effect is reduced bandwidth.

This feature is similar to redundant interfaces. The major difference is a redundant interface group only uses one link at a time, where an aggregate link group uses the total bandwidth of the functioning links in the group, up to eight (or more).

An interface is available to be an aggregate interface if:

- It is a physical interface and not a VLAN interface or subinterface.
- It is not already part of an aggregate or redundant interface.
- It is in the same VDOM as the aggregated interface. Aggregate ports cannot span multiple VDOMs.
- It does not have an IP address and is not configured for DHCP or PPPoE.
- It is not referenced in any security policy, VIP, IP Pool, or multicast policy.

- It is not an HA heartbeat interface.
- It is not one of the FortiGate-5000 series backplane interfaces.

When an interface is included in an aggregate interface, it is not listed on the *Network* > *Interfaces* page. Interfaces still appear in the CLI although configuration for those interfaces do not take affect. You cannot configure the interface individually and it is not available for inclusion in security policies, VIPs, IP pools, or routing.

Sample configuration

This example creates an aggregate interface on a FortiGate-140D POE using ports 3-5 with an internal IP address of 10.1.1.123, as well as the administrative access to HTTPS and SSH.

To create an aggregate interface in the GUI:

1. Go to *Network* > *Interfaces* and select *Create New* > *Interface*.
2. Set *Name* to *aggregate*.
3. Set *Type* to *802.3ad Aggregate*.
4. Set *Interface members* to *port4*, *port5*, and *port6*.
5. Set *Addressing mode* to *Manual*.
6. Set *IP/Netmask* to *10.1.1.123/24*.
7. For *Administrative Access*, select *HTTPS* and *SSH*.
8. Click *OK*.

To create an aggregate interface in the CLI:

```
config system interface
    edit "aggregate"
        set vdom "root"
        set ip 10.1.1.123 255.255.255.0
        set allowaccess https ssh
        set type aggregate
        set member "port4" "port5" "port6"
        set snmp-index 45
    next
end
```

Redundancy

In a redundant interface, traffic only goes over one interface at any time. This differs from an aggregated interface where traffic goes over all interfaces for increased bandwidth. This difference means redundant interfaces can have more robust configurations with fewer possible points of failure. This is important in a fully-meshed HA configuration.

An interface is available to be in a redundant interface if:

- It is a physical interface and not a VLAN interface.
- It is not already part of an aggregated or redundant interface.
- It is in the same VDOM as the redundant interface.
- It does not have an IP address and is not configured for DHCP or PPPoE.
- It has no DHCP server or relay configured on it.
- It does not have any VLAN subinterfaces.
- It is not referenced in any security policy, VIP, or multicast policy.

- It is not monitored by HA.
- It is not one of the FortiGate-5000 series backplane interfaces.

When an interface is included in a redundant interface, it is not listed on the *Network* > *Interfaces* page. You cannot configure the interface individually and it is not available for inclusion in security policies, VIPs, or routing.

Sample configuration

To create a redundant interface in the GUI:

1. Go to *Network* > *Interfaces* and select *Create New* > *Interface*.
2. Set *Name* to *redundant*.
3. Set *Type* to *Redundant Interface*.
4. Set *Interface members* to *port4*, *port5*, and *port6*.
5. Set *Addressing mode* to *Manual*.
6. Set *IP/Netmask* to *10.13.101.100/24*.
7. For *Administrative Access*, select *HTTPS* and *SSH*.
8. Click *OK*.

To create a redundant interface in the CLI:

```
config system interface
    edit "redundant"
        set vdom "root"
        set ip 10.13.101.100 255.255.255.0
        set allowaccess https http
        set type redundant
        set member "port4" "port5" "port6"
        set snmp-index 9
    next
end
```

VLANs

Virtual Local Area Networks (VLANs) multiply the capabilities of your FortiGate unit and can also provide added network security. VLANs use ID tags to logically separate devices on a network into smaller broadcast domains. These smaller domains forward packets only to devices that are part of that VLAN domain. This reduces traffic and increases network security.

VLANs in NAT mode

In NAT mode, the FortiGate unit functions as a layer-3 device. In this mode, the FortiGate unit controls the flow of packets between VLANs and can also remove VLAN tags from incoming VLAN packets. The FortiGate unit can also forward untagged packets to other networks such as the Internet.

In NAT mode, the FortiGate unit supports VLAN trunk links with IEEE 802.1Q-compliant switches or routers. The trunk link transports VLAN-tagged packets between physical subnets or networks. When you add VLAN subinterfaces to the FortiGate's physical interfaces, the VLANs have IDs that match the VLAN IDs of packets on the trunk link. The FortiGate unit directs packets with VLAN IDs to subinterfaces with matching IDs.

You can define VLAN subinterfaces on all FortiGate physical interfaces. However, if multiple virtual domains are configured on the FortiGate unit, you only have access to the physical interfaces on your virtual domain. The FortiGate unit can tag packets leaving on a VLAN subinterface. It can also remove VLAN tags from incoming packets and add a different VLAN tag to outgoing packets.

Normally in VLAN configurations, the FortiGate unit's internal interface is connected to a VLAN trunk, and the external interface connects to an Internet router that is not configured for VLANs. In this configuration, the FortiGate unit can apply different policies for traffic on each VLAN interface connected to the internal interface, which results in less network traffic and better security.

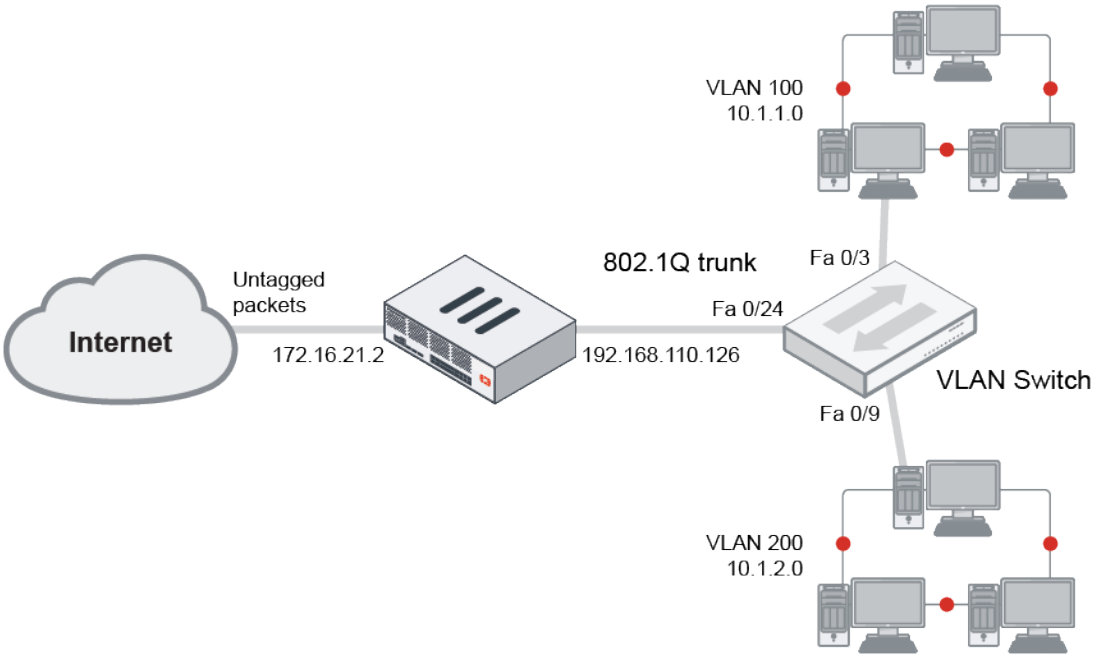
Sample topology

In this example, two different internal VLAN networks share one interface on the FortiGate unit and share the connection to the Internet. This example shows that two networks can have separate traffic streams while sharing a single interface. This configuration can apply to two departments in a single company or to different companies.

There are two different internal network VLANs in this example. VLAN_100 is on the 10.1.1.0/255.255.255.0 subnet, and VLAN_200 is on the 10.1.2.0/255.255.255.0 subnet. These VLANs are connected to the VLAN switch.

The FortiGate internal interface connects to the VLAN switch through an 802.1Q trunk. The internal interface has an IP address of 192.168.110.126 and is configured with two VLAN subinterfaces (VLAN_100 and VLAN_200). The external interface has an IP address of 172.16.21.2 and connects to the Internet. The external interface has no VLAN subinterfaces.

When the VLAN switch receives packets from VLAN_100 and VLAN_200, it applies VLAN ID tags and forwards the packets of each VLAN both to local ports and to the FortiGate unit across the trunk link. The FortiGate unit has policies that allow traffic to flow between the VLANs, and from the VLANs to the external network.



Sample configuration

In this example, both the FortiGate unit and the Cisco 2950 switch are installed and connected and basic configuration has been completed. On the switch, you need access to the CLI to enter commands. No VDOMs are enabled in this

example.

General configuration steps include:

1. Configure the external interface.
2. Add two VLAN subinterfaces to the internal network interface.
3. Add firewall addresses and address ranges for the internal and external networks.
4. Add security policies to allow:
   - the VLAN networks to access each other.
   - the VLAN networks to access the external network.

To configure the external interface:

```
config system interface
    edit external
        set mode static
        set ip 172.16.21.2 255.255.255.0
    next
end
```

To add VLAN subinterfaces:

```
config system interface
    edit VLAN_100
        set vdom root
        set interface internal
        set type vlan
        set vlanid 100
        set mode static
        set ip 10.1.1.1 255.255.255.0
        set allowaccess https ping
    next
    edit VLAN_200
        set vdom root
        set interface internal
        set type vlan
        set vlanid 200
        set mode static
        set ip 10.1.2.1 255.255.255.0
        set allowaccess https ping
    next
end
```

To add the firewall addresses:

```
config firewall address
    edit VLAN_100_Net
        set type ipmask
        set subnet 10.1.1.0 255.255.255.0
    next
    edit VLAN_200_Net
        set type ipmask
        set subnet 10.1.2.0 255.255.255.0
    next
end
```

To add security policies:

Policies 1 and 2 do not need NAT enabled, but policies 3 and 4 do need NAT enabled.

```
config firewall policy
    edit 1
        set srcintf VLAN_100
        set srcaddr VLAN_100_Net
        set dstintf VLAN_200
        set dstaddr VLAN_200_Net
        set schedule always
        set service ALL
        set action accept
        set nat disable
        set status enable
    next
    edit 2
        set srcintf VLAN_200
        set srcaddr VLAN_200_Net
        set dstintf VLAN_100
        set dstaddr VLAN_100_Net
        set schedule always
        set service ALL
        set action accept
        set nat disable
        set status enable
    next
    edit 3
        set srcintf VLAN_100
        set srcaddr VLAN_100_Net
        set dstintf external
        set dstaddr all
        set schedule always
        set service ALL
        set action accept
        set nat enable
        set status enable
    next
    edit 4
        set srcintf VLAN_200
        set srcaddr VLAN_200_Net
        set dstintf external
        set dstaddr all
        set schedule always
        set service ALL
        set action accept
        set nat enable
        set status enable
    next
end
```

VLANs in transparent mode

In transparent mode, the FortiGate unit behaves like a layer-2 bridge but can still provide services such as antivirus scanning, web filtering, spam filtering, and intrusion protection to traffic. Some limitations of transparent mode is that you

cannot use SSL VPN, PPTP/L2TP VPN, DHCP server, or easily perform NAT on traffic. The limits in transparent mode apply to IEEE 802.1Q VLAN trunks passing through the unit.

You can insert the FortiGate unit operating in transparent mode into the VLAN trunk without making changes to your network. In a typical configuration, the FortiGate unit internal interface accepts VLAN packets on a VLAN trunk from a VLAN switch or router connected to internal network VLANs. The FortiGate external interface forwards VLAN-tagged packets through another VLAN trunk to an external VLAN switch or router and on to external networks such as the Internet. You can configure the unit to apply different policies for traffic on each VLAN in the trunk.

To pass VLAN traffic through the FortiGate unit, you add two VLAN subinterfaces with the same VLAN ID, one to the internal interface and the other to the external interface. You then create a security policy to permit packets to flow from the internal VLAN interface to the external VLAN interface. If required, create another security policy to permit packets to flow from the external VLAN interface to the internal VLAN interface. Typically in transparent mode, you do not permit packets to move between different VLANs. Network protection features such as spam filtering, web filtering, and anti-virus scanning, are applied through the UTM profiles specified in each security policy, enabling very detailed control over traffic.

When the FortiGate unit receives a VLAN-tagged packet on a physical interface, it directs the packet to the VLAN subinterface with the matching VLAN ID. The VLAN tag is removed from the packet and the FortiGate unit then applies security policies using the same method it uses for non-VLAN packets. If the packet exits the FortiGate unit through a VLAN subinterface, the VLAN ID for that subinterface is added to the packet and the packet is sent to the corresponding physical interface.

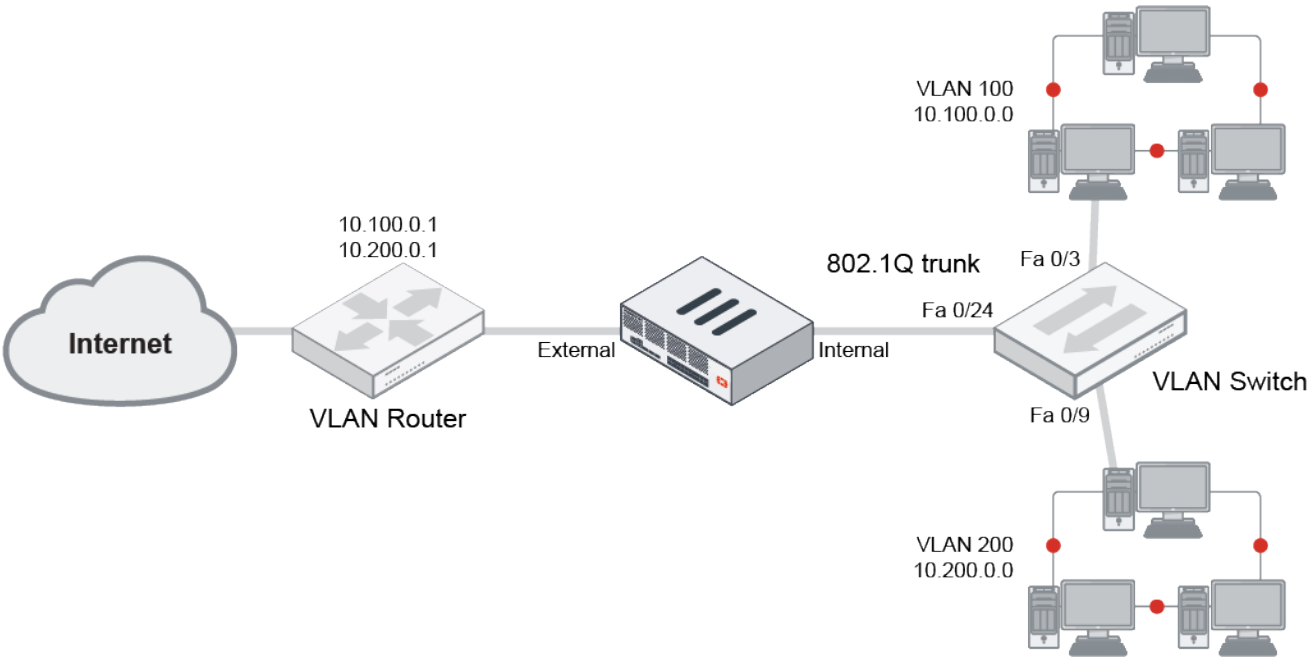
Sample topology

In this example, the FortiGate unit is operating in transparent mode and is configured with two VLANs: one with an ID of 100 and the other with ID 200. The internal and external physical interfaces each have two VLAN subinterfaces, one for VLAN_100 and one for VLAN_200.

The IP range for the internal VLAN_100 network is 10.100.0.0/255.255.0.0, and for the internal VLAN_200 network is 10.200.0.0/255.255.0.0.

The internal networks are connected to a Cisco 2950 VLAN switch which combines traffic from the two VLANs onto one in the FortiGate unit's internal interface. The VLAN traffic leaves the FortiGate unit on the external network interface, goes on to the VLAN switch, and on to the Internet. When the FortiGate units receives a tagged packet, it directs it from the incoming VLAN subinterface to the outgoing VLAN subinterface for that VLAN.

In this example, we create a VLAN subinterface on the internal interface and another one on the external interface, both with the same VLAN ID. Then we create security policies that allow packets to travel between the VLAN_100_int interface and the VLAN_100_ext interface. Two policies are required: one for each direction of traffic. The same is required between the VLAN_200_int interface and the VLAN_200_ext interface, for a total of four security policies.



Sample configuration

There are two main steps to configure your FortiGate unit to work with VLANs in transparent mode:

1. Add VLAN subinterfaces.
2. Add security policies.

You can also configure the protection profiles that manage antivirus scanning, web filtering, and spam filtering.

To add VLAN subinterfaces:

```
config system interface
    edit VLAN_100_int
        set type vlan
        set interface internal
        set vlanid 100
    next
    edit VLAN_100_ext
        set type vlan
        set interface external
        set vlanid 100
    next
    edit VLAN_200_int
        set type vlan
        set interface internal
        set vlanid 200
    next
    edit VLAN_200_ext
        set type vlan
        set interface external
        set vlanid 200
    next
end
```

To add security policies:

```
config firewall policy
    edit 1
        set srcintf VLAN_100_int
        set srcaddr all
        set dstintf VLAN_100_ext
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 2
        set srcintf VLAN_100_ext
        set srcaddr all
        set dstintf VLAN_100_int
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 3
        set srcintf VLAN_200_int
        set srcaddr all
        set dstintf VLAN_200_ext
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 4
        set srcintf VLAN_200_ext
        set srcaddr all
        set dstintf VLAN_200_int
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
end
```

Enhanced MAC VLANs

The Media Access Control (MAC) Virtual Local Area Network (VLAN) feature in Linux allows you to configure multiple virtual interfaces with different MAC addresses (and therefore different IP addresses) on a physical interface.

FortiGate implements an enhanced MAC VLAN consisting of a MAC VLAN with bridge functionality. Because each MAC VLAN has a unique MAC address, virtual IP addresses (VIPs) and IP pools are supported, and you can disable Source Network Address Translation (SNAT) in policies.

MAC VLAN cannot be used in a transparent mode virtual domain (VDOM). In a transparent mode VDOM, a packet leaves an interface with the MAC address of the original source instead of the interface's MAC address. FortiGate implements an enhanced version of MAC VLAN where it adds a MAC table in the MAC VLAN which learns the MAC addresses when traffic passes through.

If you configure a VLAN ID for an enhanced MAC VLAN, it won't join the switch of the underlying interface. When a packet is sent to this interface, a VLAN tag is inserted in the packet and the packet is sent to the driver of the underlying interface. When the underlying interface receives a packet, if the VLAN ID doesn't match, it won't deliver the packet to this enhanced MAC VLAN interface.

When using a VLAN ID, the ID and the underlying interface must be a unique pair, even if the belong to different VDOMs. This is because the underlying, physical interface uses the VLAN ID as the identifier to dispatch traffic among the VLAN and enhanced MAC VLAN interfaces.

If you use an interface in an enhanced MAC VLAN, do not use it for other purposes such as a management interface, HA heartbeat interface, or in Transparent VDOMs.

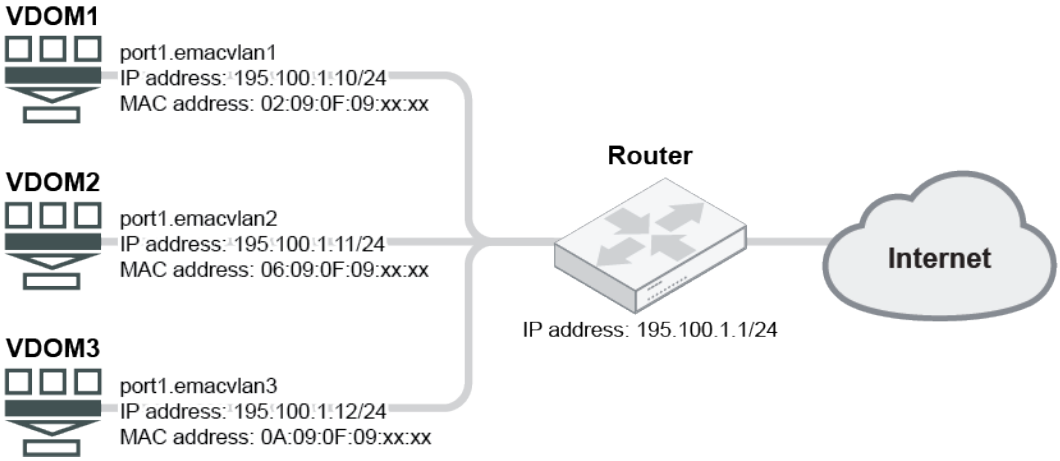
If a physical interface is used by an EMAC VLAN interface, you cannot use it in a Virtual Wire Pair.

In high availability (HA) configurations, enhanced MAC VLAN is treated as a physical interface. It's assigned a unique physical interface ID and the MAC table is synchronized with the secondary devices in the same HA cluster.

Example 1: Enhanced MAC VLAN configuration for multiple VDOMs that use the same interface or VLAN

In this example, a FortiGate is connected, through port 1 to a router that's connected to the Internet. Three VDOMs share the same interface (port 1) which connects to the same router that's connected to the Internet. Three enhanced MAC VLAN interfaces are configured on port 1 for the three VDOMs. The enhanced MAC VLAN interfaces are in the same IP subnet segment and each have unique MAC addresses.

The underlying interface (port 1) can be a physical interface, an aggregate interface, or a VLAN interface on a physical or aggregate interface.



To configure enhanced MAC VLAN for this example in the CLI:

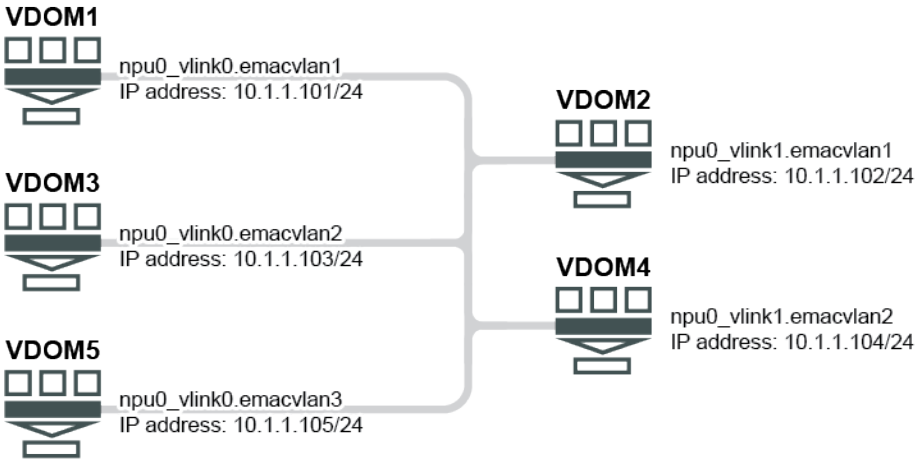
```
config system interface
    edit port1.emacvlan1
        set vdom VDOM1
        set type emac-vlan
        set interface port1
    next
    edit port 1.emacvlan2
```

```
        set vdom VDOM2
        set type emac-vlan
        set interface port1
    next
    edit port1.emacvlan3
        set vdom VDOM3
        set type emac-vlan
        set interface port1
    next
end
```

Example 2: Enhanced MAC VLAN configuration for shared VDOM links among multiple VDOMs

In this example, multiple VDOMs can connect to each other using enhanced MAC VLAN on network processing unit (NPU) virtual link (Vlink) interfaces.

FortiGate VDOM links (NPU-Vlink) are designed to be peer-to-peer connections and VLAN interfaces on NPU Vlink ports use the same MAC address. Connecting more than two VDOMs using NPU Vlinks and VLAN interfaces is not recommended.



To configure enhanced MAC VLAN for this example in the CLI:

```
config system interface
    edit npu0_vlink0.emacvlan1
        set vdom VDOM1
        set type emac-vlan
        set interface npu0_vlink0
    next
    edit npu0_vlink0.emacvlan2
        set vdom VDOM3
        set type emac-vlan
        set interface npu0_vlink0
    next
    edit npu0_vlink1.emacvlan1
        set vdom VDOM2
        set type emac-vlan
        set interface npu0_vlink1
```

```
    next
end
```

Example 3: Enhanced MAC VLAN configuration for unique MAC addresses for each VLAN interface on the same physical port

Some networks require a unique MAC address for each VLAN interface when the VLAN interfaces share the same physical port. In this case, the enhanced MAC VLAN interface is used the same way as normal VLAN interfaces.

To configure this, use the `set vlanid` command for the VLAN tag. The VLAN ID and interface must be a unique pair, even if they belong to different VDOMs.

To configure enhanced MAC VLAN:

```
config system interface
    edit <interface-name>
        set type emac-vlan
        set vlanid <VLAN-ID>
        set interface <physical-interface>
    next
end
```

Inter-VDOM routing

VDOM links allow VDOMs to communicate internally without using additional physical interfaces.

Inter-VDOM routing is the communication between VDOMs. VDOM links are virtual interfaces that connect VDOMs. A VDOM link contains a pair of interfaces, each one connected to a VDOM and forming either end of the inter-VDOM connection.

When VDOMs are configured on your FortiGate unit, configuring inter-VDOM routing and VDOM links is like creating a VLAN interface. VDOM links can be managed in either the CLI or in the network interface list in the GUI.

VDOM link does not support traffic offload. If you want to use traffic offload, use NPU-VDOM-LINK.

To configure a VDOM link in the GUI:

1. In the Global VDOM, go to *Network* > *Interfaces*.
2. Click *Create New* > *VDOM Link*.
3. Configure the fields, including the *Name*, *Virtual Domain*, IP information, *Administrative Access*, and others, then click *OK*.

By default, VDOM links are created as point-to-point (ppp) links. If required, the link type can be changed in the CLI.

For example, when running OSPF in IPv6, a link-local address is required in order to communicate with OSPF neighbors. For a VDOM link to obtain a link-local address its type must be set to `ethernet`.

To configure a VDOM link in the CLI:

```
config global
    config system vdom-link
        edit "<vdom-link-name>"
            set type {ppp | ethernet}
        next
    end
    config system interface
        edit "<vdom-link-name0>"
            set vdom "<VDOM Name>"
            set type vdom-link
        next
        edit "<vdom-link-name1>"
            set vdom "<VDOM Name>"
            set type vdom-link
        next
    end
end
```

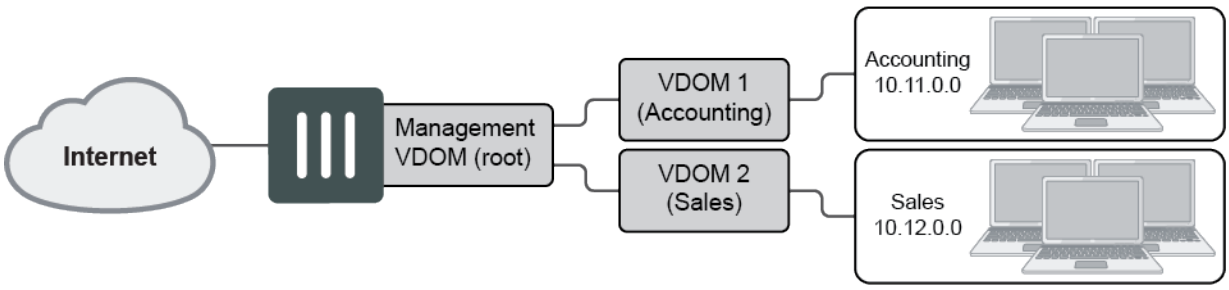
To delete a VDOM link in the GUI:

1. In the Global VDOM, go to *Network* > *Interfaces*.
2. Select a *VDOM Link* and click *Delete*.

To delete a VDOM link in the CLI:

```
config global
    config system vdom-link
        delete <VDOM-LINK-Name>
    end
end
```

Example



This example shows how to configure a FortiGate unit to use inter-VDOM routing.

Two departments of a company, Accounting and Sales, are connected to one FortiGate. The company uses a single ISP to connect to the Internet.

This example includes the following general steps. We recommend following the steps in the order below.

Create the VDOMs

To enable VDOMs:

```
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the device when VDOM mode is enabled.

To create the Sales and Accounting VDOMs:

```
config global
    config vdom
        edit Accounting
        next
        edit Sales
        next
    end
end
```

Configure the physical interfaces

Next, configure the physical interfaces. This example uses three interfaces on the FortiGate unit: port2 (internal), port3 (DMZ), and port1 (external). Port2 and port3 interfaces each have a department's network connected. Port1 is for all traffic to and from the Internet and uses DHCP to configure its IP address, which is common with many ISPs.

To configure the interfaces:

```
config global
    config system interface
        edit port2
            set alias AccountingLocal
            set vdom Accounting
            set mode static
            set ip 172.100.1.1 255.255.0.0
            set allowaccess https ping ssh
            set description "The accounting dept. internal interface"
        next
        edit port3
            set alias SalesLocal
            set vdom Sales
            set mode static
            set ip 192.168.1.1 255.255.0.0
            set allowaccess https ping ssh
            set description "The sales dept. internal interface"
        next
        edit port1
            set alias ManagementExternal
            set vdom root
            set mode dhcp
            set allowaccess https ssh snmp
            set description "The system wide management interface."
        next
```

```
    end
end
```

Configure the VDOM links

To complete the connection between each VDOM and the management VDOM, add the two VDOM links. One pair is the Accounting – management link and the other is the Sales – management link.

When configuring inter-VDOM links, you do not have to assign IP addresses to the links unless you are using advanced features such as dynamic routing that require them. Not assigning IP addresses results in faster configuration and more available IP addresses on your networks.

To configure the Accounting and management VDOM link:

```
config global
    config system vdom-link
        edit AccountVlnk
        next
    end
    config system interface
        edit AccountVlnk0
            set vdom Accounting
            set ip 11.11.11.2 255.255.255.0
            set allowaccess https ping ssh
            set description "Accounting side of the VDOM link"
        next
        edit AccountVlnk1
            set vdom root
            set ip 11.11.11.1 255.255.255.0
            set allowaccess https ping ssh
            set description "Management side of the VDOM link"
        next
    end
end
```

To configure the Sales and management VDOM link:

```
config global
    config system vdom-link
        edit SalesVlnk
        next
    end
    config system interface
        edit SalesVlnk0
            set vdom Sales
            set ip 12.12.12.2 255.255.255.0
            set allowaccess https ping ssh
            set description "Sales side of the VDOM link"
        next
        edit SalesVlnk1
            set vdom root
            set ip 12.12.12.1 255.255.255.0
            set allowaccess https ping ssh
            set description "Management side of the VDOM link"
        next
```

```
    end
end
```

Configure the firewall and security profile

With the VDOMs, physical interfaces, and VDOM links configured, the firewall must now be configured to allow the proper traffic. Firewalls are configured per-VDOM, and firewall objects and routes must be created for each VDOM separately.

To configure the firewall policies from AccountingLocal to Internet:

```
config vdom
    edit Accounting
        config firewall policy
            edit 1
                set name "Accounting-Local-to-Management"
                set srcintf port2
                set dstintf AccountVlnk0
                set srcaddr all
                set dstaddr all
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
    edit root
        config firewall policy
            edit 2
                set name "Accounting-VDOM-to-Internet"
                set srcintf AccountVlnk1
                set dstintf port1
                set srcaddr all
                set dstaddr all
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
end
```

To configure the firewall policies from SalesLocal to the Internet:

```
config vdom
    edit Sales
        config firewall policy
            edit 3
                set name "Sales-local-to-Management"
                set srcintf port3
                set dstintf SalesVlnk0
                set srcaddr all
                set dstaddr all
```

```
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
    edit root
        config firewall policy
            edit 4
                set name "Sales-VDOM-to-Internet"
                set srcintf SalesVlnk1
                set dstintf port1
                set srcaddr all
                set dstaddr all
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
end
```

Test the configuration

When the inter-VDOM routing has been configured, test the configuration to confirm proper operation. Testing connectivity ensures that physical networking connections, FortiGate unit interface configurations, and firewall policies are properly configured.

The easiest way to test connectivity is to use the `ping` and `traceroute` commands to confirm the connectivity of different routes on the network.

Test both from AccountingLocal to the internet and from SalesLocal to the internet.

Software switch

A software switch is a virtual switch that is implemented at the software or firmware level and not at the hardware level. A software switch can be used to simplify communication between devices connected to different FortiGate interfaces. For example, using a software switch, you can place the FortiGate interface connected to an internal network on the same subnet as your wireless interfaces. Then devices on the internal network can communicate with devices on the wireless network without any additional configuration on the FortiGate unit, such as additional security policies.

A software switch can also be useful if you require more hardware ports for the switch on a FortiGate unit. For example, if your FortiGate unit has a 4-port switch, WAN1, WAN2, and DMZ interfaces, and you need one more port, you can create a soft switch that can include the four-port switch and the DMZ interface, all on the same subnet. These types of applications also apply to wireless interfaces, virtual wireless interfaces, and physical interfaces such as those in FortiWiFi and FortiAP units.

Similar to a hardware switch, a software switch functions like a single interface. It has one IP address and all the interfaces in the software switch are on the same subnet. Traffic between devices connected to each interface are not regulated by security policies, and traffic passing in and out of the switch are controlled by the same policy.

When setting up a software switch, consider the following:

- Ensure that you have a back up of the configuration.
- Ensure that you have at least one port or connection, such as the console port, to connect to the FortiGate unit. If you accidentally combine too many ports, you need a way to undo errors.
- The ports that you include must not have any link or relation to any other aspect of the FortiGate unit, such as DHCP servers, security policies, and so on.
- For increased security, you can create a captive portal for the switch to allow only specific user groups access to the resources connected to the switch.

Some of the difference between software and hardware switches are:

Feature	Software switch	Hardware switch
Processing	Packets are processed in software by the CPU.	Packets are processed in hardware by the hardware switch controller, or SPU where applicable.
STP	Not Supported	Supported
Wireless SSIDs	Supported	Not Supported
Intra-switch traffic	Allowed by default. Can be explicitly set to require a policy.	Allowed by default.

To create a software switch in the GUI:

1. Go to *Network* > *Interfaces*.
2. Click *Create New* > *Interface*.
3. Set *Type* to *Software Switch*.
4. Configure the *Name*, *Interface members*, and other fields as required.
   To add an interface to a software switch, it cannot be referenced by an existing configuration and its IP address must be set to 0.0.0.0/0.0.0.0.
5. Click *OK*.

To create a software switch in the CLI:

```
config system switch-interface
    edit <interface>
        set vdom <vdom>
        set member <interface_list>
        set type switch
    next
end
config system interface
    edit <interface>
        set vdom <vdom>
        set type switch
        set ip <ip_address>
        set allowaccess https ssh ping
    next
end
```

To add an interface to a software switch, it cannot be referenced by an existing configuration and its IP address must be set to 0.0.0.0/0.0.0.0.

Example

For this example, the wireless interface (WiFi) needs to be on the same subnet as the DMZ1 interface to facilitate wireless synchronizing from an iPhone and a local computer. Because synchronizing between two subnets is problematic, putting both interfaces on the same subnet allows the synchronizing will work. The software switch will accomplish this.

1. Clear the interfaces and back up the configuration:
   a. Ensure the interfaces are not used for other security policy or for other use on the FortiGate unit.
   b. Check the WiFi and DMZ1 ports to ensure that DHCP is not enabled and that there are no other dependencies on these interfaces.
   c. Save the current configuration so that it can be recovered if something foes wrong.
2. Merge the WiFi port and DMZ1 port to create a software switch named `synchro` with an IP address of 10.10.21.12 and administrative access for HTTPS, SSH and PING:

```
config system switch-interface
    edit synchro
        set vdom "root"
        set type switch
        set member dmz1 wifi
    next
end
config system interface
    edit synchro
        set ip 10.10.21.12 255.255.255.0
        set allowaccess https ssh ping
    next
end
```

After the switch is set up, you add security policies, DHCP servers, and any other settings that are required.

Hardware switch

A hardware switch is a virtual switch interface that groups different ports together so that the FortiGate can use the group as a single interface. Supported FortiGate models have a default hardware switch called either *internal* or *lan*. The hardware switch is supported by the chipset at the hardware level.

Ports that are connected to the same hardware switch behave like they are on the same physical switch in the same broadcast domain. Ports can be removed from a hardware switch and assigned to another switch or used as standalone interfaces.

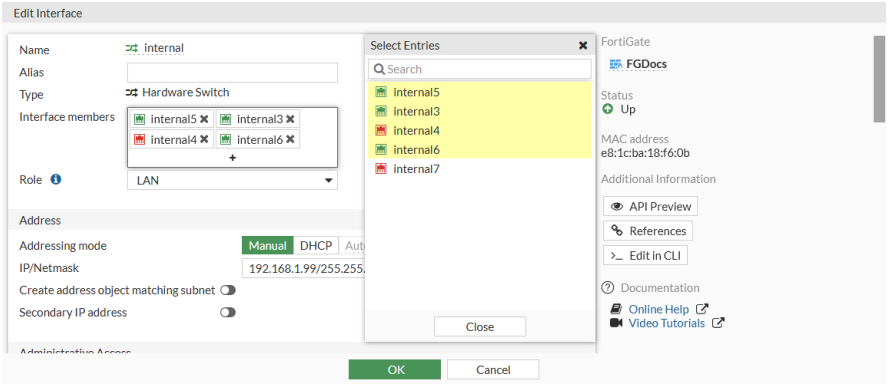
Some of the difference between hardware and software switches are:

Feature	Hardware switch	Software switch
Processing	Packets are processed in hardware by the hardware switch controller, or SPU where applicable.	Packets are processed in software by the CPU.

Feature	Hardware switch	Software switch
STP	Supported	Not Supported
Wireless SSIDs	Not Supported	Supported
Intra-switch traffic	Allowed by default.	Allowed by default. Can be explicitly set to require a policy.

To change the ports in a hardware switch in the GUI:

1. Go to *Network* > *Interface* and edit the hardware switch.
2. Click inside the *Interface members* field.



3. Select interfaces to add or remove them from the hardware switch, then click *Close*.
   To add an interface to a hardware switch, it cannot be referenced by an existing configuration and its IP address must be set to 0.0.0.0/0.0.0.0.
4. Click *OK*.
   Removed interfaces will now be listed as standalone interfaces in the *Physical Interface* section.

To remove ports from a hardware switch in the CLI:

```
config system virtual-switch
    edit "internal"
        config port
            delete internal2
            delete internal7
            ...
        end
    next
end
```

To add ports to a hardware switch in the CLI:

```
config system virtual-switch
    edit "internal"
        set physical-switch "sw0"
        config port
            edit "internal3"
            next
            edit "internal5"
            next
```

```
            edit "internal4"
            next
            edit "internal6"
            next
        end
    next
end
```

To add an interface to a hardware switch, it cannot be referenced by an existing configuration and its IP address must be set to 0.0.0.0/0.0.0.0.

Zone

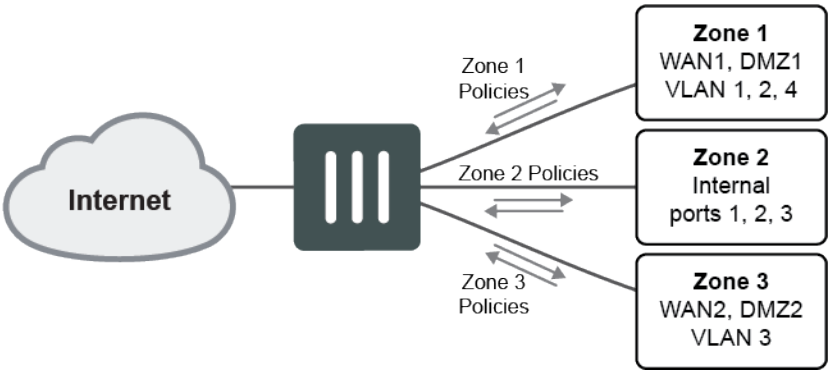
Zones are a group of one or more physical or virtual FortiGate interfaces that you can apply security policies to control inbound and outbound traffic. Grouping interfaces and VLAN subinterfaces into zones simplifies the creation of security policies where a number of network segments can use the same policy settings and protection profiles.

When you add a zone, you select the names of the interfaces and VLAN subinterfaces to add to the zone. Each interface still has its own address. Routing is still done between interfaces, that is, routing is not affected by zones. You can use security policies to control the flow of intra-zone traffic.

For example, in the sample configuration below, the network includes three separate groups of users representing different entities on the company network. While each group has its own set of ports and VLANs in each area, they can all use the same security policy and protection profiles to access the Internet. Rather than the administrator making nine separate security policies, he can make administration simpler by adding the required interfaces to a zone and creating three policies.

Sample configuration

You can configure policies for connections to and from a zone but not between interfaces in a zone. For this example, you can create a security policy to go between zone 1 and zone 3, but not between WAN2 and WAN1, or WAN1 and DMZ1.



To create a zone in the GUI:

1. Go to *Network* > *Interfaces*.

If VDOMs are enabled, go to the VDOM to create a zone.

2. Click *Create New* > *Zone*.
3. Configure the *Name* and add the *Interface Members*.
4. Enable or disable *Block intra-zone traffic* as required.
5. Click *OK*.

To configure a zone to include the internal interface and a VLAN using the CLI:

```
config system zone
    edit zone_1
        set interface internal VLAN_1
        set intrazone {deny | allow}
    next
end
```

Using zone in a firewall policy

To configure a firewall policy to allow any interface to access the Internet using the CLI:

```
config firewall policy
    edit 2
        set name "2"
        set srcintf "Zone_1"
        set dstintf "port15"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Intra-zone traffic

In the zone configuration you can `set intrazone deny` to prohibit the different interfaces in the same zone to talk to each other.

For example, if you have ten interfaces in your zone and the `intrazone` setting is `deny`. You now want to allow traffic between a very small number of networks on different interfaces that are part of the zone but you do not want to disable the intra-zone blocking.

In this example, the zone VLANs are defined as: `192.168.1.0/24`, `192.168.2.0/24`, ... `192.168.10.0/24`.

This policy allows traffic from 192.168.1.x to 192.168.2.x even though they are in the same zone and intra-zone blocking is enabled. The intra-zone blocking acts as a default deny rule and you have to specifically override it by creating a policy within the zone.

To enable intra-zone traffic, create the following policy:

Source Interface	Zone-name, e.g., `Vlans`
Source Address	192.168.1.0/24
Destination	Zone-name (same as Source Interface, i.e., `Vlans`)
Destination Address	192.168.2.0/24

Virtual wire pair

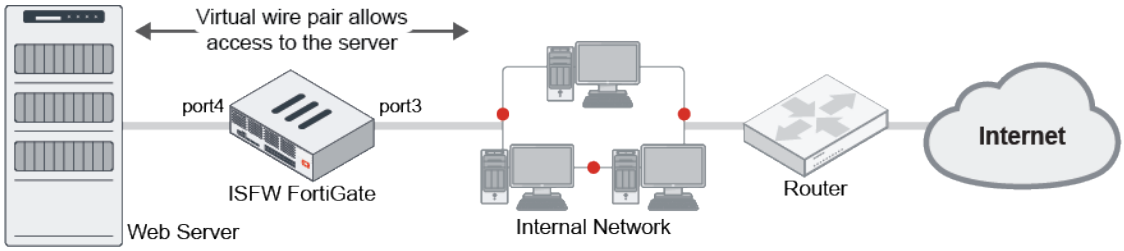
A virtual wire pair consists of two interfaces that do not have IP addressing and are treated like a transparent mode VDOM. All traffic received by one interface in the virtual wire pair can only be forwarded to the other interface, provided a virtual wire pair firewall policy allows this traffic. Traffic from other interfaces cannot be routed to the interfaces in a virtual wire pair. Redundant and 802.3ad aggregate (LACP) interfaces can be included in a virtual wire pair.

Virtual wire pairs are useful for a typical topology where MAC addresses do not behave normally. For example, port pairing can be used in a Direct Server Return (DSR) topology where the response MAC address pair may not match the request's MAC address pair.

Example

In this example, a virtual wire pair (port3 and port4) makes it easier to protect a web server that is behind a FortiGate operating as an Internal Segmentation Firewall (ISFW). Users on the internal network access the web server through the ISFW over the virtual wire pair.

Interfaces used in a virtual wire pair cannot be used to access the ISFW FortiGate. Before creating a virtual wire pair, make sure you have a different port configured to allow admin access using your preferred protocol.



To add a virtual wire pair using the GUI:

1. Go to *Network* > *Interfaces*.
2. Click *Create New* > *Virtual Wire Pair*.
3. Enter a name for the virtual wire pair.

4. Select the *Interface Members* to add to the virtual wire pair (*port3* and *port 4*).
   These interfaces cannot be part of a switch, such as the default LAN/internal interface.
5. If required, enable *Wildcard VLAN* and set the *VLAN Filter*.
6. Click *OK*.

To add a virtual wire pair using the CLI:

```
config system virtual-wire-pair
    edit "VWP-name"
        set member "port3" "port4"
        set wildcard-vlan disable
    next
end
```

To create a virtual wire pair policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Virtual Wire Pair Policy*.
2. Click *Create New*.
3. In the *Virtual Wire Pair* field, click the + to add the virtual wire pair.
4. Select the direction (arrows) that traffic is allowed to flow.
5. Configure the other settings as needed.
6. Click *OK*.

To create a virtual wire pair policy using the CLI:

```
config firewall policy
    edit 1
        set name "VWP-Policy"
        set srcintf "port3" "port4"
        set dstintf "port3" "port4"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set fsso disable
    next
end
```

Configuring multiple virtual wire pairs in a virtual wire pair policy

You can create a virtual wire pair policy that includes different virtual wire pairs in NGFW profile and policy mode. This reduces overhead to create multiple similar policies for each VWP. In NGFW policy mode, multiple virtual wire pairs can be configured in a *Security Virtual Wire Pair Policy* and *Virtual Wire Pair SSL Inspection & Authentication* policy.

The virtual wire pair settings must have wildcard VLAN enabled. When configuring a policy in the CLI, the virtual wire pair members must be entered in `srcintf` and `dstintf` as pairs.

To configure multiple virtual wire pairs in a policy in the GUI:

1. Configure the virtual wire pairs:
   a. Go to *Network* > *Interfaces* and click *Create New* > *Virtual Wire Pair*.
   b. Create a pair with the following settings:

Name	test-vwp-1
Interface members	wan1, wan2
Wildcard VLAN	Enable

   c. Click *OK*.
   d. Click *Create New* > *Virtual Wire Pair* and create another pair with the following settings:

Name	test-vwp-2
Interface members	port19, port20
Wildcard VLAN	Enable

   e. Click *OK*.
2. Configure the policy:
   a. Go to *Policy & Objects* > *Firewall Virtual Wire Pair Policy* and click *Create New*.
   b. In the *Virtual Wire Pair* field, click the + to add *test-vwp-1* and *test-vwp-2*. Select the direction for each of the selected virtual wire pairs.

   c. Configure the other settings as needed.
   d. Click *OK*.

To configure multiple virtual wire pairs in a policy in the CLI:

1. Configure the virtual wire pairs:

```
config system virtual-wire-pair
    edit "test-vwp-1"
        set member "wan1" "wan2"
        set wildcard-vlan enable
    next
    edit "test-vwp-2"
        set member "port19" "port20"
        set wildcard-vlan enable
    next
end
```

2. Configure the policy:

```
config firewall policy
    edit 1
        set name "vwp1&2-policy"
        set srcintf "port19" "wan1"
        set dstintf "port20" "wan2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

PRP handling in NAT mode with virtual wire pair

PRP (Parallel Redundancy Protocol) is supported in NAT mode for a virtual wire pair. This preserves the PRP RCT (redundancy control trailer) while the packet is processed by the FortiGate.

To configure PRP handling on a device in NAT mode:

1. Enable PRP in the VDOM settings:

```
(root) # config system settings
    set prp-trailer-action enable
end
```

2. Enable PRP in the NPU attributes:

```
(global) # config system npu
    set prp-port-in "port15"
    set prp-port-out "port16"
end
```

3. Configure the virtual wire pair:

```
(root) # config system virtual-wire-pair
    edit "test-vwp-1"
        set member "port15" "port16"
```

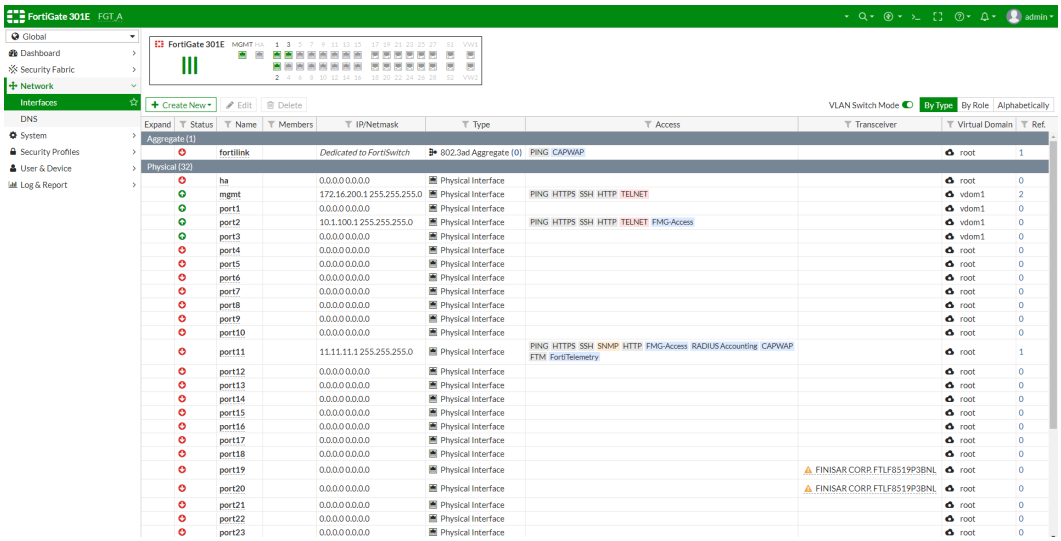
```
    next
end
```

Virtual switch support for FortiGate 300E series

On the FortiGate 300E series, switch ports can be assigned to different VLANs.

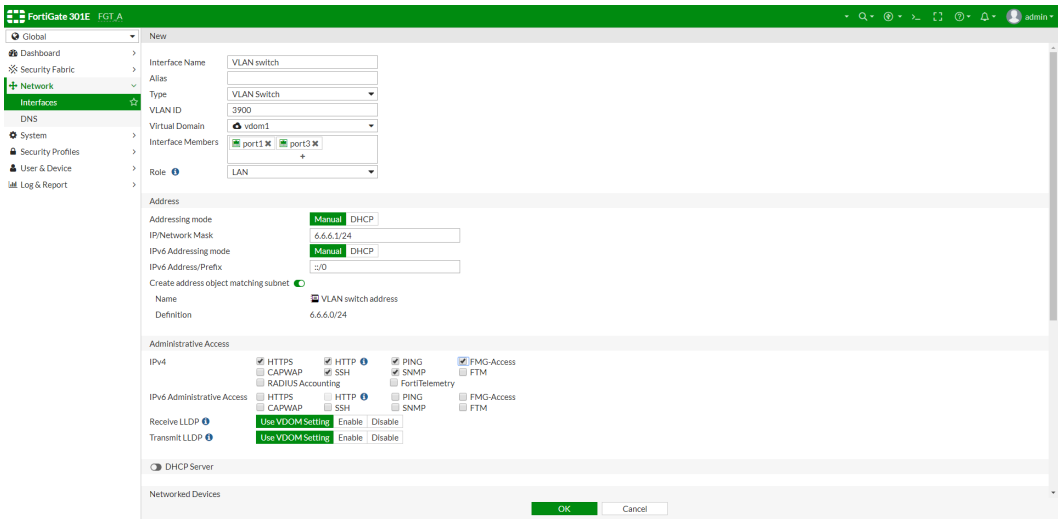
To create a VLAN switch in the GUI:

1. Go to *Network* > *Interfaces* and enable *VLAN Switch Mode*.

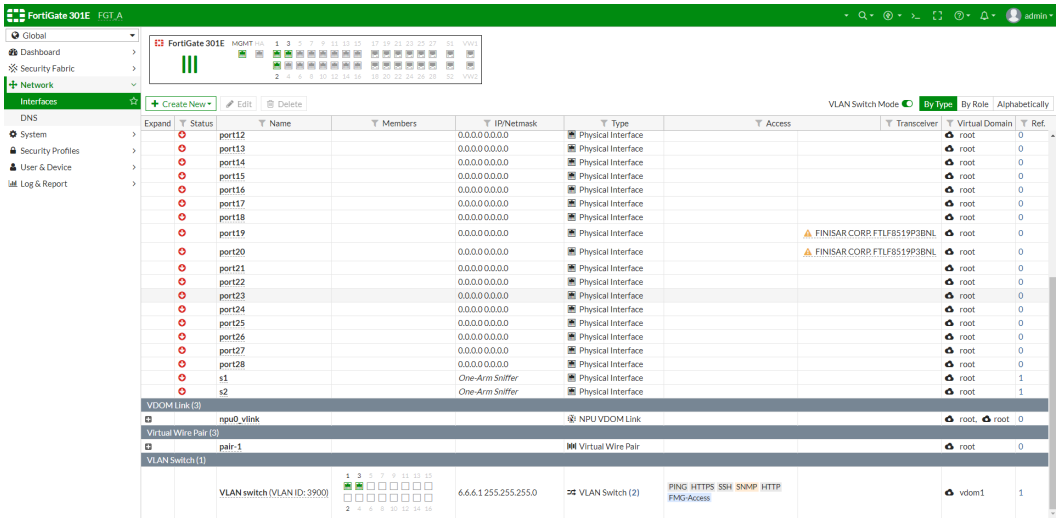


2. Click *Create New* > *Interface*.
3. Enter an interface name and configure the following:
   a. For *Type*, select *VLAN Switch*.
   b. (Optional) Enter a *VLAN ID* (range is 3900–3999).
   c. If applicable, select a *Virtual Domain*.
   d. Add the *Interface Members*.
   e. Configure the *Address* and *Administrative Access* settings as needed.

4. Click *OK*.



The new VLAN switch is visible in the interface table:



To create a VLAN switch in the CLI:

1. Enable VLAN switch mode:

```
config system global
    set virtual-switch-vlan enable
end
```

2. Create the VLAN switch. Optionally, you can assign an ID to the VLAN:
The default ID is `0`. You can use the default ID, or you can assign an ID to the VLAN (3900–3999).

```
config system virtual-switch
    edit "VLAN switch"
        set physical-switch "sw0"
        set vlan 3900
        config port
            edit "port1"
            next
```

```
            edit "port3"
            next
        end
    next
end
```

3. Configure the VLAN switch interface:

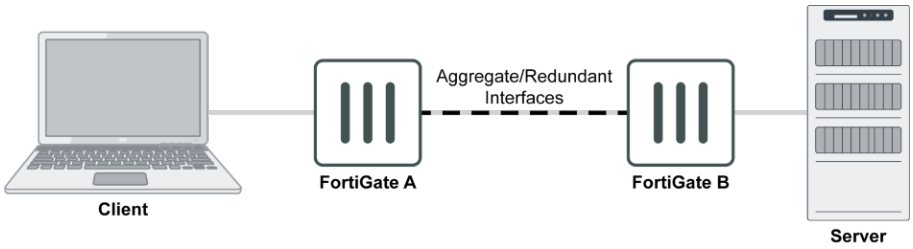
```
config system interface
    edit "VLAN switch"
        set vdom "vdom1"
        set ip 6.6.6.1 255.255.255.0
        set allowaccess ping https ssh snmp http fgfm
        set type hard-switch
        set snmp-index 15
    next
end
```

4. (Optional) Create a trunk interface:

```
config system interface
    edit port2
        set trunk enable
    next
end
```

Failure detection for aggregate and redundant interfaces

When an aggregate or redundant interface goes down, the corresponding fail-alert interface changes to down. When an aggregate or redundant interface comes up, the corresponding fail-alert interface changes to up.



Fail-detect for aggregate and redundant interfaces can be configured using the CLI.

To configure an aggregate interface so that port3 goes down with it:

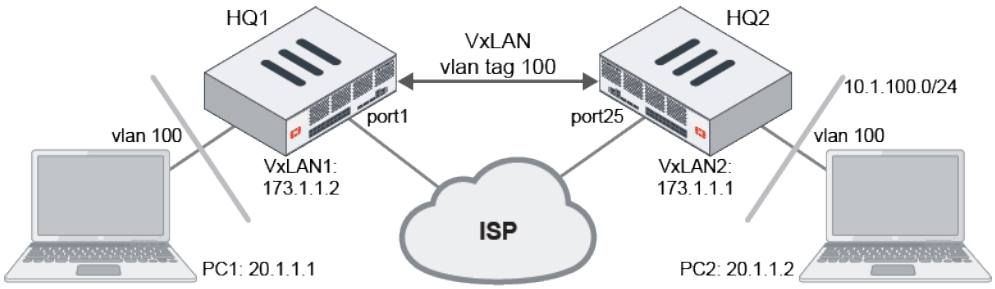
```
config system interface
   edit "agg1"
      set vdom "root"
      set fail-detect enable
      set fail-alert-method link-down
      set fail-alert-interfaces "port3"
      set type aggregate
      set member "port1" "port2"
   next
end
```

To configure a redundant interface so that port4 goes down with it:

```
config system interface
   edit "red1"
      set vdom "root"
      set fail-detect enable
      set fail-alert-method link-down
      set fail-alert-interfaces "port4"
      set type redundant
      set member "port1" "port2"
   next
end
```

VLAN inside VXLAN

VLANs can be assigned to VXLAN interfaces. In a data center network where VXLAN is used to create an L2 overlay network and for multitenant environments, a customer VLAN tag can be assigned to VXLAN interface. This allows the VLAN tag from VLAN traffic to be encapsulated within the VXLAN packet.



To configure VLAN inside VXLAN on HQ1:

1. Configure VXLAN:

```
config system vxlan
   edit "vxlan1"
      set interface port1
      set vni 1000
      set remote-ip 173.1.1.1

   next
end
```

2. Configure system interface:

```
config system interface
   edit vlan100
     set vdom root
     set vlanid 100
     set interface dmz
   next
   edit vxlan100
     set type vlan
     set vlanid 100
     set vdom root
     set interface vxlan1
```

```
   next
end
```

3. Configure software-switch:

```
config system switch-interface
   edit sw1
      set vdom root
      set member vlan100 vxlan100
      set intra-switch-policy implicit
   next
end
```

The default `intra-switch-policy implicit` behavior allows traffic between member interfaces within the switch. Therefore, it is not necessary to create firewall policies to allow this traffic.

Instead of creating a software-switch, it is possible to use a virtual-wire-pair as well. See Virtual wire pair with VXLAN on page 157.

To configure VLAN inside VXLAN on HQ2:

1. Configure VXLAN:

```
config system vxlan
   edit "vxlan2"
      set interface port25
      set vni 1000
      set remote-ip 173.1.1.2
   next
end
```

2. Configure system interface:

```
config system interface
      edit vlan100
      set vdom root
      set vlanid 100
      set interface port20
   next
   edit vxlan100
      set type vlan
      set vlanid 100
      set vdom root
      set interface vxlan2
   next
end
```

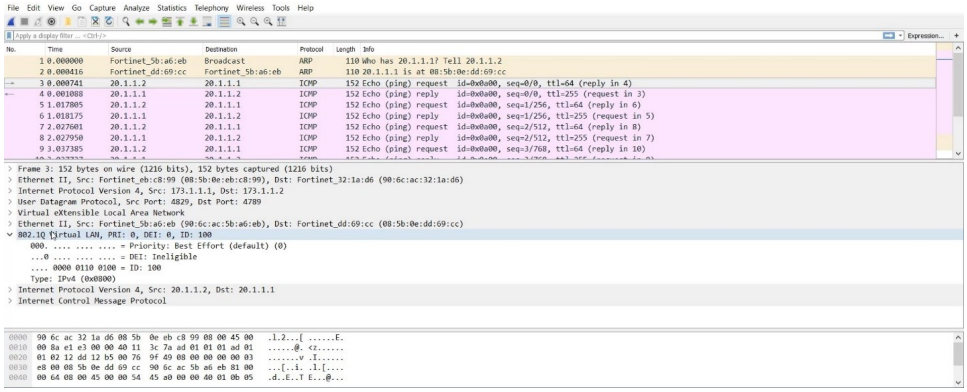
3. Configure software-switch:

```
config system switch-interface
   edit sw1
      set vdom root
      set member vlan100 vxlan100
   next
end
```

To verify the configuration:

Ping PC1 from PC2.

The following is captured on HQ2:

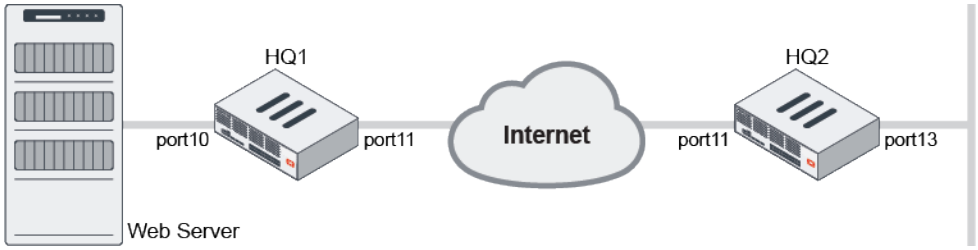


This captures the VXLAN traffic between 172.1.1.1 and 172.1.1.2 with the VLAN 100 tag inside.

Virtual wire pair with VXLAN

Virtual wire pairs can be used with VXLAN interfaces.

In this examples, VXLAN interfaces are added between FortiGate HQ1 and FortiGate HQ2, a virtual wire pair is added in HQ1, and firewall policies are created on both HQ1 and HQ2.



To create VXLAN interface on HQ1:

```
config system interface
    edit "port11"
        set vdom "root"
        set ip 10.2.2.1 255.255.255.0
        set allowaccess ping https ssh snmp telnet
    next
end
config system vxlan
    edit "vxlan1"
        set interface "port11"
        set vni 1000
        set remote-ip "10.2.2.2"
    next
end
```

To create VXLAN interface on HQ2:

```
config system interface
    edit "port11"
        set vdom "root"
        set ip 10.2.2.2 255.255.255.0
        set allowaccess ping https ssh snmp http
    next
end
config system vxlan
    edit "vxlan1"
        set interface "port11"
        set vni 1000
        set remote-ip "10.2.2.1"
    next
end
config system interface
    edit "vxlan1"
        set vdom "root"
        set ip 10.1.100.2 255.255.255.0
        set allowaccess ping https ssh snmp
    next
end
```

To create a virtual wire pair on HQ1:

```
config system virtual-wire-pair
    edit "vwp1"
        set member "port10" "vxlan1"
    next
end
```

To create a firewall policy on HQ1:

```
config firewall policy
    edit 5
        set name "vxlan-policy"
        set srcintf "port10" "vxlan1"
        set dstintf "port10" "vxlan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set webfilter-profile "default"
        set dnsfilter-profile "default"
        set ips-sensor "default"
        set application-list "default"
        set fsso disable
    next
end
```

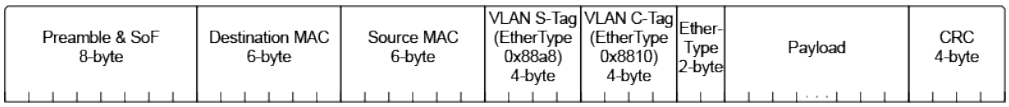
To create a firewall policy on HQ2:

```
config firewall policy
    edit 5
        set name "1"
        set srcintf "port13"
        set dstintf "vxlan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set nat enable
    next
end
```

QinQ

QinQ (802.1ad) allows multiple VLAN tags to be inserted into a single frame, and can be configured on supported FortiGate devices.

In this example, the customer connects to a provider that uses 802.1ad double-tagging to separate their customer VLANs. The FortiGate connecting to the provider double-tags its frames with an outer provider-tag (S-Tag) and an inner customer-tag (C-Tag).



The customer identifies itself with the provider-tag (S-Tag) 232 and uses the customer-tag (C-Tag) 444 for traffic to its VLAN.

To configure the interfaces:

1. Configure the interface to the provider that uses the outer tag (S-Tag):

```
config system interface
    edit "vlan-8021ad"
        set vdom "root"
        set vlan-protocol 8021ad
        set device-identification enable
        set role lan
        set snmp-index 47
        set interface "PORT"
        set vlanid 232
    next
end
```

2. Configure a dynamic VLAN interface that uses the inner tag (C-Tag):

```
config system interface
    edit "DVLAN"
        set vdom "vdom1"
        set device-identification enable
```

```
            set role lan
            set snmp-index 48
            set interface "vlan-8021ad"
            set vlanid 444
        next
    end
```

Assign a subnet with the FortiIPAM service

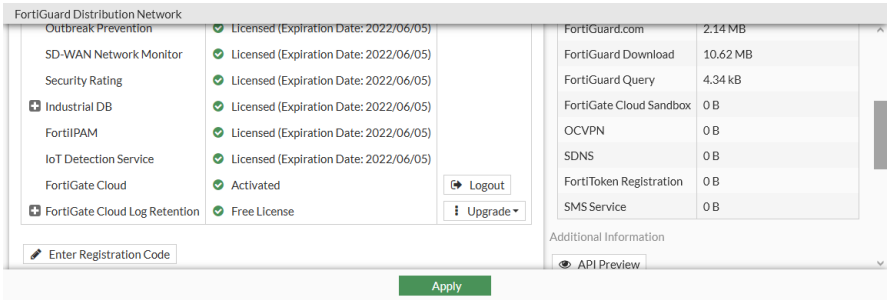
The FortiIPAM (IP Address Management) service automatically assigns subnets to FortiGate to prevent duplicate IP addresses from overlapping within the same Security Fabric.

After the FortiIPAM registration is synced to FortiGuard from FortiCare, FortiGate can use FortiIPAM to automatically assign IP addresses based on the configured network size for the FortiGate interface.

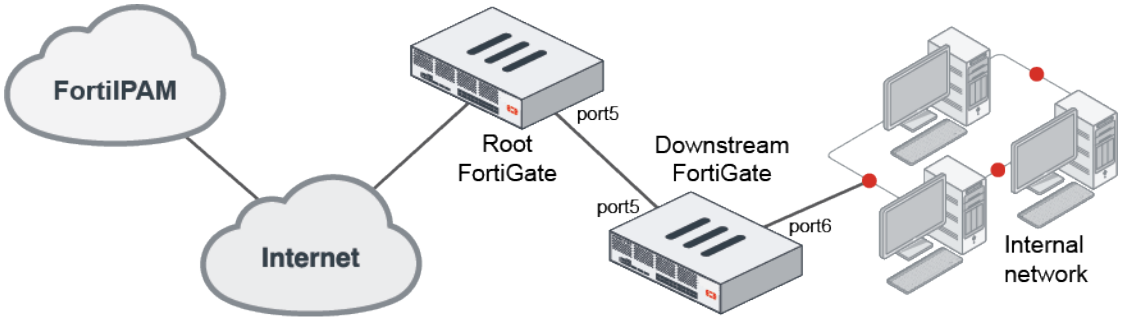
FortiIPAM is a paid service, and must be registered to the FortiGate in FortiCare.

To verify the FortiIPAM service registration:

1. Go to *System* > *FortiGuard*.
2. Find the *FortiIPAM* row and confirm that the FortiIPAM service is registered.



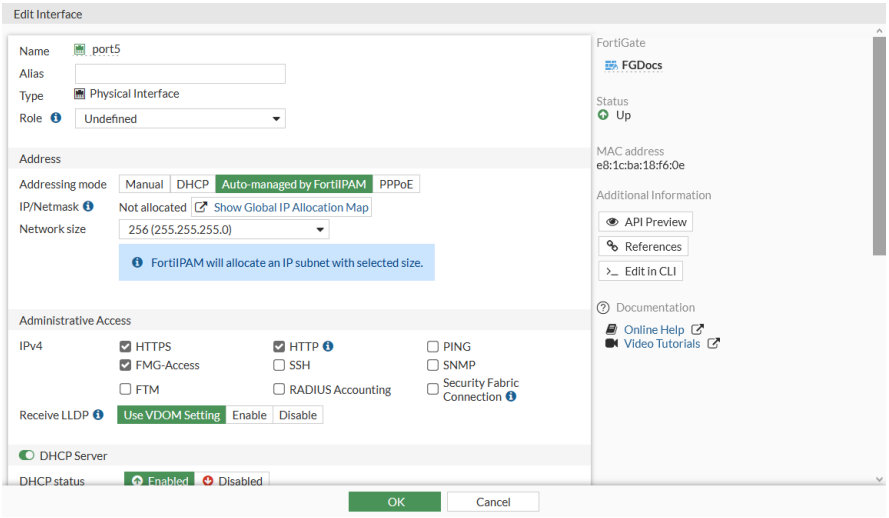
Example



In this example, port5 on the root FortiGate is configured to be managed by FortiIPAM, with DHCP to supply IP address to the network. The downstream FortiGate gets its IP address from the DHCP, and then uses FortiIPAM to assign IP addresses to the internal network.

To configure the interface on the root FortiGate in the GUI:

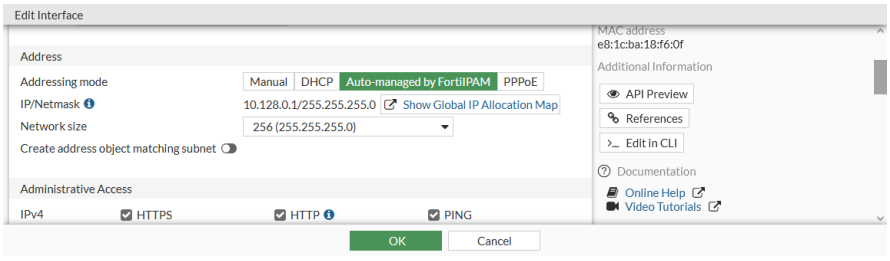
1. Go to *Network* > *Interfaces* and edit port5.
2. Set *Role* to *LAN*.
3. Set *Addressing mode* to *Auto-managed by FortiIPAM*.
4. Set *Network size* as needed.
5. Enable *DHCP Server*. The DHCP settings will be configured by FortiIPAM.



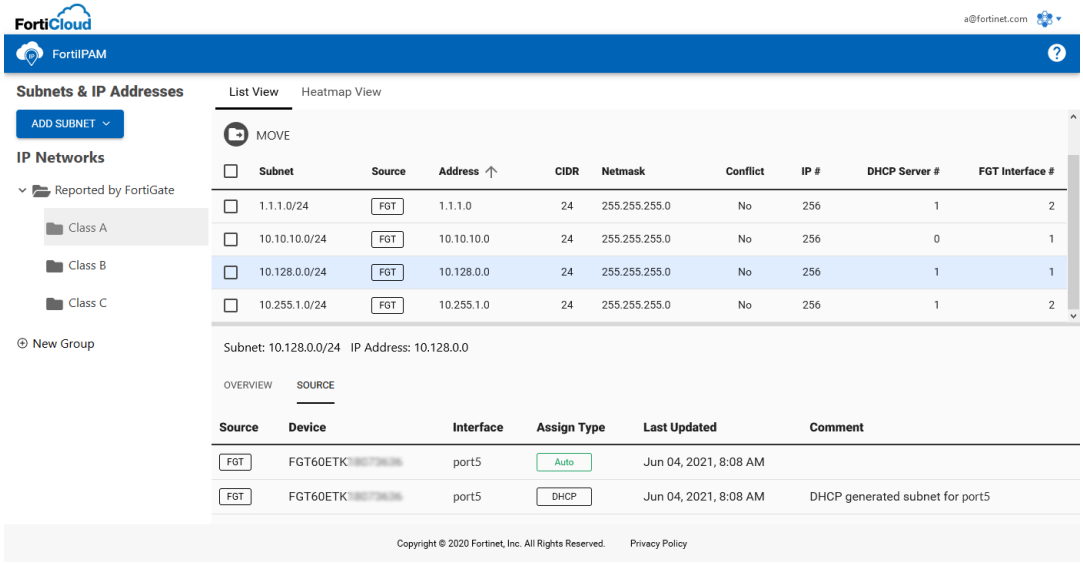
6. Click *OK*.

To view the IP allocation map in the GUI:

1. Go to *Network* > *Interfaces* and edit port5.
   The interface should have received an IP address from FortiIPAM.



2. Click *Show Global IP Allocation Map*. FortiCloud opens in your default browser.
3. Click *Login* and log in to FortiCloud.
4. In the FortiIPAM portal, click on the root FortiGate's subnet then select the *SOURCE* tab.



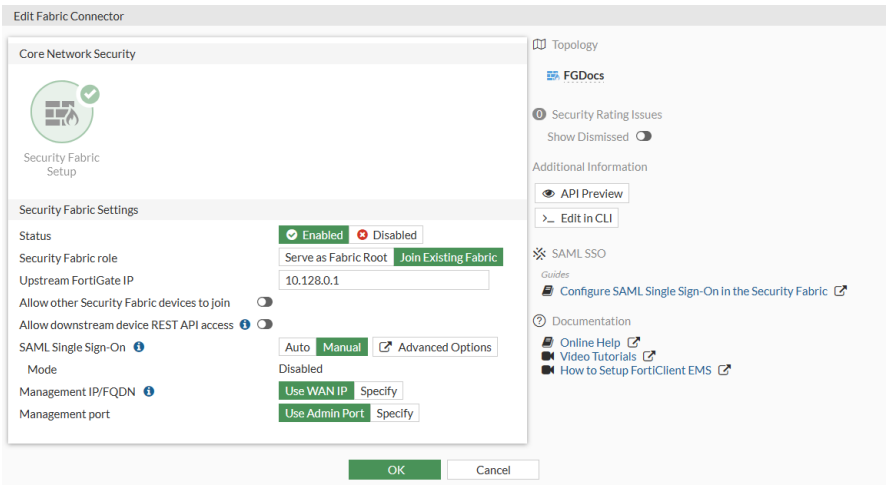
The columns show the device serial number, the interface, how the interface is assigned, and when it was last updated.

To configure DHCP on the downstream FortiGate in the GUI:

1. Go to *System* > *FortiGuard* and verify FortiIPAM is licensed.
2. Go to *Network* > *Interfaces* and edit port5.
3. Set *Addressing mode* to *DHCP*.
4. Click *OK*.
5. Edit port5 again, and confirm that it received an IP address from the DHCP server configured on the root FortiGate.

To add the downstream FortiGate to the Security Fabric in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and edit *Security Fabric Setup*.
2. Set *Status* to *Enabled*.
3. Set *Security Fabric role* to *Join Existing Fabric*.
4. Enter the FortiGate Root IP address as the *Upstream FortiGate IP*.



5. Click *OK*.

To configure the interface that connects to the internal network to use FortiIPAM on the downstream FortiGate in the GUI:

1. Go to *Network* > *Interfaces* and edit port6.
2. Set *Role* to *LAN*.
3. Set *Addressing mode* to *Auto-managed by FortiIPAM*.
4. Set *Network size* as needed.
5. Enable *DHCP Server*. The DHCP settings will be configured by FortiIPAM.
6. Click *OK*.

To view the IP allocation map in the GUI:

1. Go to *Network* > *Interfaces* and edit port6.
2. The interface should have received an IP address from FortiIPAM.
3. Click *Show Global IP Allocation Map*. FortiCloud opens in your default browser.
4. Click *Login*and log in to FortiCloud.
5. In the FortiIPAM portal, click on a subnet and confirm that the IP address is different than the root FortiGate's IP address.

To configure FortiIPAM in the CLI:

1. Verify the FortiIPAM service registration:

```
# diagnose test update info
...
System contracts:
...
    IPMC,Mon Jun  6 17:00:00 2022
...
```

2. Configure the interface on the root FortiGate:

```
config system interface
    edit "port5"
```

```
        set vdom "root"
        set ip-managed-by-fortiipam enable
        set managed-subnetwork-size 256
    next
end

config system dhcp server
    edit 1
        set interface "port5"
        set dhcp-settings-from-fortiipam enable
    next
end
```

3. View the IP address and DHCP information from the FortiIPAM:

```
# show system interface
config system interface
    edit "port5"
        set vdom "root"
        set ip 10.128.1.1 255.255.255.0
        set type physical
        set device-identification enable
        set lldp-transmission enable
        set role lan
        set snmp-index 4
        set ip-managed-by-fortiipam enable
    next
end

# show system dhcp server
config system dhcp server
    edit 1
        set dns-service default
        set default-gateway 10.128.0.1
        set netmask 255.255.255.0
        set interface "port5"
        config ip-range
            edit 1
                set start-ip 10.128.0.1
                set end-ip 10.128.0.254
            next
        end
        set dhcp-settings-from-fortiipam enable
        config exclude-range
            edit 1
                set start-ip 10.128.0.1
                set end-ip 10.128.0.1
            next
        end
    next
end
```

4. Configure DHCP on the downstream FortiGate:

```
config system interface
    edit "port5"
        set mode dhcp
```

```
    next
end
```

5. Add the downstream FortiGate to the Security Fabric

```
config system csf
    set status enable
    set upstream-ip 10.128.0.1
end
```

6. On the downstream FortiGate, configure the interface that connects to the internal network to use FortiIPAM:

```
config system interface
    edit "port6"
        set ip-managed-by-fortiipam enable
        set managed-subnetwork-size 512
    next
end
```

```
config system dhcp server
    edit 1
        set interface "port6"
        set dhcp-settings-from-fortiipam enable
    next
end
```

You can also use the REST API to view the FortiIPAM service information:

```
https://172.16.116.xxx/api/v2/monitor/license/status
..."fortiipam_cloud":{
    "type":"live_cloud_service",
    "status":"licensed",
    "expires":1618531200,
    "entitlement":"IPMC"
}
```

Configure a VRF ID on an interface

From the *Network* > *Interfaces* page, users can configure VRF (virtual routing and forwarding) IDs directly on the interface. The VRF IDs can be displayed in the routing monitor and can be used to create blackhole static routes.

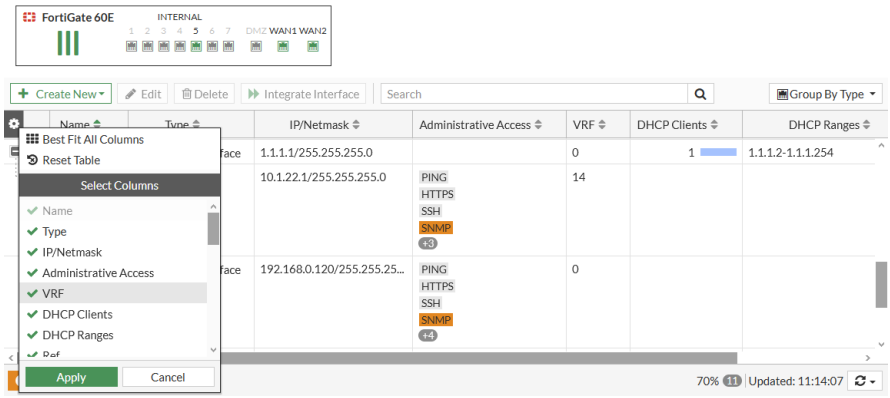
VRF allows multiple routing table instances to co-exist on the same router. One or more interfaces may have a VRF, and packets are only forwarded between interfaces with the same VRF.

Enable *Advanced Routing* in *System* > *Feature Visibility* to use this feature.

To configure a VRF ID in the GUI:

1. Configure the interface:
   a. Go to *Network* > *Interfaces* and click *Create New* > *Interface*.
   b. Enter a value in the VRF ID field.
   c. Configure the other settings as needed.

   d. Click *OK*.
   e. To add the VRF column in the interface table, click the gear icon, select *VRF*, and click *Apply*.



2. Add a blackhole static route using the VRF ID:
   a. Go to *Network* > *Static Routes* and click *Create New*.
   b. Enter the subnet.
   c. In the *Interface* field, select *Blackhole*.
   d. In the *VRF ID* field, enter the ID you created in step 1.

   e. Click *OK*.

To configure a VRF ID in the CLI:

1. Configure the interface:

```
config system interface
    edit interface42
        ...
        set vrf 14
    next
end
```

2. Add a blackhole static route using the VRF ID:

```
config router static
    edit 3
        set dst 8.8.8.8 255.255.255.255
        set blackhole enable
        set vrf 14
    next
end
```

Interface MTU packet size

Changing the maximum transmission unit (MTU) on FortiGate interfaces changes the size of transmitted packets. Most FortiGate device's physical interfaces support jumbo frames that are up to 9216 bytes, but some only support 9000 or 9204 bytes.

To avoid fragmentation, the MTU should be the same as the smallest MTU in all of the networks between the FortiGate and the destination. If the packets sent by the FortiGate are larger than the smallest MTU, then they are fragmented, slowing down the transmission. Packets with the DF flag set in the IPv4 header are dropped and not fragmented .

On many network and endpoint devices, the path MTU is used to determine the smallest MTU and to transmit packets within that size.

- ASIC accelerated FortiGate interfaces, such as NP6, NP7, and SOC4 (np6xlite), support MTU sizes up to 9216 bytes.
- FortiGate VMs can have varying maximum MTU sizes, depending on the underlying interface and driver.
- Virtual interfaces, such as VLAN interfaces, inherit their MTU size from their parent interface.

To verify the supported MTU size:

```
config system interface
    edit <interface>
        set mtu-override enable
        set mtu ?
            <integer>    Maximum transmission unit (<min>-<max>)
    next
end
```

To change the MTU size:

```
config system interface
    edit <interface>
        set mtu-override enable
        set mtu <max bytes>
```

```
    next
end
```

Maximum MTU size on a path

To manually test the maximum MTU size on a path, you can use the ping command on a Windows computer.

For example, you can send ICMP packets of a specific size with a DF flag, and iterate through increasing sizes until the ping fails.

- The `-f` option specifies the Do not Fragment (DF) flag.
- The `-l` option specifies the length, in bytes, of the Data field in the echo Request messages. This does not include the 8 bytes for the ICMP header and 20 bytes for the IP header. Therefore, if the maximum MTU is 1500 bytes, then the maximum supported data size is: 1500 - 8 - 20 = 1472 bytes.

To determine the maximum MTU size on a path:

1. In Windows command prompt, try a likely MTU size:

```
>ping 4.2.2.1 -l 1472 -f
Pinging 4.2.2.1 with 1472 bytes of data:
Reply from 4.2.2.1: bytes=1472 time=41ms TTL=52
Reply from 4.2.2.1: bytes=1472 time=42ms TTL=52
Reply from 4.2.2.1: bytes=1472 time=103ms TTL=52
Reply from 4.2.2.1: bytes=1472 time=38ms TTL=52

Ping statistics for 4.2.2.1:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 38ms, Maximum = 103ms, Average = 56ms
```

2. Increase the size and try the ping again:

```
>ping 4.2.2.1 -l 1473 -f
Pinging 4.2.2.1 with 1473 bytes of data:
Request timed out.

Ping statistics for 4.2.2.1:
    Packets: Sent = 1, Received = 0, Lost = 1 (100% loss),
```

   The second test fails, so the maximum MTU size on the path is 1472 bytes + 8-byte ICMP header + 20-byte IP header = 1500 bytes

Maximum segment size

The TCP maximum segment size (MSS) is the maximum amount of data that can be sent in a TCP segment. The MSS is the MTU size of the interface minus the 20 byte IP header and 20 byte TCP header. By reducing the TCP MSS, you can effectively reduce the MTU size of the packet.

The TCP MSS can be configured in a firewall policy, or directly on an interface.

To configure the MSS in a policy:

```
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set tcp-mss-sender 1448
        set tcp-mss-receiver 1448
    next
end
```

To configure the MSS on an interface:

```
config system interface
    edit "wan2"
        set vdom "root"
        set mode dhcp
        set allowaccess ping fgfm
        set type physical
        set tcp-mss 1448
        set role wan
    next
end
```

One-arm sniffer

You can use a one-arm sniffer to configure a physical interface as a one-arm intrusion detection system (IDS). Traffic sent to the interface is examined for matches to the configured security profile. The matches are logged, and then all received traffic is dropped. Sniffing only reports on attacks; it does not deny or influence traffic.

You can also use the one-arm sniffer to configure the FortiGate to operate as an IDS appliance to sniff network traffic for attacks without actually processing the packets. To configure a one-arm IDS, enable sniffer mode on a physical interface and connect the interface to the SPAN port of a switch or a dedicated network tab that can replicate the traffic to the FortiGate.

If the one-arm sniffer option is not available, this means the interface is in use. Ensure that the interface is not selected in any firewall policies, routes, virtual IPs, or other features where a physical interface is specified. The option also does not appear it the role is set to WAN. Ensure the role is set to LAN, DMZ, or undefined.

The following table lists some of the one-arm sniffer settings you can configure:

Field	Description
Filters	Enable this setting to include filters that define a more granular sniff of network traffic. Select specific hosts, ports, VLANs, and protocols. In all cases, enter a number or range for the filter type. The standard protocols are: • UDP: 17 • TCP: 6

Field	Description
	• ICMP: 1
Include IPv6 Packets	If the network is running IPv4 and IPv6 addresses, enable this setting to sniff both types; otherwise, the FortiGate will only sniff IPv4 traffic.
Include Non-IPv6 Packets	Enable this setting for a more intense content scan of the traffic.
Security Profiles	The following profiles are configurable in the GUI and CLI: • Antivirus • Web filter • Application control • IPS • File filter The following profiles are only configurable in the CLI: • Email filter • DLP • IPS DoS

CPU usage and packet loss

Traffic scanned on the one-arm sniffer interface is processed by the CPU, even if there is an SPU, such as NPU or CP, present. The one-arm sniffer may cause higher CPU usage and perform at a lower level than traditional inline scanning, which uses NTurbo or CP to accelerate traffic when present.

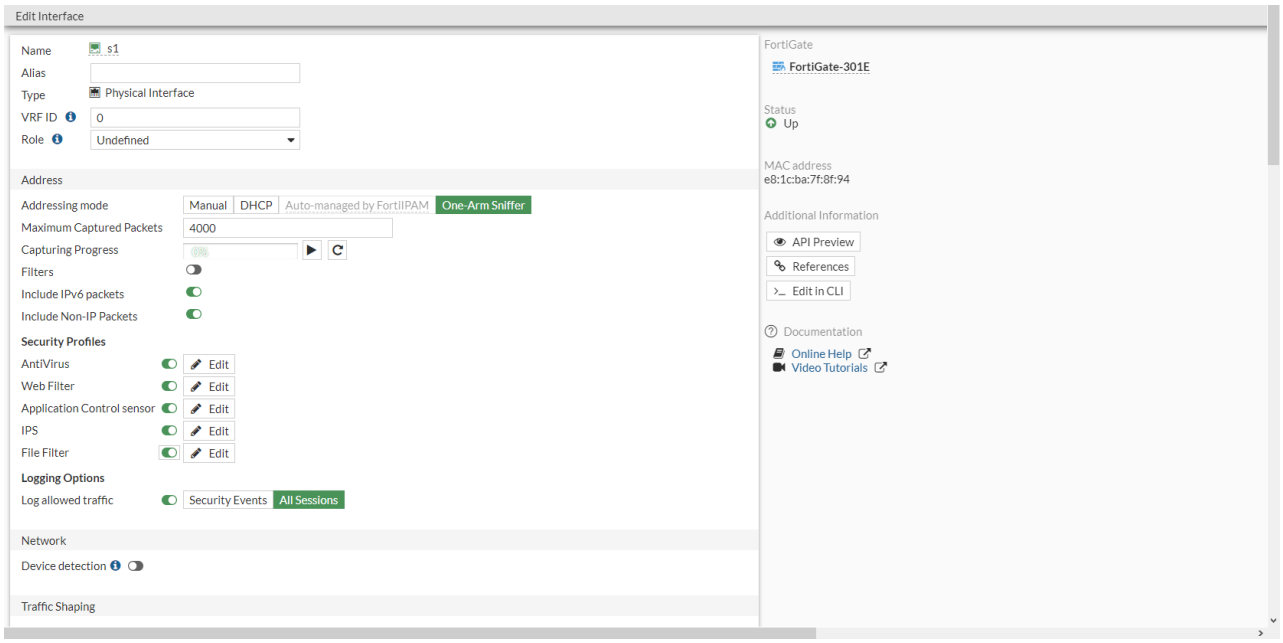
The absence of high CPU usage does not indicate the absence of packet loss. Packet loss may occur due to the capacity of the TAP devices hitting maximum traffic volume during mirroring, or on the FortiGate when the kernel buffer size is exceeded and it is unable to handle bursts of traffic.

Sample configuration

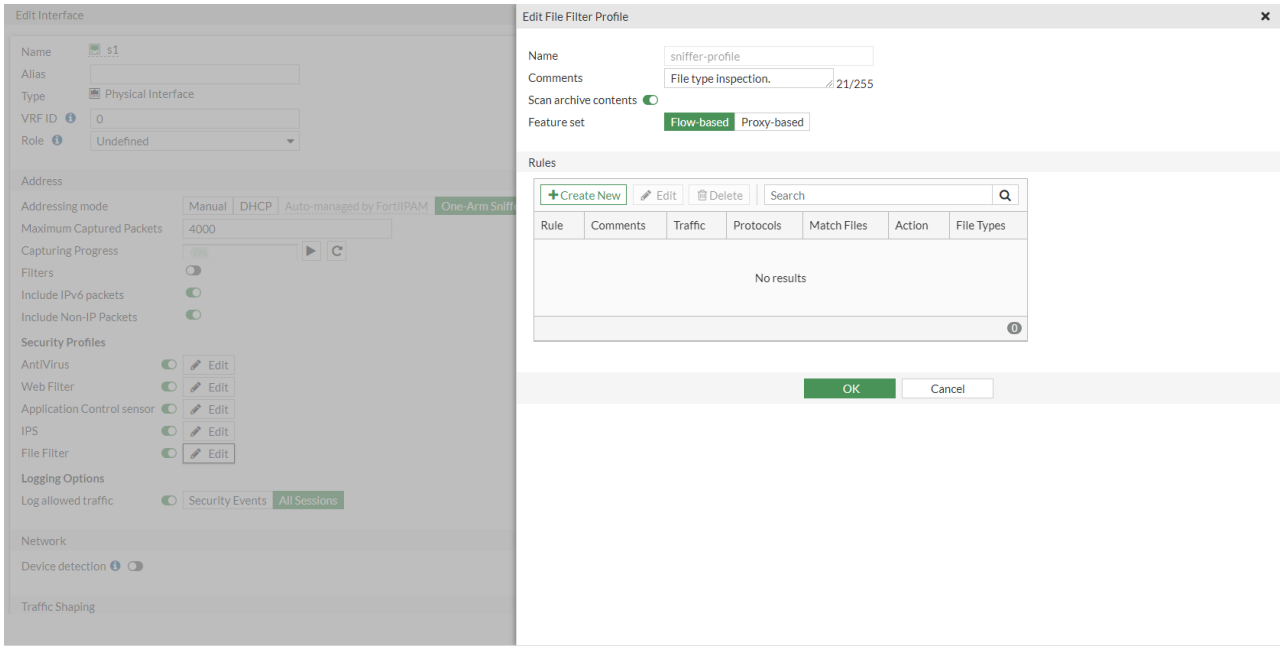
The following example shows how to configure a file filter profile that blocks PDF and RAR files used in a one-arm sniffer policy.

To configure a one-arm sniffer policy in the GUI:

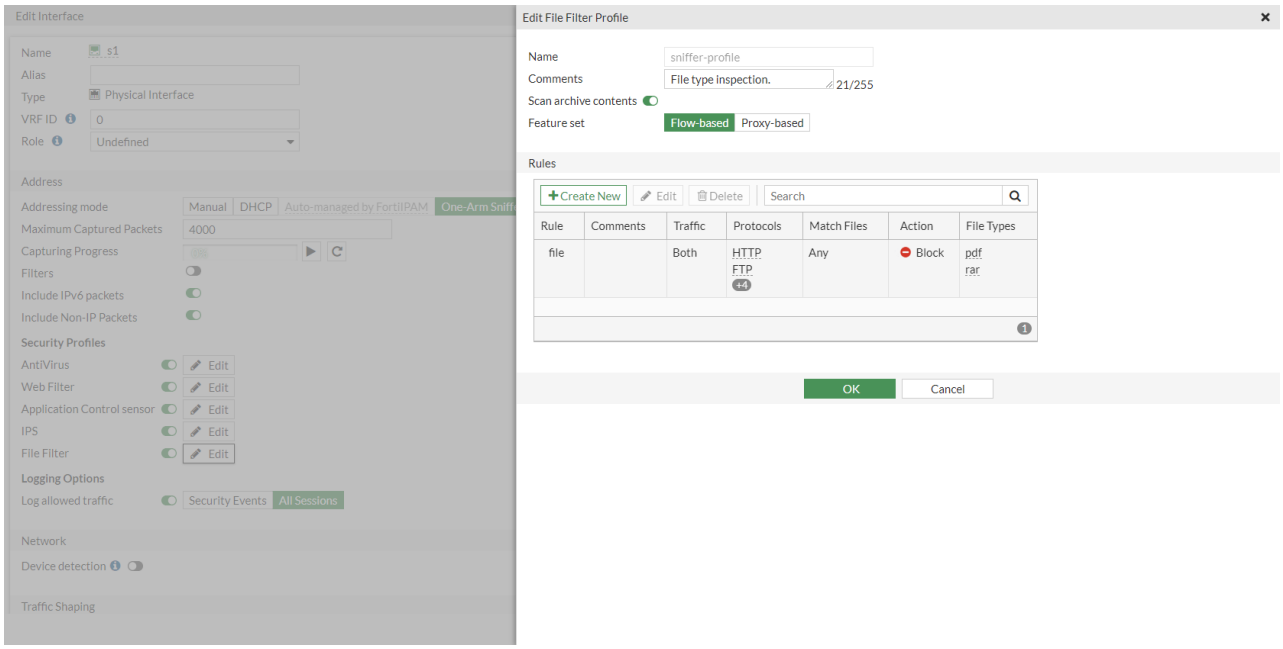
1. Go to *Network* > *Interfaces* and double-click a physical interface to edit it.
2. For *Role*, select either *LAN*, *DMZ*, or *Undefined*.
3. For *Addressing Mode*, select *One-Arm Sniffer*.



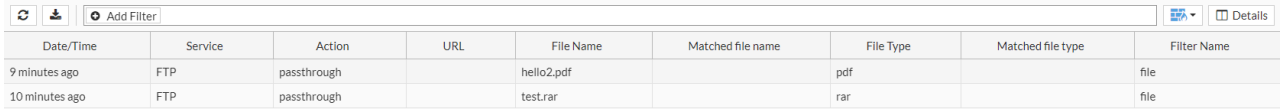
4. In the *Security Profiles* section, enable *File Filter* and click *Edit*. The *Edit File Filter Profile* pane opens.
5. In the *Rules* table, click *Create New*.



6. Configure the rule:
   a. For *File types*, click the + and select *pdf* and *rar*.
   b. For *Action*, select *Block*.
   c. Click *OK* to save the rule.
7. Click *OK* to save the file filter profile.



8. Click *OK* to save the interface settings.
9. Go to *Log & Report* > *File Filter* to view the logs.



To configure a one-arm sniffer policy in the CLI:

1. Configure the interface:

```
config system interface
    edit "s1"
        set vdom "root"
        set ips-sniffer-mode enable
        set type physical
        set role undefined
        set snmp-index 31
    next
end
```

2. Configure the file filter profile:

```
config file-filter profile
    edit "sniffer-profile"
        set comment "File type inspection."
        config rules
            edit "1"
                set protocol http ftp smtp imap pop3 cifs
                set action block
                set file-type "pdf" "rar"
            next
        end
```

```
    next
end
```

3. Configure the firewall sniffer policy:

```
config firewall sniffer
    edit 1
        set interface "s1"
        set file-filter-profile-status enable
        set file-filter-profile "sniffer-profile"
    next
end
```

4. View the log:

```
# execute log filter  category  19
# execute log display
1 logs found.
1 logs returned.

1: date=2020-12-29 time=09:14:46 eventtime=1609262086871379250 tz="-0800"
logid="1900064000" type="utm" subtype="file-filter" eventtype="file-filter"

```

Interface migration wizard

The *Integrate Interface* option on the *Network* > *Interfaces* page helps migrate a physical port into another interface or interface type such as aggregate, software switch, redundant, zone, or SD-WAN zone. The FortiGate will migrate object references either by replacing the existing instance with the new interface, or deleting the existing instance based on the user's choice. Users can also change the VLAN ID of existing VLAN sub-interface or FortiSwitch VLANs.

The interface migration wizard does not support turning an aggregate, software switch, redundant, zone, or SD-WAN zone interface back into a physical interface.

Integrating an interface

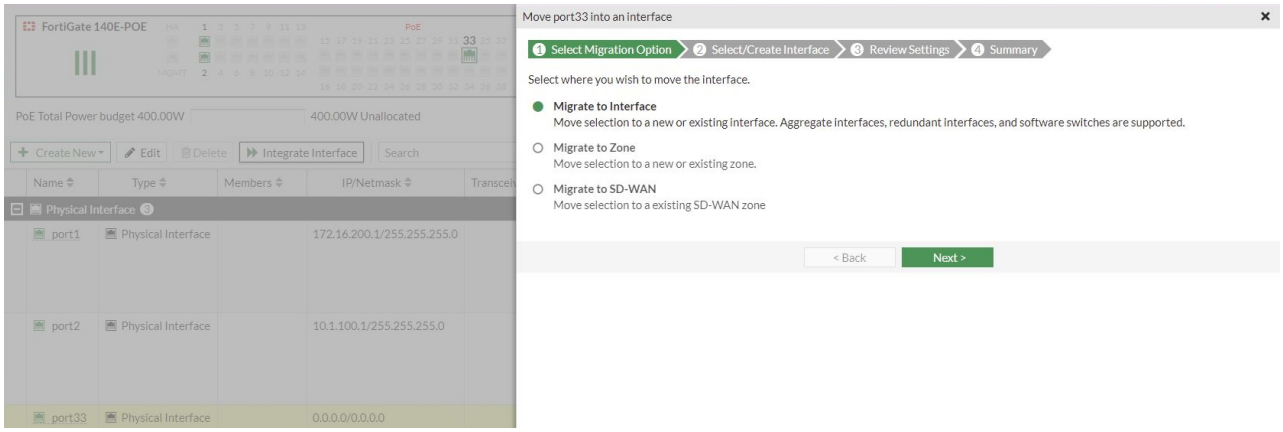
In this example, a DHCP server interface is integrated into a newly created redundant interface, which transfers the DHCP server to a redundant interface.

To integrate an interface:

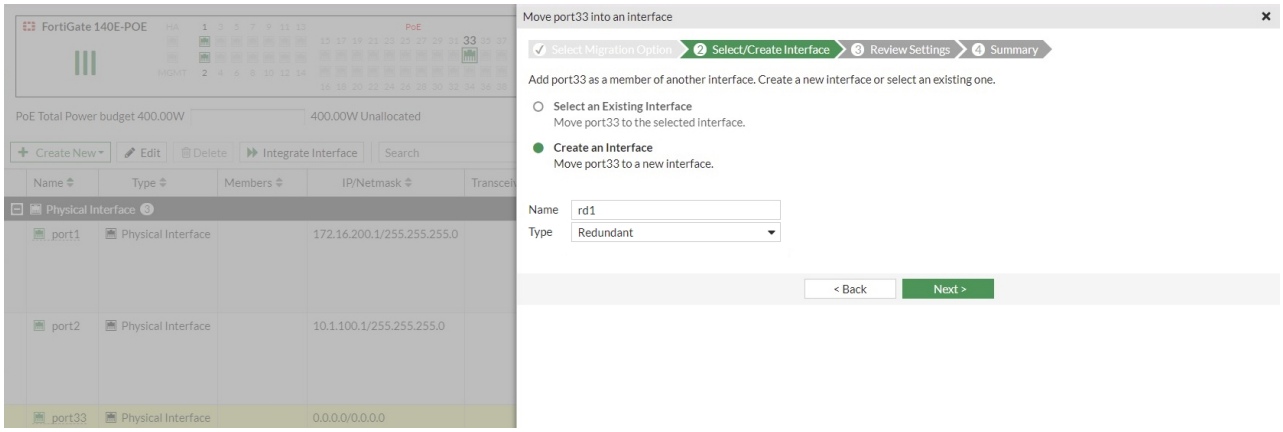
1. Go to *Network* > *Interfaces* and select an interface in the list.
2. Click *Integrate Interface*. The wizard opens.

Alternatively, select an interface in the list. Then right-click and select *Integrate Interface*.

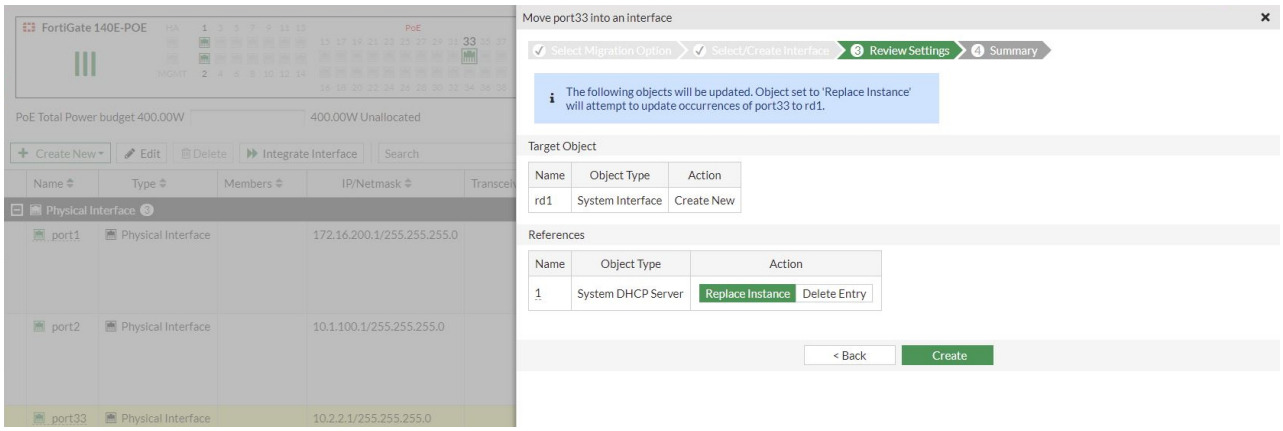
3. Select *Migrate to Interface* and click *Next*.



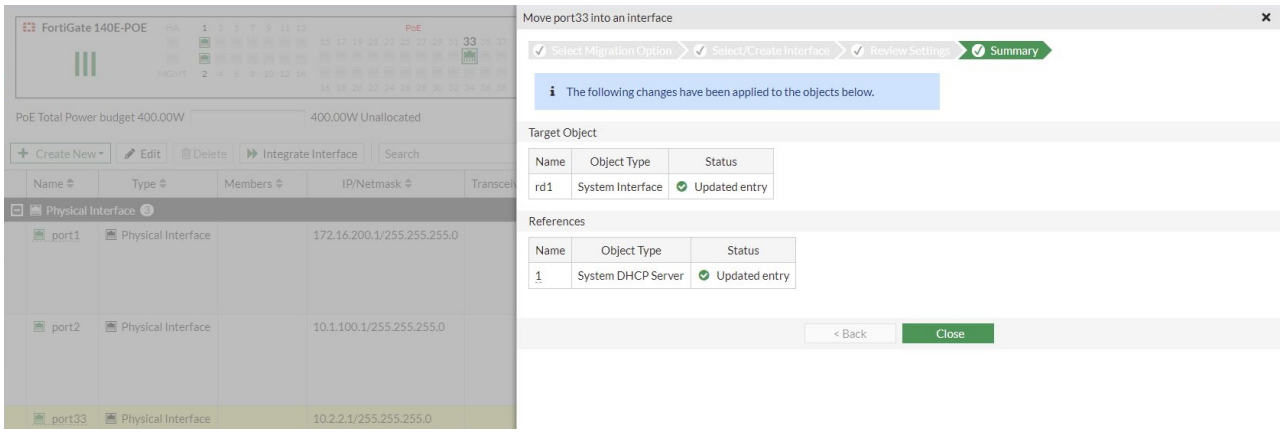
4. Select *Create an Interface*. Enter a name (*rd1*) and set the *Type* to *Redundant*.



5. Click *Next*. The *References* sections lists the associated services with options to *Replace Instance* or *Delete Entry*.
6. For the DHCP server *Action*, select *Replace Instance* and click *Create*.



7. The migration occurs automatically and the statuses for the object and reference change to *Updated entry*. Click *Close*.

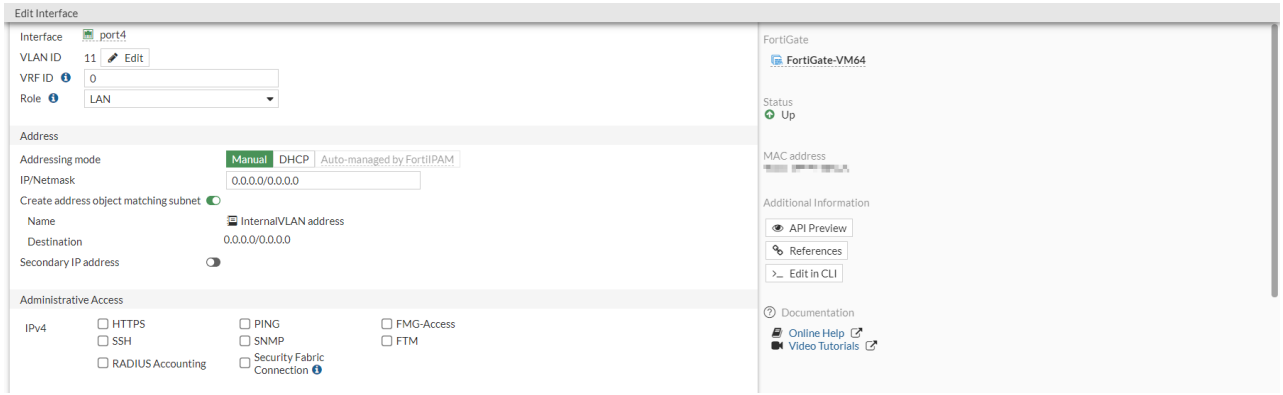


Changing the VLAN ID

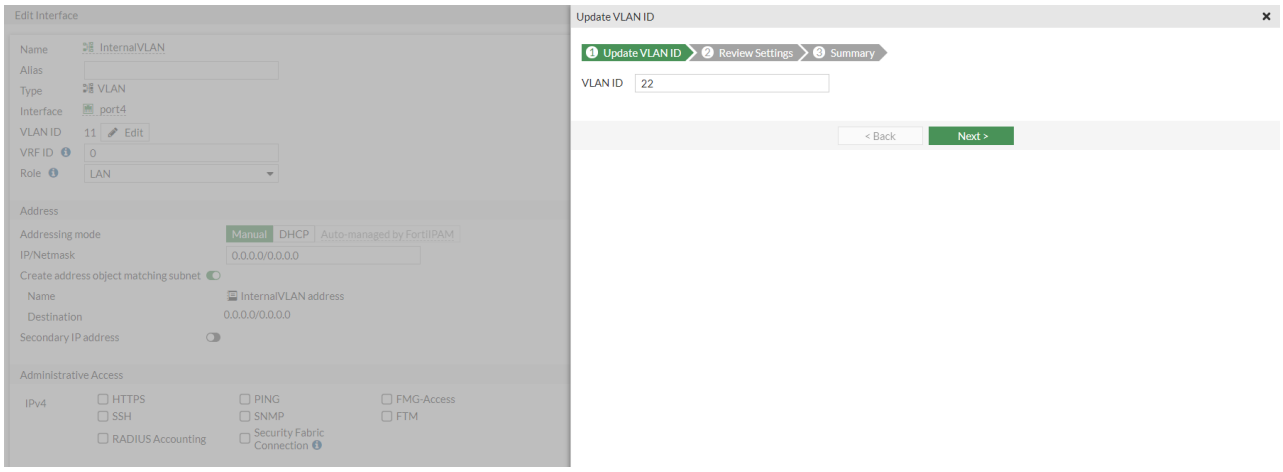
In this example, the VLAN ID of *InternalVLAN* is changed from 11 to 22.

To change the VLAN ID:

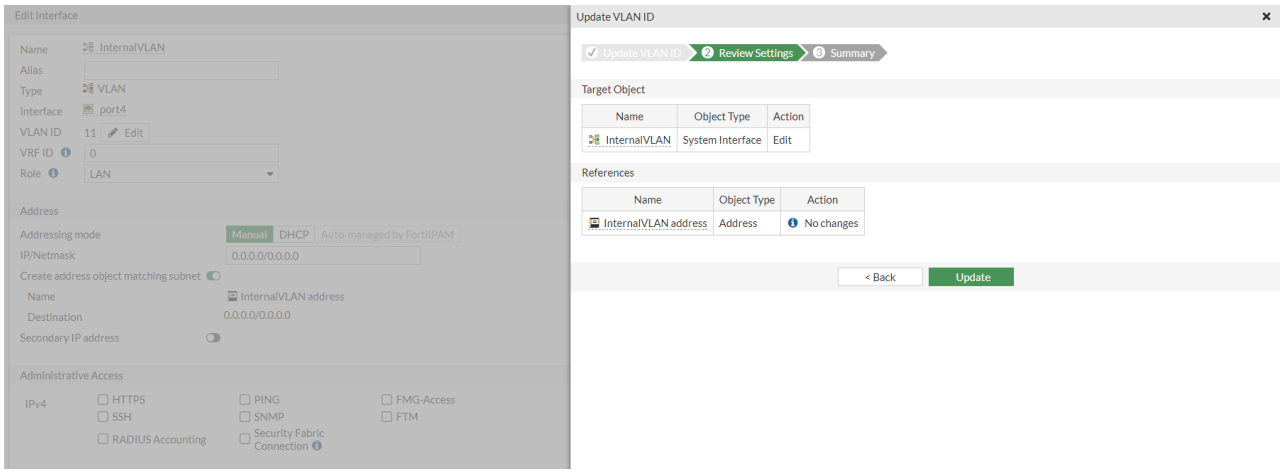
1. Go to *Network* > *Interfaces* and edit an existing interface.
2. Beside the *VLAN ID* field, click *Edit*. The *Update VLAN ID* window opens.



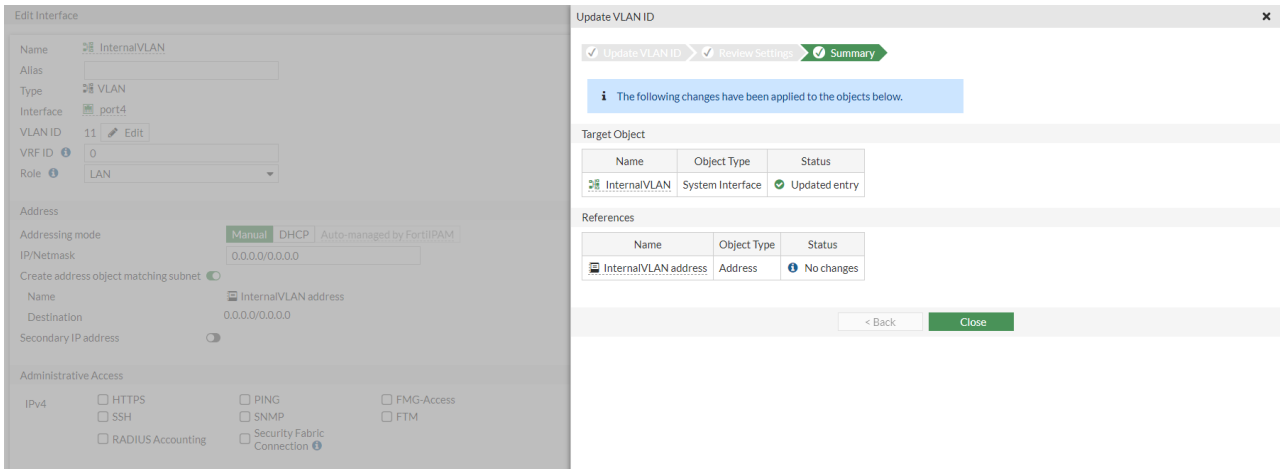
3. Enter the new ID (*22*) and click *Next*.



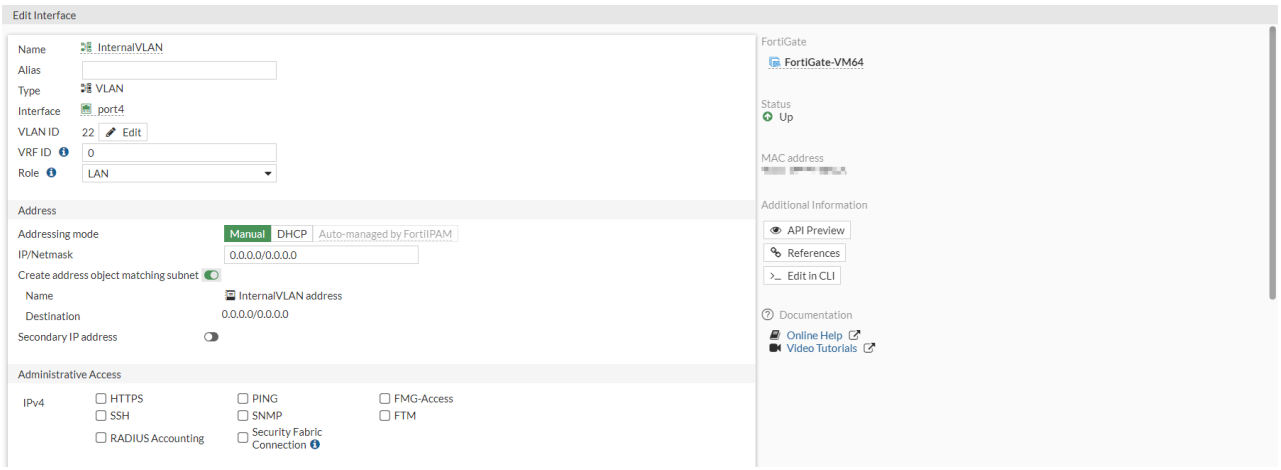
4. Verify the changes, then click *Update* and *OK*.



5. The target object status changes to *Updated entry*. Click *Close*.



In the interface settings, the ID displays as *22*.



DNS

Domain name system (DNS) is used by devices to locate websites by mapping a domain name to a website's IP address.

A FortiGate can serve different roles based on user requirements:

- A FortiGate can control what DNS server a network uses.
- A FortiGate can function as a DNS server.

FortiGuard Dynamic DNS (DDNS) allows a remote administrator to access a FortiGate's Internet-facing interface using a domain name that remains constant even when its IP address changes.

FortiOS supports DNS configuration for both IPv4 and IPv6 addressing. When a user requests a website, the FortiGate looks to the configured DNS servers to provide the IP address of the website in order to know which server to contact to complete the transaction.

The FortiGate queries the DNS servers whenever it needs to resolve a domain name into an IP address, such as for NTP or web servers defined by their domain names.

The following topics provide information about DNS:

- Important DNS CLI commands on page 177
- DNS domain list on page 179
- FortiGate DNS server on page 180
- DDNS on page 182
- DNS latency information on page 186
- DNS over TLS and HTTPS on page 188
- DNS troubleshooting on page 192

Important DNS CLI commands

DNS settings can be configured with the following CLI command:

```
config system dns
    set primary <ip_address>
    set secondary <ip_address>
    set protocol {cleartext dot doh}
    set ssl-certificate <string>
    set server-hostname <hostname>
    set domain <domains>
    set ip6-primary <ip6_address>
    set ip6-secondary <ip6_address>
    set timeout <integer>
    set retry <integer>
    set dns-cache-limit <integer>
    set dns-cache-ttl <integer>
    set cache-notfound-responses {enable | disable}
    set interface-select-method {auto | sdwan | specify}
    set interface <interface>
    set source-ip <class_ip>
end
```

For a FortiGate with multiple logical CPUs, you can set the DNS process number from 1 to the number of logical CPUs. The default DNS process number is 1.

```
config system global
    set dnsproxy-worker-count <integer>
end
```

DNS protocols

The following DNS protocols can be enabled:

- `cleartext`: Enable clear text DNS over port 53 (default).
- `dot`: Enable DNS over TLS.
- `doh`: Enable DNS over HTTPS.

For more information, see DNS over TLS and HTTPS on page 188.

cache-notfound-responses

When enabled, any DNS requests that are returned with `NOT FOUND` can be stored in the cache. The DNS server is not asked to resolve the host name for `NOT FOUND` entries. By default, this option is disabled.

dns-cache-limit

Set the number of DNS entries that are stored in the cache (0 to 4294967295, default = 5000). Entries that remain in the cache provide a quicker response to requests than going out to the Internet to get the same information.

dns-cache-ttl

The duration that the DNS cache retains information, in seconds (60 to 86400 (1 day), default = 1800).

DNS domain list

You can configure up to eight domains in the DNS settings using the GUI or the CLI.

When a client requests a URL that does not include an FQDN, FortiOS resolves the URL by traversing through the DNS domain list and performing a query for each domain until the first match is found.

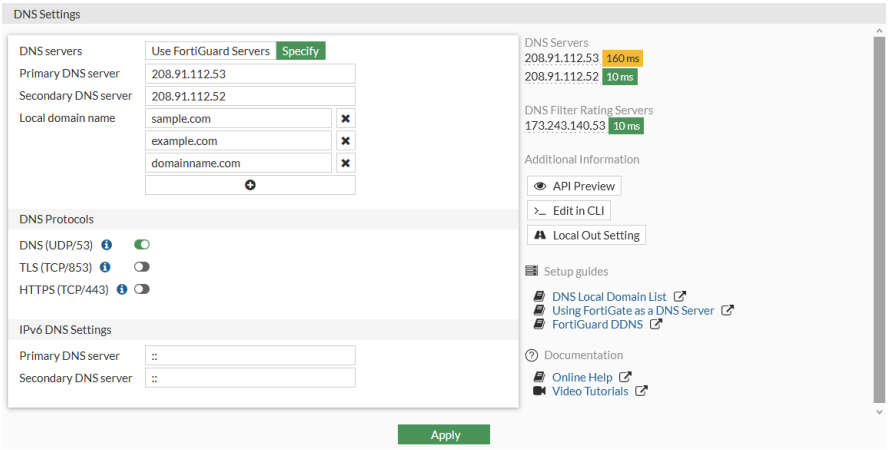
By default, FortiGate uses FortiGuard's DNS servers:

- Primary: 208.91.112.53
- Secondary: 208.91.112.52

You can also customize the DNS timeout time and the number of retry attempts.

To configure a DNS domain list in the GUI:

1. Go to *Network* > *DNS*.
2. Set *DNS Servers* to *Specify*.
3. Configure the primary and secondary DNS servers as needed.
4. In the *Local Domain Name* field, enter the first domain (`sample.com` in this example).
5. Click the + to add more domains (`example.com` and `domainname.com` in this example). You can enter up to eight domains.
6. Configure additional DNS protocol and IPv6 settings as needed.



7. Click *Apply*.

To configure a DNS domain list in the CLI:

```
config system dns
    set primary 208.91.112.53
    set secondary 208.91.112.52
    set domain "sample.com" "example.com" "domainname.com"
end
```

Verify the DNS configuration

In the following example, the local DNS server has the entry for *host1* mapped to the FQDN of *host1.sample.com*, and the entry for *host2* is mapped to the FQDN of *host2.example.com*.

To verify that the DNS domain list is configured:

1. Open Command Prompt.
2. Enter `ping host1`.
   The system returns the following response:
   ```
   PING host1.sample.com (1.1.1.1): 56 data bytes
   ```
   As the request does not include an FQDN, FortiOS traverses the configured DNS domain list to find a match. Because *host1* is mapped to the *host1.sample.com*, FortiOS resolves *host1* to *sample.com*, the first entry in the domain list.
3. Enter `ping host2`.
   The system returns the following response:
   ```
   PING host2.example.com (2.2.2.2): 56 data bytes
   ```
   FortiOS traverses the domain list to find a match. It first queries sample.com, the first entry in the domain list, but does not find a match. It then queries the second entry in the domain list, example.com. Because *host2* is mapped to the FQDN of *host2.example.com*, FortiOS resolves *host2* to *example.com*.

DNS timeout and retry settings

The DNS timeout and retry settings can be customized using the CLI.

```
config system dns
    set timeout <integer>
    set retry <integer>
end
```

`timeout <integer>`	The DNS query timeout interval, in seconds (1 - 10, default = 5).
`retry <integer>`	The number of times to retry the DNS query (0 - 5, default - 2).

FortiGate DNS server

You can create local DNS servers for your network. Depending on your requirements, you can either manually maintain your entries (primary DNS server), or use it to refer to an outside source (secondary DNS server).

A local, primary DNS server requires that you to manually add all URL and IP address combinations. Using a primary DNS server for local services can minimize inbound and outbound traffic, and access time. Making it authoritative is not recommended, because IP addresses can change, and maintaining the list can become labor intensive.

A secondary DNS server refers to an alternate source to obtain URL and IP address combinations. This is useful when there is a primary DNS server where the entry list is maintained.

FortiGate as a DNS server also supports TLS and HTTPS connections to a DNS client. See DNS over TLS and HTTPS on page 188 for details.

By default, DNS server options are not available in the FortiGate GUI.

To enable DNS server options in the GUI:

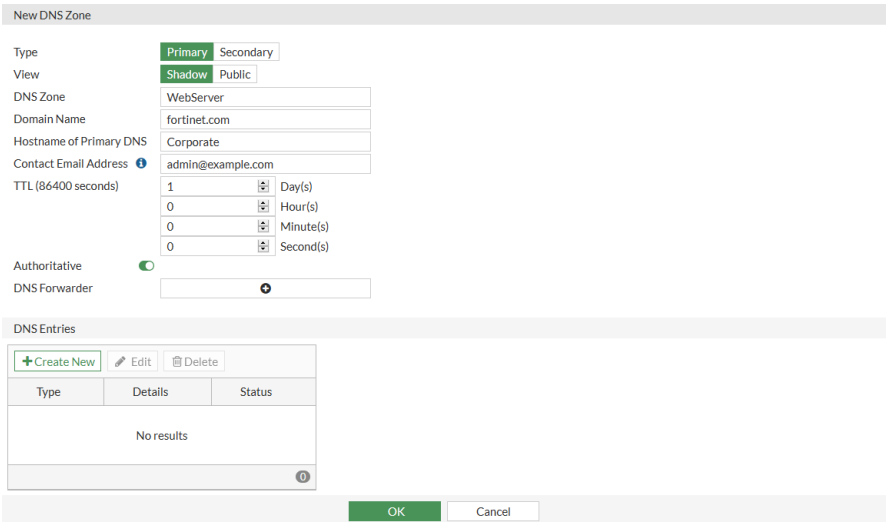
1. Go to *System* > *Feature Visibility*.
2. Enable *DNS Database* in the *Additional Features* section.
3. Click *Apply*.

Example configuration

This section describes how to create an unauthoritative primary DNS server. The interface mode is recursive so that, if the request cannot be fulfilled, the external DNS servers will be queried.

To configure FortiGate as a primary DNS server in the GUI:

1. Go to *Network* > *DNS Servers*.
2. In the *DNS Database* table, click *Create New*.
3. Set *Type* to *Primary*.
4. Set *View* to *Shadow*.
   The *View* setting controls the accessibility of the DNS server. If you select *Public*, external users can access or use the DNS server. If you select *Shadow*, only internal users can use it.
5. Enter a *DNS Zone*, for example, *WebServer*.
6. Enter the *Domain Name* of the zone, for example, *fortinet.com*.
7. Enter the *Hostname* of the DNS server, for example, *Corporate*.
8. Enter the *Contact Email Address* for the administrator, for example, *admin@example.com*.
9. Disable *Authoritative*.



10. Add DNS entries:
    a. In the *DNS Entries* table, click *Create New*.
    b. Select a *Type*, for example *Address (A)*.
    c. Set the *Hostname*, for example *web.example.com*.

    d. Configure the remaining settings as needed. The options vary depending on the selected *Type*.
    e. Click *OK*.
11. Add more DNS entries as needed.

12. Click *OK*.
13. Enable DNS services on an interface:
    a. Go to *Network* > *DNS Servers*.
    b. In the *DNS Service on Interface* table, click *Create New*.
    c. Select the *Interface* for the DNS server, such as *wan2*.
    d. Set the *Mode* to *Recursive*.

    e. Click *OK*.

To configure FortiGate as a primary DNS server in the CLI:

```
config system dns-database
    edit WebServer
        set domain example.com
        set type master
        set view shadow
        set ttl 86400
        set primary-name corporate
        set contact admin@example.com
        set authoritative disable
        config dns-entry
            edit 1
                set status enable
                set hostname web.example.com
                set type A
                set ip 192.168.21.12
            next
        end
    next
end
config system dns-server
    edit wan2
        set mode recursive
    next
end
```

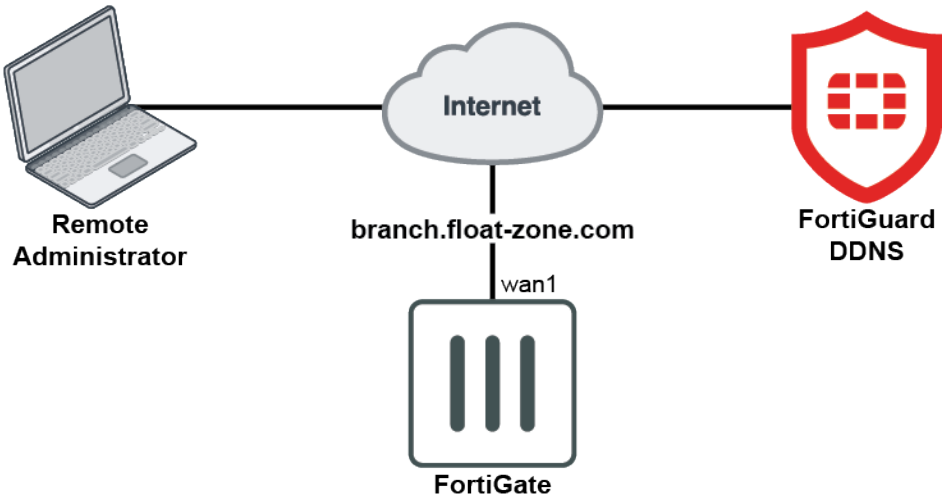
DDNS

If your external IP address changes regularly and you have a static domain name, you can configure the external interface to use a dynamic DNS (DDNS) service. This ensures that external users and customers can always connect to your company firewall. If you have a FortiGuard subscription, you can use FortiGuard as the DDNS server.

- FortiGate does not support DDNS for pure TP mode.
- FortiGate models 1000D and higher do not support DDNS in the GUI.

You can configure FortiGuard as the DDNS server using the GUI or CLI.

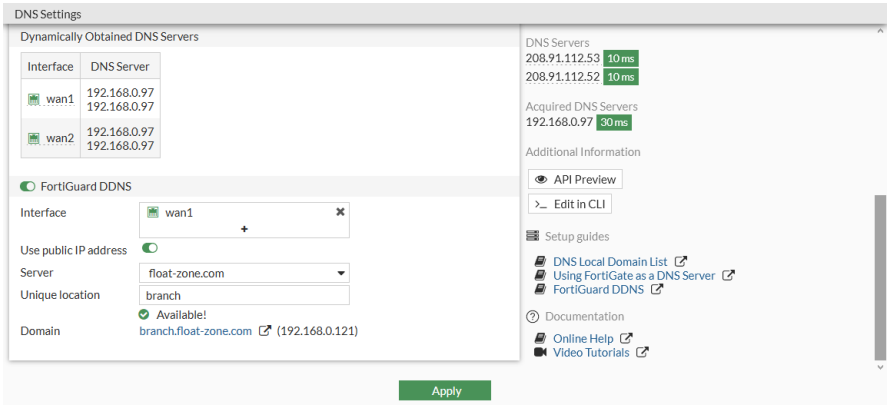
Sample topology



In this example, FortiGuard DDNS is enabled and the DDNS server is set to *float-zone.com*. Other DDNS server options include *fortiddns.com* and *fortidyndns.com*.

To configure FortiGuard DDNS service as a DDNS server in the GUI:

1. Go to *Network* > *DNS*
2. Enable *FortiGuard DDNS*.
3. Select the *Interface* with the dynamic connection.
4. Select the *Server* that you have an account with.
5. Enter your *Unique Location*.



6. Click *Apply*.

To configure the FortiGuard DDNS service as an IPv4 DDNS server in the CLI:

```
config system ddns
    edit 1
        set ddns-server FortiGuardDDNS
```

```
        set server-type ipv4
        set ddns-domain "branch.float-zone.com"
        set addr-type ipv4
        set use-public-ip enable
        set monitor-interface "wan1"
    next
end
```

To configure the FortiGuard DDNS service as an IPv6 DDNS server in the CLI:

```
config system ddns
    edit 1
        set ddns-server FortiGuardDDNS
        set server-type ipv6
        set ddns-domain "fgtatest001.float-zone.com"
        set addr-type ipv6
        set monitor-interface "wan1"
    next
end
```

DDNS servers other than FortiGuard

If you do not have a FortiGuard subscription, or want to use a different DDNS server, you can configure a DDNS server for each interface. Only the first configure port appears in the GUI.

The available commands vary depending on the selected DDNS server.

To configure DDNS servers other than FortiGuard in the CLI:

```
config system ddns
    edit <DDNS_ID>
        set monitor-interface <external_interface>
        set ddns-server <ddns_server_selection>
        set server-type {ipv4 | ipv6}
        set ddns-server-addr <address>
        set addr-type ipv6 {ipv4 | ipv6}
        ...
    next
end
```

To configure an IPv6 DDNS client with generic DDNS on port 3 in the CLI:

```
config system ddns
    edit 1
        set ddns-server genericDDNS
        set server-type ipv6
        set ddns-server-addr "2004:16:16:16::2" "16.16.16.2" "ddns.genericddns.com"
        set ddns-domain "test.com"
        set addr-type ipv6
        set monitor-interface "port3"
    next
end
```

Refresh DDNS IP addresses

When FortiGuard is the DDNS server, you can configure FortiGate to refresh DDNS IP addresses. FortiGate periodically checks the DDNS server that is configured.

To configure FortiGate to refresh DDNS IP addresses in the CLI:

```
config system ddns
    edit 1
        set use-public-ip enable
        set update-interval seconds
    next
end
```

Disable cleartext

When `clear-text` is disabled, FortiGate uses the SSL connection to send and receive DDNS updates.

To disable cleartext and set the SSL certificate in the CLI:

```
config system ddns
    edit 2
        set clear-text disable
        set ssl-certificate <cert_name>
    next
end
```

DDNS update override

A DHCP server has an override command option that allows DHCP server communications to go through DDNS to perform updates for the DHCP client. This enforces a DDNS update of the A field every time even if the DHCP client does not request it. This allows support for the `allow`, `ignore`, and `deny client-updates` options.

To enable DDNS update override in the CLI:

```
config system dhcp server
    edit 1
        set ddns-update enable
        set ddns-update-override enable
        set ddns-server-ip <ddns_server_ip>
        set ddns-zone <ddns_zone>
    next
end
```

Troubleshooting

To debug DDNS:

```
# diagnose debug application ddnscd -1
# diagnose debug enable
```

To check if a DDNS server is available:

```
# diagnose test application ddnscd 3
```

Not available:

```
FortiDDNS status:
ddns_ip=0.0.0.0, ddns_ip6=::, ddns_port=443 svr_num=0 domain_num=0
```

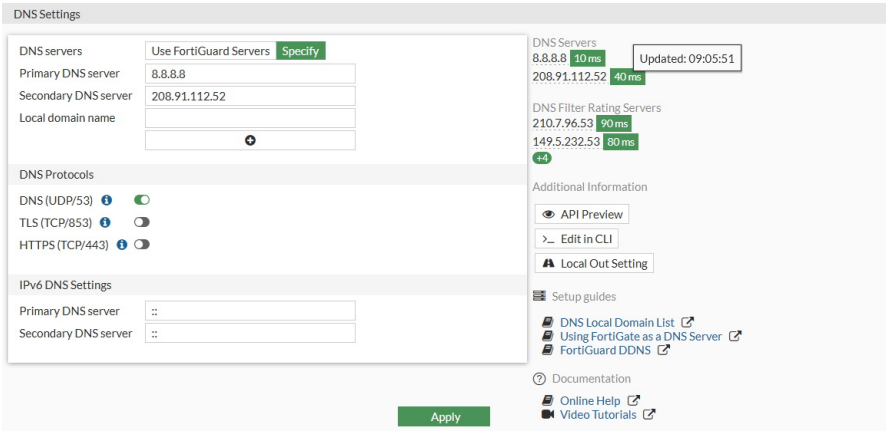
Available:

```
FortiDDNS status:
ddns_ip=208.91.113.230, ddns_ip6=::, ddns_port=443 svr_num=1 domain_num=3
svr[0]= 208.91.113.230
domain[0]= fortiddns.com
domain[1]= fortidyndns.com
domain[2]= float-zone.com
```

DNS latency information

High latency in DNS traffic can result in an overall sluggish experience for end-users. In the *DNS Settings* pane, you can quickly identify DNS latency issues in your configuration.

Go to *Network* > *DNS* to view DNS latency information in the right side bar. If you use FortiGuard DNS, latency information for DNS, DNS filter, web filter, and outbreak prevention servers is also visible. Hover your pointer over a latency value to see when it was last updated.



To view DNS latency information using the CLI:

```
# diagnose test application dnsproxy 2
worker idx: 0
worker: count=1 idx=0
retry_interval=500 query_timeout=1495
DNS latency info:
vfid=0 server=2001::1 latency=1494 updated=73311
vfid=0 server=208.91.112.52 latency=1405 updated=2547
vfid=0 server=208.91.112.53 latency=19 updated=91
SDNS latency info:
vfid=0 server=173.243.138.221 latency=1 updated=707681
DNS_CACHE: alloc=35, hit=26
```

```
RATING_CACHE: alloc=1, hit=49
DNS UDP: req=66769 res=63438 fwd=83526 alloc=0 cmp=0 retrans=16855 to=3233
          cur=111 switched=8823467 num_switched=294 v6_cur=80 v6_switched=7689041 num_v6_
switched=6
         ftg_res=8 ftg_fwd=8 ftg_retrans=0
DNS TCP: req=0, res=0, fwd=0, retrans=0 alloc=0, to=0
FQDN: alloc=45 nl_write_cnt=9498 nl_send_cnt=21606 nl_cur_cnt=0
Botnet: searched=57 hit=0 filtered=57 false_positive=0
```

To view the latency from web filter and outbreak protection servers using the CLI:

```
# diagnose debug rating
Locale   : english

Service  : Web-filter
Status   : Enable
License  : Contract

Service  : Antispam
Status   : Disable

Service  : Virus Outbreak Prevention
Status   : Disable

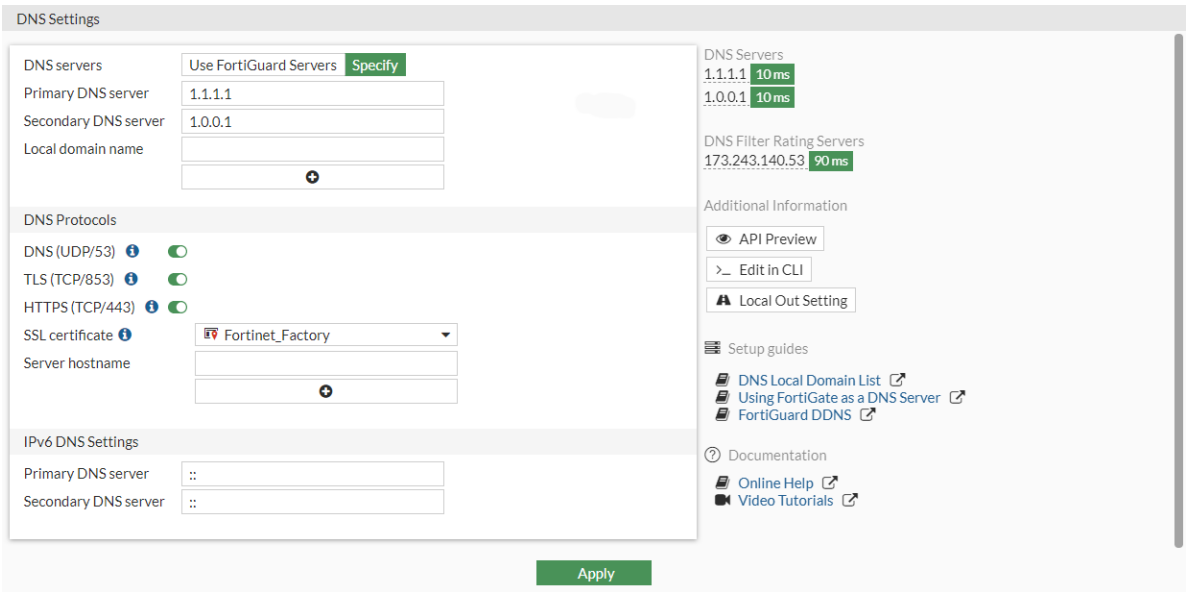
DNS over TLS and HTTPS

DNS over TLS (DoT) is a security protocol for encrypting and encapsulating DNS queries and responses over the TLS protocol. DoT increases user privacy and security by preventing eavesdropping and manipulation of DNS data via man-in-the-middle attacks. Similarly, DNS over HTTPS (DoH) provides a method of performing DNS resolution over a secure HTTPS connection. DoT and DoH are supported in explicit mode where the FortiGate acts as an explicit DNS server that listens for DoT and DoH requests. Local-out DNS traffic over TLS and HTTPS is also supported.

Basic configurations for enabling DoT and DoH for local-out DNS queries

To enable DoT and DoH DNS in the GUI:

1. Go to *Network* > *DNS*.
2. Enter the primary and secondary DNS server addresses.
3. In the *DNS Protocols* section, enable *TLS (TCP/853)* and *HTTPS (TCP/443)*.



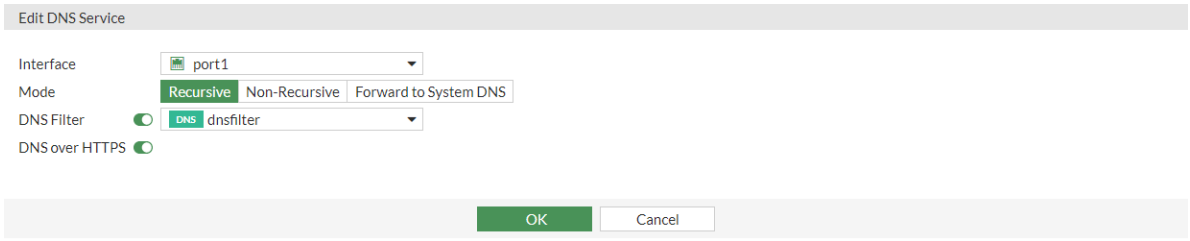
4. Configure the other settings as needed.
5. Click *Apply*.

To enable DoT and DoH DNS in the CLI:

```
config system dns
    set primary 1.1.1.1
    set secondary 1.0.0.1
    set protocol {cleartext dot doh}
end
```

To enable DoH on the DNS server in the GUI:

1. Go to *Network* > *DNS Servers*.
2. In the *DNS Service on Interface* section, edit an existing interface, or create a new one.
3. Select a *Mode*, and *DNS Filter* profile.
4. Enable *DNS over HTTPS*.



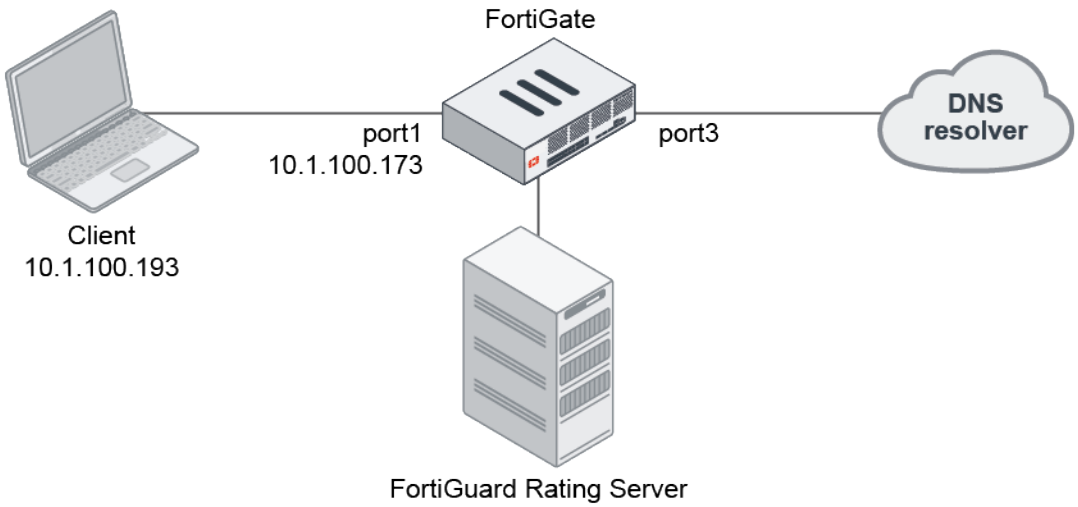
5. Click *OK*.

To enable DoH on the DNS server in the CLI:

```
config system dns-server
    edit "port1"
        set dnsfilter-profile "dnsfilter"
        set doh enable
    next
end
```

Examples

The following examples demonstrate how configure DNS settings to support DoT and DoH queries made to the FortiGate.



DoT

The following example uses a DNS filter profile where the education category is blocked.

To enable scanning DoT traffic in explicit mode with a DNS filter:

1. Configure the DNS settings:

```
config system dns
    set primary 1.1.1.1
    set secondary 1.0.0.1
    set protocol dot
end
```

2. Configure the DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
            end
        end
    next
end
```

3. Configure the DNS server settings:

```
config system dns-server
    edit "port1"
        set dnsfilter-profile "dnsfilter"
    next
end
```

4. Send a DNS query over TLS (this example uses kdig on an Ubuntu client) using the FortiGate as the DNS server. The www.ubc.ca domain belongs to the education category:

```
root@client:/tmp# kdig -d @10.1.100.173 +tls +header +all www.ubc.ca
;; DEBUG: Querying for owner(www.ubc.ca.), class(1), type(1), server(10.1.100.173), port
(853), protocol(TCP)
;; DEBUG: TLS, received certificate hierarchy:
;; DEBUG:  #1,
C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=FortiGate,CN=FG3H1E5818903681,EMAIL=support
@fortinet.com
;; DEBUG:      SHA-256 PIN: Xhkpv9ABEhxDLtWG+lGEndNrBR7B1xjRYlGn2ltlkb8=
;; DEBUG:  #2, C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=Certificate
Authority,CN=fortinet-subca2001,EMAIL=support@fortinet.com
;; DEBUG:      SHA-256 PIN: 3T8EqFBjpRSkxQNPFagjUNeEUghXOEYp904ROlJM8yo=
;; DEBUG:  #3, C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=Certificate
Authority,CN=fortinet-ca2,EMAIL=support@fortinet.com
;; DEBUG:      SHA-256 PIN: /QfV4N3k5oxQR5RHtW/rbn/HrHgKpMLN0DEaeXY5yPg=
;; DEBUG: TLS, skipping certificate PIN check
;; DEBUG: TLS, skipping certificate verification
;; TLS session (TLS1.2)-(ECDHE-RSA-SECP256R1)-(AES-256-GCM)
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 56719
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.ubc.ca.                  IN      A

;; ANSWER SECTION:
www.ubc.ca.             60      IN      A       208.91.112.55

;; Received 44 B
;; Time 2021-03-12 23:11:27 PST
;; From 10.1.100.173@853(TCP) in 0.2 ms
root@client:/tmp#
```

The IP returned by the FortiGate for ubc.ca belongs to the FortiGuard block page, so the query was blocked successfully.

DoH

The following example uses a DNS filter profile where the education category is blocked.

To configure scanning DoH traffic in explicit mode with a DNS filter:

1. Configure the DNS settings:

```
config system dns
    set primary 1.1.1.1
    set secondary 1.0.0.1
    set protocol doh
end
```

2. Configure the DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
```

```
                next
            end
        end
    next
end
```

3. Configure the DNS server settings:

```
config system dns-server
    edit "port1"
        set dnsfilter-profile "dnsfilter"
        set doh enable
    next
end
```

4. In your browser, enable DNS over HTTPS.
5. On your computer, edit the TCP/IP settings to use the FortiGate interface address as the DNS server.
6. In your browser, go to a website in the education category (www.ubc.ca). The website is redirected to the block page.

DNS troubleshooting

The following diagnose command can be used to collect DNS debug information. If you do not specify worker ID, the default worker ID is `0`.

```
# diagnose test application dnsproxy
worker idx: 0
1. Clear DNS cache
2. Show stats
3. Dump DNS setting
4. Reload FQDN
5. Requery FQDN
6. Dump FQDN
7. Dump DNS cache
8. Dump DNS DB
9. Reload DNS DB
10. Dump secure DNS policy/profile
11. Dump Botnet domain

```

Important fields include:

`tls`	1 if the connection is TLS, 0 if the connection is not TLS.
`rt`	The round trip time of the DNS latency.
`probe`	The number of probes sent.

To dump the second DNS worker's cache:

```
diagnose test application dnsproxy 7 1
```

To enable debug on the second worker:

```
diagnose debug application dnsproxy -1 1
```

To enable debug on all workers by specifying -1 as worker ID:

```
diagnose debug application dnsproxy -1 -1
```

Explicit and transparent proxies

This section contains instructions for configuring explicit and transparent proxies.

- Explicit web proxy on page 194
- Transparent proxy on page 198
- FTP proxy on page 197
- Proxy policy addresses on page 200
- Proxy policy security profiles on page 207
- Explicit proxy authentication on page 211
- Transparent web proxy forwarding on page 217
- Upstream proxy authentication in transparent proxy mode on page 221
- Multiple dynamic header count on page 223
- Restricted SaaS access on page 225
- Explicit proxy and FortiSandbox Cloud on page 227
- Proxy chaining on page 230
- Agentless NTLM authentication for web proxy on page 235
- Multiple LDAP servers in Kerberos keytabs and agentless NTLM domain controllers on page 238
- Learn client IP addresses on page 239
- Explicit proxy authentication over HTTPS on page 240

Explicit web proxy

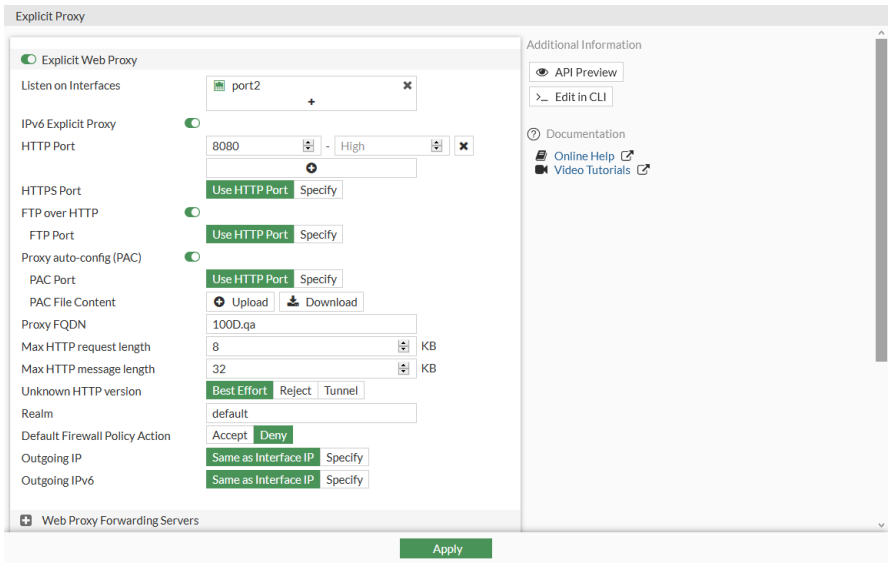
Explicit web proxy can be configured on FortiGate for proxying HTTP and HTTPS traffic.

To deploy explicit proxy, individual client browsers can be manually configured to send requests directly to the proxy, or they can be configured to download proxy configuration instructions from a Proxy Auto-Configuration (PAC) file.

When explicit proxy is configured on an interface, the interface IP address can be used by client browsers to forward requests directly to the FortiGate. FortiGate also supports PAC file configuration.

To configure explicit web proxy in the GUI:

1. Enable and configure explicit web proxy:
   a. Go to *Network* > *Explicit Proxy*.
   b. Enable *Explicit Web Proxy*.
   c. Select *port2* as the *Listen on Interfaces* and set the *HTTP Port* to *8080*.
   d. Configure the remaining settings as needed.



e. Click *Apply*.

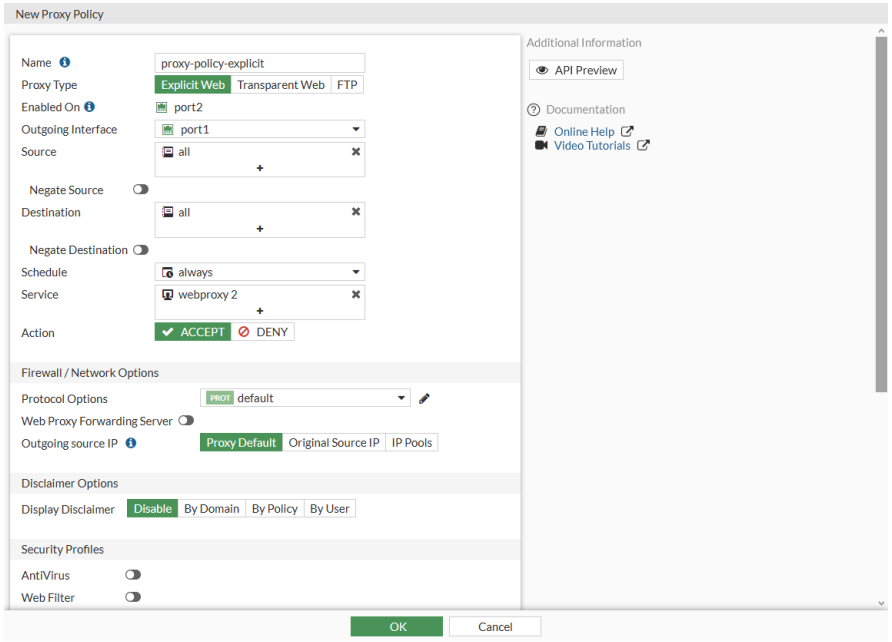
2. Create an explicit web proxy policy:

a. Go to *Policy & Objects* > *Proxy Policy*.

b. Click *Create New*.

c. Set *Proxy Type* to *Explicit Web* and *Outgoing Interface* to *port1*.

d. Also set *Source* and *Destination* to *all*, *Schedule* to *always*, *Service* to *webproxy*, and *Action* to *ACCEPT*.



e. Click *OK* to create the policy.

This example creates a basic policy. If required, security profiles can be enabled, and deep SSL inspection can be selected to inspect HTTPS traffic.

3. Configure a client to use the FortiGate explicit proxy:
   Set the FortiGate IP address as the proxy IP address in the browser, or use an automatic configuration script for the PAC file.

To configure explicit web proxy in the CLI:

1. Enable and configure explicit web proxy:

```
config web-proxy explicit
    set status enable
    set ftp-over-http enable
    set socks enable
    set http-incoming-port 8080
    set ipv6-status enable
    set unknown-http-version best-effort
end
config system interface
    edit "port2"
        set vdom "vdom1"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
        set type physical
        set explicit-web-proxy enable
        set snmp-index 12
        end
    next
end
```

2. Create an explicit web proxy policy:

```
config firewall proxy-policy
    edit 1
        set name "proxy-policy-explicit"
        set proxy explicit-web
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
    next
end
```

This example creates a basic policy. If required, security profiles can be enabled, and deep SSL inspection can be selected to inspect HTTPS traffic.

3. Configure a client to use the FortiGate explicit web proxy:
   Set the FortiGate IP address as the proxy IP address in the browser, or use an automatic configuration script for the PAC file.

FTP proxy

FTP proxies can be configured on the FortiGate so that FTP traffic can be proxied. When the FortiGate is configured as an FTP proxy, FTP client applications should be configured to send FTP requests to the FortiGate.

To configure explicit FTP proxy in the GUI:

1. Enable and configure explicit FTP proxy:
   a. Go to *Network* > *Explicit Proxy*.
   b. Enable *Explicit FTP Proxy*.
   c. Select *port2* as the *Listen on Interfaces* and set the *HTTP Port* to *21*.
   d. Configure the *Default Firewall Policy Action* as needed.

   e. Click *Apply*.
2. Create an explicit FTP proxy policy:
   a. Go to *Policy & Objects* > *Proxy Policy*.
   b. Click *Create New*.
   c. Set *Proxy Type* to *FTP* and *Outgoing Interface* to *port1*.
   d. Also set *Source* and *Destination* to *all*, *Schedule* to *always*, and *Action* to *ACCEPT*.

   e. Click *OK* to create the policy.

This example creates a basic policy. If required, security profiles can be enabled.

3. Configure the FTP client application to use the FortiGate IP address.

To configure explicit FTP proxy in the CLI:

1. Enable and configure explicit FTP proxy:

```
config ftp-proxy explicit
    set status enable
    set incoming-port 21
end
config system interface
    edit "port2"
        set vdom "vdom1"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
        set type physical
        set explicit-ftp-proxy enable
        set snmp-index 12
    next
end
```

2. Create an explicit FTP proxy policy:

```
config firewall proxy-policy
    edit 4
        set name "proxy-policy-ftp"
        set proxy ftp
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
    next
end
```

This example creates a basic policy. If required, security profiles can be enabled.

3. Configure the FTP client application to use the FortiGate IP address.

Transparent proxy

In a transparent proxy deployment, the user's client software, such as a browser, is unaware that it is communicating with a proxy.

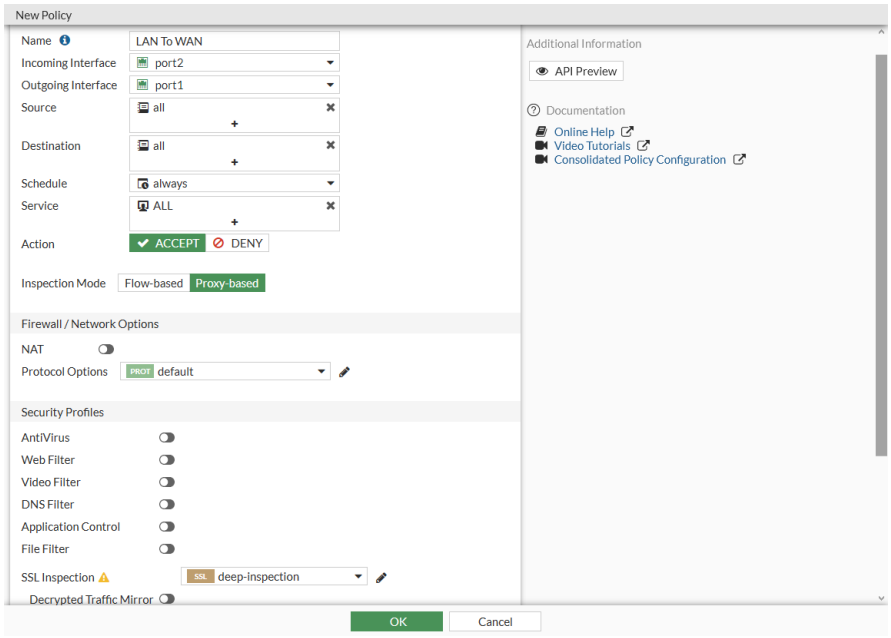
Users request internet content as usual, without any special client configuration, and the proxy serves their requests. FortiGate also allows user to configure in transparent proxy mode.

To redirect HTTPS traffic, SSL inspection is required.

To configure transparent proxy in the GUI:

1. Configure a regular firewall policy with HTTP redirect:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Click *Create New*.

c. Name the policy appropriately, set the *Incoming Interface* to *port2*, and set the *Outgoing Interface* to *port1*.
d. Also set *Source* and *Destination* to *all*, *Schedule* to *always*, *Service* to *ALL*, and *Action* to *ACCEPT*.
e. Set *Inspection Mode* to *Proxy-based* and *SSL Inspection* to *deep-inspection*.



f. Configure the remaining settings as needed.
g. Click *OK*.

2. Configure a transparent proxy policy:
   a. Go to *Policy & Objects* > *Proxy Policy*.
   b. Click *Create New*.
   c. Set *Proxy Type* to *Transparent Web*, set the *Incoming Interface* to *port2*, and set the *Outgoing Interface* to *port1*.
   d. Also set *Source* and *Destination* to *all*, *Schedule*to *always*, *Service* to *webproxy*, and *Action* to *ACCEPT*.

   e. Configure the remaining settings as needed.
   f. Click *OK* to create the policy.

3. No special configuration is required on the client to use FortiGate transparent proxy. As the client is using the FortiGate as its default gateway, requests will first hit the regular firewall policy, and then be redirected to the transparent proxy policy.

To configure transparent proxy in the CLI:

1. Configure a regular firewall policy with HTTP redirect:

```
config firewall policy
    edit 1
        set name "LAN To WAN"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set http-policy-redirect enable
        set fsso disable
        set ssl-ssh-profile "deep-inspection"
        set nat enable
    next
end
```

2. Configure a transparent proxy policy:

```
config firewall proxy-policy
    edit 5
        set name "proxy-policy-transparent"
        set proxy transparent-web
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
    next
end
```

This example creates a basic policy. If required, security profiles can be enabled, and deep SSL inspection can be selected to inspect HTTPS traffic.

3. No special configure is required on the client to use FortiGate transparent proxy. As the client is using the FortiGate as its default gateway, requests will first hit the regular firewall policy, and then be redirected to the transparent proxy policy.

Proxy policy addresses

Proxy addresses are designed to be used only by proxy policies. The following address types are available:

- Host regex match on page 201
- URL pattern on page 202
- URL category on page 203
- HTTP method on page 203

- HTTP header on page 204
- User agent on page 205
- Advanced (source) on page 205
- Advanced (destination) on page 206

Fast policy match

The fast policy match function improves the performance of IPv4 explicit and transparent web proxies on FortiGate devices.

When enabled, after the proxy policies are configured, the FortiGate builds a fast searching table based on the different proxy policy matching criteria. When fast policy matching is disabled, web proxy traffic is compared to the policies one at a time from the beginning of the policy list.

Fast policy matching is enabled by default, and can be configured with the following CLI command:

```
config web-proxy global
    set fast-policy-match {enable | disable}
end
```

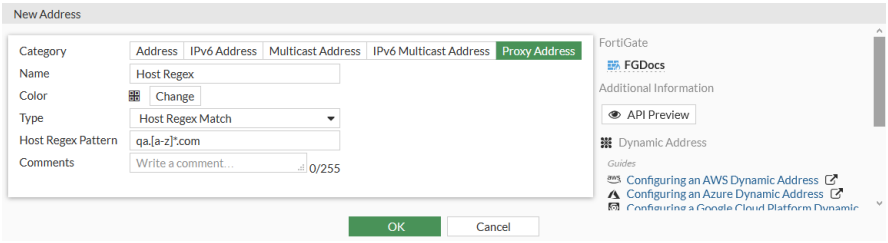
Host regex match

In this address type, a user can create a hostname as a regular expression. Once created, the hostname address can be selected as a destination of a proxy policy. This means that a policy will only allow or block requests that match the regular expression.

This example creates a host regex match address with the pattern *qa.[a-z]*.com*.

To create a host regex match address in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Set the following:
   - *Category* to *Proxy Address*,
   - *Name* to *Host Regex*,
   - *Type* to *Host Regex Match*, and
   - *Host Regex Pattern* to *qa.[a-z]*.com*.



4. Click *OK*.

To create a host regex match address in the CLI:

```
config firewall proxy-address
    edit "Host Regex"
        set type host-regex
        set host-regex "qa.[a-z]*.com"
    next
end
```

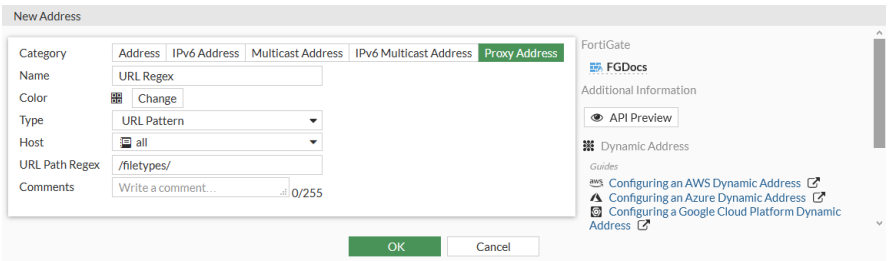
URL pattern

In this address type, a user can create a URL path as a regular expression. Once created, the path address can be selected as a destination of a proxy policy. This means that a policy will only allow or block requests that match the regular expression.

This example creates a URL pattern address with the pattern */filetypes/*.

To create a URL pattern address in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Set the following:
   - *Category* to *Proxy Address*,
   - *Name* to *URL Regex*,
   - *Type* to *URL Pattern*,
   - *Host* to *all*, and
   - *URL Path Regex* to */filetypes/*.



4. Click *OK*.

To create a URL pattern address in the CLI:

```
config firewall proxy-address
    edit "URL Regex"
        set type url
        set host "all"
        set path "/filetypes/"
    next
end
```

URL category

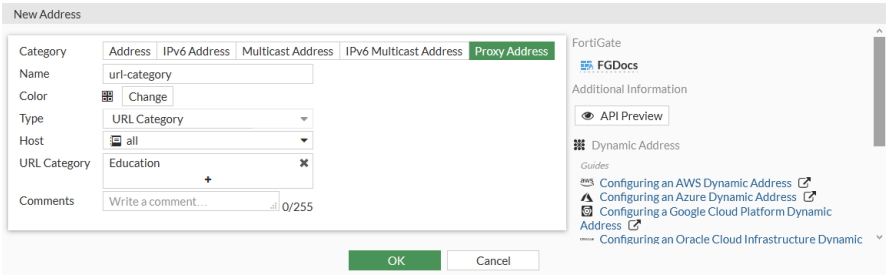
In this address type, a user can create a URL category based on a FortiGuard URL ID. Once created, the address can be selected as a destination of a proxy policy. This means that a policy will only allow or block requests that match the URL category.

The example creates a URL category address for URLs in the *Education* category. For more information about categories, see https://fortiguard.com/webfilter/categories.

For information about creating and using custom local and remote categories, see Web rating override on page 919 and Threat feeds on page 1852.

To create a URL category address in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Set the following:
   - *Category* to *Proxy Address*,
   - *Name* to *url-category*,
   - *Type* to *URL Category*,
   - *Host* to *all*, and
   - *URL Category* to *Education*.



4. Click *OK*.

To create a URL category address in the CLI:

```
config firewall proxy-address
    edit "url-category"
        set type category
        set host "all"
        set category 30
    next
end
```

To see a list of all the categories and their numbers, when editing the address, enter `set category ?`.

HTTP method

In this address type, a user can create an address based on the HTTP request methods that are used. Multiple method options are supported, including: *CONNECT*, *DELETE*, *GET*, *HEAD*, *OPTIONS*, *POST*, *PUT*, and *TRACE*. Once created, the address can be selected as a source of a proxy policy. This means that a policy will only allow or block requests that match the selected HTTP method.

The example creates a HTTP method address that uses the GET method.

To create a HTTP method address in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Set the following:
   - *Category* to *Proxy Address*,
   - *Name* to *method_get*,
   - *Type* to *HTTP Method*,
   - *Host* to *all*, and
   - *Request Method* to *GET*.
4. Click *OK*.

To create a HTTP method address in the CLI:

```
config firewall proxy-address
    edit "method_get"
        set type method
        set host "all"
        set method get
    next
end
```

HTTP header

In this address type, a user can create a HTTP header as a regular expression. Once created, the header address can be selected as a source of a proxy policy. This means that a policy will only allow or block requests where the HTTP header matches the regular expression.

This example creates a HTTP header address with the pattern *Q[A-B]*.

To create a HTTP header address in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Set the following:
   - *Category* to *Proxy Address*,
   - *Name* to *HTTP-header*,
   - *Type* to *HTTP Header*,
   - *Host* to *all*,
   - *Header Name* to *Header_Test*, and
   - *Header Regex* to *Q[A-B]*.
4. Click *OK*.

To create a HTTP header address in the CLI:

```
config firewall proxy-address
    edit "method_get"
        set type header
        set host "all"
        set header-name "Header_Test"
        set header "Q[A-B]"
    next
end
```

User agent

In this address type, a user can create an address based on the names of the browsers that are used as user agents. Multiple browsers are supported, such as Chrome, Firefox, Internet Explorer, and others. Once created, the address can be selected as a source of a proxy policy. This means that a policy will only allow or block requests from the specified user agent.

This example creates a user agent address for Google Chrome.

To create a user agent address in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Set the following:
   - *Category* to *Proxy Address*,
   - *Name* to *UA-Chrome*,
   - *Type* to *User Agent*,
   - *Host* to *all*, and
   - *User Agent* to *Google Chrome*.
4. Click *OK*.

To create a user agent address in the CLI:

```
config firewall proxy-address
    edit "UA-Chrome"
        set type ua
        set host "all"
        set ua chrome
    next
end
```

Advanced (source)

In this address type, a user can create an address based on multiple parameters, including HTTP method, User Agent, and HTTP header. Once created, the address can be selected as a source of a proxy policy. This means that a policy will only allow or block requests that match the selected address.

This example creates an address that uses the get method, a user agent for Google Chrome, and an HTTP header with the pattern *Q[A-B]*.

To create an advanced (source) address in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Set the following:
   - *Category* to *Proxy Address*,
   - *Name* to *advanced_src*,
   - *Type* to *Advanced (Source)*,
   - *Host* to *all*,
   - *Request Method* to *GET*,
   - *User Agent* to *Google Chrome*, and
   - *HTTP header* to *Header_Test* : *Q[A-B]*.
4. Click *OK*.

To create an advanced (source) address in the CLI:

```
config firewall proxy-address
    edit "advance_src"
        set type src-advanced
        set host "all"
        set method get
        set ua chrome
        config header-group
            edit 1
                set header-name "Header_Test"
                set header "Q[A-B]"
            next
        end
    next
end
```

Advanced (destination)

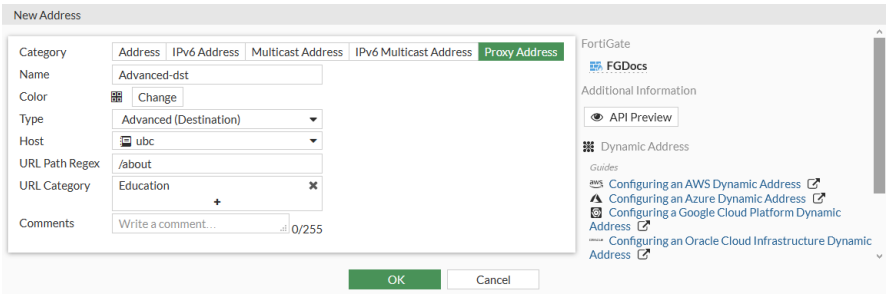
In this address type, a user can create an address based on URL pattern and URL category parameters. Once created, the address can be selected as a destination of a proxy policy. This means that a policy will only allow or block requests that match the selected address.

This example creates an address with the URL pattern */about* that are in the *Education* category. For more information about categories, see https://fortiguard.com/webfilter/categories.

To create an advanced (destination) address in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Set the following:
   - *Category* to *Proxy Address*,
   - *Name* to *Advanced-dst*,
   - *Type* to *Advanced (Destination)*,
   - *Host* to *all*,

- *URL Path Regex* to */about*, and
- *URL Category* to *Education*.



4. Click *OK*.

To create an advanced (destination) address in the CLI:

```
config firewall proxy-address
    edit "Advanced-dst"
        set type dst-advanced
        set host "ubc"
        set path "/about"
        set category 30
    next
end
```

Proxy policy security profiles

Web proxy policies support most security profile types.

Security profiles must be created before they can be used in a policy, see Security Profiles on page 740 for information.

Explicit web proxy policy

The security profiles supported by explicit web proxy policies are:

- *AntiVirus*
- *Web Filter*
- *Application Control*
- *IPS*
- *DLP Sensor*
- *ICAP*
- *Web Application Firewall*
- *SSL Inspection*

To configure security profiles on an explicit web proxy policy in the GUI:

1. Go to *Policy & Objects* > *Proxy Policy*.
2. Click *Create New*.
3. Set the following:

Proxy Type	Explicit Web
Outgoing Interface	port1
Source	all
Destination	all
Schedule	always
Service	webproxy
Action	ACCEPT

4. In the *Firewall / Network Options* section, set *Protocol Options* to *default*.
5. In the *Security Profiles* section, make the following selections (for this example, these profiles have all already been created):

AntiVirus	av
Web Filter	urlfiler
Application Control	app
IPS	Sensor-1
DLP Sensor	dlp
ICAP	default
Web Application Firewall	default
SSL Inspection	deep-inspection

6. Click *OK* to create the policy.

To configure security profiles on an explicit web proxy policy in the CLI:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "web"
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "av"
        set webfilter-profile "urlfilter"
        set dlp-sensor "dlp"
        set ips-sensor "sensor-1"
```

```
        set application-list "app"
        set icap-profile "default"
        set waf-profile "default"
        set ssl-ssh-profile "deep-inspection"
    next
end
```

Transparent proxy

The security profiles supported by transparent proxy policies are:

- *AntiVirus*
- *Web Filter*
- *Application Control*
- *IPS*
- *DLP Sensor*
- *ICAP*
- *Web Application Firewall*
- *SSL Inspection*

To configure security profiles on a transparent proxy policy in the GUI:

1. Go to *Policy & Objects* > *Proxy Policy*.
2. Click *Create New*.
3. Set the following:

Proxy Type	Explicit Web
Incoming Interfae	port2
Outgoing Interface	port1
Source	all
Destination	all
Schedule	always
Service	webproxy
Action	ACCEPT

4. In the *Firewall / Network Options* section, set *Protocol Options* to *default*.
5. In the *Security Profiles* section, make the following selections (for this example, these profiles have all already been created):

AntiVirus	av
Web Filter	urlfiler
Application Control	app
IPS	Sensor-1

DLP Sensor	dlp
ICAP	default
Web Application Firewall	default
SSL Inspection	deep-inspection

6. Click *OK* to create the policy.

To configure security profiles on a transparent proxy policy in the CLI:

```
config firewall proxy-policy
    edit 2
        set proxy transparent-web
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "av"
        set webfilter-profile "urlfilter"
        set dlp-sensor "dlp"
        set ips-sensor "sensor-1"
        set application-list "app"
        set icap-profile "default"
        set waf-profile "default"
        set ssl-ssh-profile "certificate-inspection"
    next
end
```

FTP proxy

The security profiles supported by FTP proxy policies are:

- *AntiVirus*
- *Application Control*
- *IPS*
- *DLP Sensor*

To configure security profiles on an FTP proxy policy in the GUI:

1. Go to *Policy & Objects* > *Proxy Policy*.
2. Click *Create New*.
3. Set the following:

Proxy Type	FTP
Outgoing Interface	port1
Source	all

Destination	all
Schedule	always
Action	ACCEPT

4. In the *Firewall / Network Options* section, set *Protocol Options* to *default*.
5. In the *Security Profiles* section, make the following selections (for this example, these profiles have all already been created):

AntiVirus	av
Application Control	app
IPS	Sensor-1
DLP Sensor	dlp

6. Click *OK* to create the policy.

To configure security profiles on an FTP proxy policy in the CLI:

```
config firewall proxy-policy
    edit 3
        set proxy ftp
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "av"
        set dlp-sensor "dlp"
        set ips-sensor "sensor-1"
        set application-list "app"
    next
end
```

Explicit proxy authentication

FortiGate supports multiple authentication methods. This topic explains using an external authentication server with Kerberos as the primary and NTLM as the fallback.

To configure Explicit Proxy with authentication:

1. Enable and configure the explicit proxy on page 212.
2. Configure the authentication server and create user groups on page 212.
3. Create an authentication scheme and rules on page 214.
4. Create an explicit proxy policy and assign a user group to the policy on page 215.
5. Verify the configuration on page 216.

Enable and configure the explicit proxy

To enable and configure explicit web proxy in the GUI:

1. Go to *Network* > *Explicit Proxy*.
2. Enable *Explicit Web Proxy*.
3. Select *port2* as the *Listen on Interfaces* and set the *HTTP Port* to *8080*.
4. Configure the remaining settings as needed.
5. Click *Apply*.

To enable and configure explicit web proxy in the CLI:

```
config web-proxy explicit
    set status enable
    set ftp-over-http enable
    set socks enable
    set http-incoming-port 8080
    set ipv6-status enable
    set unknown-http-version best-effort
end
config system interface
    edit "port2"
        set vdom "vdom1"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
        set type physical
        set explicit-web-proxy enable
        set snmp-index 12
        end
    next
end
```

Configure the authentication server and create user groups

Since we are using an external authentication server with Kerberos authentication as the primary and NTLM as the fallback, Kerberos authentication is configured first and then FSSO NTLM authentication is configured.

For successful authorization, the FortiGate checks if user belongs to one of the groups that is permitted in the security policy.

To configure an authentication server and create user groups in the GUI:

1. Configure Kerberos authentication:
   a. Go to *User & Authentication* > *LDAP Servers*.
   b. Click *Create New*.

c. Set the following:

Name	ldap-kerberos
Server IP	172.18.62.220
Server Port	389
Common Name Identifier	cn
Distinguished Name	dc=fortinetqa,dc=local

d. Click *OK*

2. Define Kerberos as an authentication service. This option is only available in the CLI. For information on generating a keytab, see Generating a keytab on a Windows server on page 217.
3. Configure FSSO NTLM authentication:

   FSSO NTLM authentication is supported in a Windows AD network. FSSO can also provide NTLM authentication service to the FortiGate unit. When a user makes a request that requires authentication, the FortiGate initiates NTLM negotiation with the client browser, but does not process the NTLM packets itself. Instead, it forwards all the NTLM packets to the FSSO service for processing.

   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New* and select *FSSO Agent on Windows AD* from the *Endpoint/Identity* category.
   c. Set the *Name* to *FSSO*, *Primary FSSO Agent* to *172.16.200.220*, and enter a password.
   d. Click *OK*.
4. Create a user group for Kerberos authentication:
   a. Go to *User & Authentication* > *User Groups*.
   b. Click *Create New*.
   c. Set the *Name* to *Ldap-Group*, and *Type* to *Firewall*.
   d. In the *Remote Groups* table, click *Add*, and set the *Remote Server* to the previously created *ldap-kerberos* server.
   e. Click *OK*.
5. Create a user group for NTLM authentication:
   a. Go to *User & Authentication* > *User Groups*.
   b. Click *Create New*.
   c. Set the *Name* to *NTLM-FSSO-Group*, *Type* to *Fortinet Single Sign-On (FSSO)*, and add *FORTINETQA/FSSO* as a member.
   d. Click *OK*.

To configure an authentication server and create user groups in the CLI:

1. Configure Kerberos authentication:

```
config user ldap
    edit "ldap-kerberos"
        set server "172.18.62.220"
        set cnid "cn"
        set dn "dc=fortinetqa,dc=local"
        set type regular
        set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
        set password *********
```

```
    next
end
```

2. Define Kerberos as an authentication service:

```
config user krb-keytab
    edit "http_service"
        set pac-data disable
        set principal "HTTP/FGT.FORTINETQA.LOCAL@FORTINETQA.LOCAL"
        set ldap-server "ldap-kerberos"
        set keytab
"BQIAAABFAAIAEEZPUlRJTkVUUUEuTE9DQUwABEhUVFAAFEZHVC5GT1JUSU5FVFFBLkxPQ0FMAAAAAQAAAAAEAAE
ACKLCMonpitnVAAAARQACABBGT1JUSU5FVFFBLkxPQ0FMAARIVFRQABRGR1QuRk9SVElORVRRQS5MT0NBTAAAAAE
AAAAABAADAAiiwjKJ6YrZ1QAAAE0AAgAQRk9SVElORVRRQS5MT0NBTAAESFRUUAAURkdULkZPUlRJTkVUUUEuTE9
DQUwAAAABAAAAAAQAFwAQUHo9uqR9cSkzyxdzKCEXdwAAAF0AAgAQRk9SVElORVRRQS5MT0NBTAAESFRUUAAURkd
ULkZPUlRJTkVUUUEuTE9DQUwAAAABAAAAAAQAEgAgzee854Aq1HhQiKJZvV4tL2Poy7hMIARQpK8MCB//BIAAAAB
NAAIAEEZPUlRJTkVUUUEuTE9DQUwABEhUVFAAFEZHVC5GT1JUSU5FVFFBLkxPQ0FMAAAAAQAAAAAEABEAEG49vHE
iiBghr63Z/lnwYrU="
    next
end
```

   For information on generating a keytab, see Generating a keytab on a Windows server on page 217.

3. Configure FSSO NTLM authentication:

```
config user fsso
    edit "1"
        set server "172.18.62.220"
        set password *********
    next
end
```

4. Create a user group for Kerberos authentication:

```
config user group
    edit "Ldap-Group"
        set member "ldap" "ldap-kerberos"
    next
end
```

5. Create a user group for NTLM authentication:

```
config user group
    edit "NTLM-FSSO-Group"
        set group-type fsso-service
        set member "FORTINETQA/FSSO"
    next
end
```

Create an authentication scheme and rules

Explicit proxy authentication is managed by authentication schemes and rules. An authentication scheme must be created first, and then the authentication rule.

To create an authentication scheme and rules in the GUI:

1. Create an authentication scheme:
   a. Go to *Policy & Objects* > *Authentication Rules*.
   b. Click *Create New* > *Authentication Schemes*.
   c. Set the *Name* to *Auth-scheme-Negotiate* and select *Negotiate* as the *Method*.
   d. Click *OK*.
2. Create an authentication rule:
   a. Go to *Policy & Objects* > *Authentication Rules*.
   b. Click *Create New* > *Authentication Rules*.
   c. Set the *Name* to *Auth-Rule*, *Source Address* to *all*, and *Protocol* to *HTTP*.
   d. Enable *Authentication Scheme*, and select the just created *Auth-scheme-Negotiate* scheme.
   e. Click *OK*.

To create an authentication scheme and rules in the CLI:

1. Create an authentication scheme:

```
config authentication scheme
    edit "Auth-scheme-Negotiate"
        set method negotiate       <<< Accepts both Kerberos and NTLM as fallback
    next
end
```

2. Create an authentication rule:

```
config authentication rule
    edit "Auth-Rule"
        set status enable
        set protocol http
        set srcaddr "all"
        set ip-based enable
        set active-auth-method "Auth-scheme-Negotiate"
        set comments "Testing"
    next
end
```

Create an explicit proxy policy and assign a user group to the policy

To create an explicit proxy policy and assign a user group to it in the GUI:

1. Go to *Policy & Objects* > *Proxy Policy*.
2. Click *Create New*.
3. Set *Proxy Type* to *Explicit Web* and *Outgoing Interface* to *port1*.
4. Set *Source* to *all*, and the just created user groups *NTLM-FSSO-Group* and *Ldap-Group*.
5. Also set *Destination* to *all*, *Schedule* to *always*, *Service* to *webproxy*, and *Action* to *ACCEPT*.
6. Click *OK*.

To create an explicit proxy policy and assign a user group to it in the CLI:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "web"
        set action accept
        set schedule "always"
        set logtraffic all
        set groups "NTLM-FSSO-Group" "Ldap-Group"
        set av-profile "av"
        set ssl-ssh-profile "deep-custom"
    next
end
```

Verify the configuration

Log in using a domain and system that would be authenticated using the Kerberos server, then enter the `diagnose wad user list` CLI command to verify:

```
# diagnose wad user list
ID: 8, IP: 10.1.100.71, VDOM: vdom1
  user name   : test1@FORTINETQA.LOCAL
  duration    : 389
  auth_type   : IP
  auth_method : Negotiate
  pol_id      : 1
  g_id        : 1
  user_based  : 0
  expire      : no
  LAN:
    bytes_in=4862 bytes_out=11893
  WAN:
    bytes_in=7844 bytes_out=1023
```

Log in using a system that is not part of the domain. The NTLM fallback server should be used:

```
# diagnose wad user list
ID: 2, IP: 10.1.100.202, VDOM: vdom1
  user name   : TEST31@FORTINETQA
  duration    : 7
  auth_type   : IP
  auth_method : NTLM
  pol_id      : 1
  g_id        : 5
  user_based  : 0
  expire      : no
  LAN:
    bytes_in=6156 bytes_out=16149
  WAN:
    bytes_in=7618 bytes_out=1917
```

Generating a keytab on a Windows server

A keytab is used to allow services that are not running Windows to be configured with service instance accounts in the Active Directory Domain Service (AD DS). This allows Kerberos clients to authenticate to the service through Windows Key Distribution Centers (KDCs).

For an explanation of the process, see https://docs.microsoft.com/en-us/windows-server/administration/windows-commands/ktpass.

To generate a keytab on a Windows server:

1. On the server, create a user for the FortiGate:
   - The service name is the FQDN for the explicit proxy interface, such as the hostname in the client browser proxy configuration. In this example, the service name is *FGT*.
   - The account only requires *domain users* membership.
   - The password must be very strong.
   - The password is set to never expire.
2. Add the FortiGate FQDN in to the Windows DNS domain, as well as in-addr.arpa.
3. Generate the Kerberos keytab using the `ktpass` command on Windows servers and many domain workstations:

   ```
   # ktpass -princ HTTP/<domain name of test fgt>@realm -mapuser <user> -pass <password> -crypto all -ptype KRB5_NT_PRINCIPAL -out fgt.keytab
   ```

   For example:

   ```
   ktpass -princ HTTP/FGT.FORTINETQA.LOCAL@FORTINETQA.LOCAL -mapuser FGT -pass ********** -crypto all -ptype KRB5_NT_PRINCIPAL -out fgt.keytab
   ```

   If the FortiGate is handling multiple keytabs in Kerberos authentication, use different passwords when generating each keytab.

4. Encode the keytab to base64 in a text file:
   - On Windows: `certutil -encode fgt.keytab tmp.b64 && findstr /v /c:- tmp.b64 > fgt.txt`
   - On Linux: `base64 fgt.keytab > fgt.txt`
   - On MacOS: `base64 -i fgt.keytab -o fgt.txt`
5. Use the code in `fgt.txt` as the keytab parameter when configuring the FortiGate.

Transparent web proxy forwarding

In FortiOS, there is an option to enable proxy forwarding for transparent web proxy policies and regular firewall policies for HTTP and HTTPS.

In previous versions of FortiOS, you could forward proxy traffic to another proxy server (proxy chaining) with explicit proxy. Now, you can forward web traffic to the upstream proxy without having to reconfigure your browsers or publish a proxy auto-reconfiguration (PAC) file.

Once configured, the FortiGate forwards traffic generated by a client to the upstream proxy. The upstream proxy then forwards it to the server.

To configure proxy forwarding:

1. Configure the web proxy forwarding server:

```
config web-proxy forward-server
    edit "upStream_proxy_1"
        set ip 172.16.200.20
        set healthcheck enable
        set monitor "http://www.google.ca"
    next
end
```

2. Append the web proxy forwarding server to a firewall policy:

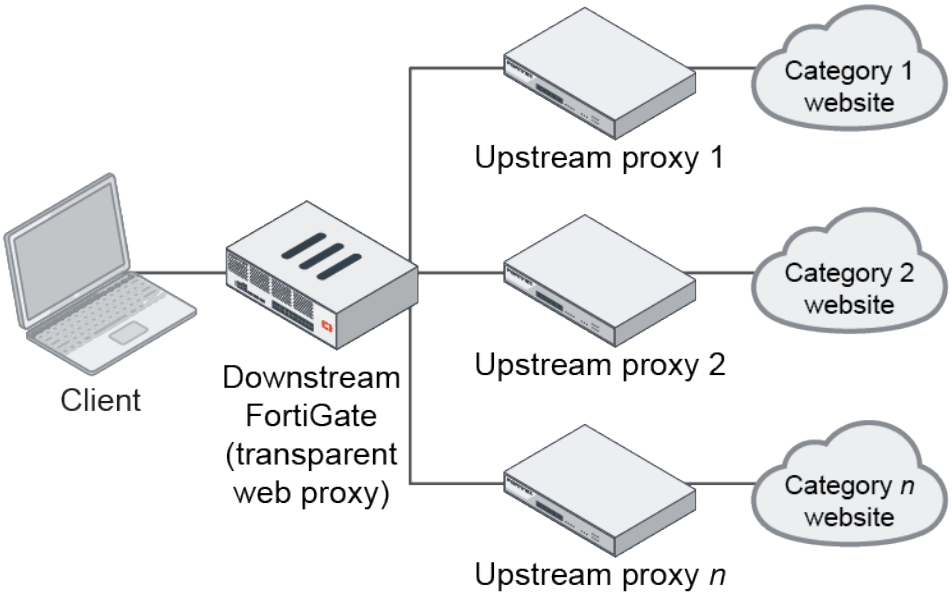
```
config firewall policy
    edit 1
        set name "LAN To WAN"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set logtraffic all
        set webproxy-forward-server "upStream_proxy_1"
        set fsso disable
        set av-profile "av"
        set ssl-ssh-profile "deep-custom"
        set nat enable
    next
end
```

Selectively forward web requests to a transparent web proxy

Web traffic over HTTP/HTTPS can be forwarded selectively by the FortiGate's transparent web proxy to an upstream web proxy to avoid overwhelming the proxy server. Traffic can be selected by specifying the proxy address, which can be based on a FortiGuard URL category.

The FortiGuard web filter service must be enabled on the downstream FortiGate.

Topology



Forwarding behavior

The forward server will be ignored if the proxy policy matching for a particular session needs the FortiGate to see authentication information inside the HTTP (plain text) message. For example, assume that user authentication is required and a forward server is configured in the transparent web proxy, and the authentication method is an active method (such as basic). When the user or client sends the HTTP request over SSL with authentication information to the FortiGate, the request cannot be forwarded to the upstream proxy. Instead, it will be forwarded directly to the original web server (assuming deep inspection and `http-policy-redirect` are enabled in the firewall policy).

The FortiGate will close the session before the client request can be forwarded if all of the following conditions are met:

- The certificate inspection is configured in the firewall policy that has the `http-policy-redirect` option enabled.
- A previously authenticated IP-based user record cannot be found by the FortiGate's memory during the SSL handshake.
- Proxy policy matching needs the FortiGate to see the HTTP request authentication information.

This means that in order to enable user authentication and use `webproxy-forward-server` in the transparent web proxy policy at the same time, the following best practices should be followed:

- In the firewall policy that has the `http-policy-redirect` option enabled, set `ssl-ssh-profile` to use the `deep-inspection` profile.
- Use IP-based authentication rules; otherwise, the `webproxy-forward-server` setting in the transparent web proxy policy will be ignored.
- Use a passive authentication method such as FSSO. With FSSO, once the user is authenticated as a domain user by a successful login, the web traffic from the user's client will always be forwarded to the upstream proxy as long as the authenticated user remains unexpired. If the authentication method is an active authentication method (such as basic, digest, NTLM, negotiate, form, and so on), the first session containing authentication information will bypass the forward server, but the following sessions will be connected through the upstream proxy.

Sample configuration

On the downstream FortiGate proxy, there are two category proxy addresses used in two separate transparent web proxy policies as the destination address:

- In the policy with `upstream_proxy_1` as the forward server, the proxy address `category_infotech` is used to match URLs in the information technology category.
- In the policy with `upstream_proxy_2` as the forward server, the proxy address `category_social` is used to match URLs in the social media category.

To configure forwarding requests to transparent web proxies:

1. Configure the proxy forward servers:

```
config web-proxy forward-server
    edit "upStream_proxy_1"
        set ip 172.16.200.20
    next
    edit "upStream_proxy_2"
        set ip 172.16.200.46
    next
end
```

2. Configure the web proxy addresses:

```
config firewall proxy-address
    edit "category_infotech"
        set type category
        set host "all"
        set category 52
    next
    edit "category_social"
        set type category
        set host "all"
        set category 37
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set http-policy-redirect enable
        set ssl-ssh-profile "deep-inspection"
        set av-profile "av"
        set nat enable
    next
end
```

4. Configure the proxy policies:

```
config firewall proxy-policy
    edit 1
        set proxy transparent-web
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "category_infotech"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set webproxy-forward-server "upStream_proxy_1"
        set utm-status enable
        set ssl-ssh-profile "deep-inspection"
        set av-profile "av"
    next
    edit 2
        set proxy transparent-web
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "category_social"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set webproxy-forward-server "upStream_proxy_2"
        set utm-status enable
        set ssl-ssh-profile "deep-inspection"
        set av-profile "av"
    next
end
```

Upstream proxy authentication in transparent proxy mode

A downstream proxy FortiGate that needs to be authenticated by the upstream web proxy can use the basic authentication method to send its username and password, in the base64 format, to the upstream web proxy for authentication. If the authentication succeeds, web traffic that is forwarded from the downstream proxy FortiGate to the upstream proxy can be accepted and forwarded to its destinations.

In this example, a school has a FortiGate acting as a downstream proxy that is configured with firewall policies for each user group (students and staff). In each policy, a forwarding server is configured to forward the web traffic to the upstream web proxy.

The username and password that the upstream web proxy uses to authenticate the downstream proxy are configured on the forwarding server, and are sent to the upstream web proxy with the forwarded HTTP requests.

	Username	Password
student.proxy.local:8080	students	ABC123
staff.proxy.local:8081	staff	123456

On the downstream FortiGate, configure forwarding servers with the usernames and passwords for authentication on the upstream web proxy, then apply those servers to firewall policies for transparent proxy. For explicit web proxy, the forwarding servers can be applied to proxy policies.

When the transparent proxy is configured, clients can access websites without configuring a web proxy in their browser. The downstream proxy sends the username and password to the upstream proxy with forwarded HTTP requests to be authenticated.

To configure the forwarding server on the downstream FortiGate:

```
config web-proxy forward-server
    edit "Student_Upstream_WebProxy"
        set addr-type fqdn
        set fqdn "student.proxy.local"
        set port 8080
        set username "student"
        set password ABC123
    next
    edit "Staff_Upstream_WebProxy"
        set addr-type fqdn
        set fqdn "staff.proxy.local"
        set port 8081
        set username "staff"
        set password 123456
    next
end
```

To configure firewall policies for transparent proxy:

```
config firewall policy
    edit 1
        set srcintf "Vlan_Student"
        set dstintf "port9"
        set srcaddr "Student_Subnet"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set av-profile "av"
        set webproxy-forward-server "Student_Upstream_WebProxy"
        set nat enable
    next
    edit 2
        set srcintf "Vlan_Staff"
        set dstintf "port9"
        set srcaddr "Staff_Subnet"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
```

```
        set av-profile "av"
        set webproxy-forward-server "Staff_Upstream_WebProxy"
        set nat enable
    next
end
```

Multiple dynamic header count

Multiple dynamic headers are supported for web proxy profiles, as well as Base64 encoding and the append/new options.

Administrators only have to select the dynamic header in the profile. The FortiGate will automatically display the corresponding static value. For example, if the administrator selects the `$client-ip` header, the FortiGate will display the actual client IP address.

The supported headers are:

`$client-ip`	Client IP address
`$user`	Authentication user name
`$domain`	User domain name
`$local_grp`	Firewall group name
`$remote_grp`	Group name from authentication server
`$proxy_name`	Proxy realm name

To configure dynamic headers using the CLI:

Since authentication is required, FSSO NTLM authentication is configured in this example.

1. Configure LDAP:

```
config user ldap
    edit "ldap-kerberos"
        set server "172.18.62.220"
        set cnid "cn"a
        set dn "dc=fortinetqa,dc=local"
        set type regular
        set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
        set password *********
    next
end
```

2. Configure FSSO:

```
config user fsso
    edit "1"
        set server "172.18.62.220"
        set password *********
    next
end
```

3. Configure a user group:

```
config user group
    edit "NTLM-FSSO"
        set group-type fsso-service
        set member "FORTINETQA/FSSO"
    next
end
```

4. Configure an authentication scheme:

```
config authentication scheme
    edit "au-sch-ntlm"
        set method ntlm
    next
end
```

5. Configure an authentication rule:

```
config authentication rule
    edit "au-rule-fsso"
        set srcaddr "all"
        set active-auth-method "au-sch-ntlm"
    next
end
```

6. Create a web proxy profile that adds a new dynamic and custom `Via` header:

```
config web-proxy profile
    edit "test"
        set log-header-change enable
        config headers
            edit 1
                set name "client-ip"
                set content "$client-ip"
            next
            edit 2
                set name "Proxy-Name"
                set content "$proxy_name"
            next
            edit 3
                set name "user"
                set content "$user"
            next
            edit 4
                set name "domain"
                set content "$domain"
            next
            edit 5
                set name "local_grp"
                set content "$local_grp"
            next
            edit 6
                set name "remote_grp"
                set content "$remote_grp"
            next
            edit 7
                set name "Via"
                set content "Fortigate-Proxy"
            next
```

```
        end
    next
end
```

7. In the proxy policy, append the web proxy profile created in the previous step:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "web"
        set action accept
        set schedule "always"
        set logtraffic all
        set groups "NTLM-FSSO"
        set webproxy-profile "test"
        set utm-status enable
        set av-profile "av"
        set webfilter-profile "content"
        set ssl-ssh-profile "deep-custom"
    next
end
```

8. Once traffic is being generated from the client, look at the web filter logs to verify that it is working.

   The corresponding values for all the added header fields are shown at *Log & Report* > *Web Filter*, in the *Change headers* section at the bottom of the *Log Details* pane.

```
1: date=2019-02-07 time=13:57:24 logid="0344013632" type="utm" subtype="webfilter"
eventtype="http_header_change" level="notice" vd="vdom1" eventtime=1549576642 policyid=1
transid=50331689 sessionid=1712788383 user="TEST21@FORTINETQA" group="NTLM-FSSO"
profile="test" srcip=10.1.100.116 srcport=53278 dstip=172.16.200.46 dstport=80
srcintf="port2" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6
service="HTTP" url="http://172.16.200.46/" agent="curl/7.22.0" chgheaders="Added=client-
ip: 10.1.100.116|Proxy-Name: 1.1 100D.qa|user: TEST21|domain: FORTINETQA|local_grp:
NTLM-FSSO|remote_grp: FORTINETQA/FSSO|Via: Fortigate-Proxy"
```

Restricted SaaS access

With the web proxy profile, you can specify access permissions for Microsoft Office 365, Google G Suite, and Dropbox. You can insert vendor-defined headers that restrict access to the specific accounts. You can also insert custom headers for any destination.

You can configure the web proxy profile with the required headers for the specific destinations, and then directly apply it to a policy to control the header's insertion.

To implement Office 365 tenant restriction, G Suite account access control, and Dropbox network access control:

1. Configure a web proxy profile according to the vendors' specifications:
   a. Define the traffic destination (service provider).
   b. Define the header name, defined by the service provider.

c. Define the value that will be inserted into the traffic, defined by your settings.

2. Apply the web proxy profile to a policy.

The following example creates a web proxy profile for Office 365, G Suite, and Dropbox access control.

Due to vendors' changing requirements, this example may no longer comply with the vendors' official guidelines.

To create a web proxy profile for access control using the CLI:

1. Configure the web proxy profile:

```
config web-proxy profile
   edit "SaaS-Tenant-Restriction"
        set header-client-ip pass
        set header-via-request pass
        set header-via-response pass
        set header-x-forwarded-for pass
        set header-front-end-https pass
        set header-x-authenticated-user pass
        set header-x-authenticated-groups pass
        set strip-encoding disable
        set log-header-change disable
        config headers
            edit 1
                set name "Restrict-Access-To-Tenants"  <---header name defined by
Office365 spec. input EXACTLY as it is
                set dstaddr "Microsoft Office 365" <----built-in destination address for
Office365
                set action add-to-request
                set base64-encoding disable
                set add-option new
                set protocol https http
                set content "contoso.onmicrosoft.com,fabrikam.onmicrosoft.com"  <----
your tenants restriction configuration
            next
            edit 2
                set name "Restrict-Access-Context"  <----header name defined by
Office365 spec. input EXACTLY as it is
                set dstaddr "Microsoft Office 365"  <----build-in destination address
for Office365
                set action add-to-request
                set base64-encoding disable
                set add-option new
                set protocol https http
                set content "456ff232-35l2-5h23-b3b3-3236w0826f3d" <----your directory
ID can find in Azure portal
            next
            edit 3
                set name "X-GooGApps-Allowed-Domains"  <----header name defined by
Google G suite.
                set dstaddr "G Suite"  <---- built-in G Suite destination address
                set action add-to-request
```

```
                set base64-encoding disable
                set add-option new
                set protocol https http
                set content "abcd.com"    <----your domain restriction when you create G
Suite account
            next
            edit 4
                set name "X-Dropbox-allowed-Team-Ids" <----header defined by Dropbox
                set dstaddr "wildcard.dropbox.com"  <----build-in destination address
for Dropbox
                set action add-to-request
                set base64-encoding disable
                set add-option new
                set protocol https http
                set content "dbmid:FDFSVF-DFSDF"  <----your team-Id in Dropbox
            next
        end
    next
end
```

2. Apply the web proxy profile to a firewall policy:

```
config firewall policy
    edit 1
        set name "WF"
        set srcintf "port10" "wifi"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set webproxy-profile "SaaS-Tenant-Restriction"
        set utm-status enable
        set utm-inspection-mode proxy
        set logtraffic all
        set webfilter-profile "blocktest2"
        set application-list "g-default"
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set nat enable
    next
end
```

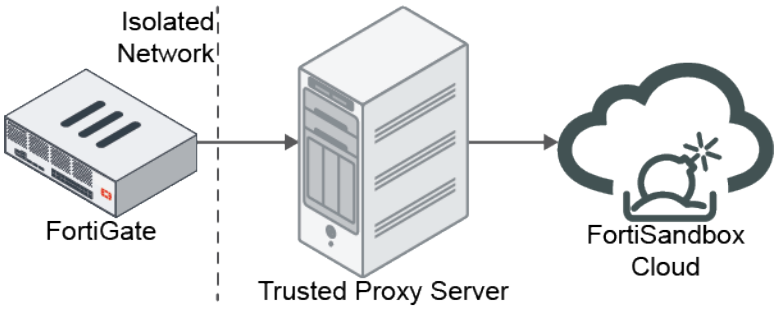
Explicit proxy and FortiSandbox Cloud

Explicit proxy connections can leverage FortiSandbox Cloud for advanced threat scanning and updates. This allows FortiGates behind isolated networks to connect to FortiCloud services.



To configure FortiGuard services to communicate with an explicit proxy server:

```
config system fortiguard
    set proxy-server-ip 172.16.200.44
    set proxy-server-port 3128
    set proxy-username "test1"
    set proxy-password *********
end
```

To verify the explicit proxy connection to FortiSandbox Cloud:

```
# diagnose debug application forticldd -1
Debug messages will be on for 30 minutes.
# diagnose debug enable
[2942] fds_handle_request: Received cmd 23 from pid-2526, len 0

Proxy chaining

For the explicit web proxy you can configure web proxy forwarding servers to use proxy chaining to redirect web proxy sessions to other proxy servers. Proxy chaining can be used to forward web proxy sessions from the FortiGate unit to one or more other proxy servers on your network or on a remote network. You can use proxy chaining to integrate the FortiGate explicit web proxy with a web proxy solution that you already have in place.

A FortiGate unit can forward sessions to most web proxy servers including a remote FortiGate unit with the explicit web proxy enabled. No special configuration of the explicit web proxy on the remote FortiGate unit is required.

You can deploy the explicit web proxy with proxy chaining in an enterprise environment consisting of small satellite offices and a main office. If each office has a FortiGate unit, users at each of the satellite offices can use their local FortiGate unit as an explicit web proxy server. The satellite office FortiGate units can forward explicit web proxy sessions to an explicit web proxy server at the central office. From here the sessions can connect to web servers on the Internet.

FortiGate proxy chaining does not support web proxies in the proxy chain authenticating each other.

The following examples assume explicit web proxy has been enabled.

To enable explicit web proxy in the GUI:

1. Go to *System* > *Feature Visibility*.
2. In the *Security Features* column, enable *Explicit Proxy*.

3. Configure the explicit web proxy settings. See Explicit web proxy on page 194.

To add a web proxy forwarding server in the GUI:

1. Go to *Network* > *Explicit Proxy*. The *Explicit Proxy* page opens.
2. In the *Web Proxy Forwarding Servers* section, click *Create New*.
3. Configure the server settings:

Name	Enter the name of the forwarding server.
Proxy Address Type	Select the type of IP address of the forwarding server. A forwarding server can have an *FQDN* or *IP* address.
Proxy Address	Enter the IP address of the forwarding server.
Port	Enter the port number on which the proxy receives connections. Traffic leaving the FortiGate explicit web proxy for this server has its destination port number changed to this number.
Server Down Action	Select the action the explicit web proxy will take if the forwarding server is down. • *Block*: Blocks the traffic if the remote server is down. • *Use Original Server*: Forwards the traffic from the FortiGate to its destination as if no forwarding server is configured.
Health Monitor	Select to enable health check monitoring.
Health Check Monitor Site	Enter the address of a remote site.

4. Click *OK*.

Example

The following example adds a web proxy forwarding server named `fwd-srv` at address `proxy.example.com` and port `8080`.

To add a web proxy forwarding server in the CLI:

```
config web-proxy forward-server
    edit fwd-srv
        set addr-type fqdn
        set fqdn proxy.example.com
        set port 8080
    next
end
```

Web proxy forwarding server monitoring and health checking

By default, a FortiGate unit monitors a web proxy forwarding server by forwarding a connection to the remote server every 10 seconds. The remote server is assumed to be down if it does not respond to the connection. FortiGate continues checking the server. The server is assumed to be back up when the server sends a response. If you enable health checking, the FortiGate unit attempts to get a response from a web server every 10 seconds by connecting through the remote forwarding server.

You can configure health checking for each remote server and specify a different website to check for each one.

If the remote server is found to be down you can configure the FortiGate unit to block sessions until the server comes back up or to allow sessions to connect to their destination, bypassing the remote forwarding server. You cannot configure the FortiGate unit to fail over to another remote forwarding server.

To configure proxy server monitor and health checking in the GUI:

1. Go to *Network* > *Explicit Proxy*. The *Explicit Proxy* page opens.
2. In the *Web Proxy Forwarding Servers* section, edit a server.
3. Configure the *Server Down Action* and *Health Monitor* settings.

Server Down Action	Select the action the explicit web proxy will take if the forwarding server is down. • *Block*: Blocks the traffic if the remote server is down. • *Use Original Server*: Forwards the traffic from the FortiGate to its destination as if no forwarding server configured.
Health Monitor	Select to enable health check monitoring.
Health Check Monitor Site	Enter the address of a remote site.

4. Click *OK*.

Example

The following example enables health checking for a web proxy forwarding server and sets the server down option to bypass the forwarding server if it is down.

To configure proxy server monitor and health checking in the CLI:

```
config web-proxy forward-server
    edit fwd-srv
        set healthcheck enable
        set monitor http://example.com
        set server-down-option pass
    next
end
```

Grouping forwarding servers and load balancing traffic to the servers

You can add multiple web proxy forwarding servers to a forwarding server group and then add the server group to an explicit web proxy policy instead of adding a single server. Forwarding server groups are created from the FortiGate CLI but can be added to policies from the web-based manager (or from the CLI).

When you create a forwarding server group you can select a load balancing method to control how sessions are load balanced to the forwarding servers in the server group. Two load balancing methods are available:

- *Weighted* load balancing sends more sessions to the servers with higher weights. You can configure the weight for each server when you add it to the group.
- *Least-session* load balancing sends new sessions to the forwarding server that is processing the fewest sessions.

When you create a forwarding server group you can also enable *affinity*. Enable affinity to have requests from the same client processed by the same server. This can reduce delays caused by using multiple servers for a single multi-step client operation. Affinity takes precedence over load balancing.

You can also configure the behavior of the group if all of the servers in the group are down. You can select to block traffic or you can select to have the traffic pass through the FortiGate explicit proxy directly to its destination instead of being sent to one of the forwarding servers.

Example

The following example adds a forwarding server group that uses weighted load balancing to load balance traffic to three forwarding servers. Server weights are configured to send most traffic to `server2`. The group has `affinity` enabled and blocks traffic if all of the forward servers are down.

To configure load balancing in the CLI:

```
config web-proxy forward-server
    edit server_1
        set ip 172.20.120.12
        set port 8080
    next
    edit server_2
        set ip 172.20.120.13
        set port 8000
    next
    edit server_3
        set ip 172.20.120.14
        set port 8090
    next
end
config web-proxy forward-server-group
    edit New-fwd-group
        set affinity enable
        set ldb-method weighted
        set group-down-option block
        config server-list
            edit server_1
                set weight 10
            next
            edit server_2
                set weight 40
            next
            edit server_3
                set weight 10
            next
        end
    next
end
```

Adding proxy chaining to an explicit web proxy policy

You can enable proxy chaining for web proxy sessions by adding a web proxy forwarding server or server group to an explicit web proxy policy. In a policy you can select one web proxy forwarding server or server group. All explicit web

proxy traffic accepted by this security policy is forwarded to the specified web proxy forwarding server or server group.

To add an explicit web proxy forwarding server in the GUI:

1. Go to *Policy & Objects* > *Proxy Policy* and click *Create New*.
2. Configure the policy settings:

Proxy Type	Explicit Web
Outgoing Interface	wan1
Source	Internal_subnet
Destination	all
Schedule	always
Service	webproxy
Action	Accept

3. Enable *Web Proxy Forwarding Server* and select the forwarding server, (for example,*fwd-srv*).
4. Click *OK*.

Example

The following example adds a security policy that allows all users on the `10.31.101.0` subnet to use the explicit web proxy for connections through the `wan1` interface to the Internet. The policy forwards web proxy sessions to a remote forwarding server named *fwd-srv*.

To add an explicit web proxy forwarding server in the CLI:

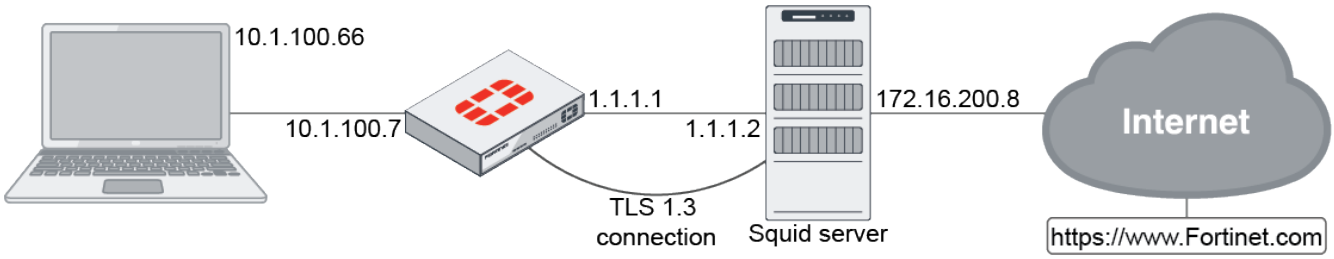
```
config firewall proxy-policy
    edit 0
        set proxy explicit-web
        set dstintf "wan1"
        set srcaddr "Internal_subnet"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set webproxy-forward-server "fwd-srv"
    next
end
```

Using TLS 1.3 with web proxy forward servers

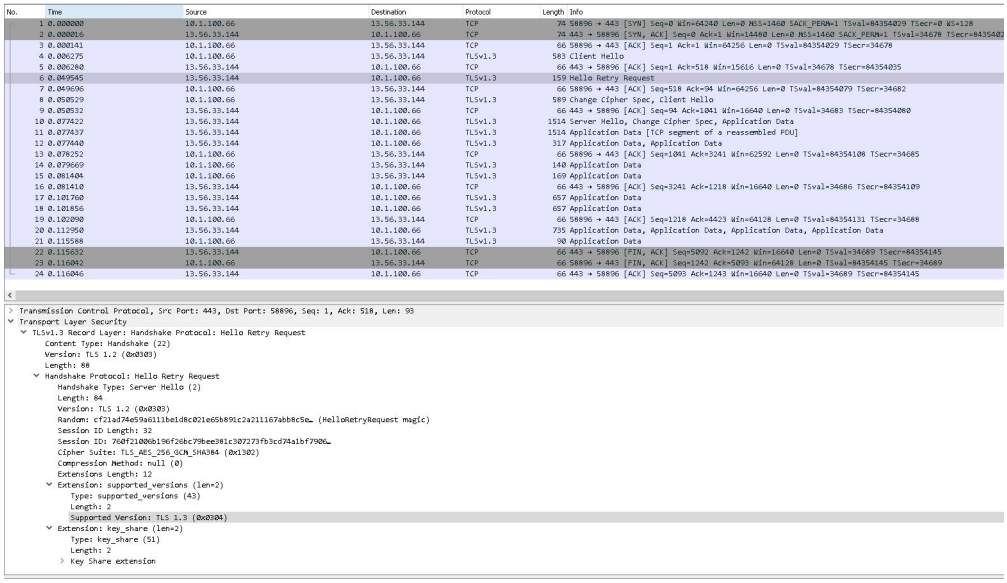
A FortiGate can handle TLS 1.3 traffic in both deep and certificate inspection modes.

Example

The following example demonstrates that the Squid server and the FortiGate can handle TLS 1.3 traffic.



The following output from the Squid server demonstrates that the FortiGate supports TLS 1.3 traffic and forwards the hello retry request back to the client PC. The client PC then sends the client hello again, and the connection is successfully established.



Agentless NTLM authentication for web proxy

Agentless Windows NT LAN Manager (NTLM) authentication includes support for the following items:

- Multiple servers
- Individual users

You can use multiple domain controller servers for the agentless NTLM. They can be used for load balancing and high service stability.

You can also use user-based matching in groups for Kerberos and agentless NTLM. In these scenarios, FortiOS matches the user's group information from an LDAP server.

To support multiple domain controllers for agentless NTLM using the CLI:

1. Configure an LDAP server:

```
config user ldap
    edit "ldap-kerberos"
        set server "172.18.62.177"
        set cnid "cn"
```

```
        set dn "dc=fortinetqa,dc=local"
        set type regular
        set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
        set password *********
    next
end
```

2. Configure multiple domain controllers:

```
config user domain-controller
    edit "dc1"
        set ip-address 172.18.62.177
        config extra-server
            edit 1
                set ip-address 172.18.62.220
            next
        end
        set ldap-server "ldap-kerberos"
    next
end
```

3. Create an authentication scheme and rule:

```
config authentication scheme
    edit "au-ntlm"
        set method ntlm
        set domain-controller "dc1"
    next
end

config authentication rule
    edit "ru-ntlm"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "au-ntlm"
    next
end
```

4. In the proxy policy, append the user group for authorization:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "web"
        set action accept
        set schedule "always"
        set groups "ldap-group"
        set utm-status enable
        set av-profile "av"
        set ssl-ssh-profile "deep-custom"
    next
end
```

This configuration uses a round-robin method. When the first user logs in, the FortiGate sends the authentication request to the first domain controller. Later when another user logs in, the FortiGate sends the authentication request to another domain controller.

5. Verify the behavior after the user successfully logs in:

```
# diagnose wad user list
ID: 1825, IP: 10.1.100.71, VDOM: vdom1
    user name   : test1
    duration    : 497
    auth_type   : Session
    auth_method : NTLM
    pol_id      : 1   g_id        : 5
    user_based  : 0   e
    xpire      : 103
    LAN:
        bytes_in=2167 bytes_out=7657
    WAN:
        bytes_in=3718 bytes_out=270
```

To support individual users for agentless NTLM using the CLI:

1. Configure an LDAP server:

```
config user ldap
    edit "ldap-kerberos"
        set server "172.18.62.177"
        set cnid "cn"
        set dn "dc=fortinetqa,dc=local"
        set type regular
        set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
        set password *********
    next
end
```

2. Configure the user group and allow user-based matching:

```
config user group
    edit "ldap-group"
        set member "ldap" "ldap-kerberos"
        config match
            edit 1
                set server-name "ldap-kerberos"
                set group-name "test1"
            next
        end
    next
end
```

3. Create an authentication scheme and rule:

```
config authentication scheme
    edit "au-ntlm"
        set method ntlm
        set domain-controller "dc1"
    next
end

config authentication rule
    edit "ru-ntlm"
        set srcaddr "all"
        set ip-based disable
```

```
        set active-auth-method "au-ntlm"
    next
end
```

4. In the proxy policy, append the user group for authorization:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "web"
        set action accept
        set schedule "always"
        set groups "ldap-group"
        set utm-status enable
        set av-profile "av"
        set ssl-ssh-profile "deep-custom"
    next
end
```

This implementation lets you configure a single user instead of a whole group. The FortiGate will now allow the user named `test1`.

To verify the configuration using the CLI:

```
diagnose wad user list
    ID: 1827, IP: 10.1.15.25, VDOM: vdom1
    user name    : test1
    duration     : 161
    auth_type    : Session
    auth_method : NTLM
    pol_id       : 1
    g_id         : 5
    user_based   : 0
    expire       : 439
    LAN:
            bytes_in=1309 bytes_out=4410
      WAN:
            bytes_in=2145 bytes_out=544
```

Multiple LDAP servers in Kerberos keytabs and agentless NTLM domain controllers

Multiple LDAP servers can be configured in Kerberos keytabs and agentless NTLM domain controllers for multi-forest deployments.

To use multiple LDAP servers in Kerberos keytabs and agentless NTLM domain controllers:

1. Add multiple LDAP servers:

```
config user ldap
    edit "ldap-kerberos"
        set server "172.16.200.98"
        set cnid "cn"
```

```
            set dn "dc=fortinetqa,dc=local"
            set type regular
            set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
            set password xxxxxxxxx
        next
        edit "ldap-two"
            set server "172.16.106.128"
            set cnid "cn"
            set dn "OU=Testing,DC=ad864r2,DC=com"
            set type regular
            set username "cn=Testadmin,cn=users,dc=AD864R2,dc=com"
            set password xxxxxxxxx
        next
    end
```

2. Configure a Kerberos keytab entry that uses both LDAP servers:

```
config user krb-keytab
    edit "http_service"
        set pac-data disable
        set principal "HTTP/FGT.FORTINETQA.LOCAL@FORTINETQA.LOCAL"
        set ldap-server "ldap-kerberos" "ldap-two"
        set keytab xxxxxxxxx
    next
end
```

3. Configure a domain controller that uses both LDAP servers:

```
config user domain-controller
    edit "dc1"
        set ip-address 172.16.200.98
        set ldap-server "ldap-two" "ldap-kerberos"
    next
end
```

Learn client IP addresses

Learning the actual client IP addresses is imperative for authorization. This function identifies the real client IP address when there is a NATing device between the FortiGate and the client.

```
config web-proxy global
    set learn-client-ip {enable | disable}
    set learn-client-ip-from-header {true-client-ip | x-real-ip | x-forwarded-for}
    set learn-client-ip-srcaddr <address> ... <address>
end
```

`learn-client-ip {enable | disable}`	Enable/disable learning the client's IP address from headers.
`learn-client-ip-from-header {true-client-ip | x-real-ip | x-forwarded-for}`	Learn client IP addresses from the specified headers.
`learn-client-ip-srcaddr <address> ... <address>`	The source address names.

Example

In this example, the real client IP address is used to match a policy for FSSO authentication.

To enable learning the client IP address:

```
config web-proxy global
    set proxy-fqdn "default.fqdn"
    set webproxy-profile "default"
    set learn-client-ip enable
       set learn-client-ip-from-header x-forwarded-for
    set learn-client-ip-srcaddr "all"
end
```

To configure the proxy policy:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "mgmt1"
        set srcaddr "all"
        set dstaddr "all"
        set service "w"
        set action accept
        set schedule "always"
        set groups "fsso1"
        set utm-status enable
        set av-profile "default"
        set dlp-sensor "default"
        set profile-protocol-options "default"
        set ssl-ssh-profile "deep-inspection"
    next
end
```

To configure the authentication scheme and rule:

```
config authentication scheme
    edit "scheme1"
        set method fsso
    next
end
```

```
config authentication rule
    edit "rule1"
        set srcaddr "all"
        set sso-auth-method "scheme1"
    next
end
```

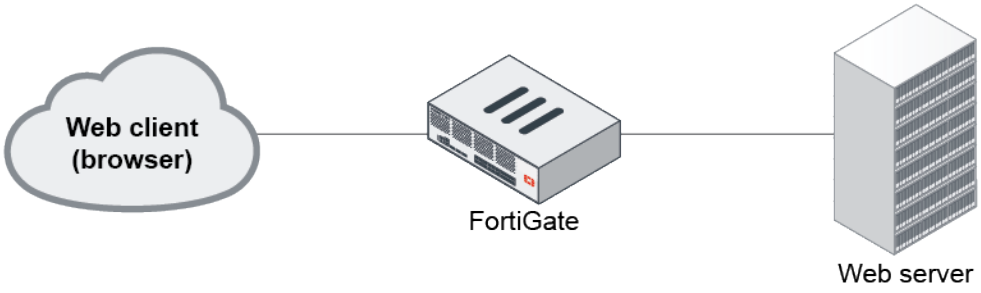
Explicit proxy authentication over HTTPS

When a HTTP request requires authentication in an explicit proxy, the authentication can be redirected to a secure HTTPS captive portal. Once authentication is complete, the client can be redirected back to the original destination over

HTTP.

Example

A user visits a website via HTTP through the explicit web proxy on a FortiGate. The user is required to authenticate by either basic or form IP-based authentication for the explicit web proxy service. The user credentials need to be transmitted over the networks in a secured method over HTTPS rather than in plain text. The user credentials are protected by redirecting the client to a captive portal of the FortiGate over HTTPS for authentication where the user credentials are encrypted and transmitted over HTTPS.



In this example, explicit proxy authentication over HTTPS is configured with form IP-based authentication. Once configured, you can enable authorization for an explicit web proxy by configuring users or groups in the firewall proxy policy.

To configure explicit proxy authentication over HTTPS:

1. Configure the authentication settings:

```
config authentication setting
    set captive-portal-type fqdn
    set captive-portal "fgt-cp"
    set auth-https enable
end
```

2. Configure the authentication scheme:

```
config authentication scheme
    edit "form"
        set method form
        set user-database "local-user-db"
    next
end
```

3. Configure the authentication rule:

```
config authentication rule
    edit "form"
        set srcaddr "all"
        set active-auth-method "form"
    next
end
```

If a session-based basic authentication method is used, enable `web-auth-cookie`.

4. Configure the firewall address:

```
config firewall address
    edit "fgt-cp"
        set type fqdn
        set fqdn "fgt.fortinetqa.local"
    next
end
```

5. Configure the interface:

```
config system interface
    edit "port10"
        set ip 10.1.100.1 255.255.255.0
        set explicit-web-proxy enable
        set proxy-captive-portal enable
    next
end
```

6. Configure a firewall proxy policy with users or groups (see Explicit web proxy on page 194).

Verification

When a client visits a HTTP website, the client will be redirected to the captive portal for authentication by HTTPS. For example, the client could be redirected to a URL by a HTTP 303 message similar to the following:

HTTP/1.1 303 See Other

Connection: close

Content-Type: text/html

Cache-Control: no-cache

Location: https://fgt.fortinetqa.local:7831/XX/YY/ZZ/cpauth?scheme=http&4Tmthd=0&host=172.16.200.46&port=80&rule=75&uri=Lw==&

Content-Length: 0

The captive portal URL used for authentication is *https://fgt.fortinetqa.local:7831/...*. Once the authentication is complete with all user credentials protected by HTTPS, the client is redirected to the original HTTP website they intended to visit.

DHCP server

A DHCP server leases IP addresses from a defined address range to clients on the network that request dynamically assigned addresses.

A DHCP server can be in server or relay mode. In server mode, you can define one or more address ranges it assigns addresses from, and options such as the default gateway, DNS server, lease time, and other advanced options. In relay mode, the interface forwards DHCP requests from DHCP clients to an external DHCP server and returns the responses to the DHCP clients. The DHCP server must have appropriate routing so that its response packets to the DHCP clients arrive at the unit.

- DHCP options on page 246
- IP address assignment with relay agent information option on page 247
- DHCP client options on page 249

Configure a DHCP server on an interface

To configure a DHCP server in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit an interface.
3. Enable the *DHCP Server* option and configure the settings.
4. Click *OK*.

To configure a DHCP server in the CLI:

```
config system dhcp server
    edit 1
        set dns-service default
        set default-gateway 192.168.1.2
        set netmask 255.255.255.0
        set interface "port1"
        config ip-range
            edit 1
                set start-ip 192.168.1.1
                set end-ip 192.168.1.1
```

```
            next
            edit 2
                set start-ip 192.168.1.3
                set end-ip 192.168.1.254
            next
        end
        set timezone-option default
        set tftp-server "172.16.1.2"
    next
end
```

Configure a DHCP relay on an interface

To configure a DHCP relay in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit an interface.
3. Enable the *DHCP Server* option and set *DHCP status* to *Disabled*.
4. Expand the *Advanced* section and set *Mode* to *Relay*.
5. Enter the *DHCP Server IP*.
6. Click *OK*.

To configure a DHCP relay in the CLI:

1. Configure the interface:

```
config system interface
    edit "port2"
        set vdom "root"
        set dhcp-relay-service enable
        set ip 10.1.1.5 255.255.255.0
        set allowaccess ping https ssh fabric
        set type physical
        set snmp-index 4
        set dhcp-relay-ip "192.168.20.10"
    next
end
```

2. On the DHCP server settings for the interface, set the status to disable:

```
config system dhcp server
    edit 17
        set status disable
        set dns-service default
        set default-gateway 10.1.1.5
        set netmask 255.255.255.0
        set interface "port2"
    next
end
```

Configure a DHCP server and relay on an interface

A FortiGate interface can be configured to work in DHCP server mode to lease out addresses, and at the same time relay the DHCP packets to another device, such as a FortiNAC to perform device profiling.

The DHCP message to be forwarded to the relay server under the following conditions:

- `dhcp-relay-request-all-server` is enabled
- Message type is either DHCPDISCOVER or DHCPINFORM
- Client IP address in client message is 0
- Server ID is NULL in the client message
- Server address is a broadcast address (255.255.255.255)
- Server address is 0

To configure a DHCP server and relay in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit an interface.
3. Enable the *DHCP Server* option and set *DHCP status* to *Enabled*.
4. Edit the address range as required.
5. Expand the *Advanced* section and set *Mode* to *Relay*.
6. Enter the *DHCP Server IP*.
7. Click *OK*.
8. In the CLI, enable `dhcp-relay-request-all-server`.

To configure a DHCP server and relay in the CLI:

1. Configure the interface:

```
config system interface
    edit "port2"
        set vdom "root"
        set dhcp-relay-service enable
        set ip 10.1.1.5 255.255.255.0
        set allowaccess ping https ssh fabric
        set type physical
        set snmp-index 4
        set dhcp-relay-ip "192.168.20.10"
        set dhcp-relay-request-all-server enable
    next
end
```

2. Configure the DHCP server settings:

```
config system dhcp server
    edit 17
        set status enable
        set dns-service default
        set default-gateway 10.1.1.5
        set netmask 255.255.255.0
        set interface "port2"
    next
end
```

DHCP options

When adding a DHCP server, you can include DHCP codes and options. The DHCP options are BOOTP vendor information fields that provide additional vendor-independent configuration parameters to manage the DHCP server. For example, you might need to configure a FortiGate DHCP server that gives out a separate option as well as an IP address, such as an environment that needs to support PXE boot with Windows images.

The option numbers and codes are specific to the application. The documentation for the application indicates the values to use. Option codes are represented in a option value/HEX value pairs. The option is a value between 1 and 255.

You can add up to three DHCP code/option pairs per DHCP server.

For detailed information about DHCP options, see RFC 2132, DHCP Options and BOOTP Vendor Extensions.

To configure option 252 with value http://192.168.1.1/wpad.dat using the CLI:

```
config system dhcp server
    edit <server_entry_number>
        set option1 252 687474703a2f2f3139322e3136382e312e312f777061642e646174
    next
end
```

Option 82

The DHCP relay agent information option (option 82 in RFC 3046) helps protect the FortiGate against attacks such as spoofing (forging) of IP addresses and MAC addresses, and DHCP IP address starvation.

This option is disabled by default. However, when `dhcp-relay-service` is enabled, `dhcp-relay-agent-option` becomes enabled.

To configure the DHCP relay agent option using the CLI:

```
config system interface
    edit <interface>
        set vdom root
        set dhcp-relay-service enable
        set dhcp-relay-ip <ip>
        set dhcp-relay-agent-option enable
        set vlanid <id>
    next
end
```

See IP address assignment with relay agent information option on page 247 for an example.

Option 42

This option specifies a list of the NTP servers available to the client by IP address.

```
config system dhcp server
    edit 2
        set ntp-service {local | default | specify}
        set ntp-server1 <class_ip>
        set ntp-server2 <class_ip>
        set ntp-server3 <class_ip>
```

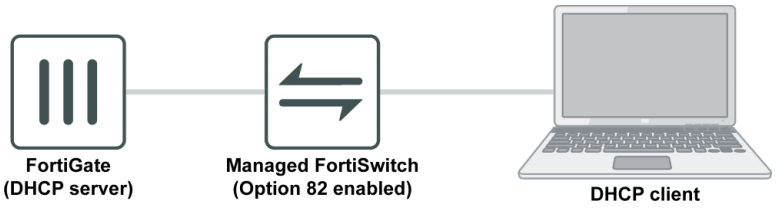
```
    next
end
```

The NTP service options include:

- `local`: The IP address of the interface that the DHCP server is added to becomes the client's NTP server IP address.
- `default`: Clients are assigned the FortiGate's configured NTP servers.
- `specify`: Specify up to three NTP servers in the DHCP server configuration.

IP address assignment with relay agent information option

Option 82 (DHCP relay information option) helps protect the FortiGate against attacks such as spoofing (or forging) of IP and MAC addresses, and DHCP IP address starvation.



The following CLI variables are included in the `config system dhcp server` > `config reserved-address` command:

`circuit-id-type {hex | string}`	DHCP option type; hex or string (default).
`circuit-id <value>`	Option 82 circuit ID of the client that will get the reserved IP address. Format: *vlan-mod-port* • vlan: VLAN ID (2 bytes) • mod: 1 = snoop, 0 = relay (1 byte) • port: port number (1 byte)
`remote-id-type {hex | string}`	DHCP option type; hex or string (default).
`remote-id <value>`	Option 82 remote ID of the client that will get the reserved IP address. Format: the MAC address of the client.
`type {mac | option82}`	The DHCP reserved address type; mac (default) or option82.

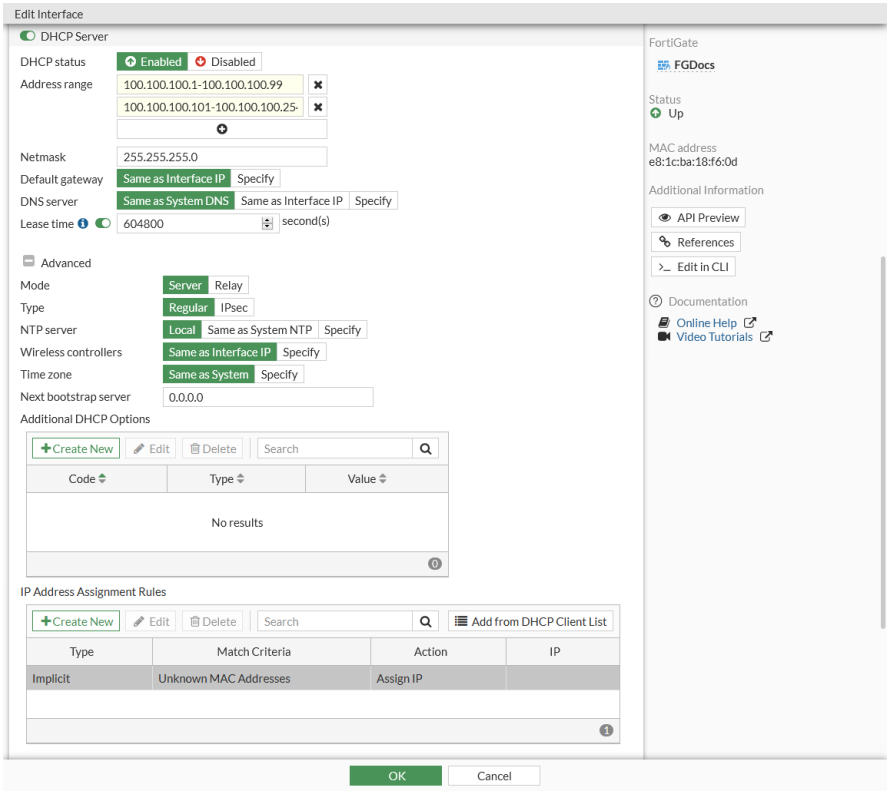
To create an IP address assignment rule using option 82 in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit an existing port, or create a new one.

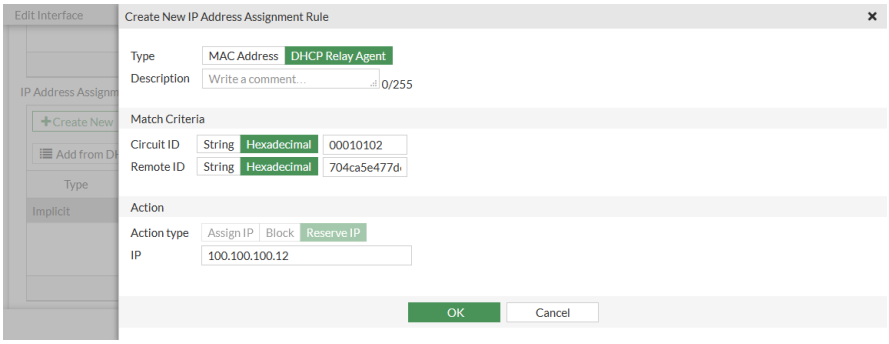
   The port *Role* must be *LAN* or *Undefined*.

3. Enable *DHCP Server*.
4. Configure the address ranges and other settings as needed.

5. Click + to expand the *Advanced* options.



6. In the *IP Address Assignment Rules* table, click *Create New*.
   The *Create New IP Address Assignment Rule* pane opens.
7. Configure the new rule:
   a. For the *Type*, select *DHCP Relay Agent*.
   b. Enter the *Circuit ID* and *Remote ID*.
   c. Enter the *IP* address that will be reserved.



8. Click *OK*.

To create an IP address assignment rule using option 82 with the CLI:

```
config system dhcp server
    edit 1
        set netmask 255.255.255.0
        set interface "port4"
        config ip-range
```

```
            edit 1
                set start-ip 100.100.100.1
                set end-ip 100.100.100.99
            next
            edit 2
                set start-ip 100.100.100.101
                set end-ip 100.100.100.254
            next
        end
        config reserved-address
            edit 1
                set type option82
                set ip 100.100.100.12
                set circuit-id-type hex
                set circuit-id "00010102"
                set remote-id-type hex
                set remote-id "704ca5e477d6"
            next
        end
    next
end
```

DHCP client options

When an interface is in DHCP addressing mode, DHCP client options can be configured in the CLI. For example, a vendor class identifier (usually DCHP client option 60) can be specified so that a request can be matched by a specific DHCP offer.

Multiple options can be configured, but any options not recognized by the DHCP server are discarded.

To configure client option 60 - vendor class identifier:

```
config system interface
    edit port1
        set vdom vdom1
        set mode dhcp
        config client-options
            edit 1
                set code 60
                set type hex
                set value aabbccdd
            next
        end
        set type physical
        set snmp-index 4
    next
end
```

Variable	Description
`code <integer>`	DHCP client option code (0 - 255, default = 0). See Dynamic Host Configuration Protocol (DHCP) and Bootstrap Protocol (BOOTP) Parameters for a list of possible options.

Variable	Description
`type {hex | string | ip | fqdn}`	DHCP client option type (default = hex).
`value <string>`	DHCP client option value.
`ip <ip>`	DHCP client option IP address. This option is only available when `type` is `ip`.

Static routing

Static routing is one of the foundations of firewall configuration. It is a form of routing in which a device uses manually-configured routes. In the most basic setup, a firewall will have a default route to its gateway to provide network access. In a more complex setup with dynamic routing, ADVPN, or SD-WAN involved, you would still likely find static routes being deployed.

This section explores concepts in using static routing and provides examples in common use cases:

- Routing concepts on page 250
- Policy routes on page 260
- Equal cost multi-path on page 263
- Dual internet connections on page 268

The following topics include additional information about static routes:

- Deploying the Security Fabric on page 1642
- Security Fabric over IPsec VPN on page 1662
- Adding a static route on page 321
- Configure VDOM-A on page 1456
- Configure VDOM-A on page 1466
- IPsec VPN in an HA environment on page 1053
- IPsec VPN to Azure with virtual network gateway on page 989
- FortiGate as dialup client on page 1009
- ADVPN with BGP as the routing protocol on page 1121
- ADVPN with OSPF as the routing protocol on page 1130
- ADVPN with RIP as the routing protocol on page 1139
- Basic site-to-site VPN with pre-shared key on page 955
- Site-to-site VPN with digital certificate on page 960
- Site-to-site VPN with overlapping subnets on page 967
- Tunneled Internet browsing on page 1036
- FortiGate multiple connector support on page 1944
- IPsec aggregate for redundancy and traffic load-balancing on page 1059
- Use MAC addresses in SD-WAN rules and policy routes on page 372
- Using BGP tags with SD-WAN rules on page 407

Routing concepts

This section contains the following topics:

- Default route on page 251
- Adding or editing a static route on page 251
- Configuring FQDNs as a destination address in static routes on page 252
- Routing table on page 252
- Viewing the routing database on page 255
- Kernel routing table on page 256
- Route cache on page 257
- Route look-up on page 258
- Blackhole routes on page 258
- Reverse path look-up on page 259
- Asymmetric routing on page 259
- Routing changes on page 260

Default route

The default route has a destination of `0.0.0.0/0.0.0.0`, representing the least specific route in the routing table. It is a catch all route in the routing table when traffic cannot match a more specific route. Typically this is configured with a static route with an administrative distance of `10`. In most instances, you will configure the next hop interface and the gateway address pointing to your next hop. If your FortiGate is sitting at the edge of the network, your next hop will be your ISP gateway. This provides internet access for your network.

Sometimes the default route is configured through DHCP. On some desktop models, the WAN interface is preconfigured in DHCP mode. Once the WAN interface is plugged into the network modem, it will receive an IP address, default gateway, and DNS server. FortiGate will add this default route to the routing table with a distance of `5`, by default. This will take precedence over any default static route with a distance of `10`. Therefore, take caution when you are configuring an interface in DHCP mode, where *Retrieve default gateway from server* is enabled. You may disable it and/or change the distance from the *Network* > *Interfaces* page when you edit an interface.

Adding or editing a static route

To add a static route using the GUI:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Enter the following information:

Dynamic Gateway	When enabled, a selected DHCP/PPPoE interface will automatically retrieve its dynamic gateway.
Destination	• Subnet Enter the destination IP address and netmask. A value of `0.0.0.0/0.0.0.0` creates a default route. • Named Address Select an address or address group object. Only addresses with static route configuration enabled will appear on the list. This means a geography type address cannot be used. • Internet Service Select an Internet Service. These are known IP addresses of popular

	services across the Internet.
Interface	Select the name of the interface that the static route will connect through.
Gateway Address	Enter the gateway IP address. When selecting an IPsec VPN interface or SD-WAN creating a blackhole route, the gateway cannot be specified.
Administrative Distance	Enter the distance value, which will affect which routes are selected first by different protocols for route management or load balancing. The default is 10.
Advanced Options	Optionally, expand *Advanced Options* and enter a *Priority*. When two routes have an equal distance, the route with a lower priority number will take precedence. The default is 0.

3. Click *OK*.

Configuring FQDNs as a destination address in static routes

You can configure FQDN firewall addresses as destination addresses in a static route, using either the GUI or the CLI.

In the GUI, to add an FQDN firewall address to a static route in the firewall address configuration, enable the *Static Route Configuration* option. Then, when you configure the static route, set *Destination* to *Named Address*.

To configure an FQDN as a destination address in a static route using the CLI:

```
config firewall address
    edit 'Fortinet-Documentation-Website'
        set type fqdn
        set fqdn docs.fortinet.com
        set allow-routing enable
    next
end

config router static
    edit 0
        set dstaddr Fortinet-Documentation-Website
        ...
    next
end
```

Routing table

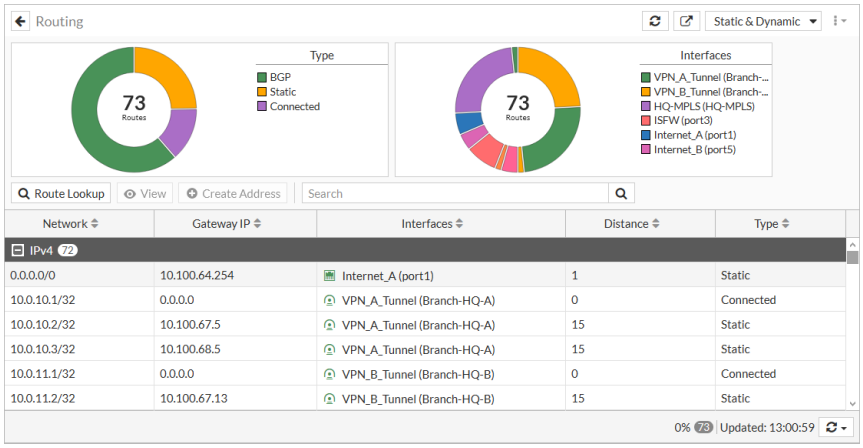
A routing table consists of only the best routes learned from the different routing protocols. The most specific route always takes precedence. If there is a tie, then the route with a lower administrative distance will be injected into the routing table. If administrative distances are also equal, then all the routes are injected into the routing table, and *Cost* and *Priority* become the deciding factors on which a route is preferred. If these are also equal, then FortiGate will use Equal cost multi-path on page 263 to distribute traffic between these routes.

Viewing the routing table in the GUI

You can view routing tables in the FortiGate GUI under *Dashboard* > *Network* > *Static & Dynamic Routing* by default. Expand the widget to see the full page. Additionally, if you want to convert the widget into a dashboard, click on the *Save as Monitor* icon on the top right of the page.

You can also monitor policy routes by toggling from *Static & Dynamic* to *Policy* on the top right corner of the page. The active policy routes include policy routes that you created, SD-WAN rules, and Internet Service static routes. It also supports downstream devices in the Security Fabric.

The following figure show an example of the static and dynamic routes in the Routing Monitor:



To view more columns, right-click on the column header to select the columns to be displayed:

Field	Description
IP Version	Shows whether the route is IPv4 or IPv6.
Network	The IP addresses and network masks of destination networks that the FortiGate can reach.
Gateway IP	The IP addresses of gateways to the destination networks.
Interfaces	The interface through which packets are forwarded to the gateway of the destination network.
Distance	The administrative distance associated with the route. A lower value means the route is preferable compared to other routes to the same destination.
Type	The type values assigned to FortiGate routes (Static, Connected, RIP, OSPF, or BGP): • *Connected*: All routes associated with direct connections to FortiGate interfaces • *Static*: The static routes that have been added to the routing table manually • *RIP*: All routes learned through RIP • *RIPNG*: All routes learned through RIP version 6 (which enables the sharing of routes through IPv6 networks) • *BGP*: All routes learned through BGP • *OSPF*: All routes learned through OSPF • *OSPF6*: All routes learned through OSPF version 6 (which enables the sharing of routes through IPv6 networks) • *IS-IS*: All routes learned through IS-IS • *HA*: RIP, OSPF, and BGP routes synchronized between the primary unit and the subordinate units of a high availability (HA) cluster. HA routes are maintained on subordinate units and are visible only if you're viewing the router monitor from a virtual domain that is configured as a subordinate virtual domain in a virtual cluster.

Field	Description
Metric	The metric associated with the route type. The metric of a route influences how the FortiGate dynamically adds it to the routing table. The following are types of metrics and the protocols they are applied to: • *Hop count*: Routes learned through RIP • *Relative cost*: Routes learned through OSPF • *Multi-Exit Discriminator (MED)*: Routes learned through BGP. By default, the MED value associated with a BGP route is zero. However, the MED value can be modified dynamically. If the value was changed from the default, the Metric column displays a non-zero value.
Priority	In static routes, priorities are 0 by default. When two routes have an equal distance, the route with the lower priority number will take precedence.
VRF	Virtual routing and forwarding (VRF) allows multiple routing table instances to co-exist. VRF can be assigned to an Interface. Packets are only forwarded between interfaces with the same VRF.
Up Since	The total accumulated amount of time that a route learned through RIP, OSPF, or BGP has been reachable.

Viewing the routing table in the CLI

Viewing the routing table using the CLI displays the same routes as you would see in the GUI.

If VDOMs are enabled on the FortiGate, all routing-related CLI commands must be run within a VDOM and not in the global context.

To view the routing table using the CLI:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
             O - OSPF, IA - OSPF inter area
             N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
             E1 - OSPF external type 1, E2 - OSPF external type 2
             i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
             * - candidate default
Routing table for VRF=0
S* 0.0.0.0/0 [1/0] via 172.31.0.1, MPLS [1/0]
     via 192.168.2.1, port1 [1/0] via 192.168.122.1, port2
S 1.2.3.4/32 [10/0] via 172.16.100.81, VLAN100
C 10.10.2.0/24 is directly connected, hub
C 10.10.2.1/32 is directly connected, hub
O 10.10.10.0/24 [110/101] via 192.168.2.1, port1, 01:54:18
C 10.253.240.0/20 is directly connected, wqt.root
S 110.2.2.122/32 [22/0] via 2.2.2.2, port2, [3/3]
C 172.16.50.0/24 is directly connected, WAN1-VLAN50
C 172.16.60.0/24 is directly connected, WAN2-VLAN60
C 172.16.100.0/24 is directly connected, VLAN100
C 172.31.0.0/30 is directly connected, MPLS
C 172.31.0.2/32 is directly connected, MPLS
B 192.168.0.0/24 [20/0] via 172.31.0.1, MPLS, 00:31:43
C 192.168.2.0/24 is directly connected, port1
C 192.168.20.0/24 is directly connected, port3
```

```
C 192.168.99.0/24 is directly connected, Port1-VLAN99
C 192.168.122.0/24 is directly connected, port2
Routing table for VRF=10
C 172.16.101.0/24 is directly connected, VLAN101
```

Examining an entry:

```
B 192.168.0.0/24 [20/0] via 172.31.0.1, MPLS, 00:31:43
```

Value	Description
`B`	BGP. The routing protocol used.
`192.168.0.0/24`	The destination of this route, including netmask.
`[20/0]`	`20` indicates an administrative distance of `20` out of a range of `0` to `255`. `0` is an additional metric associated with this route, such as in OSPF.
`172.31.0.1`	The gateway or next hop.
`MPLS`	The interface that the route uses.
`00:31:43`	The age of the route in `HH:MM:SS`.

Viewing the routing database

The routing database consists of all learned routes from all routing protocols before they are injected into the routing table. This likely lists more routes than the routing table as it consists of routes to the same destinations with different distances. Only the best routes are injected into the routing table. However, it is useful to see all learned routes for troubleshooting purposes.

To view the routing database using the CLI:

```
# get router info routing-table database
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
             O - OSPF, IA - OSPF inter area
             N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
             E1 - OSPF external type 1, E2 - OSPF external type 2
             i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
             > - selected route, * - FIB route, p - stale info
Routing table for VRF=0
S *> 0.0.0.0/0 [1/0] via 172.31.0.1, MPLS
     *> [1/0] via 192.168.2.1, port1
     *> [1/0] via 192.168.122.1, port2
S *> 1.2.3.4/32 [10/0] via 172.16.100.81, VLAN100
C *> 10.10.2.0/24 is directly connected, hub
C *> 10.10.2.1/32 is directly connected, hub
O *> 10.10.10.0/24 [110/101] via 192.168.2.1, port1, 02:10:17
C *> 10.253.240.0/20 is directly connected, wqt.root
S *> 110.2.2.122/32 [22/0] via 2.2.2.2, port2, [3/3]
C *> 172.16.50.0/24 is directly connected, WAN1-VLAN50
C *> 172.16.60.0/24 is directly connected, WAN2-VLAN60
C *> 172.16.100.0/24 is directly connected, VLAN100
O 172.31.0.0/30 [110/201] via 192.168.2.1, port1, 00:47:36
C *> 172.31.0.0/30 is directly connected, MPLS
```

Selected routes are marked by the > symbol. In the above example, the OSPF route to destination `172.31.0.0/30` is not selected.

Kernel routing table

The kernel routing table makes up the actual Forwarding Information Base (FIB) that used to make forwarding decisions for each packet. The routes here are often referred to as kernel routes. Parts of this table are derived from the routing table that is generated by the routing daemon.

To view the kernel routing table using the CLI:

```
# get router info kernel
tab=254 vf=0 scope=0 type=1 proto=11 prio=0 0.0.0.0/0.0.0.0/0->0.0.0.0/0 pref=0.0.0.0
     gwy=172.31.0.1 flag=04 hops=0 oif=31(MPLS) gwy=192.168.2.1 flag=04 hops=0 oif=3(port1)
     gwy=192.168.122.1 flag=04 hops=0 oif=4(port2)
tab=254 vf=0 scope=0 type=1 proto=17 prio=0 192.168.122.98/255.255.255.255/0->1.1.1.1/32
     pref=0.0.0.0 gwy=192.168.122.1 dev=4(port2)
tab=254 vf=0 scope=0 type=1 proto=17 prio=0 172.31.0.2/255.255.255.255/0->1.1.1.1/32
     pref=0.0.0.0 gwy=172.31.0.1 dev=31(MPLS)
tab=254 vf=0 scope=0 type=1 proto=17 prio=0 192.168.2.5/255.255.255.255/0->1.1.1.1/32
     pref=0.0.0.0 gwy=192.168.2.1 dev=3(port1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=0 0.0.0.0/0.0.0.0/0->1.2.3.4/32 pref=0.0.0.0
     gwy=172.16.100.81 dev=20(VLAN100)
tab=254 vf=0 scope=0 type=1 proto=17 prio=0 192.168.122.98/255.255.255.255/0->8.8.8.8/32
     pref=0.0.0.0 gwy=192.168.122.1 dev=4(port2)
```

The kernel routing table entries are:

Value	Description
`tab`	Table number: It will either be `254` (unicast) or `255` (multicast).
`vf`	Virtual domain of the firewall: It is the VDOM index number. If VDOMs are not enabled, this number is `0`.
`type`	Type of routing connection. Valid values include: • `0` - unspecific • `1` - unicast • `2` - local • `3` - broadcast • `4` - anycast • `5` - multicast • `6` - blackhole • `7` - unreachable • `8` - prohibited
`proto`	Type of installation that indicates where the route came from. Valid values include: • `0` - unspecific • `2` - kernel • `11` - ZebOS routing module • `14` - FortiOS

Value	Description
	• 15 - HA • 16 - authentication based • 17 - HA1
prio	Priority of the route. Lower priorities are preferred.
->0.0.0.0/0 (->x.x.x.x/mask)	The IP address and subnet mask of the destination.
pref	Preferred next hop along this route.
gwy	Gateway: The address of the gateway this route will use.
dev	Outgoing interface index: This number is associated with the interface for this route. If VDOMs are enabled, the VDOM is also included here. If an interface alias is set for this interface, it is also displayed here.

Route cache

The route cache contains recently used routing entries in a table. It is consulted before the routing table to speed up the route look-up process.

To view the route cache using the CLI:

```
# diagnose ip rtcache list
family=02 tab=254 vrf=0 vf=0 type=01 tos=0 flag=00000200
     0.0.0.0@0->208.91.113.230@3(port1) gwy=192.168.2.1 prefsrc=192.168.2.5
     ci: ref=0 lastused=1 expire=0 err=00000000 used=5 br=0 pmtu=1500
family=02 tab=254 vrf=0 vf=0 type=01 tos=0 flag=00000200
     192.168.2.5@0->8.8.8.8@3(port1) gwy=192.168.2.1 prefsrc=0.0.0.0
     ci: ref=0 lastused=0 expire=0 err=00000000 used=2 br=0 pmtu=1500
family=02 tab=254 vrf=0 vf=0 type=02 tos=8 flag=80000200
     8.8.8.8@31(MPLS)->172.31.0.2@6(root) gwy=0.0.0.0 prefsrc=172.31.0.2
     ci: ref=1 lastused=0 expire=0 err=00000000 used=0 br=0 pmtu=16436
family=02 tab=254 vrf=0 vf=0 type=02 tos=0 flag=84000200
     192.168.20.6@5(port3)->192.168.20.5@6(root) gwy=0.0.0.0 prefsrc=192.168.20.5
     ci: ref=2 lastused=0 expire=0 err=00000000 used=1 br=0 pmtu=16436
...
```

The size of the route cache is calculated by the kernel. However, you can modify it.

To modify the size of the route cache:

```
config system global
    set max-route-cache-size <number_of_cache_entries>
end
```

Route look-up

Route look-up typically occurs twice in the life of a session. Once when the first packet is sent by the originator and once more when the first reply packet is sent from the responder. When a route look-up occurs, the routing information is written to the session table and the route cache. If routing changes occur during the life of a session, additional routing look-ups may occur.

FortiGate performs a route look-up in the following order:

1. Policy-based routes: If a match occurs and the action is to forward, traffic is forwarded based on the policy route.
2. Route Cache: If there are no matches, FortiGate looks for the route in the route cache.
3. Forwarding Information Base, otherwise known as the kernel routing table.
4. If no match occurs, the packet is dropped.

Searching the routing table

When there are many routes in your routing table, you can perform a quick search by using the search bar to specify your criteria, or apply filters on the column header to display only certain routes. For example, if you want to only display static routes, you may use "static" as the search term, or filter by the *Type* field with value *Static*.

Route look-up on the other hand provides a utility for you to enter criteria such as *Destination*, *Destination Port*, *Source*, *Protocol* and/or *Source Interface*, in order to determine the route that a packet will take. Once you click *Search*, the corresponding route will be highlighted.

You can also use the CLI for a route look-up. The CLI provides a basic route look-up tool.

To look-up a route in the CLI:

```
# get router info routing-table details 4.4.4.4
Routing table for VRF=0
Routing entry for 0.0.0.0/0
       Known via "static", distance 1, metric 0, best
       * 172.31.0.1, via MPLS distance 0
       * 192.168.2.1, via port1 distance 0
       * 192.168.122.1, via port2 distance 0
```

Blackhole routes

Sometimes upon routing table changes, it is not desirable for traffic to be routed to a different gateway. For example, you may have traffic destined for a remote office routed through your IPsec VPN interface. When the VPN is down, traffic will try to re-route to another interface. However, this may not be viable and traffic will instead be routed to your default route through your WAN, which is not desirable. Traffic may also be routed to another VPN, which you do not want. For such scenarios, it is good to define a blackhole route so that traffic is dropped when your desired route is down. Upon reconnection, your desired route is once again added to the routing table and your traffic will resume routing to your desired interface. For this reason, blackhole routes are created when you configure an IPsec VPN using the IPsec wizard.

To create a blackhole route in the GUI:

1. Go to *Network* > *Static Routes*.
2. Click *Create New*. The *New Static Route* screen appears.
3. Specify a *Destination* type.

4. Select *Blackhole* from the *Interface* field.
5. Type the desired *Administrative Distance*.
6. Click *OK*.

Route priority for a *Blackhole* route can only be configured from the CLI.

Reverse path look-up

Whenever a packet arrives at one of the interfaces on a FortiGate, the FortiGate determines whether the packet was received on a legitimate interface by doing a reverse look-up using the source IP address in the packet header. This protects against IP spoofing attacks. If the FortiGate does not have a route to the source IP address through the interface on which the packet was received, the FortiGate drops the packet as per Reverse Path Forwarding (RPF) check. There are two modes of RPF – feasible path and strict. The default feasible RPF mode checks only for the existence of at least one active route back to the source using the incoming interface. The strict RPF check ensures the best route back to the source is used as the incoming interface.

To configure a strict Reverse Path Forwarding check in the CLI:

```
config system settings
    set strict-src-check enable
end
```

You can remove RPF state checks without needing to enable asymmetric routing by disabling state checks for traffic received on specific interfaces. Disabling state checks makes a FortiGate less secure and should only be done with caution for troubleshooting purposes.

To remove Reverse Path Forwarding checks from the state evaluation process in the CLI:

```
config system interface
    edit <interface_name>
        set src-check disable
    next
end
```

Asymmetric routing

The firewall tries to ensure symmetry in its traffic by using the same source-destination combination in the original and reverse path. Asymmetric routing occurs when traffic in the returning direction takes a different path than the original. There may be various scenarios in which this happens. For example, traffic in the original direction hits the firewall on `port1`, and is routed to `port2`. However, returning traffic is received on `port3` instead. In this scenario, asymmetric routing occurs and the returning traffic is blocked.

If for some specific reason it is required that a FortiGate unit should permit asymmetric routing, you can configure it by using CLI commands per VDOM.

To configure asymmetric routing per VDOM by using the CLI:

```
config vdom
    edit <vdom_name>
        config system settings
            set asymroute enable
        end
    next
end
```

Routing changes

When routing changes occur, routing look-up may occur on an existing session depending on certain configurations.

Routing Changes without SNAT

When a routing change occurs, FortiGate flushes all routing information from the session table and performs new routing look-up for all new packets on arrival by default. You can modify the default behavior using the following commands:

```
config system interface
    edit <interface>
        set preserve-session-route enable
    next
end
```

By enabling `preserve-session-route`, the FortiGate marks existing session routing information as persistent. Therefore, routing look-up only occurs on new sessions.

Routing Changes with SNAT

When SNAT is enabled, the default behavior is opposite to that of when SNAT is not enabled. After a routing change occurs, sessions with SNAT keep using the same outbound interface as long as the old route is still active. This may be the case if the priority of the static route was changed. You can modify this default behavior using the following commands:

```
config system global
    set snat-route-change enable
end
```

By enabling `snat-route-change`, sessions with SNAT will require new route look-up when a routing change occurs. This will apply a new SNAT to the session.

Policy routes

Policy routing allows you to specify an interface to route traffic. This is useful when you need to route certain types of network traffic differently than you would if you were using the routing table. You can use the incoming traffic's protocol, source or destination address, source interface, or port number to determine where to send the traffic.

When a packet arrives, the FortiGate starts at the top of the policy route list and attempts to match the packet with a policy. For a match to be found, the policy must contain enough information to route the packet. At a minimum, this requires the outgoing interface to forward the traffic, and the gateway to route the traffic to. If one or both of these are not specified in the policy route, then the FortiGate searches the routing table to find the best active route that corresponds

to the policy route. If no routes are found in the routing table, then the policy route does not match the packet. The FortiGate continues down the policy route list until it reaches the end. If no matches are found, then the FortiGate does a route lookup using the routing table.

Policy routes are sometimes referred to as Policy-based routes (PBR).

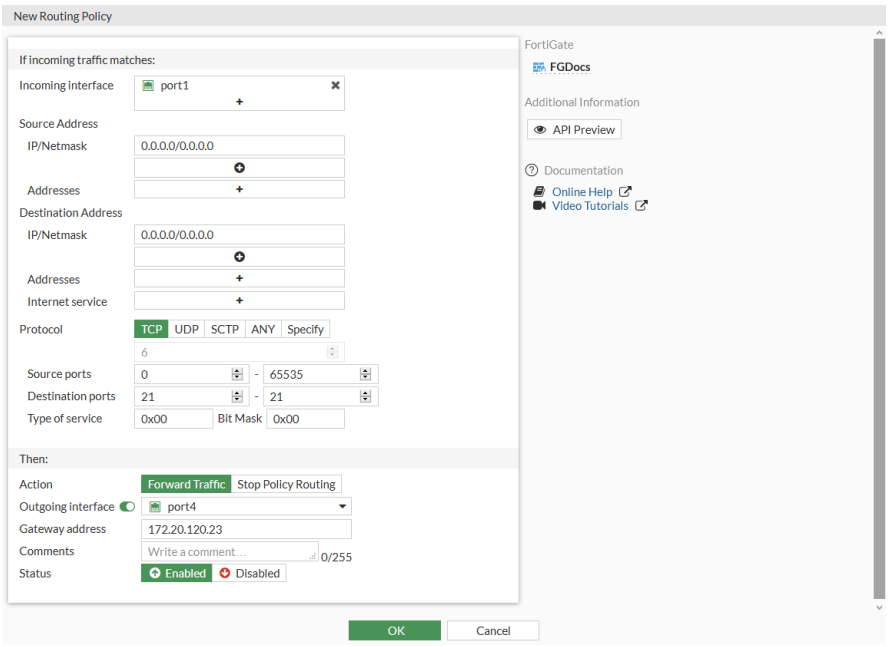
Configuring a policy route

In this example, a policy route is configured to send all FTP traffic received at port1 out through port4 and to a next hop router at 172.20.120.23. To route FTP traffic, the protocol is set to TCP (6) and the destination ports are set to 21 (the FTP port).

To configure a policy route in the GUI:

1. Go to *Network* > *Policy Routes*.
2. Click *Create New* > *Policy Route*.
3. Configure the following fields:

Incoming interface	port1
Source Address	0.0.0.0/0.0.0.0
Destination Address	0.0.0.0/0.0.0.0
Protocol	TCP
Destination ports	21 - 21
Type of service	0x00
Bit Mask	0x00
Outgoing interface	Enable and select port4
Gateway address	172.20.120.23



4. Click *OK*.

To configure a policy route in the CLI:

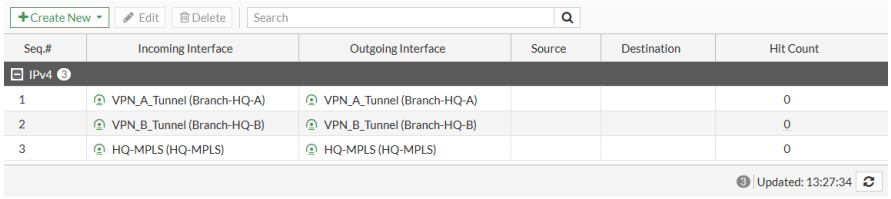
```
config router policy
    edit 1
        set input-device "port1"
        set src "0.0.0.0/0.0.0.0"
        set dst "0.0.0.0/0.0.0.0"
        set protocol 6
        set start-port 21
        set end-port 21
        set gateway 172.20.120.23
        set output-device "port4"
        set tos 0x00
        set tos-mask 0x00
    next
end
```

Moving a policy route

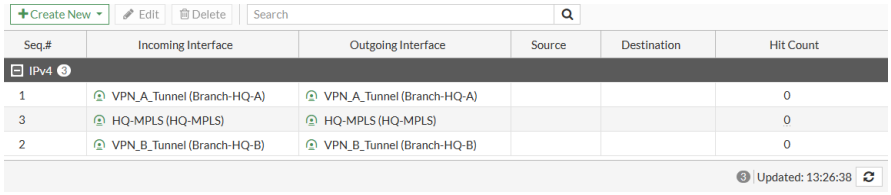
A routing policy is added to the bottom of the table when it is created. Routing policies can be moved to a different location in the table to change the order of preference. In this example, routing policy 3 will be moved before routing policy 2.

To move a policy route in the GUI:

1. Go to *Network* > *Policy Routes*.
2. In the table, select the policy route.



3. Drag the selected policy route to the desired position.

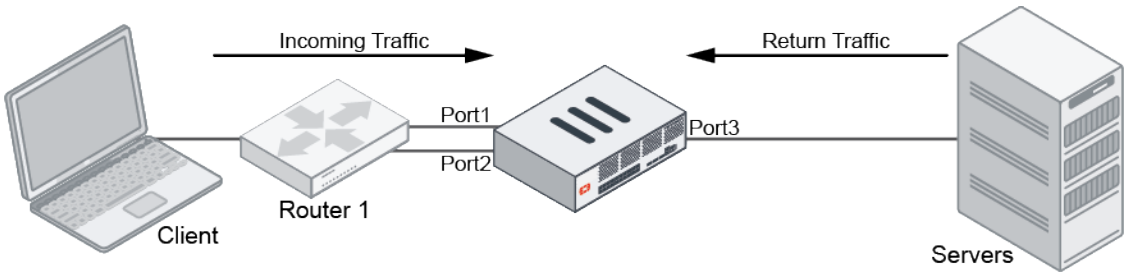


To move a policy route in the CLI:

```
config router policy
    move 3 after 1
end
```

Policy routes on return traffic

If a policy route is configured to match return traffic, the policy route will not be checked.



For example: traffic from the client to the servers enters the FortiGate on either port1 or port2, and a policy route is defined to match traffic that is sent from the servers' subnet to port2. The return traffic will not be checked against the policy route.

If auxiliary session is enabled, the traffic will egress from an interface based on the best route. If auxiliary session is disable, traffic will egress on the same interface where the incoming traffic arrived .

For more information, see Controlling return path with auxiliary session on page 1440.

Equal cost multi-path

Equal cost multi-path (ECMP) is a mechanism that allows a FortiGate to load-balance routed traffic over multiple gateways. Just like routes in a routing table, ECMP is considered after policy routing, so any matching policy routes will

take precedence over ECMP.

ECMP pre-requisites are as follows:

- Routes must have the same destination and costs. In the case of static routes, costs include distance and priority
- Routes are sourced from the same routing protocol. Supported protocols include static routing, OSPF, and BGP

ECMP and SD-WAN implicit rule

ECMP and SD-WAN implicit rule are essentially similar in the sense that an SD-WAN implicit rule is processed after SD-WAN service rules are processed. See Implicit rule on page 358 to learn more.

The following table summarizes the different load-balancing algorithms supported by each:

ECMP	SD-WAN		Description
	GUI	CLI	
`source-ip-based`	Source IP	`source-ip-based`	Traffic is divided equally between the interfaces. Sessions that start at the same source IP address use the same path. This is the default selection.
`weight-based`	Sessions	`weight-based`	The workload is distributed based on the number of sessions that are connected through the interface. The weight that you assign to each interface is used to calculate the percentage of the total sessions allowed to connect through an interface, and the sessions are distributed to the interfaces accordingly.
`usage-based`	Spillover	`usage-based`	The interface is used until the traffic bandwidth exceeds the ingress and egress thresholds that you set for that interface. Additional traffic is then sent through the next interface member.
`source-dest-ip-based`	Source-Destination IP	`source-dest-ip-based`	Traffic is divided equally between the interfaces. Sessions that start at the same source IP address and go to the same destination IP address use the same path.
Not supported	Volume	`measured-volume-based`	This mode is supported in SD-WAN only. The workload is distributed based on the number of packets that are going through the interface.

To configure the ECMP algorithm from the CLI:

- At the VDOM-level:
  ```
  config system settings
  ```

```
      set v4-ecmp-mode {source-ip-based* | weight-based | usage-based | source-dest-ip-
           based}
   end
```

- If SD-WAN is enabled, the above option is not available and ECMP is configured under the SD-WAN settings:

```
   config system sdwan
      set sdwan enable
      set load-balance-mode {source-ip-based* | weight-based | usage-based | source-dest-ip-
           based | measured-volume-based}
   end
```

For ECMP in IPv6, the mode must also be configured under SD-WAN.

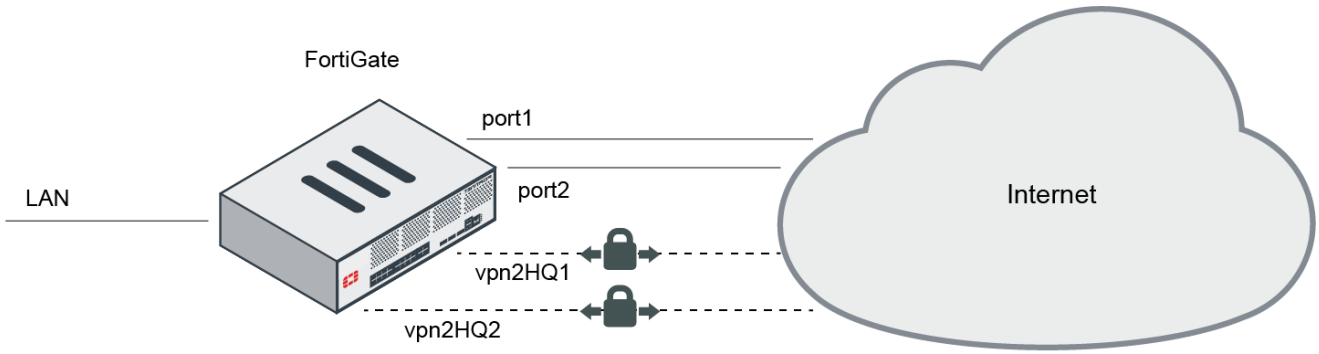
```
# diagnose sys vd list
system fib version=63
list virtual firewall info:
name=root/root index=0 enabled fib_ver=40 use=168 rt_num=46 asym_rt=0 sip_helper=0, sip_nat_
     trace=1, mc_fwd=0, mc_ttl_nc=0, tpmc_sk_pl=0
ecmp=source-ip-based, ecmp6=source-ip-based asym_rt6=0 rt6_num=55 strict_src_check=0 dns_
     log=1 ses_num=20 ses6_num=0 pkt_num=19154477
```

To change the number of paths allowed by ECMP:

```
config system settings
   set ecmp-max-paths <number of paths>
end
```

Setting `ecmp-max-paths` to the lowest value of `1` is equivalent to disabling ECMP.

ECMP configuration examples



The following examples demonstrate the behavior of ECMP in different scenarios:

- Example 1: Default ECMP on page 265
- Example 2: Same distance, different priority on page 266
- Example 3: Weight-based ECMP on page 266
- Example 4: Load-balancing BGP routes on page 267

Example 1: Default ECMP

```
config router static
```

```
   edit 1
      set gateway 172.16.151.1
      set device "port1"
   next
   edit 2
      set gateway 192.168.2.1
      set device "port2"
   next
end

# get router info routing-table all
Routing table for VRF=0
S*    0.0.0.0/0 [10/0] via 172.16.151.1, port1
                [10/0] via 192.168.2.1, port2
C    172.16.151.0/24 is directly connected, port1
C    192.168.2.0/24 is directly connected, port2
```

Result:

Both routes are added to the routing table and load-balanced based on the source IP.

Example 2: Same distance, different priority

```
config router static
   edit 1
      set gateway 172.16.151.1
      set priority 5
      set device "port1"
   next
   edit 2
      set gateway 192.168.2.1
      set device "port2"
   next
end

# get router info routing-table all
Routing table for VRF=0
S*    0.0.0.0/0 [10/0] via 192.168.2.1, port2
                [10/0] via 172.16.151.1, port1, [5/0]
C    172.16.151.0/24 is directly connected, port1
C    192.168.2.0/24 is directly connected, port2
```

Result:

Both routes are added to the routing table, but traffic is routed to `port2` which has a lower priority value with a default of `0`.

Example 3: Weight-based ECMP

```
config router static
   edit 3
      set dst 10.10.30.0 255.255.255.0
      set weight 80
      set device "vpn2HQ1"
   next
   edit 5
```

```
      set dst 10.10.30.0 255.255.255.0
      set weight 20
      set device "vpn2HQ2"
   next
end

# get router info routing-table all
Routing table for VRF=0
...
S    10.10.30.0/24 [10/0] is directly connected, vpn2HQ1, [0/80]
                   [10/0] is directly connected, vpn2HQ2, [0/20]
C    172.16.151.0/24 is directly connected, port1
C    192.168.0.0/24 is directly connected, port3
C    192.168.2.0/24 is directly connected, port2
```

Result:

Both routes are added to the routing table, but 80% of the sessions to `10.10.30.0/24` are routed to `vpn2HQ1`, and 20% are routed to `vpn2HQ2`.

Example 4: Load-balancing BGP routes

```
config router bgp
   set as 64511
   set router-id 192.168.2.86
   set ebgp-multipath enable
   config neighbor
      edit "192.168.2.84"
         set remote-as 64512
      next
      edit "192.168.2.87"
         set remote-as 64512
      next
   end
end

# get router info routing-table all
Routing table for VRF=0
...
C    172.16.151.0/24 is directly connected, port1
C    192.168.0.0/24 is directly connected, port3
C    192.168.2.0/24 is directly connected, port2
B    192.168.80.0/24 [20/0] via 192.168.2.84, port2, 00:00:33
                     [20/0] via 192.168.2.87, port2, 00:00:33
```

Result:

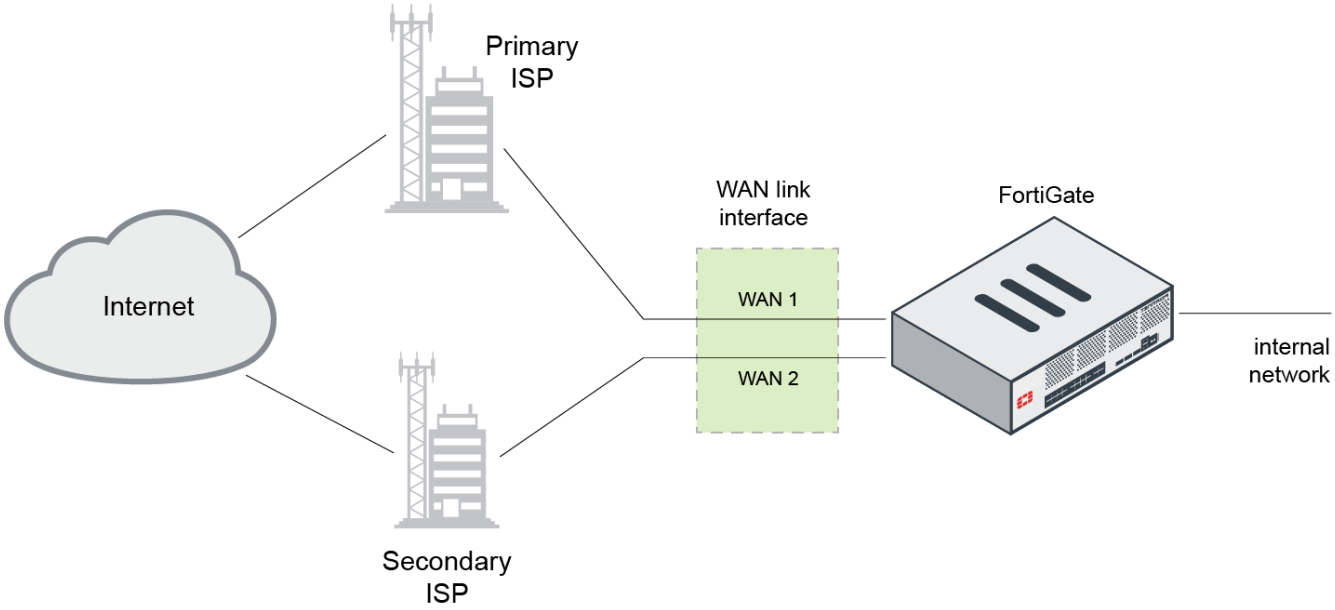
The network `192.168.80.0/24` is advertised by two BGP neighbors. Both routes are added to the routing table, and traffic is load-balanced based on Source IP.

For multiple BGP paths to be added to the routing table, you must enable `ebgp-multipath` for eBGP or `ibgp-multipath` for iBGP. These settings are disabled by default.

Dual internet connections

Dual internet connections, also referred to as dual WAN or redundant internet connections, refers to using two FortiGate interfaces to connect to the Internet. This is generally accomplished with SD-WAN, but this legacy solution provides the means to configure dual WAN without using SD-WAN. You can use dual internet connections in several ways:

- Link redundancy: If one interface goes down, the second interface automatically becomes the main connection.
- Load sharing: This ensures better throughput.
- Use a combination of link redundancy and load sharing.



This section describes the following dual internet connection scenarios:

- Scenario 1: Link redundancy and no load-sharing on page 268
- Scenario 2: Load-sharing and no link redundancy on page 270
- Scenario 3: Link redundancy and load-sharing on page 272

Scenario 1: Link redundancy and no load-sharing

Link redundancy ensures that if your Internet access is no longer available through a certain port, the FortiGate uses an alternate port to connect to the Internet.

In this scenario, two interfaces, WAN1 and WAN2, are connected to the Internet using two different ISPs. WAN1 is the primary connection. In the event of a failure of WAN1, WAN2 automatically becomes the connection to the Internet. For this configuration to function correctly, you must configure the following settings:

- Link health monitor on page 269: To determine when the primary interface (WAN1) is down and when the connection returns.
- Routing on page 269: Configure a default route for each interface.
- Security policies on page 270: Configure security policies to allow traffic through each interface to the internal network.

Link health monitor

Adding a link health monitor is required for routing failover traffic. A link health monitor confirms the device interface connectivity by probing a gateway or server at regular intervals to ensure it is online and working. When the server is not accessible, that interface is marked as down.

Set the `interval` (how often to send a ping) and `failtime` (how many lost pings are considered a failure). A smaller interval value and smaller number of lost pings results in faster detection, but creates more traffic on your network.

The link health monitor supports both IPv4 and IPv6, and various other protocols including ping, tcp-echo, udp-echo, http, and twamp.

To add a link health monitor (IPv4) using the CLI:

```
config system link-monitor
   edit <link-monitor-name>
      set addr-mode ipv4
      set srcintf <interface-name>
      set server <server-IP-address>
      set protocol {ping tcp-echo udp-echo http twamp}
      set gateway-ip <gateway-IP-address>
      set interval <seconds>
      set failtime <retry-attempts>
      set recoverytime <number-of-successful-responses>
      set status enable
   next
end
```

Option	Description
`set update-cascade-interface {enable | disable}`	This option is used in conjunction with fail-detect and fail-alert options in interface settings to cascade the link failure down to another interface. See the Bring other interfaces down when link monitor fails KB article for details.
`set update-static-route {enable | disable}`	When the link fails, all static routes associated with the interface will be removed.

Routing

You must configure a default route for each interface and indicate your preferred route as follows:

- Specify different distances for the two routes. The lower of the two distance values is declared active and placed in the routing table

  OR

- Specify the same distance for the two routes, but give a higher priority to the route you prefer by defining a lower value. Both routes will be added to the routing table, but the route with a higher priority will be chosen as the best route

In the following example, we will use the first method to configure different distances for the two routes. You might not be able to connect to the backup WAN interface because the FortiGate does not route traffic out of the backup interface.

The FortiGate performs a reverse path look-up to prevent spoofed traffic. If an entry cannot be found in the routing table that sends the return traffic out through the same interface, the incoming traffic is dropped.

To configure the routing of the two interfaces using the GUI:

1. Go to *Network* > *Static Routes*, and click *Create New*.
2. Enter the following information:

Destination	For an IPv4 route, enter a subnet of `0.0.0.0/0.0.0.0`. For an IPv6 route, enter a subnet of `::/0`.
Interface	Select the primary connection. For example, `wan1`.
Gateway Address	Enter the gateway address.
Administrative Distance	Leave as the default of `10`.

3. Click *OK*.
4. Repeat the above steps to set *Interface* to `wan2` and *Administrative Distance* to `20`.

To configure the routing of the two interfaces using the CLI:

```
config router {static | static6}
   edit 0
      set dst 0.0.0.0 0.0.0.0
      set device wan1
      set gateway <gateway_address>
      set distance 10
   next
   edit 0
      set dst 0.0.0.0 0.0.0.0
      set device wan2
      set gateway <gateway_address>
      set distance 20
   next
end
```

Security policies

When you create security policies, you need to configure duplicate policies to ensure that after traffic fails over WAN1, regular traffic is allowed to pass through WAN2, as it did with WAN1. This ensures that failover occurs with minimal effect to users.

Scenario 2: Load-sharing and no link redundancy

Load sharing may be accomplished in a few of the following ways of the many possible ways:

- By defining a preferred route with a lower distance, and specifying policy routes to route certain traffic to the secondary interface.
- By defining routes with same distance values but different priorities, and specifying policy routes to route certain traffic to the secondary interface.
- By defining routes with same distance values and priorities, and use equal-cost multi-path (ECMP) routing to equally distribute traffic between the WAN interfaces.

In our example, we will use the first option for our configuration. In this scenario, because link redundancy is not required, you do not have to configure a link monitor.

Traffic behaviour without a link monitor is as follows:

- If the remote gateway is down but the primary WAN interface of a FortiGate is still up, the FortiGate will continue to route traffic to the primary WAN. This results in traffic interruptions.
- If the primary WAN interface of a FortiGate is down due to physical link issues, the FortiGate will remove routes to it and the secondary WAN routes will become active. Traffic will failover to the secondary WAN.

Routing

Configure routing as you did in Scenario 1: Link redundancy and no load-sharing on page 268 above.

Policy routes

By configuring policy routes, you can redirect specific traffic to the secondary WAN interface. This works in this case because policy routes are checked before static routes. Therefore, even though the static route for the secondary WAN is not in the routing table, traffic can still be routed using the policy route.

In this example, we will create a policy route to route traffic from one address group to the secondary WAN interface.

To configure a policy route from the GUI:

1. Go to *Network* > *Policy Routes*, and click *Create New*.
2. Enter the following information:

Incoming interface	Define the source of the traffic. For example, `internal`.
Source Address	If we prefer to route traffic only from a group of addresses, define an address or address group, and add here.
Destination Address	Because we want to route all traffic from the address group here, we do not specify a destination address.
Protocol	Specify any protocol.
Action	Forward traffic.
Outgoing interface	Select the secondary WAN as the outbound interface. For example, `wan2`.
Gateway address	Input the gateway address for your secondary WAN. Because its default route has a higher distance value and is not added to the routing table, the gateway address must be added here.

3. Click OK.

To configure a policy route from the CLI:

```
config router policy
   edit 1
      set input-device "internal"
      set srcaddr "Laptops"
```

```
      set gateway <gateway_address>
      set output-device "wan2"
   next
end
```

Security policies

Your security policies should allow all traffic from `internal` to WAN1. Because link redundancy is not needed, you do not need to duplicate all WAN1 policies to WAN2. You will only need to define policies used in your policy route.

Scenario 3: Link redundancy and load-sharing

In this scenario, both the links are available to distribute Internet traffic with the primary WAN being preferred more. Should one of the interfaces fail, the FortiGate will continue to send traffic over the other active interface. The configuration is a combination of both the link redundancy and the load-sharing scenarios. The main difference is that the configured routes have equal distance values, with the route with a higher priority being preferred more. This ensures both routes are active in the routing table, but the route with a higher priority will be the best route.

Link health monitor

Link monitor must be configured for both the primary and the secondary WAN interfaces. This ensures that if the primary or the secondary WAN fails, the corresponding route is removed from the routing table and traffic re-routed to the other WAN interface.

For configuration details, see sample configurations in Scenario 1: Link redundancy and no load-sharing on page 268.

Routing

Both WAN interfaces must have default routes with the same distance. However, preference is given to the primary WAN by giving it a higher priority.

To configure the routing of the two interfaces using the CLI:

```
config router {static | static6}
   edit 0
      set dst 0.0.0.0 0.0.0.0
      set device wan1
      set gateway <gateway_address>
      set distance 10
      set priority 0
   next
   edit 0
      set dst 0.0.0.0 0.0.0.0
      set device wan2
      set gateway <gateway_address>
      set distance 10
      set priority 10
   next
end
```

Policy routes

The policy routes configuration is very similar to that of the policy routes in Scenario 2: Load-sharing and no link redundancy on page 270, except that the gateway address should not be specified. When a policy route is matched and the gateway address is not specified, the FortiGate looks at the routing table to obtain the gateway. In case the secondary WAN fails, traffic may hit the policy route. Because there is no gateway specified and the route to the secondary WAN is removed by the link monitor, the policy route will by bypassed and traffic will continue through the primary WAN. This ensures that the policy route is not active when the link is down.

Security policies

When you create security policies, you need to configure duplicate policies to ensure that after traffic fails over WAN1, regular traffic is allowed to pass through WAN2, as it was with WAN1. This ensures that failover occurs with minimal effect to users.

RIP

The following topics include information about Routing Information Protocol (RIP):

- ADVPN with RIP as the routing protocol on page 1139

OSPF

The following topics include information about Open Shortest Path First (OSPF):

- OSPF with IPsec VPN for network redundancy on page 1046
- IPsec aggregate for redundancy and traffic load-balancing on page 1059
- ADVPN with OSPF as the routing protocol on page 1130

BGP

The following topics include information about Border Gateway Protocol (BGP):

- ADVPN and shortcut paths on page 428
- ADVPN with BGP as the routing protocol on page 1121
- Applying BGP route-map to multiple BGP neighbors on page 419
- BGP multiple path support on page 410
- Configuring RADIUS SSO authentication on page 1352
- Controlling traffic with BGP route mapping and service rules on page 413
- IBGP and EBGP support in VRF on page 425
- IKEv2 IPsec site-to-site VPN to an AWS VPN gateway on page 983
- Route leaking between VRFs on page 287

- SD-WAN related diagnose commands on page 513
- Using BGP tags with SD-WAN rules on page 407

Multicast

The following topics include information about multicast:

- Multicast routing and PIM support on page 274
- Configuring multicast forwarding on page 275

Multicast routing and PIM support

Multicasting (also called IP multicasting) consists of using a single multicast source to send data to many receivers. Multicasting can be used to send data to many receivers simultaneously while conserving bandwidth and reducing network traffic. Multicasting can be used for one-way delivery of media streams to multiple receivers and for one-way data transmission for news feeds, financial information, and so on. Many dynamic routing protocols such as RIPv2, OSPF, and EIGRP use multicasting to share hello packets and routing information.

A FortiGate can operate as a Protocol Independent Multicast (PIM) version 2 router. FortiGates support PIM sparse mode (RFC 4601) and PIM dense mode (RFC 3973), and can service multicast servers or receivers on the network segment to which a FortiGate interface is connected. Multicast routing is not supported in transparent mode.

To support PIM communications, the sending and receiving applications, and all connecting PIM routers in between, must be enabled with PIM version 2. PIM can use static routes, RIP, OSPF, or BGP to forward multicast packets to their destinations. To enable source-to-destination packet delivery, sparse mode or dense mode must be enabled on the PIM router interfaces. Sparse mode routers cannot send multicast messages to dense mode routers. If the FortiGate is located between a source and a PIM router, between two PIM routers, or is connected directly to a receiver, you must manually create a multicast policy to pass encapsulated (multicast) packets or decapsulated data (IP traffic) between the source and destination.

PIM domains

A PIM domain is a logical area comprising a number of contiguous networks. The domain contains at least one bootstrap router (BSR), and if sparse mode is enabled, a number of rendezvous points (RPs) and designated routers (DRs). When PIM is enabled, the FortiGate can perform any of these functions at any time as configured.

A PIM domain can be configured in the GUI by going to *Network* > *Multicast*, or in the CLI using `config router multicast`. Note that PIM version 2 must be enabled on all participating routers between the source and receivers. Use `config router multicast` to set the global operating parameters.

When PIM is enabled, the FortiGate allocates memory to manage mapping information. The FortiGate communicates with neighboring PIM routers to acquire mapping information and, if required, processes the multicast traffic associated with specific multicast groups.

Instead of sending multiple copies of generated IP traffic to more than one specific IP destination address, PIM-enabled routers encapsulate the data and use a Class D multicast group address (224.0.0.0 to 239.255.255.255) to forward multicast packets to multiple destinations. A single stream of data can be sent because one destination address is used. Client applications receive multicast data by requesting that the traffic destined for a certain multicast group address be delivered to them.

Configuring multicast forwarding

There is sometimes confusion between the terms forwarding and routing. These two functions should not take place at the same time. Multicast forwarding should be enabled when the FortiGate is in NAT mode and you want to forward multicast packets between multicast routers and receivers. However, this function should not be enabled when the FortiGate itself is operating as a multicast router, or has an applicable routing protocol that uses multicast.

Multicast forwarding is not supported on enhanced MAC VLAN interfaces. To use multicast with enhanced MAC VLAN interfaces, use PIM (Multicast routing and PIM support on page 274).

There are two steps to configure multicast forwarding:

1. Enabling multicast forwarding on page 275
2. Configuring multicast policies on page 276

Enabling multicast forwarding

Multicast forwarding is enabled by default. If a FortiGate is operating in transparent mode, adding a multicast policy enables multicast forwarding. In NAT mode you must use the `multicast-forward` setting to enable or disable multicast forwarding.

Multicast forwarding in NAT mode

When `multicast-forward` is enabled, the FortiGate forwards any multicast IP packets in which the TTL is 2 or higher to all interfaces and VLAN interfaces, except the receiving interface. The TTL in the IP header will be reduced by 1. Even though the multicast packets are forwarded to all interfaces, you must add multicast policies to allow multicast packets through the FortiGate.

To enable multicast forwarding in NAT mode:

```
config system settings
    set multicast-forward enable
end
```

Prevent the TTL for forwarded packets from being changed

You can use the `multicast-ttl-notchange` option so that the FortiGate does not increase the TTL value for forwarded multicast packets. Use this option only if packets are expiring before reaching the multicast router.

To prevent the TTL for forwarded packets from being changed:

```
config system settings
    set multicast-ttl-notchange enable
end
```

Disable multicast traffic from passing through the FortiGate without a policy check in transparent mode

In transparent mode, the FortiGate does not forward frames with multicast destination addresses. The FortiGate should not interfere with the multicast traffic used by routing protocols, streaming media, or other multicast communication. To

avoid any issues during transmission, you can disable `multicast-skip-policy` and configure multicast security policies.

To disable multicast traffic from passing through the FortiGate without a policy check in transparent mode:

```
config system settings
    set multicast-skip-policy disable
end
```

Configuring multicast policies

Multicast packets require multicast policies to allow packets to pass from one interface to another. Similar to firewall policies, in a multicast policy you specify the source and destination interfaces, and the allowed address ranges for the source and destination addresses of the packets. You can also use multicast policies to configure source NAT and destination NAT for multicast packets.

Keep the following in mind when configuring multicast policies:

- The matched forwarded (outgoing) IP multicast source IP address is changed to the configured IP address.
- The `snat` setting is optional. Use it when SNAT is needed.

IPv4 and IPv6 multicast policies can be configured in the GUI. Go to *System* > *Feature Visibility*, and enable *Multicast Policy* and *IPv6*.

Sample basic policy

In this basic policy, multicast packets received on an interface are flooded unconditionally to all interfaces on the forwarding domain, except the incoming interface.

```
config firewall multicast-policy
    edit 1
        set srcintf "any"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

The destination address (`dstaddr`) is a multicast address object. The `all` option corresponds to all multicast addresses in the range 224.0.0.0-239.255.255.255.

Sample policy with specific source and destination interfaces

This multicast policy only applies to the source port `wan1` and the destination port `internal`.

```
config firewall multicast-policy
    edit 1
        set srcintf "wan1"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
```

```
    next
end
```

Sample policy with specific source address object

In this policy, packets are allowed to flow from `wan1` to `internal`, and sourced by the address 172.20.120.129, which is represented by the `example_addr-1` address object.

```
config firewall multicast-policy
    edit 1
        set srcintf "wan1"
        set dstintf "internal"
        set srcaddr "example_addr-1"
        set dstaddr "all"
    next
end
```

Sample detailed policy

This policy accepts multicast packets that are sent from a PC with IP address 192.168.5.18 to destination address range 239.168.4.0-255. The policy allows the multicast packets to enter the `internal` interface and then exit the `external` interface. When the packets leave the external interface, their source address is translated to 192.168.18.10.

```
config firewall address
    edit "192.168.5.18"
        set subnet 192.168.5.18 255.255.255.255
    next
end

config firewall multicast-address
    edit "239.168.4.0"
        set start-ip 239.168.4.0
        set end-ip 239.168.4.255
    next
end

config firewall multicast-policy
    edit 1
        set srcintf "internal"
        set dstintf "external"
        set srcaddr "192.168.5.18"
        set dstaddr "239.168.4.0"
        set snat enable
        set snat-ip 192.168.18.10
    next
end
```

To configure multicast policies in the GUI, enable *Multicast Policy* in *System* > *Feature Visibility*.

FortiExtender

The following topics include information about FortiExtender:

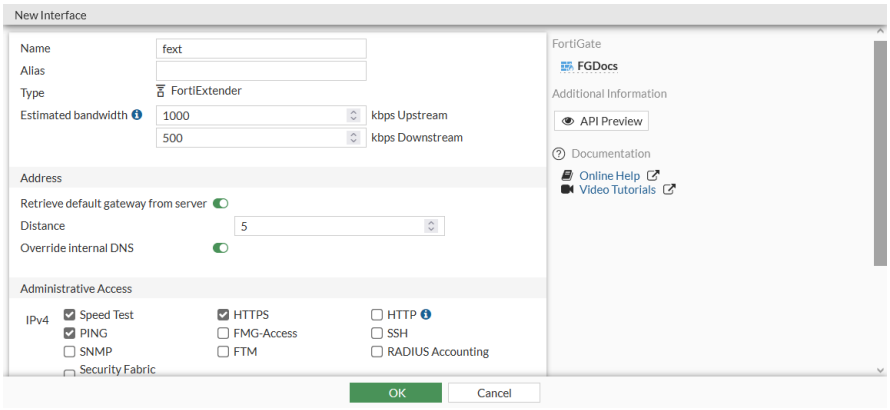
- Adding a FortiExtender on page 278
- Data plan profiles on page 280

Adding a FortiExtender

To add a FortiExtender to the FortiGate, create a virtual FortiExtender interface, then add a FortiExtender and assign the interface to the modem. Like other interface types, the FortiExtender interface can be used in static routes, SD-WAN (see Manage dual FortiExtender devices), policies, and other functions.

To create a virtual FortiExtender interface in the GUI:

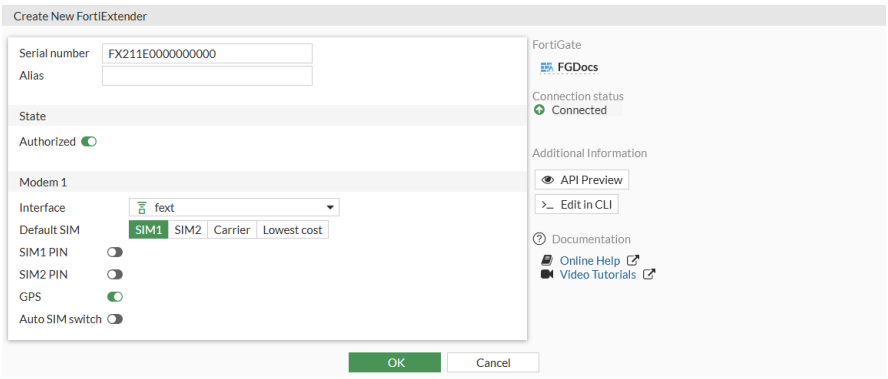
1. Go to *Network* > *Interfaces* and click *Create New* > *FortiExtender*.
2. Enter a name for the interface.
3. Configure the remaining settings as needed. See Interface settings on page 122 for more details.



4. Click *OK*.

To add a FortiExtender in the GUI:

1. Go to *Network* > *FortiExtender* and click *Create New* > *Extenders*.
2. Enter your FortiExtender's serial number in the *Serial number* field.
3. Optionally, set an *Alias* for the FortiExtender.
4. In the *State* section, enable *Authorized*.
5. Set *Interface* to the FortiExtender interface.
6. Configure the remaining setting as required. See the FortiExtender Administration Guide for more information.



7. Click *OK*.
8. In the extenders list, right-click on the FortiExtender and select *Diagnostics and Tools* to review the modem and SIM status, and other details about the FortiExtender.

To create a virtual FortiExtender interface in the CLI:

```
config system interface
    edit "fext"
        set vdom "root"
        set mode dhcp
        set allowaccess ping https speed-test
        set type fext-wan
        set estimated-upstream-bandwidth 1000
        set estimated-downstream-bandwidth 500
    next
end
```

To configure the FortiExtender in the CLI:

```
config extender-controller extender
    edit "FX211E0000000000"
        set id "FX211E0000000000"
        set authorized enable
        config modem1
            set ifname "fext"
        end
    next
end
```

To verify the modem settings in the CLI:

```
get extender modem-status FX211E0000000000 1
Modem 0:
    physical_port:       2-1.2
    manufacture:         Sierra Wireless, Incorporated
    product:             Sierra Wireless, Incorporated
    ....
```

Data plan profiles

The data plan profile allows users to configure connectivity settings based on modem, carrier, slot, SIM ID, or cost. Users can also specify billing details related to the data plan, as well as smart switch thresholds to define when to switch over to a different SIM.

A FortiExtender has multiple SIM card slots. Certain models also have multiple modems. Essentially, each modem can make one connection with one of the two SIMs associated with the modem. The data plan profile allows users to create general configurations that work across multiple SIMs, or specific profiles that work on a specific SIM. First, the data plan matches the criteria based on the modem ID and type.

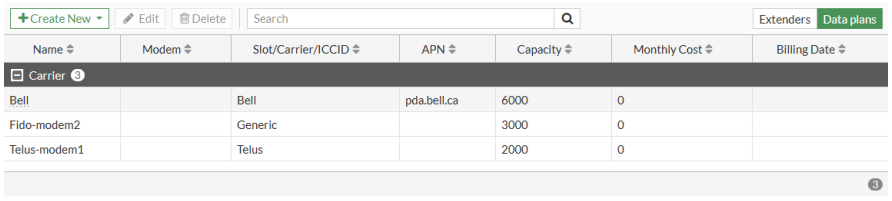
Syntax

```
config extender-controller dataplan
    edit <name>
        set modem-id {modem1 | modem2 | all}
        set type {carrier | slot | iccid | generic}
    next
end
```

Variable	Description
set modem-id (*Available on* in the GUI)	Select the match criterion based on the modem: • `modem1`: Use modem 1. • `modem2`: Use modem 2. • `all`: Use both modems (default).
set type (*Type* in the GUI)	Select the match criterion based on the type: • `carrier`: Assign by SIM carrier. • `slot`: Assign to SIM slot 1 or 2. • `iccid`: Assign to a specific SIM by ICCID. • `generic`: Compatible with any SIM (default). Assigned if no other data plan matches the chosen SIM.

When a modem connects to the network through a SIM, it will read the SIM information and try to match a data plan based on the modem ID and type. It then uses the data plan connectivity settings to connect (authentication, PDN type, preferred subnet, APN, private network). The billing details (such as the monthly data limit) and smart switch threshold settings define how the SIMs will be switched.

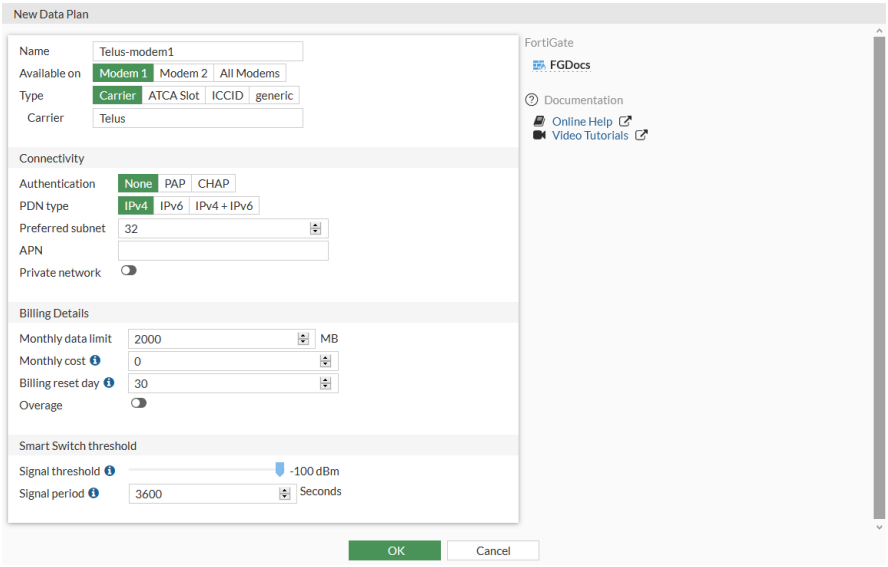
Multiple data plans can be configured:



Once the FortiExtender is controlled by the FortiGate, the data plan is sent to the FortiExtender. The format is identical between devices.

To configure a data plan in the GUI:

1. Go to *Network* > *FortiExtender* and click *Create New* > *Data plans*.
2. Enter a name for the plan.
3. Set *Available on* to *All Modems* or *Modem 1*.
4. Set the plan *Type*. If *Carrier* is selected, enter the carrier name. If *ICCID* is selected, enter the ICCID number.
5. Configure the other settings as needed.



6. Click *OK*.

To configure a data plan in the CLI:

```
config extender-controller dataplan
    edit "Telus-modem1"
        set modem-id modem1
        set type carrier
        set carrier "Telus"
        set capacity 2000
        set billing-date 30
    next
    edit "Fido-modem2"
        set modem-id modem2
        set type carrier
        set carrier "Generic"
        set capacity 3000
    next
    edit "Bell"
        set type carrier
        set carrier "Bell"
        set apn "pda.bell.ca"
        set capacity 6000
    next
end
```

Direct IP support for LTE/4G

Direct IP is a public IP address that is assigned to a computing device, which allows the device to directly access the internet.

When an LTE modem is enabled in FortiOS, a DHCP interface is created. As a result, the FortiGate can acquire direct IP (which includes IP, DNS, and gateway) from the LTE network carrier.

Since some LTE modems require users to input the access point name (APN) for the LTE network, the LTE modem configuration allows you to set the APN.

LTE modems can only be enabled by using the CLI.

To enable direct IP support using the CLI:

1. Enable the LTE modem:

```
config system lte-modem
  set status enable
end
```

2. Check that the LTE interface was created:

```
config system interface
  edit "wwan"
    set vdom "root"
    set mode dhcp
    set status down
    set distance 1
    set type physical
    set snmp-index 23
  next
end
```

Shortly after the LTE modem joins its carrier network, `wwan` is enabled and granted direct IP:

```
config system interface
    edit wwan
        get
name                : wwan
....
ip                  : 100.112.75.43 255.255.255.248
....
status              : up
....
defaultgw           : enable
DHCP Gateway        : 100.112.75.41
Lease Expires       : Thu Feb 21 19:33:27 2019
dns-server-override : enable
Acquired DNS1       : 184.151.118.254
Acquired DNS2       : 70.28.245.227
....
```

PCs can reach the internet via the following firewall policy:

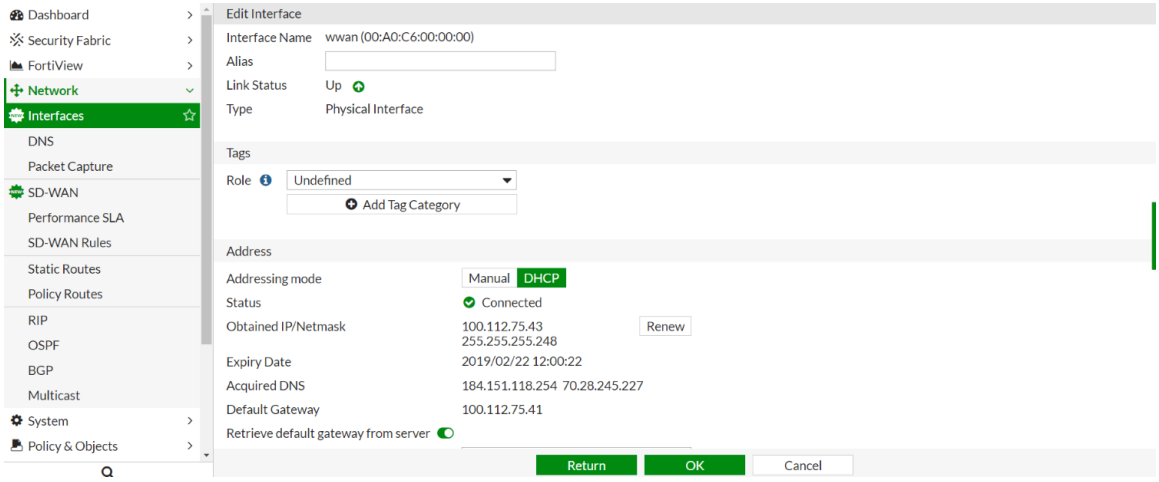
```
config firewall policy
  edit 5
    set name "LTE"
    set srcintf "port9"
    set dstintf "wwan"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set fsso disable
    set nat enable
  next
end
```

Sample LTE interface

When an LTE modem is enabled, you can view the LTE interface in the GUI and check the acquired IP, DNS, and gateway.

To view the LTE interface in the GUI:

1. Go to *Network* > *Interfaces*.
2. Double-click the LTE interface to view the properties.
3. Look in the *Address* section to see the *Obtained IP/Netmask*, *Acquired DNS*, and *Default Gateway*.



4. Click *Return*.

To configure the firewall policy that uses the LTE interface:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit the LTE policy.
3. In the *Outgoing Interface* field, select the interface (`wwan` in this example).

4. Configure the rest of the policy as needed.
5. Click *OK*.

Limitations

- Most LTE modems have a preset APN in their SIM card. Therefore, the APN does not need to be set in the FortiOS configuration. In cases where the internet cannot be accessed, consult with your carrier and set the APN in the LTE modem configuration (for example, inet.bell.ca):

```
config system lte-modem
  set status enable
  set apn "inet.bell.ca"
end
```

- Some models, such as the FortiGate 30E-3G4G, have built-in LTE modems. In this scenario, the LTE modem is enabled by default. The firewall policy via the LTE interface is also created by default. Once you plug in a SIM card, your network devices can connect to the internet.

  Sample FortiGate 30E-3G4G default configuration:

```
config system lte-modem
  set status enable
  set extra-init ''
  set manual-handover disable
  set force-wireless-profile 0
  set authtype none
  set apn ''
  set modem-port 255
  set network-type auto
  set auto-connect disable
  set gpsd-enabled disable
  set data-usage-tracking disable
  set gps-port 255
end
```

```
config firewall policy
....
  edit 3
    set srcintf "internal"
    set dstintf "wwan"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set nat enable
  next
end
```

LLDP reception

Device detection can scan LLDP as a source for device identification, but the FortiGate does not read or store the full information. Enabling LLDP reception allows the FortiGate to receive and store LLDP messages, learn about active neighbors, and makes the LLDP information available via the CLI, REST API, and SNMP.

You need to enable `device-identification` at the interface level, and then `lldp-reception` can be enabled on three levels: globally, per VDOM, or per interface.

To configure device identification on an interface:

```
config system interface
    edit <port>
        set device-identification enable
    next
end
```

To configure LLDP reception globally:

```
config system global
    set lldp-reception enable
end
```

To configure LLDP reception per VDOM:

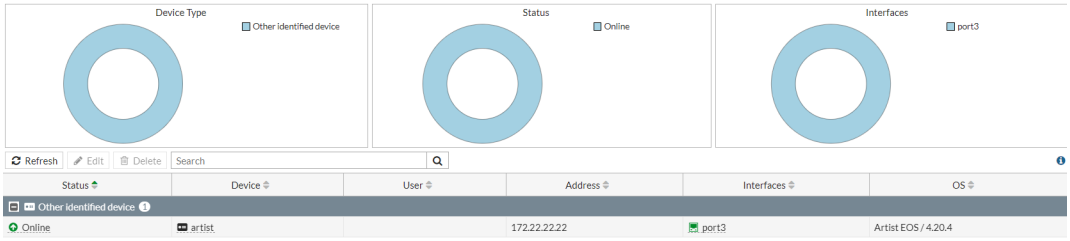
```
config system setting
    set lldp-reception enable
end
```

To configure LLDP reception per interface:

```
config system interface
    edit <port>
        set lldp-reception enable
    next
end
```

To view the LLDP information in the GUI:

1. Go to *Dashboard* > *Users & Devices*.
2. Expand the *Device Inventory* widget to full screen.



To view the received LLDP information in the CLI:

```
# diagnose user device list
    hosts
      vd root/0 44:0a:a0:0a:0a:0a gen 3 req S/2
        created 10290s gen 1 seen 0s port3 gen 1
        ip 172.22.22.22 src lldp
        type 20 'Other Network Device' src lldp id 155 gen 2
        os 'Artist EOS ' version '4.20.4' src lldp id 155
        host 'artist' src lldp
```

To view additional information about LLDP neighbors and ports:

```
# diagnose lldprx neighbor {summary | details | clear}
# diagnose lldprx port {details | summary | neighbor | filter}
# diagnose lldprx port neighbor {summary | details}
```

Note that the port index in the output corresponds to the port index from the following command:

```
# diagnose netlink interface list port2 port3 | grep index
      if=port2 family=00 type=1 index=4 mtu=1500 link=0 master=0
      if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
```

To view the received LLDP information in the REST API:

```
{
  "http_method":"GET",
  "results":[
    {
      "mac":"90:9c:9c:c9:c9:90",
      "chassis_id":"90:9C:9C:C9:C9:90",
      "port":19,
      "port_id":"port12",
      "port_desc":"port12",
      "system_name":"S124DN3W00000000",
      "system_desc":"FortiSwitch-124D v3.6.6,build0416,180515 (GA)",

}
```

Route leaking between VRFs

This feature provides generic route leaking capabilities between locally defined VRFs (VRF-lite). If VRF leaking is not configured, VRFs are isolated.

In this example, interface *npu0_vlink0* belongs to VRF 10 and is used to leak 1.2.2.2/32 from VRF10 to VRF20, and interface *npu0_vlink1* belongs to VRF 20 and is used to leak 172.28.1.0/24 from VRF20 to VRF10. So, VRF10 can see 172.28.1.0/24, and VRF20 can see 1.2.2.2/32.

To configure VRF leaking:

1. Configure the prefix list and route map to filter what will be leaked:

```
config router prefix-list
    edit "1"
        config rule
            edit 1
                set prefix 1.2.2.2 255.255.255.255
            next
        end
    next
    edit "2"
        config rule
            edit 1
                set prefix 172.28.1.0 255.255.255.0
            next
        end
    next
end

config router route-map
    edit "from10"
        config rule
```

```
            edit 1
                set match-ip-address "1"
            next
        end
    next
    edit "from20"
        config rule
            edit 1
                set match-ip-address "2"
            next
        end
    next
end
```

2. Configure the VDOM link interfaces for the leaking and routing:

```
config system interface
    edit "npu0_vlink0"
        set vdom "root"
        set vrf 10
        set ip 172.16.201.1 255.255.255.0
        set allowaccess ping https ssh snmp http
    next
    edit "npu0_vlink1"
        set vdom "root"
        set vrf 20
        set ip 172.16.201.2 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
    next
end
```

3. Configure the BGP VRF leak:

```
config router bgp
    set as 44
    set router-id 4.4.4.4
    config neighbor
        edit "172.16.200.1"
            set soft-reconfiguration enable
            set remote-as 11
            set update-source "port1"
        next
        edit "172.16.202.1"
            set soft-reconfiguration enable
            set remote-as 22
            set update-source "port3"
        next
    end
    config vrf-leak
        edit "10"
            config target
                edit "20"
                    set route-map "from10"
                    set interface "npu0_vlink0"
                next
            end
        next
```

```
            edit "20"
                config target
                    edit "10"
                        set route-map "from20"
                        set interface "npu0_vlink1"
                    next
                end
            next
        end
    end
```

4. Confirm that the filtered routed leaked as expected:

```
# get router info routing-table all
Routing table for VRF=10
B       1.1.1.1/32 [20/0] via 172.16.200.1, port1, 01:03:16
B       1.2.2.2/32 [20/0] via 172.16.200.1, port1, 01:03:16

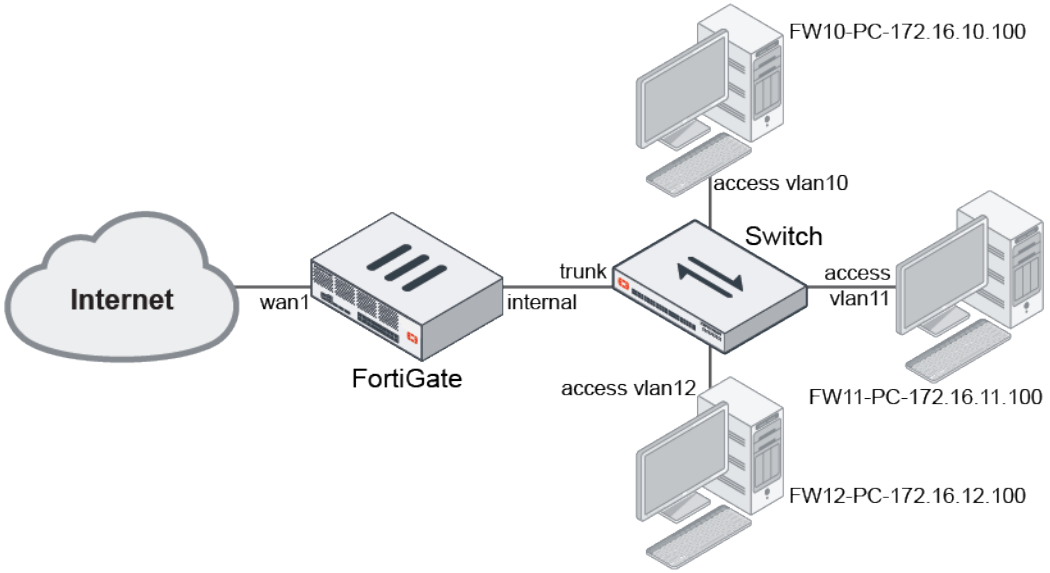
```

Route leaking between multiple VRFs

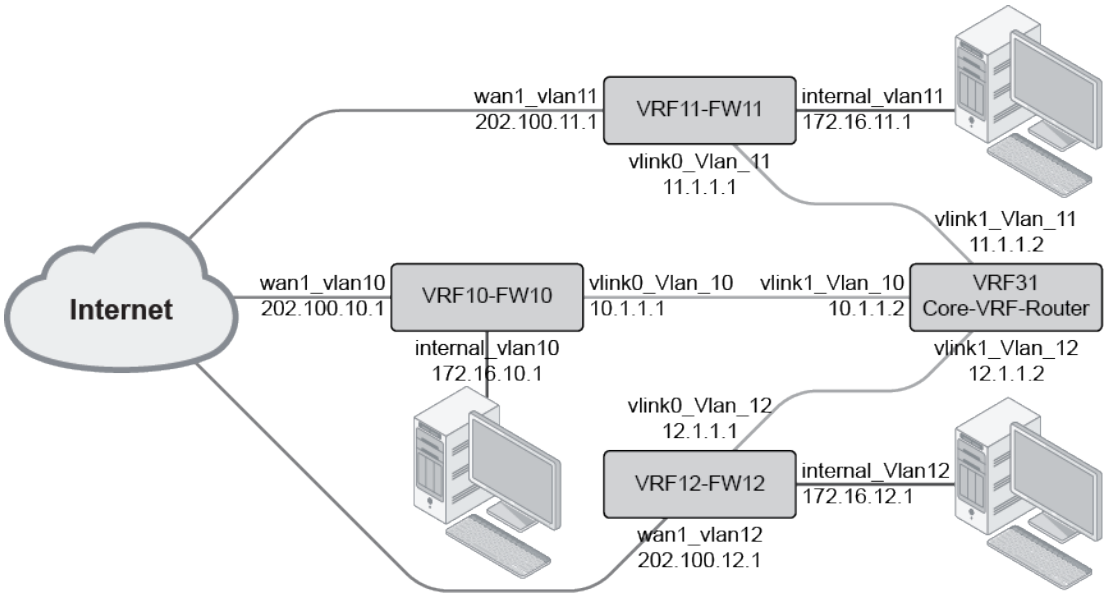
In this example, routing leaking between three VRFs in a star topology is configured. This allows the solution to be scaled to more VRFs without building full mesh, one-to-one connections between each pair of VRFs. VLAN subinterfaces are created on VDOM links to connect each VRF to the central VRF, allowing routes to be leaked from a VRF to the central VRF, and then to the other VRFs. Static routes are used for route leaking in this eaxmple.

For instructions on creating route leaking between two VRFs, see Route leaking between VRFs on page 287.

Physical topology:



Logical topology:



In this example, a specific route is leaked from each of the VRFs to each of the other VRFs. VLAN subinterfaces are created based on VDOM links to connect each VRF to the core VRF router.

Multi VDOM mode is enabled so that NP VDOM links can be used. The setup could be configured without enabling multi VDOM mode by manually creating non-NP VDOM links, but this is not recommended as the links are not offloaded to the NPU.

After VDOMs are enabled, all of the configuration is done in the *root* VDOM.

To configure the FortiGate:

1. Enable multi VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```

If the FortiGate has an NP, the VDOM links will be created:

```
# show system interface
config system interface
    ...
    edit "npu0_vlink0"
        set vdom "root"
        set type physical
    next
    edit "npu0_vlink1"
        set vdom "root"
        set type physical
    next
    ...
end
```

If multi VDOM mode is not used, the VDOM links can be manually created:

```
config system vdom-link
    edit <name of vdlink>
    next
end
```

2. Allow interface subnets to use overlapping IP addresses:

```
config vdom
    edit root
        config system settings
            set allow-subnet-overlap enable
        end
```

3. Configure the inter-connecting VLAN subinterfaces between VRF based on VDOM-LINK:

```
config system interface
    edit "vlink0_Vlan_10"
        set vdom "root"
        set vrf 10
        set ip 10.1.1.1 255.255.255.252
        set allowaccess ping https ssh http
        set alias "vlink0_Vlan_10"
        set role lan
        set interface "npu0_vlink0"
        set vlanid 10
    next
    edit "vlink1_Vlan_10"
        set vdom "root"
        set vrf 31
        set ip 10.1.1.2 255.255.255.252
        set allowaccess ping https ssh http
        set alias "vlink1_Vlan_10"
        set role lan
```

```
            set interface "npu0_vlink1"
            set vlanid 10
        next
        edit "vlink0_Vlan_11"
            set vdom "root"
            set vrf 11
            set ip 11.1.1.1 255.255.255.252
            set allowaccess ping https ssh http
            set alias "vlink0_Vlan_11"
            set role lan
            set interface "npu0_vlink0"
            set vlanid 11
        next
        edit "vlink1_Vlan_11"
            set vdom "root"
            set vrf 31
            set ip 11.1.1.2 255.255.255.252
            set allowaccess ping https ssh http
            set alias "vlink1_Vlan_11"
            set role lan
            set interface "npu0_vlink1"
            set vlanid 11
        next
        edit "vlink0_Vlan_12"
            set vdom "root"
            set vrf 12
            set ip 12.1.1.1 255.255.255.252
            set allowaccess ping https ssh http
            set alias "vlink0_Vlan_12"
            set role lan
            set interface "npu0_vlink0"
            set vlanid 12
        next
        edit "vlink1_Vlan_12"
            set vdom "root"
            set vrf 31
            set ip 12.1.1.2 255.255.255.252
            set allowaccess ping https ssh http
            set alias "vlink1_Vlan_12"
            set role lan
            set interface "npu0_vlink1"
            set vlanid 12
        next
    end
```

4. Configure a zone to allow intrazone traffic between VLANs in the central VRF:

```
config system zone
    edit "Core-VRF-Router"
        set intrazone allow
        set interface "vlink1_Vlan_10" "vlink1_Vlan_11" "vlink1_Vlan_12"
    next
end
```

5. Add allow policies for the VRF31 core router:

```
config firewall policy
    edit 0
        set name "any_to_core_vrf31"
        set srcintf "any"
        set dstintf "Core-VRF-Router"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
    edit 0
        set name "core_vrf31_to_any"
        set srcintf "Core-VRF-Router"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

6. Configure VRF10, VRF11, and VRF12 on the Internal and WAN VLAN sub-interfaces:

```
config system interface
    edit "Internal_VRF10"
        set vdom "root"
        set vrf 10
        set ip 172.16.10.1 255.255.255.0
        set allowaccess ping https ssh http
        set alias "Internal_VRF10"
        set role lan
        set interface "internal"
        set vlanid 10
    next
    edit "Internal_VRF11"
        set vdom "root"
        set vrf 11
        set ip 172.16.11.1 255.255.255.0
        set allowaccess ping https ssh http
        set alias "Internal_VRF11"
        set role lan
        set interface "internal"
        set vlanid 11
    next
    edit "Internal_VRF12"
        set vdom "root"
        set vrf 12
        set ip 172.16.12.1 255.255.255.0
        set allowaccess ping https ssh http
        set alias "Internal_VRF12"
        set role lan
        set interface "internal"
        set vlanid 12
```

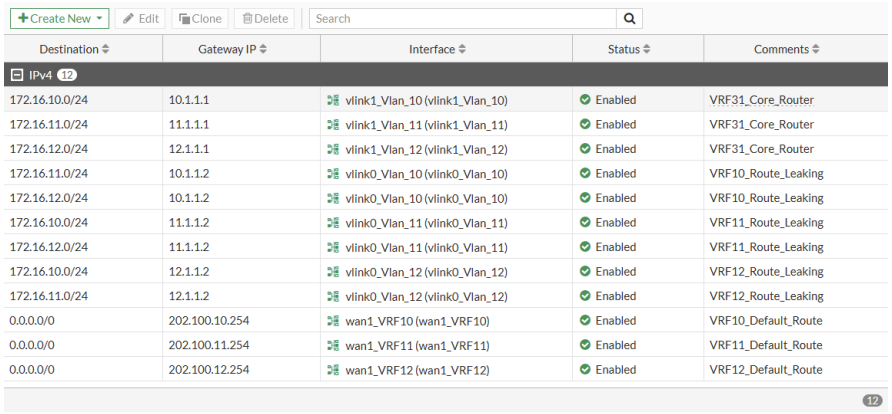
```
    next
    edit "wan1_VRF10"
        set vdom "root"
        set vrf 10
        set ip 202.100.10.1 255.255.255.0
        set allowaccess ping
        set alias "wan1_VRF10"
        set role wan
        set interface "wan1"
        set vlanid 10
    next
    edit "wan1_VRF11"
        set vdom "root"
        set vrf 11
        set ip 202.100.11.1 255.255.255.0
        set allowaccess ping
        set alias "wan1_VRF11"
        set role wan
        set interface "wan1"
        set vlanid 11
    next
    edit "wan1_VRF12"
        set vdom "root"
        set vrf 12
        set ip 202.100.12.1 255.255.255.0
        set allowaccess ping
        set alias "wan1_VRF12"
        set role wan
        set interface "wan1"
        set vlanid 12
    next
end
```

7. Configure static routing and route leaking between each VRF and Core-VRF-Router:

```
config router static
    edit 1
        set dst 172.16.10.0 255.255.255.0
        set gateway 10.1.1.1
        set device "vlink1_Vlan_10"
        set comment "VRF31_Core_Router"
    next
    edit 2
        set dst 172.16.11.0 255.255.255.0
        set gateway 11.1.1.1
        set device "vlink1_Vlan_11"
        set comment "VRF31_Core_Router"
    next
    edit 3
        set dst 172.16.12.0 255.255.255.0
        set gateway 12.1.1.1
        set device "vlink1_Vlan_12"
        set comment "VRF31_Core_Router"
    next
    edit 4
        set dst 172.16.11.0 255.255.255.0
```

```
            set gateway 10.1.1.2
            set device "vlink0_Vlan_10"
            set comment "VRF10_Route_Leaking"
        next
        edit 5
            set dst 172.16.12.0 255.255.255.0
            set gateway 10.1.1.2
            set device "vlink0_Vlan_10"
            set comment "VRF10_Route_Leaking"
        next
        edit 6
            set dst 172.16.10.0 255.255.255.0
            set gateway 11.1.1.2
            set device "vlink0_Vlan_11"
            set comment "VRF11_Route_Leaking"
        next
        edit 7
            set dst 172.16.12.0 255.255.255.0
            set gateway 11.1.1.2
            set device "vlink0_Vlan_11"
            set comment "VRF11_Route_Leaking"
        next
        edit 8
            set dst 172.16.10.0 255.255.255.0
            set gateway 12.1.1.2
            set device "vlink0_Vlan_12"
            set comment "VRF12_Route_Leaking"
        next
        edit 9
            set dst 172.16.11.0 255.255.255.0
            set gateway 12.1.1.2
            set device "vlink0_Vlan_12"
            set comment "VRF12_Route_Leaking"
        next
        edit 10
            set gateway 202.100.10.254
            set device "wan1_VRF10"
            set comment "VRF10_Default_Route"
        next
        edit 11
            set gateway 202.100.11.254
            set device "wan1_VRF11"
            set comment "VRF11_Default_Route"
        next
        edit 12
            set gateway 202.100.12.254
            set device "wan1_VRF12"
            set comment "VRF12_Default_Route"
        next
    end
```

In the GUI, go to *Network* > *Static Routes* to view the static routes:



+Create New | Edit | Clone | Delete | Search

Destination	Gateway IP	Interface	Status	Comments
IPv4 12				
172.16.10.0/24	10.1.1.1	vlink1_Vlan_10 (vlink1_Vlan_10)	Enabled	VRF31_Core_Router
172.16.11.0/24	11.1.1.1	vlink1_Vlan_11 (vlink1_Vlan_11)	Enabled	VRF31_Core_Router

8. Configure firewall policies for VRF10, VRF11, and VRF12

```
config firewall policy
    edit 6
        set name "VRF10_to_Internet_Policy"
        set srcintf "Internal_VRF10"
        set dstintf "wan1_VRF10"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
    edit 7
        set name "VRF10_to_VRF_Leaking_Route"
        set srcintf "Internal_VRF10"
        set dstintf "vlink0_Vlan_10"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
    edit 8
        set name "VRF_Leaking_Route_to_VRF10"
        set srcintf "vlink0_Vlan_10"
        set dstintf "Internal_VRF10"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
    edit 9
        set name "VRF11_to_Internet_Policy"
        set srcintf "Internal_VRF11"
        set dstintf "wan1_VRF11"
        set srcaddr "all"
```

```
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
    edit 10
        set name "VRF11_to_VRF_Leaking_Route"
        set srcintf "Internal_VRF11"
        set dstintf "vlink0_Vlan_11"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
    edit 11
        set name "VRF_Leaking_Route_to_VRF11"
        set srcintf "vlink0_Vlan_11"
        set dstintf "Internal_VRF11"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
    edit 12
        set name "VRF12_to_Internet_Policy"
        set srcintf "Internal_VRF12"
        set dstintf "wan1_VRF12"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
    edit 13
        set name "VRF12_to_VRF_Leaking_Route"
        set uuid 92bccf8e-b27b-51eb-3c56-6d5259af6299
        set srcintf "Internal_VRF12"
        set dstintf "vlink0_Vlan_12"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
    edit 14
        set name "VRF_Leaking_Route_to_VRF12"
```

```
        set srcintf "vlink0_Vlan_12"
        set dstintf "Internal_VRF12"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

In the GUI, go to *Policy & Objects* > *Firewall Policy* to view the policies.

To check the results:

1. On the FortiGate, check the routing table to see each VRF:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default

a. Ping a public IP address through VRF10:

```
# ping 8.8.8.8
PING 8.8.8.8 (8.8.8.8) 56(84) bytes of data.
64 bytes from 8.8.8.8: icmp_seq=1 ttl=113 time=4.33 ms
64 bytes from 8.8.8.8: icmp_seq=2 ttl=113 time=4.17 ms
64 bytes from 8.8.8.8: icmp_seq=3 ttl=113 time=4.04 ms
^C
--- 8.8.8.8 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2002ms
rtt min/avg/max/mdev = 4.049/4.188/4.336/0.117 ms
```

b. Ping the internet gateway through VRF10:

```
# ping 202.100.10.254
PING 202.100.10.254 (202.100.10.254) 56(84) bytes of data.
64 bytes from 202.100.10.254: icmp_seq=1 ttl=254 time=0.294 ms
64 bytes from 202.100.10.254: icmp_seq=2 ttl=254 time=0.225 ms
64 bytes from 202.100.10.254: icmp_seq=3 ttl=254 time=0.197 ms
^C
--- 202.100.10.254 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2000ms
rtt min/avg/max/mdev = 0.197/0.238/0.294/0.044 ms
```

c. Ping the FW11-PC on VRF11 from VRF10:

```
# ping 172.16.11.100
PING 172.16.11.100 (172.16.11.100) 56(84) bytes of data.
64 bytes from 172.16.11.100: icmp_seq=1 ttl=61 time=0.401 ms
64 bytes from 172.16.11.100: icmp_seq=2 ttl=61 time=0.307 ms
64 bytes from 172.16.11.100: icmp_seq=3 ttl=61 time=0.254 ms
64 bytes from 172.16.11.100: icmp_seq=4 ttl=61 time=0.277 ms
64 bytes from 172.16.11.100: icmp_seq=5 ttl=61 time=0.262 ms
^C
--- 172.16.11.100 ping statistics ---
```

```
5 packets transmitted, 5 received, 0% packet loss, time 3999ms
rtt min/avg/max/mdev = 0.254/0.300/0.401/0.054 ms
```

3. On the FortiGate, sniff traffic between VRF10 and VRF11:

```
# diagnose sniffer packet any "icmp and host 172.16.11.100" 4 1 0
interfaces=[any]
filters=[icmp and host 172.16.11.100]

```

NetFlow

NetFlow allows you to collect IP network traffic statistics for an interface, and then export those statistics for analysis. NetFlow samplers, that sample every packet, are configured per interface. Full NetFlow is supported through the information maintained in the firewall session.

To configure NetFlow:

```
config system netflow
    set collector-ip <ip>
    set collector-port <port>
    set source-ip <ip>
    set active-flow-timeout <integer>
    set inactive-flow-timeout <integer>
    set template-tx-timeout <integer>
    set template-tx-counter <integer>
end
```

collector-ip <ip>	Collector IP address.
collector-port <port>	NetFlow collector port number (0 - 65535)
source-ip <ip>	Source IP address, for communication with the NetFlow agent.
active-flow-timeout <integer>	Timeout to report active flows, in minutes (1 - 60, default = 30).
inactive-flow-timeout <integer>	Timeout for periodic report of finished flows, in seconds (10 - 600, default = 15).
template-tx-timeout <integer>	Timeout for periodic template flowset transmission, in minutes (1 - 1440, default = 30).
template-tx-counter <integer>	Counter of flowset records, before resending a template flowset record (10 - 6000, default = 20).

To configure NetFlow in a specific VDOM:

```
config vdom
    edit <vdom>
        config system vdom-netflow
            set vdom-netflow enable
            set collector-ip <ip>
            set collector-port <port>
            set source-ip <ip>
        end
    next
end
```

To configure a NetFlow sampler on an interface:

```
config system interface
    edit <interface>
        set netflow-sampler {disable | tx | rx | both}
    next
end
```

disable	Disable the NetFlow protocol on this interface (default).
tx	Monitor transmitted traffic on this interface.
rx	Monitor received traffic on this interface.
both	Monitor transmitted/received traffic on this interface.

Verification and troubleshooting

If data are not seen on the NetFlow collector after it has been configured, use the following sniffer commands to verify if the FortiGate and the collector are communicating:

- By collector port:

  ```
  # diagnose sniffer packet 'port <collector-port>'  6 0 a
  ```

- By collector IP address:

```
# diagnose sniffer packet 'host <collector-ip>' 6 0 a
```

NetFlow uses the sflow daemon. The current NetFlow configuration can be viewed using test level 3 or 4:

```
# diagnose test application sflowd 3
```

```
# diagnose test application sflowd 4
Netflow Cache Stats:
vdoms=1 Collectors=1 Cached_intf=2 Netflow_enabled_intf=1 Live_sessions=0 Session cache max
count:71950
```

NetFlow templates

Netflow uses templates to capture and categorize the data that it collects. FortiOS supports the following Netflow templates:

Name	Template ID	Description
STAT_OPTIONS	256	Statistics information about exporter
APP_ID_OPTIONS	257	Application information
IPV4	258	No NAT IPv4 traffic
IPV6	259	No NAT IPv6 traffic
ICMP4	260	No NAT ICMPv4 traffic
ICMP6	261	No NAT ICMPv6 traffic
IPV4_NAT	262	Source/Destination NAT IPv4 traffic
IPV4_AF_NAT	263	AF NAT IPv4 traffic (4->6)
IPV6_NAT	264	Source/Destination NAT IPv6 traffic
IPV6_AF_NAT	265	AF NAT IPv6 traffic (6->4)
ICMP4_NAT	266	Source/Destination NAT ICMPv4 traffic
ICMP4_AF_NAT	267	AF NAT ICMPv4 traffic (4->6)
ICMP6_NAT	268	Source/Destination NAT ICMPv6 traffic
ICMPv6_AF_NAT	269	AF NAT ICMPv6 traffic (6->4)

NetFlow on FortiExtender and tunnel interfaces

NetFlow sampling is supported on FortiExtender and VPN tunnel interfaces.

VPN tunnel interfaces can be IPsec, IP in IP, or GRE tunnels. NetFlow sampling is supported on both NPU and non-NPU offloaded tunnels.

Examples

In the following examples, a FortiExtender and a VPN tunnel interface are configured with NetFlow sampling.

To configure a FortiExtender interface with NetFlow sampling:

1. Configure a FortiExtender interface with NetFlow sampling enabled for both transmitted and received traffic:

```
config system interface
    edit "fext-211"
        set vdom "root"
        set mode dhcp
        set type fext-wan
        set netflow-sampler both
        set role wan
        set snmp-index 8
        set macaddr 2a:4e:68:a3:f4:6a
    next
end
```

2. Check the NetFlow status and configuration:

Device index 26 is the FortiExtender interface `fext-211`.

```
# diagnose test application sflowd 3
===== Netflow Vdom Configuration =====
Global collector:172.18.60.80:[2055] source ip: 0.0.0.0 active-timeout(seconds):60
inactive-timeout(seconds):600
____ vdom: root, index=0, is master, collector: disabled (use global config) (mgmt vdom)
   |_ coll_ip:172.18.60.80[2055],src_ip:10.6.30.105,seq_num:300,pkts/time to next
template: 18/29
   |_ exported: Bytes:3026268, Packets:11192, Sessions:290 Flows:482
   |____ interface:fext-211 sample_direction:both device_index:26 snmp_index:8
```

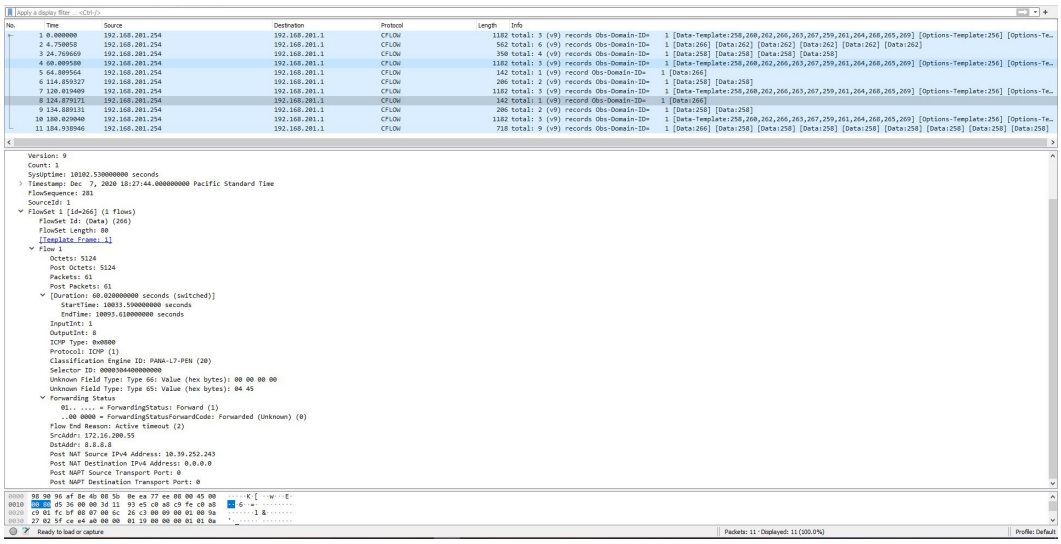
3. Check the network interface list:

```
# diagnose netlink interface list
...
if=fext-211 family=00 type=1 index=26 mtu=1500 link=0 master=0
ref=27 state=start present fw_flags=60000 flags=up broadcast run multicast
...
```

4. Check the session list for the FortiExtender interface and NetFlow flowset packet:

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=1732 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty netflow-origin netflow-reply
statistic(bytes/packets/allow_err): org=145572/1733/1 reply=145572/1733/1 tuples=2
tx speed(Bps/kbps): 83/0 rx speed(Bps/kbps): 83/0
orgin->sink: org pre->post, reply pre->post dev=5->26/26->5
gwy=10.39.252.244/172.16.200.55
hook=post dir=org act=snat 172.16.200.55:61290->8.8.8.8:8(10.39.252.243:61290)
hook=pre dir=reply act=dnat 8.8.8.8:61290->10.39.252.243:0(172.16.200.55:61290)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=0
serial=00001298 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
no_ofld_reason:  non-npu-intf
total session 1
```

5. The flowset packet can be captured on UDP port 2055 by a packet analyzer, such as Wireshark:



To configure a VPN tunnel interface with NetFlow sampling:

1. Configure a VPN interface with NetFlow sampling enabled for both transmitted and received traffic:

```
config system interface
    edit "A-to-B_vpn"
        set vdom "vdom1"
        set type tunnel
        set netflow-sampler both
        set snmp-index 42
        set interface "port3"
    next
end
```

2. Configure the VPN tunnel:

```
config vpn ipsec phase1-interface
    edit "A-to-B_vpn"
        set interface "port3"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set comments "VPN: A-to-B_vpn [Created by VPN wizard]"
        set wizard-type static-fortigate
        set remote-gw 10.2.2.2
        set psksecret ENC
    next
end
```

```
config vpn ipsec phase2-interface
    edit "A-to-B_vpn"
        set phase1name "A-to-B_vpn"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set comments "VPN: A-to-B_vpn [Created by VPN wizard]"
        set src-addr-type name
        set dst-addr-type name
        set src-name "A-to-B_vpn_local"
```

```
        set dst-name "A-to-B_vpn_remote"
    next
end
```

3. Check the NetFlow status and configuration:

   Device index 52 is the VPN interface `A-to-B_vpn`.

```
# diagnose test application sflowd 3
===== Netflow Vdom Configuration =====
Global collector:172.18.60.80:[2055] source ip: 0.0.0.0 active-timeout(seconds):60
inactive-timeout(seconds):15
____ vdom: vdom1, index=1, is master, collector: disabled (use global config) (mgmt
vdom)
   |_ coll_ip:172.18.60.80[2055],src_ip:10.1.100.1,seq_num:60,pkts/time to next
template: 15/6
   |_ exported: Bytes:11795591, Packets:48160, Sessions:10 Flows:34
   |____ interface:A-to-B_vpn sample_direction:both device_index:52 snmp_index:42
```

4. Check the session list for the VPN interface and NetFlow flowset packet (unencapsulated traffic going through the VPN tunnel):

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=6 expire=3599 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3

SD-WAN

SD-WAN is a software-defined approach to managing Wide-Area Networks (WAN). It allows you to offload internet-bound traffic, meaning that private WAN services remain available for real-time and mission critical applications. This added flexibility improves traffic flow and reduces pressure on the network.

SD-WAN platforms create hybrid networks that integrate broadband and other network services into the corporate WAN while maintaining the performance and security of real-time and sensitive applications.

SD-WAN with Application Aware Routing can measure and monitor the performance of multiple services in a hybrid network. It uses application routing to offer more granular control of where and when an application uses a specific service, allowing better use of the overall network.

Some of the key benefits of SD-WAN include:

- Reduced cost with transport independence across MPLS, 3G/4G LTE, and others.
- Improve business application performance thanks to increased availability and agility.
- Optimized user experience and efficiency with SaaS and public cloud applications.

SD-WAN has 4 objects:

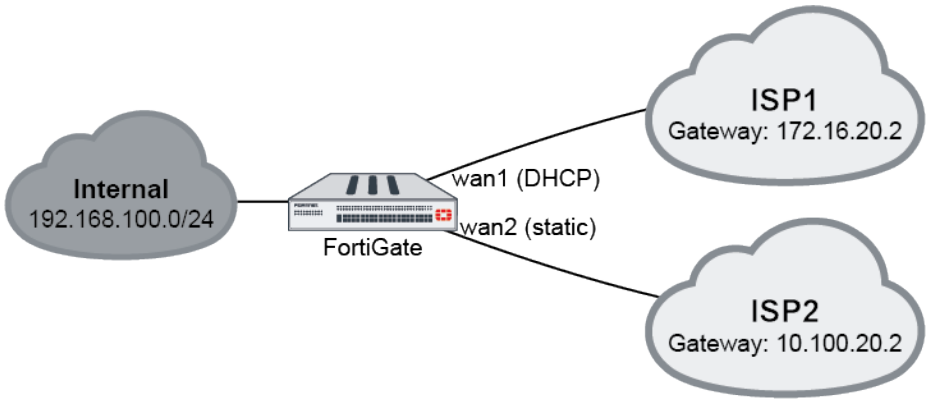
- **SD-WAN zones**
  SD-WAN is divided into zones. SD-WAN member interfaces are assigned to zones, and zones are used in policies as source and destination interfaces. You can define multiple zones to group SD-WAN interfaces together, allowing logical groupings for overlay and underlay interfaces. See SD-WAN zones on page 329.
- **SD-WAN members**
  Also called interfaces, SD-WAN members are the ports and interfaces that are used to run traffic. At least one interface must be configured for SD-WAN to function; up to 255 member interfaces can be configured. See Configuring the SD-WAN interface on page 320.
- **Performance SLAs**
  Also called health-checks, performance SLAs are used to monitor member interface link quality, and to detect link failures. They can be used to remove routes, and to reroute traffic when an SD-WAN member cannot detect the server. They can also be used in SD-WAN rules to select the preferred member interface for forwarding traffic. See Performance SLA on page 334.
- **SD-WAN rules**
  Also called services, SD-WAN rules are used to control path selection. Specific traffic can be dynamically sent to the best link, or use a specific route. There are five modes:
  - *auto*: Assign interfaces a priority based on quality.
  - *manual*: Assign interfaces a priority manually.
  - *priority*: Assign interfaces a priority based on the link-cost-factor quality of the interface.
  - *sla*: Assign interfaces a priority based on selected SLA settings.
  - *load-balance*: Distribute traffic among all available links based on the load balance algorithm.

  See SD-WAN rules on page 358.

SD-WAN quick start

This section provides an example of how to start using SD-WAN for load balancing and redundancy.

In this example, two ISP internet connections, wan1 (DHCP) and wan2 (static), use SD-WAN to balance traffic between them at 50% each.



1. Configuring the SD-WAN interface on page 320
2. Adding a static route on page 321
3. Selecting the implicit SD-WAN algorithm on page 322
4. Configuring firewall policies for SD-WAN on page 322
5. Link monitoring and failover on page 323
6. Results on page 324
7. Configuring SD-WAN in the CLI on page 327

Configuring the SD-WAN interface

First, SD-WAN must be enabled and member interfaces must be selected and added to a zone. The selected FortiGate interfaces can be of any type (physical, aggregate, VLAN, IPsec, and others), but must be removed from any other configurations on the FortiGate.

In this step, two interfaces are configured and added to the default SD-WAN zone (virtual-wan-link) as SD-WAN member interfaces. This example uses a mix of static and dynamic IP addresses; your deployment could also use only one or the other.

Once the SD-WAN members are created and added to a zone, the zone can be used in firewall policies, and the whole SD-WAN can be used in static routes.

To configure SD-WAN members:

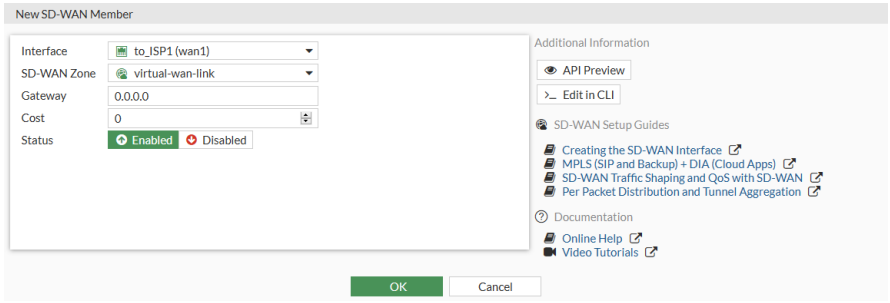
1. Configure the wan1 and wan2 interfaces. See Interface settings on page 122 for details.
   a. Set the wan1 interface *Addressing mode* to *DHCP* and *Distance* to *10*.

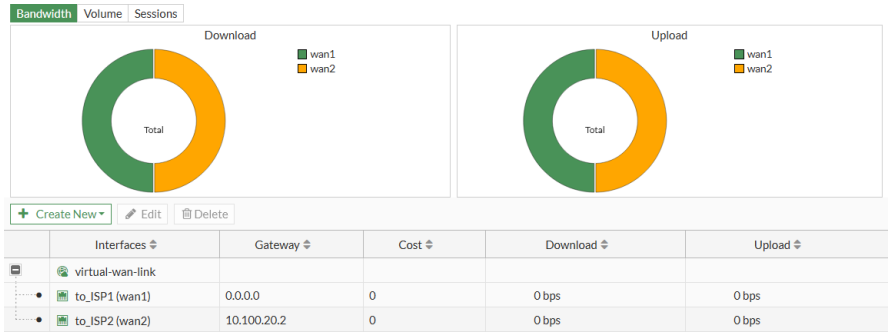
   By default, a DHCP interface has a distance of 5, and a static route has a distance of 10. It is important to account for this when configuring your SD-WAN for 50/50 load balancing by setting the DHCP interface's distance to 10.

   b. Set the wan2 interface *IP/Netmask* to *10.100.20.1 255.255.255.0*.
2. Go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
3. Set the *Interface* to *wan1*.

4. Leave *SD-WAN Zone* as *virtual-wan-link*.
5. As wan1 uses DHCP, leave *Gateway* set to *0.0.0.0*.
   If IPv6 visibility is enabled in the GUI, an IPv6 gateway can also be added for each member. See Feature visibility on page 1562 for details.
6. Leave *Cost* as *0*.
   The *Cost* field is used by the Lowest Cost (SLA) strategy. The link with the lowest cost is chosen to pass traffic. The lowest possible *Cost* is *0*.



7. Set *Status* to *Enable*, and click *OK*.
8. Repeat the above steps for wan2, setting *Gateway* to the ISP's gateway: *10.100.20.2*.

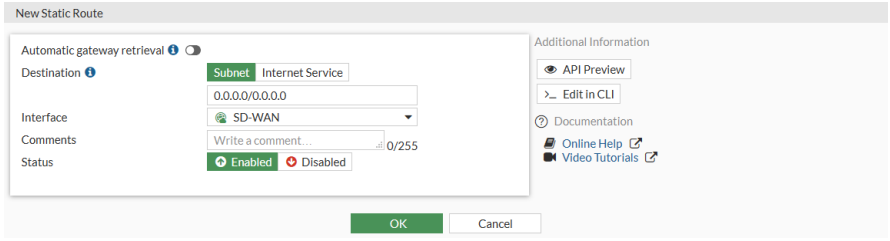


Adding a static route

You must configure a default route for the SD-WAN. The default gateways for each SD-WAN member interface do not need to be defined in the static routes table. FortiGate will decide what route or routes are preferred using Equal Cost Multi-Path (ECMP) based on distance and priority.

To create a static route for SD-WAN:

1. Go to *Network* > *Static Routes*.
2. Click *Create New*. The *New Static Route* page opens.
3. Set *Destination* to *Subnet*, and leave the IP address and subnet mask as *0.0.0.0/0.0.0.0*.
4. From the *Interface* drop-down list, select *SD-WAN*.



5. Ensure that *Status* is *Enabled*.
6. Click *OK*.

Selecting the implicit SD-WAN algorithm

SD-WAN rules define specific routing options to route traffic to an SD-WAN member.

If no routing rules are defined, the default *Implicit* rule is used. It can be configured to use one of five different load balancing algorithms. See Implicit rule on page 358 for more details and examples.

This example shows four methods to equally balance traffic between the two WAN connections. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and edit the *sd-wan* rule to select the method that is appropriate for your requirements.

- *Source IP* (CLI command: `source-ip-based`):
  Select this option to balance traffic equally between the SD-WAN members according to a hash algorithm based on the source IP addresses.
- *Session* (`weight-based`):
  Select this option to balance traffic equally between the SD-WAN members by the session numbers ratio among its members. Use weight 50 for each of the 2 members.
- *Source-Destination IP* (`source-dest-ip-based`):
  Select this option to balance traffic equally between the SD-WAN members according to a hash algorithm based on the source and destination IP addresses.
- *Volume* (`measured-volume-based`):
  Select this option to balance traffic equally between the SD-WAN members according to the bandwidth ratio among its members.

Configuring firewall policies for SD-WAN

SD-WAN zones can be used in policies as source and destination interfaces. Individual SD-WAN members cannot be used in policies.

You must configure a policy that allows traffic from your organization's internal network to the SD-WAN zone. Policies configured with the SD-WAN zone apply to all SD-WAN interface members in that zone.

To create a firewall policy for SD-WAN:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*. The *New Policy* page opens.

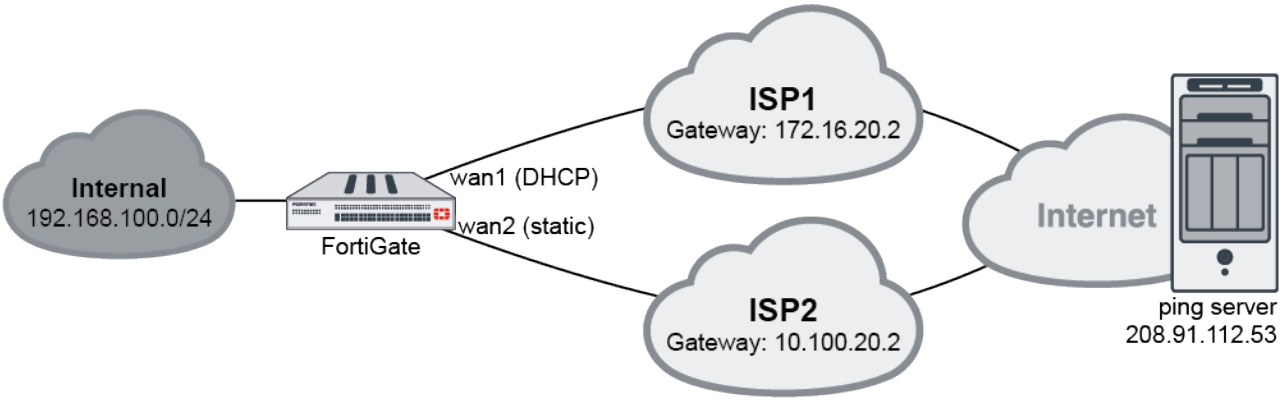
3. Configure the following:

Name	Enter a name for the policy.
Incoming Interface	*internal*
Outgoing Interface	*virtual-wan-link*
Source	*all*
Destination	*all*
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*
Firewall / Network Options	Enable *NAT* and set *IP Pool Configuration* to *Use Outgoing Interface Address*.
Security Profiles	Apply profiles as required.
Logging Options	Enable *Log Allowed Traffic* and select *All Sessions*. This allows you to verify results later.

4. Enable the policy, then click *OK*.

Link monitoring and failover

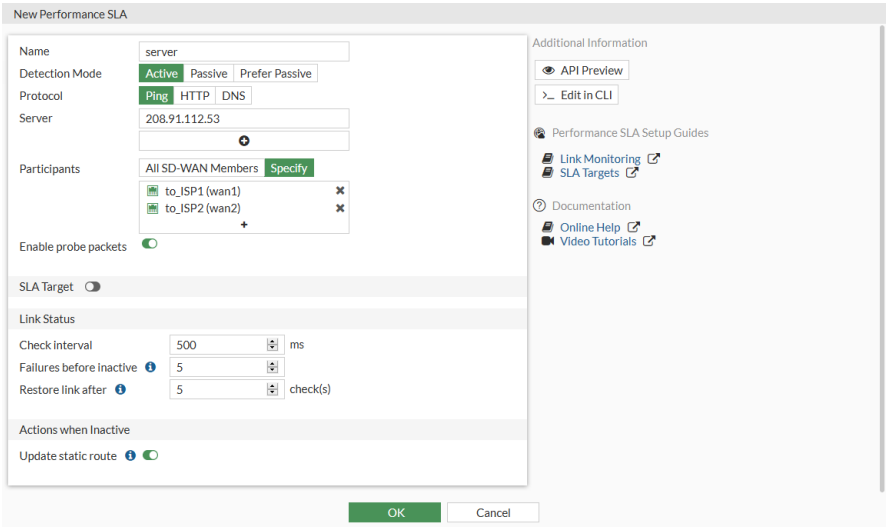
Performance SLA link monitoring measures the health of links that are connected to SD-WAN member interfaces by sending probing signals through each link to a server, and then measuring the link quality based on latency, jitter, and packet loss. If a link is broken, the routes on that link are removed and traffic is routed through other links. When the link is working again, the routes are re-enabled. This prevents traffic being sent to a broken link and lost.



In this example, the detection server IP address is 208.91.112.53. A performance SLA is created so that, if ping fails per the metrics defined, the routes to that interface are removed and traffic is detoured to the other interface. The ping protocol is used, but other protocols could also be selected as required.

To configure a performance SLA:

1. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, and click *Create New*.
2. Enter a name for the SLA and set *Protocol* to *Ping*.
3. In the *Server* field, enter the detection server IP address (208.91.112.53 in this example).
4. In the *Participants* field, select *Specify* and add wan1 and wan2.



SLA targets are not required for link monitoring.

5. Configure the required metrics in *Link Status*.
6. Ensure that *Update static route* is enabled. This disables static routes for the inactive interface and restores routes on recovery.
7. Click *OK*.

Results

The following GUI pages show the function of the SD-WAN and can be used to confirm that it is setup and running correctly:

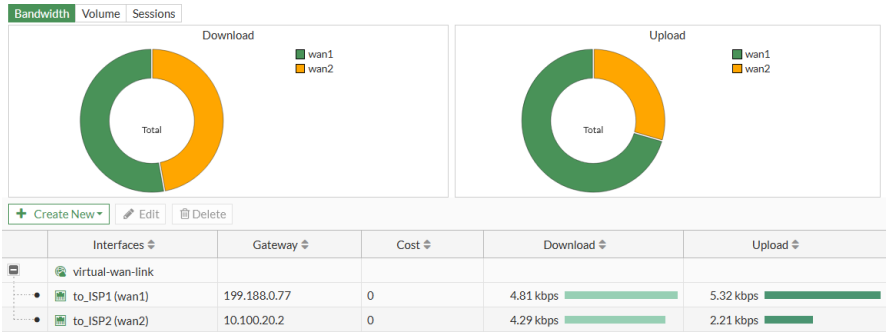
- Interface usage on page 324
- Performance SLA on page 325
- Routing table on page 327
- Firewall policy on page 327

Interface usage

Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab to review the SD-WAN interfaces' usage.

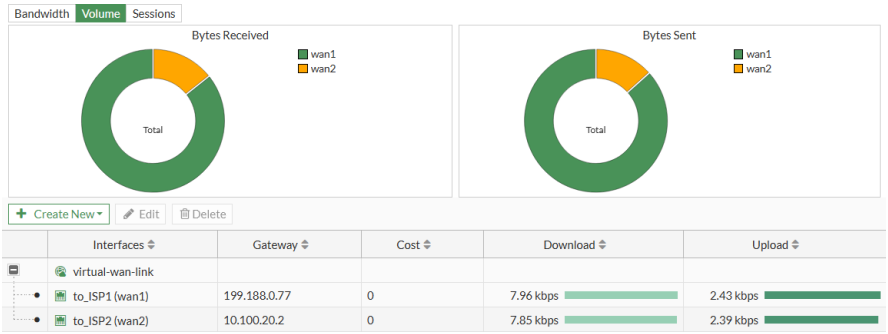
Bandwidth

Select *Bandwidth* to view the amount of downloaded and uploaded data for each interface.



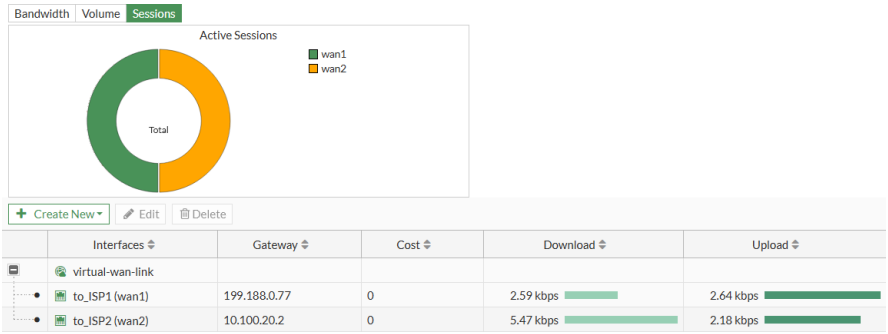
Volume

Select *Volume* to see donut charts of the received and sent bytes on the interfaces.



Sessions

Select *Sessions* to see a donut chart of the number of active sessions on each interface.

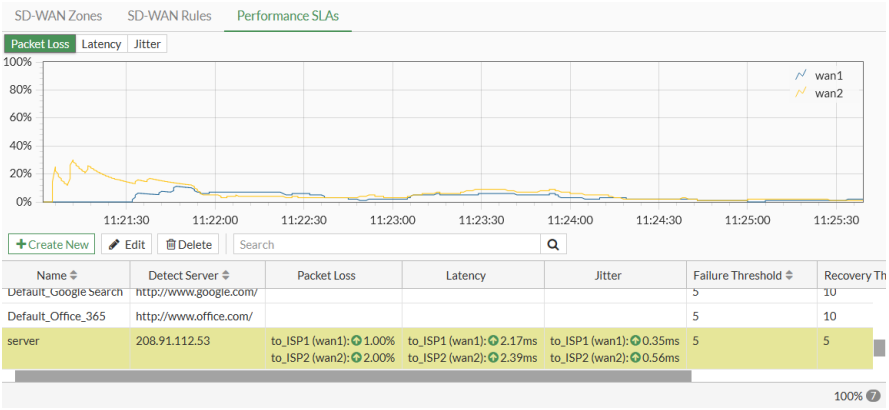


Performance SLA

Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, and select the SLA from the table (*server* in this example) to view the packet loss, latency, and jitter on each SD-WAN member in the health check server.

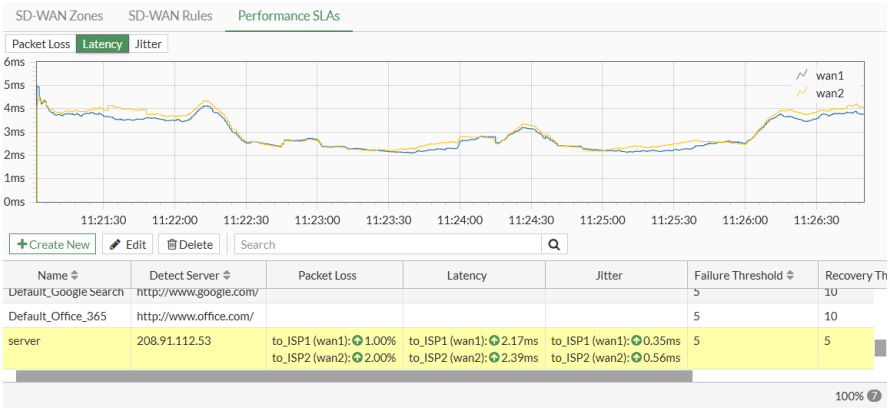
Packet loss

Select *Packet Loss* to see the percentage of packets lost for each member.



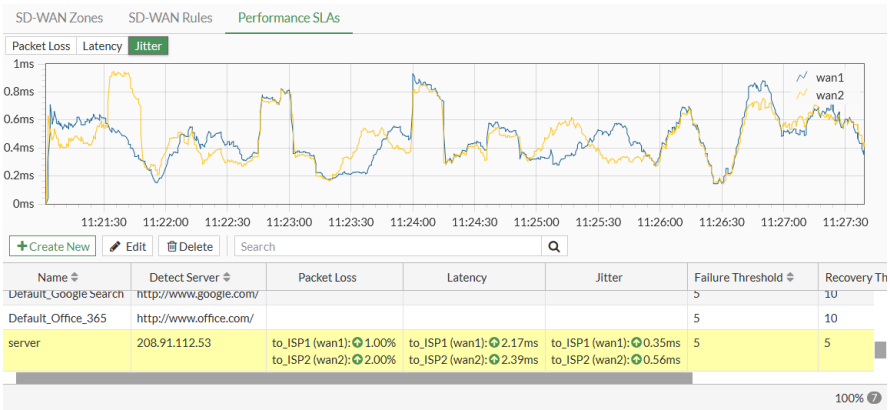
Latency

Select *Latency* to see the current latency, in milliseconds, for each member.



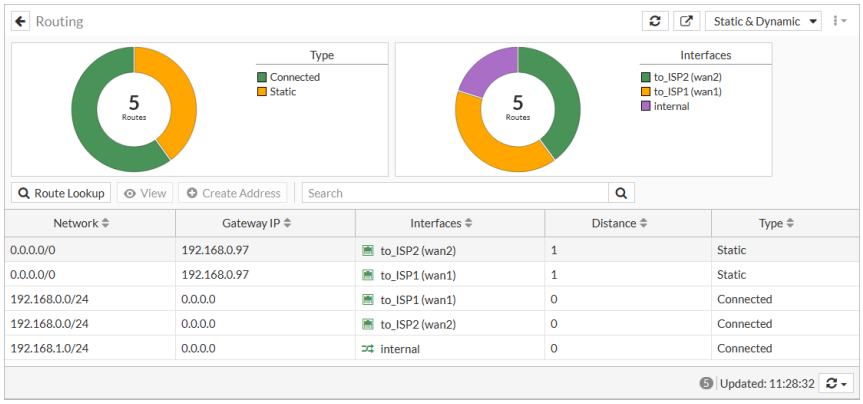
Jitter

Select *Jitter* to see the jitter, in milliseconds, for each member.



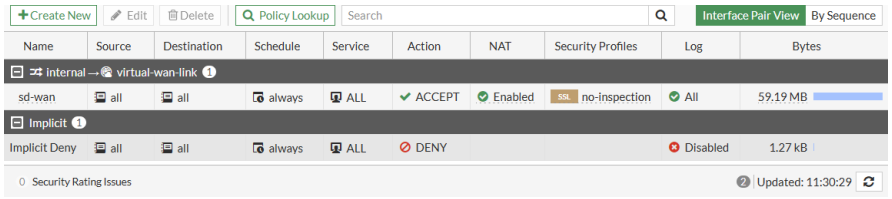
Routing table

Go to *Dashboard* > *Network*, expand the *Routing* widget, and select *Static & Dynamic* to review all static and dynamic routes. For more information about the widget, see Static & Dynamic Routing monitor on page 75.



Firewall policy

Go to *Policy & Objects* > *Firewall Policy* to review the SD-WAN policy.



Configuring SD-WAN in the CLI

This example can be entirely configured using the CLI.

To configure SD-WAN in the CLI:

1. Configure the wan1 and wan2 interfaces:

```
config system interface
    edit "wan1"
        set alias to_ISP1
        set mode dhcp
        set distance 10
    next
    edit "wan2"
        set alias to_ISP2
        set ip 10.100.20.1 255.255.255.0
    next
end
```

2. Enable SD-WAN and add the interfaces as members:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "wan1"
        next
        edit 2
            set interface "wan2"
            set gateway 10.100.20.2
        next
    end
end
```

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

3. Create a static route for SD-WAN:

```
config router static
    edit 1
        set sdwan enable
    next
end
```

4. Select the implicit SD-WAN algorithm:

```
config system sdwan
    set load-balance-mode {source-ip-based | weight-based | source-dest-ip-based |
measured-volume-based}
end
```

5. Create a firewall policy for SD-WAN:

```
config firewall policy
    edit <policy_id>
        set name <policy_name>
        set srcintf "internal"
        set dstintf "virtual-wan-link"
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
        set utm-status enable
        set ssl-ssh-profile <profile_name>
        set av-profile <profile_name>
        set webfilter-profile <profile_name>
        set dnsfilter-profile <profile_name>
        set emailfilter-profile <profile_name>
        set ips_sensor <sensor_name>
        set application-list <app_list>
        set voip-profile <profile_name>
        set logtraffic all
        set nat enable
```

```
            set status enable
        next
    end
```

6. Configure a performance SLA:

```
config system sdwan
    config health-check
        edit "server"
            set server "208.91.112.53"
            set update-static-route enable
            set members 1 2
        next
    end
end
```

Results

To view the routing table:

```
# get router info routing-table all

Routing table for VRF=0
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default

S*      0.0.0.0/0 [1/0] via 172.16.20.2, wan1
                  [1/0] via 10.100.20.2, wan2
C       10.100.20.0/24 is directly connected, wan2
C       172.16.20.2/24 is directly connected, wan1
C       192.168.0.0/24 is directly connected, internal
```

To diagnose the Performance SLA status:

```
FGT # diagnose sys sdwan health-check
Health Check(server):
Seq(1): state(alive), packet-loss(0.000%) latency(15.247), jitter(5.231) sla_map=0x0
Seq(2): state(alive), packet-loss(0.000%) latency(13.621), jitter(6.905) sla_map=0x0
```

SD-WAN zones

SD-WAN is divided into zones. SD-WAN member interfaces are assigned to zones, and zones are used in policies as source and destination interfaces.

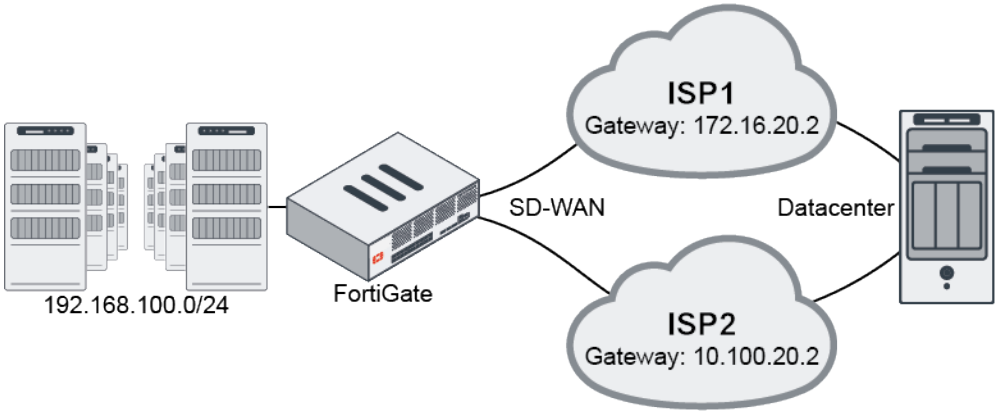
You can define multiple zones to group SD-WAN interfaces together, allowing logical groupings for overlay and underlay interfaces. The zones are used in firewall policies to allow for more granular control. SD-WAN members cannot be used directly in policies.

Static routes use the entire SD-WAN, not just individual zones or members.

In the CLI:

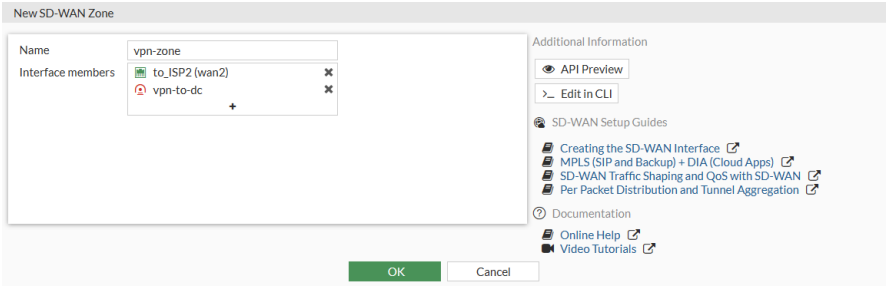
- `config system sdwan` has replaced `config system virtual-wan-link`.
- `diagnose sys sdwan` has replaced `diagnose sys virtual-wan-link`.
- When configuring a static route, the `sdwan` variable has replaced the `virtual-wan-link` variable.

When the Security Fabric is configured, SD-WAN zones are included in the Security Fabric topology views.

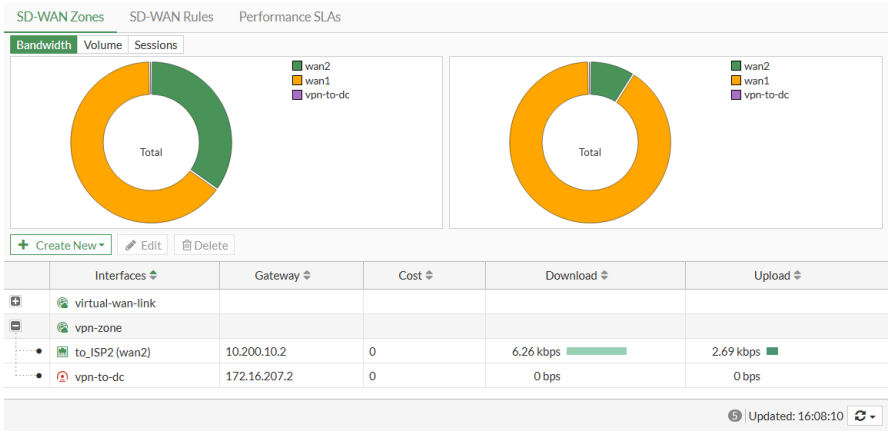


To create an SD-WAN zone in the GUI:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab.
   The default SD-WAN zone is *virtual-wan-link*.
2. Click *Create New* > *SD-WAN Zone*.
3. Enter a name for the new zone.
4. If SD-WAN members have already been created, add the required members to the zone.
   Members can also be added to the zone after it has been created by editing the zone, or when creating or editing the member.

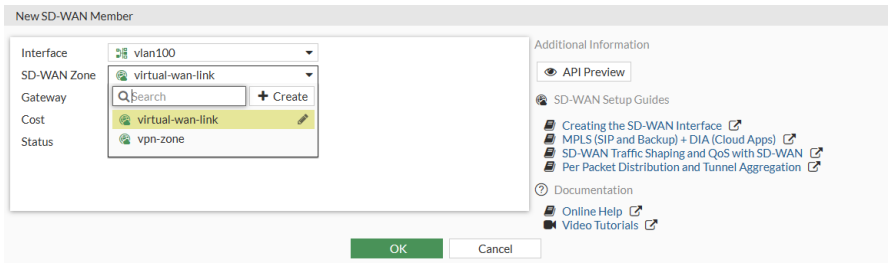


5. Click *OK*.

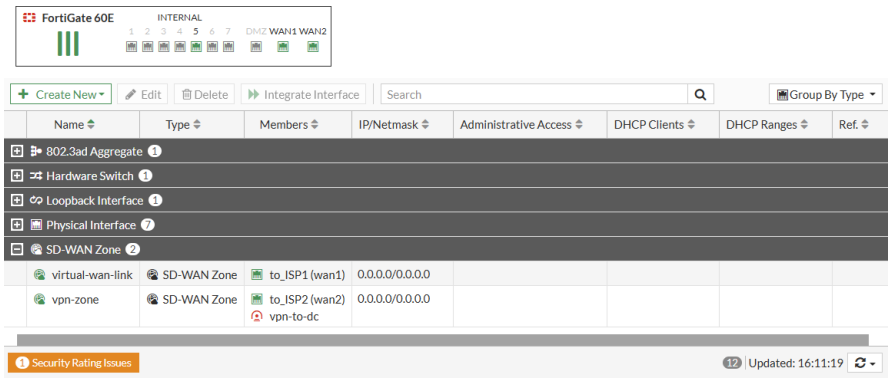


To create an SD-WAN interface member in the GUI:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. Select an interface.
   The interface can also be left as *none* and selected later, or click *+VPN* to create an IPsec VPN for the SD-WAN member.
3. Select the SD-WAN zone that the member will join. A member can also be moved to a different zone at any time.



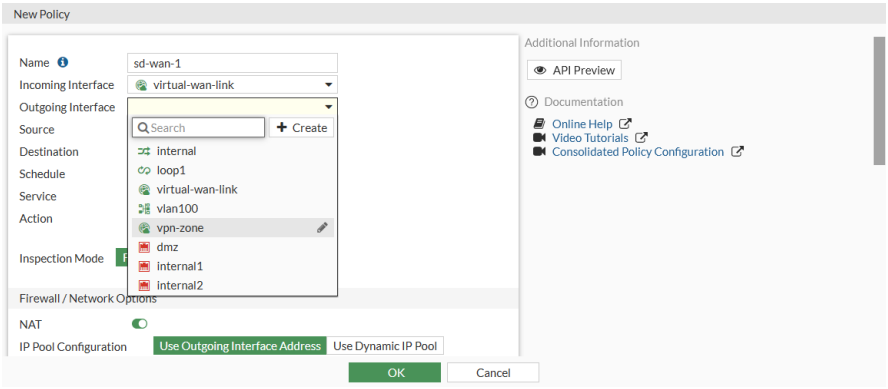
4. Set the *Gateway*, *Cost*, and *Status* as required.
5. Click *OK*.
   The interface list at *Network* > *Interfaces* shows the SD-WAN zones and their members.



To create a policy using the SD-WAN zone in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*, *Policy & Objects* > *Proxy Policy*, or *Policy & Objects* > *Security Policy*.
2. Click *Create New* .

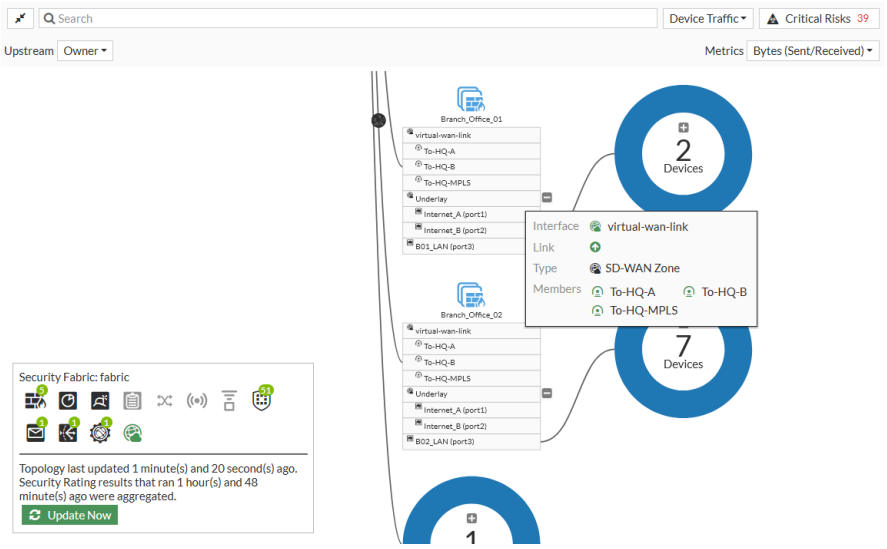
3. Configure the policy settings as needed, selecting an SD-WAN zone or zones for the incoming and/or outgoing interface.



4. Click *OK*.

To view SD-WAN zones in a Security Fabric topology:

1. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology*. The SD-WAN zones and their members are shown.



To configure SD-WAN in the CLI:

1. Enable SD-WAN and create a zone:

```
config system sdwan
    set status enable
    config zone
        edit "vpn-zone"
        next
    end
end
```

2. Configure SD-WAN members and add them to a zone:

```
config system sdwan
    config members
        edit 1
            set interface "to_FG_B_root"
            set zone "vpn-zone"
        next
        edit 2
            set interface "GRE_1"
            set zone "vpn-zone"
        next
    end
end
```

To create a policy using the SD-WAN zone in the CLI:

```
config firewall policy
    edit <policy_id>
        set name <policy_name>
        set srcintf internal
        set dstintf vpn-zone
        set srcaddr all
        set dstaddr all
        set action accept
```

```
        set schedule always
        set service ALL
        set utm-status enable
        set ssl-ssh-profile <profile_name>
        set av-profile <profile_name>
        set webfilter-profile <profile_name>
        set dnsfilter-profile <profile_name>
        set emailfilter-profile <profile_name>
        set ips_sensor <sensor_name>
        set application-list <app_list>
        set voip-profile <profile_name>
        set logtraffic all
        set nat enable
        set status enable
    next
end
```

Performance SLA

The following topics provide instructions on configuring performance SLA:

- Link health monitor on page 334
- Factory default health checks on page 337
- Health check options on page 339
- Link monitoring example on page 342
- SLA targets example on page 343
- Passive WAN health measurement on page 344
- Health check packet DSCP marker support on page 348
- Manual interface speedtest on page 348
- Scheduled interface speedtest on page 349
- Monitor performance SLA on page 351
- SLA monitoring using the REST API on page 354

Link health monitor

Performance SLA link health monitoring measures the health of links that are connected to SD-WAN member interfaces by either sending probing signals through each link to a server, or using session information that is captured on firewall policies (see Passive WAN health measurement on page 344 for information), and measuring the link quality based on latency, jitter, and packet loss. If a link fails all of the health checks, the routes on that link are removed from the SD-WAN link load balancing group, and traffic is routed through other links. When the link is working again the routes are reestablished. This prevents traffic being sent to a broken link and lost.

When an SD-WAN member has multiple health checks configured, all of the checks must fail for the routes on that link to be removed from the SD-WAN link load balancing group.

Two health check servers can be configured to ensure that, if there is a connectivity issue, the interface is at fault and not the server. A server can only be used in one health check.

The FortiGate uses the first server configured in the health check server list to perform the health check. If the first server is unavailable, then the second server is used. The second server continues to be used until it becomes unavailable, and then the FortiGate returns to the first server, if it is available. If both servers are unavailable, then the health check fails.

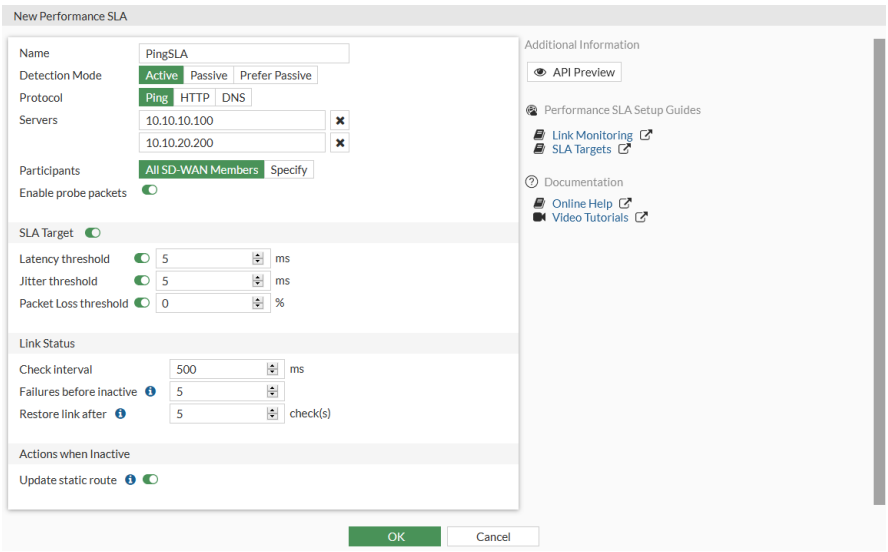
You can configure the protocol that is used for status checks, including: Ping, HTTP, DNS, TCP echo, UDP echo, two-way active measurement protocol (TWAMP), TCP connect, and FTP. In the GUI, only Ping, HTTP, and DNS are available.

You can view link quality measurements by going to *Network* > *SD-WAN* and selecting the *Performance SLAs* tab. The table shows the default health checks, the health checks that you configured, and information about each health check. The values shown in the *Packet Loss*, *Latency*, and *Jitter* columns are for the health check server that the FortiGate is currently using. The green up arrows indicate that the server is responding, and does not indicate if the health checks are being met. See Results on page 324 for more information.

To configure a link health monitor in the GUI:

1. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, and click *Create New*.
2. Set a *Name* for the SLA.
3. Set the *Protocol* that you need to use for status checks: *Ping*, *HTTP*, or *DNS*.
4. Set *Server* to the IP addresses of up to two servers that all of the SD-WAN members in the performance SLA can reach.
5. Set *Participants* to *All SD-WAN Members*, or select *Specify* to choose specific SD-WAN members.
6. Set *Enable probe packets* to enable or disable sending probe packets.
7. Configure *SLA Target*:
   If the health check is used in an SD-WAN rule that uses *Manual* or *Best Quality* strategies, enabling *SLA Target* is optional. If the health check is used in an SD-WAN rule that uses *Lowest Cost (SLA)* or *Maximum Bandwidth (SLA)* strategies, then *SLA Target* is enabled.

   When *SLA Target* is enabled, configure the following:
   - *Latency threshold*: Calculated based on last 30 probes (default = 5ms).
   - *Jitter threshold*: Calculated based on last 30 probes (default = 5ms).
   - *Packet Loss threshold*: Calculated based on last 100 probes (default = 0%).
8. In the *Link Status* section configure the following:
   - *Check interval*: The interval in which the FortiGate checks the interface, in milliseconds (500 - 3600000, default = 500).
   - *Failures before inactive*: The number of failed status checks before the interface shows as inactive (1 - 3600, default =5). This setting helps prevent flapping, where the system continuously transfers traffic back and forth between links
   - *Restore link after*: The number of successful status checks before the interface shows as active (1 - 3600, default = 5). This setting helps prevent flapping, where the system continuously transfers traffic back and forth between links
9. In the *Actions when Inactive* section, enable *Update static route* to disable static routes for inactive interfaces and restore routes when interfaces recover.



10. Click *OK*.

To configure a link health monitor in the CLI:

```
config system sdwan
    config health-check
        edit "PingSLA"
            set addr-mode {ipv4 | ipv6}
            set server <server1_IP_address> <server2_IP_address>
            set detect-mode {active | passive | prefer-passive}
            set protocol {ping | tcp-echo | udp-echo | http | twamp | dns | tcp-connect |
ftp}
            set ha-priority <integer>
            set probe-timeout <integer>
            set probe-count <integer>
            set probe-packets {enable | disable}
            set interval <integer>
            set failtime <integer>
            set recoverytime <integer>
            set diffservcode <binary>
            set update-static-route {enable | disable}
            set update-cascade-interface {enable | disable}
            set sla-fail-log-period <integer>
            set sla-pass-log-period <integer>
            set threshold-warning-packetloss <integer>
            set threshold-alert-packetloss <integer>
            set threshold-warning-latency <integer>
            set threshold-alert-latency <integer>
            set threshold-warning-jitter <integer>
            set threshold-alert-jitter <integer>
            set members <member_number> ... <member_number>
            config sla
                edit 1
                    set link-cost-factor {latency jitter packet-loss}
                    set latency-threshold <integer>
                    set jitter-threshold <integer>
                    set packetloss-threshold <integer>
```

```
                next
            end
        next
    end
end
```

Additional settings are available for some of the protocols:

Protocol	Additional options

http	`port <port_number>`
	`http-get <url>`
	`http-match <response_string>`

twamp	`port <port_number>`
	`security mode {none | authentication}`
	`password <password>`
	`packet-size <size>`

ftp	`ftp {passive | port}` `ftp-file <path>`

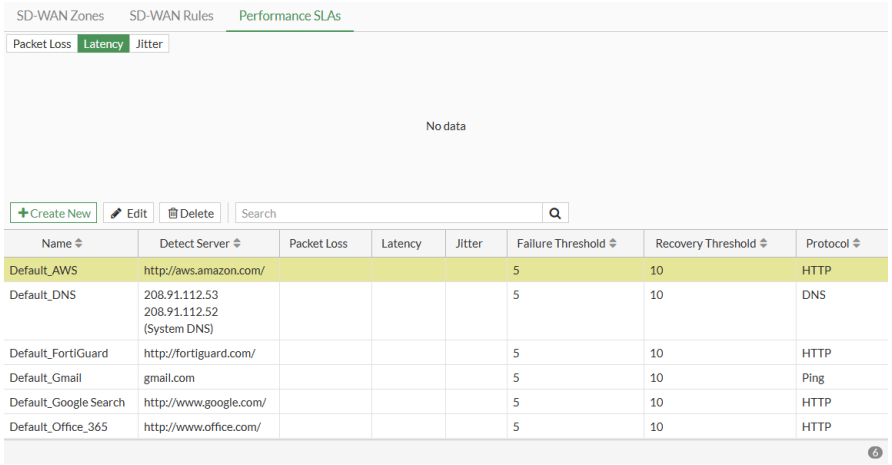
For more examples see Health check options on page 339.

Factory default health checks

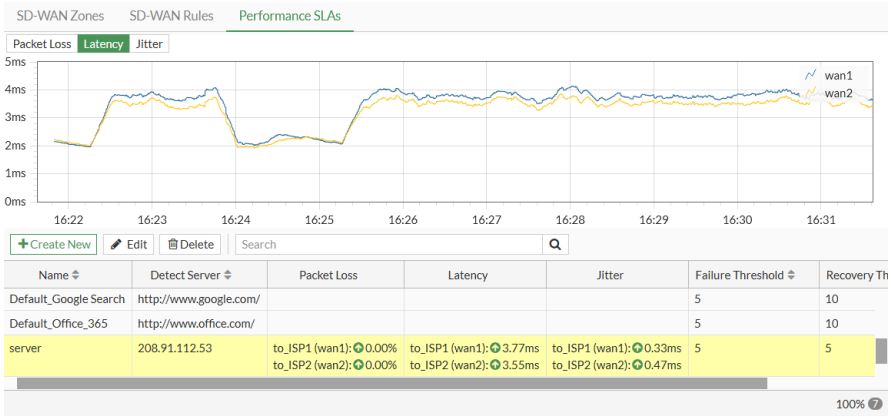
There are six predefined performance SLA profiles for newly created VDOMs or factory reset FortiGate devices:

- AWS
- System DNS
- FortiGuard
- Gmail
- Google Search
- Office 365

You can view and configure the SLA profiles by going to *Network* > *SD-WAN* and selecting the *Performance SLAs* tab.



After configuring a health check, you will be able to view packet loss, latency, and jitter data for the SLA profiles. If a value is colored red, it means that it failed to meet the SLA requirements.



To configure the performance SLA profiles in the CLI:

```
config system sdwan
    config health-check
        edit "Default_DNS"
            set system-dns enable
            set interval 1000
            set probe-timeout 1000
            set recoverytime 10
            config sla
                edit 1
                    set latency-threshold 250
                    set jitter-threshold 50
                    set packetloss-threshold 5
                next
            end
        next
        edit "Default_Office_365"
            set server "www.office.com"
            set protocol http
            set interval 1000
            set probe-timeout 1000
            set recoverytime 10
            config sla
                edit 1
                    set latency-threshold 250
                    set jitter-threshold 50
                    set packetloss-threshold 5
                next
            end
        next
        edit "Default_Gmail"
            set server "gmail.com"
            set interval 1000
            set probe-timeout 1000
            set recoverytime 10
            config sla
                edit 1
```

```
                    set latency-threshold 250
                    set jitter-threshold 50
                    set packetloss-threshold 2
                next
            end
        next
        edit "Default_AWS"
            set server "aws.amazon.com"
            set protocol http
            set interval 1000
            set probe-timeout 1000
            set recoverytime 10
            config sla
                edit 1
                    set latency-threshold 250
                    set jitter-threshold 50
                    set packetloss-threshold 5
                next
            end
        next
        edit "Default_Google Search"
            set server "www.google.com"
            set protocol http
            set interval 1000
            set probe-timeout 1000
            set recoverytime 10
            config sla
                edit 1
                    set latency-threshold 250
                    set jitter-threshold 50
                    set packetloss-threshold 5
                next
            end
        next
        edit "Default_FortiGuard"
            set server "fortiguard.com"
            set protocol http
            set interval 1000
            set probe-timeout 1000
            set recoverytime 10
            config sla
                edit 1
                    set latency-threshold 250
                    set jitter-threshold 50
                    set packetloss-threshold 5
                next
            end
        next
    end
end
```

Health check options

Health checks include several protocols and protocol specific options.

The health check protocol options include:

ping	Use PING to test the link with the server.
tcp-echo	Use TCP echo to test the link with the server.
udp-echo	Use UDP echo to test the link with the server.
http	Use HTTP-GET to test the link with the server.
twamp	Use TWAMP to test the link with the server.
dns	Use DNS query to test the link with the server. The FortiGate sends a DNS query for an A Record and the response matches the expected IP address.
tcp-connect	Use a full TCP connection to test the link with the server. The method to measure the quality of the TCP connection can be: • `half-open`: FortiGate sends SYN and gets SYN-ACK. The latency is based on the round trip between SYN and SYN-ACK (default). • `half-close`: FortiGate sends FIN and gets FIN-ACK. The latency is based on the round trip between FIN and FIN-ACK.
ftp	Use FTP to test the link with the server. The FTP mode can be: • `passive`: The FTP health-check initiates and establishes the data connection (default). • `port`: The FTP server initiates and establishes the data connection.

To use UDP-echo and TCP-echo as health checks:

```
config system sdwan
    set status enable
    config health-check
        edit "h4_udp1"
            set protocol udp-echo
            set port 7
            set server <server>
        next
        edit "h4_tcp1"
            set protocol tcp-echo
            set port 7
            set server <server>
        next
        edit "h6_udp1"
            set addr-mode ipv6
            set server "2032::12"
            set protocol udp-echo
            set port 7
        next
    end
end
```

To use DNS as a health check, and define the IP address that the response must match:

```
config system sdwan
    set status enable
    config health-check
```

```
        edit "h4_dns1"
            set protocol dns
            set dns-request-domain "ip41.forti2.com"
            set dns-match-ip 1.1.1.1
        next
        edit "h6_dns1"
            set addr-mode ipv6
            set server "2000::15.1.1.4"
            set protocol dns
            set port 53
            set dns-request-domain "ip61.xxx.com"
        next
    end
end
```

To use TCP Open (SYN/SYN-ACK) and TCP Close (FIN/FIN-ACK) to verify connections:

```
config system sdwan
    set status enable
    config health-check
        edit "h4_tcpconnect1"
            set protocol tcp-connect
            set port 443
            set quality-measured-method {half-open | half-close}
            set server <server>
        next
        edit "h6_tcpconnect1"
            set addr-mode ipv6
            set server "2032::13"
            set protocol tcp-connect
            set port 444
            set quality-measured-method {half-open | half-close}
        next
    end
end
```

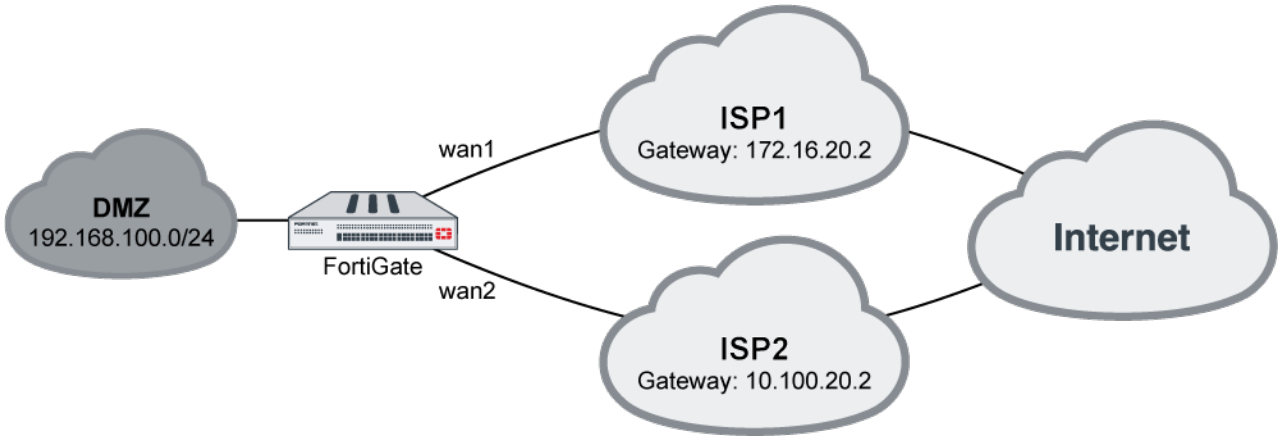
To use active or passive mode FTP to verify connections:

```
config system sdwan
    set status enable
    config health-check
        edit "h4_ftp1"
            set protocol ftp
            set port 21
            set user "root"
            set password ***********
            set ftp-mode {passive | port}
            set ftp-file "1.txt"
            set server <server>
        next
        edit "h6_ftp1"
            set addr-mode ipv6
            set server "2032::11"
            set protocol ftp
            set port 21
            set user "root"
```

```
            set password ***********
            set ftp-mode {passive | port}
            set ftp-file "2.txt"
        next
    end
end
```

Link monitoring example

Performance SLA link monitoring measures the health of links that are connected to SD-WAN member interfaces by sending probing signals through each link to a server and measuring the link quality based on latency, jitter, and packet loss. If a link is broken, the routes on that link are removed, and traffic is routed through other links. When the link is working again, the routes are reenabbled. This prevents traffic being sent to a broken link and lost.



In this example:

- Interfaces wan1 and wan2 connect to the internet through separate ISPs
- The detection server IP address is 208.91.114.182

A performance SLA is created so that, if one link fails, its routes are removed and traffic is detoured to the other link.

To configure a Performance SLA using the GUI:

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 319 for details.
2. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, and click *Create New*.
3. Enter a name for the SLA and select a protocol.
4. In the *Server* field, enter the detection server IP address (208.91.114.182 in this example).
5. In the *Participants* field, select both wan1 and wan2.
6. Configured the remaining settings as needed, then click *OK*.

To configure a Performance SLA using the CLI:

```
config system sdwan
    config health-check
        edit "server"
            set server "208.91.114.182"
            set update-static-route enable
```

```
            set members 1 2
        next
    end
end
```

To diagnose the Performance SLA status:

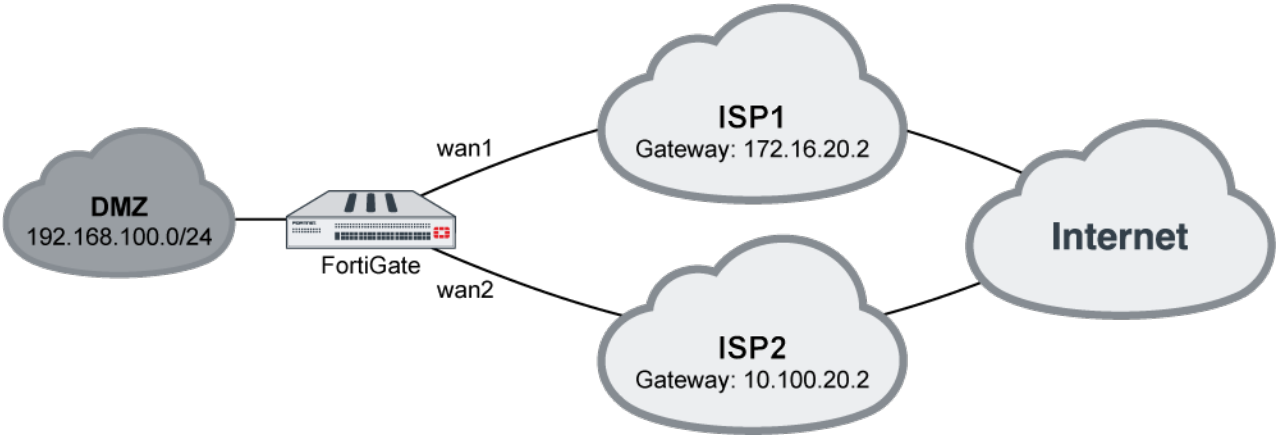
```
# diagnose sys sdwan health-check
Health Check(server):
Seq(1): state(alive), packet-loss(0.000%) latency(15.247), jitter(5.231) sla_map=0x0
Seq(2): state(alive), packet-loss(0.000%) latency(13.621), jitter(6.905) sla_map=0x0
```

SLA targets example

SLA targets are a set of constraints that are used in SD-WAN rules to control the paths that traffic take.

The available constraints are:

- *Latency threshold*: Latency for SLA to make decision, in milliseconds (0 - 10000000, default = 5).
- *Jitter threshold*: Jitter for SLA to make decision, in milliseconds (0 - 10000000, default = 5).
- *Packet loss threshold*: Packet loss for SLA to make decision, in percentage (0 - 100, default = 0).



To configure Performance SLA targets using the GUI:

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 319 for details.
2. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.
3. Create a new Performance SLA or edit an existing one. See Link monitoring example on page 342.
4. Enable *SLA Targets*and configure the constraints. To add multiple SLA targets, use the CLI.
5. Configured the remaining settings as needed, then click *OK*.

To configure Performance SLA targets using the GUI:

```
config system sdwan
    config health-check
        edit "server"
            set server "208.91.114.182"
```

```
            set members 1 2
            config sla
                edit 1
                    set link-cost-factor latency jitter packet-loss
                    set latency-threshold 10
                    set jitter-threshold 10
                    set packetloss-threshold 1
                next
                edit 2
                    set link-cost-factor latency packet-loss
                    set latency-threshold 15
                    set packetloss-threshold 2
                next
            end
        next
    end
end
```

The `link-cost-factor` variable is used to select which constraints are enabled.

Passive WAN health measurement

SD-WAN passive WAN health measurement determines the health check measurements using session information that is captured on firewall policies that have `passive-wan-health-measurement` enabled. Passive measurements analyze session information that is gathered from various TCP sessions to determine the jitter, latency, and packet loss.

Using passive WAN health measurement reduces the amount of configuration required and decreases the traffic that is produced by health check monitor probes doing active measurements. Passive WAN health measurement analyzes real-life traffic; active WAN health measurement using a detection server might not reflect the real-life traffic.

By default, active WAN health measurement is enabled when a new health check is created.

To configure passive WAN health check:

```
config system sdwan
    config health-check
        edit "1"
            set server <ip_address>
            set detect-mode {passive | prefer-passive}
            set members <members>
        next
    end
end
```

`passive`	Health is measured using traffic, without probes. No link health monitor needs to be configured.
`prefer-passive`	Health is measured using traffic when there is traffic, and using probes when there is no traffic. A link health monitor must be configured, see Link health monitor for details.

To enable passive WAN health measurement in a policy:

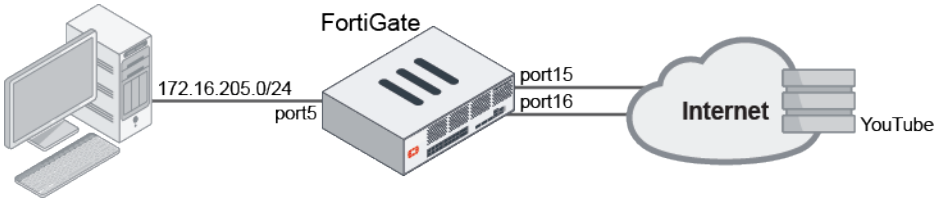
```
config firewall policy
    edit 1
        set dstintf <SD-WAN zone>
        set passive-wan-health-measurement enable
    next
end
```

When `passive-wan-health-measurement` is enabled, `auto-asic-offload` will be disabled.

Example

In this example, the FortiGate is configured to load-balance between two WAN interfaces, port15 and port16. A health check is configured in passive mode, and SLA thresholds are set. Passive WAN health measurement is enabled on the SD-WAN policy.

Measurements are taken from YouTube traffic generated by the PC. When latency is introduced to the traffic on port15, the passive health check trigger threshold is exceeded and traffic is rerouted to port16.



To configure the SD-WAN:

```
config system sdwan
    set status enable
    config zone
        edit "SD-WAN"
        next
    end
    config members
        edit 1
            set zone "SD-WAN"
            set interface "port15"
            set gateway 172.16.209.2
        next
        edit 2
            set zone "SD-WAN"
            set interface "port16"
            set gateway 172.16.210.2
        next
    end
    config health-check
        edit "Passive_Check"
            set detect-mode passive
            set members 1 2
```

```
            config sla
                edit 1
                    set latency-threshold 500
                    set jitter-threshold 500
                    set packetloss-threshold 10
                next
                edit 2
                    set latency-threshold 1000
                    set jitter-threshold 1000
                    set packetloss-threshold 10
                next
            end
        next
    end
    config service
        edit 1
            set name "Background_Traffic"
            set mode load-balance
            set src "172.16.205.0"
            set internet-service enable
            set internet-service-app-ctrl 31077 33321 41598 31076 33104 23397 30201 16420
17396 38569 25564
            config sla
                edit "Passive_Check"
                    set id 2
                next
            end
            set priority-member 1 2
        next
        edit 2
            set name "Foreground_Traffic"
            set mode sla
            set src "172.16.205.0"
            set protocol 1
            set dst "all"
            config sla
                edit "Passive_Check"
                    set id 2
                next
            end
            set priority-member 1 2
        next
    end
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "SD-WAN-HC-policy"
        set srcintf "port5"
        set dstintf "SD-WAN"
        set nat enable
        set srcaddr "all"
        set dstaddr "all"
        set action accept
```

```
        set schedule "always"
        set service "ALL"
        set passive-wan-health-measurement enable
        set auto-asic-offload disable
    next
end
```

Results

When both links pass the SLA:

```
# diagnose sys link-monitor-passive interface
Interface port16 (28):
  Latency 10.000 Jitter 5.000 Packet_loss 0.000% Last_updated Fri Mar 5 10:09:21 2021

Interface port15 (27):
  Latency 60.000 Jitter 0.000 Packet_loss 0.000% Last_updated Fri Mar 5 10:39:24 2021
```

```
# diagnose sys sdwan health-check
Health Check(Passive_Check):
Seq(1 port15): state(alive), packet-loss(0.000%) latency(60.000), jitter(0.750) sla_map=0x3
Seq(2 port16): state(alive), packet-loss(0.000%) latency(10.000), jitter(5.000) sla_map=0x3
```

```
# diagnose sys sdwan service 2

Service(2): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(1: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 port15), alive, sla(0x1), gid(0), cfg_order(0), cost(0), selected
    2: Seq_num(2 port16), alive, sla(0x1), gid(0), cfg_order(1), cost(0), selected
  Src address(1):
        172.16.205.0-172.16.205.255

  Dst address(1):
        8.8.8.8-8.8.8.8
```

When the latency is increased to 610ms on port15, the SLA is broken and pings are sent on port16:

```
# diagnose sys sdwan health-check
Health Check(Passive_Check):
Seq(1 port15): state(alive), packet-loss(0.000%) latency(610.000), jitter(2.500) sla_map=0x3
Seq(2 port16): state(alive), packet-loss(0.000%) latency(50.000), jitter(21.000) sla_map=0x3
```

```
# diagnose sys sdwan service 2

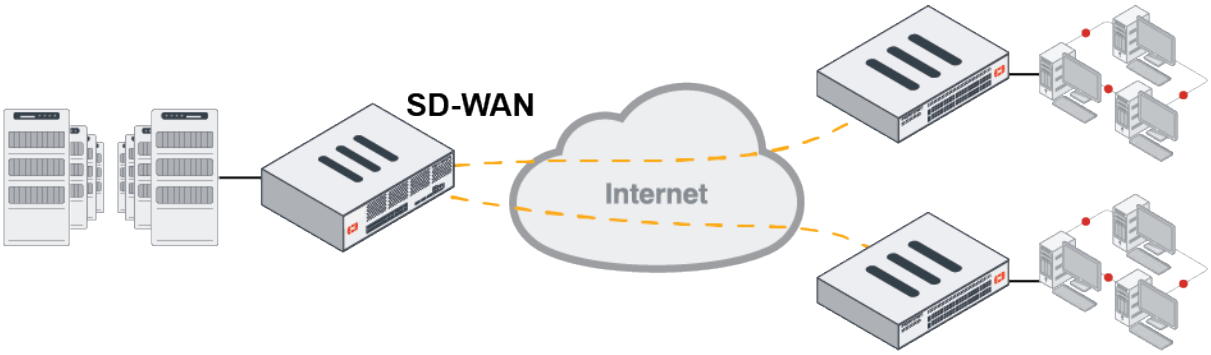
Service(2): Address Mode(IPV4) flags=0x200
  Gen(6), TOS(0x0/0x0), Protocol(1: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(2 port16), alive, sla(0x1), gid(1), cfg_order(1), cost(0), selected
    2: Seq_num(1 port15), alive, sla(0x0), gid(2), cfg_order(0), cost(0), selected
  Src address(1):
        172.16.205.0-172.16.205.255

  Dst address(1):
        8.8.8.8-8.8.8.8
```

Health check packet DSCP marker support

SD-WAN health check probe packets support Differentiated Services Code Point (DSCP) markers for accurate evaluation of the link performance for high priority applications by upstream devices.

When the SD-WAN health check packet is sent out, the DSCP can be set with a CLI command.



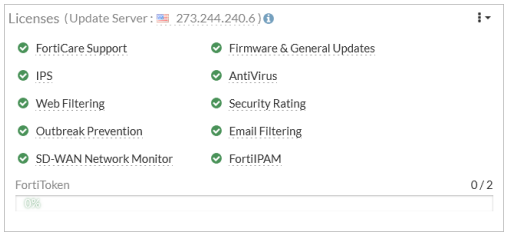
To mark health-check packets with DSCP:

```
config system sdwan
   config health-check
      edit <name>
         set diffservcode <6 bits binary, range 000000-111111>
      next
   end
end
```

Manual interface speedtest

An interface speedtest can be manually performed on WAN interfaces in the GUI. The results of the test can be added to the interface's *Estimated bandwidth*. The estimated upstream and downstream bandwidths can be used in SD-WAN service rules to determine the best link to use when either Maximize Bandwidth or Best Quality strategies are selected.

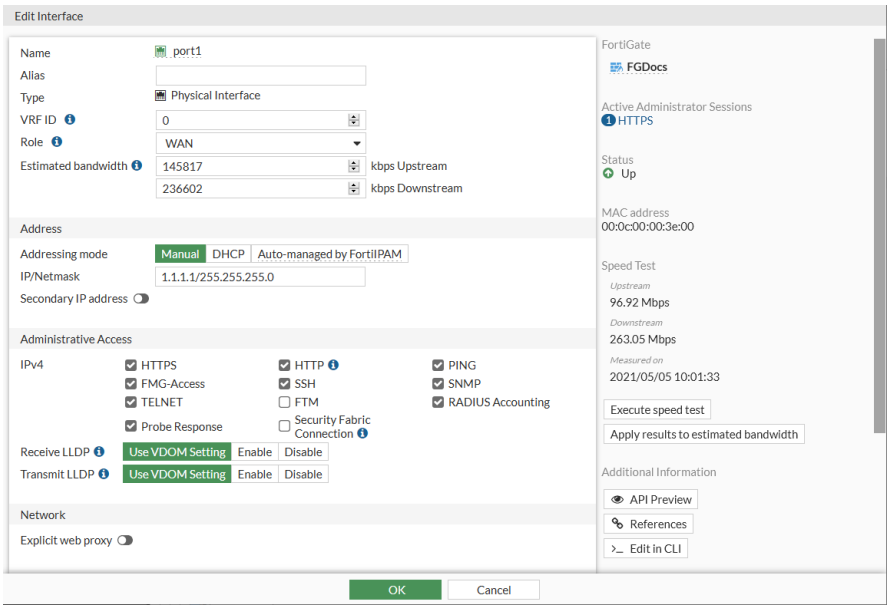
An SD-WAN Network Monitor license is required to use the speedtest. The *License* widget and the *System* > *FortiGuard* page show the license status.



To run an interface speedtest in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit a WAN interface. The interfaces can be grouped by role using the grouping dropdown on the right side of the toolbar.

3. Click *Execute speed test* in the right pane.



4. When the test completes, click *OK* in the *Confirm* pane to apply the results to the estimated bandwidth. The results can also be applied later by clicking *Apply results to estimated bandwidth*.

   The speedtest results are used to populate the *Estimated bandwidth* fields.
5. Click *OK*.

The FortiGate must be connected to FortiGuard, and able to reach either the AWS or Google speedtest servers.

Scheduled interface speedtest

The SD-WAN Network Monitor service supports running a speed test based on a schedule. The test results are automatically updated in the interface `measured-upstream-bandwidth` and `measured-downstream-bandwidth` fields. These fields do not impact the interface inbound bandwidth, outbound bandwidth, estimated upstream bandwidth, or estimated downstream bandwidth settings.

An SD-WAN Network Monitor license is required to use the speedtest. The *License* widget and the *System* > *FortiGuard* page show the license status.

When the scheduled speed tests run, it is possible to temporarily bypass the bandwidth limits set on the interface and configure custom maximum or minimum bandwidth limits. These configurations are optional.

```
config system speed-test-schedule
    edit <interface>
        set schedules <schedule> ...
        set update-inbandwidth enable {enable | disable}
        set update-outbandwidth enable {enable | disable}
        set update-inbandwidth-maximum <integer>
        set update-inbandwidth-minimum <integer>
        set update-outbandwidth-maximum <integer>
        set update-outbandwidth-minimum <integer>
```

```
    next
end
```

`update-inbandwidth enable {enable | disable}`	Enable/disable bypassing the interface's inbound bandwidth setting.
`update-outbandwidth enable {enable | disable}`	Enable/disable bypassing the interface's outbound bandwidth setting.
`update-inbandwidth-maximum <integer>`	Maximum downloading bandwidth to be used in a speed test, in Kbps (0 - 16776000).
`update-inbandwidth-minimum <integer>`	Minimum downloading bandwidth to be considered effective, in Kbps (0 - 16776000).
`update-outbandwidth-maximum <integer>`	Maximum uploading bandwidth to be used in a speed test, in Kbps (0 - 16776000).
`update-outbandwidth-minimum <integer>`	Minimum uploading bandwidth to be considered effective, in Kbps (0 - 16776000).

In the following example, a speed test is scheduled on port1 at 10:00 AM, and another one at 14:00 PM.

To run a speed test based on a schedule:

1. Configure the recurring schedules:

```
config firewall schedule recurring
    edit "10"
        set start 10:00
        set end 12:00
        set day monday tuesday wednesday thursday friday
    next
    edit "14"
        set start 14:00
        set end 16:00
        set day monday tuesday wednesday thursday friday
    next
end
```

2. Configure the speed test schedule:

```
config system speed-test-schedule
    edit "port1"
        set schedules "10" "14"
        set update-inbandwidth enable
        set update-outbandwidth enable
        set update-inbandwidth-maximum 60000
        set update-inbandwidth-minimum 10000
        set update-outbandwidth-maximum 50000
        set update-outbandwidth-minimum 10000
    next
end
```

3. View the speed test results:

```
config system interface
    edit port1
```

```
            get | grep measure
                measured-upstream-bandwidth: 23691
                measured-downstream-bandwidth: 48862
                bandwidth-measure-time:  Wed Jan 27 14:00:39 2021
        next
    end
```

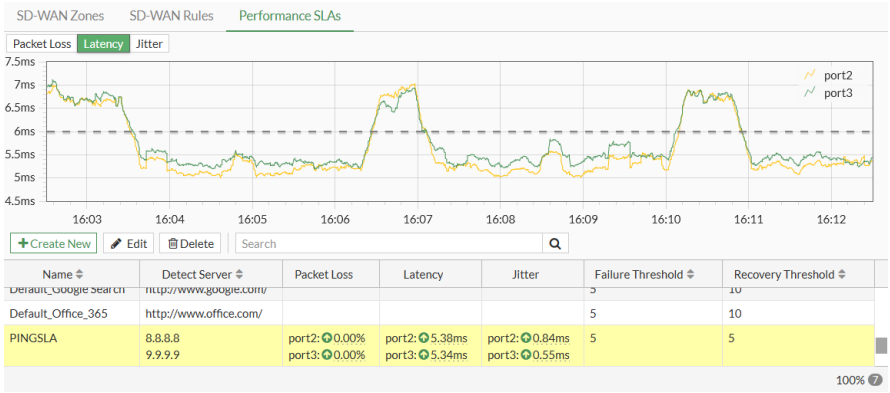
Monitor performance SLA

SD-WAN diagnostics can be used to help maintain your SD-WAN solution

Monitoring SD-WAN link quality status

Link quality plays a significant role in link selection for SD-WAN. Investigate any prolonged issues with packet loss, latency, or jitter to ensure that your network does not experience degraded performance or an outage.

You can monitor the link quality status of SD-WAN interface members by going to *Network* > *SD-WAN* and selecting the *Performance SLAs* tab.



The live charts show the packet loss, latency, or jitter for the selected health check. Hover the cursor over a line in the chart to see the specific value for that interface at that specific time.

The table shows information about each health check, including the configured servers, link quality data, and thresholds. The colored arrow indicates the status of the interface when the last status check was performed: green means that the interface was active, and red means that the interface was inactive. Hover the cursor over the arrow for additional information.

Monitoring system event logs

The features adds an SD-WAN daemon function to keep a short, 10 minute history of SLA that can be viewed in the CLI.

Performance SLA results related to interface selection, session failover, and other information, can be logged. These logs can then be used for long-term monitoring of traffic issues at remote sites, and for reports and views in FortiAnalyzer.

The time intervals that Performance SLA fail and pass logs are generated in can be configured.

To configure the fail and pass logs' generation time interval:

```
config system sdwan
    config health-check
        edit "PingSLA"
            set sla-fail-log-period 30
            set sla-pass-log-period 60
        next
    end
end
```

To view the 10 minute Performance SLA link status history:

```
FGDocs # diagnose sys sdwan sla-log PingSLA 1
Timestamp: Fri Sep  4 10:32:37 2020, vdom root, health-check PingSLA, interface: wan2,
status: up, latency: 4.455, jitter: 0.430, packet loss: 0.000%.
Timestamp: Fri Sep  4 10:32:37 2020, vdom root, health-check PingSLA, interface: wan2,
status: up, latency: 4.461, jitter: 0.436, packet loss: 0.000%.
Timestamp: Fri Sep  4 10:32:38 2020, vdom root, health-check PingSLA, interface: wan2,
status: up, latency: 4.488, jitter: 0.415, packet loss: 0.000%.
...
Timestamp: Fri Sep  4 10:42:36 2020, vdom root, health-check PingSLA, interface: wan2,
status: up, latency: 6.280, jitter: 0.302, packet loss: 0.000%.
Timestamp: Fri Sep  4 10:42:37 2020, vdom root, health-check PingSLA, interface: wan2,
status: up, latency: 6.261, jitter: 0.257, packet loss: 0.000%.
Timestamp: Fri Sep  4 10:42:37 2020, vdom root, health-check PingSLA, interface: wan2,
status: up, latency: 6.229, jitter: 0.245, packet loss: 0.000%.
```

SLA pass logs

The FortiGate generates Performance SLA logs at the specified pass log interval (`sla-pass-log-period`) when SLA passes.

```
date="2021-04-15" time="10:04:56" id=6951431609690095758 bid=52507 dvid=1047

In the FortiAnalyzer GUI:

SLA monitoring using the REST API

SLA log information and interface SLA information can be monitored using the REST API. This feature is also be used by FortiManager as part of its detailed SLA monitoring and drill-down features.

Interface log command example:

```
https://172.172.172.9/api/v2/monitor/virtual-wan/interface-log
{
  "http_method":"GET",
  "results":[
    {
      "interface":"port13",
      "logs":[
        {
          "timestamp":1547087168,
          "tx_bandwidth":3447,
          "rx_bandwidth":3457,
          "bi_bandwidth":6904,
          "tx_bytes":748875,
          "rx_bytes":708799,
          "egress_queue":[
          ]
        },
        {
          "timestamp":1547087178,
          "tx_bandwidth":3364,
          "rx_bandwidth":3400,
          "bi_bandwidth":6764,
          "tx_bytes":753789,
          "rx_bytes":712835,
          "egress_queue":[
          ]
        },
....
....
```

SLA log command example:

```
https://172.172.172.9/api/v2/monitor/virtual-wan/sla-log
{
  "http_method":"GET",

SD-WAN rules

The following topics provide instructions on configuring SD-WAN rules:

- Implicit rule on page 358
- Best quality strategy on page 362
- Lowest cost (SLA) strategy on page 365
- Maximize bandwidth (SLA) strategy on page 368
- Minimum number of links for a rule to take effect on page 371
- Use MAC addresses in SD-WAN rules and policy routes on page 372
- SD-WAN traffic shaping and QoS on page 373
- SDN dynamic connector addresses in SD-WAN rules on page 378
- Application steering using SD-WAN rules on page 380
- DSCP tag-based traffic steering in SD-WAN on page 392

Implicit rule

SD-WAN rules define specific policy routing options to route traffic to an SD-WAN member. When no explicit SD-WAN rules are defined, or if none of the rules are matched, then the default implicit rule is used.

In an SD-WAN configuration, the default route usually points to the SD-WAN interface, so each active member's gateway is added to the routing table's default route. FortiOS uses equal-cost multipath (ECMP) to balance traffic between the interfaces. One of five load balancing algorithms can be selected:

Source IP (`source-ip-based`)	Traffic is divided equally between the interfaces, including the SD-WAN interface. Sessions that start at the same source IP address use the same path. This is the default selection.
Sessions (`weight-based`)	The workload is distributing based on the number of sessions that are connected through the interface. The weight that you assign to each interface is used to calculate the percentage of the total sessions that are allowed to connect through an interface, and the sessions are distributed to the interfaces accordingly. Sessions with the same source and destination IP addresses (`src-ip` and `dst-ip`) are forwarded to the same path, but are still considered in later session ratio calculations. An interface's weight value cannot be zero.
Spillover (`usage-based`)	The interface is used until the traffic bandwidth exceeds the ingress and egress thresholds that you set for that interface. Additional traffic is then sent through the next SD-WAN interface member.
Source-Destination IP (`source-dest-ip-based`)	Traffic is divided equally between the interfaces. Sessions that start at the same source IP address and go to the same destination IP address use the same path.
Volume (`measured-volume-based`)	The workload is distributing based on the number of packets that are going through the interface.

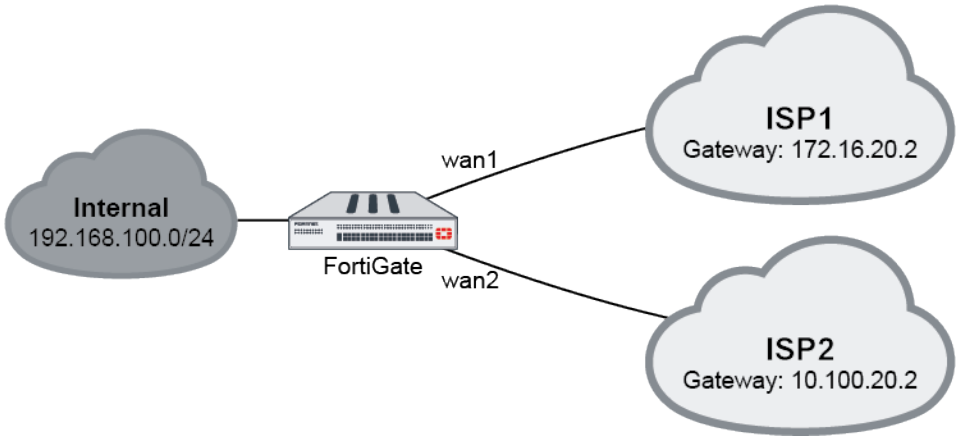
	The volume weight that you assign to each interface is used to calculate the percentage of the total bandwidth that is allowed to go through an interface, and the bandwidth is distributed to the interfaces accordingly. An interface's volume value cannot be zero.

You cannot exclude an interface from participating in load balancing using the implicit rule. If the weight or volume were set to zero in a previous FortiOS version, the value is treated as a one.

Interfaces with static routes can be excluded from ECMP if they are configured with a lower priority than other static routes.

Examples

The following four examples demonstrate how to use the implicit rules (load-balance mode).



If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

Example 1

Outgoing traffic is equally balanced between wan1 and wan2, using *source-ip-based* or *source-dest-ip-based* mode.

Using the GUI:

1. On the FortiGate, enable SD-WAN and add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 319 for details.
2. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab.
3. Edit the *sd-wan* rule (the last default rule).
4. For the *Load Balancing Algorithm*, select either *Source IP* or *Source-Destination IP*.
5. Click *OK*.

Using the CLI:

1. Enable SD-WAN and add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 319 for details.
2. Set the load balancing algorithm:
   Source IP based:

```
config system sdwan
    set load-balance-mode source-ip-based
end
```

   Source-Destination IP based:

```
config system sdwan
    set load-balance-mode source-dest-ip-based
end
```

Example 2

Outgoing traffic is balanced between wan1 and wan2 with a customized ratio, using *weight-based* mode: wan1 runs 80% of the sessions, and wan2 runs 20% of the sessions.

Sessions with the same source and destination IP addresses (`src-ip` and `dst-ip`) will be forwarded to the same path, but will still be considered in later session ratio calculations.

Using the GUI:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab.
2. Edit the *sd-wan* rule (the last default rule).
3. For the *Load Balancing Algorithm*, select *Sessions*.
4. Enter 80 in the *wan1* field, and 20 in the *wan2* field.
5. Click *OK*.

Using the CLI:

```
config system sdwan
    set load-balance-mode weight-based
    config members
        edit 1
            set interface "wan1"
            set weight 80
        next
        edit 2
            set interface "wan2"
            set weight 20
        next
    end
end
```

Example 3

Outgoing traffic is balanced between wan1 and wan2 with a customized ratio, using *measured-volume-based* mode: wan1 runs 80% of the volume, and wan2 runs 20% of the volume.

Using the GUI:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab.
2. Edit the *sd-wan* rule (the last default rule).
3. For the *Load Balancing Algorithm*, select *Volume*.
4. Enter 80 in the *wan1* field, and 20 in the *wan2* field.
5. Click *OK*.

Using the CLI:

```
config system sdwan
    set load-balance-mode measured-volume-based
    config members
        edit 1
            set interface "wan1"
            set volume-ratio 80
        next
        edit 2
            set interface "wan2"
            set volume-ratio 20
        next
    end
end
```

Example 4

Load balancing can be used to reduce costs when internet connections are charged at different rates. For example, if wan2 charges based on volume usage and wan1 charges a fixed monthly fee, we can use wan1 at its maximum bandwidth, and use wan2 for overflow.

In this example, wan1's bandwidth is 10Mbps down and 2Mbps up. Traffic will use wan1 until it reaches its spillover limit, then it will start to use wan2. Note that `auto-asic-offload` must be disabled in the firewall policy.

Using the GUI:

1. On the FortiGate, enable SD-WAN and add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 319 for details.
2. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab.
3. Edit the *sd-wan* rule (the last default rule).
4. For the *Load Balancing Algorithm*, select *Spillover*.
5. Enter 10000 in the *wan1 Ingress Spillover Threshold* field, and 2000 in the *wan1 Egress Spillover Threshold* field.
6. Click *OK*.

Using the CLI:

```
config system sdwan
    set load-balance-mode usage-based
    config members
        edit 1
            set interface "wan1"
            set spillover-threshold 2000
            set ingress-spillover-threshold 10000
```

```
        next
    end
end
```

Best quality strategy

SD-WAN rules are used to control how sessions are distributed to SD-WAN members. Rules can be configured in one of five modes:

- `auto`: Interfaces are assigned a priority based on quality.
- Manual (`manual`): Interfaces are manually assigned a priority.
- Best Quality (`priority`): Interface are assigned a priority based on the link-cost-factor of the interface.
- Lowest Cost (SLA) (`sla`): Interfaces are assigned a priority based on selected SLA settings. See Lowest cost (SLA) strategy on page 365.
- Maximize Bandwith (SLA) (`load-balance`): Traffic is distributed among all available links based on the selected load balancing algorithm. See Maximize bandwidth (SLA) strategy on page 368.

When using *Best Quality* mode, SD-WAN will choose the best link to forward traffic by comparing the *link-cost-factor*, selected from one of the following:

GUI	CLI	Description
Latency	`latency`	Select a link based on latency.
Jitter	`jitter`	Select a link based on jitter.
Packet Loss	`packet-loss`	Select a link based on packet loss.
Downstream	`inbandwidth`	Select a link based on available bandwidth of incoming traffic.
Upstream	`outbandwidth`	Select a link based on available bandwidth of outgoing traffic.
Bandwidth	`bibandwidth`	Select a link based on available bandwidth of bidirectional traffic.
Customized profile	`custom-profile-1`	Select link based on customized profile. If selected, set the following weights: • packet-loss-weight: Coefficient of packet-loss. • latency-weight: Coefficient of latency. • jitter-weight: Coefficient of jitter. • bandwidth-weight: Coefficient of reciprocal of available bidirectional bandwidth.

If the *Downstream* (`inbandwidth`), *Upstream* (`outbandwidth`), or *Bandwidth* (`bibandwidth`) quality criteria is used, the FortiGate will compare the bandwidth based on the configured upstream and downstream bandwidth values.

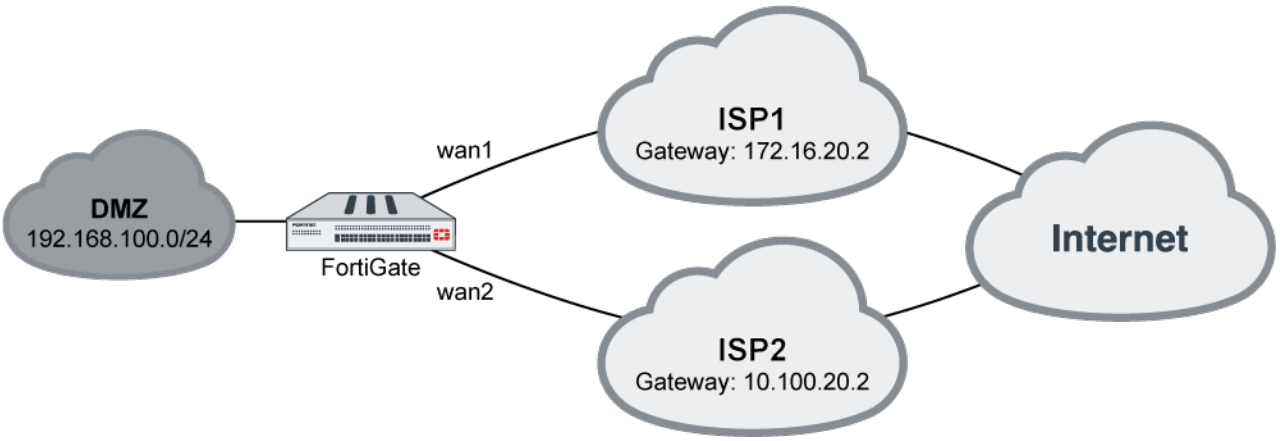
The interface speedtest can be used to populate the bandwidth values based on the speedtest results. See Manual interface speedtest on page 348 for details.

To manually configure the upstream and downstream bandwidth values:

```
config system interface
    edit <interface>
        set estimated-upstream-bandwidth <speed in kbps>
        set estimated-downstream-bandwidth <speed in kbps>
```

```
    next
end
```

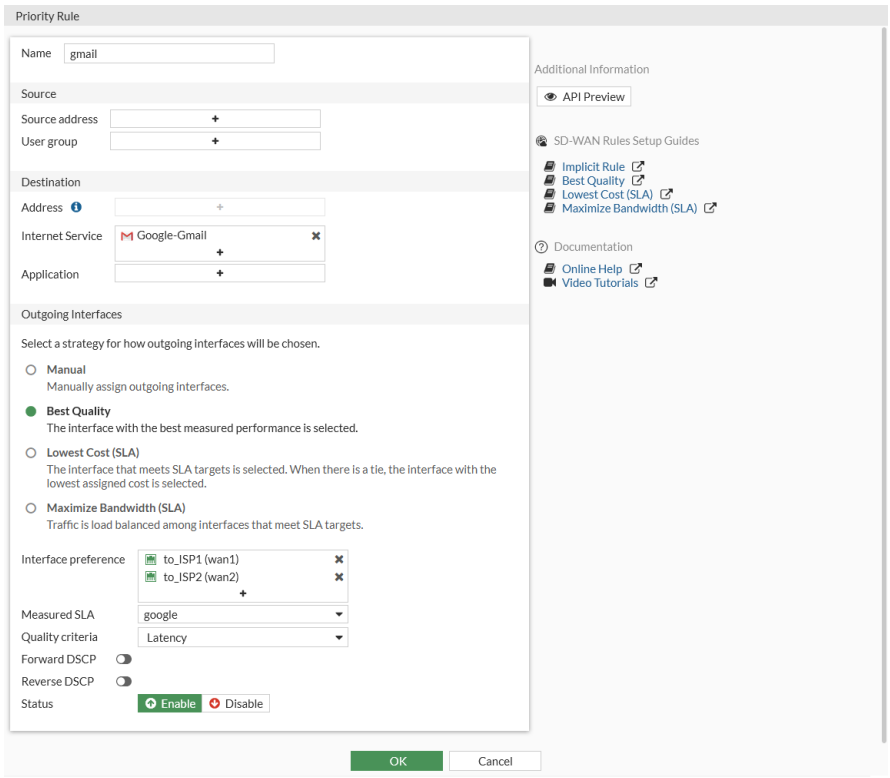
Example



In this example, your wan1 and wan2 SD-WAN interfaces connect to two ISPs that both go to the public internet, and you want Gmail services to use the link with the least latency.

To configure an SD-WAN rule to use Best Quality:

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 319 for details.
2. Create a new Performance SLA named *google*. See Link monitoring example on page 342.
3. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
4. Enter a name for the rule, such as *gmail*.
5. Configure the following settings:



Internet Service	Google-Gmail
Strategy	Best Quality
Interface preference	wan1 and wan2
Measured SLA	google (created in step 2).
Quality criteria	Latency

6. Click *OK* to create the rule.

To configure an SD-WAN rule to use priority:

```
config system sdwan
    config health-check
        edit "google"
            set server "google.com"
            set members 1 2
        next
    end
    config service
        edit 1
            set name "gmail"
            set mode priority
            set internet-service enable
            set internet-service-id 65646
            set health-check "google"
            set link-cost-factor latency
```

```
            set priority-members 1 2
        next
    end
end
```

To diagnose the Performance SLA status:

```
FGT # diagnose sys sdwan health-check google
Health Check(google):
Seq(1): state(alive), packet-loss(0.000%) latency(14.563), jitter(4.334) sla_map=0x0
Seq(2): state(alive), packet-loss(0.000%) latency(12.633), jitter(6.265) sla_map=0x0

FGT # diagnose sys sdwan service 1
Service(1):

    TOS(0x0/0x0), protocol(0: 1->65535), Mode(priority), link-cost-facotr(latency), link-
cost-threshold(10), health-check(google) Members:

        1: Seq_num(2), alive, latency: 12.633, selected
        2: Seq_num(1), alive, latency: 14.563, selected

    Internet Service: Google-Gmail(65646)
```

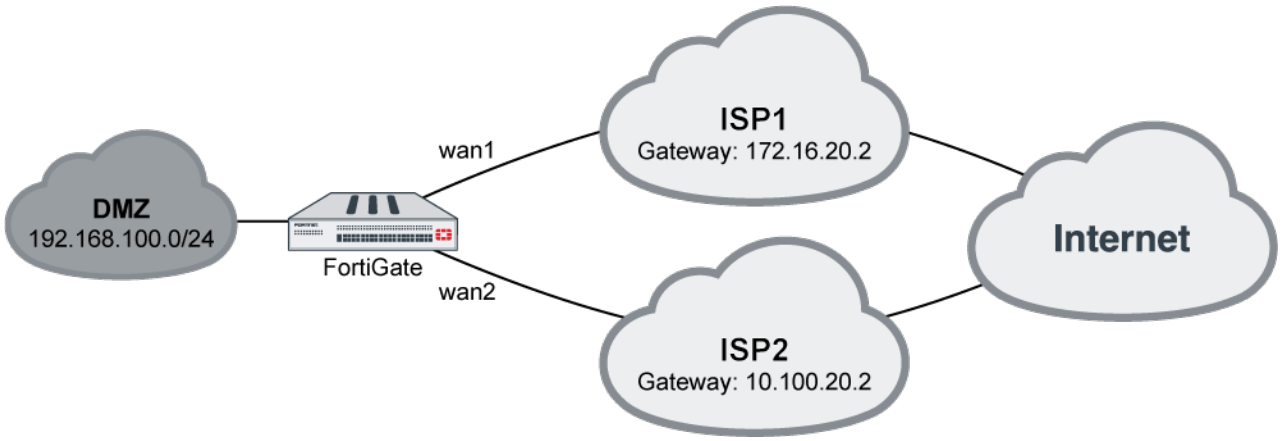
As wan2 has a smaller latency, SD-WAN will put Seq_num(2) on top of Seq_num(1) and wan2 will be used to forward Gmail traffic.

Lowest cost (SLA) strategy

SD-WAN rules are used to control how sessions are distributed to SD-WAN members. Rules can be configured in one of five modes:

- `auto`: Interfaces are assigned a priority based on quality.
- Manual (`manual`): Interfaces are manually assigned a priority.
- Best Quality (`priority`): Interface are assigned a priority based on the link-cost-factor of the interface. See Best quality strategy on page 362.
- Lowest Cost (SLA) (`sla`): Interfaces are assigned a priority based on selected SLA settings.
- Maximize Bandwidth (SLA) (`load-balance`): Traffic is distributed among all available links based on the selected load balancing algorithm. See Maximize bandwidth (SLA) strategy on page 368.

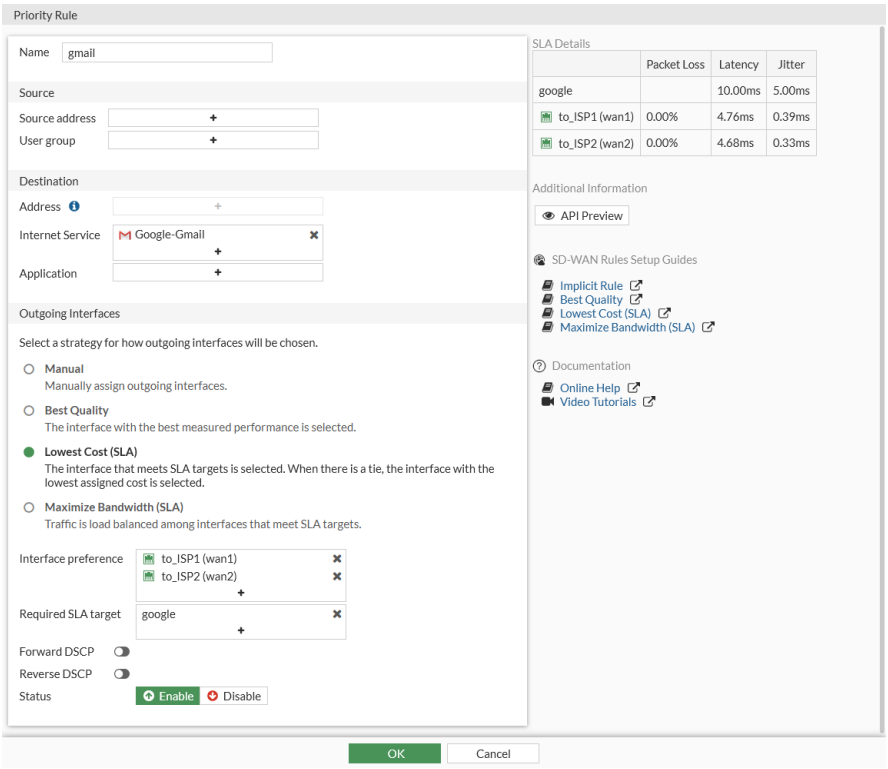
When using *Lowest Cost (SLA)* mode (`sla` in the CLI), SD-WAN will choose the lowest cost link that satisfies SLA to forward traffic. The lowest possible cost is `0`. If multiple eligible links have the same cost, the *Interface preference* order will be used to select a link.



In this example, your wan1 and wan2 SD-WAN interfaces connect to two ISPs that both go to the public internet. The cost of wan2 is less than that of wan1. You want to configure Gmail services to use the lowest cost interface, but the link quality must meet a standard of latency: 10ms, and jitter: 5ms.

To configure an SD-WAN rule to use Lowest Cost (SLA):

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 319 for details.
2. Create a new Performance SLA named *google* that includes an SLA Target with *Latency threshold* = 10ms and *Jitter threshold* = 5ms. See Link monitoring example on page 342.
3. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
4. Enter a name for the rule, such as *gmail*.
5. Configure the following settings:



Internet Service	Google-Gmail
Strategy	Lowest Cost (SLA)
Interface preference	wan1 and wan2
Required SLA target	google (created in step 2).

6. Click *OK* to create the rule.

To configure an SD-WAN rule to use SLA:

```
config system sdwan
    config members
        edit 1
            set interface "wan1"
            set cost 10
        next
        edit 2
            set interface "wan2"
            set cost 5
        next
    end
    config health-check
        edit "google"
            set server "google.com"
            set members 1 2
            config sla
                edit 1
                    set latency-threshold 10
                    set jitter-threshold 5
                next
            end
        next
    end
    config service
        edit 1
            set name "gmail"
            set mode sla
            set internet-service enable
            set internet-service-id 65646
            config sla
                edit "google"
                    set id 1
                next
            end
            set priority-members 1 2
        next
    end
end
```

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

To diagnose the Performance SLA status:

```
FGT # diagnose sys sdwan health-check google
Health Check(google):
Seq(1): state(alive), packet-loss(0.000%) latency(14.563), jitter(4.334) sla_map=0x0
Seq(2): state(alive), packet-loss(0.000%) latency(12.633), jitter(6.265) sla_map=0x0

FGT # diagnose sys sdwan service 1
Service(1): Address Mode(IPV4) flags=0x0

    TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla)
    Members:<<BR>>

        1: Seq_num(2), alive, sla(0x1), cfg_order(1), selected
        2: Seq_num(1), alive, sla(0x1), cfg_order(0), selected

    Internet Service: Google.Gmail(65646)
```

When both wan1 and wan2 meet the SLA requirements, Gmail traffic will only use wan2. If only wan1 meets the SLA requirements, Gmail traffic will only use wan1, even though it has a higher cost. If neither interface meets the requirements, wan2 will be used.

If both interface had the same cost and both met the SLA requirements, the first link configured in `set priority-members` would be used.

Maximize bandwidth (SLA) strategy

SD-WAN rules are used to control how sessions are distributed to SD-WAN members. Rules can be configured in one of five modes:

- `auto`: Interfaces are assigned a priority based on quality.
- Manual (`manual`): Interfaces are manually assigned a priority.
- Best Quality (`priority`): Interface are assigned a priority based on the link-cost-factor of the interface. See Best quality strategy on page 362.
- Lowest Cost (SLA) (`sla`): Interfaces are assigned a priority based on selected SLA settings. See Lowest cost (SLA) strategy on page 365.
- Maximize Bandwidth (SLA) (`load-balance`): Traffic is distributed among all available links based on the selected load balancing algorithm.

When using *Maximize Bandwidth* mode (`load-balance` in the CLI), SD-WAN will choose all of the links that satisfies SLA to forward traffic based on a load balancing algorithm. The load balancing algorithm, or hash method, can be one of the following:

round-robin	All traffic are distributed to selected interfaces in equal portions and circular order. This is the default method, and the only option available when using the GUI.
source-ip-based	All traffic from a source IP is sent to the same interface.
source-dest-ip-based	All traffic from a source IP to a destination IP is sent to the same interface.
inbandwidth	All traffic are distributed to a selected interface with most available bandwidth for incoming traffic.

outbandwidth	All traffic are distributed to a selected interface with most available bandwidth for outgoing traffic.
bibandwidth	All traffic are distributed to a selected interface with most available bandwidth for both incoming and outgoing traffic.

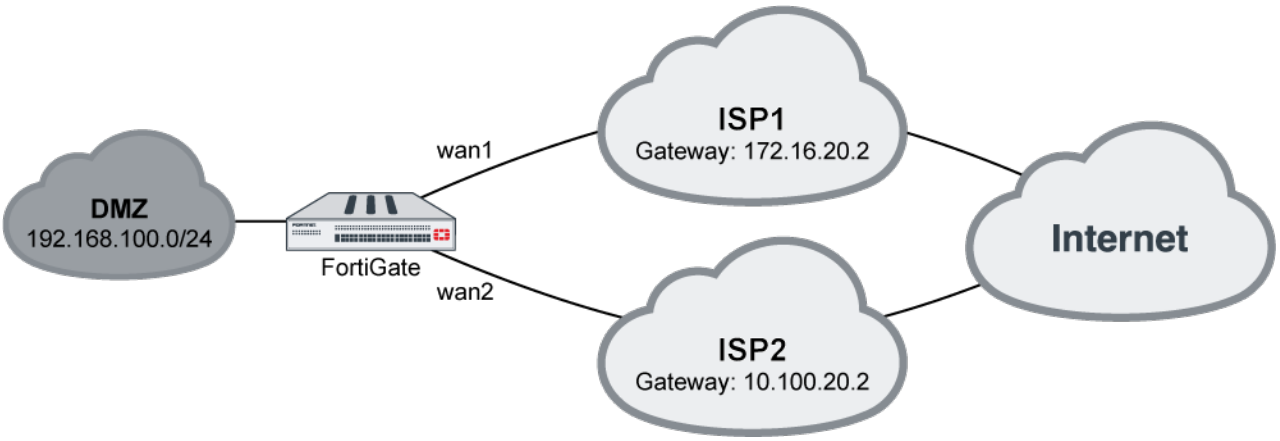
When the `inbandwidth`, `outbandwidth`), or `bibandwidth` load balancing algorithm is used, the FortiGate will compare the bandwidth based on the configured upstream and downstream bandwidth values.

The interface speedtest can be used to populate the bandwidth values based on the speedtest results. See Manual interface speedtest on page 348 for details.

To manually configure the upstream and downstream bandwidth values:

```
config system interface
    edit <interface>
        set estimated-upstream-bandwidth <speed in kbps>
        set estimated-downstream-bandwidth <speed in kbps>
    next
end
```

ADVPN is not supported in this mode.

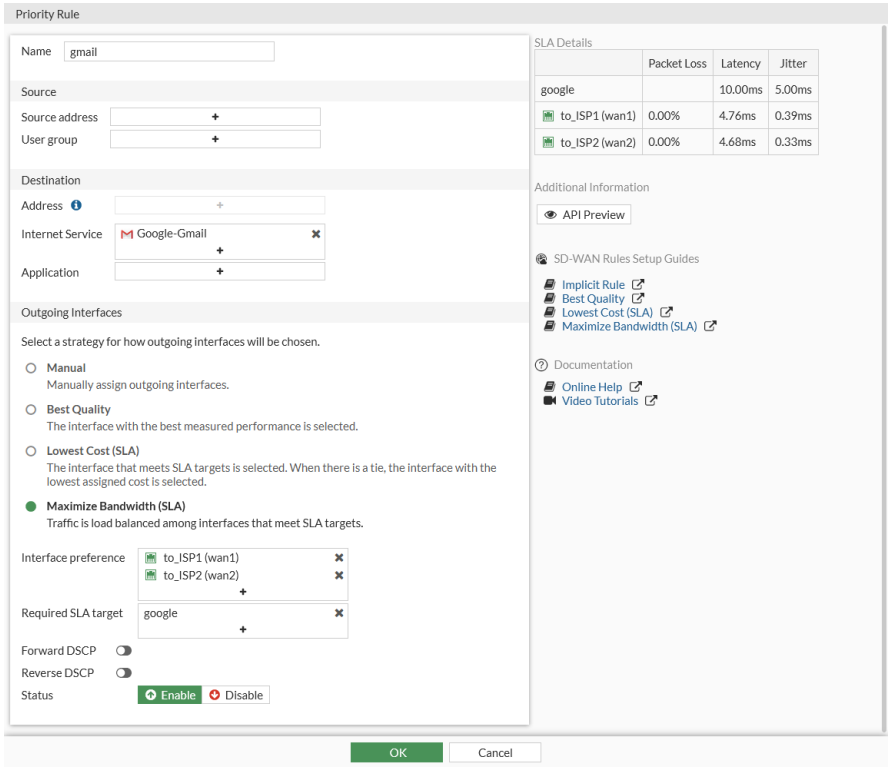


In this example, your wan1 and wan2 SD-WAN interfaces connect to two ISPs that both go to the public internet. You want to configure Gmail services to use both of the interface, but the link quality must meet a standard of latency: 10ms, and jitter: 5ms. This can maximize the bandwidth usage.

To configure an SD-WAN rule to use Maximize Bandwidth (SLA):

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 319 for details.
2. Create a new Performance SLA named *google* that includes an SLA Target 1 with *Latency threshold* = 10ms and *Jitter threshold* = 5ms. See Link monitoring example on page 342.
3. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
4. Enter a name for the rule, such as *gmail*.

5. Configure the following settings:



Field	Setting
Internet Service	Google-Gmail
Strategy	Maximize Bandwidth (SLA)
Interface preference	wan1 and wan2
Required SLA target	google (created in step 2).

6. Click *OK* to create the rule.

To configure an SD-WAN rule to use SLA:

```
config system sdwan
    config health-check
        edit "google"
            set server "google.com"
            set members 1 2
            config sla
                edit 1
                    set latency-threshold 10
                    set jitter-threshold 5
                next
            end
        next
    end
    config service
        edit 1
```

```
            set name "gmail"
            set addr-mode ipv4
            set mode load-balance
            set hash-mode round-robin
            set internet-service enable
            set internet-service-name Google-Gmail
            config sla
                edit "google"
                    set id 1
                next
            end
            set priority-members 1 2
        next
    end
end
```

To diagnose the performance SLA status:

```
FGT # diagnose sys sdwan health-check google
Health Check(google):
Seq(1): state(alive), packet-loss(0.000%) latency(14.563), jitter(4.334) sla_map=0x0
Seq(2): state(alive), packet-loss(0.000%) latency(12.633), jitter(6.265) sla_map=0x0

FGT # diagnose sys sdwan service 1
Service(1): Address Mode(IPV4) flags=0x0

    TOS(0x0/0x0), Protocol(0: 1->65535), Mode(load-balance)
    Members:<<BR>>

        1: Seq_num(1), alive, sla(0x1), num of pass(1), selected
        2: Seq_num(2), alive, sla(0x1), num of pass(1), selected

    Internet Service: Google.Gmail(65646)
```

When both wan1 and wan2 meet the SLA requirements, Gmail traffic will use both wan1 and wan2. If only one of the interfaces meets the SLA requirements, Gmail traffic will only use that interface.

If neither interface meets the requirements but health-check is still alive, then wan1 and wan2 tie. The traffic will try to balance between wan1 and wan2, using both interfaces to forward traffic.

Minimum number of links for a rule to take effect

In `sla` and `load-balance` modes, you can specify the number of links that must be up for the rule to take effect.

Example

In this example, ports 1 to 4 each have 10Mbps of bandwidth, and port 5 has 50Mbps. An application requires 35Mbps of bandwidth, so the SD-WAN rule balances the traffic between ports 1 to 4. If one of the links goes down, all of the traffic must be passed to port 5, so the minimum required number of links is 4.

To set the minimum number of links in a rule:

```
config system sdwan
    config service
        edit 1
            set mode load-balance
            set minimum-sla-meet-members 4
            set dst <destination>
            config sla
                edit <sla>
                    set id <id>
                next
            end
            set priority-members 1 2 3 4
        next
    end
end
```

Use MAC addresses in SD-WAN rules and policy routes

You can use MAC addresses as the source in SD-WAN rules and policy routes.

The FABRIC_DEVICE address object (a dynamic object that includes the IPs of Security Fabric devices) can be used as a source or destination in SD-WAN rules and policy routes.

The `diagnose ip proute match` command accepts either the IP or MAC address format for the source:

```
diagnose ip proute match <destination> <source> <interface> <protocol> <port>
```

To configure a MAC address as a source for SD-WAN and a policy route:

1. Configure the MAC address:

```
config firewall address
    edit "mac-add"
        set type mac
        set macaddr 70:4c:a5:86:de:56
    next
end
```

2. Configure the policy route:

```
config router policy
    edit 3
        set srcaddr "mac-add"
        set gateway 15.1.1.34
        set output-device ha
    next
end
```

3. Configure the SD-WAN rule:

```
config system sdwan
    config service
        edit 1
            set dst "all"
            set src "mac-add"
```

```
            set priority-members 1
        next
        edit 2
            set dst "FABRIC_DEVICE"
            set priority-members 2
        next
    end
end
```

To verify the policy route matching for a MAC address:

```
# diagnose ip proute match 3.1.1.34 70:4c:a5:86:de:56 port3 22 6
dst=3.1.1.34 src=0.0.0.0 smac=70:4c:a5:86:de:56 iif=11 protocol=22 dport=6
id=00000003 type=Policy Route
seq-num=3
```

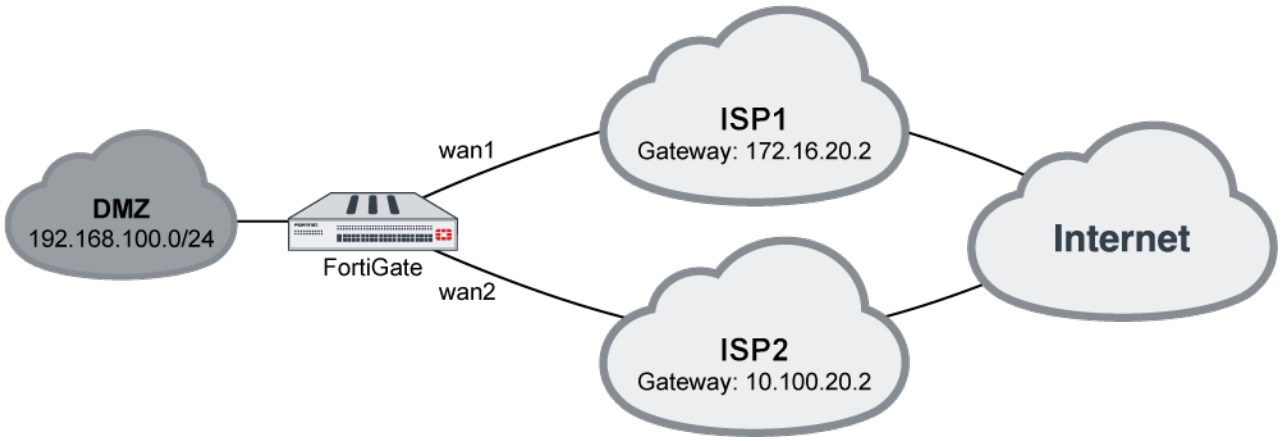
SD-WAN traffic shaping and QoS

Use a traffic shaper in a firewall shaping policy to control traffic flow. You can use it to control maximum and guaranteed bandwidth, or put certain traffic to one of the three different traffic priorities: high, medium, or low.

An advanced shaping policy can classify traffic into 30 groups. Use a shaping profile to define the percentage of the interface bandwidth that is allocated to each group. Each group of traffic is shaped to the assigned speed limit based on the outgoing bandwidth limit configured on the interface.

For more information, see Traffic shaping on page 643.

Sample topology



Sample configuration

This example shows a typical customer usage where the customer's SD-WAN uses the default zone, and has two member: wan1 and wan2, each set to 10Mb/s.

An overview of the procedures to configure SD-WAN traffic shaping and QoS with SD-WAN includes:

1. Give HTTP/HTTPS traffic high priority and give FTP low priority so that if there are conflicts, FortiGate will forward HTTP/HTTPS traffic first.

2. Even though FTP has low priority, configure FortiGate to give it a 1Mb/s guaranteed bandwidth on each SD-WAN member so that if there is no FTP traffic, other traffic can use all the bandwidth. If there is heavy FTP traffic, it can still be guaranteed a 1Mb/s bandwidth.
3. Traffic going to specific destinations such as a VOIP server uses wan1 to forward, and SD-WAN forwards with an Expedited Forwarding (EF) DSCP tag 101110.

To configure SD-WAN traffic shaping and QoS with SD-WAN in the GUI:

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route.
   See SD-WAN quick start on page 319.
2. Add a firewall policy with *Application Control* enabled. See Configuring firewall policies for SD-WAN on page 322.
3. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shapers* tab, and edit *low-priority*.
   a. Enable *Guaranteed Bandwidth* and set it to *1000* kbps.
4. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
   a. Name the traffic shaping policy, for example, *HTTP-HTTPS*.
   b. Set the following:

Source	*all*
Destination	*all*
Service	*HTTP* and *HTTPS*
Outgoing interface	*virtual-wan-link*
Shared Shaper	Enable and set to *high-priority*
Reverse Shaper	Enable and set to *high-priority*

   c. Click *OK*.
5. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
   a. Name the traffic shaping policy, for example, *FTP*.
   b. Set the following:

Source	*all*
Destination	*all*
Service	*FTP*, *FTP_GET*, and *FTP_PUT*
Outgoing interface	*virtual-wan-link*
Shared Shaper	Enable and set to *low-priority*
Reverse Shaper	Enable and set to *low-priority*

   c. Click *OK*
6. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
   a. Enter a name for the rule, such as *Internet*.
   b. In the *Destination* section, click *Address* and select the VoIP server that you created in the firewall address.
   c. Under *Outgoing Interfaces* select *Manual*.
   d. For *Interface preference* select *wan1*.
   e. Click *OK*.
7. Use CLI commands to modify DSCP settings. See the DSCP CLI commands below.

To configure the firewall policy using the CLI:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf "virtual-wan-link"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set application-list "default"
        set nat enable
    next
end
```

To configure the firewall traffic shaper priority using the CLI:

```
config firewall shaper traffic-shaper
    edit "high-priority"
        set maximum-bandwidth 1048576
        set per-policy enable
    next
    edit "low-priority"
        set guaranteed-bandwidth 1000
        set maximum-bandwidth 1048576
        set priority low
        set per-policy enable
    next
end
```

To configure the firewall traffic shaping policy using the CLI:

```
config firewall shaping-policy
    edit 1
        set name "http-https"
        set service "HTTP" "HTTPS"
        set dstintf "virtual-wan-link"
        set traffic-shaper "high-priority"
        set traffic-shaper-reverse "high-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 2
        set name "FTP"
        set service "FTP" "FTP_GET" "FTP_PUT"
        set dstintf "virtual-wan-link"
        set traffic-shaper "low-priority"
        set traffic-shaper-reverse "low-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

To configure SD-WAN traffic shaping and QoS with SD-WAN in the CLI:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "wan1"
            set gateway 172.16.20.2
        next
        edit 2
            set interface "wan2"
            set gateway 10.100.20.2
        next
    end
    config service
        edit 1
            set name "SIP"
            set priority-members 1
            set dst "voip-server"
            set dscp-forward enable
            set dscp-forward-tag 101110
        next
    end
end
```

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

To use the diagnose command to check if specific traffic is attached to the correct traffic shaper:

```
# diagnose firewall iprope list 100015

policy index=1 uuid_idx=0 action=accept
flag (0):
shapers: orig=high-priority(2/0/134217728) reply=high-priority(2/0/134217728)
cos_fwd=0  cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=0 chk_client_info=0x0 app_list=0 ips_view=0

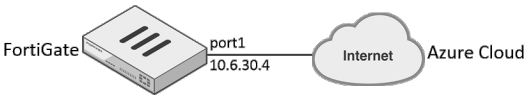
SDN dynamic connector addresses in SD-WAN rules

SDN dynamic connector addresses can be used in SD-WAN rules. FortiGate supports both public (AWS, Azure, GCP, OCI, AliCloud) and private (Kubernetes, VMware ESXi and NSX, OpenStack, ACI, Nuage) SDN connectors.

The configuration procedure for all of the supported SDN connector types is the same. This example uses an Azure public SDN connector.



There are four steps to create and use an SDN connector address in an SD-WAN rule:

1. Configure the FortiGate IP address and network gateway so that it can reach the Internet.
2. Create an Azure SDN connector.
3. Create a firewall address to associate with the configured SDN connector.
4. Use the firewall address in an SD-WAN service rule.

To create an Azure SDN connector:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. In the *Public SDN* section, click *Microsoft Azure*.

4. Enter the following:

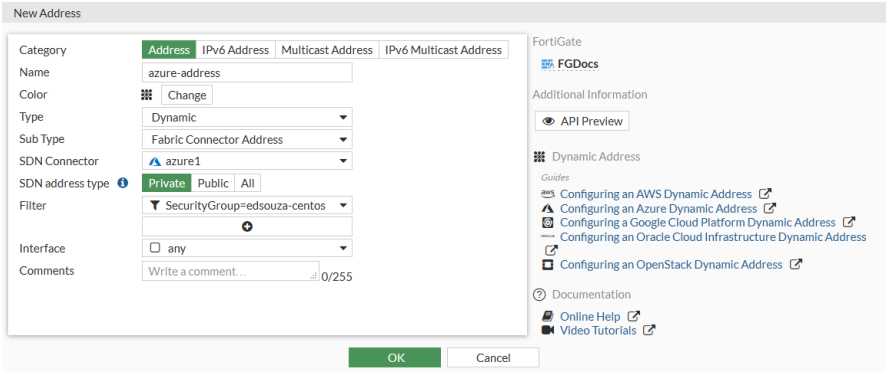
Name	azure1
Status	Enabled
Update Interval	Use Default
Server region	Global
Directory ID	942b80cd-1b14-42a1-8dcf-4b21dece61ba
Application ID	14dbd5c5-307e-4ea4-8133-68738141feb1
Client secret	xxxxxx
Resource path	disabled

5. Click *OK*.

To create a firewall address to associate with the configured SDN connector:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Enter the following:

Category	Address
Name	azure-address
Type	Dynamic
Sub Type	Fabric Connector Address
SDN Connector	azure1
SDN address type	Private
Filter	SecurityGroup=edsouza-centos
Interface	Any



4. Click *OK*.

To use the firewall address in an SD-WAN service rule:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Set the *Name* to *Azure1*.
3. For the *Destination Address* select *azure-address*.
4. Configure the remaining settings as needed. See SD-WAN rules on page 358 for details.
5. Click *OK*.

Diagnostics

Use the following CLI commands to check the status of and troubleshoot the connector.

To see the status of the SDN connector:

```
# diagnose sys sdn status
SDN Connector          Type        Status          Updating        Last update
-------------------------------------------------------------------------------
azure1                 azure       connected       no              n/a
```

To debug the SDN connector to resolve the firewall address:

```
# diagnose debug application azd -1
    Debug messages will be on for 30 minutes.

    ...
    azd sdn connector azure1 start updating IP addresses
    azd checking firewall address object azure-address-1, vd 0
     IP address change, new list:
      10.18.0.4
      10.18.0.12
      ...
      ...
# diagnose sys sdwan service

    Service(2): Address Mode(IPV4) flags=0x0
      TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
      Service role: standalone
      Member sub interface:
      Members:
        1: Seq_num(1), alive, selected
      Dst address:
            10.18.0.4 - 10.18.0.4
            10.18.0.12 - 10.18.0.12
             ... ...
             ... ...
             ... ...
```

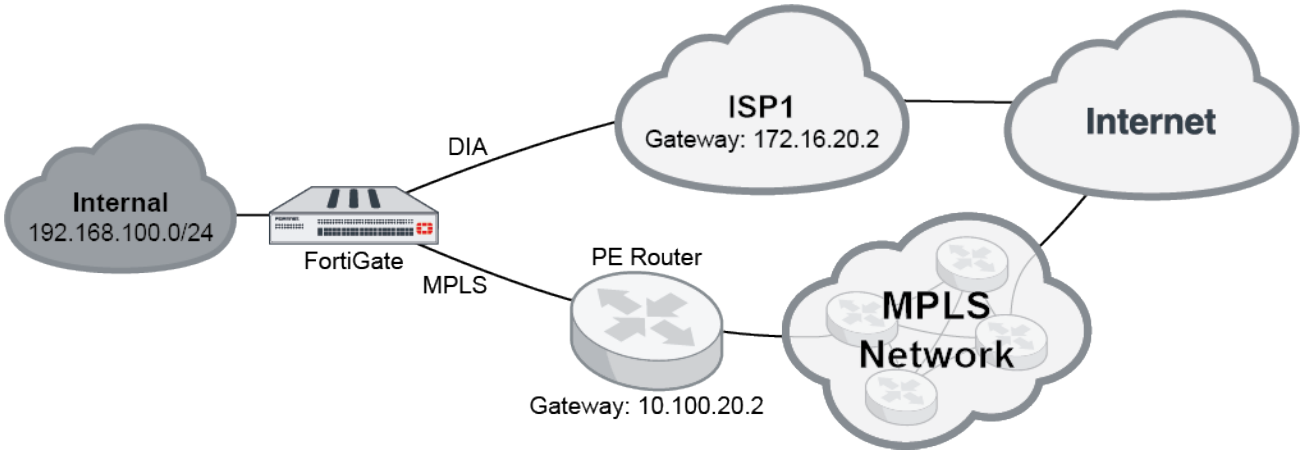
Application steering using SD-WAN rules

This topic covers how to use application steering in a topology with multiple WAN links. The following examples illustrate how to use different strategies to perform application steering to accommodate different business needs:

- Static application steering with a manual strategy on page 381
- Dynamic application steering with lowest cost and best quality strategies on page 383

Static application steering with a manual strategy

This example covers a typical usage scenario where the SD-WAN has two members: MPLS and DIA. DIA is primarily used for direct internet access to internet applications, such as Office365, Google applications, Amazon, and Dropbox. MPLS is primarily used for SIP, and works as a backup when DIA is not working.



This example configures all SIP traffic to use MPLS while all other traffic uses DIA. If DIA is not working, the traffic will use MPLS.

To configure an SD-WAN rule to use SIP and DIA in the GUI:

1. Add port1 (DIA) and port2 (MPLS) as SD-WAN members, and configure a static route. See Configuring the SD-WAN interface on page 320 for details.
2. Create a firewall policy with an *Application Control* profile configured. See Configuring firewall policies for SD-WAN on page 322 for details.
3. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
4. Enter a name for the rule, such as *SIP*.
5. Click the *Application* field and select the applicable SIP applications from the *Select Entries* panel.
6. Under *Outgoing Interfaces*, select *Manual*.
7. For *Interface preference*, select *MPLS*.
8. Click *OK*.
9. Click *Create New* to create another rule.
10. Enter a name for the rule, such as *Internet*.
11. Click the *Address* field and select *all* from the panel.
12. Under *Outgoing Interfaces*, select *Manual*.
13. For *Interface preference*, select *DIA*.
14. Click *OK*.

To configure the firewall policy using the CLI:

```
config firewall policy
    edit 1
```

```
        set name "1"
        set srcintf "dmz"
        set dstintf "virtual-wan-link"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set fsso disable
        set application-list "default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

To configure an SD-WAN rule to use SIP and DIA using the CLI:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "MPLS"
        next
        edit 2
            set interface "DIA"
        next
    end
    config service
        edit 1
            set name "SIP"
            set internet-service enable
            set internet-service-app-ctrl 34640 152305677 38938 26180 26179 30251
            set priority-members 2
        next
        edit 2
            set name "Internet"
            set dst "all"
            set priority-members 1
        next
    end
end
```

All SIP traffic uses MPLS. All other traffic goes to DIA. If DIA is broken, the traffic uses MPLS. If you use VPN instead of MPLS to run SIP traffic, you must configure a VPN interface, for example vpn1, and then replace member 1 from MPLS to vpn1 for SD-WAN member.

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

To use the diagnose command to check performance SLA status using the CLI:

```
# diagnose sys sdwan service 1

Service(1): Address Mode(IPV4) flags=0x0

TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
Members:<<BR>>

1: Seq_num(1), alive, selected

Internet Service: SIP(4294836224 34640) SIP.Method(4294836225 152305677) SIP.Via.NAT
(4294836226 38938) SIP_Media.Type.Application(4294836227 26180) SIP_Message(4294836228
26179) SIP_Voice(4294836229 30251)
```

```
# diagnose sys sdwan service 2

Service(2): Address Mode(IPV4) flags=0x0

TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
Members:<<BR>>

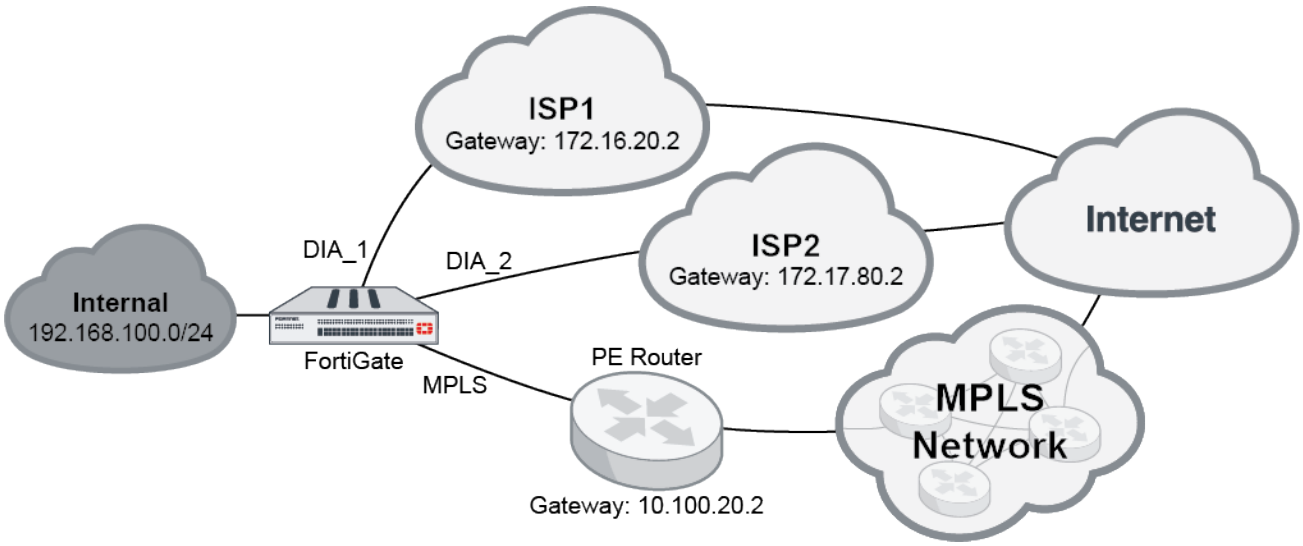
1: Seq_num(2), alive, selected

Dst address: 0.0.0.0-255.255.255.255
```

```
# diagnose sys sdwan internet-service-app-ctrl-list
Ctrl application(SIP 34640):Internet Service ID(4294836224)
Ctrl application(SIP.Method 152305677):Internet Service ID(4294836225)
Ctrl application(SIP.Via.NAT 38938):Internet Service ID(4294836226)
Ctrl application(SIP_Media.Type.Application 26180):Internet Service ID(4294836227)
Ctrl application(SIP_Message 26179):Internet Service ID(4294836228)
Ctrl application(SIP_Voice 30251):Internet Service ID(4294836229)
```

Dynamic application steering with lowest cost and best quality strategies

In this example, the SD-WAN has three members: two ISPs (DIA_1 and DIA_2) that are used for access to internet applications, and an MPLS link that is used exclusively as a backup for business critical applications.



Business applications, such as Office365, Google, Dropbox, and SIP, use the *Lowest Cost (SLA)* strategy to provide application steering, and traffic falls back to MPLS only if both ISP1 and ISP2 are down. Non-business applications, such as Facebook and Youtube, use the *Best Quality* strategy to choose between the ISPs.

To configure the SD-WAN members, static route, and firewall policy in the GUI:

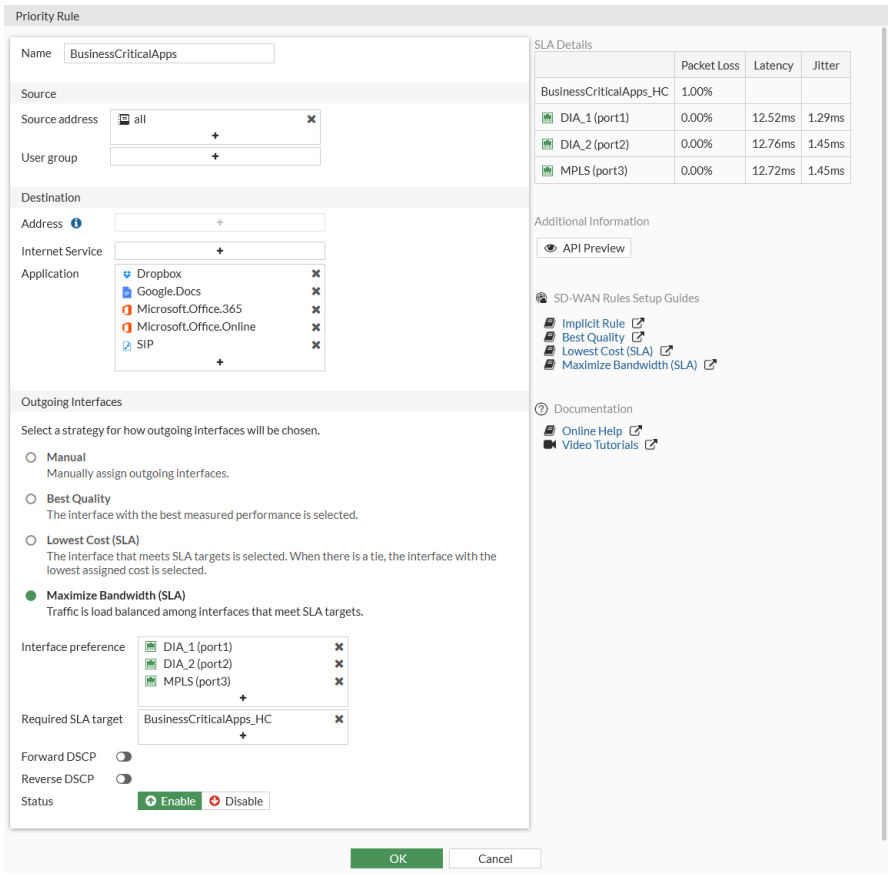
1. Add port1 (DIA_1), port2 (DIA_2), and port3 (MPLS) as SD-WAN members. Set the cost of DIA_1 and DIA_2 to *0*, and MPLS to *20*. See Configuring the SD-WAN interface on page 320 for details.
2. Configure a static route. See Adding a static route on page 321 for details.
3. Create a firewall policy to allow traffic out on SD-WAN, with an *Application Control* profile configured. See Configuring firewall policies for SD-WAN on page 322 for details.

To configure the SD-WAN rule and performance SLA checks for business critical application in the GUI:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Set the name to *BusinessCriticalApps*.
   This rule will steer your business critical traffic to the appropriate link based on the *Lowest Cost (SLA)*.
3. Set *Source address* to *all*.
4. Under *Destination*, set *Application* to your required applications. In this example: *Microsoft.Office.365*, *Microsoft.Office.Online*, *Google.Docs*, *Dropbox*, and *SIP*.
5. Under *Outgoing Interfaces*, select *Lowest Cost (SLA)*.
   The lowest cost is defined in the SD-WAN member interface settings (see Configuring the SD-WAN interface on page 320). The lowest possible cost is *0*, which represents the most preferred link. In this example, DIA_1 and DIA_2 both have a cost of *0*, while MPLS has a cost of *20* because it is used for backup.
6. In *Interface preference*, add the interfaces in order of preference when the cost of the links is tied. In this example, DIA_1, DIA_2, then MPLS.
   MPLS will always be chosen last, because it has the highest cost. DIA_1 and DIA_2 have the same cost, so an interface is selected based on their order in the *Interface preference* list.
7. Set *Required SLA target* to ensure that only links that pass your SLA target are chosen in this SD-WAN rule:
   a. Click in the *Required SLA target* field.
   b. In the *Select Entries* pane, click *Create*. The *New Performace SLA* pane opens.
   c. Set *Name* to *BusinessCriticalApps_HC*.
      This health check is used for business critical applications in your SD-WAN rule.
   d. Leave *Protocol* set to *Ping*, and add up to two servers, such as *office.com* and *google.com*.
   e. Set *Participants* to *Specify*, and add all three interfaces: DIA_1, DIA_2, and MPLS.
   f. Enable *SLA Target*.
      The attributes in your target determine the quality of your link. The SLA target of each link is compared when determining which link to use based on the lowest cost. Links that meet the SLA target are preferred over links that fail, and move to the next step of selection based on cost. If no links meet the SLA target, then they all move to the next step.

      In this example, disable *Latency threshold* and *Jitter threshold*, and set *Packet loss threshold* to *1*.
   g. Click *OK*.
   h. Select the new performance SLA to set it as the *Required SLA target*.

   When multiple SLA targets are added, you can choose which target to use in the SD-WAN rule.



8. Click *OK* to create the SD-WAN rule.

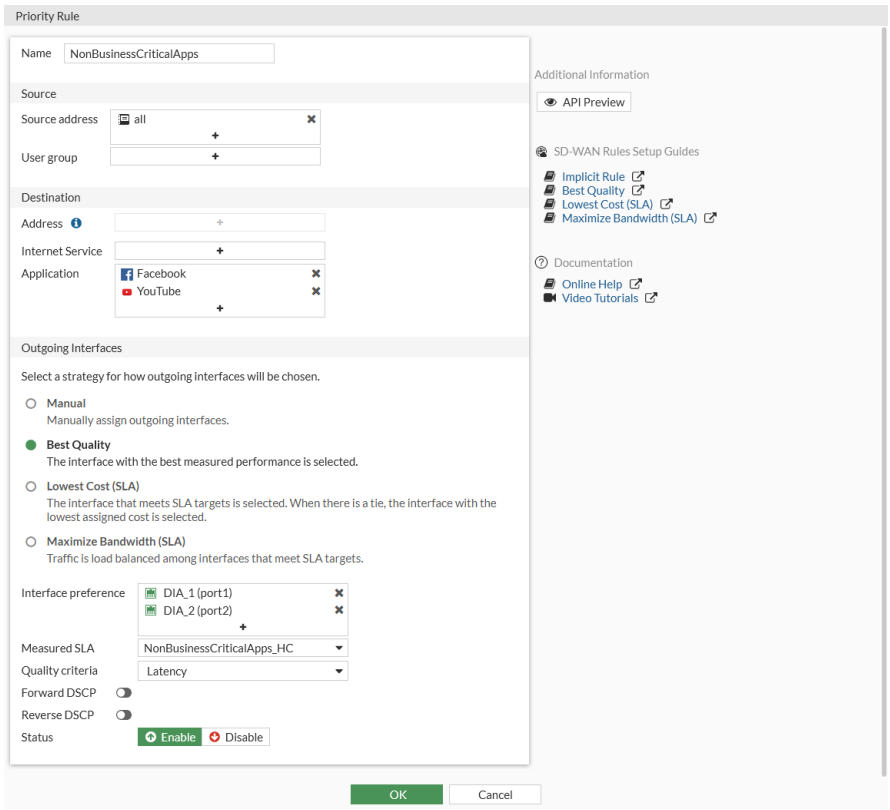
To configure the SD-WAN rule and performance SLA checks for non-business critical application in the GUI:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Set the name to *NonBusinessCriticalApps*.
   This rule will steer your non-business critical traffic to the appropriate link based on the *Best Quality*. No SLA target must be met, as the best link is selected based on the configured quality criteria and interface preference order.
3. Set *Source address* to *all*.
4. Under *Destination*, set *Application* to your required applications. In this example: *Facebook*, and *Youtube*.
5. Under *Outgoing Interfaces*, select *Best Quality*.
6. In *Interface preference*, add the interfaces in order of preference.
   By default, a more preferred link has an advantage of 10% over a less preferred link. For example, when latency is used, the preferred link's calculated latency = real latency / (1+10%).

The preferred link advantage can be customized in the CLI when the mode is `priority` (*Best Quality*) or `auto`:

```
config system sdwan
    config service
        edit <id>
            set link-cost-threshold <integer>
        next
    end
end
```

7. Create and apply a new performance SLA profile:
   a. Click in the *Measured SLA* field.
   b. In the drop-down list, click *Create*. The *New Performace SLA* pane opens.
   c. Set *Name* to *NonBusinessCritical_HC*.
   This health check is used for non-business critical applications in your SD-WAN rule.
   d. Leave *Protocol* set to *Ping*, and add up to two servers, such as *youtube.com* and *facebook.com*.
   e. Set *Participants* to *Specify*, and add the DIA_1 and DIA_2 interfaces. In this example, MPLS is not used for non-business critical applications.
   f. Leave *SLA Target* disabled.
   g. Click *OK*.
   h. Select the new performance SLA from the list to set it as the *Measured SLA*.
8. Set *Quality criteria* as required. In this example, *Latency* is selected.
   For bandwidth related criteria, such as *Downstream*, *Upstream*, and *Bandwidth* (bi-directional), the selection is based on available bandwidth. An estimated bandwidth should be configured on the interface to provide a baseline, maximum available bandwidth.



9. Click *OK* to create the SD-WAN rule.

To configure the SD-WAN members, static route, and firewall policy in the CLI:

1. Configure the interfaces:

```
config system interface
    edit "port1"
        set ip <class_ip&net_netmask>
        set alias "DIA_1"
        set role wan
    next
    edit "port2"
        set ip <class_ip&net_netmask>
        set alias "DIA_2"
        set role wan
    next
    edit "port3"
        set ip <class_ip&net_netmask>
        set alias "MPLS"
        set role wan
    next
end
```

2. Configure the SD-WAN members:

```
config system sdwan
    set status enable
    config members
```

```
        edit 1
            set interface "port1"
            set gateway 172.16.20.2
        next
        edit 2
            set interface "port2"
            set gateway 172.17.80.2
        next
        edit 3
            set interface "port3"
            set gateway 10.100.20.2
            set cost 20
        next
    end
end
```

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

3. Configure a static route. See Adding a static route on page 321 for details.
4. Create a firewall policy to allow traffic out on SD-WAN, with an *Application Control* profile configured. See Configuring firewall policies for SD-WAN on page 322 for details.

To configure the SD-WAN rule and performance SLA checks for business critical application in the CLI:

1. Configure the *BusinessCriticalApps_HC* health-check:

```
config system sdwan
    config health-check
        edit "BusinessCriticalApps_HC"
            set server "office.com" "google.com"
            set members 1 2 3
            config sla
                edit 1
                    set link-cost-factor packet-loss
                    set packetloss-threshold 1
                next
            end
        next
    end
end
```

2. Configure the *BusinessCriticalApps* service to use *Lowest Cost (SLA)*:

```
config system sdwan
    config service
        edit 1
            set name "BusinessCriticalApps"
            set mode sla
            set src "all"
            set internet-service enable
            set internet-service-app-ctrl 17459 16541 33182 16177 34640
            config sla
                edit "BusinessCriticalApps_HC"
                    set id 1
```

```
                next
            end
            set priority-members 1 2 3
        next
    end
end
```

To configure the SD-WAN rule and performance SLA checks for non-business critical application in the CLI:

1. Configure the *nonBusinessCriticalApps_HC* health-check:

```
config system sdwan
    config health-check
        edit "NonBusinessCriticalApps_HC"
            set server "youtube.com" "facebook.com"
            set members 1 2
        next
    end
end
```

2. Configure the *NonBusinessCriticalApps* service to use *Lowest Cost (SLA)*:

```
config system sdwan
    config service
        edit 4
            set name "NonBusinessCriticalApps"
            set mode priority
            set src "all"
            set internet-service enable
            set internet-service-app-ctrl 15832 31077
            set health-check "NonBusinessCriticalApps_HC"
            set priority-members 1 2
        next
    end
end
```

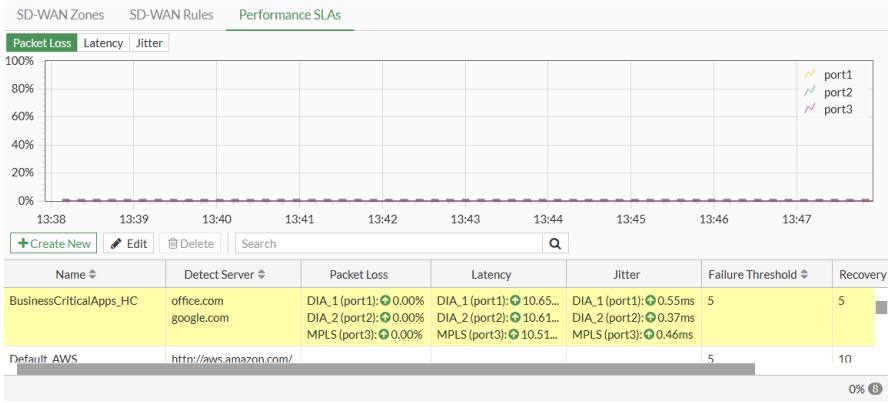
Verification

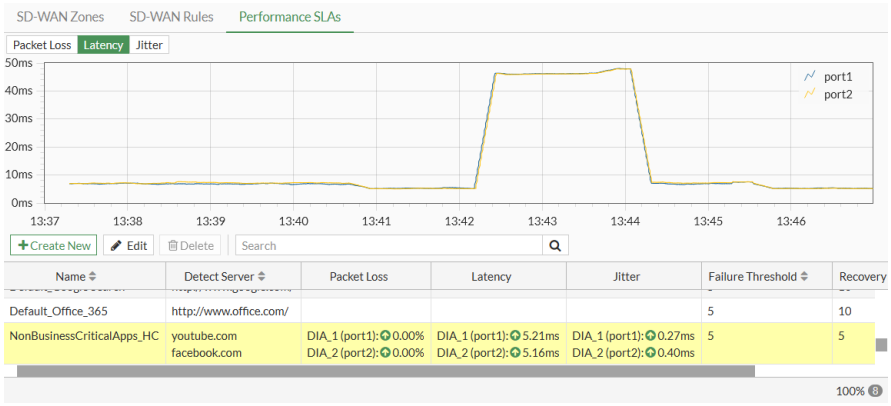
Check the following GUI pages, and run the following CLI commands to confirm that your traffic is being steered by the SD-WAN rules.

Health checks

To verify the status of each of the health checks in the GUI:

1. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, and select each of the health checks from the list.





To verify the status of each of the health checks in the CLI:

```
# diagnose sys sdwan health-check
Health Check(BusinessCritical_HC):
Seq(1 port1): state(alive), packet-loss(0.000%) latency(12.884), jitter(0.919) sla_map=0x1
Seq(2 port2): state(alive), packet-loss(0.000%) latency(13.018), jitter(0.723) sla_map=0x1
Seq(3 port3): state(alive), packet-loss(0.000%) latency(13.018), jitter(0.923) sla_map=0x1
Health Check(NonBusinessCritical_HC):
Seq(1 port1): state(alive), packet-loss(0.000%) latency(6.888), jitter(0.953) sla_map=0x0
Seq(2 port2): state(alive), packet-loss(0.000%) latency(6.805), jitter(0.830) sla_map=0x0
```

Rule members and hit count

To verify the active members and hit count of the SD-WAN rule in the GUI:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab.

   The interface that is currently selected by the rule has a checkmark next to its name in the *Members* column. Hover the cursor over the checkmark to open a tooltip that gives the reason why that member is selected. If multiple members are selected, only the highest ranked member is highlighted (unless the mode is *Maximize Bandwidth (SLA)*).

To verify the active members and hit count of the SD-WAN rule in the CLI:

```
# diagnose sys sdwan service

Service(3): Address Mode(IPV4) flags=0x0
  Gen(13), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members:
    1: Seq_num(1 port1), alive, sla(0x1), cfg_order(0), cost(0), selected
    2: Seq_num(2 port2), alive, sla(0x1), cfg_order(1), cost(0), selected
    3: Seq_num(3 port3), alive, sla(0x1), cfg_order(2), cost(20), selected

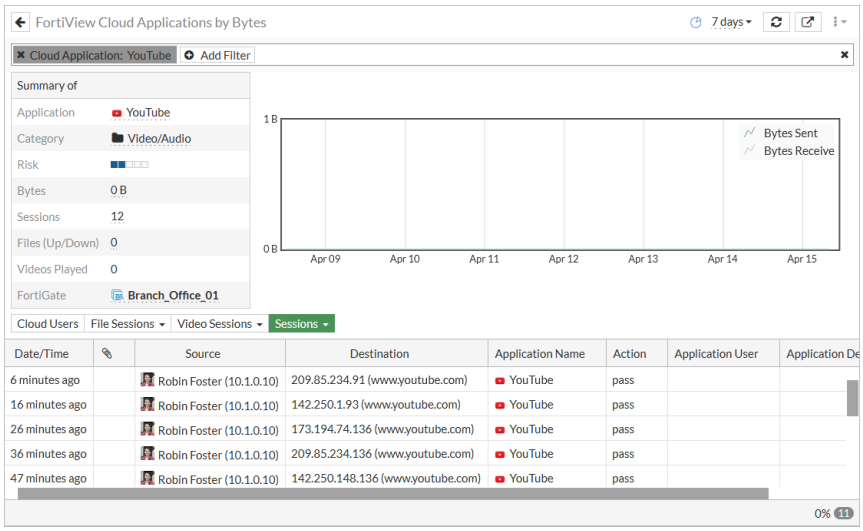
```

Applications and sessions

To verify sessions in FortiView:

1. Go to a dashboard and add the *FortiView Cloud Applications* widget sorted by bytes. See Cloud application view on page 110 for details.

2. Drill down on an application, such as *YouTube*, then select the *Sessions* tab.



To verify applications identified by Application Control in SD-WAN:

```
# diagnose sys sdwan internet-service-app-ctrl-list

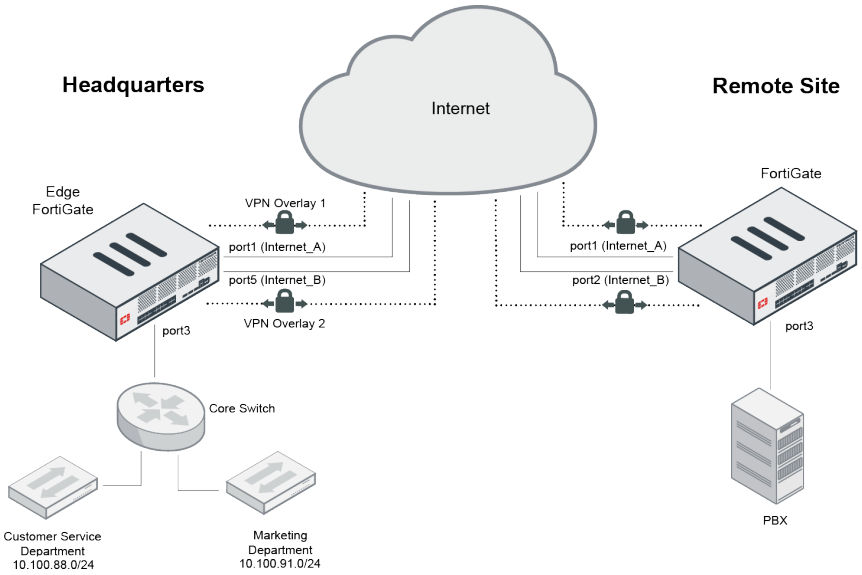
DSCP tag-based traffic steering in SD-WAN

This document demonstrates the Differentiated Services Code Point (DSCP) tag-based traffic steering in Fortinet secure SD-WAN. You can use this guide as an example to deploy DSCP tag-based traffic steering in Fortinet secure SD-WAN.

DSCP tags are often used to categorize traffic to provide quality of service (QoS). Based on DSCP tags, you can provide SD-WAN traffic steering on an edge device.

In this example, we have two different departments at the Headquarters site - Customer Service and Marketing. Traffic from each of these departments is marked with separate DSCP tags by the core switch, and passes through the core switch to the edge FortiGate. The edge FortiGate reads the DSCP tags and steers traffic to the preferred interface based on the defined SD-WAN rules.



In our example, we consider two types of traffic - social media traffic and VoIP traffic. VoIP traffic from Customer Service is considered to be more important than social media traffic. Each of these traffic types is marked with a DSCP tag by the core switch - VoIP traffic is marked with the DSCP tag of `011100`, and social media traffic is marked with the DSCP tag of `001100`. The DSCP tagged traffic is then passed on to the edge FortiGate. The edge FortiGate identifies the DSCP tagged traffic and based on the defined SD-WAN rules, the edge FortiGate steers:

- VoIP traffic to the preferred VPN overlay with the least jitter in order to provide the best quality of voice communication with the remote VoIP server (PBX)
- Social media traffic to the preferred Internet link with a lower cost (less expensive and less reliable)

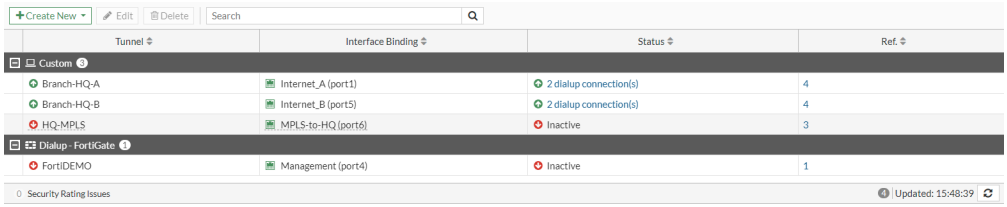
If you are familiar with SD-WAN configurations in FortiOS, you can directly jump to the Configuring SD-WAN rules on page 395 section to learn how to configure the SD-WAN rules to perform traffic steering. Otherwise, you can proceed with all of the following topics to configure the edge FortiGate:

- Configuring IPsec tunnels on page 393
- Configuring SD-WAN zones on page 394
- Configuring firewall policies on page 394
- Configuring Performance SLA test on page 395
- Configuring SD-WAN rules on page 395
- Results on page 398

Configuring IPsec tunnels

In our example, we have two interfaces `Internet_A (port1)` and `Internet_B(port5)` on which we have configured IPsec tunnels `Branch-HQ-A` and `Branch-HQ-B` respectively. To learn how to configure IPsec tunnels, refer to the IPsec VPNs on page 929 section.

After you have configured the IPsec tunnels, go to *VPN* > *IPsec Tunnels* to verify the IPsec tunnels.

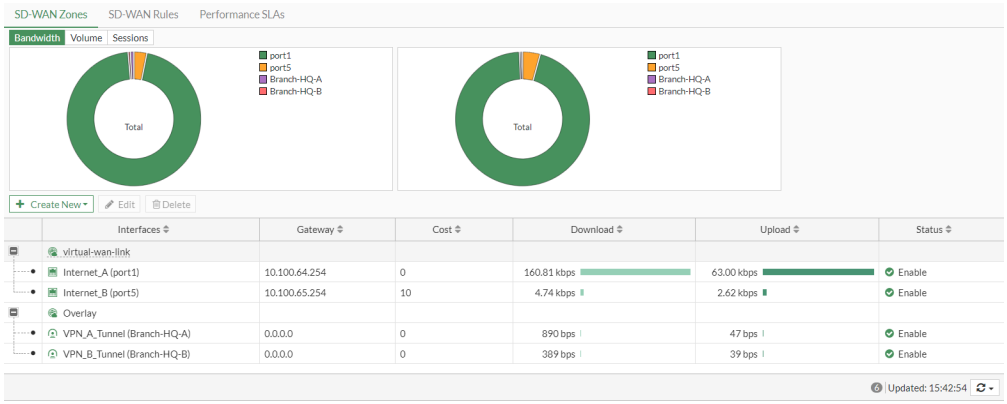


Configuring SD-WAN zones

In order for us to steer traffic based on SD-WAN rules, first we need to configure SD-WAN interface members and assign them to SD-WAN zones. For more information about SD-WAN zones, see SD-WAN zones on page 329.

In our example, we created two SD-WAN zones. The `virtual-wan-link` SD-WAN zone for the underlay traffic passing through the `Internet_A(port1)` and `Internet_B(port5)` interfaces, and the `Overlay` SD-WAN zone for the overlay traffic passing through the `Branch-HQ-A` and `Branch-HQ-B` interfaces.

Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab to verify the configurations.



In this screenshot, we have configured the `Internet_A(port1)` and `Internet_B(port5)` SD-WAN interface members with their *Cost* values being `0` and `10` respectively. A lower *Cost* value indicates that this member is the primary interface member, and is preferred more than a member with a higher *Cost* value when using the *Lowest Cost (SLA)* strategy.

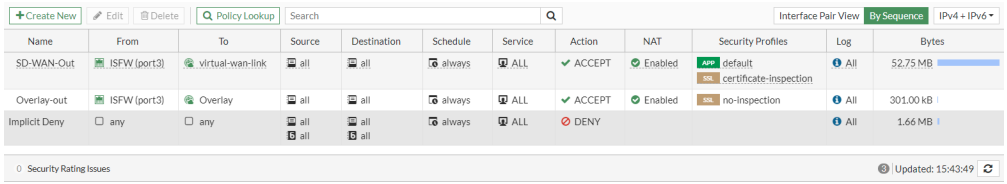
We also need to configure a static route that points to the *SD-WAN* interface. For more information static routes, see Adding a static route on page 321.

Configuring firewall policies

Configure firewall policies for both the overlay and underlay traffic. For more information about firewall policies, see Policies on page 524.

In this example, the *Overlay-out* policy governs the overlay traffic and the *SD-WAN-Out* policy governs the underlay traffic. The firewall policies are configured accordingly.

Once created, verify the firewall policies by navigating to *Policy & Objects* > *Firewall Policy*:

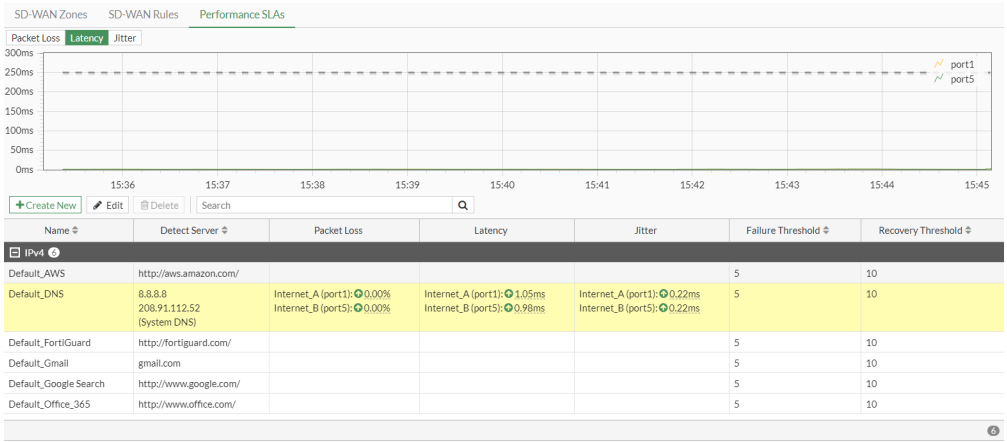


The *Security Profiles* column indicates that the *Overlay-out* firewall policy for the overlay traffic is set up to not scan any traffic, while the *SD-WAN-Out* firewall policy is set to scan all web traffic to identify and govern social media traffic as *Application Control* profile is active.

Configuring Performance SLA test

Configure a performance SLA test that will be tied to the SD-WAN interface members we created and assigned to SD-WAN zones. For more information about Performance SLA, see SLA targets example on page 343.

In this example, we created a *Performance SLA* test *Default_DNS* with `Internet_A(port1)` and `Internet_B (port5)` interface members as participants. We will use the created *Performance SLA* test to steer all web traffic passing through the underlays other than social media traffic based on the *Lowest Cost (SLA)* strategy.



Configuring SD-WAN rules

Configure SD-WAN rules to govern the steering of DSCP tag-based traffic to the appropriate interfaces. Traffic will be steered based on the *Criteria* configured as part of the SD-WAN rules configuration.

In our example, we configured three different SD-WAN rules to govern DSCP tagged traffic. We have one SD-WAN rule each for VoIP traffic, social media traffic (Facebook in this case), and all other web traffic. VoIP traffic is always steered to either of the two overlay SD-WAN zones - `VPN_A_tunnel(Branch-HQ-A)` or `VPN_B_tunnel(Branch-HQ-B)`. Similarly, social media traffic and other web traffic is always steered to either of the two underlay SD-WAN zones - `Internet_A(port1)` or `Internet_B(port5)`. The interface that is preferred by the system over another depends upon the *Criteria* configured in the SD-WAN rule definition.

We configured the following SD-WAN rules:

- SD-WAN rule for VoIP traffic on page 396
- SD-WAN rule for social media traffic on page 396
- SD-WAN rule for other web traffic on page 397

SD-WAN rule for VoIP traffic

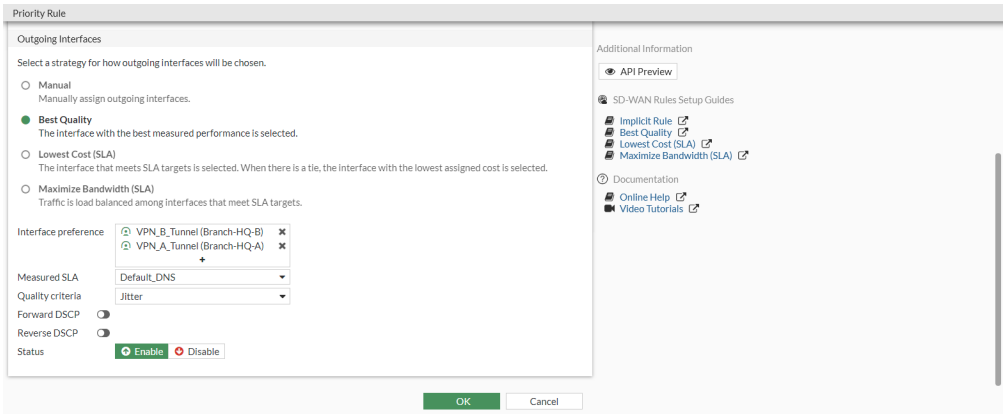
To configure SD-WAN rule for DSCP tagged VoIP traffic using the CLI:

```
config sys sdwan
    config service
        edit 5
            set name "VoIP-Steer"
            set mode priority
            set tos 0x70
            set tos-mask 0xf0
            set dst "all"
            set health-check "Default_DNS"
            set link-cost-factor jitter
            set priority-members 4 3
        next
    end
end
```

The `VoIP-Steer` SD-WAN rule configured above governs the DSCP tagged VoIP traffic.

DSCP values commonly are 6-bit binary numbers that are padded with zeros at the end. Therefore, in this example, VoIP traffic with DSCP tag `011100` will become `01110000`. This 8-bit binary number `01110000` is represented in its hexadecimal form `0x70` as the `tos` (Type of Service bit pattern) value. The `tos-mask` (Type of Service evaluated bits) hexadecimal value of `0xf0` (binary `11110000`) is used to check the four most significant bits from the `tos` value in this case. Hence, the first four bits of the `tos` (`0111`) will be used to match the first four bits of the DSCP tag in our policy above. Only the non-zero bit positions are used for comparison and the zero bit positions are ignored from the `tos-mask`.

We used the *Best Quality* strategy to define the *Criteria* to select the preferred interface from the overlay SD-WAN zone. With the *Best Quality* strategy selected, the interface with the best measured performance is selected. The system prefers the interface with the least *Jitter*.



For more information about configuring SD-WAN rules with the *Best Quality* strategy, see Best quality strategy on page 362.

SD-WAN rule for social media traffic

To configure SD-WAN rule for DSCP tagged social media traffic using the CLI:

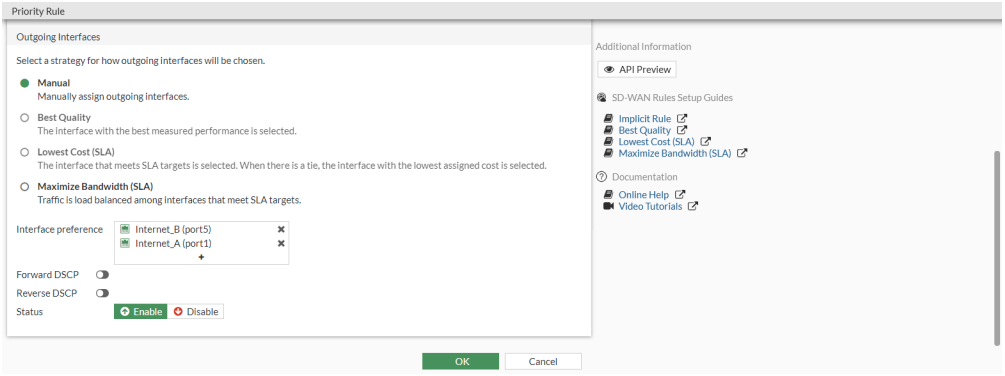
```
FortiGate # config sys sdwan
```

```
config service
   edit 3
      set name "Facebook-DSCP-steer"
      set tos 0x30
      set tos-mask 0xf0
      set dst "all"
      set priority-members 2 1
end
```

The `Facebook-DSCP-steer` SD-WAN rule configured above governs the DSCP tagged social media traffic.

DSCP values commonly are 6-bit binary numbers that are padded with zeros at the end. Therefore, in this example, social media traffic with DSCP tag `001100` will become `00110000`. This 8-bit binary number `00110000` is represented in its hexadecimal form `0x30` as the `tos` (Type of Service bit pattern) value. The `tos-mask` (Type of Service evaluated bits) hexadecimal value of `0xf0` (binary `11110000`) is used to check the four most significant bits from the `tos` value in this case. Hence, the first four bits of the `tos` (`0011`) will be used to match the first four bits of the DSCP tag in our policy above. Only the non-zero bit positions are used for comparison and the zero bit positions are ignored from the `tos-mask`.

We used a manual strategy to select the preferred interface from the underlay SD-WAN zone. We manually select the preferred interface as *Internet_B(port5)* to steer all social media traffic to.



For more information about configuring SD-WAN rules with static application steering with a manual strategy, see Static application steering with a manual strategy on page 381.

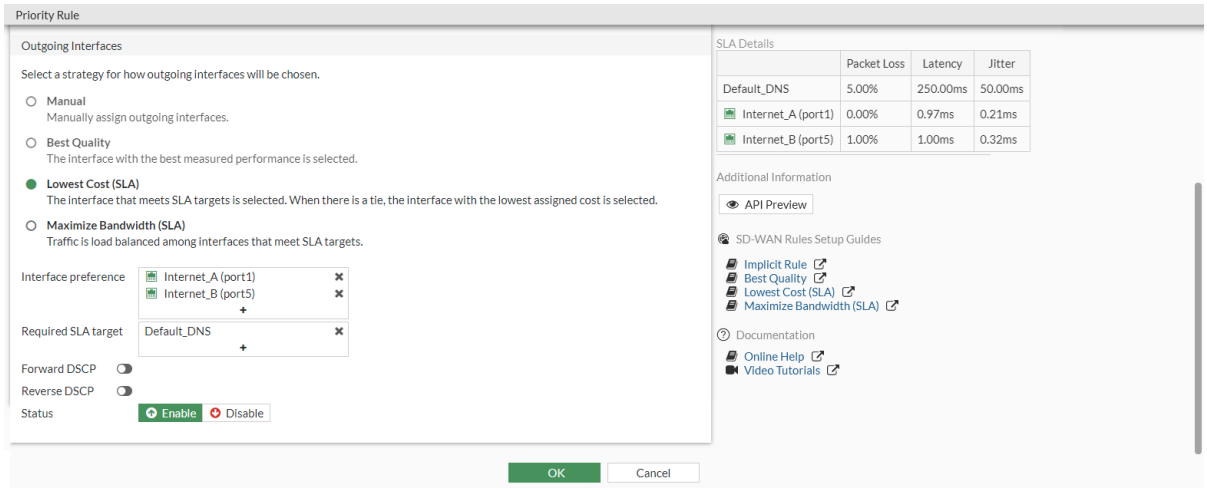
SD-WAN rule for other web traffic

To configure SD-WAN rule for all other web traffic using the CLI:

```
FortiGate # config sys sdwan
   config service
      edit 2
         set name "All-traffic"
         set mode sla
         set dst "all"
         config sla
            edit "Default_DNS"
               set id 1
            next
         end
         set priority-members 1 2
   end
```

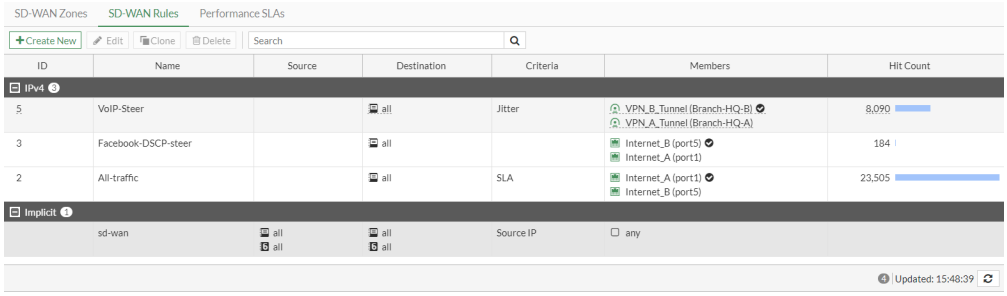
The `All-traffic` SD-WAN rule configured above governs all other web traffic.

We used the *Lowest Cost (SLA)* strategy to define the *Criteria* to select the preferred interface from the underlay SD-WAN zone. With the *Lowest Cost (SLA)* strategy selected, the interface that meets the defined *Performance SLA* targets (*Default_DNS* in our case) is selected. When there is a tie, the interface with the lowest assigned *Cost* (`Internet_A (port1)` in our case) is selected.



For more information about configuring SD-WAN rules with the *Lowest Cost (SLA)* strategy, see Lowest cost (SLA) strategy on page 365.

Once configured, verify your SD-WAN rules by navigating to *Network* > *SD-WAN* and selecting the *SD-WAN Rules* tab.



Results

The following sections show the function of the FortiGate and specifically of secure SD-WAN with respect to DSCP tagged traffic steering, and can be used to confirm that it is setup and running correctly:

- Verifying the DSCP tagged traffic on FortiGate on page 398
- Verifying service rules on page 400
- Verifying traffic steering as per the defined SD-WAN rules on page 401
- Verifying steered traffic leaving the required interface on page 401

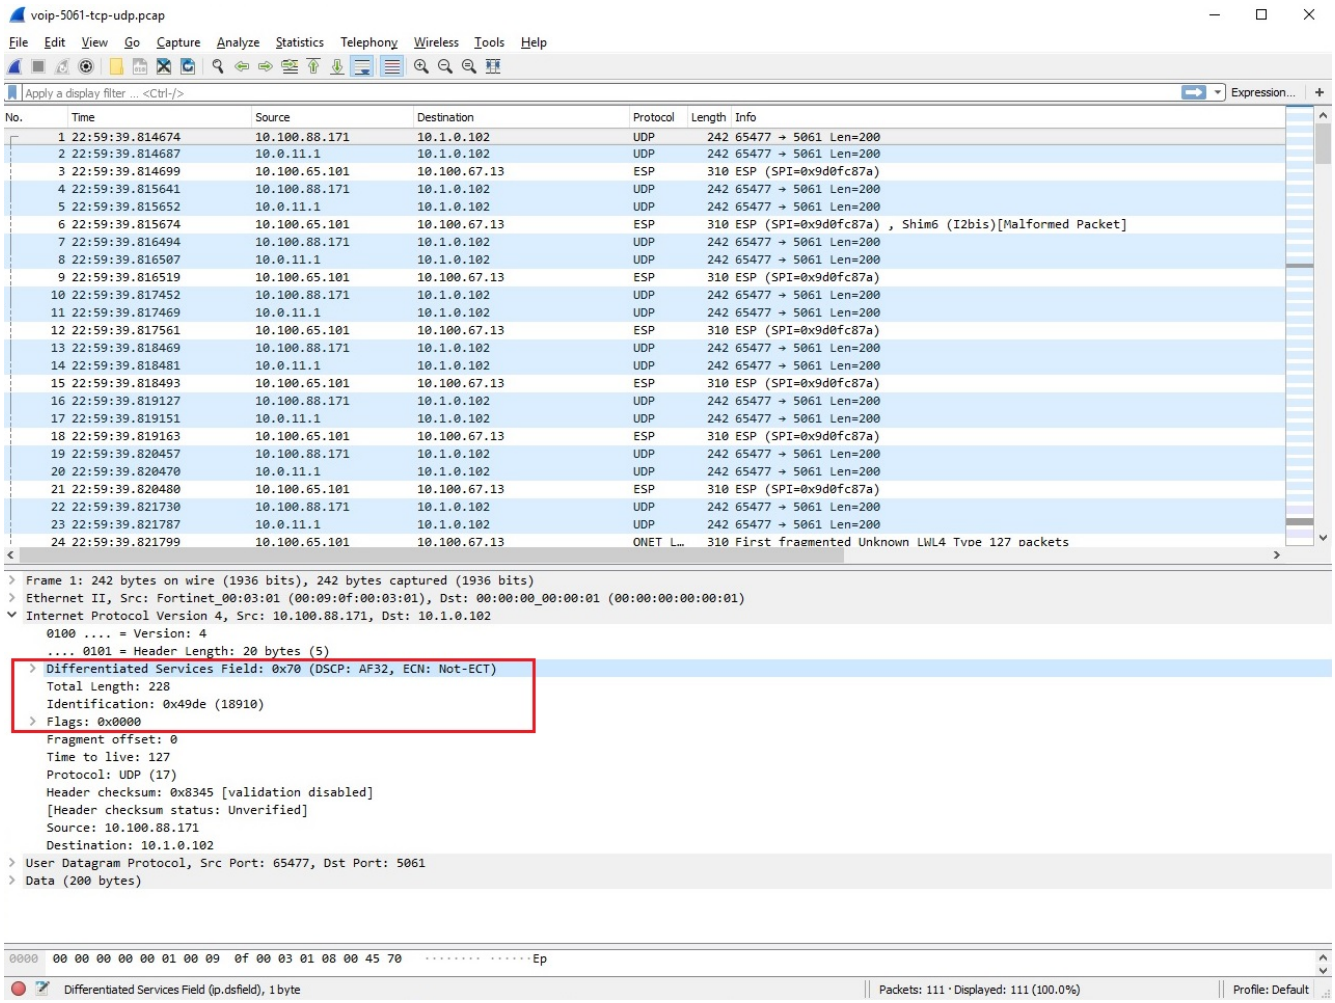
Verifying the DSCP tagged traffic on FortiGate

To verify the incoming DSCP tagged traffic, we used packet sniffing and converting the sniffed traffic to a desired format. For more information about packet sniffing, see Using the FortiOS built-in packet sniffer on the *Fortinet Knowledge Base*.

For VoIP traffic that is marked with DSCP tag `0x70`:

```
# diagnose sniffer packet any '(ip and ip[1] & 0xfc == 0x70)' 6 0 l
```

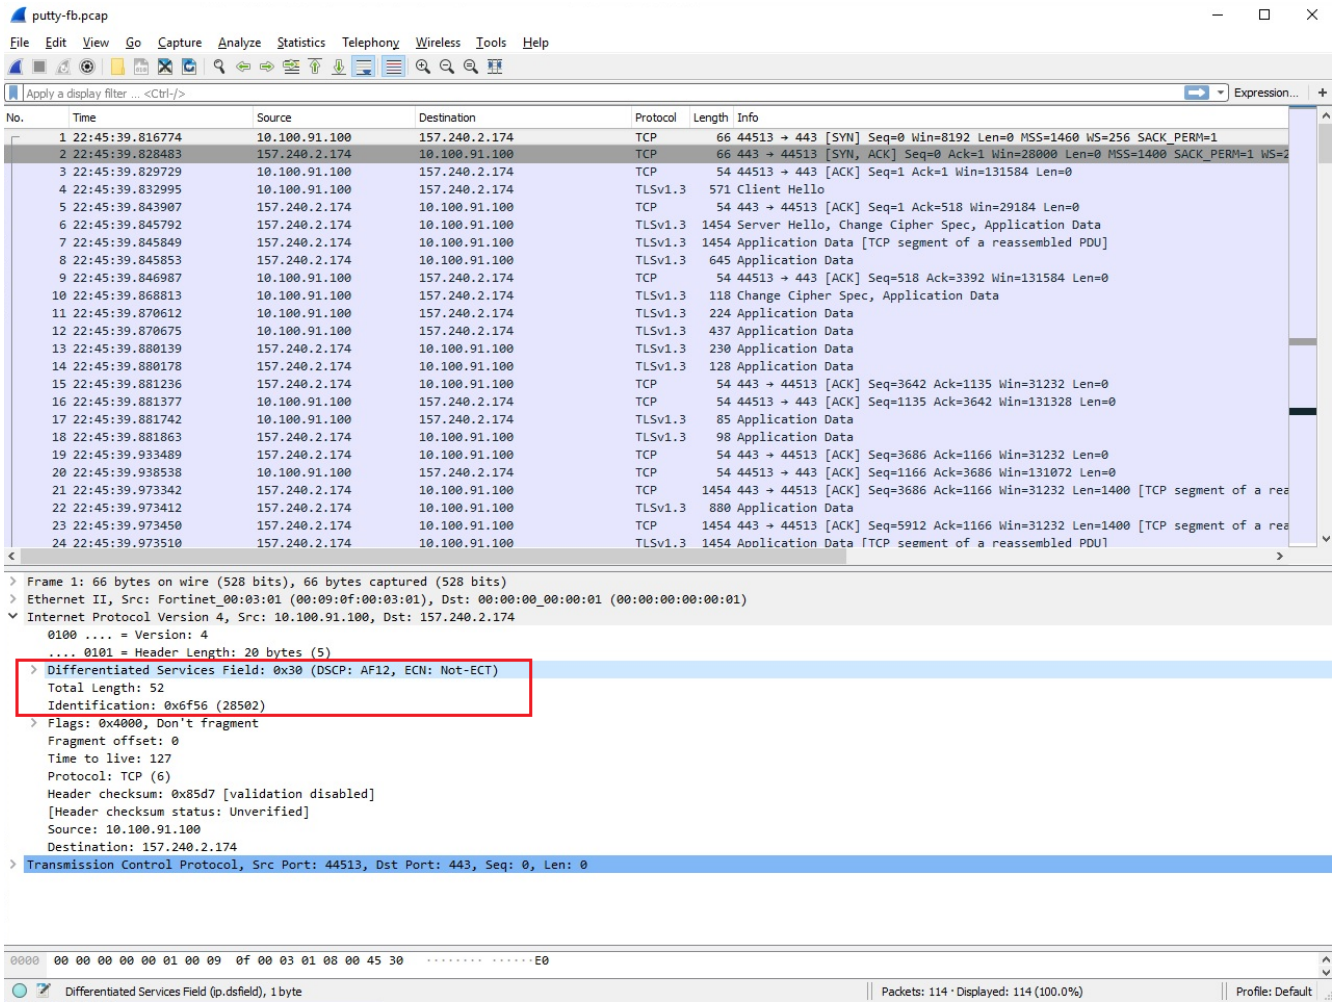
We used the open-source packet analyzer *Wireshark* to verify that VoIP traffic is tagged with the `0x70` DSCP tag.



For web traffic marked with DSCP tag `0x30`:

```
# diagnose sniffer packet any '(ip and ip[1] & 0xfc == 0x30)' 6 0 l
```

We used the open-source packet analyzer *Wireshark* to verify that web traffic is tagged with the `0x30` DSCP tag.



Verifying service rules

The following CLI commands show the appropriate DSCP tags and the corresponding interfaces selected by the SD-WAN rules to steer traffic:

```
# diagnose sys sdwan service

Service(5): Address Mode(IPV4) flags=0x0
   Gen(1), TOS(0x70/0xf0), Protocol(0: 1->65535), Mode(manual)
   Members:
      1: Seq_num(4 Branch-HQ-B), alive, selected
   Dst address:
         0.0.0.0-255.255.255.255

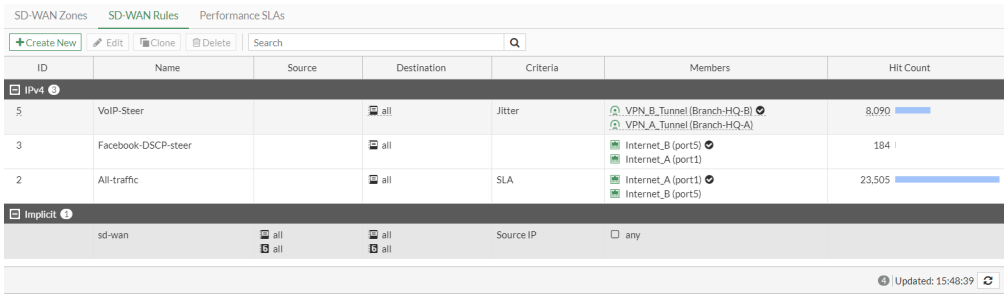
Service(3): Address Mode(IPV4) flags=0x0
   Gen(1), TOS(0x30/0xf0), Protocol(0: 1->65535), Mode(manual)
   Members:
      1: Seq_num(2 port5), alive, selected
   Dst address:
         0.0.0.0-255.255.255.255

Service(2): Address Mode(IPV4) flags=0x0
```

```
Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
Members:
   1: Seq_num(1 port1), alive, sla(0x1), cfg_order(0), cost(0), selected
   2: Seq_num(2 port5), alive, sla(0x1), cfg_order(1), cost(10), selected
Dst address:
      0.0.0.0-255.255.255.255
```

Verifying traffic steering as per the defined SD-WAN rules

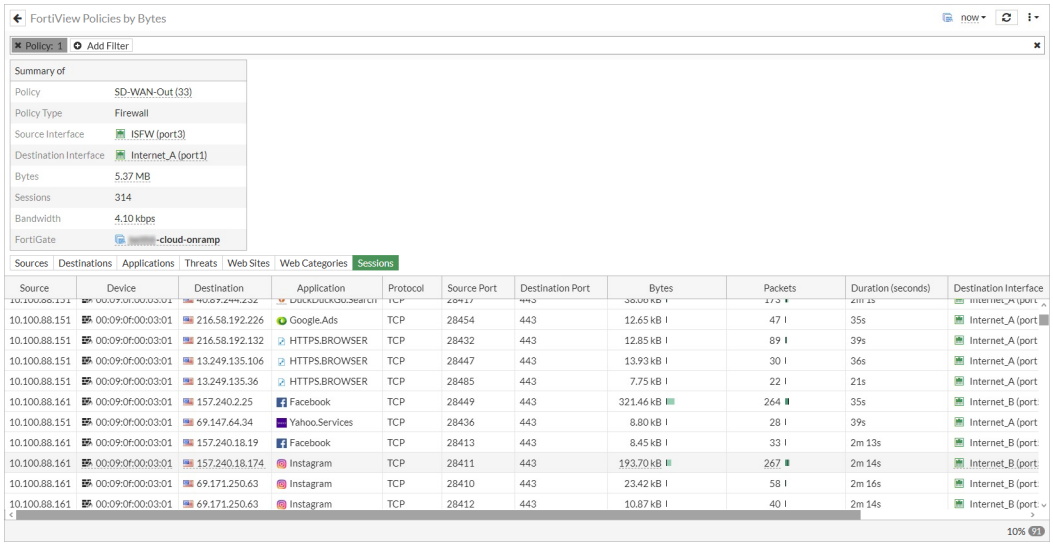
Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab to review the *Hit Count* on the appropriate SD-WAN interfaces.



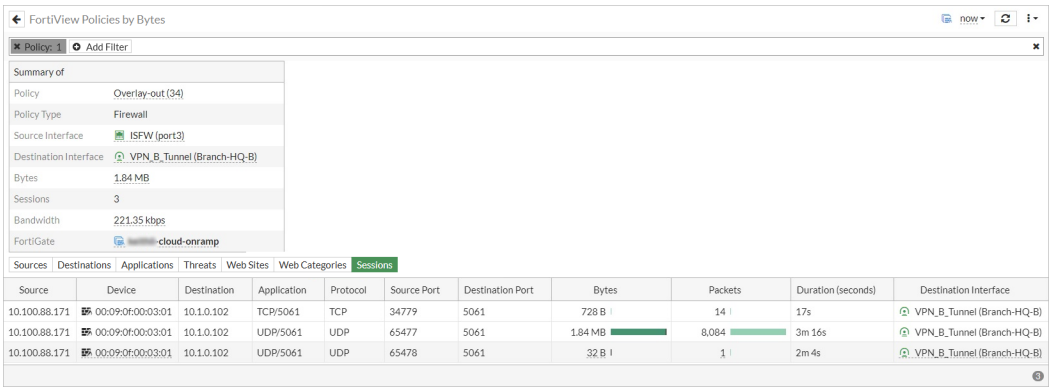
Verifying steered traffic leaving the required interface

Go to *Dashboard* > *Top Policies* to confirm that web traffic (port 443) flows through the right underlay interface members, and VoIP traffic flows through the right overlay interface member.

Web traffic leaves either `Interface_A(port1)` or `Interface_B(port5)`:



VoIP traffic leaves the preferred `VPN_B_Tunnel(Branch-HQ-B)` interface:



Advanced routing

The following topics provide instructions on SD-WAN advanced routing:

- Local out traffic on page 402
- Using BGP tags with SD-WAN rules on page 407
- BGP multiple path support on page 410
- Controlling traffic with BGP route mapping and service rules on page 413
- Applying BGP route-map to multiple BGP neighbors on page 419
- IBGP and EBGP support in VRF on page 425

Local out traffic

Local out, or self-originating, traffic is traffic that originates from the FortiGate going to external servers and services. The traffic can be from Syslog, FortiAnalyzer logging, FortiGuard services, remote authentication, and others.

By default, local out traffic relies on routing table lookups to determine the egress interface that is used to initiate the connection. However, many types of local out traffic support selecting the egress interface based on SD-WAN or manually specified interfaces. When manually specifying the egress interface, the source IP address can also be manually configured.

Go to *Network* > *Local Out Routing* to configure the available types of local out traffic. Some types of traffic can only be configured in the CLI.

By default *Local Out Routing* is not visible in the GUI. Go to *System* > *Feature Visibility* to enable it. See Feature visibility on page 1562 for more information.

When VDOMs are enabled, the following entries are available on the local out routing page:

Global view	VDOM view
External Resources	**LDAP Servers**
AWS_IP_Blacklist	ldap

Global view	VDOM view
AWS_Malware_Hash	**Log**
Log	Log FortiAnalyzer Override Settings
Log FortiAnalyzer Setting	Log Syslogd Override Settings
Log FortiAnalyzer Cloud Setting	**RADIUS Servers**
FortiGate Cloud Log Settings	fac_radius_server
Log Syslogd Setting	**TACACS+**
System	TACACS
System DNS	
System FortiGuard	
System FortiSandbox	

If a service is disabled, it is grayed out. To enable it, select the service and click *Enable Service*. If a service is enabled, there is a *Local Out Setting* button in the gutter of that service's edit page to directly configure the local-out settings.

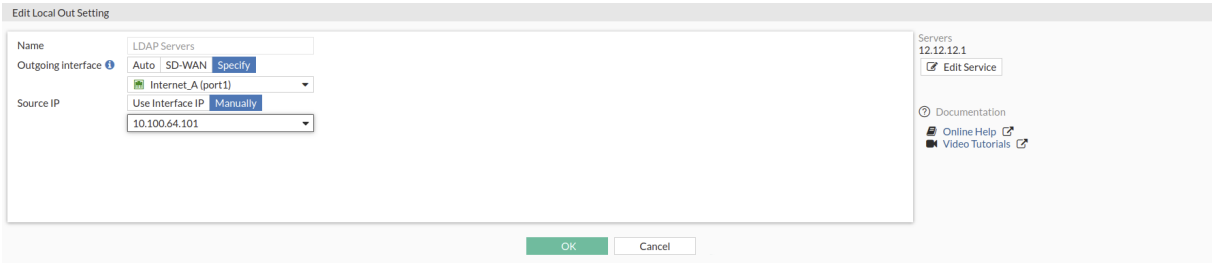
Examples

To configure DNS local-out routing:

1. Go to *Network* > *Local Out Routing* and double-click *System DNS*.
2. For *Outgoing interface*, select one of the following:

Auto	Select the outgoing interface automatically based on the routing table.
SD-WAN	Select the outgoing interface using the configured SD-WAN interfaces and rules.
Specify	Select the outgoing interface from the dropdown.
Use Interface IP	Use the primary IP, which cannot be configured by the user.
Manually	Selected an IP from the list, if the selected interface has multiple IPs configured.

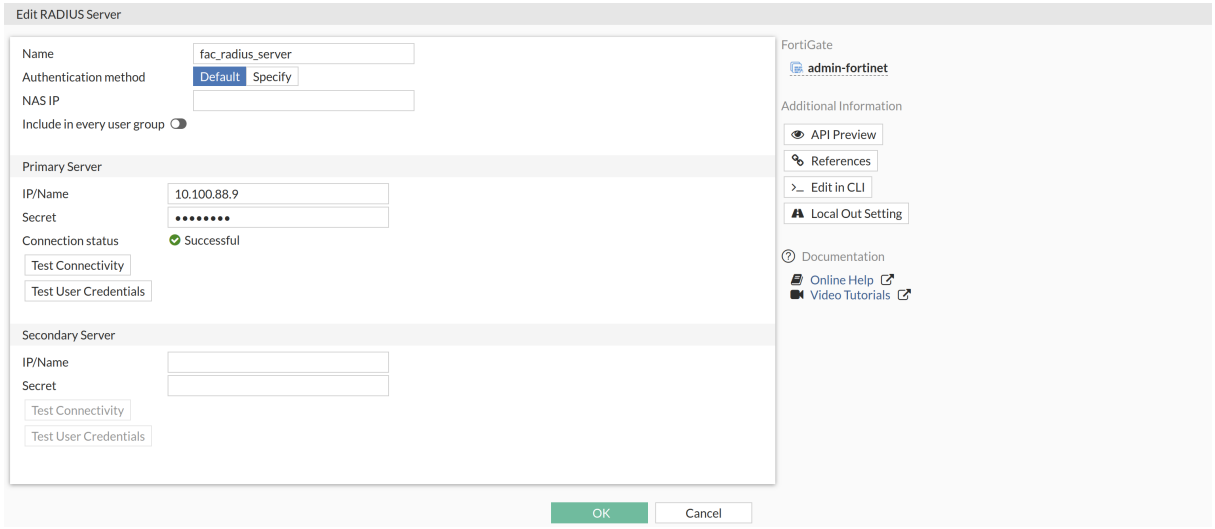
3. If *Specify* is selected, select a setting for *Source IP*:



4. Click *OK*.

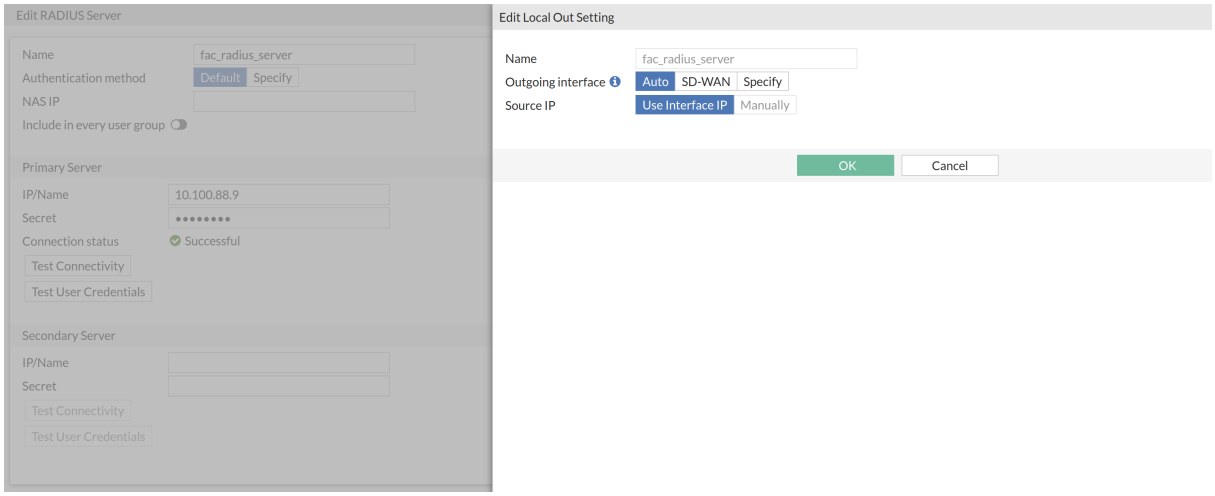
To edit local-out settings from a RADIUS server entry:

1. Go to *User & Authentication* > *RADIUS Servers* and double-click an entry to edit it.
2. Click *Local Out Setting*.



The *Edit Local Out Setting* pane opens.

3. Configure the settings for *Outgoing interface* and *Source IP*.



4. Click *OK*.

Configuring local out routing in the CLI

Some local out routing settings can only be configured using the CLI.

PING

IPv4 and IPv6 pings can be configured to use SD-WAN rules:

```
execute ping-options use-sdwan {yes | no}
execute ping6-options use-sd-wan {yes | no}
```

Traceroute

IPv4 traceroute can be configured to use SD-WAN rules:

```
execute traceroute-options use-sdwan {yes | no}
```

Central management

Central management traffic can use SD-WAN rules or a specific interface:

```
config system central-management
    set interface-select-method {auto | sdwan | specify}
    set interface <interface>
end
```

NTP server

NTP server traffic can use SD-WAN rules or a specific interface:

```
config system ntp
    config ntpserver
        edit <id>
            set interface-select-method {auto | sdwan | specify}
            set interface <interface>
        next
    end
end
```

DHCP proxy

DHCP proxy traffic can use SD-WAN rules or a specific interface:

```
config system settings
    set dhcp-proxy-interface-select-method {auto | sdwan | specify}
    set dhcp-proxy-interface <interface>
end
```

dhcp-proxy-interface-select-method {auto | sdwan | specify}	Select the interface selection method: • `auto`: Set the outgoing interface automatically (default). • `sdwan`: Set the interface by SD-WAN or policy routing rules. • `specify`: Set the interface manually.
dhcp-proxy-interface <interface>	Specify the outgoing interface. This option is only available and must be configured when `interface-select-method` is `specify`.

DHCP relay

DHCP relay traffic can use SD-WAN rules or a specific interface:

```
config system interface
    edit <interface>
        set dhcp-relay-interface-select-method {auto | sdwan | specify}
        set dhcp-relay-interface <interface>
    next
end
```

dhcp-relay-interface-select-method {auto | sdwan | specify}	Select the interface selection method: • `auto`: Set the outgoing interface automatically (default). • `sdwan`: Set the interface by SD-WAN or policy routing rules. • `specify`: Set the interface manually.
dhcp-relay-interface <interface>	Specify the outgoing interface. This option is only available and must be configured when `interface-select-method` is `specify`.

CA and local certificate renewal with SCEP

Certificate renewal with SCEP traffic can use SD-WAN rules or a specific interface:

```
config vpn certificate setting
    set interface-select-method {auto | sdwan | specify}
    set interface <interface>
end
```

IPS TLS protocol active probing

TLS active probing can use SD-WAN rules or a specific interface:

```
config ips global
    config tls-active-probe
        set interface-selection-method {auto | sdwan | specify}
        set interface <interface>
        set vdom <VDOM>
        set source-ip <IPv4 address>
        set source-ip6 <IPv6 address>
    end
end
```

interface-select-method {auto | sdwan | specify}	Select the interface selection method: • `auto`: Set the outgoing interface automatically (default). • `sdwan`: Set the interface by SD-WAN or policy routing rules. • `specify`: Set the interface manually.
interface <interface>	Specify the outgoing interface. This option is only available and must be configured when `interface-select-method` is `specify`.
vdom <VDOM>	Specify the VDOM. This option is only available and must be configured when `interface-select-method` is `sdwan` or `specify`.
source-ip <IPv4 address>	Specify the source IPv4 address. This option is only available and must be configured when `interface-select-method` is `sdwan` or `specify`.
source-ip6 <IPv6 address>	Specify the source IPv6 address. This option is only available and must be configured when `interface-select-method` is `sdwan` or `specify`.

Netflow and sflow

Netflow and sflow can use SD-WAN rules or a specific interface:

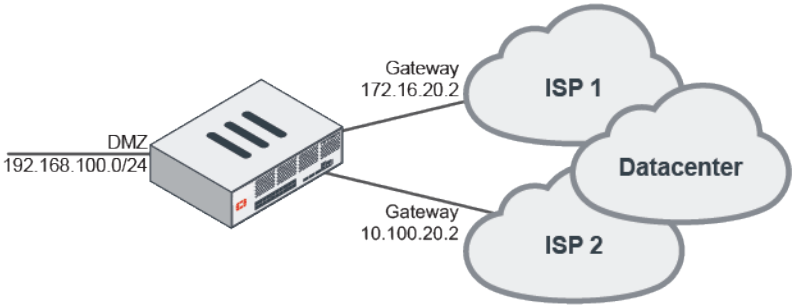
```
config system {netflow | sflow | vdom-netflow | vdom-sflow}
    set interface-select-method {auto | sdwan | specify}
```

```
    set interface <interface>
end
```

interface-select-method {auto | sdwan | specify}	Select the interface selection method: • `auto`: Set the outgoing interface automatically (default). • `sdwan`: Set the interface by SD-WAN or policy routing rules. • `specify`: Set the interface manually.
interface <interface>	Specify the outgoing interface. This option is only available and must be configured when `interface-select-method` is `specify`.

Using BGP tags with SD-WAN rules

SD-WAN rules can use Border Gateway Protocol (BGP) learned routes as dynamic destinations.



In this example, a customer has two ISP connections, wan1 and wan2. wan1 is used primarily for direct access to internet applications, and wan2 is used primarily for traffic to the customer's data center.

The customer could create an SD-WAN rule using the data center's IP address range as the destination to force that traffic to use wan2, but the data center's IP range is not static. Instead, a BGP tag can be used.

For this example, wan2's BGP neighbor advertises the data center's network range with a community number of 30:5.

This example assumes that SD-WAN is enabled on the FortiGate, wan1 and wan2 are added as SD-WAN members in the *virtual-wan-link* SD-WAN zone, and a policy and static route have been created. See SD-WAN quick start on page 319 for details.

FortiOS supports IPv4 and IPv6 route tags.

To configure BGP tags with SD-WAN rules:

1. Configure the community list:

```
config router community-list
    edit "30:5"
        config rule
            edit 1
                set action permit
                set match "30:5"
            next
```

```
        end
    next
end
```

2. Configure the route map:

```
config router route-map
    edit "comm1"
        config rule
            edit 1
                set match-community "30:5"
                set set-route-tag 15
            next
        end
    next
end
```

3. Configure BGP:

```
config router bgp
    set as xxxxx
    set router-id xxxx
    config neighbor
        edit "10.100.20.2"
            set soft-reconfiguration enable
            set remote-as xxxxx
            set route-map-in "comm1"
        next
    end
end
```

4. Configure a firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf "virtual-wan-link"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

5. Edit the SD-WAN configuration:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "wan1"
            set gateway 172.16.20.2
        next
        edit 2
            set interface "wan2"
        next
```

```
        end
        config service
            edit 1
                set name "DataCenter"
                set mode manual
                set route-tag 15
                set priority-members 2
            next
        end
    end
```

Troubleshooting BGP tags with SD-WAN rules

Check the network community

Use the `get router info bgp network` command to check the network community:

```
# get router info bgp network
BGP table version is 5, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network Next Hop Metric LocPrf Weight RouteTag Path
*> 0.0.0.0/0 10.100.1.5 32768 0 ?
*> 1.1.1.1/32 0.0.0.0 32768 0 ?
*> 10.1.100.0/24 172.16.203.2 32768 0 ?
*> 10.100.1.0/30 0.0.0.0 32768 0 ?

```

Check dynamic BGP addresses

Use the `get router info route-map-address` command to check dynamic BGP addresses:

```
# get router info route-map-address
Extend-tag: 15, interface(wan2:16)
        10.100.11.0/255.255.255.0
```

Check dynamic BGP addresses used in policy routes

Use the `diagnose firewall proute list` command to check dynamic BGP addresses used in policy routes:

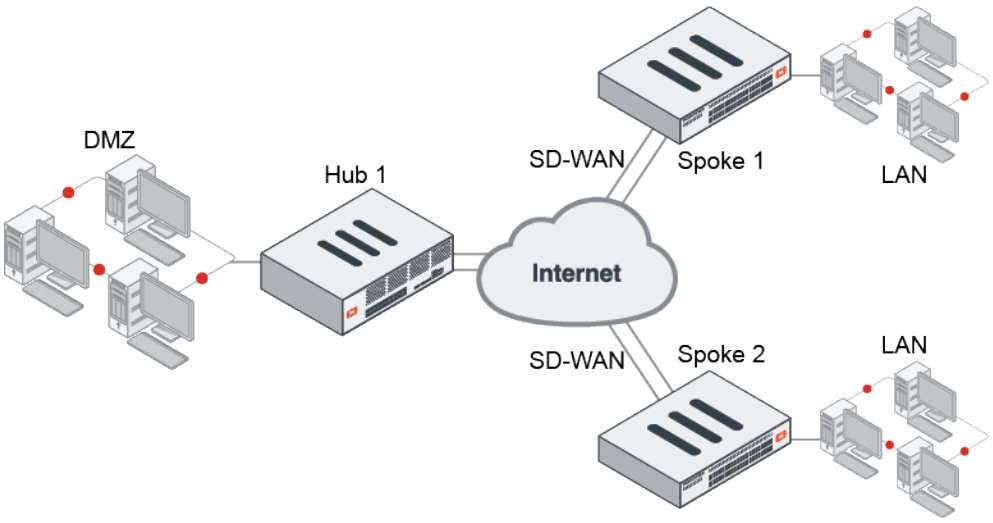
```
# diagnose firewall proute list
list route policy info(vf=root):

id=4278779905 vwl_service=1(DataCenter) flags=0x0 tos=0x00 tos_mask=0x00 protocol=0
sport=0:65535 iif=0 dport=1-65535 oif=16
source wildcard(1): 0.0.0.0/0.0.0.0
destination wildcard(1): 10.100.11.0/255.255.255.0
```

BGP multiple path support

BGP supports multiple paths, allowing an ADVPN to advertise multiple paths. This allows BGP to extend and keep additional network paths according to RFC 7911.

In this example, Spoke1 and Spoke2 each have four VPN tunnels that are connected to the Hub with ADVPN. The Spoke-Hub has established four BGP neighbors on all four tunnels.



Spoke 1 and Spoke 2 can learn four different routes from each other.

To configure the hub:

```
config router bgp
    set as 65505
    set router-id 11.11.11.11
    set ibgp-multipath enable
    set additional-path enable
    set additional-path-select 4
    config neighbor-group
        edit "gr1"
            set capability-default-originate enable
            set remote-as 65505
            set additional-path both
            set adv-additional-path 4
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.0.0 255.255.0.0
            set neighbor-group "gr1"
        next
    end
    config network
        edit 12
            set prefix 11.11.11.11 255.255.255.255
        next
    end
end
```

To configure a spoke:

```
config router bgp
    set as 65505
    set router-id 2.2.2.2
    set ibgp-multipath enable
```

```
        set additional-path enable
        set additional-path-select 4
        config neighbor
            edit "10.10.100.254"
                set soft-reconfiguration enable
                set remote-as 65505
                set additional-path both
                set adv-additional-path 4
            next
            edit "10.10.200.254"
                set soft-reconfiguration enable
                set remote-as 65505
                set additional-path both
                set adv-additional-path 4
            next
            edit "10.10.203.254"
                set soft-reconfiguration enable
                set remote-as 65505
                set additional-path both
                set adv-additional-path 4
            next
            edit "10.10.204.254"
                set soft-reconfiguration enable
                set remote-as 65505
                set additional-path both
                set adv-additional-path 4
            next
        end
        config network
            edit 3
                set prefix 22.1.1.0 255.255.255.0
            next
        end
    end
```

To view the BGP routing table on a spoke:

```
Spoke1 # get router info routing-table bgp
    Routing table for VRF=0
    B*      0.0.0.0/0 [200/0] via 10.10.200.254, vd2-2, 03:57:26
            [200/0] via 10.10.203.254, vd2-3, 03:57:26
            [200/0] via 10.10.204.254, vd2-4, 03:57:26
            [200/0] via 10.10.100.254, vd2-1, 03:57:26
    B       1.1.1.1/32 [200/0] via 11.1.1.1 (recursive via 12.1.1.1), 03:57:51

[200/0] via 10.10.200.3, vd2-2, 03:57:26
[200/0] via 10.10.100.3, vd2-1, 03:57:26
```

Controlling traffic with BGP route mapping and service rules

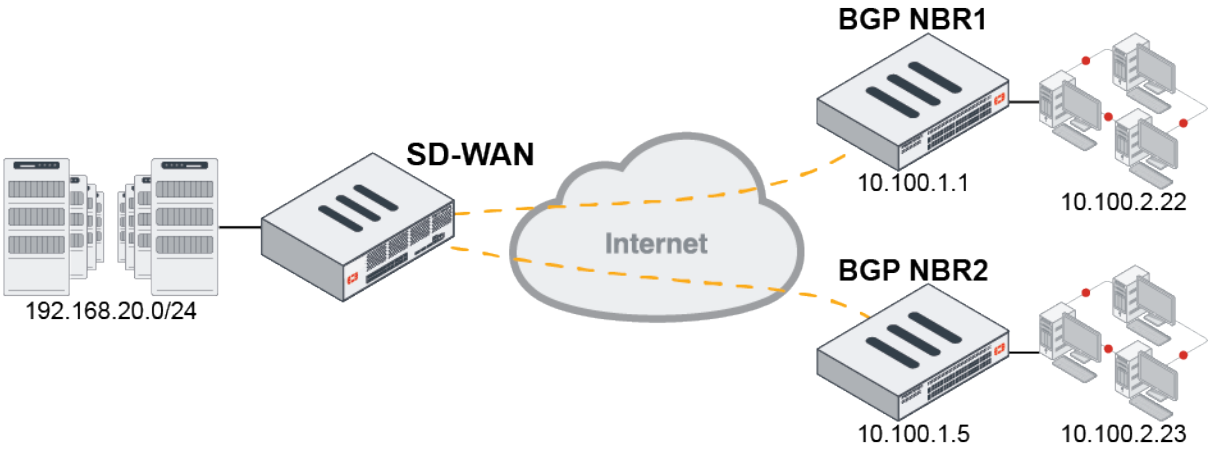
SD-WAN allows you to select different outbound WAN links based on performance SLAs. It is important that BGP neighbors are aware of these settings, and changes to them.

BGP can adapt to changes in SD-WAN link SLAs in the following ways:

- Applying different route-maps based on the SD-WAN's health checks. For example, different BGP community strings can be advertised to BGP neighbors when SLAs are not met.
- Traffic can be selectively forwarded based on the active BGP neighbor. If the SD-WAN service's role matches the active SD-WAN neighbor, the service is enabled. If there is no match, then the service is disabled.

Example

In this topology, a branch FortiGate has two SD-WAN gateways serving as the primary and secondary gateways. The gateways reside in different datacenters, but have a full mesh network between them.



This example shows how route-maps and service rules are selected based on performance SLAs and the member that is currently active. Traffic flows through the primary gateway unless the neighbor's health check is outside of its SLA. If that happens, traffic routes to the secondary gateway.

BGP NBR1 is the primary neighbor and BGP NBR2 is the secondary neighbor.

The branch FortiGate's wan1 and wan2 interfaces are members of the SD-WAN. When the SD-WAN neighbor status is primary, it will advertise community *20:1* to BGP NBR1 and *20:5* to BGP NBR2. When the SD-WAN neighbor status is secondary, it will advertise *20:5* to BGP NBR1 and *20:2* to BGP NBR2.

Only one of the primary or secondary neighbors can be active at one time. The SD-WAN neighbor status is used to decide which neighbor is selected:

- **Primary**: The primary neighbor takes precedence if its SLAs are met.
- **Secondary**: If the primary neighbor's SLAs are not met, the secondary neighbor becomes active if its SLAs are met.
- **Standalone**: If neither the primary or secondary neighbor's SLAs are met, the SD-WAN neighbor status becomes standalone.

Route map

SD-WAN is configured to let BGP advertise different communities when the SLA status changes. When the SLA is missed, it triggers BGP to advertise a different community to its BGP neighbor based on its route-map. The BGP neighbors can use the received community string to select the best path to reach the branch.

To configure BGP route-maps and neighbors:

1. Configure an access for the routes to be matched:

```
config router access-list
    edit "net192"
        config rule
            edit 1
                set prefix 192.168.20.0 255.255.255.0
            next
        end
    next
end
```

2. Configure the primary neighbor's preferred route-map:

```
config router route-map
    edit "comm1"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "20:1"
            next
        end
    next
end
```

3. Configure the secondary neighbor's preferred route-map:

```
config router route-map
    edit "comm2"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "20:2"
            next
        end
    next
end
```

4. Configure the failed route-map:

```
config router route-map
    edit "comm5"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "20:5"
            next
        end
    next
end
```

5. Configure BGP neighbors:

```
config router bgp
    set as 65412
    set router-id 1.1.1.1
    set ibgp-multipath enable
    config neighbor
        edit "10.100.1.1"
            set soft-reconfiguration enable
            set remote-as 20
            set route-map-out "comm5"
            set route-map-out-preferable "comm1"
        next
        edit "10.100.1.5"
            set soft-reconfiguration enable
            set remote-as 20
            set route-map-out "comm5"
            set route-map-out-preferable "comm2"
        next
    end
end
```

When SLAs are met, `route-map-out-preferable` is used. When SLAs are missed, `route-map-out` is used.

To configure SD-WAN:

1. Configure the SD-WAN members:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "port1"
        next
        edit 2
            set interface "port2"
        next
    end
end
```

2. Configure health checks for each member:

```
config system sdwan
    config health-check
        edit "ping"
```

```
            set server "10.100.2.22"
            set members 1
            config sla
                edit 1
                    set link-cost-factor packet-loss
                    set packetloss-threshold 1
                next
            end
        next
        edit "ping2"
            set server "10.100.2.23"
            set members 2
            config sla
                edit 1
                    set link-cost-factor packet-loss
                    set packetloss-threshold 1
                next
            end
        next
    end
end
```

3. Configure the SD-WAN neighbors and assign them a role and the health checks used to determine if the neighbor meets the SLA:
   SD-WAN neighbors can only be configured in the CLI.

```
config system sdwan
    config neighbor
        edit "10.100.1.1"
            set member 1
            set role primary
            set health-check "ping"
            set sla-id 1
        next
        edit "10.100.1.5"
            set member 2
            set role secondary
            set health-check "ping2"
            set sla-id 1
        next
    end
end
```

Service rules

Create SD-WAN service rules to direct traffic to the primary neighbor when its SLAs are met, and to the secondary neighbor when the primary neighbor's SLAs are missed.

To configure the SD-WAN service rules:

```
config system sdwan
    config service
        edit 1
            set name "Primary-Out"
            set role primary
            set dst "all"
```

```
            set src "all"
            set priority-members 1
        next
        edit 2
            set name "Secondary-Out"
            set role secondary
            set dst "all"
            set src "all"
            set priority-members 2
        next
    end
end
```

If neither the primary nor secondary neighbors are active, the SD-WAN neighbor status becomes standalone. Only service rules with `standalone-action` enabled will continue to pass traffic. This option is disabled by default.

Verification

To verify when the primary neighbor is passing traffic:

1. Verify the health check status:

```
FortiGate-Branch # diagnose sys sdwan health-check
Health Check(ping):
Seq(1 port1): state(alive), packet-loss(0.000%) latency(0.569), jitter(0.061) sla_
map=0x1
Health Check(ping2):
Seq(2 port2): state(alive), packet-loss(0.000%) latency(3.916), jitter(2.373) sla_
map=0x1
```

2. Verify SD-WAN neighbor status:

```
FortiGate-Branch # diagnose sys sdwan neighbor
SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
        Selected role(primary) last_secondary_select_time/current_time in seconds 0/572
Neighbor(10.100.1.1): member(1) role(primary)
        Health-check(ping:1)  sla-pass selected alive
Neighbor(10.100.1.5): member(2) role(secondary)
        Health-check(ping2:1)  sla-pass alive
```

3. Verify service rules status:

```
FortiGate-Branch # diagnose sys sdwan service

Service(1): Address Mode(IPV4) flags=0x0
  Gen(3), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Service role: primary
  Members:
    1: Seq_num(1 port1), alive, selected
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255
```

```
Service(2): Address Mode(IPV4) flags=0x0
  Gen(6), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Service role: secondary, disabled by unselected.
  Members:
    1: Seq_num(2 port2), alive, selected
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255
```

4. Verify neighbor routers:
   a. Primary neighbor router:

```
FGT-NBR1 # get router info bgp network 192.168.20.0
BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  64512
    10.100.1.2 from 10.100.1.2 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 20:1
      Last update: Thu Apr 30 13:41:40 2020
```

   b. Secondary neighbor router:

```
FGT-NBR2 # get router info bgp network 192.168.20.0
VRF 0 BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  64512
    10.100.1.6 from 10.100.1.6 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 20:5
      Last update: Thu Apr 30 13:41:39 2020
```

To verify when the secondary neighbor is passing traffic:

1. Verify the health check status:

```
FortiGate-Branch # diagnose sys sdwan health-check
Health Check(ping):
Seq(1 port1): state(dead), packet-loss(54.000%) sla_map=0x0
Health Check(ping2):
Seq(2 port2): state(alive), packet-loss(0.000%) latency(4.339), jitter(3.701) sla_
map=0x1
```

2. Verify SD-WAN neighbor status:

```
FortiGate-Branch # diagnose sys sdwan neighbor
SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
        Selected role(secondary) last_secondary_select_time/current_time in seconds
936/936
Neighbor(10.100.1.1): member(1) role(primary)
        Health-check(ping:1)  sla-fail dead
Neighbor(10.100.1.5): member(2) role(secondary)
        Health-check(ping2:1)  sla-pass selected alive
```

3. Verify service rules status:

```
FortiGate-Branch # diagnose sys sdwan service

Service(1): Address Mode(IPV4) flags=0x0
  Gen(4), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Service role: primary, disabled by unselected.
  Members:
    1: Seq_num(1 port1), alive, selected
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255

Service(2): Address Mode(IPV4) flags=0x0
  Gen(7), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Service role: secondary
  Members:
    1: Seq_num(2 port2), alive, selected
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255
```

4. Verify neighbor routers:
   a. Primary neighbor router:

```
FGT-NBR1 # get router info bgp network 192.168.20.0
BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  64512
    10.100.1.2 from 10.100.1.2 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 20:5
      Last update: Thu Apr 30 15:41:58 2020
```

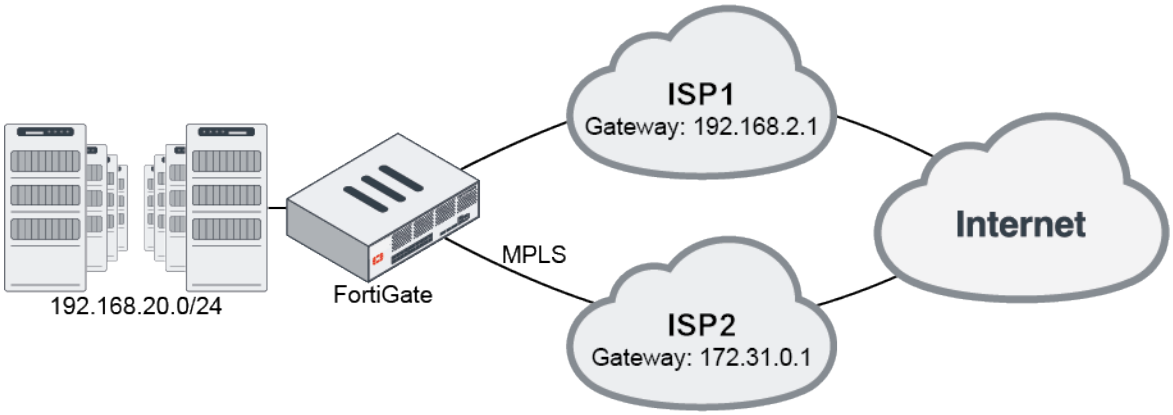
   b. Secondary neighbor router:

```
FGT-NBR2 # get router info bgp network 192.168.20.0
VRF 0 BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  64512
    10.100.1.6 from 10.100.1.6 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 20:2
      Last update: Thu Apr 30 15:42:07 2020
```

Applying BGP route-map to multiple BGP neighbors

Controlling traffic with BGP route mapping and service rules explained how BGP can apply different route-maps to the primary and secondary SD-WAN neighbors based on SLA health checks.

In this example, SD-WAN neighbors that are not bound to primary and secondary roles are configured.



The FortiGate has multiple SD-WAN links and has formed BGP neighbors with both ISPs.

ISP1 is used primarily for outbound traffic, and has an SD-WAN service rule using the lowest cost algorithm applied to it. When SLAs for ISP1 are not met, it will fail over to the MPLS line.

Inbound traffic is allowed by both WAN links, with each WAN advertising a community string when SLAs are met. When SLAs are not met, the WAN links advertise a different community string.

This example uses two SD-WAN links. The topology can be expanded to include more links as needed.

To configure BGP route-maps and neighbors:

1. Configure an access list for routes to be matched:

```
config router access-list
    edit "net192"
        config rule
            edit 1
                set prefix 192.168.20.0 255.255.255.0
            next
        end
    next
end
```

2. Configure route-maps for neighbor ISP1:

```
config router route-map
    edit "comm1"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "64511:1"
            next
        end
    next
    edit "comm-fail1"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "64511:5"
            next
```

```
        end
    next
end
```

3. Configure route-maps for neighbor ISP2:

```
config router route-map
    edit "comm2"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "64522:1"
            next
        end
    next
    edit "comm-fail2"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "64522:5"
            next
        end
    next
end
```

4. Configure the BGP neighbors:

```
config router bgp
    set as 64512
    set keepalive-timer 1
    set holdtime-timer 3
    config neighbor
        edit "192.168.2.1"
            set soft-reconfiguration enable
            set remote-as 64511
            set route-map-out "comm-fail1"
            set route-map-out-preferable "comm1"
        next
        edit "172.31.0.1"
            set soft-reconfiguration enable
            set remote-as 64522
            set route-map-out "comm-fail2"
            set route-map-out-preferable "comm2"
        next
    end
    config network
        edit 1
            set prefix 192.168.20.0 255.255.255.0
        next
    end
end
```

When SLAs are met, `route-map-out-preferable` is used. When SLAs are missed, `route-map-out` is used.

To configure SD-WAN:

1. Configure the SD-WAN members:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "port1"
            set gateway 192.168.2.1
        next
        edit 2
            set interface "MPLS"
            set cost 20
        next
    end
end
```

2. Configure the health checks that must be met:

```
config system sdwan
    config health-check
        edit "pingserver"
            set server "8.8.8.8"
            set members 2 1
            config sla
                edit 1
                    set link-cost-factor packet-loss
                    set packetloss-threshold 2
                next
            end
        next
    end
end
```

3. Configure the SD-WAN neighbors and assign them a role and the health checks used to determine if the neighbor meets the SLA:
   When no role is defined, the default role, `standalone`, is used.

```
config system sdwan
    config neighbor
        edit "192.168.2.1"
            set member 1
            set health-check "pingserver"
            set sla-id 1
        next
        edit "172.31.0.1"
            set member 2
            set health-check "pingserver"
            set sla-id 1
        next
    end
end
```

Service rules

Create SD-WAN service rules to direct traffic to the SD-WAN links based on the lowest cost algorithm The same SLA health check and criteria that are used for the SD-WAN neighbor are used for this SD-WAN service rule.

When no roles are defined in the service rule, the default role, `standalone`, is used.

To configure the SD-WAN service rule:

```
config system sdwan
    config service
        edit 1
            set name "OutboundAll"
            set mode sla
            set dst "all"
            set src "all"
            config sla
                edit "pingserver"
                    set id 1
                next
            end
            set priority-members 1 2
        next
    end
end
```

Verification

To verify that when both SLAs are met, port1 is selected due to its lower cost:

1. Verify the health check status:

```
FortiGate-Branch # diagnose sys sdwan health-check
Health Check(pingserver):
Seq(2 MPLS): state(alive), packet-loss(0.000%) latency(24.709), jitter(14.996) sla_
map=0x1
Seq(1 port1): state(alive), packet-loss(0.000%) latency(28.771), jitter(14.840) sla_
map=0x1
```

2. Verify SD-WAN neighbor status:

```
FortiGate-Branch # diagnose sys sdwan neighbor
Neighbor(192.168.2.1): member(1) role(standalone)
        Health-check(pingserver:1)  sla-pass selected alive
Neighbor(172.31.0.1): member(2) role(standalone)
        Health-check(pingserver:1)  sla-pass selected alive
```

3. Verify service rules status:
   Because the service role is `standalone`, it matches both neighbors. The mode (SLA) determines that port1 is lower cost.

```
FortiGate-Branch # diagnose sys sdwan service

Service(1): Address Mode(IPV4) flags=0x0
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Service role: standalone
  Members:
```

```
    1: Seq_num(1 port1), alive, sla(0x1), cfg_order(0), cost(0), selected
    2: Seq_num(2 MPLS), alive, sla(0x1), cfg_order(1), cost(20), selected
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255
```

4. Verify neighbor routers:
   a. Primary neighbor router:

```
FGT-NBR1 # get router info bgp network 192.168.20.0
BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  64512
    192.168.2.5 from 192.168.2.5 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 64511:1
      Last update: Thu Apr 30 23:59:05 2020
```

   b. Secondary neighbor router:

```
FGT-NBR2 # get router info bgp network 192.168.20.0
VRF 0 BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  64512
    172.31.0.2 from 172.31.0.2 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 64522:1
      Last update: Fri May  1 00:11:28 2020
```

To verify that when neighbor ISP1 misses SLAs, MPLS is selected and BGP advertises a different community string for ISP1:

1. Verify the health check status:

```
FortiGate-Branch # diagnose sys sdwan health-check
Health Check(pingserver):
Seq(2 MPLS): state(alive), packet-loss(0.000%) latency(25.637), jitter(17.820) sla_
map=0x1
Seq(1 port1): state(dead), packet-loss(16.000%) sla_map=0x0
```

2. Verify SD-WAN neighbor status:

```
FortiGate-Branch # diagnose sys sdwan neighbor
Neighbor(192.168.2.1): member(1) role(standalone)
        Health-check(pingserver:1)  sla-fail dead
Neighbor(172.31.0.1): member(2) role(standalone)
        Health-check(pingserver:1)  sla-pass selected alive
```

3. Verify service rules status:
   As SLA failed for neighbor ISP1, MPLS is preferred.

```
FortiGate-Branch # diagnose sys sdwan service
```

```
Service(1): Address Mode(IPV4) flags=0x0
  Gen(3), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Service role: standalone
  Members:
    1: Seq_num(2 MPLS), alive, sla(0x1), cfg_order(1), cost(20), selected
    2: Seq_num(1 port1), dead, sla(0x0), cfg_order(0), cost(0)
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255
```

4. Verify neighbor routers:
   The community received on ISP1 is updated.
   a. Primary neighbor router:

```
FGT-NBR1 # get router info bgp network 192.168.20.0
BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  64512
    192.168.2.5 from 192.168.2.5 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 64511:5
      Last update: Fri May  1 00:33:26 2020
```

   b. Secondary neighbor router:

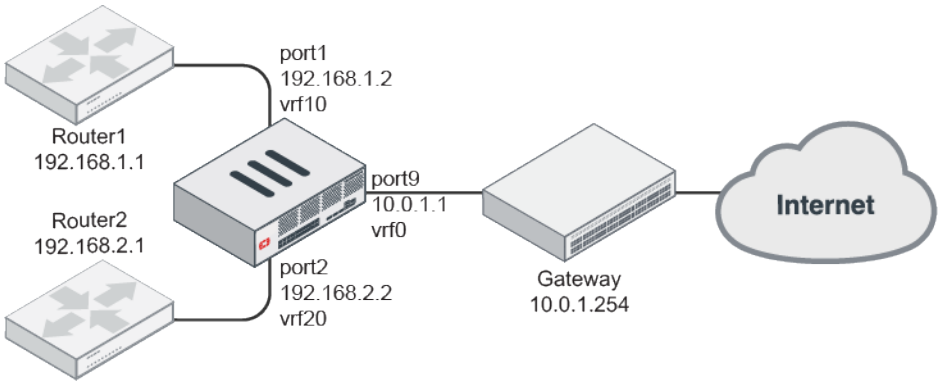
```
FGT-NBR2 # get router info bgp network 192.168.20.0
VRF 0 BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  64512
    172.31.0.2 from 172.31.0.2 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 64522:1
      Last update: Fri May  1 00:22:42 2020
```

IBGP and EBGP support in VRF

Support is included for internal and external border gateway protocols (IBGP and EBGP) in virtual routing and forwarding (VRF).

FortiGate can establish neighbor connections with other FortiGates or routers, and the learned routes are put into different VRF tables according to the neighbor's settings.

This example uses the following topology:



- BGP routes learned from the Router1 neighbor are put into vrf10.
- BGP routes learned from the Router2 neighbor are put into vrf20.

To configure this example:

```
config system interface
    edit port1
        set vrf 10
    next
    edit port2
        set vrf 20
    next
end
```

```
config router bgp
    config neighbor
        edit "192.168.1.1"
            set update-source port1
        next
        edit "192.168.2.1"
            set interface port2
        next
    end
end
```

Results

Using the above topology:

- Both Router1 and Router2 establish OSPF and BGP neighbor with the FortiGate.
- Router1 advertises 10.10.1.0/24 into OSPF and 10.10.2.0/24 into BGP.
- Router2 advertises 20.20.1.0/24 into OSPF and 20.20.2.0/24 into BGP.

When port1 and port2 have not set VRF, all of the routing is in VRF=0:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default
```

```
Routing table for VRF=0
S*      0.0.0.0/0 [5/0] via 10.0.1.254, port9
C       10.0.1.0/24 is directly connected, port9
O       10.10.1.0/24 [110/10] via 192.168.1.1, port1, 00:18:31
B       10.10.2.0/24 [20/200] via 192.168.1.1, port1, 00:01:31
O       20.20.1.0/22 [110/10] via 192.168.2.1, port2, 00:19:05
B       20.20.2.0/24 [20/200] via 192.168.2.1, port2, 00:01:31
C       192.168.1.0/24 is directly connected, port1
C       192.168.2.0/24 is directly connected, port2
```

After VRF is set for BGP, BGP routes are added to the VRF tables along with OSPF and connected routes:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default

Routing table for VRF=0
S*      0.0.0.0/0 [5/0] via 10.0.1.254, port9
C       10.0.1.0/24 is directly connected, port9

Routing table for VRF=10
O       10.10.1.0/24 [110/10] via 192.168.1.1, port1, 00:18:31
B       10.10.2.0/24 [20/200] via 192.168.1.1, port1, 00:01:31
C       192.168.1.0/24 is directly connected, port1

Routing table for VRF=20
O       20.20.1.0/22 [110/10] via 192.168.2.1, port2, 00:19:05
B       20.20.2.0/24 [20/200] via 192.168.2.1, port2, 00:01:31
C       192.168.2.0/24 is directly connected, port2
```

BGP neighbor groups

This feature is also supported in the BGP neighbor groups. For example:

```
config router bgp
    config neighbor-group
        edit "FGT"
            set update-source "port1"
        next
    end
    config neighbor-range
        edit 1
            set prefix 172.16.201.0 255.255.255.0
            set neighbor-group "FGT"
        next
    end
end
```

Note that the `set interface` command is not supported.

VPN overlay

The following topics provide instructions on SD-WAN VPN overlays:

- ADVPN and shortcut paths on page 428
- SD-WAN monitor on ADVPN shortcuts on page 441

ADVPN and shortcut paths

This topic provides an example of how to use SD-WAN and ADVPN together.

ADVPN (Auto Discovery VPN) is an IPsec technology that allows a traditional hub-and-spoke VPN's spokes to establish dynamic, on-demand, direct tunnels between each other to avoid routing through the topology's hub device. The primary advantage is that it provides full meshing capabilities to a standard hub-and-spoke topology. This greatly reduces the provisioning effort for full spoke-to-spoke low delay reachability, and addresses the scalability issues associated with very large fully meshed VPN networks.

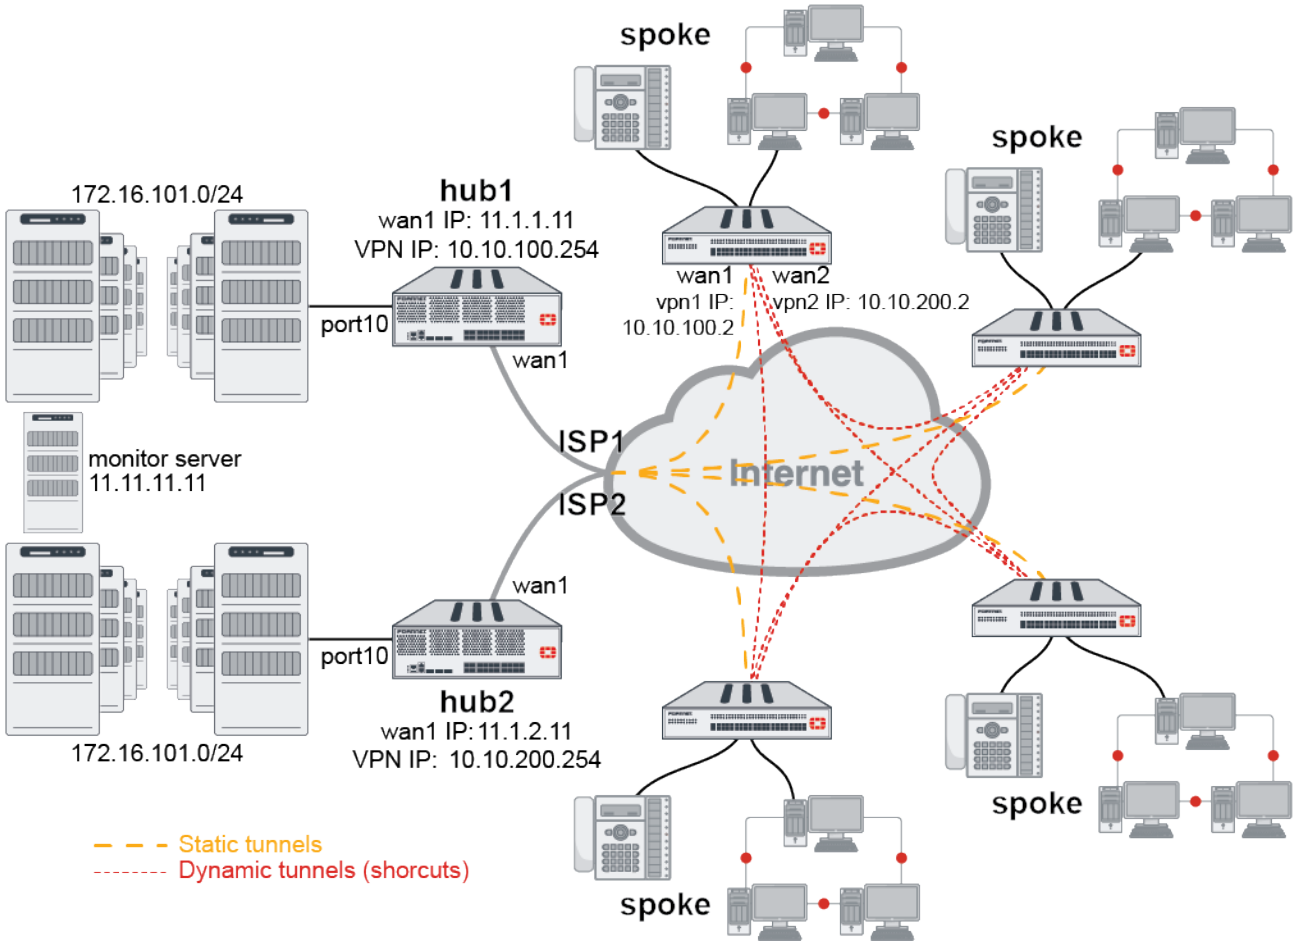
If a customer's head office and branch offices all have two or more internet connections, they can build a dual-hub ADVPN network. Combined with SD-WAN technology, the customer can load-balance traffic to other offices on multiple dynamic tunnels, control specific traffic using specific connections, or choose better performance connections dynamically.

SD-WAN load-balance mode rules (or services) do not support ADVPN members. Other modes' rules, such as SLA and priority, support ADVPN members.

This topic covers three parts:

1. Configure dual-hub ADVPN with multiple branches.
2. Configure BGP to exchange routing information among hubs and spokes.
3. Configure SD-WAN on spoke to do load-balancing and control traffic.

Configuration example



A typical ADVPN configuration with SD-WAN usually has two hubs, and each spoke connects to two ISPs and establishes VPN tunnels with both hubs.

This example shows a hub-and-spoke configuration using two hubs and one spoke:

- Hub1 and Hub2 both use wan1 to connect to the ISPs and port10 to connect to internal network.
- Spoke1 uses wan1 to connect to ISP1 and wan2 to connect to ISP2.
- wan1 sets up VPN to hub1.
- wan2 sets up VPN to hub2.

The SD-WAN is configured on the spoke. It uses the two VPN interfaces as members and two rules to control traffic to headquarters or other spokes using ADVPN VPN interfaces. You can create more rules if required.

For this example:

- Use SD-WAN member 1 (via ISP1) and its dynamic shortcuts for financial department traffic if member 1 meets SLA requirements. If it doesn't meet SLA requirements, it will use SD-WAN member 2 (via ISP2).
- Use SD-WAN member 2 (via ISP2) and its dynamic shortcuts for engineering department traffic.
- Load balance other traffic going to hubs and other spokes between these two members.
- Set up all other traffic to go with their original ISP connection. All other traffic does not go through SD-WAN.
- Set up basic network configuration to let all hubs and spokes connect to their ISPs and the Internet.

Hub internal network	172.16.101.0/24
Spoke1 internal network	10.1.100.0/24
ADVPN 1 network	10.10.100.0/24
ADVPN 2 network	10.10.200.0/24
Hub1 wan1 IP	11.1.1.11
Hub2 wan1 IP	11.1.2.11
Hub1 VPN IP	10.10.100.254
Hub2 VPN IP	10.10.200.254
Spoke1 to hub1 VPN IP	10.10.100.2
Spoke1 to hub2 VPN IP	10.10.200.2
Ping server in Headquarters	11.11.11.11
Internal subnet of spoke1	22.1.1.0/24
Internal subnet of spoke2	33.1.1.0/24
Firewall addresses	Configure hub_subnets and spoke_subnets before using in policies. These can be customized.

The GUI does not support some ADVPN related options, such as auto-discovery-sender, auto-discovery-receiver, auto-discovery-forwarder, and IBGP neighbor-group setting, so this example only provides CLI configuration commands.

Hub1 sample configuration

To configure the IPsec phase1 and phase2 interface:

```
config vpn ipsec phase1-interface
    edit "hub-phase1"
        set type dynamic
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-
sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "hub-phase2"
        set phase1name "hub-phase1"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-
sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

To configure the VPN interface and BGP:

```
config system interface
    edit "hub-phase1"
        set ip 10.10.100.254 255.255.255.255
        set remote-ip 10.10.100.253 255.255.255.0
    next
end
config router bgp
    set as 65505
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65505
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.100.0 255.255.255.0
            set neighbor-group "advpn"
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
        edit 2
            set prefix 11.11.11.0 255.255.255.0
         next
    end
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "hub-phase1"
        set dstintf "port10"
        set srcaddr "spoke_subnets"
        set dstaddr "hub_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from spokes to headquater"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "hub-phase1"
```

```
        set dstintf "hub-phase1"
        set srcaddr "spoke_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from spokes to spokes"
    next
    edit 3
        set name "internal2spoke"
        set srcintf "port10"
        set dstintf "hub-phase1"
        set srcaddr "hub_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from headquater to spokes"
    next
end
```

Hub2 sample configuration

Hub2 configuration is the same as hub1 except the wan1 IP address, VPN interface IP address, and BGP neighbor-range prefix.

To configure the IPsec phase1 and phase2 interface:

```
config vpn ipsec phase1-interface
    edit "hub-phase1"
        set type dynamic
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-
sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "hub-phase2"
        set phase1name "hub-phase1"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-
sha256
    next
end
```

To configure the VPN interface and BGP:

```
config system interface
    edit "hub-phase1"
```

```
        set ip 10.10.200.254 255.255.255.255
        set remote-ip 10.10.200.253 255.255.255.0
    next
end
config router bgp
    set as 65505
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65505
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.200.0 255.255.255.0
            set neighbor-group "advpn"
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
        edit 2
            set prefix 11.11.11.0 255.255.255.0
         next
    end
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "hub-phase1"
        set dstintf "port10"
        set srcaddr "spoke_subnets"
        set dstaddr "hub_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from spokes to headquater"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "hub-phase1"
        set dstintf "hub-phase1"
        set srcaddr "spoke_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from spokes to spokes"
    next
    edit 3
        set name "internal2spoke"
```

```
        set srcintf "port10"
        set dstintf "hub-phase1"
        set srcaddr "hub_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from headquater to spokes"
    next
end
```

Spoke1 sample configuration

To configure the IPsec phase1 and phase2 interface:

```
config vpn ipsec phase1-interface
    edit "spoke1-phase1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 11.1.1.11
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1-2-phase1"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 11.1.2.11
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1-phase2"
        set phase1name "spoke1-phase1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1-2-phase2"
        set phase1name "spoke1-2-phase1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
end
```

To configure the VPN interface and BGP:

```
config system interface
    edit "spoke1-phase1"
        set ip 10.10.100.2 255.255.255.255
        set remote-ip 10.10.100.254 255.255.255.0
    next
    edit "spoke1-2-phase1"
        set ip 10.10.200.2 255.255.255.255
        set remote-ip 10.10.200.254 255.255.255.0
    next
end
config router bgp
    set as 65505
    config neighbor
        edit "10.10.100.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65505
        next
        edit "10.10.200.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65505
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "spoke1-phase1"
        next
        edit 2
            set interface "spoke1-2-phase1"
        next
    end
    config health-check
        edit "ping"
            set server "11.11.11.11"
            set members 1 2
            config sla
                edit 1
                    set latency-threshold 200
                    set jitter-threshold 50
                    set packetloss-threshold 5
                next
            end
```

```
        next
    end
    config service
        edit 1
            set mode sla
            set dst "finacial-department"
            config sla
                edit "ping"
                    set id 1
                next
            end
            set priority-member 1 2
        next
        edit 2
            set member 2
            set dst "engineering-department"
        next
    end
end
```

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "virtual-wan-link"
        set srcaddr "spoke_subnets"
        set dstaddr "spoke_subnets" "hub_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow internal traffic going out to headquater and other spokes"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "virtual-wan-link"
        set dstintf "internal"
        set srcaddr "spoke_subnets" "hub_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow headquater and other spokes traffic coming in"
    next
end
```

Troubleshooting ADVPN and shortcut paths

Before spoke vs spoke shortcut VPN is established

Use the following CLI commands to check status before spoke vs spoke shortcut VPN is established.

```
# get router info bgp summary
BGP router identifier 2.2.2.2, local AS number 65505
BGP table version is 13
3 BGP AS-PATH entries
0 BGP community entries

Neighbor        V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.100.254   4      65505    3286    3270       11    0    0 00:02:15        5
10.10.200.254   4      65505    3365    3319       12    0    0 00:02:14        5

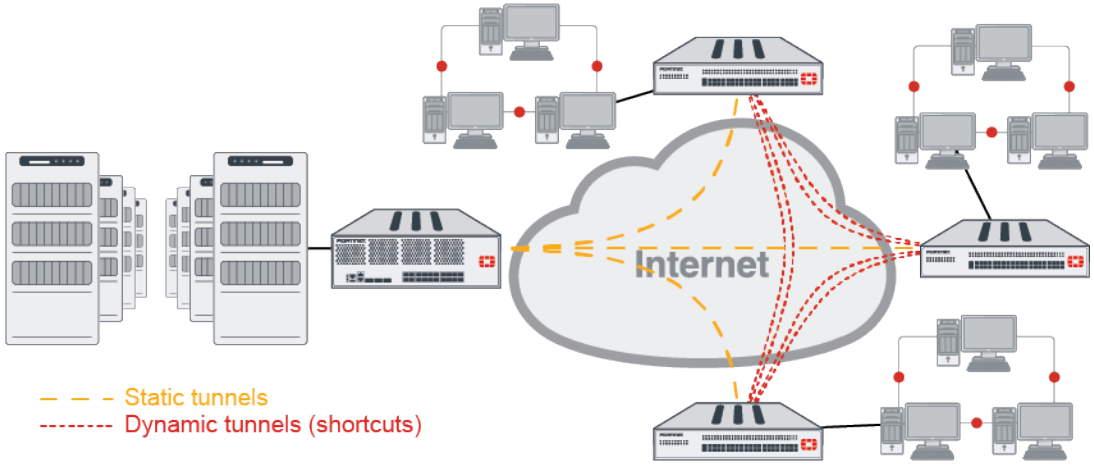
SD-WAN monitor on ADVPN shortcuts

SD-WAN monitors ADVPN shortcut link quality by dynamically creating link monitors for each ADVPN link. The dynamic link monitor on the spoke will use ICMP probes and the IP address of the gateway as the monitored server. These ICMP probes will not be counted as actual user traffic that keeps the spoke-to-spoke tunnel alive.



- When no shortcut is established:

```
# diagnose sys sdwan health-check
Health Check(ping):
Seq(1 tunnel-1): state(alive), packet-loss(0.000%) latency(0.038), jitter(0.006) sla_
map=0x3
Seq(2 tunnel-2): state(alive), packet-loss(0.000%) latency(0.035), jitter(0.004) sla_
map=0x3
```

- When one shortcut is established:

```
# diagnose sys sdwan health-check
Health Check(ping):
Seq(1 tunnel-1): state(alive), packet-loss(0.000%) latency(0.039), jitter(0.003) sla_
map=0x3
Seq(1 tunnel-1_0): state(alive), packet-loss(0.000%) latency(0.060), jitter(0.023) sla_
map=0x3
Seq(2 tunnel-2): state(alive), packet-loss(0.000%) latency(0.035), jitter(0.002) sla_
map=0x3
```

- When more than one shortcut is established:

```
# diagnose sys sdwan health-check
Health Check(ping):
Seq(1 tunnel-1): state(alive), packet-loss(0.000%) latency(0.036), jitter(0.004) sla_
map=0x3
Seq(1 tunnel-1_0): state(alive), packet-loss(0.000%) latency(0.041), jitter(0.009) sla_
map=0x3
Seq(2 tunnel-2): state(alive), packet-loss(0.000%) latency(0.030), jitter(0.005) sla_
map=0x3
Seq(2 tunnel-2_0): state(alive), packet-loss(0.000%) latency(0.031), jitter(0.004) sla_
map=0x3
```

Hold down time to support SD-WAN service strategies

In a hub and spoke SD-WAN topology with shortcuts created over ADVPN, a downed or recovered shortcut can affect which member is selected by an SD-WAN service strategy. When a downed shortcut tunnel recovers and the shortcut is added back into the service strategy, the shortcut is held at a low priority until the hold down time has elapsed.

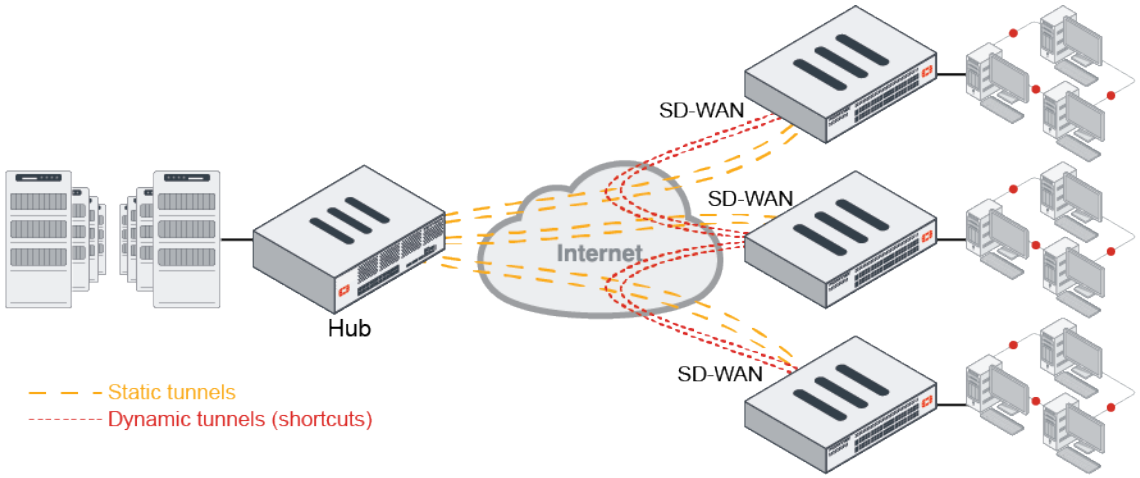
By default, the hold down time is zero seconds. It can be set to 0 - 10000000 seconds.

To configure the hold down time:

```
config system sdwan
    config service
        edit 1
            set hold-down-time <integer>
        next
    end
end
```

Example

In this example, the hold down time is set to 15 seconds, and then the SD-WAN service is looked at before and after the hold down elapses after a downed shortcut recovers.



To configure the hold down time:

```
config system sdwan
    config service
        edit 1
            set hold-down-time 15
        next
    end
end
```

To view which SD-WAN member is selected before and after the hold down time elapses:

Before the hold down time has elapsed:

```
# diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(34), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor(packet-
loss), link-cost-threshold(0), heath-check(ping)

```

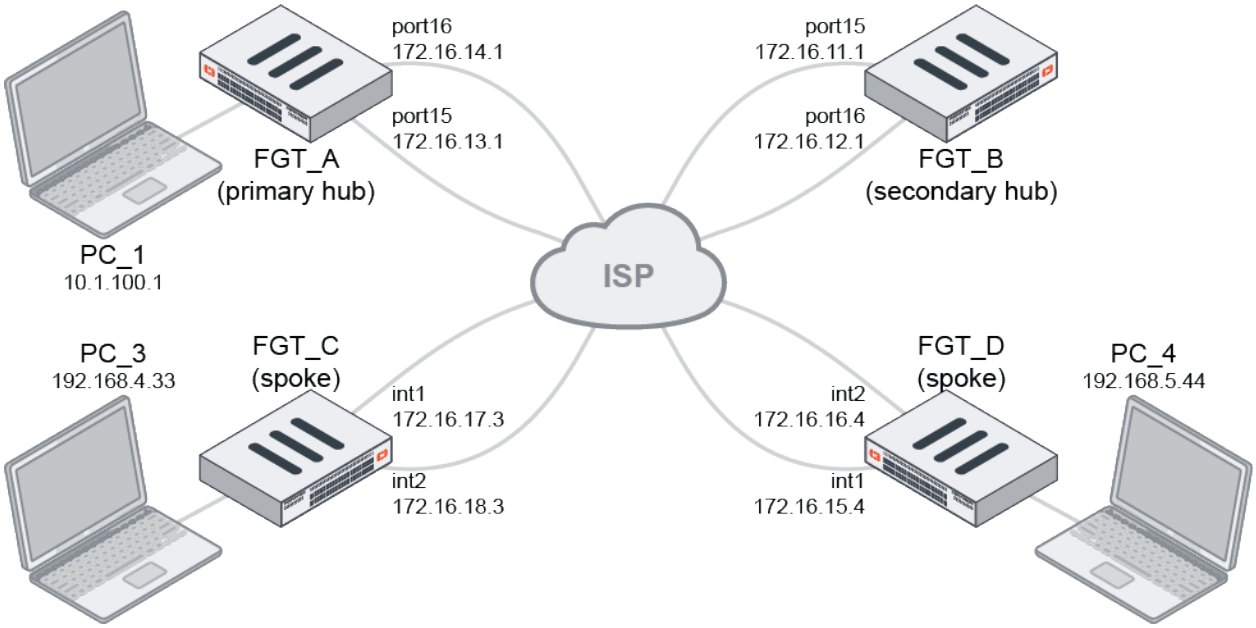
SD-WAN integration with OCVPN

OCVPN has the capability to enable SD-WAN in order to dynamically add its tunnel interfaces as SD-WAN members. Users can configure SD-WAN health checks and service rules to direct traffic over the OCVPN tunnels.

The following example uses a dual hub and spoke topology. Each hub and spoke has two WAN link connections to the ISP. The spokes generate two IPsec tunnels to each hub (four tunnels in total). BGP neighbors are established over each tunnel and routes from the hubs and other spokes learned from all neighbors, which forms an ECMP scenario. All tunnels are placed as SD-WAN members, so traffic can be distributed across tunnels based on the configured SD-WAN service rules.



To integrate SD-WAN with OCVPN in the GUI:

1. Configure the primary hub:
   a. Go to *VPN* > *Overlay Controller VPN* and set the *Status* to *Enable*.
   b. For *Role*, select *Primary Hub*.

c. Enter the WAN interfaces (*port15* and *port16*) and tunnel IP allocation block (*10.254.0.0/16*).

The WAN interface is position sensitive, meaning a tunnel will be created with the first position interface on the hub to the first position interface on the spoke, and so on. In this example, FGT_A (primary hub) will create two tunnels with FGT_C (spoke):

- FGT_A port15 <==> FGT_C internal1
- FGT_A port16 <==> FGT_C internal2

d. Enable *Auto-discovery shortcuts*.

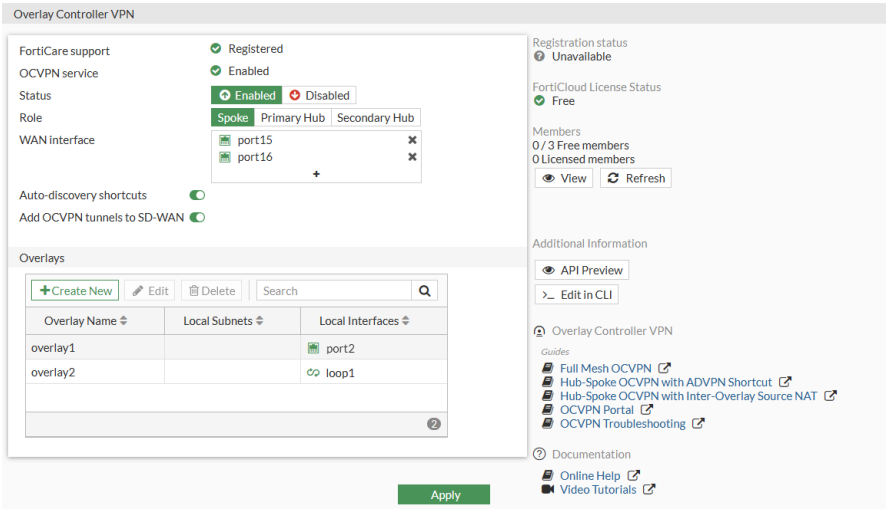
e. Enable *Add OCVPN tunnels to SD-WAN*. The IPsec tunnels will be added automatically to the SD-WAN members if SD-WAN is enabled.

2. Configure the overlays on the primary hub:

a. In the *Overlays* section, click *Create New*.

b. Enter a name and add the local interface (*port2*). Note the overlay is either based on local subnets or local interfaces, but not both.
By default, inter-overlay traffic is not enabled. Toggle *Allow traffic from other overlays* to enable it.

c. Click *OK* and repeat these steps to create the second overlay (*loop1*).



d. Click *Apply*.

3. Configure the secondary hub with the same settings as the primary hub.

4. Configure the spoke:

a. Go to *VPN* > *Overlay Controller VPN* and set the *Status* to *Enable*.

b. For *Role*, select *Spoke*.

c. Enter the WAN interfaces (*internal1* and *internal2*).

d. Enable *Auto-discovery shortcuts*.

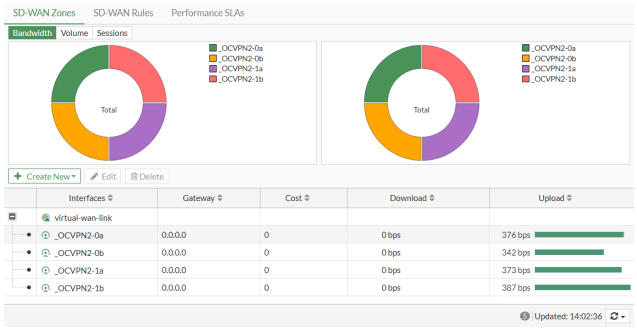
e. Enable *Add OCVPN tunnels to SD-WAN*. The IPsec tunnels will be added automatically to the SD-WAN members if SD-WAN is enabled.

f. Configure the overlays.

The overlay names on the spokes must match the names on the hub for the traffic to be allowed through the same overlay.

g. Click *Apply*.

5. Configure the other spoke with the same settings.
6. On a spoke, go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab to view the configuration generated by OCVPN.



Firewall policies will be automatically generated by OCVPN between the local interfaces and the SD-WAN interface. Each policy will define the proper local and remote networks for its source and destination addresses.

To integrate SD-WAN with OCVPN in the CLI:

1. Configure the primary hub:

```
config vpn ocvpn
    set role primary-hub
    set sdwan enable
    set wan-interface "port15" "port16"
    set ip-allocation-block 10.254.0.0 255.255.0.0
    config overlays
        edit "overlay1"
            config subnets
                edit 1
                    set type interface
                    set interface "port2"
                next
            end
        next
        edit "overlay2"
            config subnets
                edit 1
                    set type interface
                    set interface "loop1"
                next
            end
        next
    end
end
```

2. Configure the secondary hub with the same settings as the primary hub.
3. Configure the spoke:

```
config vpn ocvpn
    set status enable
    set sdwan enable
    set wan-interface "internal1" "internal2"
    config overlays
        edit "overlay1"
            config subnets
```

```
                edit 1
                    set type interface
                    set interface "wan2"
                next
            end
        next
        edit "overlay2"
            config subnets
                edit 1
                    set type interface
                    set interface "loop1"
                next
            end
        next
    end
end
```

4. Configure the other spoke with the same settings.
5. Configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "_OCVPN2-0a"
        next
        edit 2
            set interface "_OCVPN2-0b"
        next
        edit 3
            set interface "_OCVPN2-1a"
        next
        edit 4
            set interface "_OCVPN2-1b"
        next
    end
end
```

Firewall policies will be automatically generated by OCVPN between the local interfaces and the SD-WAN interface. Each policy will define the proper local and remote networks for its source and destination addresses.

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

To verify the integration is working after the ADVPN shortcut is triggered:

1. Check the routing table on the spoke:

```
FGT_C # get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
```

```
       * - candidate default

3. Check the SD-WAN state:

```
FGT_C # diagnose sys sdwan health-check
Health Check(Default_DNS):
Health Check(Default_Office_365):
Health Check(Default_Gmail):
Health Check(Default_AWS):
Health Check(Default_Google Search):
Health Check(Default_FortiGuard):
Health Check(ocvpn):
Seq(1 _OCVPN2-0a): state(alive), packet-loss(0.000%) latency(0.364), jitter(0.028) sla_
map=0x0
Seq(2 _OCVPN2-0b): state(alive), packet-loss(0.000%) latency(0.287), jitter(0.026) sla_
map=0x0
Seq(3 _OCVPN2-1a): state(dead), packet-loss(100.000%) sla_map=0x0
Seq(4 _OCVPN2-1b): state(dead), packet-loss(100.000%) sla_map=0x0
Seq(4 _OCVPN2-1b_0): state(alive), packet-loss(0.000%) latency(0.289), jitter(0.029)
sla_map=0x0
```

Forward error correction on VPN overlay networks

This topic shows an SD-WAN with forward error correction (FEC) on VPN overlay networks. FEC is a technique used to control and correct errors in data transmission by sending redundant data across the VPN. It uses six parameters in IPsec phase1/phase1-interface settings:

`fec-ingress`	Enable/disable Forward Error Correction for ingress IPsec traffic (default = disable).
`fec-egress`	Enable/disable Forward Error Correction for egress IPsec traffic (default = disable).
`fec-base`	The number of base Forward Error Correction packets (1 - 100, default = 20).
`fec-redundant`	The number of redundant Forward Error Correction packets (1 - 100, default = 10).
`fec-send-timeout`	The time before sending Forward Error Correction packets, in milliseconds (1 - 1000, default = 8).
`fec-receive-timeout`	The time before dropping Forward Error Correction packets, in milliseconds (1 - 1000, default = 5000).

For every `fec-base` number of sent packets, the tunnel will send `fec-redundant` number of redundant packets.

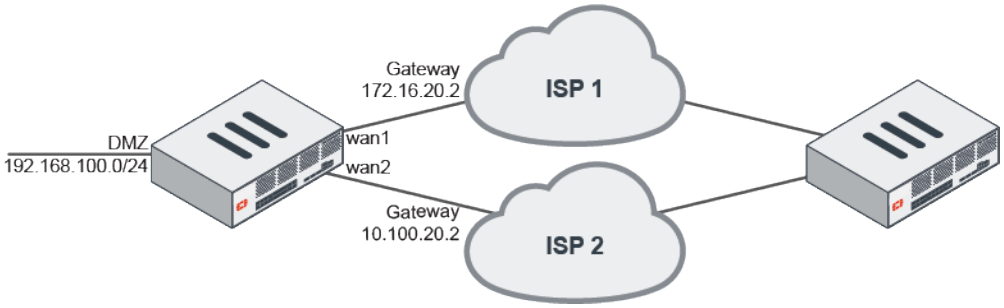
If your FortiGate is NPU capable, disable `npu-offload` in your phase1 configurations:

```
config vpn ipsec phase1-interface
    edit <name>
        set npu-offload disable
    next
end
```

Example

For example, a customer has two ISP connections, wan1 and wan2. Using these two connections, create two IPsec VPN interfaces as SD-WAN members. Configure FEC on each VPN interface to lower packet loss ratio by re-transmitting the

packets using its backend algorithm.



To configure IPsec VPN:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.201.2
        set psksecret ftnt1234
        set fec-egress enable
        set fec-send-timeout 8
        set fec-base 20
        set fec-redundant 10
        set fec-ingress enable
        set fec-receive-timeout 5000
    next
    edit "vd1-p2"
        set interface "wan2"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.202.2
        set psksecret ftnt1234
        set fec-egress enable
        set fec-send-timeout 8
        set fec-base 20
        set fec-redundant 10
        set fec-ingress enable
        set fec-receive-timeout 5000
    next
end
config vpn ipsec phase2-interface
    edit "vd1-p1"
        set phase1name "vd1-p1"
    next
    edit "vd1-p2"
        set phase1name "vd1-p2"
    next
end
```

To configure the interface:

```
config system interface
    edit "vd1-p1"
        set ip 172.16.211.1 255.255.255.255
        set remote-ip 172.16.211.2 255.255.255.255
    next
    edit "vd1-p2"
        set ip 172.16.212.1 255.255.255.255
        set remote-ip 172.16.212.2 255.255.255.255
    next
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "vd1-p1"
            set gateway 172.16.211.2
        next
        edit 1
            set interface "vd2-p2"
            set gateway 172.16.212.2
        next
    end
end
```

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

To use the diagnose command to check VPN FEC status:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
```

```
name=vd1 ver=1 serial=1 172.16.200.1:0->172.16.200.2:0

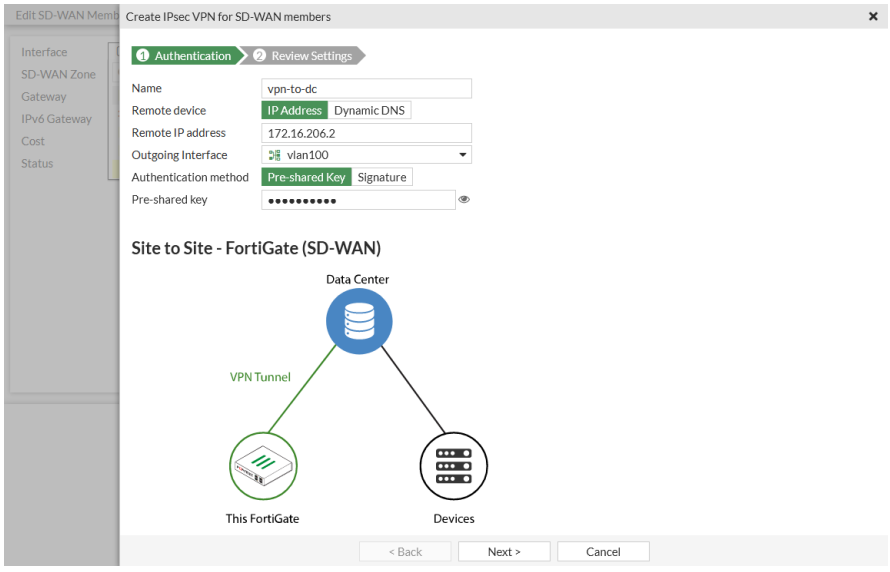
Dual VPN tunnel wizard

This wizard is used to automatically set up multiple VPN tunnels to the same destination over multiple outgoing interfaces. This includes automatically configuring IPsec, routing, and firewall settings, avoiding cumbersome and error-prone configuration steps.

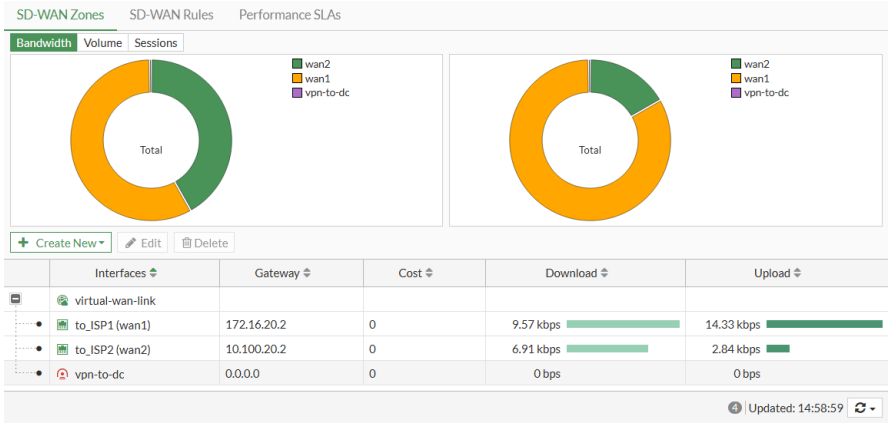
To create a new SD-WAN VPN interface using the tunnel wizard:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. In the *Interface* drop-down, click *+VPN*. The *Create IPsec VPN for SD-WAN members* pane opens.



3. Enter the required information, then click *Next*.
4. Review the settings then click *Create*.

5. Click *Close* to return to the SD-WAN page.
   The newly created VPN interface will be highlighted in the *Interface* drop-down list.
6. Select the VPN interface to add it as an SD-WAN member, then click *OK*.



Duplicate packets based on SD-WAN rules

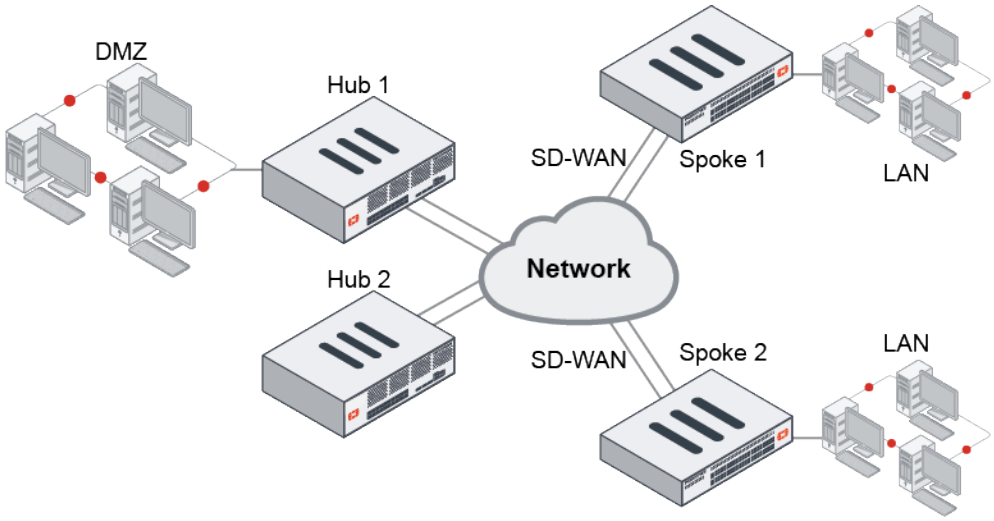
SD-WAN duplication rules can specify SD-WAN service rules to trigger packet duplication. This allows the duplication to occur based on an SD-WAN rule instead of the source, destination, and service parameters in the duplication rule.

1. Packets can be forced to duplicate to all members of the same SD-WAN zone. See Duplicate packets on other zone members on page 457 for details.

   For example, in Spoke 1 set `packet-duplication` to `force` so that when a client sends a packet to the server, it is duplicated to all members of the same zone as long as its health check is alive. If a members health check is dead, then the member is removed from the SD-WAN duplication zone.
2. Packets can be duplicated to other members of the SD-WAN zone only when the condition of the link is not good enough.

   Set `packet-duplication` to `on-demand` so that, when the SLA of the member does not match (sla_map=0) the packet is duplicated, but when the SLA does match (sla_map!=0) the packet is not duplicated.
3. Packets can be duplicated to all members of the same SD-WAN zone when the traffic matches one or more regular SD-WAN service rules.

The following example shows the third type of packet duplication.



In this example, SD-WAN is configured with three members: vpn1, vpn2, and vpn3. Service rule 1 controls all traffic from 10.100.20.0/24 to 172.16.100.0/24 using member 1.

To send a duplicate of the traffic that matches service rule 1 using member 2, members 1 and 2 are added to the same SD-WAN zone, and a duplicate rule is configured with service-id set to 1.

To send a duplicate of the traffic that matches service rule 1 using member 2:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "zone2"
        next
    end
    config members
        edit 1
            set interface "vpn1"
        next
        edit 2
            set interface "vpn2"
        next
        edit 3
            set interface "vpn3"
            set zone "zone2"
        next
    end
    config service
        edit 1
            set dst "172.16.100.0"
            set src "10.100.20.0"
            set priority-members 1
        next
    end
    config duplication
        edit 1
            set service-id 1
```

```
            set packet-duplication force
        next
    end
end
```

Duplicate packets on other zone members

When duplication rules are used, packets are duplicated on other good links within the SD-WAN zone and de-duplicated on the destination FortiGate. Use `force` mode to force duplication on other links within the SD-WAN zone, or use `on-demand` mode to trigger duplication only when SLA fails on the selected member.

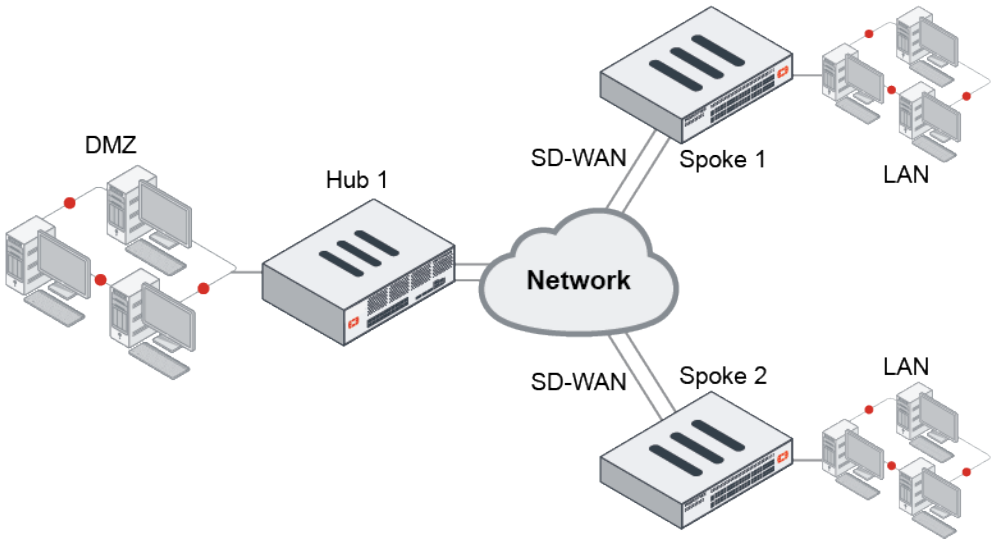
The duplication rule is configured in the CLI by using the `config duplication` command. The following options can be configured:

Parameter	Description
srcaddr	Source address or address group names.
dstaddr	Destination address or address group names.
srcaddr6	Source IPv6 address or IPv6 address group names.
dstaddr6	Destination IPv6 address or IPv6 address group names.
srcintf	Incoming (ingress) interfaces or zones.
dstintf	Outgoing (egress) interfaces or zones.
service	Service and service group names.
packet-duplication	Configure packet duplication method. • disable: Disable packet duplication (default). • force: Duplicate packets across all interface members of the SD-WAN zone. • on-demand: Duplicate packets across all interface members of the SD-WAN zone based on the link quality.
packet-de-duplication	Enable/disable discarding of packets that have been duplicated (default = disable).

The `duplication-max-num <integer>` option under `config system sdwan` is the maximum number of interface members that a packet is duplicated on in the SD-WAN zone (2 - 4, default = 2). If this value is set to 3, the original packet plus two more copies are created. If there are three member interfaces in the SD-WAN zone and the `duplication-max-num` is set to 2, the packet duplication follows the configuration order, so the packets are duplicated on the second member.

Example

The packet duplication feature works best in a spoke-spoke or hub-and-spoke topology. In this example, a hub-and-spoke ADVPN topology is used. Before shortcuts are established, Hub 1 forwards the duplicate packets from Spoke 1 to Spoke 2. Once shortcuts are established, Hub 1 is transparent, and duplicate packets are exchanged directly between the spokes.



To configure packet duplication between Spoke 1 and Spoke 2:

1. Configure Spoke 1:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "sdwanzone_v4"
        next
    end
    config members
        edit 1
            set interface "t1"
            set zone "sdwanzone_v4"
        next
        edit 4
            set interface "t21"
            set zone "sdwanzone_v4"
        next
        edit 2
            set interface "t2"
            set zone "sdwanzone_v4"
        next
    end
    config health-check
        edit "h1"
            set server "10.34.1.1"
            set interval 1000
            set failtime 10
            set members 1 2
            config sla
                edit 1
                    set packetloss-threshold 40
                next
            end
```

```
            next
        end
        config duplication
            edit 1
                set srcaddr "all"
                set dstaddr "all"
                set srcintf "port1"
                set dstintf "sdwanzone_v4"
                set service "ALL"
                set packet-duplication force
                set packet-de-duplication enable
            next
        end
    end
```

2. Configure Spoke 2 with similar settings.

Advanced configuration

The following topics provide instructions on SD-WAN advanced configuration:

- SD-WAN with FGCP HA on page 459
- Configuring SD-WAN in an HA cluster that uses the internal hardware switches on page 466
- SD-WAN configuration portability on page 469

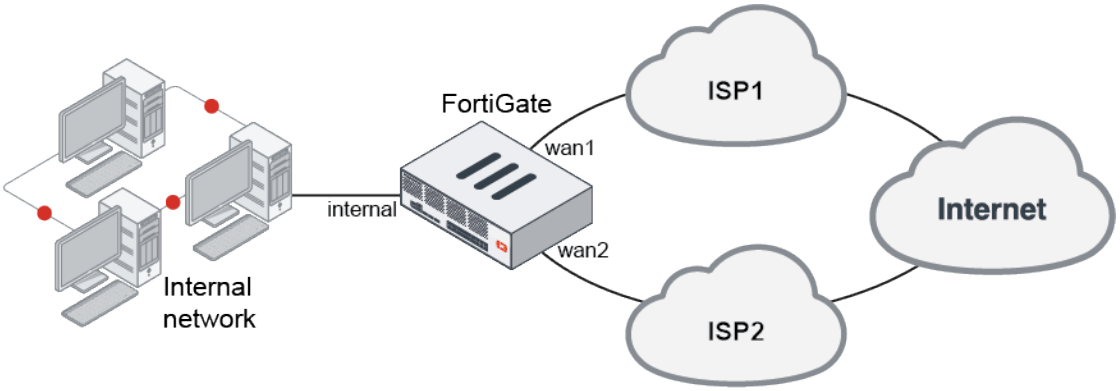
See also Per packet distribution and tunnel aggregation on page 1074.

SD-WAN with FGCP HA

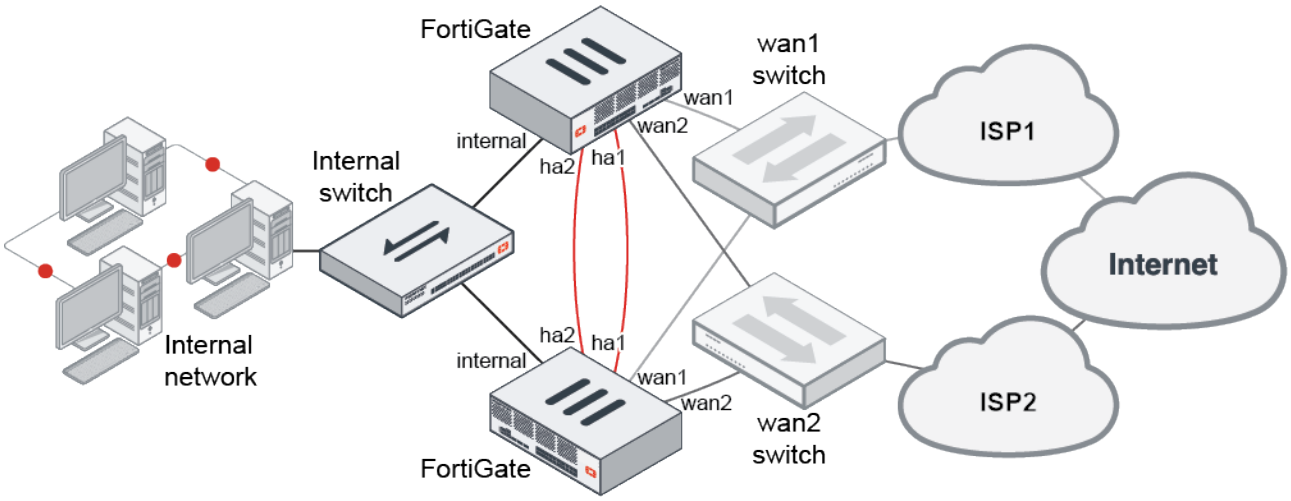
This example shows how to convert a standalone FortiGate SD-WAN solution to a FGCP HA cluster with full-mesh WAN set up. This configuration allows you to load balance your internet traffic between multiple ISP links. It also provides redundancy for your internet connection if your primary ISP in unavailable, or if one of the FortiGates in the HA cluster fails.

This example assumes that a standalone FortiGate has already been configured for SD-WAN by following the SD-WAN quick start on page 319.

Standalone FortiGate:



FGCP HA cluster:



The following devices are required to convert the topology to HA:

- A second FortiGate that is the same model running the same firmware version.
- Two switches for connecting each FortiGate's WAN interface to the corresponding ISP modem.

Before you begin:

- Ensure that the licenses and subscriptions on both HA members match.
- Ensure that there are one or more ports reserved for HA heartbeat.
- Ensure you have physical access to both HA members.

Enabling HA and re-cabling the WAN interfaces will cause network interruptions. This procedure should be performed during a maintenance window.

Configuring the standalone FortiGate for HA

After running the following commands, the FortiGate negotiates to establish an HA cluster. You might temporarily lose connectivity with the FortiGate as FGCP negotiations take place and the MAC addresses of the FortiGate interfaces are changed to HA virtual MAC addresses.

This configurations sets the HA mode to active-passive.

The ha1 and ha2 interfaces are configured as the heartbeat interfaces, with priorities set to 200 and 100 respectively. Setting different priorities for the heartbeat interfaces is a best practice, but is not required.

If you have more than one cluster on the same network, each cluster should have a different group ID. Changing the group ID changes the cluster interface's virtual MAC addresses. If the group IP causes a MAC address conflict on your network, select a different group ID.

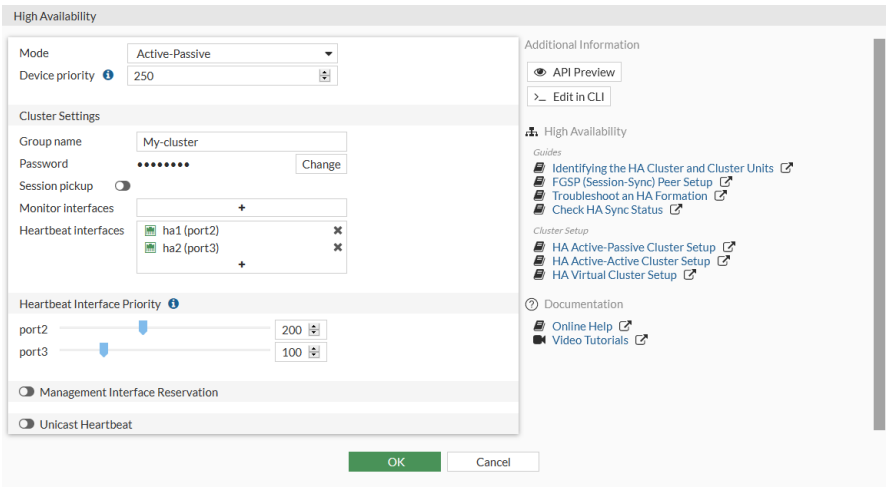
Enabling override and increasing the device priority means that this FortiGate always becomes the primary unit.

To configure the standalone FortiGate for HA in the GUI:

1. Go to *System* > *Settings* and change the *Host name* so that the FortiGate can be easily identified as the primary unit.
2. Go to *System* > *HA* and configure the following options:

Mode	Active-Passive
Device priority	250
Group name	My-cluster
Password	<password>
Heartbeat interfaces	ha1 and ha2
Heartbeat Interface Priority	**port2** (ha1): 200 **port3** (ha2): 100

Override and the group ID can only be configured from the CLI.



3. Click *OK*.
   Connectivity with the FortiGate will temporarily be lost.

To configure the standalone FortiGate for HA in the CLI:

1. Change the host name so that the FortiGate can be easily identified:

```
config system global
    set hostname primary_FG
end
```

2. Configure HA:

```
config system ha
    set mode a-p
    set group-id 100
```

```
    set group-name My-cluster
    set password <password>
    set priority 250
    set override enable
    set hbdev ha1 200 ha2 100
end
```

If HA mode does not start after running the above steps, ensure that none of the FortiGate's interfaces use DHCP or PPPoE addressing.

Configuring the secondary FortiGate for HA

The secondary FortiGate must be the same model and running the same firmware version as the primary FortiGate. The HA settings are the same as the for the primary unit, except the secondary device has a lower priority and override is not enabled.

It is best practice to reset the FortiGate to factory default settings prior to configuring HA. This reduces the chance of synchronization problems.

```
# execute factoryreset
This operation will reset the system to factory default!
Do you want to continue? (y/n) y
```

This is unnecessary if the device is new from the factory.

To configure the secondary FortiGate for HA in the GUI:

1. Go to *System* > *Settings* and change the *Host name* so that the FortiGate can be easily identified as the backup unit.
2. Go to *System* > *HA* and configure the options the same as for the primary FortiGate, except with a lower priority:

Mode	Active-Passive
Device priority	128
Group name	My-cluster
Password	<password>
Heartbeat interfaces	ha1 and ha2
Heartbeat Interface Priority	**port2** (ha1): 200 **port3** (ha2): 100

3. Click *OK*.

To configure the secondary FortiGate for HA in the CLI:

1. Change the host name so that the secondary FortiGate can be easily identified:

```
config system global
    set hostname secondary_FG
end
```

2. Configure HA:

```
config system ha
    set mode a-p
    set group-id 100
    set group-name My-cluster
    set password <password>
    set priority 128
    set hbdev ha1 200 ha2 100
end
```

Connecting the heartbeat interfaces between the FortiGates

To connect and check the heartbeat interfaces:

1. Connect the heartbeat interfaces ha1 and ha2 between the primary and secondary FortiGate.
   a. An HA primary device is selected. Because the primary FortiGate has a higher priority and override enabled, it assumes the role of HA primary.
   b. The secondary FortiGate synchronizes its configuration from the primary device.
2. Verify that the checksums match between the primary and secondary FortiGates:

```
# diagnose sys ha checksum cluster

================== FG5H0XXXXXXXXX0 ==================

is_manage_primary()=1, is_root_primary()=1
debugzone
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad

checksum
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad

================== FG5H0XXXXXXXXX1 ==================

is_manage_primary()=0, is_root_primary()=0
debugzone
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad

checksum
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad
```

If all of the cluster members have identical checksums, then their configurations are synchronized. If the checksums are not the same, wait for a few minutes, then repeat the command. Some parts of the configuration might take a significant amount of time to synchronize (tens of minutes).

Connecting other traffic interfaces

After the device configurations are synchronized, you can connect the rest of the traffic interfaces. Making these connections will disrupt traffic as cables are disconnected and reconnected.

Switches must be used between the cluster and the ISPs, and between the cluster and the internal network, as shown in the topology diagram.

Checking cluster operations

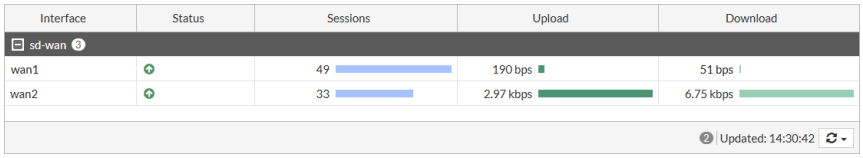
The *HA Status* dashboard widget shows the synchronization status. Hover over the host names of each FortiGate in the widget to verify that they are synchronized and have the same checksum.

To view more information about the cluster status, including the number of sessions passing through the cluster members, go to *System* > *HA*.

See Check HA synchronization status on page 1502 for more information.

Results

1. Browse the internet on a computer in the internal network.
2. Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab to see the bandwidth, volume, and sessions for traffic on the SD-WAN interfaces. See Results on page 324 for details.
3. Go to *Dashboard* > *Network*, and expand the *SD-WAN* widget to see information about each interface, such as the number of sessions and the bit rate.



Testing HA failover

All traffic should currently be flowing through the primary FortiGate. If it becomes unavailable, traffic fails over to the secondary FortiGate. When the primary FortiGate rejoins the cluster, the secondary FortiGate continues to operate as the primary FortiGate.

To test this, ping a reliable IP address from a computer in the internal network, and then power off the primary FortiGate.

There will be a momentary pause in the ping results until traffic diverts to the backup FortiGate, allowing the ping traffic to continue:

```
64 bytes from 184.25.76.114: icmp_seq=69 ttl=52 time=8.719 ms\
64 bytes from 184.25.76.114: icmp_seq=70 ttl=52 time=8.822 ms\
64 bytes from 184.25.76.114: icmp_seq=74 ttl=52 time=8.901 ms\
Request timeout for icmp_seq 75\
64 bytes from 184.25.76.114: icmp_seq=76 ttl=52 time=8.860 ms\
64 bytes from 184.25.76.114: icmp_seq=77 ttl=52 time=9.174 ms\
64 bytes from 184.25.76.114: icmp_seq=83 ttl=52 time=8.639 ms}
```

If you are using port monitoring, you can also unplug the primary FortiGate's internet facing interface to test failover.

After the secondary FortiGate becomes the primary, you can log into the cluster using the same IP address as before the fail over. If the primary FortiGate is powered off, you will be logged into the backup FortiGate. Check the host name to verify what device you have logged into. The FortiGate continues to operate in HA mode, and if you restart the primary FortiGate, it will rejoin the cluster and act as the backup FortiGate. Traffic is not disrupted when the restarted FortiGate rejoins the cluster.

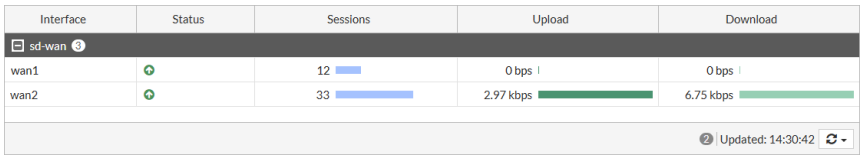
You can also use the CLI to force an HA failover. See Force HA failover for testing and demonstrations on page 1526 for information.

Testing ISP failover

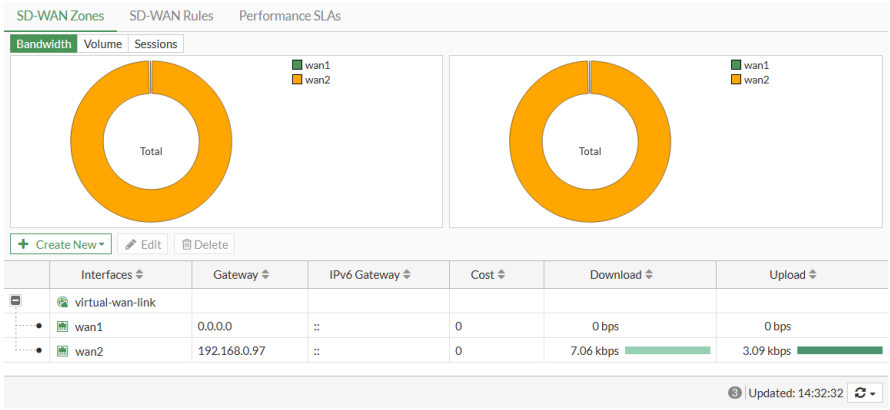
To test a failover of the redundant internet configuration, you need to simulate a failed internet connection to one of the ports. You can do this by disconnecting power from the wan1 switch, or by disconnecting the wan1 interfaces of both FortiGates from ISP1.

After disconnecting, verify that users still have internet access

- Go to *Dashboard* > *Network*, and expand the *SD-WAN* widget. The *Upload* and *Download* columns for wan1 show that traffic is not going through that interface.



- Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab. The *Bandwidth*, *Volume*, and *Sessions* tabs show that traffic is entirely diverted to wan2.



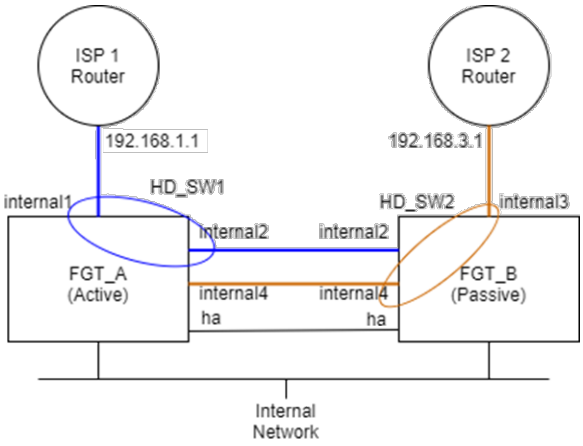
Users on the network should not notice the wan1 failure. If you are using the wan1 gateway IP address to connect to the administrator dashboard, it will appear as though you are still connecting through wan1.

After verifying a successful failover, reestablish the connection to ISP1.

Configuring SD-WAN in an HA cluster that uses the internal hardware switches

In this SD-WAN configuration, two FortiGates in an active-passive (A-P) HA pair are used to provide hardware redundancy. Instead of using external switches to provide a mesh network connection to the ISP routers, the FortiGates use their built-in hardware switches to connect to the ISP routers.

Only FortiGate models that have hardware switches can be used for this solution. Ports in a software switch are not in a forwarding state when a FortiGate is acting as a secondary device in a A-P cluster.



In this topology:

- Two hardware switches are created, HD_SW1 and HD_SW2.
- HD_SW1 is used to connect to ISP 1 Router and includes the internal1 and internal2 ports.
- HD_SW2 is used to connect to ISP 2 Router and includes the internal3 and internal4 ports.
- Another interface on each device is used as the HA heartbeat interface, connecting the two FortiGates in HA.

The FortiGates create two hardware switches to connect to ISP 1 and ISP2. When FGT_A is the primary device, it reaches ISP 1 on internal1 in HD_SW1 and ISP 2 on internal4 in HD_SW2. When FGT_B is the primary device, it reaches ISP 1 on internal2 in HD_SW1 and ISP 2 on internal3 on HD_SW2.

HA failover

This is not a standard HA configuration with external switches. In the case of a device failure, one of the ISPs will no longer be available because the switch that is connected to it will be down.

For example, If FGT_A loses power, HA failover will occur and FGT_B will become the primary unit. Its connection to internal2 on HD_SW1 will also be down, so it will be unable to connect to ISP 1. Its SD-WAN SLAs will be broken, and traffic will only be routed through ISP 2.

A link on a hardware switch cannot be monitored in HA monitor, so it is impossible to perform link failure when a port in either of the hardware switches fails. Performing a link failure is unnecessary in this configuration though, because any link failure on the hardware switch will be experienced by both cluster members. SD-WAN SLA health checks should be used to monitor the health of each ISP.

Failure on a hardware switch or ISP router

If a hardware switch or switch interface is down, or the ISP router is down, the SD-WAN can detect the broken SLA and continue routing to the other ISP.

For example, if FGT_A is the primary unit, and ISP 2 Router becomes unreachable, the SLA health checks on SD-WAN will detect the broken SLA and cause traffic to stop routing to ISP 2.

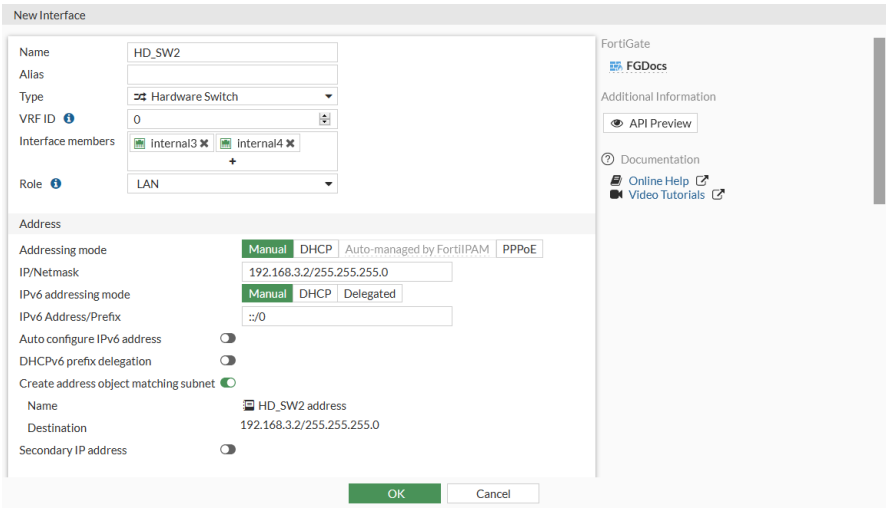
Configuration

To configure the HA A-P cluster with internal hardware switches:

1. Configure two FortiGates with internal switches in an A-P HA cluster (follow the steps in HA active-passive cluster setup on page 1507), starting by connecting the heartbeat interface.
2. When the HA cluster is up, connect to the primary FortiGate's GUI.
3. Remove the existing interface members from the default hardware switch:
   a. Go to *Network* > *Interfaces*.
   b. In the *LAN* section, double-click the *internal* interface to edit it.
   c. In *Interface Members*, remove all of the interfaces
   d. Click *OK*.
4. Configure the hardware switch interfaces for the two ISPs:
   a. Go to *Network* > *Interfaces* and click *Create New* > *Interface*.
   b. Enter a name (*HD_SW1*).
   c. Set *Type* to *Hardware Switch*.
   d. In *Interface Members*, add two interfaces (*internal1* and *internal2*).
   e. Set *IP/Netmask* to 192.168.1.2/24.
   f. Configure the remaining settings as needed.

   g. Click *OK*.
   h. Repeat these steps to create a second hardware switch interface (*HD_SW2*) with two interface members

(*internal3* and *internal4*) and *IP/Netmask* set to *192.168.3.2/24*.



To connect the devices as shown in the topology:

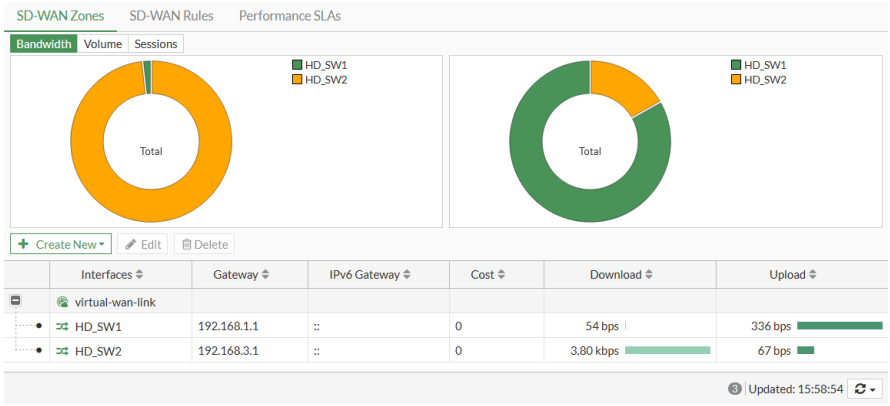
1. Connect the incoming interface to the internal switch on both FortiGates.
2. On FGT_A, connect internal1 of HD_SW1 to ISP 1 Router.
3. On FGT_B, connect internal3 of HD_SW2 to ISP 2 Router.
4. For HD_SW1, connect FGT_A internal2 directly to FGT_B internal2.
5. For HD_SW2, connect FGT_A internal4 directly to FGT_B internal4.

To configure SD-WAN:

The primary FortiGate makes all the SD-WAN decisions.

---

1. On the primary FortiGate, go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. In the *Interface* dropdown, select *HD_SW1*.
3. Leave *SD-WAN Zone* set to *virtual-wan-link*.
4. Enter the *Gateway* address *192.168.1.1*.
5. Click *OK*.
6. Repeat these steps to add the second interface (*HD_SW2*) with the gateway *192.168.3.1*.
7. Click *Apply*.



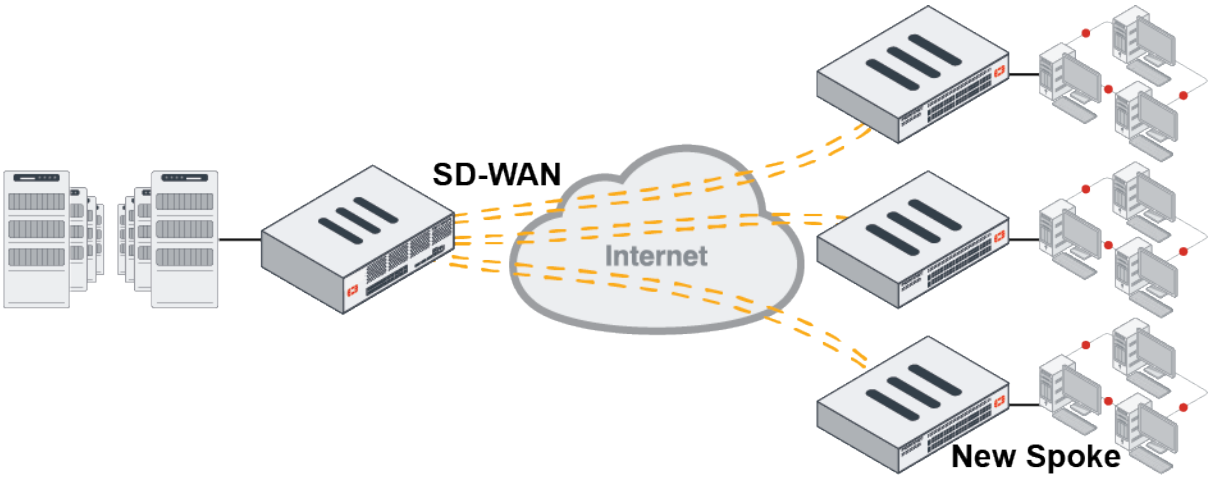
8. Create a health check:
   a. Go to *Network* > *SD-WAN*, select the *Performance SLA* tab, and click *Create New*.
   b. Set *Name* to *GW_HC*.
   c. Set *Protocol* to *Ping* and *Servers* to *8.8.8.8*.
   d. Set *Participants* to *All SD-WAN Members*.
   e. Enable *SLA Target* and leave the default values.
   f. Click *OK*.
9. Create SD-WAN rules as needed. The SLA health check can be used to determine when the ISP connections are in or out of SLA, and to failover accordingly.

SD-WAN configuration portability

When configuring SD-WAN, adding interfaces to members is optional.

This allows the SD-WAN to be configured without associating any interfaces to SD-WAN members. It also allows a configuration to be copied directly from one device to another, without requiring the devices to have interfaces with the same names.

After the configuration is created, add interfaces to the members make it functional.

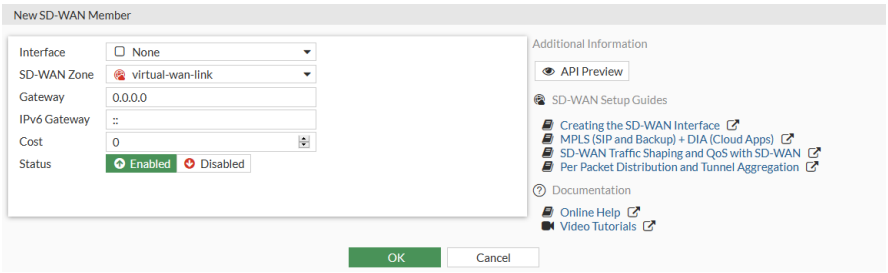


Example 1

In this example, we create a template with two SD-WAN members configured without assigned interfaces that are used in a performance SLA and SD-WAN rule. The template can be used to configure new devices, as in Example 2 on page 473. Interfaces are then assigned to the members, and the configuration becomes active.

To create the SD-WAN members in the GUI:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. Leave all the settings set to their default values and click *OK*.



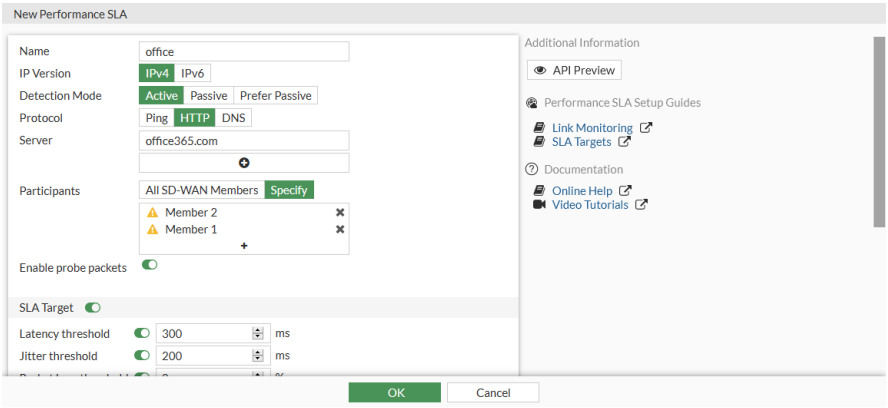
3. Repeat the above steps to create a second member.
   The empty members are listed on the *SD-WAN Zones* tab.

   The members are disabled until interfaces are configured, but can still be used in performance SLAs and SD-WAN rules.

To create a performance SLA in the GUI:

1. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.
2. Click *Create New*.

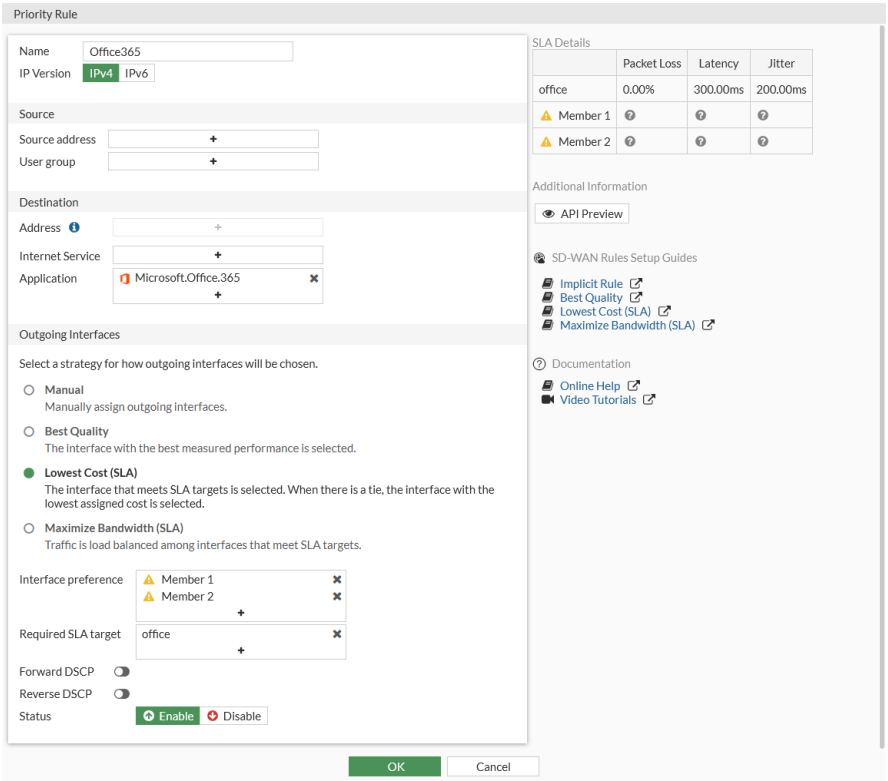
3. Configure the performance SLA, specifying the empty members as participants.



4. Click *OK*.

To create an SD-WAN rule in the GUI:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Configure the rule, adding both members to the *Interface preference* field:

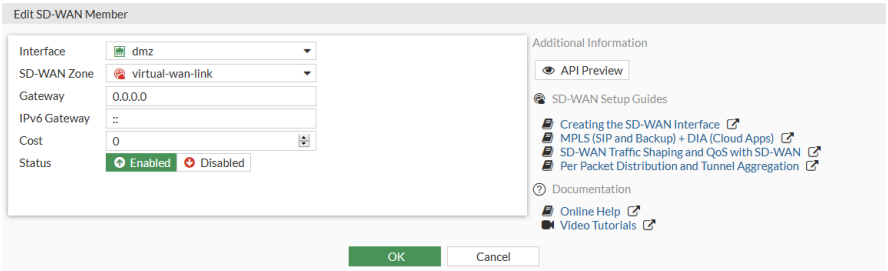


3. Click *OK*.

To assign interfaces to the SD-WAN members in the GUI:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab.
2. Edit the first member

3. Set *Interface* to an actual interface.



4. Click *OK*.
5. Repeat the above steps to assign an interface to the second member.

To configure the SD-WAN in the CLI:

1. Create SD-WAN members:

```
config system sdwan
    set status enable
    config members
        edit 1
        next
        edit 2
        next
    end
end
```

2. Create a health check (performance SLA):

```
config system sdwan
    config health-check
        edit "office"
            set server "office365.com"
            set protocol http
            set sla-fail-log-period 300
            set sla-pass-log-period 300
            set members 2 1
            config sla
                edit 1
                    set latency-threshold 300
                    set jitter-threshold 200
                next
                edit 2
                    set link-cost-factor latency
                    set latency-threshold 20
                next
            end
        next
    end
end
```

3. Create a service (rule):

```
config system sdwan
    config service
        edit 3
            set name "Office365"
```

```
                set mode sla
                set internet-service enable
                set internet-service-app-ctrl 33182
                config sla
                    edit "office"
                        set id 2
                    next
                end
                set priority-members 1 2
            next
        end
    end
```

The SD-WAN configuration can now be used in as a template for new spokes, as in Example 2 on page 473.

To assign interfaces to the SD-WAN members in the CLI:

```
config system sdwan
    config members
        edit 1
            set interface "_OCVPN4-0.0"
        next
        edit 2
            set interface "_OCVPN4-0.1"
        next
    end
end
```

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

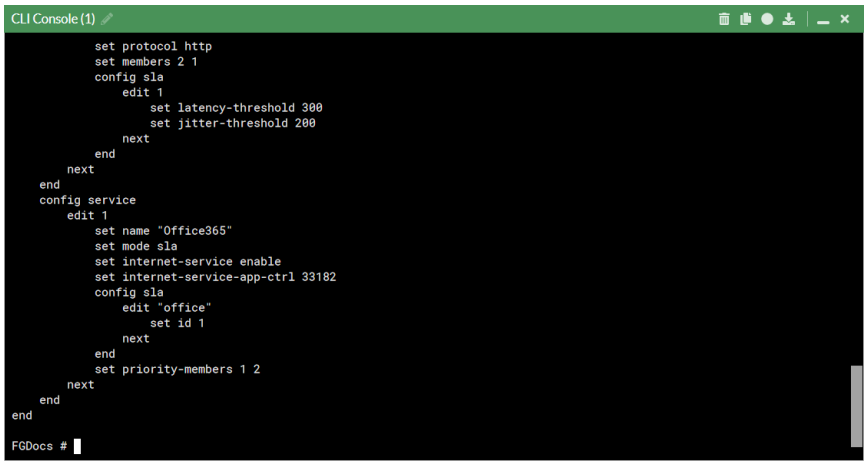
Example 2

In this example, the configuration from Example 1 is copied onto a new FortiGate.

Using the CLI console and the GUI

To copy the SD-WAN configuration from the original FortiGate:

1. Optionally, change the console screen paging setting. See Screen paging on page 32 for details.
2. Open the CLI console.
3. If necessary, click *Clear console* to empty the console.
4. Enter the following command:
   `show system sdwan`
5. Either click *Download* and open the file in a text editor, or click *Copy to clipboard* and paste the content into a text editor.



6. Edit the CLI configuration as necessary. For example, the first line that shows the `show` command should be deleted, and the default health checks can be removed.
7. If required, save the CLI configuration as a text file.

To paste the SD-WAN configuration onto a new FortiGate:

1. Copy the SD-WAN configuration from the text editor.
2. On the new FortiGate, open the CLI console.
3. Press *Ctrl* + *v* to paste the CLI commands.
4. In necessary, press *Enter* to apply the last `end` command.
   The SD-WAN configuration is copied to the new FortiGate.
   If the interfaces do not exist, the SD-WAN members are created without interfaces, and are disabled until interfaces are configured.

To assign interfaces to the SD-WAN members:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab.
2. Edit the first member
3. Set *Interface* to an actual interface.
4. Click *OK*.
5. Repeat the above steps to assign an interface to the second member.

Using a terminal emulator

The following instructions use PuTTy. The steps may vary in other terminal emulators.

To copy the SD-WAN configuration from the original FortiGate:

1. Connect to the FortiGate. See Connecting to the CLI on page 25 for details.
2. Enter the following command:
   ```
   show system sdwan
   ```
3. Select the output, press *Ctrl* + *c* to copy it, and then paste it into a text editor.
4. Edit the CLI configuration as necessary. For example, the default health checks can be removed.
5. If required, save the CLI configuration as a text file.

To paste the SD-WAN configuration onto a new FortiGate:

1. Connect to the new FortiGate. See Connecting to the CLI on page 25 for details.
2. Copy the SD-WAN configuration from the text editor.
3. Right-click to paste the SD-WAN configuration.
4. In necessary, press *Enter* to apply the last `end` command.
   The SD-WAN configuration is copied to the new FortiGate.

   If the interfaces do not exist, the SD-WAN members are created without interfaces, and are disabled until interfaces are configured.

To assign interfaces to the SD-WAN members in the CLI:

```
config system sdwan
    config members
        edit 1
            set interface "_OCVPN4-0.0"
        next
        edit 2
            set interface "_OCVPN4-0.1"
        next
    end
end
```

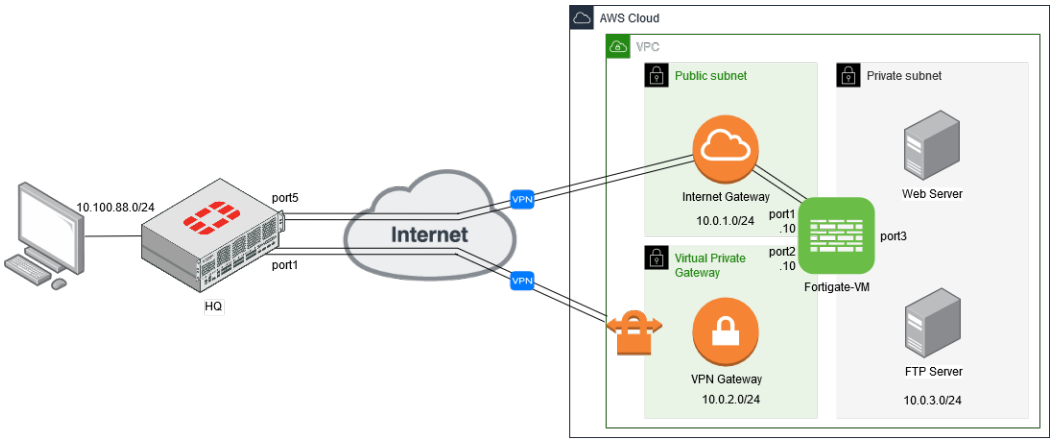
If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

SD-WAN cloud on-ramp

In this example, you configure a connection to a new cloud deployment that has some remote servers. SD-WAN is used to steer traffic through the required overlay tunnel.

The on-premise FortiGate has two internet connections, each with a single VPN connection. The two VPN gateways are configured on the cloud for redundancy, one terminating at the FortiGate-VM, and the other at the native AWS VPN Gateway.

This example uses AWS as the Infrastructure as a Service (IaaS) provider, but the same configuration can also apply to other services. A full mesh VPN setup is not shown, but can be added later if required.



To connect to the servers that are behind the cloud FortiGate-VM, virtual IP addresses (VIPs) are configured on port2 to map to the servers:

- VPN traffic terminating on port1 is routed to the VIP on port2 to access the web servers.
- VPN traffic terminating on the VPN gateway accesses the VIPs on port2 directly.

There are four major steps to configure this setup:

1. Configuring the VPN overlay between the HQ FortiGate and cloud FortiGate-VM on page 476
2. Configuring the VPN overlay between the HQ FortiGate and AWS native VPN gateway on page 481
3. Configuring the VIP to access the remote servers on page 484
4. Configuring the SD-WAN to steer traffic between the overlays on page 487

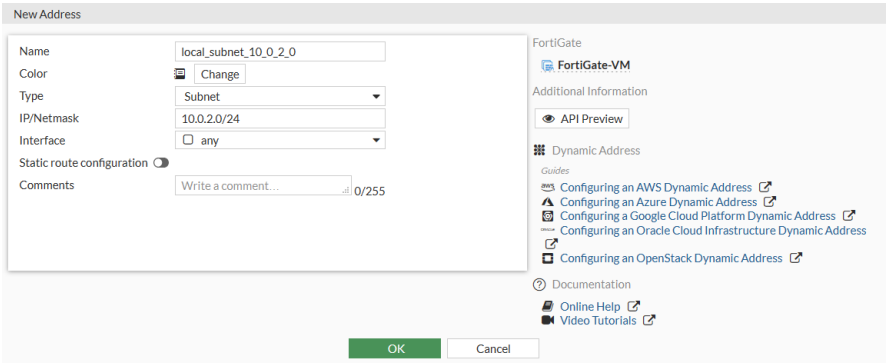
After the configuration is complete, verify the traffic to ensure that the configuration is working as expected, see Verifying the traffic on page 491.

Configuring the VPN overlay between the HQ FortiGate and cloud FortiGate-VM

Configure the cloud FortiGate-VM

To create an address for the VPN gateway:

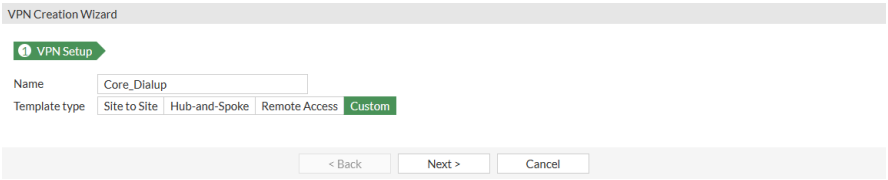
1. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
2. Set *Name* to *local_subnet_10_0_2_0*.
3. Set *IP/Netmask* to *10.0.2.0/24*.



4. Click *OK*.

To configure a custom IPsec VPN:

1. Go to *VPN* > *IPsec Wizard*.
2. Set *Name* to *Core_Dialup*.
3. Set *Template type* to *Custom*.

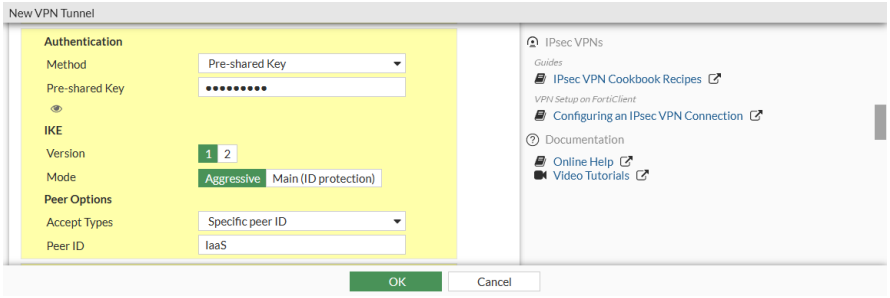


4. Click *Next*.
5. Configure *Network* settings:

Remote Gateway	Dialup User
Interface	port1
NAT Traversal	Enable

6. Configure *Authentication* settings:

Method	Pre-shared Key
Pre-shared Key	Enter the pre-shared key.
Version	1
Mode	Aggressive This setting allows the peer ID to be specified.
Accept Types	Specific peer ID
Peer ID	IaaS The other end of the tunnel needs to have its local ID set to IaaS.



7. Leave the default *Phase 1 Proposal* settings and disable *XAUTH*.

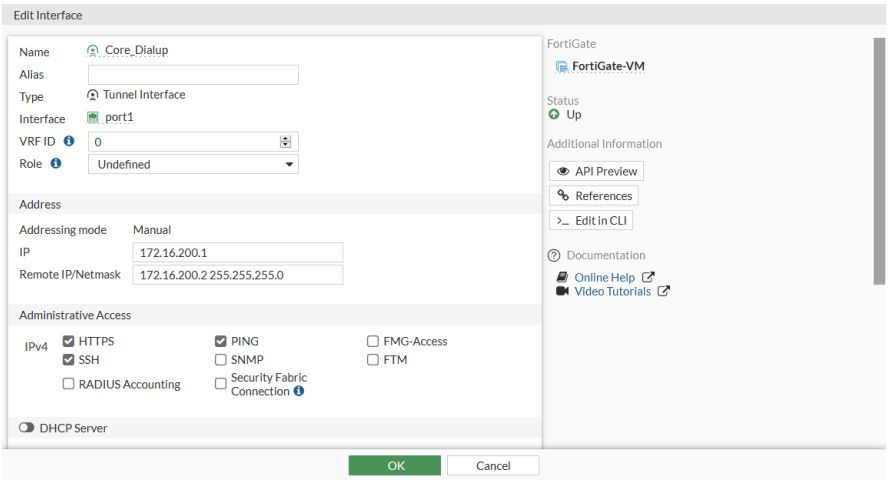
8. Configure the *Phase 2 Selector* settings:

Name	Ent_Core
Local Address	Named Address - *local_subnet_10_0_2_0*
Remote Address	Named Address - *all* This setting allows traffic originating from both the remote subnet 10.100.88.0 and the health checks from the VPN interface on the remote FortiGate. For increased security, each subnet can be specified individually.

9. Click *OK*.

To configure remote and local tunnel IP addresses:

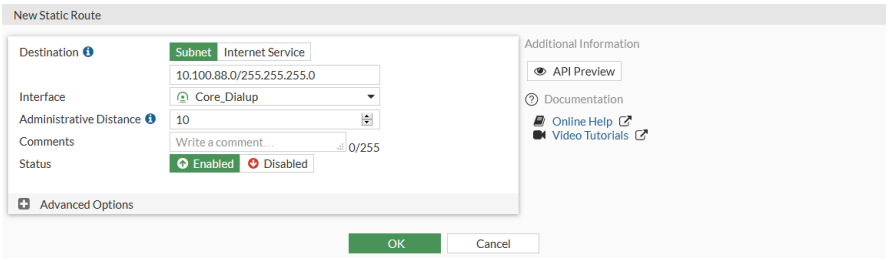
1. Go to *Network* > *Interfaces* and edit the *Core_Dialup* interface under *port1*.
2. Set *IP* to *172.16.200.1*.
3. Set *Remote IP/Netmask* to *172.16.200.2 255.255.255.0*. This is where remote health check traffic will come from.
4. Enable *Administrative access* for *HTTPS*, *PING*, and *SSH*.



5. Click *OK*.

To configure a route to the remote subnet through the tunnel:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Set *Destination* to *Subnet* and enter the IP address and netmask: *10.100.88.0/255.255.255.0*.
3. Set *Interface* to *Core_Dialup*.

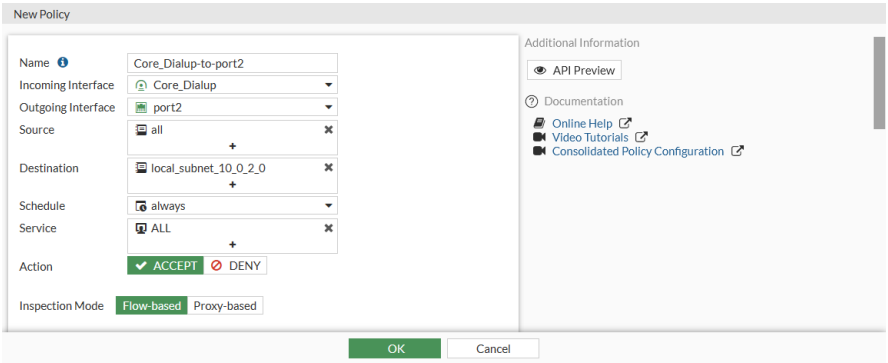


4. Click *OK*.

To configure a firewall policy to allow traffic from the tunnel to port2:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

Name	Core_Dialup-to-port2
Incoming Interface	Core_Dialup
Outgoing Interface	port2
Source	all
Destination	local_subnet_10_0_2_0
Schedule	always
Service	ALL
Action	ACCEPT



3. Configure the remaining settings as required.
4. Click *OK*.

Configure the HQ FortiGate

To create an address for the VPN gateway:

1. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
2. Set *Name* to *remote_subnet_10_0_2_0*.
3. Set *IP/Netmask* to *10.0.2.0/24*.
4. Click *OK*.

To configure a custom IPsec VPN:

1. Go to *VPN* > *IPsec Wizard*.
2. Set *Name* to *FGT_AWS_Tun*.
3. Set *Template type* to *Custom*.
4. Click *Next*.
5. Configure *Network* settings:

Remote Gateway	Static IP Address
IP Address	100.21.29.17
Interface	port5
NAT Traversal	Enable

6. Configure *Authentication* settings:

Method	Pre-shared Key
Pre-shared Key	Enter the pre-shared key.
Version	1
Mode	Aggressive This setting allows the peer ID to be specified.
Accept Types	Any peer ID

7. Leave the default *Phase 1 Proposal* settings, except set *Local ID* to *IaaS*.
8. Disable *XAUTH*.
9. Configure the *Phase 2 Selector* settings:

Name	FGT_AWS_Tun
Local Address	Named Address - *all* This setting allows traffic originating from both the local subnet 10.100.88.0 and the health checks from the VPN interface. For increased security, each subnet can be specified individually.
Remote Address	Named Address - *remote_subnet_10_0_2_0*

10. Click *OK*.

To configure local and remote tunnel IP addresses:

1. Go to *Network* > *Interfaces* and edit the *FGT_AWS_Tun* interface under *port5*.
2. Set *IP* to *172.16.200.2*.
3. Set *Remote IP/Netmask* to *172.16.200.1 255.255.255.0*.
4. Enable *Administrative access* for *HTTPS*, *PING*, and *SSH*.
5. Click *OK*.

Routing is defined when creating the SD-WAN interface. The firewall policy is created after the SD-WAN interface is defined.

Configuring the VPN overlay between the HQ FortiGate and AWS native VPN gateway

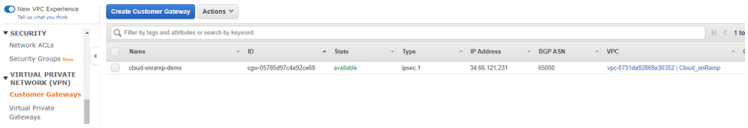
This example uses static routing. It is assumed that the AWS VPN Gateway is already configured, and that proper routing is applied on the corresponding subnet.

Verify the AWS configuration

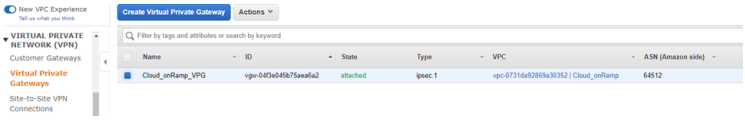
See Creating routing tables and associate subnets in the AWS Administration Guide for configuration details.

To check the AWS configuration:

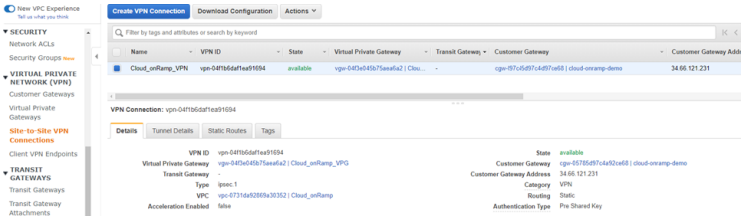
1. Go to *Virtual Private Network (VPN)* > *Customer Gateways* to confirm that the customer gateway defines the FortiGate IP address as its Gateway IP address, in this case *34.66.121.231*.



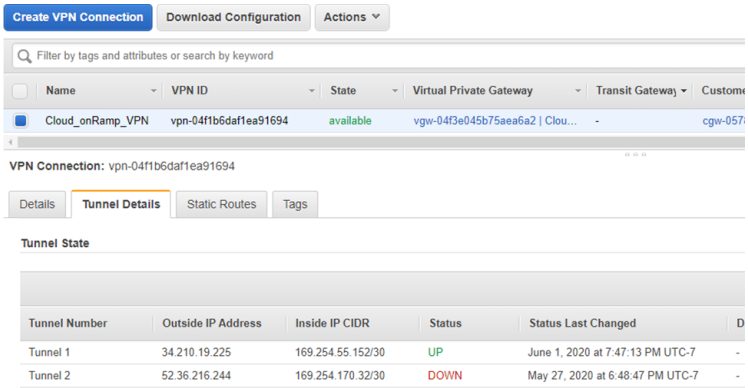
2. Go to *Virtual Private Network (VPN)* > *Virtual Private Gateways* to confirm that a virtual private gateway (VPG) has been created. In this case it is attached to the *Cloud_onRamp* VPC that contains the FortiGate and servers.



3. Go to *Virtual Private Network (VPN)* > *Site-to-Site VPN Connections* to confirm that site-to-site VPN connections have been created and attached to the customer gateway and virtual private gateway.
If *Routing Options* is *Static*, the IP prefix of the remote subnet on the HQ FortiGate (10.100.88.0) is entered here.



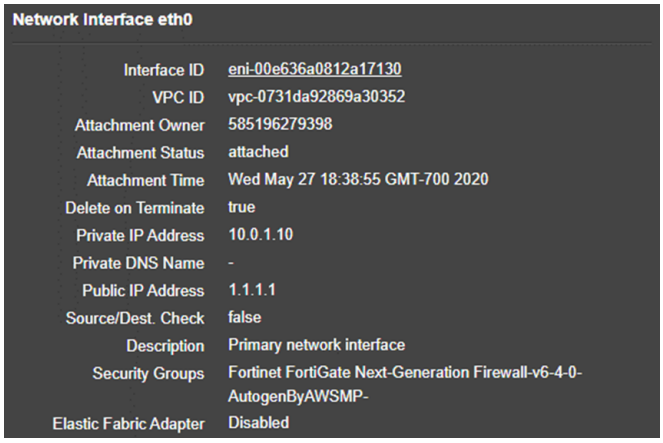
AWS site-to-site VPN always creates two VPN tunnels for redundancy. In this example, only Tunnel 1 is used.



4. Click *Download Configuration* to download the FortiGate's tunnel configurations. The configuration can be referred to when configuring the FortiGate VPN.

5. The new VPG is attached to your VPC, but to successfully route traffic to the VPG, proper routing must be defined. Go to *Virtual Private Cloud* > *Subnets*, select the *Cloud-OnRamp-VPN*, and select the *Route Table* tab to verify that there are at least two routes to send traffic over the VPG.

   - *169.254.0.0/24* defines the tunnel IP address. Health check traffic originating from the FortiGate will come from this IP range.
   - *10.100.0.0/16* defines the remote subnet from the HQ FortiGate.
   - Both routes point to the just created VPG *vgw-04xxxx*.
6. On the cloud FortiGate-VM EC2 instances, ensure that port1 and port2 both have *Source/Dest. Check* set to *false*. This allows the FortiGate to accept and route traffic to and from a different network.
   If you launched the instance from the AWS marketplace, this setting defaults to *true*.

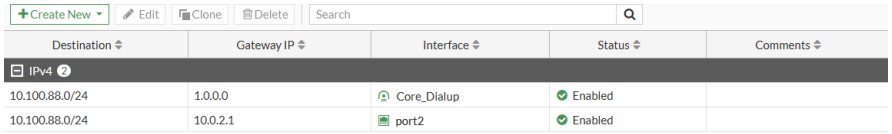


Configure routing to the VPG on the cloud FortiGate-VM

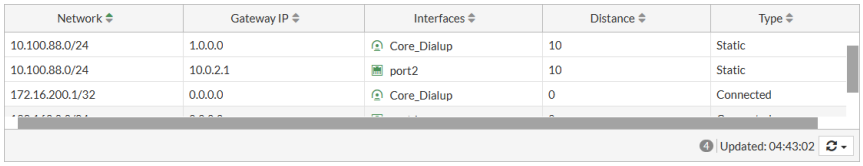
To configure routing to the VPG on the cloud FortiGate-VM:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Set *Destination* to *Subnet* and enter the IP address and netmask: *10.100.88.0/255.255.255.0*.
3. Set *Gateway Address* to *Specify* and enter *10.0.2.1*.

4. Set *Interface* to *port2*.
   The new route must have the same *Administrative Distance* as the route that was created for traffic through the *Core_Dialup* tunnel to ensure that both routes are added to the routing table (see To configure a route to the remote subnet through the tunnel).
   The *Gateway Address* is arbitrarily set to 10.0.2.1. The VPG does not have an IP address, but the address defined here allows the FortiGate to route traffic out of port2, while AWS routes the traffic based on its routing table.
5. Click *OK*.
6. Go to *Network* > *Static Routes* to view the configured static routes:



7. If *Optimal* dashboards is selected, go to *Dashboard* > *Network* and expand the Routing widget to view the routing table.
   If *Comprehensive* dashboards is selected, go to *Dashboard* > *Routing Monitor* and select *Static & Dynamic* in the widget toolbar to view the routing table:



Configure IPsec VPN on the HQ FortiGate

To configure a custom IPsec VPN:

1. Go to *VPN* > *IPsec Wizard*.
2. Set *Name* to *AWS_VPG*.
3. Set *Template type* to *Custom*.
4. Click *Next*.
5. Configure *Network* settings:

Remote Gateway	Static IP Address
IP Address	34.210.19.225 This address is taken from the downloaded AWS configuration file.
Interface	port1
NAT Traversal	Enable

6. Configure *Authentication* settings:

Method	Pre-shared Key
Pre-shared Key	Enter the pre-shared key.
Version	1
Mode	Main

7. Configure the *Phase 1 Proposal* settings using information from the downloaded AWS configuration file.

8. Disable *XAUTH*.
9. Configure the *Phase 2 Selector* settings:

Name	AWS_VPG
Local Address	Named Address - *all* This setting allows traffic originating from both the local subnet 10.100.88.0 and the health checks from the VPN interface. For increased security, each subnet can be specified individually.
Remote Address	Named Address - *remote_subnet_10_0_2_0*

10. Click *OK*.

To configure local and remote tunnel IP addresses:

1. Go to *Network* > *Interfaces* and edit the *AWS_VPG* interface under *port1*.
2. Set *IP* to *169.254.55.154*.
3. Set *Remote IP/Netmask* to *169.254.55.153 255.255.255.0*.
4. Enable *Administrative access* for *HTTPS* and *PING*.
5. Click *OK*.

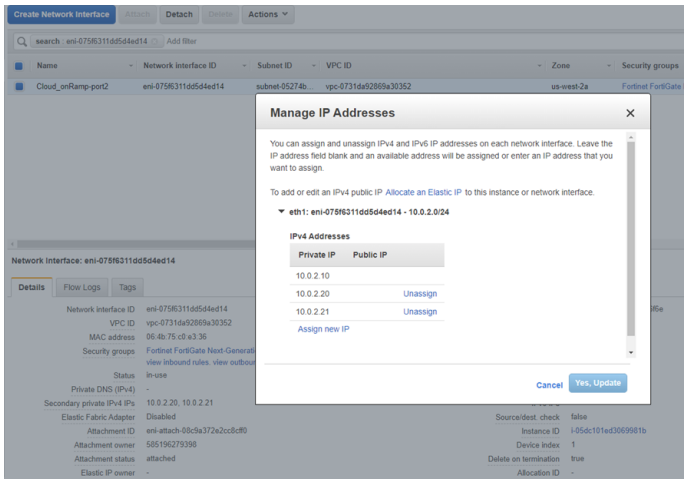
Routing is defined when creating the SD-WAN interface. The firewall policy is created after the SD-WAN interface is defined.

Configuring the VIP to access the remote servers

VIPs, interface IP addresses, and policies are created on the cloud FortiGate-VM to allow access to the remote servers.

To configure additional private IPs on AWS for the FortiGate VIP:

1. On the FortiGate EC2 instance, edit the *Elastic Network Interface* that corresponds to *port2*. In this example, Network Interface *eth1*.
2. Go to *Actions* > *Manage IP Addresses*.
3. Add two private IP address in the 10.0.2.0/24 subnet.
   These address will be used in the VIPs on the FortiGate. This ensures that traffic to these IP addresses is routed to the FortiGate by AWS.

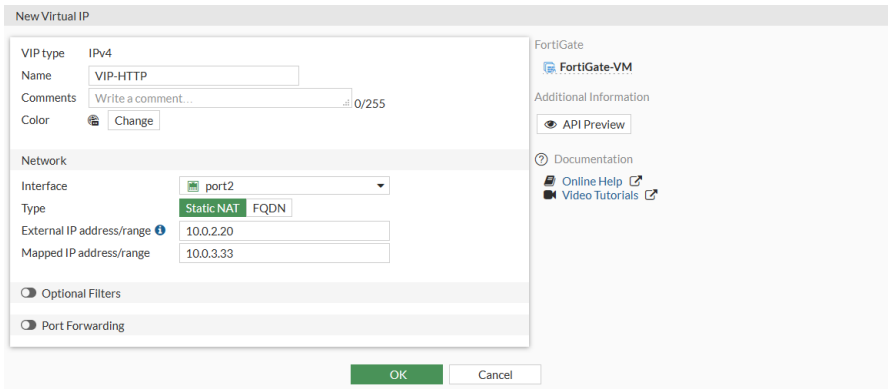


4. Click *Yes, Update*.

To configure VIPs on the cloud FortiGate-VM:

1. Go to *Policy & Objects* > *Virtual IPs* and click *Create New* > *Virtual IP*.
2. Configure the following:

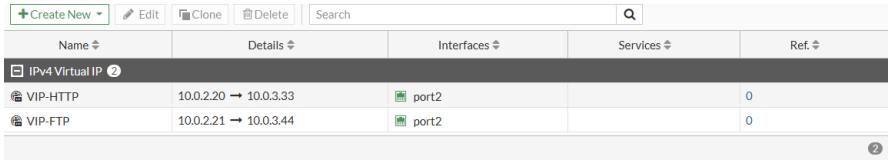
Name	VIP-HTTP
Interface	port2
External IP address/range	10.0.2.20
Mapped IP address/range	10.0.3.33



3. Click *OK*.

4. Create a second VIP for the FTP server with the following settings:

Name	VIP-FTP
Interface	port2
External IP address/range	10.0.2.21
Mapped IP address/range	10.0.3.44



To configure firewall policies to allow traffic from port2 to port3:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

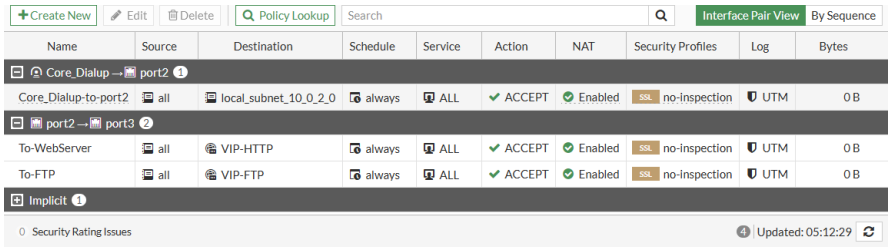
Name	To-WebServer
Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	VIP-HTTP
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled

3. Configure the remaining settings as required.
4. Click *OK*.
5. Create a second policy for the FTP VIP with the following settings:

Name	To-FTP
Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	VIP-FTP
Schedule	always
Service	ALL
Action	ACCEPT

NAT	Enabled

6. Click *OK*.



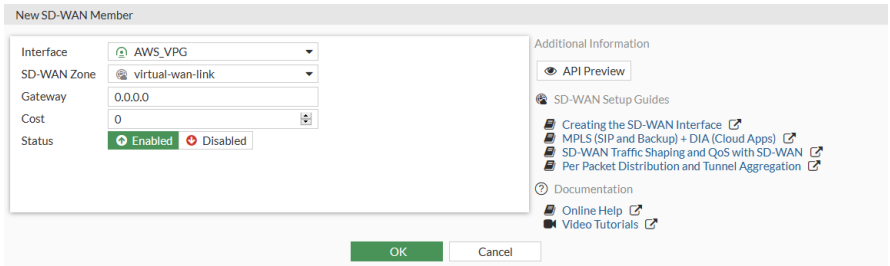
Configuring the SD-WAN to steer traffic between the overlays

Configure the HQ FortiGate to use two overlay tunnels for SD-WAN, steering HTTPS and HTTP traffic through the FGT_AWS_Tun tunnel, and SSH and FTP throguh the AWS_VPG tunnel.

1. Add SD-WAN member interfaces
2. Configure a route to the remote network
3. Configure firewall policies
4. Configure a health check
5. Configure SD-WAN rules

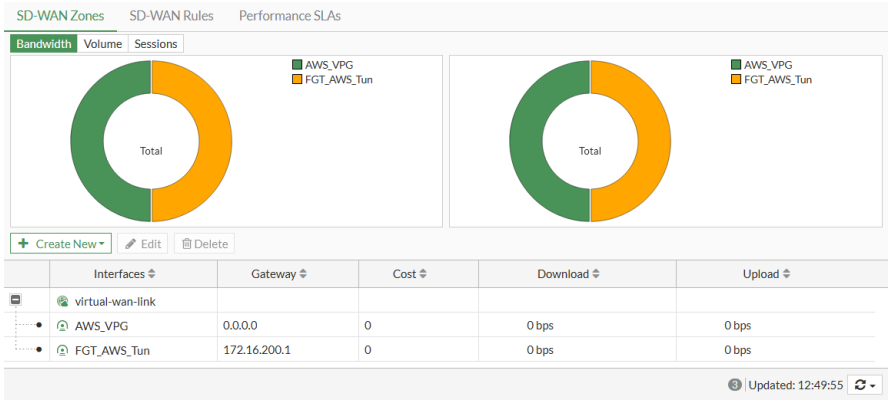
To add SD-WAN member interfaces:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. Set *Interface* to *AWS_VPG* then click *OK*.



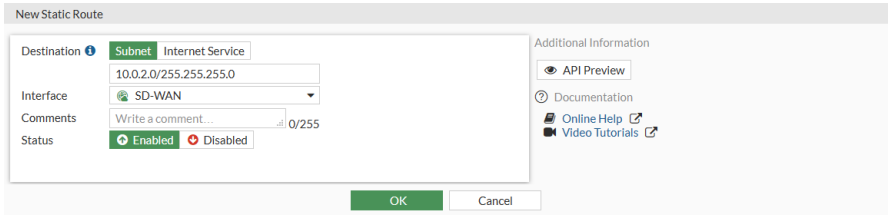
3. Click *Create New* > *SD-WAN Member* again.
4. Set *Interface* to *FGT_AWS_Tun*.
5. Set *Gateway* to *172.16.200.1*.

6. Click *OK*.



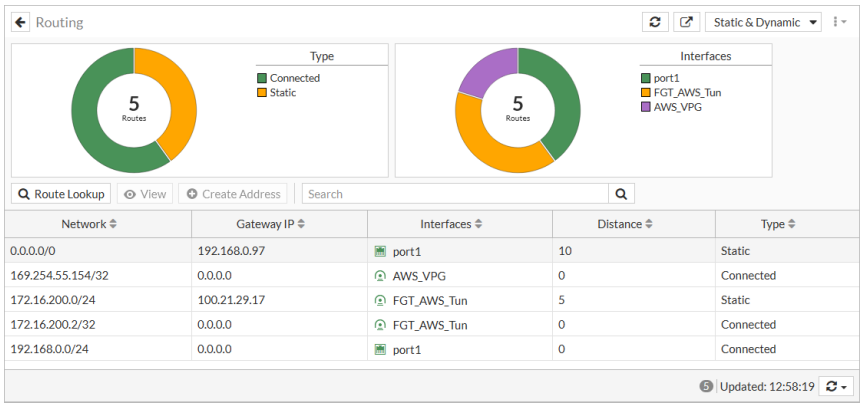
To configure a route to the remote network 10.0.2.0/24:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Set *Destination* to *Subnet* and enter the IP address and netmask: *10.0.2.0/255.255.255.0*.
3. Set *Interface* to *SD-WAN*.



4. Click *OK*.

   Individual routes to each tunnel are automatically added to the routing table with the same distance:



To configure firewall policies to allow traffic from the internal subnet to SD-WAN:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

Name	ISFW-to-IaaS

Incoming Interface	port3
Outgoing Interface	virtual-wan-link
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled

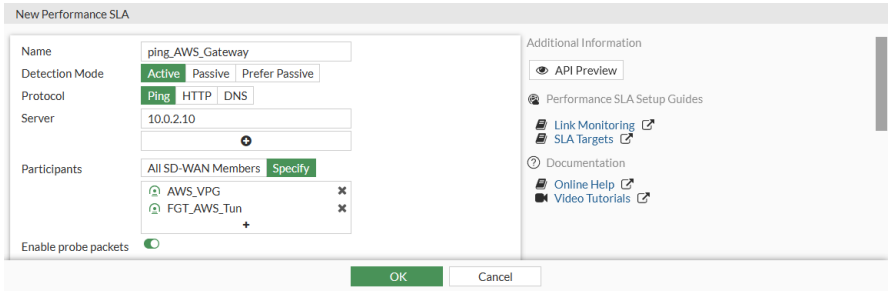
3. Configure the remaining settings as required.
4. Click *OK*.
   Once the firewall policies are configured, the VPN tunnels should come up when there is traffic.

To configure a health check to monitor the status of the tunnels:

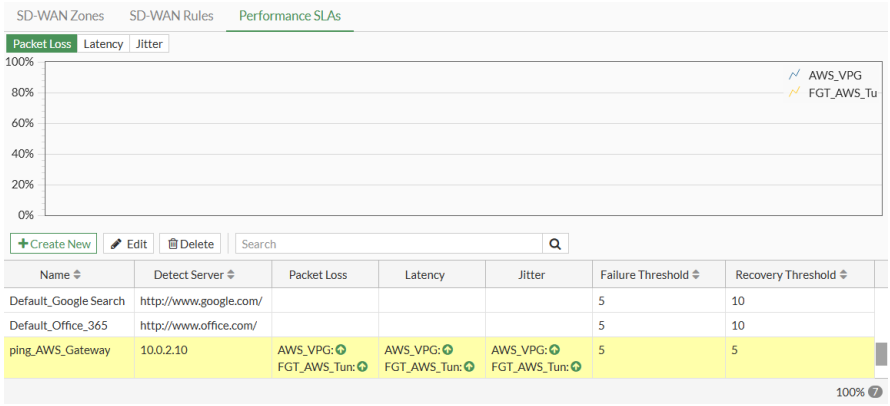
As you are accessing the servers on the 10.0.2.0/24 subnet, it is preferable to use the FortiGate port2 interface as the ping server for detection. This ensures that, if the gateway is not reachable in either tunnel, its routes are brought down and traffic continues on the other tunnel.

1. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, and click *Create New*.
2. Configure the following:

Name	ping_AWS_Gateway
Protocol	Ping
Server	10.0.2.10
Participants	Specify Add AWS_VPG and FGT_AWS_Tun as participants.



3. Click *OK*.



Health check probes originate from the VPN interface's IP address. This is why the phase2 selectors are configured with *Local Address* set to *all*.

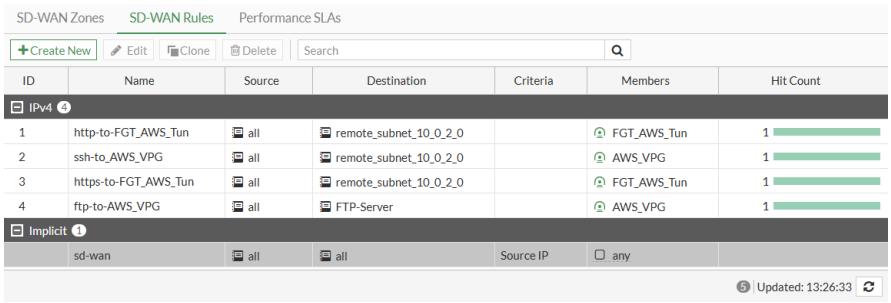
To configure SD-WAN rules to steer traffic:

HTTPS and HTTP traffic is steered to the FGT_AWS_Tun tunnel, and SSH and FTP traffic is steered to the AWS_VPG tunnel. The Manual algorithm is used in this example.

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Configure the following:

Name	http-to-FGT_AWS_Tun
Source Address	all
Address	remote_subnet_10_0_2_0
Protocol	TCP
Port range	80 - 80
Outgoing Interfaces	Manual
Interface preference	FGT_AWS_Tun

3. Click *OK*.
4. Create other SD-WAN rules as required:



Verifying the traffic

To verify that pings are sent across the IPsec VPN tunnels

- On the HQ FortiGate, run the following CLI command:

```
# diagnose sniffer packet any 'host 10.0.2.10' 4 0 1 interfaces=[any]
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.0.2.10]
pcap_snapshot: snaplen raised from 0 to 262144
2021-06-05 11:35:14.822600 AWS_VPG out 169.254.55.154 -> 10.0.2.10: icmp: echo request
2021-06-05 11:35:14.822789 FGT_AWS_Tun out 172.16.200.2 -> 10.0.2.10: icmp: echo request
2021-06-05 11:35:14.877862 FGT_AWS_Tun in 10.0.2.10 -> 172.16.200.2: icmp: echo reply
2021-06-05 11:35:14.878887 AWS_VPG in 10.0.2.10 -> 169.254.55.154: icmp: echo reply
```

- On the cloud FortiGate-VM, run the following CLI command:

```
# diagnose sniffer packet any 'host 10.0.2.10' 4 0 1 interfaces=[any]
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.0.2.10]
pcap_snapshot: snaplen raised from 0 to 262144
2021-06-05 11:37:57.176329 port2 in 169.254.55.154 -> 10.0.2.10: icmp: echo request
2021-06-05 11:37:57.176363 port2 out 10.0.2.10 -> 169.254.55.154: icmp: echo reply

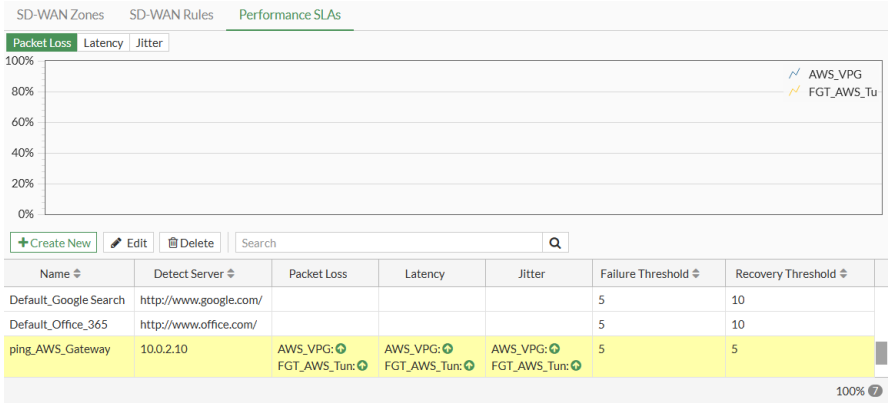
2021-06-05 11:37:57.176514 Core_Dialup out 10.0.2.10 -> 172.16.200.2: icmp: echo reply
```

To verify the SLA health checks on the HQ FortiGate:

1. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, select *Packet Loss*, and click the *ping_AWS_Gateway* SLA:

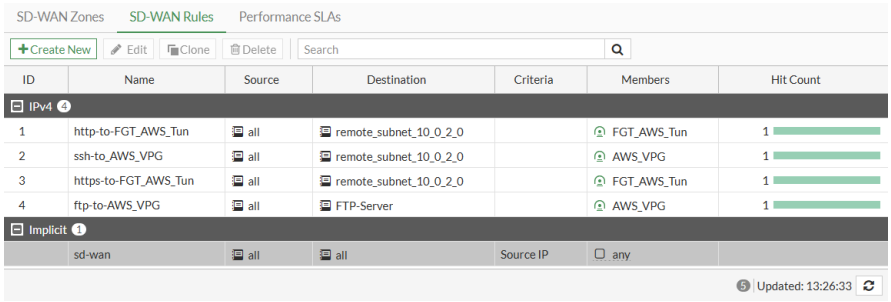


2. Run the following CLI command:

```
# diagnose sys sdwan health-check
…
Seq(1 AWS_VPG): state(alive), packet-loss(0.000%) latency(56.221), jitter(0.290) sla_
map=0x0
Seq(2 FGT_AWS_Tun): state(alive), packet-loss(0.000%) latency(55.039), jitter(0.223)
sla_map=0x0
```

To verify service rules:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab:



2. Run the following CLI command:

```
# diagnose sys sdwan service

Service(1): Address Mode(IPV4) flags=0x0
  Gen(1), TOS(0x0/0x0), Protocol(6: 80->80), Mode(manual)
  Members:
    1: Seq_num(2 FGT_AWS_Tun), alive, selected
  Src address:
        0.0.0.0-255.255.255.255
  Dst address:
        10.0.2.0-10.0.2.255

Service(2): Address Mode(IPV4) flags=0x0
  Gen(1), TOS(0x0/0x0), Protocol(6: 22->22), Mode(manual)

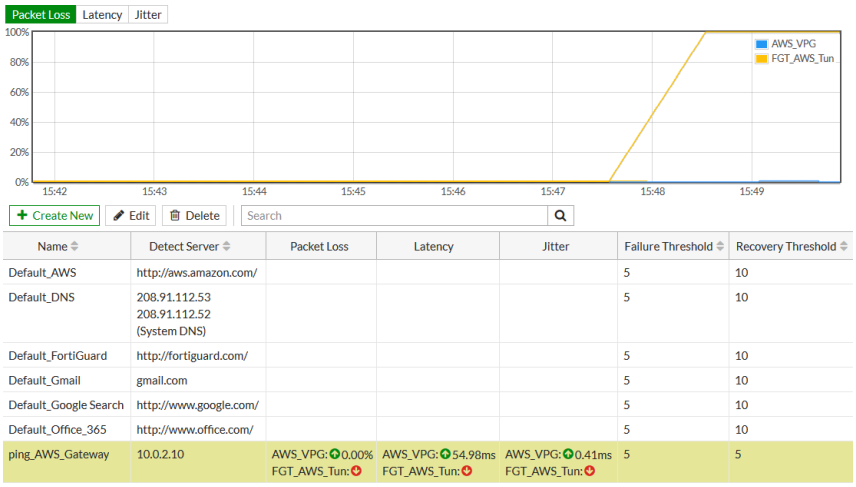
To simulate an issue on an overlay VPN tunnel:

On the cloud FortiGate-VM, disable the firewall policy allowing Core_Dialup to port2.

1. Health-checks through the FGT_AWS_Tun tunnel fail:
   a. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, select *Packet Loss*, and click the *ping_AWS_Gateway* SLA:



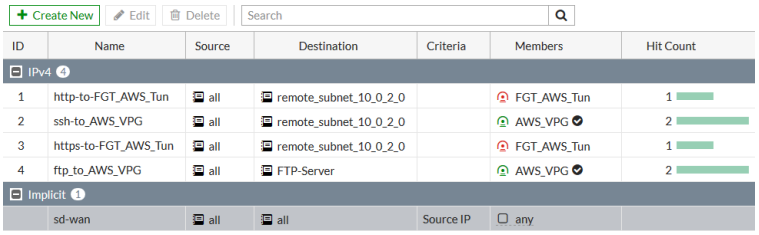
Name	Detect Server	Packet Loss	Latency	Jitter	Failure Threshold	Recovery Threshold
Default_AWS	http://aws.amazon.com/				5	10
Default_DNS	208.91.112.53 208.91.112.52 (System DNS)				5	10
Default_FortiGuard	http://fortiguard.com/				5	10
Default_Gmail	gmail.com				5	10
Default_Google Search	http://www.google.com/				5	10
Default_Office_365	http://www.office.com/				5	10
ping_AWS_Gateway	10.0.2.10	AWS_VPG: 0.00% FGT_AWS_Tun:	AWS_VPG: 54.98ms FGT_AWS_Tun:	AWS_VPG: 0.41ms FGT_AWS_Tun:	5	5

b. Run the following CLI command:

```
# diagnose sys sdwan health-check
…
Seq(1 AWS_VPG): state(alive), packet-loss(0.000%) latency(52.746), jitter(0.713) sla_
map=0x0
Seq(2 FGT_AWS_Tun): state(dead), packet-loss(19.000%) sla_map=0x0
```

2. Service rules show that the member is down:

a. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab:



ID	Name	Source	Destination	Criteria	Members	Hit Count
IPv4 4						
1	http-to-FGT_AWS_Tun	all	remote_subnet_10_0_2_0		FGT_AWS_Tun	1
2	ssh-to_AWS_VPG	all	remote_subnet_10_0_2_0		AWS_VPG	2
3	https-to-FGT_AWS_Tun	all	remote_subnet_10_0_2_0		FGT_AWS_Tun	1
4	ftp_to_AWS_VPG	all	FTP-Server		AWS_VPG	2
Implicit 1						
	sd-wan	all	all	Source IP	any	

b. Run the following CLI command:

```
# diagnose sys sdwan service

Service(1): Address Mode(IPV4) flags=0x0
  Gen(2), TOS(0x0/0x0), Protocol(6: 80->80), Mode(manual)
  Members:
    1: Seq_num(2 FGT_AWS_Tun), dead
  Src address:
        0.0.0.0-255.255.255.255
  Dst address:
        10.0.2.0-10.0.2.255

Service(2): Address Mode(IPV4) flags=0x0
  Gen(1), TOS(0x0/0x0), Protocol(6: 22->22), Mode(manual)

npu_state=0x3041008
total session 2
```

4. Routes to the *FGT_AWS_Tun* tunnel are removed:
   a. If *Optimal* dashboards is selected, go to *Dashboard* > *Network* and expand the Routing widget to view the routing table.
   If *Comprehensive* dashboards is selected, go to *Dashboard* > *Routing Monitor* and select *Static & Dynamic* in the widget toolbar to view the routing table:

Network	Gateway IP	Interfaces	Distance	IP Version	Type
IPv4 40					
0.0.0.0/0	10.100.64.254	Internet_A (port1)	1	IPv4	Static
0.0.0.0/0	10.100.65.254	Internet_B (port5)	1	IPv4	Static
10.0.2.0/24	169.254.55.153	AWS_VPG	1	IPv4	Static
10.0.10.0/24	0.0.0.0	VPN_A_Tunnel (Branch-HQ-A)	0	IPv4	Connected
10.0.10.1/32	0.0.0.0	VPN_A_Tunnel (Branch-HQ-A)	0	IPv4	Connected

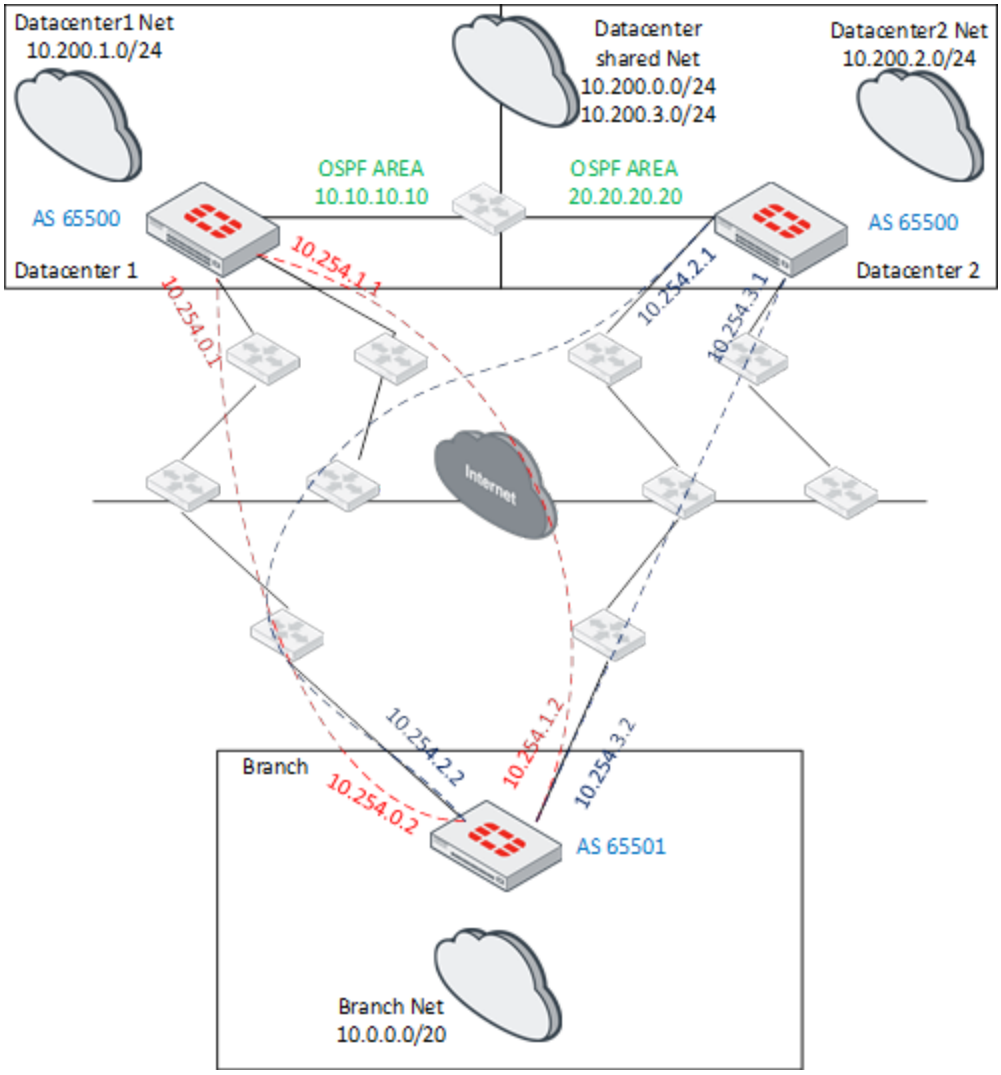
   b. Run the following CLI command:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default

Routing table for VRF=0
S*      0.0.0.0/0 [1/0] via 10.100.64.254, port1
                  [1/0] via 10.100.65.254, port5
S       10.0.2.0/24 [1/0] via 169.254.55.153, AWS_VPG
C       10.0.10.0/24 is directly connected, Branch-HQ-A
C       10.0.10.1/32 is directly connected, Branch-HQ-A
…
```

Hub and spoke SD-WAN deployment example

This topology diagram shows an overview of the network that is configured in this example:



Datacenter configuration

The datacenter is configured to support:

- Zero touch provisioning of new spokes
- Point to multipoint VPN
- Central management of access with the datacenter firewall
- Dynamic peering, to share routing information between branches and the datacenter
- VDOM compatibility, with inter-VDOM links for isolation and segmentation

To configure the datacenter, complete the following steps:

1. Configure dial-up (dynamic) VPN
2. Configure VPN interfaces
3. Configure loopback interface
4. Configure BGP
5. Firewall policies
6. Configure a blackhole route

Configure dial-up (dynamic) VPN

Dial-up, or dynamic, VPNs are used to facilitate zero touch provisioning of new spokes to establish VPN connections to the hub FortiGate.

The `exchange-interface-ip` option is enabled to allow the exchange of IPsec interface IP addresses. This allows a point to multipoint connection to the hub FortiGate.

The `add-route` option is disabled to allow multiple dial-up tunnels to be established to the same host that is advertising the same network. This dynamic network discovery is facilitated by the BGP configuration; see Configure BGP on page 501 for details.

Wildcard security associations are defined for the phase2 interface because routing is used to determine if traffic is subject to encryption and transmission through the IPsec VPN tunnel. The phase1 interface name must be 11 characters or less.

A dynamic VPN configuration must be defined for each interface that connects to the internet.

To configure the IPsec phase1 interfaces:

```
config vpn ipsec phase1-interface
    edit "vpn-isp-a"
        set type dynamic
        set interface "port2"
        set peertype any
        set exchange-interface-ip enable
        set proposal aes256-sha256
        set add-route disable
        set dhgrp 5
        set net-device enable
        set psksecret ********
    next
    edit "vpn-isp-b"
        set type dynamic
        set interface "port3"
        set peertype any
        set exchange-interface-ip enable
        set proposal aes256-sha256
        set add-route disable
        set dhgrp 5
        set net-device enable
        set psksecret ********
    next
end
```

To configure the IPsec phase2 interfaces:

```
config vpn ipsec phase2-interface
    edit "vpn-isp-a_p2"
        set phase1name "vpn-isp-a"
        set proposal aes256-sha256
        set pfs disable
        set replay disable
    next
    edit "vpn-isp-b_p2"
        set phase1name "vpn-isp-b"
        set proposal aes256-sha256
        set pfs disable
        set replay disable
    next
end
```

Configure VPN interfaces

To establish the BGP session, IP addresses must be assigned to the tunnel interfaces that BGP will use to peer.

The hub IP address is set to the address that the tunnels connect to. The remote IP address is set to highest unused IP address that is part of the tunnel network. This establishes two connected routes directly back to the branch FortiGate in the hub FortiGate's routing table.

Ping is allowed on the virtual interface to confirm that a point to point tunnel has been established between the hub and branch FortiGates.

To define IP addresses for VPN interfaces:

```
config system interface
    edit "vpn-isp-a"
        set vdom "root"
        set ip 10.254.0.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 10.254.0.254 255.255.255.0
        set interface "port2"
    next
    edit "vpn-isp-b"
        set vdom "root"
        set ip 10.254.1.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 10.254.1.254 255.255.255.0
        set interface "port3"
    next
end
```

Configure loopback interface

A loopback interface must be defined on the hub FortiGate to be used as a common probe point for the FortiGates that are using SD-WAN. The FortiGates send a probe packet from each of their SD-WAN member interfaces so that they can determine the best route according to their policies. Ping is allowed so that it can be used for measurements.

To configure the loopback interface on the hub FortiGate:

```
config system interface
    edit "loopback_0"
        set vdom "root"
        set ip 10.255.255.1 255.255.255.255
        set allowaccess ping
        set type loopback
    next
end
```

Configure BGP

Network route discovery is facilitated by BGP.

EBGP is used to prevent the redistribution of routes that are in the same Autonomous System (AS) number as the host. It is also required to influence route selection on the branches with AS-Path prepending. EBGP multipath is enabled so that the hub FortiGate can dynamically discover multiple paths for networks that are advertised at the branches.

The neighbor range and group settings are configured to allow peering relationships to be established without defining each individual peer. Connecting branches have their tunnel interfaces configured within the range of the BGP peer.

In order to facilitate the fastest route failovers, configure the following timers to their lowest levels: `scan-time`, `advertisement-interval`, `keep-alive-timer`, and `holdtime-timer`.

To configure BGP on the hub FortiGate:

```
config router bgp
    set as 65500
    set router-id 10.10.0.1
    set ebgp-multipath enable
    set graceful-restart enable
    config neighbor-group
        edit "branch-peers-1"
            set soft-reconfiguration enable
            set remote-as 65501
        next
        edit "branch-peers-2"
            set soft-reconfiguration enable
            set remote-as 65501
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.254.0.0 255.255.255.0
            set neighbor-group "branch-peers-1"
        next
        edit 2
            set prefix 10.254.1.0 255.255.255.0
            set neighbor-group "branch-peers-2"
        next
    end
    config network
        edit 1
            set prefix 10.200.1.0 255.255.255.0
```

```
        next
        edit 2
            set prefix 10.200.0.0 255.255.255.0
        next
        edit 3
            set prefix 10.200.3.0 255.255.255.0
        next
    end
end
```

Firewall policies

Centralized access is controlled from the hub FortiGate using Firewall policies. In addition to layer three and four inspection, security policies can be used in the policies for layer seven traffic inspection.

It is best practice to only allow the networks and services that are required for communication through the firewall. The following rules are the minimum that must be configured to allow SD-WAN to function:

Source Interface	Destination Interface	Source Address	Destination Address	Action	Schedule	Service	Comments
<vpn interfaces>	<internal Interface>	<branch tunnel IP addresses>	<hub FortiGate internal interface>	Accept	Always	ICMP	Allow health checks to the hub FortiGate
<vpn interfaces>	<internal Interface>	<branch networks>	<datacenter networks>	Accept	Always	<allowed services>	Allow traffic from branch networks

For this example, a simple policy that allows all traffic is configured.

To configure a firewall policy:

```
config firewall policy
    edit 1
        set name "Allow All"
        set srcintf "any"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

Configure a blackhole route

If there is a temporary loss of connectivity to the branch routes, it is best practice to send the traffic that is destined for those networks into a blackhole until connectivity is restored.

To configure a blackhole route for branch networks:

```
config router static
    edit 6
        set dst 10.0.0.0/14
        set distance 254
        set blackhole enable
    next
end
```

Branch configuration

The branches are configured to support:

- Client side SD-WAN with intelligent load balancing based on link quality
- Easy to create configuration templates for quick spoke deployment
- Split tunnel deployment for local internet access
- VDOM compatibility, with inter-VDOM links for isolation and segmentation

To configure a branch, complete the following steps:

1. Configure VPN to the hub
2. Configure VPN interfaces
3. Configure BGP
4. Configure SD-WAN
5. Firewall configuration

Configure VPN to the hub

The branch uses a normal site-to-site VPN configuration.

Wildcard security associations are define in the phase2 configuration because dynamic routing with BGP determines what traffic must traverse the VPN tunnel for encryption/transmission.

To make sure that the VPN is established, `auto-negotiate` is enabled.

To configure the IPsec phase1 interfaces:

```
config vpn ipsec phase1-interface
    edit "vpn_dc1-1"
        set interface "port2"
        set peertype any
        set exchange-interface-ip enable
        set proposal aes256-sha256
        set dhgrp 5
        set remote-gw 172.16.0.78
        set psksecret ********
    next
    edit "vpn_dc1-2"
        set interface "port3"
        set peertype any
        set exchange-interface-ip enable
```

```
        set proposal aes256-sha256
        set dhgrp 5
        set remote-gw 172.16.0.82
        set psksecret ********
    next
end
```

To configure the IPsec phase2 interfaces:

```
config vpn ipsec phase2-interface
    edit "vpn_dc1-1_p2"
        set phase1name "vpn_dc1-1"
        set proposal aes256-sha256
        set pfs disable
        set replay disable
        set auto-negotiate enable
    next
    edit "vpn_dc1-2_p2"
        set phase1name "vpn_dc1-2"
        set proposal aes256-sha256
        set pfs disable
        set replay disable
        set auto-negotiate enable
    next
end
```

Configure VPN interfaces

The branch must define its local tunnel interface IP address, and the remote tunnel interface IP address of the datacenter FortiGate, to establish the point to multipoint VPN.

To define IP addressses for VPN interfaces:

```
config system interface
    edit "vpn_dc1-1"
        set vdom "root"
        set ip 10.255.0.2 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 10.255.0.1 255.255.255.255
        set interface "port2"
    next
    edit "vpn_dc1-2"
        set vdom "root"
        set ip 10.255.1.2 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 10.255.1.1 255.255.255.255
        set interface "port3"
    next
end
```

Configure BGP

BGP enables learning dynamic routes from the datacenter. The BGP configuration is normal, with the definition of the datacenter FortiGate tunnel IP addresses set as BGP peers.

Routes that have the same network mask, administrative distance, priority, and AS length are automatically considered for SD-WAN when the interfaces that those routes are on are added to the SD-WAN interface group.

In order to facilitate the fastest route failovers, configure the following timers to their lowest levels: `scan-time`, `advertisement-interval`, `keep-alive-timer`, and `holdtime-timer`.

The `distance-external` option might need to be configured if you need routes that are learned from BGP to take precedence over static routes.

To configure BGP on the branch FortiGate:

```
config router bgp
    set as 65501
    set router-id 10.254.0.2
    set ebgp-multipath enable
    config neighbor
        edit "10.254.0.1"
            set soft-reconfiguration enable
            set remote-as 65500
        next
        edit "10.254.1.1"
            set soft-reconfiguration enable
            set remote-as 65500
        next
    end
end
```

Configure SD-WAN

SD-WAN configuration is required to load balance based on the quality of the links. It can be configured to select the best link based on characteristics such as jitter, packet loss, and latency. A policy route is created by the FortiGate to select the best link based on the defined criteria.

For SD-WAN interfaces, or members, the peer is defined to reference the BGP neighbor that is tied to that specific interface.

The health check is the ping server that gathers the link characteristics used for link selection. It is recommended that the minimum `failtime` be set to `2`.

The service definition defines the criteria for the policy routes. It can match based on the following characteristics:

- Protocol
- Destination Address
- Source Address
- Identity Based Group
- Internet Service Definition
- Source Port
- Destination Port
- Destination Route Tag

To dynamically determine the networks of the policy routes, routes that are learned from a BGP neighbor are matched against a route map, and a tag is defined for the matching routes. The service rules learn the networks based on these tags, instead of defining objects based on the learned addresses' network prefixes . See Dynamic definition of SD-WAN routes on page 508 for details on configuring the FortiGate to use the destination tags for the SD-WAN service definition.

To define the SD-WAN member interfaces:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "vpn_dc1-1"
        next
        edit 2
            set interface "vpn_dc1-2"
        next
    end
end
```

To define the SD-WAN health checks:

```
config system sdwan
    config health-check
        edit "datacenter1"
            set server "10.200.1.1"
            set interval 1
            set failtime 2
            set recoverytime 10
        next
    end
end
```

To define the SD-WAN service rules:

```
config system sdwan
    config service
        edit 1
            set mode priority
            set dst n-corporate
            set health-check "datacenter1"
            set priority-members 1 2
        next
    end
end
```

Firewall configuration

Centralized access is controlled from the hub FortiGate using Firewall policies. In addition to layer three and four inspection, security policies can be used in the policies for layer seven traffic inspection.

It is best practice to only allow the networks and services that are required for communication through the firewall. The following rules are the minimum that must be configured to allow SD-WAN to function:

Source Interface	Destination Interface	Source Address	Destination Address	Action	Schedule	Service	Comments
<internal interface>	<virtual wan link>	<branch networks>	<datacenter networks>	Accept	Always	<allowed services>	Allow traffic from branch to datacenter
<virtual wan link>	<internal Interface>	<datacenter networks>	<branch networks>	Accept	Always	<allowed services>	Allow traffic from datacenter to branch

For this example, a simple policy that allows all traffic is configured.

To configure a firewall policy:

```
config firewall policy
    edit 1
        set name "Allow All"
        set srcintf "any"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

Validation

The following commands can be used to validate the connections on the datacenter and branches.

Datacenter

Routing table:

```
# get router info routing-table all
```

VPN establishment:

```
# diagnose vpn ike gateway list
```

Branch

SD-WAN validation:

```
# diagnose sys sdwan member
# diagnose sys sdwan service
# diagnose sys sdwan health-check
```

Routing table:

```
# get router info routing-table all
# get router info route-map-address
# get router info bgp route-map <route-map-name>
```

VPN establishment:

```
# diagnose vpn ike gateway list
```

Dynamic definition of SD-WAN routes

Dynamic definitions of SD-WAN routes alleviate administrators from needing to know the destination of the traffic that is being load balanced, which, in an environment where routes are constantly added and removed, required a significant amount of administrative overhead.

The FortiGate can be configured to apply a route map to a BGP neighbor, and tag the routes that are learned from that neighbor with the `set-route-tag` command. After those routes are assigned a tag ID in the route map, the ID can be referenced in the SD-WAN rule.

To define the route map to apply to the BGP neighbor:

```
config router route-map
    edit "map-comm1"
        config rule
            edit 1
                set match-origin igp
                set set-route-tag 12
            next
            edit 2
                set match-ip-address "pf-all-in"
                set set-route-tag 11
            next
        end
    next
end
```

To apply the route map to the BGP neighbor:

```
config router bgp
    config neighbor
        edit "10.254.0.1"
            set route-map-in "map-comm1"
        next
    end
end
```

To reference tagged routes in an SD-WAN rule:

```
config system sdwan
    config service
        edit 1
```

```
            set mode priority
            set dst-tag 11
            set health-check "datacenter1"
            set priority-members 1 2
        next
    end
end
```

Adding another datacenter

Datacenter FortiGates should be configured to establish an OSPF neighbor relationship with the internal core router. This allows the dynamic redistribution of routes to the branches that are receiving updates from the datacenter FortiGates.

To ensure the fastest failover with OSPF, the following timers are set to their minimum levels: `spf-timers`, `hello-interval`, `dead-interval`.

Bi-directional forwarding is enabled to allow the fastest convergence time if there is a failure with a peering neighbor.

To configure OSPF:

```
config router ospf
    set router-id 10.10.10.10
    set spf-timers 0 1
    set distribute-list-in "pf-datacenter2-tunnel"
    set restart-mode graceful-restart
    config area
        edit 10.10.10.10
        next
    end
    config ospf-interface
        edit "port5"
            set interface "port5"
            set dead-interval 3
            set hello-interval 1
            set bfd enable
        next
    end
    config network
        edit 1
            set prefix 192.168.100.0 255.255.255.252
            set area 10.10.10.10
        next
    end
    config redistribute "connected"
        set status enable
        set routemap "redistribute-branch-tunnel"
    end
    config redistribute "static"
    end
    config redistribute "rip"
    end
    config redistribute "bgp"
        set status enable
        set routemap "redistribute-branch-networks"
```

```
    end
    config redistribute "isis"
    end
end
```

Troubleshooting SD-WAN

The following topics provide instructions on SD-WAN troubleshooting:

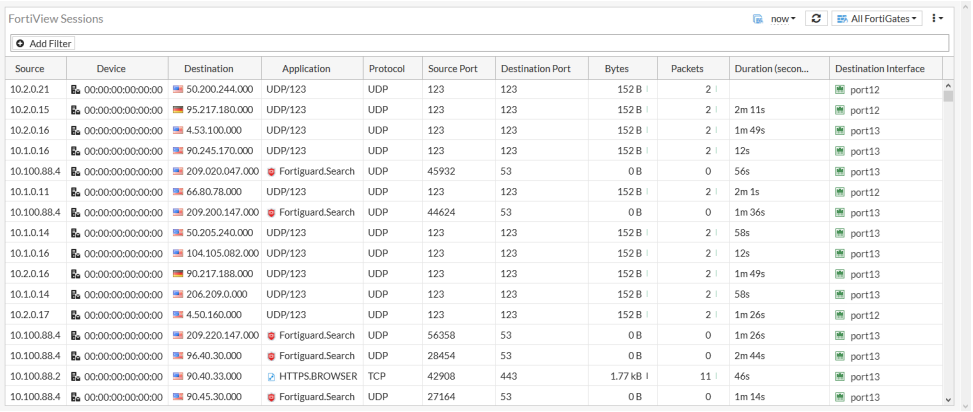
- Tracking SD-WAN sessions on page 510
- Understanding SD-WAN related logs on page 510
- SD-WAN related diagnose commands on page 513
- SD-WAN bandwidth monitoring service on page 518
- Using SNMP to monitor health check on page 520

Tracking SD-WAN sessions

You can check the destination interface in *Dashboard* > *FortiView Sessions* in order to see which port the traffic is being forwarded to.

The example below demonstrates a source-based load-balance between two SD-WAN members:

- If the source IP address is an *even* number, it will go to *port13*.
- If the source IP address is an *odd* number, it will go to *port12*.



Source	Device	Destination	Application	Protocol	Source Port	Destination Port	Bytes	Packets	Duration (secon...	Destination Interface
10.2.0.21	00:00:00:00:00:00	50.200.244.000	UDP/123	UDP	123	123	152 B	2		port12
10.2.0.15	00:00:00:00:00:00	95.217.180.000	UDP/123	UDP	123	123	152 B	2	2m 11s	port12
10.2.0.16	00:00:00:00:00:00	4.53.100.000	UDP/123	UDP	123	123	152 B	2	1m 49s	port13
10.1.0.16	00:00:00:00:00:00	90.245.170.000	UDP/123	UDP	123	123	152 B	2	12s	port13
10.100.88.4	00:00:00:00:00:00	209.020.047.000	Fortiguard.Search	UDP	45932	53	0 B	0	56s	port13
10.1.0.11	00:00:00:00:00:00	66.80.78.000	UDP/123	UDP	123	123	152 B	2	2m 1s	port12
10.100.88.4	00:00:00:00:00:00	209.200.147.000	Fortiguard.Search	UDP	44624	53	0 B	0	1m 36s	port13
10.1.0.14	00:00:00:00:00:00	50.205.240.000	UDP/123	UDP	123	123	152 B	2	58s	port13
10.1.0.16	00:00:00:00:00:00	104.105.082.000	UDP/123	UDP	123	123	152 B	2	12s	port13
10.2.0.16	00:00:00:00:00:00	90.217.188.000	UDP/123	UDP	123	123	152 B	2	1m 49s	port13
10.1.0.14	00:00:00:00:00:00	206.209.0.000	UDP/123	UDP	123	123	152 B	2	58s	port13
10.2.0.17	00:00:00:00:00:00	4.50.160.000	UDP/123	UDP	123	123	152 B	2	1m 26s	port12
10.100.88.4	00:00:00:00:00:00	209.220.147.000	Fortiguard.Search	UDP	56358	53	0 B	0	1m 26s	port13
10.100.88.4	00:00:00:00:00:00	96.40.30.000	Fortiguard.Search	UDP	28454	53	0 B	0	2m 44s	port13

10.100.88.4	00:00:00:00:00:00	90.45.30.000	Fortiguard.Search	UDP	27164	53	0 B	0	1m 14s	port13

Understanding SD-WAN related logs

This topic lists the SD-WAN related logs and explains when the logs will be triggered.

Health-check detects a failure:

- When health-check detects a failure, it will record a log:

```
1: date=2021-04-20 time=17:06:31 eventtime=1618963591590008160 tz="-0700"
logid="0100022921" type="event" subtype="system" level="critical" vd="root"
```

```
logdesc="Routing information changed" name="test" interface="R150" status="down"
msg="Static route on interface R150 may be removed by health-check test. Route:
(10.100.1.2->10.100.2.22 ping-down)"
```

- When health-check detects a recovery, it will record a log:

```
2: date=2021-04-20 time=17:11:46 eventtime=1618963906950174240 tz="-0700"
logid="0100022921" type="event" subtype="system" level="critical" vd="root"
logdesc="Routing information changed" name="test" interface="R150" status="up"
msg="Static route on interface R150 may be added by health-check test. Route:
(10.100.1.2->10.100.2.22 ping-up)"
```

Health-check has an SLA target and detects SLA qualification changes:

- When health-check has an SLA target and detects SLA changes, and changes to fail:

```
1: date=2021-04-20 time=21:32:33 eventtime=1618979553388763760 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link status" eventtype="Health Check" healthcheck="test"
slatargetid=1 oldvalue="2" newvalue="1" msg="Number of pass member changed."

2: date=2021-04-20 time=21:32:33 eventtime=1618979553388751880 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link status" eventtype="Health Check" healthcheck="test"
slatargetid=1 member="1" msg="Member status changed. Member out-of-sla."
```

- When health-check has an SLA target and detects SLA changes, and changes to pass:

```
1: date=2021-04-20 time=21:38:49 eventtime=1618979929908765200 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link status" eventtype="Health Check" healthcheck="test"
slatargetid=1 oldvalue="1" newvalue="2" msg="Number of pass member changed."

2: date=2021-04-20 time=21:38:49 eventtime=1618979929908754060 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="information" vd="root"
logdesc="Virtual WAN Link status" eventtype="Health Check" healthcheck="test"
slatargetid=1 member="1" msg="Member status changed. Member in sla."
```

SD-WAN calculates a link's session/bandwidth over/under its ratio and stops/resumes traffic:

- When SD-WAN calculates a link's session/bandwidth over its configured ratio and stops forwarding traffic:

```
1: date=2021-04-20 time=21:55:14 eventtime=1618980914728863220 tz="-0700"
logid="0113022924" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link volume status" eventtype="Volume" interface="R160" member="2"
msg="Member enters into conservative status with limited ablity to receive new sessions
for too much traffic."
```

- When SD-WAN calculates a link's session/bandwidth according to its ratio and resumes forwarding traffic:

```
2: date=2021-04-20 time=22:12:52 eventtime=1618981972698753360 tz="-0700"
logid="0113022924" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link volume status" eventtype="Volume" interface="R160" member="2"
msg="Member resume normal status to receive new sessions for internal adjustment"
```

The SLA mode service rule's SLA qualified member changes:

- When the SLA mode service rule's SLA qualified member changes. In this example R150 fails the SLA check, but is still alive:

```
1: date=2021-04-20 time=22:40:46 eventtime=1618983646428803040 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link status" eventtype="Service" serviceid=1 service="test"
seq="2,1" msg="Service prioritized by SLA will be redirected in sequence order."
```

- When the SLA mode service rule's SLA qualified member changes. In this example R150 changes from fail to pass:

```
2: date=2021-04-20 time=22:41:51 eventtime=1618983711678827920 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link status" eventtype="Service" serviceid=1 service="test"
seq="1,2" msg="Service prioritized by SLA will be redirected in sequence order."
```

The priority mode service rule member's link status changes:

- When priority mode service rule member's link status changes. In this example R150 changes to better than R160, and both are still alive:

```
1: date=2021-04-20 time=22:56:55 eventtime=1618984615708804760 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link status" eventtype="Service" serviceid=1 service="test"
metric="packet-loss" seq="2,1" msg="Service prioritized by performance metric will be
redirected in sequence order."
```

- When priority mode service rule member's link status changes. In this example R160 changes to better than R150, and both are still alive:

```
2: date=2021-04-20 time=22:56:58 eventtime=1618984618278852140 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link status" eventtype="Service" serviceid=1 service="test"
metric="packet-loss" seq="1,2" msg="Service prioritized by performance metric will be
redirected in sequence order."
```

SD-WAN member is used in service and it fails the health-check:

- When SD-WAN member fails the health-check, it will stop forwarding traffic:

```
1: date=2021-04-20 time=23:04:32 eventtime=1618985072898756700 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link status" eventtype="Service" interface="R150" member="1"
serviceid=1 service="test" gateway=10.100.1.1 msg="Member link is unreachable or miss
threshold. Stop forwarding traffic. "
```

- When SD-WAN member passes the health-check again, it will resume forwarding logs:

```
2: date=2021-04-20 time=23:06:08 eventtime=1618985168018789600 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link status" eventtype="Service" interface="R150" member="1"
serviceid=1 service="test" gateway=10.100.1.1 msg="Member link is available. Start
forwarding traffic. "
```

Load-balance mode service rule's SLA qualified member changes:

- When load-balance mode service rule's SLA qualified member changes. In this example R150 changes to not meet SLA:

```
1: date=2021-04-20 time=23:10:24 eventtime=1618985425048820800 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link status" eventtype="Service" serviceid=1 service="test"
```

```
member="2(R160)" msg="Service will be load balanced among members with available
routing."
```

- When load-balance mode service rule's SLA qualified member changes. In this example R150 changes to meet SLA:

```
2: date=2021-04-20 time=23:11:34 eventtime=1618985494478807100 tz="-0700"
logid="0113022923" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link status" eventtype="Service" serviceid=1 service="test"
member="2(R160),1(R150)" msg="Service will be load balanced among members with available
routing."
```

SLA link status logs, generated with interval sla-fail-log-period or sla-pass-log-period:

- When SLA fails, SLA link status logs will be generated with interval sla-fail-log-period:

```
1: date=2021-04-20 time=23:18:10 eventtime=1618985890469018260 tz="-0700"
logid="0113022925" type="event" subtype="sdwan" level="notice" vd="root"
logdesc="Virtual WAN Link SLA information" eventtype="SLA" healthcheck="test"
slatargetid=1 interface="R150" status="up" latency="0.061" jitter="0.004"
packetloss="2.000%" inbandwidthavailable="0kbps" outbandwidthavailable="200.00Mbps"
bibandwidthavailable="200.00Mbps" inbandwidthused="1kbps" outbandwidthused="1kbps"
bibandwidthused="2kbps" slamap="0x0" metric="packetloss" msg="Health Check SLA status.
SLA failed due to being over the performance metric threshold."
```

- When SLA passes, SLA link status logs will be generated with interval sla-pass-log-period:

```
2: date=2021-04-20 time=23:18:12 eventtime=1618985892509027220 tz="-0700"
logid="0113022925" type="event" subtype="sdwan" level="information" vd="root"
logdesc="Virtual WAN Link SLA information" eventtype="SLA" healthcheck="test"
slatargetid=1 interface="R150" status="up" latency="0.060" jitter="0.003"
packetloss="0.000%" inbandwidthavailable="0kbps" outbandwidthavailable="200.00Mbps"
bibandwidthavailable="200.00Mbps" inbandwidthused="1kbps" outbandwidthused="1kbps"
bibandwidthused="2kbps" slamap="0x1" msg="Health Check SLA status."
```

SD-WAN related diagnose commands

This topic lists the SD-WAN related diagnose commands and related output.

To check SD-WAN health-check status:

```
FGT # diagnose sys sdwan health-check
Health Check(server):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.110), jitter(0.024) sla_map=0x0
Seq(2 R160): state(alive), packet-loss(0.000%) latency(0.068), jitter(0.009) sla_map=0x0

FGT # diagnose sys sdwan health-check
Health Check(ping):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.100), jitter(0.017) sla_map=0x0
Seq(2 R160): state(dead), packet-loss(100.000%) sla_map=0x0

FGT # diagnose sys sdwan health-check google
Health Check(google):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.081), jitter(0.019) sla_map=0x0
Seq(2 R160): state(alive), packet-loss(0.000%) latency(0.060), jitter(0.004) sla_map=0x0
```

To check SD-WAN member status:

- When SD-WAN load-balance mode is *source-ip-based*/*source-dest-ip-based*.

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 0
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 0
```

- When SD-WAN load-balance mode is *weight-based*.

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 33
  Session count: 15
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 66
  Session count: 1
```

- When SD-WAN load-balance mode is *measured-volume-based*.
  - Both members are under volume and still have room:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 33
  Config volume ratio: 33, last reading: 218067B, volume room 33MB
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 66
  Config volume ratio: 66, last reading: 202317B, volume room 66MB
```

  - Some members are overloaded and some still have room:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 0
  Config volume ratio: 33, last reading: 1287767633B, overload volume 517MB
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 63
  Config volume ratio: 66, last reading: 1686997898B, volume room 63MB
```

- When SD-WAN load balance mode is *usage-based*/*spillover*.
  - When no spillover occurs:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 255
  Egress-spillover-threshold: 400kbit/s, ingress-spillover-threshold: 300kbit/s
  Egress-overbps=0, ingress-overbps=0
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 254
  Egress-spillover-threshold: 0kbit/s, ingress-spillover-threshold: 0kbit/s
  Egress-overbps=0, ingress-overbps=0
```

  - When member has reached limit and spillover occurs:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 255
```

```
    Egress-spillover-threshold: 400kbit/s, ingress-spillover-threshold: 300kbit/s
    Egress-overbps=1, ingress-overbps=0
  Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
  weight: 254
    Egress-spillover-threshold: 0kbit/s, ingress-spillover-threshold: 0kbit/s
    Egress-overbps=0, ingress-overbps=0
```

- You can also use the `diagnose netlink dstmac list` command to check if you are over the limit.

```
FGT # diagnose netlink dstmac list R150
dev=R150 mac=00:00:00:00:00:00 vwl rx_tcp_mss=0 tx_tcp_mss=0 egress_overspill_
threshold=50000 egress_bytes=100982 egress_over_bps=1 ingress_overspill_
threshold=37500 ingress_bytes=40 ingress_over_bps=0 sampler_rate=0 vwl_zone_id=1
intf_qua=0
```

To check SD-WAN service rules status:

- *Manual mode* service rules.

```
FGT # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Members(2):
    1: Seq_num(1 R150), alive, selected
    2: Seq_num(2 R160), alive, selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *Auto mode* service rules.

```
FGT # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(auto), link-cost-factor(latency),
link-cost-threshold(10), heath-check(ping)
  Members(2):
    1: Seq_num(2 R160), alive, latency: 0.066, selected
    2: Seq_num(1 R150), alive, latency: 0.093
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *Priority mode* service rules.

```
FGT # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor
(latency), link-cost-threshold(10), heath-check(ping)
  Members(2):
    1: Seq_num(2 R160), alive, latency: 0.059, selected
    2: Seq_num(1 R150), alive, latency: 0.077, selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *Load-balance* mode service rules.

```
FGT # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(load-balance hash-mode=round-robin)
  Members(2):
    1: Seq_num(1 R150), alive, sla(0x1), gid(2), num of pass(1), selected
```

```
    2: Seq_num(2 R160), alive, sla(0x1), gid(2), num of pass(1), selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *SLA mode* service rules.

```
FGT # diagnose sys sdwan service
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 R150), alive, sla(0x1), gid(0), cfg_order(0), cost(0), selected
    2: Seq_num(2 R160), alive, sla(0x1), gid(0), cfg_order(1), cost(0), selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

To check interface logs from the past 15 minutes:

```
FGT (root) # diagnose sys sdwan intf-sla-log R150
Timestamp: Wed Apr 21 16:58:27 2021, used inbandwidth: 655bps, used outbandwidth:
81655306bps, used bibandwidth: 81655961bps, tx bys: 3413479982bytes, rx bytes: 207769bytes.

SD-WAN bandwidth monitoring service

The bandwidth measuring tool is used to detect true upload and download speeds. Bandwidth tests can be run on demand or automated using a script, and can be useful when configuring SD-WAN SLA and rules to balance SD-WAN traffic.

The speed test tool requires a valid SD-WAN Bandwidth Monitoring Service license.

The speed test tool is compatible with iperf3.6 with SSL support. It can test the upload bandwidth to the FortiGate Cloud speed test service. It can initiate the server connection and send download requests to the server. The tool can be run up to 10 times a day .

FortiGate downloads the speed test server list. The list expires after 24 hours. One of the speed test servers is selected, based on user input. The speed test runs, testing upload and download speeds. The test results are shown in the command terminal.

To download the speed test server list:

```
# execute speed-test-server download
Download completed.
```

To check the speed test server list:

```
# execute speed-test-server list
AWS_West valid
        Host: 34.210.67.183 5204 fortinet
        Host: 34.210.67.183 5205 fortinet
        Host: 34.210.67.183 5206 fortinet
        Host: 34.210.67.183 5207 fortinet

        Host: 35.197.18.234 5207 fortinet
```

To run the speed test:

You can run the speed test without specifying a server. The system will automatically choose one server from the list and run the speed test.

```
# execute speed-test auto
The license is valid to run speed test.
Speed test quota for 2/1 is 9
current vdom=root
Run in uploading mode.
Connecting to host 35.230.2.124, port 5206
[ 16] local 172.16.78.185 port 2475 connected to 35.230.2.124 port 5206
```

```
[ ID] Interval Transfer Bitrate Retr Cwnd
[ 16] 0.00-1.01 sec 11.0 MBytes 91.4 Mbits/sec 0 486 KBytes

[ 11] 0.00-5.00 sec 55.7 MBytes 93.4 Mbits/sec receiver

speed test Done.
```

To add a script to run a speed test automatically once every 24 hours:

```
config system auto-script
    edit "speedtest"
        set interval 86400
        set repeat 0
        set start auto
        set script "
execute speed-test-server download
execute speed-test"
    next
end
```

To view the results of the speed test script:

```
execute auto-script result speedtest
```

Using SNMP to monitor health check

You can monitor SD-WAN health check related statistics using SNMP. The MIB file can be downloaded by going to *System* > *SNMP* and clicking *Download FortiGate MIB File*.

The following OIDs can be monitored:

Name	OID	Description
fgVWLHealthCheckLinkNumber	.1.3.6.1.4.1.12356.101.4.9.1	The number of health check links in fgVWLHealthCheckLinkTable

Name	OID	Description
fgVWLHealthCheckLinkTable	.1.3.6.1.4.1.12356.101.4.9.2	SD-WAN health check statistics table. This table has a dependent expansion relationship with fgVdTable.Only health checks with a configured member link are present in this table.
fgVWLHealthCheckLinkTableEntry	.1.3.6.1.4.1.12356.101.4.9.2.1	SD-WAN health check statistics on a virtual domain.
fgVWLHealthCheckLinkID	.1.3.6.1.4.1.12356.101.4.9.2.1.1	SD-WAN health check link ID. Only health checks with configured member link are present in this table. Virtual-wan-link health check link IDs are only unique within a virtual domain.
fgVWLHealthCheckLinkName	.1.3.6.1.4.1.12356.101.4.9.2.1.2	Health check name.
fgVWLHealthCheckLinkSeq	.1.3.6.1.4.1.12356.101.4.9.2.1.3	SD-WAN member link sequence.
fgVWLHealthCheckLinkState	.1.3.6.1.4.1.12356.101.4.9.2.1.4	Health check state on a specific member link.
fgVWLHealthCheckLinkLatency	.1.3.6.1.4.1.12356.101.4.9.2.1.5	The average latency of a health check on a specific member link within last 30 probes, in float number.
fgVWLHealthCheckLinkJitter	.1.3.6.1.4.1.12356.101.4.9.2.1.6	The average jitter of a health check on a specific member link within last 30 probes, in float number.
fgVWLHealthCheckLinkPacketSend	.1.3.6.1.4.1.12356.101.4.9.2.1.7	The total number of packets sent by a health check on a specific member link.
fgVWLHealthCheckLinkPacketRecv	.1.3.6.1.4.1.12356.101.4.9.2.1.8	The total number of packets received by a health check on a specific member link.
fgVWLHealthCheckLinkPacketLoss	.1.3.6.1.4.1.12356.101.4.9.2.1.9	The packet loss percentage of a health check on a specific member link within last 30 probes, in float number.
fgVWLHealthCheckLinkVdom	.1.3.6.1.4.1.12356.101.4.9.2.1.10	The VDOM that the link monitor entry exists in. This name corresponds to the fgVdEntName used in fgVdTable.

Name	OID	Description
fgVWLHealthCheckLinkBandwidthIn	.1.3.6.1.4.1.12356.101.4.9.2.1.11	The available bandwidth of incoming traffic detected by a health check on a specific member link, in Mbps,
fgVWLHealthCheckLinkBandwidthOut	.1.3.6.1.4.1.12356.101.4.9.2.1.12	The available bandwidth of outgoing traffic detected by a health check on a specific member link, in Mbps.
fgVWLHealthCheckLinkBandwidthBi	.1.3.6.1.4.1.12356.101.4.9.2.1.13	The available bandwidth of bi-direction traffic detected by a health check on a specific member link, in Mbps.
fgVWLHealthCheckLinkIfName	.1.3.6.1.4.1.12356.101.4.9.2.1.14	SD-WAN member interface name.

Example

This example shows a SD-WAN health check configuration and its collected statistics.

To configure the SD-WAN health check:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "port1"
            set gateway 192.168.2.1
        next
        edit 2
            set interface "MPLS"
            set zone "SD-Zone2"
            set cost 20
        next
        edit 3
            set interface "port2"
        next
    end
    config health-check
        edit "pingserver"
            set server "8.8.8.8"
            set sla-fail-log-period 10
            set sla-pass-log-period 20
            set members 2 1 3
            config sla
                edit 1
                    set link-cost-factor jitter packet-loss
```

```
                set packetloss-threshold 2
            next
        end
    next
  end
end
```

The collected statistics:

fgVWLHealthCheckLinkID	.1.3.6.1.4.1.12356.101.4.9.2.1.1	1	2	3
fgVWLHealthCheckLinkName	.1.3.6.1.4.1.12356.101.4.9.2.1.2	pingserver	pingserver	pingserver
fgVWLHealthCheckLinkSeq	.1.3.6.1.4.1.12356.101.4.9.2.1.3	2	1	3
fgVWLHealthCheckLinkState	.1.3.6.1.4.1.12356.101.4.9.2.1.4	0	0	0
fgVWLHealthCheckLinkLatency	.1.3.6.1.4.1.12356.101.4.9.2.1.5	39.302	43.124	44.348
fgVWLHealthCheckLinkJitter	.1.3.6.1.4.1.12356.101.4.9.2.1.6	4.346	3.951	5.05
fgVWLHealthCheckLinkPacketSend	.1.3.6.1.4.1.12356.101.4.9.2.1.7	3657689	3657689	3657689

Policy and Objects

This section contains topics on configuring policies and traffic shaping:

- Policies on page 524
- Objects on page 618
- Traffic shaping on page 643
- Zero Trust Network Access on page 685

Policies

The firewall policy is the axis around which most features of the FortiGate revolve. Many firewall settings end up relating to or being associated with the firewall policies and the traffic they govern. Any traffic going through a FortiGate has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it is processed, if it is processed, and whether or not it is allowed to pass through the FortiGate.

When the firewall receives a connection packet, it analyzes the source address, destination address, and service (by port number). It also registers the incoming interface, the outgoing interface it needs to use, and the time of day. Using this information, the FortiGate firewall attempts to locate a security policy that matches the packet. If a policy matches the parameters, then the FortiGate takes the required action for that policy. If it is *Accept*, the traffic is allowed to proceed to the next step. If the action is *Deny* or a match cannot be found, the traffic is not allowed to proceed.

The two basic actions at the initial connection are either *Accept* or *Deny*:

- If the action is *Accept*, the policy permits communication sessions. There may be other packet processing instructions, such as requiring authentication to use the policy or restrictions on the source and destination of the traffic.
- If the action is *Deny*, the policy blocks communication sessions, and you can optionally log the denied traffic. If no security policy matches the traffic, the packets are dropped. A *Deny* security policy is needed when it is required to log the denied traffic, also called *violation traffic*.

One other action can be associated with the policy:

- *IPsec*: this is an *Accept* action that is specifically for IPsec VPNs.

The following topics provide instructions on configuring policies:

- Firewall policy parameters on page 525
- Profile-based NGFW vs policy-based NGFW on page 526
- NGFW policy mode application default service on page 530
- Application logging in NGFW policy mode on page 532
- Policy views and policy lookup on page 533
- Policy with source NAT on page 535
- Policy with destination NAT on page 548
- Policy with Internet Service on page 562
- NAT64 policy and DNS64 (DNS proxy) on page 578

- NAT46 policy on page 581
- Local-in policies on page 584
- DoS protection on page 586
- Access control lists on page 593
- Mirroring SSL traffic in policies on page 594
- Inspection mode per policy on page 597
- OSPFv3 neighbor authentication on page 599
- Firewall anti-replay option per policy on page 601
- Enabling advanced policy options in the GUI on page 601
- Recognize anycast addresses in geo-IP blocking on page 602
- Matching GeoIP by registered and physical location on page 603
- Authentication policy extensions on page 604
- HTTP to HTTPS redirect for load balancing on page 605
- Use Active Directory objects directly in policies on page 607
- FortiGate Cloud / FDN communication through an explicit proxy on page 610
- No session timeout on page 612
- MAP-E support on page 613
- Seven-day rolling counter for policy hit counters on page 617

Firewall policy parameters

For traffic to flow through the FortiGate firewall, there must be a policy that matches its parameters:

- Incoming interface(s)
- Outgoing interface(s)
- Source address(es)
- User(s) identity
- Destination address(es)
- Internet service(s)
- Schedule
- Service

Without all six (possibly eight) of these things matching, the traffic is declined.

Traffic flow initiated from each direction requires a policy, that is, if sessions can be initiated from both directions, each direction requires a policy.

Just because packets can go from point A to point B on port X does not mean that the traffic can flow from point B to point A on port X. A policy must be configured for each direction.

When designing a policy, there is often reference to the traffic flow, but most communication is two-way so trying to determine the direction of the flow might be confusing. If traffic is HTTP web traffic, the user sends a request to the website, but most of the traffic flow will be coming from the website to the user or in both directions? For the purposes of determining the direction for a policy, the important factor is the direction of the initiating communication. The user is sending a request to the website, so this is the initial communication; the website is responding so the traffic is from the user's network to the Internet.

FortiOS does not perform a reverse-path check on reply traffic that matches an allowed session based on the IP tuple. The request traffic can be sent on one interface and the reply traffic could return on another interface.

Profile-based NGFW vs policy-based NGFW

Profile-based next-generation firewall (NGFW) mode is the traditional mode where you create a profile (antivirus, web filter, and so on) and then apply the profile to a policy.

In policy-based NGFW mode, you allow applications and URL categories to be used directly in security policies, without requiring web filter or application control profiles.

In policy-based mode:

- Central NAT is always enabled. If no Central SNAT policy exists, you must create one. See Central SNAT on page 541 for more information.
- Pre-match rules are defined separately from security policies, and define broader rules, such as SSL inspection and user authentication.

If your FortiGate operates in NAT mode, rather than enabling source NAT in individual NGFW policies, go to *Policy & Objects* > *Central SNAT* and add source NAT policies that apply to all matching traffic. In many cases, you may only need one SNAT policy for each interface pair.

The NGFW mode is set per VDOM, and it is only available when the VDOM inspection mode is flow-based. You can operate your entire FortiGate or individual VDOMs in NGFW policy mode.

Switching from profile-based to policy-based mode converts your policies to policy-based. To avoid issues, you could create a new VDOM for the policy-based mode. We recommend backing up your configuration before switching modes. See Configuration backups on page 55 for information.

Enabling policy-based NGFW mode

To enable policy-based NGFW mode without VDOMs in the GUI:

1. Go to *System* > *Settings*.
2. In *NGFW Mode*, select *Policy-based*.
3. Click *Apply*.

To enable policy-based NGFW mode with VDOMs in the GUI:

1. Go to *System* > *VDOM* .
2. Double-click a VDOM to edit the settings.
3. In *NGFW Mode*, select *Policy-based*.
4. Click *OK*.

To enable policy-based NGFW mode without VDOMs in the CLI:

```
config system settings
    set ngfw-mode policy-based
end
```

To enable policy-based NGFW mode with VDOMs in the CLI:

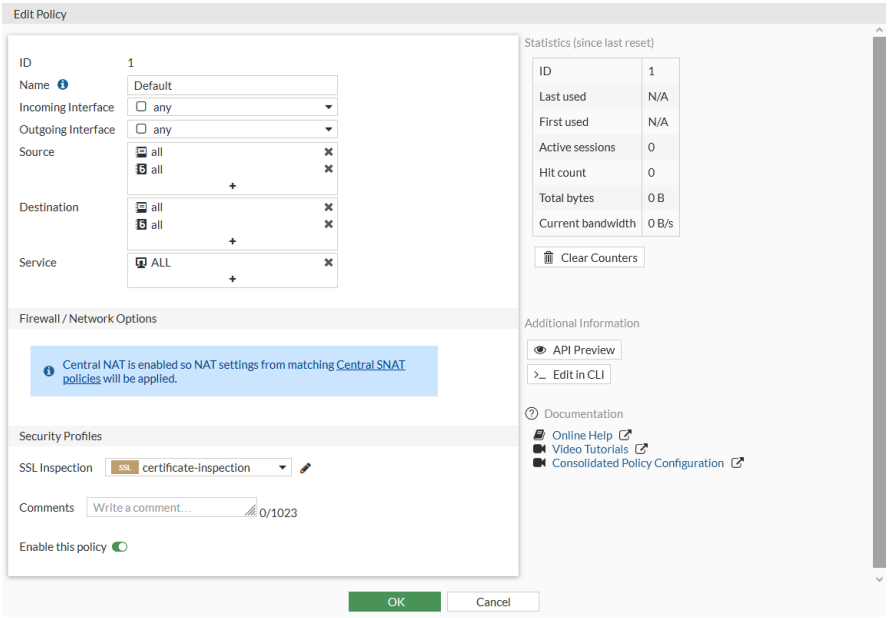
```
config vdom
    edit <vdom>
        config system settings
            set ngfw-mode policy-based
        end
    next
end
```

Security and SSL Inspection & Authentication policies

Security policies work with SSL Inspection & Authentication policies to inspect traffic. To allow traffic from a specific user or user group, both Security and SSL Inspection & Authentication policies must be configured. A default SSL Inspection & Authentication policy with the certificate-inspection SSL Inspection profile is preconfigured. Traffic will match the SSL Inspection & Authentication policy first. If the traffic is allowed, packets are sent to the IPS engine for application, URL category, user, and user group match, and then, if enabled, UTM inspection (antivirus, IPS, DLP, and email filter) is performed.

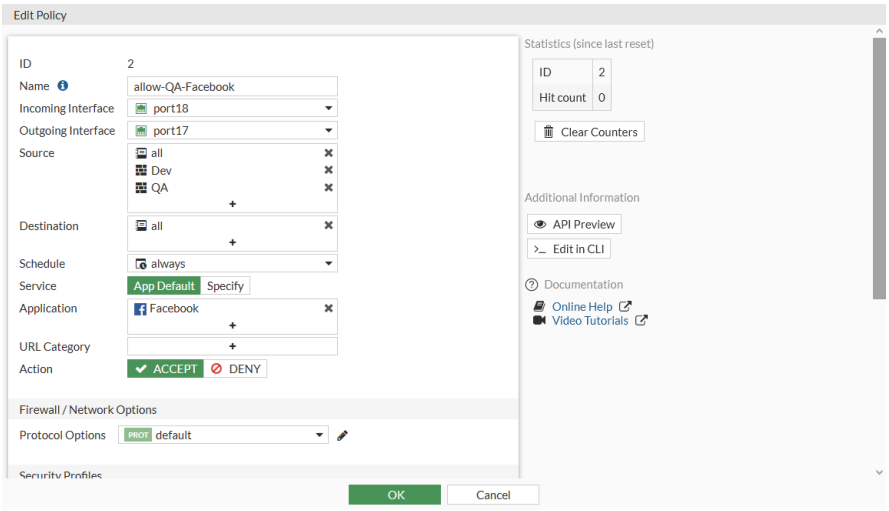
SSL Inspection & Authentication policies are used to pre-match traffic before sending the packets to the IPS engine:

- There are no schedule or action options; traffic matching the policy is always redirected to the IPS engine.
- SSL inspection, formerly configured in the VDOM settings, is configured in an SSL Inspection & Authentication policy.
- Users and user groups that require authentication must be configured in an SSL Inspection & Authentication policy.



Security policies work with SSL Inspection & Authentication policies to inspect traffic:

- Applications and URL categories can be configured directly in the policy.
- Users and user groups that require authentication must also be configured in a security policy.
- The available actions are *Accept* or *Deny*.
- The *Service* option can be used to enforce the standard port for the selected applications. See NGFW policy mode application default service on page 530 for details.
- UTM inspection is configured in a security policy.



To configure policies for Facebook and Gmail access in the CLI:

1. Configure an SSL Inspection & Authentication policy:

```
config firewall policy
    edit 1
        set name "Policy-1"
        set srcintf "port18"
        set dstintf "port17"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        set ssl-ssh-profile "new-deep-inspection"
        set groups "Dev" "HR" "QA" "SYS"
    next
end
```

2. Configure security policies:

```
config firewall security-policy
    edit 2
        set name "allow-QA-Facebook"
        set srcintf "port18"
        set dstintf "port17"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set application 15832
        set groups "Dev" "QA"
    next
```

```
        edit 4
            set name "allow-QA-Email"
            set srcintf "port18"
            set dstintf "port17"
            set srcaddr "all"
            set dstaddr "all"
            set action accept
            set schedule "always"
            set url-category 23
            set groups "QA"
        next
    end
```

Logs

In the application control and web filter logs, `securityid` maps to the security policy ID.

Application control log:

```
date=2019-06-17 time=16:35:47 logid="1059028704" type="utm" subtype="app-ctrl"

```

Other NGFW policy-based mode options

You can combine *Application Control* and *Web Filter* in the same NGFW mode policy.

The following security profiles can be used in NGFW policy-based mode:

- AntiVirus
- Web Filter
- Intrusion Prevention
- File Filter
- Email Filter

Logging can also be enabled in security policies.

NGFW policy mode application default service

In NGFW policy-based mode, the application default service enforces applications running only on their default service port. The applications specified in the policy are monitored, and if traffic is detected from a nonstandard port, it is blocked, and a log entry is recorded with a *port-violation* event type.

If you are not using the default ports, and need to pick specific services, select *Specify* to select the required services.

Example

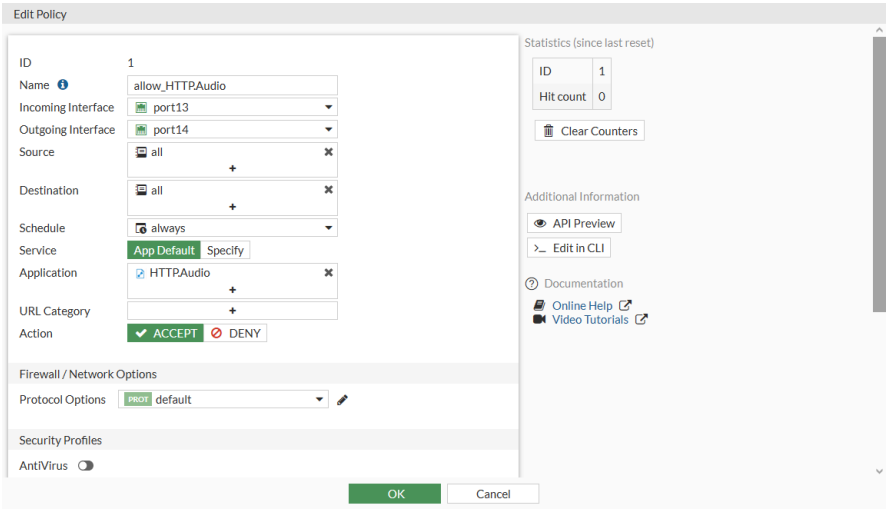
In this example, the standard port is enforced for HTTPS traffic using the HTTP.Audio application.

First, an SSL Inspection & Authentication policy is created do to traffic pre-match, and then a security policy is created to allow the HTTP.Audio application when using the default port. Fetching an MP3 file from an HTTP server using port 443 is allowed, but is blocked when using a nonstandard port, such as 8443.

To enforce the HTTP.Audio application using the default port in the GUI:

1. Create a new SSL Inspection & Authentication policy, or use the default policy.
2. Go to *Policy & Objects* > *Security Policy*, and click *Create New*.
3. Enter a name for the policy, such as *allow_HTTP.Audio*.
4. Configure the ports as needed.
5. Set *Service* to *App Default*.
6. In the *Application* field, select *HTTP.Audio*.

7. Set the *Action* to *Accept*.



8. Click *OK*.

To enforce the HTTP.Audio application using the default port in the CLI:

1. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "consolidated_all"
        set srcintf "port13"
        set dstintf "port14"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        set ssl-ssh-profile "new-deep-inspection"
    next
end
```

2. Create a security policy:

```
config firewall security-policy
    edit 1

        set name "allow_HTTP.Audio"
        set srcintf "port13"
        set dstintf "port14"
        set srcaddr "all"
        set enforce-default-app-port enable
        set action accept
        set schedule "always"
        set logtraffic all
        set application 15879
    next
end
```

Logs

The application logs show logs with an event type of `port-violation` for traffic on port 8443 that is blocked, and an event type of `signature` for traffic on port 443 that is allowed.

Blocked:

```
2: date=2019-06-18 time=16:15:40 logid="1060028736" type="utm" subtype="app-ctrl"
eventtype="port-violation" level="warning" vd="vd1" eventtime=1560899740218875746 tz="-0700"
appid=15879 srcip=10.1.100.22 dstip=172.16.200.216 srcport=52680 dstport=8443
srcintf="port13" srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" proto=6
service="HTTPS" direction="incoming" policyid=1 sessionid=5041 appcat="Video/Audio"
app="HTTP.Audio" action="block" hostname="172.16.200.216" incidentserialno=1906780850
url="/app_data/story.mp3" securityid=2 msg="Video/Audio: HTTP.Audio," apprisk="elevated"
```

Allowed:

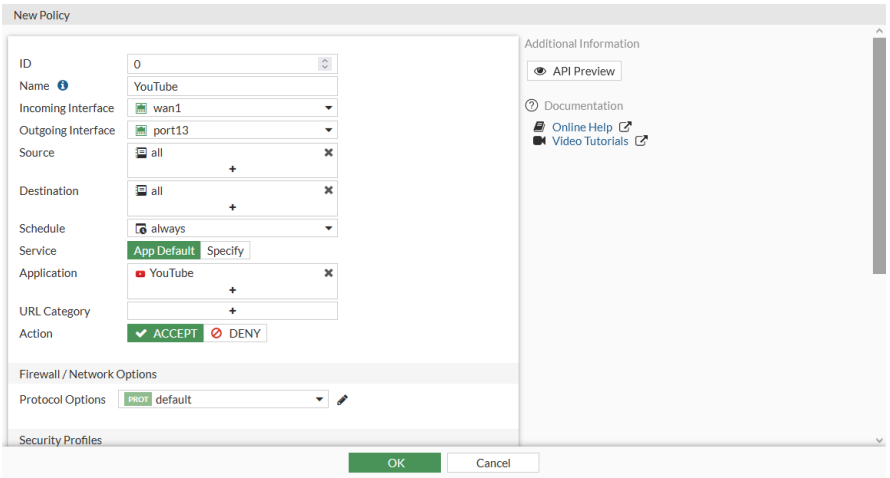
```
1: date=2019-06-18 time=16:15:49 logid="1059028704" type="utm" subtype="app-ctrl"
eventtype="signature" level="information" vd="vd1" eventtime=1560899749258579372 tz="-0700"
appid=15879 srcip=10.1.100.22 dstip=172.16.200.216 srcport=54527 dstport=443
srcintf="port13" srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" proto=6
service="HTTPS" direction="incoming" policyid=1 sessionid=5064 appcat="Video/Audio"
app="HTTP.Audio" action="pass" hostname="172.16.200.216" incidentserialno=1139663486
url="/app_data/story.mp3" securityid=2 msg="Video/Audio: HTTP.Audio," apprisk="elevated"
```

Application logging in NGFW policy mode

In NGFW policy mode, if an application, application category, or application group is selected on a security policy, and traffic logging is set to *UTM* or *All*, then application control logs will be generated. In addition, when a signature is set to the *ACCEPT* action under a security policy, all corresponding child signatures will be assessed and logged as well.

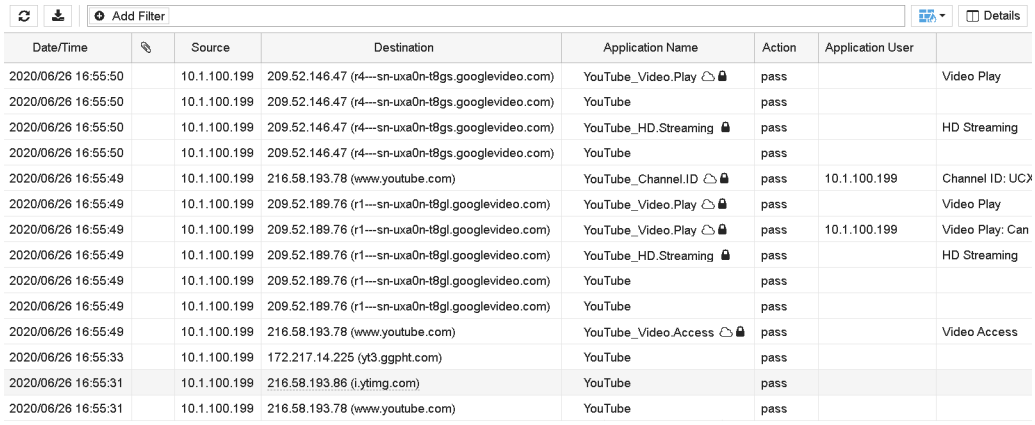
To verify application logging:

1. Go to *Policy & Objects* > *Security Policy* and configure a new policy for YouTube.
2. Set *Action* to *ACCEPT* and *Log Allowed Traffic* to *Security Events*.



3. Configure the remaining settings as required, then click *OK*.
4. On a client system, play some YouTube videos.

5. On FortiOS, go to *Log & Report* > *Application Control* and view the logs.
   There are logs not only for *YouTube*, but also for *YouTube_Video.Play*, *YouTube_Video.Access*, and so on, as verified from the *Application Name* column.



Date/Time		Source	Destination	Application Name	Action	Application User

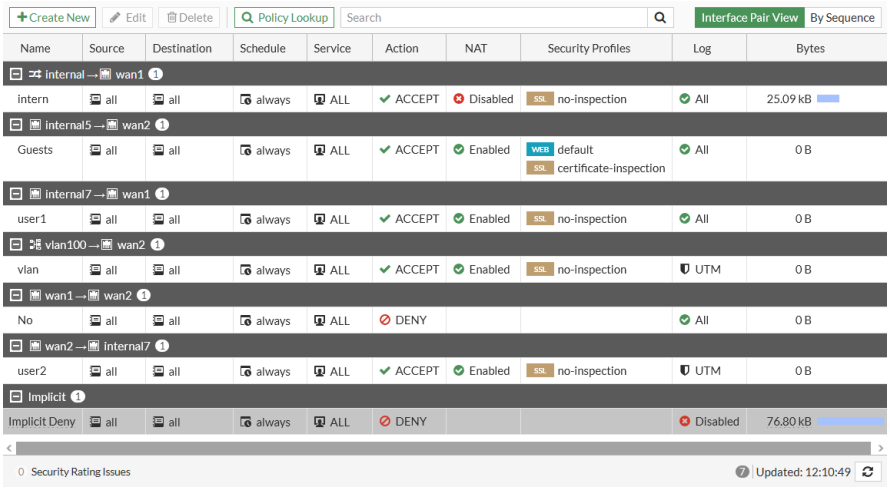
Policy views and policy lookup

This topic provides a sample of firewall policy views and firewall policy lookup.

Policy views

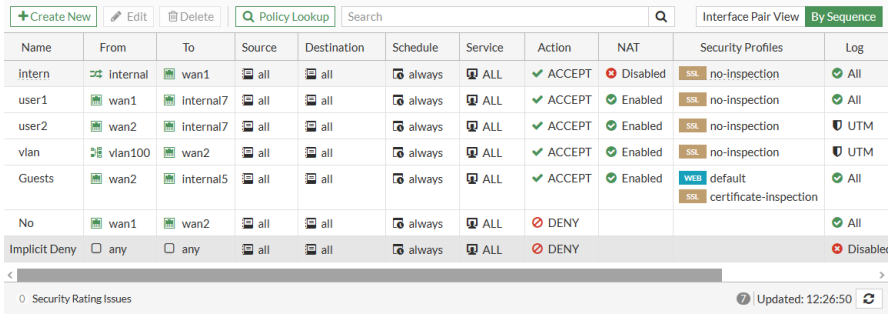
In *Policy & Objects* policy list page, there are two policy views: *Interface Pair View* and *By Sequence* view.

Interface Pair View displays the policies in the order that they are checked for matching traffic, grouped by the pairs of Incoming and Outgoing interfaces. For example, all policies referencing traffic from WAN1 to DMZ are in one section. The policies referencing traffic from DMZ to WAN1 are in another section. The sections are collapsible so that you only need to look at the sections you want.



Name	Source	Destination	Schedule	Service	Action	NAT	Security Profiles	Log	Bytes
internal → wan1 1									
intern	all	all	always	ALL	ACCEPT	Disabled	SSL no-inspection	All	25.09 kB
internal5 → wan2 1									
Guests	all	all	always	ALL	ACCEPT	Enabled	WEB default SSL certificate-inspection	All	0 B
internal7 → wan1 1									
user1	all	all	always	ALL	ACCEPT	Enabled	SSL no-inspection	All	0 B
vlan100 → wan2 1									
vlan	all	all	always	ALL	ACCEPT	Enabled	SSL no-inspection	UTM	0 B
wan1 → wan2 1									
No	all	all	always	ALL	DENY			All	0 B
wan2 → internal7 1									
user2	all	all	always	ALL	ACCEPT	Enabled	SSL no-inspection	UTM	0 B
Implicit 1									
Implicit Deny	all	all	always	ALL	DENY			Disabled	76.80 kB

By Sequence displays policies in the order that they are checked for matching traffic without any grouping.



The default display is *Interface Pair View*. You can switch between the two views except if *any* or multiple-interfaces are applied in the policy.

How *Any* or multiple-interfaces policy can change the *Interface Pair View*

The FortiGate unit automatically changes the view on the policy list page to *By Sequence* whenever there is a policy containing *any* or multiple-interfaces as the *Source* or *Destination* interface. If the *Interface Pair View* is grayed out, it is likely that one or more policies have used the *any* or multiple-interfaces.

When you use *any* or multiple-interfaces, the policy goes into multiple sections because it might be any one of a number of interface pairings. Policies are divided into sections using the interface pairings, for example, port1 to port2.

Each section has its own policy order. The order in which a policy is checked for matching criteria to a packet's information is based solely on the position of the policy within its section or within the entire list of policies. If the policy is in multiple sections, FortiGate cannot place the policy in order in multiple sections. Therefore the view can only be *By Sequence*.

Policy lookup

Firewall policy lookup is based on the `Source_interfaces/Protocol/Source_Address/Destination_Address` that matches the `source-port` and `dst-port` of the protocol. Use this tool to find out which policy matches specific traffic from a number of policies. After completing the lookup, the matching firewall policy is highlighted on the policy list page.

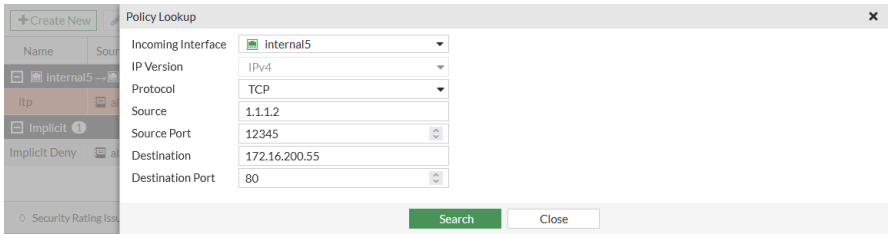
The Policy Lookup tool has the following requirements:

- Transparent mode does not support Policy lookup function.
- When executing the policy lookup, you need to confirm whether the relevant route required for the policy work already exists.

Sample configuration

This example uses the TCP protocol to show how policy lookup works:

1. In *Policy & Objects* policy list page, click *Policy Lookup* and enter the traffic parameters.



2. Click *Search* to display the policy lookup results.

Policy with source NAT

The following topics provide instructions on configuring policies with source NAT:

- Static SNAT on page 535
- Dynamic SNAT on page 536
- Central SNAT on page 541
- Configuring an IPv6 SNAT policy on page 544
- SNAT policies with virtual wire pairs on page 546

Static SNAT

Network Address Translation (NAT) is the process that enables a single device such as a router or firewall to act as an agent between the Internet or Public Network and a local or private network. This agent acts in real time to translate the source or destination IP address of a client or server on the network interface. For the source IP translation, this enables a single public address to represent a significantly larger number of private addresses. For the destination IP translation, the firewall can translate a public destination address to a private address. So we don't have to configure a real public IP address for the server deployed in a private network.

We can subdivide NAT into two types: source NAT (SNAT) and destination NAT (DNAT). This topic is about SNAT, We support three NAT working modes: static SNAT, dynamic SNAT, and central SNAT.

In static SNAT all internal IP addresses are always mapped to the same public IP address. This is a port address translation, Since we have 60416 available port numbers, this one public IP address can handle the conversion of 60,416 internal IP addresses.

Internal Source IP	Source Port	Translated Source IP	Translated Source Port
10.1.100.1	11110	172.16.200.1	5117
10.1.100.1	11111	172.16.200.1	5118
10.1.100.2	11112	172.16.200.1	5119
.....	.....	172.16.200.1	.....
.....	.....	172.16.200.1	65533

FortiGate firewall configurations commonly use the Outgoing Interface address.

Sample configuration

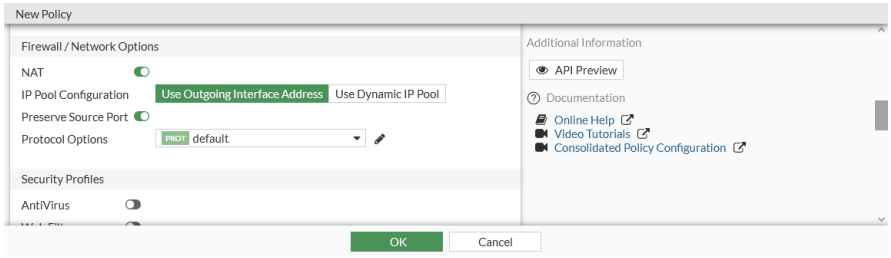
The following example of static SNAT uses an internal network with subnet 10.1.100.0/24 (vlan20) and an external/ISP network with subnet 172.16.200.0/24 (vlan30).

When the clients in internal network need to access the servers in external network, We need to translate IP addresses from 10.1.100.0/24 to an IP address 172.16.200.0/24, In this example, we implement static SNAT by creating a firewall policy.

To configure static NAT:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the required policy parameters.

3. Enable *NAT* and select *Use Outgoing Interface Address*. For packets that match this policy, its source IP address is translated to the IP address of the outgoing interface.
4. If needed, enable *Preserve Source Port* to keep the same source port for services that expect traffic to come from a specific source port. Disable *Preserve Source Port* to allow more than one connection through the firewall for that service.



5. Click *OK*.

Dynamic SNAT

Dynamic SNAT maps the private IP addresses to the first available public address from a pool of addresses. In the FortiGate firewall, this can be done by using IP pools. IP pools is a mechanism that allows sessions leaving the FortiGate firewall to use NAT. An IP pool defines a single IP address or a range of IP addresses to be used as the source address for the duration of the session. These assigned addresses are used instead of the IP address assigned to that FortiGate interface.

IP pool types

FortiGate uses four types of IPv4 IP pools. This topic focuses on some of the differences between them.

Overload

This type of IP pool is similar to static SNAT mode. We need to define an external IP range that contains one or more IP addresses. When there is only one IP address it is almost the same as static SNAT, the outgoing interface address is used. When it contains multiple IP addresses, it is equivalent to an extended mode of static SNAT.

For instance, if we define an overload type IP pool with two external IP addresses (172.16.200.1—172.16.200.2), since there are 60,416 available port numbers per IP, this IP pool can handle 60,416*2 internal IP addresses.

Original Source IP	Original Source Port	Translated Source IP	Translated Source Port
10.1.100.1	11110	172.16.200.1	5117
10.1.100.2	11111	172.16.200.1	5118
.....	.....	172.16.200.1	.....
.....	.....	172.16.200.1	65533
.....	.....	172.16.200.2	5117
.....	.....	.....	.....
.....	.....	172.16.200.2	65533

The mapped IP address can be calculated from the source IP address. The index number of the address in the pool is the remainder of the source IP address, in decimal, divided by the number addresses in the pool.

To calculate the decimal value of the source IP address, either use an online calculator, or use the following equation:

$$a.b.c.d = a * (256)^3 + b * (256)^2 + c * (256) + d$$

For example:

$$192.168.0.1 = 192 * (256)^3 + 168 * (256)^2 + 0 * (256) + 1 = 3232235521$$

If there is one IP pool, where:

- P_1 = the first address in the IP pool
- R_1 = the number of IP addresses in the IP pool
- X = the source IP address as a decimal number
- Y = the mapped IP address

Then the equation to determine the mapped address is:

$$Y = P_1 + X \bmod R_1$$

For example:

IP pool	Source IP address
172.26.73.20 to 172.26.73.90	192.168.1.200

1. Convert the source IP address to a decimal number:
$$192 * (256)^3 + 168 * (256)^2 + 1 * (256) + 200 = 3232235976$$
2. Determine the number of IP addresses in the pool:
$$172.26.73.90 - 172.26.73.20 = 71$$
3. Find the remainder of the source IP address divided by the number of addresses in the pool:
$$3232235976 \bmod 71 = 26$$
4. Add the remainder to the first IP address in the pool:
$$172.26.73.20 + 26 = 172.26.73.46$$
So, the mapped IP address is **172.26.73.46**.

If there are multiple IP pools, the calculation is similar to when there is only one pool.

If there are two IP pools, where:

- P_1 = the first address in the first IP pool
- P_2 = the first address in the second IP pool
- R_1 = the number of IP addresses in the first IP pool
- R_2 = the number of IP addresses in the second IP pool
- X = the source IP address as a decimal number
- Y = the mapped IP address

Then the equations to determine the mapped address are:

$$\text{If } X \bmod (R_1 + R_2) >= R_1, \text{ then } Y = P_2 + X \bmod R_2$$

$$\text{If } X \bmod (R_1 + R_2) < R_1, \text{ then } Y = P_1 + X \bmod R_1$$

For example:

IP pools	Source IP address
pool01: 172.26.73.20 to 172.26.73.90	192.168.1.200
pool02: 172.26.75.50 to 172.26.75.150	

1. Convert the source IP address to a decimal number:
$$192 * (256)^3 + 168 * (256)^2 + 1 * (256) + 200 = 3232235976$$
2. Determine the total number of IP addresses in the pools:
$$(172.26.73.90 - 172.26.73.20) + (172.26.75.50 - 172.26.75.150) = 71 + 101 = 172$$
3. Find the remainder of the source IP address divided by the number of addresses in the pools:
$$3232235976 \bmod 172 = 108$$
4. The remainder is greater than the number of addresses in pool01, so the address is selected from pool02 and the remainder is recalculated based only on pool02:
$$3232235976 \bmod 101 = 40$$
5. Add the new remainder to the first IP address in pool02:
$$172.26.75.50 + 40 = 172.26.75.90$$
So, the mapped IP address is **172.26.75.90**.

One-to-one

This type of IP pool means that the internal IP address and the external (translated) IP address match one-to-one. The port address translation (PAT) is disabled when using this type of IP pool. For example, if we define a one-to-one type IP pool with two external IP addresses (172.16.200.1 - 172.16.200.2), this IP pool only can handle two internal IP addresses.

Fixed port range

For the overload and one-to-one IP pool types, we do not need to define the internal IP range. For the fixed port range type of IP pool, we can define both internal IP range and external IP range. Since each external IP address and the number of available port numbers is a specific number, if the number of internal IP addresses is also determined, we can calculate the port range for each address translation combination. So we call this type fixed port range. This type of IP pool is a type of port address translation (PAT).

For instance, if we define one external IP address (172.16.200.1) and ten internal IP addresses (10.1.100.1-10.1.100.10), we have translation IP+Port combination like following table:

Original Source IP	Original Source Port	Translated Source IP	Translated Source Port Range
10.1.100.1	.....	172.16.200.1	5117~11157
10.1.100.2	.....	172.16.200.1	11158~17198
10.1.100.3	.....	172.16.200.1	.....
10.1.100.4	.....	172.16.200.1	.....
10.1.100.5	.....	172.16.200.1	.....
10.1.100.6	.....	172.16.200.1	.....
10.1.100.7	.....	172.16.200.1	.....
10.1.100.8	.....	172.16.200.1	.....
10.1.100.9	.....	172.16.200.1	53445~59485
10.1.100.10	.....	172.16.200.1	59486~65526

Port block allocation

This type of IP pool is also a type of port address translation (PAT). It gives users a more flexible way to control the way external IPs and ports are allocated. Users need to define *Block Size/Block Per User* and external IP range. *Block Size* means how many ports each Block contains. *Block per User* means how many blocks each user (internal IP) can use.

The following is a simple example:

- **External IP Range**: 172.16.200.1—172.16.200.1
- **Block Size**: 128
- **Block Per User**: 8

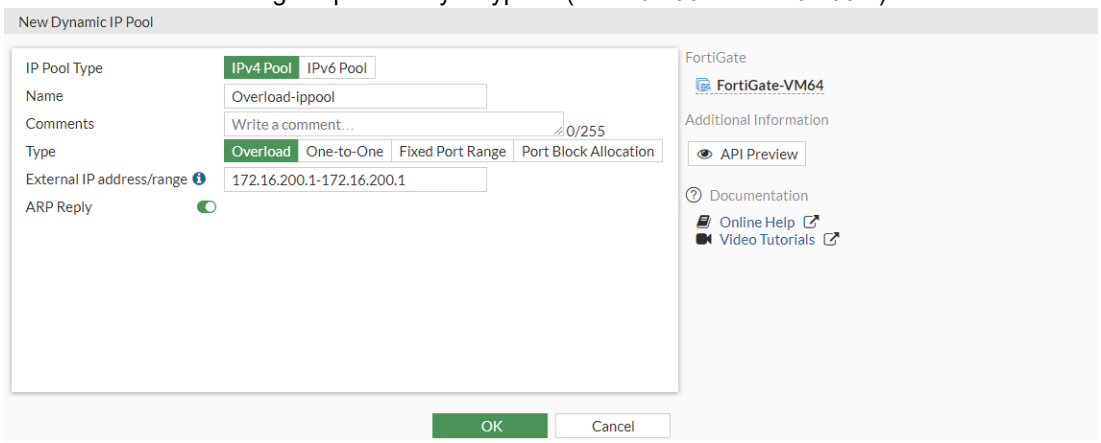
Result:

- **Total-PBAs**: 472 (60416/128)
- **Maximum ports can be used per User (Internal IP Address)**: 1024 (128*8)
- **How many Internal IP can be handled**: 59 (60416/1024 or 472/8)

Sample configuration

To configure overload IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *Create New*.
2. Select *IPv4 Pool* and then select *Overload*.
3. Enter the external IP range separated by a hyphen (*172.16.200.1-172.16.200.1*).



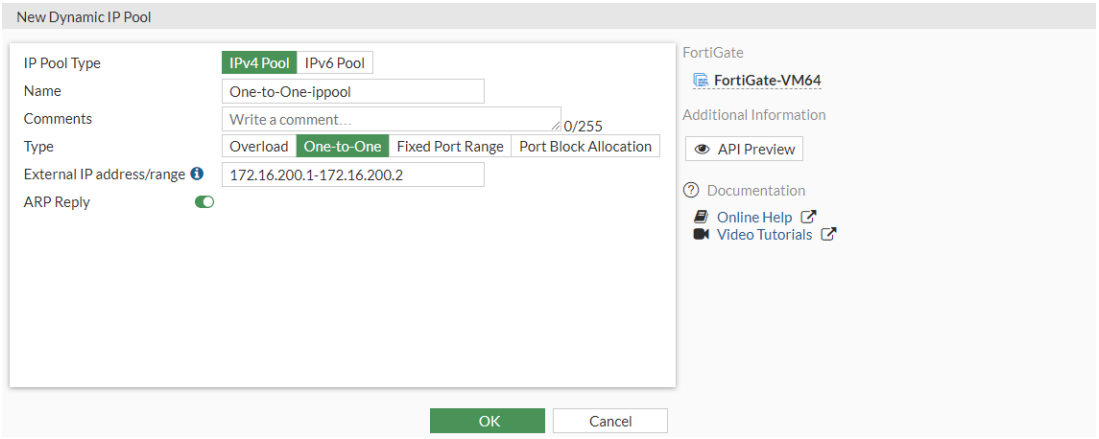
4. Click *OK*.

To configure overload IP pool in the CLI:

```
config firewall ippool
    edit "Overload-ippool"
        set startip 172.16.200.1
        set endip 172.16.200.1
    next
end
```

To configure one-to-one IP pool using the GUI:

1. In *Policy & Objects* > *IP Pools*, click *Create New*.
2. Select *IPv4 Pool* and then select *One-to-One*.
3. Enter the external IP range separated by a hyphen (*172.16.200.1-172.16.200.2*).



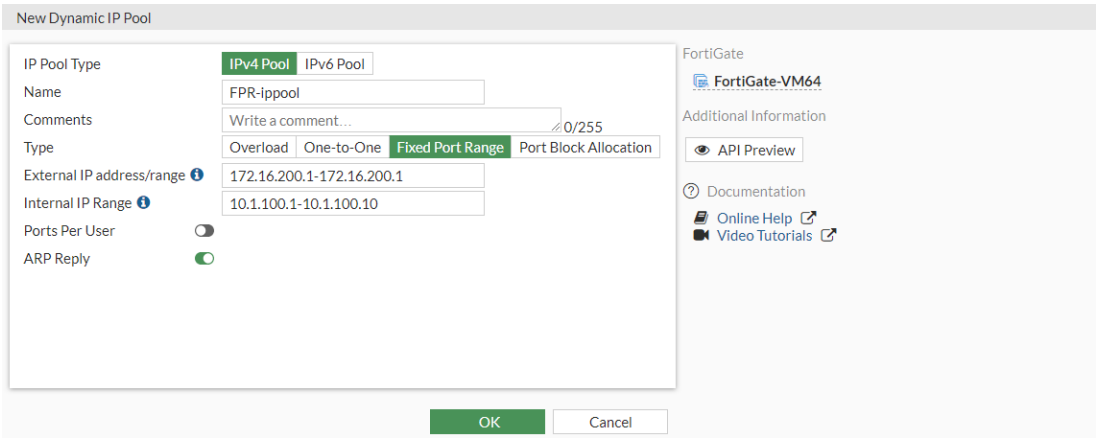
4. Click *OK*.

To configure one-to-one IP pool in the CLI:

```
config firewall ippool
    edit "One-to-One-ippool"
        set type one-to-one
        set startip 172.16.200.1
        set endip 172.16.200.2
    next
end
```

To configure fixed port range IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *Create New*.
2. Select *IPv4 Pool* and then select *Fixed Port Range*.
3. Enter the external IP range separated by a hyphen *172.16.200.1-172.16.200.1*).
4. Enter the internal IP range separated by a hyphen *10.1.100.1-10.1.100.10*).



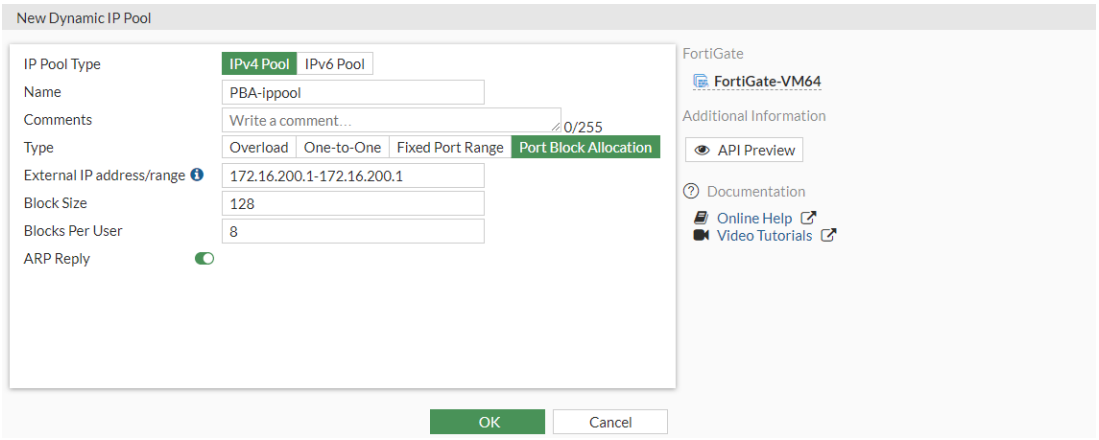
5. Click *OK*.

To configure fixed port range IP pool in the CLI:

```
config firewall ippool
    edit "FPR-ippool"
        set type fixed-port-range
        set startip 172.16.200.1
        set endip 172.16.200.1
        set source-startip 10.1.100.1
        set source-endip 10.1.100.10
   next
end
```

To configure port block allocation IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *Create New*.
2. Select *IPv4 Pool* and then select *Port Block Allocation*.
3. Enter the external IP range separated by a hyphen *172.16.200.1-172.16.200.1*).



4. Click *OK*.

To configure port block allocation IP pool in the CLI:

```
config firewall ippool
    edit PBA-ippool
        set type port-block-allocation
        set startip 172.16.200.1
        set endip 172.16.200.1
        set block-size 128
        set num-blocks-per-user 8
    next
end
```

Central SNAT

The central SNAT table enables you to define and control (with more granularity) the address translation performed by FortiGate. With the NAT table, you can define the rules for the source address or address group, and which IP pool the destination address uses.

While similar in functionality to IP pools where a single address is translated to an alternate address from a range of IP addresses, with IP pools there is no control over the translated port. When using the IP pool for source NAT, you can

define a fixed port to ensure the source port number is unchanged. If no fixed port is defined, the port translation is randomly chosen by FortiGate. With the central NAT table, you have full control over both the IP address and port translation.

FortiGate reads the NAT rules from the top down until it hits a matching rule for the incoming address. This enables you to create multiple NAT policies that dictate which IP pool is used based on the source address. NAT policies can be rearranged within the policy list. NAT policies are applied to network traffic after a security policy.

The central SNAT table allows you to create, edit, delete, and clone central SNAT entries.

Central SNAT notes

- The central NAT feature in not enabled by default.
- If central NAT is enabled, the NAT option under IPv4 policies is skipped and SNAT must be done via `central-snat-map`. The firewall policy list and dialog boxes have messages and redirection links to show this information.
- If NGFW mode is policy-based, then it is assumed that central NAT (specifically SNAT) is enabled implicitly.
- The option to toggle NAT in `central-snat-map` policies has been added. Previously it was only shown in NGFW policy-based mode.
- In the central SNAT policy dialog box, the port mapping fields for the original port have been updated to accept ranges.
- If per VDOM NAT is enabled, NAT is skipped in firewall policy.
- The central SNAT window contains a table of all the central SNAT policies.

Sample configuration

To enable or disable central SNAT using the CLI:

```
config system settings
   set central-nat [enable | disable]
end
```

When central NAT is enabled, *Policy & Objects* displays the Central SNAT section.

To create central SNAT using the GUI:

1. In *Policy & Objects* > *Central SNAT*.
   The right pane displays a table of Central SNAT entries.
2. To create a new entry, click *Create New* in the right pane.
   To edit an entry, double-click the policy you want to edit.
3. To set the *Incoming Interface*, click + in that field.
4. In the pane on the right, select an interface to add it.
   You can select multiple interfaces.
5. To set the *Outgoing Interface*, click click + in that field.
6. In the pane on the right, select an interface to add it.
   You can select multiple interfaces.
7. To set the *Source Address*, click click + in that field.
8. In the pane on the right, select an address to add it.
   You can select multiple addresses.
9. To set the *Destination Address*, click click + in that field.

10. In the pane on the right, select an address to add it.
    You can select multiple addresses.
11. In *NAT > IP Pool Configuration*, select either *Use Outgoing Interface Address* or *Use Dynamic IP Pool*.
    If you select *Use Dynamic IP Pool*, click + and select which IP pool to use.
12. Select one of the following *Protocol* parameters.
    - *ANY*. Use any protocol traffic.
    - *TCP*. Use TCP traffic only. Protocol number is set to *6*.
    - *UDP*. Use UDP traffic only. Protocol number is set to *17*.
    - *SCTP*. Use SCTP traffic only. Protocol number is set to *132*.
    - *Specify*. You can specify the traffic filter protocol by setting the protocol number.
13. If you use the *Overload* type of IP pool, you can enable *Explicit Port Mapping*.
    a. If you enable *Explicit Port Mapping*, set the *Original Source Port* to the start number of the source port range.
    b. Set the *Translated Port* to the start number of the translated port range.
14. Click *OK*.

To configure central SNAT using the CLI:

```
config firewall central-snat-map
edit <policyID number>set status [enable|disable]
  set orig-addr <valid address object preconfigured on the FortiGate>
  set srcintf <name of interface on the FortiGate>
  set dst-addr <valid address object preconfigured on the FortiGate>
  set dstintf <name of interface on the FortiGate>
  set protocol <integer for protocol number>
  set orig-port <integer for original port number>
  set nat-port <integer for translated port number>
  set comments <string>
end
```

To set NAT to be not available regardless of NGFW mode:

```
config firewall central-snat-map
    edit 1
        set orig-addr "192-86-1-86"
        set srcintf "port23"
        set dst-addr "192-96-1-96"
        set dstintf "port22"
        set nat-ippool "pool1"
        set protocol 17
        set orig-port 2896-2897
        set nat enable
    next
end
```

To hide NAT port if NAT IP pool is not set or if NAT is disabled:

```
config firewall central-snat-map
    edit 1
        set orig-addr "192-86-1-86"
        set srcintf "port23"
        set dst-addr "192-96-1-96"
        set dstintf "port22"
```

```
        set nat-ippool "pool1"
        set protocol 17
        set orig-port 2896-2897
        set nat disable
    next
end
```

To change original port to accept range:

```
config firewall central-snat-map
    edit 1
        set orig-addr "192-86-1-86"
        set srcintf "port23"
        set dst-addr "192-96-1-96"
        set dstintf "port22"
        set nat-ippool "pool1"
        set protocol 17
        set orig-port 2896-2897 (help text changed to: Original port or port range).
        set nat-port 35804-35805
    next
end
```

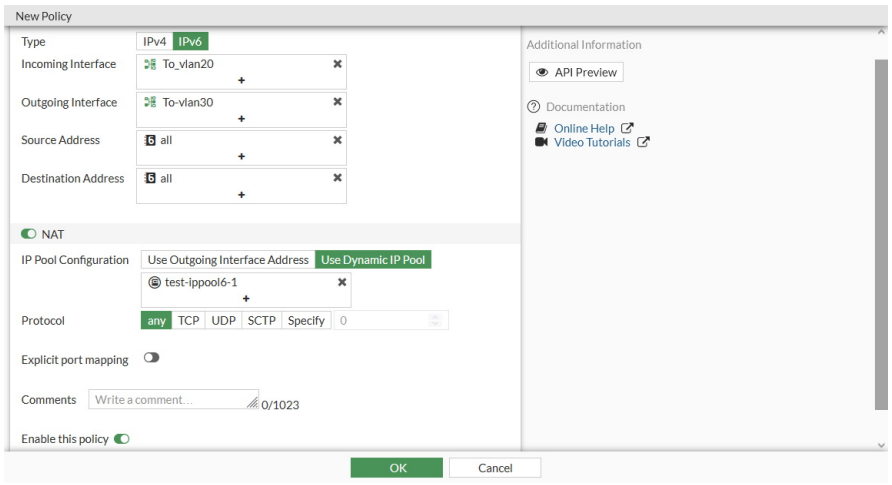
Configuring an IPv6 SNAT policy

IPv4 and IPv6 central SNAT maps are displayed in the same table.

To configure an IPv6 policy with central SNAT in the GUI:

1. Enable central SNAT:
   a. In the Global VDOM, go to *System* > *VDOM*.
   b. Select a VDOM and click *Edit*. The *Edit Virtual Domain Settings* pane opens.
   c. Enable *Central SNAT*.

   d. Click *OK*.
2. In to the VDOM with central SNAT enabled (FG-traffic in this example), go to *Policy & Objects* > *Central SNAT* and click *Create New*.
3. Configure the policy settings:
   a. For *Type*, select *IPv6*.
   b. Enter the interface, address, and IP pool information.
   c. Configure the remaining settings as needed.



d. Click *OK*.

The matching SNAT traffic will be handled by the IPv6 central SNAT map.

To configure an IPv6 policy with central SNAT in the CLI:

1. Enable central SNAT:

```
config vdom
    edit FG-traffic
        config system settings
            set central-nat enable
        end
    next
end
```

2. Create an IPv6 central SNAT policy:

```
config vdom
    edit FG-traffic
        config firewall central-snat-map
            edit 2
                set type ipv6
                set srcintf "wan2"
                set dstintf "wan1"
                set orig-addr6 "all"
                set dst-addr6 "all"
                set nat-ippool6 "test-ippool6-1"
            next
        end
    next
end
```

3. Verify the SNAT traffic:

```
(FG-traffic) # diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
3.602891 wan2 in 2000:10:1:100::41 -> 2000:172:16:200::55: icmp6: echo request seq 0
3.602942 wan1 out 2000:172:16:200::199 -> 2000:172:16:200::55: icmp6: echo request seq 0
3.603236 wan1 in 2000:172:16:200::55 -> 2000:172:16:200::199: icmp6: echo reply seq 0
3.603249 wan2 out 2000:172:16:200::55 -> 2000:10:1:100::41: icmp6: echo reply seq 0
```

```
4.602559 wan2 in 2000:10:1:100::41 -> 2000:172:16:200::55: icmp6: echo request seq 1
4.602575 wan1 out 2000:172:16:200::199 -> 2000:172:16:200::55: icmp6: echo request seq 1
4.602956 wan1 in 2000:172:16:200::55 -> 2000:172:16:200::199: icmp6: echo reply seq 1
4.602964 wan2 out 2000:172:16:200::55 -> 2000:10:1:100::41: icmp6: echo reply seq 1
^C
8 packets received by filter
0 packets dropped by kernel
```

SNAT policies with virtual wire pairs

Source NAT (SNAT) can be configured in IPv4 and IPv6 policies with virtual wire pair (VWP) interfaces, and between VWP interfaces when central NAT is enabled.

To configure a policy using SNAT and a VWP interface when central NAT is disabled:

1. Create the VWP interface:

```
config system virtual-wire-pair
    edit "test-vw-1"
        set member "port1" "port4"
    next
end
```

2. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

```
config firewall ippool
    edit "vwp-pool-1"
        set startip 172.16.222.99
        set endip 172.16.222.100
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 88
        set srcintf "port4"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set ippool enable
        set poolname "vwp-pool-1"
    next
end
```

4. Verify the IP pool functions as expected and traffic passes through:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
23.438095 port4 in 172.16.200.11 -> 172.16.200.156: icmp: echo request
23.438126 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
```

```
23.438492 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
23.438501 port4 out 172.16.200.156 -> 172.16.200.11: icmp: echo reply
24.439305 port4 in 172.16.200.11 -> 172.16.200.156: icmp: echo request
24.439319 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
24.439684 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
24.439692 port4 out 172.16.200.156 -> 172.16.200.11: icmp: echo reply

8 packets received by filter
0 packets dropped by kernel
```

To configure a SNAT between VWP interfaces when central NAT is enabled:

1. Enable central NAT:

```
config system settings
    set central-nat enable
end
```

2. Create the VWP interface:

```
config system virtual-wire-pair
    edit "test-vw-1"
        set member "port1" "port4"
    next
end
```

3. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

```
config firewall ippool
    edit "vwp-pool-1"
        set startip 172.16.222.99
        set endip 172.16.222.100
    next
end
```

4. Configure the SNAT policy:

```
config firewall central-snat-map
    edit 2
        set srcintf "port4"
        set dstintf "port1"
        set orig-addr "all"
        set dst-addr "all"
        set nat-ippool "vwp-pool-1"
    next
end
```

5. Configure the firewall policy:

```
config firewall policy
    edit 90
        set srcintf "port4"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
```

```
        next
    end
```

Policy with destination NAT

The following topics provide instructions on configuring policies with destination NAT:

- Static virtual IPs on page 548
- Virtual IP with services on page 550
- Virtual IPs with port forwarding on page 552
- Virtual server load balance on page 553

Static virtual IPs

Static Virtual IPs (VIP) are used to map external IP addresses to internal IP addresses. This is also called destination NAT, where a packet's destination is being NAT'd, or mapped, to a different address.

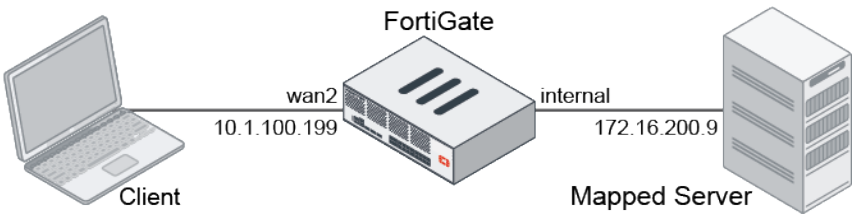
Static VIPs are commonly used to map public IP addresses to resources behind the FortiGate that use private IP addresses. A static one-to-one VIP is when the entire port range is mapped. A port forwarding VIP is when the mapping is configured on a specific port or port range.

Some of the VIP configuration options are:

Setting	Description
VIP Type	• IPv4 (`config firewall vip`) - The source and destination are both IPv4. • IPv6 (`config firewall vip6`) - The source and destination are both IPv6. • NAT46 (`config firewall vip46`) - The source if IPv4 and the destination is IPv6. • NAT64 (`config firewall vip64`) - The source if IPv6 and the destination is IPv4. **Note:** *IPv6* is only available when *IPv6* is enabled in the *Feature Visibility*. *NAT46* and *NAT64* are only available when *IPv6* and *NAT46 & NAT64* are enabled in the *Feature Visibility*. *IPv6* must be enabled so that the *NAT46 & NAT64* option is available.
Interface (`extintf`)	The external interface that the firewall policy source interface must match. For example, if the external interface is port1, then the VIP can be used in a policy from port1 to port3, but not in a policy from port2 to port3. If the external interface is *any*, then the VIP can be used in any firewall policy.
Type (`type`)	• Static NAT - Use an external IP address or address range. • FQDN - Use an external IP or FQDN address. • load-balance (CLI only) - Load balance traffic. • server-load-balance - Load balance traffic across multiple servers. SSL processing can be offloaded to the FortiGate. This type of VIP is configure from *Policy & Objects* > *Virtual Servers*. • dns-translation (CLI only) - DNS translation.

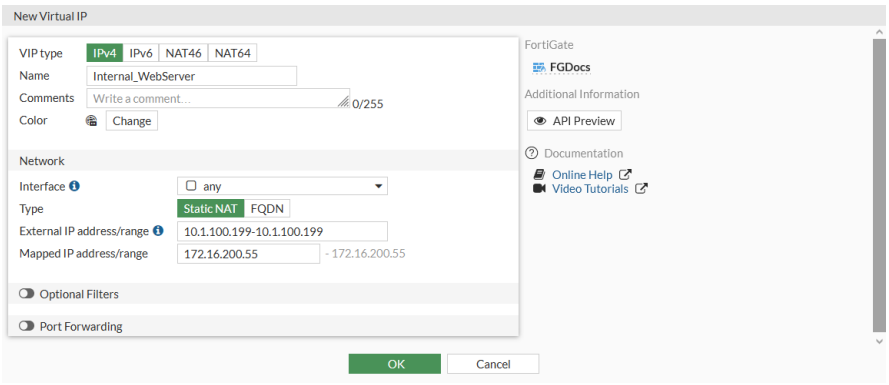
Setting	Description
	• access-proxy - Used for ZTNA. See ZTNA HTTPS access proxy example on page 702 for details.
External IP address/range (`extip`)	In a static NAT VIP, the external IP address is the IP address that the FortiGate listens for traffic on. When the external interface in not *any*, 0.0.0.0 can be used to make the external IP address equivalent to the external interface's IP address. The external IP address is also used to perform SNAT for the mapped server when the server outbound traffic with a destination interface that matches the external interface. The firewall policy must also have NAT enabled.
Mapped IP address/range (`mappedip`)	The address or range that the internal resource is being mapped to.
`srcintf-filter` (CLI only)	Listen for traffic to the external IP address only on the specified interface. While the external interface restricts the policies where the VIP can be used, it does not restrict listening to only the external interface. To restrict listening to only a specific interface, `srcint-filter` must be configured.
`nat-source-vip` (CLI only)	Force all of the traffic from the mapped server to perform SNAT with the external IP address, regardless of the destination interface. If `srcint-filter` is defined, then `nat-source-vip` only forces SNAT to be performed when the destination matches the `srcintf-filter` interface. In both cases, the firewall policy must have NAT enabled.
`arp-reply` (CLI only)	Enable/disable responding to ARP requests on the external IP address (default = enable).
Source address (`src-filter`)	Restrict the source IP address, address range, or subnet that is allowed to access the VIP.
Services (`service`)	Set the services that are allowed to be mapped.
Port Forwarding (`portforward`)	Enable port forwarding to specify the port (`mappedport`) to map to If no services are configured, you can configure the protocol (`protocol`) to use when forwarding packets, the external service port range (`extport`) to be mapped to a port range on the destination network, and the mapped port range (`mappedport`) on the destination network.

Sample configuration



To create a virtual IP in the GUI:

1. In *Policy & Objects* > *Virtual IPs* and click *Create New* > *Virtual IP*.
2. Select a *VIP Type* based on the IP versions used.
3. Enter a unique name for the virtual IP.
4. Enter values for the *External IP address/range* and *Mapped to IP address/range* fields:



5. Click *OK*.

To create a virtual IP in the CLI:

```
config firewall vip
    edit "Internal_WebServer"
        set extip 10.1.100.199
        set extintf "any"
        set mappedip "172.16.200.55"
    next
end
```

To apply a virtual IP to policy in the CLI:

```
config firewall policy
    edit 8
        set name "Example_Virtual_IP_in_Policy"
        set srcintf "wan2"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "Internal_WebServer"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Virtual IP with services

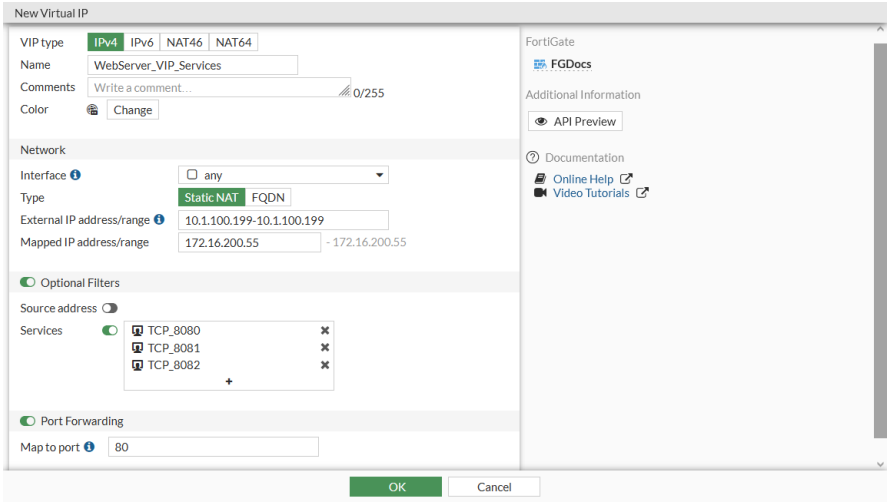
Virtual IP with services is a more flexible virtual IP mode. This mode allows users to define services to a single port number mapping.

This topic shows how to use virtual IP with services enabled. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to an internal WebServer TCP port 80. This allows remote connections to communicate with a server behind the firewall.

Sample configuration

To create a virtual IP with services in the GUI:

1. In *Policy & Objects* > *Virtual IPs* and click *Create New* > *Virtual IP*.
2. Set *VIP Type* to *IPv4*.
3. Enter a unique name for the virtual IP and fill in the other fields.
4. Configure the fields in the *Network* section. For example:
   - Set *Interface* to *any*.
   - Set *External IP Address/Range* to *10.1.100.199*.
   - Set *Mapped IP Address/Range* to *172.16.200.55*.
5. Enable *Optional Filters* and then enable *Services*.
6. In the *Services* field click + to display the *Services* pane.
7. In the *Services* pane select *TCP_8080*, *TCP_8081*, and *TCP_8082*.
8. Enable *Port Forwarding* and set *Map to Port* to *80*.



9. Click *OK*.

To see the results:

1. Apply the above virtual IP to the Firewall policy.
2. The results are:
   - Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.55:80 in internal network.

To create a virtual IP with services in the CLI:

```
config firewall vip
    edit "WebServer_VIP_Services"
        set service "TCP_8080" "TCP_8081" "TCP_8082"
        set extip 10.1.100.199
        set extintf "any"
        set portforward enable
        set mappedip "172.16.200.55"
        set mappedport 80
    next
end
```

Virtual IPs with port forwarding

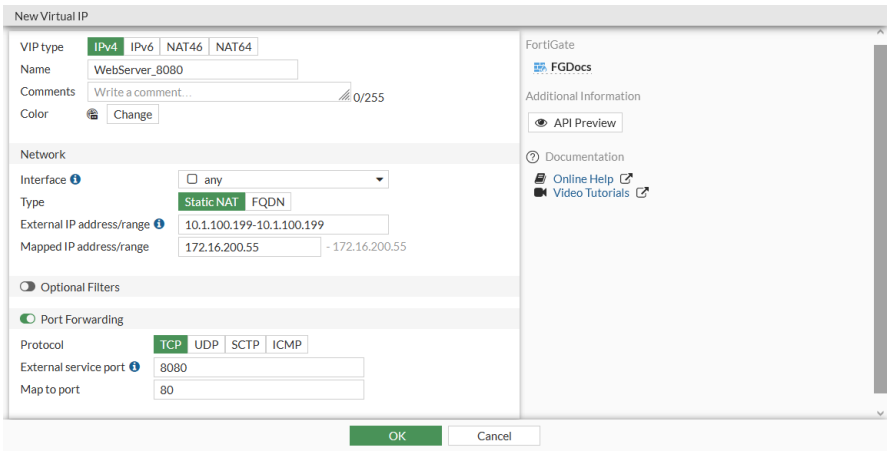
If you need to hide the internal server port number or need to map several internal servers to the same public IP address, enable port-forwarding for Virtual IP.

This topic shows how to use virtual IPs to configure port forwarding on a FortiGate unit. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to different internal WebServers' TCP port 80. This allows remote connections to communicate with a server behind the firewall.

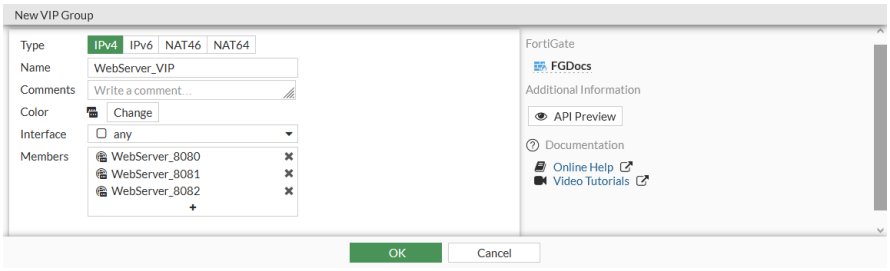
Sample configuration

To create a virtual IP with port forwarding in the GUI:

1. In *Policy & Objects* > *Virtual IPs*.
2. Click *Create New* and select *Virtual IP*.
3. For *VIP Type*, select *IPv4*.
4. Enter a unique name for the virtual IP and fill in the other fields.
5. Configure the fields in the *Network* section. For example:
   - Set *Interface* to *any*.
   - Set *External IP Address/Range* to *10.1.100.199*.
   - Set *Mapped IP Address/Range* to *172.16.200.55*.
6. Leave *Optional Filters* disabled.
7. Enable *Port Forwarding*.
8. Configure the fields in the *Port Forwarding* section. For example:
   - Set *Protocol* to *TCP*.
   - Set *External Service Port* to *8080*.
   - Set *Map to Port* to *80*.



9. Click *OK*.
10. Follow the above steps to create two additional virtual IPs.
    a. For one virtual IP:
        - Use a different *Mapped IP Address/Range*, for example, *172.16.200.56*.
        - Set *External Service Port* to *8081*.
        - Use the same *Map to Port* numbers: *80*.
    b. For the other virtual IP:
        - Use a different *Mapped IP Address/Range*, for example, *172.16.200.57*.
        - Set *External Service Port* to *8082*.
        - Use the same *Map to Port* numbers: *80*.
11. Create a *Virtual IP Group* and put the above three virtual IPs into that group.



To see the results:

1. Apply the above virtual IP to the Firewall policy.
2. The results are:
    - Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
    - Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.56:80 in internal network.
    - Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.57:80 in internal network

Virtual server load balance

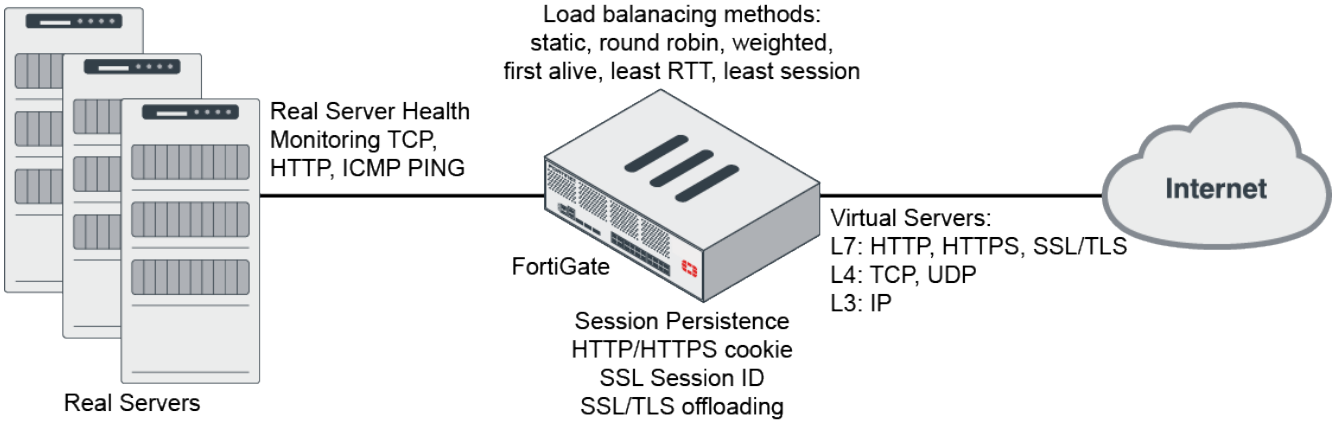
This topic shows a special virtual IP type: virtual server. Use this type of VIP to implement server load balancing.

The FortiOS server load balancing contains all the features of a server load balancing solution. You can balance traffic across multiple backend servers based on multiple load balancing schedules including:

- Static (failover)
- Round robin
- Weighted (to account for different sized servers or based on the health and performance of the server including round trip time and number of connections)

The load balancer supports HTTP, HTTPS, IMAPS, POP3S, SMTPS, SSL/TLS, and generic TCP/UDP and IP protocols. Session persistence is supported based on the SSL session ID based on an injected HTTP cookie, or based on the HTTP or HTTPS host. SSL/TLS load balancing includes protection from protocol downgrade attacks. Server load balancing is supported on most FortiGate devices and includes up to 10,000 virtual servers on high end systems.

Sample topology



SSL/TLS offloading

FortiGate SSL/TLS offloading is designed for the proliferation of SSL/TLS applications. The key exchange and encryption/decryption tasks are offloaded to the FortiGate unit where they are accelerated using FortiASIC technology which provides significantly more performance than a standard server or load balancer. This frees up valuable resources on the server farm to give better response to business operations. Server load balancing offloads most SSL/TLS versions including SSL 3.0, TLS 1.0, and TLS 1.2, and supports full mode or half mode SSL offloading with DH key sizes up to 4096 bits.

FortiGate SSL offloading allows the application payload to be inspected before it reaches your servers. This prevents intrusion attempts, blocks viruses, stops unwanted applications, and prevents data leakage. SSL/TLS content inspection supports TLS versions 1.0, 1.1, and 1.2 and SSL versions 1.0, 1.1, 1.2, and 3.0.

Virtual server requirements

When creating a new virtual server, you must configure the following options:

- Virtual Server Type.
- Load Balancing Methods.
- Health check monitoring (optional).
- Session persistence (optional).
- Virtual Server IP (External IP Address).
- Virtual Server Port (External Port).
- Real Servers (Mapped IP Address & Port).

Virtual server types

Select the protocol to be load balanced by the virtual server. If you select a general protocol such as IP, TCP, or UDP, the virtual server load balances all IP, TCP, or UDP sessions. If you select specific protocols such as HTTP, HTTPS, or SSL, you can apply additional server load balancing features such as *Persistence* and *HTTP Multiplexing*.

HTTP	Select *HTTP* to load balance only HTTP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 80 for HTTP sessions). You can enable *HTTP Multiplexing*. You can also set *Persistence* to *HTTP Cookie* to enable cookie-based persistence.
HTTPS	Select *HTTPS* to load balance only HTTPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 443 for HTTPS sessions). You can enable *HTTP Multiplexing*. You can also set *Persistence* to *HTTP Cookie* to enable cookie-based persistence, or you can set *Persistence* to *SSL Session ID*.
IMAPS	Select *IMAPS* to load balance only IMAPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 993 for IMAPS sessions). You can also set *Persistence* to *SSL Session ID*.
POP3S	Select *POP3S* to load balance only POP3S sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 995 for POP3S sessions). You can also set *Persistence* to *SSL Session ID*.
SMTPS	Select *SMTPS* to load balance only SMTPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 465 for SMTPS sessions). You can also set *Persistence* to *SSL Session ID*.
SSL	Select *SSL* to load balance only SSL sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced. You can also set *Persistence* to *SSL Session ID*.
TCP	Select *TCP* to load balance only TCP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced.
UDP	Select *UDP* to load balance only UDP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced.
IP	Select *IP* to load balance all sessions accepted by the security policy that contains this virtual server.

Load balancing methods

The load balancing method defines how sessions are load balanced to real servers.

All load balancing methods do not send traffic to real servers that are down or not responding. FortiGate can only determine if a real server is not responding by using a health check monitor. You should always add at least one health

check monitor to a virtual server or to real servers; otherwise load balancing might try to distribute sessions to real servers that are not functioning.

Static	The traffic load is statically spread evenly across all real servers. Sessions are not assigned according to how busy individual real servers are. This load balancing method provides some persistence because all sessions from the same source address always go to the same real server. Because the distribution is stateless, so if a real server is added, removed, or goes up or down, the distribution is changed and persistence might be lost.
Round Robin	Directs new requests to the next real server. This method treats all real servers as equals regardless of response time or the number of connections. This method does not direct requests to real servers that down or non responsive.
Weighted	Real servers with a higher weight value receive a larger percentage of connections. Set the real server weight when adding a real server.
Least Session	Directs requests to the real server that has the least number of current connections. This method works best in environments where the real servers or other equipment you are load balancing all have similar capabilities. This load balancing method uses the FortiGate session table to track the number of sessions being processed by each real server. The FortiGate unit cannot detect the number of sessions actually being processed by a real server.
Least RTT	Directs sessions to the real server with the lowest round trip time. The round trip time is determined by a ping health check monitor. The default is 0 if no ping health check monitors are added to the virtual server.
First Alive	Directs sessions to the first live real server. This load balancing schedule provides real server failover protection by sending all sessions to the first live real server. If a real server fails, all sessions are sent to the next live real server. Sessions are not distributed to all real servers so all sessions are processed by the first real server only.
HTTP Host	Load balances HTTP host connections across multiple real servers using the host's HTTP header to guide the connection to the correct real server.

Health check monitoring

In the FortiGate GUI, you can configure health check monitoring so that the FortiGate unit can verify that real servers are able respond to network connection attempts. If a real server responds to connection attempts, the load balancer continues to send sessions to it. If a real server stops responding to connection attempts, the load balancer assumes that the server is down and does not send sessions to it. The health check monitor configuration determines how the load balancer tests real servers. You can use a single health check monitor for multiple load balancing configurations. You can configure TCP, HTTP, DNS, and ping health check monitors. You usually set the health check monitor to use the same protocol as the traffic being load balanced to it. For example, for an HTTP load balancing configuration, you would normally use an HTTP health check monitor.

Session persistence

Use persistence to ensure a user is connected to the same real server every time the user makes an HTTP, HTTPS, or SSL request that is part of the same user session. For example, if you are load balancing HTTP and HTTPS sessions to a collection of eCommerce web servers, when users make a purchase, they will be starting multiple sessions as they navigate the eCommerce site. In most cases, all the sessions started by this user during one eCommerce session should be processed by the same real server. Typically, the HTTP protocol keeps track of these related sessions using

cookies. HTTP cookie persistence ensure all sessions that are part of the same user session are processed by the same real server.

When you configure persistence, the FortiGate unit load balances a new session to a real server according to the load balance method. If the session has an HTTP cookie or an SSL session ID, the FortiGate unit sends all subsequent sessions with the same HTTP cookie or SSL session ID to the same real server.

Real servers

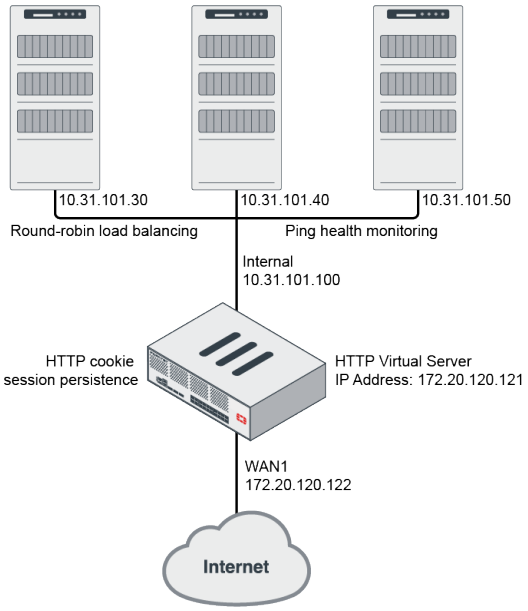
Add real servers to a load balancing virtual server to provide information the virtual server requires to send sessions to the server. A real server configuration includes the IP address of the real server and port number the real server receives sessions on. The FortiGate unit sends sessions to the real server's IP address using the destination port number in the real server configuration.

When configuring a real server, you can also specify the weight (if the load balance method is set to *Weighted*) and you can limit the maximum number of open connections between the FortiGate unit and the real server. If the maximum number of connections is reached for the real server, the FortiGate unit automatically switches all further connection requests to other real servers until the connection number drops below the limit. Setting *Maximum Connections* to 0 means that the FortiGate unit does not limit the number of connections to the real server.

Sample of HTTP load balancing to three real web servers

This example describes the steps to configure the load balancing configuration below. In this configuration, a FortiGate unit is load balancing HTTP traffic from the Internet to three HTTP servers on the internal network. HTTP sessions are accepted at the wan1 interface with destination IP address 172.20.120.121 on TCP port 8080, and forwarded from the internal interface to the web servers. When forwarded, the destination address of the session is translated to the IP address of one of the web servers.

This load balancing configuration also includes session persistence using HTTP cookies, round-robin load balancing, and TCP health monitoring for the real servers. Ping health monitoring consists of the FortiGate unit using ICMP ping to ensure the web servers can respond to network traffic.



General steps:

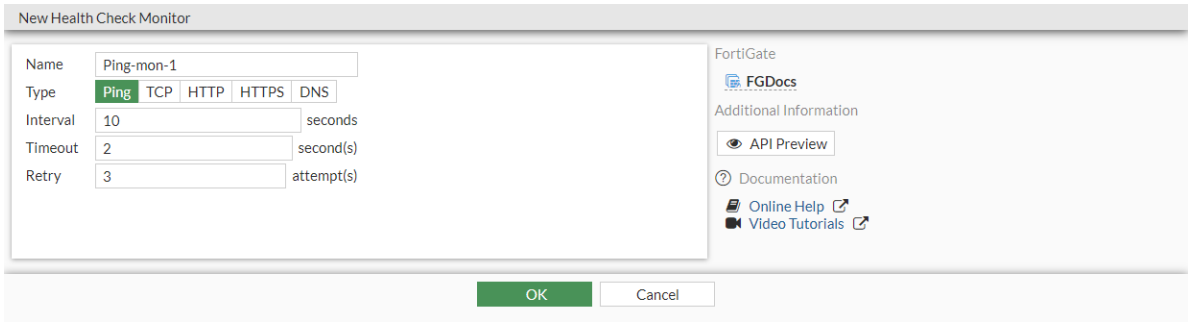
1. Create a health check monitor.
   A ping health check monitor causes the FortiGate to ping the real servers every 10 seconds. If one of the servers does not respond within 2 seconds, the FortiGate unit will retry the ping 3 times before assuming that the HTTP server is not responding.
2. Create a load balance virtual server with three real servers.
3. Add the load balancing virtual server to a policy as the destination address.

To see the virtual servers and health check monitors options in the GUI, *Load Balance* must be selected in *Feature Visibility* > *Additional Features*. See Feature visibility on page 1562 on page 1 for details.

Configure a load balancing virtual server in the GUI

To create a health check monitor:

1. Go to *Policy & Objects* > *Health Check*.
2. Click *Create New*.
3. Set the following:
   - *Name* to *Ping-mon-1*
   - *Type* to *Ping*
   - *Interval* to *10* seconds
   - *Timeout* to *2* seconds
   - *Retry* to *3* attempt(s)

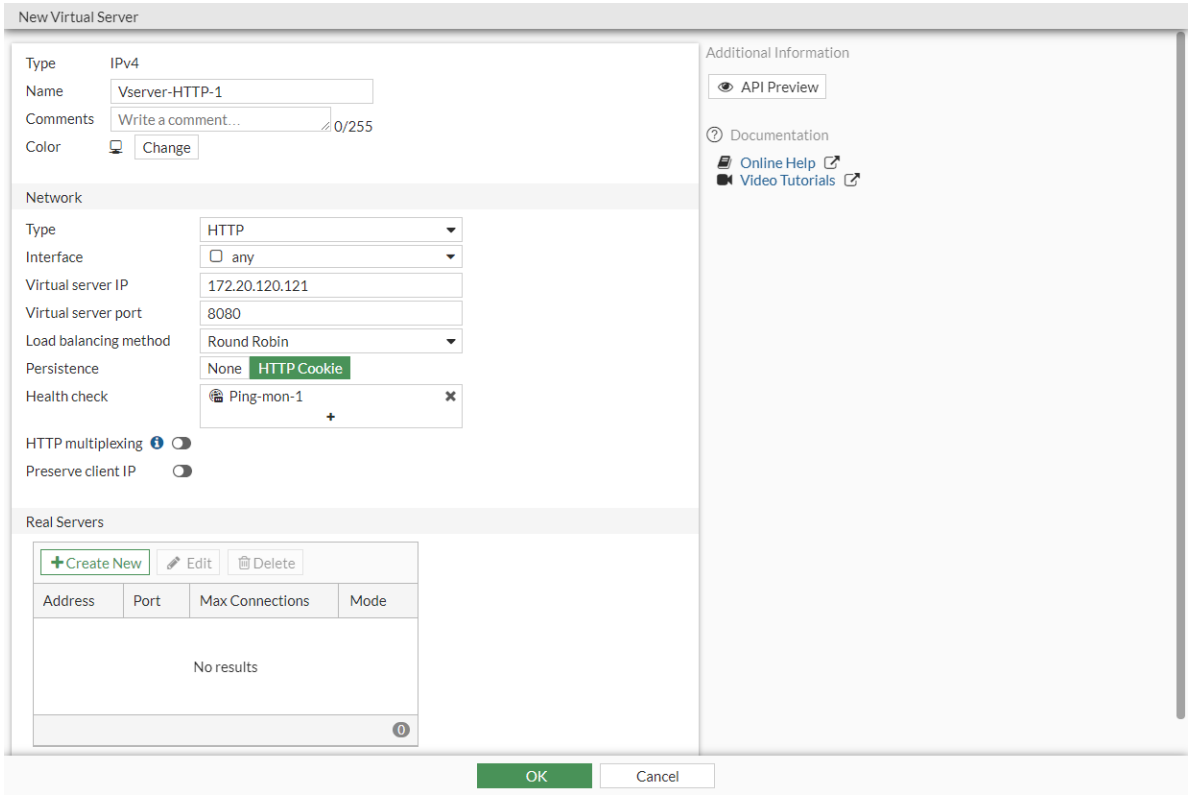


4. Click *OK*.

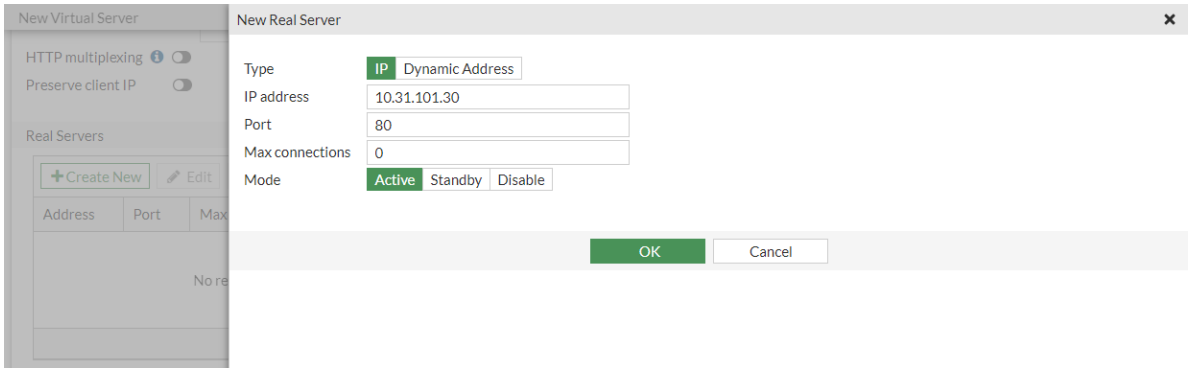
To create a virtual server:

1. Go to *Policy & Objects* > *Virtual Servers*.
2. Click *Create New*.
3. Set the following:
   - *Name* to *Vserver-HTTP-1*
   - *Type* to *HTTP*
   - *Interface* to *wan1*
   - *Virtual Server IP* to *172.20.120.121*
   - *Virtual Server Port* to *8080*

- *Load Balance Method* to *Round Robin*
- *Persistence* to *HTTP Cookie*
- *Health Check* to *Ping-mon-1*



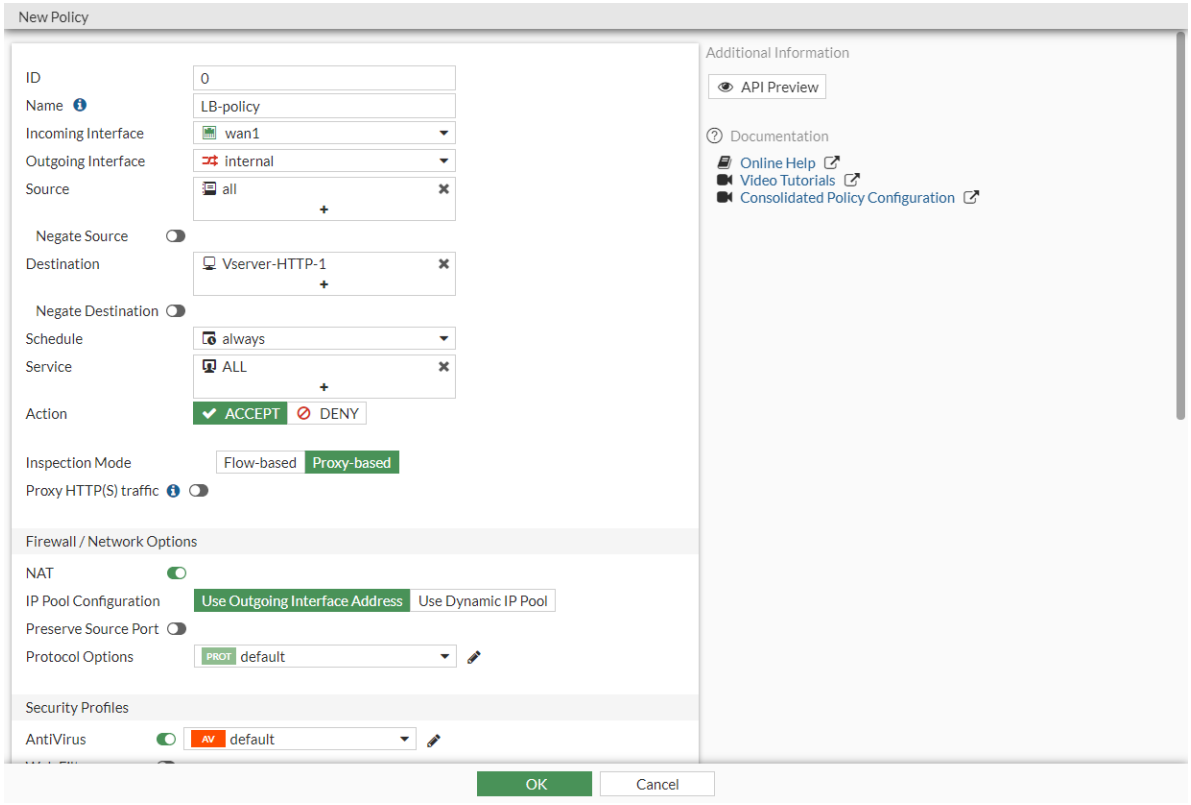
4. In the *Real Servers* table, click *Create New*.
5. Set the following for the first real server:
   - *Type* to *IP*
   - *IP Address* to *10.31.101.30*
   - *Port* to *80*
   - *Max Connections* to *0*
   - *Mode* to *Active*



6. Click *OK*. Configure two more real servers with IP addresses 10.31.101.40 and 10.31.101.50, and the same settings as the first real server.
7. Click *OK*.

To create a security policy that includes the load balance virtual server as the destination address:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Set the *Inspection Mode* to *Proxy-based*. The new virtual server will not be available if the inspection mode is *Flow-based*.
4. Set the following:
   - *Name* to *LB-policy*
   - *Incoming Interface* to *wan1*
   - *Outgoing Interface* to *internal*
   - *Source* to *all*
   - *Destination* to *Vserver-HTTP-1*
   - *Schedule* to *always*
   - *Service* to *ALL*
   - *Action* to *ACCEPT*
5. Enable *NAT* and set *IP Pool Configuration* to *Use Outgoing Interface Address*.
6. Enable *AntiVirus* and select an antivirus profile.



7. Click *OK*.

Configure a load balancing virtual server in the CLI

To configure HTTP load balancing to three real web servers in the CLI:

1. Create a health check monitor:

```
config firewall ldb-monitor
    edit "Ping-mon-1"
        set type ping
        set interval 10
        set timeout 2
        set retry 3
    next
end
```

2. Create a virtual server:

```
config firewall vip
    edit "Vserver-HTTP-1"
        set type server-load-balance
        set extip 172.20.120.121
        set extintf "any"
        set server-type http
        set monitor "Ping-mon-1"
        set ldb-method round-robin
        set persistence http-cookie
        set extport 8080
        config realservers
            edit 1
                set type ip
                set ip 10.31.101.30
                set port 80
            next
            edit 2
                set type ip
                set ip 10.31.101.40
                set port 80
            next
            edit 3
                set type ip
                set ip 10.31.101.50
                set port 80
            next
        end
    next
end
```

3. Add the load balancing virtual server to a policy as the destination address:

```
config firewall policy
    edit 2
        set name "LB-policy"
        set inspection-mode proxy
        set srcintf "wan1"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "Vserver-HTTP-1"
        set action accept
```

```
            set schedule "always"
            set service "ALL"
            set utm-status enable
            set ssl-ssh-profile "certificate-inspection"
            set av-profile "default"
            set fsso disable
            set nat enable
        next
    end
```

Results

Traffic accessing 172.20.120.121:8080 is forwarded in turn to the three real servers.

If the access request has an http-cookie, FortiGate forwards the access to the corresponding real server according to the cookie.

Policy with Internet Service

The following topics provide instructions on configuring policies with Internet Service:

- Using Internet Service in policy on page 562
- Using custom Internet Service in policy on page 564
- Using extension Internet Service in policy on page 566
- Global IP address information database on page 568
- IP reputation filtering on page 570
- Internet service groups in policies on page 571
- Allow creation of ISDB objects with regional information on page 575
- Internet service customization on page 577

Using Internet Service in policy

This topic shows how to apply a predefined Internet Service entry into a policy.

The Internet Service Database is a comprehensive public IP address database that combines IP address range, IP owner, service port number, and IP security credibility. The data comes from the FortiGuard service system. Information is regularly added to this database, for example, geographic location, IP reputation, popularity & DNS, and so on. All this information helps users define Internet security more effectively. You can use the contents of the database as criteria for inclusion or exclusion in a policy.

From FortiOS version 5.6, Internet Service is included in the firewall policy. It can be applied to a policy only as a destination object. From version 6.0, Internet Service can be applied both as source and destination objects in a policy. You can also apply Internet Services to shaping policy.

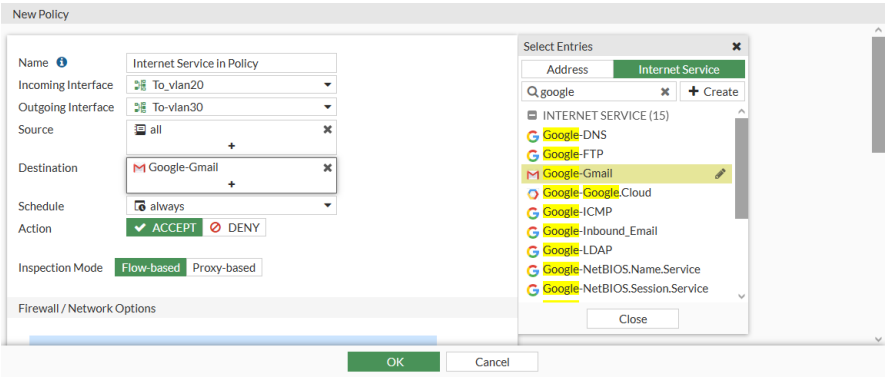
There are three types of Internet Services you can apply to a firewall policy:

- Predefined Internet Services
- Custom Internet Services
- Extension Internet Services

Sample configuration

To apply a predefined Internet Service entry to a policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Click in the *Destination* field.
3. In the *Select Entries* pane, click *Internet Service* and select *Google-Gmail*.



4. Configure the remaining fields as needed.
5. Click *OK*.

To apply a predefined Internet Service entry to a policy in the CLI:

In the CLI, enable the `internet-service` first and then use its ID to apply the policy.

This example uses Google Gmail and its ID is 65646. Each Internet Service has a unique ID.

```
config firewall policy
    edit 9
        set name "Internet Service in Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

To diagnose an Internet Service entry in the CLI:

```
# diagnose internet-service id-summary 65646
Version: 0000600096
Timestamp: 201902111802
Total number of IP ranges: 444727
Number of Groups: 7
Group(0), Singularity(20), Number of IP ranges(142740)
```

```
Group(1), Singularity(19), Number of IP ranges(1210)
Group(2), Singularity(16), Number of IP ranges(241)
Group(3), Singularity(15), Number of IP ranges(38723)
Group(4), Singularity(10), Number of IP ranges(142586)
Group(5), Singularity(8), Number of IP ranges(5336)
Group(6), Singularity(6), Number of IP ranges(113891)
Internet Service: 65646(Google.Gmail)
Number of IP range: 60
Number of IP numbers: 322845
Singularity: 15
Reputation: 5(Known and verified safe sites such as Gmail, Amazon, eBay, etc.)
Icon Id: 510
Second Level Domain: 53(gmail.com)
Direction: dst
Data source: isdb
```

Result

Because the IP and services related to Google Gmail on the Internet are included in this Internet Service (65646), all traffic to Google Gmail is forwarded by this policy.

Using custom Internet Service in policy

Custom Internet Services can be created and used in firewall policies.

When creating a custom Internet Service, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges
- Reputation

You must use CLI to create a custom Internet Service, except for geographic based services (see Allow creation of ISDB objects with regional information on page 575).

CLI syntax

```
config firewall internet-service-custom
    edit <name>
       set comment <comment>
       set reputation {1 | 2 | 3 | 4 | 5}
       config entry
           edit <ID>
               set protocol <protocol #>
               set dst <object_name>
               config port-range
                   edit <ID>
                       set start-port <port #>
                       set end-port <port #>
                   next
               end
           next
       end
```

```
    end
end
```

Sample configuration

To configure a custom Internet Service:

```
config firewall internet-service-custom
   edit "test-isdb-1"
       set comment "Test Custom Internet Service"
       set reputation 4
       config entry
          edit 1
              set protocol 6
              config port-range
                  edit 1
                      set start-port 80
                      set end-port 443
                  next
              end
              set dst "10-1-100-0"
          next
          edit 2
              set protocol 6
              config port-range
                  edit 1
                      set start-port 80
                      set end-port 80
                  next
              end
              set dst "172-16-200-0"
          next
       end
   next
end
```

To apply a custom Internet Service into a policy:

```
config firewall policy
    edit 1
        set name "Internet Service in Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set internet-service-custom "test-isdb-1"
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Result

In addition to the IP address, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which access to 10.1.100.0/24 and TCP/80-443 and 172.16.200.0/24 and TCP/80.

Using extension Internet Service in policy

Extension Internet Service lets you add custom or remove existing IP address and port ranges to an existing predefined Internet Service entries. Using an extension type Internet Service is actually editing a predefined type Internet Service entry and adding IP address and port ranges to it.

When creating an extension Internet Service and adding custom ranges, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges

You must use CLI to add custom IP address and port entries into a predefined Internet Service.

You must use GUI to remove entries from a predefined Internet Service.

Custom extension Internet Service CLI syntax

```
config firewall internet-service-extension
    edit <ID #>
        set comment <comment>
        config entry
            edit <ID #>
                set protocol <number #>
                set dst <object_name>
                config port-range
                    edit <ID #>
                        set start-port <number #>
                        set end-port <number #>
                    next
                end
            next
        end
    end
end
```

Sample configuration

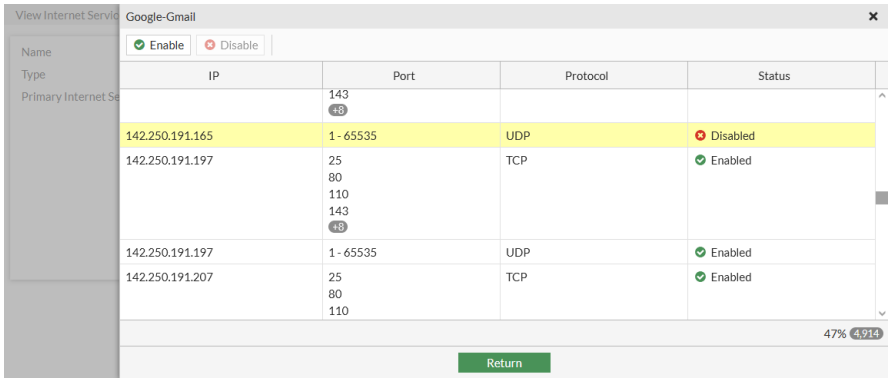
To configure an extension Internet Service in the CLI:

```
config firewall internet-service-extension
    edit 65646
        set comment "Test Extension Internet Service 65646"
        config entry
            edit 1
                set protocol 6
                config port-range
                    edit 1
                        set start-port 80
```

```
                    set end-port 443
                next
            end
            set dst "172-16-200-0"
        next
        edit 2
            set protocol 17
            config port-range
                edit 1
                    set start-port 53
                    set end-port 53
                next
            end
            set dst "10-1-100-0"
        next
    end
next
end
```

To remove IP address and port entries from an existing Internet Service in the GUI:

1. Go to *Policy & Objects* > *Internet Service Database*.
2. Search for *Google-Gmail*.
3. Select *Google-Gmail* and click *Edit*.
4. In the gutter, click *View/Edit Entries*.
5. Select the *IP* entry that you need to remove and click *Disable*.



6. Click *Return* twice.

To remove IP address and port entries from an existing Internet Service in the CLI:

```
config firewall internet-service-extension
    edit 65646
        config disable-entry
            edit 1
                set protocol 17
                config port-range
                    edit 1
                    next
                end
                config ip-range
                    edit 1
```

```
                        set start-ip 142.250.191.165
                        set end-ip 142.250.191.165
                    next
                end
            next
        end
    next
end
```

To apply an extension Internet Service into policy in the CLI:

```
config firewall policy
    edit 9
        set name "Internet Service in Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Result

In addition to the IP addresses, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which accesses 10.1.100.0/24 and UDP/53 and 172.16.200.0/24 and TCP/80-443. At the same time, the traffic that accesses 2.20.183.160 is dropped because this IP address and port is disabled from Google.Gmail.

Global IP address information database

The Internet Service and IP Reputation databases download details about public IP address, including: ownership, known services, geographic location, blocklisting information, and more. The details are available in drilldown information, tooltips, and other mechanisms in the FortiView and other pages.

The global IP address database is an integrated database containing all public IP addresses, and is implemented in the Internet Service Database.

To view the owner of the IP address:

```
(global) # get firewall internet-service-owner ?
    id    Internet Service owner ID.
    1  Google
    2  Facebook
    3  Apple
    4  Yahoo
    5  Microsoft
    ......
```

```
    115  Cybozu
    116  VNC
```

To check for any known service running on an IP address:

```
(global) # diagnose internet-service info FG-traffic 6 80 8.8.8.8
    Internet Service: 65537(Google.Web)
```

To check GeoIP location and blocklist information:

```
(global) # diagnose internet-service id 65537 | grep 8.8.8.8
    8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(6) port(80 443)
    8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(17) port(443)
```

To check a known malicious server:

```
(global) # diagnose internet-service id-summary 3080383
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7
    Group(0), Singularity(20), Number of IP ranges(142740)
    Group(1), Singularity(19), Number of IP ranges(1210)
    Group(2), Singularity(16), Number of IP ranges(241)
    Group(3), Singularity(15), Number of IP ranges(38723)
    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 3080383(Botnet.C&C.Server)
    Number of IP range: 111486
    Number of IP numbers: 111486
    Singularity: 20
    Reputation: 1(Known malicious sites related to botnet servers, phishing sites, etc.)
    Icon Id: 591
    Second Level Domain: 1(other)
    Direction: dst
    Data source: irdb
```

To check questionable usage:

```
(global) # diagnose internet-service id-summary 2818238
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7
    Group(0), Singularity(20), Number of IP ranges(142740)
    Group(1), Singularity(19), Number of IP ranges(1210)
    Group(2), Singularity(16), Number of IP ranges(241)
    Group(3), Singularity(15), Number of IP ranges(38723)
    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 2818238(Tor.Relay.Node)
    Number of IP range: 13718
    Number of IP numbers: 13718
```

```
    Singularity: 20
    Reputation: 2(Sites providing high risk services such as TOR, proxy, P2P, etc.)
    Icon Id: 43
    Second Level Domain: 1(other)
    Direction: dst
    Data source: irdb

(global) # diagnose internet-service id-summary 2818243
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7
    Group(0), Singularity(20), Number of IP ranges(142740)
    Group(1), Singularity(19), Number of IP ranges(1210)
    Group(2), Singularity(16), Number of IP ranges(241)
    Group(3), Singularity(15), Number of IP ranges(38723)
    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 2818243(Tor.Exit.Node)
    Number of IP range: 1210
    Number of IP numbers: 1210
    Singularity: 19
    Reputation: 2(Sites providing high risk services such as TOR, proxy, P2P, etc.)
    Icon Id: 43
    Second Level Domain: 1(other)
    Direction: src
    Data source: irdb
```

IP reputation filtering

There are currently five reputation levels in the Internet Service Database (ISDB), and custom reputation levels can be defined in a custom internet service. You can configure firewall policies to filter traffic according to the desired reputation level. If the reputation level of either the source or destination IP address is equal to or greater than the level set in the policy, then the packet is forwarded, otherwise, the packet is dropped.

The five default reputation levels are:

1	Known malicious sites, such as phishing sites or sites related to botnet servers
2	High risk services sites, such as TOR, proxy, and P2P
3	Unverified sites
4	Reputable social media sites, such as Facebook and Twitter
5	Known and verified safe sites, such as Gmail, Amazon, and eBay

The default minimum reputation level in a policy is zero, meaning that the reputation filter is disabled.

For IP addresses that are not included in the ISDB, the default reputation level is three.

The default reputation direction is `destination`.

To set the reputation level and direction in a policy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "wan1"
        set dstaddr "all"
        set reputation-minimum 3
        set reputation-direction source
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

In a policy, if `reputation-minimum` is set, and the `reputation-direction` is `destination`, then the `dstaddr`, `service`, and `internet-service` options are removed from the policy.

If `reputation-minimum` is set, and the `reputation-direction` is `source`, then the `srcaddr`, and `internet-service-src` options are removed from the policy.

Internet service groups in policies

This feature provides support for Internet Service Groups in traffic shaping and firewall policies. Service groups can be used as the source and destination of the policy. Internet Service Groups are used as criteria to match traffic; the shaper will be applied when the traffic matches.

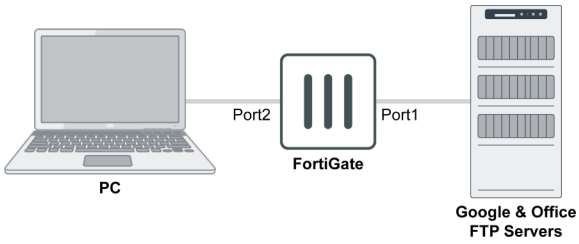
To use a group as a destination, `internet-service` must be enabled. To use a group as a source, `internet-service-src` must be enabled.

The following CLI variables are available in the `firewall policy` and `firewall shaping-policy` commands:

Variable	Description
`internet-service-group <string>`	Internet Service group name.
`internet-service-custom-group <string>`	Custom Internet Service group name.
`internet-service-src-group <string>`	Internet Service source group name.
`internet-service-src-custom-group <string>`	Custom Internet Service source group name.

Examples

The following examples use the below topology.



Example 1

In this example, the PC is allowed to access Google, so all Google services are put into an Internet Service Group.

To configure access to Google services using an Internet Service Group using the CLI:

1. Create a Service Group:

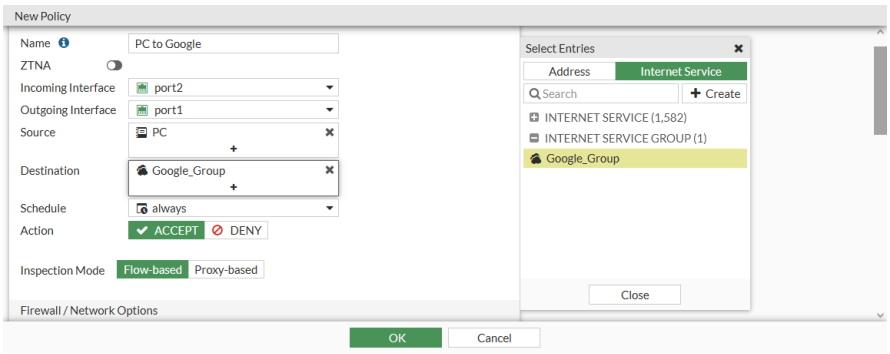
```
config firewall internet-service-group
    edit "Google_Group"
        set direction destination
        set member Google-Other Google-Web Google-ICMP Google-DNS Google-Outbound_Email
Google-SSH Google-FTP Google-NTP Google-Inbound_Email Google-LDAP Google-
NetBIOS.Session.Service Google-RTMP Google-NetBIOS.Name.Service Google-Google.Cloud
Google-Gmail
    next
end
```

2. Create a firewall policy to allow access to all Google Services from the PC:

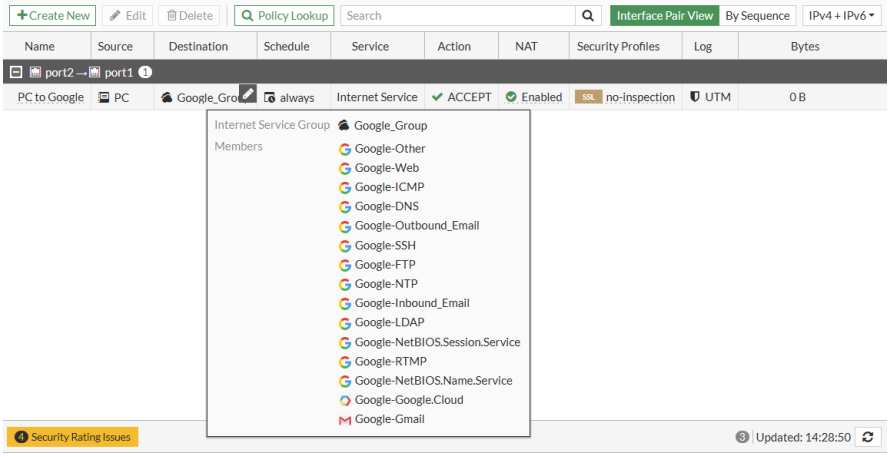
```
config firewall policy
    edit 1
        set name "PC to Google"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-group "Google_Group"
        set action accept
        set schedule "always"
        set fsso disable
        set nat enable
    next
end
```

To configure access to Google services using an Internet Service Group in the GUI:

1. On the FortiGate, create a Service Group using the CLI.
2. Go to *Policy & Objects* > *Firewall Policy*, and create a new policy.
3. Set the *Destination* as the just created Internet Service Group.



4. Configure the remaining options, then click *OK*.
5. Go to *Policy & Objects* > *Firewall Policy* and hover over the group to view a list of its members.



Example 2

In this example, two office FTP servers are put into an Internet Custom Service Group, and the PC connection to the FTP servers is limited to 1Mbps.

To put two FTP servers into a custom service group and limit the PC connection speed to them in the CLI:

1. Create custom internet services for the internal FTP servers:

```
config firewall internet-service-custom
    edit "FTP_PM"
        config entry
            edit 1
                config port-range
                    edit 1
                        set start-port 21
                        set end-port 21
                    next
                end
                set dst "PM_Server"
            next
        end
```

```
        next
        edit "FTP_QA"
            config entry
                edit 1
                    config port-range
                        edit 1
                            set start-port 21
                            set end-port 21
                        next
                    end
                    set dst "QA_Server"
                next
            end
        next
    end
```

2. Create a custom internet server group and add the just created custom internet services to it:

```
config firewall internet-service-custom-group
    edit "Internal_FTP"
        set member "FTP_QA" "FTP_PM"
    next
end
```

3. Create a traffic shaper to limit the maximum bandwidth:

```
config firewall shaper traffic-shaper
    edit "Internal_FTP_Limit_1Mbps"
        set guaranteed-bandwidth 500
        set maximum-bandwidth 1000
        set priority medium
    next
end
```

4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:

```
config firewall shaping-policy
    edit 1
        set name "For Internal FTP"
        set internet-service enable
        set internet-service-custom-group "Internal_FTP"
        set dstintf "port1"
        set traffic-shaper "Internal_FTP_Limit_1Mbps"
        set traffic-shaper-reverse "Internal_FTP_Limit_1Mbps"
        set srcaddr "PC"
    next
end
```

To put two FTP servers into a custom service group and limit the PC connection speed to the in the GUI:

1. Create custom internet services for the internal FTP servers using the CLI.
2. Create a custom internet server group and add the just created custom internet services to it using the CLI.
3. Create a traffic shaper to limit the maximum bandwidth:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shapers* tab, and click *Create New*.
   b. Enter a *Name* for the shaper, such as *Internal_FTP_Limit_1Mbps*.
   c. Set the *Traffic Priority* to *Medium*.

d. Enable *Max Bandwidth* and set it to *1000*.
e. Enable *Guaranteed Bandwidth* and set it to *500*.
f. Click *OK*.

4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
   b. Set the *Destination* to the just created custom internet service group, and apply the just create traffic shaper.

   c. Configure the remaining options as shown, then click *OK*.

Allow creation of ISDB objects with regional information

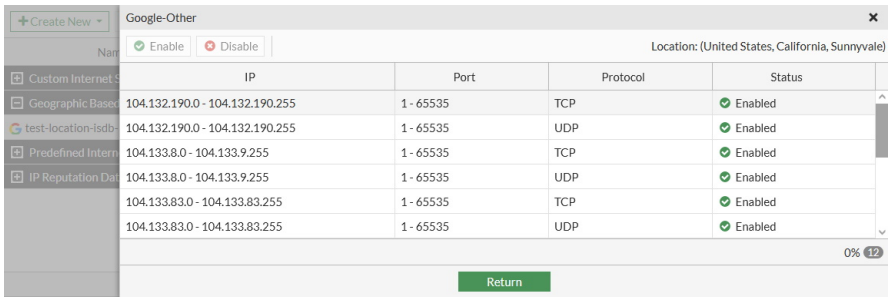
Geographic-based Internet Service Database (ISDB) objects allow users to define a country, region, and city. These objects can be used in firewall policies for more granular control over the location of the parent ISDB object. ISDB objects are now referenced in policies by name instead of ID.

To apply a location-based ISDB object to a policy in the GUI:

1. Create the ISDB object:
   a. Go to *Policy & Objects* > *Internet Service Database* and click *Create New* > *Geographic Based Internet Service*.
   b. Configure the settings as required.

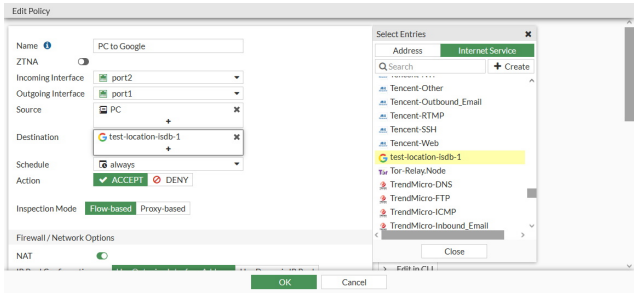
   c. Click *OK*.

2. View the IP ranges in the location-based internet service:
   a. Go to *Policy & Objects* > *Internet Service Database* .
   b. In the table, hover over the object created in step 1 and click *View/Edit Entries*. The list of IPs is displayed:



c. Click *Return*.

3. Add the ISDB object to a policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and create a new policy or edit an existing one.
   b. For *Destination*, click *Internet Service* and select the ISDB object created in step 1.
   c. Configure the other settings as needed.



d. Click *OK*.

To apply a location-based ISDB object to a policy in the CLI:

1. Create the ISDB object:

```
config firewall internet-service-name
    edit "test-location-isdb-1"
        set type location
        set internet-service-id 65536
        set country-id 840
        set region-id 283
        set city-id 23352
    next
end
```

2. View the IP ranges in the location-based internet service:

```
# diagnose internet-service id 65536 | grep "country(840) region(283) city(23352)"
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation
(4), domain(5) popularity(0) botnet(0) proto(6) port(1-65535)
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation
(4), domain(5) popularity(0) botnet(0) proto(17) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0)
reputation(4), domain(5) popularity(4) botnet(0) proto(6) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0)
reputation(4), domain(5) popularity(4) botnet(0) proto(17) port(1-65535)
```

3. Add the ISDB object to a policy:

```
config firewall policy
    edit 3
        set name "PC to Google"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "PC"
        set internet-service enable
        set internet-service-name "test-location-isdb-1"
        set action accept
        set schedule "always"
        set logtraffic all
        set logtraffic-start enable
        set auto-asic-offload disable
        set nat enable
    next
end
```

Internet service customization

Internet Service Database (ISDB) entries can be tuned for their environments by adding custom ports and port ranges, as well as port mapping.

To add a custom port range:

```
config firewall internet-service-addition
    edit 65646
        set comment "Add custom port-range:tcp/8080-8090 into 65646"
        config entry
            edit 1
                set protocol 6
                config port-range
                    edit 1
                        set start-port 8080
                        set end-port 8090
                    next
                end
            next
        end
    next
end
Warning: Configuration will only be applied after rebooting or using the 'execute internet-
service refresh' command.
```

To verify that the change was applied:

```
 # diagnose internet-service info FG-traffic 6 8080 2.20.183.160
 Internet Service: 65646(Google.Gmail)
```

To configure additional port mapping:

```
config firewall internet-service-append
    set match-port 10
```

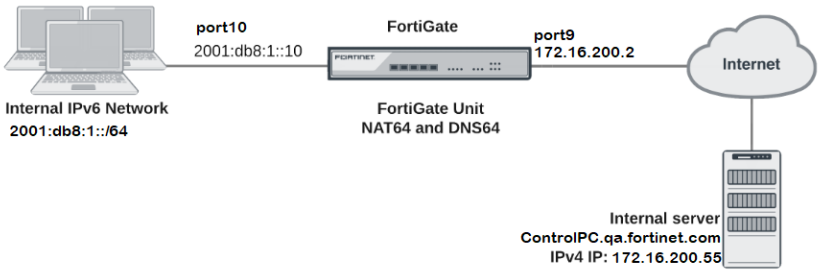
```
    set append-port 20
end
Warning: Configuration will only be applied after rebooting or using the 'execute internet-
service refresh' command.
```

NAT64 policy and DNS64 (DNS proxy)

NAT64 policy translates IPv6 addresses to IPv4 addresses so that a client on an IPv6 network can communicate transparently with a server on an IPv4 network.

NAT64 policy is usually implemented in combination with the DNS proxy called DNS64. DNS64 synthesizes AAAA records from A records and is used to synthesize IPv6 addresses for hosts that only have IPv4 addresses. DNS proxy and DNS64 are interchangeable terms.

Sample topology



In this example, a host on the internal IPv6 network communicates with `ControlPC.qa.fortinet.com` that only has IPv4 address on the Internet.

1. The host on the internal network does a DNS lookup for `ControlPC.qa.fortinet.com` by sending a DNS query for an AAAA record for `ControlPC.qa.fortinet.com`.
2. The DNS query is intercepted by the FortiGate DNS proxy. The DNS proxy performs an A-record query for `ControlPC.qa.fortinet.com` and gets back an RRSet containing a single A record with the IPv4 address `172.16.200.55`.
3. The DNS proxy then synthesizes an AAAA record. The IPv6 address in the AAAA record begins with the configured NAT64 prefix in the upper 96 bits and the received IPv4 address in the lower 32 bits. By default, the resulting IPv6 address is `64:ff9b::172.16.200.55`.
4. The host on the internal network receives the synthetic AAAA record and sends a packet to the destination address `64:ff9b::172.16.200.55`.
5. The packet is routed to the FortiGate internal interface (port10) where it is accepted by the NAT64 security policy.
6. The FortiGate unit translates the destination address of the packets from IPv6 address `64:ff9b::172.16.200.55` to IPv4 address `172.16.200.55` and translates the source address of the packets to `172.16.200.200` (or another address in the IP pool range) and forwards the packets out the port9 interface to the Internet.

Sample configuration

To enable display for IPv6, NAT46/NAT64, and DNS Database using the GUI:

1. Go to *System* > *Feature Visibility*.
2. In the *Basic Features* section, enable *IPv6*.
3. In the *Additional Features* section, enable the following features:
   - *NAT46 & NAT64*
   - *DNS Database*
4. Click *Apply*.

To enable display for IPv6, NAT46/NAT64, and DNS Database using the CLI:

```
config system global
   set gui-ipv6 enable
end
config system settings
   set gui-nat46-64 enable
   set gui-dns-database enable
end
```

To enable DNS proxy on the IPv6 interface using the GUI:

1. Go to *Network* > *DNS Servers*.
2. In *DNS Service on Interface*, click *Create New*.
3. For *Interface*, select *port10*.
4. Click *OK*.

To enable DNS proxy on the IPv6 interface using the CLI:

```
config system dns-server
   edit "port10"
       set mode forward-only
   next
end
```

To configure IPv6 DHCP server using the CLI:

```
config system dhcp6 server
   edit 1
       set subnet 2001:db8:1::/64
       set interface "port10"
       config ip-range
           edit 1
               set start-ip 2001:db8:1::11
               set end-ip 2001:db8:1::20
           next
       end
       set dns-server1 2001:db8:1::10
   next
end
```

To enable NAT64 and related settings using the CLI:

Enabling NAT64 with the `config system nat64` command means that all IPv6 traffic received by the current VDOM can be subject to NAT64 if the source and destination address matches an NAT64 security policy.

By default, the setting `always-synthesize-aaaa-record` is enabled. If you disable this setting, the DNS proxy (DNS64) will attempt to find an AAAA records for queries to domain names and therefore resolve the host names to IPv6 addresses. If the DNS proxy cannot find an AAAA record, it synthesizes one by adding the NAT64 prefix to the A record.

`nat64-prefix` setting is the `nat64` prefix. By default, it is `64:ff9b::/96`.

```
config system nat64
   set status enable
end
```

To create NAT64 policy using the GUI:

1. Add an IPv4 firewall address for the external network.
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*.
   c. For *Name*, enter *external-net4*.
   d. For *IP/Network*, enter *17216.200.0/24*.
   e. For *Interface*, select *port9.*
   f. Click *OK*.
2. Add an IPv6 firewall address for the internal network.
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*.
   c. Change *Category* to *IPv6 Address*.
   d. For *Name*, enter *internal-net6*.
   e. For *IPv6 Address*, enter *2001:db8:1::/48*.
   f. Click *OK*.
3. Add an IP pool containing the IPv4 address that is used as the source address of the packets exiting port9.
   a. Go to *Policy & Objects* > *IP Pools*.
   b. Click *Create New*.
   c. For *Name*, enter *exit-pool4*.
   d. For *External IP Range*, enter *172.16.200.200-172.16.200.210*.
   e. Click *OK*.
4. Add a NAT64 policy that allows connections from the internal IPv6 network to the external IPv4 network.
   a. Go to *Policy & Objects* > *NAT64 Policy*.
   b. Click *Create New*.
   c. For *Incoming Interface*, select *port10*.
   d. For *Outgoing Interface*, select *port9*.
   e. For *Source Address*, select *internal-net6*.
   f. For *Destination Address*, select *external-net4*.
   g. Set *IP Pool Configuration* to *Use Dynamic IP Pool* and select the IP pool *exit-pool4*.
   h. Click *OK*.

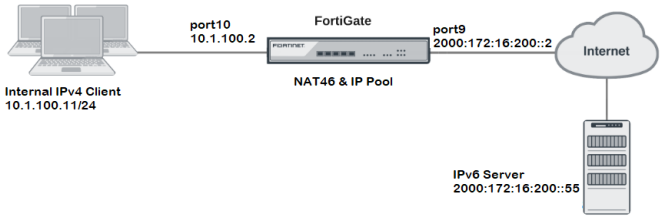
To create NAT64 policy using the CLI:

```
config firewall address
    edit "external-net4"
        set associated-interface "port9"
        set subnet 172.16.200.0 255.255.255.0
    next
end
config firewall address6
    edit "internal-net6"
        set ip6 2001:db8:1::/48
    next
end
config firewall ippool
    edit "exit-pool4"
        set startip 172.16.200.200
        set endip 172.16.200.210
    next
end
config firewall policy64
    edit 1
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "internal-net6"
        set dstaddr "external-net4"
        set action accept
        set schedule "always"
        set service "ALL"
        set ippool enable
        set poolname "exit-pool4"
    next
end
```

NAT46 policy

NAT46 refers to the mechanism that allows IPv4 addressed hosts to communicate with IPv6 hosts. Without such a mechanism, IPv4 environments cannot connect to IPv6 networks.

Sample topology



In this example, an IPv4 client tries to connect to an IPv6 server. A VIP is configured on FortiGate to map the server IPv6 IP address `2000:172:16:200:55` to an IPv4 address `10.1.100.55`. On the other side, an IPv6 IP pool is configured and the source address of packets from client are changed to the defined IPv6 address. In this setup, the client PC can access the server by using IP address `10.1.100.55`.

Sample configuration

To enable display for IPv6 and NAT46/NAT64 using the GUI:

1. Go to *System* > *Feature Visibility*.
2. In the *Basic Features* section, enable *IPv6*.
3. In the *Additional Features* section, enable *NAT46 & NAT64*.
4. Click *Apply*.

To enable display for IPv6 and NAT46/NAT64 using the CLI:

```
config system global
    set gui-ipv6 enable
end
config system settings
    set gui-nat46-64 enable
end
```

To configure VIP46 using the GUI:

1. Go to *Policy & Objects* > *Virtual IPs*.
2. Click *Create New*.
3. For *Name*, enter *vip46_server*.
4. For *External IP Address/Range*, enter *10.1.100.55- 10.1.100.55*.
5. For *Mapped IP Address/Range*, enter *2000:172:16:200::55*.
6. Click *OK*.

To configure VIP46 using the CLI:

```
config firewall vip46
    edit "vip46_server"
        set extip 10.1.100.55
        set mappedip 2000:172:16:200::55
    next
end
```

To configure IPv6 IP pool using the GUI:

1. Go to *Policy & Objects* > *IP Pools*.
2. Click *Create New*.
3. For *Name*, enter *client_expternal*.
4. For *External IP Range*, enter *2000:172:16:201::11- 2000:172:16:201::20*.
5. Click *OK*.

To configure IPv6 IP pool using the CLI:

```
config firewall ippool6
    edit "client_external"
        set startip 2000:172:16:201::11
        set endip 2000:172:16:201::20
```

```
    next
end
```

To enable NAT64 and configure address prefix using the CLI:

```
config system nat64
    set status enable
    set secondary-prefix-status enable
    config secondary-prefix
        edit "1"
            set nat64-prefix 2000:172:16:201::/96
        next
    end
end
```

To create NAT46 policy using the GUI:

1. Go to *Policy & Objects* > *NAT46 Policy*.
2. Click *Create New*.
3. For *Incoming Interface*, select *port10*.
4. For *Outgoing Interface*, select *port9*.
5. For *Source Address*, select *all*.
6. For *Destination Address*, select *vip46_server*.
7. Set *IP Pool Configuration* to *Use Dynamic IP Pool* and select the IP pool *client_expernal*.
8. Click *OK*.

To create NAT46 policy using the CLI:

```
config firewall policy46
    edit 1
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "vip46_server"
        set action accept
        set schedule "always"
        set service "ALL"
        set ippool enable
        set poolname "client_external"
    next
end
```

Sample troubleshooting

Example to trace flow to see the whole process.

```
# diagnose debug flow filter saddr 10.1.100.11
# diagnose debug flow show function-name enable
show function name
# diagnose debug flow show iprope enable
show trace messages about iprope
# diagnose debug flow trace start 5
```

```

```

Local-in policies

While security profiles control traffic flowing through the FortiGate, local-in policies control inbound traffic that is going to a FortiGate interface.

Administrative access traffic (HTTPS, PING, SSH, and others) can be controlled by allowing or denying the service in the interface settings. Trusted hosts can be configured under an administrator to restrict the hosts that can access the administrative service.

Local-in policies allow administrators to granularly define the source and destination addresses, interface, and services. Traffic destined for the FortiGate interface specified in the policy that meets the other criteria is subject to the policies action.

Local-in policies can be used to restrict administrative access or other services, such as VPN, that can be specified as services. You can define source addresses or address groups to restrict access from. For example, by using a geographic type address you can restrict a certain geographic set of IP addresses from accessing the FortiGate.

By default, no local-in policies are defined, so there are no restrictions on local-in traffic.

Local-in policies can only be created or edited in the CLI. You can view the existing local-in policies in the GUI by enabling it in *System* > *Feature Visibility* under the *Additional Features* section. This page does not list the custom local-in policies.

To configure a local-in policy using the CLI:

```
config firewall {local-in-policy | local-in-policy6}
    edit <policy_number>
        set intf <interface>
        set srcaddr <source_address> [source_address] ...
        set dstaddr <destination_address> [destination_address] ...
        set action {accept | deny}
        set service <service_name> [service_name] ...
        set schedule <schedule_name>
        set comments <string>
    next
end
```

For example, to prevent the source subnet 10.10.10.0/24 from pinging port1, but allow administrative access for PING on port1:

```
config firewall address
    edit "10.10.10.0"
        set subnet 10.10.10.0 255.255.255.0
    next
end
config firewall local-in-policy
    edit 1
        set intf "port1"
        set srcaddr "10.10.10.0"
        set dstaddr "all"
        set service "PING"
        set schedule "always"
    next
end
```

To test the configuration:

1. From the PC at 10.10.10.12, start a continuous ping to port1:

   ```
   ping 192.168.2.5 –t
   ```

2. On the FortiGate, enable debug flow:

   ```
   # diagnose debug flow filter addr 10.10.10.12
   # diagnose debug flow filter proto 1
   # diagnose debug enable
   # diagnose debug flow trace start 10
   ```

3. The output of the debug flow shows that traffic is dropped by local-in policy 1:

   ```
   # id=20085 trace_id=1 func=print_pkt_detail line=5746 msg="vd-root:0 received a packet
   (proto=1, 10.10.10.12:1->192.168.2.5:2048) from port1. type=8, code=0, id=1, seq=128."
   id=20085 trace_id=1 func=init_ip_session_common line=5918 msg="allocate a new session-
   0017c5ad"
   id=20085 trace_id=1 func=vf_ip_route_input_common line=2615 msg="find a route:
   ```

```
flag=80000000 gw-192.168.2.5 via root"
id=20085 trace_id=1 func=fw_local_in_handler line=474 msg="iprope_in_check() check
failed on policy 1, drop"
```

Additional options

To disable or re-enable the local-in policy, use the `set status {enable | disable}` command.

To dedicate the interface as an HA management interface, use the `set ha-mgmt-intf-only enable` command.

DoS protection

A Denial of Service (DoS) policy examines network traffic arriving at a FortiGate interface for anomalous patterns, which usually indicates an attack.

A denial of service occurs when an attacking system starts an abnormally large number of sessions with a target system. The large number of sessions slows down or disables the target system, preventing legitimate users from using it.

DoS policies are checked before security policies, preventing attacks from triggering more resource intensive security protection and slowing down the FortiGate.

DoS anomalies

Predefined sensors are setup for specific anomalous traffic patterns. New DoS anomalies cannot be added by the user.

The predefined anomalies that can be used in DoS policies are:

Anomaly	Description	Recommended Threshold
tcp_syn_flood	If the SYN packet rate of new TCP connections, including retransmission, to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second.
tcp_port_scan	If the SYN packet rate of new TCP connections, including retransmission, from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second.
tcp_src_session	If the number of concurrent TCP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
tcp_dst_session	If the number of concurrent TCP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
udp_flood	If the UDP traffic to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second.
udp_scan	If the number of UDP sessions originating from one source IP address exceeds the configured threshold value, the action is executed.	2000 sessions per second.

Anomaly	Description	Recommended Threshold
udp_src_session	If the number of concurrent UDP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
udp_dst_session	If the number of concurrent UDP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
icmp_flood	If the number of ICMP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	250 packets per second.
icmp_sweep	If the number of ICMP packets originating from one source IP address exceeds the configured threshold value, the action is executed.	100 sessions per second.
icmp_src_session	If the number of concurrent ICMP connections from one source IP address exceeds the configured threshold value, the action is executed.	300 concurrent sessions
icmp_dst_session	If the number of concurrent ICMP connections to one destination IP address exceeds the configured threshold value, the action is executed.	1000 concurrent sessions
ip_src_session	If the number of concurrent IP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
ip_dst_session	If the number of concurrent IP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
sctp_flood	If the number of SCTP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second
sctp_scan	If the number of SCTP sessions originating from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second
sctp_src_session	If the number of concurrent SCTP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions
sctp_dst_session	If the number of concurrent SCTP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions

For thresholds based on the number of concurrent sessions, blocking the anomaly will not allow more than the number of concurrent sessions to be set as the threshold.

For example, if the period for a particular anomaly is 60 seconds, such as those where the threshold is measured in concurrent sessions, after the 60 second timer has expired the number of allowed sessions that match the anomaly

criteria is reset to zero. This means that, if you allow 10 sessions through before blocking, after the 60 seconds has elapsed, another 10 sessions will be allowed. The attrition of sessions from expiration should keep the allowed sessions from reaching the maximum.

For rate based thresholds, where the threshold is measured in packets per second, the *Block* action prevents anomalous traffic from overwhelming the firewall in two ways:

- continuous: Block packets once an anomaly is detected, and continue to block packets while the rate is above the threshold. This is the default setting.
- periodical: After an anomaly is detected, allow the configured number of packets per second.

For example, if a DoS policy is configured to block icmp_flood with a threshold of 10pps, and a continuous ping is started at a rate of 20pps for 1000 packets:

- In continuous mode, the first 10 packets are passed before the DoS sensor if triggered, and then the remaining 990 packets are blocked.
- In periodical mode, 10 packets are allowed to pass per second, so 500 packets are blocked in the 50 seconds during which the ping is occuring.

The actual numbers of passed and blocked packets may not be exact, as fluctuations in the rates can occur, but the numbers should be close to the defined threshold.

To configure the block action for rate based anomaly sensors:

```
config ips global
    set anomaly-mode {continuous | periodical}
end
```

DoS policies

A DoS policy can be configured to use one or more anomalies.

To configure a DoS policy in the GUI:

1. Go to *Policy & Objects* > *IPv4 DoS Policy* or *Policy & Objects* > *IPv6 DoS Policy* and click *Create New*.
   If the option is not visible, enable *DoS Policy* in *Feature Visibility*. See Feature visibility on page 1562 for details.

2. Configure the following:

Name	Enter a name for the policy.
Incoming Interface	Enter the interface that the policy applies to.
Source Address	Enter the source address.
Destination Address	Enter the destination address. This is the address that the traffic is addressed to. In this case, it must be an address that is associated with the firewall interface. For example, it could be an interface address, a secondary IP address, or the address assigned to a VIP address.
Service	Select the services or service groups. The ALL service can used or, to optimize the firewall resources, only the services that will be answered on an interface can be used.

L3 Anomalies
L4 Anomalies
	Configure the anomalies:
	• *Logging*: Enable/disable logging for specific anomalies or all of them. Anomalous traffic will be logged when the action is *Block* or *Monitor*.
	• *Action*: Select the action to take when the threshold is reached:
	  • *Disable*: Do not scan for the anomaly.
	  • *Block*: Block the anomalous traffic.
	  • *Monitor*: Allow the anomalous traffic, but record a log message if logging is enabled.
	• *Threshold*: The number of detected instances per minute that triggers the anomaly action.

Comments	Optionally, enter a comment.

3. Enable the policy, then click *OK*.

The quarantine option is only available in the CLI. See Quarantine on page 590 for information.

To configure a DoS policy in the GUI:

```
config firewall DoS-policy
    edit 1
        set name "Flood"
        set interface "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        config anomaly
            edit "icmp_flood"
                set status enable
                set log enable
                set action block
                set quarantine attacker
                set quarantine-expiry 1d1h1m
```

```
                set quarantine-log enable
                set threshold 100
            next
        end
    next
end
```

`name <string>`	Enter a name for the policy.
`interface <string>`	Enter the interface that the policy applies to.
`srcaddr <string>`	Enter the source address.
`dstaddr <string>`	Enter the destination address. This is the address that the traffic is addressed to. In this case, it must be an address that is associated with the firewall interface. For example, it could be an interface address, a secondary IP address, or the address assigned to a VIP address.
`service <string>`	Enter the services or service groups. The `ALL` service can used or, to optimize the firewall resources, only the services that will be answered on an interface can be used.
`status {enable | disable}`	Enable/disable this anomaly.
`log {enable | disable}`	Enable/disable anomaly logging. When enabled, a log is generated whenever the anomaly action is triggered, regardless of which action is configured.
`action {pass | block}`	Set the action to take when the threshold is reached: • `pass`: Allow traffic, but record a log message if logging is enabled. • `block`: Block traffic if this anomaly is found.
`quarantine {none | attacker}`	Set the quarantine method (see Quarantine on page 590): • `none`: Disable quarantine. • `attacker`: Block all traffic from the attacker's IP address, and add the attacker's IP address to the banned user list.
`quarantine-expiry <###d##h##m>`	Set the duration of the quarantine, in days, hours, and minutes (###d##h##m) (1m - 364d23h59m, default = 5m). This option is available if `quarantine` is set `attacker`.
`quarantine-log {enable | disable}`	Enable/disable quarantine logging (default = disable). This option is available if `quarantine` is set `attacker`.
`threshold <integer>`	The number of detected instances per minute that triggers the anomaly action. The default value varies depending on the anomaly.

Quarantine

Quarantine is used to block any further traffic from a source IP address that is considered a malicious actor or a source of traffic that is dangerous to the network. Traffic from the source IP address is blocked for the duration of the quarantine, and the source IP address is added to the banned user list.

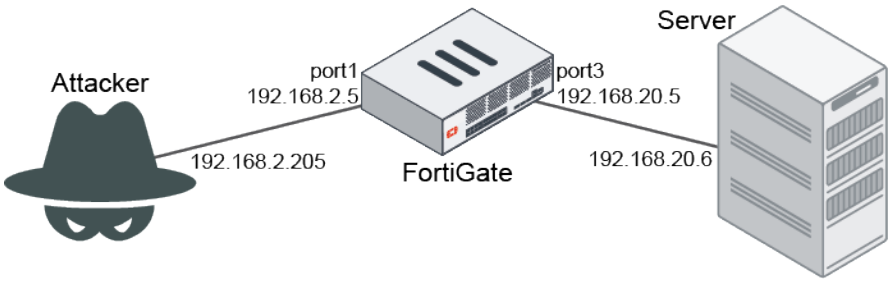
The banned user list is kept in the kernel, and used by Antivirus, Data Leak Prevention (DLP), DoS, and Intrusion Prevention System (IPS). Any policies that use any of these features will block traffic from the attacker's IP address.

To view the quarantined user list:

```
# diagnose user quarantine list
src-ip-addr       created                  expires                  cause
192.168.2.205     Wed Nov 25 12:47:54 2020 Wed Nov 25 12:57:54 2020 DOS
```

Troubleshooting DoS attacks

The best way to troubleshoot DoS attacks is with Anomaly logs and IPS anomaly debug messages.



To test an icmp_flood attack:

1. From the Attacker, launch an icmp_flood with 50pps lasting for 3000 packets.
2. On the FortiGate, configure continuous mode and create a DoS policy with an icmp_flood threshold of 30pps:

```
config firewall DoS-policy
    edit 1
        set name icmpFlood
        set interface "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        config anomaly
            edit "icmp_flood"
                set status enable
                set log enable
                set action block
                set threshold 30
            next
        end
    next
end
```

3. Configure the debugging filter:

```
# diagnose ips anomaly config
DoS sensors in kernel vd 0:
DoS id 1 proxy 0
  0 tcp_syn_flood status 0 log 0 nac 0 action 0 threshold 2000
  ...
  7 udp_dst_session status 0 log 0 nac 0 action 0 threshold 5000
  8 icmp_flood status 1 log 1 nac 0 action 7 threshold 30
  9 icmp_sweep status 0 log 0 nac 0 action 0 threshold 100
  ...
total # DoS sensors: 1.
```

```
# diagnose ips anomaly filter id 8
```

4. Launch the icmp_flood from a Linux machine. This example uses Nmap:

```
$ sudo nping --icmp --rate 50 -c 3000 192.168.2.50
SENT (0.0522s) ICMP [192.168.2.205 > 192.168.2.50 Echo request (type=8/code=0) id=8597
seq=1] IP [ttl=64 id=47459 iplen=28 ]
...
Max rtt: 11.096ms | Min rtt: 0.028ms | Avg rtt: 1.665ms
Raw packets sent: 3000 (84.000KB) | Rcvd: 30 (840B) | Lost: 2970 (99.00%)
Nping done: 1 IP address pinged in 60.35 seconds
```

5. During the attack, check the anomaly list on the FortiGate:

```
# diagnose ips anomaly list
list nids meter:
id=icmp_flood         ip=192.168.2.50 dos_id=1 exp=998 pps=46 freq=50

total # of nids meters: 1.
```

id=icmp_flood	The anomaly name.
ip=192.168.2.50	The IP address of the host that triggered the anomaly. It can be either the client or the server. For icmp_flood, the IP address is the destination IP address. For icmp_sweep, it would be the source IP address.
dos_id=1	The DoS policy ID.
exp=998	The time to be expired, in jiffies (one jiffy = 0.01 seconds).
pps=46	The number of packets that had been received when the diagnose command was executed.
freq=50	For session based anomalies, freq is the number of sessions. For packet rate based anomalies (flood, scan): • In continuous mode: freq is the greater of pps, or the number of packets received in the last second. • In periodic mode: freq is the pps.

6. Go to *Log & Report* > *Anomaly* and download the logs:

```
date=2020-11-20 time=14:38:39 eventtime=1605911919824184594 tz="-0800"
logid="0720018433" type="utm" subtype="anomaly" eventtype="anomaly" level="alert"
vd="root" severity="critical" srcip=192.168.2.205 srccountry="Reserved"
dstip=192.168.2.50 srcintf="port1" srcintfrole="undefined" sessionid=0 action="clear_
session" proto=1 service="PING" count=1307 attack="icmp_flood" icmpid="0x2195"
icmptype="0x08" icmpcode="0x00" attackid=16777316 policyid=1 policytype="DoS-policy"
ref="http://www.fortinet.com/ids/VID16777316" msg="anomaly: icmp_flood, 31 > threshold
30, repeats 28 times" crscore=50 craction=4096 crlevel="critical"

date=2020-11-20 time=14:39:09 eventtime=1605911949826224056 tz="-0800"
logid="0720018433" type="utm" subtype="anomaly" eventtype="anomaly" level="alert"
vd="root" severity="critical" srcip=192.168.2.205 srccountry="Reserved"
dstip=192.168.2.50 srcintf="port1" srcintfrole="undefined" sessionid=0 action="clear_
session" proto=1 service="PING" count=1497 attack="icmp_flood" icmpid="0x2195"
icmptype="0x08" icmpcode="0x00" attackid=16777316 policyid=1 policytype="DoS-policy"
```

```
ref="http://www.fortinet.com/ids/VID16777316" msg="anomaly: icmp_flood, 50 > threshold
30, repeats 1497 times" crscore=50 craction=4096 crlevel="critical"
```

Analysis

In the first log message:

msg="anomaly: icmp_flood, 31 > threshold 30	At the beginning of the attack, a log is recorded when the threshold of 30pps is broken.
repeats 28 times	The number of packets that has exceeded the threshold since the last time a log was recorded.
srcip=192.168.2.205 dstip=192.168.2.50	The source and destination IP addresses of the attack.
action="clear_session"	Equivalent to block. If `action` was set to `monitor` and logging was enabled, this would be `action="detected"`.

In the second log message:

- Because it is an ongoing attack, the FortiGate generates one log message for multiple packets every 30 seconds..
- It will not generate a log message if:
  - The same attack ID happened more than once in a five second period, or
  - The same attack ID happened more than once in a 30 second period and the actions are the same and have the same source and destination IP addresses.

msg="anomaly: icmp_flood, 50 > threshold 30	In the second before the log was recorded, 50 packets were detected, exceeding the configured threshold.
repeats 1497 times	The number of packets that has exceeded the threshold since the last time a log was recorded

Access control lists

An access control list (ACL) is a granular, targeted blocklist that is used to block IPv4 and IPv6 packets on a specified interface based on the criteria configured in the ACL policy.

On FortiGate models with ports that are connected through an internal switch fabric with TCAM capabilities, ACL processing is offloaded to the switch fabric and does not use CPU resources. VLAN interfaces that are based on physical switch fabric interfaces are also supported. Interfaces that are connected through an internal switch fabric usually have names prefixed with *port* or *lan*, such as *port1* or *lan2*; other interfaces are not supported.

The packets will be processed by the CPU when offloading is disabled or not possible, such as when a port on a supported model does not connect to the internal fabric switch.

ACL is supported on the following FortiGate models:

- 100D, 100E, 100EF, 101E
- 140D, 140D-POE, 140E, 140E-POE
- 1200D, 1500D, 1500DT

- 3000D, 3100D, 3200D, 3700D, 3800D, 3810D, 3815D
- All 300E and larger E-series models
- All 100F and larger F-series models

Example

To block all IPv4 and IPv6 telnet traffic from port2 to Company_Servers:

```
config firewall acl
    edit 1
       set interface "port2"
       set srcaddr "all"
       set dstaddr "Company_Servers"
       set service "TELNET"
    next
end
config firewall acl6
    edit 1
        set interface "port2"
        set srcaddr "all"
        set dstaddr "Company_Servers_v6"
        set service "TELNET"
    next
end
```

Diagnose commands

To check the number of packets dropped by an ACL:

```
# diagnose firewall acl counter
ACL id 1 dropped 0 packets
```

```
# diagnose firewall acl counter6
ACL id 2 dropped 0 packets
```

To clear the packet drop counters:

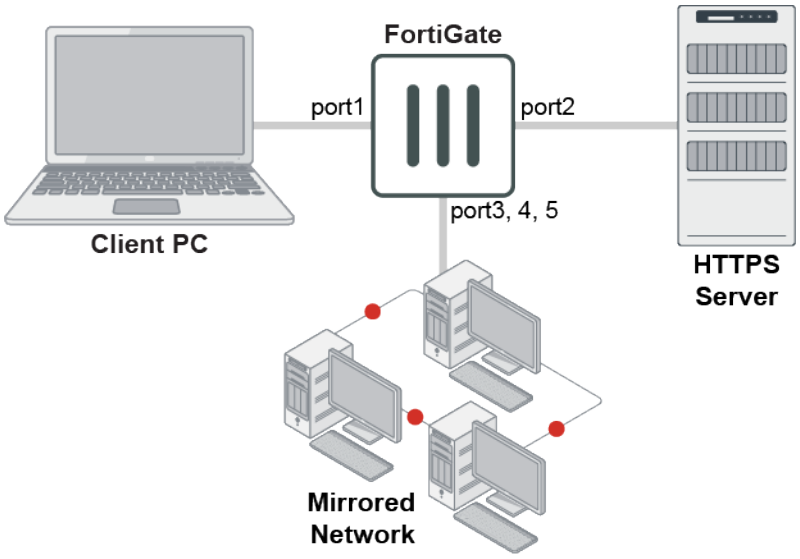
```
# diagnose firewall acl clearcounter
```

```
# diagnose firewall acl clearcounter6
```

Mirroring SSL traffic in policies

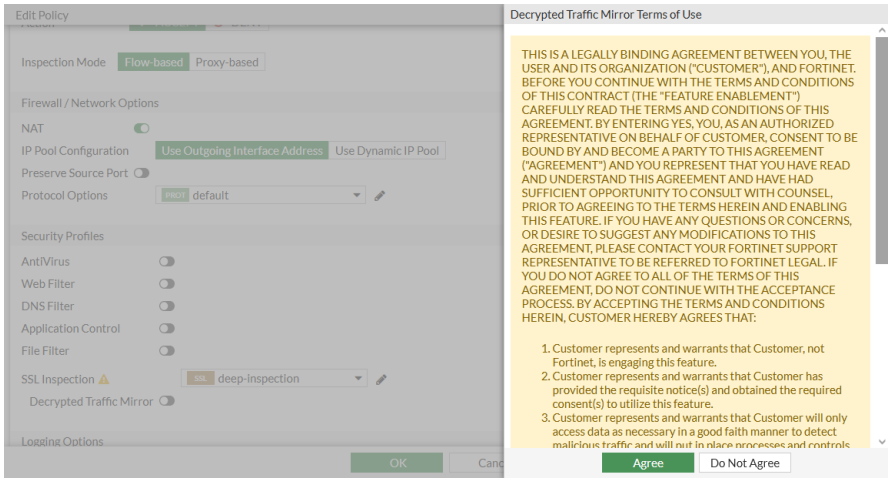
SSL mirroring allows the FortiGate to decrypt and mirror traffic to a designated port. A new decrypted traffic mirror profile can be applied to IPv4, IPv6, and explicit proxy firewall policies in both flow and proxy mode. Full SSL inspection must be used in the policy for the traffic mirroring to occur.

SSL inspection is automatically enabled when you enable a security profile on the policy configuration page.

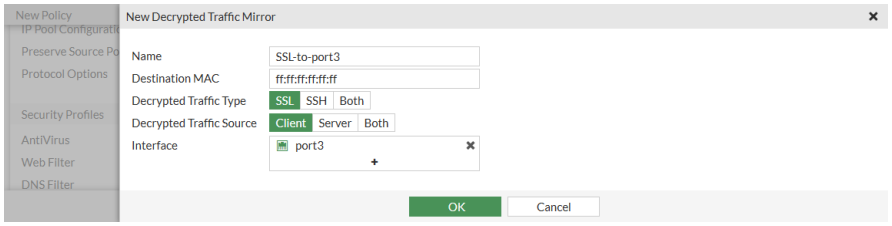


To configure SSL mirroring in a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy, or edit an existing one.
3. Configure the interfaces, sources, and other required information.
4. In the *Security Profiles* section, for *SSL Inspection*, select *deep-inspection*, or another profile that uses *Full SSL Inspection*.
5. Enable *Decrypted Traffic Mirror* . The terms of use agreement opens.



6. Click *Agree* to accept the terms.
7. In the drop-down list, select a decrypted traffic mirror, or click *Create* to create a new one.
   In this example, a new decrypted traffic mirror is created using the port3 interface.



8. Click *OK* to save the policy.

To configure SSL mirroring in proxy mode in the CLI:

1. Create the decrypted traffic mirror profile:

```
config firewall decrypted-traffic-mirror
    edit SSL-to-port3
        set dstmac ff:ff:ff:ff:ff:ff
        set traffic-type ssl
        set traffic-source client
        set interface port3
    next
end
```

2. Configure the policy to enable SSL traffic mirroring:

```
config firewall policy
    edit 1
        set name "mirror-policy"
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set ssl-ssh-profile "deep-inspection"
        set decrypted-traffic-mirror "SSL-to-port3"

THIS IS A LEGALLY BINDING AGREEMENT BETWEEN YOU, THE USER AND ITS ORGANIZATION
("CUSTOMER"), AND FORTINET. BEFORE YOU CONTINUE WITH THE TERMS AND CONDITIONS OF THIS
CONTRACT (THE "FEATURE ENABLEMENT") CAREFULLY READ THE TERMS AND CONDITIONS OF THIS
AGREEMENT. BY ENTERING YES, YOU, AS AN AUTHORIZED REPRESENTATIVE ON BEHALF OF CUSTOMER,
CONSENT TO BE BOUND BY AND BECOME A PARTY TO THIS AGREEMENT ("AGREEMENT") AND YOU
REPRESENT THAT YOU HAVE READ AND UNDERSTAND THIS AGREEMENT AND HAVE HAD SUFFICIENT
OPPORTUNITY TO CONSULT WITH COUNSEL, PRIOR TO AGREEING TO THE TERMS HEREIN AND ENABLING
THIS FEATURE. IF YOU HAVE ANY QUESTIONS OR CONCERNS, OR DESIRE TO SUGGEST ANY
MODIFICATIONS TO THIS AGREEMENT, PLEASE CONTACT YOUR FORTINET SUPPORT REPRESENTATIVE TO
BE REFERRED TO FORTINET LEGAL. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THIS
AGREEMENT, DO NOT CONTINUE WITH THE ACCEPTANCE PROCESS. BY ACCEPTING THE TERMS AND
CONDITIONS HEREIN, CUSTOMER HEREBY AGREES THAT:

1. Customer represents and warrants that Customer, not Fortinet, is engaging this
feature.

2. Customer represents and warrants that Customer has provided the requisite notice(s)
and obtained the required consent(s) to utilize this feature.

3. Customer represents and warrants that Customer will only access data as necessary in
a good faith manner to detect malicious traffic and will put in place processes and
controls to ensure this occurs.

4. Customer represents and warrants that Customer has the right to enable and utilize
this feature, and Customer is fully in compliance with all applicable laws in so doing.
```

```
5. Customer shall indemnify Fortinet in full for any of the above certifications being
untrue.

6. Customer shall promptly notify Fortinet Legal in writing of any breach of these Terms
and Conditions and shall indemnify Fortinet in full for any failure by Customer or any
of its employees or representatives to abide in full by the Terms and Conditions above.

7. Customer agrees that these Terms and Conditions shall be governed by the laws of the
State of California, without regards to the choice of laws provisions thereof and
Customer hereby agrees that any dispute related to these Terms and Conditions shall be
resolved in Santa Clara County, California, USA, and Customer hereby consents to
personal jurisdiction in Santa Clara County, California, USA.

Do you want to continue? (y/n) y
    next
end
```

Inspection mode per policy

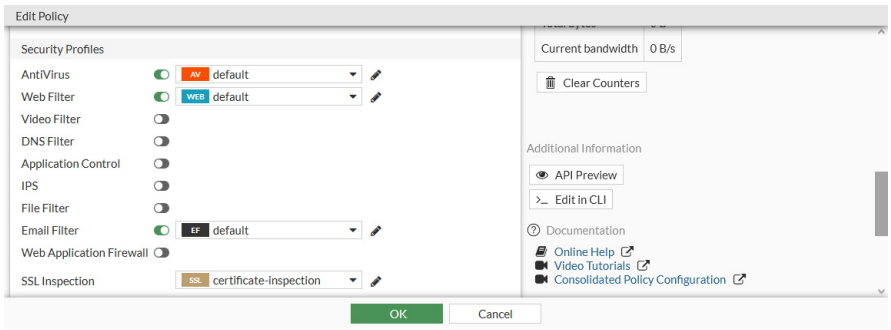
Inspection mode is configured on a per-policy basis in NGFW mode. This gives you more flexibility when setting up different policies.

When configuring a firewall policy, you can select a *Flow-based* or *Proxy-basedInspection Mode*. The default setting is *Flow-based*.

To configure inspection mode in a policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy, or edit an existing policy.
3. Configure the policy as needed.
   a. If you change the *Inspection Mode* to *Proxy-based*, the *Proxy HTTP(S) traffic* option displays.

   b. In the *Security Profiles* section, if no security profiles are enabled, the default *SSL Inspection* is *no-inspection*.
   c. In the *Security Profiles* section, if you enable any security profile, the *SSL Inspection* changes to *certificate-inspection*.



To see the inspection mode changes using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set nat enable
    next
end
```

To see the HTTP and SSH policy redirect settings when inspection mode is set to proxy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set http-policy-redirect enable
        set ssh-policy-redirect enable
        set nat enable
    next
end
```

To see the default SSL-SSH policy set to no inspection using the CLI:

```
config firewall policy
    edit 1
       show fu | grep ssl-ssh-profile
        set ssl-ssh-profile "no-inspection"
    next
end
```

OSPFv3 neighbor authentication

OSPFv3 neighbor authentication is available for enhanced IPv6 security.

To configure an OSPF6 interface:

```
config router ospf6
    config ospf6-interface
        edit <name>
            set authentication {none | ah | esp | area}
            set key-rollover-interval <integer>
            set ipsec-auth-alg {md5 | sha1 | sha256 | sha384 | sha512}
            set ipsec-enc-alg {null | des | 3des | aes128 | aes192 | aes256}
            config ipsec-keys
                edit <spi>
                    set auth-key <string>
                    set enc-key <string>
                next
            end
        next
    end
end
```

To configure an OSPF6 virtual link:

```
config router ospf6
    config area
        edit <id>
            config virtual-link
                edit <name>
                    set authentication {none | ah | esp | area}
                    set key-rollover-interval <integer>
                    set ipsec-auth-alg {md5 | sha1 | sha256 | sha384 | sha512}
                    set ipsec-enc-alg {null | des | 3des | aes128 | aes192 | aes256}
                    config ipsec-keys
                        edit <spi>
                            set auth-key <string>
                            set enc-key <string>
                        next
                    end
                next
            end
        next
    end
end
```

To configure an OSPF6 area:

```
config router ospf6
    config area
        edit <id>
            set authentication {none | ah | esp}
            set key-rollover-interval <integer>
            set ipsec-auth-alg {md5 | sha1 | sha256 | sha384 | sha512}
            set ipsec-enc-alg {null | des | 3des | aes128 | aes192 | aes256}
```

```
            config ipsec-keys
                edit <spi>
                    set auth-key <string>
                    set enc-key <string>
                next
            end
        next
    end
end
```

CLI command descriptions

Command	Description
<id>	Area entry IP address.
authentication {none | ah | esp | area}	Authentication mode: • `none`: Disable authentication • `ah`: Authentication Header • `esp`: Encapsulating Security Payload • `area`: Use the routing area authentication configuration
key-rollover-interval <integer>	Enter an integer value (300 - 216000, default = 300).
ipsec-auth-alg {md5 | sha1 | sha256 | sha384 | sha512}	Authentication algorithm.
ipsec-enc-alg {null | des | 3des | aes128 | aes192 | aes256}	Encryption algorithm.
<spi>	Security Parameters Index.
auth-key <string>	Authentication key should be hexadecimal numbers. Key length for each algorithm: • MD5: 16 bytes • SHA1: 20 bytes • SHA256: 32 bytes • SHA384:48 bytes • SHA512:84 bytes If the key is shorter than the required length, it will be padded with zeroes.
enc-key <string>	Encryption key should be hexadecimal numbers. Key length for each algorithm: • DES: 8 bytes • 3DES: 24 bytes • AES128: 16 bytes • AES192: 24 bytes • AES256: 32 bytes If the key is shorter than the required length, it will be padded with zeroes.

Firewall anti-replay option per policy

When the global anti-replay option is disabled, the FortiGate does not check TCP flags in packets. The per policy anti-replay option overrides the global setting. This allows you to control whether or not TCP flags are checked per policy.

To enable the anti-replay option so TCP flags are checked using the CLI:

```
config firewall policy
   edit 1
      set name "policyid-1"
      set srcintf "wan2"
      set dstintf "wan1"
      set srcaddr "all"
      set dstaddr "all"
      set action accept
      set schedule "always"
      set service "ALL"
      set anti-replay enable
      set logtraffic all
      set nat enable
   next
end
```

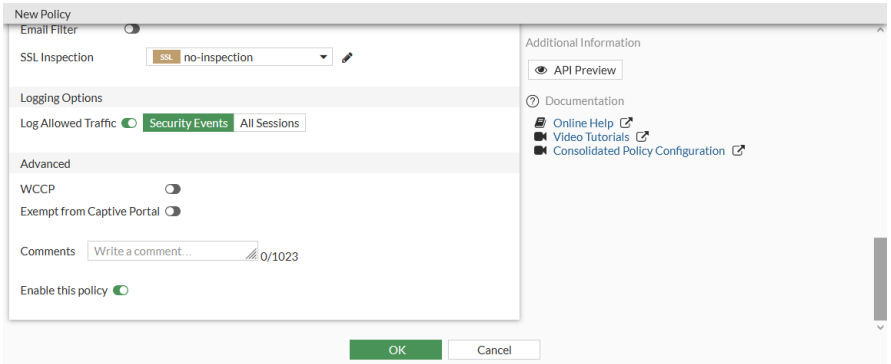
Enabling advanced policy options in the GUI

Advanced policy options can be enabled so that you can configure the options in the GUI.

To enable advanced policy options:

```
config system settings
    set gui-advanced-policy enable
end
```

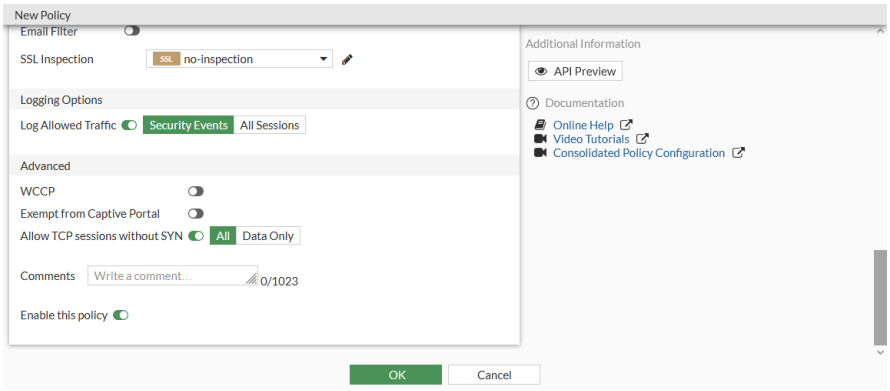
Advanced policy options are now available when creating or editing a policy in the GUI:



To enable configuring TCP sessions without SYN:

```
config system settings
    set tcp-session-without-syn enable
end
```

TCP sessions without SYN can now be configured when creating or editing a policy in the GUI:



Recognize anycast addresses in geo-IP blocking

An anycast IP can be advertised from multiple locations and the router selects a path based on latency, distance, cost, number of hops, and so on. This technique is widely used by providers to route users to the closest server. Since the IP is hosted in multiple geographic locations, there is no way to specify one single location to that IP.

Anycast IP address ranges can be bypassed in geo-IP blocking. The ISDB contains a list of confirmed anycast IP ranges that can be used for this purpose.

When the source or destination is set to `geoip`, you can enable the `geoip-anycast` option. Once enabled, IPs where the anycast option is set to `1` in `geoip_db` are bypassed in country matching and blocking.

You can only use the CLI to configure this feature.

To enable the geoip-anycast option using the CLI:

```
config firewall policy
   edit 1
      set name "policyid-1"
      set srcintf "wan2"
      set dstintf "wan1"
      set srcaddr "all"
      set dstaddr "test-geoip-CA_1"
      set action accept
      set schedule "always"
      set service "ALL"
      set geoip-anycast enable
      set logtraffic all
      set nat enable
   next
end
```

To check the geoip-anycast option for an IP address using the CLI:

```
diagnose geoip ip2country 1.0.0.1
```

```
1.0.0.1 - Australia, is anycast ip
```

The anycast IP is `1.0.0.1`.

Matching GeoIP by registered and physical location

IP addresses have both a physical and registered location in the geography IP database. Sometimes these two locations are different. The `geoip-match` command allows users to match an IPv4 address in an firewall policy to its physical or registered location when a GeoIP is used as a source or destination address. IPv6 policies currently support geography address objects but do not support `geoip-match`.

In the following example, the physical location of 220.243.219.10 is CA (Canada), the registered location is CN (China), and it is not an anycast IP.

To configure GeoIP matching based on registered location:

1. Create a firewall policy to match the IP:

```
config firewall policy
    edit 1
        set name "policy_id_1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "test-geoip-CA"
        set action accept
        set schedule "always"
        set service "ALL"
        set geoip-match registered-location
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

   Since CA is applied as a destination address and registered location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will be blocked because the registered location is CN.

2. Verify that the policy is blocking traffic from the IP address:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.383798 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.381982 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
7.382608 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
^C
3 packets received by filter
0 packets dropped by kernel
```

To configure GeoIP matching based on physical location:

1. Create a firewall policy to match the IP:

```
config firewall policy
    edit 1
```

```
            set name "policy_id_1"
            set srcintf "wan2"
            set dstintf "wan1"
            set srcaddr "all"
            set dstaddr "test-geoip-CA"
            set action accept
            set schedule "always"
            set service "ALL"
            set geoip-match physical-location
            set logtraffic all
            set auto-asic-offload disable
            set nat enable
        next
    end
```

Since CA is applied as a destination address and physical location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will pass through.

2. Verify that the policy is allowing traffic from the IP address:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.273985 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
5.274176 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
6.274426 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.274438 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
7.273978 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
7.273987 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
^C
6 packets received by filter
0 packets dropped by kernel
```

Authentication policy extensions

By default, unauthenticated traffic is permitted to fall to the next policy. This means that unauthenticated users are only forced to authenticate against a policy when there are no other matching policies. To avoid this, you can force authentication to always take place.

To set that authentication requirement:

```
config user setting
    set auth-on-demand {always | implicitly}
end
```

Where:

`always`	Always trigger firewall authentication on demand.
`implicitly` (default)	Implicitly trigger firewall authentication on demand. This is the default setting (and the behavior in FortiOS 6.0 and earlier).

In the following example, authentication is required; traffic that would otherwise be allowed by the second policy is instead blocked by the first policy.

To use forced authentication:

```
config user setting
    set auth-on-demand always
end
config firewall policy
    edit 1
        set name "QA to Database"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "Database"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set groups "qa_group"
        set nat enable
    next
    edit 2
        set name "QA to Internet"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set nat enable
    next
end
```

HTTP to HTTPS redirect for load balancing

You can configure a virtual server with HTTP to HTTPS redirect enabled. When enabled, a virtual server can convert a client's HTTP requests to HTTPS requests. Through this mandatory conversion, HTTP traffic is converted to HTTPS traffic. This conversion improves the security of the user network.

You can only enable this feature by using the CLI. After you enable this feature, traffic flows as follows:

- When FortiGate receives an HTTP request for an external IP, such as 10.1.100.201 in the following example, FortiGate sends an HTTP 303 response back to the original client and redirects HTTP to HTTPS, instead of forwarding the HTTP request to the real backend servers.
- The client browser restarts the TCP session to HTTPS.
- The HTTPS session comes to the FortiGate where a matching firewall policy allows the HTTPS traffic and establishes a secure SSL connection, and then forwards the request to the real backend servers.

To configure virtual server with HTTPS redirect enabled:

1. Create a virtual server with `server-type` set to `http`:
```
config firewall vip
  edit "virtual-server-http"
    set type server-load-balance
```

```
      set extip 10.1.100.201
      set extintf "wan2"
      set server-type http
      set ldb-method round-robin
      set extport 80
      config realservers
         edit 1
            set ip 172.16.200.44
            set port 80
         next
         edit 2
            set ip 172.16.200.55
            set port 80
         next
      end
   next
end
```

2. Create a virtual server with `server-type` set to `https` and with the same external IP address:

```
config firewall vip
   edit "virtual-server-https"
      set type server-load-balance
      set extip 10.1.100.201
      set extintf "wan2"
      set server-type https
      set ldb-method round-robin
      set extport 443
         config realservers
            edit 1 set ip 172.16.200.44
            set port 443
         next
         edit 2
            set ip 172.16.200.55
            set port 443
         next
      end
      set ssl-certificate "Fortinet_CA_SSL"
   next
end
```

3. Enable the `http-redirect` option for the virtual server with `server-type` set to `http`:

```
config firewall vip
   edit "virtual-server-http"
      set http-redirect enable
   next
end
```

4. Add the two virtual servers to a policy:

```
config firewall policy
   edit 9
      set srcintf "wan2"
      set dstintf "wan1"
      set srcaddr "all"
      set dstaddr "virtual-server-http" "virtual-server-https"
      set action accept
      set schedule "always"
      set service "ALL"
      set inspection-mode proxy set logtraffic all
      set auto-asic-offload disable
```

```
        set nat enable
    next
end
```

Use Active Directory objects directly in policies

Active Directory (AD) groups can be used directly in identity-based firewall policies. You do not need to add remote AD groups to local FSSO groups before using them in policies.

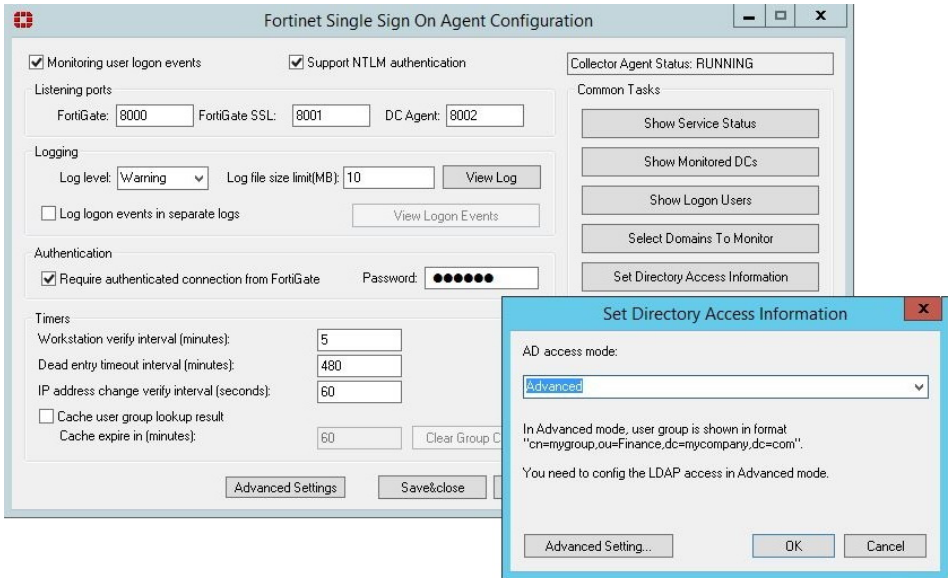
FortiGate administrators can define how often group information is updated from AD LDAP servers.

To retrieve and use AD user groups in policies:

1. Set the FSSO Collector Agent AD access mode on page 607
2. Add an LDAP server on page 607
3. Create the FSSO collector that updates the AD user groups list on page 608
4. Use the AD user groups in a policy on page 610

Set the FSSO Collector Agent AD access mode

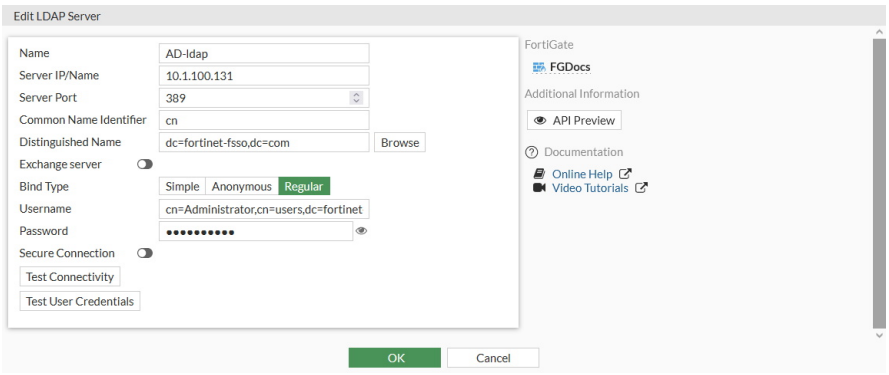
To use this feature, you must set FSSO Collector Agent to *Advanced* AD access mode. If the FSSO Collector Agent is running in the default mode, FortiGate cannot correctly match user group memberships.



Add an LDAP server

To add an LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers*.
2. Click *Create New*.
3. Configure the settings as needed.



4. If secure communication over TLS is supported by the remote AD LDAP server:
   a. Enable *Secure Connection* .
   b. Select the protocol.
   c. Select the certificate from the CA that issued the AD LDAP server certificate.
   If the protocol is LDAPS, the port will automatically change to 636.
5. Click *OK*.

To add an LDAP server in the CLI:

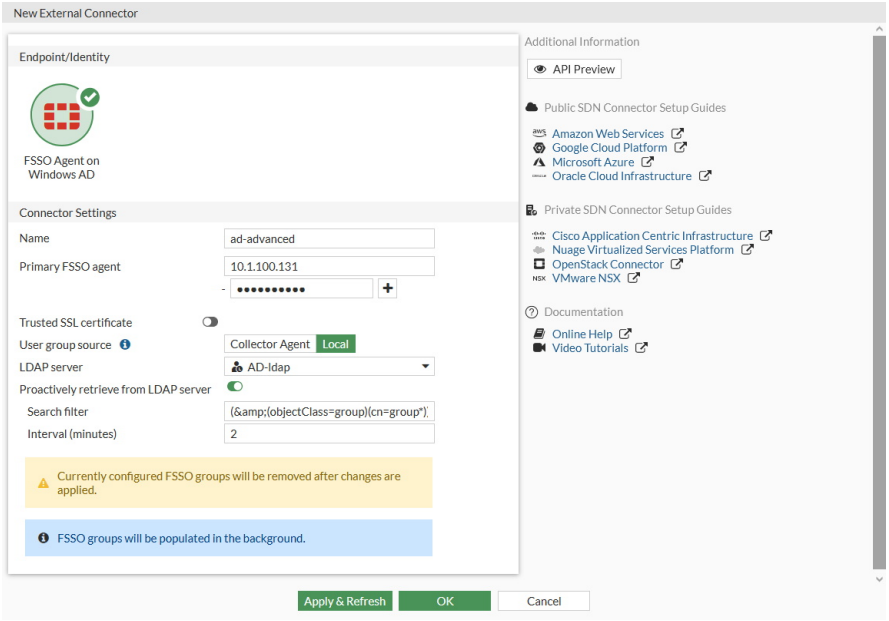
```
config user ldap
    edit "AD-ldap"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
    next
end
```

Create the FSSO collector that updates the AD user groups list

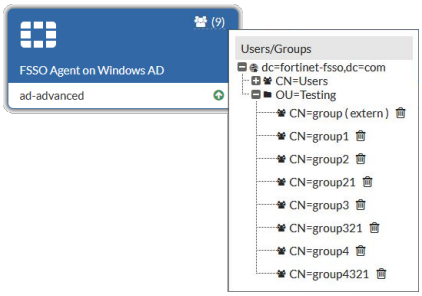
To create an FSSO agent connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. In the *Endpoint/Identity* section, click *FSSO Agent on Windows AD*.
4. Fill in the *Name*
5. Set the *Primary FSSO Agent* to the IP address of the FSSO Collector Agent, and enter its password.
6. Set the *User Group Source* to *Local*.
7. Set the *LDAP Server* to the just created *AD-ldap* server.
8. Enable *Proactively Retrieve from LDAP Server*.
9. Set the *Search Filter* to *(&(objectClass=group)(cn=group*))*.
   The default search filter retrieves all groups, including Microsoft system groups. In this example, the filter is configured to retrieve *group1*, *group2*, etc, and not groups like *grp199*.
   The filter syntax is not automatically checked; if it is incorrect, the FortiGate might not retrieve any groups.

10. Set the *Interval (minutes)* to configure how often the FortiGate contacts the remote AD LDAP server to update the group information.



11. Click *OK*.
12. To view the AD user groups that are retrieved by the FSSO agent, hover the cursor over the group icon on the fabric connector listing.



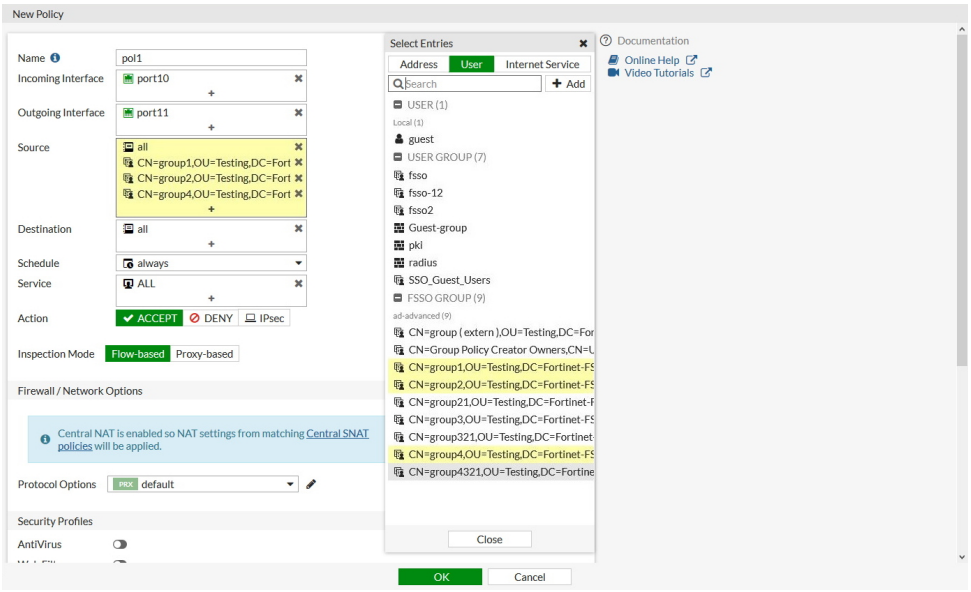
To create an FSSO agent connector in the CLI:

```
config user fsso
    edit "ad-advanced"
        set server "10.1.100.131"
        set password XXXXXXXXXXXXXX
        set ldap-server "AD-ldap"
        set ldap-poll enable
        set ldap-poll-interval 2
        set ldap-poll-filter "(&amp;(objectClass=group)(cn=group*))"
    next
end
```

You can view the retrieved AD user groups with the `show user adgrp` command.

Use the AD user groups in a policy

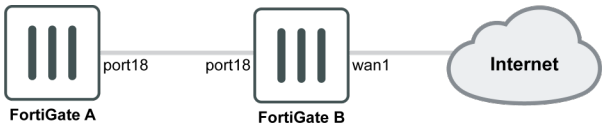
The AD user groups retrieved by the FortiGate can be used directly in firewall policies.



FortiGate Cloud / FDN communication through an explicit proxy

Explicit proxy communication to FortiGate Cloud and FortiGuard servers from FortiGate is enabled. A proxy server can be configured in the FortiGuard settings so that all FortiGuard connections under the `forticldd` process can be established through the proxy server.

Not all FortiGuard services are supported by these proxy settings. For example, web filter service traffic to FortiGuard will not be directed to the configured proxy.



To configure a proxy server and communicate with FortiGate Cloud though it:

1. Configure FortiGate B as a proxy server:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
```

```
        set schedule "always"
        set logtraffic all
        set users "guest1"
    next
end
config user local
    edit "guest1"
        set type password
        set passwd 123456
    next
end
config authentication scheme
    edit "local-basic"
        set method basic
        set user-database "local-user-db"
    next
end
config authentication rule
    edit "local-basic-rule"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "local-basic"
    next
end
```

2. Configure a firewall policy on FortiGate B to allow FortiGate A to get DNS resolution:

```
config firewall policy
    edit 1
        set name "dns"
        set srcintf "port18"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "DNS"
        set fsso disable
        set nat enable
    next
end
```

3. Configure the FortiGuard proxy settings on FortiGate A:

```
config system fortiguard
    set proxy-server-ip 10.2.2.2
    set proxy-server-port 8080
    set proxy-username "guest1"
    set proxy-password 123456
end
```

4. On FortiGate A, log in to FortiGate Cloud to activate the logging service:

```
execute fortiguard-log login <username> <password>
```

5. On FortiGate A, view the `forticldd` debug message to see the connection to the log controller through the proxy server:

```
# diagnose test application forticldd 1
```

No session timeout

To allow clients to permanently connect with legacy medical applications and systems that do not have keepalive or auto-reconnect features, the session timeout can be set to never for firewall services, policies, and VDOMs.

The options to disable session timeout are hidden in the CLI.

To set the session TTL value of a custom service to never:

```
config firewall service custom
    edit "tcp_23"
        set tcp-portrange 23
        set session-ttl never
    next
end
```

To set the session TTL value of a policy to never:

```
config firewall policy
    edit 201
        set srcintf "wan1"
        set dstintf "wan2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "TCP_8080"
        set logtraffic disable
        set session-ttl never
        set nat enable
    next
end
```

To set the session TTL value of a VDOM to never:

```
config system session-ttl
    set default never
    config port
        edit 1
            set protocol 6
            set timeout never
            set start-port 8080
            set end-port 8080
        next
    end
end
```

To view a session list with the timeout set to never:

```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=9 expire=never timeout=never flags=00000000
sockflag=00000000 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
```

```
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=2290/42/1 reply=2895/34/1 tuples=2

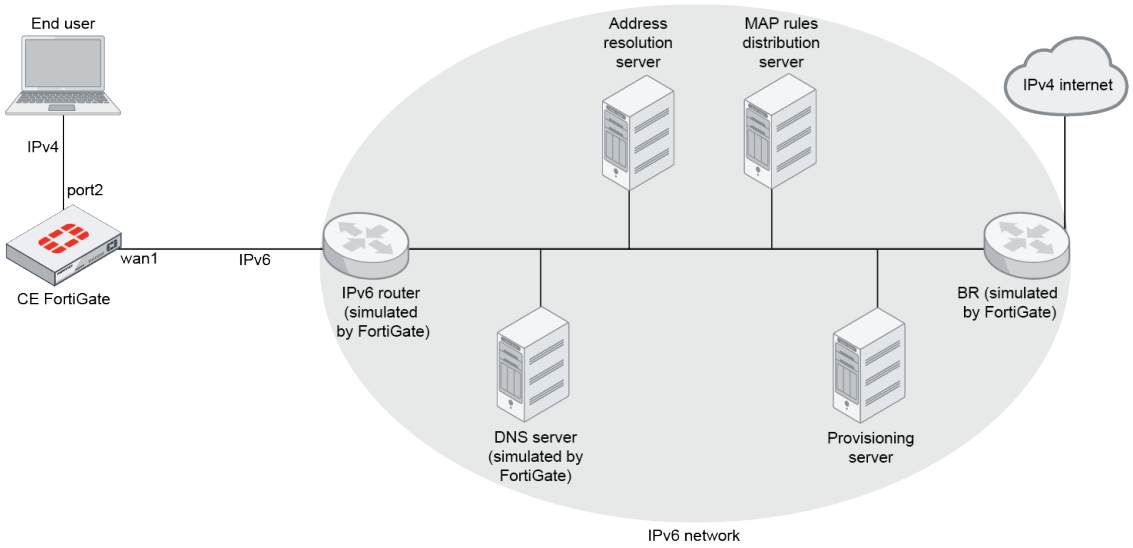
no_ofld_reason:  disabled-by-policy
total session 1
```

MAP-E support

On a customer edge (CE) FortiGate, an IPv4-over-IPv6 (MAP-E) tunnel can be created between the FortiGate and the border relay (BR) operating in an IPv6 network. A tunnel interface is created between the FortiGate and BR, which can be applied to firewall policies and IPsec VPN.



To configure a MAP-E tunnel between the FortiGate and the BR:

1. Configure fixed IP mode.
   a. Configure IPv6 on the interface:

```
config system interface
    edit "wan1"
        config ipv6
            set autoconf enable
            set unique-autoconf-addr enable
            set interface-identifier ::6f:6c1f:3400:0
```

```
        end
    next
end
```

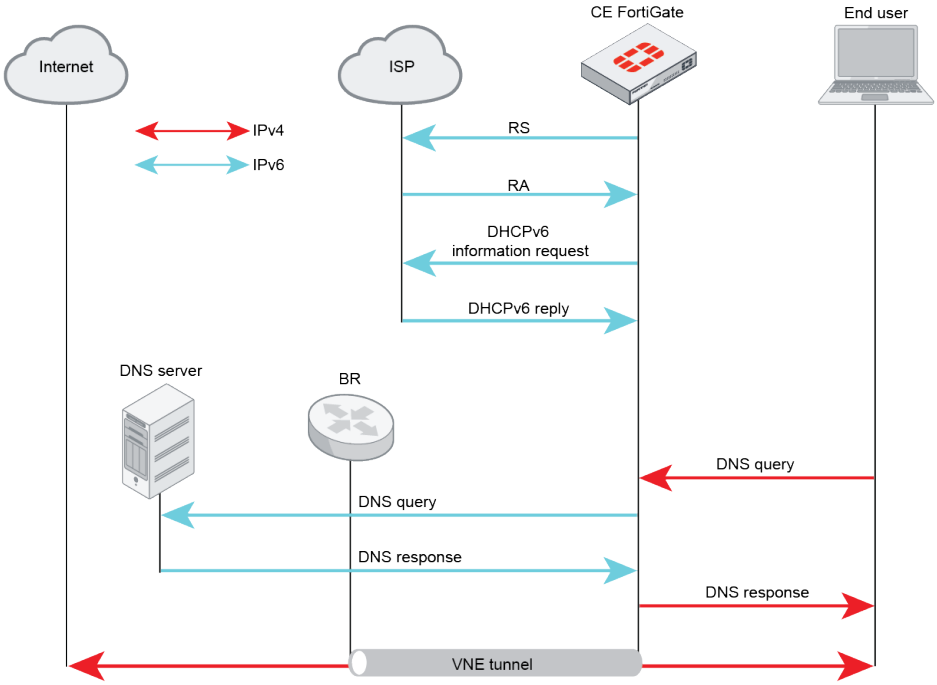
The `interface-identifier` is an IPv6 address. Its last 64-bit will be kept and the rest will be cleared automatically. It will combine with the IPv6 prefix it gets from the IPv6 router to generate the IPv6 address of the interface.

By default, `unique-autoconf-addr` is disabled. It must be enabled so it can handle IPv6 prefix changing.

b. Configure the VNE tunnel:

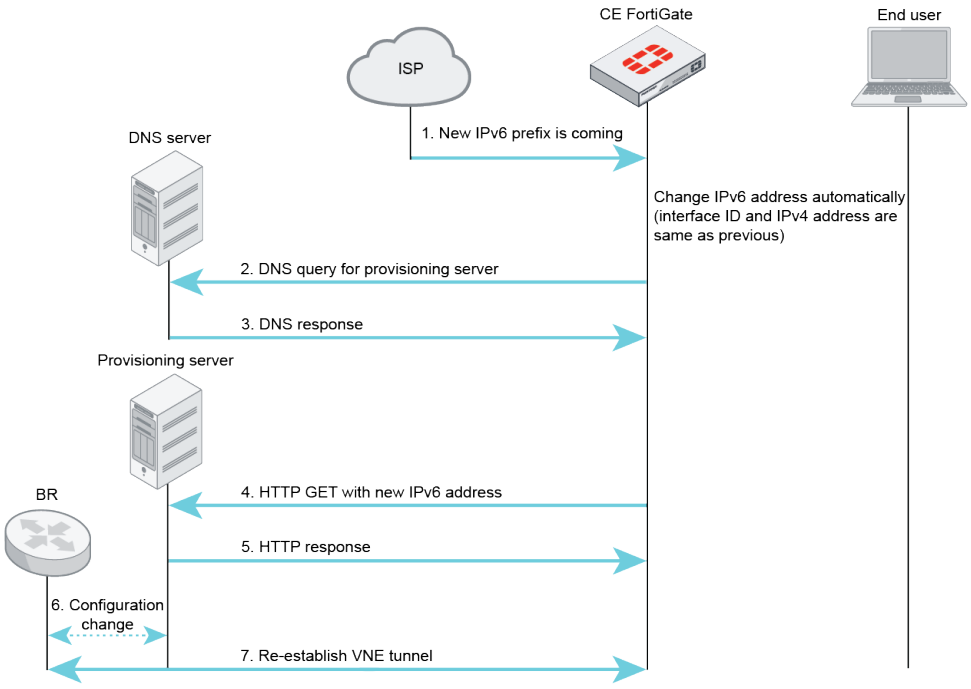
```
config system vne-tunnel
    set status enable
    set interface "wan1"
    set mode fixed-ip
    set ipv4-address 10.10.81.81 255.255.255.0
    set br 2001:160::82
    set update-url "http://qa.forosqa.com/update?user=xxxx&pass=yyyy"
end
```

Initial sequence overview of VNE tunnel under fixed IP mode:



Once the IPv6 address of the FortiGate changes, the tunnel will be down because the BR does not know the FortiGate's new IPv6 address. The FortiGate uses `update-url` to update the new IPv6 address to the provisioning server. The provisioning server updates the FortiGate's IPv6 address to the BR so the VNE tunnel can be re-established.

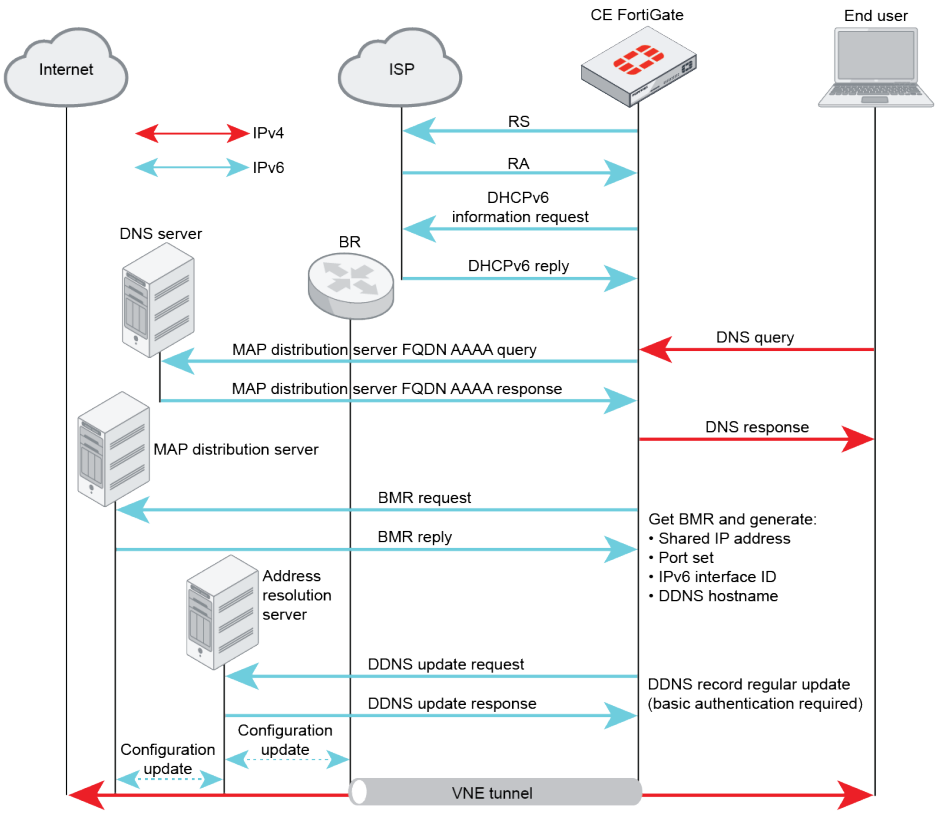
Communication sequence overview of re-establishing VNE tunnel:



2. Configure the VNE tunnel to use MAP-E mode:

```
config system vne-tunnel
    set status enable
    set interface 'wan1'
    set ssl-certificate "Fortinet_Factory"
    set bmr-hostname ********
    set auto-asic-offload enable
    set mode map-e
end
```

Initial sequence overview of VNE tunnel under MAP-E mode:



The FortiGate sends a MAP rule request to the MAP distribution server once the IPv6 address is configured on the FortiGate by RS/RA. Next, the FortiGate will send an AAAA query to get the IPv6 address of the MAP distribution server. After sending the BMR request to the MAP distribution server, the FortiGate will get the IPv4 address, port set, BR IPv6 address, and hostname of the address resolution server from the BMR reply. The VNE tunnel between the FortiGate and BR is now established.

The address resolution server is actually a dynamic DNS. The hostname is used for the FortiGate to maintain an IPv6 address when it changes.

The FortiGate updates the DDNS server with its IPv6 address whenever it updates, which in turn provides the update to the MAP distribution server and BR so they know how to resolve the FortiGate by hostname.

Once the VNE tunnel is established, a tunnel interface is created (`vne.root`), and an IPv4-over-IPv6 tunnel is set up between the FortiGate and BR. The route, firewall policy, and DNS server can now be configured to let the traffic go through the VNE tunnel and the and protect the end-user. The VNE tunnel can also be used in IPsec phase 1.

3. Configure the route:

```
config router static
    edit 1
        set device "vne.root"
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 111
        set name "ff"
        set srcintf "port2"
        set dstintf "vne.root"
```

```
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set nat enable
    next
end
```

5. Configure the DNS server:

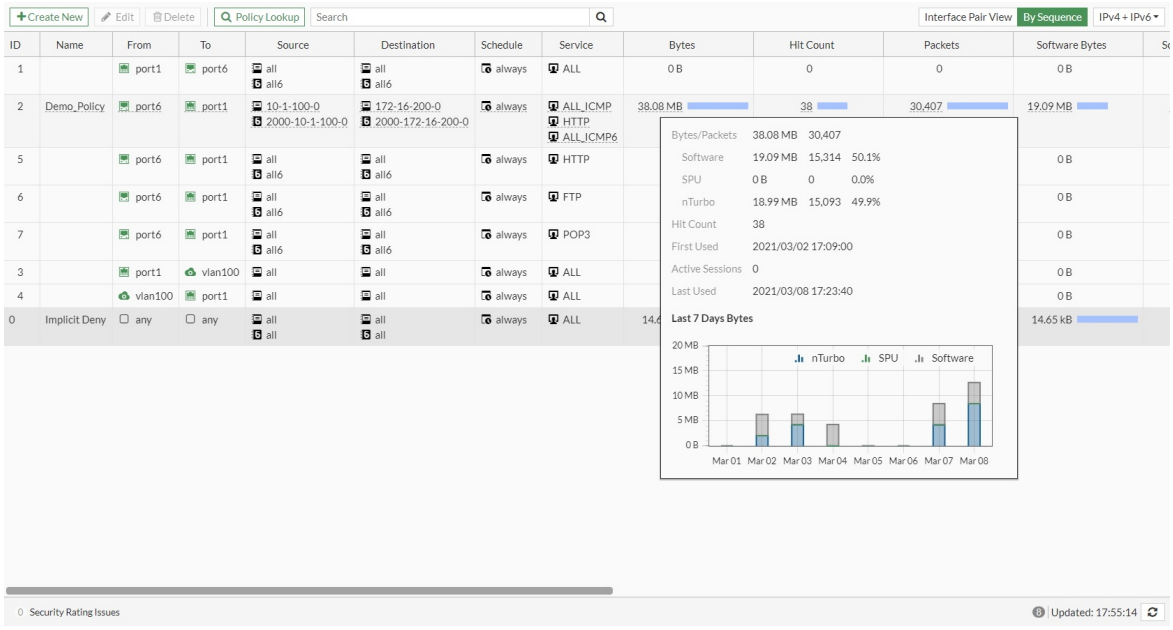
```
config system dns-server
    edit "port2"
    next
end
```

Seven-day rolling counter for policy hit counters

Instead of storing a single number for the hit count and byte count collected since the inception of each policy, seven numbers for the last seven days and an active counter for the current day are stored. The past seven-day hit count is displayed in the policy list and policy pages. A seven-day bar chart shows statistics on each policy page. This feature is currently supported in firewall and multicast policies, but not security policies.

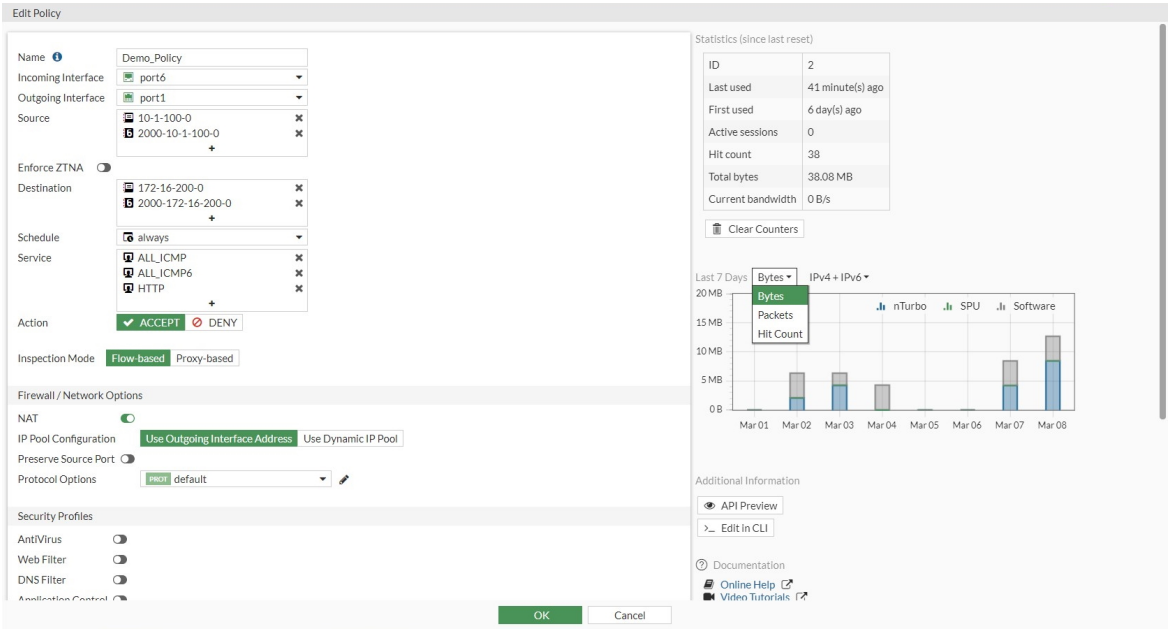
To view the rolling counter information in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* or *Policy & Objects* > *Multicast Policy*.
2. Select a policy and hover over the *Bytes*, *Packets*, or *Hit Count* values to view the tooltip with the corresponding traffic statistics and bar graph (this example uses firewall policies).



3. Click *Edit*. The policy traffic statistics appear in the right-hand side of the page.

4. Use the dropdowns to filter the bar graph data by counter (*Bytes*, *Packets*, or *Hit Count*) and policy type (*IPv4*, *IPv6*, or *IPv4 + IPv6*).



5. Optionally, click *Clear Counters* to delete the traffic statistics for the policy.
6. Click *OK*.

To view the rolling counter information in the CLI:

```
# diagnose firewall iprope show 100004 2
idx=2 pkts/bytes=14709/18777329 asic_pkts/asic_bytes=8087/10413737 nturbo_pkts/nturbo_
bytes=8087/10413737 flag=0x0 hit count:19 (4 7 0 1 1 3 3 0)
    first:2021-03-02 17:09:00 last:2021-03-08 17:23:40
 established session count:0
    first est:2021-03-02 17:11:20 last est:2021-03-08 17:23:40

# diagnose firewall iprope6 show 100004 2
idx=2 pkts/bytes=15698/19307164 asic_pkts/asic_bytes=7006/8578911 nturbo_pkts/nturbo_
bytes=7006/8578911 flag=0x0 hit count:19 (4 7 0 1 3 2 2 0)
    first:2021-03-02 17:10:32 last:2021-03-08 17:23:33
 established session count:0
    first est:2021-03-02 17:11:43 last est:2021-03-08 17:23:33
```

Objects

The following topics provide information about objects:

- Address group exclusions on page 619
- MAC addressed-based policies on page 620
- ISDB well-known MAC address list on page 622
- Dynamic policy — fabric devices on page 623
- FSSO dynamic address subtype on page 625
- ClearPass integration for dynamic address objects on page 629

- Group address objects synchronized from FortiManager on page 632
- Using wildcard FQDN addresses in firewall policies on page 634
- Configure FQDN-based VIPs on page 636
- IPv6 geography-based addresses on page 637
- Array structure for address objects on page 639
- IPv6 MAC addresses and usage in firewall policies on page 641

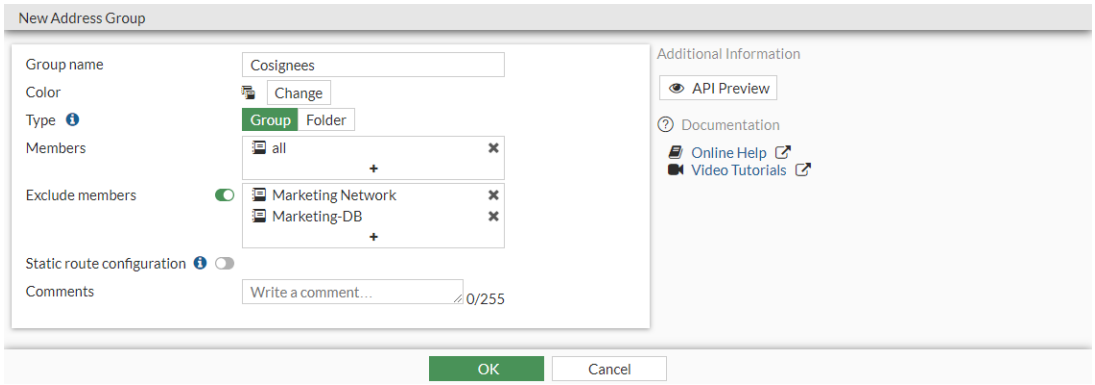
Address group exclusions

Specific IP addresses or ranges can be subtracted from the address group with the *Exclude Members* setting in IPv4 address groups.

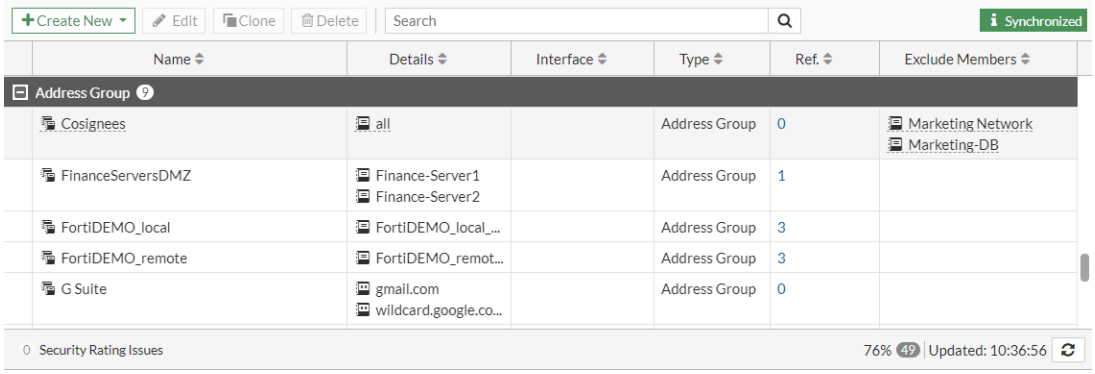
This feature is only supported for IPv4 address groups, and only for addresses with a *Type* of *IP Range* or *Subnet*.

To exclude addresses from an address group using the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Create a new address group, or edit an existing address group.
3. Enable *Exclude Members* and click the + to add entries.
4. Configure the other settings as needed.
5. Click *OK*.



The excluded members are listed in the *Exclude Members* column.



To exclude addresses from an address group using the CLI:

```
config firewall addrgrp
    edit <address group>
        set exclude enable
        set exclude-member <address> <address> ... <address>
    next
end
```

MAC addressed-based policies

MAC addresses can be added to the following IPv4 policies:

- Firewall
- Virtual wire pair
- ACL
- Central SNAT
- DoS

A MAC address is a link layer-based address type and it cannot be forwarded across different IP segments. In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range.

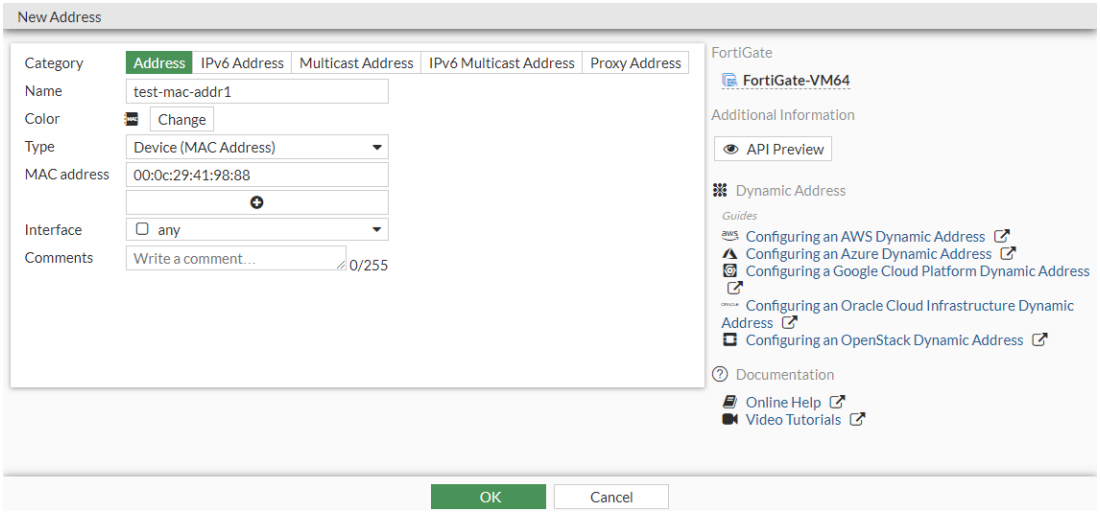
FortiOS only supports the MAC address type as source address for policies in NAT mode VDOM. When you use the MAC address type in a policy as source address in NAT mode VDOM, IP address translation (NAT) is still performed according to the rules defined in the policy. The MAC address type only works for source address matching. It does not have any association with NAT actions.

For policies in transparent mode or the virtual wire pair interface, you can use the MAC address type as source or destination address.

To configure a MAC address using the GUI:

1. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
2. Enter a name.
3. For *Category*, select *Address*.
4. For *Type*, select *Device (MAC Address)*.

5. Enter the MAC address.



6. Click *OK*.
7. Go to *Policy & Objects* > *Firewall Policy* to apply the address type to a policy in NAT mode VDOM:
   a. For *Source*, select the MAC address you just configured.
   b. For *Destination*, select an address.

   In NAT mode VDOM, this address type cannot be used as destination address.

   c. Configure the other settings as needed.
   d. Click *OK*.

To configure a MAC address using the CLI:

1. Create a new MAC address:

```
config firewall address
    edit "test-mac-addr1"
        set type mac
        set macaddr 00:0c:29:41:98:88
    next
end
```

2. Apply the address type to a policy. In transparent mode or the virtual wire pair interface, this address type can be mixed with other address types in the policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "test-mac-addr1" "10-1-100-42"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
```

```
            set nat enable
        next
    end
```

ISDB well-known MAC address list

The Internet Service Database (ISDB) includes well-known vendor MAC address range lists. The lists can only be used for source MAC addresses in IPv4 policies, and include the vendor name and the MAC address ranges that the vendor belongs to.

To view the vendor list:

```
# diagnose vendor-mac id
Please input Vendor MAC ID.
ID: 1 name: "Asus"
ID: 2 name: "Acer"
ID: 3 name: "Amazon"
ID: 4 name: "Apple"
ID: 5 name: "Xiaomi"
ID: 6 name: "BlackBerry"
ID: 7 name: "Canon"
ID: 8 name: "Cisco"
ID: 9 name: "Linksys"
ID: 10 name: "D-Link"
ID: 11 name: "Dell"
ID: 12 name: "Ericsson"
ID: 13 name: "LG"
ID: 14 name: "Fujitsu"
ID: 15 name: "Fitbit"
ID: 16 name: "Fortinet"
ID: 17 name: "OPPO"
ID: 18 name: "Hitachi"
ID: 19 name: "HTC"
ID: 20 name: "Huawei"
ID: 21 name: "HP"
ID: 22 name: "IBM"
ID: 23 name: "Juniper"
ID: 24 name: "Lenovo"
ID: 25 name: "Microsoft"
ID: 26 name: "Motorola"
ID: 27 name: "Netgear"
ID: 28 name: "Nokia"
ID: 29 name: "Nintendo"
ID: 30 name: "PaloAltoNetworks"
ID: 31 name: "Polycom"
ID: 32 name: "Samsung"
ID: 33 name: "Sharp"
ID: 34 name: "Sony"
ID: 35 name: "Toshiba"
ID: 36 name: "VMware"
ID: 37 name: "Vivo"
ID: 38 name: "Zyxel"
ID: 39 name: "ZTE"
```

To view the MAC address ranges for a vendor:

```
# diagnose vendor-mac id 16
Vendor MAC: 16(Fortinet)
Version: 0000700021
Timestamp: 201908081432
Number of MAC ranges: 6
00:09:0f:00:00:00 - 00:09:0f:ff:ff:ff
04:d5:90:00:00:00 - 04:d5:90:ff:ff:ff
08:5b:0e:00:00:00 - 08:5b:0e:ff:ff:ff
70:4c:a5:00:00:00 - 70:4c:a5:ff:ff:ff
90:6c:ac:00:00:00 - 90:6c:ac:ff:ff:ff
e8:1c:ba:00:00:00 - e8:1c:ba:ff:ff:ff
```

To query the vendor of a specific MAC address or range:

```
# diagnose vendor-mac match 00:09:0f:ff:ff:ff 48
Vendor MAC: 16(Fortinet), matched num: 1
```

To use the vendor ID in a firewall policy:

```
config firewall policy
    edit 9
        set name "policy_id_9"
        set uuid 6150cf30-308d-51e9-a7a3-bcbd05d61f93
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set vendor-mac 36 16
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Only packets whose source MAC address belong to Fortinet or VMware are passed by the policy.

Dynamic policy — fabric devices

The dynamic address group represents the configured IP addresses of all Fortinet devices connected to the Security Fabric. It currently includes FortiManager, FortiAnalyzer, FortiClient EMS, FortiMail, FortiAP(s), and FortiSwitch(es). Like other dynamic address groups for fabric connectors, it can be used as an IPv4 address in firewall policies and objects.

The list of firewall addresses includes a default address object called `FABRIC_DEVICE`. You can apply the `FABRIC_DEVICE` object to the following types of policies:

- Firewall policy (including virtual wire pairs)
- IPv4 shaping policy

- IPv4 ACL policy
- `policy64` and `policy46` (IPv4 only)

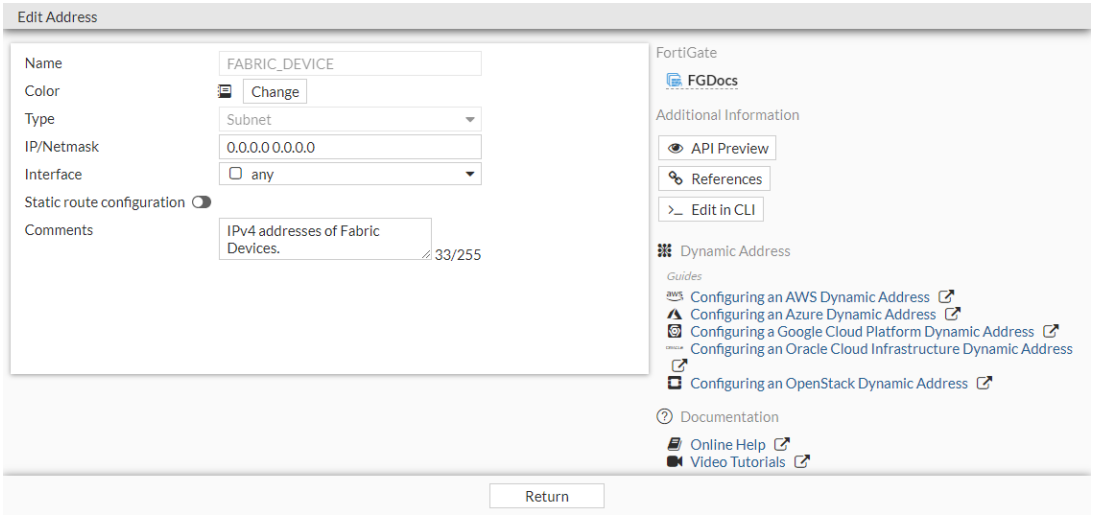
You cannot apply the `FABRIC_DEVICE` object to the following types of policies:

- IPv4 explicit proxy policy

You also cannot use the `FABRIC_DEVICE` object with the following settings:

- Custom extension on `internet-service`
- Exclusion of `addrgrp`

Initially the `FABRIC_DEVICE` object does not have an address value. The address value is populated dynamically as things change. As a result, you cannot edit the `FABRIC_DEVICE` object, add any addresses to the object, or remove any addresses from the object. The *Edit Address* pane in the GUI only has a *Return* button because the object is read-only:



The `FABRIC_DEVICE` object address values are populated based on:

- FortiAnalyzer IP (from the *Fabric Settings* pane)
- FortiManager IP (from the *Fabric Settings* pane)
- FortiMail IP (from the *Fabric Settings* pane)
- FortiClient EMS IP (from the *Fabric Settings* pane)
- FortiAP IPs (from the *FortiAP Setup* pane or DHCP)
- FortiSwitch IPs (from the *FortiSwitch Setup* page or DHCP)

To apply the FABRIC_DEVICE object to a firewall policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy or edit an existing policy.
3. For the *Destination* field, select *FABRIC_DEVICE* from the list of address entries.
4. Configure the rest of the policy as needed.
5. Click *OK*.

To apply the FABRIC_DEVICE object to a firewall policy using the CLI:

```
config firewall address
    edit "FABRIC_DEVICE"
```

```
        set type ipmask
        set comment "IPv4 addresses of Fabric Devices."
        set visibility enable
        set associated-interface ''
        set color 0
        set allow-routing disable
        set subnet 0.0.0.0 0.0.0.0
    next
end

config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "FABRIC_DEVICE"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set fsso disable
        set nat enable
    next
end
```

Diagnose command

You can use the diagnose command to list IP addresses of Fortinet devices that are configured in the Security Fabric.

To run the diagnose command using the CLI:

```
(root) # diagnose firewall sf-addresses list

FabricDevices: 172.18.64.48
FortiAnalyzer: 172.18.60.25
FortiSandbox: 172.18.52.154
FortiManager: 172.18.28.31
FortiClientEMS: 172.18.62.6
FortiAP:
FortiSwitch:
FortiAP/SW-DHCP:
```

FSSO dynamic address subtype

The Fortinet Single Sign-ON (FSSO) dynamic firewall address subtype can be used in policies that support dynamic address types. The FortiGate will update the dynamic address used in firewall policies based on the source IP information for the authenticated FSSO users.

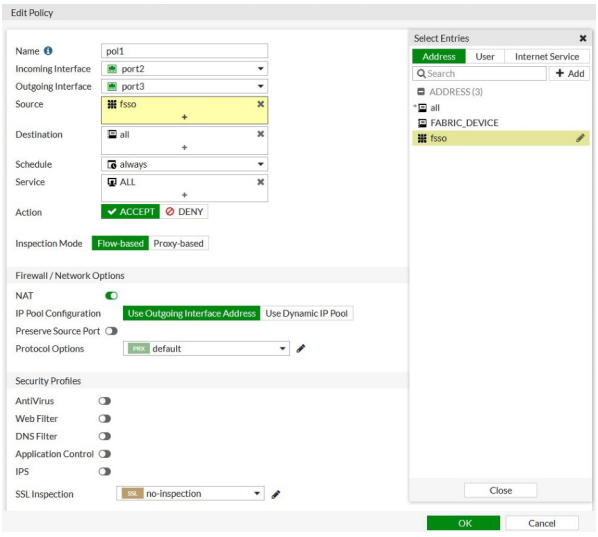
It can also be used with FSSO group information that is forwarded by ClearPass Policy Manager (CPPM) via FortiManager, and other FSSO groups provided by the FSSO collector agent or FortiNAC.

To configure FSSO dynamic addresses with CPPM and FortiManager in the GUI:

1. Create the dynamic address object:
   a. Go to *Policy & Objects* > *Addresses*, and click *Create New* > *Address*.
   b. For *Type*, select *Dynamic*.
   c. For *Sub Type*, select *Fortinet Single Sign-On (FSSO)*. The *Select Entries* pane opens and displays all available FSSO groups.
   d. Select one or more groups.
   e. Click *OK* to save the configuration.

   In the address table, there will be an error message for the address you just created (*Unresolved dynamic address: fsso*). This is expected because there are currently no authenticated FSSO users (based on source IP) in the local FSSO user list.

2. Add the dynamic address object to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Create a new policy or edit an existing policy.
   c. For *Source*, add the dynamic FSSO address object you just created.
   d. Configure the rest of the policy as needed.
   e. Click *OK* to save your changes.

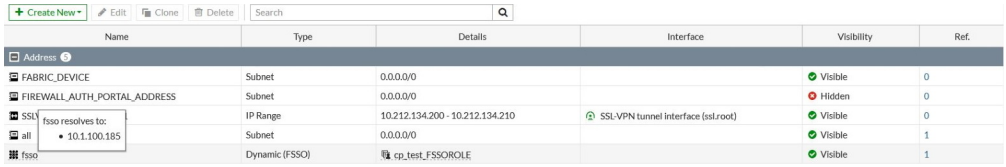


3. Test the authentication to add a source IP address to the FSSO user list:
   a. Log in as user and use CPPM for user authentication to connect to an external web server. After successful authentication, CPPM forwards the user name, source IP address, and group membership to the FortiGate via FortiManager.

b. Go to *Monitor* > *Firewall User Monitor* to view the user name (*fsso1*) and IP address.

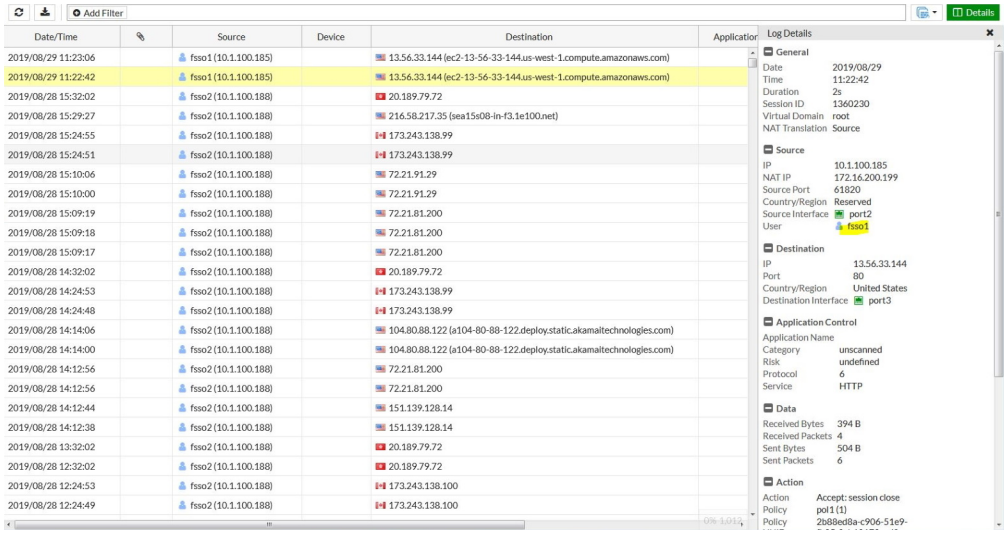
c. Go to *Policy & Objects* > *Addresses* to view the updated address table. The error message no longer appears.

d. Hover over the dynamic FSSO address to view the IP address (*fsso resolves to: 10.1.100.185*).

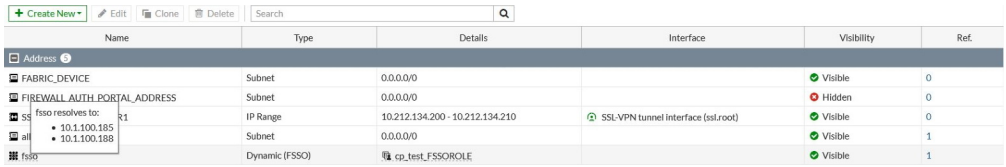


To verify user traffic in the GUI:

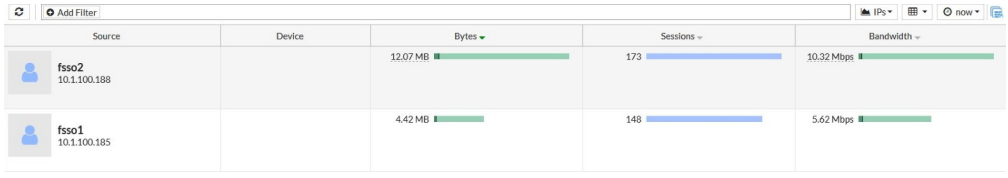
1. Go to *Log & Report* > *Forward Traffic*.
Details for the user *fsso1* are visible in the traffic log:



- If another user is authenticated by CPPM, then the dynamic address *fsso* entry in the address table will be updated. The IP address for user *fsso2* (*10.1.100.188*) is now visible:



2. Go to *FortiView* > *Sources* to verify that the users were able to successfully pass the firewall policy.



If a user logs off and CPPM receives log off confirmation, then CPPS updates the FortiGate FSSO user list via FortiManager. The user IP address is deleted from the dynamic FSSO address, and the user is no longer be able to pass the firewall policy.

To configure FSSO dynamic addresses with CPPM and FortiManager in the CLI:

1. Create the dynamic address object:

```
config firewall address
    edit "fsso"
        set type dynamic
        set sub-type fsso
        set fsso-group "cp_test_FSSOROLE"
    next
end
```

2. Add the dynamic address object to a policy:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "fsso"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set fsso disable
        set nat enable
    next
end
```

To verify user traffic in the CLI:

1. Check the FSSO user list:

```
diagnose debug authd fsso list
----FSSO logons----
IP: 10.1.100.185  User: fsso1  Groups: cp_test_FSSOROLE  Workstation:  MemberOf: FSSO-
CPPM cp_test_FSSOROLE
Total number of logons listed: 1, filtered: 0
----end of FSSO logons----
```

2. Check the authenticated firewall users list:

```
diagnose firewall auth list
10.1.100.185, fsso1
type: fsso, id: 0, duration: 2928, idled: 2928
server: FortiManager
packets: in 0 out 0, bytes: in 0 out 0
group_id: 2 33554433
group_name: FSSO-CPPM cp_test_FSSOROLE
----- 1 listed, 0 filtered ------
```

After user traffic passes through the firewall, the nu

```
diagnose firewall auth list
10.1.100.185, fsso1
type: fsso, id: 0, duration: 3802, idled: 143
server: FortiManager
packets: in 1629 out 1817, bytes: in 2203319 out 133312
```

```
group_id: 2 33554433
group_name: FSSO-CPPM cp_test_FSSOROLE
----- 1 listed, 0 filtered ------
```

ClearPass integration for dynamic address objects

ClearPass Policy Manager (CPPM) can gather information about the statuses of network hosts, for example, the latest patches or virus infections. Based on this information, CPPM send the IP addresses and current states, such as Healthy or Infected, to the FortiGate.

On the FortiGate, the IP addresses received from CPPM are added to a dynamic firewall address with the *clearpass-spt* subtype. This address can be used in any policy that supports dynamic addresses, such as Firewall or SSL-VPN policies.

In this example, you create two dynamic IP addresses that are used in two firewall policies (deny and allow). One policy allows traffic (host state = Healthy), and the other denies traffic (host state = Infected). When CPPM sends the information, the IP addresses are assigned according to their host state: Healthy or Infected.

You can then verify that traffic from the Infected host is denied access by the deny policy, and traffic from the Healthy host is allowed access by the allow policy.

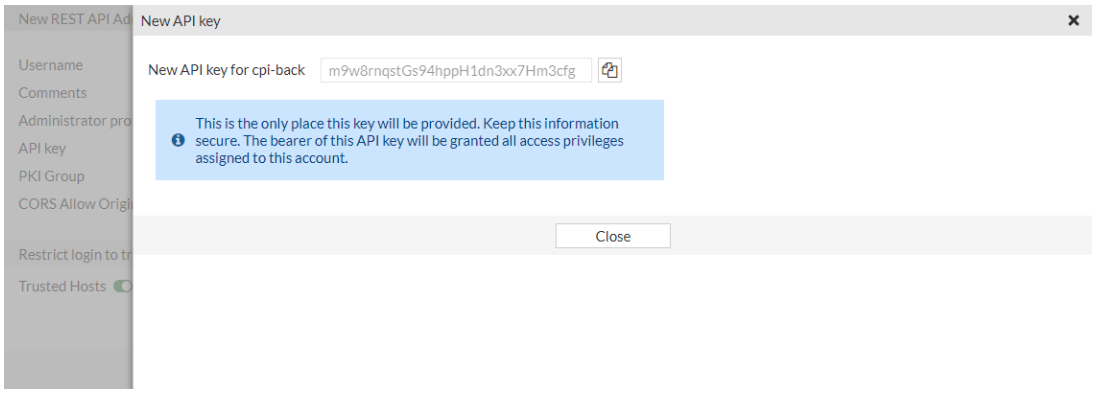
Create a REST API administrator

A REST API administrator is required to generate an authorization token for REST API messages, and to limit hosts that can send REST API messages to the FortiGate.

To create a REST API administrator in the GUI:

1. Go to *System* > *Administrators*.
2. Click *Create New* > *REST API Admin*.
3. Configure the *Username* and other information as needed.
4. Disable *PKI Group*.
5. In the *Trusted Hosts* field, enter *10.1.100.0/24*.

   For this example, an administrator profile called *clearpass* was created with full read/write access. See Administrator profiles on page 1413 for details.
6. Click *OK*.
   The *New API key* pane opens.



The API key is the REST API authorization token that is used in REST API messages sent by CPPM to the FortiGate.

7. Copy the API key to a secure location. A new key can be generated if this one is lost or compromised.
8. Click *Close*.

To create a REST API administrator in the CLI:

```
config system api-user
    edit "cpi-back"
        set accprofile "clearpass"
        config trusthost
            edit 1
                set ipv4-trusthost 10.1.100.0 255.255.255.0
            next
        end
    next
end
```

```
execute api-user generate-key cp-api
    New API key: 0f1HxGHh9r9p74k7qgfHNH40p51bjs
    NOTE: The bearer of this API key will be granted all access privileges assigned to the
api-user cp-api.
```

Create dynamic IP addresses with the clearpass subtype

Two dynamic IP addresses are required, one for the allow policy, and the other for the deny policy.

To create the dynamic IP addresses:

```
config firewall address
    edit "cppm"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt healthy
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
    edit "cppm-deny"
        set type dynamic
```

```
        set sub-type clearpass-spt
        set clearpass-spt infected
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
end
```

Create firewall policies

Two firewall policies are required, one to accept traffic (*cppm-allow*), and the other to deny traffic (*cppm-deny*).

To create the firewall policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Configure the allow policy:
   a. Click *Create New*.
   b. Enter a name for the policy.
   c. Set *Source* set to *cppm*.
   d. Set *Action* to *ACCEPT*.
   e. Configure the remaining settings as needed.
   f. Click *OK*.
3. Configure the deny policy:
   a. Click *Create New*.
   b. Enter a name for the policy.
   c. Set *Source* set to *cppm-deny*.
   d. Set *Action* to *DENY*.
   e. Configure the remaining settings as needed.
   f. Click *OK*.

To create the firewall policies in the CLI:

```
config firewall address
    edit "cppm"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt healthy
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
    edit "cppm-deny"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt infected
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
```

```
    next
end
```

Verification

Go to *Log & Report* > *Forward Traffic* to review traffic logs and ensure that traffic is allowed or denied as expected.

To verify that FortiGate addresses are assigned correctly, enter the following:

```
# diagnose firewall dynamic list
List all dynamic addresses:
cppm-deny: ID(141)
        ADDR(10.1.100.188)

cppm: ID(176)
        ADDR(10.1.100.185)
        ADDR(10.1.100.186)
```

Group address objects synchronized from FortiManager

Address objects from external connectors that are learned by FortiManager are synchronized to FortiGate. These objects can be grouped together with the FortiGate CLI to simplify selecting connector objects in the FortiGate GUI. Multiple groups can be created.

This option is only available for objects that are synchronized from FortiManager.

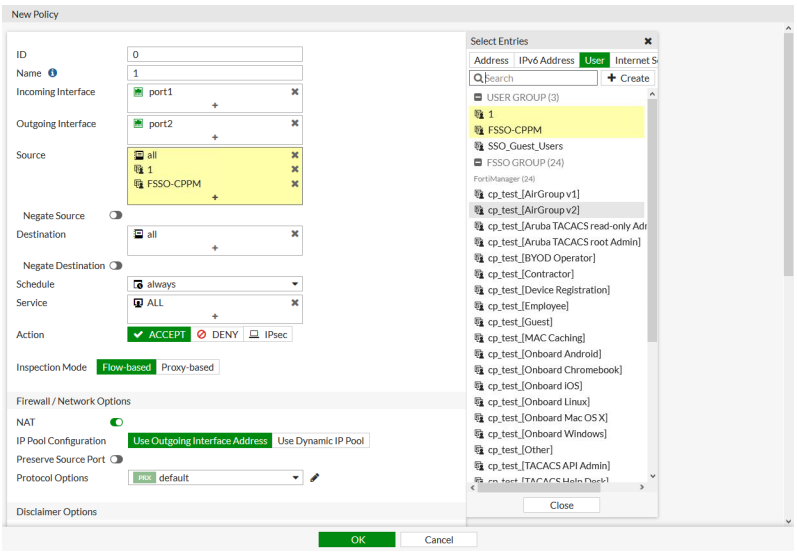
To add an object to a connector group:

```
config user adgrp
    edit <object_name>
        set server-name "FortiManager"
        set connector-source <group_name>
    next
end
```

Example

In this example, objects learned by the FortiManager from an Aruba ClearPass device are synchronized to the FortiGate. Some of the objects are then added to a group called *ClearPass* to make them easier to find in the object list when creating a firewall policy.

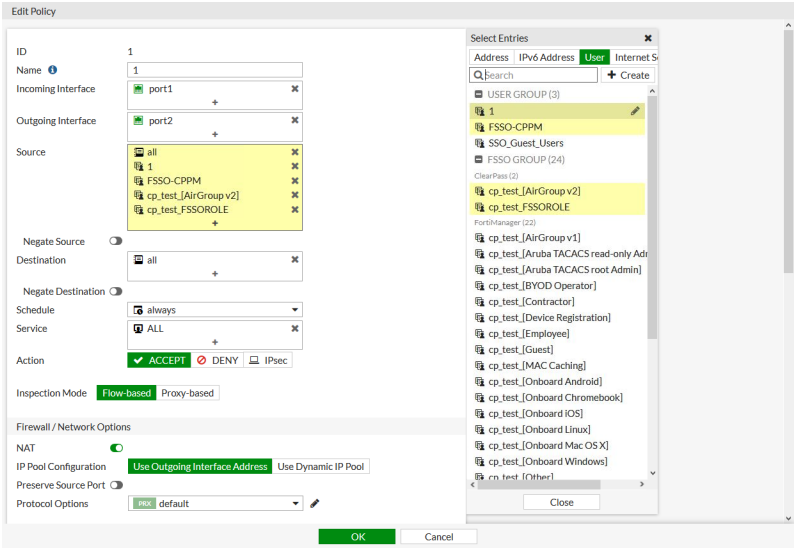
Prior to being grouped, the synchronized objects are listed under the FortiManager heading in the object lists.



To add some of the objects to a group:

```
config user adgrp
    edit "cp_test_FSSOROLE"
        set server-name "FortiManager"
        set connector-source "ClearPass"
    next
    edit "cp_test_[AirGroup v2]"
        set server-name "FortiManager"
        set connector-source "ClearPass"
    next
end
```

The objects are now listed under the *ClearPass* heading.



Using wildcard FQDN addresses in firewall policies

You can use wildcard FQDN addresses in firewall policies. IPv4, IPv6, ACL, local, shaping, NAT64, NAT46, and NGFW policy types support wildcard FQDN addresses.

For wildcard FQDN addresses to work, the FortiGate should allow DNS traffic to pass through. Clients behind the FortiGate should use the same DNS server(s) as the FortiGate to ensure the FortiGate and the clients are resolving to the same addresses.

Initially, the wildcard FQDN object is empty and contains no addresses. When the client tries to resolve a FQDN address, the FortiGate will analyze the DNS response. The IP address(es) contained in the answer section of the DNS response will be added to the corresponding wildcard FQDN object.

Since FortiGate must analyze the DNS response, it does not work with DNS over HTTPS.

When the wildcard FQDN gets the resolved IP addresses, FortiOS loads the addresses into the firewall policy for traffic matching.

The FortiGate will keep the IP addresses in the FQDN object table as long as the DNS entry itself has not expired. Once it expires, the IP address is removed from the wildcard FQDN object until another query is made. At any given time, a single wildcard FQDN object may have up to 1000 IP addresses.

The DNS expiry TTL value is set by the authoritative name server for that DNS record. If the TTL for a specific DNS record is very short and you would like to cache the IP address longer, then you can extend it with the CLI. See To extend the TTL for a DNS record in the CLI: on page 636

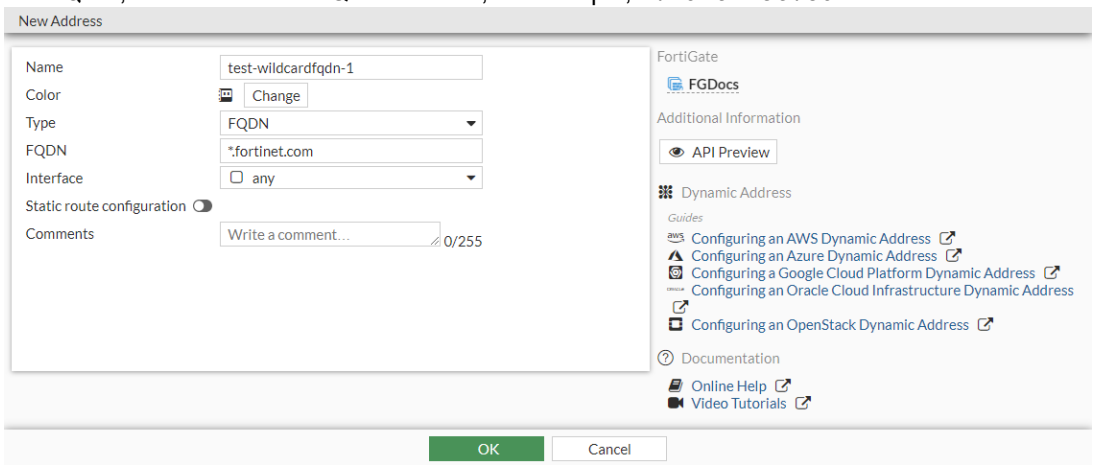
For more information, see FQDN address firewall object type.

Wildcard FQDN IPs are synchronized to other autoscale members whenever a peer learns of a wildcard FQDN address.

To create a wildcard FQDN using the GUI:

1. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
2. Specify a *Name*.
3. For *Type*, select *FQDN*.

4. For *FQDN*, enter a wildcard FQDN address, for example, `*.fortinet.com`.



5. Click *OK*.

To use a wildcard FQDN in a firewall policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. For *Destination*, select the wildcard FQDN.
3. Configure the rest of the policy as needed.
4. Click *OK*.

To create a wildcard FQDN using the CLI:

```
config firewall address
    edit "test-wildcardfqdn-1"
        set type fqdn
        set fqdn "*.fortinet.com"
    next
end
```

To use wildcard FQDN in a firewall policy using the CLI:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "test-wildcardfqdn-1"
        set action accept
        set schedule "always"
        set service "ALL"
        set auto-asic-offload disable
        set nat enable
    next
end
```

To use the diagnose command to list resolved IP addresses of wildcard FQDN objects:

```
# diagnose firewall fqdn list

List all FQDN:
```

***.fortinet.com**: ID(48) ADDR(96.45.36.159) ADDR(192.168.100.161) ADDR(65.39.139.161)

Alternatively:

```
diagnose test application dnsproxy 6

worker idx: 0

vfid=0 name=*.fortinet.com ver=IPv4  min_ttl=3266:0, cache_ttl=0 , slot=-1, num=3,
wildcard=1

       96.45.36.159 (ttl=68862:68311:68311) 192.168.100.161 (ttl=3600:3146:3146)
65.39.139.161

(ttl=3600:3481:3481)
```

To use the diagnose command for firewall policies which use wildcard FQDN:

```
# diagnose firewall iprope list 100004
...
destination fqdn or dynamic address (1):*.fortinet.com ID(48) uuid_idx=57 ADDR
(208.91.114.104) ADDR(208.91.114.142) ADDR(173.243.137.143) ADDR(65.104.9.196) ADDR
(96.45.36.210)
...
```

To extend the TTL for a DNS record in the CLI:

In this the example the `set cache-ttl` value has been extended to 3600 seconds.

```
config firewall address
   edit "fortinet.com"
      set type fqdn
      set fqdn "www.fortinet.com”
      set cache-ttl 3600
   next
end
```

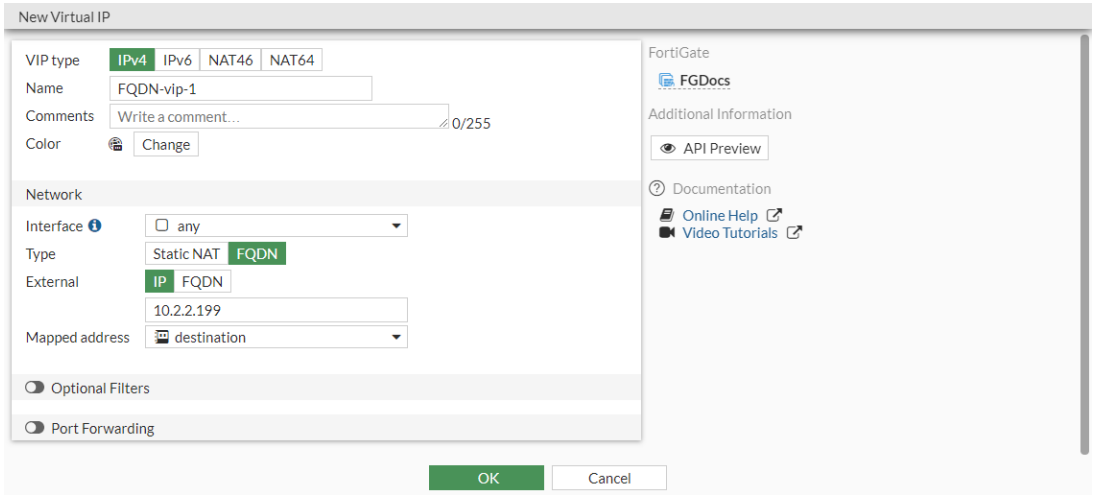
Configure FQDN-based VIPs

In public cloud environments, sometimes it is necessary to map a VIP to an FQDN address.

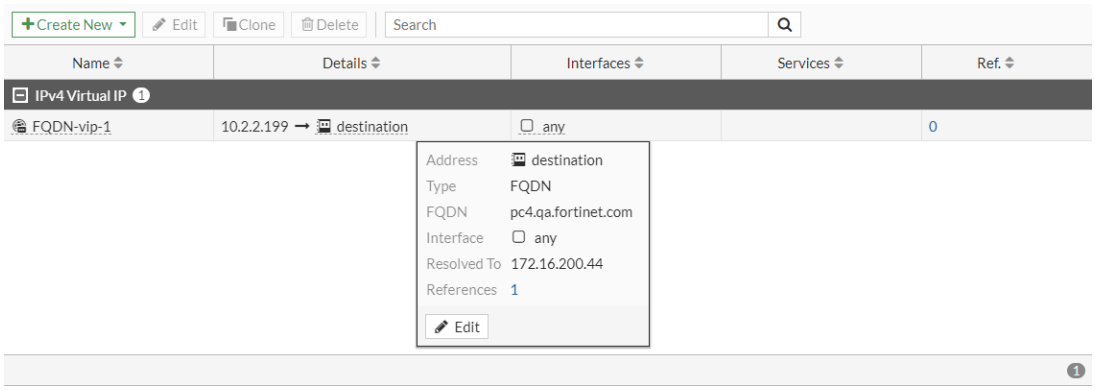
To configure an FQDN-based VIP in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* and click *Create New* > *Virtual IP*.
2. Enter a name for the VIP.
3. Select an interface.
4. For *Type*, select *FQDN*.
5. For *External*, select *IP* and enter the external IP address.

6. For *Mapped address*, select an FQDN address.



7. Click *OK*.
   In the virtual IP list, hover over the address to view more information.



To configure an FQDN-based VIP in the CLI:

```
config firewall vip
    edit "FQDN-vip-1"
        set type fqdn
        set extip 10.2.2.199
        set extintf "any"
        set mapped-addr "destination"
    next
end
```

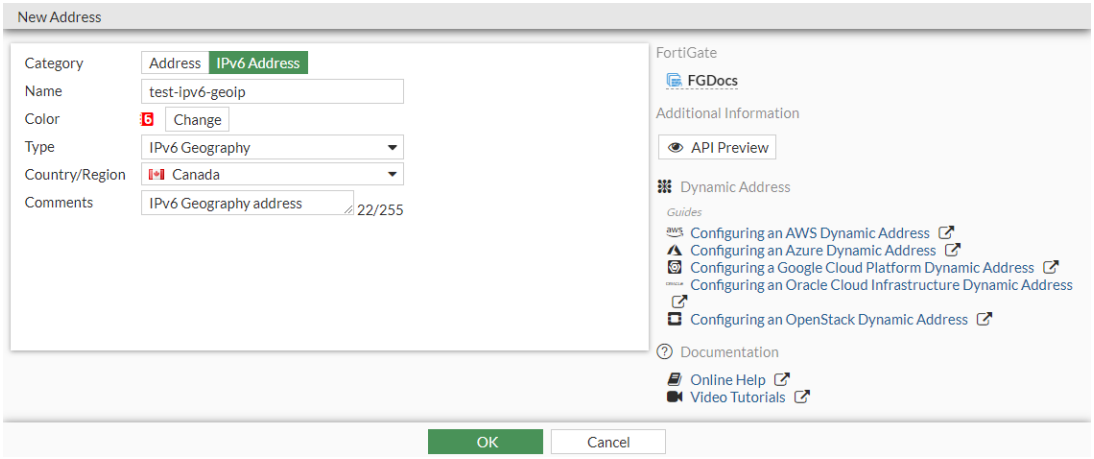
IPv6 geography-based addresses

Geography-based IPv6 addresses can be created and applied to IPv6 firewall policies.

IPv6 geography-based addresses do not support `geoip-override` or `geoip-anycast`.

To create an IPv6 geography-based address in the GUI:

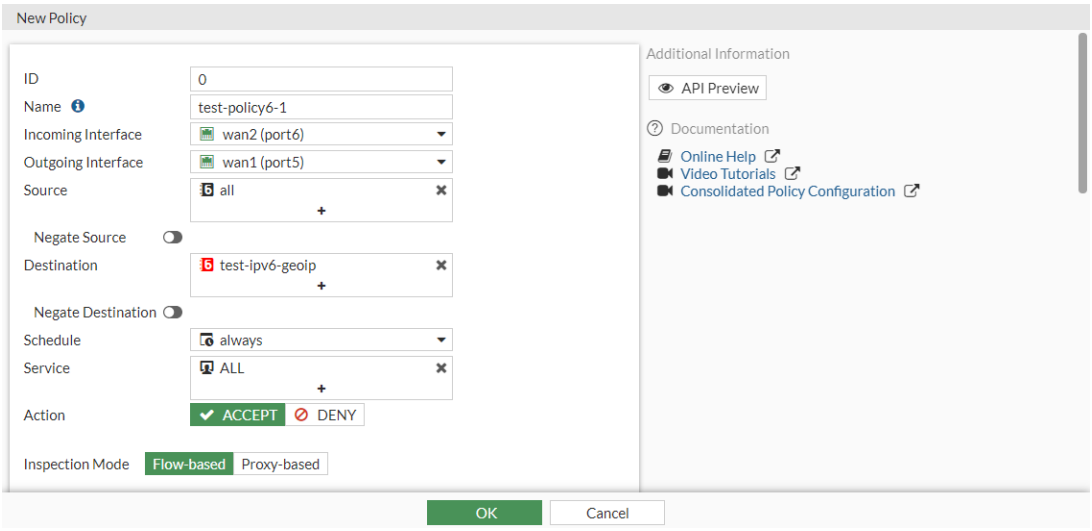
1. Go to *Policy and Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Set *Category* to *IPv6 Address*.
4. Enter a name for the address.
5. Set *Type* to *IPv6 Geography*.
6. Select the *Country/Region* from the list.
7. Optionally, enter comments.



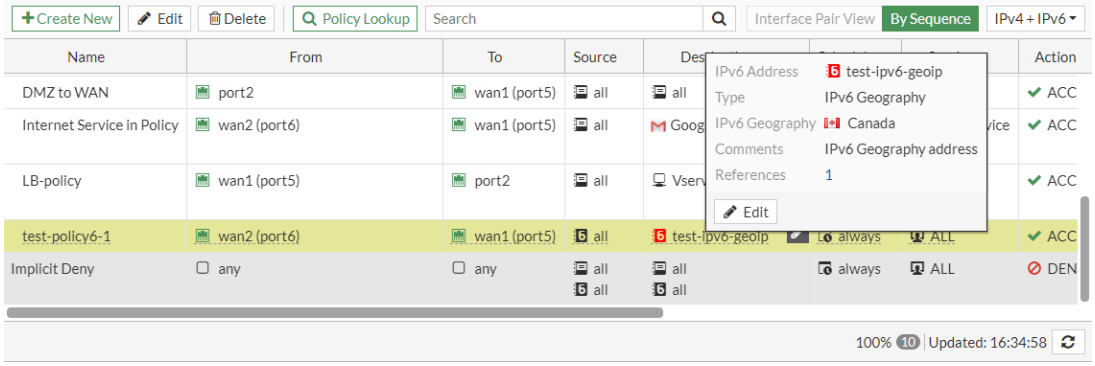
8. Click *OK*.

To use the IPv6 geography address in a policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit an existing policy, or create a new one, using the IPv6 geography address as the *Source* or *Destination Address*.



3. In the policy list, hover over the address to view details.



To configure an IPv6 geography-based address in the CLI:

1. Create an IPv6 geography-based address:

```
config firewall address6
    edit "test-ipv6-geoip"
        set type geography
        set color 6
        set comment "IPv6 Geography address"
        set country "CA"
    next
end
```

2. Use the IPv6 geography-based address in a policy:

```
config firewall policy
    edit 1
        set name "test-policy6-1"
        set srcintf "port6"
        set dstintf "port5"
        set srcaddr6 "all"
        set dstaddr6 "test-ipv6-geoip"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

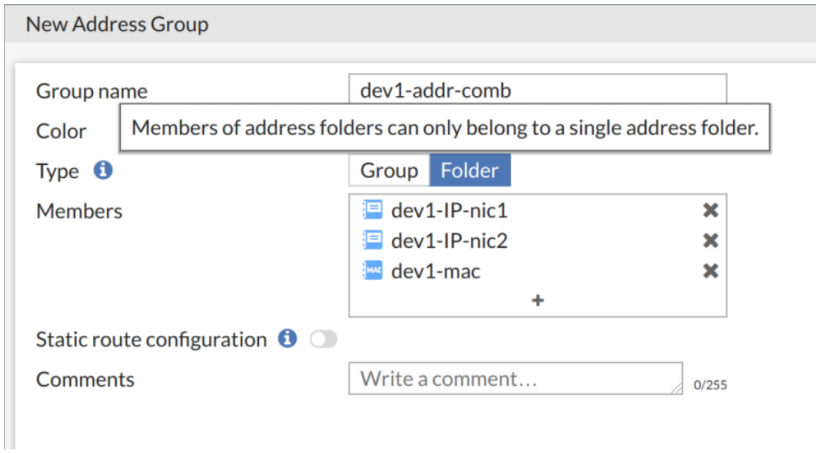
Array structure for address objects

Some address objects logically belong to the same device, such as two IPs from the same computer. These address objects can be grouped into an address folder, which is an exclusive list of address objects that do not appear in other address groups or folders.

In the CLI, the folder type can be set after the member list is already populated. If the member list contains an incompatible entry, then the setting will be discarded when the `next`/`end` command is issued. If the folder type is set before the member list is populated, then the possible member entry list will be filtered according to the selected type.

To create an address folder in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address Group* and enter a name.
3. For *Type*, select *Folder*.
4. For *Members*, click the + to add the addresses. Address folders and groups are exclusive, so the *Select Entries* window filters out address objects that are a member of an existing group or folder.



5. Click *OK*.
6. In the address table, expand the *Address Group* section to view the folder (*dev1-addr-comb*). The expandable folder view shows the address folder's child objects:

	safe-network1-devices	Address Group (Folder)	2 entries		0
	dev1-addr-comb	Address Group (Folder)	3 entries		1
	dev1-IP-nic1	Subnet	192.168.1.25/32		1
	dev1-IP-nic2	Subnet	192.168.1.22/32		1
	dev1-mac	Device (MAC Address)	00:0a:95:9d:68:16		1
	dev2-addr-comb	Address Group (Folder)	4 entries		1
	dev2-IP-nic1	Subnet	192.168.1.101/32		1
	dev2-IP-nic2	Subnet	192.168.1.102/32		1
	dev2-IP-nic3	Subnet	192.168.1.103/32		1
	dev2-mac	Device (MAC Address)	11:5b:12:2c:87:02		1

To configure an address folder in the CLI:

```
config firewall addrgrp
    edit "safe-network1-devices"
        set type folder
        set member "dev1-addr-comb" "dev2-addr-comb"
        set comment ''
        set exclude disable
        set color 13
    next
end
```

```
config firewall addrgrp
    edit "dev1-addr-comb"
        set type folder
        set member "dev1-IP-nic1" "dev1-IP-nic2" "dev1-mac"
```

```
        set comment ''
        set exclude disable
        set color 18
    next
end
config firewall addrgrp
    edit "dev2-addr-comb"
        set type folder
        set member "dev2-IP-nic1" "dev2-IP-nic2" "dev2-IP-nic3" "dev2-mac"
        set comment ''
        set exclude disable
        set color 5
    next
end
```

IPv6 MAC addresses and usage in firewall policies

Users can define IPv6 MAC addresses that can be applied to the following policies:

- Firewall
- Virtual wire pair
- ACL/DoS
- Central NAT
- NAT64
- Local-in

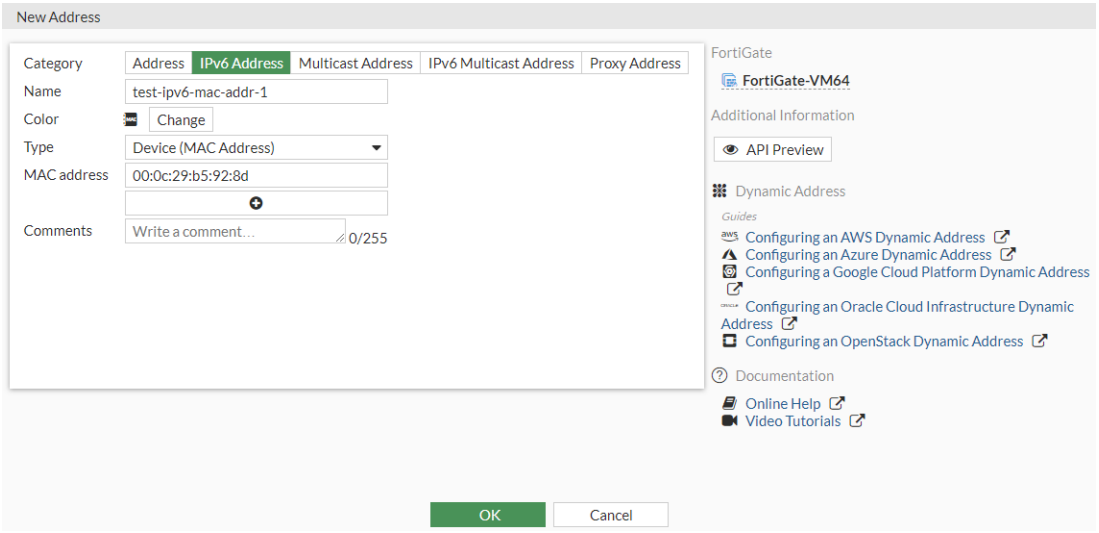
In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range. In this example, a firewall policy is configured in a NAT mode VDOM with the IPv6 MAC address as a source address.

IPv6 MAC addresses cannot be used as destination addresses in VDOMs when in NAT operation mode.

To configure IPv6 MAC addresses in a policy in the GUI:

1. Create the MAC address:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. For *Category*, select *IPv6 Address*.
   c. Enter an address name.
   d. For *Type*, select *Device (MAC Address)*.

e. Enter the the MAC address.



f. Click *OK*.

2. Configure the policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Source*, select the IPv6 MAC address object.
   c. Configure the other settings as needed.
   d. Click *OK*.

To configure IPv6 MAC addresses in a policy in the CLI:

1. Create the MAC address:

```
config firewall address6
    edit "test-ipv6-mac-addr-1"
        set type mac
        set macaddr 00:0c:29:b5:92:8d
    next
end
```

2. Configure the policy:

```
config firewall policy
    edit 2
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "test-ipv6-mac-addr-1" "2000-10-1-100-0"
        set dstaddr6 "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Traffic shaping

QoS (quality of service) is the capability to adjust quality aspects of your overall network traffic, including techniques such as priority-based queuing and traffic policing. Because bandwidth is finite and some types of traffic are slow, jitter or packet loss sensitive, bandwidth intensive, or critical for operations, QoS is a useful tool to optimize the performance of various applications in your network. QoS is especially important for managing voice and streaming multimedia traffic because these types of traffic can rapidly consume bandwidth and are sensitive to latency. You can implement QoS on FortiGate devices using the following techniques:

Technique	Description
Traffic policing	The FortiGate drops packets that do not conform to the configured bandwidth limitations. Note that excessive traffic policing can degrade network performance rather than improve it.
Traffic shaping	The FortiGate ensures that traffic consumes bandwidth at least at the guaranteed rate by assigning a greater priority queue to the traffic if the guaranteed rate is not being met. The FortiGate ensures that traffic does not consume more than the maximum configured bandwidth. Traffic that exceeds the maximum rate is subject to traffic policing.
Queuing	The FortiGate transmits packets in the order of their assigned priority queue for that physical interface. All traffic in a higher priority traffic queue must be completely transmitted before traffic in lower priority queues is transmitted.

When determining how to configure QoS, it is helpful to know when a FortiGate uses each technique in the overall traffic processing flow and the considerations for each technique. After the FortiGate accepts packets, it classifies the traffic and may apply traffic policing at additional points during traffic processing. The FortiGate may also apply QoS techniques, such as prioritization and traffic shaping. Traffic shaping consists of both traffic policing to enforce bandwidth limits and adjusting priority queues to help packets achieve the guaranteed rate.

Traffic shaping accuracy is optimal for security policies without a protection profile where no FortiGate content inspection is processed.

You can enable traffic shaping in *System* > *Feature Visibility* under the *Additional Features* section.

The following topics provide information about configuring traffic shaping policies:

- Determining your QoS requirements on page 644
- Packet rates on page 645
- Changing traffic shaper bandwidth unit of measurement on page 647
- Shared traffic shaper on page 647
- Per-IP traffic shaper on page 651
- Type of Service-based prioritization and policy-based traffic shaping on page 654
- Interface-based traffic shaping profile on page 657
- Interface-based traffic shaping with NP acceleration on page 666

- Classifying traffic by source interface on page 667
- Configuring traffic class IDs on page 668
- Traffic shaping schedules on page 671
- DSCP matching (shaping) on page 674
- QoS assignment and rate limiting for quarantined VLANs on page 678
- Weighted random early detection queuing on page 679

Determining your QoS requirements

Before implementing QoS, you should identify the types of traffic that:

- Are important to your organization
- Use high amounts of bandwidth
- Are sensitive to latency or packet loss

Discovering the needs and relative importance of each traffic type on your network will help you design an appropriate overall approach, including how you configure each available QoS component technique. Some organizations discover they only need to configure bandwidth limits for some services. Other organizations determine they need to fully configure interface and security policy bandwidth limits for all services, and prioritize the queuing of critical services relative to traffic rate.

For example, your organization wants to guarantee sufficient bandwidth for revenue-producing e-commerce traffic. You need to ensure that customers complete transactions and do not experience service delays. At the same time, you need to ensure low latency for voice over IP (VoIP) traffic that sales and customer support teams use, while traffic latency and bursts may be less critical to the success of other network applications, such as long term, resumable file transfers.

Best practices

The following list includes recommendations and considerations when configuring QoS in your network:

- Ensure maximum bandwidth limits at the source interface and security policy are not too low. This can cause the FortiGate to discard an excessive number of packets.
- Consider the ratios of how packets are distributed between the available queues, and which queues are used by which types of services. Assigning most packets to the same priority queue can reduce the effects of configuring prioritization. Assigning a lot of high bandwidth services to high priority queues may take too much bandwidth away from lower priority queues and cause increased or indefinite latency. For example, you may want to prioritize a latency-sensitive service, such as SIP, over a bandwidth-intensive service, such as FTP. Also consider that bandwidth guarantees can affect queue distribution, and assign packets to queue 0 instead of their regular queue in high-volume situations.
- Decide whether or not to guarantee bandwidth because it causes the FortiGate to assign packets to queue 0 if the guaranteed packet rate is not being met. When you compare queuing behavior for low and high bandwidth situations, this means the effect of prioritization only becomes visible as traffic volumes rise and exceed their guarantees. Because of this, you might want only some services to use bandwidth guarantees. This way, you can avoid the possibility that all traffic uses the same queue in high-volume situations, which negates the effects of configuring prioritization.
- Configure prioritization for all through traffic by either ToS (type of service)-based priority or security policy priority, not both, to simplify analysis and troubleshooting. Traffic subject to both ToS-based and security policy priorities use a combined priority from both parts of the configuration. Traffic subject to only one of the prioritization methods will use only that priority. If you configure both methods, or if you configure either method for only a subset of traffic, packets that apply to the combined configuration may receive a lower priority queue than packets that apply to only one of the priority methods, as well as packets that do not apply to the configured prioritization. For example, if both

the ToS-based priority and security policy priority dictate that a packet should receive a medium priority, in the absence of bandwidth guarantees, a packet will use queue 3. If only ToS-based priority is configured, the packet will use queue 1. If only security policy priority is configured, the packet will use queue 2. If no prioritization is configured, the packet will use queue 0.

- Because you can configure QoS using a combination of security policies and ToS-based priorities, and to distribute traffic over the six possible queues for each physical interface, the results of those configurations can be more difficult to analyze because of their complexity. In those cases, prioritization behavior can vary by several factors, including: traffic volume, ToS or differentiated services (DiffServ) markings, and correlation of session to a security policy.

The FortiGate does not prioritize traffic based on the differentiated services code point (DSCP) marking configured in the security policy. However, ToS-based prioritization can be used for ingress traffic.

- Use the UDP protocol to obtain more accurate testing results. Packets that are discarded by traffic shapers impact flow-control mechanisms, such as TCP.
- Do not oversubscribe outbandwidth throughput. For example, sum [guaranteed bandwidth] < outbandwidth. For accurate bandwidth calculations, you must set the outbandwidth parameter on interfaces.

Packet rates

The formula for packet rates specified for maximum bandwidth or guaranteed bandwidth is:

rate = amount / time

where rate is in Kbps

Burst size cannot exceed the configured maximum bandwidth. The FortiGate drops packets that exceed the configured maximum bandwidth. Packets deduct from the amount of bandwidth available to subsequent packets, and available bandwidth regenerates at a fixed rate. As a result, the available bandwidth for a packet may be less than the configured rate, down to a minimum of 0 Kbps.

Alternatively, rate calculation and behavior can be described using the token bucket metaphor. A traffic flow has an associated bucket, which represents burst size bounds and is the size of the configured bandwidth limit. The bucket receives tokens, which represent available bandwidth at the fixed configured rate. As time passes, tokens are added to the bucket up to capacity, and excess tokens are discarded. When a packet arrives at the FortiGate, the packet must deduct bandwidth tokens from the bucket equal to its size in order to leave the FortiGate. If there are not enough tokens, the packet cannot leave the FortiGate and is dropped.

Bursts are not redistributed over a longer interval, so bursts are propagated rather than smoothed. However, peak size is limited. The maximum burst size is the capacity of the bucket, which is the configured bandwidth limit. The actual size varies depending on the current number of tokens in the bucket, which may be less than the capacity of the bucket due to deductions made by previous packets and the fixed rate at which tokens accumulate. A depleted bucket refills at the rate of the configured bandwidth limit. Bursts cannot borrow tokens from other time intervals.

By limiting traffic peaks and token regeneration, the available bandwidth may be less than the capacity of the bucket, but the limit of the total amount per time interval is ensured. Total bandwidth use during each interval of one second is, at most, the integral of the configured rate.

Rate discrepancy

You may observe that external clients, such as FTP or BitTorrent, initially report rates between the maximum bandwidth and twice the amount of the maximum bandwidth depending on the size of their initial burst. For example, when a connection is initiated following a period of no network activity. The apparent discrepancy in rates is caused by a difference in perspective when delimiting time intervals. A burst from the client may initially consume all tokens in the bucket, and before the end of one second as the bucket regenerates, is allowed to consume almost another bucket worth of bandwidth. From the perspective of the client, this equals one time interval. However, from the perspective of the FortiGate, the bucket cannot accumulate tokens when it is full. Therefore, the time interval for token regeneration begins after the initial burst and does not contain the burst. These different points of reference result in an initial discrepancy equal to the size of the burst. The client's rate contains it, but the FortiGate's rate does not. However, if the connection is sustained to its limit and time progresses over an increasing number of intervals, this discrepancy decreases in importance relative to the bandwidth total. The client reported rate will eventually approach the configured rate limit for the FortiGate.

Example

The maximum bandwidth is 50 Kbps, there has been no network activity for one or more seconds, and the bucket is full. A burst from an FTP client immediately consumes 50 kilobits. Because the bucket completely regenerates over one second, by the time another second elapses from the initial burst, traffic can consume another 49.999 kilobits, for a total of 99.999 kilobits between the two points in time. From the vantage point of an external FTP client regulated by this bandwidth limit, it initially appears that the bandwidth limit is 99.999 Kbps. This is almost twice the configured limit of 50 Kbps. However, bucket capacity only regenerates at the configured rate of 50 Kbps, and the connection can only consume a maximum of 50 kilobits during each subsequent second. The result is that as bandwidth consumption is averaged over an increasing number of time intervals, each of which are limited to 50 Kbps, the effect of the first interval's doubled bandwidth size diminishes proportionately, and the client's reported rate eventually approaches the configured rate limit. The following table shows the effects of a 50 Kbps limit on client reported rates:

Total size transferred (kilobits)	Time (seconds)	Rate reported by client (Kbps)
99.999 (50 + 49.999)	1	99.999
149.999	2	74.999
199.999	3	66.666
249.999	4	62.499
299.999	5	59.998
349.999	6	58.333

Guaranteed bandwidth can also be described using a token bucket metaphor. However, because this feature attempts to achieve or exceed a rate rather than limit it, the FortiGate does not discard non-conforming packets, as it does for maximum bandwidth. Instead, when the flow does not achieve the rate, the FortiGate increases the packet priority queue, in an effort to increase the rate.

Guaranteed and maximum bandwidth rates apply to the bidirectional total for all sessions controlled by the security policy. For example, an FTP connection may entail two separate connections for the data and control portion of the session. Some packets may be reply traffic rather than initiating traffic. All packets for both connections are counted when calculating the packet rate for comparison with the guaranteed and maximum bandwidth rate.

Changing traffic shaper bandwidth unit of measurement

Bandwidth speeds are measured in kilobits per second (Kbps), and bytes that are sent and received are measured in megabytes (MB). In some cases, this can cause confusion depending on whether your ISP uses kilobits per second (Kbps), kilobytes per second (KBps), megabits per second (Mbps), or gigabits per second (Gbps).

You can change the unit of measurement for traffic shapers in the CLI.

To change the bandwidth unit of measurement for a shared traffic shaper:

```
config firewall shaper traffic-shaper
    edit <traffic_shaper_name>
        set bandwidth-unit {kbps | mbps | gbps}
    next
end
```

To change the bandwidth unit of measurement for a per-IP traffic shaper:

```
config firewall shaper per-ip-shaper
    edit <traffic_shaper_name>
        set bandwidth-unit {kbps | mbps | gbps}
    next
end
```

Shared traffic shaper

Shared traffic shaper is used in a firewall shaping policy to indicate the priority and guaranteed and maximum bandwidth for a specified type of traffic use.

The maximum bandwidth indicates the largest amount of traffic allowed when using the policy. You can set the maximum bandwidth to a value between 1 and 16776000 Kbps. The GUI displays an error if any value outside this range is used. If you want to allow unlimited bandwidth, use the CLI to enter a value of 0.

The guaranteed bandwidth ensures that there is a consistent reserved bandwidth available. When setting the guaranteed bandwidth, ensure that the value is significantly less than the interface's bandwidth capacity. Otherwise, the interface will allow very little or no other traffic to pass through, potentially causing unwanted latency.

In a shared traffic shaper, the administrator can prioritize certain traffic as high, medium, or low. FortiOS provides bandwidth to low priority connections only when high priority connections do not need the bandwidth. For example, you should assign a high traffic priority to a policy for connecting a secure web server that needs to support e-commerce traffic. You should assign less important services a low priority.

When you configure a shared traffic shaper, you can apply bandwidth shaping per policy or for all policies. By default, a shared traffic shaper applies traffic shaping evenly to all policies that use the shared traffic shaper.

When configuring a per-policy traffic shaper, FortiOS applies the traffic shaping rules defined for each security policy individually. For example, if a per-policy traffic shaper is configured with a maximum bandwidth of 1000 Kbps, any security policies that have that traffic shaper enabled get 1000 Kbps of bandwidth each.

If a traffic shaper for all policies is configured with a maximum bandwidth of 1000 Kbps, all policies share the 1000 Kbps on a first-come, first-served basis.

The configuration is as follows:

```
config firewall shaper traffic-shaper
```

```
   edit "traffic_shaper_name"
      set per-policy enable
   next
end
```

The shared traffic shaper selected in the traffic shaping policy affects traffic in the direction defined in the policy. For example, if the source port is LAN and the destination is WAN1, the traffic shaping affects the flow in this direction only, affecting the outbound traffic's upload speed. You can define the traffic shaper for the policy in the opposite direction (reverse shaper) to affect the inbound traffic's download speed. In this example, that would be from WAN1 to LAN.

Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.

The following example shows how to apply different speeds to different types of service. The example configures two shared traffic shapers to use in two firewall shaping policies. One policy guarantees a speed of 10 Mbps for VoIP traffic. The other policy guarantees a speed of 1 Mbps for other traffic. In the example, FortiOS communicates with a PC using port10 and the Internet using port9.

To configure shared traffic shapers in the GUI:

1. Create a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Name* to *Internet Access*.
   c. Set the *Incoming Interface* to *port10*.
   d. Set the *Outgoing Interface* to *port9*.
   e. Set the *Source* and *Destination* to *all*.
   f. Set the *Schedule* to *always*.
   g. Set the *Service* to *ALL*.
   h. Click *OK*.
2. Create the shared traffic shapers:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shapers* tab, and click *Create New*.
   b. Set the *Name* to *10Mbps*. This shaper is for VoIP traffic.
   c. Set the *Traffic Priority* to *High*.
   d. Enable *Max Bandwidth* and enter *20000*.
   e. Enable *Guaranteed Bandwidth* and enter *10000*.

   f. Click *OK*.

g. Repeat the above steps to create another traffic shaper named *1Mbps* with the *Traffic Priority* set to *Low*, the *Max Bandwidth* set to *10000*, and the *Guaranteed Bandwidth* set to *1000*.

3. Create a firewall shaping policy:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
   b. Set the *Name* to *VoIP_10Mbps_High*. This policy is for VoIP traffic.
   c. Set the *Source* and *Destination* to *all*.
   d. Set the *Service* to all VoIP services.
   e. Set the *Outgoing Interface* to *port9*.
   f. Enable *Shared shaper* and select *10Mbps*.
   g. Enable *Reverse shaper* and select *10Mbps*.
   h. Click *OK*.
   i. Repeat the above steps to create another firewall shaping policy named *Other_1Mbps_Low* for other traffic, with the *Source* and *Destination* set to *all*, *Service* set to *ALL*, *Outgoing Interface* set to *port9*, and *Shared shaper* and *Reverse shaper* set to *1Mbps*.

To configure shared traffic shapers in the CLI:

1. Create a firewall policy:
```
config firewall policy
   edit 1
      set name "Internet Access"
      set srcintf "port10"
      set dstintf "port9"
      set srcaddr "all"
      set dstaddr "all"
      set action accept
      set schedule "always"
      set service "ALL"
      set fsso disable
      set nat enable
   next
end
```
2. Create the shared traffic shapers:
```
config firewall shaper traffic-shaper
   edit "10Mbps"
      set guaranteed-bandwidth 10000
      set maximum-bandwidth 20000
   next
   edit "1Mbps"
      set guaranteed-bandwidth 1000
      set maximum-bandwidth 10000
      set priority low
   next
end
```
3. Create a firewall shaping policy:
```
config firewall shaping-policy
   edit 1
      set name "VOIP_10Mbps_High"
      set service "H323" "IRC" "MS-SQL" "MYSQL" "RTSP" "SCCP" "SIP" "SIP-MSNmessenger"
      set dstintf "port9"
      set traffic-shaper "10Mbps"
      set traffic-shaper-reverse "10Mbps"
      set srcaddr "all"
```

```
      set dstaddr "all"
    next
    edit 2
      set name "Other_1Mbps_Low"
      set service "ALL"
      set dstintf "port9"
      set traffic-shaper "1Mbps"
      set traffic-shaper-reverse "1Mbps"
      set srcaddr "all"
      set dstaddr "all"
    next
end
```

To troubleshoot shared traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the 10Mbps and 1Mbps shapers:

```
# diagnose firewall iprope list 100015
policy index=1 uuid_idx=0 action=accept
flag (0):
shapers: orig=10Mbps(2/1280000/2560000)
cos_fwd=0 cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=4 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -> zone(1): 38
source(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
service(15):
   [6:0x0:0/(1,65535)->(1720,1720)] helper:auto
   [6:0x0:0/(1,65535)->(1503,1503)] helper:auto
   [17:0x0:0/(1,65535)->(1719,1719)] helper:auto

3. Check the statuses of shared traffic shapers:

```
# diagnose firewall shaper traffic-shaper list
name 10Mbps
maximum-bandwidth 2500 KB/sec
guaranteed-bandwidth 1250 KB/sec
current-bandwidth 0 B/sec
priority 2
tos ff
packets dropped 0
bytes dropped 0

name 1Mbps
maximum-bandwidth 1250 KB/sec
guaranteed-bandwidth 125 KB/sec
current-bandwidth 0 B/sec
priority 4
tos ff
packets dropped 0
bytes dropped 0
```

Per-IP traffic shaper

With per-IP traffic shaping, you can limit each IP address's behavior to avoid a situation where one user uses all of the available bandwidth. In addition to controlling the maximum bandwidth used per IP address, you can also define the maximum number of concurrent sessions for an IP address. For example, if you apply a per-IP shaper of 1 Mbps to your entire network, FortiOS allocates each user/IP address 1 Mbps of bandwidth. Even if the network consists of a single

user, FortiOS allocates them 1 Mbps. If there are ten users, each user gets 1 Mbps of bandwidth, totaling 10 Mbps of outgoing traffic.

For shared shapers, all users share the set guaranteed and maximum bandwidths. For example, if you set a shared shaper for all PCs using an FTP service to 10 Mbps, all users uploading to the FTP server share the 10 Mbps.

Shared shapers affect upload speed. If you want to limit the download speed from the FTP server in the example, you must configure the shared shaper as a reverse shaper. Per-IP shapers apply the speed limit on both upload and download operations. Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.

The following example shows how to apply a per-IP shaper to a traffic shaping policy. This shaper assigns each user a maximum bandwidth of 1 Mbps and allows each user to have a maximum of ten concurrent connections to the FTP server. In the example, FortiOS communicates with users using port10 and the FTP server using port9.

To configure a per-IP traffic shaper in the GUI:

1. Create a firewall policy:
   a. Go to *Policy & Objects* > *IPv4 Policy* and click *Create New*.
   b. Set the *Name* to *FTP Access*.
   c. Set the *Incoming Interface* to *port10*.
   d. Set the *Outgoing Interface* to *port9*.
   e. Set the *Source* to *all*.
   f. Set the *Destination* to *FTP_Server*.
   g. Set the *Schedule* to *always*.
   h. Set the *Service* to *ALL*.
   i. Click *OK*.
2. Create the per-IP traffic shaper:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shapers* tab, and click *Create New*.
   b. Set *Type* to *Per IP Shaper*.
   c. Enter the *Name* (*FTP_Max_1M*). This shaper is for VoIP traffic.
   d. Enable *Max Bandwidth* and enter *1000*.
   e. Enable *Max Concurrent Connections* and enter *10*. This means that each user can have up to ten concurrent connections to the FTP server.

   f. Click *OK*.

3. Create a firewall shaping policy:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
   b. Enter the *Name* (*FTP speed 1M*).
   c. Set the *Source* to the addresses and users that require access to the FTP server.
   d. Set the *Destination* to *FTP_Server*.
   e. Set the *Service* to *ALL*.
   f. Set the *Outgoing Interface* to *port9*.
   g. Enable *Per-IP shaper* and select *FTP_Max_1M*.
   h. Click *OK*.

To configure a per-IP traffic shaper in the CLI:

1. Create a firewall policy:
```
config firewall policy
   edit 1
      set name "FTP Access"
      set srcintf "port10"
      set dstintf "port9"
      set srcaddr "all"
      set dstaddr "FTP_Server"
      set action accept
      set schedule "always"
      set service "ALL"
      set fsso disable
      set nat enable
   next
end
```
2. Create the per-IP traffic shaper:
```
config firewall shaper per-ip-shaper
   edit "FTP_Max_1M"
      set max-bandwidth 1000
      set max-concurrent-session 10
   next
end
```
3. Create a firewall shaping policy:
```
config firewall shaping-policy
   edit 1
      set name "FTP speed 1M"
      set service "ALL"
      set dstintf "port9"
      set per-ip-shaper "FTP_Max_1M"
      set srcaddr "PC1" "WinPC" "PC2"
      set dstaddr "FTP_Server"
   next
end
```

To troubleshoot per-IP traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the FTP_Max_1M shaper:
```
# diagnose firewall iprope list 100015
policy index=3 uuid_idx=0 action=accept
flag (0):
```

```
shapers: per-ip=FTP_Max_1M
cos_fwd=0 cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=2 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -> zone(1): 38
source(3): 10.1.100.11-10.1.100.11, uuid_idx=30, 10.1.100.143-10.1.100.143, uuid_idx=32,
     10.1.100.22-10.1.100.22, uuid_idx=31,
dest(1): 172.16.200.55-172.16.200.55, uuid_idx=89,
service(1):
   [0:0x0:0/(0,65535)->(0,65535)] helper:auto
```

2. Check if the correct traffic shaper is applied to the session. The example output shows that the FTP_Max_1M shaper is applied to the session:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=36 expire=3567 timeout=3600 flags=00000000
     sockflag=00000000 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=FTP_Max_1M
class_id=0 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ helper=ftp vlan_cos=0/255
state=may_dirty per_ip npu npd mif route_preserve
statistic(bytes/packets/allow_err): org=506/9/1 reply=416/6/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=39->38/38->39 gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.11:58275->172.16.200.55:21(172.16.200.1:58275)
hook=pre dir=reply act=dnat 172.16.200.55:21->172.16.200.1:58275(10.1.100.11:58275)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=2
serial=0000211a tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id = 00000000
dd_type=0 dd_mode=0
npu_state=0x100000
npu info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0,
     vlan=0x0000/0x0000
vlifid=0/0, vtag_in=0x0000/0x0000 in_npu=0/0, out_npu=0/0, fwd_en=0/0, qid=0/0
no_ofld_reason: offload-denied helper
```

3. Check the statuses of per-IP traffic shapers. The output should resemble the following:

```
# diagnose firewall shaper per-ip-shaper list
name FTP_Max_1M
maximum-bandwidth 125 KB/sec
maximum-concurrent-session 10
tos ff/ff
packets dropped 0
bytes dropped 0
addr=10.1.100.11 status: bps=0 ses=3
```

Type of Service-based prioritization and policy-based traffic shaping

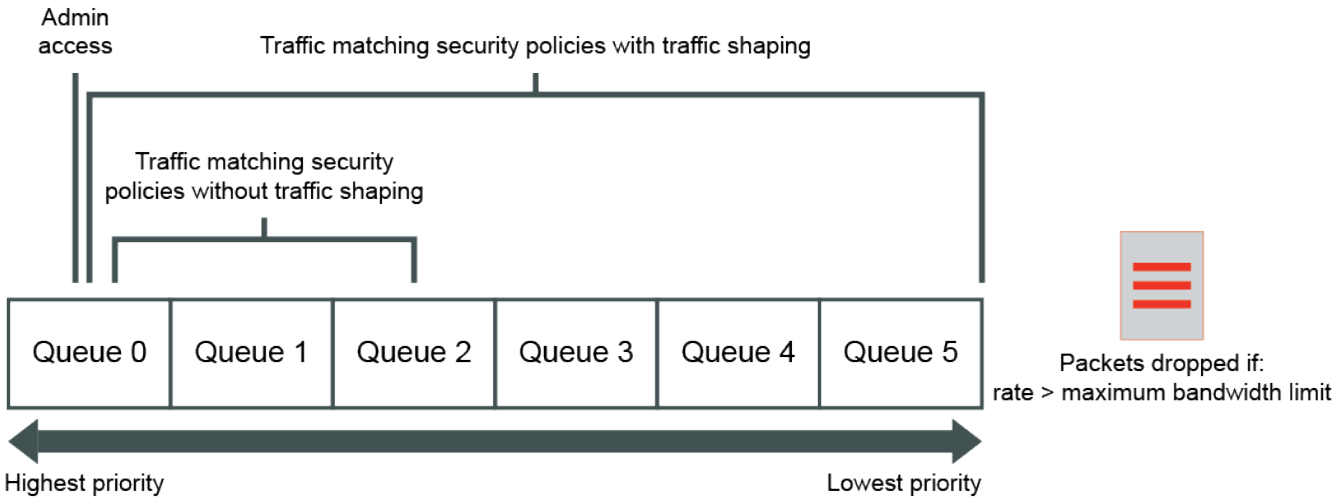
Priority queues

After packet acceptance, FortiOS classifies traffic and may apply Quality of Service (QoS) techniques, such as prioritization and traffic shaping. Traffic shaping consists of a mixture of traffic policing to enforce bandwidth limits and

priority queue adjustment to assist packets in achieving the guaranteed rate.

If you have configured prioritization, FortiOS prioritizes egressing packets by distributing them among first in first out (FIFO) queues associated with each possible priority number. Each physical interface has six priority queues. Virtual interfaces use the priority queues of the physical interface that they are bound to.

The physical interface's six queues are queue 0 to 5, where queue 0 is the highest priority queue. You might observe that your traffic uses only a subset of those six queues. For example, some traffic may always use a certain queue number. Queuing may also vary by the packet rate or mixture of services. Some queue numbers may only be used by through traffic for which you have configured traffic shaping in the security policy that applies to that traffic session.



- Administrative access traffic always uses queue 0.
- Traffic matching firewall policies without traffic shaping may use queue 0, 1, or 2. The queue is selected based on the priority value you have configured for packets with that ToS bit value, if you have configured ToS-based priorities.
- Traffic matching firewall shaping policies with traffic shaping enabled can use any queue. The queue is selected based on whether the packet rate is currently below the guaranteed bandwidth (queue 0), or above the guaranteed bandwidth. Packets at rates greater than the maximum bandwidth limit are dropped.

Priority types

Packets can be assigned a priority in one of three types:

- On entering ingress – for packets flowing through the firewall.
- Upon generation – for packets generated by the firewall (including packets generated due to AV proxying).
- On passing through a firewall policy – for packets passing through a firewall policy (firewall shaping policy) that has a traffic shaper defined.

ToS priority

The first and second types, ingress priority and priority for generated packets, are controlled by two different CLI settings:

```
config system global
    set traffic-priority-level {high | medium | low}
end
config system tos-based-priority
```

```
    edit 1
        set tos <integer>
        set priority {high | medium | low}
    next
end
```

`tos <integer>`	Set the type of service bits in the IP datagram header, 0 - 15.
`set priority {high | medium | low}`	Set the priority level, which is mapped to the following values: • high: 0 • medium: 1 • low: 2

ToS-based traffic prioritization cannot be used to apply bandwidth limits and guarantees, but can be used to prioritize traffic at per-packet levels.

Example

In the following example configuration, packets with ToS bit values of 10 are prioritized as medium and packets with ToS bit values of 20 are prioritized as high. All the other traffic is prioritized as low.

```
config system global
    set traffic-priority-level low
end
config system tos-based-priority
    edit 1
        set tos 10
        set priority medium
    next
    edit 2
        set tos 20
        set priority high
    next
end
```

Firewall shaping policy priority

You can enable traffic shaping in a firewall shaping policy. In the shared traffic shaper, you can set the firewall priority to high, medium, or low:

```
config firewall shaper traffic-shaper
    edit 1
        set priority {high | medium | low}
    next
end
```

As the priority in a traffic shaper is set to high by default, you must set some traffic at a lower priority to see results. Each priority level is mapped to a value as follows:

Firewall policy priority	Value
High (default)	1
Medium	2
Low	3

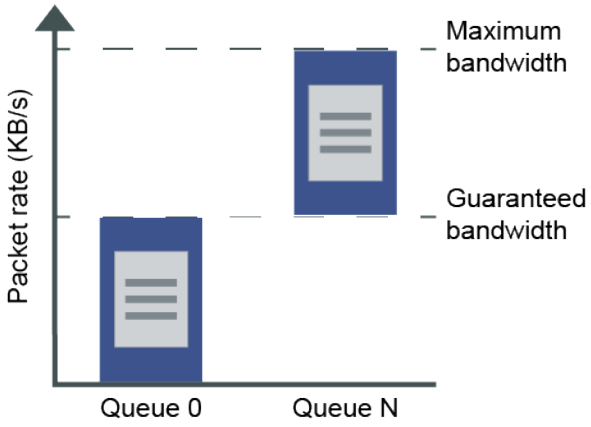
Combination of two priority types

To combine the two priority types, the global or ingress ToS-based priority value is combined with the firewall policy priority value:

ToS priority (0, 1, 2) + policy priority (1, 2, 3) = total priority (queue number)

Consider the following scenarios:

- If the current packet rate is less than the guaranteed bandwidth, packets use priority queue 0. Packet priority is 0.
- If the current packet rate exceeds the maximum bandwidth, excess packets are dropped.
- If the current packet rate is greater than the guaranteed bandwidth but less than the maximum bandwidth, FortiOS assigns a priority queue by adding the ToS-based priority and the firewall priority.
  For example, if you have enabled traffic shaping in the security policy and the security policy's traffic priority is low (value 3), and the priority normally applied to packets with that ToS bit is medium (value 1), the packets have a total packet priority of 4, and use priority queue 4.



Interface-based traffic shaping profile

A traffic shaping policy can be used for interface-based traffic shaping by organizing traffic into 30 class IDs. The shaping profile defines the percentage of the interface bandwidth that is allocated to each class. Each traffic class ID is shaped to the assigned speed according to the outgoing bandwidth limit configured to the interface.

Traffic classification

A shaping policy classifies traffic and organizes it into different class IDs, based on matching criteria. For traffic matching a criteria, you can choose to put it into 30 different shaping classes, identified by class ID 2 to 31.

You must select an outgoing interface for the traffic. The shaping policy is only applied when the traffic goes to one of the selected outgoing interfaces.

Criterion	Description
Source	• Address: match the source address of the traffic to the selected address or address group. • User: use the user credentials of the traffic to match the selected user or user group. At least one address, address group, or internet service must also be selected. • Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.
Destination	• Address: match the destination address of the traffic to the selected address or address group. • Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.
Schedule	Match the current date and time to the selected schedule. You can select a one-time schedule, recurring schedule, or schedule group. This setting is optional.
Service	Match the service of the traffic to the selected service or service group.
Application	Match the application of the traffic to the selected application, application category, or application group. Application control must be enabled in the related firewall policy to know the application of the traffic. See Application control on page 831 for more information.
URL category	Match the URL of the traffic to the selected URL category. Web filter must be enabled in the related firewall policy to know the URL of the traffic. See Web filter on page 768 for more information.

When multiple items are selected in one criterion, it is considered a match when traffic matches any one of them.

Traffic prioritization

Shaping profiles define how different shaping classes of traffic are prioritized. For each class, you can define three prioritization strategies: guaranteed bandwidth, maximum bandwidth, and priority.

For each shaping profile, a default shaping class must be defined. Traffic is prioritized based on the default shaping group in the following two circumstances:

- All traffic to the outgoing interface that does not match to any shaping policy
- Traffic with a shaping group that is not defined in a shaping profile

Prioritization strategy	Description
Guaranteed bandwidth	The percentage of the link speed that is reserved for the shaping group. The total guaranteed bandwidth for all shaping groups cannot exceed 100%.

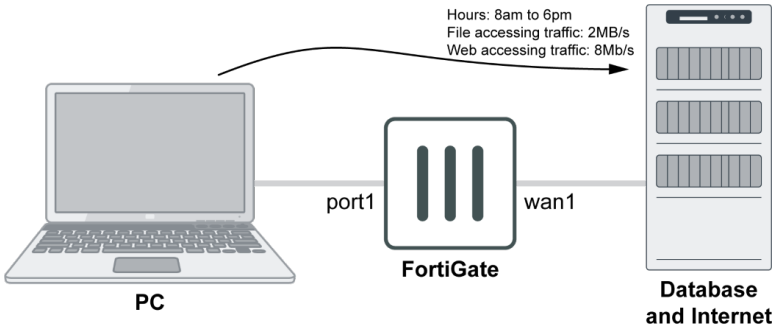
Prioritization strategy	Description
Maximum bandwidth	The maximum percentage of the link speed that the shaping group can use.
Priority	The shaping class priority: top, critical, high, medium, or low. When groups are competing for bandwidth on the interface, the group with the higher priority wins.

Applying a shaping profile to an interface

Traffic shaping is accomplished by configuring the outgoing bandwidth and outgoing shaping profile on an interface. The shaping profile uses the outgoing bandwidth of the interface as the maximum link speed, and it only works when the outgoing bandwidth is configured.

This example shows how to apply interface-based traffic shaping to web and file accessing traffic according to a schedule:

- The link speed of the wan1 interface is 10 Mb/s.
- File access can use up to 2 Mb/s from 8:00 AM to 6:00 PM.
- Web access can use 8 Mb/s from 8:00 AM to 6:00 PM.



Putting the traffic into shaping classes

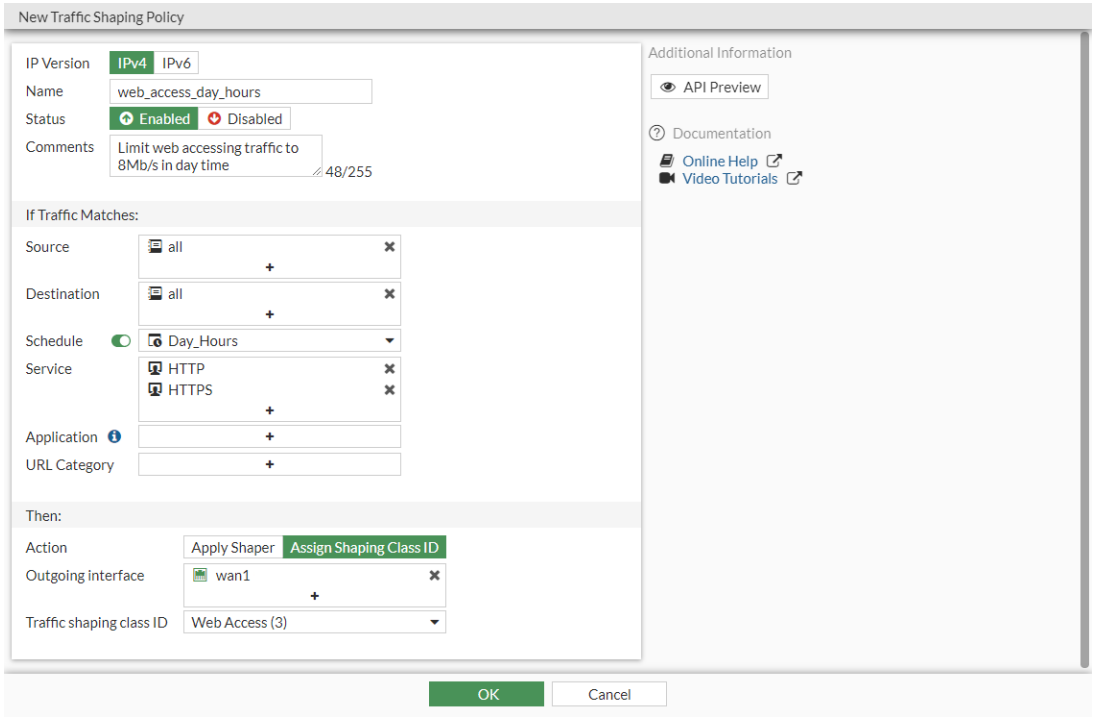
To create a recurring schedule in the GUI:

1. Go to *Policy & Objects* > *Schedules*.
2. Click *Create New* > *Schedule*.
3. Configure a recurring schedule called *Day_Hours* for everyday from 8:00 AM to 6:00 PM.
4. Click *OK*.

To create a traffic shaping policy and class ID for the web accessing traffic in the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
2. Enter a name for the policy, such as *web_access_day_hours*.
3. Enable *Schedule* and select the schedule you just created.
4. Set *Service* to web accessing services, such as *HTTP* and *HTTPS*.
5. Set *Action* to *Assign Shaping Class ID*, and *Outgoing interface* to *wan1*.
6. Click the *Traffic shaping class ID* drop down then click *Create*.
7. Enter an integer value for the *ID* (*3*) and a description for the *Name*, such as *Web Access*.
8. Click *OK*.

9. Select the class ID you just created for *Traffic shaping class ID*.

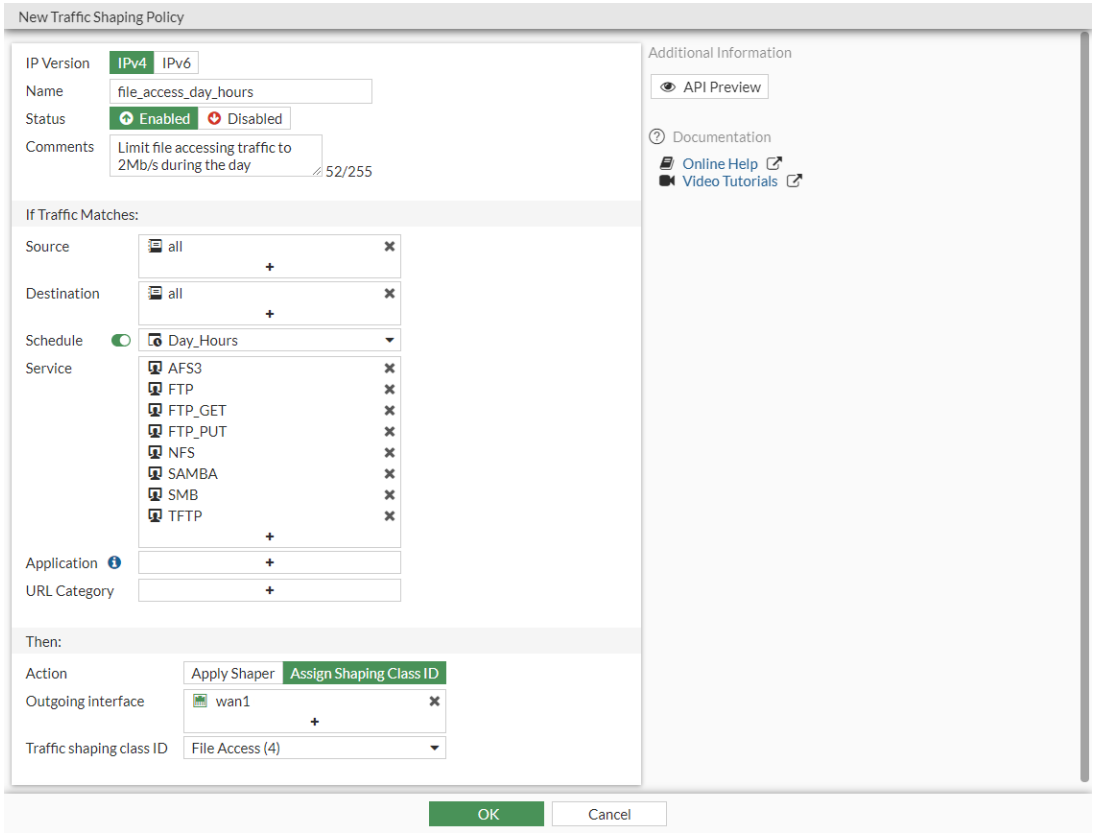


10. Configure the remaining settings as required.
11. Click *OK*.

To create a traffic shaping policy and class ID for the file accessing traffic in the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
2. Enter a name for the policy, such as *file_access_day_hours*.
3. Enable *Schedule* and select the schedule you just created.
4. Set *Service* to file accessing services, such as *ASF3*, *FTP* and *SMB*.
5. Set *Action* to *Assign Shaping Class ID*, and *Outgoing interface* to *wan1*.
6. Click the *Traffic shaping class ID* drop down then click *Create*.
7. Enter an integer value for the *ID* (*4*) and a description for the *Name*, such as *File Access*.
8. Click *OK*.

9. Select the class ID you just created for *Traffic shaping class ID*.



10. Configure the remaining settings as required.
11. Click *OK*.

To put the traffic into shaping classes in the CLI:

1. Create a recurring schedule:

```
config firewall schedule recurring
    edit "Day_Hours"
        set start 08:00
        set end 18:00
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

2. Create the traffic class IDs:

```
config firewall traffic-class
    edit 3
        set class-name "Web Access"
    next
    edit 4
        set class-name "File Access"
    next
end
```

3. Create the web and file accessing traffic shaping policies:

```
config firewall shaping-policy
    edit 2
        set name "web_access_day_hours"
        set comment "Limit web accessing traffic to 8Mb/s in day time"
        set service "HTTP" "HTTPS"
        set schedule "Day_Hours"
        set dstintf "wan1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 3
        set name "file_access_day_hours"
        set comment "Limit file accessing traffic to 2Mb/s during the day"
        set service "AFS3" "FTP" "FTP_GET" "FTP_PUT" "NFS" "SAMBA" "SMB" "TFTP"
        set schedule "Day_Hours"
        set dstintf "wan1"
        set class-id 4
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Allocating bandwidth to the shaping classes

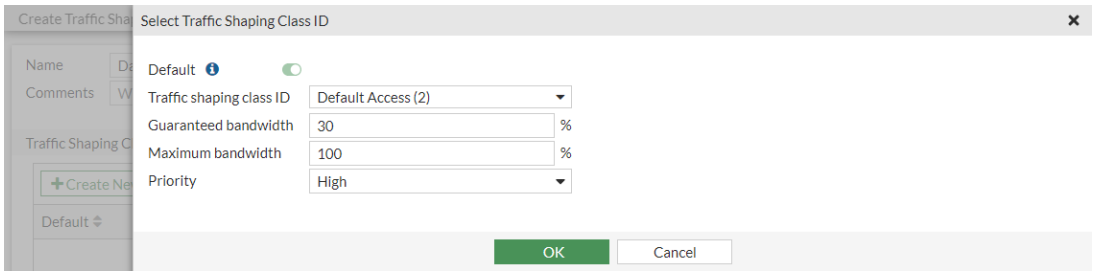
A traffic shaping profile defines the guaranteed and maximum bandwidths each class receives. In this example, file access can use up to 2 Mb/s and web access can use 8 Mb/s from 8:00 AM to 6:00 PM.

To create a traffic shaping profile using the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Profiles* tab, and click *Create New*.
2. Enter a name for the profile, such as *Day_Hours_Profile*.
3. Configure a default traffic shaping class:
   This class has a high priority, meaning that when the other classes have reached their guaranteed bandwidths, this default class will use the rest of the available bandwidth.
   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Click the *Traffic shaping class ID* drop down then click *Create*.
   c. Enter a name for the class, such as *Default Access*.
   d. Click *OK*.
   e. Select the class ID you just created for *Traffic shaping class ID*.

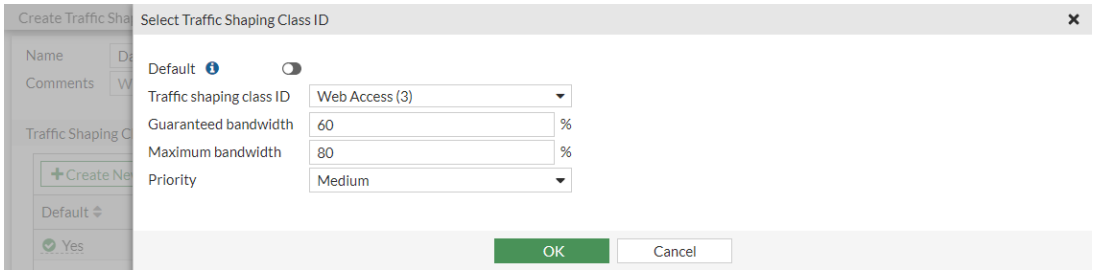
f. Configure the following settings, then click *OK*:

Guaranteed bandwidth	30
Maximum bandwidth	100
Priority	High



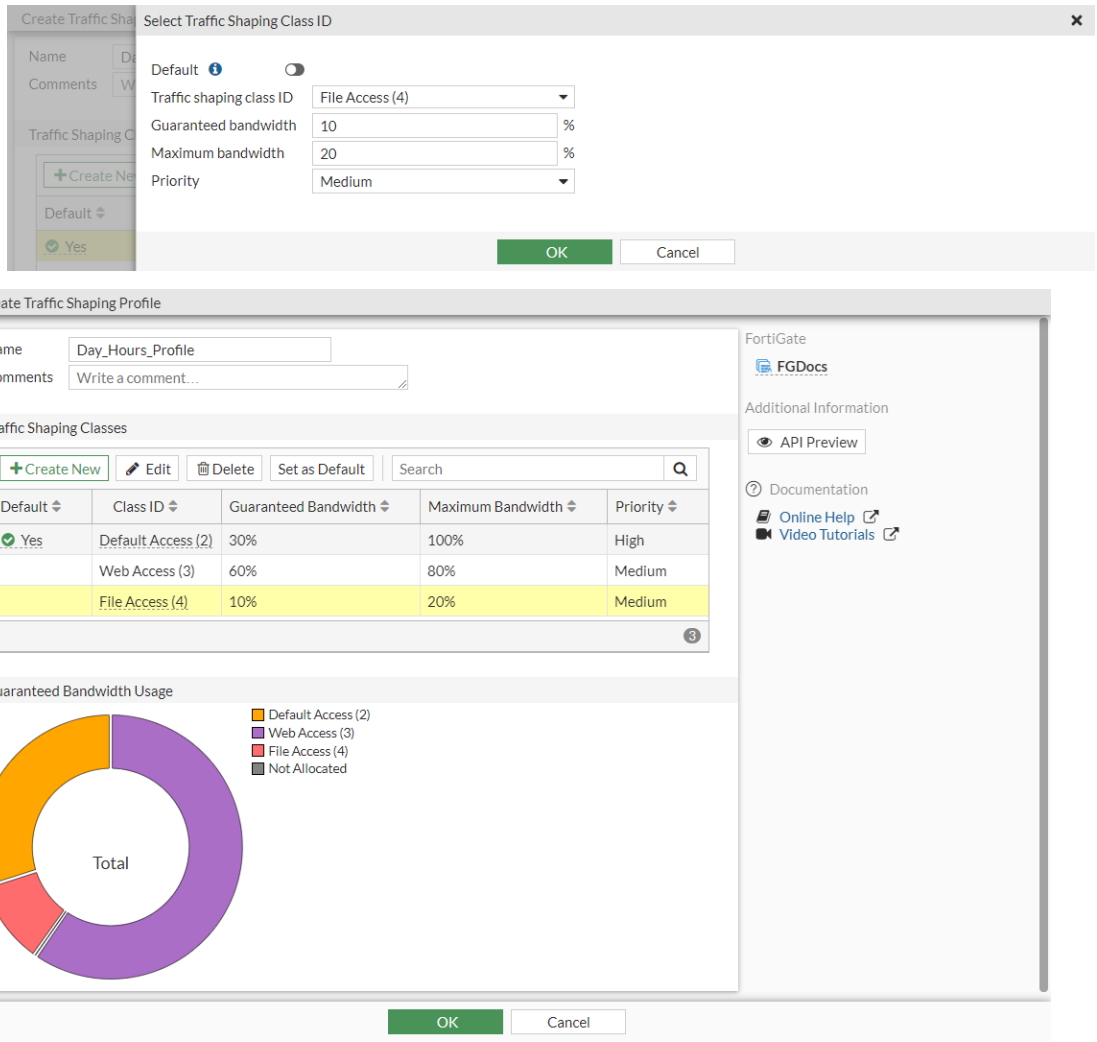
4. Configure a web accessing traffic shaping class:
When other types of traffic are competing for bandwidth, this class is guaranteed to 6 Mb/s, or 60% of the bandwidth.
   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Configure the following settings, then click *OK*:

Traffic shaping class ID	Web Access
Guaranteed bandwidth	60
Maximum bandwidth	80
Priority	Medium



5. Configure a file accessing traffic shaping class:
When other types of traffic are competing for bandwidth, this group is guaranteed to 1 Mb/s, or 10% of the bandwidth.
   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Configure the following settings, then click *OK*:

Traffic shaping class ID	File Access
Guaranteed bandwidth	10
Maximum bandwidth	20
Priority	Medium



6. Click *OK*.

To create a traffic shaping profile using the CLI:

```
config firewall shaping-profile
    edit "Day_Hours_Profile"
        set default-class-id 2
        config shaping-entries
            edit 1
                set class-id 2
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 100
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 60
                set maximum-bandwidth-percentage 80
            next
            edit 3
                set class-id 4
```

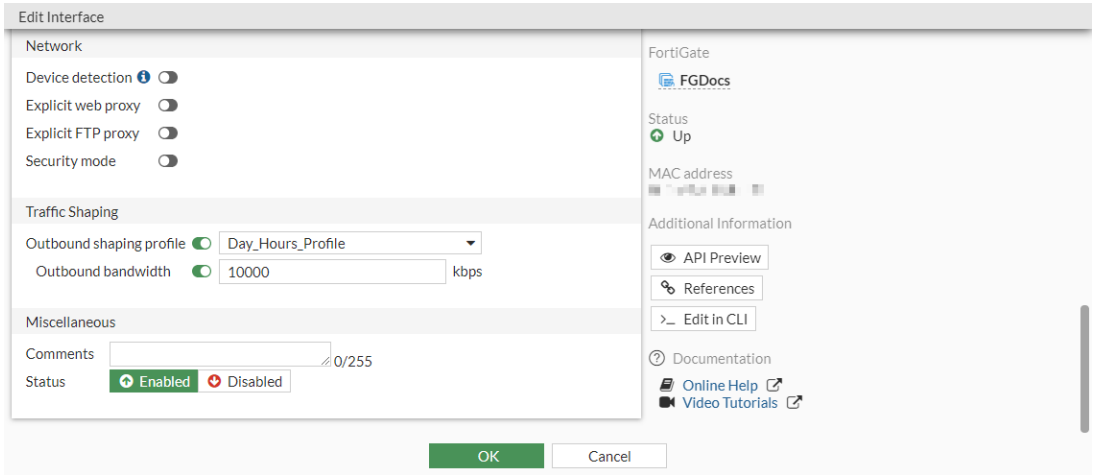
```
                set priority medium
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 20
            next
        end
    next
end
```

Defining the available bandwidth on an interface

In this example, the link speed of the wan1 interface is 10 Mb/s.

To set the bandwidth of the wan1 interface in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit the wan1 interface.
3. Under Traffic Shaping, enable *Outbound shaping profile* and select the profile that you just created, *Day_Hours_Profile*.
4. Enable *Outbound Bandwidth* and set it to *10000* Kbps.



5. Click *OK*.

To set the bandwidth of the wan1 interface in the CLI:

```
config system interface
    edit "wan1"
        set egress-shaping-profile "Day_Hours_Profile"
        set outbandwidth 10000
    next
end
```

Diagnose commands

To check that the specific traffic is put into the correct shaping group or class ID:

```
# diagnose firewall iprope list 100015
```

To check the speed limit for each class ID on an interface:

```
# diagnose netlink interface list wan1
```

Interface-based traffic shaping with NP acceleration

Interface-based traffic shaping with NP acceleration is supported on some devices.

An administrator configures the WAN interface's maximum outbound bandwidth and, based on that, creates a traffic shaping profile with a percentage based shaper. This allows for proper QoS and traffic shaping. VLAN interfaces are not supported.

This feature is supported on FortiGate 600E, 500E, and 300E models.

To configure interface-based traffic shaping:

1. Enable NPU offloading when doing interface-based traffic shaping according to the egress-shaping-profile:

```
config system npu
    set intf-shaping-offload enable
end
```

2. Configure shaping profiles:

```
config firewall shaping-profile
    edit "sdwan"
        set default-class-id 4
        config shaping-entries
            edit 1
                set class-id 4
                set guaranteed-bandwidth-percentage 3
                set maximum-bandwidth-percentage 5
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 50
                set maximum-bandwidth-percentage 100
            next
            edit 3
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 1
                set maximum-bandwidth-percentage 5
            next
        end
    next
end
```

The class number is limited to 16.

3. Configure a traffic shaper and shaping policy:

```
config firewall shaper traffic-shaper
    edit "Transactional"
        set priority medium
    next
end

config firewall shaping-policy
    edit 1
        set service "ALL"
        set dstintf "any"
        set traffic-shaper "Transactional"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

4. Apply the egress shaping profile on the interface:

```
config system interface
    edit "port2"
        set vdom "root"
        set ip 10.1.100.23 255.255.255.0
        set allowaccess ping
        set type physical
        set outbandwidth 500
        set egress-shaping-profile "sdwan"
        set snmp-index 4
    next
end
```

5. Configure a firewall policy:

```
config firewall policy
    edit 3
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

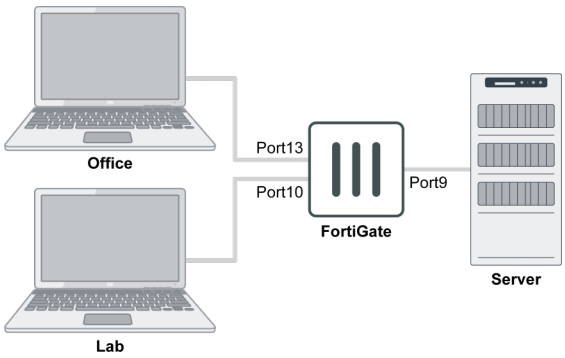
Classifying traffic by source interface

In firewall shaping policies, you can classify traffic by source interface with the following command:

```
config firewall shaping-policy
   edit 1
      set srcintf <interface_name>
      ......
   next
```

```
end
```

Sample configuration



For this example, there are two shaping policies:

- Policy 1 is for traffic from the Office to the Server, with the speed limited to 5 MB/s.
- Policy 2 is for traffic from the Lab to the Server, with the speed limited to 1 MB/s.

To configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 1
        set name "Office_Speed_5MB"
        set service "ALL"
        set srcintf "port13"
        set dstintf "port9"
        set traffic-shaper "5MB/s"
        set traffic-shaper-reverse "5MB/s"
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 2
        set name "Lab_Speed_1MB"
        set service "ALL"
        set srcintf "port10"
        set dstintf "port9"
        set traffic-shaper "1MB/s"
        set traffic-shaper-reverse "1MB/s"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Configuring traffic class IDs

You can configure traffic class IDs with a descriptive name in the GUI or CLI. Class IDs can help you correlate traffic shaping policy and profile entries.

GUI configurations

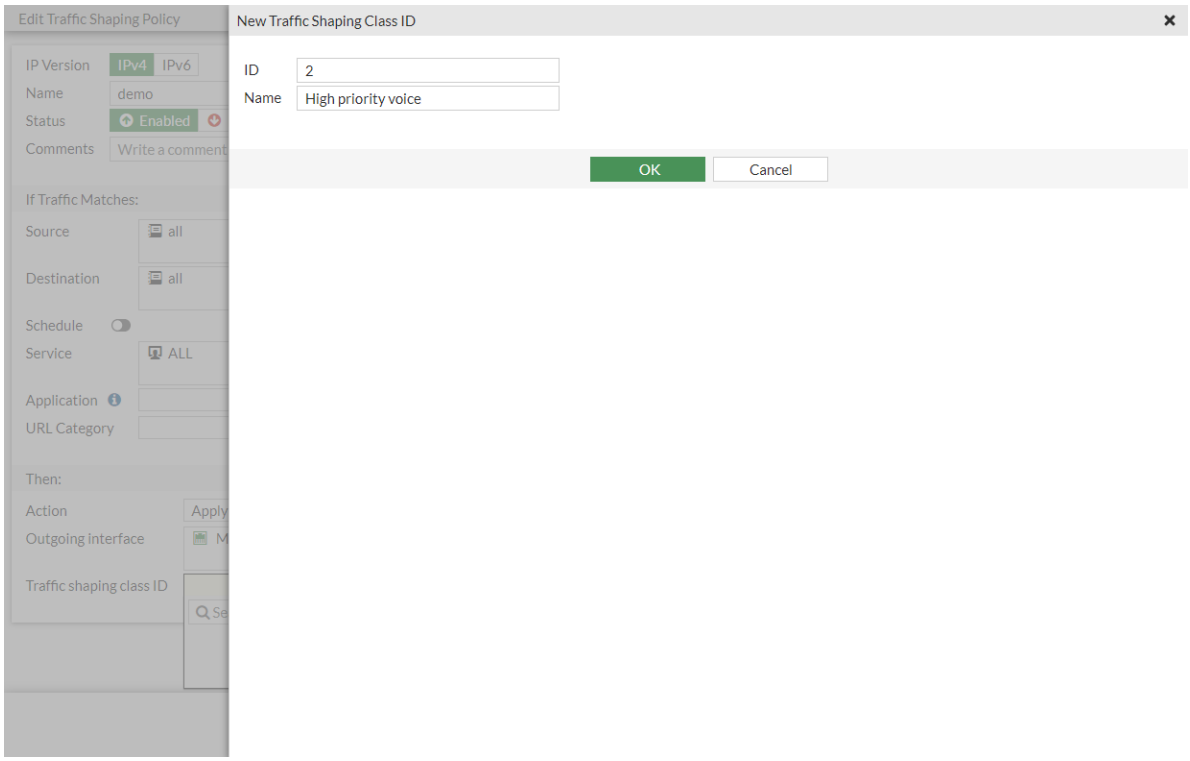
Within the GUI, there are three locations to configure the traffic class ID:

- Traffic shaping policy
- Traffic shaping profile
- Interface

Assign Shaping Class ID replaces the *Assign Group* functionality in earlier versions of FortiOS.

To configure the traffic class ID in a traffic shaping policy:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab.
2. Edit an existing policy, or create a new one.
3. In the *Then: Action* section, click *Assign Shaping Class ID*.
4. In *Traffic shaping class ID*, click *Create*.
5. Enter a value for the *ID* (integer) and a description for the *Name*.

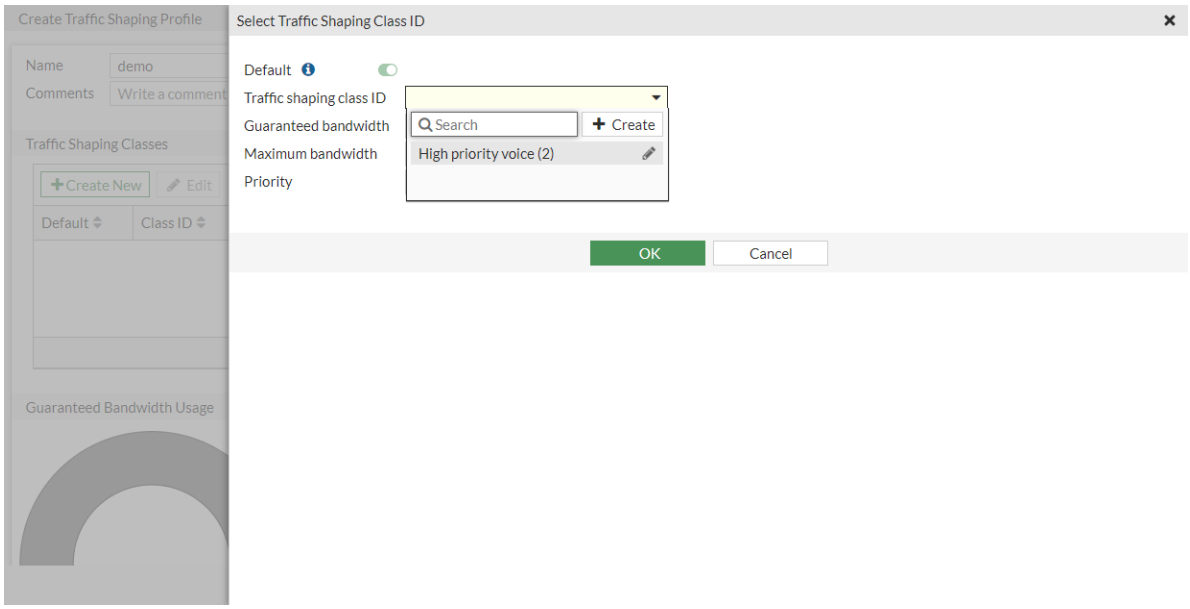


6. Click *OK*.
7. Select the newly created class ID.
8. Configure the rest of the policy as needed.
9. Click *OK*.

To configure the traffic class ID in a traffic shaping profile:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Profiles* tab.
2. Edit an existing profile, or create a new one.
3. In the *Traffic Shaping Classes* section, click *Create New*. The *Select Traffic Shaping Class ID* window opens.

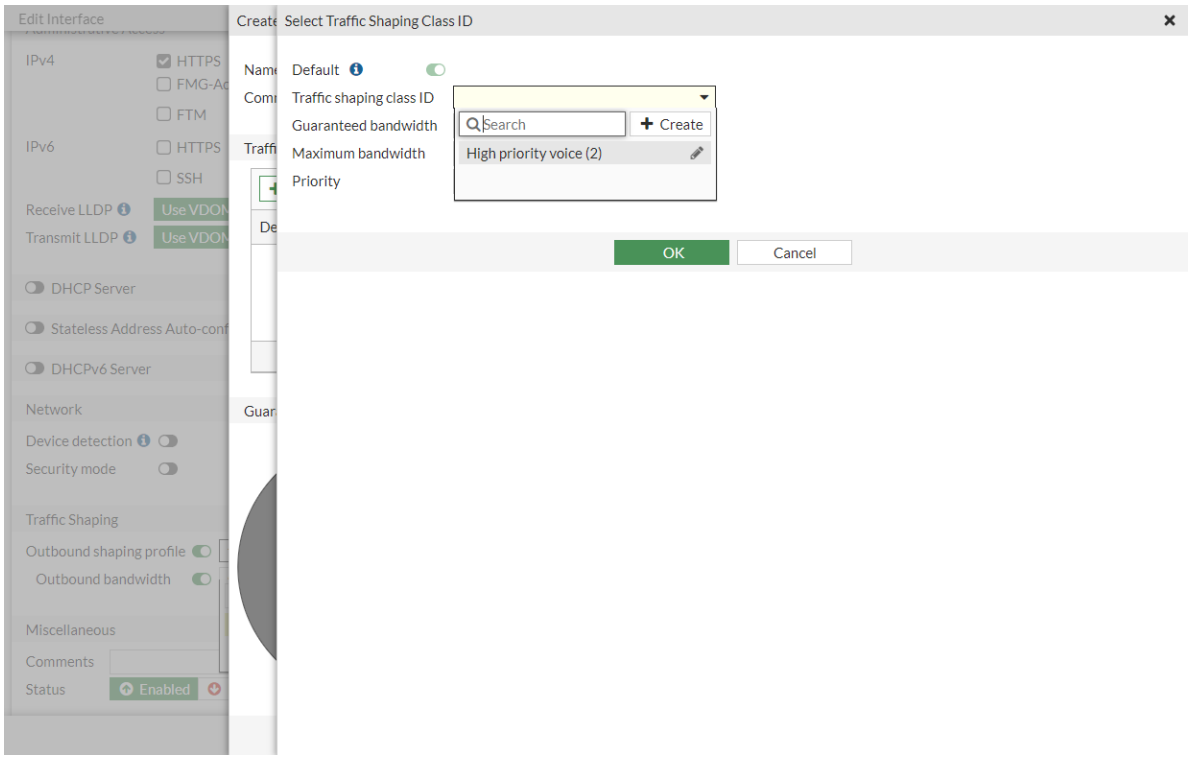
4. Click *Create* to configure a new class ID (see steps in the previous example), or select an existing class ID from the *Traffic shaping class ID* dropdown.



5. Configure the guaranteed bandwidth, maximum bandwidth, and priority settings.
6. Click *OK* to apply the class ID.
7. Click *OK* to save the traffic shaping profile.

To configure the traffic class ID in an interface:

1. Go to *Network* > *Interfaces*.
2. Edit an existing interface, or create a new one.
3. In the *Traffic Shaping* section, enable *Outbound shaping profile* and do one of the following:
   - Select an existing profile from the dropdown.
   - Click *Create* to make a new profile and follow the steps in the previous example to configure the profile and class ID.



4. Enable *Outbound Bandwidth* and enter a value.
5. Configure the rest of the interface as needed.
6. Click *OK* to save the interface.

CLI configuration

To configure the traffic class ID in the CLI:

```
config firewall traffic-class
    edit 2
        set class-name "High priority voice"
    next
    ...
end
```

Traffic shaping schedules

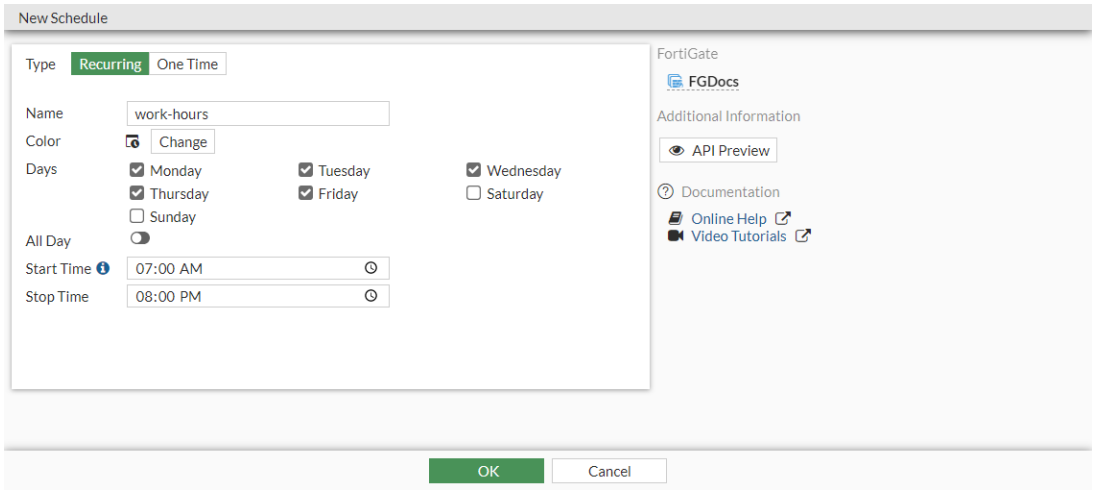
In a shaping policy, there are many matching criteria available for administrators to match a specific traffic and apply a traffic shaper or shaping group to the traffic, including using schedules. This feature gives shaping policy the ability to apply different shaping profiles at different times. Administrators can select a one-time schedule, recurring schedule, or schedule group.

Schedule is not a mandatory setting. If it is not set, then the current date and time are not used to match the traffic.

To configure a traffic shaping policy with a schedule in the GUI:

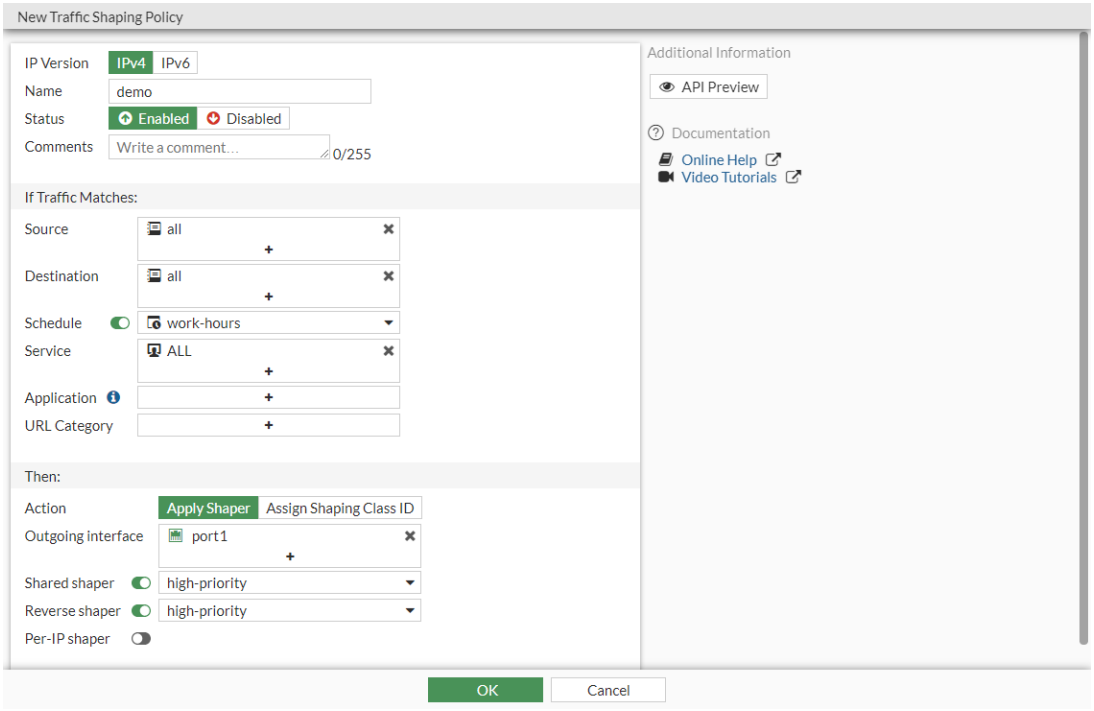
1. Go to *Policy & Objects* > *Schedules* and click *Create New* > *Schedule*.
2. Enter the following:

Type	Recurring
Name	work-hours
Days	Monday, Tuesday, Wednesday, Thursday, Friday
Start Time	07:00 AM
Stop Time	08:00 PM



3. Click *OK*.
4. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.

5. In the *If Traffic Matches* section, enable *Schedule* and select a schedule option (*work-hours*).



6. Configure the other options in the *Then* section.
7. Click *OK*.

To configure a traffic shaping policy with a schedule in the CLI:

1. Configure the recurring schedule:

```
config firewall schedule recurring
    edit "work-hours"
        set start 07:00
        set end 20:00
        set day monday tuesday wednesday thursday friday
    next
end
```

2. Configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 1
        set name "demo"
        set service "ALL"
        set schedule "work-hours"
        set dstintf "port1"
        set traffic-shaper "high-priority"
        set traffic-shaper-reverse "high-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

To troubleshoot a traffic shaping policy in the CLI:

```
# diagnose firewall iprope list 100015
policy index=1 uuid_idx=0 action=accept
flag (0):
schedule(work-hours)
shapers: orig=high-priority(2/0/134217728) reply=high-priority(2/0/134217728)
cos_fwd=0  cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=1 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -> zone(1): 9
source(1): 0.0.0.0-255.255.255.255, uuid_idx=28,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=28,
service(1):
    [0:0x0:0/(0,65535)->(0,65535)] helper:auto
```

DSCP matching (shaping)

This feature has three parts:

- DSCP matching in firewall policies
- DSCP matching in firewall shaping policies
- DSCP marking in firewall shaping policies

DSCP matching in firewall policies

Traffic is allowed or blocked according to the Differentiated Services Code Point (DSCP) values in the incoming packets.

The following CLI variables are available in the `config firewall policy` command:

`tos-mask <mask_value>`	Non-zero bit positions are used for comparison. Zero bit positions are ignored (default = 0x00). This variable replaces the `dscp-match` variable.
`tos <tos_value>`	Type of Service (ToC) value that is used for comparison (default = 0x00). This variable is only available when `tos-mask` is not zero. This variable replaces the `dscp-value` variable.
`tos-negate {enable | disable}`	Enable/disable negated ToS match (default = disable). This variable is only available when `tos-mask` is not zero. This variable replaces the `dscp-negate` variable.

DSCP matching in firewall shaping policies

Shaping is applied to the session or not according to the DSCP values in the incoming packets. The same logic and commands as in firewall policies are used.

DSCP marking in firewall shaping policies

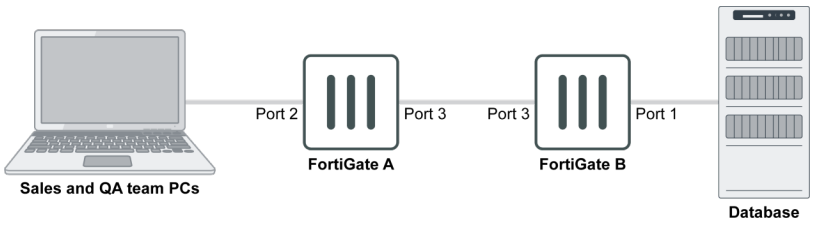
Traffic is allowed or blocked according to the DSCP values in the incoming packets. DSCP marking in firewall shaping policies uses the same logic and commands as in firewall policy and traffic-shaper.

When DSCP marking on `firewall shaper traffic-shaper`, `firewall shaping-policy`, and `firewall policy` all apply to the same session, `shaping-policy` overrides `policy`, and `shaper traffic-shaper` overrides both `shaping-policy` and `policy`.

The following CLI variables in `config firewall policy` are used to mark the packets:

`diffserv-forward {enable | disable}`	Enable/disable changing a packet's DiffServ values to the value specified in `diffservcode-forward` (default = disable).
`diffservcode-forward <dscp_value>`	The value that packet's DiffServ is set to (default = 000000). This variable is only available when `diffserv-forward` is enabled.
`diffserv-reverse {enable | disable}`	Enable/disable changing a packet's reverse (reply) DiffServ values to the value specified in `diffservcode-rev` (default = disable).
`diffservcode-rev <dscp_value>`	The value that packet's reverse (reply) DiffServ is set to (default = 000000). This variable is only available when `diffserv-rev` is enabled.

Examples



Example 1

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B does DSCP matching, allowing only the sales team to access the database.

1. Configure FortiGate A:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "QA"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 110000
        set nat enable
    next
    edit 5
```

```
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "Sales"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 111011
        set nat enable
    next
end
```

2. Configure FortiGate B:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "Database"
        set action accept
        set schedule "always"
        set service "ALL"
        set tos-mask 0xf0
        set tos 0xe0
        set fsso disable
        set nat enable
    next
end
```

Example 2

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B uses a firewall shaping policy to do the DSCP matching, limiting the connection speed of the sales team to the database to 10MB/s.

1. Configure FortiGate A:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "QA"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 110000
        set nat enable
    next
    edit 5
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "Sales"
        set dstaddr "all"
        set action accept
```

```
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 111011
        set nat enable
    next
end
```

2. Configure FortiGate B:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
config firewall shaper traffic-shaper
    edit "10MB/s"
        set guaranteed-bandwidth 60000
        set maximum-bandwidth 80000
    next
end
config firewall shaping-policy
    edit 1
        set service "ALL"
        set dstintf "port1"
        set tos-mask 0xf0
        set tos 0xe0
        set traffic-shaper "10MB/s"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Example 3

FortiGate A has a traffic shaping policy to mark traffic from the QA team with a DSCP value of 100000, while reverse traffic is marked with 000011.

1. Configure FortiGate A:

```
config firewall shaping-policy
    edit 1
        set name "QA Team 50MB"
        set service "ALL"
        set dstintf "port3"
        set traffic-shaper "50MB/s"
        set traffic-shaper-reverse "50MB/s"
        set diffserv-forward enable
        set diffserv-reverse enable
        set srcaddr "QA"
```

```
        set dstaddr "all"
        set diffservcode-forward 100000
        set diffservcode-rev 000011
    next
end
```

QoS assignment and rate limiting for quarantined VLANs

When devices are quarantined, they are isolated from the rest of the network. However, they can still impact the network if not controlled beyond isolation. A quarantined host, which offers heavy traffic, could congest the network and create a DOS-style reduction in service to authorized hosts.

Within the quarantined VLAN, two restrictions are available within the network:

- Traffic policing (also known as rate limiting)
- QoS (Quality of Service) assignment (also known as priority assignment)

Each quarantined host's traffic can be subject to rate limiting and priority adjustment. This reduces the impact that any quarantined host can have on authorized traffic on the network.

To configure QoS assignment and rate limiting for quarantined VLANs:

1. Configure a traffic policy, or use the default "quarantine" policy:

```
config switch-controller traffic-policy
    edit "quarantine"
        set description "Rate control for quarantined traffic"
        set guaranteed-bandwidth 163840
        set guaranteed-burst 8192
        set maximum-burst 163840
        set cos-queue 0
    next
end
```

2. Configure an interface:

```
config system interface
    edit "qtn.aggr1"
        set vdom "root"
        set ip 10.254.254.254 255.255.255.0
        set description "Quarantine VLAN"
        set security-mode captive-portal
        set replacemsg-override-group "auth-intf-qtn.aggr1"
        set device-identification enable
        set snmp-index 30
        set switch-controller-access-vlan enable
        set switch-controller-traffic-policy "quarantine"
        set color 6
        set interface "aggr1"
        set vlanid 4093
    next
end
```

By default, `switch-controller-traffic-policy` is empty. You need to apply the necessary traffic policy (not only limited to "quarantine").

Weighted random early detection queuing

You can use the weighted random early detection (WRED) queuing function within traffic shaping.

This topic includes three parts:

- Traffic shaping with queuing on page 679
- Burst control in queuing mode on page 680
- Multi-stage DSCP marking and class ID in traffic shapers on page 681

You cannot configure or view WRED in the GUI; you must use the CLI.

WRED is not supported when traffic is offloaded to an NPU.

Traffic shaping with queuing

Traffic shaping has a queuing option. Use this option to fine-tune the queue by setting the profile queue size or performing random early drop (RED) according to queue usage.

This example shows setting the profile queue size limit to 5 so that the queue can contain a maximum of five packets and more packets are dropped.

To set the profile queue size limit:

```
config firewall shaping-profile
    edit "profile"
        set type queuing
        set default-class-id 31
        config shaping-entries
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 10
                set limit 5  <range from 5 to 10000; default: 1000>
            next
        end
    next
end
```

This example shows performing RED according to queue usage by setting `red-probability`, `min`, and `max`. Setting `red-probability` to `10` means start to drop packets when queue usage reaches the `min` setting. When queue usage reaches the `max` setting, drop 10% of the packets.

- Level 1: when queue is less than `min` packets, drop 0% of packets.
- Level 2: when queue reaches `min` packets, start to drop packets.
- Level 3: when queue usage is between `min` and `max` packets, drop 0–10% of packets by proportion.
- Level 4: when queue (average queue size) is more than `max` packets, drop 100% of packets.

To set RED according to queue usage:

```
config firewall shaping-profile
    edit "profile"
```

```
        set type queuing
        set default-class-id 31
        config shaping-entries
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 10
                set red-probability 10 <range from 0 to 20; default: 0 no drop>
                set min 100 <range from 3 to 3000>
                set max 300 <range from 3 to 3000>
            next
        end
    next
end
```

To troubleshoot this function, use the following diagnose commands:

```
diagnose netlink intf-class list <intf>
diagnose netlink intf-qdisc list <intf>
```

Burst control in queuing mode

In a hierarchical token bucket (HTB) algorithm, each traffic class has buckets to allow a burst of traffic. The maximum burst is determined by the bucket size `burst` (for guaranteed bandwidth) and `cburst` (for maximum bandwidth). The shaping profile has `burst-in-msec` and `cburst-in-msec` parameters for each shaping entry (`class id`) to control the bucket size.

This example uses the outbandwidth of the interface as 1 Mbps and the maximum bandwidth of class is 50%.

burst = burst-in-msec * guaranteed bandwidth = 100 ms × 1 Mbps x 50% = 50000 b = 6250 B

cburst = cburst-in-msec * maximum bandwidth = 200 ms × 1 Mbps x 50% = 100000 b = 12500 B

The following example sets `burst-in-msec` to 100 and `cburst-in-msec` to 200.

To set burst control in queuing mode:

```
config firewall shaping-profile
    edit "profile"
        set type queuing
        set default-class-id 31
        config shaping-entries
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 50
                set burst-in-msec 100 <range from 0 to 2000>
                set cburst-in-msec 200 <range from 0 to 2000>
            next
        end
    next
end
```

Multi-stage DSCP marking and class ID in traffic shapers

Traffic shapers have a multi-stage method so that packets are marked with a different differentiated services code point (DSCP) and `class id` at different traffic speeds. Marking packets with a different DSCP code is for the next hop to classify the packets. The FortiGate benefits by marking packets with a different `class id`. Combined with the egress interface shaping profile, the FortiGate can handle the traffic differently according to its `class id`.

Rule	DSCP code	Class ID
speed < guarantee bandwidth	`diffservcode`	`class id` in shaping policy
guarantee bandwidth < speed < exceed bandwidth	`exceed-dscp`	`exceed-class-id`
exceed bandwidth < speed	`maximum-dscp`	`exceed-class-id`

This example sets the following parameters:

- When the current bandwidth is less than 50 Kbps, mark packets with `diffservcode` 100000 and set `class id` to 10.
- When the current bandwidth is between 50 Kbps and 100 Kbps, mark packets with `exceed-dscp` 111000 and set `exceed-class-id` to 20.
- When the current bandwidth is more than 100 Kbps, mark packets with `maximum-dscp` 111111 and set `exceed-class-id` to 20.

To set multi-stage DSCP marking and class ID in a traffic shaper:

```
config firewall shaper traffic-shaper
    edit "50k-100k-150k"
        set guaranteed-bandwidth 50
        set maximum-bandwidth 150
        set diffserv enable
        set dscp-marking-method multi-stage
        set exceed-bandwidth 100
        set exceed-dscp 111000
        set exceed-class-id 20
        set maximum-dscp 111111
        set diffservcode 100000
    next
end

config firewall shaping-policy
     edit 1
         set service "ALL"
         set dstintf PORT2
         set srcaddr "all"
         set dstaddr "all"
         set class-id 10
     next
end
```

Traffic shapers also have an `overhead` option that defines the per-packet size overhead used in rate computation.

To set the traffic shaper overhead option:

```
config firewall shaper traffic-shaper
    edit "testing"
```

```
        set guaranteed-bandwidth 50
        set maximum-bandwidth 150
        set overhead 14 <range from 0 to 100>
    next
end
```

Examples

Enabling RED for FTP traffic from QA

This first example shows how to enable RED for FTP traffic from QA. This example sets a maximum of 10% of the packets to be dropped when queue usage reaches the maximum value.

To configure the firewall address:

```
config firewall address
    edit QA_team
        set subnet 10.1.100.0/24
    next
end
```

To set the shaping policy to classify traffic into different class IDs:

```
config firewall shaping-policy
    edit 1
        set service HTTPS HTTP
        set dstintf port1
        set srcaddr QA_team
        set dstaddr all
        set class-id 10
    next
    edit 2
        set service FTP
        set dstintf port1
        set srcaddr QA_team
        set dstaddr all
        set class-id 20
    next
end
```

To set the shaping policy to define the speed of each class ID:

```
config firewall shaping-profile
    edit QA_team_profile
       set type queuing
       set default-class-id 30
            config shaping-entries
                edit 1
                    set class-id 10
                    set guaranteed-bandwidth-percentage 50
                    set maximum-bandwidth-percentage 100
                next
                edit 2
                    set class-id 20
```

```
                    set guaranteed-bandwidth-percentage 30
                    set maximum-bandwidth-percentage 60
                    set red-probability 10
                next
                edit 3
                    set class-id 30
                    set guaranteed-bandwidth-percentage 20
                    set maximum-bandwidth-percentage 50
                next
            end
    next
end
```

To apply the shaping policy to the interface:

```
config sys interface
    edit port1
        set outbandwidth 10000
        set egress-shaping-profile QA_team_profile
    next
end
```

To use diagnose commands to troubleshoot:

```
# diagnose netlink intf-class list port1
class htb 1:1 root rate 1250000Bps ceil 1250000Bps burst 1600B/8 mpu 0B overhead 0B cburst

```

Marking QA traffic with a different DSCP

This second example shows how to mark QA traffic with a different DSCP according to real-time traffic speed.

To configure the firewall address:

```
config firewall address
    edit QA_team
        set subnet 10.1.100.0/24
    next
end
```

To configure the firewall shaper traffic shaper:

```
config firewall shaper traffic-shaper
    edit "500k-1000k-1500k"
        set guaranteed-bandwidth 500
        set maximum-bandwidth 1500
        set diffserv enable
        set dscp-marking-method multi-stage
        set exceed-bandwidth 1000
        set exceed-dscp 111000
        set maximum-dscp 111111
        set diffservcode 100000
    next
end
config firewall shaping-policy
    edit QA_team
        set service "ALL"
        set dstintf port1
        set traffic-shaper "500k-1000k-1500k"
        set traffic-shaper-reverse "500k-1000k-1500k"
        set srcaddr "QA_team"
        set dstaddr "all"
    next
end
```

Zero Trust Network Access

This section includes information about ZTNA related new features:

- Zero Trust Network Access introduction on page 685
- Basic ZTNA configuration on page 687
- Establish device identity and trust context with FortiClient EMS on page 695

  - ZTNA TCP forwarding access proxy example on page 717
  - ZTNA proxy access with SAML authentication example on page 720
  - ZTNA IP MAC filtering example on page 725
- Migrating from SSL VPN to ZTNA HTTPS access proxy on page 731
- ZTNA troubleshooting and debugging on page 734

Zero Trust Network Access introduction

Zero Trust Network Access (ZTNA) is an access control method that uses client device identification, authentication, and Zero Trust tags to provide role-based application access. It gives administrators the flexibility to manage network access for On-net local users and Off-net remote users. Access to applications is granted only after device verification, authenticating the user's identity, authorizing the user, and then performing context based posture checks using Zero Trust tags.

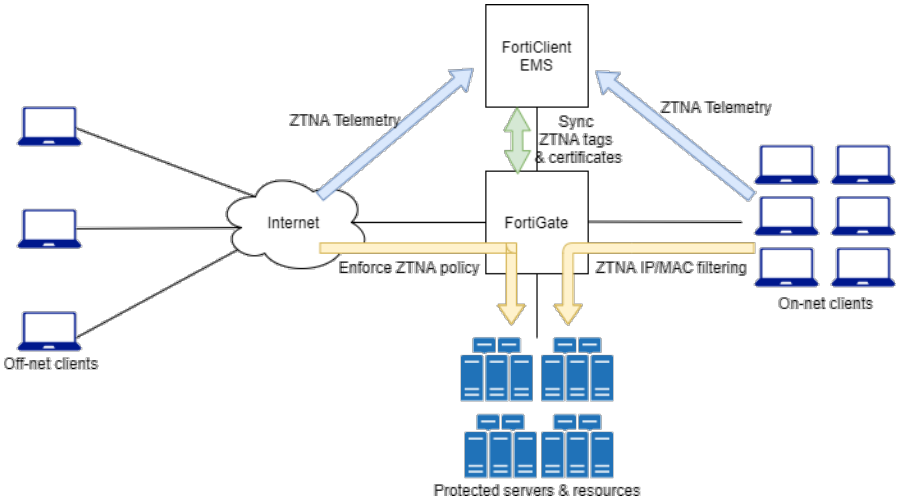
Traditionally, a user and a device have different sets of rules for on-net access and off-net VPN access to company resources. With a distributed workforce and access that spans company networks, data centers, and cloud, managing the rules can become complex. User experience is also affected when multiple VPNs are needed to get to various resources.

Full ZTNA and IP/MAC filtering

ZTNA has two modes: Full ZTNA and IP/MAC filtering:

- Full ZTNA allows users to securely access resources through a SSL encrypted access proxy. This simplifies remote access by eliminating the use of VPNs.
- IP/MAC filtering uses ZTNA tags to provide an additional factor for identification and security posture check to implement role-based zero trust access.

ZTNA telemetry, tags, and policy enforcement

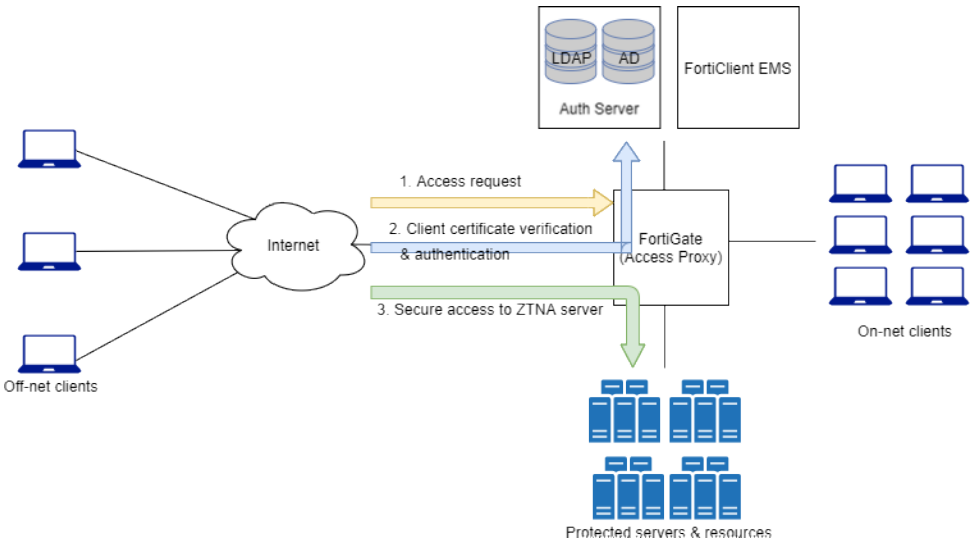


When On-net and Off-net FortiClient endpoints register to FortiClient EMS, device information, log on user information, and security posture are all shared over ZTNA telemetry with the EMS server. Clients also make a certificate signing request to obtain a client certificate from the EMS that is acting as the ZTNA Certificate Authority (CA).

Based on the client information, EMS applies matching Zero Trust tagging rules to tag the clients. These tags, and the client certificate information, are synchronized with the FortiGate in real-time. This allows the FortiGate to verify the client's identity using the client certificate, and grant access based on the ZTNA tags applied in the ZTNA rule.

For more information, see Establish device identity and trust context with FortiClient EMS on page 695.

Access proxy



The FortiGate access proxy can proxy HTTP and TCP traffic over secure HTTPS connections with the client. This enables seamless access from the client to the protected servers, without needing to form IPsec or SSL VPN tunnels.

HTTPS access proxy

The FortiGate HTTPS access proxy works as a reverse proxy for the HTTP server. When a client connects to a webpage hosted by the protected server, the address resolves to the FortiGate's access proxy VIP. The FortiGate proxies the connection and takes steps to authenticate the user. It prompts the user for their certificate on the browser, and verifies this against the ZTNA endpoint record that is synchronized from the EMS. If an authentication scheme, such as SAML authentication, is configured, the client is redirected to a captive portal for sign-on. If this passes, traffic is allowed based on the ZTNA rules, and the FortiGate returns the webpage to the client.

For example configurations, see ZTNA HTTPS access proxy example on page 702, ZTNA HTTPS access proxy with basic authentication example on page 710, and ZTNA proxy access with SAML authentication example on page 720.

TCP forwarding access proxy (TFAP)

TCP forwarding access proxy works as a special type of HTTPS reverse proxy. Instead of proxying traffic to a web server, TCP traffic is tunneled between the client and the access proxy over HTTPS, and forwarded to the protected resource. The FortiClient endpoint configures the ZTNA connection by pointing to the proxy gateway, and then specifying the destination host that it wants to reach. An HTTPS connection is made to the FortiGate's access proxy VIP, where the client certificate is verified and access is granted based on the ZTNA rules. TCP traffic is forwarded from the FortiGate to the protected resource, and an end to end connection is established.

For an example configuration, see ZTNA TCP forwarding access proxy example on page 717.

Basic ZTNA configuration components

The basic that are require to configure full ZTNA on the FortiGate are:

1. FortiClient EMS fabric connector and ZTNA tags.
2. FortiClient EMS running version 7.0.0 or later.
3. FortiClient running 7.0.0 or later.
4. ZTNA server
5. ZTNA rule
6. Firewall policy

For configuration details, see Basic ZTNA configuration on page 687.

Basic ZTNA configuration

To deploy full ZTNA, configure the following components on the FortiGate:

1. Configure a FortiClient EMS connector on page 688
2. Configure a ZTNA server on page 689
3. Configure a ZTNA rule on page 692
4. Configure a firewall policy for full ZTNA on page 693
5. Optional authentication on page 694

To configure ZTNA in the GUI, go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.

Configure a FortiClient EMS connector

To add an on-premise FortiClient EMS server in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors*.
2. Click *Create New* and click *FortiClient EMS*.
3. Enter a name for the connector and the IP address or FQDN of the EMS.
4. Click *OK*.
5. A window appears to verify the EMS server certificate. Click *Accept*.
   See FortiClient EMS for more information.

To add an on-premise FortiClient EMS server in the CLI:

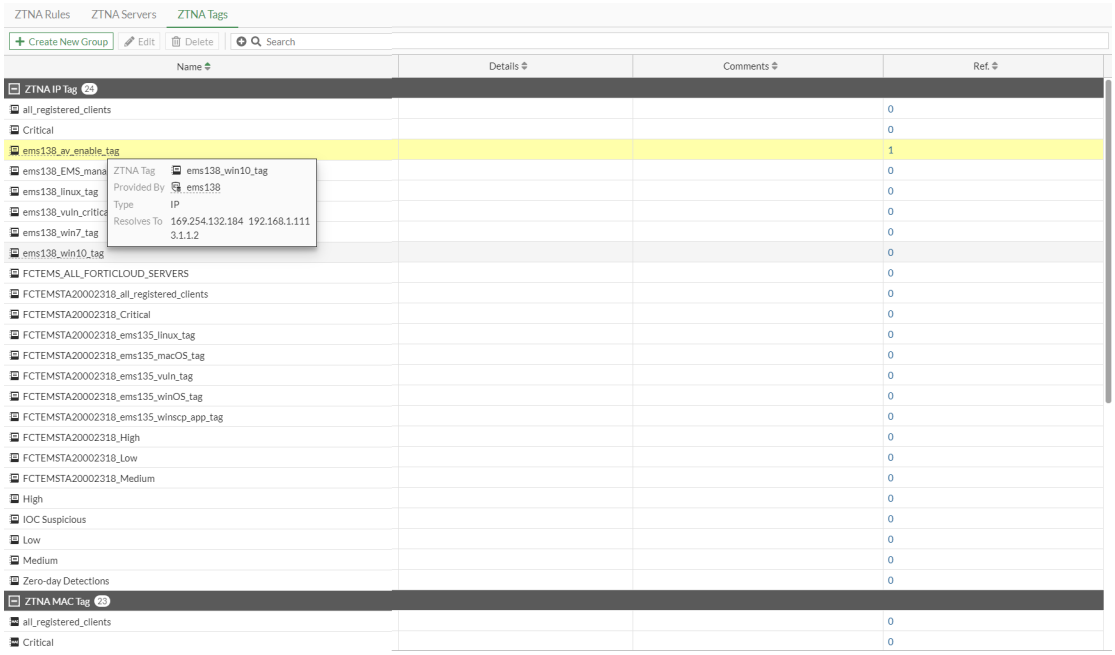
```
config endpoint-control fctems
    edit <name>
        set server <server IP or domain>
    next
end
```

ZTNA tags

After the FortiGate connects to the FortiClient EMS, it automatically synchronizes ZTNA tags.

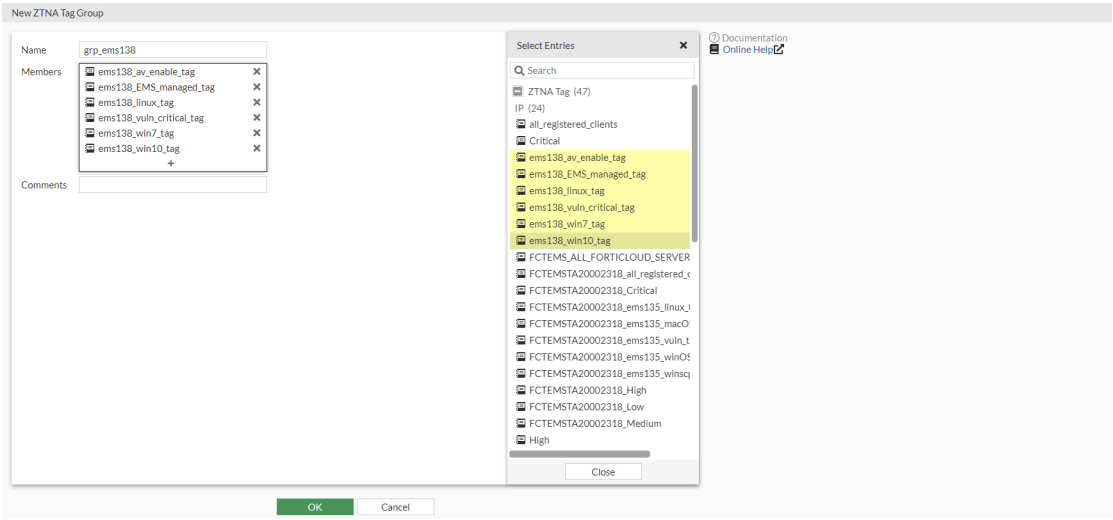
To view the synchronized ZTNA tags in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Tags* tab.
2. Hover the cursor over a tag name to view more information about the tag, such as its resolved addresses.



To create a ZTNA tag group in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Tags* tab.
2. Click *Create New Group*.
3. Enter a name for the group and select the group members.



4. Click *OK*.

To view the synchronized ZTNA tags in the CLI:

```
# diagnose firewall dynamic address
# diagnose firewall dynamic list
```

To create a ZTNA tag group in the CLI:

```
config firewall addrgrp
    edit <group name>
        set category ztna-ems-tag
        set member <members>
    next
end
```

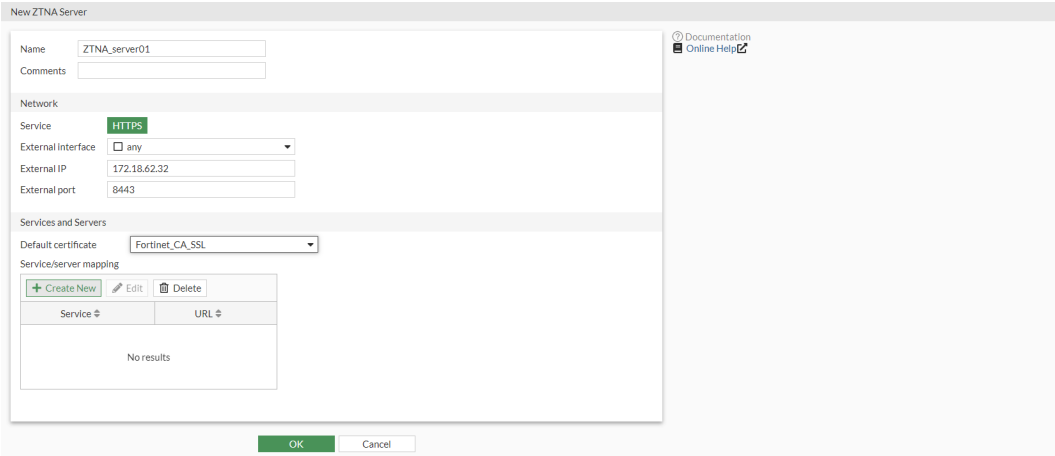
Configure a ZTNA server

To configure a ZTNA server, define the access proxy VIP and the real servers that clients will connect to. The access proxy VIP is the FortiGate ZTNA gateway that clients make HTTPS connections to. The service/server mappings define the virtual host matching rules and the real server mappings of the HTTPS requests.

To create a ZTNA server and access proxy VIP in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Servers* tab.
2. Click *Create New*.
3. Enter a name for the server.
4. Select an external interface, enter the external IP address, and select the external port that the clients will connect to.

5. Select the *Default certificate*. Clients will be presented with this certificate when they connect to the access proxy VIP.



6. Add server mapping:
   a. In the *Service/server mapping* table, click *Create New*.
   b. Set *Virtual Host* to *Any Host* or *Specify*.
      - *Any Host*: Any request that resolves to the access proxy VIP will be mapped to your real servers. For example, if both www.example1.com and www.example2.com resolve to the VIP, then both requests are mapped to your real servers.
      - *Specify*: Enter the name or IP address of the host that the request must match. For example, if www.example1.com is entered as the host, then only requests to www.example1.com will match.
   c. Configure the path as needed.

      The path can be matched by substring, wildcard, or regular expression. For example, if the virtual host is specified as www.example1.com, and the path substring is map1, then www.example1/map1 will be matched.

   d. Add a server:
      i. In the *Servers* table, click *Create New*.
      ii. Enter the server IP address and port number.
      iii. Set the server status.
      iv. Click *OK*.
      v. Add more servers as needed.

e. Click *OK*.
f. Add more server mappings as needed.

7. Click *OK*.

To create a ZTNA server and access proxy VIP in the CLI:

1. Configure an access proxy VIP:

```
config firewall vip
    edit <name>
        set type access-proxy
        set extip <external IP>
        set extintf <external interface>
        set server-type { https | ssh }
        set extport <external port>
        set ssl-certificate <certificate>
    next
end
```

2. If the virtual host is specified, configure the virtual host:

```
config firewall access-proxy-virtual-host
    edit <auto generated when configured from GUI>
        set ssl-certificate <certificate>
        set host <host name or IP>
        set host-type { sub-string | wildcard }
    next
end
```

3. Configure the server and path mapping:

```
config firewall access-proxy
    edit <name>
        set vip <vip name>
        set client-cert { enable | disable }
        set empty-cert-action { accept | block }
        config api-gateway
            edit 1
                set url-map <mapped path>
                set service { http | https | tcp-forwarding | samlsp }
                set virtual-host <name of virtual-host if specified>
                set url-map-type { sub-string | wildcard | regex }
                config realservers
                    edit 1
                        set ip <ip of real server>
                        set port <port>
                        set status { active | standby | disable }
                        set health-check { enable | disable }
                    next
                end
                set ldb-method static
                set persistence none
                set ssl-dh-bits 2048
                set ssl-algorithm high
                set ssl-min-version tls-1.1
                set ssl-max-version tls-1.3
            next
```

```
        end
    next
end
```

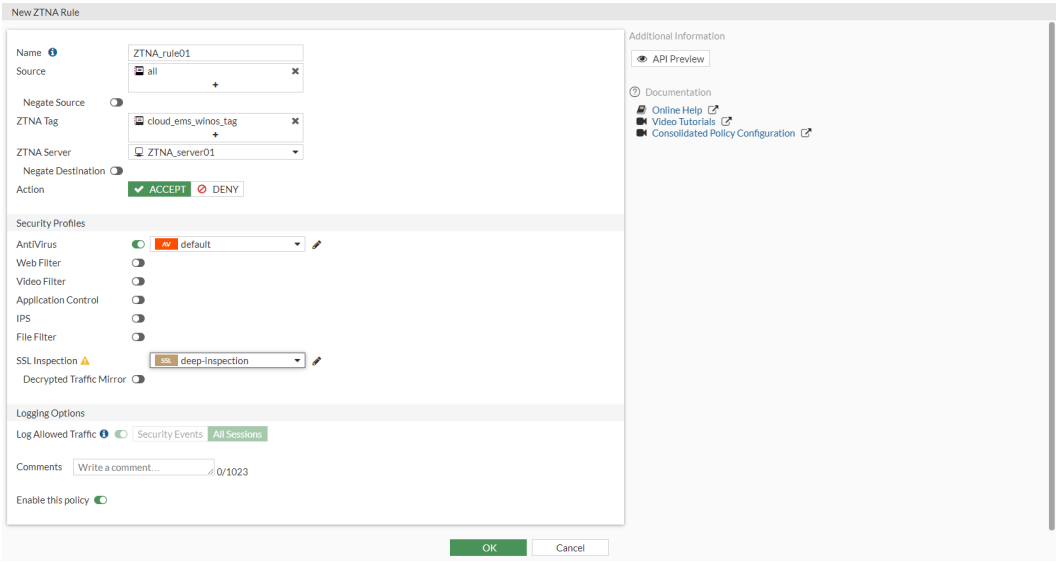
The load balance method for the real servers can only be specified in the CLI.

Configure a ZTNA rule

A ZTNA rule is a proxy policy used to enforce access control. ZTNA tags or tag groups can be defined to enforce zero trust role based access. Security profiles can be configured to protect this traffic.

To configure a ZTNA rule in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Rules* tab.
2. Click *Create New*.
3. Enter a name for the rule.
4. Add the ZTNA tags or tag groups that are allowed access.
5. Select the ZTNA server.



6. Configure the remaining options as needed.
7. Click *OK*.

To configure a ZTNA rule in the CLI:

```
config firewall proxy-policy
    edit 1
        set name <ZTNA rule name>
        set proxy access-proxy
        set access-proxy <access proxy>
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag <ZTNA tag(s)>
        set action accept
        set schedule "always"
```

```
        set logtraffic all
        set utm-status enable
        set ssl-ssh-profile <inspection profile>
    next
end
```

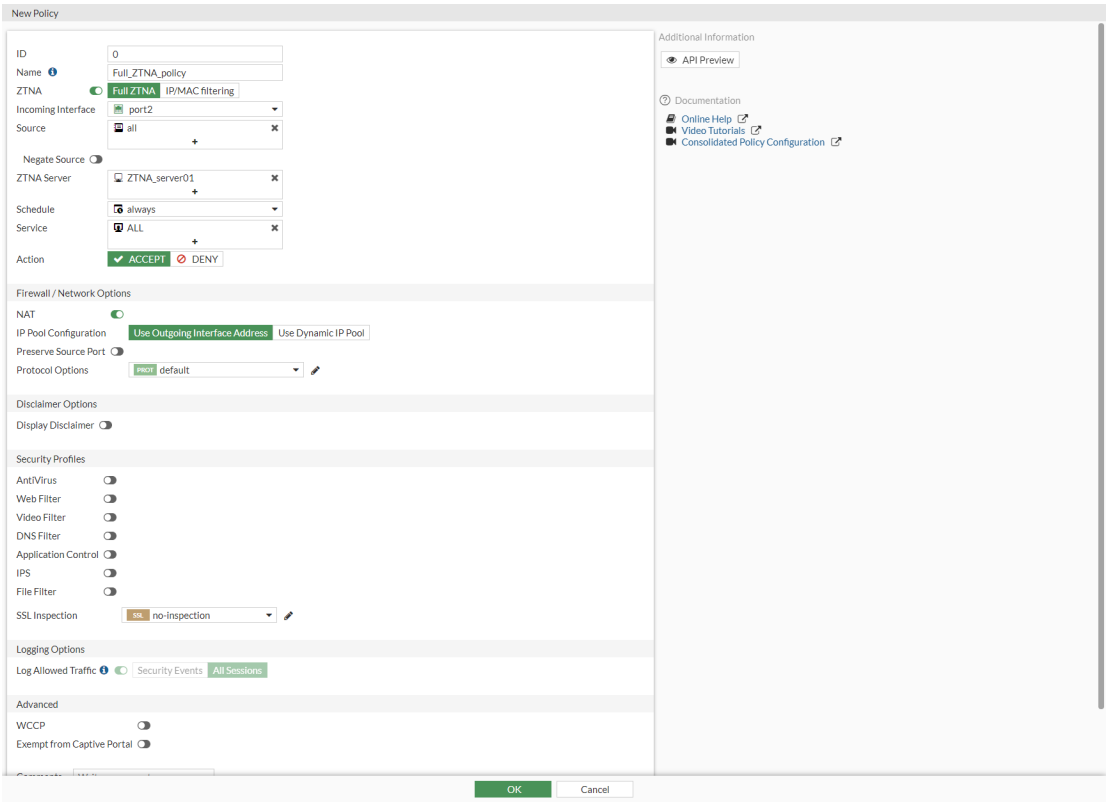
Configure a firewall policy for full ZTNA

The firewall policy matches and redirects client requests to the access proxy VIP. The source interface and addresses that are allowed access to the VIP can be defined. By default, the destination is any interface, so once a policy is configured for full ZTNA, the policy list will be organized by sequence.

UTM processing of the traffic happens at the ZTNA rule.

To configure a firewall policy for full ZTNA in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter a name for the policy.
3. Enable *ZTNA* and select *Full ZTNA*.
4. Set *ZTNA Server* to the configured ZTNA server.



5. Configure the remaining settings as needed.
6. Click *OK*.

To configure a firewall policy for full ZTNA in the CLI:

```
config firewall policy
    edit <policy ID>
        set name <policy name>
        set srcintf <source interface>
        set dstintf "any"
        set srcaddr <source address>
        set dstaddr <access proxy VIP>
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
    next
end
```

Optional authentication

To configure authentication to the access proxy, you must configure an authentication scheme and authentication rule in the CLI. They are used to authenticate proxy-based policies, similar to configuring authentication for explicit and transparent proxy.

The authentication scheme defines the method of authentication that is applied. For ZTNA, basic HTTP and SAML methods are supported. Each method has additional settings to define the data source to check against. For example, with basic HTTP authentication, a user database can reference an LDAP server, RADIUS server, local database, or other supported authentication servers that the user is authenticated against.

The authentication rule defines the proxy sources and destinations that require authentication, and which authentication scheme to apply. For ZTNA, active authentication method is supported. The active authentication method references a scheme where users are actively prompted for authentication, like with basic authentication.

After the authentication rule triggers the method to authenticate the user, a successful authentication returns the groups that the user belongs to. In the ZTNA rule and proxy policy you can define a user or user group as the allowed source. Only users that match that user or group are allowed through the proxy policy.

To configure a basic authentication scheme:

```
config authentication scheme
    edit <name>
        set method basic
        set user-database <auth server>
    next
end
```

To configure an authentication rule:

```
config authentication rule
    edit <name>
        set status enable
        set protocol http
        set srcintf <interface>
        set srcaddr <address>
```

```
        set dstaddr <address>
        set ip-based enable
        set active-auth-method <active auth scheme>
    next
end
```

To apply a user group to a ZTNA rule in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Rules* tab.
2. Edit an existing rule, or click *Create New* to create a new rule.
3. Click in the *Source* field, select the *User* tab, and select the users and user groups that will be allowed access.
4. Configure the remaining settings as required.
5. Click *OK*.

To apply a user group to a ZTNA rule in the CLI:

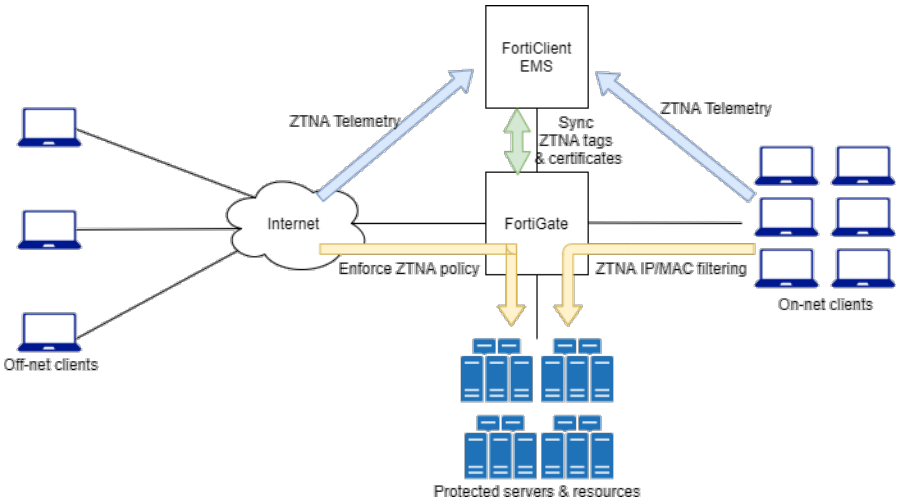
```
config firewall proxy-policy
    edit <policy ID>
        set name <ZTNA rule name>
        set proxy access-proxy
        set access-proxy <access proxy>
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag <ZTNA tags>
        set action accept
        set schedule "always"
        set logtraffic all
        set groups <user group>
        set utm-status enable
        set ssl-ssh-profile <inspection profile>
    next
end
```

The authentication rule and scheme defines the method used to authenticate users. With basic HTTP authentication, a sign in prompt is shown after the client certificate prompt. After the authentication passes, the returned groups that the user is a member of are checked against the user groups that are defined in the ZTNA rule. If a group matches, then the user is allowed access after passing a posture check.

For more information, see ZTNA HTTPS access proxy with basic authentication example on page 710 and ZTNA proxy access with SAML authentication example on page 720.

Establish device identity and trust context with FortiClient EMS

How device identity is established through client certificates, and how device trust context is established between FortiClient, FortiClient EMS, and the FortiGate, are integral to ZTNA.



Device roles

FortiClient

FortiClient endpoints provide the following information to FortiClient EMS when they register to the EMS:

- Device information (network details, operating system, model, and others)
- Logged on user information
- Security posture (On-net/Off-net, antivirus software, vulnerability status, and others)

It also requests and obtains a client device certificate from the EMS ZTNA Certificate Authority (CA) on its first attempt to connect to the access proxy. The client uses this certificate to identify itself to the FortiGate.

FortiClient EMS

FortiClient EMS issues and signs the client certificate with the FortiClient UID, certificate serial number, and EMS serial number. The certificate is then synchronized to the FortiGate. EMS also shares its EMS ZTNA CA certificate with the FortiGate, so that the FortiGate can use it to authenticate the clients.

FortiClient EMS uses zero trust tagging rules to tag endpoints based on the information that it has on each endpoint. The tags are also shared with the FortiGate.

FortiGate

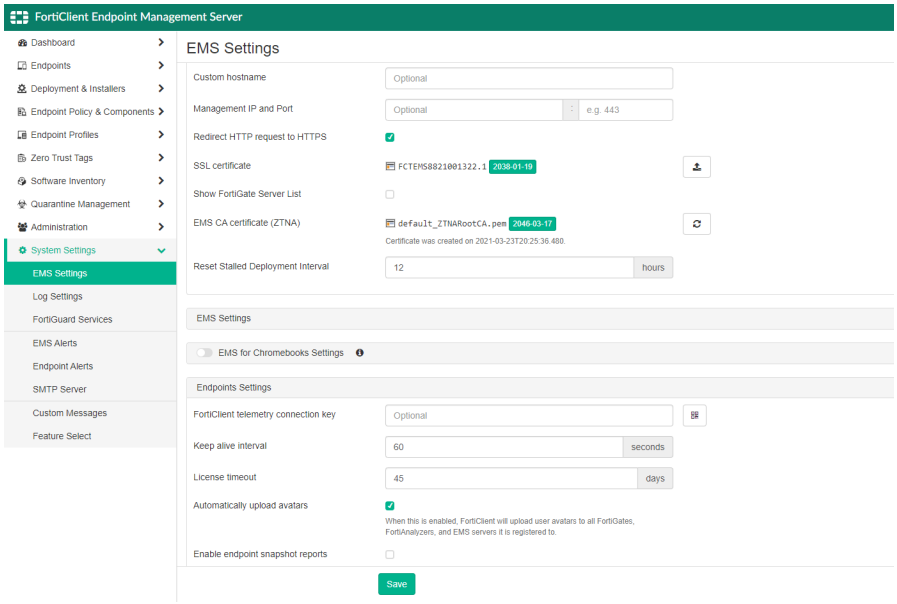
The FortiGate maintains a continuous connection to the EMS server to synchronize endpoint device information, including primarily:

- FortiClient UID
- Client certificate SN
- EMS SN
- Device credentials (user/domain)
- Network details (IP and MAC address and routing to the FortiGate)

When a device's information changes, such as when a client moves from on-net to off-net, or their security posture changes, EMS is updated with the new device information and then updates the FortiGate. The FortiGate's WAD daemon can use this information when processing ZTNA traffic.

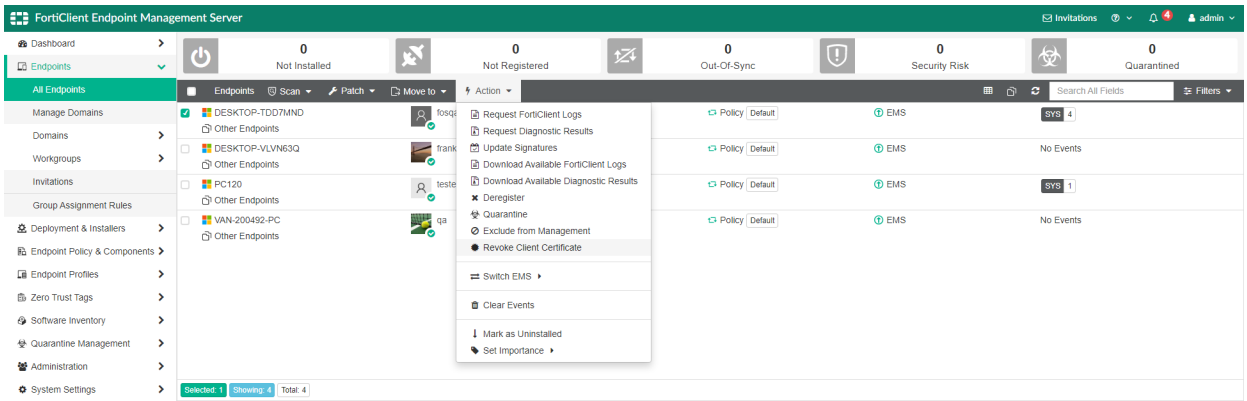
Certificate management on FortiClient EMS

FortiClient EMS has a *default_ZTNARootCA* certificate generated by default that the ZTNA CA uses to sign CSRs from the FortiClient endpoints. Clicking the refresh button revokes and updates the root CA, forcing updates to the FortiGate and FortiClient endpoints by generating new certificates for each client.



Do not confuse the EMS CA certificate (ZTNA) with the SSL certificate. The latter is the server certificate that is used by EMS for HTTPS access and fabric connectivity to the EMS server.

EMS can also manage individual client certificates. To revoke the current client certificate that is used by the endpoint: go to *Endpoint* > *All Endpoints*, select the client, and click *Action* > *Revoke Client Certificate*.



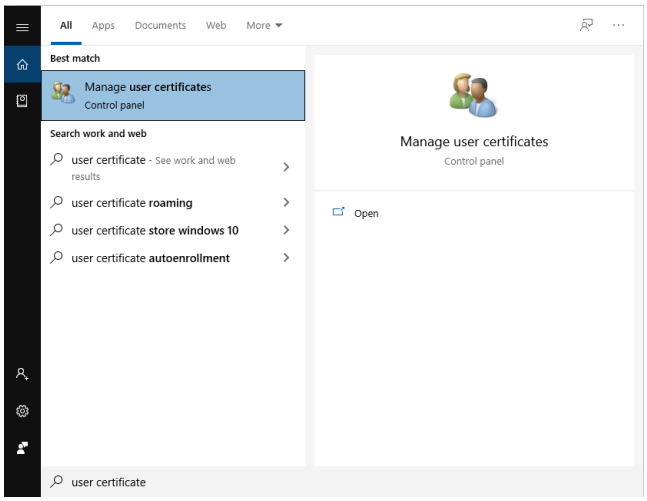
Locating and viewing the client certificate on an endpoint

In Windows, FortiClient automatically installs certificates into the certificate store. The certificate information in the store, such as certificate UID and SN, should match the information on EMS and the FortiGate.

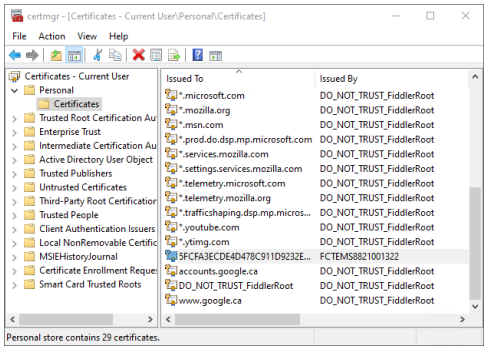
To locate certificates on other operating systems, consult the vendor documentation.

To locate the client certificate and EMS ZTNA CA certificate on a Windows PC:

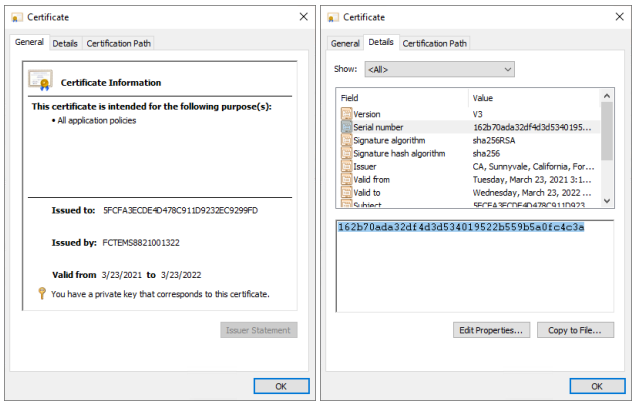
1. In the Windows search box, enter *user certificate* and click *Manage user certificates* from the results.



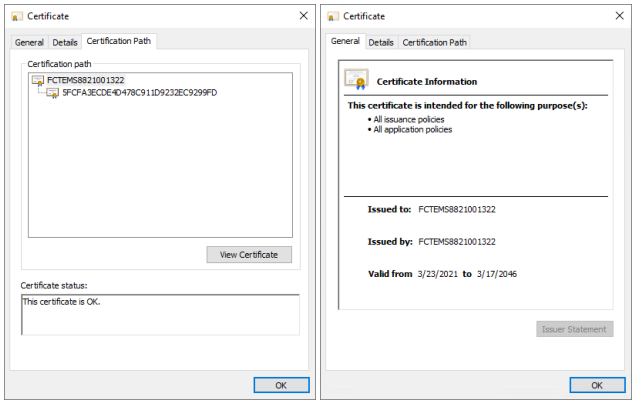
2. In the certificate manager, go to *Certificates - Current User* > *Personal* > *Certificates* and find the certificate that is issued by the FortiClient EMS.



3. Right-click on it and select Properties.
4. The *General* tab shows the client certificate UID and the issue and expiry dates. The *Details* tab show the certificate SN.



5. Go to the *Certificate Path* tab to see the full certificate chain.
6. Select the root CA and click *View Certificate* to view the details about the EMS ZTNA CA certificate.



Verifying that the client information is synchronized to the FortiGate

The following diagnose commands help to verify the presence of matching endpoint record, and information such as the client UID, client certificate SN, and EMS certificate SN on the FortiGate. If any of the information is missing or incomplete, client certificate authentication might fail because the corresponding endpoint entry is not found. More in-depth diagnosis would be needed to determine the reason for the missing records.

Command	Description
`# diagnose endpoint record list <ip>`	Show the endpoint record list. Optionally, filter by the endpoint IP address.
`# diagnose endpoint wad-comm find-by uid <uid>`	Query endpoints by client UID.
`# diagnose endpoint wad-comm find-by ip-vdom <ip> <vdom>`	Query endpoints by the client IP-VDOM pair.
`# diagnose wad dev query-by uid <uid>`	Query from WAD diagnose command by UID.
`# diagnose wad dev query-by ipv4 <ip>`	Query from WAD diagnose command by IP address.

Command	Description
# diagnose test application fcnacd 7 # diagnose test application fcnacd 8	Check the FortiClient NAC daemon ZTNA and route cache.

To check the endpoint record list for IP address 10.6.30.214:

```
# diagnose endpoint record list 10.6.30.214
Record #1:
                IP Address = 10.6.30.214
                MAC Address = 00:0c:29:ba:1e:61
                MAC list = 00:0c:29:ba:1e:61;00:0c:29:ba:1e:6b;
                VDOM = root (0)
                EMS serial number: FCTEMS8821001322
                Client cert SN: 17FF6595600A1AF53B87627AB4EBEDD032593E64
                Quarantined: no
                Online status: online
                Registration status: registered
                On-net status: on-net
                Gateway Interface: port2
                FortiClient version: 7.0.0
                AVDB version: 84.778
                FortiClient app signature version: 18.43
                FortiClient vulnerability scan engine version: 2.30
                FortiClient UID: 5FCFA3ECDE4D478C911D9232EC9299FD
                …
                Number of Routes: (1)
                        Gateway Route #0:
                                - IP:10.1.100.214, MAC: 00:0c:29:ba:1e:6b, Indirect: no
                                - Interface:port2, VFID:0, SN: FG5H1E5819902474
online records: 1; offline records: 0; quarantined records: 0
```

SSL certificate based authentication

A client certificate is obtained when an endpoint registers to EMS. FortiClient automatically submits a CSR request and the FortiClient EMS signs and returns the client certificate. This certificate is stored in the operating system's certificate store for subsequent connections. The endpoint information is synchronized between the FortiGate and FortiClient EMS. When an endpoint disconnects or is unregistered from EMS, its certificate is removed from the certificate store and revoked on EMS. The endpoint obtains a certificate again when it reconnected the EMS.

By default, client certificate authentication is enabled on the access proxy, so when the HTTPS request is received the FortiGate's WAD process challenges the client to identify itself with its certificate. The FortiGate makes a decision based on the following possibilities:

1. If the client responds with the correct certificate that the client UID and certificate SN can be extracted from:
   - If the client UID and certificate SN match the record on the FortiGate, the client is allowed to continue with the ZTNA proxy rule processing.
   - If the client UID and certificate SN do not match the record on the FortiGate, the client is blocked from further ZTNA proxy rule processing.
2. If the client cancels and responds with an empty client certificate:

- If `empty-cert-action` is set to `accept`, the client is allowed to continue with ZTNA proxy rule processing.
- If `empty-cert-action` is set to `block`, the client is blocked from further ZTNA proxy rule processing.

To configure the client certificate actions:

```
config firewall access-proxy
    edit <name>
        set client-cert {enable | disable}
        set empty-cert-action {accept | block}
    next
end
```

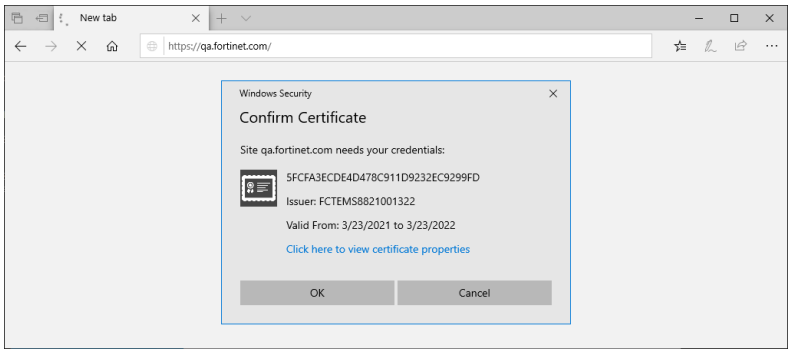
Example

In this example, a client connects to *qa.fortinet.com* and is prompted for a client certificate.

- `client-cert` is set to `enable`, and `empty-cert-action` is set to `block`.
- The ZTNA server is configured, and a ZTNA rule is set to allow this client.
- The domain resolves to the FortiGate access proxy VIP.

Scenario 1:

When prompted for the client certificate, the client clicks *OK* and provides a valid certificate that is verified by the FortiGate.

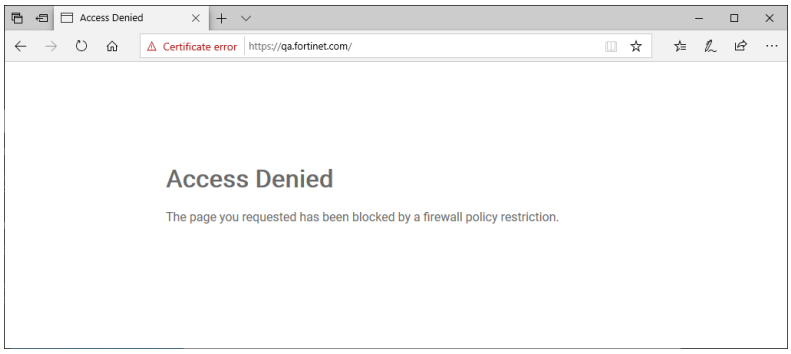


Result:

The client passes SSL certificate authentication and is allowed to access the website.

Scenario 2:

When prompted for the client certificate, the client clicks *Cancel*, resulting in an empty certificate response to the access proxy.



Result:

Because the certificate response is empty and `empty-cert-action` is set to `block`, the WAD daemon blocks the connection.

Currently, the Microsoft Edge and Google Chrome browsers are supported by ZTNA.

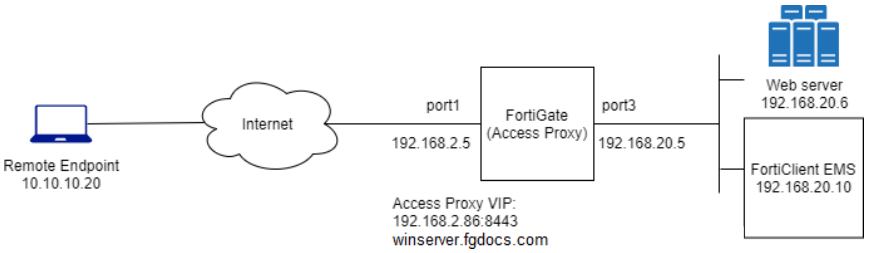
ZTNA configuration examples

This section includes the following ZTNA configuration examples:

- ZTNA HTTPS access proxy example on page 702
- ZTNA HTTPS access proxy with basic authentication example on page 710
- ZTNA TCP forwarding access proxy example on page 717
- ZTNA proxy access with SAML authentication example on page 720
- ZTNA IP MAC filtering example on page 725

ZTNA HTTPS access proxy example

In this example, an HTTPS access proxy is configured to demonstrate its function as a reverse proxy on behalf of the web server it is protecting. It verifies user identity, device identity, and trust context, before granting access to the protected source.



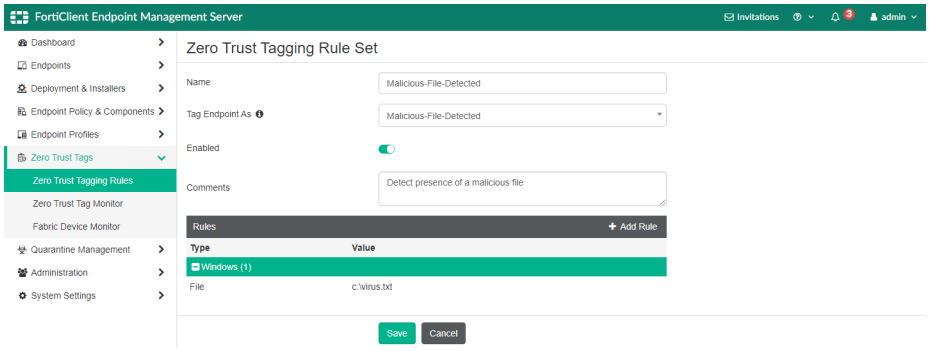
This example shows access control that allows or denies traffic based on ZTNA tags. Traffic is allowed when the FortiClient endpoint is tagged as *Low* risk, and denied when the endpoint is tagged with *Malicious-File-Detected*.

This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure ZTNA in the GUI, go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.

To configure a Zero Trust tagging rule on the FortiClient EMS:

1. Log in to the FortiClient EMS.
2. Go to *Zero Trust Tags* > *Zero Trust Tagging Rules*, and click *Add*.
3. In the *Name* field, enter *Malicious-File-Detected*.
4. In the *Tag Endpoint As* dropdown list, select *Malicious-File-Detected*.
   EMS uses this tag to dynamically group together endpoints that satisfy the rule, as well as any other rules that are configured to use this tag.
5. Click *Add Rule* then configure the rule:
   a. For *OS*, select *Windows*.
   b. From the *Rule Type* dropdown list, select *File* and click the + button.
   c. Enter a file name, such as *C:\virus.txt*.
   d. Click *Save*.

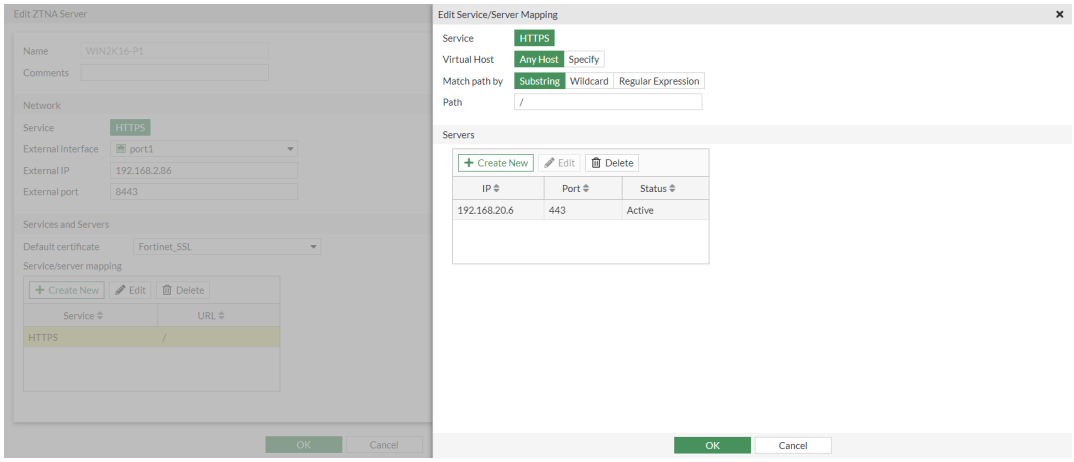


6. Click *Save*.

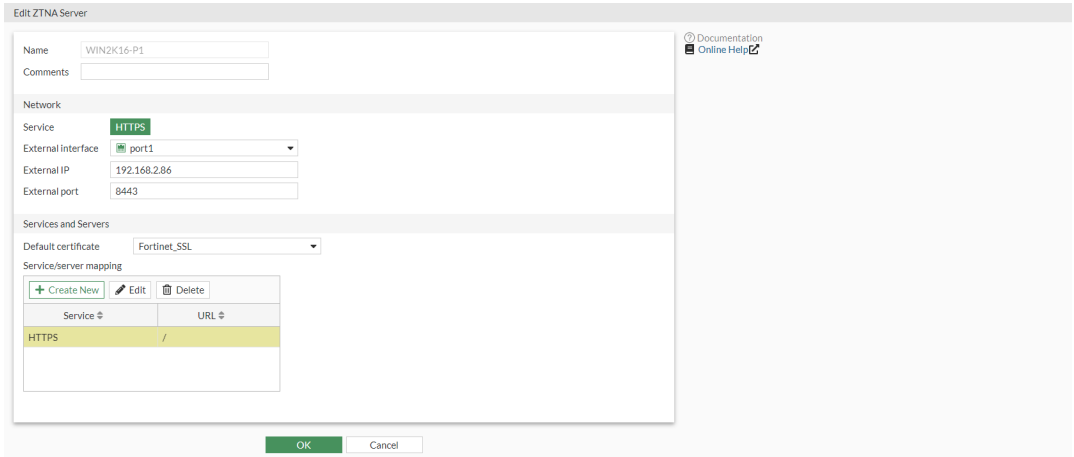
To configure HTTPS access proxy VIP in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Servers* tab.
2. Click *Create New*.
3. Set *Name* to *WIN2K16-P1*.
4. Configure the network settings:
   a. Set *External interface* to *port1*.
   b. Set *External IP* to *192.168.2.86*.
   c. Set *External port* to *8443*.
5. Select the *Default certificate*. Clients will be presented with this certificate when they connect to the access proxy VIP.
6. Add server mapping:
   a. In the *Service/server mapping* table, click *Create New*.
   b. Set *Virtual Host* to *Any Host*.
   c. Configure the path as needed. For example, to map to *winserver.fgdocs.com/fortigate*, enter */fortigate*.

d. Add a server:
   i. In the *Servers* table, click *Create New*.
   ii. Set *IP* to *192.168.20.6*.
   iii. Set *Port* to *443*.
   iv. Click *OK*.



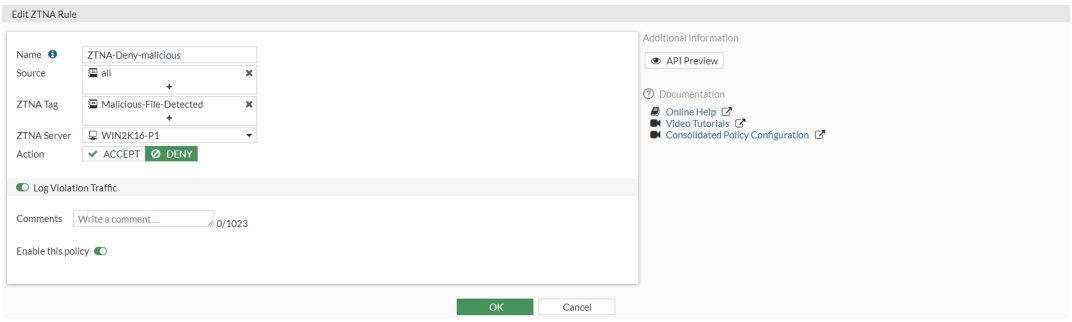
e. Click *OK*.



7. Click *OK*.

To configure ZTNA rules to allow and deny traffic based on ZTNA tags in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Rules* tab.
2. Create a rule to deny traffic:
   a. Click *Create New* again to create another rule.
   b. Set *Name* to *ZTNA-Deny-malicious*.
   c. Add the ZTNA tag *Malicious-File-Detected*.
   This tag is dynamically retrieved from EMS when you first created the Zero Trust Tagging Rule.
   d. Select the ZTNA server *WIN2K16-P1*.
   e. Set *Action* to *DENY*.
   f. Enable *Log Violation Traffic*.



g. Click *OK*.

3. Create a rule to allow traffic:
   a. Click *Create New*.
   b. Set *Name* to *proxy-WIN2K16-P1*.
   c. Add the ZTNA tag *Low*.
   d. Select the ZTNA server *WIN2K16-P1*.

   e. Configure the remaining options as needed.
   f. Click *OK*.
4. On the ZTNA rules list, make sure that the deny rule (*ZTNA-Deny-malicious*) is above the allow rule (*proxy-WIN2K16-P1*).

To configure a firewall policy for full ZTNA in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set *Name* to *ZTNA-P1*.
3. Enable *ZTNA* and select *Full ZTNA*.
4. Set *Incoming Interface* to *port1*.
5. Set *ZTNA Server* to *WIN2K16-P1*.
6. Configure the remaining settings as needed.
   UTM processing of the traffic happens at the ZTNA rule.
7. Click *OK*.

To configure HTTPS access in the CLI:

1. Configure the access proxy VIP:

```
config firewall vip
    edit "WIN2K16-P1"
        set type access-proxy
        set extip 192.168.2.86
        set extintf "port1"
        set server-type https
        set extport 8443
        set ssl-certificate "Fortinet_SSL"
    next
end
```

2. Configure the server and path mapping:

```
config firewall access-proxy
    edit "WIN2K16-P1"
        set vip "WIN2K16-P1"
        set client-cert enable
        config api-gateway
            edit 1
                set service https
                config realservers
                    edit 1
                        set ip 192.168.20.6
                        set port 443
                    next
                end
            next
        end
    next
end
```

3. Configure ZTNA rules:

```
config firewall proxy-policy
    edit 3
        set name "ZTNA-Deny-malicious"
        set proxy access-proxy
        set access-proxy "WIN2K16-P1"
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag "FCTEMS0000109188_Malicious-File-Detected"
        set schedule "always"
        set logtraffic all
    next
    edit 2
        set name "proxy-WIN2K16-P1"
        set proxy access-proxy
        set access-proxy "WIN2K16-P1"
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag "FCTEMS0000109188_Low"
        set action accept
        set schedule "always"
        set logtraffic all
```

```
    next
end
```

4. Configure a firewall policy for full ZTNA:

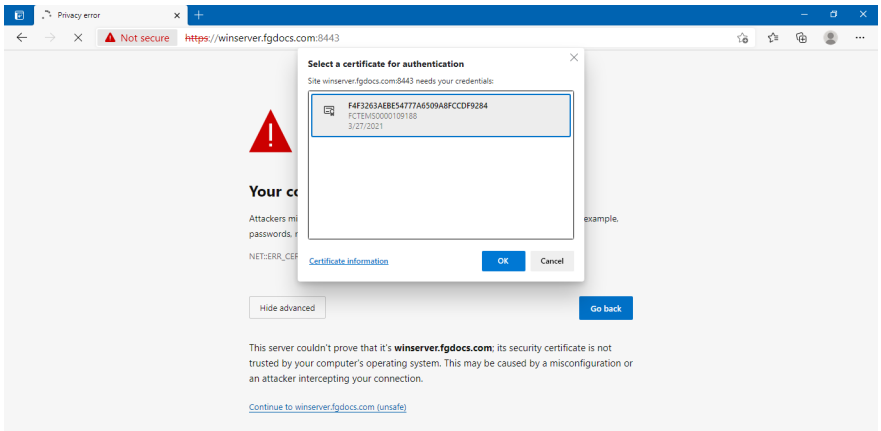
```
config firewall policy
    edit 24
        set name "ZTNA-P1"
        set srcintf "port1"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "WIN2K16-P1"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
    next
end
```

Testing the remote access to the HTTPS access proxy

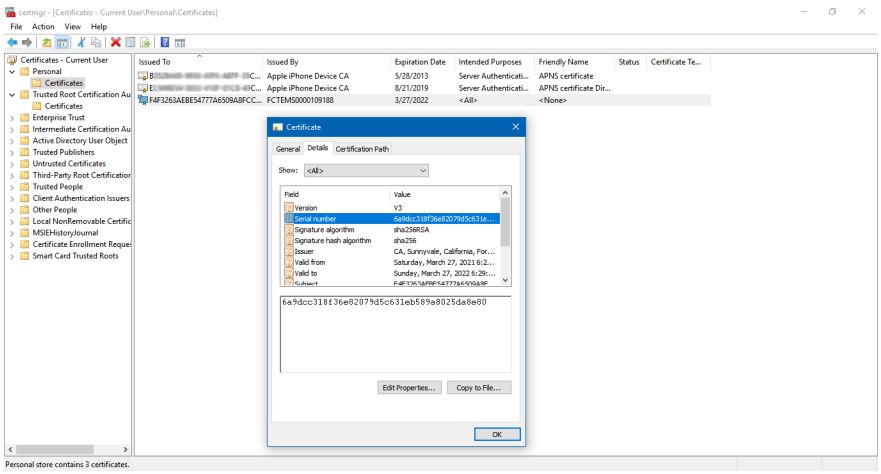
After FortiClient EMS and FortiGate are configured, the HTTPS access proxy remote connection can be tested.

Access allowed:

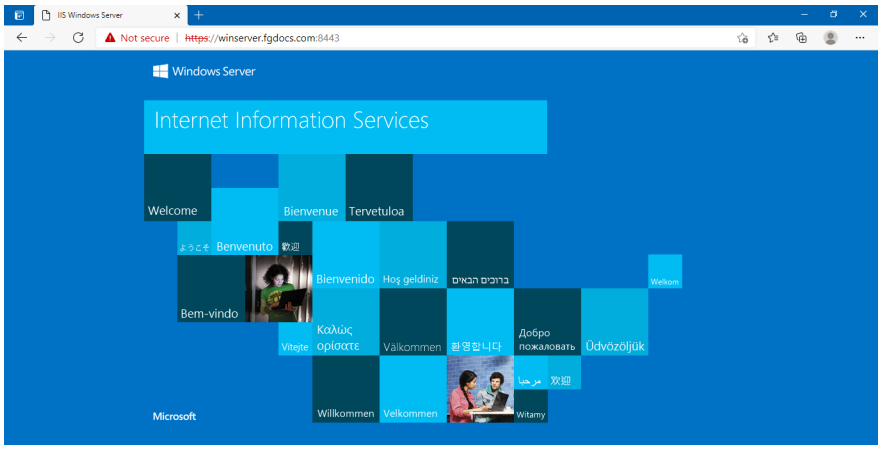
1. On the remote Windows PC, open FortiClient.
2. On the *Zero Trust Telemetry* tab, make sure that you are connected to the EMS server.
3. Open a browser and enter the address of the server and the access port. When entering the FQDN, make sure that the DNS can resolve the address to the IP address of the FortiGate. In this example, winserver.fgdocs.com resolves to 192.168.2.86.
4. The browser prompts for the client certificate to use. Select the EMS signed certificate, then click *OK*.



The certificate is in the *User Configuration* store, under *Personal* > *Certificates*. The details show the SN of the certificate, which matches the record on the FortiClient EMS and the FortiGate.

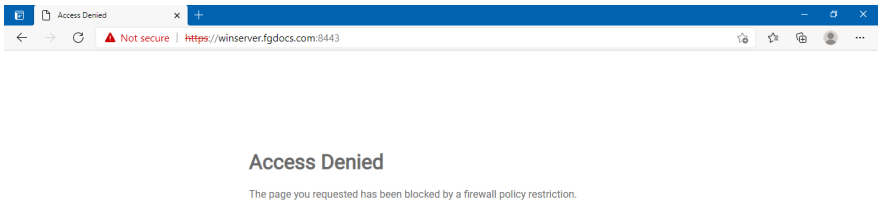


5. The client is verified by the FortiGate to authenticate your identity.
6. The FortiGate matches your security posture by verifying your ZTNA tag and matching the corresponding ZTNA rule, and you are allowed access to the web server.



Access denied:

1. On the remote Windows PC, trigger the Zero Trust Tagging Rule by creating the file in C:\virus.txt.
2. Open a browser and enter the address http://winserver.fgdocs.com:8443.
3. The client is verified by the FortiGate to authenticate your identity.
4. FortiGate checks your security posture. Because EMS has tagged the PC with the *Malicious-File-Detected* tag, it matches the *ZTNA-Deny-malicious* rule.
5. You are denied access to the web server.



Logs and debugs

Access allowed:

```
# diagnose endpoint record list
Record #1:
                IP Address = 10.10.10.20
                MAC Address = 9c:b7:0d:2d:5c:d1
                MAC list = 24:b6:fd:fa:54:c1;06:15:cd:45:f1:2e;9c:b7:0d:2d:5c:d1;

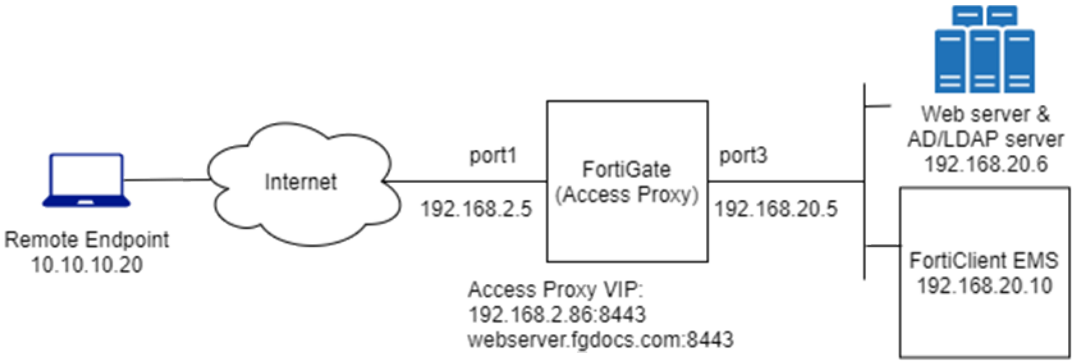
ZTNA HTTPS access proxy with basic authentication example

This example expands on the previous example (ZTNA HTTPS access proxy example on page 702), adding LDAP authentication to the ZTNA rule. Users are allowed based on passing the client certificate authentication check, user authentication, and security posture check.

Users that are in the AD security group *ALLOWED-VPN* are allowed access to the access proxy. Users that are not part of this security group are not allowed access.



This example assumes that the FortiGate EMS fabric connector is already successfully connected.

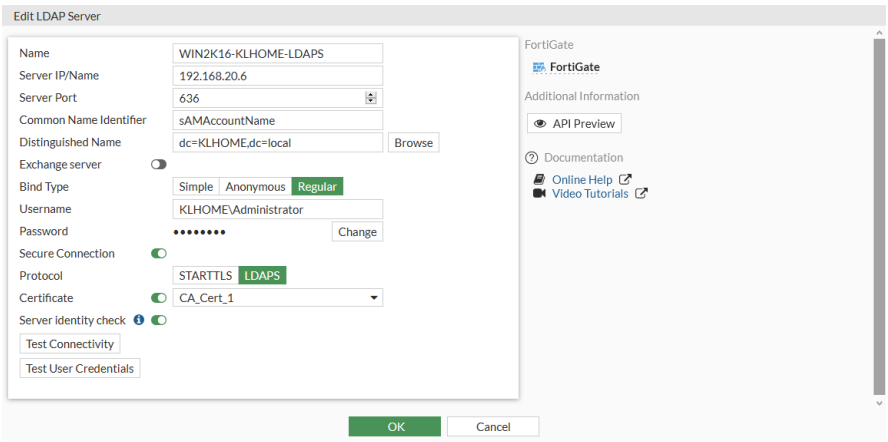
LDAP/Active Directory Users and Groups:

- Domain: KLHOME.local
- Users (Groups):
  - radCurtis (Domain Users, ALLOWED-VPN)
  - radKeith (Domain Users)

To configure a secure connection to the LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
2. Configure the following settings:

Name	WIN2K16-KLHOME-LDAPS
Server IP/Name	192.168.20.6
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=KLHOME,dc=local
Exchange server	Disabled
Bind Type	Regular Enter the *Username* and *Password* for LDAP binding and lookup.
Secure Connection	Enabled • Set *Protocol* to *LDAPS* • Enable *Certificate* and select the CA certificate to validate the server certificate.
Server identity check	Optionally, enable to verify the domain name or IP address against the server certificate.



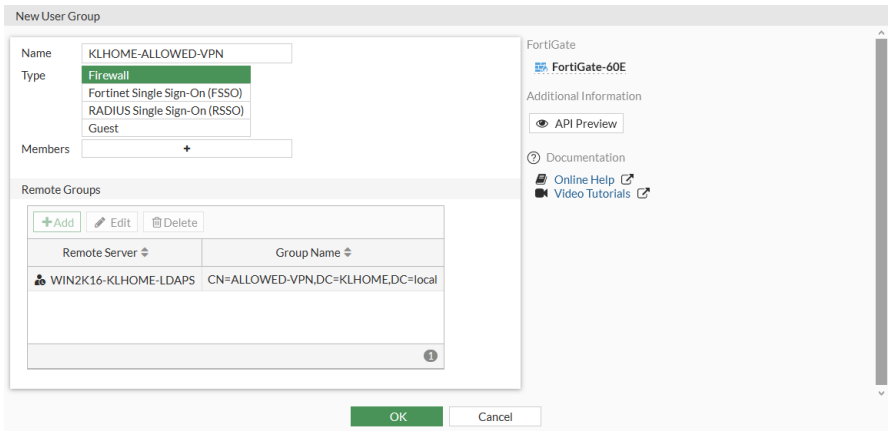
3. Click *Test Connectivity* to verify the connection to the server.
4. Click *OK*.

To configure a secure connection to the LDAP server in the CLI:

```
config user ldap
    edit "WIN2K16-KLHOME-LDAPS"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password <password>
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

To configure a remote user group from the LDAP server in the GUI:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Set the name to *KLHOME-ALLOWED-VPN*.
3. Set *Type* to *Firewall*.
4. In the *Remote Groups* table click *Add*:
   a. Set *Remote Server* to *WIN2K16-KLHOME-LDAPS*.
   b. Locate the *ALLOWED-VPN* group, right-click on it, and click *Add Selected*.
   c. Click *OK*.



5. Click *OK*.

To configure a remote user group from the LDAP server in the CLI:

```
config user group
    edit "KLHOME-ALLOWED-VPN"
        set member "WIN2K16-KLHOME-LDAPS"
        config match
            edit 1
                set server-name "WIN2K16-KLHOME-LDAPS"
                set group-name "CN=ALLOWED-VPN,DC=KLHOME,DC=local"
            next
        end
    next
end
```

Authentication scheme and rules

After the LDAP server and user group have been configured, an authentication scheme and rule must be configured.

To configure authentication schemes and rules in the GUI, go to *System* > *Feature Visibility* and enable *Explicit Proxy*.

Authentication scheme

The authentication scheme defines the method of authentication that is applied. In this example, basic HTTP authentication is used so that users are prompted for a username and password the first time that they connect to a website through the HTTPS access proxy.

To configure an authentication scheme in the GUI:

1. Go to *Policy & Objects* > *Authentication Rules* and click *Create New* > *Authentication Scheme*.
2. Set the name to *ZTNA-Auth-scheme*.
3. Set *Method* to *Basic*.
4. Set *User database* to *Other* and select *WIN2K16-KLHOME-LDAPS* as the LDAP server.
5. Click *OK*.

To configure an authentication scheme in the CLI:

```
config authentication scheme
    edit "ZTNA-Auth-scheme"
        set method basic
        set user-database "WIN2K16-KLHOME-LDAPS"
    next
end
```

Authentication rule

The authentication rule defines the proxy sources and destination that require authentication, and what authentication scheme is applied. In this example, active authentication through the basic HTTP prompt is used and applied to all sources.

To configure an authentication rule in the GUI:

1. Go to *Policy & Objects* > *Authentication Rules* and click *Create New* > *Authentication Rule*.
2. Set the name to *ZTNA-Auth-rule*.
3. Set *Source Address* to *all*.
4. Set *Protocol* to *HTTP*.
5. Enable *Authentication Scheme* and select *ZTNA-Auth-scheme*.
6. Click *OK*.

To configure an authentication rule in the CLI:

```
config authentication rule
    edit "ZTNA-Auth-rule"
        set srcaddr "all"
        set active-auth-method "ZTNA-Auth-scheme"
    next
end
```

Applying the user group to a ZTNA rule

A user or user group must be applied to the ZTNA rule that you need to control user access to. The authenticated user from the authentication scheme and rule must match the user or user group in the ZTNA rule.

In this example, the user group is applied to the two ZTNA rules that were configured in ZTNA HTTPS access proxy example on page 702.

To apply a user group to the ZTNA rules in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Rules* tab.
2. Edit the *ZTNA-Deny-malicious* rule.
3. Click in the *Source* field, select the *User* tab, select the *KLHOME-ALLOWED-VPN* group, then click *Close*.
4. Click *OK*.
5. Edit the *proxy-WIN2K16-P1* rule.
6. Click in the *Source* field, select the *User* tab, select the *KLHOME-ALLOWED-VPN* group, then click *Close*.
7. Click *OK*.

To apply a user group to the ZTNA rules in the CLI:

```
config firewall proxy-policy
    edit 3
        set name "ZTNA-Deny-malicious"
        set proxy access-proxy
        set access-proxy "WIN2K16-P1"
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag "FCTEMS0000109188_Malicious-File-Detected"
        set schedule "always"
        set logtraffic all
        set groups "KLHOME-ALLOWED-VPN"
    next
    edit 2
        set name "proxy-WIN2K16-P1"
        set proxy access-proxy
        set access-proxy "WIN2K16-P1"
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag "FCTEMS0000109188_Low"
        set action accept
        set schedule "always"
        set logtraffic all
        set groups "KLHOME-ALLOWED-VPN"
    next
end
```

Testing remote access to the HTTPS access proxy with user authentication

Scenario 1: access allowed - user radCurtis

1. On a remote Windows PC, open the FortiClient app, select the *Zero Trust Telemetry* tab, and confirm that you are connected to the EMS server.
2. In a browser, enter the address of the server and the access port.

   If entering an FQDN, make sure that DNS can resolve the address to the IP address of the FortiGate. In this example, *winserver.fgdocs.com* resolves to 192.168.2.86.
3. When the browser asks for the client certificate to use, select the EMS signed certificate, then click *OK*.

   The client certificate is verified by the FortiGate to authenticate your identity.
4. When prompted, enter the username *radCurtis* and the password, and click *Sign in*.

   As *radCurtis* is a member of the *ALLOWED-VPN* group in Active Directory, it will match the *KLHOME-ALLOWED-VPN* user group. After the user authentication passes, the FortiGate performs a posture check on the ZTNA group. When that passes, you are allowed access to the website.

Verifying the results

```
# diagnose firewall auth list

10.10.10.20, radCurtis
        type: fw, id: 0, duration: 13, idled: 13
        expire: 587, allow-idle: 600
        packets: in 0 out 0, bytes: in 0 out 0
```

```
        group_id: 8 16777220
        group_name: KLHOME-ALLOWED-VPN grp_16777220

# diagnose test application fcnacd 7
ZTNA Cache:
-uid F4F3263AEBE54777A6509A8FCCDF9284: { "tags": [ "all_registered_clients", "Low" ], "user_
name": "keith", "client_cert_sn": "6C7433E8E2CEDEB49B6C3C3C03677A3521EA4486", "ems_sn":
"FCTEMS0000109188" }
```

The `user_name` is the windows log in username learned by FortiClient. It might not match the username used in firewall user authentication.

```
# execute log display

1: date=2021-04-13 time=00:11:56 eventtime=1618297916023667886 tz="-0700" logid="0000000010"
type="traffic" subtype="forward" level="notice" vd="root" srcip=10.10.10.20 srcport=51513
srcintf="port1" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved"
dstip=192.168.20.6 dstport=443 dstintf="root" dstintfrole="undefined" sessionid=2319197
srcuuid="2d8e1736-8ec6-51eb-885c-009bdf9c31d7" dstuuid="5445be2e-5d7b-51ea-e2c3-
ae6b7855c52f" service="HTTPS" wanoptapptype="web-proxy" proto=6 action="accept" policyid=2
policytype="proxy-policy" poluuid="5aba29de-8ec6-51eb-698f-25b59d5bf852" duration=10
user="radCurtis" group="KLHOME-ALLOWED-VPN" authserver="WIN2K16-KLHOME-LDAPS" wanin=104573
rcvdbyte=104573 wanout=2364 lanin=3538 sentbyte=3538 lanout=104445 appcat="unscanned"
```

Scenario 2: access denied – user radKeith

1. If scenario 1 has just been tested, log in to the FortiGate and deauthenticate the user:
   a. Go to *Dashboard* > *Users & Devices* and expand the *Firewall Users* widget.
   b. Right-click on the user *radCurtis* and select deauthenticate.
2. On a remote Windows PC, open the FortiClient app, select the *Zero Trust Telemetry* tab, and confirm that you are connected to the EMS server.
3. In a browser, enter the address *winserver.fgdocs.com*.
4. When the browser asks for the client certificate to use, select the EMS signed certificate, then click *OK*. This option might not appear if you have already selected the certificate when testing scenario 1.

   The client certificate is verified by the FortiGate to authenticate your identity.
5. When prompted, enter the username *radKeith* and the password, and click *Sign in*.

   As *radKeith* is not a member of the *ALLOWED-VPN* group in Active Directory, it will not match the *KLHOME-ALLOWED-VPN* user group. Because no other policies are matched, this user is implicitly denied

Verifying the results

Go to *Dashboard* > *Users & Devices*, expand the *Firewall Users* widget, and confirm that user *radKeith* is listed, but no applicable user group is returned.

```
# execute log display

1: date=2021-04-13 time=12:29:21 eventtime=1618342161821542277 tz="-0700" logid="0000000013"

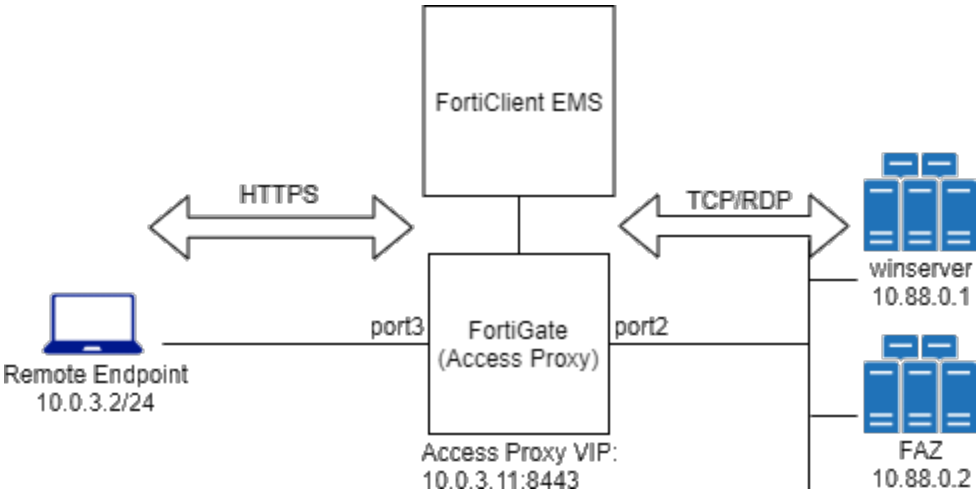
dstintfrole="undefined" srcuuid="5445be2e-5d7b-51ea-e2c3-ae6b7855c52f" srccountry="Reserved"
```

```
dstcountry="Reserved" sessionid=2394329 proto=6 action="deny" policyid=0 policytype="proxy-
policy" user="radKeith" authserver="WIN2K16-KLHOME-LDAPS" service="HTTPS" trandisp="noop"
url="https://winserver.fgdocs.com/" agent="Chrome/89.0.4389.114" duration=0 sentbyte=0
rcvdbyte=0 sentpkt=0 rcvdpkt=0 appcat="unscanned" crscore=30 craction=131072 crlevel="high"
msg="Traffic denied because of explicit proxy policy"
```

ZTNA TCP forwarding access proxy example

In this example, a TCP forwarding access proxy (TFAP) is configured to demonstrate an HTTPS reverse proxy that forwards TCP traffic to the designated resource. The access proxy tunnels TCP traffic between the client and the FortiGate over HTTPS, and forwards the TCP traffic to the protected resource. It verifies user identity, device identity, and trust context, before granting access to the protected source.

RDP access is configured to one server, and SSH access to the other.



This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure the access proxy VIP:

```
config firewall vip
    edit "ZTNA-tcp-server"
        set type access-proxy
        set extip 10.0.3.11
        set extintf "port3"
        set server-type https
        set extport 8443
        set ssl-certificate "Fortinet_SSL"
    next
end
```

To configure the server addresses:

```
config firewall address
    edit "FAZ"
        set subnet 10.88.0.2 255.255.255.255
    next
    edit "winserver"
        set subnet 10.88.0.1 255.255.255.255
```

```
    next
end
```

To configure access proxy server mappings:

```
config firewall access-proxy
    edit "ZTNA-tcp-server"
        set vip "ZTNA-tcp-server"
        set client-cert enable
        config api-gateway
            edit 1
                set service tcp-forwarding
                config realservers
                    edit 1
                        set address "FAZ"
                        set mappedport 22
                    next
                    edit 2
                        set address "winserver"
                        set mappedport 3389
                    next
                end
            next
        end
    next
end
```

The mapped port (`mappedport`) restricts the mapping to the specified port or port range. If `mappedport` is not specified, then any port will be matched.

To configure a ZTNA rule (proxy policy):

```
config firewall proxy-policy
    edit 0
        set name "ZTNA_remote"
        set proxy access-proxy
        set access-proxy "ZTNA-tcp-server"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
    next
end
```

To configure a firewall policy for full ZTNA:

```
config firewall policy
       edit 1
        set name "Full_ZTNA_policy"
        set srcintf "port3"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "ZTNA-tcp-server"
        set action accept
```

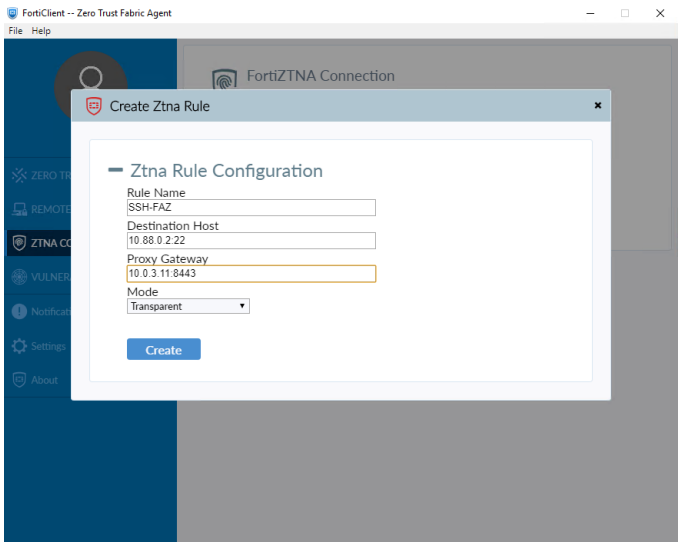
```
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
    next
end
```

Test the connection to the access proxy

Before connecting, users must create a ZTNA rule in FortiClient.

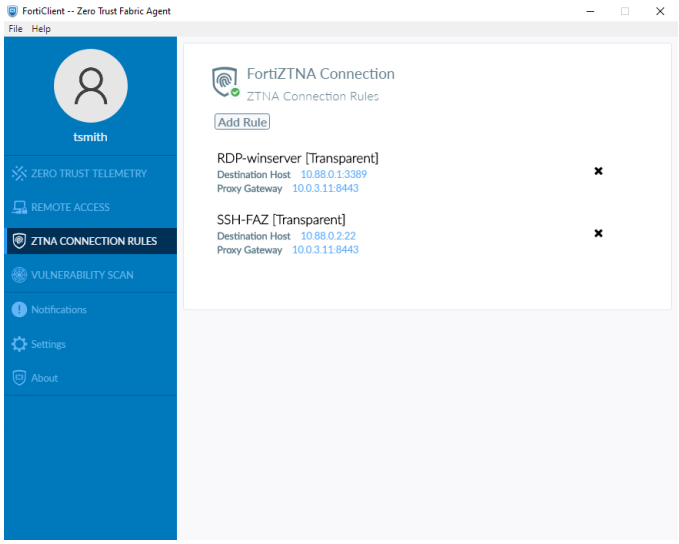
To create a ZTNA rule in FortiClient:

1. On the *ZTNA Connection Rules* tab, click *Add Rule*.
2. Set *Rule Name* to *SSH-FAZ*.
3. Set *Destination Host* to *10.88.0.2:22*. This is the real IP address and port of the server.
4. Set *Proxy Gateway* to *10.0.3.11:8443*. This is the access proxy address and port that are configured on the FortiGate.



5. Click *Create*.
6. Create a second rule with the following settings:
   - *Rule Name*: *RDP_winserver*
   - *Destination Host*: *10.88.0.1:3389*

- *Proxy Gateway*: *10.0.3.11:8443*



After creating the ZTNA connection rules, you can SSH and RDP directly to the server IP address and port.

Logs

RDP:

```
1: date=2021-03-24 time=23:42:35 eventtime=1616654555724552835 tz="-0700" logid="0000000010"

```

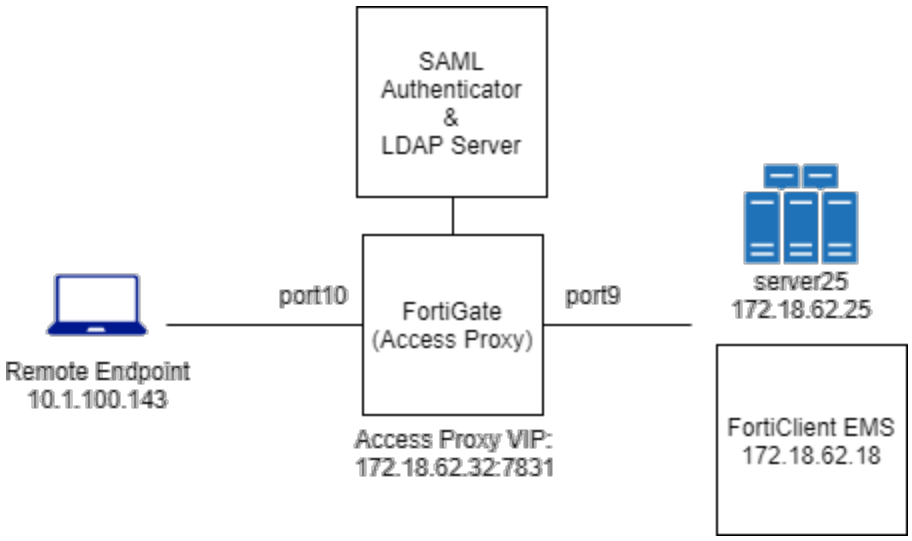
ZTNA proxy access with SAML authentication example

In this example, an HTTPS access proxy is configured, and SAML authentication is applied to authenticate the client. The FortiGate acts as the SAML SP and a SAML authenticator serves as the IdP. In addition to verifying the user and

device identity with the client certificate, the user is also authorized based on user credentials to establish a trust context before granting access to the protected resource.



This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure the access proxy VIP:

```
config firewall vip
    edit "ZTNA_server01"
        set type access-proxy
        set extip 172.18.62.32
        set extintf "any"
        set server-type https
        set extport 7831
        set ssl-certificate "Fortinet_CA_SSL"
    next
end
```

To configure access proxy server mappings:

```
config firewall access-proxy
    edit "ZTNA_server01"
        set vip "ZTNA_server01"
        set client-cert enable
        config api-gateway
            edit 1
                set service https
                config realservers
                    edit 1
                        set ip 172.18.62.25
                        set port 443
                    next
                end
            next
        end
    next
end
```

To configure a firewall policy for full ZTNA:

```
config firewall policy
    edit 2
        set name "Full_ZTNA_policy"
        set srcintf "port10"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "ZTNA_server01"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set nat enable
    next
end
```

To configure a SAML server:

```
config user saml
    edit "saml_ztna"
        set cert "Fortinet_CA_SSL"
        set entity-id "https://fgt9.myqalab.local:7831/samlap"
        set single-sign-on-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/"
        set single-logout-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/logout/"
        set idp-entity-id "http://MYQALAB.LOCAL/adfs/services/trust"
        set idp-single-sign-on-url "https://myqalab.local/adfs/ls"
        set idp-single-logout-url "https://myqalab.local/adfs/ls"
        set idp-cert "REMOTE_Cert_4"
        set digest-method sha256
        set adfs-claim enable
        set user-claim-type upn
        set group-claim-type group-sid
    next
end
```

To map the SAML server into an access proxy configuration:

```
config firewall access-proxy
    edit "ZTNA_server01"
        config api-gateway
             edit 3
                set service samlsp
                set saml-server "saml_ztna"
            next
        end
    next
end
```

To configure an LDAP server and an LDAP server group to verify user groups:

```
config user ldap
    edit "ldap-10.1.100.198"
        set server "10.1.100.198"
        set cnid "cn"
```

```
        set dn "dc=myqalab,dc=local"
        set type regular
        set username "cn=fosqa1,cn=users,dc=myqalab,dc=local"
        set password **********
        set group-search-base "dc=myqalab,dc=local"
    next
end

config user group
    edit "ldap-group-saml"
        set member "ldap-10.1.100.198"
    next
end
```

To configure the authentication settings, rule, and scheme to match the new SAML server:

```
config authentication setting
    set active-auth-scheme "saml_ztna"
    set captive-portal "fgt9.myqalab.local"
end

config authentication rule
    edit "saml_ztna"
        set srcintf "port10"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "saml_ztna"
        set web-auth-cookie enable
    next
end

config authentication scheme
    edit "saml_ztna"
        set method saml
        set saml-server "saml_ztna"
        set saml-timeout 30
        set user-database "ldap-10.1.100.198"
    next
end
```

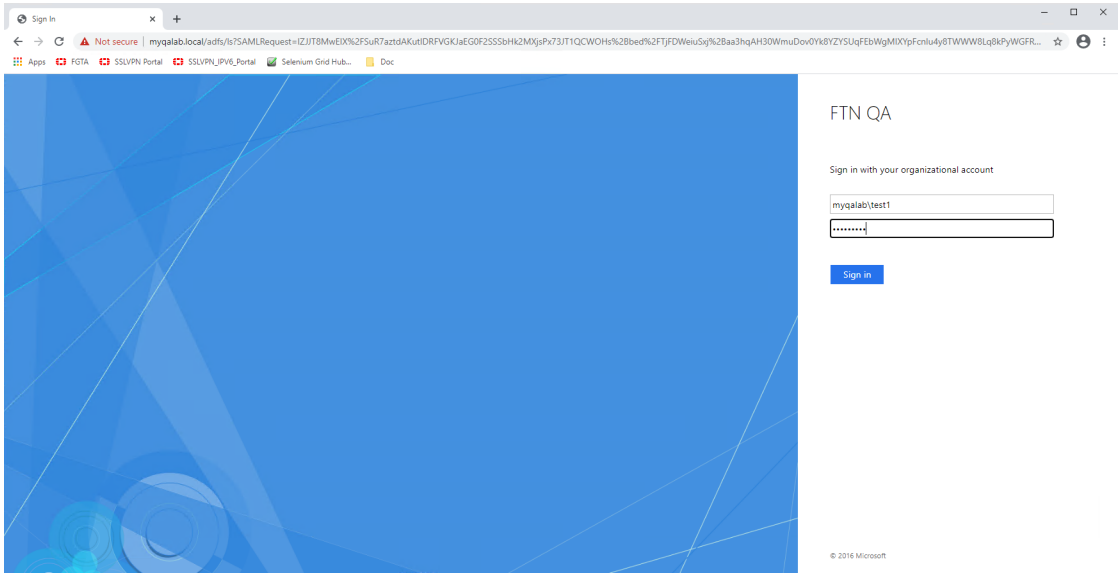
To enable user group authentication in an access-proxy type firewall proxy-policy:

```
config firewall proxy-policy
    edit 6
        set name "ZTNA_remote"
        set proxy access-proxy
        set access-proxy "ZTNA_server01"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set groups "ldap-group-saml"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
    next
end
```

Testing the connection

To test the connection:

1. On a client PC, try to access the webpage through the HTTPS access proxy. For example, go to http://172.18.62.32:7831 in a browser.
2. The client PC is prompted for a client certificate. After the certificate is validated, you are redirected to a SAML log in portal.



3. Enter your user credentials. The SAML server authenticates and sends a SAML assertion response message to the FortiGate.
4. The FortiGate queries the LDAP server for the user group, and then verifies the user group against the groups or groups defined in the proxy policy.
5. The user is proxied to the webpage on the real web server.

Logs and debugs

Use the following command to check the user information after the user has been authenticated:

```
# diagnose wad user list
ID: 7, VDOM: vdom1, IPv4: 10.1.100.143
  user name    : test1@MYQALAB.local
  worker       : 0
  duration     : 124
  auth_type    : Session
  auth_method  : SAML
  pol_id       : 6

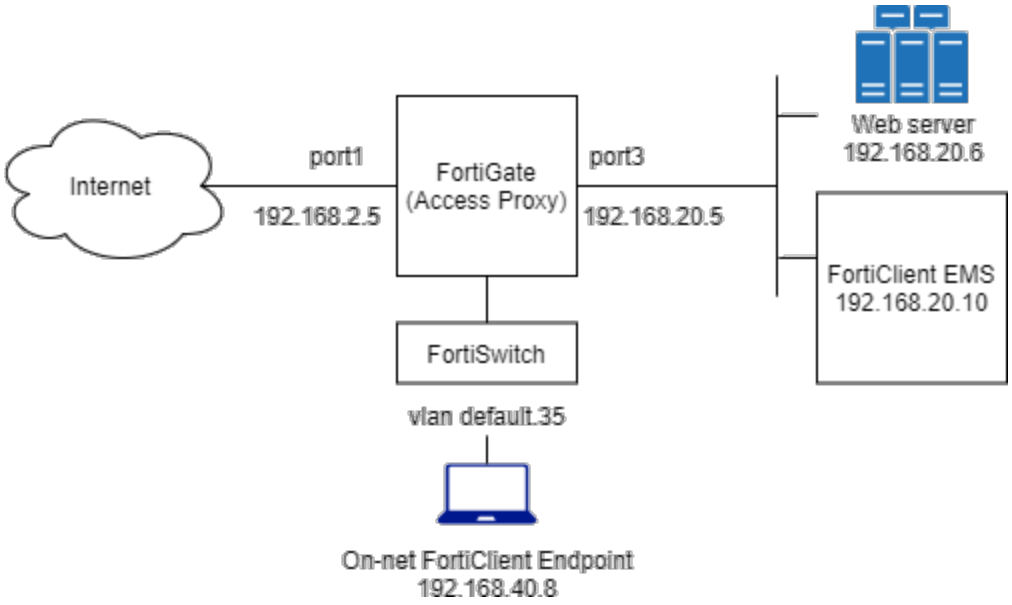
ZTNA IP MAC filtering example

In this example, firewall policies in ZTNA IP/MAC filtering mode are configured that use ZTNA tags to control access between on-net devices and an internal web server. This mode does not require the use of the access proxy, and only uses ZTNA tags for access control. Traffic is passed when the FortiClient endpoint is tagged as *Low* risk only. Traffic is denied when the FortiClient endpoint is tagged with *Malicious-File-Detected*.



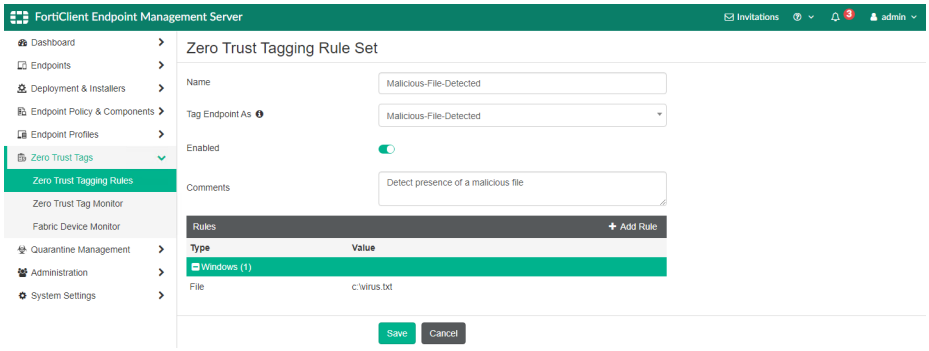
This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure ZTNA in the GUI, go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.

To configure a Zero Trust tagging rule on the FortiClient EMS:

1. Log in to the FortiClient EMS.
2. Go to *Zero Trust Tags* > *Zero Trust Tagging Rules*, and click *Add*.
3. In the *Name* field, enter *Malicious-File-Detected*.
4. In the *Tag Endpoint As* dropdown list, select *Malicious-File-Detected*.

   EMS uses this tag to dynamically group together endpoints that satisfy the rule, as well as any other rules that are configured to use this tag.
5. Click *Add Rule* then configure the rule:
   a. For *OS*, select *Windows*.
   b. From the *Rule Type* dropdown list, select *File* and click the + button.
   c. Enter a file name, such as *C:\virus.txt*.
   d. Click *Save*.



6. Click *Save*.

To configure a firewall policy in ZTNA IP/MAC filtering mode to block access in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set *Name* to *block-internal-malicious-access*.
3. Enable *ZTNA* and select *IP/MAC filtering*.
4. Set *ZTNA Tag* to *Malicious-File-Detected*.
5. Set *Incoming Interface* to *default.35*.
6. Set *Outgoing Interface* to *port3*.
7. Set *Source* and *Destination* to *all*.
8. Set *Service* to *ALL*.
9. Set *Action* to *DENY*.
10. Enable *Log Violation Traffic*.
11. Configuring the remaining settings as needed.
12. Click *OK*.

To configure a firewall policy in ZTNA IP/MAC filtering mode to allow access in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set *Name* to *allow-internal-access*.
3. Enable *ZTNA* and select *IP/MAC filtering*.

4. Set *ZTNA Tag* to *Low*.
5. Set *Incoming Interface* to *default.35*.
6. Set *Outgoing Interface* to *port3*.
7. Set *Source* and *Destination* to *all*.
8. Set *Service* to *ALL*.
9. Set *Action* to *ACCEPT*.
10. Enable *Log Violation Traffic* and set it to *All Sessions*.
11. Configuring the remaining settings as needed.
12. Click *OK*.

To configure a firewall policies in ZTNA IP/MAC filtering mode to block and allow access in the CLI:

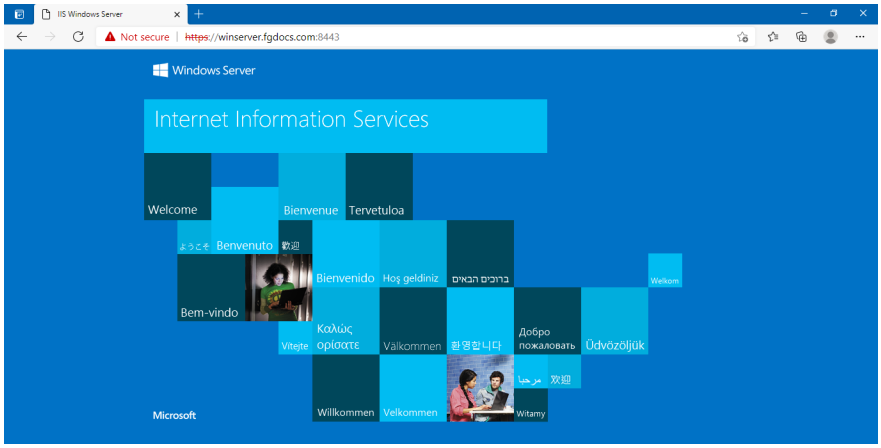
```
config firewall policy
    edit 29
        set name "block-internal-malicious-access"
        set srcintf "default.35"
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set ztna-status enable
        set ztna-ems-tag "FCTEMS0000109188_Malicious-File-Detected"
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
    edit 30
        set name "allow-internal-access"
        set srcintf "default.35"
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set ztna-status enable
        set ztna-ems-tag "FCTEMS0000109188_Low"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set nat enable
    next
end
```

Testing the access to the web server from the on-net client endpoint

Access allowed:

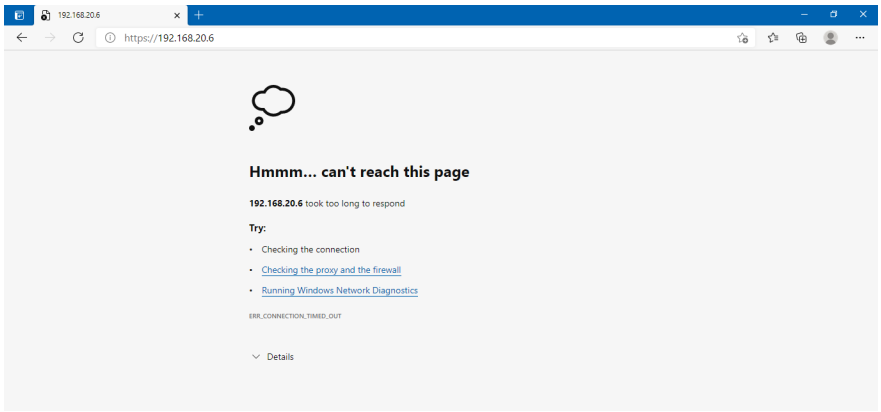
1. On the remote Windows PC, open FortiClient.
2. On the *Zero Trust Telemetry* tab, make sure that you are connected to the EMS server.
3. Open a browser and enter the address of the server.
4. The FortiGate matches your security posture by verifying your ZTNA tag and matching the corresponding `allow-`

`internal-access` firewall policy, and you are allowed access to the web server.



Access denied:

1. On the remote Windows PC, trigger the Zero Trust Tagging Rule by creating the file in C:\virus.txt.
2. Open a browser and enter the address of the server.
3. FortiGate checks your security posture. Because EMS has tagged the PC with the *Malicious-File-Detected* tag, it matches the *block-internal-malicious-access* firewall policy.
4. You are denied access to the web server.



Logs and debugs

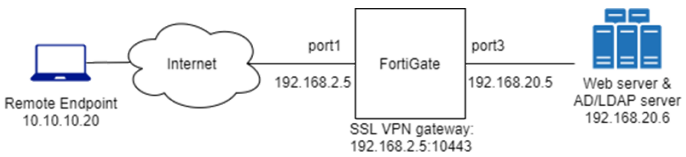
Migrating from SSL VPN to ZTNA HTTPS access proxy

ZTNA can be used to replace VPN based teleworking solutions. Teleworking configurations that use SSL VPN tunnel or web portal mode access with LDAP user authentication can be migrated to ZTNA with HTTPS access proxy.

Scenarios

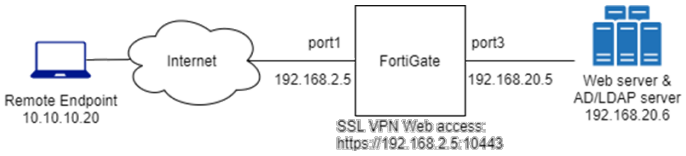
SSL VPN tunnel mode access with LDAP user authentication

Remote users that are in the *ALLOWED-VPN* active directory group have access to a specific web server when they connect through the SSL VPN tunnel. The FortiGate enables split tunneling to the web server so that only traffic to that destination is routed through the tunnel. The web server hosts internal websites that are only accessible by employees.



SSL VPN Web mode access with LDAP user authentication

Remote users that are in the *ALLOWED-VPN* active directory group have access to a specific web server when they connect through the SSL VPN web portal. The web server hosts internal websites that are only accessible by employees. The pre-defined bookmark to the internal website is the only site that allows remote access.



Configuration

To configure an LDAP server:

```
config user ldap
    edit "WIN2K16-KLHOME-LDAPS"
        set server "192.168.20.6"
        set server-identity-check disable
        set cnid "sAMAccountName"
```

```
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password **********
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

To configure a user group:

```
config user group
    edit "KLHOME-ALLOWED-VPN"
        set member "WIN2K16-KLHOME-LDAPS"
        config match
            edit 1
                set server-name "WIN2K16-KLHOME-LDAPS"
                set group-name "CN=ALLOWED-VPN,DC=KLHOME,DC=local"
            next
        end
    next
end
```

To configure the tunnel mode portal and SSL VPN settings:

```
config vpn ssl web portal
    edit "tunnel-access"
        set tunnel-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "no-access"
    config authentication-rule
        edit 1
            set groups "KLHOME-ALLOWED-VPN"
            set portal "tunnel-access"
        next
    end
end
```

To configure the web mode portal and SSL VPN settings:

```
config vpn ssl web portal
    edit "web-access"
        set web-mode enable
        set user-bookmark disable
        config bookmark-group
```

```
            edit "gui-bookmarks"
                config bookmarks
                    edit "winserver"
                        set url "https://192.168.20.6"
                    next
                end
            next
        end
        set display-connection-tools disable
    next
end
```

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "no-access"
    config authentication-rule
        edit 1
            set groups "KLHOME-ALLOWED-VPN"
            set portal "web-access"
        next
    end
end
```

To configure a firewall address and policy:

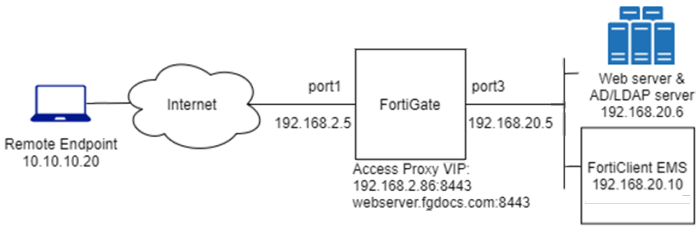
```
config firewall address
    edit "winserver"
        set subnet 192.168.20.6 255.255.255.255
    next
end
```

```
config firewall policy
    edit 32
        set name "SSLVPNtoWinserver"
        set srcintf "ssl.root"
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "winserver"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set groups "KLHOME-ALLOWED-VPN"
    next
end
```

With both the SSL VVPN tunnel and web portals, the remote user can connect through the SSL VPN and access the website at https://192.168.20.6. To monitor their access, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget.

Migrating to ZTNA HTTPS access proxy

Both the SSL VPN tunnel and web portals can be migrated into a ZTNA configuration using the same LDAP server and user group for authentication. The ZTNA solution provides multi-factor authentication using the client certificate, and additional security posture checks.



Instead of connecting to the SSL VPN tunnel or web portal, the remote user connects to the HTTPS access proxy that forwards traffic to the web server after authentication and security posture checks are completed. This provides granular control over who can access the web resource using role-based access control. It also gives the user transparent access to the website using only their browser.

For more information, see ZTNA HTTPS access proxy example on page 702 and ZTNA HTTPS access proxy with basic authentication example on page 710.

ZTNA troubleshooting and debugging

The following debug commands can be used to troubleshoot ZTNA issues:

Command	Description
`# diagnose endpoint fctems test-connectivity <EMS>`	Verify FortiGate to FortiClient EMS connectivity.
`# execute fctems verify <EMS>`	Verify the FortiClient EMS's certificate.
`# diagnose test application fcnacd 2`	Dump the EMS connectivity information.
`# diagnose debug app fcnacd -1` `# diagnose debug enable`	Run real-time FortiClient NAC daemon debugs.
`# diagnose endpoint record list <ip>`	Show the endpoint record list. Optionally, filter by the endpoint IP address.
`# diagnose endpoint wad-comm find-by uid <uid>`	Query endpoints by client UID.
`# diagnose endpoint wad-comm find-by ip-vdom <ip> <vdom>`	Query endpoints by the client IP-VDOM pair.
`# diagnose wad dev query-by uid <uid>`	Query from WAD diagnose command by UID.
`# diagnose wad dev query-by ipv4 <ip>`	Query from WAD diagnose command by IP address.
`# diagnose firewall dynamic list`	List EMS ZTNA tags and all dynamic IP and MAC addresses.
`# diagnose test application fcnacd 7` `# diagnose test application fcnacd 8`	Check the FortiClient NAC daemon ZTNA and route cache.

Command	Description

`# diagnose wad debug enable category all`
`# diagnose wad debug enable level verbose`
`# diagnose debug enable`
	Run real-time WAD debugs.

`# diagnose debug reset`	Reset debugs when completed

The WAD daemon handles proxy related processing. The FortiClient NAC daemon (fcnacd) handles FortiGate to EMS connectivity.

Troubleshooting usage and output

1. Verify the FortiGate to EMS connectivity and EMS certificate:

```
# diagnose endpoint fctems test-connectivity WIN10-EMS
Connection test was successful:
```

```
# execute fctems verify WIN10-EMS
Server certificate already verified.
```

```
# diagnose test application fcnacd 2
EMS context status:
FortiClient EMS number 1:
        name: WIN10-EMS confirmed: yes
        fetched-serial-number: FCTEMS0000109188
Websocket status: connected
```

2. If fcnacd does not report the proper status, run real-time fcnacd debugs:

```
# diag debug app fcnacd -1
# diag debug enable
```

3. Verify the following information about an endpoint:
   - Network information
   - Registration information
   - Client certificate information
   - Device information
   - Vulnerability status
   - Relative position with the FortiGate

```
# diagnose endpoint record list 10.6.30.214
Record #1:
                IP Address = 10.6.30.214
                MAC Address = 00:0c:29:ba:1e:61
                MAC list = 00:0c:29:ba:1e:61;00:0c:29:ba:1e:6b;
                VDOM = root (0)
                EMS serial number: FCTEMS8821001322
                Client cert SN: 17FF6595600A1AF53B87627AB4EBEDD032593E64
                Quarantined: no
                Online status: online
```

```
                Registration status: registered
                On-net status: on-net
                Gateway Interface: port2
                FortiClient version: 7.0.0
                AVDB version: 84.778
                FortiClient app signature version: 18.43
                FortiClient vulnerability scan engine version: 2.30
                FortiClient UID: 5FCFA3ECDE4D478C911D9232EC9299FD
                Host Name: ADPC
    …
                Number of Routes: (1)
                        Gateway Route #0:
                                - IP:10.1.100.214, MAC: 00:0c:29:ba:1e:6b, Indirect: no
                                - Interface:port2, VFID:0, SN: FG5H1E5819902474
online records: 1; offline records: 0; quarantined records: 0
```

4. Query the endpoint information, include ZTNA tags, by UID or IP address:

```
# diagnose endpoint wad-comm find-by uid 5FCFA3ECDE4D478C911D9232EC9299FD
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
        status code:ok
        Domain: qa.wangd.com
        User: user1
        Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
        EMS SN: FCTEMS8821001322
        Routes(1):
         - route[0]: IP=10.1.100.214, VDom=root
        Tags(3):
         - tag[0]: name=ZT_OS_WIN
         - tag[1]: name=all_registered_clients
         - tag[2]: name=Medium

# diagnose endpoint wad-comm find-by ip-vdom 10.1.100.214 root
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
        status code:ok
        Domain: qa.wangd.com
        User: user1
        Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
        EMS SN: FCTEMS8821001322
        Routes(1):
         - route[0]: IP=10.1.100.214, VDom=root
        Tags(3):
         - tag[0]: name=ZT_OS_WIN
         - tag[1]: name=all_registered_clients
         - tag[2]: name=Medium
```

5. Query endpoint information from WAD by UID or IP address:

```
# diagnose wad dev query-by uid 5FCFA3ECDE4D478C911D9232EC9299FD
Attr of type=0, length=32, value(ascii)=5FCFA3ECDE4D478C911D9232EC9299FD
Attr of type=4, length=30, value(ascii)=MAC_FCTEMS8821001322_ZT_OS_WIN
Attr of type=4, length=26, value(ascii)=FCTEMS8821001322_ZT_OS_WIN
Attr of type=4, length=43, value(ascii)=MAC_FCTEMS8821001322_all_registered_clients
Attr of type=4, length=39, value(ascii)=FCTEMS8821001322_all_registered_clients
Attr of type=4, length=27, value(ascii)=MAC_FCTEMS8821001322_Medium
Attr of type=4, length=23, value(ascii)=FCTEMS8821001322_Medium
```

```
Attr of type=5, length=18, value(ascii)=FOSQA@qa.wangd.com
Attr of type=6, length=40, value(ascii)=17FF6595600A1AF53B87627AB4EBEDD032593E64

# diagnose wad dev query-by ipv4 10.1.100.214
Attr of type=0, length=32, value(ascii)=5FCFA3ECDE4D478C911D9232EC9299FD
Attr of type=4, length=30, value(ascii)=MAC_FCTEMS8821001322_ZT_OS_WIN
Attr of type=4, length=26, value(ascii)=FCTEMS8821001322_ZT_OS_WIN

Attr of type=4, length=27, value(ascii)=MAC_FCTEMS8821001322_Medium
Attr of type=4, length=23, value(ascii)=FCTEMS8821001322_Medium
Attr of type=5, length=18, value(ascii)=FOSQA@qa.wangd.com
Attr of type=6, length=40, value(ascii)=17FF6595600A1AF53B87627AB4EBEDD032593E64
```

6. List all the dynamic ZTNA IP and MAC addresses learned from EMS:

```
# diagnose firewall dynamic list
List all dynamic addresses:
FCTEMS0000109188_all_registered_clients: ID(51)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
FCTEMS0000109188_Low: ID(78)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
FCTEMS0000109188_Malicious-File-Detected: ID(190)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
```

7. Check the FortiClient NAC daemon ZTNA and route cache:

```
# diagnose test application fcnacd 7
ZTNA Cache:
-uid 5FCFA3ECDE4D478C911D9232EC9299FD: { "tags": [ "ZT_OS_WIN", "all_registered_
clients", "Medium" ], "domain": "qa.wangd.com", "user_name": "user1", "client_cert_sn":
"17FF6595600A1AF53B87627AB4EBEDD032593E64", "owner": "FOSQA@qa.wangd.com", "gateway_
route_list": [ { "gateway_info": { "fgt_sn": "FG5H1E5819902474", "interface": "port2",
"vdom": "root" }, "route_info": [ { "ip": "10.1.100.214", "mac": "00-0c-29-ba-1e-6b",
"route_type": "direct" } ] } ], "ems_sn": "FCTEMS8821001322" }

# diagnose test application fcnacd 8
IP-VfID Cache:
IP: 10.1.100.206, vfid: 0, uid: 3DED29B54386416E9888F2DCBD2B9D21
IP: 10.1.100.214, vfid: 0, uid: 5FCFA3ECDE4D478C911D9232EC9299FD
```

8. Troubleshoot WAD with real-time debugs to understand how the proxy handled a client request:

```
# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable

[0x7fbd7a46bb60] Received request from client: 10.10.10.20:56312

Always reset the debugs after using them:

```
# diagnose debug reset
```

Security Profiles

This section contains information about configuring FortiGate security features, including:

- Inspection modes on page 740
- Antivirus on page 745
- Web filter on page 768
- Filtering based on YouTube channel on page 803
- DNS filter on page 806
- Application control on page 831
- Intrusion prevention on page 843
- File filter on page 853
- Email filter on page 859
- Data leak prevention on page 866
- VoIP solutions on page 874
- ICAP on page 887
- Web application firewall on page 893
- SSL & SSH Inspection on page 896
- Custom signatures on page 909
- Overrides on page 918

If you are unable to view a security profile feature, go to *System* > *Feature Visibility* to enable it.

Inspection modes

FortiOS supports flow-based and proxy-based inspection in firewall policies. You can select the inspection mode when configuring a policy.

Flow-based inspection takes a snapshot of content packets and uses pattern matching to identify security threats in the content.

Proxy-based inspection reconstructs content that passes through the FortiGate and inspects the content for security threats.

Certain security profiles allows users to display flow-based or proxy-based feature sets.

This following topics provide information about inspection modes for various security profile features:

- Flow mode inspection (default mode) on page 741
- Proxy mode inspection on page 741
- Inspection mode feature comparison on page 743

Flow mode inspection (default mode)

When a firewall policy's inspection mode is set to flow, traffic flowing through the policy will not be buffered by the FortiGate. Unlike proxy mode, the content payload passing through the policy will be inspected on a packet by packet basis with the very last packet held by the FortiGate until the scan returns a verdict. If a violation is detected in the traffic, a reset packet is issued to the receiver, which terminates the connection, and prevents the payload from being sent successfully.

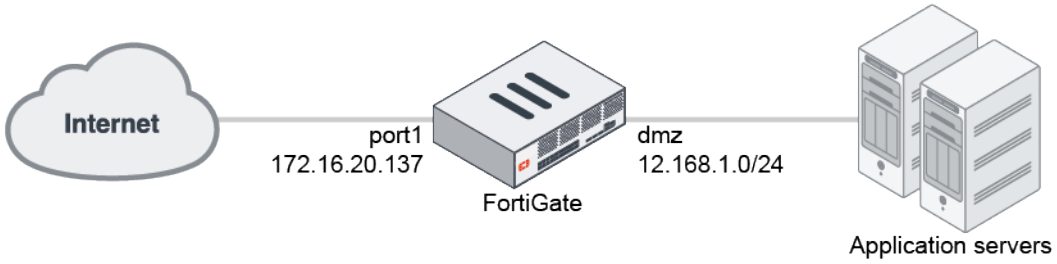
Flow-based inspection identifies and blocks security threats in real time as they are identified. All applicable flow-based security modules are applied simultaneously in one single pass, using Direct Filter Approach (DFA) pattern matching to identify possible attacks or threats. Pattern matching is offloaded and accelerated by CP8 or CP9 processors.

Flow-based inspection typically requires lower processing resources than proxy-based inspection and does not change packets, unless a threat is found and packets are blocked.

Use case

It is recommended to apply flow inspection to policies that prioritize traffic throughput, such as allowing connections to a streaming or file server.

For example, you have an application server that accepts connections from users for a daily quiz show app, HQ. Each HQ session sees 500,000+ participants, and speed is very important because participants have less than 10 seconds to answer the quiz show questions.



In this scenario, a flow inspection policy is recommended to prioritize throughput. The success of the application depends on providing reliable service for large numbers of concurrent users. The policy would include an IPS sensor to protect the server from external DOS attacks.

Proxy mode inspection

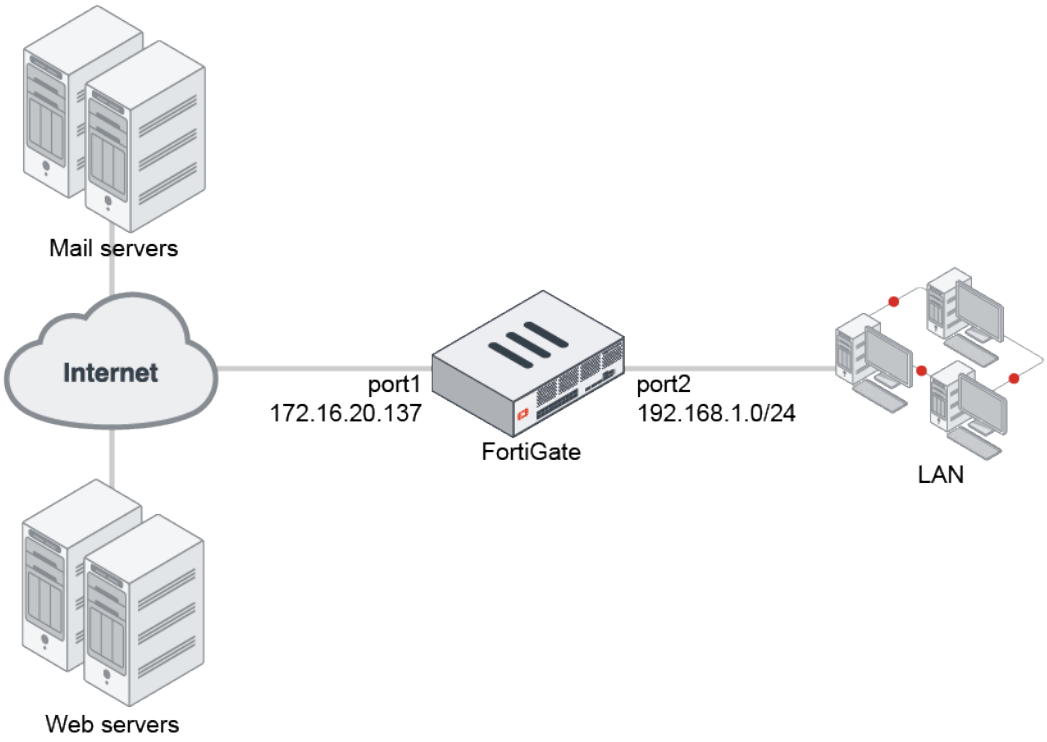
When a firewall policy's inspection mode is set to proxy, traffic flowing through the policy will be buffered by the FortiGate for inspection. This means that the packets for a file, email message, or web page will be held by the FortiGate until the entire payload is inspected for violations (virus, spam, or malicious web links). After FortiOS finishes the inspection, the payload is either released to the destination (if the traffic is clean) or dropped and replaced with a replacement message (if the traffic contains violations).

To optimize inspection, the policy can be configured to block or ignore files or messages that exceed a certain size. To prevent the receiving end user from timing out, you can apply client comforting. This allows small portions of the payload to be sent while it is undergoing inspection.

Proxy mode provides the most thorough inspection of the traffic; however, its thoroughness sacrifices performance, making its throughput slower than that of a flow mode policy. Under normal traffic circumstances, the throughput difference between a proxy-based and flow-based policy is not significant.

Use case 1

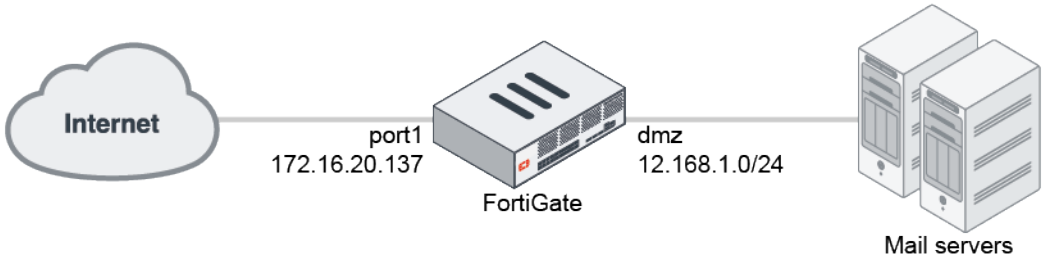
Your organization deals with sensitive data on a regular basis and a data leak would significantly harm your business. At the same time, you wish to protect your employees from malicious content, such as viruses and phishing emails, which could be used to gain access to your network and the sensitive data on your systems.



In this scenario, a proxy inspection policy is recommended to prioritize network security. You want traffic inspection to be as thorough as possible to avoid any data leaks from exiting the LAN and any malicious content from entering it. The policy would include antivirus, DLP, web, and email filters all operating in proxy mode.

Use case 2

You have a corporate mail server in your domain that is used by your employees for everyday business activities. You want to protect your employees from phishing emails and viruses. At the same time, you want to also protect your web servers from external attacks.



In this scenario, a proxy inspection policy is recommended to prioritize the safety of employee emails. Applying the antivirus and email filter in this mode allows you to filter out any malware and spam emails received by the mail servers via SMTP or MAPI. An IPS sensor would be used to prevent DOS attacks on the mail servers.

Inspection mode feature comparison

The following table shows which UTM profile can be configured on a flow mode or proxy mode inspection policy.

Some UTM profiles are hidden in the GUI and can only be configured using the CLI. To configure profiles in a firewall policy in CLI, enable the `utm-status` setting.

Some profiles might have feature differences between flow-based and proxy-based Inspection. From the GUI and CLI, you can set the *Feature set* option to be *Flow-based* or *Proxy-based* to display only the settings for that mode.

	Flow Mode Inspection Policy		Proxy Mode Inspection Policy		
UTM Profile	GUI	CLI	GUI	CLI	Feature set option
AntiVirus	Yes	Yes	Yes	Yes	GUI/CLI
Web Filter	Yes	Yes	Yes	Yes	GUI/CLI
DNS Filter	Yes	Yes	Yes	Yes	N/A
Application Control	Yes	Yes	Yes	Yes	N/A
Intrusion Prevention System	Yes	Yes	Yes	Yes	N/A
File Filter	Yes	Yes	Yes	Yes	GUI/CLI
Email Filter	Yes	Yes	Yes	Yes	GUI/CLI
Data Leak Prevention	No	Yes	No	Yes	CLI
VoIP	Yes	Yes	Yes	Yes	N/A
ICAP	No	No	Yes	Yes	N/A
Web Application Firewall	No	No	Yes	Yes	N/A
SSL/SSH Inspection	Yes	Yes	Yes	Yes	N/A

The following sections outline differences between flow-based and proxy-based inspection for a security profile.

Feature comparison between Antivirus inspection modes

The following table indicates which Antivirus features are supported by their designated scan modes.

Part1	Replacement Message	Content Disarm	Mobile Malware	Virus Outbreak	Sandbox Inspection	NAC Quarantine
Proxy	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes*	No	Yes	Yes	Yes	Yes

*IPS Engine caches the URL and a replacement message is presented after the second attempt.

Part 2	Archive Blocking	Emulator	Client Comforting	Infection Quarantine	Heuristics	Treat EXE as Virus
Proxy	Yes	Yes	Yes	Yes (1)	Yes	Yes (2)
Flow	Yes	Yes	No	Yes	Yes	Yes (2)

1. Only available on FortiGate models with HDD or when FortiAnalyzer or FortiGate Cloud is connected and enabled.
2. Only applies to inspection on IMAP, POP3, SMTP, and MAPI protocols.

Part 3	External Blocklist	EMS Threat Feed	AI/ML Based Detection
Proxy	Yes	Yes	Yes
Flow	Yes	No	Yes

Feature comparison between Web Filter inspection modes

The following table indicates which Web Filter features are supported by their designated inspection modes.

	FortiGuard Category-Based Filter	Category Usage Quota	Override Blocked Categories	Search Engines	Static URL Filter	Rating Option	Proxy Option	Web Profile Override
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes (1)	No	Yes (2)	No	Yes	Yes	Limited (3)	No

1. Local Category and Remote Category filters do not support the warning and authenticate actions.
2. Local Category and Remote Category filters cannot be overridden.
3. Only HTTP POST Action is supported.

Feature comparison between Email Filter inspection modes

The following tables indicate which Email Filters are supported by the specified inspection modes for local filtering and FortiGuard-assisted filtering.

Local Filtering	Banned Word Check	Block/Allow List	HELO/ EHLO DNS Check	Return Address DNS Check	DNSBL/ ORBL Check	MIME Header Check
Proxy	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	No	No	No	Yes

FortiGuard-Assisted Filtering	Phishing URL Check	Anti-Spam Block List Check	Submit Spam to FortiGuard	Spam Email Checksum Check	Spam URL Check
Proxy	Yes	Yes	Yes	Yes	Yes
Flow	No	No	No	No	No

Feature comparison between DLP inspection modes

The following table indicates which DLP filters are supported by their designated inspection modes.

	Credit Card Filter	SSN Filter	Regex Filter	File-Type Filter	File-Pattern Filter	Fingerprint Filter	Watermark Filter	Encrypted Filter	File-Size Filter
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	No	No	Yes	Yes*

*File-size filtering only works if file size is present in the protocol exchange.

Antivirus

FortiOS offers the unique ability to implement both flow-based and proxy-based antivirus concurrently, depending on the traffic type, users, and locations. Flow-based antivirus offers higher throughput performance.

FortiOS includes two preloaded antivirus profiles:

- *default*
- *wifi-default*

You can customize these profiles, or you can create your own to inspect certain protocols, remove viruses, analyze suspicious files with FortiSandbox, and apply botnet protection to network traffic. Once configured, you can add the antivirus profile to a firewall policy.

This functionality requires a subscription to FortiGuard Antivirus.

Protocol comparison between antivirus inspection modes

The following table indicates which protocols can be inspected by the designated antivirus scan modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SSH
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes*	Yes

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SSH
Flow	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No

* Proxy mode antivirus inspection on CIFS protocol has the following limitations:

- Cannot detect infections within some archive files.
- Cannot detect oversized files.

Other antivirus differences between inspection modes

Starting from 6.4.0, the scan mode option is no longer available for flow-based AV.

This means that AV no longer exclusively uses the default or legacy scan modes when handling traffic on flow-based firewall policies. Instead, AV in flow-based policies uses a hybrid of the two scan modes. Flow AV may use a pre-filtering database for malware detection in some circumstances as opposed to the full AV signature database in others. The scan method is determined by the IPS engine algorithm that is based on the type of file being scanned.

In contrast, proxy mode maintains the scan mode option, which can be toggled between default or legacy mode. In default mode, the WAD daemon uses a stream-based approach, while legacy mode disables this stream-based approach. Proxy default scan-mode uses pre-scanning and stream-based scanning for HTTP, FTP, SFTP, and SCP protocols.

AI-based malware detection

The AV Engine AI malware detection model integrates into regular AV scanning to help detect potentially malicious Windows Portable Executables (PEs) in order to mitigate zero-day attacks. Previously, this type of detection was handled by heuristics that analyzed file behavior. With AV Engine AI, the module is trained by FortiGuard AV against many malware samples to identify file features that make up the malware. The AV Engine AI package can be downloaded by FortiOS via FortiGuard on devices with an active AV subscription. The `machine-learning-detection` setting is enabled by default at a per-VDOM level. Files detected by the AV Engine AI are identified with the W32/AI.Pallas.Suspicious virus signature.

To configure machine learning-based malware detection:

```
config antivirus settings
    set machine-learning-detection {enable| monitor | disable}
end
```

The following topics provide information about antivirus profiles:

- Proxy mode stream-based scanning on page 747
- Databases on page 748
- Content disarm and reconstruction on page 749
- FortiGuard outbreak prevention on page 751
- External malware block list on page 753
- Malware threat feed from EMS on page 756
- Checking flow antivirus statistics on page 759
- CIFS support on page 761
- Using FortiSandbox with antivirus on page 766

Proxy mode stream-based scanning

Stream-based scanning provides the following AV improvements over legacy scan mode:

- Archive files (ZIP, GZIP, BZIP2, TAR, ISO) that exceed the oversize limit are uncompressed and scanned for infections.
- The contents of large archive files are scanned without having to buffer the entire file.
- Small files are scanned locally by the WAD daemon if only AV scanning is needed in the policy.
- File filtering on HTTP/HTTPS is handled locally by the WAD daemon.

This means that the overall memory usage is optimized when an archive file is scanned, and better security is achieved by scanning archives that would otherwise be bypassed.

However, stream-based scanning has limitations on the more complex features that it can scan. For the following features, traffic will be automatically handed off to the scanunit daemon for scanning (as in the case of legacy mode):

- Heuristic AV scan
- DLP
- Quarantine
- FortiGuard outbreak prevention and external block list
- Content disarm

To configure the scan mode:

```
config antivirus profile
    edit <name>
        set feature-set proxy
        ...
        set scan-mode {default | legacy}
    next
end
```

TCP windows

Some file transfer applications can negotiate large TCP windows. For example, WinSCP can negotiate an initial TCP window size of about 2GB.

The TCP window options can be used to prevent overly large initial TCP window sizes, helping avoid channel flow control issues. It allows stream-based scan's flow control to limit peers from sending data that exceeds a policy's configured oversize limit.

To configure TCP window size options:

```
config firewall profile-protocol-options
    edit <string>
        config {ftp | ssh}
            ...
            set stream-based-uncompressed-limit <integer>
            set tcp-window-type {system | static | dynamic}
            set tcp-window-size <integer>
            set tcp-window-minimum <integer>
            set tcp-window-maximum <integer>
            ...
```

```
        end
    next
end
```

`{ftp | ssh}`	• `ftp`: Configure FTP protocol options. • `ssh`: Configure SFTP and SCP protocol options.
`stream-based-uncompressed-limit <integer>`	The maximum stream-based uncompressed data size that will be scanned, in MB (default = 0 (unlimited)). Stream-based uncompression used only under certain conditions.).
`tcp-window-type {system | static | dynamic}`	The TCP window type to use for this protocol. • `system`: Use the system default TCP window size for this protocol (default). • `static`: Manually specify the TCP window size. • `dynamic`: Vary the TCP window size based on available memory within the limits configured in `tcp-window-minimum` and `tcp-window-maximum`.
`tcp-window-size <integer>`	The TCP static window size (65536 - 33554432, default = 262144). This option is only available when `tcp-window-type` is `static`.
`tcp-window-minimum <integer>`	The minimum TCP dynamic window size (65536 - 1048576, default = 131072). This option is only available when `tcp-window-type` is `dynamic`.
`tcp-window-maximum <integer>`	The maximum TCP dynamic window size (1048576 - 33554432, default = 8388608). This option is only available when `tcp-window-type` is `dynamic`.

Databases

The antivirus scanning engine uses a virus signatures database to record the unique attributes of each infection. The antivirus scan searches for these signatures and when one is discovered, the FortiGate determines if the file is infected and takes action.

All FortiGates have the normal antivirus signature database. Some models have additional databases that you can use. The database you use depends on your network and security needs, and on your FortiGate model.

The extended virus definitions database is the default setting and provides comprehensive antivirus protection. Low-end FortiGate models cannot support the extreme database. The FortiGate 300D is the lowest model that supports the extreme database. All VMs support the extreme database. The `use-extreme-db` setting is only available on models that support the extreme database.

Extended	This is the default setting. This database includes currently spreading viruses, as determined by the FortiGuard Global Security Research Team, plus recent viruses that are no longer active. These viruses may have been spreading within the last year but have since nearly or completely disappeared.
Extreme	This includes the extended database, plus a large collection of zoo viruses. These are viruses that have not spread in a long time and are largely dormant. Some zoo viruses might rely on operating systems and hardware that are no longer widely used.

To change the antivirus database:

```
config antivirus settings
    set use-extreme-db {enable | disable}
end
```

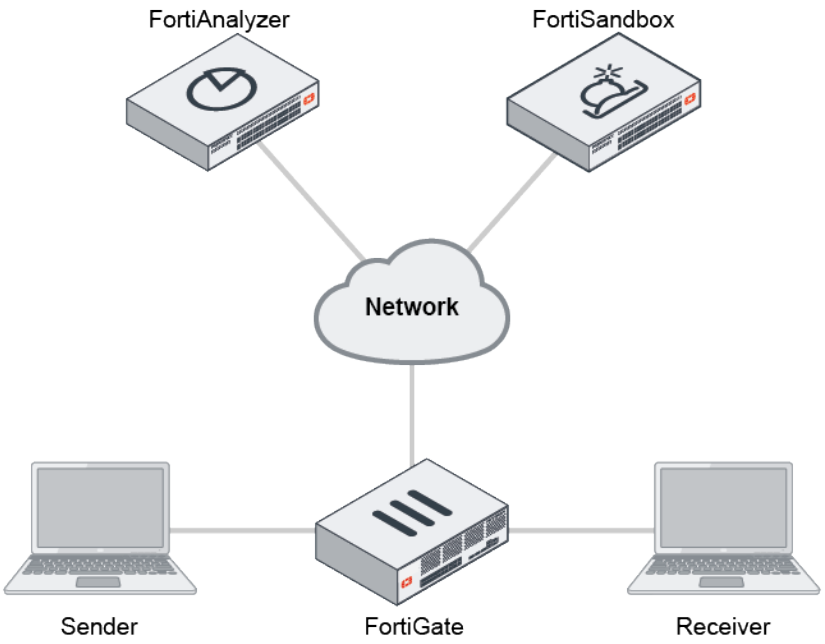
Content disarm and reconstruction

Content disarm and reconstruction (CDR) allows the FortiGate to sanitize Microsoft Office documents and PDF files (including those that are in ZIP archives) by removing active content, such as hyperlinks, embedded media, JavaScript, macros, and so on from the files (disarm) without affecting the integrity of its textual content (reconstruction). It allows network administrators to protect their users from malicious document files.

Files processed by CDR can be stored locally for quarantine on FortiAnalyzer, FortiSandbox, or FortiGate models with a hard disk. The original copies can also be obtained in the event of a false positive.

CDR is supported on HTTP, SMTP, POP3, and IMAP. Note that SMTP splice and client-comfort mode are not supported. CDR does not support flow-based inspection modes.

Sample topology

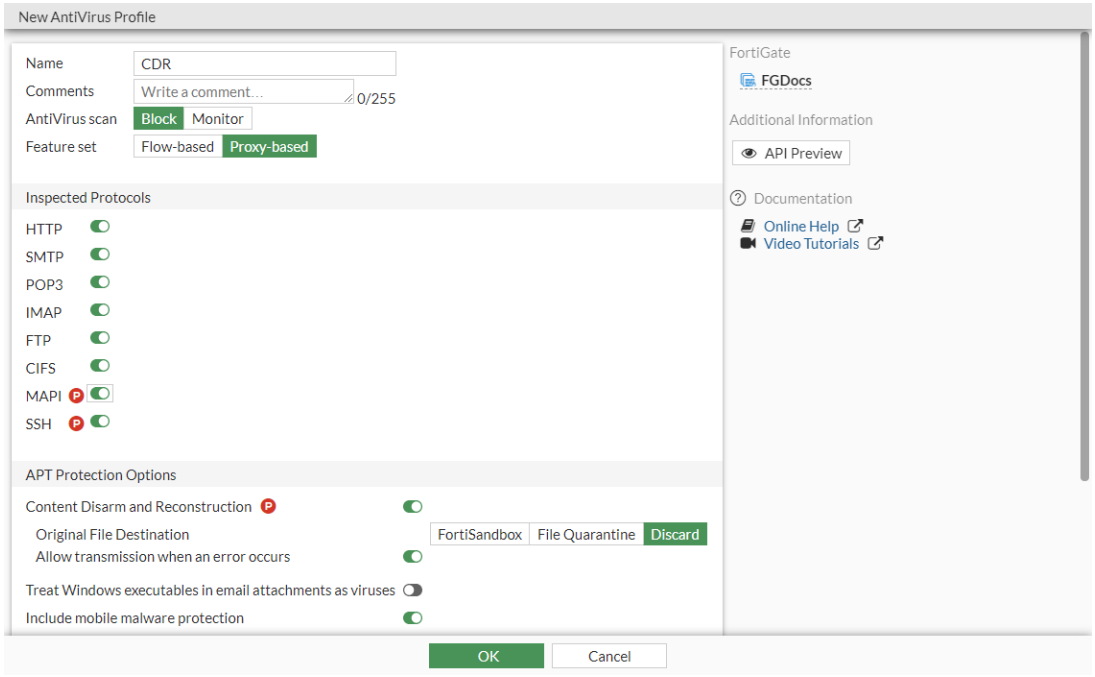


In this example, the a Microsoft Office document with an embedded hyperlink (that redirects to an external website) is sent to the receiver. When the user receives the file, the hyperlink in the document is deactivated.

To configure CDR:

1. Go to *Security Profiles* > *AntiVirus*.
2. Edit an antivirus profile, or create a new one.

3. Under *APT Protection Options*, enable *Content Disarm and Reconstruction*.



4. Select a quarantine location from the available options:

FortiSandbox	Saves the original document file to a connected FortiSandbox.
File Quarantine	Saves the original document file to disk (if possible) or a connected FortiAnalyzer based on the FortiGate log settings (`config log fortianalyzer setting`).
Discard	The default setting, which discards the original document file.

5. Click *OK*.

To edit the CDR detection parameters:

By default, stripping of all active Microsoft Office and PDF content types are enabled. In this example, stripping macros in Microsoft Office documents will be disabled.

```
config antivirus profile
    edit av
        config content-disarm
            set office-macro disable
            set detect-only {enable | disable}
            set cover-page {enable | disable}
        end
    next
end
```

Where:

detect-only	Only detect disarmable files, do not alter content. Disabled by default.
cover-page	Attach a cover page to the file's content when the file has been processed by CDR. Enabled by default.

FortiGuard outbreak prevention

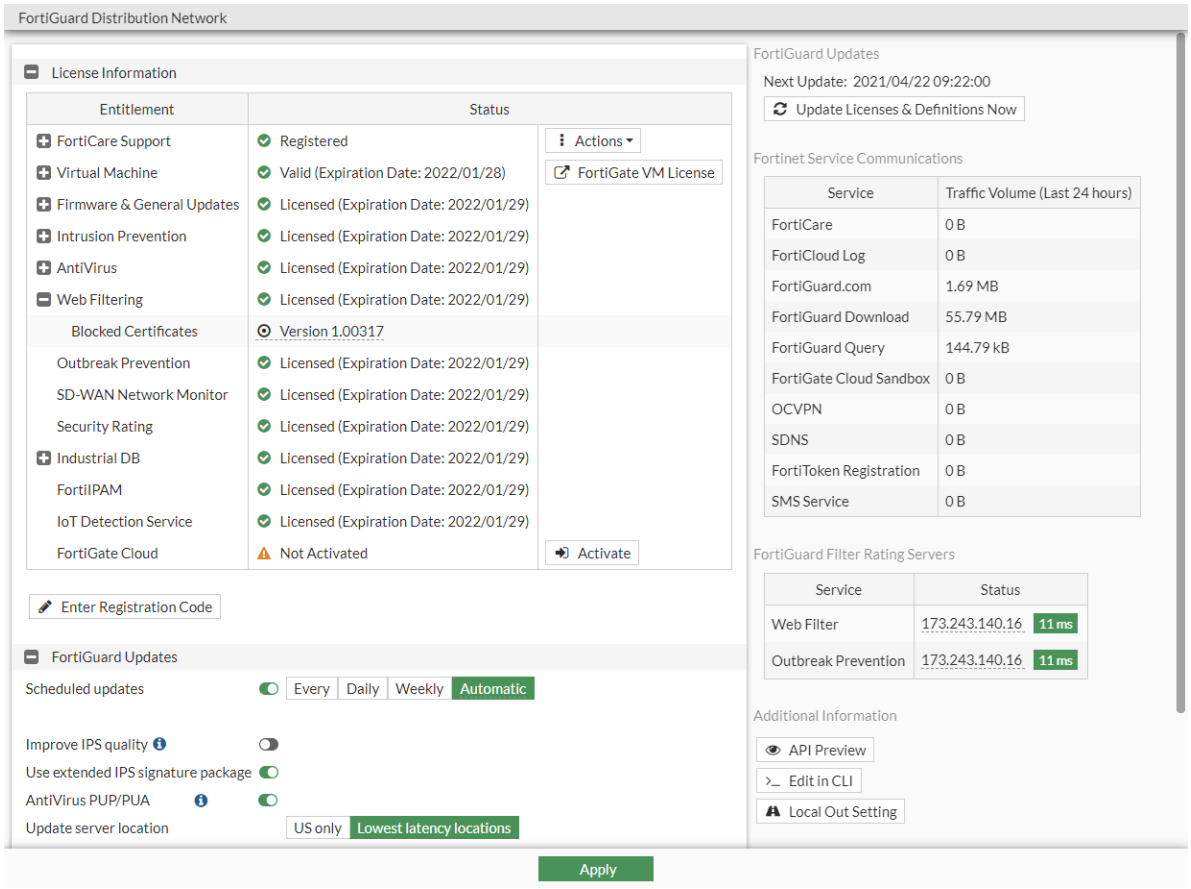
FortiGuard Virus Outbreak Protection Service (VOS) allows the FortiGate antivirus database to be subsidized with third-party malware hash signatures curated by FortiGuard. The hash signatures are obtained from FortiGuard's Global Threat Intelligence database. The antivirus database queries FortiGuard with the hash of a scanned file. If FortiGuard returns a match, the scanned file is deemed to be malicious. Enabling the AV engine scan is not required to use this feature.

FortiGuard VOS can be used in both proxy-based and flow-based policy inspections across all supported protocols.

The FortiGate must be registered with a valid FortiGuard outbreak prevention license.

To verify FortiGuard antivirus license information:

1. Go to *System* > *FortiGuard* and locate the *Outbreak Prevention* section in the table.



2. See the instructions in the video, How to Purchase or Renew FortiGuard Services, if required.

To enable FortiGuard outbreak prevention:

1. Go to *Security Profiles* > *AntiVirus*.
2. Edit an antivirus profile, or create a new one.

3. Under *Virus Outbreak Protection*, enable *Use FortiGuard outbreak prevention database*.
4. Click *OK*.

To verify FortiGuard antivirus license information:

```
# diagnose debug rating
Locale       : english

Service      : Web-filter
Status       : Enable
License      : Contract

Service      : Antispam
Status       : Disable

Service      : Virus Outbreak Prevention
Status       : Enable
License      : Contract

External malware block list

The external malware block list allows users to add their own malware signatures in the form of MD5, SHA1, and SHA256 hashes. The FortiGate's antivirus database retrieves an external malware hash list from a remote server and polls the hash list every *n* minutes for updates. Enabling the AV engine scan is not required to use this feature.

The external malware block list can be used in both proxy-based and flow-based policy inspections, but it is not supported in AV quick scan mode.

Note that using different types of hashes simultaneously may slow down the performance of malware scanning. It is recommended to use one type of hash.

To create the external block list:

1. Create the malware hash list.
   The malware hash list follows a strict format in order for its contents to be valid. Malware hash signature entries must be separated into each line. A valid signature needs to follow this format:

   ```
   # MD5 Entry with hash description
   aa67243f746e5d76f68ec809355ec234  md5_sample1

   # SHA1 Entry with hash description
   a57983cb39e25ab80d7d3dc05695dd0ee0e49766  sha1_sample2

   # SHA256 Entry with hash description
   ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379  sha256_sample1

   # Entry without hash description
   0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521

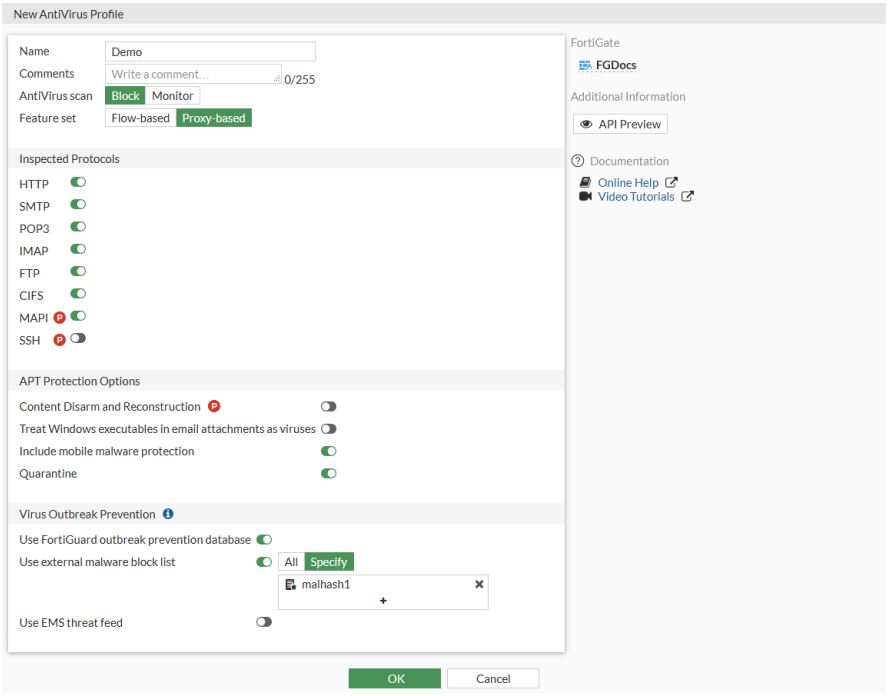
   # Invalid entries
   7688499dc71b932feb126347289c0b8a_md5_sample2
   7614e98badca10b5e2d08f8664c519b7a906fbd5180ea5d04a82fce9796a4b87sha256_sample3
   ```

2. Configure the external malware block list source:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. Click *Malware Hash*.
   c. Configure the settings as needed. The URI must point to the malware hash list on the remote server.
   d. Click *OK*.
3. To view entries inside the malware block list on the *External Connectors* page, hover over the malware hash card and click *View Entries*.

To configure antivirus to use an external block list in the GUI:

1. Go to *Security Profiles* > *AntiVirus* and edit the antivirus profile.
2. In the *Virus Outbreak Prevention* section, enable *Use external malware block list* and click *Specify*.
3. Click the + in the field and select a threat feed.

4. Optionally, enable *Quarantine*.



5. Configure the other settings as needed.
6. Click *OK*.

To configure antivirus to use an external block list in the CLI:

```
config antivirus profile
    edit "Demo"
        set feature-set proxy
        set mobile-malware-db enable
        config http
            set av-scan disable
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set content-disarm disable
        end
        config ftp
            set av-scan disable
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
        end
        config imap
            set av-scan monitor
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set executables default
```

```
        set content-disarm disable
    end
    config pop3
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
        set executables default
        set content-disarm disable
    end
    config smtp
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
        set executables default
        set content-disarm disable
    end
    config mapi
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
        set executables default
    end
    config nntp
        set av-scan disable
        set outbreak-prevention disable
        set external-blocklist disable
        set quarantine disable
        set emulator enable
    end
    config cifs
        set av-scan monitor
        set outbreak-prevention block
        set external-blocklist block
        set quarantine enable
        set emulator enable
    end
    config ssh
        set av-scan disable
        set outbreak-prevention disable
        set external-blocklist disable
        set quarantine disable
        set emulator enable
    end
    set outbreak-prevention-archive-scan enable
    set external-blocklist-archive-scan enable
    set external-blocklist-enable-all disable
    set external-blocklist "malhash1"
    set av-virus-log enable
    set av-block-log enable
    set extended-log disable
```

```
        set scan-mode default
    next
end
```

The quarantine setting is configured in each protocol (`set quarantine`). The malware threat feed is also specified (`set external-blocklist-enable-all disable`) to the threat connector, malhash1 (`set external-blocklist "malhash1"`).

To verify the scanunit daemon updated itself with the external hashes:

```
# diagnose sys scanunit malware-list list
md5 'aa67243f746e5d76f68ec809355ec234' profile 'malhash1' description 'md5_sample1'
sha1 'a57983cb39e25ab80d7d3dc05695dd0ee0e49766' profile 'malhash1' description 'sha1_
sample2'
sha256 '0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521' profile 'malhash1'
description ''
sha256 'ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379' profile 'malhash1'
description 'sha256_sample1'
```

Malware threat feed from EMS

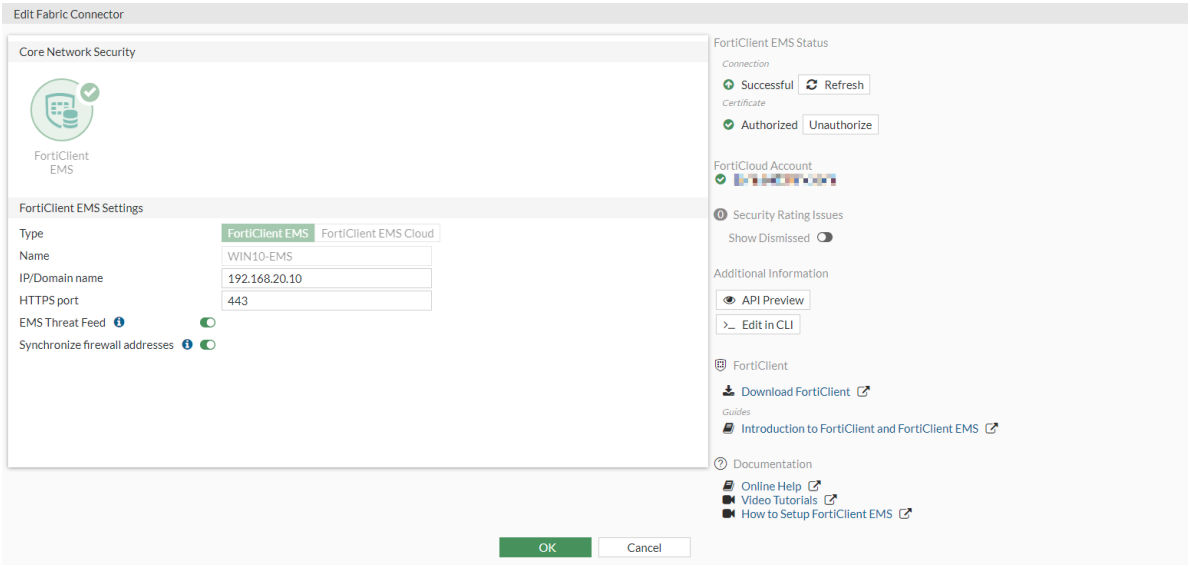
A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. This feature is currently only supported in proxy mode.

If an external malware blocklist and the FortiGuard outbreak prevention database are also enabled in the antivirus profile, the checking order is: AV local database, EMS threat feed, external malware blocklist, FortiGuard outbreak prevention database. If the EMS threat feed and external malware blocklist contain the same hash value, then the EMS infection will be reported if both of them are blocked.

To configure an EMS threat feed in an antivirus profile in the GUI:

1. Enable the EMS threat feed:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
   b. Enable *EMS Threat Feed*.

c. Configure the other settings if needed (see FortiClient EMS on page 1610 for more details).



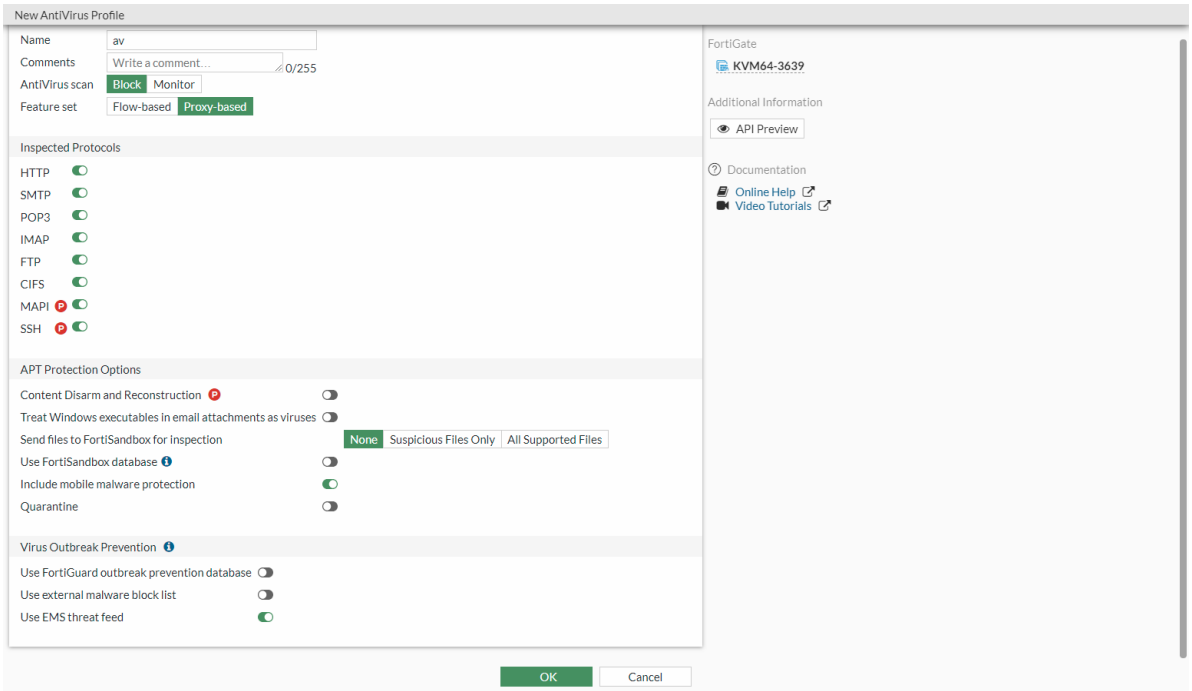
d. Click *OK*.

2. Create the antivirus profile:

a. Go to *Security Profiles* > *AntiVirus* and click *Create New*.

b. In the *Virus Outbreak Prevention* section, enable *Use EMS threat feed*.

c. Configure the other settings as needed.



d. Click *OK*.

To configure an EMS threat feed in an antivirus profile in the CLI:

1. Enable the EMS threat feed:

```
config endpoint-control fctems
    edit "WIN10-EMS"
        set fortinetone-cloud-authentication disable
        set server "192.168.20.10"
        set https-port 443
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-avatars enable
        set pull-tags enable
        set pull-malware-hash enable
        unset capabilities
        set call-timeout 30
        set websocket-override disable
    next
end
```

2. Create the antivirus profile:

```
config antivirus profile
    edit "av"
        config http
            set av-scan block
        end
        config ftp
            set av-scan block
        end
        config imap
            set av-scan block
        end
        config pop3
            set av-scan block
        end
        config smtp
            set av-scan block
        end
        config cifs
            set av-scan block
        end
        set external-blocklist-enable-all enable
        set ems-threat-feed enable
    next
end
```

Sample log

```
# execute log filter category utm-virus
# execute log display

```

Checking flow antivirus statistics

Two CLI commands are used for the antivirus statistics:

- `diagnose ips av stats show`
- `diagnose ips av stats clear`

SNMP uses an API to get the antivirus statistics.

To check flow antivirus statistics:

1. Create an antivirus profile:

```
config antivirus profile
    edit "av-test"
        config http
            set av-scan monitor
        end
        config ftp
            set av-scan block
            set quarantine enable
        end
    next
end
```

2. Enable the profile in a firewall policy:

```
config firewall policy
    edit 1
        set name "policy1"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set fsso disable
        set av-profile "av-test"
        set ssl-ssh-profile "custom-deep-inspection"
```

```
        set nat enable
    next
end
```

3. On the client PC, download the EICAR Standard Anti-Virus Test File via HTTP.
4. Check the antivirus statistics on the FortiGate. Since the action is set to monitor for HTTP, `HTTP virus detected` increases by 1:

```
# diagnose ips av stats show
AV stats:
HTTP virus detected: 1
HTTP virus blocked: 0
SMTP virus detected: 0
SMTP virus blocked: 0
POP3 virus detected: 0
POP3 virus blocked: 0
IMAP virus detected: 0
IMAP virus blocked: 0
NNTP virus detected: 0
NNTP virus blocked: 0
FTP virus detected: 0
FTP virus blocked: 0
SMB virus detected: 0
SMB virus blocked: 0
```

5. On the client PC, download the EICAR file via FTP.
6. Check the antivirus statistics on the FortiGate. Since quarantine is enabled for FTP, `FTP virus detected` and `FTP virus blocked` increase by 1:

```
# diagnose ips av stats show
AV stats:
HTTP virus detected: 1
HTTP virus blocked: 0
SMTP virus detected: 0
SMTP virus blocked: 0
POP3 virus detected: 0
POP3 virus blocked: 0
IMAP virus detected: 0
IMAP virus blocked: 0
NNTP virus detected: 0
NNTP virus blocked: 0
FTP virus detected: 1
FTP virus blocked: 1
SMB virus detected: 0
SMB virus blocked: 0
```

7. Check the antivirus statistics using an SNMP walk:

```
root:~# snmpwalk -c public -v 1 10.1.100.6 1.3.6.1.4.1.12356.101.8.2.1.1
iso.3.6.1.4.1.12356.101.8.2.1.1.1.1 = Counter32: 2  (fgAvVirusDetected)
iso.3.6.1.4.1.12356.101.8.2.1.1.2.1 = Counter32: 1  (fgAvVirusBlocked)
iso.3.6.1.4.1.12356.101.8.2.1.1.3.1 = Counter32: 1  (fgAvHTTPVirusDetected)
iso.3.6.1.4.1.12356.101.8.2.1.1.4.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.5.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.6.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.7.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.8.1 = Counter32: 0
```

```
iso.3.6.1.4.1.12356.101.8.2.1.1.9.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.10.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.11.1 = Counter32: 1  (fgAvFTPVirusDetected)
iso.3.6.1.4.1.12356.101.8.2.1.1.12.1 = Counter32: 1  (fgAvFTPVirusBlocked)
iso.3.6.1.4.1.12356.101.8.2.1.1.13.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.14.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.15.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.16.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.17.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.18.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.19.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.20.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.21.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.22.1 = Counter32: 0
```

8. Optionally, reset the antivirus statistics to zero:

```
# diagnose ips av stats clear
```

CIFS support

Antivirus scanning on Common Internet File System (CIFS) traffic is supported in flow-based and proxy-based inspection. The file filter profile handles the configuration of file filtering on CIFS. The antivirus profile handles the antivirus configuration for CIFS scanning.

File filtering for CIFS is performed by inspecting the first 4 KB of the file to identify the file's magic number. If a match occurs, CIFS file filtering prevents the CIFS command that contains that file from running. The file filter functions differently for un-encrypted and encrypted CIFS traffic:

- For un-encrypted CIFS traffic, the standalone file filter works in flow and proxy mode.
- For encrypted CIFS traffic, the CIFS profile must be enabled in the firewall policy because the SMB server's credential settings are still be configured in CIFS profile. Using the standalone file filter only works in proxy mode.

For a CIFS profile to be available for assignment in a policy, the policy must use proxy inspection mode. See Proxy mode inspection on page 741 for details. Note that in proxy inspection mode, special condition archive files (encrypted, corrupted, mailbomb, and so on) marked by the antivirus engine are blocked automatically.

Messages that are compressed with LZNT1, LZ77, and LZ77+Huffman algorithms can be scanned in proxy mode.

Configure file-type filtering and antivirus scanning on CIFS traffic

To configure file-type filtering and antivirus scanning on CIFS traffic:

1. Configure a CIFS domain controller on page 761
2. Configure a CIFS profile on page 762
3. Configure an antivirus profile on page 764

Configure a CIFS domain controller

The domain controller must be configured when CIFS traffic is encrypted. The configuration tells the FortiGate the network location of the domain controller and the superuser credentials.

To configure the CIFS domain controller:

```
config user domain-controller
    edit "SERVER_NAME"
        set hostname "host"
        set domain-name "EXAMPLE.COM"
        set username "admin-super"
        set password *********
        set ip 172.16.201.40
    next
end
```

Configure a CIFS profile

To create a CIFS profile, configure the server credential type and create a file filter profile.

Set the CIFS server credential type

The CIFS server credential type can be `none`, `credential-replication`, or `credential-keytab`.

none

The CIFS profile assumes the CIFS traffic is unencrypted. This is the default value.

```
config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type none
        end
    next
end
```

credential-replication

To decrypt CIFS traffic, FortiOS obtains the session key from the domain controller by logging in to the superuser account. The domain controller must be configured.

```
config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type credential-replication
            set domain-controller "SERVER_NAME"
        end
    next
end
```

Variable	Description
domain-controller <string>	The previously configured domain to decrypt CIFS traffic for.

credential-keytab

To decrypt CIFS traffic, FortiOS uses a series of keytab values. This method is used when the SMB connection is authenticated by Kerberos. Keytab entries must be configured, and are stored in FortiOS in plaintext.

```
config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type credential-keytab
            config server-keytab
                edit "keytab1"
                    set keytab
"BQIAAABFAAEAC0VYQU1QTEUuQ09NAAdleGFtcGxlAAAAAVUmAlwBABIAILdV5P6NXT8RrTvapcMJQxDYCjRQiD0Bzxh
wS9h0VgyM"
                next
            end
        end
    next
end
```

Variable	Description
keytab <keytab>	Base64 encoded keytab file containing the credentials of the server.

Configure CIFS file filtering

Multiple rules can be added to a file filter profile. See File filter on page 853.

To configure a file filter for CIFS traffic:

```
config file-filter profile
    edit "cifs"
        set comment "block zip files on unencrypted cifs traffic"
        set feature-set flow
        set replacemsg-group ''
        set log enable
        config rules
            edit "rule1"
                set protocol cifs
                set action block
                set direction any
                set password-protected any
                set file-type zip
            next
        end
    next
end
```

Variable	Description
comment <string>	A brief comment describing the entry.
feature-set {flow | proxy}	Flow or proxy mode feature set (default = `flow`).
replacemsg-group <string>	Replacement message group.
log {enable | disable}	Enable/disable file filter logging (default = `enable`).
scan-archive-contents [enable | disable]	Enable/disable scanning of archive contents (default = `enable`).

Variable	Description
protocol {http ftp smtp imap pop3 mapi cifs ssh}	Filter based on the specified protocol(s).
action {log-only | block}	The action to take for matched files: • `log-only`: Allow the content and write a log message (default). • `block`: Block the content and write a log message.
direction {incoming | outgoing | any}	Match files transmitted in the session's originating (`incoming`) and/or reply (`outgoing`) direction (default = `any`).
password-protected [yes | any]	Match only password-protected files (`yes`) or any file (default = `any`).
file-type <file_type>	The file types to be matched. See Supported file types on page 856 for details.

Configure an antivirus profile

The antivirus profile handles the antivirus configuration for CIFS scanning.

To configure an antivirus profile:

```
config antivirus profile
    edit "av"
        ...
        config cifs
            set av-scan {disable | block | monitor}
            set outbreak-prevention {disable | block | monitor}
            set external-blocklist {disable | block | monitor}
            set quarantine {enable | disable}
            set archive-block {encrypted corrupted partiallycorrupted multipart nested
mailbomb fileslimit timeout unhandled}
            set archive-log {encrypted corrupted partiallycorrupted multipart nested
mailbomb fileslimit timeout unhandled}
            set emulator {enable | disable}
        end
    next
end
```

Variable	Description
av-scan	Enable antivirus scan service: • `disable`: Disable (default). • `block`: Block the virus infected files. • `monitor`: Log the virus infected files.
outbreak-prevention {disable | block | monitor}	Enable the virus outbreak prevention service: • `disable`: Disable (default). • `block`: Block the matched files. • `monitor`: Log the matched files.
external-blocklist {disable | block | monitor}	Enable the external blocklist: • `disable`: Disable (default). • `block`: Block the matched files.

Variable	Description
	• `monitor`: Log the matched files.
quarantine {enable | disable}	Enable/disable quarantine for infected files (default = `disable`).
archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to block: • `encrypted`: Block encrypted archives. • `corrupted`: Block corrupted archives. • `partiallycorrupted`: Block partially corrupted archives. • `multipart`: Block multipart archives. • `nested`: Block nested archives. • `mailbomb`: Block mail bomb archives. • `fileslimit`: Block exceeded archive files limit. • `timeout`: Block scan timeout. • `unhandled`: Block archives that FortiOS cannot open.
archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to log: • `encrypted`: Log encrypted archives. • `corrupted`: Log corrupted archives. • `partiallycorrupted`: Log partially corrupted archives. • `multipart`: Log multipart archives. • `nested`: Log nested archives. • `mailbomb`: Log mail bomb archives. • `fileslimit`: Log exceeded archive files limit. • `timeout`: Log scan timeout. • `unhandled`: Log archives that FortiOS cannot open.
emulator {enable | disable}	Enable/disable the virus emulator (default = `enable`).

Log samples

File-type detection events generated by CIFS profiles are logged in the `utm-cifs` log category. Antivirus detection over the CIFS protocol generates logs in the `utm-virus` category. See the FortiOS Log Message Reference for more information.

Logs generated by CIFS profile file filter:

```

Using FortiSandbox with antivirus

Antivirus profiles can submit potential zero-day viruses to FortiSandbox for inspection. Based on FortiSandbox's analysis, the FortiGate can supplement its own antivirus database with FortiSandbox's threat intelligence to detect files determined as malicious or suspicious. This augments the FortiGate antivirus with zero-day detection.

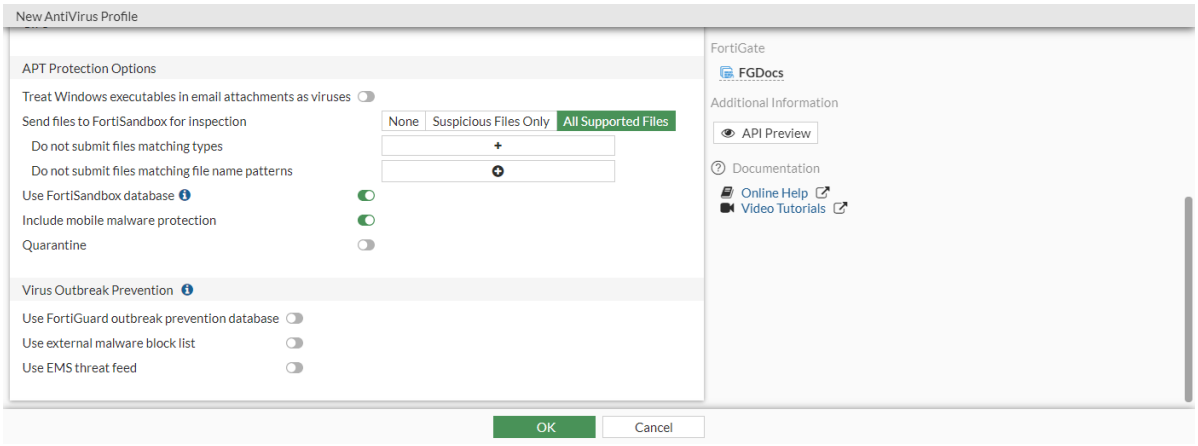
FortiSandbox can be used with antivirus in both proxy-based and flow-based inspection modes. The FortiGate first examines the file for any known viruses. When a match is found, the file is tagged as known malware. If no match is found, the files are forwarded to FortiSandbox using the following options:

- *All Supported Files*: all files matching the file types defined in the scan profile of the FortiSandbox are forwarded.
- *Suspicious Files Only*: files classified by the antivirus as having any possibility of active content are forwarded to FortiSandbox. When using FortiGate Cloud Sandbox, we recommend selecting this option due to its submission limits.
- *None*: files are not forwarded to FortiSandbox.

For more information, see Sandboxing on page 1605.

To enable FortiSandbox inspection in an antivirus profile:

1. Go to *Security Profiles* > *AntiVirus*.
2. Create, edit, or clone an antivirus profile.
3. In the *APT Protection Options* section, set *Send Files to FortiSandbox for Inspection* to either *Suspicious Files Only* or *All Supported Files*.
4. Optionally, for *Do not submit files matching types*, click the + to exclude certain file types from being sent to FortiSandbox.
5. Optionally, for *Do not submit files matching file name patterns*, click the + to enter a wildcard pattern to exclude files from being sent to FortiSandbox.



6. Enable *Use FortiSandbox Database*.
7. Click *OK*.

FortiGate diagnostics

To view the detection count:

```
# diagnose test application quarantined 7
Total: 0

Statistics:
        vfid: 0, detected: 2, clean: 1252, risk_low: 6, risk_med: 2, risk_high: 1, limit_
reached:0
```

To verify the address is configured correctly:

```
# diagnose test application quarantined 1
…
fortisandbox-fsb1 is enabled: analytics, realtime=yes, taskfull=no
addr=172.18.52.154/514, source-ip=0.0.0.0, keep-alive=no. ssl_opt=3, hmac_alg=0
…
```

To run the diagnostics for real-time debugging:

```
# diagnose debug application quarantined -1
# diagnose debug enable
```

To check the FortiGate Cloud server status:

```
# diagnose test application forticldd 3
…
    Active APTServer status:  up
```

To view FortiGate Cloud Sandbox submission statistics for advanced debugging:

```
# diagnose test application quarantined 2
```

FortiSandbox diagnostics

To run the OFTP debug for advanced debugging:

```
# diagnose-debug device <client serial number>
```

Web filter

Web filtering restricts or controls user access to web resources and can be applied to firewall policies using either policy-based or profile-based NGFW mode.

In FortiOS, there are three main components of web filtering:

- Web content filter: blocks web pages containing words or patterns that you specify.
- URL filter: uses URLs and URL patterns to block or exempt web pages from specific sources, or block malicious URLs discovered by FortiSandbox.
- FortiGuard Web Filtering service: provides many additional categories you can use to filter web traffic.

These components interact with each other to provide maximum control over what users on your network can view and protect your network from many internet content threats.

Web filters are applied in the following order:

1. URL filter
2. FortiGuard Web Filtering
3. Web content filter
4. Web script filter
5. Antivirus scanning

FortiOS includes three preloaded web filter profiles:

- *default*
- *monitor-all* (monitors and logs all URLs visited, flow-based)
- *wifi-default* (default configuration for offloading WiFi traffic)

You can customize these profiles, or you can create your own to manage network user access.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

The following topics provide information about web filters:

- URL filter on page 769
- FortiGuard filter on page 774
- Credential phishing prevention on page 780
- Additional antiphishing settings on page 783
- Usage quota on page 786
- Web content filter on page 788
- Advanced filters 1 on page 791
- Advanced filters 2 on page 794
- Web filter statistics on page 797
- URL certificate blocklist on page 798

URL filter

The URL filter uses specific URLs with patterns containing text and regular expressions so the FortiGate can process the traffic based on the filter action (exempt, block, allow, monitor) and web pages that match the criteria. Once a URL filter is configured, it can be applied to a firewall policy.

The following filter types are available:

URL filter type	Description
Simple	The FortiGate tries to strictly match the full context. For example, if you enter *www.facebook.com* in the *URL* field, it only matches traffic with *www.facebook.com*. It won't match *facebook.com* or *message.facebook.com*. When the FortiGate finds a match, it performs the selected URL action.
Regular expression/ wildcard	The FortiGate tries to match the pattern based on the rules of regular expressions or wildcards. For example, if you enter **fa** in the *URL* field, it matches all the content that has *fa* such as *www.facebook.com*, *message.facebook.com*, *fast.com*, and so on. When the FortiGate finds a match, it performs the selected URL action.

For more information, see the URL Filter expressions technical note in the Knowledge Base.

The following actions are available:

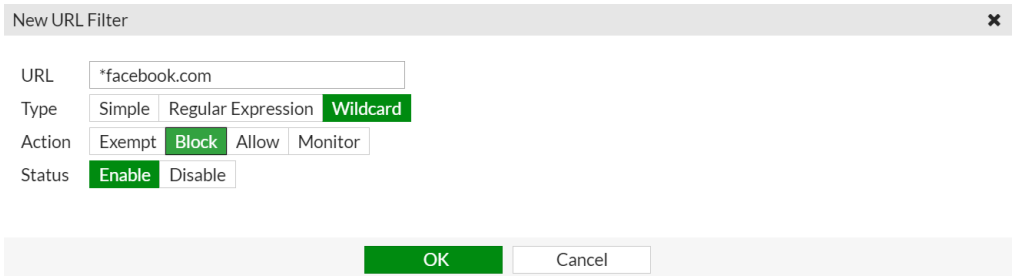
URL filter action	Description
Exempt	The traffic is allowed to bypass the remaining FortiGuard web filters, web content filters, web script filters, antivirus scanning, and DLP proxy operations.
Block	The FortiGate denies or blocks attempts to access any URL that matches the URL pattern. A replacement message is displayed.
Allow	The traffic is passed to the remaining FortiGuard web filters, web content filters, web script filters, antivirus proxy operations, and DLP proxy operations. If the URL does not appear in the URL list, the traffic is permitted.
Monitor	The traffic is processed the same way as the *Allow* action. For the *Monitor* action, a log message is generated each time a matching traffic pattern is established.

In the following example, a URL filter will be created to block the facebook.com URL using a wildcard.

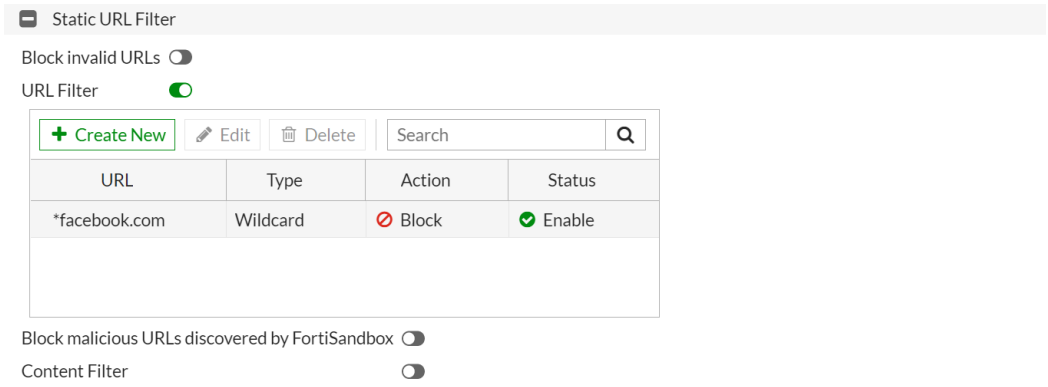
Configuring a URL filter in the GUI

To create a URL filter for Facebook:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *URL Filter*.
3. Click *Create New*. The *New URL Filter* pane opens.
4. For URL, enter **facebook.com*, for *Type*, select *Wildcard*, and for *Action*, select *Block*.



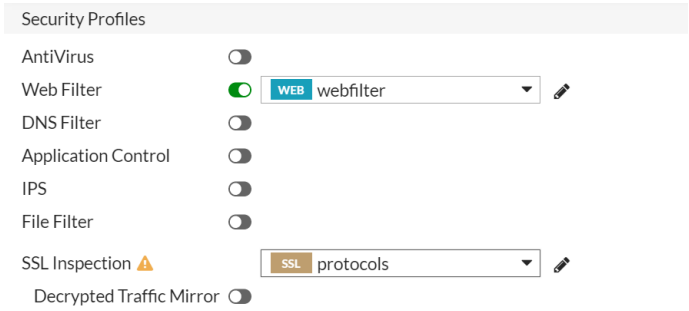
5. Click *OK*. The entry appears in the table.



6. Configure the other settings as needed.
7. Click *OK*.

To apply the web filter profile to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit a policy, or create a new one.
3. In the *Security Profiles* section, enable *Web Filter* and select the profile you created.



4. Configure the other settings as needed.
5. Click *OK*.

Configuring a URL filter in the CLI

To create a URL filter for Facebook:

```
config webfilter urlfilter
    edit 1
        set name "webfilter"
        config entries
            edit 1
                set url "*facebook.com"
                set type wildcard
                set action block
            next
        end
    next
end
```

To apply the URL filter to a web filter profile:

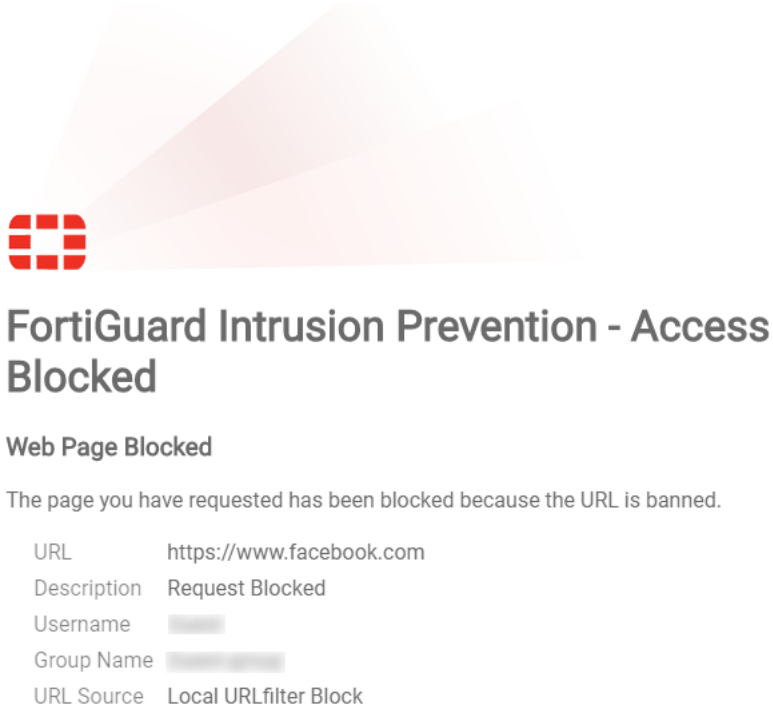
```
config webfilter profile
    edit "webfilter"
        config web
            set urlfilter-table 1
        end
        config ftgd-wf
            ...
        end
    next
end
```

To apply the web filter profile to a firewall policy:

```
config firewall policy
    edit 1
        set name "WF"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set webfilter-profile "webfilter"
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set nat enable
    next
end
```

Verifying the URL filter results

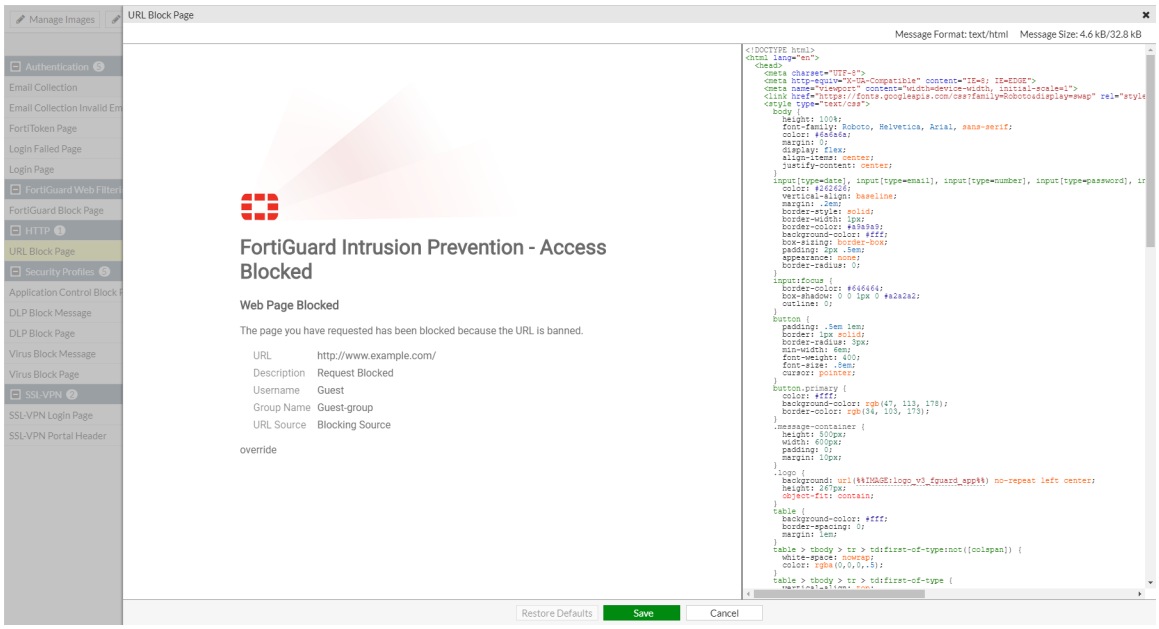
Verify the URL filter results by going to a blocked website. For example, when you go to the Facebook website, the replacement message appears:



To customize the URL web page blocked message:

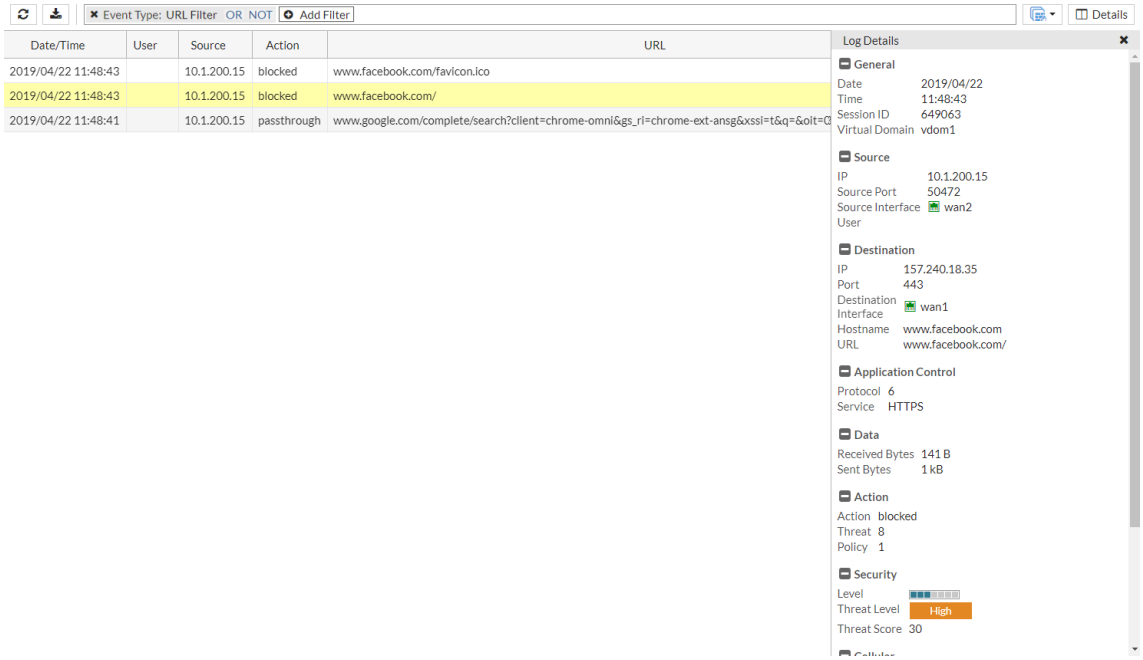
1. Go to *System* > *Replacement Messages*.
2. In the *HTTP* section, select *URL Block Page* and click *Edit*.

3. Edit the HTML to customize the message.



To check web filter logs in the GUI:

1. Go to *Log & Report* > *Web Filter*.
2. If there are a lot of log entries, click *Add Filter* and select *Event Type* > *urlfilter* to display logs generated by the URL filter.



To check web filter logs in the CLI:

```
# execute log filter category utm-webfilter
# execute log display
```

```
1: date=2019-04-22 time=11:48:43 logid="0315012544" type="utm" subtype="webfilter"
eventtype="urlfilter" level="warning" vd="vdom1" eventtime=1555958923322174610
urlfilteridx=0 urlsource="Local URLfilter Block" policyid=1 sessionid=649063
srcip=10.1.200.15 srcport=50472 srcintf="wan2" srcintfrole="wan" dstip=157.240.18.35
dstport=443 dstintf="wan1" dstintfrole="wan" proto=6 service="HTTPS"
hostname="www.facebook.com" profile="webfilter" action="blocked" reqtype="direct" url="/"
sentbyte=1171 rcvdbyte=141 direction="outgoing" msg="URL was blocked because it is in the
URL filter list" crscore=30 craction=8 crlevel="high"
```

FortiGuard filter

The FortiGuard filter enhances the web filter features by sorting billions of web pages into a wide range of categories that users can allow or block.

The FortiGuard Web Filtering service includes over 45 million individual website ratings that apply to more than two billion pages. When the FortiGuard filter is enabled in a web filter profile and applied to firewall policies, if a request for a web page appears in traffic controlled by one of the firewall policies, the URL is sent to the nearest FortiGuard server. The URL category or rating is returned. If the category is blocked, the FortiGate shows a replacement message in place of the requested page. If the category is not blocked, the page request is sent to the requested URL as normal.

To use this service, you must have a valid FortiGuard license.

The following actions are available:

FortiGuard web filter action	Description
Allow	Permit access to the sites in the category.
Monitor	Permit and log access to sites in the category. User quotas can be enabled for this option (see Usage quota on page 786).
Block	Prevent access to the sites in the category. Users trying to access a blocked site see a replacement message indicating the site is blocked.
Warning	Display a message to the user allowing them to continue if they choose.
Authenticate	Require the user to authenticate with the FortiGate before allowing access to the category or category group.
Disable	Remove the category from the from the web filter profile. This option is only available for local or remote categories from the right-click menu.

FortiGuard web filter categories

FortiGuard has many web filter categories, including two local categories and a special remote category. Refer to the following table for more information:

FortiGuard web filter category	Where to find more information
All URL categories	See Web Filter Categories.

FortiGuard web filter category	Where to find more information
Local categories	See Web rating override on page 919.
Remote category	See Threat feeds on page 1852.

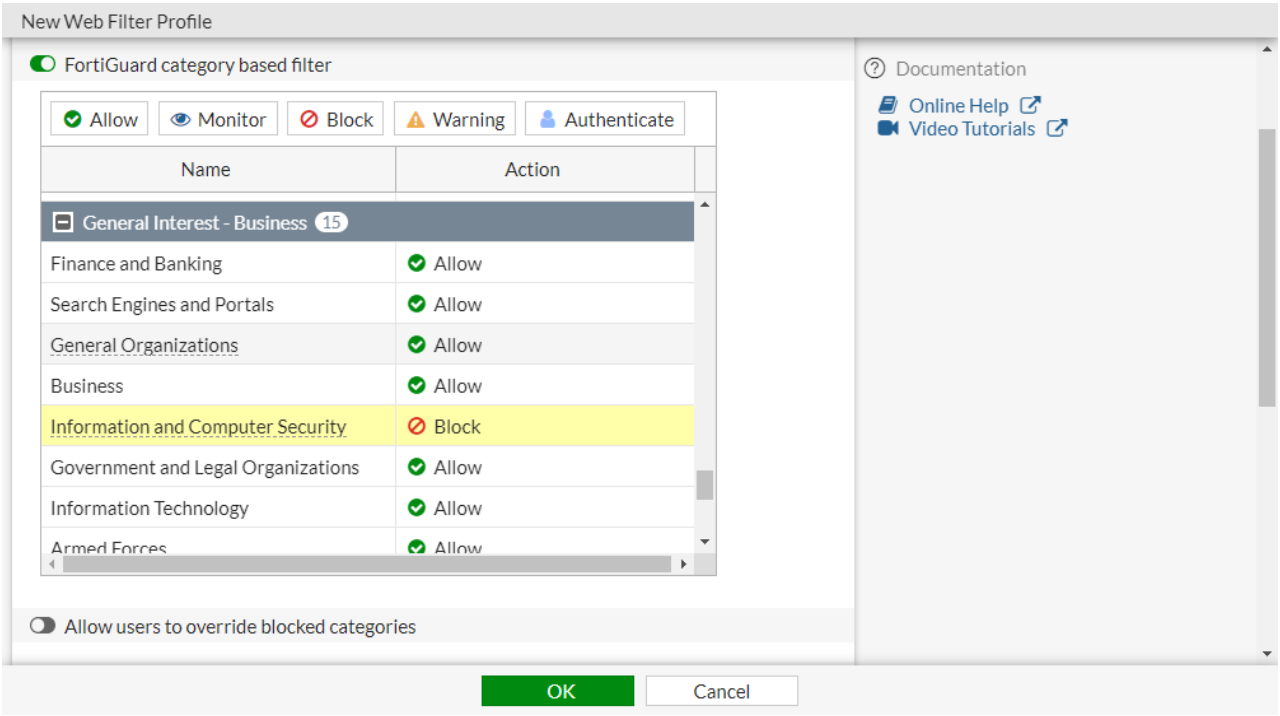
The priority of categories is local category > external category > FortiGuard built-in category. If a URL is configured as a local category, it only follows the behavior of the local category and not the external or FortiGuard built-in category.

Blocking a web category

The following example shows how to block a website based on its category. The information and computer security category (category 52) will be blocked.

To block a category in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information and Computer Security*, then click *Block*.



3. Configure the remaining settings as needed.
4. Click *OK*.

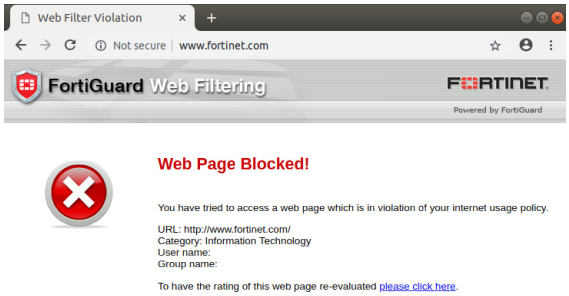
To block a category in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
                edit 1
```

```
                set category 52
                set action block
            next
        end
    end
next
end
```

To verify that the category is blocked:

1. Go to a website that belongs to the blocked category, such as www.fortinet.com. The page should be blocked and display a replacement message.



To view the log of a blocked website in the GUI:

1. Go to *Log & Report* > *Web Filter*.
2. Select an entry with *blocked* in the *Action* column and click *Details*.
3. 
To view the log of a blocked website in the CLI:

```
# execute log filter category utm-webfilter
# execute log display

1: date=2019-04-22 time=13:46:25 logid="0316013056" type="utm" subtype="webfilter"
eventtype="ftgd_blk" level="warning" vd="vdom1" eventtime=1555965984972459609 policyid=1
sessionid=659263 srcip=10.1.200.15 srcport=49234 srcintf="wan2" srcintfrole="wan"
dstip=54.183.57.55 dstport=80 dstintf="wan1" dstintfrole="wan" proto=6 service="HTTP"
hostname="www.fortinet.com" profile="webfilter" action="blocked" reqtype="direct" url="/"
```

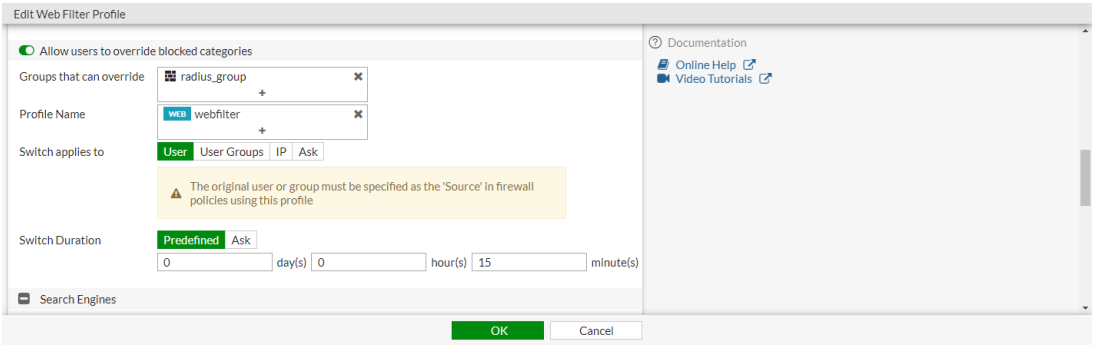
```
sentbyte=386 rcvdbyte=0 direction="outgoing" msg="URL belongs to a denied category in
policy" method="domain" cat=52 catdesc="Information Technology"
```

Allowing users to override blocked categories

There is an option to allow users with valid credentials to override blocked categories.

To allow users to override blocked categories in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. Enable *Allow users to override blocked categories*.
3. Enter information in the following fields:
   - *Groups that can override*
   - *Profile name*
   - *Switch applies to*
   - *Switch Duration*
4. Configure the other settings as needed.



5. Click *OK*.

To allow users to override blocked categories in the CLI:

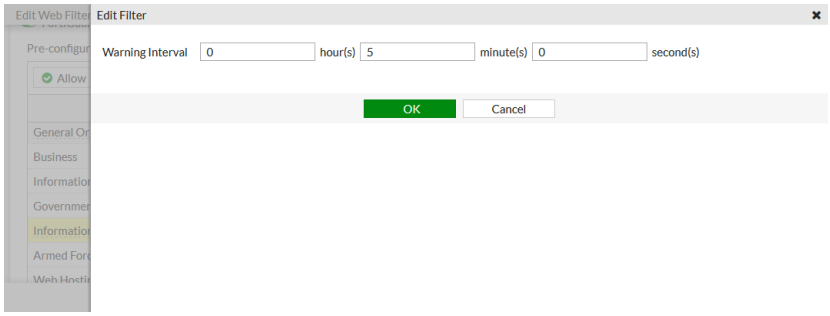
```
config webfilter profile
    edit "webfilter"
        set ovrd-perm bannedword-override urlfilter-override fortiguard-wf-override
contenttype-check-override
        config override
            set ovrd-user-group "radius_group"
            set profile "webfilter"
        end
        config ftgd-wf
            unset options
        end
    next
end
```

Issuing a warning on a web category

The following example shows how to issue a warning when a user visits a website in a specific category (information and computer security, category 52).

To configure a warning for a category in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information and Computer Security*, then click *Warning*.
3. Set the *Warning Interval*, then click *OK*.
   The warning interval is the amount of time until the warning appears again after the user proceeds past it.



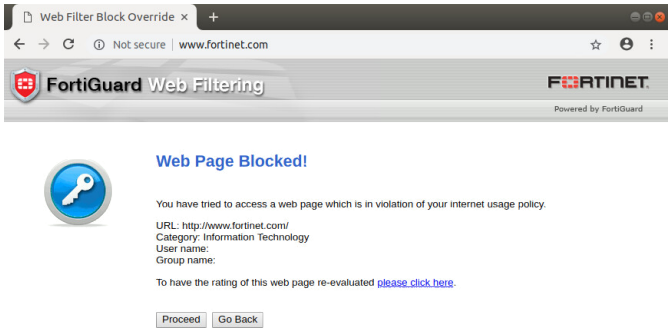
4. Configure the remaining settings as needed.
5. Click *OK*.

To configure a warning for a category in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set category 52
                    set action warning
                next
            end
        end
    next
end
```

To verify that the warning works:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed* or *Go Back*.



Authenticating a web category

The following example shows how to authenticate a website based on its category (information and computer security, category 52).

To authenticate a category in the GUI:

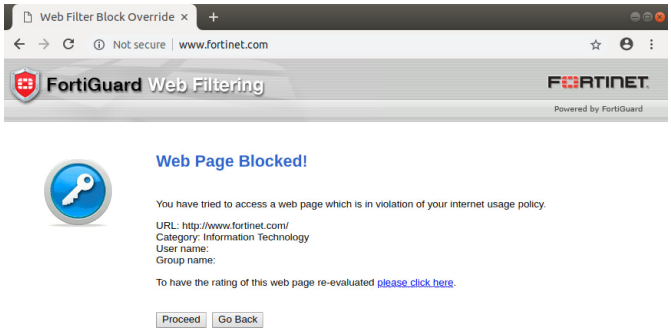
1. Go to *Security Profiles* > *Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, select *Information and Computer Security*, then click *Authenticate*.
3. Set the *Warning Interval* and select one or more user groups, then click *OK*.
4. Configure the remaining settings as needed.
5. Click *OK*.

To authenticate a category in the CLI:

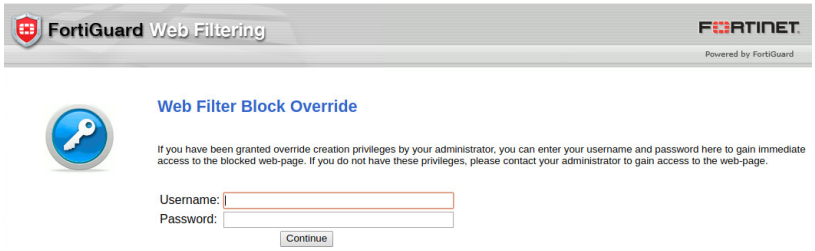
```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set category 52
                    set action authenticate
                    set auth-usr-grp "local_group"
                next
            end
        end
    next
end
```

To verify that you have configured authentication:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed*.



3. Enter the username and password for the configured user group, then click *Continue*.



Customizing the replacement message page

When the category action is *Block*, *Warning*, or *Authenticate*, you can customize the replacement message page that a user sees.

To customize the replacement message page:

1. Go to *Security Profiles* > *Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, right-click on a category and select *Customize*.
3. Select a *Replacement Message Group*. See Replacement message groups on page 1544 for details.
4. Optionally, click *Edit FortiGuard Block Page* or *Edit FortiGuard Warning Page* to make modifications.
5. Click *Save*.
6. Configure the remaining settings as needed.
7. Click *OK*.

Credential phishing prevention

When credential phishing prevention is enabled, the FortiGate scans for corporate credentials submitted to external websites and compares them to sensitive credentials stored in the corporate domain controller. Based on the configured antiphishing rules in proxy mode web filter profiles, the FortiGate will block the URL or alert the user if the credentials match ones that are stored on the corporate domain controller.

- The corporate domain controller must be configured in the `domain controller`.
- Credentials can be matched based on sAMAccountName, user principal name (UPN), or down-level logon name.

- The antiphishing profile defines the corporate domain controller, antiphishing check option, default action if no rules match, antiphishing status, and so on.
- Inspection entries in the profile define what action occurs when the submission request matches the specified FortiGuard categories.
- The profile scans for pre-defined and custom username and password fields in the HTTP request, such as `username`, `auth`, and `password`. You can evaluate custom fields by configuring custom patterns.
- The URL filter defines individual URLs that the antiphish action (block or log) is applied to when the URL submission request matches.

Web-based URL filter actions and FortiGuard category-based filtering have higher priority than antiphishing URL filter actions and FortiGuard filtering:

- If a request is blocked by the web-based URL filter or FortiGuard filter, there is no further antiphishing scanning. Antiphishing scanning only happens after the web-based URL filtes and FortiGuard filters allow the traffic.
- If a submission matches an entry in the URL filter table that has an antiphishing action, the defined action is taken. No further FortiGuard category-based rules are applied.
- Like firewall rules, the URL filter table and Fortiguard category-based antiphishing rules use a top-down priority. The rule that matches first is the one that is used.

In this example, URLs that match FortiGuard category 37 (social networking) will be blocked and other categories will be logged.

To configure credential phishing prevention:

1. Configure the corporate domain controller:

```
config user domain-controller
    edit "win2016"
        set hostname "win2016"
        set domain-name "corpserver.local"
        set username "Administrator"
        set password **********
        set ip <server_ip>
    next
end
```

The `hostname` and the `domain-name` are case sensitive.

2. Configure the antiphishing profile, which includes the FortiGuard category rule:

```
config webfilter profile
    edit <profile-name>
        set feature-set proxy
        ...
        config web
            ...
        end
        config antiphish
            set status enable
            set domain-controller "win2016"
```

```
            set default-action block
            set check-uri enable
            set check-basic-auth enable
            set max-body-len 65536
            config inspection-entries
                edit "inspect-37"
                    set fortiguard-category 37
                    set action block
                next
                edit "inspect-others"
                    set fortiguard-category all
                    set action log
                next
            end
            config custom-patterns
                edit "customer-name"
                    set category username
                next
                edit "customer-passwd"
                   set category password
                next
            end
        end
        ...
        set web-antiphishing-log enable
    next
end
```

- `check-uri` enables support for scanning HTTP GET URI parameters.
- `check-basic-auth` enables support for scanning the HTTP basic authentication field.

3. Configure the URL filter to scan specific URLs.
   The antiphish action is added to the URL filter table entry, and the URL filter is applied to the web filter profile:

```
config webfilter urlfilter
    edit 1
        set name "antiphish-table"
        config entries
            edit 1
                set url "www.example.com"
                set type simple
                set antiphish-action block
                set status enable
                set referrer-host ''
            next
        end
    next
end
config webfilter profile
    edit "<profile-name>"
        config web
            set urlfilter-table 1
        end
        ...
    next
end
```

4. Optionally, define custom patterns to scan fields other than the built-in username and password keywords:

```
config webfilter profile
    edit "<profile-name>"
        config custom-patterns
                edit "customer-name"
                    set category username
                next
                edit "customer-passwd"
                   set category password
                next
            end
        end
    next
end
```

Additional antiphishing settings

The following settings are available for antiphishing:

- Enable DNS service lookup in the domain controller so that the domain controller IP does not need to be configured. The DNS server will resolve the domain controller IP.
- Specify a source IP or port for the fetching domain controller.
- Use an LDAP server as a credential source (only the OpenLDAP server is supported).
- Block or log valid usernames regardless of password match.
- Use literal custom patterns type for username and password.
- Active Directory Lightweight Directory Services (AD LDS) support

Configuration examples

To enable DNS service lookup:

```
config user domain-controller
    edit "win2016"
        set ad-mode ds
        set dns-srv-lookup enable
        set hostname "win2016"
        set username "replicate"
        set password **********
        set domain-name "SMB2016.LAB"
    next
end
```

To specify the source IP and port for the fetching domain controller:

```
config user domain-controller
    edit "win2016"
        set ad-mode ds
        set hostname "win2016"
        set username "replicate"
        set password **********
        set ip-address 172.18.52.188
        set source-ip-address 172.16.100.1
```

```
        set source-port 2000
        set domain-name "SMB2016.LAB"

    next
end
```

To use an LDAP server as a credential store:

1. Configure the LDAP server:

```
config user ldap
    edit "openldap"
        set server "172.18.60.214"
        set cnid "cn"
        set dn "dc=qafsso,dc=com"
        set type regular
        set username "cn=Manager,dc=qafsso,dc=com"
        set password **********
        set antiphish enable
        set password-attr "userPassword"
    next
end
```

2. Configure the web filter profile:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set action block
                next
            end
        end
        config antiphish
            set status enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            set authentication ldap
            set ldap "openldap"
        end
        set log-all-url enable
    next
end
```

To configure username-only credential matching:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
```

```
            unset options
            ...
        end
        config antiphish
            set status enable
            set check-username-only enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            set domain-controller "win2016"
        end
        set log-all-url enable
    next
end
```

To configure different custom pattern types for usernames and passwords:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            ...
        end
        config antiphish
            set status enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            config custom-patterns
                edit "qwer"
                    set type literal
                next
                edit "[0-6]Dat*"
                next
                edit "dauw9"
                    set category password
                    set type literal
                next
                edit "[0-5]foo[1-4]"
                    set category password
                next
            end
            set domain-controller "win2016"
        end
        set log-all-url enable
    next
end
```

In this example, the `qwer` and `dauw9` entries use the literal type, while `[0-6]Dat*` and `[0-5]foo[1-4]` use the default regex type.

To configure Active Directory in LDS mode:

```
config user domain-controller
    edit "win2016adlds"
        set hostname "win2016adlds"
        set username "foo"
        set password **********
        set ip-address 192.168.10.9
        set domain-name "adlds.local"
        set ad-mode lds
        set adlds-dn "CN=adlds1part1,DC=ADLDS,DC=COM"
        set adlds-ip-address 192.168.10.9
        set adlds-port 3890
    next
end
```

Usage quota

In addition to using category and classification blocks and overrides to limit user access to URLs, you can set a daily quota by category, category group, or classification. Quotas allow access for a specified length of time or a specific bandwidth, and are calculated separately for each user. Quotas are reset daily at midnight.

Quotas can be set for the *Monitor*, *Warning*, or *Authenticate* actions. Once the quota is reached, the traffic is blocked and the replacement message page displays.

Quotas are only available in proxy-based inspection mode.

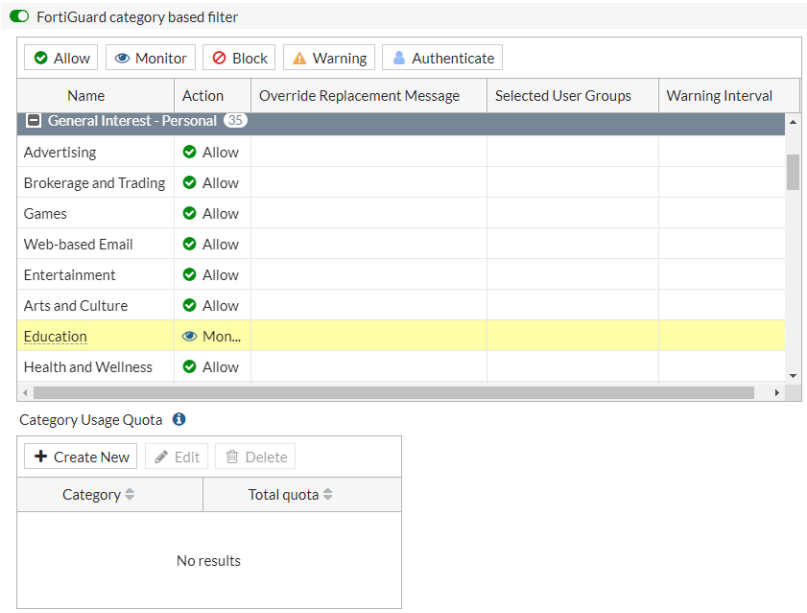
Configuring a quota

The following example shows how to set a time quota for the education category (category 30).

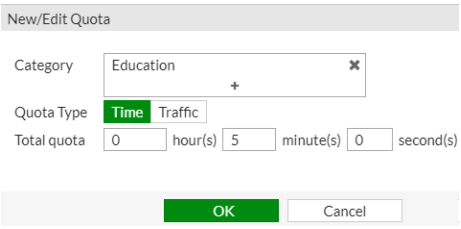
To configure a quota in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. For *Feature set*, select *Proxy-based*.
3. In the *FortiGuard category based filter* section, scroll to the *General Interest - Personal* and click the + to expand the section.

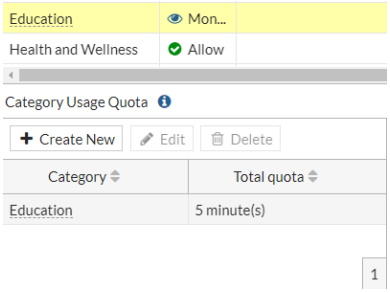
4. Select *Education*, then click *Monitor*.



5. In the *Category Usage Quota* section, click *Create New*.
   The *New/Edit Quota* pane opens.
6. In the *Category* field, select *Education*.
7. For the *Quota Type*, select *Time* and set the *Total quota* to 5 minutes.



8. Click *OK*. The entry appears in the table.



9. Configure the other settings as needed.
10. Click *OK*.

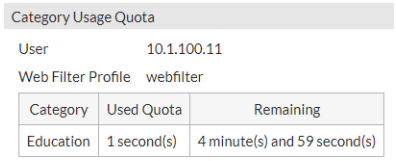
To configure a quota in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
           unset options
           config filters
```

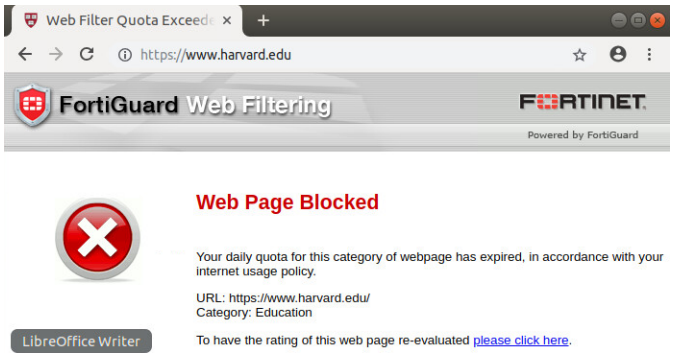
```
            edit 1
               set category 30
            next
         end
         config quota
            edit 1
               set category 30
               set type time
               set duration 5m
            next
         end
      end
   next
end
```

To verify the quota usage:

1. Go to a website that belongs to the education category, such https://www.harvard.edu/. You can view websites in that category at the moment.
2. In FortiOS, go to *Dashboard* > *FortiGuard Quota Monitor* to check the used and remaining time .



3. When the quota reaches its limit, traffic is blocked and the replacement page displays.



Web content filter

You can control access to web content by blocking webpages containing specific words or patterns. This helps to prevent access to pages with questionable material. You can specify words, phrases, patterns, wildcards, and regular expressions to match content on webpages. You can use multiple web content filter lists and select the best one for each web filter profile. The maximum number of web content patterns in a list is 5000.

When configuring a web content filter list, the following patterns are available:

Web content pattern type	Description
Wildcard	Use this setting to block or exempt one word or text strings of up to 80 characters. You can also use wildcard symbols such as *?* or * to represent one or more characters. For example, a wildcard expression *forti*.com* matches *fortinet.com* and *fortiguard.com*. The * represents any character appearing any number of times.
Regular expression	Use this setting to block or exempt patterns of regular expressions that use some of the same symbols as wildcard expressions, but for different purposes. In regular expressions, * represents the character before the symbol. For example, *forti*.com* matches *fortiii.com* but not *fortinet.com* or *fortiice.com*. In this case, the symbol * represents *i* appearing any number of times.

Content evaluation

The web content filter scans the content of every webpage that is accepted by a firewall policy. The system administrator can specify banned words and phrases and attach a numerical value (or score) to the importance of those words and phrases. When the web content filter scan detects banned content, it adds the scores of banned words and phrases found on that page. If the sum is higher than a threshold set in the web filter profile, the FortiGate blocks the page.

The default score for web content filter is 10 and the default threshold is 10. This means that by default, a webpage is blocked by a single match. These settings can only be configured in the CLI.

Banned words or phrases are evaluated according to the following rules:

- The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.
- The score for any word in a phrase without quotation marks is counted.
- The score for a phrase in quotation marks is counted only if it appears exactly as written.

The following table is an example of how rules are applied to the webpage contents . For example, a webpage contains only this sentence:

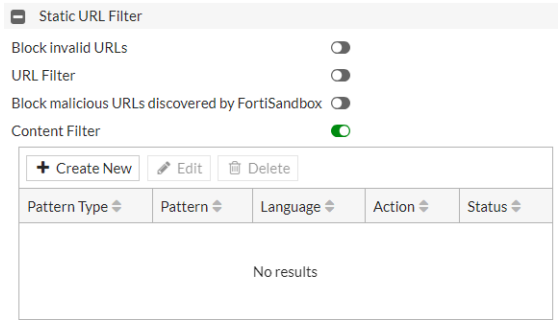
The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.

Banned pattern	Assigned score	Score added to the sum for the entire page	Threshold score	Comment
word	20	20	20	Appears twice but is only counted once. The webpage is blocked.
word phrase	20	40	20	Each word appears twice but is only counted once, giving a total score of 40. The webpage is blocked.
word sentence	20	20	20	*word* appears twice and *sentence* does not appear, but since any word in a phrase without quotation marks is counted, the score for this pattern is 20. The webpage is blocked.

Banned pattern	Assigned score	Score added to the sum for the entire page	Threshold score	Comment
"word sentence"	20	0	20	This phrase does not appear exactly as written. The webpage is allowed.
"word or phrase"	20	20	20	This phrase appears twice but is only counted once. The webpage is blocked.

To configure a web content filter in the GUI:

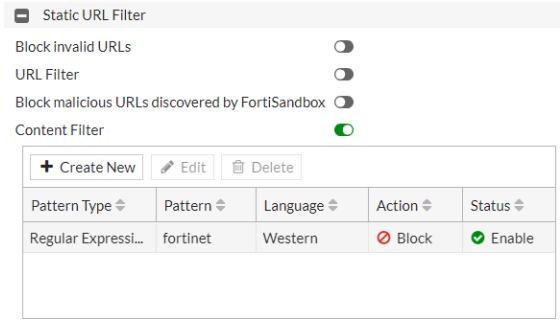
1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Content Filter*.



3. Click *Create New*. The *New Web Content Filter* pane opens.
4. Configure the following settings:

Pattern Type	Regular Expression
Pattern	fortinet
Language	Western
Action	Block
Status	Enable

5. Click *OK*. The entry appears in the table.



6. Configure the other settings as needed.
7. Click *OK*.

To configure a web content filter in the CLI:

1. Create the content (banned word) table:

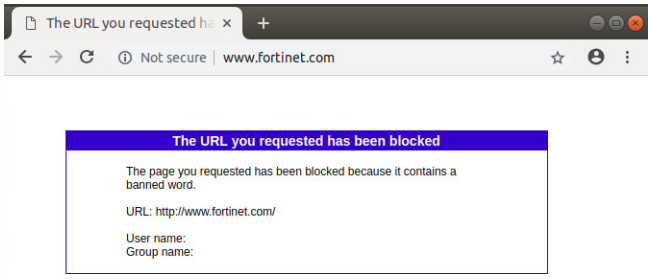
```
config webfilter content
   edit 1
      set name "webfilter"
      config entries
         edit "fortinet"
           set pattern-type regexp
           set status enable
           set lang western
           set score 10
           set action block
         next
      end
   next
end
```

2. Apply the content table to the web filter profile:

```
config webfilter profile
   edit "webfilter"
      config web
         set bword-threshold 10
         set bword-table 1
      end
      config ftgd-wf
         unset options
      end
   next
end
```

To verify the content filter:

1. Go to a website with the word *fortinet*, such as www.fortinet.com.
The website is blocked and a replacement page displays:



Advanced filters 1

This topic gives examples of the following advanced filter features:

- Block malicious URLs discovered by FortiSandbox on page 792
- Allow websites when a rating error occurs on page 792
- Rate URLs by domain and IP address on page 793
- Block invalid URLs on page 793

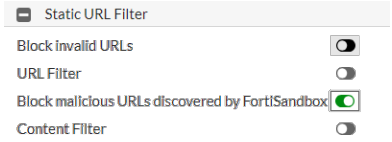
Block malicious URLs discovered by FortiSandbox

This setting blocks malicious URLs that FortiSandbox finds. Your FortiGate must be connected to a registered FortiSandbox.

For information on configuring FortiSandbox, see Using FortiSandbox with antivirus on page 766.

To block malicious URLs discovered by FortiSandbox in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block malicious URLs discovered by FortiSandbox*.



3. Click *OK*.

To block malicious URLs discovered by FortiSandbox in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set blocklist enable
        end
    next
end
```

Allow websites when a rating error occurs

If you do not have a FortiGuard license, but you have enabled services that need a FortiGuard license (such as FortiGuard filter), then you will get a rating error message.

Use this setting to allow access to websites that return a rating error from the FortiGuard Web Filter service.

To allow websites with rating errors in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Allow websites when a rating error occurs*.
3. Click *OK*.

To allow websites with rating errors in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            set options error-allow
        end
    next
end
```

Rate URLs by domain and IP address

If you enable this setting, in addition to only sending domain information to FortiGuard for rating, the FortiGate always sends both the URL domain name and the TCP/IP packet's IP address (except for private IP addresses) to FortiGuard for the rating.

The FortiGuard server might return a different category of IP address and URL domain. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. This rating weight is hard-coded in FortiOS.

For example, if we use a spoof IP of Google as www.irs.gov, the FortiGate will send both the IP address and domain name to FortiGuard to get the rating. We get two different ratings: one is the search engine and portals that belong to the Google IP, the second is the government and legal organizations that belongs to www.irs.gov. Because the search engine and portals rating has a higher weight than government and legal organizations, the traffic is rated as search engine and portals.

To rate URLs by domain and IP address in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Rate URLs by domain and IP address*.
3. Click *OK*.

To rate URLs by domain and IP address in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            set options rate-server-ip
        end
    next
end
```

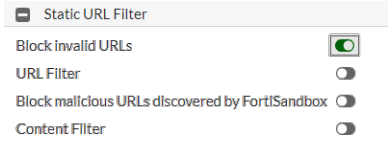
Block invalid URLs

Use this setting to block websites when their SSL certificate CN field does not contain a valid domain name.

This option also blocks URLs that contains spaces. If there is a space in the URL, it must be written as *%20* in the URL path.

To block invalid URLs in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block invalid URLs* .



3. Click *OK*.

To block invalid URLs in the CLI:

```
config webfilter profile
    edit "webfilter"
        set options block-invalid-url
    next
end
```

Advanced filters 2

This topic gives examples of the following advanced filter features:

- Safe search on page 794
- Log all search keywords on page 795
- Restrict Google account usage to specific domains on page 795
- HTTP POST action on page 796
- Remove Java applets, ActiveX, and cookies on page 796

These advanced filters are only available in proxy-based inspection mode.

Safe search

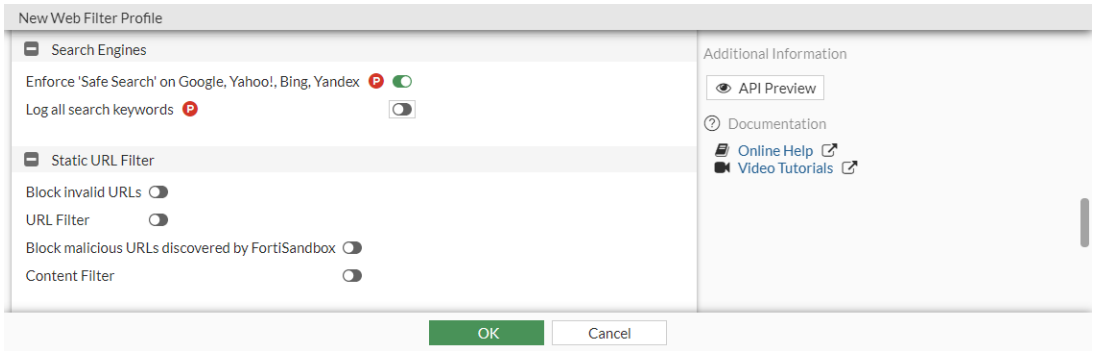
This setting applies to popular search sites and prevents explicit websites and images from appearing in search results.

The supported search sites are:

- Google
- Yahoo
- Bing
- Yandex

To enable safe search in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Enforce 'Safe Search' on Google, Yahoo!, Bing, Yandex*.



3. Click *OK*.

To enable safe search in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set safe-search url header
        end
    next
end
```

Log all search keywords

Use this setting to log all search phrases.

To enable logging search keywords in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Log all search keywords*.
3. Click *OK*.

To enable logging search keywords in the CLI:

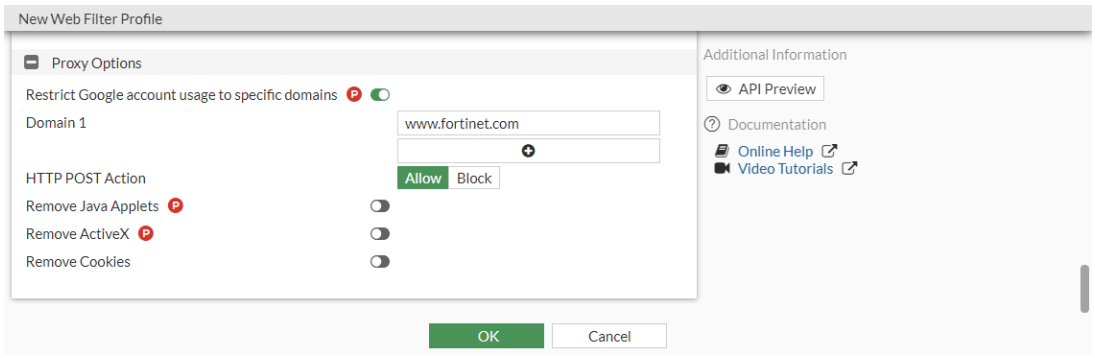
```
config webfilter profile
    edit "webfilter"
        config web
            set log-search enable
        end
    next
end
```

Restrict Google account usage to specific domains

Use this setting to block access to certain Google accounts and services, while allowing access to accounts with domains in the exception list.

To enable Google account restriction:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, enable *Restrict Google account usage to specific domains*.
3. Click the + and enter the domains that Google can access, such as www.fortinet.com.



4. Click *OK*.

When you try to use Google services like Gmail, only traffic from the domain of www.fortinet.com can go through. Traffic from other domains is blocked.

HTTP POST action

Use this setting to select the action to take with HTTP POST traffic. HTTP POST is the command used by the browser when you send information, such as a completed form or a file you are uploading to a web server. The action options are allow or block. The default is allow.

To configure HTTP POST in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, for *HTTP POST Action*, select *Allow* or *Block*.
3. Click *OK*.

To configure HTTP POST in the CLI:

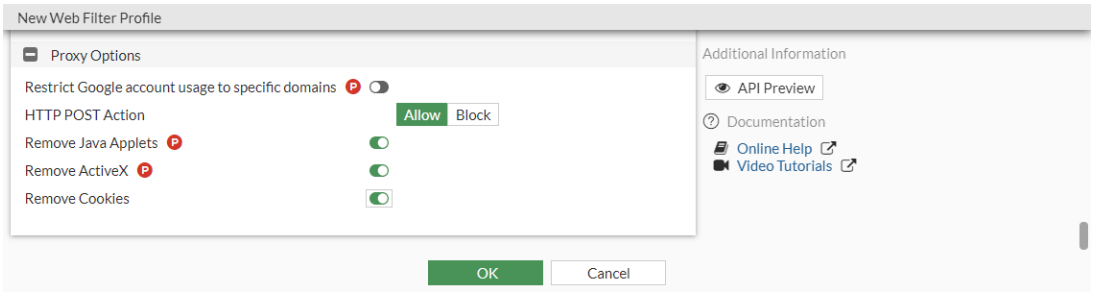
```
config webfilter profile
    edit "webfilter"
        set post-action {normal | block}
        config ftgd-wf
            unset options
        end
    next
end
```

Remove Java applets, ActiveX, and cookies

Web filter profiles have settings to filter Java applets, ActiveX, and cookies from web traffic. Note that if these filters are enabled, websites using Java applets, ActiveX, and cookies might not function properly.

To enable these filters in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile. and go to the *Proxy Options* section.
2. In the *Proxy Options* section, enabled the filters you want to use: *Remove Java Applets*, *Remove ActiveX*, or *Remove Cookies*.



To enable these filters in the CLI:

```
config webfilter profile
   edit "webfilter"
      set options {activexfilter cookiefilter javafilter}
      config ftgd-wf
         unset options
      end
   next
end
```

Web filter statistics

FortiOS provides diagnostics commands to view web filter statistics reports, which are either proxy-based or flow-based. The commands are available in both VDOM and global command lines.

Proxy-based web filter statistics report

Use the `diagnose wad filter vd {<VDOM> | global}` command to filter for per-VDOM or global statistics reports.

In the following example, there are two VDOMs (root and vdom1) using proxy-based policies that have web filter profiles enabled.

To view per-VDOM statistics reports:

```
(global) # diagnose wad filter vd root
Drop_unknown_session is enabled.

(global) # diagnose wad stats filter list
filtering of vdom root
  dlp          = 0
  content-type = 0
  urls:
    examined = 6
    allowed = 3
    blocked = 0
    logged = 0
    overridden = 0

(global) # diagnose wad filter vd vdom1
(global) # diagnose wad stats filter list
filtering of vdom vdom1
  dlp          = 0
  content-type = 0
  urls:
    examined = 13
    allowed = 2
    blocked = 9
    logged = 8
    overridden = 0

(global) # diagnose wad filter vd ALL
(global) # diagnose wad stats filter list
```

```
    filtering of all accessible vdoms
      dlp          = 0
      content-type = 0
      urls:
        examined = 19
        allowed = 5
        blocked = 9
        logged = 8
        overridden = 0
```

Flow-based web filter statistics report

Use the `diagnose webfilter stats list {<VDOM> | global}` command to check the flow-based web filter statistics.

In the following example, the VDOM is using flow-based policies that have web filter profiles enabled.

To view web filter statistics:

```
# diagnose webfilter stats list root
Proxy/flow URL filter stats:
request:   9474
blocked:   8606
allowed:   868
overridden:0
logged:    8606
pending:   0
```

URL certificate blocklist

As increasing numbers of malware have started to use SSL to attempt to bypass IPS, maintaining a fingerprint-based certificate blocklist is useful to block botnet communication that relies on SSL.

This feature adds a dynamic package that is distributed by FortiGuard and is part of the Web Filtering service. It is enabled by default for SSL/SSH profiles, and can be configured using the following CLI commands:

```
config vdom
    edit <vdom>
        config firewall ssl-ssh-profile
            edit "certificate-inspection"
                set block-blocklisted-certificates enable
            next
            edit "deep-inspection"
                set block-blocklisted-certificates enable
            next
        end
    next
end
```

Video filter

With the video filter profile, you can filter YouTube videos based on FortiGuard categories or by channel ID for a more granular override of a single channel, user, or video. The video filter profile is currently supported in proxy-based policies and requires SSL deep inspection. The FortiGuard Video filtering service is based on a valid FortiGuard web filter license.

The following topics provide information about video filters:

- Filtering based on FortiGuard categories on page 799
- Filtering based on YouTube channel on page 803

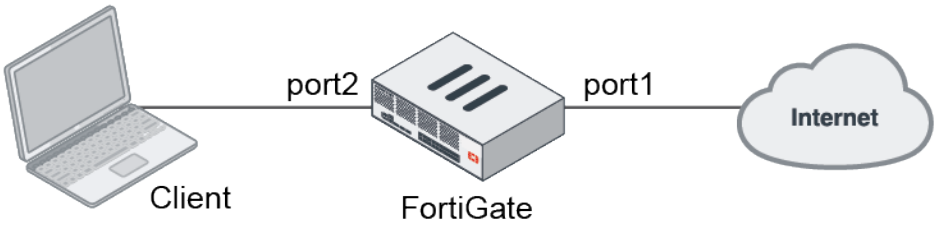
Filtering based on FortiGuard categories

Video filtering is only proxy-based and uses the WAD daemon to inspect the video in four phases:

1. When the WAD receives a video query from a client, it extracts the video ID (`vid`) and tries to check the category and channel from the local cache.
2. If there is no match from the local cache, it connects to the FortiGuard video rating server to query the video category.
3. If the FortiGuard rating fails, it uses the `videofilter.youtube-key` to communicate with the Google API server to get its category and channel ID. This is the API query setting and it requires the user's own YouTube API key string. This configuration is optional.
4. If all steps fail to match the video, the WAD calls on the IPS engine to match the video ID and channel ID from the application signature database.

The FortiGuard anycast service must be enabled to use this feature.

In the following example, a new video filter profile is created to block the Knowledge category.



In the firewall policy settings, the default application control profile is recommended because it blocks QUIC traffic. Many Google services use the QUIC protocol on UDP/443. By blocking QUIC, YouTube will use standard HTTPS TCP/443 connections.

To configure a video filter based on FortiGuard categories in the GUI:

1. Create the video filter profile:
   a. Go to *Security Profiles* > *Video Filter* and click *Create New*.
   b. Enter a name (*category_filter*).
   c. In the *FortiGuard Category Based Filter* section, set the *Knowledge* category *Action* to *Block*.
   d. Click *OK*.
2. Create the firewall policy:
   a. Enter the following:

Incoming Interface	port2
Outgoing Interface	port1
Source	All
Destination	All
Service	All
Inspection Mode	Proxy-based
NAT	Enable
Video Filter	Enable and select *category_filter*
Application Control	Enable and select *default*
SSL Inspection	deep-inspection
Log Allowed Traffic	All Sessions

   b. Configure the other settings as needed and click *OK*.

To configure a video filter based on FortiGuard categories in the CLI:

1. Create the video filter profile:

```
config videofilter profile
    edit "category_filter"
        config fortiguard-category
            edit 5
                set action block
                set category-id 4
                set log enable
            next
        end
    next
end
```

2. Create the firewall policy:

```
config firewall policy
    edit 10
        set name "client_yt_v4"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
```

```
            set dstaddr "all"
            set action accept
            set schedule "always"
            set service "ALL"
            set utm-status enable
            set inspection-mode proxy
            set ssl-ssh-profile "deep-inspection"
            set application-list "default"
            set videofilter-profile "category_filter"
            set logtraffic all
            set nat enable
        next
    end
```

To configure the YouTube API key (optional):

```
config videofilter youtube-key
    edit 1
        set key ********
        set status enable
    next
end
```

Verifying that the video is blocked

When a user browses to YouTube and selects a video based in the Knowledge category, a replacement message will appear. This replacement message says the URL is blocked, and displays the URL of the YouTube video. On the FortiGate, verify the forward traffic and web filter logs.

Sample forward traffic log

```
2: date=2021-04-27 time=15:27:13 eventtime=1619562433424944288 tz="-0700" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="vdom1" srcip=10.1.100.11 srcport=60628
srcintf="port2" srcintfrole="undefined" dstip=172.217.3.206 dstport=443 dstintf="port1"
dstintfrole="undefined" srccountry="Reserved" dstcountry="United States" sessionid=8230
proto=6 action="client-rst" policyid=10 policytype="policy" poluuid="a5e991ba-a799-51eb-
4efe-ce32b9f70b75" policyname="client_yt_v4" service="HTTPS" trandisp="snat"
transip=172.16.200.1 transport=60628 duration=95 sentbyte=3546 rcvdbyte=21653 sentpkt=24
rcvdpkt=34 appcat="unscanned" wanin=2152 wanout=2290 lanin=2000 lanout=2000
utmaction="block" countweb=3 utmref=65532-0
```

Sample web filter log

```
1: date=2021-04-27 time=15:25:37 eventtime=1619562338128550236 tz="-0700" logid="0347013664"
type="utm" subtype="webfilter" eventtype="videofilter-category" level="warning" vd="vdom1"
msg="Video category is blocked." policyid=10 sessionid=8230 srcip=10.1.100.11
dstip=172.217.3.206 srcport=60628 dstport=443 srcintf="port2" srcintfrole="undefined"
dstintf="port1" dstintfrole="undefined" proto=6 service="HTTPS" action="blocked"
videoinfosource="Cache" profile="category_filter" videoid="EAyo3_zJj5c" videocategoryid=4
hostname="www.youtube.com" url="https://www.youtube.com/watch?v=EAyo3_zJj5c"
```

Troubleshooting and debugging

To verify if the FortiGuard video filtering license is valid:

```
# get system fortiguard

fortiguard-anycast  : enable
fortiguard-anycast-source: debug
protocol            : https
port                : 443
...
webfilter-license   : Contract
webfilter-expiration: Fri Dec 13 2030
...
videofilter-license : Contract
videofilter-expiration: Fri Dec 13 2030
```

The `videofilter` license should be synchronized with the `webfilter` license.

To verify the WAD worker is running:

```
# diagnose test app wad 1000
Process [0]: WAD manager type=manager(0) pid=232 diagnosis=yes.
Process [1]: type=worker(2) index=0 pid=294 state=running
              diagnosis=no debug=enable valgrind=supported/disabled
...
Process [6]: type=YouTube-filter-cache-service(9) index=0 pid=290 state=running
              diagnosis=no debug=enable valgrind=unsupported/disabled
...
```

To display and debug video filter cache:

```
# diagnose test app wad ?
....
        321:  Display Video Filter Cache stats.
        322:  Reset Video Filter Cache stats.
        323:  Flush Video Filter Cache entries.
        324:  Display Video Filter module stats.
        325:  Request category list from Youtube API.
        326:  Display FTGD agent module stats.
        327:  Reset FTGD agent module stats.
        328:  Toggle Video Filter Cache Check.
        329:  Toggle Video Filter FTGD Query.
        330:  Toggle Video Filter API Check.
```

To enable real-time WAD debugs:

```
# diagnose wad debug enable level verbose
# diagnose wad debug enable category video
# diagnose debug enable
```

Sample output

```

Filtering based on YouTube channel

Video filtering can be configured to filter specific YouTube channels. The following identifiers are used for YouTube channels:

```
given <channel-id>, affect on:
   www.youtube.com/channel/<channel-id>
   www.youtube.com/user/<user-id>
```

matches channel-id from <meta itemprop="channelId" content="<channel-id>">

```
   www.youtube.com/watch?v=<string>
```

matches channel-id from <meta itemprop="channelId" content="<channel-id>">

The *Restrict YouTube access* setting in the video filter profile adds the HTTP header `YouTube-Restrict: Strict` or `YouTube-Restrict: Moderate` into the HTTP request when enabled. When YouTube reads this header, it applies the appropriate content restriction based on the selected mode. YouTube Restricted Mode is an optional setting that filters out potentially mature videos while leaving a large number of videos still available (see Restrict YouTube content

available to users and Manage your organization's YouTube settings for more information). Google defines the restricted YouTube access modes as follows:

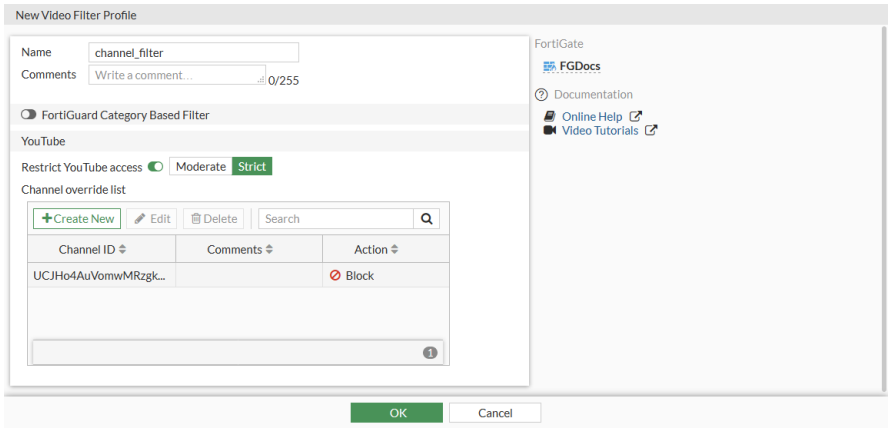
- Strict Restricted YouTube access: this setting is the most restrictive. Strict Restricted Mode does not block all videos, but works as a filter to screen out many videos based on an automated system, while leaving some videos still available for viewing.
- Moderate Restricted YouTube access: this setting is similar to Strict Restricted Mode but makes a much larger collection of videos available.

Restrict YouTube access has changed in 7.0.1. Upgrading to 7.0.1 is recommended to use this feature.

To configure a video filter based on a YouTube channel in the GUI:

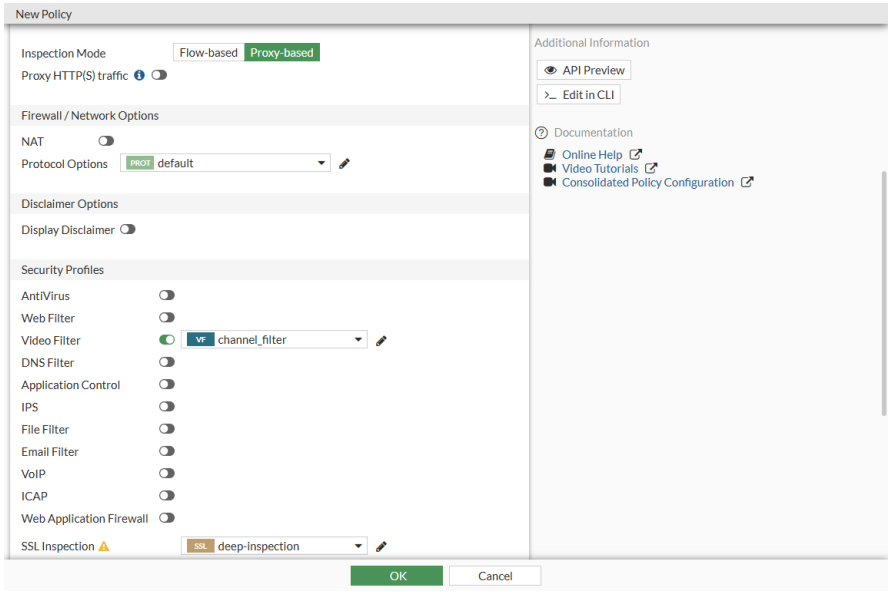
1. Go to *Security Profiles* > *Video Filter* and click *Create New*.
2. In the *Channel override list* section, click *Create New*. The *New Channel Override Entry* pane opens.
   a. Enter a *Channel ID* and select an *Action*.

   b. Click *OK*.
3. Optionally, enable *Restrict YouTube access* and select a setting (*Moderate* or *Strict*).



4. Click *OK*.
5. Create the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Inspection Mode*, select *Proxy-based*.
   c. Enable *Video Filter* and select the profile you created.

d. For *SSL Inspection*, select *deep-inspection*.



e. Configure the other settings as needed and click *OK*.

To configure a video filter based on a YouTube channel in the CLI:

1. Create the channel filter:

```
config videofilter youtube-channel-filter
    edit 1
        set name "channel_filter"
        config entries
            edit 1
                set action block
                set channel-id "UCJHo4AuVomwMRzgkA5DQEOA"
            next
        end
    next
end
```

2. Create the video filter profile:

```
config videofilter profile
    edit "channel_filter"
        set youtube-channel-filter 1
        set youtube-restrict strict
    next
end
```

3. Create the firewall policy:

```
config firewall policy
    edit 1
        set name "video-filter"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
```

```
            set action accept
            set schedule "always"
            set service "ALL"
            set utm-status enable
            set inspection-mode proxy
            set ssl-ssh-profile "deep-inspection"
            set videofilter-profile "channel_filter"
            set nat disable
        next
    end
```

Vimeo access

The video filter profile includes a setting to restrict Vimeo access, which can only be configured in the CLI.

To restrict Vimeo access:

```
config videofilter profile
    edit <name>
        set vimeo-restrict {7 | 134}
    next
end
```

`vimeo-restrict {7 | 134}`	Set the Vimeo restriction: • 7: do not show mature content • 134: do not show unrated and mature content

DNS filter

You can apply DNS category filtering to control user access to web resources. You can customize the default profile, or create your own to manage network user access and apply it to a firewall policy, or you can add it to a DNS server on a FortiGate interface. For more information about configuring DNS, see DNS on page 177.

DNS filtering has the following features:

- FortiGuard Filtering: filters the DNS request based on the FortiGuard domain rating.
- Botnet C&C domain blocking: blocks the DNS request for the known botnet C&C domains.
- External dynamic category domain filtering: allows you to define your own domain category.
- DNS safe search: enforces Google, Bing, and YouTube safe addresses for parental controls.
- Local domain filter: allows you to define your own domain list to block or allow.
- External IP block list: allows you to define an IP block list to block resolved IPs that match this list.
- DNS translation: maps the resolved result to another IP that you define.

DNS filtering connects to the FortiGuard secure DNS server over anycast by default. For more information about this configuration, see DNS over TLS and HTTPS on page 188.

In FortiOS 6.4, the DNS proxy daemon handles the DNS filter in flow and proxy mode policies. Starting in 7.0, the IPS engine handles the DNS filter in flow mode policies and queries the FortiGuard web filter server for FortiGuard categories. In proxy mode, the DNS proxy daemon handles the DNS filter and queries the FortiGuard SDNS server for

FortiGuard categories. When a DNS filter profile is enabled in `config system dns-server`, the DNS proxy daemon handles the traffic.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

DNS filter profiles cannot be used in firewall policies with NGFW policy-based mode; see Profile-based NGFW vs policy-based NGFW on page 526 for more information. They can be used in the DNS server; see FortiGate DNS server on page 180 for more information.

FortiGuard DNS rating service

DNS over TLS connections to the FortiGuard secure DNS server is supported. The CLI options are only available when `fortiguard-anycast` is enabled. DNS filtering connects to the FortiGuard secure DNS server over anycast by default.

To configure DoT to the secure DNS server in the CLI:

```
config system fortiguard
    set fortiguard-anycast enable
    set fortiguard-anycast-source fortinet
    set anycast-sdns-server-ip 0.0.0.0
    set anycast-sdns-server-port 853
end
```

The following topics provide information about DNS filters:

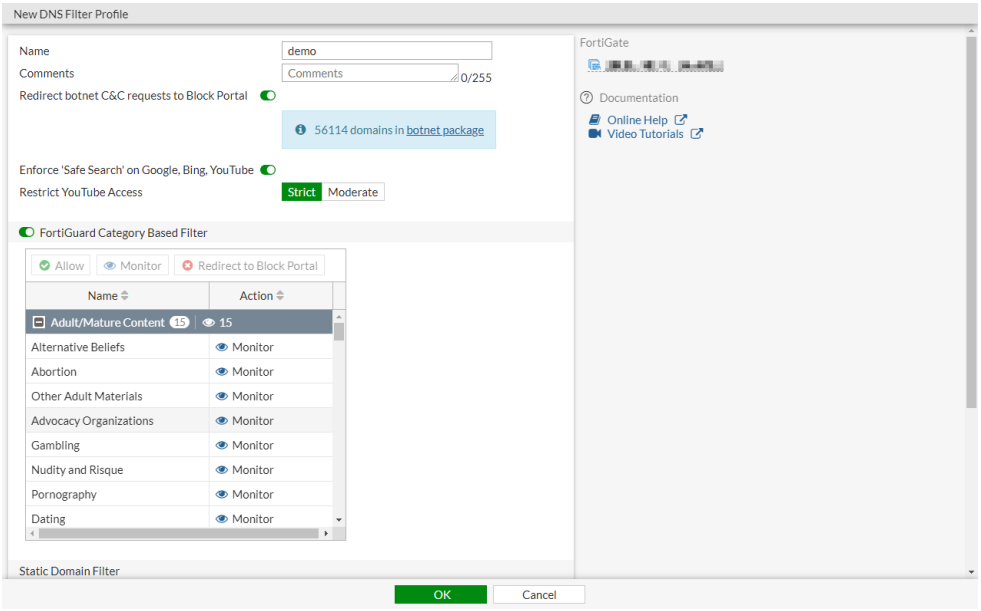
- Configuring a DNS filter profile on page 807
- FortiGuard category-based DNS domain filtering on page 810
- Botnet C&C domain blocking on page 812
- DNS safe search on page 816
- Local domain filter on page 818
- DNS translation on page 821
- Applying DNS filter to FortiGate DNS server on page 824
- DNS inspection with DoT and DoH on page 825
- Troubleshooting for DNS filter on page 829

Configuring a DNS filter profile

Once a DNS filter is configured, it can be applied to a firewall policy.

To configure DNS Filter profile in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Configure the settings as needed.



3. Click *OK*.

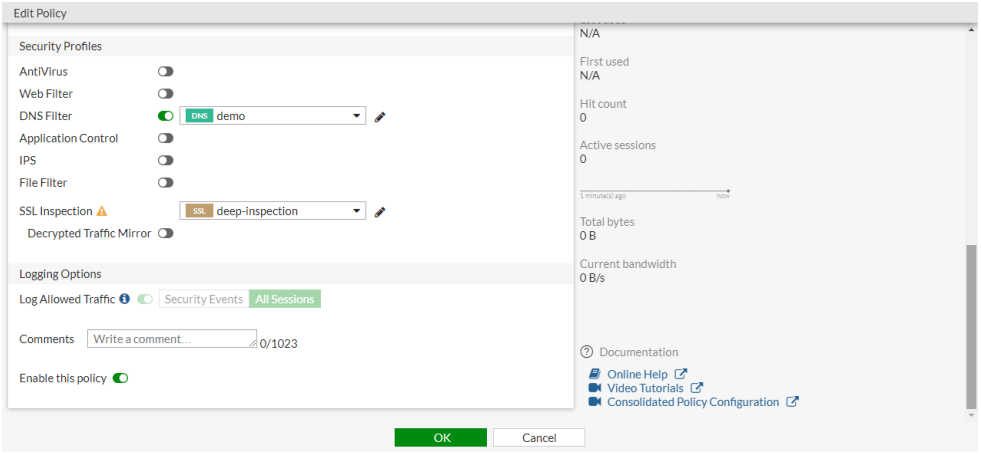
To create or configure DNS Filter profile in the CLI:

```
config dnsfilter profile
    edit "demo"
        set comment ''
        config domain-filter
            unset domain-filter-table
        end
        config ftgd-dns
            set options error-allow
            config filters
                edit 2
                    set category 2
                    set action monitor
                next
                edit 7
                    set category 7
                    set action block
                next
                ...
                edit 22
                    set category 0
                    set action monitor
                next
            end
        end
        set log-all-domain enable
        set sdns-ftgd-err-log enable
        set sdns-domain-log enable
```

```
        set block-action redirect
        set block-botnet enable
        set safe-search enable
        set redirect-portal 93.184.216.34
        set youtube-restrict strict
    next
end
```

To apply DNS Filter profile to the policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.
2. In the *Security Profiles* section, enable *DNS Filter* and select the DNS filter.



3. Configure the other settings as needed.
4. Click *OK*.

To apply DNS Filter profile to the policy in the CLI:

```
config firewall policy
    edit 1
        set name "Demo"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set fsso disable
        set dnsfilter-profile "demo"
        set profile-protocol-options "default"
        set ssl-ssh-profile "deep-inspection"
        set nat enable
    next
end
```

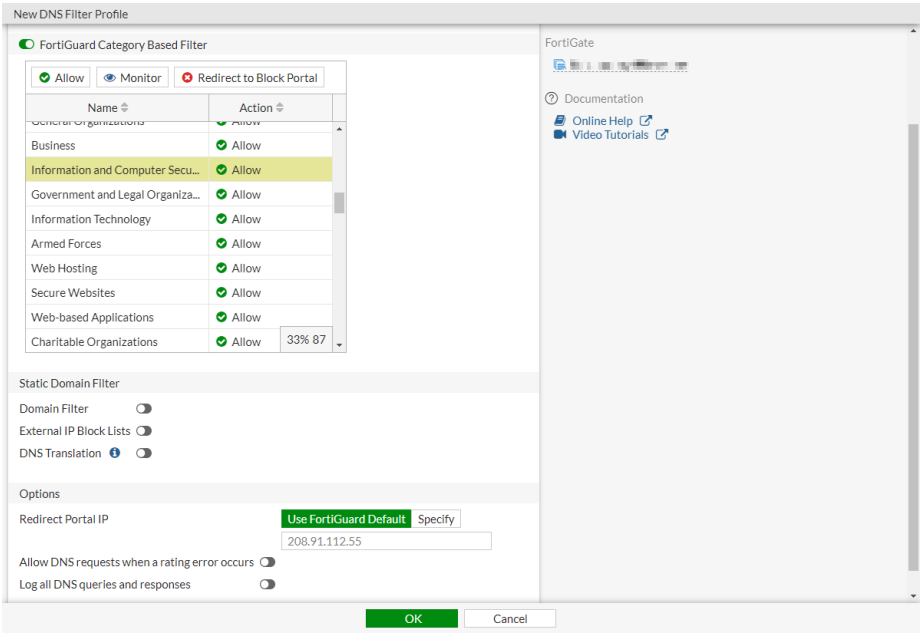
FortiGuard category-based DNS domain filtering

You can use the FortiGuard category-based DNS domain filter to inspect DNS traffic. This makes use of FortiGuard's continuously updated domain rating database for more reliable protection.

The FortiGate must have a FortiGuard Web Filter license to use the FortiGuard category-based filter.

To configure FortiGuard category-based DNS domain filtering in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *FortiGuard Category Based Filter*.
3. Select the category and then select *Allow*, *Monitor*, or *Redirect to Block Portal* for that category.
4. In the *Options* section, select a setting for *Redirect Portal IP*. Select either *Use FortiGuard Default* (208.91.112.55) or click *Specify* and enter another portal IP. The FortiGate will use the portal IP to replace the resolved IP in the DNS response packet.



5. Click *OK*.

To configure FortiGuard category-based DNS domain filtering in the CLI:

```
config dnsfilter profile
   edit "demo"
      set comment ''
      config domain-filter
         unset domain-filter-table
      end
      config ftgd-dns
         set options error-allow
         config filters
             edit 2
```

```
                set category 2
                set action monitor
            next
            edit 7
                set category 7
                set action monitor
            next
            ...
            edit 22
                set category 0
                set action monitor
            next
        end
    end
    set log-all-domain enable
    set sdns-ftgd-err-log enable
    set sdns-domain-log enable
    set block-action {redirect | block}
    set block-botnet enable
    set safe-search enable
    set redirect-portal 93.184.216.34
    set youtube-restrict strict
  next
end
```

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, to do a DNS query for some domains. For example:

```
#dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 61252
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 13; ADDITIONAL: 11

;; QUESTION SECTION:
;; www.example.com.             IN      A

;; ANSWER SECTION:
www.example.com.        17164   IN      A       93.184.216.34

;; AUTHORITY SECTION:

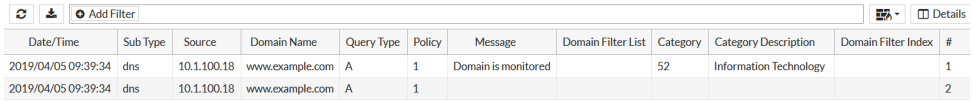
;; Received 509 B
;; Time 2019-04-05 09:39:33 PDT
;; From 172.16.95.16@53(UDP) in 3.8 ms
```

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *DNS Query*. There are logs for the DNS traffic that just passed through the FortiGate with the FortiGuard rating for the domain name.



Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description	Domain Filter Index	#
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1	Domain is monitored		52	Information Technology		1
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1						2

To check the DNS filter log in the CLI:

```
#execute log filter category utm-dns

# execute log display
2 logs found.
2 logs returned.

1: date=2019-04-05 time=09:39:34 logid="1501054802" type="utm" subtype="dns" eventtype="dns-
response" level="notice" vd="vdom1" eventtime=1554482373 policyid=1 sessionid=50868

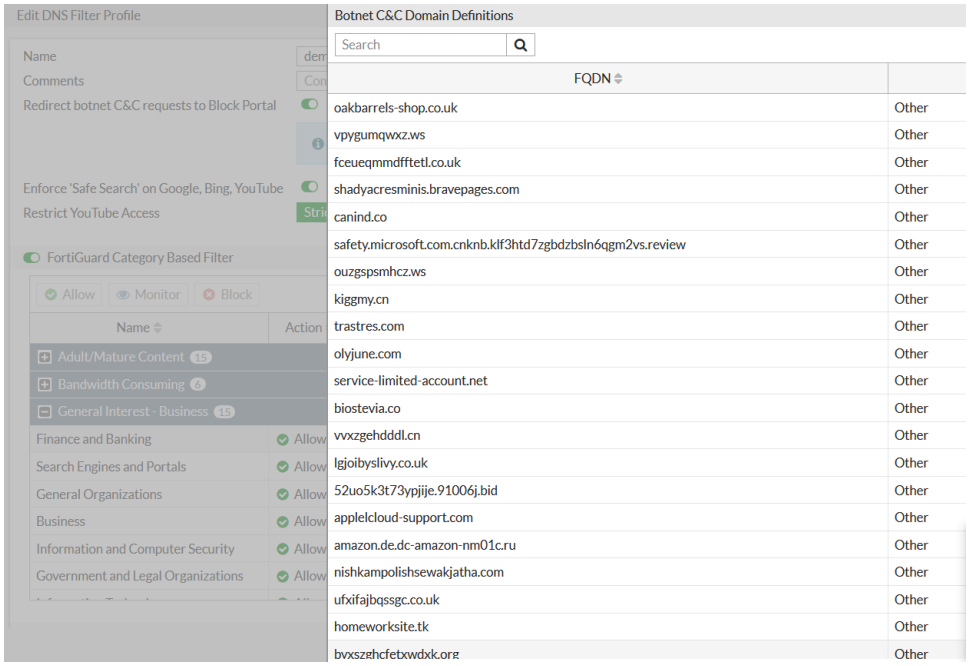
```

Botnet C&C domain blocking

FortiGuard Service continually updates the botnet C&C domain list. The botnet C&C domain blocking feature can block the botnet website access at the DNS name resolving stage. This provides additional protection for your network.

To configure botnet C&C domain blocking in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *Redirect botnet C&C requests to Block Portal*.
3. Optionally, click the *botnet package* link. The *Botnet C&C Domain Definitions* pane opens, which displays the latest list.



4. Configure the other settings as needed.
5. Click *OK*.

To configure botnet C&C domain blocking in the CLI:

```
config dnsfilter profile
   edit "demo"
      set comment ''
      config domain-filter
         unset domain-filter-table
      end
      config ftgd-dns
         set options error-allow
         config filters
            ...
         end
      end
      set log-all-domain enable
      set sdns-ftgd-err-log enable
      set sdns-domain-log enable
      set block-action block
      set block-botnet enable
      set safe-search enable
      set redirect-portal 208.91.112.55
      set youtube-restrict strict
   next
end
```

Verifying the logs

Select a botnet domain from that list. From your internal network PC, use a command line tool, such as dig or nslookup, to send a DNS query to traverse the FortiGate. For example:

```
#dig canind.co
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 997
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; canind.co.                   IN      A

;; ANSWER SECTION:
canind.co.              60      IN      A       208.91.112.55

;; Received 43 B
;; Time 2019-04-05 09:55:21 PDT
;; From 172.16.95.16@53(UDP) in 0.3 ms
```

The botnet domain query was blocked and redirected to the portal IP (208.91.112.55) .

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *DNS Query* to view the DNS query blocked as a botnet domain.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1	Domain was blocked by dns botnet C&C			
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1				

To check the DNS filter log in the CLI:

```
(vdom1) # execute log filter category utm-dns

(vdom1) # execute log display
2 logs found.
2 logs returned.

1: date=2019-04-04 time=16:43:59 logid="1501054601" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1554421439 policyid=1 sessionid=14135
srcip=10.1.100.18 srcport=57447 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16

dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=24339
qname="canind.co" qtype="A" qtypeval=1 qclass="IN"
```

Botnet C&C IPDB blocking

FortiOS also maintains a botnet C&C IP address database (IPDB). If a DNS query response IP address (resolved IP address) matches an entry inside the botnet IPDB, this DNS query is blocked by the DNS filter botnet C&C.

To view the botnet IPDB list in the CLI:

```
(global) # diagnose sys botnet list 9000 10
9000. proto=TCP ip=103.228.28.166, port=80, rule_id=7630075, name_id=3, hits=0
9001. proto=TCP ip=5.9.32.166, port=481, rule_id=4146631, name_id=7, hits=0
9002. proto=TCP ip=91.89.44.166, port=80, rule_id=48, name_id=96, hits=0
9003. proto=TCP ip=46.211.46.166, port=80, rule_id=48, name_id=96, hits=0
9004. proto=TCP ip=77.52.52.166, port=80, rule_id=48, name_id=96, hits=0
9005. proto=TCP ip=98.25.53.166, port=80, rule_id=48, name_id=96, hits=0
9006. proto=TCP ip=70.120.67.166, port=80, rule_id=48, name_id=96, hits=0
9007. proto=TCP ip=85.253.77.166, port=80, rule_id=48, name_id=96, hits=0
9008. proto=TCP ip=193.106.81.166, port=80, rule_id=48, name_id=96, hits=0
9009. proto=TCP ip=58.13.84.166, port=80, rule_id=48, name_id=96, hits=0
```

Select an IP address from the IPDB list and use a reverse lookup service to find its corresponding domain name. From your internal network PC, use a command line tool, such as dig or nslookup, to query this domain and verify that it is blocked by the DNS filter botnet C&C. For example:

```
# dig cpe-98-25-53-166.sc.res.rr.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 35135
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; cpe-98-25-53-166.sc.res.rr.com.              IN      A

;; ANSWER SECTION:
cpe-98-25-53-166.sc.res.rr.com. 60      IN      A       208.91.112.55

;; Received 64 B
;; Time 2019-04-05 11:06:47 PDT
;; From 172.16.95.16@53(UDP) in 0.6 ms
```

Since the resolved IP address matches the botnet IPDB, the query was blocked and redirected to the portal IP (208.91.112.55) .

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *DNS Query* to view the DNS query blocked by botnet C&C IPDB.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1	Domain was blocked by dns botnet C&C			
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1				

To check the DNS filter log in the CLI:

```
(global) # execute log filter category utm-dns

(global) # execute log display
2 logs found.
2 logs returned.

1: date=2019-04-05 time=11:06:48 logid="1501054600" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1554487606 policyid=1 sessionid=55232

qname="cpe-98-25-53-166.sc.res.rr.com" qtype="A" qtypeval=1 qclass="IN"
```

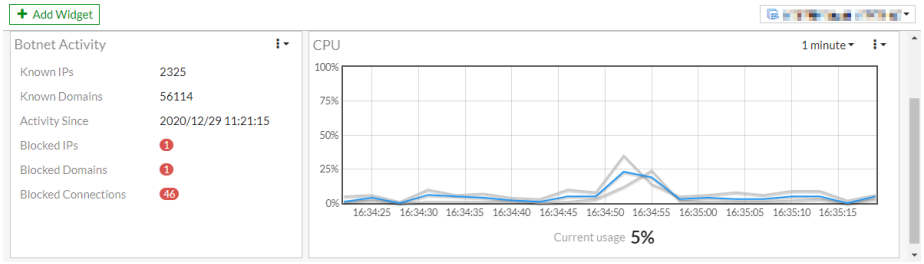
To check botnet activity:

1. Go to *Dashboard* > *Status* and locate the *Botnet Activity* widget.



2. If you do not see the widget, click *Add Widget*, and add the *Botnet Activity* widget.

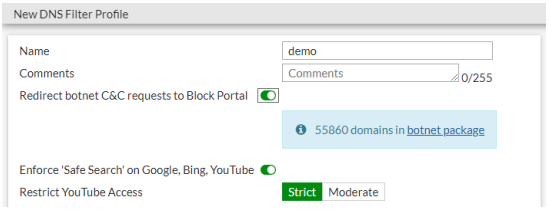
DNS safe search

The DNS safe search option helps avoid explicit and inappropriate results in the Google, Bing, and YouTube search engines. The FortiGate responds with content filtered by the search engine.

For individual search engine safe search specifications, refer to the documentation for Google, Bing, and YouTube.

To configure safe search in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *Enforce 'Safe search' on Google, Bing, YouTube*.
3. For *Restrict YouTube Access*, click *Strict* or *Moderate*.



4. Configure the other settings as needed.
5. Click *OK*.

To configure safe search in the CLI:

```
config dnsfilter profile
    edit "demo"
```

```
        config ftgd-dns
            set options error-allow
            config filters
                edit 2
                    set category 2
                next
               ...
            end
        end
        set log-all-domain enable
        set block-botnet enable
        set safe-search enable
        set youtube-restrict strict
    next
end
```

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, and perform a DNS query on www.bing.com. For example:

```
# dig www.bing.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 46568
;; Flags: qr rd ra; QUERY: 1; ANSWER: 2; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.bing.com.                IN      A

;; ANSWER SECTION:
www.bing.com.           103     IN      CNAME   strict.bing.com
strict.bing.com.        103     IN      A       204.79.197.220

;; Received 67 B
;; Time 2019-04-05 14:34:52 PDT
;; From 172.16.95.16@53(UDP) in 196.0 ms
```

The DNS query for www.bing.com returns with a CNAME strict.bing.com, and an A record for the CNAME. The user's web browser then connects to this address with the same search engine UI, but any explicit content search is filtered out.

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *DNS Query*.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1	DNS Safe Search enforced		41	Search Engines and Portals
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1				

   The DNS filter log in FortiOS shows a message of *DNS Safe Search enforced*.

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns
# execute log display
2 logs found.
2 logs returned.

1: date=2019-04-05 time=14:34:53 logid="1501054804" type="utm" subtype="dns" eventtype="dns-
```

```

Local domain filter

In addition to the FortiGuard category-based domain filter, you can define a local static domain filter to allow or block specific domains.

In a DNS filter profile, the local domain filter has a higher priority than FortiGuard category-based domain filter. DNS queries are scanned and matched first with the local domain filter. If an entry matches and the local filter action is set to block, then that DNS query is blocked and redirected.

If the local domain filter list has no match, then the FortiGuard category-based domain filter is used. If a DNS query domain name rating belongs to the block category, the query is blocked and redirected. If the FortiGuard category-based filter has no match, then the original resolved IP address is returned to the client DNS resolver.

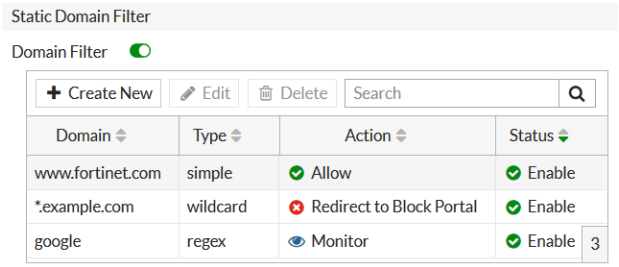
If the local domain filter action is set to allow and an entry matches, it will skip the FortiGuard category-based domain filter and directly return to the client DNS resolver. If the local domain filter action is set to monitor and an entry matches, it will go to the FortiGuard category-based domain filter for scanning and matching.

To configure the local domain filter in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. In the *Static Domain Filter* section, enable *Domain Filter*.
3. Click *Create New*. The *Create Domain Filter* pane opens.
4. Enter a domain, and select a *Type* and *Action*. This example has three filters:

Domain	Type	Action
www.fortinet.com	Simple	Allow
*.example.com	Wildcard	Redirect to Block Portal
google	Reg. Expression	Monitor

5. Click *OK*. The entry appears in the table.



6. Configure the other settings as needed.
7. Click *OK*.

To configure the local domain filter in the CLI:

```
config dnsfilter domain-filter
    edit 1
        set name "demo"
        set comment ''
        config entries
            edit 1
                set domain "www.fortinet.com"
                set type simple
                set action allow
                set status enable
            next
            edit 2
                set domain "*.example.com"
                set type wildcard
                set action block
                set status enable
            next
            edit 3
                set domain "google"
                set type regex
                set action monitor
                set status enable
            next
        end
    next
end
```

Wildcard entries are converted to regular expressions by FortiOS. As a result, wildcards will match any suffix, as long as there is a word boundary following the search term.

For example:

```
config entries
    edit 1
        set domain "*.host"
        set type wildcard
    next
end
```

will match `wp36.host` and `wp36.host.pressdns.com`, but not `wp36.host123.pressdnds.com`.

To avoid this, use an explicit regular expression search string:

```
config entries
    edit 1
        set domain "^.*\\.host$"
        set type regexp
    next
end
```

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *DNS Query*.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 15:37:06	dns	10.1.100.18	www.google.com	A	1	Domain belongs to a denied category in policy		41	Search Engines and Port
2019/04/05 15:37:06	dns	10.1.100.18	www.google.com	A	1				
2019/04/05 15:36:59	dns	10.1.100.18	www.example.com	A	1	Domain was blocked because it is in the domain-filter list	demo		
2019/04/05 15:36:59	dns	10.1.100.18	www.example.com	A	1				
2019/04/05 15:36:51	dns	10.1.100.18	www.fortinet.com	A	1	Domain was allowed because it is in the domain-filter list	demo		
2019/04/05 15:36:51	dns	10.1.100.18	www.fortinet.com	A	1				

Since the local domain filter for *google* is set to monitor, it is blocked by the FortiGuard category-based domain filter because the policy action is deny.

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns
# execute log display
...
7: date=2019-04-05 time=15:37:06 logid="1501054803" type="utm" subtype="dns" eventtype="dns-

```

DNS translation

This setting allows you to translate a DNS resolved IP address to another IP address you specify on a per-policy basis.

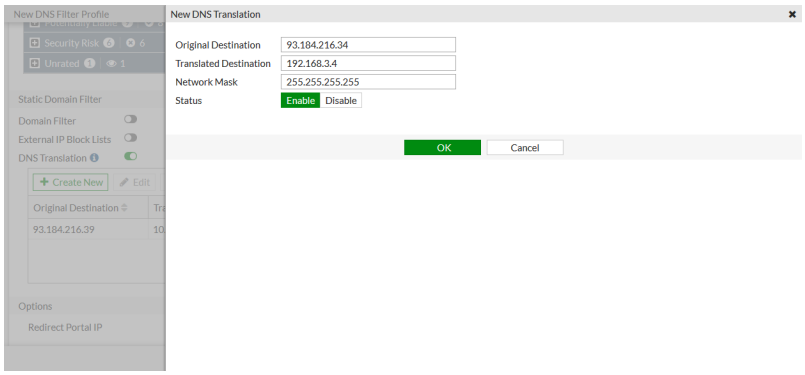
For example, website A has a public address of 1.2.3.4. However, when your internal network users visit this website, you want them to connect to the internal host 192.168.3.4. You can use DNS translation to translate the DNS resolved address 1.2.3.4 to 192.168.3.4. Reverse use of DNS translation is also applicable. For example, if you want a public DNS query of your internal server to get a public IP address, then you can translate a DNS resolved private IP to a public IP address.

Sample configuration

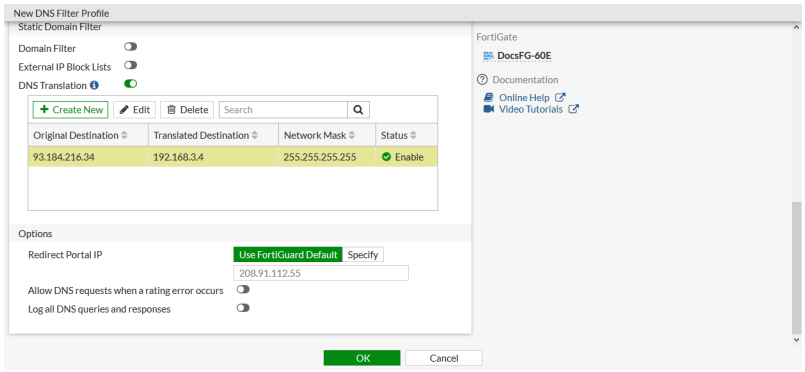
This configuration forces the DNS filter profile to translate 93.184.216.34 (www.example.com) to 192.168.3.4. When internal network users perform a DNS query for www.example.com, they do not get the original www.example.com IP address of 93.184.216.34. Instead, it is replaced with 192.168.3.4.

To configure DNS translation in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. In the *Static Domain Filter* section, enable *DNS Translation*.
3. Click *Create New*. The *New DNS Translation* pane opens.
4. Enter the *Original Destination* (the domain's original IP address), the *Translated Destination* IP address, and the *Network Mask*.



5. Click *OK*. The entry appears in the table.



6. Configure the other settings as needed.
7. Click *OK*.

To configure DNS translation in the CLI:

```
config dnsfilter profile
    edit "demo"
        set comment ''
        ...
        config dns-translation
            edit 1
                set src 93.184.216.34
                set dst 192.168.3.4
                set netmask 255.255.255.255
            next
        end
        set redirect-portal 0.0.0.0
        set redirect-portal6 ::
        set youtube-restrict strict
    next
end
```

To check DNS translation using a command line tool before DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 27030
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
```

```
;; www.example.com.             IN      A

;; ANSWER SECTION:
www.example.com.        33946   IN      A       93.184.216.34

;; AUTHORITY SECTION:
example.com.            18578   IN      NS      b.iana-servers.net.
example.com.            18578   IN      NS      a.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 10:47:26 PDT
;; From 172.16.95.16@53(UDP) in 0.5 ms
```

To check DNS translation using a command line tool after DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 62060
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.             IN      A

;; ANSWER SECTION:
www.example.com.        32491   IN      A       192.168.3.4

;; AUTHORITY SECTION:
example.com.            17123   IN      NS      b.iana-servers.net.
example.com.            17123   IN      NS      a.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 11:11:41 PDT
;; From 172.16.95.16@53(UDP) in 0.5 ms
```

DNS translation network mask

The following is an example of DNS translation that uses a network mask:

To configure DNS translation in the CLI:

```
config dns-translation
        edit 1
           set src 93.184.216.34
           set dst 1.2.3.4
           set netmask 255.255.224.0
        next
    end
```

To check DNS translation using a command line tool after DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 6736
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.             IN      A
```

```
;; ANSWER SECTION:
www.example.com.        29322   IN      A       1.2.24.34

;; AUTHORITY SECTION:
example.com.            13954   IN      NS      a.iana-servers.net.
example.com.            13954   IN      NS      b.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 12:04:30 PDT
;; From 172.16.95.16@53(UDP) in 2.0 ms
```

The binary arithmetic to convert 93.184.216.34 to 1.2.3.4 with the subnet mask is as follows:

1. AND src(Original IP) with negative netmask (93.184.216.34 & ~255.255.224.0):

```
01011101.10111000.11011000.00100010 93.184.216.34
00000000.00000000.00011111.11111111 ~255.255.224.0
----------------------------------------------------- &
00000000.00000000.00011000.00100010 0.0.24.34
```

2. AND dst(Translated IP) with netmask:

```
00000001.00000010.00000011.00000100 1.2.3.4
11111111.11111111.11100000.00000000 255.255.224.0
----------------------------------------------------- &
00000001.00000010.00000000.00000000 1.2.0.0
```

3. Final step 2 bitwise-OR 3:

```
00000000.00000000.00011000.00100010 0.0.24.34
00000001.00000010.00000000.00000000 1.2.0.0
----------------------------------------------------- |
00000001.00000010.00011000.00100010 1.2.24.34
```

Applying DNS filter to FortiGate DNS server

You can configure a FortiGate as a DNS server in your network. When you enable DNS service on a specific interface, the FortiGate will listen for DNS service on that interface.

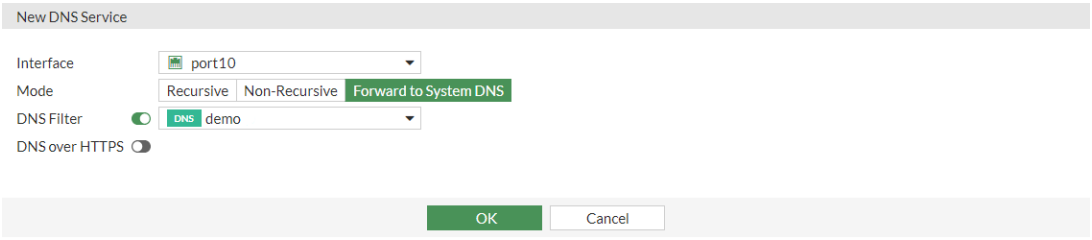
Depending on the configuration, DNS service works in three modes: *Recursive*, *Non-Recursive*, or *Forward to System DNS* (server). For details on how to configure the FortiGate as a DNS server and configure the DNS database, see FortiGate DNS server on page 180.

You can apply a DNS filter profile to *Recursive* and *Forward to System DNS* mode. This is the same as the FortiGate working as a transparent DNS proxy for DNS relay traffic.

To configure DNS service in the GUI:

1. Go to *Network* > *DNS Servers* (if this option is not available, go to *System* > *Feature Visibility* and enable *DNS Database*).
2. In the *DNS Service on Interface* section, click *Create New* and select an *Interface* from the dropdown.
3. For *Mode*, select *Forward to System DNS*.

4. Enable *DNS Filter* and select a profile from the dropdown.



5. Click *OK*.

To configure DNS service in the CLI:

```
config system dns-server
    edit "port10"
        set mode forward-only
        set dnsfilter-profile "demo"
    next
end
```

To check DNS service with a DNS filter profile using a command line tool:

In this example, port10 is enabled as a DNS service with the DNS filter profile demo. The IP address of port10 is 10.1.100.5 , and the DNS filter profile is configured to block category 52 (information technology). From your internal network PC, use a command line tool, such as dig or nslookup, to perform a DNS query. For example:

```
# dig @10.1.100.5 www.fortinet.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 52809
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.fortinet.com.            IN      A

;; ANSWER SECTION:
www.fortinet.com.       60      IN      A       208.91.112.55

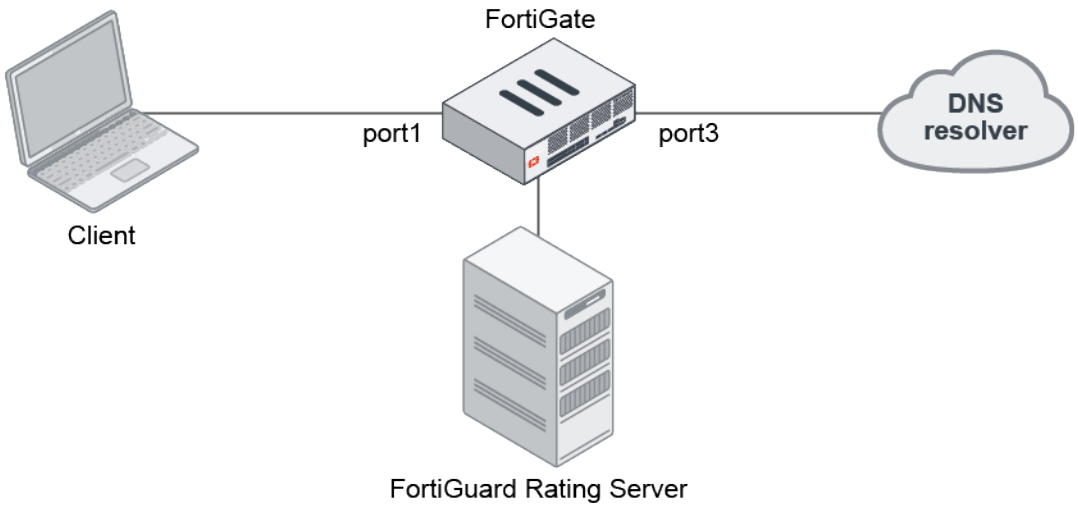
;; Received 50 B
;; Time 2019-04-08 14:36:34 PDT
;; From 10.1.100.5@53(UDP) in 13.6 ms
```

The relay DNS traffic was filtered based on the DNS filter profile configuration. It was blocked and redirected to the portal IP (208.91.112.55).

DNS inspection with DoT and DoH

DNS over TLS (DoT) and DNS over HTTPS (DoH) are supported in DNS inspection. Prior to 7.0, DoT and DoH traffic silently passes through the DNS proxy. In 7.0. the WAD is able to handle DoT and DoH, and redirect DNS queries to the DNS proxy for further inspection.

In the following examples, the FortiGate inspects DNS queries made over DoT and DoH to a Cloudflare DNS server. The DNS filter profile blocks the education category.



To configure DNS inspection of DoT and DoH queries in the GUI:

1. Configure the SSL-SSH profile:
   a. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
   b. Set *Inspection method* to *Full SSL Inspection*. DoT and DoH can only be inspected using doing deep inspection.
   c. In the *Protocol Port Mapping* section, enable *DNS over TLS*.

   d. Configure the other settings as needed.
   e. Click *OK*.

2. Configure the DNS filter profile:
   a. Go to *Security Profiles* > *DNS Filter* and click *Create New*.
   b. Enable *Redirect botnet C&C requests to Block Portal*.
   c. Enable *FortiGuard Category Based Filter* and set the *Action* for the *Education* category to *Redirect to Block Portal*.
   d. Configure the other settings as needed.
   e. Click *OK*.
3. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enable *DNS Filter* and select the profile you created.
   c. For *SSL Inspection*, select the profile you created.
   d. Configure the other settings as needed.
   e. Click *OK*.

Toconfigure DNS inspection of DoT and DoH queries in the CLI:

1. Configure the SSL-SSH profile:

```
config firewall ssl-ssh-profile
    edit "ssl"
        config dot
            set status deep-inspection
            set client-certificate bypass
            set unsupported-ssl-cipher allow
            set unsupported-ssl-negotiation allow
            set expired-server-cert block
            set revoked-server-cert block
            set untrusted-server-cert allow
            set cert-validation-timeout allow
            set cert-validation-failure block
        end
    next
end
```

2. Configure the DNS filter profile:

```
config dnsfilter profile
    edit "dnsfilter"
        config ftgd-dns
            config filters
                edit 1
                    set category 30
                    set action block
                next
            end
        end
        set block-botnet enable
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
```

```
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "ssl"
        set webfilter-profile "webfilter"
        set dnsfilter-profile "dnsfilter"
        set nat enable
    next
end
```

Testing the connection

To query DNS over TLS:

1. Send a DNS query over TLS to the Cloudflare server 1.1.1.1 (this example uses kdig on an Ubuntu client). The www.ubc.ca domain belongs to the education category:

```
~$ kdig -d @1.1.1.1 +tls-ca +tls-host=cloudflare-dns.com www.ubc.ca
;; DEBUG: Querying for owner(www.ubc.ca.), class(1), type(1), server(1.1.1.1), port
(853), protocol(TCP)
;; DEBUG: TLS, imported 128 system certificates
;; DEBUG: TLS, received certificate hierarchy:
;; DEBUG:  #1, C=US,ST=California,L=San Francisco,O=Cloudflare\, Inc.,CN=cloudflare-
dns.com
;; DEBUG:      SHA-256 PIN: elpYCnCs9ZtkQBI4+cb2QtZcyOl5UI9jMkSvbTsTad0=
;; DEBUG:  #2, C=US,ST=California,L=Sunnyvale,O=Fortinet,OU=Certificate
Authority,CN=FG3H1E5818903681,EMAIL=support@fortinet.com
;; DEBUG:      SHA-256 PIN: s48VtdODlNZfAG2g/92hMLhitU51qsP9pkHAUtTJ+f4=
;; DEBUG: TLS, skipping certificate PIN check
;; DEBUG: TLS, The certificate is trusted.
;; TLS session (TLS1.3)-(ECDHE-SECP256R1)-(ECDSA-SECP256R1-SHA256)-(AES-256-GCM)
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 56850
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.ubc.ca.                  IN      A

;; ANSWER SECTION:
www.ubc.ca.             60      IN      A       208.91.112.55

;; Received 44 B
;; Time 2021-03-12 06:53:37 UTC
;; From 1.1.1.1@853(TCP) in 6.0 ms
```

In this query, the FortiGate inspects the DNS query to the Cloudflare DNS server. It replaces the result with the IP of the FortiGuard block page, which successfully blocks the query.

To query DNS over HTTPS:

1. In your browser, enable DNS over HTTPS.
2. Go to www.ubc.ca. The website is redirected to the block page.

Troubleshooting for DNS filter

If you have trouble with the DNS filter profile in your policy, start with the following troubleshooting steps:

- Check the connection between the FortiGate and FortiGuard DNS rating server (SDNS server).
- Check that the FortiGate has a valid FortiGuard web filter license.
- Check the FortiGate DNS filter configuration.

Checking the connection between the FortiGate and FortiGuard SDNS server

You need to ensure the FortiGate can connect to the FortiGuard SDNS server. By default, the FortiGate uses UDP port 53 to connect to the SDNS server.

To check the connection between the FortiGate and SDNS server:

1. Verify the FortiGuard SDNS server information:

```
# diagnose test application dnsproxy 3
...
FDG_SERVER:208.91.112.220:53
FGD_CATEGORY_VERSION:8
SERVER_LDB: gid=6f00, tz=-420, error_allow=0
FGD_REDIR:208.91.112.55
```

   The SDNS server IP address might be different depending on location (in this example, it is 208.91.112.220:53).
2. In the management VDOM, check the communication between the FortiGate and the SDNS server:

```
#execute ping 208.91.112.220
```

3. Optionally, you can check the communication using a PC on the internal network (this example uses dig).
   a. Disable the DNS filter profile so that it does not affect your connection check.
   b. Ping your ISP or a public DNS service provider's DNS server, for example, Google's public DNS server of 8.8.8.8:

```
#dig @8.8.8.8 www.fortinet.com
```

      Or, specify the SDNS server as a DNS server:

```
#dig @208.91.112.220 www.fortinet.com
```

   c. Verify that you can get a domain www.fortinet.com A record from the DNS server. This shows that the UDP port 53 connection path is not blocked.

```
#dig @8.8.8.8 www.fortinet.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 35121
;; Flags: qr rd ra; QUERY: 1; ANSWER: 3; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.fortinet.com.            IN      A

;; ANSWER SECTION:

1.elb.amazonaws.com.
fortinet-prod4-858839915.us-west-1.elb.amazonaws.com. 51        IN      A
52.8.142.247
fortinet-prod4-858839915.us-west-1.elb.amazonaws.com. 51        IN      A
13.56.55.78

;; Received 129 B
;; Time 2019-04-29 14:13:18 PDT
;; From 8.8.8.8@53(UDP) in 13.2 ms
```

Checking the FortiGuard DNS rating service license

The FortiGuard DNS rating service shares the license with the FortiGuard web filter, so you must have a valid web filter license for the DNS rating service to work. While the license is shared, the DNS rating service uses a separate connection mechanism from the web filter rating.

To check the DNS rating service license in the CLI:

1. View the DNS settings:

   ```
   # diagnose test application dnsproxy 3
   ```

2. Look for the `FGD_DNS_SERVICE_LICENSE` line and check that the license has not expired:

   ```
   FGD_DNS_SERVICE_LICENSE:
   server=208.91.112.220:53, expiry=2022-10-03, expired=0, type=2
   ```

3. Check the `sdns-server` lines to show the functioning servers:

   ```
   sdns-server:208.91.112.220:53 tz=-480 tls=0 req=0 to=0 res=0 rt=4 ready=1 timer=0
   probe=0 failure=0 last_failed=0
   ```

Checking the FortiGate DNS filter profile configuration

To check the DNS filter profile configuration:

1. In FortiOS, create a local domain filter and set the *Action* to *Redirect to Block Portal* (see Local domain filter on page 818).
2. Apply this DNS filter profile to the policy.
3. From the client PC, perform a DNS query on this domain. If you get the profile's redirected portal address, this means that the DNS filter profile works as expected.

Additional troubleshooting

Use `diagnose test application dnsproxy <test level>` to troubleshoot further DNS proxy information, where:

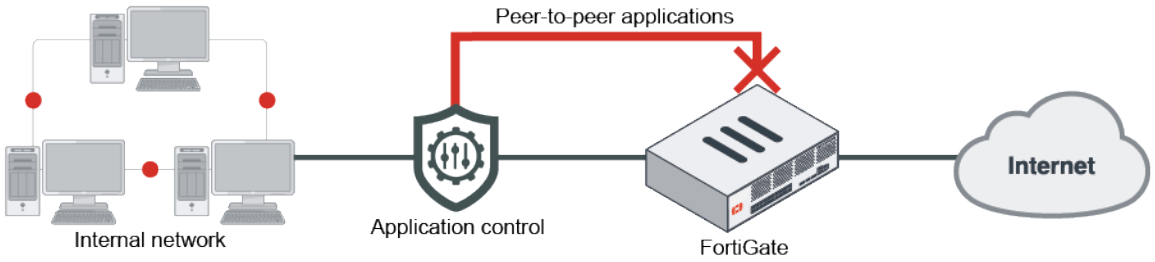
Test level	Action
1	Clear DNS cache
2	Show statistics
3	Dump DNS setting
4	Reload FQDN
5	Requery FQDN
6	Dump FQDN
7	Dump DNS cache
8	Dump DNS database
9	Reload DNS database
10	Dump secure DNS policy/profile
11	Dump botnet domain
12	Reload secure DNS setting
13	Show hostname cache
14	Clear hostname cache
15	Show SDNS rating cache
16	Clear SDNS rating cache
17	Show DNS debug bit mask
18	Show DNS debug object members
99	Restart the dnsproxy worker

To debug DNS proxy details:

```
#diagnose debug application dnsproxy -1
#diagnose debug {enable | disable}
```

Application control

FortiGates can recognize network traffic generated by a large number of applications. Application control sensors specify what action to take with the application traffic. Application control uses IPS protocol decoders that can analyze network traffic to detect application traffic, even if the traffic uses non-standard ports or protocols. Application control supports traffic detection using the HTTP protocol (versions 1.0, 1.1, and 2.0).



FortiOS includes three preloaded application sensors:

- *default* (monitors all applications)
- *wifi-default* (default configuration for offloading WiFi traffic)
- *block-high-risk*

You can customize these sensors, or you can create your own to log and manage the applications on your network.

Once configured, you can add the application sensor to a firewall policy.

This functionality requires a subscription to FortiGuard Application Control.

The following topics provide information about application control:

- Basic category filters and overrides on page 832
- Excluding signatures in application control profiles on page 835
- Port enforcement check on page 837
- Protocol enforcement on page 838
- SSL-based application detection over decrypted traffic in a sandwich topology on page 839
- Matching multiple parameters on application control signatures on page 840
- Application signature dissector for DNP3 on page 843

Basic category filters and overrides

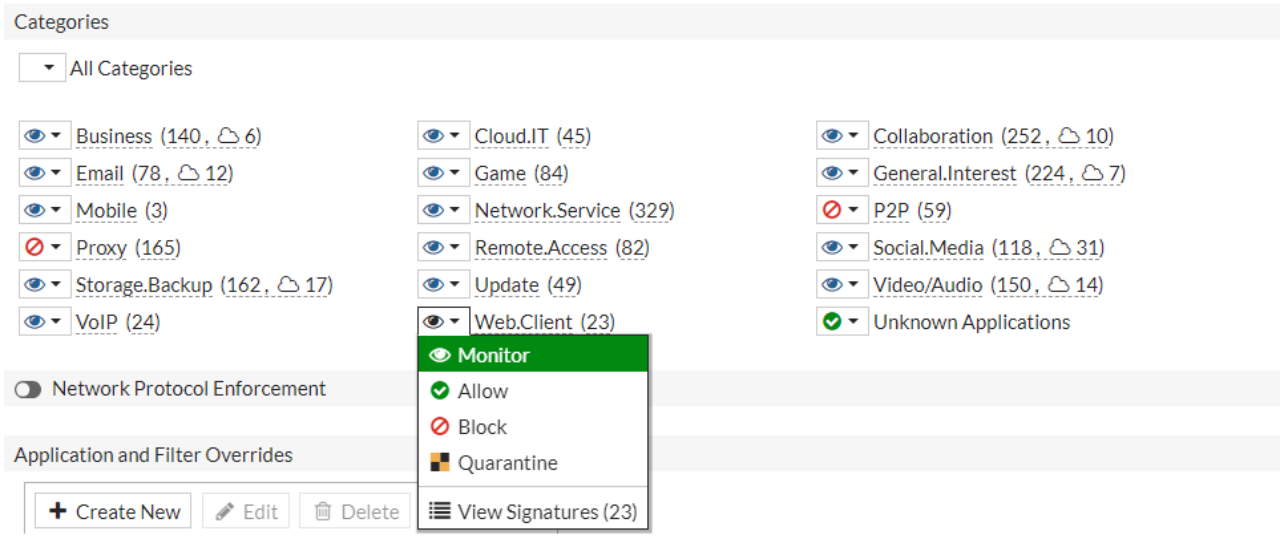
Once you have created an application sensor, you can define the applications that you want to control. You can add applications and filters using categories, application overrides, and/or filter overrides with designated actions (monitor, allow, block, or quarantine).

Configuring category filters

Categories allow you to choose groups of signatures based on a category type. Applications belonging to the category trigger the action that is set for the category. For a list of application control categories, refer to the FortiGuard Labs website.

To configure category filters in the GUI:

1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. Under *Categories*, click the icon next to the category name to set the action or view the application signatures.



3. Click *OK*.

To configure category filters in the CLI:

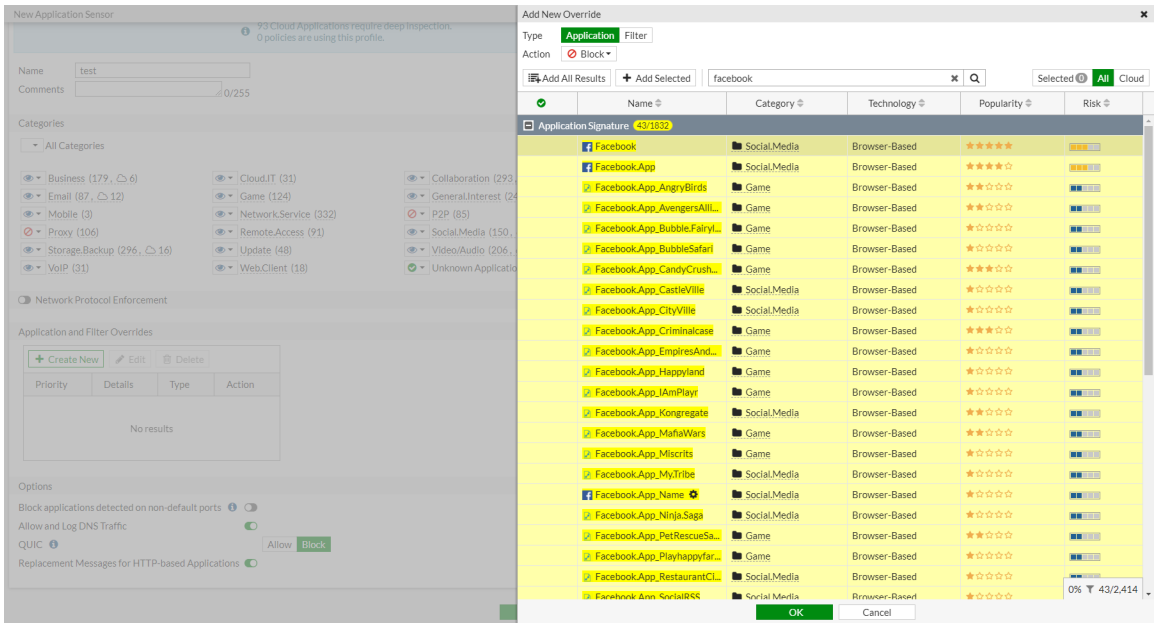
```
config application list
    edit <name>
        config entries
            edit <id>
                set category <id>
                set action {pass | block | reset}
                set log {enable | disable}
            next
        end
    next
end
```

Configuring application and filter overrides

Multiple application signatures can be added for one sensor with a designated action. Filters can be added based on behavior, application category, popularity, protocol, risk, technology, or vendor subtypes.

To configure overrides in the GUI:

1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. In the *Application and Filter Overrides* table, click *Create New*.
3. Add an application:
   a. For *Type*, select *Application*.
   b. Select an *Action* from the dropdown.
   c. In the *Search* box, enter an application name and press `Enter`.
   d. In the search results, select desired the applications (you can select multiple applications) and click *Add Selected*.



e. Click *OK*.

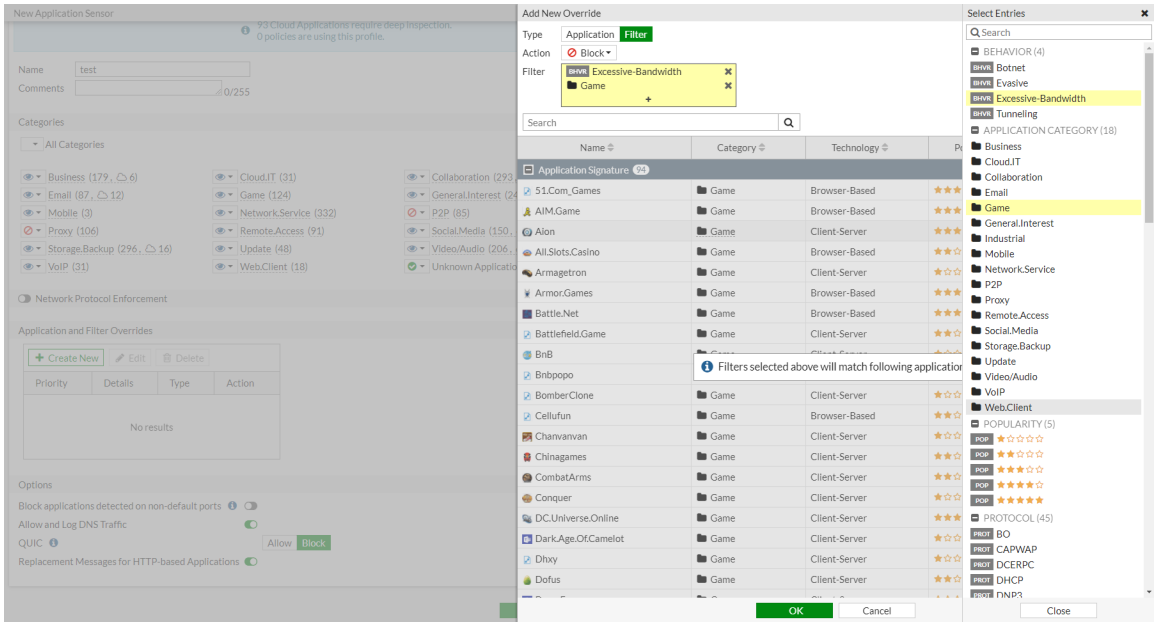
4. Add a filter:

a. In the *Application and Filter Overrides* table, click *Create New*.

b. For *Type*, select *Filter*.

c. Select an *Action* from the dropdown.

d. In the *Filter* field, click the + . The *Select Entries* pane opens, and you can search based on filter subtypes. This example has excessive bandwidth (under behavior) and game (under application category).



e. Click *OK*.

5. Click *OK*.

To configure overrides in the CLI:

```
config application list
    edit <name>
        config entries
            edit <id>
                set protocols <integer>
                set risk <integer>
                set vendor <id>
                set technology <id>
                set behavior <id>
                set popularity <integer>
                set action {pass | block | reset}
                set log {enable | disable}
            next
        end
    next
end
```

`protocols <integer>`	Application protocol filter (0 - 47, or all).
`risk <integer>`	Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).
`vendor <id>`	Application vendor filter (0 - 25, or all).
`technology <id>`	Application technology filter: • all • 0 (network-protocol) • 1 (browser-based) • 2 (client-server) • 4 (peer-to-peer)
`behavior <id>`	Application behavior filter: • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
`popularity <integer>`	Application popularity filter (1 - 5, from least to most popular).
`action {pass | block | reset}`	Pass/block traffic or reset the connection for traffic from this application (default = block).
`log {enable | disable}`	Enable/disable logging for this application list (default = enable).

Excluding signatures in application control profiles

In an application control list, the exclusion option allows users to specify a list of applications they wish to exclude from an entry filtered by category, technology, or others. By excluding the signature, the application is no longer processed on

the entry in which it is excluded, but may match subsequent entries that exist.

To configure signature exclusion:

```
config application list
    edit <name>
        config entries
            edit <id>
                set category <id>
                set exclusion <application id>
                set action {pass | block | reset}
            next
        end
    next
end
```

Sample configurations

In the following example, category 23 (social media) is blocked in the entries, and signature 34527 (Instagram) is excluded from this entry. Traffic to Instagram will pass because the signature is removed from entry 1 and the action of `other-application-action` is set to `pass`.

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
                    set category 23
                    set exclusion 34527
                    set action block
                next
            end
    next
end
```

In the following example, entry 1 is configured so that category 23 (social media) is set to pass and signature 34527 (Instagram) is excluded. In entry 2, application 34527 (Instagram) is blocked, so the traffic to Instagram will be blocked, even though it is excluded in entry 1. Traffic to other signatures in category 23, such as Facebook, will still pass.

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
```

```
                    set category 23
                    set exclusion 34527
                    set action pass
                next
                edit 2
                    set application 34527
                    set action block
                next
            end
    next
end
```

In the following example, an explicit proxy is behind the FortiGate with an excluded signature for 107347980 (Proxy.HTTP) and category 6 (proxy) is set to block. The client will allow normal proxy traffic to pass, but it will discard all proxy application traffic (such as KProxy, Tor, and so on).

To configure signature exclusion:

```
config application list
    edit "test"
        set other-application-action pass
        set unknown-application-action pass
        set other-application-log enable
        set unknown-application-log enable
            config entries
                edit 1
                    set category 6
                    set exclusion 107347980
                    set action block
                next
            end
    next
end
```

Port enforcement check

Most networking applications run on specific ports. For example, SSH runs on port 22, and Facebook runs on ports 80 and 443.

If the default network service is enabled in the application control profile, a port enforcement check is done at the application profile level, and any detected application signatures running on the non-standard TCP/IP port are blocked. This means that each allowed application runs on its default port.

To configure port enforcement check:

```
config application list
    edit <name>
        set enforce-default-app-port enable
        config entries
            edit 1
                set application 15896
                set action pass
            next
        end
```

```
    next
end
```

For example, when applying this application control sensor, FTP traffic (application 15896) with the standard port (port 21) is allowed, while the non-standard port (port 2121) is blocked.

Protocol enforcement

Protocol enforcement allows you to configure networking services (e.g. FTP, HTTP, HTTPS) on known ports (e.g. 21, 80, 443). For protocols that are not allowlisted under select ports, the IPS engine performs the violation action to block, allow, or monitor that traffic.

This feature can be used in the following scenarios::

- When one protocol dissector confirms the service of network traffic, protocol enforcement can check whether the confirmed service is allowlisted under the server port. If it is not allowlisted, the traffic is considered a violation and IPS can take the action specified in the configuration (block or monitor it).
- When there is no confirmed service for the network traffic, the traffic is considered a service violation if IPS dissectors rule out all of the services enforced under its server port.

In an applicable profile, a default-network-service list can be created to associate well known ports with accepted services.

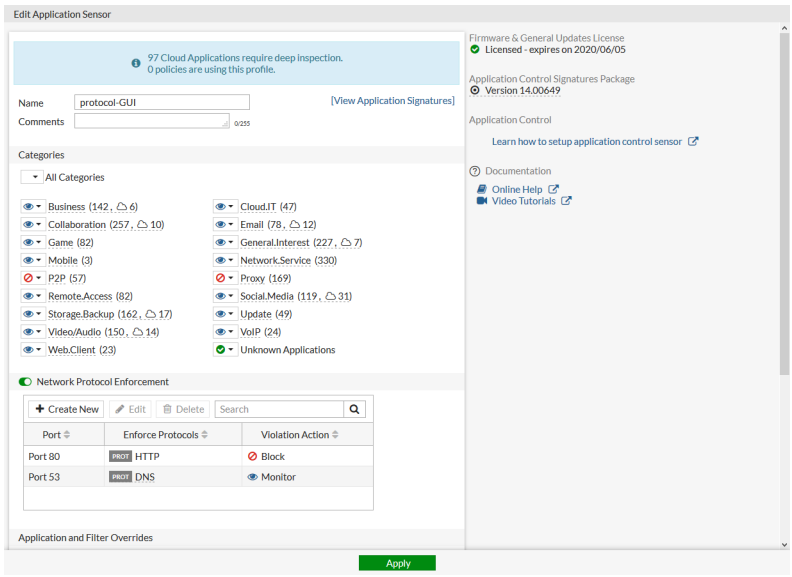
To setup protocol enforcement in the CLI:

```
config application list
   edit "protocol-GUI"
      set other-application-log enable
      set control-default-network-services {enable | disable}   # Enable/Disable enforcement
of protocols over select ports
      config default-network-services                           # Default network service
entries
         edit 1
           set port 80                        # Port number, enter an integer value from <0>
to <65535>
           set services http                  # Network protocols: http, ssh, ftp, dns,
smtp, pop3, imap, snmp, nntp, and https
         next
         edit 2
           set port 53
           set services dns
           set violation-action {pass | monitor | block}      # Pass, Log, or block when
non-DNS traffic run over port 53
         next
      end
   next
end
```

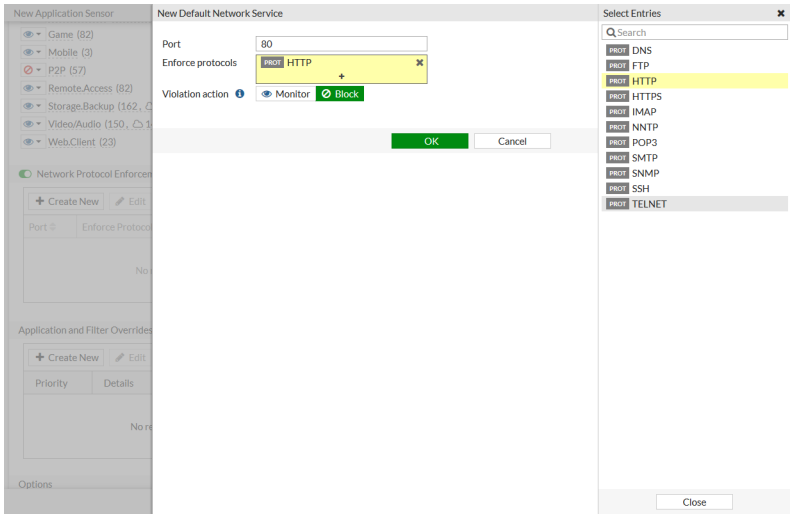
To setup protocol enforcement in the GUI:

1. Go to *Security Profiles* > *Application Control*.
2. Create a new application sensor or edit an existing one.

3. Enable *Network Protocol Enforcement*.
   Enforcement entries can be created, edited, or deleted to configure network services on certain ports and determine the violation action.



4. Click *Create New* in the *Network Protocol Enforcement* table.

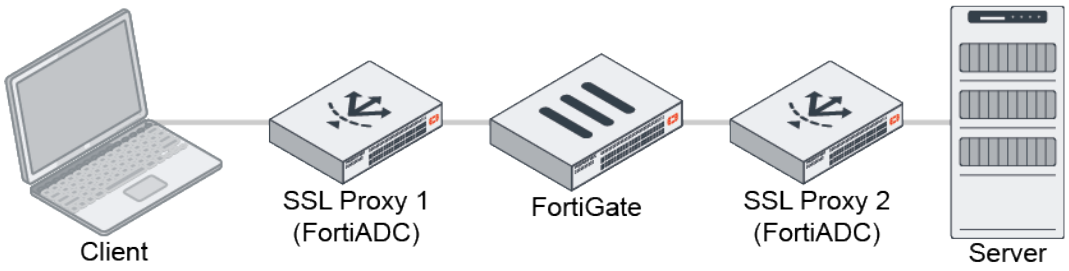


5. In the *New Default Network Service* pane:
   a. Enter a *Port* number.
   b. Select *Enforced protocols*.
   c. Choose the *Violation action*.
   d. Click *OK*.
6. Click *OK*.

SSL-based application detection over decrypted traffic in a sandwich topology

When a FortiGate is sandwiched between SSL encryption and decryption devices, the FortiGate can process the decrypted traffic that passes between those devices. This feature adds support for decrypted traffic in application

control. In some pre-defined signatures, the signature is pre-marked with the *require_ssl_di* tag. The `force-inclusion-ssl-di-sigs` option under `application list` allows users to control the inspection of dissected traffic. When this option is enabled, the IPS engine forces the pre-marked SSL-based signatures to be applied to the decrypted traffic of the respective applications. In the following topology, SSL Proxy 1 handles the client connection and SSL Proxy 2 handles the server connection, leaving the content unencrypted as traffic passes through the FortiGate.



To configure SSL-based application detection over decrypted traffic:

```
config application list
    edit "test"
        set force-inclusion-ssl-di-sigs {enable | disable}
    next
end
```

Example pre-marked SSL-based signature:

F-SBID(--vuln_id 15722; --attack_id 42985; --name "Facebook_Chat"; --group im; --protocol tcp; --default_action pass; --revision 4446; --app_cat 23; --vendor 3; --technology 1; --behavior 9; --pop 4; --risk 2; --language "Multiple"; --weight 20; --depend-on 15832; --depend-on 38468; ***--require_ssl_di "Yes"****; --casi 1; --casi 8; --parent 15832; --app_port "TCP/443"; --severity info; --status hidden; --service http; --flow from_client; --pattern "/pull?"; --context uri; --no_case; --pattern ".facebook.com"; --context host; --no_case; --tag set,Tag.Facebook.Pull; --tag quiet; --scan-range 10m,all; --date 20190301;)*

All signatures that include the *require_ssl_di* tag are pre-defined and cannot be customized.

Matching multiple parameters on application control signatures

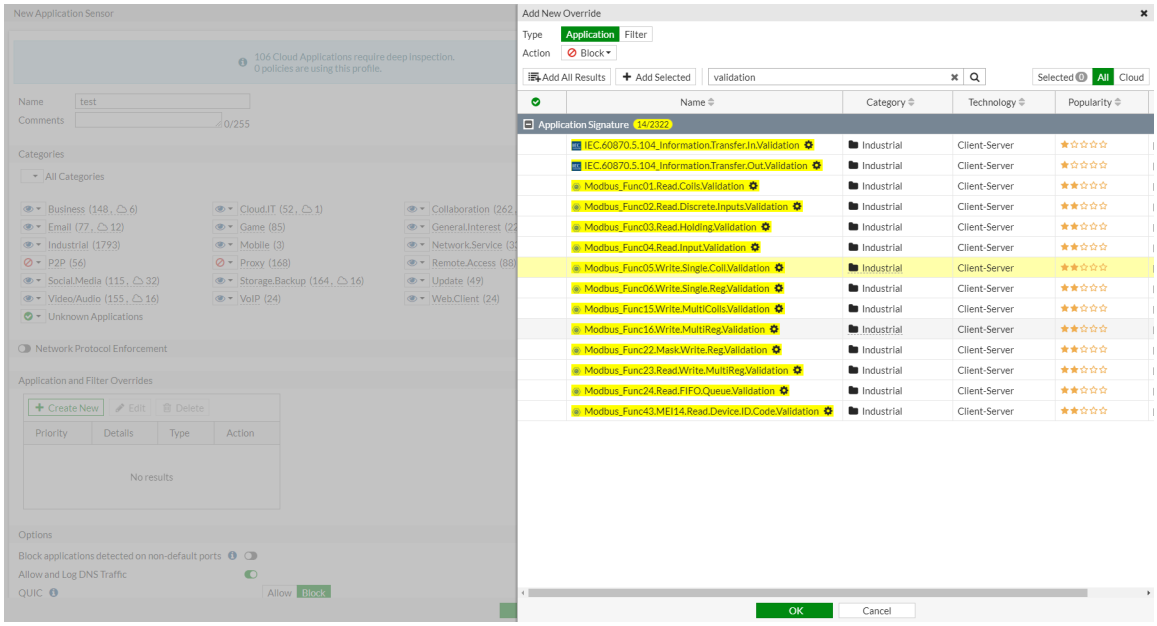
Application control signatures that support parameters (such as SCADA protocols) can have multiple parameters grouped together and matched at the same time. Multiple application parameter groups can be added to an override. Traffic will be flagged if it matches at least one parameter group.

This example uses the Modbus_Func05.Write.Single.Coil.Validation signature. This is an industrial signature, so ensure that no signatures are excluded:

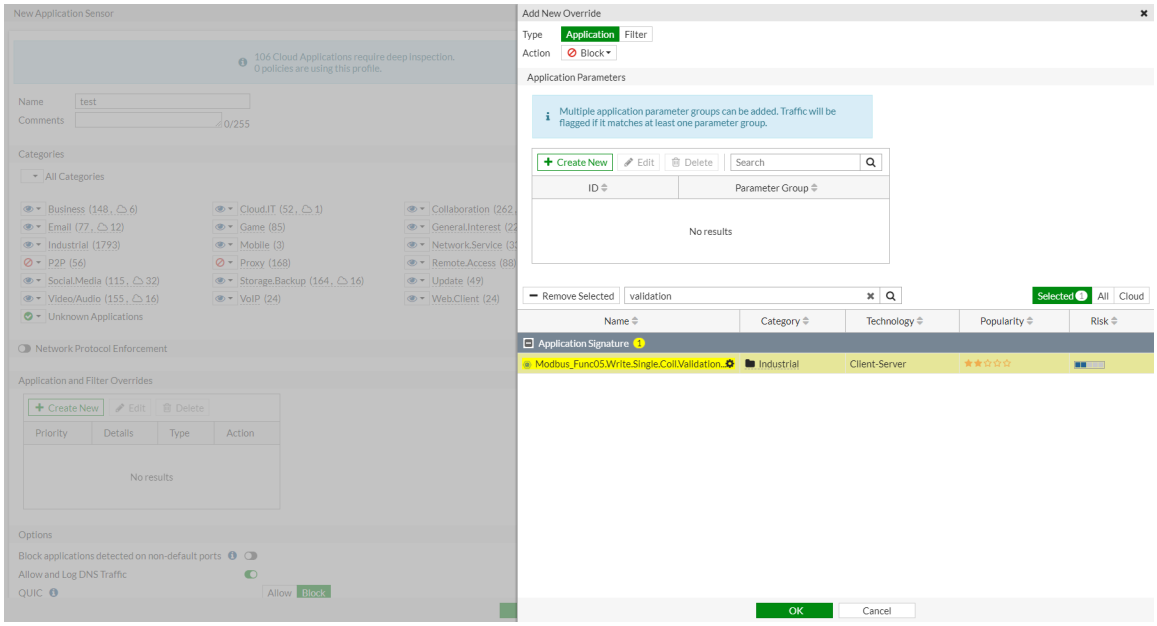
```
config ips global
    set exclude-signatures none
end
```

To configure an application sensor with multiple parameters in the GUI:

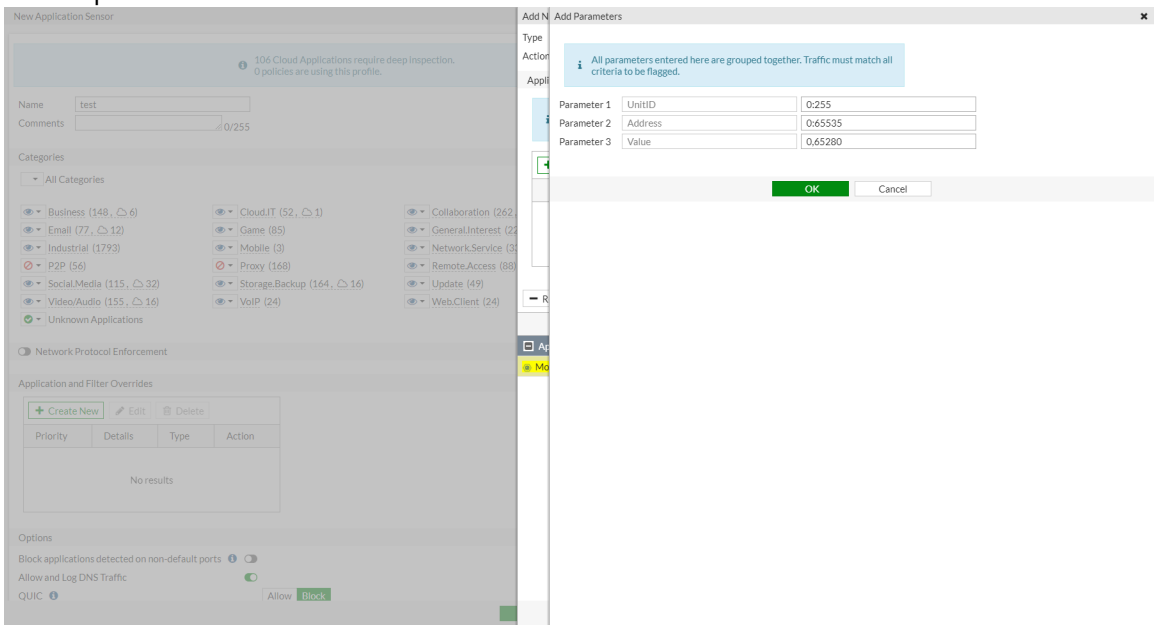
1. Go to *Security Profiles* > *Application Control* and click *Create New*, or edit an existing sensor.
2. In the *Application and Filter Overrides* table, click *Create New*.
3. Search for *Modbus_Func05.Write.Single.Coil.Validation* and press `Enter`. A gear icon beside the signature name indicates it has configurable application parameters.
4. In the search results, select *Modbus_Func05.Write.Single.Coil.Validation* and click *Add Selected*.



5. Click the *Selected* tab. In the *Application Parameters* section, click *Create New*.



6. Edit the parameter values as needed.



7. Click *OK*.
8. Add more signatures if needed.
9. Click *OK*.

To configure an application sensor with multiple parameters in the CLI:

```
config application list
    edit "test"
        set other-application-log enable
        config entries
            edit 1

                set application 48885
                config parameters
                    edit 1
                        config members
                            edit 1
                                set name "UnitID"
                                set value "0:255"
                            next
                            edit 2
                                set name "Address"
                                set value "0:65535"
                            next
                            edit 3
                                set name "Value"
                                set value "0,65280"
                            next
                        end
                    next
                end
            next
            edit 2
```

```
                set category 2 6
            next
        end
    next
end
```

Application signature dissector for DNP3

The DNP3 application signature dissector supports detecting DNP3 traffic that is encapsulated by the RealPort protocol (Net.CX). DNP3 is used in industrial solutions over serial ports, USB ports, printers, and so on. RealPort encapsulation allows transportation of the underlying protocols over TCP/IP. The FortiGate industrial signatures must be enabled to use RealPort.DNP3 signatures:

```
config ips global
    set exclude-signatures none
end
```

IPS engine version 7.0015 and later supports RealPort.DNP3 dissectors.

Intrusion prevention

With the FortiOS intrusion prevention system (IPS), you can detect and block network-based attacks. You can configure IPS sensors based on IPS signatures, IPS filters, outgoing connections to botnet sites, and rate-based signatures.

FortiOS includes eight preloaded IPS sensors:

- *all_default*
- *all_default_pass*
- *default*
- *high_security*
- *protect_client*
- *protect_email_server*

- *protect_http_server*
- *wifi-default*

You can customize these sensors, or you can create your own and apply it to a firewall policy.

This functionality requires a subscription to FortiGuard IPS Service.

The following topic provides information about IPS sensors:

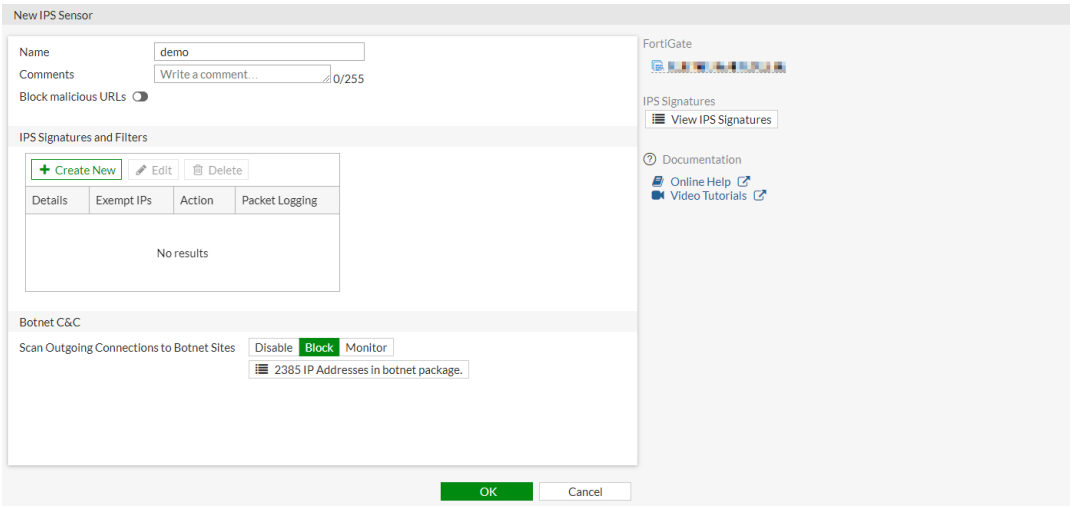
- Botnet C&C IP blocking on page 844
- Detecting IEC 61850 MMS protocol in IPS on page 848
- IPS signature filter options on page 850

Botnet C&C IP blocking

The *Botnet C&C* section consolidates multiple botnet options in the IPS profile. This allows you to enable botnet blocking across all traffic that matches the policy by configuring one setting in the GUI, or by the `scan-botnet-connections` option in the CLI.

To configure botnet C&C IP blocking in the GUI:

1. Go to *Security Profiles* > *Intrusion Prevention* and click *Create New*, or edit an existing sensor.
2. Navigate to the *Botnet C&C* section.
3. For *Scan Outgoing Connections to Botnet Sites*, select *Block* or *Monitor*.



4. Configure the other settings as needed.
5. Click *OK*.
6. Add the sensor to a firewall policy.
   The IPS engine will scan outgoing connections to botnet sites. If you access a botnet IP, an IPS log is generated for this attack.

7. Go to *Log & Report* > *Intrusion Prevention* to view the log.

To configure botnet C&C IP blocking in the CLI:

```
config ips sensor
   edit "Demo"
      set scan-botnet-connections {disable | block | monitor}
   next
end
```

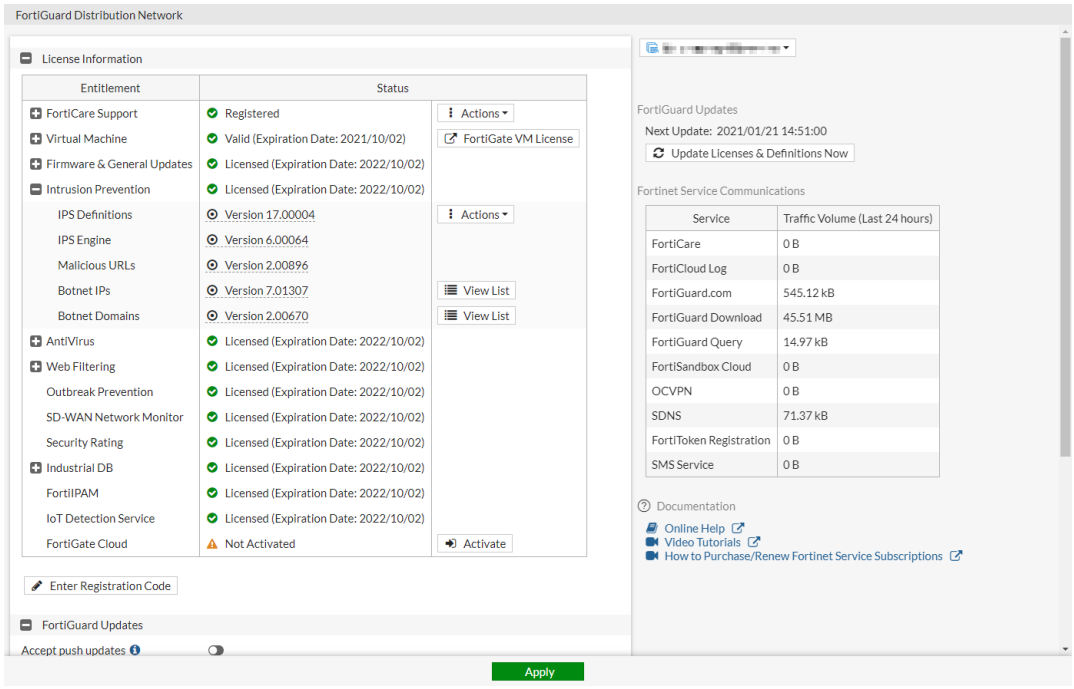
The `scan-botnet-connections` option is no longer available in the following CLI commands:

- `config firewall policy`
- `config firewall interface-policy`
- `config firewall proxy-policy`
- `config firewall sniffer`

Botnet IPs and domains lists

To view botnet IPs and domains lists:

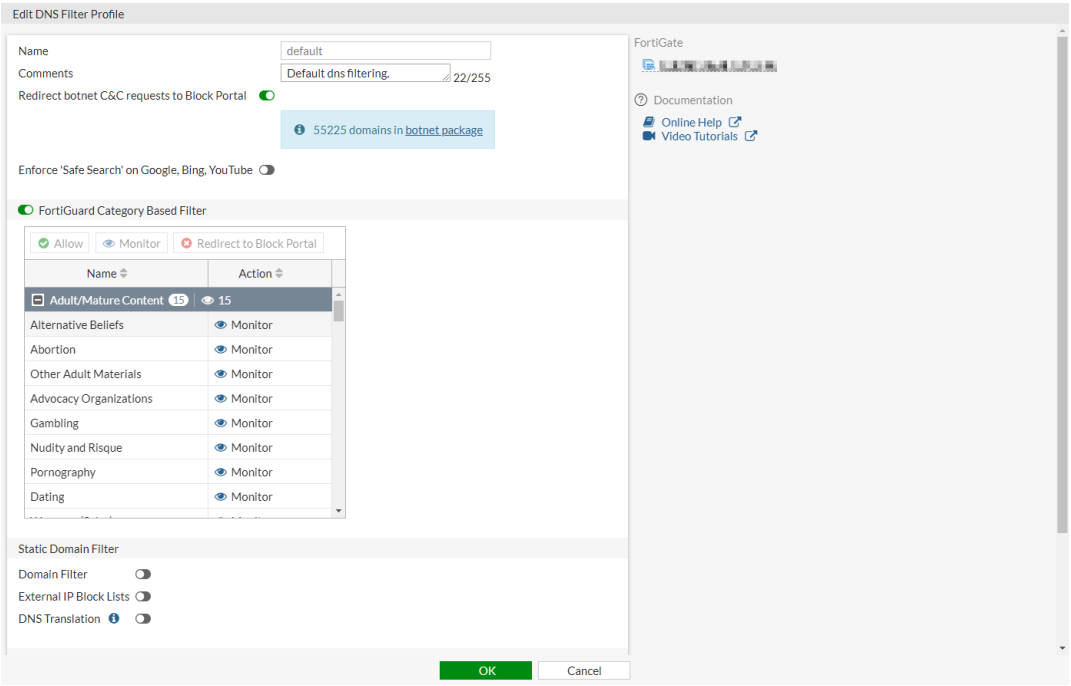
1. Go to *System* > *FortiGuard*. *Botnet IPs* and *Botnet Domains* are visible in the *Intrusion Prevention* section.
2. Click *View List* for more details.



Botnet C&C domain blocking

To block connections to botnet domains:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing filter.
2. Enable *Redirect botnet C&C requests to Block Portal*.

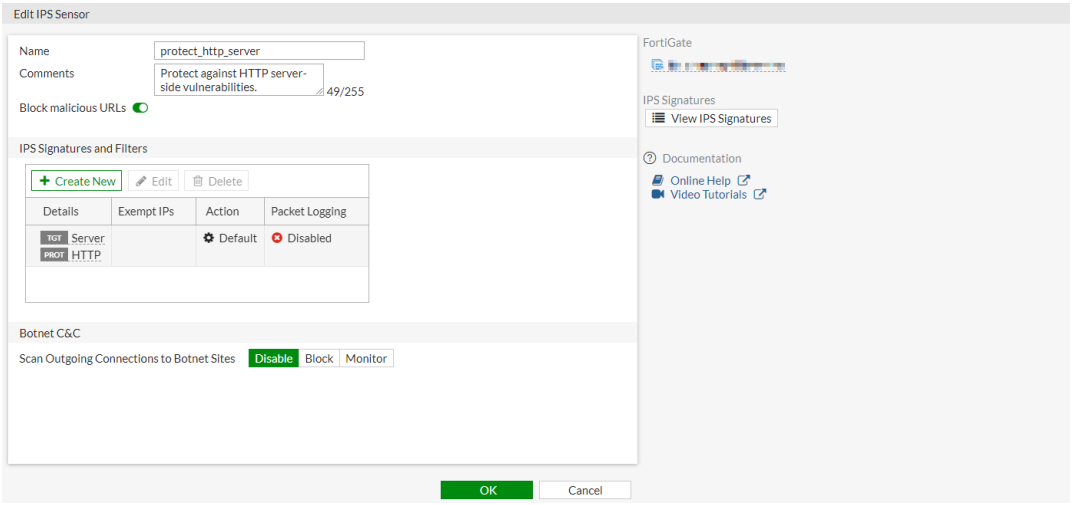


3. Configure the other settings as needed.
4. Click *OK*.
5. Add the filter profile to a firewall policy.

Botnet C&C URL blocking

To block malicious URLs:

1. Go to *Security Profiles* > *Intrusion Prevention* and click *Create New*, or edit an existing sensor.
2. Enable *Block malicious URLs*.



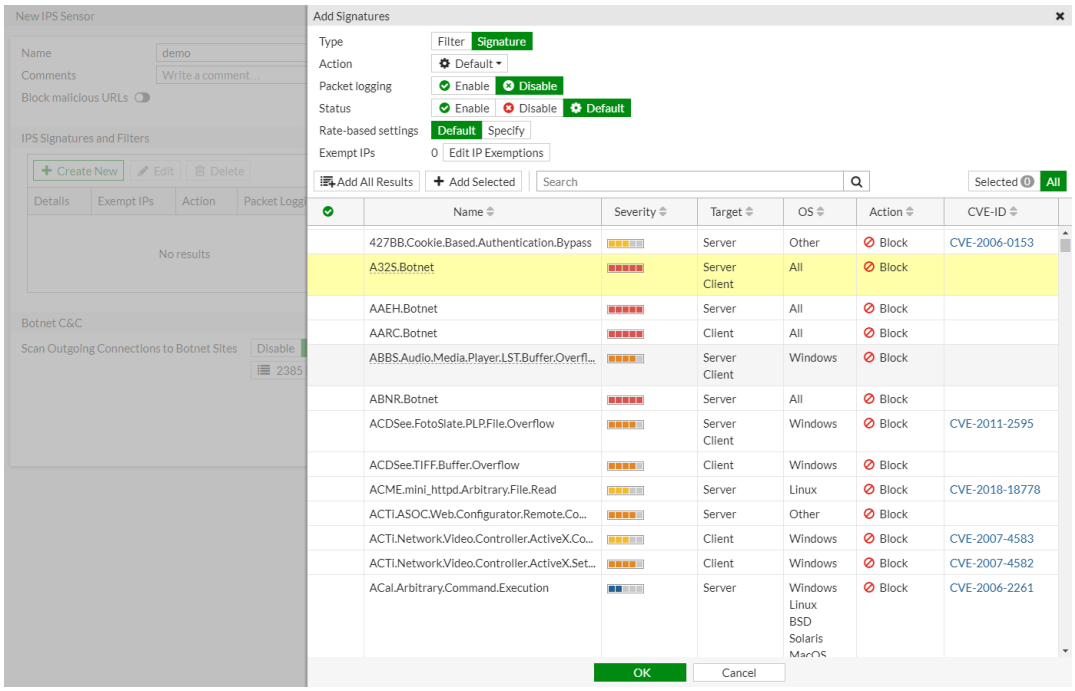
3. Configure the other settings as needed.
4. Click *OK*.
5. Add the sensor to a firewall policy.

Botnet C&C signature blocking

To add IPS signatures to a sensor:

1. Go to *Security Profiles* > *Intrusion Prevention* and click *Create New*, or edit an existing sensor.
2. In the *IPS Signatures and Filters* section, click *Create New*. A list of available signatures appears.
3. For *Type*, select *Signature*. Select the signatures you want to include from the list.
4. Configure the other settings as needed.

5. Click *Add Selected*.



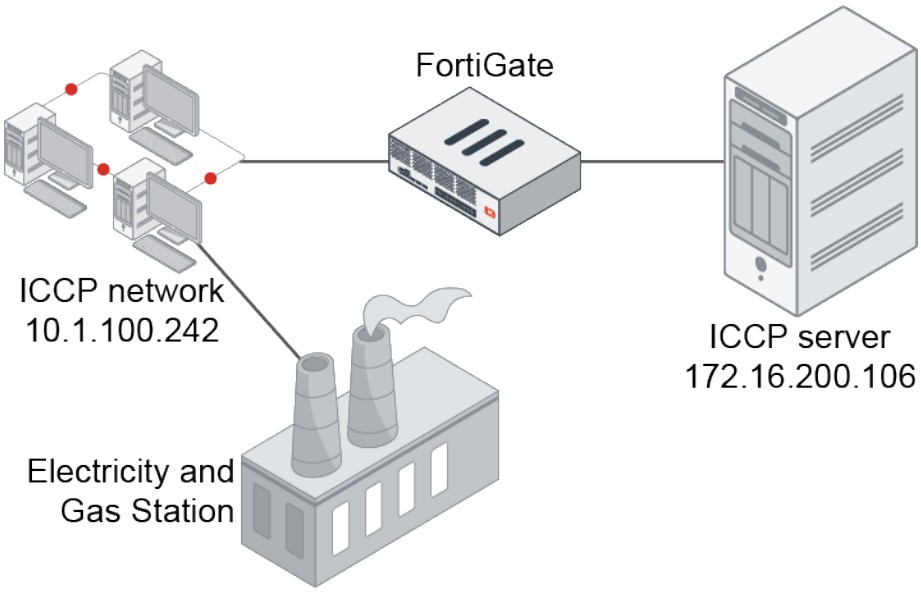
6. Click *OK*.
7. Add the sensor to a firewall policy to detect or block attacks that match the IPS signatures.

Detecting IEC 61850 MMS protocol in IPS

IEC 61850 is a SCADA protocol whose services are mapped to a number of protocols, including MMS services. MMS/ICCP detection is supported in IPS. The purpose of the MMS dissectors is to identify every IEC 61850 service to distinguish different MMS/ICCP messages. IPS engine 6.0.12 and later support MMS dissectors.

The following scenarios are also supported:

- Multiple MMS PDUs are transferred in one TCP payload, and the IPS engine identifies individuals.
- An MMS message is split over multiple TCP segments, where MMS runs over COTP segments.
- ICCP/TASE.2 that also uses MMS transport (ISO transport over TCP for ICCP) is detected.



Industrial signatures must be enabled in the global IPS settings to receive MMS/ICCP signatures. By default, industrial signatures are excluded.

```
config ips global
    set exclude-signatures none
end
```

Below are some industrial signatures for MMS/ICCP messages that can be detected by the IPS engine. This is not an exhaustive list.

- MMS_GetNameList.Request
- MMS_GetNamedVariableListAttributes.Request
- MMS_GetVariableAccessAttributes.Request
- MMS_Identify.Request
- MMS_Initiate.Request
- MMS_Read.Request
- MMS_Reset.Request
- ICCP_Transfer.Reporting
- ICCP_Create.Dataset
- ICCP_Abort
- ICCP_Start.Transfer.DSTransferSet
- ICCP_Get.Dataset.Element.Values
- ICCP_Get.Next.DSTransfer.Set.Value
- ICCP_Delete.Dataset
- ICCP_Start.Transfer.IMTransferSet

Diagnose command

The COTP dissector adds support for identifying every MMS PDU, and let the IPS engine separate them, like the Modbus and IEC-104 services for example.

```
# diagnose ips debug enable all
# diagnose debug enable
```

```
[284@78]ips_l7_dsct_processor: serial=8142 create: cotp
[284@78]ips_l7_dsct_processor: serial=8142 create: iec104
[284@78]ips_l7_dsct_processor: serial=8142 create: modbus
```

Log samples

MMS dissectors can be triggered, and MMS/ICCP signatures can be monitored and logged.

Log samples:

```
date=2020-03-26 time=15:51:10 logid="1059028704" type="utm" subtype="app-ctrl"

msg="Industrial: ICCP_Transfer.Reporting," apprisk="elevated"
```

IPS signature filter options

IPS signature filter options include hold time and CVE pattern.

Hold time

The hold time option allows you to set the amount of time that signatures are held after a FortiGuard IPS signature update per VDOM. During the holding period, the signature's mode is monitor. The new signatures are enabled after the hold time to avoid false positives.

The hold time can be from 0 days and 0 hours (default) up to 7 days, in the format `##d##h`.

To configure the amount of time to hold and monitor IPS signatures:

```
config system ips
    set signature-hold-time 3d12h
    set override-signature-hold-by-id enable
end
```

When a signature that is on hold is matched, the log will include the message `signature is on hold`:

```
date=2010-07-06 time=00:00:57 logid="0419016384" type="utm" subtype="ips"
eventtype="signature" level="alert" vd="vd1" eventtime=1278399657778481842 tz="-0700"
severity="info" srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55 srcintf="port13"
srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" sessionid=3620
action="detected" proto=6 service="HTTP" policyid=1 attack="Eicar.Virus.Test.File"
srcport=52170 dstport=80 hostname="172.16.200.55" url="/virus/eicar" direction="incoming"
```

```
attackid=29844 profile="test" ref="http://www.fortinet.com/ids/VID29844"
incidentserialno=25165825 msg="file_transfer: Eicar.Virus.Test.File, (signature is on hold)"
```

To view signatures being held by rule ID 29844 on the VDOM:

```
# diagnose ips signature on-hold vd1 29844
Rule: 29844, attack_id: 58886, last updated: 20170411
Rule: 29844, attack_id: 59517, last updated: 20170411
Rule: 29844, attack_id: 60105, last updated: 20170411
...
```

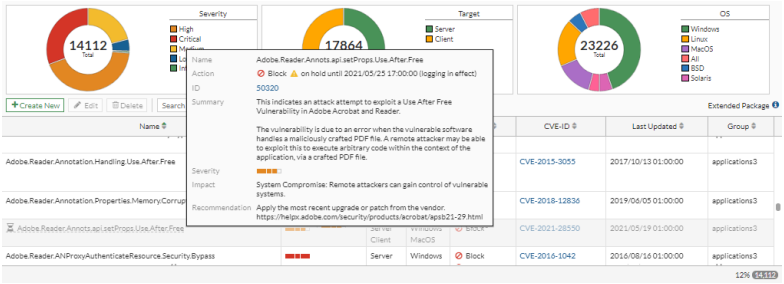
To view all help signatures on the VDOM:

```
# diagnose ips signature on-hold vd1
Rule: 17541, attack_id: 20899, last updated: 20140423
Rule: 17557, attack_id: 20934, last updated: 20140423
Rule: 17559, attack_id: 20932, last updated: 20140423
Rule: 17560, attack_id: 20933, last updated: 20140423
Rule: 17562, attack_id: 20928, last updated: 20170908
Rule: 17677, attack_id: 21187, last updated: 20171106
Rule: 17713, attack_id: 43756, last updated: 20140424
Rule: 17759, attack_id: 21298, last updated: 20140423
...
```

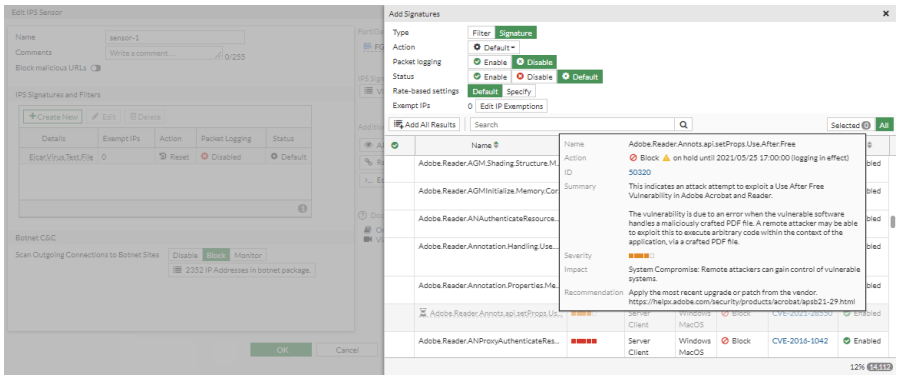
Viewing on hold information in the GUI

On hold signatures are grayed out in the GUI with an hourglass icon beside the signature name. A tooltip displays the on hold expiry time and other details.

On the *Security Profiles* > *IPS Signatures* page, for example, the *Adobe.Reader.Annots.api.setProps.Use.After.Free* signature is on hold. Hover over the grayed-out entry to view the tooltip, which includes the action and hold time expiry. On this page, all on hold signatures are displayed as on hold regardless of whether `override-signature-hold-by-id` is enabled.



The same tooltip is available on the *Edit IPS Sensor* (*Security Profiles* > *Intrusion Prevention*) page when creating or editing the IPS signatures. In the *Add Signatures* pane when the *Type* is *Signature*, signatures on hold are only displayed as on hold if `override-signature-hold-by-id` is enabled.



You can still use on hold signatures in an IPS sensor profile; however, the profile will not block matching traffic. It will monitor it instead (logging in effect) until the on hold time expires.

CVE pattern

The CVE pattern option allows you to filter IPS signatures based on CVE IDs or with a CVE wildcard, ensuring that any signatures tagged with that CVE are automatically included.

To configure CVE patterns for CVE-2010-0177 and all CVE-2017 CVEs:

```
config ips sensor
    edit "cve"
        set comment "cve"
        config entries
            edit 1
                set cve "cve-2010-0177"
                set status enable
                set log-packet enable
                set action block
            next
            edit 2
                set cve "cve-2017"
                set action reset
            next
        end
    next
end
```

For example, the CVE of the IPS signature *Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution* is CVE-2010-0177. This matches the CVE filter in the IPS sensor, so traffic is blocked and logged:

```
date=2020-07-13 time=15:44:56 logid="0419016384" type="utm" subtype="ips"
eventtype="signature" level="alert" vd="vd1" eventtime=1594593896666145871 tz="-0700"
severity="critical" srcip=10.1.100.22 srccountry="Reserved" dstip=172.16.200.55
srcintf="port2" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined"
sessionid=1638 action="dropped" proto=6 service="HTTPS" policyid=1
attack="Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution" srcport=58298 dstport=443
```

```
hostname="172.16.200.55" url="/Mozilla" direction="incoming" attackid=20853 profile="sensor-
1" ref="http://www.fortinet.com/ids/VID20853" incidentserialno=124780667 msg="web_client:
Mozilla.Firefox.PluginArray.NsMimeType.Code.Execution," crscore=50 craction=4096
crlevel="critical"
```

File filter

The file filter can be applied directly to firewall policies and supports various traffic protocols in proxy or flow mode.

Protocol	Proxy mode	Flow mode
CIFS	Yes	Yes
FTP	Yes	Yes
HTTP	Yes	Yes
IMAP	Yes	Yes
MAPI	Yes	No
POP3	Yes	Yes
SMTP	Yes	Yes
SSH	Yes	No

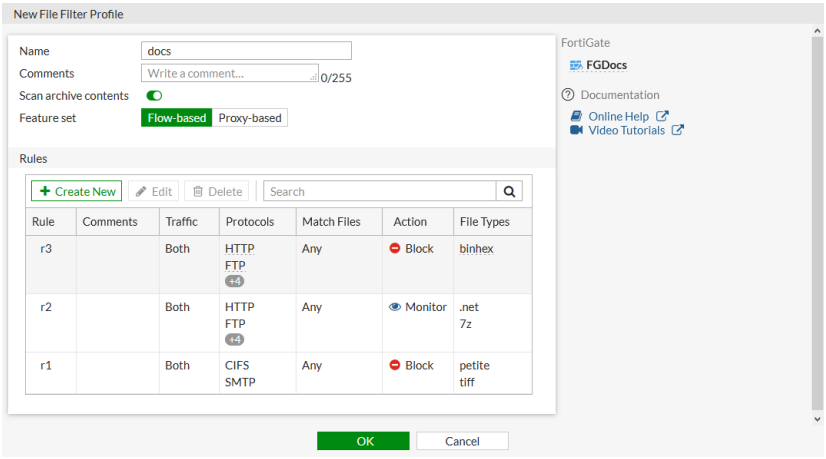
Prior to FortiOS 6.4.1, file filter was embedded in the web filter, email filter, SSH inspection, and CIFS profiles.

To configure a file filter in the GUI:

1. Configure the filter profile:
   a. Go to *Security Profiles* > *File Filter* and click *Create New*.
   b. Select a *Feature set*.
   c. In the *Rules* table, click *Create New*.
   d. Configure the settings as required.

   e. Click *OK* to save the rule.

f. Optionally, create more rules.



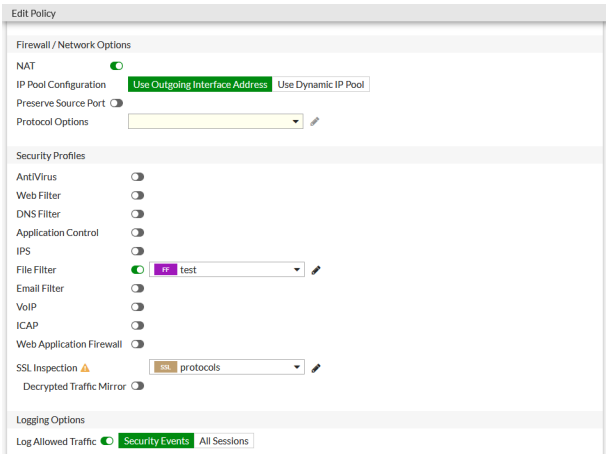
g. Click *OK* to save the filter profile.

2. Apply the filter to a policy:

a. Go to *Policy & Objects* > *Firewall Policy* and edit an existing policy or create a new one.

b. In the *Security Profiles* section, enable *File Filter*.

c. Select the filter from the dropdown box.



d. Configure the other settings as needed.

e. Click *OK*.

To configure a file filter in the CLI:

1. Configure the file filter profile:

```
config file-filter profile
    edit "test"
        set comment ''
        set feature-set flow
        set replacemsg-group ''
        set log enable
        set scan-archive-contents enable
        config rules
            edit "r2"
                set comment ''
```

```
                set protocol http ftp smtp imap pop3 cifs
                set action block
                set direction outgoing
                set password-protected any
                set file-type "sis" "tar" "tiff" "torrent" "upx" "uue" "wav" "wma" "xar"
"xz" "zip"
            next
            edit "r1"
                set comment ''
                set protocol http ftp smtp imap pop3 cifs
                set action log-only
                set direction any
                set password-protected any
                set file-type ".net" "7z" "activemime" "arj" "aspack" "avi" "base64"
"bat" "binhex" "bmp" "bzip" "bzip2"
            next
            edit "r3"
                set comment ''
                set protocol http ftp smtp imap pop3
                set action block
                set direction any
                set password-protected any
                set file-type "binhex"
            next
        end
    next
end
```

2. Apply the filter to a policy:

```
config firewall policy
    edit 1
        set name "filefilter-policy"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set file-filter-profile "test"
        set auto-asic-offload disable
        set np-acceleration disable
        set nat enable
    next
end
```

Logs

Go to *Log & Report* > *File Filter* to view the file filter logs.

Log samples

```

Supported file types

File filter allows the FortiGate to block files passing through based on file type based on the file's meta data only, and not on file size or file content. A DLP sensor must be configured to block files based on size or content, such as SSN numbers, credit card numbers, or regexp.

The following file types are supported in file filter and DLP profiles:

Type	Description
.net	Match .NET files
7z	Match 7-Zip files
activemime	Match ActiveMime files
arj	Match ARJ compressed files
aspack	Match ASPack files
avi	Match AVI files
base64	Match Base64 files
bat	Match Windows batch files
binhex	Match BinHex files
bmp	Match BMP files
bzip	Match Bzip files
bzip2	Match Bzip2 files
cab	Match Windows CAB files
chm	Match Windows compiled HTML help files
class	Match CLASS files
cod	Match COD files
crx	Match Chrome extension files
dmg	Match Apple disk image files
elf	Match ELF files
exe	Match Windows executable files
flac	Match FLAC files
fsg	Match FSG files
gif	Match GIF files
gzip	Match Gzip files
hlp	Match Windows help files
hta	Match HTA files
html	Match HTML files

Type	Description
iso	Match ISO archive files
jad	Match JAD files
javascript	Match JavaScript files
jpeg	Match JPEG files
lzh	Match LZH compressed files
mach-o	Match Mach object files
mime	Match MIME files
mov	Match MOV files
mp3	Match MP3 files
mpeg	Match MPEG files
msi	Match Windows Installer MSI Bzip files
msoffice	Match MS-Office files. For example, DOC, XLS, PPT, and so on.
msofficex	Match MS-Office XML files. For example, DOCX, XLSX, PPTX, and so on.
pdf	Match PDF files
petite	Match Petite files
png	Match PNG files
rar	Match RAR archives
rm	Match RM files
sis	Match SIS files
tar	Match TAR files
tiff	Match TIFF files
torrent	Match torrent files
unknown*	Match unknown files
upx	Match UPX files
uue	Match UUE files
wav	Match WAV files
wma	Match WMA files
xar	Match XAR archive files
xz	Match XZ files
zip	Match ZIP files

* This file type is only available in DLP profiles.

Email filter

Email filters can be configured to perform spam detection and filtering. You can customize the default profile, or create your own and apply it to a firewall policy.

Two kinds of filtering can be defined in a single profile, and they will act independent of one another.

Filter options can be organized according to the source of the decision:

- Local options: the FortiGate qualifies the email based on local conditions, such as block/allowlists, banned words, or DNS checks using FortiGuard Antispam.
- FortiGuard-based options: the FortiGate qualifies the email based on the score or verdict returned from FortiGuard Antispam.
- Third-party options: the FortiGate qualifies the email based on information from a third-party source (like an ORB list).

Local and FortiGuard block/allowlists can be enabled and combined in a single profile. When combined, the local block/allowlist has a higher priority than the FortiGuard block list during a decision making process. For example, if a client IP address is blocklisted in the FortiGuard server, but you want to override this decision and allow the IP to pass through the filter, you can define the IP address or subnet in a local block/allowlist with the clear action. Because the information coming from the local list has a higher priority than the FortiGuard service, the email will be considered clean.

Some features of this functionality require a subscription to FortiGuard Antispam.

Protocol comparison between email filter inspection modes

The following table indicates which email filters are supported by their designated inspection modes.

	SMTP	POP3	IMAP	MAPI
Proxy	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	No

The following topics provide information about email filter profiles:

- Local-based filters on page 860
- FortiGuard-based filters on page 863
- Protocols and actions on page 864
- Configuring webmail filtering on page 866

Local-based filters

You can make block/allowlists from emails or IP subnets to forbid or allow them to send or receive emails. With the `spamhelodns` (*HELO DNS Lookup*) and `spamraddrdns` (*Return Email DNS Check*) options, the FortiGate performs a standard DNS check on the machine name used in the HELO SMTP message, and/or the return to field to determine if these names belong to a registered domain. The FortiGate does not check the FortiGuard service during these operations.

You can also define a list of banned words. Emails that contain any of these banned words are considered spam.

Banned words can only be configured in the CLI.

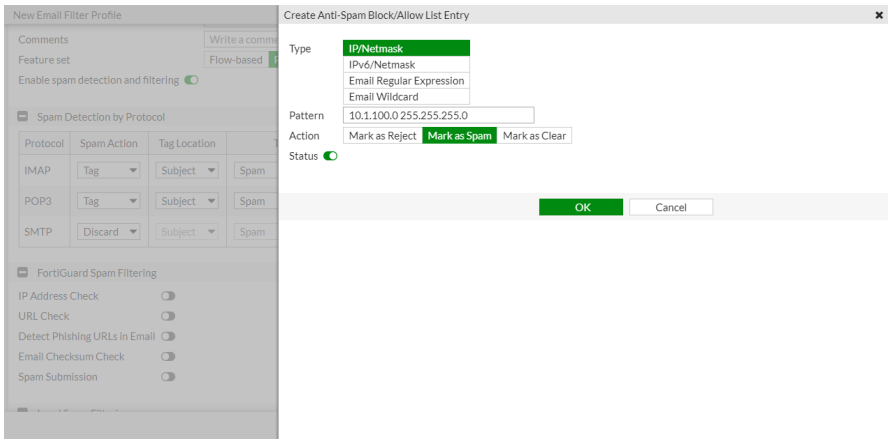
By default, HELO/DNS and Return-to/DNS checls are done before the block/allow list check. In some situations, such as when configuring a block/allow list to clear an email from performing further filtering, use the following command to give precedence to the block/allow list:

```
config emailfilter profile
    edit <filter>
        config smtp
            set local-override enable
        next
    end
end
```

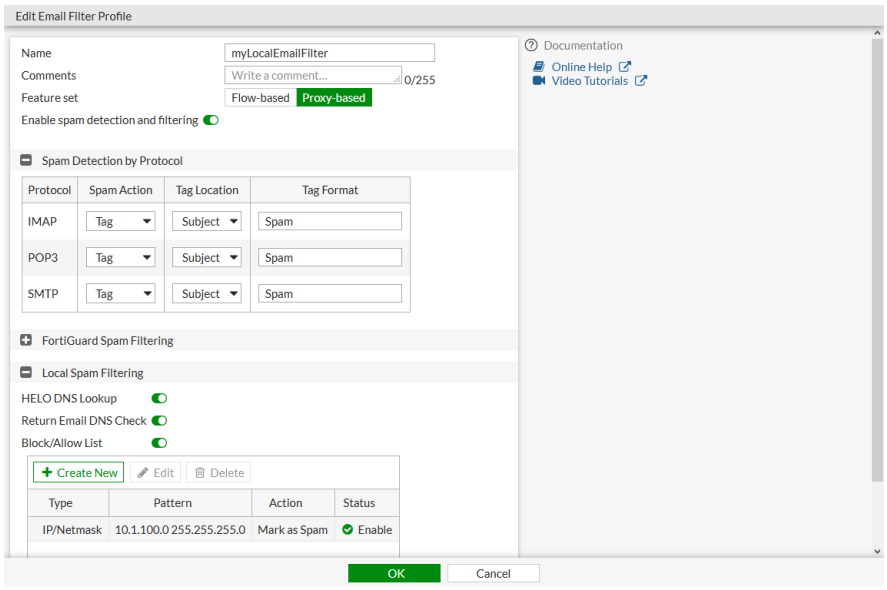
To configure a local-based email filter in the GUI:

1. Configure the email filter profile:
   a. Go to *Security Profiles* > *Email Filter* and click *Create New*, or edit an existing profile.
   b. Select a *Feature set* and enable *Enable spam detection and filtering*.
   c. In the *Local Spam Filtering* section, enable the desired filters (*HELO DNS Lookup*, *Return Email DNS Check*, *Block/Allow List*).
   d. If *Block/Allow List* is enabled, click *Create New*. The *Create Anti-Spam Block/Allow List Entry* pane opens.

e. Select a *Type*, enter a *Pattern*, and select and *Action*.



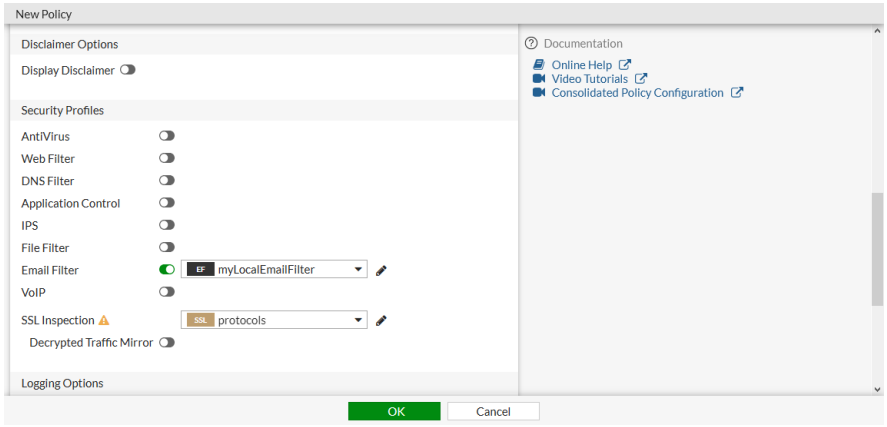
f. Click *OK* to save the block/allow list.



g. Click *OK* save the email filter profile.

2. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.
   b. Set the inspection-mode to *Proxy-based*.

c. Enable the *Email Filter* option and select the previously created profile.



d. Set *SSL Inspection* to a profile that has deep SSL inspection enabled.
Deep inspection is required if you intend to filter SMTP, POP3, IMAP, or any SSL/TLS encapsulated protocol.

e. Configure the other settings as needed.

f. Click *OK*.

To configure a local-based email filter in the CLI:

1. Configure a block/allow list:

```
config emailfilter block-allow-list
    edit 1
        set name "myBAL"
        config entries
            edit 1
                set status enable
                set type ip
                set action spam
                set addr-type ipv4
                set ip4-subnet 10.1.100.0 255.255.255.0
            next
        end
    next
end
```

2. Configure an email filter profile:

```
config emailfilter profile
    edit "myLocalEmailFilter"
        set spam-filtering enable
        set options spambal spamhelodns spamraddrdns
        config smtp
            set action tag
        end
        set spam-bal-table 1
    next
end
```

3. Use the profile in a firewall policy:

```
config firewall policy
    edit 1
```

```
        .....
        set inspection-mode proxy
        set emailfilter-profile "myLocalEmailFilter"
    next
end
```

To configure banned words:

1. Configure a banned words list:

```
config emailfilter bword
    edit 1
        set name "banned"
        config entries
            edit 1
                set pattern <string>
            next
        end
    next
end
```

2. Configure an email filter profile:

```
config emailfilter profile
    edit "myBannedWordsProfile"
        set spam-filtering enable
        set options bannedword
        set spam-bword-table 1
    next
end
```

3. Use the profile in a firewall policy:

```
config firewall policy
    edit 1
        .....
        set inspection-mode proxy
        set emailfilter-profile "myBannedWordsProfile"
    next
end
```

FortiGuard-based filters

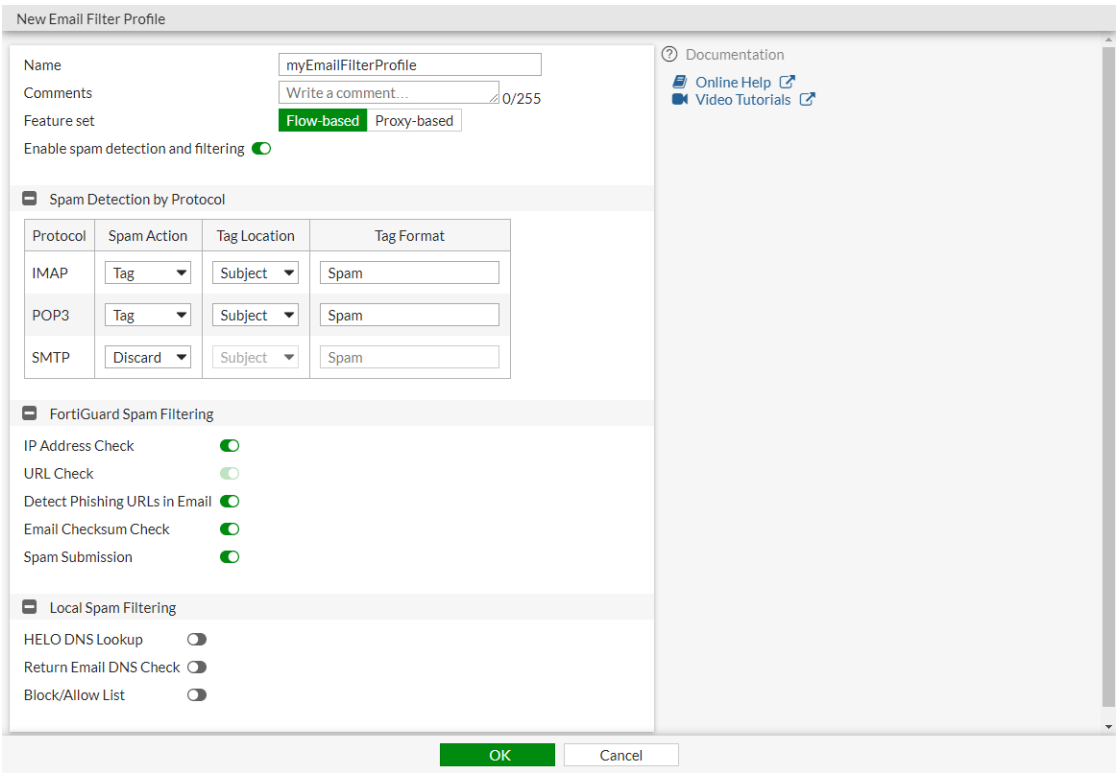
The FortiGate consults FortiGuard servers to help identify spammer IP address or emails, known phishing URLs, known spam URLs, known spam email checksums, and others.

FortiGuard servers have maintained databases that contain blocklists, which are fed from Fortinet sensors and labs distributed all over the world.

To configure the FortiGuard filters in the GUI:

1. Go to *Security Profiles* > *Email Filter* and click *Create New*.
2. Enable *Enable spam detection and filtering*.

3. In the *FortiGuard Spam Filtering Spam Filtering* section, you can enable or disable the following filters:
   - *IP Address Check*
   - *URL Check*
   - *Detect Phishing URLs in Email*
   - *Email Checksum Check*
   - *Spam Submission*



4. Click *OK*.

To configure the FortiGuard filters in the CLI:

```
config emailfilter profile
    edit "myEmailFilterProfile"
        set spam-filtering enable
        set options spamfsip spamfssubmit spamfschksum spamfsurl spamfsphish
    next
end
```

Protocols and actions

In an email filter profile, there are options to configure settings for SMTP, POP3, IMAP, and MAPI protocols. For each protocol, you can set an action to either discard (block), tag, or pass the log for that protocol. The action options vary per protocol. For the tag action, the spam email can be tagged with configured text in the subject or header.

MAPI is only configurable in the CLI and with the proxy feature set.

To configure protocols in an email filer:

```
config emailfilter profile
    edit <name>
        set feature-set {flow | proxy}
        set spam-filtering enable
        set options {bannedword spambal spamfsip spamfssubmit spamfschksum spamfsurl
spamhelodns spamraddrdns spamrbl spamhdrcheck spamfsphish}
        config smtp
            set log-all {enable | disable}
            set action {pass | tag | discard}
            set tag-type {subject | header | spaminfo}
            set tag-msg <string>
            set hdrip {enable | disable}
            set local-override {enable | disable}
        end
        config imap
            set log-all {enable | disable}
            set action {pass | tag}
            set tag-type {subject | header | spaminfo}
            set tag-msg <string>
        end
        config pop3
            set log-all {enable | disable}
            set action {pass | tag}
            set tag-type {subject | header | spaminfo}
            set tag-msg <string>
        end
        config mapi
            set log-all {enable | disable}
            set action {pass | discard}
        end
    next
end
```

`options ...`	The following options are available: • bannedword: content block. • spambal: block/allow list. • spamfsip: email IP address FortiGuard antispam block list check. • spamfssubmit: add FortiGuard antispam spam submission text. • spamfschksum: email checksum FortiGuard antispam check. • spamfsurl: email content URL FortiGuard antispam check. • spamhelodns: email HELO/EHLO domain DNS check. • spamraddrdns: email return address DNS check. • spamrbl: email DNSBL and ORBL check. • spamhdrcheck: email MIME header check. • spamfsphish: email content phishing URL FortiGuard antispam check.
`tag-type {subject | header | spaminfo}`	Set the tag type: • subject: prepend text to the spam email subject. • header: append a user-defined MIME header to the spam email. • spaminfo: append spam information to the spam email header.
`tag-msg <string>`	Subject text or header added to the spam email.

`hdrip {enable | disable}`	Enable/disable SMTP email header IP checks for spamfsip, spamrbl, and spambal filters.
`local-override {enable | disable}`	Enable/disable local filter to override SMTP remote check result.

For more information, see config emailfilter profile in the FortiOS CLI Reference.

Configuring webmail filtering

You can configure an email filter to detect and log emails sent by Gmail and Hotmail. These interfaces do not use standard email protocols (SMTP, POP3, or IMAP) and use HTTPS instead. However, you can still configure the email filter to detect emails that pass through the FortiGate.

The FortiGate only detects and logs the emails, it does not discard or tag them.

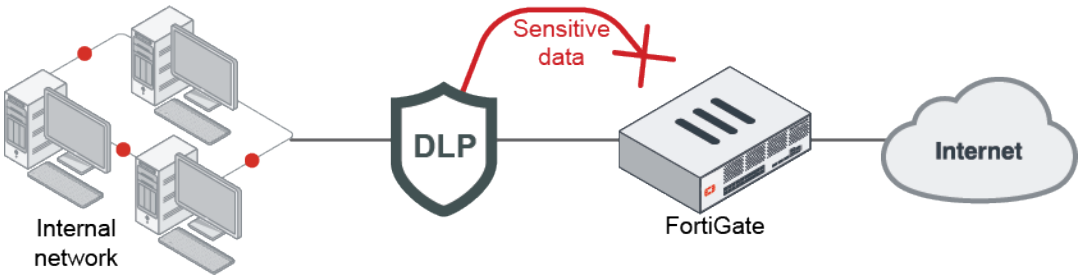
To configure webmail filtering:

```
config emailfilter profile
    edit <name>
        set spam-filtering enable
        config msn-hotmail
            set log-all enable
        end
        config gmail
            set log-all enable
        end
    next
end
```

Data leak prevention

The FortiGate data leak prevention (DLP) system prevents sensitive data from leaving or entering your network. You can customize the default sensor or create your own by adding individual filters based on file type, file size, a regular expression, an advanced rule, or a compound rule. Once configured, you can apply the DLP sensor to a firewall policy. Data matching defined sensitive data patterns is blocked, logged, or allowed when it passes through the FortiGate.

DLP can only be configured in the CLI.



The filters in a DLP sensor can examine traffic for the following:

- Known files using DLP fingerprinting
- Known files using DLP watermarking
- Particular file types
- Particular file names
- Files larger than a specified size
- Data matching a specified regular expression
- Credit card and Social Security numbers

Filters are ordered, but there is no precedence between the possible actions.

DLP is primarily used to stop sensitive data from leaving your network. DLP can also be used to prevent unwanted data from entering your network and to archive some or all of the content that passes through the FortiGate. DLP archiving is configured per filter, which allows a single sensor to archive only the required data. You can configure the DLP archiving protocol in the CLI (see Configure DLP sensors).

There are two forms of DLP archiving:

- Summary only: a summary of all the activity detected by the sensor is recorded. For example, when an email message is detected, the sender, recipient, message subject, and total size are recorded. When a user accesses the web, every URL that they visit is recorded.
- Full: detailed records of all the activity detected by the sensor is recorded. For example, when an email message is detected, the message itself, including any attachments, is recorded. When a user accesses the web, every page that they visit is archived.

The following topics provide information about DLP:

- Basic DLP filter types on page 868
- DLP fingerprinting on page 870

Protocol comparison between DLP inspection modes

The following table indicates which protocols can be inspected by DLP based on the specified inspection modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SFTP/SCP
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	No	No	Yes	No

Logging and blocking files by file name

Sometimes, file names are not accurately recorded in DLP logs, even though the files are blocked correctly based on the DLP sensor. This is particularly apparent on cloud-based services, such as Google Drive or SharePoint.

For HTTP file uploads, some cloud services use proprietary encodings and APIs to transfer files and exchange metadata, instead of standard HTTP mechanisms, requiring custom handling of the proprietary API. If a cloud service changes the API without notice, the custom handling becomes outdated and file names might not be logged properly. Due to this, special consideration must be taken when using DLP to block files by file pattern. To block a specific file type, it is better to block by file type, and not by file name pattern.

Basic DLP filter types

The following basic filter types can be configured in the CLI:

- File type and name
- File size
- Regular expression
- Credit card and SSN

File type and name

A file type filter allows you to block, allow, log, or quarantine based on the file type specified in the file filter list (see Supported file types on page 856).

```
config dlp filepattern
    edit <id>
        set name <string>
        config entries
            edit <pattern>
                set filter-type {type | pattern}
                set file-type <file type>
            next
        end
    next
end
```

To configure file type and name filtering:

1. Create a file pattern to filter files based on the file name patter or file type.
   For example, to filter for GIFs and PDFs:

```
config dlp filepattern
    edit 11
        set name "sample_config"
        config entries
            edit "*.gif"
                set filter-type pattern
            next
            edit "pdf"
                set filter-type type
                set file-type pdf
```

```
            next
         end
      next
   end
```

2. Create the DLP sensor:

```
config dlp sensor
   edit <name>
      config filter
         edit <id>
            set name <string>
            set proto {smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs}
            set filter-by file-type
            set file-type 11
            set action {allow | log-only | block | quarantine-ip}
         next
      end
   next
end
```

File size

A file size filter checks for files that exceed the specific size, and performs the DLP sensor's configured action on them.

To configure file size filtering:

```
config dlp sensor
   edit <name>
      config filter
         edit <id>
            set name <string>
            set proto {smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs}
            set filter-by file-size
            set file-type 11
            set action {allow | log-only | block | quarantine-ip}
         next
      end
   next
end
```

Regular expression

A regular expression filter is used to filter files or messages based on the configured regular expression pattern.

To configure regular expression filtering:

```
config dlp sensor
   edit <name>
      config filter
         edit <id>
            set name <string>
            set type {file | message}
            set proto {smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs}
```

```
                set filter-by regexp
                set regexp <string>
                set action {allow | log-only | block | quarantine-ip}
            next
        end
    next
end
```

Credit card and SSN

The credit card sensor can match the credit card number formats used by American Express, Mastercard, and Visa. It can be used to filter files or messages.

The SSN sensor can be used to filter files or messages for Social Security Numbers.

To configure credit card or SSN filtering:

```
config dlp sensor
   edit <name>
      config filter
         edit <id>
            set name <string>
            set type {file | message}
            set proto {smtp pop3 imap http-get http-post ftp nntp mapi ssh cifs}
            set filter-by {credit-card | ssn}
            set action {allow | log-only | block | quarantine-ip}
         next
      end
   next
end
```

DLP fingerprinting

DLP fingerprinting can be used to detect sensitive data. The file that the DLP sensor will filter for is uploaded and the FortiGate generates and stores a checksum fingerprint. The FortiGate unit generates a fingerprint for all of the files that are detected in network traffic, and compares all of the checksums stored in its database. If a match is found, the configured action is taken.

Any type of file can be detected by DLP fingerprinting, and fingerprints can be saved for each revision of a file as it is updated.

To use fingerprinting:

- Select the files to be fingerprinted by targeting a document source.
- Add fingerprinting filters to DLP sensors.
- Add the sensors to firewall policies that accept traffic that the fingerprinting will be applied on.

The document fingerprint feature requires a FortiGate device that has internal storage.

To configure a DLP fingerprint document:

```
config dlp fp-doc-source
    edit <name_str>
        set server-type smb
        set server <string>
        set period {none | daily | weekly | monthly}
        set vdom {mgmt | current}
        set scan-subdirectories {enable | disable}
        set remove-deleted {enable | disable}
        set keep-modified {enable | disable}
        set username <string>
        set password <password>
        set file-path <string>
        set file-pattern <string>
        set sensitivity <Critical | Private | Warning>
        set tod-hour <integer>
        set tod-min <integer>
        set weekday {sunday | monday | tuesday | wednesday | thursday | friday |
saturday}
        set date <integer>
    next
end
```

Command	Description
server-type smb	The protocol used to communicate with document server. Only Samba (SMB) servers are supported.
server <string>	IPv4 or IPv6 address of the server.
period {none | daily | weekly | monthly}	The frequency that the FortiGate checks the server for new or changed files.
vdom {mgmt | current}	The VDOM that can communicate with the file server.
scan-subdirectories {enable | disable}	Enable/disable scanning subdirectories to find files.
remove-deleted {enable | disable}	Enable/disable keeping the fingerprint database up to date when a file is deleted from the server.
keep-modified {enable | disable}	Enable/disable keeping the old fingerprint and adding a new one when a file is changed on the server.
username <string>	The user name required to log into the file server.
password <password>	The password required to log into the file server.
file-path <string>	The path on the server to the fingerprint files.
file-pattern <string>	Files matching this pattern on the server are fingerprinted.
sensitivity <Critical | Private | Warning>	The sensitivity or threat level for matches with this fingerprint database.
tod-hour <integer>	Set the hour of the day. This option is only available when `period` is not `none`.

Command	Description
tod-min <integer>	Set the minute of the hour. This option is only available when `period` is not `none`.
weekday {sunday | monday | tuesday | wednesday | thursday | friday | saturday}	Set the day of the week. This option is only available when `period` is `weekly`.
date <integer>	Set the day of the month. This option is only available when `period` is `monthly`.

To configure a DLP fingerprint sensor:

```
config dlp sensor
    edit <sensor name>
        config filter
            edit <id number of filter>
                set proto {smtp | pop3 | imap http-get | http-post | ftp | nntp | mapi}
                set filter-by fingerprint
                set sensitivity {Critical | Private | Warning}
                set match-percentage <integer>
                set action {allow | log-only | block | ban | quarantine-ip}
            next
        end
    next
end
```

Command	Description
proto {smtp | pop3 | imap http-get | http-post | ftp | nntp | mapi}	The protocol to inspect.
filter-by fingerprint	Match against a fingerprint sensitivity.
sensitivity {Critical | Private | Warning}	Select a DLP file pattern sensitivity to match.
match-percentage <integer>	The percentage of the checksum required to match before the sensor is triggered.
action {allow | log-only | block | ban | quarantine-ip}	The action to take with content that this DLP sensor matches.

View the DLP fingerprint database on the FortiGate

The CLI debug command `diagnose test application dlpfingerprint` can be used to display the fingerprint information that is on the FortiGate.

```
Fingerprint Daemon Test Usage;
-------------------------------------
  1 : This menu
  2 : Dump database
  3 : Dump all files
  5 : Dump all chunk
  6 : Refresh all doc sources in all VDOMs
  7 : Show the db file size and the limit
  9 : Display stats
```

```
 10 : Clear stats
 99 : Restart this daemon
```

For example, option 3 will dump all fingerprinted files:

```
DLP_WANOPT-CLT (global) # diagnose test application dlpfingerprint 3
DLPFP diag_test_handler called
File DB:
---------------------------------------

VoIP solutions

You can configure VoIP profiles to allow SIP and SCCP traffic and to protect your network from SIP- and SCCP-based attacks.

FortiOS includes two preloaded VoIP profiles:

- *default*
- *strict*

You can customize these profiles, or you can create your own and add them to firewall policies that allow VoIP.

VoIP profiles cannot be used NGFW policy-based mode. See Profile-based NGFW vs policy-based NGFW on page 526 for more information.

The following topics provide information about VoIP profiles:

- General use cases on page 875
- SIP message inspection and filtering on page 879
- SIP pinholes on page 881

- SIP over TLS on page 882
- Custom SIP RTP port range support on page 883
- Voice VLAN auto-assignment on page 885

General use cases

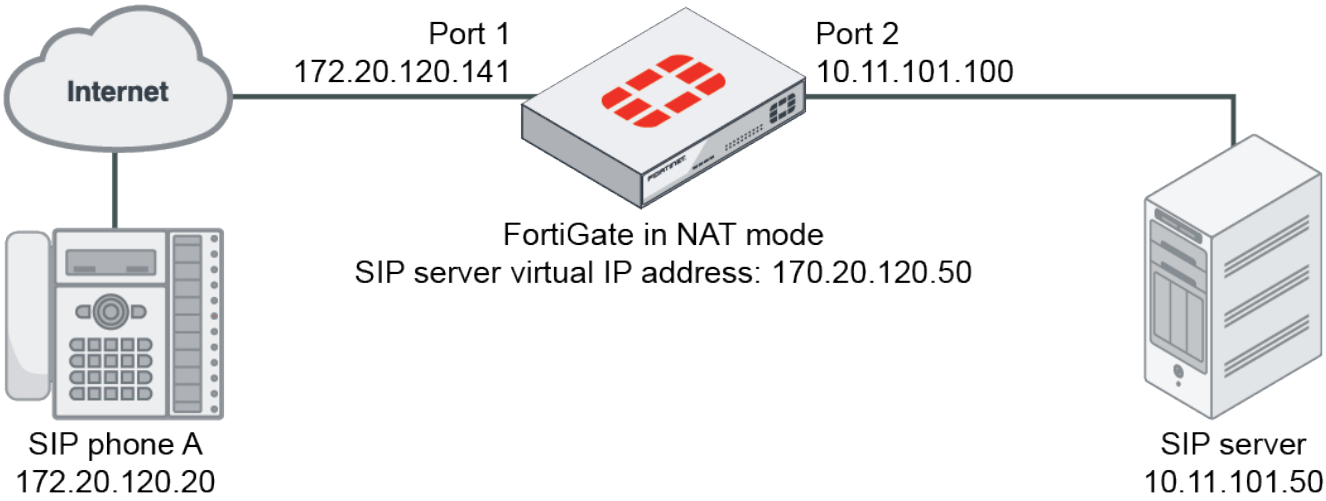
There are three scenarios in which the FortiOS session initiation protocol (SIP) solution is usually deployed:

1. The SIP server is in a private network, protected from the internet by a FortiOS device.
2. The SIP clients are in a private network, protected from the internet by a FortiOS device.
3. The SIP server is in a private network, such as a corporation's internal network or an ISP's network, protected from the Internet by a FortiOS device. The SIP clients are in a remote private network, such as a SOHO network, and behind a NAT device that is not aware of SIP applications.

The following VIP, NAT, and HNT examples show configurations for each of the three common scenarios.

VIP

A FortiGate with SIP Application Layer Gateway (ALG) or SIP Session Helper protects the SIP server from the internet, while SIP phones from the internet need to register to the SIP server and establish calls through it.



A VIP needs to be configured for the SIP server, and the VIP must be applied in a firewall policy for the phones to send REGISTER messages through the FortiGate from port1 to port2.

Only one firewall policy needs to be configured for all SIP phones on both the internet and private network to register to the SIP server through Port1 and set up SIP calls.

Assuming either SIP ALG or SIP Session Helper is enabled, configure the FortiGate with the following CLI commands:

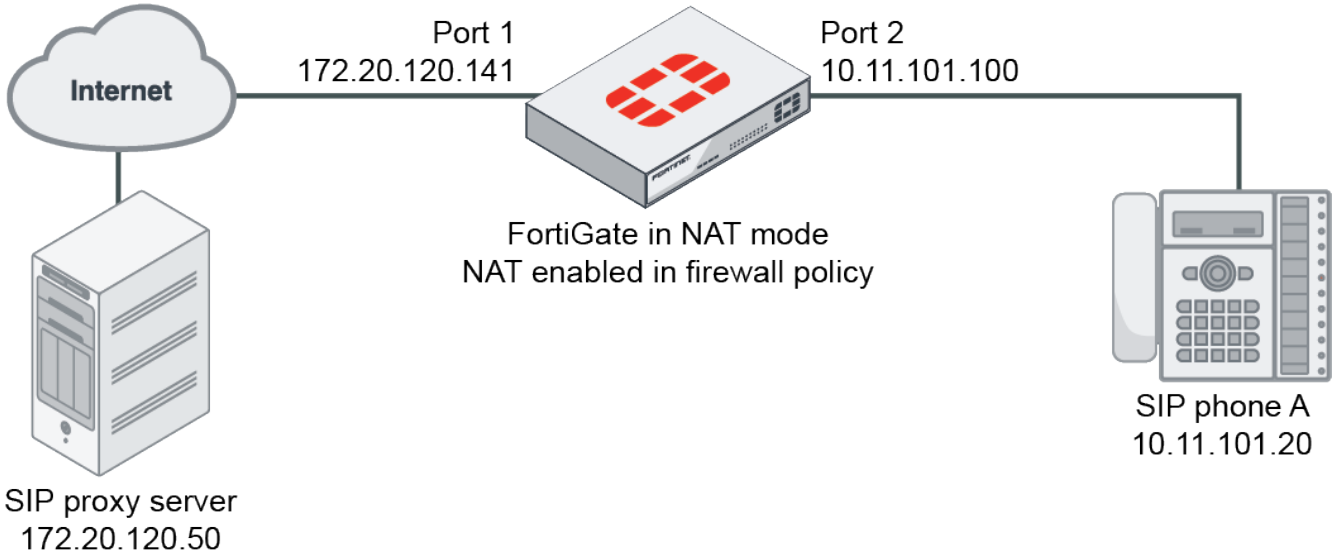
```
config firewall vip
    edit "VIP_for_SIP_Server"
        set extip 172.20.120.50
        set extintf "port1"
        set mappedip "10.11.101.50"
    next
end
```

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "VIP_for_SIP_Server"
        set action accept
        set schedule "always"
        set service "SIP"
    next
end
```

Setting `service` to `SIP` and not `All` in the firewall policy can improve protection by restricting the data traffic passing through the FortiGate to the SIP call traffic only.

NAT

A FortiGate with SIP ALG or SIP Session Helper protects the SIP phones and the internal network from the internet, while SIP phones in the internal network need to register to the SIP server installed on the internet and establish calls through it.



One firewall policy needs to be configured with NAT enabled for SIP phones to send REGISTER messages through the FortiGate from port2 to port1.

Assuming either SIP ALG or SIP Session Helper is enabled, configure the FortiGate with the following CLI commands:

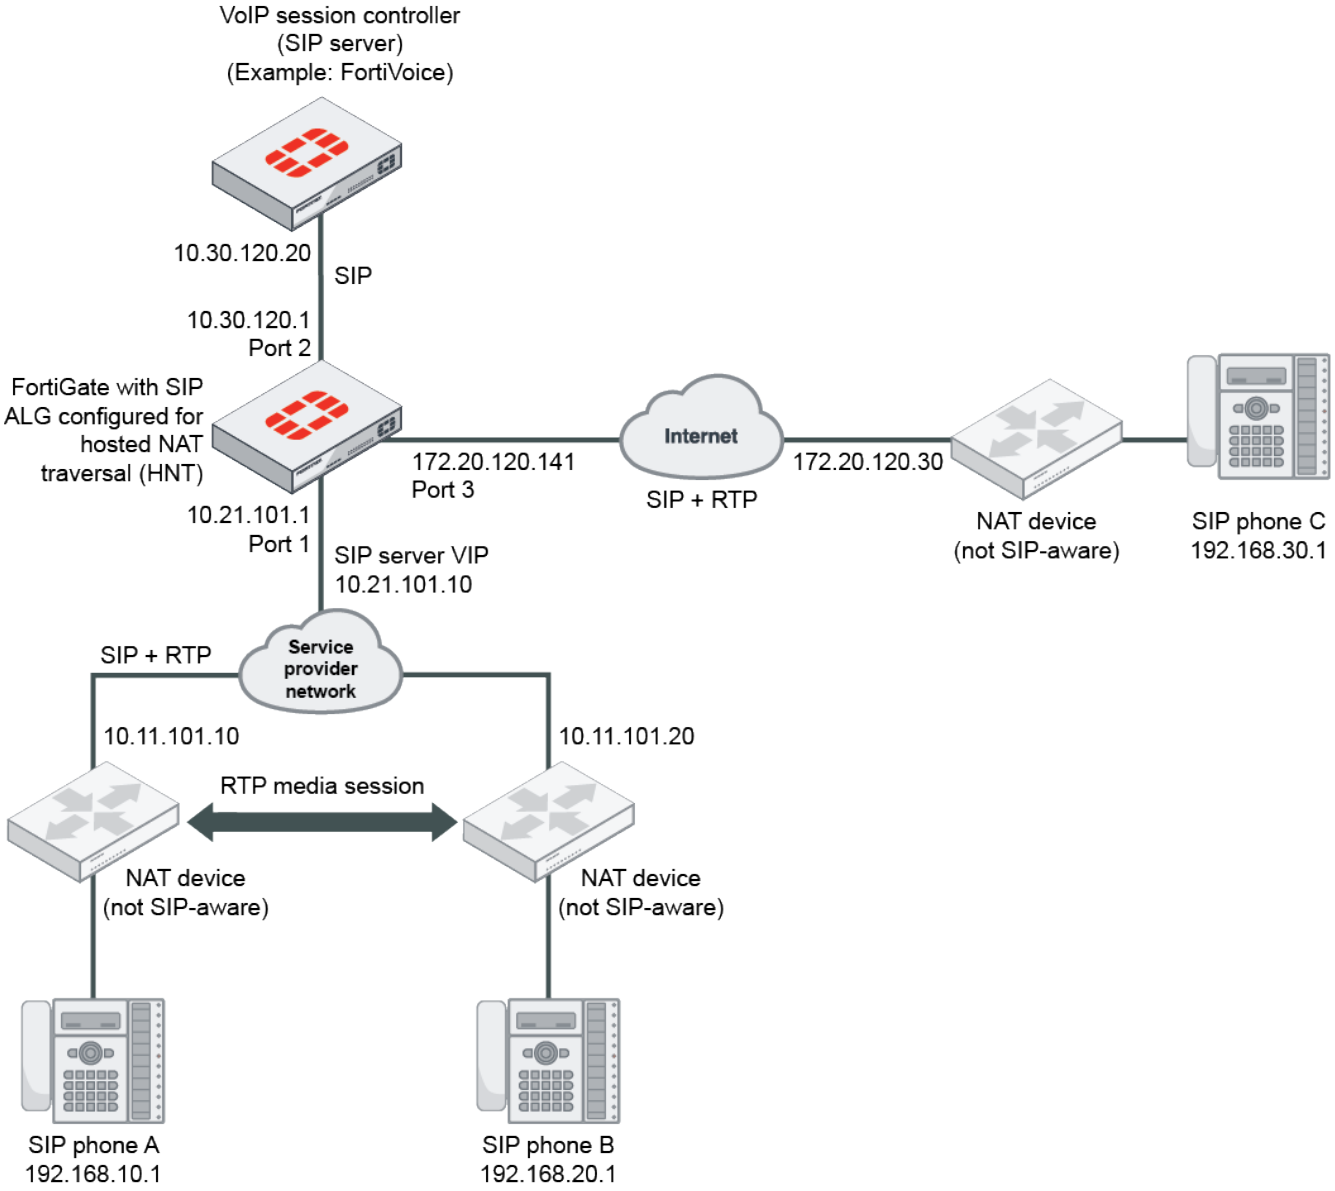
```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
```

```
            set service "SIP"
            set nat enable
        next
    end
```

HNT

A FortiGate with SIP ALG protects the SIP server from the internet, while SIP phones are in remote private networks behind NAT devices that are not aware of the SIP application. This is only supported in proxy mode.

For example, the SIP server is located in an ISP's service cloud that is protected by the FortiGate SIP ALG, and the SIP phones are installed in the home networks of the ISP's customers.



The SIP messages traversing the remote NAT devices might have their IP addresses translated by the NAT device at the network layer, but untranslated at the SIP application layer because those NAT devices are not aware of the

SIP applications. This causes problems in a SIP session initiated process. Special configurations for the Hosted NAT Traversal (HNT) are required to resolve this issue.

To configure the FortiGate with HNT support for SIP phones A and B to set up calls with each other:

1. Identify port1 as the external interface:

```
config system interface
    edit "port1"
        set external enable
    next
end
```

2. Configure VIP for the SIP server:

```
config firewall vip
    edit "VIP_for_SIP_Server"
        set extip 10.21.101.10
        set extintf "port1"
        set mappedip "10.30.120.20"
    next
end
```

3. Configure a VoIP profile with HNT enabled:

```
config voip profile
    edit "hnt"
        config sip
            set hosted-nat-traversal enable
            set hnt-restrict-source-ip enable
        end
    next
end
```

`hosted-nat-traversal` must be enabled.

`hnt-restrict-source-ip` does not have to be enabled, but can be enabled to restrict the RTP packets' source IP to be the same as the SIP packets' source IP.

4. Apply the VoIP profile and VIP in a firewall policy for phone A and B to register and set up SIP calls through the FortiGate and SIP server:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "VIP_for_SIP_Server"
        set action accept
        set schedule "always"
        set service "SIP"
        set utm-status enable
        set voip-profile "hnt"
        set nat enable
    next
end
```

`nat` must be enabled in the firewall policy.

SIP message inspection and filtering

SIP ALG provides users with security features to inspect and control SIP messages that are transported through FortiOS devices, including:

- Verifying the SIP message syntax.
- Blocking particular types of SIP requests.
- Restricting the rate of particular SIP requests.

These can be performed in both proxy-based or flow-based firewall policies. In 7.0, flow-based SIP inspection is done by the IPS engine. This optimizes memory and CPU usage when VoIP profiles with SIP inspection are configured with other UTM profiles in a flow-based firewall policy because inspection is done entirely by the IPS engine.

These features are configured in the VoIP profile:

```
config voip profile
    edit <name>
        set feature-set {proxy | flow}
            config sip
                set ...
                ...
            end
    next
end
```

For more information, see config voip profile in the FortiOS CLI Reference.

The VoIP profile can then be applied to a firewall policy to process the SIP call traffic. The firewall policy's inspection mode decides whether inspection happens on the SIP ALG proxy or on the IPS engine.

```
config firewall policy
    edit <policy>
        set inspection-mode {proxy | flow}
        set voip-profile <profile>
    next
end
```

SIP message syntax inspection

For syntax verification, the following attributes are available for configuration in the VoIP profile to determine what action is taken when a specific syntax error or attack based on invalid syntax is detected. For example, the action can be set to pass or discard it.

```
malformed-request-line
malformed-header-via
```

```
malformed-header-from
malformed-header-to
malformed-header-call-id
malformed-header-cseq
malformed-header-rack
malformed-header-rseq
malformed-header-contact
malformed-header-record-route
malformed-header-route
malformed-header-expires
malformed-header-content-type
malformed-header-content-length
malformed-header-max-forwards
malformed-header-allow
malformed-header-p-asserted-identity
malformed-header-sdp-v
malformed-header-sdp-o
malformed-header-sdp-s
malformed-header-sdp-i
malformed-header-sdp-c
malformed-header-sdp-b
malformed-header-sdp-z
malformed-header-sdp-k
malformed-header-sdp-a
malformed-header-sdp-t
malformed-header-sdp-r
malformed-header-sdp-m
malformed-header-no-require*
malformed-header-no-proxy-require*
```

* = only available in flow mode

SIP message blocking

The following options are available in the VoIP profile to block SIP messages:

```
block-long-lines
block-unknown
block-ack
block-bye
block-cancel
block-info
block-invite
block-message
block-notify
block-options
block-prack
block-publish
block-refer
block-register
block-subscribe
block-update
block-geo-red-options**
```

** = only available in proxy mode

SIP message rate limiting

The rate of certain types of SIP requests that are passing through the SIP ALG can be restricted:

```
register-rate
invite-rate
subscribe-rate
message-rate
notify-rate
refer-rate
update-rate
options-rate
ack-rate
prack-rate
info-rate
publish-rate
bye-rate
cancel-rate
```

Additionally, flow-based SIP supports the following rate tracking features:

```
register-rate-track none
invite-rate-track none
subscribe-rate-track none
message-rate-track none
notify-rate-track none
refer-rate-track none
update-rate-track none
options-rate-track none
ack-rate-track none
prack-rate-track none
info-rate-track none
publish-rate-track none
bye-rate-track none
cancel-rate-track none
```

SIP pinholes

When SIP ALG processes a SIP call, it usually opens pinholes for SIP signaling and RTP/RTCP packets. NAT usually takes place during the process at both the network and SIP application layers. SIP ALG ensures that, with NAT happening, corresponding SIP and RTP/RTCP pinholes are created during the process when it is necessary for call sessions to be established through FortiOS devices.

By default, SIP ALG manages pinholes automatically, but some special configurations can be used to restrict the pinholes if required.

SIP pinhole restriction

By default, the *strict-register* attribute is enabled. When enabled, after a SIP endpoint registers to the SIP server through a firewall policy on the FortiOS device, only the SIP messages sent from the same IP address as the SIP server are allowed to pass through the SIP pinhole that is created in the FortiOS device to reach the SIP endpoints. If the attribute is disabled, SIP messages from any IP addresses can pass through the pinhole created after the registration.

SIP pinhole restriction is only supported by SIP ALG and in proxy mode.

```
config voip profile
    edit "voip-profile-name"
        config sip
            set strict-register [enable|disable]
            ...
        end
    next
end
```

RTP/RTCP pinhole restriction

In a SIP call through SIP ALG, the NATed RTP/RTCP port range is 5117 to 65533 by default. If required, the port range can be restricted.

```
config voip profile
    edit "voip-profile-name"
        config sip
            set nat-port-range <start_port_number>-<end_port_number>
            ...
        end
    next
end
```

In a SIP call session, the RTP port number is usually an even number and the RTCP port number is an odd number that is one more than the RTP port number. It is best practice to configure `start_port_number` to an even number, and `end_port_number` to an odd number, for example:

```
config voip profile
    edit "voip-profile-name"
        conf sip
            set nat-port-range 30000-39999
        end
    next
end
```

SIP over TLS

Some SIP phones and servers can communicate using TLS to encrypt the SIP signaling traffic. To allow SIP over TLS calls to pass through the FortiGate, the encrypted signaling traffic must be unencrypted and inspected. The FortiGate SIP ALG intercepts, unencrypts , and inspects the SIP packets, which are then re-encrypted and forwarded to their destination.

The SIP ALG only supports full mode TLS. This means that the SIP traffic between SIP phones and the FortiGate, and between the FortiGate and the SIP server, is always encrypted. The highest TLS version supported by SIP ALG is TLS 1.2.

To enable SIP over TLS support, the SSL mode in the VoIP profile must be set to `full`. The SSL server and client certificates can be provisioned so that the FortiGate can use them to establish connections to SIP phones and servers, respectively.

This configuration is only supported in proxy mode.

To configure SIP over TLS:

1. Configure a VoIP profile with SSL enabled:

```
config voip profile
    edit "tls"
        config sip
            set ssl-mode full
            set ssl-client-certificate "ssl_client_cert"
            set ssl-server-certificate "ssl_server_cert"
        end
    next
end
```

   The `ssl_server_cert`, `ssl_client_cert`, and key files can be generated using a certification tool, such as OpenSLL, and imported to the local certificate store of the FortiGate from *System* > *Certificates* in the GUI. Existing local certificates in the certificate store can also be used. As always for TLS connections, the certificates used must be verified and trusted at the other end of the connection when required.

   For example, the CA certificate of the SIP server's certificate should be imported to the FortiGate as an external CA certification, such that the FortiGate can use it to verify the SIP server's certificate when setting up the TLS connection. The CA certificate configured as the `ssl_server_cert` should be installed as the trusted certificate on the SIP phones. The deployment of the certificates across the network depends on the SIP client and server devices that are used in the system.

2. Apply the profile to the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "vip_sip_server"
        set action accept
        set schedule "always"
        set service "SIP"
        set utm-status enable
        set voip-profile "tls"
    next
end
```

Custom SIP RTP port range support

The `nat-port-range` variable is used to specify a port range in the VoIP profile to restrict the NAT port range for real-time transport protocol/real-time transport control protocol (RTP/RTCP) packets in a session initiation protocol (SIP) call session that is handled by the SIP application layer gateway (ALG) in a FortiGate device.

When NAT is enabled, or VIP is used in a firewall policy for SIP ALG to handle a SIP call session established through a FortiGate device, the SIP ALG can perform NAT to translate the ports used for the RTP/RTCP packets when they are flowing through the device between the external and internal networks.

You can control the translated port range for RTP/RTCP packets using the CLI:

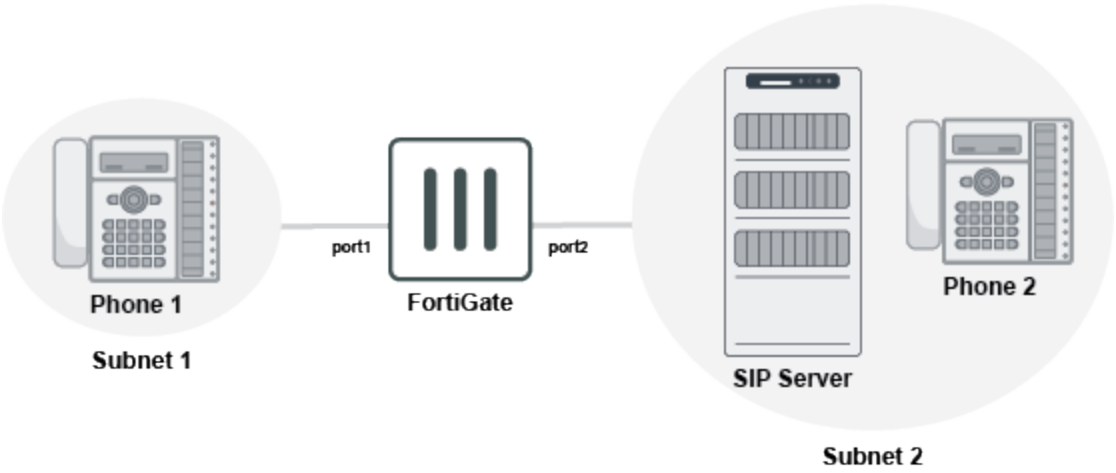
```
config voip profile
   edit <profile-name>
      config sip
         set nat-port-range <port range>
      end
   next
end
```

Command	Description
nat-port-range <port range>	The NAT port range (minimum port number = 5117, default = 5117-65535).

Example

In this example, Phone1 is in subnet_1, and the SIP server and phone are in subnet_2. All SIP signaling messages and RTP/RTCP packets go through the SIP Server. The RTP/RTCP ports on Phone1 are configured as 17078/17079.

The FortiGate administrator wants to use NAT for the port 17078/17079 to 30000/30001. As a result, all RTP/RTCP packets going out of port2 have source ports of 30000/30001, and all RTP/RTCP packets going into port2 also have destination ports of 30000/30001, which is specified in `nat-port-range`.



To configure the custom port range:

```
config voip profile
   edit "natPortRange"
        config sip
           set nat-port-range 30000-30001
        end
   next
end
configure firewall policy
   edit 1
        set srcintf port1
        set  dstintf port2
```

```
        set srcaddr all
        set dstaddr all
        set service SIP
        set action accept
        set schedule always
        set voip-profile natPortRange
        set nat enable
end
```

If phone1 and phone2 are registered to the SIP server, and they establish a call session between them through the FortiGate and the SIP server, then the RTP/RTCP ports 17078/17079 of phone1 will be translated to ports 30000/30001 at the FortiGate unit based on the NAT port range setting. That is, the RTP/RTCP packets egressing port2 of the Fortigate will have source ports of 30000/30001, and the RTP/RTCP packets ingressing port2 will have destination ports of 30000/30001.

Voice VLAN auto-assignment

You can leverage LLDP-MED to assign voice traffic to the desired voice VLAN. After detection and setup, the IP phone on the network is segmented to its own VLAN for policy, prioritization, and reporting. The LLDP reception capabilities in FortiOS have been extended to support LLDP-MED assignment for voice, voice signaling, guest, guest voice signaling, softphone, video conferencing, streaming video, and video signaling.

You can configure this feature using the following steps:

1. Setting up the VLAN for the voice device
2. Setting up the DHCP server for the voice VLAN
3. Setting up the LLDP network policy
4. Enabling LLDP on the physical interface that the VLAN belongs to
5. Applying the LLDP network policy on the physical interface
6. Confirming that the VLAN was assigned

To set up the VLAN for the voice device:

```
config system interface
    edit "vlan_100"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
        set alias "voice_vlan"
        set device-identification enable
        set role lan
        set snmp-index 25
        set interface "port10"
        set vlanid 100
    next
end
```

To set up the DHCP server for the voice VLAN:

```
config system dhcp server
    edit 1
        set dns-service default
        set default-gateway 192.168.1.99
        set netmask 255.255.255.0
```

```
        set interface "vlan_100"
        config ip-range
            edit 1
                set start-ip 192.168.1.110
                set end-ip 192.168.1.210
            next
        end
    next
end
```

To set up the LLDP network policy:

```
config system lldp network-policy
    edit "1"
        config voice
            set status enable
            set tag dot1q
            set vlan 100
        end
    next
end
```

To enable LLDP on the physical interface that the VLAN belongs to:

```
config system interface
    edit "port10"
        set vdom "root"
        set type physical
        set lldp-reception enable
        set lldp-transmission enable
        set snmp-index 14
    next
end
```

To apply the LLDP network policy on the physical interface:

```
config system interface
    edit "port10"
        set lldp-network-policy "1"
    next
end
```

To confirm that the VLAN was assigned as expected:

1. Connect an IP phone to the network.
2. Check the IP address on the phone.
   The IP address should belong to the voice VLAN.
3. Sniff on the FortiGate incoming interface to see if traffic from the IP phone has the desired VLAN tag.
   In the example commands above, the voice VLAN was configured as VLAN 100. Therefore, voice traffic from the IP phone should be in VLAN 100.

ICAP

Internet Content Adaptation Protocol (ICAP) is an application layer protocol that is used to offload tasks from the firewall to separate, specialized servers. For more information see RFC 3507.

ICAP profiles can only be applied to policies that use proxy-based inspection. If you enable ICAP in a policy, HTTP and HTTPS (if HTTPS inspection is supported) traffic that is intercepted by the policy is transferred to the ICAP server specified by the selected ICAP profile. Responses from the ICAP server are returned to the FortiGate, and then forwarded to their destination.

By default, *ICAP* is not visible in the GUI. See Feature visibility on page 1562 for instructions on making it visible.

ICAP filter profiles cannot be used in NGFW policy-based mode. See Profile-based NGFW vs policy-based NGFW on page 526 for more information.

To configure ICAP:

1. Set up your ICAP server.
2. On the FortiGate, add an ICAP server.
3. Create an ICAP profile.
4. Use the ICAP profile in a firewall policy that covers the traffic that needs to be offloaded to the ICAP server.

The following topics provide information about ICAP:

- ICAP configuration example on page 888
- ICAP response filtering on page 890
- Secure ICAP clients on page 892

TCP connection pool for connections to ICAP server

A TCP connection pool can maintain local-out TCP connections to the external ICAP server due to a backend update in FortiOS. TCP connections will not be terminated once data has been exchanged with the ICAP server, but instead are reused in the next ICAP session to maximize efficiency.

For example, consider a scenario where an ICAP profile is used as a UTM profile in an explicit web proxy policy, and a client visits web servers through this proxy policy.

Once the WAD is initialized, when a HTTP request is sent from the client to the server through the FortiGate with an ICAP profile applied to the matched proxy policy, a TCP connection is established between the FortiGate and the ICAP server to exchange data.

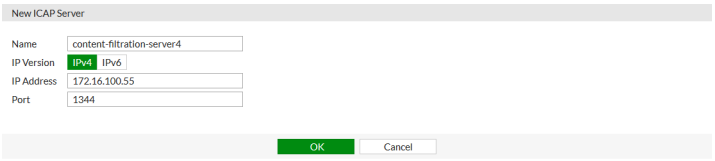
When an ICAP session is finished, the TCP connection is kept in the WAD connection pool. When another ICAP session needs to be established, the WAD will check if there are any idle connections available in the connection pool. If an idle connection is available, then it will be reused; otherwise, a new TCP connection is established for the ICAP session. This process can be checked in the WAD debug log.

ICAP configuration example

In this example, the ICAP server performs proprietary content filtering on HTTP and HTTPS requests. If the content filter is unable to process a request, then the request is blocked. Streaming media is not considered by the filter, so it is allowed through and is not processed.

To add the ICAP server to the FortiGate in the GUI:

1. Go to *Security Profiles* > *ICAP Servers*.
2. Click *Create New*.
3. In the *Name* field, enter a name for the ICAP server, such as *content-filtration-server4*.
4. Select the *IP Version*.
5. In the *IP Address* field, enter the IP address of the ICAP server.
6. In the *Port* field, enter a new port number if required. The default value is *1344*.

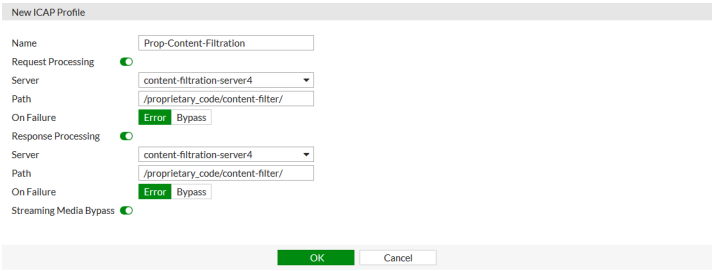


7. Click *OK*.

The maximum number of concurrent connections to ICAP server can be configured in the CLI. The default setting is 100 connections.

To create an ICAP profile in the GUI:

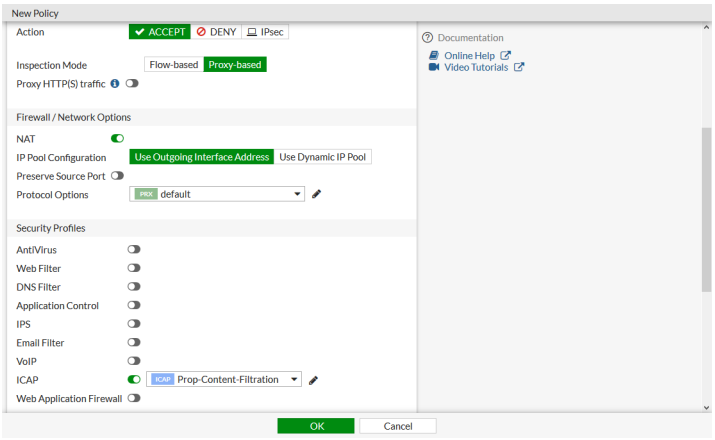
1. Go to *Security Profiles* > *ICAP*.
2. Click *Create New*.
3. In the *Name* field, enter a name for the ICAP profile, such as *Prop-Content-Filtration*.
4. Enable *Request Processing* then set the following:
   - *Server* - Select the ICAP server. In this example, select *content-filtration-server4*
   - *Path* - The path to the processing component on the server, such as */proprietary_code/content-filter/*.
   - *On Failure* - Select *Error* to block the request. If the message cannot be processed, it will not be blocked.
5. Enable *Response Processing* then set the following:
   - *Server* - Select the ICAP server: *content-filtration-server4*
   - *Path* - The path to the processing component on the server, such as */proprietary_code/content-filter/*.
   - *On Failure* - Select *Error* to block the request. If the message cannot be processed, it will not be blocked.
6. Enable *Streaming Media Bypass* to not offload streaming media to the ICAP server.



7. Click *OK*.

To add the ICAP profile to a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Configure the policy as needed to apply to the required traffic.
4. Set *Inspection Mode* to *Proxy-based*.
5. Under *Security Profiles*, enable *ICAP* and select the ICAP server.



6. Click *OK*.

To configure the ICAP setup in the CLI:

1. Add the ICAP server:

```
config icap server
    edit "content-filtration-server4"
        set ip-version 4
        set ip-address 172.16.100.55
        set port 1344
        set max-connections 200
    next
end
```

2. Create the ICAP profile:

```
config icap profile
    edit "Prop-Content-Filtration"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "content-filtration-server4"
        set response-server "content-filtration-server4"
        set request-failure error
        set response-failure error
        set request-path "/proprietary_code/content-filter/"
        set response-path "/proprietary_code/content-filter/"
        set methods delete get head options post put trace other
    next
end
```

3. Add the ICAP profile to a policy:

```
config firewall policy
    edit 5
        set name "icap_filter3"
        set srcintf "virtual-wan-link"
        set dstintf "virtual-wan-link"
        set srcaddr "FABRIC_DEVICE"
        set dstaddr "FABRIC_DEVICE"
        set dstaddr-negate enable
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "certificate-inspection"
        set icap-profile "Prop-Content-Filtration"
        set logtraffic disable
        set fsso disable
        set nat enable
    next
end
```

ICAP response filtering

ICAP HTTP responses can be forwarded or bypassed based on the HTTP header value and status code.

When configuring the ICAP profile, if `response` is enabled, the `respmod-default-action` option can be configured:

- If `respmod-default-action` is set to forward, FortiGate will treat every HTTP response, and send ICAP requests to the ICAP server.
- If `respmod-default-action` is set to bypass, FortiGate will only send ICAP requests if the HTTP response matches the defined rules, and the rule's action is set to forward.

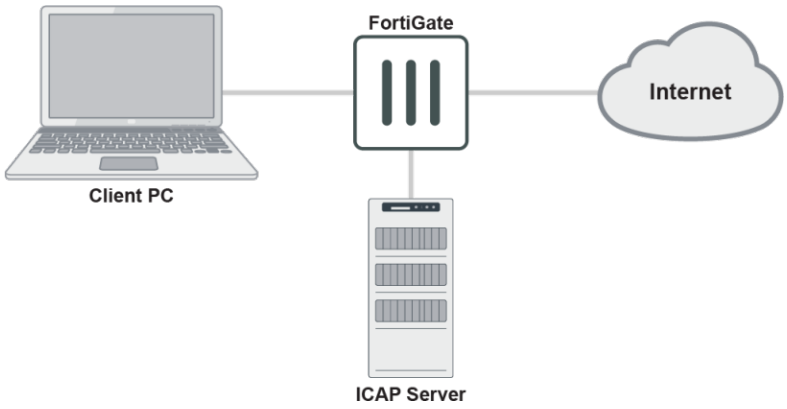
When configuring a response rule:

- The `http-resp-status-code` option is configured to specific HTTP response codes. If the HTTP response has any one of the configured values, then the rule takes effect.
- Multiple header value matching groups can be configured. If the header value matches one of the groups, then the rule takes effect.
- If both status codes and header values are specified in a rule, the response must match at least one of each.

The UTM ICAP log category is used for logging actions when FortiGate encounters errors with the ICAP server, such as no service, unreachable, error response code, or timeout. If an error occurs, a traffic log and an associated UTM ICAP log will be created.

Example

The FortiGate acts as a gateway for the client PC and connects to a reachable ICAP server. The ICAP server can be in NAT, transparent, or proxy mode.



In this example, client request HTTP responses will be forwarded to the ICAP server from all hosts if they have an HTTP status code of 200, 301, or 302, and have `content-type: image/jpeg` in the their header.

To configure an ICAP profile with HTTP response rules:

```
config icap profile
    edit "icap_profile2"
        set request disable
        set response enable
        set streaming-content-bypass disable
        set preview disable
        set response-server "icap_server1"
        set response-failure error
        set response-path ''
        set methods delete get head options post put trace other
        set response-req-hdr disable
        set respmod-default-action bypass
        config respmod-forward-rules
            edit "rule2"
                set host "all"
                set action forward
                set http-resp-status-code 200 301 302
                config header-group
                    edit 2
                        set header-name "content-type"
                        set header "image/jpeg"
                    next
                end
            next
        end
    next
end
```

To view the logs if an error occurs:

1. View the traffic log:

```
# execute log filter category 0
# execute log display
1 logs found.
1 logs returned.
```

```
 1: date=2019-10-25 time=17:43:47 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1572050627037314464 tz="-0700" srcip=10.1.100.145
srcport=47968 srcintf="port1" srcintfrole="undefined" dstip=172.16.200.46 dstport=80
dstintf="port2" dstintfrole="undefined" poluuid="a4d5324e-f6c3-51e9-ce2d-f360994fb547"
sessionid=43549 proto=6 action="close" policyid=1 policytype="policy" service="HTTP"
dstcountry="Reserved" srccountry="Reserved" trandisp="snat" transip=172.16.200.1
transport=47968 duration=1 sentbyte=485 rcvdbyte=398 sentpkt=6 rcvdpkt=5
appcat="unscanned" wanin=478 wanout=165 lanin=165 lanout=165 utmaction="block"
counticap=1 crscore=5 craction=262144 crlevel="low" utmref=65532-0
```

2. View the UTM ICAP log:

```
# execute log filter category 20
# execute log display
1 logs found.
1 logs returned.

 1: date=2019-10-25 time=17:43:46 logid="2000060000" type="utm" subtype="icap"
eventtype="icap" level="warning" vd="vdom1" eventtime=1572050626010097145 tz="-0700"
msg="Request blocked due to ICAP server error" service="HTTP" srcip=10.1.100.145
dstip=172.16.200.46 srcport=47968 dstport=80 srcintf="port1" srcintfrole="undefined"
dstintf="port2" dstintfrole="undefined" policyid=1 sessionid=43549 proto=6
action="blocked" profile="icap_profile1" url="/icap_test/"
```

The logs show that, in this case, the ICAP services stopped before the access. When the client tried to access HTTP and ICAP took effect, the FortiGate sent the ICAP request to the ICAP server and received an error. The client sees a *502 Bad Gateway* message, and FortiGate writes the two logs. In the GUI, the logged traffic is displayed as *Result: Deny: UTM Blocked*.

Secure ICAP clients

A secure SSL connection from the FortiGate to the ICAP server can be configured as follows:

```
config icap server
    edit "server"
        set secure {enable | disable}
        set ssl-cert <certificate>
    next
end
```

To configure a secure ICAP client:

1. Configure the ICAP server:

```
config icap server
    edit "icap_server1"
        set ip-version 4
        set ip-address 192.168.10.2
        set port 11344
        set max-connections 100
        set secure enable
        set ssl-cert "ACCVRAIZ1"
    next
end
```

Port 11344 is the standard port for secure ICAP. This must be configured manually if the secure connection is enabled.

2. Configure the ICAP profile:

```
config icap profile
    edit "icap_profile1"
        set request enable
        set response enable
        set streaming-content-bypass enable
        set request-server "icap_server1"
        set response-server "icap_server1"
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "protocols"
        set icap-profile "icap_profile1"
    next
end
```

Web application firewall

Web application firewall (WAF) profiles can detect and block known web application attacks. You can configure WAF profiles to use signatures and constraints to examine web traffic. You can also enforce an HTTP method policy, which controls the HTTP method that matches the specified pattern.

You can customize the default profile, or you can create your own profile to apply access rules and HTTP protocol constraints to traffic. You can apply WAF profiles to firewall policies when the inspection mode is set to proxy-based.

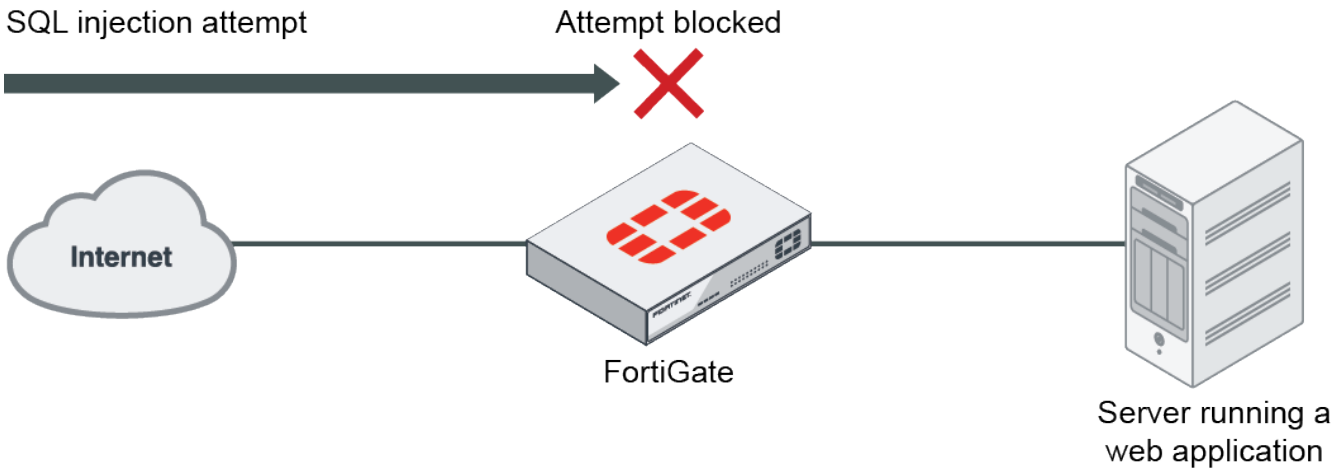
Web application firewall profiles cannot be used NGFW policy-based mode. See Profile-based NGFW vs policy-based NGFW on page 526 for more information.

The following topic provides information about WAF profiles:

- Protecting a server running web applications on page 893

Protecting a server running web applications

You can use a web application firewall profile to protect a server that is running a web application, such as webmail.



Web application firewall profiles are created with a variety of options called signatures and constraints. Once these options are enabled, the action can be set to allow, monitor, or block. The severity can be set to high, medium, or low.

In the following example, the default profile will be targeted to block SQL injection attempts and generic attacks.

The web application firewall feature is only available when the policy inspection mode is proxy-based.

To protect a server running web applications:

1. Enable the web application firewall:
   a. Go to *System* > *Feature Visibility*.
   b. Under *Security Features*, enable *Web Application Firewall*.
   c. Under *Additional Features*, click *Show More* and enable *Multiple Security Profiles*.
   d. Click *Apply*.
2. Edit the default web application firewall profile:
   Trojans and *Known Exploits* are blocked by default.

a. Go to *Security Profiles* > *Web Application Firewall*.
b. Edit the *default* profile signature:
   i. Enable *SQL Injection (Extended)* and *Generic Attacks (Extended)*.
   ii. For both signatures, set the *Action* to *Block* and the *Severity* to *High*.

   iii. Click *Apply*.

3. Apply the profile to a security policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Edit the policy that allows access to the web server:
      i. Under *Firewall / Network Options*, select the appropriate *Protocol Option*.
      ii. Under *Security Profiles*, enable *Web Application Firewall* and set it to use the *default* profile.
      iii. Set the *SSL Inspection* to use the *deep-inspection* profile.

   iv. Click *OK*.

4. Verify that the web application firewall blocks traffic:
   a. Use the following URL to simulate an attack on your web server and substitute the IP address of your server:
   `http://<server IP>/index.php?username=1'%20or%20'1'%20=%20'1&password=1'%20or%20'1'%20=%20'1`
   An error message appears, stating that the web application firewall has blocked the traffic:

Offloading to a FortiWeb

If you have a FortiWeb, you may be able to offload the functions of the web application control to your FortiWeb. To find out if this option is available, refer to the FortiOS or FortiWeb Release Notes for information about device compatibility.

To offload to a FortiWeb:

1. Go to *Security Fabric* > *Fabric Connectors*.
2. Click *Create New*, and click *Fabric Device*.
3. Enter the following for the device:
   a. Name (`FortiWeb`)
   b. FortiWeb IP address
   c. HTTPS service port
4. Click *Generate*.
5. Enter your credentials to generate the access token.
6. Click *OK*.

SSL & SSH Inspection

Secure sockets layer (SSL) content scanning and inspection allows you to apply antivirus scanning, web filtering, and email filtering to encrypted traffic. You can apply SSL inspection profiles to firewall policies.

FortiOS includes four preloaded SSL/SSH inspection profiles, three of which are read-only and can be cloned:

- *certificate-inspection*
- *deep-inspection*
- *no-inspection*

The *custom-deep-inspection* profile can be edited, or you can create your own SSL/SSH inspection profiles.

Deep inspection (also known as SSL/SSH inspection) is typically applied to outbound policies where destinations are unknown. Depending on your policy requirements, you can configure the following:

- Which CA certificate will be used to decrypt the SSL encrypted traffic
- Which SSL protocols will be inspected
- Which ports will be associated with which SSL protocols for inspection
- Whether or not to allow invalid SSL certificates
- Whether or not SSH traffic will be inspected
- Which addresses or web category allowlists can bypass SSL inspection

The following topics provide information about SSL & SSH Inspection:

- Certificate inspection on page 897
- Deep inspection on page 899
- Protecting an SSL server on page 901
- Handling SSL offloaded traffic from an external decryption device on page 901
- SSH traffic file scanning on page 904
- Redirect to WAD after handshake completion on page 905
- HTTP/2 support in proxy mode SSL inspection on page 906
- Define multiple certificates in an SSL profile in replace mode on page 907

Certificate inspection

FortiGate supports certificate inspection. The default configuration has a built-in *certificate-inspection* profile which you can use directly. When you use certificate inspection, the FortiGate only inspects the headers up to the SSL/TLS layer.

If you do not want to deep scan for privacy reasons but you want to control web site access, you can use *certificate-inspection*.

SSL inspection options

The following options are available when configuring an SSL inspection profile:

Enable SSL inspection of	Select *Multiple Clients Connecting to Multiple Servers*. This is normally used when inspecting outbound internet traffic
Inspection method	Select *SSL Certificate Inspection*.
CA certificate	Use the default *Fortinet_CA_SSL* certificate.
Blocked certificates	The FortiGate receives Botnet C&C SSL connections from FortiGuard that contain SHA1 fingerprints of malicious certificates. By default, these certificates are blocked. Click *View Blocked Certificates* to see a detailed list.
Untrusted SSL certificates	Configure the action to take when a server certificate is not issued by a trusted CA. • *Allow*: Allow the untrusted server certificate. This is the default value. • *Block*: Block the session • *Ignore*: This option is for Full SSL inspection only. It re-signs the server certificate as trusted. When configured in the GUI for certificate inspection it has no effect and the setting is not saved. Click *View Trusted CAs List* to see a list of the factory bundled and user imported CAs that are trusted by the FortiGate.
Server certificate SNI check	Check the SNI in the hellp message with the CN or SAN field in the returned server certificate. • *Enable*: If mismatched, use the CN in the server certificate to do URL filtering.

- *Strict*: If mismatched, close the connection.
- *Disable*: Server certificate SNI check is disabled.

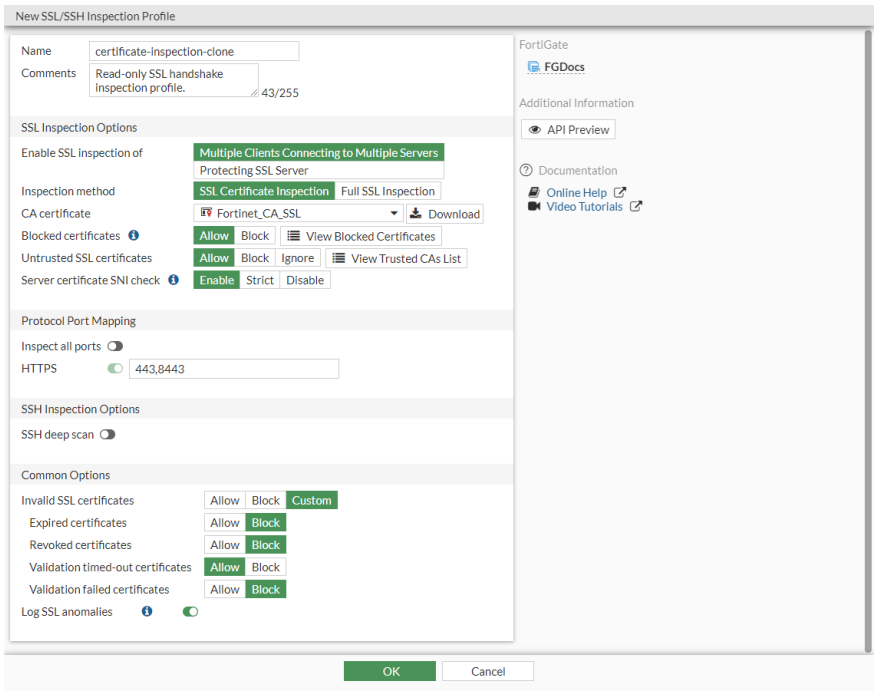
Inspect non-standard HTTPS ports

The built-in *certificate-inspection* profile is read-only and only listens on port 443. If you want to make changes, you must create a new certificate inspection profile.

If you know the non-standard port that the web server uses, such as port 8443, you can add this port to the *HTTPS* field.

To add a port to the inspection profile in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection*.
2. Create a new profile, or clone the default profile.
3. If you do no know what port is used in the HTTPS web server, under *Protocol Port Mapping*enable *Inspect All Ports*. If you know the port, such as port 8443, then set *HTTPS* to *443,8443*.



4. Configure the remaining setting as needed.
5. Click *OK*.

Common options

Invalid SSL certificates can be blocked, allowed, or a different actions can be configured for the different invalid certificates types:

Expired certificates	Action to take when the server certificate is expired. The default action is block.

Revoked certificates	Action to take when the server certificate is revoked. The default action is block.
Validation timed-out certificates	Action to take when the server certificate validation times out. The default action is allow.
Validation failed certificates	Action to take when the server certificate validation fails. The default action is block.

By default, SSL anomalies logging is enabled. Logs are generated in the UTM log type under the SSL subtype when invalid certificates are detected.

Deep inspection

You can configure address and web category allowlists to bypass SSL deep inspection.

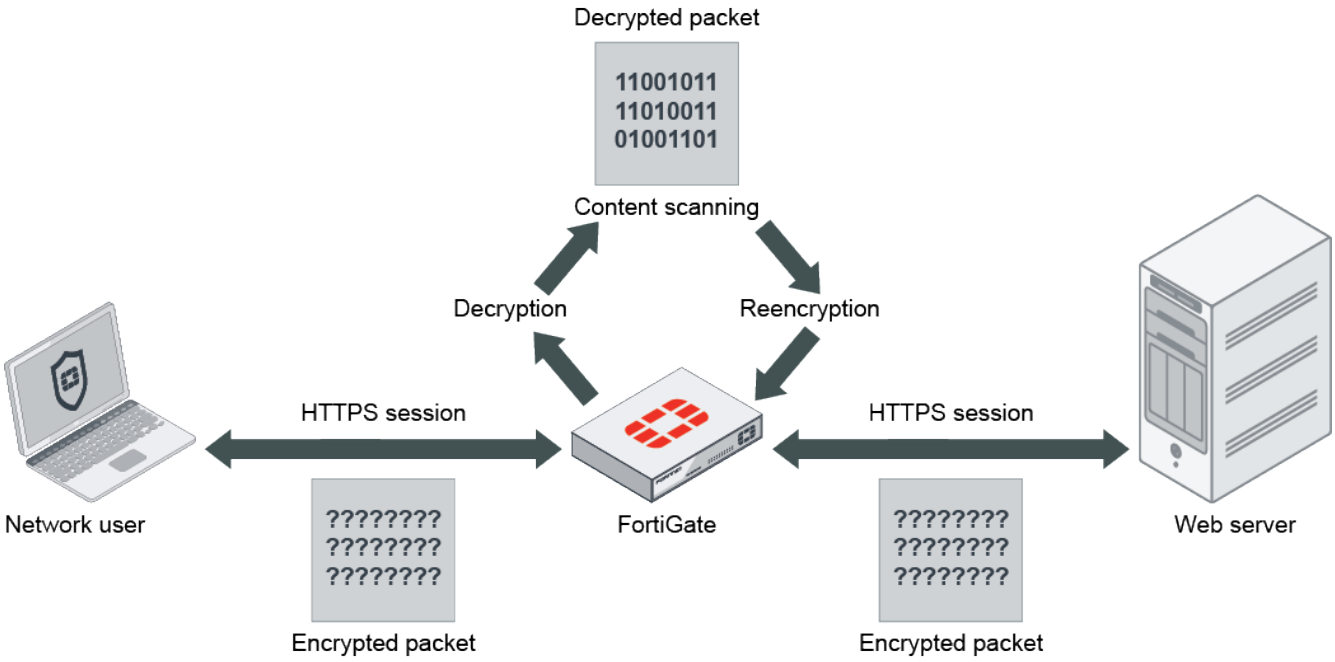
Reasons for using deep inspection

While Hypertext Transfer Protocol Secure (HTTPS) offers protection on the Internet by applying Secure Sockets Layer (SSL) encryption to web traffic, encrypted traffic can be used to get around your network's normal defenses.

For example, you might download a file containing a virus during an e-commerce session, or you might receive a phishing email containing a seemingly harmless download that, when launched, creates an encrypted session to a command and control (C&C) server and downloads malware onto your computer. Because the sessions in these attacks are encrypted, they might get past your network's security measures.

When you use deep inspection, the FortiGate impersonates the recipient of the originating SSL session, then decrypts and inspects the content to find threats and block them. It then re-encrypts the content and sends it to the real recipient.

Deep inspection not only protects you from attacks that use HTTPS, it also protects you from other commonly-used SSL-encrypted protocols such as SMTPS, POP3S, IMAPS, and FTPS.



Browser messages when using deep inspection

When FortiGate re-encrypts the content, it uses a certificate stored on the FortiGate such as *Fortinet_CA_SSL*, *Fortinet_CA_Untrusted*, or your own CA certificate that you uploaded.

Because there is no *Fortinet_CA_SSL* in the browser trusted CA list, the browser displays an untrusted certificate warning when it receives a FortiGate re-signed server certificate. To stop the warning messages, trust the FortiGate-trusted CA *Fortinet_CA_SSL* and import it into your browser.

After importing *Fortinet_CA_SSL* into your browser, if you still get messages about untrusted certificate, it must be due to *Fortinet_CA_Untrusted*. Never import the *Fortinet_CA_Untrusted* certificate into your browser.

To import *Fortinet_CA_SSL* into your browser:

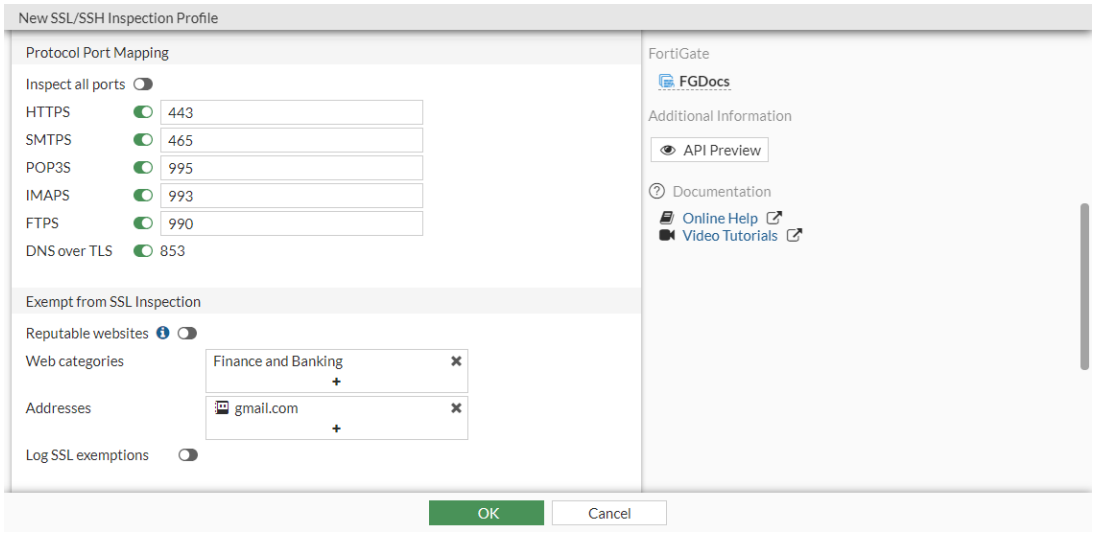
1. On the FortiGate, go to *Security Profiles* > *SSL/SSH Inspection* and edit the *deep-inspection* profile.
   The default *CA Certificate* is *Fortinet_CA_SSL*.
2. Click *Download* and save the certificate to the management computer.
3. On the client PC, use the *Certificate Import Wizard* to install the certificate into the *Trusted Root Certificate Authorities* store.
   If a security warning appears, select *Yes* to install the certificate.

Exempt web sites from deep inspection

If you do not want to apply deep inspection for privacy or other reasons, you can exempt the session by address, category, or allowlist.

If you know the address of the server you want to exempt, you can exempt that address. You can exempt specific address type including IP address, IP address range, IP subnet, FQDN, wildcard-FQDN, and geography.

If you want to exempt all bank web sites, an easy way is to exempt the *Finance and Banking* category which includes all finance and bank web sites identified in FortiGuard. For information about creating and using custom local and remote categories, see Web rating override on page 919 and Threat feeds on page 1852.



If you want to exempt commonly trusted web sites, you can bypass the SSL allowlist in the SSL/SSH profile by enabling *Reputable websites*. The allowlist includes common web sites trusted by FortiGuard.

Protecting an SSL server

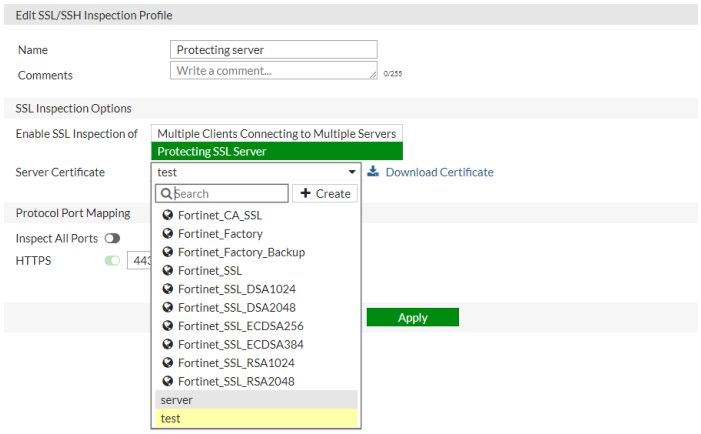
You typically use the FortiGate *Protecting SSL Server* profile as an inbound policy for clients on the internet that access the server through the internal side of the FortiGate.

Protecting SSL Server uses a server certificate to protect a single server.

You can use *Protecting SSL Server* if you do not want a client on the internet to directly access your internal server, and you want the FortiGate to simulate your real server.

To upload a server certificate into FortiGate and use that certificate in the SSL/SSH inspection profile:

1. Go to *System* > *Certificates*.
2. Select *Import* > *Local Certificate* and upload the certificate.
3. Go to *Security Profiles* > *SSL/SSH Inspection* and edit or create a new profile.
4. For *Enable SSL Inspection of*, select *Protecting SSL Server*.
5. For *Server Certificate*, select the local certificate you imported.
6. Click *Apply*.



When you apply the *Protecting SSL Server* profile in a policy, the FortiGate will send the server certificate to the client as your server does.

Handling SSL offloaded traffic from an external decryption device

In scenarios where the FortiGate is sandwiched between load-balancers and SSL processing is offloaded on the external load-balancers, the FortiGate can perform scanning on the unencrypted traffic by specifying the `ssl-offloaded` option in firewall `profile-protocol-options`. This option is supported in proxy and flow mode (previous versions only supported proxy mode).

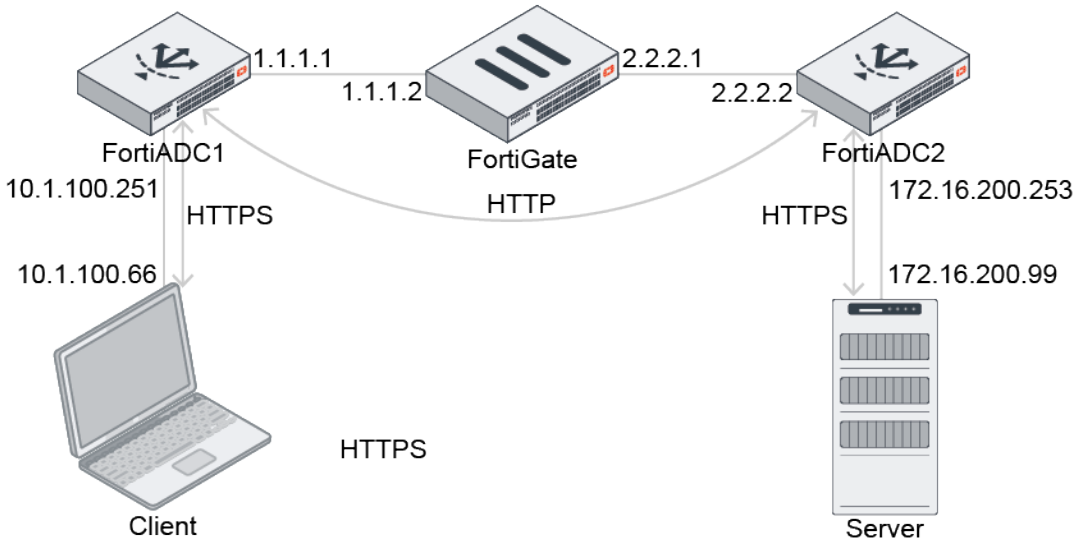
If the FortiGate receives an AUTH TLS, PBSZ, or PROT command before receiving plain text traffic from a decrypted device, by default, it will expect encrypted traffic, determine that the traffic belongs to an abnormal protocol, and bypass the traffic.

When the `ssl-offloaded` command is enabled, the AUTH TLS command is ignored, and the traffic is treated as plain text rather than encrypted data. SSL decryption and encryption are performed by the external device.

Sample topology

In this example, the FortiGate is between two FortiADCs and in SSL offload sandwich mode. The FortiGate receives plain text from ADC1 and forwards plain text to ADC2. There is no encrypted traffic passing through the FortiGate.

The client sends HTTPS traffic to ADC1, which then decrypts the traffic and sends HTTP to the FortiGate. The FortiGate forwards HTTP to ADC2, and the ADC2 re-encrypts the traffic to HTTPS.



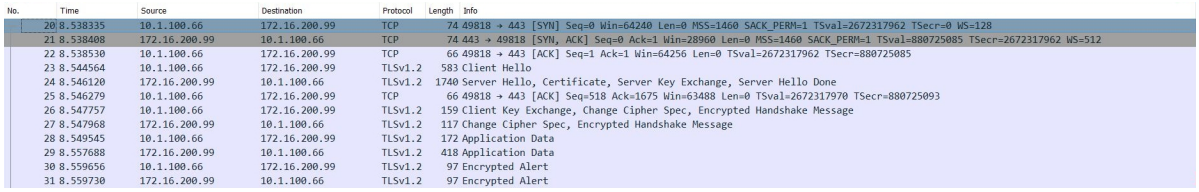
To configure SSL offloading:

```
config firewall profile-protocol-options
    edit "default-clone"
        config http
            set ports 80
            unset options
            unset post-lang
            set ssl-offloaded yes
        end
        config ftp
            set ports 21
            set options splice
            set ssl-offloaded yes
        end
        config imap
            set ports 143
            set options fragmail
            set ssl-offloaded yes
        end
        config pop3
            set ports 110
            set options fragmail
            set ssl-offloaded yes
        end
        config smtp
            set ports 25
            set options fragmail splice
            set ssl-offloaded yes
```

```
        end
    next
end
```

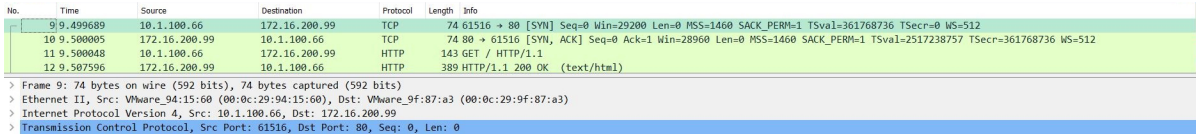
Verifying the packet captures

The ADC1 incoming port capture shows that ADC1 receives HTTPS traffic:



No.	Time	Source	Destination	Protocol	Length	Info
20	8.538335	10.1.100.66	172.16.200.99	TCP	74	49818 → 443 [SYN] Seq=0 Win=64240 Len=0 MSS=1460 SACK_PERM=1 TSval=2672317962 TSecr=0 WS=128
21	8.538408	172.16.200.99	10.1.100.66	TCP	74	443 → 49818 [SYN, ACK] Seq=0 Ack=1 Win=28960 Len=0 MSS=1460 SACK_PERM=1 TSval=880725085 TSecr=2672317962 WS=512
22	8.538530	10.1.100.66	172.16.200.99	TCP	66	49818 → 443 [ACK] Seq=1 Ack=1 Win=64256 Len=0 TSval=2672317962 TSecr=880725085
23	8.544564	10.1.100.66	172.16.200.99	TLSv1.2	583	Client Hello
24	8.546120	172.16.200.99	10.1.100.66	TLSv1.2	1740	Server Hello, Certificate, Server Key Exchange, Server Hello Done
25	8.546279	10.1.100.66	172.16.200.99	TCP	66	49818 → 443 [ACK] Seq=518 Ack=1675 Win=63488 Len=0 TSval=2672317970 TSecr=880725093
26	8.547757	10.1.100.66	172.16.200.99	TLSv1.2	159	Client Key Exchange, Change Cipher Spec, Encrypted Handshake Message
27	8.547968	172.16.200.99	10.1.100.66	TLSv1.2	117	Change Cipher Spec, Encrypted Handshake Message
28	8.549545	10.1.100.66	172.16.200.99	TLSv1.2	172	Application Data
29	8.557688	172.16.200.99	10.1.100.66	TLSv1.2	418	Application Data
30	8.559656	10.1.100.66	172.16.200.99	TLSv1.2	97	Encrypted Alert
31	8.559730	172.16.200.99	10.1.100.66	TLSv1.2	97	Encrypted Alert

The ADC1 outgoing port capture shows that ADC1 decrypts traffic and forwards HTTP traffic to the FortiGate:



No.	Time	Source	Destination	Protocol	Length	Info
9	9.499689	10.1.100.66	172.16.200.99	TCP	74	61516 → 80 [SYN] Seq=0 Win=29200 Len=0 MSS=1460 SACK_PERM=1 TSval=361768736 TSecr=0 WS=512
10	9.500005	172.16.200.99	10.1.100.66	TCP	74	80 → 61516 [SYN, ACK] Seq=0 Ack=1 Win=28960 Len=0 MSS=1460 SACK_PERM=1 TSval=2517238757 TSecr=361768736 WS=512
11	9.500048	10.1.100.66	172.16.200.99	HTTP	143	GET / HTTP/1.1
12	9.507596	172.16.200.99	10.1.100.66	HTTP	389	HTTP/1.1 200 OK (text/html)

```
> Frame 9: 74 bytes on wire (592 bits), 74 bytes captured (592 bits)
> Ethernet II, Src: VMware_94:15:60 (00:0c:29:94:15:60), Dst: VMware_9f:87:a3 (00:0c:29:9f:87:a3)

SSH traffic file scanning

FortiGates can buffer, scan, log, or block files sent over SSH traffic (SCP and SFTP) depending on the file size, type, or contents (such as viruses or sensitive content).

This feature is supported in proxy-based inspection mode. It is currently not supported in flow-based inspection mode.

You can configure the following SSH traffic settings in the CLI:

- Protocol options
- DLP sensor
- Antivirus (profile and quarantine options)

To configure SSH protocol options:

```
config firewall profile-protocol-options
    edit "protocol"
        config ssh
           set options {oversize clientcomfort servercomfort}
           set comfort-interval <1 - 900>
           set comfort-amount <1 - 65535>
           set oversize-limit <1 - 798>
           set uncompressed-oversize-limit <0 - 798>
           set uncompressed-nest-limit <2 - 100>
           set scan-bzip2 {enable | disable}
        end
    next
end
```

To configure SCP block and log options:

```
config ssh-filter profile
    edit "ssh-test"
        set block scp
        set log scp
    next
end
```

To configure the DLP sensor:

```
config dlp sensor
    edit "test"
        set full-archive-proto ssh
        set summary-proto ssh
        config filter
            edit 1
                set proto ssh
            next
        end
    next
end
```

To configure the antivirus profile options:

```
config antivirus profile
    edit "av"
        config ssh
            set av-scan {disable | block | monitor}
            set outbreak-prevention {disable | block | monitor}
            set external-blocklist {disable | block | monitor}
            set quarantine {enable | disable}
            set archive-block {encrypted corrupted partiallycorrupted multipart nested
mailbomb fileslimit timeout unhandled}
            set archive-log {encrypted corrupted partiallycorrupted multipart nested
mailbomb fileslimit timeout unhandled}
            set emulator {enable | disable}
        end
    next
end
```

To configure the antivirus quarantine options:

```
config antivirus quarantine
    set drop-infected ssh
    set store-infected ssh
    set drop-blocked ssh
    set store-blocked ssh
    set drop-heuristic ssh
    set store-heuristic ssh
end
```

Redirect to WAD after handshake completion

In a proxy-based policy, the TCP connection is proxied by the FortiGate. A TCP 3-way handshake can be established with the client even though the server did not complete the handshake.

This option uses IPS to handle the initial TCP 3-way handshake. It rebuilds the sockets and redirects the session back to proxy only when the handshake with the server is established.

To enable proxy after a TCP handshake in an SSL/SSH profile:

```
config firewall ssl-ssh-profile
    edit "test"
        config https
            set ports 443
            set status certificate-inspection
            set proxy-after-tcp-handshake enable
        end
        .....
   next
end
```

To enable proxy after a TCP handshake in protocol options:

```
config firewall profile-protocol-options
    edit "test"
```

```
        config http
            set ports 80
            set proxy-after-tcp-handshake enable
            unset options
            unset post-lang
        end
        ....
    next
end
```

HTTP/2 support in proxy mode SSL inspection

Security profiles in proxy mode can perform SSL inspection on HTTP/2 traffic that is secured by TLS 1.2 or 1.3 using the Application-Layer Protocol Negotiation (ALPN) extension.

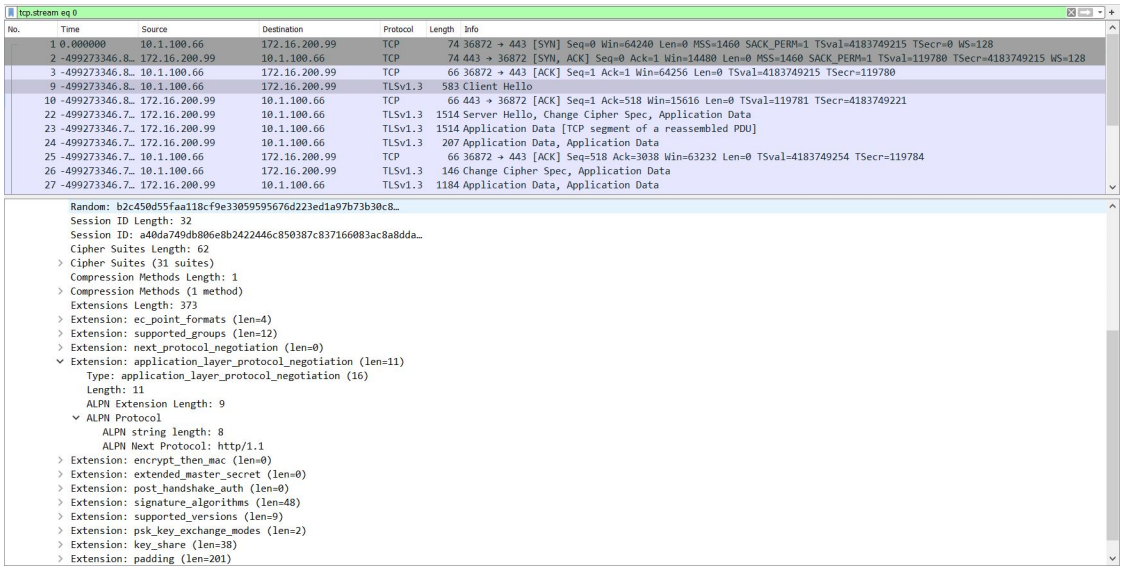
To set the ALPN support:

```
config firewall ssl-ssh-profile
    edit <profile>
        set supported-alpn {all | http1-1 | http2 | none}
    next
end
```

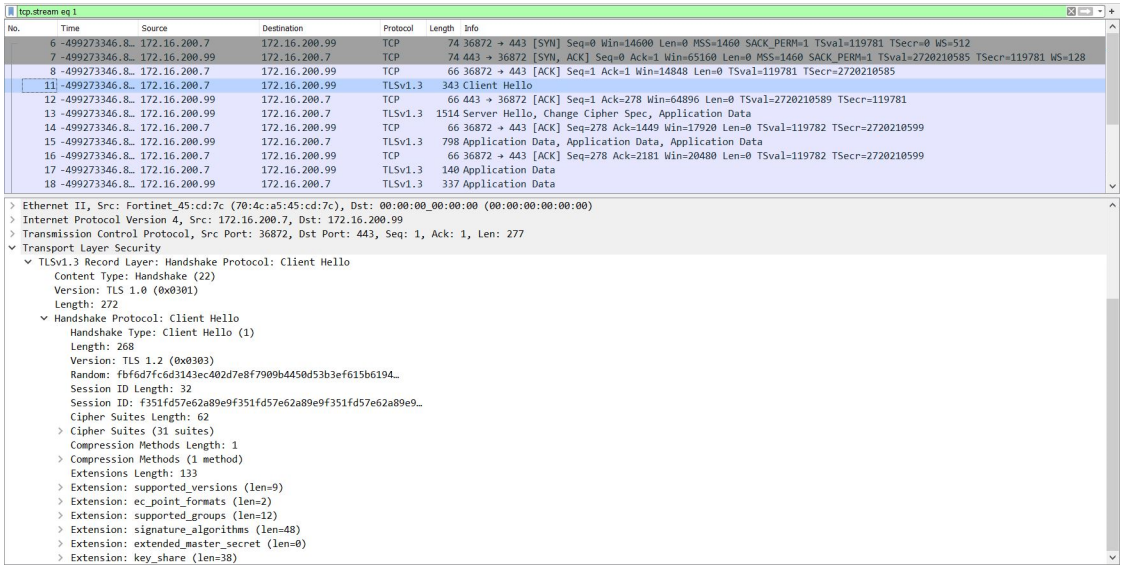
`all`	The FortiGate forwards ALPN extensions that use either HTTP/2 or HTTP/1.1. This is the default value.
`http1-1`	The FortiGate only forwards ALPN extensions that use HTTP/1.1. If the ALPN extension uses HTTP/2, then the FortiGate strips the ALPN header from the Client Hello.
`http2`	The FortiGate only forwards ALPN extensions that use HTTP/2. If the ALPN extension uses HTTP/1.1, then the FortiGate strips the ALPN header from the Client Hello.
`none`	The FortiGate always strips the ALPN header from the Client Hello when forwarding.

For example, if `supported-alpn` is set to `http2`, but the extension uses HTTP/1.1, the ALPN header is stripped from the Client Hello:

- Incoming packet capture:



- Outgoing packet capture:

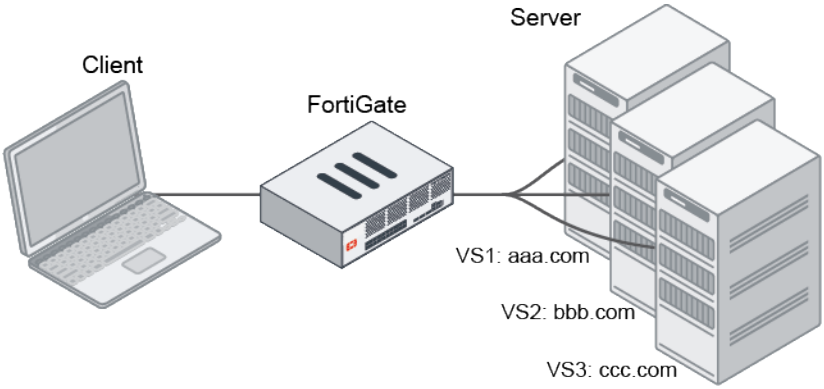


Define multiple certificates in an SSL profile in replace mode

Multiple certificates can be defined in an SSL inspection profile in replace mode (*Protecting SSL Server*). This allows multiple sites to be deployed on the same protected server IP address, and inspection based on matching the SNI in the certificate.

When the FortiGate receives the client and server hello messages, it will compare the server name identification (SNI) and the common name (CN) with the certificate list in the SSL profile, and use the matched certificate as a replacement. If there is no matched server certificate in the list, then the first server certificate in the list is used as a replacement.

Example



To configure an SSL profile in replace mode with multiple certificates:

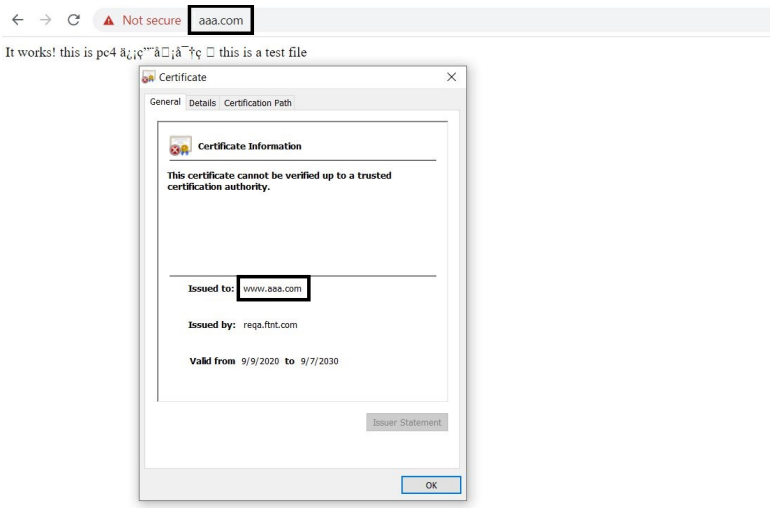
```
config firewall ssl-ssh-profile
    edit "multi-cert"
        set server-cert-mode replace
        set server-cert "bbb" "aaa"
    next
end
```

To configure a policy that uses the SSL profile:

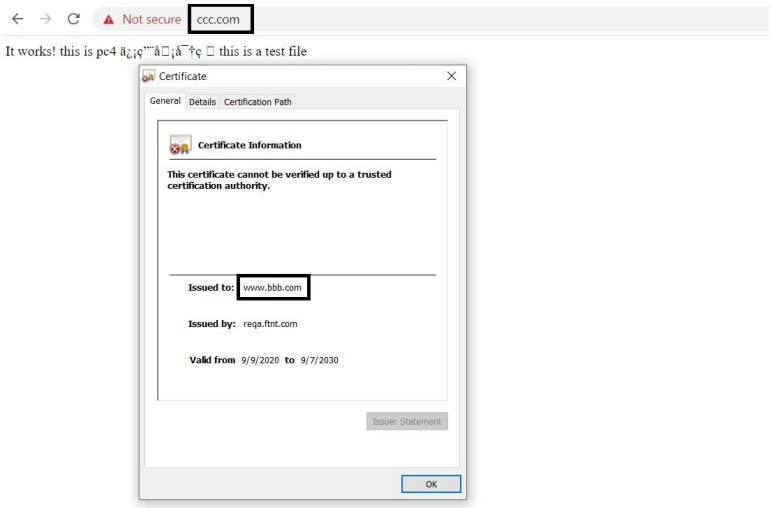
```
config firewall policy
    edit 1
        set name "multi-cert"
        set srcintf "port6"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "multi-cert"
        set av-profile "default"
        set webfilter-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

Results

If the SNI matches the CN in the certificate list in the SSL profile, then the FortiGate uses the matched server certificate. In this example, when the client accesses *www.aaa.com*, the FortiGate will use the *aaa* certificate as a replacement.



If the SNI does not match the CN in the certificate list in the SSL profile, then the FortiGate uses the first server certificate in the list. In this example, when the client accesses *www.ccc.com*, because there is no certificate for *www.ccc.com*, the FortiGate will use the *bbb* certificate as a replacement.



Custom signatures

You can create the following custom signatures and apply them to firewall policies:

- IPS signature
- Application signature
- Application group

The following topic provides information about custom signatures:

- Application groups in traffic shaping policies on page 910
- Blocking applications with custom signatures on page 913
- Filters for application control groups on page 915

Application groups in traffic shaping policies

Application groups can be configured in traffic shaping policies. In this example, there are two traffic shaping policies:

- Policy 1 is for traffic related to cloud applications and has high priority.
- Policy 2 is for other traffic and has low priority.

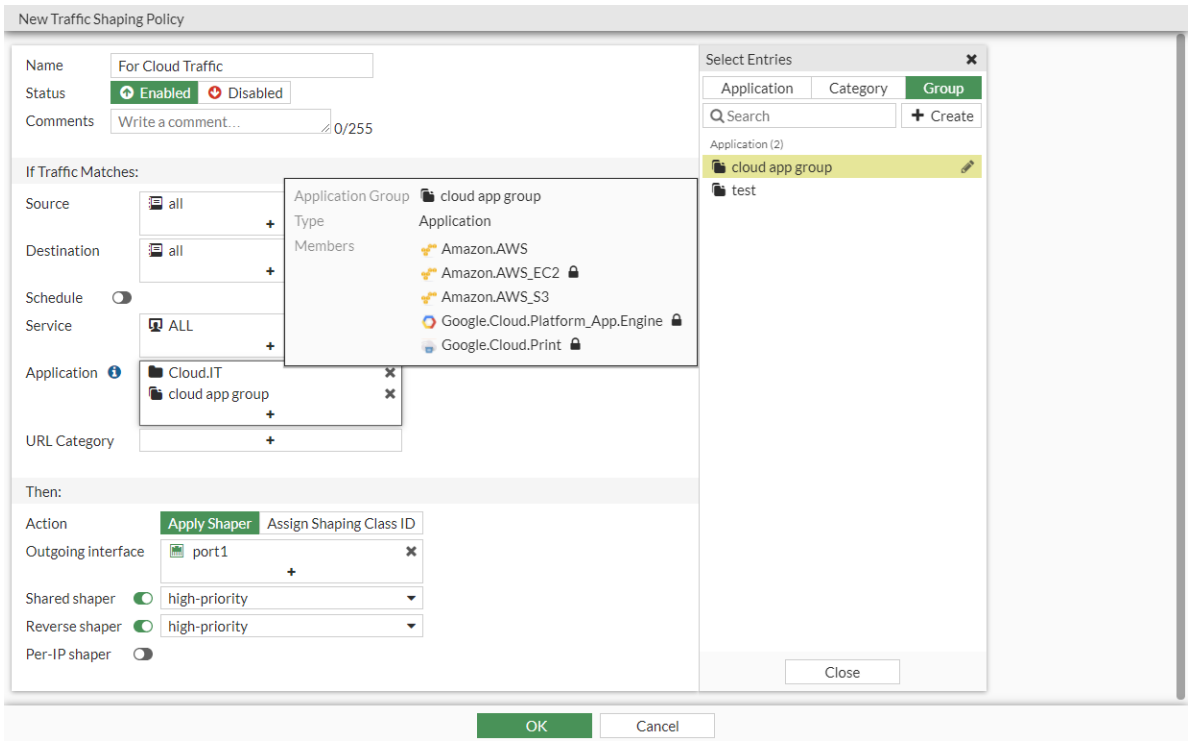
At least one firewall policy must have application control enabled for the applications to match any policy traffic.

To configure a traffic shaping policy to use an application group in the GUI:

1. Configure an application group for cloud applications:
   a. Go to *Security Profiles* > *Application Signatures*.
   b. Click *Create New* > *Application Group*. The *New Application Group* page opens.
   c. Enter a name for the group, and for *Type*, select *Application*.
   d. Click the + to add the group the members.

   e. Click *OK*.
2. Create the shaping policy for the high priority cloud application traffic:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policies* tab, and click *Create New*.
   b. Enter the following:

Name	For Cloud Traffic
Source	All
Destination	All
Service	All
Application	Add the *Cloud.IT* category and the *cloud app group* application group.
Outgoing interface	port1
Shared shaper	high-priority
Reverse shaper	high-priority



New Traffic Shaping Policy
Name

Amazon.AWS_EC2
Amazon.AWS_S3
Google.Cloud.Platform_App.Engine
Google.Cloud.Print
Select Entries
Application
Category
Group
Search
Create
Application (2)
cloud app group
test
Close
OK
Cancel

c. Click *OK*.

3. Create the shaping policy for the low priority other traffic:
   a. Click *Create New* and enter the following:

Name	For Other Traffic
Source	All
Destination	All
Service	All
Outgoing interface	port1
Shared shaper	low-priority
Reverse shaper	low-priority

   b. Click *OK*.

To configure a traffic shaping policy to use an application group in the CLI:

1. Configure an application group for cloud applications:

```
config application group
    edit "cloud app group"
        set application 27210 36740 35944 43296 33048
    next
end
```

2. Create the shaping policies for the high priority cloud application traffic and low priority other traffic:

```
config firewall shaping-policy
    edit 1
        set name "For Cloud Traffic"
        set service "ALL"
```

```
            set app-category 30
            set app-group "cloud app group"
            set dstintf "port1"
            set traffic-shaper "high-priority"
            set traffic-shaper-reverse "high-priority"
            set srcaddr "all"
            set dstaddr "all"
        next
        edit 2
            set name "For Other Traffic"
            set service "ALL"
            set dstintf "port1"
            set traffic-shaper "low-priority"
            set traffic-shaper-reverse "low-priority"
            set srcaddr "all"
            set dstaddr "all"
        next
    end
```

Blocking applications with custom signatures

Custom signatures can be used in application control profiles to block web traffic from specific applications, such as out of support operating systems.

In this example, you create a custom signature to detect PCs running Windows NT 6.1 operating systems, including Windows 7 and Windows Server 2008 R2. The signature is added to an application control profile and the action is set to block. The profile is then used in a firewall policy so that web traffic matching the signature is blocked. The logs generated by this example can be used to help identify other computers that you need to block.

To make the settings visible in the GUI:

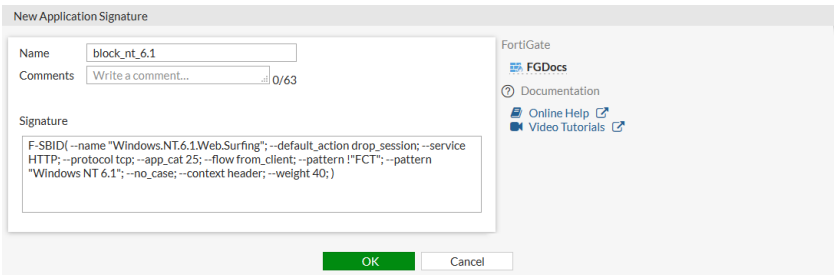
1. Go to *System* > *Feature Visibility*
2. In the *Security Features* section, enable *Application Control*.
3. Click *Apply*.

To create the custom application signature:

1. Go to *Security Profiles* > *Application Signatures* and click *Create New* > *Custom Application Signature*.
2. Enter a name for the custom signature, such as *block_nt_6.1*.
3. Enter the *Signature*. In this example:

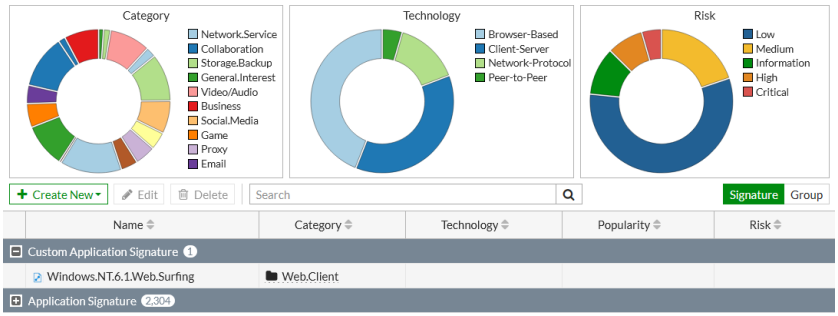
   ```
   F-SBID( --attack_id 6483; --name "Windows.NT.6.1.Web.Surfing"; --default_action drop_
   session; --service HTTP; --protocol tcp; --app_cat 25; --flow from_client; --pattern
   !"FCT"; --pattern "Windows NT 6.1"; --no_case; --context header; --weight 40; )
   ```

   This signature scans HTTP and HTTPS traffic that matches the pattern *Windows NT 6.1* in its header. For blocking older versions of Windows, such as Windows XP, you would use the pattern *Windows NT 5.1*. An attack ID is automatically generated when the signature is created.



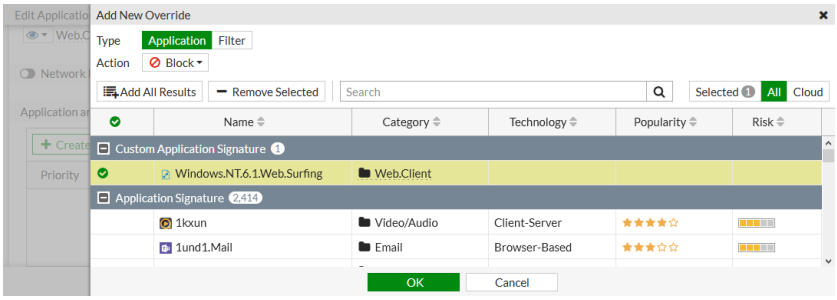
4. Click *OK*.

   The signature is included in the *Custom Application Signature* section of the signature list.



To use the signature in an application control profile:

1. Go to *Security Profiles* > *Application Control*.
2. Create a new profile, or edit an existing one.
3. In the *Application and Filter Overrides* table, click *Create New*.
4. Set *Type* to *Application* and *Action* to *Block*.
5. Select the custom signature from the list, using the search feature if required, then click *Add Selected*.



6. Click *OK*.

   The signature is added to the table.

7. Click *OK*.

To add the application control profile to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit the policy that is currently allows a connection from the internal network to the internet.
3. In the *Security Profiles* section, enable *Application Control* and select the profile.

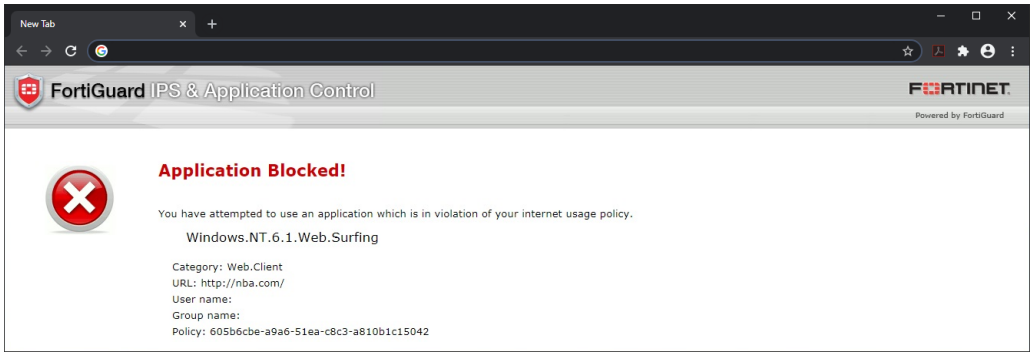
   If deep inspection is not enabled, then only HTTP traffic will be scanned. To scan HTTPS traffic, set SSL Inspection

to a profile that includes deep inspection. See SSL & SSH Inspection on page 896 for more information.

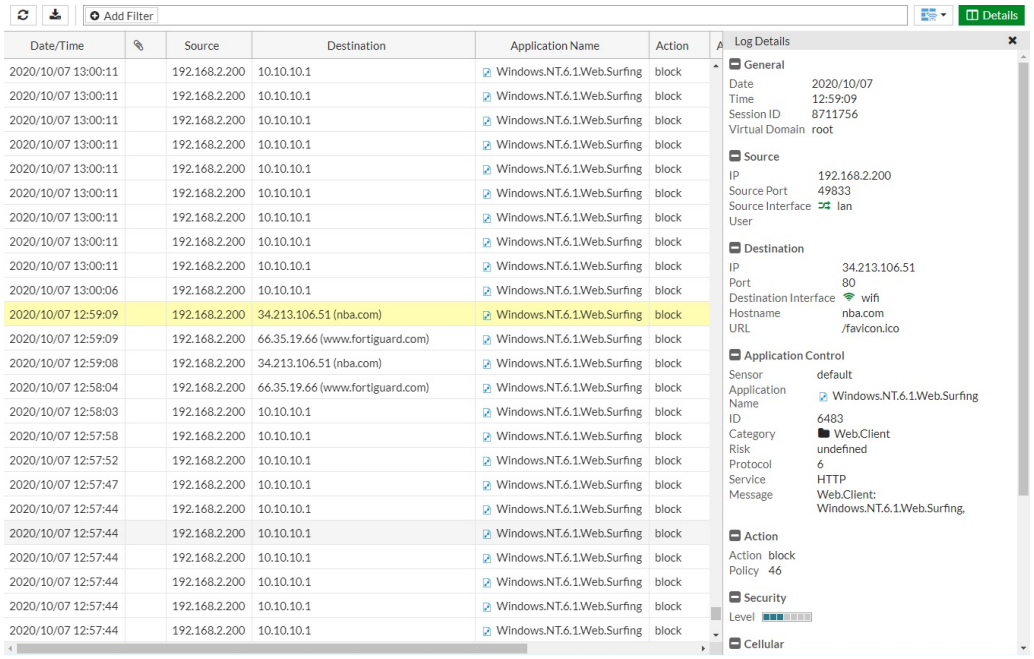
4. Click *OK*.

Results

When a PC that is running one of the affected operating systems tries to connect to the internet using a web browser, a replacement message is shown. For information on customizing replacement messages, see Replacement messages on page 1541.



Go to *Log & Report* > *Application Control* to view the web traffic that is logged for the PC that is blocked by the application signature.



Filters for application control groups

When defining application groups in NGFW policy or profile mode, the following group filters are available: protocols, risk, vendor, technology, behavior, popularity, and category.

```
config application group
    edit <name>
        set type filter
        set protocols <integer>
        set risk <integer>
        set vendor <id>
        set technology <id>
        set behavior <id>
        set popularity <integer>
        set category <id>
    next
end
```

`protocols <integer>`	Application protocol filter (0 - 47, or all).
`risk <integer>`	Risk or impact of allowing traffic from this application to occur (1 - 5; low (1), elevated (2), medium (3), high (4), and critical (5)).
`vendor <id>`	Application vendor filter (0 - 25, or all).
`technology <id>`	Application technology filter: • all • 0 (network-protocol) • 1 (browser-based) • 2 (client-server) • 4 (peer-to-peer)
`behavior <id>`	Application behavior filter: • all • 2 (botnet) • 3 (evasive) • 5 (excessive bandwidth) • 6 (tunneling) • 9 (cloud)
`popularity <integer>`	Application popularity filter (1 - 5, from least to most popular).
`category <id>`	Application category filter: • 2 (P2P) • 3 (VoIP) • 5 (video/audio) • 6 (proxy) • 7 (remote access) • 8 (game) • 12 (general interest) • 15 (network service) • 17 (update) • 21 (email) • 22 (storage backup) • 23 (social media) • 25 (web client)

- 26 (industrial)
- 28 (collaboration)
- 29 (business)
- 30 (cloud IT)
- 31 (mobile)
- 32 (unknown applications)

Sample configurations

In this example, a single filter (risk level 1) is configured in the application group in NGFW policy mode, so only signatures matching this filter will match the security policy.

To configure the application group:

```
config application group
    edit "risk_1"
        set type filter
        set risk 1
    next
end
```

To configure the security policy:

```
config firewall security-policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set status enable
        set schedule "always"
        set enforce-default-app-port disable
        set service "ALL"
        set app-group risk_1
        set logtraffic all
    next
end
```

In this example, the application group is configured so that only signatures matching both filters, category 5 (video/audio) and technology 1 (browser-based), will match the security policy. The application group can also be configured in a traffic shaping policy.

To configure the application group:

```
config application group
    edit "two"
        set type filter
        set category 5
        set technology 1
    next
 end
```

To configure the security policy:

```
config firewall security-policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set status enable
        set schedule "always"
        set enforce-default-app-port disable
        set service "ALL"
        set app-group two
        set logtraffic all
    next
end
```

To configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 1
        set ip-version 4
        set service "ALL"
        set app-group two
        set dstintf port1
        set traffic-shaper "max-100"
        set traffic-shaper-reverse "max-100"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Overrides

Web filter configuration can be separated into profile configuration and profile overrides.

You can also override web filter behavior based on the FortiGuard website categorization:

- Use alternate categories (web rating overrides): this method manually assigns a specific website to a different Fortinet category or a locally-created category.
- Use alternate profiles: configured users or IP addresses can use an alternative web filter profile when attempting to access blocked websites.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

The following topics provide information about web overrides:

- Web rating override on page 919
- Web profile override on page 924

Web rating override

Web rating overrides allow you to add specific URLs to both FortiGuard and custom web ratings categories.

In a web filter profile, the action for each category can be configured. See FortiGuard filter on page 774 for details. A web rating override in a custom category will not impact any web filters until the category's action is changed to *Allow*, *Monitor* (default), *Block*, *Warning*, or *Authenticate* in the specific web filter profile's settings. If a URL is in multiple enabled categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

In SSL/SSH inspection profiles, custom categories must be explicitly selected to be exempt from SSL inspection. In proxy addresses, custom categories must be explicitly selected as URL categories for them to apply. In both settings, if a URL is in multiple selected categories, the order of precedence is local categories, then remote categories, and then FortiGuard categories.

Web rating override requires a FortiGuard license.

Web filter profiles

In this example, *www.fortinet.com* is added to both a custom, or local, category (*Seriously*) and an external threat feed, or remote, category (*OnAworkComputer*). The local category action is set to *Monitor*, while the remote category action is set to *Block*. When a user browses to *www.fortinet.com*, the local category action takes precedence over both the remote category and the FortiGuard category (*Information Technology*), so the *Monitor* action is taken.

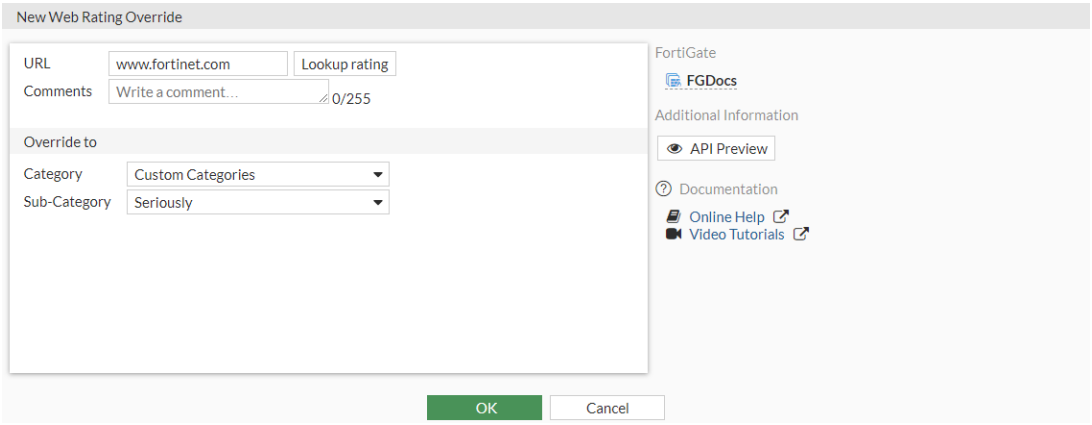
To create a custom category in the GUI:

1. Go to *Security Profiles* > *Web Rating Overrides*.
2. Click *Custom Categories*, then click *Create New*.
3. Enter a name for the category, and ensure that the *Status* is set to *Enable*.
4. Click *OK*.

To create a web rating override in the GUI:

1. Go to *Security Profiles* > *Web Rating Overrides* and click *Create New*.
2. Enter the URL to override.
3. Optionally, click *Lookup rating* to see what its current rating is, if it has one.

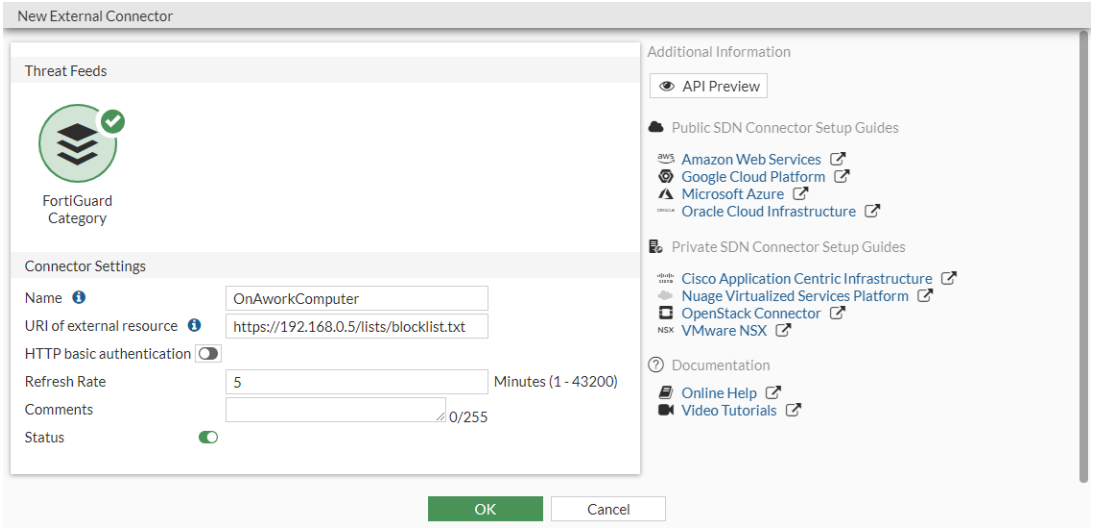
4. For *Category*, select *Custom Categories* and for *Sub-Category* select the category previously created.



5. Click *OK*.

To create a new FortiGuard category threat feed in the GUI:

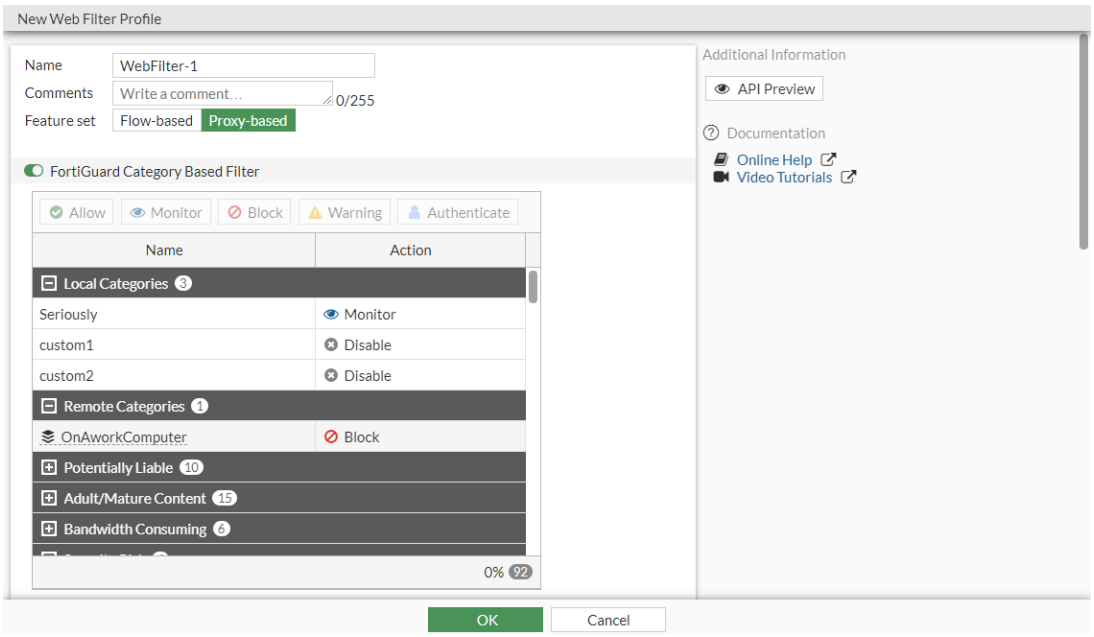
1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name for the threat feed, such as *OnAworkComputer*.
4. Enter the *URI of external resource*.



5. Configure the remaining settings as needed, then click *OK*.

To use the new categories in a web filter profile in the GUI:

1. Go to *Security Profiles* > *Web Filter* and create or edit a web filter profile. See FortiGuard filter on page 774 for more information.
2. Enable *FortiGuard category based filter*
3. Set the action for the *Seriously* category in the *Local Categories* group to *Monitor*.
4. Set the action for the *OnAworkComputer* category in the *Remote Categories* group to *Block*.



Setting the custom category action to *Allow* is equivalent to setting the CLI `action` variable to `monitor` and `log` variable to `disable`.

5. Configure the remaining settings are required, then click *OK*.

To use local and remote categories in a web filter profile in the CLI:

1. Create the custom category and add a URL to it:

```
config vdom
    edit root
        config webfilter ftgd-local-cat
            edit "Seriously"
                set id 140
            next
        end
        config webfilter ftgd-local-rating
            edit "www.fortinet.com"
                set rating 140
            next
        end
    next
end
```

2. Create a *FortiGuard Category Threat Feed* external connector to import an external blocklist.

```
config global
    config system external-resource
        edit "OnAworkComputer"
            set category 192
            set resource "https://192.168.0.5/lists/blocklist.txt"
        next
```

```
    end
end
```

3. Enable the new category in a web filter profile. See FortiGuard filter on page 774 for details.
   Custom local categories have an ID range of 140 to 191. Remote categories have an ID range of 192 to 221.

```
config vdom
    edit root
        config webfilter profile
            edit "WebFilter-1"
                set feature-set proxy
                config ftgd-wf
                    unset options
                    config filters
                        edit 12
                            set category 12
                            set action warning
                        next
                        ...
                        edit 23
                            set action warning
                        next
                        edit 140
                            set category 140
                        next
                        edit 192
                            set category 192
                            set action block
                        next
                    end
                end
            next
        end
    next
end
```

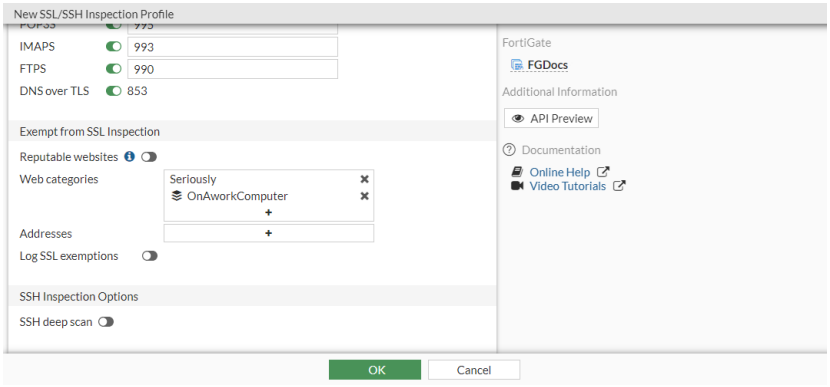
   When a filter is added for the local and remote categories (140 and 192 in this example), the default action is `monitor` with logging enabled.

SSL/SSH inspection profiles

To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection*.
2. Create a new profile or edit an existing one.
3. Ensure that *Inspection method* is *Full SSL Inspection*.

4. In the *Exempt from SSL Inspection* section, add the local and remote categories to the *Web categories* list .



5. Configure the remaining settings as required, then click *OK*.

To use local and remote categories in an SSL/SSH inspection profile to exempt them from SSL inspection in the CLI:

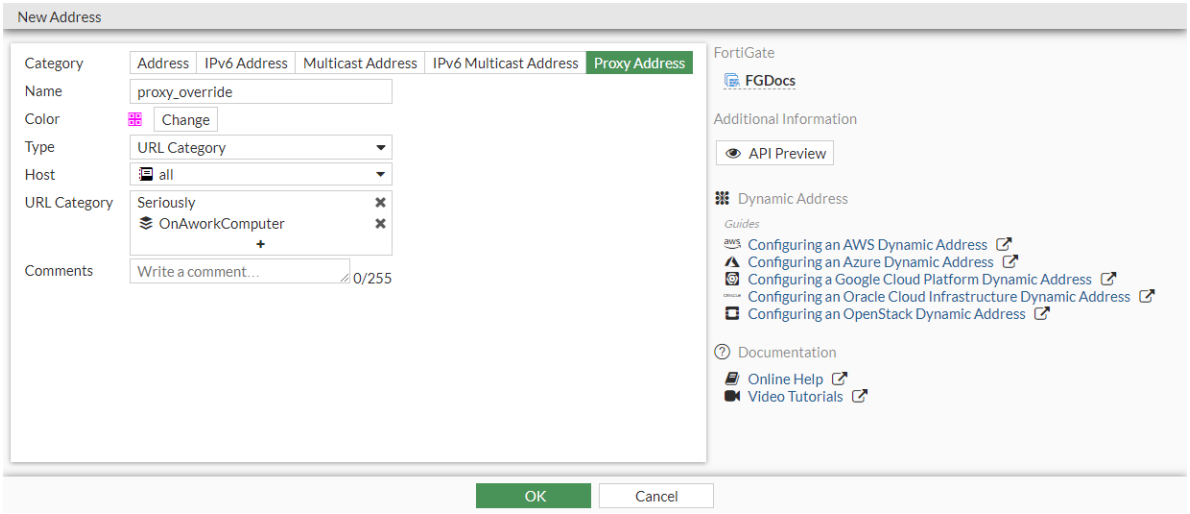
```
config vdom
    edit root
        config firewall ssl-ssh-profile
            edit "SSL_Inspection"
                config https
                    set ports 443
                    set status deep-inspection
                end
                ...
                config ssl-exempt
                    edit 1
                        set fortiguard-category 140
                    next
                    edit 2
                        set fortiguard-category 192
                    next
                end
            next
        end
    next
end
```

Proxy addresses

To use local and remote categories in a proxy address in the GUI:

1. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*, or edit an existing proxy address.
2. Set *Category* to *Proxy Address*.
3. Set *Type* to *URL Category*.

4. In the *URL Category*, add the local and remote categories.



5. Configure the remaining settings as required, then click *OK*.

To use local and remote categories in a proxy address in the CLI:

```
config vdom
    edit root
        config firewall proxy-address
            edit "proxy_override"
                set type category
                set host "all"
                set category 140 192
                set color 23
            next
        end
    next
end
```

Web profile override

You can use the following profile override methods:

- Administrative override
- Allow users to override blocked categories

Administrative override

Administrators can grant temporary access to sites that are otherwise blocked by a web filter profile. You can grant temporary access to a user, user group, or source IP address. You can set the time limit by selecting a date and time. The default is 15 minutes.

When the administrative web profile override is enabled, a blocked access page or replacement message does not appear, and authentication is not required.

Scope range

You can choose one of the following scope ranges:

- User: authentication for permission to override is based on whether or not the user is using a specific user account.
- User group: authentication for permission to override is based on whether or not the user account supplied as a credential is a member of the specified user group.
- Source IP: authentication for permission to override is based on the IP address of the computer that was used to authenticate. This would be used for computers that have multiple users. For example, if a user logs on to the computer, engages the override by using their credentials, and then logs off, anyone who logs on with an account on that computer would be using the alternate override web filter profile.

When you enter an IP address in the administrative override method, only individual IP addresses are allowed.

Differences between IP and identity-based scope

Using the IP scope does not require using an identity-based policy.

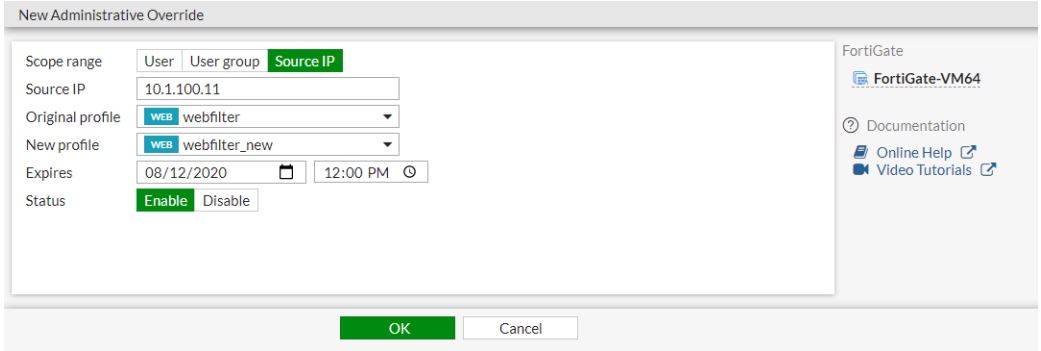
When using the administrative override method and IP scope, you might not see a warning message when you change from using the original web filter profile to using the alternate profile. There is no requirement for credentials from the user so, if allowed, the page will just appear in the browser.

Configuring a web profile administrative override

This example describes how to override the *webfilter* profile with the *webfilter_new* profile.

To configure web profile administrative override using the GUI:

1. Go to *Security Profiles* > *Web Profile Overrides* and click *Create New*.
   The *New Administrative Override* pane opens.
2. Configure the administrative override:
   a. For *Scope Range*, click *Source IP*.
   b. In the *Source IP* field, enter the IP address for the client computer (`10.1.100.11` in this example).
   c. In the *Original profile* dropdown, select *webfilter*.
   d. In the *New profile* dropdown, select *webfilter_new*.
   In the *Expires* field, the default 15 minutes appears, which is the desired duration for this example.



3. Click *OK*.

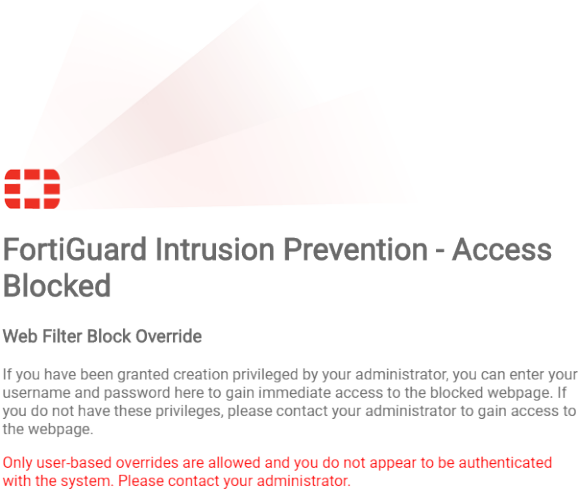
To configure web profile administrative override using the CLI:

```
config webfilter override
   edit 1
      set status enable
      set scope ip
      set old-profile "webfilter"
      set new-profile "webfilter_new"
      set expires 2020/08/12 12:00:00
      set initiator "admin"
      set ip 10.1.100.11
   next
end
```

Allow users to override blocked categories

For both override methods, the scope ranges (for specified users, user groups, or IP addresses) allow sites blocked by web filtering profiles to be overridden for a specified length of time.

But there is a difference between the override methods when the users or user group scope ranges are selected. In both cases, you would need to apply the user or user group as source in the firewall policy. With administrative override, if you do not apply the source in the firewall policy, the traffic will not match the override and will be blocked by the original profile. With *Allow users to override blocked categories*, the traffic will also be blocked, but instead of displaying a blocking page, the following message appears:



When you choose the user group scope, once one user overrides, it will affect the other users in the group when they attempt to override. For example, user1 and user2 both belong to the local_user group. Once user1 successfully overrides, this will generate an override entry for the local_user group instead of one specific user. This means that if user2 logs in from another PC, they can override transparently.

Other features

Besides the scope, there are some other features in *Allow users to override blocked categories*.

Apply to group(s)

Individual users can not be selected. You can select one or more of the user groups recognized by the FortiGate. They can be local to the system or from a third party authentication device, such as an AD server through FSSO.

Switch duration

Administrative override sets a specified time frame that is always used for that override. The available options in *Allow users to override blocked categories* are:

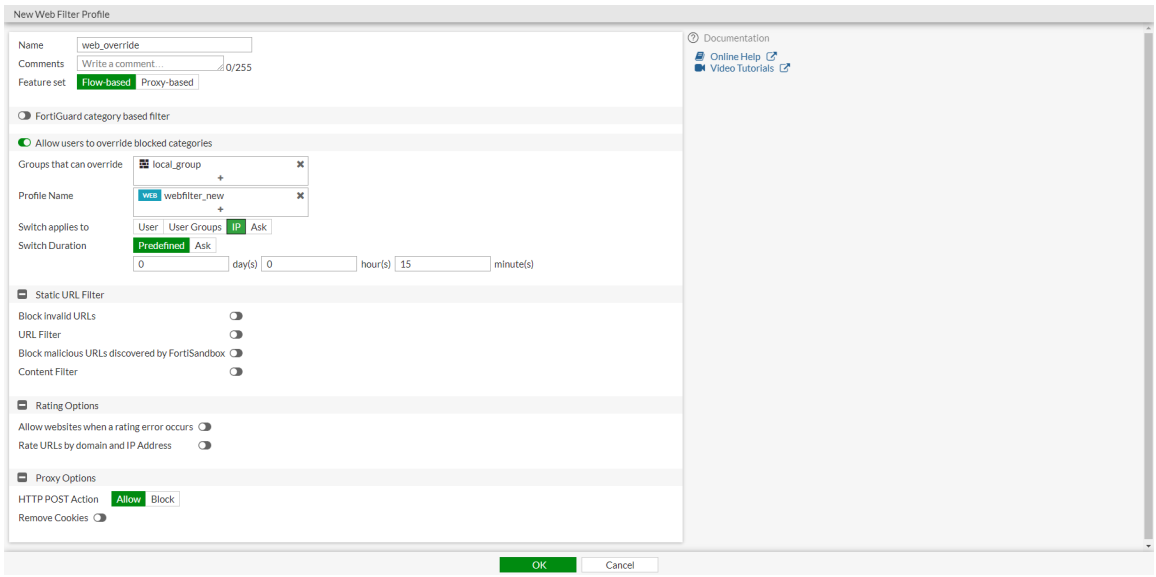
- *Predefined*: the value entered is the set duration (length of time in days, hours, or minutes) that the override will be in effect. If the duration variable is set to 15 minutes, the length of the override will always be 15 minutes. The option will be visible in the override message page, but the setting will be grayed out.
- *Ask*: the user has the option to set the override duration once it is engaged. The user can set the duration in terms of days, hours, or minutes.

Creating a web profile users override

This example describes how to allow users in the *local_group* to override the *webfilter_new* profile.

To allow users to override blocked categories using the GUI:

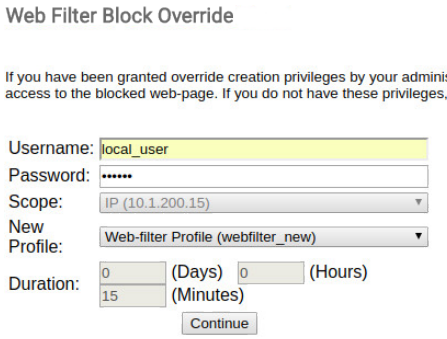
1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a name for the profile.
3. Enable *Allow users to override blocked categories*.
4. Configure the web filter profile:
   a. Click the *Groups that can override* field, and select a group (*local_group* in this example).
   b. Click the *Profile Name* field, and select the *webfilter_new* profile.
   c. For the *Switch applies to* field, click *IP*.
   d. For the *Switch Duration* field, click *Predefined*. The default *15* minutes appears, which is the desired duration for this example.
   e. Configure the rest of the profile as needed.



5. Click *OK*.

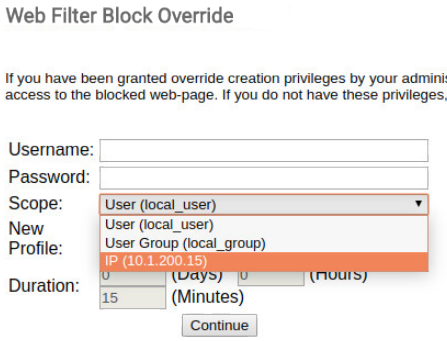
Using the ask feature

This option is only available in the *Allow users to override blocked categories* method. It configures the message page to have the user choose which scope they want to use. Normally on the message page, the scope options are grayed out and not editable. In the following example, the *Scope* is predefined with *IP*.



When the ask option is enabled (through the *Switch applies to* field in the GUI), the *Scope* dropdown is editable. Users can choose one of the following:

- User
- User group
- IP



User and *User Group* are only available when there is a user group in the firewall policy. You must specify a user group as a source in the firewall policy so the scope includes *User* and *User Group*; otherwise, only the IP option will be available.

VPN

Virtual Private Network (VPN) technology lets remote users connect to private computer networks to gain access to their resources in a secure way. For example, an employee traveling or working at home can use a VPN to securely access the office network through the Internet.

Instead of remotely logging into a private network using an unencrypted and unsecured Internet connection, using a VPN ensures that unauthorized parties cannot access the office network and cannot intercept information going between the employee and the office. Another common use of a VPN is to connect the private networks of multiple offices.

Fortinet offers VPN capabilities in the FortiGate Unified Threat Management (UTM) appliance and in the FortiClient Endpoint Security suite of applications. You can install a FortiGate unit on a private network and install FortiClient software on the user's computer. You can also use a FortiGate unit to connect to the private network instead of using FortiClient software.

The following sections provide information about VPN:

- IPsec VPNs on page 929
- SSL VPN on page 1190

IPsec VPNs

The following sections provide instructions on configuring IPsec VPN connections in FortiOS 7.0.0.

- General IPsec VPN configuration on page 929
- Site-to-site VPN on page 955
- Remote access on page 1008
- Aggregate and redundant VPN on page 1042
- Overlay Controller VPN (OCVPN) on page 1086
- ADVPN on page 1116
- Other VPN topics on page 1151
- VPN IPsec troubleshooting on page 1183

General IPsec VPN configuration

The following sections provide instructions on general IPsec VPN configurations:

- Network topologies on page 930
- Phase 1 configuration on page 930
- Phase 2 configuration on page 943
- VPN security policies on page 947
- Blocking unwanted IKE negotiations and ESP packets with a local-in policy on page 951
- Configurable IKE port on page 952

Network topologies

The topology of your network will determine how remote peers and clients connect to the VPN and how VPN traffic is routed.

Topology	Description
Site-to-Site	Standard one-to-one VPN between two FortiGates. See Site-to-site VPN on page 955.
Hub and spoke/ADVPN	One central FortiGate (hub) has multiple VPNs to other remote FortiGates (spokes). In ADVPN, shortcuts can be created between spokes for direct communication. See ADVPN on page 1116.
OCVPN	Fortinet's cloud based solution for automating VPN setup between devices registered to the same account. See Overlay Controller VPN (OCVPN) on page 1086.
FortiClient dialup	Typically remote FortiClient dialup clients use dynamic IP addresses through NAT devices. The FortiGate acts as a dialup server allowing dialup VPN connections from multiple sources. See FortiClient as dialup client on page 1015.
FortiGate dialup	Similar to site-to-site except one end is a dialup server and the other end is a dialup client. This facilitates scenarios in which the remote dialup end has a dynamic address, or does not have a public IP, possibly because it is behind NAT. See FortiGate as dialup client on page 1009.
Aggregate VPN	Natively support aggregating multiple VPN tunnels to increase performance and provide redundancy over multiple links. See IPsec aggregate for redundancy and traffic load-balancing on page 1059.
Redundant VPN	Options for supporting redundant and partially redundant IPsec VPNs, using route-based approaches. See Redundant hub and spoke VPN on page 1079.
L2TP over IPsec	Configure VPN for Microsoft Windows dialup clients using the built in L2TP software. Users do not have to install any Fortinet software. See L2TP over IPsec on page 1032.
GRE over IPsec	Legacy support for routers requiring point-to-point GRE over IPsec for tunneling. See GRE over IPsec on page 971.

Phase 1 configuration

Phase 1 configuration primarily defines the parameters used in IKE (Internet Key Exchange) negotiation between the ends of the IPsec tunnel. The local end is the FortiGate interface that initiates the IKE negotiations. The remote end is the remote gateway that responds and exchanges messages with the initiator. Hence, they are sometimes referred to as the initiator and responder. The purpose of phase 1 is to secure a tunnel with one bi-directional IKE SA (security association) for negotiating IKE phase 2 parameters.

The `auto-negotiate` and `negotiation-timeout` commands control how the IKE negotiation is processed when there is no traffic, and the length of time that the FortiGate waits for negotiations to occur.

IPsec tunnels can be configured in the GUI using the *VPN Creation Wizard*. Go to *VPN* > *IPsec Wizard*. The wizard includes several templates (site-to-site, hub and spoke, remote access), but a custom tunnel can be configured with the following settings:

Name		Phase 1 definition name. The maximum length is 15 characters for an interface mode VPN and 35 characters for a policy-based VPN. For a policy-based VPN, the name normally reflects where the remote connection originates. For a route-based tunnel, the FortiGate also uses the name for the virtual IPsec interface that it creates automatically.
Network		
	IP Version	Protocol, either IPv4 or IPv6.
	Remote Gateway	Category of the remote connection: • *Static IP Address*: the remote peer has a static IP address. • *Dialup User*: one or more FortiClient or FortiGate dialup clients with dynamic IP addresses will connect to the FortiGate. • *Dynamic DNS*: a remote peer that has a domain name and subscribes to a dynamic DNS service will connect to the FortiGate.
	IP Address	The IP address of the remote peer. This option is only available when the *Remote Gateway* is *Static IP Address*.
	Dynamic DNS	The domain name of the remote peer. This option is only available when the *Remote Gateway* is *Dynamic DNS*.
	Interface	The interface through which remote peers or dialup clients connect to the FortiGate. This option is only available in NAT mode. By default, the local VPN gateway IP address is the IP address of the interface that was selected (*Primary IP* in the *Local Gateway* field).
	Local Gateway	IP address for the local end of the VPN tunnel (*Primary IP* is used by default): • *Secondary IP*: secondary address of the interface selected in the *Interface* field. • *Specify*: manually enter an address. Interface mode cannot be configured in a transparent mode VDOM.
	Mode Config	This option is only available when the *Remote Gateway* is *Dialup User*. Configure the client IP address range, subnet mask/prefix length, DNS server, and split tunnel capability to automate remote client addressing.
	NAT Traversal	This option is only available when the *Remote Gateway* is *Static IP Address* or *Dynamic DNS*. ESP (encapsulating security payload), the protocol for encrypting data in the VPN session, uses IP protocol 50 by default. However, it does not use any port numbers so when traversing a NAT device, the packets cannot be demultiplexed. Enabling NAT traversal encapsulates the ESP packet inside a UDP packet, thereby adding a unique source port to the packet. This allows the NAT device to map the packets to the correct session. • *Enable*: a NAT device exists between the local FortiGate and the VPN

		peer or client. Outbound encrypted packets are wrapped inside a UDP IP header that contains a port number. The local FortiGate and the VPN peer or client must have the same NAT traversal setting (both selected or both cleared) to connect reliably. When in doubt, enable NAT traversal. • *Disable*: disable the NAT traversal setting. • *Forced*: the FortiGate will use a port value of zero when constructing the NAT discovery hash for the peer. This causes the peer to think it is behind a NAT device, and it will use UDP encapsulation for IPsec, even if no NAT is present. This approach maintains interoperability with any IPsec implementation that supports the NAT-T RFC.
	Keepalive Frequency	Keepalive frequency setting. This option is only available when *NAT Traversal* is set to *Enable* or *Forced*. The NAT device between the VPN peers may remove the session when the VPN connection remains idle for too long. The value represents an interval in seconds where the connection will be maintained with periodic keepalive packets. The keepalive interval must be smaller than the session lifetime value used by the NAT device. The keepalive packet is a 138-byte ISAKMP exchange.
	Dead Peer Detection	Reestablishes VPN tunnels on idle connections and cleans up dead IKE peers if required. This feature minimizes the traffic required to check if a VPN peer is available or unavailable (dead). The available options are: • *Disable*: disable dead peer detection (DPD). • *On Idle*: triggers DPD when IPsec is idle. • *On Demand*: Passively sends DPD to reduce load on the firewall. Only triggers DPD when IPsec outbound packets are sent, but no reply is received from the peer. When there is no traffic and the last DPD-ACK has been received, IKE will not send DPDs periodically. Notifications are received whenever a tunnel goes up or down, or to keep the tunnel connection open when no traffic is being generated inside the tunnel. For example, in scenarios where a dialup client or dynamic DNS peer connects from an IP address that changes periodically, traffic may be suspended while the IP address changes. When *Dead Peer Detection* is selected, optionally specify a retry count and a retry interval using `dpd-retrycount` and `dpd-retryinterval`. See Dead peer detection on page 936.
	Forward Error Correction	Enable on both ends of the tunnel to correct errors in data transmission by sending redundant data across the VPN.
	Device creation	Advanced option. When enabled, a dynamic interface (network device) is created for each dialup tunnel.
	Aggregate member	Advanced option. When enabled, the tunnel can be used as an aggregate member candidate.
Authentication		

Method	Either *Pre-shared Key* or *Signature*.
Pre-shared Key	The pre-shared key that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. The same key must be defined at the remote peer or client. See Pre-shared key.
Certificate Name	The server certificate that the FortiGate will use to authenticate itself to the remote peer or dialup client during phase 1 negotiations. See Digital certificates.
IKE Version	Either *1* or *2*. See Choosing IKE version 1 and 2 on page 938.
Mode	This option is only available when IKEv1 is selected. The two available options are: • *Aggressive*: the phase 1 parameters are exchanged in a single message with unencrypted authentication information. • *Main (ID protection)*: the phase 1 parameters are exchanged in multiple rounds with encrypted authentication information. When the remote VPN peer has a dynamic IP address and is authenticated by a pre-shared key, you must select *Aggressive* mode if there is more than one dialup phase 1 configuration for the interface IP address. When the remote VPN peer has a dynamic IP address and is authenticated by a certificate, you must select *Aggressive* mode if there is more than one phase 1 configuration for the interface IP address and these phase 1 configurations use different proposals.
Peer Options	Options to authenticate VPN peers or clients depending on the *Remote Gateway* and *Authentication Method* settings.
Any peer ID	Accepts the local ID of any remote VPN peer or client. The FortiGate does not check identifiers (local IDs). *Mode* can be set to *Aggressive* or *Main*. This option can be used with digital certificate authentication, but for higher security, use *Peer certificate*.
Specific peer ID	This option is only available when *Aggressive Mode* is enabled. Enter the identifier that is used to authenticate the remote peer. The identifier must match the local ID configured by the remote peer's administrator. If the remote peer is a FortiGate, the identifier is specified in the *Local ID* field of the *Phase 1 Proposal* settings. If the remote peer is a FortiClient user, the identifier is specified in the *Local ID* field. In circumstances where multiple remote dialup VPN tunnels exist, each tunnel must have a peer ID set.
Peer certificate	Define the CA certificate used to authenticate the remote peer when the authentication mode is *Signature*. If the FortiGate will act as a VPN client, and you are using security certificates for authentication, set the *Local ID* to the distinguished name (DN) of the local server certificate that the FortiGate unit will use for authentication purposes.

	Peer ID from dialup group	Authenticate multiple FortiGate or FortiClient dialup clients that use unique identifiers and unique pre-shared keys (or unique pre-shared keys only) through the same VPN tunnel. You must create a dialup user group for authentication purposes. Select the group from the list next to the *Peer ID from dialup group* option. You must set *Mode* to *Aggressive* when the dialup clients use unique identifiers and unique pre-shared keys. If the dialup clients use unique pre-shared keys only, you can set *Mode* to *Main* if there is only one dialup Phase 1 configuration for this interface IP address.
Phase 1 Proposal		The encryption and authentication algorithms used to generate keys for the IKE SA. There must be a minimum of one combination. The remote peer or client must be configured to use at least one of the proposals that you define.
	Encryption	The following symmetric-key encryption algorithms are available: • *DES*: Digital Encryption Standard, a 64-bit block algorithm that uses a 56-bit key. • *3DES*: triple-DES; plain text is encrypted three times by three keys. • *AES128*: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key. • *AES128GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2. • *AES192*: a 128-bit block algorithm that uses a 192-bit key. • *AES256*: a 128-bit block algorithm that uses a 256-bit key. • *AES256GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2. • *CHACHA20POLY1305*: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2. See also HMAC settings.
	Authentication	The following message digests that check the message authenticity during an encrypted session are available: • *MD5*: message digest 5. • *SHA1*: secure hash algorithm 1; a 160-bit message digest. • *SHA256*: a 256-bit message digest. • *SHA384*: a 384-bit message digest. • *SHA512*: a 512-bit message digest. In IKEv2, encryption algorithms include authentication, but a PRF (pseudo random function) is still required (*PRFSHA1*, *PRFSHA256*, *PRFSHA384*, *PRFSHA512*). See also HMAC settings.
	Diffie-Hellman Groups	Asymmetric key algorithms used for public key cryptography. Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the *Diffie-Hellman Groups* (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.

	Key Lifetime	The time (in seconds) that must pass before the IKE encryption key expires. When the key expires, a new key is generated without interrupting service. The keylife can be from 120 to 172 800 seconds.
	Local ID	Optional setting. This value must match the peer ID value given for the remote VPN peer's *Peer Options*. • If the FortiGate will act as a VPN client and you are using peer IDs for authentication purposes, enter the identifier that the FortiGate will supply to the VPN server during the phase 1 exchange. • If the FortiGate will act as a VPN client and you are using security certificates for authentication, select the distinguished name (DN) of the local server certificate that the FortiGate will use for authentication purposes.
XAUTH		This option supports the authentication of dialup clients. It is only available for IKE version 1. • *Disable*: do not use XAuth. • *Client*: available only if the *Remote Gateway* is set to *Static IP Address* or *Dynamic DNS*. If the FortiGate is a dialup client, enter the user name and password for the FortiGate to authenticate itself to the remote XAuth server. • *PAP Server*, *CHAP Server*, *Auto Server*: available only if *Remote Gateway* is set to *Dialup User*. Dialup clients authenticate as members of a dialup user group. A user group must be created first for the dialup clients that need access to the network behind the FortiGate. The FortiGate must be configured to forward authentication requests to an external RADIUS or LDAP authentication server. Select the server type based on the encryption method used between the FortiGate, the XAuth client, and the external authentication server. Then select the user group (*Inherit from policy* or *Choose*). See Using XAuth authentication on page 941.
	Username	User name used for authentication.
	Password	Password used for authentication.

Additional CLI configurations

The following phase 1 settings can be configured in the CLI:

VXLAN over IPsec	Packets with a VXLAN header are encapsulated within IPsec tunnel mode.
	
	To configure VXLAN over IPsec:
	
	`config vpn ipsec phase1-interface/phase1`
	`  edit ipsec`
	`  set interface <name>`
	`  set encapsulation vxlan/gre`
	`  set encapsulation-address ike/ipv4/ipv6`
	`  set encap-local-gw4 xxx.xxx.xxx.xxx`

	set encap-remote-gw xxx.xxx.xxx.xxx next end
IPsec tunnel idle timer	Define an idle timer for IPsec tunnels. When no traffic has passed through the tunnel for the configured `idle-timeout` value, the IPsec tunnel will be flushed. **To configure IPsec tunnel idle timeout:** config vpn ipsec phase1-interface edit p1 set idle-timeout [enable | disable] set idle-timeoutinterval <integer> *IPsec tunnel idle timeout in minutes (10 - 43200).* next end
Monitor tunnel for failover	Monitor a site-to-site tunnel to guarantee operational continuity if the primary tunnel fails. Configure the secondary phase 1 interface to monitor the primary interface. **To configure the monitor:** config vpn ipsec phase1-interface edit <secondary phase1-interface> set monitor <primary phase1-interface> next end
Passive mode	Passive mode turns one side of the tunnel to be a responder only. It does not initiate VPN tunnels either by auto-negotiation, rekey, or traffic initiated behind the FortiGate. **To configure passive mode:** config vpn ipsec phase1-interface edit <example> set rekey {enable | disable} set passive-mode {enable | disable} set passive-tunnel-interface {enable | disable} next end

Dead peer detection

By default, dead peer detection (DPD) sends probe messages every five seconds. If you are experiencing high network traffic, you can experiment with increasing the ping interval. However, longer intervals will require more traffic to detect dead peers, which will result in more traffic.

In a dynamic (dialup) connection, the *On Idle* option encourages dialup server configurations to more proactively delete tunnels if the peer is unavailable.

In the GUI, the dead peer detection option can be configured in the GUI when defining phase 1 options. The following CLI commands support additional options for specifying a retry count and a retry interval.

For example, enter the following to configure DPD on the existing IPsec phase 1 configuration to use 15-second intervals and to wait for three missed attempts before declaring the peer dead and taking action.

To configure DPD:

```
config vpn ipsec phase1-interface
    edit <value>
        set dpd [disable | on-idle | on-demand]
        set dpd-retryinveral 15
        set dpd-retrycount 3
    next
end
```

DPD scalability

On a dialup server, if many VPN connections are idle, the increased DPD exchange could negatively impact the performance/load of the daemon. The `on-demand` option in the CLI triggers DPD when IPsec traffic is sent, but no reply is received from the peer.

When there is no traffic and the last DPD-ACK had been received, IKE will not send DPDs periodically. IKE will only send out DPDs if there are outgoing packets to send, but no inbound packets have since been received.

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as `3des-sha256`). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500

DPD sent/recv: 000001e1/00000000
```

Choosing IKE version 1 and 2

If you create a route-based VPN, you have the option of selecting IKE version 2. Otherwise, IKE version 1 is used.

IKEv2, defined in RFC 4306, simplifies the negotiation process that creates the security association (SA).

If you select IKEv2:

- There is no choice in phase 1 of aggressive or main mode.
- Extended authentication (XAUTH) is not available.
- You can utilize EAP and MOBIKE.

Repeated authentication in IKEv2

This feature provides the option to control whether a device requires its peer to re-authenticate or whether re-key is sufficient. It does not influence the re-authentication or re-key behavior of the device itself, which is controlled by the peer (the default being to re-key). This solution is in response to RFC 4478. As described by the IETF, "the purpose of this is to limit the time that security associations (SAs) can be used by a third party who has gained control of the IPsec peer".

To configure IKE SA re-authentication:

```
config vpn ipsec phase1-interface
    edit p1
        set reauth [enable | disable]
    next
end
```

IKEv2 quick crash detection

There is support for IKEv2 quick crash detection (QCD) as described in RFC 6290.

RFC 6290 describes a method in which an IKE peer can quickly detect that the gateway peer it has and established an IKE session with has rebooted, crashed, or otherwise lost IKE state. When the gateway receives IKE messages or ESP packets with unknown IKE or IPsec SPIs, the IKEv2 protocol allows the gateway to send the peer an unprotected IKE message containing INVALID_IKE_SPI or INVALID_SPI notification payloads.

RFC 6290 introduces the concept of a QCD token, which is generated from the IKE SPIs and a private QCD secret, and exchanged between peers during the protected IKE AUTH exchange.

To configure QCD:

```
config system settings
    set ike-quick-crash-detect [enable | disable]
end
```

IKEv1 quick crash detection

Based on the IKEv2 QCD feature previously described, IKEv1 QCD is implemented using a new IKE vendor ID (Fortinet Quick Crash Detection) so both endpoints must be FortiGates. The QCD token is sent in the phase 1 exchange and must be encrypted, so this is only implemented for IKEv1 in main mode (aggressive mode is not supported as there is no available AUTH message to include the token). Otherwise, the feature works the same as in IKEv2 (RFC 6290).

IKEv1 fragmentation

UDP fragmentation can cause issues in IPsec when either the ISP or perimeter firewall(s) cannot pass or fragment the oversized UDP packets that occur when using a very large public security key (PSK). The result is that IPsec tunnels do not come up. The solution is IKE fragmentation.

For most configurations, enabling IKE fragmentation allows connections to automatically establish when they otherwise might have failed due to intermediate nodes dropping IKE messages containing large certificates, which typically push the packet size over 1500 bytes.

FortiOS will fragment a packet on sending if only all the following are true:

- Phase 1 contains `set fragmentation enable`.
- The packet is larger than the minimum MTU (576 for IPv4, 1280 for IPv6).
- The packet is being re-transmitted.

By default, IKE fragmentation is enabled.

To configure IKEv1 fragmentation:

```
config vpn ipsec phase1-interface
    edit 1
        set fragmentation [enable | disable]
    next
end
```

IKEv2 fragmentation

RFC 7383 requires each fragment to be individually encrypted and authenticated. With IKEv2, a copy of the unencrypted payloads around for each outgoing packet would need to be kept in case the original single packet was never answered and would retry with fragments. With the following implementation, if the IKE payloads are greater than a configured threshold, the IKE packets are preemptively fragmented and encrypted.

To configure IKEv2 fragmentation:

```
config vpn ipsec phase1-interface
    edit ike
        set ike-version 2
        set fragmentation [enable|disable]
        set fragmentation-mtu <500-16000>
    next
end
```

IPsec global IKE embryonic limit

When trying to establish thousands of tunnels simultaneously, a situation can arise where new negotiations starve other SAs from progressing to an established state in IKEv2. The IKE daemon can prioritize established SAs, offload groups 20 and 21 to CP9, and optimize the default embryonic limits for mid- and high-end platforms. The IKE embryonic limit can be configured in the CLI.

```
config system ike
    set embryonic-limit <integer>
end
```

`embryonic-limit <integer>`	Set the maximum number of IPsec tunnels to negotiate simultaneously (50 - 20000, default = 1000).

To configure an IKE embryonic limit of 50:

```
config system ike
    set embryonic-limit 50
end
```

Pre-shared key vs digital certificates

A FortiGate can authenticate itself to remote peers or dialup clients using either a pre-shared key or a digital certificate.

Pre-shared key

Using a pre-shared key is less secure than using certificates, especially if it is used alone, without requiring peer IDs or extended authentication (XAuth). There also needs to be a secure way to distribute the pre-shared key to the peers.

If you use pre-shared key authentication alone, all remote peers and dialup clients must be configured with the same pre-shared key. Optionally, you can configure remote peers and dialup clients with unique pre-shared keys. On the FortiGate, these are configured in user accounts, not in the phase 1 settings.

The pre-shared key must contain at least six printable characters and should be known by network administrators. For optimum protection against currently known attacks, the key must consist of a minimum of 16 randomly chosen alphanumeric characters. The limit is 128 characters.

If you authenticate the FortiGate using a pre-shared key, you can require remote peers or dialup clients to authenticate using peer IDs, but not client certificates.

To authenticate the FortiGate using a pre-shared key:

1. Go to *VPN* > *IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.
3. Configure or edit the *Authentication* settings as follows:

Method	*Pre-shared Key*
Pre-shared Key	<string>
IKE Version	*1* or *2*
Mode	*Aggressive* or *Main*
Peer Options	Select an *Accept Type* and the corresponding peer. Options vary based on the *Remote Gateway* and *Authentication Method* settings in the *Network* section. *Peer Options* are only available in *Aggressive* mode.

4. For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define *XAUTH* parameters.
6. Click *OK*.

Digital certificates

To authenticate the FortiGate using digital certificates, you must have the required certificates installed on the remote peer and on the FortiGate. The signed server certificate on one peer is validated by the presence of the root certificate installed on the other peer. If you use certificates to authenticate the FortiGate, you can also require the remote peers or dialup clients to authenticate using certificates. See Site-to-site VPN with digital certificate on page 960 for a detailed example.

To authenticate the FortiGate using a digital certificate:

1. Go to *VPN* > *IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network* section as needed.
3. Configure or edit the *Authentication* settings as follows:

Method	*Signature*
Certificate Name	Select the certificate used to identify this FortiGate. If there are no imported certificates, use *Fortinet_Factory*.
IKE Version	*1* or *2*
Mode	*Aggressive* is recommended.
Peer Options	For *Accept Type*, select *Peer certificate* and select the peer and the CA certificate used to authenticate the peer. If the other end is using the Fortinet_Factory certificate, then use the *Fortinet_CA* certificate here.

4. For the *Phase 1 Proposal* section, keep the default settings unless changes are needed to meet your requirements.
5. Optionally, for authentication parameters for a dialup user group, define *XAUTH* parameters.
6. Click *OK*.

Using XAuth authentication

Extended authentication (XAuth) increases security by requiring remote dialup client users to authenticate in a separate exchange at the end of phase 1. XAuth draws on existing FortiGate user group definitions and uses established authentication mechanisms such as PAP, CHAP, RADIUS, and LDAP to authenticate dialup clients. You can configure a FortiGate to function either as an XAuth server or client. If the server or client is attempting a connection using XAuth and the other end is not using XAuth, the failed connection attempts that are logged will not specify XAuth as the reason.

XAuth server

A FortiGate can act as an XAuth server for dialup clients. When the phase 1 negotiation completes, the FortiGate challenges the user for a user name and password. It then forwards the user's credentials to an external RADIUS or LDAP server for verification.

If the user records on the RADIUS server have suitably configured Framed-IP-Address fields, you can assign client virtual IP addresses by XAuth instead of from a DHCP address range.

The authentication protocol you use for XAuth depends on the capabilities of the authentication server and the XAuth client:

- Select *PAP Server* whenever possible.
- You must select *PAP Server* for all implementations of LDAP and some implementations of Microsoft RADIUS.

- Select *Auto Server* when the authentication server supports *CHAP Server* but the XAuth client does not. The FortiGate will use PAP to communicate with the XAuth client and CHAP to communicate with the authentication server. You can also use *Auto Server* to allow multiple source interfaces to be defined in an IPsec/IKE policy.

Before you begin, create user accounts and user groups to identify the dialup clients that need to access the network behind the FortiGate dialup server. If password protection will be provided through an external RADIUS or LDAP server, you must configure the FortiGate dialup server to forward authentication requests to the authentication server.

To configure XAuth to authenticate a dialup user group:

1. On the FortiGate dialup server, go to *VPN* > *IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network*, *Authentication*, and *Phase 1 Proposal* sections as needed.
3. In the *XAUTH* section, select the encryption method *Type* to use between the XAuth client, the FortiGate, and the authentication server.
4. For *User Group*:
   a. Click *Inherit from policy* for multiple user groups defined in the IPsec/IKE policy, or
   b. Click *Choose* and in the dropdown, select the user group that needs to access the private network behind the FortiGate.

Only one user group may be defined for *Auto Server*.

5. Click *OK*.
6. Create as many policies as needed, specifying the source user(s) and destination address.

XAuth client

If the FortiGate acts as a dialup client, the remote peer, acting as an XAuth server, might require a username and password. You can configure the FortiGate as an XAuth client with its own username and password, which it provides when challenged.

To configure the FortiGate dialup client as an XAuth client:

1. On the FortiGate dialup client, go to *VPN* > *IPsec Tunnels* and create a new tunnel, or edit an existing one.
2. Configure or edit the *Network*, *Authentication*, and *Phase 1 Proposal* sections as needed.
3. In the *XAUTH* section, for *Type*, select *Client*.
4. For *Username*, enter the FortiGate PAP, CHAP, RADIUS, or LDAP user name that the FortiGate XAuth server will compare to its records when the FortiGate XAuth client attempts to connect.
5. Enter the *Password* for the user name.
6. Click *OK*.

Dynamic IPsec route control

You can add a route to a peer destination selector by using the `add-route` option, which is available for all dynamic IPsec phases 1 and 2, for both policy-based and route-based IPsec VPNs.

The `add-route` option adds a route to the FortiGate routing information base when the dynamic tunnel is negotiated. You can use the distance and priority options to set the distance and priority of this route. If this results in a route with the lowest distance, it is added to the FortiGate forwarding information base.

You can also enable `add-route` in any policy-based or route-based phase 2 configuration that is associated with a dynamic (dialup) phase 1. In phase 2, `add-route` can be enabled, disabled, or set to use the same route as phase 1.

The `add-route` option is enabled by default.

To configure add-route in phase 1:

```
config vpn ipsec
    edit <name>
        set type dynamic
        set add-route {enable | disable}
    next
end
```

To configure add-route in phase 2:

```
config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end
```

Blocking IPsec SA negotiation

For interface-based IPsec, IPsec SA negotiation blocking can only be removed if the peer offers a wildcard selector. If a wildcard selector is offered, then the wildcard route will be added to the routing table with the distance/priority value configured in phase 1. If that is the route with the lowest distance, it will be installed into the forwarding information base.

In this scenario, it is important to ensure that the distance value configured for phase 1 is set appropriately.

Phase 2 configuration

After phase 1 negotiations end successfully, phase 2 begins. In Phase 2, the VPN peer or client and the FortiGate exchange keys again to establish a secure communication channel. The phase 2 proposal parameters select the encryption and authentication algorithms needed to generate keys for protecting the implementation details of security associations (SAs). The keys are generated automatically using a Diffie-Hellman algorithm.

The basic phase 2 settings associate IPsec phase 2 parameters with the phase 1 configuration that specifies the remote end point of the VPN tunnel. In most cases, you need to configure only basic Phase 2 settings.

Some settings can be configured in the CLI. The following options are available in the *VPN Creation Wizard* after the tunnel is created:

New Phase 2	
Name	Phase 2 definition name.
Local Address	A value of `0.0.0.0/0` means all IP addresses behind the local VPN peer. Add a specific address or range to allow traffic from and to only this local address. See Quick mode selectors on page 945.

	Remote Address	Enter the destination IP address that corresponds to the recipients or network behind the remote VPN peer. A value of `0.0.0.0/0` means all IP addresses behind the remote VPN peer. See Quick mode selectors on page 945.
Advanced		Select the encryption and authentication algorithms that will be proposed to the remote VPN peer. To establish a VPN connection, at least one of the proposals specified must match the configuration on the remote peer.
	Encryption	The following symmetric-key encryption algorithms are available: • *NULL*: do not use an encryption algorithm. • *DES*: Digital Encryption Standard, a 64-bit block algorithm that uses a 56-bit key. • *3DES*: triple-DES; plain text is encrypted three times by three keys. • *AES128*: Advanced Encryption Standard, a 128-bit block algorithm that uses a 128-bit key. • *AES128GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 128-bit key. Only available for IKEv2. • *AES192*: a 128-bit block algorithm that uses a 192-bit key. • *AES256*: a 128-bit block algorithm that uses a 256-bit key. • *AES256GCM*: AES in Galois/Counter Mode, a 128-bit block algorithm that uses a 256-bit key. Only available for IKEv2. • *CHACHA20POLY1305*: a 128-bit block algorithm that uses a 128-bit key and a symmetric cipher. Only available for IKEv2. See ChaCha20 and Poly1305 AEAD cipher on page 947, AES-GCM for IKEv2 phase 1 on page 947, and HMAC settings.
	Authentication	The following message digests that check the message authenticity during an encrypted session are available: • NULL: do not use a message digest. • *MD5*: message digest 5. • *SHA1*: secure hash algorithm 1; a 160-bit message digest. • *SHA256*: a 256-bit message digest. • *SHA384*: a 384-bit message digest. • *SHA512*: a 512-bit message digest. See also HMAC settings.
	Enable Replay Detection	Replay attacks occur when an unauthorized party intercepts a series of IPsec packets and replays them back into the tunnel. Replay detection allows the FortiGate to check all IPsec packets to see if they have been received before. If any encrypted packets arrive out of order, the FortiGate discards them. Note that 64-bit extended sequence numbers (as described in RFC 4303, RFC 4304 as an addition to IKEv1, and RFC 5996 for IKEv2) are supported for IPsec when replay detection is enabled.
	Enable Perfect Forward Secrecy (PFS)	Perfect forward secrecy (PFS) improves security by forcing a new Diffie-Hellman exchange whenever keylife expires.

Diffie-Hellman Group	Asymmetric key algorithms used for public key cryptography. Select one or more from groups 1, 2, 5, and 14 through 32. At least one of the *Diffie-Hellman Groups* (DH) settings on the remote peer or client must match one the selections on the FortiGate. Failure to match one or more DH groups will result in failed negotiations.
Local Port	Enter the port number that the local VPN peer uses to transport traffic related to the specified service (protocol number). The range is from 0 to 65535. To specify all ports, select *All*, or enter `0`.
Remote Port	Enter the port number that the remote VPN peer uses to transport traffic related to the specified service (protocol number). To specify all ports, select *All*, or enter `0`.
Protocol	Enter the IP protocol number of the service. To specify all services, select *All*, or enter `0`.
Auto-negotiate	Select this option for the tunnel to be automatically renegotiated when the it expires. See Auto-negotiate on page 946.
Autokey Keep Alive	Select this option for the tunnel to remain active when no data is being processed.
Key Lifetime	Select the method for determining when the phase 2 key expires: • *Seconds* • *Kilobytes* • *Both* Enter a corresponding value for *Seconds* and/or *Kilobytes* in the text boxes. If *Both* is selected, the key expires when either the time has passed or the number of kilobytes have been processed.

Quick mode selectors

Quick mode selectors determine which IP addresses can perform IKE negotiations to establish a tunnel. By only allowing authorized IP addresses access to the VPN tunnel, the network is more secure.

The default settings are as broad as possible: any IP address or configured address object using any protocol on any port.

While the dropdown menus for specifying an address also show address groups, the use of address groups may not be supported on a remote endpoint device that is not a FortiGate.

When configuring a quick mode selector for *Local Address* and *Remote Address*, valid options include IPv4 and IPv6 single addresses, subnets, or ranges.

There are some configurations that require specific selectors:

- The VPN peer is a third-party device that uses specific phase2 selectors.
- The FortiGate connects as a dialup client to another FortiGate, in which case (usually) you must specify a local IP address, IP address range, or subnet. However, this is not required if you are using dynamic routing and `mode-cfg`.

With FortiOS VPNs, your network has multiple layers of security, with quick mode selectors being an important line of defense:

- Routes guide traffic from one IP address to another.
- Phase 1 and phase 2 connection settings ensure there is a valid remote end point for the VPN tunnel that agrees on the encryption and parameters.
- Quick mode selectors allow IKE negotiations only for allowed peers.
- Security policies control which IP addresses can connect to the VPN.
- Security policies also control what protocols are allowed over the VPN along with any bandwidth limiting.

If you are editing an existing phase 2 configuration, the local address and remote address fields are unavailable if the tunnel has been configured to use firewall addresses as selectors. This option exists only in the CLI.

Using the add-route option

Consider using the `add-route` option to add a route to a peer destination selector in phase 2 to automatically match the settings in phase 1.

To configure add-route:

```
config vpn ipsec {phase2 | phase2-interface}
    edit <name>
        set add-route {phase1 | enable | disable}
    next
end
```

Auto-negotiate

By default, the phase 2 security association (SA) is not negotiated until a peer attempts to send data. The triggering packet and some subsequent packets are dropped until the SA is established. Applications normally resend this data, so there is no loss, but there might be a noticeable delay in response to the user.

If the tunnel goes down, the auto-negotiate feature (when enabled) attempts to re-establish the tunnel. Auto-negotiate initiates the phase 2 SA negotiation automatically, repeating every five seconds until the SA is established.

Automatically establishing the SA can be important for a dialup peer. It ensures that the VPN tunnel is available for peers at the server end to initiate traffic to the dialup peer. Otherwise, the VPN tunnel does not exist until the dialup peer initiates traffic.

To configure auto-negotiate:

```
config vpn ipsec phase2
    edit <phase2_name>
        set auto-negotiate enable
    next
end
```

Installing dynamic selectors via auto-negotiate

The IPsec SA connect message generated is used to install dynamic selectors. These selectors can be installed via the auto-negotiate mechanism. When phase 2 has `auto-negotiate` enabled, and phase 1 has `mesh-selector-type` set to `subnet`, a new dynamic selector will be installed for each combination of source and destination subnets. Each dynamic selector will inherit the auto-negotiate option from the template selector and begin SA negotiation. Phase 2 selector sources from dialup clients will all establish SAs without traffic being initiated from the client subnets to the hub.

DHCP

The `dhcp-ipsec` option lets the FortiGate assign VIP addresses to FortiClient dialup clients through a DHCP server or relay. This option is only available if the remote gateway in the phase 1 configuration is set to dialup user, and it only works in policy-based VPNs.

With `dhcp-ipsec`, the FortiGate dialup server acts as a proxy for FortiClient dialup clients that have VIP addresses on the subnet of the private network behind the FortiGate. In this case, the FortiGate dialup server acts as a proxy on the local private network for the FortiClient dialup client. A host on the network behind the dialup server issues an ARP request, corresponding to the device MAC address of the FortiClient host (when a remote server sends an ARP to the local FortiClient dialup client). The FortiGate then answers the ARP request on behalf of the FortiClient host, and then forwards the associated traffic to the FortiClient host through the tunnel.

Acting as a proxy prevents the VIP address assigned to the FortiClient dialup client from causing possible ARP broadcast problems—the normal and VIP addresses can confuse some network switches when two addresses have the same MAC address.

ChaCha20 and Poly1305 AEAD cipher

In IKEv2 to support RFC 7634, the ChaCha20 and Poly1305 crypto algorithms can be used together as a combined mode AEAD cipher (like AES-GCM) in the `crypto_ftnt` cipher in `cipher_chacha20poly1305.c`:

```
config vpn ipsec phase2-interface
    edit <name>
        set phase1name <name>
        set proposal chacha20poly1305
    next
end
```

AES-GCM for IKEv2 phase 1

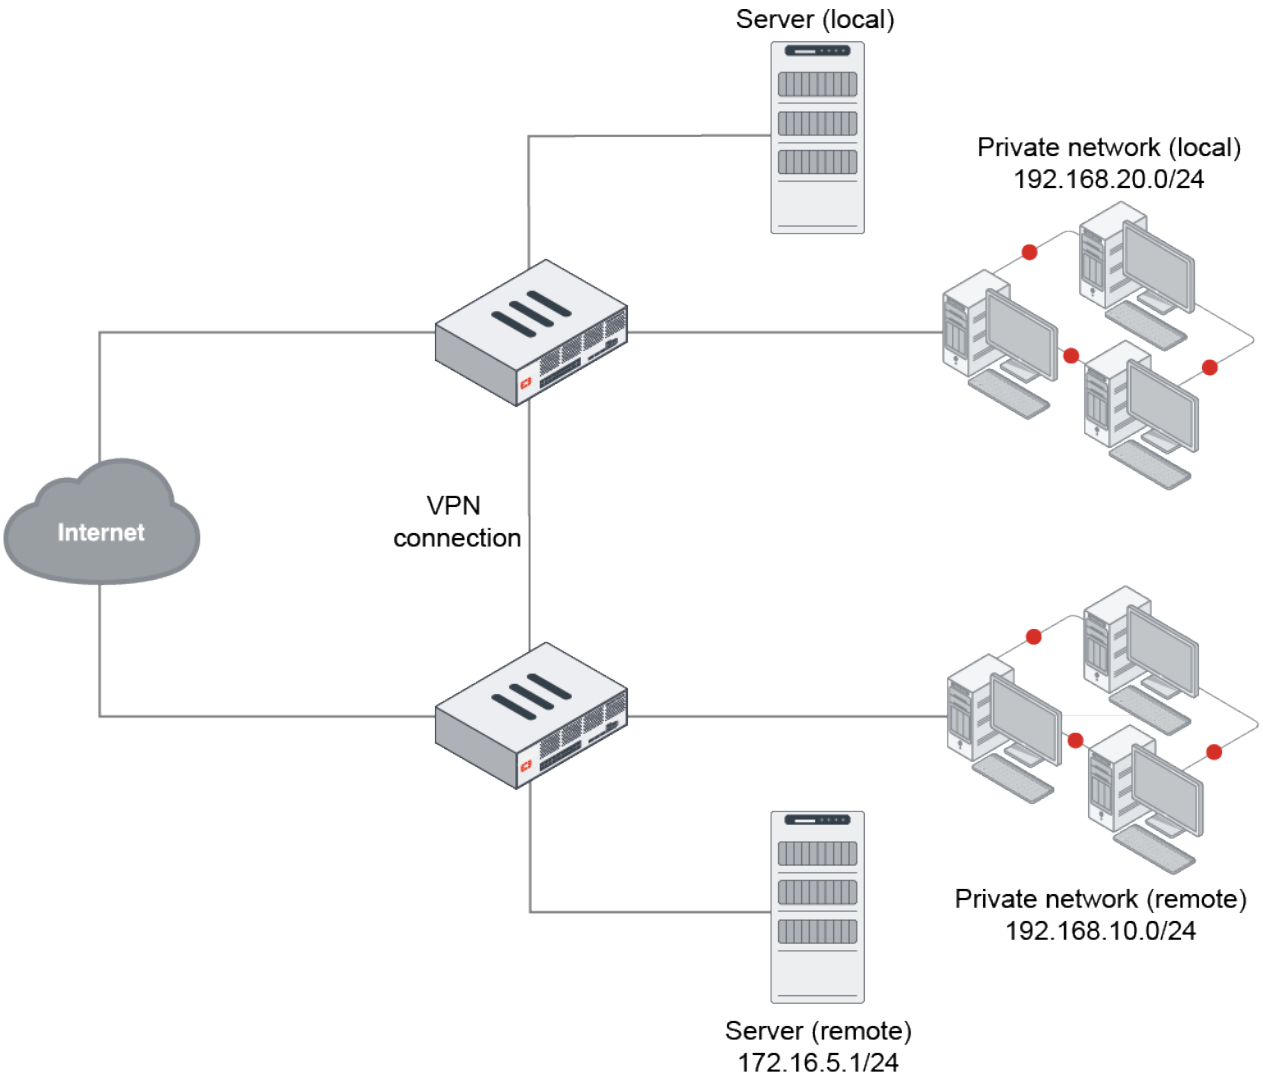
In IKEv2 to support RFC 5282, the AEAD algorithm AES-GCM supports 128- and 256-bit variants:

```
config vpn ipsec phase2-interface
    edit <name>
        set phase1name <name>
        set proposal [aes128gcm | aes256gcm]
    next
end
```

VPN security policies

This section explains how to specify the source and destination IP addresses of traffic transmitted through an IPsec VPN, and how to define appropriate security policies.

Topology



Defining policy addresses

In a gateway-to-gateway, hub-and-spoke, dynamic DNS, redundant tunnel, or transparent configuration, you need to define a policy address for the private IP address of the network behind the remote VPN peer (for example, `192.168.10.0/255.255.255.0` or `192.168.10.0/24`).

In a peer-to-peer configuration, you need to define a policy address for the private IP address of a server or host behind the remote VPN peer (for example, `172.16.5.1/255.255.255.255`, `172.16.5.1/32`, or `172.16.5.1`).

For a FortiGate dialup server in a dialup-client or internet-browsing configuration, the source IP should reflect the IP addresses of the dialup clients:

Defining security policies

Policy-based and route-based VPNs require different security policies.

- A policy-based VPN requires an IPsec policy. You specify the interface to the private network, the interface to the remote peer and the VPN tunnel. A single policy can enable traffic inbound, outbound, or in both directions.
- A route-based VPN requires an accept policy for each direction. For the source and destination interfaces, you specify the interface to the private network and the virtual IPsec interface (phase 1 configuration) of the VPN. The IPsec interface is the destination interface for the outbound policy and the source interface for the inbound policy. One security policy must be configured for each direction of each VPN interface.

If the policy that grants the VPN connection is limited to certain services, DHCP must be included, otherwise the client will not be able to retrieve a lease from the FortiGate's (IPsec) DHCP server because the DHCP request (coming out of the tunnel) will be blocked.

Policy-based VPN

An IPsec policy enables the transmission and reception of encrypted packets, specifies the permitted direction of VPN traffic, and selects the VPN tunnel. In most cases, a single policy is needed to control both inbound and outbound IP traffic through a VPN tunnel. For a detailed example, see Policy-based IPsec tunnel on page 976. Be aware of the following before creating an IPsec policy.

Allow traffic to be initiated from the remote site

Policies specify which IP addresses can initiate a tunnel. By default, traffic from the local private network initiates the tunnel. When the *Allow traffic to be initiated form the remote site* option is selected, traffic from a dialup client, or a computer on a remote network, initiates the tunnel. Both can be enabled at the same time for bi-directional initiation of the tunnel.

Outbound and inbound NAT

When a FortiGate operates in NAT mode, you can enable inbound or outbound NAT. Outbound NAT may be performed on outbound encrypted packets or IP packets in order to change their source address before they are sent through the tunnel. Inbound NAT is performed to intercept and decrypt emerging IP packets from the tunnel.

By default, these options are not selected in security policies and can only be set through the CLI.

Defining multiple IPsec policies for the same tunnel

You must define at least one IPsec policy for each VPN tunnel. If the same remote server or client requires access to more than one network behind a local FortiGate, the FortiGate must be configured with an IPsec policy for each network. Multiple policies may be required to configure redundant connections to a remote destination or control access to different services at different times.

To ensure a secure connection, the FortiGate must evaluate policies with *Action* set to *IPsec* before *ACCEPT* and *DENY*. Because the FortiGate unit reads policies starting at the top of the list, you must move all IPsec policies to the top of the list, and be sure to reorder your multiple IPsec policies that apply to the tunnel so that specific constraints can be evaluated before general constraints. If you create two equivalent IPsec policies for two different tunnels, the system will select the correct policy based on the specified source and destination addresses.

Adding multiple IPsec policies for the same VPN tunnel can cause conflicts if the policies specify similar source and destination addresses, but have different settings for the same service. When policies overlap in this manner, the system may apply the wrong IPsec policy or the tunnel may fail.

Route-based VPN

When you define a route-based VPN, you create a virtual IPsec interface on the physical interface that connects to the remote peer. You create ordinary accept policies to enable traffic between the IPsec interface and the interface that connects to the private network. This makes configuration simpler than for policy-based VPNs.

To configure policies for a route-based VPN:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New* and define an *ACCEPT* policy to permit communication between the local private network and the private network behind the remote peer and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the interface that connects to the private network behind this FortiGate.
Outgoing Interface	Select the IPsec interface you configured.
Source	Select the address name you defined for the private network behind this FortiGate.
Destination	Select the address name you defined for the private network behind the remote peer.
Action	Select *ACCEPT*.
NAT	Disable *NAT*.

3. Click *OK*.
   To permit the remote client to initiate communication, you need to define a security policy for communication in that direction.
4. Click *Create New* and enter these settings in particular:

Name	Enter a name for the security policy.
Incoming Interface	Select the IPsec interface you configured.
Outgoing Interface	Select the interface that connects to the private network behind this FortiGate.
Source	Select the address name you defined for the private network behind the remote peer.
Destination	Select the address name you defined for the private network behind this FortiGate.
Action	Select *ACCEPT*.
NAT	Disable *NAT*.

5. Click *OK*.

Blocking unwanted IKE negotiations and ESP packets with a local-in policy

It is not unusual to receive IPsec connection attempts or malicious IKE packets from all over the internet. Malicious parties use these probes to try to establish an IPsec tunnel in order to gain access to your private network. A good way to prevent this is to use local-in policies to deny such traffic.

Sometimes there are malicious attempts using crafted invalid ESP packets. These invalid attempts are automatically blocked by the FOS IPsec local-in handler when it checks the SPI value against the SAs of existing tunnels. The IPsec local-in handler processes the packet instead of the firewall's local-in handler. So when these attempts are blocked, you will notice an `unknown SPI` message in your VPN logs instead of being silently blocked by your local-in policy. These log messages are rate limited.

Sample log and alert email

```
Message meets Alert condition
```

```
date=2020-08-11 time=09:28:40 devname=toSite1 devid=FGT60Fxxxxxxxxxx logid="0101037131"
type="event" subtype="vpn" level="error" vd="root" eventtime=1597163320747963100 tz="-0700"
logdesc="IPsec ESP" msg="IPsec ESP" action="error" remip=131.62.25.102 locip=192.157.116.88
remport=40601 locport=500 outintf="wan1" cookies="N/A" user="N/A" group="N/A"
xauthuser="N/A" xauthgroup="N/A" assignip=N/A vpntunnel="N/A" status="esp_error" error_
num="Received ESP packet with unknown SPI." spi="f6c9e2x1" seq="02000400"
```

Note that invalid SPIs may not always indicate malicious activity. For example, the SPI may not match during rekey, or when one unit flushes its tunnel SAs. Administrators should collect as much information as possible before making a conclusion.

To block undesirable IPsec connection attempts and IKE packets using a local-in policy:

1. Configure an address group that excludes legitimate IPs:

```
config firewall addrgrp
    edit "All_exceptions"
        set member "all"
        set exclude enable
        set exclude-member "remote-vpn"
    next
end
```

2. Create a local-in policy that blocks IKE traffic from the address group:

```
config firewall local-in-policy
    edit 1
        set intf "wan1"
        set srcaddr "All_exceptions"
        set dstaddr "all"
        set service "IKE"
        set schedule "always"
    next
end
```

The default action is deny.

3. Verify the traffic blocked by the local-in policy:

```
# diagnose debug flow filter dport 500
# diagnose debug flow trace start 10
# diagnose debug enable

id=20085 trace_id=290 func=print_pkt_detail line=5588 msg="vd-root:0 received a packet
(proto=17, 10.10.10.13:500->10.10.10.1:500) from wan1. "
id=20085 trace_id=290 func=init_ip_session_common line=5760 msg="allocate a new session-
003442e7"
id=20085 trace_id=290 func=vf_ip_route_input_common line=2598 msg="find a route:
flag=84000000 gw-10.10.10.1 via root"
id=20085 trace_id=290 func=fw_local_in_handler line=430 msg="iprope_in_check() check
failed on policy 1, drop"
```

Configurable IKE port

Some ISPs block UDP port 500 or UDP port 4500, preventing an IPsec VPN from being negotiated and established. To accommodate this, the IKE port can be changed.

To set the IKE port:

```
config system settings
    set ike-port <integer>
end
```

ike-port	UDP port for IKE/IPsec traffic (1024 - 65535, default = 500).

Example 1: site-to-site VPN without NAT

In this example, the IKE port is set to 6000 on the two site-to-site VPN gateways. There is no NAT between the VPN gateways, but the ISP has blocked UDP port 500. A site-to-site VPN is established using the defined IKE port.

To set the IKE port:

```
config system settings
    set ike-port 6000
end
```

To configure and check the site-to-site VPN:

1. Configure the phase1 and phase2 interfaces:

```
config vpn ipsec phase1-interface
    edit "s2s"
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set wizard-type static-fortigate
        set remote-gw 11.101.1.1
```

```
        set psksecret **********
    next
end
config vpn ipsec phase2-interface
    edit "s2s"
        set phase1name "s2s"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "s2s_local"
        set dst-name "s2s_remote"
    next
end
```

2. Check the IKE gateway list and confirm that the specified port is used:

```
# diagnose vpn ike gateway list

vd: root/0
name: s2s
version: 2
interface: port27 17
addr: 173.1.1.1:6000 -> 11.101.1.1:6000
tun_id: 11.101.1.1
remote_location: 0.0.0.0
created: 194s ago
PPK: no
IKE SA: created 1/2  established 1/2  time 0/4500/9000 ms
IPsec SA: created 1/2  established 1/2  time 0/4500/9000 ms
...
```

3. Check the VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=s2s ver=2 serial=1 173.1.1.1:6000->11.101.1.1:6000 tun_id=11.101.1.1 dst_mtu=1500
dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=auto/1 encap=none/520 options[0208]=npu
frag-rfc  run_state=0 accept_traffic=1 overlay_id=0
...
```

Example 2: dialup VPN with NAT

In this example, the IKE port is set to 5000 on the VPN gateway and the dialup peer. The dialup peer is behind NAT, so NAT traversal (NAT-T) is used. The ISP blocks both UDP port 500 and UDP port 4500. The VPN connection is initiated on UDP port 5000 from the dialup VPN client and remains on port 5000 since NAT-T floating to 4500 is only required when the IKE port is 500.

To set the IKE port:

```
config system settings
    set ike-port 5000
end
```

To configure and check the dialup VPN with NAT:

1. Configure the phase1 and phase2 interfaces:

```
config vpn ipsec phase1-interface
    edit "server"
        set type dynamic
        set interface "port27"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set wizard-type static-fortigate
        set psksecret **********
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "server"
        set phase1name "server"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "server_local"
        set dst-name "server_remote"
    next
end
```

2. Check the IKE gateway list and confirm that the specified port is used:

```
# diagnose vpn ike gateway list

vd: root/0
name: server_0
version: 2
interface: port27 17
addr: 173.1.1.1:5000 -> 173.1.1.2:65416
tun_id: 173.1.1.2
remote_location: 0.0.0.0
created: 90s ago
nat: peer
PPK: no
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
IPsec SA: created 1/1  established 1/1  time 0/0/0 ms
...
```

3. Check the VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=server_0 ver=2 serial=a 173.1.1.1:5000->173.1.1.2:65416 tun_id=173.1.1.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
bound_if=17 lgwy=static/1 tun=tunnel/15 mode=dial_inst/3 encap=none/904 options
```

```
[0388]=npu rgwy-chg rport-chg frag-rfc  run_state=0 accept_traffic=1 overlay_id=0
...
```

Site-to-site VPN

A site-to-site VPN connection lets branch offices use the Internet to access the main office's intranet. A site-to-site VPN allows offices in multiple, fixed locations to establish secure connections with each other over a public network such as the Internet.

The following sections provide instructions for configuring site-to-site VPNs:

- FortiGate-to-FortiGate on page 955
- FortiGate-to-third-party on page 983

FortiGate-to-FortiGate

This section contains the following topics about FortiGate-to-FortiGate VPN configurations:

- Basic site-to-site VPN with pre-shared key on page 955
- Site-to-site VPN with digital certificate on page 960
- Site-to-site VPN with overlapping subnets on page 967
- GRE over IPsec on page 971
- Policy-based IPsec tunnel on page 976

Basic site-to-site VPN with pre-shared key

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a pre-shared key.

To configure IPsec VPN authenticating a remote FortiGate peer with a pre-shared key in the GUI:

1. Configure the HQ1 FortiGate.
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *No NAT Between Sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. For the IP address, enter *172.16.202.1*.
      iii. For *Outgoing interface*, enter *port1*.

iv. For *Authentication Method*, select *Pre-shared Key*.
v. In the *Pre-shared Key* field, enter *sample* as the key.
vi. Click *Next*.

c. Configure the following settings for *Policy & Routing*:
i. From the *Local Interface* dropdown menu, select the local interface.
ii. Configure the *Local Subnets* as *10.1.100.0*.
iii. Configure the *Remote Subnets* as *172.16.101.0*.
iv. Click *Create*.

2. Configure the HQ2 FortiGate.
a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
i. Enter a VPN name.
ii. For *Template Type*, select *Site to Site*.
iii. For *Remote Device Type*, select *FortiGate*.
iv. For *NAT Configuration*, select *No NAT Between Sites*.
v. Click *Next*.

b. Configure the following settings for *Authentication*:
i. For *Remote Device*, select *IP Address*.
ii. For the IP address, enter *172.16.2001*.
iii. For *Outgoing interface*, enter *port25*.
iv. For *Authentication Method*, select *Pre-shared Key*.
v. In the *Pre-shared Key* field, enter *sample* as the key.
vi. Click *Next*.

c. Configure the following settings for *Policy & Routing*:
i. From the *Local Interface* dropdown menu, select the local interface.
ii. Configure *Local Subnets* as *172.16.101.0*.
iii. Configure the *Remote Subnets* as *10.1.100.0*.
iv. Click *Create*.

To configure IPsec VPN authenticating a remote FortiGate peer with a pre-shared key using the CLI:

1. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.
a. Configure HQ1.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 172.16.200.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
end
```

b. Configure HQ2.

```
config system interface
    edit "port25"
        set vdom "root"
        set ip 172.16.202.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

2. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.

a. Configure HQ1.

```
config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end
```

b. Configure HQ2.

```
config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
```

3. Configure the IPsec phase1-interface.

a. Configure HQ1.

```
config vpn ipsec phase1-interface
    edit "to_HQ2"
        set interface "port1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
    next
end
```

b. Configure HQ2.

```
config vpn ipsec phase1-interface
    edit "to_HQ1"
        set interface "port25"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret  sample
```

```
    next
end
```

4. Configure the IPsec phase2-interface.
   a. Configure HQ1.

```
config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

   b. Configure HQ2.

```
config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

5. Configure the static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.
   a. Configure HQ1.

```
config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "to_HQ2"
    next
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

   b. Configure HQ2.

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ1"
    next
    edit 3
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable
        set distance 254
     next
end
```

6. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.
   a. Configure HQ1.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "dmz"
        set dstintf "to_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

   b. Configure HQ2.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ1"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

7. Run `diagnose` commands. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish. If the PSK failed to match, the following error shows up in the debug output:

```
ike 0:to_HQ2:15037: parse error
ike 0:to_HQ2:15037: probable pre-shared secret mismatch'
```

   The following commands are useful to check IPsec phase1/phase2 interface status.

a. Run the `diagnose vpn ike gateway list` command on HQ1. The system should return the following:

```
vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 5s ago
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms
id/spi: 12 6e8d0532e7fe8d84/3694ac323138a024
direction: responder
status: established 5-5s ago = 0ms
proposal: aes128-sha256
key: b3efb46d0d385aff-7bb9ee241362ee8d
lifetime/rekey: 86400/86124
DPD sent/recv: 00000000/00000000
```

b. Run the `diagnose vpn tunnel list` command on HQ1. The system should return the following:

```
list all ipsec tunnel in vd 0
name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0
bound_if=11 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/528 options[0210]=create_
dev frag-rfcaccept_traffic=1

```

Site-to-site VPN with digital certificate

This is a sample configuration of IPsec VPN authenticating a remote FortiGate peer with a certificate. The certificate on one peer is validated by the presence of the CA certificate installed on the other peer.

To configure IPsec VPN authenticating a remote FortiGate peer with a digital certificate in the GUI:

1. Import the certificate.
2. Configure user peers.
3. Configure the HQ1 FortiGate.
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *No NAT Between Sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. For the IP address, enter *172.16.202.1*.
      iii. For *Outgoing interface*, enter *port1*.
      iv. For *Authentication Method*, select *Signature*.
      v. In the *Certificate name* field, select the imported certificate.
      vi. From the *Peer Certificate CA* dropdown list, select the desired peer CA certificate.
      vii. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure the *Local Subnets* as *10.1.100.0*.
      iii. Configure the *Remote Subnets* as *172.16.101.0*.
      iv. Click *Create*.
4. Configure the HQ2 FortiGate.
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *No NAT Between Sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. For the IP address, enter *172.16.2001*.
      iii. For *Outgoing interface*, enter *port25*.
      iv. For *Authentication Method*, select *Signature*.
      v. In the *Certificate name* field, select the imported certificate.
      vi. From the *Peer Certificate CA* dropdown list, select the peer CA certificate.
      vii. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure *Local Subnets* as *172.16.101.0*.
      iii. Configure the *Remote Subnets* as *10.1.100.0*.
      iv. Click *Create*.

To configure IPsec VPN authenticating a remote FortiGate peer with a digital certificate using the CLI:

1. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. The IPsec tunnel is established over the WAN interface.
   a. Configure HQ1.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 172.16.200.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
end
```

   b. Configure HQ2.

```
config system interface
    edit "port25"
        set vdom "root"
        set ip 172.16.202.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

2. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.
   a. Configure HQ1.

```
config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end
```

   b. Configure HQ2.

```
config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
```

3. Configure the import certificate and its CA certificate information. The certificate and its CA certificate must be imported on the remote peer FortiGate and on the primary FortiGate before configuring IPsec VPN tunnels. If the built-in Fortinet_Factory certificate and the Fortinet_CA CA certificate are used for authentication, you can skip this step.

a. Configure HQ1.

```
config vpn certificate local
    edit "test1"
        ...
        set range global
    next
end
config vpn certificate ca
    edit "CA_Cert_1"
        ...
        set range global
    next
end
```

b. Configure HQ2.

```
config vpn certificate local
    edit "test2"
        ...
        set range global
    next
end
config vpn certificate ca
    edit "CA_Cert_1"
        ...
        set range global
    next
end
```

4. Configure the peer user. The peer user is used in the IPsec VPN tunnel peer setting to authenticate the remote peer FortiGate.

a. If not using the built-in Fortinet_Factory certificate and Fortinet_CA CA certificate, do the following:

i. Configure HQ1.

```
config user peer
    edit "peer1"
        set ca "CA_Cert_1"
    next
end
```

ii. Configure HQ2.

```
config user peer
    edit "peer2"
        set ca "CA_Cert_1"
    next
end
```

b. If the built-in Fortinet_Factory certificate and Fortinet_CA CA certificate are used for authentication, the peer user must be configured based on Fortinet_CA.

i. Configure HQ1.

```
config user peer
    edit "peer1"
        set ca "Fortinet_CA"
    next
end
```

ii. Configure HQ2.

```
config user peer
    edit "peer2"
        set ca "Fortinet_CA"
    next
end
```

5. Configure the IPsec phase1-interface.
   a. Configure HQ1.

```
config vpn ipsec phase1-interface
    edit "to_HQ2"
        set interface "port1"
        set authmethod signature
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set certificate "test1"
        set peer "peer1"
    next
end
```

   b. Configure HQ2.

```
config vpn ipsec phase1-interface
    edit "to_HQ1"
        set interface "port25"
        set authmethod signature
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set certificate "test2"
        set peer "peer2"
    next
end
```

6. Configure the IPsec phase2-interface.
   a. Configure HQ1.

```
config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

   b. Configure HQ2.

```
config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

7. Configure the static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.
   a. Configure HQ1.

```
config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "to_HQ2"
    next
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

   b. Configure HQ2.

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ1"
    next
    edit 3
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable
        set distance 254
     next
end
```

8. Configure two firewall policies to allow bidirectional IPsec traffic flow over the IPsec VPN tunnel.
   a. Configure HQ1.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ2"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "dmz"
        set dstintf "to_HQ2"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. Configure HQ2.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "to_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ1"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

9. Run `diagnose` commands. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish. If the remote FortiGate certificate cannot be validated, the following error shows up in the debug output:

```
ike 0: to_HQ2:15314: certificate validation failed
```

The following commands are useful to check IPsec phase1/phase2 interface status.

a. Run the `diagnose vpn ike gateway list` command on HQ1. The system should return the following:

```
vd: root/0
name: to_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500

```

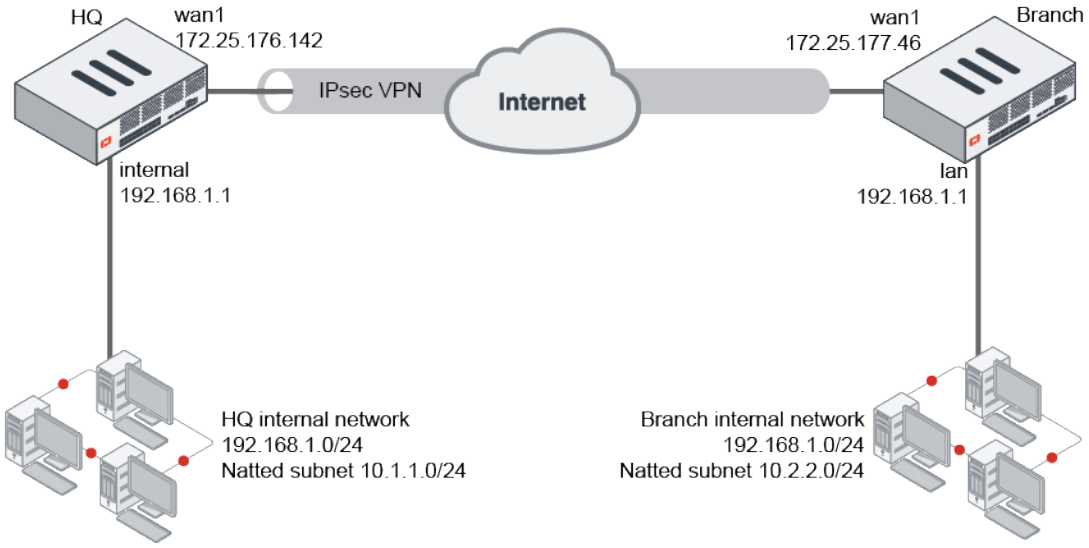
Site-to-site VPN with overlapping subnets

This is a sample configuration of IPsec VPN to allow transparent communication between two overlapping networks that are located behind different FortiGates using a route-based tunnel with source and destination NAT.

In the following topology, both FortiGates (HQ and Branch) use 192.168.1.0/24 as their internal network, but both networks need to be able to communicate to each other through the IPsec tunnel.

New virtual subnets of equal size must be configured and used for all communication between the two overlapping subnets. The devices on both local networks do not need to change their IP addresses. However, the devices and users must use the new subnet range of the remote network to communicate across the tunnel.



Configuring the HQ FortiGate

To configure IPsec VPN:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. Enter the name *VPN-to-Branch* and click *Next*.
3. For the *IP Address*, enter the Branch public IP address (*172.25.177.46*), and for *Interface*, select the HQ WAN interface (*wan1*).
4. For *Pre-shared Key*, enter a secure key. You will use the same key when configuring IPsec VPN on the Branch FortiGate.

5. In the *Phase 2 Selectors* section, enter the subnets for the *Local Address* (*10.1.1.0/24*) and *Remote Address* (*10.2.2.0/24*).
6. Optionally, expand *Advanced* and enable *Auto-negotiate*.
7. Click *OK*.

To configure the static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. In the *Destination* field, enter the remote address subnet (*10.2.2.0/24*).
3. For *Interface*, select the VPN tunnel you just created, *VPN-to-Branch*.
4. Click *OK*.
5. Create another route with the same *Destination*, but change the *Administrative Distance* to *200* and for *Interface*, select *Blackhole*. This is a best practice for route-based IPsec VPN tunnels because it ensures traffic for the remote FortiGate's subnet is not sent using the default route in the event that the IPsec tunnel goes down.

To configure the address objects:

1. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
2. For *Name*, enter *HQ-original*.
3. For *IP/Netmask*, enter the original LAN subnet of HQ (*192.168.1.0/24*).
4. For *Interface*, select the LAN-side interface (*internal*).
5. Click *OK*
6. Create another address object named *Branch-new*, but for *IP/Netmask*, enter the new LAN subnet of Branch (*10.2.2.0/24*), and select the VPN interface (*VPN-to-Branch*).

To configure the IP pool:

1. Go to *Policy & Objects* > *IP Pools* and click *Create New*.
2. For *Name*, enter *HQ-new*.
3. For *Type*, select *Fixed Port Range*.
4. Enter the *External IP address/range* (*10.1.1.1 – 10.1.1.254*, the new HQ subnet) and *Internal IP Range* (*192.168.1.1 – 192.168.1.254*, the original HQ subnet).
5. Click *OK*.

To configure the VIP:

1. Go to *Policy & Objects* > *Virtual IPs* and click *Create New* > *Virtual IP*.
2. For *Name*, enter *HQ-new-to-original*.
3. For *Interface*, select the VPN interface (*VPN-to-Branch*).
4. Enter the *External IP address/range* (*10.1.1.1 – 10.1.1.254*, the new HQ subnet) and *Mapped IP address/range* (*192.168.1.1 – 192.168.1.254*, the original HQ subnet).
5. Click *OK*.

To configure the firewall policy for traffic from HQ to Branch:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. For *Name*, enter *From-HQ-to-Branch*.
3. For *Incoming Interface*, select the LAN-side interface (*internal*).
4. For *Outgoing Interface*, select the VPN tunnel interface (*VPN-to-Branch*).

5. For *Source*, select *HQ-original*.
6. For *Destination*, select *Branch-new*.
7. For *Service*, select *ALL*.
8. Enable *NAT*.
9. Select *Use Dynamic IP Pool* and select the *HQ-new* IP pool.
10. Click *OK*.

To configure the firewall policy for traffic from Branch to HQ:

1. Click *Create New* and for *Name*, enter *From-Branch-to HQ*.
2. For *Incoming Interface*, select the VPN tunnel interface (*VPN-to-Branch*).
3. For *Outgoing Interface*, select the LAN-side interface (*internal*).
4. For *Source*, select *Branch-new*.
5. For *Destination*, select the *HQ-new-to-original* VIP.
6. For *Service*, select *ALL*.
7. Disable *NAT*.
8. Click *OK*.

Configuring the Branch FortiGate

To configure IPsec VPN:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. Enter the name *VPN-to-HQ* and click *Next*.
3. For the *IP Address*, enter the HQ public IP address (*172.25.176.142*), and for *Interface*, select the Branch WAN interface (*wan1*).
4. For *Pre-shared Key*, enter the matching secure key used in the *VPN-to-Branch* tunnel.
5. In the *Phase 2 Selectors* section, enter the subnets for the *Local Address* (*10.2.2.0/24*) and *Remote Address* (*10.1.1.0/24*).
6. Optionally, expand *Advanced* and enable *Auto-negotiate*.
7. Click *OK*.

To configure the static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. In the *Destination* field, enter the remote address subnet (*10.1.1.0/24*).
3. For *Interface*, select the VPN tunnel you just created, *VPN-to-HQ*.
4. Click *OK*.
5. Create another route with the same *Destination*, but change the *Administrative Distance* to *200* and for *Interface*, select *Blackhole*.

To configure the address objects:

1. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
2. For *Name*, enter *Branch-original*.
3. For *IP/Netmask*, enter the original LAN subnet of Branch (*192.168.1.0/24*).
4. For *Interface*, select the LAN-side interface (*lan*).
5. Click *OK*

6. Create another address object named *HQ-new*, but for *IP/Netmask*, enter the new LAN subnet of HQ (*10.1.1.0/24*), and select the VPN interface (*VPN-to-HQ*).

To configure the IP pool:

1. Go to *Policy & Objects* > *IP Pools* and click *Create New*.
2. For *Name*, enter *Branch-new*.
3. For *Type*, select *Fixed Port Range*.
4. Enter the *External IP address/range* (*10.2.2.1 – 10.2.2.254*, the new Branch subnet) and *Internal IP Range* (*192.168.1.1 – 192.168.1.254*, the original Branch subnet).
5. Click *OK*.

To configure the VIP:

1. Go to *Policy & Objects* > *Virtual IPs* and click *Create New* > *Virtual IP*.
2. For *Name*, enter *Branch-new-to-original*.
3. For *Interface*, select the VPN interface (*VPN-to-HQ*).
4. Enter the *External IP address/range* (*10.2.2.1 – 10.2.2.254*, the new Branch subnet) and *Mapped IP address/range* (*192.168.1.1 – 192.168.1.254*, the original Branch subnet).
5. Click *OK*.

To configure the firewall policy for traffic from Branch to HQ:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. For *Name*, enter *From-Branch-to-HQ*.
3. For *Incoming Interface*, select the LAN-side interface (*lan*).
4. For *Outgoing Interface*, select the VPN tunnel interface (*VPN-to-HQ*).
5. For *Source*, select *Branch-original*.
6. For *Destination*, select *HQ-new*.
7. For *Service*, select *ALL*.
8. Enable *NAT*.
9. Select *Use Dynamic IP Pool* and select the *Branch-new* IP pool.
10. Click *OK*.

To configure the firewall policy for traffic from HQ to Branch:

1. Click *Create New* and for *Name*, enter *From-HQ-to-Branch*.
2. For *Incoming Interface*, select the VPN tunnel interface (*VPN-to-HQ*).
3. For *Outgoing Interface*, select the LAN-side interface (*lan*).
4. For *Source*, select *HQ-new*.
5. For *Destination*, select the *Branch-new-to-original* VIP.
6. For *Service*, select *ALL*.
7. Disable *NAT*.
8. Click *OK*.

To verify the communication across the tunnel:

1. Go to *Dashboard* > *Network* and click the *IPsec* widget to expand to full screen view. The tunnels should be up on both FortiGates. If you did not enable *Auto-negotiate* in the IPsec VPN settings, you may have to select the tunnel and click *Bring Up*.
2. From a PC on the HQ network, ping a PC on the Branch network using the new IP for the Branch PC. The ping should be successful.

```
C:\Users\jheadley>ping 10.2.2.98

Pinging 10.2.2.98 with 32 bytes of data:
Reply from 10.2.2.98: bytes=32 time=7ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62
Reply from 10.2.2.98: bytes=32 time=1ms TTL=62

Ping statistics for 10.2.2.98:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 1ms, Maximum = 7ms, Average = 2ms
```

3. From a PC on the Branch network, ping a PC on the HQ network using the new IP for the HQ PC. The ping should be successful.

```
Johns-MacBook-Air:~ John$ ping 10.1.1.12
PING 10.1.1.12 (10.1.1.12): 56 data bytes

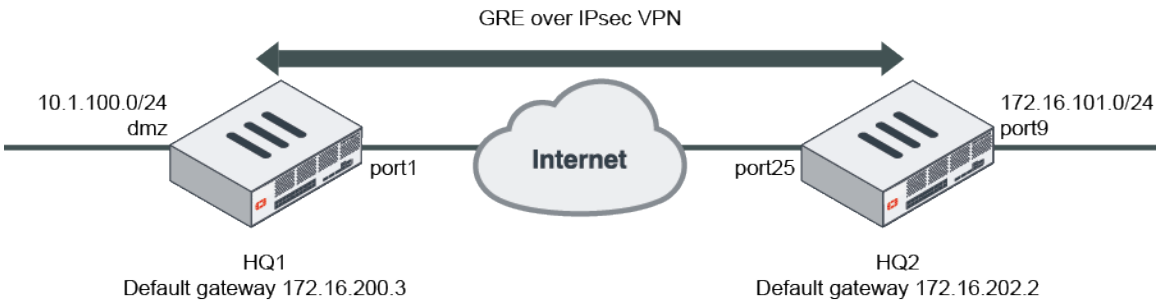
```

GRE over IPsec

This is an example of GRE over an IPsec tunnel using a static route over GRE tunnel and `tunnel-mode` in the `phase2-interface` settings.



To configure GRE over an IPsec tunnel:

1. Enable subnet overlapping at both HQ1 and HQ2.

```
config system settings
    set allow-subnet-overlap enable
end
```

2. Configure the WAN interface and static route.
   a. HQ1.

```
config system interface
    edit "port1"
        set ip 172.16.200.1 255.255.255.0
    next
    edit "dmz"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.200.3
        set device "port1"
    next
end
```

   b. HQ2.

```
config system interface
    edit "port25"
        set ip 172.16.202.1 255.255.255.0
    next
    edit "port9"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 172.16.202.2
        set device "port25"
    next
end
```

3. Configure IPsec phase1-interface and phase2-interface.
   a. HQ1.

```
config vpn ipsec phase1-interface
    edit "greipsec"
        set interface "port1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
        next
end
config vpn ipsec phase2-interface
    edit "greipsec"
        set phase1name "greipsec"
```

```
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set protocol 47
    next
end
```

b. HQ2.

```
config vpn ipsec phase1-interface
    edit "greipsec"
        set interface "port25"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample
        next
end
config vpn ipsec phase2-interface
    edit "greipsec"
        set phase1name "greipsec"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set protocol 47
    next
end
```

4. Configure IPsec tunnel interface IP address.

a. HQ1.

```
config system interface
    edit "greipsec"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
end
```

b. HQ2.

```
config system interface
    edit "greipsec"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
    next
end
```

5. Configure the GRE tunnel.

a. HQ1.

```
config system gre-tunnel
    edit "gre_to_HQ2"
        set interface "greipsec"
        set remote-gw 10.10.10.2
        set local-gw 10.10.10.1
    next
end
```

b. HQ2.

```
config system gre-tunnel
    edit "gre_to_HQ1"
        set interface "greipsec"
        set remote-gw 10.10.10.1
        set local-gw 10.10.10.2
    next
end
```

6. Configure the firewall policy.

a. HQ1.

```
config firewall policy
    edit 1
        set srcintf "dmz"
        set dstintf "gre_to_HQ2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "gre_to_HQ2"
        set dstintf "dmz"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set srcintf "greipsec"
        set dstintf "greipsec"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. HQ2.

```
config firewall policy
    edit 1
        set srcintf "port9"
        set dstintf "gre_to_HQ1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "gre_to_HQ1"
        set dstintf "port9"
```

```
            set srcaddr "all"
            set dstaddr "all"
            set action accept
            set schedule "always"
            set service "ALL"
        next
        edit 3
            set srcintf "greipsec"
            set dstintf "greipsec"
            set srcaddr "all"
            set dstaddr "all"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

7. Configure the static route.
   a. HQ1.

```
config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "gre_to_HQ2"
    next
end
```

   b. HQ2.

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "gre_to_HQ1"
    next
end
```

To view the VPN tunnel list on HQ1:

```
diagnose vpn tunnel list
list all ipsec tunnel in vd 0

  dec:pkts/bytes=347/37476, enc:pkts/bytes=347/58296
```

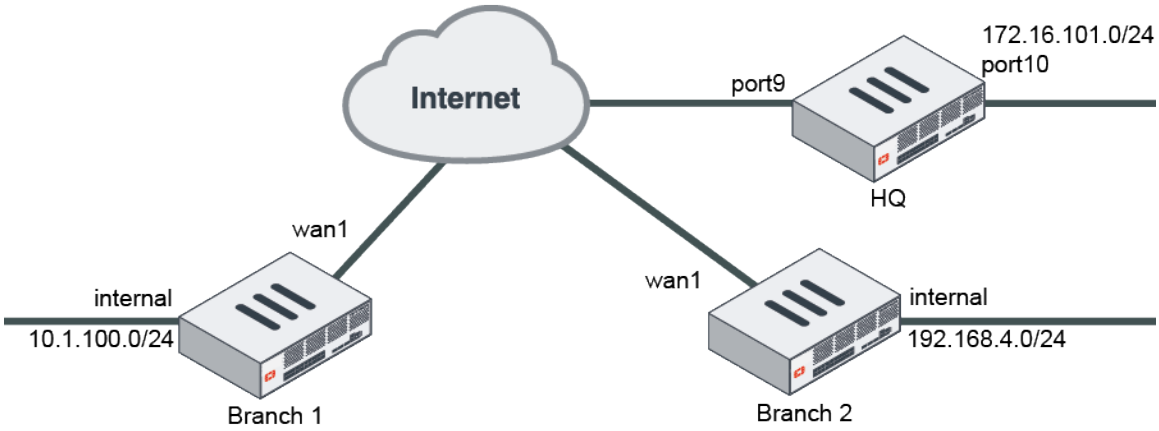
To view the static routing table on HQ1:

```
get router info routing-table static
Routing table for VRF=0
S*      0.0.0.0/0 [10/0] via 172.16.200.3, port1
S       172.16.101.0/24 [10/0] is directly connected, gre_to_HQ2
```

Policy-based IPsec tunnel

This is an example of policy-based IPsec tunnel using site-to-site VPN between branch and HQ. HQ is the IPsec concentrator.

Sample topology



Sample configuration

To configure a policy-based IPsec tunnel using the GUI:

- Configure the IPsec VPN at HQ.
- Configure the IPsec concentrator at HQ.
- Configure the firewall policy at HQ.
- Configure IPsec VPN at branch 1.
- Configure the firewall policy at branch 1.
- Configure IPsec VPN at branch 2.
- Configure the firewall policy at branch 2.

To configure the IPsec VPN at HQ:

1. Go to *VPN* > *IPsec Wizard* to set up branch 1.
   a. Enter a VPN *Name*. In this example, *to_branch1*.
   b. For *Template Type*, click *Custom*. Click *Next*.
   c. Uncheck *Enable IPsec Interface Mode*.
   d. For *Remote Gateway*, select *Static IP Address*.

e. Enter IP address, in this example, *15.1.1.2*.
f. For *Interface*, select *port9*.
g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
h. Click *OK*.

2. Go to *VPN* > *IPsec Wizard* to set up branch 2.
a. Enter a VPN *Name*. In this example, *to_branch2*.
b. For *Template Type*, click *Custom*. Click *Next*.
c. Uncheck *Enable IPsec Interface Mode*.
d. For *Remote Gateway*, select *Static IP Address*.
e. Enter IP address, in this example, *13.1.1.2*.
f. For *Interface*, select *port9*.
g. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
h. Click *OK*.

To configure the IPsec concentrator at HQ:

1. Go to *VPN* > *IPsec Concentrator* and click *Create New*.
2. Enter a name. In this example, *branch*.
3. Add the *Members to_branch1* and *to_branch2*.
4. Click *OK*.

To configure the firewall policy at HQ:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. For *Incoming Interface*, select *port10*.
4. For *Outgoing Interface*, select *port9*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure IPsec VPN at branch 1:

1. Go to *VPN* > *IPsec Wizard* to set up branch 1.
2. Enter a VPN name. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click *OK*.

To configure the firewall policy at branch 1:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *Branch1/Branch2*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure IPsec VPN at branch 2:

1. Go to *VPN* > *IPsec Wizard* to set up branch 1.
2. Enter a VPN name. In this example, *to_HQ*.
3. For *Template Type*, click *Custom*. Click *Next*.
4. Uncheck *Enable IPsec Interface Mode*.
5. For *Remote Gateway*, select *Static IP Address*.
6. Enter IP address, in this example, *22.1.1.1*.
7. For *Interface*, select *wan1*.
8. In the *Authentication* section, for *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
9. Click *OK*.

To configure the firewall policy at branch 2:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter a policy *Name*.
3. Choose the *Incoming Interface*, in this example, *internal*.
4. Choose the *Outgoing Interface*, in this example, *wan1*.
5. Select the *Source*, *Destination*, *Schedule*, *Service*, and set *Action* to *IPsec*.
6. Select the *VPN Tunnel*, in this example, *to_HQ*.
7. In this example, enable *Allow traffic to be initiated from the remote site*.
8. Click *OK*.

To configure a policy-based IPsec tunnel using the CLI:

1. Configure the HQ WAN interface and static route.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
```

```
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the HQ IPsec phase1 and phase2.

```
config vpn ipsec phase1
    edit "to_branch1"
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 15.1.1.2
        set psksecret sample
        next
    edit "to_branch2"
        set interface "port9"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 13.1.1.2
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_branch1"
        set phase1name "to_branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
    edit "to_branch2"
        set phase1name "to_branch2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
    edit 1
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "10.1.100.0"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_branch1"
    next
    edit 2
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "192.168.4.0"
        set action ipsec
```

```
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_branch2"
    next
end
```

4. Configure the IPsec concentrator at HQ.

```
config vpn ipsec concentrator
    edit "branch"
        set member "to_branch1" "to_branch2"
    next
end
```

5. Configure the branch WAN interface and static route.
   a. For branch 1.

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

   b. For branch 2.

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

6. Configure the branch IPsec phase1 and phase2.
   a. For branch 1.

```
config vpn ipsec phase1
    edit "to_HQ"
        set interface "wan1"
```

```
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 22.1.1.1
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_HQ"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

b. For branch 2.

```
config vpn ipsec phase1
    edit "to_HQ"
        set interface "wan1"
        set peertype any
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 22.1.1.1
        set psksecret sample
        next
end
config vpn ipsec phase2
    edit "to_HQ"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

7. Configure the branch firewall policy.

a. For branch 1.

```
config firewall policy
    edit 1
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.1.100.0"
        set dstaddr "all"
        set action ipsec
        set schedule "always"
        set service "ALL"
        set inbound enable
        set vpntunnel "to_HQ"
    next
end
```

b. For branch 2.

```
config firewall policy
    edit 1
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "192.168.4.0"
        set dstaddr "all"
```

```
            set action ipsec
            set schedule "always"
            set service "ALL"
            set inbound enable
            set vpntunnel "to_HQ"
        next
    end
```

To view the IPsec VPN tunnel list at HQ:

```
# diagnose vpn tunnel list

FortiGate-to-third-party

This section contains the following topics about FortiGate-to-third-party VPN configurations:

- IKEv2 IPsec site-to-site VPN to an AWS VPN gateway on page 983
- IPsec VPN to Azure with virtual network gateway on page 989
- IPsec VPN to an Azure with virtual WAN on page 998
- IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets on page 1002
- Cisco GRE-over-IPsec VPN on page 1002

IKEv2 IPsec site-to-site VPN to an AWS VPN gateway

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an AWS virtual private cloud (VPC).

AWS uses unique identifiers to manipulate a VPN connection's configuration. Each VPN connection is assigned an identifier and is associated with two other identifiers: the customer gateway ID for the FortiGate and virtual private gateway ID.

This example includes the following IDs:

- VPN connection ID: vpn-07e988ccc1d46f749
- Customer gateway ID: cgw-0440c1aebed2f418a
- Virtual private gateway ID

This example assumes that you have configured VPC-related settings in the AWS management portal as described in Create a Secure Connection using AWS VPC.

This example includes creating and configuring two tunnels. You must configure both tunnels on your FortiGate.

To configure IKEv2 IPsec site-to-site VPN to an AWS VPN gateway:

1. Configure the first VPN tunnel:
   a. Configure Internet Key Exchange (IKE).
   b. Configure IPsec.
   c. Configure the tunnel interface.
   d. Configure border gateway protocol (BGP).
   e. Configure firewall policies.
2. Configure the second VPN tunnel:
   a. Configure Internet Key Exchange (IKE).
   b. Configure IPsec.
   c. Configure the tunnel interface.
   d. Configure BGP.
   e. Configure firewall policies.

To configure IKE for the first VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, Diffie-Hellman (DH), lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec dead peer detection (DPD) causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
   edit vpn-07e988ccc1d46f749-0
      set interface "wan1"
      set dpd enable
      set local-gw 35.170.66.108
      set dhgrp 2
      set proposal aes128-sha1
      set keylife 28800
      set remote-gw 3.214.239.164
      set psksecret iCelks0UOob8z4SYMRM6zlx.rU2C3jth
      set dpd-retryinterval 10
   next
end
```

To configure IPsec for the first VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
   edit "vpn-07e988ccc1d46f749-0"
      set phase1name "vpn-07e988ccc1d46f749-0"
      set proposal aes128-sha1
      set dhgrp 2
      set pfs enable
      set keylifeseconds 3600
   next
end
```

To configure the tunnel interface for the first VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
   edit "vpn-07e988ccc1d46f749-0"
      set vdom "root"
      set ip 169.254.45.90 255.255.255.255
      set allowaccess ping
      set type tunnel
      set tcp-mss 1379
      set remote-ip 169.254.45.89
      set mtu 1427
      set interface "wan1"
   next
end
```

To configure BGP for the first VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP autonomous system number (ASN) (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
   set as 65000
   config neighbor
      edit 169.254.45.89
         set remote-as 64512
      end
   end
end
config router bgp
   config neighbor
      edit 169.254.45.89
         set capability-default-originate enable
      end
   end
end
config router prefix-list
   edit "default_route"
      config rule
         edit 1
            set prefix 0.0.0.0 0.0.0.0
         next
      end
   end
end
config router route-map
   edit "routemap1"
      config rule
         edit 1
            set match-ip-address "default_route"
         next
      end
   next
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
config network
   edit 1
      set prefix 192.168.0.0 255.255.0.0
   next
end
```

To configure firewall policies for the first VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, and 4, so you would proceed to create policy 5.

```
config firewall policy
   edit 5
      set srcintf "vpn-07e988ccc1d46f749-0"
      set dstintf internal
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
   next
end
config firewall policy
   edit 5
      set srcintf internal
      set dstintf "vpn-07e988ccc1d46f749-0"
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
   next
end
```

To configure IKE for the second VPN tunnel:

A policy is established for the supported ISAKMP encryption, authentication, DH, lifetime, and key parameters. These sample configurations fulfill the minimum requirements for AES128, SHA1, and DH Group 2. Category VPN connections in the GovCloud AWS region have a minimum requirement of AES128, SHA2, and DH Group 14. To take advantage of AES256, SHA256, or other DH groups such as 14-18, 22, 23, and 24, you must modify these sample configuration files. Higher parameters are only available for VPNs of category "VPN", not for "VPN-Classic".

Your FortiGate's external interface's address must be static. Your FortiGate may reside behind a device performing NAT. To ensure NAT traversal can function, you must adjust your firewall rules to unblock UDP port 4500. If not behind NAT, it is recommended to disable NAT traversal.

Begin configuration in the root VDOM. The interface name must be shorter than 15 characters. It is best if the name is shorter than 12 characters. IPsec DPD causes periodic messages to be sent to ensure a security association remains operational.

```
config vpn ipsec phase1-interface
   edit vpn-07e988ccc1d46f749-1
      set interface "wan1"
      set dpd enable
      set local-gw 35.170.66.108
      set dhgrp 2
      set proposal aes128-sha1
      set keylife 28800
      set remote-gw 100.25.187.58
      set psksecret IjFzyDneUtDdAT4RNmQ85apUG3y4Akre
      set dpd-retryinterval 10
   next
end
```

To configure IPsec for the second VPN tunnel:

The IPsec transform set defines the encryption, authentication, and IPsec mode parameters.

```
config vpn ipsec phase2-interface
   edit "vpn-07e988ccc1d46f749-1"
      set phase1name "vpn-07e988ccc1d46f749-1"
      set proposal aes128-sha1
      set dhgrp 2
      set pfs enable
      set keylifeseconds 3600
   next
end
```

To configure the tunnel interface for the second VPN tunnel:

You must configure a tunnel interface as the logical interface associated with the tunnel. All traffic routed to the tunnel interface must be encrypted and transmitted to the VPC. Similarly, traffic from the VPC will be logically received on this interface.

You must configure the interface's address with your FortiGate's address. If the address changes, you must recreate the FortiGate and VPN connection with Amazon VPC.

The `tcp-mss` option causes the router to reduce the TCP packets' maximum segment size to prevent packet fragmentation.

```
config system interface
   edit "vpn-07e988ccc1d46f749-1"
      set vdom "root"
      set ip 169.254.44.162 255.255.255.255
      set allowaccess ping
      set type tunnel
      set tcp-mss 1379
      set remote-ip 169.254.44.161
      set mtu 1427
      set interface "wan1"
   next
end
```

To configure BGP for the second VPN tunnel:

BGP is used within the tunnel to exchange prefixes between the virtual private gateway and your FortiGate. The virtual private gateway announces the prefix according to your VPC.

The local BGP ASN (65000) is configured as part of your FortiGate. If you must change the ASN, you must recreate the FortiGate and VPN connection with AWS.

Your FortiGate may announce a default route (0.0.0.0/0) to AWS. This is done using a prefix list and route map in FortiOS.

```
config router bgp
   set as 65000
   config neighbor
      edit 169.254.44.161
         set remote-as 64512
      end
config router bgp
   config neighbor
      edit 169.254.44.161
         set capability-default-originate enable
      end
   end
config router prefix-list
   edit "default_route"
      config rule
         edit 1
            set prefix 0.0.0.0 0.0.0.0
         next
      end
   end
end
config router route-map
   edit "routemap1"
      config rule
         edit 1
            set match-ip-address "default_route"
         next
      end
   next
end
```

To advertise additional prefixes to the Amazon VPC, add these prefixes to the network statement and identify the prefix you want to advertise. Ensure that the prefix is present in the routing table of the device with a valid next-hop. If you want to advertise 192.168.0.0/16 to Amazon, you would do the following:

```
config router bgp
config network
   edit 1
      set prefix 192.168.0.0 255.255.0.0
   next
end
```

To configure firewall policies for the second VPN tunnel:

Create a firewall policy permitting traffic from your local subnet to the VPC subnet, and vice-versa.

This example policy permits all traffic from the local subnet to the VPC. First, view all existing policies using the `show firewall policy` command. Then, create a new firewall policy starting with the next available policy ID. In this example, running `show firewall policy` displayed policies 1, 2, 3, 4, and 5, so you would proceed to create policy 6.

```
config firewall policy
   edit 6
      set srcintf "vpn-07e988ccc1d46f749-1"
      set dstintf internal
      set srcaddr all
      set dstaddr all
      set action accept
      set schedule always
      set service ANY
   next
end
config firewall policy
   edit 6
         set srcintf internal
         set dstintf "vpn-07e988ccc1d46f749-1"
         set srcaddr all
         set dstaddr all
         set action accept
         set schedule always
         set service ANY
   next
end
```

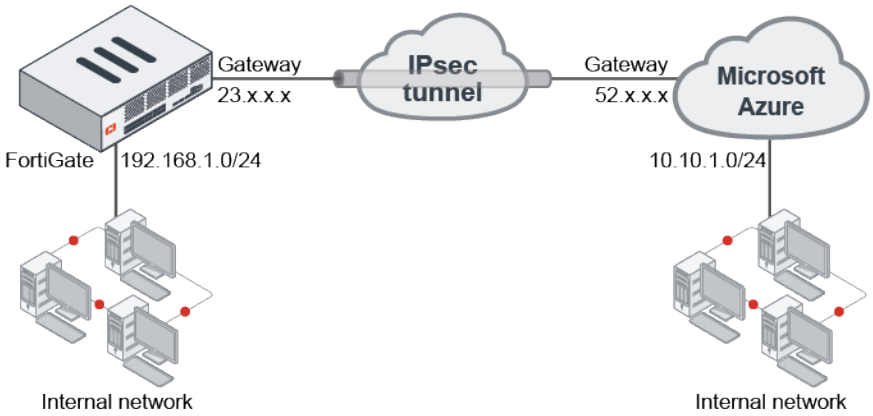
IPsec VPN to Azure with virtual network gateway

This example shows how to configure a site-to-site IPsec VPN tunnel to Microsoft Azure. It shows how to configure a tunnel between each site, avoiding overlapping subnets, so that a secure tunnel can be established.

Prerequisites

- A FortiGate with an Internet-facing IP address
- A valid Microsoft Azure account

Sample topology



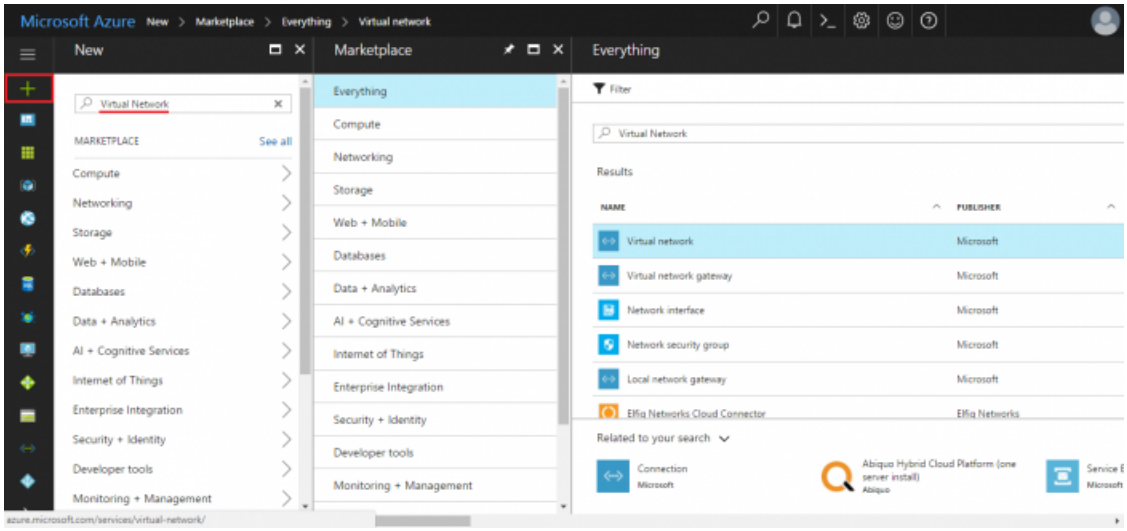
Sample configuration

This sample configuration shows how to:

1. Configure an Azure virtual network
2. Specify the Azure DNS server
3. Configure the Azure virtual network gateway
4. Configure the Azure local network gateway
5. Configure the FortiGate tunnel
6. Create the Azure firewall object
7. Create the FortiGate firewall policies
8. Create the FortiGate static route
9. Create the Azure site-to-site VPN connection
10. Check the results

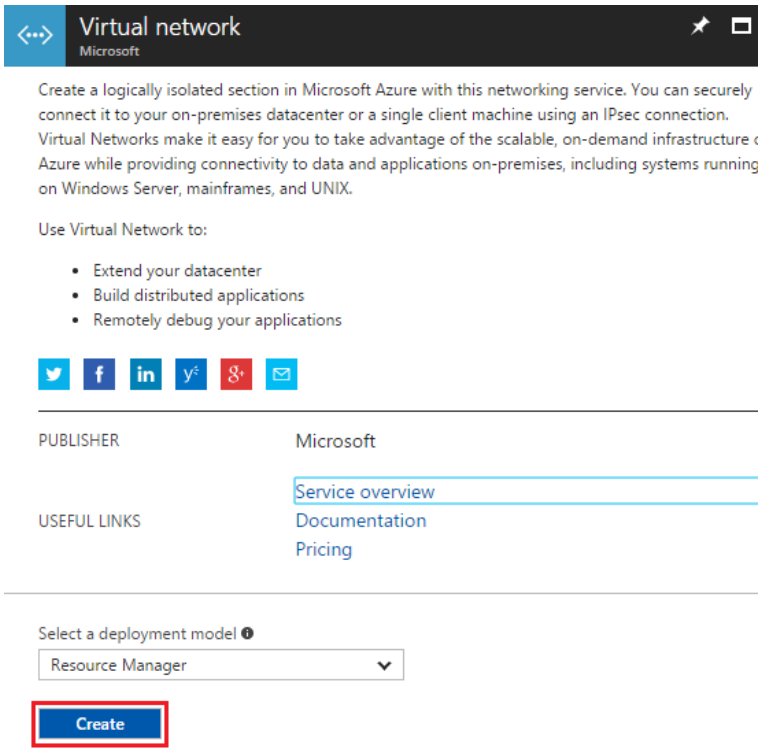
To configure an Azure virtual network:

1. Log in to Azure and click *New*.
2. In *Search the Marketplace*, type *Virtual network*.
3. Click *Virtual network* to open the *Virtual network* pane.

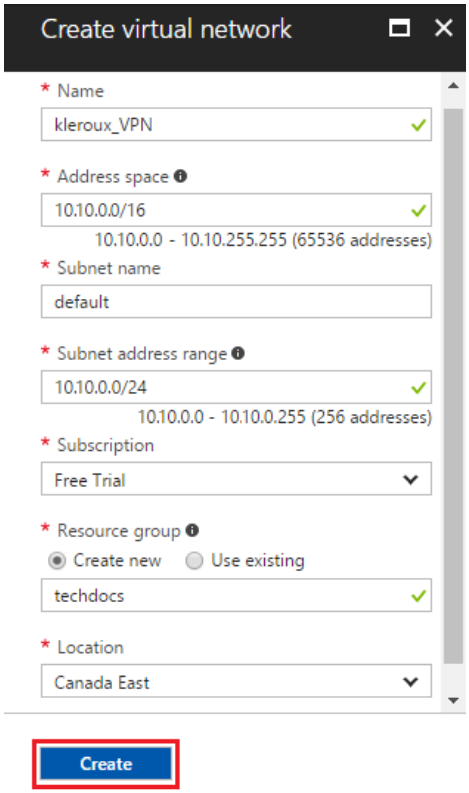


4. At the bottom of the *Virtual network* pane, click the *Select a deployment model* dropdown list and select *Resource Manager*.

5. Click *Create*.

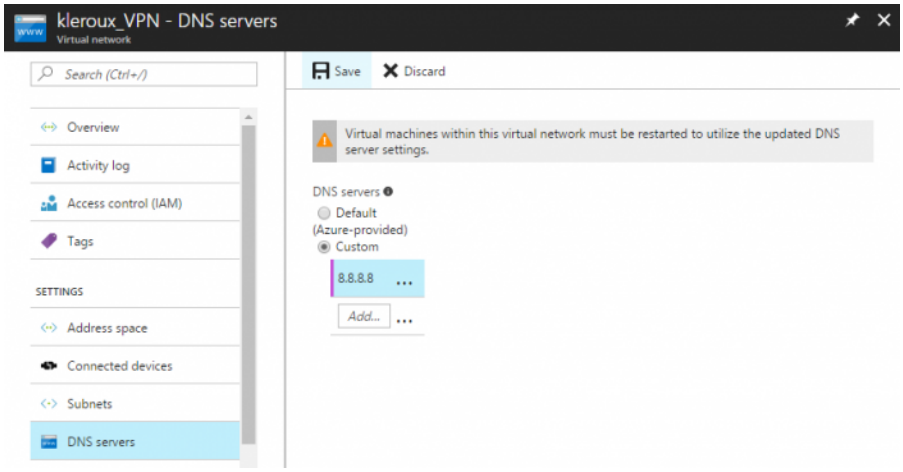


6. On the *Create virtual network* pane, enter you virtual network settings, and click *Create*.



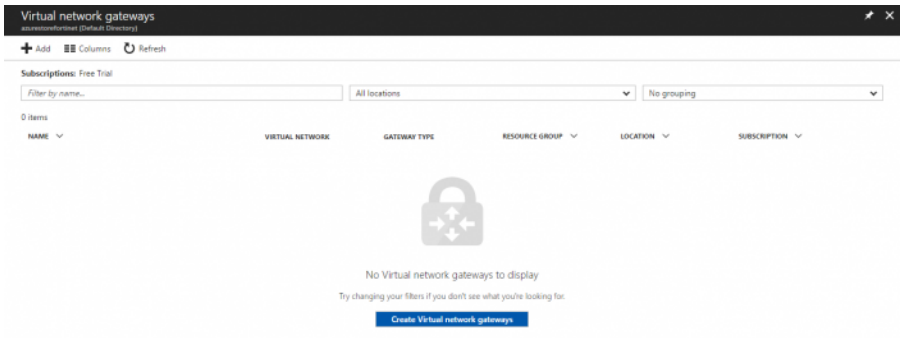
To specify the Azure DNS server:

1. Open the virtual network you just created.
2. Click *DNS servers* to open the *DNS servers* pane.
3. Enter the IP address of the DNS server and click *Save*.

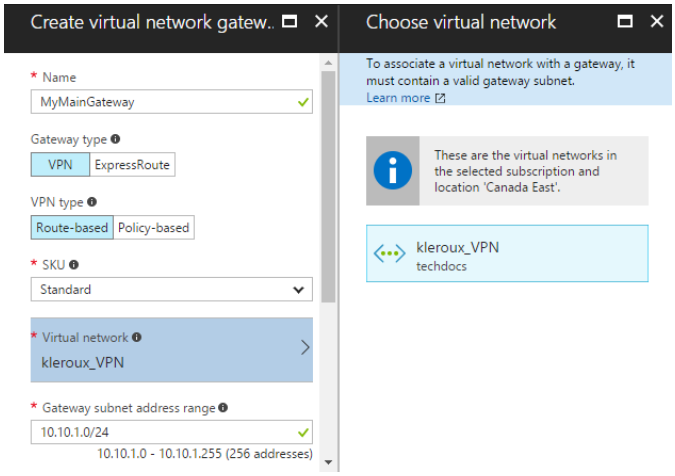


To configure the Azure virtual network gateway:

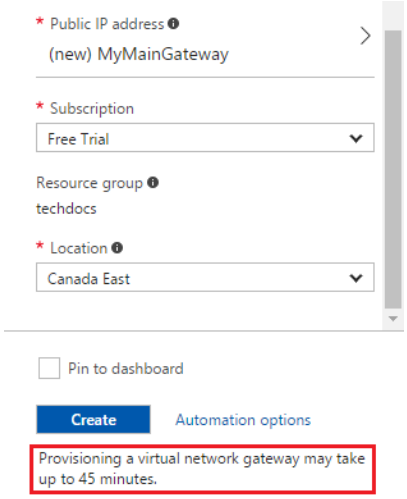
1. In the portal dashboard, go to *New*.
2. Search for *Virtual Network Gateway* and click it to open the *Virtual network gateway* pane.



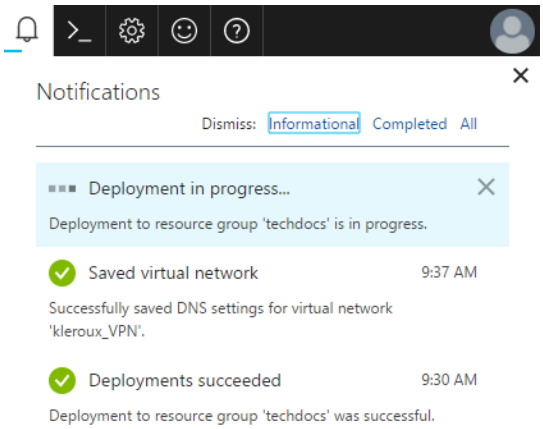
3. Click *Create Virtual network gateways* and enter the settings for your virtual network gateway.



4. If needed, create a Public IP address.

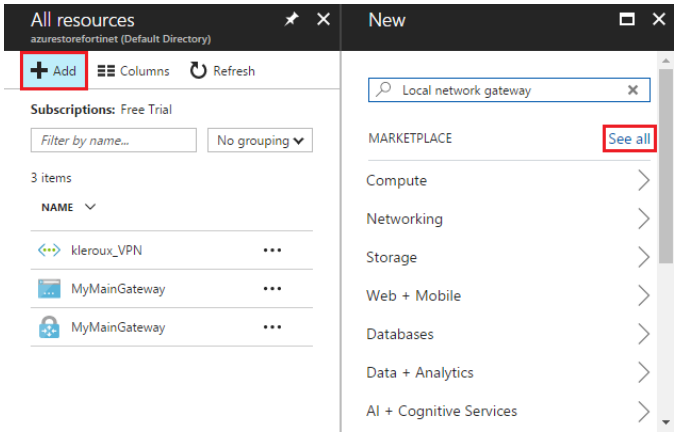


5. Click *Create*.
Creating the virtual network gateway might take some time. When the provisioning is done, you'll receive a notification.

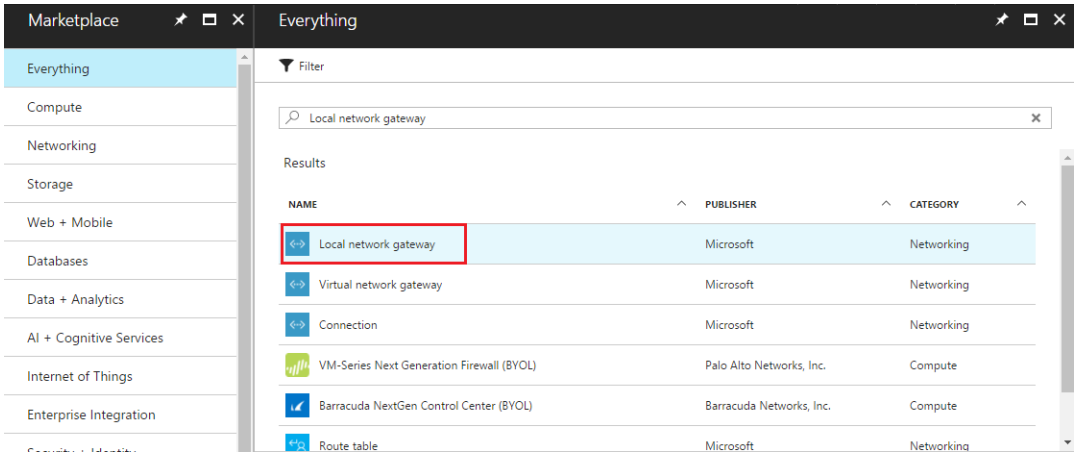


To configure the Azure local network gateway:

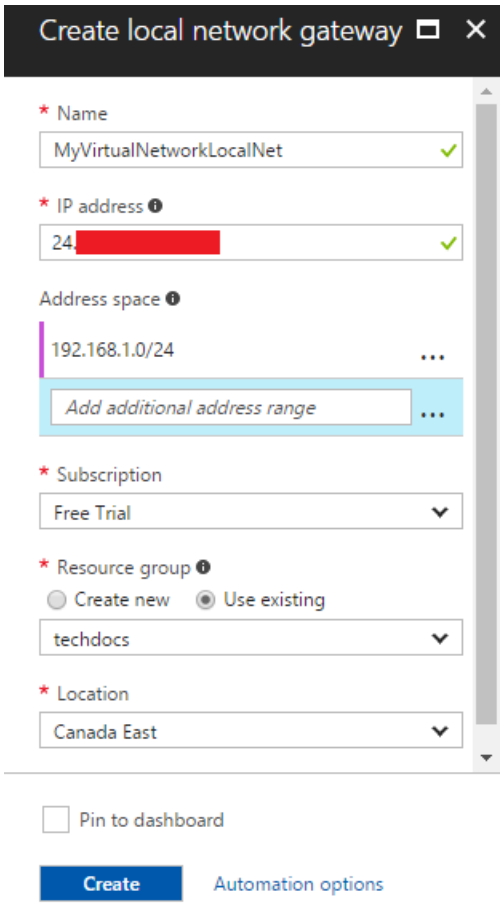
1. In the portal dashboard, click *All resources*.
2. Click *Add* and then click *See all*.



3. In the *Everything* pane, search for *Local network gateway* and then click *Create local network gateway*.



4. For the *IP address*, enter the local network gateway IP address, that is, the FortiGate's external IP address.



5. Set the remaining values for your local network gateway and click *Create*.

To configure the FortiGate tunnel:

1. In the FortiGate, go to *VPN* > *IP Wizard*.
2. Enter a *Name* for the tunnel, click *Custom*, and then click *Next*.
3. Configure the *Network* settings.
   a. For *Remote Gateway*, select *Static IP Address* and enter the IP address provided by Azure.
   b. For *Interface*, select *wan1*.
   c. For *NAT Traversal*, select *Disable*,
   d. For *Dead Peer Detection*, select *On Idle*.
   e. In the Authentication section, select
4. Configure the *Authentication* settings.
   a. For *Method*, select *Pre-shared Key* and enter the *Pre-shared Key*.
   b. For *IKE*, select *2*.
5. Configure the *Phase 1 Proposal* settings.
   a. Set the Encryption and Authentication combination to the three supported encryption algorithm combinations accepted by Azure.
      - AES256 and SHA1
      - 3DES and SHA1

- AES256 and SHA256

b. For *Diffie-Hellman Groups*, select *2*.

c. Set *Key Lifetime (seconds)* to *28800*.

6. In *Phase 2 Selectors*, expand the *Advanced* section to configure the *Phase 2 Proposal* settings.
   a. Set the Encryption and Authentication combinations:
   - AES256 and SHA1
   - 3DES and SHA1
   - AES256 and SHA256

   b. Uncheck *Enable Perfect Forward Secrecy (PFS)*.
   c. Set *Key Lifetime (seconds)* to *27000*.
7. Click *OK*.

To create the Azure firewall object:

1. In the FortiGate, go to *Policy & Objects* > *Addresses*.
2. Create a firewall object for the Azure VPN tunnel.

To create the FortiGate firewall policies:

1. In the FortiGate, go to *Policy & Objects* > *Firewall Policy*.
2. Create a policy for the site-to-site connection that allows outgoing traffic.
   a. Set the *Source* address and *Destination* address using the firewall objects you just created.
   b. Disable *NAT*.
3. Create another policy that allows incoming traffic.
   a. For this policy, reverse the *Source* address and *Destination* address.
4. We recommend limiting the TCP maximum segment size (MSS) being sent and received so as to avoid packet drops and fragmentation.
   To do this, use the following CLI commands on both policies.

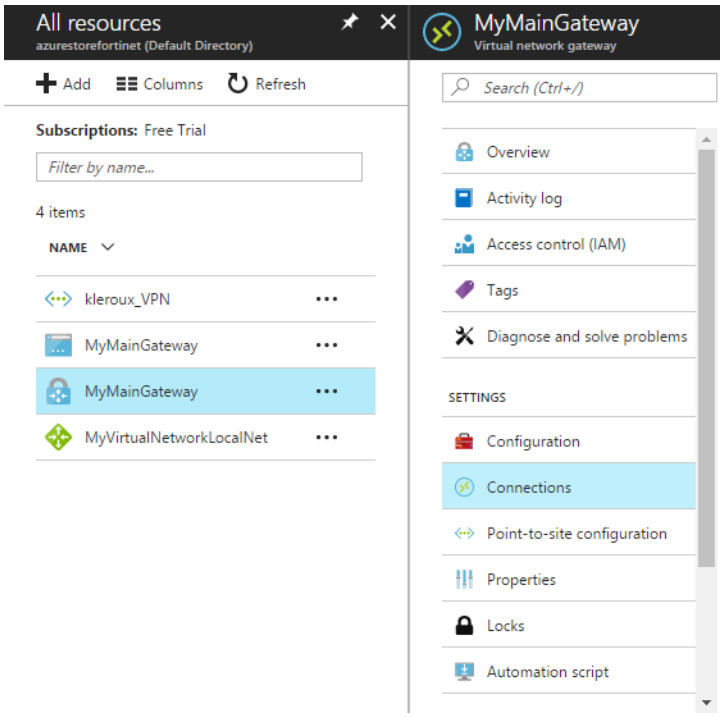
```
config firewall policy
   edit <policy-id>
      set tcp-mss-sender 1350
      set tcp-mss-receiver 1350
   next
end
```

To create the FortiGate static route:

1. In the FortiGate, go to *Network* > *Static Routes*.
2. Create an IPv4 Static Route that forces outgoing traffic going to Azure to go through the route-based tunnel.
3. Set the *Administrative Distance* to a value lower than the existing default route value.

To create the Azure site-to-site VPN connection:

1. In the Azure portal, locate and select your virtual network gateway.
2. In the *Settings* pane, click *Connections* and then click *Add*.



3. Enter the settings for your connection. Ensure the *Shared Key (PSK)* matches the *Pre-shared Key* for the FortiGate tunnel.

To check the results:

1. In the FortiGate, go to *Monitor* > *IPsec Monitor* and check that the tunnel is up. If the tunnel is down, right-click the tunnel and select *Bring Up*.
2. In the FortiGate, go to *Log & Report* > *Events*.
   a. Select an event to view more information and verify the connection.

3. In the Azure portal dashboard, click *All resources* and locate your virtual network gateway.
   a. In your virtual network gateway pane, click *Connections* to see the status of each connection.

   b. Click a connection to open the *Essentials* pane to view more information about that connection.
      - If the connection is successful, the *Status* shows *Connected*.
      - See the *ingress* and *egress* bytes to confirm traffic flowing through the tunnel.

IPsec VPN to an Azure with virtual WAN

This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an Azure virtual network (VNet). This example uses Azure virtual WAN (vWAN) to establish the VPN connection.

- Azure must use IPsec v2 for this configuration.
- Azure uses overlapped subnet IP addresses for the IPsec interfaces.

To configure IKEv2 IPsec site-to-site VPN to an Azure VPN gateway:

1. In the Azure management portal, configure vWAN-related settings as described in Tutorial: Create a Site-to-Site connection using Azure Virtual WAN.
   If a custom BGP IP address is configured on Azure's vWAN, such as 169.254.21.6 and 169.254.21.7, you must configure the FortiGate `remote-IP` to the corresponding *Custom BGP IP Address* value. If a custom BGP IP address is not configured, FortiGate `remote-IPs` should point to the *Default BGP IP Address* value.
2. Download the VPN configuration. The following shows an example VPN configuration:

```
[ {"configurationVersion":{"LastUpdatedTime":"2019-07-
    16T22:16:28.0409002Z","Version":"be5c5787-b903-43b1-a237-
    49eae1b373e4"},"vpnSiteConfiguration":
    {"Name":"toaws","IPAddress":"3.220.252.93","BgpSetting":
```

{"Asn":7225,"BgpPeeringAddress":"169.254.24.25","PeerWeight":32768},"LinkName":"toa
ws"},"vpnSiteConnections":[{"hubConfiguration":
{"AddressSpace":"10.1.0.0/16","Region":"West US","ConnectedSubnets":
["10.2.0.0/16"]},"gatewayConfiguration":{"IpAddresses":
{"Instance0":"52.180.90.47","Instance1":"52.180.89.94"},"BgpSetting":
{"Asn":65515,"BgpPeeringAddresses":
{"Instance0":"10.1.0.7","Instance1":"10.1.0.6"},"PeerWeight":0}},"connectionConfigu
ration":{"IsBgpEnabled":true,"PSK":"Fortinet123#","IPsecParameters":
{"SADataSizeInKilobytes":102400000,"SALifeTimeInSeconds":3600}}}]}]

3. Configure the following on the FortiGate. Note for `set proposal`, you can select from several proposals.

```
config vpn ipsec phase1-interface
   edit "toazure1"
      set interface "port1"
      set ike-version 2
      set keylife 28800
      set peertype any
      set proposal aes256-sha1
      set dhgrp 2
      set remote-gw 52.180.90.47
      set psksecret **********
   next
   edit "toazure2"
      set interface "port1"
      set ike-version 2
      set keylife 28800
      set peertype any
      set proposal aes256-sha1
      set dhgrp 2
      set remote-gw 52.180.89.94
      set psksecret **********
   next
end
config vpn ipsec phase2-interface
   edit "toazure1"
      set phase1name "toazure1"
      set proposal aes256-sha1
      set dhgrp 2
      set keylifeseconds 3600
   next
   edit "toazure2"
      set phase1name "toazure2"
      set proposal aes256-sha1
      set dhgrp 2
      set keylifeseconds 3600
   next
end
config system settings
   set allow-subnet-overlap enable
end
config system interface
   edit "toazure1"
      set vdom "root"
      set ip 169.254.24.25 255.255.255.255
      set type tunnel
      set remote-ip 10.1.0.7 255.255.255.255
      set snmp-index 4
      set interface "port1"
```

```
    next
    edit "toazure2"
      set vdom "root"
      set ip 169.254.24.25 255.255.255.255
      set type tunnel
      set remote-ip 10.1.0.6 255.255.255.255
      set snmp-index 5
      set interface "port1"
    next
  end
  config router bgp
    set as 7225
    set router-id 169.254.24.25
    config neighbor
      edit "10.1.0.7"
        set remote-as 65515
      next
      edit "10.1.0.6"
        set remote-as 65515
      next
    end
    config network
      edit 1
        set prefix 172.30.101.0 255.255.255.0
      next
    end
    config redistribute "connected"
      set status enable
    end
    config redistribute "rip"
    end
    config redistribute "ospf"
    end
    config redistribute "static"
    end
    config redistribute "isis"
    end
    config redistribute6 "connected"
    end
    config redistribute6 "rip"
    end
    config redistribute6 "ospf"
    end
    config redistribute6 "static"
    end
    config redistribute6 "isis"
    end
  end
```

4. Run `diagnose vpn tunnel list`. If the configuration was successful, the output should resemble the following:

```
name=toazure1 ver=2 serial=3 172.30.1.83:4500->52.180.90.47:4500

```

IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets

When a Cisco ASA unit has multiple subnets configured, multiple phase 2 tunnels must be created on the FortiGate to allocate to each subnet (rather than having multiple subnets on one phase 2 tunnel).

The FortiGate uses the same SPI value to bring up the phase 2 negotiation for all of the subnets, while the Cisco ASA expects different SPI values for each of its configured subnets. Using multiple phase 2 tunnels on the FortiGate creates different SPI values for each subnet.

To configure multiple phase 2 interfaces in route-based mode:

```
config vpn ipsec phase2-interface
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

To configure multiple phase 2 interfaces in policy-based mode:

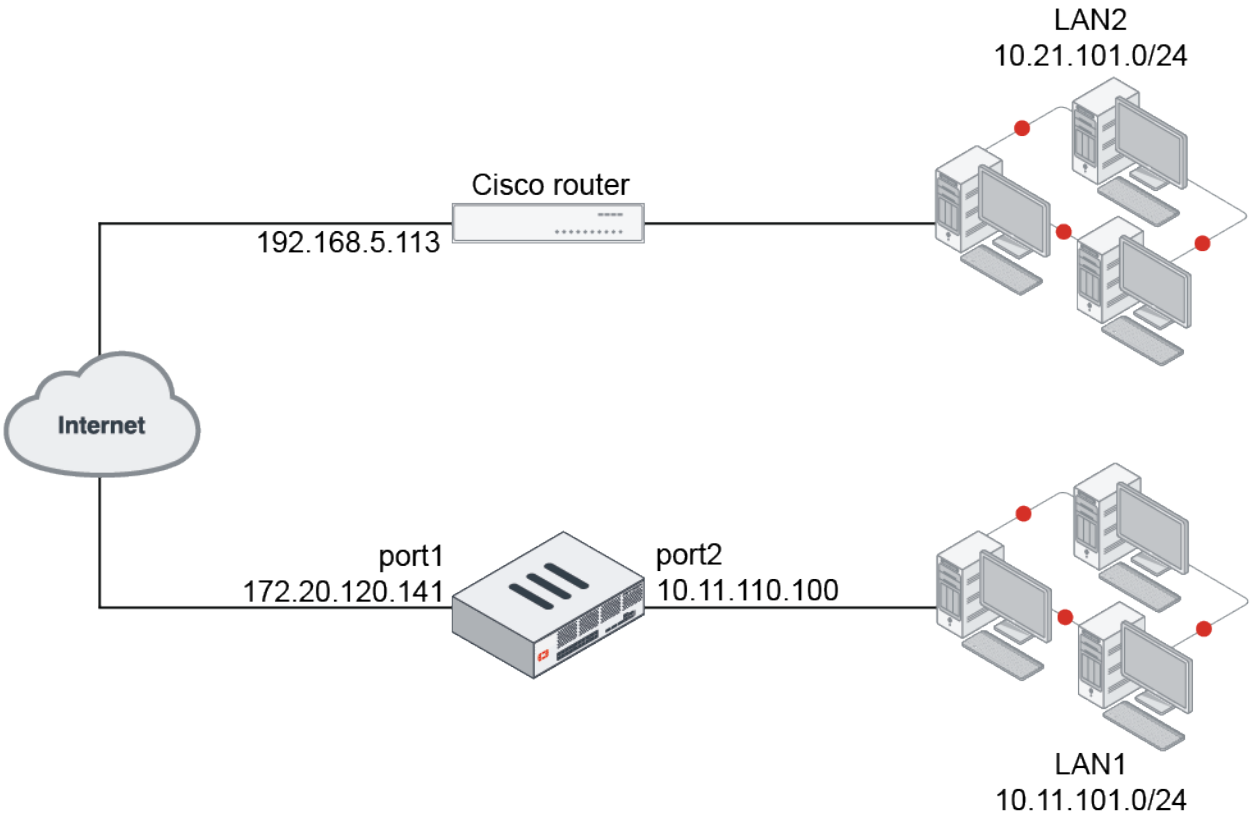
```
config vpn ipsec phase2
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

Cisco GRE-over-IPsec VPN

This is a sample configuration of a FortiGate VPN that is compatible with Cisco-style VPNs that use GRE in an IPsec tunnel. Cisco products with VPN support often use the GRE protocol tunnel over IPsec encryption. Cisco VPNs can use either transport mode or tunnel mode IPsec.

Topology

In this example, LAN1 users are provided with access to LAN2.



Configuring the FortiGate

There are five steps to configure GRE-over-IPsec with a FortiGate and Cisco router:

1. Enable overlapping subnets.
2. Configure a route-based IPsec VPN on the external interface.
3. Configure a GRE tunnel on the virtual IPsec interface.
4. Configure security policies.
5. Configure the static route.

Enabling overlapping subnets

Overlapping subnets are required because the IPsec and GRE tunnels will use the same addresses. By default, each FortiGate network interface must be on a separate network. This configuration assigns an IPsec tunnel endpoint and the external interface to the same network.

To enable overlapping subnets:

```
config system settings
    set allow-subnet-overlap enable
    next
end
```

Configuring a route-based IPsec VPN

A route-based VPN that use encryption and authentication algorithms compatible with the Cisco router is required. Pre-shared key authentication is used in this configuration.

To configure route-based IPsec in the GUI:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name (*tocisco*) and click *Next*.
3. Enter the following:

Remote Gateway	Static IP Address
IP Address	Cisco router public interface (192.168.5.113)
Interface	FortiGate public interface (172.20.120.141)
Authentication Method	Pre-shared Key
Pre-shared Key	Entry must match the pre-shared key on the Cisco router
Mode	Main (ID Protection)
Phase 1 Proposal	3DES-SHA1, AES128-SHA1 (at least one proposal must match the settings on the Cisco router)
Local Address	GRE local tunnel endpoint IP address (172.20.120.141)
Remote Address	GRE remote tunnel endpoint IP address (192.168.5.113)
Phase 2 Proposal	3DES-MD5 (at least one proposal must match the settings on the Cisco router)
Local Port	0
Remote Port	0
Protocol	47

4. Click *OK*.
5. If the Cisco router is configured to use transport mode IPsec, configure transport mode on the FortiGate:

```
config vpn phase2-interface
    edit tocisco_p2
        set encapsulation transport-mode
    next
end
```

To configure route-based IPsec in the CLI:

```
config vpn ipsec phase1-interface
    edit tocisco
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set remote-gw 192.168.5.113
        set psksecret xxxxxxxxxxxxxxx
    next
end
```

```
config vpn ipsec phase2-interface
    edit tocisco_p2
        set phase1name tocisco
        set proposal 3des-md5
        set encapsulation [tunnel-mode | transport-mode]
        set protocol 47
        set src-addr-type ip
        set dst-start-ip 192.168.5.113
        set src-start-ip 172.20.120.141
    next
end
```

To add the IPsec tunnel end addresses:

```
config system interface
    edit tocisco
        set ip 172.20.120.141 255.255.255.255
        set remote-ip 192.168.5.113
    next
end
```

Configuring the GRE tunnel

The local gateway and remote gateway addresses must match the local and remote gateways of the IPsec tunnel. The GRE tunnel runs between the virtual IPsec public interface on the FortiGate unit and the Cisco router.

To configure the GRE tunnel:

```
config system gre-tunnel
    edit gre1
        set interface tocisco
        set local-gw 172.20.120.141
        set remote-gw 192.168.5.113
        set keepalive-interval <integer>
        set keepalive-failtimes <integer>
    next
end
```

The Cisco router configuration requires an address for its end of the GRE tunnel, so you need to add the tunnel end addresses.

To add the tunnel end addresses:

```
config system interface
    edit gre1
        set ip 10.0.1.1 255.255.255.255
        set remote-ip 10.0.1.2
    next
end
```

Configuring the security policies

Two sets of security policies are required:

- Policies to allow traffic to pass in both directions between the GRE virtual interface and the IPsec virtual interface.
- Policies to allow traffic to pass in both directions between the protected network interface and the GRE virtual interface.

To configure security policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter the following to allow traffic between the protected network and the GRE tunnel:

Name	LANtoGRE
Incoming Interface	Interface that connects to the private network behind the FortiGate (port2)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

3. Click *OK*.
4. Create a new policy and enter the following to allow traffic between the GRE tunnel and the protected network:

Name	GREtoLAN
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Interface that connects to the private network behind the FortiGate (port2)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

5. Click *OK*.
6. Create a new policy and enter the following to allow traffic between the GRE virtual interface and the IPsec virtual interface:

Name	GREtoIPsec
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Virtual IPsec interface (tocisco)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

7. Click *OK*.

8. Create a new policy and enter the following to allow traffic between the IPsec virtual interface and the GRE virtual interface:

Name	IPsectoGRE
Incoming Interface	Virtual IPsec interface (tocisco)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

9. Click *OK*.

To configure security policies in the CLI:

```
config firewall policy
    edit 1
        set name LANtoGRE
        set srcintf port2
        set dstintf gre1
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 2
        set name GREtoLAN
        set srcintf gre1
        set dstintf port2
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 3
        set name GREtoIPsec
        set srcintf gre1
        set dstintf tocisco
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 4
        set name IPsectoGRE
        set srcintf tocisco
        set dstintf gre1
        set srcaddr all
        set dstaddr all
```

```
        set action accept
        set schedule always
        set service ALL
    next
end
```

Configuring routing

to direct traffic destined for the network behind the Cisco router into the GRE-over-IPsec tunnelTraffic destined for the network behind the Cisco router must be routed to the GRE tunnel. To do this, create a static route

To create the static route in the GUI:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Enter the following:

Destination	IP and netmask for the network behind the Cisco router (10.21.101.0 255.255.255.0)
Interface	GRE tunnel virtual interface (gre1)
Administrative Distance	Leave the default setting

3. Click *OK*.

To create the static route in the CLI:

```
config router static
    edit 0
        set device gre1
        set dst 10.21.101.0 255.255.255.0
    next
end
```

Configuring the Cisco router

For more information, refer to Configuring and verifying a GRE over IPsec tunnel in the Fortinet Knowledge Base.

Remote access

Remote access lets users connect to the Internet using a dialup connection over traditional POTS or ISDN telephone lines. Virtual private network (VPN) protocols are used to secure these private connections.

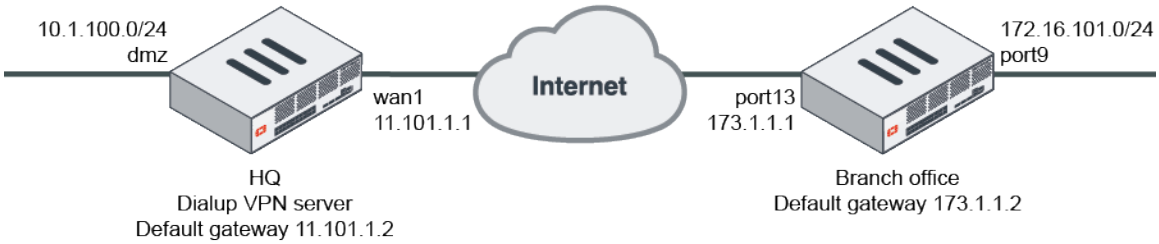
The following topics provide instructions on configuring remote access:

- FortiGate as dialup client on page 1009
- FortiClient as dialup client on page 1015
- Add FortiToken multi-factor authentication on page 1019
- Add LDAP user authentication on page 1020
- iOS device as dialup client on page 1021
- IKE Mode Config clients on page 1025
- IPsec VPN with external DHCP service on page 1029

- L2TP over IPsec on page 1032
- Tunneled Internet browsing on page 1036
- Restricting VPN access to rogue/non-compliant devices with Security Fabric

FortiGate as dialup client

This is a sample configuration of dialup IPsec VPN and the dialup client. In this example, a branch office FortiGate connects via dialup IPsec VPN to the HQ FortiGate.



You can configure dialup IPsec VPN with FortiGate as the dialup client using the GUI or CLI.

To configure IPsec VPN with FortiGate as the dialup client in the GUI:

1. Configure the dialup VPN server FortiGate:
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *The remote site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Incoming Interface*, select the incoming interface.
      ii. For *Authentication Method*, select *Pre-shared Key*.
      iii. In the *Pre-shared Key* field, enter *your-psk* as the key.
      iv. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure the *Local Subnets* as *10.1.100.0/24*.
      iii. Configure the *Remote Subnets* as *172.16.101.0/24*.
      iv. Click *Create*.
2. Configure the dialup VPN client FortiGate:
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *This site is behind NAT*.
      v. Click *Next*.

b. Configure the following settings for *Authentication*:
  i. For *IP Address*, enter *11.101.1.1*.
  ii. For *Outgoing Interface*, select *port13*.
  iii. For *Authentication Method*, select *Pre-shared Key*.
  iv. In the *Pre-shared Key* field, enter *your-psk* as the key.
  v. Click *Next*.
c. Configure the following settings for *Policy & Routing*:
  i. From the *Local Interface* dropdown menu, select the local interface. In this example, it is *port9*.
  ii. Configure the *Local Subnets* as *172.16.101.0*.
  iii. Configure the *Remote Subnets* as *10.1.100.0*.
  iv. Click *Create*.

To configure IPsec VPN with FortiGate as the dialup client in the CLI:

1. In the CLI, configure the user, user group, and firewall address. Only the HQ dialup server FortiGate needs this configuration. The address is an IP pool to assign an IP address for the dialup client FortiGate.

```
config user local
    edit "vpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
config firewall address
    edit "client_range"
        set type iprange
        set start-ip 10.10.10.1
        set end-ip 10.10.10.200
    next
end
```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.
  a. Configure the HQ FortiGate.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 11.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 11.101.1.2
        set device "wan1"
    next
end
```

b. Configure the branch office FortiGate.

```
config system interface
    edit "port13"
        set vdom "root"
        set ip 173.1.1.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 173.1.1.2
        set device "port13"
    next
end
```

3. Configure the internal interface and protected subnet. The internal interface connects to the internal network. Traffic from this interface will route out the IPsec VPN tunnel.
   a. Configure the HQ FortiGate.

```
config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end
config firewall address
    edit "10.1.100.0"
        set subnet 10.1.100.0 255.255.255.0
    next
end
```

   b. Configure the branch office FortiGate.

```
config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
config firewall address
    edit "172.16.101.0"
        set subnet 172.16.101.0 255.255.255.0
    next
end
```

4. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.
   a. Configure the HQ FortiGate.

```
config vpn ipsec phase1-interface
    edit "for_Branch"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype any
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
```

```
        set dpd on-idle
        set xauthtype auto
        set authusrgrp "vpngroup"
        set net-device enable
        set assign-ip-from name
        set dns-mode auto
        set ipv4-split-include "10.1.100.0"
        set ipv4-name "client_range"
        set save-password enable
        set psksecret sample
        set dpd-retryinterval 60
    next
end
```

b. Configure the branch office FortiGate.

```
config vpn ipsec phase1-interface
    edit "to_HQ"
        set interface "port13"
        set mode aggressive
        set peertype any
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set xauthtype client
        set authusr "vpnuser1"
        set authpasswd vpnuser1-password
        set remote-gw 11.101.1.1
        set psksecret sample
    next
end
```

5. Configure the IPsec phase2-interface.

a. Configure the HQ FortiGate:

```
config vpn ipsec phase2-interface
    edit "for_Branch_p2"
        set phase1 name "for_Branch"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

b. Configure the branch office FortiGate.

```
config vpn ipsec phase2-interface
    edit "to_HQ_p2"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

6. Configure the static routes on the branch office FortiGate. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

```
config router static
    edit 2
```

```
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ"
    next
    edit 3
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

7. Configure the firewall policy to allow the branch office to HQ network flow over the IPsec tunnel. This configuration only supports traffic from the branch office FortiGate to the HQ FortiGate. Traffic is dropped from the HQ FortiGate to the branch office FortiGate.
   a. Configure the HQ FortiGate.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_Branch"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

   b. Configure the branch office FortiGate.

```
config firewall policy
    edit 1
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

8. Run `diagnose` commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.
   a. Run the `diagnose vpn ike gateway list` command on the HQ FortiGate. The system should return the following:

```
vd: root/0
name: for_Branch_0
version: 1
interface: wan1 5
addr: 11.101.1.1:500 -> 173.1.1.1:500
created: 1972s ago
xauth-user: vpnuser1
assigned IPv4 address: 10.10.10.1/255.255.255.252
IKE SA: created 1/1 established 1/1 time 10/10/10 ms
```

```
IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
id/spi: 184 5b1c59fab2029e43/bf517e686d3943d2

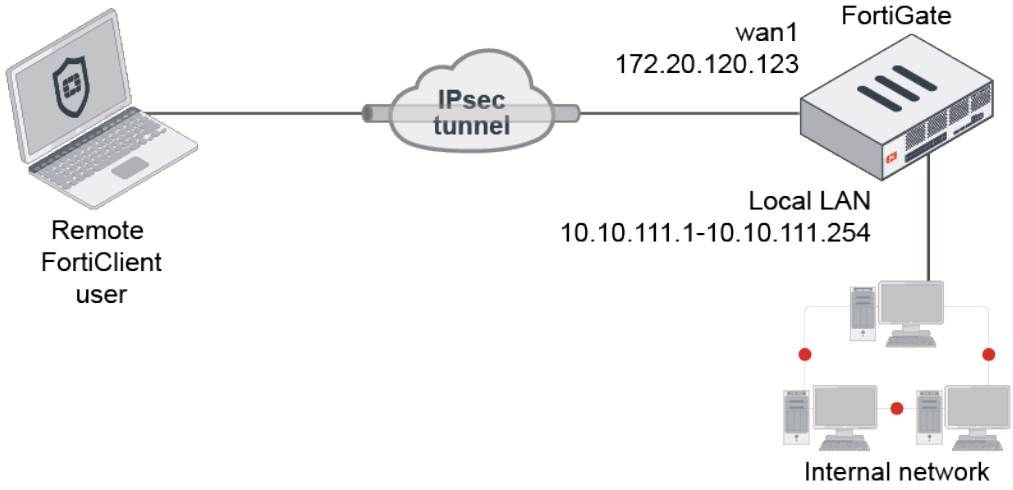
FortiClient as dialup client

This is a sample configuration of dialup IPsec VPN with FortiClient as the dialup client.



You can configure dialup IPsec VPN with FortiClient as the dialup client using the GUI or CLI.

If multiple dialup IPsec VPNs are defined for the same dialup server interface, each phase1 configuration must define a unique peer ID to distinguish the tunnel that the remote client is connecting to. When a client connects, the first IKE message that is in aggressive mode contains the client's local ID. FortiGate matches the local ID to the dialup tunnel referencing the same Peer ID, and the connection continues with that tunnel.

To configure IPsec VPN with FortiClient as the dialup client on the GUI:

1. Configure a user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user *vpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *vpngroup* with the member *vpnuser1*.
2. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
   a. Enter a VPN name.
   b. For *Template Type*, select *Remote Access*.
   c. For *Remote Device Type*, select *Client-based* > *FortiClient*.
   d. Click *Next*.
3. Configure the following settings for *Authentication*:
   a. For *Incoming Interface*, select *wan1*.
   b. For *Authentication Method*, select *Pre-shared Key*.
   c. In the *Pre-shared Key* field, enter *your-psk* as the key.
   d. From the *User Group* dropdown list, select *vpngroup*.
   e. Click *Next*.
4. Configure the following settings for *Policy & Routing*:
   a. From the *Local Interface* dropdown menu, select *lan*.
   b. Configure the *Local Address* as *local_network*.
   c. Configure the *Client Address Range* as *10.10.2.1-10.10.2.200*.
   d. Keep the default values for the *Subnet Mask*, *DNS Server*, *Enable IPv4 Split tunnel*, and *Allow Endpoint Registration*.
   e. Click *Next*.
5. Adjust the *Client Options* as needed, then click *Create*.
6. Optionally, define a unique Peer ID in the phase1 configuration:
   a. Go to *VPN* > *IPsec Tunnels* and edit the just created tunnel.
   b. Click *Convert To Custom Tunnel*.
   c. In the *Authentication* section, click *Edit*.
   d. Under *Peer Options*, set *Accept Types* to *Specific peer ID*.
   e. In the *Peer ID* field, enter a unique ID, such as *dialup1*.
   f. Click *OK*.

To configure IPsec VPN with FortiClient as the dialup client using the CLI:

1. In the CLI, configure the user and group.

```
config user local
    edit "vpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this

FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
    next
end
config firewall address
    edit "local_subnet_1"
        set subnet 10.10.111.0 255.255.255.0
    next
    edit "local_subnet_2"
        set subnet 10.10.112.0 255.255.255.0
    next
end
config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1" "local_subnet_2"
    next
end
```

3. Configure the WAN interface. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

4. Configure the client address pool. You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

5. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
    edit "for_client"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype one
        set peerid "dialup1"
        set net-device enable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set xauthtype auto
```

```
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set save-password enable
        set psksecret your-psk
        set dpd-retryinterval 60
    next
end
```

6. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "for_client"
        set phase1name "for_client"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

7. Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_client"
        set dstintf "lan"
        set srcaddr "client_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To configure FortiClient:

1. In FortiClient, go to *Remote Access* and click *Add a new connection*.
2. Set the *VPN* to *IPsec VPN* and the *Remote Gateway* to the FortiGate IP address.
3. Set the *Authentication Method* to *Pre-Shared Key* and enter the key.
4. Expand *Advanced Settings* > *Phase 1* and in the *Local ID* field, enter *dialup1*.
5. Configure remaining settings as needed, then click *Save*.
6. Select the VPN, enter the username and password, then select *Connect*.

Diagnose the connection

Run `diagnose` commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

1. Run the `diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: for_client_0
version: 1
interface: port1 15
```

```
addr: 172.20.120.123:4500 ->172.20.120.254:64916
created: 37s ago
xauth-user: vpnuser1
assigned IPv4 address: 10.10.1.1/255.255.255.255
nat: me peer

Add FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 1015). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Edit the user:
   a. Go to *User & Authentication* > *User Definition* and edit local user *vpnuser1*.
   b. Enable *Two-factor Authentication* and select one mobile *Token* from the list,
   c. Enter the user's *Email Address*.
   d. Enable *Send Activation Code* and select *Email*.
   e. Click *Next* and click *Submit*.
2. Activate the mobile token.
   a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Edit the user and user group:

```
config user local
    edit "vpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
        set email-to <user's email address>
        set passwd <user's password>
    next
end
```

2. Activate the mobile token.
   a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Add LDAP user authentication

This configuration adds LDAP user authentication to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 1015). You must have already generated and exported a CA certificate from your AD server.

To configure LDAP user authentication using the GUI:

1. Import the CA certificate into FortiGate:
   a. Go to *System* > *Certificates*.
   If the *Certificates* option is not visible, enable it in *Feature Visibility*. See Feature visibility on page 1562 for details.
   b. Click *Import* > *CA Certificate*.
   c. Set *Type* to *File*.
   d. Click *Upload* then find and select the certificate file.
   e. Click *OK*.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   f. Optionally, rename the system generated *CA_Cert_1* to something more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

2. Configure the LDAP user:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Set *Name* to *ldaps-server* and specify *Server IP/Name*.
   c. Specify *Common Name Identifier* and *Distinguished Name*.
   d. Set *Bind Type* to *Regular*.
   e. Specify *Username* and *Password*.
   f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
   g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
   h. Click *OK*.
3. Add the LDAP user to the user group:
   a. Go to *User & Authentication* > *User Groups* and edit the *vpngroup* group.
   b. In *Remote Groups*, click *Add* to add the *ldaps-server* remote server.
   c. Click *OK*.

To configure LDAP user authentication using the CLI:

1. Import the CA certificate using the GUI.
2. Configure the LDAP user:

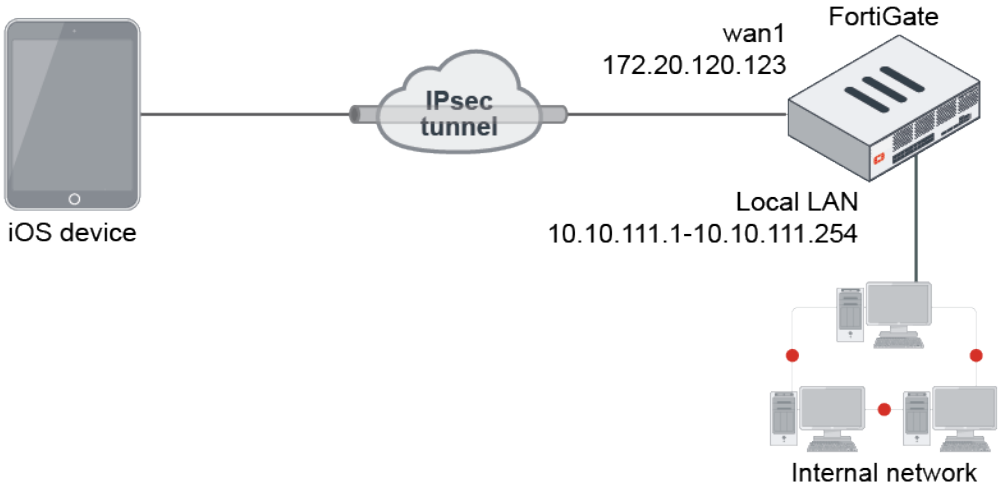
```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

3. Add the LDAP user to the user group:

```
config user group
    edit "vpngroup"
        append member "ldaps-server"
    next
end
```

iOS device as dialup client

This is a sample configuration of dialup IPsec VPN with an iPhone or iPad as the dialup client.



You can configure dialup IPsec VPN with an iOS device as the dialup client using the GUI or CLI.

To configure IPsec VPN with an iOS device as the dialup client on the GUI:

1. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
   a. Enter a VPN name.
   b. For *Template Type*, select *Remote Access*.
   c. For *Remote Device Type*, select *Native* > *iOS Native*.
   d. For *NAT Configuration*, set *No NAT Between Sites*.
   e. Click *Next*.
2. Configure the following settings for *Authentication*:
   a. For *Incoming Interface*, select *wan1*.
   b. For *Authentication Method*, select *Pre-shared Key*.
   c. In the *Pre-shared Key* field, enter *your-psk* as the key.
   d. From the *User Group* dropdown list, select *vpngroup*.
   e. Deselect *Require 'Group Name' on VPN client*.
   f. Click *Next*.
3. Configure the following settings for *Policy & Routing*:
   a. From the *Local Interface* dropdown menu, select *lan*.
   b. Configure the *Local Address* as *local_network*.
   c. Configure the *Client Address Range* as *10.10.2.1-10.10.2.200*.
   d. Keep the default values for the *Subnet Mask*, *DNS Server*, and *Enable IPv4 Split tunnel*.
   e. Click *Create*.

To configure IPsec VPN with an iOS device as the dialup client using the CLI:

1. In the CLI, configure the user and group.

```
config user local
    edit "vpnuser1"
        set type password
        set passwd your-password
    next
end
```

```
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
    next
end

config firewall address
    edit "local_subnet_1"
        set ip 10.10.111.0 255.255.255.0
    next
end

config firewall address
    edit "local_subnet_2"
        set ip 10.10.112.0 255.255.255.0
    next
end

config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1" "local_subnet_2"
    next
end
```

3. Configure the WAN interface. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

4. Configure the client address pool. You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

5. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
    edit "for_ios_p1"
        set type dynamic
        set interface "wan1"
        set peertype any
        set net-device enable
        set mode-cfg enable
        set proposal aes256-sha256 aes256-md5 aes256-sha1
        set dpd on-idle
        set dhgrp 14 5 2
        set xauthtype auto
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set psksecret your-psk
        set dpd-retryinterval 60
    next
end
```

6. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "for_ios_p2"
        set phase1name "for_ios_p1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set pfs disable
        set keepalive enable
    next
end
```

7. Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.

```
config firewall policy
    edit 1
        set name "ios_vpn"
        set srcintf "for_ios_p1"
        set dstintf "lan"
        set srcaddr "ios_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

8. Configure the iOS device.
   a. In the iOS device, go to *Settings* > *General* > *VPN* and select *Add VPN Configuration*.
   b. Set the *Type* to *IPsec* and enter a *Description*. Set the *Server* to the FortiGate's Internet-facing interface, and enter the username in *Account*. Enter the user password, the preshared IPsec VPN secret, then select *Done*.
   c. Ensure that the IPsec VPN configuration is highlighted (indicated by a checkmark), and select the *Not Connected* button. The IPsec VPN connects with the user's credentials and secret. The status changes to *Connected*, and a VPN icon appears at the top of the screen.
9. Run `diagnose` commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

a. Run the `diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: for_ios_p1_0
version: 1
interface: port1 15
addr: 172.20.120.123:4500 -> 172.20.120.254:64916
created: 17s ago
xauth-user: u1
assigned IPv4 address: 10.10.2.1/255.255.255.255
nat: me peer

IKE Mode Config clients

IKE Mode Config is an alternative to DHCP over IPsec. It allows dialup VPN clients to obtain virtual IP address, network, and DNS configurations amongst others from the VPN server. A FortiGate can be configured as either an IKE Mode Config server or client.

IKE Mode Config can configure the host IP address, domain, DNS addresses ,and WINS addresses. IPsec parameters such as gateway address, encryption, and authentication algorithms must be configured. Several network equipment vendors support IKE Mode Config.

An IKE Mode Config server or client is configured using `config vpn ipsec phase1-interface` and involves the following parameters:

Parameter	Description
ike-version {1 | 2}	IKE v1 is the default for FortiGate IPsec VPNs. IKE Mode Config is also compatible with IKE v2.
mode-cfg {enable | disable}	Enable/disable IKE Mode Config.
type {static | dynamic | ddns}	If you set `type` to `dynamic`, an IKE Mode Config server is created. The other settings create an IKE Mode Config client.
assign-ip {enable | disable}	Enable to request an IP address from the server. This configuration is for IKE Mode Config clients only.
interface <interface_name>	Specify the physical, aggregate, or VLAN interface to which the IPsec tunnel will be bound.
proposal <encryption_ combination>	The encryption and authentication settings that the client will accept.
ip-version {4 | 6}	By default, IPsec VPNs use IPv4 addressing.
ipv4-split-exclude <string> ipv6-split-exclude <string>	Specify the subnets that should not be sent over the IPsec tunnel. This configuration is for IKE Mode Config clients only (see Split-exclude in IKEv1).

Creating an IKE Mode Config client

In this example, the FortiGate connects to a VPN gateway with a static IP address that can be reached through port 1. Only the port, gateway, and proposal information needs to be configured. All other configuration information will come from the IKE Mode Config server.

To configure an IKE Mode Config client:

```
config vpn ipsec phase1-interface
    edit vpn1
        set ip-version 4
        set type static
        set remote-gw <gw_address>
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set mode-cfg enable
        set assign-ip enable
    next
end
```

Split-exclude in IKEv1

The `split-exclude` option specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of `split-include`, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The `split-include` and `split-exclude` options can be specified at the same time.

To configure split-exclude:

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version 1
```

```
        set type dynamic
        set mode-cfg enable
        set ipv4-split-exclude <string>
        set ipv6-split-exclude <string>
    next
end
```

Creating an IKE Mode Config server

In this example, the FortiGate assigns IKE Mode Config clients addresses in the range of 10.11.101.160 - 10.11.101.180. DNS and WINS server addresses are also provided. The public interface of the FortiGate unit is port1.

When IKE Mode-Configuration is enabled, multiple server IPs can be defined in IPsec phase 1.

The `ipv4-split-include` parameter specifies a firewall address (`OfficeLAN`), which represents the networks that the clients will have access to. This destination IP address information is sent to the clients.

To configure an IKE Mode Config server:

```
config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
        set interface "wan1"
        set xauthtype auto
        set mode aggressive
        set mode-cfg enable
        set proposal 3des-sha1 aes128-sha1
        set dpd disable
        set dhgrp 2
        set authusrgrp "FG-Group1"
        set ipv4-start-ip 10.10.10.10
        set ipv4-end-ip 10.10.10.20
        set ipv4-dns-server1 1.1.1.1
        set ipv4-dns-server2 2.2.2.2
        set ipv4-dns-server3 3.3.3.3
        set ipv4-wins-server1 4.4.4.4
        set ipv4-wins-server2 5.5.5.5
        set domain "fgt1c-domain"
        set banner "fgt111C-banner"
        set backup-gateway "100.100.100.1" "host1.com" "host2"
        set ipv4-split-include OfficeLAN
    next
end
```

Assigning IP addresses

Once the basic configuration is enabled, you can configure IP address assignment for clients, as well as DNS and WINS server assignments. Usually you will want to assign IP addresses to clients. The easiest way is to assign addresses from a specific range, similar to a DHCP server.

To assign an IP from an address range:

```
config vpn ipsec phase1-interface
    edit vpn1
```

```
        set ip-version 4
        set assign-ip enable
        set assign-ip-from range
        set ipv4-start-ip <range_start>
        set ipv4-end-ip <range_end>
        set ipv4-netmask <netmask>
    next
end
```

To assign an IP from a named firewall address or group:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set assign-ip-from name
        set ipv4-name <name>
        set ipv6-name <name>
    next
end
```

RADIUS server

If the client is authenticated by a RADIUS server, you can obtain the user's IP address assignment from the Framed-IP-Address attribute. The user must be authenticated using XAuth.

The users must be authenticated by a RADIUS server and assigned to the FortiGate user group `<grp_name>`. Since the IP address is not static, type is set to dynamic and `mode-cfg` is enabled. With IKE Mode Config, compatible clients can configure themselves with settings provided by the FortiGate.

To assign an IP from a RADIUS server:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set mode-cfg enable
        set assign-ip enable
        set assign-ip-from usrgrp
        set xauthtype auto
        set authusrgrp <grp_name>
    next
end
```

DHCP server

IKE Mode Config can use a remote DHCP server to assign the client IP addresses. Up to eight server addresses can be selected for either IPv4 or IPv6. The DHCP proxy must be enabled first.

To assign an IP from a DHCP server:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip <address>
    set dhcp6-server-ip <address>
end
```

```
config vpn ipsec phase1-interface
    edit vpn1
        set mode-cfg enable
        set assign-ip-from dhcp
    next
end
```

Certificate groups

IKE certificate groups consisting of up to four RSA certificates can be used in IKE phase 1. Since CA and local certificates are global, the IKE daemon loads them once for all VDOMs and indexes them into trees based on subject and public key hash (for CA certificates), or certificate name (for local certificates). Certificates are linked together based on the issuer, and certificate chains are built by traversing these links. This reduces the need to keep multiple copies of certificates that could exist in multiple chains.

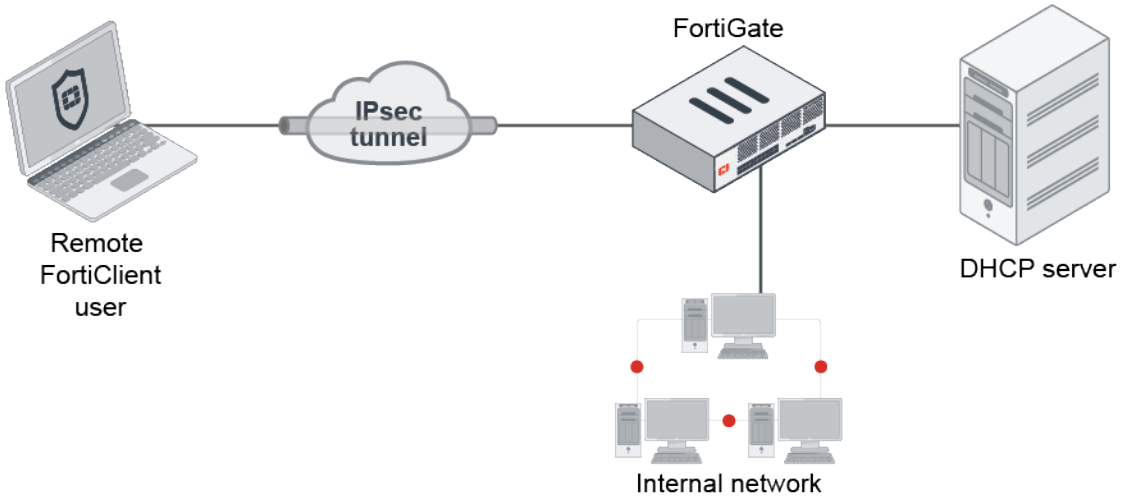
To configure the IKE local ID:

```
config vpn certificate local
    edit <name>
        set ike-localid <string>
        set ike-localid-type {asnldn | fqdn}
    next
end
```

IPsec VPN with external DHCP service

You can use an external DHCP server to assign IP addresses to your IPsec VPN clients. This is a common scenario found in enterprises where all DHCP leases need to be managed centrally.

In this example, the DHCP server assigns IP addresses in the range of 172.16.6.100 to 172.16.6.120. The server is attached to internal2 on the FortiGate and has an IP address of 192.168.3.70.



To configure a DHCP server to assign IP addresses to IPsec VPN clients:

1. Create a user group for remote users:
   a. Go to *User & Authentication* > *User Definition* and click *Create New*.
   b. For *User Type*, select *Local User*.
   c. Complete the wizard, and click *Submit*.
   d. Go to *User & Authentication* > *User Groups* and click *Create New*..
   e. Create a *Firewall* user group for your remote users.
   f. For *Members*, add the user you just created.
   g. Click *OK*.
2. Add a firewall address for the local network and IPsec VPN client range:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Create a new *Subnet* address for the LAN, including the IP mask and local interface (*internal2*).
   c. Click *OK*.
   d. Create a new *IP Range* address for the IPsec VPN client range (`172.16.6.100–172.16.6.120`).
   e. Click *OK*.
3. Configure the IPsec VPN using a VPN tunnel in the CLI:

```
config vpn ipsec phase1-interface
    edit "dhcp_vpn"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set dhgrp 5
        set xauthtype auto
        set authusrgrp "ipsecvpn"
        set psksecret **********
        set dpd-retryinterval 60
    next
end

config vpn ipsec phase2-interface
    edit "toclient"
        set phase1name "dhcp_vpn"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set dhgrp 5
        set dhcp-ipsec enable
    next
end
```

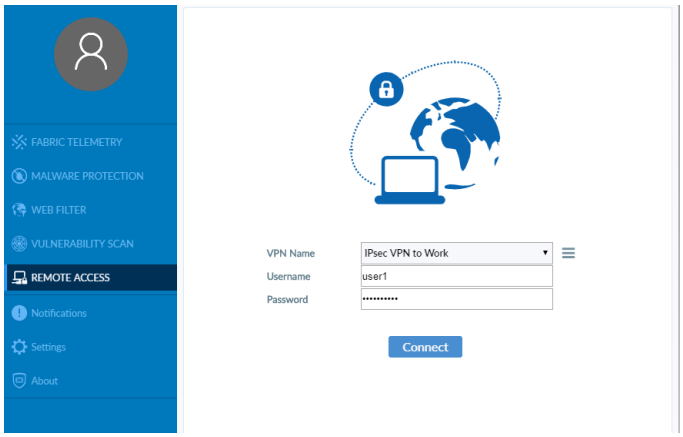
4. Configure the IPsec VPN interface:
   a. Go to *Network* > *Interfaces* and edit the newly created IPsec VPN interface.
   b. Enable the *DHCP Server*.
   c. Expand *Advanced* and change the *Mode* to *Relay*.
   d. Enter the external DHCP server IP address (`192.168.3.70`).
   e. Change the *Type* to *IPsec*.
   f. Click *OK*.

5. Create a security policy for access to the local network:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Configure the following parameters:
      i. Set the *Incoming Interface* to the tunnel interface created in step 3 (*dhcp_vpn*).
      ii. Set the *Outgoing Interface* (*internal2*).
      iii. Set the *Source* to the IPsec VPN client range defined in step 2 (*ipsecvpn_range*).
      iv. Set the *Destination* to the subnet address defined in step 2 (*Local LAN*).
      v. Set the *Service* to *ALL*.
   c. Click *OK*.
6. Configure FortiClient:
   a. In FortiClient, go to *REMOTE ACCESS* > *Add a new connection*.

   b. Configure the following parameters:
      i. Set the *VPN* type to *IPsec VPN*.
      ii. Enter a connection name.
      iii. Set the *Remote Gateway* to the FortiGate external IP address.
      iv. Set the *Authentication Method* to *Pre-shared key* and enter the key below.
      v. Expand the *Advanced Settings* > *VPN Settings* and for *Options*, select *DHCP over IPsec*.
      vi. Click *Save*.

   c. Select the new connection, and enter the user name and password.

d. Click *Connect*.



Once the connection is established, the external DHCP server assigns the user an IP address and FortiClient displays the connection status, including the IP address, connection duration, and bytes sent and received.

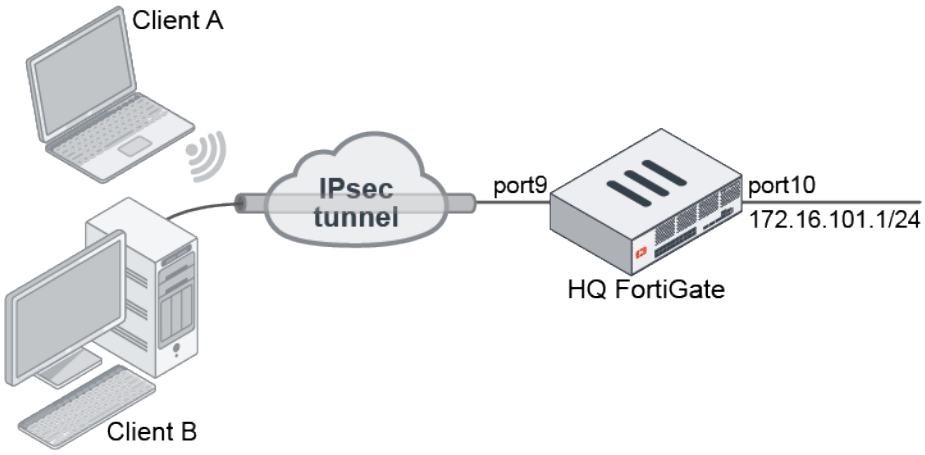
Verification

1. In FortiOS, go to *Monitor* > *IPsec Monitor* and verify that the tunnel *Status* is *Up*.
2. Go to *Log & Report* > *Forward Traffic* and verify the *Sent / Received* column displays the traffic flow through the tunnel.

L2TP over IPsec

This is an example of L2TP over IPsec.

This example uses a locally defined user for authentication, a Windows PC or Android tablet as the client, and `net-device` is set to `enable` in the `phase1-interface` settings. If `net-device` is set to `disable`, only one device can establish an L2TP over IPsec tunnel behind the same NAT device.



To configure L2TP over an IPsec tunnel using the GUI:

1. Go to *VPN* > *IPsec Wizard*.
2. Enter a VPN *Name*. In this example, *L2tpoIPsec*.

3. Configure the following settings for *VPN Setup*:
   a. For *Template Type*, select *Remote Access*.
   b. For *Remote Device Type*, select *Native* and *Windows Native*.
   c. Click *Next*.
4. Configure the following settings for *Authentication*:
   a. For *Incoming Interface*, select *port9*.
   b. For *Authentication Method*, select *Pre-shared Key*.
   c. In the *Pre-shared Key* field, enter *your-psk* as the key.
   d. For *User Group*, select *L2tpusergroup*
   e. Click *Next*.
5. Configure the following settings for *Policy & Routing*:
   a. From the *Local Interface* dropdown menu, select *port10*.
   b. Configure the *Local Address* as *172.16.101.0*.
   c. Configure the *Client Address Range* as *10.10.10.1-10.10.10.100*.
   d. Leave the *Subnet Mask* at its default value.
   e. Click *Create*.

To configure L2TP over an IPsec tunnel using the CLI:

1. Configure the WAN interface and static route on HQ.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure IPsec phase1-interface and phase2-interface on HQ.

```
config vpn ipsec phase1-interface
    edit "L2tpoIPsec"
        set type dynamic
        set interface "port9"
        set peertype any
        set proposal aes256-md5 3des-sha1 aes192-sha1
        set dpd on-idle
        set dhgrp 2
        set net-device enable
        set psksecret sample
        set dpd-retryinterval 60
    next
end
```

```
config vpn ipsec phase2-interface
    edit "L2tpoIPsec"
        set phase1name "L2tpoIPsec"
        set proposal aes256-md5 3des-sha1 aes192-sha1
        set pfs disable
        set encapsulation transport-mode
        set l2tp enable
    next
end
```

3. Configure a user and user group on HQ.

```
config user local
    edit "usera"
        set type password
        set passwd usera
        next
end
config user group
    edit "L2tpusergroup"
        set member "usera"
    next
end
```

4. Configure L2TP on HQ.

```
config vpn l2tp
    set status enable
    set eip 10.10.10.100
    set sip 10.10.10.1
    set usrgrp "L2tpusergroup"
end
```

5. Configure a firewall address that is applied in L2TP settings to assign IP addresses to clients once the L2TP tunnel is established.

```
config firewall address
    edit "L2TPclients"
        set type iprange
        set start-ip 10.10.10.1
        set end-ip 10.10.10.100
    next
end
```

6. Configure a firewall policy.

```
config firewall policy
    edit 1
        set name "Bridge_IPsec_port9_for_l2tp negotiation"
        set srcintf "L2tpoIPsec"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "L2TP"
    next
    edit 2
        set srcintf "L2tpoIPsec"
```

```
            set dstintf "port10"
            set srcaddr "L2TPclients"
            set dstaddr "172.16.101.0"
            set action accept
            set schedule "always"
            set service "ALL"
            set nat enable
        next
    end
```

To view the VPN tunnel list on HQ:

```
# diagnose vpn tunnel list

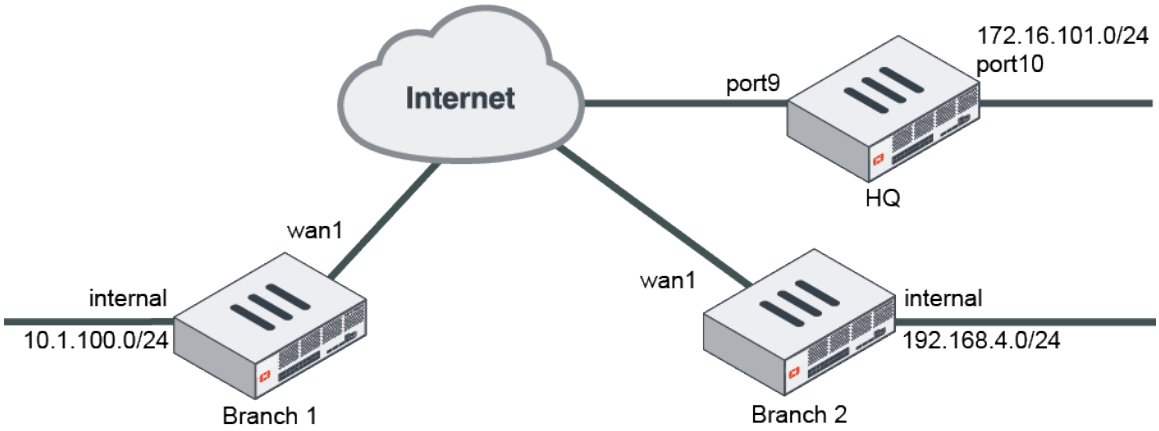
Tunneled Internet browsing

This is a sample configuration of tunneled internet browsing using a dialup VPN. To centralize network management and control, all branch office traffic is tunneled to HQ, including Internet browsing.



To configure a dialup VPN to tunnel Internet browsing using the GUI:

1. Configure the dialup VPN server FortiGate at HQ:
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name, in this example, *HQ*.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *The remote site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Incoming Interface*, select *port9*.
      ii. For *Authentication Method*, select *Pre-shared Key*.
      iii. In the *Pre-shared Key* field, enter *sample* as the key.
      iv. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select *port10*.
      ii. Configure the *Local Subnets* as *172.16.101.0*.
      iii. Configure the *Remote Subnets* as *0.0.0.0/0*.
      iv. For *Internet Access*, select *Share Local*.
      v. For *Shared WAN*, select *port9*.
      vi. Click *Create*.
2. Configure the dialup VPN client FortiGate at a branch:
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name, in this example, *Branch1* or *Branch2*.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *The remote site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *IP Address*, select *Remote Device* and enter *22.1.1.1*.
      ii. For *Outgoing Interface*, select *wan1*.
      iii. For *Authentication Method*, select *Pre-shared Key*.
      iv. In the *Pre-shared Key* field, enter *sample* as the key.
      v. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select *internal*.
      ii. Configure the *Local Subnets* as *10.1.100.0/192.1684.0*.
      iii. Configure the *Remote Subnets* as *0.0.0.0/0*.
      iv. For *Internet Access*, select *Use Remote*.
      v. Configure the *Local Gateway* to *15.1.1.1/13.1.1.1*.
      vi. Click *Create*.

To configure a dialup VPN to tunnel Internet browsing using the CLI:

1. Configure the WAN interface and static route on the FortiGate at HQ.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure IPsec phase1-interface and phase2-interface configuration at HQ.

```
config vpn ipsec phase1-interface
    edit "HQ"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "HQ"
        set phase1name "HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
    edit 1
        set srcintf "HQ"
        set dstintf "port9" "port10"
        set srcaddr "10.1.100.0" "192.168.4.0"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

4. Configure the WAN interface and static route on the FortiGate at the branches.
   a. Branch1.

```
config system interface
    edit "wan1"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

   b. Branch2.

```
config system interface
    edit "wan1"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

5. Configure IPsec phase1-interface and phase2-interface configuration at the branches.
   a. Branch1.

```
config vpn ipsec phase1-interface
    edit "branch1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "branch1"
        set phase1name "branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 10.1.100.0 255.255.255.0
```

```
    next
end
```

b. Branch2.

```
config vpn ipsec phase1-interface
    edit "branch2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "branch2"
        set phase1name "branch2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 192.168.4.0 255.255.255.0
    next
end
```

6. Configure the firewall policy at the branches.

a. Branch1.

```
config firewall policy
    edit 1
        set name "outbound"
        set srcintf "internal"
        set dstintf "branch1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound"
        set srcintf "branch1"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. Branch2.

```
config firewall policy
    edit 1
        set name "outbound"
```

```
            set srcintf "internal"
            set dstintf "branch2"
            set srcaddr "all"
            set dstaddr "all"
            set action accept
            set schedule "always"
            set service "ALL"
        next
        edit 2
            set name "inbound"
            set srcintf "branch2"
            set dstintf "internal"
            set srcaddr "all"
            set dstaddr "all"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

7. Configure the static routes at the branches.
   a. Branch1.

```
config router static
    edit 2
        set dst 22.1.1.1/32
        set gateway 15.1.1.1
        set device "wan1"
        set distance 1
    next
    edit 3
        set device "branch1"
        set distance 5
    next
end
```

   b. Branch2.

```
config router static
    edit 2
        set dst 22.1.1.1/32
        set gateway 13.1.1.1
        set device "wan1"
        set distance 1
    next
    edit 3
        set device "branch2"
        set distance 5
    next
end
```

8. Optionally, view the VPN tunnel list on a branch with the `diagnose vpn tunnel list` command:

```
list all ipsec tunnel in vd 0
----
name=branch1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu create_
dev frag-rfc  accept_traffic=1
```

```
proxyid_num=1 child_num=1 refcnt=19 ilast=0 olast=0 ad=r/2
stat: rxp=1 txp=1661 rxb=65470 txb=167314
dpd: mode=on-idle on=1 idle=5000ms retry=3 count=0 seqno=2986
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=branch1 proto=0 sa=1 ref=5 serial=1 auto-negotiate adr
  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
  SA:  ref=6 options=1a227 type=00 soft=0 mtu=1438 expire=697/0B replaywin=1024
       seqno=13a esn=0 replaywin_lastseq=00000000 itn=0
  life: type=01 bytes=0/0 timeout=2368/2400
  dec: spi=c53a8f7e esp=aes key=16 ecee0cd48664d903d3d6822b1f902fd2
       ah=sha1 key=20 2440a189126c222093ca9acd8b37127285f1f8a7
  enc: spi=6e3636fe esp=aes key=16 fdaa20bcc96f74ae9885e824d3efa29d
       ah=sha1 key=20 70c0891c769ad8007ea1f31a39978ffbc73242d0
  dec:pkts/bytes=0/16348, enc:pkts/bytes=313/55962
  npu_flag=03 npu_rgwy=22.1.1.1 npu_lgwy=15.1.1.2 npu_selid=1 dec_npuid=1 enc_npuid=1
```

9. Optionally, view static routing table on a branch with the `get router info routing-table static` command:

```
Routing table for VRF=0
S*      0.0.0.0/0 [5/0] is directly connected, branch1
S*      22.1.1.1/32 [1/0] via 15.1.1.1, wan1
```

Aggregate and redundant VPN

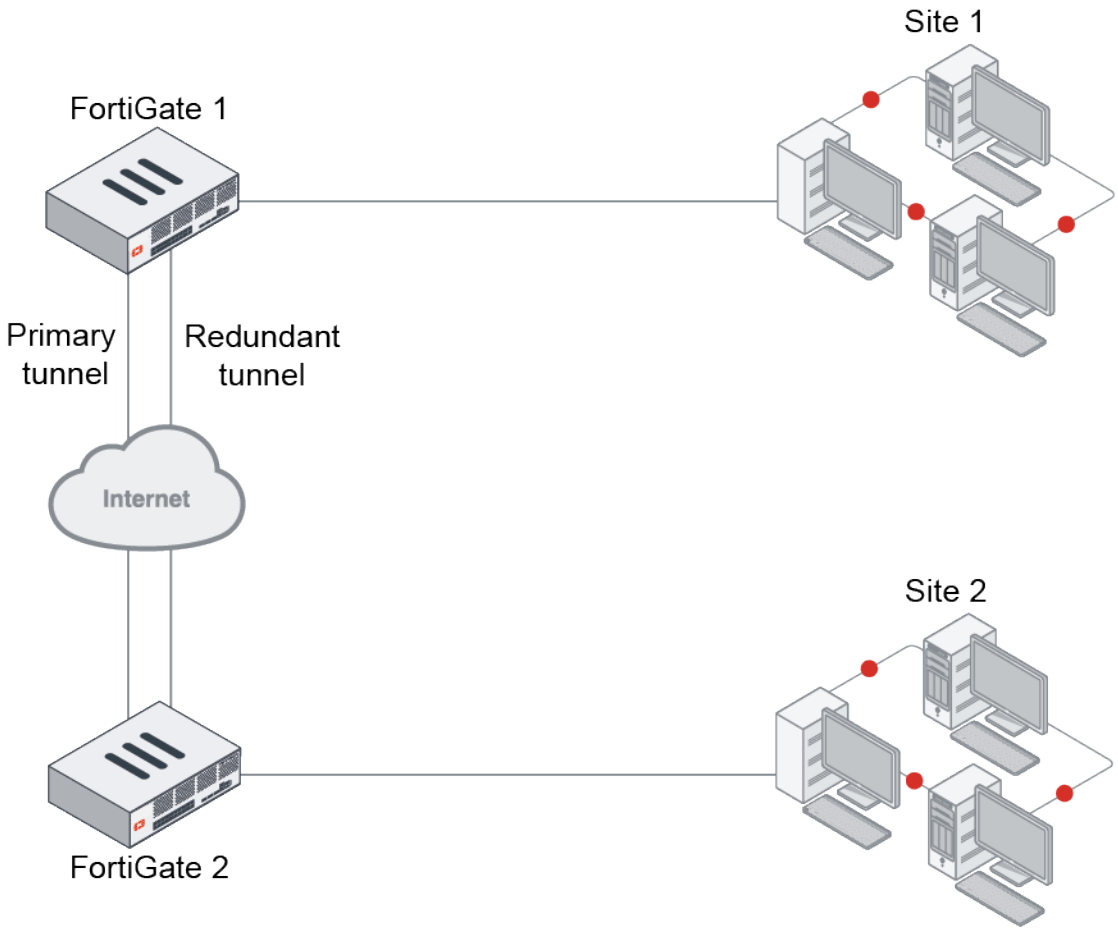
The following topics provide instructions on configuring aggregate and redundant VPNs:

- Manual redundant VPN configuration on page 1042
- OSPF with IPsec VPN for network redundancy on page 1046
- IPsec VPN in an HA environment on page 1053
- IPsec aggregate for redundancy and traffic load-balancing on page 1059
- Per packet distribution and tunnel aggregation on page 1074
- Redundant hub and spoke VPN on page 1079
- Weighted round robin for IPsec aggregate tunnels on page 1084

Manual redundant VPN configuration

A FortiGate with two interfaces connected to the internet can be configured to support redundant VPNs to the same remote peer. Four distinct paths are possible for VPN traffic from end to end. If the primary connection fails, the FortiGate can establish a VPN using the other connection.

Topology



The redundant configuration in this example uses route-based VPNs. The FortiGates must operate in NAT mode and use auto-keying.

This example assumes the redundant VPNs are essentially equal in cost and capability. When the original VPN returns to service, traffic continues to use the replacement VPN until the replacement VPN fails. If the redundant VPN uses more expensive facilities, only use it as a backup while the main VPN is down.

A redundant configuration for each VPN peer includes:

- One phase 1 configuration for each path between the two peers with dead peer detection enabled
- One phase 2 definition for each phase 1 configuration
- One static route for each IPsec interface with different distance values to prioritize the routes
- Two firewall policies per IPsec interface, one for each direction of traffic

To configure the phase 1 and phase 2 VPN settings:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name and click *Next*.

3. Enter the following phase 1 settings for path 1:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

4. Configure the remaining phase 1 and phase 2 settings as needed.
5. Click *OK*.
6. Repeat these steps for the remaining paths.
   a. Path 2:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

   b. Path 3:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

   c. Path 4:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

To configure the static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. In the *Destination* field, enter the subnet of the private network.
3. For *Interface*, select one of the IPsec interfaces on the local peer.
4. Enter a value for *Administrative Distance*.
5. Click *OK*.
6. Repeat these steps for the three remaining paths, and enter different values for *Administrative Distance* to prioritize the paths.

To configure the firewall policies:

1. Create the policies for the local primary interface:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Name	Enter a name for the policy.
Incoming Interface	Select the local interface to the internal (private) network.
Outgoing Interface	Select one of the virtual IPsec interfaces.
Source	All
Destination	All
Schedule	Always
Service	All
Action	ACCEPT

   c. Click *OK*.
   d. Click *Create New* and configure the policy for the other direction of traffic:

Name	Enter a name for the policy.
Incoming Interface	Select one of the virtual IPsec interfaces.
Outgoing Interface	Select the local interface to the internal (private) network.
Source	All
Destination	All
Schedule	Always
Service	All
Action	ACCEPT

   e. In the policy list, drag the VPN policies above any other policies with similar source and destination addresses.
2. Repeat these steps to create the policies for the three remaining paths.

Creating a backup IPsec interface

A route-based VPN can be configured to act as a backup IPsec interface when the main VPN is out of service. This can only be configured in the CLI.

The backup feature works on interfaces with static addresses that have dead peer detection enabled. The `monitor` option creates a backup VPN for the specified phase 1 configuration.

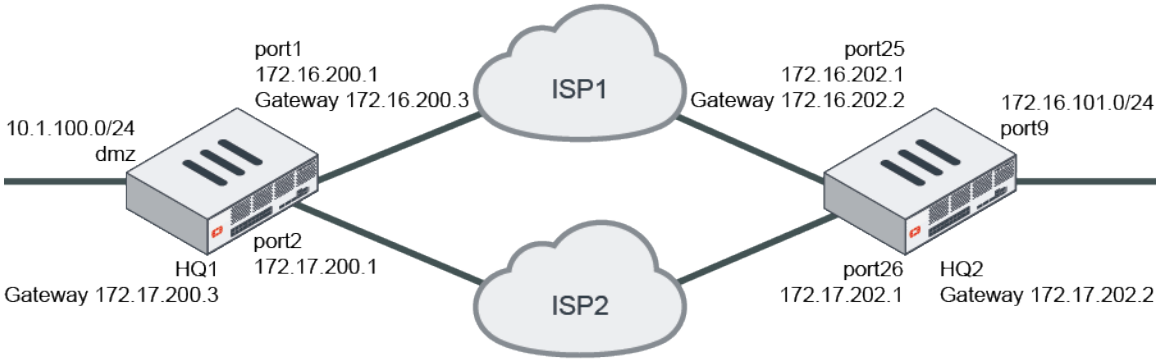
To create a backup IPsec interface:

```
config vpn ipsec phase1-interface
    edit main_vpn
        set dpd on-demand
        set interface port1
```

```
        set nattraversal enable
        set psksecret ********
        set remote-gw 192.168.10.8
        set type static
    next
    edit backup_vpn
        set dpd on-demand
        set interface port2
        set monitor main_vpn
        set nattraversal enable
        set psksecret ********
        set remote-gw 192.168.10.8
        set type static
    next
end
```

OSPF with IPsec VPN for network redundancy

This is a sample configuration of using OSPF with IPsec VPN to set up network redundancy. Route selection is based on OSPF cost calculation. You can configure ECMP or primary/secondary routes by adjusting OSPF path cost.



Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure OSPF with IPsec VPN to achieve network redundancy using the CLI:

1. Configure the WAN interface and static route.
   Each FortiGate has two WAN interfaces connected to different ISPs. The ISP1 link is for the primary FortiGate and the IPS2 link is for the secondary FortiGate.
   a. Configure HQ1.

```
config system interface
   edit "port1"
      set alias to_ISP1
      set ip 172.16.200.1 255.255.255.0
   next
   edit "port2"
      set alias to_ISP2
      set ip 172.17.200.1 255.255.255.0
   next
end
config router static
   edit 1
```

```
      set gateway 172.16.200.3
      set device "port1"
    next
    edit 2
      set gateway 172.17.200.3
      set device "port2"
      set priority 100
    next
  end
```

b. Configure HQ2.

```
config system interface
  edit "port25"
    set alias to_ISP1
    set ip 172.16.202.1 255.255.255.0
  next
  edit "port26"
    set alias to_ISP2
    set ip 172.17.202.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.202.2
    set device "port25"
  next
  edit 2
    set gateway 172.17.202.2
    set device "port26"
    set priority 100
  next
end
```

2. Configure the internal (protected subnet) interface.

a. Configure HQ1.

```
config system interface
  edit "dmz"
    set ip 10.1.100.1 255.255.255.0
  next
end
```

b. Configure HQ2.

```
config system interface
  edit "port9"
    set ip 172.16.101.1 255.255.255.0
  next
end
```

3. Configure IPsec phase1-interface and phase-2 interface. On each FortiGate, configure two IPsec tunnels: a primary and a secondary.

a. Configure HQ1.

```
config vpn ipsec phase1-interface
  edit "pri_HQ2"
    set interface "port1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set psksecret sample1
```

```
    next
    edit "sec_HQ2"
      set interface "port2"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.202.1
      set psksecret sample2
    next
    end
  config vpn ipsec phase2-interface
    edit "pri_HQ2"
      set phase1name "pri_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
    next
    edit "sec_HQ2"
      set phase1name "sec_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
    next
  end
```

b. Configure HQ2.

```
  config vpn ipsec phase1-interface
    edit "pri_HQ1"
      set interface "port25"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.200.1
      set psksecret sample1
    next
    edit "sec_HQ1"
      set interface "port26"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.200.1
      set psksecret sample2
    next
  end
  config vpn ipsec phase2-interface
    edit "pri_HQ1"
      set phase1name "pri_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
    next
    edit "sec_HQ1"
      set phase1name "sec_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
    next
  end
```

4. Configure an inbound and outbound firewall policy for each IPsec tunnel.
   a. Configure HQ1.
```
config firewall policy
   edit 1
      set name "pri_inbound"
      set srcintf "pri_HQ2"
      set dstintf "dmz"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "pri_outbound"
      set srcintf "dmz"
      set dstintf "pri_HQ2"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 3
      set name "sec_inbound"
      set srcintf "sec_HQ2"
      set dstintf "dmz"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 4
      set name "sec_outbound"
      set srcintf "dmz"
      set dstintf "sec_HQ2"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```
   b. Configure HQ2.
```
config firewall policy
   edit 1
      set name "pri_inbound"
      set srcintf "pri_HQ1"
      set dstintf "port9"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
```

```
    edit 2
      set name "pri_outbound"
      set srcintf "port9"
      set dstintf "pri_HQ1"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"

      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
    next
  end
```

5. Assign an IP address to the IPsec tunnel interface.
   a. Configure HQ1.

```
config system interface
  edit "pri_HQ2"
    set ip 10.10.10.1 255.255.255.255
    set remote-ip 10.10.10.2 255.255.255.255
  next
  edit "sec_HQ2"
    set ip 10.10.11.1 255.255.255.255
    set remote-ip 10.10.11.2 255.255.255.255
  next
end
```

   b. Configure HQ2.

```
config system interface
  edit "pri_HQ1"
    set ip 10.10.10.2 255.255.255.255
    set remote-ip 10.10.10.1 255.255.255.255
  next
  edit "sec_HQ1"
    set ip 10.10.11.2 255.255.255.255
    set remote-ip 10.10.11.1 255.255.255.255
  next
end
```

6. Configure OSPF.
   a. Configure HQ1.
```
config router ospf
   set router-id 1.1.1.1
   config area
      edit 0.0.0.0
      next
   end
   config ospf-interface
      edit "pri_HQ2"
         set interface "pri_HQ2"
         set cost 10
         set network-type point-to-point
      next
      edit "sec_HQ2"
         set interface "sec_HQ2"
         set cost 20
         set network-type point-to-point
      next
   end
   config network
      edit 1
         set prefix 10.10.10.0 255.255.255.0
      next
      edit 2
         set prefix 10.10.11.0 255.255.255.0
      next
      edit 3
         set prefix 10.1.100.0 255.255.255.0
      next
   end
end
```
   b. Configure HQ2.
```
config router ospf
   set router-id 2.2.2.2
   config area
      edit 0.0.0.0
      next
   end
   config ospf-interface
      edit "pri_HQ1"
         set interface "pri_HQ1"
         set cost 10
         set network-type point-to-point
      next
      edit "sec_HQ1"
         set interface "sec_HQ1"
         set cost 20
         set network-type point-to-point
      next
   end
   config network
      edit 1
         set prefix 10.10.10.0 255.255.255.0
      next
      edit 2
```

```
            set prefix 10.10.11.0 255.255.255.0
        next
        edit 3
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end
```

To check VPN and OSPF states using diagnose and get commands:

1. Run the `HQ1 # diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500

   dec:pkts/bytes=1/68, enc:pkts/bytes=1/136
```

3. Run the `HQ1 # get router info ospf neighbor` command. The system should return the following:
```
OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:37 10.10.10.2 pri_HQ2
2.2.2.2 1. Full/ - 00:00:32 10.10.11.2 sec_HQ2
```
4. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:
```
Routing table for VRF=0
O 172.16.101.0/24 [110/20] via 10.10.10.2, pri_HQ2 , 00:03:21
```
In case the primary tunnel is down after route convergence.
5. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:
```
Routing table for VRF=0
O 172.16.101.0/24 [110/110] via 10.10.11.2, sec_HQ2 , 00:00:01
```

IPsec VPN in an HA environment

This is a sample configuration of site-to-site IPsec VPN in an HA environment.

For this example, set up HA as described in the HA topics. When setting up HA, enable the following options to ensure IPsec VPN traffic is not interrupted during an HA failover:

- `session-pickup` under HA settings.
- `ha-sync-esp-seqno` under IPsec phase1-interface settings.

You can configure IPsec VPN in an HA environment using the GUI or CLI.

In this example, the VPN name for HQ1 is "to_HQ2", and the VPN name for HQ2 is "to_HQ1".

To configure IPsec VPN in an HA environment in the GUI:

1. Set up IPsec VPN on HQ1 (the HA cluster):
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, set *No NAT between sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. In the *IP address* field, enter *172.16.202.1*.
      iii. For *Outgoing Interface*, select port1.
      iv. For *Authentication Method*, select *Pre-shared Key*.
      v. In the *Pre-shared Key* field, enter an example key.
      vi. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure the *Local Subnets* as *10.1.100.0/24*.
      iii. Configure the *Remote Subnets* as *172.16.101.0/24*.
      iv. Click *Create*.
2. Set up IPsec VPN on HQ2:
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, set *No NAT between sites*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Remote Device*, select *IP Address*.
      ii. In the *IP address* field, enter 172.16.200.1.
      iii. For *Outgoing Interface*, select port13.
      iv. For *Authentication Method*, select *Pre-shared Key*.
      v. In the *Pre-shared Key* field, enter an example key.
      vi. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the desired local interface. In this example, it is port9.
      ii. Configure the *Local Subnets* as 172.16.101.0.
      iii. Configure the *Remote Subnets* as 10.1.100.0
      iv. Click *Create*.

To configure IPsec VPN in an HA environment using the CLI:

1. Configure HA. In this example, two FortiGates work in active-passive mode. The HA heartbeat interfaces are WAN1 and WAN2:

```
config system ha
```

```
    set group-name "FGT-HA"
    set mode a-p
    set password sample
    set hbdev "wan1" 50 "wan2" 50
    set session-pickup enable
    set priority 200
    set override-wait-time 10
end
```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.
   a. Configure HQ1:
   ```
   config system interface
      edit "port1"
         set vdom "root"
         set ip 172.16.200.1 255.255.255.0
      next
   end
   config router static
      edit 1
         set gateway 172.16.200.3
         set device "port1"
      next
   end
   ```
   b. Configure HQ2:
   ```
   config system interface
      edit "port25"
         set vdom "root"
         set ip 172.16.202.1 255.255.255.0
      next
   end
   config router static
      edit 1
         set gateway 172.16.202.2
         set device "port25"
      next
   end
   ```
3. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.
   a. Configure HQ1:
   ```
   config system interface
      edit "dmz"
         set vdom "root"
         set ip 10.1.100.1 255.255.255.0
      next
   end
   ```
   b. Configure HQ2:
   ```
   config system interface
      edit "port9"
         set vdom "root"
         set ip 172.16.101.1 255.255.255.0
      next
   end
   ```
4. Configure the IPsec phase1-interface. This example uses PSK as the authentication method. You can also use signature authentication.

a. Configure HQ1:
```
config vpn ipsec phase1-interface
   edit "to_HQ2"
      set interface "port1"
      set peertype any
      set net-device enable
      set ha-sync-esp-seqno enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample
   next
end
```
b. Configure HQ2:
```
config vpn ipsec phase1-interface
   edit "to_HQ1"
      set interface "port25"
      set peertype any
      set net-device enable
      set ha-sync-esp-seqno enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.200.1
      set psksecret sample
   next
```

5. Configure the IPsec phase2-interface:

a. Configure HQ1:
```
config vpn ipsec phase2-interface
   edit "to_HQ2"
      set phase1name "to_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
   next
end
```
b. Configure HQ2:
```
config vpn ipsec phase2-interface
   edit "to_HQ1"
      set phase1name "to_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
      set auto-negotiate enable
   next
end
```

6. Configure static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure IPsec traffic does not match the default route when the IPsec tunnel is down.

a. Configure HQ1:
```
config router static
   edit 2
      set dst 172.16.101.0 255.255.255.0
      set device "to_HQ2"
   next
   edit 3
      set dst 172.16.101.0 255.255.255.0
      set blackhole enable
      set distance 254
   next
```

```
end
```

b. Configure HQ2:

```
config router static
   edit 2
      set dst 10.1.100.0 255.255.255.0
      set device "to_HQ1"
   next
   edit 3
      set dst 10.1.100.0 255.255.255.0
      set blackhole enable
      set distance 254
   next
end
```

7. Configure two firewall policies to allow bi-directional IPsec traffic flow over the IPsec tunnel:

a. Configure HQ1:

```
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "to_HQ2"
      set dstintf "dmz"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "dmz"
      set dstintf "to_HQ2"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

b. Configure HQ2:

```
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "to_HQ1"
      set dstintf "port9"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "port9"
      set dstintf "to_HQ1"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
```

```
      set schedule "always"
      set service "ALL"
   next
end
```

8. Use the following `diagnose` commands to check IPsec phase1/phase2 interface status including the sequence number on the secondary FortiGate. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.
   a. Run the `HQ1 # diagnose vpn ike gateway list` command. The system should return the following:
   ```
   vd: root/0
   name: to_HQ2
   version: 1
   interface: port1 11
   addr: 172.16.200.1:500 -> 172.16.202.1:500
   created: 5s ago
   IKE SA: created 1/1 established 1/1 time 0/0/0 ms
   IPsec SA: created 2/2 established 2/2 time 0/0/0 ms

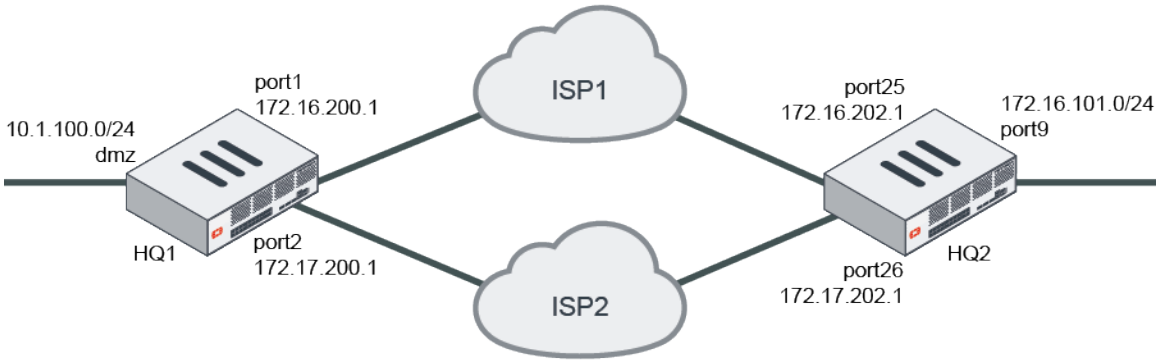
IPsec aggregate for redundancy and traffic load-balancing

This is a sample configuration of a multiple site-to-site IPsec VPN that uses an IPsec aggregate interface to set up redundancy and traffic load-balancing. The VPN tunnel interfaces must have `net-device` disabled in order to be members of the IPsec aggregate.

Each FortiGate has two WAN interfaces connected to different ISPs. OSPF runs over the IPsec aggregate in this configuration.

The supported load balancing algorithms are: L3, L4, round-robin (default), weighted round-robin, and redundant. The first four options allow traffic to be load-balanced, while the last option (redundant) uses the first tunnel that is up for all traffic.

Dynamic routing can run on the aggregate interface, and it can be a member interface in SD-WAN (not shown in this configuration).



Configuring the HQ1 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.
5. Configure OSPF.

To create the IPsec tunnels:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter pri_HQ2 and click *Next*.
3. Enter the following:

Phase 1	
IP Address	172.16.202.1
Interface	port1
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named sec_HQ2 with the following settings:

Phase 1	
IP Address	172.17.202.1
Interface	port2
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Aggregate*.
2. For *Name*, enter agg_HQ2.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ2* and *sec_HQ2*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ2
Outgoing Interface	dmz
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	dmz
Outgoing Interface	agg_HQ2
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network* > *Interfaces* and edit agg_HQ2.
2. For *IP*, enter 10.10.10.1.
3. For *Remote IP/Netmask*, enter 10.10.10.2 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network* > *OSPF*.
2. For *Router ID*, enter 1.1.1.1.
3. In the *Areas* table, click *Create New*.
   a. For *Area ID*, enter 0.0.0.0.
   b. Click *OK*.

4. In the *Networks* table, click *Create New*.
   a. Set the *Area* to *0.0.0.0*.
   b. For *IP/Netmask*, enter 10.1.100.0/24.
   c. Click *OK*.
   d. Click *Create New*.
   e. For *IP/Netmask*, enter 10.10.10.0/24.
   f. Click *OK*.
5. Click *Apply*.

Configuring the HQ2 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.
5. Configure OSPF.

To create the IPsec tunnels:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter pri_HQ1 and click *Next*.
3. Enter the following:

Phase 1	
IP Address	172.16.200.1
Interface	port25
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named sec_HQ1 with the following settings:

Phase 1

IP Address	172.17.200.1
Interface	port26
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Aggregate*.
2. For *Name*, enter agg_HQ1.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ1* and *sec_HQ1*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ1
Outgoing Interface	port9
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	port9

Outgoing Interface	agg_HQ1
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network* > *Interfaces* and edit agg_HQ1.
2. For *IP*, enter 10.10.10.2.
3. For *Remote IP/Netmask*, enter 10.10.10.1 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network* > *OSPF*.
2. For *Router ID*, enter 2.2.2.2.
3. In the *Areas* table, click *Create New*.
   a. For *Area ID*, enter 0.0.0.0.
   b. Click *OK*.
4. In the *Networks* table, click *Create New*.
   a. Set the *Area* to *0.0.0.0*.
   b. For *IP/Netmask*, enter 172.16.101.0/24.
   c. Click *OK*.
   d. Click *Create New*.
   e. For *IP/Netmask*, enter 10.10.10.0/24.
   f. Click *OK*.
5. Click *Apply*.

Monitoring the traffic in the GUI

To monitor the traffic:

1. Go to *Dashboard* > *Network* , hover over the *IPsec* widget, then click *Expand to Full Screen*.
2. Expand the aggregate tunnel in the table to view statistics for each aggregate member.

Configuring the HQ1 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.

5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port1, port2, and dmz as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
   edit "pri_HQ2"
      set interface "port1"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample1
   next
   edit "sec_HQ2"
      set interface "port2"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.202.1
      set psksecret sample2
   next
   end
config vpn ipsec phase2-interface
   edit "pri_HQ2"
      set phase1name "pri_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
           chacha20poly1305
      set auto-negotiate enable
   next
   edit "sec_HQ2"
      set phase1name "sec_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
           chacha20poly1305
      set auto-negotiate enable
   next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
   edit "agg_HQ2"
      set member "pri_HQ2" "sec_HQ2"
   next
end
```

To configure the firewall policies:

```
config firewall policy
   edit 1
```

```
      set name "inbound"
      set srcintf "agg_HQ2"
      set dstintf "dmz"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "dmz"
      set dstintf "agg_HQ2"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
   edit "agg_HQ2"
      set ip 10.10.10.1 255.255.255.255
      set remote-ip 10.10.10.2 255.255.255.255
   next
end
```

To configure OSPF:

```
config router ospf
   set router-id 1.1.1.1
   config area
      edit 0.0.0.0
      next
   end
   config network
      edit 1
         set prefix 10.1.100.0 255.255.255.0
      next
      edit 2
         set prefix 10.10.10.0 255.255.255.0
      next
   end
end
```

Configuring the HQ2 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.

5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port25, port26, and port9 as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
   edit "pri_HQ1"
      set interface "port25"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.200.1
      set psksecret sample1
   next
   edit "sec_HQ1"
      set interface "port26"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.200.1
      set psksecret sample2
   next
end
config vpn ipsec phase2-interface
   edit "pri_HQ1"
      set phase1name "pri_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
           chacha20poly1305
      set auto-negotiate enable
   next
   edit "sec_HQ1"
      set phase1name "sec_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
           chacha20poly1305
      set auto-negotiate enable
   next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
   edit "agg_HQ1"
      set member "pri_HQ1" "sec_HQ1"
   next
end
```

To configure the firewall policies:

```
config firewall policy
   edit 1
```

```
      set name "inbound"
      set srcintf "agg_HQ1"
      set dstintf "port9"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "port9"
      set dstintf "agg_HQ1"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
   edit "agg_HQ1"
      set ip 10.10.10.2 255.255.255.255
      set remote-ip 10.10.10.1 255.255.255.255
   next
end
```

To configure OSPF:

```
config router ospf
   set router-id 2.2.2.2
   config area
      edit 0.0.0.0
      next
   end
   config network
      edit 1
         set prefix 172.16.101.0 255.255.255.0
      next
      edit 2
         set prefix 10.10.10.0 255.255.255.0
      next
   end
end
```

Monitoring the traffic in the CLI

To view debugging information:

1. Verify the status of the phase 1 IKE SAs:

```
# diagnose vpn ike gateway list
vd: root/0
```

```
name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms
  id/spi: 173 dcdede154681579b/e32f4c48c4349fc0 direction: responder status: established
       1498-1498s ago = 10ms proposal: aes128-sha256 key: d7230a68d7b83def-
       588b94495cfa9d38 lifetime/rekey: 86400/84631 DPD sent/recv: 0000000d/00000006
vd: root/0
name: sec_HQ2
version: 1
interface: port2 12
addr: 172.17.200.1:500 -> 172.17.202.1:500
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms
  id/spi: 174 a567bd7bf02a04b5/4251b6254660aee2 direction: responder status: established

```

```
   dec:pkts/bytes=38/2568, enc:pkts/bytes=39/5432
```

3. Debug the IPsec aggregation list:

```
# diagnose sys ipsec-aggregate list
agg_HQ2 algo=RR member=2 run_tally=2
members:
   pri_HQ2
   sec_HQ2
```

4. Verify the OSPF neighbor information:

```
# get router info ospf neighbor
OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:34 10.10.10.2 agg1_HQ2
```

5. Verify the OSPF routing table:

```
# get router info routing-table ospf
Routing table for VRF=0
O 172.16.101.0/24 [110/20] via 10.10.10.2, agg1_HQ2 , 00:18:43
```

Packet distribution for aggregate dial-up IPsec tunnels

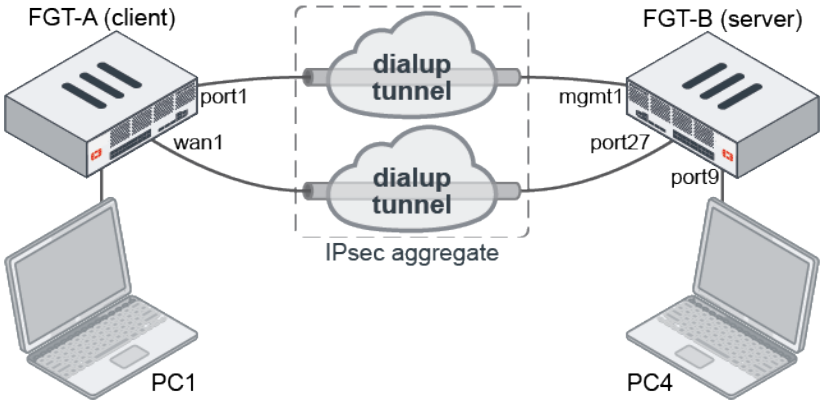
To support per-packet load balancing on aggregate dial-up IPsec tunnels between sites, each spoke must be configured with a location ID. On the hub, per-packet load balancing is performed on the tunnels in the IPsec aggregate that have the same location ID.

Multiple dial-up VPN tunnels from the same location can be aggregated on the VPN hub and load balanced based on the configured load balance algorithm.

IPsec traffic cannot be offloaded to the NPU.

Example

In this example, an IPsec aggregate tunnel is formed between two dial-up IPsec tunnels in order to support per-packet load balancing.



To configure the client FortiGate (FGT-A):

1. Configure the IPsec tunnels:

```
config vpn ipsec phase1-interface
    edit "client1"
```

```
        set interface "port1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.4
        set psksecret **********
    next
    edit "client2"
        set interface "wan1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
    edit "agg1"
        set member "client1" "client2"
    next
end
```

3. Configure the location ID:

```
config system settings
    set location-id 1.1.1.1
end
```

To configure the server FortiGate (FGT-B):

1. Configure the IPsec tunnels:

```
config vpn ipsec phase1-interface
    edit "server1"
        set type dynamic
        set interface "mgmt1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret ***********
        set dpd-retryinterval 60
    next
    edit "server2"
        set type dynamic
        set interface "port27"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret **********
```

```
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "server1"
        set phase1name "server1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
    edit "server2"
        set phase1name "server2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
    edit "server"
        set member "server1" "server2"
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
        set srcintf "server"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To check the IPsec tunnel and aggregate state:

1. List all of the VPN tunnels:

```
FGDocs # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------

```

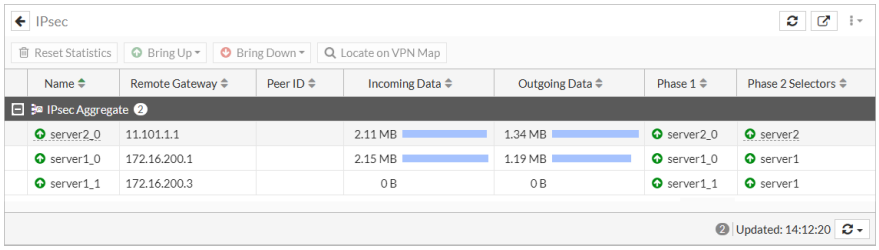
2. List the IPsec aggregate members:

```
# diagnose sys ipsec-aggregate list
server
members(3):
        server1_1
        server1_0
        server2_0
```

3. In the GUI, go to *Dashboard* > *Network* and expand the *IPsec* widget to review the traffic distributed over the aggregate members:



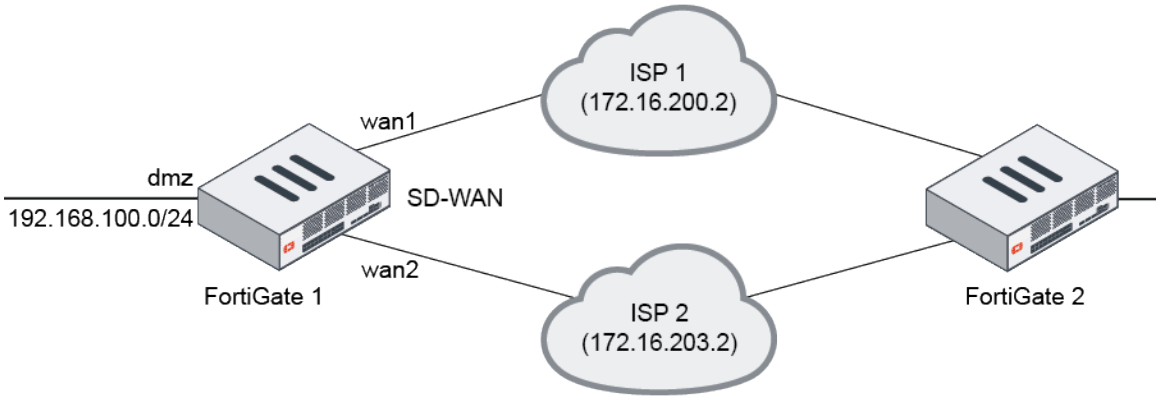
Per packet distribution and tunnel aggregation

This is a sample configuration of aggregating IPsec tunnels by using per-packet load-balancing.

This feature only allows static and DDNS tunnels to be members.

Dynamic (dialup) tunnels are not allowed because dialup instances tend to have different locations and hence different routing. This conflicts with the rule that all the members of an aggregate must have the same routing.

For example, a customer has two ISP connections, wan1 and wan2. On each FortiGate, two IPsec VPN interfaces are created. Next, an `ipsec-aggregate` interface is created and added as an SD-WAN member.



Configuring FortiGate 1

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.201.2
        set psksecret ftnt1234
    next
    edit "vd1-p2"
        set interface "wan2"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.202.2
        set psksecret ftnt1234
    next
end
```

```
config vpn ipsec phase2-interface
    edit "vd1-p1"
        set phase1name "vd1-p1"
    next
    edit "vd1-p2"
        set phase1name "vd1-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg1"
        set member "vd1-p1" "vd1-p2"
        set algorithm L3
    next
end
```

```
config system interface
    edit "agg1"
        set vdom "root"
        set ip 172.16.11.1 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.2 255.255.255.255
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "agg1"
            set gateway 172.16.11.2
        next
    end
end
```

Configuring FortiGate 2

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd2-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
```

```
        set dhgrp 14
        set remote-gw 172.16.200.1
        set psksecret ftnt1234
    next
    edit "vd2-p2"
        set interface "wan2"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.203.1
        set psksecret ftnt1234
    next
end
config vpn ipsec phase2-interface
    edit "vd2-p1"
        set phase1name "vd2-p1"
    next
    edit "vd2-p2"
        set phase1name "vd2-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg2"
        set member "vd2-p1" "vd2-p2"
        set algorithm L3
    next
end
config system interface
    edit "agg2"
        set vdom "root"
        set ip 172.16.11.2 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.1 255.255.255.255
    next
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "agg2"
            set gateway 172.16.11.1
        next
    end
end
```

Related diagnose commands

To display aggregate IPsec members:

```
# diagnose sys ipsec-aggregate list
agg1 algo=L3 member=2 run_tally=2
members:
        vd1-p1
        vd1-p2
```

To check the VPN status:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0

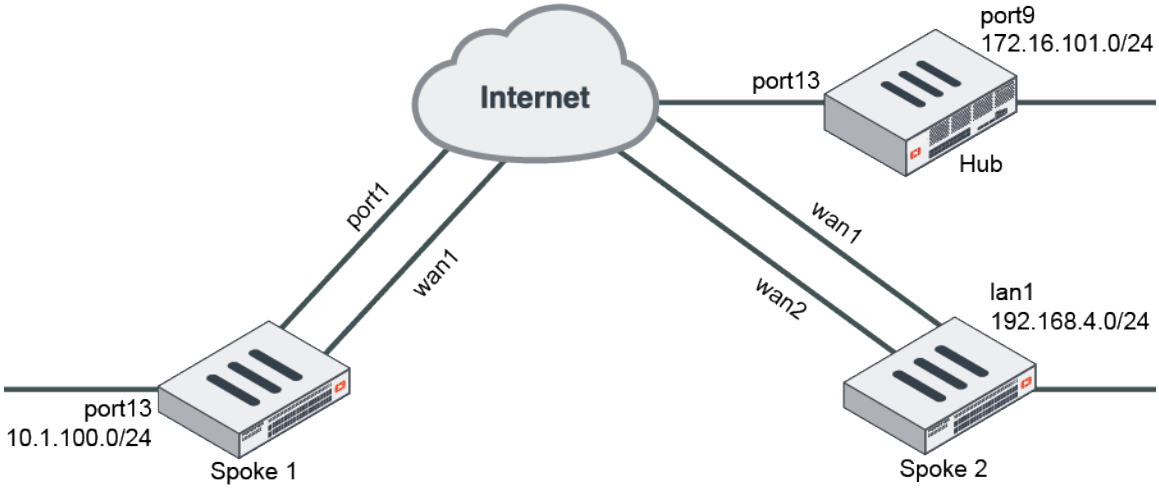
Redundant hub and spoke VPN

A redundant hub and spoke configuration allows VPN connections to radiate from a central FortiGate unit (the hub) to multiple remote peers (the spokes). Traffic can pass between private networks behind the hub and private networks behind the remote peers. Traffic can also pass between remote peer private networks through the hub.

This is a sample configuration of hub and spoke IPsec VPN. The following applies for this scenario:

- The spokes have two WAN interfaces and two IPsec VPN tunnels for redundancy.
- The secondary VPN tunnel is up only when the primary tunnel is down by dead peer detection.



Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure redundant hub and spoke VPN using the FortiOS CLI:

1. Configure the hub.
   a. Configure the WAN, internal interface, and static route.

```
config system interface
   edit "port13"
      set alias "WAN"
      set ip 172.16.202.1 255.255.255.0
   next
   edit "port9"
      set alias "Internal"
      set ip 172.16.101.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.202.2
      set device "port13"
   next
```

```
end
```

b. Configure the IPsec phase1-interface and phase2-interface.

```
config vpn ipsec phase1-interface
   edit "hub"
      set type dynamic
      set interface "port13"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set dpd on-idle
      set psksecret sample
      set dpd-retryinterval 60
   next
end
config vpn ipsec phase2-interface
   edit "hub"
      set phase1name "hub"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
           aes256gcm chacha20poly1305
   next
end
```

c. Configure the firewall policy.

```
config firewall policy
   edit 1
      set name "spoke-hub"
      set srcintf "hub"
      set dstintf "port9"
      set srcaddr "all"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "spoke-spoke"
      set srcintf "hub"
      set dstintf "hub"
      set srcaddr "all"
      set dstaddr "all"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

2. Configure the spokes.

a. Configure the WAN, internal interface, and static route.

i. Configure Spoke1.

```
config system interface
   edit "port1"
      set ip 172.16.200.1 255.255.255.0
   next
   edit "wan1"
      set mode dhcp
      set distance 10
      set priority 100
   next
```

```
    edit "dmz"
      set ip 10.1.100.1 255.255.255.0
    next
  end
  config router static
    edit 1
      set gateway 172.16.200.2
      set device "port1"
    next
  end
```

ii. Configure Spoke2.

```
config system interface
  edit "wan1"
    set ip 172.16.200.3 255.255.255.0
  next
  edit "wan2"
    set mode dhcp
    set distance 10
    set priority 100
  next
  edit "lan1"
    set ip 192.168.4.1 255.255.255.0
  next
end
config router static
  edit 1
    set gateway 172.16.200.2
    set device "wan1"
  next
end
```

b. Configure IPsec phase1-interface and phase2-interface.

i. Configure Spoke1.

```
config vpn ipsec phase1-interface
  edit "primary"
    set interface "port1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set psksecret sample
    next
  edit "secondary"
    set interface "wan1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set monitor "primary"
    set psksecret sample
    next
end
config vpn ipsec phase2-interface
  edit "primary"
    set phase1name "primary"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
         aes256gcm chacha20poly1305
```

```
      set auto-negotiate enable
      set src-subnet 10.1.100.0 255.255.255.0
    next
    edit "secondary"
      set phase1name "secondary"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
          aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 10.1.100.0 255.255.255.0
    next
  end
```

ii. Configure Spoke2.

```
config vpn ipsec phase1-interface
  edit "primary"
    set interface "wan1"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set psksecret sample
    next
  edit "secondary"
    set interface "wan2"
    set peertype any
    set net-device enable
    set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
    set remote-gw 172.16.202.1
    set monitor "primary"
    set psksecret sample
    next
end
config vpn ipsec phase2-interface
  edit "primary"
    set phase1name "primary"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
    set auto-negotiate enable
    set src-subnet 192.168.4.0 255.255.255.0
  next
  edit "secondary"
    set phase1name "secondary"
    set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
        aes256gcm chacha20poly1305
    set auto-negotiate enable
    set src-subnet 192.168.4.0 255.255.255.0
  next
end
```

c. Configure the firewall policy.

i. Configure Spoke1.

```
config firewall policy
  edit 1
    set srcintf "dmz"
    set dstintf "primary" "secondary"
    set srcaddr "10.1.100.0"
    set dstaddr "172.16.101.0"
    set action accept
```

```
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2.

```
config firewall policy
    edit 1
        set srcintf "lan1"
        set dstintf "primary" "secondary"
        set srcaddr "192.168.4.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the static route.

i. Configure Spoke1.

```
config router static
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set distance 1
        set device "primary"
    next
    edit 4
        set dst 172.16.101.0 255.255.255.0
        set distance 3
        set device "secondary"
    next
end
```

ii. Configure Spoke2.

```
config router static
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set distance 1
        set device "primary"
    next
    edit 4
        set dst 172.16.101.0 255.255.255.0
        set distance 3
        set device "secondary"
    next
end
```

3. Run `diagnose` and `get` commands.

a. Run the `Spoke1 # diagnose vpn tunnel list` command. The system should return the following:

```
name=primary ver=1 serial=1 172.16.200.1:0->172.16.202.1:0
bound_if=11 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/528 options[0210]=create_
     dev frag-rfc accept_traffic=1

   src: 0:10.1.100.0/255.255.255.0:0 dst: 0:0.0.0.0/0.0.0.0:0
```

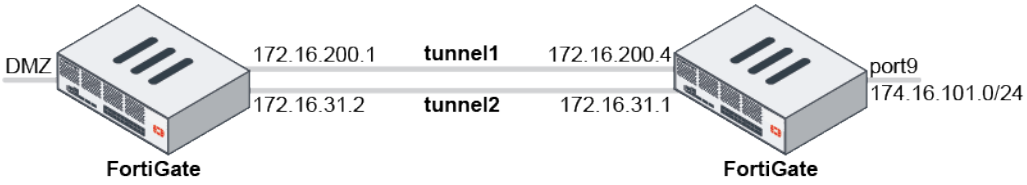
b. Run the `Spoke1 # get router info routing-table static` command. The system should return the following:

```
Routing table for VRF=0
.................
S 172.16.101.0/24 [1/0] is directly connected, primary
```

Weighted round robin for IPsec aggregate tunnels

A weighted round robin algorithm can be used for IPsec aggregate tunnels to distribute traffic by the weight of each member tunnel.

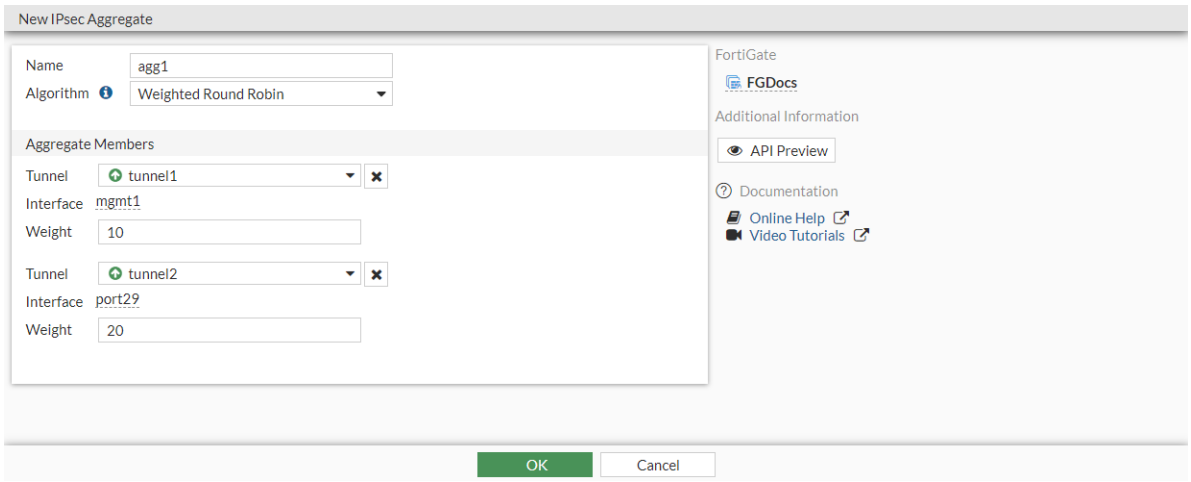
In this example, the FortiGate has two IPsec tunnels put into IPsec aggregate. Traffic is distributed among the members, with one third over *tunnel1*, and two thirds over *tunnel2*. To achieve this, the weighted round robin algorithm is selected, *tunnel1* is assigned a weight of 10, and *tunnel2* is assigned a weight of 20.



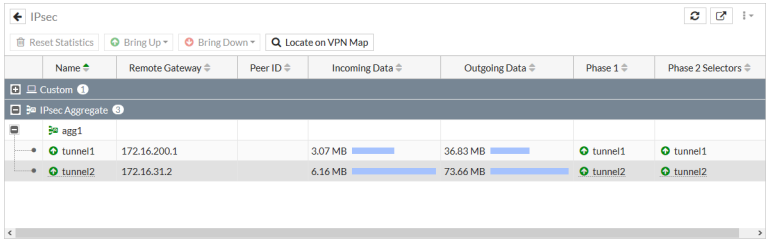
To create the IPsec aggregate in the GUI:

1. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Tunnel*.
2. Complete the wizard to create the *tunnel1* and *tunnel2* custom IPsec tunnels. Ensure that *Aggregate member* is *Enabled* for each tunnel under the *Network* > *Advanced* section.
3. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Aggregate*.
4. Enter a name for the aggregate, such as *agg1*, and ensure that *Algorithm* is *Weighted Round Robin*.
5. Add *tunnel1* as an aggregate members, and set *Weight* to *10*.

6. Add *tunnel2* as a second aggregate members, and set its *Weight* to *20*.



7. Click *OK*.
8. To view and monitor the aggregate tunnel statistics, go to the *IPsec* widget on the *Network* dashboard.



To create the IPsec aggregate in the CLI:

1. Create the *tunnel1* and *tunnel2* custom IPsec tunnels with aggregate-member enabled and aggregate-weight set for both tunnels:

```
config vpn ipsec phase1-interface
    edit "tunnel1"
        ...
        set aggregate-member enable
        set aggregate-weight 10
        ...
    next
    edit "tunnel2"
        ...
        set aggregate-member enable
        set aggregate-weight 20
        ...
    next
end
```

2. Create the IPsec aggregate:

```
config system ipsec-aggregate
    edit "agg1"
        set member "tunnel1" "tunnel2"
        set algorithm weighted-round-robin
    next
end
```

Overlay Controller VPN (OCVPN)

Overlay Controller VPN (OCVPN) is a cloud based solution to simplify IPsec VPN setup. When OCVPN is enabled, IPsec phase1-interfaces, phase2-interfaces, static routes, and firewall policies are generated automatically on all FortiGates that belong to the same community network. A community network is defined as all FortiGates registered to FortiCare using the same FortiCare account.

If the network topology changes on any FortiGates in the community (such as changing a public IP address in DHCP mode, adding or removing protected subnets, failing over in dual WAN), the IPsec-related configuration for all devices is updated with Cloud assistance in self-learning mode. No intervention is required.

The following topics provide instructions on configuring OCVPN:

- Full mesh OCVPN on page 1086
- Hub-spoke OCVPN with ADVPN shortcut on page 1091
- Hub-spoke OCVPN with inter-overlay source NAT on page 1095
- OCVPN portal on page 1099
- SD-WAN integration with OCVPN on page 444
- Allow FortiClient to join OCVPN on page 1100
- Troubleshooting OCVPN on page 1104

Full mesh OCVPN

This example shows how to configure a full mesh Overlay Controller VPN (OCVPN), establishing full mesh IPsec tunnels between all of the FortiGates.

License

- Free license: Three devices full mesh, 10 overlays, 16 subnets per overlay.
- Full License: Maximum of 16 devices, 10 overlays, 16 subnets per overlay.

Prerequisites

- All FortiGates must be running FortiOS 6.2.0 or later.
- All FortiGates must have Internet access.
- All FortiGates must be registered on FortiCare using the same FortiCare account.

Restrictions

- Non-root VDOMs do not support OCVPN.
- FortiOS 6.2.x is not compatible with FortiOS 6.0.x.

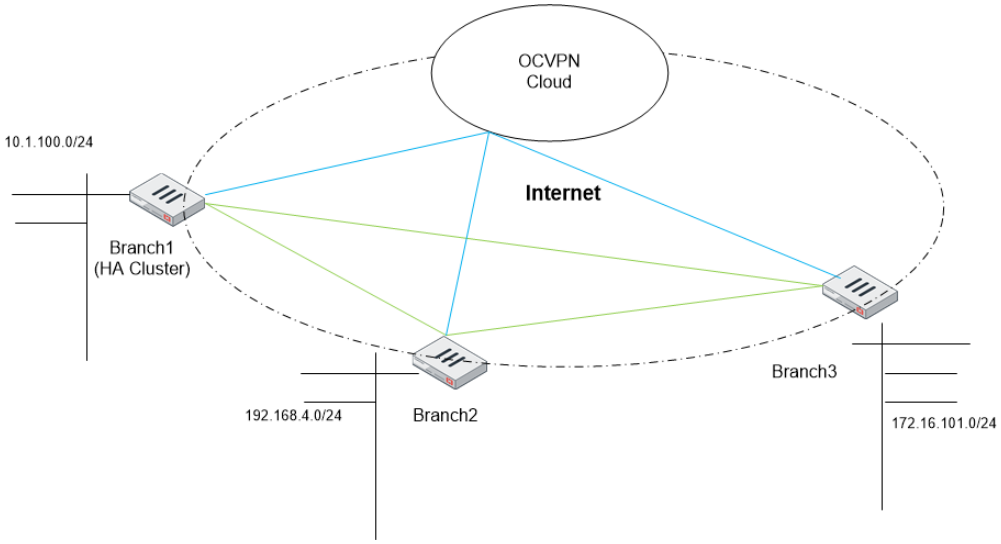
Terminology

Poll-interval	How often FortiGate tries to fetch OCVPN-related data from OCVPN Cloud.
Role	The device OCVPN role of spoke, primary-hub, or secondary-hub.
Overlay	Defines network overlays and bind to subnets.

Subnet	Internal network subnet (IPsec protected subnet). Traffic to or from this subnet enters the IPsec tunnel encrypted by IPsec SA.

Sample topology

The following example shows three FortiGate units registered on FortiCare using the same FortiCare account. Each FortiGate unit has one internal subnet, and no NAT exists between the units.



Sample configuration

The following overlays and subnets are used:

- Branch1:
  - Overlay name: QA. Local subnets: 10.1.100.0/24
  - Overlay name: PM. Local subnets: 10.2.100.0/24
- Branch2:
  - Overlay name: QA. Local interfaces: lan1
  - Overlay name: PM. Local interfaces: lan2
- Branch3:
  - Overlay name: QA. Local subnets: 172.16.101.0/24
  - Overlay name: PM. Local subnets: 172.16.102.0/24

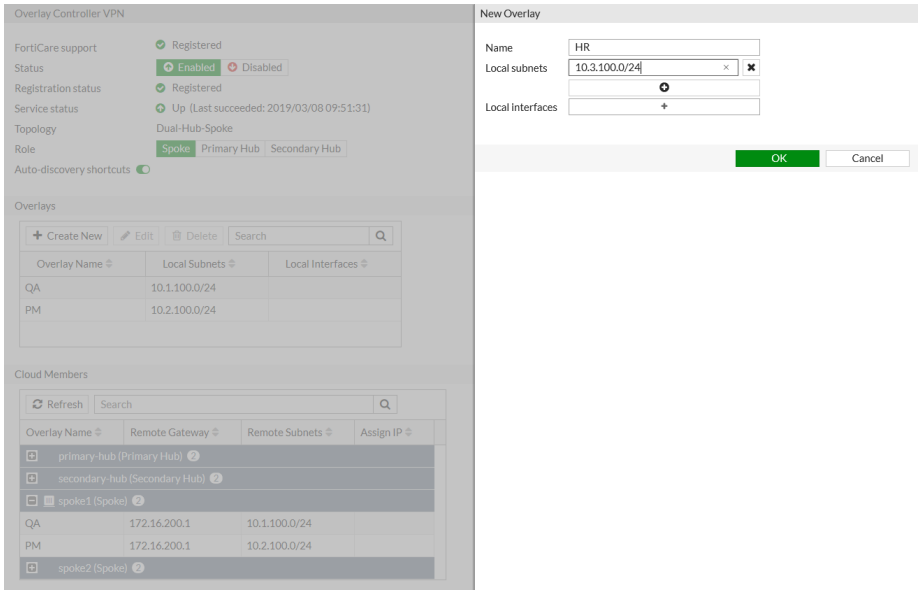
The overlay names on each device must be the same for local and remote selector pairs to be negotiated.

To register FortiGates on FortiCare:

1. Go to *System* > *FortiGuard* > *License Information* > *FortiCare Support*.
2. To register, click *Register* or *Launch Portal*.
3. Complete the options to register FortiGate on FortiCare.

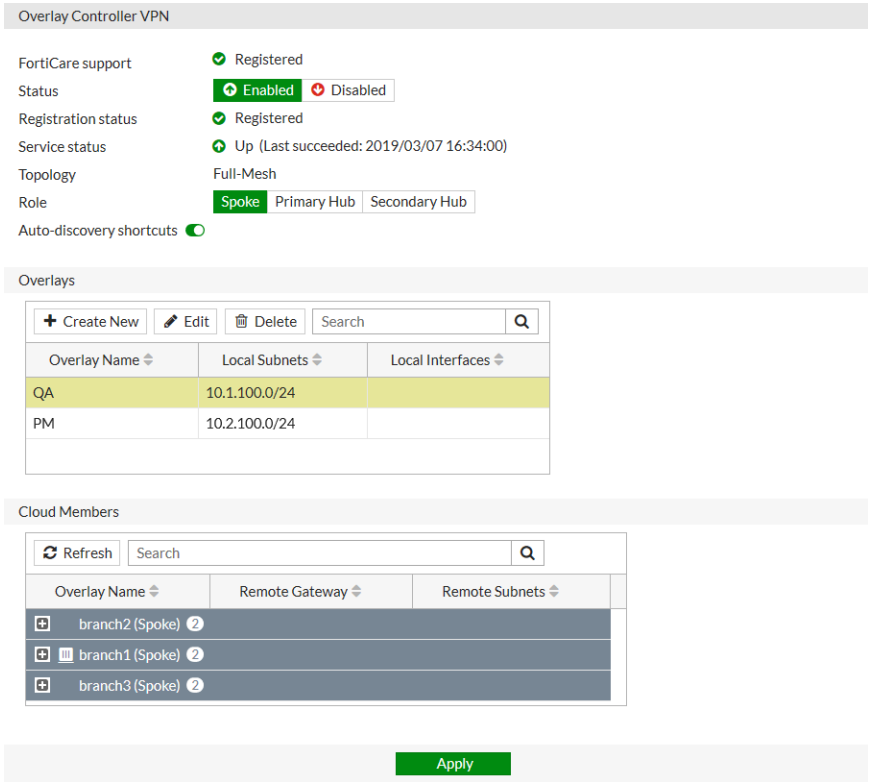
To enable OCVPN in the GUI:

1. Go to *VPN* > *Overlay Controller VPN*.
2. Create the first overlay by setting the following options:
   a. For *Status*, click *Enabled*.
   b. For *Role*, click *Spoke*.
   c. In the *Overlays* section, click *Create New* to create a network overlay.



3. Specify the *Name*, *Local subnets*, and/or *Local interfaces*.
   The local subnet must be routable and interfaces must have IP addresses.

4. Click *OK*.



5. Click *Apply* to commit the configuration.
6. Repeat this procedure to create all the overlays.

To enable OCVPN in the CLI:

1. Configure Branch1:

```
config vpn ocvpn
    set status enable
    set multipath disable
    config overlays
        edit 1
            set name "QA"
            config subnets
                edit 1
                    set subnet 10.1.100.0 255.255.255.0
                next
            end
        next
        edit 2
            set name "PM"
            config subnets
                edit 1
                    set subnet 10.2.100.0 255.255.255.0
                next
            end
        next
```

```
    end
end
```

2. Configure Branch2:

```
config vpn ocvpn
    set status enable
    set multipath disable
    config overlays
         edit 1
             set name "QA"
             config subnets
                  edit 1
                        set type interface
                        set interface "lan1"
                  next
             end
         next
         edit 2
             set name "PM"
             config subnets
                  edit 1
                        set type interface
                        set interface "lan2"
                  next
             end
         next
    end
end
```

3. Configure Branch3:

```
config vpn ocvpn
    set status enable
    set multipath disable
    config overlays
         edit 1
             set name "QA"
             config subnets
                 edit 1
                     set subnet 172.16.101.0 255.255.255.0
                 next
             end
         next
         edit 1
             set name "PM"
             config subnets
                 edit 1
                     set subnet 172.16.102.0 255.255.255.0
                 next
             end
         next
    end
end
```

Hub-spoke OCVPN with ADVPN shortcut

This topic shows a sample configuration of a hub-spoke One-Click VPN (OCVPN) with an Auto Discovery VPN (ADVPN) shortcut. OCVPN automatically detects the network topology based on members' information. To form a hub-spoke OCVPN, at least one device must announce its role as the primary hub, another device can work as the secondary hub (for redundancy), while others function as spokes.

License

- Free license: Hub-spoke network topology not supported.
- Full license: Maximum of 2 hubs, 10 overlays, 64 subnets per overlay; 1024 spokes, 10 overlays, 16 subnets per overlay.

Prerequisites

- All FortiGates must be running FortiOS 6.2.0 or later.
- All FortiGates must have Internet access.
- All FortiGates must be registered on FortiCare using the same FortiCare account.

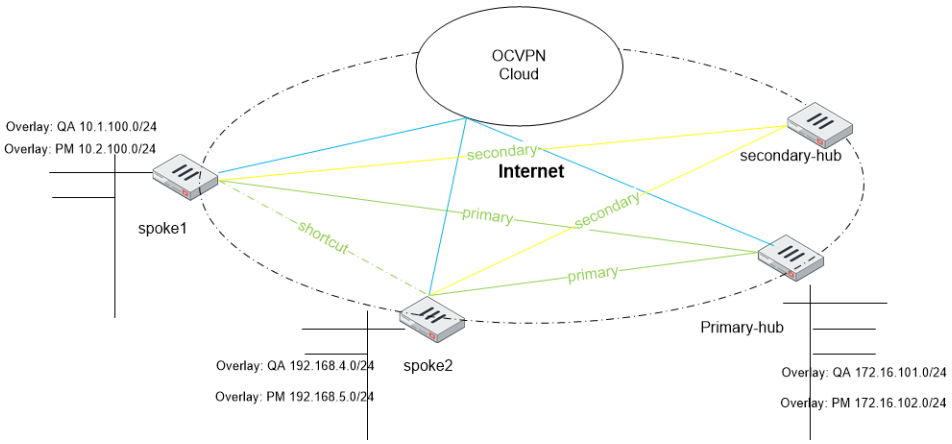
Restrictions

- Non-root VDOMs do not support OCVPN.
- FortiOS 6.2.x is not compatible with FortiOS 6.0.x.

OCVPN device roles

- Primary hub.
- Secondary hub.
- Spoke (OCVPN default role).

Sample topology



Sample configuration

The steps below use the following overlays and subnets for the sample configuration:

- Primary hub:
  - Overlay name: QA. Local subnets: 172.16.101.0/24
  - Overlay name: PM. Local subnets: 172.16.102.0/24
- Secondary hub:
  - Overlays are synced from primary hub.
- Spoke1:
  - Overlay name: QA. Local subnets: 10.1.100.0/24
  - Overlay name: PM. Local subnets: 10.2.100.0/24
- Spoke2:
  - Overlay name: QA. Local interfaces: lan1
  - Overlay name: PM. Local interfaces: lan2

The overlay names on each device must be the same for local and remote selector pairs to be negotiated.

To register FortiGates on FortiCare:

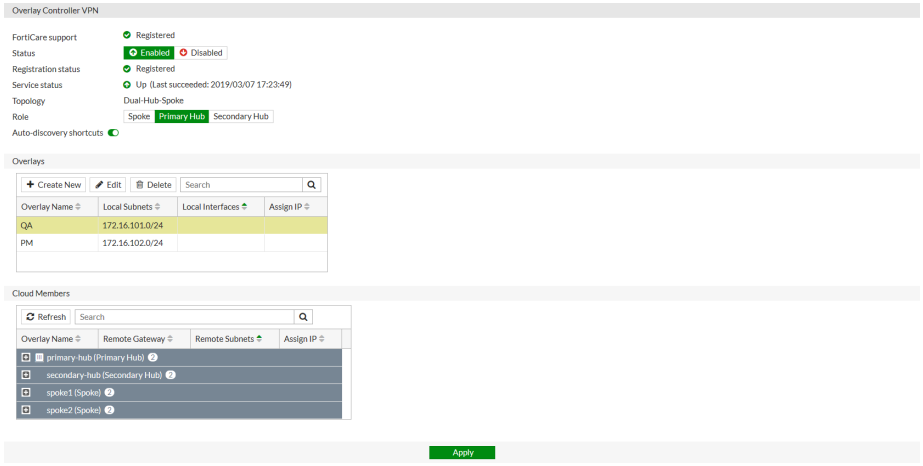
1. Go to *System* > *FortiGuard* > *License Information* > *FortiCare Support*.
2. To register, click *Register* or *Launch Portal*.
3. Complete the options to register FortiGate on FortiCare.

To enable hub-spoke OCVPN in the GUI:

1. Go to *VPN* > *Overlay Controller VPN*.
2. Configure the OCVPN primary hub by setting the following options:
   a. For *Status*, click *Enabled*.
   b. For *Role*, click *Primary Hub*.
   c. In the *Overlays* section, click *Create New* to create a network overlay.

   d. Specify the *Name*, *Local subnets*, and/or *Local interfaces*. Then click *OK*.

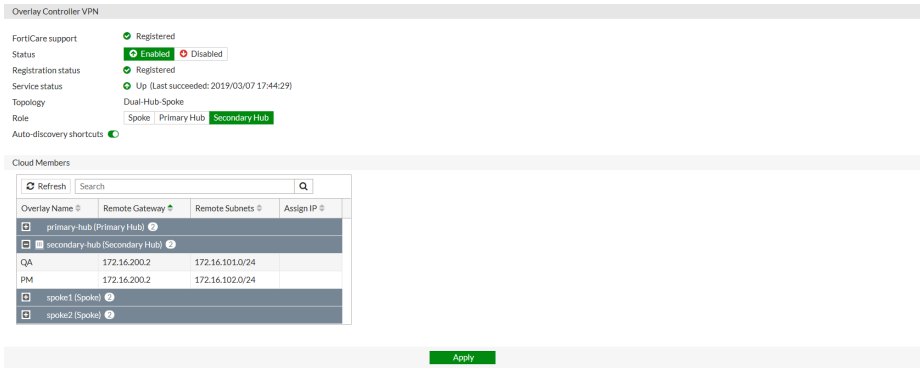
e. Click *Apply* to commit the configuration.



3. Configure the OCVPN secondary hub:
Overlays are synced from the primary hub and cannot be defined in the secondary hub.

a. In the *Overlay Controller VPN* pane, select *Secondary Hub* for the *Role*.

b. Select *Apply* to commit the configuration.



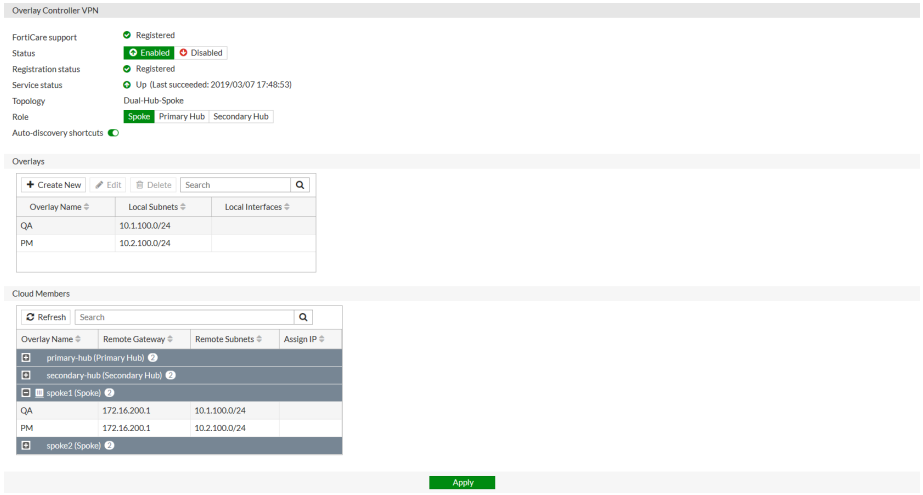
4. Configure the OCVPN spokes:

a. In the *Overlay Controller VPN* pane, select *Spoke* for the *Role*.

b. In the *Overlays* section, click *Create New* to create a network overlay.

c. Specify the *Name*, *Local subnets*, and/or *Local interfaces*.
The local subnet must be routable and interfaces must have IP addresses.

d. Click *OK* and then click *Apply* to commit the configuration.



To enable hub-spoke OCVPN in the CLI:

1. Configure the OCVPN primary hub:

```
config vpn ocvpn
    set status enable
    set role primary-hub
    config overlays
        edit 1
            set name "QA"
            config subnets
                edit 1
                    set subnet 172.16.101.0 255.255.255.0
                next
            end
        next
        edit 2
            set name "PM"
            config subnets
                edit 1
                    set subnet 172.16.102.0 255.255.255.0
                next
            end
        next
    end
end
```

2. Configure the OCVPN secondary hub:

```
config vpn ocvpn
    set status enable
    set role secondary-hub
end
```

3. Configure the OCVPN spoke1:

```
config vpn ocvpn
    set status enable
    config overlays
```

```
            edit 1
                set name "QA"
                config subnets
                    edit 1
                        set subnet 10.1.100.0 255.255.255.0
                    next
                end
            next
            edit 2
                set name "PM"
                config subnets
                    edit 1
                        set subnet 10.2.100.0 255.255.255.0
                    next
                end
            next
        end
    end
```

4. Configure the OCVPN spoke2:

```
    config vpn ocvpn
        set status enable
        config overlays
            edit 1
                set name "QA"
                config subnets
                    edit 1
                        set subnet 192.168.4.0 255.255.255.0
                    next
                end
            next
            edit 2
                set name "PM"
                config subnets
                    edit 1
                        set subnet 192.168.5.0 255.255.255.0
                    next
                end
            next
        end
    end
```

Hub-spoke OCVPN with inter-overlay source NAT

This topic shows a sample configuration of hub-spoke OCVPN with inter-overlay source NAT. OCVPN isolates traffic between overlays by default. With NAT enabled on spokes and `assign-ip` enabled on hub, you can have inter-overlay communication.

Inter-overlay communication means devices from any source addresses and any source interfaces can communicate with any devices in overlays' subnets when the overlay option `assign-ip` is enabled.

You must first disable `auto-discovery` before you can enable NAT.

License

- Free license: Hub-spoke network topology not supported.
- Full License: Maximum of 2 hubs, 10 overlays, 64 subnets per overlay; 1024 spokes, 10 overlays, 16 subnets per overlay.

Prerequisites

- All FortiGates must be running FortiOS 6.2.0 or later.
- All FortiGates must have Internet access.
- All FortiGates must be registered on FortiCare using the same FortiCare account.

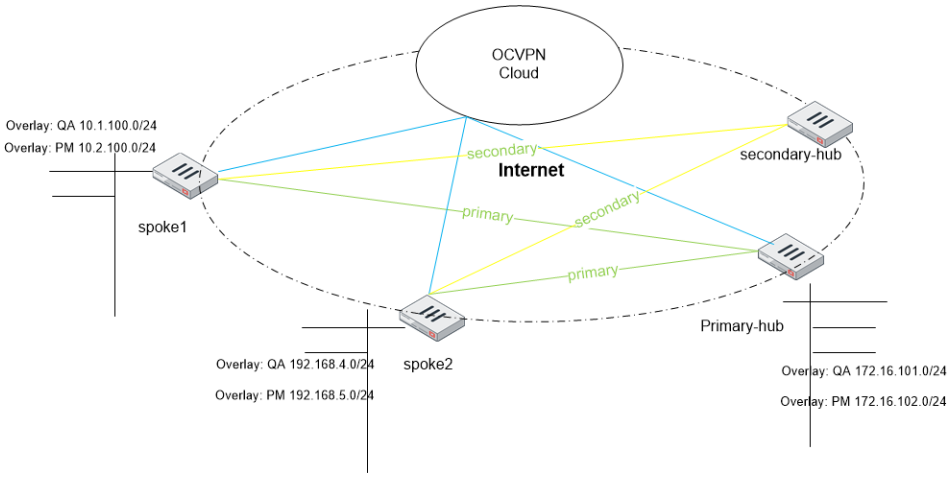
Restrictions

- Non-root VDOMs do not support OCVPN.
- FortiOS 6.2.x is not compatible with FortiOS 6.0.x.

OCVPN device roles

- Primary hub.
- Secondary hub.
- Spoke (OCVPN default role).

Sample topology



Sample configuration

You can only configure this feature using the CLI.

The overlay names on each device must be the same for local and remote selector pairs to be negotiated.

To enable inter-overlay source NAT in the CLI:

1. Configure the primary hub, enable overlay QA, and configure `assign-ip` and IP range:

```
config vpn ocvpn
    set status enable
    set role primary-hub
    config overlays
        edit 1
            set name "QA"
            set assign-ip enable
            set ipv4-start-ip 172.16.101.100
            set ipv4-end-ip 172.16.101.200
            config subnets
                edit 1
                    set subnet 172.16.101.0 255.255.255.0
                next
            end
        next
        edit 2
            set name "PM"
            set assign-ip enable
            config subnets
                edit 1
                    set subnet 172.16.102.0 255.255.255.0
                next
            end
        next
    end
end
```

2. Configure the secondary hub:

```
config vpn ocvpn
    set status enable
    set role secondary-hub
end
```

3. Configure spoke1 and enable NAT on the spoke:

```
config vpn ocvpn
    set status enable
    set auto-discovery disable
    set nat enable
    config overlays
        edit 1
            set name "QA"
            config subnets
                edit 1
                    set subnet 10.1.100.0 255.255.255.0
                next
            end
        next
        edit 2
            set name "PM"
            config subnets
                edit 1
                    set subnet 10.2.100.0 255.255.255.0
```

```
                next
            end
        next
    end
end
```

4. Configure spoke2 and enable NAT on the spoke:

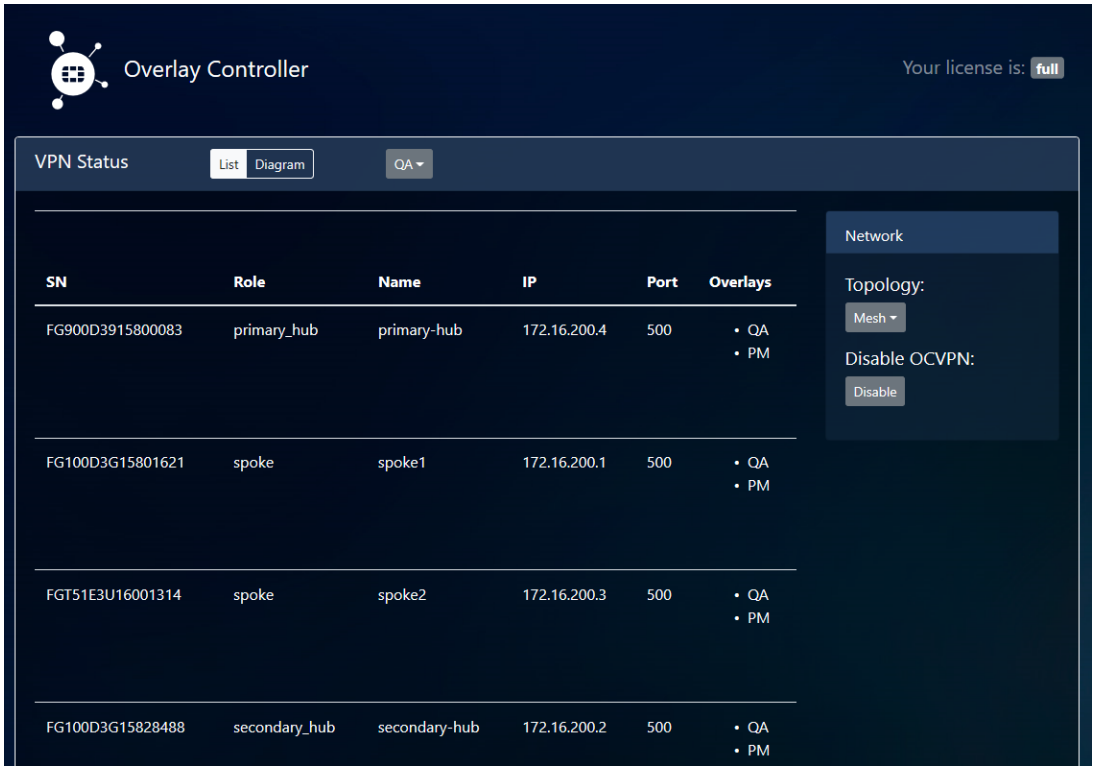
```
config vpn ocvpn
    set status enable
    set auto-discovery disable
    set nat enable
    config overlays
        edit 1
            set name "QA"
            config subnets
                edit 1
                    set subnet 192.168.4.0 255.255.255.0
                next
            end
        next
        edit 2
            set name "PM"
            config subnets
                edit 1
                    set subnet 192.168.5.0 255.255.255.0
                next
            end
        next
    end
end
```

A firewall policy with NAT is generated on the spoke:

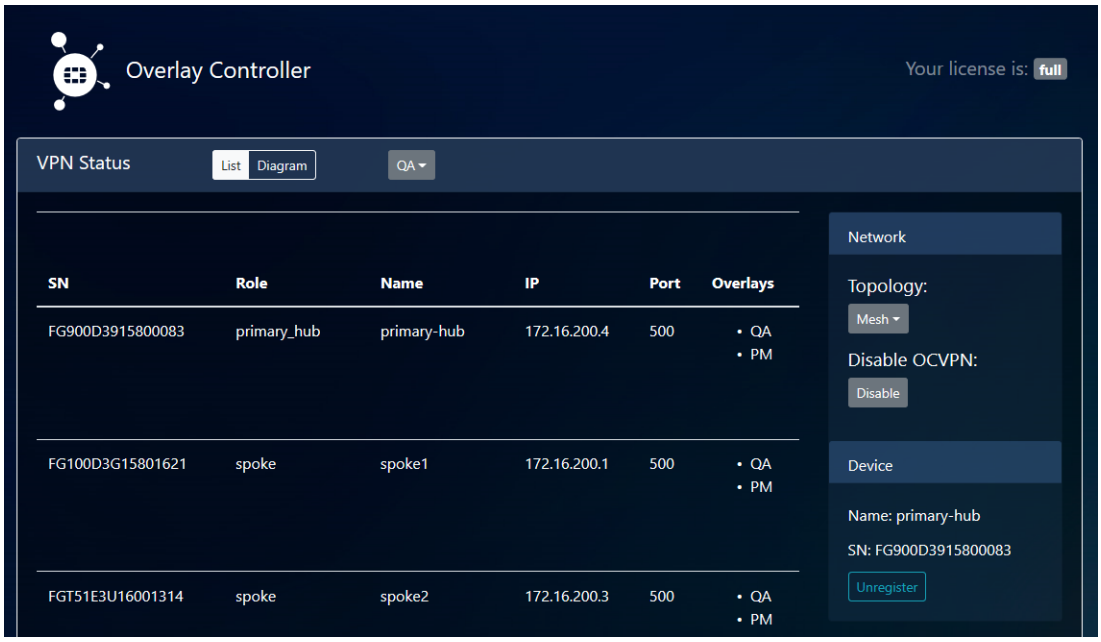
```
edit 9
   set name "_OCVPN2-1.1_nat"
   set uuid 3f7a84b8-3d36-51e9-ee97-8f418c91e666
   set srcintf "any"
   set dstintf "_OCVPN2-1.1"
   set srcaddr "all"
   set dstaddr "_OCVPN2-1.1_remote_networks"
   set action accept
   set schedule "always"
   set service "ALL"
   set comments "Generated by OCVPN Cloud Service."
   set nat enable
next
```

OCVPN portal

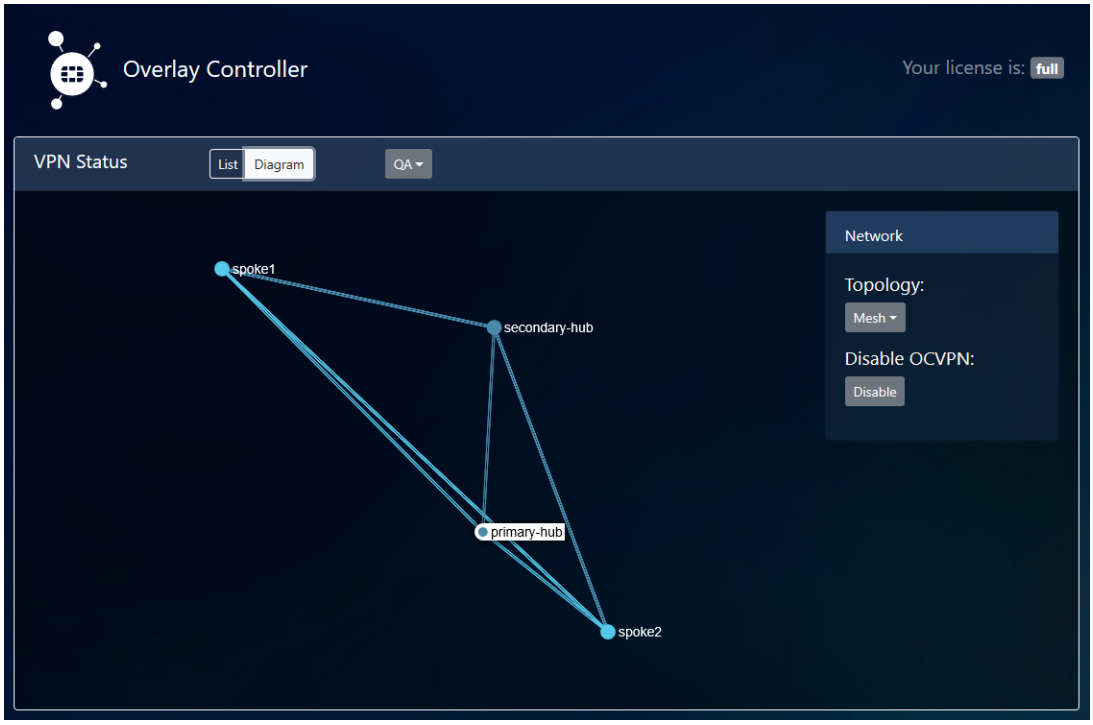
When you log into the OCVPN portal, the OCVPN license type and device information display. The device information includes the device serial number, OCVPN role, hostname, public IP address, port number, and overlays.



You can unregister an OCVPN device from the OCVPN portal under *Device* on the right pane.

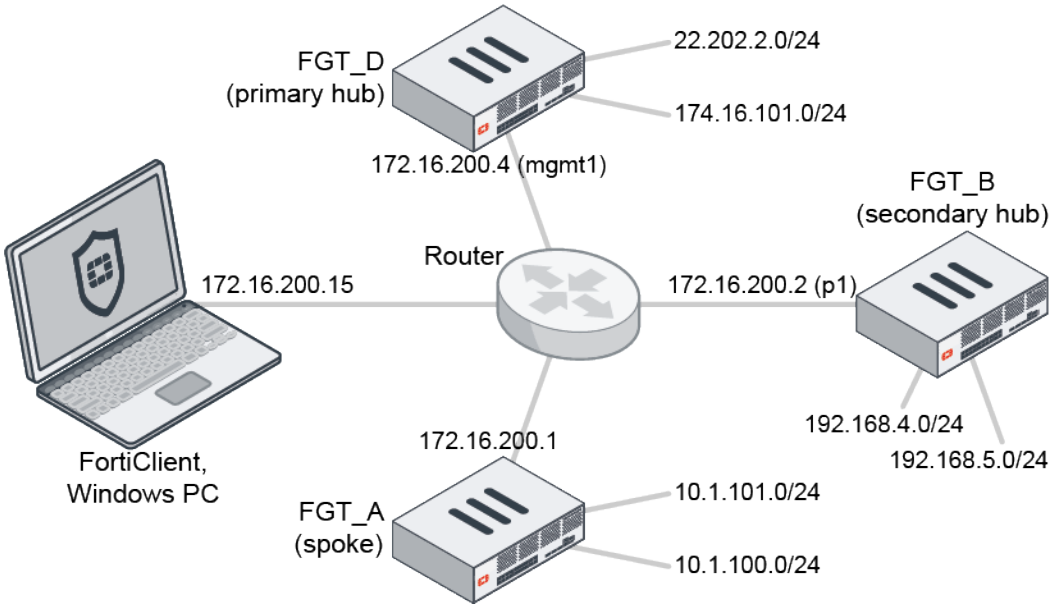


Use the OCVPN *Diagram* to show the OCVPN network topology.



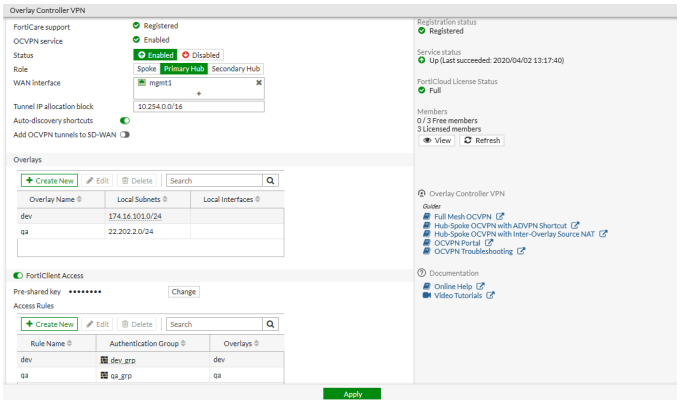
Allow FortiClient to join OCVPN

Administrators can configure remote access for FortiClient within an OCVPN hub. This provides simple configurations to allow a user group access to an overlay network.



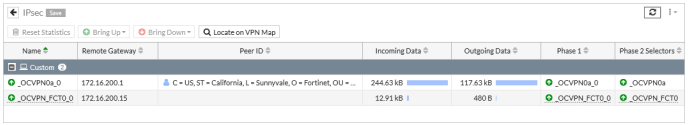
To configure remote FortiClient access to an OCVPN hub in the GUI:

1. On the primary hub, configure the users and user groups required for the FortiClient dialup user authentication and authorization. In this example, there are two user groups (*dev_grp* and *qa_grp*).
2. Go to *VPN* > *Overlay Controller VPN* and in the *Overlays* section, click *Create New*.
3. Enter a name and the local subnet (174.16.101.0/24 for *dev* and 22.202.2.0/24 for *qa*).
4. Enable *FortiClient Access*.
5. In the *Access Rules* section, click *Create New*.
6. Enter a name, and select the authentication groups and overlays.The authentication groups will be used by the IPsec phase 1 interface for authentication, and by firewall policies for authorization. The overlay allows access to the resource.
7. Click *OK*.
8. Create more rules if needed.
9. Click *Apply*.



To view the tunnel status and activity in the GUI:

1. Go to *Dashboard* > *Network*.
2. Click the *IPsec* widget to expand to full screen view.



To configure remote FortiClient access to an OCVPN hub in the CLI:

```
config vpn ocvpn
    set status enable
    set role primary-hub
    set wan-interface "mgmt1"
    set ip-allocation-block 10.254.0.0 255.255.0.0
    config overlays
        edit "dev"
            config subnets
                edit 1
                    set subnet 174.16.101.0 255.255.255.0
                next
            end
        next
```

```
        edit "qa"
            config subnets
                edit 1
                    set subnet 22.202.2.0 255.255.255.0
                next
            end
        next
    end
    config forticlient-access
        set status enable
        set psksecret xxxxxxxxxxxx
        config auth-groups
            edit "dev"
                set auth-group "dev_grp"
                set overlays "dev"
            next
            edit "qa"
                set auth-group "qa_grp"
                set overlays "qa"
            next
        end
    end
end
```

To view the tunnel status and activity in the CLI:

```
# diagnose vpn ike gateway list

vd: root/0
name: _OCVPN_FCT0_0

Troubleshooting OCVPN

This document includes troubleshooting steps for the following OCVPN network topologies:

- Full mesh OCVPN.
- Hub-spoke OCVPN with ADVPN shortcut.
- Hub-spoke OCVPN with inter-overlay source NAT.

For OCVPN configurations in other network topologies, see the other OCVPN topics.

Troubleshooting full mesh network topology

- Branch_1 # `diagnose vpn ocvpn status`

```

ADVPN

Auto-Discovery VPN (ADVPN) allows the central hub to dynamically inform spokes about a better path for traffic between two spokes.

The following topics provide instructions on configuring ADVPN:

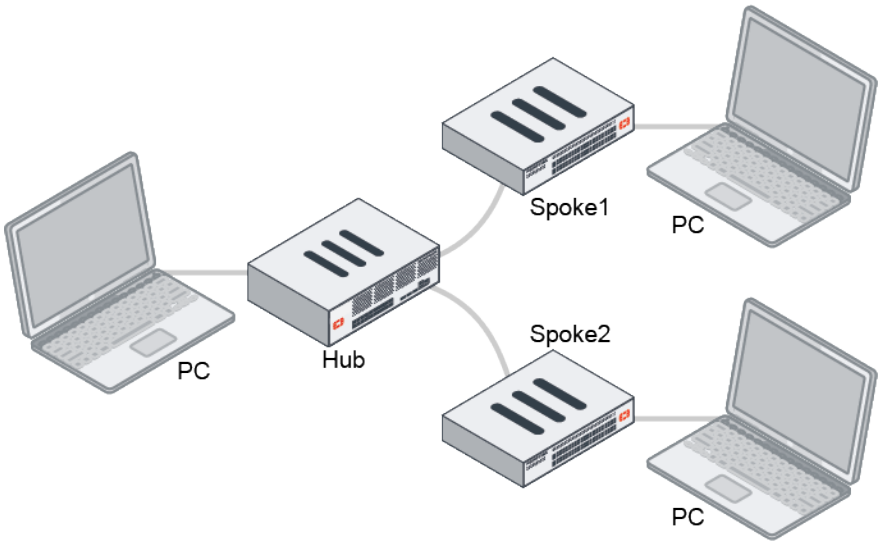
- IPsec VPN wizard hub-and-spoke ADVPN support on page 1117
- ADVPN with BGP as the routing protocol on page 1121
- ADVPN with OSPF as the routing protocol on page 1130
- ADVPN with RIP as the routing protocol on page 1139
- UDP hole punching for spokes behind NAT on page 1148

IPsec VPN wizard hub-and-spoke ADVPN support

When using the IPsec VPN wizard to create a hub and spoke VPN, multiple local interfaces can be selected. At the end of the wizard, changes can be reviewed, real-time updates can be made to the local address group and tunnel interface, and easy configuration keys can be copied for configuring the spokes.

When editing a VPN tunnel, the Hub & Spoke Topology section provides access to the easy configuration keys for the spokes, and allows you to add more spokes.

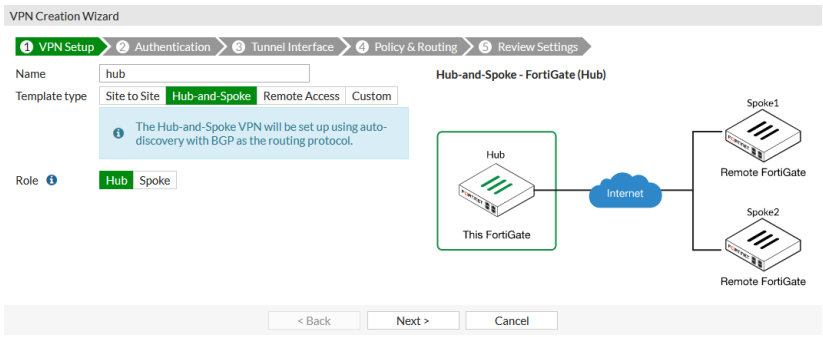
This example shows the configuration of a hub with two spokes.



To configure the hub:

1. Go to *VPN* > *IPsec Wizard*.
2. Go through the steps of the wizard:
   a. *VPN Setup*:

Name	hub
Template Type	Hub-and-Spoke
Role	Hub



b. *Authentication*:

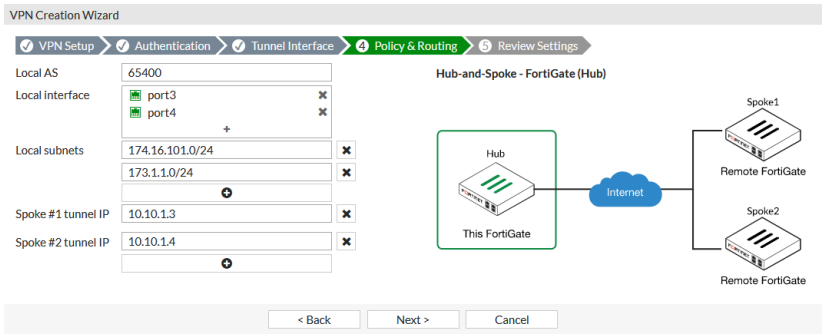
Incoming Interface	port1
Authentication method	Pre-shared Key
Pre-shared key	<key>

c. *Tunnel Interface*:

Tunnel IP	10.10.1.1
Remote IP/netmask	10.10.1.2/24

d. *Policy & Routing*:
Multiple local interfaces and subnets can be configured.

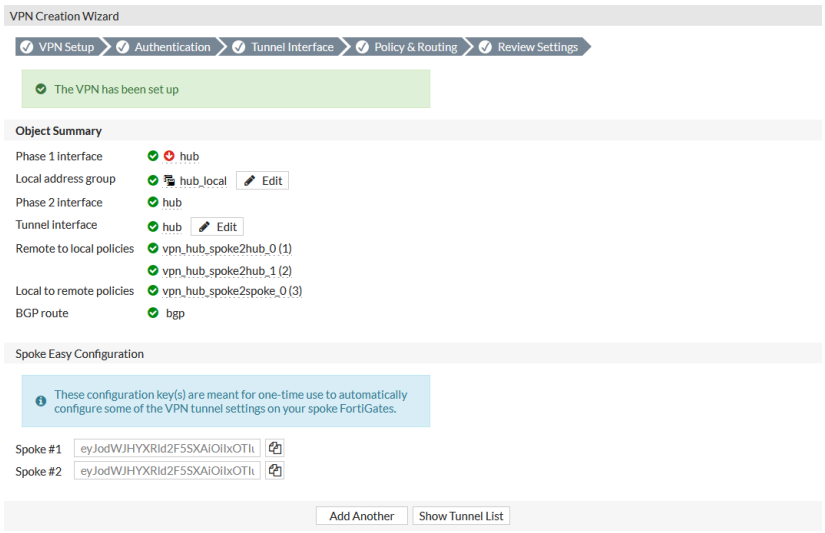
Local AS	65400
Local interface	port3 port4
Local subnets	174.16.101.0/24 173.1.1.0/24
Spoke #1 tunnel IP	10.10.1.3
Spoke #2 tunnel IP	10.10.1.4



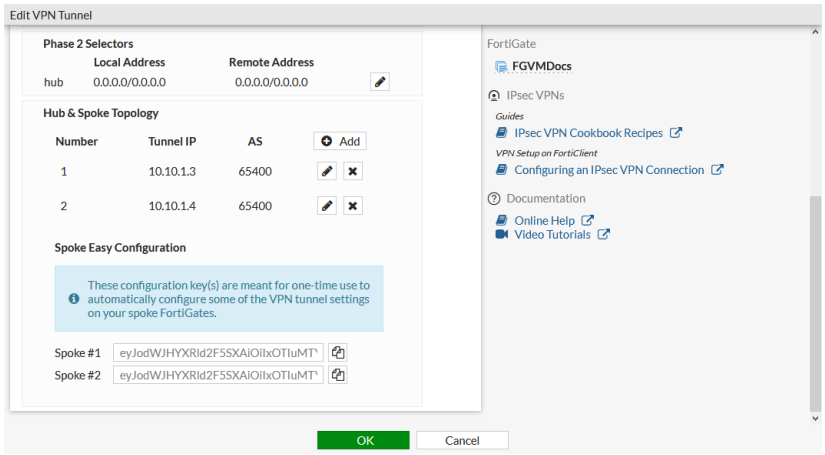
e. *Review Settings*:
Confirm that the settings look correct, then click *Create*.

3. The summary shows details about the set up hub:

- The *Local address group* and *Tunnel interface* can be edited directly on this page.
- Spoke easy configuration keys can be used to quickly configure the spokes.



4. Click *Show Tunnel List* to go to *VPN* > *IPsec Tunnels*.
5. Edit the VPN tunnel to add more spokes and to copy the spokes' easy configuration keys.

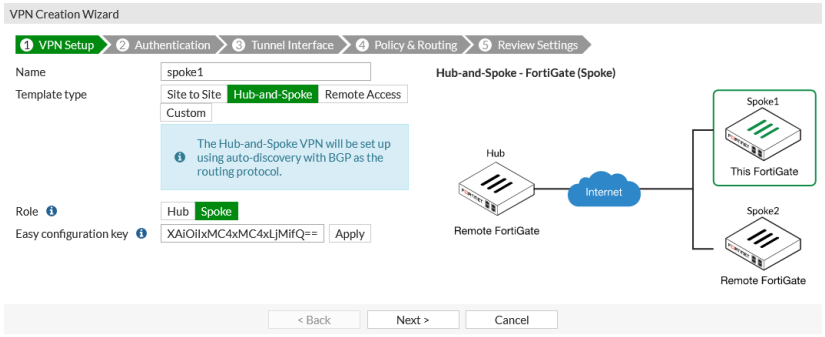


To configure the spokes:

1. Go to *VPN* > *IPsec Wizard*.
2. On the *VPN Setup* page of the wizard, enter the following:

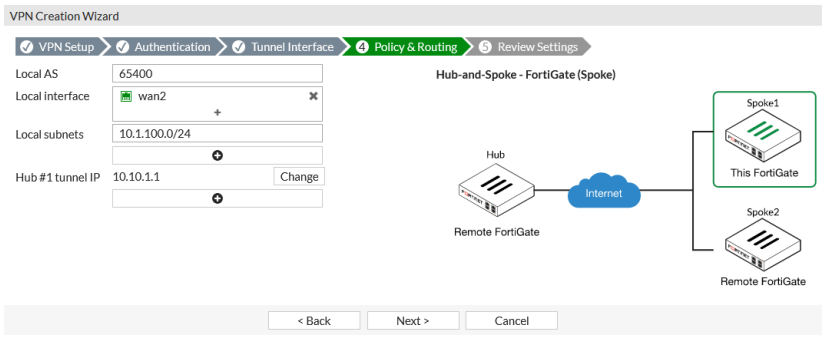
Name	spoke1
Template Type	Hub-and-Spoke
Role	Spoke

3. In the *Easy configuration key* field, paste the *Spoke #1* key from the hub FortiGate, click *Apply*, then click *Next*.



4. Adjust the *Authentication* settings as required, enter the *Pre-shared key*, then click *Next*.
5. Adjust the *Tunnel Interface* settings as required, then click *Next*.
6. Configure the *Policy & Routing* settings, then click *Next*:

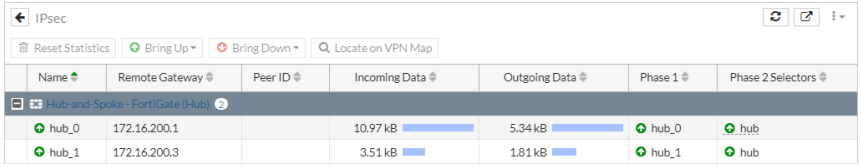
Local interface	wan2
Local subnets	10.1.100.0/24



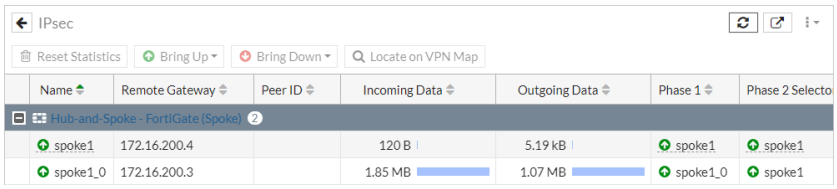
7. Review the settings, then click *Create*.
8. The summary shows details about the set up spoke. The *Local address group* and *Tunnel interface* can be edited directly on this page.
9. Follow the same steps to configure the second spoke.

To check that the tunnels are created and working:

1. On the hub FortiGate, go to *Dashboard* > *Network* and expand the IPsec widget.
   The tunnels to the spokes are established.



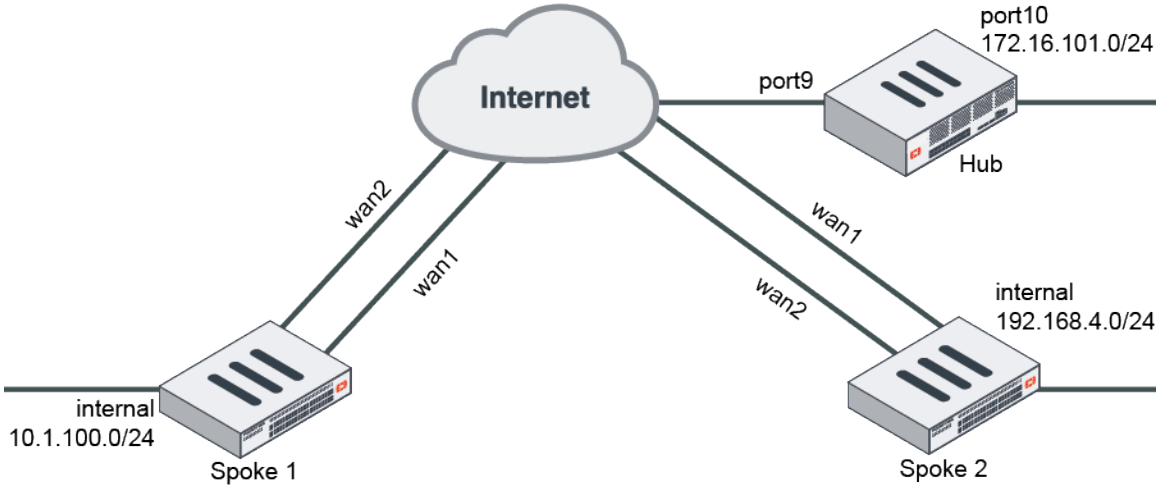
2. On a spoke, go to *Dashboard* > *Network* and expand the IPsec widget.
   The tunnel to the hub and the spoke to spoke shortcut are established.



ADVPN with BGP as the routing protocol

This is a sample configuration of ADVPN with BGP as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- IBGP must be used between the hub and spoke FortiGates.
- `bgp neighbor-group/neighbor-range` must be reused.



To configure ADVPN with BGP as the routing protocol using the CLI:

1. Configure hub FortiGate WAN interface, internal interface, and a static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:

a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
3des-sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's BGP:

```
config router bgp
    set as 65412
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65412
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.10.0 255.255.255.0
            set neighbor-group "advpn"
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
```

```
        set device "wan1"
    next
end
```

ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
```

```
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
```

```
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' BGP:

i. Configure Spoke1:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
```

```
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and BGP states:
   a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu

proxyid=spoke1_backup proto=0 sa=0 ref=2 serial=1 auto-negotiate adr
  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

   b. Run the `get router info bgp summary` command on Spoke1. The system should return the following:

```
BGP router identifier 7.7.7.7, local AS number 65412
BGP table version is 2
1 BGP AS-PATH entries
0 BGP community entries

Neighbor             V         AS [[QualityAssurance62/MsgRcvd]]
[[QualityAssurance62/MsgSent]]   [[QualityAssurance62/TblVer]]  InQ OutQ Up/Down
State/PfxRcd
10.10.10.254       1.          65412     143     142         1.     1.     1.
00:24:45                   2

Total number of neighbors 1
```

c. Run the `get router info routing-table bgp` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
B       172.16.101.0/24 [200/0] via 10.10.10.254, spoke1, 00:23:57
B       192.168.4.0/24 [200/0] via 10.10.10.254, spoke1, 00:22:03
```

d. Generate traffic between the spokes and check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
create_dev frag-rfc  accept_traffic=1

npu_flag=03 npu_rgwy=13.1.1.2 npu_lgwy=15.1.1.2 npu_selid=5 dec_npuid=1 enc_npuid=1
```

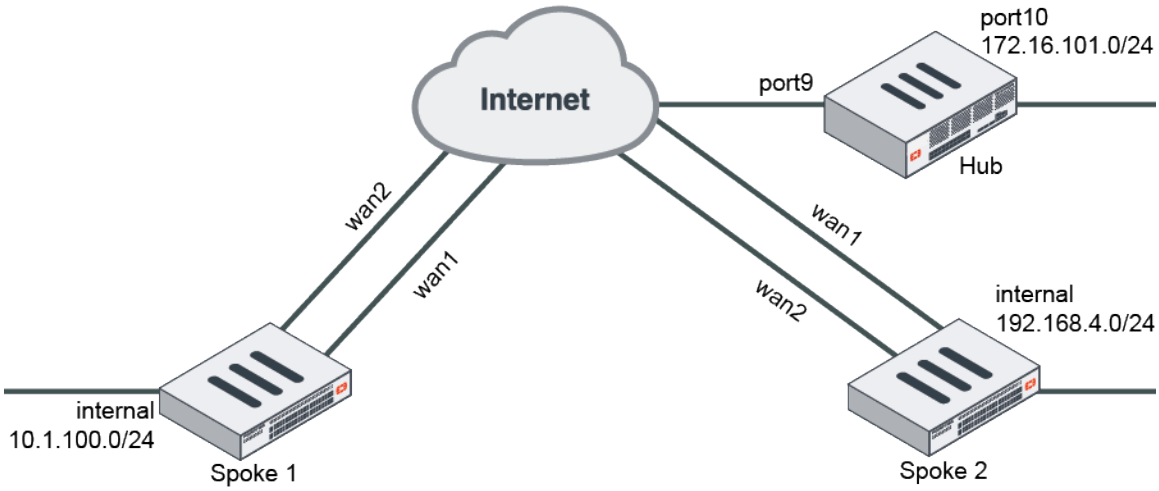
e. Run the `get router info routing-tale bgp` command. The system should return the following:

```
Routing table for VRF=0
B       172.16.101.0/24 [200/0] via 10.10.10.254, spoke1, 00:23:57
B       192.168.4.0/24 [200/0] via 10.10.10.3, spoke1_0 , 00:22:03
```

ADVPN with OSPF as the routing protocol

This is a sample configuration of ADVPN with OSPF as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device enable` must be run.
- OSPF must be used between the hub and spoke FortiGates.



To configure ADVPN with OSPF as the routing protocol using the CLI:

1. Configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
```

```
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
3des-sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

   b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
```

```
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's OSPF:

```
config router ospf
    set router-id 1.1.1.1
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
```

```
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
```

```
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
```

```
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' OSPF:

i. Configure Spoke1:

```
config router ospf
    set router-id 7.7.7.7
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router ospf
    set router-id 8.8.8.8
    config area
        edit 0.0.0.0
        next
    end
    config network
```

```
            edit 1
                set prefix 10.10.10.0 255.255.255.0
            next
            edit 2
                set prefix 192.168.4.0 255.255.255.0
            next
        end
    end
```

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and OSPF states:
   a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
create_dev frag-rfc  accept_traffic=1

proxyid_num=1 child_num=1 refcnt=19 ilast=5 olast=2 ad=r/2
stat: rxp=1 txp=263 rxb=16452 txb=32854

proxyid=spoke1_backup proto=0 sa=0 ref=2 serial=1 auto-negotiate adr
  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

   b. Run the `get router info ospf neighbor` command on Spoke1. The system should return the following:

```
OSPF process 0, VRF 0: Neighbor ID Pri State Dead Time Address Interface 8.8.8.8 1.
Full/ - 00:00:35 10.10.10.254 spoke1 1.1.1.1 1. Full/ - 00:00:35 10.10.10.254 spoke1
```

   c. Run the `get router info routing-table ospf` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
O       172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:23:23
O       192.168.4.0/24   [110/110] via 10.10.10.254, spoke1, 00:22:35
```

d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
create_dev frag-rfc  accept_traffic=1

proxyid_num=1 child_num=1 refcnt=19 ilast=2 olast=2 ad=r/2
stat: rxp=1 txp=313 rxb=16452 txb=35912
dpd: mode=on-idle on=1 idle=5000ms retry=3 count=0 seqno=2303

npu_flag=03 npu_rgwy=13.1.1.2 npu_lgwy=15.1.1.2 npu_selid=a dec_npuid=1 enc_npuid=1
```

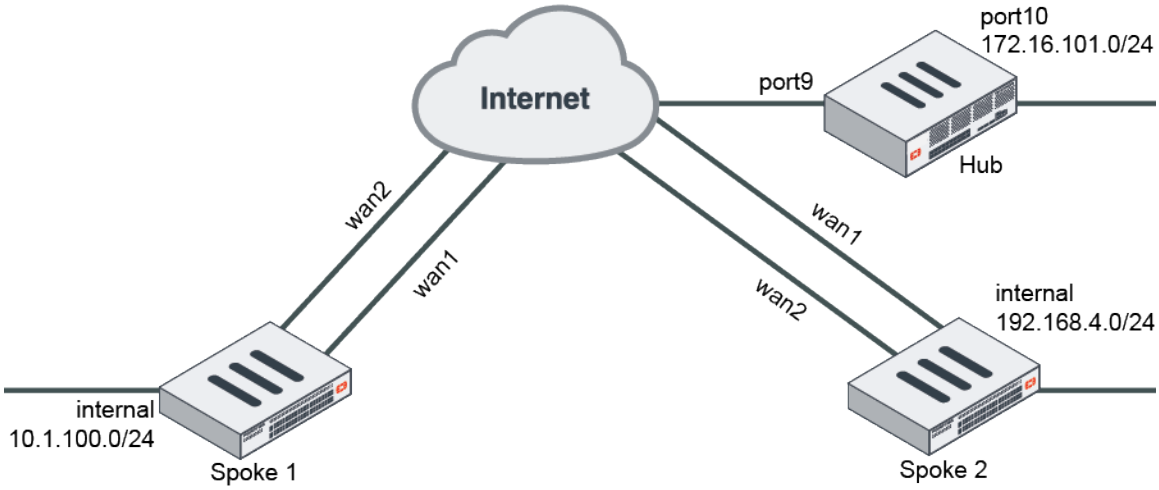
e. Run the `get router info routing-tale ospf` command. The system should return the following:

```
Routing table for VRF=0
O       172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:27:14
O       192.168.4.0/24  [110/110] via  10.10.10.3, spoke1_0, 00:26:26
```

ADVPN with RIP as the routing protocol

This is a sample configuration of ADVPN with RIP as routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- RIP must be used between the hub and spoke FortiGates.
- `split-horizon-status enable` must be run on the hub FortiGate.



To configure ADVPN with RIP as the routing protocol using the CLI:

1. In the CLI, configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
```

```
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1
3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256
3des-sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

   b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
```

```
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's RIP:

```
config router rip
    set default-information-originate enable
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 172.16.101.0 255.255.255.0
        next
    end
    config interface
        edit "advpn-hub"
            set split-horizon-status disable
        next
    end
end
```

3. Configure the spoke FortiGates:

a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:

i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
```

```
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
```

```
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
```

```
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256
aes128gcm aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' RIP:

i. Configure Spoke1:

```
config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1:

a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
create_dev frag-rfc  accept_traffic=1

proxyid_num=1 child_num=1 refcnt=17 ilast=2 olast=2 ad=r/2
stat: rxp=1 txp=87 rxb=200 txb=6208

  enc: spi=6e36349d esp=aes key=16 914a40a7993eda75c4dea2f42905f27d
       ah=sha1 key=20 8040eb08342edea2dae5eee058fd054a46688267
  dec:pkts/bytes=1/132, enc:pkts/bytes=86/11696
  npu_flag=03 npu_rgwy=22.1.1.1 npu_lgwy=15.1.1.2 npu_selid=1 dec_npuid=1 enc_npuid=1
----
name=spoke1_backup ver=1 serial=1 12.1.1.2:0->22.1.1.1:0
bound_if=6 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
create_dev frag-rfc  accept_traffic=0

proxyid_num=1 child_num=0 refcnt=11 ilast=0 olast=0 ad=/0
stat: rxp=0 txp=0 rxb=0 txb=0
dpd: mode=on-idle on=0 idle=5000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=spoke1_backup proto=0 sa=0 ref=2 serial=1 auto-negotiate adr
  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

b. Run the `get router info rip database` command on Spoke1. The system should return the following:

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
       C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP

   Network            Next Hop         Metric From            If     Time
Rc 10.1.100.0/24                             1.                 internal
Rc 10.10.10.2/32                               1.                 spoke1
R  172.16.101.0/24    10.10.10.254             1. 10.10.10.254      spoke1 02:28
R  192.168.4.0/24      10.10.10.254              1. 10.10.10.254       spoke1 02:44
```

c. Run the `get router info routing-table rip` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
R       172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:08:38
R       192.168.4.0/24 [120/3] via 10.10.10.254, spoke1, 00:08:38
```

d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu
create_dev frag-rfc  accept_traffic=1

proxyid_num=1 child_num=0 refcnt=19 ilast=3 olast=3 ad=r/2
stat: rxp=1 txp=78 rxb=200 txb=5546

```

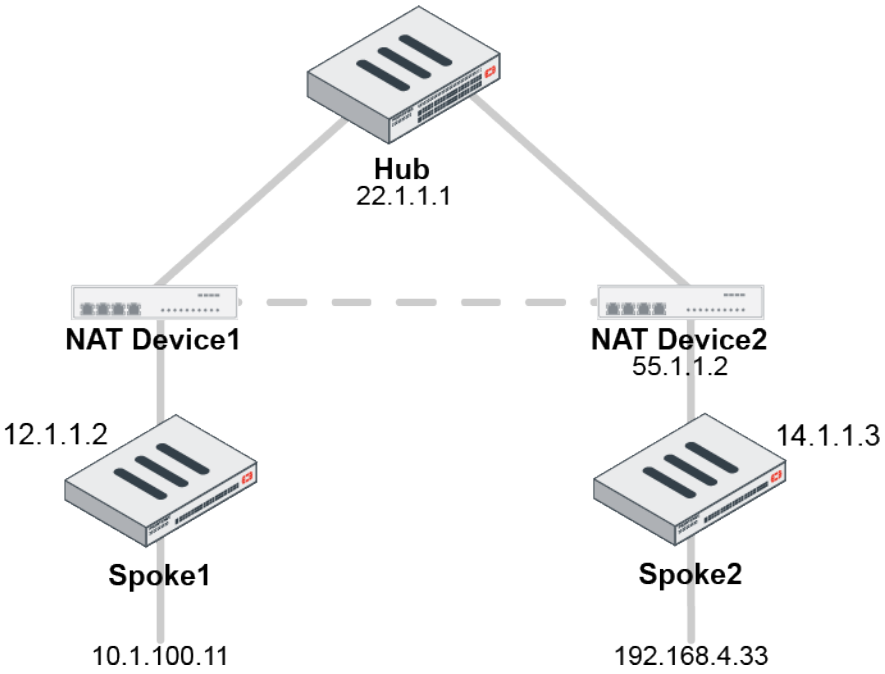
e. Run the `get router info routing-tale rip` command. The system should return the following:

```
Routing table for VRF=0
R       172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:09:04
R       192.168.4.0/24 [120/2] via 10.10.10.3, spoke1_0, 00:00:02
```

UDP hole punching for spokes behind NAT

UDP hole punching allows ADVPN shortcuts to be established through a UDP hole on a NAT device. The NAT device must support RFC 4787 Endpoint-Independent Mapping.

In the following example, device 10.1.100.11 behind Spoke1 needs to reach device 192.168.4.33 behind Spoke2. Spoke1 and Spoke2 are behind NAT devices and have established IPsec tunnels to the Hub. The hole punching creates a shortcut between Spoke1 and Spoke2 that bypasses the Hub.



To verify the ADVPN shortcut is established between both spokes behind NAT:

```
# diagnose debug enable
# diagnose debug application ike -1
ike 0: comes 22.1.1.1:4500->12.1.1.2:4500,ifindex=6....

VPN and ASIC offload

This topic provides a brief introduction to VPN traffic offloading.

IPsec traffic processed by NPU

1. Check the device ASIC information. For example, a FortiGate 900D has an NP6 and a CP8.

```
# get hardware status
Model name: [[QualityAssurance62/FortiGate]]-900D
ASIC version: CP8
ASIC SRAM: 64M
CPU: Intel(R) Xeon(R) CPU E3-1225 v3 @ 3.20GHz
Number of CPUs: 4
RAM: 16065 MB
Compact Flash: 1925 MB /dev/sda
Hard disk: 244198 MB /dev/sdb
USB Flash: not available
Network Card chipset: [[QualityAssurance62/FortiASIC]] NP6 Adapter (rev.)
```

2. Check port to NPU mapping.

```
# diagnose npu np6 port-list
Chip   XAUI Ports            Max   Cross-chip
                             Speed offloading
----
np6_0  0
        1.    port17           1G    Yes
        1.    port18           1G    Yes
```

```
        1.    port19          1G    Yes
        1.    port20          1G    Yes
        1.    port21          1G    Yes
        1.    port22          1G    Yes
        1.    port23          1G    Yes
        1.    port24          1G    Yes
        1.    port27          1G    Yes
        1.    port28          1G    Yes
        1.    port25          1G    Yes
        1.    port26          1G    Yes

        1.    port14          1G    Yes
        1.    portA           10G   Yes
        1.
----
```

3. Configure the option in IPsec phase1 settings to control NPU encrypt/decrypt IPsec packets (enabled by default).

```
config vpn ipsec phase1/phase1-interface
    edit "vpn_name"
        set npu-offload enable/disable
    next
end
```

4. Check NPU offloading. The NPU encrypted/decrypted counter should tick. The `npu_flag 03` flag means that the traffic processed by the NPU is bi-directional.

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0

```

2. Two options are used to control if the CP processes packets. If disabled, packets are processed by the CPU.

```
config system global
    set ipsec-asic-offload disable
    set ipsec-hmac-offload disable
end
```

IPsec traffic processed by CPU

IPsec traffic might be processed by the CPU for the following reasons:

- Some low end models do not have NPUs.
- NPU offloading and CP IPsec traffic processing manually disabled.
- Some types of proposals - SEED, ARIA, chacha20poly1305 - are not supported by the NPU or CP.
- NPU flag set to 00 and software encrypt/decrypt counter ticked.

```

Encryption algorithms

This topic provides a brief introduction to IPsec phase 1 and phase 2 encryption algorithms and includes the following sections:

- IKEv1 phase 1 encryption algorithm
- IKEv1 phase 2 encryption algorithm
- IKEv2 phase 1 encryption algorithm
- IKEv2 phase 2 encryption algorithm
- HMAC settings

IKEv1 phase 1 encryption algorithm

The default encryption algorithm is:

```
aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
```

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports:

- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-md5
- aes192-sha1

- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5
- seed128-sha1
- seed128-sha256
- seed128-sha384
- seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. FortiOS supports Suite-B on new kernel platforms only. IPsec traffic **cannot** offload to NPU. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

IKEv1 phase 2 encryption algorithm

The default encryption algorithm is:

```
aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
```

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:

- null-md5
- null-sha1

- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

With the AESGCM encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256
- seed-sha384
- seed-sha512

IKEv2 phase 1 encryption algorithm

The default encryption algorithm is:

```
aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384 chacha20poly1305-
     prfsha256
```

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports:

- 3des-md5
- 3des-sha1
- 3des-sha256

- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes128gcm-prfsha1
- aes128gcm-prfsha256
- aes128gcm-prfsha384
- aes128gcm-prfsha512
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512
- aes256gcm-prfsha1
- aes256gcm-prfsha256
- aes256gcm-prfsha384
- aes256gcm-prfsha512

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the chacha20poly1305 encryption algorithm, FortiOS supports:

- chacha20poly1305-prfsha1
- chacha20poly1305-prfsha256
- chacha20poly1305-prfsha384
- chacha20poly1305-prfsha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5
- seed128-sha1
- seed128-sha256
- seed128-sha384
- seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. FortiOS supports Suite-B on new kernel platforms only. IPsec traffic **cannot** offload to NPU. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

IKEv2 phase 2 encryption algorithm

The default encryption algorithm is:

```
aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
```

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:

- null-md5
- null-sha1
- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

With the AESGCM encryption algorithm, IPsec traffic **cannot** offload NPU. CP9 supports AESGCM offloading. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null
- aria256-md5
- aria256-sha1
- aria256-sha256

- aria256-sha384
- aria256-sha512

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256
- seed-sha384
- seed-sha512

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as 3des-sha256). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500
virtual-interface-addr: 172.31.0.2 -> 172.31.0.1
created: 1015820s ago
IKE SA: created 1/13 established 1/13 time 10/1626/21010 ms
IPsec SA: created 1/24 established 1/24 time 0/11/30 ms

  id/spi: 124 43b087dae99f7733/6a8473e58cd8990a

  lifetime/rekey: 86400/17436
  DPD sent/recv: 000001e1/00000000
```

Fragmenting IP packets before IPsec encapsulation

The `ip-fragmentation` command controls packet fragmentation before IPsec encapsulation, which can benefit packet loss in some environments.

The following options are available for the `ip-fragmentation` variable.

Option	Description
pre-encapsulation	Fragment before IPsec encapsulation.
post-encapsulation (default value)	Fragment after IPsec encapsulation (RFC compliant).

To configure packet fragmentation using the CLI:

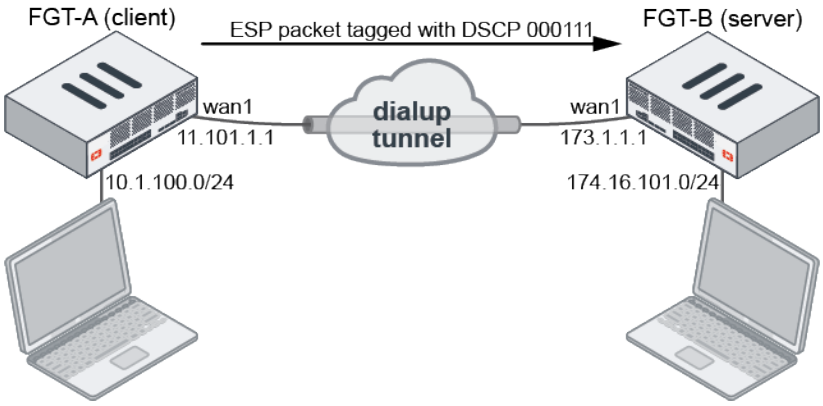
```
config vpn ipsec phase1-interface
   edit "demo"
      set interface "port1"
      set authmethod signature
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set ip-fragmentation pre-encapsulation
      set remote-gw 172.16.200.4
      set certificate "Fortinet_Factory"
   next
end
```

Configure DSCP for IPsec tunnels

Configuring the differentiated services (DiffServ) code in phase2 of an IPsec tunnel allows the tag to be applied to the Encapsulating Security Payload (ESP) packet.

- If `diffserv` is disabled in the IPsec phase2 configuration, then the ESP packets' DSCP value is copied from the inner IP packet DSCP.
- If `diffserv` is enabled in the IPsec phase2 configuration, then ESP packets' DSCP value is set to the configured value.

Offloading traffic to the NPU must be disabled for the tunnel.



In this example, NPU offloading is disabled, diffserv is enabled, and the diffserv code is set to 000111 on FGT-A. Only one side of the tunnel needs to have diffserv enabled.

To configure IPsec on FGT-A:

1. Configure the phase1-interface:

```
config vpn ipsec phase1-interface
    edit "s2s"
        set interface "wan1"
```

```
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set npu-offload disable
        set dhgrp 14 5
        set wizard-type static-fortigate
        set remote-gw 173.1.1.1
        set psksecret ***********
    next
end
```

2. Configure the phase2-interface:

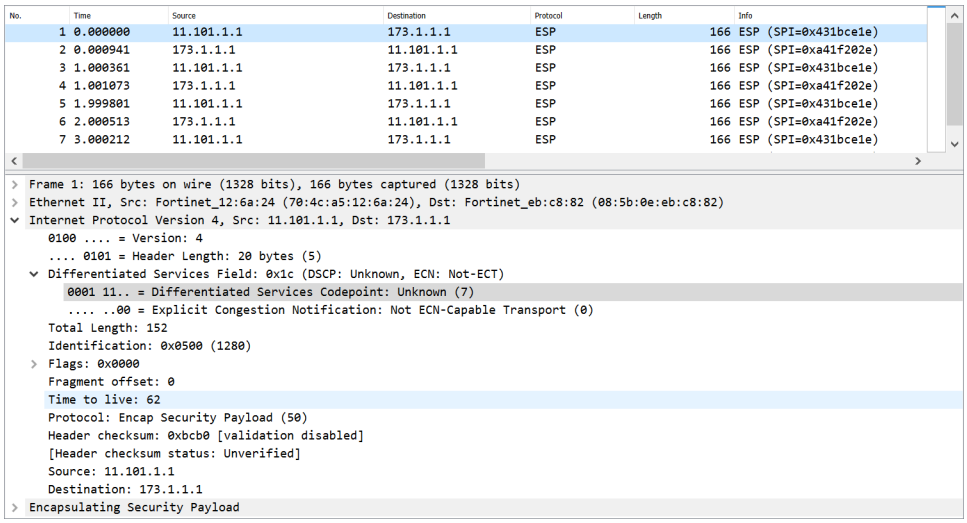
```
config vpn ipsec phase2-interface
    edit "s2s"
        set phase1name "s2s"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set dhgrp 14 5
        set diffserv enable
        set diffservcode 000111
        set src-addr-type name
        set dst-addr-type name
        set src-name "s2s_local"
        set dst-name "s2s_remote"
    next
end
```

3. Check the state of the IPsec tunnel:

```
FGT-A # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=s2s ver=1 serial=1 11.101.1.1:0->173.1.1.1:0 dst_mtu=1500
bound_if=17 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/512 options[0200]=frag-rfc
run_state=0 accept_traffic=1 overlay_id=0

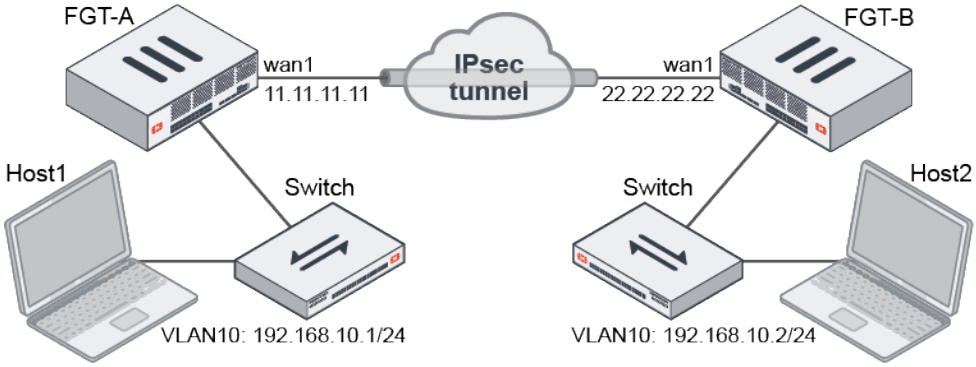
proxyid_num=1 child_num=0 refcnt=11 ilast=12 olast=2978 ad=/0
stat: rxp=4 txp=4 rxb=608 txb=336
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=s2s proto=0 sa=1 ref=2 serial=2 dscp
  src: 0:10.1.100.0/255.255.255.0:0
  dst: 0:174.16.101.0/255.255.255.0:0
  SA:  ref=3 options=110226 type=00 soft=0 mtu=1438 expire=39916/0B replaywin=2048
       seqno=5 esn=0 replaywin_lastseq=00000005 itn=0 qat=0 hash_search_len=1
  life: type=01 bytes=0/0 timeout=42899/43200
  dec: spi=a41f202e esp=aes key=16 8a02875b80b884d961af227fe8b5cdee
       ah=sha1 key=20 fc9760b79e79dbbeef630ec0c5dca74777976208
  enc: spi=431bce1e esp=aes key=16 851117af24212da89e466d8bea9632bb
       ah=sha1 key=20 0807cc0af2dc4ea049a6b1a4af410ccc71e2156d
  dec:pkts/bytes=4/336, enc:pkts/bytes=4/608
  npu_flag=00 npu_rgwy=173.1.1.1 npu_lgwy=11.101.1.1 npu_selid=1 dec_npuid=0 enc_npuid=0
run_tally=1
```

4. Use a packet analyzer, or sniffer, to check the ESP packets:



VXLAN over IPsec tunnel with virtual wire pair

In this example, a site-to-site VPN tunnel is formed between two FortiGates. Multiple VLANs are configured that match on each FortiGate. Host1 and Host2 are connected to VLAN10 on the switches.



To configure FGT-A in the CLI:

1. Configure the WAN interface:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 11.11.11.11 255.255.255.0
        set allowaccess ping https ssh http fgfm
        set type physical
        set role wan
        set snmp-index 1
    next
end
```

2. Configure a static route to send all traffic out the WAN interface:

```
config router static
    edit 1
```

```
        set gateway 11.11.11.1
        set device "wan1"
    next
end
```

3. Configure the IPsec tunnel:

```
config vpn ipsec phase1-interface
    edit "ipsec"
        set interface "wan1"
        set peertype any
        set proposal aes256-sha1
        set remote-gw 22.22.22.22
        set psksecret **********
    next
end
config vpn ipsec phase2-interface
    edit "ipsec"
        set phase1name "ipsec"
        set proposal aes256-sha1
        set auto-negotiate enable
    next
end
```

4. Configure the VXLAN interface and bind it to the IPsec interface:

```
config system vxlan
    edit "vxlan"
        set interface "ipsec"
        set vni 10
        set remote-ip "22.22.22.22"
    next
end
```

   The remote IP address is the peer side WAN IP address.

5. Configure a virtual wire pair with the LAN and VXLAN interfaces as members:

```
config system virtual-wire-pair
    edit "vwp"
        set member "port1" "vxlan"
        set wildcard-vlan enable
    next
end
```

   The interfaces added to the virtual wire pair cannot be part of a switch, such as the default internal interface.

   By enabling wildcard VLANs on the virtual wire pair, all VLAN tagged traffic that is allowed by the virtual wire pair firewall policies passes through the pair.

6. Configure a firewall policy to allow traffic between the LAN and VXLAN interfaces:

```
config firewall policy
    edit 4
        set name "vwp-pol"
        set srcintf "port1" "vxlan"
        set dstintf "port1" "vxlan"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
```

```
        set schedule "always"
        set service "ALL"
    next
end
```

To configure FGT-B in the CLI:

1. Configure the WAN interface:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 22.22.22.22 255.255.255.0 255.255.255.0
        set allowaccess ping https ssh http fgfm
        set type physical
        set role wan
        set snmp-index 1
    next
end
```

2. Configure a static route to send all traffic out the WAN interface:

```
config router static
    edit 1
        set gateway 22.22.22.2
        set device "wan1"
    next
end
```

3. Configure the IPsec tunnel:

```
config vpn ipsec phase1-interface
    edit "ipsec"
        set interface "wan1"
        set peertype any
        set proposal aes256-sha1
        set remote-gw 11.11.11.11
        set psksecret **********
    next
end
config vpn ipsec phase2-interface
    edit "ipsec"
        set phase1name "ipsec"
        set proposal aes256-sha1
        set auto-negotiate enable
    next
end
```

4. Configure the VXLAN interface and bind it to the IPsec interface:

```
config system vxlan
    edit "vxlan"
        set interface "ipsec"
        set vni 10
        set remote-ip "11.11.11.11"
    next
end
```

The remote IP address is the peer side WAN IP address.

5. Configure a virtual wire pair with the LAN and VXLAN interfaces as members:

```
config system virtual-wire-pair
    edit "vwp"
        set member "port1" "vxlan"
        set wildcard-vlan enable
    next
end
```

6. Configure a firewall policy to allow traffic between the LAN and VXLAN interfaces:

```
config firewall policy
    edit 4
        set name "vwp-pol"
        set srcintf "port1" "vxlan"
        set dstintf "port1" "vxlan"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

Test the configuration

To test the configuration, ping Host2 (VLAN10: 192.168.10.2/24) from Host1 (VLAN10: 192.168.10.1/24):

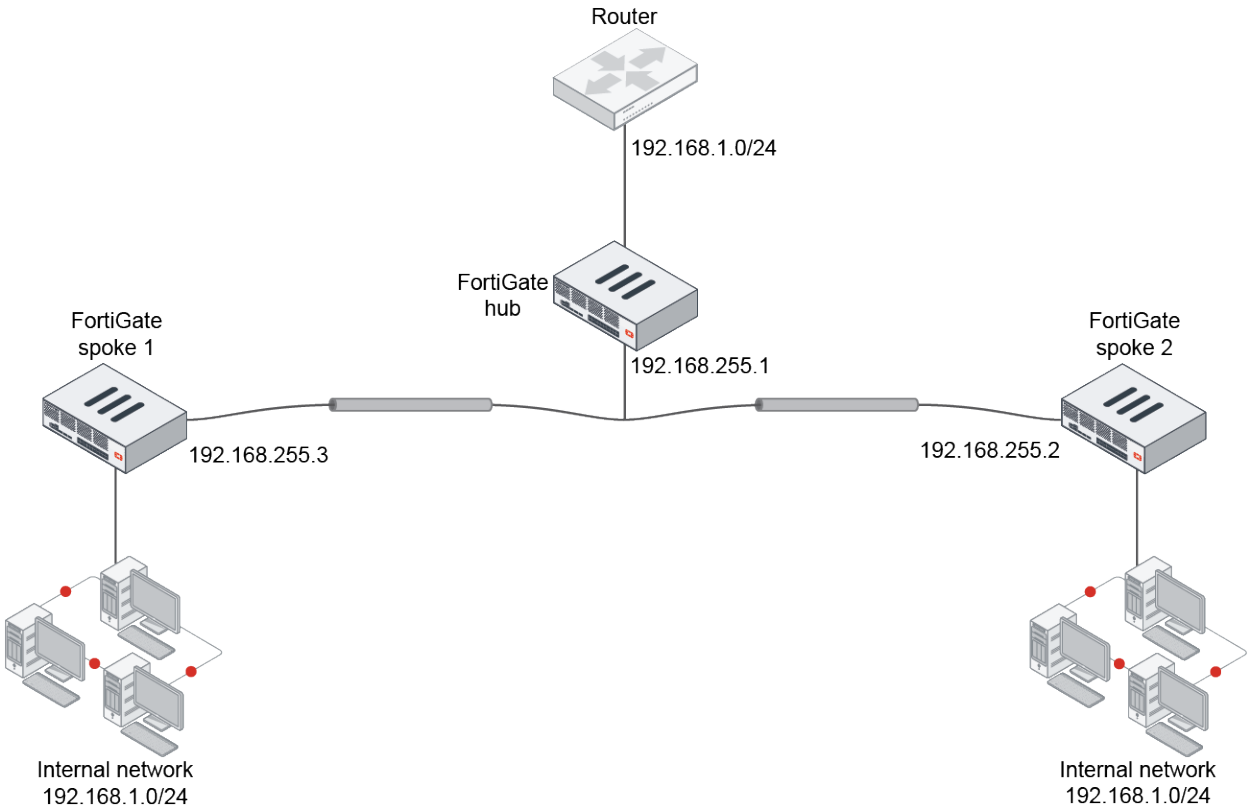
```
C:\>ping 192.168.10.2

Pinging 192.168.10.2 with 32 bytes of data:
Reply from 192.168.10.2: bytes=32 time=8ms TTL=56
Reply from 192.168.10.2: bytes=32 time=8ms TTL=56
Reply from 192.168.10.2: bytes=32 time=8ms TTL=56
Reply from 192.168.10.2: bytes=32 time=11ms TTL=56

Ping statistics for 192.168.10.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 8ms, Maximum = 11ms, Average = 8ms
```

VXLAN over IPsec using a VXLAN tunnel endpoint

This example describes how to implement VXLAN over IPsec VPN using a VXLAN tunnel endpoint (VTEP).



This example shows a specific configuration that uses a hub-and-spoke topology. However, the same logic can be applied to a static VPN with or without XAuth. In this hub-and-spoke topology, dialup VPN is convenient because it uses a single phase 1 dialup definition on the hub FortiGate. Additional spoke tunnels are added without any changes to the hub, other than adding a user account for each additional spoke. Spoke-to-spoke communication is established through the hub. This example assumes the authentication users and user groups have already been created.

IPsec tunnel interfaces are used to support VXLAN tunnel termination. An IP address is set for each tunnel interface. Ping access is allowed for troubleshooting purposes.

VTEPs are created on each of the hub and spokes in order to forward VXLAN traffic through the IPsec tunnels. VXLAN encapsulates OSI layer 2 Ethernet frames within layer 3 IP packets. You will need to either combine the internal port and VXLAN interface into a soft switch, or create a virtual wire pair so that devices behind port1 have direct layer 2 access to remote peers over the VXLAN tunnel. This example uses a switch interface on the hub and a virtual wire pair on the spokes to demonstrate the two different methods.

Finally, in order to apply an IPsec VPN interface on the VXLAN interface setting, `net-device` must be disabled in the IPsec VPN phase 1 settings. All VXLAN interfaces in this example share the same VXLAN network ID (`vni`).

To configure the hub FortiGate:

1. Configure the phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
   edit "SPOKES"
      set type dynamic
      set interface "port2"
      set mode aggressive
      set peertype one
```

```
      set net-device disable
      set proposal aes256-sha256
      set xauthtype auto
      set authusrgrp "SPOKES"
      set peerid "SPOKES"
      set psksecret <secret>
   next
end
config vpn ipsec phase2-interface
   edit "SPOKES"
      set phase1name "SPOKES"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
   next
end
```

2. Configure the IPsec VPN policy that allows VXLAN traffic between spokes:

```
config firewall policy
   edit 1
      set name "VXLAN_SPOKE_to_SPOKE"
      set srcintf "SPOKES"
      set dstintf "SPOKES"
      set srcaddr "NET_192.168.255.0"
      set dstaddr "NET_192.168.255.0"
      set action accept
      set schedule "always"
      set service "UDP_4789"
      set logtraffic all
      set fsso disable
   next
end
```

3. Configure the IPsec tunnel interfaces (the remote IP address is not used, but it is necessary for this configuration):

```
config system interface
   edit "SPOKES"
      set vdom "root"
      set ip 192.168.255.1 255.255.255.255
      set allowaccess ping
      set type tunnel
      set remote-ip 192.168.255.254 255.255.255.0
      set snmp-index 12
      set interface "port2"
   next
end
```

4. Configure the VXLAN interface (the remote IP is the tunnel interfaces IPs of the spokes):

```
config system VXLAN
   edit "SPOKES_VXLAN"
      set interface "SPOKES"
      set vni 1
      set remote-ip "192.168.255.2" "192.168.255.3"
   next
end
```

To configure the spoke FortiGates:

1. Configure the phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
   edit "HUB"
      set interface "port2"
      set mode aggressive
      set peertype any
      set net-device disable
      set proposal aes256-sha256
      set localid "SPOKES"
      set xauthtype client
      set authusr "SPOKE1"
      set authpasswd <secret>
      set remote-gw <hub public IP>
      set psksecret <secret>
   next
end
config vpn ipsec phase2-interface
   edit "HUB"
      set phase1name "HUB"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 192.168.255.2 255.255.255.255
   next
end
```

The hub FortiGate inserts a reverse route pointing to newly established tunnel interfaces for any of the subnets that the spoke FortiGate's source quick mode selectors provides. This is why you should set the tunnel IP address here.

2. Configure the IPsec VPN policy:

```
config firewall policy
   edit 1
      set name "VTEP_IPSEC_POLICY"
      set srcintf "HUB"
      set dstintf "HUB"
      set srcaddr "none"
      set dstaddr "none"
      set action accept
      set schedule "always"
      set service "PING"
      set logtraffic disable
      set fsso disable
   next
end
```

3. Configure the IPsec tunnel interfaces:

```
config system interface
   edit "HUB"
      set vdom "root"
      set ip 192.168.255.2 255.255.255.255
      set allowaccess ping
```

```
      set type tunnel
      set remote-ip 192.168.255.1 255.255.255.0
      set snmp-index 12
      set interface "port2"
   next
end
```

4. Configure the VXLAN interface (the remote IP is the tunnel interface IP of the hub):

```
config system VXLAN
   edit "HUB_VXLAN"
      set interface "HUB"
      set vni 1
      set remote-ip "192.168.255.1"
   next
end
```

To establish a VXLAN tunnel between spokes, you can add a spoke's tunnel IP address in `remote-ip`.

To add more remote IP addresses to a VXLAN interface, the interface cannot be in use. You may want to provision future spokes' remote IP addresses at this point to avoid traffic disruption. Otherwise, you must delete the reference (the policy in this example) before adding remote IP addresses.

To bind the VXLAN interface to the internal interface:

1. Configure a switch interface on the hub:

```
config system switch-interface
    edit "SW"
        set vdom "root"
        set member "port1" "SPOKES_VXLAN"
        set intra-switch-policy {implicit | explicit}
    next
end
```

Allowing intra-switch traffic is implicitly allowed by default. Use `set intra-switch-policy explicit` to require firewall policies to allow traffic between switch interfaces.

2. Configure a virtual wire pair on the spokes:

```
config system virtual-wire-pair
    edit "VWP"
        set member "HUB_VXLAN" "port1"
    next
end
```

The virtual wire pair requires an explicit policy to allow traffic between interfaces.

To test the configuration:

1. Ping the hub FortiGate from the spoke FortiGate:

```
user@pc-spoke1:~$ ping 192.168.1.1 -c 3PING 192.168.1.1 (192.168.1.1) 56(84) bytes of
data.
64 bytes from 192.168.1.1: icmp_seq=1 ttl=64 time=1.24 ms
64 bytes from 192.168.1.1: icmp_seq=2 ttl=64 time=0.672 ms
64 bytes from 192.168.1.1: icmp_seq=3 ttl=64 time=0.855 ms
--- 192.168.1.1 ping statistics ---
3 packets transmitted, 3 received, 0% packet loss, time 2002ms
rtt min/avg/max/mdev = 0.672/0.923/1.243/0.239 ms
```

2. Sniff traffic on the hub FortiGate:

```
# diagnose sniffer packet any 'icmp or (udp and port 4789)' 4 0 ainterfaces=[any]
filters=[icmp or (udp and port 4789)]
15:00:01.438230 SPOKES in 192.168.255.2.4790 -&gt; 192.168.255.1.4789: udp 106
<<<<1

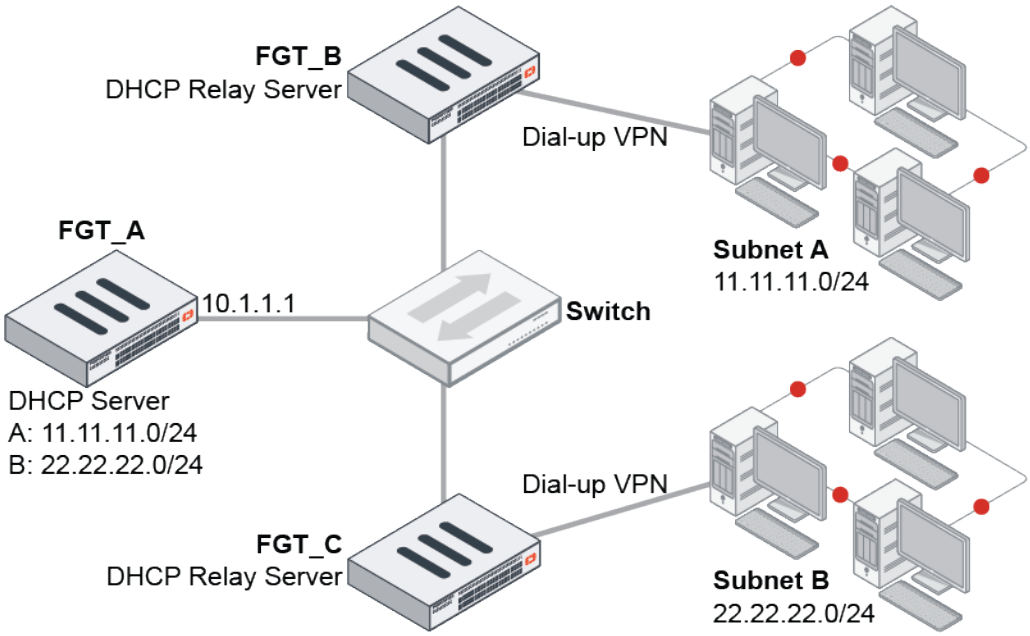
```

Defining gateway IP addresses in IPsec with mode-config and DHCP

For an IPsec tunnel, the gateway IP address (giaddr) can be defined on a DHCP relay agent. Both IPv4 and IPv6 addresses are supported. An IPsec tunnel with mode-config and DHCP relay cannot specify a DHCP subnet range to the DHCP server.

The DHCP server assigns an IP address based on the giaddr set on the IPSec phase1 interface and sends an offer to this subnet. The DHCP server must have a route to the specified subnet giaddr.

Example



To define the gateway IP address on the DHCP relay server:

1. Configure the VPN IPsec phase1 interface:

```
config vpn ipsec phase1-interface
    edit "ipv4"
        set type dynamic
        set interface "port2"
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal des-md5 des-sha1
        set dpd on-idle
        set dhgrp 5
        set assign-ip-from dhcp
        set dhcp-ra-giaddr 11.11.11.1
        set psksecret ***********
        set dpd-retryinterval 60
    next
end
```

IPv6 could also be configured:

```
config vpn ipsec phase1-interface
    edit "ipv6"
        set type dynamic
        set interface "port2"
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal des-md5 des-sha1
        set dpd on-idle
```

```
            set dhgrp 5
            set assign-ip-from dhcp
            set dhcp6-ra-linkaddr 2000:11:11:11::1
            set psksecret **********
            set dpd-retryinterval 60
        next
    end
```

2. Enable DHCP proxy and configure the DHCP server IP address:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip "10.1.1.1"
end
```

3. Repeat the above steps for FGT_C and subnet B.

FQDN support for remote gateways

FortiGate supports FQDN when defining an IPsec remote gateway with a dynamically assigned IPv6 address. When FortiGate attempts to connect to the IPv6 device, FQDN will resolve the IPv6 address even when the address changes.

Using FQDN to configure the remote gateway is useful when the remote end has a dynamic IPv6 address assigned by their ISP or DHCPv6 server.

To set the VPN to DDNS and configure FQDN:

```
config vpn ipsec phase1-interface
    edit "ddns6"
        set type ddns
        set interface "agg1"
        set ip-version 6
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dpd on-idle
        set remotegw-ddns "rgwa61.vpnlab.org"
        set psksecret **********
    next
end

config vpn ipsec phase2-interface
    edit "ddns6"
        set phase1name "ddns6"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set src-addr-type subnet6
        set dst-addr-type subnet6
        set src-subnet6 2003:1:1:1::/64
    next
end
```

FQDN resolves the IPv6 address

```
# diagnose test application dnsproxy 7

vfid=0, name=rgwa61.vpnlab.org, ttl=3600:3547:1747
         2003:33:1:1::22 (ttl=3600)
```

FortiGate uses FQDN to connect to the IPv6 device

```
# diagnose vpn tunnel list name ddns6
list ipsec tunnel by names in vd 0
------------------------------------------------------
name=ddns6 ver=2 serial=2 2003:33:1:1::1:0->2003:33:1:1::22:0 dst_mtu=1500

SSL VPN

The following topics provide information about SSL VPN in FortiOS 7.0.0.

- SSL VPN best practices on page 1191
- SSL VPN quick start on page 1193
- SSL VPN tunnel mode on page 1200
- SSL VPN web mode for remote user on page 1207
- SSL VPN authentication on page 1211
- SSL VPN to IPsec VPN on page 1294

- SSL VPN protocols on page 1304
- FortiGate as SSL VPN Client on page 1305
- Dual stack IPv4 and IPv6 support for SSL VPN on page 1314
- SSL VPN troubleshooting on page 1324
- Restricting VPN access to rogue/non-compliant devices with Security Fabric

SSL VPN best practices

Securing remote access to network resources is a critical part of security operations. SSL VPN allows administrators to configure, administer, and deploy a remote access strategy for their remote workers.

Choosing the correct mode of operation and applying the proper levels of security are integral to providing optimal performance and user experience, and keeping your user data safe.

The below guidelines outline selecting the correct SSL VPN mode for your deployment and employing best practices to ensure that your data are protected.

Information about SSL VPN throughput and maximum concurrent users is available on your device's datasheet; see Next-Generation Firewalls Models and Specifications.

Tunnel mode

In tunnel mode, the SSL VPN client encrypts all traffic from the remote client computer and sends it to the FortiGate through an SSL VPN tunnel over the HTTPS link between the user and the FortiGate.

The FortiGate establishes a tunnel with the client, and assigns a virtual IP (VIP) address to the client from a range reserved addresses. While the underlying protocols are different, the outcome is very similar to a IPsec VPN tunnel. All client traffic is encrypted, allowing the users and networks to exchange a wide range of traffic, regardless of the application or protocols.

Use this mode if you require:

- A wide range of applications and protocols to be accessed by the remote client.
- No proxying is done by the FortiGate.
- Straightforward configuration and administration, as traffic is controlled by firewall policies.
- A transparent experience for the end user. For example, a user that needs to RDP to their server only requires a tunnel connection; they can then use the usual client application, like Windows Remote Desktop, to connect.

Full tunneling forces all traffic to pass through the FortiGate (see SSL VPN full tunnel for remote user on page 1200). Split tunneling only routes traffic to the designated network through the FortiGate (see SSL VPN split tunnel for remote user on page 1193).

Limitations

Tunnel mode requires that the FortiClient VPN client be installed on the remote end. The standalone FortiClient VPN client is free to use, and can accommodate SSL VPN and IPsec VPN tunnels. For supported operating systems, see the FortiClient Technical Specifications.

Web mode

Web-only mode provides clientless network access using a web browser with built-in SSL encryption. Users authenticate to FortiGate's SSL VPN Web Portal, which provides access to network services and resources, including HTTP/HTTPS, Telnet, FTP, SMB/CIFS, VNC, RDP, and SSH. When a user starts a connection to a server from the web portal, FortiOS proxies this communication with the server. All communication between the FortiGate and the user continues to be over HTTPS, regardless of the service that is being accesssed.

Use this mode if you require:

- A clientless solution in which all remote services are access through a web portal.
- Tight control over the contents of the web portal.
- Limited services provided to the remote users.

Limitations

- Multiple applications and protocols are not supported.
- VNC and RDP access might have limitations, such as certain shortcut keys not being supported.
- In some configurations RDP can consume a significant amount of memory and CPU time.
- Firewall performance might decrease as remote usage increases.
- Highly customized web pages might not render correctly.

Security best practices

Integrate with authentication servers

For networks with many users, integrate your user configuration with existing authentication servers through LDAP, RADIUS, or FortiAuthenticator.

By integrating with existing authentication servers, such as Windows AD, there is a lower change of making mistakes when configuring local users and user groups. Your administration effort is also reduces.

See SSL VPN with LDAP user authentication on page 1211 for more information.

Use a non-factory SSL certificate for the SSL VPN portal

Your certificate should identify your domain so that a remote user can recognize the identity of the server or portal that they are accessing through a trusted CA.

The default Fortinet factory self-signed certificates are provided to simplify initial installation and testing. If you use these certificates you are vulnerable to man-in-the-middle attacks, where an attacker spoofs your certificate, compromises your connection, and steals your personal information. It is highly recommended that you purchase a server certificate from a trusted CA to allow remote users to connect to SSL VPN with confidence. See Procure and import a signed SSL certificate on page 1567 for more information.

Enabling the *Do not Warn Invalid Server Certificate* option on the client disables the certificate warning message, potentially allowing users to accidentally connect to untrusted servers. Disabling invalid server certificate warnings is not recommended.

Use multi-factor authentication

Multi-factor authentication (MFA) ensures that the end-user is who they claim to be by requiring at least two factors - a piece of information that the user knows (password), and an asset that the user has (OTP). A third factor, something a user is (fingerprint or face), may be enabled as well. FortiToken Mobile is typically used for MFA.

FortiGate comes with two free FortiTokens, and more can be purchased from the FortiToken Mobile iOS app or through Fortinet partners.

See SSL VPN with FortiToken mobile push authentication on page 1240 for more information.

2FA, a subset of MFA, can also be set up with email tokens. See Email Two-Factor Authentication on FortiGate for information.

Deploy user certificates for remote SSL VPN users

This method of 2FA uses a user certificate as the second authentication factor. This is more secure, as it identifies the end user using a certificate. The configuration and administration of this solution is significantly more complicated, and requires administrators with advanced knowledge of the FortiGate and certificate deployment.

See SSL VPN with certificate authentication on page 1222 for more information.

Define your minimum supported TLS version and cipher suites

Minimum and maximum supported TLS version can be configured in the FortiGate CLI. The cipher algorithm can also be customized.

See How to control the SSL version and cipher suite for SSL VPN for more information.

Properly administer firewall policies and profiles against only the access level required for the remote user

Users do not all require the same access. Access should only be granted after careful considerations. Typically, users are placed in groups, and each group is allowed access to limited resources.

Using SSL VPN realms simplifies defining the control structure for mapping users and groups to the appropriate resources.

See SSL VPN multi-realm on page 1287 for more information.

SSL VPN quick start

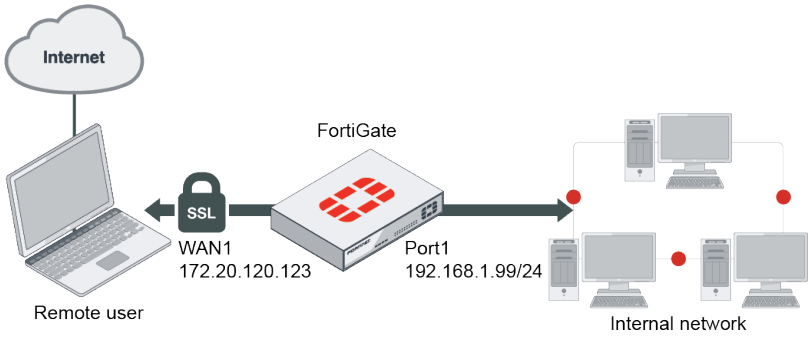
The following topics provide introductory instructions on configuring SSL VPN:

- SSL VPN split tunnel for remote user on page 1193
- Connecting from FortiClient VPN client on page 1196
- Set up FortiToken multi-factor authentication on page 1198
- Connecting from FortiClient with FortiToken on page 1199

SSL VPN split tunnel for remote user

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient but accessing the Internet without going through the SSL VPN tunnel.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internal subnet *192.168.1.0*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to create a tunnel mode only portal *my-split-tunnel-portal*.
   b. Enable *Split Tunneling*.
   c. Select *Routing Address* to define the destination network that will be routed through the tunnel. Leave undefined to use the destination in the respective firewall policies.
4. Configure SSL VPN settings.
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.

e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-split-tunnel-portal*.

5. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn split tunnel access*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Choose an *Outgoing Interface*. In this example, *port1*.
   e. Set the *Source* to *all* and group to *sslvpngroup*.
   f. In this example, the *Destination* is *all*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end

config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "my-split-tunnel-portal"
```

```
        set tunnel-mode enable
        set split-tunneling  enable
        set split-tunneling-routing-address "192.168.1.0"
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-split-tunnel-portal"
        next
    next
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn split tunnel access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

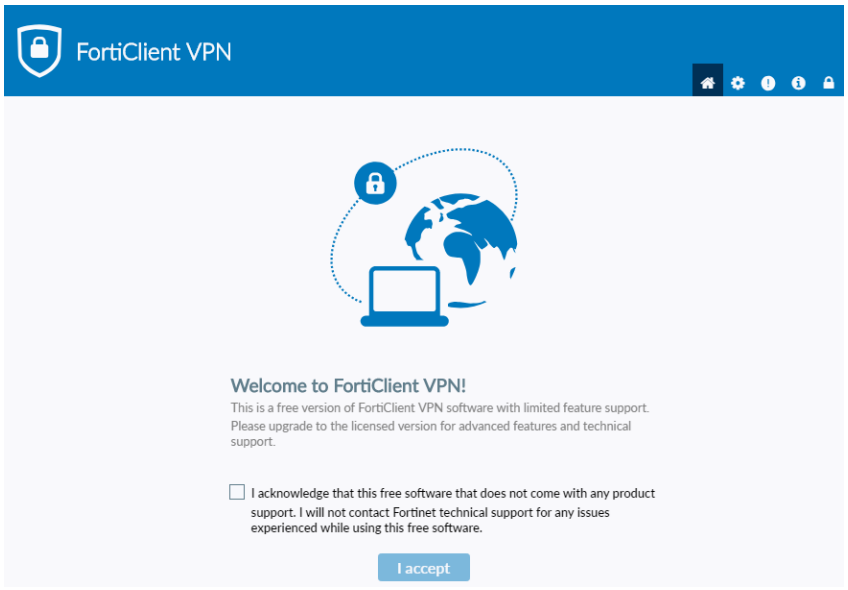
Connecting from FortiClient VPN client

For FortiGate administrators, a free version of FortiClient VPN is available which supports basic IPsec and SSL VPN and does not require registration with EMS. This version does not include central management, technical support, or some advanced features.

Downloading and installing the standalone FortiCient VPN client

You can download the free VPN client from FNDN or FortiClient.com.

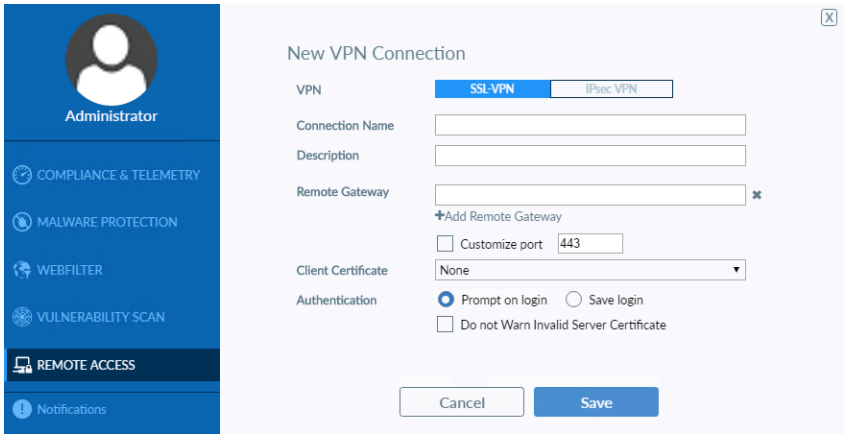
When the free VPN client is run for the first time, it displays a disclaimer. You cannot configure or create a VPN connection until you accept the disclaimer and click *I accept*:



Configuring an SSL VPN connection

To configure an SSL VPN connection:

1. On the *Remote Access* tab, click on the settings icon and then *Add a New Connection*.



2. Select *SSL-VPN*, then configure the following settings:

Connection Name	SSLVPNtoHQ
Description	(Optional)
Remote Gateway	172.20.120.123
Customize port	10443
Client Certificate	Select *Prompt on connect* or the certificate from the dropdown list.
Authentication	Select *Prompt on login* for a prompt on the connection screen

3. Click *Save* to save the VPN connection.

Connecting to SSL VPN

To connect to SSL VPN:

1. On the *Remote Access* tab, select the VPN connection from the dropdown list.
   Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the *Connect* button.
4. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
5. Click the *Disconnect* button when you are ready to terminate the VPN session.

Checking the SSL VPN connection

To check the SSL VPN connection using the GUI:

1. On the FortiGate, go to *VPN* > *Monitor* > *SSL-VPN Monitor* to verify the list of SSL users.
2. On the FortiGate, go to *Log & Report* > *Forward Traffic* to view the details of the SSL entry.

To check the tunnel log in using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type    Timeout   From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)         291       10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User          Source IP      Duration   I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9          22099/43228    10.212.134.200
```

Set up FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the split tunnel configuration (SSL VPN split tunnel for remote user on page 1193). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Configure a user and user group:
   a. Go to *User & Authentication* > *User Definition* and edit local user *sslvpnuser1*.
   b. Enable *Two-factor Authentication* and select one mobile *Token* from the list,
   c. Enter the user's *Email Address*.
   d. Enable *Send Activation Code* and select *Email*.
   e. Click *Next* and click *Submit*.
2. Activate the mobile token.
   When a FortiToken is added to user *sslvpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Configure a user and user group:

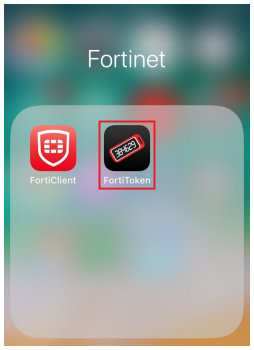
```
config user local
    edit "sslvpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
        set email-to <user's email address>
        set passwd <user's password>
    next
end
config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

2. Activate the mobile token.
   When a FortiToken is added to user *sslvpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Connecting from FortiClient with FortiToken

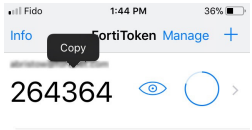
To activate your FortiToken:

1. On your device, open FortiToken Mobile. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.



2. You should have received your notification via email, select + and use the device camera to scan the token QR code in your email.

3. FortiToken Mobile provisions and activates your token and generates token codes immediately. To view the OTP's digits, select the eye icon. After you open the application, FortiToken Mobile generates a new six-digit OTP every 30 seconds.



To connect to SSL VPN:

1. On the *Remote Access* tab, select the VPN connection from the dropdown list.
   Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the *Connect* button.
4. A Token field will appear, prompting you for the FortiToken code. Enter the FortiToken code from your Mobile device.
5. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
6. Click the *Disconnect* button when you are ready to terminate the VPN session.

SSL VPN tunnel mode

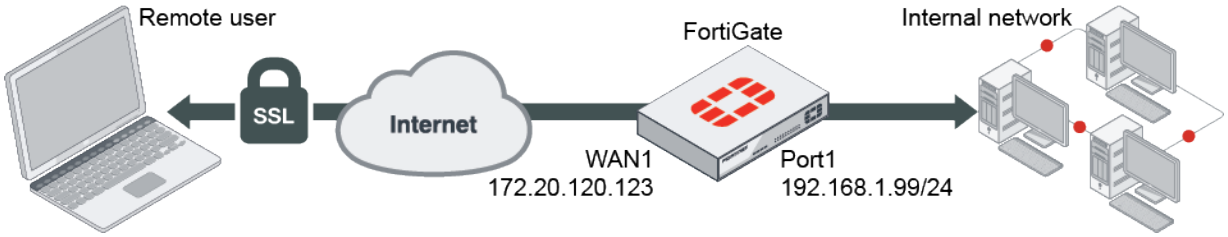
The following topics provide instructions on configuring SSL VPN tunnel mode:

- SSL VPN full tunnel for remote user
- SSL VPN tunnel mode host check

SSL VPN full tunnel for remote user

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address:
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.

2. Configure user and user group:
   a. Go to *User & Authentication* > *User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal:
   a. Go to *VPN* > *SSL-VPN Portals* to create a tunnel mode only portal *my-full-tunnel-portal*.
   b. Disable *Split Tunneling*.
4. Configure SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-full-tunnel-portal*.
5. Configure SSL VPN firewall policies to allow remote user to access the internal network:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set *Name* to *sslvpn tunnel mode access*.
   c. Set *Incoming Interface* to *SSL-VPN tunnel interface(ssl.root)*.
   d. Set *Outgoing Interface* to *port1*.
   e. Set the *Source* Address to *all* and User to *sslvpngroup*.
   f. Set *Destination* to *all*, *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   g. Click *OK*.
   h. Click *Create New*.
   i. Set *Name* to *sslvpn tunnel mode outgoing*.
   j. Configure the same settings as the previous policy, except set *Outgoing Interface* to *wan1*.
   k. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
```

```
        set passwd your-password
    next
end

config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

4. Configure SSL VPN web portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "my-full-tunnel-portal"
        set tunnel-mode enable
        set split-tunneling disable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-full-tunnel-portal"
        next
    end
end
```

6. Configure SSL VPN firewall policies to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn tunnel mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "sslvpn tunnel mode outgoing"
        set srcintf "ssl.root"
        set dstintf "wan1"
        set srcaddr "all"
```

```
            set dstaddr "all"
            set groups "sslvpngroup"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

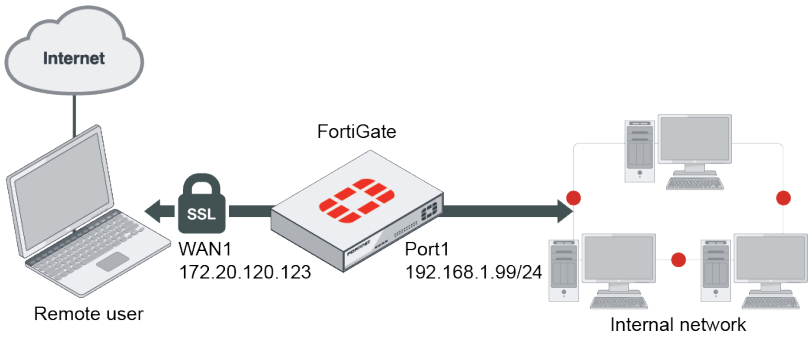
To see the results:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
7. After connection, all traffic except the local subnet will go through the tunnel *FGT*.
8. Go to *VPN* > *Monitor* > *SSL-VPN Monitor* to verify the list of SSL users.
9. On the FortiGate, go to *Log & Report* > *Forward Traffic* and view the details for the SSL entry.

SSL VPN tunnel mode host check

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by tunnel mode using FortiClient with AV host check.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to create a tunnel mode only portal *my-split-tunnel-portal*.
   b. Enable *Tunnel Mode* and *Enable Split Tunneling*.
   c. Select *Routing Address*.
4. Configure SSL VPN settings.
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*.

   It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 1191 and learn how to Procure and import a signed SSL certificate on page 1567.

   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-split-tunnel-portal*.
5. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn tunnel access with av check*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Choose an *Outgoing Interface*. In this example, *port1*.
   e. Set the *Source* to *all* and group to *sslvpngroup*.
   f. In this example, the *Destination* is *all*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Click *OK*.
6. Use CLI to configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user's computer.

```
config vpn ssl web portal
    edit my-split-tunnel-access
        set host-check av
    next
end
```

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end

config user group
    edit "sslvpngroup"
        set member "vpnuser1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "my-split-tunnel-portal"
        set tunnel-mode enable
        set split-tunneling  enable
        set split-tunneling-routing-address "192.168.1.0"
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
```

```
        set source-address6 "all"
        set default-portal "full-access"
        config authentication-rule
            edit 1
                set groups "sslvpngroup"
                set portal "my-split-tunnel-portal"
            next
        end
    end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

7. Configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user's computer:

```
config vpn ssl web portal
    edit my-split-tunnel-access
        set host-check av
    next
end
```

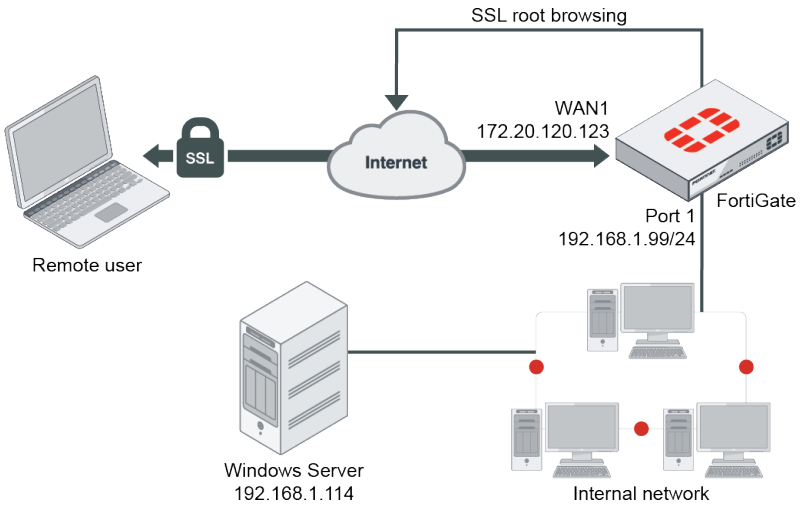
To see the results:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
   If the user's computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to *192.168.1.0* goes through the tunnel. Other traffic goes through local gateway.
8. On the FortiGate, go to *VPN* > *Monitor* > *SSL-VPN Monitor* to verify the list of SSL users.
9. On the FortiGate, go to *Log & Report* > *Forward Traffic* and view the details for the SSL entry.

SSL VPN web mode for remote user

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by web mode using a web browser.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to create a web mode only portal *my-web-portal*.
   b. Set *Predefined Bookmarks for Windows server* to type *RDP*.
4. Configure SSL VPN settings.
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.

d. Choose a certificate for *Server Certificate*.

It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 1191 and learn how to Procure and import a signed SSL certificate on page 1567.

e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *web-access*.
f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-Web-portal*.

5. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn web mode access*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Choose an *Outgoing Interface*. In this example, *port1*.
   e. Set the *Source* to *all* and group to *sslvpngroup*.
   f. In this example, the *Destination* is the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end

config user group
    edit "sslvpngroup"
```

```
        set member "vpnuser1"
    next
end
```

4. Configure SSL VPN web portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "my-web-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-web-portal"
        next
    end
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
```

```
    next
end
```

To see the results:

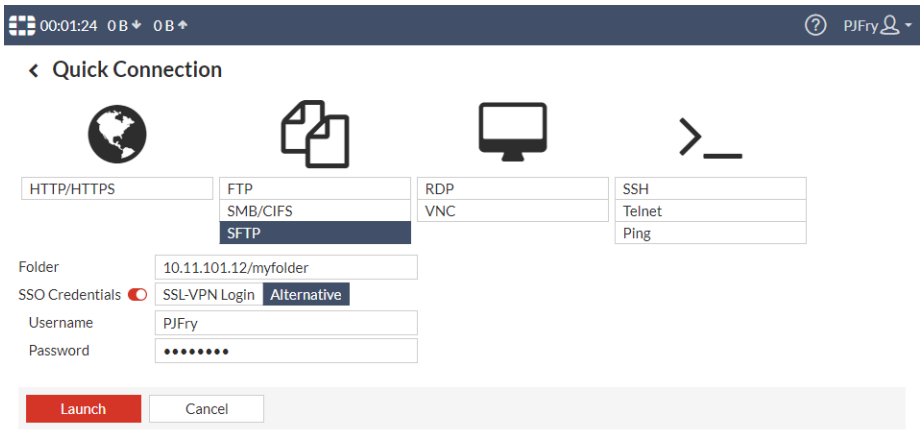
1. In a web browser, log into the portal *https://172.20.120.123:10443* using the credentials you've set up.
2. In the portal with the predefined bookmark, select the bookmark to begin an RDP session. If there are no predefined bookmarks, the Quick Connection tool can be used; see Quick Connection tool on page 1210 for more information.
3. Go to *VPN* > *Monitor* > *SSL-VPN Monitor* to verify the list of SSL users.
4. Go to *Log & Report* > *Forward Traffic* to view the details for the SSL entry.

Quick Connection tool

The Quick Connection tool allows a user to connect to a resource when it is not a predefined bookmark. The tool allows the user to specify the type of server and the URL or IP address of the host.

To connect to a resource:

1. Select the connection type.
2. Enter the required information, such as the IP address or URL of the host.
3. Click *Launch*.



In a VNC session, to send Ctrl+Alt+Del, press *F8* then select *Send Ctrl-Alt-Delete*.

RDP sessions

Some Windows servers require that a specific security be set for RDP sessions, as opposed to the standard RDP encryption security. For example, Windows 10 requires that TLS be used.

You can specify a location option if the remote computer does not use the same keyboard layout as your computer by appending it to the *Host* field using the following format: `<IP address> -m <locale>`

The available options are:

ar	Arabic	fr-be	Belgian French	no	Norwegian
da	Danish	fr-ca	Canadian French	pl	Polish
de	German	fr-ch	Swiss French	pt	Portuguese
de-ch	Swiss German	hr	Croatian	pt-br	Brazilian Portuguese
en-gb	British English	hu	Hungarian	ru	Russian
en-uk	UK English	it	Italian	sl	Slovenian
en-us	US English	ja	Japanese	sv	Sudanese
es	Spanish	lt	Lithuanian	tk	Turkmen
fi	Finnish	lv	Latvian	tr	Turkish
fr	French	mk	Macedonian		

SSL VPN authentication

The following topics provide instructions on configuring SSL VPN authentication:

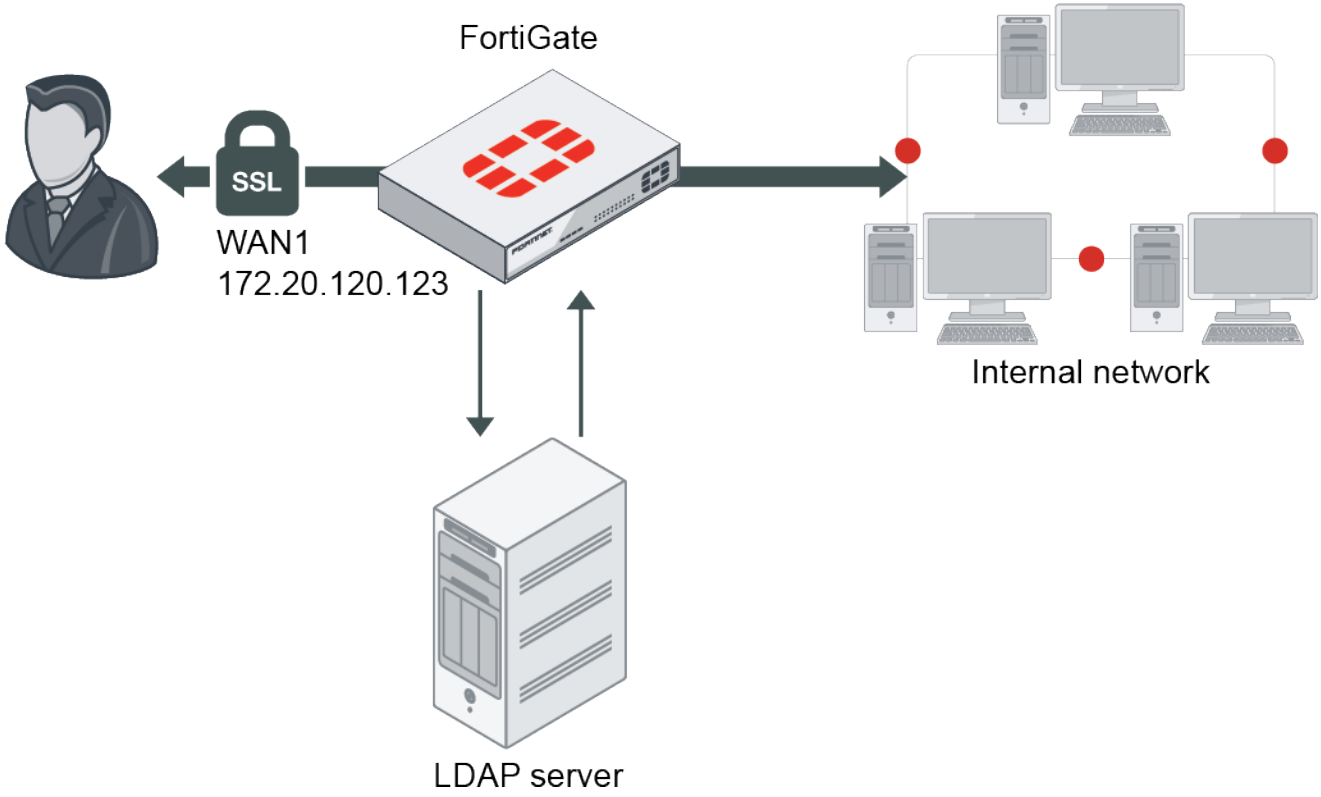
- SSL VPN with LDAP user authentication on page 1211
- SSL VPN with LDAP user password renew on page 1216
- SSL VPN with certificate authentication on page 1222
- SSL VPN with LDAP-integrated certificate authentication on page 1227
- SSL VPN for remote users with MFA and user case sensitivity on page 1232
- SSL VPN with FortiToken mobile push authentication on page 1240
- SSL VPN with RADIUS on FortiAuthenticator on page 1246
- SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator on page 1250
- SSL VPN with RADIUS password renew on FortiAuthenticator on page 1255
- SSL VPN with RADIUS on Windows NPS on page 1259
- SSL VPN with multiple RADIUS servers on page 1264
- SSL VPN with local user password policy on page 1273
- Dynamic address support for SSL VPN policies on page 1278
- SSL VPN multi-realm on page 1287
- NAS-IP support per SSL-VPN realm on page 1292

SSL VPN with LDAP user authentication

This is a sample configuration of SSL VPN for LDAP users. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network:
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Specify *Common Name Identifier* and *Distinguished Name*.
   d. Set *Bind Type* to *Regular*.
   e. Specify *Username* and *Password*.
   f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
   g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
4. Configure user group:
   a. Go to *User & Authentication* > *User Groups* to create a user group.
   b. Enter a *Name*.
   c. In *Remote Groups*, click *Add* to add *ldaps-server*.
5. Configure SSL VPN web portal:
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
   This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *ldaps-group* mapping portal *full-access*.
7. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *ldaps-group*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

4. Configure the LDAP server:

```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

5. Configure user group:

```
config user group
    edit "ldaps-group"
        set member "ldaps-server"
    next
end
```

6. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
```

```
     next
end
```

7. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "ldaps-group"
            set portal "full-access"
        next
    end
end
```

8. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “ldaps-group”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Enter the *ldu1* user credentials, then click *Login*.
3. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *ldu1* credentials.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *Events* and select *VPN Events* from the event type dropdown list to view the details of the SSL VPN connection event log.
3. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         229        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         291        10.1.100.254   0/0          0/0

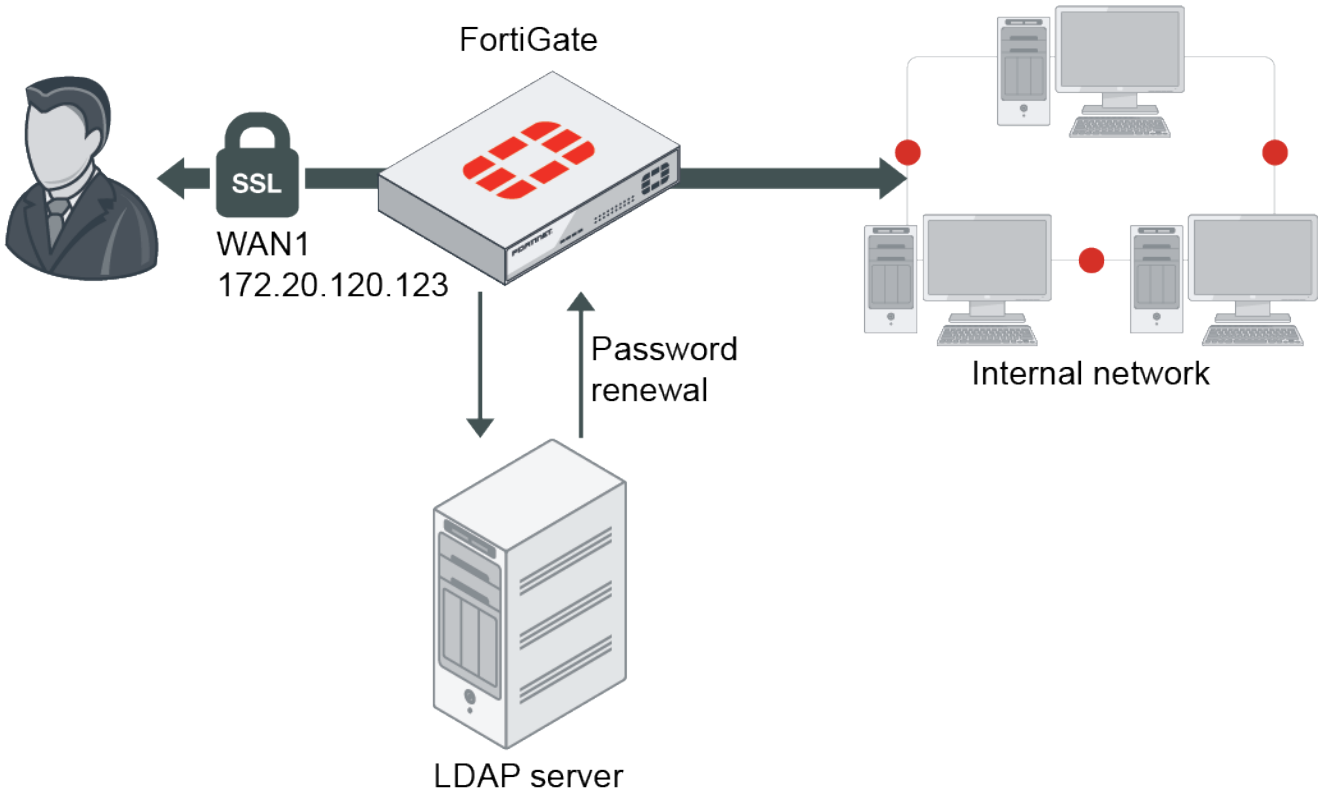
SSL VPN sessions:
 Index   User    Source IP      Duration    I/O Bytes      Tunnel/Dest IP
 0       ldu1    10.1.100.254   9           22099/43228    10.212.134.200
```

SSL VPN with LDAP user password renew

This is a sample configuration of SSL VPN for LDAP users with *Force Password Change on next logon*. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server with *Force password change on next logon*.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:

The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Specify *Common Name Identifier* and *Distinguished Name*.
   d. Set *Bind Type* to *Regular*.
   e. Specify *Username* and *Password*.
   f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
   g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
   h. To enable the `password-renew` option, use these CLI commands.

```
config user ldap
    edit "ldaps-server"
        set password-expiry-warning enable
        set password-renewal enable
    next
end
```

4. Configure user group:
   a. Go to *User & Authentication* > *User Groups* to create a user group.
   b. Enter a *Name*.
   c. In *Remote Groups*, click *Add* to add *ldaps-server*.
5. Configure SSL VPN web portal:
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *ldaps-group* mapping portal *full-access*.
7. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *ldaps-group*.

e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
h. Enable *NAT*.
i. Configure any remaining firewall and security options as desired.
j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

4. Configure the LDAP server:

The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
```

```
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
        set password-expiry-warning enable
        set password-renewal enable
    next
end
```

5. Configure user group:

```
config user group
    edit "ldaps-group"
        set member "ldaps-server"
    next
end
```

6. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

7. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "ldaps-group"
            set portal "full-access"
        next
    end
end
```

8. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "ldaps-group"
```

```
            set action accept
            set schedule "always"
            set service "ALL"
            set nat enable
        next
    end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *ldu1* credentials.
   Use a user that is configured on FortiAuthenticator with *Force password change on next logon*.
3. Click *Login*. You are prompted to enter a new password. The prompt will timeout after 90 seconds.
4. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *ldu1* credentials.
   You are prompted to enter a new password. The prompt will timeout after 90 seconds.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *Events* and select *VPN Events* from the event type dropdown list to view the details of the SSL VPN connection event log.
3. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         229        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         291        10.1.100.254   0/0          0/0
```

```
SSL VPN sessions:
 Index   User     Source IP       Duration    I/O Bytes       Tunnel/Dest IP
 0       ldu1     10.1.100.254    9           22099/43228     10.212.134.200
```

SSL VPN with certificate authentication

This is an example configuration of SSL VPN that requires users to authenticate using a client certificate. The client certificate is issued by the company Certificate Authority (CA). Each user is issued a certificate with their username in the subject.

There are two ways to configure certificate authentication:

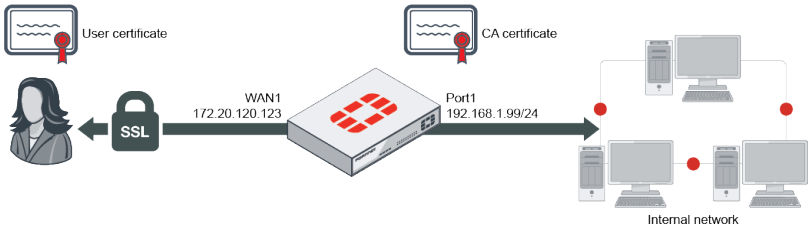
1. Using PKI users
2. Configuring the SSL VPN settings to require a client certificate

In this example, the server and client certificates are signed by the same Certificate Authority (CA).

Self-signed certificates are provided by default to simplify initial installation and testing. It is **HIGHLY** recommended that you acquire a signed certificate for your installation.

Continuing to use these certificates can result in your connection being compromised, allowing attackers to steal your information, such as credit card details.

For more information, please review the Use a non-factory SSL certificate for the SSL VPN portal on page 1192 and learn how to Procure and import a signed SSL certificate on page 1567.



Using PKI users

When using PKI users, the FortiGate authenticates the user based on there identity in the subject or the common name on the certificate. The certificate must be signed by a CA that is known by the FortiGate, either through the default CA certificates or through importing a CA certificate.

The user can either match a static subject or common name defined in the PKI user settings, or match an LDAP user in the LDAP server defined in the PKI user settings. Multi-factor authentication can also be enabled with the password as the second factor.

Configuring the SSL VPN settings to require a client certificate

Using this method, the user is authenticated based on their regular username and password, but SSL VPN will still require an additional certificate check. The client certificate only needs to be signed by a known CA in order to pass authentication.

This method can be configured by enabling *Require Client Certificate* (`reqclientcert`) in the SSL-VPN settings.

Configuration

In the following example, SSL VPN users are authenticated using the first method. A PKI user is configured with multi-factor authentication

Pre-requisites:

- The CA has already issued a client certificate to the user.
- The CA has issued a server certificate for the FortiGate's SSL VPN portal.
- The CA certificate is available to be imported on the FortiGate.

To configure SSL VPN in the GUI:

1. Install the server certificate. The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic.
   a. Go to *System* > *Feature Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
      - Set *Type* to *Certificate*.
      - Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
      - If required, you can change the *Certificate Name*.

   The server certificate now appears in the list of *Certificates*.
2. Install the CA certificate.

   The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.
   a. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   b. Select *Local PC* and then select the certificate file.

   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
3. Configure PKI users and a user group.

   To use certificate authentication, use the CLI to create PKI users.

```
config user peer
    edit pki01
        set ca CA_Cert_1
        set subject User01
    next
end
```

   Ensure that the subject matches the name of the user certificate. In this example, *User01*.
4. After you have create a PKI user, a new menu is added to the GUI:
   a. Go to *User & Authentication* > *PKI* to see the new user.
   b. Edit the user account.
   c. Enable *Two-factor authentication* and set a password for the account.
   d. Go to *User & Authentication* > *User Groups* and create a group called *sslvpngroup*.
   e. Add the PKI user *pki01* to the group.
5. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.

      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.

6. Configure SSL VPN settings.
   a. Go to *VPN* > *SSL-VPN Settings* and enable SSL-VPN.
   b. Set the *Listen on Interface(s)* to *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the local certificate that was imported.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
7. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as needed.
   j. Click *OK*.

To configure SSL VPN in the CLI:

1. Configure the protected subnet:

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

2. Install the server certificate:

   The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic. While it is easier to install the server certificate in the GUI, the CLI can be used to import a p12 certificate from a TFTP server.

   To import a p12 certificate, put the certificate *server_certificate.p12* on your TFTP server, then run following command on the FortiGate:

```
execute vpn certificate local import tftp server_certificate.p12 <your tftp_server> p12
<your password for PKCS12 file>
```

   To check that the server certificate is installed:

```
show vpn certificate local server_certificate
```

3. Install the CA certificate:

   The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users. While it is easier to install the CA certificate from GUI, the CLI can be used to import a CA certificates from a TFTP server.

   To import a CA certificate, put the CA certificate on your TFTP server, then run following command on the FortiGate:

```
execute vpn certificate ca import tftp <your CA certificate name> <your tftp server>
```

To check that a new CA certificate is installed:

```
show vpn certificate ca
```

4. Configure PKI users and a user group:

```
config user peer
    edit pki01
        set ca CA_Cert_1
        set subject User01
        set two-factor enable
        set passwd **********
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "pki01"
    next
end
```

5. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

6. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
```

```
            set service "ALL"
            set nat enable
        next
    end
```

Installation

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the user certificate on Windows 7, 8, and 10:

1. Double-click the certificate file to open the *Import Wizard*.
2. Use the *Import Wizard* to import the certificate into the *Personal store* of the current user.

To install the user certificate on Mac OS X:

1. Open the certificate file, to open *Keychain Access*.
2. Double-click the certificate.
3. Expand *Trust* and select *Always Trust*.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection.
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Enable *Client Certificate* and select the authentication certificate.
6. Save your settings.
7. Use the credentials you've set up to connect to the SSL VPN tunnel.
   If the certificate is correct, you can connect.

To see the results of web portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.
   A message requests a certificate for authentication.
2. Select the user certificate.
3. Enter your user credentials.
   If the certificate is correct, you can connect to the SSL VPN web portal.

To check the SSL VPN connection using the GUI:

1. Go to *VPN* > *Monitor* > *SSL-VPN Monitor* to verify the list of SSL users.
2. Go to *Log & Report* > *Events* and select *VPN Events* from the event type dropdown list to view the details for the SSL connection log.

To check the SSL VPN connection using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User     Auth Type      Timeout         From     HTTP in/out    HTTPS in/out
 0       pki01,cn=User01          1(1)            229     10.1.100.254   0/0     0/0
 1       pki01,cn=User01          1(1)            291     10.1.100.254   0/0     0/0

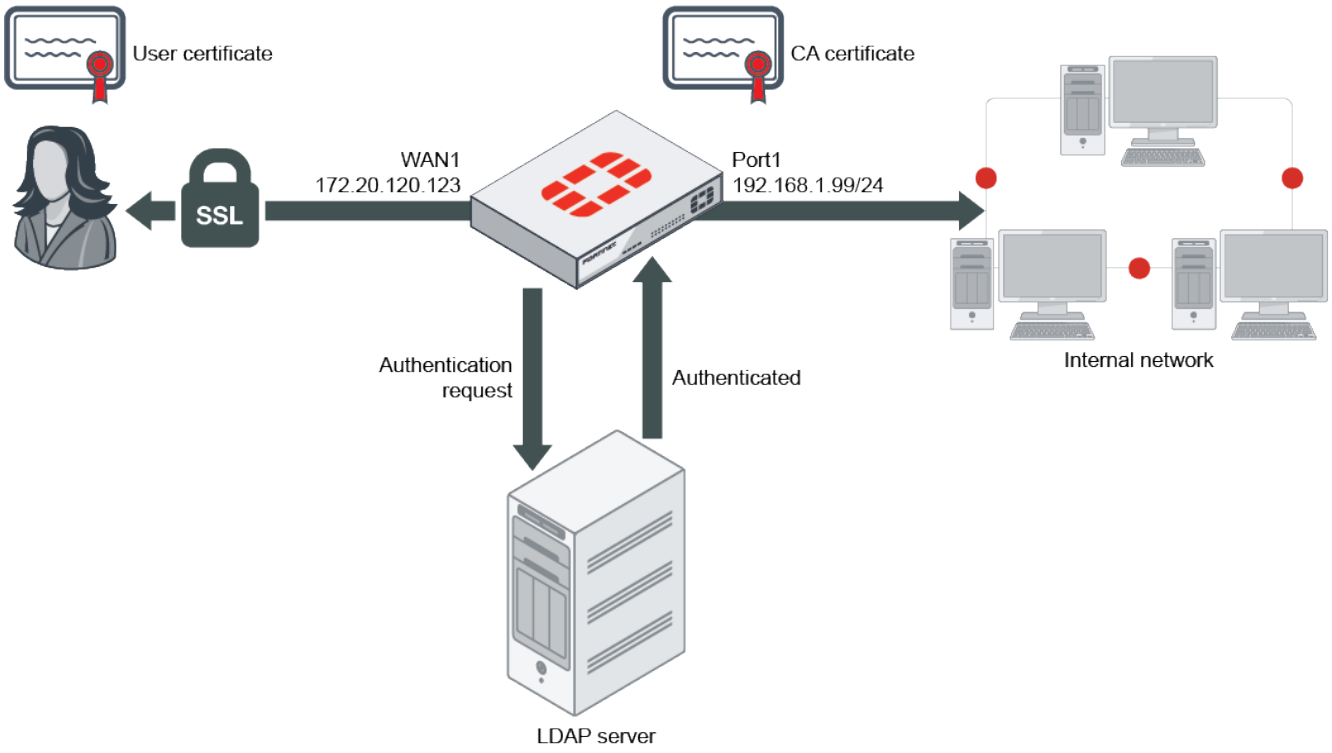
SSL VPN sessions:
 Index   User     Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       pki01,cn=User01          10.1.100.254    9       22099/43228    10.212.134.200
```

SSL VPN with LDAP-integrated certificate authentication

This is a sample configuration of SSL VPN that requires users to authenticate using a certificate with LDAP `UserPrincipalName` checking.

This sample uses Windows 2012R2 Active Directory acting as both the user certificate issuer, the certificate authority, and the LDAP server.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

In this sample, the *User Principal Name* is included in the subject name of the issued certificate. This is the user field we use to search LDAP in the connection attempt.

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the server certificate:

The server certificate is used for authentication and for encrypting SSL VPN traffic.

1. Go to *System* > *Feature Visibility* and ensure *Certificates* is enabled.
2. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
3. Set *Type* to *Certificate*.
4. Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
5. If required, change the *Certificate Name*.
   The server certificate now appears in the list of *Certificates*.

To install the CA certificate:

The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.

1. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
2. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure the LDAP server:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Set *Distinguished Name* to *dc=fortinet-fsso,dc=com*.
   d. Set *Bind Type* to *Regular*.
   e. Set *Username* to *cn=admin,ou=testing,dc=fortinet-fsso,dc=com*.
   f. Set *Password*.
   g. Click *OK*.
3. Configure PKI users and a user group:
   To use certificate authentication, use the CLI to create PKI users.

```
config user peer
    edit user1
```

```
        set ca CA_Cert_1
        set ldap-server "ldap-AD"
        set ldap-mode principal-name
    next
end
```

When you have create a PKI user, a new menu is added to the GUI:

a. Go to *User & Authentication* > *PKI* to see the new user.
b. Go to *User & Authentication* > *User* > *User Groups* and create a group *sslvpn-group*.
c. Add the PKI peer object you created as a local member of the group.
d. Add a remote group on the LDAP server and select the group of interest.
You need these users to be members using the LDAP browser window.

4. Configure SSL VPN web portal:
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
   This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpn-group* mapping portal *full-access*.
6. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpn-group*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure the LDAP server:

```
config user ldap
    edit "ldap-AD"
        set server "172.18.60.206"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=admin,ou=testing,dc=fortinet-fsso,dc=com"
        set password ldap-server-password
    next
end
```

4. Configure PKI users and a user group:

```
config user peer
    edit user1
        set ca CA_Cert_1
        set ldap-server "ldap-AD"
        set ldap-mode principal-name
    next
end

config user group
    edit "sslvpn-group"
        set member "ldap-AD" "user1"
        config match
            edit 1
                set server-name "ldap-AD"
                set group-name "CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            next
        end
    next
end
```

5. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

6. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpn-group"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpn-group"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection.
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
   d. Enable *Client Certificate* and select the authentication certificate.
4. Save your settings.
   Connecting to the VPN only requires the user's certificate. It does not require username or password.

To see the results of web portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.
   A message requests a certificate for authentication.
2. Select the user certificate.
   You can connect to the SSL VPN web portal.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *VPN Events* to view the details of the SSL VPN connection event log.
3. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the SSL VPN connection using the CLI:

Below is a sample output of `diagnose debug application fnbamd -1` while the user connects. This is a shortened output sample of a few locations to show the important parts. This sample shows lookups to find the group memberships (three groups total) of the user and that the correct group being found results in a match.

```
[1148] fnbamd_ldap_recv-Response len: 16, svr: 172.18.60.206
[829] fnbamd_ldap_parse_response-Got one MESSAGE. ID:4, type:search-result
[864] fnbamd_ldap_parse_response-ret=0
[1386] __fnbamd_ldap_primary_grp_next-Auth accepted
[910] __ldap_rxtx-Change state to 'Done'
[843] __ldap_rxtx-state 23(Done)

[2015] __match_ldap_group-Matching group 'CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM' -
'CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM'
[2091] fnbamd_auth_cert_check-Group 'sslvpn-group' matched
[2120] fnbamd_auth_cert_result-Result for ldap svr[0] 'ldap-AD' is SUCCESS
[2126] fnbamd_auth_cert_result-matched user 'test3', matched group 'sslvpn-group'
```

You can also use `diagnose firewall auth list` to validate that a firewall user entry exists for the SSL VPN user and is part of the right groups.

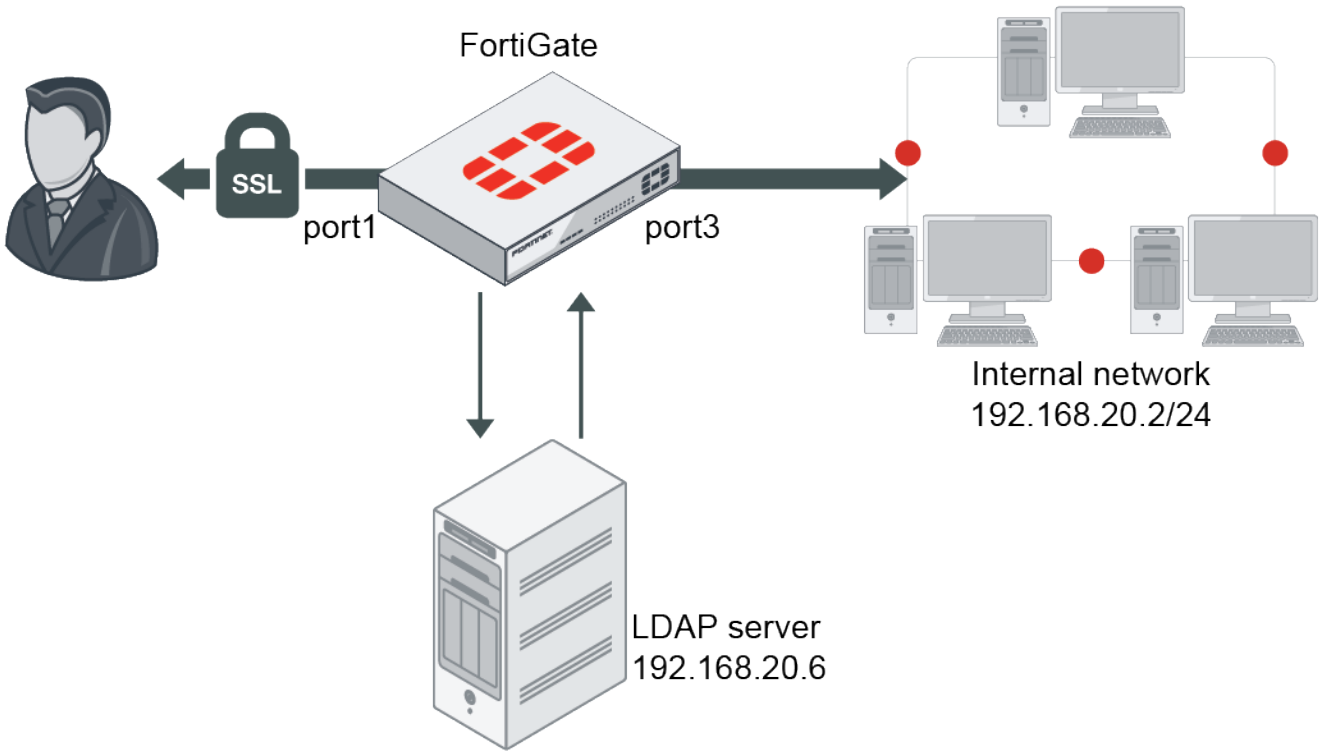
SSL VPN for remote users with MFA and user case sensitivity

By default, remote LDAP and RADIUS user names are case sensitive. When a remote user object is applied to SSL VPN authentication, the user must type the exact case that is used in the user definition on the FortiGate.

Case sensitivity can be disabled by disabling the `username-case-sensitivity` CLI command, allowing the remote user object to match any case that the end user types in.

In this example, a remote user is configured with multi-factor authentication (MFA). The user group includes the LDAP user and server, and is applied to SSL VPN authentication and the policy.

Topology



Example configuration

To configure the LDAP server:

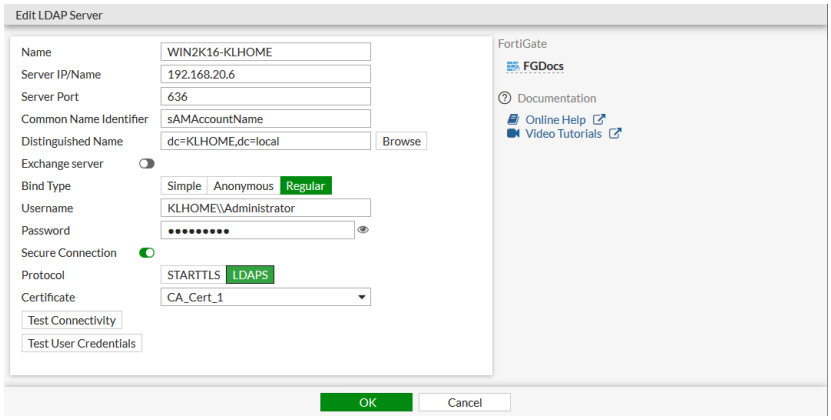
1. Generate and export a CA certificate from the AD server .
2. Import the CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Configure the following options for this example:

Name	WIN2K16-KLHOME
Server IP/Name	192.168.20.6
Server Port	636

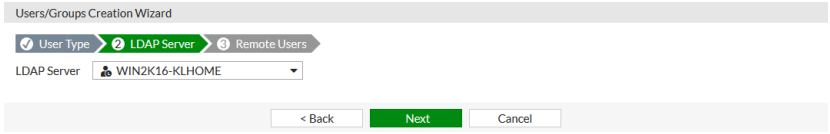
Common Name Identifier	sAMAccountName
Distinguished Name	dc=KLHOME,dc=local
Bind Type	Regular
Username	KLHOME\\Administrator
Password	*********
Secure Connection	Enable
Protocol	LDAPS
Certificate	CA_Cert_1 This is the CA certificate that you imported in step 2.



c. Click *OK*.

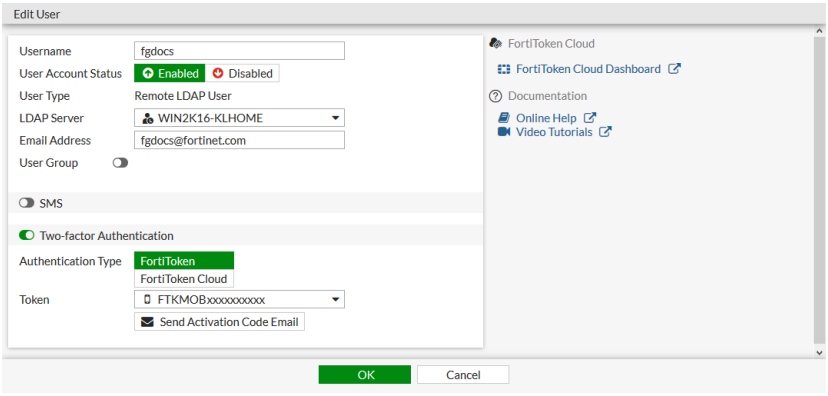
To configure an LDAP user with MFA:

1. Go to *User & Authentication* > *User Definition* and click *Create New*.
2. Select *Remote LDAP User*, then click *Next*.
3. Select the just created LDAP server, then click *Next*.



4. Right click to add the selected user, then click *Submit*.
5. Edit the user that you just created.
   The username will be pulled from the LDAP server with the same case as it has on the server.
6. Set the *Email Address* to the address that FortiGate will send the FortiToken to.
7. Enable *Two-factor Authentication*.
8. Set *Authentication Type* to *FortiToken*.

9. Set *Token* to a FortiToken device. See for more information.



10. Click *OK*.

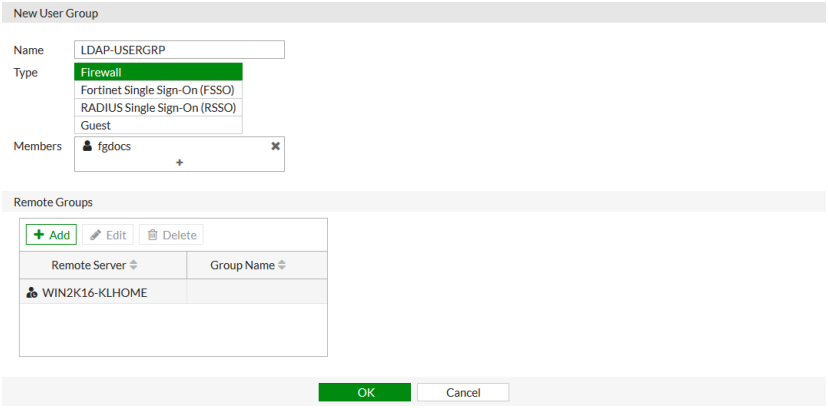
To disable case sensitivity on the remote user:

This can only be configured in the CLI.

```
config user local
    edit "fgdocs"
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to "fgdocs@fortinet.com"
        set username-case-sensitivity disable
        set ldap-server "WIN2K16-KLHOME"
    next
end
```

To configure a user group with the remote user and the LDAP server:

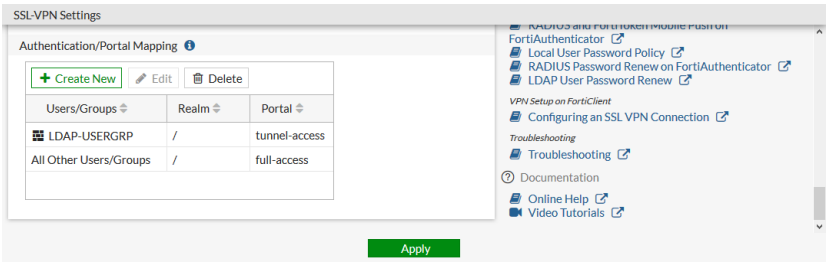
1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Set the *Name* to *LDAP-USERGRP*.
3. Set *Members* to the just created remote user.
4. In the *Remote Groups* table, click *Add*:
   a. Set *Remote Server* to the LDAP server.
   b. Set the group or groups that apply, and right click to add them.
   c. Click *OK*.



5. Click *OK*.

To apply the user group to the SSL VPN portal:

1. Go to *VPN* > *SSL-VPN Settings*.
2. In the *Authentication/Portal Mapping* table, click *Create New*.
   a. Set *Users/Groups* to the just created user group.
   b. Configure the remaining settings as required.
   c. Click *OK*.

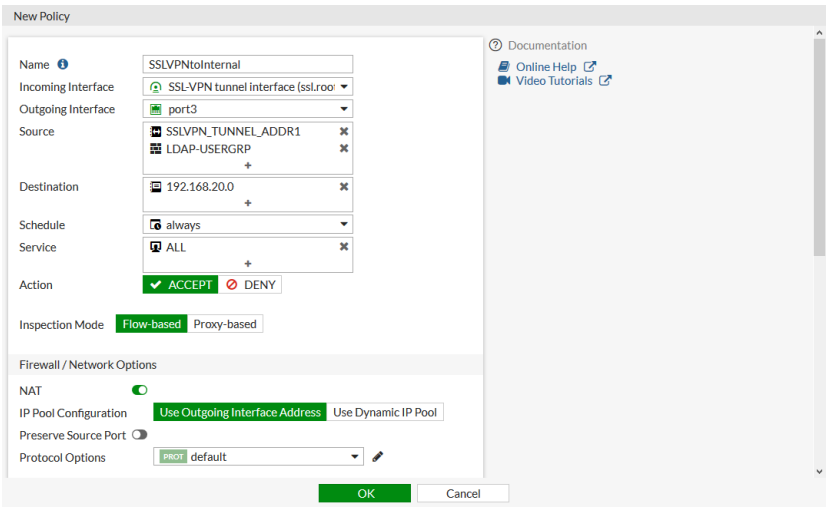


3. Click *Apply*.

To apply the user group to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

Name	SSLVPNtoInteral
Incoming Interface	SSL-VPN tunnel interface (ssl.root)
Outgoing Interface	port3
Source	Address - SSLVPN_TUNNEL_ADDR1 User - LDAP-USERGRP
Destination	The address of the internal network. In this case: 192.168.20.0.
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled



3. Configuring the remaining settings as required.
4. Click *OK*.

To configure this example in the CLI:

1. Configure the LDAP server:

```
config user ldap
    edit "WIN2K16-KLHOME"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password *********
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

2. Configure an LDAP user with MFA:

```
config user local
    edit "fgdocs"
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to "fgdocs@fortinet.com"
        set username-case-sensitivity disable
        set ldap-server "WIN2K16-KLHOME"
    next
end
```

3. Disable case sensitivity on the remote user:

```
config user local
    edit "fgdocs"
        set type ldap
        set two-factor fortitoken
```

```
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to "fgdocs@fortinet.com"
        set username-case-sensitivity disable
        set ldap-server "WIN2K16-KLHOME"
    next
end
```

4. Configure a user group with the remote user and the LDAP server:

```
config user group
    edit "LDAP-USERGRP"
        set member "fgdocs" "WIN2K16-KLHOME"
    next
end
```

5. Apply the user group to the SSL VPN portal:

```
config vpn ssl settings
    set servercert <server certificate>
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "LDAP-USERGRP"
            set portal "full-access"
        next
    end
end
```

6. Apply the user group to a firewall policy:

```
config firewall policy
    edit 5
        set name "SSLVPNtoInternal"
        set srcintf "ssl.root"
        set dstintf "port3"
        set srcaddr "SSLVPN_TUNNEL_ADDR1"
        set dstaddr "192.168.20.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set groups "LDAP-USERGRP"
        set nat enable
    next
end
```

Verification

To setup the VPN connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface.

   c. If required, set the *Customize Port*.
4. Save your settings.

To test the connection with case sensitivity disabled:

1. Connect to the VPN:
   a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
   b. When prompted, enter your FortiToken code.
   You should now be connected.
2. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS
in/out
 0       fgdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0
0/0

SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       fgdocs          LDAP-USERGRP    192.168.2.202   45      99883/5572
10.212.134.200
```

3. Disconnect from the VPN connection.
4. Reconnect to the VPN:
   a. Log in to the tunnel with the username, using a different case than on the FortiGate.
   b. When prompted, enter your FortiToken code.
   You should now be connected.
5. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS
in/out
 0       FGDOCS          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0
0/0

SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       FGDOCS          LDAP-USERGRP    192.168.2.202   45      99883/5572
10.212.134.200
```

In both cases, the remote user is matched against the remote LDAP user object and prompted for multi-factor authentication.

To test the connection with case sensitivity enabled:

1. Enable case sensitivity for the user:

```
config user local
    edit "fgdocs"
        set username-case-sensitivity enable
    next
end
```

2. Connect to the VPN
   a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
   b. When prompted, enter your FortiToken code.
   You should now be connected.
3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS
in/out
 0       fgdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0
0/0

SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       fgdocs          LDAP-USERGRP    192.168.2.202   45      99883/5572
10.212.134.200
```

1. Disconnect from the VPN connection.
2. Reconnect to the VPN:
   a. Log in to the tunnel with the username, using a different case than on the FortiGate.
   You will not be prompted for your FortiToken code. You should now be connected.
3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS
in/out
 0       FGdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0
0/0

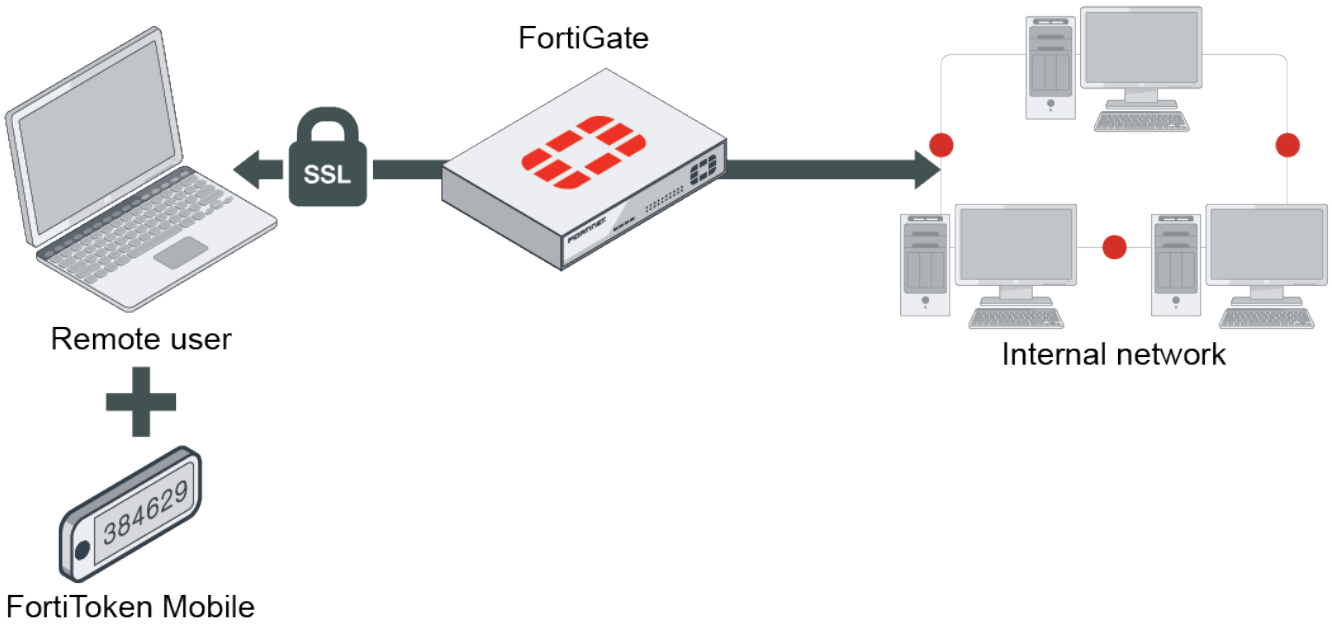
SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       FGdocs          LDAP-USERGRP    192.168.2.202   45      99883/5572
10.212.134.200
```

In this case, the user is allowed to log in without a FortiToken code because the entered user name did not match the name defined on the remote LDAP user object. Authentication continues to be evaluated against the LDAP server though, which is not case sensitive.

SSL VPN with FortiToken mobile push authentication

This is a sample configuration of SSL VPN that uses FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Register FortiGate for FortiCare Support:
   To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.
   a. Go to *Dashboard* > *Licenses*.
   b. Hover the pointer on *FortiCare Support* to check if FortiCare registered. If not, click it and select *Register*.
3. Add FortiToken mobile to FortiGate:
   If your FortiGate has FortiToken installed, skip this step.
   a. Go to *User & Authentication* > *FortiTokens* and click *Create New*.
   b. Select *Mobile Token* and type in *Activation Code*.
   c. Every FortiGate has two free mobile tokens. Go to *User & Authentication* > *FortiTokens* and click *Import Free Trial Tokens*.
4. Enable FortiToken mobile push:
   To use FTM-push authentication, use CLI to enable FTM-Push on the FortiGate.

   a. Ensure `server-ip` is reachable from the Internet and enter the following CLI commands:

```
config system ftm-push
    set server-ip 172.20.120.123
    set status enable
end
```

   b. Go to *Network* > *Interfaces*.
   c. Edit the *wan1* interface.
   d. Under *Administrative Access* > *IPv4*, select *FTM*.
   e. Click *OK*.
5. Configure user and user group:
   a. Go to *User & Authentication* > *User Definition* to create a local user *sslvpnuser1*.
   b. Enter the user's *Email Address*.
   c. Enable *Two-factor Authentication* and select one mobile *Token* from the list,
   d. Enable *Send Activation Code* and select *Email*.
   e. Click *Next* and click *Submit*.
   f. Go to *User & Authentication* > *User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
6. Activate the mobile token:
   a. When the user *sslvpnuser1* is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.
7. Configure SSL VPN web portal:
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
   This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
8. Configure SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
9. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Register FortiGate for FortiCare Support.
   To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.

```
diagnose forticare direct-registration product-registration -a "your account@xxx.com" -p
"your password" -T "Your Country/Region" -R "Your Reseller" -e 1
```

4. Add FortiToken mobile to FortiGate:

```
execute fortitoken-mobile import <your FTM code>
```

   If your FortiGate has FortiToken installed, skip this step.

   Every FortiGate has two free mobile Tokens. You can download the free token.

```
execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

5. Enable FortiToken mobile push:
   a. To use FTM-push authentication, ensure `server-ip` is reachable from the Internet and enable FTM-push in the FortiGate:

```
config system ftm-push
    set server-ip 172.20.120.123
    set status enable
end
```

   b. Enable FTM service on WAN interface:

```
config system interface
    edit "wan1"
        append allowaccess ftm
    next
end
```

6. Configure user and user group:

```
config user local
    edit "sslvpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
        set email-to <user's email address>
        set passwd <user's password>
    next
end
config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

7. Activate the mobile token.
   When the user *sslvpnuser1* is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.
8. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

9. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

10. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
```

```
            set schedule "always"
            set service "ALL"
            set nat enable
        next
    end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
   The FortiGate pushes a login request notification through the FortiToken mobile application.
3. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN portal.
4. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *sslvpnuser1* credentials and click *FTM Push*.
   The FortiGate pushes a login request notification through the FortiToken mobile application.
6. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User           Auth Type    Timeout   From           HTTP in/out   HTTPS in/out
 0       sslvpnuser1    1(1)         229       10.1.100.254   0/0           0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

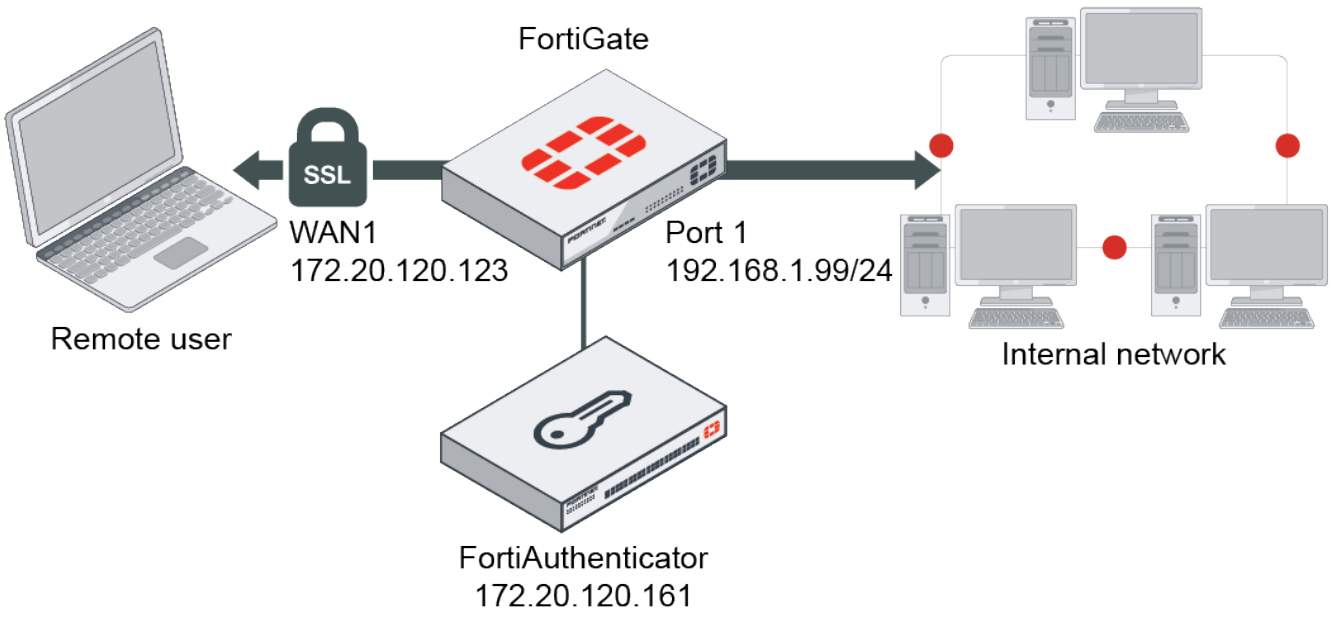
```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type    Timeout   From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)         291       10.1.100.254   0/0          0/0
```

```
SSL VPN sessions:
 Index   User          Source IP      Duration   I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9          22099/43228    10.212.134.200
```

SSL VPN with RADIUS on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. Create a user on the FortiAuthenticator.
   a. On the FortiAuthenticator, go to *Authentication* > *User Management* > *Local Users* to create a user *sslvpnuser1*.
   b. Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
   c. Go to *Authentication* > *User Management* > *User Groups* to create a group *sslvpngroup*.
   d. Add *sslvpnuser1* to the group by moving the user from *Available users* to *Selected users*.
2. Create the RADIUS client (FortiGate) on the FortiAuthenticator.
   a. On the FortiAuthenticator, go to *Authentication* > *RADIUS Service* > *Clients* to add the FortiGate as a RADIUS client *OfficeServer*).
   b. Enter the FortiGate IP address and set a *Secret*.
   The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
   c. Set *Realms* to *local* | *Local users*.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Addresses* and create an address for internal subnet *192.168.1.0*.
2. Create a RADIUS user and user group .
   a. On the FortiGate, go to *User & Authentication* > *RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
   b. For *Name*, use *FAC-RADIUS*.
   c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.
   d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
   e. Select *Test User Credentials* and enter the credentials for *sslvpnuser1*.
   The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
   f. Go to *User & Authentication* > *User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
   g. For *Name*, use *SSLVPNGroup*.
   h. In *Remote Groups*, click *Add*.
   i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
   j. Leave the *Groups* field blank.
3. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
   This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
4. Configure SSL VPN settings.
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
5. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. *Incoming Interface* must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example: *port1*.
   e. Set the *Source* > *Address* to *all* and *Source* > *User* to *sslvpngroup*.
   f. Set *Destination* > *Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure the remaining options as required.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Create a RADIUS user and user group.

```
config user radius
    edit "FAC-RADIUS"
        set server "172.20.120.161"
        set secret <FAC client secret>
    next
end

config user group
    edit "sslvpngroup"
        set member "FAC-RADIUS"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
```

```
        config authentication-rule
            edit 1
                set groups "sslvpngroup"
                set portal "full-access"
            next
        end
    end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```
    config firewall policy
        edit 1
            set name "sslvpn web mode access"
            set srcintf "ssl.root"
            set dstintf "port1"
            set srcaddr "all"
            set dstaddr "192.168.1.0"
            set groups "sslvpngroup"
            set action accept
            set schedule "always"
            set service "ALL"
            set nat enable
        next
    end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
3. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection.
   - Set the connection name.
   - Set *Remote Gateway* to *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *sslvpnuser1* credentials and check that you are logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)         229        10.1.100.254   0/0          0/0
```

```
SSL VPN sessions:
 Index   User     Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type   Timeout    From           HTTP in/out  HTTPS in/out

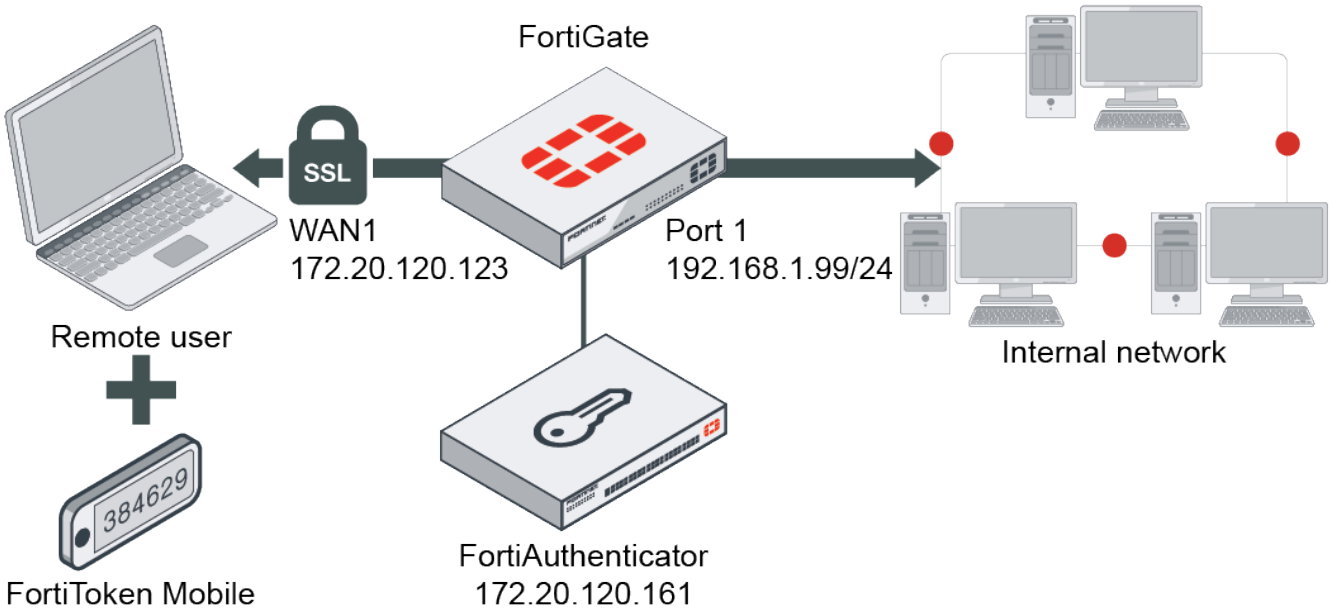
SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server and FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. On the FortiAuthenticator, go to *System* > *Administration* > *System Access* and configure a *Public IP/FQDN for FortiToken Mobile*. If the FortiAuthenticator is behind a firewall, the public IP/FQDN will be an IP/port forwarding rule directed to one of the FortiAuthenticator interfaces. The interface that receives the approve/deny FTM push responses must have the *FortiToken Mobile API* service enabled.
2. Add a FortiToken mobile license on the FortiAuthenticator:
   a. Go to *Authentication* > *User Management* > *FortiTokens*.
   b. Click *Create New*.
   c. Set *Token type* to *FortiToken Mobile* and enter the *FortiToken Activation codes*.
3. Create the RADIUS client (FortiGate) on the FortiAuthenticator:
   a. Go to *Authentication* > *RADIUS Service* > *Clients* to add the FortiGate as a RADIUS client *OfficeServer*).
   b. Enter the FortiGate IP address and set a *Secret*.
      The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
   c. Set *Authentication method* to *Enforce two-factor authentication*.
   d. Select *Enable FortiToken Mobile push notifications authentication*.
   e. Set *Realms* to *local* | *Local users*.
4. Create a user and assign FortiToken mobile to the user on the FortiAuthenticator:
   a. Go to *Authentication* > *User Management* > *Local Users* to create a user *sslvpnuser1*.
   b. Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
   c. Enable *Token-based authentication* and select to deliver the token code by *FortiToken*.
   d. Select the FortiToken added from the FortiToken Mobile dropdown menu.
   e. Set *Delivery method* to *Email* and fill in the *User Information* section.
   f. Go to *Authentication* > *User Management* > *User Groups* to create a group *sslvpngroup*.
   g. Add *sslvpnuser1* to the group by moving the user from *Available users* to *Selected users*.
5. Install the FortiToken mobile application on your Android or iOS smartphone.
   The FortiAuthenticator sends the FortiToken mobile activation to the user's email address.
6. Activate the FortiToken mobile through the FortiToken mobile application by entering the activation code or scanning the QR code.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Create a RADIUS user and user group:
   a. On the FortiGate, go to *User & Authentication* > *RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
   b. For *Name*, use *FAC-RADIUS*.
   c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.
   d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
   e. Select *Test User Credentials* and enter the credentials for *sslvpnuser1*.
      The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.

   f. Go to *User & Authentication* > *User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
   g. For *Name*, use *SSLVPNGroup*.
   h. In *Remote Groups*, click *Add*.
   i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
   j. Leave the *Groups* field blank.
3. Configure SSL VPN web portal:
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
   This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
4. Configure SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
5. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example: *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Create a RADIUS user and user group:

```
config user radius
    edit "FAC-RADIUS"
        set server "172.20.120.161"
        set secret <FAC client secret>
    next
end

config user group
    edit "sslvpngroup"
        set member "FAC-RADIUS"
    next
end
```

4. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

5. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
```

```
            set schedule "always"
            set service "ALL"
            set nat enable
        next
    end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
   The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
3. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN portal.
4. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example: *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *sslvpnuser1* credentials and click *FTM Push*.
   The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
6. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type   Timeout   From           HTTP in/out   HTTPS in/out
 0       sslvpnuser1   1(1)        229       10.1.100.254   0/0           0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login on CLI:

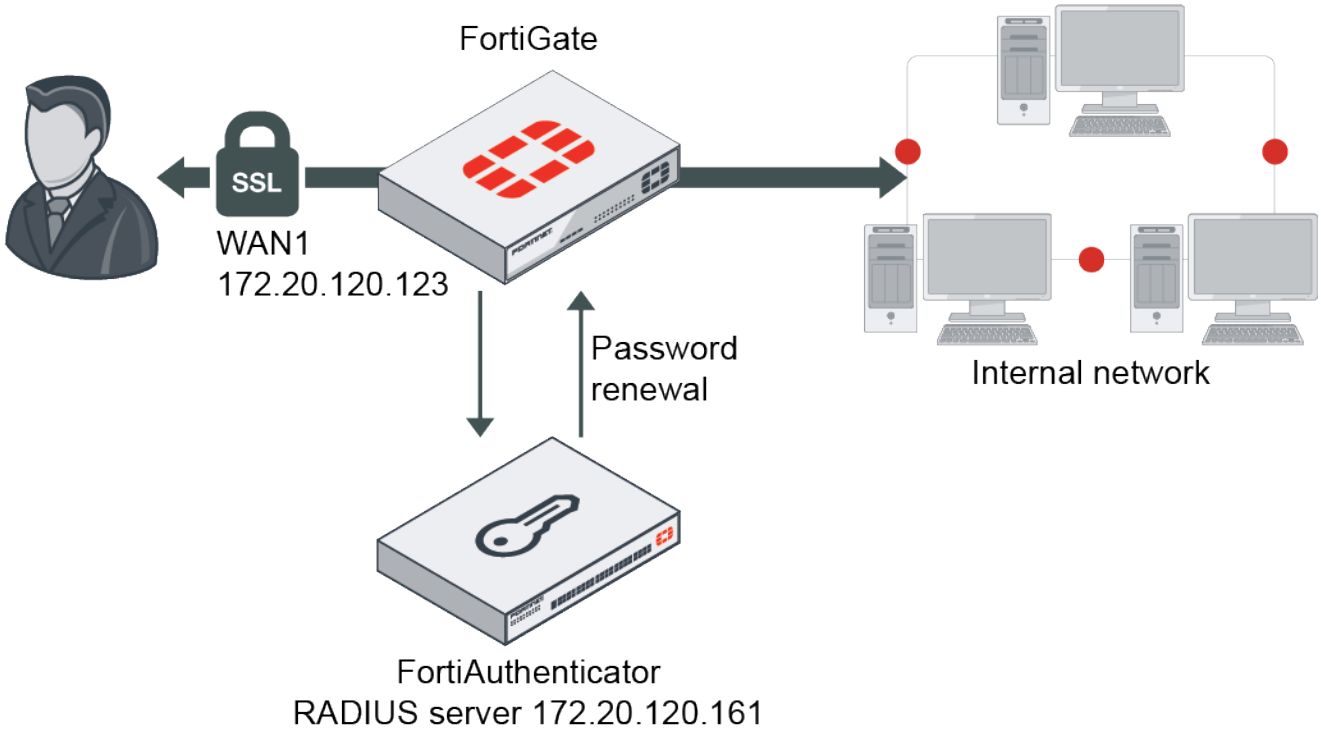
```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type    Timeout   From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)         291       10.1.100.254   0/0          0/0
```

```
SSL VPN sessions:
 Index   User          Source IP      Duration    I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9           22099/43228    10.212.134.200
```

SSL VPN with RADIUS password renew on FortiAuthenticator

This is a sample configuration of SSL VPN for RADIUS users with *Force Password Change on next logon*. In this example, the RADIUS server is a FortiAuthenticator. A user *test1* is configured on FortiAuthenticator with *Force password change on next logon*.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.

2. Create a RADIUS user.
   a. Go to *User & Authentication* > *RADIUS Servers* to create a user.
   b. Set *Authentication method* to *MS-CHAP-v2*.
   c. Enter the *IP/Name* and *Secret*.
   d. Click *Create*.
      Password renewal only works with the MS-CHAP-v2 authentication method.
   e. To enable the `password-renew` option, use these CLI commands.

```
config user radius
    edit "fac"
        set server "172.20.120.161"
        set secret <fac radius password>
        set auth-type ms_chap_v2
        set password-renewal enable
    next
end
```

3. Configure user group.
   a. Go to *User & Authentication* > *User Groups* to create a user group.
   b. For the *Name*, enter *fac-group*.
   c. In *Remote Groups*, click *Add* to add *Remote Server* you just created.
4. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings.
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *fac-group* mapping portal *full-access*.
6. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *fac-group*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure the RADIUS server.

```
config user radius
    edit "fac"
        set server "172.18.58.107"
        set secret <fac radius password>
        set auth-type ms_chap_v2
        set password-renewal enable
    next
end
```

4. Configure user group.

```
config user group
    edit "fac-group"
        set member "fac"
    next
end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
```

```
        set source-interface "wan1"
        set source-address "all"
        set default-portal "web-access"
        config authentication-rule
            edit 1
                set groups "fac-group"
                set portal "full-access"
            next
        end
    end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "fac-group"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *test1* credentials.
   Use a user which is configured on FortiAuthenticator with *Force password change on next logon*.
3. Click *Login*. You are prompted to enter a new password.
4. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection.
   - Set the connection name.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *test1* credentials.
   You are prompted to enter a new password.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *Events* and select *VPN Events* from the event type dropdown list to view the details of the SSL

VPN connection event log.

3. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out   HTTPS in/out
 0       test1   1(1)         229        10.1.100.254   0/0           0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout   From           HTTP in/out  HTTPS in/out
 0       test1   1(1)         291       10.1.100.254   0/0          0/0

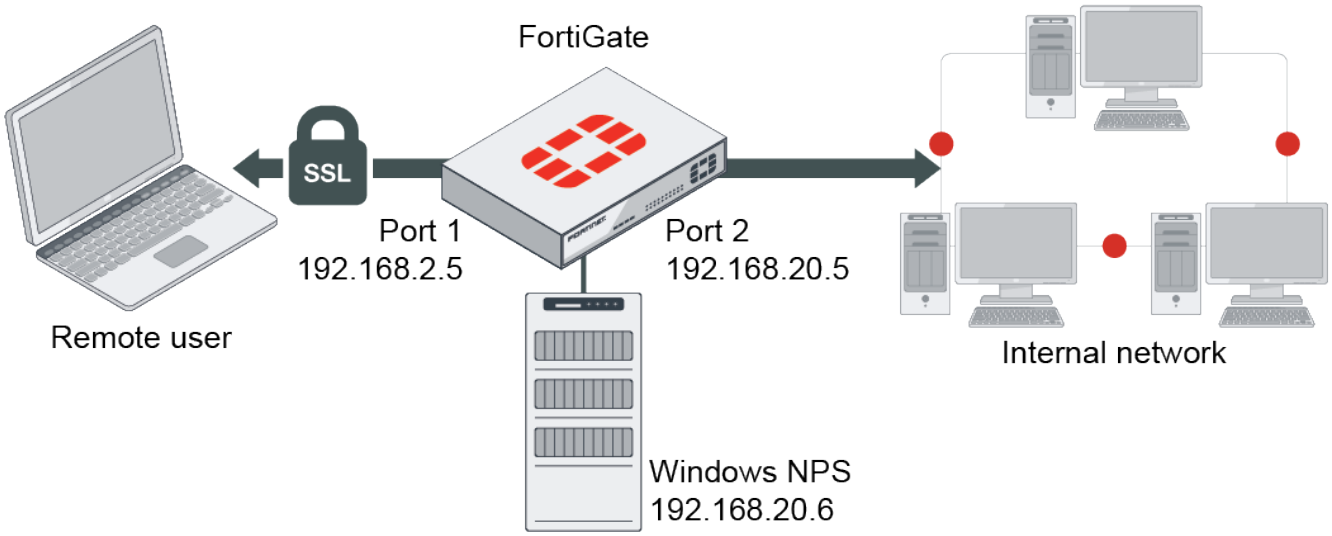
SSL VPN sessions:
 Index   User    Source IP      Duration   I/O Bytes      Tunnel/Dest IP
 0       test1   10.1.100.254   9          22099/43228    10.212.134.200
```

SSL VPN with RADIUS on Windows NPS

This is an example configuration of SSL VPN that uses Windows Network Policy Server (NPS) as a RADIUS authentication server.

The NPS must already be configured to accept the FortiGate as a RADIUS client and the choice of authentication method, such as MS-CHAPv2. A shared key must also have been created.

Example



The user is connecting from their PC to the FortiGate's port1 interface. RADIUS authentication occurs between the FortiGate and the Windows NPS, and the SSL-VPN connection is established once the authentication is successful.

Configure SSL-VPN with RADIUS on Windows NPS in the GUI

To configure the internal and external interfaces:

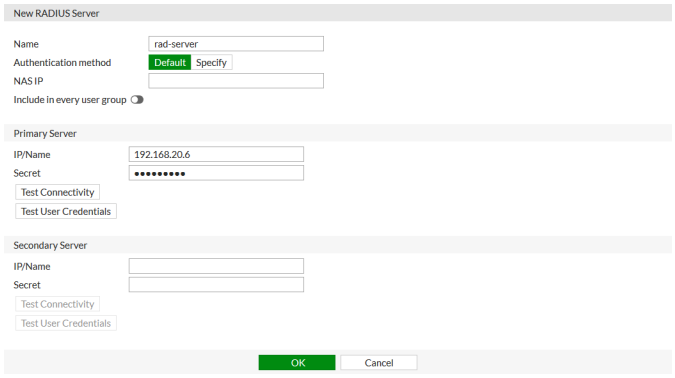
1. Go to *Network* > *Interfaces*
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
2. Set *Name* to *192.168.20.0*.
3. Leave *Type* as *Subnet*
4. Set *IP/Netmask* to *192.168.20.0/24*.
5. Click *OK*.

To add the RADIUS server:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Set *Name* to *rad-server*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Optionally, click *Test User Credentials* to test user credentials. Testing from the GUI is limited to PAP.

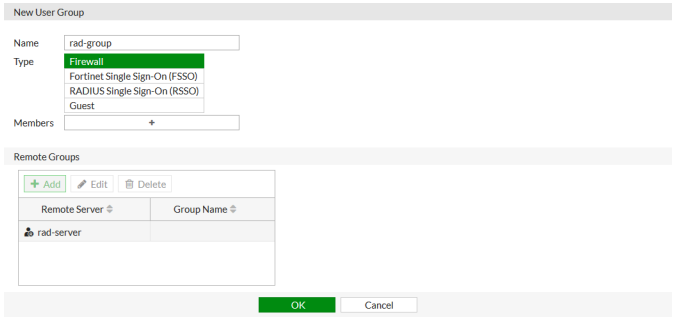


7. Click *OK*.

To configure a user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Set *Name* to *rad-group*.

3. Under *Remote Groups*, click *Add* and add the *rad-server*.



4. Click *OK*.

To configure SSL VPN settings:

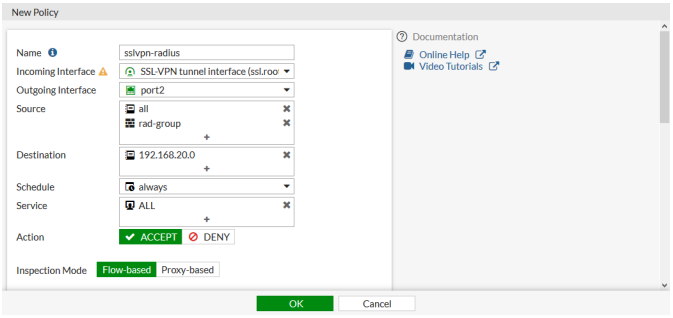
1. Go to *VPN* > *SSL-VPN Settings*.
2. Select the *Listen on Interface(s)*, in this example, *port1*.
3. Set *Listen on Port* to *10443*.
4. If you have a server certificate, set *Server Certificate* to the authentication certificate.
5. Under *Authentication/Portal Mapping*:
   a. Edit *All Other Users/Groups* and set *Portal* to *web-access*.
   b. Click *Create New* and create a mapping for the *rad-group* user group with *Portal* set to *full-access*.

   c. Click *OK*.
6. Click *Apply*.

To configure an SSL VPN firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set the policy name, in this example, *sslvpn-radius*.
3. Set *Incoming Interface* to *SSL-VPN tunnel interface(ssl.root)*.
4. Set *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port2*.
5. Set the *Source* > *Address* to *all* and *Source* > *User* to *rad-group*.
6. Set *Destination* > *Address* to the internal protected subnet *192.168.20.0*.
7. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.

8. Enable *NAT*.



9. Configure the remaining options as required.
10. Click *OK*.

Configure SSL-VPN with RADIUS on Windows NPS in the CLI

To configure SSL VPN using the CLI:

1. Configure the internal and external interfaces:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.2.5 255.255.255.0
        set alias internal
    next
    edit "port2"
        set vdom "root"
        set ip 192.168.20.5 255.255.255.0
        set alias external
    next
end
```

2. Configure the firewall address:

```
config firewall address
    edit "192.168.20.0"
        set subnet 192.168.20.0 255.255.255.0
    next
end
```

3. Add the RADIUS server:

```
config user radius
    edit "rad-server"
        set server "192.168.20.6"
        set secret *********
    next
end
```

4. Create a user group and add the RADIUS server to it:.

```
config user group
    edit "rad-group"
        set member "rad-server"
    next
end
```

5. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "rad-group"
            set portal "full-access"
        next
    end
end
```

6. Configure an SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn-radius"
        set srcintf "ssl.root"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "192.168.20.0"
        set groups "rad-group"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Results

To connect with FortiClient in tunnel mode:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to *192.168.2.5*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the RADIUS user credentials.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *Events* and select *VPN Events* from the event type drop-down list to view the details of the SSL VPN connection event log.
3. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User     Group   Auth Type      Timeout         From     HTTP in/out    HTTPS in/out
 0       radkeith         rad-group        2(1)            295     192.168.2.202  0/0     0/0

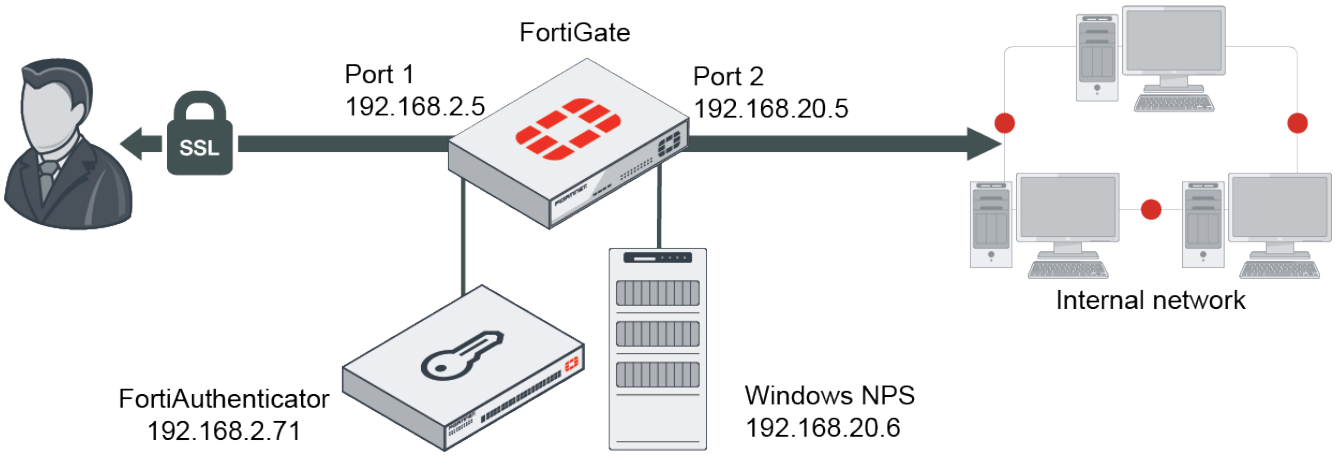
SSL VPN sessions:
 Index   User     Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       radkeith         rad-group        192.168.2.202   18      28502/4966
10.212.134.200
```

SSL VPN with multiple RADIUS servers

When configuring two or more RADIUS servers, you can configure a Primary and Secondary server within the same RADIUS server configurations for backup purposes. You can also configure multiple RADIUS servers within the same User Group to service the access request at the same time.

A tertiary server can be configured in the CLI.

Sample topology



Sample configurations

- Configure a Primary and Secondary server for backup on page 1264
- Authenticating to two RADIUS servers concurrently on page 1268

Configure a Primary and Secondary server for backup

When you define a Primary and Secondary RADIUS server, the access request will always be sent to the Primary server first. If the request is denied with an Access-Reject, then the user authentication fails. However, if there is no response from the Primary server after another attempt, the access request will be sent to the Secondary server.

In this example, you will use a Windows NPS server as the Primary server and a FortiAuthenticator as the Secondary server. It is assumed that users are synchronized between the two servers.

To configure the internal and external interfaces:

1. Go to *Network* > *Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
2. Set *Name* to *192.168.20.0*.
3. Leave *Type* as *Subnet*
4. Set IP/*Netmask* to *192.168.20.0/24*.
5. Click *OK*.

To add the RADIUS servers:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Set *Name* to *PrimarySecondary*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Under *Secondary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
7. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
8. *Click OK.*

To configure the user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. In the *Name* field, enter *PrimarySecondaryGroup*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *PrimarySecondary*.
4. Click *OK*, and then click *OK* again.

To configure the SSL VPN settings:

1. Go to *VPN* > *SSL-VPN Settings*.
2. From the *Listen on Interface(s)* dropdown select *port1*.
3. In the *Listen on Port* field enter *10443*.
4. Optionally, from the *Server Certificate* dropdown, select the authentication certificate if you have one for this SSL VPN portal.
5. Under *Authentication/Portal Mapping*, set the default portal web-access.
   a. Select *All Other Users/Groups* and click *Edit*.
   b. From the *Portal* dropdown, select *web-access*.

   c. Click *OK*.
6. Create a web portal for *PrimarySecondaryGroup*.
   a. Under *Authentication/Portal Mapping*, click *Create New*.
   b. Click *Users/Groups* and select *PrimarySecondaryGroup*.
   c. From the *Portal* dropdown, select *full-access*.
   d. Click *OK*.

To configure SSL VPN firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New* to create a new policy, or double-click an existing policy to edit it and configure the following settings:

Name	Enter a name for the policy.
Incoming Interface	*SSL-VPN tunnel interface (ssl.root)*
Outgoing interface	Set to the local network interface so that the remote user can access the internal network. For this example, select *port3*.
Source	In the *Address* tab, select *SSLVPN_TUNNEL_ADDR1* In the *User* tab, select *PrimarySecondaryGroup*
Destination	Select the internal protected subnet *192.168.20.0*.
Schedule	*always*
Service	*All*
Action	*Accept*
NAT	*Enable*

3. Configure any remaining firewall and security options as required.
4. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the internal interface and firewall address:

```
config system interface
   edit "port3"
      set vdom "root"
      set ip 192.168.20.5 255.255.255.0
      set alias "internal"
   next
end
config firewall address
   edit "192.168.20.0"
      set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
      set subnet 192.168.20.0 255.255.255.0
   next
end
```

2. Configure the RADIUS server:

```
config user radius
```

```
    edit "PrimarySecondary"
      set server "192.168.20.6"
      set secret <secret>
      set secondary-server "192.168.2.71"
      set secondary-secret <secret>
    next
  end
```

3. Add the RADIUS user to the user group:

```
  config user group
    edit "PrimarySecondaryGroup"
      set member "PrimarySecondary "
    next
  end
```

4. Configure SSL VPN settings:

```
  config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
      edit 1
        set groups "PrimarySecondaryGroup "
        set portal "full-access"
      next
    end
  end
```

5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:

```
  config firewall policy
    edit 1
      set name "sslvpn-radius"
      set srcintf "ssl.root"
      set dstintf "port3"
      set srcaddr "all"
      set dstaddr "192.168.20.0"
      set groups "PrimarySecondaryGroup"
      set action accept
      set schedule "always"
      set service "ALL"
      set nat enable
    next
  end
```

To verify the connection:

User *radkeith* is a member of both the NPS server and the FAC server.

When the Primary server is up, it will connect to the SSL VPN tunnel using FortiClient.

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 16:26:50.838453 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 118
2020-05-15 16:26:50.883166 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 20
2020-05-15 16:26:50.883374 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 182
2020-05-15 16:26:50.884683 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 228
```

The access request is sent to the Primary NPS server 192.168.20.6, and the connection is successful.

```
# get vpn ssl monitor
SSL VPN Login Users:

Index   User            Group                   Auth Type      Timeout         From     HTTP
in/out    HTTPS in/out

0       radkeith       PrimarySecondaryGroup   2(1)            285     192.168.2.202
 0/0     0/0

SSL VPN sessions:

Index   User       Group                   Source IP      Duration        I/O Bytes
Tunnel/Dest IP

0       radkeith   PrimarySecondaryGroup   192.168.2.202   62              132477/4966
10.212.134.200
```

When the Primary server is down, and the Secondary server is up, the connection is made to the SSLVPN tunnel again:

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 16:31:23.016875 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:28.019470 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:30.011874 port1 out 192.168.2.5.23848 -> 192.168.2.71.1812: udp 118
2020-05-15 16:31:30.087564 port1 in 192.168.2.71.1812 -> 192.168.2.5.23848: udp 20
```

Access request is sent to the Primary NPS server 192.168.20.6, but there was no response. RADIUS authentication falls through to the Secondary FortiAuthenticator 192.168.2.71, and the authentication was accepted. The VPN connection is established.

```
# get vpn ssl monitor
SSL VPN Login Users:

Index   User            Group                  Auth Type      Timeout         From     HTTP

0       radkeith        PrimarySecondaryGroup   192.168.2.202   48              53544/4966
  10.212.134.200
```

Authenticating to two RADIUS servers concurrently

There are times where users are located on separate RADIUS servers. This may be the case when migrating from an old server to a new one for example. In this scenario, a Windows NPS server and a FortiAuthenticator are configured in the same User Group. The access-request is sent to both servers concurrently. If FortiGate receives an access-accept from either server, authentication is successful.

To configure the internal and external interfaces:

1. Go to *Network* > *Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.

3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
2. Set *Name* to *192.168.20.0*.
3. Leave *Type* as *Subnet*
4. Set IP/*Netmask* to *192.168.20.0/24*.
5. Click *OK*.

To configure the first RADIUS server:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Set *Name* to *win2k16*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. *Click OK.*

To configure the second RADIUS server:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Set *Name* to *fac*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. *Click OK.*

To configure the user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. In the *Name* field, enter *dualPrimaryGroup.*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *fac*.
4. Click *Add* again. From the *Remote Server* dropdown select *win2k16* and click *OK*.
5. Click *OK*, and then click *OK* again.

To configure the SSL VPN settings:

1. Go to *VPN* > *SSL-VPN Settings*.
2. From the *Listen on Interface(s)* dropdown select *port1*.
3. In the *Listen on Port* field enter *10443*.
4. Optionally, from the *Server Certificate* dropdown, select the authentication certificate if you have one for this SSL VPN portal.

5. Under *Authentication/Portal Mapping*, set the default portal web-access.
   a. Select *All Other Users/Groups* and click Edit.
   b. From the *Portal* dropdown, select *web-access*.
   c. Click *OK*.
6. Create a web portal for *PrimarySecondaryGroup*.
   a. Under *Authentication/Portal Mapping*, click *Create New*.
   b. Click *Users/Groups* and select *dualPrimaryGroup*.
   c. From the *Portal* dropdown, select *full-access*.
   d. Click *OK*.

To configure SSL VPN firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New* to create a new policy, or double-click an existing policy to edit it.

Name	Enter a name for the policy.
Incoming Interface	*SSL-VPN tunnel interface (ssl.root)*
Outgoing interface	Set to the local network interface so that the remote user can access the internal network. For this example, select *port3*.
Source	In the *Address* tab, select *SSLVPN_TUNNEL_ADDR1* In the *User* tab, select *dualPrimaryGroup*
Destination	Select the internal protected subnet *192.168.20.0*.
Schedule	*always*
Service	*All*
Action	*Accept*
NAT	*Enable*

3. Configure any remaining firewall and security options as required.
4. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the internal interface and firewall address:

```
config system interface
   edit "port3"
      set vdom "root"
      set ip 192.168.20.5 255.255.255.0
      set alias "internal"
   next
end
config firewall address
   edit "192.168.20.0"
      set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
      set subnet 192.168.20.0 255.255.255.0
   next
end
```

2. Configure the RADIUS server:
```
config user radius
   edit "win2k16"
      set server "192.168.20.6"
      set secret <secret>
   next
   edit "fac"
      set server "192.168.2.71"
      set secret <secret>
   next
end
```
3. Add the RADIUS user to the user group:
```
config user group
   edit "dualPrimaryGroup"
      set member "win2k16" "fac"
   next
end
```
4. Configure SSL VPN settings:
```
config vpn ssl settings
   set servercert "server_certificate"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set source-interface "port1"
   set source-address "all"
   set default-portal "web-access"
   config authentication-rule
      edit 1
         set groups "dualPrimaryGroup"
         set portal "full-access"
      next
   end
end
```
5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:
```
config firewall policy
   edit 1
      set name "sslvpn-radius"
      set srcintf "ssl.root"
      set dstintf "port3"
      set srcaddr "all"
      set dstaddr "192.168.20.0"
      set groups "dualPrimaryGroup"
      set action accept
      set schedule "always"
      set service "ALL"
      set nat enable
   next
end
```

To verify the connection:

User *fackeith* is a member of the FortiAuthenticator server only.

User *radkeith* is a member of both the NPS server and the FortiAuthenticator server, but has different passwords on each server.

Case 1: Connect to the SSLVPN tunnel using FortiClient with user FacAdmin:

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 17:21:31.217985 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 118
2020-05-15 17:21:31.218091 port1 out 192.168.2.5.11490 -> 192.168.2.71.1812: udp 118
2020-05-15 17:21:31.219314 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 20 <--
     access-reject
2020-05-15 17:21:31.219519 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 182
2020-05-15 17:21:31.220219 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 42
2020-05-15 17:21:31.220325 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 119
2020-05-15 17:21:31.220801 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 20
2020-05-15 17:21:31.236009 port1 in 192.168.2.71.1812 -> 192.168.2.5.11490: udp 20 <--
     access-accept
```

Access is denied by the NPS server because the user does not exist. However, access is accepted by FortiAuthenticator. The end result is the authentication is successful.

```
# get vpn ssl monitor
SSL VPN Login Users:

Index   User       Group             Auth Type      Timeout          From       HTTP
in/out    HTTPS in/out

0       fackeith  dualPrimaryGroup   2(1)            292        192.168.2.202      0/0
      0/0

SSL VPN sessions:

Index   User       Group                  Source IP      Duration        I/O Bytes
Tunnel/Dest IP

0       fackeith  dualPrimaryGroup        192.168.2.202   149              70236/4966
 10.212.134.200
```

Case 2: Connect to the SSLVPN tunnel using FortiClient with user radkeith:

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 17:26:07.335791 port1 out 192.168.2.5.17988 -> 192.168.2.71.1812: udp 118
2020-05-15 17:26:07.335911 port3 out 192.168.20.5.17988 -> 192.168.20.6.1812: udp 118
2020-05-15 17:26:07.337659 port3 in 192.168.20.6.1812 -> 192.168.20.5.17988: udp 20 <--
     access-accept
2020-05-15 17:26:07.337914 port3 out 192.168.20.5.17988 -> 192.168.20.6.1812: udp 182
2020-05-15 17:26:07.339451 port3 in 192.168.20.6.1812 -> 192.168.20.5.17988: udp 228
2020-05-15 17:26:08.352597 port1 in 192.168.2.71.1812 -> 192.168.2.5.17988: udp 20 <--
     access-reject
```

There is a password mismatch for this user on the Secondary RADIUS server. However, even though the authentication was rejected by FortiAuthenticator, it was accepted by Windows NPS. Therefore, the end result is authentication successful.

```
# get vpn ssl monitor
SSL VPN Login Users:

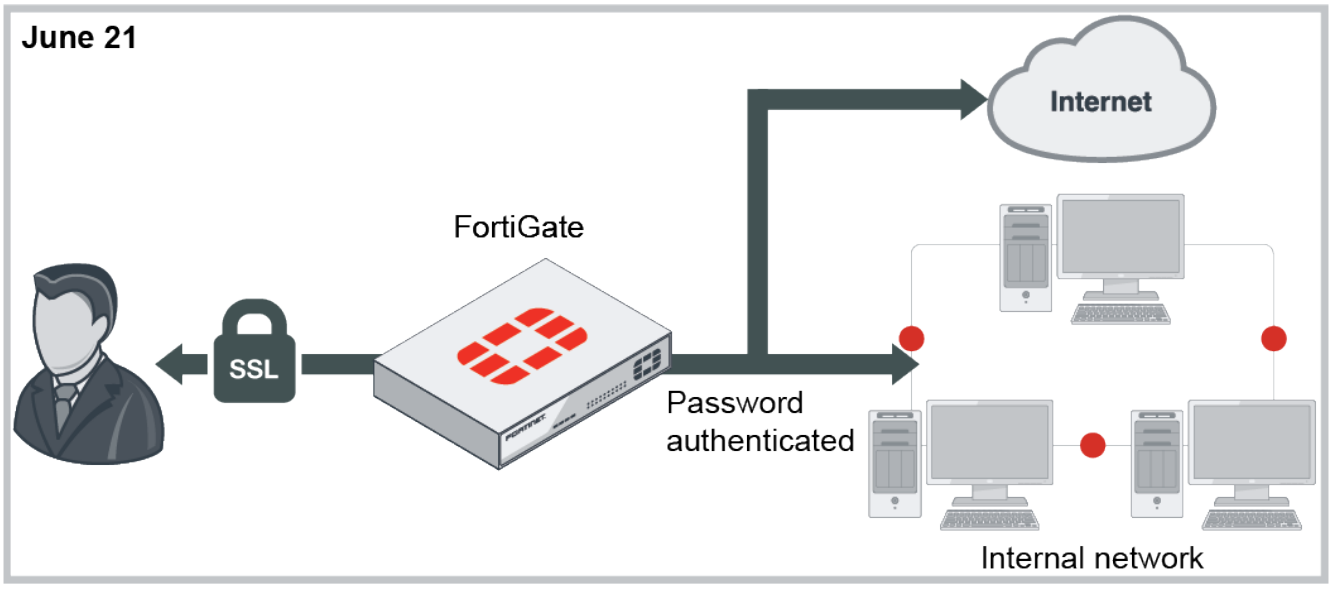
SSL VPN with local user password policy

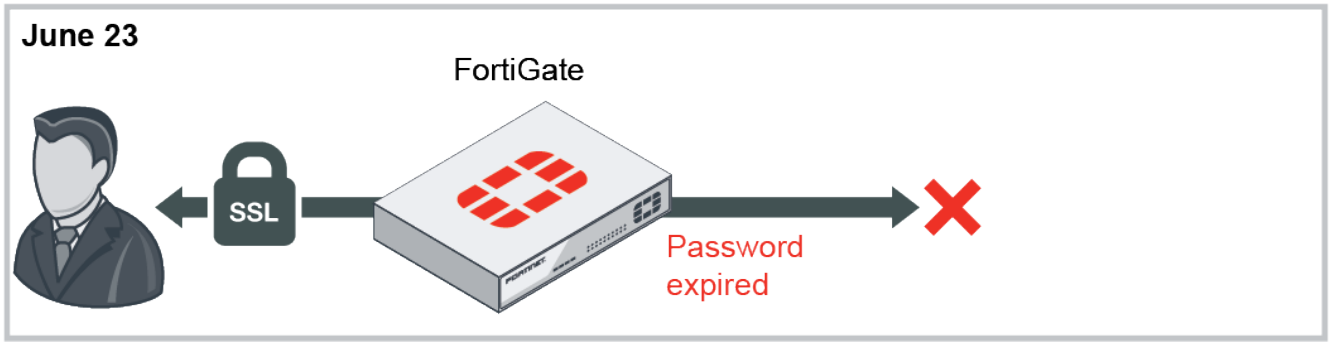
This is a sample configuration of SSL VPN for users with passwords that expire after two days. Users are warned after one day about the password expiring. The password policy can be applied to any local user password. The password policy cannot be applied to a user group or a local remote user such as LDAP/RADIUS/TACACS+.

In FortiOS 6.2, users are warned after one day about the password expiring and have one day to renew it. If the password expires, the user cannot renew the password and must contact the administrator for assistance.

In FortiOS 6.0/5.6, users are warned after one day about the password expiring and have to renew it. If the password expires, the user can still renew the password.

Sample topology





Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user.
   b. Go to *User & Authentication* > *User Groups* to create a user group and add that local user to it.
3. Configure and assign the password policy using the CLI.
   a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
    edit "pwpolicy1"
        set expire-days 2
        set warn-days 1
    next
end
```

   b. Assign the password policy to the user you just created.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd-policy "pwpolicy1"
    next
end
```

4. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
   This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings.
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
6. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.

d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
h. Enable *NAT*.
i. Configure any remaining firewall and security options as desired.
j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "sslvpngroup"
        set member "vpnuser1"
    next
end
```

4. Configure and assign the password policy.
   a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
    edit "pwpolicy1"
        set expire-days 2
        set warn-days 1
```

```
        next
    end
```

b. Assign the password policy to the user you just created.

```
    config user local
        edit "sslvpnuser1"
            set type password
            set passwd-policy "pwpolicy1"
        next
    end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
   When the warning time is reached, the user is prompted to enter a new password.
   In FortiOS 6.2, when the password expires, the user cannot renew the password and must contact the administrator.
   In FortiOS 6.0/5.6, when the password expires, the user can still renew the password.
3. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection.
   - Set the connection name.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *sslvpnuser1* credentials.
   When the warning time is reached, the user is prompted to enter a new password.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check that login failed due to password expired on GUI:

1. Go to *Log & Report* > *Events* and select *VPN Events* from the event type dropdown list to see the SSL VPN alert labeled `ssl-login-fail`.
2. Click *Details* to see the log details about the *Reason* `sslvpn_login_password_expired`.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User         Auth Type   Timeout    From           HTTP in/out   HTTPS in/out
 0       sslvpnuser1  1(1)        229        10.1.100.254   0/0           0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type   Timeout    From           HTTP in/out   HTTPS in/out
 0       sslvpnuser1   1(1)        291        10.1.100.254   0/0           0/0
```

```
SSL VPN sessions:
 Index   User          Source IP      Duration   I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9          22099/43228    10.212.134.200
```

To check the FortiOS 6.2 login password expired event log:

```
FG201E4Q17901354 # execute log  filter category event

FG201E4Q17901354 # execute log  filter field subtype vpn

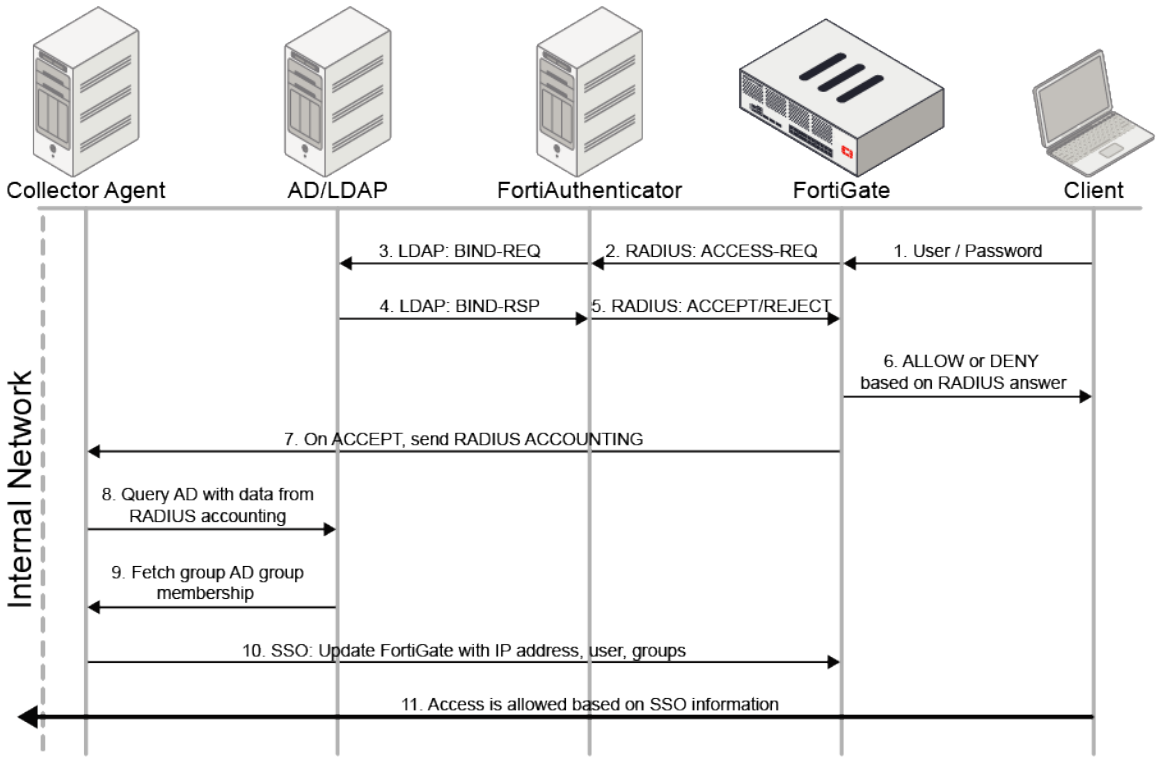
FG201E4Q17901354 # execute log  filter field action ssl-login-fail

FG201E4Q17901354 # execute log  display
1: date=2019-02-15 time=10:57:56 logid="0101039426" type="event" subtype="vpn" level="alert"
vd="root" eventtime=1550257076 logdesc="SSL VPN login fail" action="ssl-login-fail"
tunneltype="ssl-web" tunnelid=0 remip=10.1.100.254 user="u1" group="g1" dst_host="N/A"
reason="sslvpn_login_password_expired" msg="SSL user failed to logged in"
```

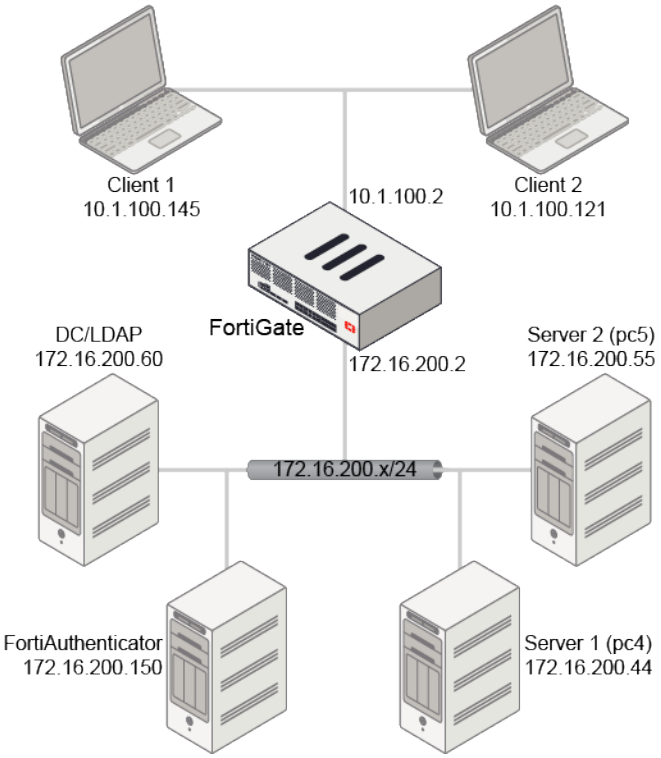
Dynamic address support for SSL VPN policies

Dynamic SSO user groups can be used in place of address objects when configuring SSL VPN policies. This allows dynamic IP addresses to be used in SSL VPN policies. A remote user group can be used for authentication while an FSSO group is separately used for authorization. Using a dummy policy for remote user authentication and a policy for FSSO group authorization, FSSO can be used with SSL VPN tunnels.

This image shows the authentication and authorization flow:



In this example, FortiAuthenticator is used as a RADIUS server. It uses a remote AD/LDAP server for authentication, then returns the authentication results to the FortiGate. This allows the client to have a dynamic IP address after successful authentication.



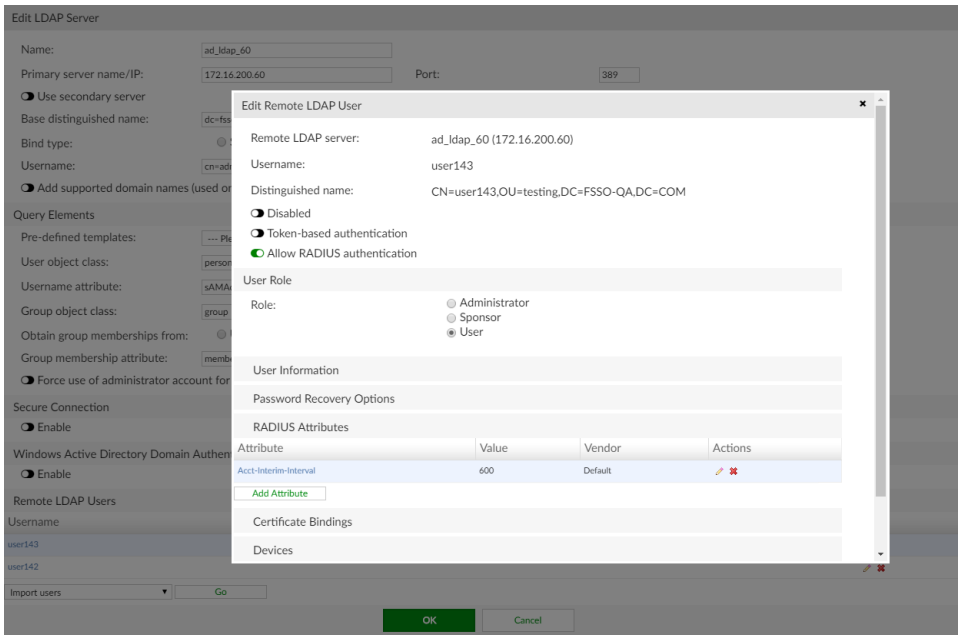
First, on the LDAP server, create two users each in their own group, *user142* in group *pc_group1*, and *user143* in group *pc_group2*.

Configure the FortiAuthenticator

To add a remote LDAP server and users on the FortiAuthenticator:

1. Go to *Authentication* > *Remote Auth. Servers* > *LDAP*.
2. Click *Create New*.
3. Set the following:
   - *Name*: *ad_ldap_60*
   - *Primary server name/IP*: *172.16.200.60*
   - *Base distinguished name*: *dc=fsso-qa,dc=com*
   - *Bind type*: Regular
   - *Username*: *cn=administrator,cn=User*
   - *Password*: <enter a password>
4. Click *OK*.
5. Edit the new LDAP server.
6. Import the remote LDAP users.
7. Edit each user to confirm that they have the RADIUS attribute *Acct-Interim-Interval*. This attribute is used by

FortiGate to send interim update account messages to the RADIUS server.



To create a RADIUS client for FortiGate as a remote authentication server:

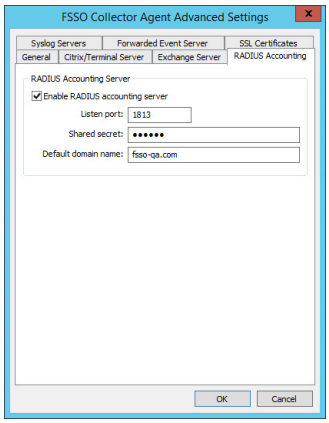
1. Go to *Authentication* > *RADIUS Service* > *Clients*.
2. Click *Create New*.
3. Set the following:
   - *Name*: *fsso_ldap*
   - *Client address*: *Range 172.16.200.1~172.16.200.10*
   - *Secret*: <enter a password>
4. In the *Realms* table, set the realm to the LDAP server that was just added: *ad_ldap_60*.
5. Click *OK*.
   FortiAuthenticator can now be used as a RADIUS server, and the authentication credentials all come from the DC/LDAP server.

Fortinet Single Sign-On Collector Agent

To configure the Fortinet Single Sign-On Collector Agent:

1. Select *Require authenticated connection from FortiGate* and enter a *Password*.
2. Click *Advanced Settings*.
3. Select the *RADIUS Accounting* tab.

4. Select *Enable RADIUS accounting server* and set the *Shared secret*.



5. Click *OK*, then click *Save&close*.
   The collector agent can now accept accounting requests from FortiGate, and retrieve the IP addresses and usernames of SSL VPN client from the FortiGate with accounting request messages.

Configure the FortiGate

To configure the FortiGate in the CLI:

1. Create a Fortinet Single Sign-On Agent fabric connector:

```
config user fsso
    edit "AD_CollectAgent"
        set server "172.16.200.60"
        set password 123456
    next
end
```

2. Add the RADIUS server:

```
config user radius
    edit "rad150"
        set server "172.16.200.150"
        set secret 123456
        set acct-interim-interval 600
        config accounting-server
            edit 1
                set status enable
                set server "172.16.200.60"
                set secret 123456
            next
        end
    next
end
```

3. Create a user group for the RADIUS server:

```
config user group
    edit "rad_group"
        set member "rad150"
    next
end
```

4. Create user groups for each of the FSSO groups:

```
config user group
    edit "fsso_group1"
        set group-type fsso-service
        set member "CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM"
    next
    edit "fsso_group2"
        set group-type fsso-service
        set member "CN=PC_GROUP2,OU=TESTING,DC=FSSO-QA,DC=COM"
    next
end
```

5. Create an SSL VPN portal and assign the RADIUS user group to it:

```
config vpn ssl web portal
    edit "testportal"
        set tunnel-mode enable
        set ipv6-tunnel-mode enable
        set web-mode enable
        ...
    next
end
config vpn ssl settings
    ...
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "rad_group"
            set portal "testportal"
        next
    end
end
```

6. Create firewall addresses:

```
config firewall address
    edit "none"
        set subnet 0.0.0.0 255.255.255.255
    next
    edit "pc4"
        set subnet 172.16.200.44 255.255.255.255
    next
    edit "pc5"
        set subnet 172.16.200.55 255.255.255.255
    next
end
```

7. Create one dummy policy for authentication only, and two normal policies for authorization:

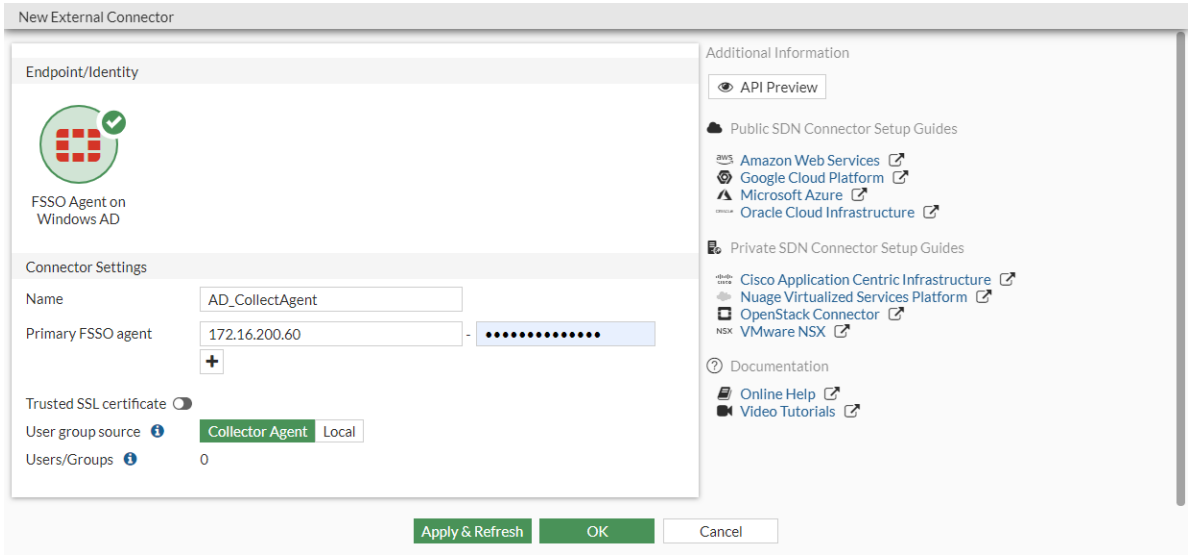
```
config firewall policy
    edit 1
        set name "sslvpn_authentication"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "none"
        set action accept
        set schedule "always"
```

```
            set service "ALL"
            set logtraffic all
            set groups "rad_group"
            set nat enable
        next
        edit 3
            set name "sslvpn_authorization1"
            set srcintf "ssl.vdom1"
            set dstintf "port1"
            set srcaddr "all"
            set dstaddr "pc4"
            set action accept
            set schedule "always"
            set service "ALL"
            set logtraffic all
            set groups "fsso_group1"
            set nat enable
        next
        edit 4
            set name "sslvpn_authorization2"
            set srcintf "ssl.vdom1"
            set dstintf "port1"
            set srcaddr "all"
            set dstaddr "pc5"
            set action accept
            set schedule "always"
            set service "ALL"
            set logtraffic all
            set groups "fsso_group2"
            set nat enable
        next
    end
```

To create an FSSO agent fabric connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. Click *FSSO Agent on Windows AD*.

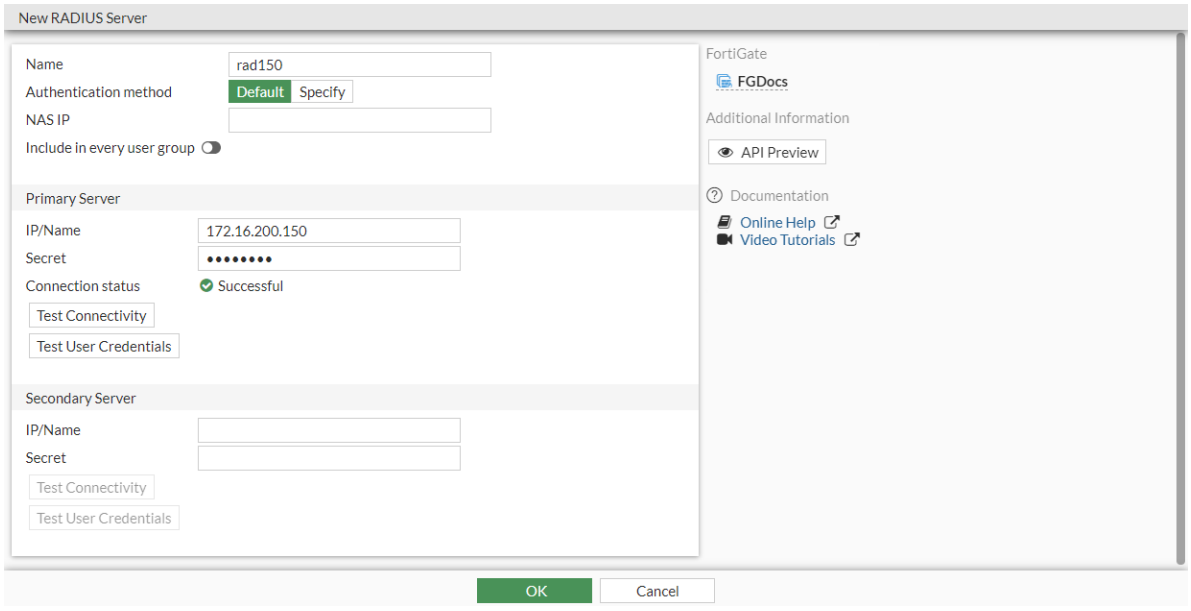
4. Enter the name and *Primary FSSO agent* information.



5. Click *Apply & Refresh*.
   The FSSO groups are retrieved from the collector agent.

To add the RADIUS server in the GUI:

1. Go to *User & Authentication* > *RADIUS Servers*.
2. Click *Create New*.
3. Enter a name for the server.
4. Enter the *IP/Name* and *Secret* for the primary server.
5. Click *Test Connectivity* to ensure that there is a successful connection.



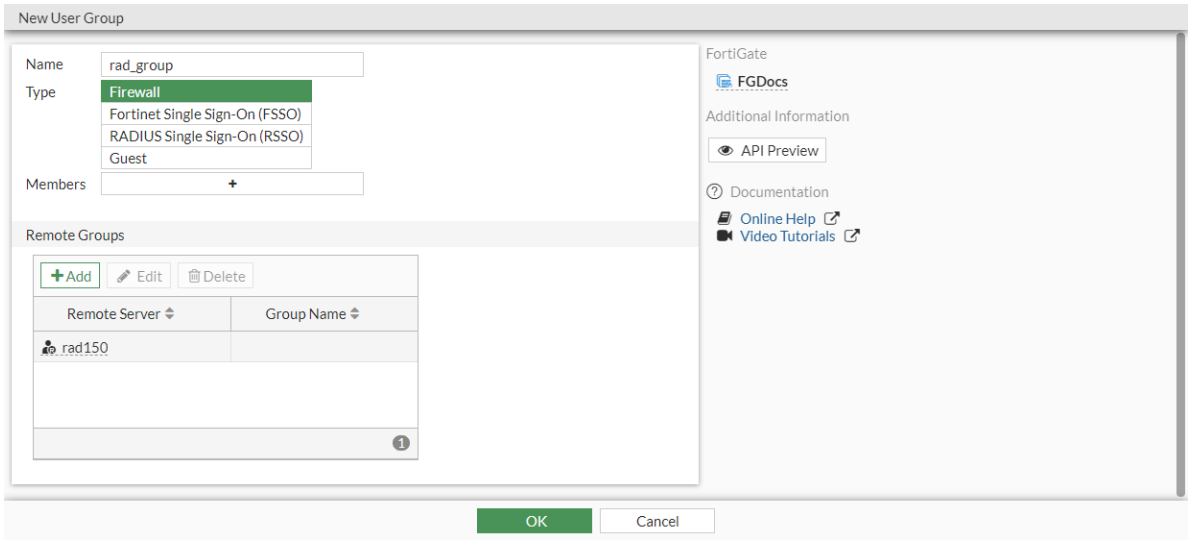
6. Click *OK*.

7. Configure an accounting server with the following CLI command:

```
config user radius
    edit rad150
        set acct-interim-interval 600
        config accounting-server
            edit 1
                set status enable
                set server 172.16.200.60
                set secret *********
            next
        end
    next
end
```

To create a user group for the RADIUS server in the GUI:

1. Go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set the *Type* to *Firewall*.
4. Add the RADIUS server as a remote group.



5. Click *OK*.

To create user groups for each of the FSSO groups in the GUI:

1. Go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set the *Type* to *Fortinet Single Sign-On (FSSO)*.
4. Add PC_GROUP1 as a member:
   `CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM`
5. Click *OK*.
6. Add a second user group with PC_GROUP2 as a member:
   `CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM`
7. Click *OK*.

To create an SSL VPN portal and assign the RADIUS user group to it in the GUI:

1. Go to *VPN* > *SSL VPN Portals*.
2. Click *Create New*.
3. Configure the portal, then click *OK*.
4. Go to *VPN* > *SSL VPN Settings*.
5. Configure the required settings.
6. Create an *Authentication/Portal Mapping* table entry:
   a. Click *Create New*.
   b. Set *User/Groups* to *rad_group*.
   c. Set *Portal* to *testportal*.
   d. Click *OK*.
7. Click *OK*.

To create policies for authentication and authorization in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Configure a dummy policy for authentication. Set the destination to *none* so that traffic is not allowed through the FortiGate, and add *rad_group* as a source.
3. Configure two authorization policies, with the FSSO groups as sources.

Confirmation

On *Client 1*, log in to FortiClient using *user142*. Traffic can go to *pc4* (172.16.200.44), but cannot go to *pc5* (172.16.200.55).

On *Client 2*, log in to FortiClient using *user143*. Traffic can go to *pc5* (172.16.200.55), but cannot go to *pc4* (172.16.200.44).

On the FortiGate, check the authenticated users list and the SSL VPN status:

```
# diagnose firewall auth list

10.212.134.200, USER142

```

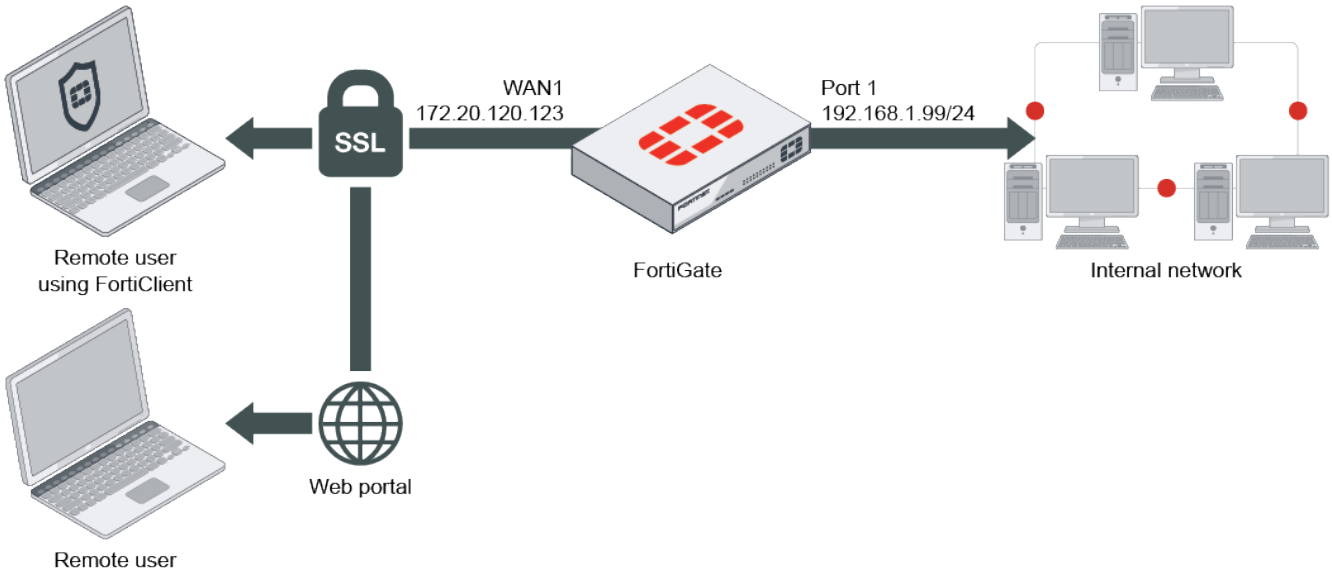
SSL VPN multi-realm

This sample shows how to create a multi-realm SSL VPN that provides different portals for different user groups.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet *QA_subnet* with subnet *192.168.1.0/24* and *HR_subnet* with subnet *10.1.100.0/24*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create local users *qa-user1* and *hr-user1*.
   b. Go to *User & Authentication* > *User Groups* to create separate user groups for web-only and full-access portals:
      - *QA_group* with member *qa-user1*.
      - *HR_group* with the member *hr-user1*.
3. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to create portal *qa-tunnel*.
   b. Enable *Tunnel Mode*.
   c. Create a portal *hr-web* with *Web Mode* enabled.
4. Configure SSL VPN realms.
   a. Go to *System* > *Feature Visibility* to enable *SSL-VPN Realms*.
   b. Go to *VPN* > *SSL-VPN Realms* to create realms for *qa* and *hr*.
   c. (Optional) To access each realm with FQDN instead of the default URLs *https://172.20.120.123:10443/hr* and *https://172.20.120.123:10443/qa*, you can configure a virtual-host for the realm in the CLI.

```
config vpn ssl web realm
   edit hr
      set virtual-host hr.mydomain.com
   next
   edit qa
      set virtual-host qa.mydomain.com
   next
end
```

   Where `mydomain.com` is the name of your domain. Ensure FQDN resolves to the FortiGate wan1 interface and that your certificate is a wildcard certificate.
5. Configure SSL VPN settings.
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.

e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *web-access*.
f. Create new *Authentication/Portal Mapping* for group *QA_group* mapping portal *qa-tunnel*.
g. Specify the realm *qa*.
h. Add another entry for group *HR_group* mapping portal *hr-web*.
i. Specify the realm *hr*.

6. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Create a firewall policy for QA access.
   c. Fill in the firewall policy name. In this example, *QA sslvpn tunnel mode access*.
   d. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   e. Choose an *Outgoing Interface*. In this example, *port1*.
   f. Set the *Source* to *all* and group to *QA_group*.
   g. In this example, the *Destination* is the internal protected subnet *QA_subnet*.
   h. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   i. Click *OK*.
   j. Create a firewall policy for HR access.
   k. Fill in the firewall policy name. In this example, *HR sslvpn web mode access*.
   l. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   m. Choose an *Outgoing Interface*. In this example, *port1*.
   n. Set the *Source* to *all* and group to *HR_group*.
   o. In this example, the *Destination* is the internal protected subnet *HR_subnet*.
   p. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   q. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end

config firewall address
    edit "QA_subnet"
        set subnet 192.168.1.0 255.255.255.0
    next
    edit "HR_subnet"
        set subnet 10.1.100.0 255.255.255.0
```

```
    next
end
```

3. Configure user and user group.

```
config user local
    edit "qa_user1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "QA_group"
        set member "qa_user1"
    next
end
```

```
config user local
    edit "hr_user1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "HR_group"
        set member "hr_user1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "qa-tunnel"
        set tunnel-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling enable
        set split-tunneling-routing-address "QA_subnet"
    next
end
```

```
config vpn ssl web portal
    edit "hr-web"
        set web-mode enable
    next
end
```

5. Configure SSL VPN realms.

```
config vpn ssl web realm
   edit hr
      set virtual-host hr.mydomain.com
   next
   edit qa
        set virtual-host qa.mydomain.com
   next
end
```

The `set virtual-host` setting is optional. For example:

```
config vpn ssl web realm
   edit hr
   next
```

```
    edit qa
    next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "QA_group"
            set portal "qa-tunnel"
            set realm qa
        next
        edit 2
            set groups "HR_group"
            set portal "hr-web"
            set realm hr
        next
    end
end
```

7. Configure two SSL VPN firewall policies to allow remote QA user to access internal QA network and HR user to access HR network.

```
config firewall policy
    edit 1
        set name "QA sslvnpn tunnel access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "QA_subnet"
        set groups "QA_group"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "HR sslvpn web access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "HR_subnet"
        set groups "HR_group"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To see the results for QA user:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection.
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to *https://172.20.120.123:10443/qa.*.
   - If a virtual-host is specified, use the FQDN defined for the realm (*qa.mydomain.com*).
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
   If the user's computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to subnet *192.168.1.0* goes through the tunnel.
8. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the list of SSL users.
9. On the FortiGate, go to *VPN* > *Monitor* > *SSL-VPN Monitor* to verify the list of SSL users.
10. On the FortiGate, go to *Log & Report* > *Forward Traffic* and view the details of the traffic.

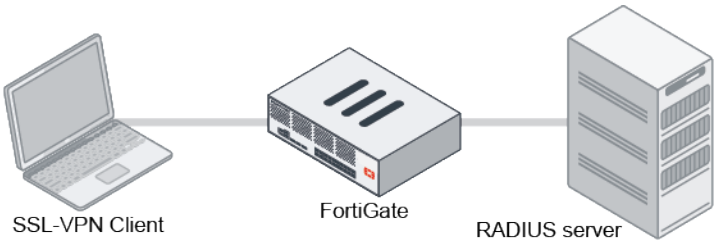
To see the results for HR user:

1. In a web browser, log into the portal *https://172.20.120.123:10443/hr* using the credentials you've set up.
2. Alternatively, if a virtual-host is specified, use the FQDN defined for the realm (*hr.mydomain.com*).
3. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the list of SSL users.
4. Go to *Log & Report* > *Forward Traffic* and view the details of the traffic.

NAS-IP support per SSL-VPN realm

For RADIUS authentication and authorization, the RADIUS client (the FortiGate) passes the username, password, and NAS-IP to the RADIUS server in its access request. The RADIUS server authenticates and authorizes based on this information. Each RADIUS server can be configured with multiple NAS-IPs for authenticating different groups and NAS clients.

On the FortiGate, configuring the NAS-IP in the realm settings overrides the RADIUS server setting, allowing multiple NAS-IPs to be mapped to the same RADIUS server.



In this example, the user wants to present one FortiGate VDOM with different NAS-IPs to a single RADIUS server based on specific rules.

To configure the SSL-VPN to use the NAS-IP in the realm settings:

1. Configure a RADIUS user and add it to a group:

```
config user radius
    edit "fac150"
        set server "172.16.200.150"
        set secret ********
        set nas-ip 172.16.200.2
        config accounting-server
            edit 1
                set status enable
                set server "172.16.200.150"
                set secret ********
            next
        end
    next
end
config user group
    edit "radgrp"
        set member "fac150"
    next
end
```

2. Configure a realm for the user with a different NAS-IP:

```
config vpn ssl web realm
    edit "realm1"
        set login-page '.......'
        set radius-server "fac150"
        set nas-ip 10.1.100.2
    next
end
```

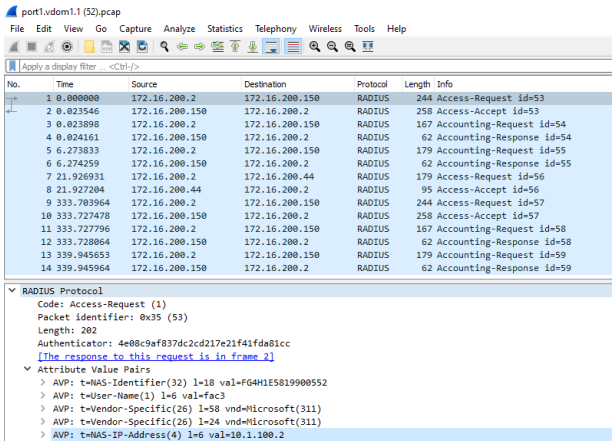
3. Configure SSL-VPN with an authentication rule that includes the user group and the realm:

```
config vpn ssl settings
    ...
    config authentication-rule
        edit 1
            set groupd "radgrp"
            set portal "testportal1"
            set realm "realm1"
        next
    end
end
```

4. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "sslvpn1"
        ...
        set srcintf "ssl.vdom1"
        set groups "radgrp"
    next
end
```

Because the RADIUS server and NAS-IP are specified in realm1, its NAS-IP is used for authentication.



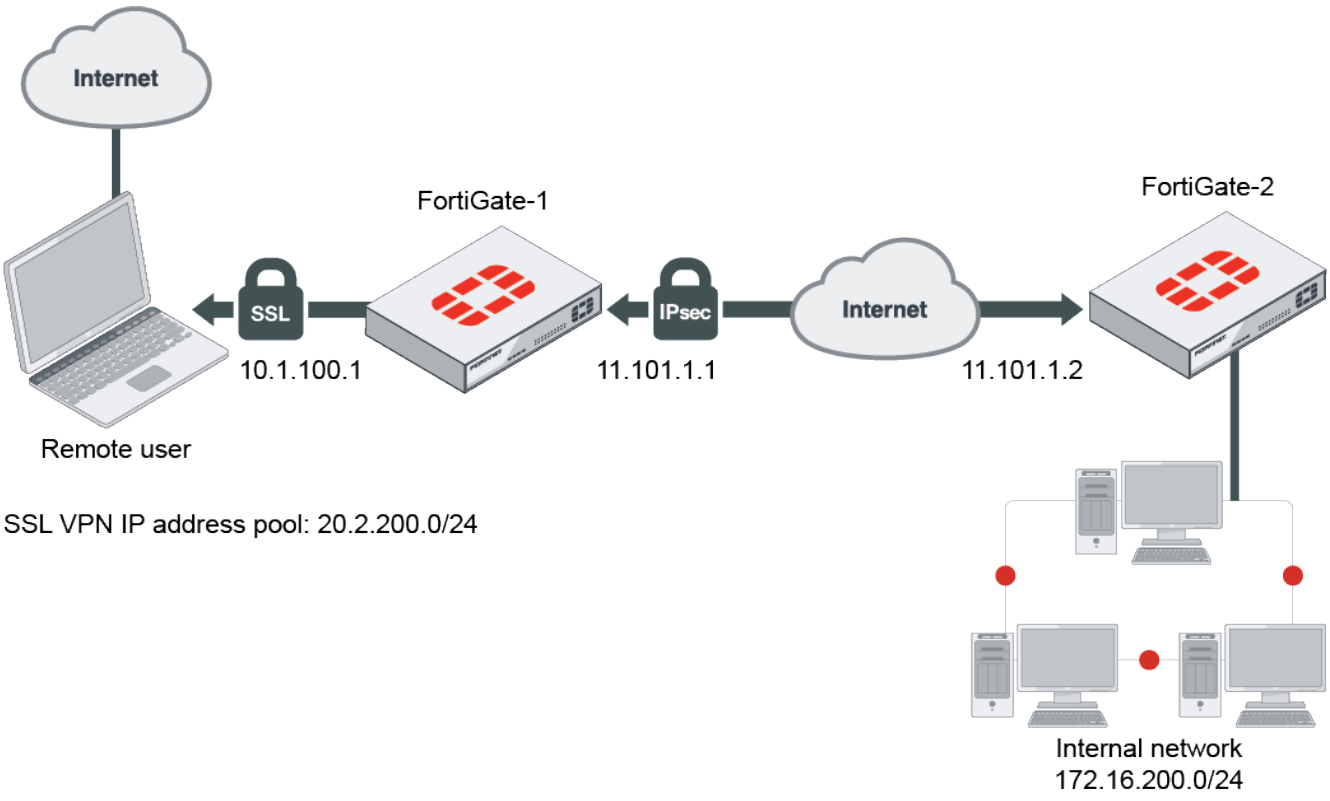
SSL VPN to IPsec VPN

This is a sample configuration of site-to-site IPsec VPN that allows access to the remote endpoint via SSL VPN.

This example uses a pre-existing user group, a tunnel mode SSL VPN with split tunneling, and a route-based IPsec VPN between two FortiGates. All sessions must start from the SSL VPN interface.

If you want sessions to start from the FGT_2 subnet, you need more policies. Also, if the remote subnet is beyond FGT_2 (if there are multiple hops), you need to include the SSL VPN subnet in those routers as well.

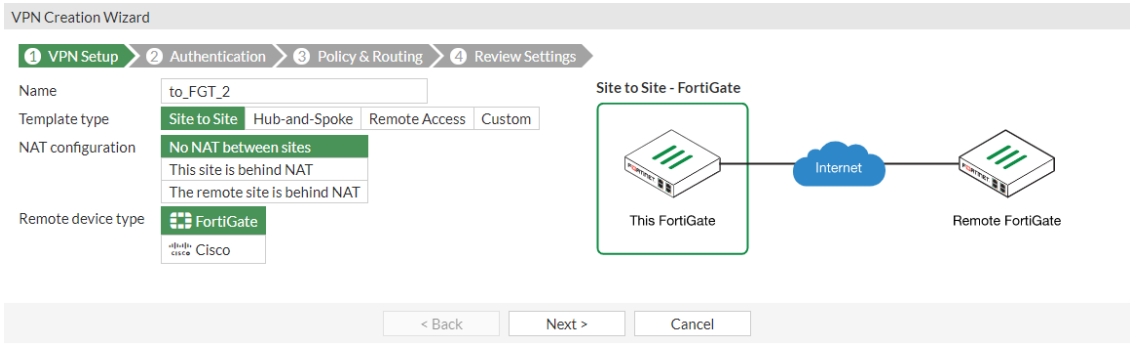
Sample topology



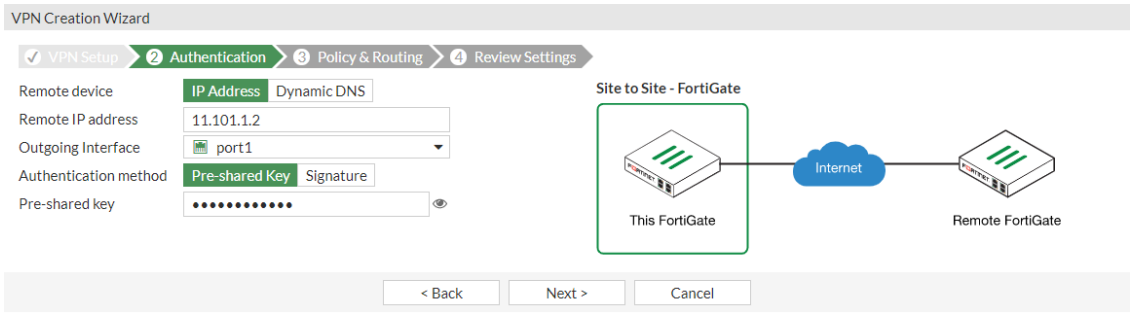
Sample configuration

To configure the site-to-site IPsec VPN on FGT_1:

1. Go to *VPN* > *IPsec Wizard*.
2. In the *VPN Setup* pane:
   a. Specify the VPN connection *Name* as *to_FGT_2*.
   b. Select *Site to Site*.
   c. Click *Next*.

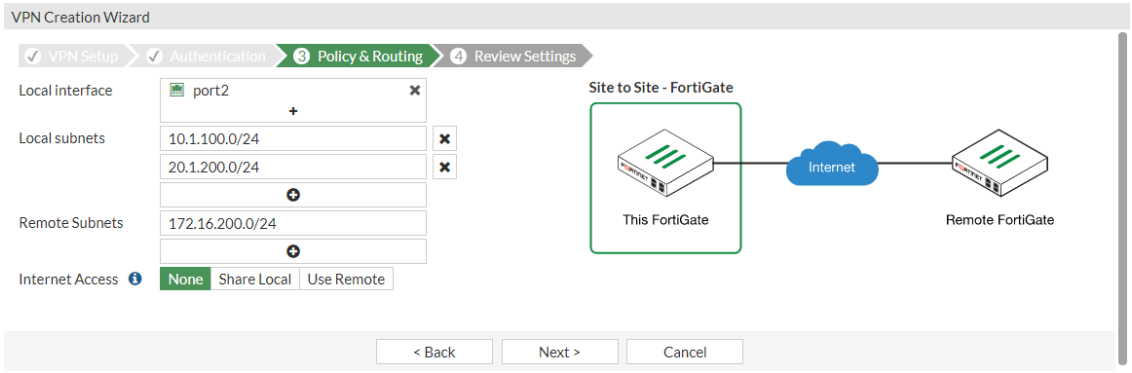


3. In the *Authentication* pane:
   a. Enter the *IP Address* to the Internet-facing interface.
   b. For *Authentication Method*, click *Pre-shared Key* and enter the *Pre-shared Key*.
   c. Click *Next*.

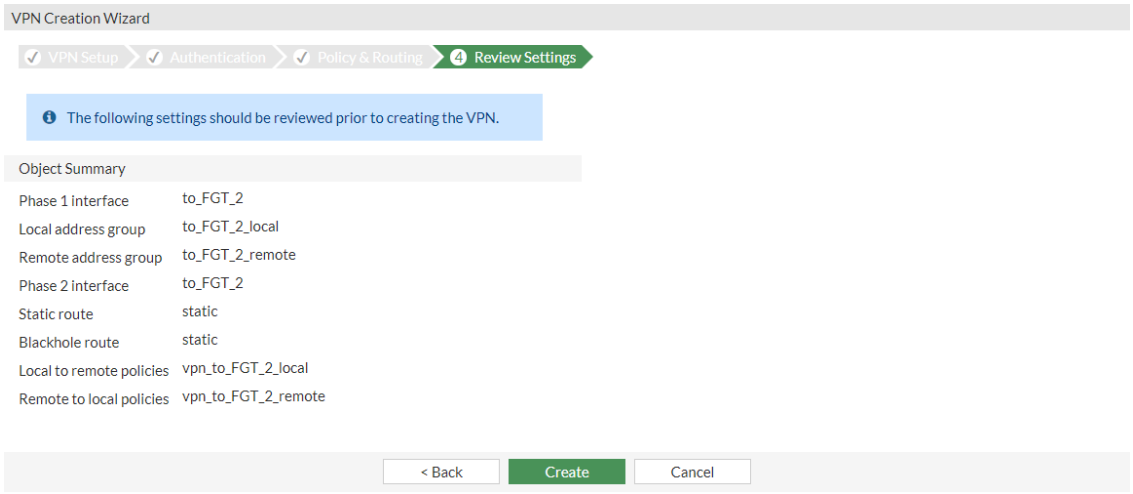


4. In the *Policy & Routing* pane:
   a. Set the *Local Interface* to the internal interface.
   b. Set the *Local Subnets* to include the internal and SSL VPN subnets for FGT_1.
   c. Set *Remote Subnets* to include the internal subnet for FGT_2.

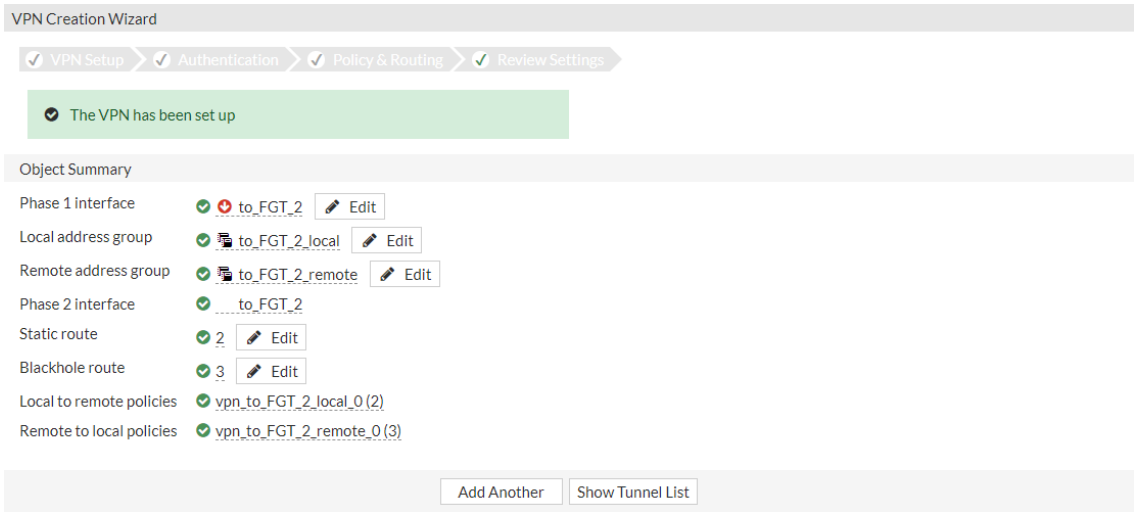
d. Click *Next*.



5. Review the VPN settings and click *Create*.

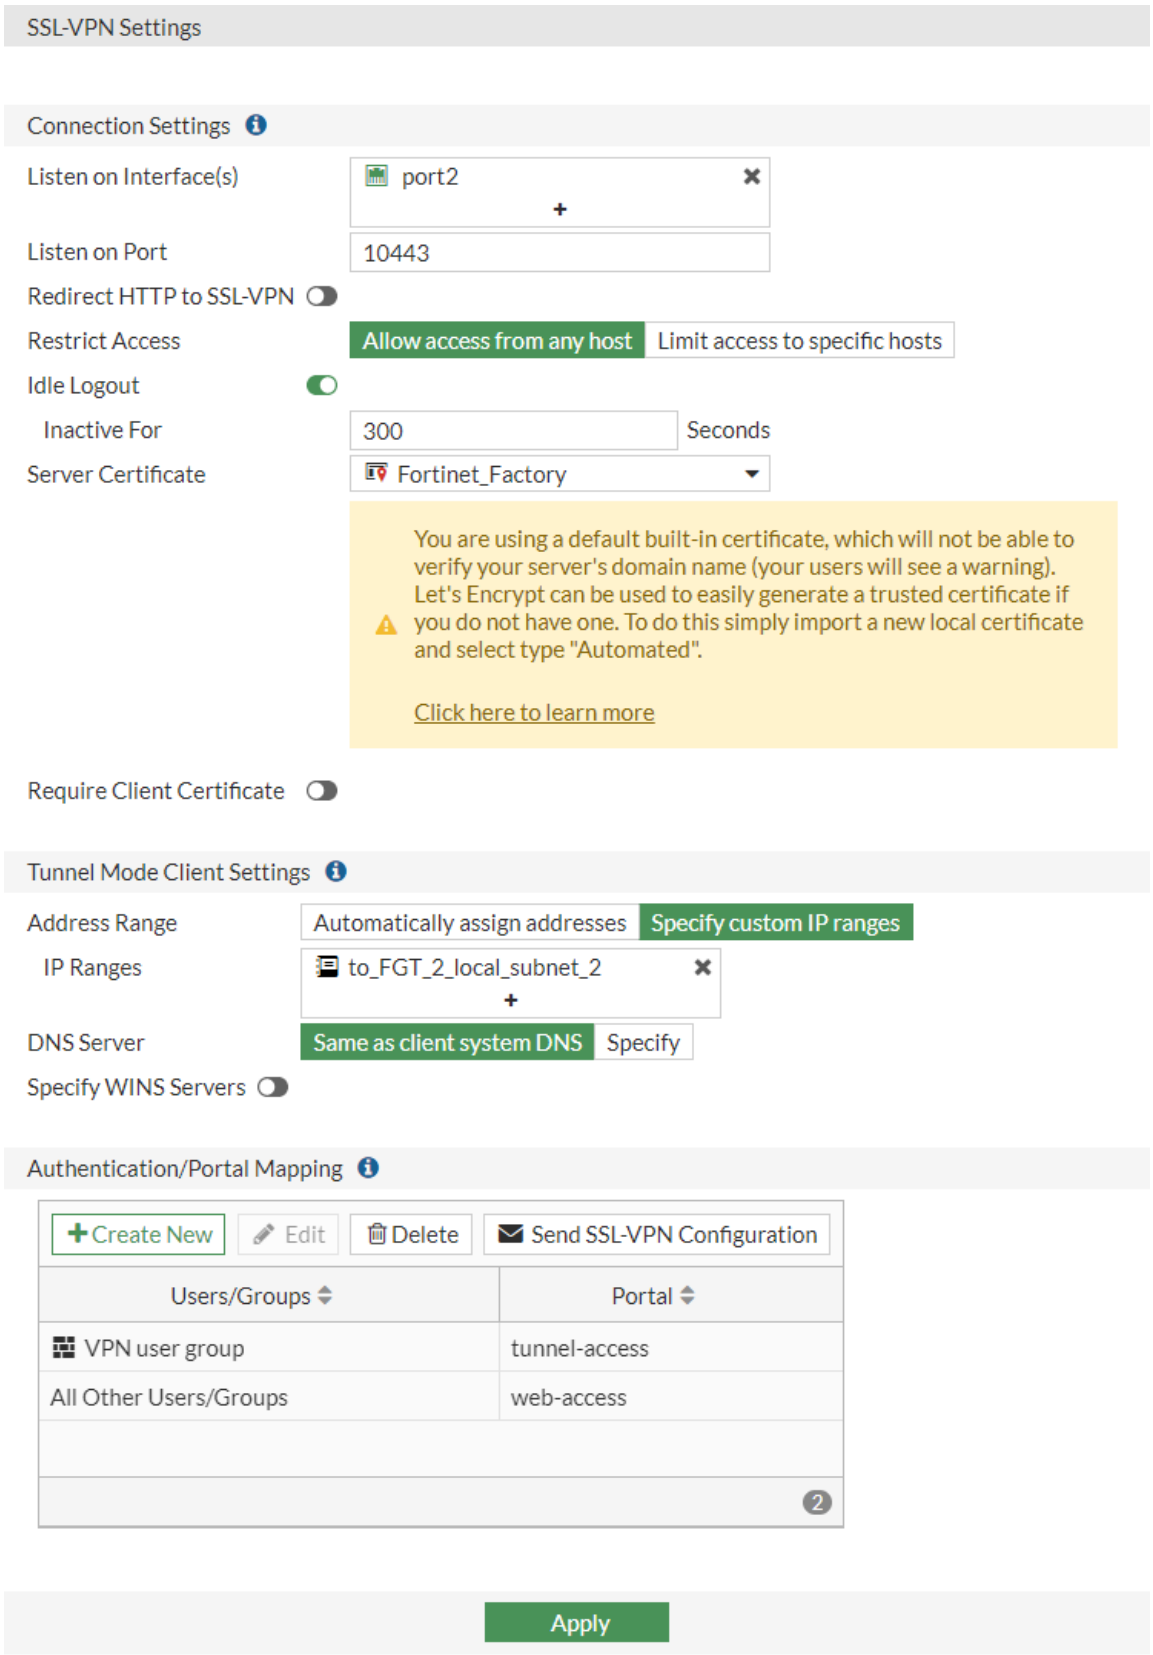


A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.



To configure SSL VPN settings:

1. Go to *VPN* > *SSL-VPN Settings*.
2. Set *Listen on Interface(s)* to *wan1*.
3. To avoid port conflicts, set *Listen on Port* to *10443*.
4. For *Restrict Access*, select *Allow access from any host*.
5. In the Tunnel Mode Client Settings section, select *Specify custom IP ranges* and include the SSL VPN subnet range created by the *IPsec Wizard*.
6. In the *Authentication/Portal Mapping* section, add the *VPN user group* to the *tunnel-access Portal*. Set *All Other Users/Groups* to the *web-access Portal*.



SSL-VPN Settings

Apply

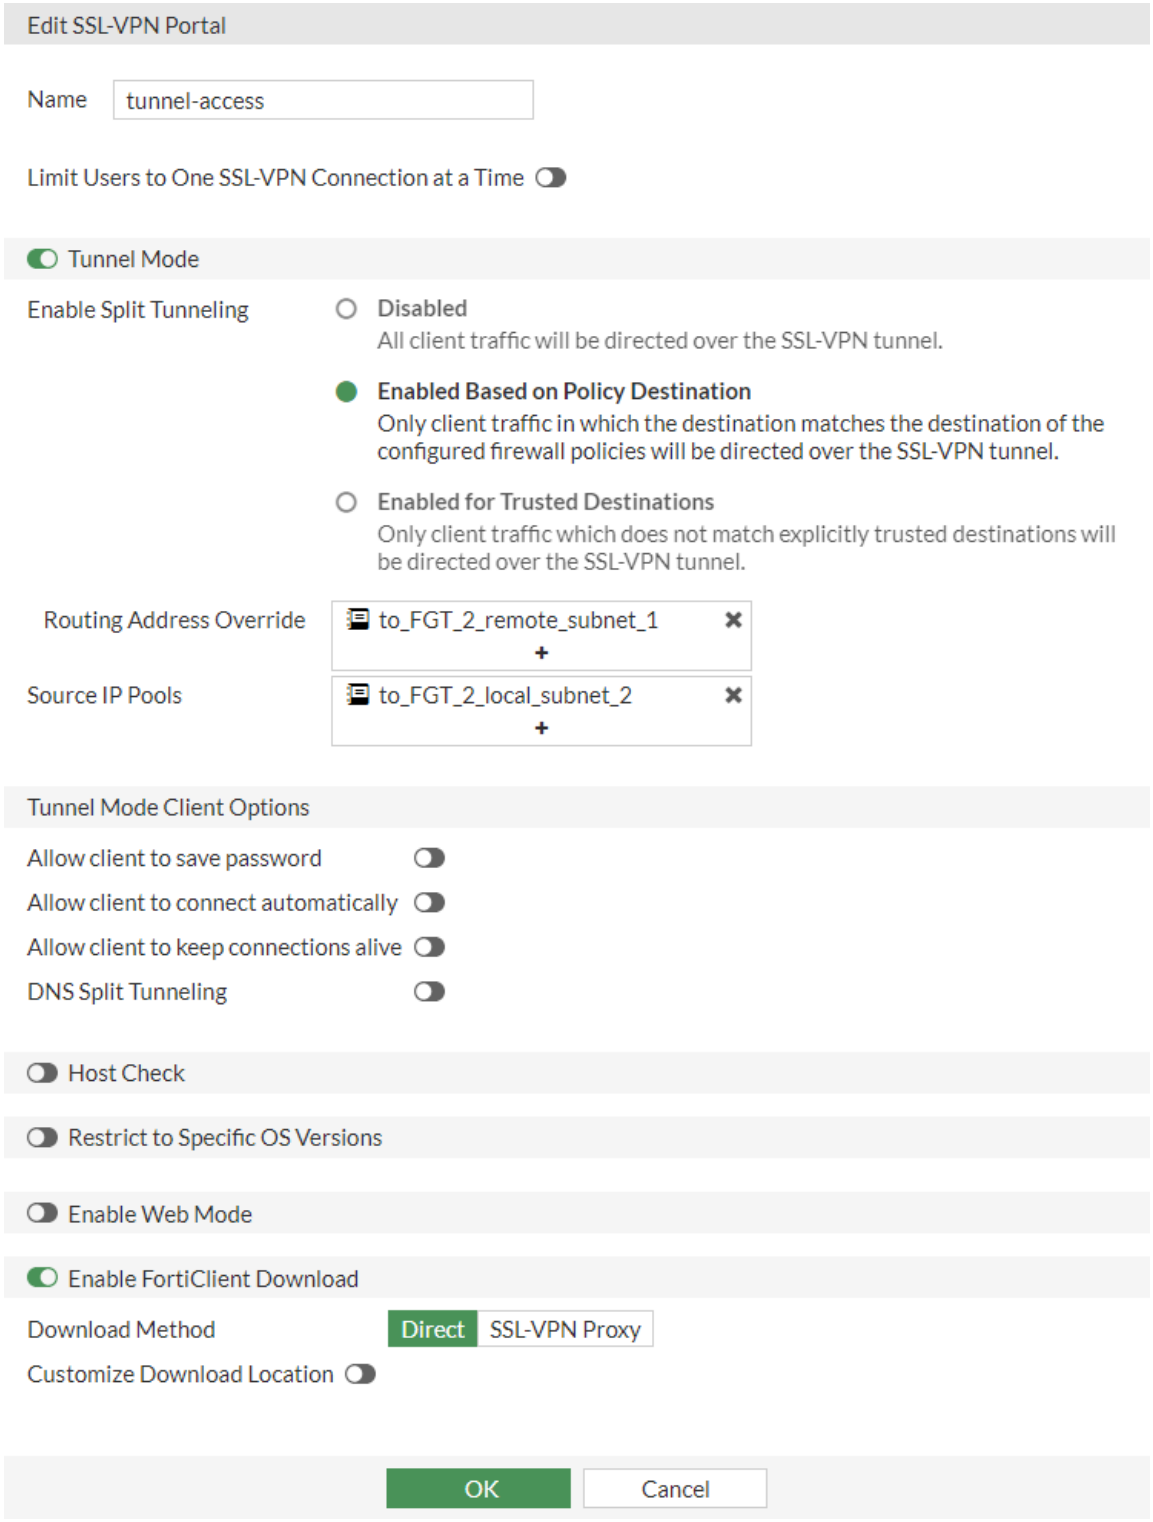
It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 1191 and learn how to Procure and import a signed SSL certificate on page 1567.

7. Click *Apply*.

To configure SSL VPN portal:

1. Go to *VPN* > *SSL-VPN Portals*.
2. Select *tunnel-access* and click *Edit*.
3. Turn on *Enable Split Tunneling* so that only traffic intended for the local or remote networks flow through FGT_1 and follows corporate security profiles.
4. For *Routing Address*, add the local and remote IPsec VPN subnets created by the *IPsec Wizard*.

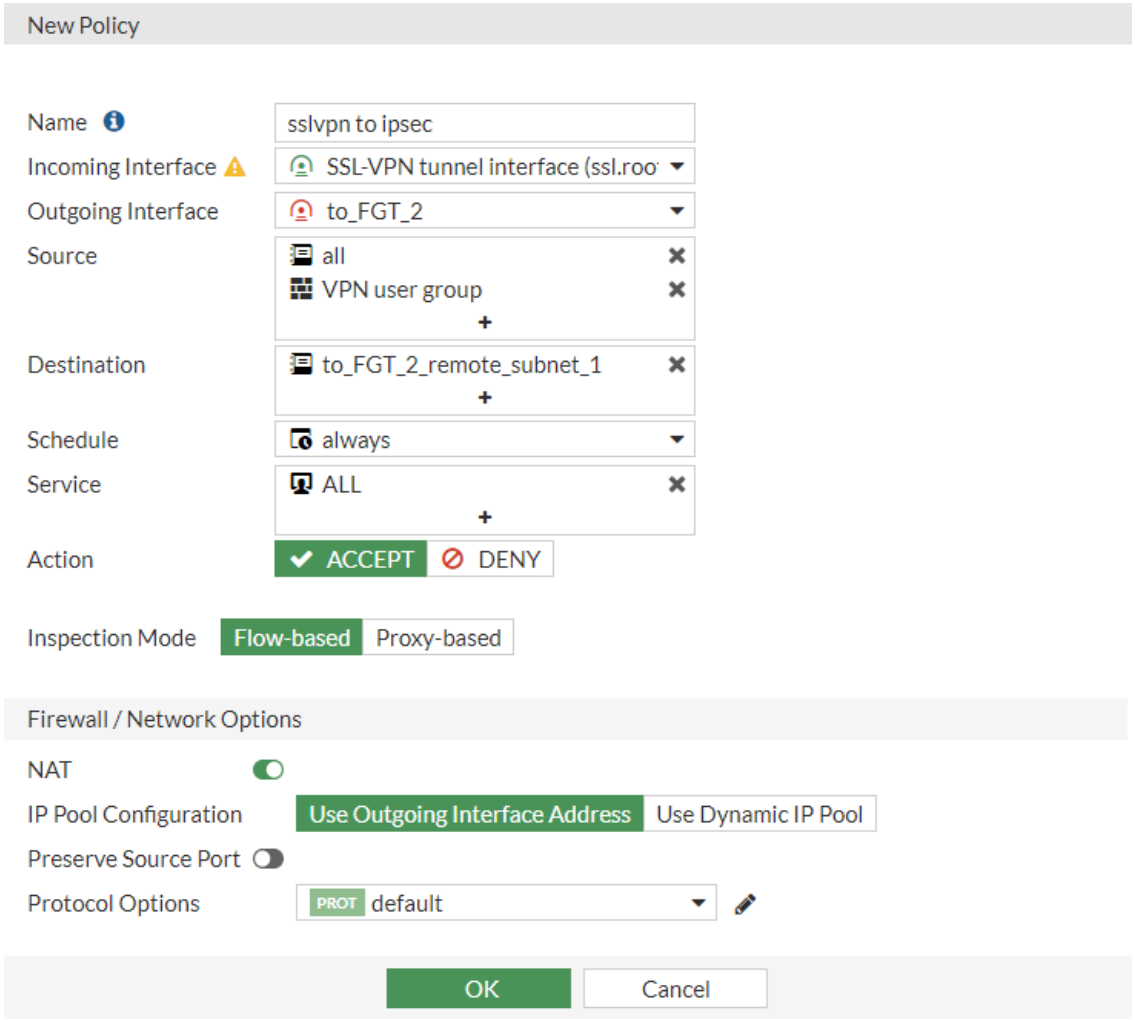
5. For *Source IP Pools*, add the SSL VPN subnet range created by the *IPsec Wizard*.



6. Click *OK*.

To add policies to FGT_1:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New* to create a policy that allows SSL VPN users access to the IPsec VPN tunnel.
3. For *Incoming Interface*, select *ssl.root*.
4. For *Outgoing Interface*, select the IPsec tunnel interface *to_FGT_2*.
5. Set the *Source* to *all* and the *VPN user group*.
6. Set *Destination* to the remote IPsec VPN subnet.
7. Specify the *Schedule*.
8. Set the *Service* to *ALL*.
9. In the *Firewall/Network Options* section, disable *NAT*.



10. Click *OK*.

To configure the site-to-site IPsec VPN on FGT_2:

1. Go to *VPN* > *IPsec Wizard*.
2. In the *VPN Setup* pane:
   a. Specify the VPN connection *Name* as *to FGT_1*.
   b. Select *Site to Site*.

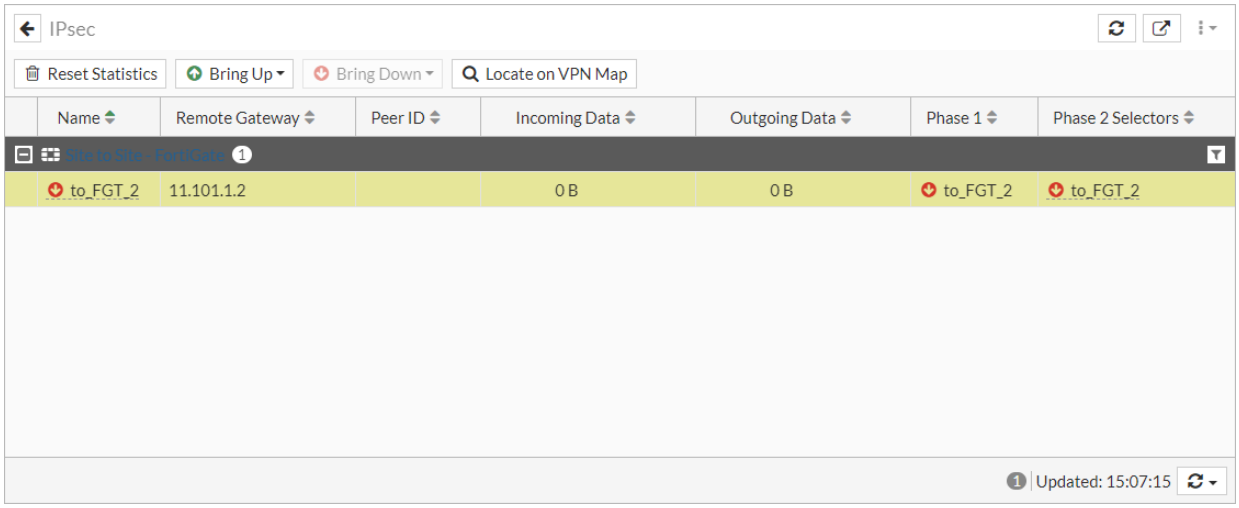
c. Click *Next*.

3. In the *Authentication* pane:
   a. Enter the *IP Address* to the Internet-facing interface.
   b. For *Authentication Method*, click *Pre-shared Key* and enter the *Pre-shared Key* of the FGT_1.
   c. Click *Next*.
4. In the *Policy & Routing* pane:
   a. Set the *Local Interface* to the internal interface.
   b. Set the *Local Subnets* to include the internal and SSL VPN subnets for FGT_2.
   c. Set *Remote Subnets* to include the internal subnet for FGT_1.
   d. Click *Create*.

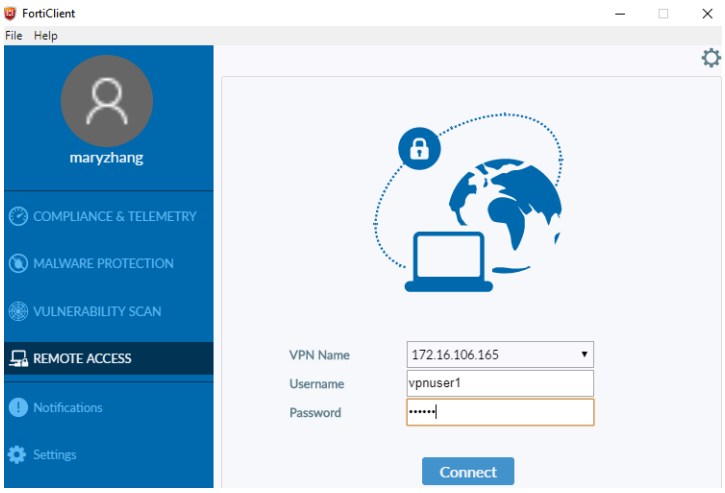
A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.

To check the results:

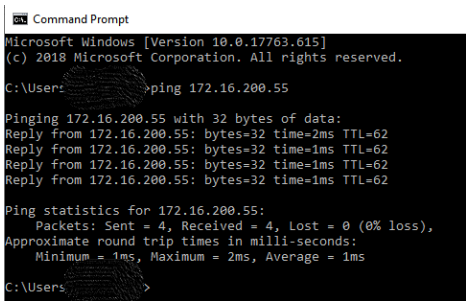
1. Go to *Dashboard* > *Network* and click the *IPsec* widget to expand to full screen view.
2. Select the tunnel and click *Bring Up*.



3. Verify that the *Status* changes to *Up*.
4. Configure the SSL VPN connection on the user's FortiClient and connect to the tunnel.



5. On the user's computer, use CLI to send a ping though the tunnel to the remote endpoint to confirm access.



6. In FortiOS, go to the following pages for further verification:
   a. Go to *Dashboard* > *Network* and click the *Routing* widget to verify the IPsec and SSL VPNs are added.
   b. Go to *VPN* > *SSL-VPN Clients* to verify the connected users.
   c. Go to *VPN* > *VPN Location Map* to view the connection activity.
   d. Go to *Log & Report* > *Events* > *VPN Events* to view tunnel statistics.
   e. Go to *Dashboard* > *FortiView Policies* to view the policy usage.

Troubleshooting

To troubleshoot on FGT_1, use the following CLI commands:

```
diagnose debug reset
diagnose debug flow show function-name enable
diagnose debug flow show iprope enable
diagnose debug flow filter addr 172.16.200.55
diagnose debug flow filter proto 1
diagnose debug flow trace start 2
diagnose debug enable
```

To troubleshoot using ping:

1. Send a ping through the SSL VPN tunnel to 172.16.200.55 and analyze the output of the debug.
2. Disable the debug output with: `diagnose debug disable`.

If traffic is entering the correct VPN tunnel on FGT_1, then run the same commands on FGT_2 to check whether the traffic is reaching the correct tunnel. If it is reaching the correct tunnel, confirm that the SSL VPN tunnel range is configured in the remote side quick mode selectors.

To troubleshoot using a sniffer command:

```
diagnose sniff packet any "host 172.16.200.44 and icmp" 4
```

To troubleshoot IPsec VPN issues, use the following commands on either FortiGate:

```
diagnose debug reset
diagnose vpn ike gateway clear
diagnose debug application ike -1
diagnose debug enable
```

SSL VPN protocols

The following topics provide information about SSL VPN protocols:

- TLS 1.3 support on page 1304
- SMBv2 support on page 1305

TLS 1.3 support

FortiOS supports TLS 1.3 for SSL VPN.

TLS 1.3 support requires IPS engine 4.205 or later and endpoints running FortiClient 6.2.0 or later.

To establish a client SSL VPN connection with TLS 1.3 to the FortiGate:

1. Enable TLS 1.3 support using the CLI:
```
config vpn ssl setting
   set ssl-max-proto-ver tls1-3
   set ssl-min-proto-ver tls1-3
end
```
2. Configure the SSL VPN and firewall policy:
   a. Configure the SSL VPN settings and firewall policy as needed.
3. For Linux clients, ensure OpenSSL 1.1.1a is installed:
   a. Run the following commands in the Linux client terminal:
   ```
   root@PC1:~/tools# openssl
   OpenSSL> version
   ```
   If OpenSSL 1.1.1a is installed, the system displays a response like the following:
   ```
   OpenSSL 1.1.1a 20 Nov 2018
   ```
4. For Linux clients, use OpenSSL with the TLS 1.3 option to connect to SSL VPN:
   a. Run the following command in the Linux client terminal:
   ```
   #openssl s_client -connect 10.1.100.10:10443 -tls1_3
   ```
5. Ensure the SSL VPN connection is established with TLS 1.3 using the CLI:
   ```
   # diagnose debug application sslvpn -1
   # diagnose debug enable
   ```
   The system displays a response like the following:
   ```
   [207:root:1d]SSL established: TLSv1.3 TLS_AES_256_GCM_SHA384
   ```

Deep inspection (flow-based)

FortiOS supports TLS 1.3 for policies that have the following security profiles applied:

- Web filter profile with flow-based inspection mode enabled.
- Deep inspection SSL/SSH inspection profile.

For example, when a client attempts to access a website that supports TLS 1.3, FortiOS sends the traffic to the IPS engine. The IPS engine then decodes TLS 1.3 and the client is able to access the website.

SMBv2 support

On all FortiGate models, SMBv2 is enabled by default for SSL VPN. Client PCs can access the SMBv2 server using SSL VPN web-only mode.

To configure SMBv2:

1. Set the minimum and maximum SMB versions.

```
config vpn ssl web portal
    edit portal-name
       set smb-min-version smbv2
       set smb-max-version smbv3
    next
end
```

2. Configure SSL VPN and firewall policies as usual.
3. Connect to the SSL VPN web portal and create an SMB bookmark for the SMBv2 server.
4. Click the bookmark to connect to the SMBv2 server.
5. On the FortiGate, use package capture to verify that SMBv2 works:

FortiGate as SSL VPN Client

The FortiGate can be configured as an SSL VPN client, using an *SSL-VPN Tunnel* interface type. When an SSL VPN client connection is established, the client dynamically adds a route to the subnets that are returned by the SSL VPN server. Policies can be defined to allow users that are behind the client to be tunneled through SSL VPN to destinations on the SSL VPN server.

FortiOS can be configured as an SSL VPN server that allows IP-level connectivity in tunnel mode, and can act as an SSL VPN client that uses the protocol used by the FortiOS SSL VPN server. This allows hub-and-spoke topologies to be configured with FortiGates as both the SSL VPN hub and spokes.

For an IP-level VPN between a device and a VPN server, this can be useful to avoid issues caused by intermediate devices, such as:

- ESP packets being blocked.
- UDP ports 500 or 4500 being blocked.
- Fragments being dropped, causing IKE negotiation that uses large certificates to fail if the peer does not support IKE fragmentation.

If the client specified destination is *all*, a default route is effectively dynamically created on the SSL VPN client, and the new default route is added to the existing default route in the form of ECMP. Some examples how to configure routing are:

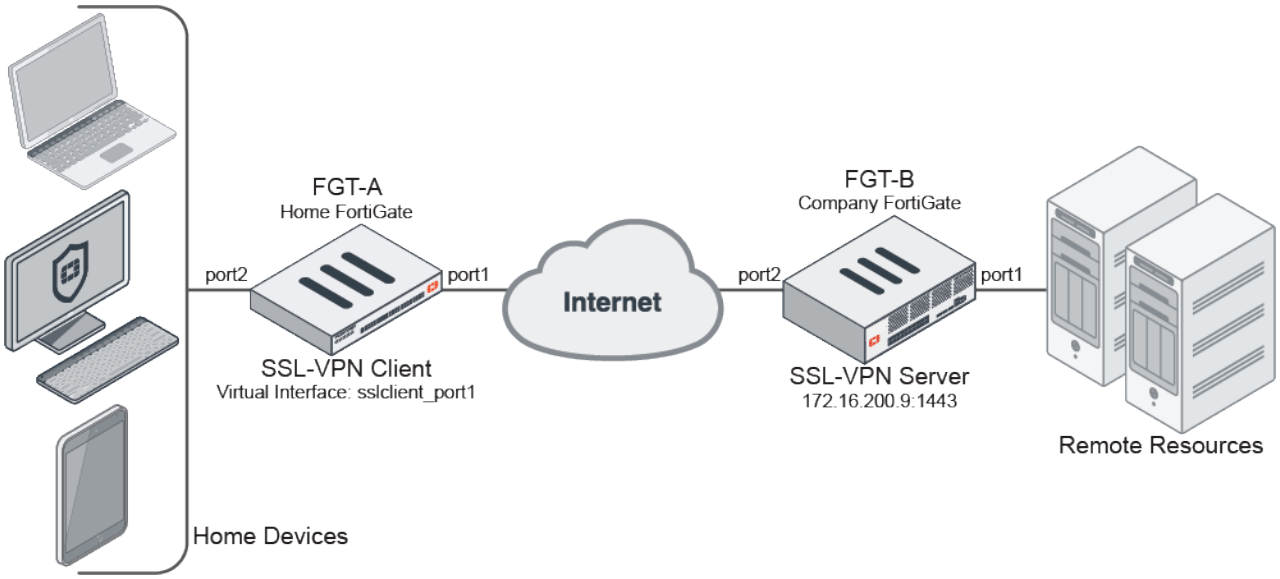
- To make all traffic default to the SSL VPN server and still have a route to the server's listening interface, on the SSL VPN client set a lower distance for the default route that is learned from the server.
- To include both default routes in the routing table, with the route learned from the SSL VPN server taking priority, on the SSL VPN client set a lower distance for the route learned from the server. If the distance is already zero, then increase the priority on the default route.
- To avoid a default being learned on the SSL VPN client, on the SSL VPN server define a specific destination.

Example

In this example, the home FortiGate (FGT-A) is configured as an SSL VPN client, and the company FortiGate (FGT-B) is configured as an SSL VPN server. After FGT-A connects to FGT-B, the devices that are connected to FGT-A can access the resources behind FGT-B.

The SSL VPN server has a custom server certificate defined, and the SSL VPN client user uses PSK and a PKI client certificate to authenticate. The FortiGates must have the proper CA certificate installed to verify the certificate chain to the root CA that signed the certificate.

Split tunneling is used so that only the destination addresses defined in the server's firewall policies are routed to the server, and all other traffic is connected directly to the internet.



Configure the SSL VPN server

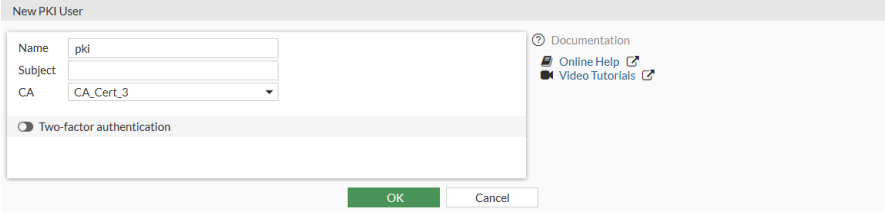
To create a local user in the GUI:

1. Go to *User & Authentication* > *User Definition* and click *Create New*.
2. Use the wizard to create a local user named *client2*.

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to *User & Authentication* > *PKI* and click *Create New*.
2. Set the *Name* to *pki*.
3. Set *CA* to the CA certificate that is used to verify the client certificate.



4. Click *OK*.
5. In the CLI, specify the CN that must be matched. If no CN is specified, then any certificate that is signed by the CA will be valid and matched.

```
config user peer
    edit "pki"
        set cn "*.fos.automation.com"
    next
end
```

To create an SSL VPN portal in the GUI:

1. Go to *VPN* > *SSL-VPN Portals* and click *Create New*.
2. Set the *Name* to *testportal2*.
3. Set *Enable Split Tunneling* to *Enabled Based on Policy Destination*.
4. Set *Source IP Pools* to *SSLVPN_TUNNEL_ADDR1*.
5. Click *OK*.

To configure SSL VPN settings in the GUI:

1. Go to *VPN* > *SSL-VPN Settings*.
2. Set *Server Certificate* to *fgt_gui_automation*.
3. In the *Authentication/Portal Mapping* table click *Create New*:
   a. Set *Users/Groups* to *client2*.
   b. Set *Portal* to *testportal2*.
   c. Click *OK*.
4. Click *OK*.
5. In the CLI, enable SSL VPN client certificate restrictive and set the user peer to *pki*:

```
config vpn ssl settings
    config authentication-rule
        edit 1
            set client-cert enable
            set user-peer "pki"
        next
    end
end
```

To create a firewall address in the GUI:

1. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
2. Set the *Name* to *bing.com*.
3. Set *Type* to *FQDN*.

4. Set *FQDN* to *www.bing.com*.
5. Click *OK*.

To create a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the policy:

Name	*sslvpn2*
Incoming Interface	*SSL-VPN tunnel interface (ssl.root)*
Outgoing Interface	*port1*
Source	*Address*: *all* *User*: *client2*
Destination	*bing.com*: This FQDN resolves to 13.107.21.200 and 204.79.197.200. Traffic to these addresses is directed to the SSL VPN, while other traffic is routed to the remote devices' default adapters or interfaces. *mantis*
Schedule	*always*
Service	*ALL*
Action	*Accept*

3. Click *OK*.

To configure the SSL VPN server (FGT-B) in the CLI:

1. Create a local user:

```
config user local
    edit "client2"
        set passwd **********
    next
end
```

2. Create a PKI user:

```
config user peer
    edit "pki"
        set ca "CA_Cert_3"
        set cn "*.fos.automation.com"
    next
end
```

3. Create a new SSL VPN portal:

```
config vpn ssl web portal
    edit "testportal2"
        set tunnel-mode enable
        set ipv6-tunnel-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling enable
```

```
        set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
        set ipv6-split-tunneling enable
        ....
    next
end
```

4. Configure SSL VPN settings, including the authentication rule for user mapping:

```
config vpn ssl settings
    set ssl-min-proto-ver tls1-1
    set servercert "fgt_gui_automation"
    set auth-timeout 0
    set login-attempt-limit 10
    set login-timeout 180
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set dns-suffix "sslvpn.com"
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "testportal1"
    config authentication-rule
        edit 1
            set users "client2"
            set portal "testportal2"
            set client-cert enable
            set user-peer "pki"
        next
    end
end
```

5. Create a firewall address and policy. The destination addresses used in the policy are routed to the SSL VPN server.

```
config firewall address
    edit "bing.com"
        set type fqdn
        set fqdn "www.bing.com"
    next
end

config firewall policy
    edit 2
        set name "sslvpn2"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "mantis" "bing.com"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "client2"
    next
end
```

Configure the SSL VPN client

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to *User & Authentication* > *PKI* and click *Create New*.
2. Set the *Name* to *fgt_gui_automation*.
3. Set *CA* to the CA certificate. The CA certificate allows the FortiGate to complete the certificate chain and verify the server 's certificate, and is assumed to already be installed on the FortiGate.
4. Click *OK*.
5. In the CLI, specify the CN of the certificate on the SSL VPN server:

```
config user peer
    edit "fgt_gui_automation"
        set cn "*.fos.automation.com"
    next
end
```

To create an SSL VPN client and virtual interface in the GUI:

1. Go to *VPN* > *SSL-VPN Clients* and click *Create New*.
2. Expand the *Interface* drop down and click *Create* to create a new virtual interface:
   a. Set the *Name* to *sslclient_port1*.
   b. Set *Interface* to *port1*.
   c. Under *Administrative Access*, select *HTTPS* and *PING*.

   d. Click *OK*.

3. Configure the SSL VPN client:

Name	*sslclientTo9*
Interface	*sslclient_port1*
Server	*172.16.200.9*
Port	*1443*
Username	*client2*
Pre-shared Key	**********
Client Certificate	*fgtb_gui_automation* This is the local certificate that is used to identify this client, and is assumed to already be installed on the FortiGate. The SSL VPN server requires it for authentication.
Peer	*fgt_gui_automation*
Administrative Distance	Configure as needed.
Priority	Configure as needed.
Status	Enabled

4. Click *OK*.

To create a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the policy:

Name	*policy_to_sslvpn_tunnel*
Incoming Interface	*port2*
Outgoing Interface	*sslclient_port1*
Source	*all*
Destination	*all*
Schedule	*always*
Service	*ALL*
Action	*Accept*

3. Click *OK*.

To configure the SSL VPN client (FGT-A) in the CLI:

1. Create the PKI user. Use the CA that signed the certificate *fgt_gui_automation*, and the CN of that certificate on the SSL VPN server.

```
config user peer
    edit "fgt_gui_automation"
```

```
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Create the SSL interface that is used for the SSL VPN connection:

```
config system interface
    edit "sslclient_port1"
        set vdom "vdom1"
        set allowaccess ping https
        set type ssl
        set role lan
        set snmp-index 46
        set interface "port1"
    next
end
```

3. Create the SSL VPN client to use the PKI user and the client certificate *fgtb_gui_automation*:

```
config vpn ssl client
    edit "sslclientTo9"
        set interface "sslclient_port1"
        set user "client2"
        set psk 123456
        set peer "fgt_gui_automation"
        set server "172.16.200.9"
        set port 1443
        set certificate "fgtb_gui_automation"
    next
end
```

4. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "policy_to_sslvpn_tunnel"
        set srcintf "port2"
        set dstintf "sslclient_port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Verification

After the tunnel is established, the route to 13.107.21.200 and 204.79.197.200 on FGT-A connects through the SSL VPN virtual interface *sslclient_port1*.

To check the routing table details:

```
(vdom1) # get router info routing-table details
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
```

```
        O - OSPF, IA - OSPF inter area
        N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
        E1 - OSPF external type 1, E2 - OSPF external type 2
        i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
        * - candidate default

Routing table for VRF=0
S*      0.0.0.0/0 [10/0] via 172.16.200.254, port1
C       10.0.1.0/24 is directly connected, link_11
C       10.1.100.0/24 is directly connected, port2
                      is directly connected, port2
C       10.212.134.200/32 is directly connected, sslclient_port1
S       13.107.21.200/32 [10/0] is directly connected, sslclient_port1
C       172.16.200.0/24 is directly connected, port1
S       192.168.100.126/32 [10/0] is directly connected, sslclient_port1
S       204.79.197.200/32 [10/0] is directly connected, sslclient_port1
```

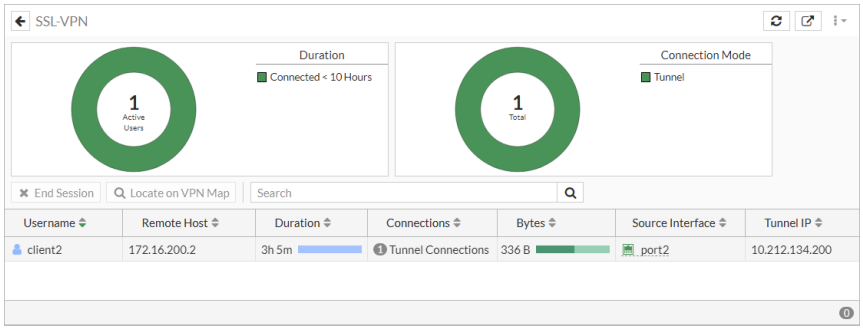
To check the added routing for an IPv6 tunnel:

```
(vdom1) # get router info6 routing-table database
IPv6 Routing Table
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
       IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, B - BGP
       > - selected route, * - FIB route, p - stale info
Timers: Uptime

S     *> ::/0 [10/0] via 2000:172:16:200::254, port1, 00:00:01, [1024/0]
      *>      [10/0] via ::, sslclient_port1, 00:00:01, [1024/0]
C     *> ::1/128 via ::, vdom1, 03:26:35
C     *> 2000:10:0:1::/64 via ::, link_11, 03:26:35
C     *> 2000:10:1:100::/64 via ::, port2, 03:26:35
C     *> 2000:172:16:200::/64 via ::, port1, 03:26:35
C     *> 2001:1::1:100/128 via ::, sslclient_port1, 00:00:01
C     *> fe80::/64 via ::, port2, 03:26:35
```

To check the connection in the GUI:

1. On the SSL VPN server FortiGate (FGT-B), go to *Dashboard* > *Network* and expand the *SSL-VPN* widget.



2. On the SSL VPN client FortiGate (FGT-A), go to *VPN* > *SSL-VPN Clients* to see the tunnel list.

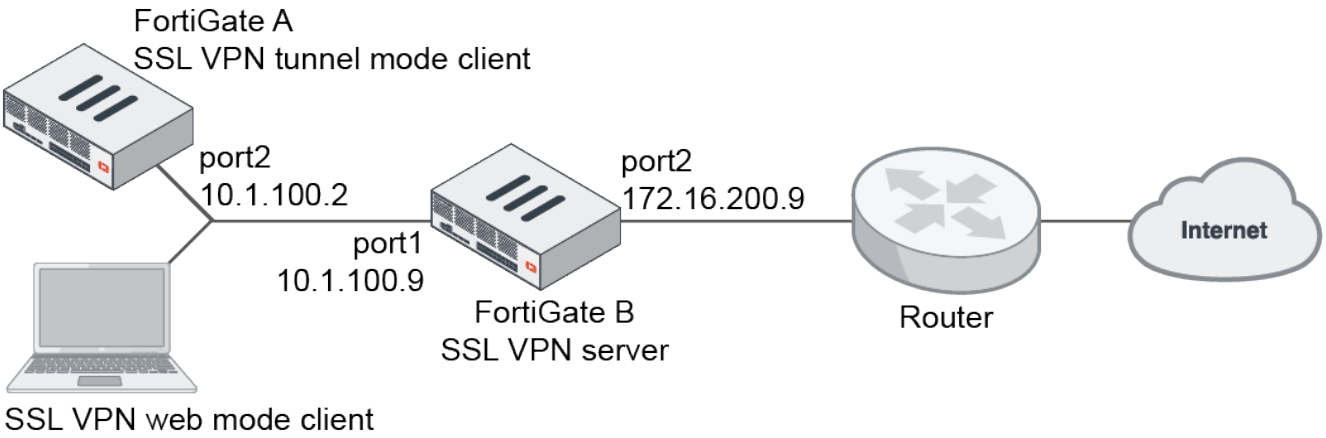
Dual stack IPv4 and IPv6 support for SSL VPN

Dual stack IPv4 and IPv6 support for SSL VPN servers and clients enables a client to establish a dual stack tunnel to allow both IPv4 and IPv6 traffic to pass through. FortiGate SSL VPN clients also support dual stack, which allows it to establish dual stack tunnels with other FortiGates.

Users connecting in web mode can connect to the web portal over IPv4 or IPv6. They can access bookmarks in either IPv4 or IPv6, depending on the preferred DNS setting of the web portal.

Example

In this example, FortiGate B works as an SSL VPN server with dual stack enabled. A test portal is configured to support tunnel mode and web mode SSL VPN.



FortiGate A is an SSL VPN client that connects to FortiGate B to establish an SSL VPN tunnel connection. It attempts to access www.bing.com and www.apple.com via separate IPv4 and IPv6 connections. Two addresses are configured on FortiGate B:

- *bing.com* uses IPv4 FQDN and resolves to 13.107.21.200 and 204.79.197.200.
- *apple_v6* uses IPv6 FQDN and resolves to 2600:140a:c000:385::1aca and 2600:140a:c000:398::1aca.

The server certificate used is fgt_gui_automation, and the CN is *.fos.automation.com.

A PC serves as a client to connect to FortiGate B in SSL VPN web mode. The PC can connect to the SSL VPN server over IPv4 or IPv6. Based on the preferred DNS setting, it will access the destination website over IPv4 or IPv6.

Dual stack tunnel mode support requires a supported client. In 7.0.0, a FortiGate in SSL VPN client mode can support dual stack tunnels. The current FortiClient 7.0.0 release does not support dual stack.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the GUI:

1. Create a local user:
   a. Go to *User & Authentication* > *User Definition* and click *Create New*. The *Users/Groups Creation Wizard* opens.
   b. Set the *User Type* to *Local User* and click *Next*.

c. Enter the *Username* (*client2*) and password, then click *Next*.
d. Optionally, configure the contact information and click *Next*.
e. Click *Submit*.

2. Configure the addresses:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Enter the following for the IPv4 address:

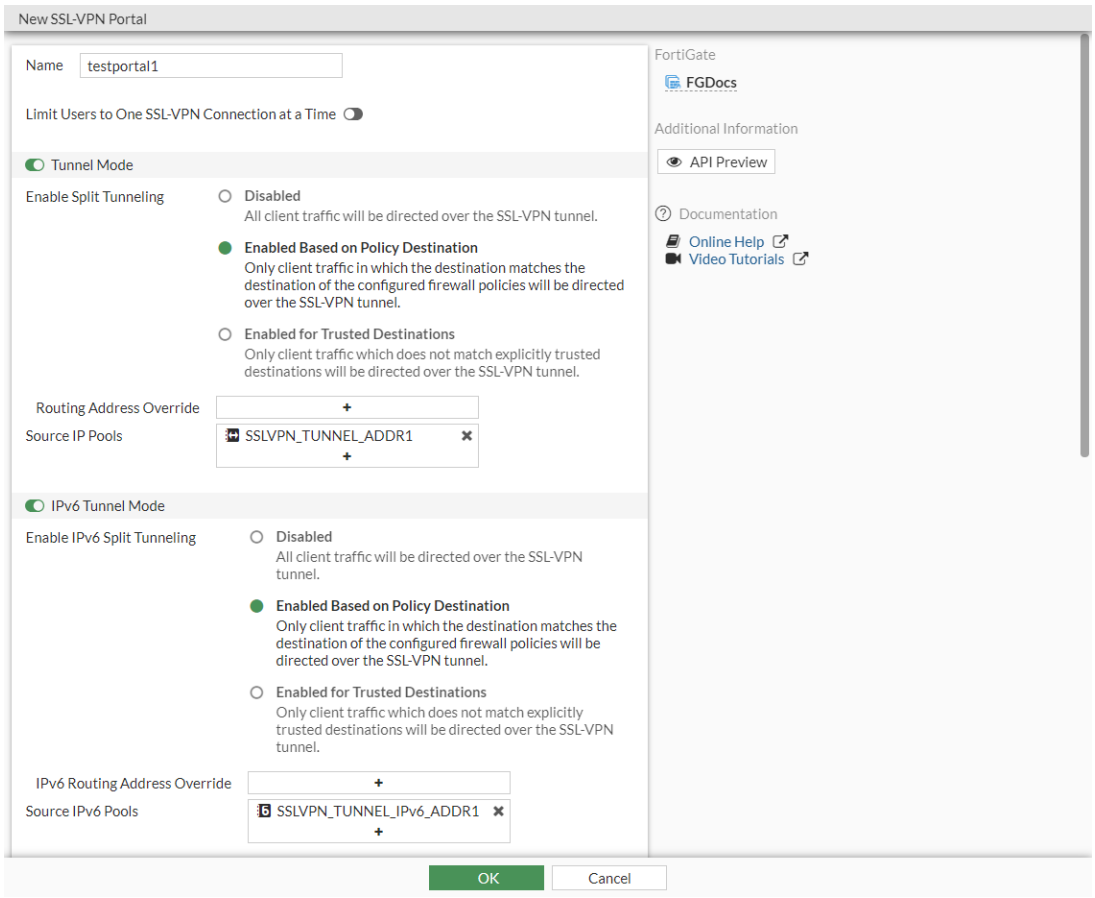
Category	Address
Name	bing.com
Type	FQDN
FQDN	www.bing.com

   c. Click *OK*.
   d. Click *Create New* > *Address* and enter the following for the IPv6 address:

Category	IPv6 Address
Name	apple_v6
Type	FQDN
FQDN	www.apple.com

   e. Click *OK*.
3. Configure the SSL VPN portal:
   a. Go to *VPN* > *SSL-VPN Portals* and click *Create New*.
   b. Enter a name (*testportal1*).
   c. Enable *Tunnel Mode* and for *Enable Split Tunneling*, select *Enable Based on Policy Destination*.
   d. For *Source IP Pools*, add *SSLVPN_TUNNEL_ADDR1*.
   e. Enable *IPv6 Tunnel Mode* and for *Enable Split Tunneling*, select *Enable Based on Policy Destination*.
   f. For *Source IP Pools*, add *SSLVPN_TUNNEL_IPv6_ADDR1*.

g. Enable *Enable Web Mode*.



h. Click *OK*.

4. Configure the SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings* and configure the following:

Listen on Interface(s)	port1
Listen on Port	1443
Restrict Access	Allow access from any host
Server Certificate	fgt_gui_automation
Address Range	Automatically assign addresses
DNS Server	Same as client system DNS
Authentication/Portal Mapping	Edit the *All Other Users/Groups* entry to use *testportal1*.

   b. Click *Apply*.
   c. Enable dual stack in the CLI:

```
config vpn ssl settings
    set dual-stack-mode enable
end
```

5. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Name	sslvpn
Incoming Interface	ssl.root
Outgoing Interface	port2
Source	all (IPv4), all (IPv6), client2
Destination	bing.com, apple_v6
Schedule	Always
Service	All
NAT	Enabled

   c. Click *OK*.

To configure FortiGate A as an SSL VPN client in the GUI:

1. Create a peer to verify the server certificate:

The PKI menu is only available in the GUI (*User & Authentication* > *PKI*) after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

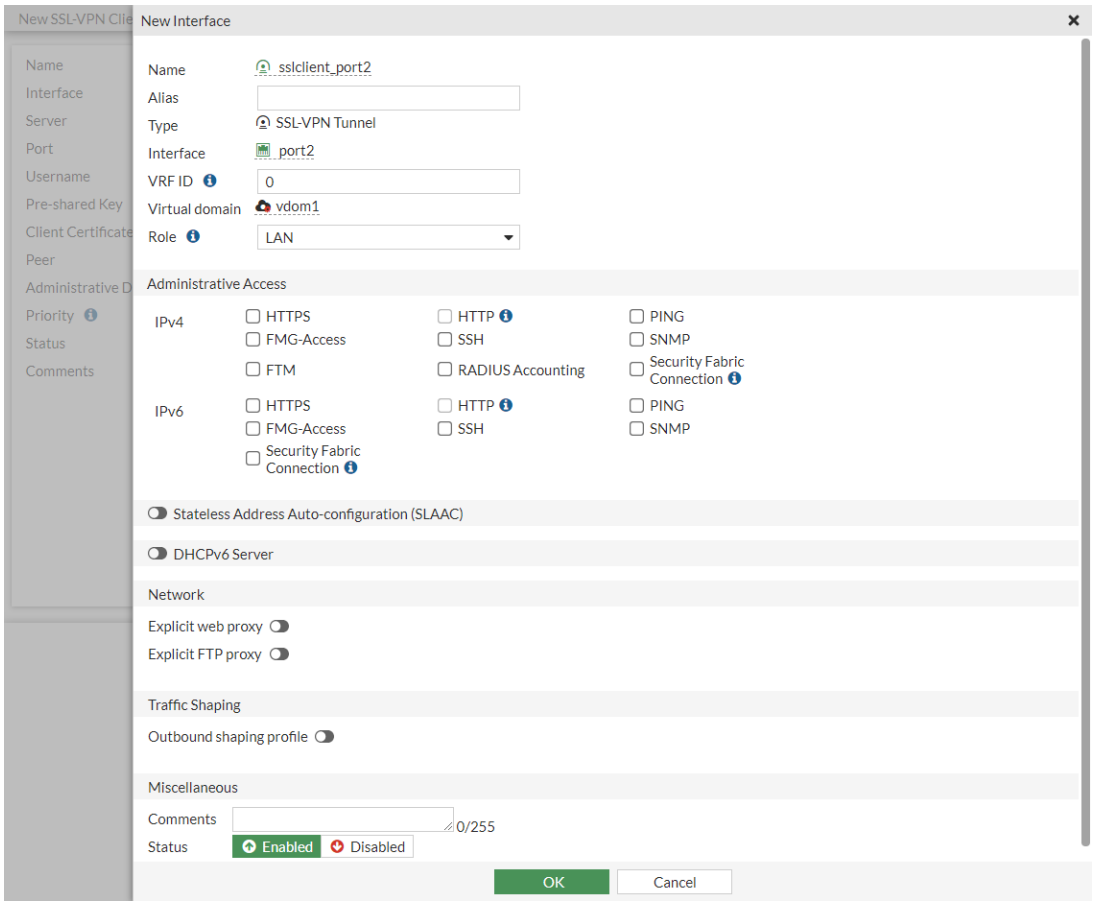
If the CA is not known or is public, import the CA that signed the server certificate.

   a. Go to *User & Authentication* > *PKI* and click *Create New*.
   b. Set the *Name* to *fgt_gui_automation*.
   c. Set *CA* to the CA certificate that is used to verify the server certificate.
   d. Click *OK*.
   e. In the CLI, specify the CN that must be matched:

```
config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Configure the SSL VPN client:
   a. Go to *VPN* > *SSL-VPN Clients* and click *Create New*.
   b. In the *Interface* dropdown, click *Create*.
      i. Enter a Name (*sslclient_port2*).
      ii. Set *Interface* to *port2*.

iii. Set *Role* to *LAN*.



iv. Click *OK*.

c. Configure the SSL VPN client:

Name	sslclientTo9
Interface	sslclient_port2
Server	Either IPv4 address *10.1.100.9* or IPv6 address *2000:10:1:100::9* can be used and will have the same results.
Port	1443
Username	client2
Pre-shared Key	******
Peer	fgt_gui_automation
Status	Enabled

d. Click *OK*.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the CLI:

1. Create a local user:

```
config user local
    edit "client1"
        set type password
        set passwd ******
    next
end
```

2. Configure the addresses:

```
config firewall address
    edit "bing.com"
        set type fqdn
        set fqdn "www.bing.com"
    next
end
config firewall address6
    edit "apple_v6"
        set type fqdn
        set fqdn "www.apple.com"
    next
end
```

3. Configure the SSL VPN portal:

```
config vpn ssl web portal
    edit "testportal1"
        set tunnel-mode enable
        set ipv6-tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
        set split-tunneling enable
        set ipv6-split-tunneling enable
    next
end
```

4. Configure the SSL VPN settings:

```
config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set port 1443
    set source-interface "port1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "testportal1"
    set dual-stack-mode enable
end
```

5. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "sslvpn"
```

```
        set srcintf "ssl.root"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "bing.com"
        set srcaddr6 "all"
        set dstaddr6 "apple_v6"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "client2"
    next
end
```

To configure FortiGate A as an SSL VPN client in the CLI:

1. Create a peer to verify the server certificate:

```
config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Configure the interface:

```
config system interface
    edit "sslclient_port2"
        set vdom "vdom1"
        set type ssl
        set role lan
        set snmp-index 46
        set interface "port2"
    next
end
```

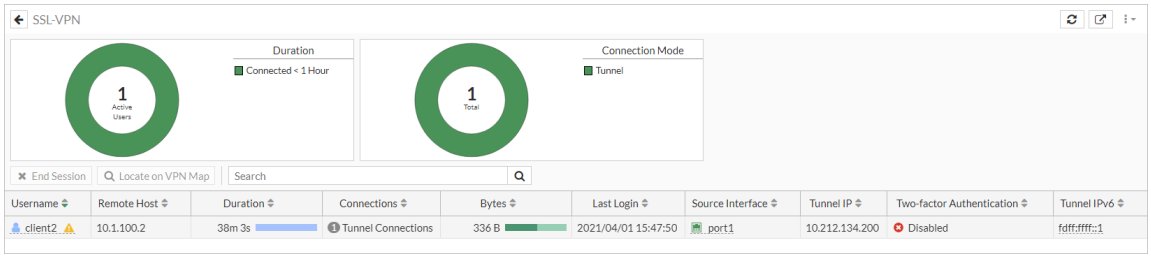
3. Configure the SSL VPN client. Either IPv4 address 10.1.100.9 or IPv6 address 2000:10:1:100::9 can be used and will have the same results:

```
config vpn ssl client
    edit "sslclientTo9"
        set interface "sslclient_port2"
        set user "client2"
        set psk ******
        set peer "fgt_gui_automation"
        set server {10.1.100.9 | 2000:10:1:100::9}
        set port 1443
    next
end
```

Testing dual stack with tunnel mode

To verify the SSL VPN tunnel connection in the GUI:

1. On FortiGate B, go to *Dashboard* > *Network*.
2. Expand the *SSL-VPN* widget.



To verify the SSL VPN tunnel connection in the CLI:

1. On FortiGate B, verify that the client is assigned with both IPv4 and IPv6 addresses:

```
(root) # get vpn ssl monitor
SSL VPN Login Users:
 Index   User     Group    Auth Type       Timeout          Auth-Timeout     From      HTTP
in/out    HTTPS in/out    Two-factor Auth
 0       client2                1(1)              292     2147483647        10.1.100.2
0/0     0/0     0

SSL VPN sessions:
 Index   User     Group    Source IP       Duration         I/O Bytes        Tunnel/Dest IP
 0       client2                10.1.100.2       5427     1756/1772
10.212.134.200,fdff:ffff::1
```

2. On FortiGate A, verify the routing tables.
   a. IPv4 with resolved addresses for www.bing.com:

```
(vdom1) # get router info routing-table database
...
Routing table for VRF=0
S     *> 0.0.0.0/0 [10/0] via 172.16.200.254, port1
C     *> 10.0.1.0/24 is directly connected, link_11
C     *> 10.1.100.0/24 is directly connected, port2
C     *> 10.212.134.200/32 is directly connected, sslclient_port2
S     *> 13.107.21.200/32 [10/0] is directly connected, sslclient_port2
C     *> 172.16.200.0/24 is directly connected, port1
S     *> 204.79.197.200/32 [10/0] is directly connected, sslclient_port2
```

   b. IPv6 with resolved addresses for www.apple.com:

```
(vdom1) # get router info6 routing-table database
...

C    *> fe80::/64 via ::, port2, 06:12:54
```

To test the address connections using ping:

1. On FortiGate A, ping www.bing.com using IPv4 ping:

```
# execute ping www.bing.com
PING www-bing-com.dual-a-0001.a-msedge.net (13.107.21.200): 56 data bytes
64 bytes from 13.107.21.200: icmp_seq=0 ttl=117 time=1.8 ms
...
```

2. On FortiGate B, sniff for IPv4 ICMP packets and observe the results:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
9.675101 ssl.root in 10.212.134.200 -> 13.107.21.200: icmp: echo request
9.675219 port2 out 172.16.200.9 -> 13.107.21.200: icmp: echo request
9.676698 port2 in 13.107.21.200 -> 172.16.200.9: icmp: echo reply
9.676708 ssl.root out 13.107.21.200 -> 10.212.134.200: icmp: echo reply
...
```

3. On FortiGate A, ping www.apple.com using IPv6 ping:

```
# execute ping6 www.apple.com
PING www.apple.com (2600:140a:c000:385::1aca): 56 data bytes
64 bytes from 2600:140a:c000:385::1aca: icmp_seq=1 ttl=52 time=1.88 ms
...
```

4. On FortiGate B, sniff for IPv6 ICMP packets and observe the results:

```
# diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
3.564296 ssl.root in fdff:fff::1 -> 2600:140a:c000:385::1aca: icmp6: echo request seq 1
3.564435 port2 out 2000:172:16:200::9 -> 2600:140a:c000:385::1aca: icmp6: echo request
seq 1
3.565929 port2 in 2600:140a:c000:385::1aca -> 2000:172:16:200::9: icmp6: echo reply seq
1 [flowlabel 0x1fdff]
3.565953 ssl.root out 2600:140a:c000:385::1aca -> fdff:fff::1: icmp6: echo reply seq 1
[flowlabel 0x1fdff]
...
```

Testing dual stack with web mode

In SSL VPN web mode, users can access both IPv4 and IPv6 bookmarks in the portal. The attribute, `prefer-ipv6-dns` can be enabled to prefer querying IPv6 DNS first, or disabled to prefer querying IPv4.

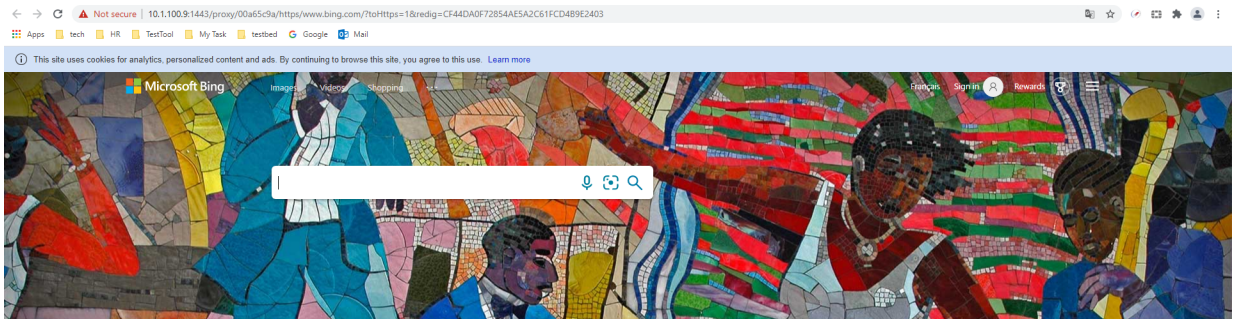
To test an IPv4 connection to the web portal and access www.bing.com over IPv6:

1. On FortiGate B, prioritize resolving IPv6 addresses:

```
config vpn ssl web portal
    edit "testportal1"
        set prefer-ipv6-dns enable
```

```
    next
end
```

2. Log in to the web portal in the browser over the IPv4 address 10.1.100.9.
3. Create a new HTTP/HTTPS bookmark named *bing* for the URL www.bing.com.
4. Click the *bing* bookmark. The bing page will open over IPv6.

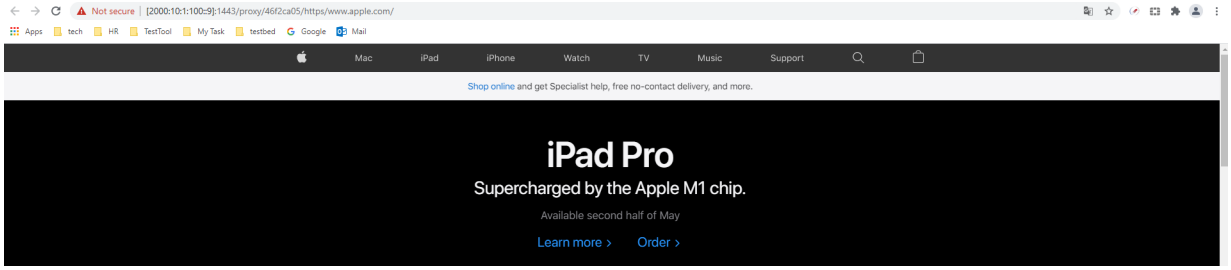


To test an IPv6 connection to the web portal and access www.apple.com over IPv4:

1. On FortiGate B, prioritize resolving IPv4 addresses:

```
config vpn ssl web portal
    edit "testportal1"
        set prefer-ipv6-dns disable
    next
end
```

2. Log in to the web portal in the browser over the IPv6 address [2000:10:1:100::9].
3. Create a new HTTP/HTTPS bookmark named *apple* for the URL www.apple.com.
4. Click the *apple* bookmark. The apple page will open over IPv4.



SSL VPN troubleshooting

The following topics provide information about SSL VPN troubleshooting:

- Debug commands on page 1325
- Troubleshooting common issues on page 1325

Debug commands

SSL VPN debug command

Use the following diagnose commands to identify SSL VPN issues. These commands enable debugging of SSL VPN with a debug level of -1 for detailed results.

```
diagnose debug application sslvpn -1
diagnose debug enable
```

The CLI displays debug output similar to the following:

```
FGT60C3G10002814 # [282:root]SSL state:before/accept initialization (172.20.120.12)
[282:root]SSL state:SSLv3 read client hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write server hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write change cipher spec A (172.20.120.12)
[282:root]SSL state:SSLv3 write finished B (172.20.120.12)
[282:root]SSL state:SSLv3 flush data (172.20.120.12)
[282:root]SSL state:SSLv3 read finished A:system lib(172.20.120.12)
[282:root]SSL state:SSLv3 read finished A (172.20.120.12)
[282:root]SSL state:SSL negotiation finished successfully (172.20.120.12)
[282:root]SSL established: DHE-RSA-AES256-SHA SSLv3 Kx=DH Au=RSA Enc=AES(256) Mac=SHA1
```

To disable the debug:

```
diagnose debug disable
diagnose debug reset
```

Remote user authentication debug command

Use the following diagnose commands to identify remote user authentication issues.

```
diagnose debug application fnbamd -1
diagnose debug reset
```

Troubleshooting common issues

To troubleshoot getting no response from the SSL VPN URL:

1. Go to *VPN* > *SSL-VPN Settings*.
   a. Check the SSL VPN port assignment.
   b. Check the *Restrict Access* setting to ensure the host you are connecting from is allowed.
2. Go to *Policy* > *Firewall Policy*.
   a. Check that the policy for SSL VPN traffic is configured correctly.
   b. Check the URL you are attempting to connect to. It should follow this pattern:

      ```
      https://<FortiGate IP>:<Port>
      ```

   c. Check that you are using the correct port number in the URL. Ensure FortiGate is reachable from the computer.

      ```
      ping <FortiGate IP>
      ```

   d. Check the browser has *TLS 1.1*, *TLS 1.2*, and *TLS 1.3* enabled.

To troubleshoot FortiGate connection issues:

1. Check the Release Notes to ensure that the FortiClient version is compatible with your version of FortiOS.
2. FortiClient uses IE security setting, In IE *Internet options* > *Advanced* > *Security*, check that *Use TLS 1.1* and *Use TLS 1.2* are enabled.
3. Check that SSL VPN *ip-pools* has free IPs to sign out. The default *ip-poolsSSLVPN_TUNNEL_ADDR1* has 10 IP addresses.
4. Export and check FortiClient debug logs.
   a. Go to *File* > *Settings*.
   b. In the *Logging* section, enable *Export logs*.
   c. Set the *Log Level* to *Debug* and select *Clear logs*.
   d. Try to connect to the VPN.
   e. When you get a connection error, select *Export logs*.

To troubleshoot SSL VPN hanging or disconnecting at 98%:

1. A new SSL VPN driver was added to FortiClient 5.6.0 and later to resolve SSL VPN connection issues. If your FortiOS version is compatible, upgrade to use one of these versions.
2. Latency or poor network connectivity can cause the login timeout on the FortiGate. In FortiOS 5.6.0 and later, use the following commands to allow a user to increase the SSL VPN login timeout setting.

```
config vpn ssl settings
  set login-timeout 180 (default is 30)
  set dtls-hello-timeout 60 (default is 10)
end
```

To troubleshoot tunnel mode connections shutting down after a few seconds:

This might occur if there are multiple interfaces connected to the Internet, for example, SD-WAN. This can cause the session to become “dirty”. To allow multiple interfaces to connect, use the following CLI commands.

If you are using a FortiOS 6.0.1 or later:

```
config system interface
  edit <name>
    set preserve-session-route enable
  next
end
```

If you are using a FortiOS 6.0.0 or earlier:

```
config vpn ssl settings
   set route-source-interface enable
end
```

To troubleshoot users being assigned to the wrong IP range:

1. Go to *VPN* > *SSL-VPN Portals* and *VPN* > *SSL-VPN Settings* and ensure the same *IP Pool* is used in both places. Using the same *IP Pool* prevents conflicts. If there is a conflict, the portal settings are used.

To troubleshoot slow SSL VPN throughput:

Many factors can contribute to slow throughput.

This recommendation tries to improve throughput by using the FortiOS Datagram Transport Layer Security (DTLS) tunnel option, available in FortiOS 5.4 and above.

DTLS allows SSL VPN to encrypt traffic using TLS and uses UDP as the transport layer instead of TCP. This avoids retransmission problems that can occur with TCP-in-TCP.

FortiClient 5.4.0 to 5.4.3 uses DTLS by default. FortiClient 5.4.4 and later uses normal TLS, regardless of the DTLS setting on the FortiGate.

To use DTLS with FortiClient:

1. Go to *File* > *Settings* and enable *Preferred DTLS Tunnel*.

To enable DTLS tunnel on FortiGate, use the following CLI commands:

```
config vpn ssl settings
  set dtls-tunnel enable
end
```

User & Authentication

In *User & Authentication*, you can control network access for different users and devices in your network. FortiGate authentication controls system access by user group. By assigning individual users to the appropriate user groups you can control each user's access to network resources. You can define local users and peer users on the FortiGate unit. You can also define user accounts on remote authentication servers and connect them to FortiOS.

You can control network access for different device types in your network by doing the following:

- Identifying and monitoring the types of devices connecting to your network
- Using MAC address based access control to allow or deny individual devices
- Using Telemetry data received from FortiClient endpoints to construct a policy to deny access to endpoints with known vulnerabilities or to quarantine compromised endpoints

The following sections provide information about users and devices:

- Endpoint control and compliance on page 1328
- User Definition on page 1337
- User Groups on page 1338
- Guest Management on page 1339
- LDAP Servers on page 1342
- RADIUS Servers on page 1352
- TACACS+ servers on page 1372
- SAML on page 1374
- Authentication Settings on page 1382
- FortiTokens on page 1383
- PKI on page 1401
- Configuring the maximum log in attempts and lockout period on page 1401
- Configuring firewall authentication on page 1402

Endpoint control and compliance

The section contains the following topics:

- Per-policy disclaimer messages on page 1328
- Compliance on page 1331
- FortiGuard distribution of updated Apple certificates on page 1333
- Integrate user information from EMS and Exchange connectors in the user store on page 1334

Per-policy disclaimer messages

FortiOS supports a customizable captive portal to direct users to install or enable required software.

Per-policy custom disclaimers in each VDOM are supported. For example, you may want to configure three firewall policies, each of which matches traffic from endpoints with different FortiClient statuses:

Endpoint status	FortiOS behavior
Endpoint does not have FortiClient installed.	Traffic matches a firewall policy that displays an in-browser warning to install FortiClient from the provided link.
Endpoint has FortiClient installed, registered to EMS, and connected to the FortiGate.	Traffic matches a dynamic firewall policy which allows the endpoint to reach its destination via this policy.
Endpoint is deregistered from EMS and disconnected from the FortiGate.	Traffic matches another dynamic firewall policy that displays warning to register FortiClient to EMS.

The replacement message groups and policy disclaimer settings must be enabled.

To enable per-policy disclaimer messages in the GUI:

1. Go to *System* > *Feature Visibility*.
2. Enable *Replacement Message Groups* and *Policy Disclaimer*.
3. Click *Apply*.

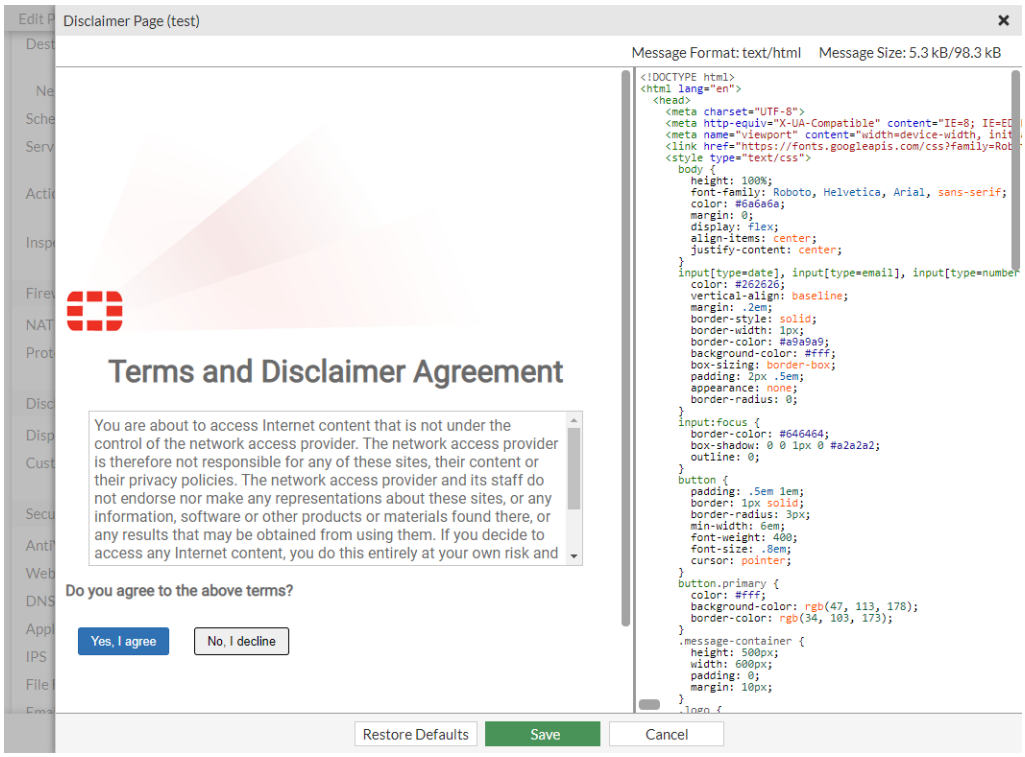
To enable per-policy disclaimer messages in the CLI:

```
config system global
    set gui-replacement-message-groups enable
end
config system settings
    set gui-policy-disclaimer enable
end
```

To configure per-policy disclaimers in the GUI:

1. Ensure the per-policy disclaimer messages option is enabled.
2. Go to *Policy & Objects* > *Firewall Policy*.
3. Edit the policy that applies when an endpoint does not have FortiClient installed.
4. Under *Disclaimer Options*, enable *Display Disclaimer* and *Customize Messages*.
5. Add a replacement message group:
   a. Select an existing replacement message group from the dropdown and click *Edit Disclaimer Message*.
   b. Click *Create*, enter a name, and click *OK*. Select the replacement message group and click *Edit*

Disclaimer Message.



6. Edit the message to warn users to install FortiClient, and provide the FortiClient download link.
7. Click *Save*.
8. Repeat the above steps for each policy that requires a custom disclaimer message.

To configure per-policy disclaimers in the CLI:

```
config firewall policy
    edit 1
        set name "111"
        set srcintf "port12"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "pc155_address"
        set action accept
        set schedule "always"
        set service "ALL"
        set wsso disable
        set groups "ems_03_group"
        set disclaimer enable
        set replacemsg-override-group "test"
        set nat enable
    next
    edit 4
        set name "44"
        set srcintf "port12"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "pc5-address"
        set action accept
```

```
        set schedule "always"
        set service "ALL"
        set wsso disable
        set groups "ems_03_group"
        set disclaimer enable
        set replacemsg-override-group "test2"
        set nat enable
    next
    edit 6
        set name "66"
        set srcintf "port12"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "all"
        set status disable
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set fsso disable
        set block-notification enable
        set replacemsg-override-group "endpoint-override"
    next
end
```

Compliance

The following topics provide information about compliance in FortiOS.

- FortiGate VM unique certificate on page 1331
- Running a file system check automatically on page 1332

FortiGate VM unique certificate

To safeguard against certificate compromise, FortiGate VM and FortiAnalyzer VM use the same deployment model as FortiManager VM where the license file contains a unique certificate tied to the serial number of the virtual device.

A hardware appliance usually comes with a BIOS certificate with a unique serial number that identifies the hardware appliance. This built-in BIOS certificate is different from a firmware certificate. A firmware certificate is distributed in all appliances with the same firmware version.

Using a BIOS certificate with a built-in serial number provides a high trust level for the other side in X.509 authentication.

Since a VM appliance has no BIOS certificate, a signed VM license can provide an equivalent of a BIOS certificate. The VM license assigns a serial number in the BIOS equivalent certificate. This gives the certificate an abstract access ability, which is similar to a BIOS certificate with the same high trust level.

This feature is only supported in new, registered VM licenses.

Sample configurations

Depending on the firmware version and VM license, the common name (CN) on the certificate will be configured differently.

License	Firmware			
	6.0	6.2	6.4	7.0
6.0	CN = FortiGate	CN = FortiGate	CN = FortiGate	CN = FortiGate
6.2	CN = FortiGate	CN = serial number	CN = serial number	CN = serial number
6.4	CN = FortiGate	CN = serial number	CN = serial number	CN = serial number
7.0	CN = FortiGate	CN = serial number	CN = serial number	CN = serial number

To view validated certificates:

1. Go to *System* > *Certificates*.
2. Double-click on a VM certificate. There are two VM certificates:
   - *Fortinet_Factory*
   - *Fortinet_Factory_Backup*

   The *Certificate Detail Information* window displays.

Running a file system check automatically

There is an option in FortiOS to enable automatic file system checks if the FortiGate shuts down ungracefully.

By default, the automatic file system check is disabled. When an administrator logs in after an ungraceful shutdown, a warning message appears advising them to manually run a file system check. A warning also appears in the CLI:

```
WARNING: File System Check Recommended! Unsafe reboot may have caused inconsistency in disk
drive.
It is strongly recommended that you check file system consistency before proceeding.
Please run 'execute disk scan 17'
Note: The device will reboot and scan during startup. This may take up to an hour
```

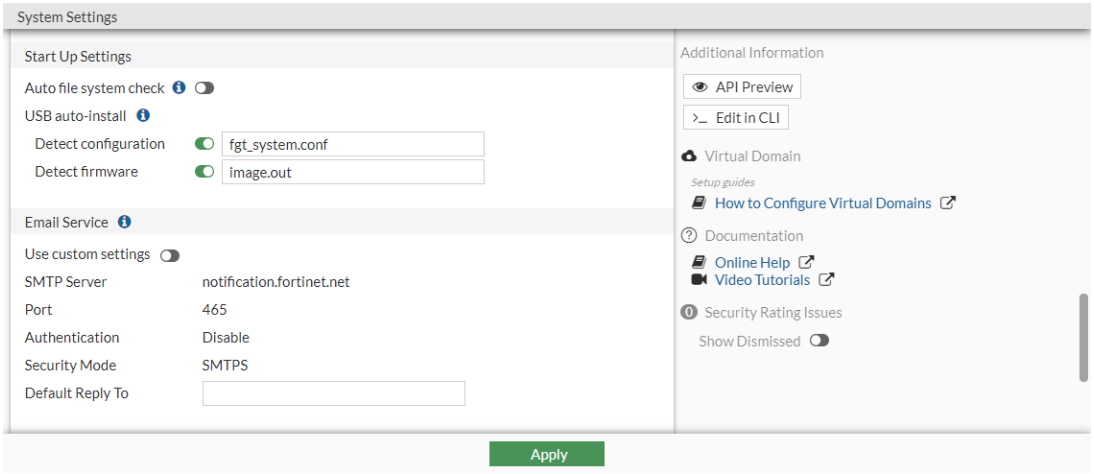
Enabling automatic file system checks

You can enable automatic file system checks in both the GUI and CLI.

To enable automatic file system checks in the GUI:

1. Go to *System* > *Settings*.
2. In the *Start Up Settings* section, enable *Auto file system check*.

3. Click *Apply*.



To enable automatic file system checks using the CLI:

```
config system global
   set autorun-log-fsck enable
end
```

FortiGuard distribution of updated Apple certificates

Push notifications for iPhone (for the purpose of two-factor authentication) require a TLS server certificate to authenticate to Apple. As this certificate is only valid for one year, a service extension allows FortiGuard to distribute updated TLS server certificates to FortiGate when needed.

FortiGuard update service updates local Apple push notification TLS server certificates when the local certificate is expired. FortiGuard update service also reinstalls certificates when the certificates are lost.

You can verify that the feature is working on the FortiGate by using the CLI shell.

To verify certificate updates:

1. Using FortiOS CLI shell, verify that all certificates are installed:

```
/data/etc/apns # ls -al
drwxr-xr-x    2 0        0       Tue Jan 15 08:42:39 2019          1024 .
drwxr-xr-x   12 0        0       Tue Jan 15 08:45:00 2019          2048 ..
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          2377 apn-dev-cert.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          1859 apn-dev-key.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          8964 apn-dis-cert.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          4482 apn-dis-key.pem
```

2. Rename all current Apple certificates.
   Apple push notification no longer works after you rename the certificates.

```
/data/etc/apns # mv apn-dis-cert.pem apn-dis-cert.pem.save
/data/etc/apns # mv apn-dev-key.pem apn-dev-key.pem.save
/data/etc/apns # mv apn-dev-cert.pem apn-dev-cert.pem.save
/data/etc/apns # mv apn-dis-key.pem apn-dis-key.pem.save
/data/etc/apns # ls -al
```

```
drwxr-xr-x   2 0  0   Tue Jan 15 08:51:15 2019   1024 .
drwxr-xr-x  12 0  0   Tue Jan 15 08:45:00 2019   2048 ..
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   2377 apn-dev-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   1859 apn-dev-key.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   8964 apn-dis-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   4482 apn-dis-key.pem.save
```

3. Run a FortiGuard update, and verify that all certificates are installed again:

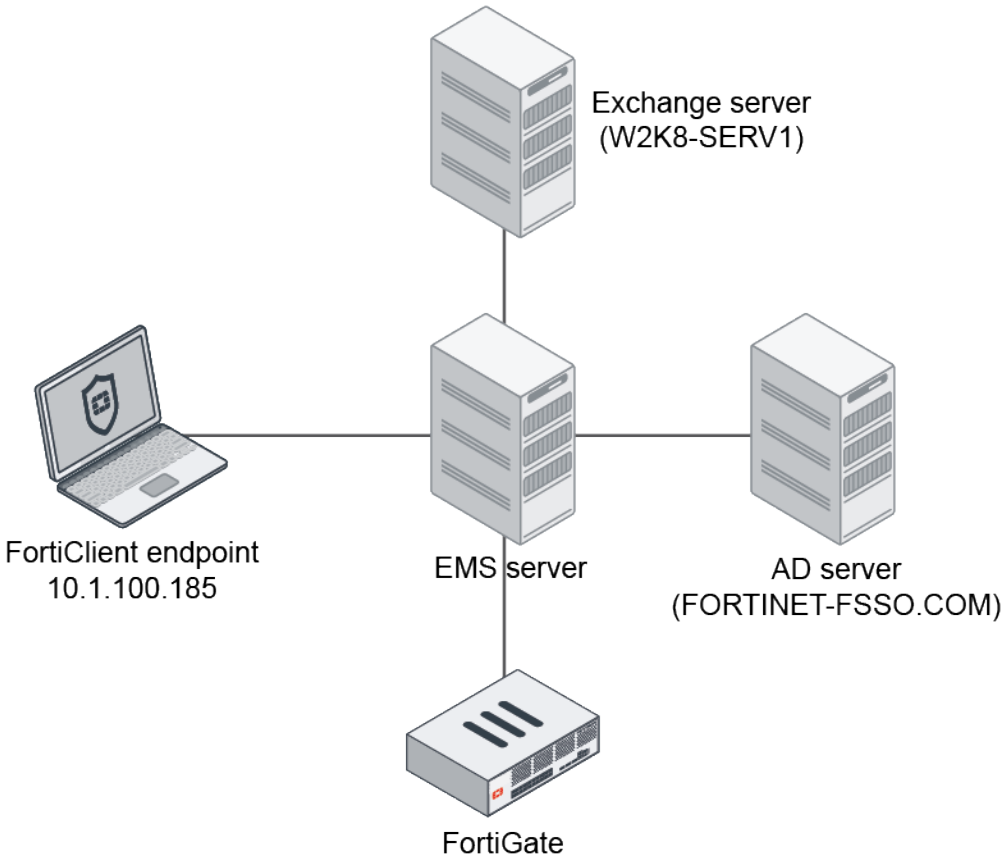
```
/data/etc/apns # ls -al
drwxr-xr-x   2 0  0   Tue Jan 15 08:56:20 2019   1024 .
drwxr-xr-x  12 0  0   Tue Jan 15 08:56:15 2019   2048 ..
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   2377 apn-dev-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   1859 apn-dev-key.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019   2167 apn-dis-cert.pem  <-- downloaded
from FortiGuard
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   8964 apn-dis-cert.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019   1704 apn-dis-key.pem   <-- downloaded
from FortiGuard
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   4482 apn-dis-key.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019     41 apn-version.dat   <-- downloaded
from FortiGuard
/data/etc/apns #
```

Integrate user information from EMS and Exchange connectors in the user store

When a FortiClient endpoint is managed by EMS, logged in user and domain information is shared with FortiOS through the EMS connector. This information can be joined with the Exchange connector to produce more complete user information in the user store.

The `diagnose user-device-store device memory list` command displays detailed device information.

Sample topology



In this example, the FortiClient PC user (test1) logs on to the AD domain (FORTINET-FSSO.COM), which is also the same domain as the Exchange server. The user information is pushed to the EMS server that the user is registered to. The FortiGate synchronizes the information from EMS, and at the same time looks up the user on the Exchange server under the Exchange connector. If the user exists on the Exchange server, additional information is fetched. These details are combined in the user store, which is visible in the *FortiClient* widget in the *Status* dashboard.

To configure the Exchange server:

```
config user exchange
    edit "exchange-140"
        set server-name "W2K8-SERV1"
        set domain-name "FORTINET-FSSO.COM"
        set username "Administrator"
        set password ********
    next
end
```

To configure the EMS server:

```
config endpoint-control fctems
    edit "ems133"
        set server "172.18.62.12"
        set certificate-fingerprint "4F:A6:76:E2:00:4F:A6:76:E2:00:4F:A6:76:E2:00:E0"
```

```
    next
end
```

To view the user information in the GUI:

1. Go to *Dashboard* > *Status*.
2. In the *FortiClient* widget, hover over a device or user name to view the information.

To view the user information in the CLI:

```
# diagnose user-device-store device memory list
...
Record #13:
        device_info
                'ipv4_address' = '10.1.100.185'
                'mac' = '00:0c:29:11:5b:6b'
                'hardware_vendor' = 'VMware'
                'vdom' = 'root'
                'os_name' = 'Microsoft'
                'os_version' = 'Windows 7 Professional Edition, 32-bit Service Pack 1
(build 7601)'
                'hostname' = 'win7-5'
                'unauth_user' = 'Administrator'
                'last_seen' = '1611356490'
                'host_src' = 'forticlient'
                'user_info_src' = 'forticlient'
                'is_forticlient_endpoint' = 'true'
                'unjoined_forticlient_endpoint' = 'false'
                'is_forticlient_unauth_user' = 'true'
                'avatar_source' = 'OS'
                'domain' = 'Fortinet-FSSO.COM'
                'forticlient_id' = '********************************'
                'forticlient_username' = 'Administrator'
                'forticlient_version' = '6.4.2'

                'is_master_device' = 'true'
                'is_detected_interface_role_wan' = 'false'
                'detected_interface_fortitelemetry' = 'true'
                'forticlient_gateway_interface' = 'port10'
                'on_net' = 'true'
                'is_online' = 'true'
```

User Definition

The following topics provide information about user definition:

- User types on page 1337
- Removing a user on page 1337

User types

You can configure FortiOS users in FortiOS or on an external authentication server. The following summarizes user account types and authentication in FortiOS:

User type	Authentication
Local	Username and password must match a user account stored in FortiOS. Authentication by FortiOS security policy.
Remote	Username and password must match a user account stored in FortiOS and on the remote authentication server. FortiOS supports LDAP, RADIUS, and TACACS+ servers.
Authentication server	A FortiOS user group can include user accounts or groups that exist on a remote authentication server.
FSSO	Microsoft Windows or Novell network users can use their network credentials to access resources through FortiOS. You can control access using FSSO user groups that contain Windows or Novell user groups as members.
PKI/peer	Digital certificate holder who authenticates using a client certificate. No password is required unless two-factor authentication is enabled.
IM	FortiOS does not authenticate IM users. FortiOS allows or blocks each IM user from accessing IM protocols. A global policy for each IM protocol governs unknown users' access to these protocols.
Guest	Guest user accounts are temporary. The account expires after a selected period of time. See Guest Management on page 1339.

Removing a user

When a user account is no longer in use, you should delete it. If any configuration objects, such as a user group, reference the user account, you must remove the references before deleting the user.

To remove references to a user:

1. Go to *User & Authentication* > *User Definition*.
2. If the value in the *Ref.* column is not 0, click it.
3. FortiOS displays a list of object references to the user. Use this information to remove these references.

To remove a user using the GUI:

1. Go to *User & Authentication* > *User Definition*.
2. Select the desired user.
3. Click *Delete*, then *OK*.

To remove a user using the CLI:

```
config user local
   delete exampleuser
end
```

User Groups

A user group is a list of users. Security policies and some VPN configurations only allow access to specified user groups. This restricted access enforces role-based access control (RBAC) to your organization's network and resources. Users must be in a group and that group must be part of the security policy.

In most cases, FortiOS authenticates a user by requesting their username and password. FortiOS checks local user accounts first. Then, if it does not find a match, FortiOS checks the RADIUS, LDAP, and TACACS+ servers that belong to the user group. Authentication succeeds when FortiOS finds a matching username and password. If the user belongs to multiple groups on a server, FortiOS matches those groups as well.

FortiOS does not allow username overlap between RADIUS, LDAP, and TACACS+ servers.

Configuring POP3 authentication

FortiOS can authenticate users who have accounts on POP3 or POP3s email servers.

To configure POP3 authentication:

```
config user pop3
   edit pop3_server1
      set server pop3.fortinet.com
      set secure starttls
      set port 110
   next
end
```

To configure a POP3 user group:

A user group can list up to six POP3 servers as members.

```
config user group
   edit pop3_grp
      set member pop3_server1
   next
```

```
end
```

Guest Management

Configuring guest access

A visitor to your premises may need a user account on your network during their stay. If you are hosting a large event, such as a conference, you may need to create many temporary accounts for the attendees. You can create many guest accounts simultaneously using randomly generated user IDs and passwords to reduce your workload for these large events.

The following describes managing guest access:

1. Create one or more guest user groups. All members of a group have the same user ID type, password type, information fields used, and type and time of expiry.
2. Create guest accounts.
3. Use captive portal authentication and select the appropriate guest group.
4. The guest receives an email, SMS message, or printout containing their user ID and password from the FortiOS administrator.
5. The guest logs onto the network using the provided credentials.
6. After the configured expiry time, the credentials are no longer valid.

This configuration consists of the following steps:

1. Add an SMS service.
2. Create a guest management administrator.
3. Create a guest user group.
4. Create guest user accounts.

To add an SMS service:

To send SMS notifications to guest users, add an email to SMS service to your FortiGate using the following commands:

```
config system sms-server
   edit <server-name>
      set mail-server <server-name>
   next
end
```

To create a guest management administrator:

1. Go to *System* > *Administrators*.
2. Click *Create New* > *Administrator*.
3. Enable *Restrict admin to guest account provisioning only*.
4. For *Guest Group*, select the desired guest groups.

To create a guest user group:

The guest group configuration determines the provided fields when you create a guest user account.

1. Go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. For *Type*, select *Guest*.
4. If desired, enable *Batch Guest Account Creation*. When this is enabled, the following is true:
   - User IDs and passwords are auto-generated.
   - User accounts only have the *User ID*, *Password*, and *Expiration* fields. You can only edit the *Expiration* field. If the expiry time is a duration, such as eight hours, the countdown starts at initial login.
   - You can print the account information to provide to the guest. Guests do not receive email or SMS notifications.
5. For *User ID*, select one of the following:

Option	Description
Email	Guest's email address.
Auto Generated	FortiOS creates a random user ID for the guest.
Specify	The administrator assigns a user ID to the guest.

6. For *Password*, select one of the following:

Option	Description
Disable	No password.
Auto Generated	FortiOS creates a random password for the guest.
Specify	The administrator assigns a password to the guest.

7. For *Start Countdown*, select one of the following:

Option	Description
On Account Creation	FortiOS counts expiry time from time of account creation.
After First Login	FortiOS counts expiry time from the guest's first login.

8. For *Time*, configure the expiry time. You can change this for individual users.
9. Configure any other field as required, then click *OK*.

Creating guest user accounts

To create a guest user account:

1. Go to *User & Authentication* > *Guest Management*.
2. Select the desired guest group.
3. Click *Create New*.
4. Configure the guest as desired.
5. Click *OK*.

To create multiple guest user accounts automatically:

1. Go to *User & Authentication* > *Guest Management*.
2. Select the desired guest group. This group must have *Batch Guest Account Creation* enabled.
3. Click *Create New* > *Multiple Users*.

4. Enter the *Number of Accounts*.
5. If desired, change the expiry.
6. Click *OK*.

Retail environment guest access

Businesses such as coffee shops provide free Internet access for customers. In this scenario, you do not need to configure guest management, as customers can access the WiFi access point without logon credentials.

However, consider that the business wants to contact customers with promotional offers to encourage future patronage. You can configure an email collection portal to collect customer email addresses for this purpose. You can configure a security policy to grant network access only to users who provide a valid email address. The first time a customer's device attempts WiFi connection, FortiOS requests an email address, which it validates. The customers' subsequent connections go directly to the Internet without interruption.

This configuration consists of the following steps:

1. Creating an email collection portal on page 1341
2. Creating a security policy on page 1341
3. Checking for harvested emails on page 1342

Creating an email collection portal

The customer's first contact with your network is a captive portal that presents a webpage requesting an email address. When FortiOS has validated the email address, the customer's device MAC address is added to the Collected Emails device group.

This example modifies the `freewifi` WiFi interface to present an email collection captive portal.

To create an email collection portal:

```
config wireless-controller vap
    edit freewifi
        set security captive-portal
        set portal-type email-collect
    next
end
```

Creating a security policy

You must configure a security policy that allows traffic to flow from the WiFi SSID to the internet interface only for members of the Collected Emails device group. This policy must be listed first. Unknown devices are not members of the Collected Emails device group, so they do not match the policy.

To create a security policy:

```
config firewall policy
    edit 3
        set srcintf "freewifi"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
```

```
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set email-collect enable
    next
end
```

Checking for harvested emails

To check for harvested emails in the GUI:

1. Go to *Dashboard* > *Users & Devices*.
2. Hover over the *Device Inventory* widget and click *Expand to Full Screen*.

To check for harvested emails in the CLI:

```
# diagnose user device list
    hosts
      vd 0 d8:d1:aa:aa:69:0f gen 35 req 30 redir 1 last 43634s 7-11_2-int
        ip 10.0.2.101 ip6 fe80::dad2:cbff:feab:610f
        type 2 'iPhone' src http c 1 gen 29
        os 'iPhone' version 'iOS 6.0.1' src http id 358 c 1
        email 'yo@yourdomain.com'
      vd 0 74:e1:bb:bb:69:f9 gen 36 req 20 redir 0 last 39369s 7-11_2-int
        ip 10.0.2.100 ip6 fe80::76e2:b6ff:fedd:69f9
        type 1 'iPad' src http c 1 gen 5
        os 'iPad' version 'iOS 6.0' src http id 293 c 1
        host 'Joes's-iPad' src dhcp
        email 'you@fortinet.com'
```

LDAP Servers

The following topics provide information about LDAP servers:

- Configuring an LDAP server on page 1342
- FSSO polling connector agent installation on page 1344
- Enabling Active Directory recursive search on page 1347
- Configuring LDAP dial-in using a member attribute on page 1348
- Configuring wildcard admin accounts on page 1349
- Configuring least privileges for LDAP admin account authentication in Active Directory on page 1351

Configuring an LDAP server

FortiOS can be configured to use an LDAP server for authentication.

To configure an LDAP server on the FortiGate:

1. Go to *User & Authentication* > *LDAP Servers*.
2. Click *Create New*.
3. Configure the following:

Name	This connection name is for reference within the FortiGate only.
Server IP/Name	LDAP server IP address or FQDN resolvable by the FortiGate.
Server Port	By default, LDAP uses port 389 and LDAPS uses 636. Use this field to specify a custom port if necessary.
Common Name Identifier	Attribute field of the object in LDAP that the FortiGate uses to identify the connecting user. The identifier is case sensitive. Common attributes are: • *cn* (Common Name) • *sAMAccountName* (SAMAccountName) • *uid* (User ID)
Distinguished Name	Used to look up user account entries on the LDAP server. It reflects the hierarchy of LDAP database object classes above the CN identifier in which you are doing the lookup. Enter *dc=COMPANY,dc=com* to specify the root of the domain to include all objects. Enter *ou=VPN-Users,dc=COMPANY,dc=com* to look up users under a specific organization unit.
Exchange server	Enable to specify the exchange server connector to collect information about authenticated users from a corporate exchange server. See Exchange Server connector on page 1849 for more details.
Bind Type	Select one of the following options: • *Simple*: bind using simple password authentication using the client name. The LDAP server only looks up against the distinguished name (DN), but does not search on the subtree. • *Anonymous*: bind using an anonymous user, and search starting from the DN and recurse over the subtrees. Many LDAP servers do not allow this. • *Regular*: bind using the username and password provided, and search starting from the DN and recurse over the subtrees.
Username	If using regular bind, enter a username with sufficient privileges to access the LDAP server. The following formats are supported: • *username\administrator* • *administrator@domain* • *cn=administrator,cn=users,dc=domain,dc=com*
Password	If using regular bind, enter the password associated with the username.
Secure Connection	Enable to apply security to the LDAP connection through STARTTLS or LDAPS.

Protocol	If *Secure Connection* is enabled, select *STARTTLS* or *LDAPS*. Selecting *STARTTLS* changes the port to 389 and selecting *LDAPS* changes the port to 636.
Certificate	Enable and select the certificate so the FortiGate will only accept a certificate from the LDAP server that is signed by this CA.
Server identity check	Enable to verify the server domain or IP address against the server certificate. This option is enabled by default and it is recommended to leave it enabled for a secure configuration.

When specifying a secure connection, there are some considerations for the certificate used by LDAP to secure the connection. The FortiGate checks the certificate presented by the LDAP server for the IP address or FQDN as specified in the *Server IP/Name* field with the following logic:

- If there is a Subject Alternative Name (SAN), it will ignore any Common Name (CN) value and look for a match in any of the SAN fields.
- If there is no SAN, it will check the CN for a match.

4. Optionally, click *Test User Credentials* to ensure that the account has sufficient access rights.
5. Click *OK*.
   The FortiGate checks the connection and updates the *Connection Status*.

FSSO polling connector agent installation

This topic gives an example of configuring a local FSSO agent on the FortiGate. The agent actively pools Windows Security Event log entries on Windows Domain Controller (DC) for user log in information. The FSSO user groups can then be used in a firewall policy.

This method does not require any additional software components, and all the configuration can be done on the FortiGate.

To configure a local FSSO agent on the FortiGate:

1. Configure an LDAP server on the FortiGate on page 1344
2. Configure a local FSSO polling connector on page 1345
3. Add the FSSO groups to a policy on page 1345

Configure an LDAP server on the FortiGate

Refer to Configuring an LDAP server on page 1342. The connection must be successful before configuring the FSSO polling connector.

Configure a local FSSO polling connector

To configure a local FSSO polling connector:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Endpoint/Identity* section, select *Poll Active Directory Server*.
3. Fill in the required information.
4. For *LDAP Server*, select the server you just created.
5. Configure the group settings:
   a. For *Users/Groups*, click *Edit*. The structure of the LDAP tree is shown in the *Users/Groups* window.
   b. Click the *Groups* tab.
   c. Select the required groups, right-click on them, and select *Add Selected*. Multiple groups can be selected at one time by holding the CTRL or SHIFT keys. The groups list can be filtered or searched to limit the number of groups that are displayed.
   d. Click the *Selected* tab and verify that the required groups are listed. To remove a group, right-click and select *Remove Selected*.
   e. Click *OK* to save the group settings.
6. Click *OK* to save the connector settings.
7. Go back to *Security Fabric* > *External Connectors*.
8. There should be two new connectors:

   - The *Local FSSO Agent* is the backend process that is automatically created when the first FSSO polling connector is created.
   - The *Active Directory Connector* is the front end connector that can be configured by FortiGate administrators.

   To verify the configuration, hover the cursor over the top right corner of the connector; a popup window will show the currently selected groups. A successful connection is also shown by a green up arrow in the lower right corner of the connector.

   If you need to get log in information from multiple DCs, then you must configure other Active Directory connectors for each additional DC to be monitored.

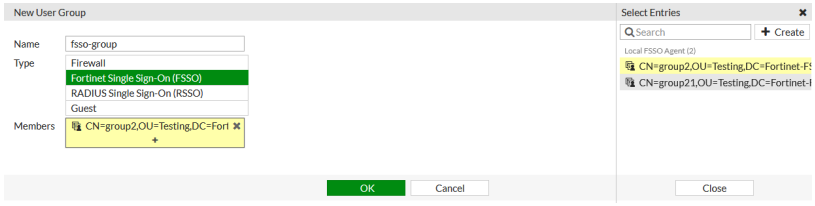
Add the FSSO groups to a policy

FSSO groups can be used in a policy by either adding them to the policy directly, or by adding them to a local user group and then adding the group to a policy.

To add the FSSO groups to a local user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Enter a name for the group in the *Name* field.
3. Set the *Type* to *Fortinet Single Sign-On (FSSO)*.

4. In the *Members* field, click the + and add the FSSO groups.



5. Click *OK*.
6. Add the local FSSO group to a policy.

To add the FSSO groups directly to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. In the *Source* field, click the +. In the *Select Entries* pane, select the *User* tab.
3. Select the FSSO groups.
4. Configure the remaining settings as required.
5. Click *OK*.

Troubleshooting

If an authenticated AD user cannot access the internet or pass the firewall policy, verify the local FSSO user list:

```
# diagnose debug authd fsso list
----FSSO logons----
IP: 10.1.100.188 User: test2 Groups: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM
Workstation: MemberOf: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM
Total number of logons listed: 1, filtered: 0
----end of FSSO logons----
```

1. Check that the group in *MemberOf* is allowed by the policy.
2. If the expected AD user is not in list, but other users are, it means that either:
   - The FortiGate missed the log in event, which can happen if many users log in at the same time, or
   - The user's workstation is unable to connect to the DC, and is currently logged in with cached credentials, so there is no entry in the DC security event log.
3. If there are no users in the local FSSO user list:
   a. Ensure that the local FSSO agent is working correctly:

```
# diagnose debug enable
# diagnose debug authd fsso server-status

Server Name                        Connection Status    Version            Address
-----------                        -----------------    -------            -------
FGT_A (vdom1) # Local FSSO Agent   connected            FSAE server 1.1    127.0.0.1
```

   The connection status must be `connected`.

   b. Verify the Active Directory connection status:

```
# diagnose debug fsso-polling detail 1
AD Server Status (connected):
ID=1, name(10.1.100.131),ip=10.1.100.131,source(security),users(0)
```

```
port=auto username=Administrator
read log eof=1, latest logon timestamp: Fri Jul 26 10:36:20 2019

polling frequency: every 10 second(s) success(274), fail(0)
LDAP query: success(0), fail(0)
LDAP max group query period(seconds): 0
LDAP status: connected

Group Filter: CN=group2,OU=Testing,DC=Fortinet-
FSSO,DC=com+CN=group21,OU=Testing,DC=Fortinet-FSSO,DC=COM
```

If the polling frequency shows successes and failures, that indicates sporadic network problems or a very busy DC. If it indicates no successes or failures, then incorrect credentials could be the issue.

If the LDAP status is connected, then the FortiGate can access the configured LDAP server. This is required for AD group membership lookup of authenticated users because the Windows Security Event log does not include group membership information. The FortiGate sends an LDAP search for group membership of authenticated users to the configure LDAP server.

FortiGate adds authenticated users to the local FSSO user list only if the group membership is one of the groups in `Group Filter`.

4. If necessary, capture the output of the local FortiGate daemon that polls Windows Security Event logs:

```
# diagnose debug application fssod -1
```

This output contains a lot of detailed information which can be captured to a text file.

Limitations

- NTLM based authentication is not supported.
- If there are a large number of user log ins at the same time, the FSSO daemon may miss some. Consider using FSSO agent mode if this will be an issue. See Public and private SDN connectors on page 1774 for information.
- The FSSO daemon does not support all of the security log events that are supported by other FSSO scenarios. For example, only Kerberos log in events 4768 and 4769 are supported.

Enabling Active Directory recursive search

By default, nested groups (groups that are members or other groups) are not searched in Windows Active Directory (AD) LDAP servers because this can slow down the group membership search. There is an option in FortiOS to enable the searching of nested groups for user group memberships on AD LDAP servers.

This option is not available for other LDAP servers, such as OpenLDAP-based servers.

The default behavior does not include nested groups:

```
config user ldap
    edit "ldap-ad"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
```

```
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
    next
end
```

The default search results only show groups that have the user as member, and no groups that have groups as members:

```
diagnose test authserver ldap ldap-ad nuser nuser
    authenticate 'nuser' against 'ldap-ad' succeeded!
    Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
```

To enable recursive search to include nested groups in the results:

```
config user ldap
    edit "ldap-ad"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
        set search-type recursive
    next
end
```

The search results now include groups that have other groups as members:

```
diagnose test authserver ldap ldap-ad nuser nuser
    authenticate 'nuser' against 'ldap-ad' succeeded!
    Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
                          CN=nested2,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=nested1,OU=Testing,DC=Fortinet-FSSO,DC=COM
```

The group nested3 is a member of the group nested2, which is a member of the group nested1.

Configuring LDAP dial-in using a member attribute

In this configuration, users defined in Microsoft AD can set up a VPN connection based on an attribute that is set to `TRUE`, instead of their user group. You can activate the *Allow Dialin* property in AD user properties, which sets the `msNPAllowDialin` attribute to *TRUE*. You can use this procedure for other member attributes as your system requires.

This configuration consists of the following steps:

1. Ensure that the AD server has the `msNPAllowDialin` attribute set to *TRUE* for the desired users.
2. Configure user LDAP member attribute settings.
3. Configure LDAP group settings.
4. Ensure that you configured the settings correctly.

To configure user LDAP member attribute settings:

```
config user ldap
   edit "ldap_server"
      set server "192.168.201.3"
```

```
      set cnid "sAMAccountName"
      set dn "DC=fortilabanz,DC=com,DC=au"
      set type regular
      set username "fortigate@sample.com"
      set password ******
      set member-attr "msNPAllowDialin"
   next
end
```

To configure LDAP group settings:

```
config user group
   edit "ldap_grp"
      set member "ldap_server"
      config match
         edit 1
            set server-name "ldap_server"
            set group-name "TRUE"
         next
      end
   next
end
```

To ensure that you configured the settings correctly:

Users that are members of the `ldap_grp` user group should be able to authenticate. The following shows sample `diagnose debug` output when the `Allow Dial-in` attribute is set to `TRUE`:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='TRUE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Passed group matching
```

If the attribute is not set to `TRUE` but is expected, you may see the following output:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='FALSE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Failed group matching
```

The difference between the two outputs is the last line, which shows passed or failed depending on whether the member attribute is set to the expected value.

Configuring wildcard admin accounts

To avoid setting up individual admin accounts in FortiOS, you can configure an admin account with the wildcard option enabled, allowing multiple remote admin accounts to match one local admin account. This way, multiple LDAP admin accounts can use one FortiOS admin account.

Benefits include:

- Fast configuration of the FortiOS admin account to work with your LDAP network, saving effort and avoiding potential errors incurred when setting up multiple admin accounts
- Reduced ongoing maintenance. As long as LDAP users belong to the same group and you do not modify the wildcard admin account in FortiOS, you do not need to configure changes on the LDAP accounts. If you add or remove a user from the LDAP group, you do not need to perform changes in FortiOS.

Potential issues include:

- Multiple users may be logged in to the same account simultaneously. This may cause issues if both users make changes simultaneously.
- Security is reduced since multiple users have login access to the same account, as opposed to an account for each user.

Wildcard admin configuration also applies to RADIUS. If configuring for RADIUS, configure the RADIUS server and RADIUS user group instead of LDAP. When using the GUI, wildcard admin is the only remote admin account that does not require you to enter a password on account creation. That password is normally used when the remote authentication server is unavailable during authentication.

This example uses default values where possible. If a specific value is not mentioned, the example sets it to its default value.

You can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 1351.

To configure the LDAP server:

The important parts of this configuration are the username and group lines. The username is the domain administrator account. The group binding allows only the GRP group access.

This example uses an example domain name. Configure as appropriate for your own network.

```
config user ldap
   edit "ldap_server"
      set server "192.168.201.3"
      set cnid "sAMAccountName"
      set dn "DC=example,DC=com,DC=au"
      set type regular
      set username "CN=Administrator,CN=Users,DC=example,DC=COM”
      set password *
      set group-member-check group-object
      set group-object-filter (&
           (objectcategory=group)member="CN=GRP,OU=training,DC=example,DC=COM"))
   next
end
```

To configure the user group and add the LDAP server:

```
config user group
   edit "ldap_grp"
      set member "ldap_server"
         config match
                 edit 1
                    set server-name "ldap_server"
                    set group-name "CN=GRP,OU=training,DC=example,DC=COM"
```

```
                next
             end
          next
       end
    end
 end
end
```

To configure the wildcard admin account:

```
config system admin
   edit "test"
      set remote-auth enable
      set accprofile "super_admin"
      set wildcard enable
      set remote-group "ldap_grp"
   next
end
```

Configuring least privileges for LDAP admin account authentication in Active Directory

An administrator should only have sufficient privileges for their role. In the case of LDAP admin bind, you can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups.

For information about Active Directory, see the product documentation.

To configure account privileges for LDAP authentication in Active Directory:

1. In the *Active Directory Users and Computers* administrative console, right-click the Organizational Unit (OU) or the top-level domain you want to configure and select *Delegate Control*.
2. In the *Delegation of Control Wizard* dialog, click *Next*.
3. In the *Users or Groups* dialog, click *Add...* and search Active Directory for the users or groups.
4. Click *OK* and then click *Next*.
5. In the *Tasks to Delegate* dialog, select *Create a custom task to delegate* and click *Next*.
6. Select *Only the following objects in the folder* and scroll to the bottom of the list. Select *User objects* and click *Next*.
7. In the *Permissions* dialog, select *General*.
8. From the *Permissions* list, select the following:
   - *Change password*
   - *Reset password*
9. Clear the *General* checkbox and select *Property-specific*.
10. From the *Permissions* list, select the following:
    - *Write lockoutTime*
    - *Read lockoutTime*
    - *Write pwdLastSet*
    - *Read pwdLastSet*
    - *Write UserAccountControl*
    - *Read UserAccountControl*

11. Click *Next* and click *Finish*.

RADIUS Servers

Topics about RADIUS servers include the following:

- Configuring RADIUS SSO authentication on page 1352
- RSA ACE (SecurID) servers on page 1358
- Support for Okta RADIUS attributes filter-Id and class on page 1363
- Send multiple RADIUS attribute values in a single RADIUS Access-Request on page 1364
- Traffic shaping based on dynamic RADIUS VSAs on page 1365

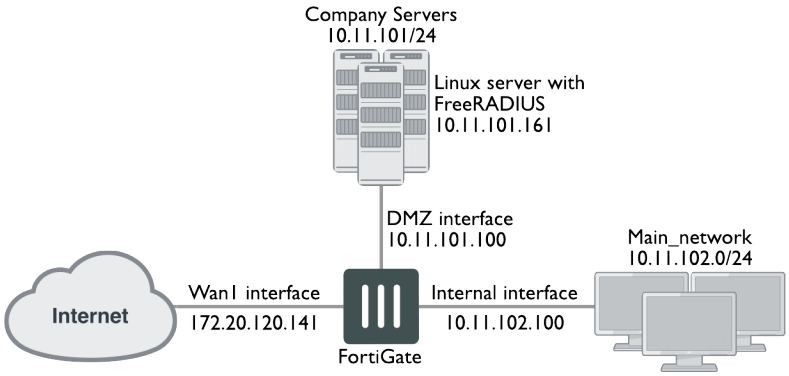
Configuring RADIUS SSO authentication

A common RADIUS SSO (RSSO) topology involves a medium-sized company network of users connecting to the Internet through the FortiGate and authenticating with a RADIUS server. The following describes how to configure FortiOS for this scenario. The example makes the following assumptions:

- VDOMs are not enabled.
- The super_admin account is used for all FortiGate configuration.
- A RADIUS server is installed on a server or FortiAuthenticator and uses default attributes.
- BGP is used for any dynamic routing.
- You have configured authentication event logging under *Log & Report*.

Example.com has an office with 20 users on the internal network who need access to the Internet. The office network is protected by a FortiGate-60C with access to the Internet through the wan1 interface, the user network on the internal interface, and all servers are on the DMZ interface. This includes an Ubuntu sever running FreeRADIUS. This example configures two users:

User	Account
Pat Lee	plee@example.com
Kelly Green	kgreen@example.com



Configuring this example consists of the following steps:

1. Configure RADIUS.
2. Configure FortiGate interfaces.
3. Configure a RSSO agent.
4. Create a RSSO user group.
5. Configure security policies.
6. Test the configuration.

To configure RADIUS:

Configuring RADIUS includes configuring a RADIUS server such as FreeRADIUS on user's computers and configuring users in the system. In this example, Pat and Kelly belong to the exampledotcom_employees group. After completing the configuration, you must start the RADIUS daemon. The users have a RADIUS client installed on their PCs that allow them to authenticate through the RADIUS server.

For any problems installing FreeRADIUS, see the FreeRADIUS documentation.

To configure FortiGate interfaces:

You must define a DHCP server for the internal network, as this network type typically uses DHCP. The wan1 and dmz interfaces are assigned static IP addresses and do not need a DHCP server. The following table shows the FortiGate interfaces used in this example:

Interface	Subnet	Act as DHCP server	Devices
wan1	172.20.120.141	No	Internet service provider
dmz	10.11.101.100	No	Servers including RADIUS server
internal	10.11.102.100	Yes: x.x.x.110-250	Internal user network

1. Go to *Network* > *Interfaces*.
2. Edit wan1:

Alias	Internet
Addressing Mode	Manual
IP/Network Mask	172.20.120.141/255.255.255.0
Administrative Access	HTTPS, SSH
Enable DHCP Server	Not selected
Comments	Internet
Administrative Status	Up

3. Click *OK*.
4. Edit dmz:

Alias	Servers
Addressing Mode	Manual

IP/Network Mask	10.11.101.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING, SNMP
Enable DHCP Server	Not selected
Listen for RADIUS Accounting Messages	Select
Comments	Servers
Administrative Status	Up

5. Click *OK*.
6. Edit internal:

Alias	Internal network
Addressing Mode	Manual
IP/Network Mask	10.11.102.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING
Enable DHCP Server	Select
Address Range	10.11.102.110 - 10.11.102.250
Netmask	255.255.255.0
Default Gateway	Same as Interface IP
Comments	Internal network
Administrative Status	Up

To create a RADIUS SSO agent:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. Under *Endpoint/Identity*, select *RADIUS Single Sign-On Agent*.
4. Enable *Use RADIUS Shared Secret*. Enter the RADIUS server's shared secret.
5. Enable *Send RADIUS Responses*. Click *OK*.

To create a RADIUS SSO user group:

1. Go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. For *Type*, select *RADIUS Single Sign-On (RSSO)*.
4. In *RADIUS Attribute Value*, enter the name of the RADIUS user group that this local user group represents.
5. Click *OK*.

Configuring security policies

The following security policies are required for RADIUS SSO:

Sequence Number	From	To	Type	Schedule	Description
1	internal	wan1	RADIUS SSO	Business hours	Authenticate outgoing user traffic
2	internal	wan1	Regular	Always	Allow essential network services and VoIP
3	dmz	wan1	Regular	Always	Allow servers to access the Internet
4	internal	dmz	Regular	Always	Allow users to access servers
5	any	any	Deny	Always	Implicit policy denying all traffic that has not been matched

You must place the RADIUS SSO policy at the top of the policy list so that it is matched first. The only exception to this is if you have a policy to deny access to a list of banned users. In this case, you must put that policy at the top so that the RADIUS SSO does not mistakenly match a banned user or IP address.

You must configure lists before creating security policies.

Schedule

You must configure a business_hours schedule. You can configure a standard Monday to Friday 8 AM to 5 PM schedule, or whatever days and hours covers standard work hours at the company.

Address groups

You must configure the following address groups:

Name	Interface	Address range included
internal_network	internal	10.11.102.110 to 10.11.102.250
company_servers	dmz	10.11.101.110 to 10.11.101.250

Service groups

You must configure the service groups. The services listed are suggestions and you may include more or less as required:

Name	Interface	Description of services to be included
essential_network_services	internal	Any network protocols required for normal network operation such as DNS, NTP, BGP

Name	Interface	Description of services to be included
essential_server_services	dmz	All the protocols required by the company servers such as BGP, HTTP, HTTPS, FTP, IMAP, POP3, SMTP, IKE, SQL, MYSQL, NTP, TRACEROUTE, SOCKs, and SNMP
user_services	internal	Any protocols required by users such as HTTP, HTTPS, FTP

The following security policy configurations are basic and only include logging and default AV and IPS. These policies allow or deny access to non-RADIUS SSO traffic. These are essential as network services including DNS, NTP, and FortiGuard require access to the Internet.

To configure security policies:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Configure the policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_network_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	ON
Comments	Essential network services

4. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	dmz
Source Address	company_servers
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_server_services

Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Company servers accessing the Internet

5. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	dmz
Destination Address	company_servers
Schedule	always
Service	all
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Access company servers

6. Click *Create New*, and configure the RADIUS SSO policy as follows, then click *OK*. This policy allows access for members of specific RADIUS groups.

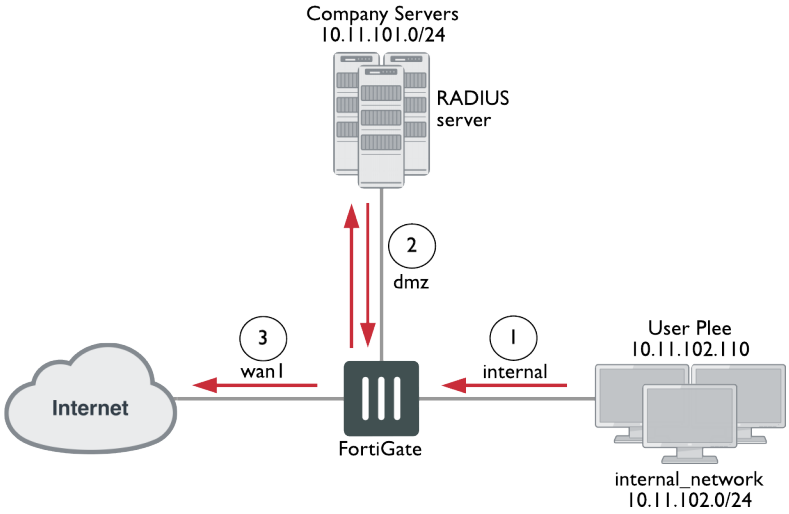
Incoming Interface	Internal
Source Address	internal_network
Source User(s)	Select the user groups that you created for RSSO.
Outgoing Interface	wan1
Destination Address	all
Schedule	business_hours
Service	ALL
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, Web Filter, IPS, and Email Filter. In each case, select the default profile.

7. Place the RSSO policy higher in the security policy list than more general policies for the same interfaces. Click *OK*.

To test the configuration:

Once configured, a user only needs to log in to their PC using their RADIUS account. After that, when they attempt to access the Internet, the FortiGate uses their session information to get their RADIUS information. Once the user is verified, they can access the website.

1. The user logs on to their PC and tries to access the Internet.
2. The FortiGate contacts the RADIUS server for the user's information. Once confirmed, the user can access the Internet. Each step generates logs that enable you to verify that each step succeeded.
3. If a step does not succeed, confirm that your configuration is correct.



RSA ACE (SecurID) servers

SecurID is a two-factor system produced by the company RSA that uses one-time password (OTP) authentication. This system consists of the following:

- Portable tokens that users carry
- RSA ACE/Server
- Agent host (the FortiGate)

When using SecurID, users carry a small device or "token" that generates and displays a pseudo-random password. According to RSA, each SecurID authenticator token has a unique 64-bit symmetric key that is combined with a powerful algorithm to generate a new code every 60 seconds. The token is time-synchronized with the SecurID RSA ACE/Server.

The RSA ACE/Server is the SecurID system's management component. It stores and validates the information about the SecurID tokens allowed on your network. Alternately, the server can be an RSA SecurID 130 appliance.

The agent host is the server on your network. In this case, this is the FortiGate, which intercepts user logon attempts. The agent host gathers the user ID and password entered from the SecurID token and sends the information to the RSA ACE/Server for validation. If valid, the RSA ACE/Server returns a reply indicating that it is a valid logon and FortiOS allows the user access to the network resources specified in the associated security policy.

Configuring SecurID with FortiOS consists of the following:

1. Configure the RSA and RADIUS servers to work with each other. See RSA server documentation.
2. Do one of the following:
   a. Configure the RSA SecurID 130 appliance.
   b. Configure the FortiGate as an agent host on the RSA ACE/Server.
3. Configure the RADIUS server in FortiOS.
4. Create a SecurID user group.
5. Create a SecurID user.
6. Configure authentication with SecurID.

The following instructions are based on RSA ACE/Server 5.1 and RSA SecurID 130 appliance. They assume that you have successfully completed all external RSA and RADIUS server configuration.

In this example, the RSA server is on the internal network and has an IP address of 192.128.100.000. The FortiOS internal interface address is 192.168.100.3. The RADIUS shared secret is fortinet123, and the RADIUS server is at IP address 192.168.100.202.

To configure the RSA SecurID 130 appliance:

1. Log on to the SecurID IMS console.
2. Go to *RADIUS* > *RADIUS clients*, then select *Add New*.

Setting	Description
RADIUS Client Basics	
Client Name	FortiGate
Associated RSA Agent	FortiGate
RADIUS Client Settings	
IP Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
Make / Model	Select *Standard Radius*.
Shared Secret	Enter the RADIUS shared secret. In this example, it is fortinet123.
Accounting	Leave unselected.
Client Status	Leave unselected.

3. Configure your FortiGate as a SecurID client:
4. Click *Save*.

To configure the FortiGate as an agent host on the RSA ACE/Server:

1. On the RSA ACE/Server, go to *Start* > *Programs* > *RSA ACE/Server*, then *Database Administration - Host Mode*.
2. From the *Agent Host* menu, select *Add Agent Host*.
3. Configure the following:

Setting	Description
Name	FortiGate

Setting	Description
Network Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
Secondary Nodes	You can optionally enter other IP addresses that resolve to the FortiGate.

For more information, see the RSA ACE/Server documentation.

To configure the RADIUS server in FortiOS:

1. Go to *User & Authentication* > *RADIUS Servers*, then click *Create New*.
2. Configure the following:

Setting	Description
Name	RSA
Authentication method	Select *Default*.
Primary Server	
IP/Name	192.168.100.102. You can click *Test* to ensure the IP address is correct and that FortiOS can contact the RADIUS server.
Secret	fortinet123

3. Click *OK*.

To create a SecurID user group:

1. Go to *User & Authentication* > *User Groups*. Click *Create New*.
2. Configure the following:

Setting	Description
Name	RSA_group
Type	Firewall

3. In *Remote Groups*, click *Add*, then select the RSA server.
4. Click *OK*.

To create a SecurID user:

1. Go to *User & Authentication* > *User Definition*. Click *Create New*.
2. Configure the following:

Setting	Description
User Type	Remote RADIUS User
Type	wloman
RADIUS Server	RSA

Setting	Description
Contact Info	(Optional) Enter email or SMS information.
User Group	RSA_group

3. Click *Create*.

You can test the configuration by entering the `diagnose test authserver radius RSA auto wloman 111111111` command. The series of 1s is the OTP that your RSA SecurID token generates that you enter for access.

Configuring authentication with SecurID

You can use the SecurID user group in several FortiOS features that authenticate by user group:

- Security policy on page 1361
- IPsec VPN XAuth on page 1362
- PPTP VPN on page 1362
- SSL VPN

Unless stated otherwise, the following examples use default values.

Security policy

The example creates a security policy that allows HTTP, FTP, and POP3 traffic from the internal interface to WAN1. If these interfaces are not available in FortiOS, substitute other similar interfaces.

To configure a security policy with SecurID authentication:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.

3. Configure the following:

Setting	Description
Incoming Interface	internal
Source Address	all
Source User(s)	RSA_group
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	HTTP, FTP, POP3
Action	ACCEPT
NAT	On
Shared Shaper	If you want to limit traffic or guarantee minimum bandwidth for traffic that uses the SecurID security policy, enable and use the default shaper, guarantee-100kbps.
Log Allowed Traffic	Enable if you want to generate usage reports on traffic that this policy has authenticated.

4. Click *OK*.

IPsec VPN XAuth

In *VPN* > *IPsec Wizard*, select the SecurID user group on the *Authentication* page. The SecurID user group members must enter their SecurID code to authenticate.

PPTP VPN

When configuring PPTP in the CLI, set `usrgrp` to the SecurID user group.

SSL VPN

You must map the SecurID user group to the portal that will serve SecurID users and include the SecurID user group in the security policy's *Source User(s)* field.

To map the SecurID group to an SSL VPN portal:

1. Go to *VPN* > *SSL-VPN Settings*.
2. Under *Authentication/Portal Mapping*, click *Create New*.

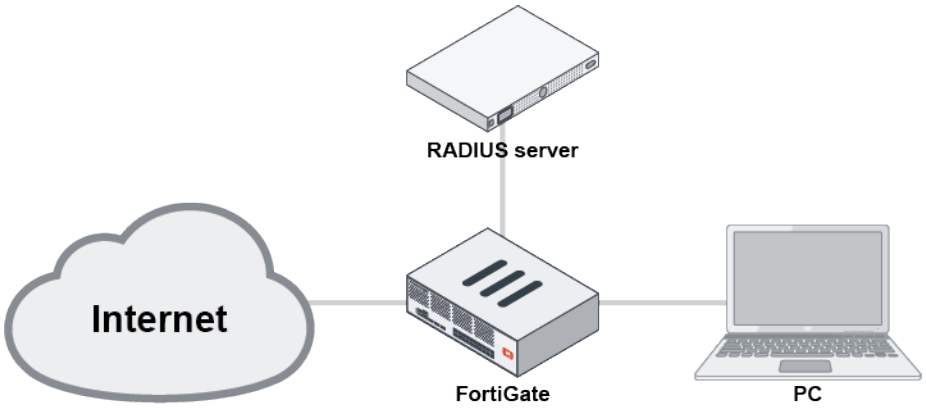
3. Configure the following:

Setting	Description
Users/Groups	RSA_group
Portal	Select the desired portal.

4. Click *OK*.

Support for Okta RADIUS attributes filter-Id and class

RADIUS user group membership information can be returned in the filter-Id (11) and class (25) attributes in RADIUS Access-Accept messages. The group membership information can be used for group matching in FortiGate user groups in firewall policies and for FortiGate wildcard administrators with remote RADIUS authentication.



In this example, a FortiAuthenticator is used as the RADIUS server. A local RADIUS user on the FortiAuthenticator is configure with two groups in the filter-Id attribute: *okta-group1* and *okta-group2*.

To create the RADIUS user and set the attribute type to override group information:

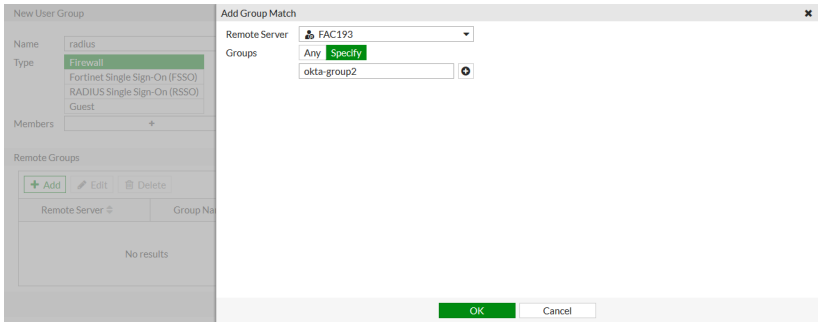
```
config user radius
    edit "FAC193"
        set server "10.1.100.189"
        set secret **********
        set group-override-attr-type filter-Id
    next
end
```

FortiOS will only use the configured filter-Id attribute, even if the RADIUS server sends group names in both class and filter-id attributes. To return group membership information from the class attribute instead, set `group-override-attr-type` to `class`.

To configure group match in the user group:

1. Go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group, and set *Type* to *Firewall*.
4. In the *Remote Groups* table, click *Add*.

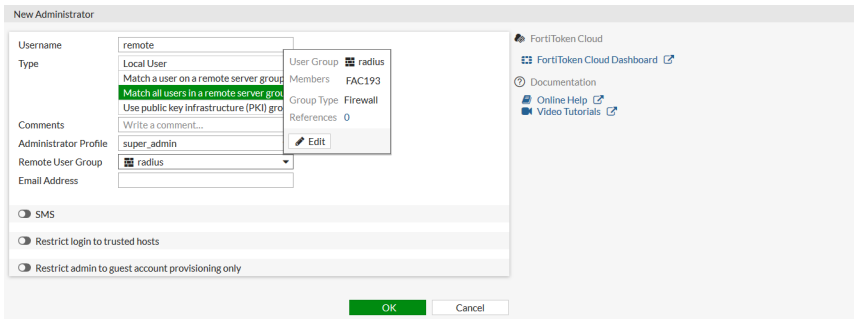
5. Set *Remote Server* to the just created RADIUS server, *FAC193*.
6. Set *Groups* to *Specify*, and enter the group name, `okta-group2`. The string must match the group name configured on the RADIUS server for the filter-Id attribute.



7. Click *OK*.
   The remote server is added to the *Remote Groups* table.
8. Click *OK*.
9. Add the new user group to a firewall policy and generate traffic on the client PC that requires firewall authentication, such as connecting to an external web server.
10. After authentication, on the FortiGate, verify that traffic is authorized in the traffic log:
    a. Go to *Log & Report* > *Forward Traffic*.
    b. Verify that the traffic was authorized.

To use the remote user group with group match in a system wildcard administrator configuration:

1. Go to *System* > *Administrators*.
2. Edit an existing administrator, or create a new one.
3. Set *Type* to *Match all users in a remote server group*.
4. Set *Remote User Group* to the remote server.



5. Configure the remaining settings as required.
6. Click *OK*.
7. Log in to the FortiGate using the remote user credentials on the RADIUS server.
   If the correct group name is returned in the filter-Id attribute, administrative access is allowed.

Send multiple RADIUS attribute values in a single RADIUS Access-Request

A managed FortiSwitch can be configured to send multiple RADIUS attribute values in a single RADIUS Access-Request. This option is configured per RADIUS user, and is set to `none` by default.

The available service type options are:

login	User should be connected to a host.
framed	User use Framed Protocol.
callback-login	User disconnected and called back.
callback-framed	User disconnected and called back, then a Framed Protocol.
outbound	User granted access to outgoing devices.
administrative	User granted access to the administrative unsigned interface.
nas-prompt	User provided a command prompt on the NAS.
authenticate-only	Authentication requested, and no authentication information needs to be returned.
callback-nas-prompt	User disconnected and called back, then provided a command prompt.
call-check	Used by the NAS in an Access-Request packet, Access-Accept to answer the call.
callback-administrative	User disconnected and called back, granted access to the admin unsigned interface.

To configure a managed FortiSwitch to the RADIUS attributes login, framed, and authenticate-only all at the same time:

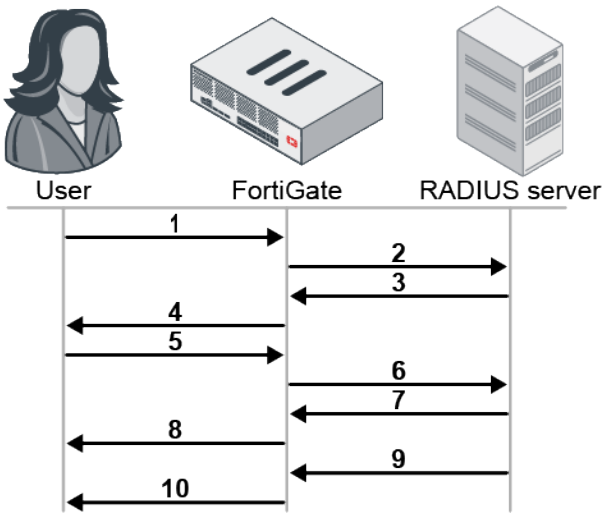
```
config user radius
    edit "Radius_Server"
        set switch-controller-service-type login framed authenticate-only
        ....
    next
end
```

Traffic shaping based on dynamic RADIUS VSAs

A FortiGate can use the WISPr-Bandwidth-Max-Down and WISPr-Bandwidth-Max-Up dynamic RADIUS VSAs (vendor-specific attributes) to control the traffic rates permitted for a certain device. The FortiGate can apply different traffic shaping to different users who authenticate with RADIUS based on the returned RADIUS VSA values. When the same user logs in from an additional device, the RADIUS server will send a CoA (change of authorization) message to update the bandwidth values to 1/*N* of the total values, where *N* is the number of logged in devices from the same user.

This feature is not supported on NP hardware. NP offloading is automatically disabled on the policy if this feature is enabled.

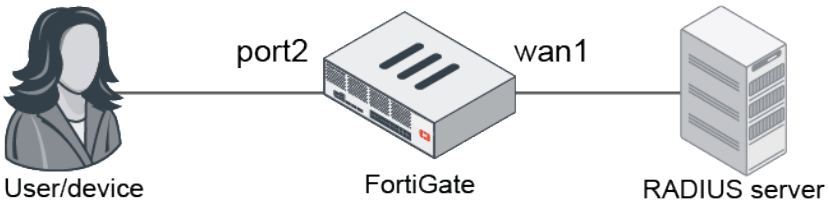
When a user logs in to two devices through RADIUS authentication. The authentication and authorization flow is as follows:



1. The user logs in to a device and the authentication is sent to the FortiGate.
2. The FortiGate sends the Access-Request message to the RADIUS server.
3. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs.
4. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds based on its IP.
5. The user logs in to a second device and the authentication is sent to the FortiGate.
6. The FortiGate sends the Access-Request message to the RADIUS server.
7. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs at half the value from the first device.
8. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds on the second device based on its IP.
9. The RADIUS server sends a CoA message and returns WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs for the first device at half the value.
10. Based on the VSA values, the FortiGate updates traffic shaping for the upload and download speeds on the first device based on its IP.

Example

In this example, the FortiGate is configured to dynamically shape user traffic based on the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs returned by the RADIUS server when the user logs in through firewall authentication.



To configure traffic shaping based on dynamic RADIUS VSAs:

1. Configure the RADIUS server users file to identify WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down:

The WISPr-Bandwidth is measured in bps, and the FortiOS dynamic shaper is measured in Bps.

```
WISPr-Bandwidth-Max-Up = 1004857,
WISPr-Bandwidth-Max-Down = 504857,
```

2. In FortiOS, configure the RADIUS server:

```
config user radius
    edit "rad1"
        set server "172.16.200.44"
        set secret ************
        set radius-coa enable
        set acct-all-servers enable
        config accounting-server
            edit 1
                set status enable
                set server "172.16.200.44"
                set secret ************
            next
        end
    next
end
```

3. Configure the RADIUS user group:

```
config user group
    edit "group_radius"
        set member "rad1"
    next
end
```

4. Configure the firewall policy with dynamic shaping and the RADIUS group:

```
config firewall policy
    edit 2
        set srcintf "port2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all6"
        set dstaddr6 "all6"
        set action accept
        set schedule "always"
        set service "ALL"
        set dynamic-shaping enable
        set groups "group_radius"
        set nat enable
    next
end
```

Verification

After a client PC is authenticated by the RADIUS server, dynamic shaping is applied to the client based on the IP address.

Use the following commands to monitor the dynamic shaper:

```
# diagnose firewall shaper dynamic-shaper stats
```

```
# diagnose firewall shaper dynamic-shaper list {ip | ipv6 | user} <address or username>
```

Use case 1

User1 is paying for rate plan A that limits their maximum bandwidth to 10 Mbps download and 5 Mbps upload. User2 is paying for rate plan B that limits their maximum bandwidth to 5 Mbps download and 5 Mbps upload. The speeds in both plans are provided by best effort, so there is no guaranteed minimum bandwidth.

User1 logs in to pc1 with RADIUS authentication and IP-based dynamic shaping is applied. User2 logs in to pc2 with RADIUS authentication and IP-based dynamic shaping is applied.

To verify the dynamic shaping:

1. On pc1, verify the bandwidth and transfer speed:

```
root@pc1:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
------------------------------------------------------------
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size:  208 KByte (default)
------------------------------------------------------------
[  3] local 10.1.100.11 port 50510 connected with 172.16.200.44 port 5001
[ ID] Interval       Transfer     Bandwidth
[  3]  0.0-25.0 sec  59.6 MBytes  20.0 Mbits/sec
[  3] Sent 42518 datagrams
[  3] Server Report:
[  3]  0.0-25.3 sec  30.1 MBytes  9.99 Mbits/sec  15.651 ms 21058/42518 (50%)
```

2. On pc2, verify the bandwidth and transfer speed:

```
root@pc2:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
------------------------------------------------------------
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size:  208 KByte (default)
------------------------------------------------------------
[  3] local 10.1.100.22 port 52814 connected with 172.16.200.44 port 5001
[ ID] Interval       Transfer     Bandwidth
[  3]  0.0-25.0 sec  59.6 MBytes  20.0 Mbits/sec
[  3] Sent 42518 datagrams
[  3] Server Report:
[  3]  0.0-25.3 sec  15.1 MBytes  5.03 Mbits/sec  15.652 ms 31710/42514 (75%)
```

3. In FortiOS, check the authentication list:

```
# diagnose firewall auth  list
10.1.100.11, test-shaper1
        src_mac: **:**:**:**:**:**
```

```
        type: fw, id: 0, duration: 38, idled: 16
        expire: 562
        flag(814): hard radius no_idle
        server: rad1
        packets: in 8207 out 3999, bytes: in 12306164 out 226963
        group_id: 3
        group_name: group_radius
10.1.100.22, test-shaper2
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 24, idled: 24
        expire: 156, max-life: 35976
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 5, bytes: in 0 out 300
        group_id: 3
        group_name: group_radius
----- 2 listed, 0 filtered ------
```

4. Check the dynamic shaper list:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 1237072 Bps/0 Bps
allow packets(original/reply): 38524/14
allow bytes(original/reply): 55270378/11285
drop packets(original/reply): 10136/0
drop bytes(original/reply): 13516198/0
life: 441
idle: 0/40
idle time limit: 600 s

addr: 10.1.100.22
bandwidth(original/reply): 625000 Bps/625000 Bps
current bandwidth(original/reply): 622909 Bps/0 Bps
allow packets(original/reply): 3232/3
allow bytes(original/reply): 4841536/243
drop packets(original/reply): 2753/0
drop bytes(original/reply): 4123994/0
life: 10
idle: 0/10
idle time limit: 36000 s
```

5. Check the session list:

```
# diagnose sys session list
session info: proto=6 proto_state=05 duration=3 expire=116 timeout=3600 flags=00000004
socktype=4 sockport=10001 av_idx=0 use=4

user group(1): 3
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] helper:auto
```

Use case 2

A user logs in to a device (pc1, 10.1.100.11) and has a maximum bandwidth of 10 Mbps download and 5 Mbps upload. The same user logs in to a second device (pc2, 10.1.100.22) and the RADIUS server sends a CoA request with the

WISPr-Bandwidth-Max to pc1. The maximum bandwidth on pc1 changes to 5 Mbps download and 2.5Mbps upload. On pc2, the maximum bandwidth is also 5 Mbps download and 2.5Mbps upload.

When the user logs out from pc1, the RADIUS server sends CoA request with the new WISPr-Bandwidth-Max for pc2. The FortiGate updates the authentication user list and dynamic shaper for pc2. The maximum bandwidth on pc2 changes to 10 Mbps download and 5 Mbps upload.

To verify the dynamic shaping:

1. Check the dynamic shaper list after the user logs in to pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 491
idle: 4/4
idle time limit: 86400 s
```

2. Check the dynamic shaper list after the user logs in to pc2:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 652
idle: 5/5
idle time limit: 600 s

addr: 10.1.100.22
bandwidth(original/reply): 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 3
idle: 3/3
idle time limit: 86400 s
```

3. Check the authentication list:

```
# diagnose firewall auth list
10.1.100.11, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 171, idled: 11
        expire: 589, max-life: 589
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
```

```
        group_id: 15
        group_name: group_radius
10.1.100.22, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 9, idled: 9
        expire: 86391
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 15
        group_name: group_radius
----- 2 listed, 0 filtered ------
```

4. Check the dynamic shaper list after the user logs out from pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.22
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 414
idle: 9/9
idle time limit: 600 s
```

5. Check the authentication list again:

```
# diagnose firewall auth  list
10.1.100.22, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 453, idled: 49
        expire: 551, max-life: 551
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 15
        group_name: group_radius
----- 1 listed, 0 filtered ------
```

TACACS+ servers

TACACS+ is a remote authentication protocol that provides access control for routers, network access servers, and other network devices through one or more centralized servers.

FortiOS sends the following proprietary TACACS+ attributes to the TACACS+ server during authorization requests:

Attribute	Description
service=<name>	User must be authorized to access the specified service.
memberof	Group that the user belongs to.
admin_prof	Administrator profile (admin access only).

Only `memberof` and `admin_prof` attributes are parsed in authentication replies.

You can configure up to ten remote TACACS+ servers in FortiOS. You must configure at least one server before you can configure remote users.

A TACACS+ server must first be added in the CLI to make the option visible in the GUI.

To configure TACACS+ authentication in the CLI:

1. Configure the TACACS+ server entry:

```
config user tacacs+
    edit "TACACS-SERVER"
        set server <IP address>
        set key <string>
        set authen-type ascii
        set source-ip <IP address>
    next
end
```

2. Configure the remote user group:

```
config user group
    edit "TACACS-GROUP"
        set group-type firewall
        set member "TACACS-SERVER"
    next
end
```

3. Configure the remote user:

```
config system admin
    edit TACACS-USER
        set remote-auth enable
        set accprofile "super_admin"
        set vdom "root"
        set wildcard enable
        set remote-group "TACACS-GROUP"
    next
end
```

To configure a TACACS+ server in the GUI:

1. Go to *User & Authentication* > *TACACS+ Servers*.
2. Click *Create New*.

3. Configure the following settings:

Name	Enter the TACACS+ server name.
Authentication Type	Select the authentication type used for the TACACS+ server. Selecting *Auto* tries PAP, MSCHAP, and CHAP, in that order.
Server IP/Name	Enter the domain name or IP address for the primary server.
Server Secret	Enter the key to access the primary server.

4. Click *OK*.

SAML

The following topics provide information about SAML:

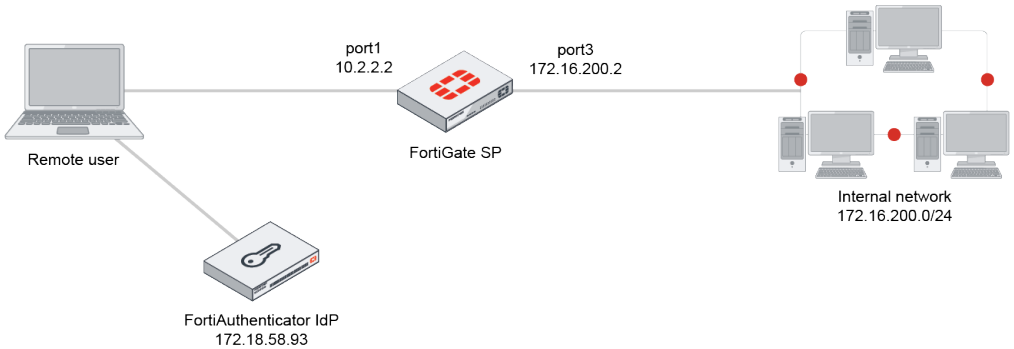
- Outbound firewall authentication for a SAML user on page 1374
- SAML SP for VPN authentication on page 1376
- SAML authentication in a proxy policy on page 1378

Outbound firewall authentication for a SAML user

When you configure a FortiGate as a service provider (SP), you can create an authentication profile that uses SAML for firewall authentication.

You must use the identity provider's (IdP) remote certificate on the SPs.

The following example uses a FortiGate as an SP and FortiAuthenticator as the IdP server:



To configure firewall authentication:

1. Configure the FortiGate SP to be a SAML user:

```
config user saml
    edit "fac-firewall"
        set entity-id "http://10.2.2.2:1000/saml/metadata/"
        set single-sign-on-url "https://10.2.2.2:1003/saml/login/"
        set single-logout-url "https://10.2.2.2:1003/saml/logout/"
        set idp-entity-id "http://172.18.58.93:443/saml-idp/bbbbbb/metadata/"
        set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/bbbbbb/login/"
        set idp-single-logout-url "https://172.18.58.93:443/saml-idp/bbbbbb/logout/"
        set idp-cert "REMOTE_Cert_3"
        set user-name "username"
        set group-name "group"
    next
end
```

2. Add the SAML user to the user group (optionally, you can configure group matching):

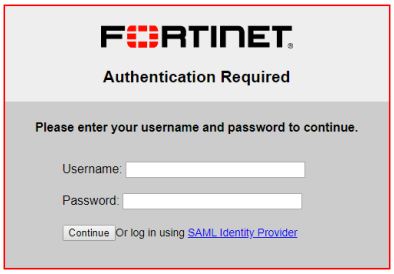
```
config user group
    edit "saml_firewall"
        set member "fac-firewall"
        config match
            edit 1
                set server-name "fac-firewall"
                set group-name "user_group1"
            next
        end
    next
end
```

3. Add the SAML user group to a firewall policy:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "pc4"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set fsso disable
        set groups "saml_firewall" "group_local"
        set users "first"
        set nat enable
    next
end
```

4. Configure the FortiAuthenticator IdP as needed.

5. Run HTTP/HTTPS authentication for a remote user. The SAML login page appears:



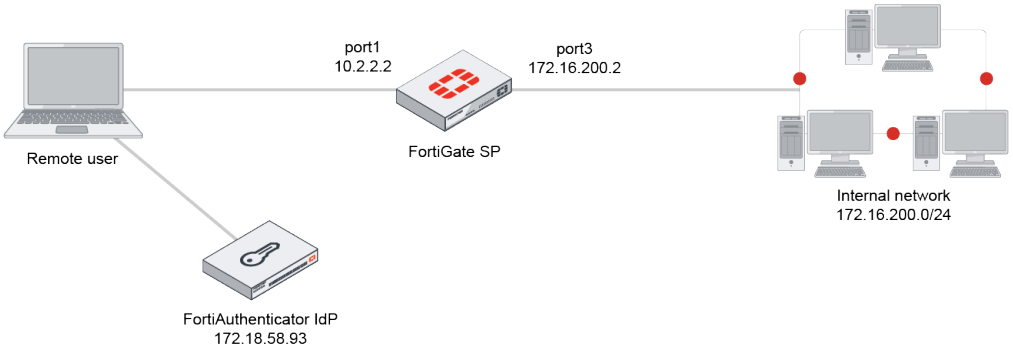
SAML SP for VPN authentication

When you configure a FortiGate as a service provider (SP), you can create an authentication profile that uses SAML for SSL VPN web portal authentication.

You can use SAML with FortiClient for SSL VPN tunnel authentication. The following licensed versions are required for this functionality:

- FortiClient (Windows) 6.4.0
- FortiClient (macOS) 6.4.1
- FortiClient (Linux) 6.4.1

The following example uses a FortiGate as an SP and FortiAuthenticator as the IdP server:



To configure SSL VPN web portal authentication:

1. Configure the FortiGate SP to be a SAML user:

```
config user saml
    edit "fac-sslvpn"
        set entity-id "https://10.2.2.2:10443/remote/saml/metadata/"
        set single-sign-on-url "https://10.2.2.2:10443/remote/saml/login/"
        set single-logout-url "https://10.2.2.2:10443/remote/saml/logout/"
        set idp-entity-id "http://172.18.58.93:443/saml-idp/ssssss/metadata/"
        set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/ssssss/login/"
        set idp-single-logout-url "https://172.18.58.93:443/saml-idp/ssssss/logout/"
        set idp-cert "REMOTE_Cert_3"
        set user-name "username"
    next
end
```

2. Add the SAML user to the user group (group matching may also be configured):

```
config user group
    edit "saml_sslvpn"
        set member "fac-sslvpn"
    next
end
```

3. Configure SSL VPN:

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "port3"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "saml_sslvpn"
            set portal "full-access"
        next
    end
end
```

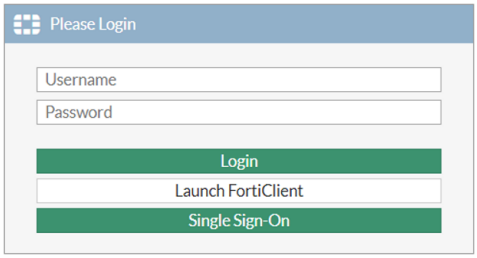
4. Add the SAML user group to a firewall policy:

```
config firewall policy
    edit 8
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set groups "local" "saml_sslvpn"
        set nat enable
    next
end
```

5. Configure the FortiAuthenticator IdP as needed.

To connect from the SSL VPN web portal:

1. In a web browser, enter the portal address. The SAML login page appears:

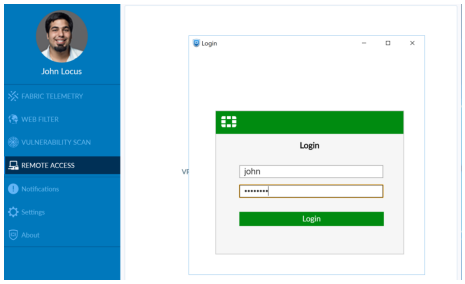


2. Enter the user name and password.

3. Click *Login*, or if SSO has been configured, click *Single-Sign-On*.
   Once authenticated, the web portal opens.

To connect from SSL VPN tunnel mode with FortiClient:

1. In FortiClient, click the *Remote Access* tab, and from the *VPN Name* dropdown, select the desired VPN tunnel.
2. Click *SAML Login*.
3. FortiClient displays an IdP authorization page in an embedded browser window. Enter the user name and password.
4. Click *Login*.

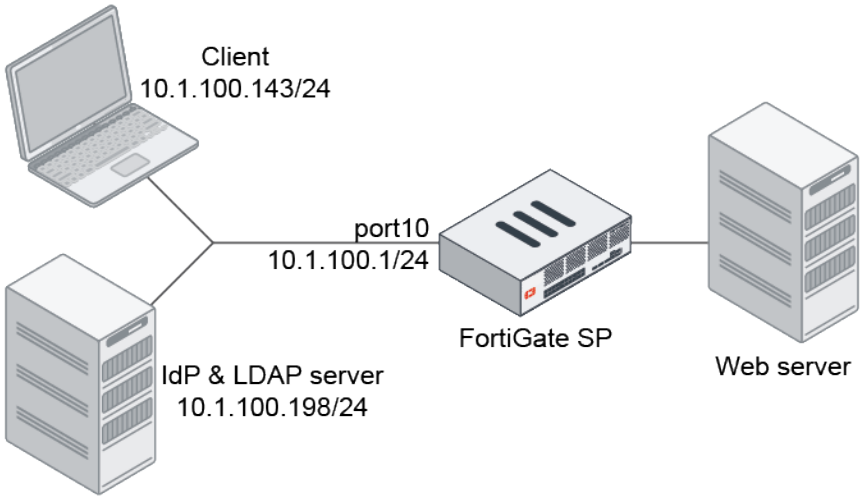


Once authenticated, FortiClient establishes the SSL VPN tunnel.

SAML authentication in a proxy policy

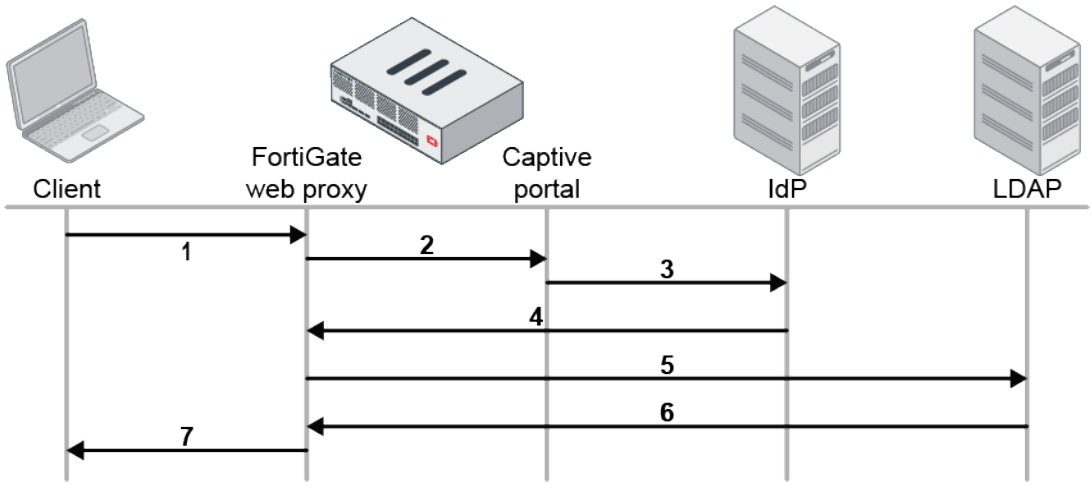
SAML user authentication can be used in explicit web proxies and transparent web proxies with the FortiGate acting as a SAML SP. SAML can be used as an authentication method for an authentication scheme that requires using a captive portal.

Topology



In this configuration, SAML authentication is used with an explicit web proxy. The IdP is a Windows 2016 server configured with ADFS. The LDAP and IdP servers are on the same server. The LDAP server is used as the user backend for the IdP to perform authentication; however, they are not required to be on the same server.

The authentication and authorization flow is as follows:



1. The client opens a browser and visits https://www.google.com.
2. The browser is redirected by the web proxy the captive portal.
3. The request is redirected to the IdP's sign-in page.
4. If the user signs in, the IdP authenticates the user and sends back a SAML assertion message to the FortiGate with the user group information.
5. If the FortiGate authentication scheme has a user database configured, the FortiGate will query the LDAP server for the user group information and ignore the user group information from the SAML message.
6. The user group information is returned. The FortiGate matches the user group information against the LDAP group in the proxy policy group settings. If there is a match, the request is authorized and the proxy policy is matched.
7. If all policy criteria match successfully, then the webpage is returned to the client.

To configure SAML authentication with an explicit web proxy:

1. Enable the web proxy:

```
config web-proxy explicit
    set status enable
    set http-incoming-port 8080
end
```

2. Enable the proxy captive portal:

```
config system interface
    edit "port10"
        set vdom "vdom1"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
        set type physical
        set explicit-web-proxy enable
        set explicit-ftp-proxy enable
        set proxy-captive-portal enable
        set snmp-index 12
    next
end
```

3. Configure the LDAP server:

```
config user ldap
    edit "ldap-10.1.100.198"
```

```
        set server "10.1.100.198"
        set cnid "cn"
        set dn "dc=myqalab,dc=local"
        set type regular
        set username "cn=fosqa1,cn=users,dc=myqalab,dc=local"
        set password ************
        set group-search-base "dc=myqalab,dc=local"
    next
end
```

4. Configure the user group:

```
config user group
    edit "ldap-group-saml"
        set member "ldap-10.1.100.198"
    next
end
```

5. Configure SAML:

```
config user saml
    edit "saml_user"
        set cert "Fortinet_CA_SSL"
        set entity-id "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/metadata/"
        set single-sign-on-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/"
        set single-logout-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/logout/"
        set idp-entity-id "http://MYQALAB.LOCAL/adfs/services/trust"
        set idp-single-sign-on-url "https://myqalab.local/adfs/ls"
        set idp-single-logout-url "https://myqalab.local/adfs/ls"
        set idp-cert "REMOTE_Cert_4"
        set digest-method sha256
        set adfs-claim enable
        set user-claim-type name
        set group-claim-type group
    next
end
```

6. Configure the authentication scheme, rule, and setting:

```
config authentication scheme
    edit "saml"
        set method saml
        set saml-server "saml_user"
        set user-database "ldap-10.1.100.198"
    next
end

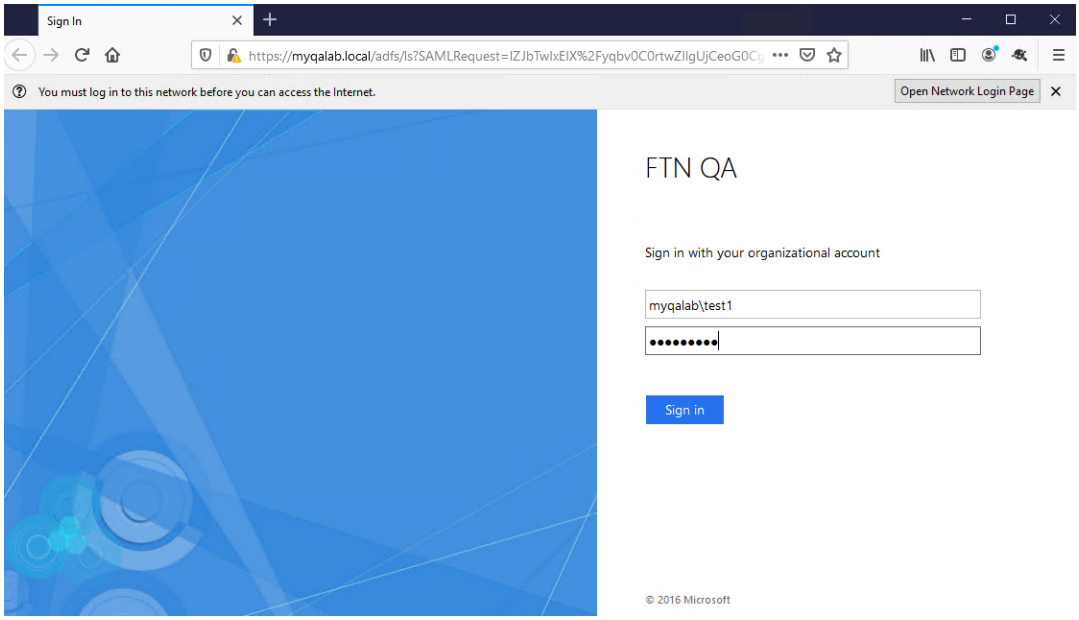
config authentication rule
    edit "saml"
        set srcaddr "all"
        set active-auth-method "saml"
    next
end

config authentication setting
    set captive-portal "fgt9.myqalab.local"
end
```

7. Configure the proxy policy:

```
config firewall proxy-policy
    edit 3
        set proxy explicit-web
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set groups "ldap-group-saml"
        set utm-status enable
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "deep-custom"
        set av-profile "av"
    next
end
```

When a user goes to www.google.com in a browser that is configured to use the FortiGate as a proxy, the IdP sign-in page appears.



Sample log

```

```

Authentication Settings

You can configure general authentication settings, including timeout, protocol support, and certificates.

You cannot customize FTP and Telnet authentication replacement messages.

To configure authentication settings using the GUI:

1. Go to *User & Authentication* > *Authentication Settings*.
2. Configure the following settings:

Setting	Description
Authentication Timeout	Enter the desired timeout in minutes. You can enter a number between 1 and 1440 (24 hours). The authentication timeout controls how long an authenticated connection can be idle before the user must reauthenticate. The default value is 5.
Protocol Support	Select the protocols to challenge during firewall user authentication. When you enable user authentication within a security policy, the authentication challenge is normally issued for any of four protocols, depending on the connection protocol: • HTTP (you can set this to redirect to HTTPS) • HTTPS • FTP • Telnet The protocols selected here control which protocols support the authentication challenge. Users must connect with a supported protocol first so they can subsequently connect with other protocols. If HTTPS is selected as a protocol support method, it allows the user to authenticate with a customized local certificate. When you enable user authentication within a security policy, FortiOS challenges the security policy user to authenticate. For user ID and password authentication, the user must provide their username and password. For certificate authentication (HTTPS or HTTP redirected to HTTPS only), you can install customized certificates on the unit and the user can also install customized certificates on their browser. Otherwise, users see a warning message and must accept a default Fortinet certificate. The network user's web browser may deem the default certificate invalid.
Certificate	If using HTTPS protocol support, select the local certificate to use for authentication. This is available only if *HTTPS* and/or *Redirect HTTP Challenge to a Secure Channel (HTTPS)* are selected.

To configure authentication settings using the CLI:

```
config user setting
```

```
    set auth-timeout 5
    set auth-type ftp http https telnet
    set auth-cert Fortinet_Factory
end
```

FortiTokens

FortiTokens are security tokens used as part of a multi-factor authentication (MFA) system on FortiGate and FortiAuthenticator. A security token is a 6-digit or 8-digit (configurable) one-time password (OTP) that is used to authenticate one's identity electronically as a prerequisite for accessing network resources. FortiToken is available as either a mobile or a physical (hard) token. Mobile tokens can be purchased as a license, or consumed with points as part of the FortiToken Cloud service.

FortiToken Mobile and physical FortiTokens store their encryption seeds on the cloud. FortiToken Mobile seeds are generated dynamically when the token is provisioned. They are always encrypted whether in motion or at rest.

You can only register FortiTokens to a single FortiGate or FortiAuthenticator for security purposes. This prevents malicious third parties from making fraudulent requests to hijack your FortiTokens by registering them on another FortiGate or FortiAuthenticator. If re-registering a FortiToken Mobile or Hard Token on another FortiGate is required, you must contact Fortinet Customer Support.

Common usage for FortiTokens includes:

- Applying MFA to a VPN dialup user connecting to the corporate network
- Applying MFA to FortiGate administrators
- Applying MFA to firewall authentication and captive portal authentication

The MFA process commonly involves:

- **Something you know**: User password
- **Something you have**: The FortiToken OTP

A third factor of authentication is added to the authentication process:

- **Something you are**: Your fingerprint or face

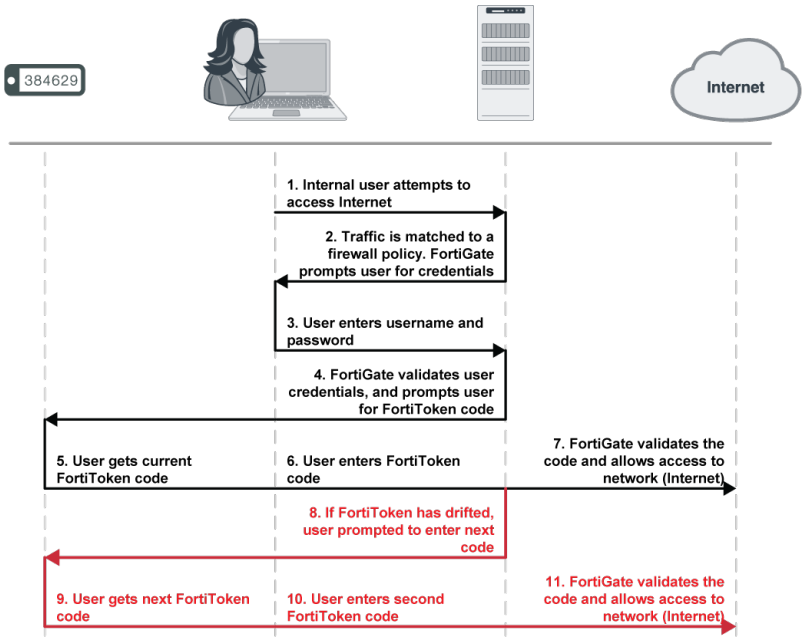
To enable the third factor, refer to the Activating FortiToken Mobile on a mobile phone on page 1387 section.

The following illustrates the FortiToken MFA process:

1. The user attempts to access a network resource.
2. FortiOS matches the traffic to an authentication security policy and prompts the user for their username and password.
3. The user enters their username and password.
4. FortiOS verifies their credentials. If valid, it prompts the user for the FortiToken code.
5. The user views the current code on their FortiToken. They enter the code at the prompt.
6. FortiOS verifies the FortiToken code. If valid, it allows the user access to network resources.

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.



This section includes the following topics to quickly get started with FortiTokens:

- FortiToken Mobile quick start on page 1384
- FortiToken Cloud on page 1392
- Registering hard tokens on page 1392
- Managing FortiTokens on page 1394
- FortiToken Mobile Push on page 1396
- Troubleshooting and diagnosis on page 1398

FortiToken Mobile quick start

FortiToken Mobile is an OATH compliant, event- and time-based one-time password (OTP) generator for mobile devices. It provides an easy and flexible way to deploy and provision FortiTokens to your end users through mobile devices. FortiToken Mobile produces its OTP codes in an application that you can download onto your Android or iOS mobile device without the need for a physical token.

You can download the free FortiToken Mobile application for Android from the Google Play Store, and for iOS from the Apple App Store.

This section focuses on quickly getting started and setting up FortiToken Mobile for use on a FortiGate:

- Registering FortiToken Mobile on page 1385
- Provisioning FortiToken Mobile on page 1386
- Activating FortiToken Mobile on a mobile phone on page 1387
- Applying multi-factor authentication on page 1391

Registering FortiToken Mobile

To deploy FortiToken Mobile for your end users, you must first register the tokens on your FortiGate. After registering the tokens, you can assign them to your end users.

Each FortiGate comes with two free FortiToken Mobile tokens. These tokens should appear under *User & Authentication > FortiTokens*. If no tokens appear, you may import them. Ensure that your FortiGate is registered and has internet access to connect to the FortiToken servers to import the tokens.

To import FortiTokens from the FortiGate GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click the *Import Free Trial Tokens* icon at the top. The two free tokens are imported.

To import FortiTokens from the FortiGate CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
# show user fortitoken
```

If only one free token appears, you can first delete that token and then follow the procedure to import the two free tokens from either the GUI or the CLI.

If you have the FortiToken Mobile redemption certificate, you can register FortiToken Mobile on a FortiGate.

To register FortiToken Mobile from the FortiGate GUI:

1. Go to *User & Authentication > FortiTokens* and click *Create New*. The *New FortiToken* dialog appears.
2. For the *Type* field, select *Mobile Token*.
3. Locate the 20-digit code on the redemption certificate and type it in the *Activation Code* field.
4. Click *OK*. The token is successfully registered.

If you attempt to add invalid FortiToken serial numbers, there is no error message. FortiOS does not add invalid serial numbers to the list.

To register FortiToken Mobile from the FortiGate CLI:

```
# execute fortitoken-mobile import <20-digit activation code>
# show user fortitoken
```

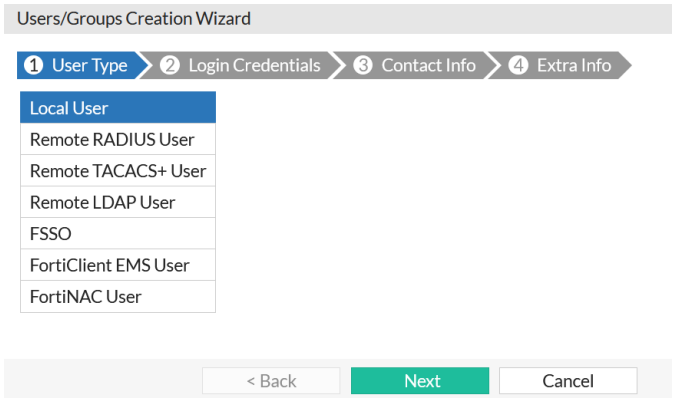
FortiToken Mobile stores its encryption seeds on the cloud. You can only register it to a single FortiGate or FortiAuthenticator.

Provisioning FortiToken Mobile

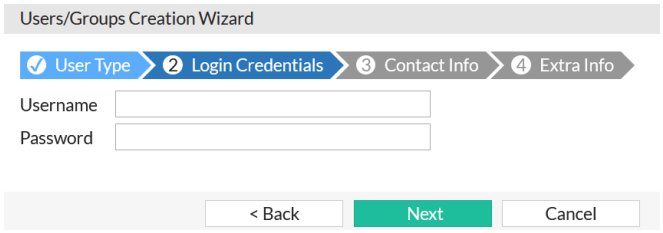
Once registered, FortiTokens need to be provisioned for users before they can be activated. In this example, you will provision a Mobile token for a local user. Similar steps can be taken to assign FortiTokens to other types of users.

To create a local user and assign a FortiToken in the FortiGate GUI:

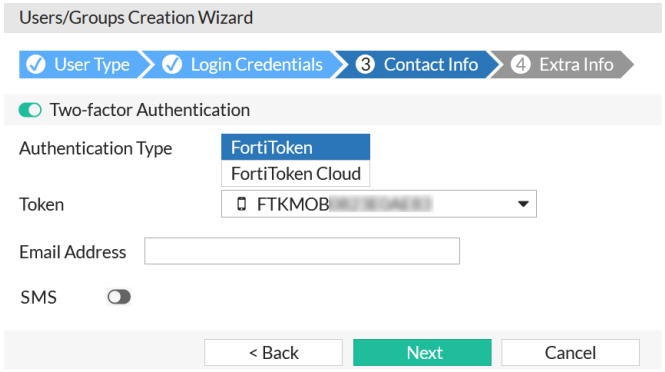
1. Go to *User & Authentication* > *User Definition*, and click *Create New*. The *Users/Groups Creation Wizard* appears.
2. In the *User Type* tab, select *Local User*, and click *Next*.



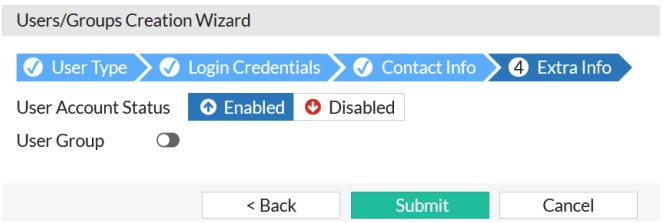
3. In the *Login Credentials* tab, enter a *Username* and *Password* for the user, and click *Next*.



4. In the *Contact Info* tab:
   a. Enable the *Two-factor Authentication* toggle.
   b. Select *FortiToken* for *Authentication Type*.
   c. Select a *Token* to assign to the user from the drop-down list.
   d. Enter the user's email address in the *Email Address* field. This is the email where the user will receive the QR code for activation of the FortiToken.
   e. Click *Next*.



5. In the *Extra Info* tab, make sure the *User Account Status* field is set to Enabled. You can also optionally assign the user to a user group by enabling the *User Group* toggle.



6. Click *Submit*. An activation code should be sent to the created user by email or SMS, depending upon the delivery method configured above.

FortiGate has the *Email Service* setting configured using the server *notifications.fortinet.net* by default. To see configuration, go to *System* > *Settings* > *Email Service*.

The activation code expires if not activated within the 3-day time period by default. However, the expiry time period is configurable.

To configure the time period (in hours) for FortiToken Mobile, using the CLI:

```
config system global
   set two-factor-ftm-expiry <1-168>
end
```

To resend the email or SMS with the activation code, refer to the Managing FortiTokens on page 1394 section.

Activating FortiToken Mobile on a mobile phone

After your system administrator provisions your token, you receive a notification with an activation code and expiry date via SMS or email. If you do not activate your token by the expiry date, you must contact your system administrator so that they can reassign your token for activation.

Platforms that support FortiToken Mobile:

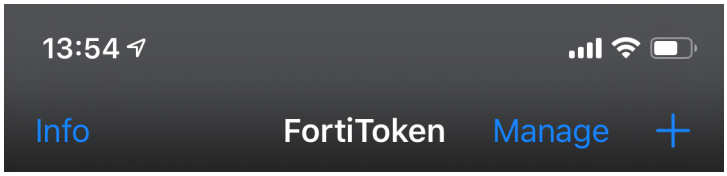
Platform	Device and firmware support
iOS	iPhone, iPad, and iPod Touch with iOS 6.0 and later.
Android	Phones and tablets with Android Jellybean 4.1 and later.
Windows	Windows 10 (desktop and mobile), Windows Phone 8.1, and Windows Phone 8. FortiToken is a Windows Universal Platform (UWP) application. To download FortiToken for Windows 10 desktop and mobile platforms, see FortiToken for Windows on the Microsoft Store.

The following instructions describe procedures when using FortiToken Mobile for iOS on an iPhone. Procedures may vary depending on your device and firmware.

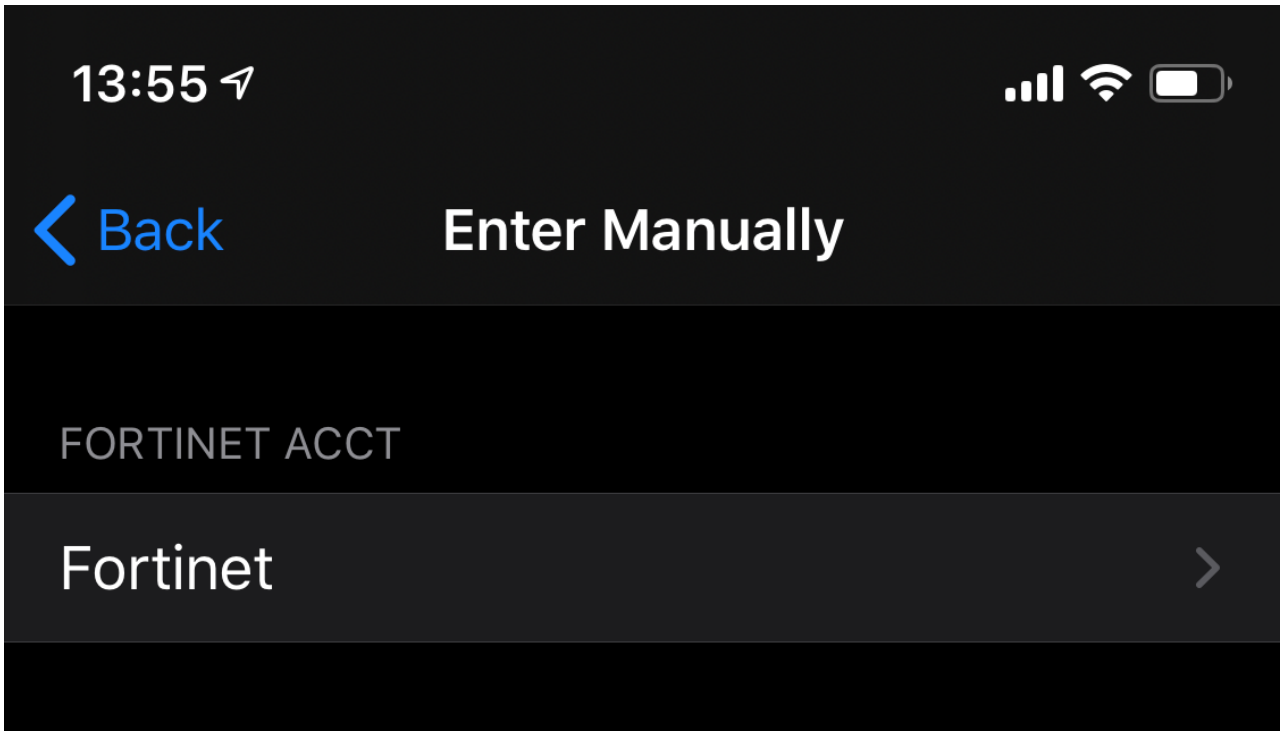
To activate FortiToken Mobile on iOS:

1. On your iOS device, tap on the FortiToken application icon to open the application. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.

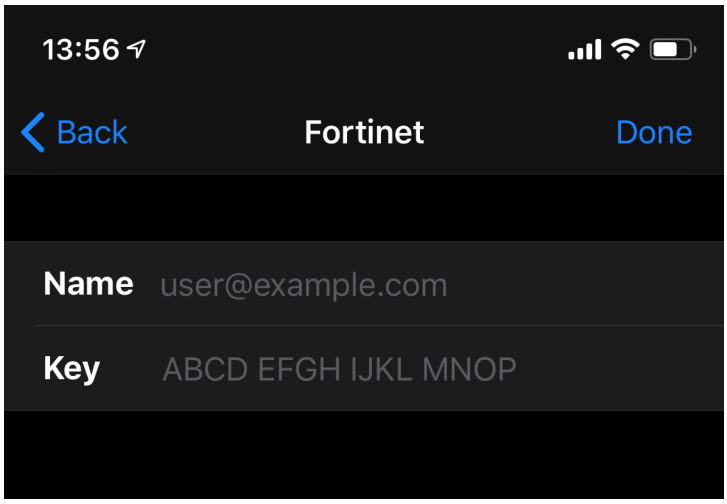
2. Tap on the + icon. The *Scan Barcode* screen appears.



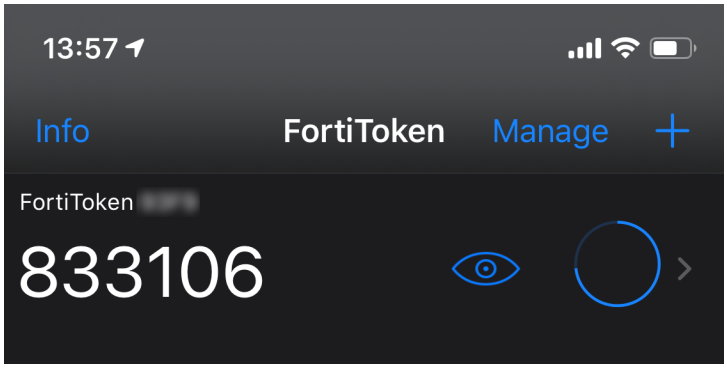
3. If you received the QR code via email, locate and scan the QR code in your email.
OR
If you received the activation key via SMS, tap on *Enter Manually* at the bottom of the screen, and tap on *Fortinet*.



Enter your email address in the *Name* field, the activation key in the *Key* field, and tap *Done*.



4. FortiToken Mobile activates your token, and starts generating OTP digits immediately. To view or hide the OTP digits, tap the eye icon.

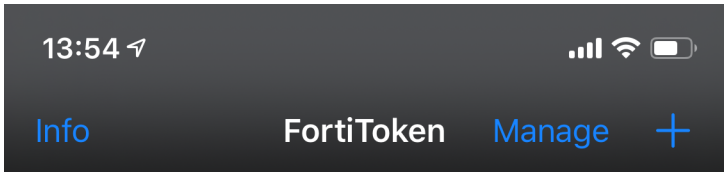


After you open the application, FortiToken Mobile generates a new 6-digit OTP every 30 seconds. All configured tokens display on the application homescreen.

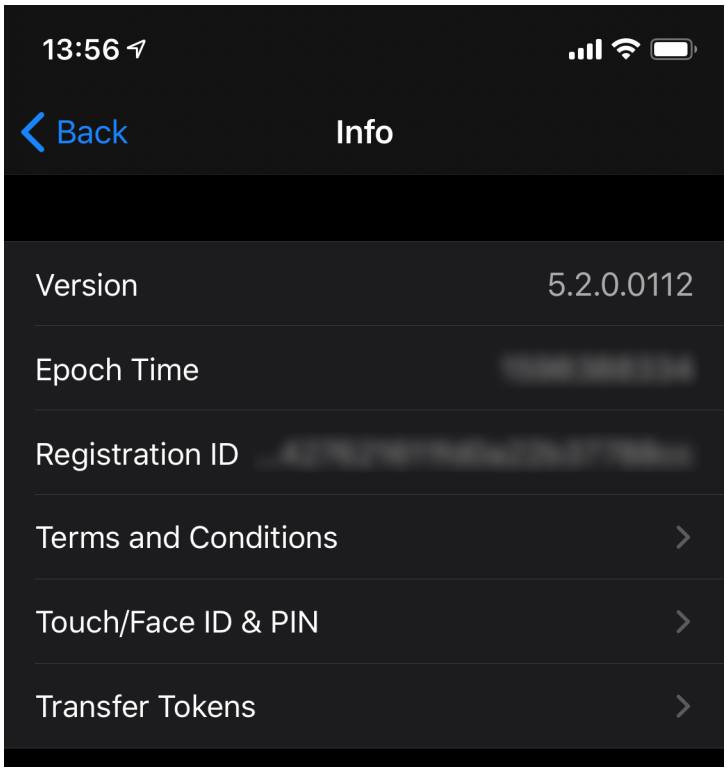
The FortiToken Mobile activation process described above caters to the MFA process that involves two factors (password and OTP) of the authentication process. A third factor (fingerprint or face) can be enabled as well.

To enable *Touch/Face ID* on iOS for FortiToken Mobile:

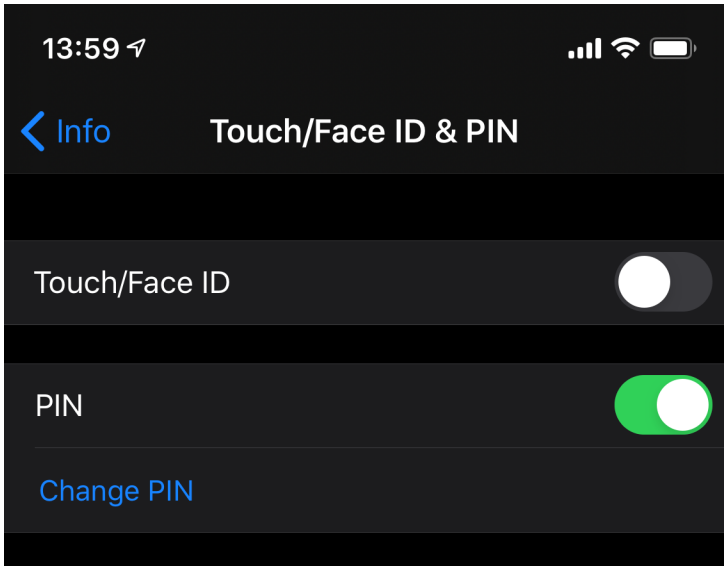
1. Open the FortiToken application and tap on *Info*.



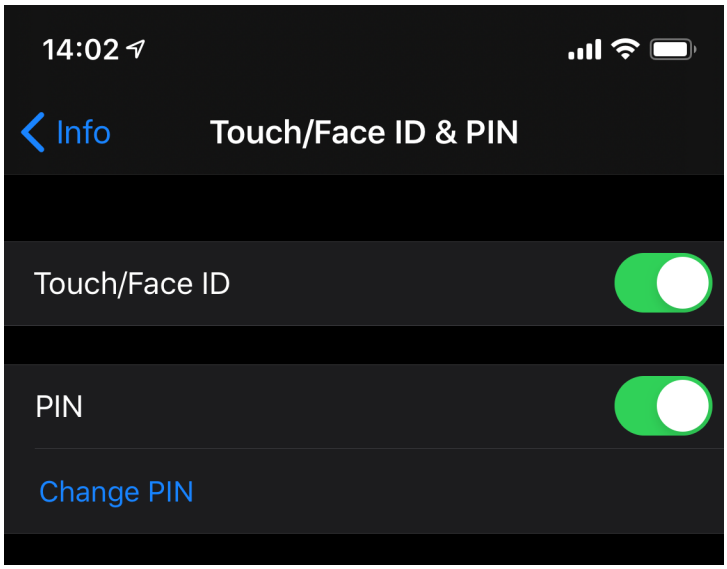
2. Tap on *Touch/Face ID & PIN*.



3. Enable and set up a 4-digit *PIN* for the application. The *PIN* is required to be enabled before you can enable *Touch/Face ID*.

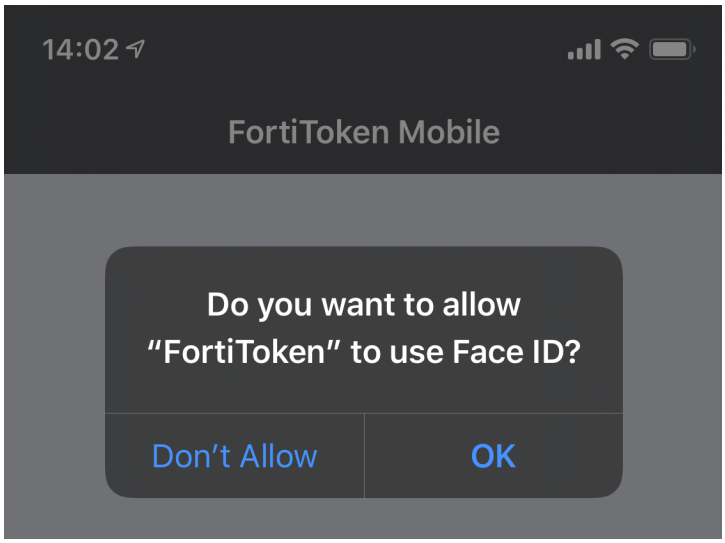


4. Enable *Touch/Face ID*.



You cannot enable *Touch/Face ID* for FortiToken if *Touch/Face ID* is not set up and enabled for device unlock (*iPhone Unlock* in this case) on iOS. You must first set up and enable *Touch/Face ID* from *Settings* on your iOS device.

5. When prompted by iOS, allow the FortiToken application to use *Touch/Face ID* by tapping on *OK* in the prompt.



Applying multi-factor authentication

Multi-factor authentication (MFA) may also be set up for SSL VPN users, administrators, firewall policy, wireless users, and so on. The following topics explain more about how you may use the newly created user in such scenarios:

- MFA for SSL VPN: Set up FortiToken multi-factor authentication on page 1198
- MFA for IPsec VPN: Add FortiToken multi-factor authentication on page 1019
- MFA for Administrators: Associating a FortiToken to an administrator account on page 1419
- MFA with Captive Portal

- MFA for wireless users via Captive Portal
- Configuring firewall authentication on page 1402

FortiToken Cloud

FortiToken Cloud is an Identity and Access Management as a Service (IDaaS) cloud service offering by Fortinet. It enables FortiGate and FortiAuthenticator customers to add MFA for their respective users, through the use of Mobile tokens or Hard tokens. It protects local and remote administrators as well as firewall and VPN users.

For information, see Getting started—FGT-FTC users in the FortiToken Cloud Administration Guide.

Registering hard tokens

Registering FortiTokens consists of the following steps:

1. Adding FortiTokens to FortiOS.
2. Activating FortiTokens.
3. Associating FortiTokens with user accounts.

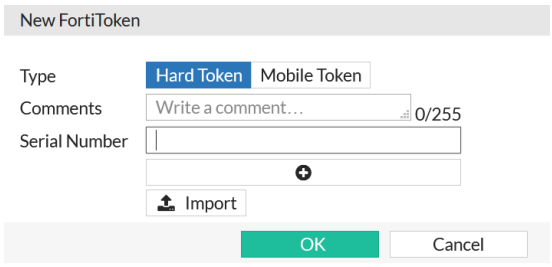
Adding FortiTokens to FortiOS

You can add FortiTokens to FortiOS in the following ways:

- Add FortiToken serial numbers using the GUI
- Add FortiToken serial numbers using the CLI
- Import FortiTokens using a serial number or seed file using the GUI

To manually add single hard token to FortiOS using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. In the *Serial Number* field, enter one or more FortiToken serial numbers.
5. Click *OK*.



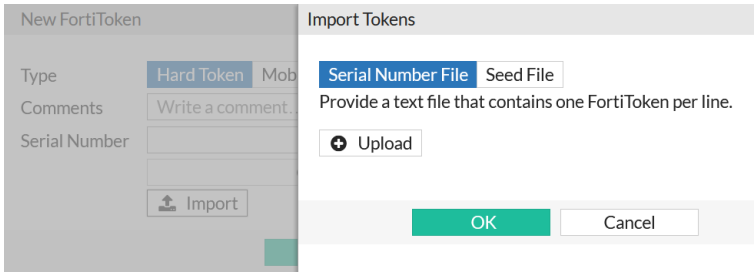
To add multiple FortiTokens to FortiOS using the CLI:

```
config user fortitoken
   edit <serial_number>
   next
   edit <serial_number2>
   next
```

```
end
```

To import multiple FortiTokens to FortiOS using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. Click *Import*. The *Import Tokens* section slides in on the screen.



5. Select *Serial Number File*.

Seed files are only used with FortiToken-200CD. These are special hardware tokens that come with FortiToken seeds on a CD. See the FortiToken Comprehensive Guide for details.

6. Click *Upload*.
7. Browse to the file's location on your local machine, select the file, then click *OK*.
8. Click *OK*.

Activating FortiTokens

You must activate the FortiTokens before starting to use them. FortiOS requires connection to FortiGuard servers for FortiToken activation. During activation, FortiOS queries FortiGuard servers about each token's validity. Each token can only be used on a single FortiGate or FortiAuthenticator. If tokens are already registered, they are deemed invalid for re-activation on another device. FortiOS encrypts the serial number and information before sending for added security.

To activate a FortiToken using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Select the desired FortiTokens that have an *Available* status.
3. Click *Activate* from the menu above.
4. Click *Refresh*. The selected FortiTokens are activated.

To activate a FortiToken using the CLI:

```
config user fortitoken
   edit <token_serial_num>
      set status activate
   next
end
```

Associating FortiTokens with user accounts

You can associate FortiTokens with local user or administrator accounts.

To associate a FortiToken to a local user account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.
2. Go to *User & Authentication* > *User Definition*. Edit the desired user account.
3. Enable *Two-factor Authentication*.
4. From the *Token* dropdown list, select the desired FortiToken serial number.
5. In the *Email Address* field, enter the user's email address.
6. Click *OK*.

To associate a FortiToken to a local user account using the CLI:

```
config user local
   edit <username>
      set type password
      set passwd "myPassword"
      set two-factor fortitoken
      set fortitoken <serial_number>
      set email-to "username@example.com"
      set status enable
   next
end
```

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

To associate a FortiToken to an administrator account, refer to the Associating a FortiToken to an administrator account on page 1419 section.

Managing FortiTokens

This section focuses on the following:

- Resending an activation email on page 1394
- Locking/unlocking FortiTokens on page 1395
- Managing FortiTokens drift on page 1395
- Deactivating FortiTokens on page 1395
- Moving FortiTokens to another device on page 1396

Resending an activation email

To resend an activation email/SMS for a mobile token on a FortiGate:

1. Go to *User & Authentication* > *User Definition* and edit the user.
2. Click *Send Activation Code Email* from the *Two-factor Authentication* section.

Locking/unlocking FortiTokens

To change FortiToken status to active or to lock:

```
config user fortitoken
   edit <token_serial_num>
      set status <active | lock>
   next
end
```

A user attempting to log in using a locked FortiToken cannot successfully authenticate.

Managing FortiTokens drift

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.

If you still experience clock drift, it may be the result of incorrect time settings on your mobile device. If so, make sure that the mobile device clock is accurate by confirming the network time and the correct timezone.

If the device clock is set correctly, the issue could be the result of the FortiGate and FortiTokens being initialized prior to setting an NTP server. This will result in a time difference that is too large to correct with the synchronize function. To avoid this, selected Tokens can be manually drift adjusted.

To show current drift and status for each FortiToken:

```
diagnose fortitoken info
FORTITOKEN DRIFT STATUS
FTK200XXXXXXXXXC 0 token already activated, and seed won't be returned
FTK200XXXXXXXXXE 0 token already activated, and seed won't be returned
FTKMOBXXXXXXXXXA 0 provisioned
FTKMOBXXXXXXXXX4 0 new
Total activated token: 0
Total global activated token: 0
Token server status: reachable
```

This command lists the serial number and drift for each configured FortiToken. You can check if it is necessary to synchronize the FortiGate and any particular FortiTokens.

To adjust Mobile FortiToken for drift:

```
# execute fortitoken sync <FortiToken_ID> <token_code1> <next_token_code2>
```

Deactivating FortiTokens

To deactivate FortiToken on a FortiGate:

1. Go to *User & Authentication* > *User Definition*.
2. Select and edit the user for which you want to deactivate the token.
3. Disable the *Two-factor Authentication* toggle.

4. Click *OK*. The token will be removed from the user's *Two-factor Authentication* column. The user will also be removed from the token's *User* column under *User & Authentication* > *FortiTokens*.

Moving FortiTokens to another device

FortiTokens can only be activated on a single FortiGate or FortiAuthenticator. To move FortiTokens to another device, you would first have to reset the registered FortiTokens on a device and then reactivate them on another device.

To reset Hard tokens registered to a FortiGate appliance (non-VM model), you can reset all hardware FTK200 tokens from the Support Portal, or during RMA transfer. See the Migrating users and FortiTokens to another FortiGate KB article, for more information.

The above process will reset all Hard tokens and you cannot select individual tokens to reset.

To reset FortiToken Mobile, a single Hard token, a Hard token registered to a VM, and so on, an administrator must contact Customer Support and/or open a ticket on the Support Portal.

Once reset, the FortiTokens can be activated on another FortiGate or FortiAuthenticator.

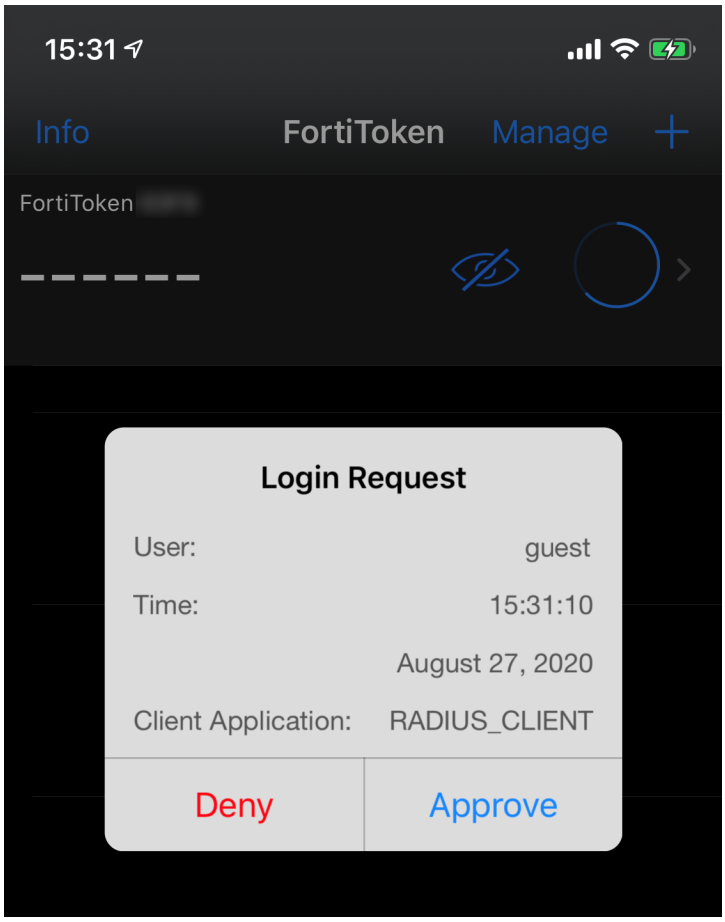
FortiToken Mobile Push

FortiToken Mobile Push allows authentication requests to be sent as push notifications to the end user's FortiToken Mobile application.

The FortiToken Mobile push service operates as follows:

1. FortiGate sends a DNS query to the FortiToken Mobile Push proxy server (*push.fortinet.com*).
2. FortiGate connects to the proxy server via an encrypted connection over TCP/443.
3. The proxy server handles the notification request by making a TLS connection with either Apple (for iOS) or Google (for Android) notification servers. Notification data may include the recipient, session, FortiGate callback IP and port, and so on.
4. The notification service from either Apple or Google notifies the user's mobile device of the push request.
5. The FortiToken Mobile application on the user's mobile displays a prompt for the user to either *Approve* or *Deny* the

request.



To configure FortiToken Mobile push services using the CLI:

```
config system ftm-push
   set status enable
   set server-ip <ip-address>
   set server-port [1-65535]
end
```

The default server port is `4433`.

The server IP address is the public IP address of the FortiOS interface that FortiToken Mobile calls back to. FortiOS uses this IP address for incoming FortiToken Mobile calls.

If an SSL VPN user authenticates with their token, then logs out and attempts to reauthenticate within a minute, a *Please wait `x` seconds to login again* message displays. This replaces a previous error/permission denied message. The `x` value depends on the calculation of how much time is left in the current time step.

```
config system interface
   edit "guest"
      set allowaccess ftm
   next
end
```

FortiOS supports FortiAuthenticator-initiated FortiToken Mobile Push notifications for users attempting to authenticate through an SSL VPN and/or RADIUS server (with FortiAuthenticator as the RADIUS server).

Troubleshooting and diagnosis

This section contains some common scenarios for FortiTokens troubleshooting and diagnosis:

- FortiToken Statuses on page 1398
- Recovering trial FortiTokens on page 1399
- Recovering lost Administrator FortiTokens on page 1399
- SSL VPN with multi-factor authentication expiry timers on page 1400

FortiToken Statuses

When troubleshooting FortiToken issues, it is important to understand different FortiToken statuses. FortiToken status may be retrieved either from the CLI or the GUI, with a slightly different naming convention.

Before you begin, verify that the FortiGate has Internet connectivity and is also connected to both the FortiGuard and registration servers:

```
# execute ping fds1.fortinet.com
# execute ping directregistration.fortinet.com
# execute ping globalftm.fortinet.net
```

The `globalftm.fortinet.net` server is the Fortinet Anycast server added in FortiOS 6.4.2.

If there are connectivity issues, retrieving FortiToken statuses or performing FortiToken activation could fail. Therefore, troubleshoot connectivity issues before continuing.

To retrieve FortiToken statuses:

- In the CLI:
  `# diagnose fortitoken info`
- In the GUI:
  Go to *User & Authentication* > *FortiTokens*.

Various FortiToken statuses in either the CLI or the GUI may be described as follows:

CLI	GUI	Description
`new`	*Available*	Newly added, not pending, not activated, not yet assigned.
`active`	*Assigned*	Assigned to a user, hardware token.
`provisioning`	*Pending*	Assigned to a user and waiting for activation on the FortiToken Mobile app.
`provisioned`	*Assigned*	Assigned to user and activated on the FortiToken Mobile app.

CLI	GUI	Description
`provision timeout`		Token provided to user but not activated on the FortiToken Mobile app. To fix, the token needs to be re-provisioned and activated in time.
`token already activated, and seed won't be returned`	*Error*	Token is locked by FortiGuard FDS. The hardware token was already activated on another device and locked by FDS.
`locked`		Either manually locked by an Administrator (`set status lock`), or locked automatically, for example, when the token is unassigned and the FortiCare FTM provisioning server was unreachable to process that change.

Recovering trial FortiTokens

You can recover trial FortiTokens if deleted from a FortiGate, or if stuck in a state where it is not possible to provision to a user.

When a token is stuck in an unusual state or with errors, delete the FortiTokens from the unit and proceed to recover trial FortiTokens.

To recover trial tokens via the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click the *Import Free Trial Tokens* button at the top. The two free trial tokens are recovered.

To recover trial tokens via the CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

- Before attempting to recover the trial tokens, both the tokens should be deleted from the unit first.
- If VDOMs are enabled, trial tokens are in the management VDOM (`root` by default).

Following error codes might come up in the CLI:

- If the device is not registered:
  ```
  # execute fortitoken-mobile import 0000-0000-0000-0000-0000
  import fortitoken license error: -7571
  ```
- If the serial number format is incorrect:
  ```
  # execute fortitoken-mobile import 0000-0000-0000-0000-00
  import fortitoken license error: -7566
  ```

Recovering lost Administrator FortiTokens

If an Administrator loses their FortiToken or the FortiToken is not working, they will not be able to log into the admin console through the GUI or the CLI. If there is another Administrator that can log into the device, they may be able to reset the two-factor settings configured for the first Administrator, or create a new Admin user for them. Note that a *super_admin* user will be able to edit other admin user settings, but a *prof_admin* user will not be able to edit *super_admin* settings.

In the case where there are no other administrators configured, the only option is to flash format the device and reload a backup config file. You must have console access to the device in order to format and flash the device. It is recommended to be physically on site to perform this operation.

The process of resetting an Admin user password using the maintainer account cannot be used to reset or disable two-factor authentication.

Before formatting the device, verify that you have a backup config file. You may or may not have the latest config file backed up, though you should consider using a backed up config file, and reconfigure the rest of the recent changes manually. Otherwise, you may need to configure your device starting from the default factory settings.

To recover lost Administrator FortiTokens:

1. If you have a backed up config file:
   a. Open the config file and search for the specific admin user. For representational purposes we will use `Test` in our example.
   ```
   # edit "Test"
      set accprofile "super_admin"
      set vdom "root"
      set two-factor fortitoken
      set fortitoken "FTKXXXXXXXXXX"
      set email-to "admin@email.com"
      set password *********
      next
   end
   ```
   b. Once you find the settings for the `Test` user, delete the `fortitoken`-related settings:
   ```
   # edit "Test"
      set accprofile "super_admin"
      set vdom "root"
      set password *********
      next
   end
   ```
2. Format the boot device during a maintenance window and reload the firmware image using instructions in the Formatting and loading FortiGate firmware image using TFTP KB article.
3. Once the reload is complete, log into the admin console from the GUI using the default admin user credentials, and go to *Configuration* > *Restore* from the top right corner to reload your config file created in Step 1 above.
4. Once the FortiGate reboots and your configuration is restored, you can log in with your admin user credentials.

SSL VPN with multi-factor authentication expiry timers

When SSL VPN is configured with multi-factor authentication (MFA), sometimes you may require a longer token expiry time than the default 60 seconds.

To configure token expiry timers using the CLI:

```
config system global
    set two-factor-ftk-expiry <number of seconds>
    set two-factor-ftm-expiry <number of seconds>
    set two-factor-sms-expiry <number of seconds>
    set two-factor-fac-expiry <number of seconds>
```

```
    set two-factor-email-expiry <number of seconds>
end
```

These timers apply to the tokens themselves and remain valid for as long as configured above. However, SSL VPN does not necessarily accept tokens for the entire duration they are valid. To ensure SSLVPN accepts the token for longer durations, you need to configure the remote authentication timeout setting accordingly.

To configure the remote authentication timeout:

```
config system global
    set remoteauthtimeout <1-300 seconds>
end
```

SSL VPN waits for a maximum of five minutes for a valid token code to be provided before closing down the connection, even if the token code is valid for longer.

The `remoteauthtimout` setting shows how long SSL VPN waits not only for a valid token to be provided before closing down the connection, but also for other remote authentication like LDAP, RADIUS, and so on.

Configuring the maximum log in attempts and lockout period

Failed log in attempts can indicate malicious attempts to gain access to your network. To prevent this security risk, you can limit the number of failed log in attempts. After the configured maximum number of failed log in attempts is reached, access to the account is blocked for the configured lockout period.

To configure number of maximum log in attempts:

This example sets the maximum number of log in attempts to five.

```
config user setting
   set auth-lockout-threshold 5
end
```

To configure the lockout period in seconds:

This example sets the lockout period to five minutes (300 seconds).

```
config user setting
   set auth-lockout-duration 300
end
```

PKI

The following topics include information about public key infrastructure (PKI):

- Creating a PKI/peer user on page 1402
- SSL VPN with certificate authentication on page 1222

- SSL VPN with LDAP-integrated certificate authentication on page 1227

Creating a PKI/peer user

A PKI/peer user is a digital certificate holder. A FortiOS PKI user account contains the information required to determine which CA certificate to use to validate the user's certificate. You can include a peer user in a firewall user group or peer certificate group used in IPsec VPN.

To define a peer user, you need the following:

- Peer username
- Text from the user's certificate's subject field, or the name of the CA certificate used to validate the user's certificate

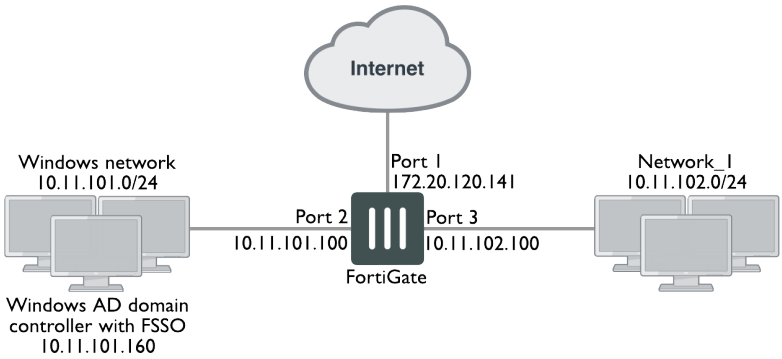
To create a peer user for PKI authentication:

```
config user peer
   edit peer1
      set subject peer1@mail.example.com
      set ca CA_Cert_1
   next
end
```

You can add or modify other configuration settings for PKI authentication, including configuring using an LDAP server to check client certificate access rights. See the *FortiOS CLI Reference*.

Configuring firewall authentication

In this example, a Windows network is connected to the FortiGate on port 2, and another LAN, Network_1, is connected on port 3.



All Windows network users authenticate when they log on to their network. Engineering and Sales groups members can access the Internet without reentering their authentication credentials. The example assumes that you have already installed and configured FSSO on the domain controller.

LAN users who belong to the Internet_users group can access the Internet after entering their username and password. The example shows two users: User1, authenticated by a password stored in FortiOS; and User 2, authenticated on an external authentication server. Both users are local users since you create the user accounts in FortiOS.

1. Create a locally authenticated user account.
2. Create a RADIUS-authenticated user account.
3. Create an FSSO user group.
4. Create a firewall user group.
5. Define policy addresses.
6. Create security policies.

Creating a locally authenticated user account

User1 is authenticated by a password stored in FortiOS.

To create a locally authenticated user account in the GUI:

1. Go to *User & Authentication* > *User Definition* and click *Create New*.
2. Configure the following settings:

User Type	Local User
User Name	User1
Password	hardtoguess1@@1
User Account Status	Enabled

3. Click *Submit*.

To create a locally authenticated user account in the CLI:

```
config user local
   edit user1
      set type password
      set passwd hardtoguess1@@1
   next
end
```

Creating a RADIUS-authenticated user account

You must first configure FortiOS to access the external authentication server, then create the user account.

To create a RADIUS-authenticated user account in the GUI:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Configure the following settings:

Name	OurRADIUSsrv
Authentication method	Default
Primary Server	

IP/Name	10.11.101.15
Secret	OurSecret

3. Click *OK*.
4. Go to *User & Authentication* > *User Definition* and click *Create New*.
5. Configure the following settings:

User Type	Remote RADIUS User
User Name	User2
RADIUS Server	OurRADIUSsrv
User Account Status	Enabled

6. Click *Submit*.

To create a RADIUS-authenticated user account in the CLI:

```
   config user radius
   edit OurRADIUSsrv
      set server 10.11.102.15
      set secret OurSecret
      set auth-type auto
   next
end
config user local
   edit User2
      set name User2
      set type radius
      set radius-server OurRADIUSsrv
   next
end
```

Creating an FSSO user group

This example assumes that you have already set up FSSO on the Windows network and that it used advanced mode, meaning that it uses LDAP to access user group information. You must do the following:

- Configure LDAP access to the Windows AD global catalog
- Specify the collector agent that sends user log in information to FortiOS
- Select Windows user groups to monitor
- Select and add the Engineering and Sales groups to an FSSO user group

To create an FSSO user group in the GUI:

1. Configure LDAP for FSSO:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Configure the following settings:

Name	ADserver

Server Name / IP	10.11.101.160
Distinguished Name	dc=office,dc=example,dc=com
Bind Type	Regular
Username	cn=FSSO_Admin,cn=users,dc=office,dc=example,dc=com
Password	Enter a secure password.

   c. Leave other fields as-is. Click *OK*.

2. Specify the collector agent for FSSO;
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. Under *Endpoint/Identity*, select *FSSO Agent on Windows AD*.
   c. Configure the following settings:

Name	Enter the Windows AD server name. This name appears in the Windows AD server list when you create user groups. In this example, the name is WinGroups.
Server IP/Name	Enter the IP address or name of the server where the agent is installed. The maximum name length is 63 characters. In this example, the IP address is 10.11.101.160.
Password	Enter the password of the server where the agent is installed. You only need to enter a password for the collector agent if you configured the agent to require authenticated access. If the TCP port used for FSSO is not the default, 8000, you can run the `config user fsso` command to change the setting in the CLI.
Collector Agent AD access mode	Advanced
LDAP Server	Select the previously configured LDAP server. In this example, it is ADserver.
User/Groups/Organization Units	Select the users, groups, and OUs to monitor.

   d. Click *OK*.

3. Create the FSSO_Internet_users user group:
   a. Go to *User & Authentication* > *User Groups* and click *Create New*.
   b. Configure the following settings:

Name	FSSO_Internet_users
Type	Fortinet Single Sign-On (FSSO)
Members	Engineering, Sales

   c. Click *OK*.

To create an FSSO user group in the CLI:

```
config user ldap
   edit "ADserver"
```

```
      set server "10.11.101.160"
      set dn "cn=users,dc=office,dc=example,dc=com"
      set type regular
      set username "cn=administrator,cn=users,dc=office,dc=example,dc=com"
      set password set_a_secure_password
   next
end
config user fsso
   edit "WinGroups"
      set ldap-server "ADserver"
      set password ********
      set server "10.11.101.160"
   next
end
config user group
   edit FSSO_Internet_users
      set group-type fsso-service
      set member CN=Engineering,cn=users,dc=office,dc=example,dc=com
           CN=Sales,cn=users,dc=office,dc=example,dc=com
   next
end
```

Creating a firewall user group

This example shows a firewall user group with only two users. You can add additional members.

To create a firewall user group in the GUI:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Configure the following settings:

Name	Internet_users
Type	Firewall
Members	User1, User2

3. Click *OK*.

To create a firewall user group in the CLI:

```
config user group
   edit Internet_users
        set group-type firewall
        set member User1 User2
   next
end
```

Defining policy addresses

To define policy addresses:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Configure the following settings:

Name	Internal_net
Type	Subnet
IP/Netmask	10.11.102.0/24
Interface	Port 3

4. Click *OK*.
5. Create another new address by repeating steps 2-4 using the following settings:

Name	Windows_net
Type	Subnet
IP/Netmask	10.11.101.0/24
Interface	Port 2

Creating security policies

You must create two security policies: one for the firewall group connecting through port 3, and one for the FSSO group connecting through port 2.

To create security policies using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Configure the following settings:

Incoming Interface	Port2
Source Address	Windows_net
Source User(s)	FSSO_Internet_users
Outgoing Interface	Port1
Destination Address	all
Schedule	always
Service	ALL
NAT	Enabled.
Security Profiles	You can enable security profiles as desired.

4. Click *OK*.
5. Create another new policy by repeating steps 2-4 using the following settings:

Incoming Interface	Port3
Source Address	Internal_net
Source User(s)	Internet_users
Outgoing Interface	Port1
Destination Address	all
Schedule	always
Service	ALL
NAT	Enabled.
Security Profiles	You can enable security profiles as desired.

6. Click *OK*.

To create security policies using the CLI:

```
config firewall policy
     edit 0
     set srcintf port2
     set dstintf port1
     set srcaddr Windows_net
     set dstaddr all
     set action accept
     set groups FSSO_Internet_users
     set schedule always
     set service ANY
     set nat enable
   next
end
config firewall policy
   edit 0
     set srcintf port3
     set dstintf port1
     set srcaddr internal_net
     set dstaddr all
     set action accept
     set schedule always
     set groups Internet_users
     set service ANY
     set nat enable
   next
end
```

Wireless configuration

See the FortiWiFi and FortiAP Configuration Guide.

Switch Controller

Use the Switch Controller function, also known as FortiLink, to remotely manage FortiSwitch units. In the commonly-used layer 2 scenario, the FortiGate that is acting as a switch controller is connected to distribution FortiSwitch units. The distribution FortiSwitch units are in the top tier of stacks of FortiSwitch units and connected downwards with Convergent or Access layer FortiSwitch units. To leverage CAPWAP and the Fortinet proprietary FortiLink protocol, set up data and control planes between the FortiGate and FortiSwitch units.

FortiLink allows administrators to create and manage different VLANs, and apply the full-fledged security functions of FortiOS to them, such as 802.1X authentication and firewall policies. Most of the security control capabilities on the FortiGate are extended to the edge of the entire network, combining FortiGate, FortiSwitch, and FortiAP devices, and providing secure, seamless, and unified access control to users.

See FortiSwitch devices managed by FortiOS.

System

This topic contains information about FortiGate administration and system configuration that you can do after installing the FortiGate in your network.

Basic system settings

Administrators

By default, FortiGate has an administrator account with the username *admin* and no password. See Administrators on page 1413 for more information.

Administrator profiles

An administrator profile defines what the administrator can see and do on the FortiGate. See Administrator profiles on page 1413 for more information.

Password policy

Set up a password policy to enforce password criteria and change frequency. See Password policy on page 1418 for more information.

Interfaces

Physical and virtual interface allow traffic to flow between internal networks, and between the internet and internal networks. See Interfaces on page 121 for more information.

Advanced system settings

SNMP

The simple network management protocol (SNMP) allows you to monitor hardware on your network. See SNMP on page 1533 for more information.

DHCP server

You can configure one or more DHCP servers on any FortiGate interface. See DHCP server on page 243 for more information.

VDOM

You can use virtual domains (VDOMs) to divide a FortiGate into multiple virtual devices that function independently. See Virtual Domains on page 1447 for more information.

High availability

You can configure multiple FortiGate devices, including private and public cloud VMs, in HA mode. See High Availability on page 1470 for more information.

Certificates

You can manage certificates on the FortiGate. See Certificates on page 1563 for more information.

Operating modes

A FortiGate or VDOM (in multi-vdom mode) can operate in either NAT/Route mode or Transparent mode.

NAT/Route mode

The FortiGate or VDOM is installed as a gateway between two networks, such as a private network and the internet. This allows the FortiGate to hide the IP addresses on the private network using NAT. NAT/Route mode can also be used when several ISPs are used for redundant internet connections.

By default, new VDOMs are set to NAT/Route operation mode.

See Configure VDOM-A on page 1456 for more information.

Transparent mode

The FortiGate or VDOM is installed between the internal network and the router. The FortiGate does not changes any IP addresses, and only applies security scanning to traffic. When you add a FortiGate that is in transparent mode to a network, it only needs to be provided with a management IP address.

Transparent mode is primarily used when increased network protection is needed without changing the network configuration.

See Configure VDOM-A on page 1466 for more information.

To change the operating mode of a FortiGate or VDOM:

```
config system settings
    set opmode {nat | transparent}
end
```

Administrators

By default, FortiGate has an administrator account with the username *admin* and no password. To prevent unauthorized access to the FortiGate, this account must be protected with a password. Additional administrators can be added for various functions, each with a unique username, password, and set of access privileges.

The following topics provide information about administrators:

- Administrator profiles on page 1413
- Add a local administrator on page 1415
- Remote authentication for administrators on page 1415
- Password policy on page 1418
- SSO administrators on page 1420
- FortiGate administrator log in using FortiCloud single sign-on on page 1421

Administrator profiles

Administrator profiles define what the administrator can do when logged into the FortiGate. When you set up an administrator account, you also assign an administrator profile which dictates what the administrator sees. Depending on the nature of the administrator's work, access level or seniority, you can allow them to view and configure as much or as little as is required. Access to CLI diagnose commands can also be disabled for global and VDOM level administrators.

By default, the FortiGate has an *admin* administrator account that uses the *super_admin* profile.

super_admin profile

This profile has access to all components of FortiOS, including the ability to add and remove other system administrators. For certain administrative functions, such as backing up and restoring the configuration, super_admin access is required. To ensure that there is always a method to administer the FortiGate, the super_admin profile can't be deleted or modified.

Lower level administrator profiles can't backup or restore the FortiOS configuration.

The super_admin profile is used by the default admin account. It is recommended that you add a password and rename this account once you have set up your FortiGate. In order to rename the default account, a second admin account is required.

Creating customized profiles

To create a profile in the GUI:

1. Go to *System* > *Admin Profiles* and click *Create New*.
2. Configure the following settings:
   - Name
   - Access permissions
   - Usage of CLI diagnose commands
   - Override idle timeout
3. Click *OK*.

To create a profile in the CLI:

```
config system accprofile
    edit <name>
        set secfabgrp {none | read | read-write}
        set ftviewgrp {none | read | read-write}
        set authgrp {none | read | read-write}
        set sysgrp {none | read | read-write}
        set netgrp {none | read | read-write}
        set loggrp {none | read | read-write}
        set fwgrp {none | read | read-write}
        set vpngrp {none | read | read-write}
        set utmgrp {none | read | read-write}
        set wanoptgrp {none | read | read-write}
        set wifi {none | read | read-write}
        set admintimeout-override {enable | disable}
        set system-diagnostics {enable | disable}
    next
end
```

Edit profiles

To edit a profile in the GUI:

1. Go to *System* > *Admin Profiles*.
2. Select the profile to be edited and click *Edit*.
3. Make the required changes.
4. Click *OK* to save any changes.

To edit a profile in the CLI:

```
config system accprofile
    edit "sample"
        set secfabgrp read
    next
end
```

Delete profiles

To delete a profile in the GUI:

1. Go to *System* > *Admin Profiles*.
2. Select the profile to be deleted and click *Delete*.
3. Click *OK*.

To delete a profile in the CLI:

```
config system accprofile
    delete "sample"
end
```

Add a local administrator

By default, FortiGate has one super admin named `admin`. You can create more administrator accounts with different privileges.

To create an administrator account in the GUI:

1. Go to *System* > *Administrators*.
2. Select *Create New* > *Administrator*.
3. Specify the *Username*.

Do not use the characters `< > ( ) # " '` in the administrator username.

Using these characters in an administrator username might have a cross site scripting (XSS) vulnerability.

4. Set *Type* to *Local User*.
5. Set the password and other fields.
6. Click *OK*.

To create an administrator account in the CLI:

```
config system admin
    edit <admin_name>
        set accprofile <profile_name>
        set vdom <vdom_name>
        set password <password for this admin>
    next
end
```

Remote authentication for administrators

Administrators can use remote authentication, such as LDAP, to connect to the FortiGate.

Setting up remote authentication for administrators includes the following steps:

1. Configure the LDAP server on page 1416
2. Add the LDAP server to a user group on page 1416
3. Configure the administrator account on page 1417

Configure the LDAP server

To configure the LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers* and select *Create New*.
2. Enter the server *Name* and *Server IP/Name*.
3. Enter the *Common Name Identifier* and *Distinguished Name*.
4. Set the *Bind Type* to *Regular* and enter the *Username* and *Password*.
5. Click *OK*.

To configure the LDAP server in the CLI:

```
config user ldap
  edit <ldap_server_name>
    set server <server_ip>
    set cnid "cn"
    set dn "dc=XYZ,dc=fortinet,dc=COM"
    set type regular
    set username "cn=Administrator,dc=XYA, dc=COM"
    set password <password>
  next
end
```

Add the LDAP server to a user group

After configuring the LDAP server, create a user group that includes that LDAP server.

To create a user group in the GUI:

1. Go to *User & Authentication* > *User Groups* and select *Create New*.
2. Enter a *Name* for the group.
3. In the *Remote groups* section, select *Create New*.
4. Select the *Remote Server* from the dropdown list.
5. Click *OK*.

To create a user group in the CLI:

```
config user group
  edit <Group_name>
    set member "ldap_server_name"
  next
end
```

Configure the administrator account

After configuring the LDAP server and adding it to a user group, create a new administrator. For this administrator, instead of entering a password, use the new user group and the wildcard option for authentication.

To create an administrator in the GUI:

1. Go to *System* > *Administrators*.
2. Select *Create New* > *Administrator*.
3. Specify the *Username*.
4. Set *Type* to *Match a user on a remote server group*.
5. In *Remote User Group*, select the user group you created.
6. Select *Wildcard*.
   The Wildcard option allows LDAP users to connect as this administrator.
7. Select an *Administrator Profile*.
8. Click *OK*.

To create an administrator in the CLI:

```
config system admin
  edit <admin_name>
    set remote-auth enable
    set accprofile super_admin
    set wild card enable
    set remote-group ldap
end
```

Other methods of administrator authentication

Administrator accounts can use different methods for authentication, including RADIUS, TACACS+, and PKI.

RADIUS authentication for administrators

To use a RADIUS server to authenticate administrators, you must:

- Configure the FortiGate to access the RADIUS server.
- Create the RADIUS user group.
- Configure an administrator to authenticate with a RADIUS server.

TACACS+ authentication for administrators

To use a TACACS+ server to authenticate administrators, you must:

- Configure the FortiGate to access the TACACS+ server.
- Create a TACACS+ user group.
- Configure an administrator to authenticate with a TACACS+ server.

PKI certificate authentication for administrators

To use PKI authentication for an administrator, you must:

- Configure a PKI user.
- Create a PKI user group.
- Configure an administrator to authenticate with a PKI certificate.

Password policy

Brute force password software can launch more than just dictionary attacks. It can discover common passwords where a letter is replaced by a number. For example, if `p4ssw0rd` is used as a password, it can be cracked.

Using secure passwords is vital for preventing unauthorized access to your FortiGate. When changing the password, consider the following to ensure better security:

- Do not use passwords that are obvious, such as the company name, administrator names, or other obvious words or phrases.
- Use numbers in place of letters, for example: `passw0rd`.
- Administrator passwords can be up to 64 characters.
- Include a mixture of numbers, symbols, and upper and lower case letters.
- Use multiple words together, or possibly even a sentence, for example: `correcthorsebatterystaple`.
- Use a password generator.
- Change the password regularly and always make the new password unique and not a variation of the existing password. for example, do not change from `password` to `password1`.
- Make note of the password and store it in a safe place away from the management computer, in case you forget it; or ensure at least two people know the password in the event one person becomes unavailable. Alternatively, have two different admin logins.

FortiGate allows you to create a password policy for administrators and IPsec pre-shared keys. With this policy, you can enforce regular changes and specific criteria for a password policy, including:

- The minimum length, between 8 and 64 characters.
- If the password must contain uppercase (A, B, C) and/or lowercase (a, b, c) characters.
- If the password must contain numbers (1, 2, 3).
- If the password must contain special or non-alphanumeric characters: !, @, #, $, %, ^, &, *, (, and)
- Where the password applies (admin or IPsec or both).
- The duration of the password before a new one must be specified.
- The minimum number of unique characters that a new password must include.

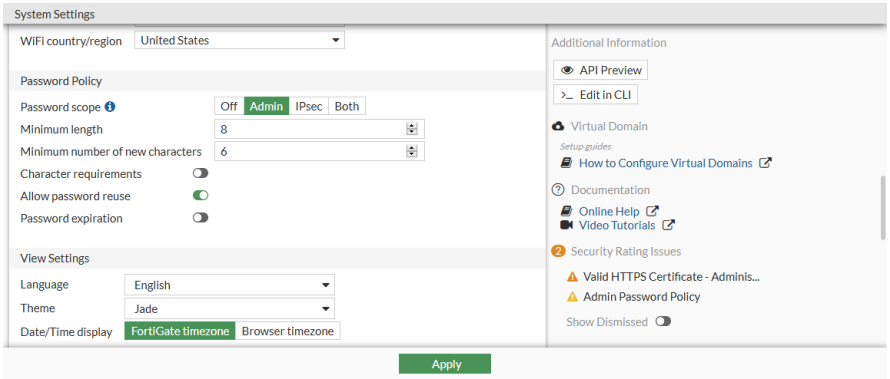
If you add a password policy or change the requirements on an existing policy, the next time that administrator logs into the FortiGate, the administrator is prompted to update the password to meet the new requirements before proceeding to log in.

For information about setting passwords, see Default administrator password on page 1431.

To create a system password policy the GUI:

1. Go to *System* > *Settings*.
2. In the *Password Policy* section, change the *Password scope* to *Admin*, *IPsec*, or *Both*.

3. Configure the password policy options.



4. Click *Apply*.

To create a system password policy the CLI:

```
config system password-policy
    set status {enable | disable}
    set apply-to {admin-password | ipsec-preshared-key}
    set minimum-length <8-128>
    set min-lower-case-letter <0-128>
    set min-upper-case-letter <0-128>
    set min-non-alphanumeric <0-128>
    set min-number <0-128>
    set min-change-characters <0-128>
    set expire-status {enable | disable}
    set expire-day <1-999>
    set reuse-password {enable | disable}
end
```

Associating a FortiToken to an administrator account

You can also associate FortiTokens with administrator accounts.

To associate a FortiToken to an administrator account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.
2. Go to *System* > *Administrators*. Edit the admin account. This example assumes that the account is fully configured except for two-factor authentication.
3. Enable *Two-factor Authentication*.
4. From the *Token* dropdown list, select the desired FortiToken serial number.
5. In the *Email Address* field, enter the administrator's email address.
6. Click *OK*.

For a mobile token, click *Send Activation Code* to send the activation code to the configured email address. The admin uses this code to activate their mobile token. You must have configured an email service in *System* > *Settings* to send the activation code.

To associate a FortiToken to an administrator account using the CLI:

```
config system admin
   edit <username>
      set password "myPassword"
      set two-factor fortitoken
      set fortitoken <serial_number>
      set email-to "username@example.com"
   next
end
```

The `fortitoken` keyword is not visible until you select `fortitoken` for the `two-factor` option.

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

SSO administrators

SSO administrators are automatically created when the FortiGate acts as a SAML service provider (SP) with *SAML Single Sign-On* enabled in the Security Fabric settings.

On the system login page, an administrator can log in with their username and password against the root FortiGate acting as the identity provider (IdP) in the Security Fabric. After the first successful log in, this user is added to the administrators table (*System* > *Administrators* under *Single Sign-On Administrator*). The default profile selected is based on the SP settings (*Default admin profile*). See Configuring a downstream FortiGate as an SP on page 1673 for more information.

SSO administrators can be manually configured in FortiOS.

To manually configure an SSO administrator in the GUI:

1. Go to *System* > *Administrators* and click *Create New* > *SSO Admin*.
2. Enter the username.
3. Select an administrator profile.
4. Click *OK*.

To manually configure an SSO administrator in the CLI:

```
config system sso-admin
    edit <name>
        set accprofile <profile>
        set vdom <vdom>
    next
end
```

FortiGate administrator log in using FortiCloud single sign-on

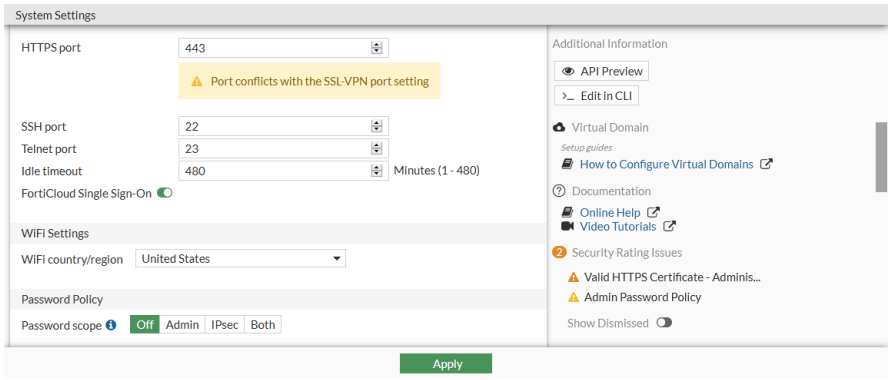
FortiGate can be configured to allow administrators to log in using FortiCloud single sign-on. Both IAM and non-IAM users on the FortiCloud support portal are supported. Non-IAM users must be the FortiCloud account that the FortiGate is registered to.

To configure an IAM user in FortiCloud:

1. Log in to your FortiCloud account at support.fortinet.com.
2. Select *Services* > *IAM* and *click Add IAM user*.
3. See Adding an IAM user in the *FortiCloud Identity & Access Management (IAM)* guide for more information. The *Portal Permissions* for *SupportSite*, *IAMPortal*, and *FortiOS SSO* must be configured to allow portal access for administrators.

To enable FortiCloud single sign-On on the FortiGate:

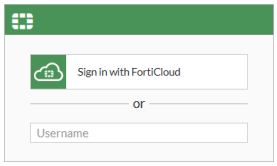
1. Log in to the FortiGate and go to *System* > *Settings*.
2. Enable *FortiCloud Single Sign-On*.



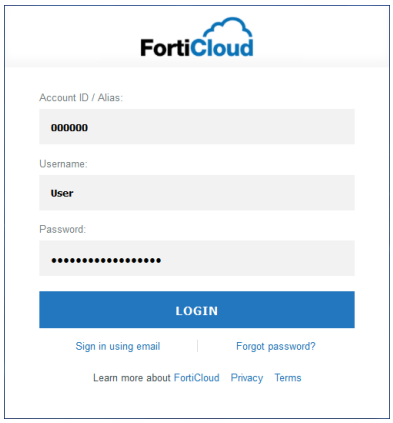
3. Click *Apply*.

To log in to the FortiGate with the FortiCloud user:

1. Go to the FortiGate log in screen.



2. Click *Sign in with FortiCloud*. The FortiCloud sign in screen opens.
3. Do one of the following:
   - Enter the email address and password.
   - Click *Sign in as IAM user* and enter the IAM user information.



4. Click *Login*.
   You are logged in to the FortiOS GUI. The SSO username is shown in the top right corner of the GUI.

Firmware

Fortinet periodically updates the FortiGate firmware to include new features and resolve important issues. After you have registered your FortiGate unit, firmware updates can be downloaded from the Fortinet Customer Service & Support website.

Always back up the current configuration before installing new firmware. See Configuration backups on page 55.

Before you install any new firmware, follow the below steps:

1. Review the Release Notes for a new firmware release.
2. Review the Supported Upgrade Paths.
3. Download a copy of the currently installed firmware, in case you need to revert to it. See Downloading a firmware image on page 1423 and Downgrading to a previous firmware version on page 1427 for details.
4. Have a plan in place in case there is a critical failure, such as the FortiGate not coming back online after the update. This could include having console access to the device (Connecting to the CLI on page 25), ensuring that you TFTP server is working (Installing firmware from system reboot on page 1428), and preparing a USB drive (Restoring from a USB drive on page 1429).
5. Backup the current configuration, including local certificates. See Configuration backups on page 55 for details.
6. Test the new firmware until you are satisfied that it applies to your configuration. See Testing a firmware version on page 1425 and Controlled upgrade on page 1430 for details.

Installing new firmware without reviewing release notes or testing the firmware may result in changes to settings and unexpected issues.

Only FortiGate admin users and administrators whose access profiles contain system read and write privileges can change the FortiGate firmware.

Firmware upgrade notifications

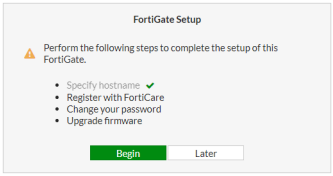
FortiGates with a firmware upgrade license that are connected to FortiGuard display upgrade notifications in the setup window, banner, and FortiGuard menu. The firmware notifications are enabled by default.

To configure firmware notifications in the CLI:

```
config system global
    set gui-firmware-upgrade-warning {enable | disable}
end
```

To use the firmware upgrade notifications in the GUI:

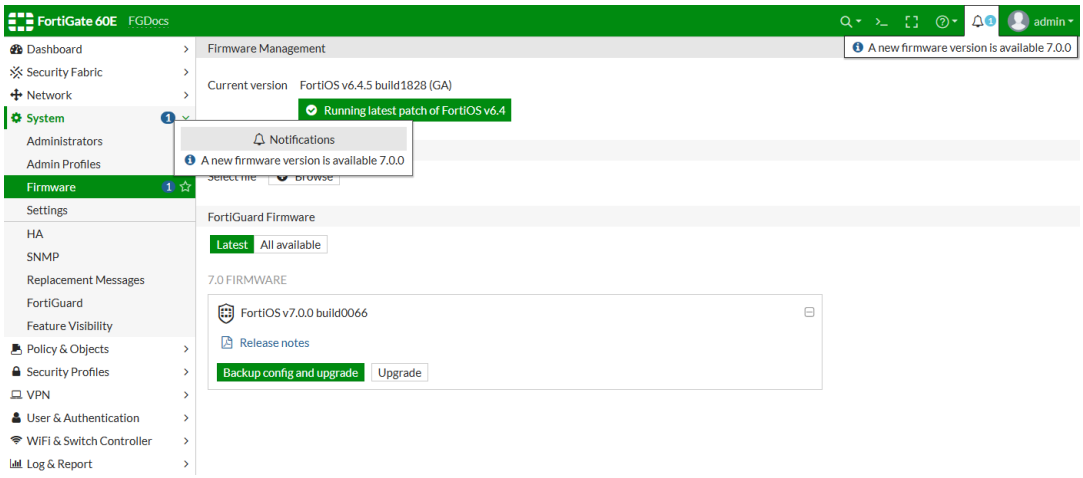
1. When you log in to FortiGate, the *FortiGate Setup* window includes an *Upgrade firmware* step. Click *Begin*.



2. Follow the steps in the *Setup Progress*, then click *Review Firmware Upgrade*.

   The *System* > *Firmware* page opens.

3. Notifications appear below the *Notification* icon in the banner, and beside *Firmware* in the tree menu.



Downloading a firmware image

Firmware images for all FortiGate units are available on the Fortinet Customer Service & Support website.

To download firmware:

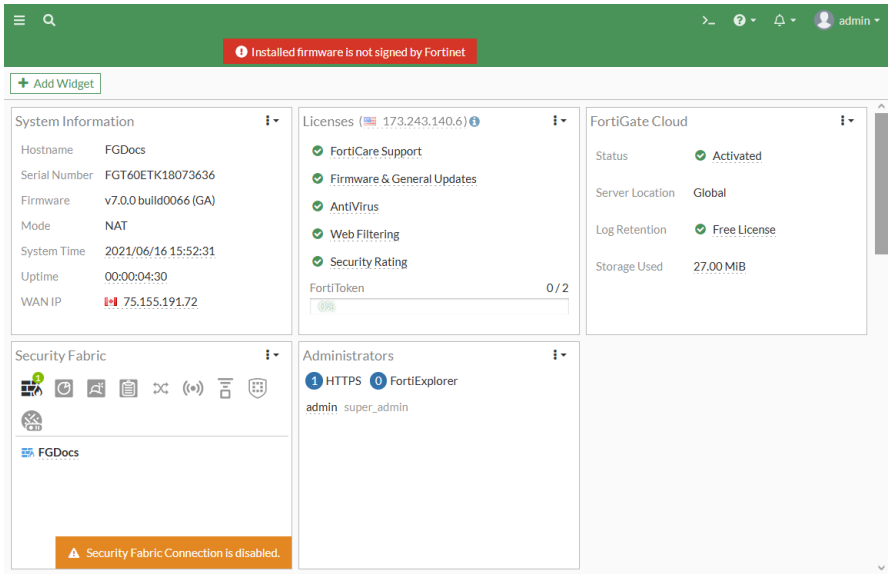
1. Log into the support site with your user name and password.
2. Go to *Support* > *Firmware Download*.
   A list of Release Notes is shown. If you have not already done so, download and review the Release Notes for the firmware version that you are upgrading your FortiGate unit to.
3. Select the *Download* tab.
4. Navigate to the folder for the firmware version that you are upgrading to.
5. Find your device model on the list. FortiWiFi devices have file names that start with *FWF*.
6. Click *HTTPS* in the far right column to download the firmware image to your computer.

Firmware can also be downloaded using FTP, but as FTP is not an encrypted file transferring protocol, HTTPS downloading is recommended.

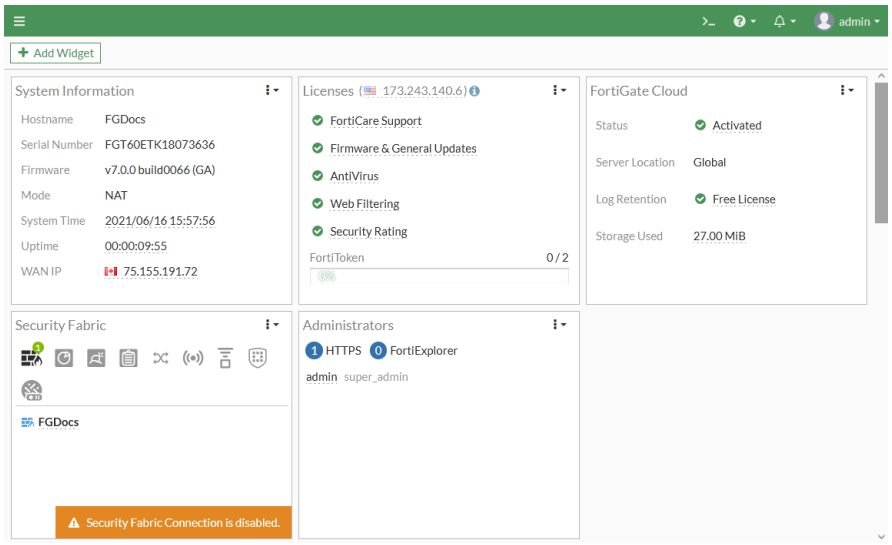
FortiOS image signing and verification

Official FortiOS firmware images are signed by the Fortinet CA. The BIOS checks the validity of an image when it is uploaded to the device. If the image is not signed by the Fortinet CA, a warning message is shown in the GUI.

Unsigned image:



Signed image:



This feature is implemented on all FortiGate F-series models and E-series models released in 2019 and later.

Testing a firmware version

The integrity of firmware images downloaded from Fortinet's support portal can be verified using a file checksum. A file checksum that does not match the expected value indicates a corrupt file. The corruption could be caused by errors in transfer or by file modification. A list of expected checksum values for each build of released code is available on Fortinet's support portal.

Image integrity is also verified when the FortiGate is booting up. This integrity check is done through a cyclic redundancy check (CRC). If the CRC fails, the FortiGate unit will encounter an error during the boot process.

Firmware images are signed and the signature is attached to the code as it is built. When upgrading an image, the running OS will generate a signature and compare it with the signature attached to the image. If the signatures do not match, the new OS will not load.

Testing before installation

FortiOS lets you test a new firmware image by installing the firmware image from a system reboot and saving it to system memory. After completing this procedure, the FortiGate unit operates using the new firmware image with the current configuration. The new firmware image is not permanently installed. The next time the FortiGate unit restarts, it operates with the originally installed firmware image using the current configuration. If the new firmware image operates successfully, you can install it permanently using the procedure explained in Upgrading the firmware.

For this procedure, you must install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

To test the new firmware version:

1. Connect to the CLI using an RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory on the TFTP server.

4. Ensure that the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Restart the FortiGate unit: `execute reboot`. The following message is shown:
   ```
   This operation will reboot the system!
   Do you want to continue? (y/n)
   ```
6. Type `y`. As the FortiGate unit starts, a series of system startup messages appears.
7. When the following messages appears:
   ```
   Press any key to display configuration menu.....
   ```
   Immediately press any key to interrupt the system startup.

   You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `execute reboot` command.

   If you successfully interrupt the startup process, the following messages appears:
   ```
   [G]: Get firmware image from TFTP server.
   [F]: Format boot device.
   [B]: Boot with backup firmware and set as default
   [C]: Configuration and information
   [Q]: Quit menu and continue to boot with default firmware.
   [H]: Display this list of options.
   Enter G, F, Q, or H:
   ```
8. Type *G* to get the new firmware image from the TFTP server. The following message appears: `Enter TFTP server address [192.168.1.168]:`
9. Type the address of the TFTP server, then press *Enter*. The following message appears: `Enter Local Address [192.168.1.188]:`
10. Type the IP address of the FortiGate unit to connect to the TFTP server.

The IP address must be on the same network as the TFTP server.

Make sure that you do not enter the IP address of another device on this network.

The following message appears:
```
Enter File Name [image.out]:
```

11. Enter the firmware image file name then press *Enter*. The TFTP server uploads the firmware image file to the FortiGate unit and the following message appears:
    ```
    Save as Default firmware/Backup firmware/Run image without saving: [D/B/R]
    ```
12. Type *R*. The FortiGate image is installed to system memory and the FortiGate unit starts running the new firmware image, but with its current configuration.

Test the new firmware image as required. When done testing, reboot the FortiGate unit, and the it will resume using the firmware that was running before you installed the test firmware.

Upgrading the firmware

Installing a new firmware image replaces the current antivirus and attack definitions, along with the definitions included with the firmware release that is being installing. After you install new firmware, make sure that the antivirus and attack definitions are up to date.

Back up your configuration before making any firmware changes.

To upgrade the firmware in the GUI:

1. Log into the FortiGate GUI as the admin administrative user.
2. Go to *System* > *Firmware*.
3. Under *Upload Firmware*, click *Browse* and locate the previously downloaded firmware image file (see Downloading a firmware image on page 1423).
4. Click *Backup config and upgrade*.
   The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.

To upgrade the firmware in the CLI:

1. Make sure that the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log into the CLI.
4. Ping the TFTP server to ensure that the FortiGate can connect to it:
   ```
   execute ping <tftp_ipv4>
   ```
5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:
   ```
   execute restore image tftp <filename> <tftp_ipv4>
   ```
   The FortiGate unit responds with the message:
   ```
   This operation will replace the current firmware version!
   Do you want to continue? (y/n)
   ```
6. Type `y`. The FortiGate unit uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.
7. Reconnect to the CLI.
8. Update the antivirus and attack definitions:
   ```
   execute update-now
   ```

Downgrading to a previous firmware version

Downgrading the firmware is not recommended.

This procedure downgrades the FortiGate to a previous firmware version. The backup configuration might not be able to be restored after downgrading.

To downgrade to a previous firmware version in the GUI:

1. Log into the FortiGate GUI as the admin administrative user.
2. Go to *System* > *Firmware*.
3. Under *Upload Firmware*, click *Browse* and locate the previously downloaded firmware image file (see Downloading a firmware image on page 1423).
4. Click *Confirm version downgrade*.
5. Click *Backup config and downgrade*.
   The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.

To downgrade to a previous firmware version in the CLI:

1. Make sure that the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log into the CLI.
4. Ping the TFTP server to ensure that the FortiGate can connect to it:
   ```
   execute ping <tftp_ipv4>
   ```
5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:
   ```
   execute restore image tftp <filename> <tftp_ipv4>
   ```
   The FortiGate unit responds with the message:
   ```
   This operation will replace the current firmware version!
   Do you want to continue? (y/n)
   ```
6. Type `y`. The FortiGate unit uploads the firmware image file, then a message similar to the following is shown:
   ```
   Get image from tftp server OK.
   Check image OK.
   This operation will downgrade the current firmware version!
   Do you want to continue? (y/n)
   ```
7. Type `y`. The FortiGate unit downgrades to the old firmware version and restarts. This process takes a few minutes.
8. Reconnect to the CLI.
9. Update the antivirus and attack definitions:
   ```
   execute update-now
   ```

Installing firmware from system reboot

In the event that the firmware upgrade does not load properly and the FortiGate unit will not boot, or continuously reboots, it is best to perform a fresh install of the firmware from a reboot using the CLI. If configured, the firmware can also be automatically installed from a USB drive; see Restoring from a USB drive on page 1429 for details.

This procedure installs a firmware image and resets the FortiGate unit to factory default settings. You can use this procedure to upgrade to a new firmware version, revert to an older firmware version, or re-install the current firmware.

To use this procedure, you must connect to the CLI using the FortiGate console port and a RJ-45 to USB (or DB-9), or null modem cable. You must also install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

Before beginning this procedure, ensure that you backup the FortiGate unit configuration. See Configuration backups on page 55 for details. If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

To install firmware from a system reboot:

1. Connect to the CLI using the RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory of the TFTP server.
4. Ensure that the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Restart the FortiGate unit: `execute reboot`. The following message is shown:
   ```
   This operation will reboot the system!
   ```

```
Do you want to continue? (y/n)
```

6. Type `y`. As the FortiGate unit starts, a series of system startup messages appears.
7. When the following messages appears:
   ```
   Press any key to display configuration menu.....
   ```
   Immediately press any key to interrupt the system startup.

   You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `execute reboot` command.

   If you successfully interrupt the startup process, the following messages appears:

   ```
   [C]: Configure TFTP parameters.
   [R]: Review TFTP parameters.
   [T]: Initiate TFTP firmware transfer.
   [F]: Format boot device.
   [I]: System information.
   [B]: Boot with backup firmware and set as default.
   [Q]: Quit menu and continue to boot.
   [H]: Display this list of options.

   Enter C,R,T,F,I,B,Q,or H:
   ```
8. If necessary, type `C` to configure the TFTP parameters, then type `Q` to return to the previous menu:

   ```
   [P]: Set firmware download port.
   [D]: Set DHCP mode.
   [I]: Set local IP address.
   [S]: Set local subnet mask.
   [G]: Set local gateway.
   [V]: Set local VLAN ID.
   [T]: Set remote TFTP server IP address.
   [F]: Set firmware file name.
   [E]: Reset TFTP parameters to factory defaults.
   [R]: Review TFTP parameters.
   [N]: Diagnose networking(ping).
   [Q]: Quit this menu.
   [H]: Display this list of options.

   Enter P,D,I,S,G,V,T,F,E,R,N,Q,or H:
   ```

   The IP address must be on the same network as the TFTP server.

   Make sure that you do not enter the IP address of another device on this network.
9. Type `T` get the new firmware image from the TFTP server.
   The FortiGate unit loads the firmware.
10. Save the firmware as the default (`D`) or backup (`B`) firmware image, or run the image without saving it (`R`).
    The FortiGate unit installs the new firmware image and restarts. The installation might take a few minutes to complete.

Restoring from a USB drive

The FortiGate firmware can be manually restored from a USB drive, or installed automatically from a USB drive after a reboot.

To restore the firmware from a USB drive:

1. Copy the firmware file to the root directory on the USB drive.
2. Connect the USB drive to the USB port of the FortiGate device.
3. Connect to the FortiGate CLI using the RJ-45 to USB (or DB-9) or null modem cable.
4. Enter the following command:
   ```
   execute restore image usb <filename>
   ```
   The FortiGate unit responds with the following message:
   ```
   This operation will replace the current firmware version! Do you want to continue?
   (y/n)
   ```
5. Type `y`. The FortiGate unit restores the firmware and restarts. This process takes a few minutes.
6. Update the antivirus and attack definitions:
   ```
   execute update-now
   ```

To install firmware automatically from a USB drive:

1. Go to *System* > *Settings*.
2. In the *Start Up Settings* section, enable *Detect firmware* and enter the name of the firmware file.
3. Copy the firmware file to the root directory on the USB drive.
4. Connect the USB drive to the USB port of the FortiGate device.
5. Reboot the FortiGate device.

Controlled upgrade

Using a controlled upgrade, you can upload a new version of the FortiOS firmware to a separate partition in the FortiGate memory for later upgrade. The FortiGate unit can be configured so that when it is rebooted, it will automatically load the new firmware. Using this option, you can stage multiple FortiGate units to upgrade simultaneously using FortiManager or a script.

To load the firmware for later installation:

```
execute restore secondary-image {ftp | tftp | usb} <filename_str>
```

To set the FortiGate unit so that when it reboots, the new firmware is loaded:

```
execute set-next-reboot {primary | secondary}
```

where `{primary | secondary}` is the partition with the preloaded firmware.

Settings

The default administrator password should be configured immediately after the FortiGate is installed, see Default administrator password on page 1431.

After that, there are several system settings that should also be configured in *System* > *Settings*:

- Changing the host name on page 1432
- Setting the system time on page 1433

- Configuring ports on page 1436
- Setting the idle timeout time on page 1437
- Setting the password policy on page 1438
- Changing the view settings on page 1438
- Setting the administrator password retries and lockout time on page 1439
- TLS configuration on page 1439
- Controlling return path with auxiliary session on page 1440
- Email alerts on page 1443

Default administrator password

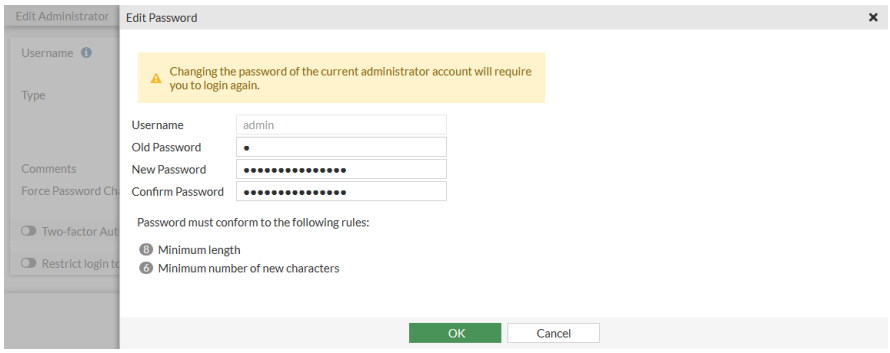
By default, your FortiGate has an administrator account set up with the username `admin` and no password. In order to prevent unauthorized access to the FortiGate, it is highly recommended that you add a password to this account.

Adding a password to the *admin* administrator is mandatory. You will be prompted to configured it the first time you log in to the FortiGate using that account, after a factory reset, and after a new image installation.

To change the default password in the GUI:

1. Go to *System* > *Administrators*.
2. Edit the *admin* account.
3. Click *Change Password*.
4. If applicable, enter the current password in the *Old Password* field.
5. Enter a password in the *New Password* field, then enter it again in the *Confirm Password* field.
   If the password does not conform to the password policy, an error is shown:

   If the password conforms to the password policy, no error message is shown:



6. Click *OK*.

To change the default password in the CLI:

```
config system admin
    edit admin
        set password <old password> <old password>
New password must conform to the password policy enforced on this device:
minimum-length=8; the new password must have at least 1 unique character(s) which don't
exist in the old password.; must not be same as last two passwords

node_check_object fail! for password *

value parse error before '*'
Command fail. Return code -49

        set password <new password> <old password>
    next
end
```

It is also recommended that you change the user name of this account; however, since you cannot change the user name of an account that is currently in use, a second administrator account must be created in order to do this.

Changing the host name

The FortiGate host name is shown in the *Hostname* field in the *System Information* widget on a dashboard, as the command prompt in the CLI, as the SNMP system name, as the device name on FortiGate Cloud, and other places. If the FortiGate is in an HA cluster, use a unique host name to distinguish it from the other devices in the cluster.

An administrator requires *System* > *Configuration* read/write access to edit the host name. See Administrator profiles on page 1413 for details.

To change the host name in the GUI:

1. Go to *System* > *Settings*.
2. In the *Host name* field, enter a new name.
3. Click *Apply*.

To change the host name in the CLI:

```
config system global
    set hostname <hostname>
end
```

Setting the system time

You can either manually set the FortiOS system time, or configure the device to automatically keep its system time correct by synchronizing with a Network Time Protocol (NTP) or Precision Time Protocol (PTP) server.

Daylight savings time is enabled by default, and can only be configured in the CLI.

For many features to work, including scheduling, logging, and SSL-dependent features, the FortiOS system time must be accurate.

To configure the date and time in the GUI:

1. Go to *System* > *Settings*.
2. In the *System Time* section, configure the following settings to either manually set the time or use an NTP server:

Time Zone	Select a time zone from the list. This should be the time zone that the FortiGate is in.
Set Time	Select either *NTP*, *PTP*, or *Manual settings*.
NTP	To use an NTP server other than FortiGuard, the CLI must be used. In the *Sync interval* field, enter how often, in minutes, that the device synchronizes its time with the NTP server.
PTP	• Set the *Mode* to *Multicast* or *Hybrid*. • Select the *Delay mechanism*: *E2E* or *P2P*. • Set the *Request interval*, in seconds. • Select the *Interface*.
Manual settings	Manually enter the *Date*, and *Time*.
Setup device as local NTP server	Enable to configure the FortiGate as a local NTP server. This option is not available if *Set Time* is *PTP*. In the *Listen on Interfaces* field, set the interface or interfaces that the FortiGate will listen for NTP requests on.

3. Click *Apply*.

To configure the date and time in the CLI:

1. Configure the timezone and daylight savings time:

```
config system global
    set timezone <integer>
```

```
    set dst {enable | disable}
end
```

2. Either manually configure the date and time, or configure an NTP or PTP server:
   - Manual:

     ```
     execute date <yyyy-mm-dd>
     execute time <hh:mm:ss>
     ```

   - NTP server:

     ```
     config system ntp
         set ntpsync enable
         set type {fortiguard | custom}
         set syncinterval <integer>
         set source-ip <ip_address>
         set source-ip6 <ip6_address>
         set server-mode {enable | disable}
         set interface <interface>
         set authentication {enable | disable}
         set key-type {MD5 | SHA1}
         set key <password>
         set key-id <integer>
         config ntpserver
             edit <server_id>
                 set server <ip_address or hostname>
                 set ntpv3 {enable | disable}
                 set authentication {enable | disable}
                 set interface-select-method {auto | sdwan | specify}
                 set key <password>
                 set key-id <integer>
             next
         end
     end
     ```

   - PTP server:

     ```
     config system ptp
         set status enable
         set mode {multicast | hybrid}
         set delay-mechanism {E2E | P2P}
         set request-interval <integer>
         set interface <string>
     end
     ```

SHA-1 authentication support (for NTPv4)

SHA-1 authentication support allows the NTP client to verify that severs are known and trusted and not intruders masquerading (accidentally or intentionally) as legitimate servers. In cryptography, SHA-1 is a cryptographic hash algorithmic function.

SHA-1 authentication support is only available for NTP clients, not NTP servers.

To configure authentication on a FortiGate NTP client:

```
config system ntp
    set ntpsync enable
    set type custom
    set syncinterval 1
    config ntpserver
        edit "883502"
            set server "10.1.100.11"
            set authentication enable
            set key **********
            set key-id 1
        next
    end
end
```

Command	Description
`authentication <enable | disable>`	Enable/disable MD5/SHA1 authentication (default = disable).
`key <passwd>`	Key for MD5/SHA1 authentication. Enter a password value.
`key-id <integer>`	Key ID for authentication. Enter an integer value from 0 to 4294967295.

To confirm that NTP authentication is set up correctly:

```
# diagnose sys ntp status
synchronized: yes, ntpsync: enabled, server-mode: disabled
ipv4 server(10.1.100.11) 10.1.100.11 -- reachable(0xff) S:4 T:6 selected
server-version=4, stratum=3
```

If NTP authentication is set up correctly, the server version is equal to 4.

PTPv2

Precision time protocol (PTP) is used to synchronize network clocks. It is best suited to situations where time accuracy is of the utmost importance, as it supports accuracy in the sub-microsecond range. Conversely, NTP accuracy is in the range of milliseconds or tens of milliseconds.

The following CLI commands are available:

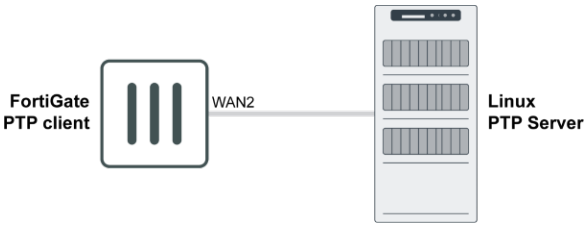
```
config system ptp
    set status {enable | disable}
    set mode {multicast | hybrid}
    set delay-mechanism {E2E | P2P}
    set request-interval <integer>
    set interface <interface>
end
```

Command	Description
status {enable | disable}	Enable or disable the FortiGate system time by synchronizing with a PTP server (default = disable).
mode {multicast | hybrid}	Use multicast or hybrid transmission (default = multicast).

Command	Description
delay-mechanism {E2E | P2P}	Use end-to-end (E2E) or peer-to-peer (P2P) delay detection (default = E2E).
request-interval <integer>	The logarithmic mean interval between the delay request messages sent by the client to the server in seconds (default = 1).
interface <interface>	The interface that the PTP client will reply through.

Sample configuration

This example uses the following topology:



To configure a FortiGate to act as a PTP client that synchronizes itself with a Linux PTP server:

1. Enable debug messages:

   ```
   # diagnose debug application ptpd -1
   ```

   This command will provide details to debug the PTP communication with the server.
2. Check the system date:

   ```
   # execute date
   current date is: 2021-04-01
   ```
3. Configure PTP in global mode:

   ```
   config system ptp
       set status enable
       set interface wan2
   end
   ```
4. Check the system date again after synchronization with the PTP server:

   ```
   # execute date
   current date is: 2021-04-27
   ```

Configuring ports

To improve security, the default ports for administrative connections to the FortiGate can be changed. Port numbers must be unique. If a conflict exists with a particular port, a warning message is shown.

When connecting to the FortiGate after a port has been changed, the port number be included, for example: `https://192.168.1.99:100`.

To configure the ports in the GUI:

1. Go to *System* > *Settings*.
2. In the *Administration Settings* section, set the HTTP, HTTPS, SSH, and Telnet ports.
3. Enable *Redirect to HTTPS* to prevent HTTP from being used by administrators.
4. Click *Apply*.

To configure the ports in the CLI:

```
config system global
    set admin-port <port>
    set admin-sport <port>
    set admin-https-redirect {enable | disable}
    set admin-ssh-port <port>
    set admin-telnet-port <port>
end
```

Custom default service port range

The default service port range can be customized using the following CLI command:

```
config system global
    set default-service-source-port <port range>
end
```

Where `<port range>` is the new default service port range, that can have a minimum value of 0 and a maximum value up to 65535. The default value is 1 to 65535.

This change effects the TCP/UDP protocol.

Setting the idle timeout time

The idle timeout period is the amount of time that an administrator will stay logged in to the GUI without any activity. This is to prevent someone from accessing the FortiGate if the management PC is left unattended. By default, it is set to five minutes.

A setting of higher than 15 minutes will have a negative effect on a security rating score. See Security rating on page 1688 for more information.

To change the idle timeout in the GUI:

1. Go to *System* > *Settings*.
2. In the *Administration Settings* section, set the *Idle timeout* to up to 480 minutes.
3. Click *Apply*.

To change the idle timeout in the CLI:

```
config system global
    set admintimeout <1-480>
end
```

Setting the password policy

A password policy can be created for administrators and IPsec pre-shared keys. See Password policy on page 1418 for information.

Changing the view settings

The view settings change the look and language of the FortiOS GUI.

To change the view settings in the GUI:

1. Go to *System* > *Settings*.
2. In the *View Settings* section, configure the following settings:

Language	Set the GUI language: *English*, *French*, *Spanish*, *Portuguese*, *Japanese*, *Traditional Chinese*, *Simplifies Chinese*, *Korean*.
Theme	Set the theme color: *Jade*, *Neutrino*, *Mariner*, *Graphite*, *Melongene*, *Retro*, *Dark Matter*, *Onyx*, or *Eclipse*.
Date/Time Display	Set the date and time to display using the FortiGate's or the browser's timezone.
NGFW Mode	Set the NGFW mode to either *Profile-based* (default) or *Policy-based*.
Central SNAT	Optionally, enable central SNAT. This option is only available in *Profile-based* mode.

3. Click *Apply*.

To change the view settings in the CLI:

```
config system global
    set language {english | french | spanish | portuguese | japanese | trach | simch |
korean}
    set gui-theme {jade | neutrino | mariner | graphite | melongene | retro | dark-matter |
onyx | eclipse}
    set gui-date-time-source {system | browser}
end
config system settings
    set ngfw-mode {profile-based | policy-based}
    set central-nat {enable | disable}
end
```

Setting the administrator password retries and lockout time

By default, the number password retry attempts is set to three, allowing the administrator a maximum of three attempts at logging in to their account before they are locked out for a set amount of time (by default, 60 seconds).

The number of attempts and the default wait time before the administrator can try to enter a password again can be configured using the CLI.

A maximum of ten retry attempts can be configured, and the lockout period can be 1 to 2147483647 seconds (over 68 years). The higher the retry attempts, the higher the risk that someone might be able to guess the password.

To configure the lockout options:

```
config system global
    set admin-lockout-threshold <failed_attempts>
    set admin-lockout-duration <seconds>
end
```

For example, to set the number of retry attempts to 1, and the lockout time to 5 minutes:

```
config system global
    set admin-lockout-threshold 1
    set admin-lockout-duration 300
end
```

If the time span between the first failed log in attempt and the lockout threshold failed attempt is less than lockout time, the lockout will be triggered.

TLS configuration

The minimum TLS version that is used for local out connections from the FortiGate can be configured in the CLI:

```
config system global
    set ssl-min-proto-version {SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
```

By default, the minimum version is TLSv1.2. The FortiGate will try to negotiate a connection using the configured version or higher. If the server that FortiGate is connecting to does not support the version, then the connection will not be made. Some FortiCloud and FortiGuard services do not support TLSv1.3.

Minimum SSL/TLS versions can also be configured individually for the following settings, not all of which support TLSv1.3:

Setting	CLI
Email server	`config system email-server`
Certificate	`config vpn certificate setting`
FortiSandbox	`config system fortisandbox`
FortiGuard	`config log fortiguard setting`

Setting	CLI
FortiAnalyzer	`config log fortianalyzer setting`
Syslog	`config log syslogd setting`
User Authentication	`config user setting`
LDAP server	`config user ldap`
POP3 server	`config user pop3`
Exchange server	`config user exchange`

A minimum (`ssl-min-proto-ver`) and a maximum (`ssl-max-proto-ver`) version can be configured for SSL VPN. See TLS 1.3 support on page 1304

Controlling return path with auxiliary session

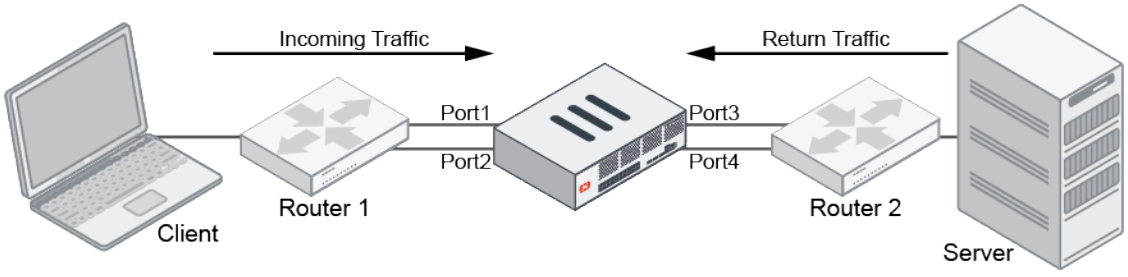
When multiple incoming or outgoing interfaces are used in SD-WAN or for load balancing, changes to routing or incoming or return traffic interfaces impacts how an existing sessions handles the traffic. Auxiliary sessions can be used to handle these changes to traffic patterns.

- In FortiOS 6.0 and earlier, the auxiliary session feature is not supported.
- In FortiOS 6.2.0 to 6.2.2, the auxiliary session feature is permanently enabled.
- In FortiOS 6.2.3 and later, the auxiliary session feature is disabled by default, and can be enabled if required.

To enable the auxiliary session feature:

```
config system settings
    set auxiliary-session {enable | disable*}
end
```

Scenarios



Incoming traffic is from the client to the server. Return traffic is from the server to the client.

Scenario 1 - Return traffic returns on the original outgoing interface

In this scenario, a session is established between port1 and port3. When the return traffic hits port3:

Auxiliary sessions disabled:

The reply to the client egresses on the original incoming interface, port1. If policy routes or SD-WAN rules are configured, they are not checked.

Auxiliary sessions enabled:

The reply to the client egresses on the best route in the routing table:

- If the best route is port1, then it will egress on port1.
- If the best route is port2, then it will egress on port2.

If policy routes or SD-WAN rules are configured, they are not checked.

Scenario 2 - Return traffic returns on an interfaces other than the original outgoing interfaces

In this scenario, a session is established between port1 and port3. When the return traffic hits port4:

Auxiliary sessions disabled:

- The session is dirtied and then gets refreshed, and interfaces on the session are updated.
- If there is a high traffic volume or flapping between the interfaces, the CPU usage increases.

Auxiliary sessions enabled:

An auxiliary session is created for the existing session, and traffic returns to the client as normal on the auxiliary session.

Scenario 3 - Incoming traffic enters on an interfaces other than the original incoming interfaces

In this scenario, a session is established between port1 and port3. When the incoming traffic hits port2:

Auxiliary sessions disabled:

The session is dirtied and then gets refreshed, and interfaces on the session are updated.

Auxiliary sessions enabled:

An auxiliary session is created for the existing session, and traffic is forwarded to the server as normal on the auxiliary session.

Scenario 4 - the routing table is changed

In this scenario, a session has been established between port1 and port3, when a new route on port4 is updated as the route to the server.

Auxiliary sessions disabled:

As long as there is a route to the destination, the session will not be dirtied or refreshed. Even though there is a better route, traffic continues on the original path between port1 and port3.

Auxiliary sessions enabled:

The session is dirtied and then gets refreshed, and interfaces on the session are updated.

Effect on NPU offloading sessions

When the auxiliary session feature is disabled, there is always one session. If the incoming or return interface changes, the FortiGate marks the session as dirty and updates the session's interfaces. This cannot be done by the NPU, so the session is not offloaded to the NPU, and is processed by the CPU instead. If Equal-Cost Multi-Path (ECMP) causes the interface to keep changing, then it will use significant CPU resources.

When the auxiliary session feature is enabled and the incoming or return interface changes, it creates an auxiliary session, and all traffic can continue to be processed by the NPU.

Verification

When an auxiliary, or reflect, session is created, it will appear as a reflect session below the existing session:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=111 expire=175 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=4

```

Email alerts

Alert emails are used to notify administrators about events on the FortiGate device, allowing a quick response to any issues.

There are two methods that can be used to configure email alerts:

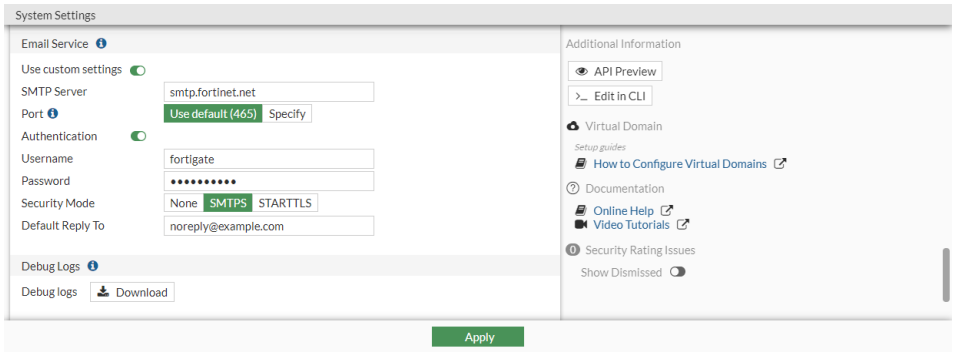
- Automation stitches on page 1445
- Alert emails on page 1447

The FortiGate has a default SMTP server, notification.fortinet.net, that provides secure mail service with SMTPS. It is used for all emails that are sent by the FortiGate, including alert emails, automation stitch emails, and FortiToken Mobile activations. You can also configure a custom email service.

To configure a custom email service in the GUI:

1. Go to *System* > *Settings*.
2. In the *Email Service* section, enable *Use custom settings*.
3. Configure the following settings:

SMTP Server	Enter the address or name of the SMTP server, such as *smtp.example.com*.
Port	If required, select *Specify* and enter a specific port number. The default is port 465.
Authentication	If required by the email server, enable authentication. If enabled, enter the *Username* and *Password*.
Security Mode	Set the security mode: *None*, *SMTPS*, or *STARTTLS*.
Default Reply To	Optionally, enter the reply to email address, such as noreply@example.com. This address will override the from address that is configured for an alert email.



4. Click *Apply*.

To configure a custom email service in the CLI:

```
config system email-server
    set reply-to "noreply@example.com"
    set server "smtp.fortinet.net"
    set port 465
    set authenticate enable
    set username "fortigate"
    set password **********
```

```
    set security smtps
end
```

Automation stitches

Automation stitches can be configured to send emails based on a variety of triggers, giving you control over the events that cause an alert, and who gets alerted. For more information, see Automation stitches on page 1696.

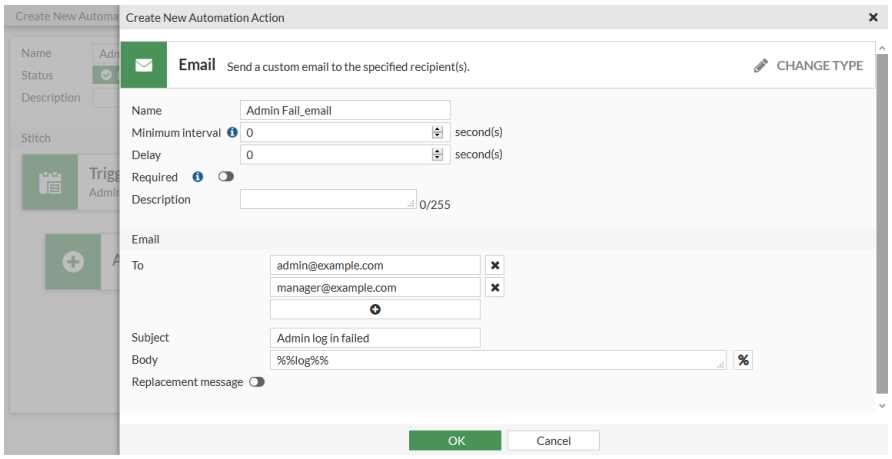
In this example, the default mail service sends an email to two recipients when an Admin login failed event occurs or there is a configuration change.

To configure the automation stitch in the GUI:

1. On the root FortiGate, go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter a name for the stitch, such as *Admin Fail*.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *FortiOS Event Log*.
   c. Enter a name for the trigger, such as *Admin Fail*.
   d. Click in the *Event* field, and in the slide out pane, search for and select *Admin login failed*.

   e. Click *OK*.
   f. Select the trigger in the list and click *Apply*.
4. Configure the action:
   a. Click *Add Action*.
   b. Click *Create* and select *Email*.
   c. Configure the following settings:

Name	Enter a name for the action, such as *Admin Fail_email*.
To	Enter the two email recipients' addresses, such as *admin@example.com* and *manager@example.com*.
Subject	Enter an subject, such as *Admin log in failed*.
Body	Edit as required. By default, the email body will include all the fields from the log event that triggered the stitch.



d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK*.
6. Create a second stitch with *Configuration Change* as the trigger, and an email action with a different subject line (such as *Configuration Change Detected*).

To configure the automation stitch in the CLI:

1. Create automation actions to send the email messages:

```
config system automation-action
    edit "Config Change_email"
        set action-type email
        set email-to "admin@example.com" "manager@example.com"
        set email-subject "Configuration Change Detected"
    next
    edit "Admin Fail_email"
        set action-type email
        set email-to "admin@example.com" "manager@example.com"
        set email-subject "Admin log in failed"
    next
end
```

2. Create the automation triggers:

```
config system automation-trigger
    edit "Config Change"
        set event-type config-change
    next
    edit "Admin Fail"
        set event-type event-log
        set logid 32002
    next
end
```

3. Create the automation stitches:

```
config system automation-stitch
    edit "Config Change"
        set trigger "Config Change"
        set action "Config Change_email"
```

```
        next
        edit "Admin Fail"
            set trigger "Admin Fail"
            set action "Admin Fail_email"
        next
    end
```

Alert emails

When configuring an alert email, you can define the threshold when an issue becomes critical and requires attention. When the threshold is reached, an email is sent to up to three recipients on the configured schedule to notify them of the issue.

Alert email messages can be configured in the CLI. For more information on the available CLI commands, see Configure alert email settings.

In this example, the FortiGate is configured to send email messages to two addresses, admin@example.com and manager@example.com, every two minutes when multiple intrusions, administrator log in or out events, or configuration changes occur.

To configure an alert email:

```
config alertemail setting
    set username fortigate@example.com
    set mailto1 admin@example.com
    set mailto2 manager@example.com
    set filter-mode category
    set email-interval 2
    set IPS-logs enable
    set configuration-changes-logs enable
    set admin-login-logs enable
end
```

Virtual Domains

Virtual Domains (VDOMs) are used to divide a FortiGate into two or more virtual units that function independently. VDOMs can provide separate security policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network.

There are two VDOM modes:

- Split-task VDOM mode: One VDOM is used only for management, and the other is used to manage traffic. See Split-task VDOM mode on page 1449.
- Multi VDOM mode: Multiple VDOMs can be created and managed as independent units. See Multi VDOM mode on page 1453.

By default, most FortiGate units support 10 VDOMs, and many FortiGate models support purchasing a license key to increase the maximum number.

Global settings are configured outside of a VDOM. They effect the entire FortiGate, and include settings such as interfaces, firmware, DNS, some logging and sandboxing options, and others. Global settings should only be changed by top level administrators.

Enable the following to prevent accidentally creating VDOMs in the CLI:

```
config system global
    set edit-vdom-prompt enable
end
```

The FortiGate displays a prompt to confirm before the VDOM is created.

Switching VDOM modes

Switching between VDOM modes is allowed, except to switch from multi VDOM to split-task VDOM mode you must first disable VDOMs.

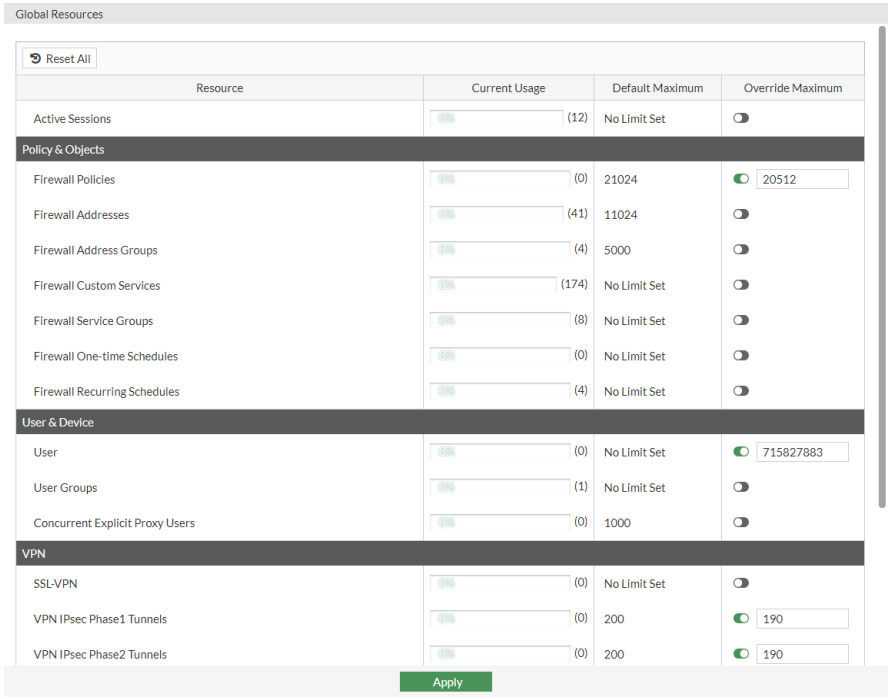
Global and per-VDOM resources

Global and per-VDOM resources can be configured when the FortiGate is in Split-Task or Multi VDOM mode. Global resources apply to resources that are shared by the whole FortiGate, while per-VDOM resources are specific to each VDOM.

By default, all per-VDOM resource settings are set to have no limits. This means that any single VDOM can use all of the FortiGate device's resources. This could deprive other VDOMs of the resources that they require, to the point that could be unable to function. We recommend settings maximum values on the resources that are vital to you.

To configure global resources:

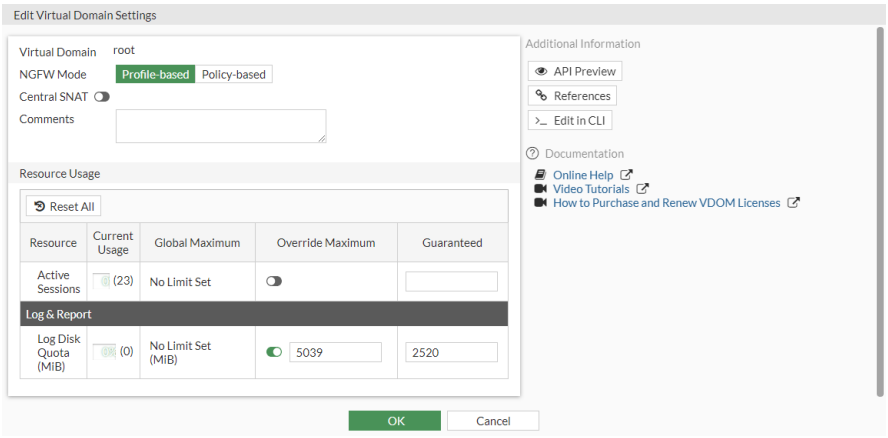
1. In the Global VDOM, go to *System* > *Global Resources*.
2. Enable the resource's override in the *Override Maximum* column, then enter the override value.



3. Click *Apply*.
   To reset the all of the override values, click *Reset All*.

To configure per-VDOM resources:

1. In the Global VDOM, go to *System* > *VDOM*.
2. Edit the VDOM whose resources need to be configured.
3. Enable the resource's override in the *Override Maximum* column, then enter the override value.
4. Optionally, enter a value in the *Guaranteed* column.



5. Click *OK*.
   To reset the all of the override values, click *Reset All*.

Split-task VDOM mode

In split-task VDOM mode, the FortiGate has two VDOMs: the management VDOM (*root*) and the traffic VDOM (*FG-traffic*).

The management VDOM is used to manage the FortiGate, and cannot be used to process traffic.

The following GUI sections are available when in the management VDOM:

- The Status dashboard
- Security Fabric topology and settings (read-only, except for *HTTP Service* settings)
- Interface and static route configuration
- FortiClient configuration
- Replacement messages
- Certificates
- System events
- Log and email alert settings
- Threat weight definitions

The traffic VDOM provides separate security policies, and is used to process all network traffic.

The following GUI sections are available when in the traffic VDOM:

- The Status, Top Usage LAN/DMZ, and Security dashboards
- Security Fabric topology, settings (read-only, except for *HTTP Service* settings), and External Connectors (*Endpoint/Identity* connectors only)
- FortiView
- Interface configuration
- Packet capture
- SD-WAN, SD-WAN Rules, and Performance SLA
- Static and policy routes
- RIP, OSPF, BGP, and Multicast
- Replacement messages
- Feature visibility
- Tags
- Certificates
- Policies and objects
- Security profiles
- VPNs
- User and device authentication
- Wifi and switch controller
- Logging
- Monitoring

Split-task VDOM mode is not available on all FortiGate models. The Fortinet Security Fabric supports split-task VDOM mode.

Enable split-task VDOM mode

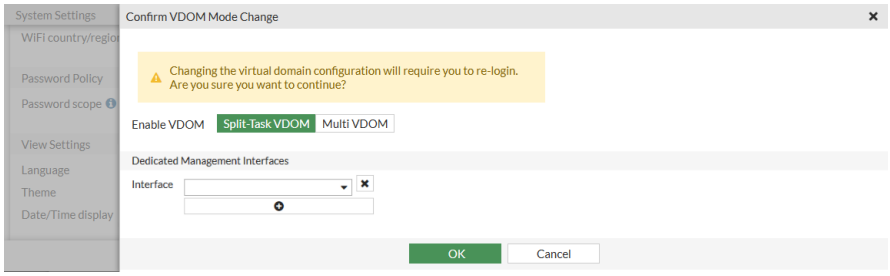
Split-task VDOM mode can be enabled in the GUI or CLI. Enabling it does not require a reboot, but does log you out of the FortiGate.

When split-task VDOM mode is enabled, all current management configuration is assigned to the *root* VDOM, and all non-management settings, such as firewall policies and security profiles, are deleted.

On VMs and FortiGate 60 series models and lower, VDOMs can only be enabled using the CLI.

To enable split-task VDOM mode in the GUI:

1. On the FortiGate, go to *System* > *Settings*.
2. In the *System Operation Settings* section, enable *Virtual Domains*.



3. Select *Split-Task VDOM* for the VDOM mode.
4. Select a *Dedicated Management Interface* from the *Interface* list. This interface is used to access the management VDOM, and cannot be used in firewall policies.
5. Click *OK*.

To enable split-task VDOM mode with the CLI:

```
config system global
    set vdom-mode split-vdom
end
```

Assign interfaces to a VDOM

An interface can only be assigned to one of the VDOMs. When split-task VDOM mode is enabled, all interfaces are assigned to the *root* VDOM. To use an interface in a policy, it must first be assigned to the traffic VDOM.

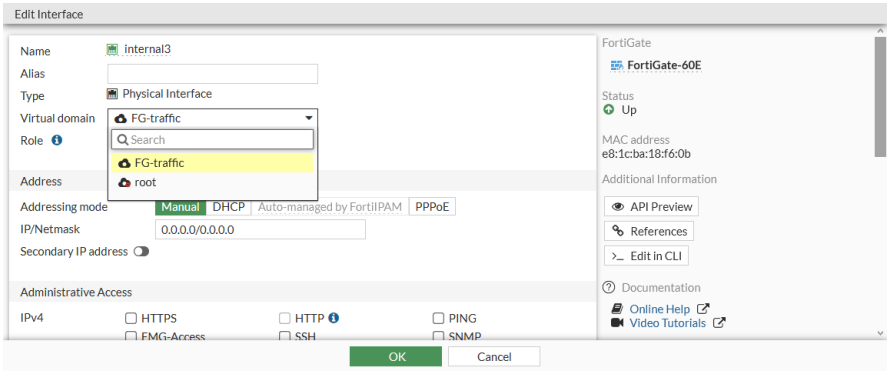
An interface cannot be moved if it is referenced in an existing configuration.

In the GUI, the interface list *Ref.* column shows if the interface is referenced in an existing configuration, and allows you to quickly access and edit those references.

To assign an interface to a VDOM in the GUI:

1. On the FortiGate, go to *Global* > *Network* > *Interfaces*.
2. Edit the interface that will be assigned to a VDOM.

3. Select the VDOM that the interface will be assigned to from the *Virtual Domain* list.



4. Click *OK*.

To assign an interface to a VDOM using the CLI:

```
config global
   config system interface
      edit <interface>
         set vdom <VDOM_name>
      next
   end
end
```

Create per-VDOM administrators

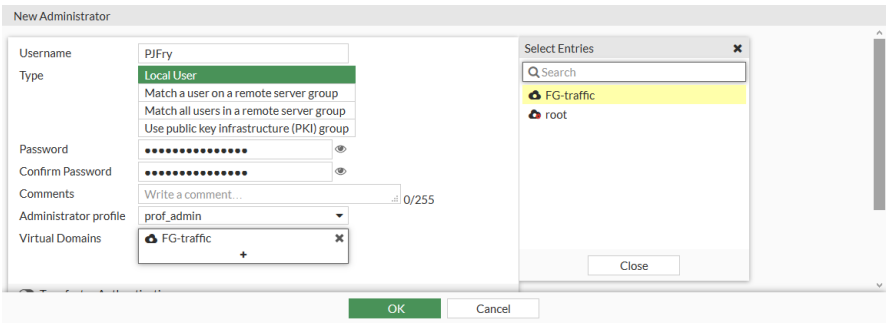
Per-VDOM administrators can be created that can access only the management or traffic VDOM. These administrators must use either the *prof_admin* administrator profile, or a custom profile.

A per-VDOM administrator can only access the FortiGate through a network interface that is assigned to the VDOM that they are assigned to. The interface must also be configured to allow management access. They can also connect to the FortiGate using the console port.

To assign an administrator to multiple VDOMs, they must be created at the global level. When creating an administrator at the VDOM level, the *super_admin* administrator profile cannot be used.

To create a per-VDOM administrator in the GUI:

1. On the FortiGate, connect to the global VDOM.
2. Go to *System* > *Administrators* and click *Create New* > *Administrator*.
3. Fill in the required information, setting the *Type* as *Local User*.
4. In the *Virtual Domains* field, add the VDOM that the administrator will be assigned to, and if necessary, remove the other VDOM from the list.



5. Click *OK*.

To create a per-VDOM administrator using the CLI:

```
config global
   config system admin
      edit <name>
         set vdom <VDOM_name>
         set password <password>
         set accprofile <admin_profile>
         ...
      next
   end
end
```

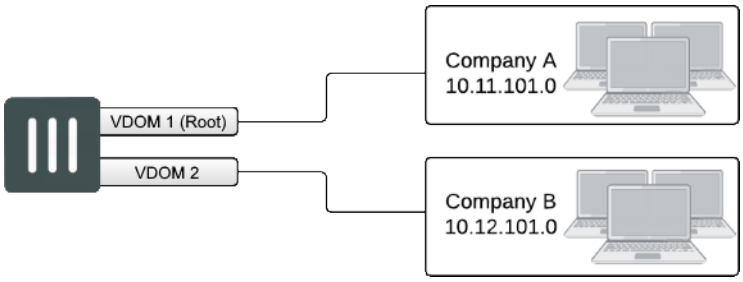
Multi VDOM mode

In multi VDOM mode, the FortiGate can have multiple VDOMs that function as independent units. One VDOM is used to manage global settings. The root VDOM cannot be deleted, and remains in the configuration even if it is not processing any traffic.

Multi VDOM mode is not available on all FortiGate models.

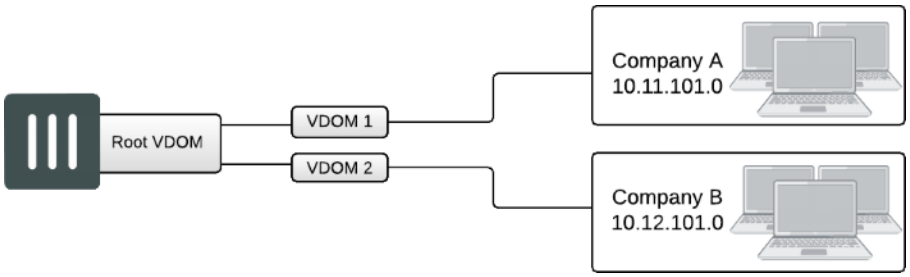
There are three main configuration types in multi VDOM mode:

Independent VDOMs:



Multiple, completely separate VDOMs are created. Any VDOM can be the management VDOM, as long as it has Internet access. There are no inter-VDOM links, and each VDOM is independently managed.

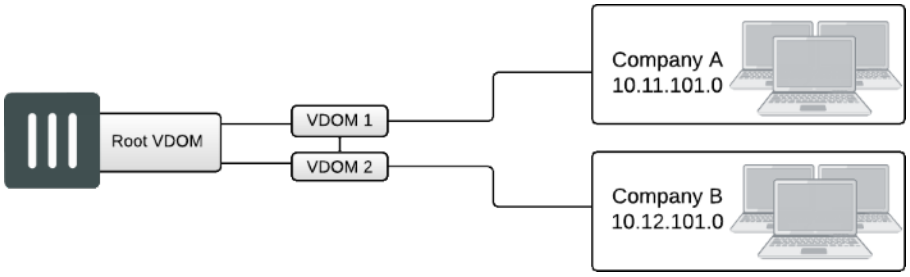
Management VDOM:



A management VDOM is located between the other VDOMs and the Internet, and the other VDOMs connect to the management VDOM with inter-VDOM links. The management VDOM has complete control over Internet access, including the types of traffic that are allowed in both directions. This can improve security, as there is only one point of ingress and egress.

There is no communication between the other VDOMs.

Meshed VDOMs:



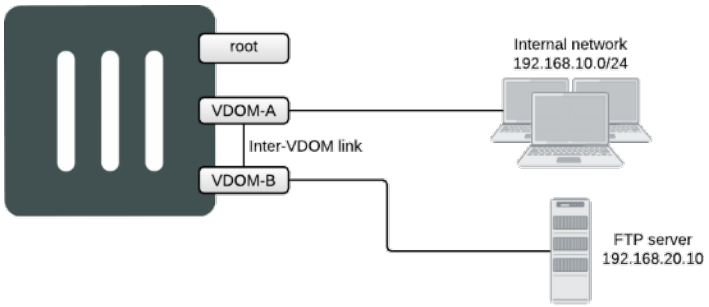
VDOMs can communicate with inter-VDOM links. In full-mesh configurations, all the VDOMs are interconnected. In partial-mesh configurations, only some of the VDOMs are interconnected.

In this configuration, proper security must be achieved by using firewall policies and ensuring secure account access for administrators and users.

Multi VDOM configuration examples

The following examples show how to configure per-VDOM settings, such as operation mode, routing, and security policies, in a network that includes the following VDOMs:

- VDOM-A: allows the internal network to access the Internet.
- VDOM-B: allows external connections to an FTP server.
- root: the management VDOM.



You can use VDOMs in either NAT or transparent mode on the same FortiGate. By default, VDOMs operate in NAT mode.

For both examples, multi VDOM mode must be enabled, and VDOM-A and VDOM-B must be created.

Enable multi VDOM mode

Multi VDOM mode can be enabled in the GUI or CLI. Enabling it does not require a reboot, but does log you out of the device. The current configuration is assigned to the *root* VDOM.

On VMs and FortiGate 60 series models and lower, VDOMs can only be enabled using the CLI.

To enable multi VDOM mode in the GUI:

1. On the FortiGate, go to *System* > *Settings*.
2. In the *System Operation Settings* section, enable *Virtual Domains*.
3. Select *Multi VDOM* for the VDOM mode.
4. Click *OK*.

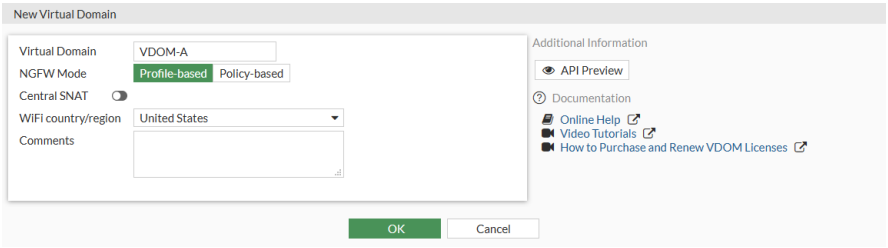
To enable multi VDOM mode with the CLI:

```
config system global
   set vdom-mode multi-vdom
end
```

Create the VDOMs

To create the VDOMs in the GUI:

1. In the *Global* VDOM, go to *System* > *VDOM* and click *Create New*.
2. In the *Virtual Domain* field, enter *VDOM-A*.



3. If required, set the *NGFW Mode*. If the *NGFW Mode* is *Profile-based*, *Central SNAT* can be enabled.
4. Click *OK* to create the VDOM.
5. Repeat the above steps for *VDOM-B*.

To create the VDOMs with the CLI:

```
config vdom
    edit VDOM-A
    next
    edit VDOM-B
    next
end
```

NAT mode

In this example, both VDOM-A and VDOM-B use NAT mode. A VDOM link is created that allows users on the internal network to access the FTP server.

This configuration requires the following steps:

1. Configure VDOM-A on page 1456
2. Configure VDOM-B on page 1458
3. Configure the VDOM link on page 1461

Configure VDOM-A

VDOM-A allows connections from devices on the internal network to the Internet. WAN 1 and port 1 are assigned to this VDOM.

The per-VDOM configuration for VDOM-A includes the following:

- A firewall address for the internal network
- A static route to the ISP gateway
- A security policy allowing the internal network to access the Internet

All procedures in this section require you to connect to VDOM-A, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses* and create a new address.
2. Enter the following information:

Name	internal-network
Type	Subnet
Subnet / IP Range	192.168.10.0/255.255.255.0
Interface	port1

3. Click *OK*.

To add the firewall addresses with the CLI:

```
config vdom
    edit VDOM-A
        config firewall address
            edit internal-network
                set associated-interface port1
                set subnet 192.168.10.0 255.255.255.0
            next
        end
    next
end
```

To add a default route in the GUI:

1. Go to *Network* > *Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.201.7
Interface	wan1
Distance	10

3. Click *OK*.

To add a default route with the CLI:

```
config vdom
    edit VDOM-A
        config router static
            edit 0
                set gateway 172.20.201.7
                set device wan1
            next
        end
    next
end
```

To add the security policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy.
2. Enter the following information:

Name	VDOM-A-Internet
Incoming Interface	port1
Outgoing Interface	wan1
Source	internal-network

Destination	all
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

3. Click *OK*.

To add the security policy with the CLI:

```
config vdom
    edit VDOM-A
        config firewall policy
            edit 1
                set name "VDOM-A-Internet"
                set srcintf "port1"
                set dstintf "wan1"
                set srcaddr "internal-network"
                set dstaddr "all"
                set action accept
                set schedule "always"
                set service "ALL"
                set nat enable
            next
        end
    next
end
```

Configure VDOM-B

VDOM-B allows external connections to reach an internal FTP server. WAN 2 and port 2 are assigned to this VDOM.

The per-VDOM configuration for VDOM-B includes the following:

- A firewall address for the FTP server
- A virtual IP address for the FTP server
- A static route to the ISP gateway
- A security policy allowing external traffic to reach the FTP server

All procedures in this section require you to connect to VDOM-B, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses* and create a new address.
2. Enter the following information:

Address Name	FTP-server
Type	Subnet

Subnet / IP Range	192.168.20.10/32
Interface	port2
Show in Address List	enabled

3. Click *OK*.

To add the firewall addresses with the CLI:

```
config vdom
    edit VDOM-B
        config firewall address
            edit FTP-server
                set associated-interface port2
                set subnet 192.168.20.10 255.255.255.255
            next
        end
    next
end
```

To add the virtual IP address in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* and create a new virtual IP address.
2. Enter the following information:

Name	FTP-server-VIP
Interface	wan2
External IP Address/Range	172.25.177.42
Internal IP Address/Range	192.168.20.10

3. Click *OK*.

To add the virtual IP address with the CLI:

```
config vdom
    edit VDOM-B
        config firewall vip
            edit FTP-server-VIP
                set extip 172.25.177.42
                set extintf wan2
                set mappedip 192.168.20.10
            next
        end
    next
end
```

To add a default route in the GUI:

1. Go to *Network* > *Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.10.10
Interface	wan2
Distance	10

3. Click *OK*.

To add a default route with the CLI:

```
config vdom
    edit VDOM-B
        config router static
            edit 0
                set gateway 172.20.10.10
                set device wan2
            next
        end
    next
end
```

To add the security policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy.
2. Enter the following information:

Name	Access-server
Incoming Interface	wan2
Outgoing Interface	port2
Source	all
Destination	FTP-server-VIP
Schedule	always
Service	FTP
Action	ACCEPT
NAT	enabled

3. Click *OK*.

To add the security policy with the CLI:

```
config vdom
    edit VDOM-B
        config firewall policy
            edit 1
                set name "Access-server"
                set srcintf "wan2"
                set dstintf "port2"
                set srcaddr "all"
                set dstaddr "FTP-server-VIP"
                set action accept
                set schedule "always"
                set service "FTP"
                set nat enable
            next
        end
    next
end
```

Configure the VDOM link

The VDOM link allows connections from VDOM-A to VDOM-B. This allows users on the internal network to access the FTP server through the FortiGate.

The configuration for the VDOM link includes the following:

- The VDOM link interface
- Firewall addresses for the FTP server on VDOM-A and for the internal network on VDOM-B
- Static routes for the FTP server on VDOM-A and for the internal network on VDOM-B
- Policies allowing traffic using the VDOM link

All procedures in this section require you to connect to the global VDOM using a global administrator account.

To add the VDOM link in the GUI:

1. In the Global VDOM, go to *Network* > *Interfaces* and select *Create New* > *VDOM link.*
2. Enter the following information:

Name		VDOM-link
Interface 0		
	Virtual Domain	VDOM-A
	IP/Netmask	0.0.0.0/0.0.0.0
Interface 1		
	Virtual Domain	VDOM-B
	IP/Netmask	0.0.0.0/0.0.0.0

3. Click *OK*.

To add the VDOM link with the CLI:

```
config global
    config system vdom-link
        edit "VDOM-link"
        next
    end
end
```

To add the firewall address on VDOM-A in the GUI:

1. In the VDOM-A VDOM, go to *Policy & Objects* > *Addresses* and create a new address.
2. Enter the following information:

Address Name	FTP-server
Type	Subnet
Subnet / IP Range	192.168.20.10/32
Interface	VDOM-link0
Show in Address List	enabled
Static Route Configuration	enabled

To add the firewall addresses on VDOM-A with the CLI:

```
config vdom
    edit VDOM-A
        config firewall address
            edit "FTP-server"
                set associated-interface "VDOM-link0"
                set allow-routing enable
                set subnet 192.168.20.10 255.255.255.255
            next
        end
    next
end
```

To add the static route on VDOM-A in the GUI:

1. Connect to VDOM-A.
2. Go to *Network* > *Static Routes* and create a new route.
3. Enter the following information:

Destination	Named Address
Named Address	FTP-server
Gateway	0.0.0.0
Interface	VDOM-link0

To add the static route on VDOM-A with the CLI:

```
config vdom
    edit VDOM-A
        config router static
            edit 0
                set device VDOM-link0
                set dstaddr FTP-server
            next
        end
    next
end
```

To add the security policy on VDOM-A in the GUI:

1. In the VDOM-A VDOM, go to *Policy & Objects* > *Firewall Policy* and create a new policy.
2. Enter the following information:

Name	Access-FTP-server
Incoming Interface	port1
Outgoing Interface	VDOM-link0
Source	internal-network
Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT
NAT	disabled

3. Click *OK*.

To add the security policy on VDOM-A with the CLI:

```
config vdom
    edit VDOM-A
        config firewall policy
            edit 0
                set name Access-FTP-server
                set srcintf port1
                set dstintf VDOM-link0
                set srcaddr internal-network
                set dstaddr FTP-server
                set action accept
                set schedule always
                set service FTP
            next
        end
    next
end
```

To add the firewall address on VDOM-B in the GUI:

1. In the VDOM-B VDOM, go to *Policy & Objects* > *Addresses* and create a new address.
2. Enter the following information:

Address Name	internal-network
Type	Subnet
Subnet / IP Range	192.168.10.0/24
Interface	VDOM-link1
Show in Address List	enabled
Static Route Configuration	enabled

3. Click *OK*.

To add the firewall addresses on VDOM-B with the CLI:

```
config vdom
    edit VDOM-B
        config firewall address
            edit internal-network
                set associated-interface VDOM-link1
                set allow-routing enable
                set subnet 192.168.10.0 255.255.255.0
            next
        end
    next
end
```

To add the static route on VDOM-B in the GUI:

1. In the VDOM-B VDOM, go to *Network* > *Static Routes* and create a new route.
2. Enter the following information:

Destination	Named Address
Named Address	internal-network
Gateway	0.0.0.0
Interface	VDOM-link1

3. Click *OK*.

To add the static route on VDOM-B with the CLI:

```
config vdom
    edit VDOM-B
        config router static
            edit 0
                set device VDOM-link1
                set dstaddr internal-network
            next
```

```
        end
    next
end
```

To add the security policy on VDOM-B in the GUI:

1. In the VDOM-B VDOM, go to *Policy & Objects* > *Firewall Policy* and create a new policy.
2. Enter the following information:

Name	Internal-server-access
Incoming Interface	VDOM-link1
Outgoing Interface	port2
Source	internal-network
Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT
NAT	disabled

3. Click *OK*.

To add the security policy on VDOM-B with the CLI:

```
config vdom
    edit VDOM-B
        config firewall policy
            edit 0
                set name Internal-server-access
                set srcintf VDOM-link1
                set dstintf port2
                set srcaddr internal-network
                set dstaddr FTP-server
                set action accept
                set schedule always
                set service FTP
            next
        end
    next
end
```

NAT and transparent mode

In this example, VDOM-A uses NAT mode and VDOM-B uses transparent mode.

This configuration requires the following steps:

1. Configure VDOM-A on page 1466
2. Configure VDOM-B on page 1468

Configure VDOM-A

VDOM-A allows connections from devices on the internal network to the Internet. WAN 1 and port 1 are assigned to this VDOM.

The per-VDOM configuration for VDOM-A includes the following:

- A firewall address for the internal network
- A static route to the ISP gateway
- A security policy allowing the internal network to access the Internet

All procedures in this section require you to connect to VDOM-A, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses* and create a new address.
2. Enter the following information:

Name	internal-network
Type	Subnet
Subnet / IP Range	192.168.10.0/24
Interface	port1
Show in Address List	enabled

3. Click *OK*.

To add the firewall addresses with the CLI:

```
config vdom
    edit VDOM-A
        config firewall address
            edit internal-network
                set associated-interface port1
                set subnet 192.168.10.0 255.255.255.0
            next
        end
    next
end
```

To add a default route in the GUI:

1. Go to *Network* > *Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.201.7

Interface	wan1
Distance	10

3. Click *OK*.

To add a default route with the CLI:

```
config vdom
    edit VDOM-A
        config firewall address
            edit 0
                set gateway 172.20.201.7
                set device wan1
            next
        end
    next
end
```

To add the security policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy.
2. Enter the following information:

Name	VDOM-A-Internet
Incoming Interface	port1
Outgoing Interface	wan1
Source	internal-network
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

3. Click *OK*.

To add the security policy with the CLI:

```
config vdom
    edit VDOM-A
        config firewall policy
            edit 0
                set name VDOM-A-Internet
                set srcintf port1
                set dstintf wan1
                set srcaddr internal-network
                set dstaddr all
                set action accept
                set schedule always
```

```
                set service ALL
                set nat enable
            next
        end
    next
end
```

Configure VDOM-B

VDOM-B allows external connections to reach an internal FTP server. WAN 2 and port 2 are assigned to this VDOM.

The per-VDOM configuration for VDOM-B includes the following:

- A firewall address for the FTP server
- A static route to the ISP gateway
- A security policy allowing external traffic to reach the FTP server

All procedures in this section require you to connect to VDOM-B, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses* and create a new address.
2. Enter the following information:

Address Name	FTP-server
Type	Subnet
Subnet / IP Range	172.25.177.42/32
Interface	port2
Show in Address List	enabled

3. Click *OK*.

To add the firewall addresses with the CLI:

```
config vdom
    edit VDOM-B
        config firewall address
            edit FTP-server
                set associated-interface port2
                set subnet 172.25.177.42 255.255.255.255
            next
        end
    next
end
```

To add a default route in the GUI:

1. Go to *Network* > *Routing Table* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.10.10

3. Click *OK*.

To add a default route with the CLI:

```
config vdom
    edit VDOM-B
        config router static
            edit 0
                set gateway 172.20.10.10
            next
        end
    next
end
```

To add the security policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and create a new policy.
2. Enter the following information:

Name	Access-server
Incoming Interface	wan2
Outgoing Interface	port2
Source	all
Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT

3. Click *OK*.

To add the security policy with the CLI:

```
config vdom
    edit VDOM-B
        config firewall policy
            edit 0
                set name Access-server
                set srcintf wan2
                set dstintf port2
```

```
                set srcaddr all
                set dstaddr FTP-server-VIP
                set action accept
                set schedule always
                set service FTP
            next
        end
    next
end
```

High Availability

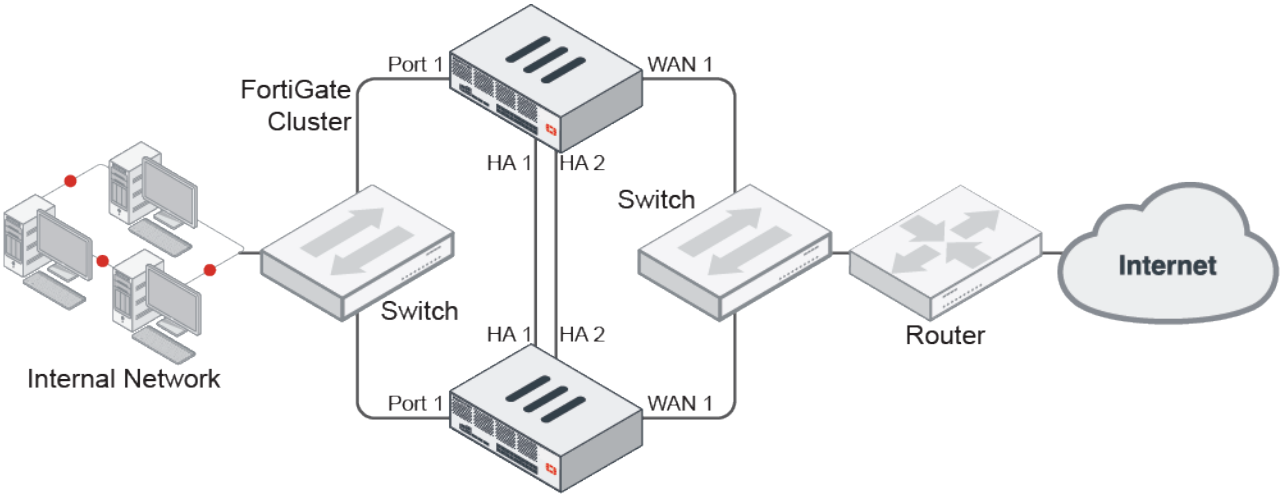
Introduction to the FGCP cluster

High availability (HA) is usually required in a system where there is high demand for little downtime. There are usually hot-swaps, backup routes, or standby backup units and as soon as the active entity fails, backup entities will start

functioning. This results in minimal interruption for the users.

The FortiGate Clustering Protocol (FGCP) is a proprietary HA solution whereby FortiGates can find other member FortiGates to negotiate and create a cluster. A FortiGate HA cluster consists of at least two FortiGates (members) configured for HA operation. All FortiGates in the cluster must be the same model and have the same firmware installed. Cluster members must also have the same hardware configuration (such as the same number of hard disks). All cluster members share the same configurations except for their host name and priority in the HA settings. The cluster works like a device but always has a hot backup device.



Critical cluster components

The following are critical components in an HA cluster:

- Heartbeat connections: members will use this to communicate with each other. In general, a two-member cluster is most common. We recommend double back-to-back heartbeat connections.
- Identical connections for internal and external interfaces: as demonstrated in the topology, we recommend similar connections from each member to the switches for the cluster to function properly.

General operation

The following are best practices for general cluster operation:

- Ensure that heartbeat communication is present.
- Enable the session synchronization option in daily operation (see FGSP (session synchronization) peer setup on page 1476).
- Monitor traffic flowing in and out of the interfaces.

Failover

FGCP provides failover protection in the following scenarios:

- The active device loses power.
- A monitored interface loses a connection.

After failover occurs, the user will not notice any difference, except that the active device has changed. See Failover protection on page 1472 for more information.

Synchronizing the configuration

FGCP uses a combination of incremental and periodic synchronization to make sure that the configuration of all cluster units is synchronized to that of the primary unit.

The following settings are not synchronized between cluster units:

- The FortiGate host name
- GUI Dashboard widgets
- HA override
- HA device priority
- The virtual cluster priority
- The HA priority setting for a ping server (or dead gateway detection) configuration
- The system interface settings of the HA reserved management interface
- The HA default route for the reserved management interface, set using the `ha-mgmt-interface-gateway` option of the `config system ha` command

Most subscriptions and licenses are not synchronized, as each FortiGate must be licensed individually. FortiToken Mobile is an exception; they are registered to the primary unit and synchronized to the secondary units.

The primary unit synchronizes all other configuration settings, including the other HA configuration settings.

All synchronization activity takes place over the HA heartbeat link using TCP/703 and UDP/703 packets.

Failover protection

The FortiGate Clustering Protocol (FGCP) provides failover protection, meaning that a cluster can provide FortiGate services even when one of the devices in the cluster encounters a problem that would result in the complete loss of connectivity for a stand-alone FortiGate unit. Failover protection provides a backup mechanism that can be used to reduce the risk of unexpected downtime, especially in mission-critical environments.

FGCP supports failover protection in four ways:

1. If a link fails.
2. If a device loses power.
3. If an SSD fails.
4. If memory utilization exceeds the threshold for a specified amount of time.

When session-pickup is enabled in the HA settings, existing TCP session are kept, and users on the network are not impacted by downtime as the traffic can be passed without reestablishing the sessions.

When and how the failover happens

1. Link fails

Before triggering a failover when a link fails, the administrator must ensure that monitor interfaces are configured. Normally, the internal interface that connects to the internal network, and an outgoing interface for traffic to the internet or outside the network, should be monitored. Any of those links going down will trigger a failover.

2. Loss of power for active unit

When an active (primary) unit loses power, a backup (secondary) unit automatically becomes the active, and the impact on traffic is minimal. There are no settings for this kind of fail over.

3. SSD failure

An HA failover can be triggered by an SSD failure.

To enable an SSD failure triggering HA fail over:

```
config system ha
    set ssd-failover enable
end
```

4. Memory utilization

An HA failover can be triggered when memory utilization exceeds the threshold for a specific amount of time.

Memory utilization is checked at the configured sample rate (`memory-failover-sample-rate`). If the utilization is above the threshold (`memory-failover-threshold`) every time that it is sampled for the entire monitor period (`memory-failover-monitor-period`), then a failover is triggered.

If the FortiGate meets the memory utilization conditions to cause failover, but the last memory triggered failover happened within the timeout period (`memory-failover-flip-timeout`), then the failover does not occur. Other HA cluster members can still trigger memory based failovers if they meet the criteria and have not already failed within the timeout period.

After a memory based failover from FortiGate A to FortiGate B, if the memory usage on FortiGate A goes down below the threshold but the memory usage on FortiGate B is still below the threshold, then a failover is not triggered, as the cluster is working normally using FortiGate B as the primary device.

When you disable memory based failover, a new HA primary selection occurs to determine the primary device.

To configure memory based HA failover:

```
config system ha
    set memory-based-failover {enable | disable}
    set memory-failover-threshold <integer>
    set memory-failover-monitor-period <integer>
    set memory-failover-sample-rate <integer>
    set memory-failover-flip-timeout <integer>
end
```

`memory-based-failover {enable | disable}`	Enable/disable memory based failover (default = disable).
`memory-failover-threshold <integer>`	The memory usage threshold to trigger a memory based failover, in percentage (0 - 95, 0 = use the conserve mode threshold, default = 0).
`memory-failover-monitor-period <integer>`	The duration of the high memory usage before a memory based failover is triggered, in seconds (1 - 300, default = 60).

`memory-failover-sample-rate <integer>`	The rate at which memory usage is sampled in order to measure memory usage, in seconds (1 - 60, default = 1).
`memory-failover-flip-timeout <integer>`	The time to wait between subsequent memory based failovers, in minutes (6 - 2147483647, default = 6).

Link monitoring and HA failover time

When a link monitor fails, only the routes that are specified in the link monitor are removed from the routing table, instead of all the routes with the same interface and gateway. If no routes are specified, then all of the routes are removed. Only IPv4 routes are supported.

On supported models, the HA heartbeat interval unit can be changed from the 100ms default to 10ms. This allows for a failover time of less than 50ms, depending on the configuration and the network.

```
config system ha
    set hb-interval-in-milliseconds {100ms | 10ms}
end
```

Route based monitoring

In this example, the FortiGate has several routes to 23.2.2.2/32 and 172.16.202.2/24, and is monitoring the link *agg1* by pinging the server at 10.1.100.22. The link monitor uses the gateway 172.16.203.2.

When the link monitor fails, only the routes to the specified subnet using interface *agg1* and gateway 172.16.203.2 are removed.

To configure the link monitor:

```
config system link-monitor
    edit "22"
        set srcintf "agg1"
        set server "10.1.100.22"
        set gateway-ip 172.16.203.2
        set route "23.2.2.2/32" "172.16.202.0/24"
    next
end
```

To check the results:

1. When the link monitor is alive:

```
# get router info routing-table static
Routing table for VRF=0
S*      0.0.0.0/0 [5/0] via 10.100.1.249, port12
S       10.1.100.0/24 [10/0] via 172.16.203.2, agg1
S       23.2.2.2/32 [10/0] via 172.16.203.2, agg1
S       23.2.3.2/32 [10/0] via 172.16.203.2, agg1
S       172.16.201.0/24 [10/0] via 172.16.200.4, port9
S       172.16.202.0/24 [10/0] via 172.16.203.2, agg1
S       172.16.204.0/24 [10/0] via 172.16.200.4, port9
```

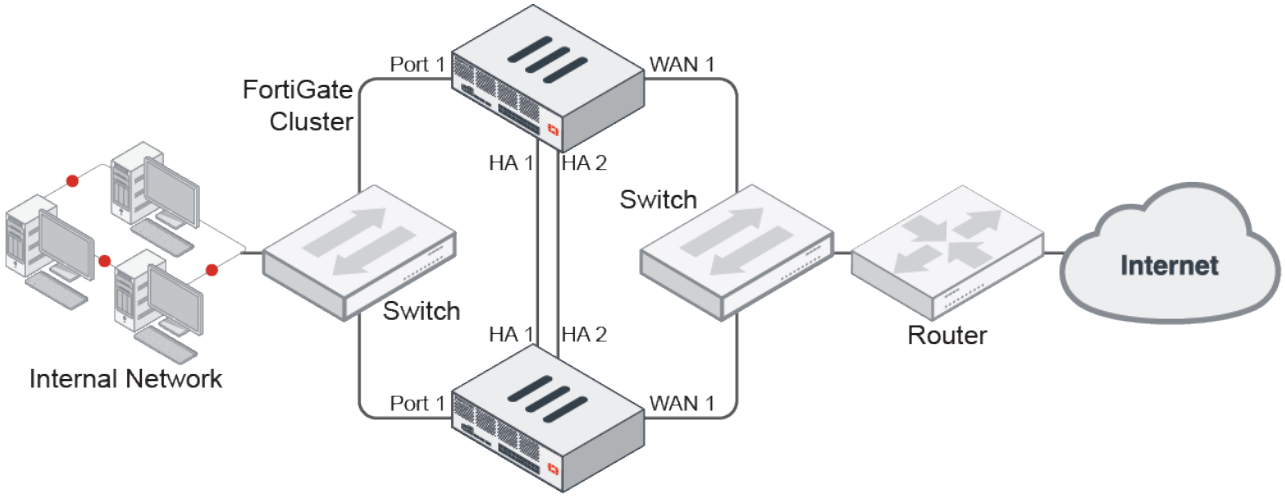
```
                          [10/0] via 172.16.203.2, agg1
                          [10/0] via 172.16.206.2, vlan100, [100/0]
```

2. When the link monitor is dead:

```
# get router info routing-table static
Routing table for VRF=0
S*      0.0.0.0/0 [5/0] via 10.100.1.249, port12
S       10.1.100.0/24 [10/0] via 172.16.203.2, agg1
S       23.2.3.2/32 [10/0] via 172.16.203.2, agg1
S       172.16.201.0/24 [10/0] via 172.16.200.4, port9
S       172.16.204.0/24 [10/0] via 172.16.200.4, port9
                          [10/0] via 172.16.203.2, agg1
                          [10/0] via 172.16.206.2, vlan100, [100/0]
```

HA failover time

In this example, the HA heartbeat interval unit is changed from 100ms to 10ms. As the default heartbeat interval is two, this means that a heartbeat is sent every 20ms. The number of lost heartbeats that signal a failure is also changed to two. So, after two consecutive heartbeats are lost, a failover will be detected in 40ms.



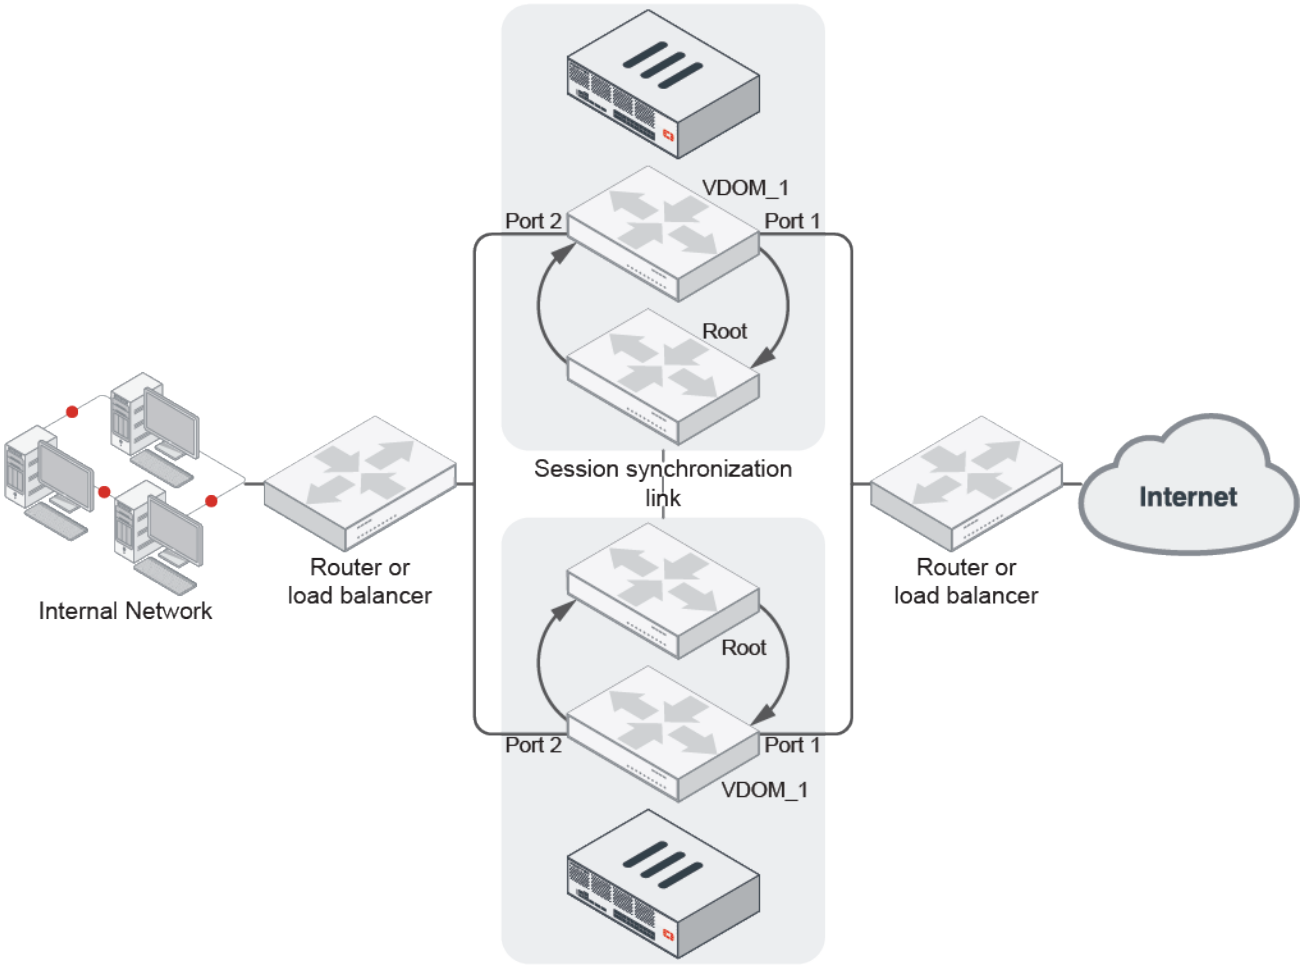
To configure the HA failover:

```
config system ha
    set group-id 240
    set group-name "300D"
    set mode a-p
    set hbdev "port3" 50 "port5" 100
    set hb-interval 2
    set hb-interval-in-milliseconds 10ms
    set hb-lost-threshold 2
    set override enable
    set priority 200
end
```

FGSP (session synchronization) peer setup

The FortiGate Session Life Support Protocol (FGSP) is a proprietary HA solution for only sharing sessions between two entities and is based on a peer-to-peer structure. The entities could be standalone FortiGates or an FGCP cluster.

Connect all necessary interfaces as per the topology diagram below. Interfaces may be changed depending on the models in use. Interface names in the topology diagram are for example purposes only.



To setup an FGSP peer through the CLI:

These instructions assume that the device has been connected to the console, the CLI is accessible, and that all FortiGates have been factory reset.

1. Connect all necessary interfaces as per the topology diagram.
2. Enter the following command to change the FortiGate unit host name:

```
config system global
    set hostname <hostname>
end
```

3. On each FGSP peer device, enter the following command:

```
config system cluster-sync
   set peerip xx.xx.xx.xx    --->> peer's interface IP for session info to be
passed.
end
```

4. Set up identical firewall policies.
   FGSP peers share the same session information which goes from the same incoming interface (example: port1) to the outgoing interface (example: port2). Firewall policies should be identical as well, and can be copied from one device to its peer.

To test the setup:

1. Initiate TCP traffic (like HTTP access) to go through *FortiGateA*.
2. Check the session information.
   For example:
   ```
   diagnose sys session filter src xxx.xxx.xxx.xxx (your PCs IP)
   diagnose sys session list
   ```
3. Use the same command on *FortiGateB* to determine if the same session information appeared.

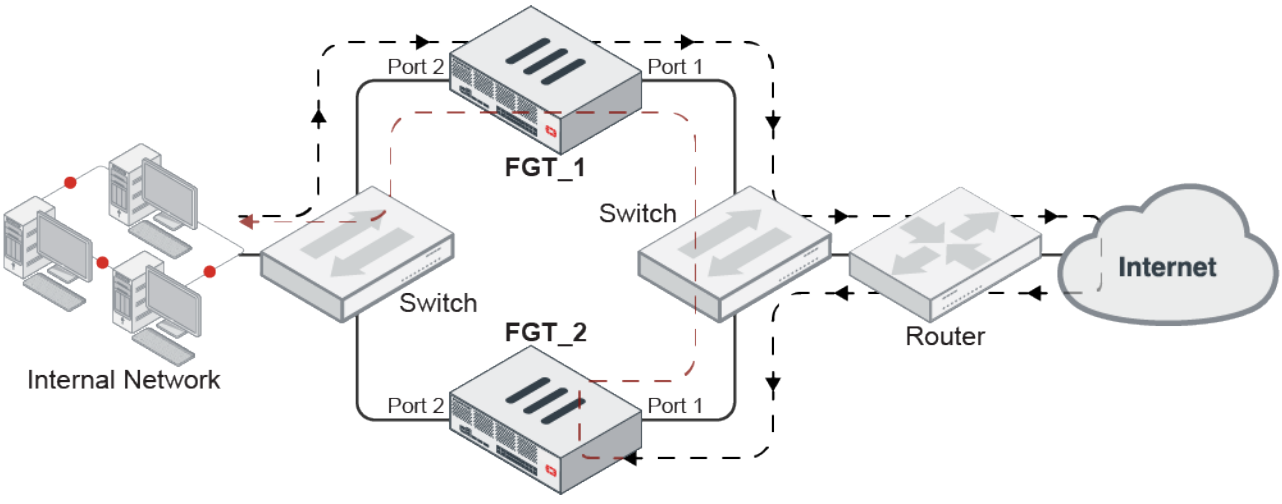
UTM inspection on asymmetric traffic in FGSP

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the session.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, traffic bounces from FGT_2 port1 to FGT_1 port1 using FGT_1's MAC address. Traffic is then inspected by FGT_1.

This example requires the following settings:

- The internal and outgoing interfaces of both FortiGates in the FGSP pair are in the same subnet.
- Both peers have layer 2 access with each other.



To configure FTG_1:

1. Configure the cluster, setting the peer IP to the IP address of FGT_2:

```
config system cluster-sync
    edit 1
        set peerip 10.2.2.2
    next
end
```

2. Configure FGSP cluster attributes:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
    set layer2-connection available
    unset session-sync-dev
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

To configure FTG_2:

1. Configure the cluster, setting the peer IP to the IP address of FGT_1:

```
config system cluster-sync
    edit 1
        set peerip 10.2.2.1
    next
end
```

2. Configure FGSP cluster attributes:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set layer2-connection available
    unset session-sync-dev
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

Results

Capture packets on FGT_2 to see that traffic bounced from FGT_2 to FGT_1 over the traffic interface.

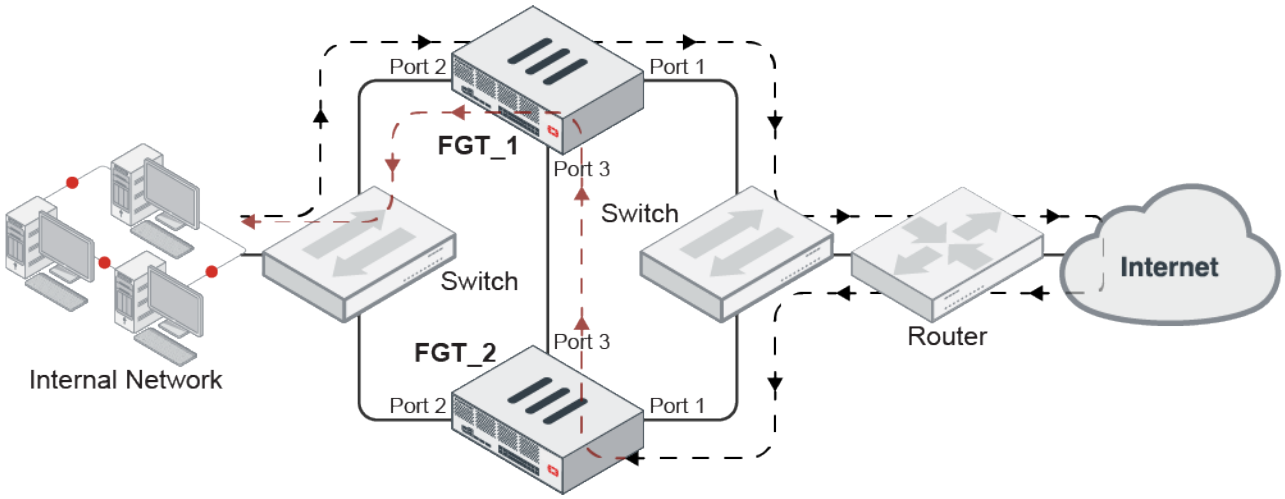
```
FGT_2 # diagnose sniffer packet any 'host 10.1.100.15 and host 172.6.200.55' 4
interfaces=[any]
filters=[host 10.1.100.15 and host 172.16.200.55]
91.803816 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800480 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800486 port1 out 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800816 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800818 port1 out 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
```

UTM inspection on asymmetric traffic on L3

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the session.

For networks where L2 connectivity is not available, such as cloud environments, traffic bound for the session owner are forwarded through the peer interface using a UDP connection.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, return traffic is packed and sent from FGT_2 to FGT_1 using UDP encapsulation between two peer interfaces (port 3). Traffic is then inspected by FGT_1.



To configure FTG_1:

1. Configure the cluster, setting the peer IP to the IP address of FGT_2:

```
config system cluster-sync
    edit 1
        set peerip 10.2.2.2
    next
end
```

2. Configure FGSP cluster attributes:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
    set layer2-connection unavailable
    unset session-sync-dev
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

To configure FTG_2:

1. Configure the cluster, setting the peer IP to the IP address of FGT_1:

```
config system cluster-sync
    edit 1
        set peerip 10.2.2.1
    next
end
```

2. Configure FGSP cluster attributes:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set layer2-connection unavailable
    unset session-sync-dev
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

Encryption for L3 on asymmetric traffic in FGSP

In scenarios where asymmetric routing between FGSP members occurs, the return traffic can be encrypted and routed back to the session owner on Layer 3 (L3).

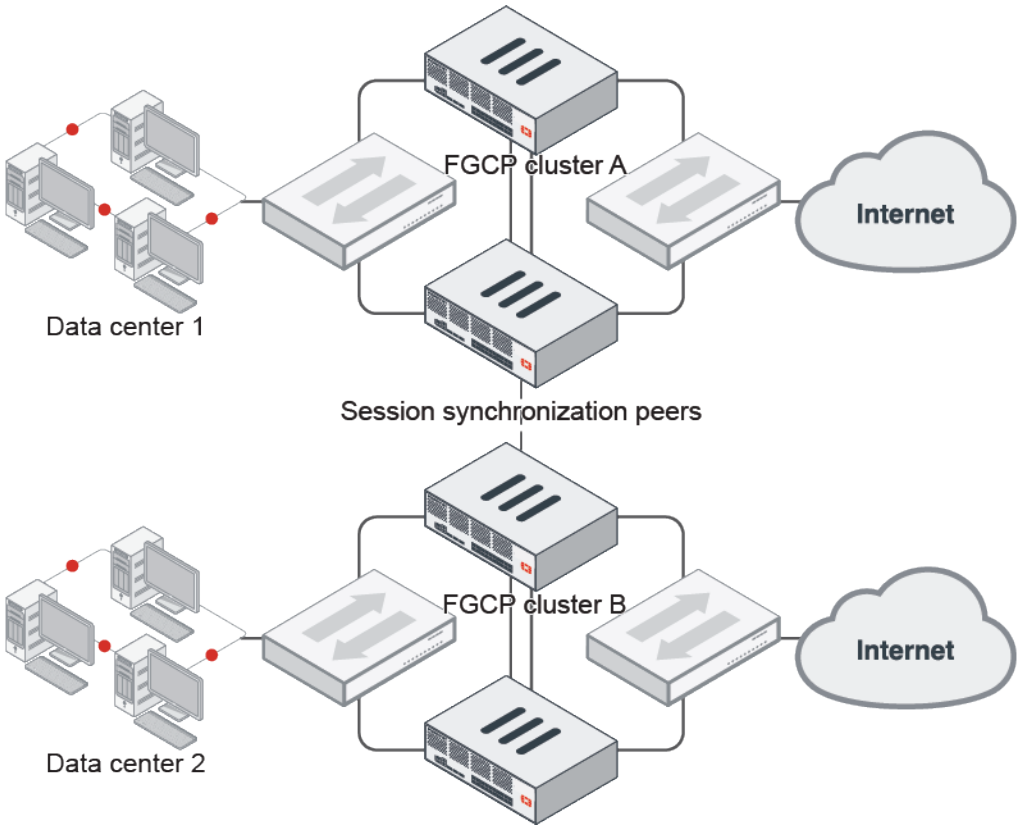
To encrypt L3 traffic in FGSP:

1. Run the following on both FortiGates:

```
config system standalone-cluster
    set encryption enable
    set psksecret xxxxxxxxx
end
```

Synchronizing sessions between FGCP clusters

Synchronizing sessions between FGCP clusters is useful when data centers in different locations are used for load-balancing, and traffic must be shared and flow freely based on demand.



There are some limitations when synchronizing sessions between FGCP clusters:

- All FortiGates must have the same model and generation, hardware configuration, and FortiOS version.
- A total of 16 clusters can share sessions.

To configure session synchronization between two clusters:

1. Configure the two clusters (see HA active-passive cluster setup on page 1507 or HA active-active cluster setup on page 1509).
2. On cluster A, configure the peer IP for the interface:

```
config system interface
    edit "port5"
        set vdom "root"
        set ip 10.10.10.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
    next
end
```

   In this example, cluster A uses port5 and its IP address, 10.10.10.1, is reachable from another cluster.
3. On cluster A, configure cluster and session synchronization:

```
config system cluster-sync
    edit 1
        set peerip 10.10.10.2
    next
end
```

4. On cluster A, configure additional FGSP attributes as needed:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
    set session-sync-dev <interface>
end
```

   The `standalone-group-id` must match between FGSP members. The `group-member-id` is unique for each FGCP cluster. `session-sync-dev` is an optional command to specify the interfaces to sync sessions.

5. On cluster B, configure the peer IP for the interface:

```
config system interface
    edit "port5"
        set vdom "root"
        set ip 10.10.10.2 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
    next
end
```

   In this example, cluster B uses port5 and its IP address, 10.10.10.2, is reachable from another cluster.

6. On cluster B, configure cluster and session synchronization:

```
config system cluster-sync
    edit 1
        set peerip 10.10.10.1
    next
end
```

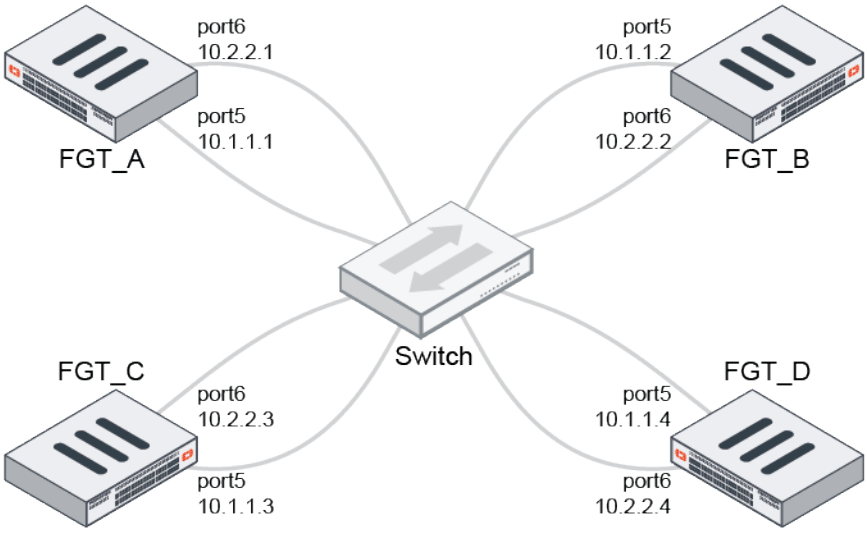
7. On cluster B, configure additional FGSP attributes as needed:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set session-sync-dev <interface>
end
```

FGSP four-member session synchronization and redundancy

By using `session-sync-dev` to offload session synchronization processing to the kernel, four-member FGSP session synchronization can be supported to handle heavy loads.

Topology



In this topology, there are three FGSP peer groups for each FortiGate. Sessions are synchronized between each FortiGate and its peer groups. Redundancy is achieved by using two dedicated session sync device links for each peer setup. There are a total of six peer IPs for each session synchronization device link in each FGSP peer. When one link is fails, session synchronization is not affected.

For optimization, `sync-packet-balance` is enabled to distribute synchronization packets processing to multiple CPUs. The session synchronization process is offloaded to the kernel, and sessions are synchronized over layer 2 over the connected interfaces (`set session-sync-dev "port5" "port6"`). Jumbo frame MTU 9216 is configured on each session synchronization device link to reduce the number of packets; however, setting MTU to 9216 is entirely optional.

To configure FGT_A:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.1/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.1/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system cluster-sync
    edit 1
        set peerip 10.1.1.2
    next
    edit 2
        set peerip 10.2.2.2
    next
    edit 3
        set peerip 10.1.1.3
    next
    edit 4
        set peerip 10.2.2.3
    next
    edit 5
        set peerip 10.1.1.4
    next
    edit 6
        set peerip 10.2.2.4
    next
end
```

To configure FGT_B:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.2/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.2/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system cluster-sync
    edit 1
        set peerip 10.1.1.1
    next
    edit 2
        set peerip 10.2.2.1
    next
    edit 3
        set peerip 10.1.1.3
    next
    edit 4
        set peerip 10.2.2.3
    next
    edit 5
        set peerip 10.1.1.4
    next
    edit 6
        set peerip 10.2.2.4
    next
end
```

To configure FGT_C:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.3/24
        set mtu-override enable
    set mtu 9216
    next
    edit port6
        set ip 10.2.2.3/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system cluster-sync
    edit 1
        set peerip 10.1.1.1
    next
    edit 2
        set peerip 10.2.2.1
    next
    edit 3
        set peerip 10.1.1.2
    next
    edit 4
        set peerip 10.2.2.2
    next
    edit 5
        set peerip 10.1.1.4
    next
    edit 6
        set peerip 10.2.2.4
    next
end
```

To configure FGT_D:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
```

```
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.4/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.4/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system cluster-sync
    edit 1
        set peerip 10.1.1.1
    next
    edit 2
        set peerip 10.2.2.1
    next
    edit 3
        set peerip 10.1.1.2
    next
    edit 4
        set peerip 10.2.2.2
    next
    edit 5
        set peerip 10.1.1.3
    next
    edit 6
        set peerip 10.2.2.3
    next
end
```

Session synchronization interfaces in FGSP

When peering over FGSP, by default, the FortiGates or FGCP clusters share information over L3 between the interfaces that are configured with Peer IP addresses. When a session synchronization interface is configured and FGSP peers are

directly connected on this interface, then session synchronization is done over L2, only falling back to L3 if the session synchronization interface becomes unavailable.

When using a session synchronization interface, the synchronization process is offloaded to the kernel. A fast, dedicated, and stable L2 connection should be used for the session synchronization interface between the FGSP peers. For redundancy, multiple synchronization interfaces can be configured.

To provide full redundancy, FGCP clusters can be used in FGSP peering. This is called FGCP over FGSP.

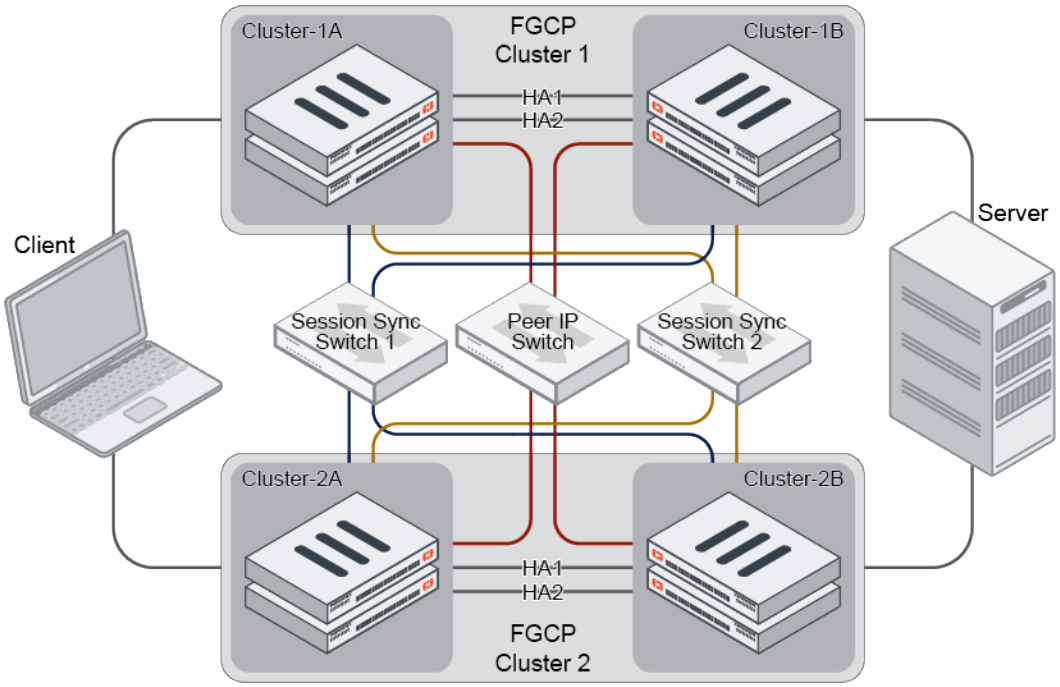
To configure session-sync interfaces:

```
config system standalone-cluster
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
    set layer2-connection {available | unavailable}
    set encryption {enable | disable}
end
```

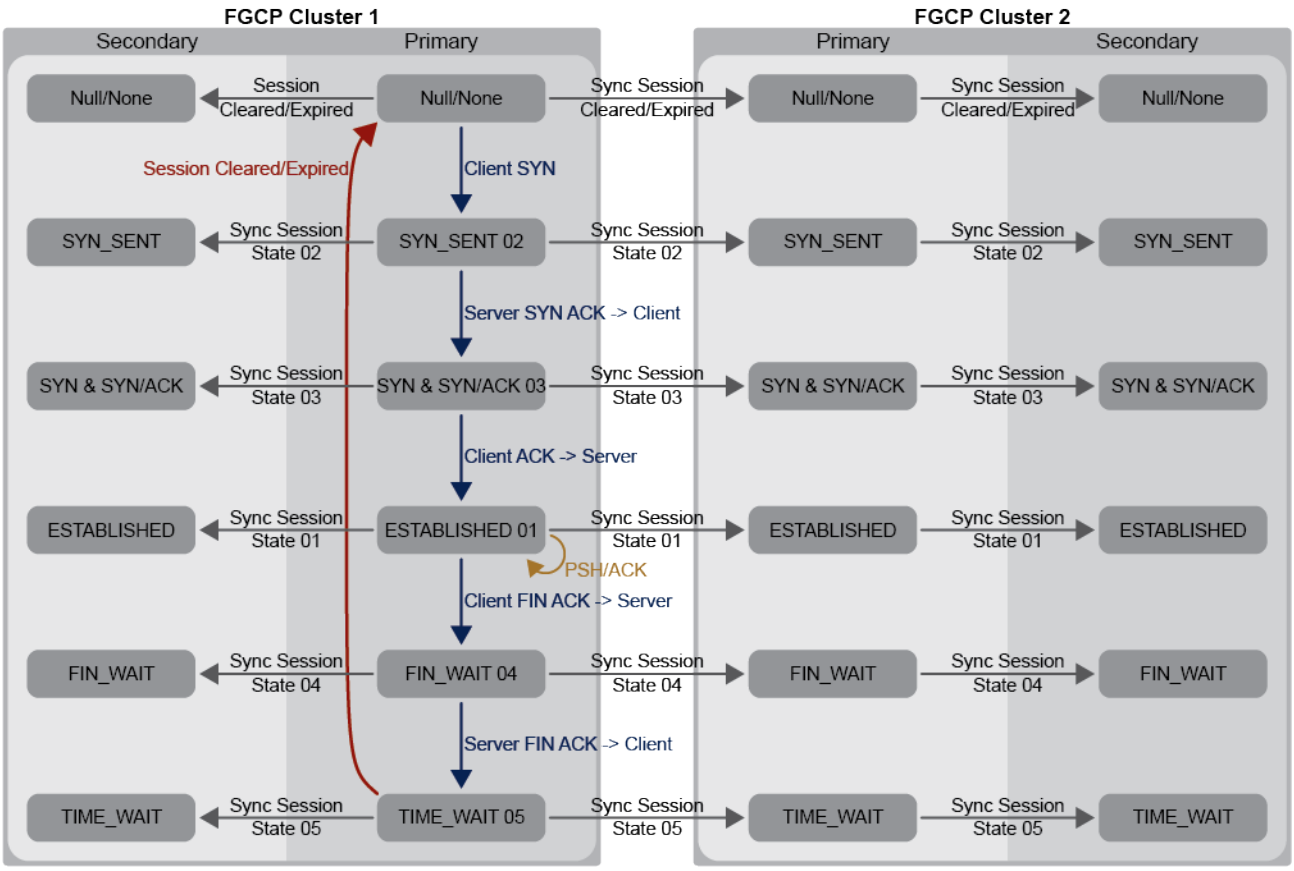
The `layer2-connection` setting is for forwarded traffic between FGSP peers. Set it to `available` if the peer interface user for traffic forwarding is directly connected and supports L2 forwarding. See UTM inspection on asymmetric traffic in FGSP on page 1477 for more information.

Session synchronization in FGCP over FGSP

The following topology uses multiple session synchronization interfaces with a full mesh backbone to prevent any single point of failure.



The state diagram summarizes the session synchronization of a TCP session. It assumes that the session is connected over FGCP Cluster 1 and processed entirely by the primary unit, Cluster-1A.



1. The session starts with the Client SYN packet.
2. As the session is established, Cluster-1A synchronizes the session with Cluster-1B over the heartbeat interface, and with Cluster-2A over the session synchronization interface.
3. Cluster-2A then synchronizes the session with Cluster-2B over its heartbeat interface.
4. The process then repeats as it transitions to different states.

Session synchronization if links fail

In the previous topology, if any single session synchronization link fails on the primary member of each cluster, session synchronization will continue on the second link from the pair of session of session synchronization interfaces.

If the second link on the primary member of the same cluster then fails, L2 session synchronization over the session synchronization interface stops, and synchronization fails over to L3 between the peer IP links.

If the Peer IP link then fails, the FGSP peers are effectively disconnected, and no session synchronization will occur.

Standalone configuration synchronization

You can configure synchronization from one standalone FortiGate to another standalone FortiGate (`standalone-config-sync`). With the exception of some configurations that do not sync (settings that identify the FortiGate to the network), the rest of the configurations are synced, such as firewall policies, firewall addresses, and UTM profiles.

This option is useful in situations when you need to set up FGSP peers, or when you want to quickly deploy several FortiGates with the same configurations. You can set up `standalone-config-sync` for multiple members.

`standalone-config-sync` is an independent feature and should be used with caution as there are some limitations. We recommend disabling it once the configurations have been synced over.

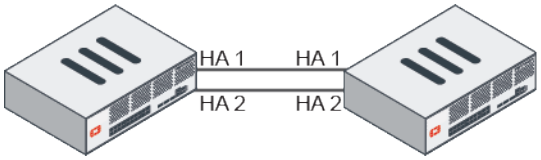
Limitations

When standalone configuration synchronization is enabled, there are some limitations, including but not limited to the following:

- Network interruptions occur during firmware upgrades: when upgrading the firmware, all members in the `standalone-config-sync` group are upgraded simultaneously. This creates downtime if the FortiGates are the only outgoing gateway in the network. We recommend disabling the option before upgrading firmware.
- Some unwanted configurations might be synced: the current design and implementation of `standalone-config-sync` is based on requirements from specific customers. Thus, some users may find that unwanted parts of the configurations are synced. Should this occur, we recommend disabling the option and modifying those configurations manually.
- The wrong primary device might be selected accidentally: `standalone-config-sync` is derived from the HA primary unit selection mechanism. All members in the group will join the selection process in the same way as a the HA cluster selection process. It is important to select the correct device as the primary, otherwise the wrong device could be selected and existing configurations could be overwritten.

Setting up standalone configuration synchronization

Two or more standalone FortiGates should be connected to each other with one or more heartbeat interfaces, either back-to-back or via a switch. In the following example, the device supplying the configurations is called "conf-prim," and the devices receiving the configurations are called "conf-secos."



To set up standalone configuration synchronization:

1. Configure the conf-prim device for the group:

```
config system ha
    set hbdev ha1 50 ha2 100
    set priority 255
    set override enable
    set standalone-config-sync enable
end
```

2. Configure the conf-prim device as needed to be functional.
3. Configure the other group members as conf-secos:

```
config system ha
    set standalone-config-sync enable
end
```

4. Wait 10–15 minutes for the configurations to sync over.
5. Verify the synchronization status:

```
# get system ha status
path=system, objname=ha, tablename=(null), size=5912
HA Health Status:
  WARNING: FG201E4Q17900771 has hbdev down;
  WARNING: FG201ETK19900991 has hbdev down;
Model: FortiGate-201E

    ha: physical/00, down, rx-bytes/packets/dropped/errors=0/0/0/0, tx=0/0/0/0
  FG201ETK19900991(updated 1 seconds ago):
    wan2: physical/1000auto, up, rx-bytes/packets/dropped/errors=83024/192/0/0,
tx=120216/278/0/0
    ha: physical/00, down, rx-bytes/packets/dropped/errors=0/0/0/0, tx=0/0/0/0
Secondary: FortiGate-201E, FG201E4Q17900771, HA cluster index = 1
Primary: FortiGate-201E, FG201ETK19900991, HA cluster index = 0
number of vcluster: 1
vcluster 1: work 169.254.0.1
Secondary: FG201E4Q17900771, HA operating index = 1
Primary: FG201ETK19900991, HA operating index = 0
```

If all members are `in-sync`, this means all members share the same configurations, except those that should not be synced. If any members are `out-of-sync`, this means the member failed to sync with the primary device.

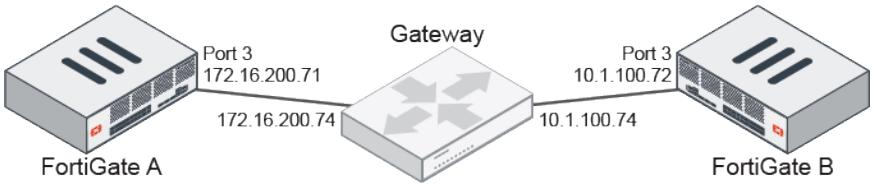
Debugging is similar when a cluster is out of sync.

Layer 3 unicast standalone configuration synchronization

Unicast standalone configuration synchronization is supported on layer 3, allowing peers to be synchronized in cloud environments that do not support layer 2 networking. Configuring a unicast gateway allows peers to be in different subnets.

Example

In this example, two FortiGates in different subnets are connected through a unicast gateway. Both cluster members use the same port for the heartbeat interface.



To configure unicast synchronization between peers:

1. Configure FortiGate A:

```
config system ha
    set group-name "testcs"
    set hbdev "port3" 50
    set standalone-config-sync enable
    config unicast-peers
        edit 1
            set peer-ip 10.1.100.72
        next
    end
    set override enable
    set priority 200
    set unicast-status enable
    set unicast-gateway 172.16.200.74
end
```

2. Configure FortiGate B:

```
config system ha
    set group-name "testcs"
    set hbdev "port3" 50
    set standalone-config-sync enable
    config unicast-peers
        edit 1
            set peer-ip 172.16.200.71
        next
    end
    set override enable
    set priority 100
    set unicast-status enable
    set unicast-gateway 10.1.100.74
end
```

3. Check the HA status on FortiGate A:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: ConfigSync
Group: 0
Debug: 0
Cluster Uptime: 2 days 3:40:25
Cluster state change time: 2021-03-08 12:00:38
Primary selected using:
    <2021/03/08 12:00:38> FGVMSLTM00000001 is selected as the primary because its
override priority is larger than peer member FGVMSLTM00000002.
    <2021/03/06 11:50:35> FGVMSLTM00000001 is selected as the primary because it's the
only member in the cluster.
ses_pickup: disable
override: enable
Configuration Status:
    FGVMSLTM21000151(updated 5 seconds ago): in-sync
    FGVMSLTM21000152(updated 5 seconds ago): in-sync
System Usage stats:
    FGVMSLTM21000151(updated 5 seconds ago):
        sessions=7, average-cpu-user/nice/system/idle=0%/0%/0%/100%, memory=24%
    FGVMSLTM21000152(updated 5 seconds ago):
        sessions=5, average-cpu-user/nice/system/idle=0%/0%/0%/100%, memory=23%
HBDEV stats:
    FGVMSLTM21000151(updated 5 seconds ago):
        port3: physical/1000auto, up, rx-
bytes/packets/dropped/errors=466060007/1049137/0/0, tx=429538329/953028/0/0
    FGVMSLTM21000152(updated 5 seconds ago):
        port3: physical/1000auto, up, rx-
bytes/packets/dropped/errors=48805199/85441/0/0, tx=33470286/81425/0/0
Primary     : FGT-71          , FGVMSLTM00000001, HA cluster index = 1
Secondary   : FGT-72          , FGVMSLTM00000002, HA cluster index = 0
number of vcluster: 1
vcluster 1: work 0.0.0.0
Primary: FGVMSLTM00000001, HA operating index = 0
Secondary: FGVMSLTM00000002, HA operating index = 1
```

4. Check the HA checksums on FortiGate A:

```
# diagnose sys ha checksum cluster

================== FGVMSLTM00000001 ==================

is_manage_primary()=1, is_root_primary()=1
debugzone
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd

checksum
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd

================== FGVMSLTM00000002 ==================

is_manage_primary()=0, is_root_primary()=1
```

```
debugzone
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd

checksum
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd
```

5. Verify that configuration changes on the primary FortiGate are synchronized to the secondary FortiGate:
   a. Adjust the administrator timeout value on FortiGate A:

```
config system global
    set admintimeout 100
end
```

   b. Check the debug messages on FortiGate B:

```
# diagnose debug cli 7
Debug messages will be on for 30 minutes.

# diagnose debug enable

create pid=15639, clictxno=0, last=1615246288
0: conf sys global
0: set admintimeout 100
0: end
```

Out-of-band management with reserved management interfaces

As part of an HA configuration, you can reserve up to four management interfaces to provide direct management access to all cluster units. For each reserved management interface, you can configure a different IP address, administrative access, and other interface settings, for each cluster unit. By connecting these interfaces to your network, you can separately manage each cluster unit from different IP addresses.

- Reserved management interfaces provide direct management access to each cluster unit, and give each cluster unit a different identity on your network. This simplifies using external services, such as SNMP, to monitor and managed separate cluster units.
- Reserved management interfaces are not assigned HA virtual MAC addresses. They retain the permanent hardware address of the physical interface, unless you manually change it using the `config system interface` command.
- Reserved management interfaces and their IP addresses should not be used for managing a cluster using FortiManager. To manage a FortiGate HA cluster with FortiManager, use the IP address of one of the cluster unit interfaces.
- Configuration changes to a reserved management interface are not synchronized to other cluster units. Other configuration changes are automatically synchronized to all cluster units.

You can configure an in-band management interface for a cluster unit. See In-band management on page 1501 for information. In-band management does not reserve the interface exclusively for HA management.

Management interface

Enable HTTPS or HTTP administrative access on the reserved management interfaces to connect to the GUI of each cluster unit. On secondary units, the GUI has the same features as the primary unit, except for unit specific information, for example:

- The System Information widget on the Status dashboard shows the secondary units serial number.
- In the cluster members list at *System* > *HA*, you can change the HA configuration of the unit that you are logged into. You can only change the host name and device priority of the primary and other secondary units.
- The system events logs shows logs for the device that you are logged into. Use the HA device drop down to view the log messages for other cluster units, including the primary unit.

Enable SSH administrative access on the reserved management interfaces to connect to the CLI of each cluster unit. The CLI prompt includes the host of the cluster unit that you are connected to. Use the `execute ha manage` command to connect to other cluster unit CLIs.

Enable SNMP administrative access on a reserved management interface to use SNMP to monitor each cluster unit using the interface's IP address. Direct management of cluster members must also be enabled, see Configuring SNMP remote management of individual cluster units example on page 1497.

Reserved management interfaces are available in both NAT and transparent mode, and when the cluster is operating with multiple VDOMs.

FortiCloud, FortiSandbox, and other management services

By default, management services such as FortiCloud, FortiSandbox, SNMP, remote logging, and remote authentication, use a cluster interface. This means that communication from each cluster unit will come from a cluster interface, and not from the individual cluster unit's interface.

You can configure HA reserved management interfaces to be used for communication with management services by enabling the `ha-direct` option. This separates management traffic for each cluster unit, and allows each unit to be individually managed. This is especially useful when cluster unit are in different physical locations.

The following management features will then use the HA reserved management interface:

- Remote logging, including syslog, FortiAnalyzer, and FortiCloud
- SNMP queries and traps
- Remote authentication and certificate verification
- Communication with FortiSandbox
- Netflow and sflow, see Routing NetFlow data over the HA management interface on page 1520 for information.

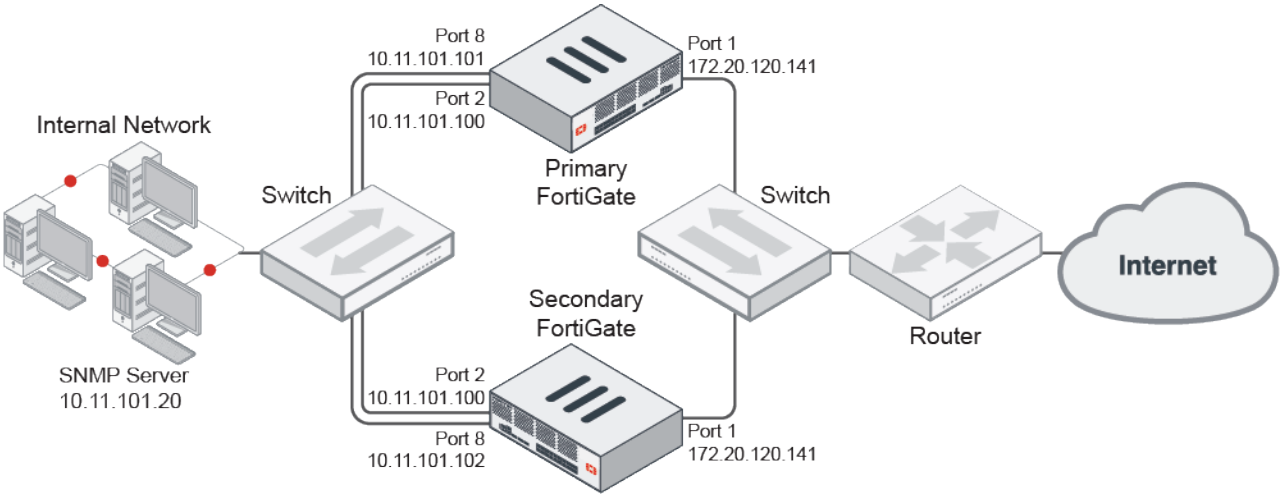
The HA reserved management interfaces can also be configured for only SNMP remote management, see Configuring SNMP remote management of individual cluster units example on page 1497.

To configure HA reserved management interfaces for communication with management services:

```
config system ha
    set ha-direct enable
end
```

Enabling `ha-direct` in a non-HA environment will make SNMP unusable.

Configuring SNMP remote management of individual cluster units example

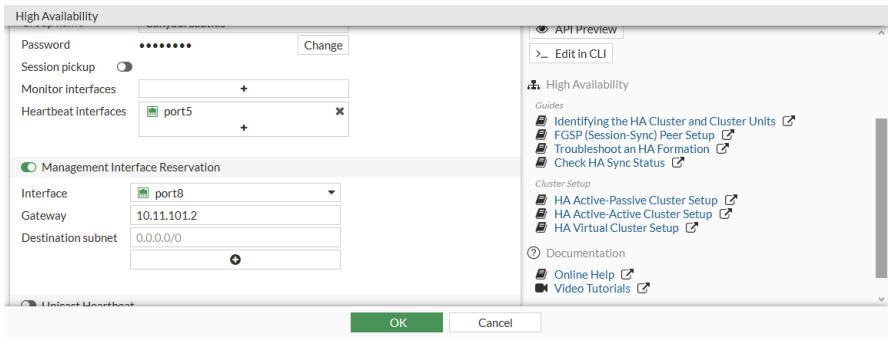


In this example, two FortiGate units are already operating in a cluster. On each unit, port8 is connected to the internal network through a switch and configured as a reserved management interface with SNMP remote management.

Configuration changes to the reserved management interface are not synchronized to other cluster units.

To configure management interface reservation in the GUI:

1. Go to *System* > *HA* and edit the primary unit.
2. Enable *Management Interface Reservation*.
3. Set *Interface* to *port8*. This interface must not be referenced anywhere else.
4. Set *Gateway* to *10.11.101.2*. The gateway is not synchronized to secondary units.



5. Optionally, enter a *Destination subnet* to indicate the destinations that should use the defined gateway. By default, 0.0.0.0/0 is used.
6. Click *OK*.

To configure management interface reservation in the CLI:

```
config system ha
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface "port8"
            set gateway 10.11.101.2
        next
    end
end
```

The reserved management interface default route is not synchronized to other cluster units.

GUI access

To configure the primary unit's reserved management interface, configure an IP address and management access on port8. Then, to configure the secondary unit's reserved management interface, access the unit's CLI through the primary unit, and configure an IP address and management access on port8. Configuration changes to the reserved management interface are not synchronized to other cluster units.

To configure the primary unit reserved management interface to allow GUI access in the CLI:

1. From a computer on the internal network, connect to the CLI at 10.11.101.100.
2. Change the port8 IP address and management access:

   ```
   config system interface
       edit port8
           set ip 10.11.101.101/24
           set allowaccess https ping ssh snmp
       next
   end
   ```

   You can now log into the primary unit's GUI by browsing to https://10.11.101.101. You can also log into the primary unit's CLI by using an SSH client to connect to 10.11.101.101.

To configure secondary unit reserved management interfaces to allow GUI access:

1. From a computer on the internal network, connect to the primary unit's CLI.
2. Connect to the secondary unit with the following command:

   ```
   execute ha manage <unit id> <username> <password>
   ```

3. Change the port8 IP address and management access:

   ```
   config system interface
       edit port8
           set ip 10.11.101.102/24
           set allowaccess https ping ssh snmp
       next
   end

   exit
   ```

   You can now log into the secondary unit's GUI by browsing to https://10.11.101.102. You can also log into the secondary unit's CLI by using an SSH client to connect to 10.11.101.102.

SNMP management

The SNMP server can get status information from the cluster members. To use the reserved management interfaces, you must add at least one HA direct management host to an SNMP community. If the SNMP configuration includes SNMP users with user names and passwords, HA direct management must be enabled for the users.

To configure the cluster for SNMP management using the reserved management interfaces in the CLI:

1. Add an SNMP community with a host for the reserved management interface of each cluster member. The host includes the IP address of the SNMP server.

```
config system snmp community
    edit 1
        set name "Community"
        config hosts
            edit 1
                set ip 10.11.101.20 255.255.255.255
                set ha-direct enable
            next
        end
    next
end
```

Enabling `ha-direct` in a non-HA environment will make SNMP unusable.

2. Add an SNMP user for the reserved management interface

```
config system snmp user
    edit "1"
        set notify-hosts 10.11.101.20
        set ha-direct enable
    next
end
```

The SNMP configuration is synchronized to all cluster units.

To get CPU, memory, and network usage information from the SNMP manager for each cluster unit using the reserved management IP addresses:

1. Connect to the SNMP manager CLI.
2. Get resource usage information for the primary unit using the MIB fields:

```
snmpget -v2c -c Community 10.11.101.101 fgHaStatsCpuUsage
snmpget -v2c -c Community 10.11.101.101 fgHaStatsMemUsage
snmpget -v2c -c Community 10.11.101.101 fgHaStatsNetUsage
```

3. Get resource usage information for the primary unit using the OIDs:

```
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.3.1
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.4.1
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.5.1
```

4. Get resource usage information for the secondary unit using the MIB fields:

```
snmpget -v2c -c Community 10.11.101.102 fgHaStatsCpuUsage
snmpget -v2c -c Community 10.11.101.102 fgHaStatsMemUsage
snmpget -v2c -c Community 10.11.101.102 fgHaStatsNetUsage
```

5. Get resource usage information for the primary unit using the OIDs:

```
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.3.1
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.4.1
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.5.1
```

Firewall local-in policies for the reserved management interface

Enabling `ha-mgmt-intf-only` applies the local-in policy only to the VDOM that contains the reserved management interface. The incoming interface is set to match any interface in the VDOM..

To add local-in policies for the reserved management interface:

```
config firewall local-in-policy
    edit 0
        set ha-mgmt-intf-only enable
        set intf any
        set srcaddr internal-net
        set dstaddr mgmt-int
        set action accept
        set service HTTPS
        set schedule weekdays
    next
end
```

NTP over reserved management interfaces

If reserved management interfaces are configured for each cluster member, and NTP is enabled, then the primary unit will contact the NTP server using the reserved management interface. The system time is then synchronized to the secondary units over the HA heartbeat interface.

```
config system interface
    edit port5
        set ip 172.16.79.46 255.255.255.0
    next
end
```

```
config system ha
    set group-name FGT-HA
    set mode a-p
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface port5
            set gateway 172.16.79.1
```

```
        next
    end
    set ha-direct enable
end

config system ntp
    set ntpsync enable
    set syncinterval 5
end
```

In-band management

In-band management IP addresses are an alternative to reserved HA management interfaces, and do not require reserving an interface exclusively for management access. They can be added to multiple interfaces on each cluster unit.

The in-band management IP address is accessible from the network that the cluster interface is connected to. It should be in the same subnet as the interface that you are adding it to. It cannot be in the same subnet as other interface IP addresses.

In-band management interfaces support ping, HTTP, HTTPS, and SNMP administrative access options.

Primary and secondary units send packets differently from an interface with a management IP address configured:

- On the primary unit, packets are sent to destinations based on routing information.
- On secondary units, packets can only be sent to destinations with the same management IP address segment.

In-band management IP address configuration is not synchronized to other cluster units.

To add an in-band management IP address to port23 with HTTPS, SSH, and SNMP access:

```
config system interface
    edit port23
        set management-ip 172.25.12.5/24
        set allowaccess https ssh snmp
    next
end
```

Troubleshoot an HA formation

The following are requirements for setting up an HA cluster or FGSP peers.

Cluster members must have:

- The same model.
- The same hardware configuration.
- The same connections.
- The same generation.

The requirement to have the same generation is done as a best practice as it avoids issues that can occur later on. If you are unsure if the FortiGates are from the same generation, please contact customer service.

Troubleshooting common HA formation errors

One member keeps shutting down during HA setup (hard drive failure):

If one member has a hard drive failure but the other does not, the one with the hard drive failure will be shut down during HA setup. In this case, RMA the member to resolve the issue.

All members are primaries and members cannot see other members:

Typically, this is a heartbeat issue. It is recommended that for a two-member cluster, you use a back-to-back connection for heartbeat communication. If there are more than three members in the cluster, a separate switch should be used to connect all heartbeat interfaces.

Check HA synchronization status

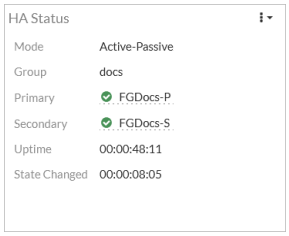
The HA synchronization status can be viewed in the GUI through either a widget on the *Dashboard* or on the *System* > *HA* page. It can also be confirmed through the CLI. When a cluster is out of synchronization, administrators should correct the issue as soon as possible as it affects the configuration integrity and can cause issues to occur.

When units are out of synchronization in an HA cluster, the GUI will compare the HA checksums and display the tables that caused HA to be out of synchronization. This can be visualized on the HA monitor page and in the HA status widget.

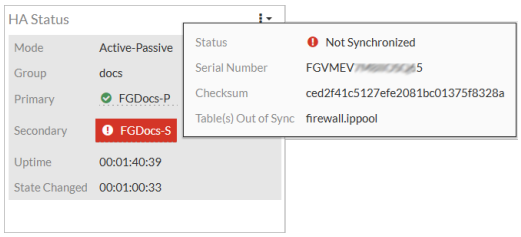
HA synchronization status in the GUI

Following HA setup, the *HA Status* widget can be added to the *Dashboard* that shows the HA synchronization statuses of the members.

A green checkmark is shown next to each member that is in synchronization.

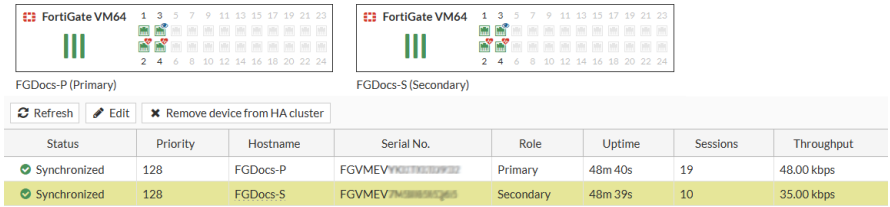


A member that is out of synchronization is highlighted in red. Hover the cursor over the unsynchronized device to see the tables that are out of synchronization and the checksum values.

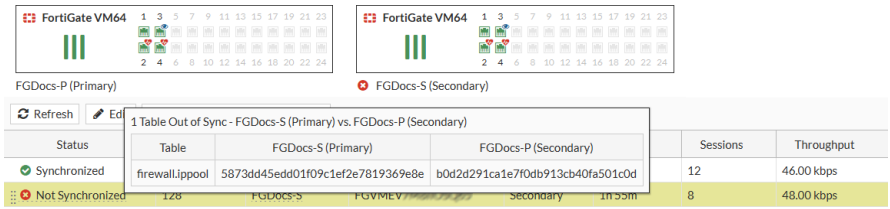


You can also go to *System* > *HA* to see the synchronization statuses of the members. A member that is out of synchronization will have a red icon next to its name. Hover the cursor over the unsynchronized device to see the tables that are out of synchronization and the checksum values.

Synchronized:



Unsynchronized:



HA synchronization status in the CLI

In the CLI, run the `get system ha status` command to see if the cluster is in synchronization . The synchronization status is reported under *Configuration Status*.

When both members are in synchronization:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: HA A-P
Group: 0
Debug: 0
Cluster Uptime: 0 days 0:52:39

Disabling stateful SCTP inspection

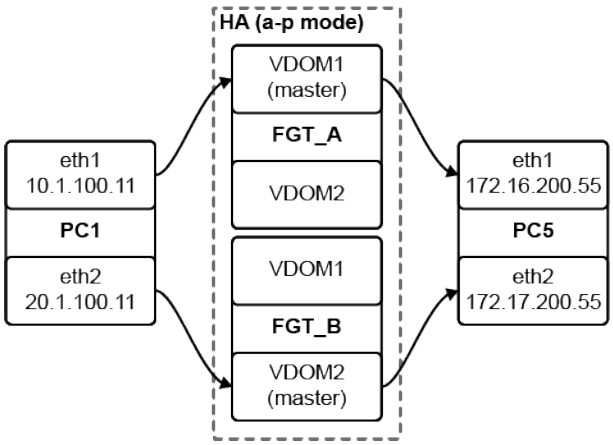
There is an option in FortiOS to disable stateful SCTP inspection. This option is useful when FortiGates are deployed in a high availability (HA) cluster that uses the FortiGate Clustering Protocol (FGCP) and virtual clustering in a multihoming topology. In this configuration, the primary stream control transmission protocol (SCTP) path traverses the primary FortiGate node by using its active VDOM (for example, VDOM1), and the backup SCTP path traverses the other passive FortiGate node by using its active VDOM (for example, VDOM2).

When stateful SCTP inspection is enabled, SCTP heartbeat traffic fails by means of the backup path because the primary path goes through a different platform and VDOM. Since there is no state sharing between VDOMs, the passive FortiGate is unaware of the original SCTP session and drops the heartbeats because of no associated sessions. When stateful SCTP inspection is disabled, the passive node permits the SCTP heartbeats to pass.

When set to `enable`, SCTP session creation without SCTP INIT is enabled. When set to `disable`, SCTP session creation without SCTP INIT is disabled (this is the default setting):

```
config system settings
    set sctp-session-without-init {enable | disable}
end
```

The following is an example topology and scenario:



In this example, FGT_A and FGT_B are in HA a-p mode with two virtual clusters. Two primaries exist on different FortiGate units. PC1 eth1 can access PC5 eth1 through VDOM1, and PC1 eth2 can access PC5 eth2 through VDOM2.

On PC5, to listen for an SCTP connection:

```
sctp_darn -H 172.16.200.55  -B 172.17.200.55 -P 2500 -l
```

On PC1, to start an SCTP connection:

```
sctp_darn -H 10.1.100.11 -B 20.1.100.11 -P 2600 -c 172.16.200.55 -c 172.17.200.55 -p 2500 -s
```

An SCTP four-way handshake is on one VDOM, and a session is created on that VDOM. With the default configuration, there is no session on any other VDOM, and the heartbeat on another path (another VDOM) is dropped. After enabling `sctp-session-without-init`, the other VDOM creates the session when it receives the heartbeat, and the heartbeat is forwarded:

```
config system settings
  set sctp-session-without-init enable
end
```

Upgrading FortiGates in an HA cluster

You can upgrade the firmware on an HA cluster in the same way as on a standalone FortiGate. During a firmware upgrade, the cluster upgrades the primary unit and all of the subordinate units to the new firmware image.

Before upgrading a cluster, back up your configuration (Configuration backups on page 55), schedule a maintenance window, and make sure that you are using a supported upgrade path (https://docs.fortinet.com/upgrade-tool).

Uninterrupted upgrade

An uninterrupted upgrade occurs without interrupting communication in the cluster.

To upgrade the cluster firmware without interrupting communication, the following steps are followed. These steps are transparent to the user and the network, and might result in the cluster selecting a new primary unit.

1. The administrator uploads a new firmware image using the GUI or CLI. See Firmware on page 1422 for details.
2. The firmware is upgraded on all of the subordinate units.

3. A new primary unit is selected from the upgraded subordinates.
4. The firmware is upgraded on the former primary unit.
5. Primary unit selection occurs, according to the standard primary unit selection process.

If all of the subordinate units crash or otherwise stop responding during the upgrade process, the primary unit will continue to operate normally, and will not be upgraded until at least one subordinate rejoins the cluster.

Interrupted upgrade

An interrupted upgrade upgrades all cluster members at the same time. This takes less time than an uninterrupted upgrade, but it interrupts communication in the cluster. Interrupted upgrade is disabled by default.

To enable interrupted upgrade:

```
config system ha
    set uninterruptible-upgrade disable
end
```

HA cluster setup examples

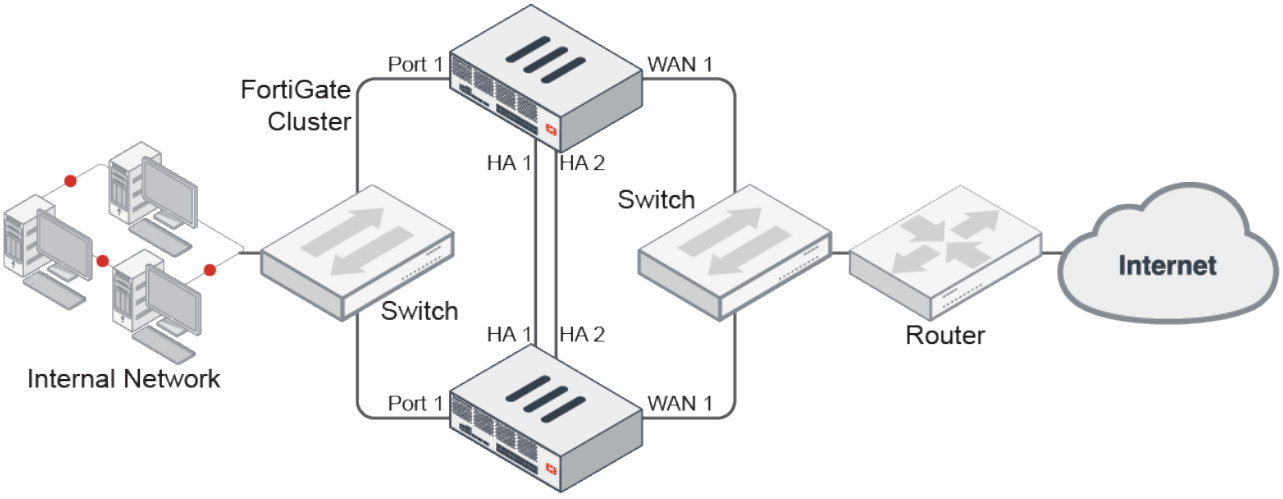
The following examples provide instructions on HA cluster setup:

- HA active-passive cluster setup on page 1507
- HA active-active cluster setup on page 1509
- HA virtual cluster setup on page 1510
- HA using a hardware switch to replace a physical switch on page 1513

HA active-passive cluster setup

An HA Active-Passive (A-P) cluster can be set up using the GUI or CLI.

This example uses the following network topology:

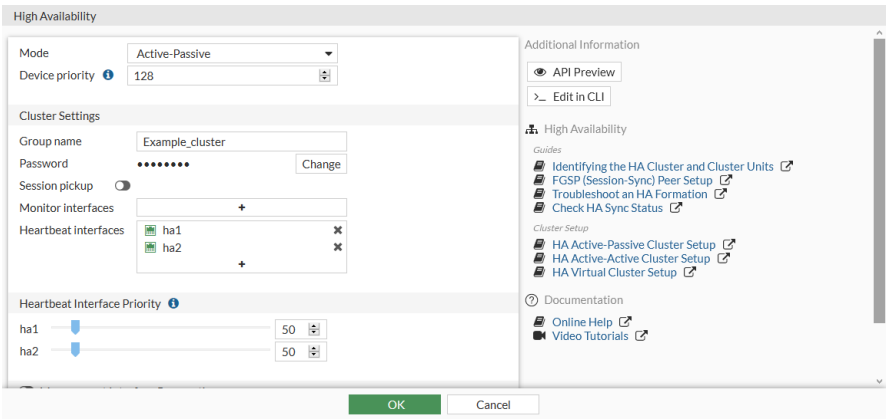


To set up an HA A-P cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to *System* > *HA* and set the following options:

Mode	Active-Passive
Device priority	128 or higher
Group name	Example_cluster
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.



4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click *OK*.
   The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.
6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.

To set up an HA A-P cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Change the hostname of the FortiGate:

```
config system global
    set hostname Example1_host
end
```

   Changing the host name makes it easier to identify individual cluster units in the cluster operations.
4. Enable HA:

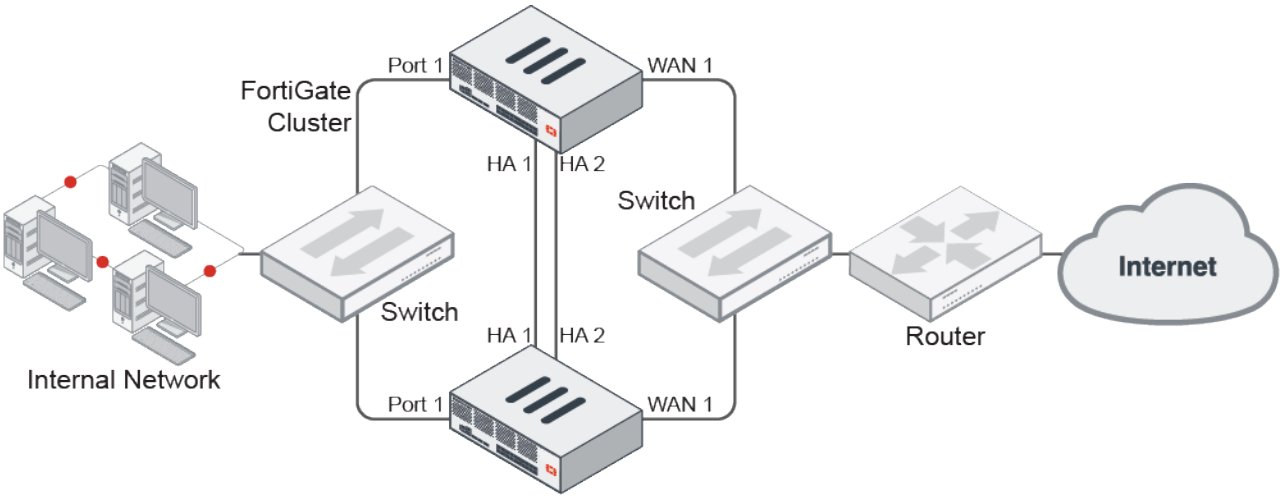
```
config system ha
    set mode a-p
    set group-name Example_cluster
    set hbdev ha1 10 ha2 20
end
```

5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster, giving each device a unique hostname.

HA active-active cluster setup

An HA Active-Active (A-A) cluster can be set up using the GUI or CLI.

This example uses the following network topology:

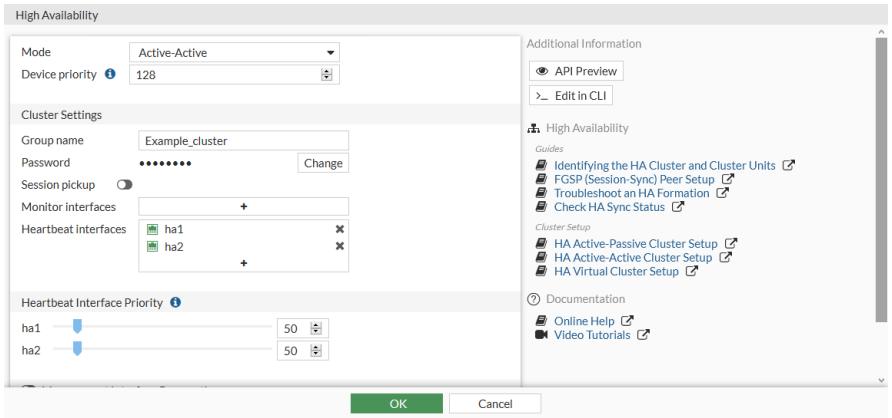


To set up an HA A-A cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to *System* > *HA* and set the following options:

Mode	Active-Active
Device priority	128 or higher
Group name	Example_cluster
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.



4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click *OK*.
   The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.
6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.

To set up an HA A-A cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Change the hostname of the FortiGate:

```
config system global
    set hostname Example1_host
end
```

   Changing the host name makes it easier to identify individual cluster units in the cluster operations.
4. Enable HA:

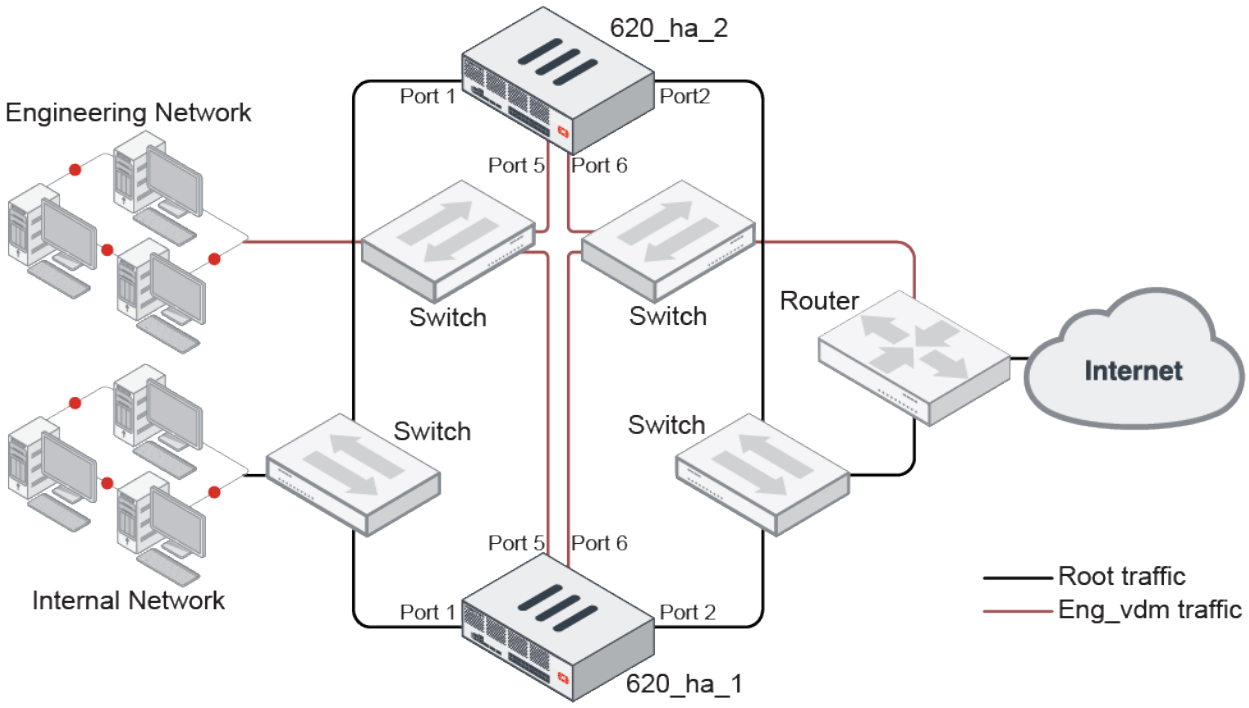
```
config system ha
    set mode a-a
    set group-name Example_cluster
    set hbdev ha1 10 ha2 20
end
```

5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster.

HA virtual cluster setup

An HA virtual cluster can be set up using the GUI or CLI.

This example uses the following network topology:



HA virtual clusters are based on VDOMs and are more complicated than regular clusters.

The root VDOM can only be associated with virtual cluster 1.

The VDOM that is assigned as the management VDOM can also only be associated with virtual cluster 1.

To set up an HA virtual cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to *System* > *HA* and set the following options:

Mode	Active-Passive
Device priority	128 or higher
Group name	Example_cluster
Heartbeat interfaces	ha1 and ha2

   Except for the device priority, these settings must be the same on all FortiGates in the cluster.
4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click *OK*.
   The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.

6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.
7. Go to *System* > *Settings* and enable *Virtual Domains*.
8. Click *Apply*. You will be logged out of the FortiGate.
9. Log back into the FortiGate, ensure that you are in the global VDOM, and go to *System* > *VDOM*.
10. Create two new VDOMs, such as VD1 and VD2:
    a. Click *Create New*. The *New Virtual Domain* page opens.
    b. Enter a name for the VDOM in the *Virtual Domain* field, then click *OK* to create the VDOM.
    c. Repeat these steps to create a second new VDOM.
11. Implement a virtual cluster by moving the new VDOMs to *Virtual cluster 2*:
    a. Go to *System* > *HA*.
    b. Enable *VDOM Partitioning*.
    c. Click on the *Virtual cluster 2* field and select the new VDOMs.

    d. Click *OK*.

To set up an HA virtual cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Set up a regular A-P cluster. See HA active-passive cluster setup on page 1507.
3. Enable VDOMs:

```
config system global
    set vdom-mode multi-vdom
end
```

   You will be logged out of the FortiGate.
4. Create two VDOMs:

```
config vdom
    edit VD1
    next
    edit VD2
```

```
    next
end
```

5. Reconfigure the HA settings to be a virtual cluster:

```
config global
    config system ha
        set vcluster2 enable
        config secondary-vcluster
            set vdom "VD1" "VD2"
        end
    end
end
```

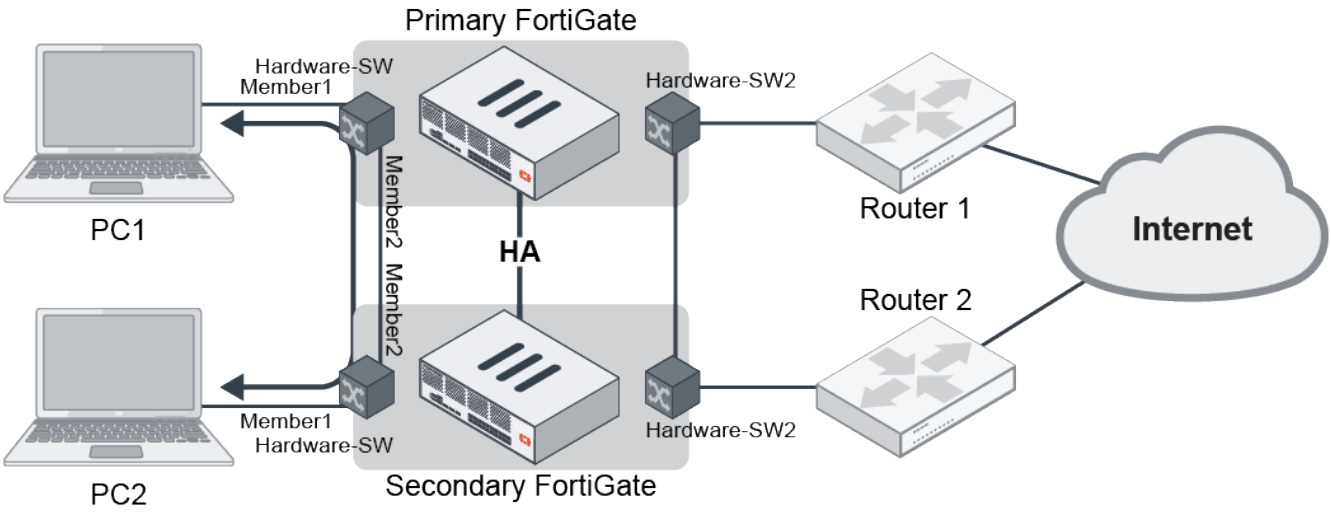
HA using a hardware switch to replace a physical switch

Using a hardware switch to replace a physical switch is not recommended, as it offers no redundancy or interface monitoring.

- If one FortiGate loses power, all of the clients connected to that FortiGate device cannot go to another device until that FortiGate recovers.
- A hardware switch cannot be used as a monitor interface in HA. Any incoming or outgoing link failures on hardware member interfaces will not trigger failover; this can affect traffic.

Examples

The examples use the following topology:



Traffic between hardware switches

When using Hardware switch in HA environment, a client device connected to the hardware switch on the primary FortiGate can communicate with client devices connected to the hardware switch on secondary FortiGates as long as there is a direct connection between the two switches.

No configuration is required after setting up the hardware switches. If a client connected to both of the hardware switches needs to reach destinations outside of the cluster, the firewall must be configured for it.

To configure the FortiGate devices:

1. Connect the devices as shown in the topology diagram.
2. On each FortiGate, configure HA:

```
config system ha
    set mode a-a
    set group-name Example_cluster
    set hbdev ha1 10 ha2 20
end
```

3. On the primary FortiGate, configure the hardware switch:

```
config system virtual-switch
    edit Hardware-SW
        set physical-switch sw0
        config port
            edit port3
            next
            edit port5
            next
        end
    next
end
```

4. On each FortiGate, configure the IP addresses on the hardware switches:

```
config system interface
    edit Hardware-SW
        set ip 6.6.6.1 255.255.255.0
        set allowaccess ping ssh http https
    next
end
```

After configuring the hardware switches, PC1 and PC2 can now communicate with each other.

Traffic passes through FortiGate

If client device needs to send traffic through the FortiGate, additional firewall configuration on the FortiGate is required.

All traffic from the hardware switches on either the primary or secondary FortiGate reaches the primary FortiGate first. The traffic is then directed according to the HA mode and firewall configuration.

To configure the FortiGate devices:

1. Connect the devices as shown in the topology diagram.
2. On each FortiGate, configure HA:

```
config system ha
    set mode a-a
    set group-name Example_cluster
    set hbdev ha1 10 ha2 20
end
```

3. On the primary FortiGate, configure the hardware switch:

```
config system virtual-switch
    edit Hardware-SW
```

```
        set physical-switch sw0
        config port
            edit port3
            next
            edit port5
            next
        end
    next
    edit Hardware-SW2
        set physical-switch sw0
        config port
            edit port1
            next
        end
    next
end
```

4. On each FortiGate, configure the IP addresses on the hardware switch:

```
config system interface
    edit Hardware-SW
        set ip 6.6.6.1 255.255.255.0
        set allowaccess ping ssh http https
    next
    edit Hardware-SW2
        set ip 172.16.200.1 255.255.255.0
        set allowaccess ping ssh http https
    next
end
```

5. On each FortiGate, configure a firewall policy:

```
config firewall policy
    edit 1
        set srcintf Hardware-SW
        set dstintf Hardware-SW2
        set srcaddr all
        set dstaddr all
        set service ALL
        set action accept
        set schedule always
        set nat enable
    next
end
```

6. On each FortiGate, configure a static route:

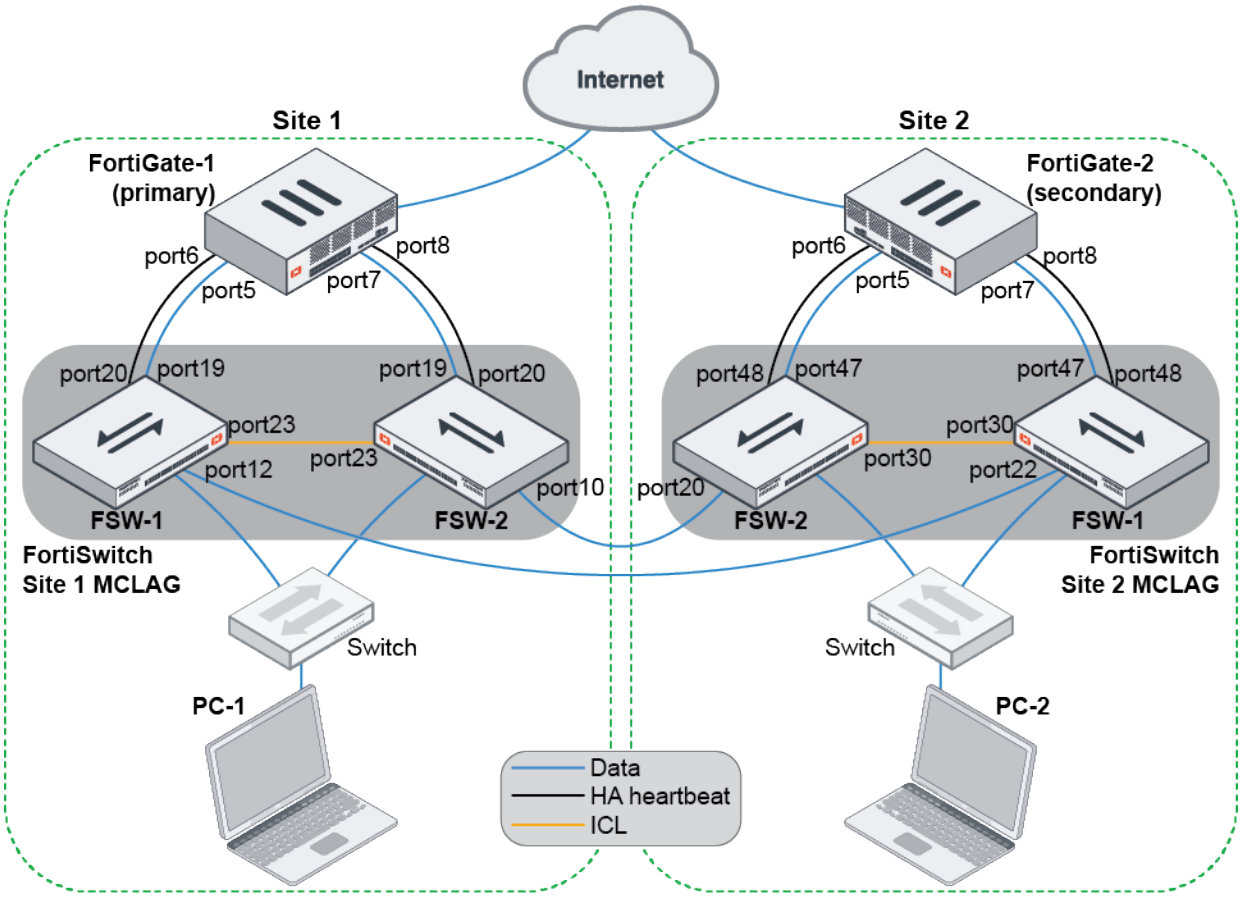
```
config router static
    edit 1
        set device Hardware-SW2
        set gateway 172.16.200.254
    next
end
```

Traffic from PC1 and PC2 can now reach destinations outside of the FortiGate cluster.

HA between remote sites over managed FortiSwitches

In a multi-site FortiGate HA topology that uses managed FortiSwitches in a multi-chassis link aggregation group (MCLAG) to connect between sites, HA heartbeat signals can be sent through the switch layer of the FortiSwitches, instead of through back-to-back links between the heartbeat interfaces. This means that two fiber connections can be used, instead of four. The FortiSwitches can be different models, but must all support MCLAG and be running version 6.4.2 or later.

This example shows how to configure heartbeat VLANs to assign to the access ports that the heartbeat interfaces connect to, passing over the trunk between the FortiSwitches on the two sites.



FortiGate HA is with two FortiGates in separate locations and the switch layer connection between the FortiSwitches is used for the heartbeat signal.

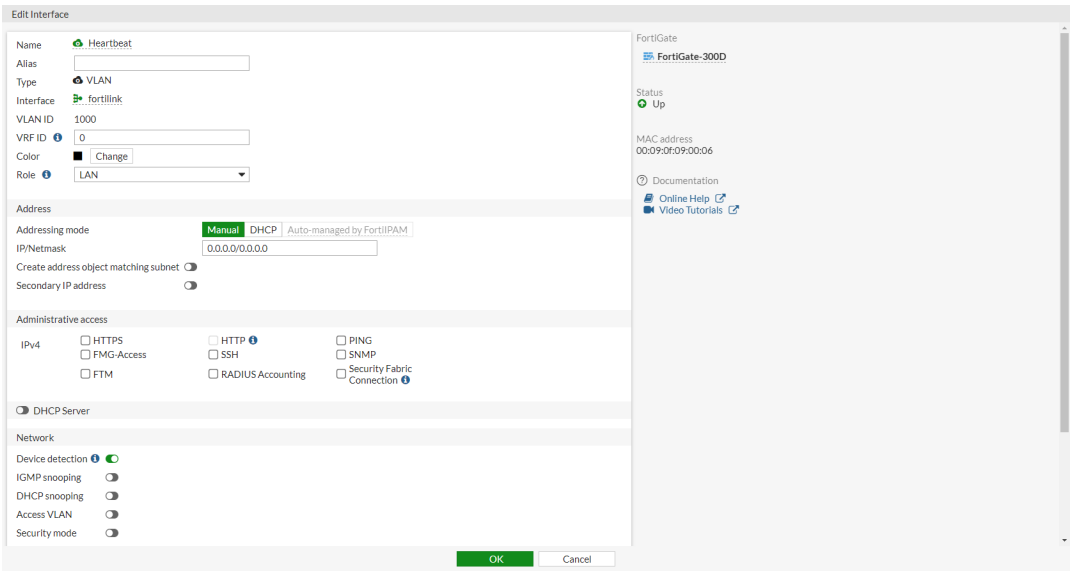
To configure the example:

1. Disconnect the physical connections between Site 1 and Site 2:
   - Disconnect the cable on Site 1 FSW-1 port 12.
   - Disconnect the cable on Site 1 FSW-2 port 10.

2. Configure Site 1:
   a. On the FortiGate, go to *WiFi & Switch Controller* > *FortiLink Interface* and configure FortiLink:

   b. Go to *System* > *HA* and configure HA:
      i. Set the heartbeat ports to the ports that are connected to FortiSwitch.
      ii. Adjust the priority and enable override so that this FortiGate becomes the primary.

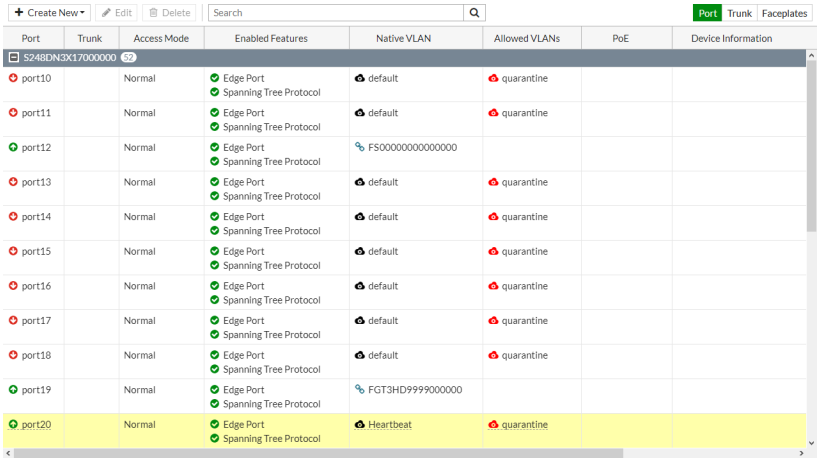
   c. Go to *WiFi & Switch Controller* > *FortiSwitch VLANs* and create a switch VLAN that is dedicated to the FortiGate HA heartbeats between the two FortiGates.



d. Assign the native VLAN of the switch ports that are connected to the heartbeat ports to the created VLAN:

i. Go to *WiFi & Switch Controller* > *FortiSwitch Ports*.

ii. In the *Native VLAN* column for the port, click the edit icon and select the *Heartbeat* VLAN.



e. On each FortiSwitch, enable MCLAG-ICL on the trunk port:

```
config switch trunk
    edit D243Z17000032-0
        set mclag-icl enable
    next
end
```

3. Configure Site 2 the same as Site 1, except set the HA priority so that the FortiGate becomes the secondary.
4. Disconnect the physical connections for FortiGate HA and FortiLink interfaces on Site 2:
   - Disconnect the cable on Site 2 FSW-1 ports 47 and 48.
   - Disconnect the cable on Site 2 FSW-2 ports 47 and 48.
5. Connect cables between the FortiSwitch MCLAG in Site 1 and Site 2:
   - Connect a cable from Site 1 FSW-1 port 12 to Site 2 FSW-1 port 22.
   - Connect a cable from Site 1 FSW-2 port 10 to Site 2 FSW-2 port 20.

6. On all of the FortiSwitches, configure the `auto-isl-port-group`. The group must match on both sides.
   a. Site 1 FSW-1:
      Set `members` to the port that is connected to Site 2 FSW-1:

```
config switch auto-isl-port-group
    edit 1
        set members port12
    next
end
```

   b. Site 1 FSW-2:
      Set `members` to the port that is connected to Site 1 FSW-1:

```
config switch auto-isl-port-group
    edit 1
        set members port22
    next
end
```

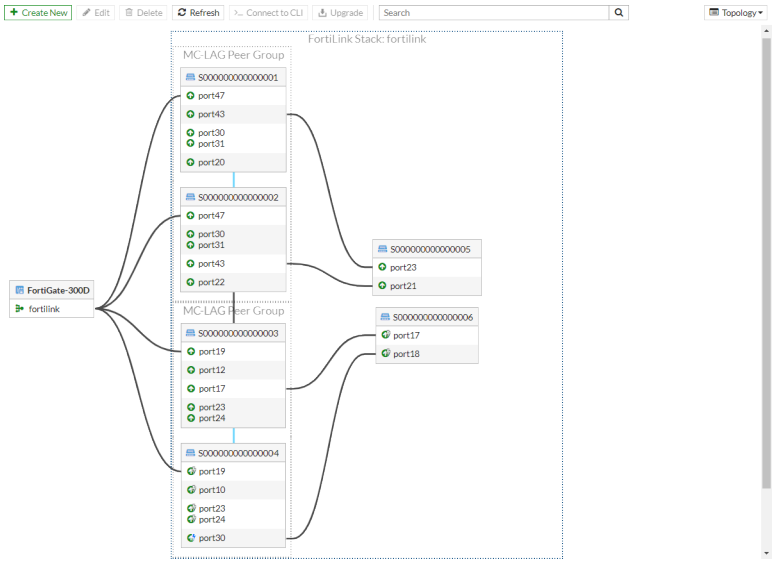
   c. Site 2 FSW-1:
      Set `members` to the port that is connected to Site 2 FSW-2:

```
config switch auto-isl-port-group
    edit 1
        set members port10
    next
end
```

   d. Site 2 FSW-2:
      Set `members` to the port that is connected to Site 1 FSW-2:

```
config switch auto-isl-port-group
    edit 1
        set members port20
    next
end
```

7. Connect the FortiGate HA and FortiLink interface connections on Site 2.
8. Configure a firewall policy and route for traffic so that the client can reach the internet.
9. Wait for HA to finish synchronizing and for all of the FortiSwitches to come online, then on FortiGate-1, go to *WiFi & Switch Controller* > *Managed FortiSwitch*.
   The page should look similar to the following:



To test the configuration to confirm what happens when there is a failover:

1. On both PC-1 and PC-2, access the internet and monitor traffic. The traffic should be going through the primary FortiGate.
2. Perform a continuous ping to an outside IP address, then reboot any one of the FortiSwitches.
   Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.
3. Perform a continuous ping to an outside IP address, then force an HA failover (see Force HA failover for testing and demonstrations on page 1526).
   Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.
4. After an HA failover, on the new primary FortiGate, go to *WiFi & Switch Controller* > *Managed FortiSwitch*.
   The switch layer tiering will be changed so that the directly connected FortiSwitches are at the top of the topology.

Routing NetFlow data over the HA management interface

In an HA environment, the `ha-direct` option allows data from services such as syslog, FortiAnalyzer, SNMP, and NetFlow to be routed over the outgoing interface.

The following example shows how NetFlow data can be routed over the HA management interface mgmt1.

To route NetFlow data over the HA management interface:

1. On the primary unit (FortiGate A), configure the HA and mgmt1 interface settings:

```
(global) # config system ha
    set group-name "test-ha"
    set mode a-p
    set password *********
    set hbdev "port6" 50
    set hb-interval 4
    set hb-lost-threshold 10
    set session-pickup enable
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
```

```
        edit 1
            set interface "mgmt1"
        next
    end
    set override enable
    set priority 200
    set ha-direct enable
end
```

```
(global) # config system interface
    edit "mgmt1"
        set ip 10.6.30.111 255.255.255.0
        set allowaccess ping https ssh http telnet fgfm
        set type physical
        set dedicated-to management
        set role lan
        set snmp-index 1
    next
end
```

2. On the secondary unit (FortiGate B), configure the HA and mgmt1 interface settings:

```
(global) # config system ha
    set group-name "test-ha"
    set mode a-p
    set password *********
    set hbdev "port6" 50
    set hb-interval 4
    set hb-lost-threshold 10
    set session-pickup enable
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface "mgmt1"
        next
    end
    set override enable
    set priority 100
    set ha-direct enable
end
```

```
(global) # config system interface
    edit "mgmt1"
        set ip 10.6.30.112 255.255.255.0
        set allowaccess ping https ssh http telnet fgfm
        set type physical
        set dedicated-to management
        set role lan
        set snmp-index 1
    next
end
```

3. On the primary unit (FortiGate A), configure the NetFlow setting:

```
(global) # config system netflow
    set collector-ip 10.6.30.59
end
```

4. Verify that NetFlow uses the mgmt1 IP:

```
(global) # diagnose test application sflowd 3
```

5. Verify that the NetFlow packets are being sent by the mgmt1 IP:

```
(vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
interfaces=[any]
filters=[udp and port 2055]
8.397265 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
23.392175 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 188
23.392189 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
...
3 packets received by filter
0 packets dropped by kernel
```

6. On the secondary device (FortiGate B), change the priority so that it becomes the primary:

```
(global) # config system ha
    set priority 250
end
```

7. Verify the NetFlow status on FortiGate A, which is using the new primary's mgmt1 IP:

```
(global) # diagnose test application sflowd 3
```

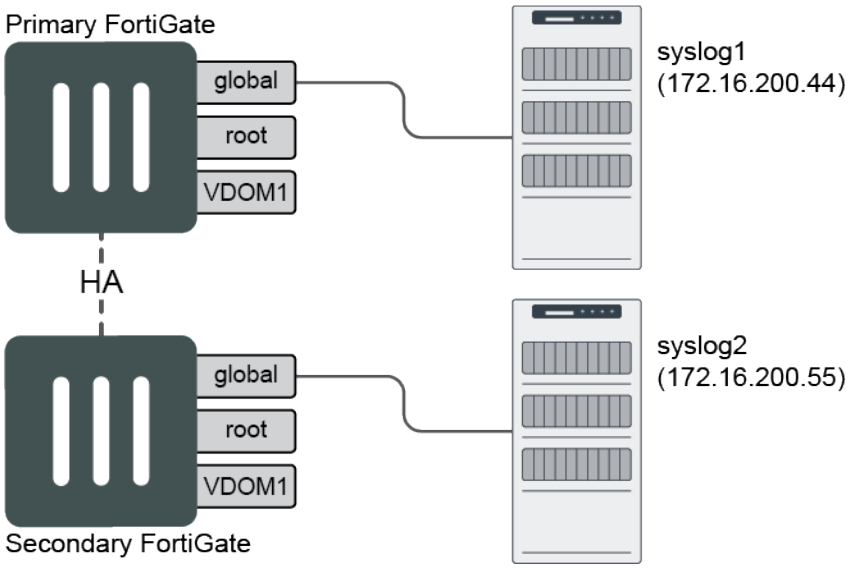
8. Verify that the NetFlow packets use the new source IP on FortiGate B:

```
(vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
interfaces=[any]
filters=[udp and port 2055]
7.579574 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
22.581830 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
29.038336 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 1140
^C
3 packets received by filter
0 packets dropped by kernel
```

Override FortiAnalyzer and syslog server settings

In an HA cluster, secondary devices can be configured to use different FortiAnalyzer devices and syslog servers than the primary device. VDOMs can also override global syslog server settings.

Configure a different syslog server on a secondary HA device



To configure the primary HA device:

1. Configure a global syslog server:

```
config global
    config log syslog setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

2. Set up a VDOM exception to enable setting the global syslog server on the secondary HA device:

```
config global
    config system vdom-exception
        edit 1
            set object log.syslogd.setting
        next
    end
end
```

To configure the secondary HA device:

1. Configure a global syslog server:

```
config global
    config log syslogd setting
        set status enable
        set server 172.16.200.55
        set facility local5
    end
end
```

2. After the primary and secondary device synchronize, generate logs on the secondary device.

To confirm that logs are been sent to the syslog server configured on the secondary device:

1. On the primary device, retrieve the following packet capture from the secondary device's syslog server:

```
# diagnose sniffer packet any "host 172.16.200.55" 6
interfaces=[any]
filters=[host 172.16.200.55]

266.859494 port2 out 172.16.200.2.7434 -> 172.16.200.55.514: udp 278
0x0000   0000 0000 0000 0009 0f09 0004 0800 4500        ..............E.
0x0010   0132 f3c7 0000 4011 9d98 ac10 c802 ac10        .2....@.........
0x0020   c837 1d0a 0202 011e 4b05 3c31 3734 3e64        .7......K.<174>d
0x0030   6174 653d 3230 3230 2d30 332d 3134 2074        ate=2020-03-14.t
0x0040   696d 653d 3132 3a30 303a 3035 2064 6576        ime=12:00:05.dev

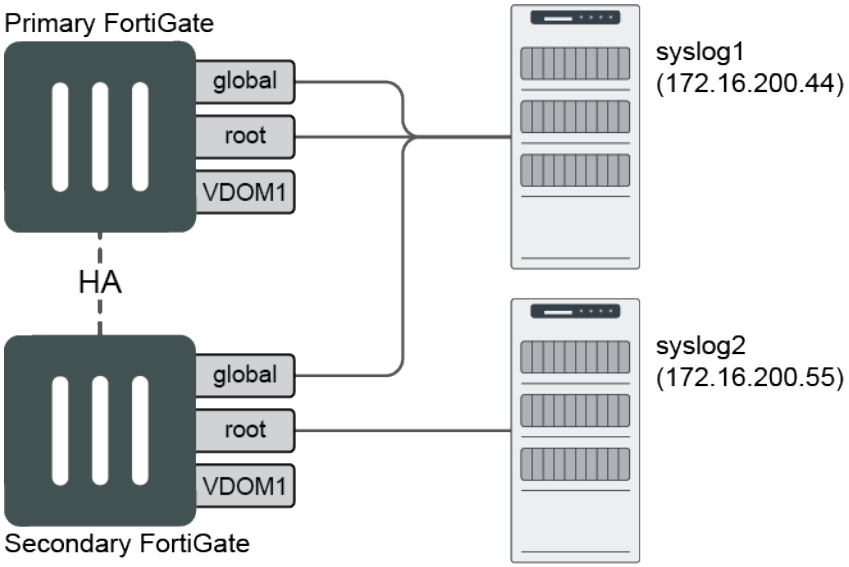
0x0100   3d22 4f75 7464 6174 6564 2072 6570 6f72        ="Outdated.repor
0x0110   7420 6669 6c65 7320 6465 6c65 7465 6422        t.files.deleted"
0x0120   206d 7367 3d22 4465 6c65 7465 2031 206f        .msg="Delete.1.o
0x0130   6c64 2072 6570 6f72 7420 6669 6c65 7322        ld.report.files"
```

Configure a different syslog server in the root VDOM on a secondary HA device



To configure the primary HA device:

1. Configure a global syslog server:

```
config global
    config log syslog setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

2. Set up a VDOM exception to enable `syslog-override` in the secondary HA device root VDOM:

```
config global
    config system vdom-exception
        edit 1
            set object log.syslogd.override-setting
            set scope inclusive
            set vdom root
        next
    end
end
```

3. In the VDOM, enable `syslog-override` in the log settings, and set up the override syslog server:

```
config root
    config log setting
        set syslog-override enable
    end
    config log syslog override-setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

After `syslog-override` is enabled, an override syslog server must be configured, as logs will not be sent to the global syslog server.

To configure the secondary HA device:

1. Configure an override syslog server in the root VDOM:

```
config root
    config log syslogd override-setting
        set status enable
        set server 172.16.200.55
        set facility local5
        set format default
    end
end
```

2. After the primary and secondary device synchronize, generate logs in the root VDOM on the secondary device.

To confirm that logs are been sent to the syslog server configured for the root VDOM on the secondary device:

1. On the primary device, retrieve the following packet capture from the syslog server configured in the root VDOM on the secondary device:

```
# diagnose sniffer packet any "host 172.16.200.55" 6
interfaces=[any]
filters=[host 172.16.200.55]

156.759696 port2 out 172.16.200.2.1165 -> 172.16.200.55.514: udp 277
0x0000   0000 0000 0000 0009 0f09 0004 0800 4500        ..............E.
0x0010   0131 f398 0000 4011 9dc8 ac10 c802 ac10        .1....@.........

Force HA failover for testing and demonstrations

This command should only be used for testing, troubleshooting, maintenance, and demonstrations.

Do not use it in a live production environment outside of an active maintenance window.

HA failover can be forced on an HA primary device. The device will stay in a failover state regardless of the conditions. The only way to remove the failover status is by manually turning it off.

Syntax

```
execute ha failover set <cluster_id>
execute ha failover unset <cluster_id>
```

Variable	Description
<cluster_id>	The cluster ID is 1 for any cluster that is not in virtual cluster mode, and can be 1 or 2 if virtual cluster mode is enabled.

Example

To manually force an HA failover:

```
# execute ha failover set 1
Caution: This command will trigger an HA failover.
It is intended for testing purposes.
Do you want to continue? (y/n)y
```

To view the failover status:

```
# execute ha failover status
failover status: set
```

To view the system status of a device in forced HA failover:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-300D
Mode: HA A-P
Group: 240
Debug: 0
Cluster Uptime: 0 days 2:11:46
Cluster state change time: 2020-03-12 17:38:04
Primary selected using:
    <2020/03/12 17:38:04> FGT3HD3914800153 is selected as the primary because it has EXE_
FAIL_OVER flag set.
    <2020/03/12 15:27:26> FGT3HD3914800069 is selected as the primary because it has the
largest value of override priority.

Querying autoscale clusters for FortiGate VM

When a FortiGate VM secondary device is added to a cluster, the new secondary member can query the cluster about its autoscale environment. FortiManager can then run this query on the new secondary member to update its autoscale record.

To view cluster information from a secondary member:

```
# diagnose sys ha checksum autoscale-cluster
```

Cluster information sample

Sample cloud topology:

```
FGT_BYOL; primary; 10.0.0.6; FGVM04TM00000066
FGT_BYOL; secondary; 10.0.0.7; FGVM00000000056
FGT_PAYG; secondary; 10.0.0.4; FGTAZ000000000CD
FGT_PAYG; secondary; 10.0.0.5; FGTAZ00000000003D
```

From the secondary device, you can see cluster checksums and the primary device:

```
# diagnose sys ha checksum autoscale-cluster
================== FGTAZ000000000CD ==================

```

To get ha sync information from the secondary device:

```
# get test hasync 50
autoscale_count=69. current_jiffies=41235125
    10.0.0.6, timeo=31430, serial_no=FGVM04TM19001766
    10.0.0.7, timeo=31430, serial_no=FGVM04TM19008156
    10.0.0.5, timeo=31430, serial_no=FGTAZR7UZRKKNR3D
```

VDOM exceptions

VDOM exceptions are settings that can be selected for specific VDOMs or all VDOMs that are not synchronized to other HA members. This can be required when cluster members are not in the same physical location, subnets, or availability zones in a cloud environment.

Some examples of possible use cases include:

- You use different source IP addresses for FortiAnalyzer logging from each cluster member. See Override FortiAnalyzer and syslog server settings on page 1522 for more information.
- You need to keep management interfaces that have specific VIPs or local subnets that cannot transfer from being synchronized.
- In a unicast HA cluster in the cloud, you use NAT with different IP pools in different subnets, so IP pools must be exempt.

When a VDOM exception is configured, the object will not be synchronized between the primary and secondary devices when the HA forms. Different options can be configured for every object.

When VDOM mode is disabled, the configured object is excluded for the entire device. To define a scope, VDOM mode must be enabled and the object must be configurable in a VDOM.

VDOM exceptions are synchronized to other HA cluster members.

To configure VDOM exceptions:

```
config global
    config system vdom-exception
        edit 1
            set object <object name>
            set scope {all* | inclusive | exclusive}
            set vdom <vdom name>
        next
    end
end
```

`object`	The name of the configuration object that can be configured independently for some or all of the VDOMs. See Objects on page 1531 for a list of available settings and resources.

`scope`	Determine if the specified object is configured independently for all VDOMs or a subset of VDOMs. • `all`: Configure the object independently on all VDOMs. • `inclusive`: Configure the object independently only on the specified VDOMs. • `exclusive`: Configure the object independently on all of the VDOMs that are not specified.
`vdom`	The names of the VDOMs that are included or excluded.

Objects

The following settings and resources can be exempt from synchronization in an HA cluster:

log.fortianalyzer.setting	system.interface
log.fortianalyzer.override-setting	vpn.ipsec.phase1-interface
log.fortianalyzer2.setting	vpn.ipsec.phase2-interface
log.fortianalyzer2.override-setting	router.bgp
log.fortianalyzer3.setting	router.route-map
log.fortianalyzer3.override-setting	router.prefix-list
log.fortianalyzer-cloud.setting	firewall.ippool
log.fortianalyzer-cloud.override-setting	firewall.ippool6
log.syslogd.setting	router.static
log.syslogd.override-setting	router.static6
log.syslogd2.setting	firewall.vip
log.syslogd2.override-setting	firewall.vip6
log.syslogd3.setting	firewall.vip46
log.syslogd3.override-setting	firewall.vip64
log.syslogd4.setting	system.sdwan
log.syslogd4.override-setting	system.saml
system.central-management	router.policy
system.csf	router.policy6
user.radius	

IKE monitor for FGSP

Split-brain situations occur in a scenario where session synchronization is down between two FGSP peers. This can have an effect if IKE fails over from one unit to another, causing the tunnel to be invalid due to the IKE session and role being out of sync, and ESP anti-replay detection. In split-brain situations, the IKE monitor provides a mechanism to maintain the integrity of the state tables and primary/secondary roles for each VPN gateway. It continues to provide fault tolerance by keeping track of the timestamp of the latest received traffic, and it uses the ESP sequence number jump ahead value to preserve the sequence number per gateway. Once the link is up, the cluster resolves the role and synchronizes the session and IKE data. During this process, if the IKE fails over from one unit to another, the tunnel will remain valid and traffic continues to flow.

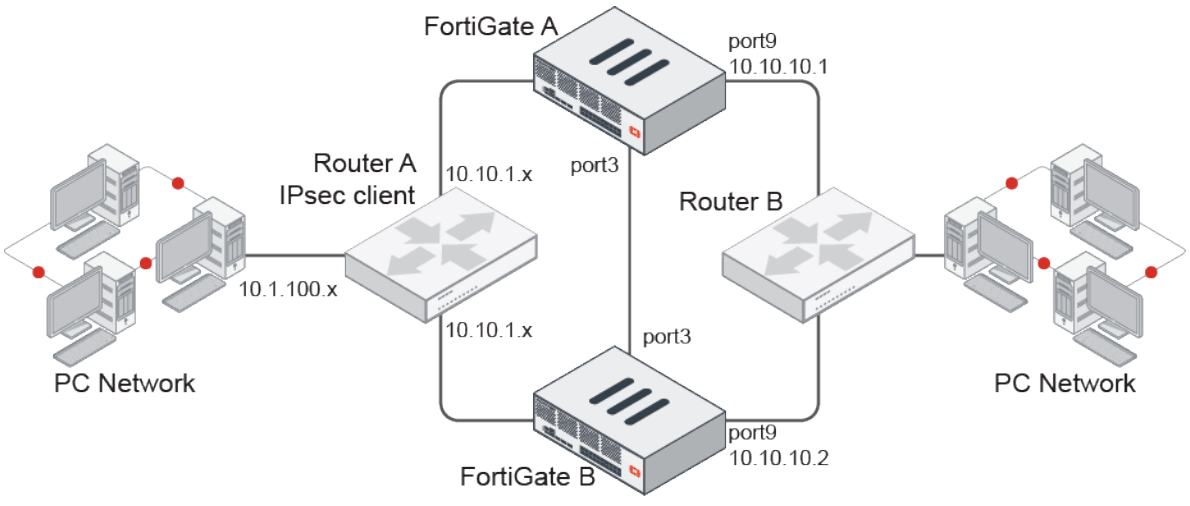
The IKE monitor only works with 2 peers in FGSP.

To configure the IKE monitor:

```
config system cluster-sync
    edit <id>
        set peerip <address>
        set ike-monitor {enable | disable}
        set ike-monitor-interval <integer>
        set ike-heartbeat-interval <integer>
        set ike-seqjump-speed <integer>
    next
end
```

`ike-monitor {enable | disable}`	Enable/disable IKE HA monitor (default = disable).
`ike-monitor-interval <integer>`	Set the monitoring interval for determining how fast the cluster members detect split-brain mode, in seconds (10 - 300, default = 15).
`ike-heartbeat-interval <integer>`	Set the heartbeat message interval for sending the heartbeat per gateway to the other peers, in seconds (1 - 60, default = 3).
`ike-seqjump-speed <integer>`	Set the ESP jump ahead factor, in packets per second equivalent (1 - 10, default = 10). A value of 10 means it is the factor for a 10G interface.

Example



In this example, FortiGate A and FortiGate B are FGSP peers with port3 as the session synchronization link. The FortiGates act as IPsec dial-up servers and PCs on the 10.1.100.0 subnet are the IPsec dial-up clients. Router A acts as the external load balancer for IKE sessions between the FortiGates. Dynamic routing OSPF is configured for the FortiGates and routers.

When PC2 and other clients form IPsec dial-up tunnels to the FGSP peers, these tunnels terminate on either FortiGate A or FortiGate B, not both. For each tunnel, one FortiGate is the primary and the other is the secondary.

When the session synchronization link goes down, the FGSP split-brain scenario occurs. Without using the IKE monitor mechanism, the IKE and ESP information becomes out of sync between the two FortiGates. The secondary FortiGate for a tunnel does not receive any information about updated tunnel status. If there is a failover and tunnel traffic begins to flow to the secondary FortiGate, the tunnel will be invalidated because its state tables for that session are out of sync.

By using the IKE monitor when a split-brain scenario occurs, each unit starts periodically monitoring traffic flows and managing the sequence number jump ahead on standby units. Using a combination of timers with ESP sequence number jump ahead lets the units maintain integrity of the shared SA runtime state table, including ESP anti-replay sequence numbers.

Once the session synchronization link is up, the FGSP peers synchronize the state tables and resume regular operations.

To configure the IKE monitor:

```
config system cluster-sync
    edit 1
        set peerip 10.10.10.2
        set ike-monitor enable
        set ike-monitor-interval 12
        set ike-heartbeat-interval 2
        set ike-seqjump-speed 2
    next
end
```

SNMP

SNMP enables you to monitor hardware on your network. You can configure the hardware, such as the FortiGate SNMP agent, to report system information and send traps (alarms or event messages) to SNMP managers. SNMP traps alert you to events that happen, such as when a log disk is full or a virus is detected.

The FortiGate SNMP implementation is read-only. SNMP v1/v2c, and v3 compliant SNMP managers have read-only access to FortiGate system information through queries, and can receive trap messages from the FortiGate unit.

- Interface access on page 1533
- MIB files on page 1534
- SNMP agent on page 1535
- SNMP v1/v2c communities on page 1535
- SNMP v3 users on page 1537
- Important SNMP traps on page 1538
- SNMP traps and query for monitoring DHCP pool on page 1540

Interface access

Before a remote SNMP manager can connect to the FortiGate SNMP agent, you must configure one or more FortiGate interfaces to accept SNMP connections.

To configure a FortiGate interface to accept SNMP connections in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit the interface.
3. In the *Administrative Access* options, enable *SNMP*.
4. Click *OK*.

To configure a FortiGate interface to accept SNMP connections in the CLI:

```
config system interface
    edit <interface>
        append allowaccess snmp
        set snmp-index <integer>
        config ipv6
            append ip6-allowaccess snmp
        end
    next
end
```

MIB files

The FortiGate SNMP agent supports Fortinet proprietary MIBs, as well as the parts of RFC 2665 and RFC 1213 that apply to FortiGate unit configuration.

Your SNMP manager may already include standard and private MIBs in a compiled database that is ready to use. You must add the Fortinet proprietary MIBs to this database to have access to Fortinet specific information.

MIB file or RFC	Description
FORTINET-CORE-MIB.mib	The Fortinet core MIB includes all system configuration and trap information that is common to all Fortinet products. Your SNMP manager requires this information to monitor Fortinet device settings and receive traps from the FortiGate SNMP agent.
FORTINET-FORTIGATE-MIB.mib	The FortiGate MIB includes all system configuration information and trap information that is specific to FortiGate units. Your SNMP manager requires this information to monitor FortiGate settings and receive traps from the FortiGate SNMP agent.
RFC-1213 (MIB II)	The FortiGate SNMP agent supports MIB II groups with the following exceptions: • No support for the EGP group from MIB II (RFC 1213, section 3.11 and 6.10). • Protocol statistics returned for MIB II groups (IP/ICMP/TCP/UDP/etc.) do not accurately capture all Fortinet traffic activity. More accurate information can be obtained from the information reported by the Fortinet MIB.
RFC-2665 (Ethernet-like MIB)	The FortiGate SNMP agent supports Ethernet-like MIB information. FortiGate SNMP does not support for the dot3Tests and dot3Errors groups.

To download the MIB files:

1. Go to *System* > *SNMP*.
2. Click *Download FortiGate MIB File* and save the file to the management computer.

3. Click *Download Fortinet Core MIB File* and save the file to the management computer.

SNMP agent

The SNMP agent sends SNMP traps originating on the FortiGate to an external monitoring SNMP manager defined in a SNMP community. The SNMP manager can monitor the FortiGate system to determine if it is operating properly, or if any critical events occurring.

The description, location, and contact information for this FortiGate system will be part of the information that the SNMP manager receives. This information is useful if the SNMP manager is monitoring many devices, and enables faster responses when the FortiGate system requires attention.

To configure the SNMP agent in the GUI:

1. Go to *System* > *SNMP*.
2. Enable *SNMP Agent*.
3. Enter a description of the agent.
4. Enter the location of the FortiGate unit.
5. Enter a contact or administrator for the SNMP Agent or FortiGate unit.
6. Click *Apply*.

To configure the SNMP agent in the CLI:

```
config system snmp sysinfo
    set status enable
    set description <string>
    set contact-info <string>
    set location <string>
end
```

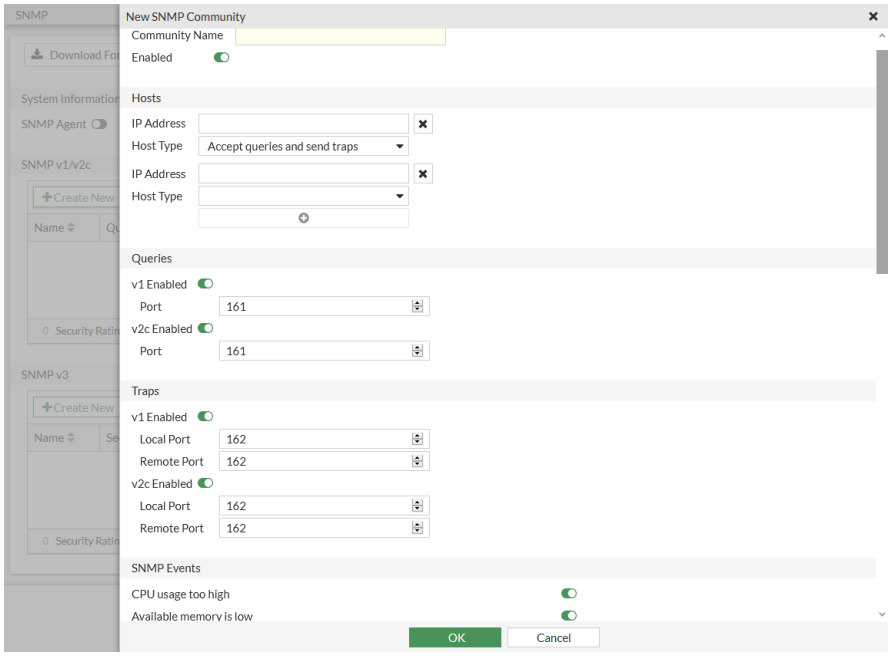
SNMP v1/v2c communities

An SNMP community is a grouping of equipment for network administration purposes. A single device can belong to multiple communities.

You must add an SNMP community to the FortiGate so that the SNMP manager can receive traps and system information. Up to three communities can be added.

To create a n SNMP v1/v2c community in the GUI:

1. Go to *System* > *SNMP*.
2. In the *SNMP v1/v2c* table, click *Create New*.



3. Enter a *Community Name* and enable the community.
4. In the *Hosts* section, enter the *IP Address* and select the *Host Type* for each SNMP manager.
5. In the *Queries* section, enable or disable v1 and v2c queries, then enter the port numbers that the SNMP managers in this community use for them.
6. In the *Traps* section, enable or disable v1 and v2c traps, then enter the local and remote port numbers that the SNMP managers in this community use for them.
7. In the *SNMP Events* section, enable or disable the events that activate traps in this community.
8. Click *OK*.

To create a n SNMP v1/v2c community in the CLI:

```
config system snmp community
    edit 2
        set name <string>
        set status {enable | disable}
        config hosts
            edit <host_id>
                set ip <ip/mask>
                set source-ip <class_ip>
                set ha-direct {enable | disable}
                set host-type {any | query | trap}
            next
        end
        set query-v1-port <port_number>
        set query-v1-status {enable | disable}
        set query-v2c-port <port_number>
        set query-v2c-status {enable | disable}
        set trap-v1-lport <port_number>
```

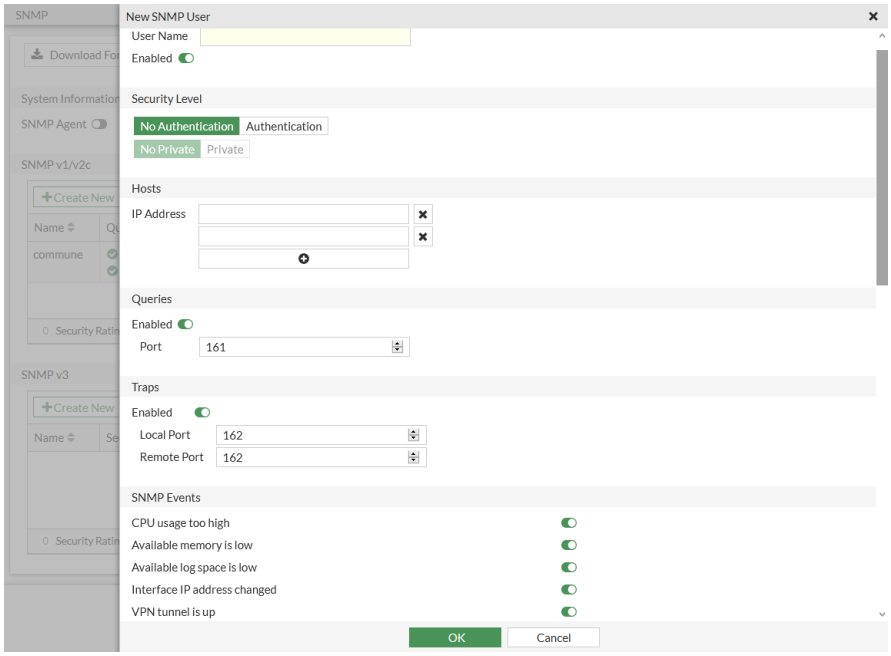
```
        set trap-v1-rport <port_number>
        set trap-v1-status {enable | disable}
        set trap-v2c-lport <port_number>
        set trap-v2c-rport <port_number>
        set trap-v2c-status {enable | disable}
        set events <events>
    next
end
```

SNMP v3 users

Authentication is used to ensure the identity of users. Privacy allows for encryption of SNMP v3 messages to ensure confidentiality of data. These protocols provide a higher level of security than is available in SNMP v1 and v2c, which use community strings for security. Both authentication and privacy are optional.

To create a n SNMP v3 user in the GUI:

1. Go to *System* > *SNMP*.
2. In the *SNMP v3* table, click *Create New*.



3. Enter a *User Name* and enable the user.
4. In the *Security Level* section, configure the security level:
   - *No Authentication*: No authentication or encryption.
   - *Authentication*: Select the authentication algorithm and password.
   - *Authentication and Private*: Select both the authentication and encryption algorithms and password.
5. In the *Hosts* section, enter the *IP Address* for each SNMP manager.
6. In the *Queries* section, enable or disable queries, then enter the port number that the SNMP managers use for them.
7. In the *Traps* section, enable or disable traps, then enter the local and remote port numbers that the SNMP managers use for them.

8. In the *SNMP Events* section, enable or disable the events that activate traps.
9. Click *OK*.

To create an SNMP v3 user in the CLI:

```
config system snmp user
    edit <user>
        set status {enable | disable}
        set trap-status {enable | disable}
        set trap-lport <port_number>
        set trap-rport <port_number>
        set queries {enable | disable}
        set query-port <port_number>
        set notify-hosts <class_ip> ... <class_ip>
        set source-ip <class_ip>
        set ha-direct {enable | disable}
        set events <events>
        set security-level {no-auth-no-priv | auth-no-priv | auth-priv}
        set auth-proto {md5 | sha | sha224 | sha256 | sha384 | sha512}
        set auth-pwd <password>
        set priv-proto {aes | des | aes256 | aes256cisco}
        set priv-pwd <password>
    next
end
```

Important SNMP traps

Link Down and Link Up traps

This trap is sent when a FortiGate port either goes down or is brought up.

For example, the following traps are generated when the state of port34 is set to down using `set status down`, and then brought up using `set status up`:

```
NET-SNMP version 5.7.3 2019-01-31 14:11:48 10.1.100.1(via UDP: [10.1.100.1]:162->
[10.1.100.11]:162) TRAP, SNMP v1, community REGR-SYS SNMPv2-MIB::snmpTraps Link Down Trap
(0) Uptime: 0:14:44.95 IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER:
down(2) IF-MIB::ifOperStatus.42 = INTEGER: down(2) FORTINET-CORE-MIB::fnSysSerial.0 =
STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE

2019-01-31 14:11:48 <UNKNOWN> [UDP: [10.1.100.1]:162->[10.1.100.11]:162]: DISMAN-EVENT-
MIB::sysUpTimeInstance = Timeticks: (88495) 0:14:44.95 SNMPv2-MIB::snmpTrapOID.0 = OID: IF-
MIB::linkDown IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER: down(2)

FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE
```

fgFmTrapIfChange trap

This trap is sent when any changes are detected on the interface. The change can be very simple, such as giving an IPV4 address.

For example, the user has given the IP address of 1.2.3.4/24 to port 1 and the EMS Manager has detected the following trap:

```
DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (7975058) 22:09:10.58 SNMPv2-
MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgFmTrapIfChange FORTINET-CORE-
MIB::fnSysSerial.0 = STRING: FG140P3G15800330 IF-MIB::ifName.45 = STRING: port1 FORTINET-
FORTIGATE-MIB::fgManIfIp.0 = IpAddress: 1.2.3.4 FORTINET-FORTIGATE-MIB::fgManIfMask.0 =
IpAddress: 255.255.255.0 FORTINET-FORTIGATE-MIB::fgManIfIp6.0 = STRING: 0:0:0:0:0:0:0:0
```

entConfigChange trap

The change to the interface in the previous example has also triggered the *ConfChange Trap* which is sent along with the *fgFmTrapIfChange* trap:

```
2018-11-15 09:30:23 FGT_A [UDP: [172.16.200.1]:162->[172.16.200.55]:162]: DISMAN-EXPRESSION-
MIB::sysUpTimeInstance = Timeticks: (8035097) 22:19:10.97 SNMPv2-MIB::snmpTrapOID.0 = OID:
ENTITY-MIB::entConfigChange
```

fgTrapDeviceNew trap

This trap is triggered when a new device, like a FortiSwitch, is connected to the FortiGate.

For example, the following scenario has given the device a new trap for adding FortiAP on a PoE interface a FortiGate 140D-POE. The trap has important information about the device name, device MAC address, and when it was last seen.

```
2018-11-15 11:17:43 UDP/IPv6: [2000:172:16:200::1]:162 [UDP/IPv6: [2000:172:16:200::1]:162]:
DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (520817) 1:26:48.17 SNMPv2-
MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgTrapDeviceNew FORTINET-CORE-
MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT_A IF-
MIB::ifIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgVdEntIndex.0 = INTEGER: 0 FORTINET-
FORTIGATE-MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 =
Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0
```

```
2018-11-15 11:17:43 FGT_A [UDP: [172.16.200.1]:162->[172.16.200.55]:162]: DISMAN-EXPRESSION-
MIB::sysUpTimeInstance = Timeticks: (520817) 1:26:48.17 SNMPv2-MIB::snmpTrapOID.0 = OID:
FORTINET-FORTIGATE-MIB::fgTrapDeviceNew FORTINET-CORE-MIB::fnSysSerial.0 = STRING:
FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT_A IF-MIB::ifIndex.0 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fgVdEntIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-
MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 = Gauge32: 5
FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0
```

fgTrapAvOversize trap

The `fgTrapAvOversize` trap is generated when the antivirus scanner detects an oversized file:

```
019-01-31 13:22:04 10.1.100.1(via UDP: [10.1.100.1]:162->[10.1.100.11]:162) TRAP, SNMP v1,
community REGR-SYS FORTINET-FORTIGATE-MIB::fgt140P Enterprise Specific Trap (602) Uptime: 1
day, 3:41:10.31 FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-
MIB::sysName.0 = STRING: FortiGate-140D-POE 2019-01-31 13:22:29 <UNKNOWN> [UDP:
[10.1.100.1]:162->[10.1.100.11]:162]: DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks:
(9967031) 1 day, 3:41:10.31 SNMPv2-MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-
MIB::fgTrapAvOversize FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-
MIB::sysName.0 = STRING: FortiGate-140D-POE
```

SNMP traps and query for monitoring DHCP pool

The SNMP DHCP event contains three traps and one query.

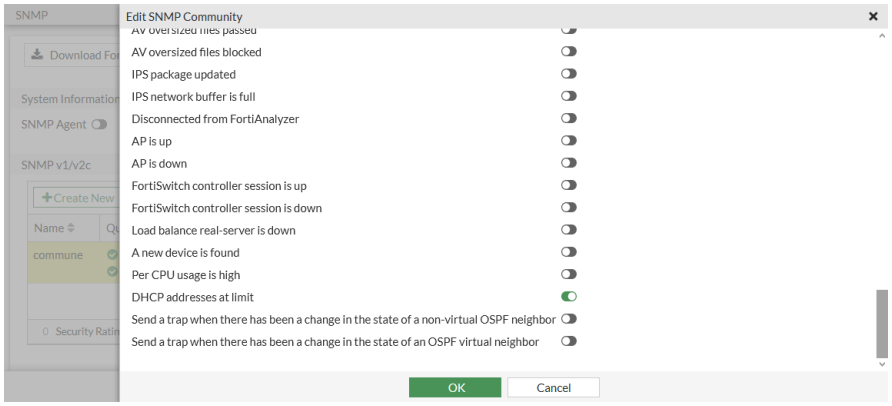
Traps are sent when:

- DHCP server IP pool usage reaches 90%
- DHCP server detect an IP address that is already in use
- DHCP client receives DHCP NAK

SNMP queries are accepted for DHCP lease usage information (OID = 1.3.6.1.4.1.12356.101.23). The query result is based on the leased out percentage.

To enable the SNMP DHCP event in the GUI:

1. Go to *System* > *SNMP*.
2. Click *Create New* in either the *SNMP v1/v2c* table or *SNMP v3* table, or edit an existing community or user.
3. Configure the settings as required.
4. In the *SNMP Events* list, enable *DHCP addresses at limit*.



5. Click *OK*.

To enable the SNMP DHCP event in the CLI:

```
config system snmp community
    edit 1
        set name "REGR-SYS"
        config hosts
            edit 1
                set ip 10.1.100.11 255.255.255.255
            next
            edit 2
```

```
                set ip 172.16.200.55 255.255.255.255
            next
        end
        set events dhcp
    next
end

config system snmp user
    edit "1"
        set notify-hosts 172.10.1.0 172.20.1.0
        set events dhcp
        set security-level auth-priv
        set auth-proto sha384
        set auth-pwd ********************
        set priv-proto aes256
        set priv-pwd **********************
    next
end
```

Replacement messages

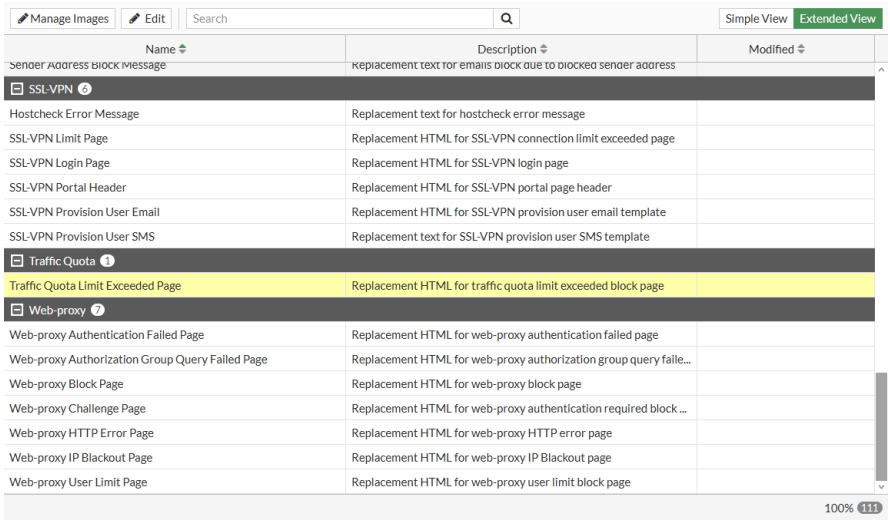
FortiOS has replacement messages that are HTML and text files. These messages can be customized to meet user requirements. The content can be modified, and images can be added.

Modifying replacement messages

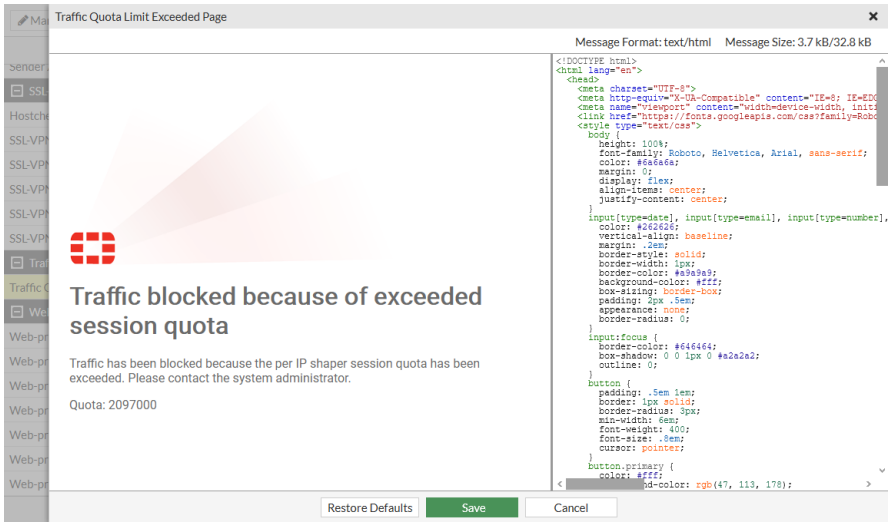
The *Replacement Messages* page has two views. *Simple View* (the default view) shows the most commonly used replacement messages. *Extended View* shows the entire list and all replacement message categories.

To modify a replacement message in the GUI:

1. Go to *System* > *Replacement Messages*.
2. Select a replacement message and click *Edit*.
   If the message you want to edit is not visible, click *Extended View* in the upper right-hand corner of the top menu.



3. Edit the HTML code.
   The message is visible on the left alongside the HTML code on the right. The message view updates in real-time as you edit the content.



4. Click *Save*.

Click *Restore Defaults* to return to the original message and code base.

To modify a replacement message in the CLI:

For example, to modify the *Traffic Quota Limit Exceeded Page* message:

```
config system replacemsg traffic-quota "per-ip-shaper-block"
    set buffer "<html>
  <head>
    <title>
      Traffic Quota Control
    </title>
```

```
  </head>
  <body>
    <font size=2>
      <table width=\"100%\">
        <tr>
          <td bgcolor=#3300cc align=\"center\" colspan=2>
            <font color=#ffffff>
              <b>
                Traffic blocked because exceeded session quota
              </b>
            </font>
          </td>
        </tr>
      </table>
      <br>
      <br>
      Traffic blocked because it exceeded the per IP shaper session quota. Please contact
the system administrator.
      <br>
      %%QUOTA_INFO%%
      <br>
      <br>
      <hr>
    </font>
  </body>
</html>"
    set header http
    set format html
end
```

Replacement message images

Images can be added to replacement messages on:

- Disclaimer pages
- Login pages
- Declined disclaimer pages
- Login failed pages
- Login challenge pages
- Keepalive pages

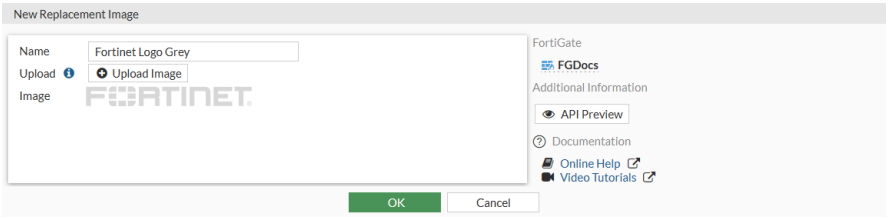
The supported image formats are GIF, JPEG, TIFF, and PNG. The maximum file size supported is 24 KB.

Adding images to replacement messages

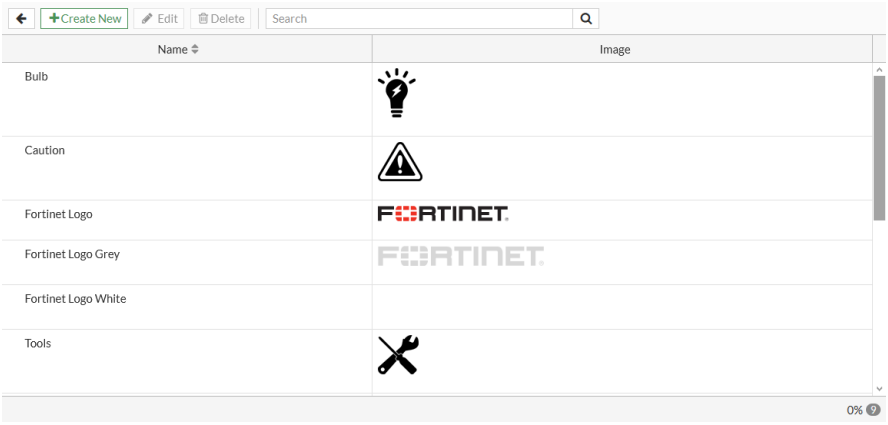
To add images to replacement messages in the GUI:

1. Go to *System* > *Replacement Messages*.
2. In the top menu, click *Manage Images*.

3. Click *Create New*.
4. Enter a name for the image.
5. Click *Upload Image* and locate the file.



6. Click *OK*.
   The file is now visible in the list.



To add images to replacement messages in the CLI:

```
config system replacemsg-image
    edit <image_name>
        set image-type {gif | jpg | tiff | png}
        set image-base64 <string>
    next
end
```

Replacement message groups

Replacement message groups allow users to customize replacement messages for individual policies and profiles.

There are two types of replacement message groups:

Type	Usage	Customizable categories
utm	Used with UTM settings in firewall policies.	• admin • alertmail • custom-message • fortiguard-wf • ftp

Type	Usage	Customizable categories
		• http • icap • mail • nac-quar • spam • sslvpn • traffic-quota • utm • webproxy
auth	Used with authentication pages in firewall policies.	• auth • webproxy

The messages added to a group do not need to be customized. The message body content, header type, and format will use the default values if not customized.

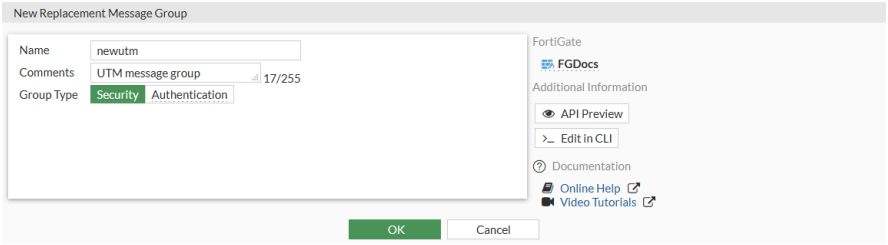
To make replacement message groups visible in the GUI:

```
config system settings
    set gui-replacement-message-groups enable
end
```

In the following example, two replacement message groups are created. The UTM message group includes custom mail-related messages and is assigned to an email filter profile. The authentication message group has a custom authentication success message that is applied to a proxy-based firewall policy that has an assigned email filter profile.

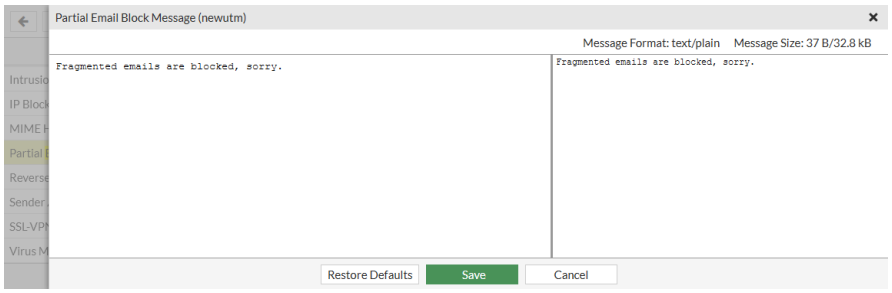
To create replacement message groups in the GUI:

1. Create the *Security* replacement message group:
   a. Go to *System* > *Replacement Message Groups*.
   b. Click *Create New*.
   c. For *Name*, enter *newutm*.
   d. In the *Comments* field, enter *UTM message group*.
   e. For *Group Type*, select *Security*.
   f. Click *OK*.



2. Customize the replacement messages in the *newutm* group:
   a. Go to *System* > *Replacement Message Groups*.
   b. Edit the *newutm* group.

c. Select the *Partial Email Block Message*.



d. Edit the message and click *Save*.

e. Select the *ASE Block Message*.

f. Edit the message and click *Save*.

3. Create the *Authentication* replacement message group:

a. Go to *System* > *Replacement Message Groups*.

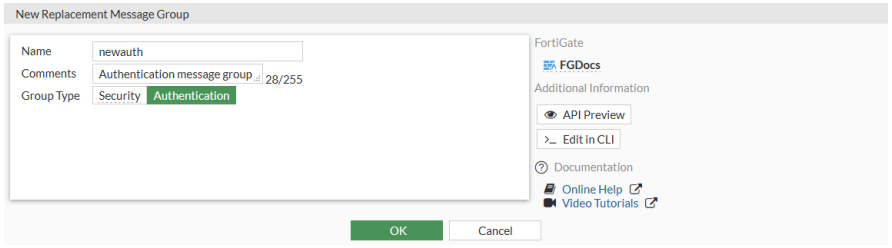
b. Click *Create New*.

c. For *Name*, enter *newauth*.

d. In the *Comments* field, enter *Authentication message group*.

e. For *Group Type*, select *Authentication*.

f. Click *OK*.



4. Apply the *newutm* replacement message group to an email filter profile in the CLI:

```
config emailfilter profile
    edit "newmsgs"
        set replacemsg-group "newutm"
    next
end
```

5. Apply the *newauth* replacement message group and the email filter profile to a firewall policy in the CLI:

```
config firewall policy
    edit 1
        ...
        set replacemsg-override-group "newauth"
        set inspection-mode proxy
        set emailfilter-profile "newmsgs"
        ...
    next
end
```

To create replacement message groups in the CLI:

1. Create the replacement message groups:

```
config system replacemsg-group
    edit "newutm"
        set comment "UTM message group"
        set group-type utm
        config mail
            edit "partial"
                set buffer "Fragmented emails are blocked, sorry."
            next
        end
        config spam
            edit "smtp-spam-ase"
                set buffer "This message has been blocked because ASE reports it as
spam. You\'re welcome."
            next
        end
    next
    edit "newauth"
        set comment 'Authentication message group'
        set group-type auth
        config auth
            edit "auth-success-msg"
                set buffer "Welcome to the firewall. Your authentication has been
accepted, please reconnect."
            next
        end
    next
end
```

2. Apply the message group to the email filter:

```
config emailfilter profile
    edit "newmsgs"
        set replacemsg-group "newutm"
    next
end
```

3. Apply the email filter and message group to the policy:

```
config firewall policy
    edit 1
        ...
        set replacemsg-override-group "newauth"
        set inspection-mode proxy
        set emailfilter-profile "newmsgs"
        ...
    next
end
```

FortiGuard

FortiGuard services can be purchased and registered to your FortiGate unit. The FortiGate must be connected to the Internet in order to automatically connect to the FortiGuard Distribution Network (FDN) to validate the license and download FDN updates.

The FortiGuard subscription update services include:

- Antivirus (AV)
- Intrusion Protection Service (IPS)
- Application Control
- Antispam
- Web Filtering
- Web Application Firewall (WAF)

To view FDN support contract information, go to *System* > *FortiGuard*. The *License Information* table shows the status of your FortiGate's support contract.

- Configuring FortiGuard updates on page 1548
- Manual updates on page 1549
- Automatic updates on page 1550
- Scheduled updates on page 1550
- Sending malware statistics to FortiGuard on page 1551
- Update server location on page 1552
- Filtering on page 1552
- Online security tools on page 1554
- FortiGuard anycast and third-party SSL validation on page 1554
- Using FortiManager as a local FortiGuard server on page 1557
- Cloud service communication statistics on page 1558
- IoT detection service on page 1559
- FortiAP query to FortiGuard IoT service to determine device details on page 1561

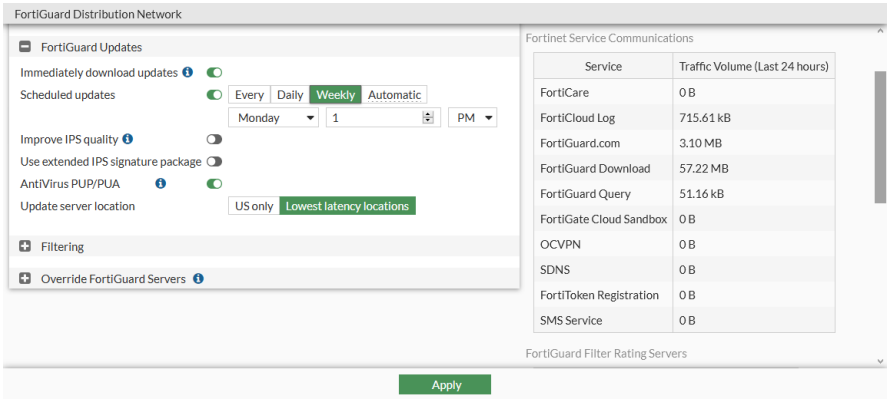
Configuring FortiGuard updates

To configure FortiGuard updates:

1. Go to *System* > *FortiGuard*
2. Scroll down to the *FortiGuard Updates* section.
3. Configure the options for connecting and downloading definition files:

Immediately download updates	The option can be enabled on 2U and larger hardware models when the FortiGuard are servers are connected in anycast mode. The FortiGate forms a secure, persistent connection with FortiGuard to get notifications of new updates through an HTTPS connection. The FortiGate uses the fds_notify daemon to wait for the notification, then makes another connection to the FortiGuard server to download the updates.

Scheduled Updates	Enable to schedule updates to be sent to the FortiGate at the specified time or automatically. See Scheduled updates on page 1550 and Automatic updates on page 1550.
Improve IPS quality	Enable to send information to the FortiGuard servers when an attack occurs. This can help keep the FortiGuard database current as attacks evolve, and improve IPS signatures.
Use extended IPS signature package	Enable to use the extended IPS database, that includes protection from legacy attacks, along with the regular IPS database that protects against the latest common and in-the-wild attacks.
AntiVirus PUP/PUA	Enable antivirus grayware checks for potentially unwanted applications.
Update server location	The FortiGuard update server location. See Update server location on page 1552 for details.



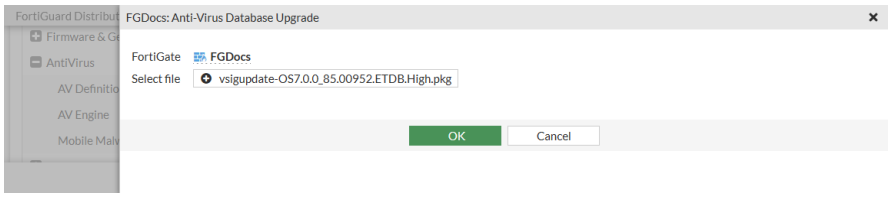
4. Click *Apply*.

Manual updates

When needed, FortiGuard Distribution Network (FDN) updates can be manually uploaded.

To manually update the signature definitions files:

1. Log in to the Fortinet Support website.
2. Go to *Support* > *Service Updates*.
3. Select your *OS Version* from the dropdown list.
4. Locate your device in the table, and download the signature definitions files.
5. On the FortiGate, go to *System* > *FortiGuard*.
6. In the *License Information* table, locate and expand the definitions that you are updating, and click *Upgrade Database* in the rightmost column.
7. In the pane that opens, click *Upload*, locate the downloaded definitions file on your computer, then click *Open*. The download may take a few minutes to complete.



8. Click *OK*.

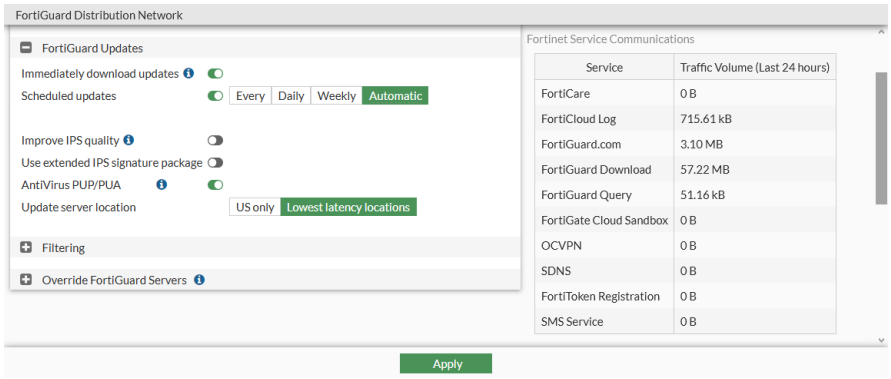
Automatic updates

The default auto-update schedule for FortiGuard packages is automatic. The update interval is calculated based on the model and percentage of valid subscriptions, within one hour.

For example, if a FortiGate 501E has 78% valid contracts, then based on this device model, the update schedule is calculated to be every 10 minutes. If you verify the system event logs (ID 0100041000), they are generated approximately every 10 minutes.

To configure automatic updates in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates* and select *Automatic*.



3. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency automatic
end
```

Scheduled updates

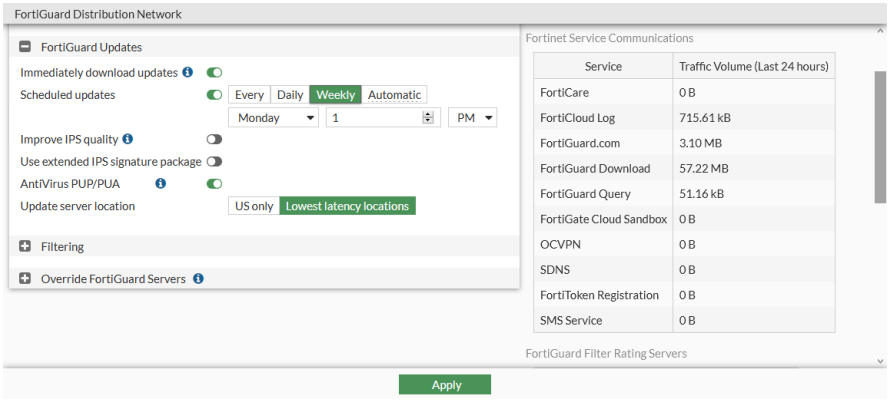
Scheduling updates ensures that the virus and IPS definitions are downloaded to your FortiGate on a regular basis.

Updating definitions can cause a brief disruption in traffic that is currently being scanned while the FortiGate unit applies the new signature database. Updates should be scheduled during off-peak hours when network usage is at a minimum to ensure that network activity will not be affected by downloading the definitions files.

A schedule of once a week means any urgent updates will not be pushed until the scheduled time. If an urgent update is required, click the *Update Licenses & Definitions Now* button to manually update the definitions.

To configure scheduled updates in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates*.
3. Configure the update schedule:



4. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency {every | daily | weekly}
    set time <hh:mm>
    set day <day_of_week>
end
```

Sending malware statistics to FortiGuard

FortiGate devices periodically send encrypted antivirus, IPS, botnet IP list, and application control statistics to FortiGuard. Included with these data is the IP address and serial number of the FortiGate, and the country that it is in. This information is never shared with external parties, Fortinet Privacy Policy.

The malware statistics are used to improve various aspects of FortiGate malware protection. For example, antivirus data allow FortiGuard to determine what viruses are currently active. Signatures for those viruses are kept in the Active AV Signature Database that is used by multiple Fortinet products.Inactive virus signatures are moved to the Extended AV Signature Database (see Configuring FortiGuard updates on page 1548). When events for inactive viruses start appearing in the malware data, the signatures are moved back into the AV Signature Database.

The FortiGate and FortiGuard servers go through a 2-way SSL/TLS 1.2 authentication before any data is transmitted. The certificates used in this process must be trusted by each other and signed by the Fortinet CA server.

The FortiGate only accepts data from authorized FortiGuard severs. Fortinet products use DNS to find FortiGuard servers and periodically update their FortiGate server list. All other servers are provided by a list that is updated through the encrypted channel.

Malware statistics are accumulated and sent every 60 minutes by default.

To configure sharing this information, use the following CLI command:

```
config system global
    set fds-statistics {enable | disable}
    set fds-statistics-period <minutes>
end
```

The submission of malware data is in accordance with the Fortinet Privacy Policy.

There is no sensitive or personal information included in these submissions. Only malware statistics are sent.

Fortinet uses the malware statistics collected in this manner to improve the performance of the FortiGate services and to display statistics on the Fortinet Support website for customers registered FortiGate devices.

Fortinet may also publish or share statistics or results derived from this malware data with various audiences. The malware statistics shared in this way do not include any customer data.

Update server location

The location of the FortiGuard update server that the FortiGate connects to can be set to either only servers in the USA only, or to the servers with the lowest latency.

On hardware FortiGate devices, the default is *Lowest latency locations*. On VM devices, the default is *US only*.

To configure the update server location in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *FortiGuard Updates* section, set *Update server location* to *US only* or *Lowest latency locations*.
3. Click *Apply*.

To configure the update server location in the CLI:

```
config system fortiguard
    set update-server-location {usa | any}
end
```

Filtering

Web filtering is used to block access to harmful, inappropriate, and dangerous web sites (see FortiGuard filter on page 774).

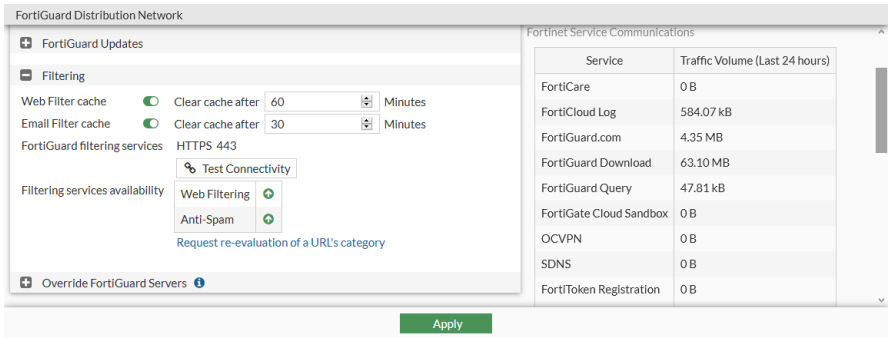
Email filtering is used to detect and block spam messages (see FortiGuard-based filters on page 863).

To configure filtering in the GUI:

1. Go to *System* > *FortiGuard*
2. Scroll down to the *Filtering* section.

3. Configure the settings as needed:

Web Filter Cache	Enable/disable web filter cache, and set the amount of time that the FortiGate will store a blocked IP address or URL locally. After the time expires, the FortiGate contacts the FDN to verify the address.
Email Filter Cache	Enable/disable email filter cache, and set the amount of time that the FortiGate will store an email address locally.
FortiGuard filtering services	The protocol and port used to contact the FortiGuard servers. These options can be changed in the CLI.
Filtering service availability	The status of the filtering service. Click *Test Connectivity* if the filtering service is not available.
Request re-evaluation of a URL's category	Click to re-evaluate a URL category rating on the FortiGuard web filter service.



4. Click *Apply*.

To configure filtering in the CLI:

```
config system fortiguard
    set protocol {https | udp}
    set port {443 | 53 | 8888}
    set antispam-force-off {enable | disable}
    set antispam-cache {enable | disable}
    set antispam-cache-ttl <integer>
    set antispam-cache-mpercent <percent>
    set antispam-timeout <integer>
    set webfilter-force-off {enable | disable}
    set webfilter-cache {enable | disable}
    set webfilter-cache-ttl <integer>
    set webfilter-timeout <integer>
end
```

When anycast is enabled (by default) the protocol is HTTPS and the port is 443.

Online security tools

FortiGuard Labs provides a number of online security tools, including but not limited to:

- **URL lookup**
  Enter a website address to see if it has been rated and what category and classification it is filed as. If you find a site that has been wrongly categorized, use this page to request that the site be re-evaluated: https://www.fortiguard.com/webfilter
- **Threat Encyclopedia**
  Browse FortiGuard Labs extensive encyclopedia of threats. Search for viruses, botnet C&C, IPS, endpoint vulnerabilities, and mobile malware: https://www.fortiguard.com/encyclopedia
- **Application Control**
  Browse FortiGuard Labs extensive encyclopedia of applications: https://www.fortiguard.com/appcontrol

FortiGuard anycast and third-party SSL validation

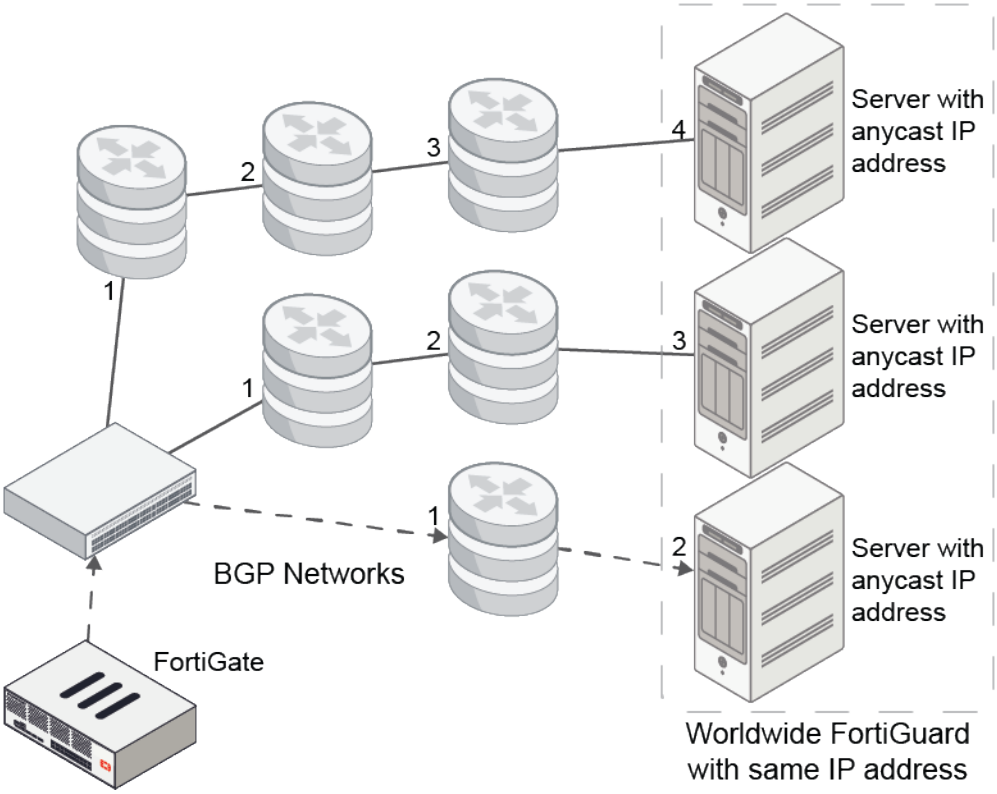
Anycast optimizes routing performance to FortiGuard servers. It is the default FortiGuard access mode.

Using Fortinet DNS servers, the FortiGate receives a single IP address for the domain name of each FortiGuard service. BGP routing optimization is transparent to the FortiGate. The domain name of each FortiGuard service is the common name in that service's certificate, which is signed by a third-party intermediate CA. The FortiGuard server uses third-party certificate verification and the Online Certificate Status Protocol (OCSP) stapling check, so that the FortiGate can always validate the FortiGuard server certificate efficiently.

FortiGate will only complete the TLS handshake with an anycast server that has a good OCSP status for its certificate. Any other status will result in a failed SSL connection. OCSP stapling is reflected on the signature interval so that *good* means that the certificate is not revoked at that timestamp. The FortiGuard servers query the CA's OCSP responder every four hours and update its OCSP status. If the FortiGuard is unable to reach the OCSP responder, it will keep the last known OCSP status for up to seven days. This cached OCSP status will be sent out immediately when a client connection request is made, optimizing the response time.

FortiGuard represents all cloud based servers; see Anycast and unicast services for details.

The anycast server has one IP address to match its domain name. The FortiGate connects with a single server address, using HTTPS and port 443, regardless of where the FortiGate is located.

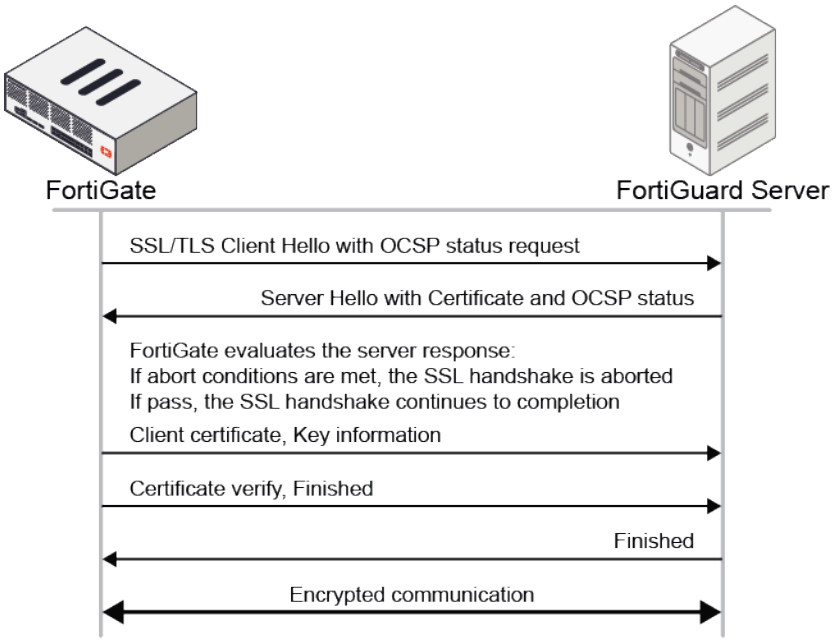


To configure the anycast FortiGuard access mode:

```
config system fortiguard
    set fortiguard-anycast {enable | disable}
    set fortiguard-anycast-source {fortinet | aws}
end
```

Connection process

The following process is used to connect to an anycast server:



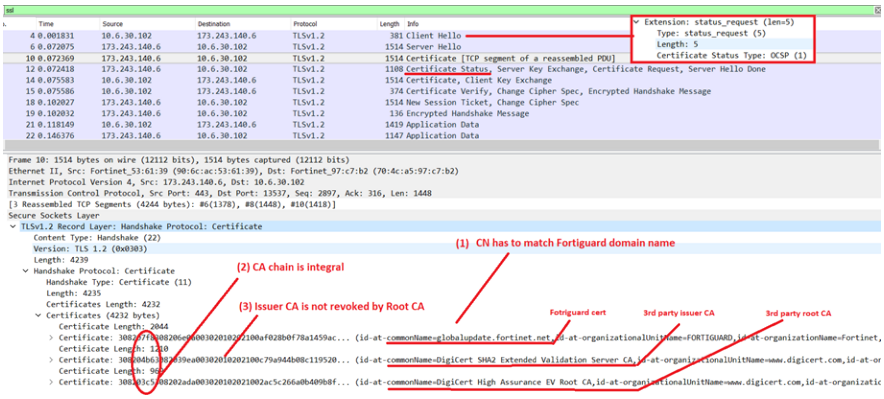
1. The FortiGate embeds the CA_bundle certificate, which includes the root CA with CRL list and third-party intermediate CA, in the root CA level.
2. The FortiGate finds the FortiGuard IP address from its domain name from DNS.
3. The FortiGate starts a TLS handshake with the FortiGuard IP address. The client hello includes an extension of the *status request*.
4. The FortiGuard servers provide a certificate with its OCSP status: *good*, *revoked*, or *unknown*.
5. The FortiGate verifies the CA chain against the root CA in the CA_bundle.
6. The FortiGate verifies the intermediate CA's revoke status against the root CA's CRL.
7. The FortiGate verifies the FortiGuard certificate's OCSP status:

```
OCSP Response Data:
    OCSP Response Status: successful (0x0)
    Response Type: Basic OCSP Response
    Version: 1 (0x0)
    Responder Id: 3DD350A5D6A0ADEEF34A600A65D321D4F8F8D60F
    Produced At: Aug 20 07:50:58 2019 GMT
    Responses:
    Certificate ID:
      Hash Algorithm: sha1
      Issuer Name Hash: 49F4BD8A18BF760698C5DE402D683B716AE4E686
      Issuer Key Hash: 3DD350A5D6A0ADEEF34A600A65D321D4F8F8D60F
      Serial Number: 02555C9F3901B799DF1873402FA9392D
    Cert Status: good
    This Update: Aug 20 07:50:58 2019 GMT
    Next Update: Aug 27 07:05:58 2019 GMT
```

   Abort conditions include:

   - The CN in the server's certificate does not match the domain name resolved from the DNS.
   - The OCSP status is not good.
   - The issuer-CA is revoked by the root-CA.
8. Once the SSL handshake is established, the FortiGate can engage the server.

Example Wireshark PCAP:



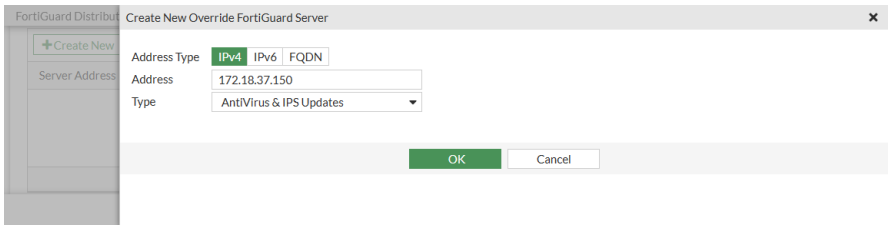
Using FortiManager as a local FortiGuard server

FortiManager can provide a local FortiGuard server with port 443 access.

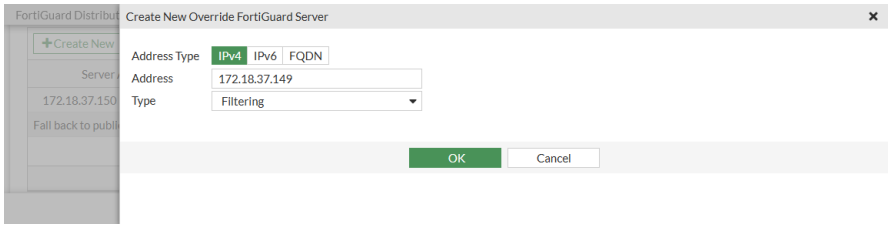
Anycast FortiGuard settings force the rating process to use port 443, even with an override server. Using a unique address in the same subnet as the FortiManager access IP address, the FortiManager can provide local FortiGuard updates and rating access with a dedicated IP address and port 443.

To use a FortiManager as a local FortiGuard server in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *Override FortiGuard Servers* table, click *Create New*. The *Create New Override FortiGuard Server* pane opens.
3. Select the server address type: *IPv4*, *IPv6*, or *FQDN*.
4. Enter the FortiManager address in the *Address* field.
5. Select the type of server: *AntiVirus & IPS Updates*, *Filtering*, or *Both*.



6. Click *OK*.
7. Click *Create New* again to add a second override FortiManager for filtering.



8. Click *OK*, then click *Apply*.

To use a FortiManager as a local FortiGuard server in the CLI:

```
config system central-management
    set type fortimanager
    set fmg "172.18.37.148"
    config server-list
        edit 1
            set server-type update
            set server-address 172.18.37.150
        next
        edit 2
            set server-type rating
            set server-address 172.18.37.149
        next
    end
    set fmg-update-port 443
    set include-default-servers enable
end
```

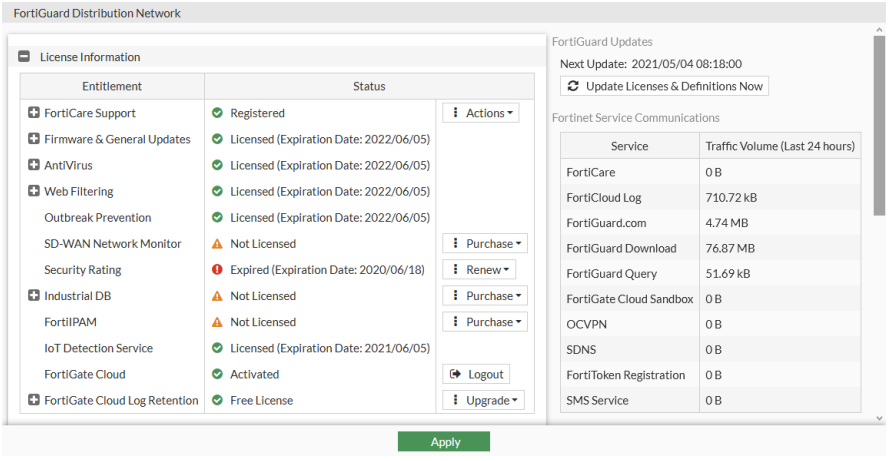
When `fmg-update-port` is set to `443`, the update process will use port 443 to connect to the override update server, which is the local FortiGuard server in the FortiManager. If this is not set, the update process will use port 8890, and the server address setting has to be the FortiManager access IP address. Override FortiGuard services come from the server list that is the local FortiGuard server in the FortiManager, and use the traditional, non-OCSP TLS handshake. If override servers in the FortiManager are not available, the default FortiGuard servers are connected, and the anycast OCSP TLS handshake is used.

Cloud service communication statistics

Fortinet service communications statistics are displayed on the *FortiGuard* page. The statistics correspond with the output from `diagnose sys service-communication`. The traffic volume values in the GUI are the sums of data from the last 24 hours.

To view Fortinet service communications statistics:

1. Go to *System* > *FortiGuard*.
   The *Fortinet Service Communications* statistics are displayed on the right side of the screen:



2. Enter the following CLI command:

```
# diagnose sys service-communication
FortiCare:
The last 1 hour(in bytes):  0 0 0 0 0 0 0 0 0 0 0 0

```

IoT detection service

Internet of Things (IoT) detection is a subscription service that allows FortiGate to detect unknown devices in FortiGuard that are not detected by the local Device Database (CIDB). When the service is activated, FortiGate can send device information to the FortiGuard collection server. When a new device is detected, FortiGate queries the results from the FortiGuard query for more information about the device.

This feature requires an IoT Detection Service license.

FortiGate device requirements:

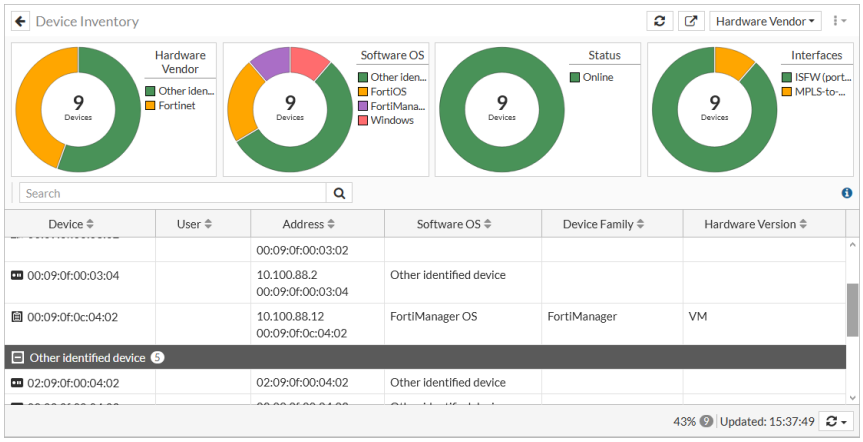
The FortiGate device must be:

- Registered with FortiCare
- Connected to an anycast FortiGuard server

How the service works:

1. Enable Device Detection on an interface..
2. FortiGate uses the interface to detect device traffic flow.
3. Upon detecting traffic from an unknown device, FortiGate sends the device data to the FortiGuard collection server.
4. The collection server returns data about the new device to the FortiGuard query server.
5. If the device signature does not appear in the local Device Database (CIDB) or some fields are not complete, FortiGate queries FortiGuard for more information about the device.

To view the latest device information in the GUI, go to *Dashboard* > *Users & Devices* and expand the *Device Inventory* widget.



To debug the daemon in the CLI:

1. Disable the local device database in order to force all queries to go to FortiGuard.

```
# diagnose src-vis local-sig disable
```

2. Enable iotd debugs.

```
# diagnose debug application iotd -1
# diagnose debug enable
```

FortiGate sends the device data to the FortiGuard collection server.

```
FortiWiFi-60E # [iotd] recv request from caller size:61
[iotd] service:collect hostname: ip: fd:-1 request tlv_len:41
[iotd] txt(.....y...w.....Jasons-iPhone6....579=23..)

      hardware vendor 'Apple'  src fortiguard  id 0  weight 100
      type 'Mobile'  src fortiguard  id 0  weight 100
      family 'Mobile'  src fortiguard  id 0  weight 100
      os 'iOS'  src fortiguard  id 0  weight 100
      host 'Jasons-iPhone6'  src dhcp
```

FortiAP query to FortiGuard IoT service to determine device details

A FortiAP collects packets from devices and queries FortiGuard with the help of the FortiGate. Device detection results are reported back to the FortiGate where this information is displayed. Querying the FortiGuard service requires an IoT

Detection Service license.

The following attributes can be configured in `wireless-controller setting`:

Attribute	Description
device-weight <integer>	Set the device upper limit of confidence (0 - 255, default = 1, 0 = disable).
device-holdoff <integer>	Set the device lower limit of creation time, in minutes (0 - 60, default = 5).
device-idle <integer>	Set the device upper limit of idle time, in minutes (0 - 14400, default = 1440).

To query the FortiGuard IoT service:

```
config wireless-controller setting
    ...
    set device-weight 1
    set device-holdoff 5
    set device-idle 1440
    ...
end
```

```
# diagnose user device list
  vd root/0  54:27:1e:e6:26:3d  gen 89  req OUA/34
    created 70s  gen 86  seen 2s  port29  gen 28
    ip 10.29.1.214  src mac
    hardware vendor 'Asustek compute'  src fortiguard  id 0  weight 21
    type 'Home & Office'  src fortiguard  id 0  weight 21
    family 'Computer'  src fortiguard  id 0  weight 21
    os 'Linux'  src dhcp  id 822  weight 128
    host 'test-wifi'  src dhcp
```

Feature visibility

Feature visibility is used to control which features are visible in the GUI. This allows features that are not in use to be hidden. Some features are also invisible by default and must be made visible before they can be configure in the GUI.

The visibility of a feature does not affect its functionality or configuration. Invisible features can still be configured using the CLI.

To change the visibility of features:

1. Go to *System* > *Feature Visibility*.
2. Change the visibility of the features as required.
   For information about what settings each option affects, click on the + icon to the right of the feature name.
   Changes are listed on the right side of the content pane.
3. Click *Apply*.

Certificates

The following topics provide instructions about certificates:

- Microsoft CA deep packet inspection on page 1563
- Procure and import a signed SSL certificate on page 1567
- ACME certificate support on page 1570

Microsoft CA deep packet inspection

In most production environments, you want to use a certificate issued be your own PKI for deep packet inspection (DPI).

An existing Microsoft root CA can be used to issue a subordinate CA (sub CA) certificate that is installed as a DPI certificate on the FortiGate.

Complete the following steps to create your own sub CA certificate and use it for DPI:

1. Create a Microsoft sub CA certificate
2. Export the certificate and private key
3. Import the certificate and private key into the FortiGate
4. Configure a firewall policy for DPI
5. Verify that the sub CA certificate is being used for DPI

The FortiGate firewall uses information in the original web server certificate, then issues a new certificate signed by the Microsoft DPI certificate. The FortiGate then sends this certificate with the issuing DPI certificate to the client's web browser when the SSL session is being established.

The browser verifies that the certificate was issued by a valid CA, then looks for the issuing CA of the Microsoft DPI certificate in its loca trusted root CA store to complete the path to trusted root CA.

The Microsoft CA root certificate is normally deployed to all client PCs in the Windows domain, so the client can complete the certificate path up to a trusted root CA. The FortiGate now controls and can inspect the two HTTPS sessions: one with the external web server, and one with the client PC.

Create a Microsoft sub CA certificate

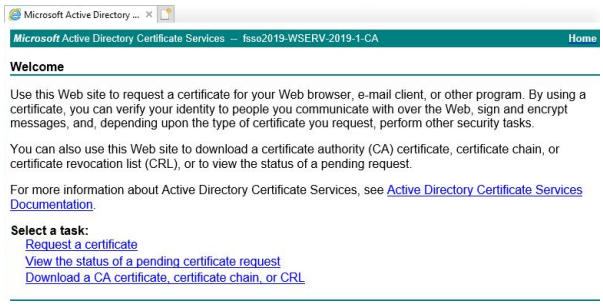
A Microsoft sub CA certificate can be created on a Microsoft CA server, or remotely using a web browser.

Creating a certificate remotely requires that the web enrollment option is configured on the Microsoft CA server. Remote certificate requests require HTTPS; requests are not allowed with HTTP.

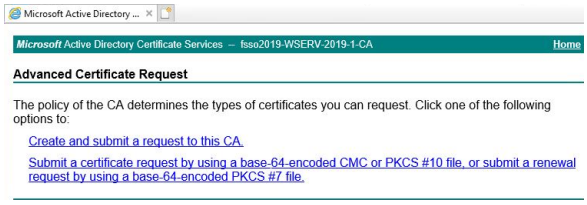
To create a Microsoft sub CA certificate remotely:

1. Open a web browser and go to one of the following URLs:
   - *https://<FQDN-CA-server>/CertSrv*
   - *https://<IP-CA-server>/CertSrv*.

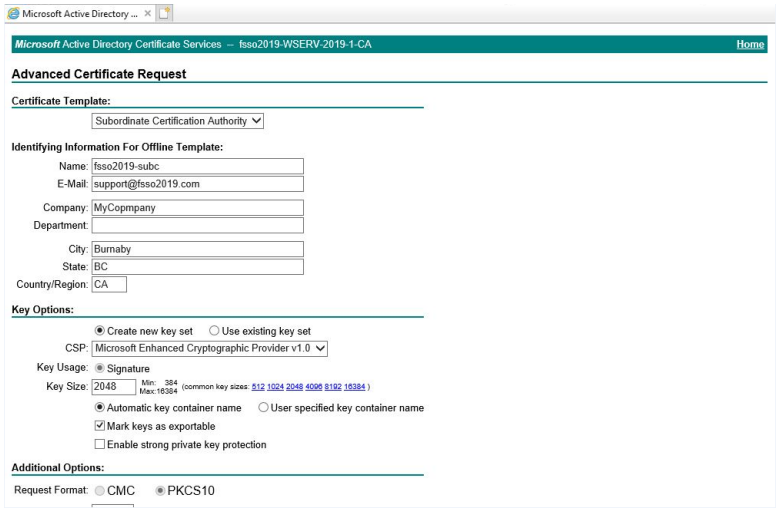
2. Log in to a domain administrator account that has web enrollment rights.



3. Click *Request a certificate*.
4. Click *advanced certificate request*.



5. Click *Create and submit a request to this CA*, then click *Yes* in the *Web Access Confirmation* warning.
6. For the *Certificate Template*, select *Subordinate Certification Authority*.
7. Enable *Mark keys as exportable*.
8. Fill out the remaining information according to your security policy.

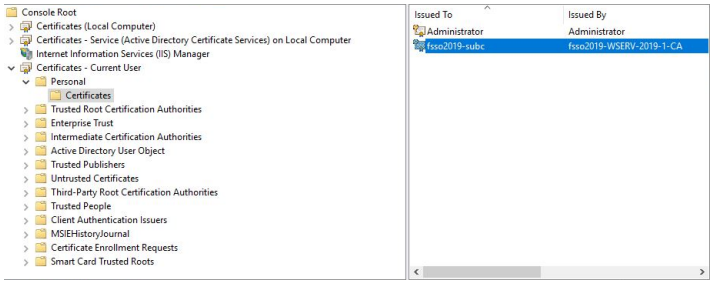


9. Submit the request.
10. Click *Yes* in the *Web Access Confirmation* warning.
11. Click *Install this certificate*.
    The certificate and private key are located in the current user's certificate store.

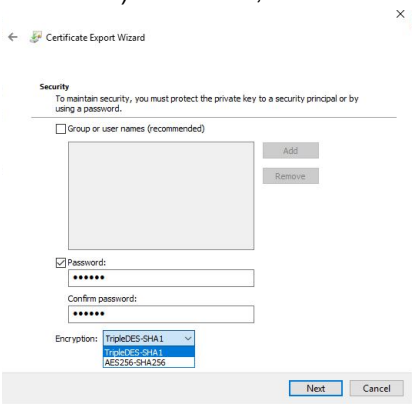
Export the certificate and private key

To export the certificate and private key:

1. Open the Microsoft Management Console (MMC) and add the *Certificate Snap-in*.
2. Go to the user's certificate store to locate the sub CA certificate that you just installed.



3. Right-click the certificate and select *All Tasks* > *Export*.
4. Click *Next* to start the *Microsoft Certificate Export Wizard*.
5. Follow the steps in the wizard:
   - When asked, select *Yes, export the private key*.
   - Only the PKCS #12 (.PFX) format is available, and it requires a password.
   - When selecting the encryption type, select *TripleDES-SHA1* if you are using an older version of FortiOS (5.6.9 and earlier). Otherwise, select *AES256-SHA256*.



6. Complete the wizard, and save the DPI certificate to a local folder.

Import the certificate and private key into the FortiGate

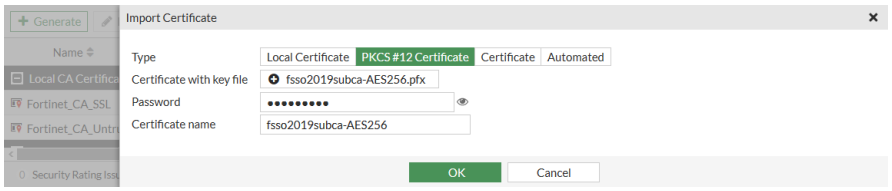
The certificate can be imported from the local computer using the GUI, or from a TFTP server using the CLI.

After importing the certificate, you can view it in the GUI to verify that it was successfully imported.

To import the certificate and private key into the FortiGate in the GUI:

1. Go to *System* > *Certificates*.
2. Select *Import* > *Local Certificate*.
3. Set *Type* to *PKCS #12 Certificate*.
4. Click *Upload* and locate the certificate file.
5. Enter the *Password*.

6. Optionally, modify the *Certificate Name*.



7. Click *OK*.

To import the certificate and private key into the FortiGate in the CLI:

```
execute vpn certificate local import <certificate file name> <tftp ip address> <password>
```

To verify that the certificate was imported:

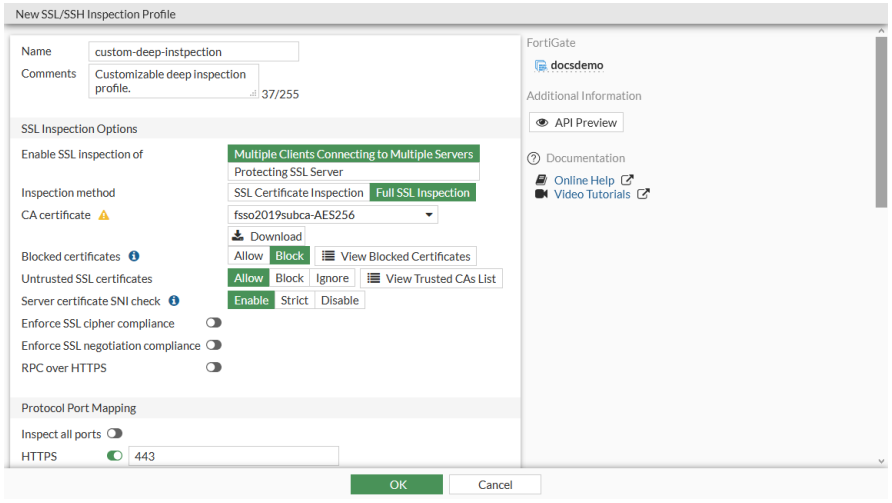
1. Go to *System* > *Certificates*. By default, the *Certificate* option is not visible, see Feature visibility on page 1562 for information.
2. Locate the newly imported certificate in the table.
3. Select the certificate and click *View Details* to view the certificate details.

Configure a firewall policy for DPI

The certificate is used in an SSL/SSH inspection profile that is then used in a firewall policy.

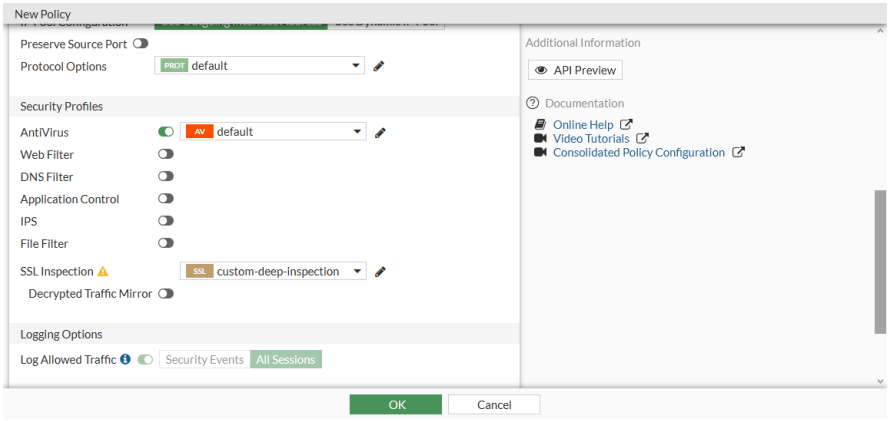
To configure a firewall policy for DPI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
2. Configure the inspection profile, selecting the new certificate



3. Click *Apply*.
4. Go to *Policy & Objects* > *Firewall Policy*.
5. Create a new policy, or edit an existing policy.

6. In the *SSL Inspection* field, select the new SSL inspection profile.



7. Configure the remaining settings as needed.
8. Click *OK*.

Verify that the sub CA certificate is being used for DPI

You can verify that the certificate is being used for resigning web server certificates when a user connects to an external HTTPS website.

To verify that the certificate is being used:

1. On a client PC that is behind the FortiGate, go to an external HTTPS website.
   When connecting to the website, no certificate warning should be shown.
2. In your web browser, view the certificate and certificate path.
   The methods for doing this vary depending on the browser. See your browsers documentation for information.

Procure and import a signed SSL certificate

A signed SSL certificate can be used when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

Before creating a certificate, you must have a registered domain. With a valid FortiGuard subscription, FortiDDNS can be used to register a domain; see DDNS on page 182 for more information.

Follow these instructions to purchase, import, and use a signed SSL certificate:

- Obtain, setup, and download an SSL certificate package from a certificate authority
- Generate a CSR
- Import the signed certificate into your FortiGate
- Configure your FortiGate to use the signed certificate

Obtain, setup, and download an SSL certificate package from a certificate authority

SSL certificate packages can be purchased from any Certificate Authority (CA), such as DigiCert, GoDaddy, or GlobalSign.

Let's Encrypt can be used to generate a free, trusted SSL certificate.

A third party CA might not sign a certificate with an intranet name or IP address. For details, see Can I request a certificate for an intranet name or IP address?

The process for purchasing, setting up, and downloading a certificate will vary depending on the CA that is used, and if a CSR must be generated on the FortiGate.

To purchase a certificate package:

1. Create an account with your chosen vendor, or use the account that you used to purchase your domain.
2. Locate the SSL Certificates page.
3. Purchase a basic SSL certificate for domain validation only. If required, a more secure SSL certificate can be purchased.
4. If required, load the CSR, either by uploaded the text file or copying and pasting the contents into the requisite text box. See Generate a CSR on page 1568 for information on generating the CSR on the FortiGate.
5. If required, set the server type to *Other*.
6. Verify the certificate per the requirements of the CA.
7. Download the signed certificate to your computer.
8. Import the signed certificate into your FortiGate; see Import the signed certificate into your FortiGate on page 1570.

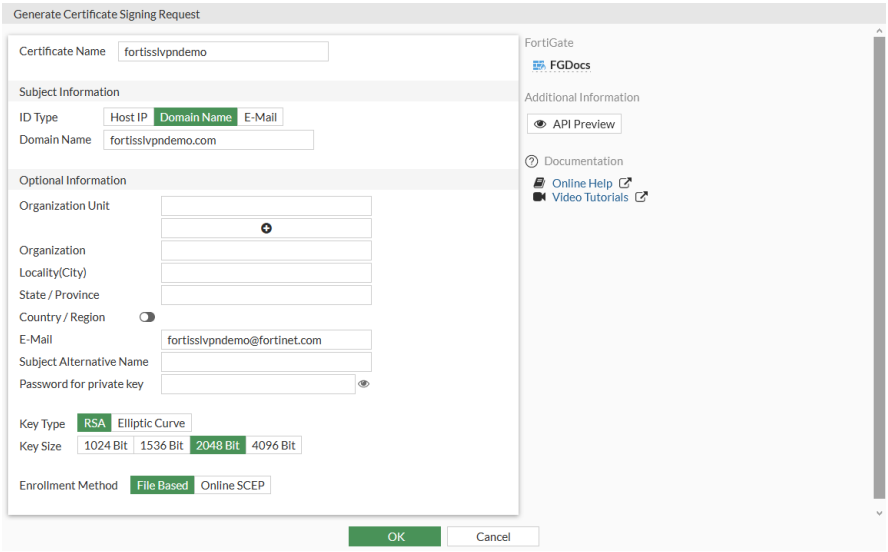
Generate a CSR

Some CAs can auto-generate the CSR during the signing process, or provide tools for creating CSRs. If necessary, a CSR can be created in your FortiGate device's GUI.

To generate a CSR on your FortiGate:

1. Go to *System* > *Certificates*. By default, the *Certificates* option is not visible, see Feature visibility on page 1562 for information.

2. Click *Generate*. The *Generate Certificate Signing Request* page opens.



3. Configure the CSR request:
   - Ensure that the certificate has a unique name.
   - Set the *ID Type* to *Domain Name* and enter a *Domain Name*.
   - An email address is required.
   - Ensure that the *Key Size* is set to *2048 Bit*.
   - Set the *Enrollment Method* to *File Based*.
4. Click *OK*.
   The CSR will be added to the certificate list with a status of *PENDING*.
5. In the certificate list, select the new CSR then click *Download* to save the CSR to your computer.
   The CSR file can be opened in any text editor, and will resemble the following:

```
-----BEGIN CERTIFICATE REQUEST-----
MIICuTCCAaECAQAwSzEcMBoGA1UEAxMTZm9ydGlzc2x2cG5kZW1vLmNvbTErMCkG

-----END CERTIFICATE REQUEST-----
```

Import the signed certificate into your FortiGate

To import the signed certificate into your FortiGate:

1. Unzip the file downloaded from the CA.
   There should be two CRT files: a CA certificate with *bundle* in the file name, and a local certificate.
2. Log in to your FortiGate unit and go to *System* > *Certificates*.
3. Click *Import* > *Local Certificate*.
4. Upload the local certificate file, then click *OK*.
5. The status of the certificate will change from *PENDING* to *OK*.
6. Click *Import* > *CA Certificate*.
7. Set the *Type* to *File*, upload the CA certificate file, then click *OK*.
   The CA certificate will be listed in the *CA Certificates* section of the certificates list.

Configure your FortiGate to use the signed certificate

After the signed certificates have been imported, you can use it when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

To configure your FortiGate to use the signed certificate for SSL VPN:

1. Go to *VPN* > *SSL-VPN Settings*.
2. Set *Server Certificate* to the new certificate.
3. Configure other settings as needed.
4. Click *Apply*.

For more information on configuring SSL VPN, see SSL VPN on page 1190 and the Setup SSL VPN video in the Fortinet Video Library.

To configure using the certificate for administrator GUI access in the CLI:

```
config system global
    set admin-server-cert fortisslvpndemo
end
```

To change the certificate that is used for administrator GUI access in the GUI:

1. Go to *System* > *Settings*.
2. In the *Administration Settings* section, change *HTTPS server certificate* as needed.
3. Click *Apply*. You will be logged out of FortiOS.

ACME certificate support

The Automated Certificate Management Environment (ACME), as defined in RFC 8555, is used by the public Let's Encrypt certificate authority (https://letsencrypt.org) to provide free SSL server certificates. The FortiGate can be configured to use certificates that are manged by Let's Encrypt, and other certificate management services, that use the ACME protocol. The server certificates can be used for secure administrator log in to the FortiGate.

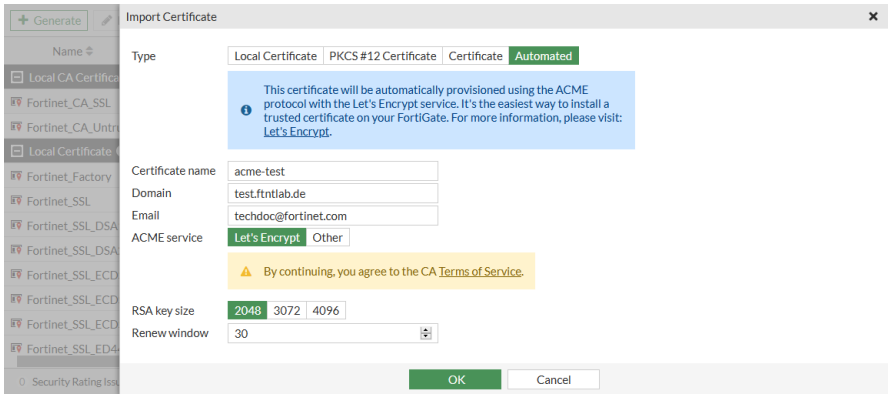
- The FortiGate must have a public IP address and a hostname in DNS (FQDN) that resolves to the public IP address.
- The configured ACME interface must be public facing so that the FortiGate can listen for ACME update requests. It must not have any VIPs, or port forwarding on port 80 (HTTP) or 443 (HTTPS).
- The Subject Alternative Name (SAN) field is automatically filled with the FortiGate DNS hostname. It cannot be edited, wildcards cannot be used, and multiple SANs cannot be added.

This example shows how to import an ACME certificate from Let's Encrypt, and use it for secured remote administrator access to the FortiGate.

To configure certificates in the GUI, go to *System* > *Feature Visibility* and enable *Certificates*.

To import an ACME certificate in the GUI:

1. Go to *System* > *Certificates* and click *Import* > *Local Certificate*.
2. Set *Type* to *Automated*.
3. Set *Certificate name* to an appropriate name for the certificate.
4. Set *Domain* to the public FQDN of the FortiGate.
5. Set *Email* to a valid email address. The email is not used during the enrollment process.
6. Ensure that *ACME service* is set to *Let's Encrypt*.

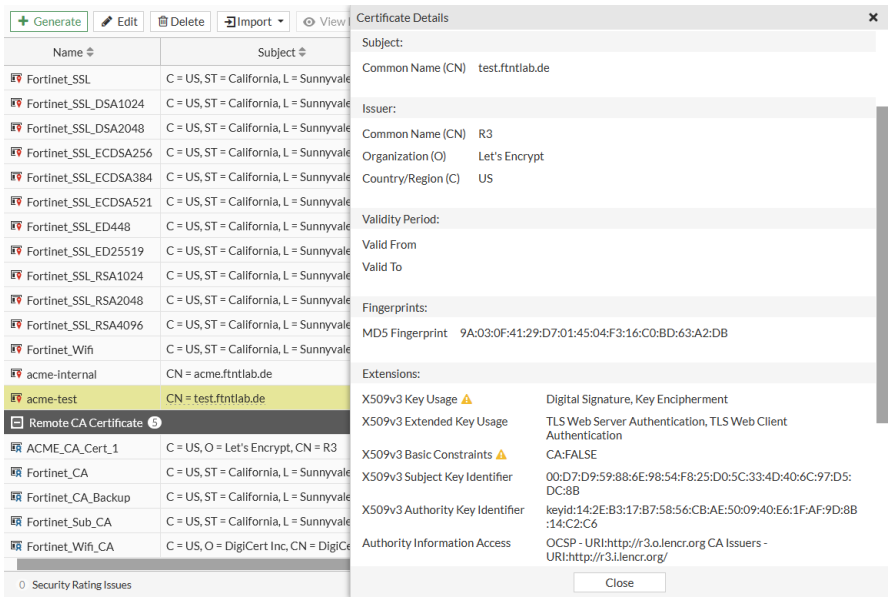


7. Configure the remaining settings as required, the click *OK*.
8. If this is the first time enrolling a server certificate with Let's Encrypt on this FortiGate, the *Set ACME Interface* pane opens.

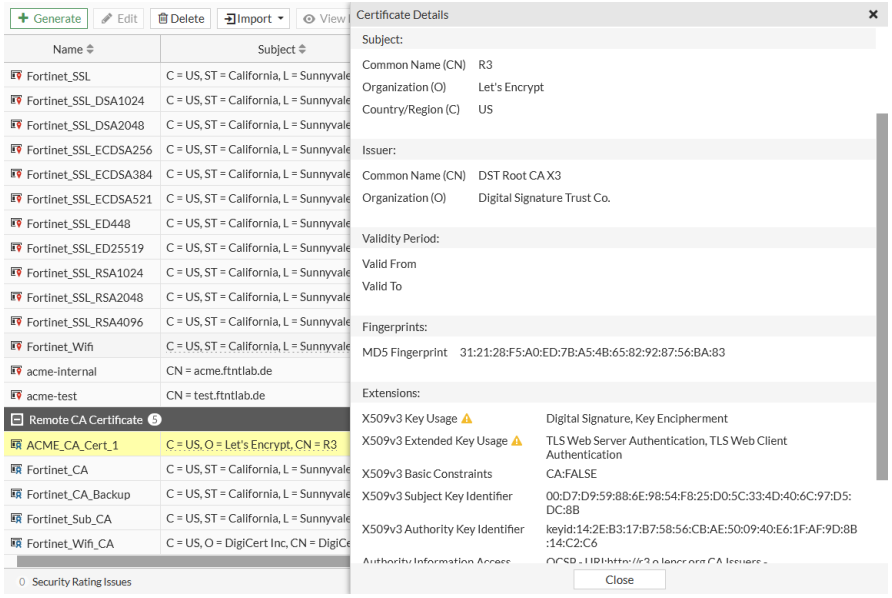
   Select the interface that the FortiGate communicates with Let's Encrypt on, then click *OK*.

   The ACME interface can later be changed in *System* > *Settings*.
9. The new server certificate is added to the *Local Certificate* list.

   Click *View Details* to verify that the FortiGate's FQDN is in the certificate's *Subject: Common Name (CN)*.

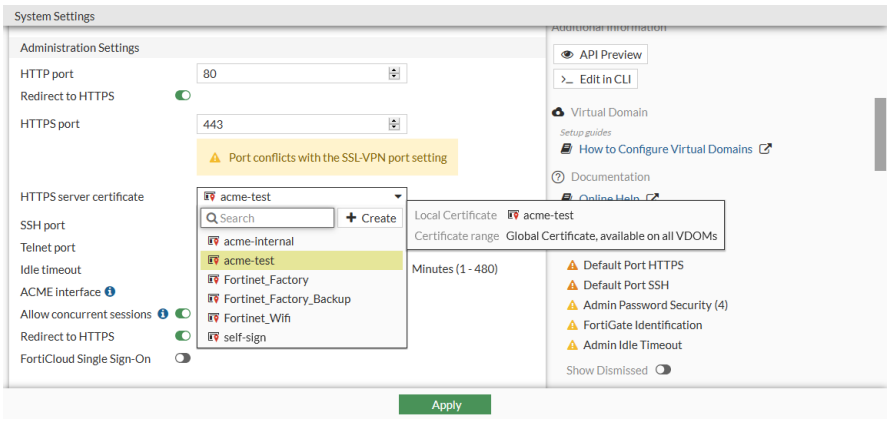


The *Remote CA Certificate* list includes the issuing Let's Encrypt intermediate CA, issued by the public CA DST Root CA X3 from Digital Signature Trust Company.



To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the GUI:

1. Go to *System* > *Settings*.
2. Set *HTTPS server certificate* to the new certificate.



3. Click *Apply*.
4. Log in to the FortiGate using an administrator account from any internet browser. There should be no warnings related to non-trusted certificates, and the certificate path should be valid.

To import an ACME certificate in the CLI:

1. Set the interface that the FortiGate communicates with Let's Encrypt on:

```
config system acme
    set interface "port1"
end
```

2. Make sure that the FortiGate can contact the Let's Encrypt enrollment server:

```
# execute ping acme-v02.api.letsencrypt.org
PING ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com (172.65.32.248): 56 data bytes
64 bytes from 172.65.32.248: icmp_seq=0 ttl=60 time=2.0 ms
64 bytes from 172.65.32.248: icmp_seq=1 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=2 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=3 ttl=60 time=2.1 ms
64 bytes from 172.65.32.248: icmp_seq=4 ttl=60 time=2.0 ms

--- ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 1.7/1.9/2.1 ms
```

3. Configure the local certificate request:

```
config vpn certificate local
    edit "acme-test"
        set enroll-protocol acme2
        set acme-domain "test.ftntlab.de"
        set acme-email "techdoc@fortinet.com"
    next
By enabling this feature you declare that you agree to the Terms of Service at
https://acme-v02.api.letsencrypt.org/directory
Do you want to continue? (y/n)y
end
```

4. Verify that the enrollment was successful:

```
# get vpn certificate local details acme-test
path=vpn.certificate, objname=local, tablename=(null), size=2632
```

```
== [ acme-test ]
        Name:        acme-test
        Subject:     CN = test.ftntlab.de
        Issuer:      C = US, O = Let's Encrypt, CN = R3
        Valid from:  2021-03-11 17:43:04  GMT
        Valid to:    2021-06-09 17:43:04  GMT
        Fingerprint: 9A:03:0F:41:29:D7:01:45:04:F3:16:C0:BD:63:A2:DB
        Serial Num:  03:d3:55:80:d2:e9:01:b4:ca:80:3f:2e:fc:24:65:ad:7c:0c
ACME details:
        Status: The certificate for the managed domain has been renewed successfully and
can be used (valid since Thu, 11 Mar 2021 17:43:04 GMT).
        Staging status: Nothing in staging
```

5. Check the ACME client full status log for the CN domain:

```
# diagnose sys acme status-full test.ftntlab.de
{
  "name": "test.ftntlab.de",
  "finished": true,
  "notified": false,
  "last-run": "Thu, 11 Mar 2021 18:43:02 GMT",
  "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT",
  "errors": 0,
  "last": {
    "status": 0,
    "detail": "The certificate for the managed domain has been renewed successfully and
can be used (valid since Thu, 11 Mar 2021 17:43:04 GMT). A graceful server restart now
is recommended.",
    "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT"
  },
  "log": {
    "entries": [
      {
        "when": "Thu, 11 Mar 2021 18:43:05 GMT",
        "type": "message-renewed"
      },
      ...
      {
        "when": "Thu, 11 Mar 2021 18:43:02 GMT",
        "type": "starting"
      }
    ]
  }
}
```

To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the CLI:

```
config system global
    set admin-server-cert "acme-test"
end
```

When you log in to the FortiGate using an administrator account there should be no warnings related to non-trusted certificates, and the certificate path should be valid.

Configuration scripts

Configuration scripts are text files that contain CLI command sequences. They can be created using a text editor or copied from a CLI console, either manually or using the *Record CLI Script* function.

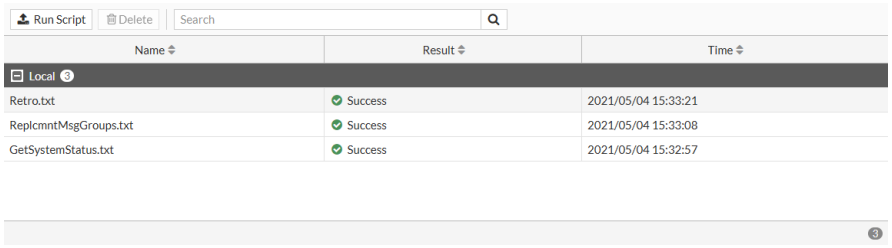
Scripts can be used to run the same task on multiple devices. For example, if your devices use the same security policies, you can enter or record the commands to create those policies in a script, and then run the script on each device. You could also create the policies in the GUI, and then copy and paste the CLI commands from the *CLI Console* using the *show* command.

If the FortiGate is managed by FortiManager, scripts can be uploaded to FortiManager and then run on any other FortiGates that are managed by that FortiManager. See Scripts in the FortiManager Administration Guide.

A comment line in a script starts with the number sign (#). Comments are not executed.

To run a script using the GUI:

1. Click on your username and select *Configuration* > *Scripts*.
2. Click *Run Script*.
3. Select the text file containing the script on your management computer, then click *OK*.
   The script runs immediately, and the *Script Execution History* table is updated, showing if the script ran successfully.



Workspace mode

Workspace mode allows administrators to make a batch of changes that are not implemented until the transaction is committed. Prior to committing, the changes can be reverted or edited as needed without impacting current operations.

When an object is edited in workspace mode it is locked, preventing other administrators from editing that object. A warning message will be shown to let the administrator know that the object is currently being configured in another transaction.

All administrators can use workspace mode; their permissions in workspace mode are the same as defined in their account profile.

A workspace mode transaction times out after five minutes if there is no activity. When a transaction times out, all changes are discarded. A warning message will be shown to let the administrator know that a timeout is imminent, or has already happened:

```
config transaction id=1 will expire in 30 seconds
config transaction id=1 will expire in 20 seconds
config transaction id=1 will expire in 10 seconds
config transaction id=1 has expired
```

The following commands are not changeable in a workspace transaction:

```
config system console
config system resource-limits
config system elbc
config system global
   set split-port
   set vdom-admin
   set management-vdom
   set wireless-mode
   set internal-switch-mode
end
config system settings
   set opmode
end
config system npu
config system np6
config system wireless
   set mode
end
config system vdom-property
config system storage
```

The `execute batch` command cannot be used in or to start workspace mode.

To use workspace mode:

1. Start workspace mode:
   ```
   execute config-transaction
   ```
   Once in workspace mode, the administrator can make configuration changes, all of which are made in a local CLI process that is not viewable by other processes.
2. Commit configuration changes:
   ```
   execute config-transaction commit
   ```
   After performing the commit, the changes are available for all other processes, and are also made in the kernel.
3. Abort configuration changes:
   ```
   execute config-transaction abort
   ```
   If changes are aborted, no changes are made to the current configuration or the kernel.

Diagnose commands

```
diagnose sys config-transaction show txn-meta
```

Show config transaction meta information. For example:

```
# diagnose sys config-transaction show txn-meta
txn_next_id=8, txn_nr=2
```

```
diagnose sys config-transaction show txn-info
```

Show config transaction information. For example:

```
# diagnose sys config-transaction show txn-info
current_jiffies=680372
```

```
txn_id=6, expire_jiffies=706104, clicmd_fpath='/dev/cmdb/txn/6_EiLl9G.conf'
txn_id=7, expire_jiffies=707427, clicmd_fpath='/dev/cmdb/txn/7_UXK6wY.conf'
```

```
diagnose sys config-transaction show txn-entity
```

Show config transaction entity. For example:

```
# diagnose sys config-transaction show txn-entity
vd='global', cli-node-oid=37(system.vdom), txn_id=7. location: fileid=0, storeid=0,
     pgnr=0, pgidx=0
vd='global', cli-node-oid=46(system.interface), txn_id=7. location: fileid=3,
     storeid=0, pgnr=0, pgidx=0
```

```
diagnose sys config-transaction show txn-lock
```

Show transaction lock status. For example:

```
# diagnose sys config-transaction show txn-lock
type=-1, refcnt=0, value=256, pid=128
```

```
diagnose sys config-transaction status
```

Show the transaction status in the current CLI.

Custom languages

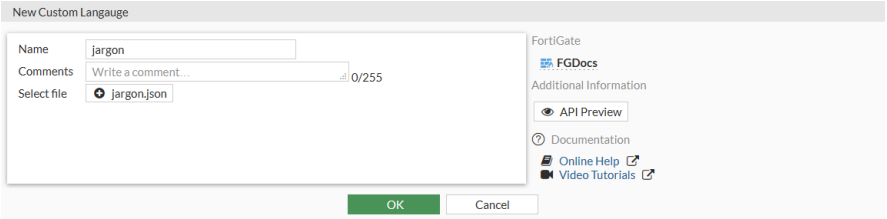
Custom languages can be uploaded and used for SSL VPN web portals. Custom languages must be enabled before they can be added in the GUI.

To enable custom languages:

```
config system global
    set gui-custom-language enable
end
```

To configure a custom language in the GUI:

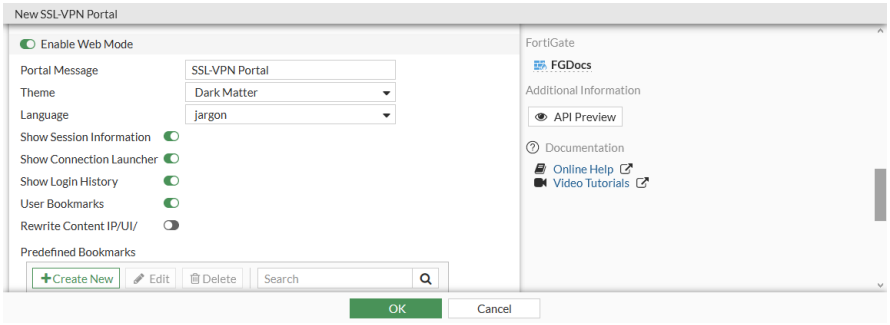
1. Go to *System* > *Custom Languages* and click *Create New*.
2. Enter the name of the language.
3. Optionally, enter a comment.
4. Click *Upload* and upload the language JSON file from your management computer.



5. Click *OK*.

To configure a language in an SSL VPN web portal in the GUI:

1. Go to *VPN* > *SSL-VPN Portals*.
2. Edit an existing portal, or click *Create New* to create a new one.
3. Enable *Enable Web Mode*, then select the language from the *Language* field.



4. Click *OK*.

To configure a custom language in the CLI:

```
config system custom-language
    edit <language>
        set filename <file>
    next
end
```

To configure a language in an SSL VPN web portal in the GUI:

```
config vpn ssl web portal
    edit <portal>
        set web-mode enable
        set custom-lang <language>
    next
end
```

RAID

Most FortiGate devices with multiple disk drives (SSD or HHD) can be configured to use RAID.

Enabling or disabling RAID, and changing the RAID level, erases all data on the log disk and reboots the device.

To verify that the FortiGate has multiple disks:

- List disk devices and partitions:

```
# execute disk list

Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
```

```
  partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev:
/dev/sda1 start: 2048

Disk SSD2 ref: 16 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sdb
  partition ref: 17 62.7GiB, 62.4GiB free mounted: Y label: WANOPTXX1FEBBFA1 dev:
/dev/sdb1 start: 2048
  partition ref: 18 63.7GiB, 63.7GiB free mounted: N label: dev: /dev/sdb2 start:
133625856
  partition ref: 19 85.0GiB, 85.0GiB free mounted: N label: dev: /dev/sdb3 start:
267249664
```

- Display information about all of the disks:

```
# diagnose hardware deviceinfo disk

Disk SSD1 ref: 255 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sda
  partition ref: 1 220.1GiB, 219.0GiB free mounted: Y label: LOGUSEDXA707476A dev:
/dev/sda1 start: 2048

Disk SSD2 ref: 16 223.6GiB type: SSD [ATA INTEL SSDSC2KB24] dev: /dev/sdb
  partition ref: 17 62.7GiB, 62.4GiB free mounted: Y label: WANOPTXX1FEBBFA1 dev:
/dev/sdb1 start: 2048
  partition ref: 18 63.7GiB, 63.7GiB free mounted: N label: dev: /dev/sdb2 start:
133625856
  partition ref: 19 85.0GiB, 85.0GiB free mounted: N label: dev: /dev/sdb3 start:
267249664

Disk SYSTEM(boot) 14.9GiB type: SSD [ATA 16GB SATA Flash] dev: /dev/sdc
  partition 247.0MiB, 155.0MiB free mounted: N label: dev: /dev/sdc1(boot) start: 1
  partition 247.0MiB, 154.0MiB free mounted: Y label: dev: /dev/sdc2(boot) start: 524289
  partition ref: 35 14.2GiB, 14.0GiB free mounted: Y label: dev: /dev/sdc3 start:
1048577

Disk USB-6(user-usb) ref: 48 28.6GiB type: USB [SanDisk Ultra] dev: /dev/sdd
<<<<<<===this info for usb disk because i have usb disk on FGT301E
  partition ref: 49 28.6GiB, 28.6GiB free mounted: Y label: dev: /dev/sdd1 start: 0

Total available disks: 4
Max SSD disks: 2 Available storage disks: 2
```

To check the RAID status:

- RAID enabled:

```
# execute disk raid status
RAID Level: Raid-1
RAID Status: OK (Background-Synchronizing) (9%)
RAID Size: 239GB

Disk 1: OK Used 228GB
Disk 2: OK Used 228GB
```

- RAID disabled:

```
# execute disk raid status
RAID Level: Unavailable
RAID Status: Unavailable
RAID Size: 0GB
```

```
Disk 1: OK Not-Used 228GB
Disk 2: OK Not-Used 228GB
```

To enable RAID:

```
# execute disk raid enable
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y

Dependent storage SSD2 removed.
Dependent storage SSD1 removed.
Raid-0 created with 2 disks.

Performing raid on the requested disk(s) and rebooting, please wait.. .

Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
- unmounting /usb : ok
- unmounting /var/storage/SSD2-WANOPTXX0EA0EF17 : ok

Formatting the disk...
- unmounting /usb : ok
Formatting /dev/md0 ... done

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.
```

To rebuild the RAID:

```
# execute disk raid rebuild
```

To rebuild the RAID to another level:

1. Check the supported RAID levels:

   ```
   # execute disk raid rebuild-level
   <RAID level> supported: Raid-0, Raid-1
   ```

2. Rebuild the RAID to the required level:

   ```
   # execute disk raid rebuild-level Raid-1
   This will erase all data on the log disk, and system will reboot!
   Do you want to continue? (y/n)y

   Dependent storage RAID removed.
   Raid-1 created with 2 disks.

   Performing raid on the requested disk(s) and rebooting, please wait...

   Configuring raid...
   - unmounting /data2 : ok
   - unmounting /var/log : ok
   ```

```
- unmounting /usb : ok

Formatting the disk...
- unmounting /usb : ok
Formatting /dev/md0 ... done

The system is going down NOW !!

Please stand by while rebooting the system.
Restarting system.
```

To disable RAID:

```
# execute disk raid disable
This will erase all data on the log disk, and system will reboot!
Do you want to continue? (y/n)y

Dependent storage RAID removed.

Performing format on the requested disk(s) and rebooting, please wait...

Configuring raid...
- unmounting /data2 : ok
- unmounting /var/log : ok
- unmounting /usb : ok

Formatting the disk...
Partitioning and formatting /dev/sda label LOGUSEDX3D36836D ... done
Partitioning and formatting /dev/sdb label WANOPTXX1FEBBFA1 ...

FortiGate encryption algorithm cipher suites

FortiGates use SSL/TLS encryption for HTTPS and SSH administrative access, and SSL VPN remote access. When establishing an SSL/TLS or SSH connection, you can control the encryption level and the ciphers that are used in order to control the security level.

HTTPS access

HTTP administrative access encryption is controlled using the following commands:

```
config sys global
    set strong-crypto {enable | disable}
    set admin-https-ssl-versions {tlsv1-1 tlsv1-2 tlsv1-3}
end
```

When strong encryption is enabled, only TLS 1.2 and TLS 1.3 are allowed. If strong encryption is then disabled, TLS 1.1 has to be manually enabled.

Specific cipher suites are supported by each TLS version:

TLS version	Supported Cipher Suites	
TLS 1.1[1]	ECDHE-RSA-AES256-SHA[1]	AES256-SHA[1]
	ECDHE-RSA-AES128-SHA[1]	AES128-SHA[1]
TLS 1.2	ECDHE-RSA-AES256-GCM-SHA384	AES256-GCM-SHA384[1]
	ECDHE-RSA-AES128-GCM-SHA256	AES128-GCM-SHA256[1]
	ECDHE-RSA-CHACHA20-POLY1305	AES256-SHA256
	ECDHE-RSA-AES256-SHA384	AES128-SHA256
	ECDHE-RSA-AES128-SHA256	AES256-SHA[1]
	ECDHE-RSA-AES256-SHA[1]	AES128-SHA[1]
	ECDHE-RSA-AES128-SHA[1]	
TLS 1.3	TLS-AES256-GCM-SHA384	TLS-AES128-GCM-SHA256
	TLS-CHACHA20-POLY1305-SHA256	

[1] Disabled if strong encryption (`strong-crypto`) is enabled.

SSH access

SSH access encryption is controlled using the following command:

```
config sys global
    set strong-crypto {enable | disable}
end
```

Different ciphers are supported by strong or weak encryption:

Encryption	Supported Ciphers	
Strong	chacha20-poly1305@openssh.com	aes256-ctr
	aes128-ctr	aes128-gcm@openssh.com
	aes192-ctr	aes256-gcm@openssh.com
Weak	arcfour256	cast128-cbc
	arcfour128	aes192-cbc
	aes128-cbc	aes256-cbc
	3des-cbc	arcfour
	blowfish-cbc	rijndael-cbc@lysator.liu.se

SSL VPN

For SSL VPN connections, the TLS versions and cipher suites are controlled using the following commands:

```
config vpn ssl setting
    set algorithm {high | medium | low}
    set ssl-max-proto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
    set ssl-min-proto-ver {tls1-0 | tls1-1 | tls1-2 | tls1-3}
    set ciphersuite {TLS-AES-128-GCM-SHA256 TLS-AES-256-GCM-SHA384 TLS-CHACHA20-POLY1305-
SHA256 TLS-AES-128-CCM-SHA256 TLS-AES-128-CCM-8-SHA256}
end
```

Cipher suites (`ciphersuite`) can only be selected when the SSL maximum version is TLS 1.3.

When the SSL VPN security level (`algorithm`) is set to high, only high levels are allowed. When it is set to medium, high and medium levels are allowed. When it is set to low, any level is allowed.

The strong encryption (`strong-crypto`) command has no effect on the SSL VPN encryption level or ciphers.

Specific cipher suites are supported by each TLS version:

TLS version	Supported Cipher Suites	
TLS 1.0	ECDHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-AES256-SHA	AES128-SHA
	DHE-RSA-CAMELLIA256-SHA	SEED-SHA[1]
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA	ECDHE-RSA-DES-CBC3-SHA[1]
	ECDHE-RSA-AES128-SHA	EDH-RSA-DES-CBC3-SHA[1]
	DHE-RSA-AES128-SHA[1]	DES-CBC3-SHA[1]
	DHE-RSA-SEED-SHA	

TLS version	Supported Cipher Suites	
TLS 1.1	ECDHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-AES256-SHA	AES128-SHA
	DHE-RSA-CAMELLIA256-SHA	SEED-SHA[1]
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA	ECDHE-RSA-DES-CBC3-SHA[1]
	ECDHE-RSA-AES128-SHA	EDH-RSA-DES-CBC3-SHA[1]
	DHE-RSA-AES128-SHA	DES-CBC3-SHA[1]
	DHE-RSA-SEED-SHA[1]	

TLS version	Supported Cipher Suites	
TLS 1.2	ECDHE-RSA-AES256-GCM-SHA384	ECDHE-RSA-AES128-SHA
	ECDHE-RSA-AES256-SHA384	DHE-RSA-AES128-GCM-SHA256
	ECDHE-RSA-AES256-SHA	DHE-RSA-AES128-CCM8
	DHE-RSA-AES256-GCM-SHA384	DHE-RSA-AES128-CCM
	ECDHE-RSA-CHACHA20-POLY1305	AES128-CCM8
	DHE-RSA-CHACHA20-POLY1305	AES128-CCM
	DHE-RSA-AES256-CCM8	DHE-RSA-AES128-SHA256
	DHE-RSA-AES256-CCM	DHE-RSA-AES128-SHA
	DHE-RSA-AES256-SHA256	ECDHE-RSA-CAMELLIA128-SHA256
	DHE-RSA-AES256-SHA	DHE-RSA-CAMELLIA128-SHA256
	ECDHE-RSA-CAMELLIA256-SHA384	DHE-RSA-SEED-SHA[1]
	DHE-RSA-CAMELLIA256-SHA256	DHE-RSA-CAMELLIA128-SHA
	DHE-RSA-CAMELLIA256-SHA	AES128-GCM-SHA256
	AES256-GCM-SHA384	AES128-SHA256
	AES256-CCM8	AES128-SHA
	AES256-CCM	CAMELLIA128-SHA256
	AES256-SHA256	SEED-SHA[1]
	AES256-SHA	CAMELLIA128-SHA
	CAMELLIA256-SHA256	ARIA128-GCM-SHA256
	CAMELLIA256-SHA	DHE-RSA-ARIA128-GCM-SHA256
	ARIA256-GCM-SHA384	ECDHE-ARIA128-GCM-SHA256
	DHE-RSA-ARIA256-GCM-SHA384	ECDHE-RSA-AES256-GCM-SHA384
	ECDHE-ARIA256-GCM-SHA384	ECDHE-RSA-DES-CBC3-SHA[1]
	ECDHE-RSA-AES128-GCM-SHA256	EDH-RSA-DES-CBC3-SHA[1]
	ECDHE-RSA-AES128-SHA256	DES-CBC3-SHA[1]
TLS 1.3	TLS_AES_256_GCM_SHA384	TLS_AES_128_CCM_SHA256
	TLS_CHACHA20_POLY1305_SHA256	TLS_AES_128_CCM_8_SHA256
	TLS_AES_128_GCM_SHA256	

[1] This cipher is not available when the SSL VPN security level (`algorithm`) is set to high.

Fortinet Security Fabric

The Fortinet Security Fabric provides an intelligent architecture that interconnects discrete security solutions into an integrated whole to detect, monitor, block, and remediate attacks across the entire attack surface. It delivers broad protection and visibility into every network segment and device, be they hardware, virtual, or cloud based.

- The physical topology view shows all connected devices, including access layer devices. The logical topology view shows information about the interfaces that each device is connected to.
- Security rating checks analyze the Security Fabric deployment to identify potential vulnerabilities and highlight best practices to improve the network configuration, deploy new hardware and software, and increase visibility and control of the network.
- Fabric connectors provide integration with multiple SDN, cloud, and partner technology platforms to automate the process of managing dynamic security updates without manual intervention.
- Automation pairs an event trigger with one or more actions to monitor the network and take the designated actions automatically when the Security Fabric detects a threat.

Security Fabric settings and usage

This section contains information about how to configure the following devices as part of the Fortinet Security Fabric:

- Components on page 1587
- Configuring the root FortiGate and downstream FortiGates
- Configuring FortiAnalyzer
- Configuring other Security Fabric devices on page 1598
- Using the Security Fabric
- Deploying the Security Fabric on page 1642
- Deploying the Security Fabric in a multi-VDOM environment on page 1650
- Synchronizing objects across the Security Fabric on page 1655
- Security Fabric over IPsec VPN on page 1662
- Leveraging LLDP to simplify Security Fabric negotiation on page 1668

System requirements

To set up the Security Fabric, the devices that you want to include must meet the Product Integration and Support requirements in the FortiOS Release Notes.

Some features of the Security Fabric are only available in certain firmware versions and models. Not all FortiGate models can run the FortiGuard Security Rating Service if they are the root FortiGate in a Security Fabric. For more information, see the Special Notices in the FortiOS Release Notes.

Prerequisites

- If devices are not already installed in your network, complete basic installation and configuration tasks by following the instructions in the device documentation.
- FortiGate devices must be operating in NAT mode.

Components

The Fortinet Security Fabric consists of different components that work together to secure you network.

The following devices are required to create a Security Fabric:

Device	Description
FortiGate	FortiGate devices are the core of the Security Fabric and can have one of the following roles: • **Root**: The root FortiGate is the main component in the Security Fabric. It is typically located on the edge of the network and connects the internal devices and networks to the Internet through your ISP. From the root FortiGate, you can see information about the entire Security Fabric on the Physical and Logical Topology pages in the GUI. • **Downstream**: After a root FortiGate is installed, all other FortiGate devices in the Security Fabric act as Internal Segmentation Firewalls (ISFWs), located at strategic points in your internal network, rather than on the network edge. This allows extra security measures to be taken around key network components, such as servers that contain valuable intellectual property. ISFW FortiGate devices create network visibility by sending traffic and information about the devices that are connected to them to the root FortiGate. See Configuring the root FortiGate and downstream FortiGates on page 1590 for more information about adding FortiGate devices in the Security Fabric. FortiGate documentation: https://docs.fortinet.com/product/fortigate
FortiAnalyzer	FortiAnalyzer gives you increased visibility into your network, centralized monitoring, and awareness of threats, events, and network activity by collecting and correlating logs from all Security Fabric devices. This gives you a deeper and more comprehensive view across the entire Security Fabric. See Configuring FortiAnalyzer on page 1596 for more information about adding FortiAnalyzer devices in the Security Fabric. FortiAnalyzer documentation: https://docs.fortinet.com/product/fortianalyzer  FortiAnalyzer Cloud 6.4.4 can be included in the security fabric if the root FortiGate is running FortiOS 6.4.4 and later.

The following devices are recommended:

Device	Description
FortiAI	FortiAI uses artificial neural networks (ANN) that can deliver sub-second malware detection and a verdict. Add FortiAI to your Security Fabric to automatically quarantine attacks. See FortiAI on page 1624 for more information about adding FortiAI devices in the Security Fabric. FortiAI documentation: https://docs.fortinet.com/product/fortiai
FortiAP	Add FortiAP devices to extend the Security Fabric to your wireless devices. Devices connected to a FortiAP appear in the Physical and Logical Topology pages in the Security Fabric menu. See FortiAP and FortiSwitch on page 1621 for more information about adding FortiAP devices in the Security Fabric. FortiAP documentation: https://docs.fortinet.com/product/fortiap
FortiClient	FortiClient adds endpoint control to devices that are located in the Security Fabric, allowing only traffic from compliant devices to flow through the FortiGate. FortiClient compliance profiles are applied by the first FortiGate that a device's traffic flows through. Device registration and on-net status information for a device that is running FortiClient appears only on the FortiGate that applies the FortiClient profile to that device. FortiClient documentation: https://docs.fortinet.com/product/forticlient
FortiDeceptor	FortiDeceptor automatically lays out a layer of decoys and lures, which helps conceal sensitive and critical assets behind a fabricated deception surface to confuse and redirect attackers while revealing their presence on your network. See FortiDeceptor on page 1628 for more information about adding FortiDeceptor devices in the Security Fabric. FortiDeceptor documentation: https://docs.fortinet.com/product/fortideceptor
FortiClient EMS	FortiClient EMS is used in the Security Fabric to provide visibility across your network, securely share information, and assign security profiles to endpoints. See FortiClient EMS on page 1610 for more information about adding FortiClient EMS devices in the Security Fabric. FortiClient EMS documentation: https://docs.fortinet.com/product/forticlient
FortiMail	FortiMail antispam processing helps offload from other devices in the Security Fabric that would typically carry out this process. See FortiMail on page 1622 for more information about adding FortiMail devices in the Security Fabric. FortiMail documentation: https://docs.fortinet.com/product/fortimail
FortiManager	Add FortiManager to simplify the network management of devices in the Security Fabric by centralizing management access in a single device. This allows you to easily control the deployment of security policies, FortiGuard content security updates, firmware revisions, and individual configurations for devices in the Security Fabric. See FortiManager on page 1603 for more information about adding FortiManager devices in the Security Fabric. FortiManager documentation: https://docs.fortinet.com/product/fortimanager

Device	Description
FortiSandbox	Add FortiSandbox to your Security Fabric to improve security with sandbox inspection. Sandbox integration allows FortiGate devices in the Security Fabric to automatically receive signature updates from FortiSandbox and add the originating URL of any malicious file to a blocked URL list. See Sandboxing on page 1605 for more information about adding FortiSandbox devices in the Security Fabric. FortiSandbox documentation: https://docs.fortinet.com/product/fortisandbox
FortiSwitch	A FortiSwitch can be added to the Security Fabric when it is managed by a FortiGate that is in the Security Fabric with the FortiLink protocol, and connected to an interface with *Security Fabric Connection* enabled. FortiSwitch ports to become logical extensions of the FortiGate. Devices connected to the FortiSwitch appear in the Physical and Logical Topology pages in the Security Fabric menu, and security features, such as FortiClient compliance profiles, are applied to them. See FortiAP and FortiSwitch on page 1621 for more information about adding FortiSwitch devices in the Security Fabric. FortiSwitch documentation: https://docs.fortinet.com/product/fortiswitch
FortiWeb	Add FortiWeb to defend the application attack surface from attacks that target application exploits. You can also configure FortiWeb to apply web application firewall features, virus scanning, and web filtering to HTTP traffic to help offload from other devices in the Security Fabric that would typically carry out these processes. See FortiWeb on page 1631 for more information about adding FortiWeb devices in the Security Fabric. FortiWeb documentation: https://docs.fortinet.com/product/fortiweb

The following devices are optional:

Device	Description
FortiADC	FortiADC devices optimize the availability, user experience, and scalability of enterprise application delivery. They enable fast, secure, and intelligent acceleration and distribution of even the most demanding enterprise applications. See Additional devices on page 1633 for more information about adding FortiADC devices in the Security Fabric. FortiADC documentation: https://docs.fortinet.com/product/fortiadc
FortiDDoS	FortiDDoS is a Network Behavior Anomaly (NBA) prevention system that detects and blocks attacks that intend to disrupt network service by overutilizing server resources. See Additional devices on page 1633 for more information about adding FortiDDoS devices in the Security Fabric. FortiDDoS documentation: https://docs.fortinet.com/product/fortiddos
FortiWLC	FortiWLC delivers seamless mobility and superior reliability with optimized client distribution and channel utilization. Both single and multi channel deployment options are supported, maximizing efficiency to make the most of available wireless spectrum. See Additional devices on page 1633 for more information about adding FortiWLC devices in the Security Fabric.

Device	Description
	FortiWLC documentation: https://docs.fortinet.com/product/wireless-controller
Other Fortinet products	Many other Fortinet products can be added to the Security Fabric, including FortiAuthenticator, FortiToken, FortiCache, and FortiSIEM. Documentation: https://docs.fortinet.com/
Third-party products	Third-party products that belong to the Fortinet Fabric-Ready Partner Program can be added to the Security Fabric.

Configuring the root FortiGate and downstream FortiGates

The following procedures include configuration steps for a typical Security Fabric implementation, where the edge FortiGate is the root FortiGate with other FortiGates that are downstream from the root FortiGate.

For information about the recommended number of downstream FortiGates, see the *FortiOS Best Practices*.

Prerequisite

- The FortiGates must be operating in NAT mode.

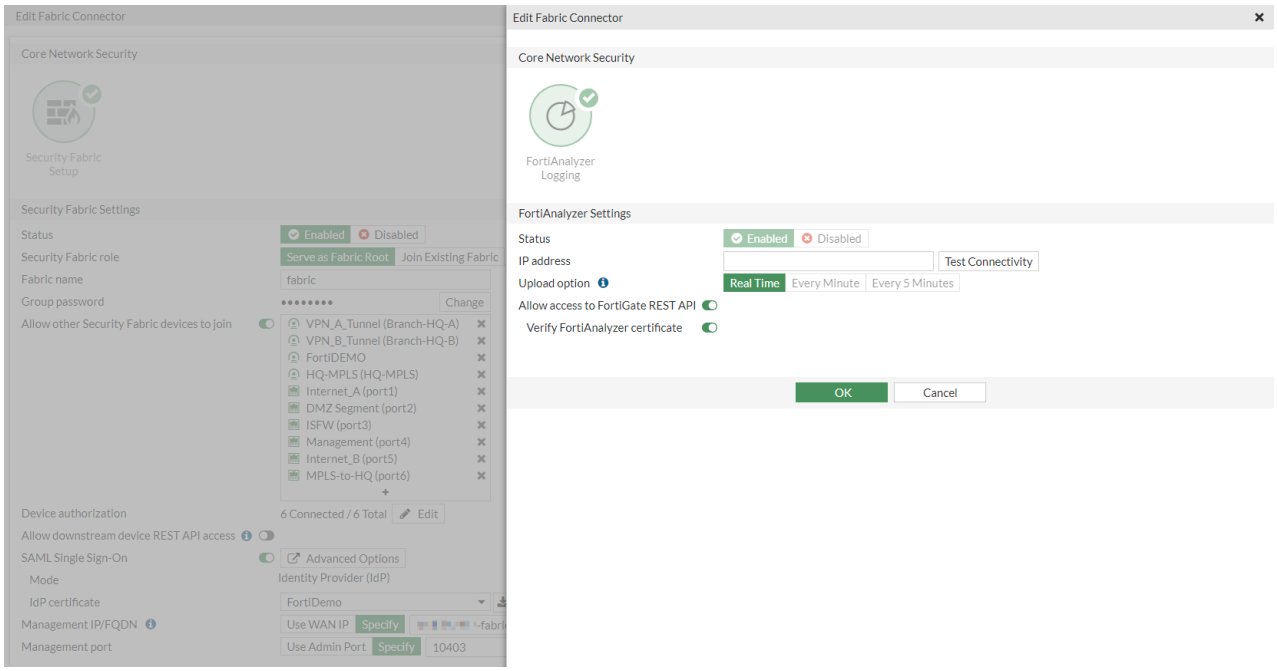
Configuring the root FortiGate

The edge FortiGate is typically configured as the root FortiGate, as this allows you to view the full topology of the Security Fabric from the top down.

The following steps describe how to add the FortiGate to serve as the root device, and how to configure the required FortiAnalyzer logging.

To configure the root FortiGate:

1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, click *Enable*.
3. Set the *Security Fabric role* to *Serve as Fabric Root*. FortiAnalyzer logging is automatically enabled and the settings can be configured in the slide-out pane.



When neither *FortiAnalyzer Logging* nor *Cloud Logging* are enabled, if the FortiGate detects that a FortiAnalyzer Cloud entitlement is available on this FortiGate, the slide-out pane will display *Cloud Logging* configurations. Otherwise, if *Cloud Logging* is enabled, the slide-out pane will display the *Cloud Logging* page. If *Cloud Logging* is disabled but FortiAnalyzer is enabled, then it will display the *FortiAnalyzer Logging* page.

4. Enter the FortiAnalyzer IP and select the *Upload option*.
5. In the *FortiAnalyzer Logging* section, in the *IP address* field, enter the IP address of the FortiAnalyzer.
6. If required, enable *Allow access to FortiGate REST API* and, optionally, *Verify FortiAnalyzer certificate*.

   The REST API accesses the FortiGate topology and shares data and results. The FortiGate will verify the FortiAnalyzer by retrieving its serial number and checking it against the FortiAnalyzer certificate. When verified, the FortiAnalyzer serial number is stored in the FortiGate configuration. When authorizing the FortiGate on the FortiAnalyzer, the FortiGate admin credentials do not need to be entered.
7. Click *Test Connectivity*.

   If you select *Test Connectivity* and this is the first time that you are connecting the FortiGate to the FortiAnalyzer, you will receive a warning message because the FortiGate has not yet been authorized on the FortiAnalyzer. You can configure this authorization when you configure the FortiAnalyzer. See Configuring FortiAnalyzer on page 1596.
8. Click *OK*. The FortiAnalyzer serial number is verified.
9. Enter a *Fabric name*.
10. Ensure *Allow other Security Fabric devices to join* is enabled.
11. Select the interfaces that will be listening for device join requests. Enabling an interface here has the same effect as going to *Network* > *Interfaces*, editing an interface, and enabling *Security Fabric Connection* under *Administrative Access*.
12. Click *OK*.

Using the root FortiGate with disk to store historic user and device information

This backend implementation allows the root FortiGate in a Security Fabric to store historic user and device information in a database on its disk. This will allow administrators to visualize users and devices over a period of time.

The daemon, user_info_history, stores this data on the disk. The information source for the historical data will be the user_info daemon, which would be recorded on the disk when user_info notifies user_info_history that a user has logged out or the device is no longer connected.

Adding downstream devices

Downstream device serial numbers can be pre-authorized from the root FortiGate, or allowed to join by request. New authorization requests include the device serial number, IP address, and HA members. HA members can include up to four serial numbers and is used to ensure that, in the event of a fail over, the secondary FortiGate is still authorized.

A downstream device's certificate can also be used to authorize the device by uploading the certificate to the root FortiGate.

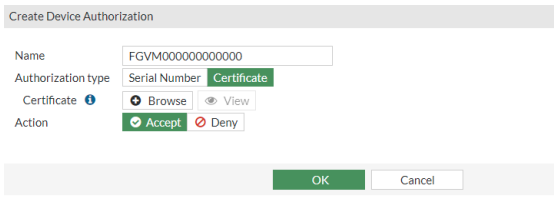
Pre-authorizing the downstream FortiGate

When a downstream Fortinet device's serial number or certificate is added to the trusted list on the root FortiGate, the device can join the Security Fabric as soon as it connects. After the new device is authorized, connected FortiAP and FortiSwitch devices are automatically included in the topology, where they can be authorized with one click.

The interface that connects to the downstream FortiGate must have *Security Fabric Connection* enabled.

To pre-authorize a FortiGate:

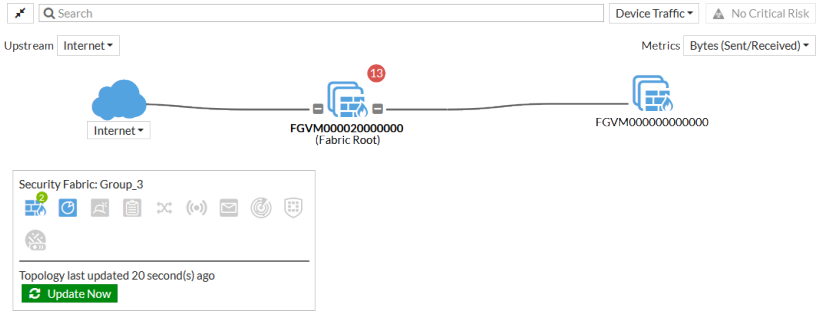
1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. In the *Device authorization* field click *Edit*. The *Device Authorization* window opens.
3. Click *Create New* to add a new device for pre-authorization.
4. Enter the device name in the *Name* field.
5. Select the *Authorization type*, either *Serial Number* or *Certificate*.
6. If *Certificate* is selected, click *Browse* to upload the downstream device's certificate from the management computer.



7. Select the *Action*, either *Accept* or *Deny*.
8. Click *OK* and add more devices as required.
9. Click *OK*.

To configure a downstream FortiGate to connect to an upstream FortiGate:

1. Configure the downstream FortiGate:
   a. On the downstream FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. Set *Status* to *Enable*.
   c. Set *Security Fabric role* to *Join Existing Fabric*.
   d. Enter the IP address of the root FortiGate in the *Upstream FortiGate IP* field.
   e. Click *OK*.
2. On the root FortiGate, go to *Security Fabric* > *Physical Topology* and verify that the downstream FortiGate that you added appears in the Security Fabric topology.

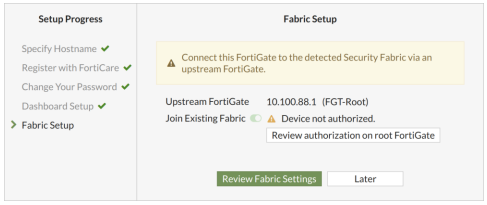


Authorizing a downstream FortiGate

When you log in to an unauthorized downstream FortiGate, the log in prompt includes the option to authorize the device on the root FortiGate.

To authorize a downstream FortiGate:

1. Log in to the unauthorized, downstream device.

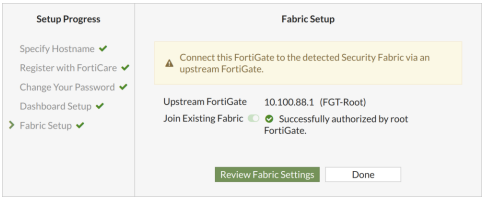


2. In the *Fabric Setup* step, click *Review authorization on root FortiGate*.
   A pop-up window opens to a log in screen for the root FortiGate.

3. Enter the log in credentials for the root FortiGate, then click *Login*.
   A list of pending authorizations is shown.

4. Select *Allow* and then click *OK* to authorize the downstream FortiGate. You can also select *Deny* to reject the authorization, or *Later* to postpone the decision to the next time that you log in.

   When authorization is allowed, the pop-up window closes, and the log in prompt shows that the downstream FortiGate has been authorized.



5. Click *Done* to log in to the downstream FortiGate.

Triggering authorization from the Fabric Connectors page

To authorize a downstream device from the Fabric Connectors page:

1. Go to *Security Fabric* > *Fabric Connectors*.
2. In the gutter on the right side of the screen, click *Review authorization on root FortiGate*.

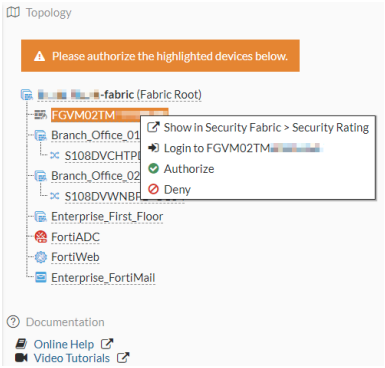
   The root FortiGate pop-up window shows the state of the device authorization.

Authorizing the downstream FortiGate from the root

To authorize the downstream FortiGate from the root:

1. Log in to the root FortiGate and go to *Security Fabric* > *Fabric Connectors*. Devices requiring authorization are highlighted in the *Topology* tree (right-side gutter).

2. Hover over a highlighted device and click *Authorize*.



You can use the FortiIPAM service to automatically assign subnets to downstream FortiGates to prevent duplicate IP addresses from overlapping within the same Security Fabric. See Assign a subnet with the FortiIPAM service on page 160.

CLI commands

Use the following commands to view, accept, and deny authorization requests, to view upstream and downstream devices, and to list or test Fabric devices:

Command	Description
`diagnose sys csf authorization pending-list`	View pending authorization requests on the root FortiGate.
`diagnose sys csf authorization accept <serial number>`	Authorize a device to join the Security Fabric.
`diagnose sys csf authorization deny <serial number>`	Deny a device from joining the Security Fabric.
`diagnose sys csf downstream`	Show connected downstream devices.
`diagnose sys csf upstream`	Show connected upstream devices.
`diagnose sys csf fabric-device list`	List all known Fabric devices.
`diagnose sys csf fabric-device test`	Test connections to locally configured Fabric devices.

Desynchronizing settings

By default, the settings for FortiAnalyzer logging, central management, sandbox inspection, and FortiClient EMS are synchronized between all FortiGates in the Security Fabric.

To disable automatic synchronization:

```
config system csf
    set configuration-sync local
end
```

Deauthorizing a device

A device can be deauthorized to remove it from the Security Fabric.

To deauthorize a device:

1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors*.
2. In the topology tree, click the device and select *Deauthorize*.
   After a device is deauthorized, the serial number is saved in a trusted list that can be viewed in the CLI using the `show system csf` command. For example, this result shows a deauthorized FortiSwitch:

```
show system csf
    config system csf
        set status enable
        set group-name "Office-Security-Fabric"
        set group-password ************
        config trusted-list
            edit "FGT6HD391800000"
        next
            edit "S248DF3X1700000"
                set action deny
            next
        end
    end
```

Configuring FortiAnalyzer

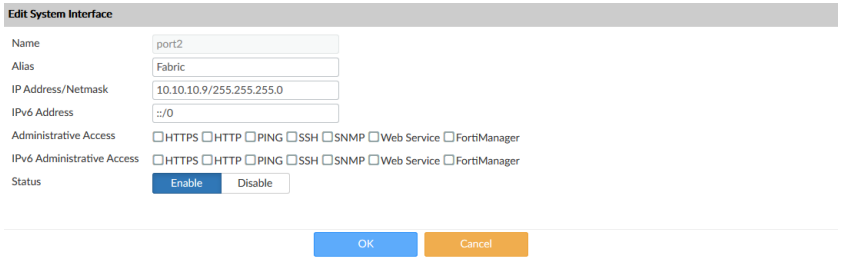
FortiAnalyzer is a required component for the Security Fabric. In 6.4.4 and later, either FortiAnalyzer or FortiAnalyzer Cloud can be used to meet this requirement. FortiAnalyzer allows the Security Fabric to show historical data for the Security Fabric topology and logs for the entire Security Fabric.

For more information about using FortiAnalyzer, see the FortiAnalyzer Administration Guide.

To connect a FortiAnalyzer to the Security Fabric:

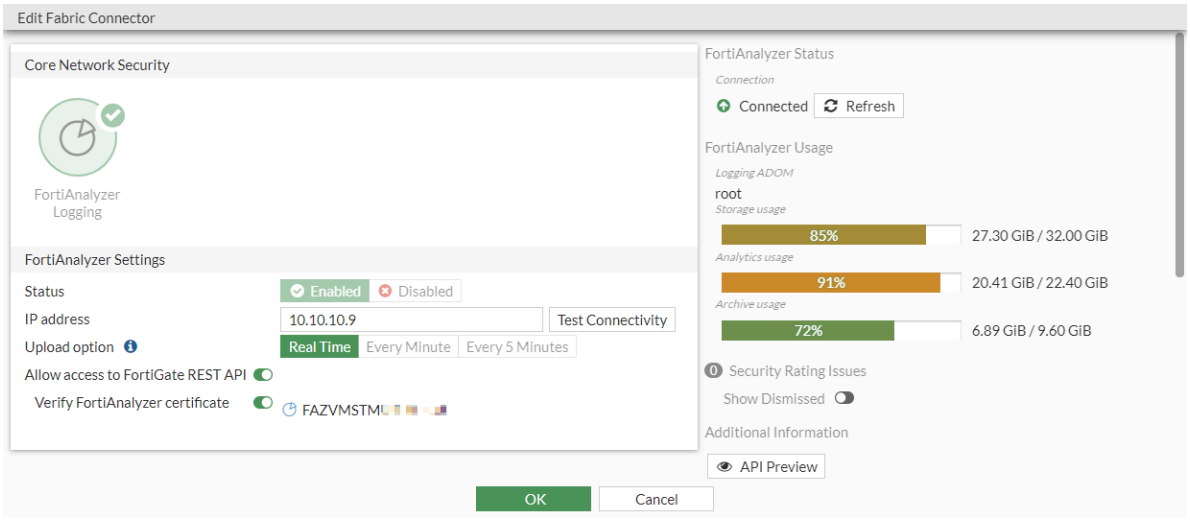
1. Enable *FortiAnalyzer Logging* on the root FortiGate. See Configuring the root FortiGate on page 1590.
2. On the FortiAnalyzer, go to *System Settings* > *Network*.
3. Edit the port that connects to the root FortiGate.

4. Set the *IP Address/Netmask* to the IP address that is used for the Security Fabric on the root FortiGate.



5. Click *OK*.
   If the FortiGates have already been configured, it will now be listed as an unauthorized device.
6. Go to *Device Manager* > *Unauthorized Devices*. The unauthorized FortiGate devices are listed.

7. Select the root and downstream FortiGates in the list, then click *Authorize*. The *Authorize Device* page opens.
8. Click *OK* .
9. Each FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiAnalyzer Logging* card. The page now shows the logging ADOM and FortiAnalyzer usage statistics (storage, analytics, archive) in the right-side gutter.



Sending traffic logs to FortiAnalyzer Cloud

FortiGates running version 6.4.4. or later, with a FortiCloud Premium subscription (AFAC) for Cloud-based Central Logging & Analytics, can send traffic logs to FortiAnalyzer Cloud in addition to UTM logs and event logs. After the Premium subscription is registered through FortiCare, FortiGuard will verify the purchase and authorize the AFAC contract. Once the contract is verified, FortiGuard will deliver the contract to FortiGate.

FortiGates with a Standard FortiAnalyzer Cloud subscription (FAZC) can only send UTM and event logs. FortiGates with a Premium subscription will send the UTM and event logs even if the Standard subscription has expired.

For information about cloud logging, see FortiAnalyzer Cloud service on page 1600

FortiAnalyzer Cloud does not support DLP/IPS archives at this time.

To verify the status a FortiCloud subscription with the CLI:

```
# diagnose test update info
```

The `FAZC` and `AFAC` fields display the subscription expiration date. The `Support contract` field displays the FortiCare account information. The `User ID` field displays the ID for FortiAnalyzer-Cloud instance.

```
...
FAZC,Tue Sep 24 16:00:00 2030
AFAC,Mon Nov 29 16:00:00 2021
...
Support contract: pending_registration=255 got_contract_info=1
account_id=[****@fortinet.com] company=[Fortinet] industry=[Technology]
User ID: 979090
```

Configuring other Security Fabric devices

This section contains information about configuring the following devices as part of the Fortinet Security Fabric:

- FortiGate Cloud on page 1598
- FortiAnalyzer Cloud service on page 1600
- FortiManager on page 1603
- FortiManager Cloud service on page 1604
- Sandboxing on page 1605
- FortiClient EMS on page 1610
- FortiNAC on page 1619
- FortiAP and FortiSwitch on page 1621
- FortiMail on page 1622
- FortiAI on page 1624
- FortiDeceptor on page 1628
- FortiWeb on page 1631
- Additional devices on page 1633

Prerequisites

- FortiGate devices must be operating in NAT mode.

FortiGate Cloud

FortiGate Cloud is a hosted security management and log retention service for FortiGate devices. It provides centralized reporting, traffic analysis, configuration management, and log retention without the need for additional hardware or software.

FortiGate Cloud offers a wide range of features:

- **Simplified central management**
  FortiGate Cloud provides a central GUI to manage individual or aggregated FortiGate and FortiWiFi devices. Adding a device to the FortiGate Cloud management subscription is straightforward. FortiGate Cloud has detailed traffic and application visibility across the whole network.
- **Hosted log retention with large default storage allocated**
  Log retention is an integral part of any security and compliance program, but administering a separate storage system is onerous. FortiGate Cloud takes care of this automatically and stores the valuable log information in the cloud. Different types of logs can be stored, including Traffic, System Events, Web, Applications, and Security Events.
- **Monitoring and alerting in real time**
  Network availability is critical to a good end-user experience. FortiGate Cloud enables you to monitor your FortiGate network in real time with different alerting mechanisms to pinpoint potential issues. Alerting mechanisms can be delivered via email.
- **Customized or pre-configured reporting and analysis tools**
  Reporting and analysis are your eyes and ears into your network's health and security. Pre-configured reports are available, as well as custom reports that can be tailored to your specific reporting and compliance requirements. The reports can be emailed as PDFs, and can cover different time periods.
- **Maintain important configuration information uniformly**
  The correct configuration of the devices within your network is essential for maintaining optimum performance and security posture. In addition, maintaining the correct firmware (operating system) level allows you to take advantage of the latest features.
- **Service security**
  All communication (including log information) between the devices and the cloud is encrypted. Redundant data centers are always used to give the service high availability. Operational security measures have been put in place to make sure your data is secure — only you can view or retrieve it.

For more information about FortiGate Cloud, see the FortiGate Cloud documentation.

Registration and activation

Before you can activate a FortiGate Cloud account, you must first register your device.

FortiGate Cloud accounts can be registered manually through the FortiGate Cloud website, https://www.forticloud.com, or you can easily register and activate your account directly from your FortiGate.

To activate your FortiGate Cloud account:

1. On your device, go to *Dashboard* > *Status*.
2. In the *FortiGate Cloud* widget, click the *Not Activated* > *Activate* button in the *Status* field.
3. A pane will open asking you to register your FortiGate Cloud account. Click *Create Account*, enter your information, view and accept the terms and conditions, and then click *OK*.
4. A second dialogue window open , asking you to enter your information to confirm your account. This sends a confirmation email to your registered email. The dashboard widget then updates to show that confirmation is required.

5. Open your email, and follow the confirmation link it contains.
   A FortiGate Cloud page will open, stating that your account has been confirmed. The *Activation Pending* message on the dashboard will change to state the type of account you have, and will provide a link to the FortiGate Cloud portal.

Enabling logging to FortiGate Cloud

To enable logging to FortiGate Cloud:

1. Go to *Security Fabric* > *Fabric Connectors* > *Cloud Logging* or *Log & Report* > *Log Settings*.
2. Enable *Cloud Logging*.
3. Select an upload option: *Realtime*, *Every Minute*, or *Every 5 Minutes* (default).
4. Click *Apply*.

Logging into the FortiGate Cloud portal

Once logging has been configured and you have registered your account, you can log into the FortiGate Cloud portal and begin viewing your logging results. There are two methods to reach the FortiGate Cloud portal:

- If you have direct network access to the FortiGate:
  a. Go to *Dashboard* > *Status*.
  b. In the *FortiGate Cloud* widget, in the *Status* field, click *Activated* > *Launch Portal*, or, in the *Licenses* widget, click *FortiCare Support* > *Launch Portal*.
- If you do not have access to the FortiGate's interface, visit the FortiGate Cloud website (https://www.forticloud.com) and log in remotely, using your email and password. It will ask you to confirm the FortiGate Cloud account you are connecting to and then you will be granted access.

Cloud sandboxing

FortiGate Cloud can be used for automated sample tracking, or sandboxing, for files from a FortiGate. This allows suspicious files to be sent to be inspected without risking network security. If the file exhibits risky behavior, or is found to contain a virus, a new virus signature is created and added to the FortiGuard antivirus signature database.

See Sandboxing on page 1605 for instructions to configure FortiGate Cloud Sandbox. Sandboxing results are shown on the *Sandbox* tab in the FortiGate Cloud portal.

FortiAnalyzer Cloud service

FortiGate supports the FortiAnalyzer Cloud service for event logging.

Traffic logs are not currently supported by FortiAnalyzer Cloud without a FortiCloud Premium subscription (AFAC). For information, see Configuring FortiAnalyzer on page 1596.

When FortiAnalyzer Cloud is licensed and enabled (see Deploying FortiAnalyzer Cloud for more information), all event logs are sent to FortiAnalyzer Cloud by default. All traffic logs, security logs, and archive files are not sent to FortiAnalyzer Cloud.

FortiAnalyzer Cloud differs from FortiAnalyzer in the following ways:

- You cannot enable FortiAnalyzer Cloud in `vdom override-setting` when global FortiAnalyzer Cloud is disabled.
- You must use the CLI to retrieve and display logs sent to FortiAnalyzer Cloud. The FortiOS GUI is not supported.
- You cannot enable FortiAnalyzer Cloud and FortiGate Cloud at the same time.

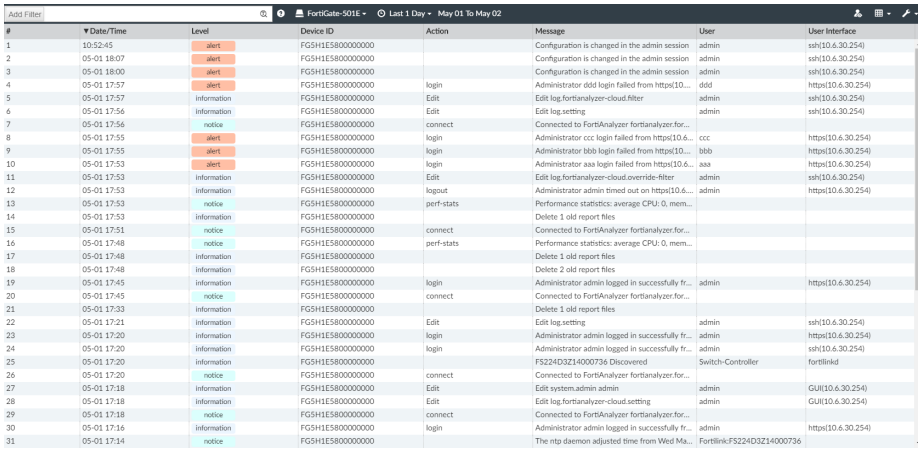
Sample settings panes

In the FortiOS *Security Fabric* > *Fabric Connectors* > *Cloud Logging* card settings page, *FortiAnalyzer Cloud* is grayed out when you do not have a FortiAnalyzer Cloud entitlement.

When you have a FortiAnalyzer Cloud entitlement, *FortiAnalyzer Cloud* is available.

You can also view the FortiAnalyzer Cloud settings in the *Log & Report* > *Log Settings* pane.

In FortiAnalyzer Cloud, you can view logs from *FortiOS* in the *Event* > *All Types* pane.



To enable fortianalyzer-cloud using the CLI:

```
config log fortianalyzer-cloud setting
   set status enable
   set ips-archive disable
   set access-config enable
   set enc-algorithm high
   set ssl-min-proto-version default
   set conn-timeout 10
   set monitor-keepalive-period 5
   set monitor-failure-retry-period 5
   set certificate ''
   set source-ip ''
   set upload-option realtime
end
config log fortianalyzer-cloud filter
   set severity information
   set forward-traffic disable
   set local-traffic disable
   set multicast-traffic disable
   set sniffer-traffic disable
   set anomaly disable
   set voip disable
   set dlp-archive disable
   set dns disable
```

```
   set ssh disable
   set ssl disable
   set cifs disable
   set filter ''
   set filter-type include
end
```

To disable fortianalyzer-cloud for a specific VDOM using the CLI:

```
config log setting
   set faz-override enable
end
config log fortianalyzer-cloud override-setting
   set status disable
end
```

To set fortianalyzer-cloud filter for a specific vdom using the CLI:

```
config log setting
   set faz-override enable
end
config log fortianalyzer-cloud override-setting
   set status enable
end
config log fortianalyzer-cloud override-filter
   set severity information
   set forward-traffic disable
   set local-traffic disable
   set multicast-traffic disable
   set sniffer-traffic disable
   set anomaly disable
   set voip disable
   set dlp-archive disable
   set dns disable
   set ssh disable
   set ssl disable
   set cifs disable
   set filter ''
   set filter-type include
end
```

To display fortianalyzer-cloud log using the CLI:

```
execute log filter device fortianalyzer-cloud
execute log filter category event
execute log display
```

```

FortiManager

When a FortiManager device is added to the Security Fabric, it automatically synchronizes with any connected downstream devices.

To add a FortiManager to the Security Fabric, configure it on the root FortiGate. The root FortiGate then pushes this configuration to downstream FortiGate devices. The FortiManager provides remote management of FortiGate devices over TCP port 541. The FortiManager must have internet access for it to join the Security Fabric.

Once configured, the FortiGate can receive antivirus and IPS updates, and allows remote management through FortiManager or the FortiGate Cloud service. The FortiGate management option must be enabled so that the FortiGate can accept management updates to its firmware and FortiGuard services.

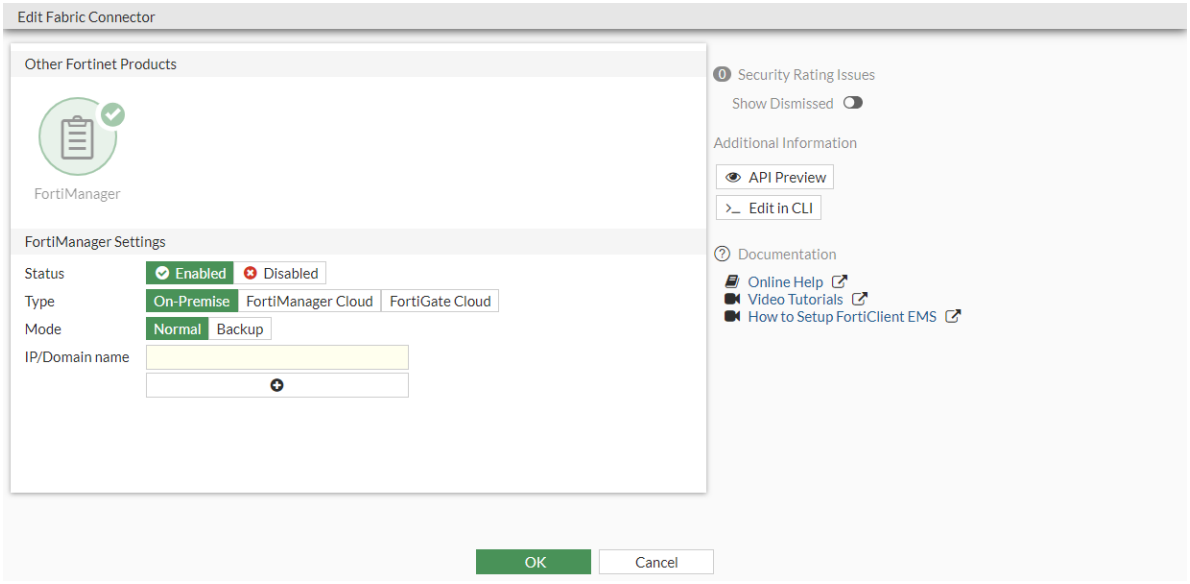
To add a FortiManager to the Security Fabric using the CLI:

```
config system central-management
   set type fortimanager
   set fmg {<IP_address> | <FQDN_address>}
end
```

To add a FortiManager to the Security Fabric using the GUI:

1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiManager* card.
2. For *Status*, click *Enable*.

3. For *Type*, click *On-Premise*.



4. Enter the *IP/Domain Name* of the FortiManager.
5. Click *OK*.
6. On the FortiManager, go to *Device Manager* and find the FortiGate in the *Unauthorized Devices* list.
7. Select the FortiGate device or devices, and click *Authorize* in the toolbar.
8. In the *Authorize Device* pop-up, adjust the device names as needed, then click *OK*.
   For more information about using FortiManager, see the FortiManager Administration Guide.

FortiManager Cloud service

This cloud-based SaaS management service is available through FortiManager. This service is included in FortiCloud accounts with a FortiManager Cloud account level subscription (ALCI).

Configuring a per-device license

Once the FortiGate has acquired a contract named *FortiManager Cloud*, FortiCloud creates a cloud-based FortiManager instance under the user account. You can launch the portal for the cloud-based FortiManager from FortiCloud, and its URL starts with the User ID.

You can use a FortiGate with a contract for *FortiManager Cloud* to configure central management by using the FQDN of *fortimanager.forticloud.com*. A FortiGate-FortiManager tunnel is established between FortiGate and the FortiManager instance.

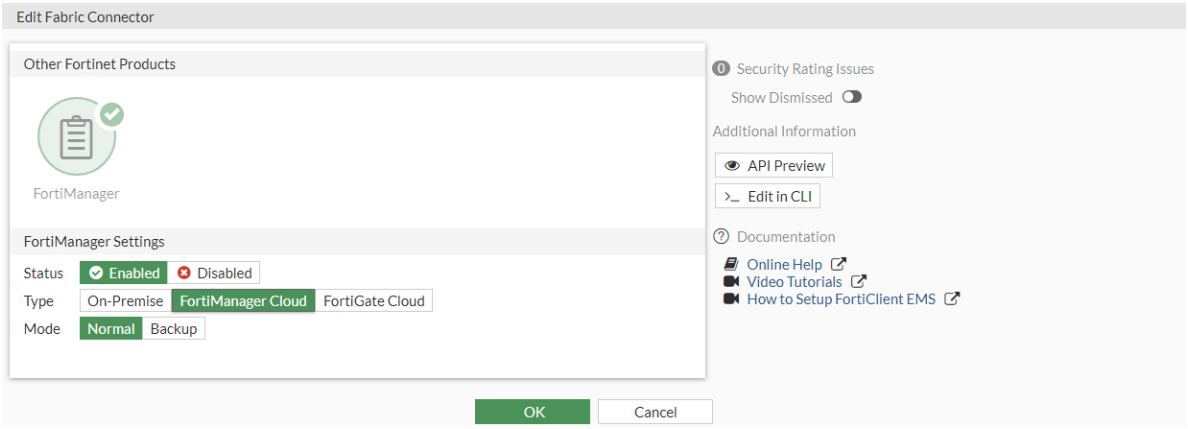
After the tunnel is established, you can execute FortiManager functions from the cloud-based FortiManager portal.

To configure FortiManager Cloud central management:

1. Enable FortiManager Cloud.
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiManager* card.
   b. For *Status*, click *Enable*.
   c. For *Type*, click *FortiManager Cloud*.

d. Click *OK*.

The *FortiManager Cloud* button can only be selected if you have a FortiManager Cloud product entitlement.



2. In the FortiManager Cloud instance, go to *Device Manager* and authorize the FortiGate. See Authorizing devices for more information.
   When using the FortiGate to enable FortiManager Cloud, the FortiGate appears as an unauthorized device. After authorizing the FortiGate, it becomes a managed device.

   In FortiOS, the *Security Fabric* > *Fabric Connectors* page now displays green arrow in the *FortiManager* card because FortiManager Cloud is registered.

Diagnostics

To verify the contract information:

```
# diagnose test update info contract
...
System contracts:
    ...
Account contracts:
    FMGC,Thu Dec  2 16:00:00 2021
...
```

To verify the FortiManager Cloud instance has launched and the FortiGate is registered:

```
# diagnose fdsm central-mgmt-status
Connection status: Up
Registration status: Registered
```

Sandboxing

The Security Fabric supports the following FortiSandbox deployments.

Type	Description	Requirements
FortiGate Cloud Sandbox	Files are sent to Fortinet's Cloud Sandbox cluster for processing.	• The FortiGate must have a valid AV license. • The FortiCloud account provides access to a portal to view submissions. This is not required for the Security Fabric.
FortiSandbox Cloud	Files are sent to a dedicated FortiCloud hosted instance of FortiSandbox for processing.	• FortiCloud premium license • FortiSandbox Cloud entitlement • The FortiGate and FortiCloud license are registered to the same account.
FortiSandbox appliance	Files are sent to a physical appliance or VM, typically residing on premise, for processing.	• None

To apply sandboxing in a Security Fabric, connect one of the FortiSandbox deployments, then configure an antivirus profile to submit files for dynamic analysis. The submission results supplement the AV signatures on the FortiGate. FortiSandbox inspection can also be used in web filter profiles.

In a Security Fabric environment, sandbox settings are configured on the root FortiGate. Once configured, the root FortiGate pushes the settings to other FortiGates in the Security Fabric.

FortiGate Cloud Sandbox

FortiGate Cloud Sandbox allows users to take advantage of FortiSandbox features without having to purchase, operate, and maintain a physical appliance. It also allows you to control the region where your traffic is sent to for analysis. This allows you to meet your country's compliance needs regarding data storage locations.

Users are not required to have a FortiCloud account to use FortiGate Sandbox Cloud.

The submission to the cloud with a valid FortiGuard Antivirus (AVDB) license is rate limited per FortiGate model. Refer to the Service Description for details. For those without any AVDB license, the submission is limited to only 100 per day.

To configure FortiGate Cloud Sandbox, you must first activate the connection from the CLI. Note that FortiGate Cloud Sandbox is decoupled from FortiGate Cloud logging, so you do not need to have a FortiCloud account or have cloud logging enabled.

To activate the FortiGate Cloud Sandbox connection:

```
# execute forticloud-sandbox region
0  Europe
1  Global
2  Japan
3  US
Please select cloud sandbox region[0-3]:3
```

After a region is selected, the following configuration is added:

```
config system fortiguard
    set sandbox-region {0 | 1 | 2 | 3}
end
```

Alternatively, using the `execute forticloud-sandbox update` command also works.

To obtain or renew a FortiGuard antivirus license:

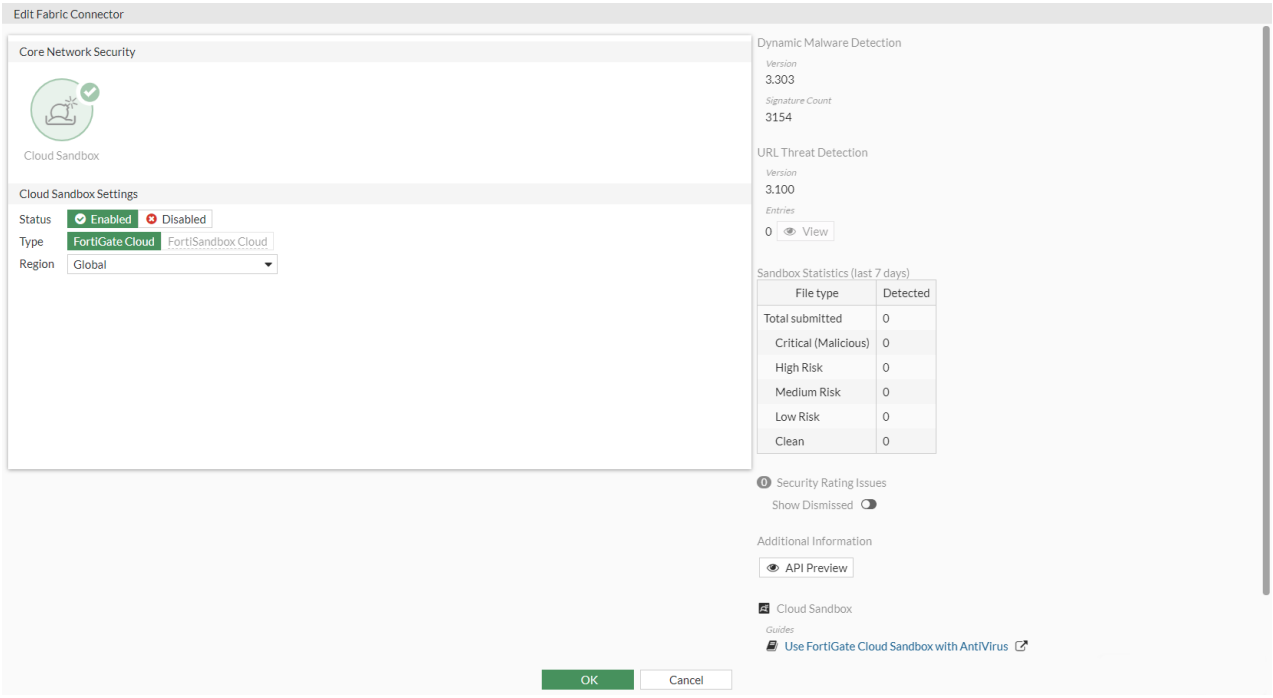
1. See the How to Purchase or Renew FortiGuard Services video for FortiGuard antivirus license purchase instructions.
2. Once a FortiGuard license is purchased and activated, users are provided with a paid FortiSandbox Cloud license.
   a. Go to *Dashboard* > *Status* to view the FortiSandbox Cloud license indicator.

   b. Alternatively, go to *System* > *FortiGuard* to view the FortiSandbox Cloud license indicator.

To enable FortiGate Cloud Sandbox in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Cloud Sandbox* card.
2. Set *Status* to *Enable*.
3. For Type, select *FortiGate Cloud*.

4. Select a *Region* from the dropdown.



5. Click *OK*.

FortiSandbox Cloud

FortiSandbox Cloud offers more features and better detection capability. Connecting to FortiSandbox Cloud will automatically use the cloud user ID of the FortiGate to connect to the dedicated FortiSandbox Cloud instance. The FortiGate automatically detects if there is a valid entitlement.

The following items are required to initialize FortiSandbox Cloud:

- A FortiCloud premium account.
- A valid FSAC contract on the FortiGate. To view contract information in the CLI, enter `diagnose test update info`. The `User ID` at the end of the output lets FortiCloud to know which FortiSandbox Cloud account the FortiGate is connected to.

To configure FortiSandbox Cloud in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Cloud Sandbox* card.
2. Set *Status* to *Enable*.
3. For *Type*, select *FortiSandbox Cloud*.

If the *FortiSandbox Cloud* option is grayed out or not visible, enter the following in the CLI:

```
config system global
    set gui-fortigate-cloud-sandbox enable
end
```

4. Click *OK*.

To configure FortiSandbox Cloud in the CLI:

```
config system fortisandbox
    set status enable
    set forticloud enable
end
```

If the FortiGate does not detect the proper entitlement, a warning is displayed and the CLI configuration will not save.

FortiSandbox appliance

FortiSandbox appliance is the on-premise option for a full featured FortiSandbox. Connecting to a FortiSandbox appliance requires that Cloud Sandbox is disabled.

To switch from Cloud Sandbox to FortiSandbox in the Security Fabric:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Cloud Sandbox* card.
2. Set *Status* to *Disabled*.
3. Click *OK*.

To enable FortiSandbox appliance in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiSandbox* card.
2. Set *Status* to *Enable*.
3. In the *Server* field, enter the FortiSandbox device's IP address.
4. Optionally, enter a *Notifier email*.
5. Click *OK*.

To enable FortiSandbox appliance in the CLI:

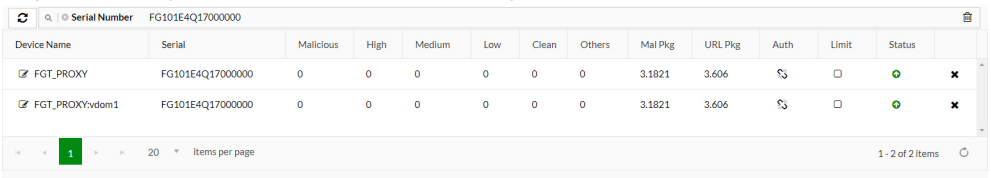
```
config system fortisandbox
    set status enable
    set forticloud disable
    set server <address>
end
```

Authorizing the FortiGate from FortiSandbox Cloud and a FortiSandbox appliance

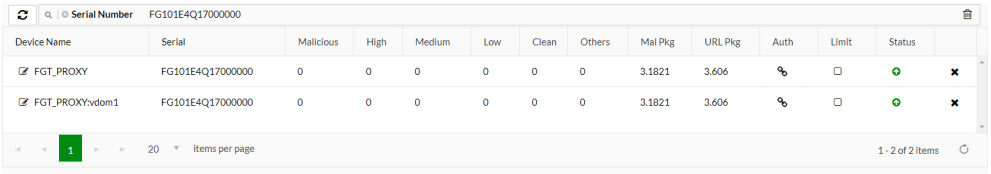
Once the FortiGate makes a connection to the FortiSandbox Cloud or appliance, the FortiGate must be authorized.

To authorize a FortiGate from FortiSandbox:

1. In the FortiSandbox GUI, go to *Scan Input* > *Device* in 3.2 or *Security Fabric* > *Device* in 4.0.
2. Search using the FortiGate serial number to locate the FortiGate. In the *Auth* column, click the link icon to authorize the FortiGate.
3. Repeat this step to authorize the VDOMs if required.



The link icon changes from an open to a closed link, which indicates that the FortiGate is authorized.



4. In the FortiGate GUI, go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiSandbox* card.
5. Click *Test connectivity*. The FortiGate is now authorized and the status displays as *Connected*.

Antivirus profiles

An antivirus profile must be configured to send files to the sandbox. Once submitted, sandbox inspection is performed on the file to detect malicious activities. The FortiGate can use the dynamic malware detection database from the sandbox to supplement the AV signature database. See Using FortiSandbox with antivirus on page 766 for more information.

Web filter profiles

Sandbox inspection can be used in web filter profiles. The FortiGate uses URL threat detection database from the sandbox to block malicious URLs. See Block malicious URLs discovered by FortiSandbox on page 792 for more information.

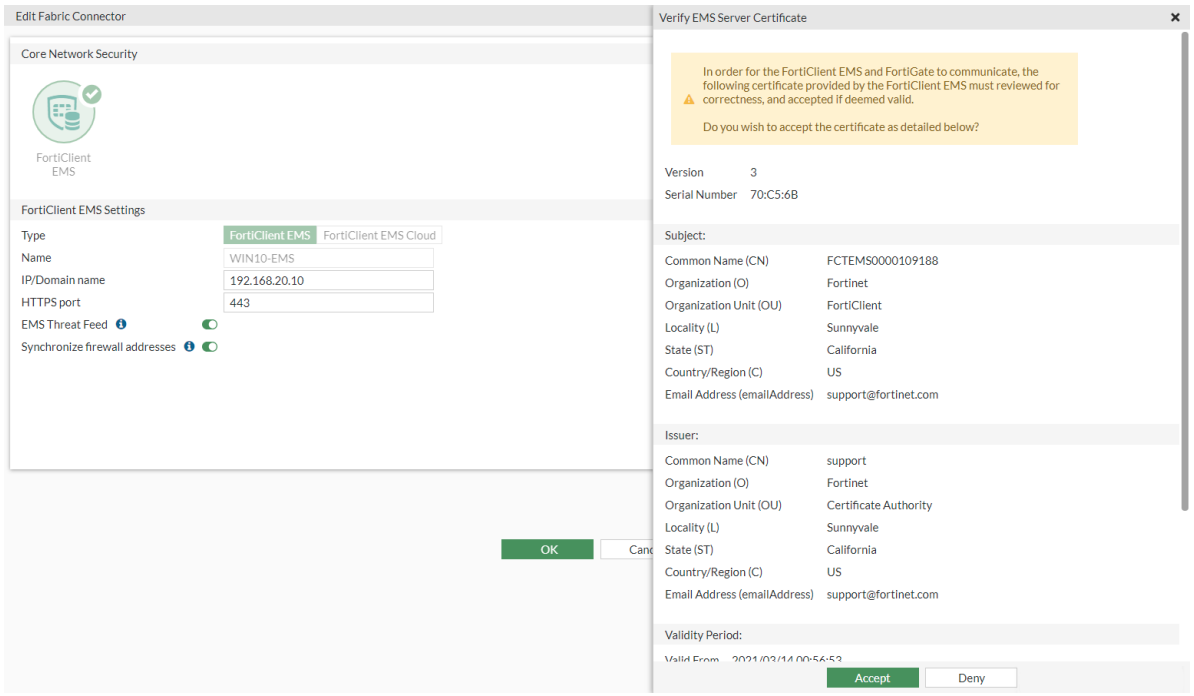
FortiClient EMS

The FortiGate Security Fabric root device can link to FortiClient Endpoint Management System (EMS) and FortiClient EMS Cloud (a cloud-based EMS solution) for endpoint connectors and automation. Up to three EMS servers can be added to the Security Fabric, including a FortiClient EMS Cloud server. EMS settings are synchronized between all fabric members.

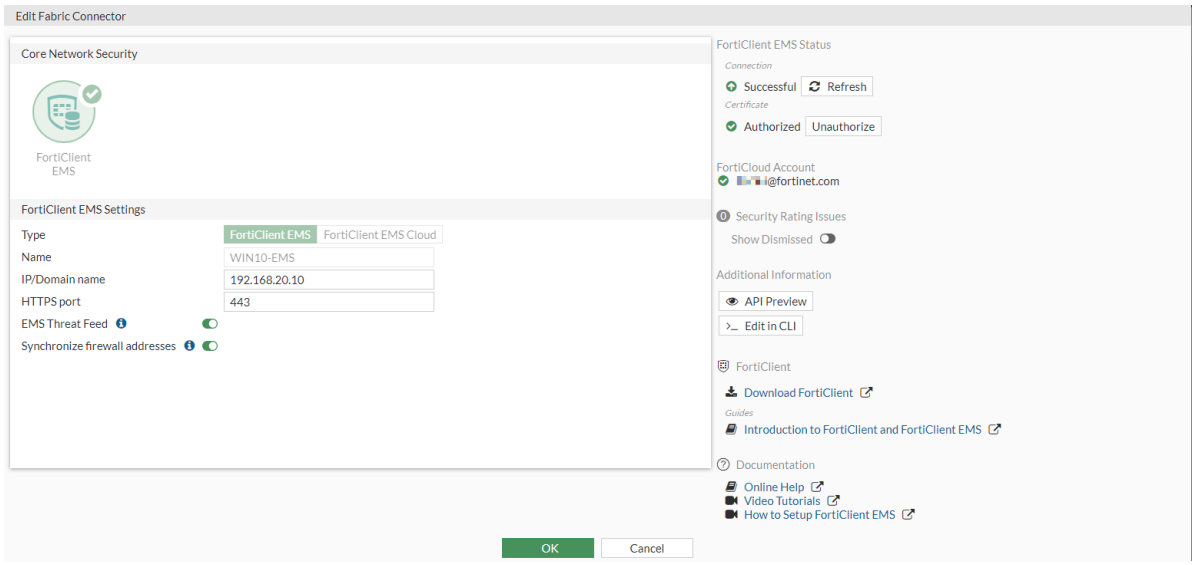
To enable cloud-based EMS services, the FortiGate must be registered to FortiCloud with an appropriate user account. The following examples presume that the EMS certificate has already been configured.

To add an on-premise FortiClient EMS server to the Security Fabric in the GUI:

1. On the root FortiGate, go to *System* > *Feature Visibility* and enable *Endpoint Control*.
2. Go to *Security Fabric* > *Fabric Connectors*.
3. Click *Create New* and click *FortiClient EMS*.
4. For *Type*, click *FortiClient EMS*.
5. Optionally, enable *EMS Threat Feed*. See Malware threat feed from EMS on page 756 for more information about using this setting in an AV profile.
6. Enter a name and IP address or FQDN. When connecting to a multitenancy-enabled EMS, Fabric connectors must use an FQDN to connect to EMS, where the FQDN hostname matches a site name in EMS (including "Default"). The following are examples of FQDNs to provide when configuring the connector to connect to the default site and to a site named SiteA, respectively: default.ems.yourcompany.com, sitea.ems.yourcompany.com. See Multitenancy.
7. Click *OK*.
   A window appears to verify the EMS server certificate:



8. Click *Accept*.
   The *FortiClient EMS Status* section displays a *Successful* connection and an *Authorized* certificate:



9. If the device is not authorized, log in to the FortiClient EMS to authorize the FortiGate under *Administration* > *Fabric Devices*.

To add a FortiClient EMS Cloud server to the Security Fabric in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors*.
2. Click *Create New* and click *FortiClient EMS*.
3. Set *Type* to *FortiClient EMS Cloud*.
4. Enter a name.

5. Click *OK*.
   A window appears to verify the EMS server certificate.
6. Click *Accept*.
   The *FortiClient EMS Status* section displays a *Successful* connection and an *Authorized* certificate.

To test connectivity with the EMS server:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* or *FortiClient EMS Cloud* card.
2. In the *FortiClient EMS Status* section under *Connection*, click *Refresh*.

To add an on-premise FortiClient EMS server to the Security Fabric in the CLI:

```
config endpoint-control fctems
    edit <ems_name>
        set server <ip_address>
        set certificate <string>
        set https-port <integer>
        set source-ip <ip_address>
    next
end
```

The `https-port` is the EMS HTTPS access port number, and the `source-ip` is the REST API call source IP address.

To add a FortiClient EMS Cloud server to the Security Fabric in the CLI:

```
config endpoint-control fctems
    edit <name>
        set fortinetone-cloud-authentication enable
        set certificate <string>
    next
end
```

To verify an EMS certificate in the CLI:

```
# execute fctems verify ems137

        Subject:     C = CA, ST = bc, L = burnaby, O = devqa, OU = top3, CN =

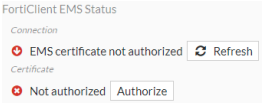
EMS configuration needs user to confirm server certificate.
Do you wish to add the above certificate to trusted remote certificates? (y/n)y
```

Troubleshooting

Certificate not trusted

When configuring a new connection to an EMS server, the certificate might not be trusted.



When you click *Authorize*, a warning displays: *The server certificate cannot be authenticated with installed CA certificates. Please install its CA certificates on this FortiGate*.

In the CLI, an error message displays when you try to verify the certificate:

```
# execute fctems verify Win2K16-EMS
certificate not configured/verified: 2
Could not verify server certificate based on current certificate authorities.
Error 1--92-60-0 in get SN call: EMS Certificate is not signed by a known CA.
```

The default FortiClient EMS certificate that is used for the SDN connection is signed by the CA certificate that is saved on the Windows server when FortiClient EMS is first installed. You can manually export and install it on the FortiGate.

To manually export and install the certificate on to the FortiGate:

1. Export the EMS certificate on the server that EMS is installed on:
   a. On the Windows server that EMS is installed on, go to *Settings* > *Manage computer certificates*.
   b. In the certificate management module, go to *Trusted Root Certification Authorities* > *Certificates*.
   c. Right click on the certificate issued by FortiClient Enterprise Management Server and select *All Tasks* > *Export*.
   d. The *Certificate Export Wizard* opens. Click *Next*.
   e. Select *Base-64 encoded X.509*, then click *Next*.

   f. Enter a file name for the certificate and click *Browse* to select the folder where it will be located, then click *Next*.
   g. Review the settings, then click *Finish*. The certificate is downloaded to the specified folder.
2. On the FortiGate, import the certificate:
   a. Go to *System* > *Certificate*. By default, the *Certificate* option is not visible, see Feature visibility on page 1562 for information.
   b. Click *Import* > *CA Certificate*.
   c. Set *Type* to *File*, and click *Upload* to import the certificate from the management computer.
   d. Click *OK*. The imported certificate is shown in the *Remote CA Certificate* section of the certificate table.
3. Try to authorize the certificate on the FortiGate:
   a. Go to *Security Fabric* > *Fabric Connectors* and edit the FortiClient EMS connector. The connection status should now say that the certificate is not authorized.
   b. Click *Authorize*. The following warning is shown:

   The warning can also be seen in the CLI:

```
# execute fctems verify Win2K16-EMS
failure in certificate configuration/verification: -4
Could not verify EMS. Error 1--94-0-401 in get SN call: Authentication denied.
```

4. Authorize the FortiGate on EMS:
   a. Log in to the EMS server console and go to *Administration* > *Fabric Devices*.
   b. Select the serial number of the FortiGate device, then click *Authorize*.

5. Try to authorize the certificate on the FortiGate again:
   a. On the FortiGate, go to *Security Fabric* > *Fabric Connectors* and edit the FortiClient EMS connector.
   b. Click *Authorize*.
   c. When presented with the EMS server certificate, click *Accept* to accept the certificate.
   Your connection should now be successful and authorized.

   d. Click *OK*.

Using EMS silent approval in the Security Fabric

FortiClient EMS with Fabric authorization and silent approval capabilities can approve the root FortiGate in a Security Fabric once, and then silently approve remaining downstream FortiGates in the Fabric. Similarly in an HA scenario, an approval only needs to be made once to the HA primary unit. The remaining cluster members are approved silently.

To use EMS silent approval:

1. Configure the EMS entry on the root FortiGate or HA primary:

```
config endpoint-control fctems
    edit "ems139"
        set fortinetone-cloud-authentication disable
        set server "172.16.200.139"
        set https-port 443
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-avatars enable
        set pull-tags enable
        set pull-malware-hash enable
        unset capabilities
        set call-timeout 30
        set websocket-override disable
    next
end
```

   When the entry is created, the capabilities are unset by default.

2. Authenticate the FortiGate with EMS:

```
# execute fctems verify ems_139
...
```

   The FortiGate will enable the Fabric authorization and silent approval based on the EMS supported capabilities.

```
config endpoint-control fctems
    edit "ems139"
        set server "172.18.62.12"
        set capabilities fabric-auth silent-approval websocket
    next
end
```

3. Configure a downstream device in the Security Fabric (see Configuring the root FortiGate and downstream FortiGates on page 1590 for more details). The downstream device will be silently approved.

4. Configure a secondary device in an HA system (see HA active-passive cluster setup on page 1507 and HA active-active cluster setup on page 1509 for more details). The secondary device will be silently approved.

Synchronizing FortiClient ZTNA tags

ZTNA tags (formerly FortiClient EMS tags in FortiOS 6.4 and earlier) are tags synchronized from FortiClient EMS as dynamic address objects on the FortiGate. FortiClient EMS uses zero-trust tagging rules to automatically tag managed endpoints based on various attributes detected by the FortiClient. When the FortiGate establishes a connection with the FortiClient EMS server via the EMS Fabric connector, it pulls zero-trust tags containing device IP and MAC addresses and converts them to read-only dynamic address objects. It also establishes a persistent WebSocket connection to monitor for changes in zero-trust tags, which keeps the device information current. These ZTNA tags can then be used in ZTNA rules, firewall rules, and NAC policies to perform security posture checks.

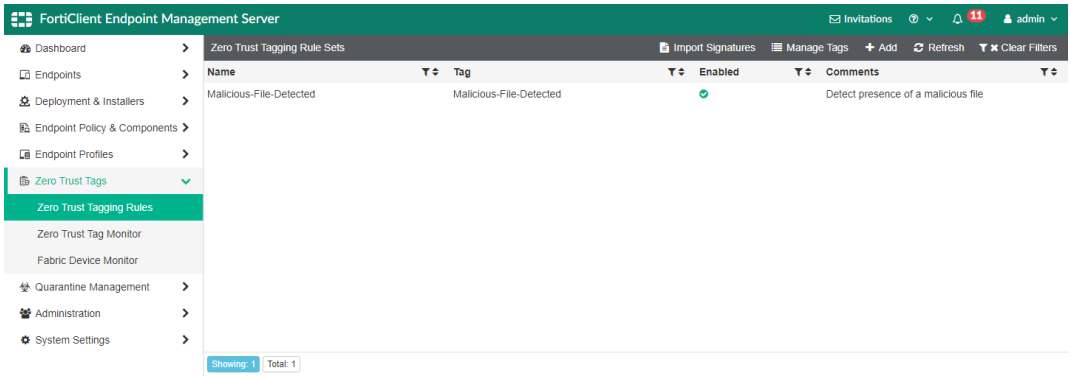
When using WebSocket, EMS pushes notifications to the corresponding FortiGate when there are updates to tags or other monitored attributes. The FortiGate then fetches the updated information using the REST API over TCP/8013. When WebSocket is not used (due to an override or unsupported EMS version), updates are triggered on demand from the FortiGate side over the REST API.

If the WebSocket capability is detected, the capabilities setting will automatically display the WebSocket option. You can use the `diagnose test application fcnacd 2` command to view the status of the WebSocket connection.

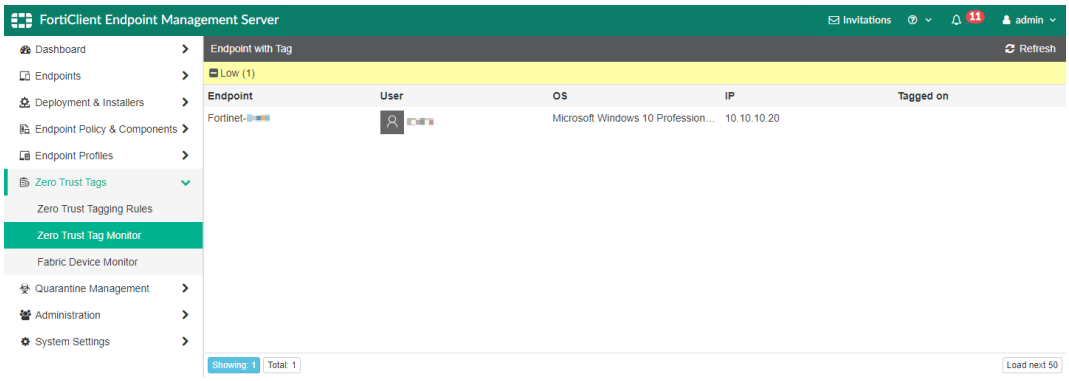
In the following example, the FortiGate connects to and retrieves ZTNA tags from a FortiClient EMS configured with tagging rules. It is assumed that zero-trust tags and rules are already created on the FortiClient EMS. For more information, see the Zero Trust Tags section of the EMS Administration Guide.

To verify zero-trust tags in FortiClient EMS:

1. Go to *Zero Trust Tags* > *Zero Trust Tagging Rules* to view the tags.



2. Go to *Zero Trust Tags* > *Zero Trust Tag Monitor* to view the registered users who match the defined tag.

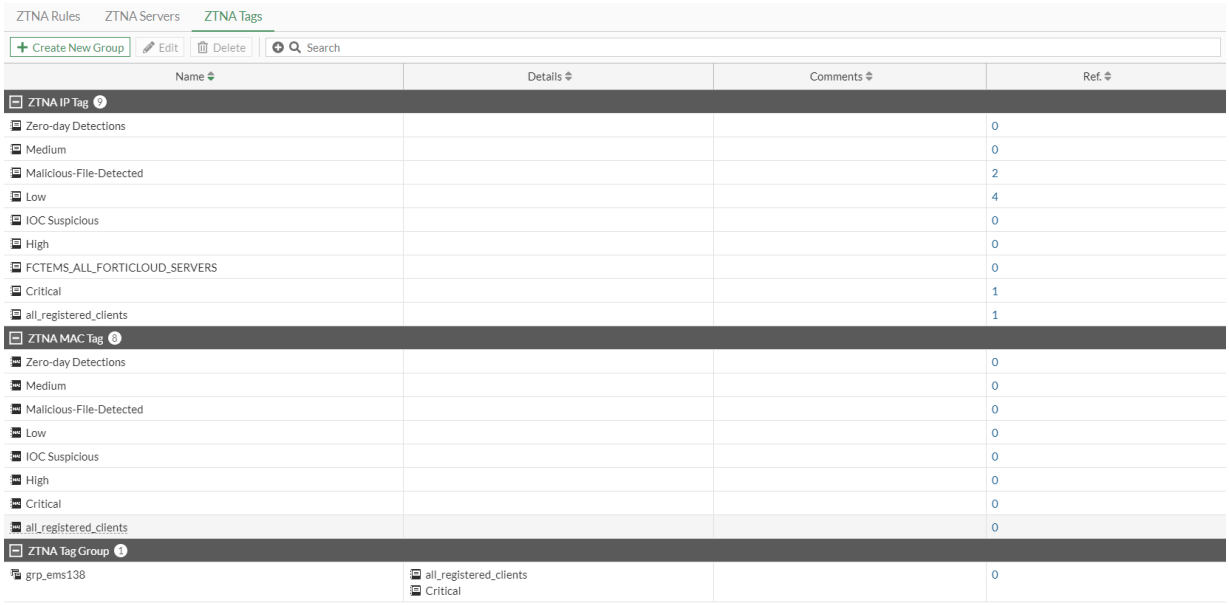


To configure the EMS Fabric connector to synchronize ZTNA tags in the GUI:

1. Configure the EMS Fabric connector:
   a. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors*.
   b. Click *Create New* and click *FortiClient EMS*.
   c. Enable *Synchronize firewall addresses*.

   d. Configure the other settings as needed and validate the certificate.
   e. Click *OK*.
2. Enable ZTNA:
   a. Go to *System* > *Feature Visibility* and enable *Zero Trust Network Access*.
   b. Click *Apply*.
3. Go to *Policy & Objects* > *ZTNA* and select the *ZTNA Tags* tab. You will see the ZTNA IP and ZTNA MAC tags

synchronized from the FortiClient EMS.



To configure the EMS Fabric connector to synchronize ZTNA tags in the CLI:

1. Configure the EMS Fabric connector on the root FortiGate:

```
config endpoint-control fctems
    edit "WIN10-EMS"
        set server "192.168.20.10"
        set https-port 443
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-avatars enable
        set pull-tags enable
        set pull-malware-hash enable
        set capabilities fabric-auth silent-approval websocket
    next
end
```

2. Verify which IPs the dynamic firewall address resolves to:

```
# diagnose firewall dynamic list
List all dynamic addresses:
FCTEMS0000100000_all_registered_clients: ID(51)
        ADDR(172.17.194.209)
        ADDR(10.10.10.20)
…

FCTEMS0000100000_Low: ID(78)
        ADDR(172.17.194.209)
        ADDR(10.10.10.20)
…

FCTEMS0000100000_Malicious-File-Detected: ID(190)
        ADDR(172.17.194.209)
```

```
            ADDR(10.10.10.20)
    ...
```

FortiNAC

A FortiNAC device can be added to the Security Fabric on the root FortiGate. After the device has been added and authorized, you can log in to the FortiNAC from the FortiGate topology views.

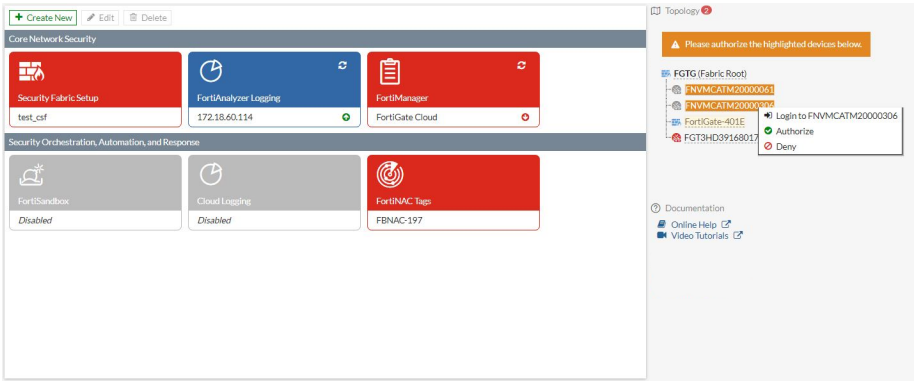
Adding a FortiNAC to the Security Fabric requires a FortiNAC with a license issued in the year 2020 or later that includes an additional certificate. The device cannot be added if it has an older license. Use the `licensetool` in the FortiNAC CLI to determine if your license includes the additional certificate.

To add a FortiNAC to the Security Fabric:

1. On the FortNAC, configure telemetry and input the IP address of the root FortiGate. See Security Fabric Connection in the *FortiNAC Administration Guide* for more information.
2. On the root FortiGate, authorize the FortiNAC.
3. Verify the connection status in the topology views.

To authorize the FortiNAC on the root FortiGate in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors*.
2. The FortiNAC device will be highlighted in the topology list in the right panel with the status *Waiting for Authorization*.
3. Click on the highlighted FortiNAC and select *Authorize*.



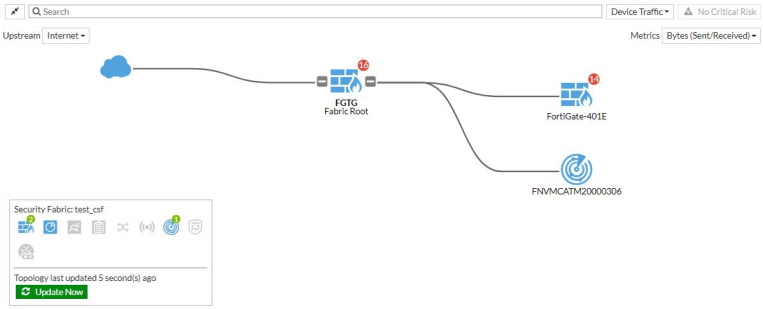
Optionally, you can also deny authorization to the FortiNAC to remove it from the list.

To authorize the FortiNAC on the root FortiGate in the CLI:

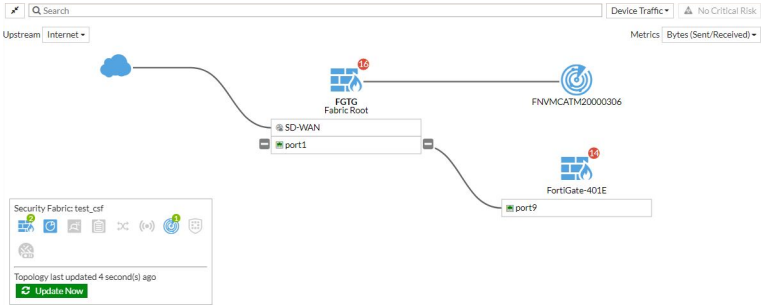
```
config system csf
    config trusted-list
        edit "FNVMCATM20000306"
            set action accept
        next
    end
end
```

To verify the connection status:

1. After the FortiNAC is authorized, go to *Security Fabric* > *Physical Topology* and confirm that it is included in the topology.



2. Go to *Security Fabric* > *Logical Topology* and confirm the FortiNAC is also displayed there.

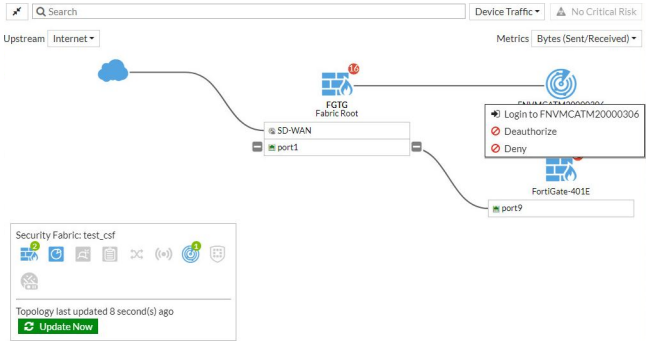


3. Run the following command in the CLI to view information about the FortiNAC device's status:

```
# diagnose sys csf downstream-devices fortinac
{
  "path":"FG5H1E5818900126:FNVMCATM20000306",
  "mgmt_ip_str":"10.1.100.197",
  "mgmt_port":0,
  "admin_port":8443,
  "serial":"FNVMCATM20000306",
  "host_name":"adnac",
  "device_type":"fortinac",
  "upstream_intf":"port2",
  "upstream_serial":"FG5H1E5818900126",
  "is_discovered":true,
  "ip_str":"10.1.100.197",
  "downstream_intf":"eth0",
  "authorizer":"FG5H1E5818900126",
  "idx":1
}
```

To log in to the FortiNAC from the FortiGate:

1. On the FortiGate, go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology*.
2. Click on the FortiNAC and select *Login to <serial_number>*.



A new tab will open to the FortiNAC log in page.

3. Enter the username and password to log in to the FortiNAC.

FortiAP and FortiSwitch

FortiAP and FortiSwitch devices can be authorized in the Security Fabric with one click. After connecting a FortiAP or FortiSwitch device to an authorized FortiGate, it will automatically be listed in the topology tree.

If the default `auto-auth-extension-device` settings on the FortiAP or FortiSwitch have been modified, manual authorization in the Security Fabric may not be required.

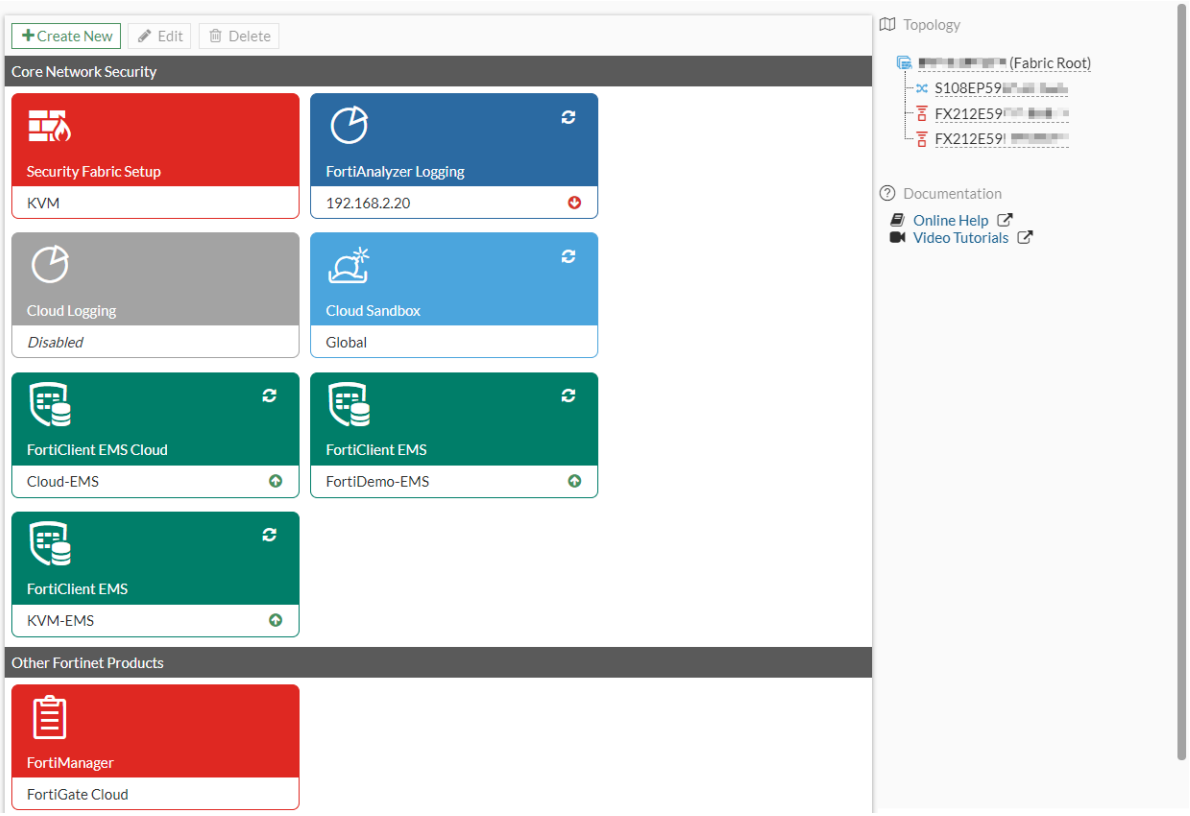
For more information about configuring FortiAPs, see Configuring the FortiGate interface to manage FortiAP units and Discovering, authorizing, and deauthorizing FortiAP units.

For more information about configuring FortiSwitches, see Using the FortiGate GUI.

To authorize FortiAP and FortiSwitch devices:

1. Connect the FortiAP or FortiSwitch device to a FortiGate.
2. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors*. The new device is shown in the *Topology* tree.

3. Click the device and select *Authorize*.



FortiMail

FortiMail can be authorized into the Security Fabric using either the gutter on the *Fabric Connectors* page, or by pre-authorizing using the FortiMail serial number or certificate.

To join the Security Fabric from FortiMail:

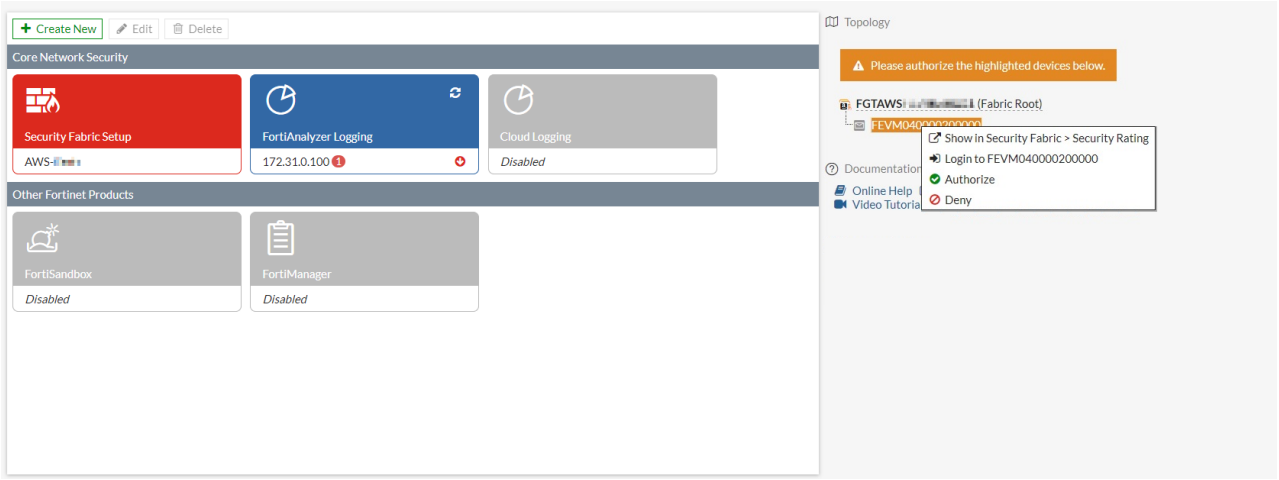
1. Go to *System* > *Customization* and click the *Corporate Security Fabric* tab (or the *Corporate Security Fabric* tab in FortiMail 6.4.2 and earlier).
2. Click the toggle to enable the Fabric.
3. Enter the *Upstream IP Address* (root FortiGate) and the *Management IP* of the FortiMail.
4. Click *Apply*.

Authorizing using FortiOS

If the FortiMail was added to the Security Fabric but not pre-authorized, you can authorize it in FortiOS on the *Fabric Connectors* page.

To authorize FortiMail:

1. Go to *Security Fabric* > *Fabric Connectors*.
2. In the topology tree, hover over the FortiMail and click *Authorize*.



3. Verify the certificate is correct, then click *Accept*.

Pre-authorizing using the FortiMail certificate

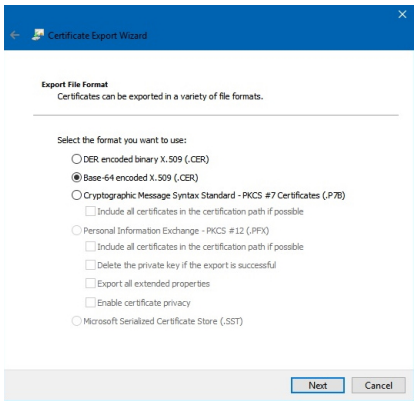
FortiMail can be pre-authorized using its serial number or certificate. When you pre-authorize, the FortiMail can join at any time, and you will not need to authorize it FortiOS. In this example, FortiMail is pre-authorized using a certificate.

To pre-authorize FortiMail using a third-party or default certificate:

1. Log in to FortiMail.
2. Download the certificate. For example, in Chrome:
   a. In the left side of the address bar, click the icon to view the site information.
   b. Click *Certificate*.
   c. Click the *Details* tab, then click *Copy to File*.

   d. The *Certificate Export Wizard* opens. Click *Next* to continue.

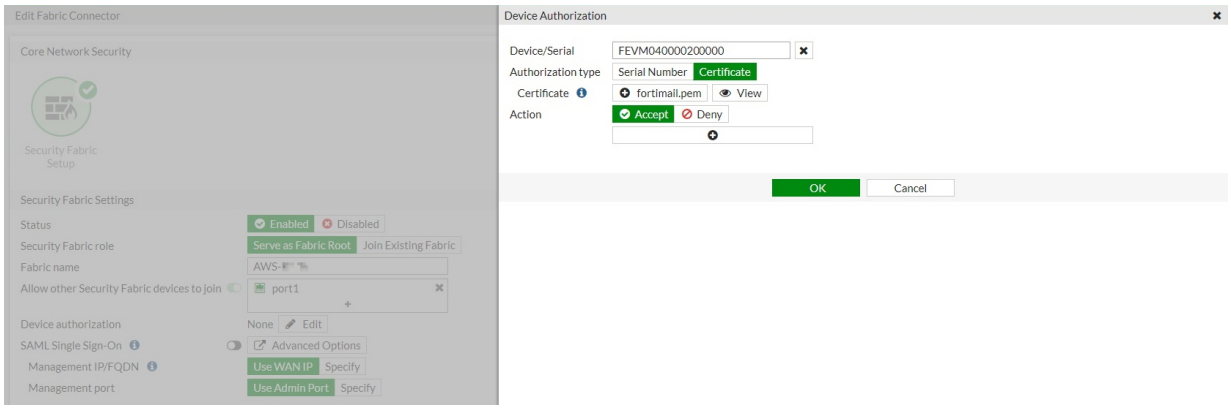
e. For the file format, select *Base-64 encoded X.509 (.CER)*, then click *Next*.



f. Browse to the folder location and enter a file name, then click *Next*.

g. Click *Finish*, then click *OK* to close the dialog box.

3. In FortiOS, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
4. Beside *Device authorization*, click *Edit* and configure the following:
   a. Enter the FortiMail serial number.
   b. For *Authorization type*, select *Serial Number*.
   c. For *Certificate*, upload the .CER file you saved previously.



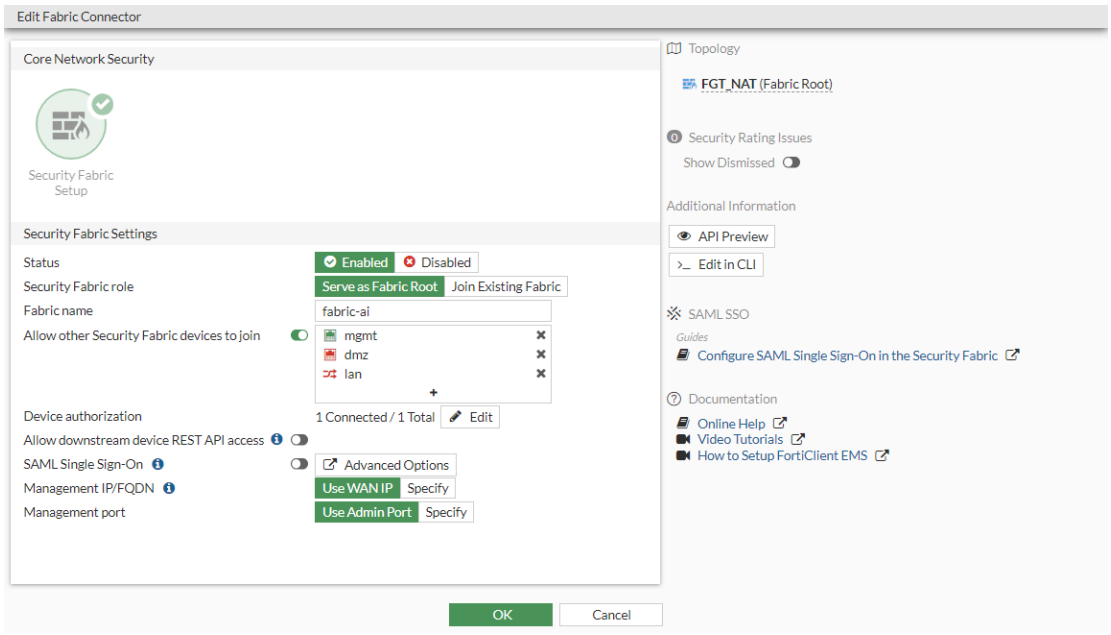
d. Click *OK*.

FortiAI

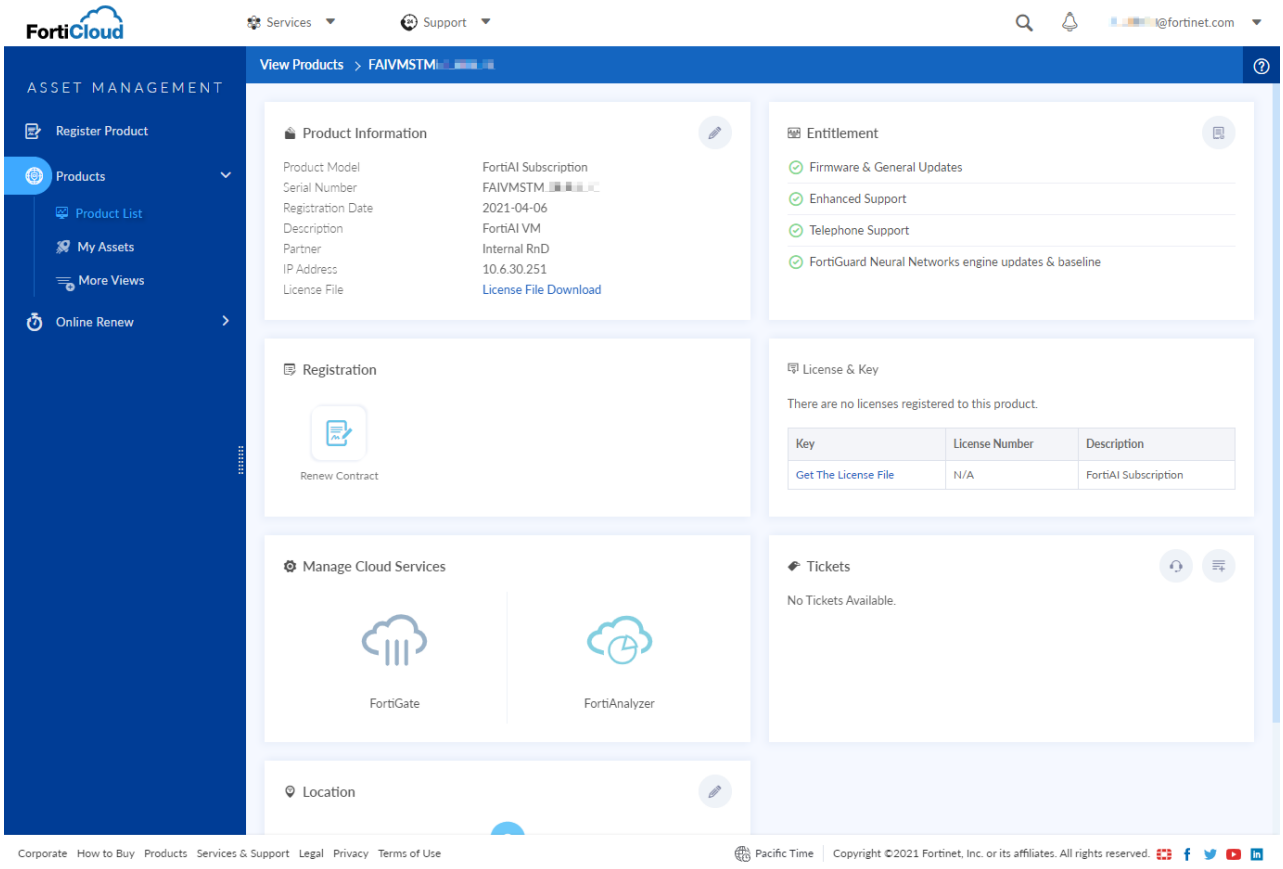
FortiAI can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

To add FortiAI to the Security Fabric in the GUI:

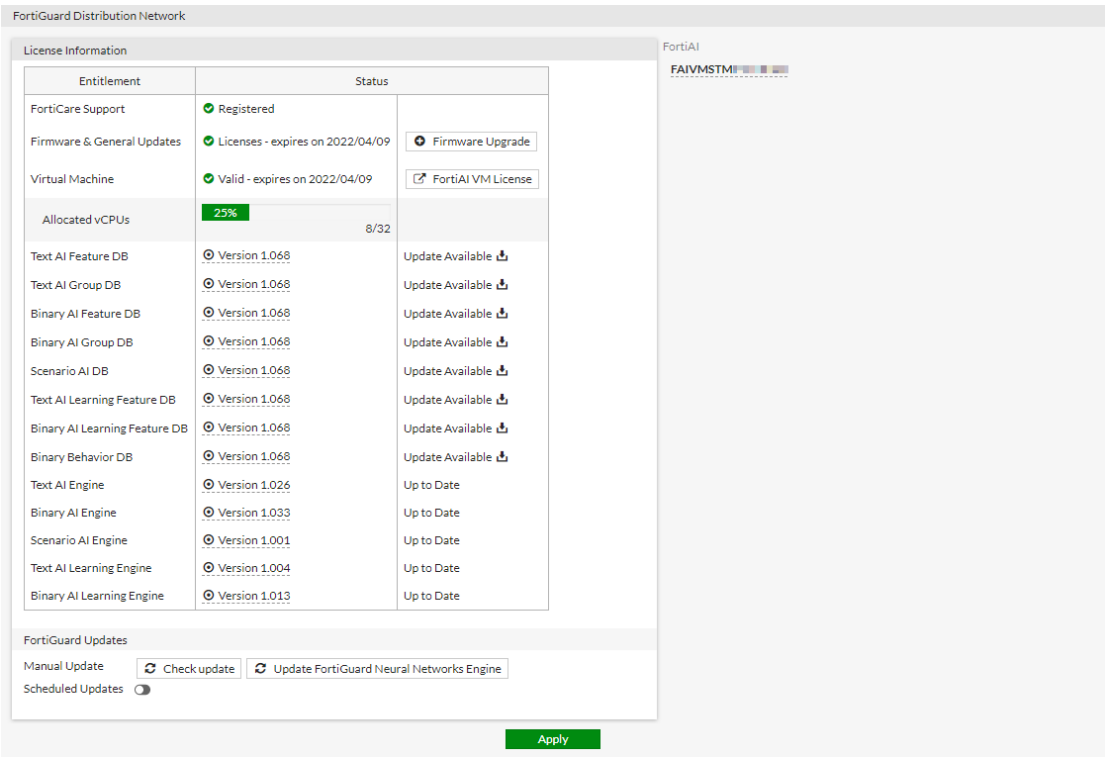
1. Enable the Security Fabric and configure the interface to allow other Security Fabric devices to join (see Configuring the root FortiGate and downstream FortiGates on page 1590).



2. Install the FortiAI appliance and activate the product with a valid license (see Registering products in the Asset Management Guide). A license file is provided after the product is registered.

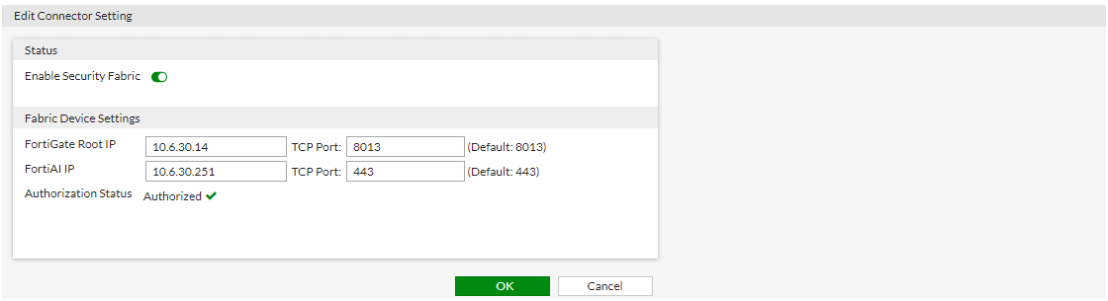


3. In FortiAI, go to *System* > *FortiGuard* and verify that the pre-trained models (engines) are up to date. Refer to the FortiGuard website for the latest FortiAI ANN versions.

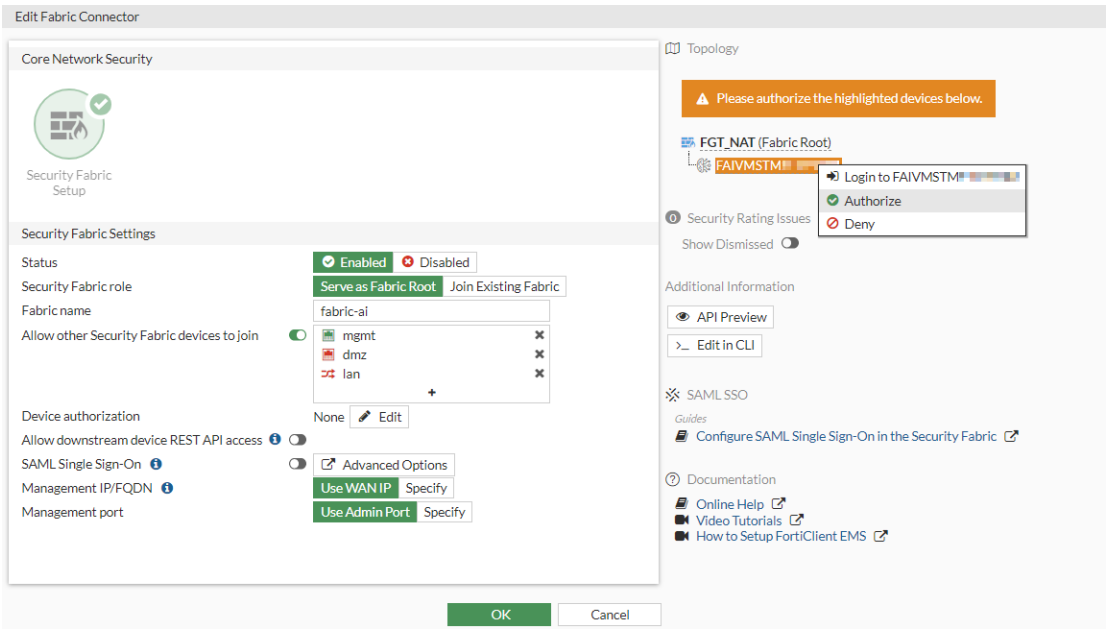


4. Configure and authorize the FortiGate in the FortiAI GUI to join the Security Fabric:
   a. Go to *Security Fabric > Fabric Connectors* and double-click the connector card.
   b. Click the toggle to *Enable Security Fabric*.
   c. Enter the *FortiGate Root IP* address and the *FortiAI IP* address.

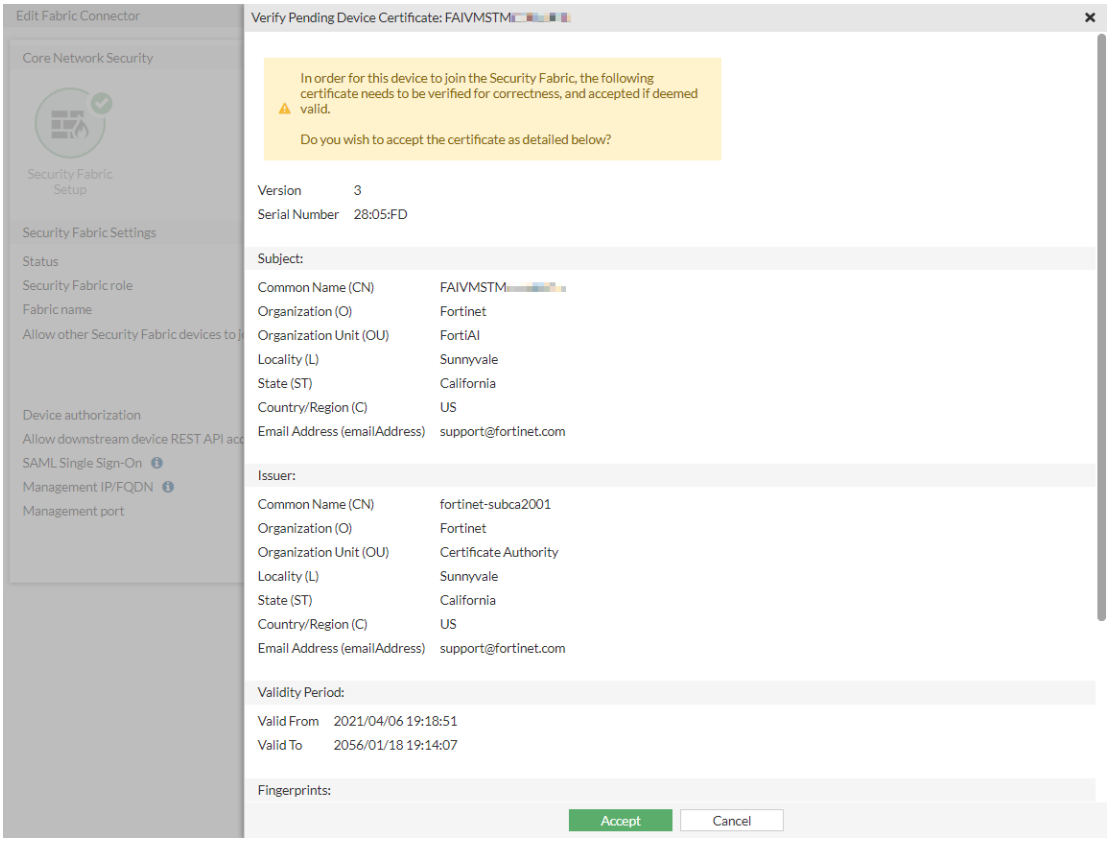
   d. Click *OK*. The FortiAI is now authorized.



5. Authorize the FortiAI in FortiOS:
   a. Go to *Security Fabric > Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. In the topology tree, click the highlighted FortiAI serial number and select *Authorize*.



c. Click *Accept* to verify the device certificate.



The *Security Fabric* widget on the dashboard also updates when the FortiAI is authorized.

6. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.

To add FortiAI to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:

```
config system interface
    edit "port1"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
end
```

2. Enable the Security Fabric:

```
config system csf
    set status enable
    set group-name "fabric-ai"
end
```

3. In FortiAI, configure the device to join the Security Fabric:

```
config system csf
    set status enable
    set upstream-ip 10.6.30.14
    set managment-ip 10.6.30.251
end
```

4. Authorize the FortiAI in FortiOS:

```
config system csf
    set status enable
    set group-name "fabric-ai"
    config trusted-list
        edit "FAIVMSTM21000000"
            set authorization-type certificate
            set certificate "********************"
        next
    end
end
```

FortiDeceptor

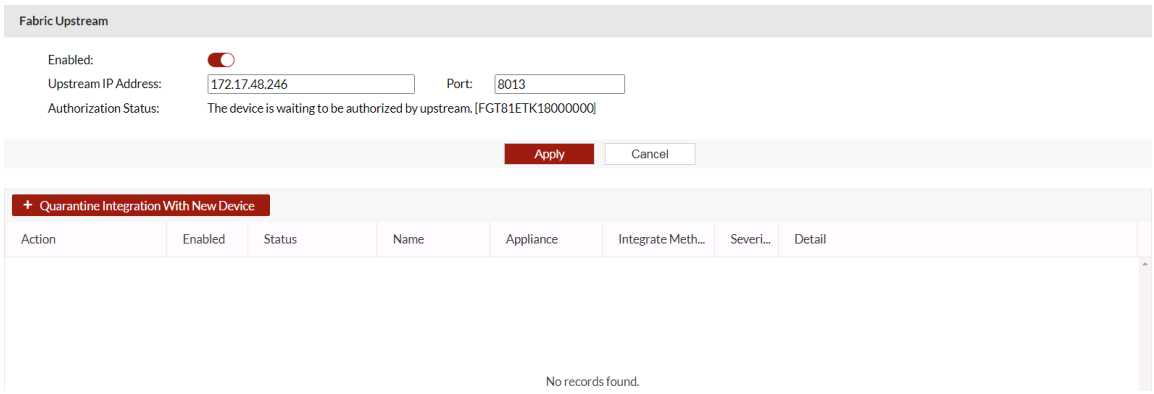
FortiDeceptor can be added to the Security Fabric so it appears in the topology views and the dashboard widgets.

To add FortiDeceptor to the Security Fabric in the GUI:

1. Enable the Security Fabric (see Configuring the root FortiGate and downstream FortiGates on page 1590 for more details) with the following settings:
   a. Configure the interface to allow other Security Fabric devices to join.
   b. Enable *Allow downstream device REST API access* so the FortiDeceptor can communicate with the FortiGate, and select an *Administrator profile*. The minimum permission required for the selected *Administrator profile* is *Read/Write* for *User & Device* (`set authgrp read-write`).
2. In FortiDeceptor, integrate the device:
   a. Go to *Fabric* > *Integration Devices*.
   b. Click *Quarantine Integration With New Device*.

c. Click the toggle to enable the device.

d. For *Upstream IP Address*, enter the root FortiGate's management IP address.

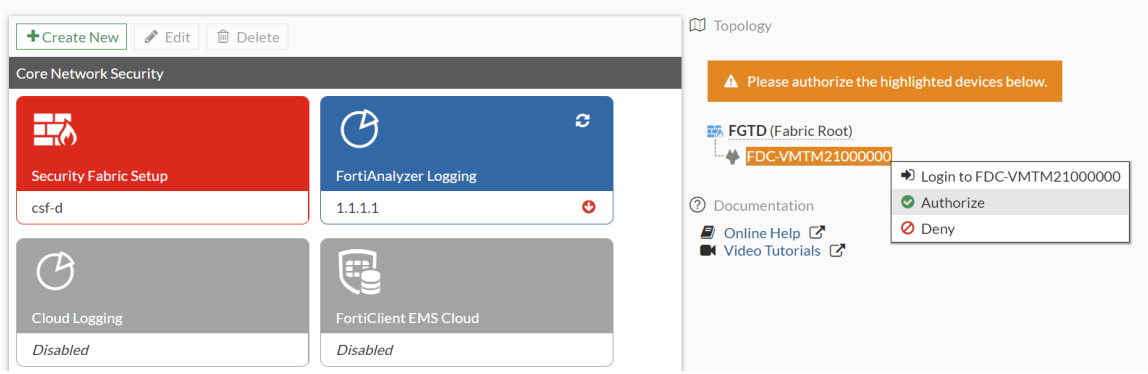


e. Click *Apply*.

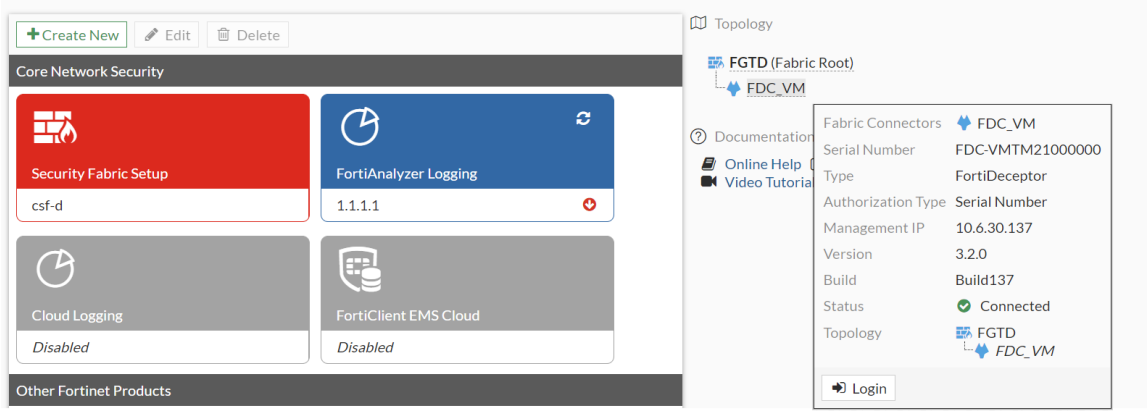
3. Authorize the FortiDeceptor in FortiOS:

a. Go to *Security Fabric* > *Fabric Connectors*.

b. In the topology tree, click the highlighted FortiDeceptor serial number and select *Authorize*.

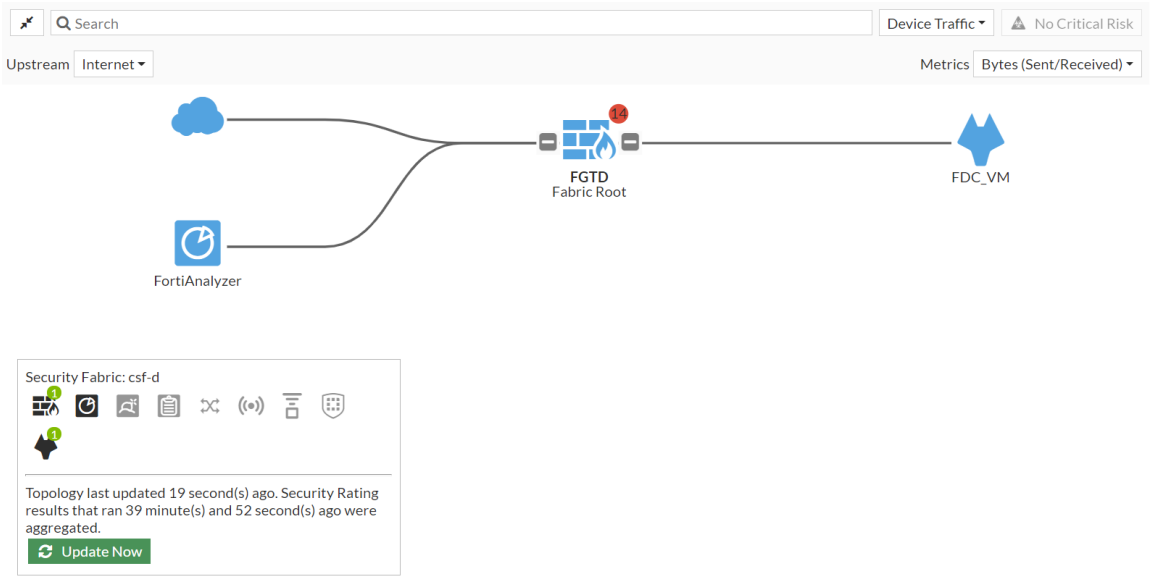


The authorized device appears in the topology tree. Hover over the device name to view the tooltip.

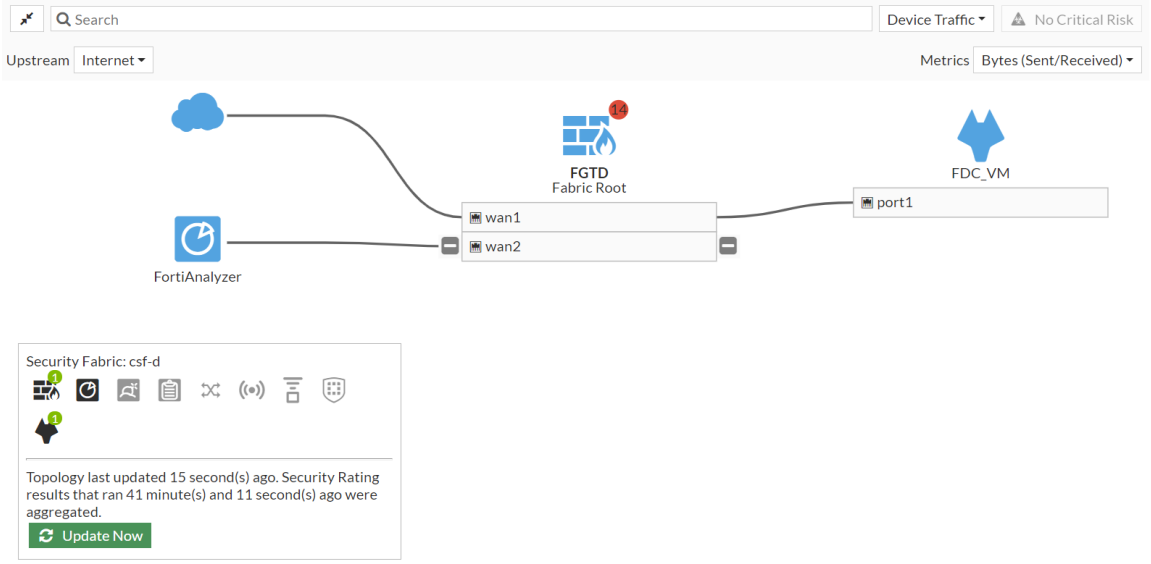


The *Security Fabric* widget on the dashboard also updates when the FortiDeceptor is authorized.

4. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information. Physical topology view:



Logical topology view:



To add FortiDeceptor to the Security Fabric in the CLI:

1. Configure the interface to allow other Security Fabric devices to join:

```
config system interface
    edit "wan1"
        ...
        set allowaccess ping https ssh snmp http fabric
        ...
    next
end
```

2. Enable the Security Fabric:

```
config system csf
    set status enable
    set group-name "csf-d"
    set downstream-access enable
    set downstream-accprofile "super_admin"
end
```

3. In FortiDeceptor, integrate the device:
   a. Go to *Fabric* > *Integration Devices*.
   b. Click *Quarantine Integration With New Device*.
   c. Click the toggle to enable the device.
   d. For *Upstream IP Address*, enter the root FortiGate's management IP address.
   e. Click *Apply*.
4. Authorize the FortiDeceptor in FortiOS:

```
config system csf
    set status enable
    set group-name "csf-d"
    config trusted-list
        edit "FDC-VMTM21000000"
            set serial "FDC-VMTM21000000"
        next
    end
end
```

FortiWeb

A FortiWeb can be configured to join a Security Fabric through the root or downstream FortiGate. Once the FortiWeb joins the Fabric, the following features are available:

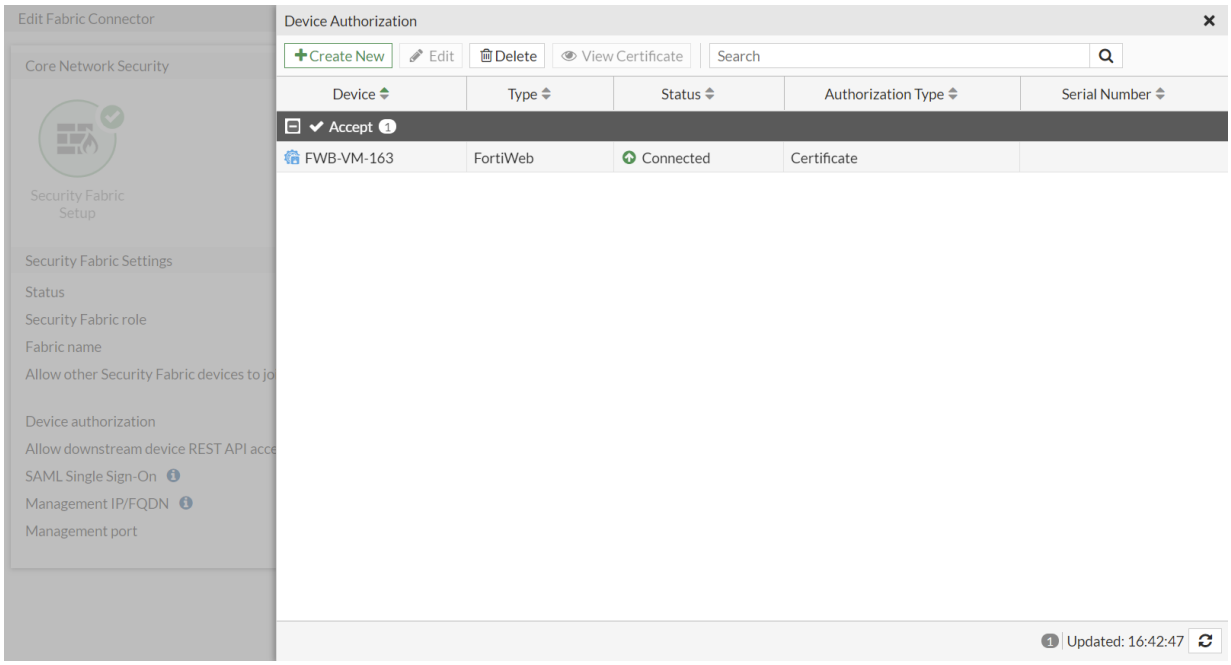
- View the FortiWeb on topology pages.
- Create a dashboard Fabric Device widget to view FortiWeb data.
- Configure single sign-on using SAML.

In the following example, a FortiWeb is pre-authorized on the root FortiGate using certificate authorization. This is example assumes the Security Fabric has already been configured.

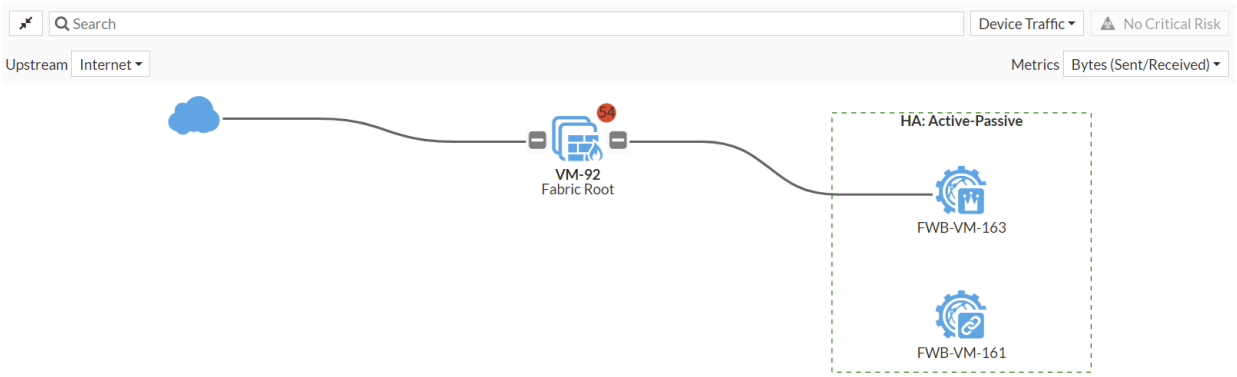
To authorize a FortiWeb to join the Security Fabric:

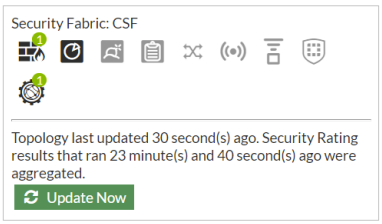
1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Beside *Device authorization*, click *Edit*. The *Device authorization* pane opens.
3. Add the FortiWeb:
   a. Click *Create New* and enter a device name.
   b. For *Authorization type*, select *Certificate*.
   c. Click *Browse* to upload the certificate.
   d. For *Action*, select *Accept*.

e. Click *OK*. The FortiWeb appears in the table.

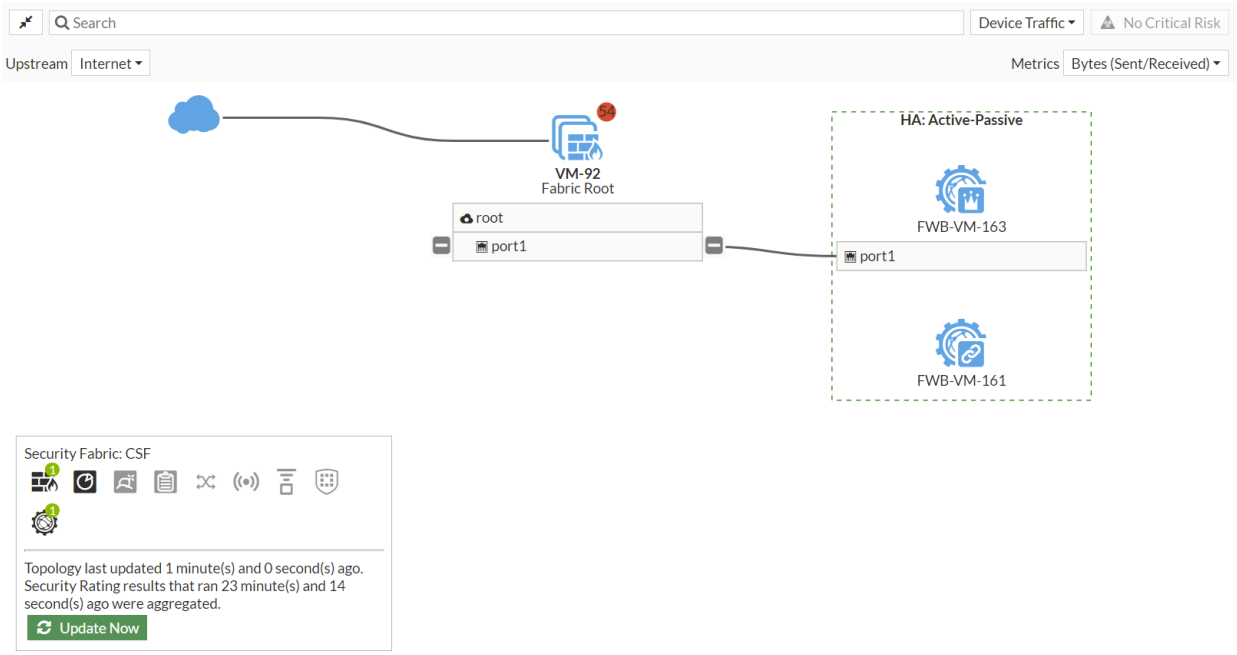


4. Go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology* to view more information.
Physical topology view:





Logical topology view:



Additional devices

The following Fortinet devices are supported by the Security Fabric and can be configured in the CLI:

- FortiADC
- FortiDDoS
- FortiWLC

In FortiOS, the device details are shown in the *Security Fabric* and *Fabric Device* dashboard widgets, the *Fabric Connectors* page, and the physical and logical topologies. See config system csf in the FortiOS CLI Reference for more information.

```
config system csf
    ...
    config fabric-device
        edit <name>
            set device-ip <IP address>
            set https-port <integer>
            set access-token <token>
        next
    end
end
```

To configure a FortiADC:

```
config system csf
    ...
    config fabric-device
        edit "FortiADC"
            set device-ip 172.18.64.36
            set https-port 443
            set access-token xxxxxxxxxxxxxxx
```

```
        next
    end
end
```

Using the Security Fabric

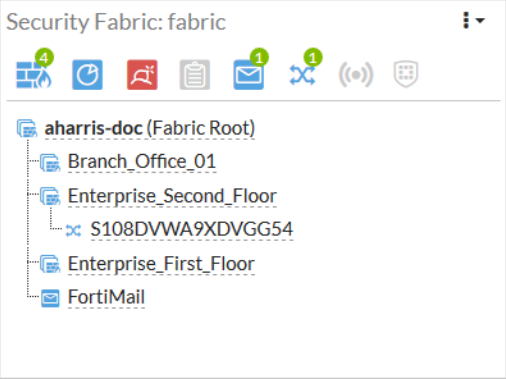
Dashboard widgets

Security Fabric widgets can be added to FortiGate dashboards, including:

- Security Fabric status on page 1634
- Fabric Device on page 1634
- FortiGate Cloud on page 1635

Security Fabric status

The Security Fabric status widget shows a summary of the devices in the Security Fabric.



Hover the cursor over the top icons to view pop-ups showing the statuses of the devices in the fabric.

The device tree shows devices that are connected, or could be connected, to you Security Fabric, according to the following color scheme:

- Blue: connected to the network
- Gray: not configured or not detected
- Red: no longer connected or not authorized

Hover over a device in the tree to view details about the device, such as it's serial number, operation mode, IP address, CPU and memory usage, and others, depending on the device type.

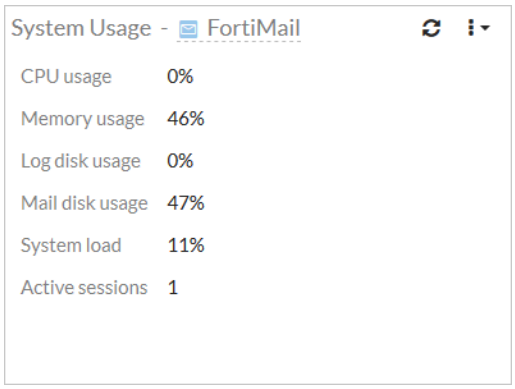
Unauthorized FortiAP and FortiSwitch devices are highlighted in the list, and can be authorized by clicking on the device name.

Fabric Device

A Fabric Device widget shows statistics and system information about the selected fabric device. Widgets can be added for various Fabric devices including FortiMail, FortiAI, and FortiDeceptor.

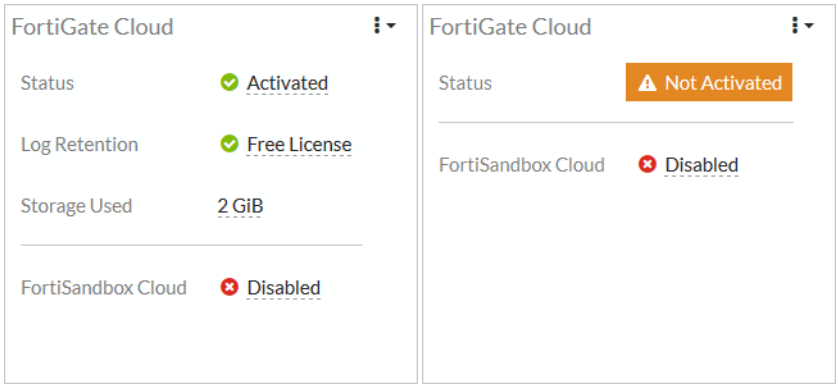
For a FortiMail device, the widget can show:

- Mail Statistics: a chart of the total messages and total spam messages over time.
- Statistics Summary: a pie chart summarizes mail statistics.
- System Information: The FortiMail System Information widget
- System Usage: System usage information, such as CPU, memory, and disk usage, as well as the number of active sessions.



FortiGate Cloud

The FortiGate Cloud widget shows the FortiGate Cloud status and information. If your account is not activated, you can activate it from the widget.



To activate your FortiGate Cloud account:

1. Click on the *Not Activated* button and select *Activate*. The *Activate FortiGate Cloud* pane opens.
2. If you already have an account:
   a. Fill in your email address, password, country or region, and reseller.
   b. Click *OK*.
3. If you are creating an account:
   a. In the *FortiCloud* field select *Create Account*.
   b. Fill in all of the required information.
   c. Click *OK*.

Topology

The full Security Fabric topology can be viewed on the root FortiGate. Downstream FortiGate devices' topology views do not include upstream devices.

The *Physical Topology* page shows the physical structure of your network, including all connected devices and the connections between them. The *Logical Topology* page shows information about the interfaces that connect devices to the Security Fabric.

In both topology pages, you can use filtering and sorting options to control the information that is shown. Hover the cursor over a device icon, port number, or endpoint to open a tooltip that shows information about that specific device, port, or endpoint. Right-click on a device to log into, configure, or deauthorize it. Right-click on an endpoint to perform various tasks, such as drilling down for more details in FortiView, quarantining the host, and banning the IP address.

The small number that might be shown in the top right corner of a device icon is the number of security ratings recommendations or warnings for that device. The circle color indicates the severity of the highest security rating check that failed. Clicking it opens the *Security Rating* page. See Security rating on page 1688 for more information.

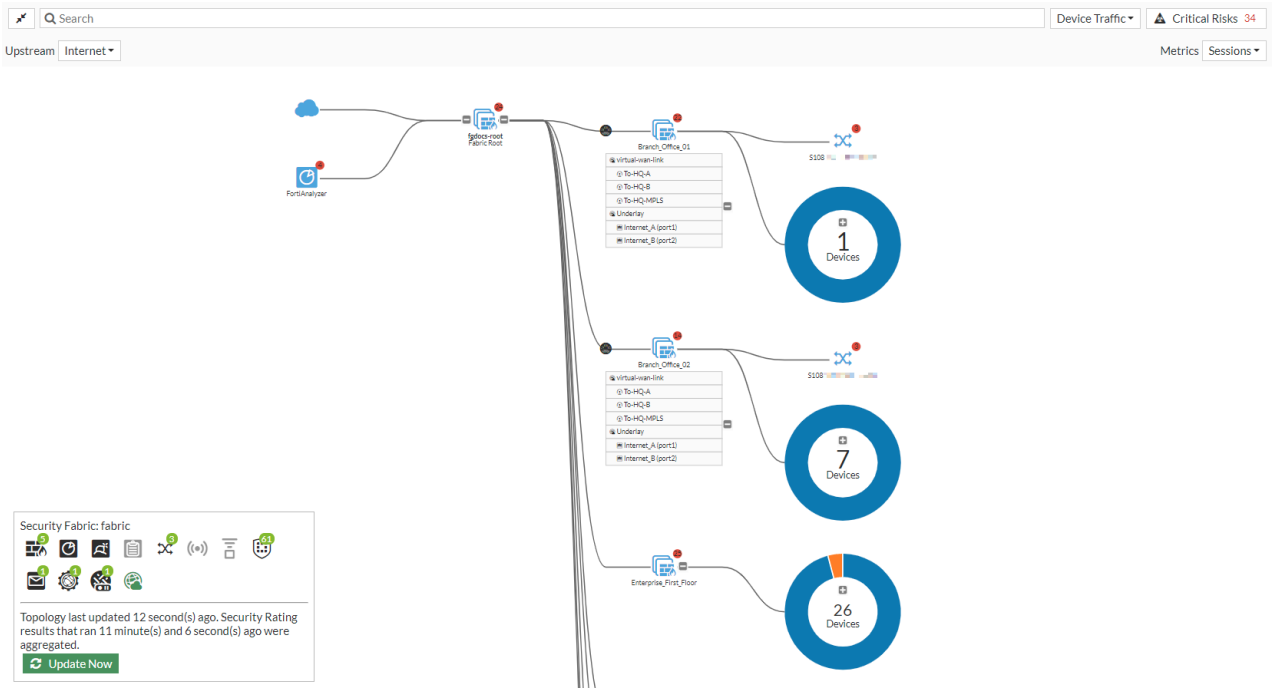
Views

From the dropdown list beside the search bar, select one of the following views:

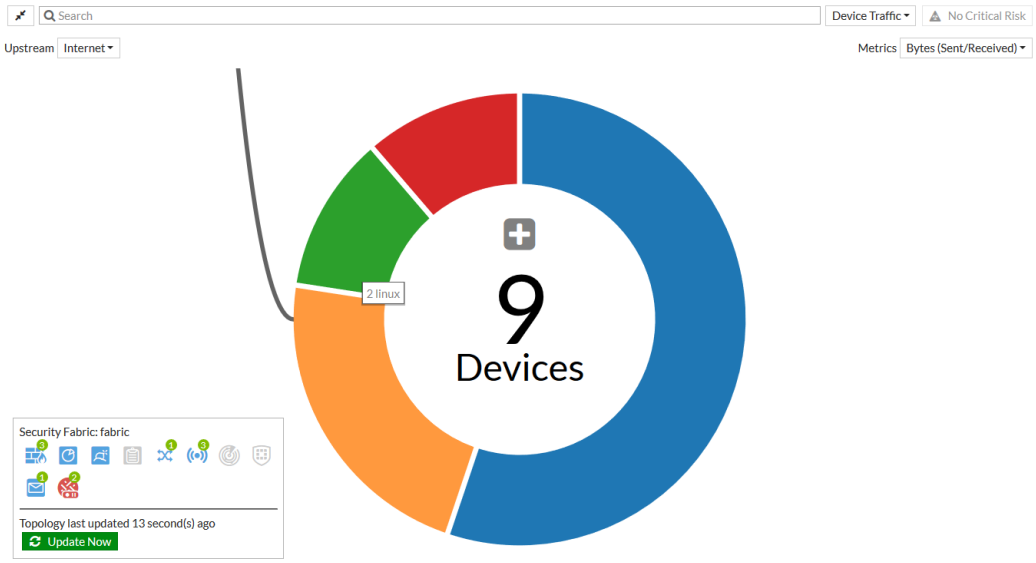
- *Device Traffic*: organize devices by traffic.
- *Device Count*: organize devices by the number of devices connected to it.
- *Device Operating System*: organize devices by operating system.
- *Device Hardware Vendor*: organize devices by hardware vendor.
- *Risk*: only include devices that have endpoints with medium, high, or critical risk values of the specified type: *All*, *Compromised Host*, *Vulnerability*, or *Threat Score*.
- *No Devices*: do not show endpoints.

Endpoint groups

The *Device Traffic* and *Device Count* views display endpoint groups as donut charts, with the total number of endpoints in the group in the center of the chart. Each sector of the donut chart represents a different endpoint operating system.



To zoom in on a donut chart, click any chart sector. Each sector represents a different endpoint OS. Hovering over each sector allows you to see the OS that the sector represents and the number of endpoints that have that OS installed.



In this example, the endpoint group contains a total of nine endpoints, with the following OSes installed:

Donut sector color	OS	Number of endpoints
Orange	Linux	2
Green	FortiMail	1
Red	FortiManager	1
Blue	Other	5

To view the endpoint group in a bubble pack display, click the + button in the center of the donut chart. You can view each individual endpoint in the bubble pack view.

FortiAP and FortiSwitch devices

Newly discovered FortiAP and FortiSwitch devices are initially shown in the topologies with gray icons to indicate that they have not been authorized. To authorize a device, click on the device icon or name and select *Authorize*. Once authorized, the device icon will turn blue.

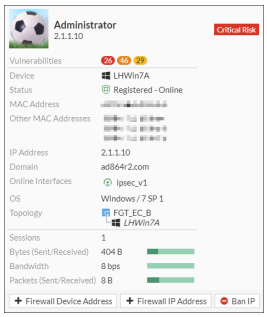
Right-click on an authorized FortiAP device to *Deauthorize* or *Restart* the device. Right-click on a FortiSwitch device to *Deauthorize*, *Restart*, or *Upgrade* the device, or to *Connect to the CLI*.

FortiAP and FortiSwitch links are enhanced to show link aggregation groups for the inter-switch link (ISL-LAG). To differentiate them from physical links, ISL-LAG links are shown with a thicker line. The endpoint circles can also be used as a reference to identify ISL-LAG groups that have more than two links.

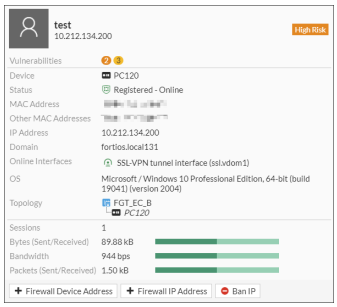
Managed clients connected over a VPN

When managed clients are connected over a VPN, EMS collects user information about these registered clients, such as the VPN connection information. The FortiGate can synchronize this user information from EMS and display it in the logical topology view to provide a detailed picture of clients and their associated VPN interfaces.

Client using an IPsec VPN interface:



Client using an SSL VPN interface:



Critical risks

Click the *Critical Risks* button to see a list of endpoints that are deemed critical risks, organized by threat severity. These are the red endpoints in the current topology view.

For each endpoint, the user's photo, name, IP address, email address, and phone number are shown. The number of vulnerabilities of each severity is shown, and if the IoC verdict is that the endpoint is compromised.

If applicable, the endpoint's host can be quarantined (click *Quarantine Host*) or their IP address can be banned (click *Ban IP*).

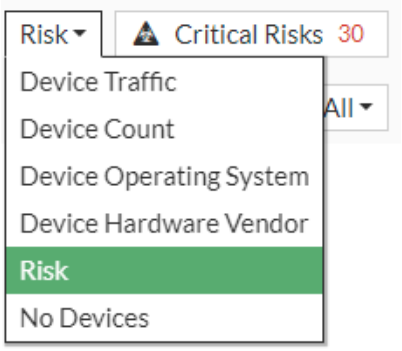
The dropdown menu also provides options to drill down to more information on compromised hosts or endpoint vulnerabilities.

Consolidated risk view

The consolidated *Risk* view mode displays different risks within the Security Fabric topology. You can use the *Risk* view mode to filter threats by *Compromised Hosts*, *Vulnerability*, and *Threat Score*.

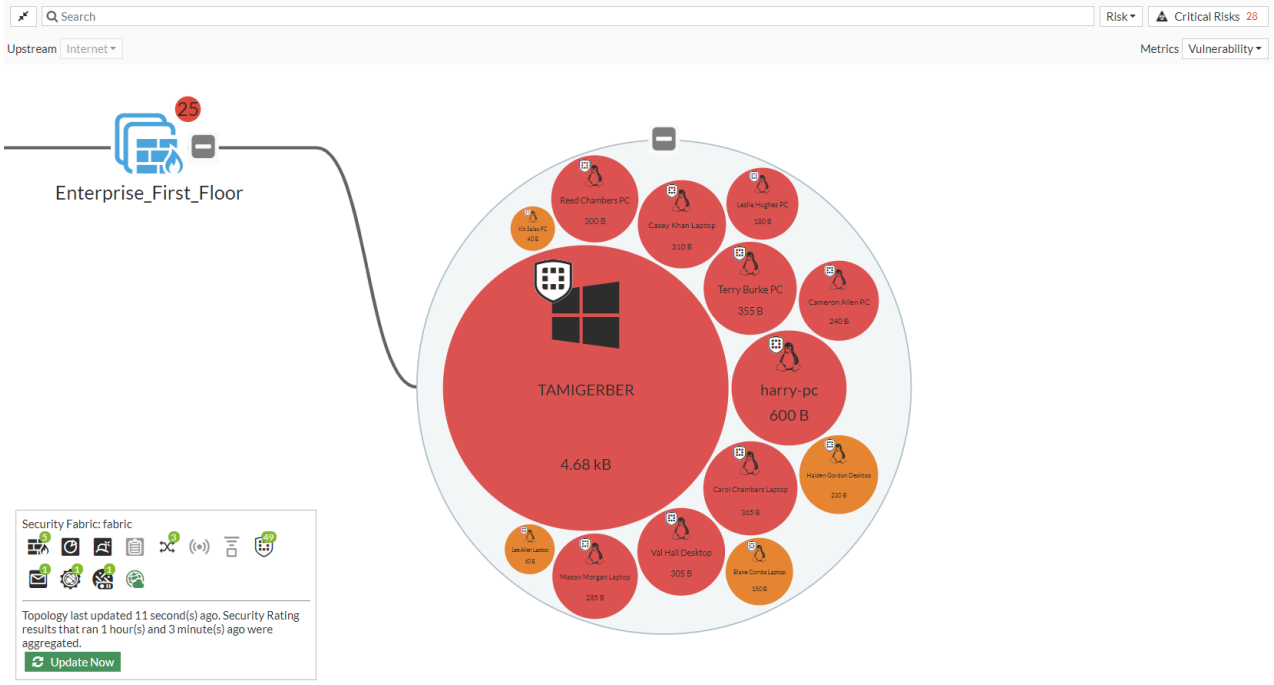
To access the consolidated risk view mode:

1. On one of the topology pages, in the view option dropdown list beside the search bar, select *Risk*.



2. Select one of the following options from the *Risk Type* dropdown menu:
   a. *All*
   b. *Compromised Hosts*
   c. *Vulnerability*
   d. *Threat Score*
3. When devices fit into the risk metric, they will appear in the endpoint groups. Click the + in the endpoint group to

display the devices in a bubble chart.

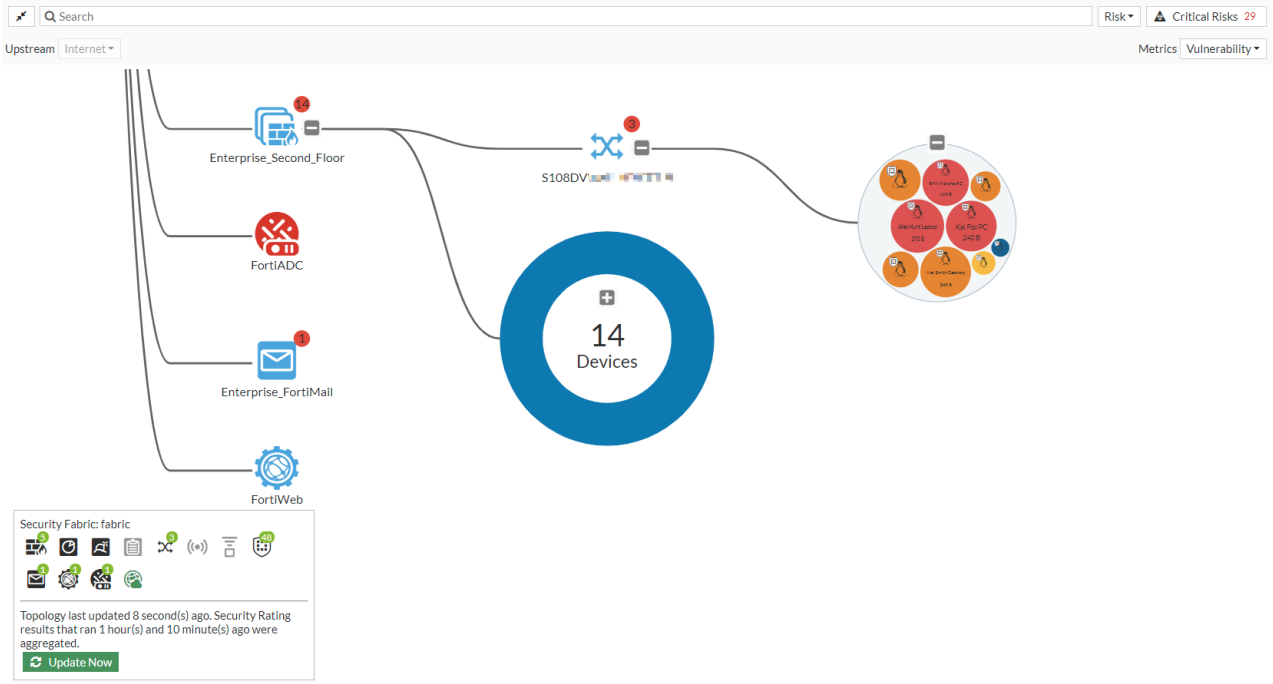


Viewing and controlling network risks in topology view

On the physical and logical topology pages, you can view and control compromised hosts. Compromised hosts behind a FortiSwitch or FortiAP can be quarantined.

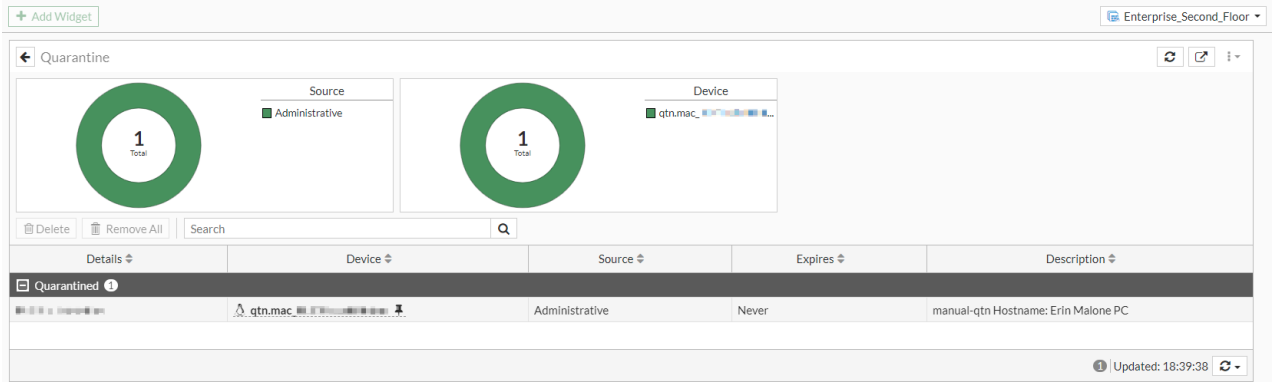
To view a compromised endpoint host:

1. Test that FortiGate detects a compromised endpoint host by opening a browser on the endpoint host and entering a malicious website URL. The browser displays a *Web Page Blocked!* warning and does not allow access to the website.
2. On the root FortiGate, go to *Security Fabric* > *Physical Topology* or *Security Fabric* > *Logical Topology*. Expand the endpoint group connected to a FortiSwitch or FortiAP.
   The endpoint host connected to the switch is highlighted in red. Mouse over the endpoint host to view a tooltip that shows the IoC verdict. The endpoint host is compromised.



To quarantine a compromised endpoint host:

1. On the *Physical Topology* or *Logical Topology* page, right-click the endpoint host and select *Quarantine Host*.
   A dialog displays the FortiGate, host MAC address, and description of the host to be quarantined. Quarantine entries for each MAC address will be created on the FortiGate that the FortiSwitch or FortiAP is connected to.
2. Click *OK*.
3. Go to *Dashboard* > *User & Devices* and click the *Quarantine* widget to expand it.
4. In the top-right corner, use the dropdown to select the FortiGate in which this host was quarantined. In this example, it is the Enterprise_Second_Floor FortiGate.



5. On the endpoint host, open a browser and visit a website such as https://www.fortinet.com/. If the website cannot be accessed, this confirms that the endpoint host is quarantined.

To show the quarantined device from the CLI:

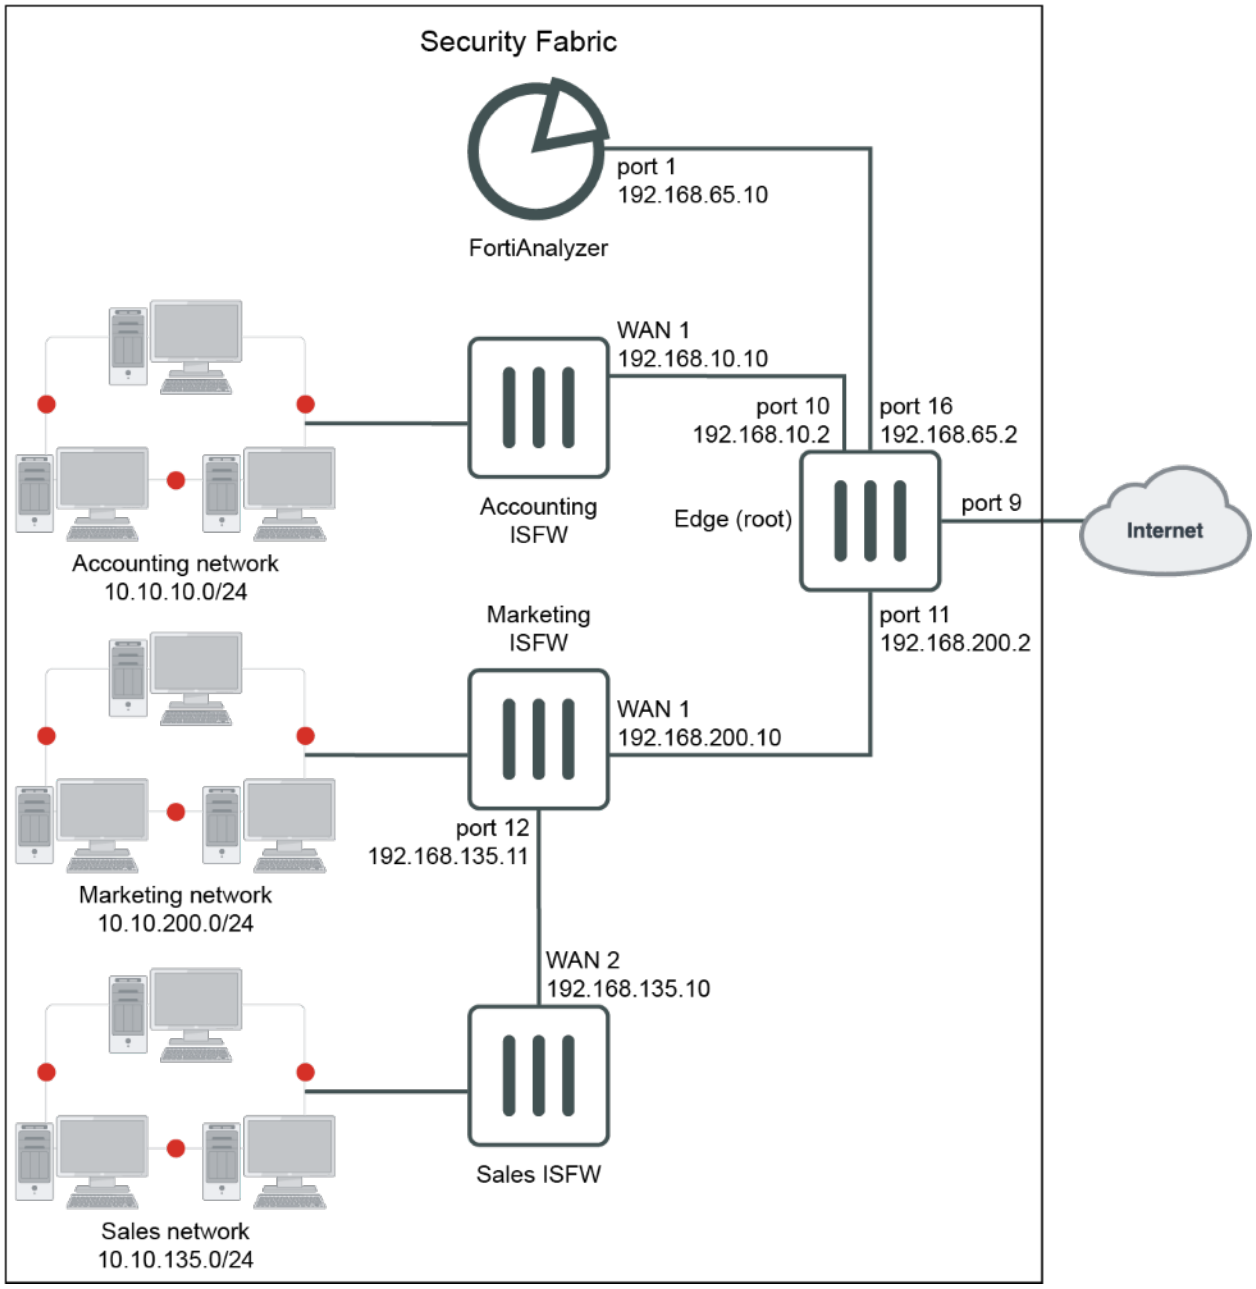
1. Log in to the downstream device where the host was quarantined (Enterprise_Second_Floor).
2. Enter the following show command:

```
Enterprise_Second_Floor # show user quarantine
config user quarantine
    set firewall-groups "QuarantinedDevices"
    config targets
        edit "Erin Malone PC"
            set description "Manually quarantined"
            config macs
                edit **:**:**:**:**:**
                    set description "manual-qtn Hostname: Erin Malone PC"
                next
            end
        next
    end
end
```

Deploying the Security Fabric

This topic provides an example of deploying Security Fabric with three downstream FortiGates connecting to one root FortiGate. To deploy Security Fabric, you need a FortiAnalyzer running firmware version 6.2 or later.

The following shows a sample network topology with three downstream FortiGates (Accounting, Marketing, and Sales) connected to the root FortiGate (Edge).



To configure the root FortiGate (Edge):

1. Configure interfaces:
   a. In the root FortiGate (Edge), go to *Network* > *Interfaces*.
   b. Edit *port16*:
      - Set *Role* to *DMZ*.
      - For the interface connected to FortiAnalyzer, set the *IP/Network Mask* to *192.168.65.2/255.255.255.0*

c. Edit *port10*:
- Set *Role* to *LAN*.
- For the interface connected to the downstream FortiGate (Accounting), set the *IP/Network Mask* to *192.168.10.2/255.255.255.0*

d. Edit *port11*:
- Set *Role* to *LAN*.
- For the interface connected to the downstream FortiGate (Marketing), set the *IP/Network Mask* to *192.168.200.2/255.255.255.0*

2. Configure Security Fabric:
a. In the root FortiGate (Edge), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
b. For *Status*, click *Enable*.
c. Set the *Security Fabric role* to *Serve as Fabric Root*. The FortiAnalyzer settings can be configured.
d. Enter the FortiAnalyzer IP (*192.168.65.10*) and select and *Upload option* (the default is *Real Time*).
e. Click *Test Connectivity*.
A warning message indicates that the FortiGate is not authorized on the FortiAnalyzer. The authorization is configured in a later step on the FortiAnalyzer.
f. Click *OK*. The FortiAnalyzer serial number is verified.
g. Enter a *Fabric name*, such as *Office-Security-Fabric*.
h. Ensure *Allow other Security Fabric devices to join* is enabled and add *port10* and *port11*.
i. Click *OK*.
3. Create a policy to allow the downstream FortiGate (Accounting) to access the FortiAnalyzer:
a. In the root FortiGate (Edge), go to *Policy & Objects* > *Addresses*.
b. Click *Create New*.
- Set *Name* to *FAZ-addr*.
- Set *Type* to *Subnet*.
- Set *Subnet/IP Range* to *192.168.65.10/32*.
- Set *Interface* to *any*.

c. Click *OK*.
d. Click *Create New*.
- Set *Name* to *Accounting*.
- Set *Type* to *Subnet*.
- Set *Subnet/IP Range* to *192.168.10.10/32*.
- Set *Interface* to *any*.

e. Click *OK*.
f. In the root FortiGate (Edge), go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
- Set *Name* to *Accounting-to-FAZ*.
- Set *srcintf* to *port10*.
- Set *dstintf* to *port16*.
- Set *srcaddr* to *Accounting-addr*.
- Set *dstaddr* to *FAZ-addr*.
- Set *Action* to *Accept*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Enable *NAT*.
- Set *IP Pool Configuration* to *Use Outgoing Interface Address*.

g. Click *OK*.

4. Create a policy to allow the two downstream FortiGates (Marketing and Sales) to access the FortiAnalyzer:
   a. In the root FortiGate (Edge), go to *Policy & Objects* > *Addresses* and click *Create New*.
      - Set *Name* to *Marketing-addr*.
      - Set *Type* to *Subnet*.
      - Set *Subnet/IP Range* to *192.168.200.10/32*.
      - Set *Interface* to *any*.
   b. Click *OK*.
   c. In the root FortiGate (Edge), go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
      - Set *Name* to *Marketing-to-FAZ*.
      - Set *srcintf* to *port11*.
      - Set *dstintf* to *port16*.
      - Set *srcaddr* to *Marketing-addr*.
      - Set *dstaddr* to *FAZ-addr*.
      - Set *Action* to *Accept*.
      - Set *Schedule* to *Always*.
      - Set *Service* to *All*.
      - Enable *NAT*.
      - Set *IP Pool Configuration* to *Use Outgoing Interface Address*.
   d. Click *OK*.

To configure the downstream FortiGate (Accounting):

1. Configure interface:
   a. In the downstream FortiGate (Accounting), go to *Network* > *Interfaces*.
   b. Edit interface *wan1*:
      - Set *Role* to *WAN*.
      - For the interface connected to root, set the *IP/Network Mask* to *192.168.10.10/255.255.255.0*
2. Configure the default static route to connect to the root FortiGate (Edge):
   a. In the downstream FortiGate (Accounting), go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *wan1*.
      - Set *Gateway Address* to *192.168.10.2*.
   b. Click *OK*.
3. Configure Security Fabric:
   a. In the downstream FortiGate (Accounting), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. For *Status*, click *Enable*.
      FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).
   c. Set the *Security Fabric role* to *Join Existing Fabric*.
   d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.10.2* set in the previous step.
   e. Disable *Allow other FortiGates to join*, because there is no downstream FortiGate connecting to it.
   f. Click *OK*.

To configure the downstream FortiGate (Marketing):

1. Configure interface:
   a. In the downstream FortiGate (Marketing), go to *Network* > *Interfaces*.
   b. Edit *port12*:
      - Set *Role* to *LAN*.
      - For the interface connected to the downstream FortiGate (Sales), set the *IP/Network Mask* to *192.168.135.11/255.255.255.0*.
   c. Edit *wan1*:
      - Set *Role* to *WAN*.
      - For the interface connected to the root FortiGate (Edge), set the *IP/Network Mask* to *192.168.200.10/255.255.255.0*.
2. Configure the default static route to connect to the root FortiGate (Edge):
   a. In the downstream FortiGate (Marketing), go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *wan1*.
      - Set *Gateway Address* to *192.168.200.2*.
   b. Click *OK*.
3. Configure Security Fabric:
   a. In the downstream FortiGate (Marketing), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. For *Status*, click *Enable*.
   FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Marketing) connects to the root FortiGate (Edge).
   c. Set the *Security Fabric role* to *Join Existing Fabric*.
   d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.200.2* set in the previous step.
   e. Enable *Allow other FortiGates to join* and add *port12*.
   f. Click *OK*.
4. Create a policy to allow another downstream FortiGate (Sales) going through FortiGate (Marketing) to access the FortiAnalyzer:
   a. In the downstream FortiGate (Marketing), go to *Policy & Objects* > *Addresses* and click *Create New*.
      - Set *Name* to *FAZ-addr*.
      - Set *Type* to *Subnet*.
      - Set *Subnet/IP Range* to *192.168.65.10/32*.
      - Set *Interface* to *any*.
   b. Click *OK*.
   c. Click *Create New*.
      - Set *Name* to *Sales-addr*.
      - Set *Type* to *Subnet*.
      - Set *Subnet/IP Range* to *192.168.135.10/32*.
      - Set *Interface* to *any*.
   d. Click *OK*.

e. In the downstream FortiGate (Marketing), go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
- Set *Name* to *Sales-to-FAZ*.
- Set *srcintf* to *port12*.
- Set *dstintf* to *wan1*.
- Set *srcaddr* to *Sales-addr*.
- Set *dstaddr* to *FAZ-addr*.
- Set *Action* to *Accept*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Enable *NAT*.
- Set *IP Pool Configuration* to *Use Outgoing Interface Address*.

f. Click *OK*.

To configure the downstream FortiGate (Accounting):

1. Configure interface:
   a. In the downstream FortiGate (Accounting), go to *Network* > *Interfaces*.
   b. Edit interface *wan1*:
      - Set *Role* to *WAN*.
      - For the interface connected to root, set the *IP/Network Mask* to *192.168.10.10/255.255.255.0*
2. Configure the default static route to connect to the root FortiGate (Edge):
   a. In the downstream FortiGate (Accounting), go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *wan1*.
      - Set *Gateway Address* to *192.168.10.2*.
   b. Click *OK*.
3. Configure Security Fabric:
   a. In the downstream FortiGate (Accounting), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. For *Status*, click *Enable*.
   FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Accounting) connects to the root FortiGate (Edge).
   c. Set the *Security Fabric role* to *Join Existing Fabric*.
   d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.10.2* set in the previous step.
   e. Disable *Allow other FortiGates to join*, because there is no downstream FortiGate connecting to it.
   f. Click *OK*.

To configure the downstream FortiGate (Sales):

1. Configure interface:
   a. In the downstream FortiGate (Sales), go to *Network* > *Interfaces*.
   b. Edit *wan2*:
      - Set *Role* to *WAN*.
      - For the interface connected to the upstream FortiGate (Marketing), set the *IP/Network Mask* to *192.168.135.10/255.255.255.0*.

2. Configure the default static route to connect to the upstream FortiGate (Marketing):
   a. In the downstream FortiGate (Sales), go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *wan2*.
      - Set *Gateway Address* to *192.168.135.11*.
   b. Click *OK*.
3. Configure Security Fabric:
   a. In the downstream FortiGate (Sales), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. For *Status*, click *Enable*.
   FortiAnalyzer automatically enables logging. Settings for the FortiAnalyzer are retrieved from the root FortiGate (Edge) when FortiGate (Sales) connects to the root FortiGate (Edge).
   c. Set the *Security Fabric role* to *Join Existing Fabric*.
   d. *Upstream FortiGate IP* is filled in automatically with the default static route *Gateway Address* of *192.168.135.11* set in the previous step.
   e. Disable *Allow other FortiGates to join*, because there is no downstream FortiGate connecting to it.
   f. Click *OK*.

To authorize downstream FortiGates (Accounting, Marketing, and Sales) on the root FortiGate (Edge):

1. In the root FortiGate (Edge), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   The *Topology* tree highlights two connected FortiGates with their serial numbers and asks you to authorize the highlighted devices.
2. Select the highlighted FortiGates and select *Authorize*.
   After they are authorized, the two downstream FortiGates (Accounting and Marketing) appear in the *Topology* tree in the *Security Fabric* > *Fabric Connectors* > *Security Fabric Setup* page. This means that the two downstream FortiGates (Accounting and Marketing) have successfully joined the Security Fabric.
3. The *Topology* tree now highlights the FortiGate with the serial number that is connected to the downstream FortiGate (Marketing) and asks you to authorize the highlighted device.
4. Select the highlighted FortiGates and select *Authorize*.
   After it is authorized, the downstream FortiGate (Sales) appears in the *Topology* tree in the *Security Fabric* > *Fabric Connectors* > *Security Fabric Setup* page. This means that the downstream FortiGates (Sales) has successfully joined the Security Fabric.

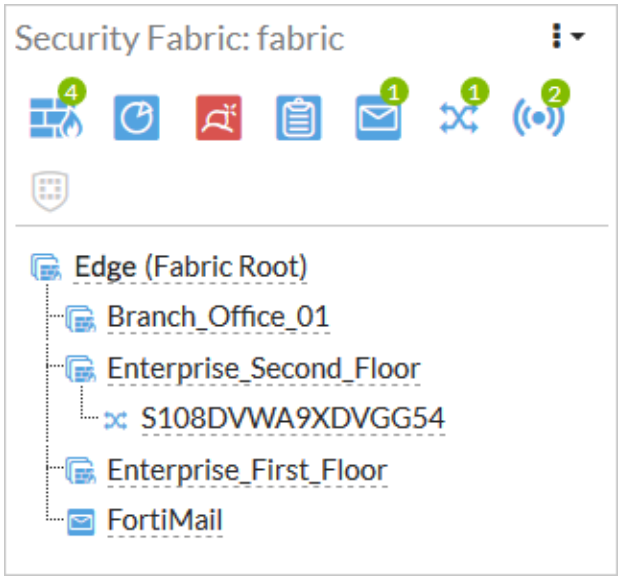
To use FortiAnalyzer to authorize all the Security Fabric FortiGates:

1. Authorize all the Security Fabric FortiGates on the FortiAnalyzer side:
   a. On the FortiAnalyzer, go to *System Settings* > *Network* > *All Interfaces*.
   b. Edit *port1* and set *IP Address/Netmask* to *192.168.65.10/255.255.255.0*.
   c. Go to *Device Manager* > *Unauthorized*. All of the FortiGates are listed as unauthorized.
      i. Select all the FortiGates and select *Authorize*. The FortiGates are now listed as authorized.
      After a moment, a warning icon appears beside the root FortiGate (Edge) because the FortiAnalyzer needs administrative access to the root FortiGate (Edge) in the Security Fabric.
      ii. Click the warning icon and enter the admin username and password of the root FortiGate (Edge).

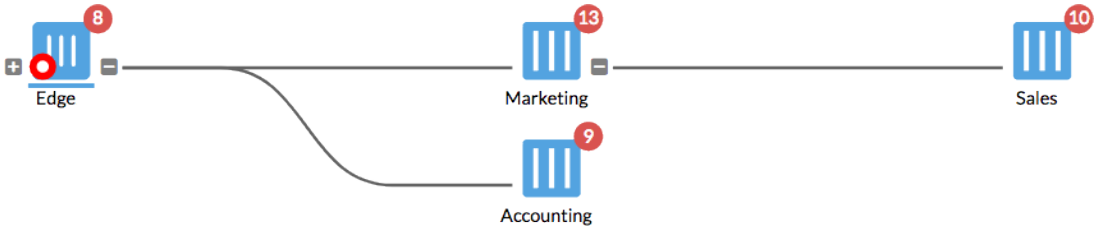
2. Check FortiAnalyzer status on all the Security Fabric FortiGates:
   a. On each FortiGate, go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
   b. Check that *Storage usage* information is shown.

To check Security Fabric deployment result:

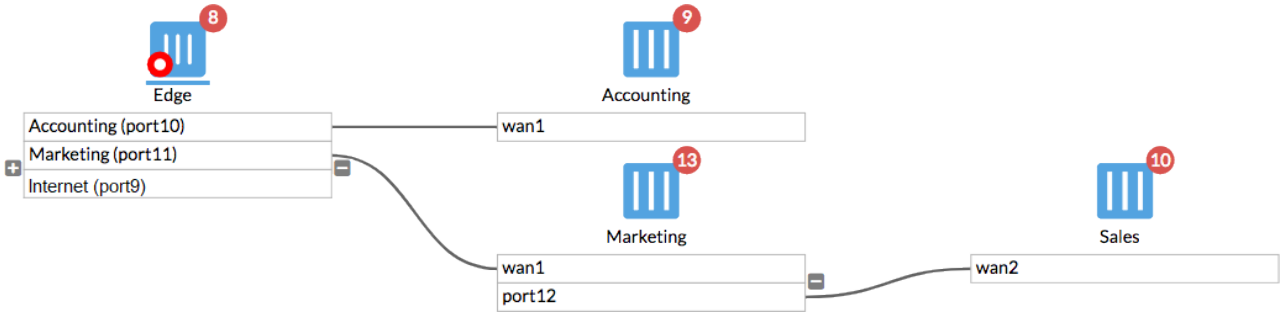
1. On FortiGate (Edge), go to *Dashboard* > *Status*.
   The *Security Fabric* widget displays all the FortiGates in the Security Fabric.



2. On FortiGate (Edge), go to *Security Fabric* > *Physical Topology*.
   This page shows a visualization of access layer devices in the Security Fabric.



3. On FortiGate (Edge), go to *Security Fabric* > *Physical Topology*.
   This dashboard shows information about the interfaces of each device in the Security Fabric.



To run diagnose commands:

1. Run the `diagnose sys csf authorization pending-list` command in the root FortiGate to show the downstream FortiGate pending for root FortiGate authorization:

```
Edge # diagnose sys csf authorization pending-list
Serial                  IP Address      HA-Members    Path
--------------------------------------------------------------------------------
FG201ETK18902514        0.0.0.0                       FG3H1E5818900718:FG201ETK18902514
```

2. Run the `diagnose sys csf downstream` command in the root or middle FortiGate to show the downstream FortiGates after they join Security Fabric:

```
Edge # diagnose sys csf downstream
1:     FG201ETK18902514 (192.168.200.10) Management-IP: 0.0.0.0 Management-port:0
parent: FG3H1E5818900718
        path:FG3H1E5818900718:FG201ETK18902514
        data received: Y downstream intf:wan1 upstream intf:port11 admin-port:443
        authorizer:FG3H1E5818900718
2:     FGT81ETK18002246 (192.168.10.10) Management-IP: 0.0.0.0 Management-port:0 parent:
FG3H1E5818900718
        path:FG3H1E5818900718:FGT81ETK18002246
        data received: Y downstream intf:wan1 upstream intf:port10 admin-port:443
        authorizer:FG3H1E5818900718
3:     FG101ETK18002187 (192.168.135.10) Management-IP: 0.0.0.0 Management-port:0
parent: FG201ETK18902514
        path:FG3H1E5818900718:FG201ETK18902514:FG101ETK18002187
        data received: Y downstream intf:wan2 upstream intf:port12 admin-port:443
        authorizer:FG3H1E5818900718
```

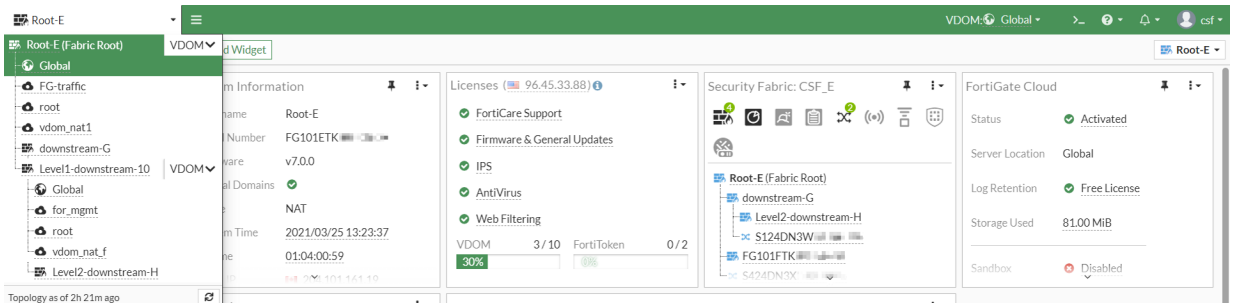
3. Run the `diagnose sys csf upstream` command in any downstream FortiGate to show the upstream FortiGate after downstream FortiGate joins Security Fabric:

```
Marketing # diagnose sys csf upstream
Upstream Information:
Serial Number:FG3H1E5818900718
IP:192.168.200.2
Connecting interface:wan1
Connection status:Authorized
```

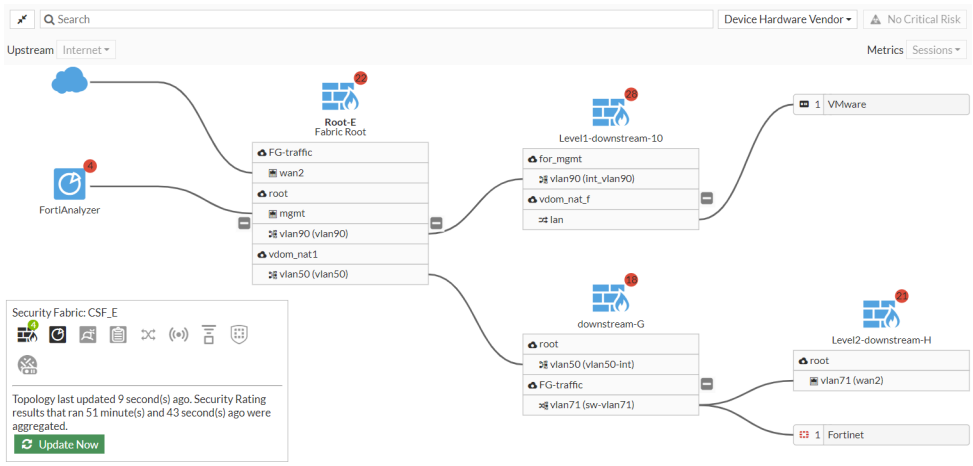
Deploying the Security Fabric in a multi-VDOM environment

A Security Fabric can be enabled in multi-VDOM environments. This allows access to all of the Security Fabric features, including automation, security rating, and topologies, across the VDOM deployment.

- Users can navigate to downstream FortiGate devices and VDOMs directly from the root FortiGate using the Fabric selection menu.



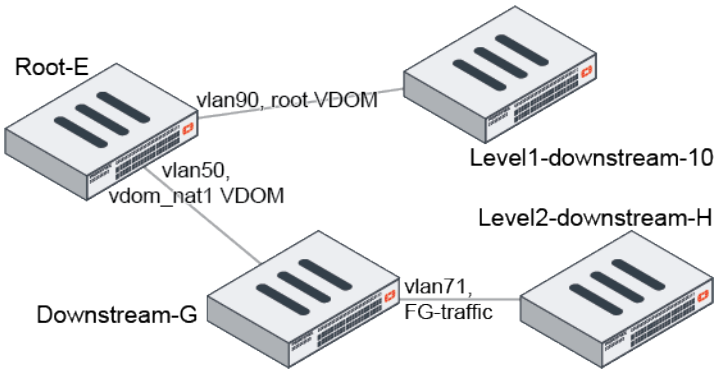
- The logical topology shows all of the configured VDOMs.



- Security rating reports include results for all of the configured VDOMs as well the entire Fabric.

Downstream FortiGate devices must connect to the upstream FortiGate from its management VDOM.

Topology



In this topology, there is a root FortiGate with three FortiGates connected through two different VDOMs. The root FortiGate is able to manage all devices running in multi-VDOM mode.

This example assumes multi-VDOM mode is already configured on each FortiGate, and that FortiAnalyzer logging is configured on the root FortiGate (see Configuring FortiAnalyzer on page 1596 and Configuring the root FortiGate and downstream FortiGates on page 1590 for more details).

To enable multi-VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```

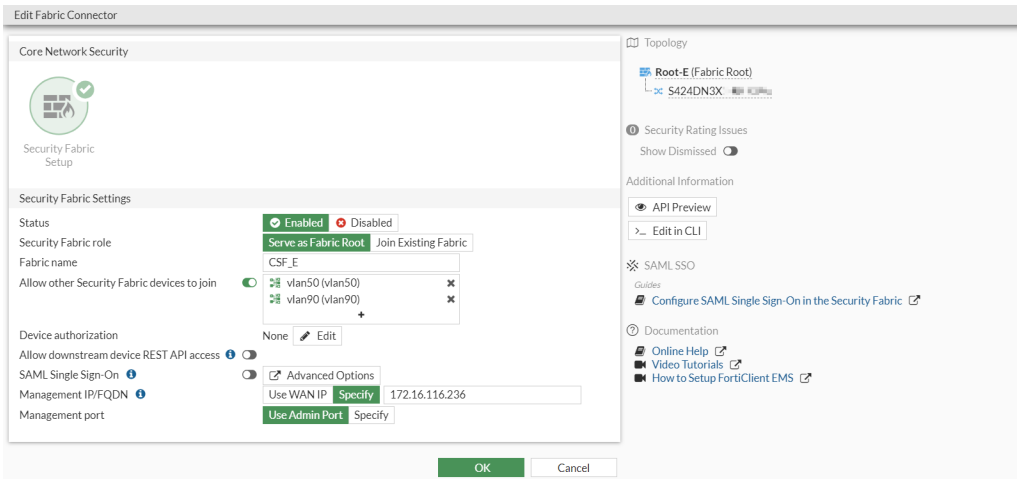
Device configurations

Root FortiGate (Root-E)

The Security Fabric is enabled, and configured so that downstream interfaces from all VDOMs can allow other Security Fabric devices to join.

To configure Root-E in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Ensure that the *Status* is *Enabled* and the *Security Fabric role* is set to *Serve as Fabric Root*.
3. Enable *Allow other Security Fabric devices to join* and click the + to add the interfaces (vlan50 and vlan90) from the vdom_nat1 and root VDOMs.



4. Configure the other settings as needed.
5. Click *OK*.

To configure Root-E in the CLI:

1. Enable the Security Fabric:

```
config system csf
    set status enable
    set group-name "CSF_E"
end
```

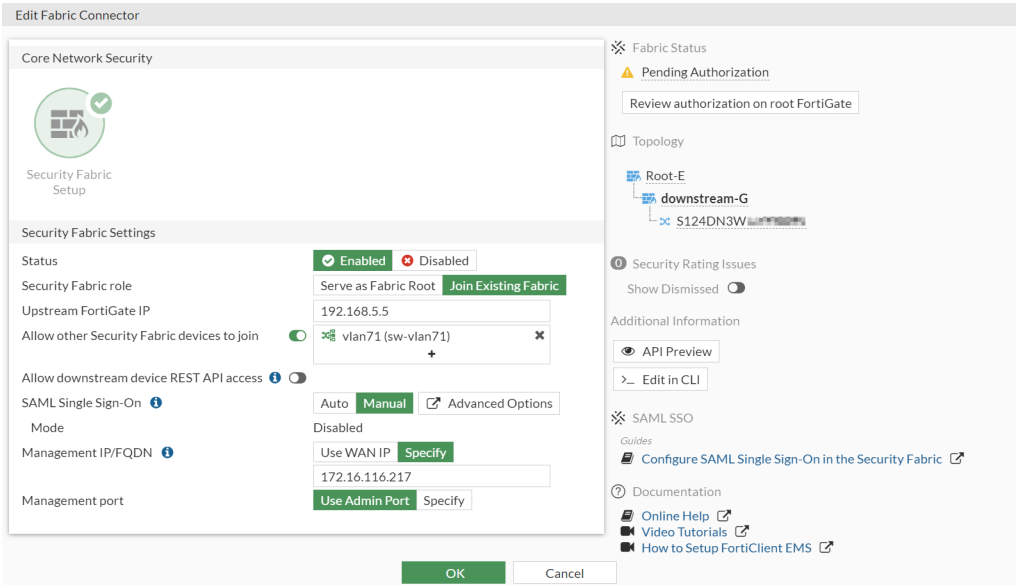
2. Configure the interfaces:

```
config system interface
    edit "vlan50"
        set vdom "vdom_nat1"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
    edit "vlan90"
        set vdom "root"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
end
```

Downstream FortiGate 1 (Downstream-G)

To configure Downstream-G in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, select *Enabled* and set the role to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root FortiGate vdom_nat1 interface (192.168.5.5). Downstream-G must use the interface from the management VDOM to connect to the upstream FortiGate IP.
4. Enable *Allow other Security Fabric devices to join* and click the + to add the downstream interface (sw-vlan71) from the FG-traffic VDOM.



5. Configure the other settings as needed.
6. Click *OK*.

To configure Downstream-G in the CLI:

1. Enable the Security Fabric:

```
config system csf
    set status enable
    set upstream-ip 192.168.5.5
end
```

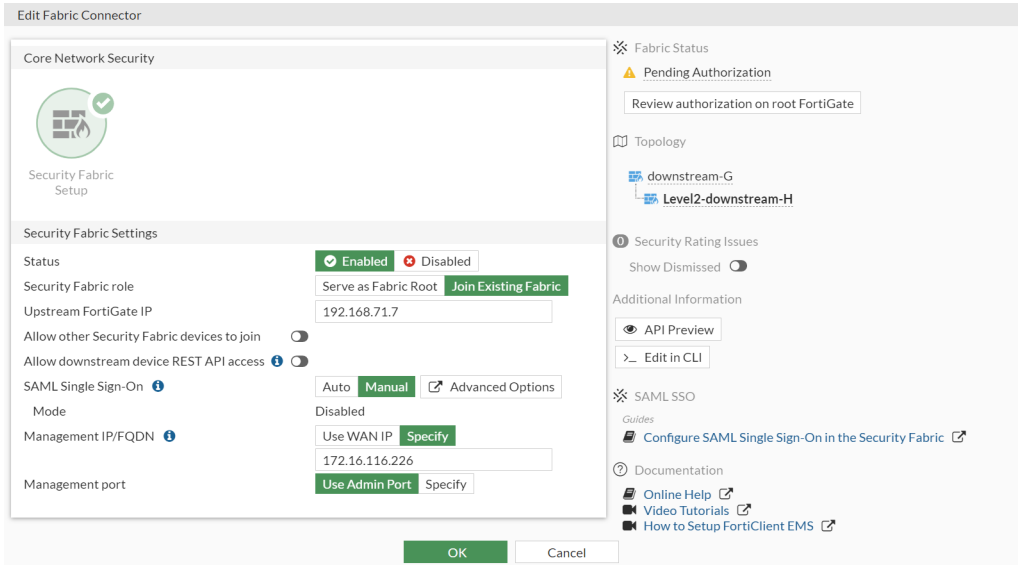
2. Configure the interfaces:

```
config system interface
    edit "sw-vlan71"
        set vdom "FG-traffic"
        ...
        set allowaccess ping https ssh http fgfm fabric
        ...
    next
end
```

Downstream FortiGate 2 (Level2-downstream-H)

To configure Level2-downstream-H in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, select *Enabled* and set the role to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Downstream-G (192.168.71.7).



4. Configure the other settings as needed.
5. Click *OK*.

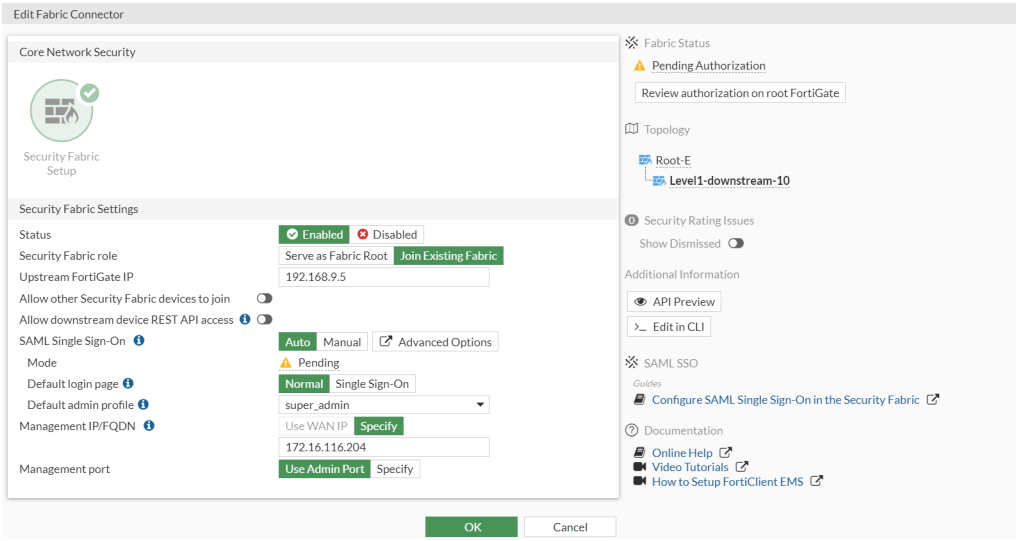
To configure Level2-downstream-H in the CLI:

```
config system csf
    set status enable
    set upstream-ip 192.168.71.7
end
```

Downstream FortiGate 3 (Level1-downstream-10)

To configure Level1-downstream-10 in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. For *Status*, select *Enabled* and set the role to *Join Existing Fabric*.
3. Enter the *Upstream FortiGate IP*, which is the IP of the root VDOM on Root-E (192.168.9.5).



4. Configure the other settings as needed.
5. Click *OK*.

To configure Level1-downstream-10 in the CLI:

```
config system csf
    set status enable
    set upstream-ip 192.168.9.5
end
```

Device authorization and verification

To authorize the downstream devices on the root FortiGate:

1. On Root-E, go to *Security Fabric* > *Fabric Connectors*.
2. In the topology tree, click the highlighted serial number and select *Authorize* for each downstream FortiGate. Once all the devices are authorized, the physical topology page shows the root and downstream FortiGates. The logical topology page shows the root and downstream FortiGates connected to interfaces in their corresponding VDOMs.

Synchronizing objects across the Security Fabric

When the Security Fabric is enabled, various objects such as addresses, services, and schedules are synced from the upstream FortiGate to all downstream devices by default. FortiOS has the following settings for object synchronization across the Security Fabric:

- Set object synchronization (`fabric-object-unification`) to `default` or `local` on a downstream device.
- Set a per object option to toggle whether the specific Fabric object will be synchronized or not. After upgrading from 6.4.3, this option is disabled for supported Fabric objects. The synchronized Fabric objects are kept as locally created objects on downstream FortiGates.
- Define the number of task workers to handle synchronizations.

The firewall object synchronization wizard helps identify objects that are not synchronized and resolves any conflicts. A warning message appears in the topology tree if there is a conflict.

Summary of CLI commands

Object synchronization can be configured as follows:

```
config system csf
    set fabric-object-unification {default | local}
    set configuration-sync {default | local}
    set fabric-workers <integer>
    ...
    next
end
```

Parameter	Description
fabric-object-unification	*default*: Global CMDB objects will be synchronized in the Security Fabric. *local*: Global CMDB objects will not be synchronized to and from this device. This command is available on the root FortiGate. If set to local, the device does not synchronize objects from the root, but will send the synchronized objects downstream.
configuration-sync	*default*: Synchronize configuration for FortiAnalyzer, FortiSandbox, and Central Management to root node. *local*: Do not synchronize configuration with root node. If downstream FortiGates are set to local, the synchronized objects from the root to downstream are not applied locally. However, the downstream FortiGate will send the configuration to lower FortiGates.
fabric-workers	Define how many task worker process are created to handle synchronizations (1-4, default = 2). The worker processes dies if there is no task to perform after 60 seconds.

The per object setting can be configured on the root FortiGate as follows:

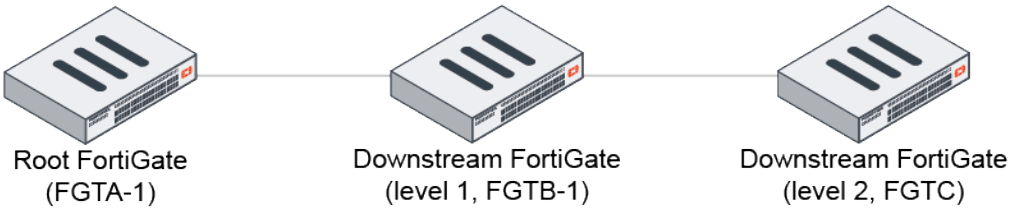
```
config firewall <object>
    edit <name>
        set fabric-object {enable | disable}
        ...
    next
end
```

Where:

- `<object>` is one of the following: `address`, `address6`, `addrgrp`, `addrgrp6`, `service category`, `service custom`, `service group`, `schedule group`, `schedule onetime`, or `schedule recurring`.

- Enabling `fabric-object` sets the object as a Security Fabric-wide global object that is synchronized to downstream FortiGates.
- Disabling `fabric-object` sets the object as local to this Security Fabric member.
- If a device in the Fabric is in multi-VDOM mode, the GUI will not display the Fabric synchronization option. Even if this is enabled in the CLI, the object will not be synchronized to any downstream devices.

Sample topology



In this Security Fabric, the root FortiGate (FGTA-1) has `fabric-object-unification` set to `default` so the Fabric objects can be synchronized to the downstream FortiGate. The level 1 downstream FortiGate (FGTB-1) has `configuration-sync` set to `local`, so it will not apply the synchronized objects locally. The level 2 downstream FortiGate (FGTC) has `configuration-sync` set to `default`, so it will apply the synchronized objects locally.

In this example, firewall addresses and address groups are used. Other supported Fabric objects have the same behaviors. The following use cases illustrate common synchronization scenarios:

- If no conflicts exist, firewall addresses and address groups can be synchronized to downstream FortiGates (see example below).
- If a conflict exists between the root and downstream FortiGates, it can be resolved with the conflict resolution wizard. After the conflict is resolved, the firewall addresses and address groups can be synchronized to downstream FortiGates (see example below).
- If `set fabric-object` (*Fabric synchronization* option in the GUI) is disabled for firewall addresses and address groups on the root FortiGate, they will not be synchronized to downstream FortiGates (see example below).

To configure the FortiGates used in this example:

```
FGTA-1 # config system csf
    set status enable
    set group-name "fabric"
    set fabric-object-unification default
    ...
end
```

```
FGTB-1 # config system csf
    set status enable
    set upstream-ip 10.2.200.1
    set configuration-sync local
    ...
end
```

```
FGTC # config system csf
    set status enable
    set upstream-ip 192.168.7.2
    set configuration-sync default
    ...
end
```

To synchronize a firewall address and address group in the Security Fabric:

1. Configure the firewall address on the root FortiGate:

```
FGTA-1 # config firewall address
    edit "add_subnet_1"
        set fabric-object enable
        set subnet 22.22.22.0 255.255.255.0
    next
end
```

2. Configure the address group on the root FortiGate:

```
FGTA-1 # config firewall addrgrp
    edit "group_subnet_1"
        set member "add_subnet_1"
        set fabric-object enable
    next
end
```

3. Check the firewall address and address group on the downstream FortiGates:

```
FGTB-1 # show firewall address add_subnet_1
entry is not found in table
```

```
FGTB-1 # show firewall addrgrp group_subnet_1
entry is not found in table
```

The synchronized objects are not applied locally on this FortiGate because `configuration-sync` is set to `local`.

```
FGTC # show firewall address add_subnet_1
config firewall address
    edit "add_subnet_1"
        set uuid 378a8094-34cb-51eb-ce40-097f298fcfdc
        set fabric-object enable
        set subnet 22.22.22.0 255.255.255.0
    next
end
```

```
FGTC # show firewall addrgrp group_subnet_1
config firewall addrgrp
    edit "group_subnet_1"
        set uuid 4d7a8a52-34cb-51eb-fce7-d93f76915319
        set member "add_subnet_1"
        set color 19
        set fabric-object enable
    next
end
```

The objects are synchronized on this FortiGate because `configuration-sync` is set to `default`.

To resolve a firewall address and address group conflict in the Security Fabric:

1. On FGTC, create a firewall address:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the following:

Name	sync_add_1
IP/Netmask	33.33.33.0 255.255.255.0

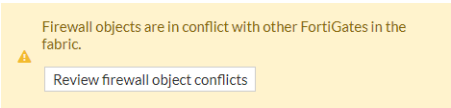
   c. Click *OK*.
2. On FGTA-1 (Fabric root), create the firewall address with same name but a different subnet:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the following:

Name	sync_add_1
IP/Netmask	11.11.11.0 255.255.255.0
Fabric synchronization	Enable

   c. Click *OK*.
3. Add the address to a different address group than what is configured on FGTC:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address Group*.
   b. Configure the following:

Name	sync_group4
Members	sync_add_1
Fabric synchronization	Enable

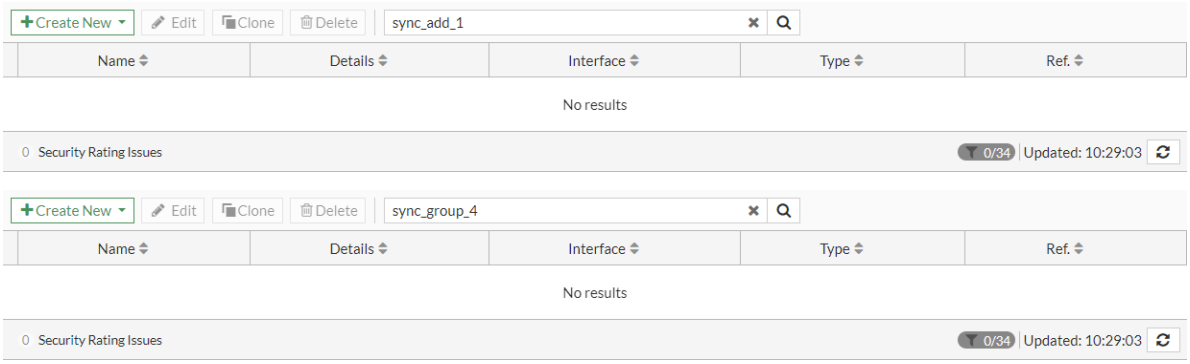
   c. Click *OK*.
4. Go to *Security Fabric* > *Fabric Connectors*. In the topology tree, there is a message that *Firewall objects are in conflict with other FortiGates in the fabric*.



5. Resolve the conflict:
   a. Click *Review firewall object conflicts*. The *Firewall Object Synchronization* pane opens.
   b. Click *Rename All Objects*. The conflicted object will be renamed on the downstream FortiGate.

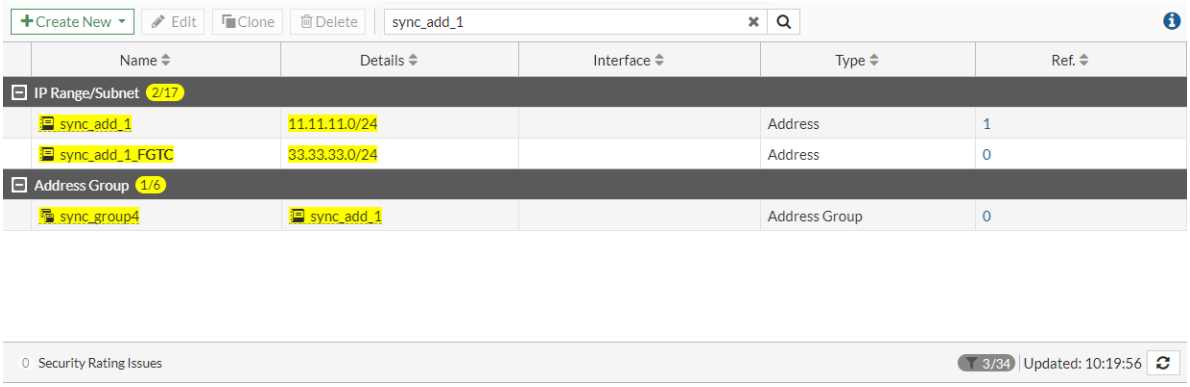
   c. The conflict is resolved. Click *Close* to exit the *Firewall Object Synchronization* pane.

   d. The topology tree no longer indicates there is a conflict.
6. Verify the results on the downstream FortiGates:
   a. On FGTB-1, go to *Policy & Objects* > *Addresses*.
   b. Search for *sync_add_1* and *sync_group4*. No results are found. The synchronized objects are not applied locally on this FortiGate because `configuration-sync` is set to `local`.



c. On FGTC, go to *Policy & Objects* > *Addresses*.

d. Search for *sync_add_1*. The original firewall address *sync_add_1* was renamed to *sync_add_1_FGTC* by resolving the conflict on FGTA-1. The address *sync_add_1* and address group *sync_group4* are synchronized from FGTA-1.



To disable Fabric synchronization on the root FortiGate in the GUI:

1. On FGTA-1, create a firewall address:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the following:

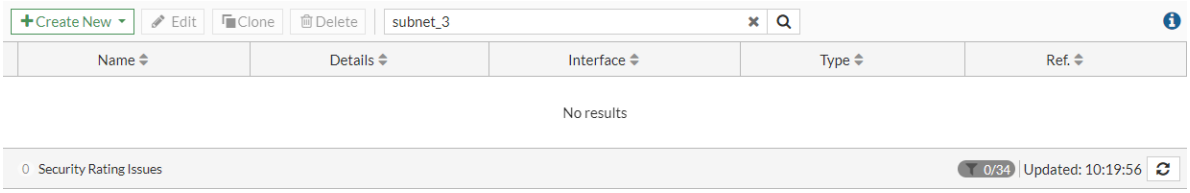
Name	add_subnet_3
IP/Netmask	33.33.33.0 255.255.255.0
Fabric synchronization	Disable

   c. Click *OK*.
2. Create the firewall address group and add the address:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address Group*.
   b. Configure the following:

Name	group_subnet_3
Members	add_subnet_3
Fabric synchronization	Disable

   c. Click *OK*.

3. On FGTB-1, go to *Policy & Objects* > *Addresses* and search for *subnet_3*. No results are found because Fabric synchronization is disabled on the root FortiGate (FGTA-1).



4. On FGTC, go to *Policy & Objects* > *Addresses* and search for *subnet_3*. No results are found because Fabric synchronization is disabled on the root FortiGate (FGTA-1).

To disable Fabric synchronization on the root FortiGate in the CLI:

1. Configure the firewall address on the root FortiGate:

```
FGTA-1 # config firewall address
    edit "add_subnet_3"
        set subnet 33.33.33.0 255.255.255.0
        set fabric-object disable
    next
end
```

2. Configure the address group on the root FortiGate:

```
FGTA-1 # config firewall addrgrp
    edit "group_subnet_3"
        set member "add_subnet_3"
        set fabric-object disable
    next
end
```

3. Check the firewall address and address group on the downstream FortiGates:

```
FGTB-1 # show firewall address add_subnet_3
entry is not found in table

FGTB-1 # show firewall addrgrp group_subnet_3
entry is not found in table

FGTC # show firewall address add_subnet_3
entry is not found in table

FGTC # show firewall addrgrp group_subnet_3
entry is not found in table
```

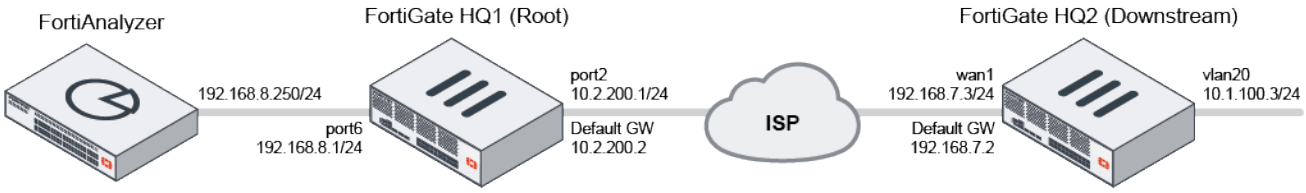
The objects are not synchronized from the root FortiGate (FGTA-1) because the `fabric-object` setting is disabled.

Security Fabric over IPsec VPN

This is an example of configuring Security Fabric over IPsec VPN.

Sample topology

This sample topology shows a downstream FortiGate (HQ2) connected to the root FortiGate (HQ1) over IPsec VPN to join Security Fabric.



Sample configuration

To configure the root FortiGate (HQ1):

1. Configure interface:
   a. In the root FortiGate (HQ1), go to *Network* > *Interfaces*.
   b. Edit *port2*:
      - Set *Role* to *WAN*.
      - For the interface connected to the Internet, set the *IP/Network Mask* to *10.2.200.1/255.255.255.0*
   c. Edit *port6*:
      - Set *Role* to *DMZ*.
      - For the interface connected to FortiAnalyzer, set the *IP/Network Mask* to *192.168.8.250/255.255.255.0*
2. Configure the static route to connect to the Internet:
   a. Go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - Set *Destination* to *0.0.0.0/0.0.0.0*.
      - Set *Interface* to *port2*.
      - Set *Gateway Address* to *10.2.200.2*.
   b. Click *OK*.
3. Configure IPsec VPN:
   a. Go to *VPN* > *IPsec Wizard*.
      - Set *Name* to *To-HQ2*.
      - Set *Template Type* to *Custom*.
      - Click *Next*.
      - Set *Authentication* to *Method*.
      - Set *Pre-shared Key* to *123456*.
   b. Leave all other fields in their default values and click *OK*.
4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
   a. Go to *Network* > *Interfaces*.
   b. Edit *To-HQ2*:
      - Set *Role* to *LAN*.
      - Set the *IP/Network Mask* to *10.10.10.1/255.255.255.255*.
      - Set *Remote IP/Network Mask* to *10.10.10.3/255.255.255.0*.

5. Configure IPsec VPN local and remote subnet:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*
      - Set *Name* to *To-HQ2_remote_subnet_2*.
      - Set *Type* to *Subnet*.
      - Set *IP/Network Mask* to *10.10.10.3/32*.
   c. Click *OK*.
   d. Click *Create New*
      - Set *Name* to *To-HQ2_local_subnet_1*.
      - Set *Type* to *Subnet*.
      - Set *IP/Network Mask* to *192.168.8.0/24*.
   e. Click *OK*.
   f. Click *Create New*
      - Set *Name* to *To-HQ2_remote_subnet_1*.
      - Set *Type* to *Subnet*.
      - Set *IP/Network Mask* to *10.1.100.0/24*.
   g. Click *OK*.
6. Configure IPsec VPN static routes:
   a. Go to *Network* > *Static Routes*
   b. Click *Create New* or *Create New* > *IPv4 Static Route*.
      - For *Named Address*, select *Type* and select *To-HQ2_remote_subnet_1*.
      - Set *Interface* to *To-HQ2*.

      Click *OK*.
   c. Click *Create New* or *Create New* > *IPv4 Static Route*.
      - For *Named Address*, select *Type* and select *To-HQ2_remote_subnet_1*.
      - Set *Interface* to *Blackhole*.
      - Set *Administrative Distance* to *254*.
   d. Click *OK*.
7. Configure IPsec VPN policies:
   a. Go to *Policy & Objects* > *Firewall Policy*
   b. Click *Create New*.
      - Set *Name* to *vpn_To-HQ2_local*.
      - Set *Incoming Interface* to *port6*.
      - Set *Outgoing Interface* to *To-HQ2*.
      - Set *Source* to *To-HQ2_local_subnet_1*.
      - Set *Destination* to *To-HQ2_remote_subnet_1*.
      - Set *Schedule* to *Always*.
      - Set *Service* to *All*.
      - Disable *NAT*.
   c. Click *OK*.
   d. Click *Create New*.
      - Set *Name* to *vpn_To-HQ2_remote*.
      - Set *Incoming Interface* to *To-HQ2*.
      - Set *Outgoing Interface* to *port6*.
      - Set *Source* to *To-HQ2_remote_subnet_1, To-HQ2_remote_subnet_2*.

- Set *Destination* to *To-HQ2_local_subnet_1*.
- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Enable *NAT*.
- Set *IP Pool Configuration* to *Use Outgoing Interface Address*.

e. Click *OK*.

8. Configure Security Fabric:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. For *Status*, click *Enable*.
   After *FortiGate Telemetry* is enabled, FortiAnalyzer automatically enables *Logging* and *Upload* is set to *Real Time*.
   c. Set the *Security Fabric role* to *Serve as Fabric Root*. The FortiAnalyzer settings can be configured.
   d. Enter the FortiAnalyzer IP (*192.168.8.250*).
   e. Click *OK*. The FortiAnalyzer serial number is verified.
   f. Enter a *Fabric name*, such as *Office-Security-Fabric*.
   g. Ensure *Allow other Security Fabric devices to join* is enabled and add VPN interface *To-HQ2*.
   h. Click *OK*.

To configure the downstream FortiGate (HQ2):

1. Configure interface:
   a. Go to *Network* > *Interfaces*.
   b. Edit interface *wan1*:
   - Set *Role* to *WAN*.
   - For the interface connected to the Internet, set the *IP/Network Mask* to *192.168.7.3/255.255.255.0*.

   c. Edit interface *vlan20*:
   - Set *Role* to *LAN*.
   - For the interface connected to local endpoint clients, set the *IP/Network Mask* to *10.1.100.3/255.255.255.0*.

2. Configure the static route to connect to the Internet:
   a. Go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
   - Set *Destination* to *0.0.0.0/0.0.0.0*.
   - Set *Interface* to *wan1*.
   - Set *Gateway Address* to *192.168.7.2*.

   b. Click *OK*.
3. Configure IPsec VPN:
   a. Go to *VPN* > *IPsec Wizard*.
   - Set *VPN Name* to *To-HQ1*.
   - Set *Template Type* to *Custom*.
   - Click *Next*.
   - In the *Network IP Address*, enter *10.2.200.1*.
   - Set *Interface* to *wan1*.
   - Set *Authentication* to *Method*.
   - Set *Pre-shared Key* to *123456*.

   b. Leave all other fields in their default values and click *OK*.

4. Configure the IPsec VPN interface IP address which will be used to form Security Fabric:
   a. Go to *Network* > *Interfaces*.
   b. Edit *To-HQ1*:
      - Set *Role* to *WAN*.
      - Set the *IP/Network Mask* to *10.10.10.3/255.255.255.255*.
      - Set *Remote IP/Network Mask* to *10.10.10.1/255.255.255.0.0*.
5. Configure IPsec VPN local and remote subnet:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*
      - Set *Name* to *To-HQ1_local_subnet_1*.
      - Set *Type* to *Subnet*.
      - Set *IP/Network Mask* to *10.1.100.0/24*.
   c. Click *OK*.
   d. Click *Create New*
      - Set *Name* to *To-HQ1_remote_subnet_1*.
      - Set *Type* to *Subnet*.
      - Set *IP/Network Mask* to *192.168.8.0/24*.
   e. Click *OK*.
6. Configure IPsec VPN static routes:
   a. Go to *Network* > *Static Routes* and click *Create New* or *Create New* > *IPv4 Static Route*.
      - For *Named Address*, select *Type* and select *To-HQ1_remote_subnet_1*.
      - Set *Interface* to *To-HQ1*.
   b. Click *OK*.
   c. Click *Create New* or *Create New* > *IPv4 Static Route*.
      - For *Named Address*, select *Type* and select *To-HQ1_remote_subnet_1*.
      - Set *Interface* to *Blackhole*.
      - Set *Administrative Distance* to *254*.
   d. Click *OK*.
7. Configure IPsec VPN policies:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
      - Set *Name* to *vpn_To-HQ1_local*.
      - Set *Incoming Interface* to *vlan20*.
      - Set *Outgoing Interface* to *To-HQ1*.
      - Set *Source* to *To-HQ1_local_subnet_1*.
      - Set *Destination* to *To-HQ1_remote_subnet_1*.
      - Set *Schedule* to *Always*.
      - Set *Service* to *All*.
      - Disable *NAT*.
   b. Click *OK*.
   c. Click *Create New*.
      - Set *Name* to *vpn_To-HQ1_remote*.
      - Set *Incoming Interface* to *To-HQ1*.
      - Set *Outgoing Interface* to *vlan20*.
      - Set *Source* to *To-HQ1_remote_subnet_1*.
      - Set *Destination* to *-HQ1_local_subnet_1*.

- Set *Schedule* to *Always*.
- Set *Service* to *All*.
- Disable *NAT*.

d. Click *OK*.

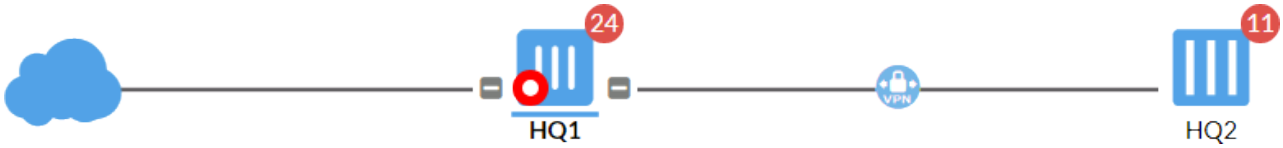
8. Configure Security Fabric:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. For *Status*, click *Enable*.
   FortiAnalyzer automatically enables logging. FortiAnalyzer settings will be retrieved when the downstream FortiGate connects to the root FortiGate.
   c. Set the *Security Fabric role* to *Join Existing Fabric*.
   d. Set the *Upstream FortiGate IP* to *10.10.10.1*.
   e. Click *OK*.

To authorize the downstream FortiGate (HQ2) on the root FortiGate (HQ1):

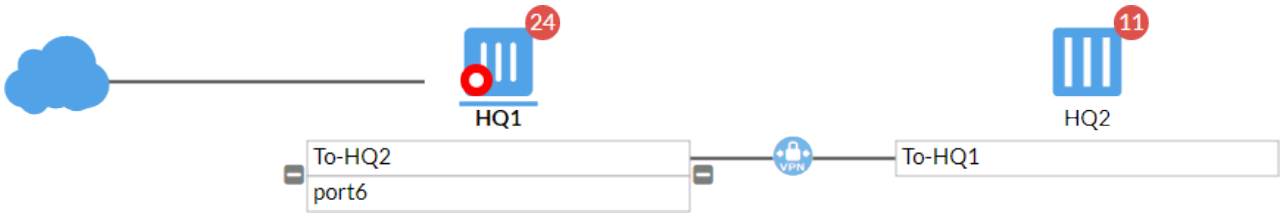
1. In the root FortiGate (HQ1), go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   The *Topology* tree highlights the connected FortiGate (HQ2) with the serial number and asks you to authorize the highlighted device.
2. Select the highlighted FortiGates and select *Authorize*.
   After authorization, the downstream FortiGate (HQ2) appears in the *Topology* tree in the *Security Fabric* > *Fabric Connectors* > *Security Fabric Setup* page. This means the downstream FortiGate (HQ2) has successfully joined the Security Fabric.

To check Security Fabric over IPsec VPN:

1. On the root FortiGate (HQ1), go to *Security Fabric* > *Physical Topology*.
   The root FortiGate (HQ1) is connected by the downstream FortiGate (HQ2) with VPN icon in the middle.



2. On the root FortiGate (HQ1), go to *Security Fabric* > *Logical Topology*.
   The root FortiGate (HQ1) VPN interface *To-HQ2* is connected by downstream FortiGate (HQ2) VPN interface *To-HQ1* with VPN icon in the middle.



To run diagnose commands:

1. Run the `diagnose sys csf authorization pending-list` command in the root FortiGate (HQ1) to show the downstream FortiGate pending for root FortiGate authorization:

```
HQ1 # diagnose sys csf authorization pending-list
Serial                  IP Address      HA-Members
Path
--------------------------------------------------------------------------------
FG101ETK18002187        0.0.0.0
FG3H1E5818900718:FG101ETK18002187
```

2. Run the `diagnose sys csf downstream` command in the root FortiGate (HQ1) to show the downstream FortiGate (HQ2) after it joins Security Fabric:

```
HQ1 # diagnose sys csf downstream
 1:     FG101ETK18002187 (10.10.10.3) Management-IP: 0.0.0.0 Management-port:0 parent:
FG3H1E5818900718
        path:FG3H1E5818900718:FG101ETK18002187
        data received: Y downstream intf:To-HQ1 upstream intf:To-HQ2 admin-port:443
        authorizer:FG3H1E5818900718
```

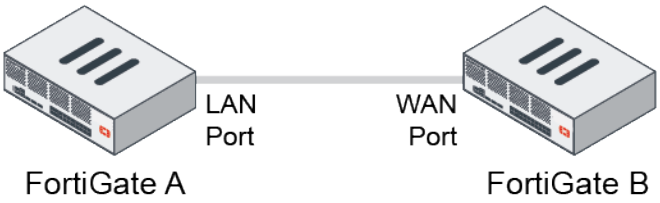
3. Run the `diagnose sys csf upstream` command in the downstream FortiGate (HQ2) to show the root FortiGate (HQ1) after the downstream FortiGate joins Security Fabric:

```
HQ2 # diagnose sys csf upstream
Upstream Information:
Serial Number:FG3H1E5818900718
IP:10.10.10.1
Connecting interface:To-HQ1
Connection status:Authorized
```

Leveraging LLDP to simplify Security Fabric negotiation

LLDP reception is enabled on WAN interfaces, which prompts FortiGates that are joining the Security Fabric if the upstream FortiGate asks.

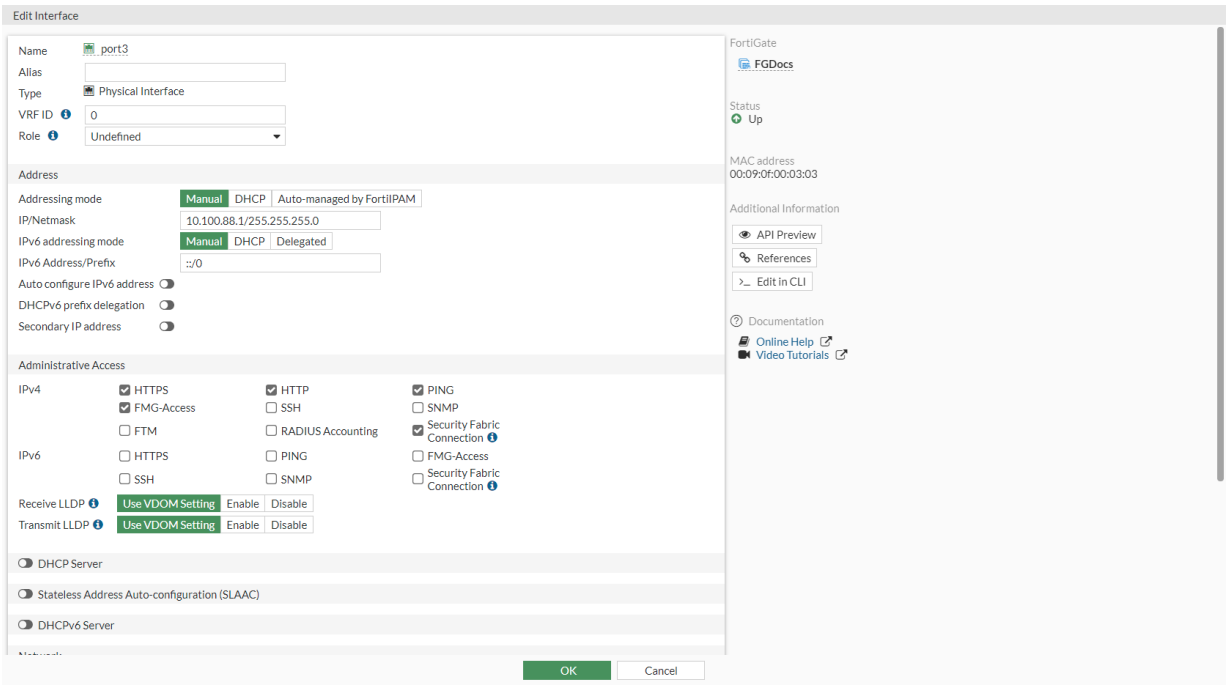
- If the interface role is undefined, LLDP reception and transmission inherit settings from the VDOM.
- If the interface role is WAN, LLDP reception is enabled.
- If the interface role is LAN, LLDP transmission is enabled.



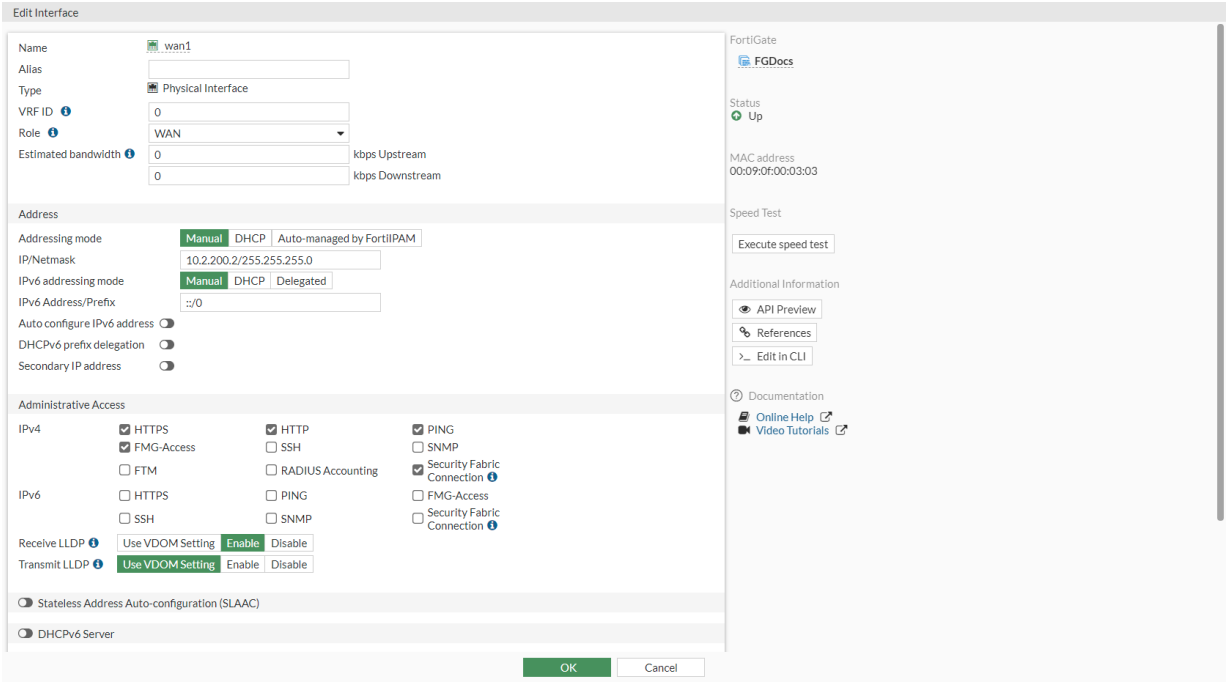
When a FortiGate B's WAN interface detects that FortiGate A's LAN interface is immediately upstream (through the default gateway), and FortiGate A has Security Fabric enabled, FortiGate B will show a notification on the GUI asking to join the Security Fabric.

To configure LLDP reception and join a Security Fabric in the GUI:

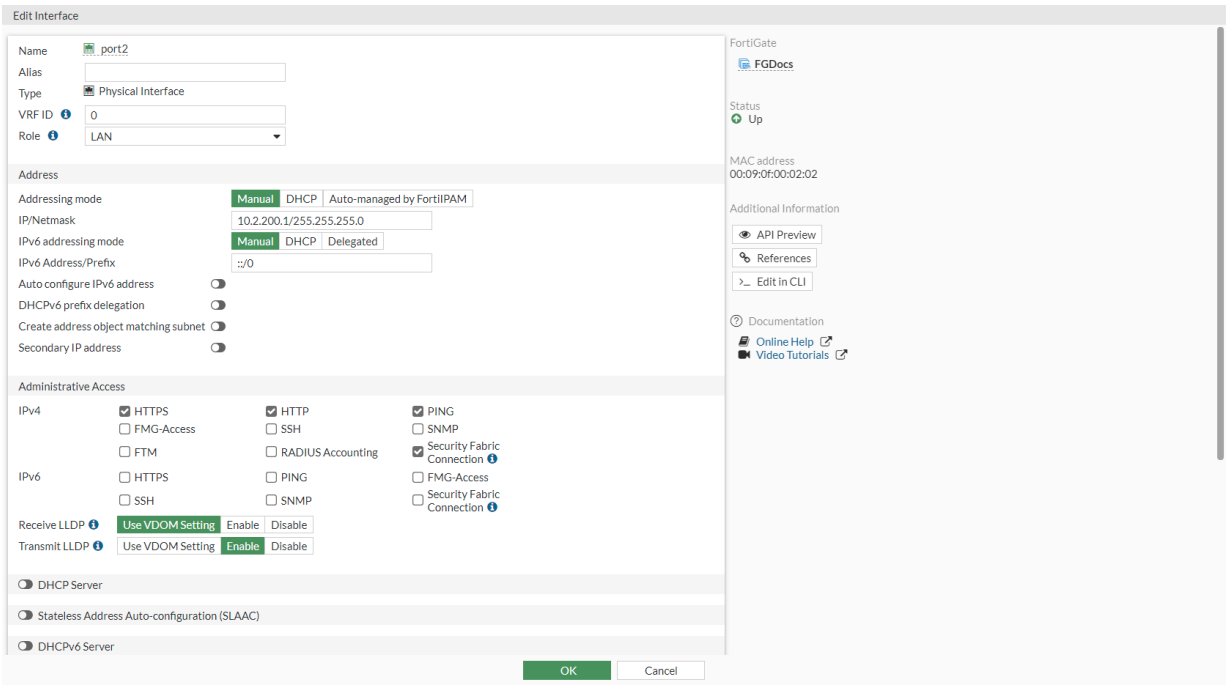
1. On FortiGate A, go to *Network* > *Interfaces*.
2. Configure an interface:
   - If the interface's role is undefined, under *Administrative Access*, set *Receive LLDP* and *Transmit LLDP* to *Use VDOM Setting*.



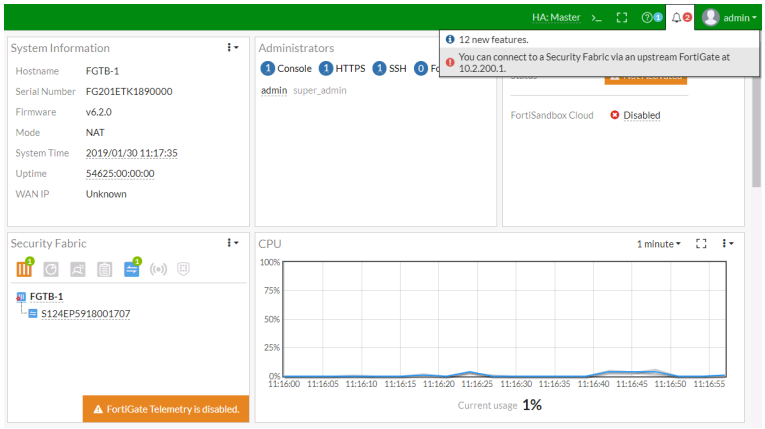
- If the interface's role is WAN, under *Administrative Access*, set *Receive LLDP* to *Enable* and *Transmit LLDP* to *Use VDOM Setting*.



- If the interface's role is LAN, under *Administrative Access*, set *Receive LLDP* to *Use VDOM Setting* and *Transmit LLDP* to *Enable*.



3. Click *OK*. A notification is shown on FortiGate B, *You can connect to a Security Fabric via an upstream FortiGate at 10.2.200.1*.



4. Click the notification. The *Core Network Security* page with the Security Fabric settings opens. All the required settings automatically configured.
5. Click *OK* to apply the settings.

To configure LLDP reception and join a Security Fabric in the CLI:

1. Configure the interface on FortiGate A:
   - Undefined role

```
config system interface
    edit "port3"
        set lldp-reception vdom
        set lldp-transmission vdom
        set role undefined
        ...
```

```
    next
end
```

- WAN role

```
config system interface
    edit "wan1"
        set lldp-reception enable
        set lldp-transmission vdom
        set role wan
        ...
    next
end
```

- LAN role

```
config system interface
    edit "port2"
        set lldp-reception vdom
        set lldp-transmission enable
        set role lan
        ...
    next
end
```

2. Edit the Security Fabric settings on FortiGate B:

```
config system csf
    set status enable
    set upstream-ip 10.2.200.1
end
```

Configuring the Security Fabric with SAML

Security Assertion Markup Language (SAML) is an open standard for exchanging authentication and authorization data between one Identity Provider (IdP) and one or more Service Providers (SP). Both parties exchange messages using the XML protocol as transport. FortiGate firewall devices can be configured as IdPs or SPs.

When the Security Fabric is enabled, you can configure the root FortiGate as the IdP. You can also configure downstream FortiGates to be automatically configured as SPs, with all links required for SAML communication, when added to the Security Fabric. Administrators must still be authorized on each device. Credentials are verified by the root FortiGate, and login credentials are shared between devices. Once authorized, an administrator can move between fabric devices without logging in again.

Optionally, the downstream FortiGate can also be manually configured as an SP, and then linked to the root FortiGate.

The authentication service is provided by the root FortiGate using local system admin accounts for authentication. Any of the administrator account types can be used for SAML log in. After successful authentication, the administrator logs in to the first downstream FortiGate SP, and can then connect to other downstream FortiGates that have the SSO account properly configured, without needing to provide credentials again, as long as admins use the same browser session. In summary, the root FortiGate IdP performs SAML SSO authentication, and individual device administrators define authorization on FortiGate SPs by using security profiles.

Configuring single-sign-on in the Security Fabric

SAML SSO enables a single FortiGate device to act as the identify provider (IdP), while other FortiGate devices act as service providers (SP) and redirect logins to the IdP.

Only the root FortiGate can be the identity provider (IdP). The downstream FortiGates can be configured as service providers (SP).

The process is as follows:

1. Configuring the root FortiGate as the IdP on page 1672
2. Configuring a downstream FortiGate as an SP on page 1673
3. Configuring certificates for SAML SSO on page 1675
4. Verifying the single-sign-on configuration on page 1677

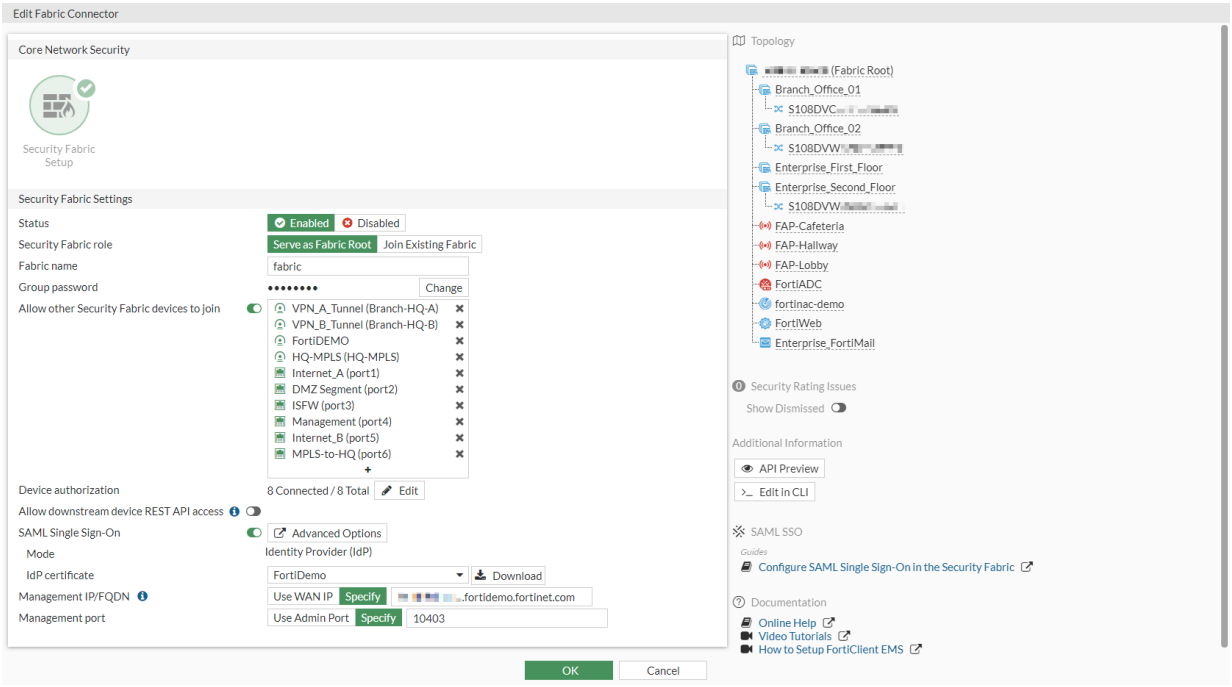
You can also use the CLI. See CLI commands for SAML SSO on page 1678.

Configuring the root FortiGate as the IdP

To configure the root FortiGate as the IdP:

1. Log in to the root FortiGate.
2. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Enable *SAML Single Sign-On*. The *Mode* field is automatically populated as *Identity Provider (IdP)*.
4. Enter an IP address in the *Management IP/FQDN* box.
5. Enter a management port in the *Management port* box.
   The *Management IP/FQDN* will be used by the SPs to redirect the login request. The *Management IP/FQDN* and *Management port* must be reachable from the user's device.
6. Select the *IdP certificate*.

7. Click *OK*.



Configuring a downstream FortiGate as an SP

There are two ways to configure the downstream FortiGate:

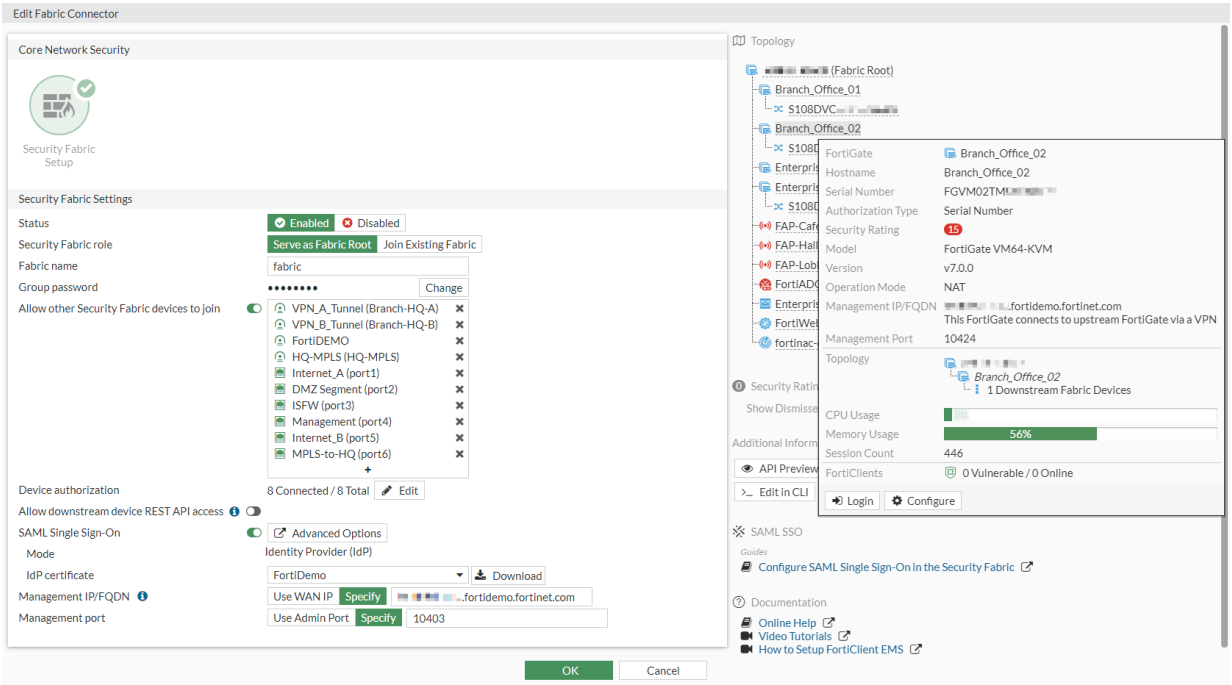
- From the root FortiGate
- From within the downstream device

An SP must be a member of the Security Fabric before you configure it.

To configure the downstream FortiGate from the root FortiGate:

1. Log in to the root FortiGate.
2. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.

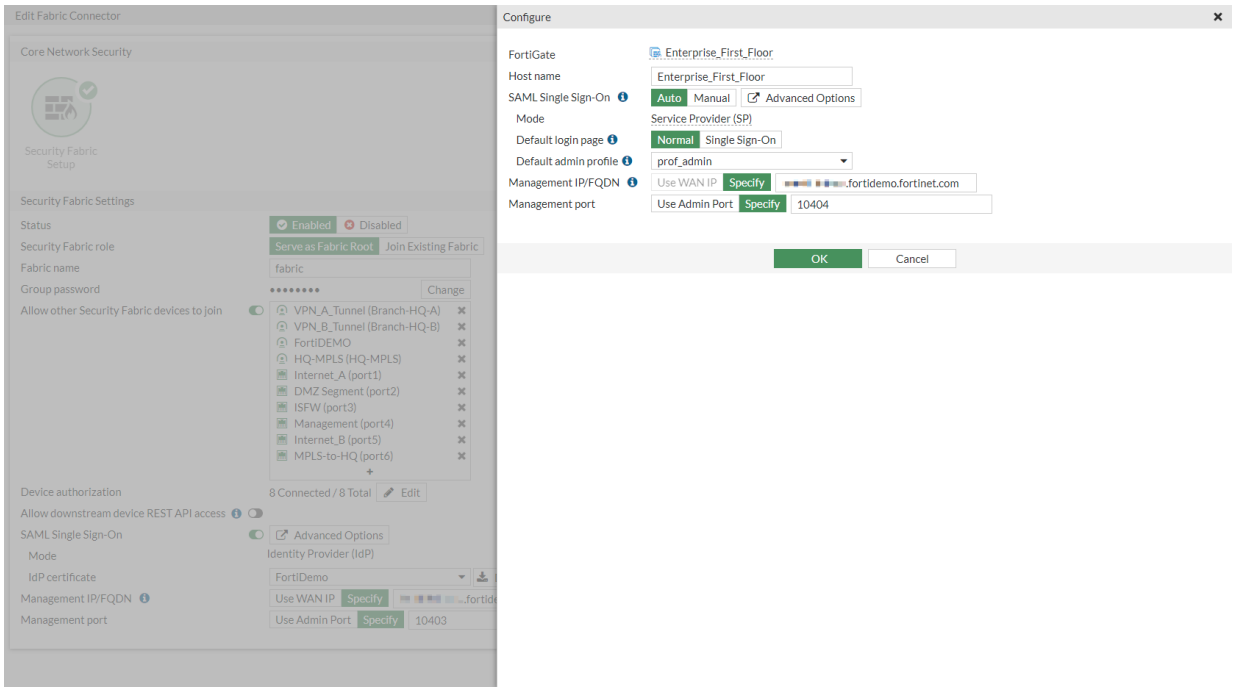
3. In the *Topology* tree, hover over a FortiGate and click *Configure*.



The *Configure* pane opens.

4. Select a *SAML Single Sign-On* option. *Auto* sets the device to SP mode. *Manual* allows you to configure the SSO settings by clicking *Advanced Options*.
5. Select a *Default login page* option.
6. Select one of the following *Default admin profile* types: *prof_admin*, *super_admin*, or *super_admin_readonly*.
7. Enter an IP address in the *Management IP/FQDN* box.
8. Enter a management port in the *Management port* box.
   The *Management IP/FQDN* will be used by the IdP and so other SPs can redirect to each other. The *Management port* must be reachable from the user's device.

9. Click *OK*.



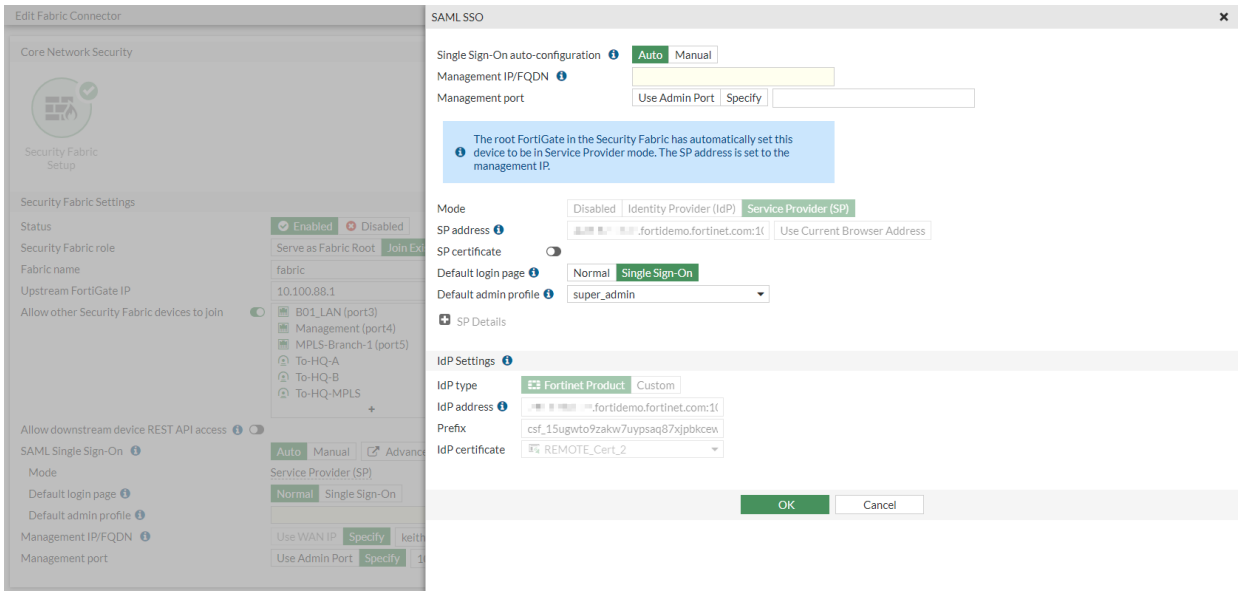
To configure the downstream FortiGate within the device:

1. Log in to the downstream FortiGate.
2. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Select a *SAML Single Sign-On* option. *Auto* sets the device to SP mode. *Manual* allows you to configure the SSO settings by clicking *Advanced Options*.
4. Select a *Default login page* option.
5. Select one of the following *Default admin profile* types: *prof_admin*, *super_admin*, or *super_admin_readonly*.
6. Enter an IP address in the *Management IP/FQDN* box.
7. Enter a management port in the *Management port* box.
   The *Management IP/FQDN* will be used by the IdP and so other SPs can redirect to each other. The *Management port* must be reachable from the user's device.
8. Click *OK*.

Configuring certificates for SAML SSO

Because communication between the root FortiGate IdP and FortiGate SPs is secured, you must select a local server certificate in the *IdP certificate* option on the root FortiGate. When downstream SPs join the IdP (root FortiGate), the SP automatically obtains the certificate.

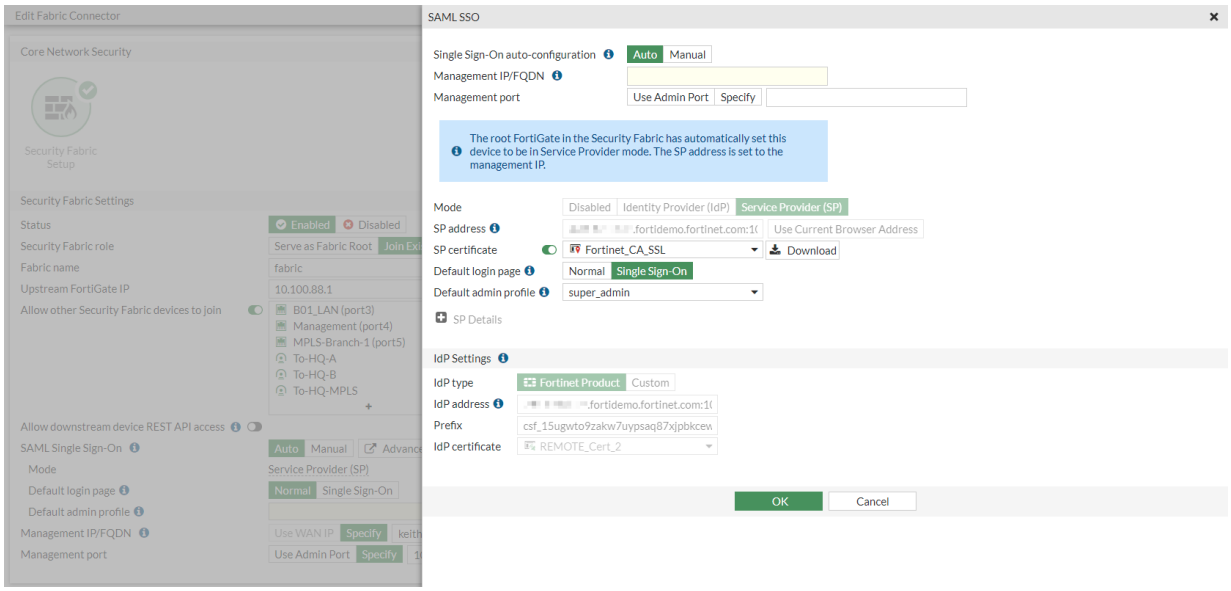
In the following SP example, the *IdP certificate* displays *REMOTE_Cert_2*, which is the root server certificate for the IdP:



It is possible to manually import a certificate from an SP to the IdP so it can be used for authentication.

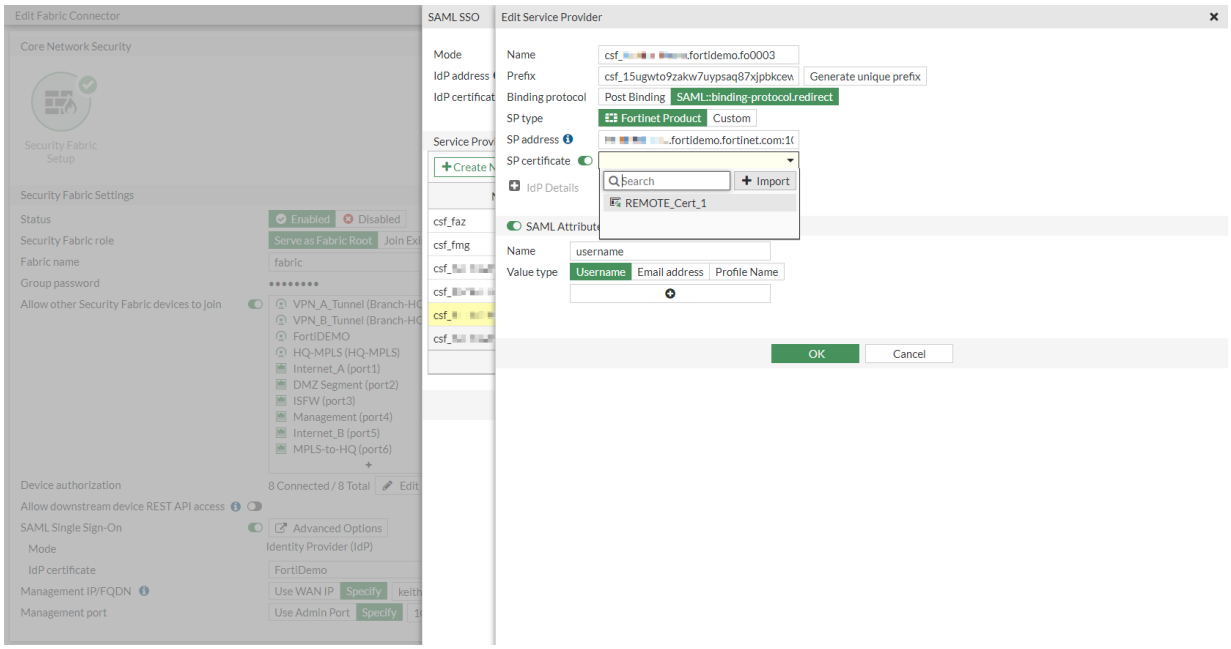
To manually import an SP certificate to an IdP:

1. Add the certificate:
   a. On the SP, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. Click *Advanced Options*. The *SAML SSO* pane opens.
   c. Enable *SP certificate* and select a certificate from the dropdown box.
   d. Click *Download*. The certificate is downloaded on the local file system.
   e. Click *OK*.



2. Import the certificate:
   a. On the IdP, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. Click *Advanced Options*. The *SAML SSO* pane opens.
   c. In the *Service Providers* table, select the SP from step 1 and click *Edit*.

d. Enable *SP certificate* and in the dropdown box, click *Import*.



The *Upload Remote Certificate* window opens.

e. Click *Upload* and select the certificate downloaded in step 1.

f. Click *OK*. The certificate is imported.

g. Click *OK*.

h. In the *IdP certificate* list, select the certificate that you imported.

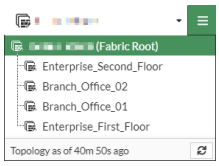
i. Click *OK*.

Verifying the single-sign-on configuration

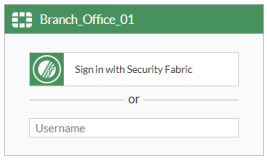
After you have logged in to a Security Fabric member using SSO, you can navigate between any Security Fabric member with SSO configured.

To navigate between Security Fabric members:

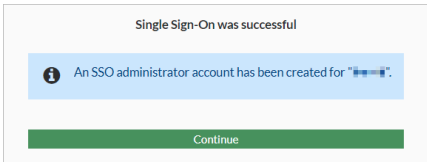
1. Log in to a Security Fabric member that is using SSO.
2. In the top banner, click the name of the device you are logged in to. A list of Security Fabric members displays.



3. Click a Security Fabric member. The login page appears. Click *Sign in with Security Fabric*.

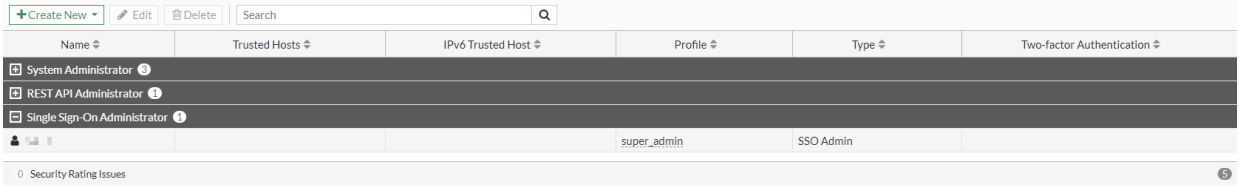


4. A prompt appears that an SSO administrator account has been created. Click *Continue*.



You are now logged in to the Security Fabric member with SSO. The letters "SSO" also display beside the user name in the top banner.

5. Go to *System* > *Administrators* > *Single-Sign-On Administrator* to view the list of SSO admins created.



CLI commands for SAML SSO

To enter a question mark (?) or a tab, Ctrl + V must be entered first. Question marks and tabs cannot be typed or copied into the CLI Console or some SSH clients.

To configure the IdP:

```
config system saml
    set status enable
    set role identity-provider
    set cert "Fortinet_Factory"
    set server-address "172.16.106.74"
    config service-providers
        edit "csf_172.16.106.74:12443"
            set prefix "csf_ngczjwqxujfsbhgr9ivhehwu37fml20"
            set sp-entity-id "http://172.16.106.74/metadata/"
            set sp-single-sign-on-url "https://172.16.106.74/saml/?acs"
            set sp-single-logout-url "https://172.16.106.74/saml/?sls"
            set sp-portal-url "https://172.16.106.74/saml/login/"
            config assertion-attributes
                edit "username"
                next
                edit "tdoc@fortinet.com"
                    set type email
                next
            end
        next
    end
end
```

To configure an SP:

```
config system saml
    set status enable
    set cert "Fortinet_Factory"
    set idp-entity-id "http://172.16.106.74/saml-idp/csf_
```

```
ngczjwqxujfsbhgr9ivhehwu37fml20/metadata/"
    set idp-single-sign-on-url "https://172.16.106.74/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/login/"
    set idp-single-logout-url "https://172.16.106.74/saml-idp/csf_
ngczjwqxujfsbhgr9ivhehwu37fml20/logout/"
    set idp-cert "REMOTE_Cert_1"
    set server-address "172.16.106.74:12443"
end
```

To configure an SSO administrator:

```
config system sso-admin
    edit "SSO-admin-name"
        set accprofile <SSO admin user access profile>
        set vdom <Virtual domain(s) that the administrator can access>
    next
end
```

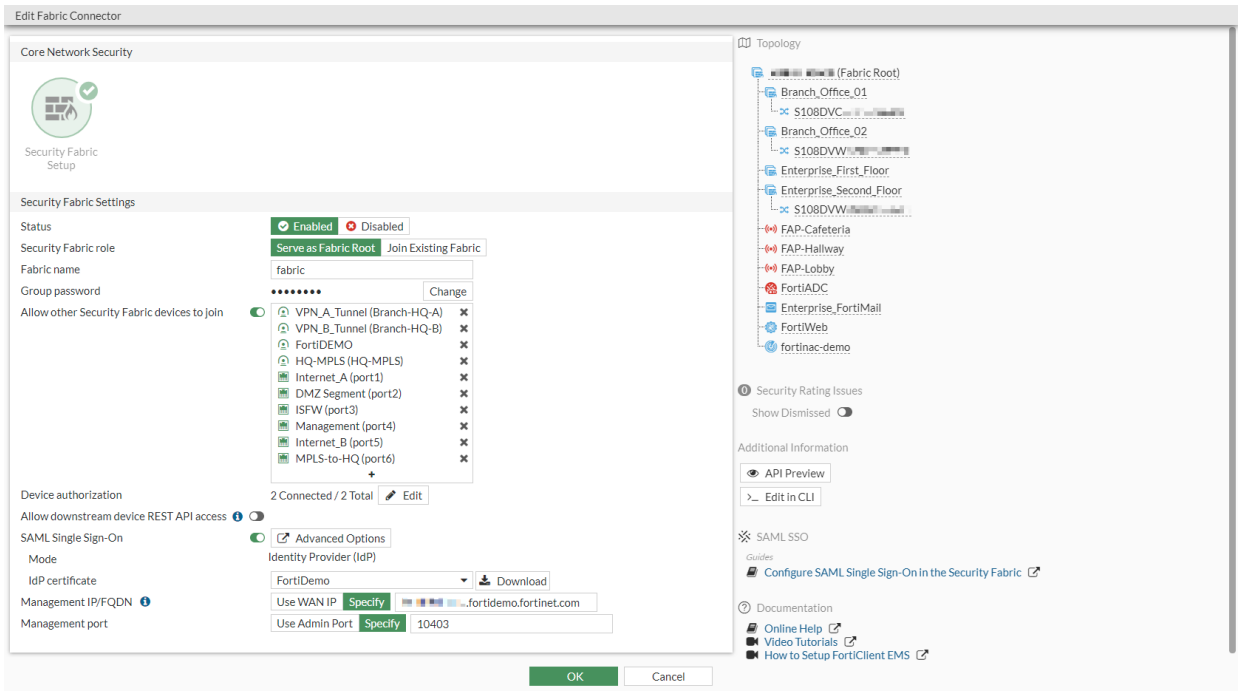
SAML SSO with pre-authorized FortiGates

You can set up SAML SSO authentication in a Security Fabric environment by starting with a root FortiGate that has one or more pre-authorized FortiGates.

After the initial configuration, you can add more downstream FortiGates to the Security Fabric, and they are automatically configured with default values for a service provider.

To set up basic SAML SSO for the Security Fabric:

1. Log in to the root FortiGate of the Security Fabric.
2. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. Join two pre-authorized FortiGates to the root FortiGate (see Configuring the root FortiGate and downstream FortiGates on page 1590).



4. Configure the IdP (see Configuring the root FortiGate as the IdP on page 1672).
5. Configure the SPs (see Configuring a downstream FortiGate as an SP on page 1673).

Navigating between Security Fabric members with SSO

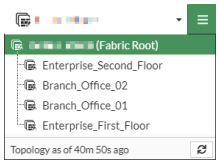
After you have logged in to a Security Fabric member by using SSO, you can navigate between any Security Fabric member with SSO configured. This can be done using the Security Fabric members dropdown menu or by logging in to a FortiGate SP from the root FortiGate IdP.

Security Fabric members dropdown

The Security Fabric members dropdown menu allows you to easily switch between all FortiGate devices that are connected to the Security Fabric. You can also use this menu to customize a FortiGate in the Security Fabric.

To navigate between Security Fabric members:

1. Log in to a Security Fabric member by using SSO.
2. In the top banner, click the name of the device you are logged into with SSO.
   A list of Security Fabric members is displayed.



3. Click the Security Fabric member.
   You are logged in to the Security Fabric member without further authentication.

To customize a FortiGate in the Security Fabric:

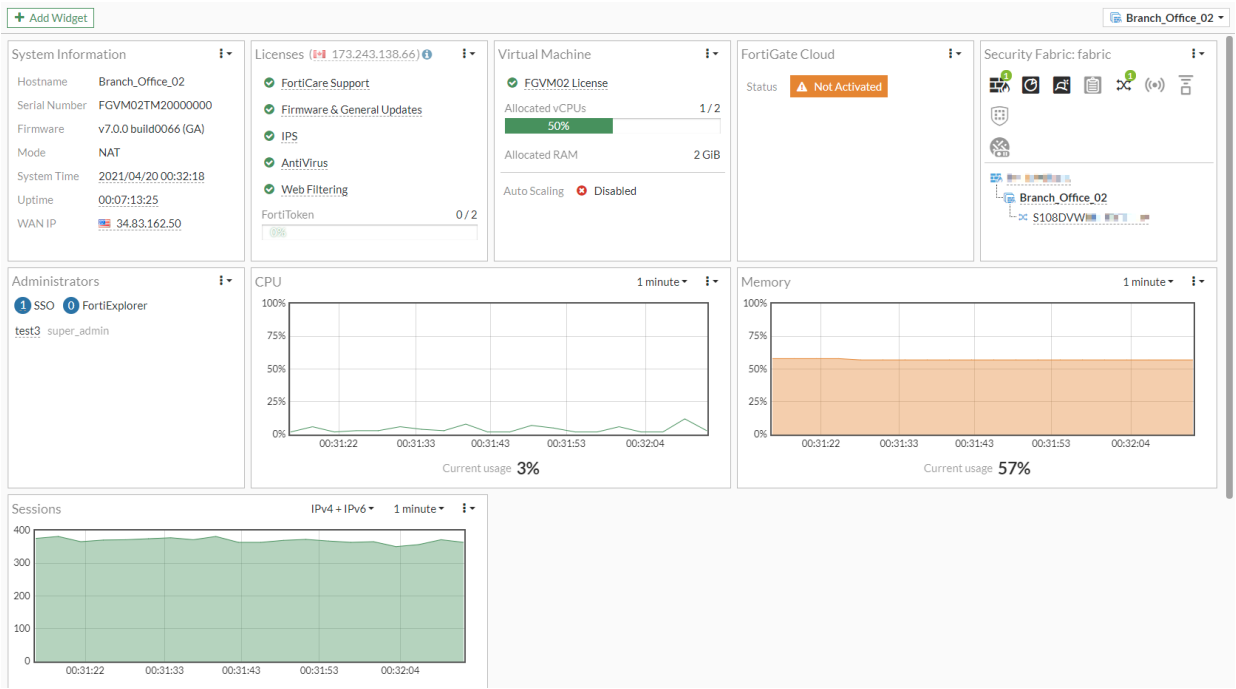
1. In the Security Fabric members dropdown menu, hover the cursor over a FortiGate so the tooltip is shown.
2. Click *Configure*. The *Configure* pane opens.
3. Edit the settings as required.
4. Click *OK*.

Logging in to an SP from the root IdP

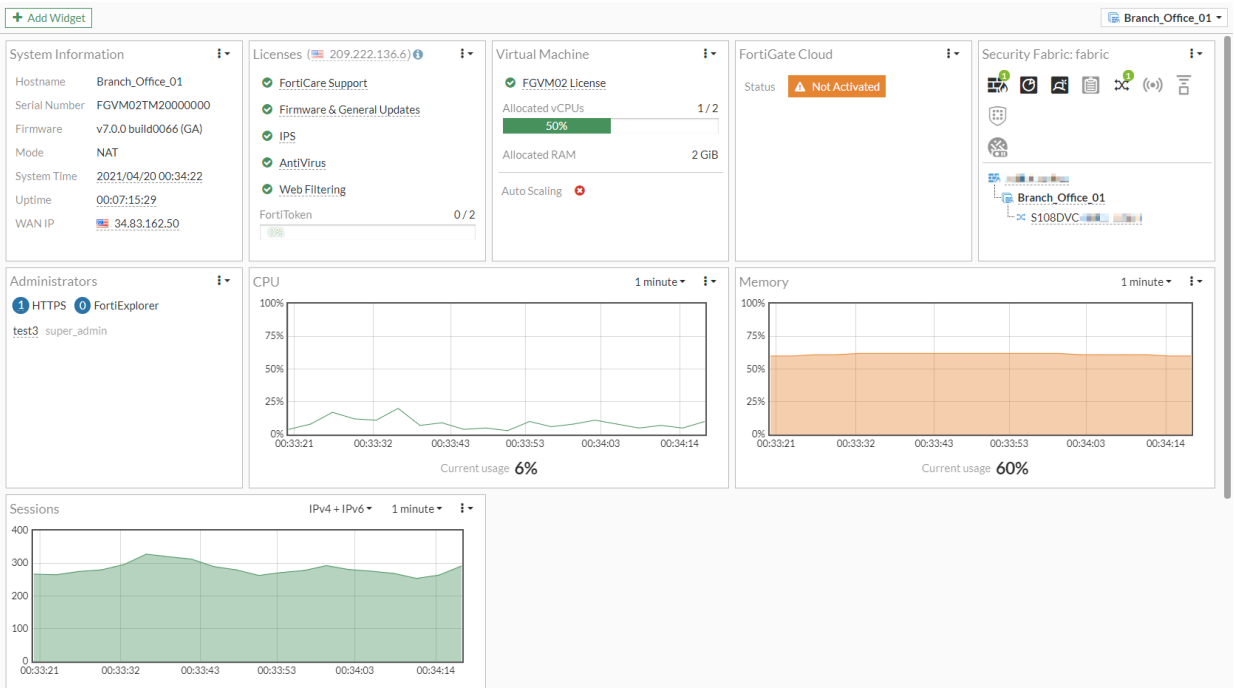
The following example describes how to log in to a root FortiGate IdP, and navigate to other FortiGate SPs in the Security Fabric without further authentication. The local administrator account is named *test3*. The local administrator account must also be available as an SSO administrator account on all downstream FortiGate SPs. Different tabs of the same browser are used to log in to the various FortiGates.

To log in to a FortiGate SP from a root FortiGate IdP:

1. Log in to the root FortiGate IdP by using the local administrator account.
   In this example, the local administrator account is named *test3*.
2. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
3. In the *Topology* tree, click one of the downstream FortiGate SPs, and select *Login to <name of FortiGate>*. The login screen is displayed.
4. In the login screen, select *Single Sign-On*.
   By using cookies in your local browser for the already-authenticated SSO administrator, FortiGate logs you in to the downstream FortiGate SP as the SSO administrator. In this example, the SSO administrator name is *test3*.



5. While still logged into the root FortiGate IdP in your browser, go to the browser tab for the root FortiGate IdP, and log in to another FortiGate SP that is displayed on the *Security Fabric* widget in the GUI.



SAML SSO login uses *SAML_IDP* session cookies of already authenticated admin users in your local browser cache to send to the root FortiGate IdP for authentication. If your browser cache is manually cleared, or you close your browser, you must authenticate again.

It is possible to log in to one downstream FortiGate SP in a Security Fabric, and then open another tab in your browser to connect to another FortiGate SP that is not a member of the Security Fabric.

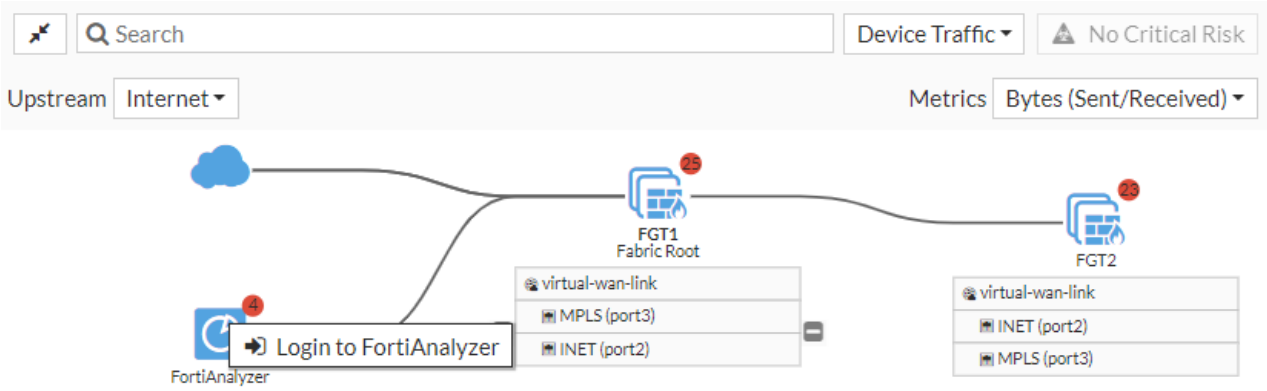
This is useful in cases where the SSO administrator and the local system administrator on the FortiGate SP both have the same login name, but are two different entities.

Integrating FortiAnalyzer management using SAML SSO

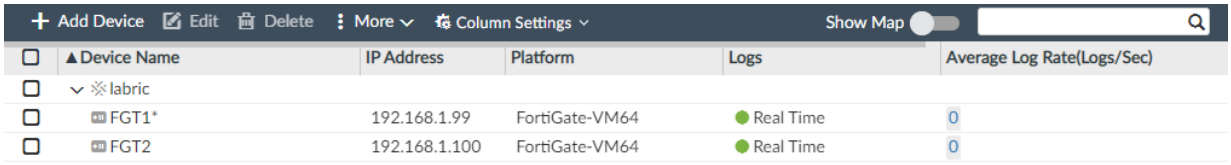
When a FortiGate acting as a Security Fabric root is configured as a SAML SSO identity provider (IdP), the FortiAnalyzer of the Security Fabric can register itself as a service provider (SP). This simplifies the configuration by enabling the setting in FortiAnalyzer to facilitate Fabric SSO access to the FortiAnalyzer once authenticated to the root FortiGate. When signed in using SSO, the FortiAnalyzer includes a Security Fabric navigation dropdown, which allows easy navigation to FortiGates in the Fabric.

To enable FortiAnalyzer as a Fabric SP in the GUI:

1. On the root FortiGate, go to *Security Fabric* > *Physical Topology* or *Logical Topology*.
2. In the topology, click the *FortiAnalyzer* icon and select *Login to FortiAnalyzer*.



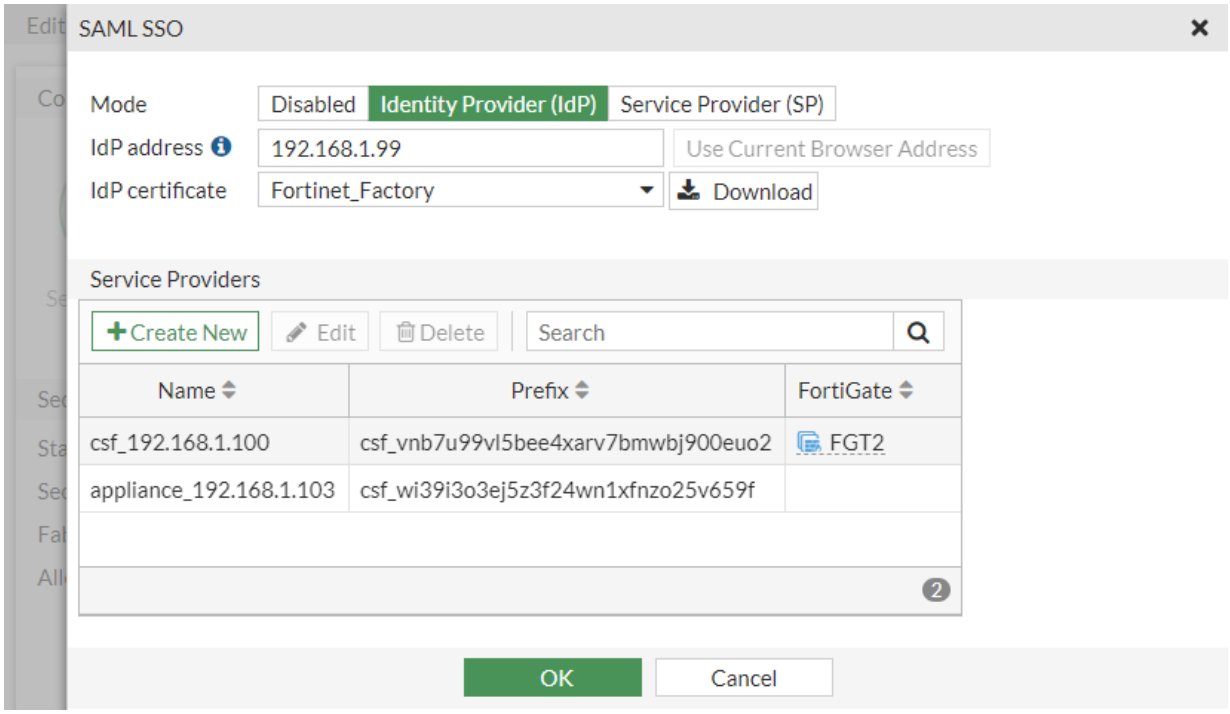
3. Enter the credentials to log in. A Security Fabric must be configured with the Fabric devices listed under the Fabric name.
   a. Go to *Device Manager* to verify the Fabric setup. There is an asterisk beside the root FortiGate.



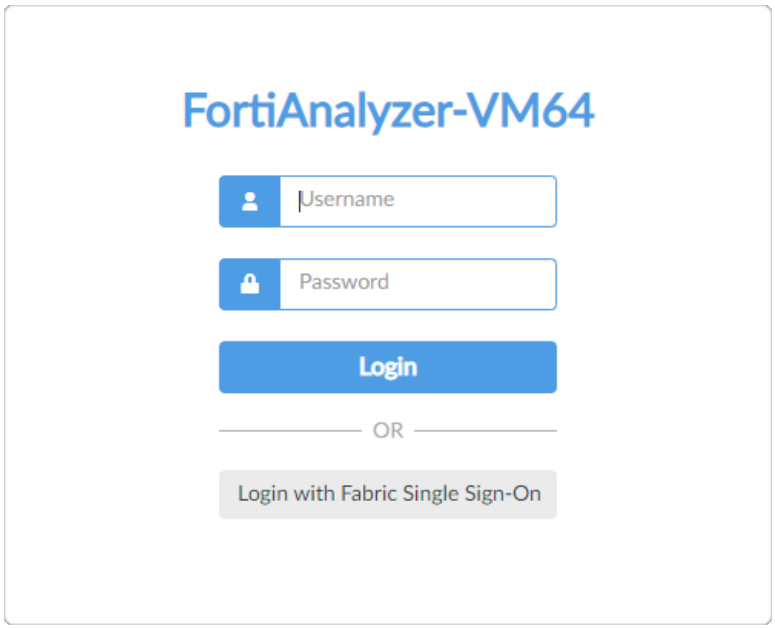
4. Edit the FortiAnalyzer SAML SSO settings:
   a. Go to *System Settings* > *Admin* > *SAML SSO*.
   b. For *Single Sign-On Mode*, select *Fabric SP* and enter the address to access the FortiAnalyzer in *Server Address*.

   c. Click *Apply* and log out of the FortiAnalyzer. The FortiAnalyzer will automatically register itself on the FortiGate and is a visible appliance in the list of SPs.

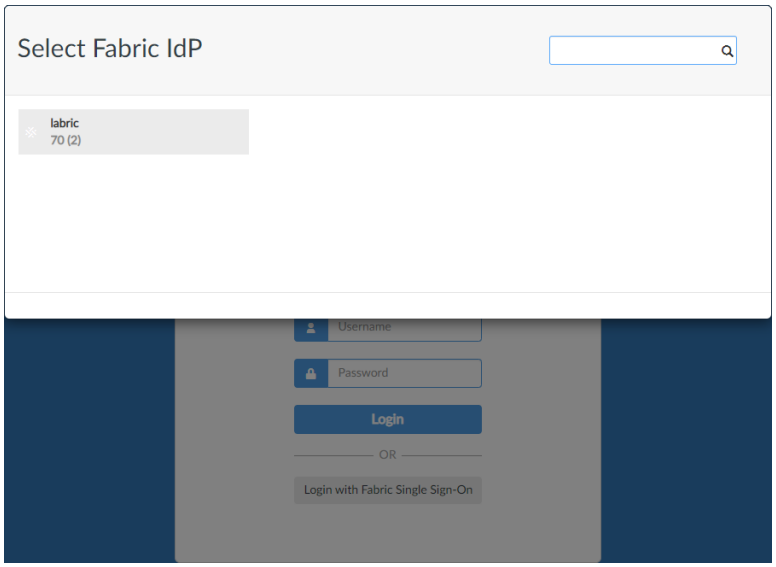
5. Verify that the FortiAnalyzer registration was successful:
   a. In FortiOS, go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
   b. In the *SAML Single Sign-On* section click *Advanced Options*. There should be an entry for the FortiAnalyzer in the *Service Providers* table (*appliance_192.168.1.103*).



6. Log in to the FortiAnalyzer. There is a new option to *Login with Fabric Single Sign-On*.



7. Click *Login with Fabric Single Sign-On*. A dialog appears to select a Fabric IdP.



8. Select a FortiGate. The ADOM containing that FortiGate opens.

To enable FortiAnalyzer as a Fabric SP in the CLI:

1. In FortiAnalyzer, enable the device as a Fabric SP:

```
config system saml
    set status enable
    set role FAB-SP
    set server-address "192.168.1.99"
end
```

   FortiAnalyzer will register itself on the FortiGate as an appliance.

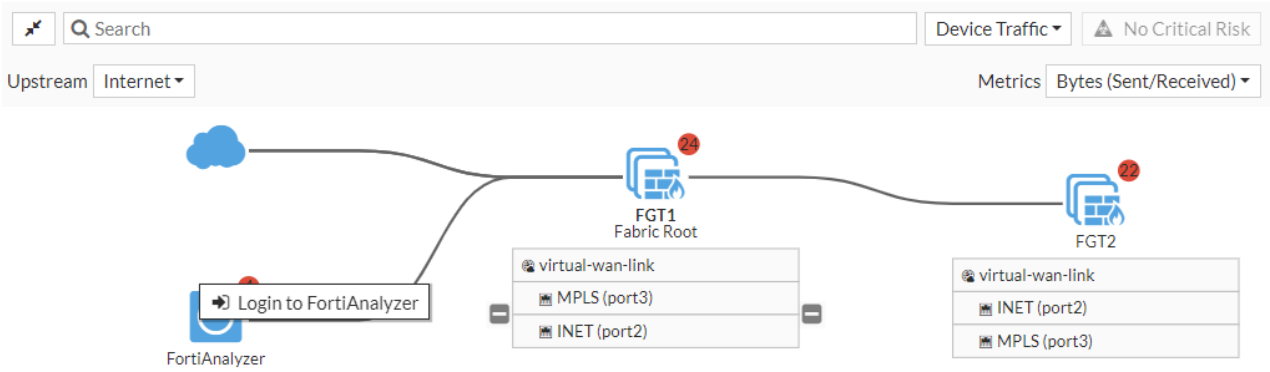
2. Verify the configuration in FortiOS:

```
show system saml
config system saml
    set status enable
    set role identity-provider
    set cert "fortigate.domain.tld"
    set server-address "192.168.1.99"
    config service-providers
        edit "appliance_192.168.1.103"
            set prefix "csf_76sh0bm4e7hf1ty54w42yrrv88tk8uj"
            set sp-entity-id "http://192.168.1.103/metadata/"
            set sp-single-sign-on-url "https://192.168.1.103/saml/?acs"
            set sp-single-logout-url "https://192.168.1.103/saml/?sls"
            set sp-portal-url "https://192.168.1.103/saml/login/"
            config assertion-attributes
                edit "username"
                next
                edit "profilename"
                    set type profile-name
                next
```

```
            end
        next
    end
end
```

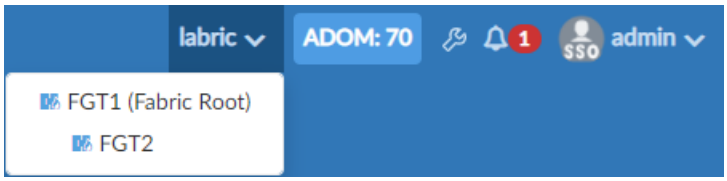
To navigate between devices using SAML SSO in FortiOS:

1. Log in to the root FortiGate.
2. Go to *Security Fabric* > *Physical Topology* or *Logical Topology*.
3. In the topology, click the *FortiAnalyzer* icon and select *Login to FortiAnalyzer*.



To navigate between devices using SAML SSO in FortiAnalyzer:

1. Log in to the FortiAnalyzer using SSO.
2. Navigate to the ADOM that contains the root FortiGate of the Security Fabric.
3. In the toolbar, click the Security Fabric name to display a dropdown a list of the Fabric FortiGates.



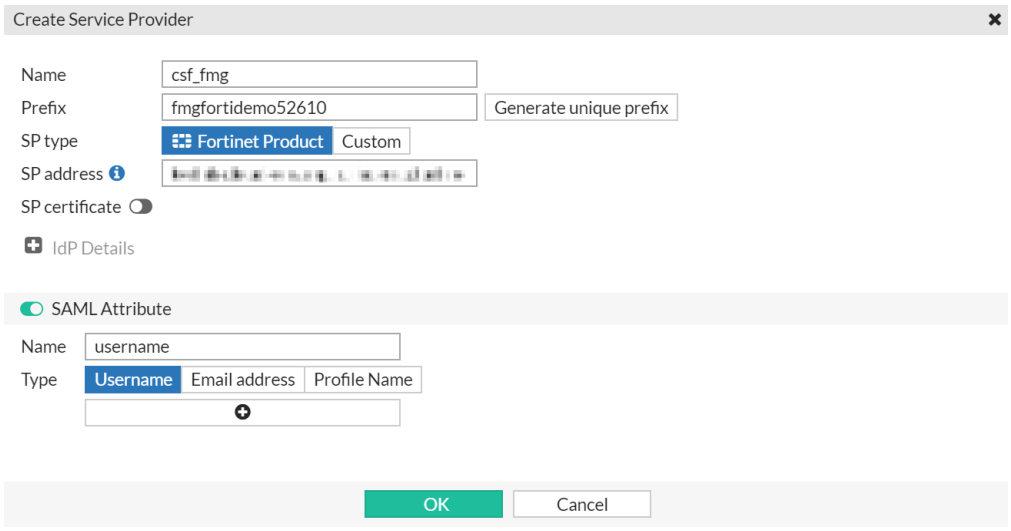
Integrating FortiManager management using SAML SSO

When a FortiGate is configured as the SAML SSO IdP, FortiManager can be added as an SP.

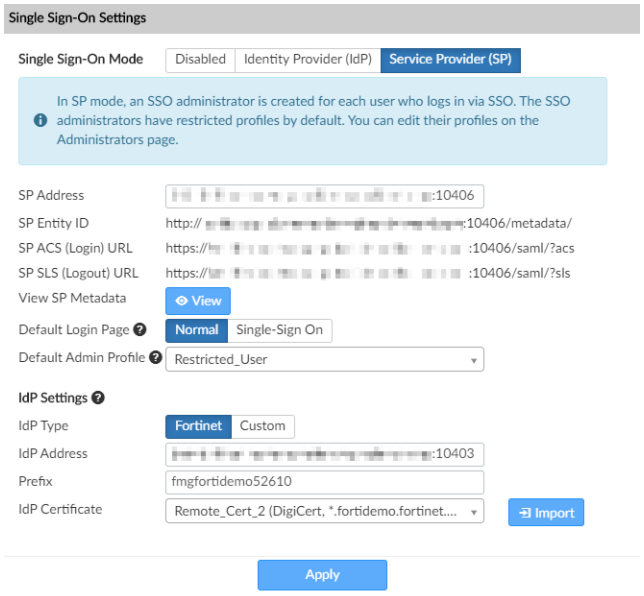
To configure FortiManager as a Fabric SP:

1. On the root FortiGate, go to *Security Fabric* > *Fabric Connectors*, and edit the *Security Fabric Setup* connector.
2. In the *Security Fabric Settings* section, click *Advanced Options*.
3. In the *Service Providers* section, click *Create New*.
4. Enter a name and a prefix for the SP. FortiOS generates a unique prefix, but you can enter your own.

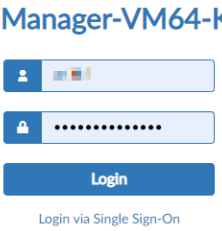
5. In *SP address*, enter the FortiManager address including the port number.



6. Click *OK*.
7. In FortiManager, go to *System Settings* > *Admin* > *SAML SSO* and in the *Single Sign-On Mode* section, click *Service Provider (SP)*.
8. Configure the *IdP Settings*:
   a. For *IdP Type*, click *Fortinet*.
   b. For *IdP Address*, enter the root FortiGate address including the port number.
   c. Enter the *Prefix* of the SP.
   d. For *IdP Certificate*, import the same certificate used on the root FortiGate.
   e. Click *Apply*.



9. To verify that the configuration works, log out of FortiManager and log in using the *Login via Single-Sign-On* link.

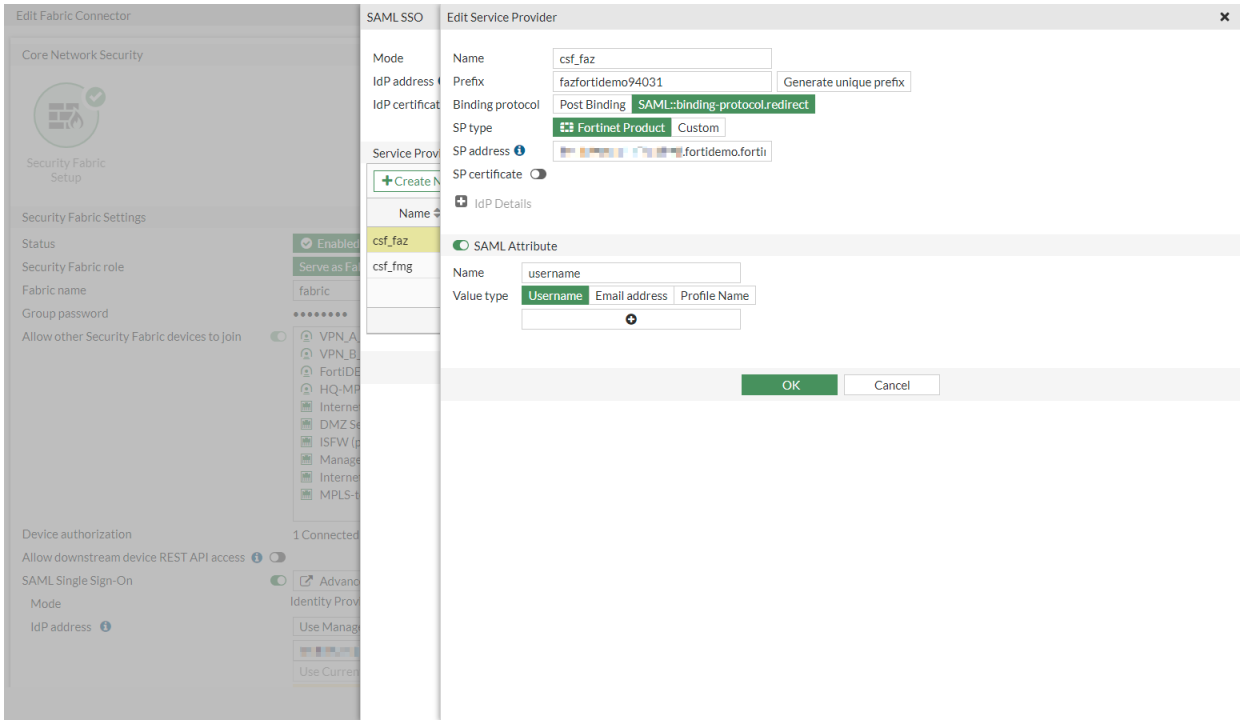


Advanced option - FortiGate SP changes

From a root FortiGate IdP, you can edit each of the FortiGate SPs. For example, you can edit a FortiGate SP to generate a new prefix, or you can add or modify SAML attributes. When you generate a new prefix value, it is propagated to the respective downstream FortiGates.

To edit an SP from the root FortiGate (IdP):

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Security Fabric Setup* card.
2. Click *Advanced Options*. The *SAML SSO* pane opens.
3. In the *Service Providers* table, select a device and click *Edit*. The *Edit Service Provider* pane opens.



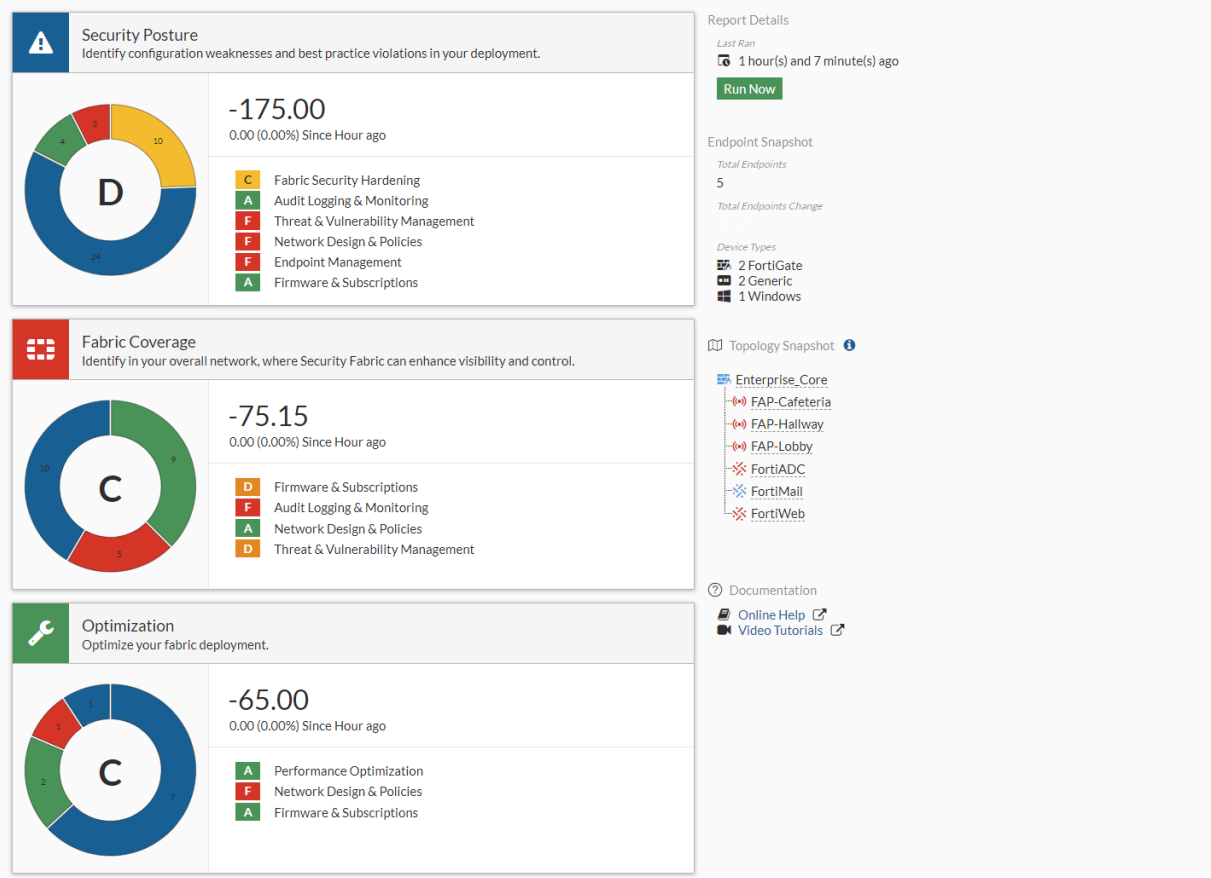
4. Edit the settings as needed.
5. Click *OK*.

Security rating

The security rating uses real-time monitoring to analyze your Security Fabric deployment, identify potential vulnerabilities, highlight best practices that can be used to improve the security and performance of your network, and calculate Security Fabric scores.

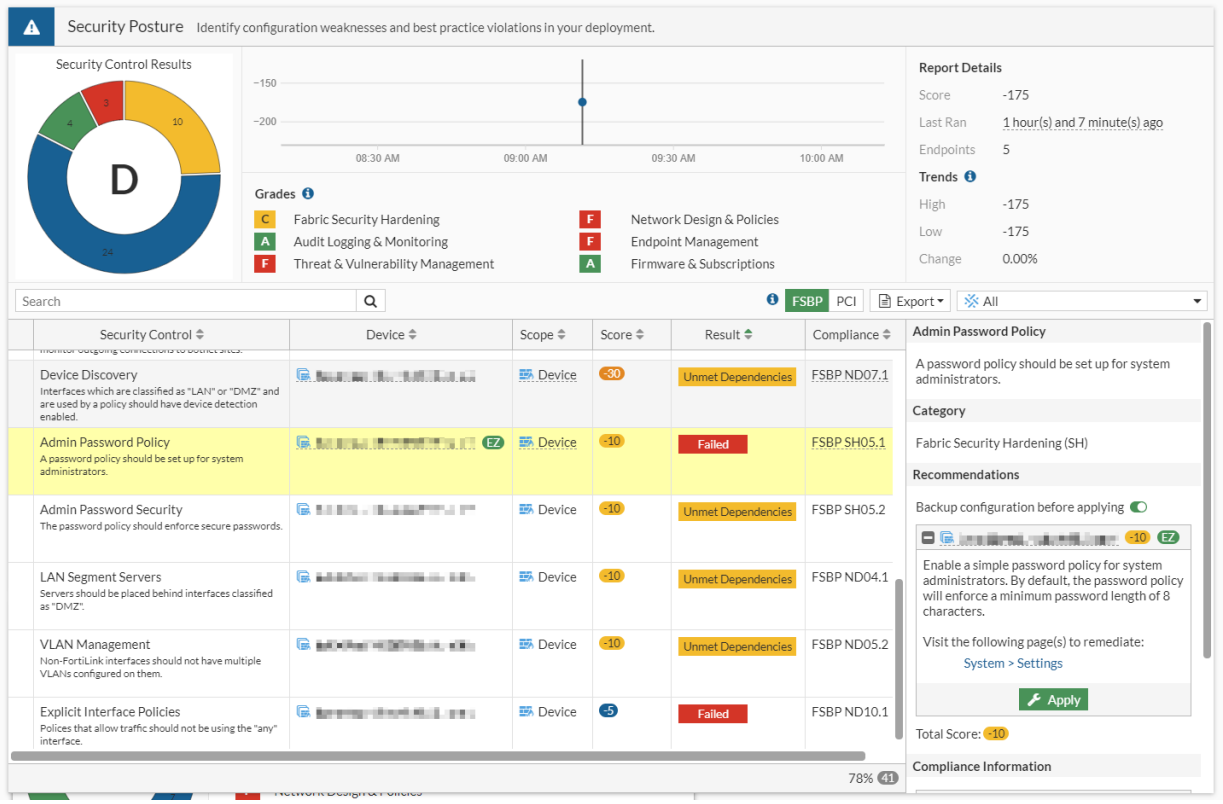
To view the security rating, go to *Security Fabric* > *Security Rating* on the root FortiGate.

The *Security Rating* page is separated into three major scorecards: *Security Posture*, *Fabric Coverage*, and *Optimization*, which provide an executive summary of the three largest areas of security focus in the Security Fabric.

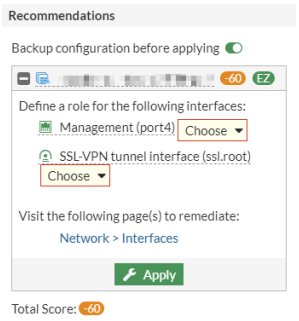


The scorecards show an overall letter grade and breakdown of the performance in sub-categories. Clicking a scorecard drills down to a detailed report of itemized results and compliance recommendations. The point score represents the net score for all passed and failed items in that area. In the drill down report, hover the cursor over a score to view the calculation breakdown.

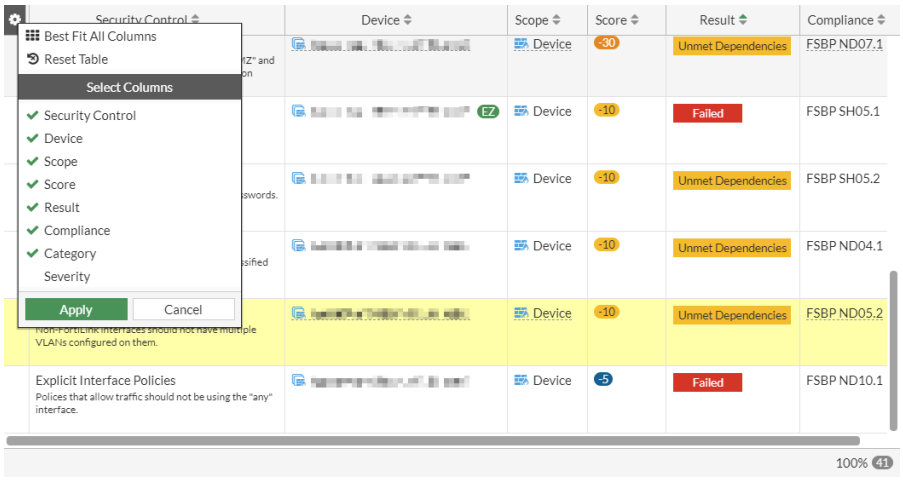
The report includes the security controls that were tested against, linking to specific FSBP or PCI compliance policies. Click the *FSBP* and *PCI* buttons to reference the corresponding standard. Users can search or filter the report results. If there is a failed check on the scorecard, there is a link in the *Recommendations* section that takes you to the page to resolve the problem.



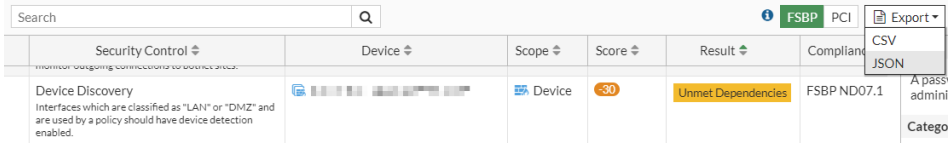
Certain remediations marked with an *EZ* symbol represent configuration recommendations that support *Easy Apply*. In the panel on the right, in the *Recommendations* section, click *Apply* to apply the changes to resolve the failed security control.



The report table can be customized by adding more columns, such as *Category*, to view, filter, or sort the results based on scorecard categories. Click the gear icon to customize the table.



Users can also export the reports as CSV or JSON files by clicking the *Export* dropdown.



To exit the current view, click the icon beside the scorecard title to return to the summary view.

For more information about security ratings, and details about each of the checks that are performed, go to Security Best Practices & Security Rating Feature.

Security rating licenses are required to run security rating checks across all the devices in the Security Fabric and to display certain notifications. It also allows ratings scores to be submitted to and received from FortiGuard for ranking networks by percentile.

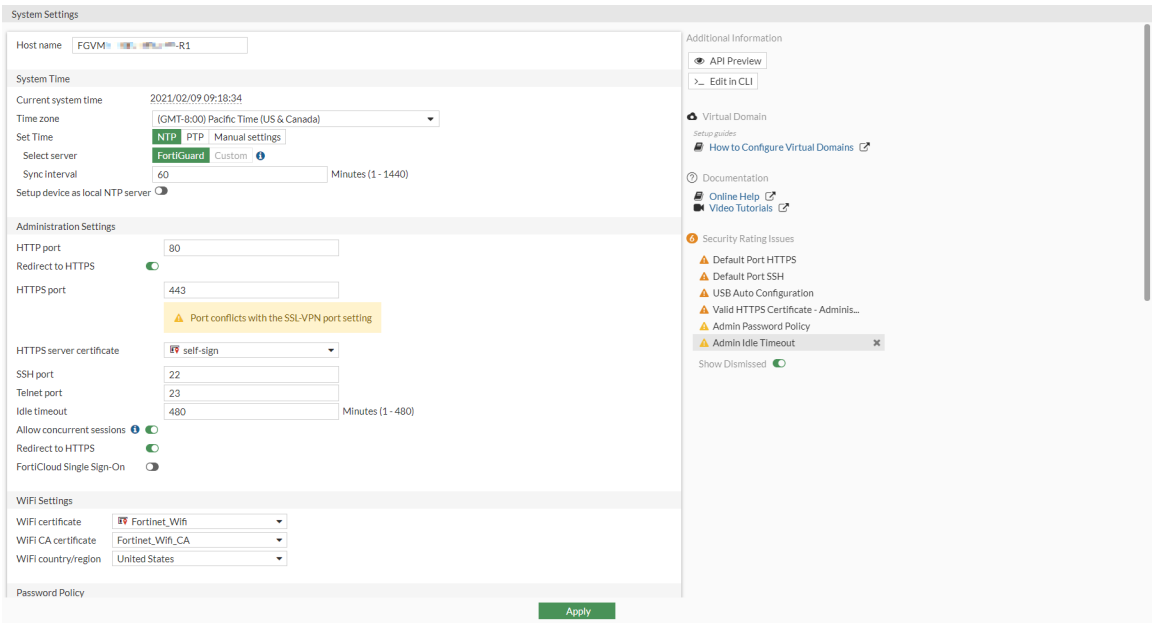
See FortiGuard Security Rating Service for more information.

Security rating notifications

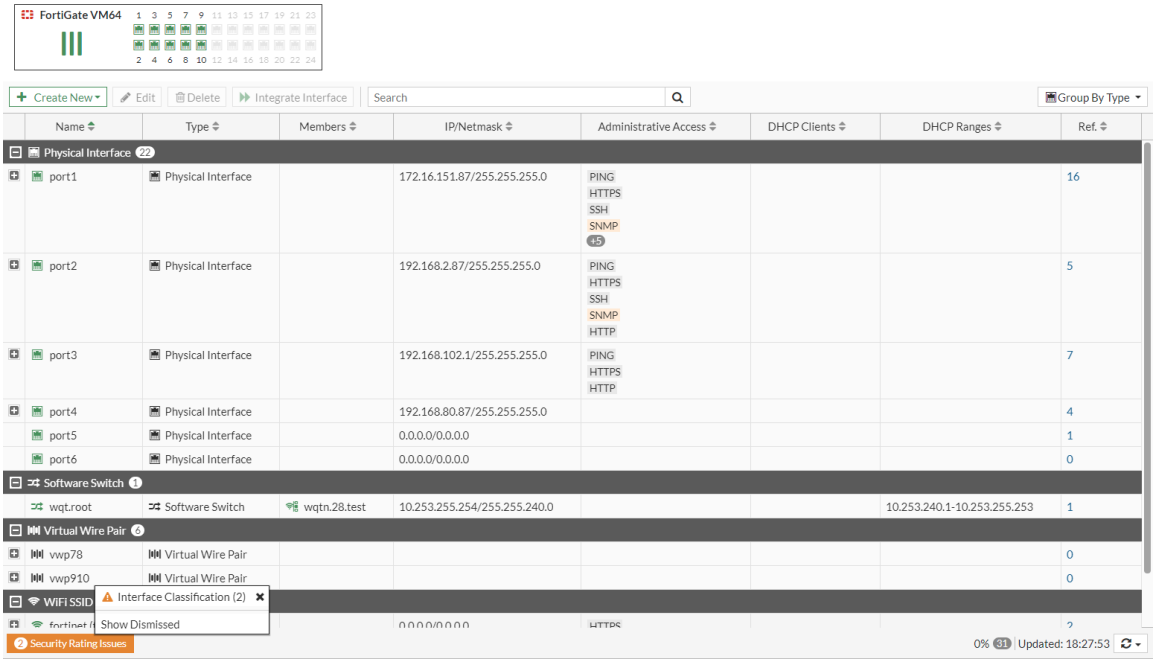
Security rating notifications are shown on settings pages, which list configuration issues determined by the security rating report. You can open the recommendations to see which items need to be fixed. Notifications can be dismissed in the GUI. Dismissed issues are unique for each administrator. Hashes for dismissed notifications are saved in local storage. If a user clears the local storage, all issues will show up again as not dismissed.

Notification locations

On the *System* > *Settings* page, there is a *Security Rating Issues* section in the right-side gutter. To dismiss a notification, hover over the issue and click the *X* beside it. To view dismissed notifications, enable *Show Dismissed*.

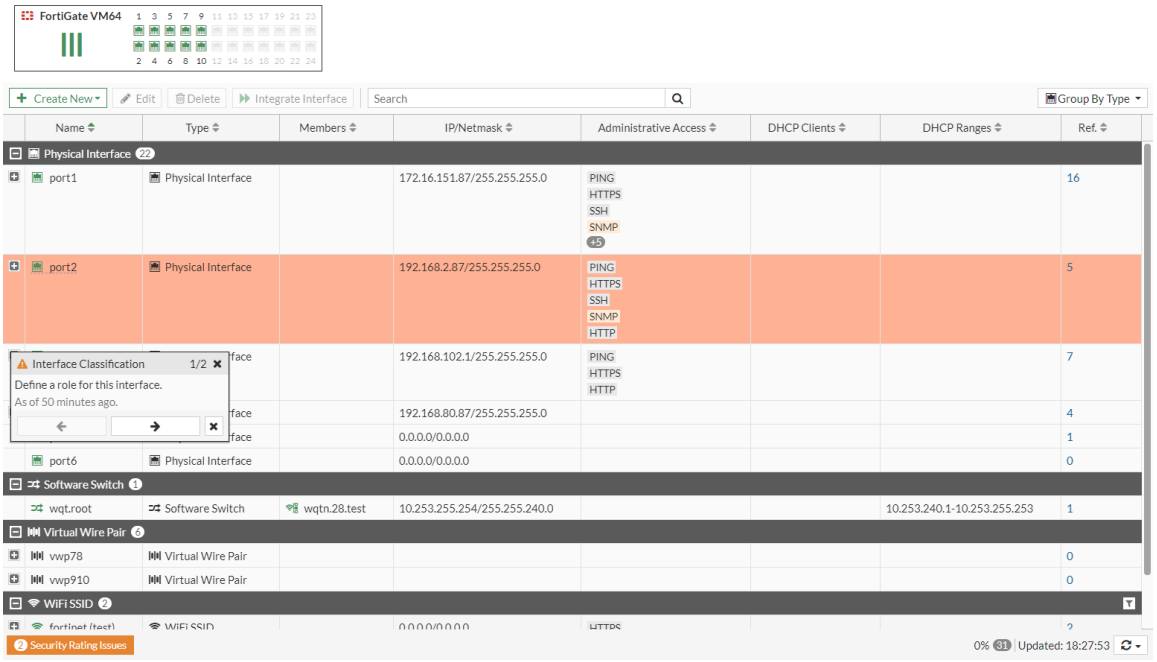


On the *Network* > *Interfaces* page, there is a *Security Rating Issues* section in the table footer. Click *Security Rating Issues* to view the list of issues. To dismiss a notification, click the *X* beside it. To view dismissed notifications, click *Show Dismissed*.



Notification pop-ups

When you click a security rating notification, a pop-up appears and the related setting is highlighted in the GUI. The pop-up contains a description of the problem and a timestamp of when the issue was found.



Once an issue is resolved, the notification disappears after the next security rating report runs.

Security rating check scheduling

Security rating checks by default are scheduled to run automatically every four hours.

To disable automatic security checks using the CLI:

```
config system global
    security-rating-run-on-schedule disable
end
```

To manually run a report using the CLI:

```
# diagnose report-runner trigger
```

Opt out of ranking

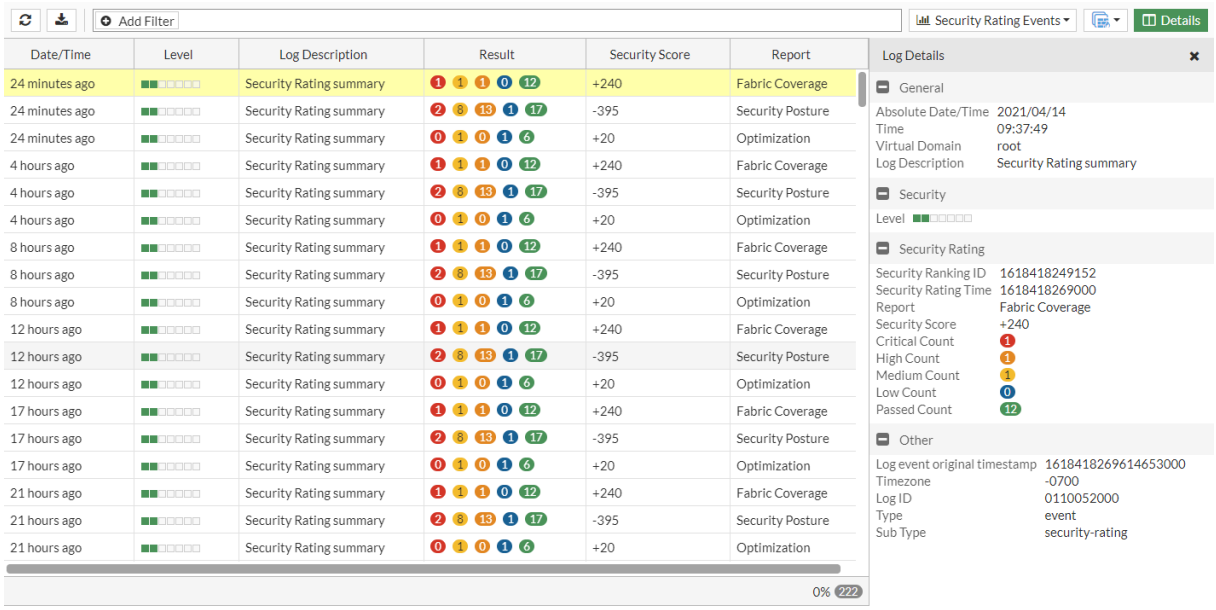
Security rating scores can be submitted to FortiGuard for comparison with other organizations' scores, allowing a percentile score to be calculated. If you opt out of submitting your score, only an absolute score will be available.

To opt out of submitting the score using the CLI:

```
config system global
    set security-rating-result-submission {enable | disable}
end
```

Logging the security rating

The results of past security checks are available on the *Log & Report > Events > Security Rating Events* page.



An event filter subtype can be created for the Security Fabric rating so event logs are created on the root FortiGate that summarize the results and show detailed information for the individual tests.

To configure security rating logging using the CLI:

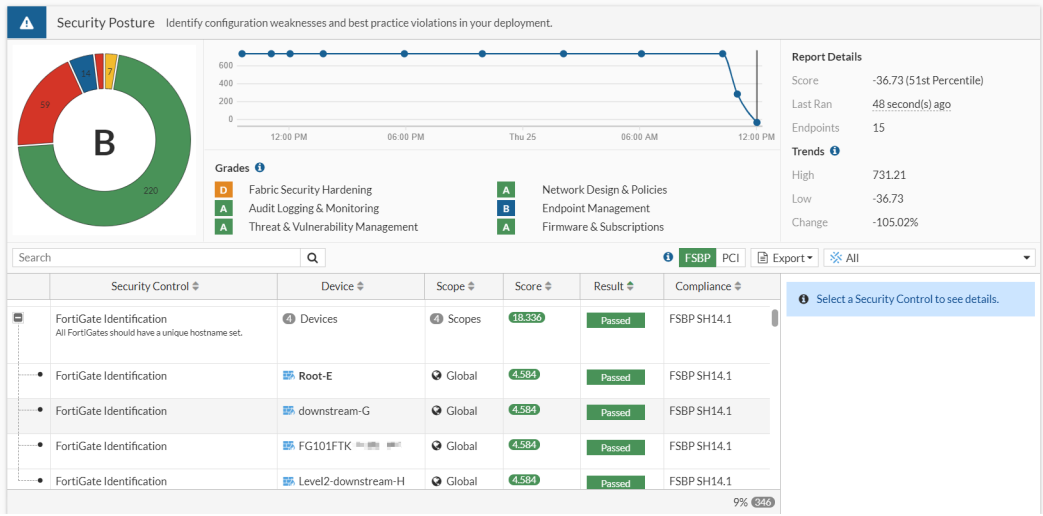
```
config log eventfilter
    set security-rating enable
end
```

Multi VDOM mode

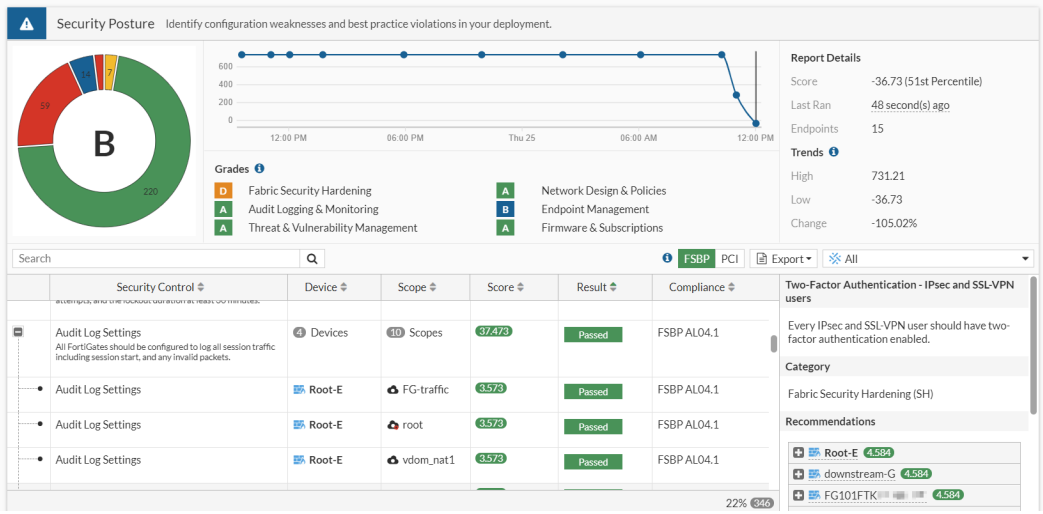
In multi VDOM mode, security rating reports can be generated in the Global VDOM for all of the VDOMs on the device. Administrators with read/write access can run the security rating report in the Global VDOM. Administrators with read-only access can only view the report.

On the report scorecards, the *Scope* column shows the VDOMs that the check was run on. On checks that support *Easy Apply*, the remediation can be run on all of the associated VDOMs.

Global scope:



VDOM scope:



The security rating event log is available on the root VDOM.

Security Fabric score

The Security Fabric score is calculated when a security rating check is run, based on the severity level of the checks that are passed or failed. A higher scores represents a more secure network. Points are added for passed checks and removed for failed checks.

Severity level	Weight (points)
Critical	50
High	25
Medium	10
Low	5

To calculate the number of points awarded to a device for a passed check, the following equation is used:

$$\text{score} = \frac{\text{<severity level weight>}}{\text{<\# of FortiGates>}} \times \text{<secure FortiGate multiplier>}$$

The secure FortiGate multiplier is determined using logarithms and the number of FortiGate devices in the Security Fabric.

For example, if there are four FortiGate devices in the Security Fabric that all pass the compatible firmware check, the score for each FortiGate device is calculated with the following equation:

$$\frac{50}{4} \times 1.292 = 16.15 \text{ points}$$

All of the FortiGate devices in the Security Fabric must pass the check in order to receive the points. If any one of the FortiGate devices fails a check, the devices that passed are not awarded any points. For the device that failed the check, the following equation is used to calculated the number of points that are lost:

$$\text{score} = \text{<severity level weight>} \times \text{<secure FortiGate multiplier>}$$

For example, if the check finds two critical FortiClient vulnerabilities, the score is calculated with the following equation:

$$-50 \times 2 = -100 \text{ points}$$

Scores are not affected by checks that do not apply to your network. For example, if there are no FortiAP devices in the Security Fabric, no points will be added or subtracted for the FortiAP firmware version check.

Automation stitches

Automation stitches automate the activities between the different components in the Security Fabric, which decreases the response times to security events. Events from any source in the Security Fabric can be monitored, and action responses can be set up to any destination.

Automation stitches can also be used on FortiGate devices that are not part of a Security Fabric.

An automation stitch consists of two parts: the trigger and the actions. The trigger is the condition or event on the FortiGate that activates the action, for example, a specific log, or a failed log in attempt. The action is what the FortiGate does in response to the trigger.

Automation stitches that use cloud-based actions (AWS Lambda, Azure Function, Google Cloud Function, and AliCloud Function) have the option to delay an action after the previous action is completed.

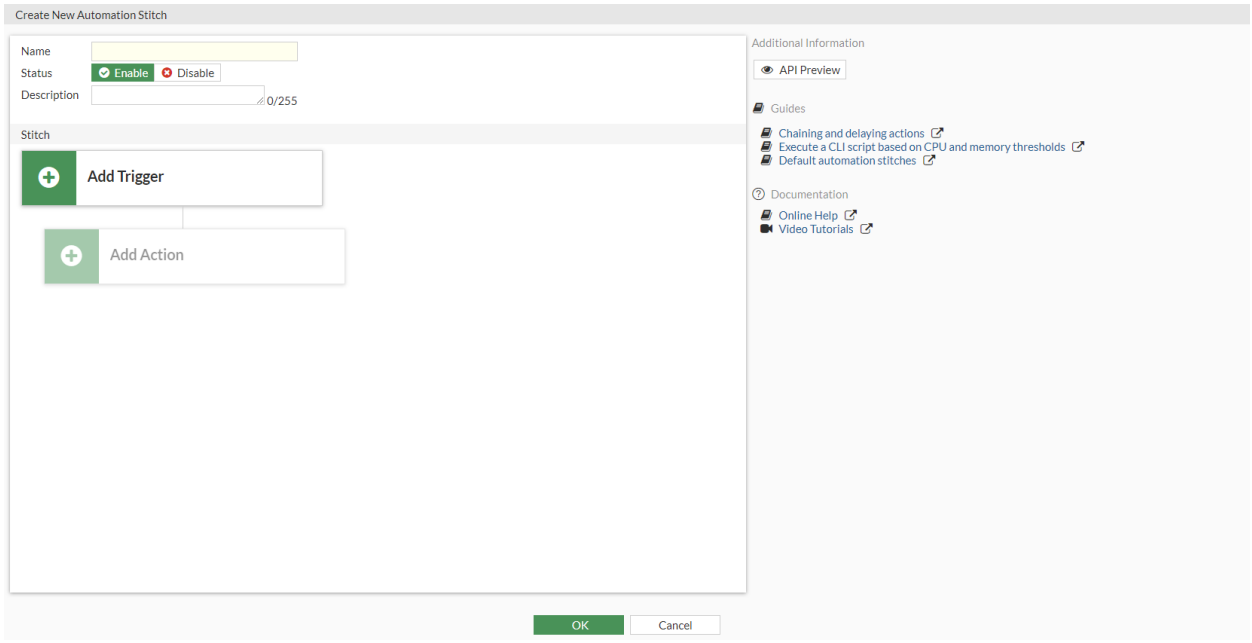
Diagnose commands are available in the CLI to test, log, and display the stitch history and settings.

Automation stitches can only be created on the root FortiGate in a Security Fabric.

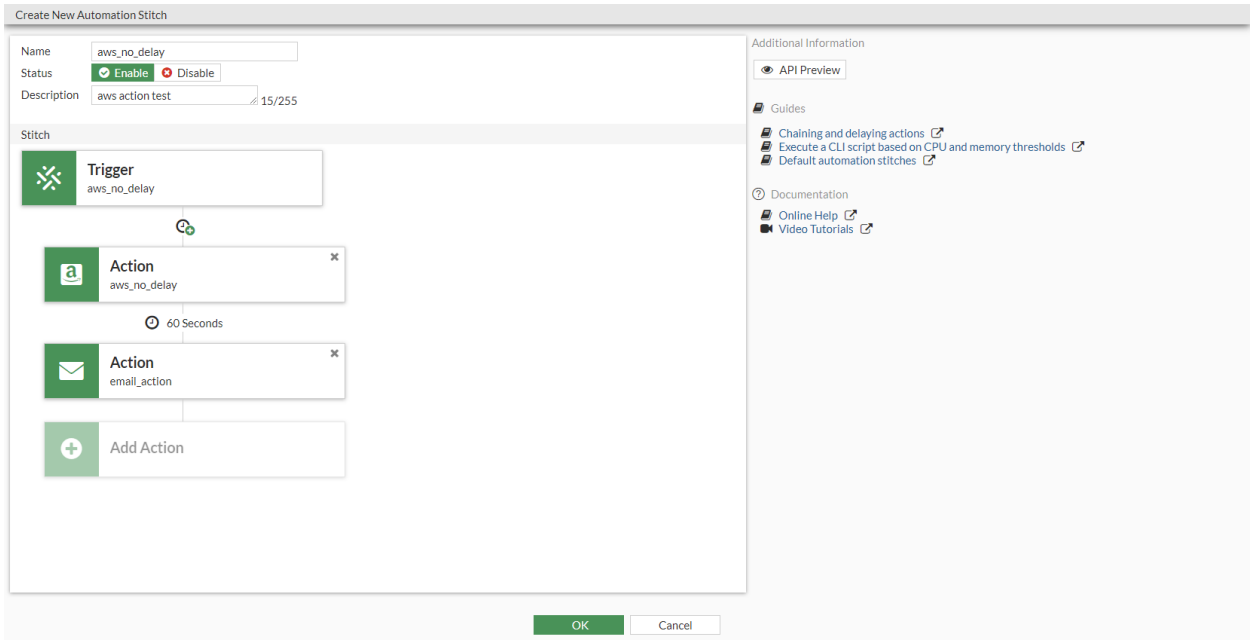
Creating automation stitches

To create an automation stitch, a trigger event and a response action or actions are selected. Automation stitches can be tested after they are created.

In the GUI, go to *Security Fabric* > *Automation* and click *Create New*. Automation stitches, actions, and triggers are configured in separate dialogs. When creating a stitch, clicking *Add Trigger* and *Add Action* displays a list of available triggers and actions, and the option to create a new one.

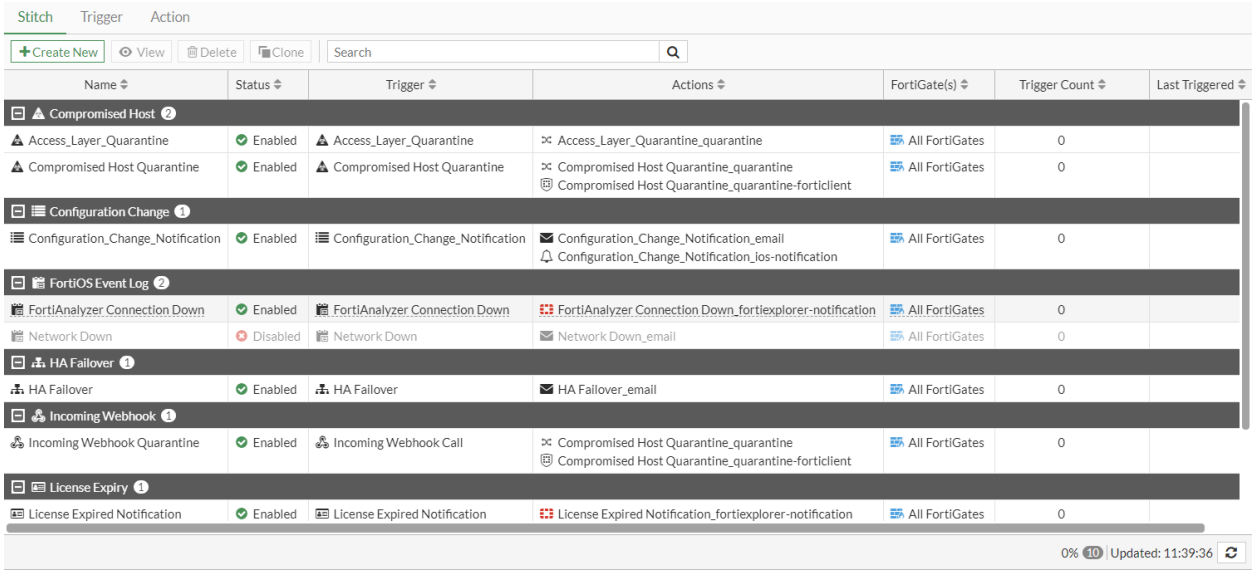


Once the stitch is configured, a process diagram of the trigger, actions, and delays is displayed.

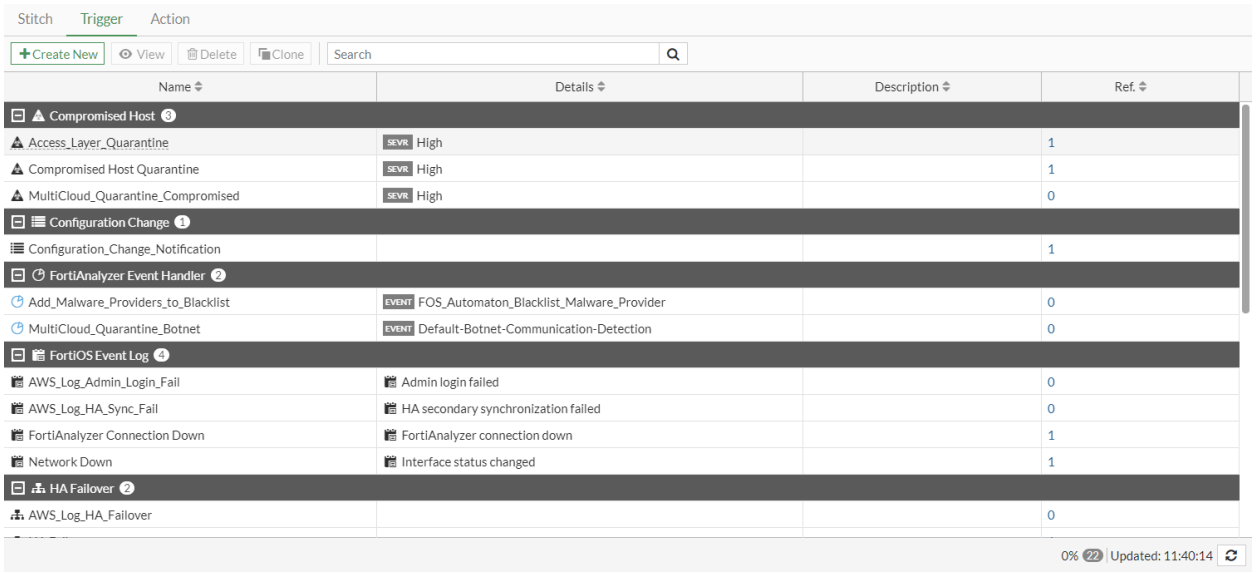


Tabs on the Automation page

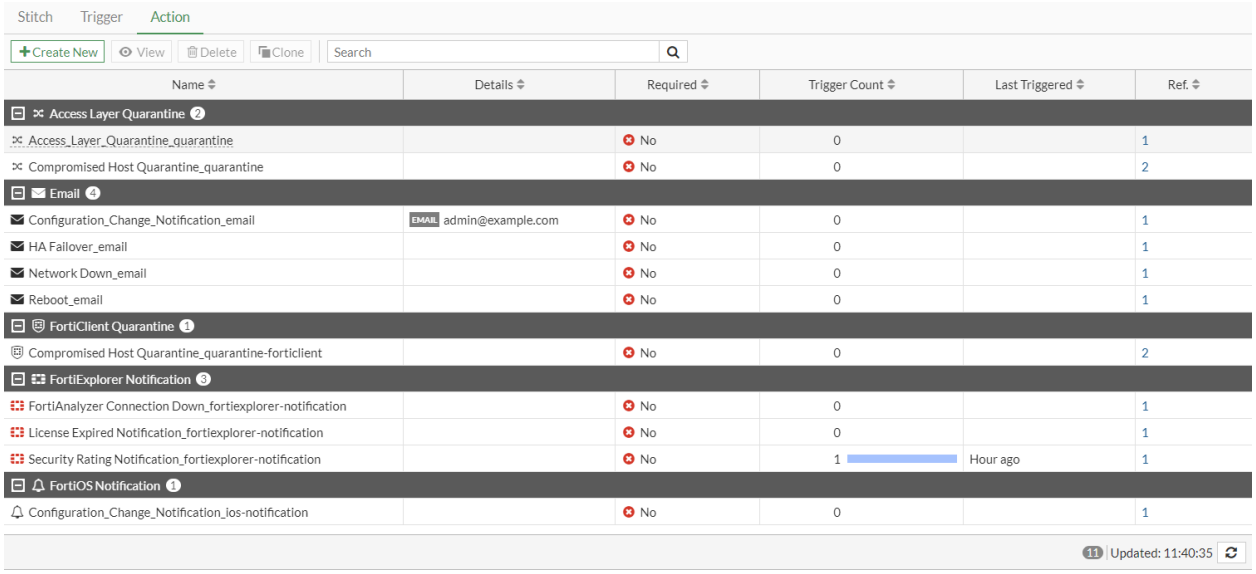
On the *Security Fabric* > *Automation* page, there are tabs for *Stitch*, *Trigger*, and *Action*. The *Stitch* tab is the default view that lists the trigger and actions used in each stitch. Individual triggers and actions can be created or edited in the corresponding tabs.



Click *Trigger* to view the list of triggers.



Click *Action* to view the list of actions.



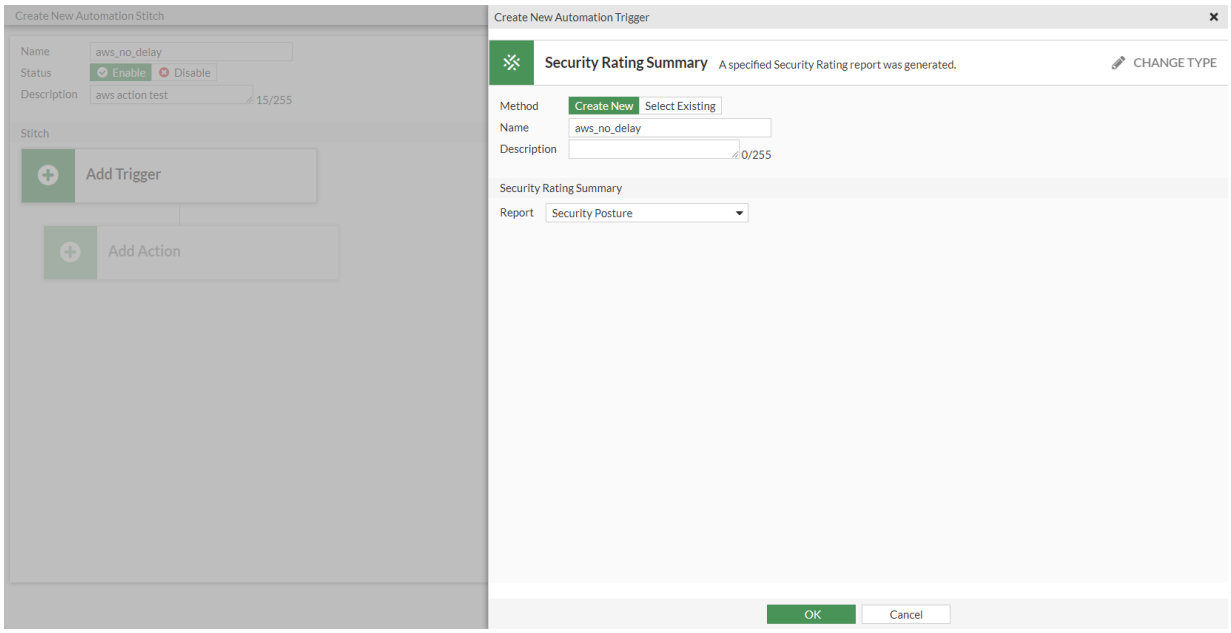
Sample configuration

The following example shows how to configure a Security Rating Summary automation stitch with AWS Lambda and Email actions.

To configure the automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name and description.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	aws_no_delay
Report	Security Posture



d. Click *OK*.

e. Select the trigger in the list and click *Apply*.

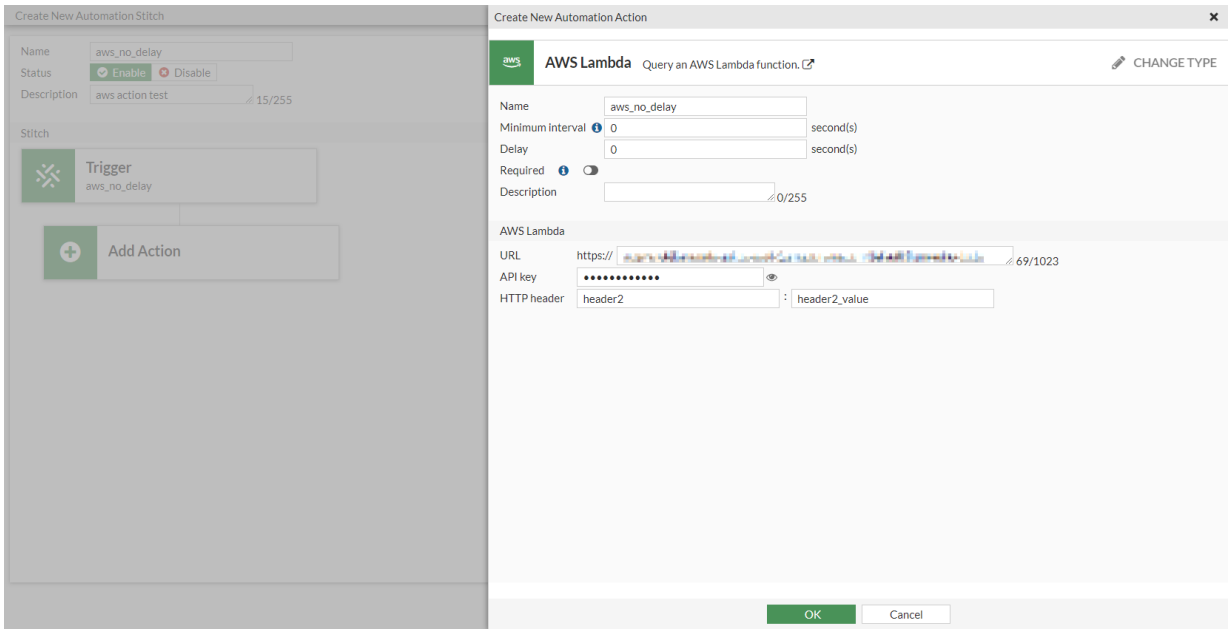
4. Configure the AWS Lambda function action:

a. Click *Add Action*.

b. Click *Create* and select *AWS Lambda*.

c. Enter the following:

Name	aws_no_delay
URL	Enter the request API URI
API key	Enter the API key
HTTP header	header2 : header2_value



d. Click *OK*.

e. Select the action in the list and click *Apply*.

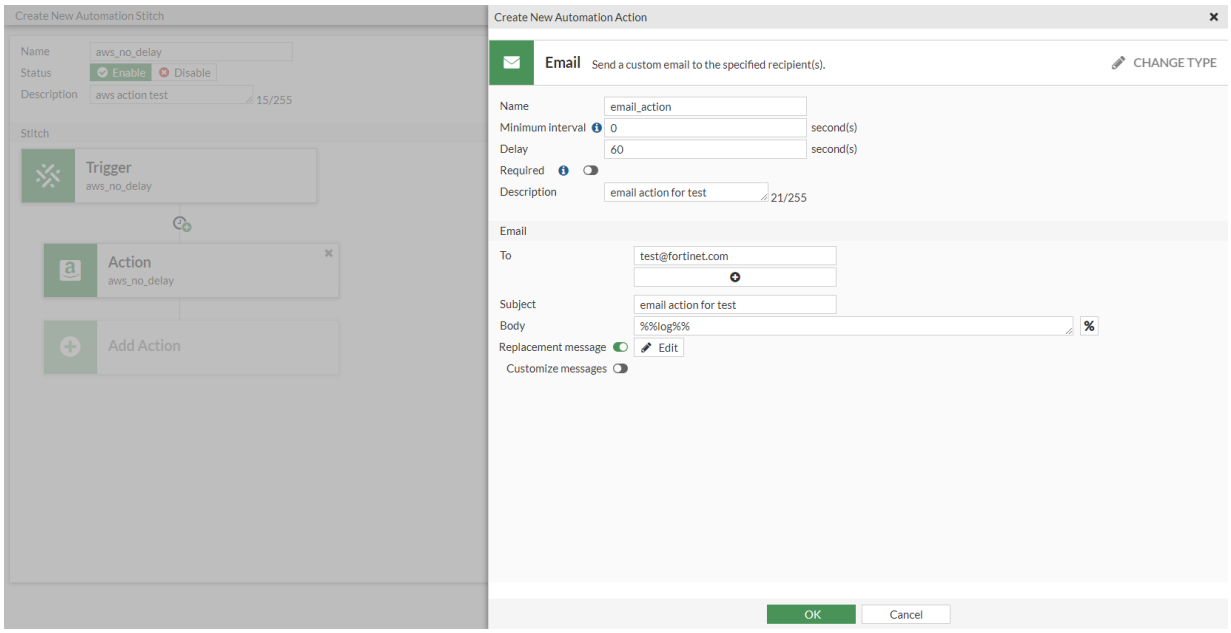
5. Configure the Email notification action:

a. Click *Add Action*.

b. Click *Create* and select *Email*.

c. Enter the following:

Name	email_action
Delay	60
To	Enter an email address
Subject	email action for test
Replacement message	Enable



d. Click *OK*.

e. Select the action in the list and click *Apply*.

6. Click *OK*.

To configure the automation stitch in the CLI:

1. Configure the trigger:

```
config system automation-trigger
    edit "aws_no_delay"
        set event-type security-rating-summary
    next
end
```

2. Configure the actions:

```
config system automation-action
    edit "aws_no_delay"
        set action-type aws-lambda
        set aws-api-key xxxxxxxxxxxx
        set uri "xxxxxxxxxx.execute-api.us-east-1.amazonaws.com/xxxxxxxxxx"
        set headers "header2:header2_value"
    next
    edit "email_action"
        set description "email action for test"
        set action-type email
        set email-to "test@fortinet.com"
        set email-subject "email action for test"
        set delay 60
        set replacement-message enable
    next
end
```

3. Configure the stitch:

```
config system automation-stitch
    edit "aws_no_delay"
        set description "aws action test"
        set trigger "aws_no_delay"
        set action "aws_no_delay" "email_action"
    next
end
```

Testing automation stitches

In the GUI, go to *Security Fabric* > *Automation*, right-click on the automation stitch and select *Test Automation Stitch*.

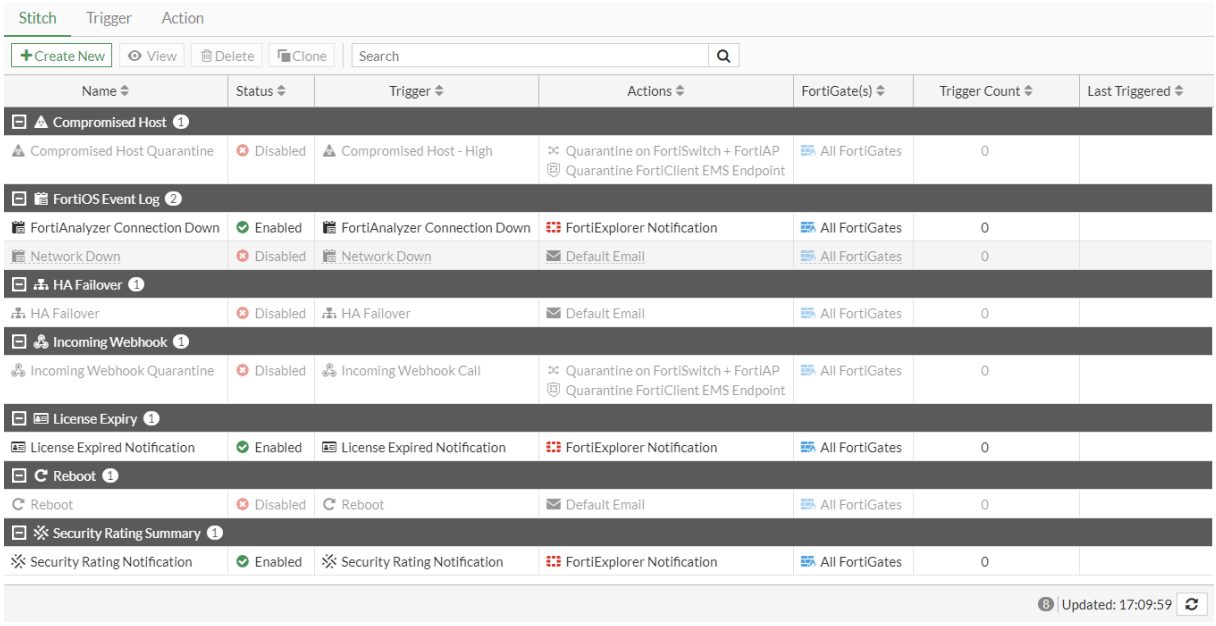
In the CLI, enter `diagnose automation test <automation-stitch name>`.

Default automation stitches

The following default automation stitches are included in FortiOS:

- Compromised Host Quarantine
- Incoming Webhook Quarantine
- HA Failover
- Network Down
- Reboot
- FortiAnalyzer Connection Down
- License Expired Notification
- Security Rating Notification

To view and edit the automation stitches in the GUI, go to *Security Fabric* > *Automation*.



CLI configurations

Compromised Host Quarantine

```
config system automation-action
   edit "Compromised Host Quarantine_quarantine"
      set action-type quarantine
      set minimum-interval 0
      set delay 0
      set required disable
   next
   edit "Compromised Host Quarantine_quarantine-forticlient"
      set action-type quarantine-forticlient
      set minimum-interval 0
      set delay 0
      set required disable
   next
end
config system automation-trigger
   edit "Compromised Host Quarantine"
      set trigger-type event-based
      set event-type ioc
      set ioc-level high
   next
end
config system automation-stitch
   edit "Compromised Host Quarantine"
      set status disable
      set trigger "Compromised Host Quarantine"
      set action "Compromised Host Quarantine_quarantine" "Compromised Host Quarantine_
           quarantine-forticlient"
   next
end
```

FortiAnalyzer Connection Down

```
config system automation-action
   edit "FortiAnalyzer Connection Down_fortiexplorer-notification"
      set action-type fortiexplorer-notification
      set minimum-interval 0
      set delay 0
      set required disable
   next
end
config system automation-trigger
   edit "FortiAnalyzer Connection Down"
      set trigger-type event-based
      set event-type event-log
      set logid 22902
   next
end
config system automation-stitch
   edit "FortiAnalyzer Connection Down"
      set status enable
      set trigger "FortiAnalyzer Connection Down"
      set action "FortiAnalyzer Connection Down_fortiexplorer-notification"
   next
```

```
end
```

Network Down

```
config system automation-action
   edit "Network Down_email"
      set action-type email
      set email-from ''
      set email-subject "Network Down"
      set minimum-interval 0
      set delay 0
      set required disable
      set message "%%log%%"
   next
end
config system automation-trigger
   edit "Network Down"
      set trigger-type event-based
      set event-type event-log
      set logid 20099
      config fields
         edit 1
            set name "status"
            set value "DOWN"
         next
      end
   next
end
config system automation-stitch
   edit "Network Down"
      set status disable
      set trigger "Network Down"
      set action "Network Down_email"
   next
end
```

HA Failover

```
config system automation-action
   edit "HA Failover_email"
      set action-type email
      set email-from ''
      set email-subject "HA Failover"
      set minimum-interval 0
      set delay 0
      set required disable
      set message "%%log%%"
   next
end
config system automation-trigger
   edit "HA Failover"
      set trigger-type event-based
      set event-type ha-failover
   next
end
config system automation-stitch
   edit "HA Failover"
```

```
      set status disable
      set trigger "HA Failover"
      set action "HA Failover_email"
   next
end
```

Incoming Webhook Quarantine

```
config system automation-action
   edit "Compromised Host Quarantine_quarantine"
      set action-type quarantine
      set minimum-interval 0
      set delay 0
      set required disable
   next
   edit "Compromised Host Quarantine_quarantine-forticlient"
      set action-type quarantine-forticlient
      set minimum-interval 0
      set delay 0
      set required disable
   next
end
config system automation-trigger
   edit "Incoming Webhook Call"
      set trigger-type event-based
      set event-type incoming-webhook
   next
end
config system automation-stitch
   edit "Incoming Webhook Quarantine"
      set status disable
      set trigger "Incoming Webhook Call"
      set action "Compromised Host Quarantine_quarantine" "Compromised Host Quarantine_
           quarantine-forticlient"
   next
end
```

License Expired Notification

```
config system automation-action
   edit "License Expired Notification_fortiexplorer-notification"
      set action-type fortiexplorer-notification
      set minimum-interval 0
      set delay 0
      set required disable
   next
end
config system automation-trigger
   edit "License Expired Notification"
      set trigger-type event-based
      set event-type license-near-expiry
      set license-type any
   next
end
config system automation-stitch
   edit "License Expired Notification"
      set status enable
```

```
      set trigger "License Expired Notification"
      set action "License Expired Notification_fortiexplorer-notification"
   next
end
```

Reboot

```
config system automation-action
   edit "Reboot_email"
      set action-type email
      set email-from ''
      set email-subject "Reboot"
      set minimum-interval 0
      set delay 0
      set required disable
      set message "%%log%%"
   next
end
config system automation-trigger
   edit "Reboot"
      set trigger-type event-based
      set event-type reboot
   next
end
config system automation-stitch
   edit "Reboot"
      set status disable
      set trigger "Reboot"
      set action "Reboot_email"
   next
end
```

Security Rating Notification

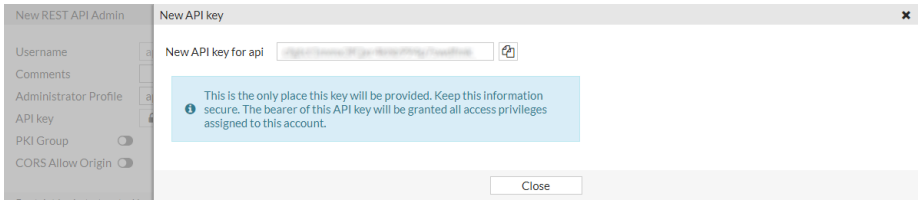
```
config system automation-action
   edit "Security Rating Notification_fortiexplorer-notification"
      set action-type fortiexplorer-notification
      set minimum-interval 0
      set delay 0
      set required disable
   next
end
config system automation-trigger
   edit "Security Rating Notification"
      set trigger-type event-based
      set event-type security-rating-summary
      set report-type posture
   next
end
config system automation-stitch
   edit "Security Rating Notification"
      set status enable
      set trigger "Security Rating Notification"
      set action "Security Rating Notification_fortiexplorer-notification"
   next
end
```

Incoming Webhook Quarantine stitch

The Incoming Webhook Quarantine stitch for API calls to the FortiGate accepts multiple parameters (MAC address and FortiClient UUID) from an Incoming Webhook trigger, which enacts either the Access Layer Quarantine action (MAC address) or the FortiClient Quarantine action (FortiClient UUID). This is a default automation stitch included in FortiOS.

To trigger the Incoming Webhook Quarantine stitch in the GUI:

1. Create a new API user:
   a. Go to *System* > *Administrators*.
   b. Click *Create New* > *REST API Admin*.
   c. Configure the *New REST API Admin* settings, and copy the API key to the clipboard.



2. Enable the stitch:
   a. Go to *Security Fabric* > *Automation*.
   b. Under *Incoming Webhook*, right-click *Incoming Webhook Quarantine*, and select *Select Status* > *Enable*.
3. Get the sample cURL request:
   a. Click the *Trigger* trigger tab.
   b. Under *Incoming Webhook*, right-click *Incoming Webhook Call*, and select *Edit*.
   c. In the *API admin key* field, enter the API key you recorded previously. The *Sample cURL request* field updates.

   d. Copy the *Sample cURL request* to the clipboard.
   e. Click *OK*.

4. Execute the request:
   a. Edit the sample cURL request you just copied.
   b. Add parameters to the `data` field (`"mac"` and `"fctuid"`), and then execute the request.

```
root@pc:~# curl -k -X POST -H 'Authorization: Bearer
cfgtct1mmx3fQxr4khb994p7swdfmk' --data '{ "mac":"0c:0a:00:0c:ce:b0", "fctuid":
"0000BB0B0ABD0D00B0D0A0B0E0F0B00B"}'
https://172.16.116.226/api/v2/monitor/system/automation-
stitch/webhook/Incoming%20Webhook%20Quarantine
{
   "http_method":"POST",
   "status":"success",
   "http_status":200,
   "serial":"FGT00E0Q00000000",
   "version":"v6.4.0",
   "build":1545
```

Encode spaces in the automation stitch name with `%20`. For example, `Incoming%20Webhook%20Quarantine`

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

To trigger the Incoming Webhook Quarantine stitch in the CLI:

1. Create a new API user and note the API key:

```
config system api-user
   edit "api"
      set api-key ************
      set accprofile "api_profile"
      set vdom "root"
      config trusthost
         edit 1
            set ipv4-trusthost 10.6.30.0 200.200.200.0
         next
      end
   next
end
```

2. Enable the automation stitch:

```
config system automation-stitch
   edit "Incoming Webhook Quarantine"
      set status enable
   next
end
```

3. Edit the cURL request to include parameters in the `data` field (`"mac"` and `"fctuid"`), then execute the request:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer
cfgtct1mmx0fQxr4khb000p70wdfmk' --data '{ "mac":"0c:0a:00:0c:ce:b0", "fctuid":
"3000BB0B0ABD0D00B0D0A0B0E0F0B00B"}'
https://100.10.100.200/api/v2/monitor/system/automation-
stitch/webhook/Incoming%20Webhook%20Quarantine
{
   "http_method":"POST",
```

```
  "status":"success",
  "http_status":200,
  "serial":"FGT80E0Q00000000",
  "version":"v6.4.0",
  "build":1545
```

Encode spaces in the automation stitch name with `%20`. For example, `Incoming%20Webhook%20Quarantine`

Once the automation stitch is triggered, the MAC address is quarantined by the FortiGate, and an event log is created. The FortiClient UUID is quarantined on the EMS server side.

Sample log

```
date=2020-02-14 time=15:37:48 logid="0100046600" type="event" subtype="system"
     level="notice" vd="root" eventtime=1581723468644200712 tz="-0800"
     logdesc="Automation stitch triggered" stitch="Incoming Webhook Quarantine"
     trigger="Incoming Webhook Quarantine" stitchaction="Compromised Host Quarantine_
     quarantine,Compromised Host Quarantine_quarantine-forticlient" from="log"
     msg="stitch:Incoming Webhook Quarantine is triggered."
```

Chaining and delaying actions

Automation stitches have the option to delay an action after the previous action is complete. Executing the next action can be delayed by up to 3600 seconds (one hour).

To configure a delay in the GUI:

1. Go to *Security Fabric* > *Automation* and click the *Action* tab.
2. Click *Create New*.
3. Select an action type, and enter a value (in seconds) in the *Delay* field.
4. Configure the other settings as needed.
5. Click *OK*.

To configure a delay in the CLI:

```
config system automation-action
    edit <name>
        ...
        set delay <integer>
    next
end
```

`set delay <integer>`	Set the delay before execution, in seconds (0 - 3600, default = 0).

Triggers

The following table outlines the available triggers.

Category	Trigger	Description
Security Fabric		
	Compromised Host	An indicator of compromise (IoC) is detected on a host endpoint. The threat level must be selected and can be *Medium* or *High*. If *Medium* is selected, both medium and high level threats are included. Additional actions are available only for *Compromised Host* triggers: • Access Layer Quarantine • FortiClient Quarantine • VMware NSX Security Tag • IP Ban
	Security Rating Summary	A summary is available for a recently run Security Rating report. Options include: • Security Posture • Fabric Coverage • Optimization • Any
	FortiAnalyzer Event Handler	The specified FortiAnalyzer event handler has occurred. See FortiAnalyzer event handler trigger on page 1712 for details.
	Fabric Connector Event	An event has occurred on a specific Fabric connector. See Fabric connector event trigger on page 1717 for details.
	FortiGate Cloud-Based IOC	IOC detection from the FortiGate Cloud IOC service. This option requires an IOC license, a web filter license, and FortiCloud logging must be enabled.
System		
	Reboot	A FortiGate is rebooting.
	HA Failover	An HA failover is occurring.
	Conserve Mode	A FortiGate entered conserve mode due to low memory. See Execute a CLI script based on CPU and memory thresholds on page 1759 for an example.
	Configuration Change	A FortiGate configuration change has occurred.
	License Expiry	A FortiGuard license is expiring. The license type must be selected. Options include: • FortiCare Support • FortiGuard Web Filter • FortiGuard AntiSpam • FortiGuard AntiVirus • FortiGuard IPS • FortiGuard Management Service • FortiGate Cloud • Any

Category	Trigger	Description
	AV & IPS DB Update	The antivirus and IPS database is updating.
	High CPU	A FortiGate has high CPU usage. See Execute a CLI script based on CPU and memory thresholds on page 1759 for an example.
Miscellaneous		
	FortiOS Event Log	The specified FortiOS log has occurred. Multiple event log IDs can be selected, and log field filters can be applied. See FortiOS event log trigger on page 1722 for an example.
	Incoming Webhook	An incoming webhook is triggered.
	Schedule	A scheduled monthly, weekly, daily, or hourly trigger. Set to occur on a specific minute of an specific hour on a specific day.

FortiAnalyzer event handler trigger

You can trigger automation stitches based on FortiAnalyzer event handlers. This allows you to define rules based on complex correlations across devices, log types, frequencies, and other criteria.

To set up a FortiAnalyzer event handler trigger:

1. Configure a FortiGate event handler on the FortiAnalyzer
2. Configure FortiAnalyzer logging on the FortiGate on page 1713
3. Configure an automation stitch that is triggered by a FortiAnalyzer event handler on page 1714

Configure a FortiGate event handler on the FortiAnalyzer

On the FortiAnalyzer, configure an event handler for the automation stitch. In this example, the event handler is triggered when an administrator logs in to the FortiGate. See Creating a custom event handler in the FortiAnalyzer Administration Guide for more information.

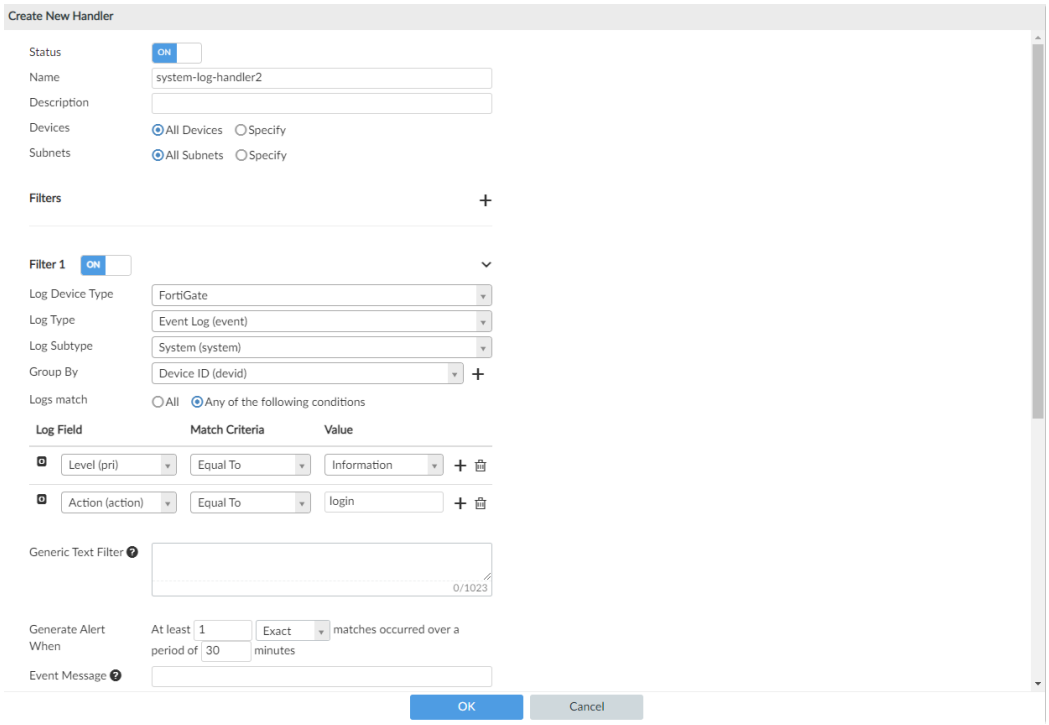
To configure an event handler on the FortiAnalyzer:

1. Go to *FortiSoC* > *Handlers* > *FortiGate Event Handlers*, and click *Create New*.
2. Configure an event handler with two conditions for the automation stitch:

Log Type	Event Log
Log Subtype	System
Group By	Device ID
Logs match	Any of the following conditions
Log Field	Level
Match Criteria	Equal To
Value	Information
Log Field	Action

Match Criteria	Equal To
Value	login

3. Configure the other settings as needed.



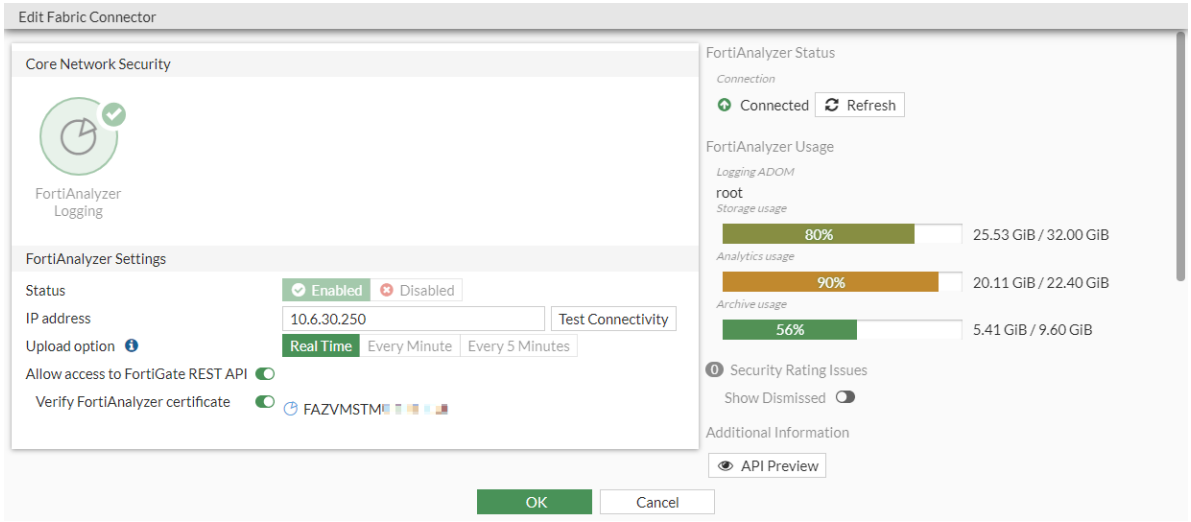
4. Click *OK*.

Configure FortiAnalyzer logging on the FortiGate

See Configuring FortiAnalyzer on page 1596 for more information.

To configure FortiAnalyzer logging in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
2. Ensure the *Status* is *Enabled*, and configure the settings as needed.



3. Click *OK*.

To configure FortiAnalyzer logging in the CLI:

```
config log fortianalyzer setting
    set status enable
    set server "10.6.30.250"
    set serial "FL-4HET000000000"
    set upload-option realtime
    set reliable enable
end
```

Configure an automation stitch that is triggered by a FortiAnalyzer event handler

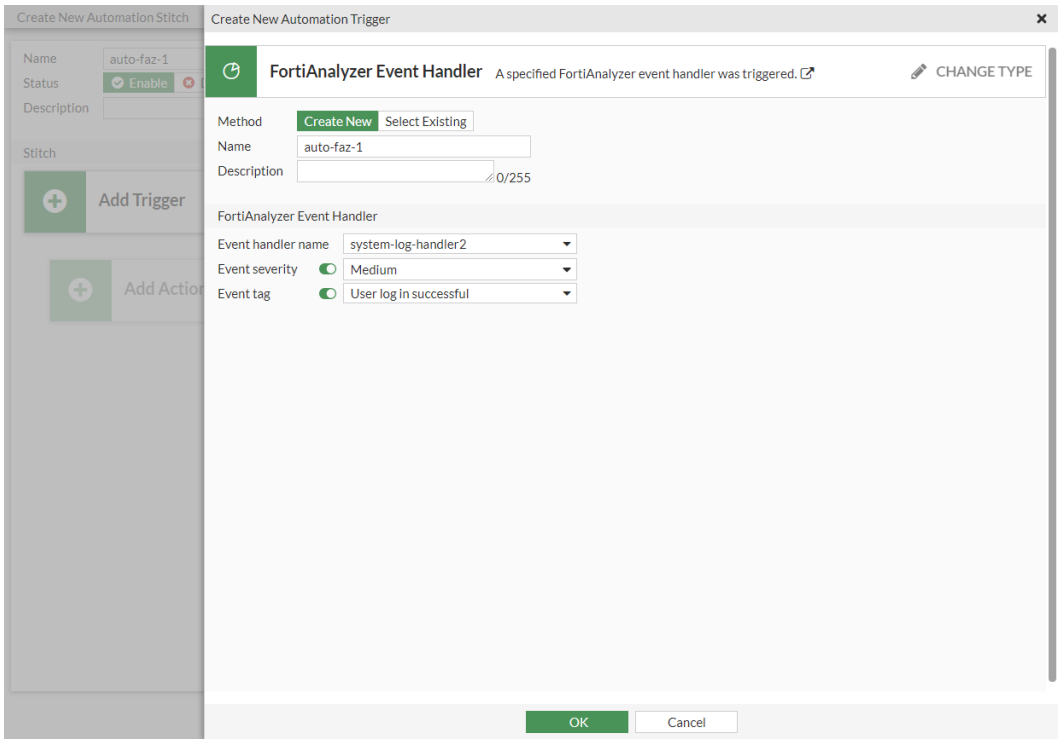
When a FortiAnalyzer event handler is triggered, it sends a notification to the FortiGate automation framework, which generates a log and triggers the automation stitch.

To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name, *auto-faz-1*.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *FortiAnalyzer Event Handler*.
   c. Enter the following:

Name	auto-faz-1
Event handler name	system-log-handler2
Event severity	Medium

Event tag	User login successful



d. Click *OK*.

e. Select the trigger in the list and click *Apply*.

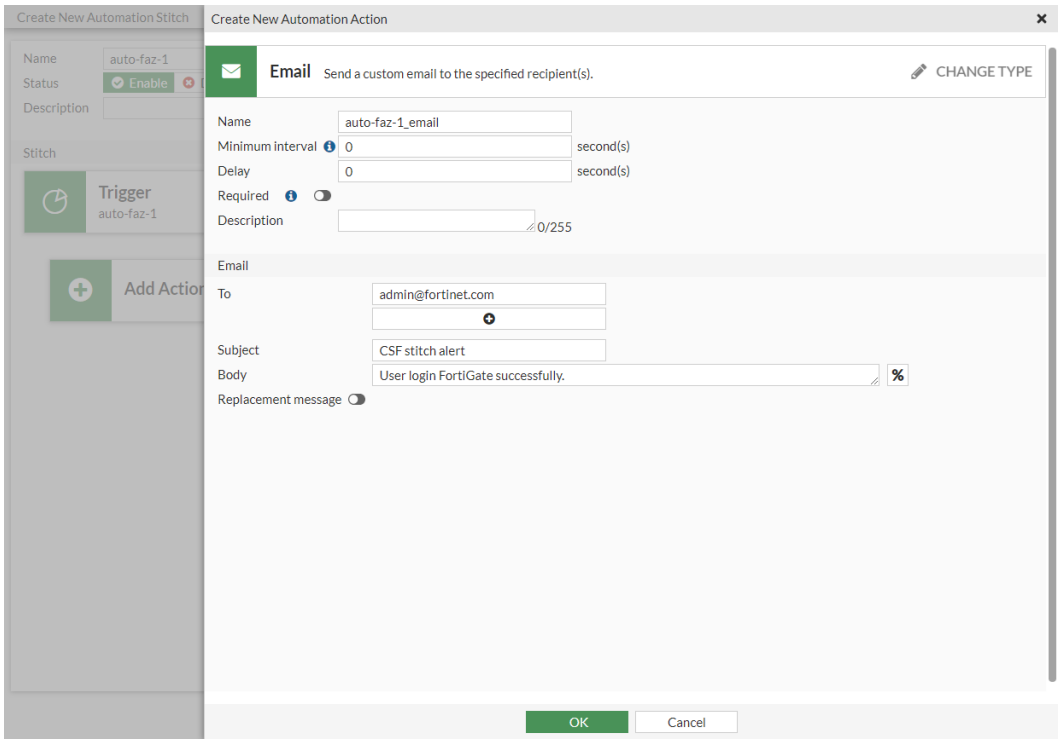
4. Configure the Email notification action:

a. Click *Add Action*.

b. Click *Create* and select *Email*.

c. Enter the following:

Name	auto-faz-1_email
To	Enter an email address
Subject	CSF stitch alert
Body	User login FortiGate successfully.



d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK*.

To configure an automation stitch that is triggered by a FortiAnalyzer event handler in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "auto-faz-1"
        set event-type faz-event
        set faz-event-name "system-log-handler2"
        set faz-event-severity "medium"
        set faz-event-tags "User log in successful"
    next
end
```

2. Create an automation action:

```
config system automation-action
    edit "auto-faz-1_email"
        set action-type email
        set email-to "admin@fortinet.com"
        set email-subject "CSF stitch alert"
        set message "User login FortiGate successfully."
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-faz-1"
```

```
            set trigger "auto-faz-1"
            set action "auto-faz-1_email"
        next
    end
```

View the trigger event log

To view the trigger event log in the GUI:

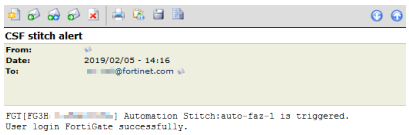
1. Log in to the FortiGate.
   The FortiAnalyzer sends a notification to the FortiGate automation framework, generates an event log on the FortiGate, and triggers the automation stitch.
2. Go to *Log & Report* > *Events* and select *System Events*. From the log location dropdown, select *FortiAnalyzer*.

To view the trigger event log in the CLI:

```
# execute log display
    ...
    date=2019-02-05 time=14:16:17 logid="0100046600" type="event" subtype="system"
level="notice" vd="root" eventtime=1549404977 logdesc="Automation stitch triggered"
stitch="auto-faz-1" trigger="auto-faz-1" from="log" msg="stitch:auto-faz-1 is triggered."
    ...
```

Sample email

The email sent by the action will look similar to the following:



Fabric connector event trigger

With the *Fabric Connector Event* trigger, any supported Fabric connector is able to trigger an automation stitch on the FortiGate based on a specific event defined on the Fabric connector. Currently, only FortiDeceptor 4.1 supports this trigger for the *Insider Threat*, *Notify Ban*, and *Notify Unban* events.

In the following example, an authorized FortiDeceptor in the Security Fabric deploys a decoy called ubuntu16 configured with SSH, SAMBA, HTTP, and HTTPS services.

This example assumes the Security Fabric is already configured. Refer to Configuring the root FortiGate and downstream FortiGates and FortiDeceptor for detailed configuration steps. On the root FortiGate, the *Allow downstream device REST API access* option must be enabled (`set downstream-access enable`). The minimum permission required for the selected *Administrator profile* is *Read/Write* for *User & Device* (`set authgrp read-write`).

Three stitches are configured, one for each FortiDeceptor trigger type:

Stitch name	Fabric connector event trigger	Actions
fortideceptor_threat	Insider threat	Email and IP ban

Stitch name	Fabric connector event trigger	Actions
fortideceptor_ban	Notify ban	Email and IP ban
fortideceptor_unban	Notify unban	Email and CLI script

To configure stitches with the Fabric connector event trigger in the GUI:

1. Configure the triggers:
   a. Go to *Security Fabric* > *Automation*, select the *Trigger* tab, and click *Create New*.
   b. In the *Security Fabric* section, click *Fabric Connector Event* and enter the following:

Name	*fdc_Insider_Threat*
Description	*Insider_Threat*
Connector	Select the FortiDeceptor connector
Event Name	*Insider Threat*

   c. Click *OK*.
   d. Repeat these steps to create two more triggers with the following settings:

Name	*fdc_Notify_Ban*
Description	*Notify_Ban*
Connector	Select the FortiDeceptor connector
Event Name	*Notify Ban*

Name	*fdc_Notify_Unban*
Description	*Notify_Unban*
Connector	Select the FortiDeceptor connector
Event Name	*Notify Unban*

2. Configure the actions:
   a. Go to *Security Fabric* > *Automation*, select the *Action* tab, and click *Create New*.
   b. In the *Security Response* section, click *IP Ban* and enter the following:

Name	*fdc_ban-ip*
Delay	*5*
Required	Enable

   c. Click *OK*.
   d. Repeat these steps to create an *Email* (in the *Notifications* section) and a *CLI Script* (in the *General* section) action with the following settings:

Email

Name	*email_log*
To	Enter an email address
Subject	*CSF stitch alert*
CLI Script	
Name	*fdc_unban*
Delay	*5*
Required	Enable
Script	*diagnose user quarantine delete src4 %%log.srcip%%*
Administrator profile	*super_admin*

3. Configure the *fortideceptor_threat* stitch:
   a. Go to *Security Fabric* > *Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *fortideceptor_threat*.
   c. Click *Add Trigger*. Select *fdc_Insider_Threat* and click *Apply*.
   d. Click *Add Action*. Select *email_log* and click *Apply*.
   e. Click *Add Action*. Select *fdc_ban-ip* and click *Apply*.
   f. Click *OK*.
4. Configure the *fortideceptor_ban* stitch:
   a. Go to *Security Fabric* > *Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *fortideceptor_ban*.
   c. Click *Add Trigger*. Select *fdc_Notify_Ban* and click *Apply*.
   d. Click *Add Action*. Select *email_log* and click *Apply*.
   e. Click *Add Action*. Select *fdc_ban-ip* and click *Apply*.
   f. Click *OK*.
5. Configure the *fortideceptor_unban* stitch:
   a. Go to *Security Fabric* > *Automation*, select the *Stitch* tab, and click *Create New*.
   b. Enter the name, *fortideceptor_unban*.
   c. Click *Add Trigger*. Select *fdc_Notify_Unban* and click *Apply*.
   d. Click *Add Action*. Select *email_log* and click *Apply*.
   e. Click *Add Action*. Select *fdc_unban* and click *Apply*.
   f. Click *OK*.

To configure stitches with the Fabric connector event trigger in the CLI:

1. Configure the triggers:

```
config system automation-trigger
    edit "fdc_Insider_Threat"
        set description "Insider_Threat"
        set event-type fabric-event
        set serial "FDC-VMTM210000**"
        set fabric-event-name "insider_threat"
    next
```

```
    edit "fdc_Notify_Ban"
        set description "Notify_Ban"
        set event-type fabric-event
        set serial "FDC-VMTM210000**"
        set fabric-event-name "notify_ban"
    next
    edit "fdc_Notify_Unban"
        set description "Notify_Unban"
        set event-type fabric-event
        set serial "FDC-VMTM210000**"
        set fabric-event-name "notify_unban"
    next
end
```

2. Configure the actions:

```
config system automation-action
    edit "fdc_ban-ip"
        set action-type ban-ip
        set delay 5
        set required enable
    next
    edit "fdc_unban"
        set action-type cli-script
        set script "diagnose user quarantine delete src4 %%log.srcip%%"
        set accprofile "super_admin"
        set delay 5
        set required enable
    next
    edit "email_log"
        set action-type email
        set email-to "*******@fortinet.com"
        set email-subject "CSF stitch alert"
    next
end
```

3. Configure the stitches:

```
config system automation-stitch
    edit "fortideceptor_threat"
        set trigger "fdc_Insider_Threat"
        set action "email_log" "fdc_ban-ip"
    next
    edit "fortideceptor_ban"
        set trigger "fdc_Notify_Ban"
        set action "email_log" "fdc_ban-ip"
    next
    edit "fortideceptor_unban"
        set trigger "fdc_Notify_Unban"
        set action "email_log" "fdc_unban"
    next
end
```

Verification

A device with IP 172.16.200.33 uses SSH to access the decoy (ubuntu16) deployed in the FortiDeceptor. The FortiDeceptor will detect the attacker IP 172.16.200.33, automatically quarantine it, and send the insider threat

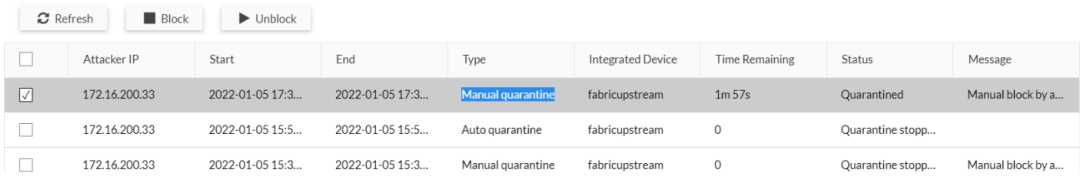
notification to the FortiGate. This notification will trigger the *fortideceptor_threat* stitch due to the insider threat event trigger, so an email alert is sent and the attacker IP (172.16.200.33) is banned.

In FortiDeceptor, if the attacker IP (172.16.200.33) is manually blocked or unblocked, the FortiDeceptor will send out the internal block or unblock notification to FortiGate (see Quarantine Status for more details). This notification will trigger the *fortideceptor_ban* or *fortideceptor_unban* stitch due the notify ban or unban event trigger. An email alert is sent, and based on the event, the IP is banned or the CLI script runs to unban the IP.

To view the quarantine details in FortiDeceptor:

1. Go to *Fabric* > *Quarantine Status*.
   a. Automatic quarantine:

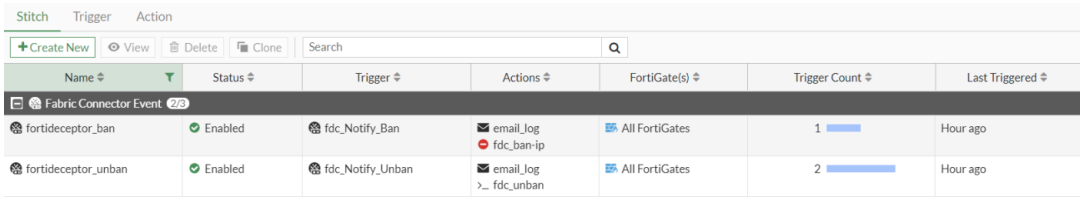
   b. Manual block or unblock:



To confirm that the stitch was triggered in the FortiOS GUI:

1. Go to *Security Fabric* > *Automation* and select the *Stitch* tab.
   a. Triggered insider threat:

   b. Triggered notify ban or unban:



To view the quarantined IP details in the FortiOS CLI:

```
# diagnose user quarantine list
src-ip-addr       created                  expires                  cause
172.16.200.33     Wed Jan  5 15:57:41 2022 indefinite               Administrative
```

If the IP is unbanned by the stitch, the list will be empty:

```
# diagnose user quarantine list
src-ip-addr       created                 expires                 cause
```

FortiOS event log trigger

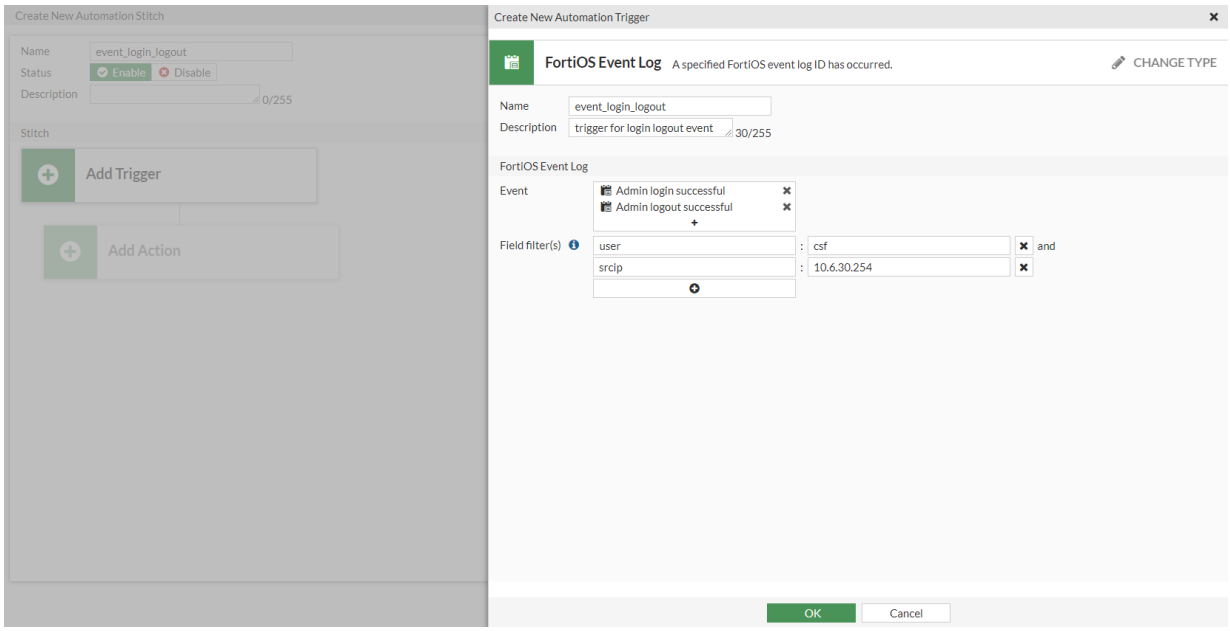
You can configure a FortiOS event log trigger for when a specific event log ID occurs. You can select multiple event log IDs, and apply log field filters.

To configure a FortiOS event log trigger in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name and description.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *FortiOS Event Log*.
   c. Enter a name and description.
   d. In the *Event* field, click the + to select multiple event log IDs.
   The *Event* options correspond to the *Message Meaning* listed in the FortiOS Log Message Reference. Hover over an entry to view the tooltip that includes the event ID and log name. In this example, the *Admin login successful* event in the GUI corresponds to log ID *32001*, which is *LOG_ID_ADMIN_LOGIN_SUCC*.

   e. In the *Field filter(s)* field, click the + to add multiple field filters. The configured filters much match in order for the stitch to be triggered.

> To view the list of available fields for a log, refer to the FortiOS Log Message Reference by appending the log ID to the document URL (https://docs.fortinet.com/document/fortigate/7.0.0/fortios-log-message-reference/<log_ID>).



f. Click *OK*.

g. Select the trigger in the list and click *Apply*.

4. Configure the rest of the stitch as needed.

To configure a FortiOS event log trigger in the CLI:

```
config system automation-trigger
    edit "event_login_logout"
        set description "trigger for login logout event"
        set event-type event-log
        set logid 32001 32003
        config fields
            edit 1
                set name "user"
                set value "csf"
            next
            edit 2
                set name "srcip"
                set value "10.6.30.254"
            next
        end
    next
end
```

Actions

The following table outlines the available actions. Multiple actions can be added to an automation stitch. Actions can be reorganized in the *Edit Automation Stitch* page by dragging and dropping the actions in the diagram.

Category	Action	Description
Security Response		
	Access Layer Quarantine	This option is only available for Compromised Host triggers. Quarantine the MAC address on access layer devices (FortiSwitch and FortiAP).
	FortiClient Quarantine	This option is only available for Compromised Host triggers. Use FortiClient EMS to block all traffic from the source addresses that are flagged as compromised hosts. Quarantined devices are flagged on the Security Fabric topology views. Go to the *Dashboard* > *Users & Devices* > *Quarantine* widget to view and manage quarantined IP addresses.
	FortiNAC Quarantine	This option is only available for Compromised Host and Incoming Webhook triggers. Use FortiNAC to quarantine a client PC and disable its MAC address. See FortiNAC Quarantine action on page 1725 for details.
	VMware NSX Security Tag	This option is only available for Compromised Host triggers. If an endpoint instance in a VMware NSX environment is compromised, the configured security tag is assigned to the compromised endpoint. See VMware NSX security tag action on page 1728 and VMware NSX-T security tag action on page 1732 for details.
	IP Ban	This option is only available for Compromised Host triggers. Block all traffic from the source addresses flagged by the IoC. Go to the *Dashboard* > *Users & Devices* > *Quarantine* widget to view and manage quarantined IP addresses.
Notifications		
	Email	Send a custom email message to the selected recipients. At least one recipient and an email subject must be specified. The email body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: *%%results.source%%* is the source property from the previous action. Replacement messages can be enabled in the email body to create branded email alerts. See Replacement messages for email alerts on page 1736 for details.
	FortiExplorer Notification	Send push notifications to FortiExplorer. The FortiGate must be registered to FortiCare on the mobile app that will receive the notification.
	Slack Notification	Send a notification to a Slack channel. See Slack Notification action on page 1741 for details.

Category	Action	Description
	Microsoft Teams Notification	Send a notification to channels in Microsoft Teams. See Microsoft Teams Notification action on page 1745 for details.
Cloud Compute		
	AWS Lambda	Send log data to an integrated AWS service. See AWS Lambda action on page 1749 for details.
	Azure Function	Send log data to an Azure function. See Azure Function action on page 1751 for details.
	Google Cloud Function	Send log data to a Google Cloud function. See Google Cloud Function action on page 1752 for details.
	AliCloud Function	Send log data to an AliCloud function. See AliCloud Function action on page 1754 for details.
General		
	CLI Script	Run one or more CLI scripts. See CLI script action on page 1756 for details. See Execute a CLI script based on CPU and memory thresholds on page 1759 for an example.
	Webhook	Send an HTTP request using a REST callback. See Webhook action on page 1765 for details, and Slack integration webhook on page 1770 and Microsoft Teams integration webhook on page 1772 for examples.
	Alert	Generate a FortiOS dashboard alert. This option is only available in the CLI.
	Disable SSID	Disable the SSID interface. This option is only available in the CLI.

FortiNAC Quarantine action

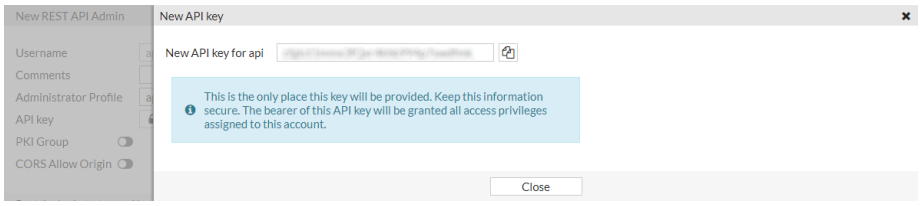
Users can configure an automation stitch with the FortiNAC Quarantine action with a Compromised Host or Incoming Webhook trigger. When the automation is triggered, the client PC will be quarantined and its MAC address is disabled in the configured FortiNAC.

In this example, the FortiNAC has been configured to join an enabled Security Fabric (see FortiNAC for more information).

To configure an automation stitch with a FortiNAC quarantine action in the GUI:

1. Create a new API user and generate the API key:
   a. Go to *System* > *Administrators* and click *Create New* > *REST API Admin*.
   b. Configure the settings as needed.
   c. Click *OK*. The *New API key* window opens.

d. Copy the key to the clipboard and click *Close*.



e. Click *OK*.

2. Configure the automation stitch trigger:
   a. Go to *Security Fabric* > *Automation* and click *Create New*.
   b. Enter the stitch name (*auto_webhook*).
   c. Click *Add Trigger*.
   d. Click *Create* and select *Incoming Webhook*.
   e. Enter a name (*auto_webhook*).
   f. Click *OK*.
   g. Paste the key in the *API admin key* field.

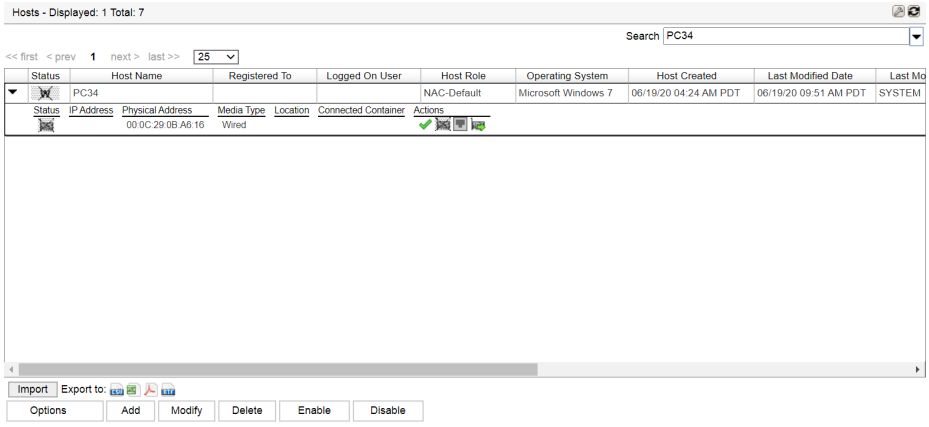
   h. Click *OK*.
   i. Select the trigger in the list and click *Apply*.

3. Configure the automation stitch action:
   a. Click *Add Action*.
   b. Click *Create* and select *FortiNAC Quarantine*.
   c. Enter an action name (*auto_webhook_quarantine-fortinac*) and click *OK*.
   d. Select the action in the list and click *Apply*.
   e. Click *OK*.

4. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer ckx7d9xdzzx14Nztd1Ncr701dpwwy9' --data '{ "srcip": "1.1.1.1", "mac":"00:0C:29:0B:A6:16", "fctuid": "A8BA0B12DA694E47BA4ADF24F8358E2F"}' https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
```

5. In FortiOS, verify the automation stitch is triggered and the action is executed:
   a. Go to *Log & Report* > *Events* and select *System Events* to confirm that the stitch was activated.
   b. Go to *Security Fabric* > *Automation* to see the last time that the stitch was triggered.
   In FortiNAC, the *Host View* shows the status of the client PC. It is quarantined and its MAC address is disabled.



To configure an automation stitch with a FortiNAC quarantine action in the CLI:

1. Create a new API user and generate the API key:

```
config system api-user
    edit "g-api-rw-user"
        set api-key ************
        set accprofile "super_admin"
        set vdom "root"
        config trusthost
            edit 1
                set ipv4-trusthost 10.6.30.0 255.255.255.0
            next
        end
    next
end
```

2. Configure the automation trigger:

```
config system automation-trigger
    edit "auto_webhook"
        set event-type incoming-webhook
    next
end
```

3. Configure the automation action:

```
config system automation-action
    edit "auto_webhook_quarantine-fortinac"
        set action-type quarantine-fortinac
    next
end
```

4. Configure the automation stitch:

```
config system automation-stitch
    edit "auto_webhook"
        set trigger "auto_webhook"
```

```
        set action "auto_webhook_quarantine-fortinac"
    next
end
```

5. On a Linux PC accessible by the FortiGate, create a cURL request to trigger the automation stitch:

```
root@pc56:~# curl -k -X POST -H 'Authorization: Bearer ckx7d9xdzzx14Nztd1Ncr701dpwwy9' -
-data '{ "srcip": "1.1.1.1", "mac":"00:0C:29:0B:A6:16", "fctuid":
"A8BA0B12DA694E47BA4ADF24F8358E2F"}'
https://172.17.48.225:4431/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
```

6. In FortiOS, verify that the automation stitch is triggered and the action is executed:

```
# diagnose test application autod 2
csf: enabled    root:yes
version:1592949233 sync time:Tue Jun 23 15:03:15 2020

total stitches activated: 1

stitch: auto_webhook
        destinations: all
        trigger: auto_webhook

                (id:15)service=auto_webhook

        local hit: 1 relayed to: 0 relayed from: 0
        actions:
                auto_webhook_quarantine-fortinac type:quarantine-fortinac interval:0

date=2020-06-23 time=15:25:44 logdesc="Internal Message" path="system" name="automation-
stitch" action="webhook" mkey="auto_webhook" srcip="1.1.1.1" mac="00:0C:29:0B:A6:16"
fctuid="A8BA0B12DA694E47BA4ADF24F8358E2F" vdom="root" service="auto_webhook"

date=2020-06-23 time=15:25:44 logid="0100046600" type="event" subtype="system"
level="notice" vd="root" eventtime=1592951144401490054 tz="-0700" logdesc="Automation
stitch triggered" stitch="auto_webhook" trigger="auto_webhook" stitchaction="auto_
webhook_quarantine-fortinac" from="log" msg="stitch:auto_webhook is triggered."
```

VMware NSX security tag action

If an endpoint instance in a VMware NSX environment is compromised, this action will assign the configured security tag to the compromised endpoint.

This action is only available when the automation trigger is set to compromised host.

To set up the NSX quarantine action, you need to:

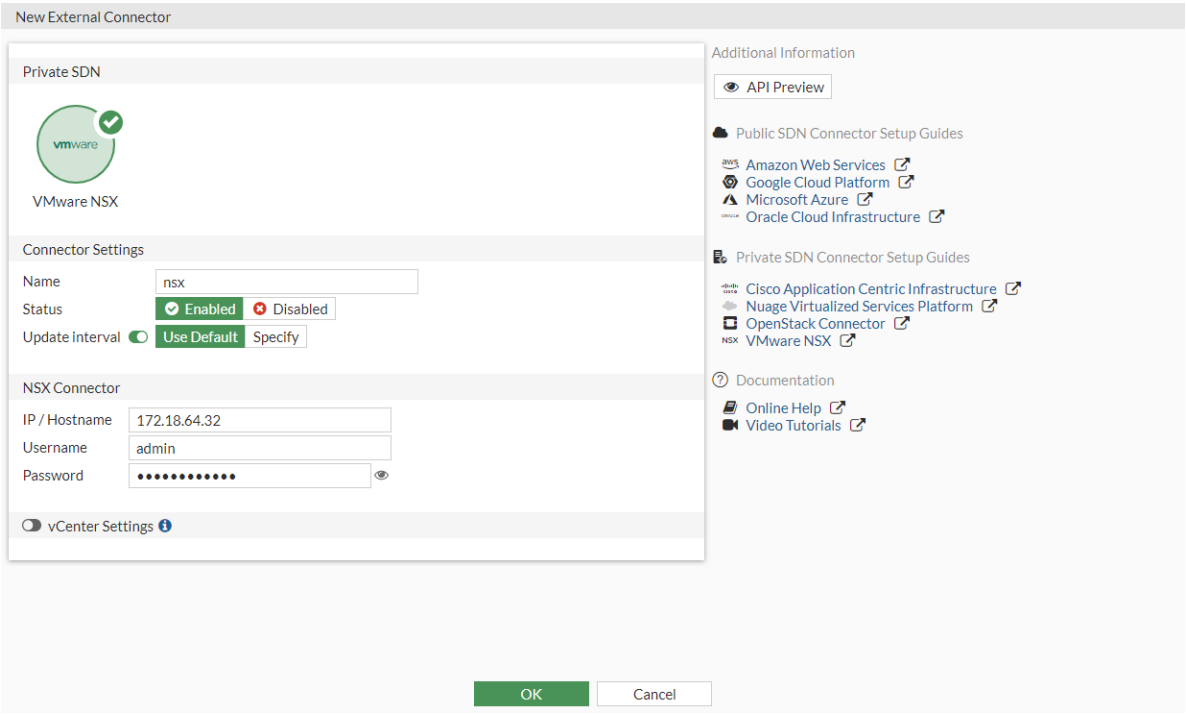
1. Configure a VMware NSX SDN connector
2. Configure an NSX security tag automation stitch
3. Configure FortiAnalyzer logging on the FortiGate

Configure a VMware NSX SDN connector

The FortiGate retrieves security tags from the VMware NSX server through the connector.

To configure a VMware NSX SDN connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. Select *VMware NSX*.
4. Configure the settings as needed.



5. Click *OK*.

To configure a VMware NSX SDN connector in the CLI:

```
config system sdn-connector
    edit "nsx"
        set type nsx
        set server "172.18.64.32"
        set username "admin"
        set password xxxxxxxxxxxx
    next
end
```

Configure an NSX security tag automation stitch

Security tags are retrieved from the VMware NSX server through the NSX SDN connector.

To configure an automation stitch with an NSX security tag in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name (*pcui-test*).

3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Compromised Host*.
   c. Enter the following:

Name	pcui-test
Threat level threshold	High

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the VMware NSX Security Tag action:
   a. Click *Add Action*.
   b. Click *Create* and select *VMware NSX Security Tag*.
   c. Enter the following:

Name	pcui-test_quarantine-nsx
Specify NSX server(s)	Enable and select the SDN connector
Security tag	Select an existing tag, or create a new one

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an automation stitch with an NSX security tag in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "pcui-test"
        set ioc-level high
    next
end
```

2. Create an automation action:

```
config system automation-action
    edit "pcui-test_quarantine-nsx"
        set action-type quarantine-nsx
        set security-tag "pcui-tag2"
        set sdn-connector "nsx"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "pcui-test"
        set trigger "pcui-test"
        set action "pcui-test_quarantine-nsx"
    next
end
```

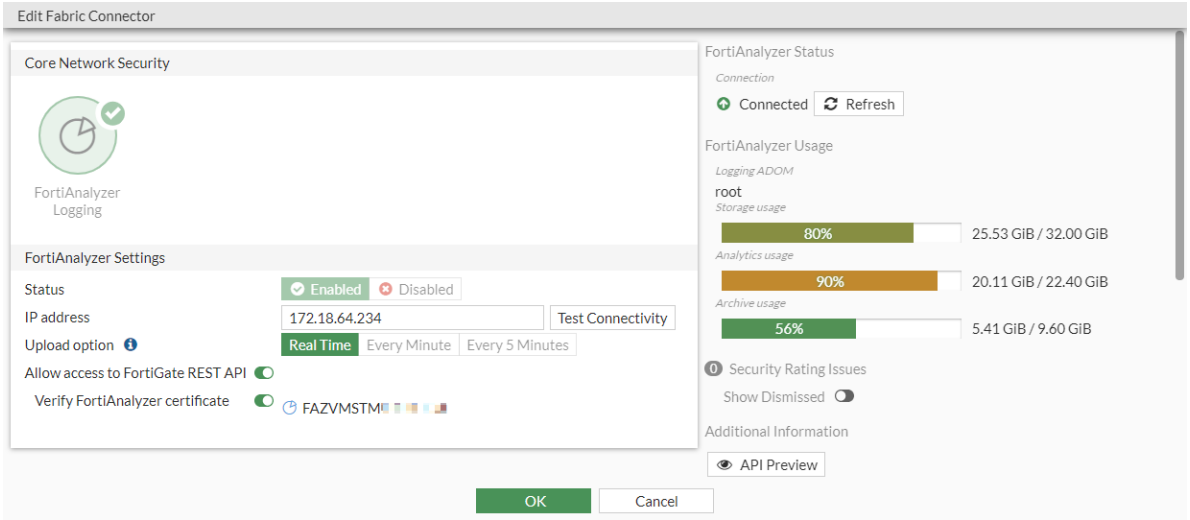
Configure FortiAnalyzer logging on the FortiGate

The FortiAnalyzer is used to send endpoint compromise notification to the FortiGate.

See Configuring FortiAnalyzer on page 1596 for more information.

To configure FortiAnalyzer logging in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiAnalyzer Logging* card.
2. Ensure the *Status* is *Enabled*, and configure the settings as needed.



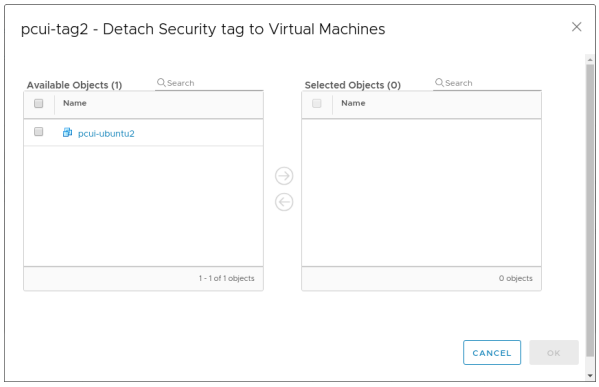
3. Click *Apply*.

To configure FortiAnalyzer logging in the CLI:

```
config log fortianalyzer setting
    set status enable
    set server "172.18.64.234"
    set serial "FL-8HFT000000000"
    set upload-option realtime
    set reliable enable
end
```

When an endpoint instance is compromised

When an endpoint instance, such as *pcui-ubuntu2*, in the VMware NSX environment is compromised, the automation stitch is triggered. The FortiGate then assigns the configured security tag, *pcui-tag2* in this example, to the compromised NSX endpoint instance.



VMware NSX-T security tag action

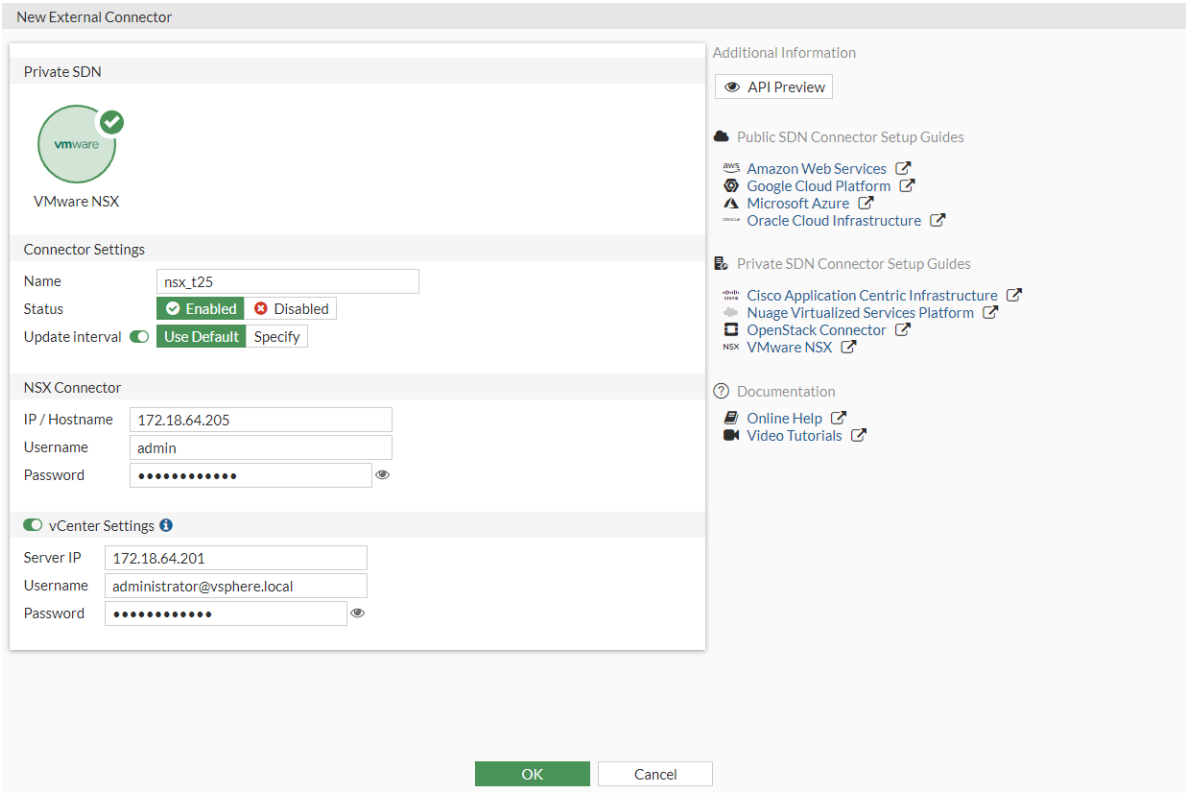
VMware NSX SDN connectors' vCenter server and credentials can be configured so the FortiGate resolves NSX-T VMs. The FortiGate uses the VMWare NSX Security Tag automation action to assign a tag to the VM through an automation stitch.

The FortiGate is notified of a compromised host on the NSX-T network by an incoming webhook or other means, such as FortiGuard IOC. An automation stitch can be configured to process this trigger and action it by assigning a VMware NSX security tag on the VM instance.

To configure an automation stitch to assign a security tag to NSX-T VMs in the GUI:

1. Configure the NSX SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. Select *VMware NSX*.
   c. Configure the connector settings.

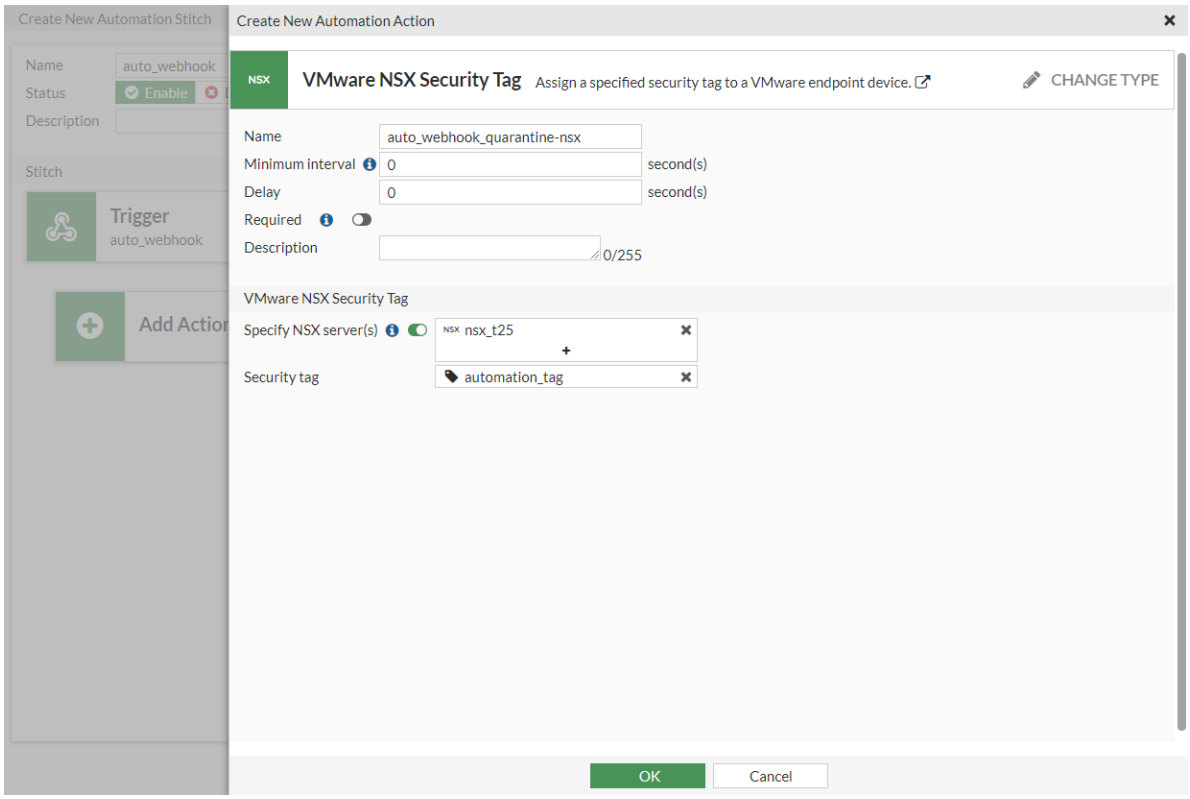
d. Enable *vCenter Settings* and configure as needed.



e. Click *OK*.

2. Configure the automation stitch trigger:
   a. Go to *Security Fabric* > *Automation* and click *Create New*.
   b. Enter the stitch name (*auto_webhook*).
   c. Click *Add Trigger*.
   d. Click *Create* and select *Incoming Webhook*.
   e. Enter a name (*auto_webhook*).
   f. Click *OK* to close the *Incoming Webhook URL* prompt.
   g. Select the trigger in the list and click *Apply*.
3. Configure the automation stitch action:
   a. Click *Add Action*.
   b. Click *Create* and select *VMware NSX Security Tag*.
   c. Enter the following:

Name	auto_webhook_quarantine-nsx
Specify NSX server(s)	Enable and select the SDN connector
Security tag	Select an existing tag, or create a new one



d. Click *OK*.

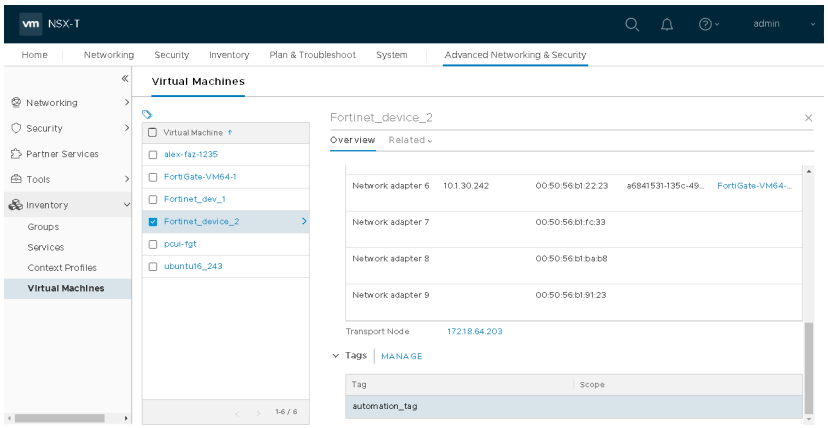
e. Select the action in the list and click *Apply*.

4. Click *OK*.

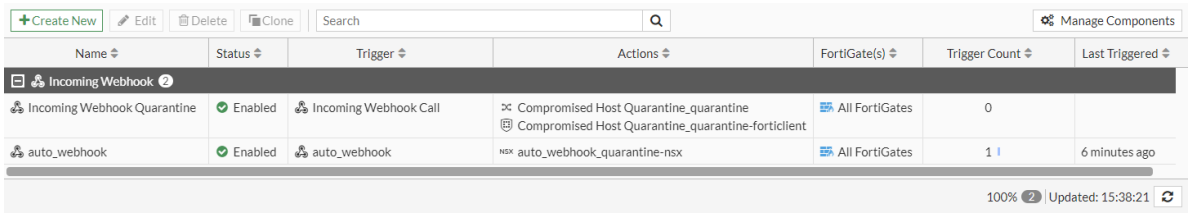
5. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

```
root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer
3fdxNG08mgNg0fh4NQ51g1NQ1QHcxx' --data '{ "srcip": "10.1.30.242"}'
https://172.16.116.230/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
{
  "http_method":"POST",
  "status":"success",
  "http_status":200,
  "serial":"FGVM08TM20000000",
  "version":"v6.4.0",
  "build":1608
}
```

The automation stitch is triggered and the configured tag is added to the NSX-T VM.



In FortiOS, the *Security Fabric* > *Automation* page shows the last trigger time.



To configure an automation stitch to assign a security tag to NSX-T VMs in the CLI:

1. Configure the NSX SDN connector:

```
config system sdn-connector
    edit "nsx_t25"
        set type nsx
        set server "172.18.64.205"
        set username "admin"
        set password xxxxxxxxxxxx
        set vcenter-server "172.18.64.201"
        set vcenter-username "administrator@vsphere.local"
        set vcenter-password xxxxxxxxxxxx
    next
end
```

2. Configure the automation stitch:

```
config system automation-trigger
    edit "auto_webhook"
        set trigger-type event-based
        set event-type incoming-webhook
    next
end

config system automation-action
    edit "auto_webhook_quarantine-nsx"
        set action-type quarantine-nsx
        set security-tag "automation_tag"
        set sdn-connector "nsx_t25"
    next
end
```

```
config system automation-stitch
    edit "auto_webhook"
        set status enable
        set trigger "auto_webhook"
        set action "auto_webhook_quarantine-nsx"
    next
end
```

3. In NSX-T, create a cURL request to trigger the automation stitch on the FortiGate:

```
root@pc56:/home# curl -k -X POST -H 'Authorization: Bearer
3fdxNG08mgNg0fh4NQ51g1NQ1QHcxx' --data '{ "srcip": "10.1.30.242"}'
https://172.16.116.230/api/v2/monitor/system/automation-stitch/webhook/auto_webhook
{
  "http_method":"POST",
  "status":"success",
  "http_status":200,
  "serial":"FGVM08TM20000000",
  "version":"v6.4.0",
  "build":1608
}
```

To verify the automation stitch is triggered and the action is executed:

```
# diagnose test application autod 2

csf: enabled root:yes
version:1586883541 sync time:Tue Apr 14 11:04:05 2020

total stitches activated: 1

stitch: auto_webhook
destinations: all
trigger: auto_webhook

(id:15)service=auto_webhook

local hit: 1 relayed to: 0 relayed from: 0
actions:
auto_webhook_quarantine-nsx type:quarantine-nsx interval:0
security tag:automation_tag
sdn connector:
nsx_t25;
```

Replacement messages for email alerts

Automation stitches with an Email action can leverage the formatting options provided by replacement messages to create branded email alerts.

You can enable a replacement message and edit the message body or select a customized replacement message group when you configure the automation action. When the automation stitch is triggered, the FortiGate will send the email with the defined replacement message.

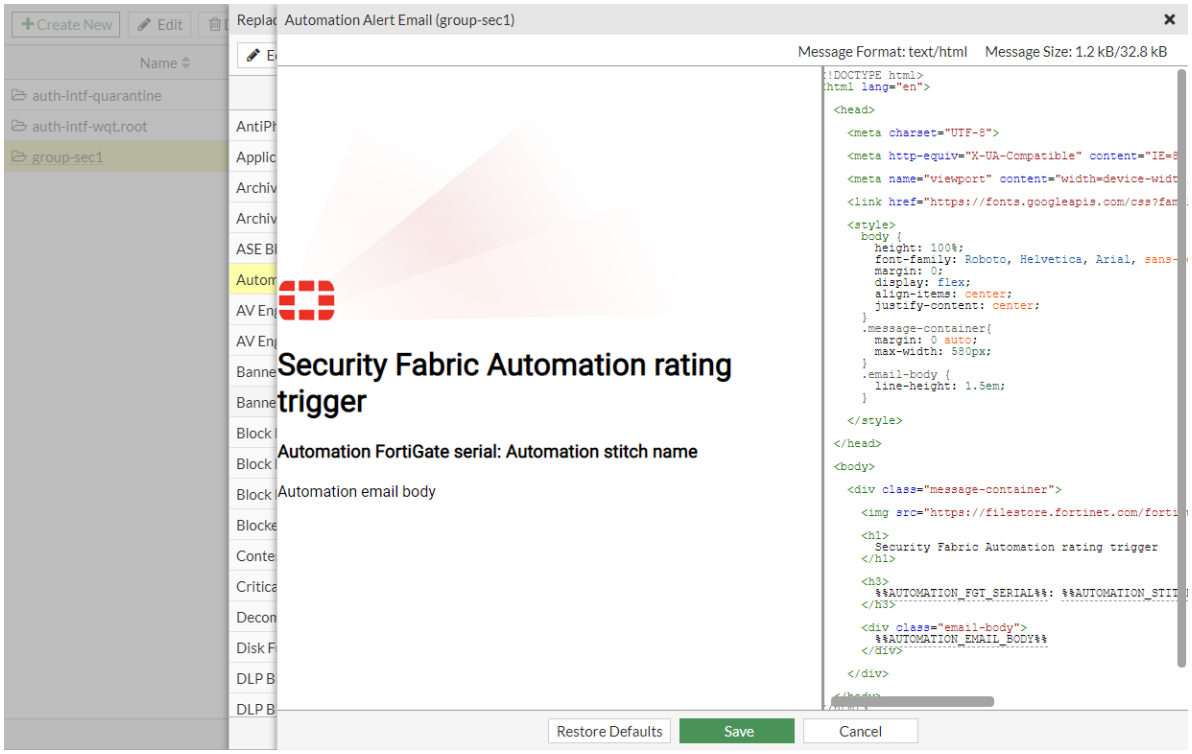
In this example, a Security Rating report triggers an Email notification action. The email uses a customized replacement message group.

To configure the replacement message group in the GUI:

1. Go to *System* > *Replacement Message Groups* and click *Create New*.
2. Enter the following:

Name	group-sec1
Group Type	Security

3. Click *OK*.
4. Select the group in the list and click *Edit*.
5. Select *Automation Alert Email* and click *Edit*.

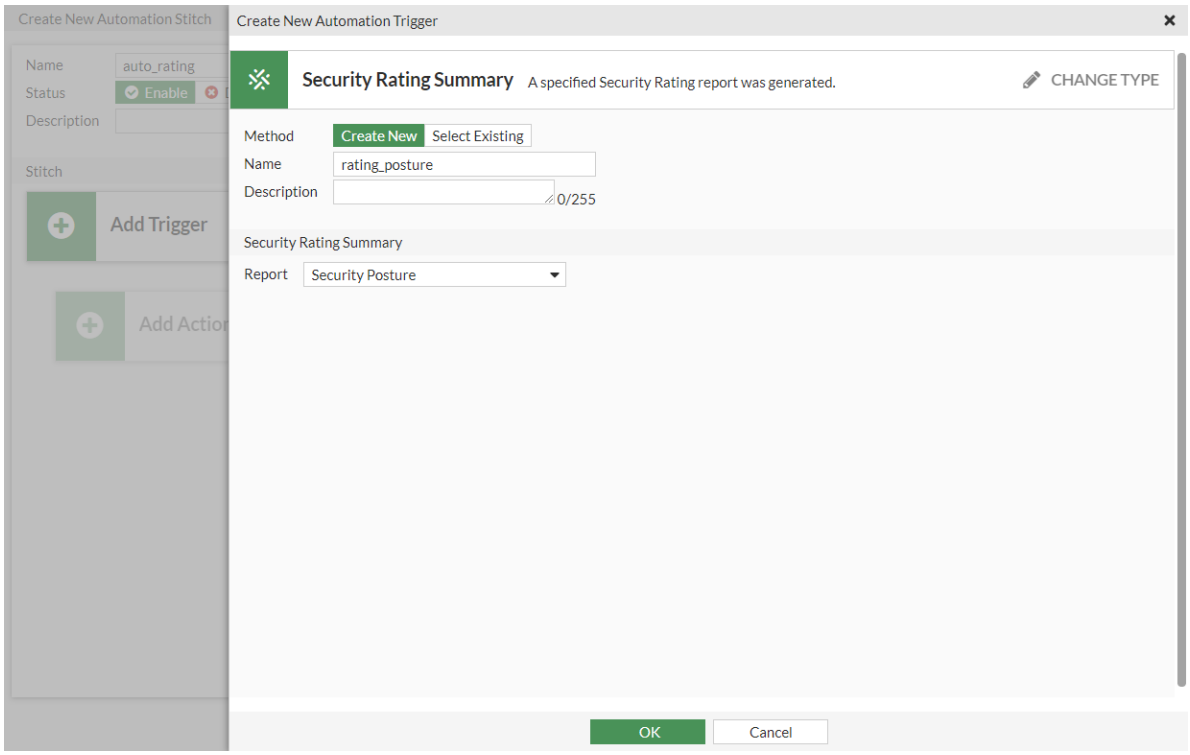


6. Edit the HTML code as needed, then click *Save*.

To configure the email action in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	rating_posture
Description	rating test
Report	Security Posture



d. Click *OK*.

e. Select the trigger in the list and click *Apply*.

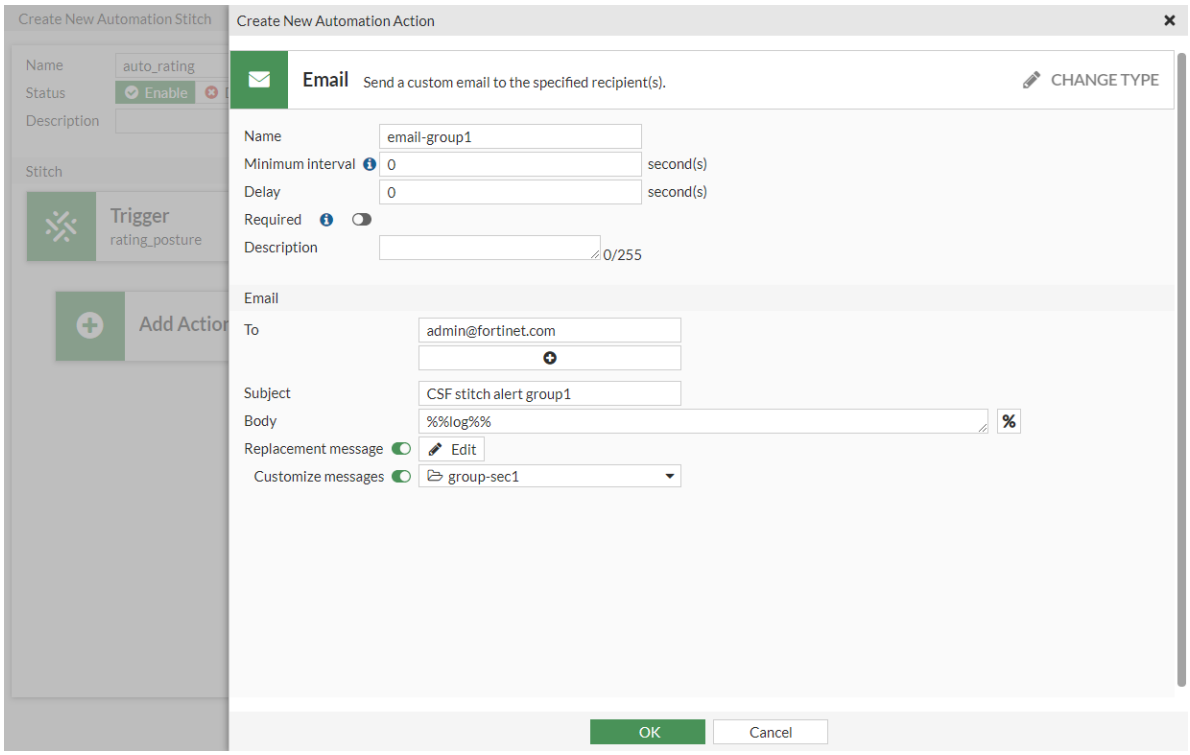
4. Configure the Email notification action:

a. Click *Add Action*.

b. Click *Create* and select *Email*.

c. Enter the following:

Name	email-group1
To	Enter an email address
Subject	CSF stitch alert group1
Replacement message	Enable
Customize messages	Enable and select group-sec1 from the dropdown



d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK*.
6. Right-click the automation stitch, and click *Test Automation Stitch*.
   After the Security Rating report is finished, the automation is triggered, and the email is delivered with the customized replacement message in the email body.

To configure the replacement message group in the CLI:

```
config system replacemsg-group
    edit "group-sec1"
        set comment ""
```

```
        set group-type utm
        config automation
            edit "automation-email"
                set buffer "...<h1> Security Fabric Automation rating trigger </h1>..."
                ...
            next
        end
    next
end
```

To configure the email action in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
    edit "rating_posture"
        set description "rating test"
        set event-type security-rating-summary
    next
end
```

2. Configure the automation action:

```
config system automation-action
    edit "email-group1"
        set action-type email
        set email-to "admin@fortinet.com"
        set email-subject "CSF stitch alert group1"
        set replacement-message enable
        set replacemsg-group "group-sec1"
    next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
    edit "auto_rating"
        set trigger "rating_posture"
        set action "email-group1"
    next
end
```

4. To view the automation stitch information after it is triggered:

```
# diagnose test application autod 3
stitch: auto_rating
        local hit: 1 relayed to: 0 relayed from: 0
        last trigger:Tue Mar 16 15:11:29 2021
        last relay:
        actions:
                email-group1:
                        done: 1 relayed to: 0 relayed from: 0
                        last trigger:Tue Mar 16 15:11:29 2021
                        last relay:

logid2stitch mapping:
id:52000  local hit: 1 relayed hits: 0
        auto_rating
```

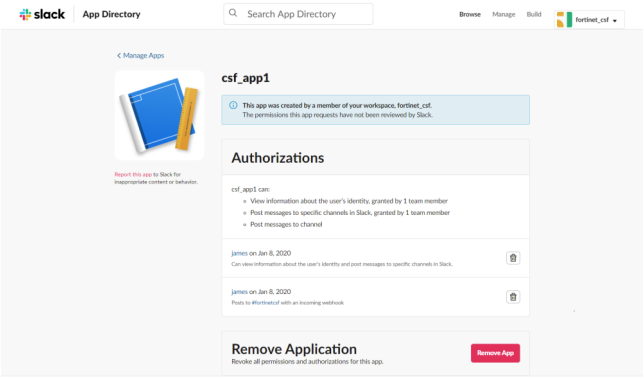
Slack Notification action

To configure an automation stitch with a Slack Notification action, you first need to configure an incoming webhook in Slack. Then you can enter the webhook URL when you configure the Slack Notification action.

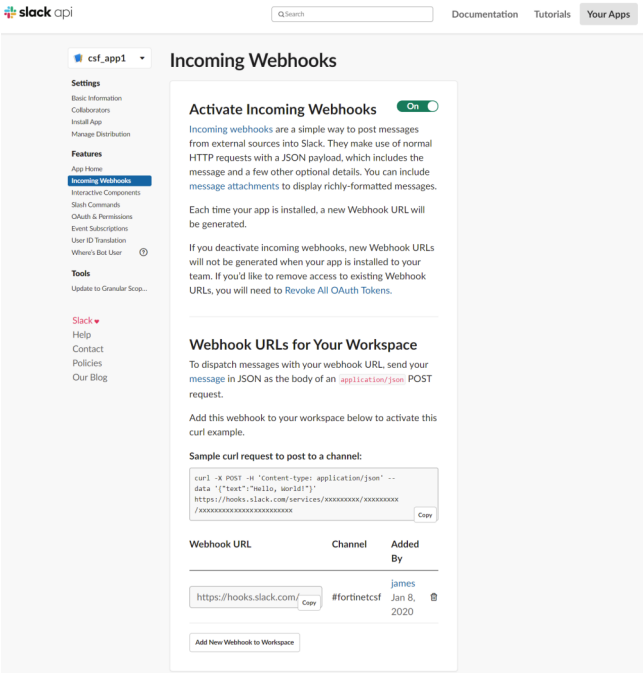
This example uses a Security Rating Summary trigger in the automation stitch with two Slack Notification actions with different notification messages. One message is a custom message, and the other is for the Security Rating Summary log with a 90 second delay.

To create an Incoming Webhook in Slack:

1. Go to the Slack website, and create a workspace.
2. Create a Slack application for the workspace.



3. Add an Incoming Webhook to a channel in the workspace (see Sending messages using Incoming Webhooks for more details).
4. Activate the Incoming Webhook, and copy the *Webhook URL* to the clipboard.



To configure an automation stitch with Slack Notification actions in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the Security Rating Summary trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	auto-rating
Report	Security Posture

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the first Slack Notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Slack Notification*.
   c. Enter the following:

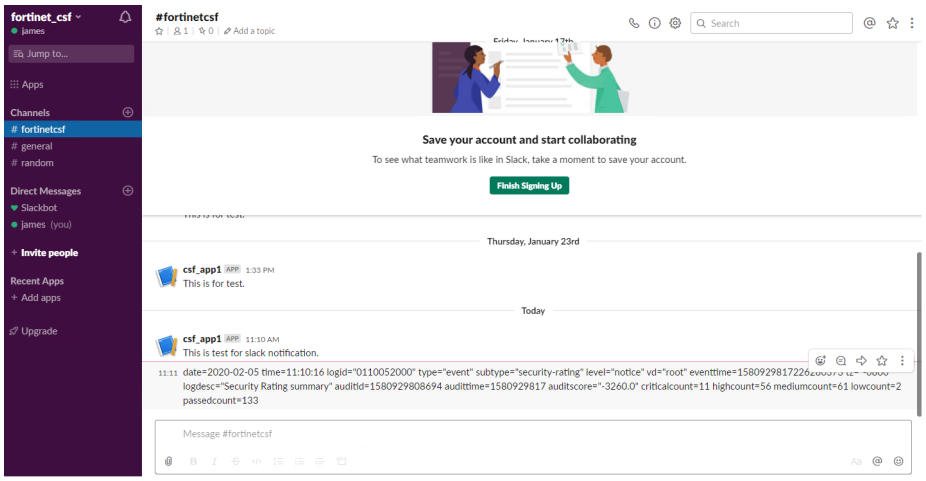
Name	slack1
URL	Paste the webhook URL from the clipboard
Message	Text
Message text	This is test for slack notification.

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.

5. Configure the second Slack Notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Slack Notification*.
   c. Enter the following:

Name	slack2
Delay	90
URL	Paste the webhook URL from the clipboard
Message	Text
Message text	%%log%%

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
6. Click *OK*.
7. Trigger the automation stitch:
   a. Right-click the automation stitch and select *Test Automation Stitch*.
   After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Slack channel.



To configure an automation stitch with Slack Notification actions in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
   edit "auto-rating"
      set event-type security-rating-summary
   next
end
```

2. Configure the automation actions:

```
config system automation-action
   edit "slack1"
      set action-type slack-notification
      set minimum-interval 0
      set delay 0
      set required disable
      set message-type text
      set message "This is test for slack notification."
      set uri "hooks.slack.com/services/xxxxxxxxx/xxxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxx"
   next
   edit "slack2"
      set action-type slack-notification
      set minimum-interval 0
      set delay 90
      set required disable
      set message-type text
      set message "%%log%%"
      set uri "hooks.slack.com/services/xxxxxxxxx/xxxxxxxxx/xxxxxxxxxxxxxxxxxxxxxxx"
   next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
   edit "auto-rating"
      set status enable
      set trigger "auto-rating"
      set action "slack1" "slack2"
   next
end
```

4. Verify that the automation action was triggered:

```
# diagnose test application autod 3
stitch: auto-rating
    local hit: 1 relayed to: 0 relayed from: 0
    last trigger:Wed Feb 05 11:10:23 2020
    last relay:
    actions:
        slack1:
            done: 1 relayed to: 0 relayed from: 0
            last trigger:Wed Feb 11:10:23 2020
            last relay:
        slack2:
            done: 1 relayed to: 0 relayed from: 0
            last trigger:Wed Feb 05 11:10:23 2020
            last relay:
```

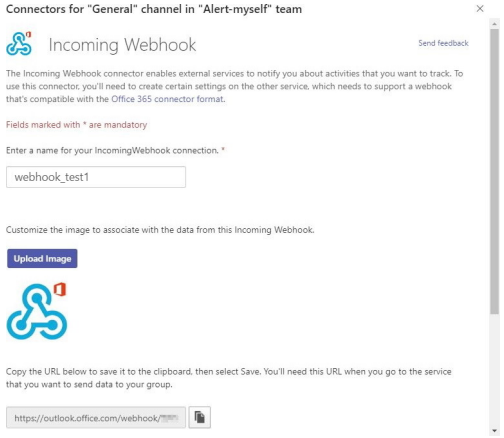
Microsoft Teams Notification action

Microsoft Teams Notification actions can be configured to send notifications to channels in Microsoft Teams. To trigger the notifications, you need to add an Incoming Webhook connector to a channel in Microsoft Teams, then you can configure the automation stitch with the webhook URL.

In the following example, you will configure an automation stitch with a Security Rating Summary trigger and two Microsoft Teams Notification actions with different notification messages. One message is for the Security Rating Summary log, and the other is a custom message with a ten second delay.

To add the Incoming Webhook connector in a Microsoft Teams channel:

1. In Microsoft Teams, click the ... (*More options*) beside the channel name, and select *Connectors*.
2. Search for *Incoming Webhook* and click *Configure*.
3. Enter a name for the webhook, upload an image for the webhook, and click *Create*.
4. Copy the webhook to the clipboard and save it.



5. Click *Done*.

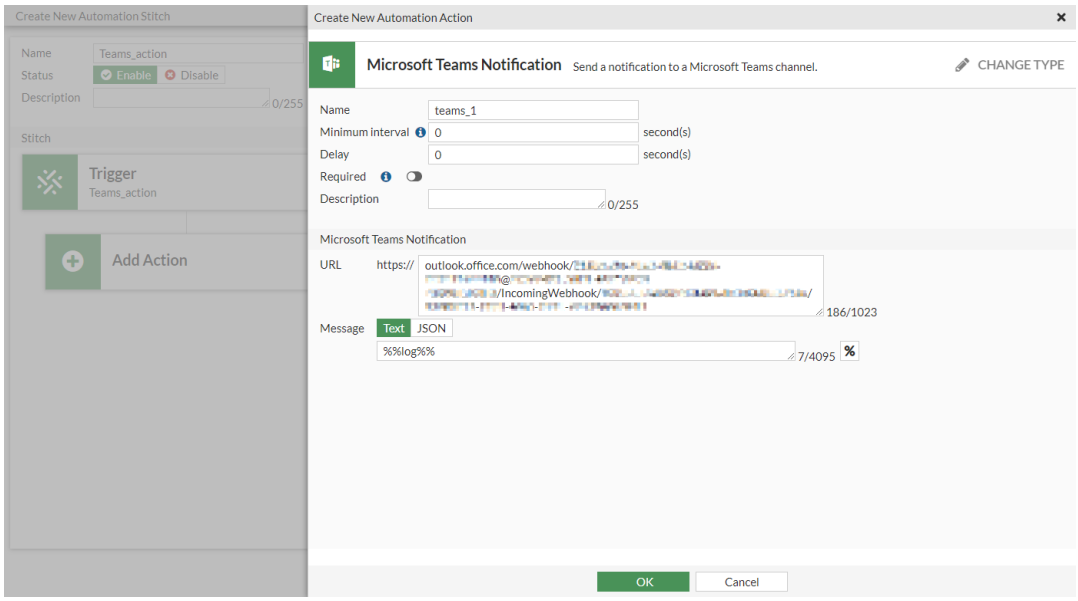
To configure an automation stitch with Microsoft Teams Notification actions in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.

3. Configure the Security Rating Summary trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter a name, and for *Report*, select *Security Posture*.

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the first Microsoft Teams Notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Microsoft Teams Notification*.
   c. Enter the following:

Name	teams_1
URL	Paste the webhook URI from the clipboard
Message	Text
Message text	%%log%%



d. Click *OK*.

e. Select the action in the list and click *Apply*.

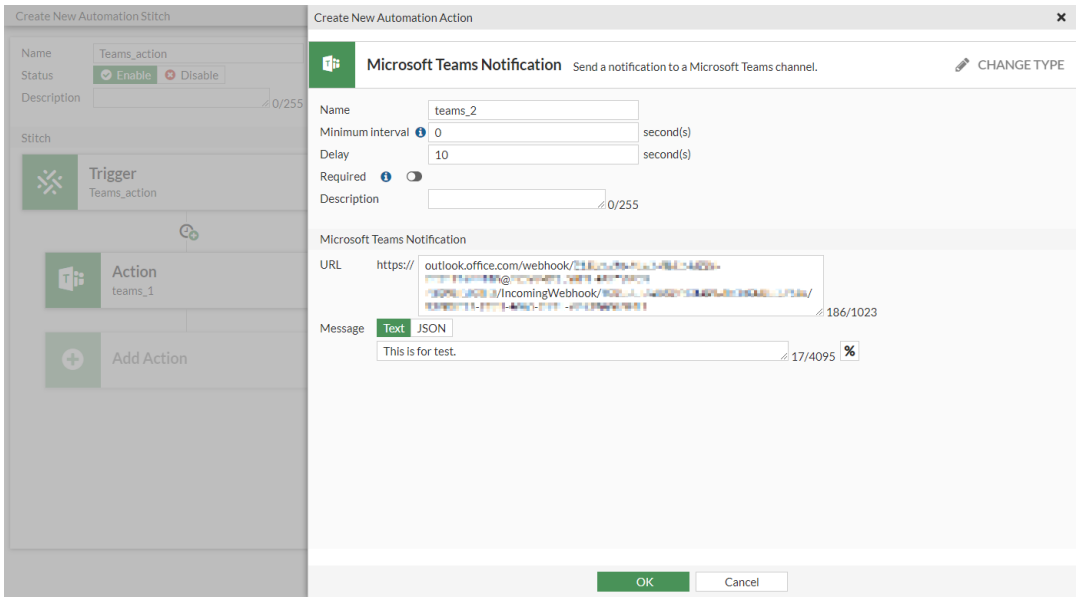
5. Configure the second Microsoft Teams Notification action:

a. Click *Add Action*.

b. Click *Create* and select *Microsoft Teams Notification*.

c. Enter the following:

Name	teams_2
Delay	10
URL	Paste the webhook URI from the clipboard
Message	Text
Message text	This is for test.



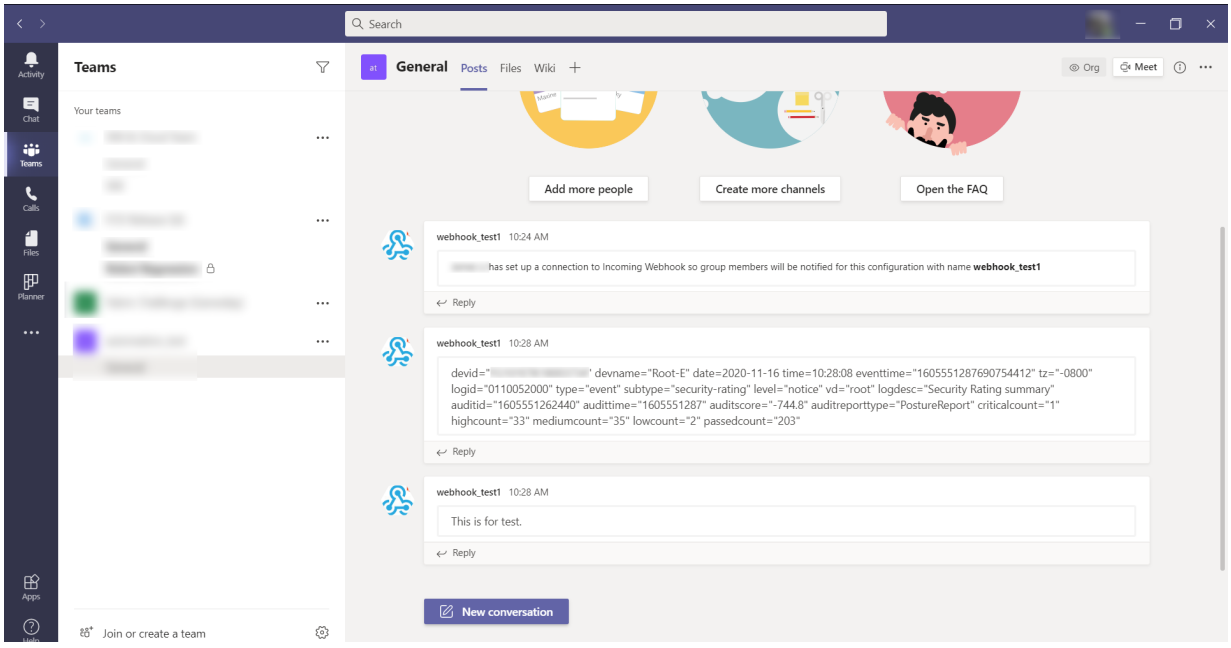
d. Click *OK*.

e. Select the action in the list and click *Apply*.

6. Click *OK*.

7. Trigger the automation stitch:

   a. Right-click the automation stitch and select *Test Automation Stitch*.
   After the Security Rating report is finished, the automation is triggered and an event log is created by the FortiGate. The two notifications are sent to the Microsoft Teams channel.



To configure an automation stitch with Microsoft Teams Notification actions in the CLI:

1. Configure the automation trigger:

```
config system automation-trigger
   edit "Teams_action"
```

```
      set event-type security-rating-summary
    next
end
```

2. Configure the automation actions:

```
config system automation-action
    edit "teams_1"
        set action-type microsoft-teams-notification
        set message-type text
        set message "%%log%%"
        set uri "outlook.office.com/webhook/xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx@xxxxxxxx-
             xxxx-xxxx-xxxx-
             xxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxx-xxxx-
             xxxx-xxxx-xxxxxxxxxxxx"
    next
    edit "teams_2"
        set action-type microsoft-teams-notification
        set delay 10
        set message-type text
        set message "This is for test."
        set uri "outlook.office.com/webhook/xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx@xxxxxxxx-
             xxxx-xxxx-xxxx-
             xxxxxxxxxxxx/IncomingWebhook/xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx/xxxxxxxx-xxxx-
             xxxx-xxxx-xxxxxxxxxxxx"
    next
end
```

3. Configure the automation stitch:

```
config system automation-stitch
    edit "Teams_action"
        set trigger "Teams_action"
        set action "teams_1" "teams_2"
    next
end
```

4. Verify that the automation action was triggered:

```
# diagnose test application autod 3
stitch: Teams_action
    local hit: 2 relayed to: 0 relayed from: 0
    last trigger:Mon Nov 16 10:28:08 2020
    last relay:
    actions:
        teams_1:
        done: 2 relayed to: 0 relayed from: 0
            last trigger:Mon Nov 16 10:28:08 2020
            last relay:
        teams_2:
        done: 2 relayed to: 0 relayed from: 0
            last trigger:Mon Nov 16 10:28:08 2020
            last relay:
logid2stitch mapping:
id:52000 local hit: 22 relayed hits: 0
Teams_action
```

AWS Lambda action

AWS Lambda functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure an AWS Lambda function automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	auto-aws
Report	Security Posture

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the AWS Lambda function action:
   a. Click *Add Action*.
   b. Click *Create* and select *AWS Lambda*.
   c. Enter the following:

Name	aws-action-1
URL	Enter the request API URI
API key	Enter the API key
HTTP header	header2 : header2_value

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an AWS Lambda function automation stitch in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "auto-aws"
        set event-type security-rating-summary
    next
end
```

2. Create the automation action:

```
config system automation-action
    edit "aws-action-1"
        set action-type aws-lambda
        set aws-api-key *************
        set uri "0100000000.execute-api.us-east-2.amazonaws.com/default/xxxxx-
autobatoon-XXX-lambdaXXX"
        set headers "header2:header2_value"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-aws"
        set trigger "auto-aws"
        set action "aws-action-1"
    next
end
```

When the automation stitch is triggered, the *Security Fabric* > *Automation* page shows the stitch trigger time. In AWS, the log shows that the function was called, executed, and finished.

Azure Function action

Azure functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure an Azure function automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	auto-azure
Report	Security Posture

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the Azure Function action:
   a. Click *Add Action*.
   b. Click *Create* and select *Azure Function*.
   c. Enter the following:

Name	azure_function
URL	Enter the request API URI
Authorization	Function
API key	Enter the API key
HTTP header	header1 : value1

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an Azure function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "auto-azure"
        set event-type security-rating-summary
    next
end
```

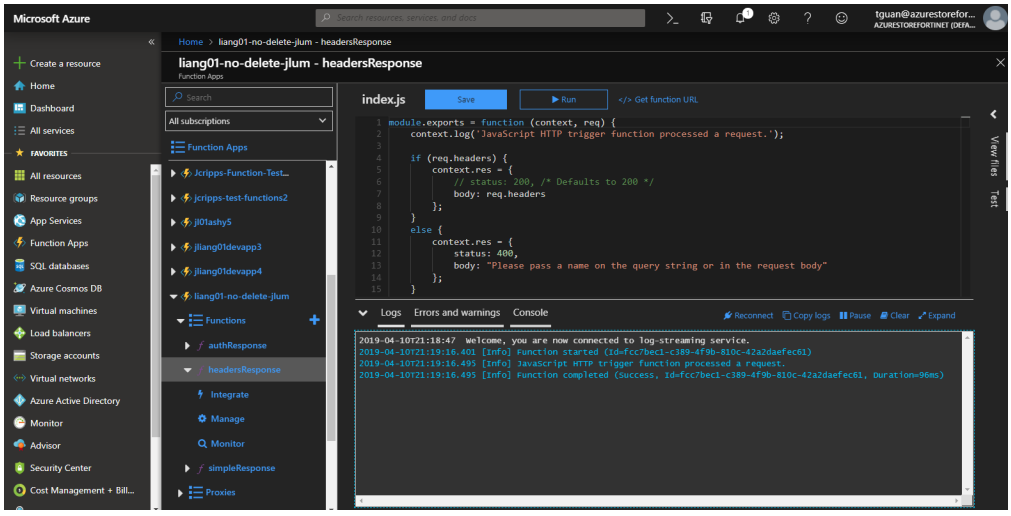
2. Create an automation action:

```
config system automation-action
    edit "azure_function"
        set action-type azure-function
        set azure-function-authorization function
        set azure-api-key **********
        set uri "xxxxx00-no-delete-xxxx.azurewebsites.net/api/headersResponse"
        set headers "header1:value1"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-azure"
        set trigger "auto-azure"
        set action "azure_function"
    next
end
```

When the automation stitch is triggered, the *Security Fabric* > *Automation* page shows the stitch trigger time. In Azure, the function log shows that the function was called, executed, and finished:



Google Cloud Function action

Google Cloud functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure a Google Cloud function automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	auto-google1
Report	Security Posture

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the Google Cloud Function action:
   a. Click *Add Action*.
   b. Click *Create* and select *Google Cloud Function*.
   c. Enter the following:

Name	google-echo
URL	Enter the request API URI
HTTP header	echo-header : echo-value

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure a Google Cloud function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "auto-google1"
        set event-type security-rating-summary
    next
end
```

2. Create an automation action:

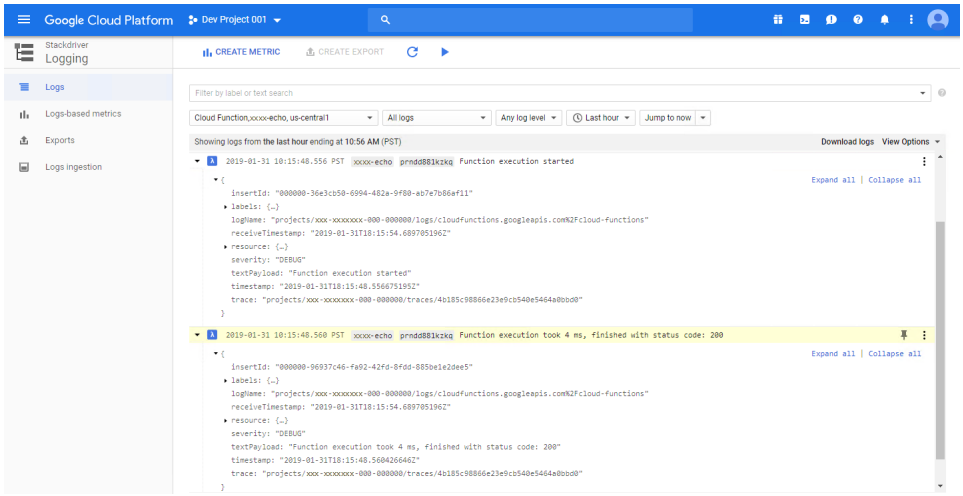
```
config system automation-action
    edit "google-echo"
        set action-type google-cloud-function
        set uri "us-central1-xxx-xxxxxxx-000-000000.cloudfunctions.net/xxxx-echo"
        set headers "echo-header:echo-value"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-google1"
        set trigger "auto-google1"
```

```
        set action "google-echo"
    next
end
```

When the automation stitch is triggered, the *Security Fabric* > *Automation* page shows the stitch trigger time. In Google Cloud, go to *Logs* to see the function log showing that the configured function was called, executed, and finished:



AliCloud Function action

AliCloud functions can be called when an automation stitch is triggered. This example uses a Security Rating Summary trigger in the automation stitch.

To configure an AliCloud function automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

Name	auto-ali
Report	Security Posture

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the AliCloud Function action:
   a. Click *Add Action*.
   b. Click *Create* and select *AliCloud Function*.
   c. Enter the following:

Name	Ali-Action-1
URL	Enter the request API URI

Authorization	Function
AccessKey ID	Enter the access key ID
AccessKey Secret	Enter the access key secret

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Click *OK*.

To configure an AliCloud function automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "auto-ali"
        set event-type security-rating-summary
    next
end
```

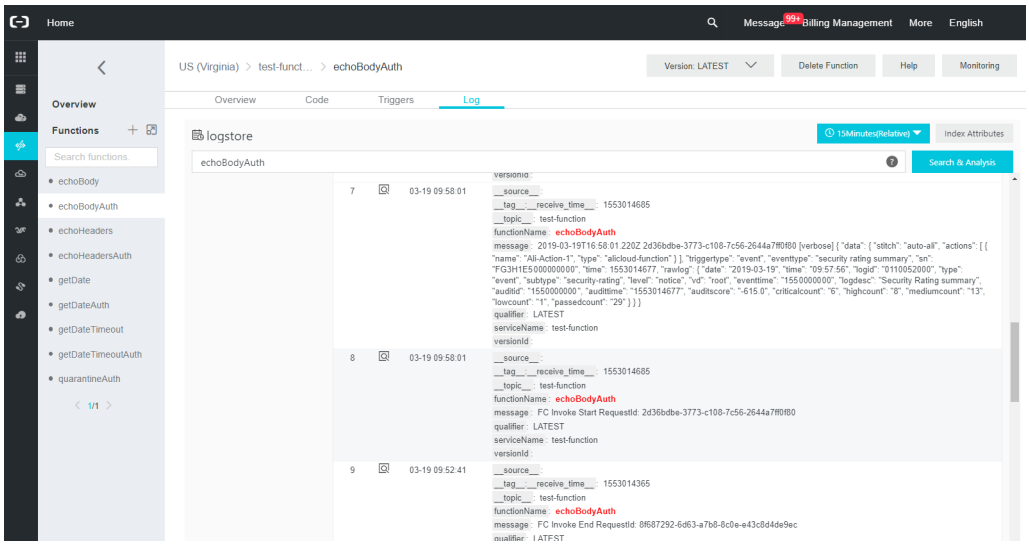
2. Create an automation action:

```
config system automation-action
    edit "Ali-Action-1"
        set action-type alicloud-function
        set alicloud-function-authorization function
        set alicloud-access-key-id "XXXXXxXXXXxxxxxx"
        set alicloud-access-key-secret xxxxxx
        set uri "0000000000000000.us-east-1.fc.aliyuncs.com/2099-99-99/proxy/test-
function/echoBodyAuth/"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-ali"
        set trigger "auto-ali"
        set action "Ali-Action-1"
    next
end
```

When the automation stitch is triggered, the *Security Fabric* > *Automation* page shows the stitch trigger time. In AliCloud, the function log shows that the function was called, executed, and finished:



CLI script action

CLI scripts can run when an automation stitch is triggered. The output of the script can be sent as an email action.

In this example, the script sets the idle timeout value to 479 minutes, and sends an email with the script output.

To configure a stitch with a CLI script action in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name (*auto-cli-1*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Security Rating Summary*.
   c. Enter the following:

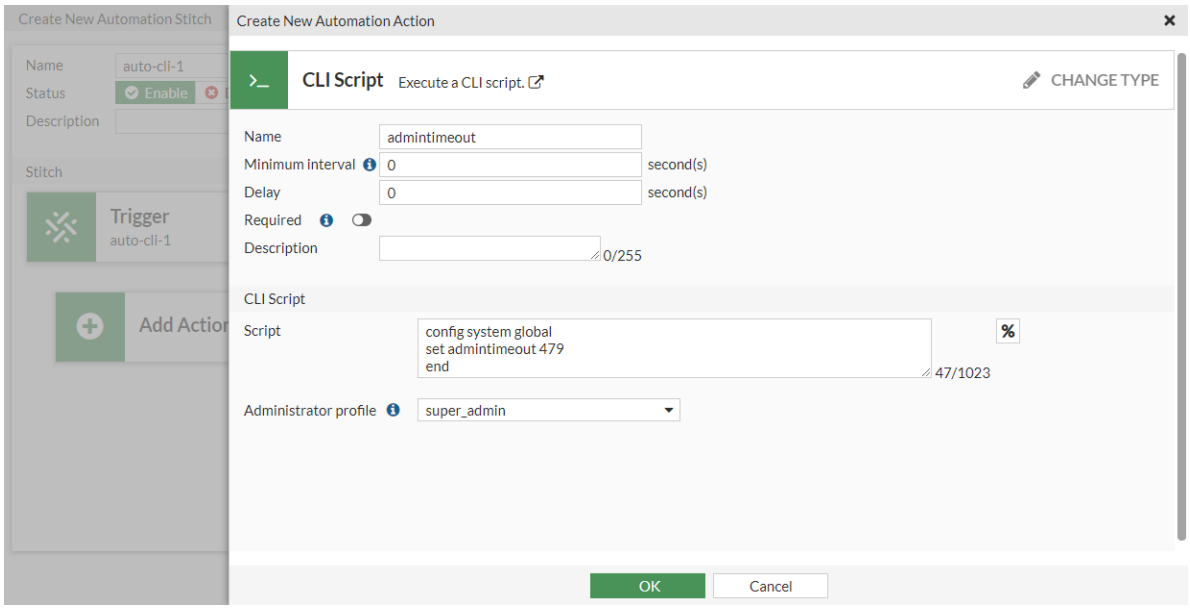
Name	auto-cli-1
Report	Security Posture

   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the CLI Script action:
   a. Click *Add Action*.
   b. Click *Create* and select *CLI Script*.
   c. Enter the following:

Name	admintimeout
Required	Enable

Script	`config system global`
	`    set admintimeout 479`
	`end`

Administrator profile	Select a profile



d. Click *OK*.

e. Select the action in the list and click *Apply*.

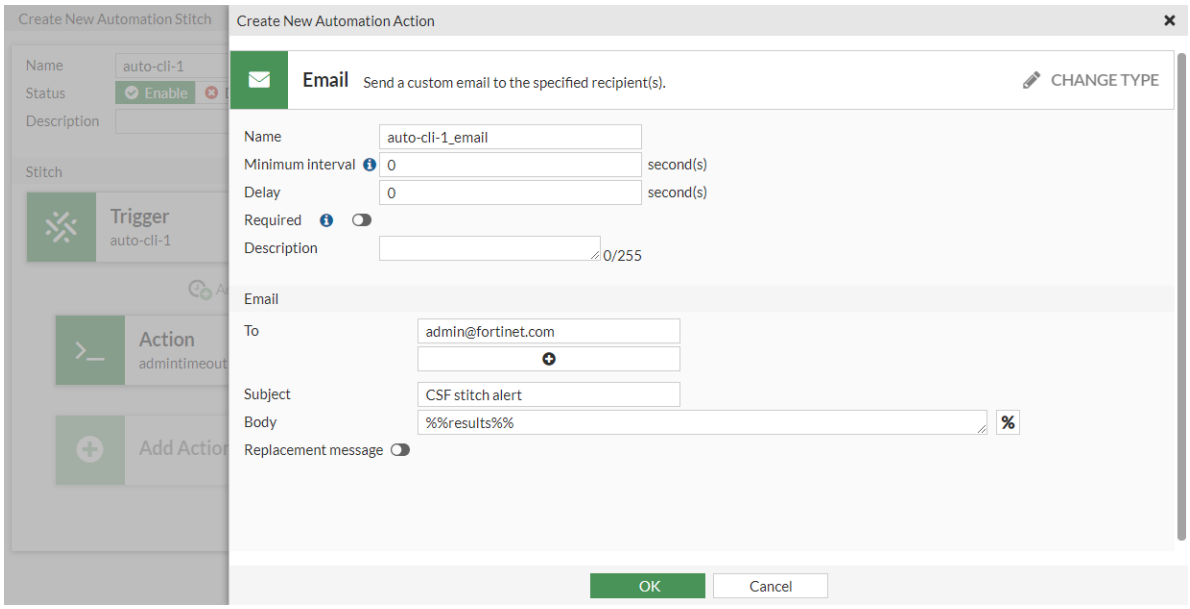
5. Configure the Email notification action:

a. Click *Add Action*.

b. Click *Create* and select *Email*.

c. Enter the following:

Name	auto-cli-1_email
To	Enter an email address
Subject	CSF stitch alert
Body	%%results%%



d. Click *OK*.

e. Select the action in the list and click *Apply*.

6. Click *OK*.

To configure a stitch with a CLI script action in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "auto-cli-1"
        set event-type security-rating-summary
    next
end
```

2. Create the automation actions:

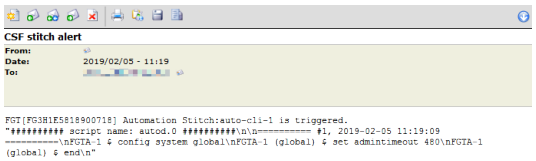
```
config system automation-action
    edit "admintimeout"
        set action-type cli-script
        set minimum-interval 0
        set delay 0
        set required enable
        set script "config system global
            set admintimeout 479
            end"
        set accprofile "super_admin"
    next
    edit "auto-cli-1_email"
        set action-type email
        set email-to "admin@fortinet.com"
        set email-subject "CSF stitch alert"
        set message "%%results%%"
        set minimum-interval 0
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto-cli-1"
        set status enable
        set trigger "auto-cli-1"
        set action "admintimeout" "auto-cli-1_email"
    next
end
```

Sample email

The email sent by the action will look similar to the following:



Execute a CLI script based on CPU and memory thresholds

Automation stitches can be created to run a CLI script and send an email message when CPU or memory usage exceeds specified thresholds.

In this example, two automation stitches are created that run a CLI script to collect debug information, and then email the results of the script to a specified email address when the CPU usage threshold is exceeded, or memory usage causes the FortiGate to enter conserve mode.

To define CPU and memory usage thresholds:

```
config system global
    set cpu-use-threshold <percent>
    set memory-use-threshold-extreme <percent>
    set memory-use-threshold-green <percent>
    set memory-use-threshold-red <percent>
end
```

Where:

cpu-use-threshold	Threshold at which CPU usage is reported, in percent of total possible CPU utilization (default = 90).
memory-use-threshold-extreme	Threshold at which memory usage is considered extreme, and new sessions are dropped, in percent of total RAM (default = 95).
memory-use-threshold-green	Threshold at which memory usage forces the FortiGate to exit conserve mode, in percent of total RAM (default = 82).
memory-use-threshold-red	Threshold at which memory usage forces the FortiGate to enter conserve mode, in percent of total RAM (default = 88).

Configuring the automation stitches

High CPU usage stitch

To create an automation stitch for high CPU usage in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name (*auto_high_cpu*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *High CPU*.
   c. Enter the name, *auto_high_cpu*.
   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the CLI Script action:
   a. Click *Add Action*.
   b. Click *Create* and select *CLI Script*.
   c. Enter the following:

Name	high_cpu_debug
Required	Enable

Script	`diagnose debug cli 8`
	`diagnose debug console timestamp enable`
	`diagnose debug enable`
	`diagnose debug crashlog read`
	`get system performance status`
	`get system session status`
	`diagnose sys session full-stat`
	`diagnose firewall iprope state`
	`diagnose sys flash list`
	`diagnose hardware sysinfo memory`
	`diagnose hardware sysinfo slab`
	`diagnose hardware sysinfo shm`
	`diagnose hardware deviceinfo disk`
	`get system arp`
	`diagnose ip arp list`
	`diagnose ip address list`
	`get router info routing-table all`
	`get router info kernel`
	`diagnose ip rtcache list`
	`diagnose sys top-summary`
	`diagnose sys top 9 99`

Administrator profile	Select a profile

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.

5. Configure the Email notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Email*.
   c. Enter the following:

Name	auto_high_cpu_email
To	Enter an email address
Subject	CSF stitch alert: high_cpu
Body	%%results%%

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
6. Click *OK*.

To create an automation stitch for high CPU usage in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "auto_high_cpu"
        set event-type high-cpu
    next
end
```

2. Create the automation actions:

```
config system automation-action
    edit "high_cpu_debug"
        set action-type cli-script
        set required enable
        set script "diagnose debug cli 8
diagnose debug console timestamp enable
diagnose debug enable
diagnose debug crashlog read
get system performance status
get system session status
diagnose sys session full-stat
diagnose firewall iprope state
diagnose sys flash list
diagnose hardware sysinfo memory
diagnose hardware sysinfo slab
diagnose hardware sysinfo shm
diagnose hardware deviceinfo disk
get system arp
diagnose ip arp list
diagnose ip address list
get router info routing-table all
get router info kernel
diagnose ip rtcache list
diagnose sys top-summary
diagnose sys top 9 99"
        set accprofile "super_admin"
    next
```

```
    edit "auto_high_cpu_email"
        set action-type email
        set email-to "person@fortinet.com"
        set email-subject "CSF stitch alert: high_cpu"
        set message "%%results%%"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto_high_cpu"
        set trigger "auto_high_cpu"
        set action "high_cpu_debug" "auto_high_cpu_email"
    next
end
```

High memory usage stitch

To create an automation stitch for high memory usage in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name (*auto_high_memory*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Conserve Mode*.
   c. Enter the name, *auto_high_memory*.
   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
4. Configure the CLI Script action:
   a. Click *Add Action*.
   b. Click *Create* and select *CLI Script*.
   c. Enter the following:

Name	high_memory_debug
Required	Enable

Script	`diagnose debug cli 8`
	`diagnose debug console timestamp enable`
	`diagnose debug enable`
	`diagnose debug crashlog read`
	`get system performance status`
	`get system session status`
	`diagnose sys session full-stat`
	`diagnose firewall iprope state`
	`diagnose sys flash list`
	`diagnose hardware sysinfo memory`
	`diagnose hardware sysinfo slab`
	`diagnose hardware sysinfo shm`
	`diagnose hardware deviceinfo disk`
	`get system arp`

	diagnose ip arp list diagnose ip address list get router info routing-table all get router info kernel diagnose ip rtcache list diagnose sys top-summary diagnose sys top 9 99
Administrator profile	Select a profile

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
5. Configure the Email notification action:
   a. Click *Add Action*.
   b. Click *Create* and select *Email*.
   c. Enter the following:

Name	auto_high_memory_email
To	Enter an email address
Subject	CSF stitch alert: high_memory
Body	%%results%%

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.
6. Click *OK*.

To create an automation stitch for high memory usage in the CLI:

1. Create the automation trigger:

```
config system automation-trigger
    edit "auto_high_memory"
        set event-type low-memory
    next
end
```

2. Create the automation actions:

```
config system automation-action
    edit "high_memory_debug"
        set action-type cli-script
        set required enable
        set script "diagnose debug cli 8
diagnose debug console timestamp enable
diagnose debug enable
diagnose debug crashlog read
get system performance status
get system session status
diagnose sys session full-stat
diagnose firewall iprope state
diagnose sys flash list
diagnose hardware sysinfo memory
```

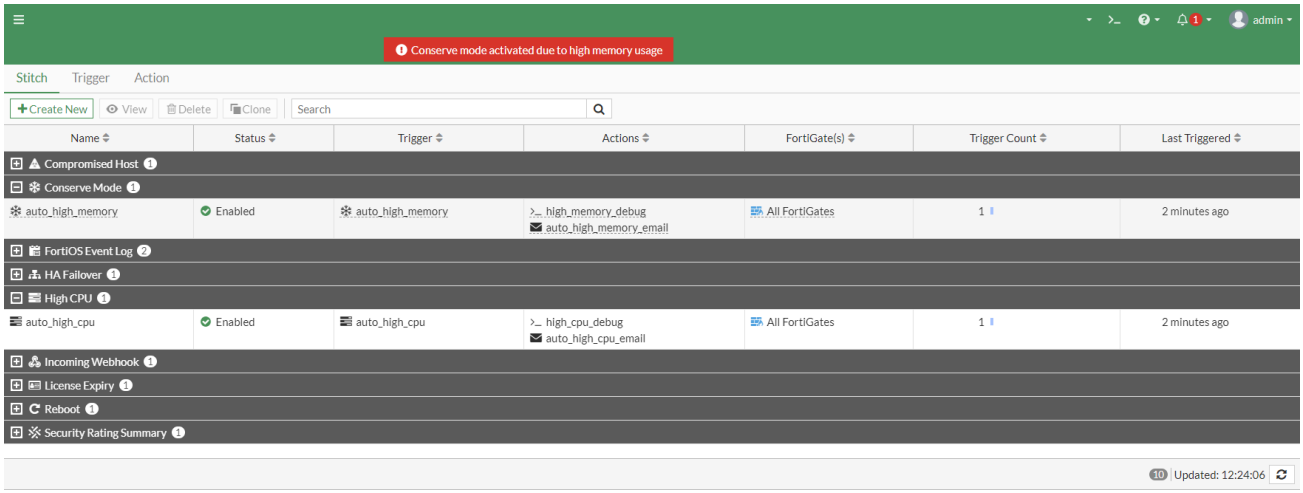
```
diagnose hardware sysinfo slab
diagnose hardware sysinfo shm
diagnose hardware deviceinfo disk
get system arp
diagnose ip arp list
diagnose ip address list
get router info routing-table all
get router info kernel
diagnose ip rtcache list
diagnose sys top-summary
diagnose sys top 9 99"
        set accprofile "super_admin"
    next
    edit "auto_high_memory_email"
        set action-type email
        set email-to "person@fortinet.com"
        set email-subject "CSF stitch alert: high_memory"
        set message "%%results%%"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "auto_high_memory"
        set trigger "auto_high_memory"
        set action "high_memory_debug" "auto_high_memory_email"
    next
end
```

Results

When the FortiGate enters conserve mode due to the `memory-use-threshold-red` being exceeded, the GUI displays a notice, and the *auto_high_memory* automation stitch is triggered. This causes the CLI script to run and the script results are emailed to the specified address.



Here is sample text from the email message:

```
CSF stitch alert: high_memory
noreply@notification.fortinet.net
```

```

Webhook action

The webhook automation stitch action makes HTTP and HTTPS requests to a specified server, with custom headers, bodies, ports, and methods. It can be used to leverage the ubiquity of HTML requests and APIs to integrate with other tools.

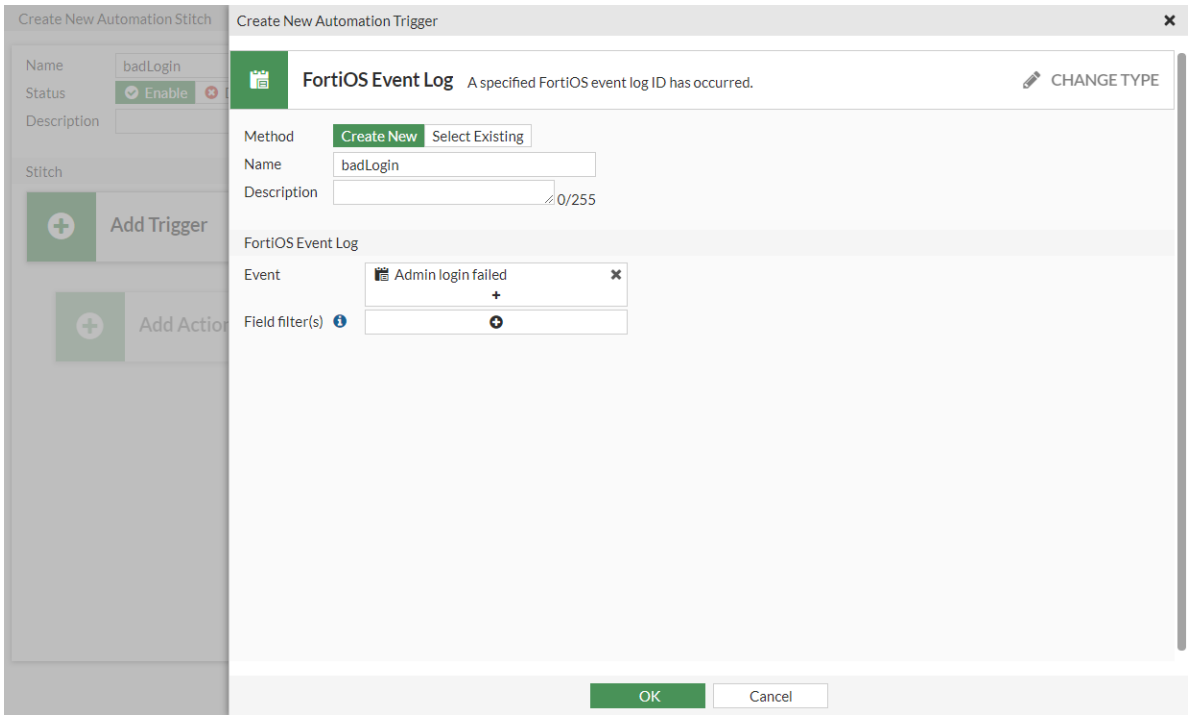
The URI and HTTP body can use parameters from logs or previous action results. Wrapping the parameter with %% will replace the expression with the JSON value for the parameter, for example: *%%results.source%%* is the source property from the previous action.

In this example, a specific log message (failed administrator log in attempt) triggers the FortiGate to send the contents of the log to a server. The server responds with a generic reply. This example assumes that the server is already configured and able to communicate with the FortiGate.

To configure the webhook automation stitch in the GUI:

1. Go to *Security Fabric* > *Automation* and click *Create New*.
2. Enter the stitch name (*badLogin*).
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *FortiOS Event Log*.
   c. Enter the following:

Name	badLogin
Event	Admin login failed



d. Click *OK*.

e. Select the trigger in the list and click *Apply*.

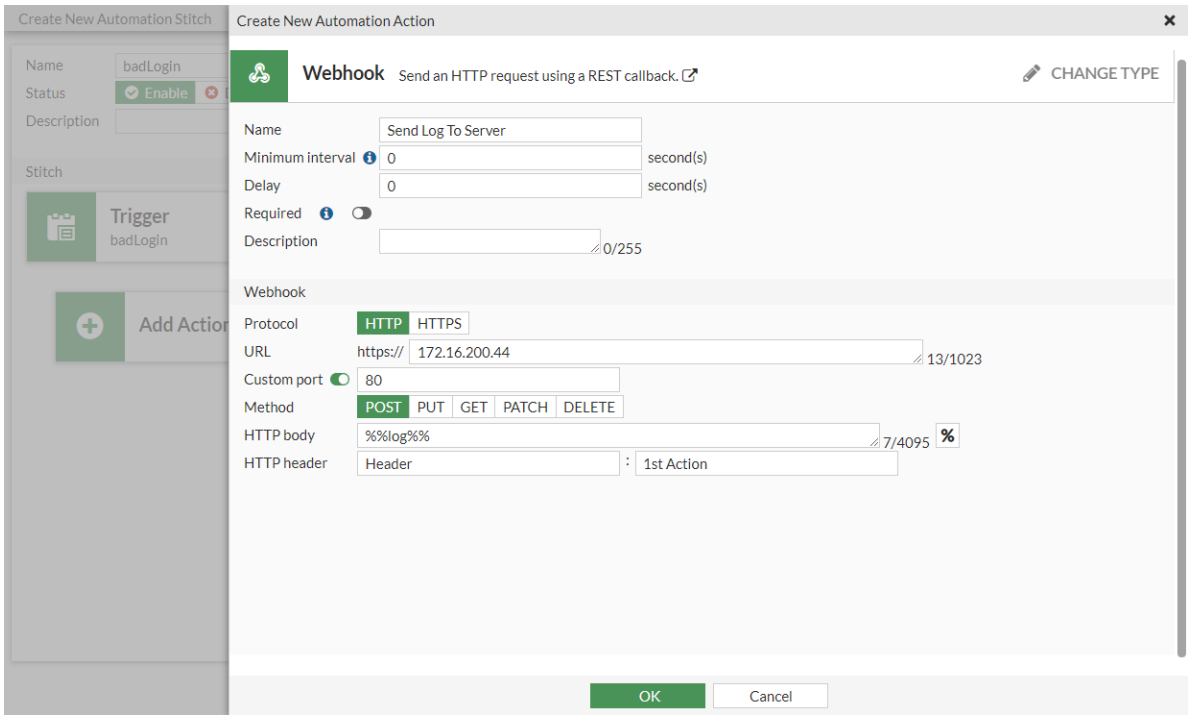
4. Configure the automation stitch action:

a. Click *Add Action*.

b. Click *Create* and select *Webhook*.

c. Enter the following:

Name	Send Log To Server
Protocol	HTTP
URL	172.16.200.44
Custom port	Enable and enter 80
Method	POST
HTTP body	%%log%%
HTTP header	Header : 1st Action



d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK*.

To configure the webhook automation stitch in the CLI:

1. Create an automation trigger:

```
config system automation-trigger
    edit "badLogin"
        set event-type event-log
        set logid 32002
    next
end
```

2. Create the automation action:

```
config system automation-action
    edit "Send Log To Server"
        set action-type webhook
        set uri "172.16.200.44"
        set http-body "%%log%%"
        set port 80
        set headers "Header:1st Action"
    next
end
```

3. Create the automation stitch:

```
config system automation-stitch
    edit "badLogin"
        set trigger "badLogin"
        set action "Send Log To Server"
```

```
        next
    end
```

To test the automation stitch:

1. Attempt to log in to the FortiGate with an incorrect username or password.
2. On the server, check the log to see that its contents were sent by the FortiGate.

   The body content is replaced with the log from the trigger.
3. On the FortiGate, go to *Log & Report* > *Events* and select *System Events* to confirm that the stitch was activated.
4. Go to *Security Fabric* > *Automation* to see the last time that the stitch was triggered.

Diagnose commands

To enable log dumping:

```
# diagnose test application autod 1
autod dumped total:1 logs, num of logids:1
autod log dumping is enabled

vdom:root(0) logid:32002 len:408 log:

```

Slack integration webhook

A webhook can be created to post messages and notifications to Slack.

In this example, a configuration change triggers the FortiGate to post a message to Slack.

To create a webhook automation stitch for Slack integration in the GUI:

1. Create an incoming webhook in Slack. See Sending messages using Incoming Webhooks for more information.
2. Go to *Security Fabric* > *Automation* and click *Create New*.
3. Enter the stitch name.
4. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Configuration Change*.

c. Enter a name (*config change*).
d. Click *OK*.
e. Select the trigger in the list and click *Apply*.

5. Configure the action:
   a. Click *Add Action*.
   b. Click *Create* and select *Webhook*.
   c. Enter the following:

Name	send to Slack
Protocol	HTTPS
URL	Enter the incoming webhook URL created in Slack
Custom port	Enable and enter 443
Method	POST
HTTP body	{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\": \"Configuration changed\", \"icon_emoji\": \":worried:\"}
HTTP header	Content-type : application/json

   d. Click *OK*.
   e. Select the action in the list and click *Apply*.

6. Click *OK*.

To create a webhook automation stitch for Slack integration in the CLI:

1. Create an incoming webhook in Slack. See Sending messages using Incoming Webhooks for more information.
2. Create the automation trigger:

```
config system automation-trigger
    edit "config change"
        set event-type config-change
    next
end
```

3. Create the automation action:

```
config system automation-action
    edit "send to Slack"
        set action-type webhook
        set protocol https
        set uri "hooks.slack.com/services/XXXXXXXX"
        set http-body "{\"channel\": \"#delivery\", \"username\": \"tleela\", \"text\":
\"Configuration changed\", \"icon_emoji\": \":worried:\"}"
        set port 443
        set headers "Content-type:application/json"
    next
end
```

4. Create the automation stitch:

```
config system automation-stitch
    edit "Slack"
        set trigger "config change"
        set action "send to Slack"
    next
end
```

Microsoft Teams integration webhook

A webhook can be created to post messages and notifications to Microsoft Teams.

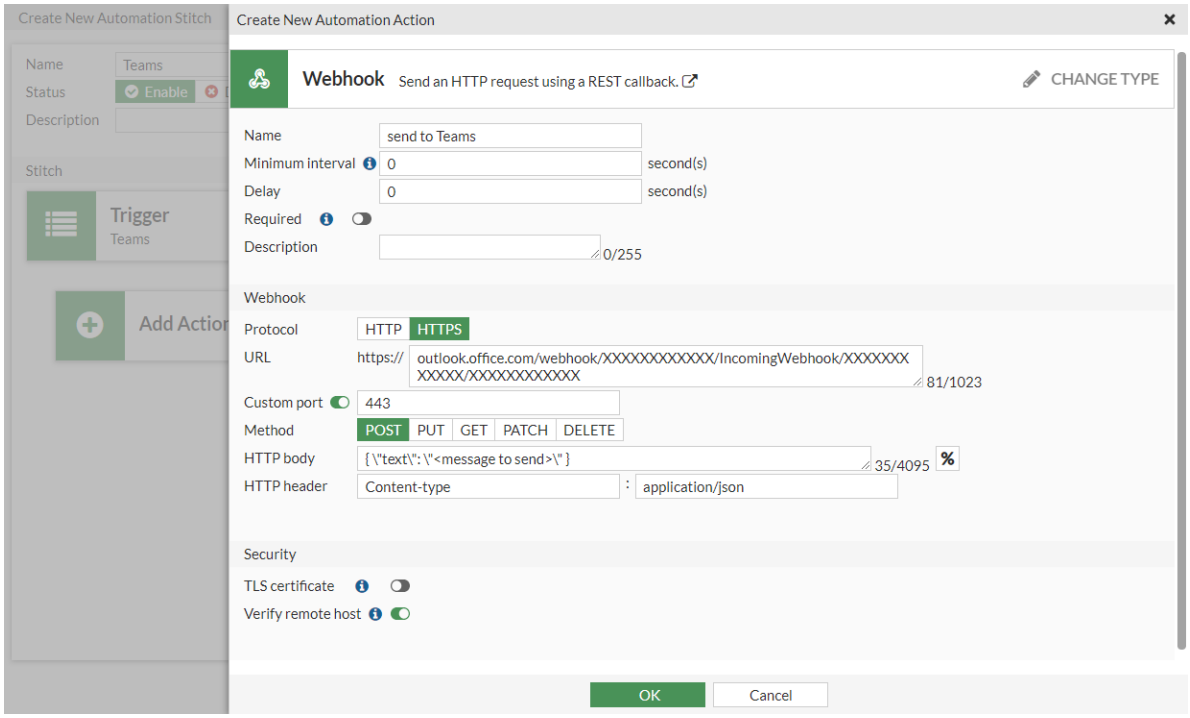
In this example, a configuration change triggers the FortiGate to post a message to Teams.

To create a webhook automation stitch for Teams integration in the GUI:

1. Create an incoming webhook in Teams. See Create an incoming webhook for information.
2. Go to *Security Fabric* > *Automation* and click *Create New*.
3. Enter the stitch name.
4. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *Configuration Change*.
   c. Enter a name (*Teams*).
   d. Click *OK*.
   e. Select the trigger in the list and click *Apply*.
5. Configure the action:
   a. Click *Add Action*.
   b. Click *Create* and select *Webhook*.

c. Enter the following:

Name	send to Teams
Protocol	HTTPS
URL	Enter the incoming webhook URL created in Teams
Custom port	Enable and enter 443
Method	POST
HTTP body	{ \"text\": \"<message to send>\" }
HTTP header	Content-type : application/json



d. Click *OK*.

e. Select the action in the list and click *Apply*.

6. Click *OK*.

To create a webhook automation stitch for Teams integration in the CLI:

1. Create an incoming webhook in Teams. See Create an incoming webhook for information.
2. Create the automation trigger:

```
config system automation-trigger
    edit "Teams"
        set event-type config-change
    next
end
```

3. Create the automation action:

```
config system automation-action
    edit "send to Teams"
        set action-type webhook
        set protocol https
        set uri
"outlook.office.com/webhook/XXXXXXXXXXXX/IncomingWebhook/XXXXXXXXXXXX/XXXXXXXXXXXX"
        set http-body "{ \"text\": \"<message to send>\" }"
        set port 443
        set headers "Content-type:application/json"
    next
end
```

4. Create the automation stitch:

```
config system automation-stitch
    edit "Teams"
        set trigger "Teams"
        set action "send to Teams"
    next
end
```

For information about more advanced messages that can be configured and sent to the Teams incoming webhook, see Sending messages to connectors and webhooks.

Public and private SDN connectors

Cloud SDN connectors provide integration and orchestration of Fortinet products with public and private cloud solutions. In a typical cloud environment, resources are dynamic and often provisioned and scaled on-demand. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric.

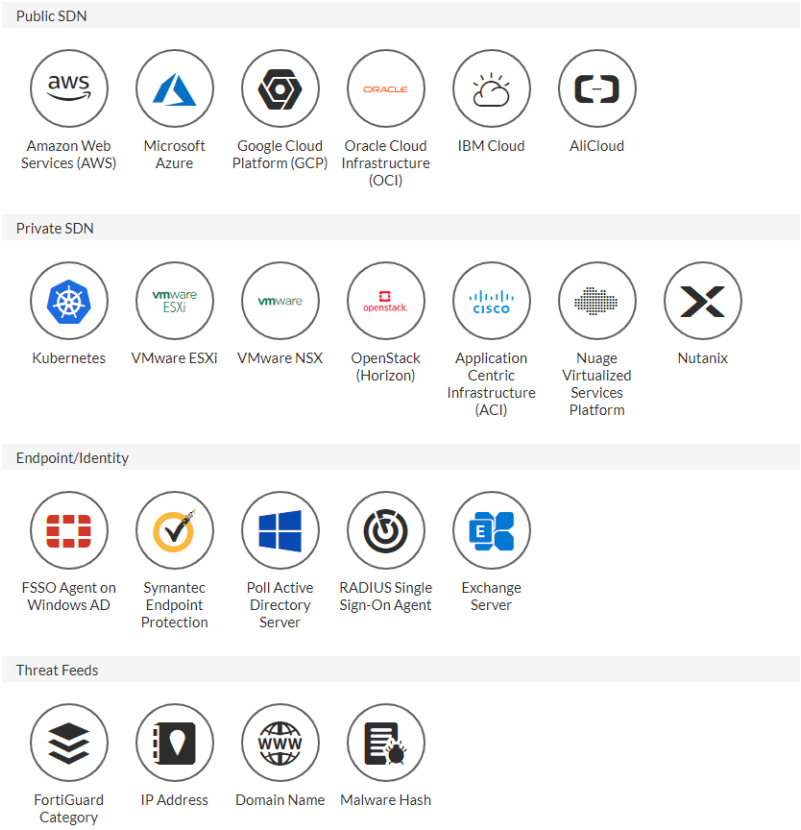
To protect the East-West or North-South traffic in these environments, the FortiGate uses the SDN connector to sync the dynamic addresses that these volatile environments use. You can then configure the dynamic address objects as sources or destinations for firewall policies. When you make changes to cloud environment resources, such as moving them to a new location or assigning different IP addresses to them, you do not need to modify the policy in FortiOS, as the SDN connector syncs changes to the cloud address objects.

These configurations consist of three primary steps:

1. Configure the cloud SDN connector to connect your FortiGate and public or private cloud account.
2. Create dynamic address objects to use the SDN connector. Use filters to sync only cloud address objects that you require.
3. Apply the dynamic address objects to your firewall policy to protect your traffic.

This chapter explores the steps in detail and describes how to connect to each currently supported cloud platform. This chapter does not discuss cloud account role-based or permission requirements. The respective cloud documents contain this information.

The following external connector categories are available in the Security Fabric: Public SDN, Private SDN, Endpoint/Identity, and Threat Feeds.



If VDOMs are enabled, SDN and Threat Feeds connectors are in the global settings, and Endpoint/Identity connectors are per VDOM.

Getting started with public and private SDN connectors

You can use SDN connectors to connect your FortiGate to public and private cloud solutions. By using an SDN connector, you can ensure that changes to cloud environment attributes are automatically updated in the Security Fabric. You can use SDN connector address objects to create policies that provide dynamic access control based on cloud environment attribute changes. There is no need to manually reconfigure addresses and policies whenever changes to the cloud environment occur.

There are four steps to creating and using an SDN connector:

1. Gather the required information. The required information depends on which public or private cloud solution SDN connector you are configuring.
2. Creating the SDN connector on page 1776
3. Creating an SDN connector address on page 1776
4. Adding the address to a firewall policy on page 1778

The following provides general instructions for creating an SDN connector and using the dynamic address object in a firewall policy. For instructions for specific public and private cloud solutions, see the relevant topic in this guide. For advanced scenarios regarding SDN connectors, see the appropriate FortiOS 7.0 cloud platform guide.

Creating the SDN connector

To create an SDN connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. Click the desired public or private cloud.
4. Enter the *Name*, *Status*, and *Update Interval* for the connector.
5. Enter previously collected information for the connector as needed.
6. Click *OK*.

To create an SDN connector in the CLI:

```
config system sdn-connector
    edit <name>
        set status {enable | disable}
        set type {connector type}
        ...
        set update-interval <integer>
    next
end
```

The available CLI commands vary depending on the selected SDN connector type.

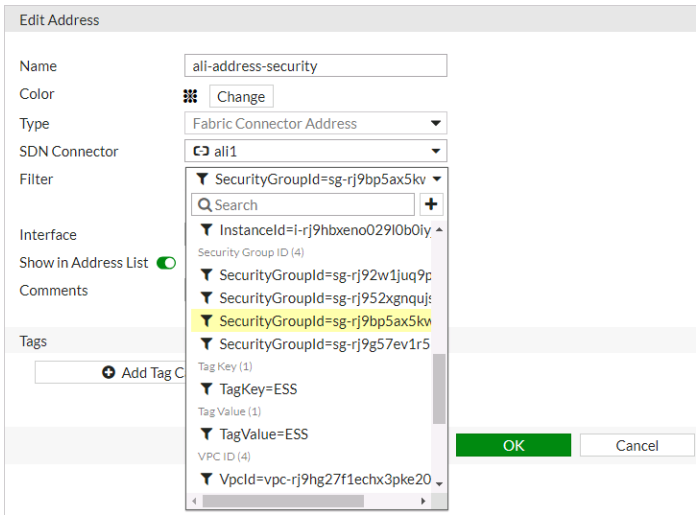
Creating an SDN connector address

You can use an SDN connector address in the following ways:

- As the source or destination address for firewall policies.
- To automatically update changes to addresses in the public or private cloud environment, based on specified filters.
- To automatically apply changes to firewall policies that use the address, based on specified filters.

To create an SDN connector address in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*.
3. Configure the address:
   a. Set the *Type* to *Dynamic*.
   b. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   c. From the *SDN Connector* dropdown list, select the desired SDN connector.
   d. From the *Filter* dropdown list, configure the desired filter. The filters available depend on the selected SDN connector type. The SDN connector automatically populates and updates IP addresses only for instances that satisfy the filter requirements. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the specified security group:



You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

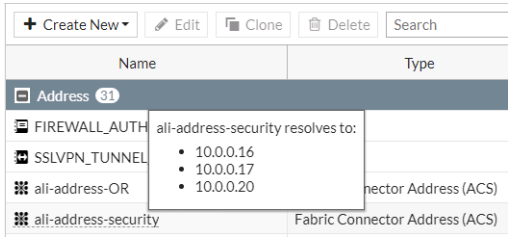
e. Configure other settings as desired.

f. Click *OK*.

4. Ensure that the SDN connector resolves dynamic firewall IP addresses as configured:

a. Go to *Policy & Objects* > *Addresses*.

b. Hover over the address that you created to see a list of IP addresses for instances that satisfy the filter that you configured. In this case, the IP addresses of instances that belong to the specified security group display:



To create an SDN connector address in the CLI:

1. Create the address:

```
config firewall address
   edit <name>
      set type dynamic
      set sdn <sdn_connector>
      set visibility enable
      set associated-interface <interface_name>
      set color <integer>
      ...
      set comment <comment>
      config tagging
         edit <name>
            set category <string>
            set tags <strings>
         next
      end
   next
end
```

2. Ensure that the SDN connector resolves dynamic firewall IP addresses as configured by running `show`. The following shows example output:

```
config firewall address
   edit "ali-address-security"
      set type dynamic
      config list
         edit "10.0.0.16"
         next
         edit "10.0.0.17"
         next
         edit "10.0.20.20"
         next
      end
      ...
   next
end
```

The available CLI commands vary depending on the selected SDN connector type.

Adding the address to a firewall policy

You can use an SDN connector address as the source or destination address in a policy.

To add the address to a firewall policy in the GUI:

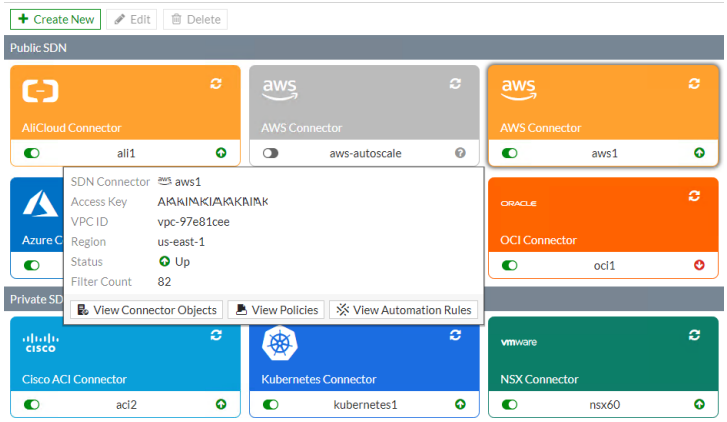
1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Use the SDN connector address as the source or destination address.
4. Configure the remaining settings as needed.
5. Click *OK*.

To add the address to a firewall policy in the CLI:

```
config firewall policy
    edit 0
        set name <name>
        set srcintf <port_name>
        set dstintf <port_name>
        set srcaddr <firewall_address>
        set dstaddr <firewall_address>
        set action accept
        set schedule <schedule>
        set service <service>
    next
end
```

Connector tooltips

In *Security Fabric* > *External Connectors*, hover over an SDN connector to view a tooltip that shows basic configuration information.



Three buttons provide additional information:

Button	Information
View Connector Objects	Connector's dynamic objects, such as filters and instances.
View Policies	List of policies that use the dynamic addresses from the connector.
View Automation Rules	List of automation actions that use the connector.

AliCloud SDN connector using access key

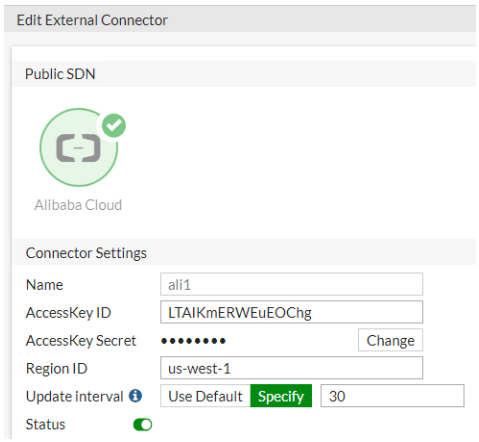
FortiOS automatically updates dynamic addresses for AliCloud using an AliCloud SDN connector, including mapping the following attributes from AliCloud instances to dynamic address groups in FortiOS:

- ImageId
- InstanceId
- SecurityGroupId
- VpcId
- VSwitchId
- TagKey
- TagValue

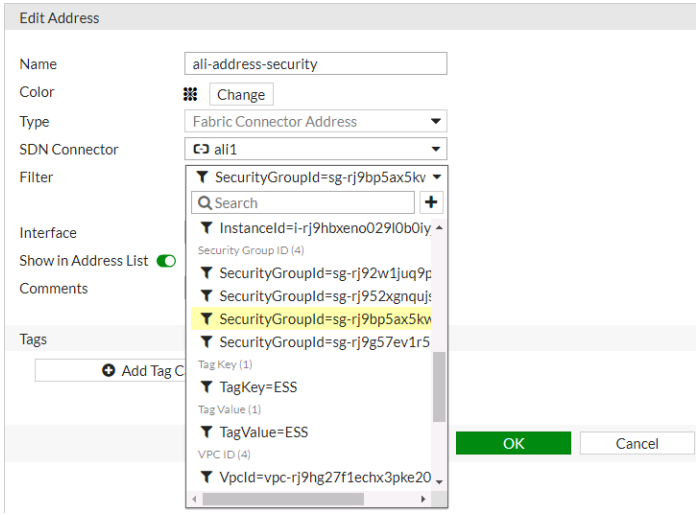
To configure AliCloud SDN connector using the GUI:

1. Configure the AliCloud SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *AliCloud*.
   c. Configure as shown, substituting the access key, secret, and region ID for your deployment. The update

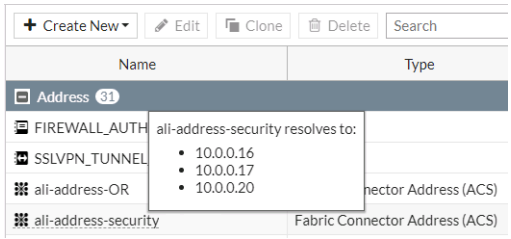
interval is in seconds.



2. Create a dynamic firewall address for the configured AliCloud SDN connector:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.
   c. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the address will automatically populate and update IP addresses only for AliCloud instances that belong to the specified security group:



3. Ensure that the AliCloud SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the security group configured in step 2:



To configure AliCloud SDN connector using CLI commands:

1. Configure the AliCloud SDN connector:
```
config system sdn-connector
   edit "ali1"
      set type acs
      set access-key "LTAIKmERWEuEOChg"
      set secret-key xxxxx
      set region "us-west-1"
      set update-interval 30
   next
end
```
2. Create a dynamic firewall address for the configured AliCloud SDN connector with the supported AliCloud filter. In this example, the AliCloud SDN Connector will automatically populate and update IP addresses only for instances that belong to the specified security group:
```
config firewall address
   edit "ali-address-security"
      set type dynamic
      set sdn "ali1"
      set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdizqb"
   next
end
```
3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:
```
config firewall address
   edit "ali-address-security"
      set type dynamic
      set sdn "ali1"
      set filter "SecurityGroupId=sg-rj9bp5ax5kwy3gqdizqb"
      config list
         edit "10.0.0.16"
         next
         edit "10.0.0.17"
         next
         edit "10.0.0.20"
         next
      end
   next
end
```

AWS SDN connector using certificates

FortiOS automatically updates dynamic addresses for AWS using an AWS SDN connector, including mapping attributes from AWS instances to dynamic address groups in FortiOS.

Configuring the SDN connector using the GUI, then checking the configuration using the CLI is recommended.

To configure an AWS SDN connector using the GUI:

1. Configure the AWS SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *Amazon Web Services (AWS)*.
   c. In the *Access key ID* field, enter the key created in the AWS management portal.

d. In the *Secret access key* field, enter the secret access key accompanying the above access key.
e. In the *Region name* field, enter the region name. Refer to AWS Regions and Endpoints for the desired region name.
f. In the *VPC ID* field, enter the VPC ID within the specified region you desire to cover with the SDN connector.
g. Click *OK*.

2. Check the configuration using the CLI:

```
config system sdn-connector
   edit "<connector-name>"
      show
```

The output resembles the following:

```
config system sdn-connector
   edit "<connector-name>"
      set access-key "<example-access-key>"
      set secret-key ENC <example-secret-key>
      set region "us-west-2"
      set vpc-id "vpc-e1e4b587"
      set update-interval 1
   next
end
```

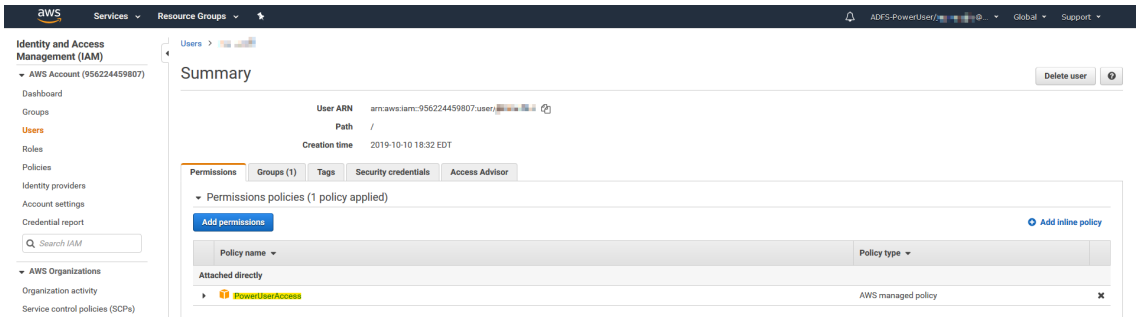
If you see that the SDN connector is not enabled in *Security Fabric > External Connectors* in the GUI, run the following commands to enable the SDN connector:

```
diagnose deb application awsd -1
diagnose debug enable
```

The output may display an error like the following:

```
FGT # awsd sdn connector AWS_SDN prepare to update
awsd sdn connector AWS_SDN start updating
aws curl response err, 403
<?xml version="1.0" encoding="UTF-8"?>
<Response><Errors><Error><Code>UnauthorizedOperation</Code><Message>You are not
     authorized to perform this
     operation.</Message></Error></Errors><RequestID>8403cc11-b185-41da-ad6d-
     23bb4db7d00a</RequestID></Response>
awsd curl failed 403
awsd sdn connector AWS_SDN failed to get instance list
aws curl response err, 403
{"Message":"User: arn:aws:iam::956224459807:user/jcarcavallo is not authorized to
     perform: eks:ListClusters on resource: arn:aws:eks:us-east-
     1:956224459807:cluster/*"}
awsd sdn connector AWS_SDN get EKS cluster list failed
awsd sdn connector AWS_SDN list EKS cluster failed
awsd sdn connector AWS_SDN start updating IP addresses
awsd sdn connector AWS_SDN finish updating IP addresses
awsd reap child pid: 569
```

In this case, you must configure power user access for the current administrator in the AWS management console:



After configuring power user access, run the following commands:

```
diagnose deb application awsd -1
diagnose debug enable
```

The output should display without error, as follows:

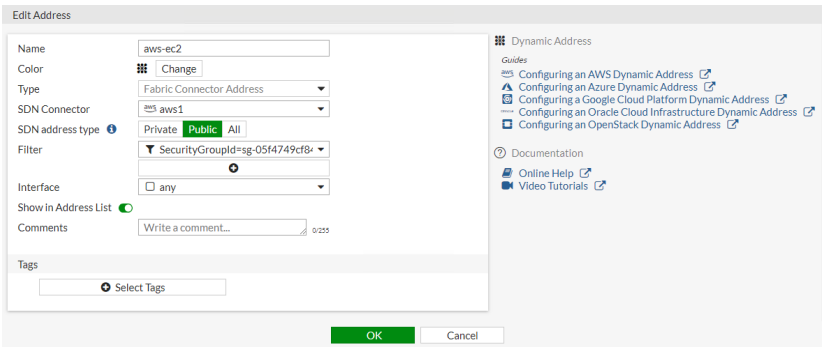
```
FGT # AWSD: update sdn connector AWS_SDN status to enabled
awsd sdn connector AWS_SDN prepare to update
awsd sdn connector AWS_SDN start updating
awsd get ec2 instance info successfully
awsd sdn connector AWS_SDN start updating IP addresses
awsd sdn connector AWS_SDN finish updating IP addresses
awsd reap child pid: 893
```

The AWS connector is now enabled.

3. Create a dynamic firewall address for the configured AWS SDN connector:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.

e. In the *Filter* field, add the desired filters. The following filters are supported:

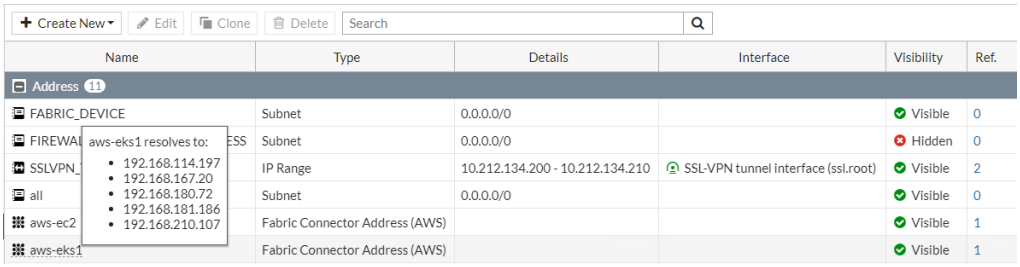
Description	Key	Example value
Architecture	architecture	x86
Autoscaling group	AutoScaleGroup	10703c-4f731e90-fortigate-payg-auto-scaling-group
AZ	placement.availabilityzone	us-east-1a
Group name	placement.groupname	
Image ID	imageId	ami-123456
Instance ID	instanceId	i-12345678
Instance type	instanceType	t2.micro
Key name	keyName	
Kubernetes cluster	k8s_cluster	
Kubernetes label and its name	k8s_label.Name	
Kubernetes namespace	k8s_namespace	
Kubernetes node name	k8s_nodename	
Kubernetes pod name	k8s_podname	
Kubernetes region	k8s_region	
Kubernetes service name	k8s_servicename	
Kubernetes zone	k8s_zone	
Private DNS name	privateDnsName	ip-172-31-10-211.us-west-2.compute.internal
Public DNS name	publicDnsName	ec2-54-202-168-254.us-west-2.compute.amazonaws.com
Security group ID	SecurityGroupId	
Subnet ID	subnetId	sub-123456
Tag and its name. This key supports a maximum of eight tags.	tag.Name	
Tenancy placement	placement.tenancy	
VPC ID	VpcId	



4. Ensure that the AWS SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the security group configured in step 2.

   The following is an example for a public SDN address type:

   The following is an example for a private SDN address type:



To configure AWS SDN connector using CLI commands:

1. Configure the AWS connector:

```
config system sdn-connector
   edit "<connector-name>"
      set access-key "<example-access-key>"
      set secret-key ENC <example-secret-key>
      set region "us-west-2"
      set vpc-id "vpc-e1e4b587"
      set update-interval 1
   next
end
```

2. Create a dynamic firewall address for the configured AWS SDN connector with the supported filter:

```
config firewall address
   edit "aws-ec2"
      set type dynamic
      set sdn "<connector-name>"
      set filter "SecurityGroupId=sg-05f4749cf84267548"
      set sdn-addr-type public
```

```
    next
    edit "aws-eks1"
      set type dynamic
      set sdn "<connector-name>"
      set filter "K8S_Region=us-west-2"
    next
end
```

3. Confirm that the AWS SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
  edit "aws-ec2"
    set type dynamic
    set sdn "<connector-name>"
    set filter "SecurityGroupId=sg-05f4749cf84267548"
    set sdn-addr-type public
    config list
      edit "34.222.246.198"
      next
      edit "54.188.139.177"
      next
      edit "54.218.229.229"
      next
    end
  next
  edit "aws-eks1"
    set type dynamic
    set sdn "<connector-name>"
    set filter "K8S_Region=us-west-2"
    config list
      edit "192.168.114.197"
      next
      edit "192.168.167.20"
      next
      edit "192.168.180.72"
      next
      edit "192.168.181.186"
      next
      edit "192.168.210.107"
      next
    end
  next
end
```

To add an EC2 instance to test automatic address population:

1. Assume that you want to boot up another instance with an IP address of 34.222.246.178, which is currently stopped. This instance belongs to the security group that the aws-ec2 address is filtering for. In the AWS management portal, start the instance.
2. Verify that the instance is running.
3. At this point, running `show` again shows the SDN connector has automatically populated and added the 34.222.246.178 instance.

```
config firewall address
  edit "aws-ec2"
    set type dynamic
    set sdn "<connector-name>"
    set filter "SecurityGroupId=sg-05f4749cf84267548"
```

```
        set sdn-addr-type public
        config list
           edit "34.222.246.198"
           next
           edit "54.188.139.177"
           next
           edit "54.218.229.229"
           next
           edit "34.222.246.178"
           next
        end
     next
end
```

Therefore, administrators do not need to add this instance to the address manually. When a firewall policy is applied to this address, 34.222.246.178 is automatically covered.

Azure SDN connector using service principal

FortiOS automatically updates dynamic addresses for Azure using Azure SDN connector, including mapping attributes from Azure instances to dynamic address groups in FortiOS.

To configure the Azure SDN connector using service principal:

1. Create an Azure SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. Select *Microsoft Azure*.
   c. Configure the connector. See Azure SDN connector service principal configuration requirements:

   d. Click *OK*.
2. Create a dynamic firewall address for the Azure connector.
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. From the *Type* dropdown list, select *Dynamic*.
   c. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   d. From the *SDN Connector* dropdown list, select the Azure SDN connector.

e. In the *Filter* field, add filters as desired. The Azure SDN connector supports the following filters:
   - `vm=<VM name>`
   - `securitygroup=<nsg id>`
   - `vnet=<VNet id>`
   - `subnet=<subnet id>`
   - `vmss=<VM scale set>`
   - `tag.<key>=<value>`
   - `servicetag=<value>`
   - `tag.<key>=<value>`

f. Click *OK*.

g. Hover the cursor over the address name to see the dynamic IP addresses that the connector resolves.

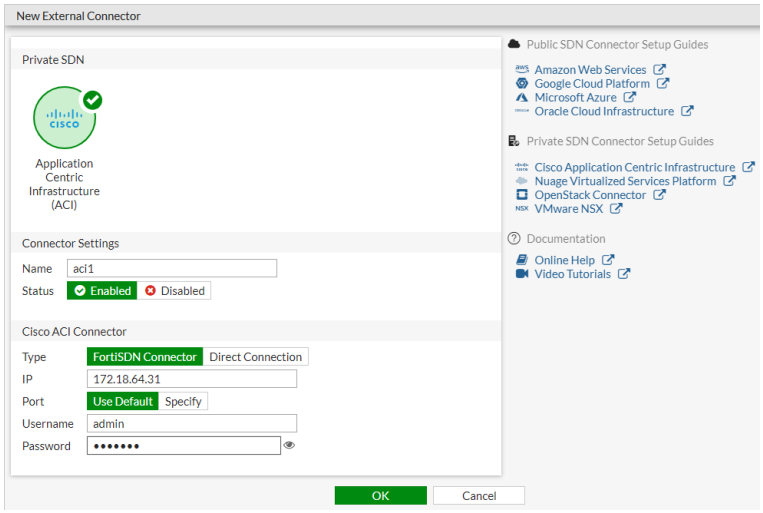
Cisco ACI SDN connector using a standalone connector

Cisco ACI (Application Centric Infrastructure) SDN connectors can be used in dynamic firewall addresses.

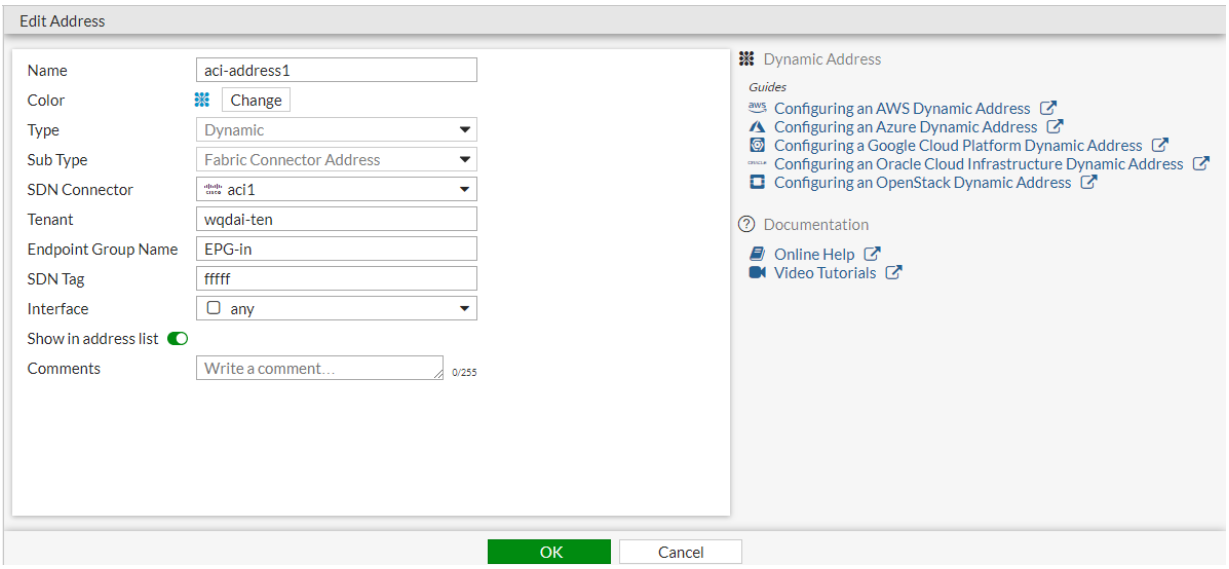
The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.

To configure a Cisco ACI connector in the GUI:

1. Create the Cisco ACI SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *Private SDN* section, click *Application Centric Infrastructure (ACI)*.
   c. In the *Cisco ACI Connector* section, for *Type*, select *Fortinet SDN Connector* and configure the remaining settings as needed.
   d. Click *OK*.



2. Create the dynamic firewall address for the connector:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the following settings:
      i. For *Type*, select *Dynamic*.
      ii. For *Sub Type*, select *Fabric Connector Address*.
      iii. For *SDN Connector*, select the first ACI connector.
      iv. Configure the remaining settings as needed.
   c. Click *OK*.



To verify the dynamic firewall IPs are resolved by the SDN connector in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. In the address table, hover over the address to view which IPs it resolves to.

To configure a Cisco ACI connector in the CLI:

1. Create the SDN connector:

```
config system sdn-connector
    edit "aci1"
        set type aci
        set server "172.18.64.31"
        set username "admin"
        set password xxxxxxx
    next
end
```

2. Create the dynamic firewall address for the connector:

```
config firewall address
    edit "aci-address1"
        set type dynamic
        set sdn "aci1"
        set color 17
        set tenant "wqdai-ten"
```

```
            set epg-name "EPG-in"
            set sdn-tag "fffff"
        next
    end
```

To verify the dynamic firewall IPs are resolved by the SDN connector in the CLI:

```
# diagnose firewall dynamic list

List all dynamic addresses:
aci1.aci.wqdai-ten.EPG-in.fffff: ID(171)
        ADDR(192.168.100.20)
```

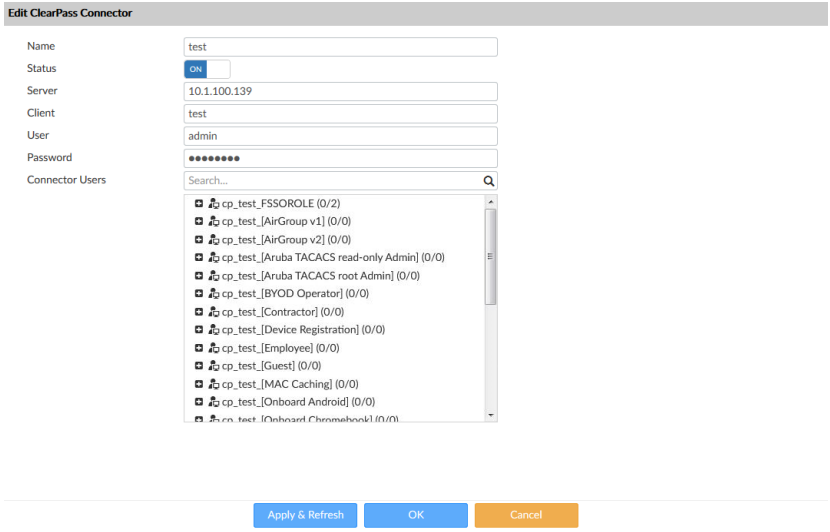
ClearPass endpoint connector via FortiManager

ClearPass Policy Manager (CPPM) is a network access system that can send information about authenticated users to third party systems, such as a FortiGate or FortiManager.

In this example, communications are established between CPPM and FortiManager, and then the FortiManager forwards information to a managed FortiGate. On the FortiGate, the user information can be used in firewall policies and added to FSSO dynamic addresses.

Configure the FortiManager

Establish communications between FortiManager and CPPM so that FortiManager can synchronize CPPM user groups. See Creating a ClearPass connector in the FortiManager Administration Guide.

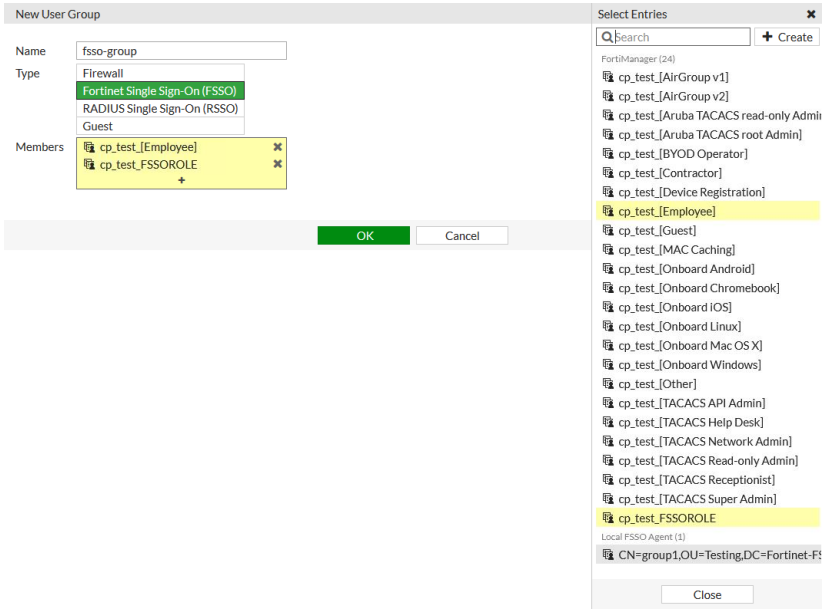


FortiManager forwards the group information to managed FortiGates.

Adding CPPM FSSO user groups to a local user group

To add CPPM user groups to a local user group in the GUI:

1. On the FortiGate, go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set *Type* to *Fortinet Single Sign-On (FSSO)*.
4. Click the *Members* field, and add one or more FSSO groups.
   FSSO groups can come from multiple sources; CPPM FSSO groups are prefixed with *cp_* and are listed under the *FortiManager* heading.



5. Click *OK*.

To add CPPM user groups to a local user group in the CLI:

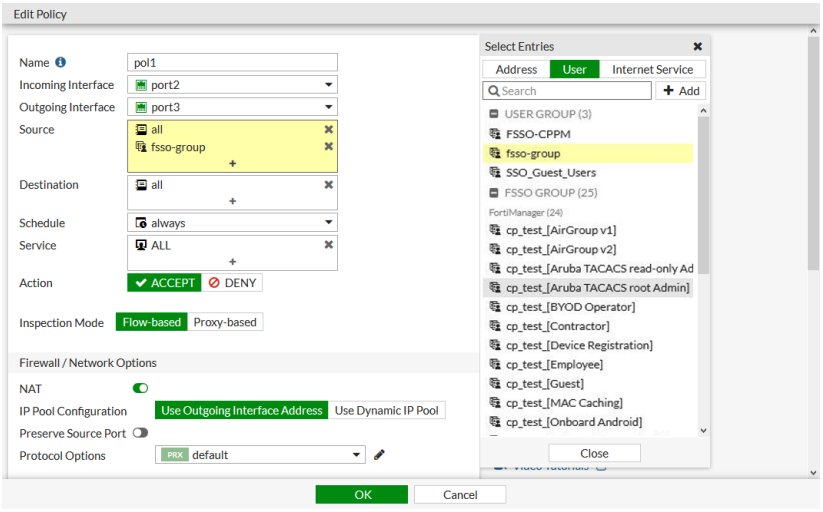
```
config user group
    edit fsso-group
        set group-type fsso-service
        set member "cp_test_[Employee]" "cp_test_FSSOROLE"
    next
end
```

Using the local FSSO user group in a firewall policy

To add the local FSSO user group to a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy, or edit an existing one.

3. Click in the *Source* field and add the *fsso-group* user group.



CPPM user groups can also be added directly to the policy.

4. Click *OK*.

To add the local FSSO user group to a firewall policy in the CLI:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "fsso-group"
        set nat enable
    next
end
```

Verification

To verify that a user was added to the FSSO list on the FortiGate:

1. Log on to the client and authenticate with CPPM.
   After successful authentication, the user is added to the FSSO list on the FortiGate.
2. On the FortiGate, go to *Dashboard* > *Users & Devices* and look at the *Firewall Users* widget to verify that the user was added.

The user group *cp_test_FSSOROLE* is listed separately because the user is a member of that group on the CPPM.

To verify that traffic can pass the firewall:

1. Log on to the client and browse to an external website.
2. On the FortiGate, go to *Dashboard* > *FortiView Sources*.
3. Double-click on the user and select the *Destinations* tab to verify that traffic is being passed by the firewall.

To verify the user address groups:

```
show user adgrp
    config user adgrp
        edit "cp_test_FSSOROLE"
            set server-name "FortiManager"
        next
        edit "cp_test_[AirGroup v1]"
            set server-name "FortiManager"
        next
        edit "cp_test_[AirGroup v2]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Aruba TACACS read-only Admin]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Aruba TACACS root Admin]"
            set server-name "FortiManager"
        next
        edit "cp_test_[BYOD Operator]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Contractor]"
            set server-name "FortiManager"
        next
        edit "cp_test_[Device Registration]"
            set server-name "FortiManager"
        next
        ...
        edit "CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            set server-name "Local FSSO Agent"   <----- !!!
        next
    end
```

GCP SDN connector using service account

FortiOS automatically updates dynamic addresses for GCP using a GCP SDN connector, including mapping attributes from GCP instances to dynamic address groups in FortiOS.

To configure GCP connector using the GUI:

1. In FortiOS, go to *Security Fabric* > *External Connectors*.
2. Click *Create New*, and select *Google Cloud Platform (GCP)*.
   Note you can create only one SDN Connector per connector type. For example, you can create one entry for GCP.

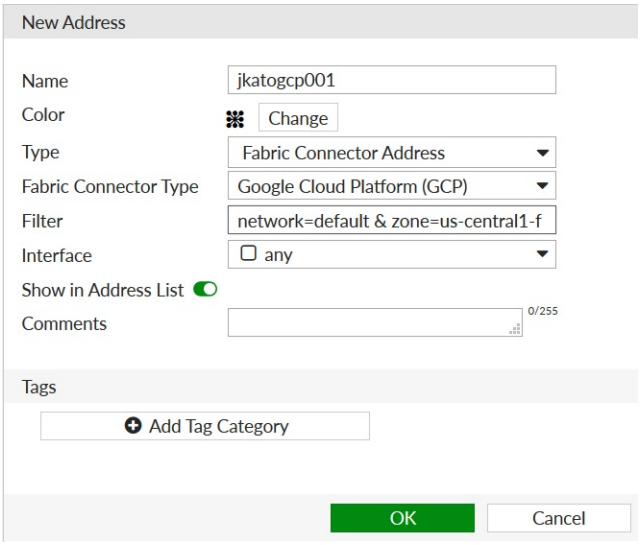
3. Configure the connector as follows:
   a. *Project name*: Enter the name of the GCP project. The VMs whose IP addresses you want to populate should be running within this project.
   b. *Service account email*: Enter the email address associated with the service account that will call APIs to the GCP project specified above.
   c. *Private key*: Enter the private key statement as shown in the text box. For details, see Creating a GCP service account.

   Once the connector is successfully configured, a green indicator appears at the bottom right corner. If the indicator is red, the connector is not working. See Troubleshooting GCP SDN Connector.
4. Create a dynamic firewall address for the configured GCP SDN connector:
   a. Go to *Policy & Objects* > *Addresses*. Click *Create New*, then select *Address*.
   a. Configure the address:
      i. *Name*: Enter the desired name.
      ii. *Type*: Select *Dynamic*.
      iii. *Fabric Connector Type*: Select *Google Cloud Platform (GCP)*.
      iv. *Filter*: The SDN connector automatically populates and updates only instances that match this filtering condition. Currently GCP supports the following filters:
         i. `id=<instance id>` : This matches an VM instance ID.
         ii. `name=<instance name>` : This matches a VM instance name.
         iii. `zone=<gcp zones>` : This matches a zone name.
         iv. `network=<gcp network name>` : This matches a network name.
         v. `subnet=<gcp subnet name>` : This matches a subnet name.
         vi. `tag=<gcp network tags>` : This matches a network tag.
         vii. `label.<gcp label key>=<gcp label value>` : This matches a free form GCP label key and its value.

         In the example, the filter is set as `'network=default & zone=us-central-1f'`. This configuration populates all IP addresses that belong to the default network in the zone us-central-1f.

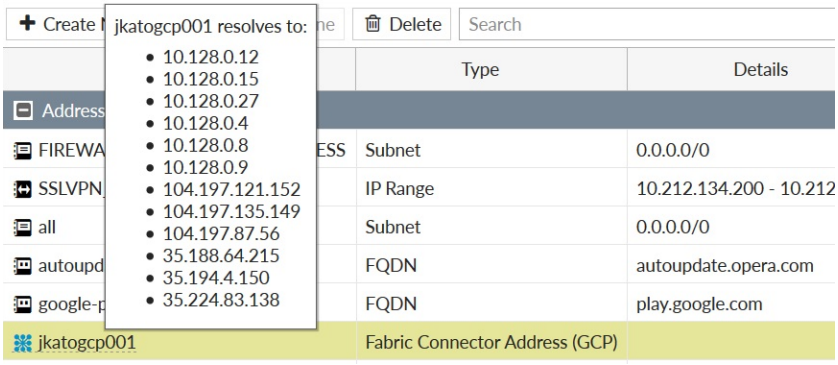
You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

Note that wildcards (such as the asterisk) are not allowed in filter values.



v. Click *OK*.

The address has been created. Wait for a few minutes before the setting takes effect. You will know that the address is in effect when the exclamation mark disappears from the address entry. When you hover over the address, you can see the list of populated IP addresses.



If the exclamation mark does not disappear, check the address settings.

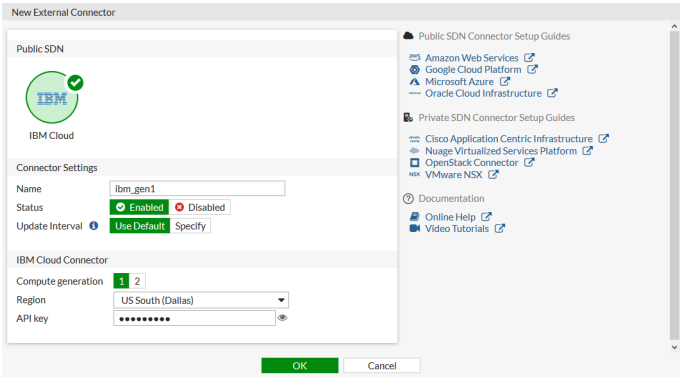
IBM Cloud SDN connector using API keys

FortiOS can automatically update dynamic addresses for IBM Cloud using an SDN connector.

To configure IBM Cloud SDN connectors using the GUI:

1. Create SDN connectors for compute generation 1 and 2:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, then select *IBM Cloud*.

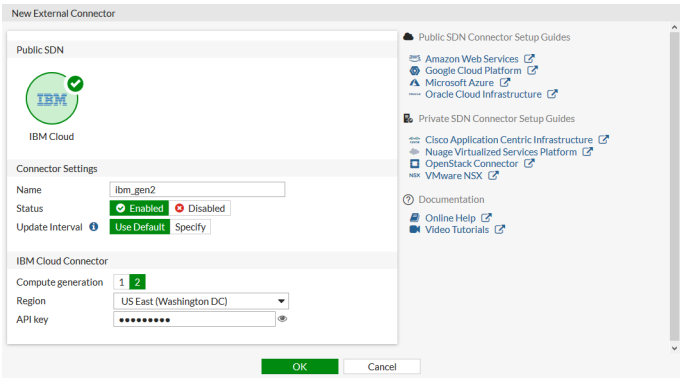
c. Configure the connector for computer generation 1:



d. Click *OK*.

e. Click *Create New*, then select *IBM Cloud*.

f. Configure the connector for computer generation 2:



g. Click *OK*.

2. Create dynamic firewall addresses for the configured connectors:

a. Go to *Policy & Objects* > *Addresses*.

b. Click *Create New* > *Address*.

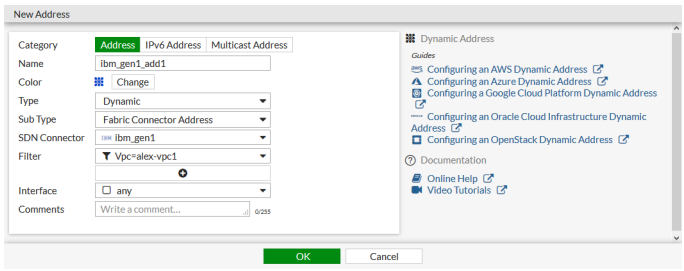
c. From the *Type* dropdown list, select *Dynamic*.

d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.

e. From the *SDN Connector* dropdown list, select the IBM SDN connector.

f. In the *Filter* field, add the desired filters. The following filters are supported:

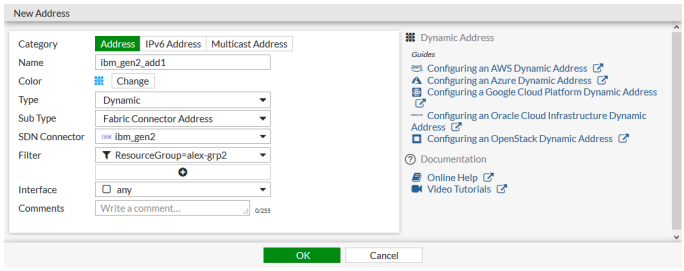
- <InstanceId>
- <InstanceName>
- <ImageId>
- <ImageName>
- <Architecture>
- <Profile>
- <Vpc>
- <Zone>
- <Subnet>
- <ResourceGroup>



g. Click *OK*.

h. Click *Create New* > *Address*.

i. Repeat the process for computer generation 2:

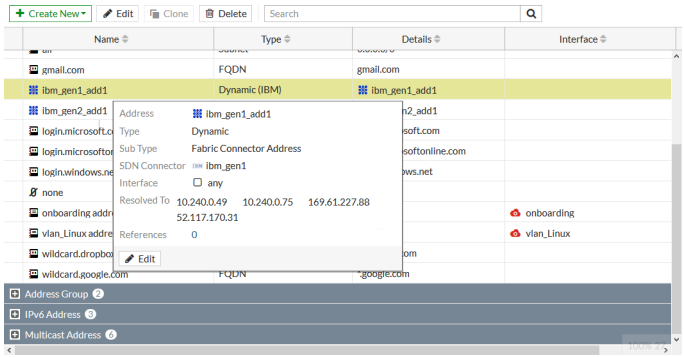


j. Click *OK*.

3. Ensure that the connectors resolve dynamic firewall IP addresses:

a. Go to *Policy & Objects* > *Addresses*.

b. Hover over the addresses created in step 2 to see a list of IP addresses that the connector has resolved:



To configure IBM Cloud SDN connectors using the CLI:

1. Create SDN connectors for compute generation 1 and 2:

```
config system sdn-connector
    edit "ibm_gen1"
        set status enable
        set type ibm
        set api-key xxxxxx
        set compute-generation 1
        set ibm-region us-south
        set update-interval 60
    next
    edit "ibm_gen2"
        set status enable
        set type ibm
```

```
        set api-key xxxxxx
        set compute-generation 2
        set ibm-region us-east
        set update-interval 60
    next
end
```

2. Create dynamic firewall addresses for the configured connectors:

```
config firewall address
    edit "ibm_gen1_add1"
        set type dynamic
        set sdn "ibm_gen1"
        set color 19
        set filter "Vpc=alex-vpc1"
    next
    edit "ibm_gen2_add1"
        set type dynamic
        set sdn "ibm_gen2"
        set color 19
        set filter "ResourceGroup=alex-grp2"
    next
end
```

3. Ensure that the connectors resolve dynamic firewall IP addresses:

```
# show firewall address ibm_gen1_add1
config firewall address
    edit "ibm_gen1_add1"
        set uuid 586841c4-7f46-51ea-dc66-dbf840af03d3
        set type dynamic
        set sdn "ibm_gen1"
        set color 19
        set filter "Vpc=alex-vpc1"
        config list
            edit "10.240.0.49"
            next
            edit "10.240.0.75"
            next
            edit "169.61.227.88"
            next
            edit "52.117.170.31"
            next
        end
    next
end
```

```
# show firewall address ibm_gen2_add1
config firewall address
    edit "ibm_gen2_add1"
        set uuid 5868c4f0-7f46-51ea-2b79-b5170fbfd4a8
        set type dynamic
        set sdn "ibm_gen2"
        set color 19
        set filter "ResourceGroup=alex-grp2"
        config list
            edit "10.241.128.4"
            next
```

```
                edit "10.241.128.5"
                next
                edit "10.241.129.4"
                next
                edit "52.117.126.69"
                next
            end
        next
    end
```

Kubernetes (K8s) SDN connectors

The following topics provide information about configuring Kubernetes SDN connectors:

- AliCloud Kubernetes SDN connector using access key on page 1799
- AWS Kubernetes (EKS) SDN connector using access key on page 1801
- Azure Kubernetes (AKS) SDN connector using client secret on page 1804
- GCP Kubernetes (GKE) SDN connector using service account on page 1806
- Oracle Kubernetes (OKE) SDN connector using certificates on page 1809
- Private cloud K8s SDN connector using secret token on page 1811

AliCloud Kubernetes SDN connector using access key

When an AliCloud SDN connector is configured, dynamic address objects can support Kubernetes filters based on cluster, service, node, pod, and more.

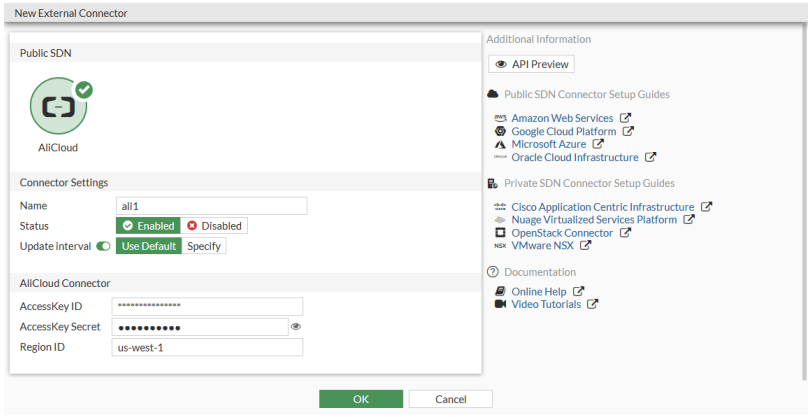
The following address filters can be applied:

- K8S_Cluster
- K8S_Namespace
- K8S_ServiceName
- K8S_NodeName
- K8S_PodName
- K8S_Region
- K8S_Zone
- K8S_Label

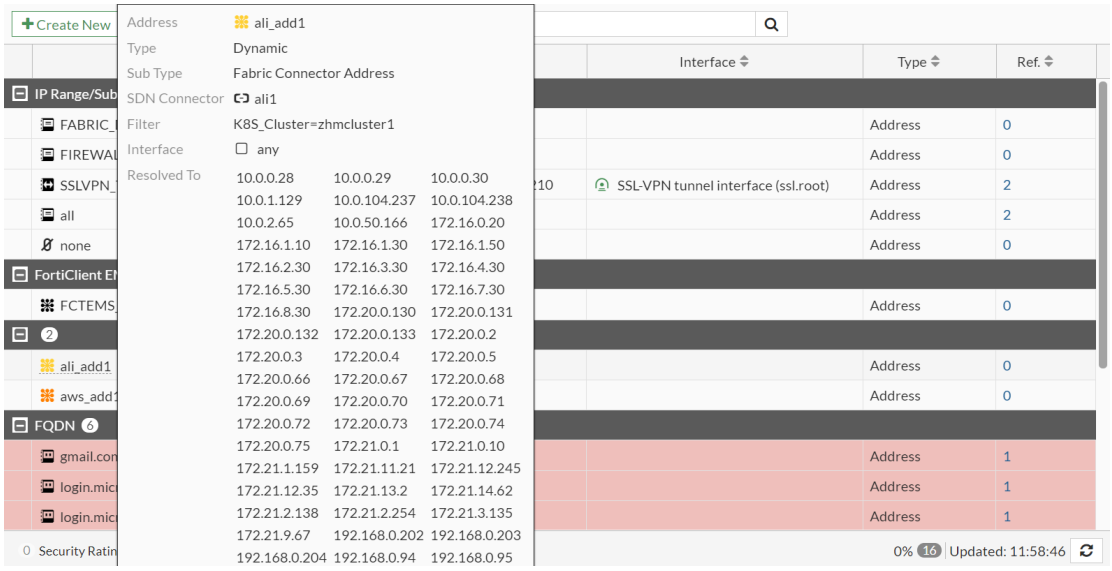
To configure an AliCloud SDN connector with a Kubernetes filter in the GUI:

1. Configure the AliCloud SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *AliCloud*.

c. Configure the settings as needed and click *OK*.



2. Create a dynamic firewall address with the supported Kubernetes filter:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New* > *Address* and enter a name.
   c. Configure the following settings:
      i. For *Type*, select *Dynamic*.
      ii. For *Sub Type*, select *Fabric Connector Address*.
      iii. For *SDN Connector*, select the connector created in step 1.
      iv. For *SDN address type*, select *Private*.
      v. For *Filter*, select *K8S_Cluster=zhmcluster*.
   d. Click *OK*.
   The corresponding IP addresses are dynamically updated and resolved after applying the Kubernetes filter.
3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:
   a. Go to *Policy & Objects* > *Addresses*.
   b. In the address table, hover over the address created in step 2 to view which IPs it resolves to:



To configure an AliCloud SDN connector with a Kubernetes filter in the CLI:

1. Configure the AliCloud SDN connector:

```
config system sdn-connector
    edit "ali1"
        set type alicloud
        set access-key "****************"
        set secret-key xxxxxxxx
        set region "us-west-1"
    next
end
```

2. Create a dynamic firewall address with the supported Kubernetes filter:

```
config firewall address
    edit "ali_add1"
        set type dynamic
        set sdn "ali1"
        set color 10
        set filter "K8S_Cluster=zhmcluster1"
    next
end
```

3. Confirm that the AliCloud SDN connector resolves dynamic firewall IP addresses using the configured filter:

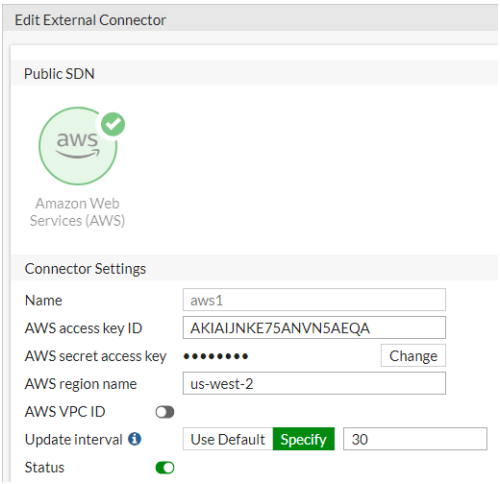
```
config firewall address
    edit "ali_add1"
        show
            config firewall address
                edit "ali_add1"
                    set uuid c48e4f00-5435-51eb-0547-aced5cf80f1f
                    set type dynamic
                    set sdn "ali1"
                    set color 10
                    set filter "K8S_Cluster=zhmcluster1"
                    config list
                        edit "10.0.0.28"
                        next
                        edit "10.0.0.29"
                        next
                        edit "10.0.0.30"
                        next
                        ...
                    end
                next
            end
    next
end
```

AWS Kubernetes (EKS) SDN connector using access key

AWS SDN connectors support dynamic address groups based on AWS Kubernetes (EKS) filters.

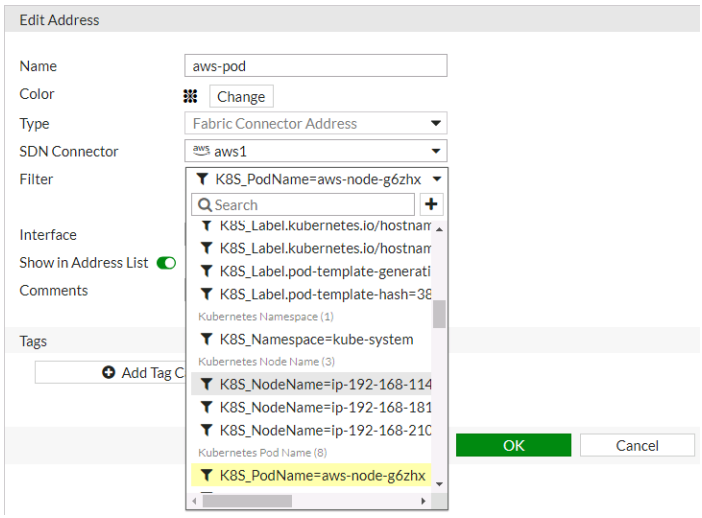
To enable an AWS SDN connector to fetch IP addresses from AWS Kubernetes:

1. Go to *Security Fabric* > *External Connectors*. Click *Create New*, then select *Amazon Web Services (AWS)*. Configure the SDN connector as desired. See AWS SDN connector using certificates on page 1781

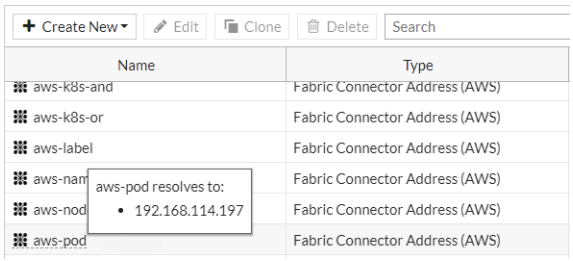


2. Go to *Policies & Objects* > *Addresses*. Click *Create New* > *Address* to create a dynamic firewall address for the configured SDN connector using the supported Kubernetes filter.
3. From the *Type* dropdown list, select *Dynamic*.
4. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
5. From the *SDN Connector* dropdown list, select the desired SDN connector.
6. In the *Filter* field, add the desired filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/pod).



7. Configure the rest of the settings, then click *OK*.
8. Ensure that the SDN connector resolves the dynamic firewall address IP addresses by going to *Policy & Objects* > *Addresses* and hovering over the newly created address.



To configure an AWS Kubernetes SDN connector through the CLI:

1. Configure the SDN connector:

```
config system sdn-connector
   edit "aws1"
      set type aws
      set access-key "AKIAIJNKE75ANVN5AEQA"
      set secret-key xxxxx
      set region "us-west-2"
      set update-interval 30
   next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:

```
config firewall address
   edit "aws-pod"
      set type dynamic
      set sdn "aws1"
      set filter "K8S_PodName=aws-node-g6zhx"
   next
end
```

The SDN connector resolves the dynamic firewall address IP address:

```
config firewall address
   edit "aws-pod"
      set type dynamic
      set sdn "aws1"
```

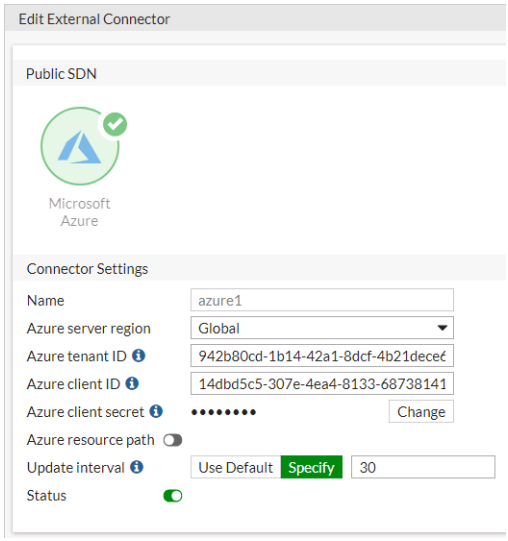
```
        set filter "K8S_PodName=aws-node-g6zhx"
        config list
           edit "192.168.114.197"
           next
        end
     next
  end
```

Azure Kubernetes (AKS) SDN connector using client secret

Azure SDN connectors support dynamic address groups based on Azure Kubernetes (AKS) filters.

To enable an Azure SDN connector to fetch IP addresses from Azure Kubernetes:

1. Configure the Azure SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *Azure*.
   c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. See Azure SDN connector service principal configuration requirements.

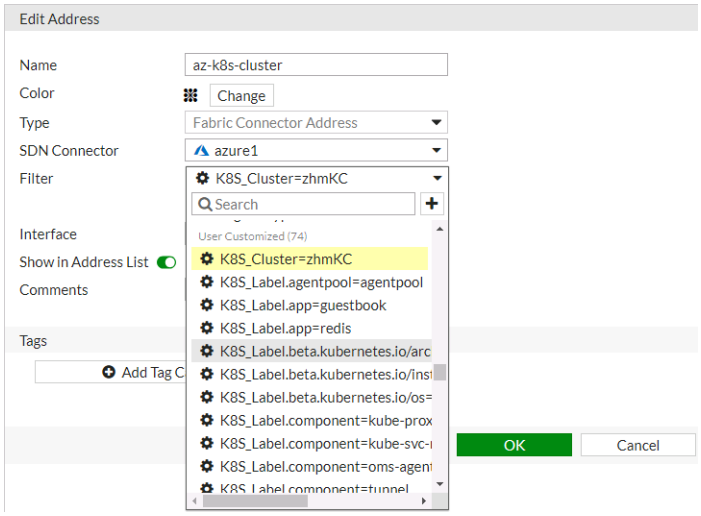


2. Create a dynamic firewall address for the configured K8s SDN connector:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   e. From the *SDN Connector* dropdown list, select the desired SDN connector.
   f. In the *Filter* field, add the desired filter. The following filters are supported:

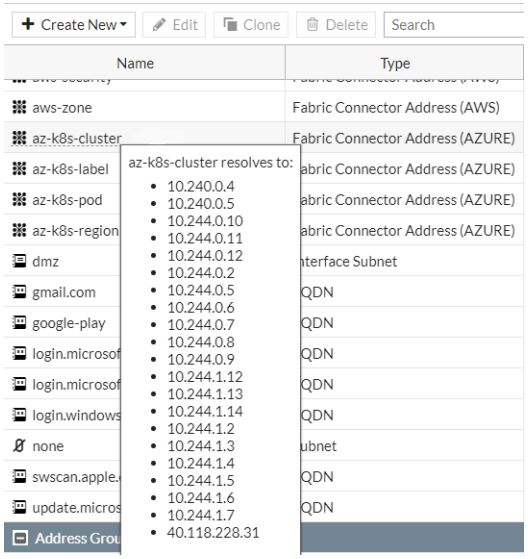
Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.

Filter	Description
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/pod).

In this example, the address is configured to automatically populate and update IP addresses only for instances that belong to the zhmKC cluster:



3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to the zhmKC cluster as configured in step 2:



To configure an Azure Kubernetes SDN connector through the CLI:

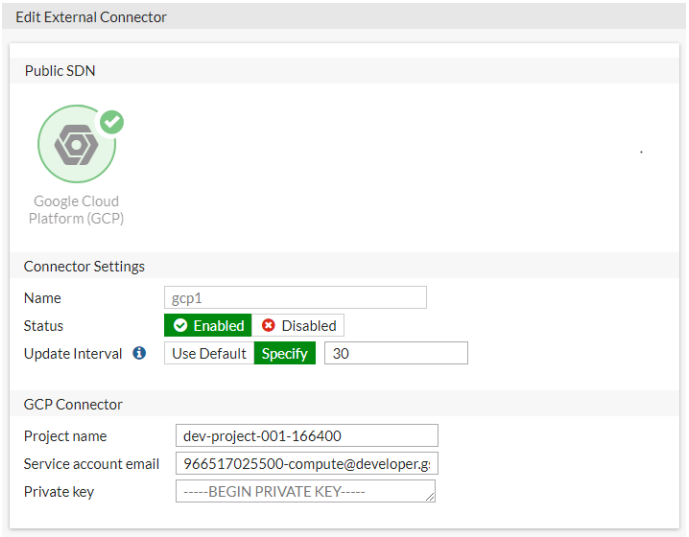
1. Configure the SDN connector:
```
config system sdn-connector
   edit "azure1"
      set type azure
      set tenant-id "942b80cd-1b14-42a1-8dcf-4b21dece61ba"
      set client-id "14dbd5c5-307e-4ea4-8133-68738141feb1"
      set client-secret xxxxx
      set update-interval 30
   next
end
```
2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter. In this example, the address will automatically populate and update IP addresses only for instances that belong to the zhmKC cluster:
```
config firewall address
   edit "az-k8s-cluster"
      set type dynamic
      set sdn "azure1"
      set filter "K8S_Cluster=zhmKC"
   next
end
```
3. Confirm that the Azure SDN connector resolves dynamic firewall IP addresses using the configured filter:
```
config firewall address
   edit "az-k8s-cluster"
      set type dynamic
      set sdn "azure1"
      set filter "K8S_Cluster=zhmKC"
      config list
         edit "10.240.0.4"
         next
         edit "10.240.0.5"
         next
         edit "10.244.0.10"
         next
      end
   next
end
```

GCP Kubernetes (GKE) SDN connector using service account

Google Cloud Platform (GCP) SDN connectors support dynamic address groups based on GCP Kubernetes Engine (GKE) filters.

To enable a GCP SDN connector to fetch IP addresses from GKE:

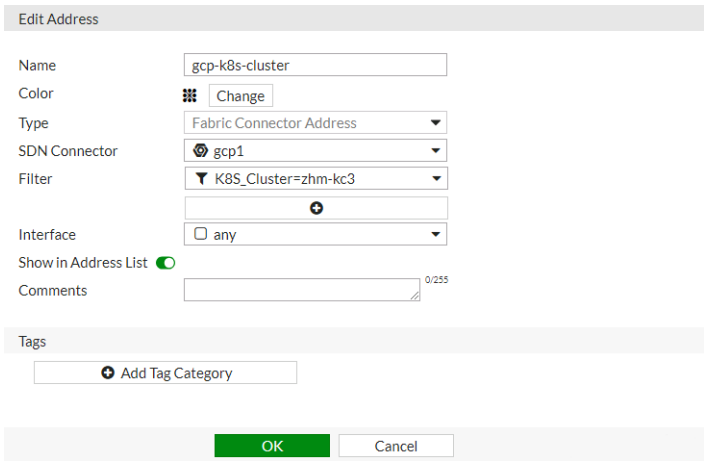
1. Go to *Security Fabric* > *External Connectors*, and configure an SDN connector for GCP.



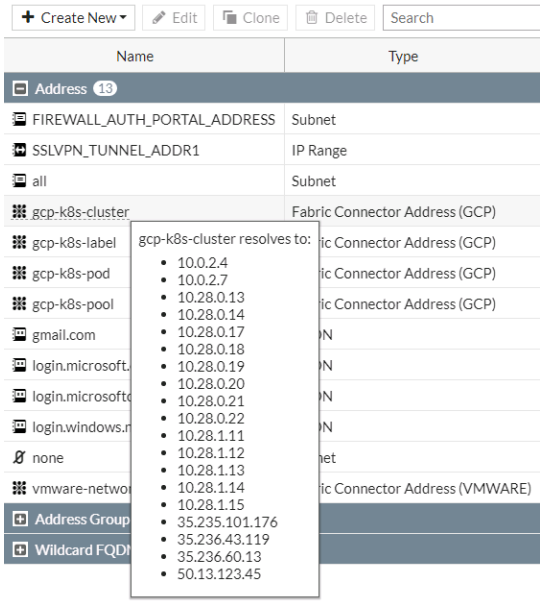
2. Go to *Policies & Objects* > *Addresses* and create a dynamic firewall address for the configured SDN connector using the supported Kubernetes filter.
3. To filter out the Kubernetes IP addresses, select the address filter or filters. The following filters are supported:

Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/Pod).

In this example, the GCP SDN connector will automatically populate and update IP addresses only for instances that belong to the zhm-kc3 cluster:



4. Configure the rest of the settings, then click *OK*.
   The dynamic firewall address IP is resolved by the SDN connector.



To configure a GCP Kubernetes SDN connector through the CLI:

1. Configure an SDN connector for Kubernetes:

```
config system sdn-connector
   edit "gcp1"
      set type gcp
      set gcp-project "dev-project-001-166400"
      set service-account "966517025500-compute@developer.gserviceaccount.com"
      set update-interval 30
   next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported Kubernetes filter:

```
config firewall address
   edit "gcp-k8s-cluster"
      set type dynamic
      set sdn "gcp1"
```

```
        set filter "K8S_Cluster=zhm-kc3"
    next
end
```

The dynamic firewall address IP is resolved by the SDN connector:

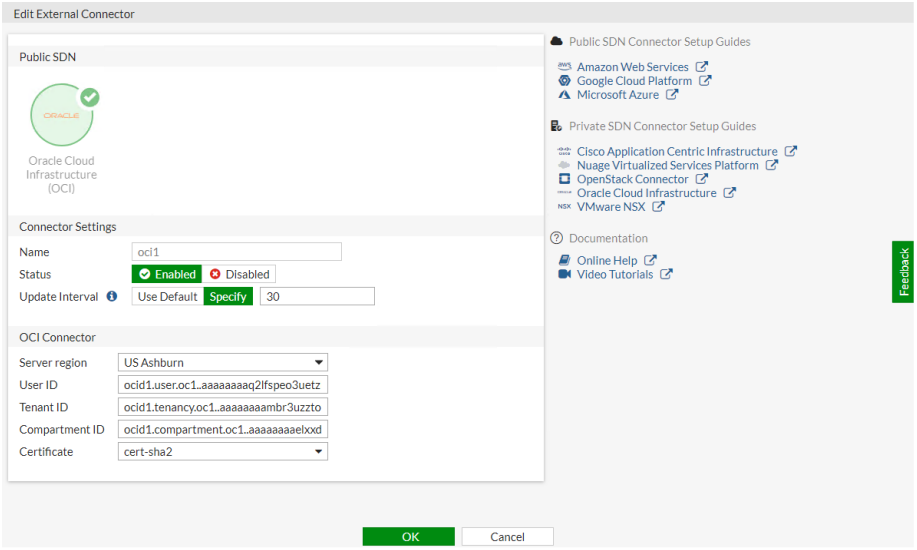
```
config firewall address
    edit "gcp-k8s-cluster"
        set type dynamic
        set sdn "gcp1"
        set filter "K8S_Cluster=zhm-kc3"
        config list
            edit "10.0.2.4"
            next
            edit "10.0.2.7"
            next
            edit "10.28.0.13"
            next
        end
    next
end
```

Oracle Kubernetes (OKE) SDN connector using certificates

OCI SDN connectors support dynamic address groups based on Oracle Kubernetes (OKE) filters.

To enable an OCI SDN connector to fetch IP addresses from Oracle Kubernetes:

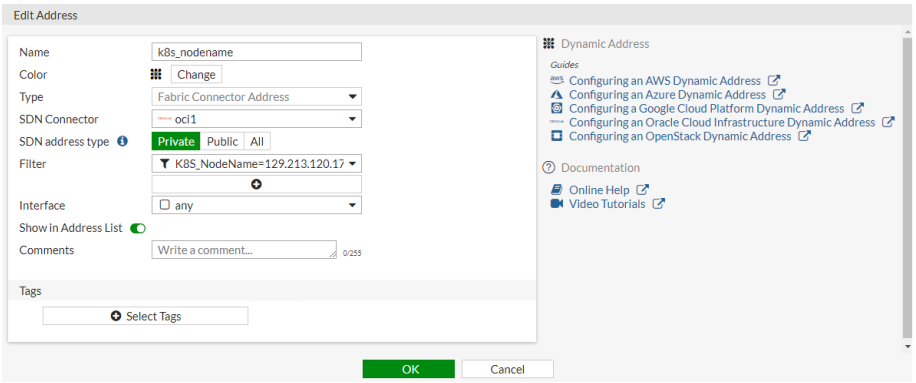
1. Configure the OCI SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *Oracle Cloud Infrastructure (OCI)*.
   c. Configure as shown substituting the region, tenant and client IDs, and client secret for your deployment. The update interval is in seconds.



2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.

c. In the *Filter* field, select the desired filters. The following filters are supported:

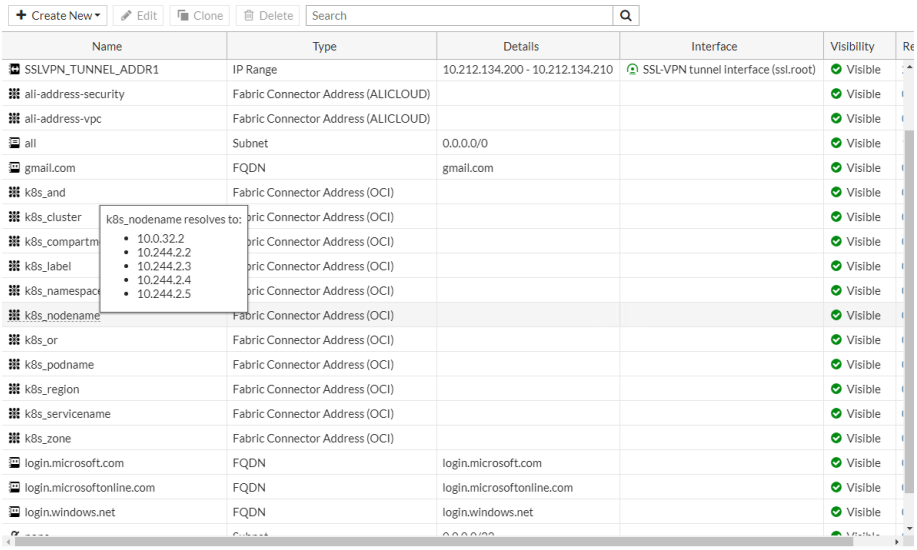
Filter	Description
k8s_cluster	Name of Kubernetes cluster.
k8s_namespace	Namespace of a Kubernetes service or pod.
k8s_svcname	Name of a Kubernetes service.
k8s_nodename	Name of a Kubernetes node.
k8s_zone	Zone of a Kubernetes node.
k8s_region	Region of a Kubernetes node.
k8s_podname	Name of a Kubernetes pod.
k8s_label.xxx	Name of label of a Kubernetes resource (cluster/service/node/Pod).



3. Confirm that the SDN connector resolves dynamic firewall IP addresses:

a. Go to *Policy & Objects* > *Addresses*.

b. Hover over the address created in step 2 to see a list of IP addresses for instances:



To configure an SDN connector through the CLI:

1. Configure the OCI SDN connector:

```
config system sdn-connector
   edit "oci1"
      set type oci
      set tenant-id
           "ocid1.tenancy.oc1..aaaaaaaambr3uzztoyhweohbzqqdo775h7d3t54zpmzkp4b2cf35vs5
           5cxxx"
      set user-id
           "ocid1.user.oc1..aaaaaaaaq2lfspeo3uetzbzpiv2pqvzzevozccnys347stwssvizqlatfx
           xx"
      set compartment-id
           "ocid1.compartment.oc1..aaaaaaaaelxxdjazqo7nzczpgypyiqcgkmytjry6nfq5345vw7e
           avpwnmxxx"
      set oci-region ashburn
      set oci-cert "cert-sha2"
      set update-interval 30
   next
end
```

2. Create dynamic firewall addresses for the configured SDN connector with supported Kubernetes filter:

```
config firewall address
   edit "k8s_nodename"
      set type dynamic
      set sdn "oci1"
      set filter "K8S_NodeName=129.213.120.172"
   next
end
```

3. Confirm that the SDN connector resolves dynamic firewall IP addresses:

```
config firewall address
   edit "k8s_nodename"
      set type dynamic
      set sdn "oci1"
      set filter "K8S_NodeName=129.213.120.172"
      config list
         edit "10.0.32.2"
         next
         edit "10.244.2.2"
         next
         edit "10.244.2.3"
         next
         edit "10.244.2.4"
         next
         edit "10.244.2.5"
         next
      end
   next
end
```

Private cloud K8s SDN connector using secret token

FortiOS automatically updates dynamic and cluster IP addresses for Kubernetes (K8s) by using a K8s SDN connector, enabling FortiOS to manage K8s pods as global address objects, as with other connectors. This includes mapping the following attributes from K8s instances to dynamic address groups in FortiOS:

Filter	Description
Namespace	Filter service IP addresses in a given namespace.
ServiceName	Filter service IP addresses by the given service name.
NodeName	Filter node IP addresses by the given node name.
PodName	Filter IP addresses by the pod name.
Label.XXX	Filter service or node IP addresses with the given label XXX. For example: `K8S_Label.app=nginx`.

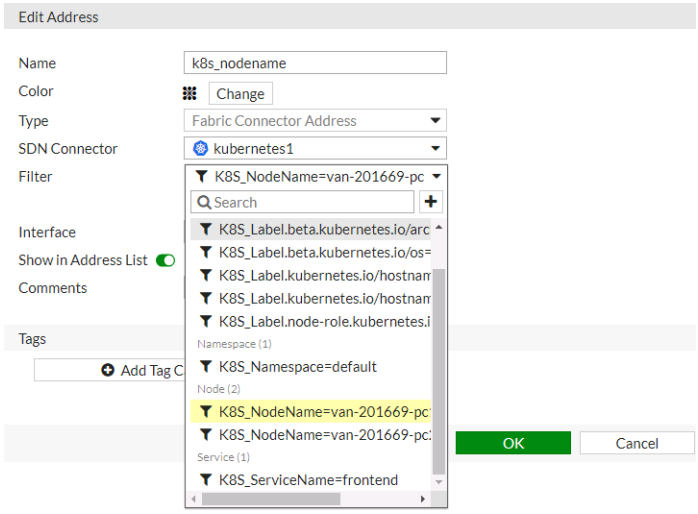
FortiOS 6.2.3 and later collect cluster IP addresses in addition to external IP addresses for exposed K8s services.

There is no maximum limit for the number of IP addresses populated with the filters.

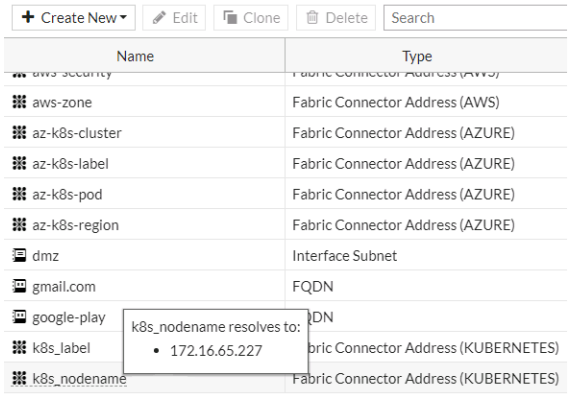
To configure K8s SDN connector using the GUI:

1. Configure the K8s SDN connector:
   a. Go to *Security Fabric* > *External Connectors* > *Create New Connector*.
   b. Select *Kubernetes*.
   c. In the *IP* field, enter the IP address that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   d. In the *Port* field, select *Specify*, then enter the port that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   e. In the *Secret token* field, enter the token that you obtained in Obtaining the IP address, port, and secret token in Kubernetes.
   f. Configure the other fields as desired.
2. Create a dynamic firewall address for the configured K8S SDN connector:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.
   c. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match

the specified node name:



3. Ensure that the K8s SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for node instances that match the node name configured in step 2:



To configure K8s SDN connector using CLI commands:

1. Configure the K8s SDN connector:

```
config system sdn-connector
   edit "kubernetes1"
      set type kubernetes
      set server "<IP address obtained in Obtaining the IP address, port, and secret
           token in Kubernetes>"
      set server-port <Port obtained in Obtaining the IP address, port, and secret token
           in Kubernetes>
      set secret-token <Secret token obtained in Obtaining the IP address, port, and
           secret token in Kubernetes>
      set update-interval 30
   next
end
```

2. Create a dynamic firewall address for the configured K8s SDN connector with the supported K8s filter. In this example, the K8s SDN connector will automatically populate and update IP addresses only for node instances that match the specified node name:

```
config firewall address
   edit "k8s_nodename"
      set type dynamic
      set sdn "kubernetes1"
      set filter "K8S_NodeName=van-201669-pc1"
   next
end
```

3. Confirm that the K8s SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
   edit "k8s_nodename"
      set type dynamic
      set sdn "kubernetes1"
      set filter "K8S_NodeName=van-201669-pc1"
      config list
         edit "172.16.65.227"
         next
      end
   next
end
```

To troubleshoot the connection:

1. In FortiOS, run the following commands:

```
diagnose deb application kubed -1
diagnose debug enable
```

2. Reset the connection on the web UI to generate logs and troubleshoot the issue. The following shows the output in the case of a failure:

```
fortigate # diagnose deb application kubed -1
Debug messages will be on for 30 minutes.

fortigate # diagnose debug enable

fortigate # k8s: update sdn connector kubernetes1 status to enabled
k8s: update sdn connector kubernetes2 status to disabled
kubed sdn connector kubernetes1 prepare to update
getting token
kubed sdn connector kubernetes1 start updating
kube url: https://172.17.215.10:6443/api/v1/services

kubed reap child pid: 1252
```

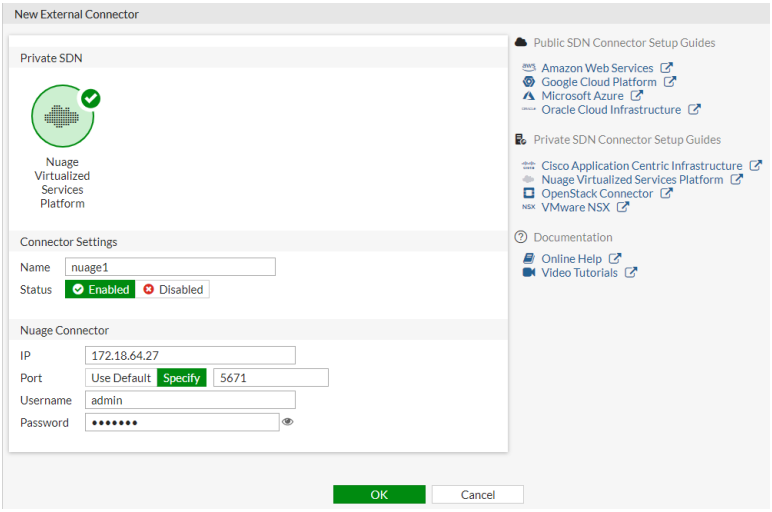
Nuage SDN connector using server credentials

You can use Nuage SDN connectors in dynamic firewall addresses.

The Fortinet SDN Connector for Cisco ACI and Nuage Networks is a standalone connector that connects to SDN controllers within Cisco ACI and Nuage Networks. You must configure a connection to the Fortinet SDN connector in FortiOS to query the dynamic addresses.

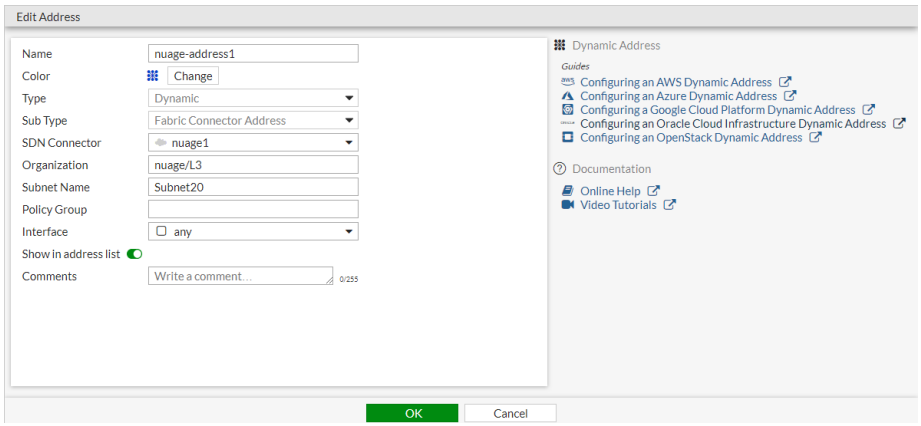
To configure a Nuage connector in the GUI:

1. Create the Nuage SDN connector:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *Private SDN* section, click *Nuage Virtualized Services Platform*.
   c. Configure the settings as needed.
   d. Click *OK*.



2. Create the dynamic firewall address for the connector:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the following settings:
      i. For *Type*, select *Dynamic*.
      ii. For *Sub Type*, select *Fabric Connector Address*.
      iii. For *SDN Connector*, select the Nuage connector.
      iv. Configure the remaining settings as needed.

c. Click *OK*.



To verify the SDN connector resolves the dynamic firewall IP addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses*.
2. In the address table, hover over an address to view which IP addresses it resolves to.

To configure a Nuage connector in the CLI:

1. Create the SDN connector:

```
config system sdn-connector
    edit "nuage1"
        set type nuage
        set server "172.18.64.27"
        set server-port 5671
        set username "admin"
        set password xxxxxxx
    next
end
```

2. Create the dynamic firewall address for the connector:

```
config firewall address
    edit "nuage-address1"
        set type dynamic
        set sdn "nuage1"
        set color 19
        set organization "nuage/L3"
        set subnet-name "Subnet20"
    next
end
```

To verify the SDN connector resolves the dynamic firewall IP addresses in the CLI:

```
# diagnose firewall dynamic list

List all dynamic addresses:
nuage1.nuage.nuage/L3.Subnet20.*: ID(196)
        ADDR(192.168.20.92)
        ADDR(192.168.20.240)
```

Nutanix SDN connector using server credentials

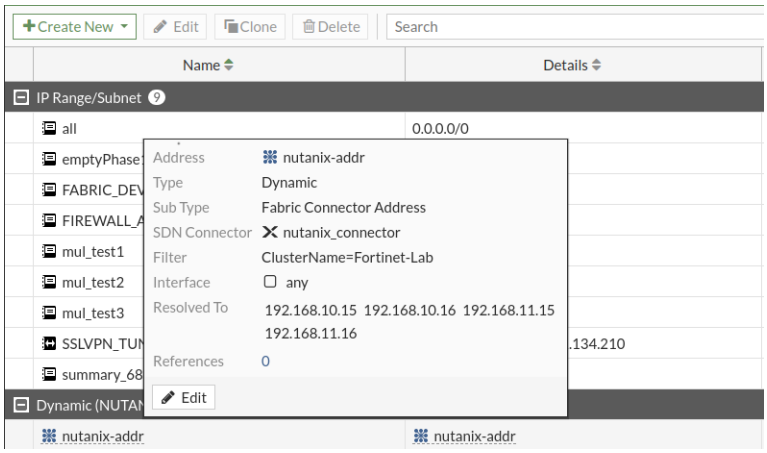
FortiOS automatically updates dynamic addresses for Nutanix using an Nutanix SDN connector, including mapping the following attributes from Nutanix instances to dynamic address groups in FortiOS:

- Cluster name
- Cluster UUID
- Description
- Host name
- Host UUID
- Hypervisor type
- Image name
- Image UUID
- Subnet name
- Subnet UUID
- VM name
- VM UUID

To configure a Nutanix connector using the GUI:

1. Configure the Nutanix SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Select *Nutanix*.
   c. In the *IP address* field, enter the IP address for your Nutanix environment.
   d. In the *Port* field, enter the desired port.
   e. In the *Username* and *Password* fields, enter the credentials for your Nutanix environment.
   f. Click *OK*.
2. Create a dynamic firewall address for the configured Nutanix SDN connector:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New*, then select *Address*.
   c. From the *Type* dropdown list, select *Dynamic*.
   d. From the *Sub Type* dropdown list, select *Fabric Connector Address*.
   e. From the *SDN Connector* dropdown list, select the Nutanix connector.
   f. From the *Filter* dropdown list, select the desired filters.
   g. Click *OK*.
3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that satisfy the filter

requirements configured in step 2. In this example, the configured filter is "ClusterName=Fortinet-Lab":



To configure a Nutanix connector using the CLI:

1. Configure the Nutanix SDN connector:

```
config system sdn-connector
   edit "nutanix_connector"
      set status disable
      set type nutanix set server "172.18.33.59"
      set server-port 9440
      set username "admin"
      set password **********
      set update-interval 60
   next
end
```

2. Create a dynamic firewall address for the configured Nutanix SDN connector:

```
config firewall address
   edit "nutanix-addr"
      set uuid 382ceafe-8e72-51eb-7300-0807ee907946
      set type dynamic
      set sdn "nutanix_connector"
      set color 2
      set filter "ClusterName=Fortinet-Lab"
   next
end
```

3. Ensure that the Nutanix SDN connector resolves dynamic firewall IP addresses:

```
config firewall address
   edit "nutanix-addr"
      set uuid 382ceafe-8e72-51eb-7300-0807ee907946
      set type dynamic
      set sdn "nutanix_connector"
      set color 2
      set filter "ClusterName=Fortinet-Lab"
      config list
         edit "192.168.10.15"
         next
         edit "192.168.10.16"
         next
         edit "192.168.11.15"
         next
         edit "192.168.11.16"
```

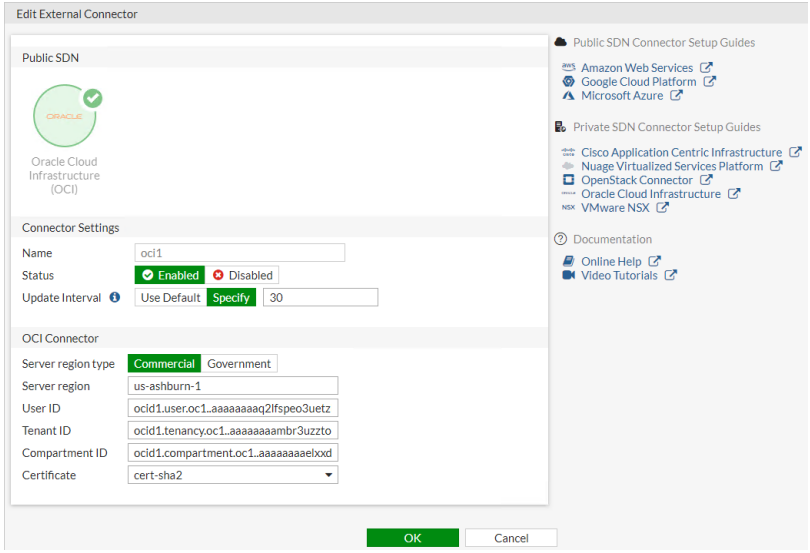
```
        next
      end
    next
end
```

OCI SDN connector using certificates

You can configure SDN connector integration with Oracle Cloud Infrastructure (OCI).

To configure an OCI SDN connector in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Public SDN* section, select *Oracle Cloud Infrastructure (OCI)*.
3. Configure the connector as desired:
   a. *User ID*: Enter the OCID of the OCI user who belongs to the administrator group. See Certificate-based SDN connector requirements.
   b. For the *OCI Certificate* field, you must select a certificate that satisfies OCI key size limits. The minimum size is 2048 bits. Do one of the following:
      i. Select the built-in default certificate called Fortinet_Factory.
      ii. Follow steps 1-2 in Using custom certificates to configure a custom certificate.



4. Click *OK*.
5. At this stage, you must register the certificate's fingerprint to the specified OCI user.
   a. Go to the OCI user, then *API Keys* > *Add Public Key*.
   b. If you selected the Fortinet_Factory certificate in step 2f, do the following:
      i. In FortiOS, go to *System* > *Certificate*. Select Fortinet_Factory, then click *Download*.
      ii. You now have the Fortinet_Factory.cer file. Create a public key file in PEM format from it, using a freely available tool of your choice such as OpenSSL.
   c. Copy and paste the content of the certificate PEM key file in the *Add Public Key* window in OCI. Click *Add*.

d. You now see the fingerprint.

You can configure the following for the fingerprint:

1. *Update Interval*: The default value is 60 seconds. You can change the value to between 1 and 3600 seconds.
2. *Status*: Green means that the connector is enabled. You can disable it at any time by toggling the switch.

e. Click *OK*.

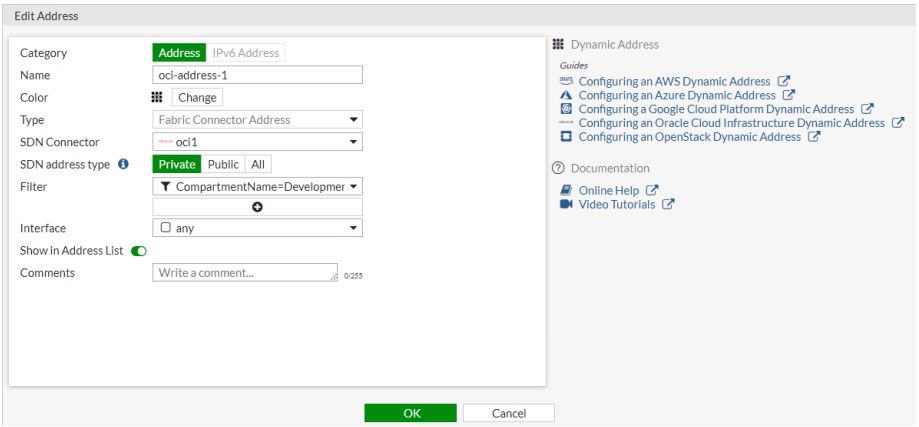
6. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
7. Configure the address as needed, selecting the OCI connector in the *SDN Connector* field. The following filters are supported:

   `'vm_name=<vm name>'`: matches VM instance name.

   `'instance_id=<instance id>'`: matches instance OCID.

   `'tag.<key>=<value>'`: matches freeform tag key and its value.

   `'definedtag.<namespace>.<key>=<value>'`: matches a tag namespace, tag key, and its value.



8. Click *OK*.

To configure an OCI SDN connector in the CLI:

1. Configure an SDN connector:

```
config system sdn-connector
    edit "oci1"
        set status enable
        set type oci
        set tenant-id
"ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaaaaa77xxxxxx54bbbbbb4xxxx35xx55xxxx"
        set user-id
"ocid1.user.oc1..aaaaaaaaa2laaaaa3aaaaaaaaaabbbbbbbbbbcccc3ccccccccccxxxxxxxx"
        set compartment-id
"ocid1.compartment.oc1..aaaaaaaaaaaaaaaaa7bbbbbbbbbbccccccccc6xxx53xxxx7xxxxxxxxx"
        set oci-region "us-ashburn-1"
```

```
        set oci-region-type commercial
        set oci-cert "cert-sha2"
        set update-interval 30
    next
end
```

2. Create a dynamic firewall address for the SDN connector with a supported filter:

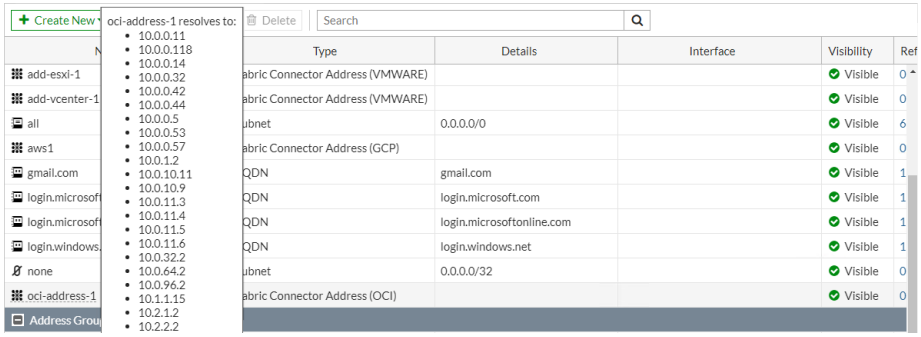
```
config firewall address
    edit "oci-address-1"
        set type dynamic
        set sdn "oci1"
        set filter "CompartmentName=DevelopmentEngineering"
    next
end
```

To confirm that dynamic firewall addresses are resolved by the SDN connector:

1. In the CLI, check that the addresses are listed:

```
config firewall address
    edit "oci-address-1"
        set type dynamic
        set sdn "oci1"
        set filter "CompartmentName=DevelopmentEngineering"
        config list
            edit "10.0.0.11"
            next
            edit "10.0.0.118"
            next
            ...
            next
        end
    next
end
```

2. In the GUI, go to *Policy & Objects* > *Addresses* and hover the cursor over the address name.



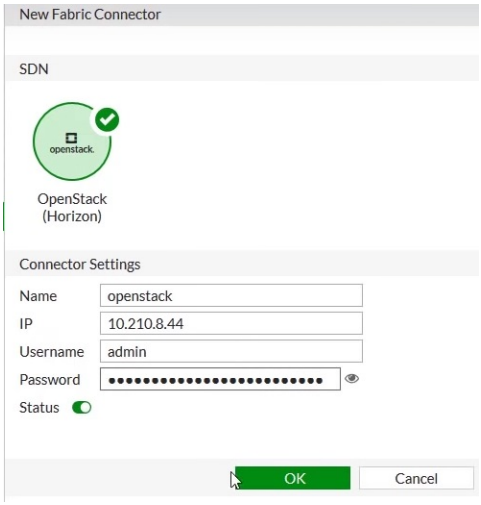
OpenStack SDN connector using node credentials

To configure OpenStack SDN connector using node credentials:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*, then select *OpenStack (Horizon)*.

3. Configure the fields as follows:
   a. *Name*: Name the connector as desired.
   b. *IP*: Enter the OpenStack management component's IP address. Generally you can find it in the OpenStack identity.

   c. *User name*: Enter the specified node's administrator name.
   d. *Password*: Enter the administrator password.



4. Click *OK*. The SDN connector is now configured.

To configure a dynamic firewall address:

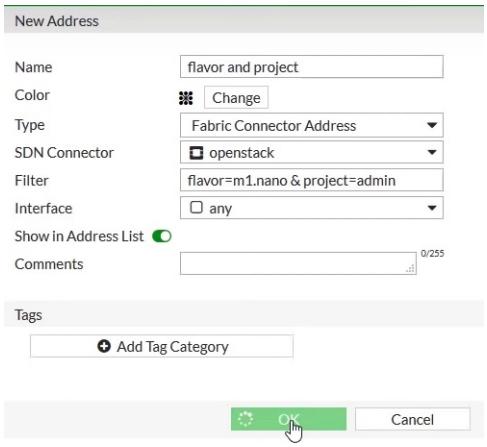
The next step is to create an address that will be used as an address group or single address that acts as the source/destination for firewall policies. The address is based on IP addresses and contains VM instances' IP addresses.

No matter what changes occur to the instances, the SDN connector populates and updates the changes automatically based on the specified filtering condition so that administrators do not need to reconfigure the address content manually. Appropriate firewall policies using the address are applied to instances that are members of the address.

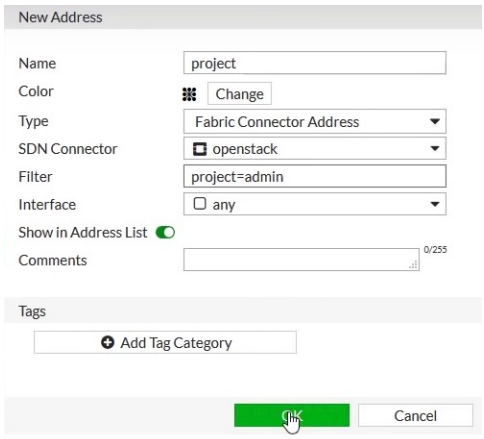
1. Go to *Policy & Objects* > *Address*. Click *Create New*, then select *Address*.
2. Configure the address as follows:
   a. *Name*: Name the address as desired.
   b. *Type*: Select *Dynamic*.
   c. *Sub Type*: Select *Fabric Connector Address*.
   d. *SDN Connector*: Select *openstack*.
   e. *Filter*: The SDN connector automatically populates and updates only IP addresses belonging to the specified filter that matches the condition. OpenStack Horizon connectors support the following filters:
      i. `id=<instance id>`: This matches a VM instance ID.
      ii. name=<instance name>: This matches a VM instance name.
      iii. `flavor=<instance flavor name>`: This matches an instance flavor name.
      iv. `keypair=<key pair name>`: This matches a key pair name.
      v. `network=<net name>`: This matches a network name.
      vi. `project=<project name>`: This matches a project name.
      vii. `availabilityzone=<zone name>`: This matches an availability zone name.
      viii. `servergroup=<group name>`: This matches a server group name.
      ix. `securitygroup=<security group name>`: This matches a security group name.
      x. `metadata.<key>=<value>`: This matches metadata with its key and value pair.

   You can set filtering conditions using multiple entries with AND ("&") or OR ("|"). When both AND and OR are specified, AND is interpreted first, then OR.

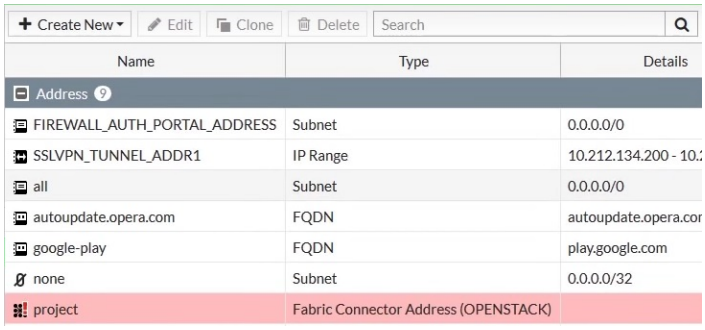
   For example, you could enter `flavor=m1.nano&project=admin`. In this case, IP addresses of instances that match both the flavor name and project name are populated. Wildcards (asterisks) are not allowed in values.



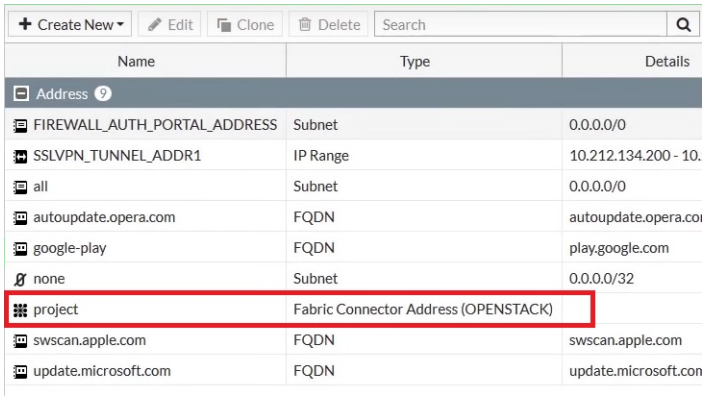
In this example, let's use project=admin, assuming the project name is admin.

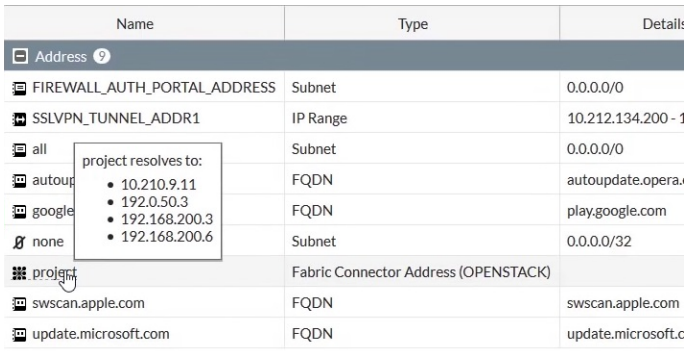


3. Click *OK* after completing all required fields.
4. Ensure that the address was created.



5. After a few minutes, the new address takes effect. Hover your cursor on the address to see a list of IP addresses and instances with the project name "admin".





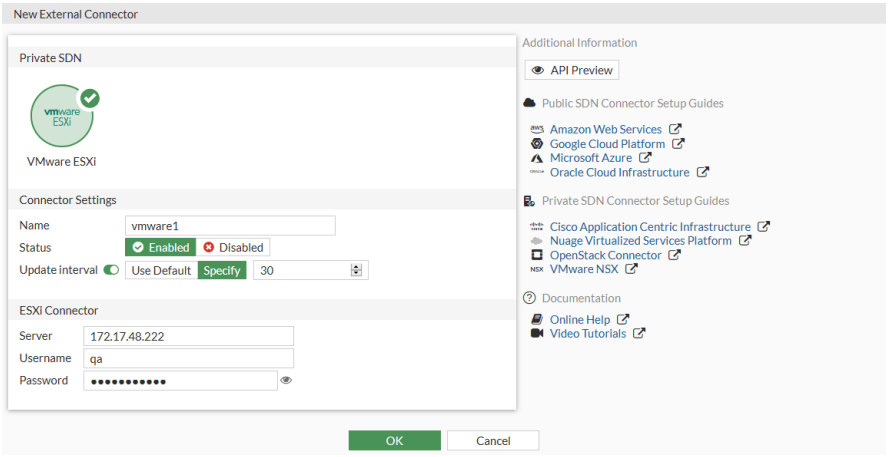
VMware ESXi SDN connector using server credentials

Dynamic addresses for VMware ESXi and vCenter servers can be automatically updated by using a VMware ESXi SDN connector, including mapping the following attributes from VMware ESXi and vCenter objects to dynamic address groups in FortiOS:

- vmid
- host
- name
- uuid
- vmuuid
- vmnetwork
- guestid
- guestname
- annotation

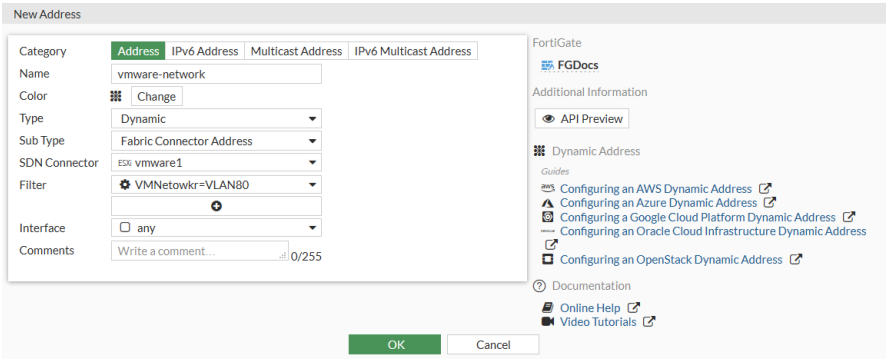
To configure VMware ESXi SDN connector using the GUI:

1. Configure the VMware ESXi SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*, and select *VMware ESXi*.
   c. Configure as shown, substituting the server IP address, username, and password for your deployment. The update interval is in seconds. The password cannot contain single or double quotes.



2. Create a dynamic firewall address for the configured VMware ESXi SDN connector:
   a. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*.
   b. Configure the address as shown, selecting the desired filter in the *Filter* dropdown list. In this example, the VMware ESXi fabric connector will automatically populate and update IP addresses only for instances that

belong to VLAN80:



3. Ensure that the VMware ESXi SDN connector resolves dynamic firewall IP addresses:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Hover over the address created in step 2 to see a list of IP addresses for instances that belong to VLAN80 as configured in step 2:

To configure VMware ESXi SDN connector using CLI commands:

1. Configure the VMware ESXi SDN connector:

```
config system sdn-connector
   edit "vmware1"
      set type vmware
      set server "172.17.48.222"
      set username "example_username"
      set password xxxxx
      set update-interval 30
   next
end
```

2. Create a dynamic firewall address for the configured VMware ESXi SDN connector with the supported VMware ESXi filter. In this example, the VMware ESXi SDN connector will automatically populate and update IP addresses only for instances that belong to the specified VLAN:

```
config firewall address
   edit "vmware-network"
      set type dynamic
      set sdn "vmware1"
      set filter "vmnetwork=VLAN80"
   next
end
```

3. Confirm that the VMware ESXi SDN connector resolves dynamic firewall IP addresses using the configured filter:

```
config firewall address
   edit "vmware-network"
      set type dynamic
      set sdn "vmware1"
      set filter "vmnetwork=VLAN80"
      config list
         edit "192.168.8.240"
         next
      end
   next
end
```

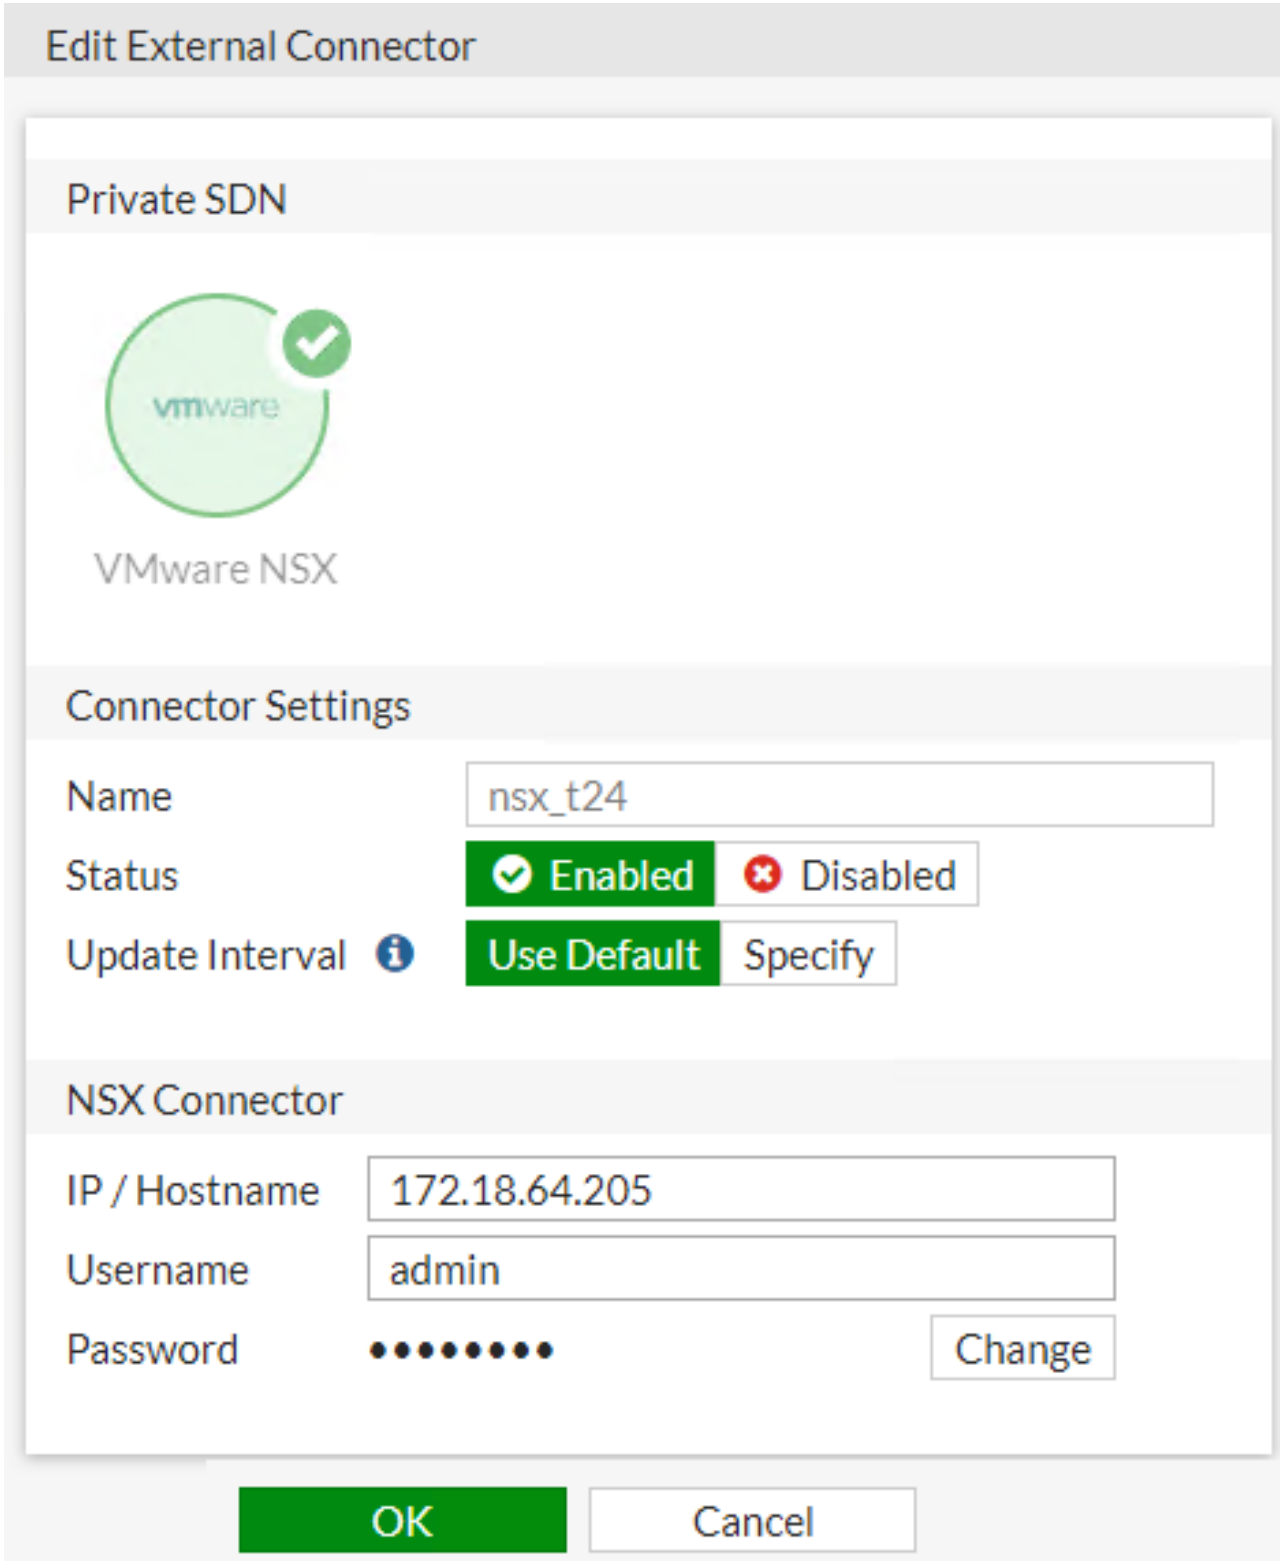
VMware NSX-T Manager SDN connector using NSX-T Manager credentials

This feature provides SDN connector configuration for VMware NSX-T manager. You can import specific groups, or all groups from the NSX-T Manager.

To configure SDN connector for NSX-T Manager in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Private SDN* section, click *VMware NSX*.

3. Enter the settings and click *OK*.



To configure SDN connector for NSX-T Manager in the CLI:

```
config system sdn-connector
    edit "nsx_t24"
        set type nsx
        set server "172.18.64.205"
        set username "admin"
        set password xxxxxx
    next
end
```

To import a specific group from the NSX-T Manager:

```
# execute nsx group import nsx_t24 root csf_ns_group
[1] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
  Name:csf_ns_group
  Address:1.1.1.0
  Address:1.1.1.1
  Address:172.16.10.104
  Address:172.16.20.104
  Address:172.16.30.104
  Address:2.2.2.0
  Address:2.2.2.2
  Address:4.4.4.0
  Address:5.5.5.0
  Address:6.6.6.6
  Address:7.7.7.7
```

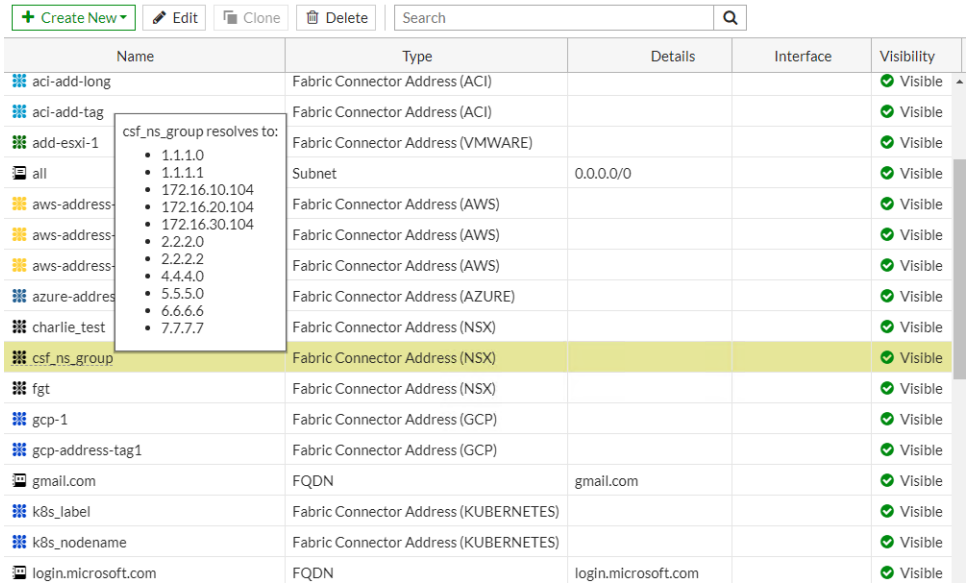
To import all groups from NSX-T Manager:

```
# execute nsx group import nsx_t24 root
[1] 663a7686-b9a3-4659-b06f-b45c908349a0 ServiceInsertion_NSGroup:
  Name:ServiceInsertion_NSGroup
  Address:10.0.0.2
[2] 336914ba-0660-4840-b0f1-9320f5c5ca5e csf_ns_group:
  Name:csf_ns_group
  Address:1.1.1.0
  Address:1.1.1.1
  Address:172.16.10.104
  Address:172.16.20.104
  Address:172.16.30.104
  Address:2.2.2.0
  Address:2.2.2.2
  Address:4.4.4.0
  Address:5.5.5.0
  Address:6.6.6.6
  Address:7.7.7.7
[3] c462ec4d-d526-4ceb-aeb5-3f168cecd89d charlie_test:
  Name:charlie_test
  Address:1.1.1.1
  Address:2.2.2.2
  Address:6.6.6.6
  Address:7.7.7.7
[4] ff4dcb08-53cf-46bd-bef4-f7aeda9c0ad9 fgt:
  Name:fgt
  Address:172.16.10.101
```

```
  Address:172.16.10.102
  Address:172.16.20.102
  Address:172.16.30.103
[5] 3dd7df0d-2baa-44e0-b88f-bd21a92eb2e5 yongyu_test:
  Name:yongyu_test
  Address:1.1.1.0
  Address:2.2.2.0
  Address:4.4.4.0
  Address:5.5.5.0
```

To view the dynamic firewall IP addresses that are resolved by the SDN connector in the GUI:

1. Go to *Policy & Objects* > *Addresses* to view the IP addresses resolved by an SDN connector.



To view the dynamic firewall IP addresses that are resolved by the SDN connector in the CLI:

```
# show firewall address csf_ns_group
config firewall address
    edit "csf_ns_group"
        set uuid ee4a2696-bacd-51e9-f828-59457565b880
        set type dynamic
        set sdn "nsx_t24"
        set obj-id "336914ba-0660-4840-b0f1-9320f5c5ca5e"
        config list
            edit "1.1.1.0"
            next
            edit "1.1.1.1"
            next
            edit "172.16.10.104"
            next
            edit "172.16.20.104"
            next
            edit "172.16.30.104"
            next
            edit "2.2.2.0"
            next
```

```
            edit "2.2.2.2"
            next
            edit "4.4.4.0"
            next
            edit "5.5.5.0"
            next
            edit "6.6.6.6"
            next
            edit "7.7.7.7"
            next
        end
    next
end
```

Multiple concurrent SDN connectors

You can configure multiple instances configured for every SDN connector. The specific connector instance must be specified when creating a dynamic firewall address.

This topic provides examples of how to create two Microsoft Azure SDN connectors and use them in new dynamic firewall addresses.

To create and use two new SDN connectors with the CLI:

1. Create two new SDN connectors:

```
config system sdn-connector
    edit "azure1"
        set type azure
        set tenant-id "942b80cd-bbbb-42a1-8888-4b21dece61ba"
        set subscription-id "2f96c44c-cccc-4621-bbbb-65ba45185e0c"
        set client-id "14dbd5cc-3333-4ea4-8888-68738141feb1"
        set client-secret xxxxx
        set update-interval 30
    next
    edit "azure2"
        set type azure
        set tenant-id "942b80cd-bbbb-42a1-8888-4b21dece61ba"
        set client-id "3baa0acc-ffff-4444-b292-0777a2c36be6"
        set client-secret xxxxx
        set update-interval 30
    next
end
```

2. Create new dynamic firewall addresses that use the new connectors:

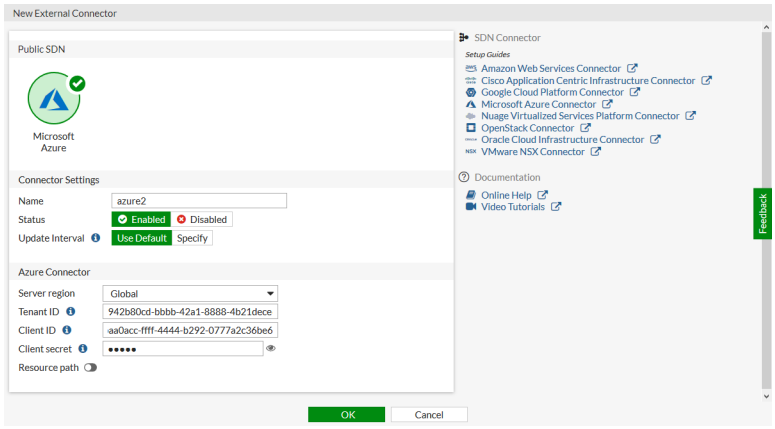
```
config firewall address
    edit "azure-address-location1"
        set type dynamic
        set color 2
        set sdn azure1
        set filter "location=WestUs"
    next
    edit "azure-address-location2"
        set type dynamic
```

```
        set color 2
        set sdn azure2
        set filter "location=NorthEurope"
    next
end
```

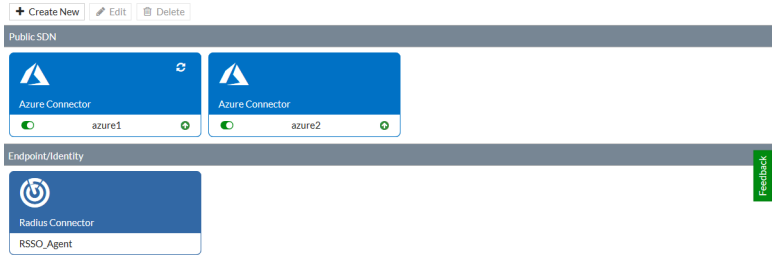
To create and use two new SDN connectors with the GUI:

1. Create two new SDN connectors:
   a. Go to *Security Fabric* > *External Connectors*, and click *Create New* in the toolbar.
   b. Click on *Microsoft Azure*.
   c. Fill in the required information, then click *OK*.

   d. Repeat the above steps for the second connector.



Two Microsoft Azure connectors will now be created.



2. Create new dynamic firewall addresses that use the new connectors:
   a. Go to *Policy and Objects* > *Addresses* and click *Create New* > *Address* in the toolbar.
   b. Enter a name for the address, and select *Fabric Connector Address* for the *Type*.
   c. Select one of the previously created SDN connectors from the *SDN Connector* drop down list.

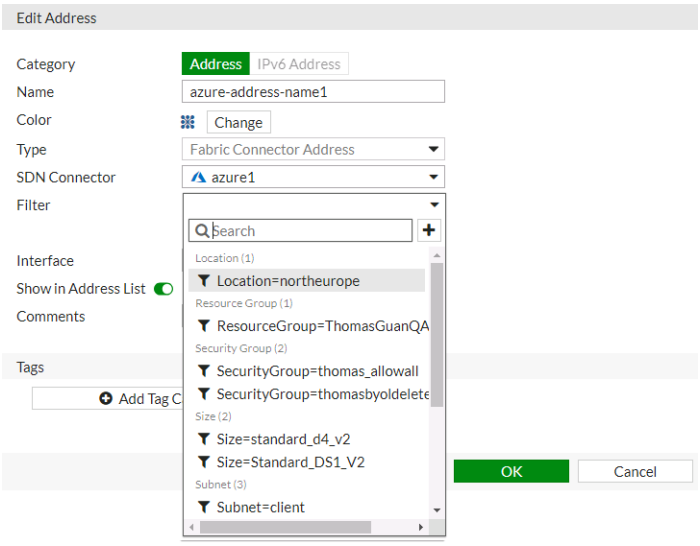
   d. Configure the rest of the required information, then click *OK* to create the address.
   e. Repeat the above steps to create the second address, selecting the other Microsoft Azure SDN connector.

Filter lookup in SDN connectors

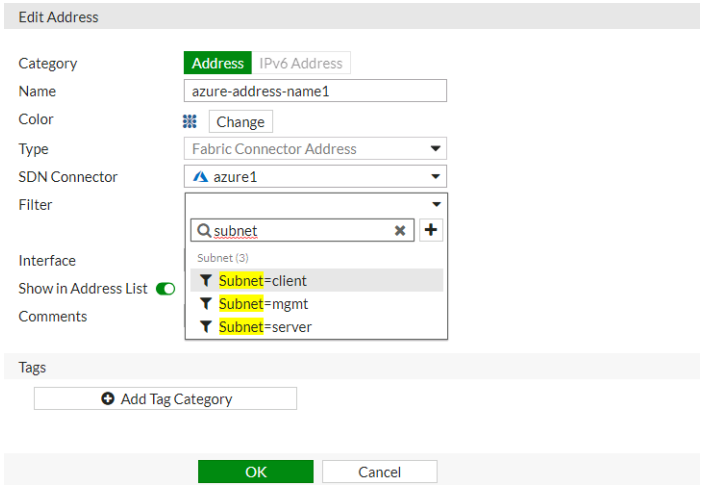
When configuring dynamic address mappings for filters in SDN connectors for Azure, GCP, OpenStack, Kubernetes, and AliCloud, FortiGate can query the filters automatically.

To use the filter lookup:

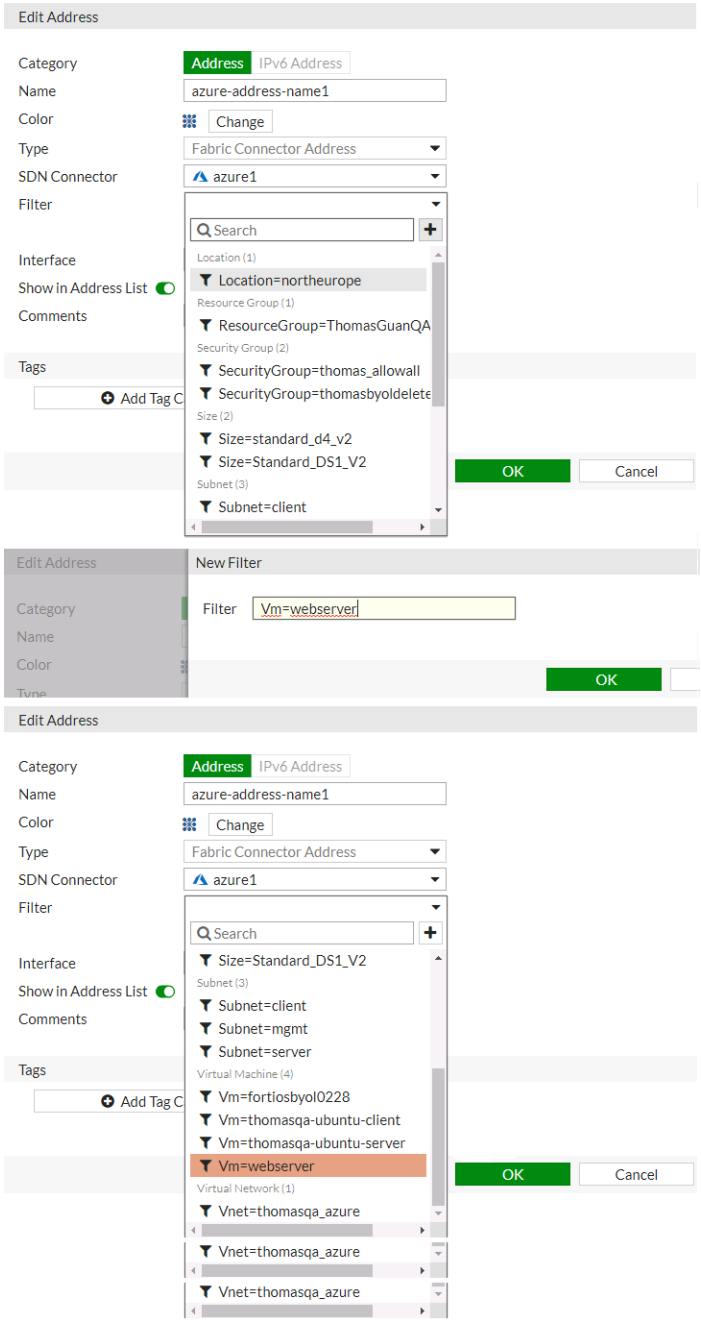
1. Navigate to *Policy & Objects* > *Addresses*.
2. Create or edit an SDN connector type dynamic IP address.
   Supported SDN connector types include: AWS, Azure, GCP, OpenStack, Kubernetes, and AliCloud. The example below is for an Azure SDN connector.
3. In the address *Filter* field, you can perform the following actions:
   - List all available filters.



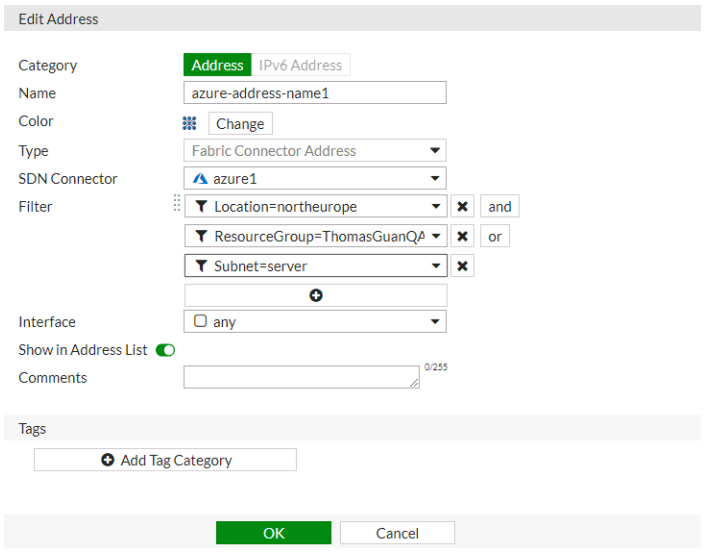
- Search the available filters.



- Create custom filters.



- Set filter logic [and|or].



Support for wildcard SDN connectors in filter configurations

Wildcards are supported for SDN connectors when configuring dynamic address filters.

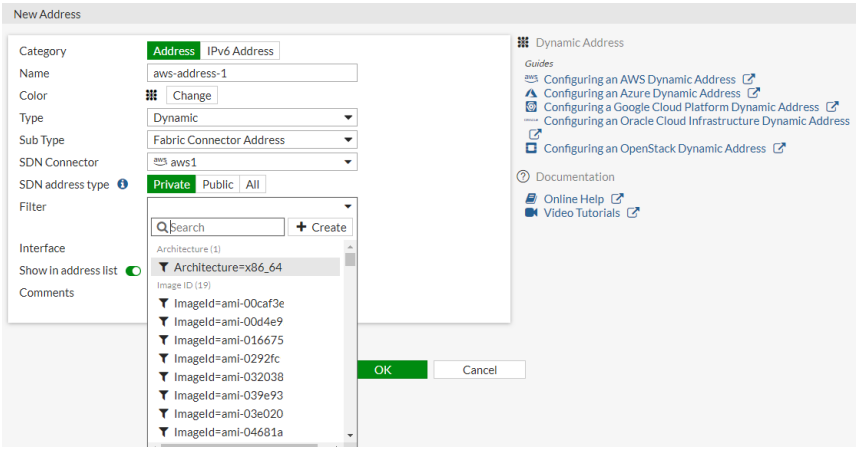
The following SDN connector types are currently supported:

- AWS
- Azure
- Google Cloud Platform
- Kubernetes
- OpenStack
- Oracle Cloud Infrastructure
- VMware ESXi

To configure a dynamic address filter for AWS in the GUI:

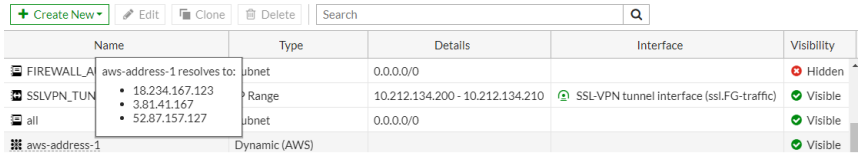
1. Create the SDN connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*.
   c. In the *Public SDN* section, click *Amazon Web Services (AWS)*.
   d. Configure the settings as needed.
   e. Click *OK*.
2. Create the dynamic firewall address:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create New* > *Address*
   c. Enter a name for the address, then configure the following settings:
      - Set *Type* to *Dynamic*.
      - Set *Sub Type* to *Fabric Connector Address*.
      - Set *SDN Connector* to *aws1*.
      - Set *SDN address type* to *Private*.

- For *Filter*, click *Create*, enter `Tag.Name=aws*`, the click *OK*.

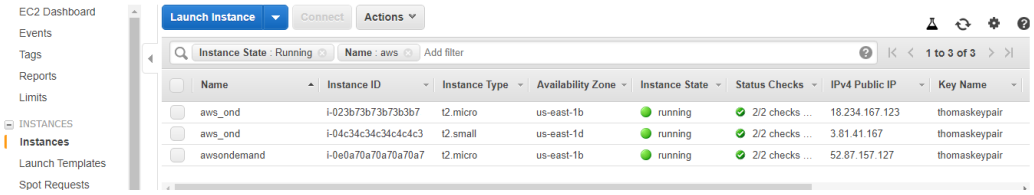


d. Click *OK*.

3. In the address table, hover over the address to view what IPs it resolves to.



4. In AWS, verify to confirm the IP addresses match.



To configure a dynamic address filter for AWS in the CLI:

1. Configure the SDN connector:

```
config firewall address
    edit "aws-address-1"
        set type dynamic
        set sdn "aws1"
        set filter "Tag.Name=aws*"
        set sdn-addr-type public
    next
end
```

2. Create the dynamic firewall address and verify where the IP addresses resolve to:

```
config firewall address
    edit "aws-address-1"
        set type dynamic
        set sdn "aws1"
        set filter "Tag.Name=aws*"
        set sdn-addr-type public
        config list
            edit "18.234.167.123"
```

```
                next
                edit "3.81.41.167"
                next
                edit "52.87.157.127"
                next
            end
        next
    end
```

3. In AWS, verify that the IP addresses match.

Endpoint/Identity connectors

SSO fabric connectors integrate SSO authentication into the network. This allows users to enter their credentials only once, and have those credentials reused when accessing other network resources through the FortiGate.

The following fabric connectors are available:

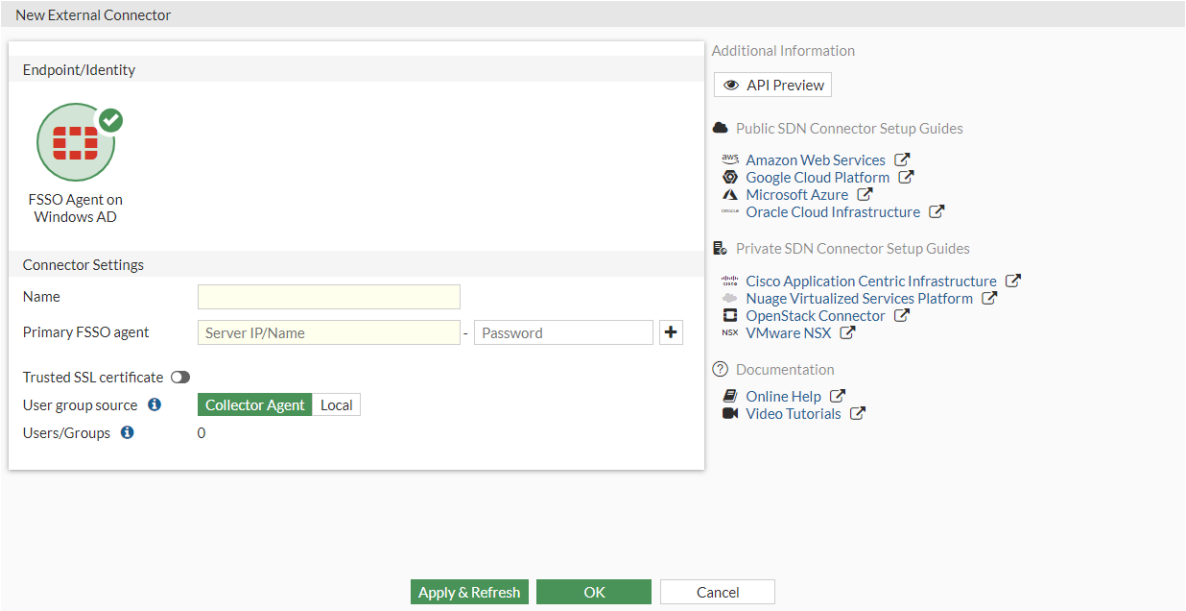
- Fortinet single sign-on agent on page 1838
- Poll Active Directory server on page 1839
- Symantec endpoint connector on page 1840
- RADIUS single sign-on agent on page 1846
- Exchange Server connector on page 1849

Fortinet single sign-on agent

To create an FSSO agent connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.

3. In the *Endpoint/Identity* section, click *FSSO Agent on Windows AD*.



4. Fill in the *Name*, and *Primary FSSO Agent* server IP address or name and *Password*.
5. Optionally, add more FSSO agents by clicking the plus icon.
6. Optionally, enable *Trusted SSL certificate* and select or import a certificate.
7. Select the *User group source*:
   - *Collector Agent*: User groups will be pushed to the FortiGate from the collector agent. Click *Apply & Refresh* to fetch group filters from the collector agent.
   - *Local*: User groups will be specified in the FortiGate unit's configuration. Select the LDAP server from the list, then click *Edit* to select the *Users*, *Groups*, and *Organizational Units*. Optionally, enable *Proactively retrieve from LDAP server* and configure the *Search filter* and *Interval*.
8. Click *OK*.

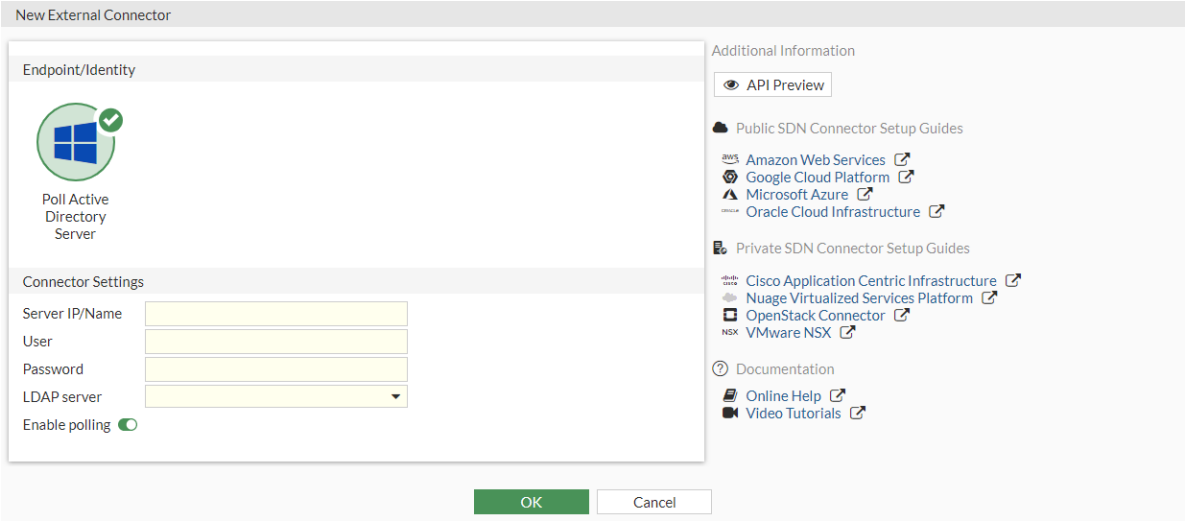
Poll Active Directory server

The FortiGate unit can authenticate users and allow them network access based on groups membership in Windows Active Directory (AD).

To create an AD server connector in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.

3. In the *Endpoint/Identity* section, click *Poll Active Directory Server*.



4. Fill in the *Server IP/Name*, *User*, and *Password* for the AD server.
5. Select the LDAP server from the list.
6. If necessary, disable *Enable Polling*. This can be used to temporarily stop the FortiGate from polling security event logs on the Windows logon server, for troubleshooting purposes.
7. Click *OK*.

Symantec endpoint connector

With the Fabric connector for Symantec Endpoint Protection Manager (SEPM), you can use the client IP information from SEPM to assign to dynamic IP addresses on FortiOS.

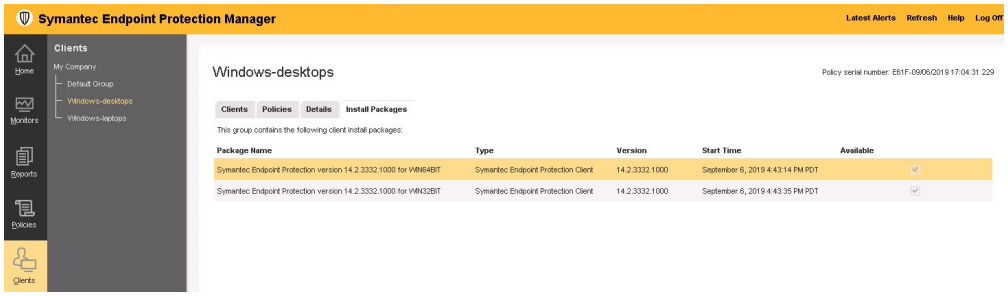
When communication between FortiGate and SEPM is established, FortiGate polls every minute for updates via TLS over port 8446. You can use the CLI to change the default one minute polling interval.

For example, you can create a dynamic Fabric Connector IP address subtype and use it in firewall policies as the source address. The dynamic IP address contains all IP addresses sent by SEPM.

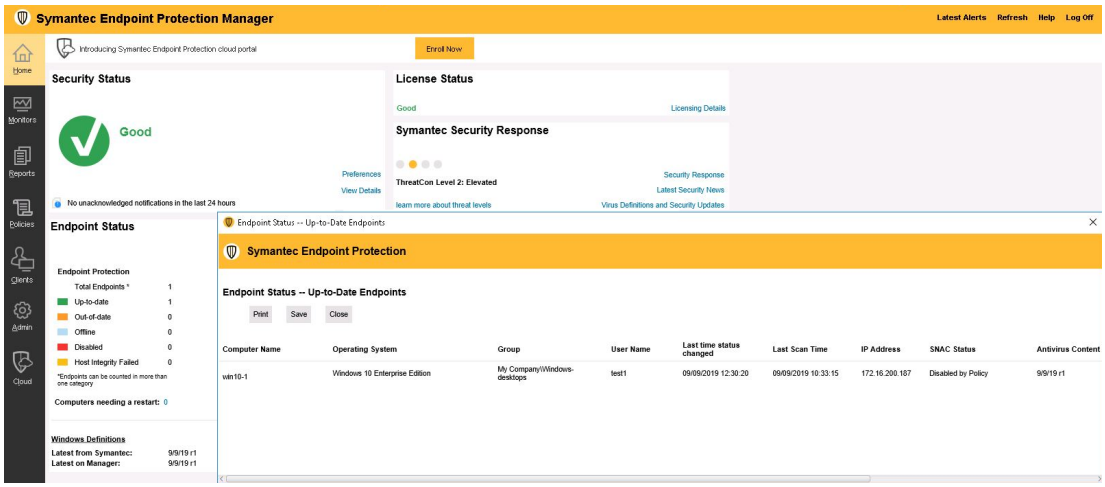
This example shows a dynamic IP address with SEPM and one client PC managed by SEPM using FortiGate as the default gateway.

To configure SEPM on a managed client PC:

1. In SEPM, create client packages for client hosts and group them into SEPM groups.
   You can install packages locally on clients or download them directly from SEPM.



2. When a package is installed on the client host, the host is considered managed by SEPM. Even if the host has multiple interfaces, only one IP per host is displayed.

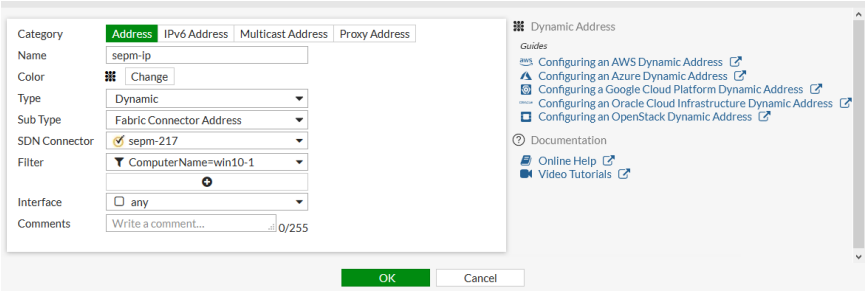


To configure Symantec endpoint connector on FortiGate in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*:
   a. In the *Endpoint/Identity* section, click *Symantec Endpoint Protection*.
   b. Fill in the *Name*, and set the *Status* and *Update Interval*.
   c. Set *Server* to the SEPM IP address.
   d. Enter the *Username* and *Password* for the server.
   e. To limit the domain or group that is monitored, enter them in the requisite fields.

   f. Click *OK*.
   When the connection is established, you can see a green up arrow in the bottom right of the card. You might need to refresh your browser to see the established connection.
2. Go to *Policy & Objects* > *Addresses* and click *Create New* > *Address*:
   a. Fill in the address *Name*.
   b. Set *Type* to *Dynamic*.
   c. Set *Sub Type* to *Fabric Connector Address*.
   d. Set *SDN Connector* to the fabric connector that you just created.

e. Add *Filters* as needed.

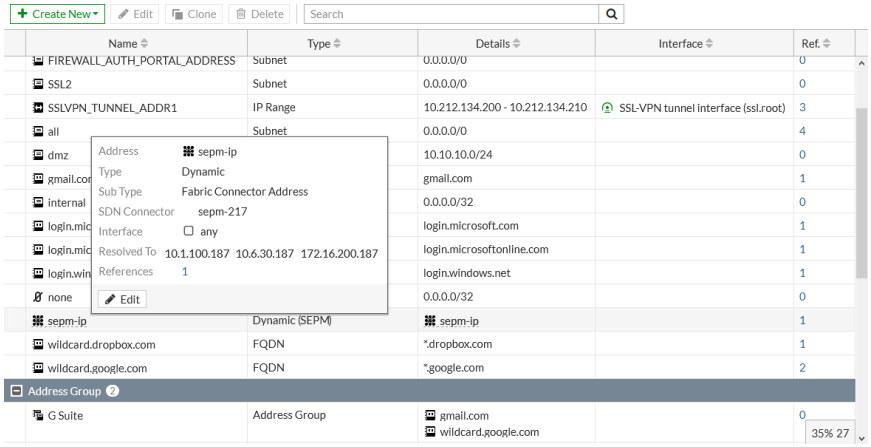


f. Click *OK*.

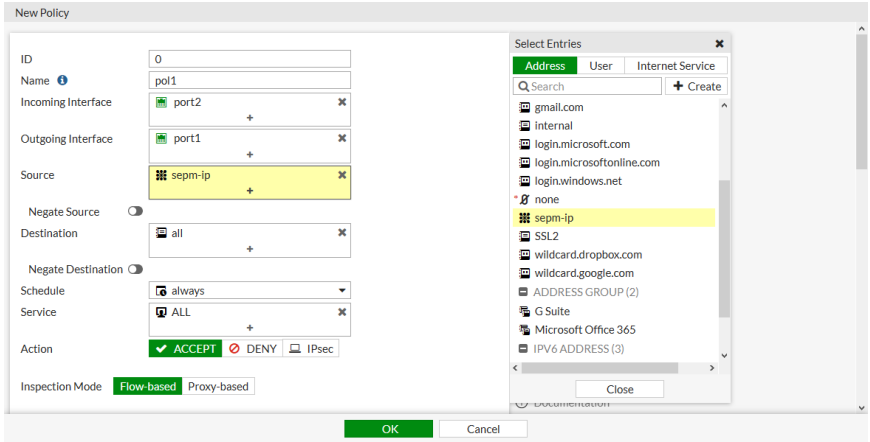
Filter options are only available for active computers that are configured and registered in SEPM. Free-form filters can be created manually by clicking *Create* and entering the filter, in the format: `filter_type=value`.

Possible manual filter types are: `GroupName`, `GroupID`, `ComputerName`, `ComputerUUID`, and `OSName`. For example: `GroupName=MyGroup`.

3. Go to *Policy & Objects* > *Addresses* and hover the cursor over the name of the new address to see the resolved IP addresses of the host.

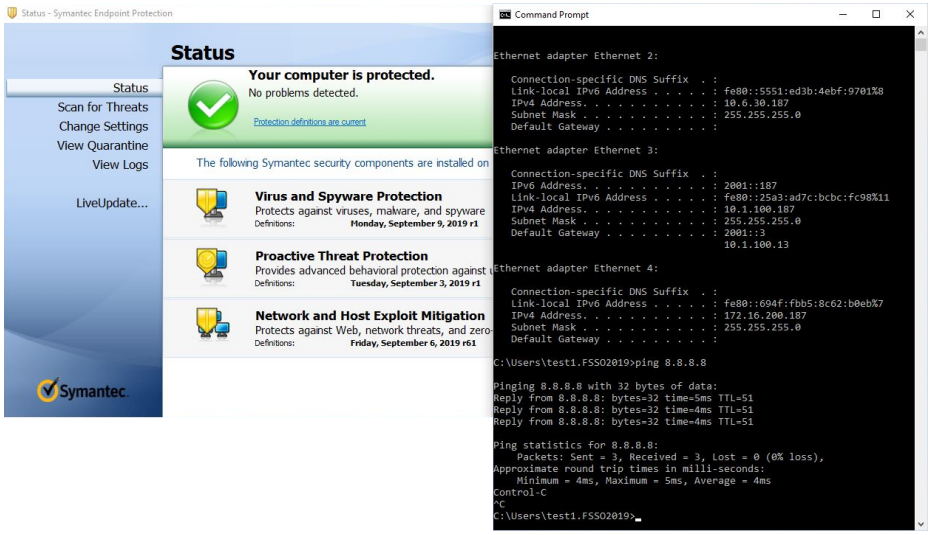


4. Go to *Policy & Objects* > *Firewall Policy*, click *Create New*, and add a policy that uses the dynamic IP address.

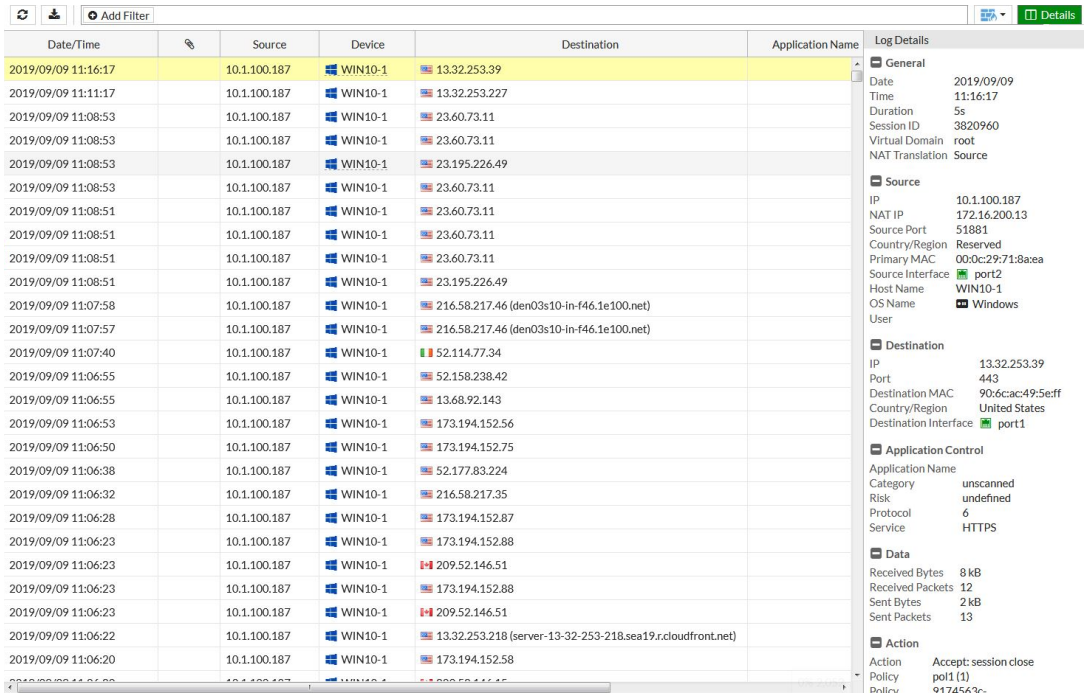


To verify the configuration:

1. On the client PC, check that it is managed by SEPM to access the Internet.



2. On the FortiGate, you can check in *Dashboard* > *FortiView Sources* and *Log & Report* > *Forward Traffic*.



Because this traffic is not authenticated traffic but is based on source IP address only, it is not shown in the GUI firewall monitor or in the `diagnose firewall auth list` CLI command.

To configure Symantec endpoint connector on FortiGate in the CLI:

1. Create the fabric connector:

```
config system sdn-connector
    edit "sepm-217"
        set type sepm
        set server "172.18.60.217"
        set username "admin"
        set password *********
        set status enable
    next
end
```

2. Create the dynamic IP address:

```
config firewall address
    edit "sepm-ip"
        set type dynamic
        set sdn "sepm-217"
        set filter "ComputerName=win10-1"
        config list
            edit "10.1.100.187"
            next
            edit "10.6.30.187"
            next
            edit "172.16.200.187"
            next
        end
    next
end
```

3. Add the dynamic IP address to the firewall policy:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "sepm-ip"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set logtraffic all
        set fsso disable
        set nat enable
    next
end
```

To troubleshoot Symantec SD connector in the CLI:

```
# diagnose debug application sepmd -1

Output is sent every minute (default). All IPv4 learned from SEPM. IPv6 also sent but not
```

```
yet supported.

```

RADIUS single sign-on agent

With RADIUS single sign-on (RSSO), a FortiGate can authenticate users who have authenticated on a remote RADIUS server. Based on which user group the user belongs to, the security policy applies the appropriate UTM profiles.

The FortiGate does not interact with the remote RADIUS server; it only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. The remote RADIUS server sends the following accounting messages to the FortiGate:

Message	Action
Start	If the information in the start message matches the RSSO configuration on the FortiGate, the user is added to the local list of authenticated firewall users.
Stop	The user is removed from the local list of authenticated firewall users because the user session no longer exists on the RADIUS server.

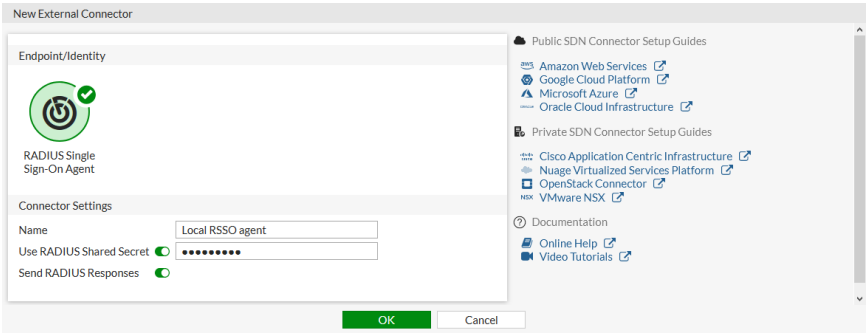
You can configure an RSSO agent connector using the FortiOSGUI; however, in most cases, you will need to use the CLI. There are some default options you may need to modify, which can only be done in the CLI.

To configure an RSSO agent connector:

1. Create the new connector:
   a. Go to *Security Fabric* > *External Connectors*.
   b. Click *Create New*.
   c. In the *Endpoint/Identity* section, click *RADIUS Single Sign-On Agent*. The *New Fabric Connector* pane opens.
   d. Enter the connector name.
   e. Enable *Use RADIUS Shared Secret*.

The value entered in *Use RADIUS Shared Secret* must be identical to what the remote RADIUS server uses to authenticate when it sends RADIUS accounting messages to the FortiGate.

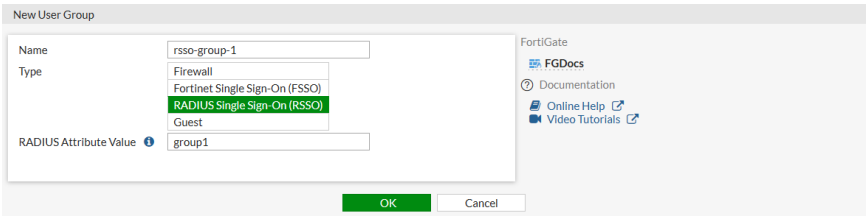
f. Enable *Send RADIUS Responses*.



You should enable *Send RADIUS Responses* because some RADIUS servers continue to send the same RADIUS accounting message several times if there is no response.

g. Click *OK*.

2. Edit the network interface:
   a. Go to *Network* > *Interfaces*.
   b. Double-click the interface that will receive the RADIUS accounting messages. The *Edit Interface* pane opens.
   c. In the *Administrative Access* section, select the *RADIUS Accounting* checkbox. This will open listening for port 1813 on this interface. The FortiGate will then be ready to receive RADIUS accounting messages.
   d. Click *OK*.
3. Create a local RSSO user group:
   a. Go to *User & Authentication* > *User Groups*.
   b. Click *Create New*.
   c. Enter the group name.
   d. For the *Type* field, click *RADIUS Single-Sign-ON (RSSO)*.
   e. Enter a value for *RADIUS Attribute Value*.
   This value by default is the class attribute. The FortiGate uses the content of this attribute in RADIUS accounting start messages to map a user to a FortiGate group, which then can be used in firewall policies.
   In this example configuration, the FortiGate will only add a remote RADIUS user to the local firewall user list if the class attribute in the RADIUS accounting START message contains the value group1.



If your users are in multiple groups, you will need to add multiple local RSSO user group.

If the RADIUS attribute value used to map users to a local RSSO group is different than the RADIUS attribute in the RADIUS accounting messages forwarded by the server, you must change it in the CLI.

f. Click *OK*.

4. Edit the local RSSO agent to modify default options using the CLI.
   For example, the default value for `rsso-endpoint-attribute` might work in common remote access scenarios where users are identified by their unique `Calling-Station-Id`, but in other scenarios the user name might be in a different attribute.

```
config user radius
    edit "Local RSSO Agent"
        set rsso-endpoint-attribute <attribute>
        set sso-attribute <attribute>
    next
end
```

5. Add the local RSSO user group to a firewall policy.

Verifying the RSSO configuration

Verification requires a working remote RADIUS server configured for RADIUS accounting forwarding and wireless or wired clients that use RADIUS for user authentication.

For a quick test, you can use one of the publicly available RADIUS test tools to send RADIUS accounting start and stop messages to the FortiGate. You can also use radclient.

To verify the RSSO configuration:

1. In radclient, enter the RADIUS attributes. These attributes are then executed with the FortiGate IP parameters (sends accounting messages to port 1813) and shared password you configured. `-x` is used for verbose output:

```
root@ControlPC:~# echo "Acct-Status-Type =Start,Framed-Ip-Address=10.1.100.185,User-
Name=test2,Acct-Session-Id=0211a4ef,Class=group1,Calling-Station-Id=00-0c-29-44-BE-B8" |
 radclient -x 10.1.100.1 acct 123456
Sending Accounting-Request of id 180 to 10.1.100.1 port 1813
        Acct-Status-Type = Start
        Framed-IP-Address = 10.1.100.185
        User-Name = "test2"
        Acct-Session-Id = "0211a4ef"
        Class = 0x67726f757031
        Calling-Station-Id = "00-0c-29-44-BE-B8"
rad_recv: Accounting-Response packet from host 10.1.100.1 port 1813, id=180, length=20
root@ControlPC:~#
```

2. Verify that the user is in the local firewall user list with the correct type (`rsso`) and local firewall group (`rsso-group1`):

```
# diagnose firewall auth l

10.1.100.185, test2
        type: rsso, id: 0, duration: 5, idled: 5
        flag(10): radius
        server: vdom1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 3
        group_name: rsso-group-1

----- 1 listed, 0 filtered ------
```

Exchange Server connector

FortiGate can collect additional information about authenticated users from corporate Microsoft Exchange Servers. After a user logs in, the additional information can be viewed in various parts of the GUI.

The Exchange connector must be mapped to the LDAP server that is used for authentication.

The following attributes are retrieved:

USER_INFO_FULL_NAME	USER_INFO_COMPANY	USER_INFO_CITY
USER_INFO_FIRST_NAME	USER_INFO_DEPARTMENT	USER_INFO_STATE
USER_INFO_LAST_NAME	USER_INFO_GROUP	USER_INFO_POSTAL_CODE
USER_INFO_LOGON_NAME	USER_INFO_TITLE	USER_INFO_COUNTRY
USER_INFO_TELEPHONE	USER_INFO_MANAGER	USER_INFO_ACCOUNT_EXPIRES
USER_INFO_EMAIL	USER_INFO_STREET	
USER_INFO_USER_PHOTO	USER_INFO_POST_OFFICE_BOX	

Kerberos Key Distribution Center (KDC) automatic discovery is enabled by default. The FortiGate must be able to use DNS to resolve the KDC IP addresses, otherwise the FortiGate will be unable to retrieve additional user information from the Exchange Server.

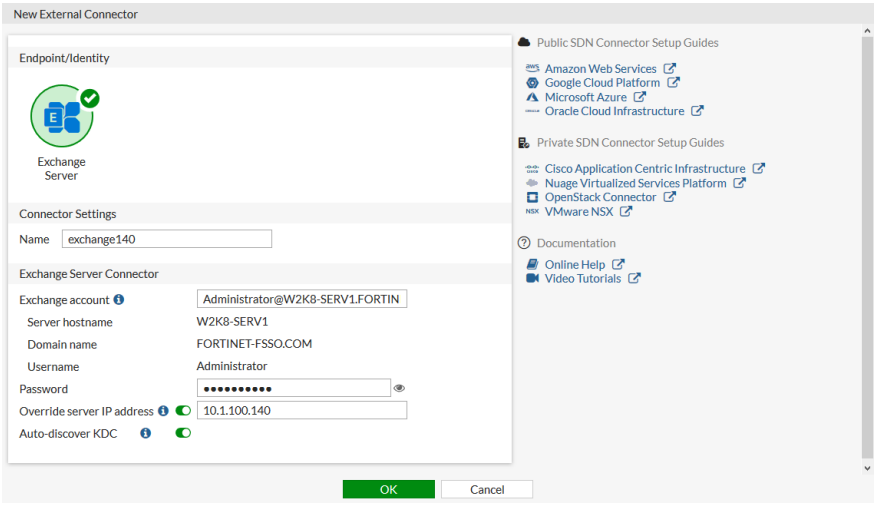
KDC automatic discovery can be disabled, and one or more internal IP addresses that the FortiGate can reach can be configured for KDC.

The Override server IP address is enabled when the IP address of the Exchange server cannot be resolved by DNS and must be entered manually.

To configure an Exchange connector in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Endpoint/Identity* section, click *Exchange Server*.
3. Set *Name* to *exchange140*.
4. Set *Exchange account* to *Administrator@W2K8-SERV1.FORTINET-FSSO.COM*.
   Administrator is the username, *W2K8-SERV1* is the exchange server name, and *FORTINET-FSSO.COM* is the domain name.
5. Set *Password* to the password.
6. Enable *Override server IP address* and set it to *10.1.100.140*.

7. Ensure that *Auto-discover KDC* is enabled.

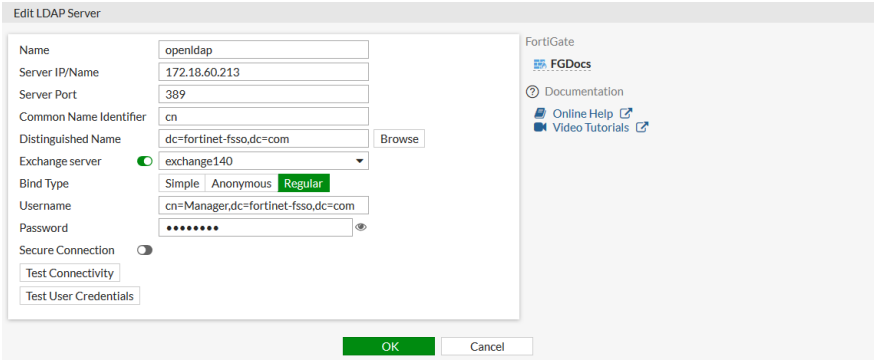


If *Auto-discover KDC* is disabled, one or more KDC IP addresses can be manually entered.

8. Click *OK*.

To link the connector to the LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers*.
2. Edit an existing LDAP server, or click *Create New* to create a new one.
3. Enable *Exchange server*, and select the connector from the list.
4. Configure the remaining settings as required.



5. Click *OK*.

To configure an Exchange connector with automatic KDC discovery in the CLI:

```
config user exchange
    edit "exchange140"
        set server-name "W2K8-SERV1"
        set domain-name "FORTINET-FSSO.COM"
        set username "Administrator"
        set password **********
        set ip 10.1.100.140
        set auto-discover-kdc enable
    next
end
```

To link the connector to the LDAP server in the CLI:

```
config user ldap
    edit "openldap"
        set server "172.18.60.213"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Manager,dc=fortinet-fsso,dc=com"
        set password **********
        set group-member-check group-object
        set group-object-filter "(&(objectclass=groupofnames)(member=*))"
        set member-attr "member"
        set user-info-exchange-server "exchange140"
    next
end
```

Verification

To verify that KDC auto-discovery is working:

```
# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable
# diagnose wad user exchange test-auto-discover
```

```
wad_diag_session_acceptor(3115): diag socket 20 accepted.
__wad_fmem_open(557): fmem=0x12490bd8, fmem_name='cmem 9188 bucket', elm_sz=9188, block_
sz=73728, overhead=0, type=advanced
Starting auto-discover test for all configured user-exchanges.
[NOTE]: If any errors are returned, try manually configuring IPs for the reported errors.

wad_rpc_nspi_test_autodiscover_kdc(1835): Starting DNS SRV request for srv(0x7f938e052050)

(0x7f938dfe8050) query(_kerberos._udp.FORTINET-FSSO.COM) n_rsp(3)
```

```
Completed auto-discover test for all configured user-exchanges.
```

To check the collected information after the user has been authenticated:

1. In the GUI, go to *Dashboard* > *Users & Devices*, expand the *Firewall Users* widget, and hover over the user name.
2. In the CLI, run the following diagnose command:

```
# diagnose wad user info 20 test1
'username' = 'test1'
'sourceip' = '10.1.100.185'
'vdom' = 'root'
'cn' = 'test1'
'givenName' = 'test1'
'sn' = 'test101'
'userPrincipalName' = 'test1@Fortinet-FSSO.COM'
'telephoneNumber' = '604-123456'
'mail' = 'test1@fortinet-fsso.com'
'thumbnailPhoto' = '/tmp/wad/user_info/76665fff62ffffffffffffffffff75ff68fffffffa'
'company' = 'Fortinet'
'department' = 'Release QA'
'memberOf' = 'CN=group321,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=g1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=group21,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'memberOf' = 'CN=group1,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'manager' = 'CN=test6,OU=Testing,DC=Fortinet-FSSO,DC=COM'
'streetAddress' = 'One Backend Street 1901'
'l' = 'Burnaby'
'st' = 'BC'
'postalCode' = '4711'
'co' = 'Canada'
'accountExpires' = '9223372036854
```

If the results are not as expected, verify what information FortiGate can collect from the Exchanger Server:

```
# diagnose test application wad 2500
# diagnose test application wad 162
```

Threat feeds

Threat feeds dynamically import an external block lists from an HTTP server in the form of a plain text file. Block lists can be used to enforce special security requirements, such as long term policies to always block access to certain websites, or short term requirements to block access to known compromised locations. The lists are dynamically imported, so that any changes are immediately imported by FortiOS.

There are four types of threat feeds:

FortiGuard Category	The file contains one URL per line. It is available as a *Remote Category* in Web Filter profiles, SSL inspection exemptions, and proxy addresses. See Web rating override on page 919 for more information. Example:

	`http://example/com.url`
	`https://example.com/url`
	`http://example.com:8080/url`

IP Address	The file contains one IP/IP range/subnet per line. It is available as an *External IP Block List* in DNS Filter profiles, and as a *Source/Destination* in IPv4, IPv6, and proxy policies.
	Example:
	`192.168.2.100`
	`172.200.1.4/16`
	`172.16.1.2/24`
	`172.16.8.1-172.16.8.100`
	`2001:0db8::eade:27ff:fe04:9a01/120`
	`2001:0db8::eade:27ff:fe04:aa01-2001:0db8::eade:27ff:fe04:ab01`

Domain Name	The file contains one domain per line. Simple wildcards are supported. It is available as a *Remote Category* in DNS Filter profiles. See External resources for DNS filter on page 1859 for more information.
	Example:
	`mail.*.example.com`
	`*-special.example.com`
	`www.*example.com`
	`example.com`

Malware Hash	The file contains one hash per line in the format `<hex hash> [optional hash description]`. Each line supports MD5, SHA1, and SHA256 hex hashes. It is automatically used for virus outbreak prevention on antivirus profiles with `external-blocklist` enabled.
	Note: For optimal performance, do not mix different hashes in the list. Only use one of MD5, SHA1, or SHA256.
	Example:
	`292b2e6bb027cd4ff4d24e338f5c48de`
	`dda37961870ce079defbf185eeeef905 Trojan-Ransom.Win32.Locky.abfl`
	`3fa86717650a17d075d856a41b3874265f8e9eab Trojan-Ransom.Win32.Locky.abfl`
	`c35f705df9e475305c0984b05991d444450809c35dd1d96106bb8e7128b9082f Trojan-Ransom.Win32.Locky.abfl`
	See External malware block list on page 753 for an example.

External resources file format

File format requirements for an external resources file:

- The file is in plain text format with each URL list, IP address, domain name, or malware hash occupying one line.
- The file is limited to 10 MB or 128 × 1024 (131072) entries, whichever limit is hit first.
- The entry limit also follows the table size limitation defined by CMDB per model.
- The external resources update period can be set to 1 minute, hourly, daily, weekly, or monthly (43200 min, 30 days).
- The external resources type as category (URL list) and domain (domain name list) share the category number range 192 to 221 (total of 30 categories).
- There is no duplicated entry validation for the external resources file (entry inside each file or inside different files).
- If the number of entries exceed the limit, a warning is displayed. Additional entries beyond the threshold will not be loaded.

For domain name list (type = domain):

- Simple wildcards are allowed in the domain name list, for example: *.test.com.
- IDN (international domain name) is supported.

For IP address list (type = address):

- The IP address can be a single IP address, subnet address, or address range. For example, 192.168.1.1, 192.168.10.0/24, or 192.168.100.1-192.168.100.254.
- The address can be an IPv4 or IPv6 address. An IPv6 address does not need to be in [ ] format.

For URL list (type=category):

- The scheme is optional, and will be truncated if found; https:// and http:// are not required.
- Wildcards are allowed at the beginning or end or the URL, for example: *.domain.com or domain.com.*.
- IDN and UTF encoding URL are supported .
- The URL can be an IPv4 or IPv6 address. An IPv6 URL must be in [ ] format.

To determine the external resource table size limit for your device:

```
# print tablesize
...
system.external-resource: 0 256 512
...
```

For this device, a FortiGate 60E, the global limit is 512 and the limit per VDOM is 256.

Create a threat feed

To create a threat feed in the GUI:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. In the *Thread Feeds* section, click on the required feed type.
4. Configure the connector settings:

Name	Enter a name for the threat feed connector.
URI of external resource	Enter the link to the external resource file. The file should be a plain text file with one entry on each line.
HTTP basic authentication	Enable/disable basic HTTP authentication. When enabled, enter the username and password in the requisite fields.
Refresh Rate	The time interval to refresh the external resource, in minutes (1 - 43200, default = 5). The applicable threat feed will be triggered to refresh between 0 minutes and the configured value. When the refresh is triggered, if another task is being processed be the schedule worker, the refresh task will be added to the queue.
Comments	Optionally, enter a description of the connector.
Status	Enable/disable the connector.

5. Click *OK*.

To create a threat feed in the CLI:

```
config system external-resource
    edit <name>
        set status {enable | disable}
        set type {category | address | domain | malware}
        set category <integer>
        set username <string>
        set password <string>
        set comments <string>
        *set resource <resource-uri>
        set user-agent <string>
        *set refresh-rate <integer>
        set source-ip <ip address>
        set interface-select-method {auto | sdwan | specify}
    next
end
```

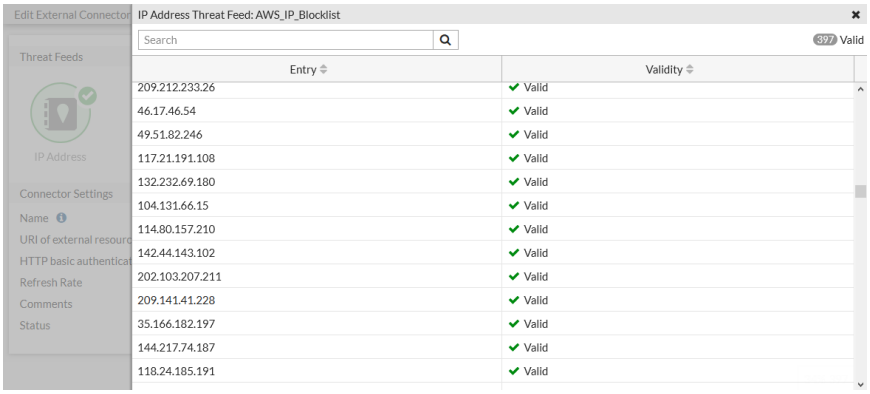
Parameters marked with an asterisk (*) are mandatory and must be filled in. Other parameters either have default values or are optional.

When multi VDOM mode is enabled, threat feed external connectors can be defined in the global VDOM or within a VDOM. See Threat feed connectors per VDOM on page 1863 for example configurations.

Update history

To review the update history of a threat feed, go to *Security Fabric* > *External Connectors*, select a feed, and click *Edit*. The *Last Update* field shows the date and time that the feed was last updated.

Click *View Entries* to view the current entries in the list.



EMS threat feed

A FortiGate can pull malware threat feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. See Malware threat feed from EMS on page 756 for an example.

External blocklist policy

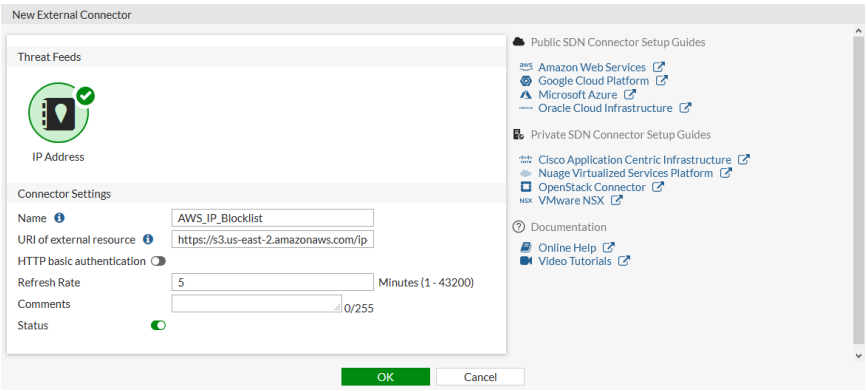
You can use the external blocklist (threat feed) for web filtering, DNS, and in firewall policies.

Sample configuration

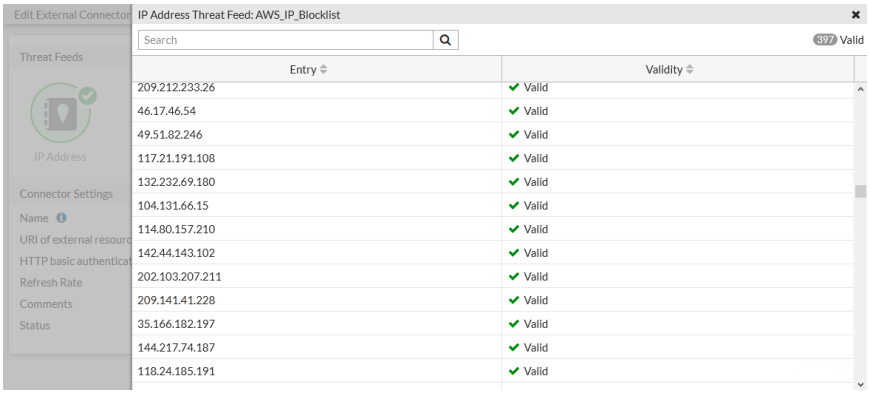
In this example, an IP address blocklist connector is created so that it can be used in a firewall policy.

To configure an external block list connector in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *IP Address*.
3. Set *Name* to *AWS_IP_Blocklist*.
4. Set the *URI of external resource* to *https://s3.us-east-2.amazonaws.com/ip-blocklist/ip.txt*.



5. Configure the remaining settings as required, then click *OK*.
6. Edit the connector, then click *View Entries* to view the IP addresses in the feed.



The blocklist can now be used in web filter and DNS profiles, and in firewall policies.

To configure an external block list connector in the CLI:

```
config system external-resource
   edit "AWS_IP_Blocklist"
      set status enable
      set type address
      set username ' '
      set password *********
```

```
      set comments ''
      set resource "https://s3.us-east-2.amazonaws.com/ip-blocklist/ip.txt"
      set refresh-rate 15
   next
end
```

To apply an external block list to a firewall policy in the CLI:

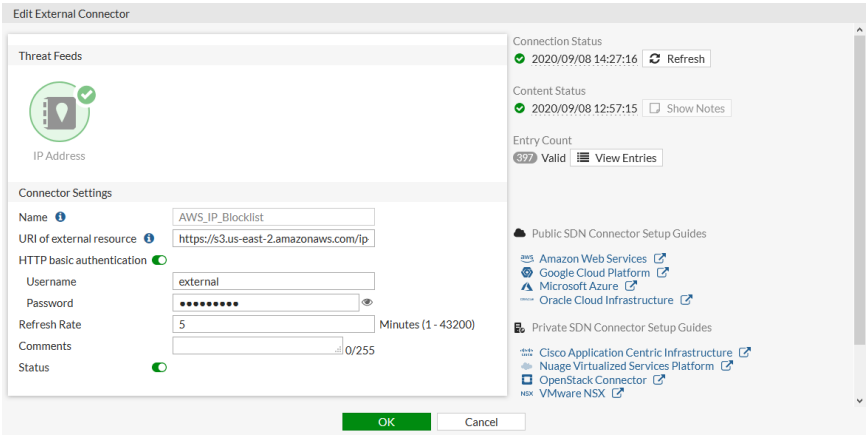
```
config firewall policy
   edit 1
      set name "policyid-1"
      set srcintf "wan2"
      set dstintf "wan1"
      set srcaddr "all"
      set dstaddr "AWS_IP_Blocklist"
      set action accept
      set schedule "always"
      set service "ALL"
      set logtraffic all
      set auto-asic-offload disable
      set nat enable
   next
end
```

External blocklist authentication

Thread feed external connectors support username and password authentication.

To enable username and password authentication in a thread feed connector:

1. Go to *Security Fabric* > *External Connectors*.
2. Edit an existing *Threat Feed* or create a new one by selecting *Create New*.
3. Enable *HTTP basic authentication*
4. Enter the *Username* and *Password*.



5. Click *OK*.

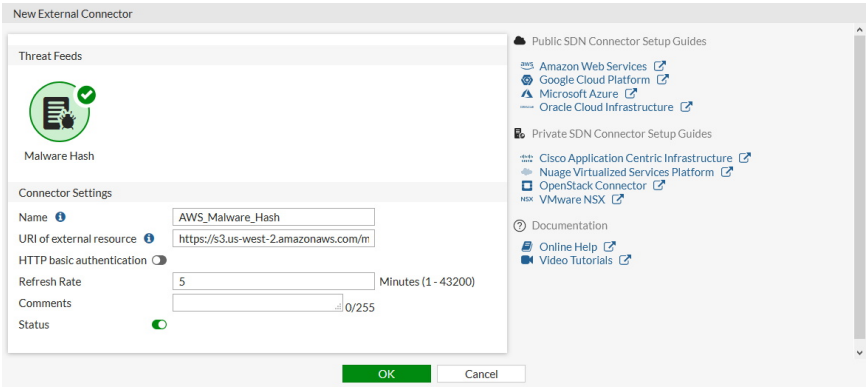
External blocklist file hashes

The malware hash threat feed connector supports a list of file hashes that can be used as part of virus outbreak prevention.

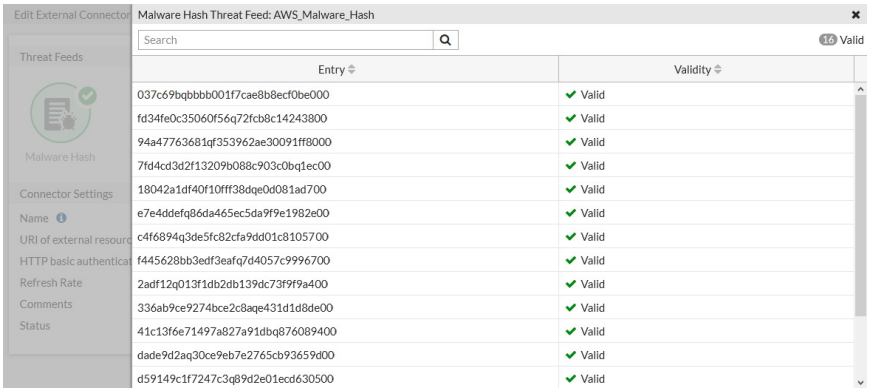
This example retrieves a malware hash from an Amazon S3 bucket, and then enables malware block lists in a antivirus profile.

To configure a malware hash connector in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *Malware Hash*.
3. Set *Name* to *AWS_Malware_Hash*.
4. Set the *URI of external resource* to *https://s3.us-west-2.amazonaws.com/malware-hash-feeds/fortinet-malware-hash-list*.



5. Click *OK*.
6. Edit the connector, then click *View Entries* to view the hash list.



7. Go to *Security Profiles* > *AntiVirus* and create a new profile, or edit an existing one.
8. Enable *Use external malware block list*.
9. Click the + and select *AWS_Malware_Hash* from the list.
10. Click *OK*.

To configure a malware hash connector in the CLI:

```
config system external-resource
    edit "AWS_Malware_Hash"
```

```
        set type malware
        set resource "https://s3.us-west-2.amazonaws.com/malware-hash-feeds/fortinet-
malware-hash-list"
    next
end

config antivirus profile
    edit "av-profile"
            set external-blocklist-enable-all disable
            set external-blocklist "AWS_Malware_Hash"
        end
    next
end
```

Logs

The `filehash` and `filehashsrc` are included in outbreak prevention detection event logs.

This example shows the log generated when a file is detected by external malware hash list outbreak prevention:

```
1: date=2018-07-30 time=13:59:41 logid="0207008212" type="utm" subtype="virus"
eventtype="malware-list" level="warning" vd="root" eventtime=1532984381 msg="Blocked by
local malware list." action="blocked" service="HTTP" sessionid=174963 srcip=192.168.101.20
dstip=172.16.67.148 srcport=37045 dstport=80 srcintf="lan" srcintfrole="lan" dstintf="wan1"
dstintfrole="wan" policyid=1 proto=6 direction="incoming" filename="mhash_block.com"
checksum="90f0cb57" quarskip="No-skip" virus="mhash_block.com" dtype="File Hash"

url="http://172.16.67.148/mhash_block.com" profile="mhash_test" agent="Firefox/43.0"
analyticssubmit="false"
```

External resources for DNS filter

External resources provides the ability to dynamically import an external block list into an HTTP server. This feature enables the FortiGate to retrieve a dynamic URL, domain name, IP address, or malware hash list from an external HTTP server periodically. The FortiGate uses these external resources as the web filter's remote categories, DNS filter's remote categories, policy address objects, or antivirus profile's malware definitions. If external resources are updated, FortiGate objects are also updated dynamically.

External resource is divided into four types:

- URL list (type = category)
- Domain name list (type = domain)
- IP address list (type = address)
- Malware hash list (type = malware)

Remote categories and external IP block list

The DNS filter profile can use two types of external resources: *domain type* (domain name list) and *address type* (IP address list).

When a *domain type* external resource is configured, it is treated as a remote category in the DNS filter profile. If the domain name in DNS query matches the entry in this external resource file, it is treated as the remote category and follows the action configured for this category in DNS filter profile.

When an *address type* external resource is configured, it can be enabled as *external-ip-blocklist* in DNS filter profile. If a DNS resolved IP address in DNS response matches the entry in the *external-ip-blocklist*, this DNS query is blocked by the DNS filter.

For external resources file format and limits, see External resources file format on page 1853.

Configuring external resources in the CLI

In the CLI, you can configure external resources files in an external HTTP server. Under global, configure the external resources file location and specify the resource type.

To configure external resources:

```
config system external-resource
   edit "Ext-Resource-Type-as-Domain-1"
      set type domain
      set category 194
      set resource "http://172.16.200.66/external-resources/Ext-Resource-Type-as-Domain-
1.txt"
      set refresh-rate 1
   next
   edit "Ext-Resource-Type-as-Address-1"
      set status enable
      set type address
      set username ' '
      set password *********
      set comments ''
      set resource "http://172.16.200.66/external-resources/Ext-Resource-Type-as-Address-
1.txt"
      set refresh-rate 1
   next
end
```

In each VDOM, the domain type external resource can be used in the DNS filter as remote category. In this example, the domain name list in the Ext-Resource-Type-as-Domain-1.txt file is treated as a remote category (category ID 194). The IP address list in the Ext-Resource-Type-as-Address-1.txt file can be applied in the DNS filter as an `external-ip-blocklist`. If the DNS resolved IP address matches any entry in the list in that file, the DNS query is blocked.

To configure the external IP block list and apply it to a policy:

```
config dnsfilter profile
   edit "default"
      set comment "Default dns filtering."
      config ftgd-dns
         config filters
            edit 1
               set category 194
               set action block
            next
            edit 2
               set category 12
            next
            edit 3
            next
```

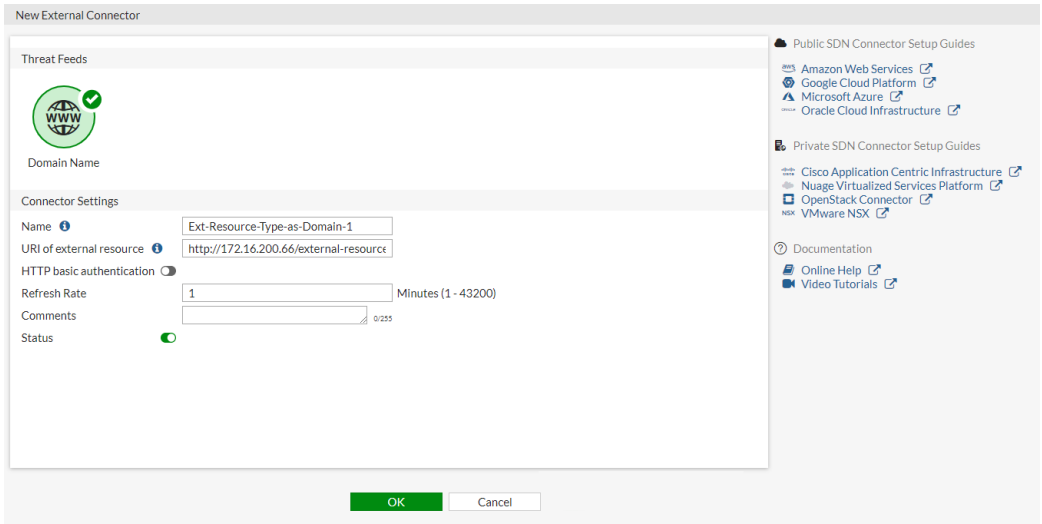
```
        end
    end
    set block-botnet enable
    set external-ip-blocklist "Ext-Resource-Type-as-Address-1"
  next
end

config firewall policy
  edit 1
    set name "DNSFilter"
    set srcintf "port10"
    set dstintf "port9"
    set srcaddr "all"
    set dstaddr "all"
    set action accept
    set schedule "always"
    set service "ALL"
    set utm-status enable
    set logtraffic all
    set dnsfilter-profile "default"
    set profile-protocol-options "protocol"
    set ssl-ssh-profile "protocols"
    set nat enable
  next
end
```

Configuring external resources in the GUI

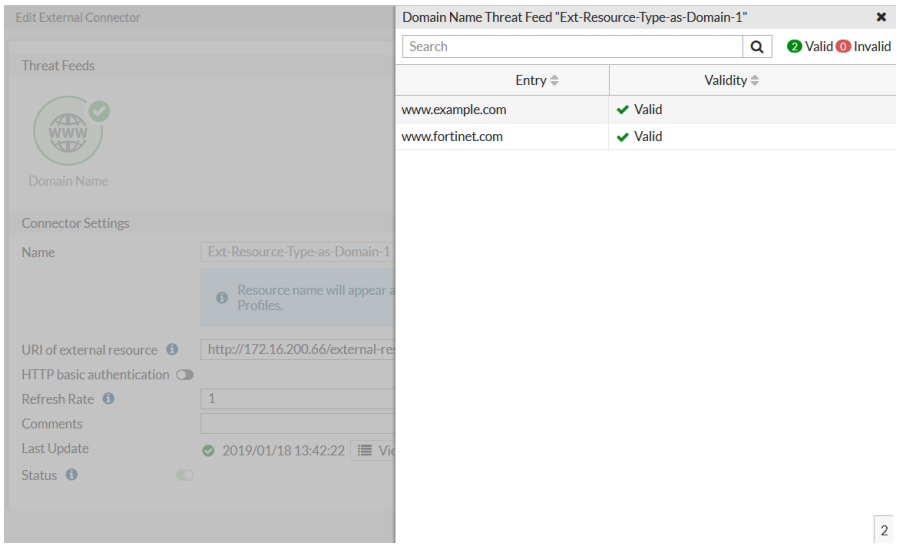
To configure, edit, or view the entries for external resources in the GUI:

1. Go to *Global* > *Security Fabric* > *External Connectors*.
2. Click *Create New*.
3. In the *Threat Feeds* section, select *Domain Name* or *IP Address*.
4. Enter the Resource *Name*, URL, location of the resource file, resource authentication credentials, and *Refresh Rate*.

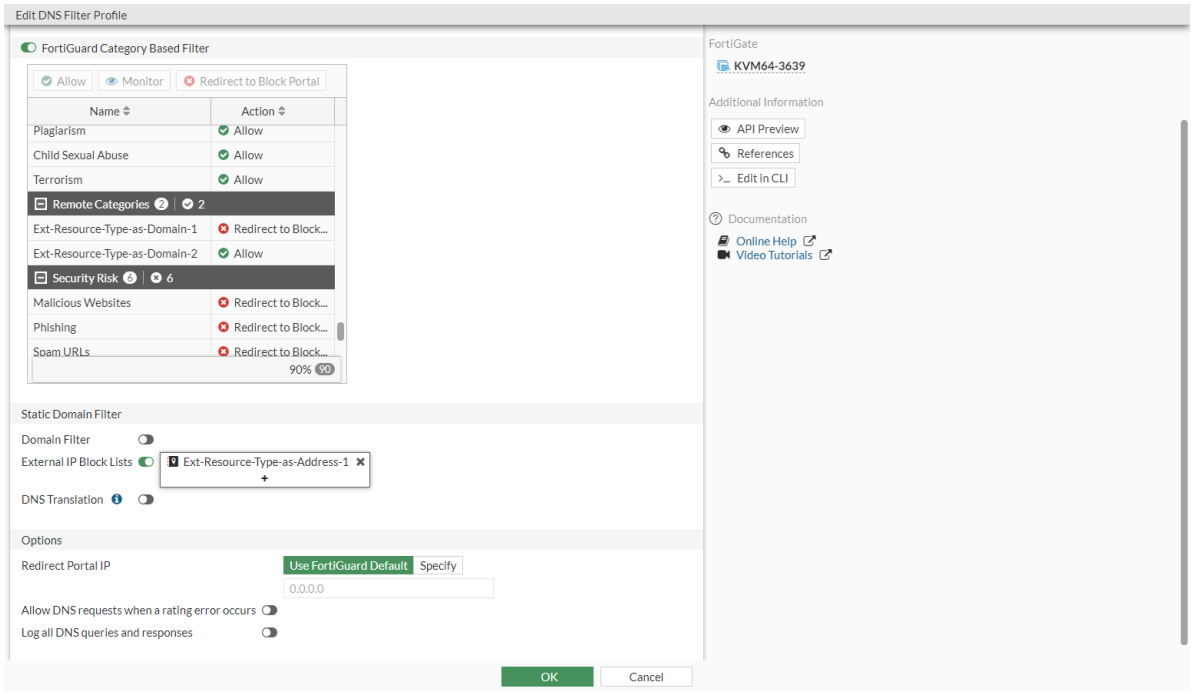


5. Click *OK*.
6. Double-click the *Threat Feeds Object* you just configured to open the *Edit* page.

7. Click *View Entries* to view the entry list in the external resources file.



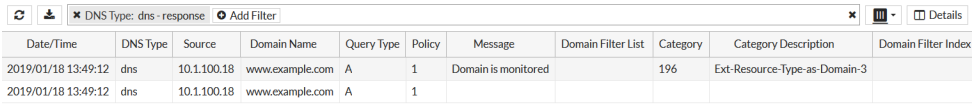
8. Go to *VDOM* > *Security Profiles* > *DNS Filter* and open a DNS filter profile. The configured external resources displays, and you can apply it in each DNS filter profile (remote category or external IP block lists).



Log sample

Remote categories

Go to *VDOM* > *Log & Report* > *DNS Query*. Some domains that match the remote category list are rated as remote category, overriding their original domain rating.



Date/Time	DNS Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description	Domain Filter Index
2019/01/18 13:49:12	dns	10.1.100.18	www.example.com	A	1	Domain is monitored		196	Ext-Resource-Type-as-Domain-3	
2019/01/18 13:49:12	dns	10.1.100.18	www.example.com	A	1					

Log example:

```
1: date=2019-01-18 time=13:49:12 logid="1501054802" type="utm" subtype="dns" eventtype="dns-
response" level="notice" vd="vdom1" eventtime=1547848151 policyid=1 sessionid=82998
srcip=10.1.100.18 srcport=42985 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16
dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="default" xid=38234
qname="www.example.com" qtype="A" qtypeval=1 qclass="IN" ipaddr="93.184.216.34" msg="Domain
is monitored" action="pass" cat=196 catdesc="Ext-Resource-Type-as-Domain-3"

2: date=2019-01-18 time=13:49:12 logid="1500054000" type="utm" subtype="dns" eventtype="dns-
query" level="information" vd="vdom1" eventtime=1547848151 policyid=1 sessionid=82998
srcip=10.1.100.18 srcport=42985 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16
dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="default" xid=38234
qname="www.example.com" qtype="A" qtypeval=1 qclass="IN"
```

External IP block lists

Go to *VDOM > Log & Report > DNS Query*. If the DNS query resolved IP address matches the entry in the `external-ip-blocklist`, the DNS query is blocked.

Date/Time	DNS Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Categor
2019/01/18 13:48:08	dns	10.1.100.18	www.example.com	A	1	Domain was blocked because it is in the domain-filter list	Ext-Resource-Type-as-Address-1		
2019/01/18 13:48:08	dns	10.1.100.18	www.example.com	A	1				

Log example:

```
1: date=2019-01-18 time=13:50:53 logid="1501054400" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1547848253 policyid=1 sessionid=83206
srcip=10.1.100.18 srcport=47281 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16
dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="default" xid=7501
qname="www.example.com" qtype="A" qtypeval=1 qclass="IN" msg="Domain was blocked because it
is in the domain-filter list" action="redirect" domainfilteridx=0 domainfilterlist="Ext-
Resource-Type-as-Address-1"

2: date=2019-01-18 time=13:50:53 logid="1500054000" type="utm" subtype="dns" eventtype="dns-
query" level="information" vd="vdom1" eventtime=1547848253 policyid=1 sessionid=83206
srcip=10.1.100.18 srcport=47281 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16
dstport=53 dstintf="port9" dstintfrole="undefined" proto=17 profile="default" xid=7501
qname="www.example.com" qtype="A" qtypeval=1 qclass="IN"
```

Threat feed connectors per VDOM

When multi-VDOM mode is enabled, a threat feed external connector can be defined in global or within a VDOM. Global threat feeds can be used in any VDOM, but cannot be edited within the VDOM. FortiGuard category and domain name-based external feeds have an added category number field to identify the threat feed. The threat feed name in global must start with `g-`. Threat feed names in VDOMs cannot start with `g-`.

FortiGuard category and domain name-based external feed entries must have a number assigned to them that ranges from 192 to 221. This number can be assigned to both external feed types. However, when a category number is used under a global entry, such as 192 with the name `g-cat-192`, this category number cannot be used in any other global or VDOM entries. If a category is used under a VDOM entry, such as 192 under VDOM1 with the name `cat-192`, the category 192 can be used in another VDOM or root with the name `cat-192`.

A thread feed connector can only be used in profiles in the VDOM that it was created in. Global connectors can be used in all VDOMs.

Each VDOM can have a maximum of 256 thread feed entries. But in total, a FortiGate can only have 511 thread feed entries.

To configure an external threat feed connector under global in the GUI:

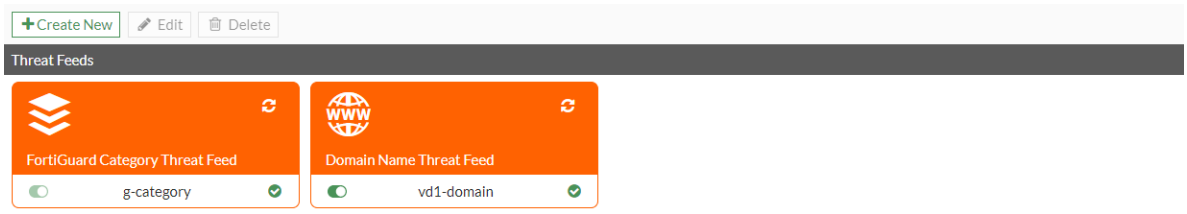
1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *FortiGuard Category*.
3. Enter a name that begins with `g-`.
4. Configure the other settings as needed.
5. Click *OK*.

To configure an external threat feed connector under global in the CLI:

```
config global
    config system external-resource
        edit "g-category"
            set status enable
            set type category
            set category 192
            set comments ''
            set resource "http://172.16.200.55/external-resource-test/513-FDGCategory.txt"
            set refresh-rate 5
        next
    end
end
```

To configure an external threat feed connector under a VDOM in the GUI:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Threat Feeds* section, click *Domain Name*.
3. Enter a name that does not begin with `g-`.
4. Configure the other settings as needed.
5. Click *OK*. The threat feed connector created under global also appears, but it is not editable.

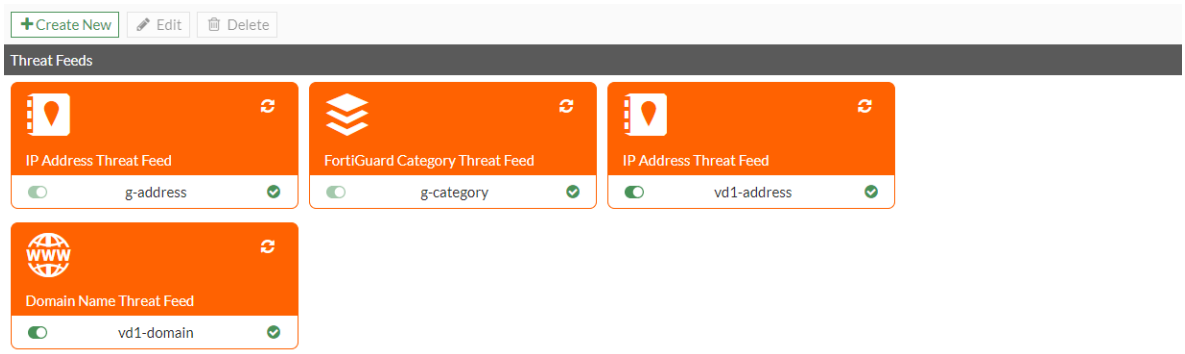


To configure an external threat feed connector under a VDOM in the CLI:

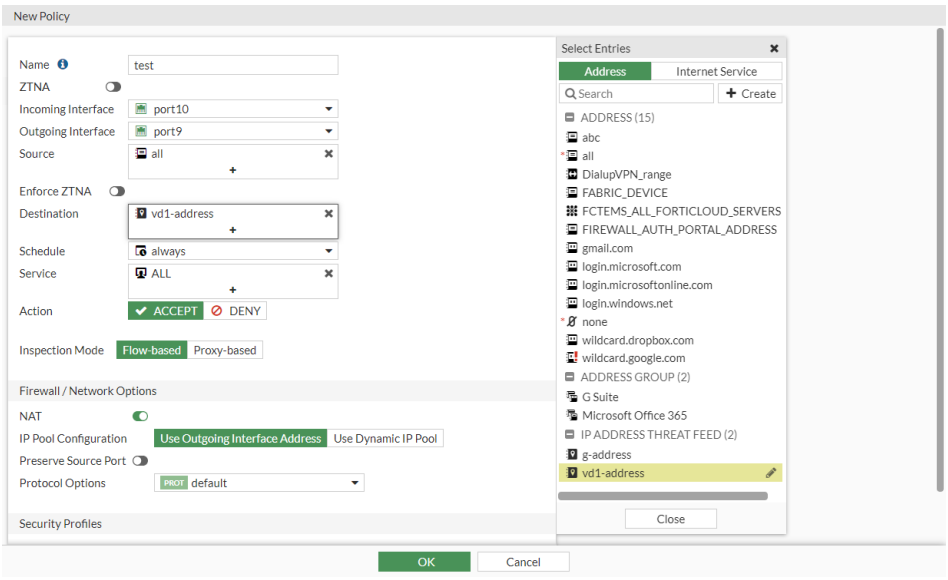
```
config vdom
    edit vd1
        config system external-resource
            edit "vd1-domain"
                set status enable
                set type domain
                set category 193
                set comments ''
                set resource "http://172.16.200.55/external-resource-test/513-Domain.txt"
                set refresh-rate 5
            next
        end
    next
end
```

To use an IP address threat feed in a policy in the GUI:

1. Configure an IP address connector in global:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *Threat Feeds* section, click *IP Address*.
   c. Enter a name that begins with `g-`.
   d. Configure the other settings as needed.
   e. Click *OK*.
2. Configure an IP address connector in the VDOM (vd1):
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. In the *Threat Feeds* section, click *IP Address*.
   c. Enter a name that does not begin with `g-`.
   d. Configure the other settings as needed.
   e. Click *OK*. The threat feed connectors created under global also appear, but they are not editable.



3. Configure the firewall policy in the VDOM (vd1):
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Destination*, select *vd1-address*. Since this policy is configured under vd1, *g-address* can also be set as the destination.



c. Configure the other settings as needed.

d. Click *OK*.

To use an IP address threat feed in a policy in the CLI:

1. Configure the IP address connectors:

```
config global
    config system external-resource
        edit "g-address"
            set status enable
            set type address
            set username ''
            set comments ''
            set resource "http://172.16.200.55/external-resource-test/513-IP.txt"
            set refresh-rate 5
        next
    end
end

config vdom
    edit vd1
        config system external-resource
            edit "vd1-address"
                set status enable
                set type address
                set comments ''
                set resource "http://172.16.200.55/external-resource-test/513-IP.txt"
                set user-agent "curl/7.58.0"
                set refresh-rate 5
            next
        end
    next
end
```

2. In the VDOM, configure a firewall policy with the external address as the destination address:

```
config vdom
    edit vd1
        config firewall policy
            edit 1
                set name "test"
                set srcintf "port10"
                set dstintf "port9"
                set srcaddr "all"
                set dstaddr "vd1-address"
                set action accept
                set schedule "always"
                set service "ALL"
                set profile-protocol-options "protocol"
                set nat enable
            next
        end
    next
end
```

Since this firewall policy is configured under `vd1`, `g-address` can also be set as the `dstaddr`.

Monitoring the Security Fabric using FortiExplorer for Apple TV

FortiExplorer for Apple TV allows you to use a TV screen to monitor your entire Security Fabric.

FortiExplorer for Apple TV is an analysis tool that provides easy to use NOC and SOC monitoring capabilities. The app features real-time data traffic, visual alerts, as well as a general overview of hardware devices, operating systems, and interfaces. The monitor also provides a wireless health summary of your entire network across multiple buildings. If an access point goes offline, you will be notified about the network's health. After the issues are resolved, you will immediately see the health update on your screen.

Getting started with FortiExplorer for Apple TV

Download FortiExplorer for Apple TV from the app store on Apple TV. After the app is installed, add devices using the Apple TV remote or by sharing a login profile with FortiExplorer. Once the devices are added, you can use FortiExplorer for Apple TV to view real-time data in the Network Operations Center, Security Operations Center, and Software-Defined Branch.

To get started with FortiExplorer for Apple TV:

1. Download the app and add devices to FortiExplorer for Apple TV.
   You can add devices by sharing a login profile with FortiExplorer or logging into the device directly on FortiExplorer for Apple TV.
2. View the physical topology of the Fabric to identify risks
3. View the Fabric components as seen on the root FortiGate.
4. View an executive summary of the three largest areas of security focus in the Security Fabric.
5. View data collected by FortiAnalyzer on the endpoints on your network.
6. View vulnerability data collected by FortiClient EMS.
7. Use the Software-Defined Branch module to monitor interface SD-WAN usage and associated service level agreements.

NOC and SOC example

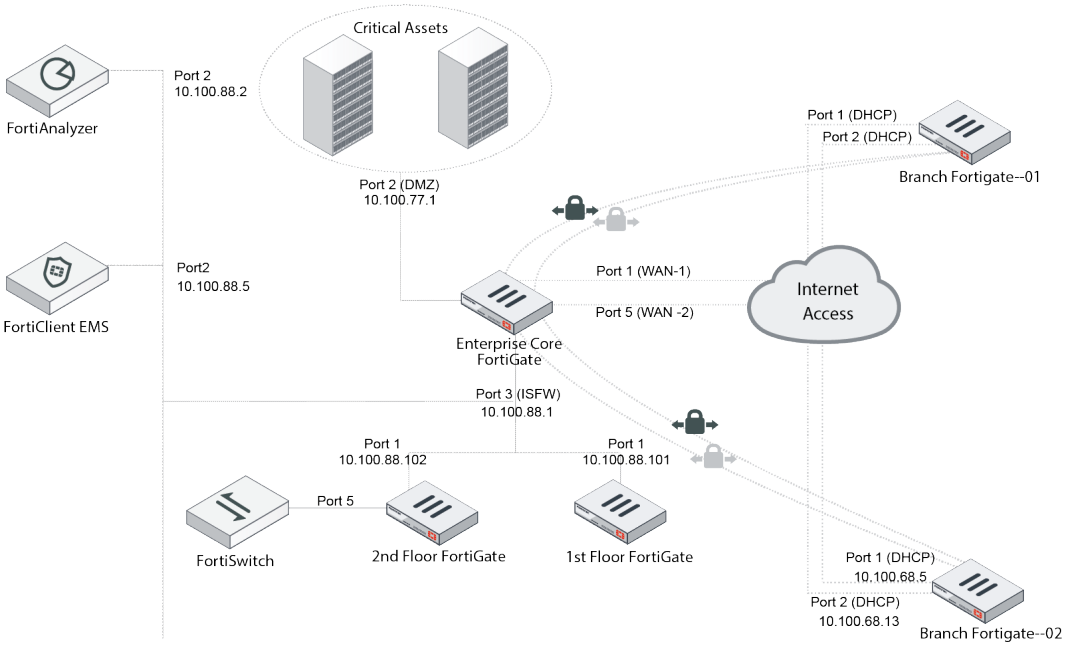
In this example, you have configured your FortiGates, FortiAnalyzer and other devices in your Security Fabric. Now you want to use FortiExplorer for Apple TV to display the status of the devices on a TV in your Network Operation Center or Security Operation Center.

Topology

This topology has a Headquarter and two Branches. Within the Headquarter is the Enterprise Core and two FortiGates acting as ISFWs. In addition, an on-premise FortiAnalyzer collects all logging information from the fabric devices. The FortiClient EMS manages all the endpoints within the topology.

The two branches are configured with SD-WAN with VPN overlays to the Enterprise Core. Traffic is steered towards the overlays and underlays based on SD-WAN Rules.

Using FortiExplorer for Apple TV, you will be able to monitor the different components in this topology.



To take advantage of the views in the FortiExplorer for Apple TV, you should configure:

- Security Fabric on all FortiGates. See Configuring the root FortiGate and downstream FortiGates on page 1590.
- FortiAnalyzer Logging. See Configuring FortiAnalyzer on page 1596.
- FortiClient EMS. See FortiClient EMS on page 1610

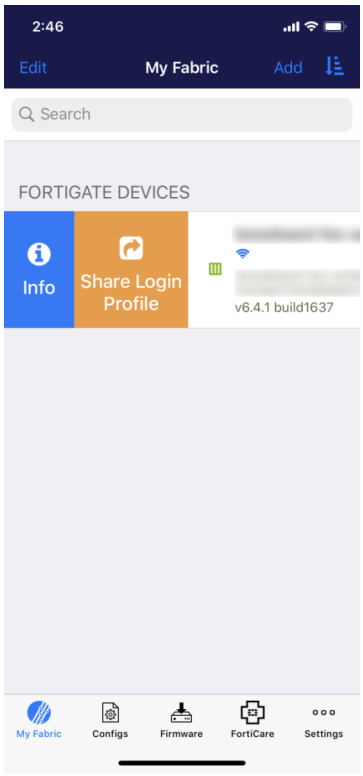
Adding the root FortiGate to FortiExplorer for Apple TV

By adding the root FortiGate, you can view the entire topology and navigate to branch FortiGates in the SD-WAN view. If you are already using FortiExplorer on a mobile device, you can connect the same FortiGate device to Apple TV by sharing the login credentials on both devices. Alternatively, you can manually connect to your root FortiGate directly from the app.

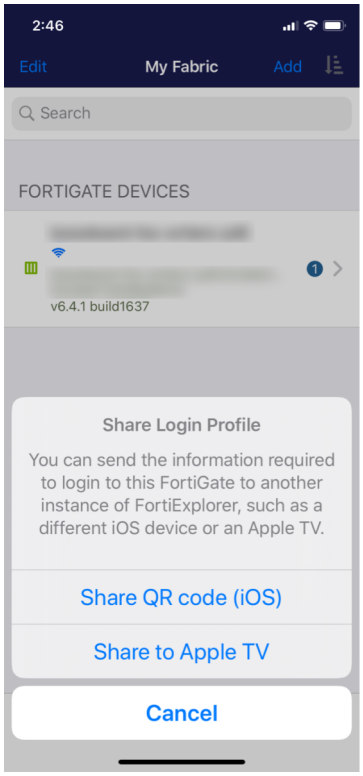
To share login credentials between FortiExplorer and FortiExplorer for Apple TV:

1. Connect the FortiExplorer and FortiExplorer for Apple TV devices to the same network.
2. On FortiExplorer for Apple TV, click *New FortiGate*.
3. In FortiExplorer, go to *My Fabric*.

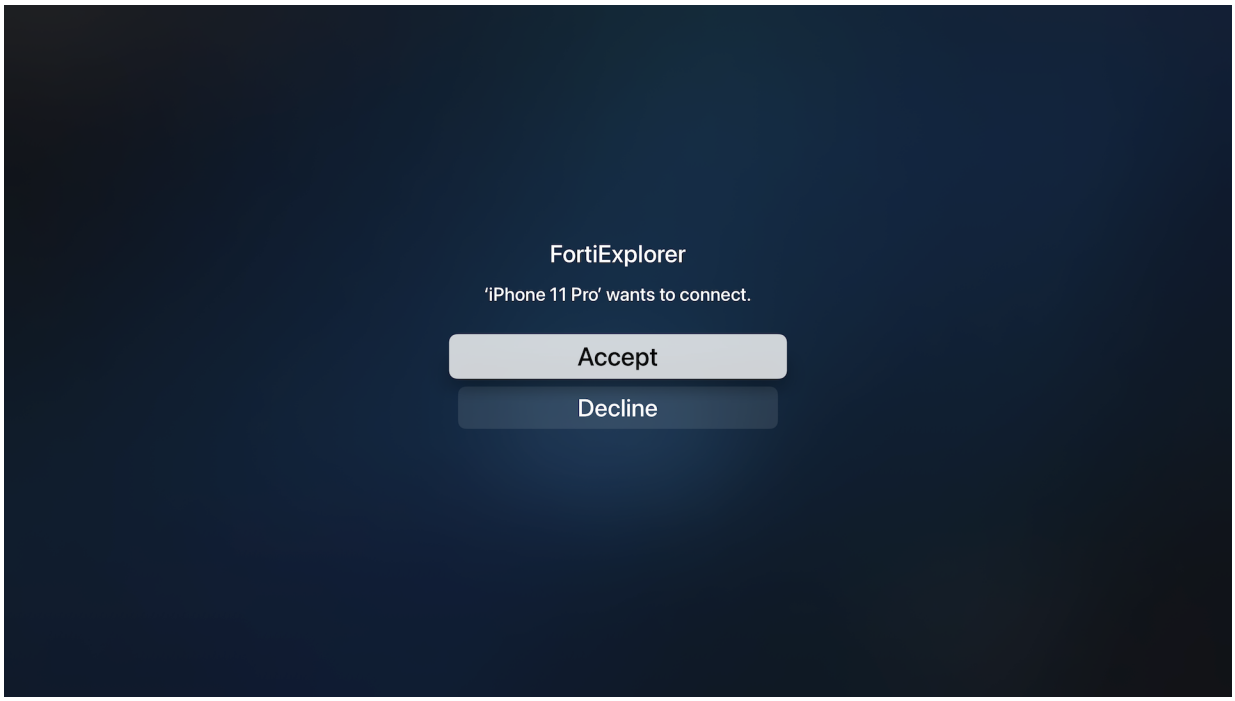
4. Swipe right on the device you want to share, and tap *Share Login Profile*.



5. Tap *Share to Apple TV*.

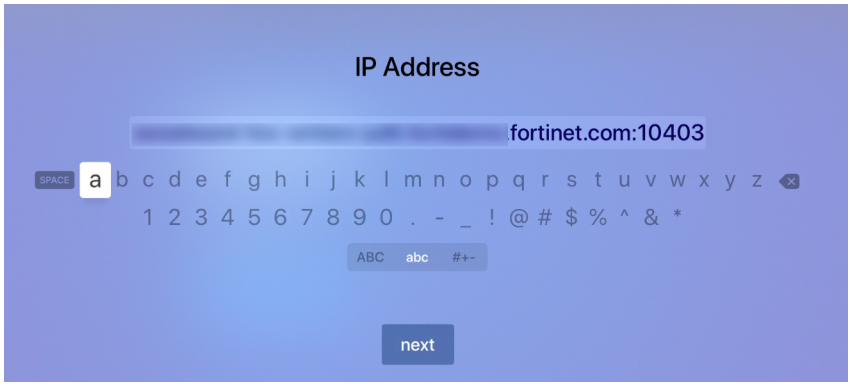


6. On Apple TV, click *Accept*. FortiExplorer for Apple TV confirms the request and proceeds to the device main menu.



To add devices to FortiExplorer for Apple TV:

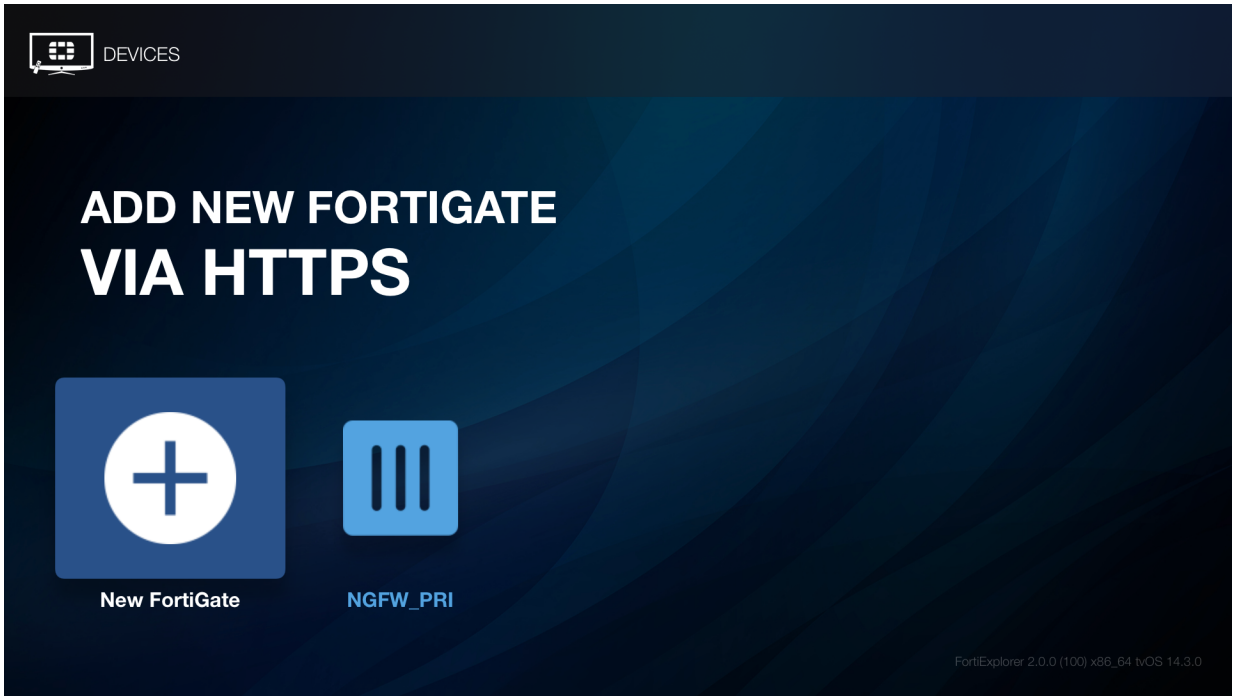
1. In the *Devices* menu, click *New FortiGate*. The *Login to FortiGate* dialog box is displayed.
2. In the *IP Address/Host Name* field, take one of the following actions:
   - Enter the device IP address and port, if not using the default admin port 443
   - Enter the full host name including the domain. Enter port if not using the default admin port 443.



3. Enter the *Username* and *Password* for the FortiGate device.
4. Click *Remember* to save time entering the login credentials later.

5. Click *Login*. The device is added to FortiExplorer for Apple TV.

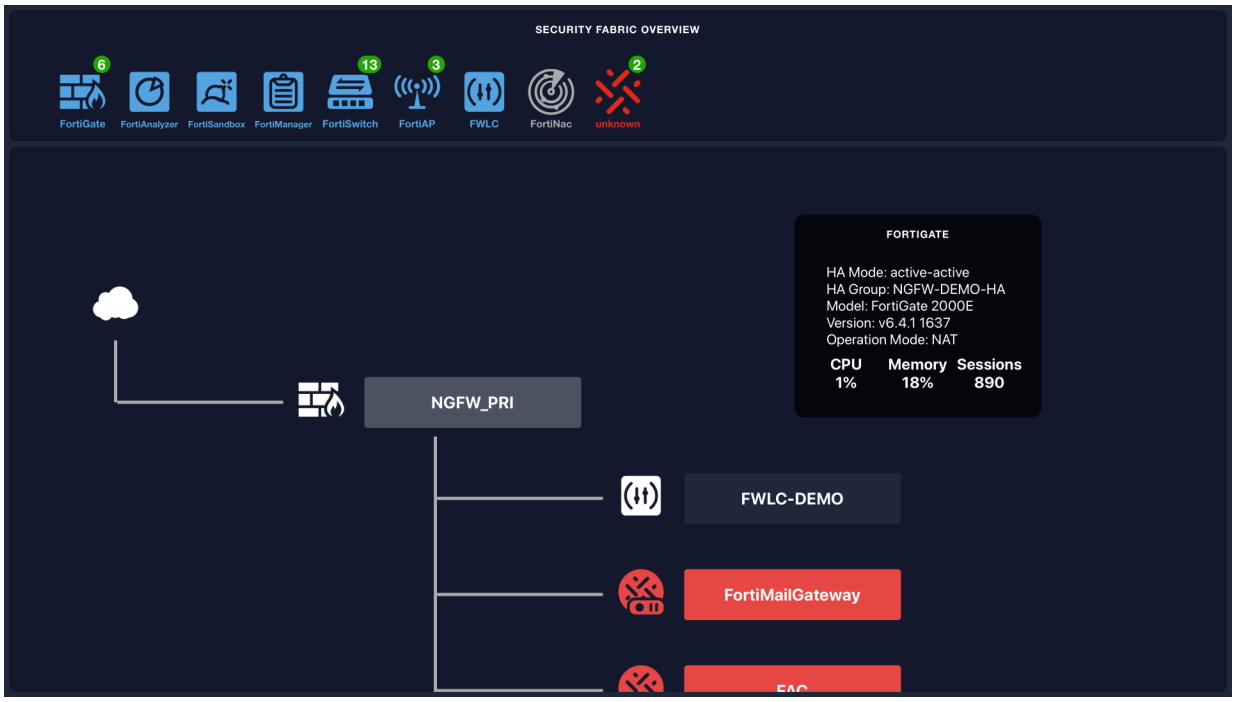
If the IP or hostname is not defined in the CN or SAN field of your certificate, you will receive a prompt that "Your connection is not private". You may choose to continue with your connection.



Viewing the Fabric Topology monitor

Use the Fabric Topology monitor to view the physical topology of the Fabric to identify risks. FortiGate devices with version 6.4. and above can drilldown further to see additional information for devices such as FortiGates, FortiAPs, and FortiSwitches.

To view the Fabric Topology monitor, go to *Network Operations Center* > *Fabric Topology*. This monitor displays the same information as the *Physical Topology* on the FortiGate



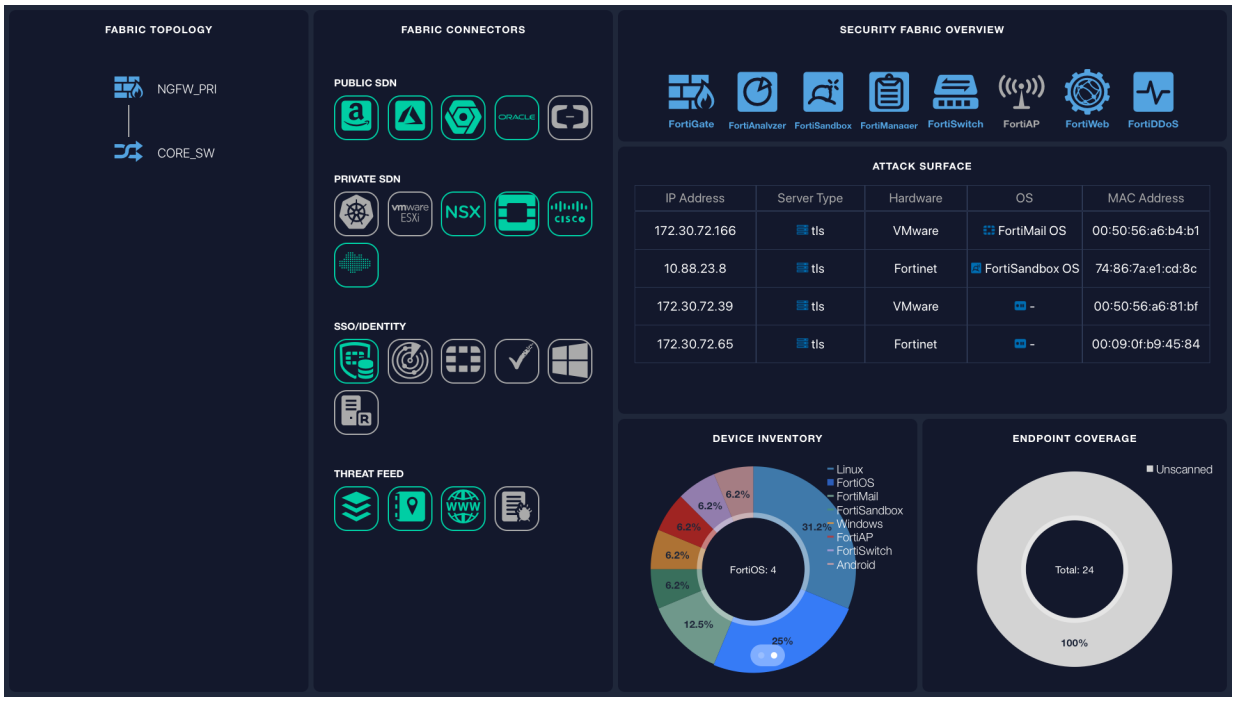
Use your remote to navigate through the devices in the Fabric topology. Click a device to view the drilldown information. To return to the default view, click the *Menu* button.

Viewing the Fabric Overview monitor

Use the Fabric Overview monitor to view the Fabric components as seen on the Dashboard of the Fabric Root FortiGate in the example topology. Each device must be authorized and be part of the Fabric.

For information about configuring the Security Fabric, see Fortinet Security Fabric on page 1586

To view the Fabric Overview monitor, go to *Network Operations Center* > *Fabric Overview*.



The Security Fabric monitor has multiple panes. To see data populated on the panes, ensure that proper configurations are applied on the Fabric devices:

Pane	Description	Configuration
Fabric Connectors	Displays external SDN connectors that are enabled.	Configure *Security Fabric* > *External Connectors*.
Security Fabric Overview	Displays the number of devices in the topology.	Configure *Security Fabric* > *Fabric Connectors*.
Attack Surface	Displays devices detected by the FortiGate with a server tag.	Ensure Device Detection is configured on the interfaces(s). Go to *Network* > *Interfaces*.
Device Inventory	Displays devices based on Hardware Vendor and detected OS	Ensure Device Detection is configured on the interface(s). Go to *Network* > *Interfaces*.
Endpoint Coverage	Displays the number of online devices and the percentage of Unscanned, Vulnerable, and Secured devices.	Ensure Device Detection is configured on the interface(s). Vulnerability scan results come from FortiClient EMS. Go to *Network* > *Interfaces*.

Device related information only corresponds to devices local to the FortiGate. Device information from downstream FortiGates do not propagate to the Upstream FortiGate.

Viewing the Security Rating monitor

The Security Rating monitor is separated into three major scorecards: *Security Posture*, *Fabric Coverage*, and *Optimization*, which provide an executive summary of the three largest areas of security focus in the Security Fabric.

To see the Security Rating summary, the root FortiGate and all FortiGates within the Fabric should have the proper FortiGuard Security Rating license. Security rating is performed on the root FortiGate. Its reports are generated periodically.

To view the Security Rating monitor, go to *Network Operations Center* > *Security Rating*.

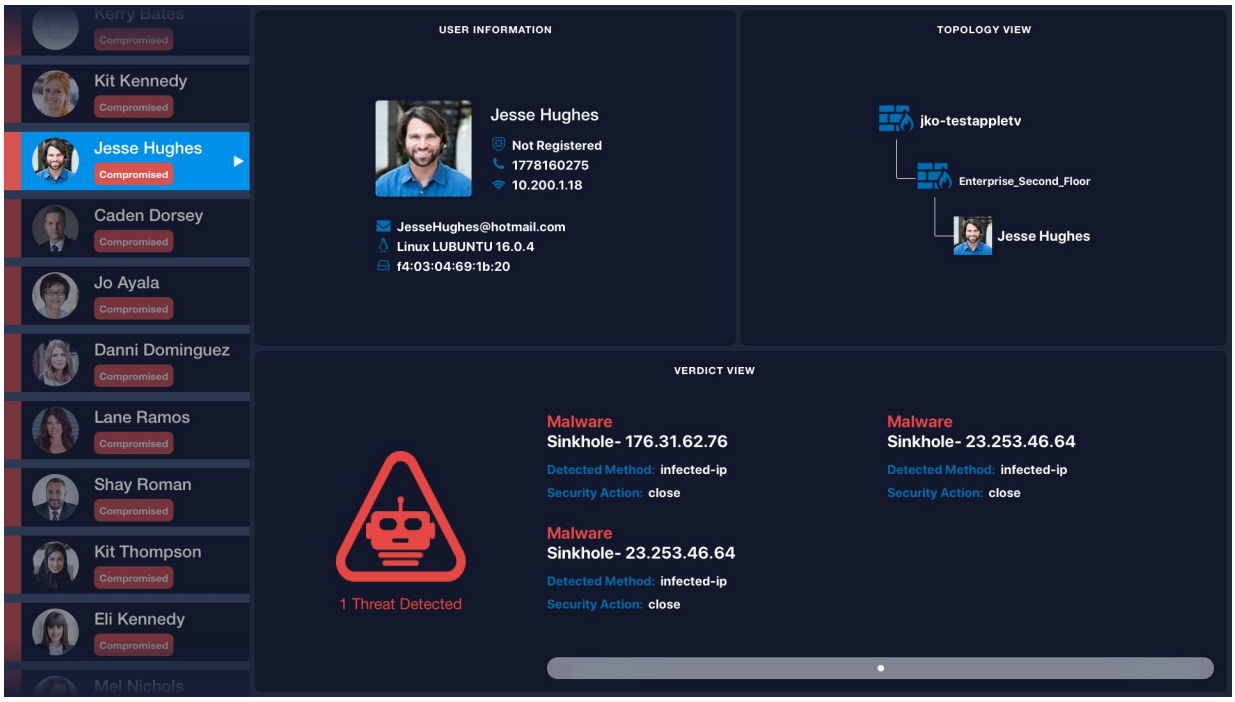
The scorecards show an overall score of the performance and sub-categories. The point score represents the net score for all passed and failed items in that area.

For more information about the Security Rating score, see Security Fabric score on page 1695.

Viewing the Compromised Hosts monitor

The Compromised Hosts monitor leverages the data collected by FortiAnalyzer on the endpoints on your network. To see compromised hosts, the FortiAnalyzer must have a FortiGuard Indicators of Compromise license. The IOC service helps identify compromised hosts based on infected websites that it may have visited.

This monitor captures the same information as seen on the *Compromised Hosts* monitor on the FortiGate.



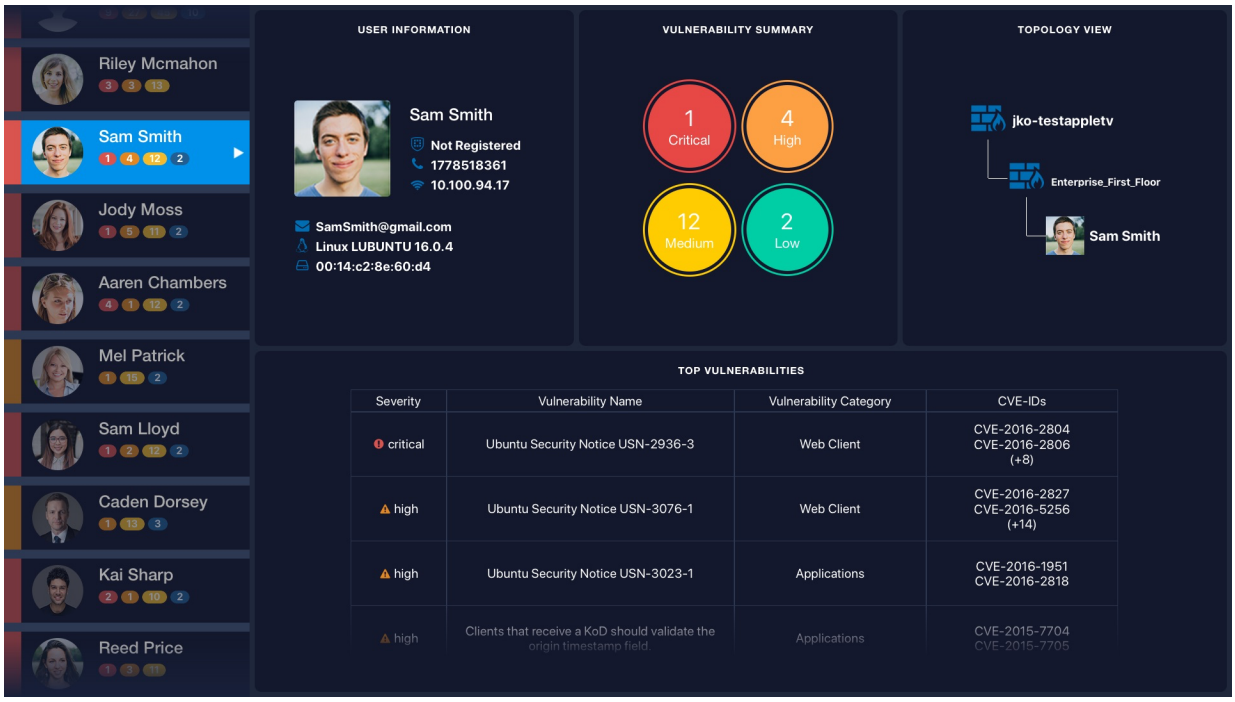
To view the Compromised Hosts monitor:

1. Go to *Security Operations Center* > *Compromised Hosts*.
2. In the left-hand pane, scroll through the user list. The monitor displays three panes:
   - The *User Information* pane displays the user's contact information and IP address.
   - The *Topology View* pane displays the user's location in the topology.
   - The *Verdict View* pane displays the *Malware*, *Detected Method*, and *Security Action*.

Viewing the Vulnerability Monitor

The Vulnerability Monitor obtains data from FortiClient EMS. It displays vulnerabilities detected by the FortiClient endpoint, categorized into Critical, High, Medium and Low risk. In this example, an on-premise FortiClient EMS is connected on the root FortiGate's Fabric Connector.

This monitor captures the same information as seen on the *Top Vulnerable Endpoint Devices* monitor on the FortiGate.



To view the Vulnerability Monitor:

1. Go to *Security Operations Center* > *Vulnerability Monitor*. The monitor displays a user list and their vulnerabilities.
2. Use your remote to scroll through the user list. The vulnerability details are displayed on the right side of the monitor.

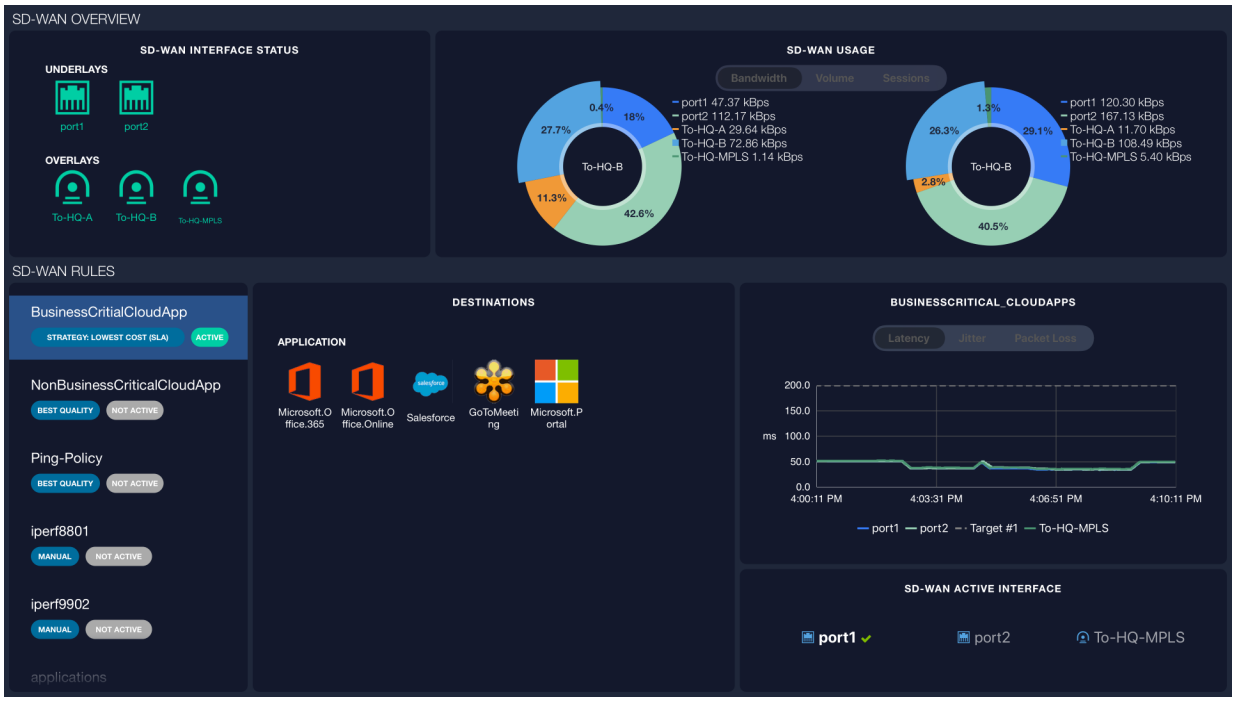
- The *User Information* pane displays the user's contact details and IP address.
- The *Vulnerability Summary* pane displays the number of vulnerabilities categorized into *Critical*, *High*, *Medium* and *Low* risk.
- The *Topology View pane* displays the user's location in the topology.
- The *Top Vulnerabilities* pane displays the top vulnerabilities by severity.

Using the SD-WAN monitor

In the example topology, the branches are configured to use SD-WAN. You can use the top-right navigation menu in the SD-WAN monitor to navigate to the Branch FortiGate to display information about the SD-WAN.

To view the SD-WAN monitor, go to *Software-Defined Branch* > *SD-WAN Monitor*.

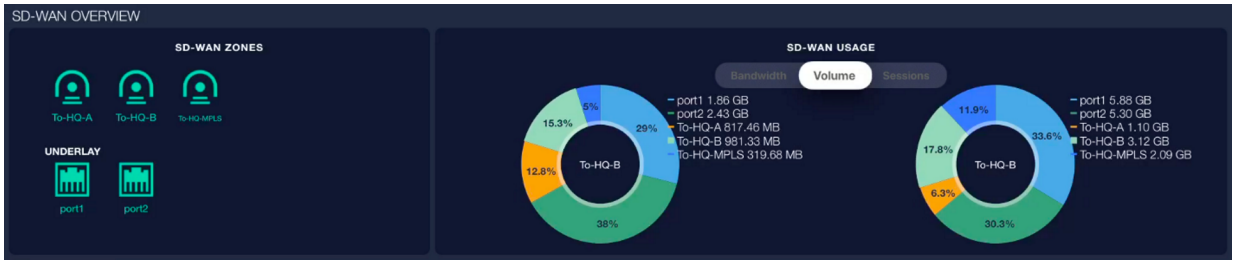
The SD-WAN monitor summarizes the SD-WAN members, Zones, SD-WAN Rules and health checks deployed on the FortiGate. It shows the interface member's SD-WAN usage and its associated service level agreements. The monitor contains a chart that shows if the ports are meeting the SLA target for bandwidth, jitter and latency per the health check in use in each SD-WAN Rule.



Some of the SD-WAN statistics are only available in FOS 6.4.1 and higher.

To view SD-WAN usage charts:

1. In the *SD-WAN Overview* area, Use your remote to select the *SD-WAN Usage* pane.
2. Scroll left and right to view *Bandwidth*, *Volume* and *Sessions* charts for the *VIRTUAL-WAN-LINK* and *Underlay* interfaces in the *SD-WAN Zones* pane.



To view SLA targets:

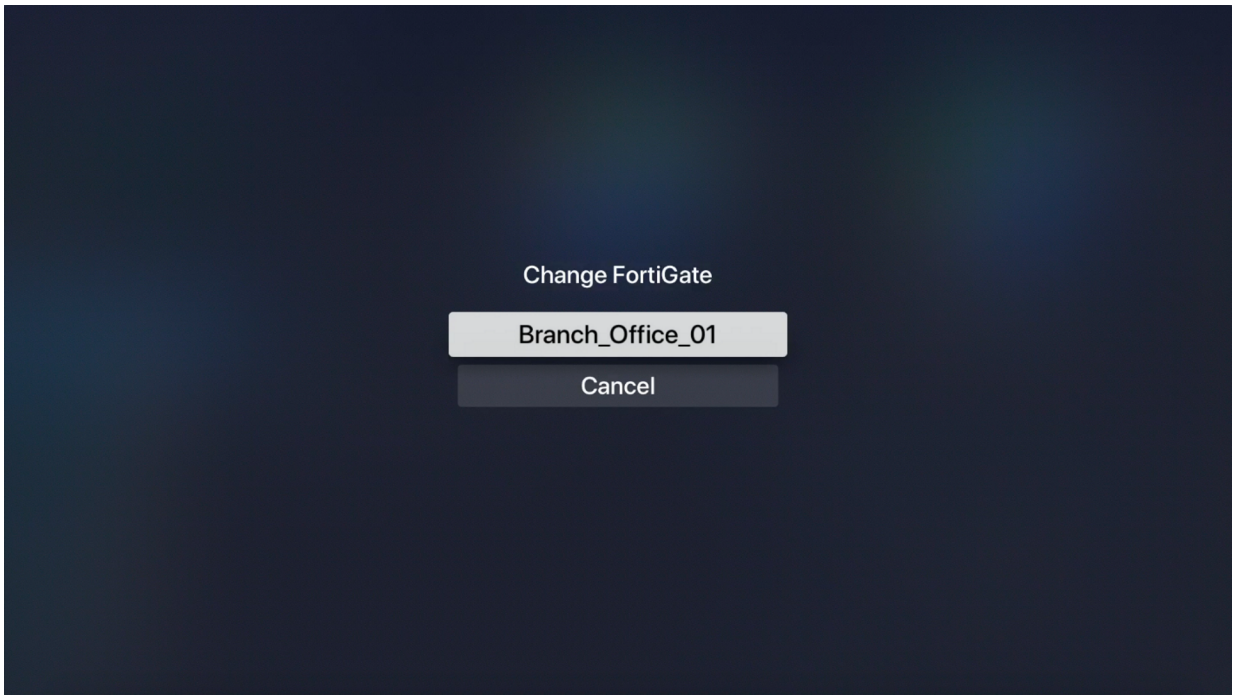
1. In the *SD-WAN Rules* area, use your remote to scroll the rules pane at the left-side of the monitor.
   - The *Destinations* pane displays the destination details.
   - The *Performance SLA* pane displays the SLA targets for the rule.
   - The *SD-WAN Active Interface* pane displays a checkmark next to the active interface.

2. Use your remote to navigate between the *Latency*, *Jitter*, and *Packet Loss* charts.

To view a branch in the topology:

1. Use your remote to swipe to the top navigation in the monitor. Wait for the topology to load.
2. At the top-right of the monitor, select the current device.

3. Select the device you want to view.



Troubleshooting

The following topics provide troubleshooting information for the Fortinet Security Fabric:

- Viewing a summary of all connected FortiGates in a Security Fabric on page 1880
- Diagnosing automation stitches on page 1882

Viewing a summary of all connected FortiGates in a Security Fabric

In downstream FortiGates, the `diagnose sys csf global` command shows a summary of all of the connected FortiGates in the Security Fabric.

To view a Security Fabric summary on a downstream FortiGate:

```
# diagnose sys csf global
Current vision:

Diagnosing automation stitches

Diagnose commands are available to:

- Test an automation stitch
- Enable or disable log dumping for automation stitches
- Display the settings of every automation stitch
- Display statistics on every automation stitch

To test an automation stitch:

```
diagnose automation test <automation-stitch-name>
```

Example:

```
# diagnose automation test HA-failover
automation test is done. stitch:HA-failover
```

To toggle log dumping:

```
diagnose test application autod 1
```

Examples:

```
# diagnose test application autod 1
autod log dumping is enabled
```

```
# diagnose test application autod 1
autod log dumping is disabled

autod logs dumping summary:
autod dumped total:7 logs, num of logids:4
```

To display the settings for all of the automation stitches:

```
diagnose test application autod 2
```

Example:

```
# diagnose test application autod 2
csf: enabled root:yes
total stitches activated: 3

stitch: Compromised-IP-Banned
        destinations: all
        trigger: Compromised-IP-Banned

       local hit: 0 relayed to: 0 relayed from: 0
        actions:

Log and Report

Logging and reporting are useful components to help you understand what is happening on your network, and to inform you about certain network activities, such as the detection of a virus, a visit to an invalid website, an intrusion, a failed log in attempt, and myriad others.

Logging records the traffic that passes through, starts from, or ends on the FortiGate, and records the actions the FortiGate took during the traffic scanning process. After this information is recorded in a log message, it is stored in a log file that is stored on a log device (a central storage location for log messages). FortiGates support several log devices, such as FortiAnalyzer, FortiGate Cloud, and syslog servers. Approximately 5% of memory is used for buffering logs sent to FortiAnalyzer. The FortiGate system memory and local disk can also be configured to store logs, so it is also considered a log device.

Reports show the recorded activity in a more readable format. A report gathers all the log information that it needs, then presents it in a graphical format with a customizable design and automatically generated charts showing what is happening on the network. Reports can be generated on FortiGate devices with disk logging and on FortiAnalyzer devices.

FortiView is a more comprehensive network reporting and monitoring tool. It integrates real-time and historical data into a single view in FortiOS. For more information, seeFortiView monitors and widgets on page 93 .

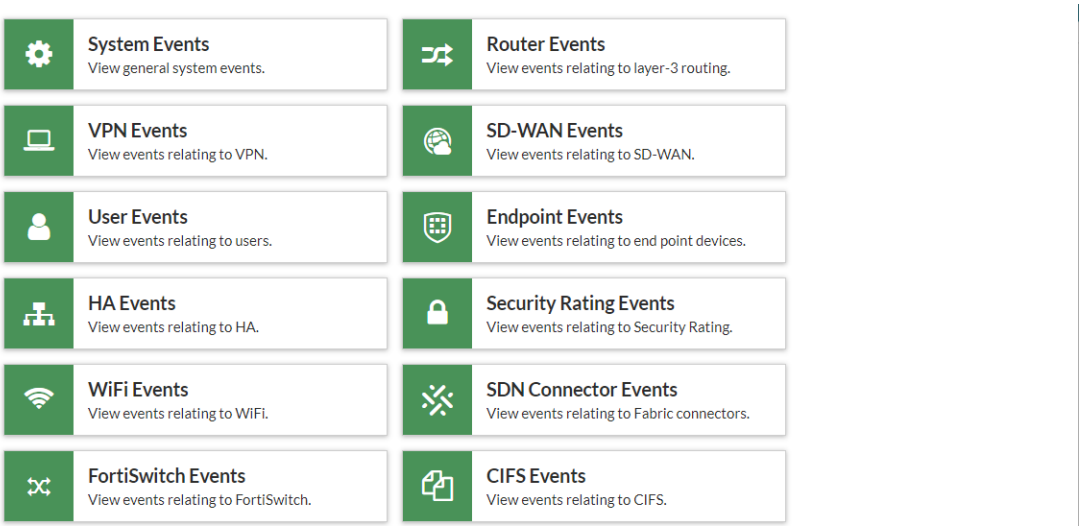
Performance statistics are not logged to disk. Performance statistics can be received by a syslog server or by FortiAnalyzer.

The following topics provide information about logging and reporting:

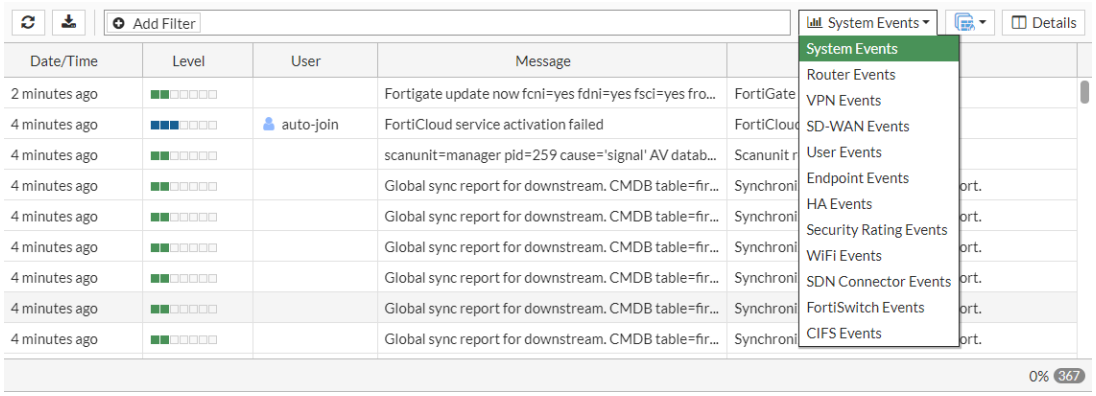
- Viewing event logs on page 1887
- Sample logs by log type on page 1888
- Log buffer on FortiGates with an SSD disk on page 1908
- Checking the email filter log on page 1911
- Supported log types to FortiAnalyzer, syslog, and FortiAnalyzer Cloud on page 1911
- Sending traffic logs to FortiAnalyzer Cloud on page 1912
- Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode on page 1915
- Configuring multiple FortiAnalyzers (or syslog servers) per VDOM on page 1917
- Source and destination UUID logging on page 1919
- Logging the signal-to-noise ratio and signal strength per client on page 1920
- RSSO information for authenticated destination users in logs on page 1923
- Threat weight on page 1926
- Logs for the execution of CLI commands on page 1927
- Troubleshooting on page 1929

Viewing event logs

Event log subtypes are available on the *Log & Report* > *Events* page. Not all of the event log subtypes are available by default.



When viewing event logs, use the event log subtype dropdown list on the to navigate between event log types.



System Events	Always available.
Router Events	Always available.
VPN Events	Available when *VPN* is enabled in *System* > *Feature Visibility*.
SD-WAN Events	Always available.
User Events	Always available.
Endpoint Events	Available when *Endpoint Control* is enabled in *System* > *Feature Visibility*.
HA Events	Always available.
Security Rating Events	Always available, but logs are only generated when a Security Rating License is registered.

WAN Opt. & Cache Events	Available on devices with two hard disks by default. On devices with one hard disk, the disk usage must be set to `wanopt` and then *WAN Opt. & Cache* must be enabled in *System* > *Feature Visibility*.
WiFi Events	Available on hardware devices when *WiFi Controller* is enabled in *System* > *Feature Visibility*.
FortiExtender Events	Available when *FortiExtender* is enabled in *System* > *Feature Visibility*.
SDN Connector Events	Always available.
FortiSwitch Events	Always available.
CIFS Events	Always available.

Sample logs by log type

This topic provides a sample raw log for each subtype and the configuration requirements.

Traffic Logs > Forward Traffic

Log configuration requirements

```
config firewall policy
    edit 1
        set srcintf "port12"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set logtraffic all
        set application-list "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Sample log

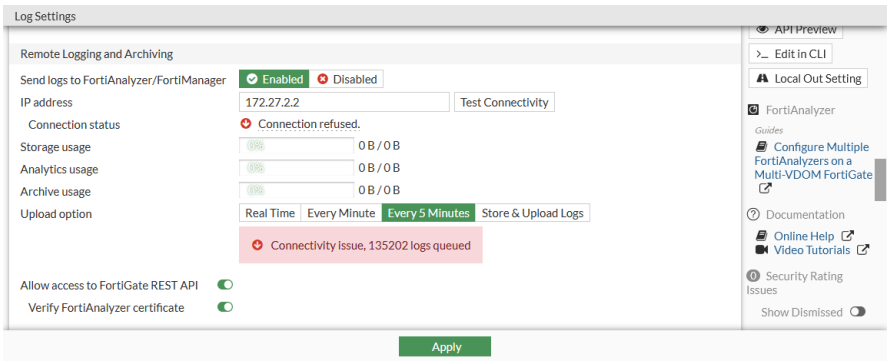
Log buffer on FortiGates with an SSD disk

FortiGates with an SSD disk have a configurable log buffer. When the connection to FortiAnalyzer is unreachable, the FortiGate is able to buffer logs on disk if the memory log buffer is full. The logs queued on the disk buffer can be sent successfully once the connection to FortiAnalyzer is restored.

The number of logs queued on the disk buffer is visible in the *Log & Report* > *Log Settings* page:



The queued logs are buffered to the memory first and then disk. `Main miglogd` handles the disk buffering job, while `miglogd-children` handles the memory buffering. Disk buffer statistics only appear under `Main miglogd`, and memory buffer statistics only appears under `miglogd-children`. If the total buffer is full, new logs will overwrite the old logs.

To configure the log buffer:

1. Allocate disk space (MB) to temporarily store logs to FortiAnalyzer:

   ```
   config system global
       set faz-disk-buffer-size 200
   end
   ```

2. Check the `Main miglogd` and `miglogd-children` statistics. The 200 MB disk buffer has been set, and there are currently no logs buffered in memory or on disk when FortiAnalyzer is reachable:

```
# diagnose test application miglogd 41 0
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz

    memory queue:
        num:0 size:0(0MB) max:101906636(97MB) logs:0

    disk max queue size:200MB total:0MB
        totol items:0
        disk queue agents:
            devid:-1-10-0-1
            buffer path:/var/log/qbuf/10.0/1
            saved size:0MB cached size:0
            save roll:0 restore roll:0
            restore id:0 space:0MB

# diagnose test application miglogd 41 1
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz

    memory queue:
        num:0 size:0(0MB) max:101906636(97MB) logs:0

    disk queue client:
        devid:-1-10-0-1 status:buffering
        Total in cache:0 size:0(0MB) max:4MB logs:0
```

3. Disable the connection between the FortiGate and FortiAnalyzer. For example, delete the FortiGate from the FortiAnalyzer authorized device list.
   Assuming a massive number of logs (~ 300000) are recorded during this downtime, the logs will be queued in the memory buffer first. If the memory buffer is full, then the remaining logs will be queued on the disk buffer.
4. Check the `Main miglogd` and `miglogd-children` statistics again. All 97 MB of the memory buffer is occupied, and 76 of the 200 MB has been taken from the disk buffer:

```
# diagnose test application miglogd 41 0
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)
VDOM:root
Queue for: global-faz

        memory queue:
                num:0 size:0(0MB) max:101906636(97MB) logs:0

        disk max queue size:200MB total:76MB
                totol items:128917
                disk queue agents:
                        devid:-1-10-0-1
                        buffer path:/var/log/qbuf/10.0/1
                        saved size:76MB cached size:3324984
                        save roll:19 restore roll:0
                        restore id:0 space:0MB

# diagnose test application miglogd 41 1
cache maximum: 106100940(101MB) objects: 165721 used: 101908358(97MB) allocated:
106449280(101MB)
```

```
VDOM:root
Queue for: global-faz

        memory queue:
                num:165718 size:101906500(97MB) max:101906636(97MB) logs:165718

        disk queue client:
                devid:-1-10-0-1 status:restoring
                restore id:1267 space:0MB
                Total in cache:3 size:1858(0MB) max:4MB logs:3
```

The overall `miglogd` statistics shows the total cached logs is the sum of the logs buffered in memory and on disk:

```
# diagnose test application miglogd 6
mem=0, disk=11, alert=0, alarm=0, sys=0, faz=300053, faz-cloud=0, webt=0, fds=0
interface-missed=44
Queues in all miglogds: cur:165718  total-so-far:165718
global log dev statistics:
faz 0: sent=0, failed=0, cached=300053, dropped=0 , relayed=0
Num of REST URLs: 0
```

5. Enable the connection between FortiAnalyzer and the FortiGate.
6. After a while, check the `miglogd` statistics to confirm that all buffered logs are being sent to FortiAnalyzer successfully:

```
# diagnose test application miglogd 6
mem=0, disk=11, alert=0, alarm=0, sys=0, faz=300058, faz-cloud=0, webt=0, fds=0
interface-missed=44
Queues in all miglogds: cur:4294832957  total-so-far:165726
global log dev statistics:
faz 0: sent=300058, failed=0, cached=0, dropped=0 , relayed=0
Num of REST URLs: 15

# diagnose test application miglogd 41 0
cache maximum: 106100940(101MB) objects: 0 used: 0(0MB) allocated: 0(0MB)

Checking the email filter log

To check the email filter log in the GUI:

1. Go to *Log & Report* > *Anti-Spam*.

To check the email filter log in the CLI:

```
# execute log filter category 5

# execute log display
1 logs found.
1 logs returned.

1: date=2019-04-09 time=03:41:18 logid="0510020491" type="utm" subtype="emailfilter"
eventtype="imap" level="notice" vd="vdom1" eventtime=1554806478647415130 policyid=1

```

Supported log types to FortiAnalyzer, syslog, and FortiAnalyzer Cloud

This topic describes which log messages are supported by each logging destination:

Log Type	FortiAnalyzer	Syslog	FortiAnalyzer Cloud
Traffic	Yes	Yes	No
Event	Yes	Yes	Yes
Virus	Yes	Yes	Yes
Webfilter	Yes	Yes	Yes
IPS	Yes	Yes	Yes
Emailfilter	Yes	Yes	Yes
Anomaly	Yes	Yes	Yes
VOIP	Yes	Yes	Yes

Log Type	FortiAnalyzer	Syslog	FortiAnalyzer Cloud
DLP	Yes	Yes	Yes
App-Ctrl	Yes	Yes	Yes
WAF	Yes	Yes	Yes
GTP	Yes	Yes	Yes
DNS	Yes	Yes	Yes
SSH	Yes	Yes	Yes
SSL	Yes	Yes	Yes
CIFS	No	Yes	Yes

Sending traffic logs to FortiAnalyzer Cloud

FortiGates with a FortiCloud Premium subscription (AFAC) for Cloud-based Central Logging & Analytics, can send traffic logs to FortiAnalyzer Cloud in addition to UTM logs and event logs. After the Premium subscription is registered through FortiCare, FortiGuard will verify the purchase and authorize the AFAC contract. Once the contract is verified, FortiGuard will deliver the contract to FortiGate.

FortiGates with a Standard FortiAnalyzer Cloud subscription (FAZC) can only send UTM and event logs. FortiGates with a Premium subscription will send the UTM and event logs even if the Standard subscription has expired.

FortiAnalyzer Cloud does not support DLP/IPS archives at this time.

Example

In the following example, you will configure a FortiGate with a valid Premium subscription (AFAC) and expired Standard subscription (FAZC) to send traffic logs to FortiAnalyzer Cloud.

1. Configure the log delivery.

```
config log fortianalyzer-cloud setting
   set status enable
   set ips-archive disable
   set access-config enable
   set enc-algorithm high
   set ssl-min-proto-version default
   set conn-timeout 10
   set monitor-keepalive-period 5
   set monitor-failure-retry-period 5
   set certificate ''
   set source-ip ''
   set interface-select-method auto
   set upload-option realtime
```

```
    set priority default
    set max-log-rate 0
end
```

2. Verify the status of the FortiCloud Premium subscription (AFAC) and standard FortiAnalyzer Cloud subscription (FAZC).

   The `FAZC` and `AFAC` fields display the subscription expiration date. The `Support contract` field displays the FortiCare account information. The `User ID` field displays the ID for FortiAnalyzer-Cloud instance.

```
# diagnose test update info
...
FAZC,Tue Sep 24 16:00:00 2030
AFAC,Mon Nov 29 16:00:00 2021
...
Support contract: pending_registration=255 got_contract_info=1
account_id=[****@fortinet.com] company=[Fortinet] industry=[Technology]
User ID: 979090
```

   The `FAZC` and `AFAC` subscriptions are valid (date of verification is November 29, 2020).

3. Check the status of FortiAnalyzer Cloud.

```
# execute log fortianalyzer-cloud test-connectivity
FortiAnalyzer Host Name: FAZVM64-VIO-CLOUD
FortiAnalyzer Adom Name: root
FortiGate Device ID: FG101FTK19000000
Registration: registered
Connection: allow
Adom Disk Space (Used/Allocated): 50351453B/53687091200B
Analytics Usage (Used/Allocated): 41368925B/37580963840B
Analytics Usage (Data Policy Days Actual/Configured): 60/60 Days
Archive Usage (Used/Allocated): 8982528B/16106127360B
Archive Usage (Data Policy Days Actual/Configured): 235/365 Days
Log: Tx & Rx (log not received)
IPS Packet Log: Tx & Rx
Content Archive: Tx & Rx
Quarantine: Tx & Rx
Certificate of Fortianalyzer valid and serial number is:FAZVCLTM20000000
```

4. When the FortiCloud Premium (AFAC) and standard FortiAnalyzer Cloud (FAZC) subscriptions are valid, the FortiGate sends the traffic, event, and UTM logs to the remote FortiAnalyzer Cloud.

   Traffic:

```
# execute log filter device fortianalyzer-cloud

```

5. When the FortiGate has a valid Premium FortiCloud subscription (AFAC) and an expired Standard FortiCloud subscription (FAZC), the FortiGate still sends the logs to the remote FortiAnalyzer Cloud.

Configuring multiple FortiAnalyzers on a FortiGate in multi-VDOM mode

This topic shows a sample configuration of multiple FortiAnalyzers on a FortiGate in multi-VDOM mode.

In this example:

- The FortiGate has three VDOMs:
  - Root (management VDOM)
  - VDOM1
  - VDOM2
- There are four FortiAnalyzers.
  These IP addresses are used as examples in the instructions below.
  - FAZ1: `172.16.200.55`
  - FAZ2: `172.18.60.25`
  - FAZ3: `192.168.1.253`
  - FAZ4: `192.168.1.254`
- Set up FAZ1 and FAZ2 under global.
  - These two collect logs from the root VDOM and VDOM2.
  - FAZ1 and FAZ2 must be accessible from management VDOM root.
- Set up FAZ3 and FAZ4 under VDOM1.
  - These two collect logs from VDOM1.
  - FAZ3 and FAZ4 must be accessible from VDOM1.

To set up FAZ1 as global FortiAnalyzer 1 from the GUI:

Prerequisite: FAZ1 must be reachable from the management root VDOM.

1. Go to *Global* > *Log & Report* > *Log Settings*.
2. Enable *Send logs to FortiAnalyzer/FortiManager*.
3. Enter the FortiAnalyzer IP.
   In this example: `172.16.200.55`.
4. For *Upload option*, select *Real Time*.
5. Click *Apply*.

To set up FAZ2 as global FortiAnalyzer 2 from the CLI:

Prerequisite: FAZ2 must be reachable from the management root VDOM.

```
config log fortianalyzer2 setting
    set status enable
    set server "172.18.60.25"
    set upload-option realtime
end
```

To set up FAZ3 and FAZ4 as VDOM1 FortiAnalyzer 1 and FortiAnalyzer 2:

Prerequisite: FAZ3 and FAZ4 must be reachable from VDOM1.

```
config log setting
   set faz-override enable
end

config log fortianalyzer override-setting
   set status enable
   set server "192.168.1.253"
   set upload-option realtime
end

config log fortianalyzer2 override-setting
   set status enable
   set server "192.168.1.254"
   set upload-option realtime
end
```

Checking FortiAnalyzer connectivity

To use the diagnose command to check FortiAnalyzer connectivity:

1. Check the global FortiAnalyzer status:

```
FGTA(global) # diagnose test application miglogd 1
faz: global , enabled
        server=172.16.200.55, realtime=3, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_172.16.200.55, reliable=1
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
                SNs: last sn update:1369 seconds ago.
                        Sn list:

                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         voip dns ssh ssl
subcategory:
        traffic: forward local multicast sniffer
        anomaly: anomaly

        server: global, id=0, fd=90, ready=1, ipv6=0, 172.16.200.55/514
        oftp-state=5
faz2: global , enabled
        server=172.18.60.25, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_172.18.60.25, reliable=0
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
                SNs: last sn update:1369 seconds ago.
                        Sn list:

                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         voip dns ssh ssl
subcategory:
        traffic: forward local multicast sniffer
        anomaly: anomaly
```

```
        server: global, id=1, fd=95, ready=1, ipv6=0, 172.18.60.25/514
        oftp-state=5
```

2. Check the VDOM1 override FortiAnalyzer status:

```
FGTA(global) # diagnose test application miglogd 3101
faz: vdom, enabled, override
        server=192.168.1.253, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_192.168.1.253, reliable=1
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
                SNs: last sn update:1369 seconds ago.
                        Sn list:
                        (FAZ-VM0000000001,age=17s)
                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         voip dns ssh ssl
subcategory:
        traffic: forward local multicast sniffer
        anomaly: anomaly

        server: vdom, id=0, fd=72, ready=1, ipv6=0, 192.168.1.253/514
        oftp-state=5
faz2: vdom, enabled, override
        server=192.168.1.254, realtime=1, ssl=1, state=connected, src=, mgmt_name=FGh_
Log_root_192.168.1.254, reliable=0
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_
verified=N
                SNs: last sn update:1369 seconds ago.
                        Sn list:
                        (FL-1KET318000008,age=17s)
                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         voip dns ssh ssl
subcategory:
        traffic: forward local multicast sniffer
        anomaly: anomaly

        server: vdom, id=1, fd=97, ready=1, ipv6=0, 192.168.1.254/514
        oftp-state=5
faz3: vdom, disabled, override
```

Configuring multiple FortiAnalyzers (or syslog servers) per VDOM

In a VDOM, multiple FortiAnalyzer and syslog servers can be configured as follows:

- Up to three override FortiAnalyzer servers
- Up to four override syslog servers

If the VDOM `faz-override` and/or `syslog-override` setting is enabled or disabled (default) before upgrading, the setting remains the same after upgrading.

If the override setting is disabled, the GUI displays the global FortiAnalyzer1 or syslog1 setting. If the override setting is enabled, the GUI displays the VDOM override FortiAnalyzer1 or syslog1 setting.

You can only use CLI to enable the override to support multiple log servers.

To enable FortiAnalyzer and syslog server override under VDOM:

```
config log setting
    set faz-override enable
    set syslog-override enable
end
```

When `faz-override` and/or `syslog-override` is enabled, the following CLI commands are available for configuring VDOM override:

To configure VDOM override for FortiAnalyzer:

1. Configure the FortiAnalyzer override settings:

```
config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-setting
    set status enable
    set server "123.12.123.123"
    set reliable enable
end
```

2. Configure the override filters:

```
config log fortianalyzer/fortianalyzer2/fortianalyzer3 override-filter
    set severity information
    set forward-traffic enable
    set local-traffic enable
    set multicast-traffic enable
    set sniffer-traffic enable
    set anomaly enable
    set voip enable
    set dlp-archive enable
    set dns enable
    set ssh enable
    set ssl enable
end
```

To configure VDOM override for a syslog server:

1. Configure the syslog override settings:

```
config log syslogd/syslogd2/syslogd3/syslogd4 override-setting
    set status enable
    set server "123.12.123.12"
    set facility local1
end
```

2. Configure the override filters:

```
config log syslogd/syslogd2/syslogd3/syslogd4 override-filter
    set severity information
    set forward-traffic enable
    set local-traffic enable
    set multicast-traffic enable
    set sniffer-traffic enable
    set anomaly enable
```

```
        set voip enable
        set dns enable
        set ssh enable
        set ssl enable
    end
```

Source and destination UUID logging

The `log-uuid` setting in `system global` is split into two settings: `log-uuid-address` and `log-uuid policy`.

The traffic log includes two `internet-service` name fields: *Source Internet Service* (`srcinetsvc`) and *Destination Internet Service* (`dstinetsvc`).

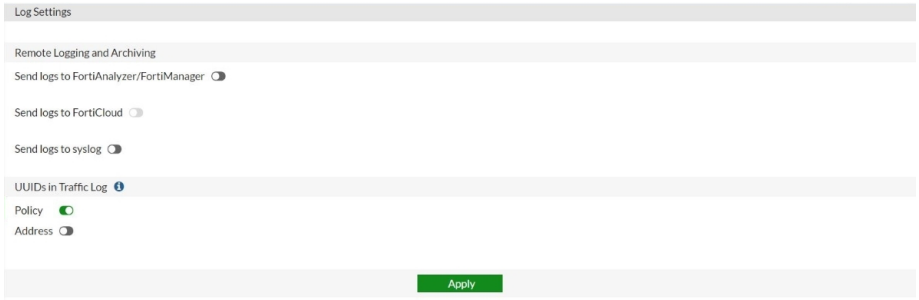
Log UUIDs

UUIDs can be matched for each source and destination that match a policy that is added to the traffic log. This allows the address objects to be referenced in log analysis and reporting.

As this may consume a significant amount of storage space, this feature is optional. By default, policy UUID insertion is enabled and address UUID insertion is disabled.

To enable address and policy UUID insertion in traffic logs using the GUI:

1. Go to *Log & Report* > *Log Settings*.
2. Under *UUIDs in Traffic Log*, enable *Policy* and/or *Address*.
3. Click *Apply*.



To enable address and policy UUID insertion in traffic logs using the CLI:

```
config system global
   set log-uuid-address enable
   set log-uuid-policy enable
end
```

Sample log

```
date=2019-01-25 time=11:32:55 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1528223575srcip=192.168.1.183 srcname="PC24"

```

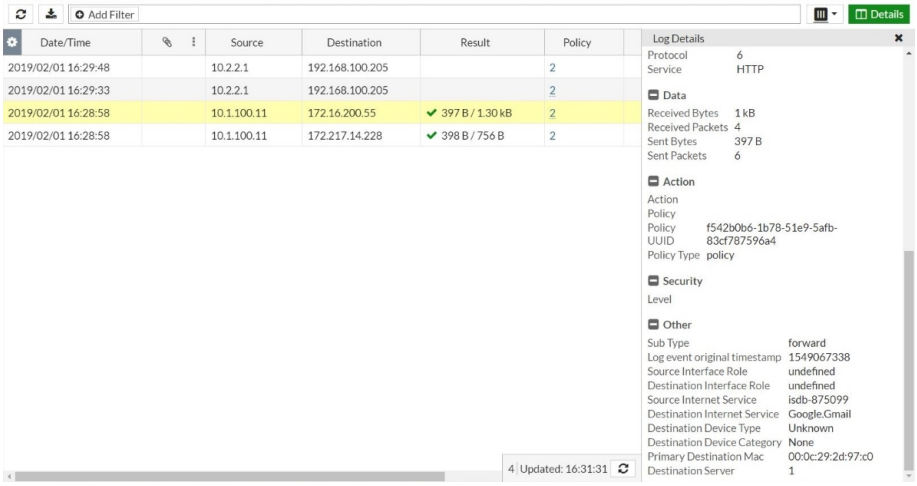
Internet service name fields

Traffic logs for `internet-service` include two fields: *Source Internet Service* and *Destination Internet Service*.

To view the internet service fields using the GUI:

1. Go to *Log & Report* > *Forward Traffic*.
2. Double-click on an entry to view the *Log Details*. The *Source Internet Service* and *Destination Internet Service* fields are visible in the *Log Details* pane.



Sample log

```

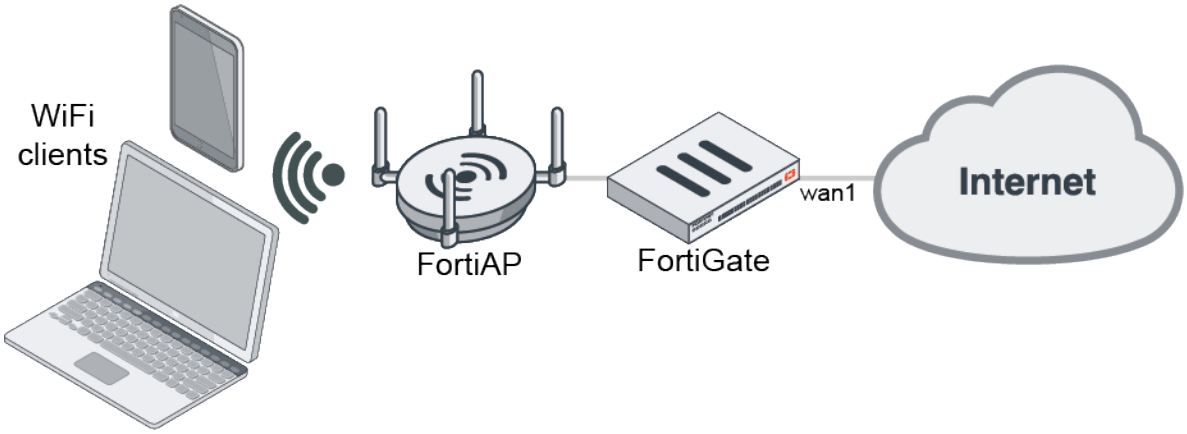
Logging the signal-to-noise ratio and signal strength per client

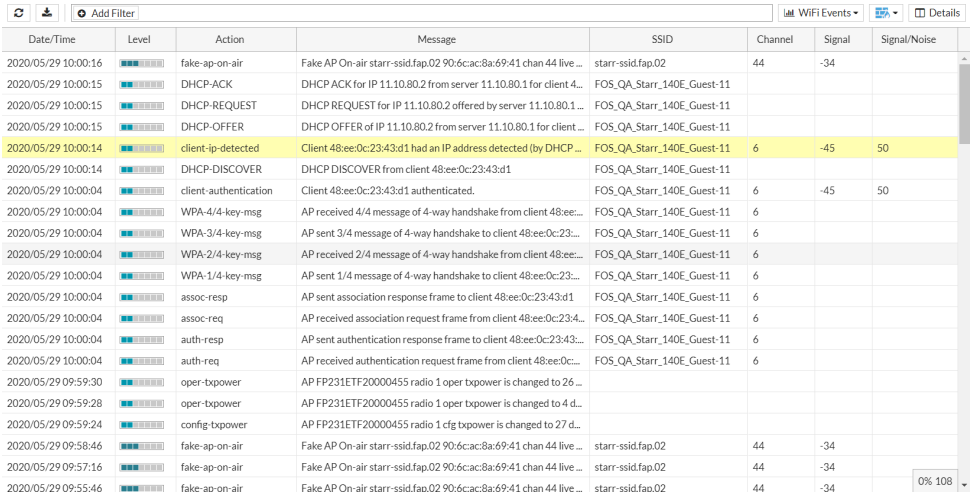
The signal-to-noise ratio (`snr`) and signal strength (`signal`) are logged per client in the WiFi event and traffic logs.

When a WiFi client connects to a tunnel or local-bridge mode SSID on an FortiAP that is managed by a FortiGate, signal-to-noise ratio and signal strength details are included in WiFi event logs for local-bridge traffic statistics and authentication, and in forward traffic logs for tunnel traffic. This allows you to store and view clients' historical signal strength and signal-to-noise ratio information.



To verify when a client is connecting to an SSID:

1. Go to *Log & Report* > *Events* and select *WiFi Events* from the events drop-down list.
   The *Signal* and *Signal/Noise* columns show the signal strength and signal-to-noise ratio for each applicable client.



Date/Time	Level	Action	Message	SSID	Channel	Signal	Signal/Noise

vap="wifi.fap.01" ssid="FOS_QA_Starr-140E-LB-cap-2" srcip=10.128.100.4 user="N/A"
```

```
stamac="00:1e:e5:df:b1:63" signal=-53 snr=52 sentbyte=8970016 rcvdbyte=985910
nextstat=300 action="sta-wl-bridge-traffic-stats" msg="Traffic stats for bridge ssid
client 00:1e:e5:df:b1:63"
```

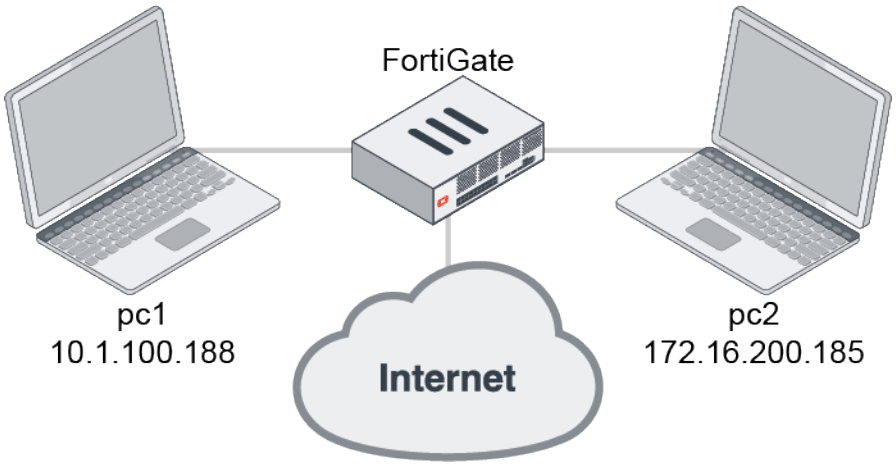
RSSO information for authenticated destination users in logs

FortiGate can use RSSO accounting information from authenticated RSSO users to populate destination users and groups, along with source users and groups.

RSSO user login information can be forwarded by the RADIUS server to the FortiGate that is listening for incoming RADIUS accounting start messages on the RADIUS accounting port. Accounting start messages usually contain the IP address, user name, and user group information. FortiGate uses this information in traffic logs, which include *dstuser* and *dstgroup* fields for user and group destination information .

For instructions on configuring RSSO, see RADIUS single sign-on agent on page 1846.

The three following scenarios show traffic between pc1 and the internet, and pc1 and pc2.



Scenario 1

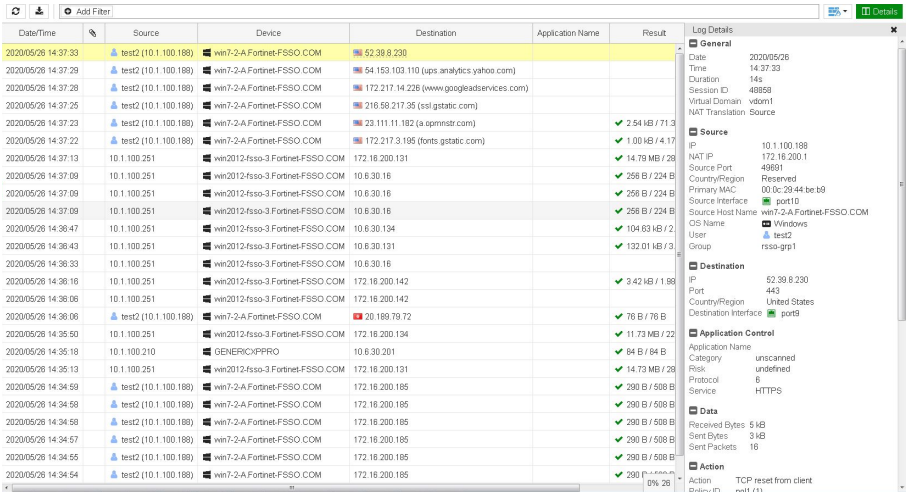
In this scenario, RSSO user *test2* in group *rsso-grp1* is authenticated on pc1. Traffic flows from pc1 to the internet.

Expected result:

In the logs, user *test2* is shown as the source user in the *rsso-grp1* group.

To verify the results:

1. In the GUI, go to *Log & Report* > *Forward Traffic* and view the details of an entry with test2 as the source.
2. In the *Source* section, *User* is *test2* and *Group* is the *rsso-grp1*.



3. The log message shows the user and group:

```
10: date=2020-05-25 time=15:34:43 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1590446083718007055 tz="-0700" srcip=10.1.100.188
srcname="win7-2-A.Fortinet-FSSO.COM" srcport=56982 srcintf="port10"
srcintfrole="undefined" dstip=172.217.3.195 dstport=443 dstintf="port9"
dstintfrole="undefined" srccountry="Reserved" dstcountry="United States"
sessionid=120651 proto=17 action="accept" policyid=1 policytype="policy"
poluuid="d130f886-9ec6-51ea-206e-8c561c5244c6" policyname="pol1" user="test2"
group="rsso-grp1" authserver="vdom1" service="udp/443" trandisp="snat"
transip=172.16.200.1 transport=56982 duration=181 sentbyte=2001 rcvdbyte=1820 sentpkt=6
rcvdpkt=4 appcat="unscanned" sentdelta=0 rcvddelta=0 srchwvendor="VMware"
osname="Windows" srcswversion="7" mastersrcmac="00:0c:29:44:be:b9"
srcmac="00:0c:29:44:be:b9" srcserver=0
```

Scenario 2

In this scenario, RSSO user *test2* is authenticated on pc1. Traffic is initialized on pc2 (172.16.200.185) going to pc1 (10.1.100.188).

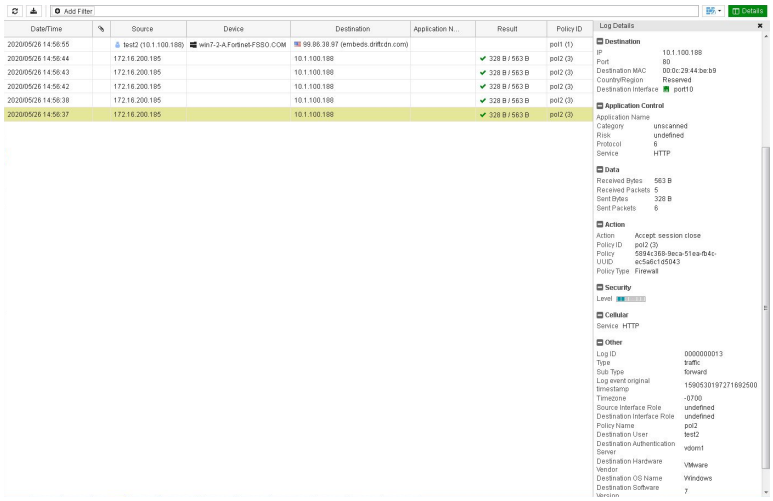
Expected result:

In the logs, user *test2* is shown as the destination user (`dstuser`). No destination group (`dstgroup`) is logged because no RSSO user is logged in on pc2, so the traffic from pc2 is unauthenticated.

To verify the results:

1. In the GUI, go to *Log & Report* > *Forward Traffic* and view the details of an entry with 172.16.200.185 (pc2) as the source.

2. In the *Other* section, *Destination User* is *test2* and no destination group is shown.



3. The log message shows the destination user:

```
1: date=2020-05-22 time=07:38:06 logid="0000000020" type="traffic" subtype="forward"
level="notice" vd="root" eventtime=1590158286585506922 tz="-0700" srcip=172.16.200.185
identifier=1 srcintf="port9" srcintfrole="undefined" dstip=10.1.100.188 dstintf="port10"
dstintfrole="undefined" srccountry="Reserved" dstcountry="Reserved" sessionid=4395
proto=1 action="accept" policyid=3 policytype="policy" poluuid="d4f18e1e-9c36-51ea-6ec0-
3a354d5910ee" policyname="pol2" dstuser="test2" dstauthserver="root" service="PING"
trandisp="snat" transip=10.1.100.1 transport=0 duration=128 sentbyte=7620 rcvdbyte=5220
sentpkt=127 rcvdpkt=87 appcat="unscanned" sentdelta=7620 rcvddelta=5220
```

Scenario 3

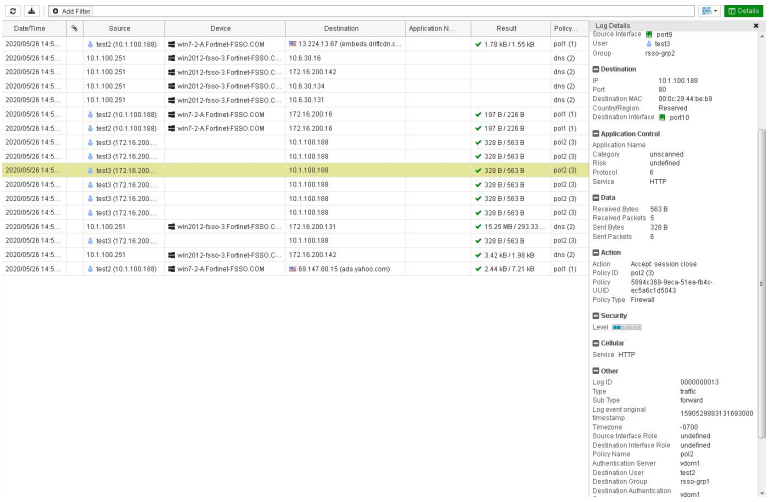
In this scenario, RSSO user *test2* in group *rsso-grp1* is authenticated on pc1, and user *test3* in group *rsso-grp2* is authenticated on pc2. Traffic flows from pc2 to pc1.

Expected result:

In the logs, user *test3* is shown as the source user in the *rsso-grp1* group. User *test2* is shown as destination user (`dstuser`) in the *rsso-grp1* destination group (`dstgroup`). The destination group is logged because an RSSO user is logged in to pc2.

To verify the results:

1. In the GUI, go to *Log & Report* > *Forward Traffic* and view the details of an entry with 172.16.200.185 (pc2) as the source.
2. In the *Source* section, *User* is *test3* and *Group* is the *rsso-grp2*. In the *Other* section, *Destination User* is *test2* and *Destination Group* is *rsso-grp1*.



3. The log message shows both the source and the destination users and groups:

```
8: date=2020-05-25 time=14:23:07 logid="0000000013" type="traffic" subtype="forward"
level="notice" vd="vdom1" eventtime=1590441786958007914 tz="-0700" srcip=172.16.200.185
srcport=64096 srcintf="port9" srcintfrole="undefined" dstip=10.1.100.188 dstport=80
dstintf="port10" dstintfrole="undefined" srccountry="Reserved" dstcountry="Reserved"

dsthwvendor="VMware" dstosname="Windows" dstswversion="7"
masterdstmac="00:0c:29:44:be:b9" dstmac="00:0c:29:44:be:b9" dstserver=0
```

Threat weight

Threat weight helps aggregate and score threats based on user-defined severity levels. It adds several fields such as threat level (`crlevel`), threat score (`crscore`), and threat type (`craction`) to traffic logs. Threat weight logging is enabled by default and the settings can be customized. Threats can be viewed from the *Top Threats* FortiView dashboard.

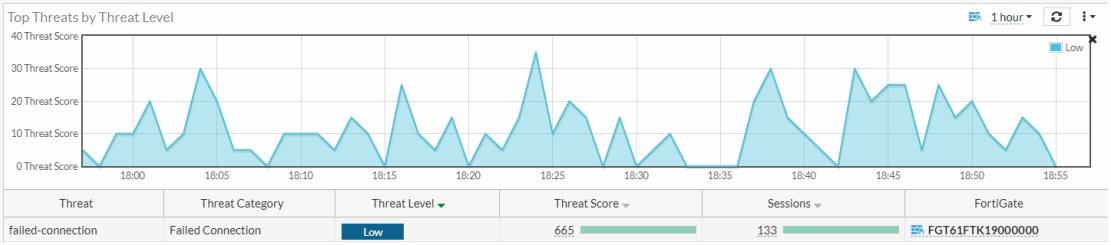
To configure threat weight settings:

1. Go to *Log & Report* > *Threat Weight*.
2. Adjust the settings as needed, such as individual weights per threat type and risk level values.
3. Click *Apply*.

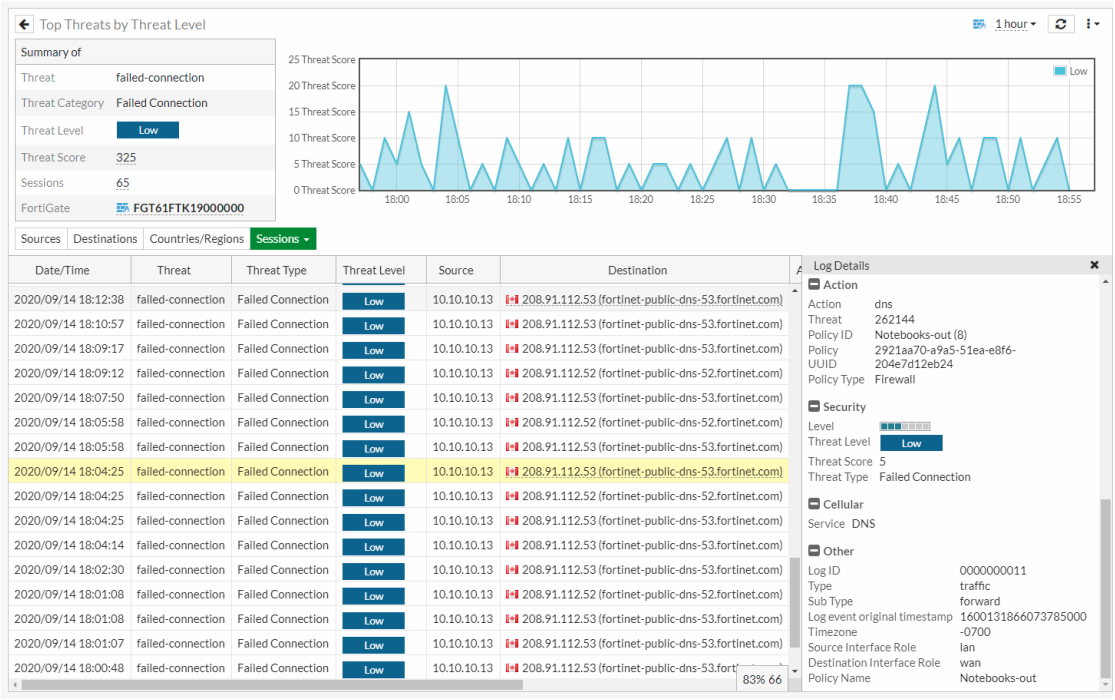
To add the Top Threats monitor to the dashboard:

1. In the tree menu, click *Dashboard* and in the FortiView section, click the + sign (*Add Monitor*).
2. In the *Security* section, enable *Show More* and click *Top Threats*.
3. Configure the settings as needed.
4. Click *Add Monitor*.

5. Go to *Dashboard* > *Top Threats*. The *Top Threats* monitor displays threats based on the scores in the traffic logs.



6. Double-click a threat to view the summary.
7. Click *Sources*, *Destinations*, *Countries/Regions*, or *Sessions* to view more information. Double-click an entry to view the log details.



Logs for the execution of CLI commands

The `cli-audit-log` option records the execution of CLI commands in system event logs (log ID 44548). In addition to `execute` and `config` commands, `show`, `get`, and `diagnose` commands are recorded in the system event logs.

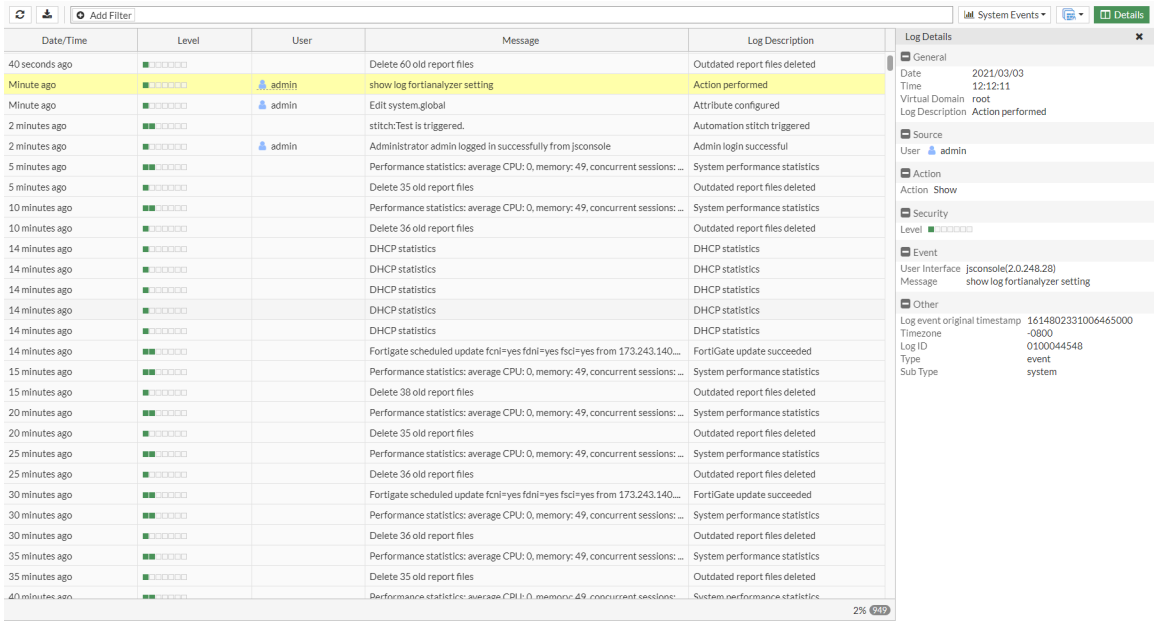
The `cli-audit-log` data can be recorded on memory or disk, and can be uploaded to FortiAnalyzer, FortiGate Cloud, or a syslog server.

To enable the CLI audit log option:

```
config system global
    set cli-audit-log enable
end
```

To view system event logs in the GUI:

1. Run the command in the CLI (`# show log fortianalyzer setting`).
2. Go to *Log & Report* > *Events* > *System Events*.
3. In the log location dropdown, select *Memory*.
4. Select the log entry and click *Details*.



To display the logs:

```
# execute log filter device disk
# execute log filter category event
# execute log filter field subtype system
# execute log filter field logid 0100044548
# execute log display
```

Sample log:

```

user="admin" ui="jsconsole(2.0.228.202)" action="Diagnose" msg="diagnose log test"
```

Troubleshooting

The following topics provide information about troubleshooting logging and reporting:

- Log-related diagnose commands on page 1929
- Backing up log files or dumping log messages on page 1935
- SNMP OID for logs that failed to send on page 1936

Log-related diagnose commands

This topic shows commonly used examples of log-related diagnose commands.

Use the following diagnose commands to identify log issues:

- The following commands enable debugging log daemon (`miglogd`) at the proper debug level:

```
diagnose debug application miglogd x
diagnose debug enable
```

- The following commands display different status/statistics of `miglogd` at the proper level:

```
diagnose test application miglogd x
diagnose debug enable
```

To get the list of available levels, press `Enter` after `diagnose test/debug application miglogd`. The following are some examples of commonly use levels.

If the debug log display does not return correct entries when log filter is set:

```
diagnose debug application miglogd 0x1000
```

For example, use the following command to display all login system event logs:

```
execute log filter device disk
execute log filter category event
execute log filter field action login

execute log display

```

You can check and/or debug the FortiGate to FortiAnalyzer connection status.

To show connect status with detailed information:

```
diagnose test application miglogd 1

faz: global , enabled
        server=172.18.64.234, realtime=3, ssl=1, state=connected, src=, mgmt_name=FGh_Log_
vdom1_172.18.64.234, reliable=0, sni_prefix_type=none, required_entitlement=none
                status: ver=6, used_disk=0, total_disk=0, global=0, vfid=0 conn_verified=Y
                SNs: last sn update:107 seconds ago.
                        Sn list:
                        (FL-8HFT718900132,age=107s)
                queue: qlen=0.
filter: severity=6, sz_exclude_list=0
         voip dns ssh ssl cifs
subcategory:
        traffic: forward local multicast sniffer
        anomaly: anomaly

        server: global, id=0, fd=132, ready=1, ipv6=0, 172.18.64.234/514
        oftp-state=5
```

To collect debug information when FortiAnalyzer is enabled:

```
diagnose debug application miglogd 0x100

To check the FortiGate to FortiGate Cloud log server connection status:

```
diagnose test application miglogd 20

FGT-B-LOG # diagnose test application miglogd 20
Home log server:
    Address: 172.16.95.92:514
```

```
Alternative log server:
    Address: 172.16.95.26:514
    oftp status: established
Debug zone info:
    Server IP:      172.16.95.92
    Server port:    514
    Server status:  up
    Log quota:      102400MB
    Log used:       673MB
    Daily volume:   20480MB
    FDS arch pause: 0
    fams archive pause: 0
```

To check real-time log statistics by log type since the miglogd daemon start:

```
diagnose test application miglogd 4

FGT-B-LOG (global) # diagnose test application miglogd 4
info for vdom: root

To check log statistics to the local/remote log device since the miglogd daemon start:

```
diagnose test application miglogd 6 1     <<<  1 means the first child daemon

diagnose test application miglogd 6 2     <<<  2 means the second child daemon

FGT-B-LOG (global) # diagnose test application miglogd 6 1
mem=4288, disk=4070, alert=0, alarm=0, sys=5513, faz=4307, webt=0, fds=0
interface-missed=208
Queues in all miglogds: cur:0  total-so-far:36974
global log dev statistics:
syslog 0: sent=6585, failed=152, relayed=0
faz 0: sent=13, failed=0, cached=0, dropped=0 , relayed=0
```

To check the miglogd daemon number and increase/decrease miglogd daemon:

```
diagnose test application miglogd 15     <<<  Show miglog ID

diagnose test application miglogd 13     <<<  Increase one miglogd child

diagnose test application miglogd 14     <<<  Decrease one miglogd child

FGT-B-LOG (global) # diagnose test application miglogd 15
Main miglogd: ID=0, children=2, active-children=2
        ID=1, duration=70465.
        ID=2, duration=70465.

FGT-B-LOG (global) # diagnose test application miglogd 13

FGT-B-LOG (global) # diagnose test application miglogd 15
Main miglogd: ID=0, children=3, active-children=3
        ID=1, duration=70486.
        ID=2, duration=70486.
        ID=3, duration=1.

FGT-B-LOG (global) # diagnose test application miglogd 14

FGT-B-LOG (global) # diagnose test application miglogd 15
Main miglogd: ID=0, children=2, active-children=2
        ID=1, duration=70604.
        ID=2, duration=70604.
```

To check the remote queue and see the maximum buffered memory size:

```
diagnose test application miglogd 41

cache maximum: 105405644(100MB) objects: 0 used: 0(0MB) allocated: 0(0MB)

VDOM:root
Queue for: global-faz

       memory queue:
               num:0 size:0(0MB) max:105405644(100MB) logs:0

Queue for: fds
```

```
memory queue:
        num:0 size:0(0MB) max:97852620(93MB) logs:0
```

Backing up log files or dumping log messages

When a log issue is caused by a particular log message, it is very help to get logs from that FortiGate. This topic provides steps for using `execute log backup` or dumping log messages to a USB drive.

Backing up full logs using execute log backup

This command backs up all disk log files and is only available on FortiGates with an SSD disk.

Before running `execute log backup`, we recommend temporarily stopping `miglogd` and `reportd`.

To stop and kill miglogd and reportd:

```
diagnose sys process daemon-auto-restart disable miglogd
diagnose sys process daemon-auto-restart disable reportd
```

Or

1. Determine the process, or thread, ID (PID) of `miglogd` and `reportd`:

   ```
   # diagnose sys top 10 99
   ```

2. Kill each process:

   ```
   # diagnose sys kill 9 <PID>
   ```

To store the log file on a USB drive:

1. Plug in a USB drive into the FortiGate.
2. Run this command:

   ```
   execute log backup /usb/log.tar
   ```

To restart miglogd and reportd:

```
diagnose sys process daemon-auto-restart enable miglogd
diagnose sys process daemon-auto-restart enable reportd
```

Dumping log messages

To dump log messages:

1. Enable log dumping for `miglogd` daemon:

   ```
   (global) # diagnose test application miglogd 26 1
   miglogd(1) log dumping is enabled
   ```

2. Display all `miglogd` dumping status:

   ```
   global) # diagnose test application miglogd 26 0 255
   miglogd(0) log dumping is disabled
   ```

```
miglogd(1) log dumping is enabled
miglogd(2) log dumping is disabled

(global) # diagnose test application miglogd 26 2
miglogd(2) log dumping is enabled

(global) # diagnose test application miglogd 26 0
miglogd(0) log dumping is enabled

(global) # diagnose test application miglogd 26 0 255
miglogd(0) log dumping is enabled
miglogd(1) log dumping is enabled
miglogd(2) log dumping is enabled
```

3. Let the FortiGate run and collect log messages.
4. List the log dump files:

```
(global) # diagnose test application miglogd 33
2019-04-17 15:50:02          20828      log-1-0.dat
2019-04-17 15:48:31           4892      log-2-0.dat
```

5. Back up log dump files to the USB drive:

```
(global) # diagnose test application miglogd 34

Dumping file miglog1_index0.dat copied to USB disk OK.

Dumping file miglog2_index0.dat copied to USB disk OK.
```

6. Disable log dumping for `miglogd` daemon:

```
(global) # diagnose test application miglogd 26 0
miglogd(0) log dumping is disabled

(global) # diagnose test application miglogd 26 1
miglogd(1) log dumping is disabled

(global) # diagnose test application miglogd 26 2
miglogd(2) log dumping is disabled

(global) # diagnose test application miglogd 26 0 255
miglogd(0) log dumping is disabled
miglogd(1) log dumping is disabled
miglogd(2) log dumping is disabled
```

SNMP OID for logs that failed to send

When a syslog server encounters low-performance conditions and slows down to respond, the buffered syslog messages in the kernel might overflow after a certain number of retransmissions, causing the overflowed messages to be lost. OIDs track the lost messages or failed logs.

SNMP query OIDs include log statistics for global log devices:

- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDeviceNumber 1.3.6.1.4.1.12356.101.21.1.1
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEntryIndex 1.3.6.1.4.1.12356.101.21.2.1.1.1

- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceEnabled 1.3.6.1.4.1.12356.101.21.2.1.1.2
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceName 1.3.6.1.4.1.12356.101.21.2.1.1.3
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceSentCount 1.3.6.1.4.1.12356.101.21.2.1.1.4
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceRelayedCount 1.3.6.1.4.1.12356.101.21.2.1.1.5
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceCachedCount 1.3.6.1.4.1.12356.101.21.2.1.1.6
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceFailedCount 1.3.6.1.4.1.12356.101.21.2.1.1.7
- FORTINET-FORTIGATE-MIB:fortinet.fnFortiGateMib.fgLog.fgLogDevices.fgLogDeviceTable.fgLogDeviceEntry.fgLogDeviceDroppedCount 1.3.6.1.4.1.12356.101.21.2.1.1.8

Where:

- fgLogDeviceNumber is the number of devices in the table.
- fgLogDeviceEnabled is either 1 or 0, indicating whether the device is enabled.
- fgLogDeviceName is the name of the device.

A FortiGate connected to a syslog server or FortiAnalyzer generates statistics that can be seen using the `diagnose test application miglogd` command:

```
(global) # diagnose test application miglogd 6
    mem=404, disk=657, alert=0, alarm=0, sys=920, faz=555, webt=0, fds=0
    interface-missed=460
    Queues in all miglogds: cur:0 total-so-far:526
    global log dev statistics:
    syslog 0: sent=254, failed=139, relayed=0
    syslog 1: sent=220, failed=139, relayed=0
    syslog 2: sent=95, failed=73, relayed=0
    faz 0: sent=282, failed=0, cached=0, dropped=0 , relayed=0
    Num of REST URLs: 3
    /api/v2/monitor/system/csf/ : 0 : 300
    /api/v2/cmdb/system/interface/ : 394.0.673.15877729363538323653.1547149763 : 1200
    /api/v2/monitor/system/ha-checksums/ : 0 : 1200
    faz 1: sent=272, failed=0, cached=0, dropped=0 , relayed=0
    Num of REST URLs: 2
    /api/v2/monitor/system/csf/ : 0 : 300
    /api/v2/cmdb/system/interface/ : 394.0.673.15877729363538323653.1547149763 : 1200
```

The same statistics are also available in `snmpwalk/snmpget` on the OID 1.3.6.1.4.1.12356.101.21.

```
snmpwalk -v2c -c REGR-SYS 172.16.200.1 1.3.6.1.4.1.12356.101.21

FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.2 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.3 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.4 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.5 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.6 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.7 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.8.8 = Counter32: 0
```

To get the type of logging device that is attached to the FortiGate:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.3
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.0 = STRING: "syslog"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.1 = STRING: "syslog2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.2 = STRING: "syslog3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.3 = STRING: "syslog4"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.4 = STRING: "faz"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.5 = STRING: "faz2"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.6 = STRING: "faz3"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.7 = STRING: "webtrends"
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.3.8 = STRING: "fds"
```

To get the present state of the logging device that is attached to the FortiGate:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.2
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.0 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.1 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.2 = INTEGER: 1
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.3 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.4 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.5 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.6 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.7 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.2.8 = INTEGER: 0
```

To get the failed log count value:

```
root@PC05:/home/tester/autolib/trunk# snmpwalk -v2c -c REGR-SYS 172.16.200.1
1.3.6.1.4.1.12356.101.21.2.1.1.7
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.0 = Counter32: 139
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.1 = Counter32: 139
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.2 = Counter32: 73
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.3 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.4 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.5 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.6 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.7 = Counter32: 0
FORTINET-FORTIGATE-MIB::fnFortiGateMib.21.2.1.1.7.8 = Counter32: 0
```

Private cloud

See the Private Cloud section in the Public/Private Cloud document library.

VM license

The *FortiGate VM License* page is accessible from the *Dashboard* > *Status* page in the *Virtual Machine* widget. Click the device license and select *FortiGate VM License*.

The *FortiGate VM License* page displays the following information:

Field	Description
License status	One of the following statuses is displayed: • Valid: the VM can connect and validate the license against a FortiManager or FortiGuard server. All features are available. • Warning: the VM cannot connect and validate against a FortiManager or FortiGuard server. A check is made against how many days the warning status is continuous. If the number is less than 30 days, the status does not change. • Invalid: the VM cannot connect and validate against a FortiManager or FortiGuard server. A check is made against how many days the warning status is continuous. If the number is 30 days or more, the status changes to invalid. GUI access is restricted until a valid license is uploaded. Firewall policies will not work. FortiGuard downloads are not available. • Pending: a temporary state where the VM is attempting to validate its license. Reasons for having a warning or invalid status include: • The network environment does not allow FortiGate-VM to connect to the FortiGuard server. • The license might be expired. Check the expiration date for evaluation or term-based licenses. • Another VM has been already validated with FortiGuard using the same license. See VM license activation for details about duplicated VM instances.
Allocated vCPUs	Number of allocated and total allowable vCPUs
Allocated RAM	Amount of allocated RAM (in FortiOS 6.2.2 and later, there are no RAM restrictions)
Expires on	Expiry date (value depends on the type of license)

This information is visible in the CLI by running `get system status` (see CLI troubleshooting).

Uploading a license file

After you submit an order for a FortiGate-VM, Fortinet sends a license registration code to the email address that you entered in the order form. Use this code on the FortiCloud portal to register the FortiGate-VM.

Once the VM is registered, you can download the license file in .LIC format. On the *FortiGate VM License* page, click *Upload*. The system will prompt you to reboot and validate the license with the FortiGuard server. Once validated, your FortiGate-VM is fully functional.

The VM license window may also appear immediately after logging in if you are running a VM with an evaluation license that has expired.

In cases where the GUI is not accessible, you can upload the license using secure copy (SCP).

For information about injecting Flex-VM license tokens, see *Injecting tokens into FortiGate-VM* in the *Flex VM Deployment Guide*.

To upload the license using SCP:

1. Enable SCP:

```
config system global
    set admin-scp enable
end
```

2. Enable SSH in the administrative access for the interface where the transfer will take place:

```
config system interface
    edit <interface>
        append allowaccess ssh
    next
end
```

3. On your computer, upload the VM license. This example is for Linux:

```
scp <filename> <admin-user>@<FortiGate_IP>:vmlicense
```

Types of VM licenses

FortiGate-VM offers perpetual licensing (normal series and V-series) and annual subscription licensing (S-series). SKUs are based on the number of vCPUs (1, 2, 4, 8, 16, 32, or unlimited).

The Flex-VM program allows qualified enterprise and MSSP customers to create as many VM entitlements as required. Resource consumption is based upon predefined points that are calculated on a daily basis. For information, see the *Flex-VM Program Guide* in the Fortinet document library.

Feature	Normal series V-series	S-series	Flex-VM
Licensing and support	The VM base is perpetual. You must separately contract support services on an annual basis. See the price list for details.	Single annually contracted SKU that contains a VM base and a FortiCare service bundle. Four support service bundle types are available: • Only FortiCare • UTM • Enterprise • ATP	An annually contracted program to create multiple sets of a single entitlement per VM. Entitlements contain a VM base and FortiCare bundle. Four support service bundle types are available: • Only FortiCare • UTM • Enterprise • ATP

Feature	Normal series	V-series	S-series	Flex-VM
vCPU number upgrade during contracted term	Not supported.		Supported. You can also upgrade the support service bundle. Contact a Fortinet sales representative to upgrade.	Supported. You can apply different VM entitlement configurations in the Flex-VM portal. API is not supported at this time.
vCPU number downgrade during contracted term	Not supported.			
VDOM support	By default, each CPU level supports up to a certain number of VDOMs. Refer to the FortiGate-VM data sheet for default limits.	By default, all CPU levels do not support adding VDOMs.		

CLI troubleshooting

In some cases, more information can be viewed from the CLI to diagnose issues with VM licensing. This is also useful when the GUI is inaccessible due to an invalid contract.

Before you begin, ensure your FortiGate has the proper routes to connect to the internet.

To view the license status, expiration date, and VM resources:

```
# get system status
Version: FortiGate-VM64-KVM v6.4.2,build1723,200730 (GA)
...
Serial-Number: FGVM08**********
....
License Status: Valid
License Expiration Date: 2020-12-10
VM Resources: 1 CPU/8 allowed, 2010 MB RAM
...
```

To display license details:

```
# diagnose debug vm-print-license
SerialNumber: FGVM08**********
CreateDate: Tue Dec 10 00:57:32 2019
License expires: Thu Dec 10 00:00:00 2020
Expiry: 366
Key: yes
Cert: yes
Key2: yes
```

```
Cert2: yes
Model: 08 (11)
CPU: 8
MEM: 2147483647
```

To display license information from FortiGuard:

```
# diagnose hardware sysinfo vm full
UUID:     abbe**************************
valid:    1
status:   1
code:     200
warn:     0
copy:     0
received: 4604955037
warning:  4600905081
recv:     202009152207
dup:
```

This combination indicates the license is valid and functioning normally:

```
valid: 1
status: 1
code: 200
```

This combination indicates the license is valid but may be running a duplicate instance:

```
valid: 1
status: 4
code: 401
```

This combination indicates the system cannot connect to FortiGuard:

```
valid:    0
status:   2
code:     502
```

This combination indicates the license is invalid:

```
valid: 0
status: 3
code: 400
```

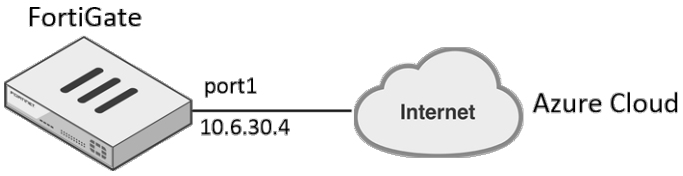
Contact Fortinet Support for assistance if your licensing issue persists.

FortiGate multiple connector support

This guide shows how to configure Fabric connectors and resolve dynamic firewall addresses through the configured Fabric connector in FortiOS.

FortiOS supports multiple Fabric connectors including public connectors (AWS, Azure, GCP, OCI, AliCloud) and private connectors (Kubernetes, VMware ESXi, VMware NSX, OpenStack, Cisco ACI, Nuage). FortiOS also supports multiple instances for each type of Fabric connector.

This guide uses an Azure Fabric connector as an example. The configuration procedure for all supported Fabric connectors is the same. In the following topology, the FortiGate accesses the Azure public cloud through the Internet:



This process consists of the following:

1. Configure the interface.
2. Configure a static route to connect to the Internet.
3. Configure two Azure Fabric connectors with different client IDs.
4. Check the configured Fabric connectors.
5. Create two firewall addresses.
6. Check the resolved firewall addresses after the update interval.
7. Run diagnose commands.

To configure the interface:

1. In FortiOS, go to *Network* > *Interfaces*.
2. Edit port1:
   a. From the *Role* dropdown list, select *WAN*.
   b. In the *IP/Network Mask* field, enter 10.6.30.4/255.255.255.0 for the interface connected to the Internet.

To configure a static route to connect to the Internet:

1. Go to *Network* > *Static Routes*. Click *Create New*.
2. In the *Destination* field, enter 0.0.0.0/0.0.0.0.
3. From the *Interface* dropdown list, select *port1*.
4. In the *Gateway Address* field, enter 10.60.30.254.

To configure two Azure Fabric connectors with different client IDs:

1. Go to *Security Fabric* > *External Connectors*.
2. Click *Create New*. Configure the first Fabric connector:
   a. Select *Microsoft Azure*.
   b. In the *Name* field, enter azure1.
   c. In the *Status* field, select *Enabled*.
   d. From the *Server* region dropdown list, select *Global*.
   e. In the *Tenant ID* field, enter the tenant ID. In this example, it is 942b80cd-1b14-42a1-8dcf-4b21dece61ba.
   f. In the *Client ID* field, enter the client ID. In this example, it is 14dbd5c5-307e-4ea4-8133-68738141feb1.
   g. In the *Client secret* field, enter the client secret.
   h. Leave the *Resource path* disabled.
   i. Click *OK*.
3. Click *Create New*. Configure the second Fabric connector:
   a. Select *Microsoft Azure*.
   b. In the *Name* field, enter azure2.
   c. In the *Status* field, select *Enabled*.
   d. From the *Server* region dropdown list, select *Global*.

e. In the *Tenant ID* field, enter the tenant ID. In this example, it is 942b80cd-1b14-42a1-8dcf-4b21dece61ba.
f. In the *Client ID* field, enter the client ID. In this example, it is 3baf0a6c-44ff-4f94-b292-07f7a2c36be6.
g. In the *Client secret* field, enter the client secret.
h. Leave the *Resource path* disabled.
i. Click *OK*.

To check the configured Fabric connectors:

1. Go to *Security Fabric* > *External Connectors*.
2. Click the *Refresh* icon in the upper right corner of each configured Fabric connector. A green up arrow appears in the lower right corner, meaning that both Fabric connectors are connected to the Azure cloud using different client IDs.

To create two firewall addresses:

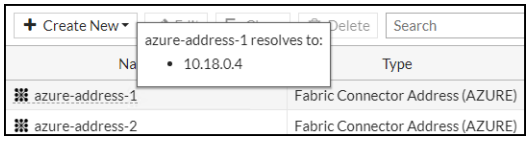
This process creates two Fabric connector firewall addresses to associate with the configured Fabric connectors.

1. Go to *Policy & Objects* > *Addresses*.
2. Click *Create New* > *Address*. Configure the first Fabric connector firewall address:
   a. In the *Name* field, enter azure-address-1.
   b. From the *Type* dropdown list, select *Fabric Connector address*.
   c. From the *SDN Connector* dropdown list, select *azure1*.
   d. For *SDN address type*, select *Private*.
   e. From the *Filter* dropdown list, select the desired filter.
   f. For *Interface*, select *any*.
   g. Click *OK*.
3. Click *Create New* > *Address*. Configure the second Fabric connector firewall address:
   a. In the *Name* field, enter azure-address-1.
   b. From the *Type* dropdown list, select *Fabric Connector address*.
   c. From the *SDN Connector* dropdown list, select *azure2*.
   d. For *SDN address type*, select *Private*.
   e. From the *Filter* dropdown list, select the desired filter.
   f. For *Interface*, select *any*.
   g. Click *OK*.

To check the resolved firewall addresses after the update interval:

By default, the update interval is 60 seconds.

1. Go to *Policy & Objects* > *Addresses*.
2. Hover over the created addresses. The firewall address that the configured Fabric connectors resolved display.



To run diagnose commands:

Run the `show sdn connector status` command. Both Fabric connectors should appear with a status of connected.

Run the `diagnose debug application azd -1` command. The output should look like the following:

```
Level2-downstream-D # diagnose debug application azd -1
...
azd sdn connector azure1 start updating IP addresses
azd checking firewall address object azure-address-1, vd 0
IP address change, new list:
10.18.0.4
...
```

To restart the Azure Fabric connector daemon, run the `diagnose test application azd 99` command.

Adding VDOMs with FortiGate v-series

Each FortiGate-VM base license type allows a default number of VDOMs. This topic provides sample procedures to add VDOMs beyond the default number using separately purchased VDOM licenses.

This topic consists of the following steps:

1. Activate the FortiGate-VM with the base license.
2. Add more VDOMs to the FortiGate-VM.

To activate the FortiGate-VM with the base license:

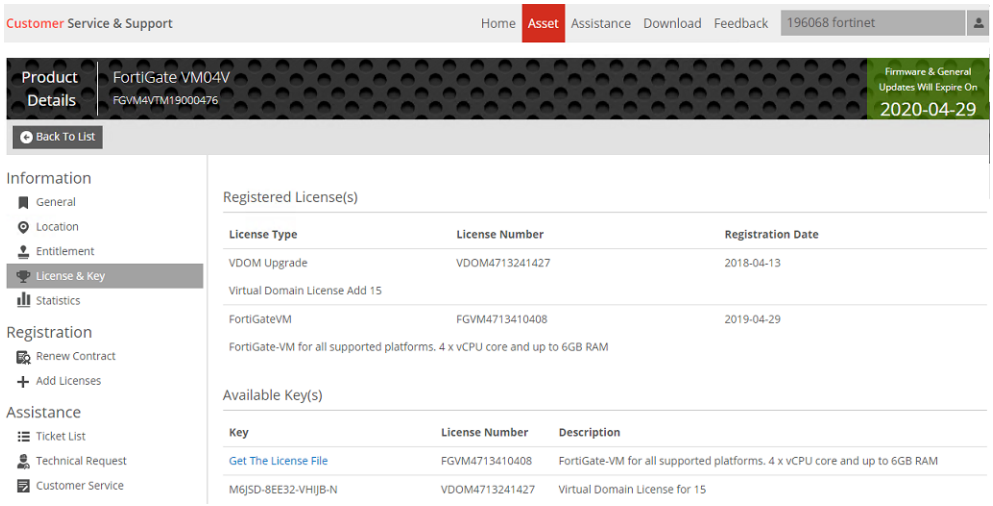
1. Purchase and register the FortiGate-VM base license in FortiCare:
   a. Purchase the FortiGate-VM base license from Fortinet or a Fortinet reseller.
   b. You receive a license certification with a registration code. Open the certification.
   c. Log in to Fortinet Customer Service & Support.
   d. Go to *Asset* > *Register/Activate* and enter the provided registration code.
   e. Follow the registration process. The serial number generates and displays on the *Registration Completion* page.
   f. Go to *Asset* > *Manage/View Products*. Click the serial number to download the license file.
2. Upload the FortiGate-VM base license file to FortiOS:
   a. Log in to the FortiGate-VM GUI.
   b. In *Dashboard* > *Status*, in the *Virtual Machine* widget, click *FortiGate VM License*.
   c. Click the *Upload* button.
   d. Select the FortiGate-VM base license file, then click *OK*. The FortiGate-VM reboots after applying the base license.
3. Verify the FortiGate-VM base license status and VDOM information:
   a. Log in to the FortiGate-VM GUI.
   b. In *Dashboard* > *Status*, in the *Virtual Machine* widget, ensure that there is a checkmark in front of the FortiGate-VM base license name. The checkmark indicates that the base license is valid.
   c. You can check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently one. This is correct since the FortiGate-VM base license only supports the default root VDOM that the system uses.

To add more VDOMs to the FortiGate-VM:

You can repeat this procedure multiple times to stack multiple VDOM licenses on the same FortiGate-VM.

1. Purchase and register the FortiGate-VM upgrade license in FortiCare. This example adds 15 VDOMs:
   a. Purchase the FortiGate-VM upgrade license from Fortinet or a Fortinet reseller.
   b. You receive a license certification with a registration code. Open the certification.
   c. Log in to Fortinet Customer Service & Support.
   d. Go to *Asset* > *Register/Activate* and enter the provided registration code.
   e. On the *Specify License Confirmation Information* screen, enter the FortiGate-VM serial number to apply the VDOM upgrade license to the FortiGate-VM. In this example, the FortiGate-VM serial number is *FGVM4VTM19000476*.

   f. Follow the registration process.
   g. Go to *Asset* > *Manage/View Products* > . Select the desired product, then click *License & Key*. The VDOM upgrade license displays under *Registered License(s)*, and a key for adding 15 VDOMs (in this example *M6JSD-8EE32-VHIJB-N*) displays under *Available Key(s)*.



2. Apply the FortiGate-VM upgrade license key to FortiOS:
   a. Log in to the FortiGate-VM CLI in the local console or using SSH.
   b. Apply the VDOM upgrade license key:
   ```
   FGVM4VTM19000476 # execute upd-vd-license M6JSD-8EE32-VHIJB-N
   update vdom license succeeded
   ```
3. Verify the FortiGate-VM VDOM information:
   a. Log in to the FortiGate-VM CLI in the local console or using SSH.
   b. Check VDOM information using the CLI. The following output shows that the maximum number of VDOMs is currently 15. When you add VDOMs for the first time on a FortiGate-VM v-series instance, FortiOS does not count the default VDOM, as the default VDOM is the so-called root VDOM that the system uses and FortiOS does not treat it as a countable VDOM in terms of VDOM addition. Therefore, as in this example, if your FortiGate-VM had the default VDOM configuration, then you add 15 VDOMs, FortiOS displays the maximum VDOM number as 15, not 16.

```

```

Terraform: FortiOS as a provider

Fortinet's Terraform support provides customers with more ways to efficiently deploy, manage, and automate security across physical FortiGate appliances and virtual environments. You can use Terraform to automate various IT infrastructure needs, thereby diminishing mistakes from repetitive manual configurations.

For example, if Fortinet is releasing a new FortiOS version, your organization may require you to test a new functionality to determine how it may impact the environment before globally deploying the new version. In this case, the ability to rapidly stand up environments and test these functions prior to production environment integration provides a resource-efficient and fault-tolerant approach.

The following example demonstrates how to use the Terraform FortiOS provider to perform simple configuration changes on a FortiGate unit. It requires the following:

- FortiOS 6.0 or later
- FortiOS Provider: This example uses terraform-provider-fortios 1.0.0.
- Terraform: This example uses Terraform 0.11.14.
- REST API administrator created on the FortiGate with the API key

For more information, see the Terraform FortiOS Provider at https://www.terraform.io/docs/providers/fortios/index.html.

To create a REST API administrator:

1. On the FortiGate, go to *System* > *Administrators* and click *Create New* > *REST API Admin*.
2. Enter the *Username* and, optionally, enter *Comments*.
3. Select an *Administrator Profile*.
4. We recommend that you create a new profile with minimal privileges for this terraform script:
   a. In the *Administrator Profile* drop down click *Create New*.
   b. Enter a name for the profile.
   c. Configure the *Access Permissions*:
      - *None*: The REST API is not permitted access to the resource.
      - *Read*: The REST API can send read requests (`HTTP GET`) to the resource.
      - *Read/Write*: The REST API can send read and write requests (`HTTP GET`/`POST`/`PUT`/`DELETE`) to the resource.
   d. Click *OK*.
5. Enter *Trusted Hosts* to specify the devices that are allowed to access this FortiGate.
6. Click *OK*.
   An API key is displayed. This key is only shown once, so you must copy and store it securely.

To configure FortiGate with Terraform Provider module support:

1. Download the terraform-provider-fortios file to a directory on the management computer.
2. Create a new file with the .tf extension for configuring your FortiGate:
```
root@mail:/home/terraform# ls
terraform-provider-fortios_v1.0.0_x4 test.tf
```
3. Edit the test.tf Terraform configuration file:
   In this example, the FortiGate's IP address is 10.6.30.5, and the API user token is 17b**********63ck. Your provider information must also be changed.

```
# Configure the FortiOS Provider
provider "fortios" {
hostname = "10.6.30.5"
token = "17b**********63ck"
}
```

4. Create the resources for configuring your DNS object and adding a static route:

```
resource "fortios_system_setting_dns" "test1" {
primary = "172.16.95.16"
secondary = "8.8.8.8"
}
resource "fortios_networking_route_static" "test1" {
dst = "110.2.2.122/32"
gateway = "2.2.2.2"
blackhole = "disable"
distance = "22"
weight = "3"
priority = "3"
device = "port2"
comment = "Terraform test"
}
```

5. Save your Terraform configuration file.

6. In the terminal, enter `terraform init` to initialize the working directory.
   It reads the provider if the name follows the convention `terraform-provider-[name]`:

```
root@mail:/home/terraform# terraform init
Initializing the backend...
Terraform has been successfully initialized!
You may now begin working with Terraform. Try running "terraform plan" to see
any changes that are required for your infrastructure. All Terraform commands
should now work.
If you ever set or change modules or backend configuration for Terraform,
rerun this command to reinitialize your working directory. If you forget, other
commands will detect it and remind you to do so if necessary.
```

7. Run `terraform -v` to verify the version of loaded provider module:

```
root@mail:/home/terraform# terraform -v
Terraform v0. 11.14
+ provider.fortios v1.0.0
```

8. Enter `terraform plan` to parse the configuration file and read from the FortiGate configuration to see what Terraform changes:
   This example create a static route and updates the DNS address. You can see that Terraform reads the DNS addresses from the FortiGate and then lists them.

```
root@mail:/home/terraform# terraform plan
Refreshing Terraform state in-memory prior to plan...
The refreshed state will be used to calculate this plan, but will not be
persisted to local or remote state storage.
fortios_networking_route_static.test1: Refreshing state... (ID: 2)
fortios_system_setting_dns.test1: Refreshing state... (ID: 208.91.112.53)
------------------------------------------------------------------------
An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
+ create
~ update in-place
Terraform will perform the following actions:
+ fortios_networking_route_static.test1
id: <computed>
blackhole: "disable"
comment: "Terraform test"
device: "port2"
distance: "22"
dst: "110.2.2.122/32"
gateway: "2.2.2.2"
priority: "3"
weight: "3"
~ fortios_system_setting_dns.test1
primary: "208.91.112.53" => "172.16.95.16"
secondary: "208.91.112.22" => "8.8.8.8"
Plan: 1 to add, 1 to change, 0 to destroy.
------------------------------------------------------------------------
Note: You didn't specify an "-out" parameter to save this plan, so Terraform
can't guarantee that exactly these actions will be performed if
"terraform apply" is subsequently run.
```

If you are running terraform-provider-fortios 1.1.0, you may see the following error:

```
Error: Error getting CA Bundle, CA Bundle should be set when
     insecure is false.
```

In this case, add the following line to the FortiOS provider configuration in the test.tf file:

```
insecure = "true"
```

9. Enter `terraform apply` to continue the configuration:

```
root@mail:/home/terraform# terraform apply
fortios_system_setting_dns.test1: Refreshing state... (ID: 208.91.112.53)
fortios_networking_route_static.test1: Refreshing state... (ID: 2)
An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
+ create
~ update in-place
Terraform will perform the following actions:
+ fortios_networking_route_static.test1
id: <computed>
blackhole: "disable"
comment: "Terraform test"
device: "port2"
distance: "22"
dst: "110.2.2.122/32"
gateway: "2.2.2.2"
priority: "3"
weight: "3"
~ fortios_system_setting_dns.test1
primary: "208.91.112.53" => "172.16.95.16"
secondary: "208.91.112.22" => "8.8.8.8"
Plan: 1 to add, 1 to change, 0 to destroy.
Do you want to perform these actions?
Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.
Enter a value: yes
fortios_networking_route_static.test1: Creating...
blackhole: "" => "disable"
comment: "" => "Terraform test"
device: "" => "port2"
distance: "" => "22"
dst: "" => "110.2.2.122/32"
gateway: "" => "2.2.2.2"
priority: "" => "3"
weight: "" => "3"
fortios_system_setting_dns.test1: Modifying... (ID: 208.91.112.53)
primary: "208.91.112.53" => "172.16.95.16"
secondary: "208.91.112.22" => "8.8.8.8"
fortios_networking_route_static.test1: Creation complete after 0s (ID: 2)
fortios_system_setting_dns.test1: Modifications complete after 0s (ID: 172.16.95.16)
Apply complete! Resources: 1 added, 1 changed, 0 destroyed.
```

The FortiGate is now configured according to the configuration file.

10. To change or delete something in the future, edit the configuration file and then apply it again. In supported cases, it deletes, adds, or updates new entries as configured. For instance, in this example you can remove the static route and revert the DNS address to its original configuration by changing the .tf file:

a. Edit the configuration file:

```
# Configure the FortiOS Provider
provider "fortios" {
hostname = "10.6.30.5"
token = "17b********************63ck"
}
resource "fortios_system_setting_dns" "test1" {
primary = "208.91.112.53"
secondary = "208.91.112.22"
}
#resource "fortios_networking_route_static" "test1" {
# dst = "110.2.2.122/32"
# gateway = "2.2.2.2"
# blackhole = "disable"
# distance = "22"
# weight = "3"
# priority = "3"
# device = "port2"
# comment = "Terraform test"
#}
```

b. Entering `terraform apply` deletes the static route that is commented out of the configuration file, and reverts the DNS address to the old address:

```
root@mail:/home/terraform# terraform apply
fortios_system_setting_dns.test1: Refreshing state... (ID: 172.16.95.16)
fortios_networking_route_static.test1: Refreshing state... (ID: 2)
An execution plan has been generated and is shown below.
Resource actions are indicated with the following symbols:
~ update in-place
- destroy
Terraform will perform the following actions:
- fortios_networking_route_static.test1
~ fortios_system_setting_dns.test1
primary: "172.16.95.16" => "208.91.112.53"
secondary: "8.8.8.8" => "208.91.112.22"
Plan: 0 to add, 1 to change, 1 to destroy.
Do you want to perform these actions?
Terraform will perform the actions described above.
Only 'yes' will be accepted to approve.
Enter a value: yes
fortios_networking_route_static.test1: Destroying... (ID: 2)
fortios_system_setting_dns.test1: Modifying... (ID: 172.16.95.16)
primary: "172.16.95.16" => "208.91.112.53"
secondary: "8.8.8.8" => "208.91.112.22"
fortios_networking_route_static.test1: Destruction complete after 0s
fortios_system_setting_dns.test1: Modifications complete after 0s (ID: 208.91.112.53)
Apply complete! Resources: 0 added, 1 changed, 1 destroyed.
```

Troubleshooting

Use the HTTPS daemon debug to begin troubleshooting why a configuration was not accepted:

```
# diagnose debug enable
# diagnose debug application httpsd -1
```

The REST API 403 error means that your administrator profile does not have sufficient permissions.

The REST API 401 error means that you do not have the correct token or trusted host.

PF and VF SR-IOV driver and virtual SPU support

FortiGate guest VM supports physical function (PF) and virtual function (VF) PCI passthrough and SR-IOV drivers.

PF provides the ability for PCI Passthrough, but requires an entire Network Interface Card (NIC) for a VM. It can usually achieve greater performance than a VF-based SR-IOV. PF is also expensive. While VF allows multiple guests VMs to share one NIC, PF is allocated to one port on a VM.

The supported driver versions are:

Driver	Version	Hypervisor	PCI passthrough/SR-IOV	vSPU (in-guest DPDK)	Notes
ixgbe	5.6.5	VMware ESXi, KVM	Yes	Yes	
Ixgbevf	4.6.3	VMware ESXi, KVM	Yes		
i40e	2.10.19.82	VMware ESXi, KVM	Yes	Yes	
i40evf	3.6.15	VMware ESXi, KVM	Yes	Yes	Available in FortiOS 6.4.0 and earlier versions.
Iavf	3.7.61.20	VMware ESXi, KVM	Yes	Yes	Replaces i40evf in FortiOS 6.4.1 and later versions. Supports Intel E810-C 100G adapters.
Mlx5	4.6-1.0.1	VMware ESXi, KVM	Yes	Yes	Supports Nvidia ConnectX-5 and ConnectX-6 100G adapters.
Bcxt_en	1.10.1-216.0.416.1	VMware ESXi, KVM	Yes	Yes	Available in FortiOS 6.4.3 and later versions. Supports Broadcom P2100G 100G adapters.
Vmxnet3	1.4.a.0-k-NAPI	VMware ESXi		Yes	The combination of VMware ESXi and NSX-T does not support virtual SPU (vSPU).

Other hypervisors, such as Xen or Microsoft Hyper-V, may work with vSPU, although they are unverified.

All tools and software utilities for UEFI 1.X have been removed from 6.2.0 and later releases. Update to UEFI 2.x to use the UEFI tools or software utilities.

You perform the configuration to use PF or VF on the hypervisor, and do not configure it on the FortiGate.

To check what driver is being used on the FortiGate:

```
# diagnose hardware deviceinfo nic port2
Name:        port2
Driver:      i40e
Version:     2.4.10
Bus:         0000:03:00.0
Hwaddr:      3c:fd:fe:1e:98:02
Permanent Hwaddr:3c:fd:fe:1e:98:02
State:       up
Link:        up
Mtu:         1500
Supported:   auto 1000full 10000full
Advertised:  auto 1000full 10000full
Auto:        disabled
Rx packets:      0
Rx bytes:        0
Rx compressed:       0
...
```

Using OCI IMDSv2

OCI IMDSv2 offers increased security for accessing instance metadata compared to IMDSv1. IMDSv2 is used in OCI SDN connectors and on instance deployments with bootstrap metadata. When upgrading from previous FortiOS builds with legacy IMDSv1 endpoints, the endpoints will be updated to IMDSv2, and the same calls can be made.

The following use cases illustrate IMDSv2 support on the FortiGate-VM.

To configure the Oracle OCI instance to use IMDSv2:

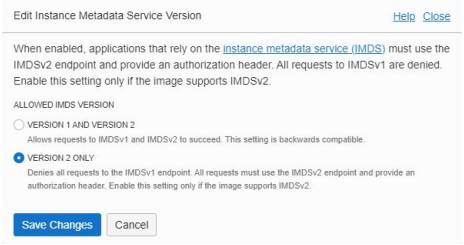
1. In OCI, deploy an instance using IMDSv2 with bootstrap metadata. There are two methods to enable IMDSv2 :
   - Use the OCI command line to deploy an instance using `user-data`. This example uses a MIME file that contains the license and configuration, as well as a JSON file that specifies to disable V1 metadata.

     ```
     oci compute instance launch
     --availability-domain wwwl:US-ASHBURN-AD-1
     --compartment-id
     ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaaaaa7xxxxxxx54aaaaaa4xxxxxxxx55xxxa
     --display-name fos-byol-v6.4.6-b2290-emulated
     ```

```
--image-id
ocid1.image.oc1.iad.aaaaaaaa6xxx43xxxxxxxxx7aaaaaaaaaaaaaaaaaaa3xxxxxxxxxxxxxx
--subnet-id
ocid1.subnet.oc1.iad.aaaaaaaaxxxxxxxxx2xxxxxxxxxxxxxxxxxxxx5aaa4xxxxxxxxxxx42aaa
--shape VM.Standard1.4
--assign-public-ip true
--user-data-file /home/oci/userdata/mime.txt
--ssh-authorized-keys-file /home/oci/userdata/myfirstkeypair.pub
--instance-options file://home/oci/scripts/metadatav2.json

root@mail:/home/oci/scripts# cat metadatav2.json
{
  "areLegacyImdsEndpointsDisabled": true
}
```

- While the instance is running, edit the instance metadata service version in the GUI ,and change the allowed IMDS version to *VERSION 2 ONLY* (see Getting Instance Metadata in the OCI documentation).

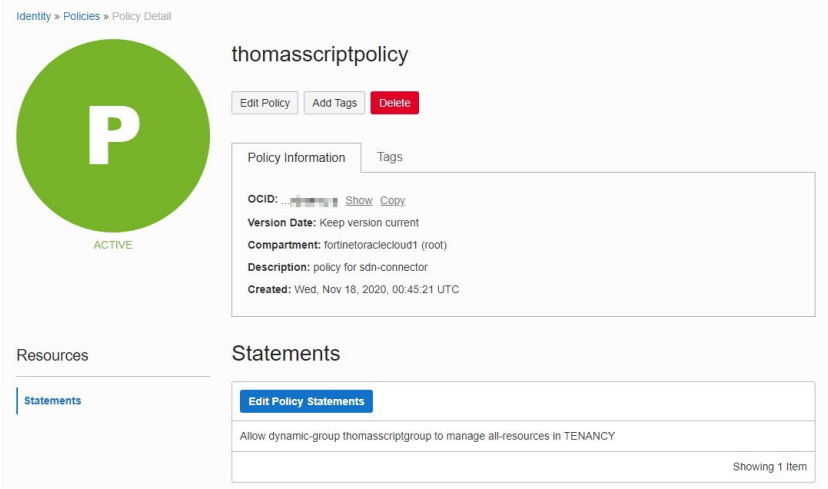


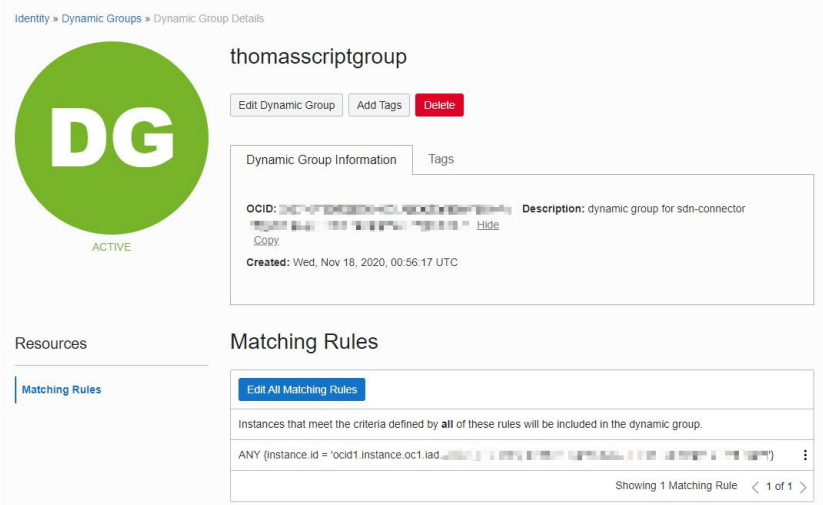
2. The FortiGate will use the metadata v2 endpoints to get the metadata bootstrap information. In FortiOS, verify this by running the following after bootup:

```
# diagnose debug cloudinit show
```

To configure an SDN connector with meta-IAM enabled and firewall addresses to obtain dynamic addresses:

1. Configure an IAM policy and dynamic group (see How Policies Work and Managing Dynamic Groups in the OCI documentation).





2. In FortiOS, configure the OCI Fabric connector (see OCI SDN connector using certificates on page 1819 for detailed instructions):
   a. Create the SDN connector.
   b. Verify that the OCI connector comes up (*Security Fabric > External Connectors* page indicates the status is up).
   c. Configure a dynamic firewall address with a filter.
   d. Verify the dynamic firewall address is resolved by the SDN connector.

To manually update the external IP:

```
# execute update-eip
instance: fos-byol-v6.4.6-b2290-emulated
    vnic0: fos-byol-v6.4.6-b2290-emulated
           10.0.0.58 (129.213.138.192)
port1: 10.0.0.58, eip: 129.213.138.192
EIP is updated successfully
```

To verify the OCI daemon debugs related to metadata:

```
# diagnose test application ocid 4
instance: fos-byol-v6.4.6-b2290-emulated
    vnic0: fos-byol-v6.4.6-b2290-emulated
           10.0.0.58

# diagnose test application ocid 5
Compartment
Id:ocid1.tenancy.oc1..aaaaaaaaaaa3aaaaaaaaaaaaaaaaa7xxxxxxx54aaaaaa4xxxxxxxx55xxxa
Instance Id:ocid1.instance.oc1.iad.axxxxxxxxxxxxxxxxxxx4aaaaa5aaaaaaaaa4xxxxxxx2aaaaaaaa
Instance Name:fos-byol-v6.4.6-b2290-emulated
OCI Regarxiehlion:us-ashburn-1

# diagnose test application ocid 6
Instance Principal Token has been refreshed
```

Troubleshooting

This section is intended for administrators with super_admin permissions who require assistance with basic and advanced troubleshooting. Admins with other types of permissions may not be able to perform all of the tasks in this section.

This section contains the following troubleshooting topics:

- Troubleshooting methodologies on page 1958
- Troubleshooting scenarios on page 1962
  - Checking the system date and time on page 1963
  - Checking the hardware connections on page 1964
  - Checking FortiOS network settings on page 1965
  - Troubleshooting CPU and network resources on page 1968
  - FortiGuard server settings on page 2002
  - Troubleshooting high CPU usage on page 1969
  - Checking the modem status on page 1973
  - Running ping and traceroute on page 1974
  - Checking the logs on page 1977
  - Verifying routing table contents in NAT mode on page 1978

Troubleshooting methodologies

The sections in this topic provide an overview of how to prepare to troubleshoot problems in FortiGate. They include verifiying your user permissions, establishing a baseline, defining the problem, and creating a plan.

Verify user permissions

Before you begin troubleshooting, verify the following:

- You have administrator privileges for the FortiGate.
- The FortiGate is integrated into your network.
- The operation mode is configured.
- The system time, DNS settings, administrator password, and network interfaces are configured.
- Firmware, FortiGuard AntiVirus, FortiGuard Application Control, and FortiGuard IPS are up to date.

If you are using a FortiGate that has virtual domains (VDOMs) enabled, you can often troubleshoot within your own VDOM. However, you should inform the super_admin for the FortiGate that you willl be performing troubleshooting tasks.

You may also need access to other networking equipment, such as switches, routers, and servers to carry out tests. If you do not have access to this equipment, contact your network administrator for assistance.

Establish a baseline

FortiGate operates at all layers of the OSI model. For this reason, troubleshooting can be complex. Establishing baseline parameters for your system before a problem occurs helps to reduce the complexity when you need to troubleshoot.

A best practice is to establish and record the normal operating status. Regular operation data shows trends, and allows you to see where changes occur when problems arise. You can gather this data by using logs and SNMP tools to monitor the system performance or by regularly running information gathering commands and saving the output.

You should back up your FortiOS configuration on a regular basis even when you are not troubleshooting. You can restore the backed up configuration as needed to save time recreating it from the factory default settings.

Use the following CLI commands to obtain normal operating data for a FortiGate:

`get system status`	Displays firmware versions and FortiGuard engine versions, and other system information.
`get system performance status`	Displays CPU and memory states, average network usage, average sessions and session setup rate, viruses caught, IPS attacks blocked, and uptime.
`get hardware memory`	Displays information about memory.
`get system session status`	Displays total number of sessions.
`get router info routing-table all`	Displays all the routes in the routing table, including their type, source, and other useful data.
`get ips session`	Displays memory used and maximum amount available to IPS as well as counts

`get webfilter ftgd-statistics`	Displays a list of FortiGuard related counts of status, errors, and other data.
`diagnose sys session list`	Displays the list of current detailed sessions.
`show sys dns`	Displays the configured DNS servers.
`diagnose sys ntp status`	Displays information about NTP servers.

You can run any commands that apply to your system for information gathering. For example, if you have active VPN connections, use the `get vpn` series of commands to get more information about them.

Use `execute tac report` to get an extensive snapshot of your system. This command runs many diagnostic commands for specific configurations. It also records the current state of each feature regardless of the features deployed on your FortiGate. If you need to troubleshoot later, you can run the same command again and compare the differences to identify any suspicious output.

Define the problem

The following questions are intended to compare the current behavior of the FortiGate with normal operations to help you define the problem. Be specific with your answers. After you define the problem, search for a solution in the troubleshooting scenarios section, and then create a plan to resolve it.

What is the problem?	The problem being observed may not be the actual problem. You should determine where the problem lies before starting to troubleshoot the FortiGate.
Was the device working before?	If the device never worked, it might be defective. For more information, see Troubleshooting your installation on page 59.
Can the problem be reproduced?	If the problem is intermittent, it may be dependent on system load. Intermittent problems are challenging to troubleshoot because they are difficult to reproduce.
What has changed?	Use the FortiGate event log to identify possible configuration changes. There may be changes in the operating environment. For example, there might be a gradual increase in load as more sites are forwarded through the firewall. If something has changed, roll back the change and assess the impact.
What is the scope of the problem?	After you isolate the problem, determine what applications, users, devices, and operating systems the problem affects. The following questions are intended to narrow the scope of the problem and identify what to check during troubleshooting. The more factors you can eliminate, the less you need to check. For this reason, be as specific and accurate as possible when gathering information. • What is not working? • Is more than one thing not working? • Is it partly working? If so, what parts are working? • Is it a connectivity issue for the entire device, or is there an application that isn't reaching the Internet? • Where did the problem occur? • When did the problem occur and to which users or groups of users?

	• What components are involved? • What applications are affected? • Can you use a packet sniffer to trace the problem? • Can you use system debugging or look in the session table to trace the problem? • Do any of the log files indicate a failure has occurred?

Create a troubleshooting plan

After you define the problem and its scope, develop a troubleshooting plan.

Create checklist	Make a list all the possible causes of the problem and how you can test for each cause. Create a checklist to keep track of what has been tried and what is left to test. Checklists are useful when more than one person is performing troubleshooting tasks.
Obtain the required equipment	Testing your solution may require additional networking equipment, computers, or other devices. Network administrators usually have additional networking equipment available to loan you, or a lab where you can bring the FortiGate unit to test. If you do not have access to equipment, check for shareware applications that can perform the same tasks. Often, there are software solutions you can use when hardware is too expensive.
Consult Fortinet troubleshooting resources	After the checklist is created, refer to the troubleshooting scenarios sections to assist with implementing your plan. See Troubleshooting scenarios on page 1962.
Gather information for technical support	If you still require technical assistance after the plan is implemented, be prepared to provide Fortinet technical support with following information: • Firmware build version (use the `get system status` command) • Network topology diagram • Recent configuration file • Recent debug log (optional) • Summary of troubleshooting steps you have taken and the results.  Do not provide the output from the `execute tac` report unless the support team requests it. The output from this command is very large and is not required in many cases.
Contact technical support	Before contacting technical support, ensure you have login access (preferably with full read/write privileges) to all networking devices that could be relevant to troubleshooting. If you are using VMs, be prepared to have someone who can log in to the virtual hosting platform in case it is necessary to check and possibly modify resource allocation.

For information about contacting technical support, go to FortiCare Support Service page.

Troubleshooting scenarios

The following table is intended to help you diagnose common problems and provides links to the corresponding troubleshooting topics:

Problem	Probable cause	Recommended action
Hardware connections	• Are all of the cables and interfaces connected properly? • Is the LED for the interface green?	Checking the hardware connections on page 1964
FortiOS network settings	• If you are having problems connecting to the management interface, is your protocol enabled on the interface for administrative access? • Does the interface have an IP address?	Checking FortiOS network settings on page 1965
CPU and memory resources	• Is the CPU running at almost 100 percent usage? • Is your FortiGate running low on memory?	Troubleshooting CPU and network resources on page 1968
Modem status	• Is the modem connected? • Are there PPP issues?	Checking the modem status on page 1973
Ping and traceroute	Is the FortiGate experiencing complete packet loss?	Running ping and traceroute on page 1974
Logs	Do you need to identify a problem?	Checking the logs on page 1977
Contents of the routing table (in NAT mode)	• Are there routes in the routing table for default and static routes? • Do all connected subnets have a route in the routing table? • Does a route have a higher priority than it should?	Verifying routing table contents in NAT mode on page 1978
Traffic routes	Is the traffic routed correctly?	Verifying the correct route is being used on page 1979
Firewall policies	Is the correct firewall policy applied to the expected traffic?	Verifying the correct firewall policy is being used on page 1979
Bridging information in transparent mode	Are you having problems in transparent mode?	Checking the bridging information in transparent mode on page 1980

Problem	Probable cause	Recommended action
Firewall session list	• Are there active firewall sessions?	Using a session table on page 1991
Wireless Network	Is the wireless network working properly?	Checking wireless information on page 1981
FortiGuard connectivity	Is the FortiGate communicating properly with FortiGuard?	Verifying connectivity to FortiGuard on page 2001
Sniffer trace	• Is traffic entering the FortiGate? Does the traffic arrive on the expected interface? • Is the ARP resolution correct for the next-hop destination? • Is the traffic exiting the FortiGate to the destination as expected? • Is the FortiGate sending traffic back to the originator?	Performing a sniffer trace (CLI and packet capture) on page 1982
Packet flow	Is traffic entering or leaving the FortiGate as expected?	Debugging the packet flow on page 1985

Checking the system date and time

The system date and time are important for FortiGuard services, logging events, and sending alerts. The wrong time makes the log entries confusing and difficult to use.

When possible, use Network Time Protocol (NTP) to set the date and time. This is an automatic method that does not require manual intervention. However, you must ensure that the port is allowed through the firewalls on your network. FortiToken synchronization requires NTP in many situations.

For information about setting the system date and time, see Setting the system time on page 1433.

To view and configure the date and time in the GUI:

1. Go to *Dashboard* > *Status*. The date and time are displayed in the *System Information* widget, next to *System Time*.
2. Go to *System* > *Settings*.
3. In the *System Time* section, select *NTP*, and then configure the *Time Zone*, and *Set Time* settings as required.

To view the date and time in the CLI:

```
execute date
execute time
```

To configure the date and time in the CLI:

Use the `set timezone ?` command to display a list of timezones and the integers that represent them.

```
config system global
   set timezone <integer>
end
```

```
config system ntp
   set type custom
      config ntpserver
         edit 1
            set server "ntp1.fortinet.net"
         next
         edit 2
            set server "ntp2.fortinet.net"
         next
      end
   set ntpsync enable
   set syncinterval 60
end
```

Checking the hardware connections

If traffic is not flowing from the FortiGate, there may be a problem with the hardware connection.

To check hardware connections:

1. Ensure the network cables are plugged into the interfaces.
2. Verify the LED connection lights for the network cables indicate there is a connection. The lights are typically green when there is a connection.
3. Change the cable when:
   - The cable or its connector are damaged.
   - You are unsure of the type or quality of the cable, such as straight through or crossover.
   - You see exposed wires at the connector.
4. Connect the FortiGate to different hardware.
5. Go to *Network* > *Interfaces* to ensure the link status for the interface is set to *Up*.
   The link status is based on the physical connection and cannot be set in FortiOS.

To enable an interface in the GUI:

You should still perform basic software connectivity tests to ensure complete connectivity even if there was a problem with the hardware connection. The interface might also be disabled, or its *Status* might be set to *Down*. See Interfaces on page 121.

1. Go to *Network* > *Interfaces*.
2. Select an interface, such as *Port1*, and click *Edit*.
3. In the *Miscellaneous* area, next to *Status*, click *Enabled*.
4. Click *OK*.

To enable an interface in the CLI:

```
config system interface
   edit port1
      set status up
   next
end
```

Checking FortiOS network settings

Check the FortiOS network settings if you have problems connecting to the management interface. FortiOS network settings include, interface settings, DNS Settings, and DHCP settings.

Interface settings

If you can access the FortiGate with the management cable only, you can view the interface settings in the GUI.

To view the interface settings in the GUI:

1. Go to *Network* > *Interfaces*.
2. Select an interface and click *Edit*.
3. Check the following interfaces to ensure they are not blocking traffic.

Setting	Description
Link Status	The status is *Up* when a valid cable is plugged in. The status is *Down* when an invalid cable is plugged in. The Link Status is shown physically by the connection LED for the interface. If the LED is green, the connection is good. If Link Status is *Down*, the interface does not work. Link status also appears in the *Network* > *Interfaces* page by default.
Addressing mode	Do not use *DHCP* if you do not have a DHCP server. You will not be able to log into an interface in DHCP mode as it will not have an IP address.
IP/Network Mask	An interface requires an IP address to connect to other devices. Ensure there is a valid IP address in this field. The one exception is when *DHCP* is enabled for this interface to get its IP address from an external DHCP server.
IPv6 address	The same protocol must be used by both ends to complete the connection. Ensure this interface and the remote connection are both using IPv4 or both are using IPv6 addresses.
Administrative access	If no protocols are selected, you will have to use the local management cable to connect to the unit. If you are using IPv6, configure the IPv6 administrative access protocols.
Status	Ensure the status is set to *Up* or the interface will not work.

To display the internal interface settings in the CLI:

```
FGT# show system interface <interface_name>
```

To view the list of possible interface settings:

```
config system interface
   edit <interface_name>
      get
end
```

DNS settings

To view DNS settings in the GUI:

Go to *Network* > *DNS*.

You can trace many networking problems back to DNS issues. Check the following items:

1. Are there values for both the *Primary DNS server* and *Secondary DNS server* fields.
2. Is the *Local Domain Name* correct?
3. Are you using IPv6 addressing? If so, are the IPv6 DNS settings correct?
4. Are you using Dynamic DNS (DDNS)? If so, is it using the correct server, credentials, and interface?
5. Can you contact both DNS servers to verify the servers are operational?
6. If an interface addressing mode is set to DHCP and is set to override the internal DNS, is that interface receiving a valid DNS entry from the DHCP server? Is it a reasonable address and can it be contacted to verify it is operational?
7. Are there any DENY security policies that need to allow DNS?
8. Can any internal device perform a successful traceroute to a location using the FQDN?

DHCP server settings

DHCP servers are common on internal and wireless networks. The DHCP server will cause problems if it is not configured correctly.

To view DHCP server settings in the GUI:

1. Go to *Network* > *Interfaces*.
2. Select an interface, and click *Edit*.

Check the following items:

1. Is the DHCP server enabled?
2. Is the DHCP server entry set to *Relay*? If so, verify there is another DHCP server to which requests can be relayed. Otherwise, set it to *Server*.
3. Does the DHCP server use a valid IP address range? Are other devices using the addresses? If one or more devices are using IP addresses in this range, you can use the IP reservation feature to ensure the DHCP server does not use these addresses. See DHCP server on page 243
4. Is there a gateway entry? If not, add a gateway entry to ensure that the server's clients have a default route.
5. Is the system DNS setting being used? A best practice is to avoid confusion by using the system DNS whenever possible. However, you can specify up to three custom DNS servers, and you should use all three entries for redundancy.

There are some situations, such as a new wireless interface, or during the initial FortiGate configuration, where interfaces override the system DNS entries. When this happens, it often shows up as intermittent Internet connectivity.

To fix the problem, go to *Network* > *DNS*, and enable *Use FortiGuard Servers*.

Checking CPU and memory resources

Check the CPU and memory resources when the FortiGate is not working, the network is slow, or there is a reduced firewall session setup rate. All processes share the system resources in FortiOS, including CPU and memory.

To view system resources in the GUI:

Go to *Dashboard* > *Status*.

The resource information is located in the *CPU* and *Memory* widgets. For information, see Dashboards and Monitors on page 62.

To view system resources in the CLI:

```
get system performance status
```

Sample output:

```
FGT# get system performance status
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU0 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU1 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU2 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
CPU3 states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
Memory: 4050332k total, 527148k used (13%), 3381312k free (83%), 141872k freeable (3%)
Average network usage: 41 / 28 kbps in 1 minute, 54 / 44 kbps in 10 minutes, 42 / 34 kbps
     in 30 minutes
Average sessions: 33 sessions in 1 minute, 48 sessions in 10 minutes, 38 sessions in 30
     minutes
Average session setup rate: 0 sessions per second in last 1 minute, 0 sessions per second
     in last 10 minutes, 0 sessions per second in last 30 minutes
Virus caught: 0 total in 1 minute
IPS attacks blocked: 0 total in 1 minute
Uptime: 0 days, 22 hours, 59 minutes
```

The first line of the output shows the CPU usage by category:

```
CPU states: 0% user 0% system 0% nice 100% idle 0% iowait 0% irq 0% softirq
```

The second line of the output shows the memory usage:

```
Memory: 4050332k total, 527148k used (13%), 3381312k free (83%), 141872k freeable (3%)
```

Memory usage should not exceed 90%. Using too much memory prevents some processes from functioning properly. For example, if the system is running low on memory, antivirus scanning enters into *failopen* mode where it drops connections or bypasses the antivirus system.

Other lines of output, such as `average network usage`, `average session setup rate`, `viruses caught`, and `IPS attacks blocked`, help determine why system resource usage is high.

For example:

- A high `average network usage` may indicate high traffic processing on the FortiGate,
- A very low or zero, `average session setup rate` may indicate the proxy is overloaded and unable to do its job.

Troubleshooting CPU and network resources

FortiGate has stopped working

If the FortiGate has stopped working, the first line of the output will look similar to this:

```
CPU states: 0% user 0% system 0% nice 100% idle
```

Network is slow

If your network is running slow, the first line of the output will look similar to this:

```
CPU states: 1% user 98% system 0% nice 1% idle
```

This example shows that all of the CPU is being used by system processes, and the FortiGate is overloaded. When overloading occurs, it is possible a process such as `scanunitid` is using all the resources to scan traffic. In this case you need to reduce the amount of traffic being scanned by blocking unwanted protocols, configuring more security policies to limit scanning to certain protocols, or similar actions.

It is also possible a hacker has accessed your network and is overloading it with malicious activity, such as running a spam server or using zombie PCs to attack other networks on the Internet.

You can use the following command to investigate the problem with the CPU:

```
get system performance top
```

This command shows all of the top processes that are running on the FortiGate and their CPU usage. The process names are on the left. If a process is using most of the CPU cycles, investigate it to determine whether the activity is normal.

Reduced firewall session setup rate

A reduced firewall session setup rate can be caused by a lack of system resources on the FortiGate, or reaching the session count limit for a VDOM.

As a best practice, administrators should record the session setup rate during normal operation to establish a baseline to help define a problem when your are troubleshooting.

The session setup rate appears in the `average sessions` section of the output.

A reduced firewall session setup rate will look similar to this:

```
Average sessions: 80 sessions in 1 minute, 30 sessions in 10 minutes, 42 sessions in 30
     minutes
Average session setup rate: 3 sessions per second in last 1 minute, 0 sessions per second in
     last 10 minutes, 0 sessions per second in last 30 minutes
```

In the example above, there were 80 sessions in 1 minute, or an average of 3 sessions per second.

The values for `10 minutes` and `30 minutes` allow you to take a longer average for a more reliable value if your FortiGate is working at maximum capacity. The smallest FortiGate can have 1,000 sessions established per second across the unit.

The session setup rate is a global command. If you have multiple VDOMs configured with many sessions in each VDOM, the session setup rate per VDOM will be slower than if there are no VDOMs configured.

High memory usage

As with any system, a FortiGate has limited hardware resources, such as memory, and all processes running on the FortiGate share the memory. Each process uses more or less memory, depending on its workload. For example, a process usually uses more memory in high traffic situations. If some processes use all of the available memory, other processes will not be able to run.

When high memory usage occurs, the services may freeze up, connections may be lost, or new connections may be refused.

If you see high memory usage in the *Memory* widget, the FotiGate may be handling high traffic volumes. Alternatively, the FortiGate may have problems with connection pool limits that are affecting a single proxy. If the FortiGate receives large volumes of traffic on a specific proxy, the unit may exceed the connection pool limit. If the number of free connections within a proxy connection pool reaches zero, issues may occur.

To view current memory usage information in the CLI:

```
diagnose hardware sysinfo memory
```

Sample output:

```
total: used: free: shared: buffers: cached: shm:
Mem: 2074185728 756936704 1317249024 0 20701184 194555904 161046528
Swap:       0       0       0
MemTotal:   2025572 kB
MemFree:    1286376 kB
MemShared:        0 kB
Buffers:      20216 kB
Cached:      189996 kB
SwapCached:       0 kB
Active:       56644 kB
Inactive:    153648 kB
HighTotal:        0 kB
HighFree:         0 kB
LowTotal:   2025572 kB
LowFree:    1286376 kB
SwapTotal:        0 kB
SwapFree:         0 kB
```

Troubleshooting high CPU usage

Connection-related problems may occur when FortiGate's CPU resources are over extended. This occurs when you deploy too many FortiOS features at the same time.

Examples of CPU intensive features:

- VPN high-level encryption
- Intensive scanning of all traffic
- Logging all traffic and packets
- Dashboard widgets that frequently perform data updates

For information on customizing the CPU use threshold, see Execute a CLI script based on CPU and memory thresholds on page 1759.

Determining the current level of CPU usage

You can view CPU usage levels in the GUI or CLI. For precise usage values for both overall usage and specific processes, use the CLI.

To view CPU usage in the GUI:

Go to *Dashboard* > *Status*. Real-time CPU usage information is located in the *CPU* widget.

To view CPU usage in the CLI:

- Show top processes information:
  ```
  diagnose sys top
  ```
- Show top threads information:
  ```
  diagnose sys top-all
  ```

Sample output:

```
Run Time: 86 days, 0 hours and 10 minutes
0U, 0N, 0S, 100I, 0WA, 0HI, 0SI, 0ST; 3040T, 2437F
     bcm.user 93 S < 3.1 0.4
     httpsd 18922 S 1.5 0.5
     httpsd 19150 S 0.3 0.5
     newcli 20195 R 0.1 0.1
     cmdbsvr 115 S 0.0 0.8
     pyfcgid 20107 S 0.0 0.6
     forticron 146 S 0.0 0.5
     httpsd 139 S 0.0 0.5
     cw_acd 166 S 0.0 0.5
     miglogd 136 S 0.0 0.5
     pyfcgid 20110 S 0.0 0.4
     pyfcgid 20111 S 0.0 0.4
     pyfcgid 20109 S 0.0 0.4
     httpsd 20192 S 0.0 0.4
     miglogd 174 S 0.0 0.4
     miglogd 175 S 0.0 0.4
     fgfmd 165 S 0.0 0.3
     newcli 20191 S 0.0 0.3
     initXXXXXXXXXXX 1 S 0.0 0.3
     httpsd 184 s 0.0 0.3
```

The following table explains the codes in the second line of the output:

Code	Description
U	Percentage of user space applications that are currently using the CPU
N	Percentage of time that the CPU spent on low priority processes since the last shutdown
S	Percentage of system processes (or kernel processes) that are using the CPU
I	Percentage of idle CPU resources
WA	Percentage of time that the CPU spent waiting on IO peripherals since the last shutdown
HI	Percentage of time that the CPU spent handling hardware interrupt routines since the last shutdown
SI	Percentage of time that the CPU spent handling software interrupt routines since the last shutdown
ST	Steal time: Percentage of time a virtual CPU waits for the physical CPU when the hypervisor is servicing another virtual processor
T	Total FortiOS system memory in MB
F	Free memory in MB

Each additional line of the command output displays information specific to processes or threads that are running on the FortiGate unit. For example, the sixth line of the output is: `newcli 20195 R 0.1 0.1`

The following table describes the data in the sixth line of the output:

Item	Description
newcli	The process (or thread) name. Duplicate process or thread names indicate that separate instances of that process or thread are running.
20195	The process or thread ID, which can be any number.
R	Current state of the process or thread. The process or thread state can be: • R - running • S - sleep • Z - zombie • D- disk sleep
0.1	The percentage of CPU capacity that the process or thread is using. CPU usage can range from 0.0 for a process or thread that is sleeping to higher values for a process or thread that's taking a lot of CPU time.
0.1	The amount of memory that the process or thread is using. Memory usage can range from 0.1 to 5.5 and higher.

You can use the following single-key commands when running `diagnose sys top` or `diagnose sys top-all`:

- `q` to quit and return to the normal CLI prompt.
- `p` to sort the processes by the amount of CPU that the processes are using.
- `m` to sort the processes by the amount of memory that the processes are using.

The output only displays the top processes or threads that are running. For example, if 20 are listed, they are the top 20 currently running, sorted by either CPU or memory usage. You can configure the number of processes or threads displayed, using the following CLI commands:

```
diagnose sys top <integer_seconds> <integer_maximum_lines>
diagnose sys top-all <integer_seconds> <integer_maximum_lines>
```

Where:

- `<integer_seconds>` is the delay in seconds (default is 5)
- `<integer_maximum_lines>` is the maximum number of lines (or processes) to list (default is 20)

Determining which features are using the most CPU resources

You can use the CLI to view the top few processes that are currently running and using the most CPU resources.

To view processes using the most CPU resources:

```
get system performance top
```

The entries at the top are using the most CPU resources. The second column from the right shows CPU usage by percentage. Note which processes are using the most resources and try to reduce their CPU load.

Processes you will see include:

- `ipsengine`: the IPS engine that scans traffic for intrusions
- `scanunitd`: antivirus scanner
- `httpsd`: secure HTTP
- `iked`: internet key exchange (IKE) in use with IPsec VPN tunnels
- `newcli`: active whenever you're accessing the CLI
- `sshd`: there are active secure socket connections
- `cmdbsrv`: the command database server application

Go to the features that are at the top of the list and look for evidence of CPU overuse. Generally, the monitor for a feature is a good place to start.

Checking for unnecessary CPU “wasters”

These are some best practices that will reduce your CPU usage, even if the FortiGate is not experiencing high CPU usage. Note that if the following information instructs you to turn off a feature that you require, disregard that part of the instructions.

- Use hardware acceleration wherever possible to offload tasks from the CPU. Offloading tasks, such as encryption, frees up the CPU for other tasks.
- Avoid the use of GUI widgets that require computing cycles, such as the *Top Sessions* widget. These widgets constantly pol the system for information, which uses CPU and other resources.
- Schedule antivirus, IPS, and firmware updates during off-peak hours. These updates do not usually consume CPU resources but they can disrupt normal operation.
- Check the log levels and which events are being logged. This is the severity of the messages that are recorded. Consider going up one level to reduce the amount of logging. Also, if there are events you do not need to monitor, remove them from the list.

- Log to FortiCloud instead of logging to memory or disk. Logging to memory quickly uses up resources and logging to local disk impacts overall performance and reduces the lifetime of the unit.
  Fortinet recommends logging to FortiCloud to avoid using too much CPU.
- If the disk is almost full, transfer the logs or data off the disk to free up space. When a disk is almost full it consumes a lot of resources to find free space and organize the files.
- If packet logging is enabled on the FortiGate, consider disabling it. When packet logging is enabled, it records every packet that comes through that policy.
- Halt all sniffers and traces.
- Ensure the FortiGate isn't scanning traffic twice. Traffic does not need to be rescanned if it enters the FortiGate on one interface, goes out another, and then comes back in again. Doing so is a waste of resources. However, ensure that traffic truly is being scanned once.
- Reduce the session timers to close unused sessions faster. Enter the following CLI commands, which reduce the default values. Note that, by default, the system adds 10 seconds to `tcp-timewait`.

```
config system global
   set tcp-halfclose-timer 30
   set tcp-halfopen-timer 30
   set tcp-timewait-timer 0
   set udp-idle-timer 60
end
```

- Go to *System* > *Feature Visibility*, and enable only features that you need.

SNMP monitoring

When CPU usage is under control, use SNMP to monitor CPU usage. Alternatively, use logging to record CPU and memory usage every 5 minutes.

Once the system is back to normal, you should set up a warning system that sends alerts when CPU resources are used excessively. A common method to do this is using SNMP. SNMP monitors many values in FortiOS and allows you to set high water marks that generate events. You can run an application on your computer to watch for and record these events.

To enable SNMP:

1. Go to *System* > *SNMP*.
2. Configure an SNMP community.

See SNMP on page 1533.

You can use the *System Resources* widget to record CPU usage if SNMP is too complicated. However, the widget only records problems as they happen and will not send you alerts for problems.

Checking the modem status

You can use the CLI to troubleshoot a modem that is not working properly, or troubleshoot a FortiGate that does not detect the modem.

To diagnose modem issues in the CLI:

```
diagnose sys modem {cmd | com | detect | history | external-modem | query| reset}
```

You should always run the following command after you connect a USB modem to FortiGate:

```
diagnose sys modem detect
```

Use the following command to view the modem's configuration, vendor and custom product identification number:

```
get system modem
```

Use the following commands to resolve connectivity issues:

- `diagnose debug enable`: Activates the debug on the console
- `diagnose debug application modemd`: Dumps communication between the modem and the unit.
- `diagnose debug application ppp`: Dumps the PPP negotiating messages.
- `execute modem dial`: Displays modem debug output.

The modem diagnose output should not contain errors when initializing. You should also verify the number used to dial into your ISP.

Running ping and traceroute

Ping and traceroute are useful tools in network troubleshooting. Alone, either tool can determine network connectivity between two points. However, ping can be used to generate simple network traffic that you can view using `diagnose` commands in FortiGate. This combination can be very powerful when you are trying to locate network problems.

Ping and traceroute can also tell you if your computer or network device has access to a domain name server (DNS). Both tools can use IP addresses or device domain names to determine why particular services, such as email or web browsing, may not work properly.

If ping does not work, it may be disabled on at least one of the interface settings and security policies for that interface.

Both ping and traceroute require particular ports to be open on firewalls to function. Since you typically use these tools to troubleshoot, you can allow them in the security policies and on interfaces only when you need them. Otherwise, keep the ports disabled for added security.

Ping

The ping command sends a very small packet to a destination, and waits for a response. The response has a timer that expires when the destination is unreachable.

Ping is part of layer 3 on the OSI Networking Model. Ping sends Internet Control Message Protocol (ICMP) “echo request” packets to the destination, and listens for “echo response” packets in reply. However, many public networks block ICMP packets because ping can be used in a denial of service (DoS) attack (such as Ping of Death or a smurf attack), or by an attacker to find active locations on the network. By default, FortiGate units have ping enabled while broadcast-forward is disabled on the external interface.

What ping can tell you

Beyond the basic connectivity information, ping can tell you the amount of packet loss (if any), how long it takes the packet to make the round trip, and the variation in that time from packet to packet.

If packet loss is detected, you should investigate the following:

- Possible ECMP, split horizon, or network loops.
- Cabling, to ensure there are no loose connections.
- Verify which security policy was used. To do this:
  Go *to Policy & Objects* > *Firewall Policy* and view the packet count column.

If there is total packet loss, you should investigate the following:

1. Ensure cabling is correct, and all equipment between the two locations is accounted for.
2. Ensure all IP addresses and routing information along the route is configured as expected.
3. Ensure all firewalls, including FortiGate security policies allow PING to pass through.

How to use ping

Ping syntax is the same for nearly every type of system on a network.

To ping from a FortiGate unit:

1. Go to *Dashboad*, and connect to the CLI through either telnet or the CLI widget.
2. Enter `execute ping 10.11.101.101` to send 5 ping packets to the destination IP address. There are no options for this command.

```
Head_Office_620b # execute ping 10.11.101.101
PING 10.11.101.101 (10.11.101.101): 56 data bytes
64 bytes from 10.11.101.101: icmp_seq=0 ttl=255 time=0.3 ms
64 bytes from 10.11.101.101: icmp_seq=1 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=2 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=3 ttl=255 time=0.2 ms
64 bytes from 10.11.101.101: icmp_seq=4 ttl=255 time=0.2 ms

--- 10.11.101.101 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.2/0.2/0.3 ms
```

To ping from a Microsoft Windows PC:

1. Open a command window.
2. Enter `ping 10.11.101.100` to ping the default internal interface of the FortiGate with four packets.
   Other options include:
   - `-t` to send packets until you press `Ctrl+C`
   - `-a` to resolve addresses to domain names where possible
   - `-n X` to send X ping packets and stop

```
C:\>ping 10.11.101.101

Pinging 10.11.101.101 with 32 bytes of data:
Reply from 10.11.101.101: bytes=32 time=10ms TTL=255
Reply from 10.11.101.101: bytes=32 time<1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255
Reply from 10.11.101.101: bytes=32 time=1ms TTL=255

Ping statistics for 10.11.101.101:
Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
Minimum = 0ms, Maximum = 10ms, Average = 3ms
```

To ping from a Linux PC:

1. Go to a shell prompt.
2. Enter "`ping 10.11.101.101`".

Traceroute

Where ping will only tell you if it reached its destination and returned successfully, traceroute shows each step of the journey to its destination and how long each step takes. If ping finds an outage between two points, you can use traceroute to locate exactly where the problem is.

Traceroute works by sending ICMP packets to test each hop along the route. It sends three packets, and then increases the time to live (TTL) setting by one each time. This effectively allows the packets to go one hop farther along the route. This is why most traceroute commands display their maximum hop count before they start tracing the route, which is the maximum number of steps it takes before it declares the destination unreachable. Also, the TTL setting may result in steps along the route timing out due to slow responses. There are many possible reasons for this to occur.

By default, traceroute uses UDP datagrams with destination ports numbered from 33434 to 33534. The traceroute utility may also offer the option to select use of ICMP echo request (type 8) instead, which the Windows tracert utility uses. If you must, allow both protocols inbound through the FortiGate security policies (UDP with ports from 33434 to 33534 and ICMP type 8).

To track traceroute packets in the GUI:

Go to *Policy & Objects* > *Firewall Policy* and view the packet count column.

This allows you to verify the connection and confirm which security policy the traceroute packets are using.

What traceroute can tell you

Both ping and traceroute verify connectivity between two points. However, only traceroute shows you each step in the connection path. Also, ping and traceroute use different protocols and ports, so one may succeed where the other fails.

You can verify your DNS connection using traceroute. If you enter an FQDN instead of an IP address for the traceroute, DNS tries to resolve that domain name. If the name isn't resolved, you have DNS issues.

Using traceroute

The traceroute command varies slightly between operating systems. In Microsoft Windows, the command name is shortened to "`tracert`". Also, your output lists different domain names and IP addresses along your route.

To use traceroute on a Microsoft Windows PC:

1. Open a command window.
2. Enter `tracert fortinet.com` to trace the route from the PC to the Fortinet web site.

```
C:\>tracert fortinet.com
Tracing route to fortinet.com [208.70.202.225]
over a maximum of 30 hops:
1 <1 ms <1 ms <1 ms 172.20.120.2
2 66 ms 24 ms 31 ms 209-87-254-xxx.storm.ca [209.87.254.221]
3 52 ms 22 ms 18 ms core-2-g0-0-1104.storm.ca [209.87.239.129]
4 43 ms 36 ms 27 ms core-3-g0-0-1185.storm.ca [209.87.239.222]
5 46 ms 21 ms 16 ms te3-x.1156.mpd01.cogentco.com [38.104.158.69]
```

```
6 25 ms 45 ms 53 ms te8-7.mpd01.cogentco.com [154.54.27.249]
7 89 ms 70 ms 36 ms te3-x.mpd01.cogentco.com [154.54.6.206]
8 55 ms 77 ms 58 ms sl-st30-chi-.sprintlink.net [144.232.9.69]
9 53 ms 58 ms 46 ms sl-0-3-3-x.sprintlink.net [144.232.19.181]
10 82 ms 90 ms 75 ms sl-x-12-0-1.sprintlink.net [144.232.20.61]
11 122 ms 123 ms 132 ms sl-0-x-0-3.sprintlink.net [144.232.18.150]
12 129 ms 119 ms 139 ms 144.232.20.7
13 172 ms 164 ms 243 ms sl-321313-0.sprintlink.net [144.223.243.58]
14 99 ms 94 ms 93 ms 203.78.181.18
15 108 ms 102 ms 89 ms 203.78.176.2
16 98 ms 95 ms 97 ms 208.70.202.225
```

The first column on the left is the hop count, which can't exceed 30 hops. When that number is reached, the traceroute ends.

The second, third, and fourth columns display how much time each of the three packets takes to reach this stage of the route. These values are in milliseconds and normally vary quite a bit. Typically a value of `<1ms` indicates a local connection.

The fifth column (farthest to the right) shows the domain name of the device and its IP address, or possibly only the IP address.

To perform a traceroute on a Linux PC:

1. Go to a command line prompt.
2. Enter "`traceroute fortinet.com`".
   The Linux traceroute output is very similar to the Windows `tracert` output.

To trace a route from a FortiGate to a destination IP address in the CLI:

```
# execute traceroute www.fortinet.com

traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms
2 209.87.254.221 <static-209-87-254-221.storm.ca> 2.448 ms 2.519 ms 2.458 ms
3 209.87.239.129 <core-2-g0-2.storm.ca> 2.917 ms 2.828 ms 9.324 ms
4 209.87.239.199 <core-3-bdi1739.storm.ca> 13.248 ms 12.401 ms 13.009 ms
5 216.66.41.113 <v502.core1.tor1.he.net> 17.181 ms 12.422 ms 12.268 ms
6 184.105.80.9 <100ge1-2.core1.nyc4.he.net> 21.355 ms 21.518 ms 21.597 ms
7 198.32.118.41 <ny-paix-gni.twgate.net> 83.297 ms 84.416 ms 83.782 ms
8 203.160.228.217 <217-228-160-203.TWGATE-IP.twgate.net> 82.579 ms 82.187 ms 82.066 ms
9 203.160.228.229 <229-228-160-203.TWGATE-IP.twgate.net> 82.055 ms 82.455 ms 81.808 ms
10 203.78.181.2 82.262 ms 81.572 ms 82.015 ms
11 203.78.186.70 83.283 ms 83.243 ms 83.293 ms

13 66.171.121.34 <www.fortinet.com> 84.023 ms 83.903 ms 84.032 ms
14 66.171.121.34 <www.fortinet.com> 83.874 ms 84.084 ms 83.810 ms
```

Checking the logs

A log message records the traffic passing through FortiGate to your network and the action FortiGate takes when it scans the traffic. You should log as much information as possible when you first configure FortiOS. If FortiGate logs are too large, you can turn off or scale back the logging for features that are not in use.

It is difficult to troubleshoot logs without a baseline. Before you can determine if the logs indicate a problem, you need to know what logs result from normal operation.

When troubleshooting with log files

- Compare current logs to a recorded baseline of normal operation.
- If you need to, increase the level of logging (such as from Warning to Information) to obtain more information. When increasing logging levels, ensure that you configure email alerts and select both disk usage and log quota. This ensures that you will be notified if the increase in logging causes problems.

To configure the log settings in the GUI:

Go to *Log & Report* > *Log Settings*.

Determine the activities that generate the most log entries:

- Check all logs to ensure important information is not overlooked.
- Filter or order log entries based on different fields, such as level, service, or IP address, to look for patterns that may indicate a specific problem, such as frequent blocked connections on a specific port for all IP addresses.

Logs can help identify and locate any problems, but they do not solve them. The purpose of logs is to speed up your problem solving and save you time and effort.

For more information about logging and log reports, see Log and Report on page 1886.

Verifying routing table contents in NAT mode

Verify the contents of the routing table when a FortiGate has limited or no connectivity.

The routing table stores the routes currently in use for both static and dynamic protocols. Storing a route in the routing table saves time and resources performing a lookup. To ensure the most recently used routes remain in the table, old routes are bumped to make room for new ones. You cannot perform this task when FortiGate is in transparent mode.

If FortiGate is running in NAT mode, verify that all desired routes are in the routing table, including local subnets, default routes, specific static routes, and dynamic routing protocols.

To view the routing table in the CLI:

```
get router info routing-table all
```

Sample output:

```
FGT# get router info routing-table all
Codes:
   K - kernel, C - connected, S - static, R - RIP, B - BGP
   O - OSPF, IA - OSPF inter area
   N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
   E1 - OSPF external type 1, E2 - OSPF external type 2
   i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
   * - candidate default
S* 0.0.0.0/0 [10/0] via 172.20.120.2, wan1
C 10.31.101.0/24 is directly connected, internal
C 172.20.120.0/24 is directly connected, wan1
```

Verifying the correct route is being used

Run a trace route from a machine in the local area network (LAN) to ensure traffic is flowing as expected through the correct route when there is more than one default route.

In the following example output:

- The first hop contains the IP address `10.10.1.99`, which is the internal interface of the FortiGate.
- The second hop contains the IP address `172.20.120.2`, to which the wan1 interface of the FortiGate is connected.

This means the route through the wan1 interface is being used for this traffic.

```
C:\>tracert www.fortinet.com
Tracing route to www.fortinet.com [66.171.121.34]
over a maximum of 30 hops:
1 <1 ms <1 ms <1 ms 10.10.1.99
2 1 ms <1 ms <1 ms 172.20.120.2
3 3 ms 3 ms 3 ms static-209-87-254-221.storm.ca [209.87.254.221]
4 3 ms 3 ms 3 ms core-2-g0-2.storm.ca [209.87.239.129]
5 13 ms 13 ms 13 ms core-3-bdi1739.storm.ca [209.87.239.199]
6 12 ms 19 ms 11 ms v502.core1.tor1.he.net [216.66.41.113]
7 22 ms 22 ms 21 ms 100ge1-2.core1.nyc4.he.net [184.105.80.9]
8 84 ms 84 ms 84 ms ny-paix-gni.twgate.net [198.32.118.41]
9 82 ms 84 ms 82 ms 217-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.217]
10 82 ms 81 ms 82 ms 229-228-160-203.TWGATE-IP.twgate.net [203.160.22
8.229]
11 82 ms 82 ms 82 ms 203.78.181.2
12 84 ms 83 ms 83 ms 203.78.186.70
13 84 ms * 85 ms 66.171.127.177
14 84 ms 84 ms 84 ms fortinet.com [66.171.121.34]
15 84 ms 84 ms 83 ms fortinet.com [66.171.121.34]
```

You can also see the route taken for each session by debugging the packet flow in the CLI. For more information, see Debugging the packet flow on page 1985.

Verifying the correct firewall policy is being used

If you have more than one firewall policy, you can check which policy is being used in the *Policy & Objects* module in the GUI.

To verify the firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Look in the *Count* column to see which policy is being used. The count must show traffic increasing.

Debugging the packet flow in the CLI shows the policy ID that's allowing the traffic. For information, see Debugging the packet flow on page 1985.

Checking the bridging information in transparent mode

Checking the bridging information is useful when you are experiencing connectivity problems. When FortiGate is set to transparent mode, it acts like a bridge and sends all incoming traffic out on the other interfaces. Each bridge is a link between interfaces.

When traffic is flowing between the interfaces, you can see the bridges listed in the CLI. If no bridges are listed, this is the likely cause of the connectivity issue. When investigating bridging information, check for the MAC address of the interface or device in question.

How to check the bridging information

To view the list of bridge instances in the CLI:

```
diagnose netlink brctl list
```

Sample output:

```
#diagnose netlink brctl list
list bridge information
1. root.b fdb: size=256 used=6 num=7 depth=2 simple=no
Total 1 bridges
```

How to display forwarding domain information

You can use forwarding domains, or collision domains, in routing to limit where packets are forwarded on the network. Layer 2 broadcasts are limited to the same group. By default, all interfaces are in group 0. For example, if the FortiGate has 12 interfaces, only two may be in the same forwarding domain, which limits packets that are broadcast to those two interfaces. This reduces traffic on the rest of the network.

Collision domains prevent the forwarding of ARP packets to all VLANs on an interface. Without collision domains, duplicate MAC addresses on VLANs may cause ARP packets to be duplicated. Duplicate ARP packets can cause some switches to reset. It's important to know what interfaces are part of which forwarding domains because this determines which interfaces can communicate with each other.

To manually configure forwarding domains in transparent mode in the CLI:

```
config system interface
   edit <interface_name>
      set forward-domain <integer>
   end
```

To display the forward domains information in the CLI:

```
diagnose netlink brctl domain <name> <id>
```

Where `<name>` is the name of the forwarding domain to display and `<id>` is the domain ID.

Sample output:

```
diagnose netlink brctl domain ione 101
show bridge root.b ione forward domain.
```

```
id=101 dev=trunk_1 6
```

To list the existing bridge MAC table in the CLI:

```
diagnose netlink brctl name host <name>
```

Sample output:

```
show bridge control interface root.b host.
fdb: size=256, used=6, num=7, depth=2, simple=no
Bridge root.b host table
```

port no	device	devname	mac addr	ttl	attributes
2	7	wan2	02:09:0f:78:69:00	0	Local Static
5	6	vlan_1	02:09:0f:78:69:01	0	Local Static
3	8	dmz	02:09:0f:78:69:01	0	Local Static
4	9	internal	02:09:0f:78:69:02	0	Local Static
3	8	dmz	00:80:c8:39:87:5a	194	
4	9	internal	02:09:0f:78:67:68	8	
1	3	wan1	00:09:0f:78:69:fe	0	Local Static

To list the existing bridge port list in the CLI:

```
diagnose netlink brctl name port <name>
```

Sample output:

```
show bridge root.b data port.
trunk_1 peer_dev=0
internal peer_dev=0
dmz peer_dev=0
wan2 peer_dev=0
wan1 peer_dev=0
```

Checking wireless information

Check wireless connections, stations, and interfaces when the problem is not caused by a physical interface.

Troubleshooting station connection issues

To check if a station entry is created on access control in the CLI:

```
FG600B3909600253 # diagnose wireless-controller wlac -d sta
* vf=0 wtp=70 rId=2 wlan=open ip=0.0.0.0 mac=00:09:0f:db:c4:03 rssi=0 idle=148 bw=0 use=2
vf=0 wtp=70 rId=2 wlan=open ip=172.30.32.122 mac=00:25:9c:e0:47:88 rssi=-40 idle=0 bw=9
     use=2
```

Enabling diagnostics for a specific station

This example uses the station MAC address to find where it is failing:

```
FG600B3909600253 # diagnose wireless-controller wlac sta_filter 00:25:9c:e0:47:88 1
Set filter sta 00:25:9c:e0:47:88 level 1

Performing a sniffer trace (CLI and packet capture)

When you troubleshoot networks and routing in particular, it helps to look inside the headers of packets to determine if they are traveling the route that you expect them to take. Packet sniffing is also known as network tap, packet capture, or logic analyzing.

For FortiGates with NP2, NP4, or NP6 interfaces that are offloading traffic, disable offloading on these interfaces before you perform a trace or it will change the sniffer trace.

Sniffing packets

To perform a sniffer trace in the CLI:

Before you start sniffing packets, you should prepare to capture the output to a file. A large amount of data may scroll by and you will not be able to see it without saving it first. One method is to use a terminal program like puTTY to connect to the FortiGate CLI. Once the packet sniffing count is reached, you can end the session and analyze the output in the file.

The general form of the internal FortiOS packet sniffer command is:

```
# diagnose sniffer packet <interface_name> <'filter'> <verbose> <count> <tsformat>
```

To stop the sniffer, type `CTRL+C`.

<interface_name>	The name of the interface to sniff, such as `port1` or `internal`. This can also be `any` to sniff all interfaces.
<'filter'>	What to look for in the information the sniffer reads. `none` indicates no filtering, and all packets are displayed as the other arguments indicate. The filter must be inside single quotes (‘).
<verbose>	The level of verbosity as one of: • **1 -** print header of packets • **2 -** print header and data from IP of packets • **3 -** print header and data from Ethernet of packets • **4 -** print header of packets with interface name
<count>	The number of packets the sniffer reads before stopping. If you don't put a number here, the sniffer will run until you stop it with <`CTRL+C`>.

<tsformat>	The timestamp format. • a: absolute UTC time, yyyy-mm-dd hh:mm:ss.ms • l: absolute LOCAL time, yyyy-mm-dd hh:mm:ss.ms • otherwise: relative to the start of sniffing, ss.ms

Simple sniffing example:

```
# diagnose sniffer packet port1 none 1 3.
```

This displays the next three packets on the port1 interface using no filtering, and verbose level 1. At this verbosity level, you can see the source IP and port, the destination IP and port, action (such as ack), and sequence numbers.

In the output below, port 443 indicates these are HTTPS packets and that 172.20.120.17 is both sending and receiving traffic.

```
Head_Office_620b # diagnose sniffer packet port1 none 1 3
interfaces=[port1]
filters=[none]
0.545306 172.20.120.17.52989 -> 172.20.120.141.443: psh 3177924955 ack 1854307757
0.545963 172.20.120.141.443 -> 172.20.120.17.52989: psh 1854307757 ack 3177925808
0.562409 172.20.120.17.52988 -> 172.20.120.141.443: psh 4225311614 ack 3314279933
```

Advanced sniffing example:

The following commands will report packets on any interface that are traveling between a computer with the host name of “PC1” and a computer with the host name of “PC2”. With verbosity 4 and above, the sniffer trace displays the interface names where traffic enters or leaves the FortiGate unit. To stop the sniffer, type CTRL+C.

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2>" 4
or
FGT# diagnose sniffer packet any "(host <PC1> or host <PC2>) and icmp" 4
```

The following CLI command for a sniffer includes the ARP protocol in the filter which may be useful to troubleshoot a failure in the ARP resolution. For example, PC2 may be down and not responding to the FortiGate ARP requests.

```
FGT# diagnose sniffer packet any "host <PC1> or host <PC2> or arp" 4
```

Using packet capture

To use packet capture, the FortiGate must have a disk. You can enable the capture-packet in the firewall policy.

To enable packet capture in the CLI:

```
config firewall policy
   edit <id>
      set capture-packet enable
   next
end
```

To configure packet capture filters in the GUI:

Go to *Network* > *Packet Capture*.

When you add a packet capture filter, enter the following information and click *OK*.

Interface	Select the interface to sniff from the drop-down menu. You must select one interface. You cannot change the interface without deleting the filter and creating a new one, unlike the other fields.
Max Packets to Save	Enter the number of packets to capture before the filter stops. This number cannot be zero. You can halt the capturing before this number is reached.
Enable Filters	Select this option to specify filter fields.
Host(s)	Enter the IP address of one or more hosts. Separate multiple hosts with commas. To enter a range, use a dash without spaces. For example, `172.16.1.5-172.16.1.15`, or enter a subnet.
Port(s)	Enter one or more ports to capture on the selected interface. Separate multiple ports with commas. To enter a range, use a dash without spaces, for example `88-90`.
VLAN(s)	Enter one or more VLANs (if any). Separate multiple VLANs with commas.
Protocol	Enter one or more protocols. Separate multiple protocols with commas. To enter a range, use a dash without spaces. For example, `1-6`, `17`, `21-25`.
Include IPv6 Packets	Select this option if you are troubleshooting IPv6 networking, or if your network uses IPv6. Otherwise, leave it disabled.
Include Non-IP Packets	The protocols in the list are all IP based except for ICMP (ping). Use this feature to capture non-IP based packets. Examples of non-IP packets include IPsec, IGMP, ARP, and ICMP.

Managing filters

If you select a filter, you have the option to start and stop packet capture in the edit window, or download the captured packets. You can also see the filter status and the number of packets captured.

You can select the filter and start capturing packets. When the filter is running, the number of captured packets increases until it reaches the *Max Packet Count* or you stop it. You cannot download the output file while the filter is running.

Packet capture controls

To start, stop, or resume packet capture, use the symbols on the screen. These symbols are the same as those used for audio or video playback. Hover over the symbol to reveal explanatory text. Similarly, to download the *.pcap file, use the download symbol on the screen.

Downloading the file

You can download the *.pcap file when the packet capture is complete. You must use a third party application, such as Wireshark, to read *,pcap files. This tool provides you with extensive analytics and the full contents of the packets that were captured.

Debugging the packet flow

Debug the packet flow when network traffic is not entering and leaving the FortiGate as expected. Debugging the packet flow can only be done in the CLI. Each command configures a part of the debug action. The final commands starts the debug.

To trace the packet flow in the CLI:

```
# diagnose debug flow trace start
```

To follow packet flow by setting a flow filter:

```
# diagnose debug flow {filter | filter6} <option>
```

- Enter `filter` if your network uses IPv4.
- Enter `filter6` if your network uses IPv6.

Replace `<option>` with one of the following variables:

Variable	Description
`addr`	IPv4 or IPv6 address
`clear`	clear filter
`daddr`	destination IPv4 or IPv6 address
`dport`	destination port
`negate`	inverse IPv4 or IPv6 filter
`port`	port
`proto`	protocol number
`saddr`	source address
`sport`	source port
`vd`	index of virtual domain; `-1` matches all

If FortiGate is connected to FortiAnalyzer or FortiCloud, the diagnose debug flow output will be recorded as event log messages and then sent to the devices. Do not run this command longer than necessary, as it generates a significant amount of data.

FortiASIC NP4 or NP6 interface pairs that offload traffic will change the packet flow. Before debugging any NP4 or NP6 interfaces, disable offloading on those interfaces.

To do this, enter `diagnose npu <interface pair> fastpath disable`, where `interface pair` is `np4`, `np6`, `np4lite`, or `np6lite`.

To start flow monitoring with a specific number of packets:

```
# diagnose debug flow trace start <N>
```

To stop flow tracing at any time:

```
# diagnose debug flow trace stop
```

The following example shows the flow trace for a device with an IP address of `203.160.224.97`:

```
# diagnose debug enable
# diagnose debug flow filter addr 203.160.224.97
# diagnose debug flow show function-name enable
# diagnose debug flow trace start 100
```

Sample output: HTTP

To observe the debug flow trace, connect to the website at the following address:

```
https://www.fortinet.com
```

Comment: SYN packet received:

```
id=20085 trace_id=209 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

SYN sent and a new session is allocated:

```
id=20085 trace_id=209 func=resolve_ip_tuple line=2799
msg="allocate a new session-00000e90"
```

Lookup for next-hop gateway address:

```
id=20085 trace_id=209 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.11.254 via port6"
```

Source NAT, lookup next available port:

```
id=20085 trace_id=209 func=get_new_addr line=1219
msg="find SNAT: IP-192.168.11.59, port-31925"
direction"
```

Matched security policy. Check to see which policy this session matches:

```
id=20085 trace_id=209 func=fw_forward_handler line=317
msg="Allowed by Policy-3: SNAT"
```

Apply source NAT:

```
id=20085 trace_id=209 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

SYN ACK received:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6, 203.160.224.97:80-
>192.168.11.59:31925) from port6."
```

Found existing session ID. Identified as the reply direction:

```
id=20085 trace_id=210 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, reply direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=210 func=__ip_session_run_tuple
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

Lookup for next-hop gateway address for reply traffic:

```
id=20085 trace_id=210 func=vf_ip4_route_input line=1543
msg="find a route: gw-192.168.3.221 via port5"
```

ACK received:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2700
msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
id=20085 trace_id=211 func=resolve_ip_tuple_fast line=2727
msg="Find an existing session, id-00000e90, original
direction"
```

Apply source NAT:

```
id=20085 trace_id=211 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from client:

```
id=20085 trace_id=212 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
192.168.3.221:1487->203.160.224.97:80) from port5."
```

Match existing session in the original direction:

```
id=20085 trace_id=212 func=resolve_ip_tuple_fast
line=2727 msg="Find an existing session, id-00000e90,
original direction"
```

Apply source NAT:

```
id=20085 trace_id=212 func=__ip_session_run_tuple
line=1502 msg="SNAT 192.168.3.221->192.168.11.59:31925"
```

Receive data from server:

```
id=20085 trace_id=213 func=resolve_ip_tuple_fast
line=2700 msg="vd-root received a packet(proto=6,
203.160.224.97:80->192.168.11.59:31925) from port6."
```

Match existing session in reply direction:

```
id=20085 trace_id=213 func=resolve_ip_tuple_fast
line=2727 msg="Find an existing session, id-00000e90,
reply direction"
```

Apply destination NAT to inverse source NAT action:

```
id=20085 trace_id=213 func=__ip_session_run_tuple
line=1516 msg="DNAT 192.168.11.59:31925-
>192.168.3.221:1487"
```

Sample output: IPsec (policy-based)

```
id=20085 trace_id=1 msg="vd-root received a packet(proto=1, 10.72.55.240:1->10.71.55.10:8)
     from internal."
id=20085 trace_id=1 msg="allocate a new session-00001cd3"
id=20085 trace_id=1 msg="find a route: gw-66.236.56.230 via wan1"
id=20085 trace_id=1 msg="Allowed by Policy-2: encrypt"
id=20085 trace_id=1 msg="enter IPsec tunnel-RemotePhase1"
```

```
id=20085 trace_id=1 msg="encrypted, and send to 15.215.225.22 with source 66.236.56.226"
id=20085 trace_id=1 msg="send to 66.236.56.230 via intf-wan1"
id=20085 trace_id=2 msg="vd-root received a packet (proto=1, 10.72.55.240:1-1071.55.10:8)
     from internal."
id=20085 trace_id=2 msg="Find an existing session, id-00001cd3, original direction"
id=20085 trace_id=2 msg="enter IPsec ="encrypted, and send to 15.215.225.22 with source
     66.236.56.226" tunnel-RemotePhase1"
id=20085 trace_id=2 msgid=20085 trace_id=2 msg="send to 66.236.56.230 via intf-wan1"
```

Testing a proxy operation

To monitor proxy operations in the CLI:

```
diagnose test application <application> <option>
```

To display a list of available application values:

```
diagnose test application ?
```

To display a list of available option values:

```
diagnose test application <application> ?
```

The `<option>` value will depend on the application value used in the command.

For example, if the application is `http`, the CLI command that displays the `<option>` values is:

```
diagnose test application http ?
```

Displaying detail Hardware NIC information

Monitoring the hardware NIC is important because interface errors indicate data link or physical layer issues which may impact the performance of the FortiGate.

To monitor hardware network operations in the CLI:

```
diagnose hardware deviceinfo nic <interface>
```

Sample output:

The following is sample output when the `<interface>` is set to `lan`:

```
System_Device_Name lan
Current_HWaddr 00:09:0f:68:35:60
Permanent_HWaddr 00:09:0f:68:35:60
State up
Link up
Speed 100
Duplex full
[……]
Rx_Packets=5685708
Tx_Packets=4107073
Rx_Bytes=617908014
```

```
Tx_Bytes=1269751248
Rx_Errors=0
Tx_Errors=0
Rx_Dropped=0
Tx_Dropped=0
[……]
```

Error descriptions

The `diagnose hardware deviceinfo nic` command displays a list of error names and values that are related to hardware.

The following table describes possible hardware errors:

Field	Description
Rx_Errors = rx error count	Bad frame was marked as error by PHY
Rx_CRC_Errors + Rx_Length_Errors - Rx_Align_Errors	This error is only valid in 10/100M mode
Rx_Dropped or Rx_No_Buffer_ Count	Running out of buffer space
Rx_Missed_Errors	Equals Rx_FIFO_Errors + CEXTERR (Carrier Extension Error Count); only valid in 1000M mode, which is marked by PHY
Tx_Errors = Tx_ Aborted_Errors	ECOL (Excessive Collisions Count); only valid in half-duplex mode
Tx_Window_Errors	Late Collisions (LATECOL) Count Late collisions are collisions that occur after 64-byte time into the transmission of the packet while working in 10 to 100 Mb/s data rate and 512-byte time into the transmission of the packet while working in the 1,000 Mb/s data rate. This register only increments if transmits are enabled and the device is in half-duplex mode.
Rx_Dropped	See Rx_Errors
Tx_Dropped	Not defined
Collisions	Total number of collisions experienced by the transmitter; valid in half-duplex mode
Rx_Length_Errors	Transmission length error
Rx_Over_Errors	Not defined
Rx_CRC_Errors	Frame CRC error
Rx_Frame_Errors	Same as Rx_Align_Errors This error is only valid in 10/100M mode.
Rx_FIFO_Errors	Same as Rx_Missed_Errors - a missed packet count

Field	Description
Tx_Aborted_Errors	See Tx_Errors
Tx_Carrier_Errors	The PHY should assert the internal carrier sense signal during every transmission. Failure to do so may indicate that the link has failed or the PHY has an incorrect link configuration. This register only increments if transmits are enabled. This register isn't valid in internal SerDes 1 mode (TBI mode for the 82544GC/EI) and is valid only when the Ethernet controller is operating at full duplex.
Tx_FIFO_Errors	Not defined
Tx_Heartbeat_Errors	Not defined
Tx_Window_Errors	See LATECOL
Tx_Single_Collision_ Frames	Counts the number of times that a successfully transmitted packet encountered a single collision The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Multiple_ Collision_Frames	A Multiple Collision Count which indicates the number of times that a transmit encountered more than one collision, but less than 16. The value increments only if transmits are enabled and the Ethernet controller is in half-duplex mode.
Tx_Deferred	Counts defer events. A deferred event occurs when the transmitter cannot immediately send a packet due to: • The medium being busy because another device is transmitting • The IPG timer hasn't expired • Half-duplex deferral events are occurring • XOFF frames are being received • he link is not up. This register only increments if transmits are enabled. This counter does not increment for streaming transmits that are deferred due to TX IPG.
Rx_Frame_Too_ Longs	The Rx frame is oversized
Rx_Frame_Too_ Shorts	The Rx frame is too short
Rx_Align_Errors	This error is only valid in 10/100M mode
Symbol Error Count	Counts the number of symbol errors between reads - SYMERRS. The count increases for every bad symbol that's received, whether or not a packet is currently being received and whether or not the link is up. This register increments only in internal SerDes mode.

Performing a traffic trace

Traffic tracing allows you to follow a specific packet stream. This is useful when you want to confirm that packets are using the route you expect them to take on your network.

To view traffic sessions:

Use this command to view the characteristics of a traffic session though specific security policies.

```
diagnose sys session
```

To trace per-packet operations for flow tracing:

```
diagnose debug flow
```

To trace per-Ethernet frame:

```
diagnose sniffer packet
```

To trace a route from a FortiGate to a destination IP address:

```
# execute traceroute www.fortinet.com
traceroute to www.fortinet.com (66.171.121.34), 32 hops max, 84 byte packets
1 172.20.120.2 0.637 ms 0.653 ms 0.279 ms
2 209.87.254.221 <static-209-87-254-221.storm.ca> 2.448 ms 2.519 ms 2.458 ms
3 209.87.239.129 <core-2-g0-2.storm.ca> 2.917 ms 2.828 ms 9.324 ms
4 209.87.239.199 <core-3-bdi1739.storm.ca> 13.248 ms 12.401 ms 13.009 ms
5 216.66.41.113 <v502.core1.tor1.he.net> 17.181 ms 12.422 ms 12.268 ms
6 184.105.80.9 <100ge1-2.core1.nyc4.he.net> 21.355 ms 21.518 ms 21.597 ms
7 198.32.118.41 <ny-paix-gni.twgate.net> 83.297 ms 84.416 ms 83.782 ms

9 203.160.228.229 <229-228-160-203.TWGATE-IP.twgate.net> 82.055 ms 82.455 ms 81.808 ms
10 203.78.181.2 82.262 ms 81.572 ms 82.015 ms
11 203.78.186.70 83.283 ms 83.243 ms 83.293 ms
12 66.171.127.177 84.030 ms 84.229 ms 83.550 ms
13 66.171.121.34 <www.fortinet.com> 84.023 ms 83.903 ms 84.032 ms
14 66.171.121.34 <www.fortinet.com> 83.874 ms 84.084 ms 83.810 ms
```

Using a session table

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all at once instead of inspecting each packet individually. Each session has an entry in the session table that includes important information about the session.

You can view FortiGate session tables from the FortiGate GUI or CLI. The most useful troubleshooting data comes from the CLI. The session table in the GUI also provides useful summary information, particularly the current policy number that the session is using.

When to use a session table

Session tables are useful when verifying open connections. For example, if you have a web browser open to browse the Fortinet website, you would expect a session entry from your computer on port 80 to the IP address for the Fortinet website.

You can also use a session table to investigate why there are too many sessions for FortiOS to process.

GUI

To view session information in the GUI:

1. Go to *Security Fabric* > *Physical Topology*.
2. From the *Metrics* dropdown, select *Sessions*.

Finding the security policy for a specific connection

Every program and device on your network must have an open communication channel or session to pass information. FortiGate manages these sessions with features such as traffic shaping, antivirus scanning, and blocking known bad websites. Each session will have an entry in the session table.

If a secure web browser session is not working properly, you can check the session table to ensure the session is still active and going to the proper address. The session table can also tell you the security policy number it matches, so you can check what is happening in that policy.

1. Get the connection information.

You need to be able to identify the session you want. To do this, you will need:

- The source IP address (usually your computer)
- The destination IP address (if you have it)
- The port number which is determined by the program you are using. Common ports are:
  - Port 80 (HTTP for web browsing)
  - Port 443 (HTTPS for SSL encrypted web browsing)
  - Port 22 (SSH for Secure Shell)
  - Port 25 (SMTP for Mail Transfer)

2. Find the session and policy ID

Go to *Security Fabric* > *Physical Topology*. From the *Metrics* dropdown, select *Sessions*.

To find your session, search for your source IP address, destination IP address (if you have it), and port number. The policy ID is listed after the destination information.

3. Use filters to find a session

If there are multiple pages of sessions, you can use a filter to hide the sessions you do not need. To filter the sessions in the table, click *Add Filter*, and select an option from the list. You can filter the table by *Destination IP*, *Source IP*, or *Source Port*.

CLI

The session table output in the CLI is very large. The CLI command supports filters to show only the data you need.

To view session data in the CLI:

```
diagnose sys session list
```

An entry is placed in the session table for each traffic session passing through a security policy

To filter session data:

```
diagnose sys session filter <option>
```

The values for `<option>` include the following:

Value	Definition
`clear`	Clear session filter
`dintf`	Destination interface
`dport`	Destination port
`dst`	Destination IP address
`duration`	Duration of the session
`expire`	Expire
`negate`	Inverse filter
`nport`	NAT'd source port
`nsrc`	NAT'd source ip address
`policy`	Policy ID
`proto`	Protocol number
`proto-state`	Protocol state
`session-state1`	Session state1
`session-state2`	Session state2
`sintf`	Source interface
`sport`	Source port
`src`	Source IP address
`vd`	Index of virtual domain, `-1` matches all

Even though UDP is a sessionless protocol, FortiGate keeps track of the following states:

- When UDP reply does not have a value of 0
- When UDP reply has a value of 1

The following table displays firewall session states from the session table:

State	Description
log	Session is being logged
local	Session is originated from or destined for local stack
ext	Session is created by a firewall session helper
may_dirty	Session is created by a policy

State	Description
	For example, the session for `ftp control channel` will have this state but `ftp data channel` won't. This is also seen when NAT is enabled.
ndr	Session will be checked by IPS signature
nds	Session will be checked by IPS anomaly
br	Session is being bridged (TP) mode

Examining the firewall session list

The firewall session list displays all open sessions in FortiGate. Examine the list for strange patterns, such as no sessions apart from the internal network, or all sessions are only to one IP address.

When you examine the firewall session list in the CLI, you can use filters to reduce the output.

To examine the firewall session list in the CLI:

You can use a filter to limit the sessions displayed by source, destination address, port, or NAT'd address. To use more than one filter, enter a separate line for each value.

The following example filters the session list based on a source address of 10.11.101.112:

```
FGT# diagnose sys session filter src 10.11.101.112
FGT# diagnose sys session list
```

The following example filters the session list based on a destination address of 172.20.120.222.

```
FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session list
```

To clear all sessions corresponding to a filter:

```
FGT# diagnose sys session filter dst 172.20.120.222
FGT# diagnose sys session clear
```

Checking source NAT information

Checking source NAT is important when you are troubleshooting from the remote end of the connection outside the firewall.

To check the source NAT information in the CLI:

When you display the session list in the CLI, you can match the NAT'd source address (`nsrc`) and port (`nport`). This is useful when multiple internal IP addresses are NAT'd to a common external-facing source IP address.

```
FGT# diagnose sys session filter nsrc 172.20.120.122
FGT# diagnose sys session filter nport 8888
FGT# diagnose sys session list
```

Finding object dependencies

You may be prevented from deleting a configuration object when other configuration objects depend on it. You can use the GUI or CLI to identify objects which depend on, or make reference to the configuration you are trying to delete. Additionally, if you have a virtual interface with dependent objects, you will need to find and remove those dependencies before deleting the interface.

To remove interface object dependencies in the GUI:

1. Go to *Network* > *Interfaces*. The *Ref.* column displays the number of objects that reference this interface.
2. Select the number in the *Ref* . column for the interface. A window listing the dependencies appears.
3. Use these detailed entries to locate and remove object references to this interface. The trash can icon is enabled after all the object dependencies are removed.
4. Remove the interface by selecting the check box for the interface, and select *Delete*.

To find object dependencies in the CLI:

When running multiple VDOMs, use the following command in the global configuration only.

```
diagnose sys cmdb refcnt show <path.object.mkey>
```

The command searches for the named object in both the most recently used global and VDOM configurations.

Examples

To verify which objects a security policy with an ID of 1 refers to:

```
diagnose sys cmdb refcnt show firewall.policy.policyid 1
```

To check what is referred to by interface `port1`:

```
diagnose sys cmdb refcnt show system.interface.name port1
```

To show all dependencies for an interface:

```
diagnose sys cmdb refcnt show system.interface.name <interface name>
```

Sample output:

In this example , the interface has dependent objects, including four address objects, one VIP, and three security policies.

```
entry used by table firewall.address:name '10.98.23.23_host'
entry used by table firewall.address:name 'NAS'
entry used by table firewall.address:name 'all'
entry used by table firewall.address:name 'fortinet.com'
entry used by table firewall.vip:name 'TORRENT_10.0.0.70:6883'
entry used by table firewall.policy:policyid '21'
entry used by table firewall.policy:policyid '14'
entry used by table firewall.policy:policyid '19'
```

Diagnosing NPU-based interfaces

Some Fortinet products contain network processors, such as NP4, NP6Lite, or NP6. Offloading requirements will vary depending on the model.

To view the initial session setup for NPU-based interfaces:

```
diagnose debug flow
```

- If the session is programmed into the ASIC (fastpath) correctly, the command will not detect the packets that arrive at the CPU.
- If the NPU functionality is disabled, the CPU detects all the packets. However, you should only disable the NPU functionality for troubleshooting purposes.

To diagnose NPU-based interfaces:

1. Get the NPx or NPU ID and port numbers.
   ```
   diagnose npu <processor> list
   ```
   The output will look like this:
   ```
   ID Model Slot Interface
   0 On-board port1 fabric1 fabric3 fabric5
   1 On-board fabric2 port2 base2 fabric4
   ```
2. Disable the NPU functionality.
   ```
   diagnose npu <processor> fastpath disable <dev_id>
   ```
   The `dev_id` is the NPx ID number.
3. Analyze the packets.
   ```
   diagnose npu <processor> fastpath-sniffer enable port1
   ```

These commands only apply to NP4 and NP6 interfaces.

The output will look similar to:

```
NP4 Fast Path Sniffer on port1 enabled
```

This causes traffic on `port1` of the network processor to be sent to the CPU. This means you can perform a standard sniffer trace and use other diagnostic commands, if it is a standard CPU-driven port.

Identifying the XAUI link used for a specific traffic stream

The `diagnose npu np6 xaui-hash` command takes a 6-tuple input of the traffic stream to identify the NP6 XAUI link that the traffic passes through.

This command is only available on the 38xxD, 39xxD, 34xxE, 36xxE, and 5001E series devices.

Syntax

```
diagnose npu np6 xaui-hash <interface> <proto> <src_ip> <dst_ip> <src_port> <dst_port>
```

Variable	Description
<interface>	The network interface that the packets are coming from.
<proto>	The proto number, 6 for TCP or 17 for UDP.
<src_ip>	The source IP address.
<dst_ip>	The destination IP address.
<src_port>	The source port.
<dst_port>	The destination port.

Examples

```
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 80
 NP6_ID: 0, XAUI_LINK: 2
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 200
NP6_ID: 6, XAUI_LINK: 2
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 20
NP6_ID: 1, XAUI_LINK: 2
# diagnose npu np6 xaui-hash port1 6 1.1.1.1 2.2.2.1 4567 23
NP6_ID: 1, XAUI_LINK: 1
```

The `NP6_ID` is the NP index of the model that is being used. It can be found with the `diagnose npu np6 port-list` command.

Date and time settings

Fortinet support may ask you to check the date and time settings for log message timestamp synchronization and for certificates that have a time requirement to check for validity.

To check time settings:

```
execute time
```

To check date settings:

```
execute date
```

If all devices have the same time, it helps to correlate log entries from different devices.

```
execute time
current time is: 12:40:48
last ntp sync:Thu Mar 16 12:00:21 2006
execute date
current date is: 2006-03-16
```

To force synchronization with an NTP server:

```
config system ntp
   set ntpsync {enable | disable}
end
```

If all devices have the same time, it helps to correlate log entries from different devices.

Running the TAC report

The Technical Assistance Center (TAC) report runs an exhaustive series of diagnostic commands. Some of the commands are only needed if you are using features, such as HA, VPN tunnels, or a modem. Fortinet support my ask you to use the report output to provide information about the current state of your FortiGate.

Due the amount of output generated, the report may take a few minutes to run. If you are logging CLI output to a file, you can run this command to familiarize yourself with the diagnostic commands.

To run the TAC report in the CLI:

```
execute tac report
```

Other commands

You may be asked to provide the following information when you contact Fortinet support.

- ARP table on page 1998
- IP address on page 2000

ARP table

The ARP table is used to determine the destination MAC addresses of the network nodes, as well as the VLANs and ports from where the nodes are reached.

To view the ARP table:

```
# get system arp

Address           Age(min)    Hardware Addr      Interface
10.10.1.3         1           50:b7:c3:75:ea:dd internal7
192.168.0.190     0           28:f1:0e:03:2a:97 wan1
192.168.0.97      0           f4:f2:6d:37:b0:99 wan1
```

To view the ARP cache in the system:

```
# diagnose ip arp list

index=14 ifname=internal7 10.10.1.3 50:b7:c3:75:ea:dd state=00000004 use=2494 confirm=1995
update=374 ref=3
index=5 ifname=wan1 192.168.0.190 28:f1:0e:03:2a:97 state=00000002 use=88 confirm=86
update=977639 ref=2
index=22 ifname=internal 192.168.1.111 00:0c:29:c6:79:3d state=00000004 use=3724
confirm=9724 update=3724 ref=0
index=5 ifname=wan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202 confirm=930202
update=924202 ref=1
index=5 ifname=wan1 192.168.0.97 f4:f2:6d:37:b0:99 state=00000002 use=78 confirm=486
```

```
update=614 ref=26
index=14 ifname=internal7 10.10.1.11 state=00000020 use=172 confirm=1037790 update=78 ref=2
```

ARP request and cache

The FortiGate must make an ARP request when it tries to reach a new destination. The base ARP reachable value determines how often an ARP request it sent; the default is 30 seconds. The actual ARP reachable time is a random number between half and three halves of the base reachable time, or 15 to 45 seconds. The random number is updated every five minutes.

ARP entries in the ARP cache are updated based on the state of the ARP entry and the objects that are using it, as highlighted in the following output sample:

```
index=5 ifname=wan1 224.0.1.140 01:00:5e:00:01:8c state=00000040 use=924202
confirm=930202 update=924202 ref=1
```

There are multiple possible states for an ARP entry, and the state-transition mechanism can be complex. Common states include the following:

State	Meaning	Description
000000002 or 0x02	REACHABLE	An ARP response was received
000000004 or 0x04	STALE	No ARP response within the expected time
000000008 or 0x08	DELAY	A transition state between STALE and REACHABLE before Probes are sent out
000000020 or 0x20	FAILED	Did not manage to resolve within the maximum configured number of probes
000000040 or 0x40	NOARP	Device does not support ARP, e.g. IPsec interface
000000080 or 0x80	PERMANENT	A statically defined ARP entry

An entry that is in the STALE (0x04) or FAILED (0x20) states with no references to it (ref=0) can be deleted. Many factors affect the state-transmit mechanism and if an entry is used by other subsystems. For example, ARP creation, ARP request/reply, neighbor lookup, routing, and others can cause an ARP entry to be in use or referenced.

The garbage collection mechanism runs every 30 seconds, and checks and removes stale and unreferenced entries if they have been stale for longer than 60 seconds. Garbage collection will also be triggered when the number of ARP entries exceeds the configured threshold. If the threshold is exceeded, no entries can be added to the ARP table.

To set the maximum number of ARP entries threshold:

```
config system global
    set arp-max-entry <integer>
end
```

arp-max-entry <integer>	The maximum number of dynamically learned MAC addresses that can be added to the ARP table (131072 to 2147483647, default = 131072).

To clear all of the entries in the ARP table:

```
execute clear system arp table
```

To delete a single ARP entry from the ARP table:

```
diagnose ip arp delete <interface name> <IP address>
```

To add static ARP entries:

```
config system arp-table
    edit 1
        set interface "internal"
        set ip 192.168.50.8
        set mac bc:14:01:e9:77:02
    next
end
```

To view a summary of the ARP table:

```
# diagnose sys device list root

list virtual firewall root info:
ip4 route_cache: table_size=65536 max_depth=2 used=31 total=34
arp: table_size=16 max_depth=2 used=5 total=6
proxy_arp: table_size=256 max_depth=0 used=0 total=0
arp6: table_size=32 max_depth=1 used=3 total=3
proxy_arp6: table_size=256 max_depth=0 used=0 total=0
local table version=00000000 main table version=0000002b
vf=root dev=root vrf=0
vf=root dev=ssl.root vrf=0
...
vf=root dev=internal5 vrf=0
ses=0/0 ses6=0/0 rt=0/0 rt6=0/0
```

IP address

You may want to verify the IP addresses assigned to the FortiGate interfaces are what you expect them to be.

To verify IP addresses:

```
diagnose ip address list
```

The output lists the:

- IP address and mask (if available)
- `index` of the interface (a type of ID number)
- `devname` (the interface name)

While physical interface names are set, virtual interface names can vary. A good way to use this command is to list all of the virtual interface names. For `vsys_ha` and `vsys_fgfm`, the IP addresses are the local host, which are virtual interfaces that are used internally.

Sample output:

```
# diagnose ip address list
IP=10.31.101.100->10.31.101.100/255.255.255.0 index=3 devname=internal
IP=172.20.120.122->172.20.120.122/255.255.255.0 index=5 devname=wan1
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=8 devname=root
```

```
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=11 devname=vsys_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=vsys_fgfm
```

FortiGuard troubleshooting

The FortiGuard service provides updates to AntiVirus (AV), Antispam (AS), Intrusion Protection Services (IPS), Webfiltering (WF), and more. The FortiGuard Distribution System (FDS) consists of a number of servers across the world that provide updates to your FortiGate unit. Problems can occur with the connection to FDS and its configuration on your local FortiGate unit.

Some of the more common troubleshooting methods are listed here, including:

- Troubleshooting process for FortiGuard updates on page 2002
- FortiGuard server settings on page 2002
- FortiGuard server settings on page 2002

Verifying connectivity to FortiGuard

You can verify FortiGuard connectivity in the GUI and CLI.

To verify FortiGuard connectivity in the GUI:

1. Got to *Dashboard* > *Status*.
2. Check the *Licenses* widget. When FortiGate is connected to FortiGuard, a green check mark appears next to the available FortiGuard services.

To verify FortiGuard connectivity in the CLI:

```
execute ping service.fortiguard.net
```

```
execute ping update.fortiguard.net
```

Sample output:

```
FG100D# execute ping service.fortiguard.net
PING guard.fortinet.net (208.91.112.196): 56 data bytes
64 bytes from 208.91.112.196: icmp_seq=0 ttl=51 time=61.0 ms
64 bytes from 208.91.112.196: icmp_seq=1 ttl=51 time=60.0 ms
64 bytes from 208.91.112.196: icmp_seq=2 ttl=51 time=59.6 ms
64 bytes from 208.91.112.196: icmp_seq=3 ttl=51 time=58.9 ms
64 bytes from 208.91.112.196: icmp_seq=4 ttl=51 time=59.2 ms

--- guard.fortinet.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 58.9/59.7/61.0 ms

FG100D# execute ping update.fortiguard.net
PING fds1.fortinet.com (208.91.112.68): 56 data bytes
64 bytes from 208.91.112.68: icmp_seq=0 ttl=53 time=62.0 ms
64 bytes from 208.91.112.68: icmp_seq=1 ttl=53 time=61.8 ms
64 bytes from 208.91.112.68: icmp_seq=2 ttl=53 time=61.3 ms
64 bytes from 208.91.112.68: icmp_seq=3 ttl=53 time=61.9 ms
64 bytes from 208.91.112.68: icmp_seq=4 ttl=53 time=61.8 ms
```

Troubleshooting process for FortiGuard updates

The following process shows the logical steps you should take when troubleshooting problems with FortiGuard updates:

1. **Does the device have a valid license that includes these services?**
   Each device requires a valid FortiGuard license to access updates for some or all of these services. You can verify the status of the support contract for your devices at the Fortinet Support website.
2. **If the device is part of a high availability (HA) cluster, do all members of the cluster have the same level of support?**
   You can verify the status of the support contract for all of the devices in your HA cluster at the Fortinet Support website.
3. **Are services enabled on the device?**
   To see the FortiGuard information and status for a device in the GUI, go to *System* > *FortiGuard*.
   Use this page to verify the status of each component, and enable each service.
4. **Can the device communicate with FortiGuard servers?**
   Go to *System* > *FortiGuard* in the GUI, and try to update AntiVirus and IPS, or test the availability of Web Filtering and AS default and alternate ports.
5. **Is there proper routing to reach the FortiGuard servers?**
   Ensure there is a static or dynamic route that allows your FortiGate to reach the FortiGuard servers. Usually a generic default route to the internet is enough, but you may need to verify this if your network is complex.
6. **Are there issues with DNS?**
   An easy way to test this is to attempt a traceroute from behind the FortiGate to an external network using the Fully Qualified Domain Name (FQDN) for a location. If the traceroute FQDN name doesn't resolve, you have general DNS problems.
7. **Is there anything upstream that might be blocking FortiGuard traffic, either on the network or ISP side?**
   Many firewalls block all ports, by default, and ISPs often block ports that are low. There may be a firewall between the FortiGate and the FortiGuard servers that's blocking the traffic. By default, FortiGuard uses port 53. If that port is blocked you need to either open a hole for it or change the port it is using.
8. **Is there an issue with source ports?**
   It is possible that ports that FortiGate uses to contact FortiGuard are being changed before they reach FortiGuard or on the return trip before they reach FortiGate. A possible solution for this is to use a fixed-port at NAT'd firewalls to ensure the port remains the same. You can use packet sniffing to find more information about what's happening with ports.
9. **Are there security policies that include antivirus?**
   If none of the security policies include antivirus, the antivirus database will not be updated. If antivirus is included, only the database type that's used will be updated.

FortiGuard server settings

Your local FortiGate connects to remote FortiGuard servers to get updates to FortiGuard information, such as new viruses that may have been found or other new threats.

This section provides methods to display FortiGuard server information on your FortiGate, and how to use that information and update it to fix potential problems.

Displaying the server list

To get a list of FDS servers FortiGate uses to send web filtering requests:

```
get webfilter status
```

or

```
diagnose debug rating
```

Rating requests are only sent to the server at the top of the list in normal operation. Each server is probed for Round Trip Time (RTT) every two minutes. Rating may not be enabled on your FortiGate.

Optionally, you can add a refresh rate to the end of the command to determine how often the server list is refreshed.

Sample output:

```
Locale       : english
License      : Contract
Expiration   : Thu Oct  9 02:00:00 2011
-=- Server List (Mon Feb 18 12:55:48 2008) -=-
IP            Weight    RTT    Flags    TZ     Packets CurrLost TotalLost
a.b.c.d        0       1       DI      2       1926879 0       11176
10.1.101.1     10      329             1       10263   0       633
10.2.102.2     20      169             0       16105   0       80
10.3.103.3     20      182             0       6741    0       776
10.4.104.4     20      184             0       5249    0       987
10.5.105.5     25      181             0       12072   0       178
```

Output details

The server list includes the IP addresses of alternate servers if the first entry cannot be reached. In this example, the IP addresses are not public addresses.

The following flags in `get webfilter status` indicate the server status:

Flag	Description
D	The server was found through the DNS lookup of the hostname. If the hostname returns more than one IP address, all of them are flagged with D and are used first for INIT requests before falling back to the other servers.
I	The server to which the last INIT request was sent
F	The server hasn't responded to requests and is considered to have failed
T	The server is currently being timed
S	Rating requests can be sent to the server. The flag is set for a server only in two cases: • The server exists in the servers list received from the (Undefined variable: FortinetVariables.ProductName1) or any other INIT server. • The server list received from the (Undefined variable: FortinetVariables.ProductName1) is empty so the (Undefined variable: FortinetVariables.ProductName1) is the only server that the (Undefined variable: FortinetVariables.ProductName6) knows and it should be used as the rating server.

Sorting the server list

The server list is sorted first by weight. The server with the smallest RTT appears at the top of the list, regardless of weight. When a packet is lost (there has been no response in 2 seconds), it is re-sent to the next server in the list. Therefore, the top position in the list is selected based on RTT, while the other positions are based on weight.

Calculating weight

The weight for each server increases with failed packets and decreases with successful packets. To lower the possibility of using a remote server, the weight isn't allowed to dip below a base weight. The base weight is calculated as the difference in hours between the FortiGate and the server multiplied by 10. The farther away the server is, the higher its base weight is and the lower it appears in the list.

Additional resources

To learn more about FortiGate and FortiOS, as well information about technical issues, please refer to the following resources:

Technical documentation

Installation, Administration, and Quick Start Guides, as well as other technical documents, are available online at the Fortinet Document Library

Fortinet video library

The Fortinet Video Library hosts a collection of video which provide valuable information about Fortinet products.

Release notes

Issues that arise after the technical documentation has been published will often be listed in the Release Notes. To find these, go to the Fortinet Document Library.

Knowledge base

The Fortinet Knowledge Base provides access to a variety of articles, white papers, and other documentation that provides technical insight into a range of Fortinet products. The Knowledge Base is available online at: http://kb.fortinet.com

Fortinet technical discussion forums

An online technical forum allows administrators to contribute to discussions about issues that relate to their Fortinet products. Searching the forum can help an administrator identify if an issue has been experienced by another user. You

can access the support forums at: https://forum.fortinet.com/

Fortinet training services online campus

The Fortinet Training Services Online Campus hosts a collection of tutorials and training materials which you can use to increase your knowledge of Fortinet products. https://www.fortinet.com/training.html

Fortinet Support

You defined your problem, researched a solution, put together a plan to find the solution, and executed that plan. At this point, if the problem hasn't been solved, it's time to contact Fortinet Support for assistance.

www.fortinet.com
