This is a sample configuration of an IPsec site-to-site VPN connection between an on-premise FortiGate and an Azure virtual network (VNet). This example uses Azure virtual WAN (vWAN) to establish the VPN connection.

- Azure must use IPsec v2 for this configuration.
- Azure uses overlapped subnet IP addresses for the IPsec interfaces.

To configure IKEv2 IPsec site-to-site VPN to an Azure VPN gateway:

1. In the Azure management portal, configure vWAN-related settings as described in Tutorial: Create a Site-to-Site connection using Azure Virtual WAN.
   If a custom BGP IP address is configured on Azure's vWAN, such as 169.254.21.6 and 169.254.21.7, you must configure the FortiGate `remote-IP` to the corresponding *Custom BGP IP Address* value. If a custom BGP IP address is not configured, FortiGate `remote-IPs` should point to the *Default BGP IP Address* value.

2. Download the VPN configuration. The following shows an example VPN configuration:

```
[ {"configurationVersion":{"LastUpdatedTime":"2019-07-16T22:16:28.0409002Z","Version":"be5c5787-
      b903-43b1-a237-49eae1b373e4"},"vpnSiteConfiguration":
      {"Name":"toaws","IPAddress":"3.220.252.93","BgpSetting":
      {"Asn":7225,"BgpPeeringAddress":"169.254.24.25","PeerWeight":32768},"LinkName":"toaws"},"v
      pnSiteConnections":[{"hubConfiguration":{"AddressSpace":"10.1.0.0/16","Region":"West
      US","ConnectedSubnets":["10.2.0.0/16"]},"gatewayConfiguration":{"IpAddresses":
      {"Instance0":"52.180.90.47","Instance1":"52.180.89.94"},"BgpSetting":
      {"Asn":65515,"BgpPeeringAddresses":
      {"Instance0":"10.1.0.7","Instance1":"10.1.0.6"},"PeerWeight":0}},"connectionConfiguration":
      {"IsBgpEnabled":true,"PSK":"Fortinet123#","IPsecParameters":
      {"SADataSizeInKilobytes":102400000,"SALifeTimeInSeconds":3600}}}]} ]
```

3. Configure the following on the FortiGate. Note for `set proposal`, you can select from several proposals.

```
config vpn ipsec phase1-interface
   edit "toazure1"
      set interface "port1"
      set ike-version 2
      set keylife 28800
      set peertype any
      set proposal aes256-sha1
      set dhgrp 2
      set remote-gw 52.180.90.47
      set psksecret **********
   next
   edit "toazure2"
      set interface "port1"
      set ike-version 2
      set keylife 28800
      set peertype any
      set proposal aes256-sha1
      set dhgrp 2
      set remote-gw 52.180.89.94
      set psksecret **********
   next
end
config vpn ipsec phase2-interface
   edit "toazure1"
      set phase1name "toazure1"
      set proposal aes256-sha1
      set dhgrp 2
      set keylifeseconds 3600
   next
   edit "toazure2"
      set phase1name "toazure2"
      set proposal aes256-sha1
      set dhgrp 2
      set keylifeseconds 3600
   next
end
config system settings
   set allow-subnet-overlap enable
end
config system interface
   edit "toazure1"
      set vdom "root"
      set ip 169.254.24.25 255.255.255.255
      set type tunnel
```

```
      set remote-ip 10.1.0.7 255.255.255.255
      set snmp-index 4
      set interface "port1"
   next
   edit "toazure2"
      set vdom "root"
      set ip 169.254.24.25 255.255.255.255
      set type tunnel
      set remote-ip 10.1.0.6 255.255.255.255
      set snmp-index 5
      set interface "port1"
   next
end
config router bgp
   set as 7225
   set router-id 169.254.24.25
   config neighbor
      edit "10.1.0.7"
         set remote-as 65515
      next
      edit "10.1.0.6"
         set remote-as 65515
      next
   end
   config network
      edit 1
         set prefix 172.30.101.0 255.255.255.0
      next
   end
   config redistribute "connected"
      set status enable
   end
   config redistribute "rip"
   end
   config redistribute "ospf"
   end
   config redistribute "static"
   end
   config redistribute "isis"
   end
   config redistribute6 "connected"
   end
   config redistribute6 "rip"
   end
   config redistribute6 "ospf"
   end
   config redistribute6 "static"
   end
   config redistribute6 "isis"
   end
end
```

4. Run `diagnose vpn tunnel list`. If the configuration was successful, the output should resemble the following:

```
name=toazure1 ver=2 serial=3 172.30.1.83:4500->52.180.90.47:4500 tun_id=52.180.90.47

```

IPSec VPN between a FortiGate and a Cisco ASA with multiple subnets

When a Cisco ASA unit has multiple subnets configured, multiple phase 2 tunnels must be created on the FortiGate to allocate to each subnet (rather than having multiple subnets on one phase 2 tunnel).

The FortiGate uses the same SPI value to bring up the phase 2 negotiation for all of the subnets, while the Cisco ASA expects different SPI values for each of its configured subnets. Using multiple phase 2 tunnels on the FortiGate creates different SPI values for each subnet.

To configure multiple phase 2 interfaces in route-based mode:

```
config vpn ipsec phase2-interface
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

To configure multiple phase 2 interfaces in policy-based mode:

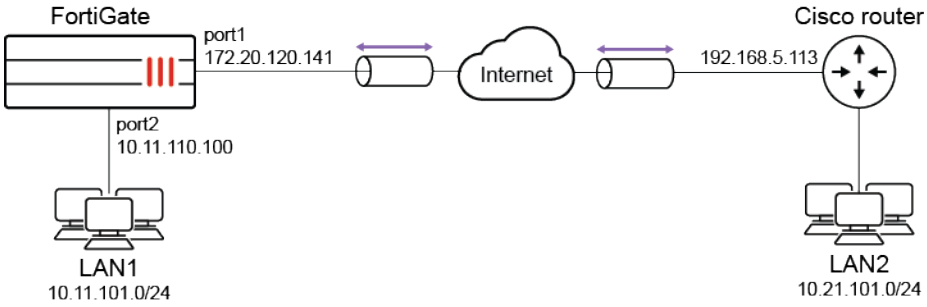
```
config vpn ipsec phase2
    edit "First subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.142.0.0 255.255.254.0
    next
    edit "Second subnet"
        set phase1name "VPN to Cisco"
        set src-subnet 192.168.227.253 255.255.255.255
        set dst-subnet 10.143.0.0 255.255.254.0
    next
end
```

Cisco GRE-over-IPsec VPN

This is a sample configuration of a FortiGate VPN that is compatible with Cisco-style VPNs that use GRE in an IPsec tunnel. Cisco products with VPN support often use the GRE protocol tunnel over IPsec encryption. Cisco VPNs can use either transport mode or tunnel mode IPsec.

Topology

In this example, LAN1 users are provided with access to LAN2.



Configuring the FortiGate

There are five steps to configure GRE-over-IPsec with a FortiGate and Cisco router:

1. Enable overlapping subnets.
2. Configure a route-based IPsec VPN on the external interface.
3. Configure a GRE tunnel on the virtual IPsec interface.
4. Configure security policies.
5. Configure the static route.

Enabling overlapping subnets

Overlapping subnets are required because the IPsec and GRE tunnels will use the same addresses. By default, each FortiGate network interface must be on a separate network. This configuration assigns an IPsec tunnel endpoint and the external interface to the same network.

To enable overlapping subnets:

```
config system settings
    set allow-subnet-overlap enable
    next
end
```

Configuring a route-based IPsec VPN

A route-based VPN that use encryption and authentication algorithms compatible with the Cisco router is required. Pre-shared key authentication is used in this configuration.

To configure route-based IPsec in the GUI:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name (*tocisco*) and click *Next*.
3. Enter the following:

Remote Gateway	Static IP Address
IP Address	Cisco router public interface (192.168.5.113)
Interface	FortiGate public interface (172.20.120.141)
Authentication Method	Pre-shared Key
Pre-shared Key	Entry must match the pre-shared key on the Cisco router
Mode	Main (ID Protection)
Phase 1 Proposal	3DES-SHA1, AES128-SHA1 (at least one proposal must match the settings on the Cisco router)
Local Address	GRE local tunnel endpoint IP address (172.20.120.141)
Remote Address	GRE remote tunnel endpoint IP address (192.168.5.113)
Phase 2 Proposal	3DES-MD5 (at least one proposal must match the settings on the Cisco router)
Local Port	0
Remote Port	0
Protocol	47

4. Click *OK*.
5. If the Cisco router is configured to use transport mode IPsec, configure transport mode on the FortiGate:

```
config vpn phase2-interface
    edit tocisco_p2
        set encapsulation transport-mode
    next
end
```

To configure route-based IPsec in the CLI:

```
config vpn ipsec phase1-interface
    edit tocisco
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set remote-gw 192.168.5.113
        set psksecret xxxxxxxxxxxxxxxx
    next
end
```

```
config vpn ipsec phase2-interface
    edit tocisco_p2
        set phase1name tocisco
        set proposal 3des-md5
        set encapsulation [tunnel-mode | transport-mode]
        set protocol 47
        set src-addr-type ip
        set dst-start-ip 192.168.5.113
        set src-start-ip 172.20.120.141
    next
end
```

To add the IPsec tunnel end addresses:

```
config system interface
    edit tocisco
        set ip 172.20.120.141 255.255.255.255
        set remote-ip 192.168.5.113
    next
end
```

Configuring the GRE tunnel

The local gateway and remote gateway addresses must match the local and remote gateways of the IPsec tunnel. The GRE tunnel runs between the virtual IPsec public interface on the FortiGate unit and the Cisco router.

To configure the GRE tunnel:

```
config system gre-tunnel
    edit gre1
        set interface tocisco
        set local-gw 172.20.120.141
        set remote-gw 192.168.5.113
        set keepalive-interval <integer>
        set keepalive-failtimes <integer>
    next
end
```

The Cisco router configuration requires an address for its end of the GRE tunnel, so you need to add the tunnel end addresses.

To add the tunnel end addresses:

```
config system interface
    edit gre1
        set ip 10.0.1.1 255.255.255.255
        set remote-ip 10.0.1.2
    next
end
```

Configuring the security policies

Two sets of security policies are required:

- Policies to allow traffic to pass in both directions between the GRE virtual interface and the IPsec virtual interface.
- Policies to allow traffic to pass in both directions between the protected network interface and the GRE virtual interface.

To configure security policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Enter the following to allow traffic between the protected network and the GRE tunnel:

Name	LANtoGRE
Incoming Interface	Interface that connects to the private network behind the FortiGate (port2)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

3. Click *OK*.
4. Create a new policy and enter the following to allow traffic between the GRE tunnel and the protected network:

Name	GREtoLAN
Incoming Interface	GRE tunnel virtual interface (gre1)
Outgoing Interface	Interface that connects to the private network behind the FortiGate (port2)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

5. Click *OK*.
6. Create a new policy and enter the following to allow traffic between the GRE virtual interface and the IPsec virtual interface:

Name	GREtoIPsec
Incoming Interface	GRE tunnel virtual interface (gre1)

Outgoing Interface	Virtual IPsec interface (tocisco)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

7. Click *OK*.
8. Create a new policy and enter the following to allow traffic between the IPsec virtual interface and the GRE virtual interface:

Name	IPsectoGRE
Incoming Interface	Virtual IPsec interface (tocisco)
Outgoing Interface	GRE tunnel virtual interface (gre1)
Source	All
Destination	All
Action	ACCEPT
NAT	Disable

9. Click *OK*.

To configure security policies in the CLI:

```
config firewall policy
    edit 1
        set name LANtoGRE
        set srcintf port2
        set dstintf gre1
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 2
        set name GREtoLAN
        set srcintf gre1
        set dstintf port2
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 3
        set name GREtoIPsec
        set srcintf gre1
```

```
        set dstintf tocisco
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
    edit 4
        set name IPsectoGRE
        set srcintf tocisco
        set dstintf gre1
        set srcaddr all
        set dstaddr all
        set action accept
        set schedule always
        set service ALL
    next
end
```

Configuring routing

to direct traffic destined for the network behind the Cisco router into the GRE-over-IPsec tunnelTraffic destined for the network behind the Cisco router must be routed to the GRE tunnel. To do this, create a static route

To create the static route in the GUI:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Enter the following:

Destination	IP and netmask for the network behind the Cisco router (10.21.101.0 255.255.255.0)
Interface	GRE tunnel virtual interface (gre1)
Administrative Distance	Leave the default setting

3. Click *OK*.

To create the static route in the CLI:

```
config router static
    edit 0
        set device gre1
        set dst 10.21.101.0 255.255.255.0
    next
end
```

Configuring the Cisco router

For more information, refer to Configuring and verifying a GRE over IPsec tunnel in the Fortinet Knowledge Base.

In this type of deployment where you configure GRE over IPsec VPN, NP7 offloading is not natively supported, even though it is supported individually for GRE and for IPsec.

To workaround this, configure two separate VDOMs where one performs IPsec tunneling and the other performs GRE encapsulation.

For more information, see the following KB: Technical Tip: GRE + IPSec not supported for NP7 offloading.

Remote access

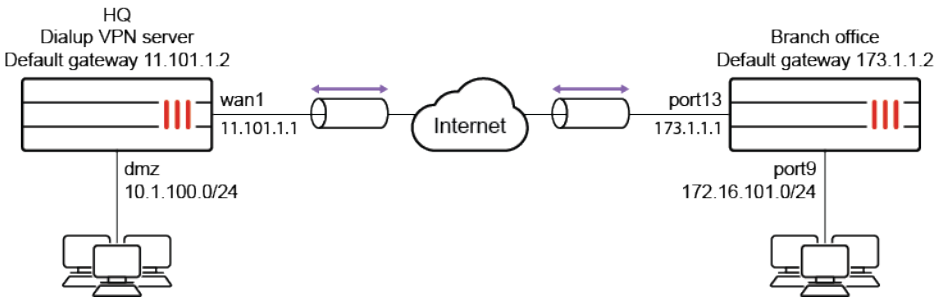
Remote access lets users connect to the Internet using a dialup connection over traditional POTS or ISDN telephone lines. Virtual private network (VPN) protocols are used to secure these private connections.

The following topics provide instructions on configuring remote access:

- FortiGate as dialup client on page 2335
- FortiClient as dialup client on page 2342
- Add FortiToken multi-factor authentication on page 2347
- Add LDAP user authentication on page 2348
- iOS device as dialup client on page 2349
- IKE Mode Config clients on page 2353
- L2TP over IPsec on page 2359
- Tunneled Internet browsing on page 2363
- Dialup IPsec VPN with certificate authentication on page 2369
- SAML-based authentication for FortiClient remote access dialup IPsec VPN clients on page 2379
- Restricting VPN access to rogue/non-compliant devices with Security Fabric
- Enhancing IPsec security using EMS SN verification on page 2399
- IPsec split DNS on page 2400
- Dialup IPsec VPN using custom TCP port on page 2400
- IPsec DNS suffix on page 2408
- LDAP authentication with IKEv2 using UDP or TCP as transport on page 2410
- Using single or multiple user groups for user authentication on page 2422
- IPsec IKEv2 VPN 2FA with EAP and certificate authentication on page 2424

FortiGate as dialup client

This is a sample configuration of dialup IPsec VPN and the dialup client. In this example, a branch office FortiGate connects via dialup IPsec VPN to the HQ FortiGate.



You can configure dialup IPsec VPN with FortiGate as the dialup client using the GUI or CLI.

To configure IPsec VPN with FortiGate as the dialup client in the GUI:

1. Configure the dialup VPN server FortiGate:
   a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *The remote site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Incoming Interface*, select the incoming interface.
      ii. For *Authentication Method*, select *Pre-shared Key*.
      iii. In the *Pre-shared Key* field, enter *your-psk* as the key.
      iv. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select the local interface.
      ii. Configure the *Local Subnets* as *10.1.100.0/24*.
      iii. Configure the *Remote Subnets* as *172.16.101.0/24*.
      iv. Click *Create*.
2. Configure the dialup VPN client FortiGate:
   a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *This site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *IP Address*, enter *11.101.1.1*.
      ii. For *Outgoing Interface*, select *port13*.

iii. For *Authentication Method*, select *Pre-shared Key*.
iv. In the *Pre-shared Key* field, enter *your-psk* as the key.
v. Click *Next*.

c. Configure the following settings for *Policy & Routing*:
i. From the *Local Interface* dropdown menu, select the local interface. In this example, it is *port9*.
ii. Configure the *Local Subnets* as *172.16.101.0*.
iii. Configure the *Remote Subnets* as *10.1.100.0*.
iv. Click *Create*.

To configure IPsec VPN with FortiGate as the dialup client in the CLI:

1. In the CLI, configure the user, user group, and firewall address. Only the HQ dialup server FortiGate needs this configuration. The address is an IP pool to assign an IP address for the dialup client FortiGate.

```
config user local
    edit "vpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
config firewall address
    edit "client_range"
        set type iprange
        set start-ip 10.10.10.1
        set end-ip 10.10.10.200
    next
end
```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.
   a. Configure the HQ FortiGate.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 11.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 11.101.1.2
        set device "wan1"
```

```
   next
end
```

b. Configure the branch office FortiGate.

```
config system interface
    edit "port13"
        set vdom "root"
        set ip 173.1.1.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 173.1.1.2
        set device "port13"
    next
end
```

3. Configure the internal interface and protected subnet. The internal interface connects to the internal network. Traffic from this interface will route out the IPsec VPN tunnel.

a. Configure the HQ FortiGate.

```
config system interface
    edit "dmz"
        set vdom "root"
        set ip 10.1.100.1 255.255.255.0
    next
end
config firewall address
    edit "10.1.100.0"
        set subnet 10.1.100.0 255.255.255.0
    next
end
```

b. Configure the branch office FortiGate.

```
config system interface
    edit "port9"
        set vdom "root"
        set ip 172.16.101.1 255.255.255.0
    next
end
config firewall address
    edit "172.16.101.0"
        set subnet 172.16.101.0 255.255.255.0
    next
end
```

4. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

a. Configure the HQ FortiGate.

```
config vpn ipsec phase1-interface
    edit "for_Branch"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype any
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set xauthtype auto
        set authusrgrp "vpngroup"
        set net-device enable
        set assign-ip-from name
        set dns-mode auto
        set ipv4-split-include "10.1.100.0"
        set ipv4-name "client_range"
        set save-password enable
        set psksecret sample
        set dpd-retryinterval 60
    next
end
```

b. Configure the branch office FortiGate.

```
config vpn ipsec phase1-interface
    edit "to_HQ"
        set interface "port13"
        set mode aggressive
        set peertype any
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set xauthtype client
        set authusr "vpnuser1"
        set authpasswd vpnuser1-password
        set remote-gw 11.101.1.1
        set psksecret sample
    next
end
```

5. Configure the IPsec phase2-interface.

a. Configure the HQ FortiGate:

```
config vpn ipsec phase2-interface
    edit "for_Branch_p2"
        set phase1 name "for_Branch"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

b. Configure the branch office FortiGate.

```
config vpn ipsec phase2-interface
    edit "to_HQ_p2"
        set phase1name "to_HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

6. Configure the static routes on the branch office FortiGate. The blackhole route is important to ensure that IPsec traffic does not match the default route when the IPsec tunnel is down.

```
config router static
    edit 2
        set dst 10.1.100.0 255.255.255.0
        set device "to_HQ"
    next
    edit 3
        set dst 10.1.100.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

7. Configure the firewall policy to allow the branch office to HQ network flow over the IPsec tunnel. This configuration only supports traffic from the branch office FortiGate to the HQ FortiGate. Traffic is dropped from the HQ FortiGate to the branch office FortiGate.

   a. Configure the HQ FortiGate.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_Branch"
        set dstintf "dmz"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

   b. Configure the branch office FortiGate.

```
config firewall policy
    edit 1
        set name "outbound"
        set srcintf "port9"
        set dstintf "to_HQ"
        set srcaddr "172.16.101.0"
        set dstaddr "10.1.100.0"
        set action accept
```

```
        set schedule "always"
        set service "ALL"
    next
end
```

8. Run `diagnose` commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.
   a. Run the `diagnose vpn ike gateway list` command on the HQ FortiGate. The system should return the following:

```
vd: root/0
name: for_Branch_0
version: 1
interface: wan1 5
addr: 11.101.1.1:500 -> 173.1.1.1:500
created: 1972s ago
xauth-user: vpnuser1
assigned IPv4 address: 10.10.10.1/255.255.255.252
IKE SA: created 1/1 established 1/1 time 10/10/10 ms
IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
id/spi: 184 5b1c59fab2029e43/bf517e686d3943d2
direction: responder
status: established 1972-1972s ago = 10ms
proposal: aes128-sha256
key: 8046488e92499247-fbbb4f6dfa4952d0
lifetime/rekey: 86400/84157
DPD sent/recv: 00000020/00000000
```

   b. Run the `diagnose vpn tunnel list` command on the HQ FortiGate. The system should return the following:

```
list all ipsec tunnel in vd 0
name=for_Branch_0 ver=1 serial=9 11.101.1.1:0->173.1.1.1:0 tun_id=173.1.1.1

```

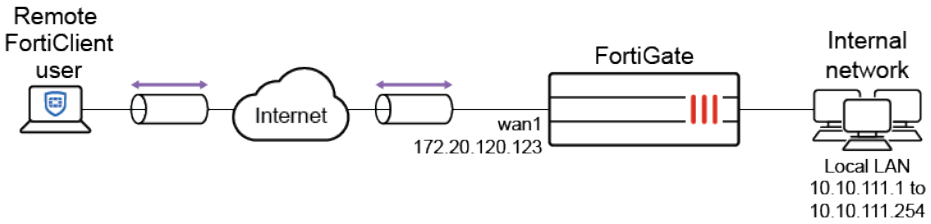
FortiClient as dialup client

This is a sample configuration of dialup IPsec VPN with FortiClient as the dialup client.



You can configure dialup IPsec VPN with FortiClient as the dialup client using the GUI or CLI.

If multiple dialup IPsec VPNs are defined for the same dialup server interface, each phase1 configuration must define a unique peer ID to distinguish the tunnel that the remote client is connecting to. When a client connects, the first IKE message that is in aggressive mode contains the client's local ID. FortiGate matches the local ID to the dialup tunnel referencing the same Peer ID, and the connection continues with that tunnel.

For VPN tunnels using IKEv2, `network-overlay` and `network-id` should be configured in place of `peer-id`:

```
config vpn ipsec phase1-interface
    edit <vpn-tunnel-name>
        set network-overlay enable
        set network-id <ID>
    next
end
```

FortiClient EMS 7.4.4 and later support configuring the Network ID on the IPsec VPN Phase 1 settings in the GUI. For earlier versions, refer to the XML reference guide for IKE settings for details on configuring the `<networkid>` setting.

Starting with FortiClient 7.4.4, IKEv1 is no longer supported on the client. Therefore, plan accordingly when choosing your IKE version. Use IKEv2 if you plan on deploying FortiClient 7.4.4 and later.

Also, FortiClient 7.4.4 does not support IPv6.

To configure IPsec VPN with FortiClient as the dialup client on the GUI:

1. Configure a user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user *vpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *vpngroup* with the member *vpnuser1*.
2. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
   a. Enter a VPN name.
   b. For *Template Type*, select *Remote Access*.
   c. For *Remote Device Type*, select *Client-based* > *FortiClient*.
   d. Click *Next*.
3. Configure the following settings for *Authentication*:

   a. For *Incoming Interface*, select *wan1*.
   b. For *Authentication Method*, select *Pre-shared Key*.
   c. In the *Pre-shared Key* field, enter *your-psk* as the key.
   d. From the *User Group* dropdown list, select *vpngroup*.
   e. Click *Next*.
4. Configure the following settings for *Policy & Routing*:
   a. From the *Local Interface* dropdown menu, select *lan*.
   b. Configure the *Local Address* as *local_network*.
   c. Configure the *Client Address Range* as *10.10.2.1-10.10.2.200*.
   d. Keep the default values for the *Subnet Mask*, *DNS Server*, *Enable IPv4 Split tunnel*, and *Allow Endpoint Registration*.
   e. Click *Next*.
5. Adjust the *Client Options* as needed, then click *Create*.
6. Optionally, define a unique Peer ID in the phase1 configuration:
   a. Go to *VPN > IPsec Tunnels* and edit the just created tunnel.
   b. Click *Convert To Custom Tunnel*.
   c. In the *Authentication* section, click *Edit*.
   d. Under *Peer Options*, set *Accept Types* to *Specific peer ID*.
   e. In the *Peer ID* field, enter a unique ID, such as *dialup1*.
   f. Click *OK*.

The DNS suffix can be configured in the phase 1 configuration using the command `set domain <string>` .This feature is available only in IKE version 1 and requires enabling unity-support using in the Phase 1 configuration. See IPsec DNS suffix on page 2408 for more information.

To configure IPsec VPN with FortiClient as the dialup client using the CLI:

1. In the CLI, configure the user and group.

```
config user local
    edit "vpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
    next
end
config firewall address
    edit "local_subnet_1"
        set subnet 10.10.111.0 255.255.255.0
    next
    edit "local_subnet_2"
        set subnet 10.10.112.0 255.255.255.0
    next
end
config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1" "local_subnet_2"
    next
end
```

3. Configure the WAN interface. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

4. Configure the client address pool. You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

5. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
    edit "for_client"
        set type dynamic
        set interface "wan1"
        set mode aggressive
        set peertype one
```

```
        set peerid "dialup1"
        set net-device enable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set xauthtype auto
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set save-password enable
        set psksecret your-psk
        set dpd-retryinterval 60
    next
end
```

6. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "for_client"
        set phase1name "for_client"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

7. Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_client"
        set dstintf "lan"
        set srcaddr "client_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

One or more user groups for user authentication can be configured under a single IPsec VPN tunnel. See Using single or multiple user groups for user authentication on page 2422 for details.

To configure FortiClient:

1. In FortiClient, go to *Remote Access* and click *Add a new connection*.
2. Set the *VPN* to *IPsec VPN* and the *Remote Gateway* to the FortiGate IP address.
3. Set the *Authentication Method* to *Pre-Shared Key* and enter the key.

4. Expand *Advanced Settings* > *Phase 1* and in the *Local ID* field, enter *dialup1*.
5. Configure remaining settings as needed, then click *Save*.
6. Select the VPN, enter the username and password, then select *Connect*.

Diagnose the connection

Run `diagnose` commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

1. Run the `diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: for_client_0
version: 1
interface: port1 15
addr: 172.20.120.123:4500 ->172.20.120.254:64916
created: 37s ago
xauth-user: vpnuser1
assigned IPv4 address: 10.10.1.1/255.255.255.255
nat: me peer
IKE SA: created 1/1 established 1/1 time 10/10/10 ms
IPsec SA: created 1/1 established 1/1 time 0/0/0 ms
id/spi: 1 b40a32d878d5e262/8bba553563a498f4
direction: responder
status: established 37-37s ago = 10ms
proposal: aes256-sha256
key: f4ad7ec3a4fcfd09-787e2e9b7bceb9a7-0dfa183240d838ba-41539863e5378381
lifetime/rekey: 86400/86092
DPD sent/recv: 00000000/00000a0e
```

2. Run the `diagnose vpn tunnel list` command. The system should return the following:

```
list all ipsec tunnel in vd 0
=
=

Add FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 2342). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Edit the user:
   a. Go to *User & Authentication* > *User Definition* and edit local user *vpnuser1*.
   b. Enable *Two-factor Authentication*.
   c. For *Authentication Type*, click *FortiToken* and select one mobile *Token* from the list.
   d. Enter the user's *Email Address*.
   e. Enable *Send Activation Code* and select *Email*.
   f. Click *Next* and click *Submit*.
2. Activate the mobile token.
   a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Edit the user and user group:

```
config user local
    edit "vpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
        set email-to <user's email address>
        set passwd <user's password>
    next
end
```

2. Activate the mobile token.
   a. When a FortiToken is added to user *vpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Add LDAP user authentication

This configuration adds LDAP user authentication to the FortiClient dialup VPN configuration (FortiClient as dialup client on page 2342). You must have already generated and exported a CA certificate from your AD server.

To configure LDAP user authentication using the GUI:

1. Import the CA certificate into FortiGate:
   a. Go to *System* > *Certificates*.
   If the *Certificates* option is not visible, enable it in *Feature Visibility*. See Feature visibility on page 3416 for details.
   b. Click *Import* > *CA Certificate*.
   c. Set *Type* to *File*.
   d. Click *Upload* then find and select the certificate file.
   e. Click *OK*.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   f. Optionally, rename the system generated *CA_Cert_1* to something more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

2. Configure the LDAP user:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Set *Name* to *ldaps-server* and specify *Server IP/Name*.
   c. Specify *Common Name Identifier* and *Distinguished Name*.
   d. Set *Bind Type* to *Regular*.
   e. Specify *Username* and *Password*.
   f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
   g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
   h. Click *OK*.
3. Add the LDAP user to the user group:
   a. Go to *User & Authentication* > *User Groups* and edit the *vpngroup* group.
   b. In *Remote Groups*, click *Add* to add the *ldaps-server* remote server.
   c. Click *OK*.

To configure LDAP user authentication using the CLI:

1. Import the CA certificate using the GUI.
2. Configure the LDAP user:

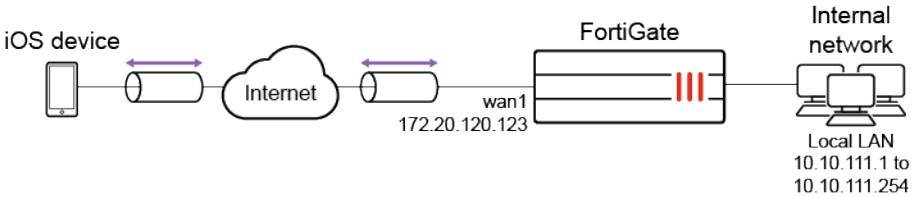
```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

3. Add the LDAP user to the user group:

```
config user group
    edit "vpngroup"
        append member "ldaps-server"
    next
end
```

iOS device as dialup client

This is a sample configuration of dialup IPsec VPN with an iPhone or iPad as the dialup client.



You can configure dialup IPsec VPN with an iOS device as the dialup client using the GUI or CLI.

This example shows VPN configurations in IKEv1. Starting with FortiClient 7.4.4, IKEv1 is no longer supported on the client. Therefore, plan accordingly when choosing your IKE version. Use IKEv2 if you plan on deploying FortiClient 7.4.4 and later.

To configure IPsec VPN with an iOS device as the dialup client on the GUI:

1. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
   a. Enter a VPN name.
   b. For *Template Type*, select *Remote Access*.
   c. For *Remote Device Type*, select *Native > iOS Native*.
   d. For *NAT Configuration*, set *No NAT Between Sites*.
   e. Click *Next*.
2. Configure the following settings for *Authentication*:
   a. For *Incoming Interface*, select *wan1*.
   b. For *Authentication Method*, select *Pre-shared Key*.
   c. In the *Pre-shared Key* field, enter *your-psk* as the key.
   d. From the *User Group* dropdown list, select *vpngroup*.
   e. Deselect *Require 'Group Name' on VPN client*.
   f. Click *Next*.
3. Configure the following settings for *Policy & Routing*:
   a. From the *Local Interface* dropdown menu, select *lan*.
   b. Configure the *Local Address* as *local_network*.
   c. Configure the *Client Address Range* as *10.10.2.1-10.10.2.200*.
   d. Keep the default values for the *Subnet Mask*, *DNS Server*, and *Enable IPv4 Split tunnel*.
   e. Click *Create*.

To configure IPsec VPN with an iOS device as the dialup client using the CLI:

1. In the CLI, configure the user and group.

```
config user local
    edit "vpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "vpngroup"
        set member "vpnuser1"
    next
end
```

2. Configure the internal interface. The LAN interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel. Creating an address group for the protected network behind this FortiGate causes traffic to this network group to go through the IPsec tunnel.

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
    next
end
```

```
config firewall address
    edit "local_subnet_1"
        set ip 10.10.111.0 255.255.255.0
    next
end

config firewall address
    edit "local_subnet_2"
        set ip 10.10.112.0 255.255.255.0
    next
end

config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1" "local_subnet_2"
    next
end
```

3. Configure the WAN interface. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

4. Configure the client address pool. You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set comment "VPN client range"
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
    next
end
```

5. Configure the IPsec phase1-interface. In this example, PSK is used as the authentication method. Signature authentication is also an option.

```
config vpn ipsec phase1-interface
    edit "for_ios_p1"
        set type dynamic
        set interface "wan1"
        set peertype any
        set net-device enable
        set mode-cfg enable
```

```
        set proposal aes256-sha256 aes256-md5 aes256-sha1
        set dpd on-idle
        set dhgrp 14 5 2
        set xauthtype auto
        set authusrgrp "vpngroup"
        set assign-ip-from name
        set ipv4-name "client_range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set psksecret your-psk
        set dpd-retryinterval 60
    next
end
```

6. Configure the IPsec phase2-interface.

```
config vpn ipsec phase2-interface
    edit "for_ios_p2"
        set phase1name "for_ios_p1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set pfs disable
        set keepalive enable
    next
end
```

7. Configure the firewall policy to allow client traffic flow over the IPsec VPN tunnel.

```
config firewall policy
    edit 1
        set name "ios_vpn"
        set srcintf "for_ios_p1"
        set dstintf "lan"
        set srcaddr "ios_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

8. Configure the iOS device.
   a. In the iOS device, go to *Settings* > *General* > *VPN* and select *Add VPN Configuration*.
   b. Set the *Type* to *IPsec* and enter a *Description*. Set the *Server* to the FortiGate's Internet-facing interface, and enter the username in *Account*. Enter the user password, the preshared IPsec VPN secret, then select *Done*.
   c. Ensure that the IPsec VPN configuration is highlighted (indicated by a checkmark), and select the *Not Connected* button. The IPsec VPN connects with the user's credentials and secret. The status changes to *Connected*, and a VPN icon appears at the top of the screen.
9. Run `diagnose` commands to check the IPsec phase1/phase2 interface status. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

a. Run the `diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: for_ios_p1_0
version: 1
interface: port1 15
addr: 172.20.120.123:4500 -> 172.20.120.254:64916
created: 17s ago
xauth-user: u1
assigned IPv4 address: 10.10.2.1/255.255.255.255
nat: me peer
IKE SA: created 1/1 established 1/1 time 150/150/150 ms
IPsec SA: created 1/1 established 1/1 time 10/10/10 ms
id/spi: 2 3c844e13c75591bf/80c2db92c8d3f602 direction: responder status: established 17-
17s ago = 150ms proposal: aes256-sha256 key: 0032ea5ee160d775-51f3bf1f9909101b-

IKE Mode Config clients

IKE Mode Config allows dialup VPN clients to obtain virtual IP address, network, and DNS configurations amongst others from the VPN server.

IKE Mode Config can configure the host IP address, domain, DNS addresses ,and WINS addresses. IPsec parameters such as gateway address, encryption, and authentication algorithms must be configured. Several network equipment vendors support IKE Mode Config.

An IKE Mode Config server or client is configured using `config vpn ipsec phase1-interface` and involves the following parameters:

Parameter	Description
ike-version {1 | 2}	IKE v1 is the default for FortiGate IPsec VPNs. IKE Mode Config is also compatible with IKE v2.
mode-cfg {enable | disable}	Enable/disable IKE Mode Config.
type {static | dynamic | ddns}	If you set `type` to `dynamic`, an IKE Mode Config server is created. The other settings create an IKE Mode Config client.
assign-ip {enable | disable}	Enable to request an IP address from the server. This configuration is for IKE Mode Config clients only.
interface <interface_name>	Specify the physical, aggregate, or VLAN interface to which the IPsec tunnel will be bound.
proposal <encryption_ combination>	The encryption and authentication settings that the client will accept.
ip-version {4 | 6}	By default, IPsec VPNs use IPv4 addressing.
ipv4-split-include <string> ipv6-split-include <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the firewall address or address group that represents the subnets that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified subnets.
split-include-service <string>	Mode Config server configuration. Applicable to IKEv1 and IKEv2. Specify the service or service group that represents the services that the clients will have access to. This information is sent to the clients so that default traffic should not flow over the IPsec tunnel except for the specified services.
ipv4-split-exclude <string> ipv6-split-exclude <string>	Specify the subnets that should not be accessed over the IPsec tunnel. This information is sent to the clients so that all default traffic should flow over the IPsec tunnel except for the specified subnets. See Split-exclude in IKEv1.
domain <string>	Allows the configuration of a DNS suffix and is available only in IKE v1. To enable this feature, unity-support must be enabled using the `set unity-support enable` command in the phase 1 configuration. A maximum of one DNS suffix can be specified per IPsec tunnel.

Creating an IKE Mode Config client

In this example, the FortiGate connects to a VPN gateway with a static IP address that can be reached through port 1. Only the port, gateway, and proposal information needs to be configured. All other configuration information will come from the IKE Mode Config server.

To configure an IKE Mode Config client:

```
config vpn ipsec phase1-interface
    edit vpn1
        set ip-version 4
        set type static
        set remote-gw <gw_address>
        set interface port1
        set proposal 3des-sha1 aes128-sha1
        set mode-cfg enable
        set assign-ip enable
    next
end
```

Creating an IKE Mode Config server

To configure IKE Mode config settings, the following must be configured first :

```
config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
        set interface <interface_name>
        set ike-version {1 | 2}
        set mode-cfg enable
        set proposal <encryption_combination>
        set ip-version {4 | 6}
    next
end
```

In this example, the FortiGate assigns IKE Mode Config clients addresses in the range of 10.11.101.160 - 10.11.101.180. DNS and WINS server addresses are also provided. The public interface of the FortiGate unit is port1.

When IKE Mode-Configuration is enabled, multiple server IPs can be defined in IPsec phase 1.

The `ipv4-split-include` parameter specifies a firewall address (`OfficeLAN`), which represents the networks that the clients will have access to. This destination IP address information is sent to the clients.

To configure an IKE Mode Config server:

```
config vpn ipsec phase1-interface
    edit "vpn-p1"
        set type dynamic
```

```
        set interface "wan1"
        set xauthtype auto
        set mode aggressive
        set mode-cfg enable
        set proposal 3des-sha1 aes128-sha1
        set dpd disable
        set dhgrp 2
        set authusrgrp "FG-Group1"
        set ipv4-start-ip 10.10.10.10
        set ipv4-end-ip 10.10.10.20
        set ipv4-dns-server1 1.1.1.1
        set ipv4-dns-server2 2.2.2.2
        set ipv4-dns-server3 3.3.3.3
        set ipv4-wins-server1 4.4.4.4
        set ipv4-wins-server2 5.5.5.5
        set domain "fgt1c-domain"
        set banner "fgt111C-banner"
        set backup-gateway "100.100.100.1" "host1.com" "host2"
        set ipv4-split-include OfficeLAN
    next
end
```

Assigning IP addresses

Once the basic configuration is enabled, you can configure IP address assignment for clients, as well as DNS and WINS server assignments. Usually you will want to assign IP addresses to clients. The easiest way is to assign addresses from a specific range, similar to a DHCP server.

To assign an IP from an address range:

```
config vpn ipsec phase1-interface
    edit vpn1
        set ip-version 4
        set assign-ip enable
        set assign-ip-from range
        set ipv4-start-ip <range_start>
        set ipv4-end-ip <range_end>
        set ipv4-netmask <netmask>
    next
end
```

To assign an IP from a named firewall address or group:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set assign-ip-from name
        set ipv4-name <name>
        set ipv6-name <name>
```

```
    next
end
```

RADIUS server

If the client is authenticated by a RADIUS server, you can obtain the user's IP address assignment from the Framed-IP-Address attribute. The user must be authenticated using XAuth.

The users must be authenticated by a RADIUS server and assigned to the FortiGate user group <grp_name>. Since the IP address is not static, type is set to dynamic and mode-cfg is enabled. With IKE Mode Config, compatible clients can configure themselves with settings provided by the FortiGate.

To assign an IP from a RADIUS server:

```
config vpn ipsec phase1-interface
    edit vpn1
        set type dynamic
        set mode-cfg enable
        set assign-ip enable
        set assign-ip-from usrgrp
        set xauthtype auto
        set authusrgrp <grp_name>
    next
end
```

DHCP server

IKE Mode Config can use a remote DHCP server to assign the client IP addresses. Up to eight server addresses can be selected for either IPv4 or IPv6. The DHCP proxy must be enabled first.

To assign an IP from a DHCP server:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip <address>
    set dhcp6-server-ip <address>
end
```

```
config vpn ipsec phase1-interface
    edit vpn1
        set mode-cfg enable
        set assign-ip-from dhcp
    next
end
```

Certificate groups

IKE certificate groups consisting of up to four RSA certificates can be used in IKE phase 1. Since CA and local certificates are global, the IKE daemon loads them once for all VDOMs and indexes them into trees based on subject and public key hash (for CA certificates), or certificate name (for local certificates). Certificates are linked together based on the issuer, and certificate chains are built by traversing these links. This reduces the need to keep multiple copies of certificates that could exist in multiple chains.

To configure the IKE local ID:

```
config vpn certificate local
    edit <name>
        set ike-localid <string>
        set ike-localid-type {asnldn | fqdn}
    next
end
```

Split-exclude

The `split-exclude` setting specifies that default traffic flows over the IPsec tunnel except for specified subnets. This is the opposite of `split-include`, which specifies that default traffic should not flow over the IPsec tunnel except for specified subnets. The `split-include` and `split-exclude` settings can be specified at the same time.

To configure split-exclude:

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version {1 | 2}
        set type dynamic
        set mode-cfg enable
        set ipv4-split-exclude <string>
        set ipv6-split-exclude <string>
    next
end
```

DNS suffix

The DNS suffix enables DNS resolution of network resources using their hostnames, without requiring clients to specify their fully qualified domain names (FQDN). This feature is particularly useful in environments where users access internal resources over VPN connections. By appending a DNS suffix to unqualified domain names (such as hostnames), it enables end systems to generate FQDNs required for DNS resolution.

Currently, DNS suffix configuration is supported only for IKE version 1 and only one DNS suffix is configurable per IPsec tunnel.

The configuration of a DNS suffix on an IPsec tunnel requires enabling unity-support in the phase 1 configuration of the IPsec tunnel:

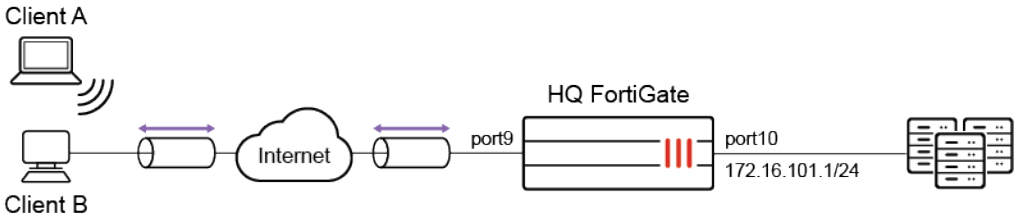
```
config vpn ipsec phase1-interface
    edit <name>
        set unity-support enable
        set domain <string>
    next
end
```

For more information, see IPsec DNS suffix on page 2408.

L2TP over IPsec

This is an example of L2TP over IPsec.

This example uses a locally defined user for authentication, a Windows PC or Android tablet as the client, and `net-device` is set to `enable` in the `phase1-interface` settings. If `net-device` is set to `disable`, only one device can establish an L2TP over IPsec tunnel behind the same NAT device.



To configure L2TP over an IPsec tunnel using the GUI:

1. Go to *VPN* > *IPsec Wizard*.
2. Enter a VPN *Name*. In this example, *L2tpoIPsec*.
3. Configure the following settings for *VPN Setup*:
   a. For *Template Type*, select *Remote Access*.
   b. For *Remote Device Type*, select *Native* and *Windows Native*.
   c. Click *Next*.
4. Configure the following settings for *Authentication*:
   a. For *Incoming Interface*, select *port9*.
   b. For *Authentication Method*, select *Pre-shared Key*.
   c. In the *Pre-shared Key* field, enter *your-psk* as the key.
   d. For *User Group*, select *L2tpusergroup*
   e. Click *Next*.
5. Configure the following settings for *Policy & Routing*:
   a. From the *Local Interface* dropdown menu, select *port10*.
   b. Configure the *Local Address* as *172.16.101.0*.
   c. Configure the *Client Address Range* as *10.10.10.1-10.10.10.100*.
   d. Leave the *Subnet Mask* at its default value.

e. Click *Create*.

To configure L2TP over an IPsec tunnel using the CLI:

1. Configure the WAN interface and static route on HQ.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure IPsec phase1-interface and phase2-interface on HQ.

```
config vpn ipsec phase1-interface
    edit "L2tpoIPsec"
        set type dynamic
        set interface "port9"
        set peertype any
        set proposal aes256-md5 3des-sha1 aes192-sha1
        set dpd on-idle
        set dhgrp 2
        set net-device enable
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "L2tpoIPsec"
        set phase1name "L2tpoIPsec"
        set proposal aes256-md5 3des-sha1 aes192-sha1
        set pfs disable
        set encapsulation transport-mode
        set l2tp enable
    next
end
```

3. Configure a user and user group on HQ.

```
config user local
    edit "usera"
        set type password
```

```
        set passwd usera
        next
end
config user group
    edit "L2tpusergroup"
        set member "usera"
    next
end
```

4. Configure L2TP on HQ.

```
config vpn l2tp
    set status enable
    set eip 10.10.10.100
    set sip 10.10.10.1
    set usrgrp "L2tpusergroup"
end
```

5. Configure a firewall address that is applied in L2TP settings to assign IP addresses to clients once the L2TP tunnel is established.

```
config firewall address
    edit "L2TPclients"
        set type iprange
        set start-ip 10.10.10.1
        set end-ip 10.10.10.100
    next
end
```

6. Configure a firewall policy.

```
config firewall policy
    edit 1
        set name "Bridge_IPsec_port9_for_l2tp negotiation"
        set srcintf "L2tpoIPsec"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "L2TP"
    next
    edit 2
        set srcintf "L2tpoIPsec"
        set dstintf "port10"
        set srcaddr "L2TPclients"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
```

```
    next
end
```

To view the VPN tunnel list on HQ:

```
# diagnose vpn tunnel list

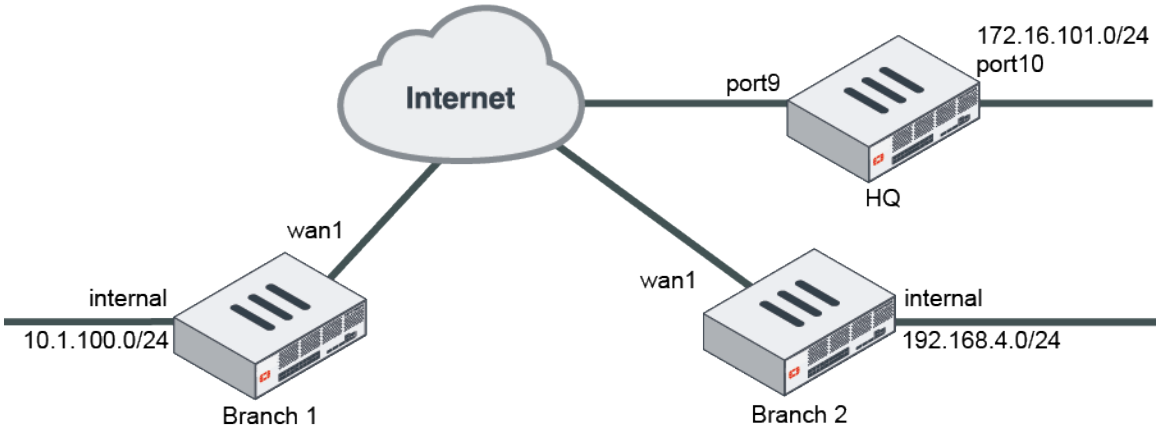
Tunneled Internet browsing

This is a sample configuration of tunneled internet browsing using a dialup VPN. To centralize network management and control, all branch office traffic is tunneled to HQ, including Internet browsing.



To configure a dialup VPN to tunnel Internet browsing using the GUI:

1. Configure the dialup VPN server FortiGate at HQ:
   a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name, in this example, *HQ*.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *The remote site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *Incoming Interface*, select *port9*.
      ii. For *Authentication Method*, select *Pre-shared Key*.
      iii. In the *Pre-shared Key* field, enter *sample* as the key.
      iv. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select *port10*.
      ii. Configure the *Local Subnets* as *172.16.101.0*.
      iii. Configure the *Remote Subnets* as *0.0.0.0/0*.
      iv. For *Internet Access*, select *Share Local*.
      v. For *Shared WAN*, select *port9*.
      vi. Click *Create*.
2. Configure the dialup VPN client FortiGate at a branch:
   a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name, in this example, *Branch1* or *Branch2*.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.
      iv. For *NAT Configuration*, select *The remote site is behind NAT*.
      v. Click *Next*.
   b. Configure the following settings for *Authentication*:
      i. For *IP Address*, select *Remote Device* and enter *22.1.1.1*.
      ii. For *Outgoing Interface*, select *wan1*.
      iii. For *Authentication Method*, select *Pre-shared Key*.
      iv. In the *Pre-shared Key* field, enter *sample* as the key.
      v. Click *Next*.
   c. Configure the following settings for *Policy & Routing*:
      i. From the *Local Interface* dropdown menu, select *internal*.
      ii. Configure the *Local Subnets* as *10.1.100.0/192.1684.0*.
      iii. Configure the *Remote Subnets* as *0.0.0.0/0*.
      iv. For *Internet Access*, select *Use Remote*.
      v. Configure the *Local Gateway* to *15.1.1.1/13.1.1.1*.
      vi. Click *Create*.

To configure a dialup VPN to tunnel Internet browsing using the CLI:

1. Configure the WAN interface and static route on the FortiGate at HQ.

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure IPsec phase1-interface and phase2-interface configuration at HQ.

```
config vpn ipsec phase1-interface
    edit "HQ"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "HQ"
        set phase1name "HQ"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

3. Configure the firewall policy at HQ.

```
config firewall policy
    edit 1
        set srcintf "HQ"
        set dstintf "port9" "port10"
        set srcaddr "10.1.100.0" "192.168.4.0"
        set dstaddr "all"
        set action accept
        set schedule "always"
```

```
        set service "ALL"
        set nat enable
    next
end
```

4. Configure the WAN interface and static route on the FortiGate at the branches.
   a. Branch1.

```
config system interface
    edit "wan1"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

   b. Branch2.

```
config system interface
    edit "wan1"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

5. Configure IPsec phase1-interface and phase2-interface configuration at the branches.
   a. Branch1.

```
config vpn ipsec phase1-interface
    edit "branch1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set remote-gw 22.1.1.1
        set psksecret sample
```

```
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "branch1"
        set phase1name "branch1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 10.1.100.0 255.255.255.0
    next
end
```

b. Branch2.

```
config vpn ipsec phase1-interface
    edit "branch2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "branch2"
        set phase1name "branch2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
        set src-subnet 192.168.4.0 255.255.255.0
    next
end
```

6. Configure the firewall policy at the branches.

a. Branch1.

```
config firewall policy
    edit 1
        set name "outbound"
        set srcintf "internal"
        set dstintf "branch1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
```

```
        set name "inbound"
        set srcintf "branch1"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

b. Branch2.

```
config firewall policy
    edit 1
        set name "outbound"
        set srcintf "internal"
        set dstintf "branch2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound"
        set srcintf "branch2"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

7. Configure the static routes at the branches.

a. Branch1.

```
config router static
    edit 2
        set dst 22.1.1.1/32
        set gateway 15.1.1.1
        set device "wan1"
        set distance 1
    next
    edit 3
        set device "branch1"
        set distance 5
    next
end
```

b. Branch2.

```
config router static
    edit 2
        set dst 22.1.1.1/32
        set gateway 13.1.1.1
        set device "wan1"
        set distance 1
    next
    edit 3
        set device "branch2"
        set distance 5
    next
end
```

8. Optionally, view the VPN tunnel list on a branch with the `diagnose vpn tunnel list` command:

```
list all ipsec tunnel in vd 0
----
name=branch1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1.1

```

9. Optionally, view static routing table on a branch with the `get router info routing-table static` command:

```
Routing table for VRF=0
S*      0.0.0.0/0 [5/0] is directly connected, branch1
S*      22.1.1.1/32 [1/0] via 15.1.1.1, wan1
```

Dialup IPsec VPN with certificate authentication

In a dialup IPsec VPN setup, a company may choose to use X.509 certificates as their authentication solution for remote users. This method includes the option to verify the remote user using a user certificate,

instead of a username and password. This method can be simpler for end users.

Administrators need to issue unique user certificates to each user for remote access management. The user certificate can be verified by the subject field, common name, or the subject identity in the Subject Alternative Name (SAN) field.

Subject field verification

This is the basic method that verifies the subject string defined in the PKI user setting matches a substring in the subject field of the user certificate. For example:

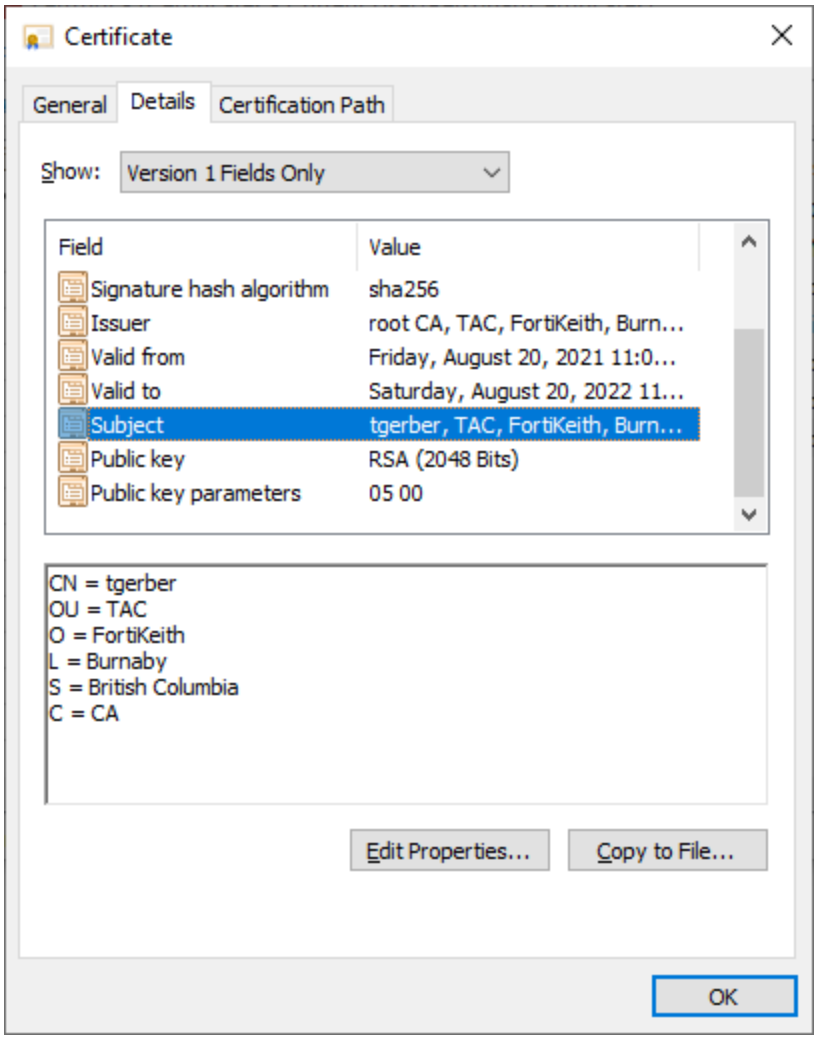
```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set subject "CN=tgerber"
    next
end
```

Common name verification

In this method, administrators can define the CN string to match the common name (CN) in the subject field of the certificate. For example:

```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set cn "tgerber"
    next
end
```

The matching certificate looks like the following:



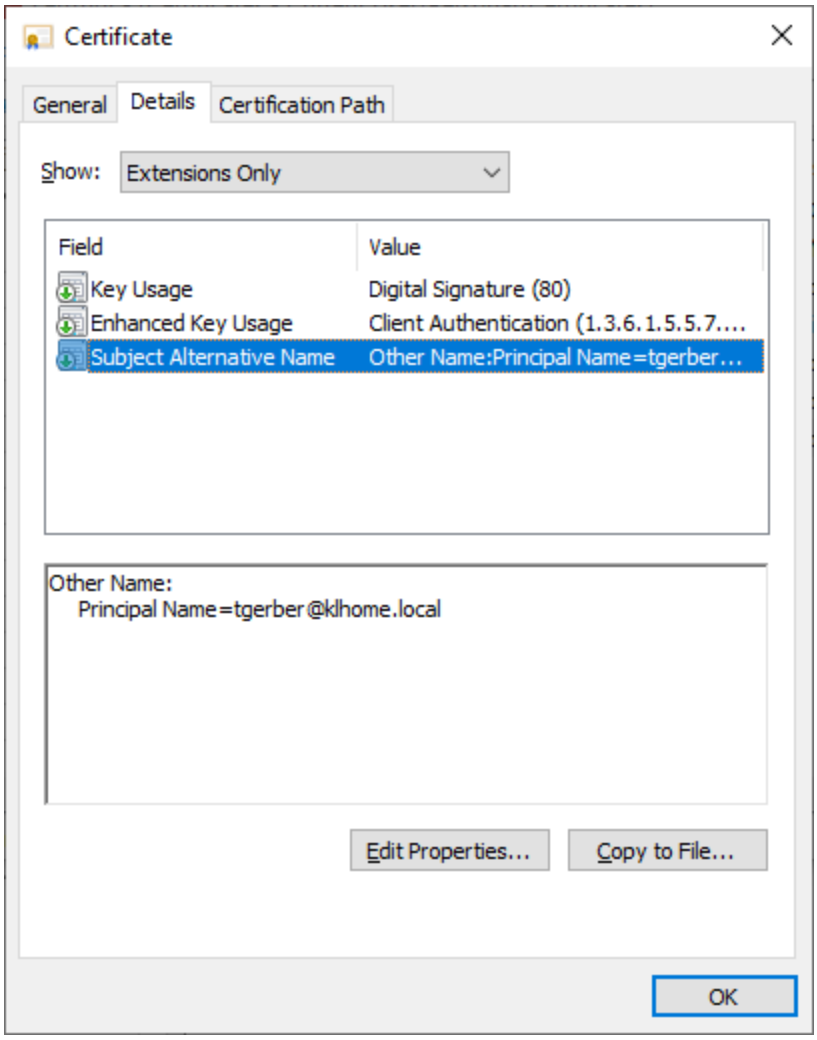
A PKI user must be created on the FortiGate for each remote user that connects to the VPN with a unique user certificate.

Principal name with LDAP integration

In this method, the PKI user setting references an LDAP server. When `mfa-mode` is set to `subject-identity`, the UPN in the user certificate's SAN field is used to look up the user in the LDAP directory. If a match is found, then authentication succeeds. For example:

```
config user peer
    edit "ldap-peer"
        set ca "CA_Cert_2"
        set mfa-server "WIN2K16-KLHOME-LDAPS"
        set mfa-mode subject-identity
    next
end
```

The matching certificate looks like the following:



This method is more scalable because only one PKI user needs to be created on the FortiGate. Remote users connect with their unique user certificate that are matched against users in the LDAP server.

The `two-factor` and `passwd` settings in the user peer configuration are not supported by IPsec. If enabled, the setting will be ignored.

```
config user peer
    edit <user>
        set two-factor enable
        set passwd **********
    next
end
```

Certificate management

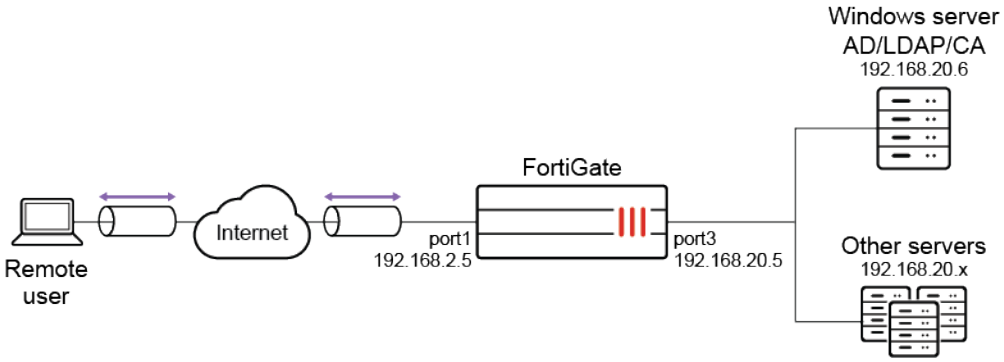
Dialup IPsec VPN with certificate authentication requires careful certificate management planning. Assuming that a company's private certificate authority (CA) is used to generate and sign all the

certificates, the following certificates are needed:

Certificate type	Description
Server certificate	The server certificate is used to identify the FortiGate IPsec dialup gateway. A CSR can be generated on the FortiGate and signed by the CA, or the CA can generate the private and public keys and export the certificate package to the FortiGate.
User certificate	The user certificate is generated and signed by the CA with unique CNs in the subject field and/or unique Principal Names in the SAN field. They are used to identify the user that is connecting to the VPN. User certificates must be installed on client machines.
CA certificate	The root CA certificate, and any subordinate CA that signed the actual user and server certificates, must be imported into the FortiGate and client machines. The CA certificate is used to verify the certificate chain of the server and user certificates.

Example

In this example, a dialup IPsec VPN tunnel is configured with certificate authentication using the subject field verification method and the LDAP integration method.



The company CA, named root CA, signs all the server and user certificates. The user, tgerber@klhome.local, has a user certificate signed by root CA installed on their endpoint. The corresponding user account is also present under the company's Active Directory.

This example shows VPN configurations in IKEv1. Starting with FortiClient 7.4.4, IKEv1 is no longer supported on the client. Therefore, plan accordingly when choosing your IKE version. Use IKEv2 if you plan on deploying FortiClient 7.4.4 and later.

There are five major steps to configure this example:

1. Importing the certificates
2. Configuring user authentication
3. Configuring the VPN
4. Configuring FortiClient and the endpoints

5. Testing and verifying the certificate authentication

Importing the certificates

The server certificate and CA certificate need to be imported into the FortiGate.

To import the server certificate:

1. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
2. For *Type*, select *PKCS #12 Certificate*.
3. Upload the key file exported from the CA and enter the password.
4. Click *OK*. The certificate now appears in the *Local Certificate* section.

To import the CA certificate:

1. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
2. For *Type*, select *File*.
3. Upload the CA certificate (usually a .CRT file). This certificate only contains the public key.
4. Click *OK*. The certificate now appears in the *Remote CA Certificate* section.

If any subordinate CA is involved in signing the certificates, you need to import its certificate.

Configuring user authentication

FortiGate PKI users do not appear in the GUI until at least one PKI user has been created in the CLI. The following instructions create the PKI users in the CLI.

To configure PKI users for subject field verification:

1. Create the PKI user and choose the CA certificate that was imported (if the certificate was signed by a subordinate CA, choose the subordinate CA's certificate):

```
config user peer
    edit "tgerber"
        set ca "CA_Cert_2"
        set subject "CN=tgerber"
    next
end
```

   For an example of CN field matching, see Common name verification.
2. Create additional users as needed.
3. Place the users into a peer group:

```
config user peergrp
    edit "pki-users"
        set member "tgerber" <user> ... <user>
```

```
    next
end
```

To configure PKI users for LDAP integration:

1. Configure the LDAP server that users connect to for authentication:

```
config user ldap
    edit "WIN2K16-KLHOME-LDAPS"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password ************
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

2. Configure the PKI user to reference the LDAP server using the CA certificate that was imported:

```
config user peer
    edit "ldap-peer"
        set ca "CA_Cert_2"
        set mfa-server "WIN2K16-KLHOME-LDAPS"
        set mfa-mode subject-identity
    next
end
```

3. Place the user into a peer group:

```
config user peergrp
    edit "pki-ldap"
        set member "ldap-peer"
    next
end
```

Configuring the VPN

To configure the VPN, the address objects must be defined first so they can be used in the VPN and policy configurations. In this example, the VPN is configured in custom mode to define the authentication settings.

To configure the address objects:

1. Create the address range for the dialup clients:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. For *Name*, enter *remote-user-range*.
   d. For *Type*, select *IP Range* and enter *172.18.200.10-172.18.200.99* in the *IP Range* field.

e. Click *OK*.

2. Create the address subnet for the destination 192.168.20.0/24:
   a. Click *Create new*.
   b. For *Name*, enter *192.168.20.0*.
   c. For *Type*, select *Subnet* and enter *192.168.20.0/24* in the *IP/Netmask* field.
   d. Click *OK*.

To configure the IPsec dialup tunnel:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Tunnel*.
2. Enter a name for the tunnel, *Dialup-cert_0*.
3. For *Template type*, select *Custom* then click *Next*.
4. In the *Network* section, enter the following:

Remote Gateway	*Dialup User*
Interface	*port1*
Mode Config	Enable
Assign IP From	*Range*
IPv4 mode config > Client Address Range	*172.18.200.10-172.18.200.99*
Enable IPv4 Split Tunnel	Enable
Accessible Networks	*192.168.20.0*

5. In the *Authentication* section, enter the following:

Method	*Signature*
Certificate Name	Select the server certificate that was imported.
Mode	*Aggressive*
Peer Options > Accept Types	*Peer certificate group*
Peer Options > Peer certificate group	Select the group based on the preferred method: • For subject verification, select *pki-users*. • For LDAP integration, select *pki-ldap*.

   When IKEv1 is used, aggressive mode should be selected so that the connecting endpoint will provide its peer ID in the first message of the IKE exchange. The peer identifier allows the FortiGate to match the correct tunnel when multiple dialup tunnels are defined.
6. For *Phase 2 Selectors*, leave the local and remote selectors as *0.0.0.0/0.0.0.0*.
7. Click *OK*.

To configure the firewall policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following:

Name	Enter a policy name.
Incoming interface	*Dialup-cert_0*
Outgoing Interface	*port3*
Source	*remote-user-range*
Destination	*192.168.20.0*
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*

3. Configure the other settings as needed.
4. Click *OK*.

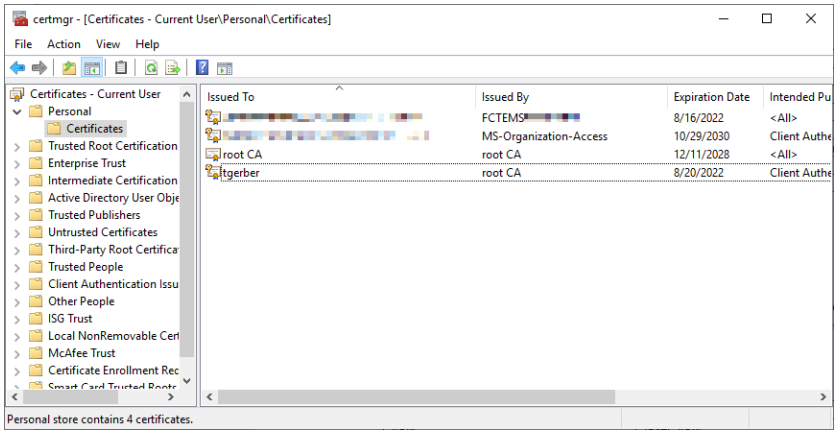
Configuring FortiClient and the endpoints

The following example is configured on a Windows PC with FortiClient 7.0.0. Other configurations may differ slightly.

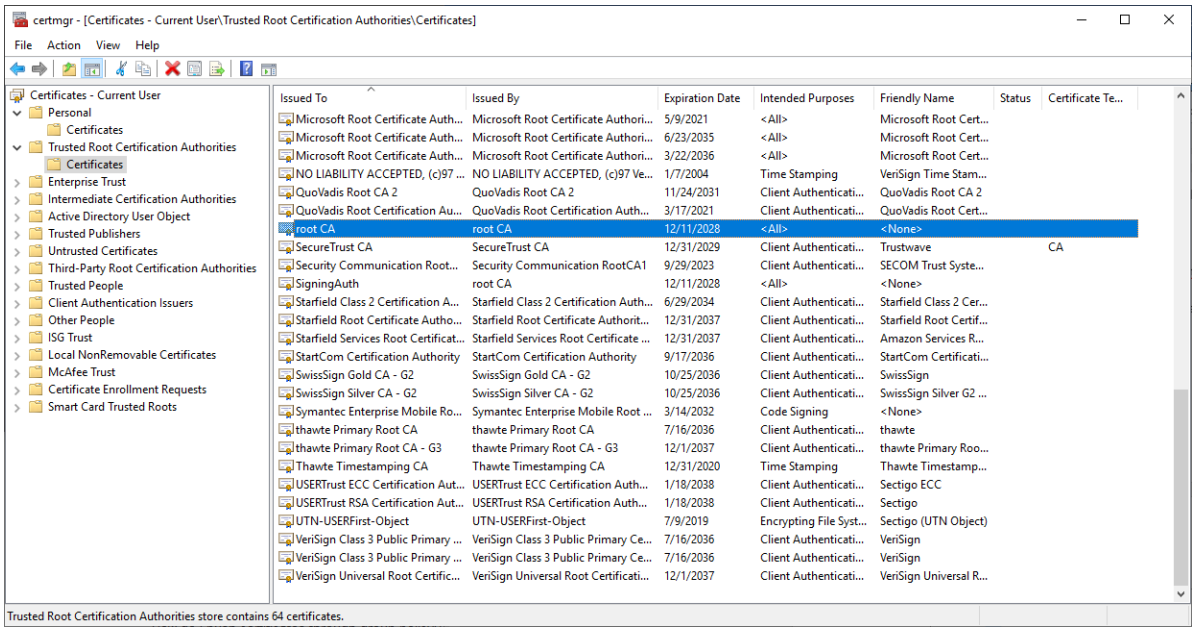
The user certificate and CA certificate must be installed on the endpoint device. They may be pushed by the administrator through group policies or another method. This example assumes that the user certificate and CA certificate are already installed on the endpoint.

To verify the user and CA certificates:

1. Open the Windows certificate manager (certmgr):
   a. In the Control Panel, type *Manage user certificate* in the search box.
   b. Click the result, *Manage user certificates*.
2. Go to *Personal* > *Certificate*. The user certificate should be listed.



3. Go to *Trusted Root Certification Authorities* > *Certificates*. The company CA certificate should be listed.



To configure the FortiClient endpoint settings:

1. In FortiClient, click the *Remote Access* tab and add a new connection:
   a. If there are no existing connections, click *Configure VPN*.
   b. If there are existing connections, click the menu icon and select *Add a new connection*.
2. Configure the following:

VPN	*IPsec VPN*
Connection Name	*Dialup-cert_0*
Remote Gateway	*192.168.2.5*
Authentication Method	*X.509 Certificate* Select the user certificate, *tgerber/root CA*, from the dropdown.
Authentication (XAuth)	*Disable*

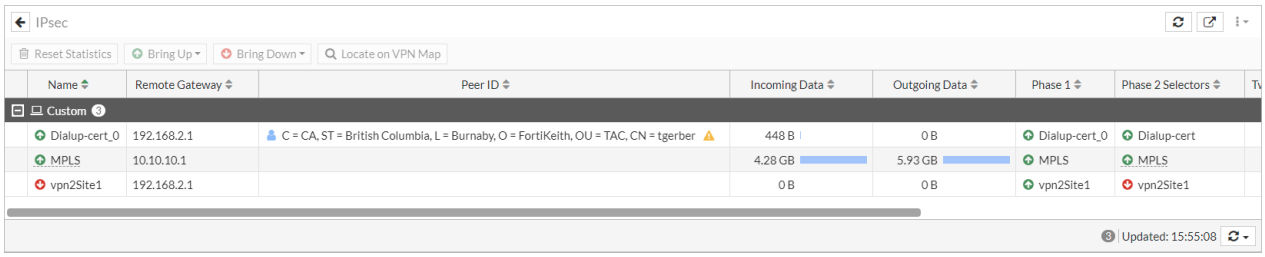
3. Click *Save*.

Testing and verifying the certificate authentication

1. On the client PC, open FortiClient and click the *Remote Access* tab.
2. Select the VPN tunnel, *Dialup-cert_0*, and click *Connect*.

   If the connection is successful, a FortiClient pop-up will appear briefly indicating that the IKE negotiation succeeded. The *Remote Access* window now displays *VPN Connected* and the associated VPN tunnel details.
3. On the FortiGate, go to *Dashboard* > *Network* and locate the *IPsec* widget to view the VPN tunnel monitor. Click the widget to expand to full view.

   The widget displays tunnel information, including the *Peer ID* containing the subject field of the user certificate.



4. Go to *Log & Report* > *System Events* and select the *VPN Events* card. Several tunnel related logs are recorded.
5. The same logs can be viewed in the CLI:

```
# execute log filter category 1
# execute log filter field subtype vpn
# execute log display
7: date=2021-08-23 time=15:53:08 eventtime=1629759188862005740 tz="-0700" logid="0101037138"
type="event" subtype="vpn" level="notice" vd="root" logdesc="IPsec connection status changed"
msg="IPsec connection status change" action="tunnel-up" remip=192.168.2.1 locip=192.168.2.5
remport=64916 locport=4500 outintf="port1" cookies="19f05ebc8c2f7a0d/7716190005538db5" user="C
= CA, ST = British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN = tgerber" group="pki-
ldap" useralt="C = CA, ST = British Columbia, L = Burnaby, O = FortiKeith, OU = TAC, CN =
tgerber" xauthuser="N/A" xauthgroup="N/A" assignip=172.18.200.10 vpntunnel="Dialup-cert_0"
tunnelip=172.18.200.10 tunnelid=3418215253 tunneltype="ipsec" duration=0 sentbyte=0 rcvdbyte=0
nextstat=0
```

6. If any issues arise during the connection, run the following debug commands to troubleshoot the issue:

```
# diagnose debug application ike -1
# diagnose debug application fnbamd -1
# diagnose debug enable
```

SAML-based authentication for FortiClient remote access dialup IPsec VPN clients

SAML-based authentication for FortiClient remote access dialup IPsec VPN clients is now supported. This feature requires FortiClient 7.2.4 and FortiClient supports only using IKEv2. Two factor authentication using FortiToken push is also supported.

The FortiGate authd daemon has been enhanced to support SAML authentication and accepts local-in traffic from the FortiClient by the TCP port number configured in the `auth-ike-saml-port` setting (0 - 65535, default = 1001). Currently, this setting can only be configured in the CLI as follows:

```
config system global
    set auth-ike-saml-port <integer>
end
```

This allows the FortiGate to act as a SAML service provider (SP) for IKEv2 FortiClient remote access IPsec VPN clients by forwarding the FortiClient's SAML request to the configured SAML identity provider (IdP) for user authentication.

The `ike-saml-server` setting enables a configured SAML server to listen on a FortiGate interface for SAML authentication requests from FortiClient remote access IPsec VPN clients. It must be configured on the interface that is directly receiving the SAML authentication requests from FortiClient. This setting can be configured in the CLI:

```
config system interface
    edit <name>
        set ike-saml-server <saml_server>
    next
end
```

The `ike-saml-server` setting must be configured on the interface that is the first point of contact for FortiClient traffic.

For example, if FortiClient user SAML authentication traffic is always routed to the FortiGate on the WAN1 interface, then `ike-saml-server` must be configured for WAN1. If it is configured for WAN2, then the authentication traffic will not reach it on WAN1, even is the FortiGate allows traffic to flow from WAN1 to WAN2.

FortiClient will validate the certificate presented to it by FortiGate during its initial SAML connection. This certificate can be configured on the FortiGate from the GUI under *User & Authentication* > *Authentication Settings* > *Certificate* under *User Authentication Options*. To import the certificate on the FortiGate, see Import a certificate on page 3425.

This certificate can also be configured in the CLI:

```
config user setting
     set auth-cert <certificate>
end
```

To prevent an invalid server certificate prompt on FortiClient, the certificate's common name (CN) should match the IPsec VPN remote gateway's FQDN. If the certificate is signed by a custom Certificate Authority or one that is not well-known, the Certificate Authority's (CA) certificate should be imported in FortiClient endpoint's Trusted Root Certificate Authority store. For details on installing a CA certificate on the endpoint, see Installing certificates on the client.

SAML authentication flow with IPsec

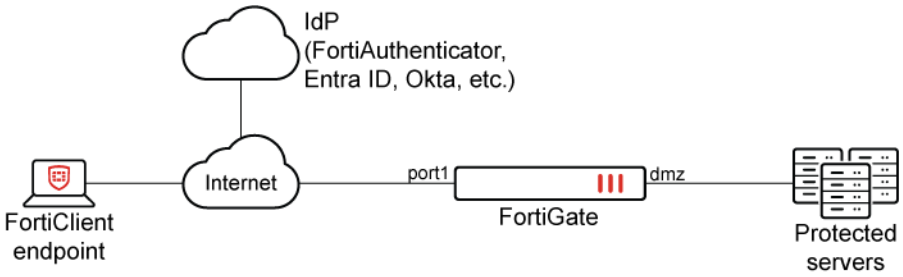
The SAML Authentication flow when using IPsec where FortiGate is the Service Provider (SP), FortiAuthenticator, Entra ID, Okta, or another SAML IdP is the Identity Provider (IdP) and FortiClient is the web-browser as follows:

1. When the FortiClient user clicks on Connect on FortiClient to connect to IPsec VPN Gateway (i.e. FortiGate), FortiClient first initiates a connection to FortiGate on the `auth-ike-saml-port` configured on FortiGate.
2. The FortiGate sends a SAML Authentication Requests inside a redirect to FortiClient. The redirect consists of URLs to reach the IdP.
3. FortiClient uses these redirects to send SAML Authentication Request to the IdP after which the login page on the IdP opens up.
4. The user authenticates to the IdP using their SAML credentials configured on the IdP.

5. The IdP sends a SAML Authentication Response that contains the user and group information in form of SAML Assertions to FortiClient.
6. FortiClient sends a SAML Authentication Response to FortiGate.
7. The FortiGate consumes the SAML Authentication Response and SAML Assertions after verifying the IdP using its IdP's certificate and provides FortiClient with a temporary token ID.
8. FortiClient initiates IPsec tunnel and presents the token ID for authentication. Upon successful verification of token ID, IPsec tunnel establishes.

SAML configuration example with different IdPs

We will now see how to configure IPsec with SAML authentication using different IdPs on FortiGate and FortiClient using the following example:



The configuration steps on the FortiGate, different IdPs and FortiClient are as follows:

1. Configure IKE-SAML authentication port number on FortiGate.
2. Configure IPsec VPN certificate on FortiGate.
3. Configure SAML IdP and SAML SP.
4. Configure IPsec IKEv2 on FortiGate.
5. Configure firewall policies on FortiGate.
6. Configure IPsec VPN profile on FortiClient.
7. Verify the IPsec connection.

Only Configuring SAML IdP and SAML SP on page 2382 is unique to individual IdPs. All other steps listed above are the same on FortiGate and FortiClient when using different IdPs.

Configuring IKE-SAML authentication port number on FortiGate

Configure a suitable TCP port number for SAML authentication (`auth-ike-saml-port`) used by FortiGate. This example uses port 9443 and the setting is configurable using CLI.

```
config system global
    set auth-ike-saml-port 9443
end
```

Configuring IPsec VPN certificate

In this step, using either the GUI or the CLI, configure the IPsec VPN certificate that is presented to FortiClient upon its initial connection.

To configure the IPsec VPN certificate in the GUI:

1. Go to *User & Authentication > Authentication Settings*.
2. Select the certificate from the *Certificate* dropdown menu. To import the certificate on FortiGate, see Import a certificate on page 3425.

To configure the IPsec VPN certificate in the CLI:

If the certificate *VPN_Certificate* has already been imported on the FortiGate, then use the following CLI commands:

```
config user setting
    set auth-cert "VPN_Certificate"
end
```

Configuring SAML IdP and SAML SP

The SAML configuration on SP (FortiGate) will vary based on selected IdPs from the list below. Select the preferred combination of SP and IdP as per your requirement from the following list.

1. Configure FortiAuthenticator as SAML IdP and FortiGate as SAML SP
2. Configure Microsoft Entra ID as SAML IdP and FortiGate as SAML SP

SAML IdPs other than FortiAuthenticator or Microsoft Entra ID can be used. Please refer to the documentation of the respective SAML IdP for details.

Configuring IPsec IKEv2 on FortiGate

Configuring Remote access VPN on FortiGate enables FortiClient to connect to the IPsec VPN gateway configured on FortiGate. FortiClient 7.2.4 GA and above supports only IKEv2 for SAML authentication. The example discussed uses full-tunnel IPsec VPN. For split-tunnel configuration and other advanced configurations as per your requirement, see Remote access on page 2334.

To configure IPsec VPN on FortiGate with FortiClient as the dialup client:

1. Go to *VPN > IPsec Tunnels*.
2. Click *Create New > IPsec Tunnel*. The *VPN Creation Wizard* is displayed.
3. Enter the *Name* as *FCT_SAML*. This example does not use the VPN wizard for the IPsec tunnel configuration but rather configures a *Custom* IPsec tunnel.
4. Configure the *Template type* as *Custom*.

5. Click *Next*.
6. Configure the following options:

Name	*FCT_SAML*
Comments	(Optional)
Network	
IP Version	*IPv4*
Remote Gateway	*Dialup User*
Interface	*port1* Select the IPsec tunnel gateway interface.
Mode Config	*Enable*
Use system DNS in mode config	(Optional) Enable FortiClient to use the host's DNS server after it connects to VPN.
Assign IP From	*Enable* Select *Address/Address Group* from the dropdown list.
IPv4 mode config	
Client Address Range	*VPN_Client_IP_Range* *VPN_Client_IP_Range* is configured from *10.212.134.1* to *10.212.134.200*. If it is not already created, select *Create > Address* from the dropdown menu to create a new address object. See Subnet on page 1626 for more information.
Subnet Mask	*255.255.255.255*
DNS Server	*8.8.8.8*
Authentication	
Method	*Pre-shared key*
Pre-shared key	Enter the pre-shared key of at least six characters.
IKE	
Version	*2*
Peer Options	
Accept Types	*Any peer ID*
Phase 1 Proposal	
Encryption	*AES128*
Authentication	*SHA256* Select the desired Encryption and Authentication algorithms that should also match with Phase1 Proposals configured on FortiClient. See Configuring IPsec VPN profile on FortiClient on page 2385.

7. Keep other configurations as defaults.

8. Click *OK*. The newly created IPsec tunnel would be now visible under *VPN > IPsec Tunnels*.
9. As IKEv2 uses EAP for user authentication, enable EAP using the CLI inside the configured IPsec tunnel for user authentication, as follows:

```
config vpn ipsec phase1-interface
    edit "FCT_SAML"
        set eap enable
        set eap-identity send-request
    next
end
```

For other advanced custom configurations as per your requirement, see Remote access on page 2334.

The SAML group configured, `<group-name>`, must be either configured inside the IPsec Phase 1 setting, `set authusrgrp <group-name>`, or in the firewall policy, `set groups <group-name>`, to allow the traffic to flow through the IPsec tunnel. If the SAML group is configured in both IPsec Phase 1 and firewall policy, the traffic stops to flow through the IPsec tunnel. In the example discussed, it is configured it in the firewall policy.

See Using single or multiple user groups for user authentication on page 2422 for more information.

Configuring firewall policies for IPsec tunnel

To configure firewall policies for IPsec tunnel:

1. Go to *Policy & Object > Firewall Policy*.
2. Click *Create New*.
3. Enter the following configuration:

Name	*IPsec to DMZ* Enter the desired name.
Incoming Interface	*FCT_SAML* Select the configured IPsec tunnel.
outgoing Interface	*DMZ* Select the interfaces that FortiClient needs access to when it connects to VPN.
Source	Under *Address*, select *VPN_Client_IP_Range*. Under *User*, select *SAML-FAC-Group* (or *SAML-ENTRA-ID-Group*). The group under *User* is the SAML user group configured in the earlier steps.
Destination	*DMZ subnet*

	Click *Create* if it is not already created. See Subnet on page 1626 for more information.
Service	*ALL*

4. Click *OK*.
5. As IPsec tunnel configured as full-tunnel, create another policy to allow traffic from *IPsec to Internet*, to allow FortiClient to access Internet through IPsec tunnel.

For additional custom settings as per your requirement, see Firewall policy on page 1463.

Configuring IPsec VPN profile on FortiClient

To configure an IPsec VPN profile on FortiClient:

1. In FortiClient, go to *Remote Access* > *Configure VPN* or *Add a new connection*.
2. Set the following settings to configure an IPsec IKEv2 profile on FortiClient:

Connection Name	*VPN-Tunnel*
Remote Gateway	*<VPN Gateway FQDN>* or *<VPN Gateway IP>*
Authentication Method	*Pre-shared key* with *Enable Single Sign On (SSO) for VPN Tunnel* enabled.
Customize port	*9443*
Advanced Settings > VPN Settings	
IKE	*Version 2*
Options	*Mode Config*

To explore additional custom options to configure IPsec VPN profile, see Configuring an IPsec VPN connection.

For VPN tunnels using IKEv2, `network-overlay` and `network-id` should be configured in place of `peer-id`:

```
config vpn ipsec phase1-interface
    edit <vpn-tunnel-name>
        set network-overlay enable
        set network-id <ID>
    next
end
```

FortiClient EMS 7.4.4 and later support configuring the Network ID on the IPsec VPN Phase 1 settings in the GUI. For earlier versions, refer to the XML reference guide for IKE settings for details on configuring the `<networkid>` setting.

Verifying IPsec connection

To verify the IPsec connection in the GUI:

1. On the client PC, open FortiClient and select the *Remote Access* tab.
2. Select the VPN tunnel, *VPN-Tunnel*, and click *Connect*.
3. If the connection is successful, a FortiClient pop-up will appear briefly indicating that the IKE negotiation succeeded. The *Remote Access* window now displays *VPN Connected* and the associated VPN tunnel details.
4. In FortiOS, go to *Dashboard* > *Network* and locate the *IPsec* widget. Click the widget to expand to full view and view more details.

To verify the IPsec connection in the CLI:

The following debugs are from FortiGate when used with FortiAuthenticator as the IdP. The debugs should be similar for other IdPs depending on the SAML attributes supported and sent by the IdP.

1. Verify the IKE gateway list:

```
# diagnose vpn ike gateway list
vd: root/0
name: FCT_SAML_0
version: 2
interface: port1 3
addr: 10.100.66.99:4500 -> 208.91.115.30:64917
tun_id: 10.212.134.1/::10.0.0.18
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 33s ago
eap-user: testuser
2FA: no
groups:
  SAML-FAC-Group 5
peer-id: 172.19.50.196
peer-id-auth: no
FortiClient UID: 19E1FA565259468FB46EDAA9D595176F
assigned IPv4 address: 10.212.134.1/255.255.255.255

Configuring FortiAuthenticator as SAML IdP and FortiGate as SAML SP

This topic discusses the configuration steps required on FortiAuthenticator to act as the Identity Provider (IdP) and FortiGate to act as Service Provider (SP) during SAML Authentication for IPsec connection, as a part of the overall configuration in SAML-based authentication for FortiClient remote access dialup IPsec VPN clients on page 2379.

In the example discussed, the following assumptions and configuration steps are used:

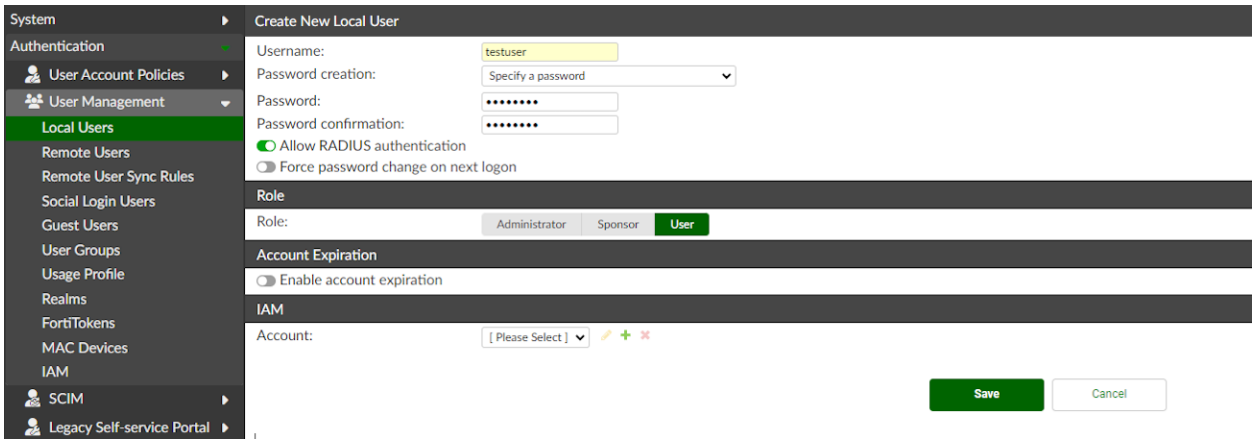
1. FortiAuthenticator is configured with local user (*testuser*) inside a User group (*IT*).
2. This user belongs to a unique realm (*samlrealm*).
3. FortiAuthenticator also requires a server certificate (also called as IdP certificate) for itself signed by a well-known CA or trusted by FortiClient endpoint and FortiGate.
4. The IdP certificate must be imported into FortiGate after which FortiAuthenticator can use the certificate to sign the SAML messages.
5. FortiAuthenticator must then be configured as SAML IdP and FortiGate as SAML SP.

To configure a local user on FortiAuthenticator:

1. Go to *Authentication* > *User Management* > *Local Users* and select *Create New*.
2. Enter the following details shown below and leave other settings as the defaults.

Username	*testuser*
Password creation	*Specify a password*
Password	Enter a desired password
Password confirmation	Re-enter the password

3. Click *Save*.



For more advanced and custom configuration options, see Local users.

To configure a user group on FortiAuthenticator:

1. Go to *Authentication* > *User Management* > *User Groups* and select *Create New*.
2. To create a user group with a local user:
   a. In the *Name* field, enter the group name as *IT*.
   b. Set the *Type* as *Local*.
   c. Under *Users*, from the *Available Users* table, select *testuser* and move it to the *Chosen Users* table.
3. Click *Save*.

For more advanced options, see User Groups.

To configure a user realm on FortiAuthenticator:

1. Go to *Authentication* > *User Management* > *Realms* and select *Create New*.
2. Name the realm as *samlrealm*.
3. In *User source*, from the dropdown, select *Local Users*.
4. Click *Save*.

For more advanced options, see Realms.

To import a server certificate on FortiAuthenticator:

1. Go to *Certificate Management* > *End Entities* > *Local Services* and select *Import*.
2. Depending on which file format your certificate is in, select the suitable *Type*.
3. Select *Upload a file* to locate the certificate file on your computer.
4. Click *Import*.

See End entities for more information on certificates on FortiAuthenticator.

To configure general SAML IdP settings on FortiAuthenticator for SAML:

1. Go to *Authentication* > *SAML IdP* > *General*, and select *Enable SAML Identity Provider portal*.
2. Configure the following settings:

Device FQDN	*<FortiAuthenticator FQDN>* To configure this setting, you must enter a *Device FQDN* in the *System Information* widget in the *Dashboard*.
Server address	*<FortiAuthenticator FQDN>* Enter the IP address or FQDN of the FortiAuthenticator device. This address must be accessible by the FortiClient endpoint.
Username input format	*username@realm*
Use default realm when user-provided realm is different from all configured realms	*Disabled*
Realms	*Realm*: *samlrealm* (Optional) *Groups* > *Filter*: *IT* Use *Groups* and *Filter* to add specific user groups. These user groups may be local users configured on the FortiAuthenticator itself or remote users populated from different remote authentication servers. See User Groups and Remote users for more information.
Legacy login sequence	*Disabled*
Default IdP certificate	*<IdP certificate>* This certificate is used by IdP to sign SAML messages before sending it to IdP. To import this certificate on FortiAuthenticator see Importing a server certificate. This certificate also needs to be imported on the SP (FortiGate) to be used in the SAML configuration. See Remote certificate on page 3431.

3. Select *Save* to apply any changes that you have made.

To configure service provider SAML settings on FortiAuthenticator for SAML:

1. Go to *SAML IdP* > *Service Providers*.
2. Click *Create New*.
3. Enter the following:

SP name	*FortiGate* Use any suitable SP name.
Server certificate	*<IdP certificate>* This certificate is used by IdP to sign SAML messages before sending it to IdP. To import this certificate on FortiAuthenticator, see Importing a server certificate. This certificate also needs to be imported on the SP (FortiGate) to be used in the SAML configuration. See Remote certificate on page 3431.
IdP Metadata	

Select an identifier to display IdP info		Click *+* to create a new IdP prefix. In the *IdP identifier* field, enter the prefix as *fac* and click *OK*. Fields such as *IdP entity id*, *IdP single sign-on URL*, and *IdP single logout URL* will populate automatically with this prefix information. These URLs must be accessible by FortiClient endpoints. Copy and paste this URL information in a separate notepad file as it will be used to configure IdP information on SP (FortiGate) later.
Authentication		
Authentication Method		*Password-only*
Assertion Attributes		Click *+* to expand it. Configure two SAML assertion attributes (*username* and *group*) as follows:
	Assertion attribute	
	SAML attribute	*username*
	User attribute	*FortiAuthenticator > Username*
	Assertion attribute	
	SAML attribute	*group*
	User attribute	*FortiAuthenticator > Group*

4. Click *Save*.

To export SAML IdP server certificate and import it on FortiGate:

1. On FortiAuthenticator, go to *Certificate Management > End Entities > Local Services*.
2. Select the certificate, *<IdP certificate>*, by selecting the left checkbox for the certificate entry in the table and clicking *Export Certificate*.
3. Go to the file location on your local computer and click *Save*.
4. On FortiGate, go to *System > Certificates*, and from the *Create/Import* dropdown, select *Remote Certificate*.
5. Select *Upload* to locate and upload the .cer remote certificate from your computer.
6. Click *OK*.
   The new certificate is now visible in the *System > Certificates* page under *Remote Certificate*.

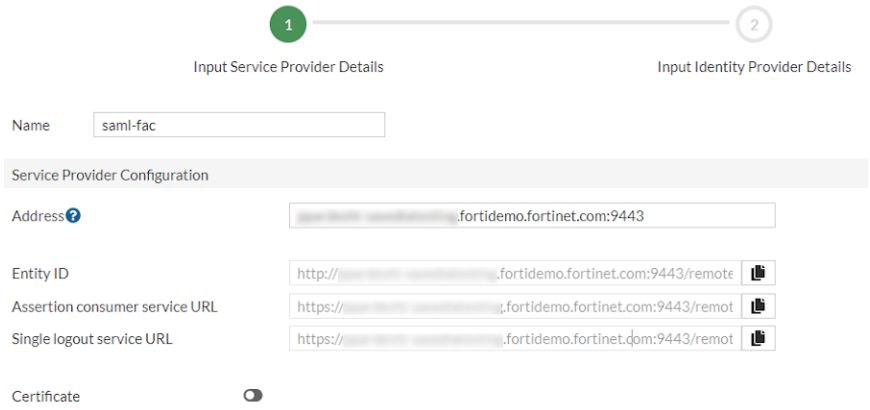
To configure SAML server on FortiGate:

1. Go to *User & Authentication > Single Sign-On*.
2. Click *Create New*.
3. Enter the *Name* as *saml-fac*.
4. In the *Address* field, enter the FQDN/IP information in the following format:
   <ipsec-vpn-gateway-fqdn/ip-address>:<saml-ike-authentication-port>
   The *Address* field is used by FortiClient to initiate IPsec connection to FortiGate.

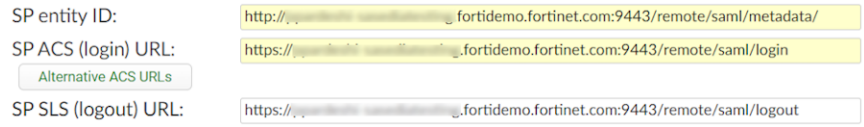
5. On the FortiGate, from *Service Provider Configuration*, copy the following URLs (*Entity ID*, *Assertion consumer service URL*, *Single logout service URL*). In FortiAuthenticator, enter it in *Authentication > SAML IdP > Service Providers > FortiGate*, inside the *SP Metadata* fields according to following mapping:

FortiGate settings	FortiAuthenticator settings
Entity ID	SP entity ID
Assertion consumer service URL	SP ACS (login) URL
Single logout service URL	SP SLS (logout) URL

The following demonstrates on the FortiGate:



The following demonstrates on FortiAuthenticator:

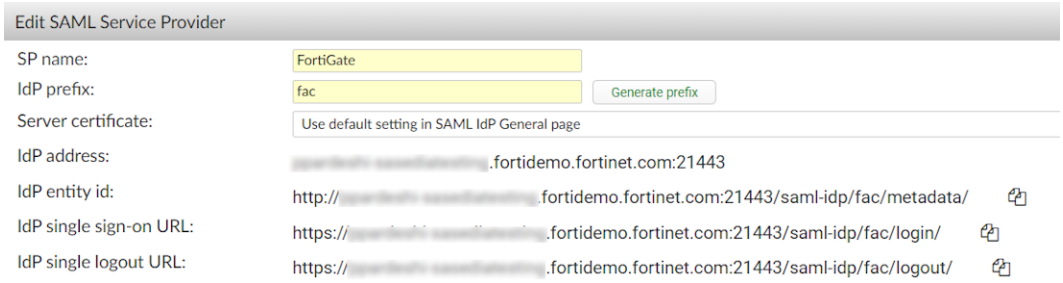


6. Click *Save* on FortiAuthenticator to save the SP URLs.
7. Return to FortiGate GUI, and click *Next*.

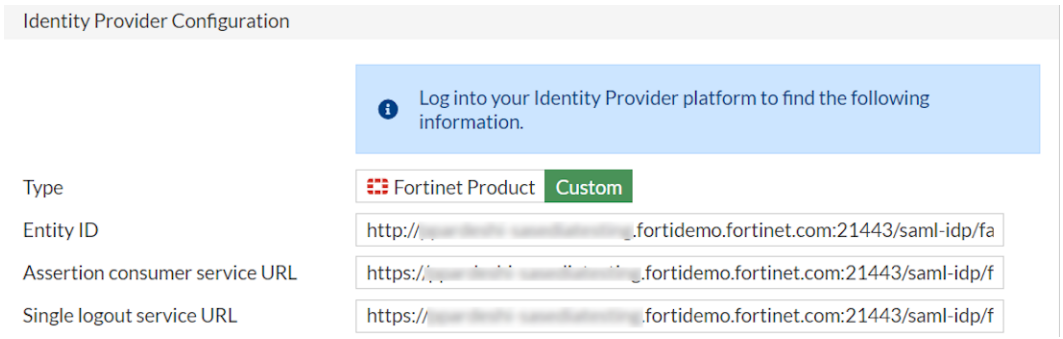
   Set the *Type* as *Custom*.The *Entity ID*, *Assertion consumer service URL*, and *Single logout service URL* fields required are available from FortiAuthenticator.
8. To copy the following URLs (*IdP entity id*, *IdP single sign-on URL*, *IdP single logout URL*) from FortiAuthenticator, go to *Authentication > SAML IdP > Service Providers > FortiGate* under *IdP Metadata*. Copy the URLs from FortiAuthenticator and paste it on FortiGate according to the following mapping:

FortiAuthenticator settings	FortiGate settings
IdP entity ID	Entity ID
IdP single sign-onURL	Assertion consumer service URL
IdP single logout URL	Single logout service URL

The following demonstrates on FortiAuthenticator:



The following demonstrates on the FortiGate:



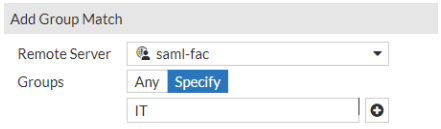
9. In the *Certificate* dropdown, select the IdP certificate that was imported on FortiGate.
10. Enter the following details in *Additional SAML Attributes*.

Attribute used to identify users	*username*
Attribute used to identify groups	*group*

11. Click *Submit* to save the changes.

To create SAML user group on FortiGate:

1. Go to *User & Authentication* > *User Groups* .
2. Click *Create New*.
3. Enter *Name* as *SAML-FAC-Group*.
4. In *Remote Groups*, click *Add*.
5. From the *Remote Server* dropdown, select *saml-fac* SAML server.
6. In the *Groups* field, click *Specify* and enter *IT*.



7. Click *OK*.
8. Click *OK*.

To associate SAML server with IPsec gateway interface:

Use FortiGate CLI to bind and associate the SAML server with the VPN gateway interface (port1) as follows:

```
config system interface
    edit "port1"
        set ike-saml-server "saml-fac"
    next
end
```

Configuring SAML on IdP and SP is now complete. The next step is to use SAML configuration inside IPsec configuration. To configure IPsec, see Configuring IPsec IKEv2 on FortiGate on page 2382.

Configuring Microsoft Entra ID as SAML IdP and FortiGate as SAML SP

This topic discusses the configurations steps required if your users are managed through Microsoft Entra ID (formerly Azure Active Directory), as a part of the overall configuration in SAML-based authentication for FortiClient remote access dialup IPsec VPN clients on page 2379. Microsoft Entra ID will be configured as Identity Provider (IdP) and FortiGate as Service Provider (SP) during SAML Authentication for IPsec connection.

To configure a user on Microsoft Entra ID:

1. Login to the Azure portal (portal.azure.com).
2. Search for *Microsoft Entra ID service* in the search bar and click on it.
3. In the left side menu, go to *Users*.
4. Select *New user* > *Create new user*.
5. In the *Basic* properties:
   a. In the *Display name* field, enter *testuser*.
   b. In the *User principal name* field, enter the username@companydomain.extension. For example, *testuser@<mydomain>.onmicrosoft.com*.
   c. Select *Show password* and then write down the value that's displayed in the *Password* box.
   d. Select *Review + create*.
6. Select *Create*.

To configure a Security group and add user to it on Microsoft Entra ID:

In this section, we create a security group named *IT* in Microsoft Entra ID for the *testuser*. FortiGate will use this security group to grant the user network access through the VPN.

1. In the Azure portal, navigate to *Microsoft Entra ID* service.
2. In the left side menu, go to *Groups*.
   a. Select *New Group*.
   b. In the *Group type* list, select *Security*.
   c. In the *Group name* field, enter *IT*.
   d. (Optional) In the *Group description* field, enter *Group for granting FortiGate VPN access*.
   e. For the *Microsoft Entra roles can be assigned to the group (Preview) settings*, select *No*.
   f. In the *Membership type* field, select *Assigned*.
   g. Under *Members*, select *No members selected*.

h. In the *Users and groups* dialog field, select *testuser* from the *Users* list, and then click *Select*.
i. Select *Create*.

3. Back in the *Groups* section in Microsoft Entra ID, find the *IT* group and note the *Object Id*. This will be needed later.

To configure Enterprise application on Azure portal:

1. Configure user and groups:
   a. In the Azure portal, search for *Enterprise applications service* in the search bar.
   b. Click on *New application* and search for *FortiGate SSL VPN*.

   The application is named for “SSL VPN” but should still work with the IPsec VPN configuration.

   c. Once the application is found, select it, change the *Name* to *FortiGate IPsec VPN*, and click *Create*. It may take a few seconds to create the application.
   d. Once the application is created, go to *Enterprise application* > *All applications* > *FortiGate IPsec VPN*.
   e. On the application's overview page, in the *Manage* section, select *Users and groups*.
   f. Select *Add user/group*, then select *Users* in the *Add Assignment* dialog.
   g. In the *Users and groups* dialog, select *testuser* in the *Users* list, and then click *Select*.
   h. (Optional) If you are expecting any role value in the SAML assertion, in the *Select Role* dialog, select the appropriate role for the user from the list. Click *Select*.
   i. In the *Add Assignment* dialog, select *Assign*.
2. Configure single sign-on:
   a. Browse to *Enterprise application* > *All applications* > *FortiGate IPsec VPN application*.
   b. In the *Manage* section, select *Single sign-on*.
   c. In the *Select a single sign-on method* page, select *SAML*.
   d. In the *Set up Single Sign-On with SAML* page, select *Edit* for *Basic SAML Configuration* to edit the settings:

   i. In *Identifier*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:<Custom SAML-IKE port>/remote/saml/metadata
   ii. In *Reply URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:<Custom SAML-IKE port>/remote/saml/login

iii. In *Sign on URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:< Custom SAML-IKE port >/remote/saml/login

iv. In *Logout URL*, enter a URL in the pattern https://<FortiGate IP or FQDN address>:< Custom SAML-IKE port >/remote/saml/logout

These URLs can be retrieved and copied directly from the FortiGate. Go to To configure SAML server on FortiGate: on page 2391 to get these URLs.

e. Click *Save*.

f. The FortiGate IPsec VPN application expects SAML assertions in a specific format, which requires you to add custom attribute mappings to the configuration.

g. The claims required by FortiGate IPsec VPN are shown in the following table. Names are case-sensitive.

Name	Source attribute
username	user.userprincipalname
group	user.groups

To create these additional claims:

i. Next to *User Attributes & Claims*, select *Edit*.

ii. Select *Add new claim*.

iii. For *Name*, enter *username*.

iv. For *Source attribute*, select *user.userprincipalname*.

v. Select *Save*.

vi. Select *Add a group claim*.

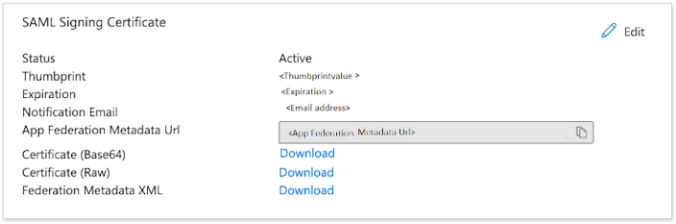
vii. Select *All groups*.

viii. Under *Advanced options*, select the *Customize the name of the group claim*.

ix. For *Name*, enter *group*.

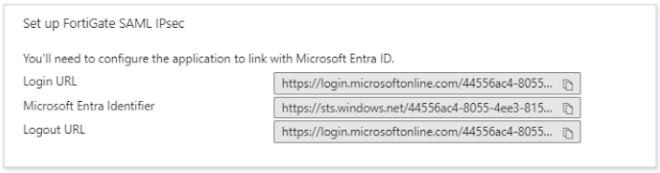
x. Select *Save*.

h. In the *Set up Single Sign-On with SAML* page, in the *SAML Signing Certificate* section, select *Download* next to *Certificate (Base64)* to download the certificate and save it on your computer. This will be needed in the step To export SAML IdP server certificate and import it on FortiGate: on page 2397



i. In the *SAML Signing Certificate* section, click *Edit*, set *Signing Option* to *Sign SAML response and assertion*, then click *Save*.

j. In the *Set up FortiGate SAML IPsec* section, copy the URLs (*Login URL*, *Microsoft Entra Identifier*, *Logout URL*) and paste it inside FortiGate's SAML server configuration, discussed in To configure SAML server on FortiGate: on page 2397.



To export SAML IdP server certificate and import it on FortiGate:

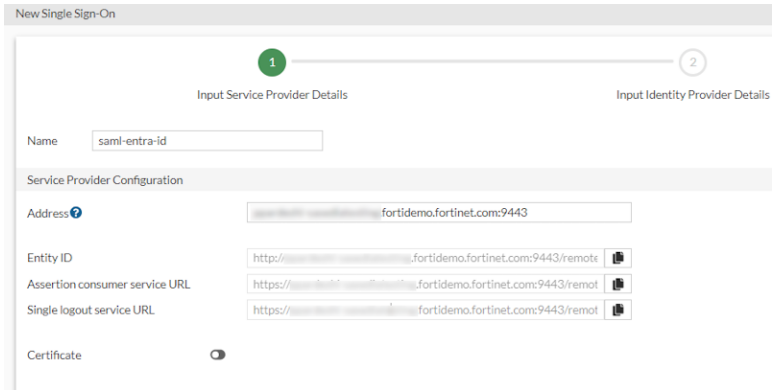
1. On FortiGate, go to *System* > *Certificates*, and from the *Create/Import* dropdown, select *Remote Certificate*.
2. Select *Upload* to locate and upload the .cer remote certificate from your computer.
3. Click *OK*. The certificate will now be visible under *System* > *Certificates* > *Remote Certificate*.

To configure SAML server on FortiGate:

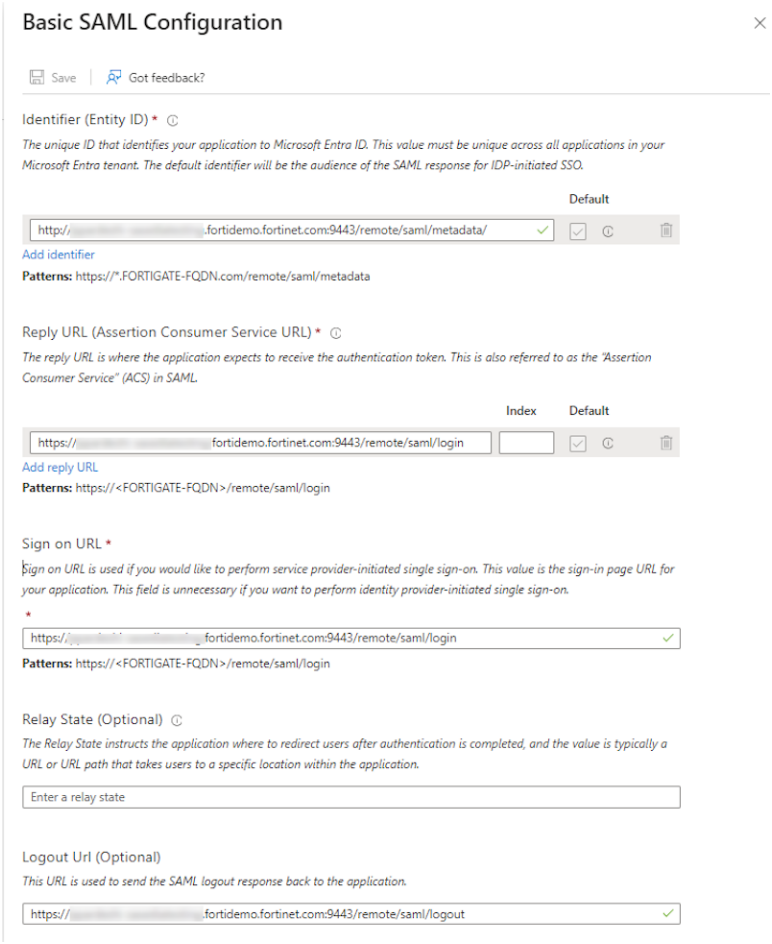
1. On the FortiGate, go to *User & Authentication* > *Single Sign-On* > *Create new*.
2. Enter the *Name* as *saml-entra-id*.
3. In the *Address* field, enter the FQDN/IP information in the following format:
   <ipsec-vpn-gateway-fqdn/ip-address>:<saml-ike-authentication-port>
   The *Address* field is used by FortiClient to initiate IPsec connection to FortiGate.
4. In *Service Provider Configuration*, copy the following URLs (*Entity ID*, *Assertion consumer service URL*, *Single logout service URL*) and use it in *Azure in Enterprise application* > *All applications* > *FortiGate IPsec VPN* > *Single sign-on page* > *Basic SAML Configuration*. Use the following mapping to copy the required values:

FortiGate settings	Microsoft Entra ID settings
Entity ID	Identifier (Entity ID)
Assertion consumer service URL	Reply URL (Assertion Consumer Service URL)
Assertion consumer service URL	Sign on URL
Single logout service URL	Logout URL (Optional)

The following demonstrates on the FortiGate:



The following demonstrates on Microsoft Entra ID:



5. On the FortiGate GUI, click *Next*.
6. In *Identity Provider Details*, set the *Type* as *Custom*.
7. Paste the URLs copied from last step of section To configure Enterprise application on Azure portal: on page 2395 according to the following mapping:

Microsoft Entra IDsettings	FortiGate settings
Login URL	Assertion consumer service URL
Microsoft Entra Identifier	Entity ID
Logout URL	Single logout service URL

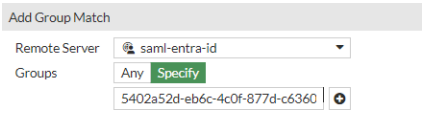
8. Select the *Certificate* from the dropdown. This certificate was imported into FortiGate in section To export SAML IdP server certificate and import it on FortiGate: on page 2397.
9. In the *Additional SAML Attributes* section, enter the following attributes:

Attribute used to identify users	*username*
Attribute used to identify groups	*group*

10. Click *Submit* to save the changes.

To configure SAML user group on FortiGate:

1. Go to *User & Authentication* > *User Groups* > *Create New*.
2. Enter *Name* as *SAML-ENTRA-ID-Group*.
3. In *Remote Groups*, click *Add*.
4. From the *Remote Server* dropdown, select *saml-entra-id SAML server*.
5. In *Groups*, click *Specify* and paste the Object ID copied in the section To configure a Security group and add user to it on Microsoft Entra ID: on page 2394.



6. Click *OK*.
7. Click *OK*.

To associate SAML server with IPsec gateway interface:

Use the FortiGate CLI to bind and associate the SAML server with the VPN gateway interface (port1) as follows:

```
config system interface
    edit "port1"
        set ike-saml-server "saml-entra-id"
    next
end
```

Configuring SAML on IdP and SP is now complete. The next step is to use SAML configuration inside IPsec configuration. To configure IPsec, see Configuring IPsec IKEv2 on FortiGate on page 2382.

Enhancing IPsec security using EMS SN verification

This feature ensures that only licensed FortiClient endpoints can establish an IPsec VPN connection with FortiGate. The FortiGate performs EMS SN verification, and for this feature to work, both the FortiGate and FortiClient endpoints must be connected to the same FortiClient EMS.

To enable the EMS SN verification in the CLI:

```
config vpn ipsec phase1-interface
    edit <name>
        set ems-sn-check {enable | disable}
    next
end
```

Command	Description
`set ems-sn-check`	Enable or disable EMS serial number verification.

IPsec split DNS

This functionality empowers clients to determine whether DNS traffic should utilize the tunnel's DNS or the local DNS server for query resolution. This is achieved by letting users specify a list of FQDNs. Only FQDNs that match the specified list are directed to the tunnel for resolution, while all other queries are handled by the local DNS server.

The `internal-domain-list` option is available on IKEv2 phase1 dialup gateways if `mode-cfg` is enabled.

To enable IPsec Split DNS in the CLI:

```
config vpn ipsec phase1-interface
    edit <name>
        set type dynamic
        set ike-version 2
        set mode-cfg enable
        set dns-mode {manual | auto}
        set internal-domain-list <domain name>
    next
end
```

Command	Description
`set internal-domain-list`	One or more internal domain names in quotes separated by spaces.

Two scenarios need attention:

1. When there is no split tunnel, or the split tunnel is set to address *all*, the user must manually select the *Enable Local LAN* checkbox in the FortiClient by navigating to *Advanced Settings* > *Phase 1*. If not, only the FQDN matching the `internal-domain-list` will be resolved, discarding other DNS queries. However, once this setting is enabled on FortiClient, any non-matching DNS query will be resolved through the local DNS server.
2. If the `dns-mode` is set to `manual`, but the *ipv4-dns-server1* is not configured, the VPN tunnel's DNS will default to 0.0.0.0 and all DNS queries will be routed through the local DNS server.

Dialup IPsec VPN using custom TCP port

Dialup IPsec VPN traditionally relies on UDP but can now operate over TCP. This enhancement enables VPN traffic from FortiClient to traverse restrictive firewalls that only permit TCP-based traffic. You can configure an IPsec VPN tunnel to exclusively use UDP or TCP, or you can configure the tunnel automatically switch to TCP mode when the firewall blocks UDP.

In high-latency or congested networks, UDP-based VPN connections may suffer from packet loss or performance degradation. TCP, with its built-in error correction and retransmission mechanisms, enhances the reliability and stability of VPN connections in such environments.

Dialup IPsec over TCP is particularly advantageous in mobile or dynamic settings such as public WiFi, hotel networks, or cellular data where network conditions and restrictions often vary. This feature ensures more seamless and dependable VPN connectivity across a broader range of scenarios.

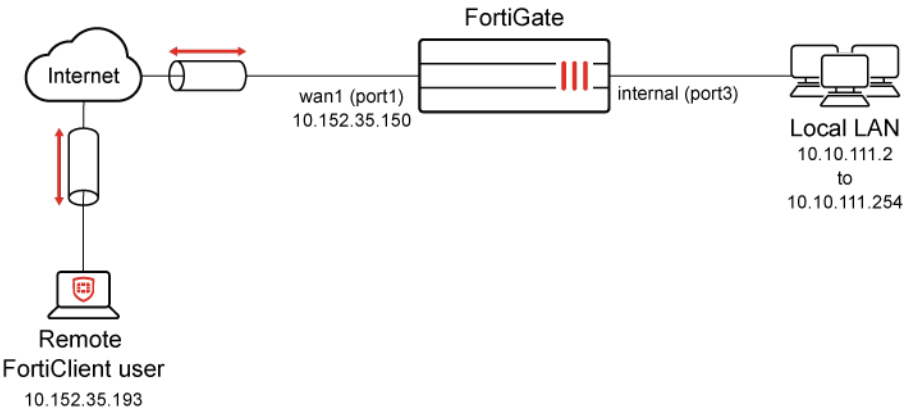
The custom TCP port functionality for IPsec is exclusively supported with IKE version 2 (IKEv2), and does not support NPU offloading.

Example

In this example, FortiGate is configured as a dialup IPsec server utilizing IKE version 2 (IKEv2) and operating on a custom TCP port (5500). IKEv2 uses EAP for user authentication. The initial setup leverages the IPsec wizard to create the dialup IPsec tunnel. By default, the wizard configures the tunnel to use IKE version 1 (IKEv1). Once the wizard completes the setup, the configuration is customized to use to IKE version 2 using the GUI. EAP user authentication is used by using user group named IPSEC, and IKE is configured to use a custom TCP port 5500 using the CLI.

On the client side, FortiClient is managed by FortiClient EMS and configured to act as the dialup IPsec client. The client is configured to connect to the FortiGate server over the custom TCP port 5500. This feature requires FortiClient 7.4.1 or later.

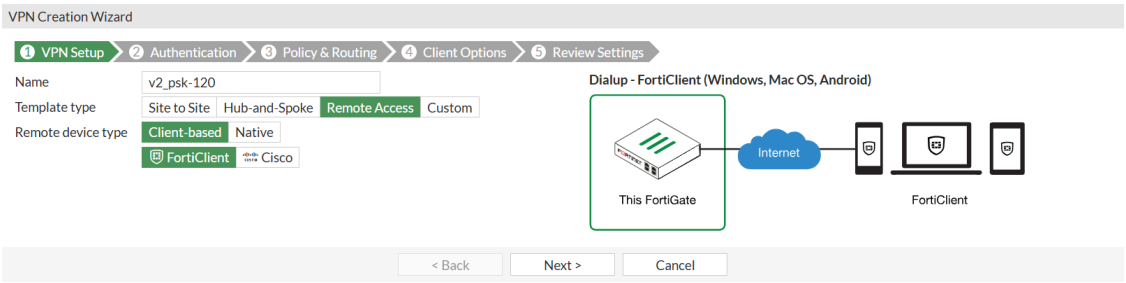
For a detailed description of the steps to configure FortiClient EMS to use the custom TCP port 5500 for IPsec VPN connections, see IPsec VPN over TCP.



To configure FortiGate as IPsec dialup server using IPsec Wizard:

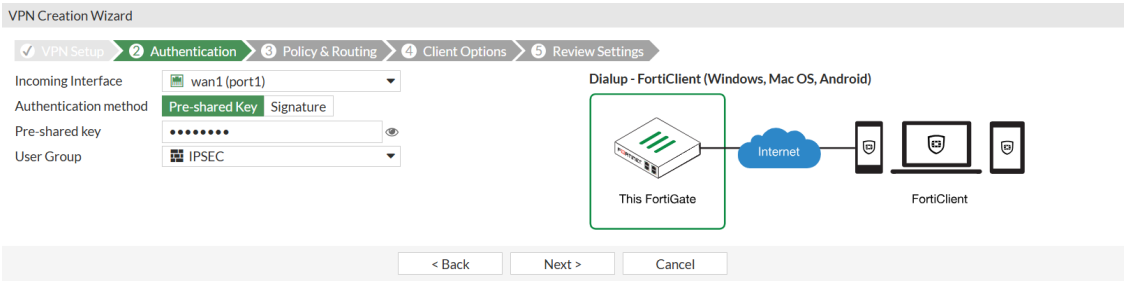
1. Go to *VPN* > *IPsec Wizard*, and enter the following:

Field	Value
Tunnel name	v2_psk-120
Template type	Remote Access
Remote device type	Client-based FortiClient



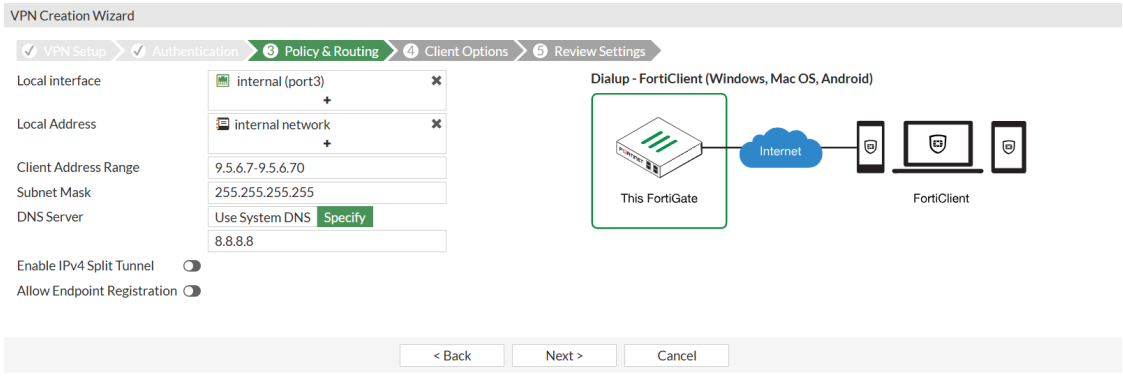
2. Click *Next*.
3. Under *Authentication* section, enter the following:

Field	Value
Incoming interface	wan1(port1)
Authentication method	Pre-shared key
Pre-shared key	Enter suitable key of at least six characters long
User Group	IPSEC To configure user groups for authentication, see User groups on page 2837. One or more user groups for user authentication can be configured under a single IPsec VPN tunnel. See Using single or multiple user groups for user authentication on page 2422 for details.



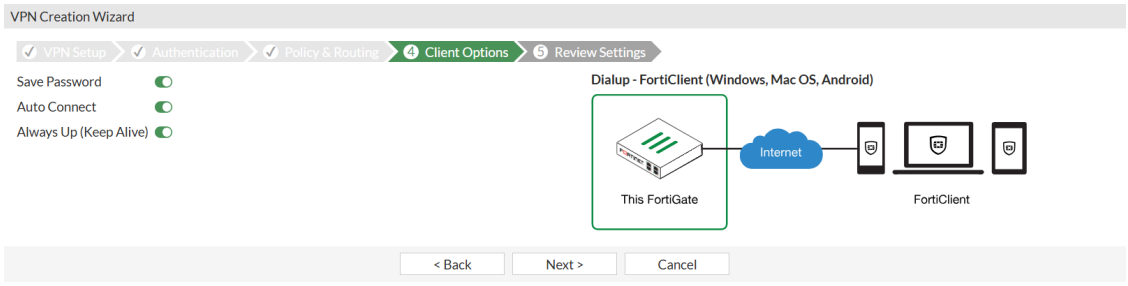
4. Click *Next*.
5. Under *Policy & Routing* section, enter the following:

Field	Value
Local interface	internal (port3)
Local address	internal network
Client Address Range	9.5.6.7-9.5.6.70
Subnet mask	255.255.255.255
DNS Server	Specify 8.8.8.8
Enable IPv4 Split Tunnel	Disable
Allow Endpoint Registration	Disable

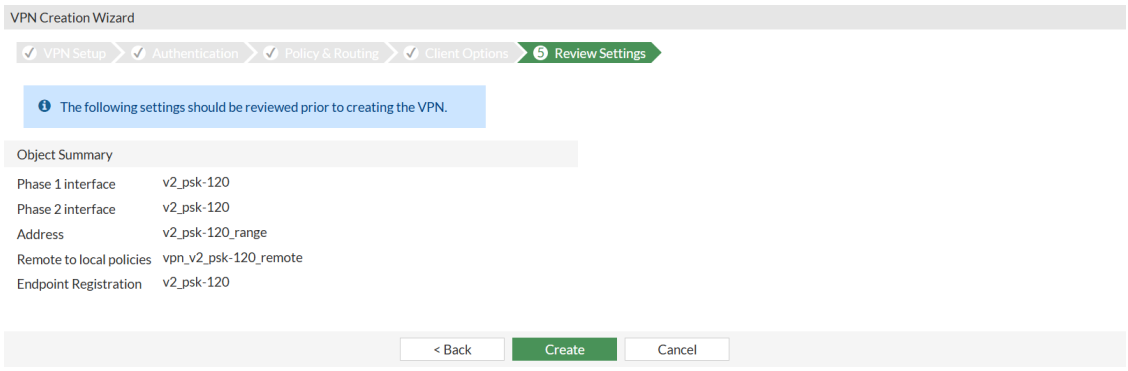


6. Click *Next*.
7. Under *Client Options* section, enter the following:

Field	Value
Save Password	Enable
Auto Connect	Enable
Always Up (Keep Alive)	Enable



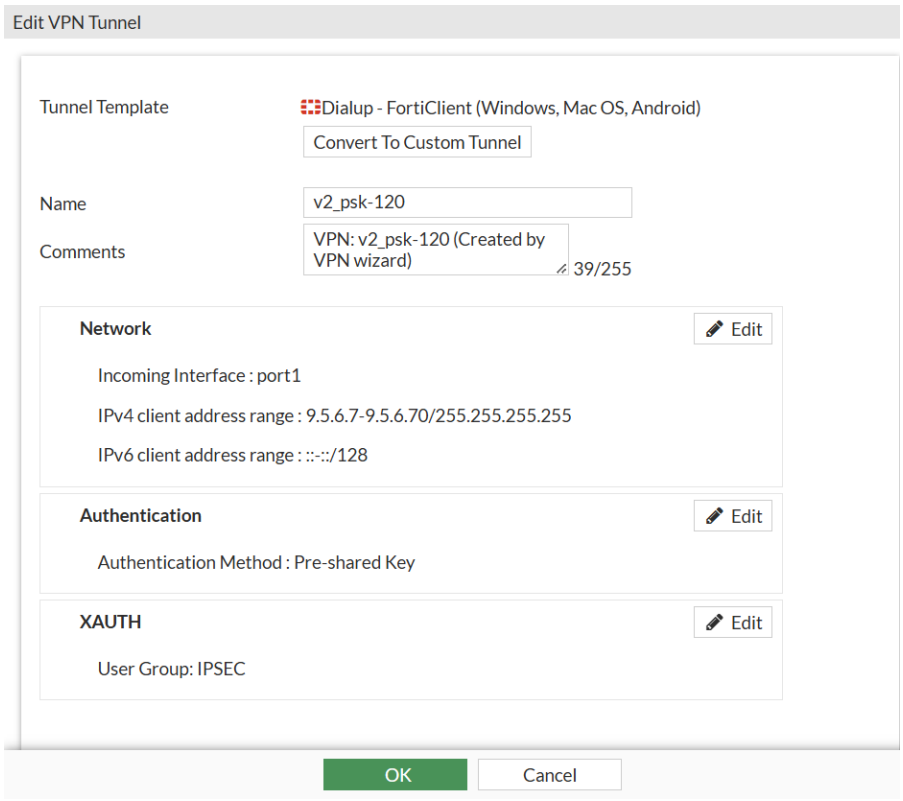
8. Click *Next*.
9. Under *Review Settings* section, review the configuration pending configuration by the wizard.



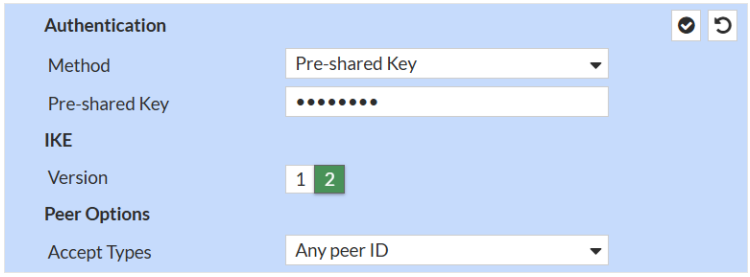
10. Click *Create*.
    A message is displayed: *The VPN has been set up*.

To configure the IPsec tunnel's method as TCP:

1. On FortiGate, go to *VPN* > *IPsec Tunnels*, select the tunnel *v2_psk-120*, and click *Edit*.
2. Under *Tunnel Template*, click *Convert to Custom Tunnel*.



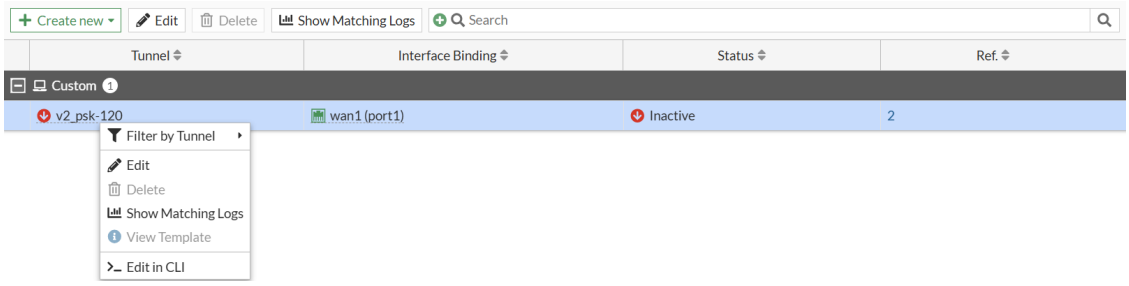
3. Under *Authentication* section, click *Edit*, and change the IKE *Version* to *2*:



4. Click the checkmark box in the top-right corner of *Authentication* section to save the IKE settings.
5. Click *OK* to apply the settings to the IPsec tunnel.

To configure FortiGate IPsec tunnel to use EAP for user authentication and TCP as transport:

1. Go to *VPN > IPsec Tunnels*, right-click IPsec tunnel *v2_psk-120* created by IPsec Wizard, and select *Edit in CLI*.



2. IPsec IKEv2 uses EAP for user authentication. You must enable the following CLI settings to enable EAP to perform user authentication. These settings can only be enabled using CLI.

```
config vpn ipsec phase1-interface
    edit v2_psk-120
        set eap enable
        set eap-identity send-request
        set authusrgrp IPSEC
    next
end
```

   EAP is now to authenticate users in user group *IPSEC*. To configure user groups, see .

3. Set `transport` to use `tcp` under Phase 1 configuration:

```
config vpn ipsec phase1-interface
    edit v2_psk-120
        set transport tcp
    next
end
```

To view and modify TCP port used by IKEv2 using CLI:

1. On the top-right corner of the FortiGate GUI, click the _> icon to open a CLI console.
   For other methods to connect to CLI, see Connecting to the CLI on page 66.
2. Enter the following command to see the default TCP IKE port used by FortiGate:

```
show full-configuration system settings | grep ike-tcp
    set ike-tcp-port 4500
```

   Notice that the setting `ike-tcp-port` is set to `4500` by default.

3. Use the following commands to modify the default TCP port to use a custom port 5500:

```
config system settings
    set ike-tcp-port 5500
end
```

ike-tcp-port <port>	Set the TCP port for IKE/IPsec traffic (1 - 65535, default = 4500).

When using TCP port 443 for IKE/IPsec traffic, GUI access can be affected for interfaces that are bound to an IPsec tunnel when the GUI admin port is also using port 443. To ensure continued functionality, change either the IKE/IPsec port or the administrative access port.

To change the administrative access port:

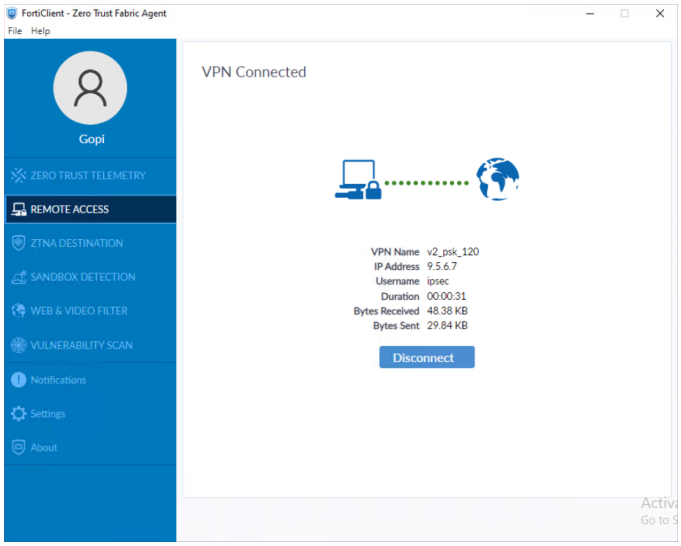
```
config system global
    set admin-sport <port>
end
```

admin-sport <port>	Set the administrative access port for HTTPS (1 - 65535, default = 443).

For port conflicts with ZTNA and SSL VPN, ZTNA and SSL VPN will take precedence. To avoid any port conflicts with other services, review the FortiOS Ports guide for other incoming ports used on the FortiGate.

To verify the VPN connection:

1. Using FortiClient, connect to the IPsec VPN gateway.



2. On FortiGate, run `diagnose vpn ike gateway list` to verify the IPsec VPN tunnel status. Note that `addr` shows the custom TCP port value, and `transport` shows `TCP`:

```
vd: root/0
name: v2_psk-120_0
version: 2
interface: port1 3
addr: 10.152.35.150:5500 -> 10.152.35.193:54854
tun_id: 9.5.6.7/::10.0.0.23
remote_location: 0.0.0.0
network-id: 0
transport: TCP
virtual-interface-addr: 169.254.1.1 -> 169.254.1.1
created: 592s ago
eap-user: ipsec
2FA: no
peer-id: 120
peer-id-auth: no
FortiClient UID: B70BAD123010487E86DB102969115E99
assigned IPv4 address: 9.5.6.7/255.255.255.255
nat: me peer
pending-queue: 0
PPK: no
```

```
IKE SA: created 1/1  established 1/1  time 80/80/80 ms

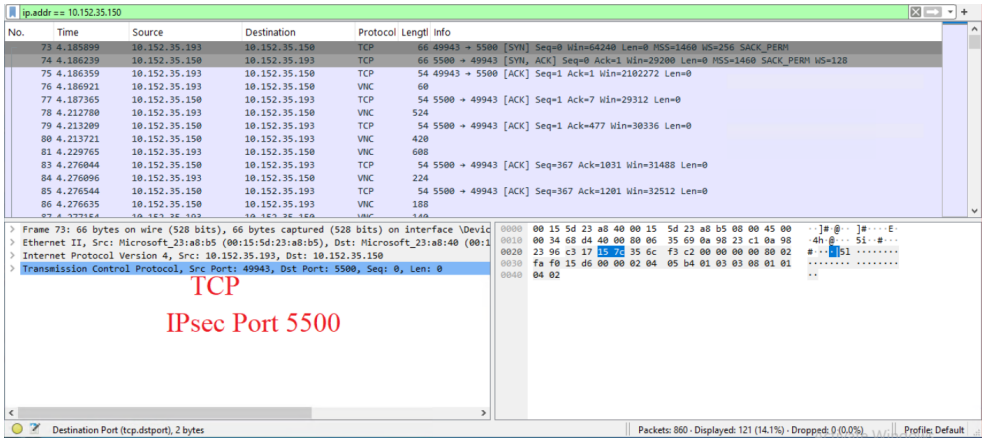
  peer-id: 120
```

3. Run a packet capture using the packet capture tool on FortiGate GUI under *Network* > *Diagnostic* tab for wan1(port1) interface with TCP port number 5500.



For more information, see Using the packet capture tool on page 855.

4. (Optional) Run the packet capture using the following command:

```
diagnose sniffer packet wan1 “port 5500” 4 0 l.
```

For more information, see Performing a sniffer trace or packet capture on page 4116.

IPsec DNS suffix

The DNS suffix enables DNS resolution of network resources using their hostnames, without requiring clients to specify their fully qualified domain names (FQDN). This feature is particularly useful in environments where users access internal resources over VPN connections. By appending a DNS suffix to unqualified domain names (such as hostnames), it enables end systems to generate FQDNs required for DNS resolution.

When a DNS suffix is configured for an IPsec tunnel, the configuration is pushed to FortiClient during VPN negotiations and is added to the DNS suffix list for the VPN adapter on the endpoint machine. This setting ensures accurate name resolution for unqualified domain names by appending the specified DNS suffix, which is essential for proper DNS resolution.

Currently, DNS suffix configuration is supported only for IKE version 1 and only one DNS suffix is configurable per IPsec tunnel.

If we assume that a DNS suffix named example.com is set for an IPsec tunnel, when a VPN client performs DNS query for server1 using only its hostname server1, the end system appends the DNS suffix it to make the FQDN server1.example.com. A DNS query is sent using this FQDN to the DNS servers configured for VPN clients.

Split Tunneling:

If split tunneling is enabled on the IPsec tunnel, ensure that the address object used for split tunneling includes the IP address of the DNS server used by VPN clients. This ensures that DNS traffic flows correctly through the VPN adapter. Without this configuration, the DNS suffix is not applied, as DNS queries will bypass the VPN adapter.

Unqualified domains:

The DNS suffix is only appended if VPN clients make DNS queries for unqualified domain names. The DNS suffix is not appended for DNS queries made for FQDNs (such as server1.example.com) or partially qualified domain names (such as server1.example).

The configuration of a DNS suffix on an IPsec tunnel requires enabling unity-support in the phase 1 configuration of the IPsec tunnel:

```
config vpn ipsec phase1-interface
    edit <name>
        set unity-support enable
        set domain <string>
    next
end
```

Command	Description
`unity-support enable`	Enables unity support to allow pushing DNS suffixes to VPN clients.
`domain <string>`	Specify the DNS suffix that is required to be pushed to VPN clients.

LDAP authentication with IKEv2 using UDP or TCP as transport

EAP-TTLS for LDAP based user authentication in IKEv2

When configuring IPsec VPNs, the user authentication mechanism used depends on the IKE version in use:

- IKE version 1 uses XAUTH (Extended Authentication) for user authentication.
- IKE version 2 uses EAP (Extensible Authentication Protocol) for user authentication.

XAUTH in IKEv1 natively supports LDAP based user authentication. In IKEv2, LDAP based user authentication is not directly supported through all EAP methods. To authenticate users against an LDAP server in IKEv2, you must use EAP-TTLS (Tunneled Transport Layer Security). EAP-TTLS allows credentials to be securely transmitted between FortiClient and FortiGate over a TLS tunnel, ensuring secure user authentication.

EAP-TTLS configuration is supported on FortiClient EMS and FortiClient version 7.4.3 and later, see EAP-TTLS support for IPsec VPN.

Both FortiClient and FortiClient EMS must be running compatible versions to enable this functionality, see EMS Compatibility chart.

Transport options: UDP, TCP or Auto mode

Different options can be selected between transport methods such as UDP, TCP, or Auto mode for IKE negotiation and encapsulation of ESP packets.

Traditionally, dial-up IPsec VPNs have used UDP as the transport protocol for IKE negotiations and encrypted traffic. With recent enhancements, IPsec VPNs can now operate over TCP, providing greater flexibility and compatibility in restrictive network environments. Using TCP as transport is beneficial in scenarios where ISPs, firewalls, or proxy servers only allow inbound and outbound TCP traffic and block UDP traffic. You can also specify a custom TCP port for IPsec communication for both FortiGate and FortiClient. For details on configuring a custom TCP port on FortiClient, see IPsec VPN over TCP. For details on configuring a custom TCP port on FortiGate, see Dialup IPsec VPN using custom TCP port on page 2400.

Requirements for using TCP as transport:

- IKE version 2
- FortiClient version 7.4.1 or later, that supports TCP as transport

In Auto mode, IKE initially uses UDP encapsulation. If the UDP connection fails to establish within the defined time threshold, it uses TCP encapsulation as fallback.

To configure the transport mode:

```
config vpn ipsec phase1-interface
    edit <name>
        set ike-version 2
        set transport {auto | udp | tcp}
        set auto-transport-threshold <integer>
```

```
    next
end
```

Command	Description
`transport {auto | udp | tcp}`	Set the IKE transport protocol: • `auto`: use UDP transport for IKE, with fallback to TCP transport. • `udp`: use UDP transport for IKE. • `tcp`: use TCP transport for IKE. This command is available when `ike-version` is set to `2`.
`auto-transport-threshold <integer>`	How long to wait for the UDP connection to establish before falling back IKE/IPsec traffic to TCP, in seconds (1 - 300, default = 15).

On FortiClient EMS, you can configure the transport method using the FortiClient EMS GUI (see Example) or the XML tag `<transport_mode>`.

The available values for this XML tag element include:

Value	Description
`0`	UDP transport mode. This is the default and used for most VPN connections.
`1`	TCP transport mode. This is recommended for use in restrictive networks.
`2`	Auto mode. FortiOS dynamically selects the transport mode.

Here is an example of the `<transport_mode>` element. It does not include all elements required for a functioning VPN connection:

```
<forticlient_configuration>
    <vpn>
        <ipsecvpn>
            <connections>
                <connection>
                        <transport_mode>1</transport_mode>
                </connection>
            </connections>
    </vpn>
</forticlient_configuration>
```

Ensure that the transport settings selected on FortiGate match the settings specified on FortiClient.

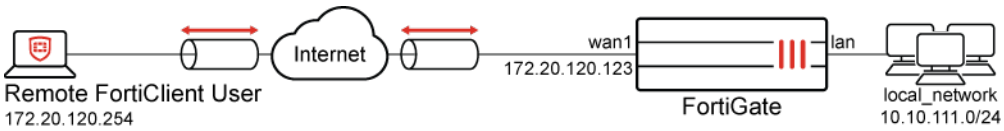
Example

This example demonstrates how to configure an IPsec VPN tunnel using IKEv2 with TCP as the transport protocol and LDAP for user authentication. It also discusses using UDP or Auto mode as transport as an optional step.

On FortiGate, an LDAP server named *LDAP-Server* is pre-configured to connect to LDAP directory server and is referenced in user group named *LDAP-Group*. For configuration steps, see Configuring an LDAP server on page 2858 and User groups on page 2837.

The *Group Name* option is configured to match users who belong to the *Domain Users* group on the LDAP server. As a result, only members of the *Domain Users* group are permitted to connect to the IPsec VPN. For more information on group-based user matching, see Tracking users in each Active Directory LDAP group on page 2867.

FortiClient is managed by FortiClient EMS. To enable support for both TCP transport and EAP-TTLS (required for secure LDAP authentication with IKEv2), ensure that both FortiClient and FortiClient EMS are running version 7.4.3 or later.



To configure dialup IPsec VPN using IKE version 2 and TCP as transport using the GUI:

1. Go to *VPN > IPsec Wizard*.
2. Configure the following settings for *VPN Setup*:

Field	Value
Name	*dialup_vpn*
Template type	*Remote Access*
Remote device type	*Client-based > FortiClient*

3. Click *Next*.
4. Configure the following settings for *Authentication*:

Field	Value
Incoming Interface	*wan1 (port1)*
Authentication Method	*Pre-shared key*
Pre-shared Key	Enter a suitable key. The same pre-shared key is configured on FortiClient EMS to connect to this IPsec tunnel.
User Group	*LDAP-Group* As the IPsec Wizard configures the IPsec tunnel using IKE version 1, the selected user group is automatically removed from the IPsec tunnel configuration during the conversion of the IKE version to IKEv2. The user groups are required to be manually added to the IPsec tunnel configuration to enable FortiGate to perform user authentication. Multiple user groups for user authentication can be configured under a single IPsec VPN tunnel; see Using single or multiple user groups for user authentication on page 2422.

5. Click *Next*.

6. Configure the following settings for *Policy & Routing*:

Field	Value
Local interface	*lan(port2)*
Local Address	*local_network* Click *+* to create a new address object with *Type* set to *Subnet* and *IP/Netmask* set to *10.10.111.0/24*, if not already configured.
Client Address Range	10.10.2.1-10.10.2.200
Subnet Mask	255.255.255.255
DNS Server	*Use System DNS*
Enable IPv4 Split Tunnel	*Enable*
Allow Endpoint Registration	*Disable* This setting is deprecated and has no effect.

7. Click *Next*.
8. Configure the following settings for *Client Options*:

Field	Value
Save Password	*Enable*
Auto Connect	*Disable*
Always Up (Keep Alive)	*Disable*

9. Click *Next*.
10. Review the configuration, then click *Create*.
    A confirmation message is shown to confirm that the VPN has been set up.

To configure dialup IPsec VPN using IKE version 2 and TCP as transport using the CLI:

1. Configure a LDAP server on FortiGate:

```
config user ldap
    edit "LDAP-Server"
        set server "203.0.113.1"
        set cnid "sAMAccountName"
        set dn "dc=financial,dc=local"
        set type regular
        set username "financial\\administrator"
        set password *****
        set port 389
    next
end
```

2. Configure a user group that uses the LDAP server along with group matching (`group-name`):

```
config user group
    edit "LDAP-Group"
        set member "LDAP-Server"
        config match
            edit 1
                set server-name "LDAP-Server"
                set group-name "CN=Domain Users,CN=Users,DC=financial,DC=local"
            next
        end
    next
end
```

3. Configure the internal interface:

```
config system interface
    edit "lan"
        set vdom "root"
        set ip 10.10.111.1 255.255.255.0
    next
end
config firewall address
    edit "local_subnet_1"
        set subnet 10.10.111.0 255.255.255.0
    next
end
config firewall addrgrp
    edit "local_network"
        set member "local_subnet_1"
    next
end
```

4. Configure the WAN interface.

   The WAN interface is the interface connected to the ISP. It can be configured in static mode (as shown here), DHCP, or PPPoE mode. It is recommended to configure it with a static IP address to ensure that the IPsec VPN configuration on the FortiClient stays unchanged if the WAN IP changes on the FortiGate. The IPsec tunnel is established over the WAN interface.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

5. Configure the client address pool.

   You must create a firewall address to assign an IP address to a client from the address pool.

```
config firewall address
    edit "client_range"
        set type iprange
        set start-ip 10.10.2.1
        set end-ip 10.10.2.200
```

```
    next
end
```

6. Configure the IPsec phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "dialup_vpn"
        set type dynamic
        set interface "wan1"
        set ike-version 2
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set dhgrp 20 21
        set eap enable
        set eap-identity send-request
        set authusrgrp "LDAP-Group"
        set transport tcp
        set assign-ip-from name
        set ipv4-name "client range"
        set dns-mode auto
        set ipv4-split-include "local_network"
        set save-password enable
        set psksecret ******
    next
end
```

To use UDP as transport method:

```
config vpn ipsec phase1-interface
    edit "dialup_vpn"
        set transport udp
    next
end
```

Ensure that UDP is also configured as desired transport when configuring FortiClient EMS.

To use UDP as transport method and TCP as fallback if UDP is blocked:

```
config vpn ipsec phase1-interface
    edit "dialup_vpn"
        set transport udp-fallback-tcp
    next
end
```

Ensure that Auto mode is also configured as desired transport when configuring FortiClient EMS.

7. Configure the IPsec phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "dialup_vpn"
        set phase1name "dialup_vpn"
```

```
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

8. Configure a firewall policy to allow client traffic flow over the IPsec VPN tunnel to the FortiGate's LAN interface:

```
config firewall policy
    edit 1
        set name "inbound"
        set srcintf "for_client"
        set dstintf "lan"
        set srcaddr "client_range"
        set dstaddr "local_network"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

One or more user groups for user authentication can be configured under a single IPsec VPN tunnel. See Using single or multiple user groups for user authentication on page 2422 for details.

To configure TCP port for dialup IPsec VPN when IKE version 2 is used with TCP as transport:

```
config system settings
    set ike-tcp-port 443
end
```

Command	Description
`ike-tcp-port <port>`	Set the TCP port for IKE/IPsec traffic (1 - 65535, default = 443).

When using TCP port 443 for IKE/IPsec traffic, GUI access can be affected for interfaces that are bound to an IPsec tunnel when the GUI admin port is also using port 443. To ensure continued functionality, change either the IKE/IPsec port or the administrative access port.

To change the administrative access port:

```
config system global
    set admin-sport <port>
end
```

Command	Description
`admin-sport <port>`	Set the administrative access port for HTTPS (1 - 65535, default = 443).

For port conflicts with ZTNA and SSL VPN, ZTNA and SSL VPN will take precedence. To avoid any port conflicts with other services, review the FortiOS Ports guide for other incoming ports used on the FortiGate.

To configure the Remote Access profile to use EAP-TTLS with IKEv2 on FortiClient EMS:

1. On FortiClient EMS, navigate to *Endpoint Profiles* > *Remote Access* and click *Edit* on the *Default* endpoint profile.
2. Under *VPN Tunnels*, click *Add Tunnel*.
3. Set *VPN type* as *Manual*.
4. Click *Next*.
5. Under *Basic Settings*, enter the following:

Field	Value
Name	*IPsec-IKEv2*
Remote Gateway	*172.20.120.123*
Authentication Method	*Pre-shared Key*
Pre-Shared Key	Enter pre-shared key that was configured on FortiGate's dialup VPN configuration.
Prompt for Username	*Enabled*

6. Click *VPN Settings*, enter the following:

Field	Value
IKE	*Version 2*
Address Assignment	*Mode Config*
Encapsulation	*IPsec over TCP*

Field	Value
	(Optional) To use UDP encapsulation, use *IKE UDP Port* and use the required UDP port. Ensure that FortiGate is also configured to use UDP as transport. (Optional) To use Auto mode, use *Auto* and set appropriate *IKE TCP Port* and *IKE UDP Port*. Ensure that FortiGate is also configured to use Auto mode as transport.
IKE TCP Port	*443*

7. Click *Phase 1*, enter the following details:

Field	Value
IKE Proposal	
Encryption, Authentication	*AES128, SHA256*
Encryption, Authentication	*AES256, SHA256*
DH Groups	*20, 21*
Key Life	*86400*
Dead Peer Detection	*Enable*
NAT Traversal	*Enable*

8. Click *Phase 2*, enter the following details:

Field	Value
IKE Proposal	
Encryption, Authentication	*AES128, SHA256*
Encryption, Authentication	*AES256, SHA256*
DH Groups	*20*
Key Life	*43200*
Enable Replay Detection	*Enable*
Enable Perfect Forward Secrecy (PFS)	*Enable*

9. Click *Save* to save the VPN Tunnel configuration.
10. Click *Save* to save *Remote Access* endpoint profile.
11. Select the same endpoint profile in the *Endpoint Profiles* > *Remote Access* tab and click *Edit*.
12. Select the XML tab to view XML configuration for the *Remote Access* profile.
13. Click *Edit*.

14. Edit the XML configuration to include the following:

```
<forticlient_configuration>
    <vpn>
        <ipsecvpn>
            <connections>
                <connection>
                    <name>IKEV2-PSK - EAP_TTLS</name>
                    <ike_settings>
                        <authentication_method>Preshared Key</authentication_method>
                        <eap_method>2</eap_method>
                    </ike_settings>
                </connection>
            </connections>
        </ipsecvpn>
    </vpn>
</forticlient_configuration>
```

15. Click *Save*.
16. On FortiClient endpoint that received the configuration, in the *Remote Access* tab, connect to the applicable IPsec VPN tunnel using LDAP credentials.

To verify VPN tunnel status using FortiGate GUI:

1. On the FortiGate, go to *Dashboard* > *Network* and expand the *IPsec* widget.
2. Find the new tunnel, *dialup_vpn_0* in this example, and check the statuses of the *Phase 1* and *Phase 2* selectors.

Successfully established dialup IPsec VPN tunnels are displayed using a parent name followed by an index, creating a structured and organized association with the parent tunnel. For example, the parent name *for_client* results in tunnel names such as *for_client_0*, *for_client_1*, and so on.

3. Hover the cursor over the tunnel name to see additional details.

To verify VPN tunnel status using FortiGate CLI:

1. Verify the IPsec Phase 1 tunnel status on the FortiGate:

```
# diagnose vpn ike gateway list name dialup_vpn_0

vd: root/0
name: dialup_vpn_0
version: 2
interface: wan1 3
addr: 172.20.120.123:443 -> 172.20.120.254:64007
tun_id: 10.10.2.1/::10.0.0.5
remote_location: 0.0.0.0
network-id: 0
transport: TCP
created: 9s ago
eap-user: johnlocus
```

```
2FA: no
peer-id: 172.20.120.254
peer-id-auth: no
assigned IPv4 address: 10.10.2.1/255.255.255.255
nat: me peer
pending-queue: 0
PPK: no

```

Note that FortiGate acts as the responder, establishes the IPsec tunnel with remote FortiClient user with IP 172.20.120.254 over TCP port 443 on its wan1 interface, and dynamically assigns a VPN IP of 10.10.2.1 to FortiClient endpoint. The authenticated username is also displayed in `eap-user` field.

2. Verify the IPsec Phase 2 tunnel status on the FortiGate:

```
# diagnose vpn tunnel list name dialup_vpn_0

list ipsec tunnel by names in vd 0
------------------------------------------------------
name=dialup_vpn_0 ver=2 serial=5 172.20.120.123:443->172.20.120.254:64007

```

Note the decryption, encryption, and authentication keys negotiated in Phase 2 to protect subnets under the `src` and `dst` fields. FortiOS also automatically adds the dynamically assigned VPN IP of 10.10.2.1 to its traffic selectors for dialup tunnel dialup_vpn_0.

To verify traffic through the IPsec tunnel:

1. On the remote FortiClient user with IP address 172.20.120.254, initiate ICMP traffic to a machine in the 10.10.111.0/24 network and verify that traffic goes through:

```
# ping 10.10.111.3

PING 10.10.111.3 (10.10.111.3) 56(84) bytes of data.
64 bytes from 10.10.111.3: icmp_seq=1 ttl=62 time=9.84 ms
64 bytes from 10.10.111.3: icmp_seq=2 ttl=62 time=0.808 ms
```

2. On FortiGate, run a sniffer trace for ICMP packets destined to 10.10.111.3:

```
# diagnose sniffer packet any 'host 10.10.111.3’ 4 0 l

Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.10.111.3]
2024-11-05 12:06:05.509711 dialup_vpn_0 in 10.10.2.1 -> 10.10.111.3: icmp: echo request
2024-11-05 12:06:05.509791 lan out 10.10.2.1 -> 10.10.111.3: icmp: echo request
2024-11-05 12:06:05.518809 lan in 10.10.111.3 -> 10.10.2.1: icmp: echo reply
2024-11-05 12:06:05.518899 dialup_vpn_0 out 10.10.111.3 -> 10.10.2.1: icmp: echo reply
```

The ICMP request packets are received on dialup_vpn_0 tunnel interface and routed to the LAN interface. ICMP reply packets are received on the LAN interface and routed back out on dialup_vpn_0 tunnel interface.

For more information, see Performing a sniffer trace or packet capture on page 4116.

3. Optionally, run real time IKE debug using appropriate filters for troubleshooting if the IPsec tunnel does not come up:

```
# diagnose vpn ike log filter rem-addr4 172.20.120.254
# diagnose debug application ike -1
# diagnose debug enable
```

For more information, see VPN IPsec troubleshooting on page 2604.

To verify LDAP authentication using EAP-TTLS on FortiClient:

1. Ensure that the logging level is set to *Debug* on FortiClient.
2. After the VPN tunnel establishes on FortiClient, go to the folder located under *C:\%ProgramFiles%\Fortinet\FortiClient\logs\trace* and open the file *FortiIKE_1.log*. The following shows expected log output for this feature:

```
[7868:11132] [FortiIKE  524    info] IPsec daemon start ipsec.exe -s FC_{73EFB30F-1CAD-4a7a-
AE2E-150282B6CE25}_000002 -i 2 -g 172.20.120.254 IPsec-IKEv2

[7868:11132] [FortiIKE  419   debug] EAP-TTLS method loaded
[7868:11132] [FortiIKE  427   debug] EAP-GTC method loaded

[7868:11132] [FortiIKE  4939   debug] 0:IPsec-IKEv2:0: initiator received EAP msg
[7868:11132] [FortiIKE  400   debug] EAP: Initialize selected EAP method: vendor 0 method 21
(TTLS)

[7868:11132] [FortiIKE  145   debug] EAP-TTLS: Phase2 type: PAP
[7868:11132] [FortiIKE  4779   debug] 0:IPsec-IKEv2:0: authentication succeeded
```

Using single or multiple user groups for user authentication

User groups enable remote users to authenticate themselves before establishing a connection to the IPsec VPN tunnel. One or more user groups for user authentication can be configured under a single IPsec VPN tunnel. For information about configuring user groups, see User groups on page 2837.

When configuring dialup or remote access IPsec VPNs, user groups can be specified in either the phase 1 settings or the firewall policy associated with the tunnel (along with the source address objects or address groups). They must not be configured in both.

The workflow for configuring user groups varies depending on whether the IPsec tunnel is set up using the IPsec Wizard or a custom IPsec configuration.

IPsec Wizard tunnel configuration

When configuring the tunnel, you can specify one or more user groups in the *User authentication method* option.

- Single user group:

  By default, the wizard uses IKEv1 and allows only a single user group to be used for user authentication, configured in the *User Group* field.
- Multiple user groups:

  By default, the wizard uses IKEv1 and allows only a single user group to be used for user authentication, configured in the *User Group* field. To use multiple groups:

  a. Specify a placeholder group when completing the wizard.
  b. After finishing the wizard, edit the tunnel and click *Convert to Custom Tunnel*.
  c. For IKEv1, edit the *XAUTH* settings and set *User Group* to Inherit from policy, then specify the user groups in the firewall policy *Source* field.

For IKEv2, enable EAP in the CLI, then specify the user groups in the firewall policy *Source* field.

```
config vpn ipsec phase1-interface
    edit <tunnel-name>
        set eap enable
        set eap-identity send-request
    next
end
```

Custom IPsec tunnel configuration

The custom IPsec tunnel configuration offers more granular settings to configure IPsec VPN. To configure a custom IPsec VPN tunnel, go to *VPN > IPsec Tunnels*, click *Create New > IPsec Tunnel*, and set the *Template Type* to *Custom*.

- Single user group:
  - GUI:

    In the VPN tunnel configuration, set IKE to version 1, enable XAUTH, and either:
    - Set *User Group* to *Choose* and select the required user group, or
    - Set *User Group* to *Inherit from Policy* and in the policy configuration, specify the user group in the *Source* field.
  - CLI:

    For IKEv1, enable XAUTH:

    ```
    config vpn ipsec phase1-interface
        edit <tunnel-name>
            set xauthtype {pap | chap | auto}
        next
    end
    ```

    For IKEv2, enable EAP:

    ```
    config vpn ipsec phase1-interface
        edit <tunnel-name>
            set eap enable
            set eap-identity send-request
        next
    end
    ```

    In the VPN tunnel configuration, either:
    - Set the user group (`set authusrgrp <group-name>`), or
    - Remove any configured user group (`unset authusrgrp`), then specify the user group in the firewall policy (`set groups <group-name>`).
- Multiple user groups:
  - GUI:

    In the VPN tunnel configuration, set IKE to version 1, enable XAUTH, and set *User Group* to *Inherit from Policy*. In the policy configuration, specify the user groups in the *Source* field.
  - CLI:

    For IKEv1, enable XAUTH:

```
config vpn ipsec phase1-interface
    edit <tunnel-name>
        set xauthtype {pap | chap | auto}
    next
end
```

For IKEv2, enable EAP:

```
config vpn ipsec phase1-interface
    edit <tunnel-name>
        set eap enable
        set eap-identity send-request
    next
end
```

In the VPN tunnel configuration, remove any configured user group (`unset authusrgrp`), then specify the user groups in the firewall policy (`set groups <group-name> ... <group-name>`).

Starting with FortiClient 7.4.4, IKEv1 is no longer supported on the client. Therefore, plan accordingly when choosing your IKE version. Use IKEv2 if you plan on deploying FortiClient 7.4.4 and later.

Also, FortiClient 7.4.4 does not support IPv6.

IPsec IKEv2 VPN 2FA with EAP and certificate authentication

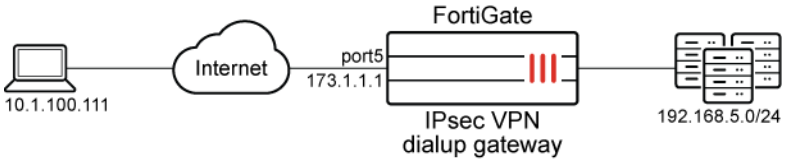
IPsec IKEv2 VPNs now support certificate authentication and EAP authentication at the same time from a dialup FortiClient. With the eap-cert-auth setting enabled, FortiGate will validate the X.509 certificate sent from FortiClient when establishing a IKEv2 tunnel. After it is authenticated, FortiGate will continue to perform EAP authentication.

```
config vpn ipsec phase1-interface
    edit <tunnel>
        set eap enable
        set eap-cert-auth {*disable | enable}
        set peer <user peer>
    next
end
```

Setting	Description
`eap enable`	Enable EAP to perform user authentication.
`eap-cert-auth {*disable | enable}`	Enable/Disable certificate authentication in addition to EAP (default = disable).
`peer <user peer>`	When eap-cert-auth is enabled, the peer certificate is validated if `peer <user peer>` is configured. If eap-cert-auth is disabled, the peer certificate is not validated even if `peer <user peer>` is configured.

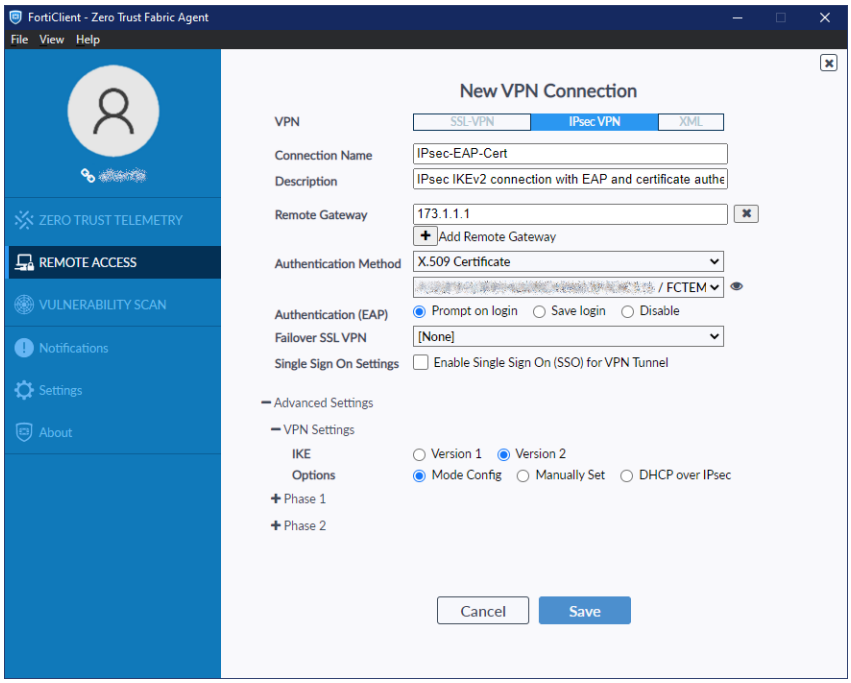
Example

In this example, FortiClient is configured to use an X.509 certificate and EAP to perform certificate and user authentication. The certificate is issued by a CA that is trusted by the FortiGate.



To configure FortiClient:

1. Go to *Remote Access*, click the sandwich menu, and select *Add a new connection*.
2. Configure the new VPN connection.



Field	Value
VPN	IPsec VPN
Connection Name	IPsec-EAP-Cert
Description	(Optional)
Remote Gateway	173.1.1.1
Authentication Method	X.509 Certificate
Authentication (EAP)	Prompt on login
Failover SSL VPN	[None]
Advanced Settings > VPN Settings	

Field	Value
IKE	Version 2
Options	Mode Config

3. Click *Save*.

To configure local users and peer (certificate authentication):

```
config user group
    edit "local-group"
        set member "usera" "userc" "bi_local"
    next
end
config user peer
    edit "peer-test3"
        set ca "Eternity-CA"
        set subject "test3"
    next
end
```

A certificate issued by Eternity-CA with `test3` in the subject will be trusted by the FortiGate.

To configure the IPsec VPN phase1:

```
config vpn ipsec phase1-interface
    edit "fct-eapcert"
        set type dynamic
        set interface "port5"
        set ike-version 2
        set authmethod signature
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha1 aes256-sha256
        set comments "VPN: fct3459 -- Created by VPN wizard"
        set dhgrp 20
        set eap enable
        set eap-identity send-request
        set eap-cert-auth enable
        set wizard-type dialup-forticlient
        set authusrgrp "local-group"
        set certificate "test1"
        set peer "peer-test3"
        set ipv4-start-ip 3.3.1.1
        set ipv4-end-ip 3.3.1.100
        set dns-mode auto
        set ipv4-split-include "fct3459_split1"
        set save-password enable
        set client-auto-negotiate enable
        set client-keep-alive enable
```

```
    next
end
```

The FortiGate will validate the client certificate based on the eap-cert-auth setting. The following examples show different outcomes from different configuration scenarios.

Scenario 1: eap-cert-auth is enabled and FortiGate receives a valid and trusted certificate

Using IKE debugs, we can observe the steps when FortiGate receives the connection request with the client certificate, validates it, and continues to perform EAP authentication before establishing the VPN connection.

```
# diagnose debug application ike -1
# diagnose debug enable
ike V=root:0:fct-eapcert:11: received FCT-UID : 4E98BCE511844FA8B161FA5DF047B12C

…
```

Checking the IPsec VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
…
```

```
name=fct-eapcert_0 ver=2 serial=6 173.1.1.1:0->10.1.100.111:0 tun_id=3.3.1.1 tun_id6=::10.0.0.5
dst_mtu=1500 dpd-link=on weight=1
bound_if=13 lgwy=static/1 tun=intf mode=dial_inst/3 encap=none/74408 options[122a8]=npu rgwy-chg
frag-rfc  run_state=0 role=primary accept_traffic=1 overlay_id=0
parent=fct-eapcert index=0
proxyid_num=1 child_num=0 refcnt=5 ilast=1 olast=13 ad=/0
stat: rxp=2 txp=97 rxb=16460 txb=53465
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=fct3459 proto=0 sa=1 ref=6 serial=1 add-route
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:3.3.1.1-3.3.1.1:0
…
```

The result shows that the tunnel is established.

Scenario 2: eap-cert-auth is enabled and FortiGate receives an invalid certificate

In this example, a user peer object is used that does not trust the issuer Eternity-CA.

```
# diagnose debug application ike -1
# diagnose debug enable
ke V=root:0:fct-eapcert:9: received FCT-UID : 4E98BCE511844FA8B161FA5DF047B12C
ike V=root:0:fct-eapcert:9: received peer identifier DER_ASN1_DN 'C = CA, ST = BC, L = Burnaby, O
= Fortinet, OU = QA, CN = test3'
ike V=root:0:fct-eapcert:9: re-validate gw ID
ike V=root:0:fct-eapcert:9: gw validation OK
ike V=root:0:fct-eapcert:9: Validating X.509 certificate
ike V=root:0:fct-eapcert:9: peer cert, subject='test3', issuer='Eternity-CA'
ike V=root:0:fct-eapcert:9: peer ID verified
ike V=root:0:fct-eapcert:9: building fnbam peer candidate list
ike V=root:0:fct-eapcert:9: FNBAM_GROUP_NAME candidate 'peer-test3'
ike V=root:0:fct-eapcert:9: certificate validation before eap pending
ike V=root:0:fct-eapcert:9: fnbam cert group matching failed
ike V=root:0:fct-eapcert:9: certificate validation failed
```

The result shows that the tunnel is not established.

Scenario 3: eap-cert-auth is disabled and FortiGate receives an invalid certificate

In this example, eap-cert-auth is disabled, so the incoming peer certificate is not validated.

```
# diagnose debug application ike -1
# diagnose debug enable
ike V=root:0:fct-eapcert:3: received FCT-UID : 4E98BCE511844FA8B161FA5DF047B12C
ike V=root:0:fct-eapcert:3: received peer identifier DER_ASN1_DN 'C = CA, ST = BC, L = Burnaby, O
= Fortinet, OU = QA, CN = test3'
ike V=root:0:fct-eapcert:3: re-validate gw ID
ike V=root:0:fct-eapcert:3: gw validation OK
ike V=root:0:fct-eapcert:3: responder preparing EAP identity request
ike V=root:0:fct-eapcert:3: local cert, subject='test1', issuer='Eternity-CA'
```

```
ike 0:fct-eapcert:3: enc
…
ike V=root:0:fct-eapcert:3: responder received EAP msg
ike V=root:0:fct-eapcert:3: send EAP message to FNBAM
ike V=root:0:fct-eapcert:3: initiating EAP authentication
ike V=root:0:fct-eapcert: EAP user "bi_local"
ike V=root:0:fct-eapcert: auth group local-group
ike V=root:0:fct-eapcert: EAP 1600011502 pending
ike V=root:0:fct-eapcert:3 EAP 1600011502 result FNBAM_CHALLENGED
ike V=root:0:fct-eapcert: EAP challenged for user "bi_local"
ike V=root:0:fct-eapcert:3: responder preparing EAP pass through message
```

Checking the IPsec VPN tunnel list:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
…
name=fct-eapcert_0 ver=2 serial=5 173.1.1.1:0->10.1.100.111:0 tun_id=3.3.1.1 tun_id6=::10.0.0.4
dst_mtu=1500 dpd-link=on weight=1
bound_if=13 lgwy=static/1 tun=intf mode=dial_inst/3 encap=none/74408 options[122a8]=npu rgwy-chg
frag-rfc  run_state=0 role=primary accept_traffic=1 overlay_id=0
parent=fct-eapcert index=0
proxyid_num=1 child_num=0 refcnt=5 ilast=0 olast=0 ad=/0
stat: rxp=641 txp=747 rxb=16325 txb=471587
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=fct3459 proto=0 sa=1 ref=6 serial=1 add-route
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:3.3.1.1-3.3.1.1:0
```

The result shows that the tunnel is established even though the client sent an untrusted certificate.

Aggregate and redundant VPN

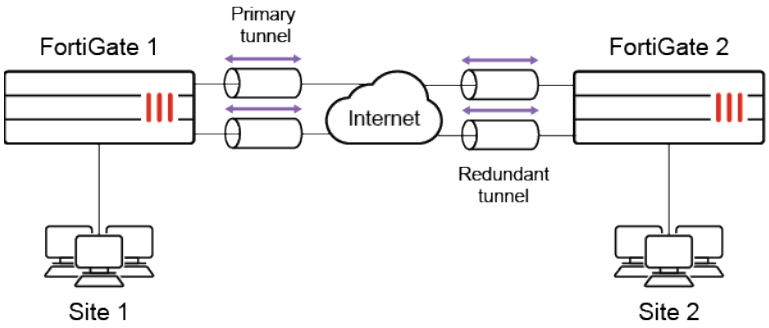
The following topics provide instructions on configuring aggregate and redundant VPNs:

- Manual redundant VPN configuration on page 2430
- OSPF with IPsec VPN for network redundancy on page 2433
- IPsec VPN in an HA environment on page 2440
- Packet distribution and redundancy for aggregate IPsec tunnels on page 2446
- Packet distribution for aggregate dial-up IPsec tunnels using location ID on page 2457
- Packet distribution for aggregate static IPsec tunnels in SD-WAN on page 2462
- Packet distribution for aggregate IPsec tunnels using weighted round robin on page 2467
- Redundant hub and spoke VPN on page 2469

Manual redundant VPN configuration

A FortiGate with two interfaces connected to the internet can be configured to support redundant VPNs to the same remote peer. Four distinct paths are possible for VPN traffic from end to end. If the primary connection fails, the FortiGate can establish a VPN using the other connection.

Topology



The redundant configuration in this example uses route-based VPNs. The FortiGates must operate in NAT mode and use auto-keying.

This example assumes the redundant VPNs are essentially equal in cost and capability. When the original VPN returns to service, traffic continues to use the replacement VPN until the replacement VPN fails. If the redundant VPN uses more expensive facilities, only use it as a backup while the main VPN is down.

A redundant configuration for each VPN peer includes:

- One phase 1 configuration for each path between the two peers with dead peer detection enabled
- One phase 2 definition for each phase 1 configuration
- One static route for each IPsec interface with different distance values to prioritize the routes
- Two firewall policies per IPsec interface, one for each direction of traffic

To configure the phase 1 and phase 2 VPN settings:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. Enter the tunnel name and click *Next*.
3. Enter the following phase 1 settings for path 1:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

4. Configure the remaining phase 1 and phase 2 settings as needed.
5. Click *OK*.

6. Repeat these steps for the remaining paths.
   a. Path 2:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the primary public interface of this peer.
Dead Peer Detection	On-Demand

   b. Path 3:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the primary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

   c. Path 4:

Remote Gateway	Static IP Address
IP Address	Enter the IP address of the secondary interface of the remote peer.
Interface	Select the secondary public interface of this peer.
Dead Peer Detection	On-Demand

To configure the static routes:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. In the *Destination* field, enter the subnet of the private network.
3. For *Interface*, select one of the IPsec interfaces on the local peer.
4. Enter a value for *Administrative Distance*.
5. Click *OK*.
6. Repeat these steps for the three remaining paths, and enter different values for *Administrative Distance* to prioritize the paths.

To configure the firewall policies:

1. Create the policies for the local primary interface:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Name	Enter a name for the policy.
Incoming Interface	Select the local interface to the internal (private) network.
Outgoing Interface	Select one of the virtual IPsec interfaces.
Source	All

Destination	All
Schedule	Always
Service	All
Action	ACCEPT

c. Click *OK*.

d. Click *Create New* and configure the policy for the other direction of traffic:

Name	Enter a name for the policy.
Incoming Interface	Select one of the virtual IPsec interfaces.
Outgoing Interface	Select the local interface to the internal (private) network.
Source	All
Destination	All
Schedule	Always
Service	All
Action	ACCEPT

e. In the policy list, drag the VPN policies above any other policies with similar source and destination addresses.

2. Repeat these steps to create the policies for the three remaining paths.

Creating a backup IPsec interface

A route-based VPN can be configured to act as a backup IPsec interface when the main VPN is out of service. This can only be configured in the CLI.

The backup feature works on interfaces with static addresses that have dead peer detection enabled. The `monitor` option creates a backup VPN for the specified phase 1 configuration.

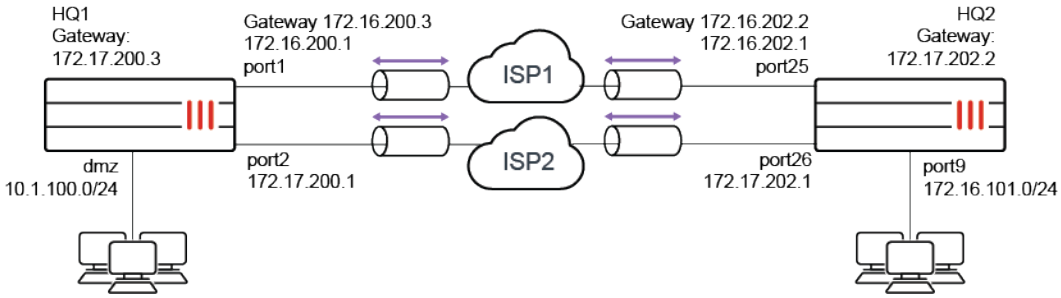
To create a backup IPsec interface:

```
config vpn ipsec phase1-interface
    edit main_vpn
        set dpd on-demand
        set interface port1
        set nattraversal enable
        set psksecret ********
        set remote-gw 192.168.10.8
        set type static
    next
    edit backup_vpn
        set dpd on-demand
        set interface port2
        set monitor main_vpn
```

```
        set nattraversal enable
        set psksecret ********
        set remote-gw 192.168.10.8
        set type static
    next
end
```

OSPF with IPsec VPN for network redundancy

This is a sample configuration of using OSPF with IPsec VPN to set up network redundancy. Route selection is based on OSPF cost calculation. You can configure ECMP or primary/secondary routes by adjusting OSPF path cost.



Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure OSPF with IPsec VPN to achieve network redundancy using the CLI:

1. Configure the WAN interface and static route.
   Each FortiGate has two WAN interfaces connected to different ISPs. The ISP1 link is for the primary FortiGate and the IPS2 link is for the secondary FortiGate.
   a. Configure HQ1.

```
config system interface
   edit "port1"
      set alias to_ISP1
      set ip 172.16.200.1 255.255.255.0
   next
   edit "port2"
      set alias to_ISP2
      set ip 172.17.200.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.200.3
      set device "port1"
   next
   edit 2
      set gateway 172.17.200.3
      set device "port2"
      set priority 100
   next
```

```
end
```

b. Configure HQ2.

```
config system interface
   edit "port25"
      set alias to_ISP1
      set ip 172.16.202.1 255.255.255.0
   next
   edit "port26"
      set alias to_ISP2
      set ip 172.17.202.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.202.2
      set device "port25"
   next
   edit 2
      set gateway 172.17.202.2
      set device "port26"
      set priority 100
   next
end
```

2. Configure the internal (protected subnet) interface.

a. Configure HQ1.

```
config system interface
   edit "dmz"
      set ip 10.1.100.1 255.255.255.0
   next
end
```

b. Configure HQ2.

```
config system interface
   edit "port9"
      set ip 172.16.101.1 255.255.255.0
   next
end
```

3. Configure IPsec phase1-interface and phase-2 interface. On each FortiGate, configure two IPsec tunnels: a primary and a secondary.

a. Configure HQ1.

```
config vpn ipsec phase1-interface
   edit "pri_HQ2"
      set interface "port1"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample1
   next
   edit "sec_HQ2"
      set interface "port2"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.202.1
      set psksecret sample2
```

```
      next
      end
   config vpn ipsec phase2-interface
      edit "pri_HQ2"
         set phase1name "pri_HQ2"
         set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
               chacha20poly1305
         set auto-negotiate enable
      next
      edit "sec_HQ2"
         set phase1name "sec_HQ2"
         set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
               chacha20poly1305
         set auto-negotiate enable
      next
   end
```

b. Configure HQ2.

```
config vpn ipsec phase1-interface
   edit "pri_HQ1"
      set interface "port25"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.200.1
      set psksecret sample1
   next
   edit "sec_HQ1"
      set interface "port26"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.200.1
      set psksecret sample2
   next
end
config vpn ipsec phase2-interface
   edit "pri_HQ1"
      set phase1name "pri_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
      set auto-negotiate enable
   next
   edit "sec_HQ1"
      set phase1name "sec_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
      set auto-negotiate enable
   next
end
```

4. Configure an inbound and outbound firewall policy for each IPsec tunnel.

a. Configure HQ1.

```
config firewall policy
   edit 1
      set name "pri_inbound"
      set srcintf "pri_HQ2"
      set dstintf "dmz"
```

```
            set srcaddr "172.16.101.0"
            set dstaddr "10.1.100.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
        edit 2
            set name "pri_outbound"
            set srcintf "dmz"
            set dstintf "pri_HQ2"
            set srcaddr "10.1.100.0"
            set dstaddr "172.16.101.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
        edit 3
            set name "sec_inbound"
            set srcintf "sec_HQ2"
            set dstintf "dmz"
            set srcaddr "172.16.101.0"
            set dstaddr "10.1.100.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
        edit 4
            set name "sec_outbound"
            set srcintf "dmz"
            set dstintf "sec_HQ2"
            set srcaddr "10.1.100.0"
            set dstaddr "172.16.101.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

b. Configure HQ2.

```
config firewall policy
    edit 1
        set name "pri_inbound"
        set srcintf "pri_HQ1"
        set dstintf "port9"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "pri_outbound"
        set srcintf "port9"
        set dstintf "pri_HQ1"
        set srcaddr "10.1.100.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
```

```
            set service "ALL"
        next
        edit 3
            set name "sec_inbound"
            set srcintf "sec_HQ1"
            set dstintf "port9"
            set srcaddr "10.1.100.0"
            set dstaddr "172.16.101.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
        edit 4
            set name "sec_outbound"
            set srcintf "port9"
            set dstintf "sec_HQ1"
            set srcaddr "172.16.101.0"
            set dstaddr "10.1.100.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

5. Assign an IP address to the IPsec tunnel interface.
   a. Configure HQ1.

```
config system interface
    edit "pri_HQ2"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.2 255.255.255.255
    next
    edit "sec_HQ2"
        set ip 10.10.11.1 255.255.255.255
        set remote-ip 10.10.11.2 255.255.255.255
    next
end
```

   b. Configure HQ2.

```
config system interface
    edit "pri_HQ1"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.1 255.255.255.255
    next
    edit "sec_HQ1"
        set ip 10.10.11.2 255.255.255.255
        set remote-ip 10.10.11.1 255.255.255.255
    next
end
```

6. Configure OSPF.
   a. Configure HQ1.

```
config router ospf
    set router-id 1.1.1.1
    config area
        edit 0.0.0.0
        next
    end
    config ospf-interface
```

```
            edit "pri_HQ2"
               set interface "pri_HQ2"
               set cost 10
               set network-type point-to-point
            next
            edit "sec_HQ2"
               set interface "sec_HQ2"
               set cost 20
               set network-type point-to-point
            next
         end
         config network
            edit 1
               set prefix 10.10.10.0 255.255.255.0
            next
            edit 2
               set prefix 10.10.11.0 255.255.255.0
            next
            edit 3
               set prefix 10.1.100.0 255.255.255.0
            next
         end
      end
```

b. Configure HQ2.

```
      config router ospf
         set router-id 2.2.2.2
         config area
            edit 0.0.0.0
            next
         end
         config ospf-interface
            edit "pri_HQ1"
               set interface "pri_HQ1"
               set cost 10
               set network-type point-to-point
            next
            edit "sec_HQ1"
               set interface "sec_HQ1"
               set cost 20
               set network-type point-to-point
            next
         end
         config network
            edit 1
               set prefix 10.10.10.0 255.255.255.0
            next
            edit 2
               set prefix 10.10.11.0 255.255.255.0
            next
            edit 3
               set prefix 172.16.101.0 255.255.255.0
            next
         end
      end
```

To check VPN and OSPF states using diagnose and get commands:

1. Run the `HQ1 # diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: pri_HQ2
version: 1
interface: port1 11

dec:pkts/bytes=1/68, enc:pkts/bytes=1/136
```

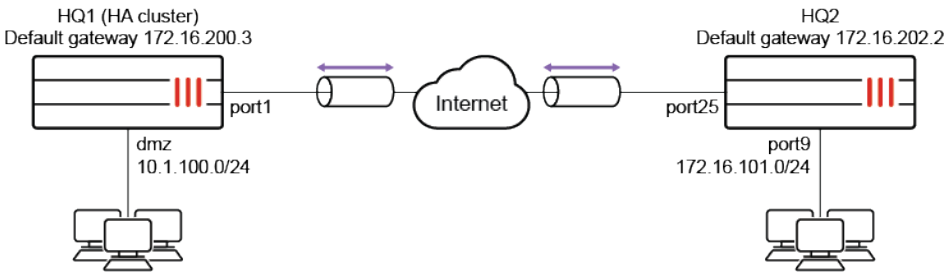
3. Run the `HQ1 # get router info ospf neighbor` command. The system should return the following:
   ```
   OSPF process 0, VRF 0:
   Neighbor ID Pri State Dead Time Address Interface
   2.2.2.2 1. Full/ - 00:00:37 10.10.10.2 pri_HQ2
   2.2.2.2 1. Full/ - 00:00:32 10.10.11.2 sec_HQ2
   ```
4. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:
   ```
   Routing table for VRF=0
   O 172.16.101.0/24 [110/20] via 10.10.10.2, pri_HQ2 , 00:03:21
   ```
   In case the primary tunnel is down after route convergence.
5. Run the `HQ1 # get router info routing-table ospf` command. The system should return the following:
   ```
   Routing table for VRF=0
   O 172.16.101.0/24 [110/110] via 10.10.11.2, sec_HQ2 , 00:00:01
   ```

IPsec VPN in an HA environment

This is a sample configuration of site-to-site IPsec VPN in an HA environment.

For this example, set up HA as described in the HA topics. When setting up HA, enable the following options to ensure IPsec VPN traffic is not interrupted during an HA failover:

- `session-pickup` under HA settings.
- `ha-sync-esp-seqno` under IPsec phase1-interface settings.



You can configure IPsec VPN in an HA environment using the GUI or CLI.

In this example, the VPN name for HQ1 is "to_HQ2", and the VPN name for HQ2 is "to_HQ1".

To configure IPsec VPN in an HA environment in the GUI:

1. Set up IPsec VPN on HQ1 (the HA cluster):
   a. Go to *VPN* > *IPsec Wizard* and configure the following settings for *VPN Setup*:
      i. Enter a VPN name.
      ii. For *Template Type*, select *Site to Site*.
      iii. For *Remote Device Type*, select *FortiGate*.

iv. For *NAT Configuration*, set *No NAT between sites*.
v. Click *Next*.

b. Configure the following settings for *Authentication*:
i. For *Remote Device*, select *IP Address*.
ii. In the *IP address* field, enter *172.16.202.1*.
iii. For *Outgoing Interface*, select port1.
iv. For *Authentication Method*, select *Pre-shared Key*.
v. In the *Pre-shared Key* field, enter an example key.
vi. Click *Next*.

c. Configure the following settings for *Policy & Routing*:
i. From the *Local Interface* dropdown menu, select the local interface.
ii. Configure the *Local Subnets* as *10.1.100.0/24*.
iii. Configure the *Remote Subnets* as *172.16.101.0/24*.
iv. Click *Create*.

2. Set up IPsec VPN on HQ2:
a. Go to *VPN > IPsec Wizard* and configure the following settings for *VPN Setup*:
i. Enter a VPN name.
ii. For *Template Type*, select *Site to Site*.
iii. For *Remote Device Type*, select *FortiGate*.
iv. For *NAT Configuration*, set *No NAT between sites*.
v. Click *Next*.

b. Configure the following settings for *Authentication*:
i. For *Remote Device*, select *IP Address*.
ii. In the *IP address* field, enter 172.16.200.1.
iii. For *Outgoing Interface*, select port13.
iv. For *Authentication Method*, select *Pre-shared Key*.
v. In the *Pre-shared Key* field, enter an example key.
vi. Click *Next*.

c. Configure the following settings for *Policy & Routing*:
i. From the *Local Interface* dropdown menu, select the desired local interface. In this example, it is port9.
ii. Configure the *Local Subnets* as 172.16.101.0.
iii. Configure the *Remote Subnets* as 10.1.100.0
iv. Click *Create*.

To configure IPsec VPN in an HA environment using the CLI:

1. Configure HA. In this example, two FortiGates work in active-passive mode. The HA heartbeat interfaces are WAN1 and WAN2:

```
config system ha
   set group-name "FGT-HA"
   set mode a-p
   set password sample
   set hbdev "wan1" 50 "wan2" 50
   set session-pickup enable
```

```
    set priority 200
    set override-wait-time 10
end
```

2. Configure the WAN interface and default route. The WAN interface is the interface connected to the ISP. It can work in static mode (as shown in this example), DHCP, or PPPoE mode. The IPsec tunnel is established over the WAN interface.
   a. Configure HQ1:
   ```
   config system interface
      edit "port1"
         set vdom "root"
         set ip 172.16.200.1 255.255.255.0
      next
   end
   config router static
      edit 1
         set gateway 172.16.200.3
         set device "port1"
      next
   end
   ```
   b. Configure HQ2:
   ```
   config system interface
      edit "port25"
         set vdom "root"
         set ip 172.16.202.1 255.255.255.0
      next
   end
   config router static
      edit 1
         set gateway 172.16.202.2
         set device "port25"
      next
   end
   ```
3. Configure the internal (protected subnet) interface. The internal interface connects to the corporate internal network. Traffic from this interface routes out the IPsec VPN tunnel.
   a. Configure HQ1:
   ```
   config system interface
      edit "dmz"
         set vdom "root"
         set ip 10.1.100.1 255.255.255.0
      next
   end
   ```
   b. Configure HQ2:
   ```
   config system interface
      edit "port9"
         set vdom "root"
         set ip 172.16.101.1 255.255.255.0
      next
   end
   ```
4. Configure the IPsec phase1-interface. This example uses PSK as the authentication method. You can also use signature authentication.
   a. Configure HQ1:
   ```
   config vpn ipsec phase1-interface
      edit "to_HQ2"
         set interface "port1"
   ```

```
        set peertype any
        set net-device enable
        set ha-sync-esp-seqno enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.202.1
        set psksecret sample
    next
end
```

b. Configure HQ2:

```
config vpn ipsec phase1-interface
    edit "to_HQ1"
        set interface "port25"
        set peertype any
        set net-device enable
        set ha-sync-esp-seqno enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.1
        set psksecret sample
    next
```

5. Configure the IPsec phase2-interface:

a. Configure HQ1:

```
config vpn ipsec phase2-interface
    edit "to_HQ2"
        set phase1name "to_HQ2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
        set auto-negotiate enable
    next
end
```

b. Configure HQ2:

```
config vpn ipsec phase2-interface
    edit "to_HQ1"
        set phase1name "to_HQ1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
        set auto-negotiate enable
    next
end
```

6. Configure static routes. Two static routes are added to reach the remote protected subnet. The blackhole route is important to ensure IPsec traffic does not match the default route when the IPsec tunnel is down.

a. Configure HQ1:

```
config router static
    edit 2
        set dst 172.16.101.0 255.255.255.0
        set device "to_HQ2"
    next
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set blackhole enable
        set distance 254
    next
end
```

b. Configure HQ2:

```
config router static
   edit 2
      set dst 10.1.100.0 255.255.255.0
      set device "to_HQ1"
   next
   edit 3
      set dst 10.1.100.0 255.255.255.0
      set blackhole enable
      set distance 254
   next
end
```

7. Configure two firewall policies to allow bi-directional IPsec traffic flow over the IPsec tunnel:

a. Configure HQ1:

```
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "to_HQ2"
      set dstintf "dmz"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "dmz"
      set dstintf "to_HQ2"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

b. Configure HQ2:

```
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "to_HQ1"
      set dstintf "port9"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "port9"
      set dstintf "to_HQ1"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
```

```
        set service "ALL"
    next
end
```

8. Use the following `diagnose` commands to check IPsec phase1/phase2 interface status including the sequence number on the secondary FortiGate. The `diagnose debug application ike -1` command is the key to troubleshoot why the IPsec tunnel failed to establish.

   a. Run the `HQ1 # diagnose vpn ike gateway list` command. The system should return the following:

```
vd: root/0
name: to_HQ2
version: 1
interface: port1 11
 addr: 172.16.200.1:500 -> 172.16.202.1:500
created: 5s ago
IKE SA: created 1/1 established 1/1 time 0/0/0 ms
IPsec SA: created 2/2 established 2/2 time 0/0/0 ms
   id/spi: 12 6e8d0532e7fe8d84/3694ac323138a024 direction: responder status: established 5-
         5s ago = 0ms proposal: aes128-sha256 key: b3efb46d0d385aff-7bb9ee241362ee8d
         lifetime/rekey: 86400/86124 DPD sent/recv: 00000000/00000000
```

   b. Run the `HQ1 # diagnose vpn tunnel list` command. The system should return the following:

```
list all ipsec tunnel in vd 0

name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1
bound_if=11 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/528 options[0210]=create_dev
      frag-rfc accept_traffic=1
proxyid_num=1 child_num=0 refcnt=11 ilast=7 olast=87 ad=/0
stat: rxp=0 txp=0 rxb=0 txb=0
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=to_HQ2 proto=0 sa=1 ref=2 serial=1 auto-negotiate
   src: 0:0.0.0.0/0.0.0.0:0 dst: 0:0.0.0.0/0.0.0.0:0 SA: ref=3 options=18227 type=00 soft=0
         mtu=1438 expire=42927/0B replaywin=2048
      seqno=1 esn=0 replaywin_lastseq=00000000 itn=0
   life: type=01 bytes=0/0 timeout=42930/43200 dec: spi=ef9ca700 esp=aes key=16
         a2c6584bf654d4f956497b3436f1cfc7
      ah=sha1 key=20 82c5e734bce81e6f18418328e2a11aeb7baa021b
    enc: spi=791e898e esp=aes key=16 0dbb4588ba2665c6962491e85a4a8d5a
      ah=sha1 key=20 2054b318d2568a8b12119120f20ecac97ab730b3
   dec:pkts/bytes=0/0, enc:pkts/bytes=0/0
```

   ESP seqno synced to primary FortiGate every five minutes, and big gap between primary and secondary to ensure that no packet is dropped after HA failover caused by tcp-replay. Check ESP sequence number synced on secondary FortiGate.

   c. Run the `HQ1 # execute ha manage 0 admin` command.

   d. Run the `HQ1-Sec # diagnose vpn tunnel list` command. The system should return the following:

```
list all ipsec tunnel in vd 0

name=to_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1

```

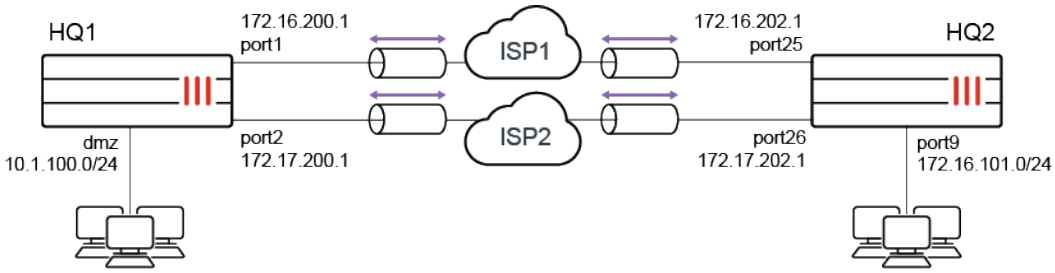
Packet distribution and redundancy for aggregate IPsec tunnels

This is a sample configuration of a multiple site-to-site IPsec VPN that uses an IPsec aggregate interface to set up redundancy and traffic load-balancing. The VPN tunnel interfaces must have `net-device` disabled in order to be members of the IPsec aggregate.

Each FortiGate has two WAN interfaces connected to different ISPs. OSPF runs over the IPsec aggregate in this configuration.

The supported load balancing algorithms are: L3, L4, round-robin (default), weighted round-robin, and redundant. The first four options allow traffic to be load-balanced, while the last option (redundant) uses the first tunnel that is up for all traffic.

Dynamic routing can run on the aggregate interface, and it can be a member interface in SD-WAN (not shown in this configuration).



Configuring the HQ1 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.
5. Configure OSPF.

To create the IPsec tunnels:

1. Go to *VPN > IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter pri_HQ2 and click *Next*.
3. Enter the following:

Phase 1	
IP Address	172.16.202.1
Interface	port1
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.
6. Create another tunnel named sec_HQ2 with the following settings:

Phase 1	
IP Address	172.17.202.1
Interface	port2
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Aggregate*.
2. For *Name*, enter agg_HQ2.
3. Select a load balancing algorithm.

4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ2* and *sec_HQ2*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ2
Outgoing Interface	dmz
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	dmz
Outgoing Interface	agg_HQ2
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network* > *Interfaces* and edit agg_HQ2.
2. For *IP*, enter 10.10.10.1.
3. For *Remote IP/Netmask*, enter 10.10.10.2 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network* > *OSPF*.
2. For *Router ID*, enter 1.1.1.1.

3. In the *Areas* table, click *Create New*.
   a. For *Area ID*, enter 0.0.0.0.
   b. Click *OK*.
4. In the *Networks* table, click *Create New*.
   a. Set the *Area* to *0.0.0.0*.
   b. For *IP/Netmask*, enter 10.1.100.0/24.
   c. Click *OK*.
   d. Click *Create New*.
   e. For *IP/Netmask*, enter 10.10.10.0/24.
   f. Click *OK*.
5. Click *Apply*.

Configuring the HQ2 FortiGate in the GUI

There are five steps to configure the FortiGate:

1. Create the IPsec tunnels.
2. Create the IPsec aggregate.
3. Configure the firewall policies.
4. Configure the aggregate VPN interface IPs.
5. Configure OSPF.

To create the IPsec tunnels:

1. Go to *VPN* > *IPsec Wizard* and select the *Custom* template.
2. For *Name*, enter pri_HQ1 and click *Next*.
3. Enter the following:

Phase 1	
IP Address	172.16.200.1
Interface	port25
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

4. Configure the other settings as needed.
5. Click *OK*.

6. Create another tunnel named sec_HQ1 with the following settings:

Phase 1	
IP Address	172.17.200.1
Interface	port26
Device creation	Disabled
Aggregate member	Enabled
Authentication Method	Pre-shared Key
Pre-shared Key	Enter the secure key
IKE Mode	Aggressive
Peer Options Accept Types	Any peer ID
Phase 2	
Auto-negotiate	Enable

To create the IPsec aggregate:

1. Go to *VPN > IPsec Tunnels* and click *Create New > IPsec Aggregate*.
2. For *Name*, enter agg_HQ1.
3. Select a load balancing algorithm.
4. From the *Tunnel* dropdown, select the tunnels that you created previously (*pri_HQ1* and *sec_HQ1*). If required, enter weights for each tunnel.
5. Click *OK*.

To configure the firewall policies:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create an inbound traffic policy with the following settings:

Name	inbound
Incoming Interface	agg_HQ1
Outgoing Interface	port9
Source	10.1.100.0
Destination	172.16.101.0
Schedule	always
Action	ACCEPT
Service	ALL

3. Click *OK*.
4. Create an outbound traffic policy with the following settings:

Name	outbound
Incoming Interface	port9
Outgoing Interface	agg_HQ1
Source	172.16.101.0
Destination	10.1.100.0
Schedule	always
Action	ACCEPT
Service	ALL

To configure the aggregate VPN interface IPs:

1. Go to *Network* > *Interfaces* and edit agg_HQ1.
2. For *IP*, enter 10.10.10.2.
3. For *Remote IP/Netmask*, enter 10.10.10.1 255.255.255.255.
4. Click *OK*.

To configure OSPF:

1. Go to *Network* > *OSPF*.
2. For *Router ID*, enter 2.2.2.2.
3. In the *Areas* table, click *Create New*.
   a. For *Area ID*, enter 0.0.0.0.
   b. Click *OK*.
4. In the *Networks* table, click *Create New*.
   a. Set the *Area* to *0.0.0.0*.
   b. For *IP/Netmask*, enter 172.16.101.0/24.
   c. Click *OK*.
   d. Click *Create New*.
   e. For *IP/Netmask*, enter 10.10.10.0/24.
   f. Click *OK*.
5. Click *Apply*.

Monitoring the traffic in the GUI

To monitor the traffic:

1. Go to *Dashboard* > *Network* , hover over the *IPsec* widget, then click *Expand to Full Screen*.
2. Expand the aggregate tunnel in the table to view statistics for each aggregate member.

Configuring the HQ1 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.
5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port1, port2, and dmz as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
   edit "pri_HQ2"
      set interface "port1"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample1
   next
   edit "sec_HQ2"
      set interface "port2"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.202.1
      set psksecret sample2
   next
   end
config vpn ipsec phase2-interface
   edit "pri_HQ2"
      set phase1name "pri_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
      set auto-negotiate enable
   next
   edit "sec_HQ2"
      set phase1name "sec_HQ2"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
      set auto-negotiate enable
   next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
   edit "agg_HQ2"
      set member "pri_HQ2" "sec_HQ2"
   next
end
```

To configure the firewall policies:

```
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "agg_HQ2"
      set dstintf "dmz"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "dmz"
      set dstintf "agg_HQ2"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
   edit "agg_HQ2"
      set ip 10.10.10.1 255.255.255.255
      set remote-ip 10.10.10.2 255.255.255.255
   next
end
```

To configure OSPF:

```
config router ospf
   set router-id 1.1.1.1
   config area
      edit 0.0.0.0
      next
   end
   config network
      edit 1
         set prefix 10.1.100.0 255.255.255.0
      next
      edit 2
         set prefix 10.10.10.0 255.255.255.0
```

```
      next
   end
end
```

Configuring the HQ2 FortiGate in the CLI

There are six steps to configure the FortiGate:

1. Configure the interfaces.
2. Configure two IPsec phase 1 and phase 2 interfaces.
3. Configure the IPsec aggregate.
4. Configure the firewall policies.
5. Configure the aggregate VPN interface IPs.
6. Configure OSPF.

To configure the interfaces:

1. Configure port25, port26, and port9 as shown in the topology diagram.

To configure two IPsec phase 1 and phase 2 interfaces:

```
config vpn ipsec phase1-interface
   edit "pri_HQ1"
      set interface "port25"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.200.1
      set psksecret sample1
   next
   edit "sec_HQ1"
      set interface "port26"
      set peertype any
      set net-device disable
      set aggregate-member enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.17.200.1
      set psksecret sample2
   next
end
config vpn ipsec phase2-interface
   edit "pri_HQ1"
      set phase1name "pri_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
      set auto-negotiate enable
   next
   edit "sec_HQ1"
      set phase1name "sec_HQ1"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
      set auto-negotiate enable
```

```
   next
end
```

To configure the IPsec aggregate:

```
config system ipsec-aggregate
   edit "agg_HQ1"
      set member "pri_HQ1" "sec_HQ1"
   next
end
```

To configure the firewall policies:

```
config firewall policy
   edit 1
      set name "inbound"
      set srcintf "agg_HQ1"
      set dstintf "port9"
      set srcaddr "10.1.100.0"
      set dstaddr "172.16.101.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
   edit 2
      set name "outbound"
      set srcintf "port9"
      set dstintf "agg_HQ1"
      set srcaddr "172.16.101.0"
      set dstaddr "10.1.100.0"
      set action accept
      set schedule "always"
      set service "ALL"
   next
end
```

To configure the aggregate VPN interface IPs:

```
config system interface
   edit "agg_HQ1"
      set ip 10.10.10.2 255.255.255.255
      set remote-ip 10.10.10.1 255.255.255.255
   next
end
```

To configure OSPF:

```
config router ospf
   set router-id 2.2.2.2
   config area
      edit 0.0.0.0
      next
   end
   config network
      edit 1
         set prefix 172.16.101.0 255.255.255.0
```

```
      next
      edit 2
         set prefix 10.10.10.0 255.255.255.0
      next
   end
end
```

Monitoring the traffic in the CLI

To view debugging information:

1. Verify the status of the phase 1 IKE SAs:

```
# diagnose vpn ike gateway list
vd: root/0
name: pri_HQ2
version: 1
interface: port1 11
addr: 172.16.200.1:500 -> 172.16.202.1:500
 tun_id: 172.16.202.1
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms
   id/spi: 173 dcdede154681579b/e32f4c48c4349fc0 direction: responder status: established 1498-
         1498s ago = 10ms proposal: aes128-sha256 key: d7230a68d7b83def-588b94495cfa9d38
         lifetime/rekey: 86400/84631 DPD sent/recv: 0000000d/00000006
vd: root/0
name: sec_HQ2
version: 1
interface: port2 12
addr: 172.17.200.1:500 -> 172.17.202.1:500
created: 1520s ago
IKE SA: created 1/2 established 1/1 time 10/10/10 ms
IPsec SA: created 2/2 established 1/1 time 0/0/0 ms
   id/spi: 174 a567bd7bf02a04b5/4251b6254660aee2 direction: responder status: established 1498-
         1498s ago = 10ms proposal: aes128-sha256 key: 9f44f500c28d8de6-febaae9d1e6a164c
         lifetime/rekey: 86400/84631 DPD sent/recv: 00000008/0000000c
```

2. Verify the phase 2 IPsec tunnel SAs:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
name=sec_HQ2 ver=1 serial=2 172.17.200.1:0->172.17.202.1:0 tun_id=172.17.202.1
bound_if=5 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/512 options[0200]=frag-rfc run_
      state=1 accept_traffic=1
proxyid_num=1 child_num=0 refcnt=7 ilast=5 olast=5 ad=/0
stat: rxp=39 txp=40 rxb=5448 txb=2732
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=15

```

```
   dec:pkts/bytes=39/2796, enc:pkts/bytes=40/5456
name=pri_HQ2 ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1
bound_if=11 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/512 options[0200]=frag-rfc run_
      state=1 accept_traffic=1
proxyid_num=1 child_num=0 refcnt=5 ilast=15 olast=15 ad=/0
stat: rxp=38 txp=39 rxb=5152 txb=2768
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=20
natt: mode=none draft=0 interval=0 remote_port=0
proxyid=pri_HQ2 proto=0 sa=1 ref=2 serial=2 auto-negotiate
   src: 0:0.0.0.0/0.0.0.0:0 dst: 0:0.0.0.0/0.0.0.0:0 SA: ref=3 options=18227 type=00 soft=0
        mtu=1438 expire=41231/0B replaywin=2048
      seqno=28 esn=0 replaywin_lastseq=00000027 itn=0
   life: type=01 bytes=0/0 timeout=42900/43200 dec: spi=1071b4f8 esp=aes key=16
        142cce377b3432ba41e64128ade6848c
      ah=sha1 key=20 20e64947e2397123f561584321adc0e7aa0c342d
   enc: spi=ec89b7ed esp=aes key=16 2ec13622fd60dacce3d28ebe5fe7ab14
      ah=sha1 key=20 c1787497508a87f40c73c0db0e835c70b3c3f42d
   dec:pkts/bytes=38/2568, enc:pkts/bytes=39/5432
```

3. Debug the IPsec aggregation list:

```
# diagnose sys ipsec-aggregate list
agg_HQ2 algo=RR member=2 run_tally=2
members:
   pri_HQ2
   sec_HQ2
```

4. Verify the OSPF neighbor information:

```
# get router info ospf neighbor
OSPF process 0, VRF 0:
Neighbor ID Pri State Dead Time Address Interface
2.2.2.2 1. Full/ - 00:00:34 10.10.10.2 agg1_HQ2
```

5. Verify the OSPF routing table:

```
# get router info routing-table ospf
Routing table for VRF=0
O 172.16.101.0/24 [110/20] via 10.10.10.2, agg1_HQ2 , 00:18:43
```

Packet distribution for aggregate dial-up IPsec tunnels using location ID

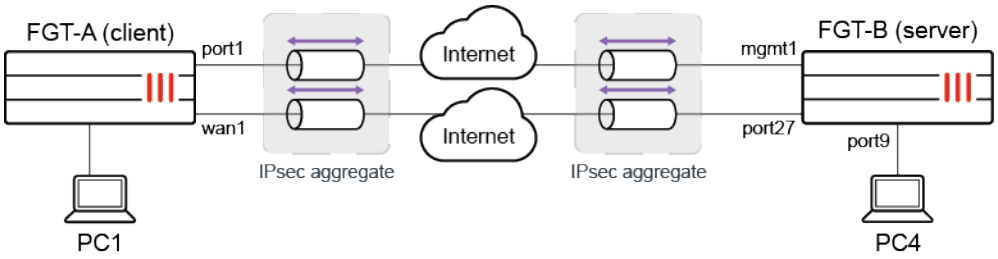
To support per-packet load balancing on aggregate dial-up IPsec tunnels between sites, each spoke must be configured with a location ID. On the hub, per-packet load balancing is performed on the tunnels in the IPsec aggregate that have the same location ID.

Multiple dial-up VPN tunnels from the same location can be aggregated on the VPN hub and load balanced based on the configured load balance algorithm.

IPsec traffic cannot be offloaded to the NPU.

Example

In this example, an IPsec aggregate tunnel is formed between two dial-up IPsec tunnels in order to support per-packet load balancing.



To configure the client FortiGate (FGT-A):

1. Configure the IPsec tunnels:

```
config vpn ipsec phase1-interface
    edit "client1"
        set interface "port1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 172.16.200.4
        set psksecret **********
    next
    edit "client2"
        set interface "wan1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
    edit "agg1"
        set member "client1" "client2"
    next
end
```

3. Configure the location ID:

```
config system settings
    set location-id 1.1.1.1
end
```

To configure the server FortiGate (FGT-B):

1. Configure the IPsec tunnels:

```
config vpn ipsec phase1-interface
    edit "server1"
        set type dynamic
        set interface "mgmt1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret ***********
        set dpd-retryinterval 60
    next
    edit "server2"
        set type dynamic
        set interface "port27"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret **********
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "server1"
        set phase1name "server1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
    edit "server2"
        set phase1name "server2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

2. Configure an aggregate of the IPsec tunnels:

```
config system ipsec-aggregate
    edit "server"
        set member "server1" "server2"
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
```

```
        set srcintf "server"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To check the IPsec tunnel and aggregate state:

1. List all of the VPN tunnels:

```
FGDocs # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=server1 ver=1 serial=1 172.16.200.4:500->0.0.0.0:500 tun_id=1.0.0.0 dst_mtu=0 dpd-link=on

```

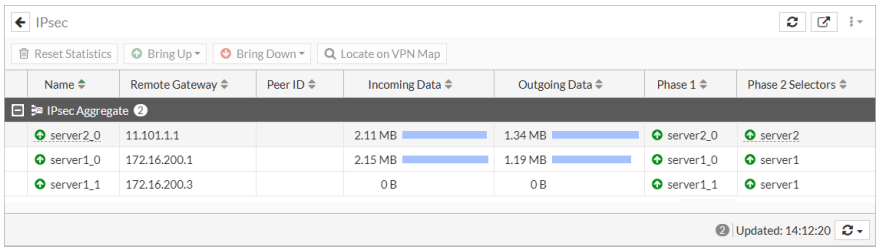
2. List the IPsec aggregate members:

```
# diagnose sys ipsec-aggregate list
server
members(3):
        server1_1
        server1_0
        server2_0
```

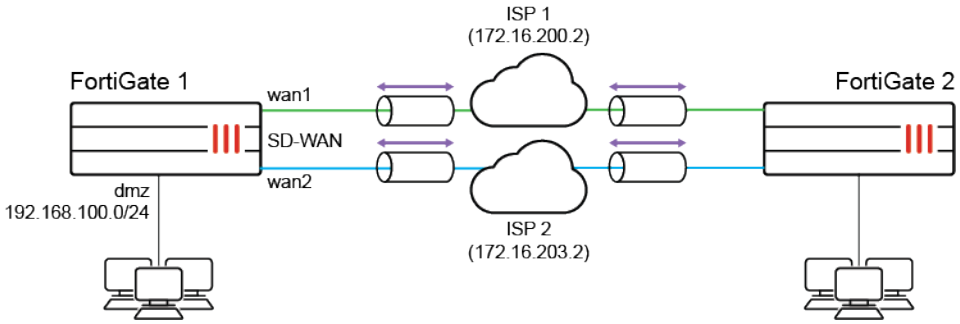
3. In the GUI, go to *Dashboard* > *Network* and expand the *IPsec* widget to review the traffic distributed over the aggregate members:



Packet distribution for aggregate static IPsec tunnels in SD-WAN

This is a sample configuration of aggregating IPsec tunnels by using per-packet load-balancing.

For example, a customer has two ISP connections, wan1 and wan2. On each FortiGate, two IPsec VPN interfaces are created. Next, an `ipsec-aggregate` interface is created and added as an SD-WAN member.



Configuring FortiGate 1

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.201.2
        set psksecret ftnt1234
    next
    edit "vd1-p2"
        set interface "wan2"
        set peertype any
        set net-device disable
        set aggregate-member enable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.202.2
        set psksecret ftnt1234
    next
end
```

```
config vpn ipsec phase2-interface
    edit "vd1-p1"
        set phase1name "vd1-p1"
    next
    edit "vd1-p2"
        set phase1name "vd1-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg1"
        set member "vd1-p1" "vd1-p2"
        set algorithm L3
    next
end
```

```
config system interface
    edit "agg1"
        set vdom "root"
        set ip 172.16.11.1 255.255.255.255
        set allowaccess ping
```

```
        set remote-ip 172.16.11.2 255.255.255.255
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "agg1"
            set gateway 172.16.11.2
        next
    end
end
```

Configuring FortiGate 2

To create two IPsec VPN interfaces:

```
config vpn ipsec phase1-interface
    edit "vd2-p1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.200.1
        set psksecret ftnt1234
    next
    edit "vd2-p2"
        set interface "wan2"
        set peertype any
        set net-device disable
```

```
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 172.16.203.1
        set psksecret ftnt1234
    next
end
```

```
config vpn ipsec phase2-interface
    edit "vd2-p1"
        set phase1name "vd2-p1"
    next
    edit "vd2-p2"
        set phase1name "vd2-p2"
    next
end
```

To create an IPsec aggregate interface:

```
config system ipsec-aggregate
    edit "agg2"
        set member "vd2-p1" "vd2-p2"
        set algorithm L3
    next
end
```

```
config system interface
    edit "agg2"
        set vdom "root"
        set ip 172.16.11.2 255.255.255.255
        set allowaccess ping
        set remote-ip 172.16.11.1 255.255.255.255
    next
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf ""virtual-wan-link""
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "agg2"
            set gateway 172.16.11.1
        next
    end
end
```

Related diagnose commands

To display aggregate IPsec members:

```
# diagnose sys ipsec-aggregate list
agg1 algo=L3 member=2 run_tally=2
members:
        vd1-p1
        vd1-p2
```

To check the VPN status:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=vd1-p1 ver=1 serial=2 172.16.200.1:0->172.16.201.2:0 tun_id=172.16.201.2 dst_mtu=0

```

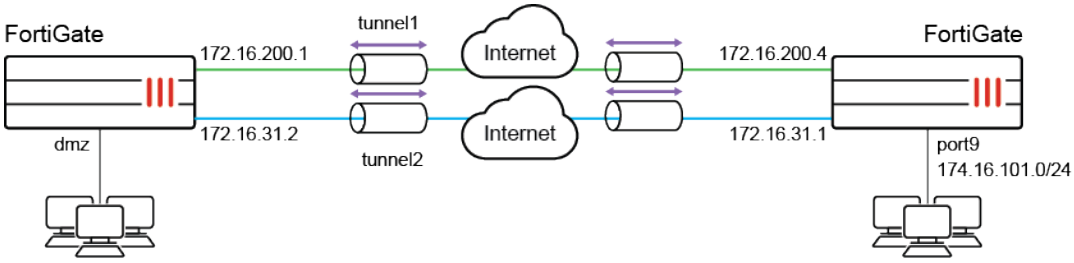
Packet distribution for aggregate IPsec tunnels using weighted round robin

A weighted round robin algorithm can be used for IPsec aggregate tunnels to distribute traffic by the weight of each member tunnel.

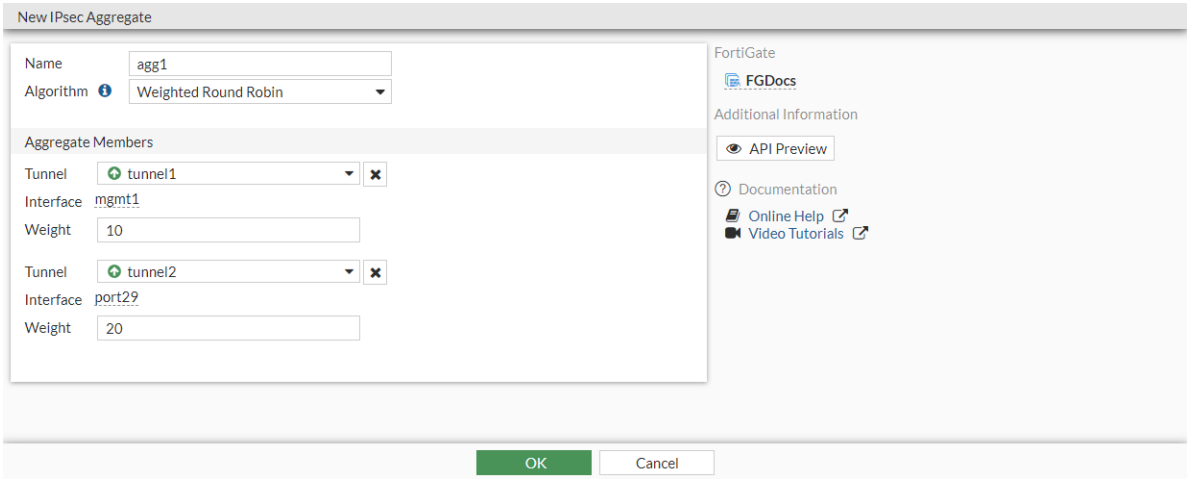
In this example, the FortiGate has two IPsec tunnels put into IPsec aggregate. Traffic is distributed among the members, with one third over *tunnel1*, and two thirds over *tunnel2*. To achieve this, the weighted round robin algorithm is selected, *tunnel1* is assigned a weight of 10, and *tunnel2* is assigned a weight of 20.



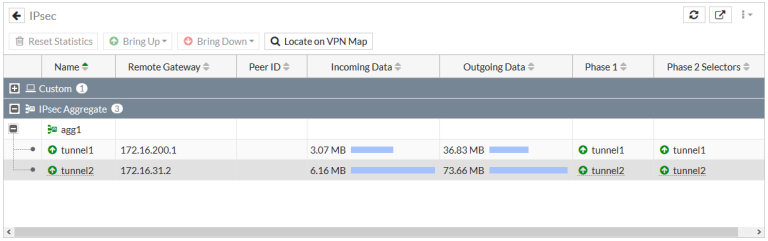
To create the IPsec aggregate in the GUI:

1. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Tunnel*.
2. Complete the wizard to create the *tunnel1* and *tunnel2* custom IPsec tunnels. Ensure that *Aggregate member* is *Enabled* for each tunnel under the *Network* > *Advanced* section.
3. Go to *VPN* > *IPsec Tunnels* and click *Create New* > *IPsec Aggregate*.
4. Enter a name for the aggregate, such as *agg1*, and ensure that *Algorithm* is *Weighted Round Robin*.
5. Add *tunnel1* as an aggregate members, and set *Weight* to *10*.

6. Add *tunnel2* as a second aggregate members, and set its *Weight* to *20*.



7. Click *OK*.
8. To view and monitor the aggregate tunnel statistics, go to the *IPsec* widget on the *Network* dashboard.



To create the IPsec aggregate in the CLI:

1. Create the *tunnel1* and *tunnel2* custom IPsec tunnels with aggregate-member enabled and aggregate-weight set for both tunnels:

```
config vpn ipsec phase1-interface
    edit "tunnel1"
        ...
        set aggregate-member enable
        set aggregate-weight 10
        ...
    next
    edit "tunnel2"
        ...
        set aggregate-member enable
        set aggregate-weight 20
        ...
    next
end
```

2. Create the IPsec aggregate:

```
config system ipsec-aggregate
    edit "agg1"
        set member "tunnel1" "tunnel2"
```

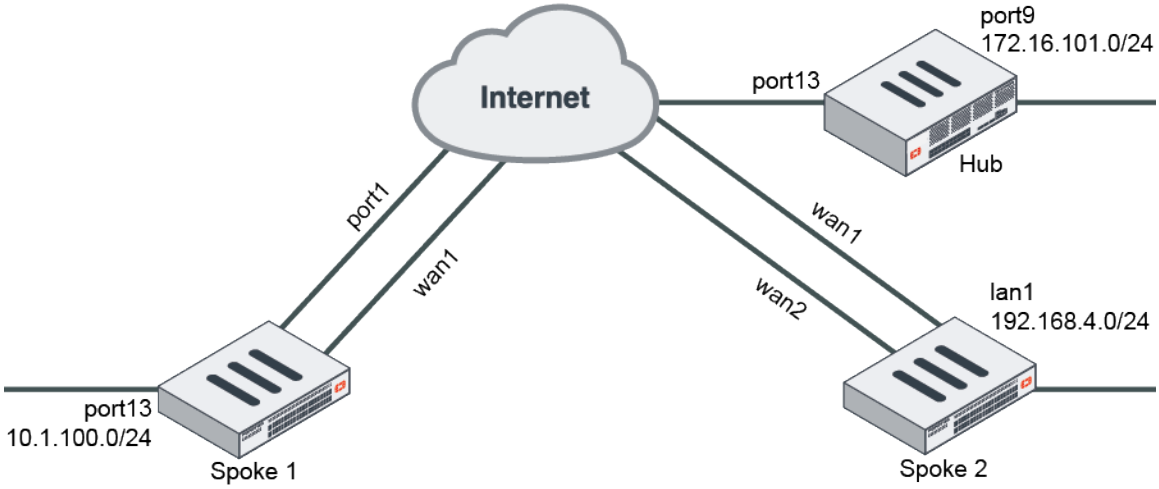
```
        set algorithm weighted-round-robin
    next
end
```

Redundant hub and spoke VPN

A redundant hub and spoke configuration allows VPN connections to radiate from a central FortiGate unit (the hub) to multiple remote peers (the spokes). Traffic can pass between private networks behind the hub and private networks behind the remote peers. Traffic can also pass between remote peer private networks through the hub.

This is a sample configuration of hub and spoke IPsec VPN. The following applies for this scenario:

- The spokes have two WAN interfaces and two IPsec VPN tunnels for redundancy.
- The secondary VPN tunnel is up only when the primary tunnel is down by dead peer detection.



Because the GUI can only complete part of the configuration, we recommend using the CLI.

To configure redundant hub and spoke VPN using the FortiOS CLI:

1. Configure the hub.
   a. Configure the WAN, internal interface, and static route.

```
config system interface
   edit "port13"
      set alias "WAN"
      set ip 172.16.202.1 255.255.255.0
   next
   edit "port9"
      set alias "Internal"
      set ip 172.16.101.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.202.2
      set device "port13"
```

```
    next
end
```

b. Configure the IPsec phase1-interface and phase2-interface.

```
config vpn ipsec phase1-interface
    edit "hub"
        set type dynamic
        set interface "port13"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set dpd on-idle
        set psksecret sample
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "hub"
        set phase1name "hub"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
            chacha20poly1305
    next
end
```

c. Configure the firewall policy.

```
config firewall policy
    edit 1
        set name "spoke-hub"
        set srcintf "hub"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke-spoke"
        set srcintf "hub"
        set dstintf "hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

2. Configure the spokes.

a. Configure the WAN, internal interface, and static route.

i. Configure Spoke1.

```
config system interface
    edit "port1"
        set ip 172.16.200.1 255.255.255.0
    next
    edit "wan1"
        set mode dhcp
        set distance 10
```

```
      set priority 100
   next
   edit "dmz"
      set ip 10.1.100.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.200.2
      set device "port1"
   next
end
```

ii. Configure Spoke2.

```
config system interface
   edit "wan1"
      set ip 172.16.200.3 255.255.255.0
   next
   edit "wan2"
      set mode dhcp
      set distance 10
      set priority 100
   next
   edit "lan1"
      set ip 192.168.4.1 255.255.255.0
   next
end
config router static
   edit 1
      set gateway 172.16.200.2
      set device "wan1"
   next
end
```

b. Configure IPsec phase1-interface and phase2-interface.

i. Configure Spoke1.

```
config vpn ipsec phase1-interface
   edit "primary"
      set interface "port1"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample
      next
   edit "secondary"
      set interface "wan1"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set monitor "primary"
      set psksecret sample
      next
end
config vpn ipsec phase2-interface
   edit "primary"
      set phase1name "primary"
```

```
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 10.1.100.0 255.255.255.0
   next
   edit "secondary"
      set phase1name "secondary"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 10.1.100.0 255.255.255.0
   next
end
```

ii. Configure Spoke2.

```
config vpn ipsec phase1-interface
   edit "primary"
      set interface "wan1"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set psksecret sample
      next
   edit "secondary"
      set interface "wan2"
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set remote-gw 172.16.202.1
      set monitor "primary"
      set psksecret sample
      next
end
config vpn ipsec phase2-interface
   edit "primary"
      set phase1name "primary"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 192.168.4.0 255.255.255.0
   next
   edit "secondary"
      set phase1name "secondary"
      set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
            aes256gcm chacha20poly1305
      set auto-negotiate enable
      set src-subnet 192.168.4.0 255.255.255.0
   next
end
```

c. Configure the firewall policy.

i. Configure Spoke1.

```
config firewall policy
   edit 1
      set srcintf "dmz"
      set dstintf "primary" "secondary"
      set srcaddr "10.1.100.0"
```

```
            set dstaddr "172.16.101.0"
            set action accept
            set schedule "always"
            set service "ALL"
        next
    end
```

ii. Configure Spoke2.

```
config firewall policy
    edit 1
        set srcintf "lan1"
        set dstintf "primary" "secondary"
        set srcaddr "192.168.4.0"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the static route.

i. Configure Spoke1.

```
config router static
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set distance 1
        set device "primary"
    next
    edit 4
        set dst 172.16.101.0 255.255.255.0
        set distance 3
        set device "secondary"
    next
end
```

ii. Configure Spoke2.

```
config router static
    edit 3
        set dst 172.16.101.0 255.255.255.0
        set distance 1
        set device "primary"
    next
    edit 4
        set dst 172.16.101.0 255.255.255.0
        set distance 3
        set device "secondary"
    next
end
```

3. Run `diagnose` and `get` commands.

a. Run the `Spoke1 # diagnose vpn tunnel list` command. The system should return the following:

```
name=primary ver=1 serial=1 172.16.200.1:0->172.16.202.1:0 tun_id=172.16.202.1

      src: 0:10.1.100.0/255.255.255.0:0 dst: 0:0.0.0.0/0.0.0.0:0
```

b. Run the `Spoke1 # get router info routing-table static` command. The system should return the following:

```
Routing table for VRF=0
.................
S 172.16.101.0/24 [1/0] is directly connected, primary
```

ADVPN

Auto-Discovery VPN (ADVPN) allows the central hub to dynamically inform spokes about a better path for traffic between two spokes.

The following topics provide instructions on configuring ADVPN:

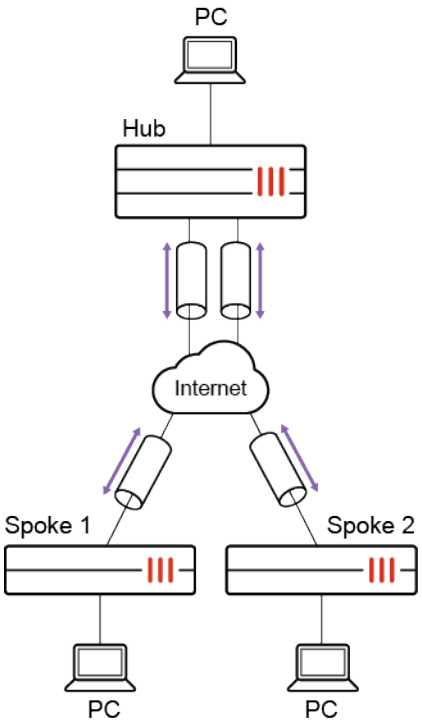
- IPsec VPN wizard hub-and-spoke ADVPN support on page 2474
- ADVPN with BGP as the routing protocol on page 2478
- ADVPN with OSPF as the routing protocol on page 2488
- ADVPN with RIP as the routing protocol on page 2498
- UDP hole punching for spokes behind NAT on page 2508

IPsec VPN wizard hub-and-spoke ADVPN support

When using the IPsec VPN wizard to create a hub and spoke VPN, multiple local interfaces can be selected. At the end of the wizard, changes can be reviewed, real-time updates can be made to the local address group and tunnel interface, and easy configuration keys can be copied for configuring the spokes.

When editing a VPN tunnel, the Hub & Spoke Topology section provides access to the easy configuration keys for the spokes, and allows you to add more spokes.

This example shows the configuration of a hub with two spokes.



To configure the hub:

1. Go to *VPN* > *IPsec Wizard*.
2. Go through the steps of the wizard:
   a. *VPN Setup*:

Name	hub
Template Type	Hub-and-Spoke
Role	Hub

   b. *Authentication*:

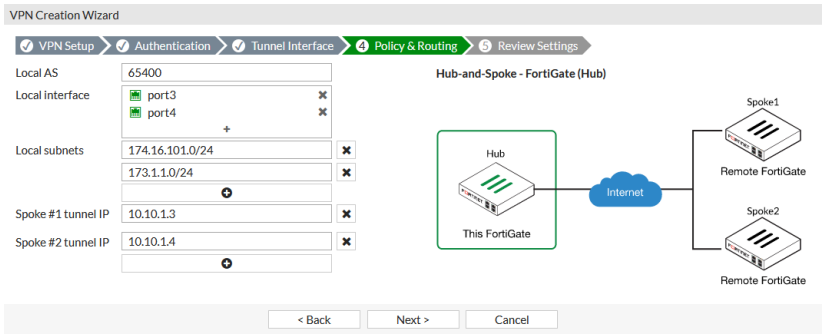
Incoming Interface	port1
Authentication method	Pre-shared Key
Pre-shared key	<key>

c. *Tunnel Interface*:

Tunnel IP	10.10.1.1
Remote IP/netmask	10.10.1.2/24

d. *Policy & Routing*:
Multiple local interfaces and subnets can be configured.

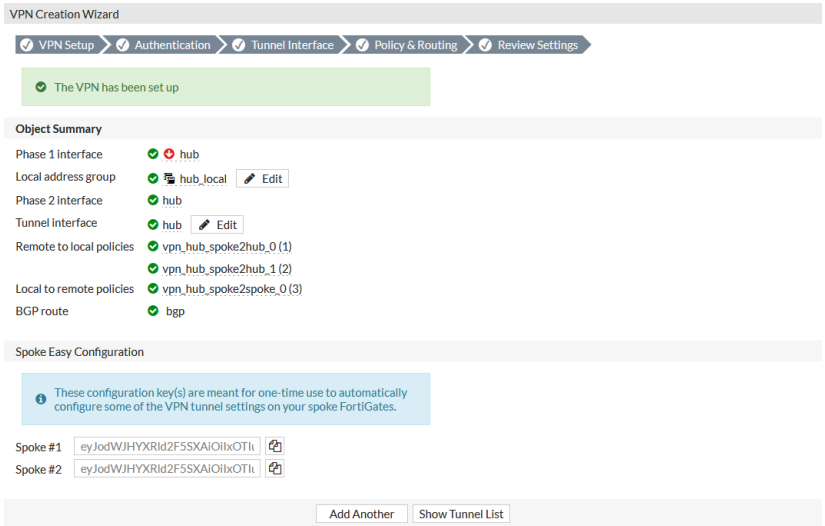
Local AS	65400
Local interface	port3 port4
Local subnets	174.16.101.0/24 173.1.1.0/24
Spoke #1 tunnel IP	10.10.1.3
Spoke #2 tunnel IP	10.10.1.4



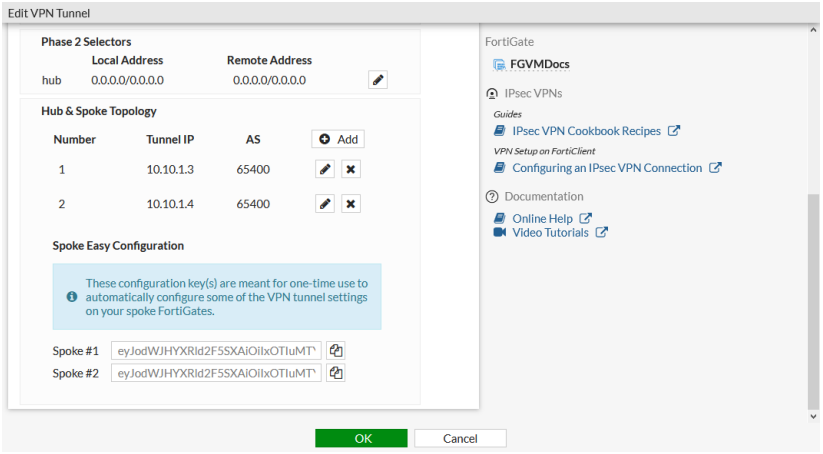
e. *Review Settings*:
Confirm that the settings look correct, then click *Create*.

3. The summary shows details about the set up hub:

- The *Local address group* and *Tunnel interface* can be edited directly on this page.
- Spoke easy configuration keys can be used to quickly configure the spokes.



4. Click *Show Tunnel List* to go to *VPN > IPsec Tunnels*.
5. Edit the VPN tunnel to add more spokes and to copy the spokes' easy configuration keys.

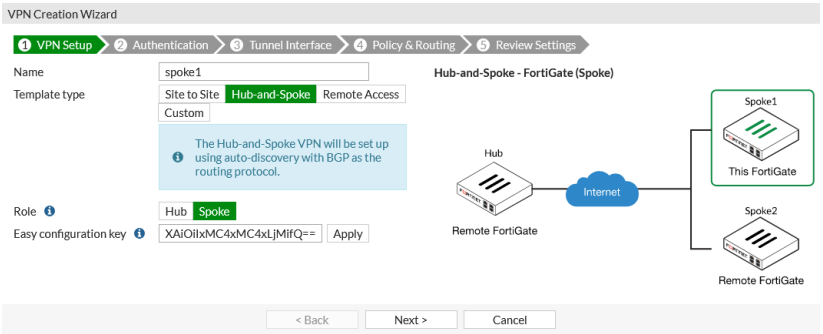


To configure the spokes:

1. Go to *VPN > IPsec Wizard*.
2. On the *VPN Setup* page of the wizard, enter the following:

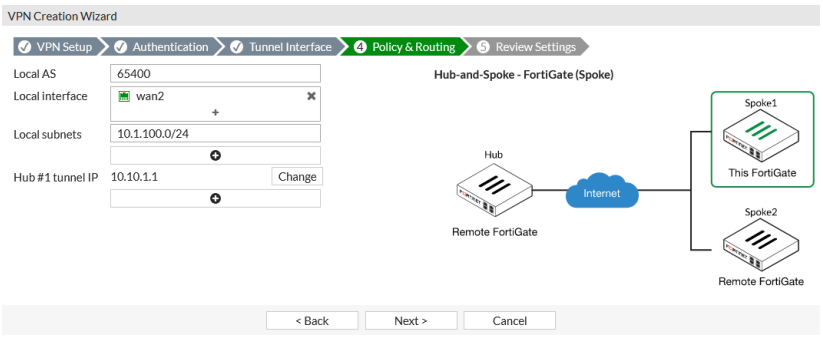
Name	spoke1
Template Type	Hub-and-Spoke
Role	Spoke

3. In the *Easy configuration key* field, paste the *Spoke #1* key from the hub FortiGate, click *Apply*, then click *Next*.



4. Adjust the *Authentication* settings as required, enter the *Pre-shared key*, then click *Next*.
5. Adjust the *Tunnel Interface* settings as required, then click *Next*.
6. Configure the *Policy & Routing* settings, then click *Next*:

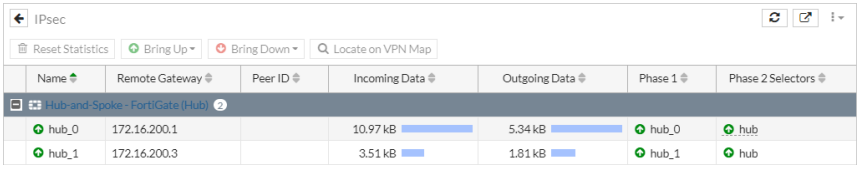
Local interface	wan2
Local subnets	10.1.100.0/24



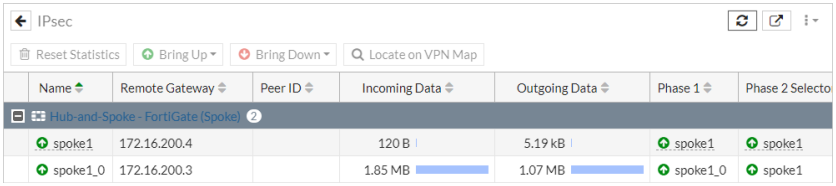
7. Review the settings, then click *Create*.
8. The summary shows details about the set up spoke. The *Local address group* and *Tunnel interface* can be edited directly on this page.
9. Follow the same steps to configure the second spoke.

To check that the tunnels are created and working:

1. On the hub FortiGate, go to *Dashboard* > *Network* and expand the IPsec widget.
   The tunnels to the spokes are established.



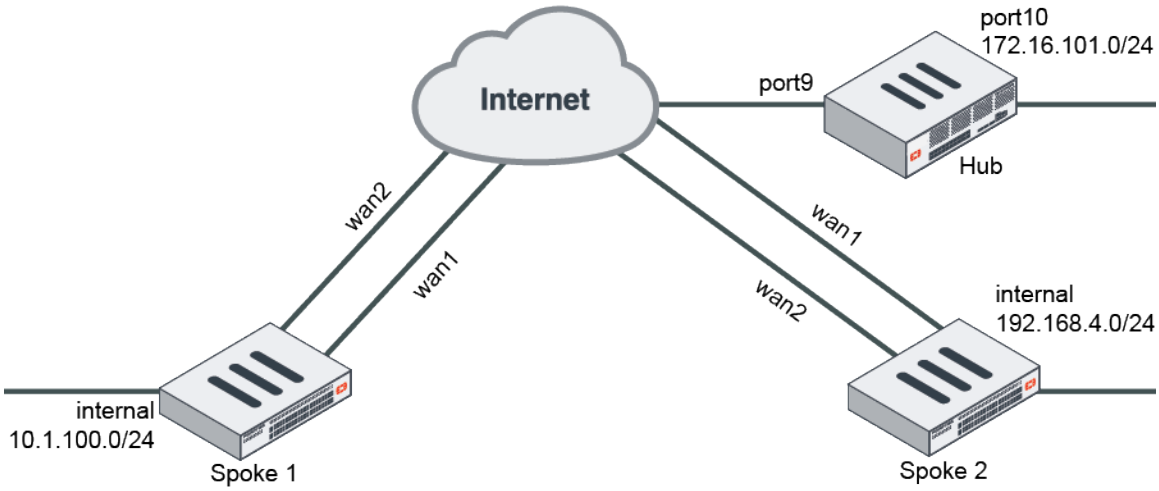
2. On a spoke, go to *Dashboard* > *Network* and expand the IPsec widget.
   The tunnel to the hub and the spoke to spoke shortcut are established.



ADVPN with BGP as the routing protocol

This is a sample configuration of ADVPN with BGP as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- IBGP must be used between the hub and spoke FortiGates.
- `bgp neighbor-group/neighbor-range` must be reused.



To configure ADVPN with BGP as the routing protocol using the CLI:

1. Configure hub FortiGate WAN interface, internal interface, and a static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-
sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
```

```
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-
sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's BGP:

```
config router bgp
    set as 65412
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65412
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.10.0 255.255.255.0
            set neighbor-group "advpn"
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end
```

3. Configure the spoke FortiGates:
   a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:
      i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

      ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
```

```
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
```

```
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
```

```
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' BGP:

i. Configure Spoke1:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
```

```
    end
end
```

ii. Configure Spoke2:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.10.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and BGP states:

a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1
bound_if=7 lgwy=static/1 tun=intf/0 mode=auto/1 encap=none/536 options[0218]=npu create_
dev frag-rfc  accept_traffic=1

proxyid_num=1 child_num=1 refcnt=19 ilast=1 olast=1 ad=r/2
stat: rxp=1 txp=160 rxb=16428 txb=8969

```

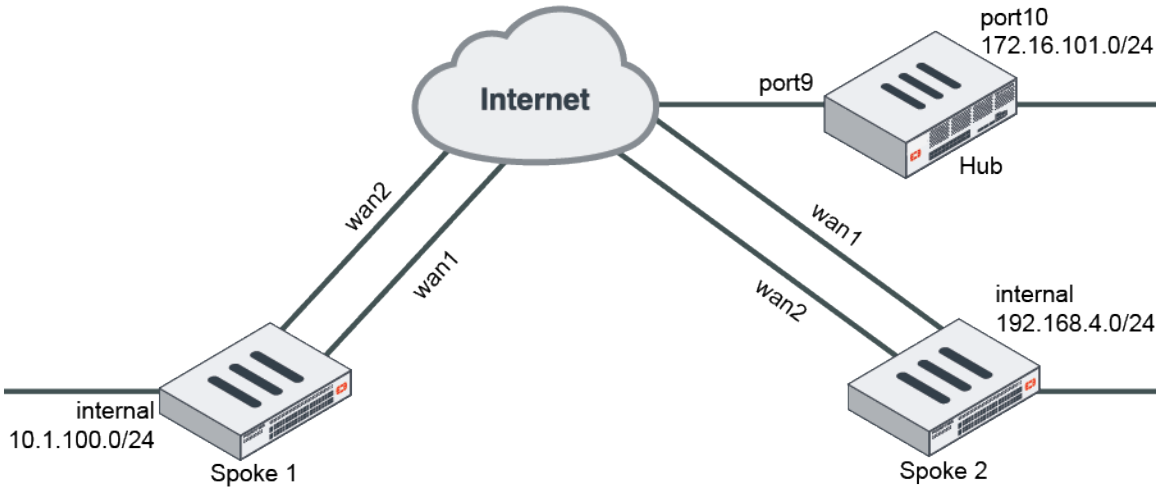
e. Run the `get router info routing-tale bgp` command. The system should return the following:

```
Routing table for VRF=0
B       172.16.101.0/24 [200/0] via 10.10.10.254, spoke1, 00:23:57
B       192.168.4.0/24 [200/0] via 10.10.10.3, spoke1_0 , 00:22:03
```

ADVPN with OSPF as the routing protocol

This is a sample configuration of ADVPN with OSPF as the routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device enable` must be run.
- OSPF must be used between the hub and spoke FortiGates.



To configure ADVPN with OSPF as the routing protocol using the CLI:

1. Configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-
sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
```

```
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-
sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's OSPF:

```
config router ospf
    set router-id 1.1.1.1
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 172.16.101.0 255.255.255.0
        next
    end
end
```

3. Configure the spoke FortiGates:
   a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:
      i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

      ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 13.1.1.2 255.255.255.0
```

```
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
```

```
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
        set phase1name "spoke2_backup"
```

```
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
```

```
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' OSPF:

i. Configure Spoke1:

```
config router ospf
    set router-id 7.7.7.7
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router ospf
    set router-id 8.8.8.8
    config area
        edit 0.0.0.0
        next
    end
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

4. Run `diagnose` and `get` commands on Spoke1 to check VPN and OSPF states:
   a. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0

```

```
src: 0:0.0.0.0/0.0.0.0:0
dst: 0:0.0.0.0/0.0.0.0:0
```

b. Run the `get router info ospf neighbor` command on Spoke1. The system should return the following:

```
OSPF process 0, VRF 0: Neighbor ID Pri State Dead Time Address Interface 8.8.8.8 1. Full/
- 00:00:35 10.10.10.254 spoke1 1.1.1.1 1. Full/ - 00:00:35 10.10.10.254 spoke1
```

c. Run the `get router info routing-table ospf` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
O       172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:23:23
O       192.168.4.0/24   [110/110] via 10.10.10.254, spoke1, 00:22:35
```

d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0

  npu_flag=03 npu_rgwy=13.1.1.2 npu_lgwy=15.1.1.2 npu_selid=a dec_npuid=1 enc_npuid=1
```

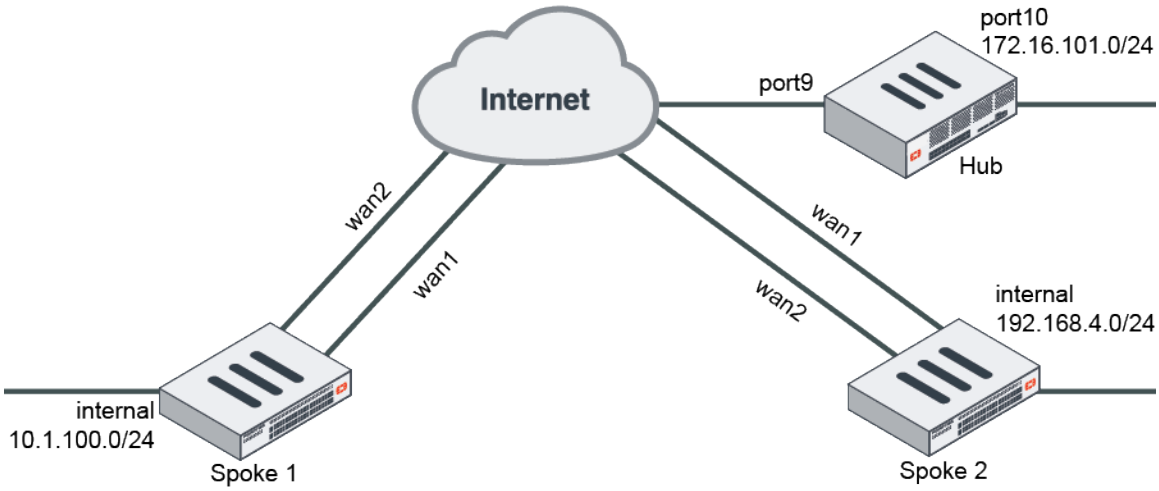
e. Run the `get router info routing-tale ospf` command. The system should return the following:

```
Routing table for VRF=0
O       172.16.101.0/24 [110/110] via 10.10.10.254, spoke1, 00:27:14
O       192.168.4.0/24  [110/110] via  10.10.10.3, spoke1_0, 00:26:26
```

ADVPN with RIP as the routing protocol

This is a sample configuration of ADVPN with RIP as routing protocol. The following options must be enabled for this configuration:

- On the hub FortiGate, IPsec phase1-interface `net-device disable` must be run.
- RIP must be used between the hub and spoke FortiGates.
- `split-horizon-status enable` must be run on the hub FortiGate.



To configure ADVPN with RIP as the routing protocol using the CLI:

1. In the CLI, configure hub FortiGate's WAN, internal interface, and static route:

```
config system interface
    edit "port9"
        set alias "WAN"
        set ip 22.1.1.1 255.255.255.0
    next
    edit "port10"
        set alias "Internal"
        set ip 172.16.101.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 22.1.1.2
        set device "port9"
    next
end
```

2. Configure the hub FortiGate:
   a. Configure the hub FortiGate IPsec phase1-interface and phase2-interface:

```
config vpn ipsec phase1-interface
    edit "advpn-hub"
        set type dynamic
        set interface "port9"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-
sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
```

```
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "advpn-hub"
        set phase1name "advpn-hub"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-
sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

b. Configure the hub FortiGate firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "advpn-hub"
        set dstintf "port10"
        set srcaddr "all"
        set dstaddr "172.16.101.0"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "advpn-hub"
        set dstintf "advpn-hub"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

c. Configure the hub FortiGate's IPsec tunnel interface IP address:

```
config system interface
    edit "advpn-hub1"
        set ip 10.10.10.254 255.255.255.255
        set remote-ip 10.10.10.253 255.255.255.0
    next
end
```

d. Configure the hub FortiGate's RIP:

```
config router rip
    set default-information-originate enable
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 172.16.101.0 255.255.255.0
        next
    end
    config interface
        edit "advpn-hub"
            set split-horizon-status disable
        next
    end
end
```

3. Configure the spoke FortiGates:
   a. Configure the spoke FortiGates' WAN, internal interfaces, and static routes:
      i. Configure Spoke1:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
        set ip 15.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 12.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 10.1.100.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 12.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 15.1.1.1
        set device "wan1"
    next
end
```

      ii. Configure the Spoke2:

```
config system interface
    edit "wan1"
        set alias "primary_WAN"
```

```
        set ip 13.1.1.2 255.255.255.0
    next
    edit "wan2"
        set alias "secondary_WAN"
        set ip 17.1.1.2 255.255.255.0
    next
    edit "internal"
        set ip 192.168.4.1 255.255.255.0
    next
end
config router static
    edit 1
        set gateway 17.1.1.1
        set device "wan2"
        set distance 15
    next
    edit 2
        set gateway 13.1.1.1
        set device "wan1"
    next
end
```

b. Configure the spoke FortiGates' IPsec phase1-interface and phase2-interface:

i. Configure Spoke1:

```
config vpn ipsec phase1-interface
    edit "spoke1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke1"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
```

```
config vpn ipsec phase2-interface
    edit "spoke1"
        set phase1name "spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1_backup"
        set phase1name "spoke1_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

ii. Configure Spoke2:

```
config vpn ipsec phase1-interface
    edit "spoke2"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke2_backup"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 22.1.1.1
        set monitor "spoke2"
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke2"
        set phase1name "spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke2_backup"
```

```
        set phase1name "spoke2_backup"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set auto-negotiate enable
    next
end
```

c. Configure the spoke FortiGates' firewall policies:

i. Configure Spoke1:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke1" "spoke1_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke1" "spoke1_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

ii. Configure Spoke2:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "spoke2" "spoke2_backup"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "spoke2" "spoke2_backup"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "all"
```

```
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

d. Configure the spoke FortiGates' tunnel interface IP addresses:

i. Configure Spoke1:

```
config system interface
    edit "spoke1"
        set ip 10.10.10.1 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke1_backup"
        set ip 10.10.10.2 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

ii. Configure Spoke2:

```
config system interface
    edit "spoke2"
        set ip 10.10.10.3 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
    edit "spoke2_backup"
        set ip 10.10.10.4 255.255.255.255
        set remote-ip 10.10.10.254 255.255.255.0
    next
end
```

e. Configure the spoke FortiGates' RIP:

i. Configure Spoke1:

```
config router rip
    config network
        edit 1
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

ii. Configure Spoke2:

```
config router rip
    config network
        edit 1
```

```
            set prefix 10.10.10.0 255.255.255.0
        next
        edit 2

  src: 0:0.0.0.0/0.0.0.0:0
  dst: 0:0.0.0.0/0.0.0.0:0
```

   b. Run the `get router info rip database` command on Spoke1. The system should return the following:

```
Codes: R - RIP, Rc - RIP connected, Rs - RIP static, K - Kernel,
       C - Connected, S - Static, O - OSPF, I - IS-IS, B - BGP
```

```
   Network            Next Hop         Metric From            If     Time
Rc 10.1.100.0/24                             1.                 internal
Rc 10.10.10.2/32                               1.                 spoke1
R  172.16.101.0/24    10.10.10.254             1. 10.10.10.254      spoke1 02:28
R  192.168.4.0/24      10.10.10.254              1. 10.10.10.254       spoke1 02:44
```

c. Run the `get router info routing-table rip` command on Spoke1. The system should return the following:

```
Routing table for VRF=0
R       172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:08:38
R       192.168.4.0/24 [120/3] via 10.10.10.254, spoke1, 00:08:38
```

d. Generate traffic between the spokes, then check the shortcut tunnel and routing table. Run the `diagnose vpn tunnel list` command on Spoke1. The system should return the following:

```
list all ipsec tunnel in vd 0
----
name=spoke1 ver=1 serial=2 15.1.1.2:0->22.1.1.1:0 tun_id=22.1.1.1

```

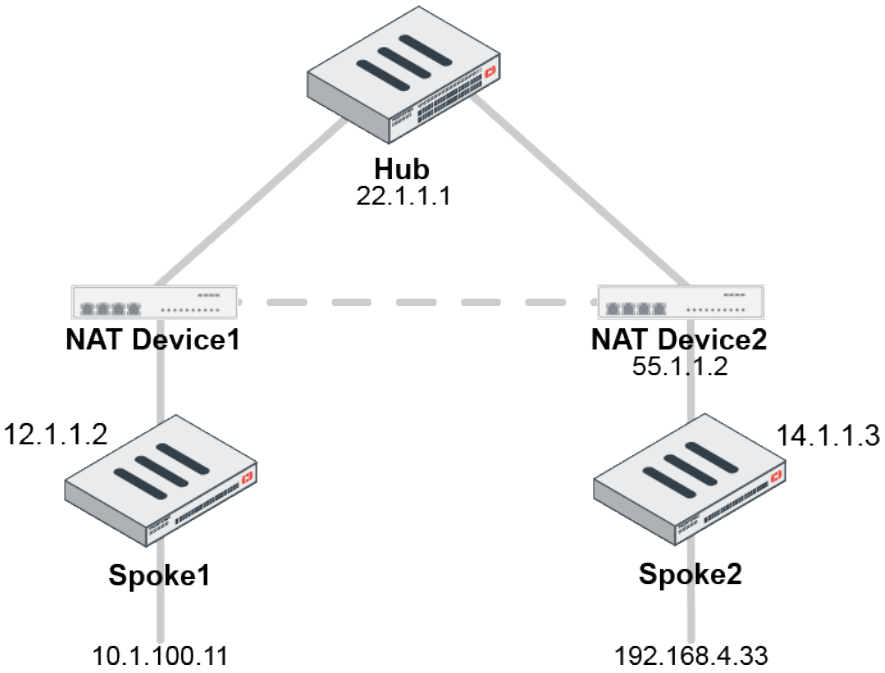
e. Run the `get router info routing-tale rip` command. The system should return the following:

```
Routing table for VRF=0
R       172.16.101.0/24 [120/2] via 10.10.10.254, spoke1, 00:09:04
R       192.168.4.0/24 [120/2] via 10.10.10.3, spoke1_0, 00:00:02
```

UDP hole punching for spokes behind NAT

UDP hole punching allows ADVPN shortcuts to be established through a UDP hole on a NAT device. The NAT device must support RFC 4787 Endpoint-Independent Mapping.

In the following example, device 10.1.100.11 behind Spoke1 needs to reach device 192.168.4.33 behind Spoke2. Spoke1 and Spoke2 are behind NAT devices and have established IPsec tunnels to the Hub. The hole punching creates a shortcut between Spoke1 and Spoke2 that bypasses the Hub.



To verify the ADVPN shortcut is established between both spokes behind NAT:

```
# diagnose debug enable
# diagnose debug application ike -1

Fabric Overlay Orchestrator

The Fabric Overlay Orchestrator feature is an easy-to-use GUI wizard that simplifies the process of configuring a self-orchestrated SD-WAN overlay within a single Security Fabric. This feature is self-orchestrated since no additional tool or device, aside from the FortiGates themselves, is required to orchestrate this configuration. An SD-WAN overlay configuration consists of IPsec and BGP configuration settings.

Currently, the Fabric Overlay Orchestrator supports a single hub architecture and builds upon an existing Security Fabric configuration. This feature configures the root FortiGate as the SD-WAN overlay hub and the downstream first-level FortiGates as the spokes.

After configuring the Fabric Overlay, you can complete the SD-WAN deployment by configuring SD-WAN rules.

If you cannot view the *VPN > Fabric Overlay Orchestrator* tree menu, configure the FortiGate as a root or a downstream device in the Security Fabric. See Configuring the root FortiGate and downstream FortiGates on page 3522 for more details.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

This section contains the following topics:

- Prerequisites on page 2512
- Network topology on page 2513
- Using the Fabric Overlay Orchestrator on page 2514
- SPA easy configuration key for FortiSASE on page 2532

Prerequisites

Create a single Fortinet Security Fabric with the following components:

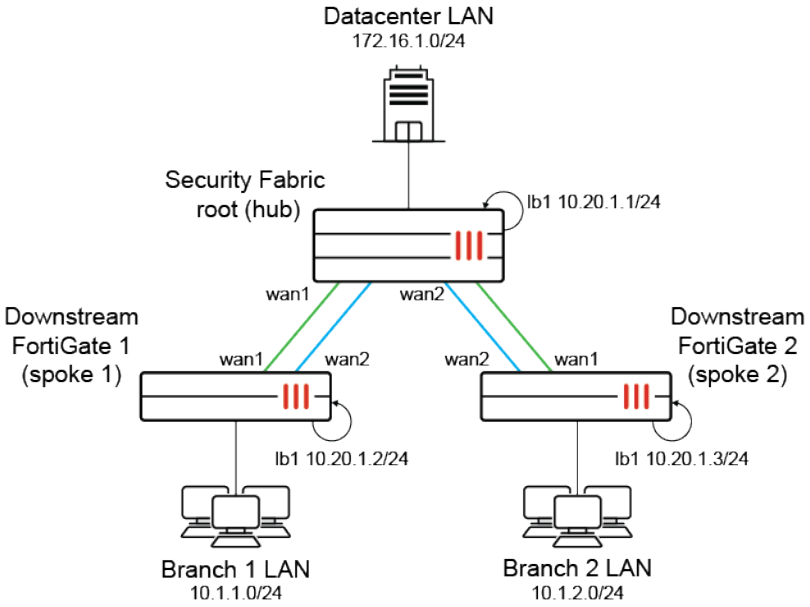
- A root FortiGate and one or more downstream FortiGates all running FortiOS 7.2.4 or later
- A FortiAnalyzer, or cloud logging using FortiAnalyzer Cloud or FortiGate Cloud
  - For FortiGate Cloud, all downstream devices must belong to the same FortiCloud account

  For more information about configuring these components, see Configuring the root FortiGate and downstream FortiGates on page 3522, Configuring FortiAnalyzer on page 3531, and Configuring cloud logging on page 3534 in the Security Fabric chapter.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

Network topology

The Fabric Overlay Orchestrator supports configuring an overlay for the following example hub and spoke topology using ADVPN and a single hub.



This topology corresponds to the single datacenter (active-passive gateway) design using the IPsec overlay design of one-to-one overlay mapping per underlay. For more details on these topics, see the SD-WAN Architectures for Enterprise guide.

In this topology, the datacenter FortiGate (Security Fabric root FortiGate) is the hub, and the branch FortiGates (Security Fabric downstream FortiGates) are the spokes. Each FortiGate has a distinctly defined LAN subnet and loopback interface (lb1) with an IP address within the 10.20.1.0/24 subnet.

The Fabric Overlay Orchestrator creates loopbacks to act as health check servers that are always up, and they can be accessed by adjacent Fabric devices. When configuring the policy creation option of either automatic or health check on the hub, the Fabric Overlay Orchestrator configures performance SLAs from the hub to the health check servers on 10.20.1.2 and 10.20.1.3 corresponding to the spoke 1 and spoke 2 FortiGates respectively. Likewise, when the Fabric Overlay Orchestrator runs on each spoke, it creates a performance SLA to the hub using its loopback address of 10.20.1.1.

Instead of using loopbacks, any business-critical applications and resources connected to the LAN of each device can be used as health check servers for performance SLAs.

Using the Fabric Overlay Orchestrator

If you cannot view the *VPN > Fabric Overlay Orchestrator* tree menu, configure the FortiGate as a root or a downstream device in the Security Fabric. See Configuring the root FortiGate and downstream FortiGates on page 3522 for more details.

The Fabric Overlay Orchestrator does not work when VDOM mode is enabled.

The following steps should be used to configure a self-orchestrated SD-WAN overlay within a single Security Fabric. These steps must be followed in order, and assume that the prerequisites and network topology are in place.

1. Configure the root FortiGate using the Fabric Overlay Orchestrator.
2. Configure one or more downstream FortiGates using the Fabric Overlay Orchestrator.
3. Configure an overlay on the spoke for an additional incoming interface on the hub (if applicable).
4. Verify the firewall policies on the hub FortiGate.
5. Verify the Fabric Overlay created by the Fabric Overlay Orchestrator:
   a. Verify the IPsec VPN tunnels on the hub FortiGate.
   b. Verify BGP routing on the hub FortiGate.
   c. Verify the performance SLAs on the hub FortiGate.
   d. Verify the firewall policies on a spoke FortiGate.
   e. Verify the IPsec VPN tunnels on a spoke FortiGate.
   f. Verify BGP routing on a spoke FortiGate.
   g. Verify the performance SLAs on a spoke FortiGate.
   h. Verify the spoke-to-spoke ADVPN communication.
6. Configure SD-WAN rules on the hub FortiGate.
7. Configure SD-WAN rules on the spoke FortiGates.

When configuring the root and downstream FortiGates, the Fabric Overlay Orchestrator configures the following settings in the background:

- IPsec overlay configuration (hub and spoke ADVPN tunnels)
- BGP configuration
- Policy routing
- SD-WAN zones
- SD-WAN performance SLAs

The FortiGate's role in the SD-WAN overlay is automatically determined by its role in the Security Fabric. The Fabric root will be the hub, and any first-level downstream devices from the Fabric root will be spokes.

After using the Fabric Overlay Orchestrator on all FortiGates and verifying the overlay settings, complete the SD-WAN deployment configuration using steps 3 (if applicable), and steps 6 and 7. See SD-WAN rules on page 941 for more information.

Creating firewall policies

The Fabric Overlay Orchestrator can create firewall policies to allow all traffic through the SD-WAN overlay, or firewall policies to just allow health check traffic through it instead. When the Fabric Overlay Orchestrator is enabled on the root FortiGate, there are three *Policy creation* options:

- *Automatic*: automatically create policies for the loopback interface and tunnel overlays.
- *Health check*: automatically create a policy for the loopback interface so the SD-WAN health checks are functional.
- *Manual*: no policies are automatically created.

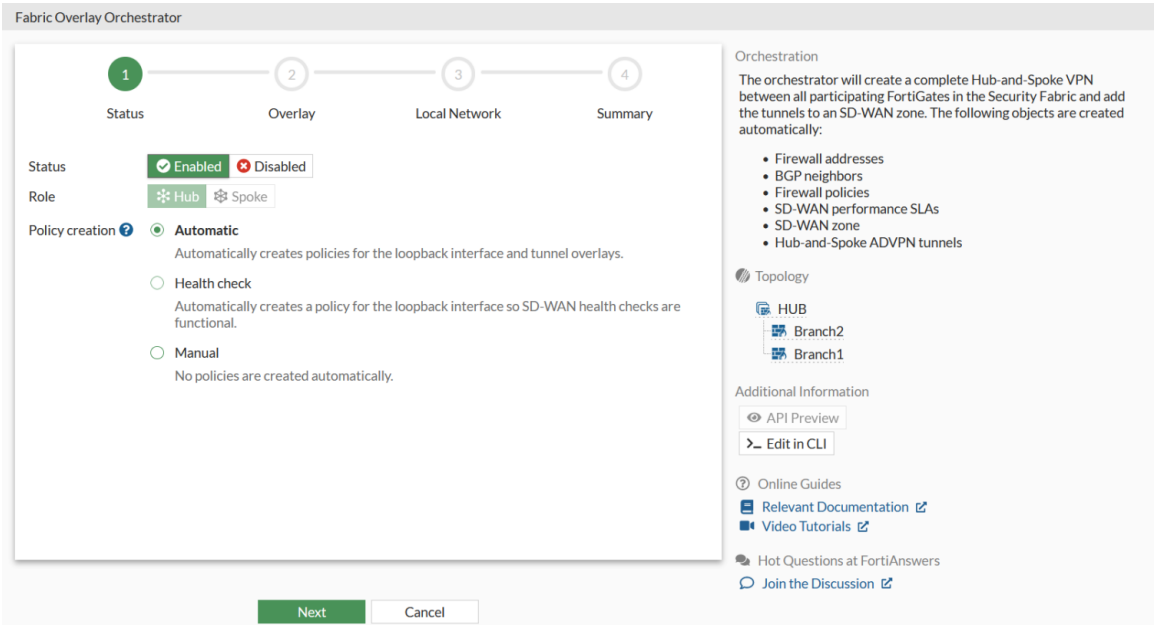
The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

When the Fabric Overlay Orchestrator is configured on a device, changing the policy creation rule will create new policies based on the rule, but it will not delete existing policies. Deleting existing policies must be performed manually.

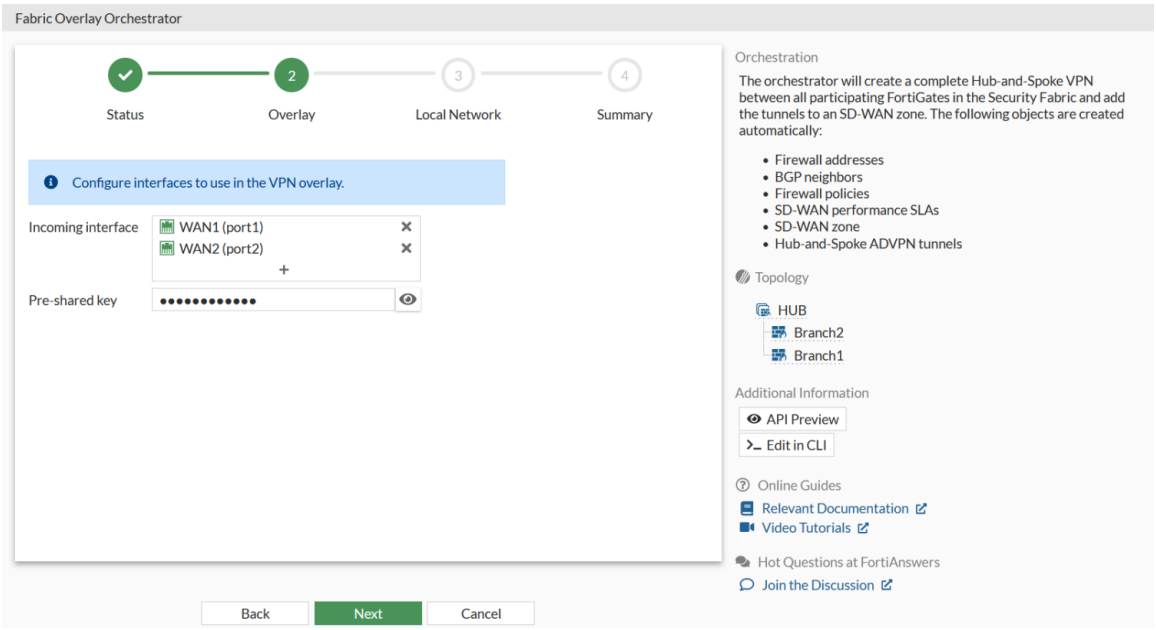
Configuring the root FortiGate using the Fabric Overlay Orchestrator

To configure the root FortiGate using the Fabric Overlay Orchestrator:

1. Go to *VPN* > *Fabric Overlay Orchestrator*.
2. Set the *Status* to *Enabled*. The *Role* is automatically selected based on the FortiGate's role in the Security Fabric. Ensure that *Hub* is selected. The Fabric root must always be the hub.
3. Set *Policy creation* to *Automatic*.

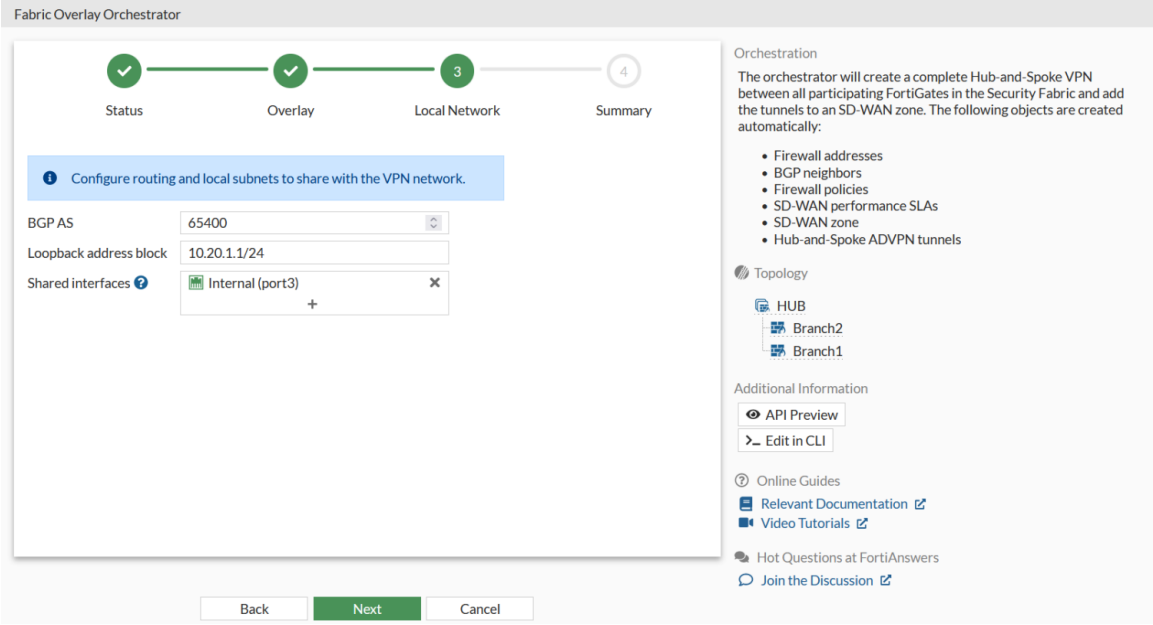


4. Click *Next*. The *Overlay* settings appear.
5. Select one or more interfaces as the *Incoming interface* or the underlay link over which the VPN overlay will be built (two incoming interfaces are selected in this example).
6. Enter the *Pre-shared key*.

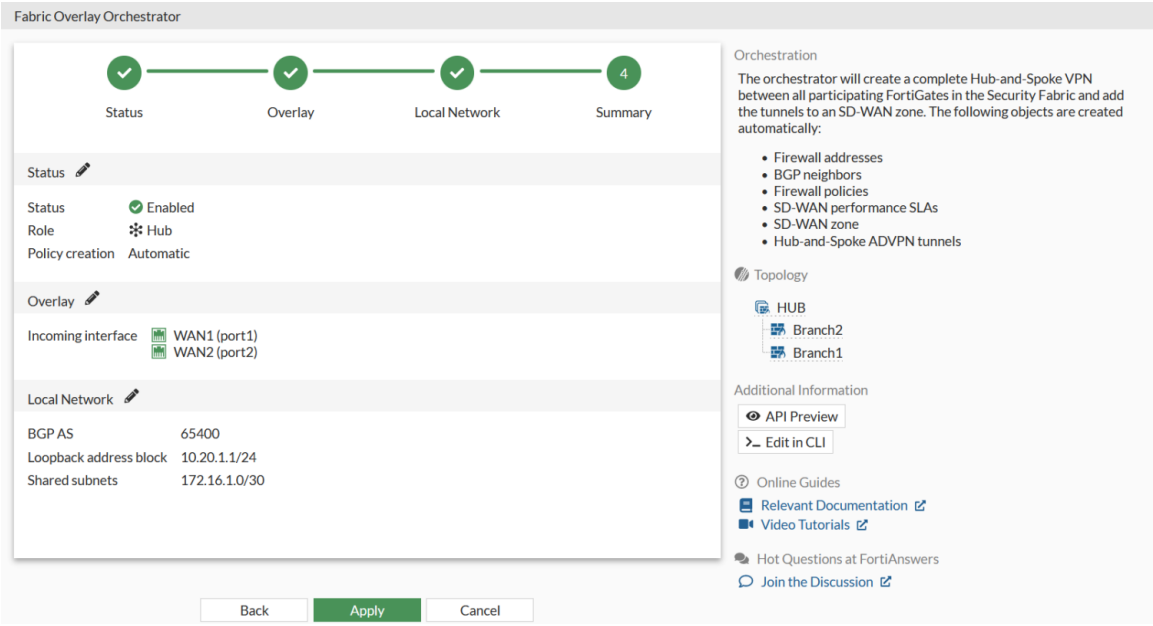


7. Click *Next*. The *Local Network* settings appear.
8. Configure routing and local subnets to share the following with the VPN network:

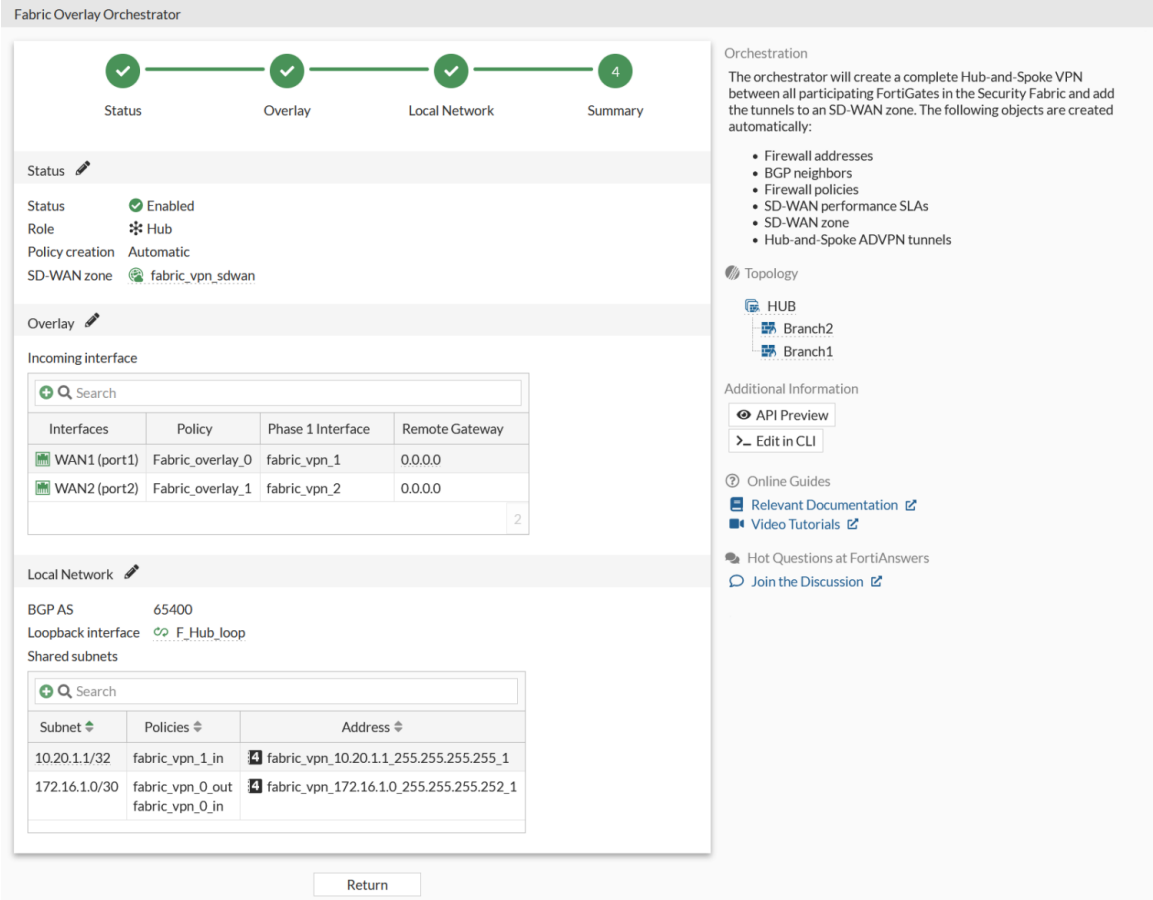
BGP AS	Optional setting to configure the BGP AS number. By default, this is set to *65400*.
Loopback address block	Optional setting to configure the loopback IP address. By default, this is set to *10.20.1.1/255.255.255.0*.
Shared interfaces	Select the interface of the local network to share with the VPN network.



9. Click *Next*. The *Summary* page appears.
10. Review the settings, then click *Apply*.



An updated *Summary* page appears with all the settings.



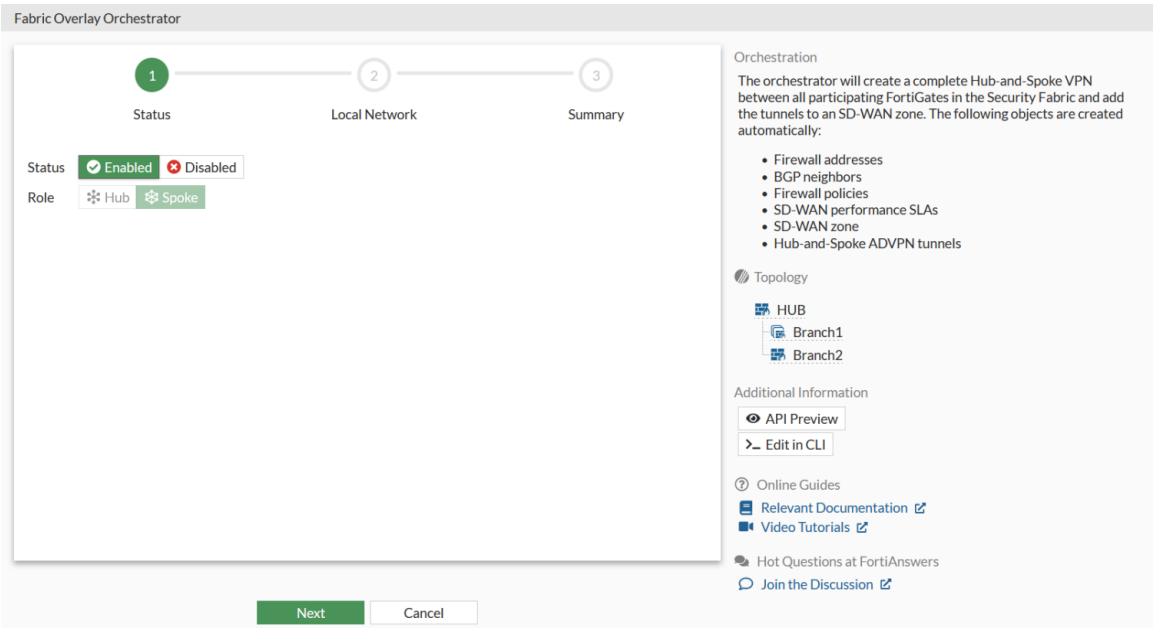
Note the following settings in this example:

SD-WAN zone	Located in the *Status* section: *fabric_vpn_sdwan*.
VPN tunnels	Located in the *Overlay* section in the *Incoming interface* table under the *Phase 1 Interface* column: *fabric_vpn1* and *fabric_vpn2*.
BGP	Located in the *Local Network* section. The *BGP AS* is *65400*. The *Shared subnets* are *10.20.1.1/32* and *172.16.1.0/30*.
Loopback interface	Located in the *Local Network* section: *F_Hub_loop*.
Firewall policies	Located in two sections: • *Overlay* section in the *Incoming interface* table under the *Policy* column: *Fabric_overlay_0* and *Fabric_overlay_1* • *Local Network* section in the *Shared subnets* table under the *Policies* column: *fabric_vpn_1_in*, *fabric_vpn_0_out*, and *fabric_vpn_0_in*

Configuring a downstream FortiGate using the Fabric Overlay Orchestrator

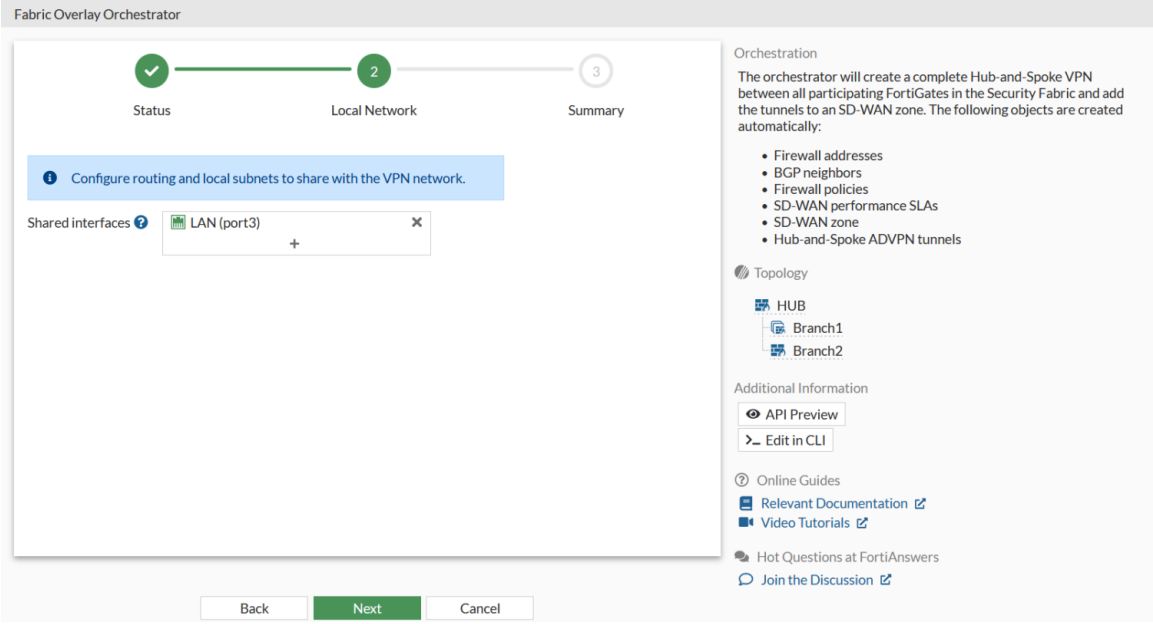
To configure a downstream FortiGate using the Fabric Overlay Orchestrator:

1. Go to *VPN* > *Fabric Overlay Orchestrator*.
2. Set the *Status* to *Enabled*. The *Role* is automatically selected based on the FortiGate's role in the Security Fabric. Ensure that *Spoke* is selected. Only downstream first-level FortiGates can be spokes.

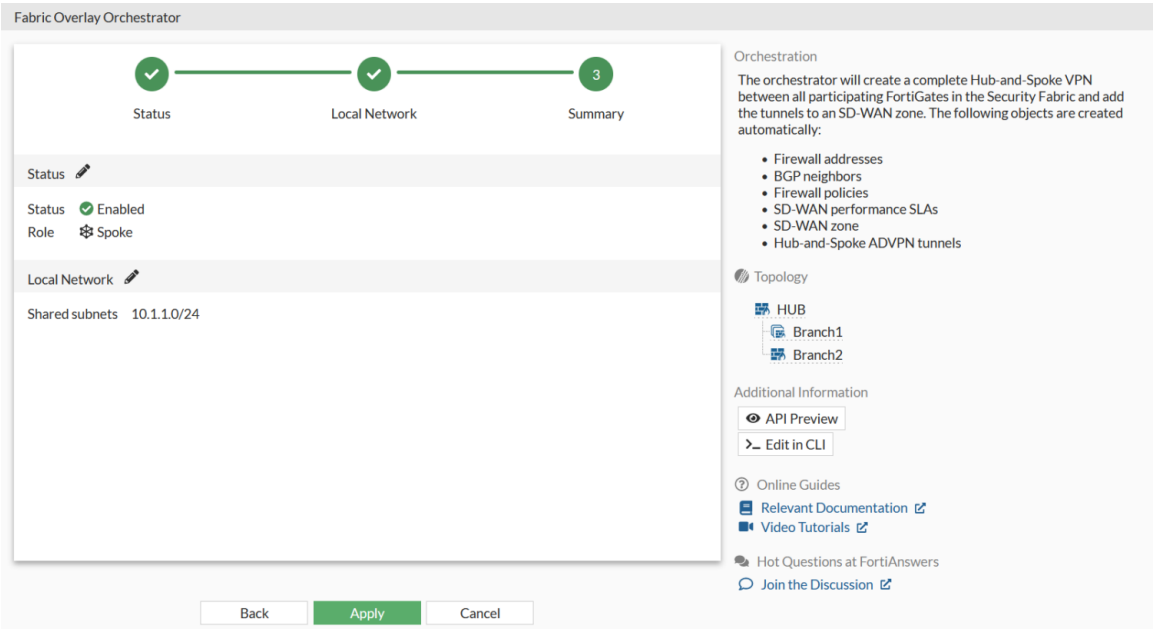


3. Click *Next*. The *Local Network* settings appear.
4. Configure the routing and local subnets to share with the VPN network in the following fields:

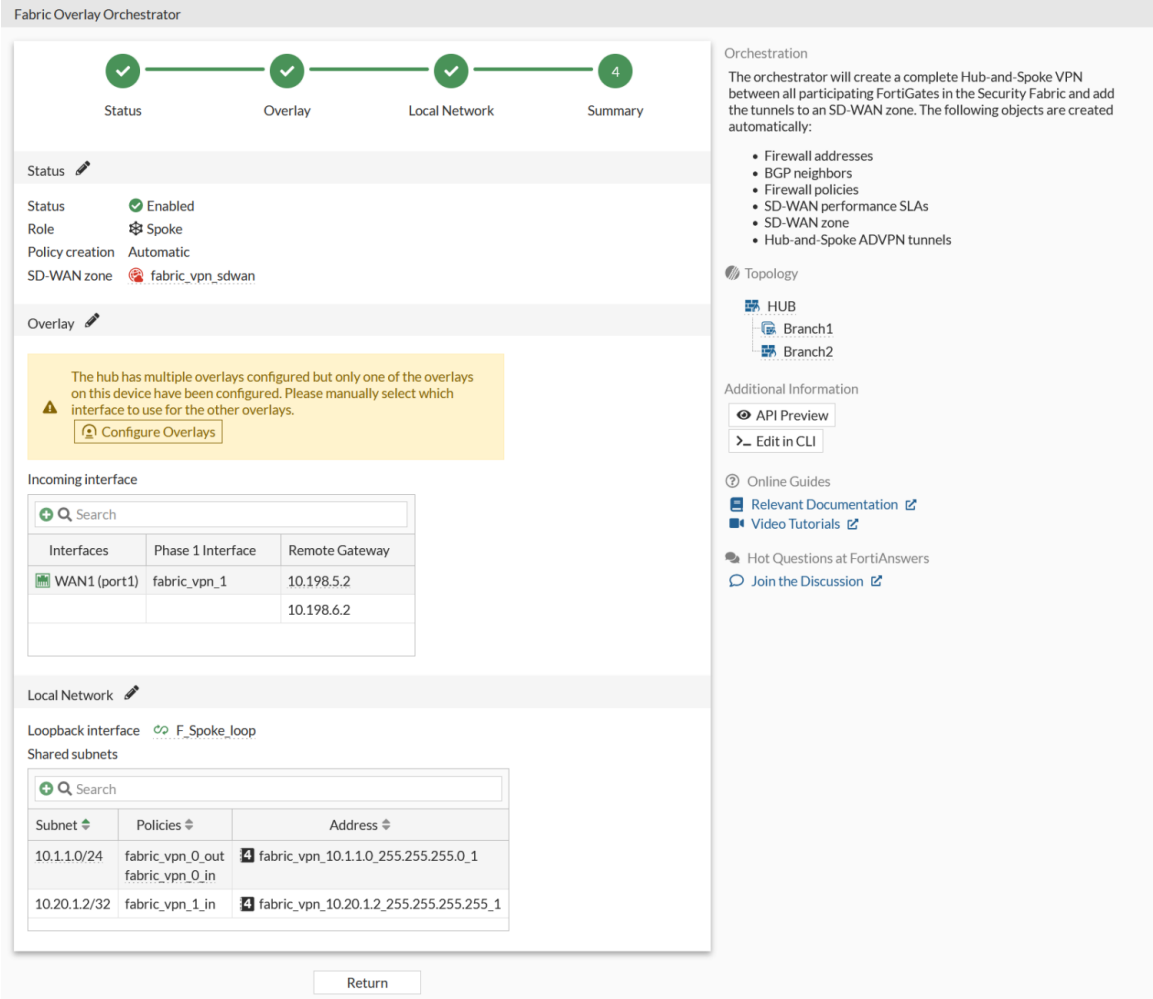
Shared interfaces	Select the interface of the local network to share with the VPN network.



5. Click *Next*. As the downstream FortiGate updates, a *Configuring spoke Fabric VPN from root FortiGate* message appears The *Summary* page appears once the update is complete.



6. Review the settings, then click *Apply*.
   An updated *Summary* page appears with all the settings.



Note the following settings in this example:

SD-WAN zone	Located in the *Status* section: *fabric_vpn_sdwan*.
VPN tunnels	Located in the *Overlay* section in the *Incoming interface* table under the *Phase 1 Interface* column: *fabric_vpn1*.
BGP	Located in the *Local Network* section. The *BGP AS* is *65400*. The *Shared subnets* are *10.1.1.0/24* and *10.20.1.2/32*.
Loopback interface	Located in the *Local Network* section: *F_Hub_loop*.
Firewall policies	Located in the *Local Network* section in the *Shared subnets* table under the *Policies* column: *fabric_vpn_0_out*, *fabric_vpn_0_in*, and *fabric_vpn_1_in*.

The loopback IP addresses for the branches are generated based on the index number of the trusted device in the root FortiGate's Security Fabric (HUB) configuration.

```
config system csf
    set status enable
    set group-name "fabric"
```

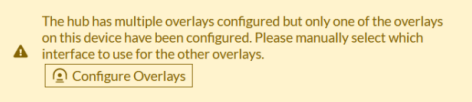
```
    config trusted-list
        edit "FGVM02TM22000001"
            set serial "FGVM02TM22000001"
            set index 1
        next
        edit "FGVM02TM22000002"
            set serial "FGVM02TM22000002"
            set index 2
        next
    end
end
```

For example, if Branch1 (index 1) is the first FortiGate and Branch2 (index 2) is the second FortiGate authorized on the root FortiGate, the loopback addresses are generated as follows:

- Branch1 loopback IP: 10.20.1.2
- Branch2 loopback IP: 10.20.1.3

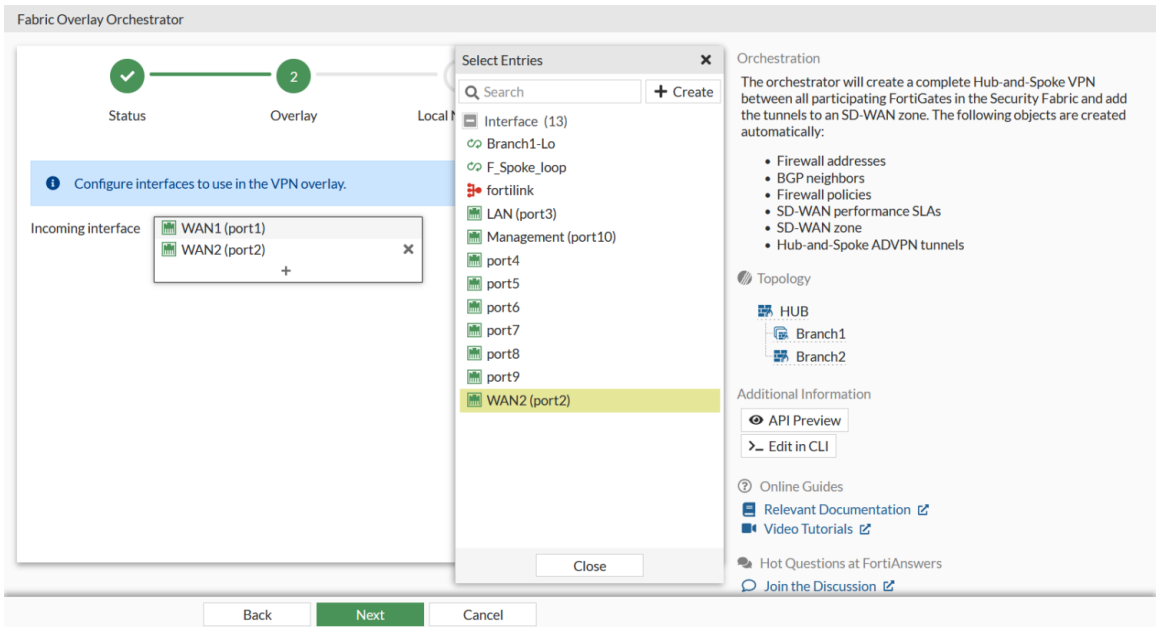
Configuring an overlay on the spoke for an additional incoming interface on the hub

A hub typically includes two incoming interfaces, but additional interfaces can be configured if needed. On downstream devices, the following warning is displayed on the *Fabric Overlay Orchestrator* page that *The hub has multiple overlays configured but only one of the overlays on this device have been configured. Please manually select which interface to use for the other overlays.*

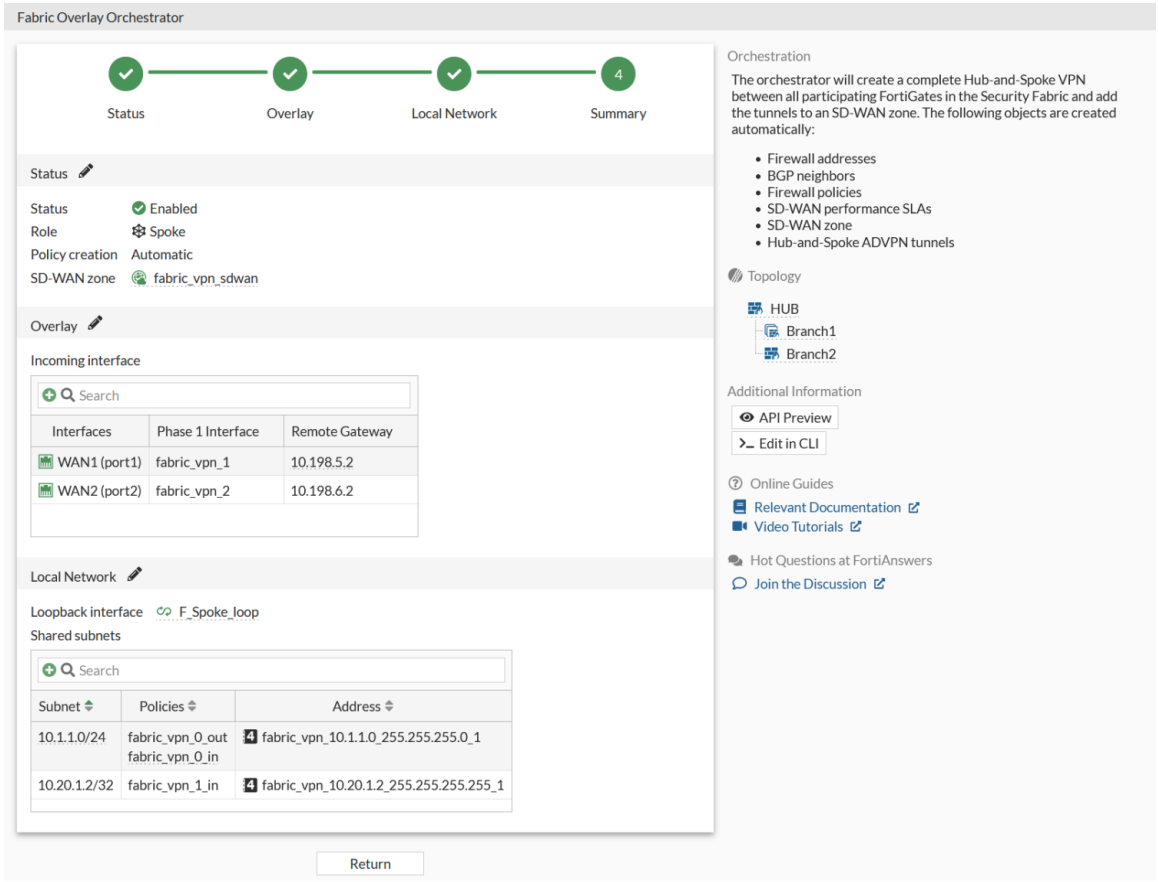


To configure an additional incoming interface on a spoke:

1. Go to *VPN > Fabric Overlay Orchestrator*.
2. Click *Configure Overlays* in the warning box.
3. Navigate to the *Overlay* section, click the *+* in the *Incoming interface* field, and select *WAN2 (port2)* to add it to the overlay.



4. Click *Next*, then complete the remaining steps in the GUI wizard. On the *Summary* page, the additional interface *WAN2 (port2)* appears in the *Incoming interfaces* table.

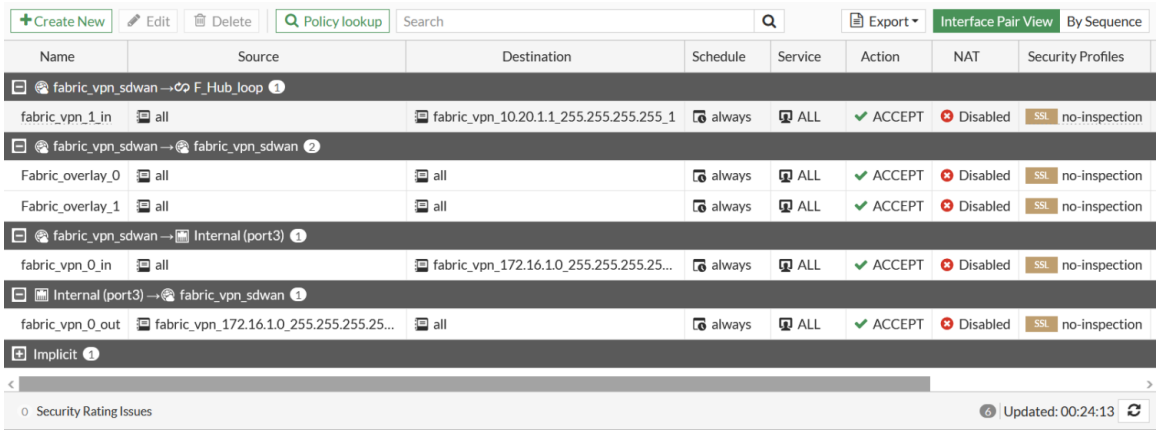


Verifying the firewall policies on the hub FortiGate

Different policies are created on the hub FortiGate based on the *Policy creation* setting in the Fabric Overlay Orchestrator configuration (*Automatic*, *Health check*, or *Manual*).

Automatic

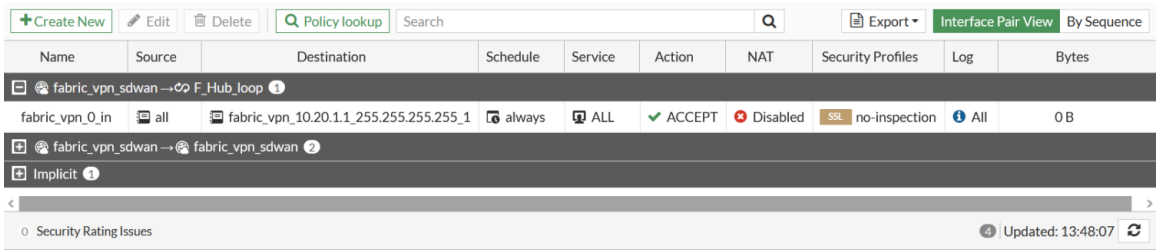
Go to *Policy & Objects* > *Firewall Policy* to verify that wildcard firewall policies have been configured on the hub FortiGate. This Fabric Overlay Orchestrator configuration example uses automatic policy creation, and the following firewall policies are configured:



The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

Health check

Go to *Policy & Objects* > *Firewall Policy* to verify that a single firewall policy allowing health check traffic to the hub's loopback has been configured on the hub FortiGate. For example:



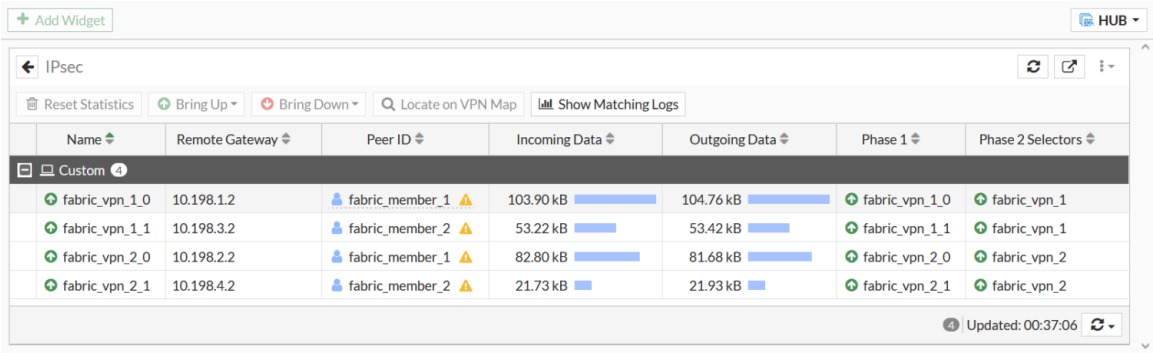
Manual

Go to *Policy & Objects* > *Firewall Policy* to verify that no firewall policies have been created by the Fabric Overlay Orchestrator. If desired, firewall policies must be manually configured on the hub FortiGate to allow traffic to the loopback interface for health checks and the overlays.

Verifying the Fabric Overlay created by the Fabric Overlay Orchestrator

To verify the IPsec VPN tunnels on the hub:

1. Go to *Dashboard* > *Network* and click the *IPsec* widget to expand it.
2. Verify that there are two tunnels established for each phase 1 interface.



The naming convention <tunnel_name>_<number> indicates the relative order in which the tunnels were established:

fabric_vpn_1_0	VPN tunnel listening on the hub's WAN1 incoming interface; established with spoke 1 using its WAN1 interface
fabric_vpn_1_1	VPN tunnel listening on the hub's WAN1 incoming interface; established with spoke 2 using its WAN1 interface
fabric_vpn_2_0	VPN tunnel listening on the hub's WAN2 incoming interface; established with spoke 1 using its WAN2 interface
fabric_vpn_2_1	VPN tunnel listening on the hub's WAN2 incoming interface; established with spoke 2 using its WAN2 interface

Verify the BGP routing on the hub:

1. In the CLI, check the BGP peering status:

```
HUB # get router info bgp summary

VRF 0 BGP router identifier 10.20.1.1, local AS number 65400
BGP table version is 11
1 BGP AS-PATH entries
0 BGP community entries
Next peer check timer due in 43 seconds

Neighbor    V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.10.1  4      65400      23      27       11    0    0 00:09:28        2
10.10.10.2  4      65400      16      16       11    0    0 00:06:36        2
10.10.11.1  4      65400      14      20       11    0    0 00:09:22        2
10.10.11.2  4      65400       7      11       11    0    0 00:03:22        2
```

```
Total number of neighbors 4
```

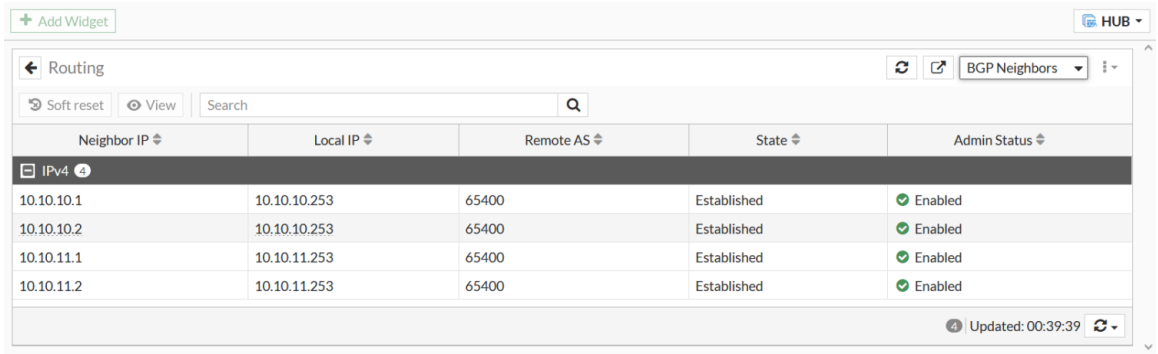
2. Check the BGP advertised routes:

```
HUB # get router info bgp neighbors 10.10.10.1 advertised-routes
VRF 0 BGP table version is 11, local router ID is 10.20.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop            Metric     LocPrf Weight RouteTag Path
*>i10.1.1.0/24      10.10.11.1                       100      0        0 i <-/2>
*>i10.1.2.0/24      10.10.11.2                       100      0        0 i <-/2>
*>i10.1.2.0/24      10.10.10.2                       100      0        0 i <-/1>
*>i10.10.10.0/24    10.10.10.253                     100  32768        0 i <-/1>
*>i10.10.11.0/24    10.10.10.253                     100  32768        0 i <-/1>
*>i10.20.1.1/32     10.10.10.253                     100  32768        0 i <-/1>
*>i10.20.1.2/32     10.10.11.1                       100      0        0 i <-/2>
*>i10.20.1.3/32     10.10.11.2                       100      0        0 i <-/2>
*>i10.20.1.3/32     10.10.10.2                       100      0        0 i <-/1>
*>i172.16.1.0/30    10.10.10.253                     100  32768        0 i <-/1>

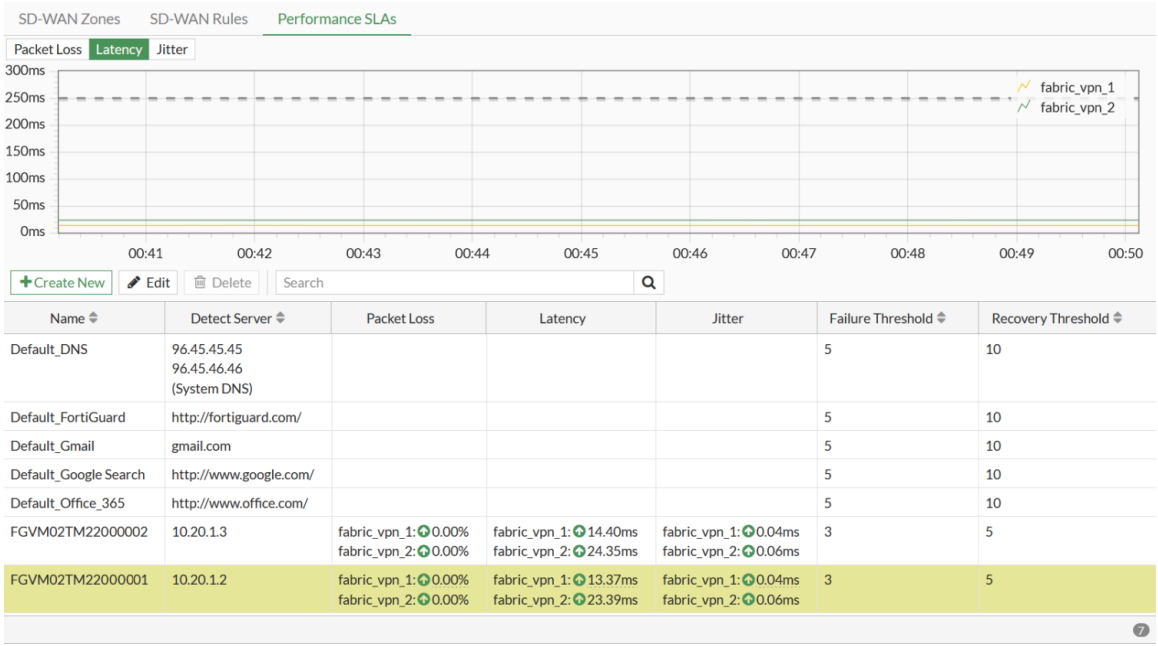
Total number of prefixes 10
```

3. In the GUI, go to *Dashboard* > *Network* and click the *Routing* widget to expand it.
4. In the dropdown, select *BGP Neighbors*.



To verify the performance SLAs on the hub:

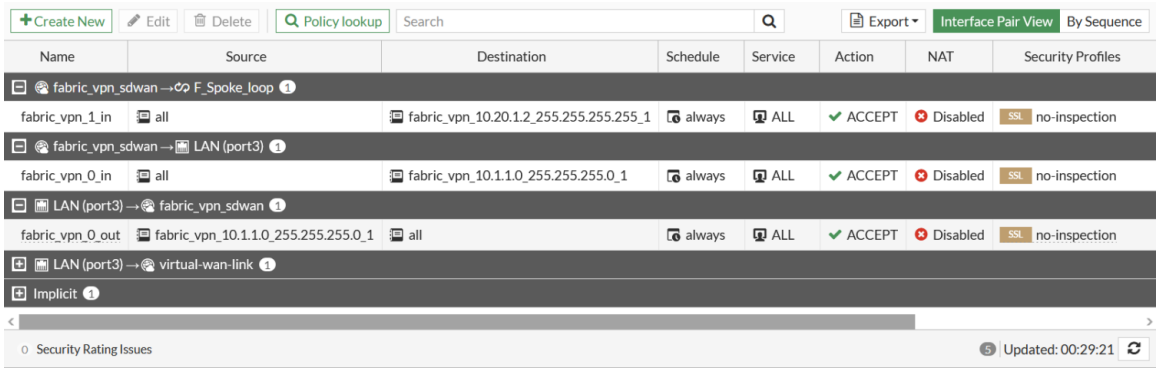
1. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.
2. Verify that the performance SLAs are automatically created for each spoke. The performance SLA naming uses the serial number of the spoke FortiGate. There are two new entries.



To verify the firewall policies on a spoke FortiGate:

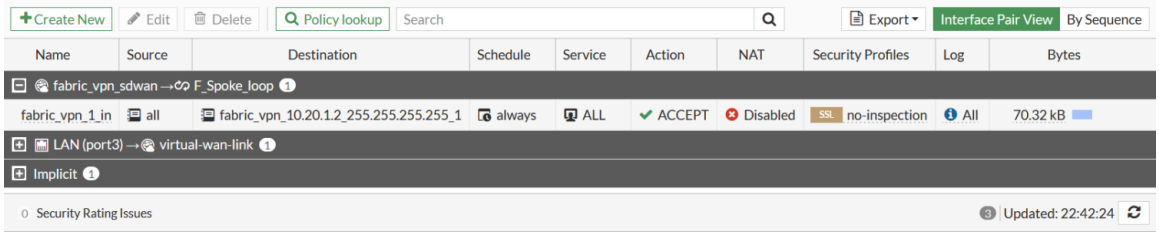
Different policies are created on the spoke FortiGates based on the hub's *Policy creation* setting in the Fabric Overlay Orchestrator configuration (*Automatic*, *Health check*, or *Manual*). The *Automatic* setting is used in this example.

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Verify that wildcard firewall policies have been configured.



The *Automatic* policy creation option creates wildcard allow policies for the tunnel overlays. For some cases, these policies do not provide the necessary granularity to restrict overlay traffic to specific subnets or hosts.

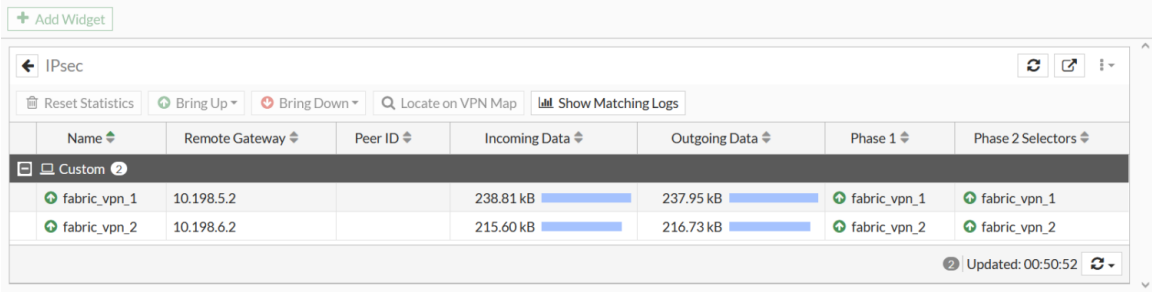
If the hub's *Policy creation*setting is *Health Check*, a single firewall policy that allows health check traffic to the spoke's loopback should be configured on the spoke FortiGates:



If the hub's *Policy creation*setting is *Manual*, there should be no new policies created by the Fabric Overlay Orchestrator. If desired, firewall policies must be manually configured on the spoke FortiGates to allow traffic to the loopback interface for health checks and the overlays.

To verify the IPsec VPN tunnels on a spoke:

1. Go to *Dashboard* > *Network* and click the *IPsec* widget to expand it.
2. Verify the IPsec tunnels that go back to the hub.



To verify BGP routing on a spoke:

1. In the CLI, check the BGP peering status:

```
Branch1 # get router info bgp summary

VRF 0 BGP router identifier 10.20.1.2, local AS number 65400
BGP table version is 5
1 BGP AS-PATH entries
0 BGP community entries

Neighbor     V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.10.253 4      65400      41      37        4    0    0 00:23:39        8
10.10.11.253 4      65400      38      34        4    0    0 00:23:33        8

Total number of neighbors 2
```

2. Check the BGP advertised routes:

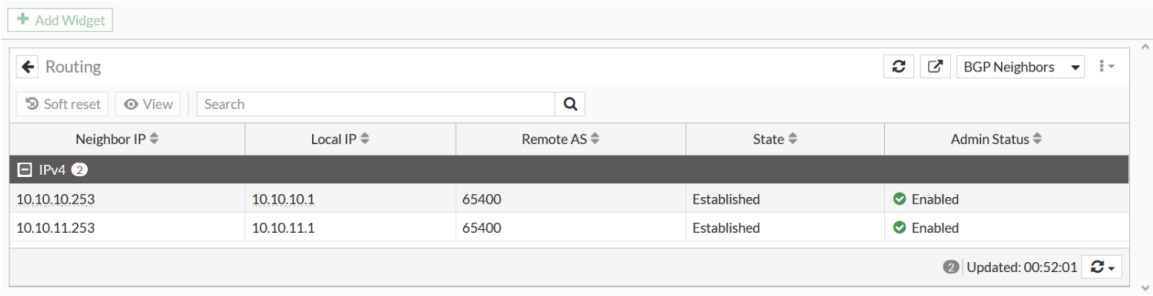
```
Branch1 # get router info bgp neighbors 10.10.10.253 advertised-routes
VRF 0 BGP table version is 5, local router ID is 10.20.1.2
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop            Metric     LocPrf Weight RouteTag Path
```

```
*>i10.1.1.0/24      10.10.10.1                100  32768        0 i <0/->
*>i10.20.1.2/32     10.10.10.1                100  32768        0 i <0/->

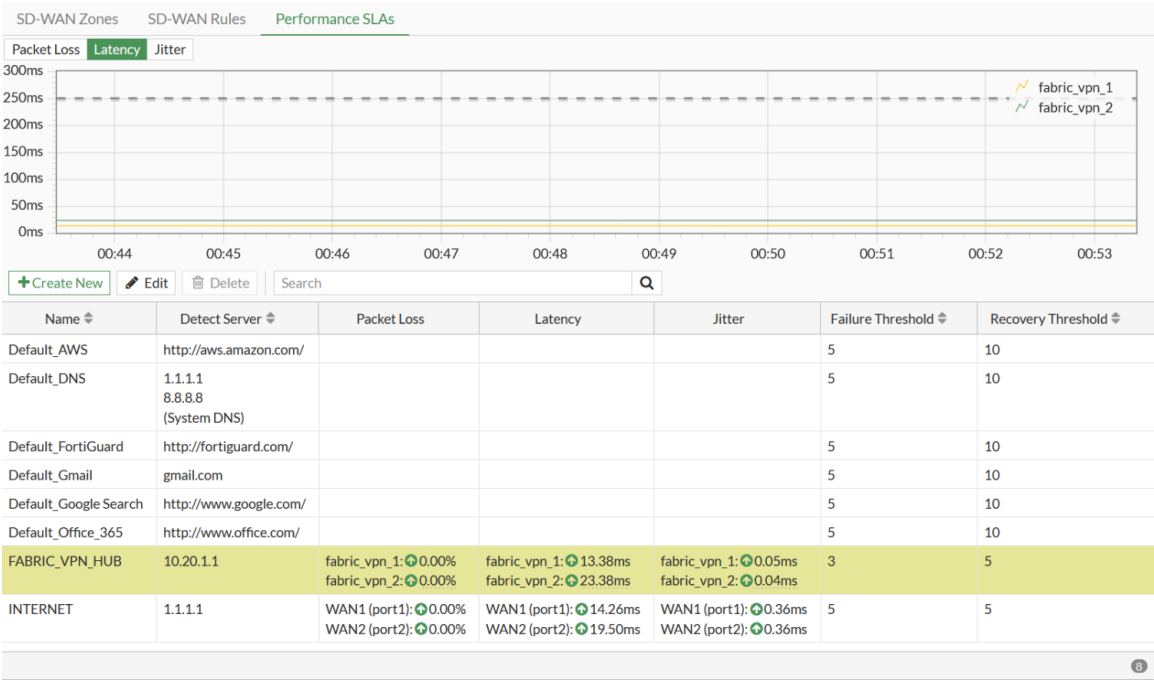
Total number of prefixes 2
```

3. In the GUI, go to *Dashboard* > *Network* and click the *Routing* widget to expand it.
4. In the dropdown, select *BGP Neighbors*.



To verify the performance SLAs on a spoke:

1. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.
2. Verify that the performance SLA is automatically created for the hub FortiGate. There is a new entry (*FABRIC_VPN_HUB*).



To verify the spoke-to-spoke ADVPN communication:

1. From Branch1, ping Branch2 (10.20.1.3):

```
Branch1 # exec ping-options source 10.20.1.2
Branch1 # exec ping 10.20.1.3
```

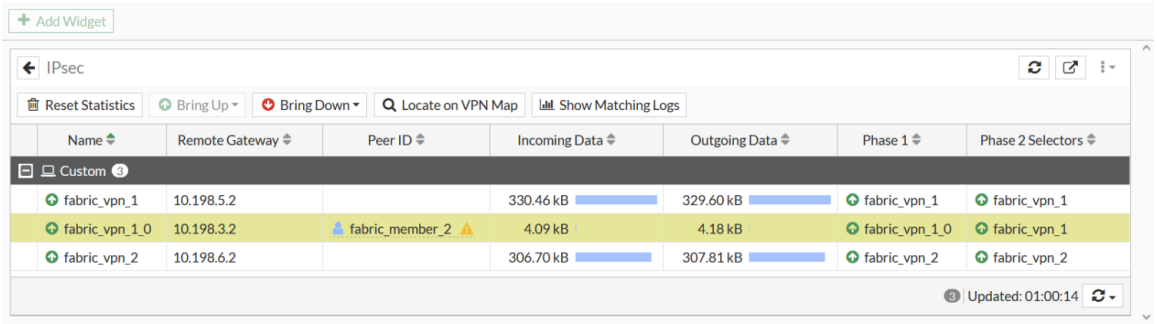
```
PING 10.20.1.3 (10.20.1.3): 56 data bytes
64 bytes from 10.20.1.3: icmp_seq=0 ttl=254 time=27.7 ms
64 bytes from 10.20.1.3: icmp_seq=2 ttl=255 time=17.4 ms
64 bytes from 10.20.1.3: icmp_seq=3 ttl=255 time=17.5 ms
64 bytes from 10.20.1.3: icmp_seq=4 ttl=255 time=17.4 ms

--- 10.20.1.3 ping statistics ---
5 packets transmitted, 4 packets received, 20% packet loss
round-trip min/avg/max = 17.4/20.0/27.7 ms
```

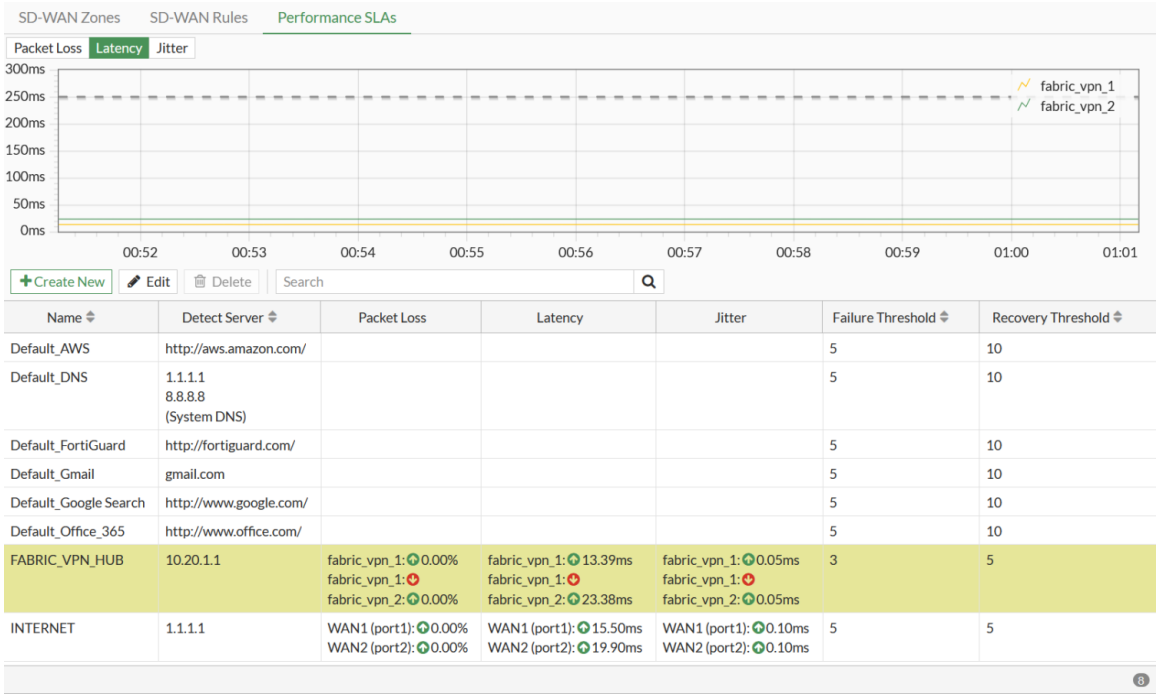
2. Verify the IPsec tunnel summary.
   - In the CLI, enter the following:

     ```
     Branch1 # get vpn ipsec tunnel summary
     'fabric_vpn_1_0' 10.198.3.2:0  selectors(total,up): 1/1  rx(pkt,err): 25/0  tx(pkt,err):
     26/2
     'fabric_vpn_1' 10.198.5.2:0  selectors(total,up): 1/1  rx(pkt,err): 8032/0  tx(pkt,err):
     8022/2
     'fabric_vpn_2' 10.198.6.2:0  selectors(total,up): 1/1  rx(pkt,err): 7462/0  tx(pkt,err):
     7478/1
     ```

     The `fabric_vpn_1_0` tunnel was created for spoke 1-to-spoke 2 communication.
   - In the GUI, go to *Dashboard* > *Network* and click the *IPsec* widget to expand it.



3. Verify that the performance SLA was updated. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.



The first performance SLA, *fabric_vpn_1*, that corresponds to the spoke-to-hub VPN tunnel is shown as up. The second one, *fabric_vpn_1* that corresponds to the spoke-to-spoke VPN tunnel (*fabric_vpn_1_0*) is shown as down since 10.20.1.1 is the IP address corresponding to the hub's loopback interface that is not present on another spoke.

Configuring SD-WAN rules on the hub FortiGate

On the hub, the Fabric Overlay Orchestrator automatically creates a performance SLA that corresponds to each spoke FortiGate using the serial number as the name of the performance SLA. SD-WAN rules must be configured on the hub FortiGate to direct traffic to each of the spokes using these performance SLAs.

To configure SD-WAN rules on the hub FortiGate:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Enter a name (such as *Hub-To-Br1*).
3. In the *Source* section, set the *Address* to the local subnet of the hub.
4. Configure the following in the *Destination* section:
   a. Set the *Address* to the local subnet of the spoke. If an address object does not exist yet, click *Create* in the slide-out pane and configure the address.
   b. Set the *Protocol number* as needed (default = *ANY*).
5. Configure the following in the *Outgoing Interfaces* section:
   a. Set the *Interface selection strategy* to *Lowest cost (SLA)*.
   b. Set the *Interface preference* to the SD-WAN members.
   c. Set *Required SLA target* to the corresponding performance SLA created by the Fabric Overlay Orchestrator for this the spoke. The name is based on the spoke FortiGate's serial number (*FGVM0XXX00000000 #1*).

6. Click *OK*.
7. Repeat these steps for the other spoke. Ensure the *Name* is unique, and that the *Destination* address corresponds to the local subnet behind the spoke.

If you need to disable the Fabric Overlay Orchestrator on the hub FortiGate by setting the *Status* to *Disabled*, you must first delete any SD-WAN rules on the hub FortiGate created using this procedure to ensure the added configuration does not block the clean-up process.

Configuring SD-WAN rules on the spoke FortiGates

On each spoke, the Fabric Overlay Orchestrator automatically creates a performance SLA that corresponds to the hub FortiGate. An SD-WAN rule must be configured on the spoke FortiGates to direct traffic to the hub FortiGate using this performance SLA.

To configure an SD-WAN rule on a spoke FortiGate:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Enter a name (such as *LAN-to-HUB*).
3. In the *Source* section, set the *Address* to the local subnet of the spoke.
4. Configure the following in the *Destination* section:
   a. Set the *Address* to the local subnet of the hub. If an address object does not exist yet, click *Create* in the slide-out pane and configure the address.
   b. Set the *Protocol number* as needed (default = *ANY*).
5. Configure the following in the *Outgoing Interfaces* section:
   a. Set the *Interface selection strategy* to *Lowest cost (SLA)*.
   b. Set the *Interface preference* to the SD-WAN members.
   c. Set *Required SLA target* to the corresponding performance SLA created by the Fabric Overlay Orchestrator, which is named *FABRIC_VPN_HUB#1* by default.
6. Click *OK*.

If you need to disable the Fabric Overlay Orchestrator on a spoke FortiGate by setting the *Status* to *Disabled*, you must first delete any SD-WAN rules on the spoke FortiGate created using this procedure to ensure the added configuration does not block the clean-up process.

SPA easy configuration key for FortiSASE

A gutter section is available in the *Fabric Overlay Orchestrator* page if the FortiSASE SPA license is active. From this section, the user can open a pane that will generate a FortiSASE SPA easy configuration key based on the current Fabric Overlay Orchestrator configuration which can be used in the SPA setup of FortiSASE.

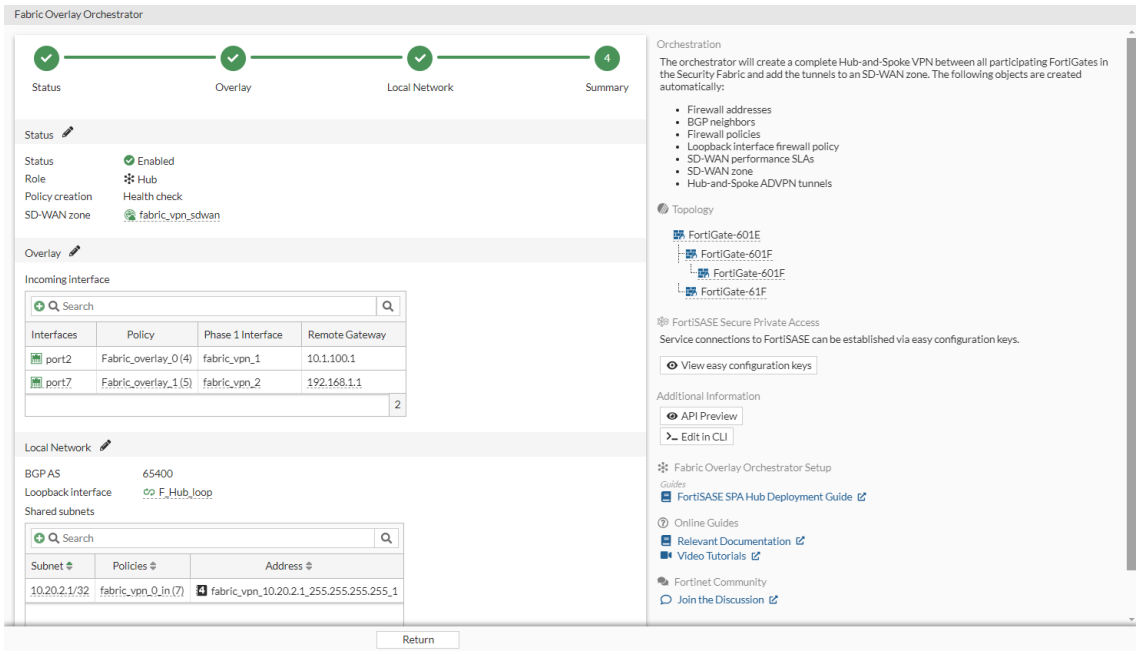
The easy configuration key is an encode of Base64 of a JSON object. It includes the FortiOS version, gateway, peer IP address, BGP Autonomous Systems (AS), BGP method, and the FortiSASE BGP router subnet.

To access the easy configuration key:

1. Prepare the two FortiGates:
   a. Go to *System* > *FortiGuard* and confirm that the FortiGates have a FortiSASE SPA license.

   b. Configure the Security Fabric in both FortiGates.
   c. Go to *VPN* > *Fabric Overlay Orchestrator* and enable it on both FortiGates. See Using the Fabric Overlay Orchestrator on page 2514.

      The *FortiSASE Secure Private Access* section will be included in the gutter.



2. Access the easy configuration key:
   a. In *VPN > Fabric Overlay Orchestrator*, click *View easy configuration keys* in the gutter.
   The *View easy configuration keys* pane is displayed.

   b. Select the *Incoming interface*.
   c. Enter the *Gateway*.

Shared subnets cannot conflict with FortiSASE's internal subnets.

   d. Click *Copy* beside the *Configuration key*.
   This easy configuration key can be pasted into FortiSASE when setting up SPA.

If the FortiOS administrator makes any changes to BGP or to their IPsec, the configuration key is auto-updated on FortiOS. However, the FortiSASE administrator needs to know to re-copy and paste the configuration into FortiSASE.

Currently, there is no way to detect the above and throw a warning on either FortiSASE nor FortiOS GUI.

Other VPN topics

The following topics provide instructions on configuring other VPN topics.

- VPN and ASIC offload on page 2535
- Encryption algorithms on page 2546

VPN and ASIC offload

This topic provides a brief introduction to VPN traffic offloading.

IPsec traffic processed by NPU

1. Check the device ASIC information. For example, a FortiGate 900D has an NP6 and a CP8.

```
# get hardware status
Model name: [[QualityAssurance62/FortiGate]]-900D
ASIC version: CP8
ASIC SRAM: 64M
CPU: Intel(R) Xeon(R) CPU E3-1225 v3 @ 3.20GHz
Number of CPUs: 4
RAM: 16065 MB
Compact Flash: 1925 MB /dev/sda
Hard disk: 244198 MB /dev/sdb
USB Flash: not available
Network Card chipset: [[QualityAssurance62/FortiASIC]] NP6 Adapter (rev.)
```

2. Check port to NPU mapping.

```
# diagnose npu np6 port-list
Chip   XAUI Ports            Max   Cross-chip
                             Speed offloading
----
np6_0  0
        1.    port17           1G    Yes
```

```
        1.    port18           1G    Yes
        1.    port19           1G    Yes
        1.    port20           1G    Yes
        1.    port21           1G    Yes
        1.    port22           1G    Yes
        1.    port23           1G    Yes
        1.    port24           1G    Yes
        1.    port27           1G    Yes
        1.    port28           1G    Yes
        1.    port25           1G    Yes
        1.    port26           1G    Yes
        1.    port31           1G    Yes
        1.    port32           1G    Yes
        1.    port29           1G    Yes
        1.    port30           1G    Yes
        1.    portB            10G   Yes
        1.
----
np6_1  0
        1.    port1            1G    Yes
        1.    port2            1G    Yes
        1.    port3            1G    Yes
        1.    port4            1G    Yes
        1.    port5            1G    Yes
        1.    port6            1G    Yes
        1.    port7            1G    Yes
        1.    port8            1G    Yes
        1.    port11           1G    Yes
        1.    port12           1G    Yes
        1.    port9            1G    Yes
        1.    port10           1G    Yes
        1.    port15           1G    Yes
        1.    port16           1G    Yes
        1.    port13           1G    Yes
        1.    port14           1G    Yes
        1.    portA            10G   Yes
        1.
----
```

3. Configure the option in IPsec phase1 settings to control NPU encrypt/decrypt IPsec packets (enabled by default).

```
config vpn ipsec phase1/phase1-interface
    edit "vpn_name"
        set npu-offload enable/disable
    next
end
```

4. Check NPU offloading. The NPU encrypted/decrypted counter should tick. The `npu_flag 03` flag means that the traffic processed by the NPU is bi-directional.

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0

```

2. Two options are used to control if the CP processes packets. If disabled, packets are processed by the CPU.

```
config system global
    set ipsec-asic-offload disable
    set ipsec-hmac-offload disable
end
```

IPsec traffic processed by CPU

IPsec traffic might be processed by the CPU for the following reasons:

- Some entry-level models do not have NPUs.
- NPU offloading and CP IPsec traffic processing manually disabled.
- Some types of proposals - SEED, ARIA, chacha20poly1305 - are not supported by the NPU or CP.
- NPU flag set to 00 and software encrypt/decrypt counter ticked.

```

Encryption algorithms

This topic provides a brief introduction to IPsec phase 1 and phase 2 encryption algorithms and includes the following sections:

- IKEv1 phase 1 encryption algorithm
- IKEv1 phase 2 encryption algorithm
- IKEv2 phase 1 encryption algorithm
- IKEv2 phase 2 encryption algorithm
- HMAC settings

IKEv1 phase 1 encryption algorithm

The default encryption algorithm is:

```
aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
```

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports:

- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5
- aes256-sha1

- aes256-sha256
- aes256-sha384
- aes256-sha512

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5
- seed128-sha1
- seed128-sha256
- seed128-sha384
- seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. IPsec traffic can be offloaded on NP6XLite and NP7 platforms. They cannot be offloaded on other NP6 processors and below. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

See Network processors (NP6, NP6XLite, NP6Lite, and NP4) and CP9, CP9XLite, and CP9Lite capabilities in the Hardware Acceleration guide for more information.

IKEv1 phase 2 encryption algorithm

The default encryption algorithm is:

```
aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
```

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:

- null-md5
- null-sha1
- null-sha256

- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- 3des-null
- 3des-md5
- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

With the AESGCM encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-null
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256
- seed-sha384
- seed-sha512

IKEv2 phase 1 encryption algorithm

The default encryption algorithm is:

```
aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384 chacha20poly1305-prfsha256
```

DES is a symmetric-key algorithm, which means the same key is used for encrypting and decrypting data. FortiOS supports:

- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

3DES applies the DES algorithm three times to each data. FortiOS supports:

- 3des-md5
- 3des-sha1

- 3des-sha256
- 3des-sha384
- 3des-sha512

AES is a symmetric-key algorithm with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes128gcm-prfsha1
- aes128gcm-prfsha256
- aes128gcm-prfsha384
- aes128gcm-prfsha512
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512
- aes256gcm-prfsha1
- aes256gcm-prfsha256
- aes256gcm-prfsha384
- aes256gcm-prfsha512

The ARIA algorithm is based on AES with different key lengths (128, 192, and 256 bits). FortiOS supports:

- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384
- aria192-sha512
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384

- aria256-sha512

With the chacha20poly1305 encryption algorithm, FortiOS supports:

- chacha20poly1305-prfsha1
- chacha20poly1305-prfsha256
- chacha20poly1305-prfsha384
- chacha20poly1305-prfsha512

SEED is a symmetric-key algorithm. FortiOS supports:

- seed128-md5
- seed128-sha1
- seed128-sha256
- seed128-sha384
- seed128-sha512

Suite-B is a set of AES encryption with ICV in GCM mode. IPsec traffic can be offloaded on NP6XLite and NP7 platforms. They cannot be offloaded on other NP6 processors and below. CP9 supports Suite-B offloading, otherwise packets are encrypted and decrypted by software. FortiOS supports:

- suite-b-gcm-128
- suite-b-gcm-256

See Network processors (NP6, NP6XLite, NP6Lite, and NP4) and CP9, CP9XLite, and CP9Lite capabilities in the Hardware Acceleration guide for more information.

IKEv2 phase 2 encryption algorithm

The default encryption algorithm is:

```
aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
```

With null encryption, IPsec traffic can offload NPU/CP. FortiOS supports:

- null-md5
- null-sha1
- null-sha256
- null-sha384
- null-sha512

With the DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- des-null
- des-md5
- des-sha1
- des-sha256
- des-sha384
- des-sha512

With the 3DES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- 3des-null
- 3des-md5

- 3des-sha1
- 3des-sha256
- 3des-sha384
- 3des-sha512

With the AES encryption algorithm, IPsec traffic can offload NPU/CP. FortiOS supports:

- aes128-null
- aes128-md5
- aes128-sha1
- aes128-sha256
- aes128-sha384
- aes128-sha512
- aes192-null
- aes192-md5
- aes192-sha1
- aes192-sha256
- aes192-sha384
- aes192-sha512
- aes256-null
- aes256-md5
- aes256-sha1
- aes256-sha256
- aes256-sha384
- aes256-sha512

NP7 and NP6XLite can offload the AESGCM encryption algorithm for IPsec traffic. CP9 supports AESGCM offloading. FortiOS supports:

- aes128gcm
- aes256gcm

With the chacha20poly1305 encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- chacha20poly1305

With the ARIA encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- aria128-null
- aria128-md5
- aria128-sha1
- aria128-sha256
- aria128-sha384
- aria128-sha512
- aria192-null
- aria192-md5
- aria192-sha1
- aria192-sha256
- aria192-sha384

- aria192-sha512
- aria256-null
- aria256-md5
- aria256-sha1
- aria256-sha256
- aria256-sha384
- aria256-sha512

With the SEED encryption algorithm, IPsec traffic **cannot** offload NPU/CP. FortiOS supports:

- seed-null
- seed-md5
- seed-sha1
- seed-sha256
- seed-sha384
- seed-sha512

HMAC settings

The FortiGate uses the HMAC based on the authentication proposal that is chosen in phase 1 or phase 2 of the IPsec configuration. Each proposal consists of the encryption-hash pair (such as 3des-sha256). The FortiGate matches the most secure proposal to negotiate with the peer.

To view the chosen proposal and the HMAC hash used:

```
# diagnose vpn ike gateway list

vd: root/0
name: MPLS
version: 1
interface: port1 3
addr: 192.168.2.5:500 -> 10.10.10.1:500
tun_id: 10.10.10.1
virtual-interface-addr: 172.31.0.2 -> 172.31.0.1
created: 1015820s ago
IKE SA: created 1/13 established 1/13 time 10/1626/21010 ms
IPsec SA: created 1/24 established 1/24 time 0/11/30 ms

  DPD sent/recv: 000001e1/00000000
```

Fragmenting IP packets before IPsec encapsulation

The `ip-fragmentation` command controls packet fragmentation before IPsec encapsulation, which can benefit packet loss in some environments.

The following options are available for the `ip-fragmentation` variable.

Option	Description
pre-encapsulation	Fragment before IPsec encapsulation.
post-encapsulation (default value)	Fragment after IPsec encapsulation (RFC compliant).

To configure packet fragmentation using the CLI:

```
config vpn ipsec phase1-interface
   edit "demo"
      set interface "port1"
      set authmethod signature
      set peertype any
      set net-device enable
      set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
      set ip-fragmentation pre-encapsulation
      set remote-gw 172.16.200.4
      set certificate "Fortinet_Factory"
   next
end
```

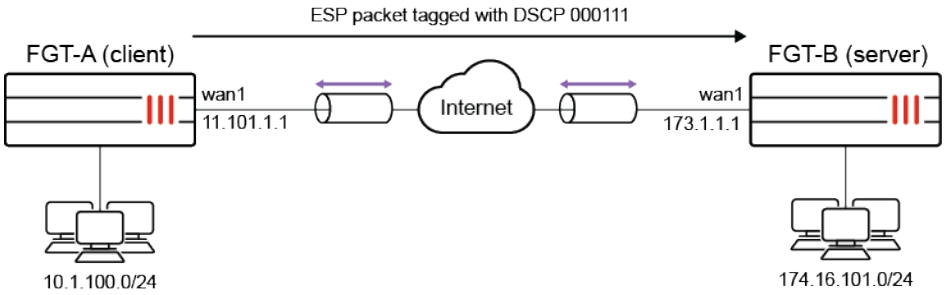
Configure DSCP for IPsec tunnels

Configuring the differentiated services (DiffServ) code in phase2 of an IPsec tunnel allows the tag to be applied to the outer IP header of the Encapsulating Security Payload (ESP) packet. This allows more control over the DSCP value of the ESP packet that can be used by the ISP for QoS controls.

This may be helpful when there is already a DSCP tag within the inner IP header of encapsulated payload. When the inner IP header has a DSCP tag:

- If `diffserv` is disabled in the IPsec phase2 configuration, then the ESP packets' DSCP value is copied from the DSCP value of the inner IP header.
- If `diffserv` is enabled in the IPsec phase2 configuration, then ESP packets' DSCP value is set to the configured value.

Offloading traffic to the NPU must be disabled for the tunnel in order for the configured DSCP value to be applied to the outer IP header of the ESP packet. If NPU offloading is enabled, and diffserv is enabled on the IPsec phase2 settings, then the DSCP value is copied from the inner IP header to the outer IP header.



In this example, NPU offloading is disabled, diffserv is enabled, and the diffserv code is set to 000111 on FGT-A. ESP packets egressing from FGT-A will have the DSCP tag which can be used by the ISP for QoS purpose. Only one side of the tunnel needs to have diffserv enabled.

To configure IPsec on FGT-A:

1. Configure the phase1-interface:

```
config vpn ipsec phase1-interface
    edit "s2s"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set npu-offload disable
        set dhgrp 14 5
        set wizard-type static-fortigate
        set remote-gw 173.1.1.1
        set psksecret ***********
    next
end
```

2. Configure the phase2-interface:

```
config vpn ipsec phase2-interface
    edit "s2s"
        set phase1name "s2s"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set dhgrp 14 5
        set diffserv enable
        set diffservcode 000111
        set src-addr-type name
        set dst-addr-type name
        set src-name "s2s_local"
        set dst-name "s2s_remote"
    next
end
```

3. Check the state of the IPsec tunnel:

```
FGT-A # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
```

```
----------------------------------------------------
name=s2s ver=1 serial=1 11.101.1.1:0->173.1.1.1:0 tun_id=173.1.1.1 dst_mtu=1500

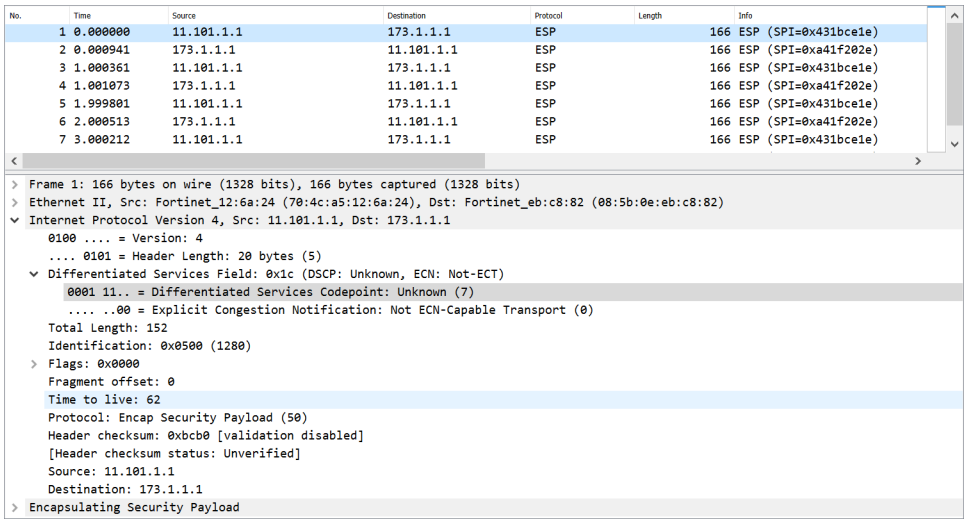
run_tally=1
```

4. Use a packet analyzer, or sniffer, to check the ESP packets:

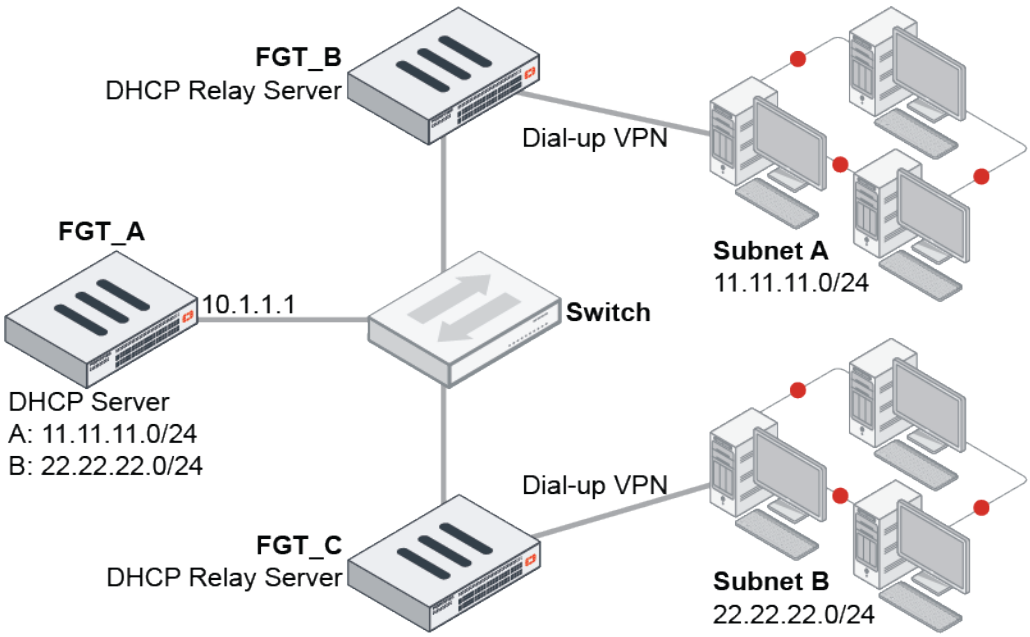


Defining gateway IP addresses in IPsec with mode-config and DHCP

For an IPsec tunnel, the gateway IP address (giaddr) can be defined on a DHCP relay agent. Both IPv4 and IPv6 addresses are supported. An IPsec tunnel with mode-config and DHCP relay cannot specify a DHCP subnet range to the DHCP server.

The DHCP server assigns an IP address based on the giaddr set on the IPSec phase1 interface and sends an offer to this subnet. The DHCP server must have a route to the specified subnet giaddr.

Example



To define the gateway IP address on the DHCP relay server:

1. Configure the VPN IPsec phase1 interface:

```
config vpn ipsec phase1-interface
    edit "ipv4"
        set type dynamic
        set interface "port2"
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal des-md5 des-sha1
        set dpd on-idle
        set dhgrp 5
        set assign-ip-from dhcp
        set dhcp-ra-giaddr 11.11.11.1
        set psksecret ***********
        set dpd-retryinterval 60
    next
end
```

IPv6 could also be configured:

```
config vpn ipsec phase1-interface
    edit "ipv6"
```

```
        set type dynamic
        set interface "port2"
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal des-md5 des-sha1
        set dpd on-idle
        set dhgrp 5
        set assign-ip-from dhcp
        set dhcp6-ra-linkaddr 2000:11:11:11::1
        set psksecret **********
        set dpd-retryinterval 60
    next
end
```

2. Enable DHCP proxy and configure the DHCP server IP address:

```
config system settings
    set dhcp-proxy enable
    set dhcp-server-ip "10.1.1.1"
end
```

3. Repeat the above steps for FGT_C and subnet B.

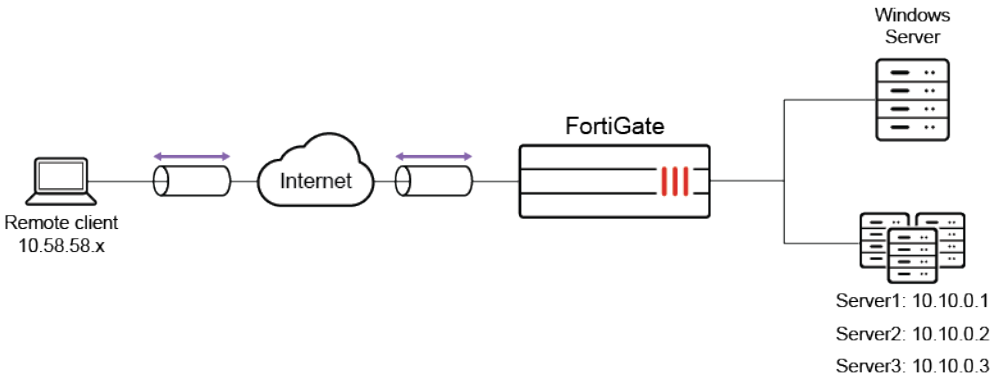
Windows IKEv2 native VPN with user certificate

In this example, IKEv2 with Extensible Authentication Protocol – Transport Layer Security (EAP-TLS) using mutual certificate authentication is configured. Mutual certificate authentication means that both the client and server use certificates to identify themselves. EAP uses RADIUS, which is handled by the Network Policy Server (NPS) on the Windows server. Certificates are generated and distributed through Active Directory Certificate Services (AD CS). An additional certificate is used to identify the IPsec gateway.

This example assumes that the following Windows server roles are installed and available:

- NPS (RADIUS)
- AD CS with a generated CA
- Group Policy Management
- DNS server

It is also assumed that a connection is established between the NPS and FortiGate, and a DNS entry exists for the NPS that the FortiGate can resolve.



Certificates

The following certificates are required:

- CA certificate for EAP-TLS to sign the client and server certificates.

  The CA certificate must be able to sign other certificates. It is created after AD CSs CA role installation. It is named lab-local-CA, as lab.local is the domain that is used in this example. The CA certificate is automatically installed on the server that is hosting the AD CS role. In this example, that server is also hosting the NPS and DNS server.

  The *Key Usage* specifies *Certificate Signing*.
- Client certificate for EAP-TLS used by the windows client.

  The client certificate is stored in the personal user certificate store and is used to authenticate the user. The certificate has *Client Authentication* and a SAN of the user's FQDN, and is signed by the CA. The CA is stored in *Current User > Trusted Root Certification Authorities*.
- Server certificate for EAP-TLS used by the server providing RADIUS authentication.

  The NPS certificate must be in the hosting server's certificate store so that the NPS can access it. It has *Server Authentication* and a SAN DNS name to match the server's IP address. The user must use the FQDN to connect to the VPN. If the IP address that the name resolves to is used, the certificate will not be considered valid.
- VPN certificate used to identify the FortiGate dialup gateway.

  The VPN certificate and private key are installed to the FortiGate using a CSR generated by the FortiGate

Configure the Windows server

The Windows server includes AD-CS, a RADIUS server, and a DNS server.

After the AD CS role has been installed and configured, the CA is ready to sign certificates.

Users and groups are defined first. The groups are configured to automatically receive certificates and relay membership to the FortiGate for granular access control through group matching in policies.

RADIUS is used to authorize connecting users. The RADIUS server returns users' groups with the access-accept response, to indicate to the FortiGate what groups the users belong to.

To create security groups and users:

1. Open *Active Directory Users and Computers*.
2. Create two groups, *Group1* and *Group2*.
3. Create two users, *User1* and *User2*.
   a. To ensure that the automatic enrollment process succeeds in subsequent steps, ensure that each users has an email address configured in the *Email* field under *Properties* > *General*.
4. Add *User1* to *Group1* and *User2* to *Group2*.

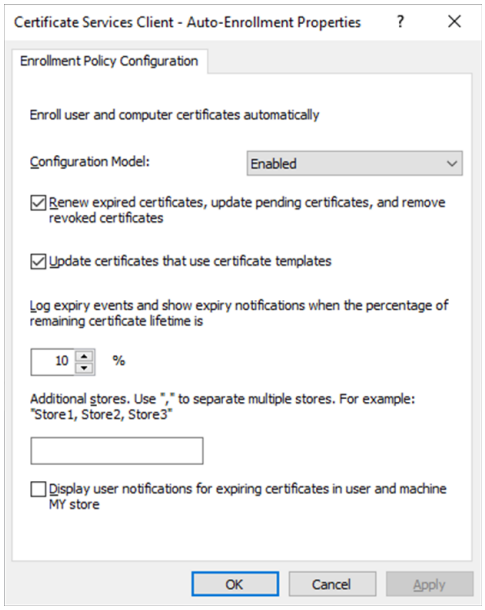
To create a certificate template to enable automatic enrollment for the user groups:

1. Open *Certification Authority*.
2. In the navigation pane, expand the new CA, right-click *Certificate Template* and click *Manage*.
3. Configure a new certificate template:
   a. Right-click the *User* template and click *Duplicate Template*.
   b. On the *General* tab, enter a *Template display name*, such as *User Auto Enroll*.
   c. Enable *Publish certificate in Active Directory* and *Do not automatically reenroll...*.

   d. Configure the remaining settings as required, then go to the *Request Handling* tab.
   e. Disable *Allow private key to be exported* and select *Enroll subject without requiring any user input*.
   f. On the *Security* tab, in *Group or user name*, click *Add*.
   g. Add *Group1* and *Group2*.
   h. Select each group and, under *Permissions*, enable *Read*, *Enroll*, and *Autoenroll*.
   i. On the *Extensions* tab, click *Application Policies* then click *Edit*.
   j. Remove all of the policies expect for *Client Authentication*.
   k. Click *OK* then close the *Certificate Templates* console.
4. In the navigation pane, right-click *Certificate Template* and click *New* > *Certificate Template to Issue*.
5. Select the new certificate template, *User Auto Enroll*, then click *OK*.

To create a group policy to enable automatic enrollment:

1. Open the *Group Policy Management* console.
2. In the navigation pane, go to *Forest:lab.local* > *Domains* > *lab.local*, and then click *Group Policy Objects*.
3. Click *Action*, and then click *New*.
4. Set a *Name* for the new GPO then click *OK*.
5. Right-click the new GPO and click *Edit*.
6. In the *Group Policy Management Editor* navigation pane, go to *User configuration* > *Policies* > *Windows Settings* > *Security Settings* > *Public Key Policies*.
7. In the content pane, double-click *Certificate Services Client - Auto-Enrollment*.
8. Set *Configuration Model* to *Enabled*.
9. Enable *Renew expired certificates...* and *Update certificates...*.



10. Click *OK*.

To verify that users are receiving certificates:

1. Log into an endpoint with a domain user.
2. On the server, open Certification Authority.
3. Expand the CA and select *Issued Certificates*.
4. Verify that the user logged into the endpoint is listed under *Requested Name*. You can also check the local user certificate store on the endpoint.

To generate and sign a CSR and import the signed certificate to the FortiGate:

1. On the FortiGate and go to *System* > *Certificates* and click *Create/Import* > *Generate CSR*.
2. Configure the CSR:

Certificate Name	vpn.lab.local

ID Type	Domain Name
Domain Name	vpn.lab.local
Subject Alternative Name	DNS:vpn.lab.local

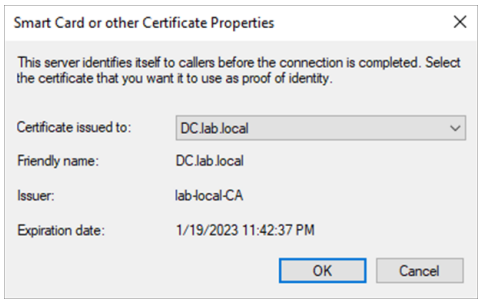
3. Configure the remaining settings as required, then click *OK*.
4. Download the CSR to a location that is accessible to the CA server, in this example: C:\CSR\
5. Sign the CSR with the previously created CA:
   a. Open the command prompt as an administrator and enter the following:

      ```
      certreq -submit -attrib "CertificateTemplate:WebServer" C:\CSR\vpn.lab.local.csr
      ```

      The *Certification Authority List* window opens.
   b. Select the CA and click *OK*.
   c. Save the signed certificate with a .cer file extension to a location that is accessible from the FortiGate.
6. Import the signed certificate to the FortiGate:
   a. On the FortiGate, go to *System > Certificates* and click *Create/Import > Certificate*.
   b. Click *Import Certificate*.
   c. Set *Type* to *Local Certificate*.
   d. Click *Upload* and locate and select the signed certificate
   e. Click *Create* then click *OK*.

To configure network policies on the RADIUS server:

1. Open the *Network Policy Server* and, in the console tree, expand *Policies*.
2. Right-click on *Network Policies* and click *New*.
3. Enter a *Policy name*, such as *VPN-Group1*, then click *Next*.
4. Under *Condition description* click *Add*:
   a. Select *User Groups*, then click *Add*.
   b. Click *Add Groups*.
   c. Enter the group name, *Group1*, click *Check Names* to confirm the group.
   d. Click *OK* in both windows.
5. Click *Next*.
6. Make sure that *Access granted* is selected, then click *Next*.
7. On the *Configure Authentication Methods* page, click *Add* and add the EAP type *Microsoft: Smart Care or other certificate*.
8. Edit the EAP type, select the previously generated certificate, then click *OK*.



9. Deselect all of the *Less secure authentication methods* then click *Next*.
10. Configure constraints as needed, then click *Next*.
11. On the *Configure Settings* page, under *RADIUS Attributes*, select *Vendor Specific*, then click *Add*:
    a. In the *Attributes* list, select *Vendor-Specific*, then click *Add*.

    b. In the *Attribute Information* window, click *Add*.
    c. In the *Vendor-Specific Attribute Information* window, enter the *Vendor Code*, *12356*, and select *Yes. It conforms*.
    d. Click *Configure Attribute* and configure the following:

Vendor-assigned attribute number	1
Attribute format	String
Attribute value	Group

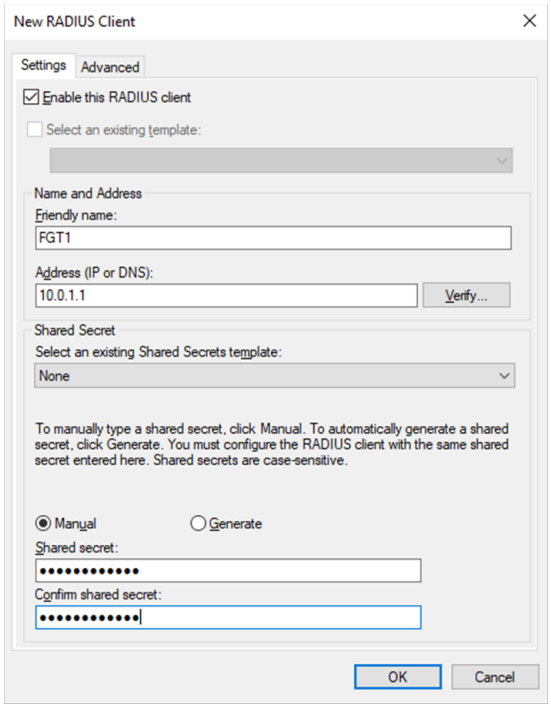
    e. Click *OK* on all three windows and on the *Add Vendor Specific Attribute* window click *Close*.
12. Click *Next*.
13. On the *Completing New Network Policy* page, review the configuration, then click *Finish*.

14. Duplicate the policy for *Group2*, and call the new policy *VPN-Group2*.
15. Reorder the policies so that *VPN-Group1* and *VPN-Group2* are one and two in the processing order.

To add the FortiGate as a RADIUS client:

1. Open the *Network Policy Server* and, in the console tree, expand *RADIUS Clients and Servers*.
2. Right-click on *RADIUS Clients* and click *New*.
3. Add the FortiGate as a RADIUS client:

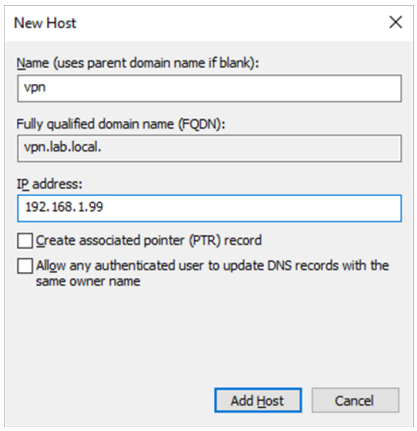
Friendly name	FGT1
Address	10.0.1.1
Shared Secret	Manually enter the shared secret.



4. Click *OK*.

To create a DNS entry for the VPN connection:

1. Open the *DNS Manager*.
2. Go to *DC > Forward Lookup Zones* and select *lab.local*.
3. Right click in the content pane and select *New Host (A or AAAA)*.
4. Enter the VPN name. The FQDN should be auto-filled with *vpn.lab.local*.



5. Enter an IP address.
6. Click *Add Host*.

Configure the FortiGate

An IPsec VPN tunnel is configured to connect to the NPS (RADIUS) server for EAP authentication. For information about IPsec VPN, see IPsec VPN on page 2227.

A RADIUS server is added to relay VPN authentication requests to the NPS server. For information about RADIUS servers, see RADIUS servers on page 2876.

Three groups are created that point to the RADIUS server for authentication: one group each for user group *Group1*, user group *Group2*, and the remote server. For information about groups, see User groups on page 2837.

Three firewall policies are created to test the functionality of the three user groups (see Policies on page 1462):

- Policy 1 allows VPN clients to communicate with each other.
- Policy 2 allows VPN clients in the *Group1* user group to communicate with *Server1* and *Server3*.
- Policy 3 allows VPN clients in the *Group2* user group to communicate with *Server1* and *Server2*.

To configure IPsec VPN in the GUI:

1. Go to *VPN > IPsec Wizard*.
2. Enter a name for the VPN, such as *VPN1*.
3. Set *Template type* to *Custom*, then click *Next*.
4. In the *Network* section, configure the following:

Remote Gateway	Dialup User
Interface	port1
Mode Config	Enable
Assign IP From	Range
Client Address Range	10.58.58.1-10.58.58.10

DNS Server	192.168.1.100
Enable IPv4 Split Tunnel	Enable
Accessible Networks	Select the networks that VPN users will have access to.

5. In the *Authentication* section, configure the following:

Method	Signature
Certificate Name	vpn.lab.local
Version	2
Accept Types	Any peer ID

6. In the *Phase 1 Proposal* section, configure the following:

Encryption / Authentication	AES128 / SHA256
Encryption / Authentication	AES256 / SHA256
Encryption / Authentication	AES128 / SHA1
Diffie-Hellman Groups	14, 5, 2
Local ID	vpn.lab.local

7. In the *Phase 2 Selectors* section, configure the following:

Local Address	Named Address - all
Remote Address	Named Address - all
Encryption / Authentication	AES128 / SHA256
Encryption / Authentication	AES256 / SHA256
Encryption / Authentication	AES128 / SHA1
Enable Perfect Forward Secrecy (PFS)	Disable
Autokey Keep Alive	Enable

8. Enable EAP settings in the CLI:

```
config vpn ipsec phase1-interface
    edit VPN1
        set eap enable
        set eap-identity send-request
    next
end
```

To configure IPsec VPN in the CLI:

```
config vpn ipsec phase1-interface
    edit "VPN1"
```

```
        set type dynamic
        set interface "port1"
        set ike-version 2
        set authmethod signature
        set peertype any
        set net-device disable
        set mode-cfg enable
        set ipv4-dns-server1 192.168.1.100
        set proposal aes128-sha256 aes256-sha256 aes128-sha1
        set localid "vpn.lab.local"
        set dpd on-idle
        set dhgrp 14 5 2
        set eap enable
        set eap-identity send-request
        set certificate "vpn.lab.local"
        set ipv4-start-ip 10.58.58.1
        set ipv4-end-ip 10.58.58.10
        set ipv4-split-include "10/8_net"
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "VPN1"
        set phase1name "VPN1"
        set proposal aes128-sha256 aes256-sha256 aes128-sha1
        set pfs disable
        set keepalive enable
        set src-addr-type name
        set dst-addr-type name
        set src-name "all"
        set dst-name "all"
    next
end
```

To add the RADIUS server in the GUI:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Enter a name for the server, such as *NPS*.
3. Enter the *Primary Server IP/Name* and *Secret*.
   The *Test User Credentials* option will not work, as it does not use certificates for the test.
4. Click *OK*.

To add the RADIUS server in the CLI:

```
config user radius
    edit "NPS"
        set server <ip>
        set secret **********
    next
end
```

To configure the user groups in the GUI:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Enter a name for the group, such as *Group1*.
3. In the *Remote Groups* table, click *Add*:
   a. Set *Remote Server* to the just created RADIUS server, *NPS*.
   b. Set *Groups* to *Specify* and enter *Group1*.
   c. Click *OK*.
4. Click *OK*.
5. Create a second group called *Group2* with the same *Remote Server* and *Group Name* set to *Group2*.
6. Create a third group called RADIUS with the same *Remote Server* but no *Group Name*.

To configure the user groups in the CLI:

```
config user group
    edit "Group1"
        set member "NPS"
        config match
            edit 1
                set server-name "NPS"
                set group-name "Group1"
            next
        end
    next
    edit "Group2"
        set member "NPS"
        config match
            edit 1
                set server-name "NPS"
                set group-name "Group2"
            next
        end
    next
    edit "RADIUS"
        set member "NPS"
    next
end
```

To configure the policies in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure policy 1:

Name	VPN-VPN
Incoming Interface	VPN1
Outgoing Interface	VPN1
Source	all, RADIUS

Destination	all
Schedule	always
Service	ALL
NAT	Disable

3. Click *OK*.
4. Click *Create New* again and configure policy 2:

Name	VPN Group1
Incoming Interface	VPN1
Outgoing Interface	Server1, Server3
Source	all, Group1
Destination	10.10.0.1, 10.10.0.3
Schedule	always
Service	ALL
NAT	Disable

5. Click *OK*.
6. Click *Create New* again and configure policy 3:

Name	VPN Group2
Incoming Interface	VPN1
Outgoing Interface	Server1, Server2
Source	all, Group2
Destination	10.10.0.1, 10.10.0.2
Schedule	always
Service	ALL
NAT	Disable

7. Click *OK*.

To configure the policies in the CLI:

```
config firewall policy
    edit 1
        set name "VPN-VPN"
        set srcintf "VPN1"
        set dstintf "VPN1"
        set action accept
        set srcaddr "all" "RADIUS"
        set dstaddr "all"
```

```
        set schedule "always"
        set service "ALL"
        set nat disable
    next
    edit 2
        set name "VPN Group1"
        set srcintf "VPN1"
        set dstintf "Server1" "Server3"
        set action accept
        set srcaddr "all" "Group1"
        set dstaddr "10.10.0.1" "10.10.0.3"
        set schedule "always"
        set service "ALL"
        set nat disable
    next
    edit 3
        set name "VPN Group2"
        set srcintf "VPN1"
        set dstintf "Server1" "Server2"
        set action accept
        set srcaddr "all" "Group2"
        set dstaddr "10.10.0.1" "10.10.0.2"
        set schedule "always"
        set service "ALL"
        set nat disable
    next
end
```

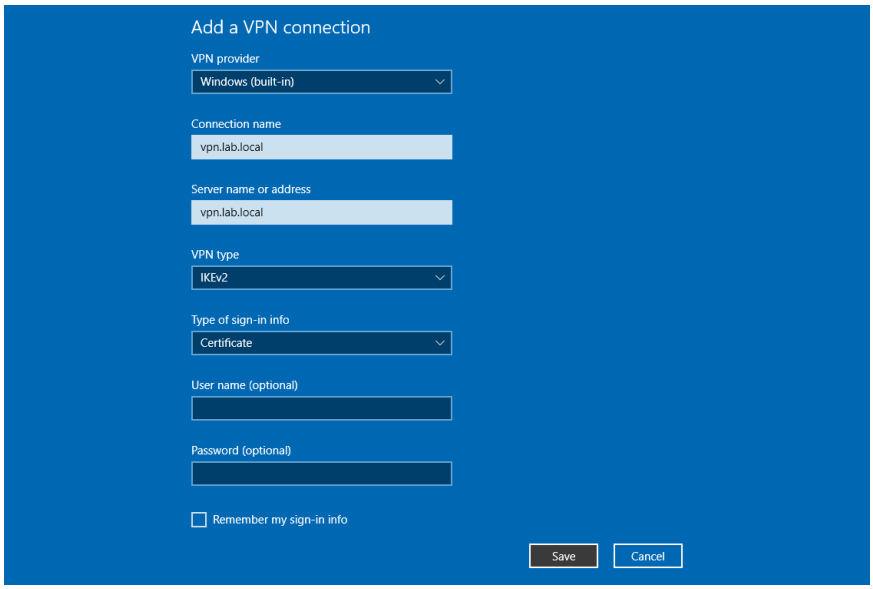
Configure the Windows client

The configuration is done on a Windows 10 Enterprise endpoint.

To add VPN connection and configure a VPN interface:

1. Open the *Settings* page and go to *Network & Internet > VPN*.
2. Click *Add a VPN connection*.
3. Configure the following:

VPN provider	Windows (built-in)
Connection name	vpn.lab.local
Server name or address	vpn.lab.local
VPN type	IKEv2
Type of sign-in info	Certificate



4. Click *Save*.
5. Go to *Network & Internet > Status* and, under *Advanced network settings*, click *Change adapter options*.
6. Select the VPN connection then click *Change settings of this connection*, or right-click on the connection and select *Properties*:
   a. Go to the *Security* tab and, in the *Authentication* section, click *Properties*.
   b. Select *Use a certificate on this computer* and enable *Use simple certification selection*.
   c. Enable *Verify the server's identity by validating the certificate*.
   d. Optionally, enable *Connect to these servers* and enter your NPS server's FQDN, in this case *DC.lab.local*.
   e. In the *Trusted Root Certificate Authorities* list, select the CA *lab-local-CA*.

   f. Click *OK*, then click *OK* again.

To test the connection:

1. Log in to the Windows endpoint as user1.
2. Open the network settings and connect to the *vpn.lab.local* VPN.
3. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server3 (10.10.0.3), but not server2 (10.10.0.2).
4. Log out of the Windows endpoint, then log back in as user2.
5. Open the network settings and connect to the *vpn.lab.local* VPN.
6. Ping each of the three servers to confirm that you can connect to server1 (10.10.0.1) and server2 (10.10.0.2), but not server3 (10.10.0.3).

IPsec IKE load balancing based on FortiSASE account information

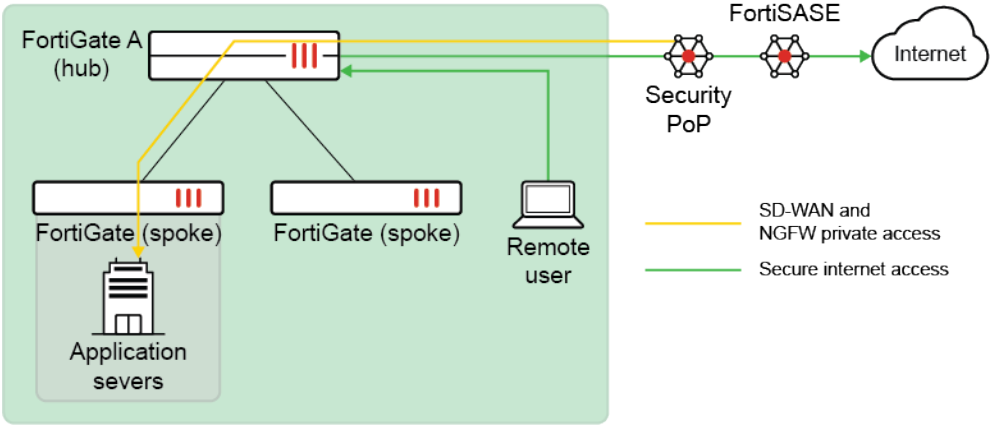
The FortiGate device ID is carried by the IKEv2 message NOTIFY payload when it is configured.

```
config vpn ipsec phase1-interface
    edit <name>
        set dev-id-notification enable
        set dev-id <string>
    next
end
```

This device ID configuration is required when the FortiGate is configured as a secure edge LAN extension for FortiSASE. It allows FortiSASE to distribute IKE/IPsec traffic according to the FortiGate device ID to achieve load balancing.

Example

In this example, a FortiGate SD-WAN is configured, which acts as a secure edge. FortiSASE ensures secure internet access for users in the local network behind the FortiGate and allows other FortiSASE remote users with secure private access to private resources behind the FortiGate.



To configure FortiGate A (FGT-A):

1. Configure the IPsec phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "ul-port1"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set localid "peerid-UNshTWcLQ22UNWqk0UwYtCQNtVhujrxAdyMG0qRsGVkx9mM8ksdaRZOF"
        set dpd on-idle
        set comments "[FGCONN] Do NOT edit. Automatically generated by extension controller."
        set dev-id-notification enable
        set dev-id "FGT_A"
        set remote-gw 172.16.200.2
        set psksecret ********
    next
end
```

2. Verify that the IPsec tunnel is established:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 3
------------------------------------------------------
name=ul-port1 ver=2 serial=3 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 tun_

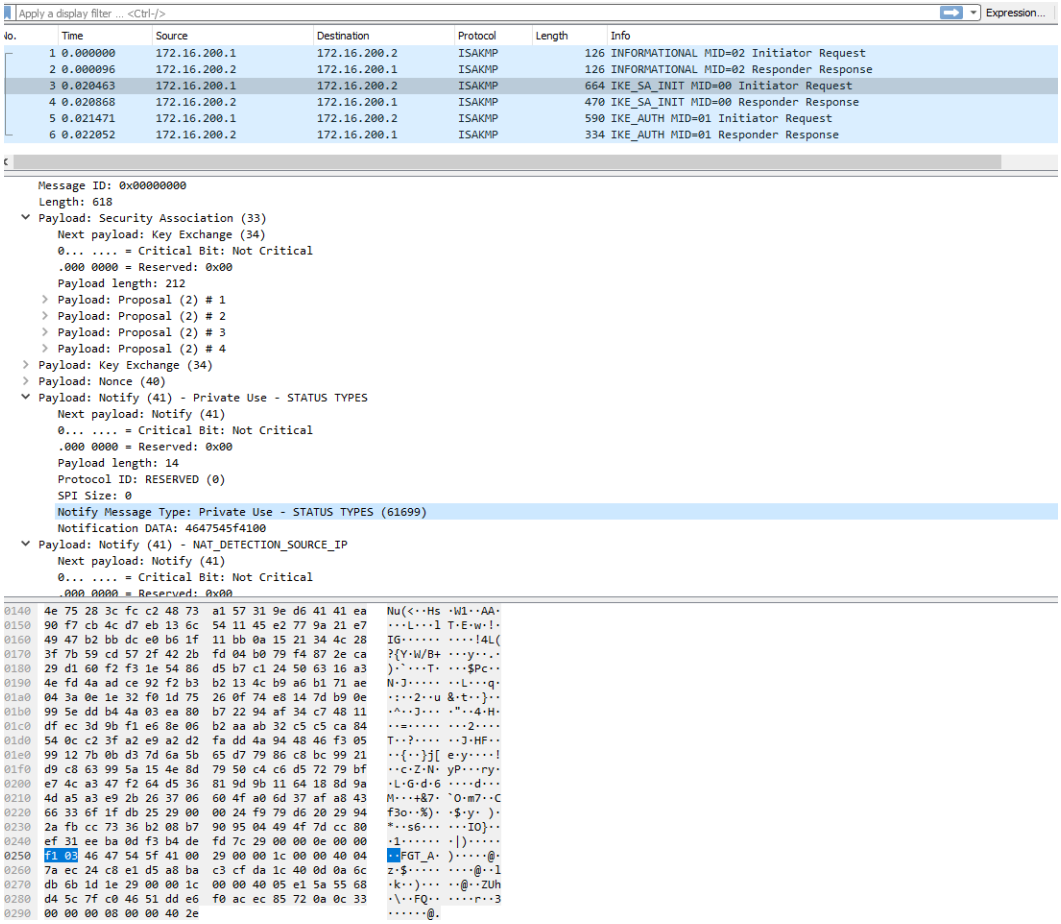
run_tally=0
```

3. Perform a packet capture of IPsec traffic (Wireshark is used in this example) and locate the initiator request IKE packet's NOTIFY message (type 61699).



IPsec SA key retrieval from a KMS server using KMIP

In environments that require centralized management of cryptographic keys where no key derivations or algorithmic operations are allowed on edge devices (such as the FortiGate), they will deploy a Key Management Services (KMS) server cluster to generate and manage all cryptographic keys. Then, the Key Management Interoperability Protocol (KMIP) is used on the edge devices to locate the KMS server, create keys if they do not exist, and retrieve keys to be used for securing these edge devices.

FortiGates have a KMIP client that sends KMIP requests to locate the Key Management Services (KMS) server, creates keys if they do not exist on the KMS server, and retrieves keys from the KMS server to use as IPsec security association (SA) keys for IKEv2 only.

This feature allows the FortiGate to offload the task of generating IPsec SA keys to a KMS server, regardless of specific IPsec VPN topologies with a FortiGate, when the administrator has the requirement to centralize cryptographic keys management in a KMS server.

The FortiGate's integrated KMIP client also supports the following:

- If the KMS server is unavailable, then the FortiGate continues to use the previous keys to avoid a network blackout.
- ADVPN configurations for the hub and spoke, so that shortcuts between two spokes will use their own encryption keys retrieved from the KMS server.

- Multiple tunnels between the same tunnel endpoints using multiple VRFs.

To configure the KMIP server:

```
config vpn kmip-server
    edit <KMS_server_ID>
        config server-list
            edit <ID>
                set server <server_IP>
                set cert <string>
            next
        end
        set username <username_defined_on_KMS_server>
        set password <password>
    next
end
```

To apply the KMS server in the phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit <name>
        set kms <KMS_server_ID>
    next
end
```

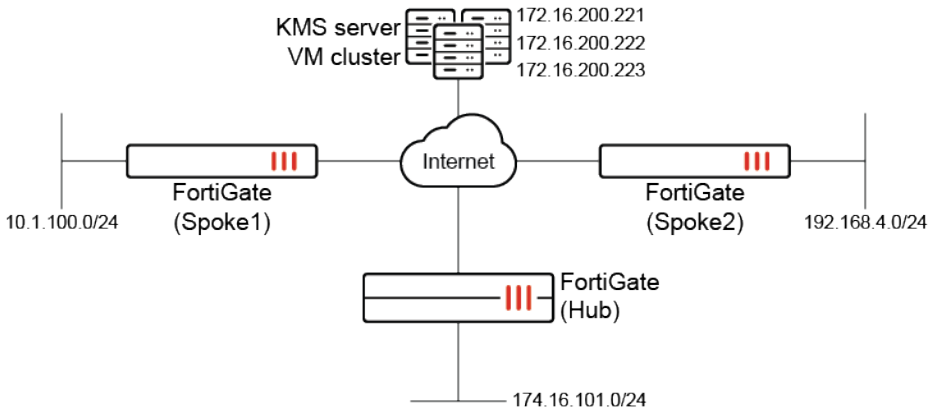
IPsec tunnels will not be established if a FortiGate VPN peer does not support KMS, or has not configured `kms <KMS_server_ID>` in `config vpn ipsec phase1-interface`.

The following diagnostic commands have been added:

- `get vpn ike kms-keys`
- `diagnose debug application kmipd -1`
- `execute kmip {create | destroy | get | locate | rekey} <parameter>`

Example

In this example, there is a topology with an ADVPN hub FortiGate and two spoke FortiGates. There is a cluster or three KMS server VMs (172.16.200.221, 172.16.200.222, and 172.16.200.223) that operates in round-robin mode. The `testuser1_Cert` certificate is issued by the KMS server, and the `testuser1` user is defined on the KMS server. Authentication to the KMS server by the KMIP client requires both a certificate and a password.



The Hub FortiGate acting as the responder will try to locate keys on the KMS server first. If they do not exist, the FortiGate requests to create new keys on KMS server. The responder sends the keys' names to the Spoke1 and Spoke2 FortiGates acting as the initiators using IKE messages, and these initiators locate and retrieve keys from KMS server using the keys' names. The `keylifeseconds` parameter in phase 2 defines how often the FortiGate will try to synchronize local keys to those on the KMS server.

The keys are retrieved from the KMS server and used as IPsec SA keys in IPsec tunnels. The key format used is: [IDi/r]-[IDr/i]-[phase2name]-ENC/AUTH-[keyalg]-[keylen].

First, this example focuses on the Hub FortiGate and the IPsec VPN connection between the Spoke1 and Hub FortiGate. Second, this example focuses on the spoke-to-spoke tunnel, also known as a shortcut tunnel or shortcut, which is established when traffic flows between the Spoke1 and Spoke2 FortiGates.

To configure IPsec SA key retrieval from a KMS server on the Hub FortiGate:

1. Configure the KMIP server:

```
config vpn kmip-server
    edit "KMS_server"
        config server-list
            edit 1
                set server "172.16.200.221"
                set cert "testuser1_Cert"
            next
            edit 2
                set server "172.16.200.222"
                set cert "testuser1_Cert"
            next
            edit 3
                set server "172.16.200.223"
                set cert "testuser1_Cert"
            next
        end
        set username "testuser1"
        set password **********
    next
end
```

2. Configure the IPsec VPN phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "hub"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set authmethod signature
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set kms "KMS_server"
        set certificate "Fortinet_Factory_Backup"
        set dpd-retryinterval 60
    next
end
```

This feature is only supported in IKEv2. The `localid` is required in the phase 1 settings when using the PSK authentication method.

3. Configure the IPsec VPN phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "hub"
        set phase1name "hub"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set keylifeseconds 7200
    next
end
```

To verify the IPsec configuration and tunnel between the Hub and Spoke1 FortiGates:

1. Verify the tunnel state on the Hub:

```
Hub # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=hub ver=2 serial=1 172.16.200.4:0->0.0.0.0:0 tun_id=10.0.0.1 tun_id6=::10.0.0.1 dst_mtu=0

```

2. Verify the KMS keys for the VPN tunnel between the Hub and Spoke1:

```
Hub # get vpn ike  kms-keys

vd: root/0
name: hub_1
addr: 172.16.200.4:500 -> 172.16.200.3:500

  phase2
  name: hub
  server: "KMS_server"
  spi: 628d1813
    enc
      keyname: "Spoke2-hub-hub-ENC-AES-16"
      key: 5fcca9194ced21b0a586a8fd7a27cbf7
    auth
      keyname: "Spoke2-hub-hub-AUTH-SHA1-20"
      key: 6d6d9dc77d5af89f062927c4d4695d404df1ffe3
  spi: 8d568113
    enc
      keyname: "hub-Spoke2-hub-ENC-AES-16"
      key: 2006f323b760238048fcd6f7783b0a04
    auth
      keyname: "hub-Spoke2-hub-AUTH-SHA1-20"
      key: bd6db68ee035088f35174b2b5c58a51fbbe3f5b5

vd: root/0
name: hub_0
addr: 172.16.200.4:500 -> 172.16.200.1:500

  phase2
  name: hub
  server: "KMS_server"
  spi: 628d1814
    enc
      keyname: "Spoke1-hub-hub-ENC-AES-16"

    auth
      keyname: "Spoke1-hub-hub-AUTH-SHA1-20"
      key: e660f491b80b2cfdcdb0d737942bea2e853dac8d
  spi: 471dfe2e
    enc
      keyname: "hub-Spoke1-hub-ENC-AES-16"
      key: 1de4b8e8accaa792e0934fbd9f933a6a
    auth
      keyname: "hub-Spoke1-hub-AUTH-SHA1-20"
      key: 1fa244d3971b4d4df59b8d7b3655a1b77f8e65af
```

3. Verify the IKE and KMIP debug messages on both FortiGates:

```
# diagnose debug application ike -1
# diagnose debug application kmipd -1
```

a. For the responder FortiGate, Hub:

```
ike 0: comes 172.16.200.1:500->172.16.200.4:500,ifindex=10,vrf=0....

ike 0:spoke1:536:spoke1:549: sending SNMP tunnel UP trap
```

To verify the IPsec configuration and tunnel between the Spoke1 and Spoke2 FortiGates:

1. Verify the tunnel state on Spoke1:

```
Spoke1 # diagnose vpn tunnel list

```

2. Verify the KMS keys for the VPN tunnel between Spoke1 and Spoke2:

```
Spoke1 # get vpn ike kms-keys

vd: root/0
name: spoke1
addr: 172.16.200.1:500 -> 172.16.200.4:500

  phase2
  name: spoke1
  server: "KMS_server"
  spi: 628d1814
    enc
      keyname: "Spoke1-hub-hub-ENC-AES-16"
```

```
      key: 5dad0d8d3568eab7c3f259349dc64039
    auth
      keyname: "Spoke1-hub-hub-AUTH-SHA1-20"
      key: e660f491b80b2cfdcdb0d737942bea2e853dac8d
  spi: 471dfe2e
    enc
      keyname: "hub-Spoke1-hub-ENC-AES-16"
      key: 1de4b8e8accaa792e0934fbd9f933a6a
    auth
      keyname: "hub-Spoke1-hub-AUTH-SHA1-20"
      key: 1fa244d3971b4d4df59b8d7b3655a1b77f8e65af

vd: root/0
name: spoke1_0
addr: 172.16.200.1:500 -> 172.16.200.3:500

  phase2
  name: spoke1
  server: "KMS_server"
  spi: 8d568114
    enc
      keyname: "Spoke1-Spoke2-spoke2-ENC-AES-16"
      key: b01c534b11792b856c1b95c78c4cad91
    auth
      keyname: "Spoke1-Spoke2-spoke2-AUTH-SHA1-20"
      key: fe6a82177db6911b3203d1306969e5ddec8fd039
  spi: 471dfe2f
    enc
      keyname: "Spoke2-Spoke1-spoke2-ENC-AES-16"
      key: a6d6a25cd986860bcc502d58f32e99de
    auth
      keyname: "Spoke2-Spoke1-spoke2-AUTH-SHA1-20"
      key: 07d712156eaca28439fbe944e3a8c9af4c45166a
```

3. Verify the FortiGate (KMIP client) connection to the KMS server:

```
Spoke1 # execute kmip locate KMS_server hub-Spoke1-hub-AUTH-SHA1-20
Locating key 'hub-Spoke1-hub-AUTH-SHA1-20', jobid=1935521133
Ret=0, jobid=1935521133
        Key ID: 2ba130bff7174ba7a237d7ea53611121383b132cf18a4fd183890ca196296cb4
```

4. Verify the IKE and KMIP debug messages on Spoke1 to confirm that when the KMS server is down during IPsec rekey, IPsec tunnel does not go down:

```
Spoke1 # diagnose debug application ike -1
Spoke1 # diagnose debug application kmipd -1

ike 0:spoke1:543:580 rekey in progress for SPI 471dfe32

```

IPsec key retrieval with a QKD system using the ETSI standardized API

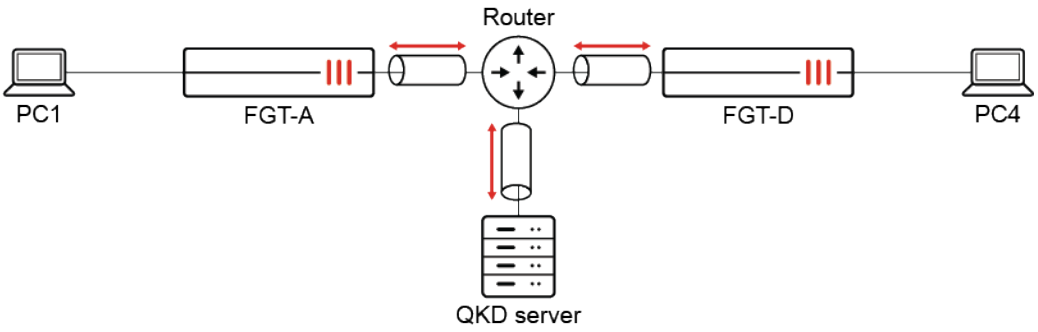
FortiGates support IPsec key retrieval with a quantum key distribution (QKD) system using the ETSI standardized API. This eliminates negotiation, simplifies the process, and enhances efficiency in IPsec key management.

```
config vpn qkd
    edit <name>
        set server <string>
        set port <integer>
        set id <string>
        set peer <string>
        set certificate <certificate_name>
    next
end
```

`server <string>`	Enter the IPv4, IPv6, or DNS address of the key management entity (KME).
`port <integer>`	Enter the port to connect to on the KME, 1 - 65535.
`id <string>`	Enter the quantum key distribution ID assigned by the KME.
`peer <string>`	Enter the peer or peer group to authenticate with the quantum key device's certificate.
`certificate <certificate_name>`	Enter the name of up to four certificates to offer to the KME.

Example

In this example, a quantum key distribution (QKD) system is deployed to perform central IPsec key management. The FortiGates installed as security gateways will terminate large amount of IPsec tunnels.



To configure IPsec key retrieval with a QKD system:

1. Configure FGT-A:
   a. Configure the QKD profile:

```
config vpn qkd
    edit "qkd_1"
        set server "172.16.200.83"
        set port 8989
        set id "FGT-A"
        set peer "qkd"
        set certificate "FGT_qkd1"
    next
end
```

   b. Configure the IPsec phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "site1"
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set qkd allow
        set qkd-profile "qkd_1"
        set remote-gw 173.1.1.1
        set psksecret **********
    next
end
```

   c. Configure the IPsec phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "site1"
        set phase1name "site1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

2. Configure FGT-D:
   a. Configure the QKD profile:

```
config vpn qkd
    edit "qkd_1"
        set server "172.16.200.83"
        set port 8989
        set id "FGT-D"
        set peer "qkd"
        set certificate "FGT_qkd3"
    next
end
```

b. Configure the IPsec phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "site2"
        set interface "port25"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set qkd require
        set qkd-profile "qkd_1"
        set remote-gw 11.101.1.1
        set psksecret **********
    next
end
```

c. Configure the IPsec phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "site2"
        set phase1name "site2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
    next
end
```

To verify the configuration:

1. Generate traffic between PC1 and PC4.
2. Run diagnostics on FGT-A:
   a. Verify the IPsec phase 1 interface status:

```
# diagnose vpn ike gateway list

vd: root/0
name: site1
version: 1
interface: wan1 17
addr: 11.101.1.1:500 -> 173.1.1.1:500
tun_id: 172.16.200.4/::172.16.200.4
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 3s ago
peer-id: 173.1.1.1
peer-id-auth: no
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
IPsec SA: created 1/1  established 1/1  time 30/30/30 ms

  id/spi: 21 ad7d995677250c7e/053f958ea7be66c8
  direction: initiator
  status: established 3-3s ago = 0ms
  proposal: aes128-sha256
```

```
  key: 5b198e1a431c20fb-c08135cf0c007704
  QKD: yes
  lifetime/rekey: 86400/86096
  DPD sent/recv: 00000000/00000000
  peer-id: 173.1.1.1
```

b. Verify the IPsec phase 2 tunnel status:

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=site1 ver=1 serial=2 11.101.1.1:0->173.1.1.1:0 tun_id=172.16.200.4 tun_
id6=::172.16.200.4 dst_mtu=1500 dpd-link=on weight=1
bound_if=17 lgwy=static/1 tun=intf mode=auto/1 encap=none/552 options[0228]=npu frag-rfc
run_state=0 role=primary accept_traffic=1 overlay_id=0

proxyid_num=1 child_num=0 refcnt=4 ilast=12 olast=11 ad=/0
stat: rxp=1 txp=2 rxb=84 txb=168
dpd: mode=on-demand on=1 idle=20000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=site1 proto=0 sa=1 ref=3 serial=2
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:0.0.0.0-255.255.255.255:0
  SA:  ref=6 options=10226 type=00 soft=0 mtu=1438 expire=42883/0B replaywin=2048
       seqno=3 esn=0 replaywin_lastseq=00000002 qat=0 rekey=0 hash_search_len=1
  life: type=01 bytes=0/0 timeout=42897/43200
  dec: spi=b2af532f esp=aes key=16 c1d5d17e6bdecd5b145f672a5054cde1
       ah=sha1 key=20 084f1c0fee48994f59a125606f9c757838dc2421
  enc: spi=3d14392a esp=aes key=16 66277c8cf2bdbd2d12a9d829dde356ad
       ah=sha1 key=20 fdbaa42cca5c3a9bffb1cf0fc74ff29a643a2b9f
  dec:pkts/bytes=1/84, enc:pkts/bytes=2/304
  npu_flag=03 npu_rgwy=173.1.1.1 npu_lgwy=11.101.1.1 npu_selid=4 dec_npuid=2 enc_npuid=2
```

The IPsec tunnel is up and traffic passes through.

c. Verify the IKE debug messages:

```
# diagnose debug application ike -1
...
ike V=root:0:site1:site1: IPsec SA connect 17 11.101.1.1->173.1.1.1:0

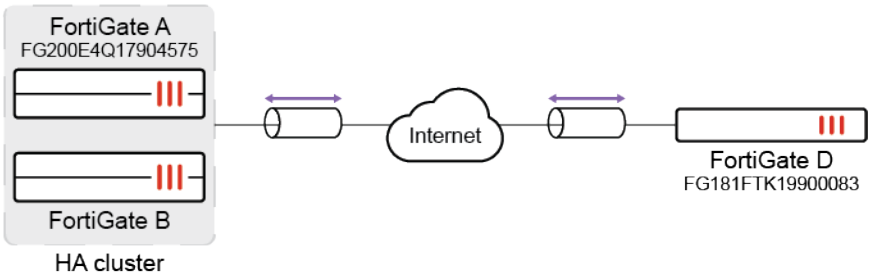
Securely exchange serial numbers between FortiGates connected with IPsec VPN

Serial numbers can be securely exchanged between FortiGates connected with IPsec VPN. This feature is supported in IKEv2, IKEv1 main mode, and IKEv1 aggressive mode. The exchange is only performed with participating FortiGates that have enabled the `exchange-fgt-device-id` setting under `config vpn ipsec phase1-interface`.

Example

In this example, FortiGates A and B are in an HA cluster, so the serial numbers will not exchange after failover. The cluster is connected to FortiGate D through IPsec VPN.



To securely exchange serial numbers between the FortiGates:

1. Configure the IPsec settings on FortiGate A.
   a. Configure the phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "to_FGTD"
        set interface "port1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set exchange-fgt-device-id enable
        set remote-gw 172.16.200.4
        set psksecret **********
    next
end
```

   b. Configure the phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "to_FGTD"
        set phase1name "to_FGTD"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
```

```
        set src-name "to_FGTD_local"
        set dst-name "to_FGTD_remote"
    next
end
```

2. Configure the IPsec settings on FortiGate D.
   a. Configure the phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "to_FGTA"
        set interface "port2"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set exchange-fgt-device-id enable
        set remote-gw 172.16.200.1
        set psksecret **********
    next
end
```

   b. Configure the phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "to_FGTA"
        set phase1name "to_FGTA"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm
aes256gcm chacha20poly1305
        set src-addr-type name
        set dst-addr-type name
        set src-name "to_FGTA_local"
        set dst-name "to_FGTA_remote"
    next
end
```

3. Verify the peer serial numbers.
   a. On FortiGate A:

```
# diagnose vpn ike gateway list

vd: root/0
name: to_FGTD
version: 1
interface: port1 19
addr: 172.16.200.1:500 -> 172.16.200.4:500
tun_id: 172.16.200.4/::172.16.200.4
remote_location: 0.0.0.0
network-id: 0
created: 783s ago
peer-id: 172.16.200.4
peer-id-auth: no
peer-SN: FG181FTK19900083
IKE SA: created 1/1  established 1/1  time 0/0/0 ms
```

```
IPsec SA: created 1/1  established 1/1  time 0/0/0 ms

  id/spi: 2 a8b2df203ef134e8/955fafbd10a04fa0
  direction: initiator
  status: established 783-783s ago = 0ms
  proposal: aes128-sha256
  key: 644db099e1178d1f-119fee3141f1e2a6
  lifetime/rekey: 86400/85316
  DPD sent/recv: 00000000/00000000
  peer-id: 172.16.200.4
```

b. On FortiGate D:

```
# diagnose vpn ike gateway list

vd: root/0
name: to_FGTA
version: 1
interface: port2 10
addr: 172.16.200.4:500 -> 172.16.200.1:500
tun_id: 172.16.200.1/::172.16.200.1
remote_location: 0.0.0.0
network-id: 0
created: 723s ago
peer-id: 172.16.200.1
peer-id-auth: no
peer-SN: FG200E4Q17904575
IKE SA: created 1/1  established 1/1  time 10/10/10 ms
IPsec SA: created 0/0

  id/spi: 7 a8b2df203ef134e8/955fafbd10a04fa0
  direction: responder
  status: established 723-723s ago = 10ms
  proposal: aes128-sha256
  key: 644db099e1178d1f-119fee3141f1e2a6
  lifetime/rekey: 86400/85406
  DPD sent/recv: 00000000/00000000
  peer-id: 172.16.200.1
```

4. After an HA failover, verify that the peer serial numbers have not changed.

a. On FortiGate B:

```
# diagnose vpn ike gateway  list

vd: root/0
name: to_FGTD
version: 2
interface: port1 19
addr: 172.16.200.1:500 -> 172.16.200.4:500
tun_id: 172.16.200.4/::172.16.200.4
remote_location: 0.0.0.0
network-id: 0
```

```
created: 104s ago
peer-id: 172.16.200.4
peer-id-auth: no
peer-SN: FG181FTK19900083
PPK: no
IKE SA: created 1/2  established 1/2  time 0/0/0 ms

peer-id: 172.16.200.1
```

To retrieve the peer serial number in FortiManager:

1. Add and authorize FortiGate A (see Adding online devices using Discover mode for more details).
2. Go to *Device Manager* > *Device & Groups* and select the FortiGate A.
3. Add the *IPsec VPN* widget (see Customizing the dashboard for more details).
4. Open the developer tools in your browser and select the *Network* tab.
5. Refresh the *IPsec VPN* widget.
6. In the *Network* tab, there should be a JSON POST request that FortiManager will proxy request to the FortiGate for the IPsec API. The response should contain the peer serial number.

Multiple interface monitoring for IPsec

IPsec can monitor multiple interfaces per tunnel, and activate a backup link only when all of the primary links are down. This can be useful if you have multiple WAN links and want to optimize your WAN link selection and performance while limiting the use of more expensive and bandwidth intensive interfaces, like 5G or LTE.

In cases where multiple primary overlays are deployed and the backup overlay is on an LTE connection, avoiding IPsec keep alive messages, BGP hellos, and SD-WAN health checks on the backup connection is required when the primary overlays are working. The backup overlay can monitor all of the primary overlays, and is not activated until the number of unhealthy primary overlays equals or surpasses the predefined threshold.

```
config vpn ipsec phase1-interface
    edit <phase-1 name>
        set monitor <overlay> <overlay> ... <overlay>
        set monitor-min <integer>
    next
end
```

`monitor`	The IPsec interfaces to monitor.
`monitor-min`	The minimum number of monitored interfaces that must become degraded before this interface is activated (0 = all interfaces, default = 0).

In this example, four primary overlays are configured, T1 - T4, on fixed broadband connections and one backup overlay, T5, is configured on an LTE connection.

The backup overlay stays down as long as the primary overlays are working normally. When all four of the primary overlays go down, the backup overlay is activated and used to forward traffic. If any of the primary overlays recover, then the backup overlay goes down.

SD-WAN can also be configured to steer traffic.

To configure the overlays:

1. Configure the VPN remote gateways:

```
config vpn ipsec phase1-interface
    edit "T1"
        set interface "dmz"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.208.2
        set psksecret **********
    next
    edit "T2"
        set interface "agg1"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.203.2
        set psksecret **********
    next
    edit "T3"
        set interface "vlan100"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.206.2
        set psksecret **********
    next
    edit "T4"
        set interface "port15"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.209.2
        set psksecret **********
    next
    edit "T5"
        set interface "vlan200"
        set ike-version 2
        set peertype any
        set monitor "T1" "T2" "T3" "T4"
        set monitor-min 4
        set net-device disable
        set proposal aes128-sha256
        set remote-gw 172.16.210.2
        set psksecret **********
```

```
   next
end
```

2. Configure the VPN tunnels:

```
config vpn ipsec phase2-interface
    edit "T1_P2"
        set phase1name "T1"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
    edit "T2_P2"
        set phase1name "T2"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
    edit "T3_P2"
        set phase1name "T3"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
    edit "T4_P2"
        set phase1name "T4"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
    edit "T5_P2"
        set phase1name "T5"
        set proposal aes256-sha256
        set auto-negotiate enable
    next
end
```

3. Configure the interfaces:

```
config system interface
    edit "T1"
        set vdom "root"
        set ip 100.1.1.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.1.2 255.255.255.0
        set snmp-index 113
        set interface "dmz"
    next
    edit "T2"
        set vdom "root"
        set ip 100.1.2.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.2.2 255.255.255.0
        set snmp-index 114
```

```
        set interface "agg1"
    next
    edit "T3"
        set vdom "root"
        set ip 100.1.3.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.3.2 255.255.255.0
        set snmp-index 115
        set interface "vlan100"
    next
    edit "T4"
        set vdom "root"
        set ip 100.1.4.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.4.2 255.255.255.0
        set snmp-index 65
        set interface "port15"
    next
    edit "T5"
        set vdom "root"
        set ip 100.1.5.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 100.1.5.2 255.255.255.0
        set snmp-index 117
        set interface "vlan200"
    next
end
```

4. Check the IPsec tunnel summary:

```
# get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T3' 172.16.206.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T4' 172.16.209.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T5' 172.16.210.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T1' 172.16.208.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
```

The backup overlay, T5, is down.

To configure steering traffic with SD-WAN:

1. Configure the SD-WAN:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
```

```
    config members
        edit 1
            set interface "T1"
        next
        edit 2
            set interface "T2"
        next
        edit 3
            set interface "T3"
        next
        edit 4
            set interface "T4"
        next
        edit 5
            set interface "T5"
        next
    end
    config service
        edit 1
            set name "1"
            set load-balance enable
            set dst "all"
            set src "172.16.205.0"
            set priority-members 1 2 3 4 5
        next
    end
end
```

2. Configure a static route:

```
config router static
    edit 5
        set dst 8.0.0.0 255.0.0.0
        set distance 1
        set sdwan-zone "virtual-wan-link"
    next
end
```

3. Check the routing table:

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T2 tunnel 172.16.203.2, [1/0]
                  [1/0] via T3 tunnel 172.16.206.2, [1/0]
                  [1/0] via T1 tunnel 172.16.208.2, [1/0]
                  [1/0] via T4 tunnel 172.16.209.2, [1/0]
```

Check the results:

- When both the T1 and T2 connections are down, T5 stays down as well, and traffic is load-balanced on T3 and T4 by the SD-WAN configuration:

```
 # get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T3' 172.16.206.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T4' 172.16.209.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T5' 172.16.210.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T1' 172.16.208.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
```

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T3 tunnel 172.16.206.2, [1/0]
                  [1/0] via T4 tunnel 172.16.209.2, [1/0]
```

Traffic is load-balanced between the remaining tunnels:

```
# diagnose sniffer packet any 'host 8.8.8.8' 4
interfaces=[any]
filters=[host 8.8.8.8]
3.027055 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.027154 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.031434 T4 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
3.031485 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
3.612818 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.612902 T3 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
3.617107 T3 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
3.617159 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.168845 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.168907 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.173150 T4 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.173174 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.710907 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.710991 T3 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.715933 T3 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
4.715958 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
```

- When all of the primary overlays are down, T5 is activated and used for traffic

```
# get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T3' 172.16.206.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T4' 172.16.209.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T5' 172.16.210.2:0  selectors(total,up): 1/1  rx(pkt,err): 0/0  tx(pkt,err): 0/4
'T1' 172.16.208.2:0  selectors(total,up): 1/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
```

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T5 tunnel 172.16.210.2, [1/0]
```

Traffic is using the backup overlay, T5:

```
# diagnose sniffer packet any 'host 8.8.8.8' 4
interfaces=[any]
filters=[host 8.8.8.8]
```

```
1.907944 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
1.908045 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
1.912283 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
1.912351 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
2.665921 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
2.665999 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
2.670209 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
2.670235 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.269997 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.270090 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.274275 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.274300 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.781848 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.781920 T5 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
5.786334 T5 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
5.786363 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
```

- If T4 recovers, T5 is deactivated and traffic switches to T4:

```
# get vpn ipsec tunnel summary
'T2' 172.16.203.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T3' 172.16.206.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T4' 172.16.209.2:0  selectors(total,up): 2/2  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T5' 172.16.210.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
'T1' 172.16.208.2:0  selectors(total,up): 2/0  rx(pkt,err): 0/0  tx(pkt,err): 0/0
```

```
# get router info routing-table static
Routing table for VRF=0
S       8.0.0.0/8 [1/0] via T4 tunnel 172.16.209.2, [1/0]
```

The primary overlay T4 has recovered, and the backup overlay is down again:

```
# diagnose sniffer packet any 'host 8.8.8.8' 4
interfaces=[any]
filters=[host 8.8.8.8]
4.555685 port5 in 172.16.205.100 -> 8.8.8.8: icmp: echo request
4.555790 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request

6.102263 T4 out 172.16.205.100 -> 8.8.8.8: icmp: echo request
6.106411 T4 in 8.8.8.8 -> 172.16.205.100: icmp: echo reply
6.106445 port5 out 8.8.8.8 -> 172.16.205.100: icmp: echo reply
```

Cross-validation for IPsec VPN

FortiOS supports a cross-validation mechanism for IPsec VPN, aimed at bolstering security and user authentication by mitigating the risk of unauthorized access and identity spoofing. This mechanism functions by cross-checking whether the username provided by the client matches the identity field specified in the peer certificate. The identity field, which could be an Othername, RFC 822 Name, or CN, serves as a unique identifier for the client.

```
config vpn ipsec phase1-interface
    edit <name>
        set cert-peer-username-validation {none | othername | rfc822name | cn}
        set cert-peer-username-strip {enable | disable}
    next
end
```

Validation can be enabled for IPsec VPN when the peer sends certificates for authentication and XAUTH, EAP, SAML, or `azure-ad-autoconnect` is used. Name matching is not case sensitive.

To configure cross-validation for IPsec VPN:

1. Configure IPsec VPN phase1:

```
config vpn ipsec phase1-interface
    edit "toclient"
        set type dynamic
        set interface "port8"
        set authmethod signature
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256
        set dpd on-idle
        set dhgrp 5
        set xauthtype auto
        set authusrgrp "vpnad01- ldap-group"
        set cert-peer-username-validation othername
        set cert-peer-username-strip enable
        set certificate "FTG-D"
    next
end
```

2. Configure IPsec VPN phase2:

```
config vpn ipsec phase2-interface
    edit "toclient"
        set phase1name "toclient"
        set proposal aes128-sha256 aes256-sha256
        set dhcp-ipsec enable
```

```
    next
end
```

3. In FortiClient, input a username that corresponds with the identity in the certificate, such as *tester2*.
4. Verify that the cross-validation succeeded and the tunnel is established:

```
# diagnose vpn ike gateway list

vd: root/0
name: toclient_0
version: 1
interface: port8 16
addr: 173.1.1.1:4500 -> 173.1.1.2:64917
tun_id: 173.1.1.2/::10.0.0.12
remote_location: 0.0.0.0
network-id: 0
transport: UDP
created: 17s ago
xauth-user: tester2
2FA: no
peer-id: DC=com, DC=vpnfosqa, CN=Users, CN=tester2
peer-id-auth: yes
FortiClient UID: 43B7079E9D244365A91CB0F139EA470F
nat: peer
pending-queue: 0
IKE SA: created 1/1  established 1/1  time 20/20/20 ms
IPsec SA: created 1/2  established 1/2  time 0/95/190 ms

  id/spi: 26 df4fd267a4ba2093/a9161305effacd5a
  direction: responder
  status: established 17-17s ago = 20ms
  proposal: aes128-sha256
  key: 3cbdc74916c1b2aa-e00b39fda1b2e324
  QKD: no
  lifetime/rekey: 86400/86112
  DPD sent/recv: 00000000/00000002
  peer-id: DC=com, DC=vpnfosqa, CN=Users, CN=tester2
```

5. In FortiClient, input a username that does not correspond with the identity in the certificate, such as *tester1*.
6. Verify that the cross-validation failed:

```
# diagnose debug application fnbamd -1
# diagnose debug enable

ike V=root:0:toclient:23: received p1 notify type INITIAL-CONTACT
ike V=root:0:toclient:23: received peer identifier DER_ASN1_DN 'DC=com, DC=vpnfosqa, CN=Users,
CN=tester2'
ike V=root:0:toclient:23: re-validate gw ID
ike V=root:0:toclient:23: gw validation OK
ike V=root:0:toclient:23: Validating X.509 certificate
```

- Filter a gateway by its local address, and then flush it:
  - `diagnose vpn ike gateway filter loc-addr4 203.0.113.2 203.0.113.8`
  - `diagnose vpn ike gateway clear`

SSL VPN

Virtual Private Network (VPN) technology lets remote users connect to private computer networks to gain access to their resources in a secure way. For example, an employee traveling or working at home can use a VPN to securely access the office network through the internet.

Instead of remotely logging into a private network using an unencrypted and unsecured internet connection, using a VPN ensures that unauthorized parties cannot access the office network and cannot intercept information going between the employee and the office. Another common use of a VPN is to connect the private networks of multiple offices.

SSL VPN uses the Secure Socket Layer (SSL) protocol to create a secure tunnel from the host's web browser to a particular application (web mode) or to provide an SSL-secured tunnel between the client and the corporate network (tunnel mode). SSL VPN operates at the application layer of the OSI model and protects specific services or applications.

SSL VPN security restricts and validates the HTTP messages sent from clients to FortiGate using web mode and/or tunnel mode. With advanced checks and binary code verification, FortiGate now automatically detects and blocks certain HTTP methods that could be used for malicious access attempts. By implementing this proactive defense, FortiGate enhances the safety of its SSL VPN feature, ensuring a more secure environment for users.

The SSL VPN web and tunnel mode feature will not be available from the GUI or the CLI on the FortiGate 90G and 91G models. Settings will not be upgraded from previous versions.

Consider migrating to using IPsec Dialup VPN for remote access.

The following topics provide information about SSL VPN in FortiOS 7.4.10.

- SSL VPN to dial-up VPN migration on page 2619
- SSL VPN best practices on page 2619
- SSL VPN security best practices on page 2622
- SSL VPN quick start on page 2629
- SSL VPN tunnel mode on page 2638
- SSL VPN web mode on page 2663
- SSL VPN authentication on page 2686
- SSL VPN to IPsec VPN on page 2780
- SSL VPN protocols on page 2787
- Configuring OS and host check on page 2791
- FortiGate as SSL VPN Client on page 2798
- Dual stack IPv4 and IPv6 support for SSL VPN on page 2807
- Disable the clipboard in SSL VPN web mode RDP connections on page 2818
- SSL VPN IP address assignments on page 2823
- Using SSL VPN interfaces in zones on page 2826
- SSL VPN troubleshooting on page 2830

- Restricting VPN access to rogue/non-compliant devices with Security Fabric

SSL VPN to dial-up VPN migration

FortiOS 7.6.0 and later does not support the SSL VPN web and tunnel mode feature on some FortiGate models:

FortiGate models	Supports SSL VPN?	FortiOS upgrade impact on SSL VPN configuration
FortiGate models with 2GB of RAM or less	No	Deleted during upgrade to FortiOS 7.6.0 or later
FortiGate models with more than 2GB of RAM	Yes	Retained after upgrade to FortiOS 7.6.0 or later

See the FortiOS 7.6 Release Notes for information about affected models.

You may want to use IPsec VPN instead of SSL VPN. A guide is available to help you decide when and how to migrate from SSL VPN to IPsec VPN. It covers:

- Background information, such as a security comparison between SSL VPN and IPsec VPN, the differences between IKEv1 and IKEv2, and information about TLS protocol for tunneling.
- Design differences between SSL VPN and IPsec VPN to consider, such as authentication methods, user groups, full tunneling versus split tunneling, client address assignments, policy configurations, FortiClient or endpoint configurations, and whether to migrate VPNs before or after FortiOS upgrade.
- Instructions for configuring IPsec tunnels using the FortiOS IPsec wizard.
- Instructions for migrating FortiClient endpoint configurations.

See the FortiOS 7.4 SSL VPN to IPsec VPN Migration guide for details.

SSL VPN best practices

Securing remote access to network resources is a critical part of security operations. SSL VPN allows administrators to configure, administer, and deploy a remote access strategy for their remote workers. When not in use, SSL VPN can be disabled.

Choosing the correct mode of operation and applying the proper levels of security are integral to providing optimal performance and user experience, and keeping your user data safe.

- Tunnel mode: Establish an SSL VPN tunnel using FortiClient to support a wide range of applications and provide a transparent end user experience that is easy to configure and administer.
- Web mode: Provide clientless network access to a limited set of applications using an SSL VPN Web Portal that is accessed using a web browser over HTTPS.

The below guidelines outline selecting the correct SSL VPN mode for your deployment and employing best practices to ensure that your data are protected.

Information about SSL VPN throughput and maximum concurrent users is available on your device's datasheet; see Next-Generation Firewalls Models and Specifications.

By default, SSL VPN tunnel mode settings and the *VPN > SSL-VPN* menus are hidden from the GUI.

To enable SSL VPN feature visibility in the GUI, go to *System > Feature Visibility*, enable *SSL-VPN*, and click *Apply*.

To enable SSL VPN feature visibility in the CLI, enter:

```
config system settings
    set gui-sslvpn enable
end
```

By default, SSL VPN web mode settings are disabled and hidden from the GUI and the CLI.

To enable SSL VPN web mode, enter:

```
config system global
    set sslvpn-web-mode enable
end
```

If this setting is disabled, even though SSL VPN tunnel mode can be correctly configured, when trying to access SSL VPN web mode using the SSL VPN portal by navigating to the listening IP address, domain, and port using a web browser, an error message will appear.

Alternative remote access solutions in FortiOS are IPsec VPN and ZTNA.

Ensure you always upgrade your FortiGate to the latest FortiOS firmware version. This ensures you are running the latest SSL VPN security enhancements to protect your VPN deployment.

Tunnel mode

In tunnel mode, the SSL VPN client encrypts all traffic from the remote client computer and sends it to the FortiGate through an SSL VPN tunnel over the HTTPS link between the user and the FortiGate. SSL VPN tunnel mode provides an easy-to-use encrypted tunnel that will traverse almost any infrastructure.

The FortiGate establishes a tunnel with the client, and assigns an IP address to the client from a range of reserved addresses. While the underlying protocols are different, the outcome is very similar to an IPsec VPN tunnel. All client traffic is encrypted, allowing the users and networks to exchange a wide range of traffic, regardless of the application or protocols.

Use this mode if you require:

- A wide range of applications and protocols to be accessed by the remote client.
- No proxying is done by the FortiGate.
- Straightforward configuration and administration, as traffic is controlled by firewall policies.
- A transparent experience for the end user. For example, a user that needs to RDP to their server only requires a tunnel connection; they can then use the usual client application, like Windows Remote Desktop, to connect.

Full tunneling forces all traffic to pass through the FortiGate (see SSL VPN full tunnel for remote user on page 2638). Split tunneling only routes traffic to the designated network through the FortiGate (see SSL VPN split tunnel for remote user on page 2630).

Avoid setting *all* as the destination address in a firewall policy when the user or group associated with that policy is using a portal with *Split tunneling* enabled. Setting *all* as the destination address will cause portal to function as a full tunnel, potentially leading to misconfigurations and complicating troubleshooting efforts.

Limitations

Tunnel mode requires that the FortiClient VPN client be installed on the remote end. The standalone FortiClient VPN client is free to use, and can accommodate SSL VPN and IPsec VPN tunnels. For supported operating systems, see the FortiClient Technical Specifications.

SSL VPN encrypts traffic using TLS and uses TCP as the transport layer. Therefore, SSL VPN is subject to retransmission issues that can occur with TCP-in-TCP that result in lower VPN throughput. For optimal SSL VPN throughput, consider enabling DTLS support. See DTLS support on page 2788.

For the highest VPN throughput, consider configuring dialup IPsec VPN instead. See FortiClient as dialup client on page 2342.

Web mode

Web-only mode provides clientless network access using a web browser with built-in SSL encryption. Users authenticate to FortiGate's SSL VPN Web Portal, which provides access to network services and resources, including HTTP/HTTPS, Telnet, FTP, SMB/CIFS, VNC, RDP, and SSH. When a user starts a connection to a server from the web portal, FortiOS proxies this communication with the server. All communication between the FortiGate and the user continues to be over HTTPS, regardless of the service that is being accessed.

The clipboard can be disabled for SSL VPN web mode RDP/VNC connections, see Disable the clipboard in SSL VPN web mode RDP connections on page 2818.

Use this mode if you require:

- A clientless solution in which all remote services are access through a web portal.
- Tight control over the contents of the web portal.
- Limited services provided to the remote users.

Do not set the virtual IP addresses as the destination address in a firewall policy when using SSL VPN web mode, as it will result in no destination address being accessible. Please note that the FortiOS SSL VPN web mode does not support mapping the virtual IP to the actual one.

Limitations

- Multiple applications and protocols are not supported.
- VNC and RDP access might have limitations, such as certain shortcut keys not being supported.
- In some configurations RDP can consume a significant amount of memory and CPU time.
- Firewall performance might decrease as remote usage increases.
- Highly customized web pages might not render correctly.

Security best practices

See SSL VPN security best practices on page 2622 for more information.

SSL VPN security best practices

SSL VPN settings on page 2623

- Define your minimum supported TLS version and cipher suites on page 2623
- Limit log in attempts and block duration on page 2623
- Limit users to one SSL VPN session at a time on page 2623
- Use a custom listening port for SSL VPN on page 2624
- Disable SSL VPN on page 2624
- Disable SSL VPN web login page on page 2624
- Enable server hostname on page 2625

Authentication on page 2625

- Integrate with authentication servers on page 2625
- Use a non-factory SSL certificate for the SSL VPN portal on page 2625
- Use multi-factor authentication on page 2626
- Use multi-factor authentication with authentication servers on page 2626
- Disable case sensitivity for remote users using authentication servers and MFA on page 2626
- Deploy user certificates for remote SSL VPN users on page 2626

Authorization on page 2627

- Properly administer firewall policies and profiles against only the access level required for the remote user on page 2627
- Set the default portal to a custom SSL VPN with all modes disabled on page 2627

- Limit incoming access to specific hosts or geography based addresses on page 2627
- Limit incoming access using local-in policies with specific hosts, geography based addresses, or schedules on page 2628
- Limit incoming access using a virtual IP, loopback interface, and firewall policy with Internet Services or a threat feed or schedule on page 2629

SSL VPN settings

Define your minimum supported TLS version and cipher suites

Minimum and maximum supported TLS version can be configured in the FortiGate CLI. The cipher algorithm can also be customized.

See How to control the SSL version and cipher suite for SSL VPN for more information.

Limit log in attempts and block duration

To prevent brute force attacks, limit log in attempts and configure the block duration:

```
config vpn ssl settings
   set login-attempt-limit 2
   set login-block-time 60
end
```

These values are the default values. The FortiGate will block attempts to connect to SSL VPN for 60 seconds after two unsuccessful log in attempts. These values can be configured as needed.

See How to limit SSL VPN login attempts and block duration for more information.

Limit users to one SSL VPN session at a time

To prevent attacks from a compromised user, you can limit a user to one SSL VPN session at a time by going to *VPN > SSL-VPN Portals*, editing a portal, and enabling *Limit Users to One SSL-VPN Connection at a Time*. This option can also be configured in the CLI:

```
config vpn ssl web portal
    edit < portal name >
        set limit-user-logins enable
    end
end
```

See Multiple sessions of SSL VPN users for more information.

Use a custom listening port for SSL VPN

To prevent external attacks targeting the default SSL VPN port 10443, use a custom listening port for SSL VPN other than port 10443.

The SSL VPN listening port can be configured from the GUI on the *VPN > SSL-VPN Settings* page by changing the *Listen on Port* field from the default 10443 to any other port. To change the listening port in the CLI:

```
config vpn ssl settings
    set port <port number>
end
```

After the SSL VPN listening port has been changed, the custom port must be communicated to end users that must use it for SSL VPN tunnel mode access using FortiClient, or for SSL VPN web portal access using a web browser, replacing 10443 in the web portal URL.

Disable SSL VPN

After the SSL VPN settings have been configured, SSL VPN can be disabled when not in use.

To disable SSL VPN in the GUI:

1. Go to *VPN > SSL-VPN Settings*.
2. Disable *Enable SSL-VPN*.
3. Click *Apply*.

If the FortiGate has VDOMs configured, then you can select the appropriate VDOM and repeat the steps to disable SSL VPN for that specific VDOM.

See How to disable SSL VPN functionality on FortiGate for more information.

Disable SSL VPN web login page

A best practice is to disable the SSL VPN web login page when SSL VPN is configured to only allow tunnel access and web access is disabled. This prevents the web login page from displaying in a browser when users access https://<FortiGate-ip>:<ssl-vpn-port-number>.

To disable SSL VPN web login page in the GUI:

1. Go to *System > Replacement Messages* and double-click *SSL-VPN Login Page* to open it for editing.
2. In the *Message Format: text/html* select from `<body>` to `</body>`, and press `Delete`.
3. Click *Save*.

To disable SSL VPN web login page in the CLI:

```
config system replacemsg sslvpn sslvpn-login
    set buffer “ “
```

```
end
```

See How to prevent the SSL-VPN web login portal from displaying when SSL-VPN web mode is disabled for more information.

Enable server hostname

Enabling server hostname ensures that if a page redirection occurs, the FortiGate server hostname is used in the host field of the HTTP header instead of a client-provided host field.

```
config vpn ssl settings
    set server-hostname <redirect host name>
end
```

Authentication

Integrate with authentication servers

For networks with many users, integrate your user configuration with existing authentication servers through LDAP, RADIUS, or FortiAuthenticator. When integrating with existing authentication servers, these users are referred to as remote users.

By integrating with existing authentication servers, such as Windows AD, there is a lower chance of making mistakes when configuring remote users and remote user groups, reducing your administration effort. Also, credentials for remote users are kept on the authentication servers themselves and are not stored on the FortiGate, unlike credentials for local users.

See SSL VPN with LDAP user authentication on page 2686 and SSL VPN with RADIUS on Windows NPS on page 2736 for more information.

It is best practice to integrate with encrypted protocols on authentication servers such as LDAPS instead of LDAP, and RADSEC over TLS instead of RADIUS. See Configuring client certificate authentication on the LDAP server on page 2873 and Configuring a RADSEC client on page 2914 for more information.

Use a non-factory SSL certificate for the SSL VPN portal

Your certificate should identify your domain so that a remote user can recognize the identity of the server or portal that they are accessing through a trusted CA.

The default Fortinet factory self-signed certificates are provided to simplify initial installation and testing. If you use these certificates you are vulnerable to man-in-the-middle attacks, where an attacker spoofs your certificate, compromises your connection, and steals your personal information. It is highly recommended that you purchase a server certificate from a trusted CA to allow remote users to connect to SSL VPN with confidence. See Procuring and importing a signed SSL certificate on page 3438 for more information.

Enabling the *Do not Warn Invalid Server Certificate* option on the client disables the certificate warning message, potentially allowing users to accidentally connect to untrusted servers. Disabling invalid server certificate warnings is not recommended.

Use multi-factor authentication

Multi-factor authentication (MFA) ensures that the end-user is who they claim to be by requiring at least two factors - a piece of information that the user knows (password), and an asset that the user has (OTP). A third factor, something a user is (fingerprint or face), may be enabled as well. FortiToken Mobile is typically used for MFA.

FortiGate comes with two free FortiTokens, and more can be purchased from the FortiToken Mobile iOS app or through Fortinet partners.

See SSL VPN with FortiToken mobile push authentication on page 2716 for more information.

2FA, a subset of MFA, can also be set up with email tokens. See Email Two-Factor Authentication on FortiGate for information.

Use multi-factor authentication with authentication servers

Users configured with MFA, such as FortiToken Mobile tokens and email tokens on the FortiGate, are still essentially local users with user credentials stored on the FortiGate.

You should therefore consider using a combination of MFA and authentication servers for optimal security. See SSL VPN with LDAP-integrated certificate authentication on page 2702, SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator on page 2726, and RADIUS integrated certificate authentication for SSL VPN on page 2918 for more information.

Disable case sensitivity for remote users using authentication servers and MFA

When using remote users with authentication servers and MFA, it is possible for MFA to be bypassed if the case of the entered username is not an exact match. To prevent this, ensure case sensitivity is disabled for each remote user that has been configured on the FortiGate with authentication server and MFA settings. See SSL VPN for remote users with MFA and user sensitivity on page 2708 for more information.

Deploy user certificates for remote SSL VPN users

This method of 2FA uses a user certificate as the second authentication factor. This is more secure, as it identifies the end user using a certificate. The configuration and administration of this solution is significantly more complicated, and requires administrators with advanced knowledge of the FortiGate and certificate deployment.

See SSL VPN with certificate authentication on page 2697 for more information.

Authorization

Properly administer firewall policies and profiles against only the access level required for the remote user

Users do not all require the same access. Access should only be granted after careful considerations. Typically, users are placed in groups, and each group is allowed access to limited resources.

Using SSL VPN realms simplifies defining the control structure for mapping users and groups to the appropriate resources.

See SSL VPN multi-realm on page 2765 for more information.

Set the default portal to a custom SSL VPN with all modes disabled

In the SSL VPN settings, it is mandatory in the *Authentication/Portal Mapping* section to configure a portal *for All Other Users/Groups* or what can be considered a default portal for other users who are not specifically mapped to access SSL VPN portals.

When the *Authentication/Portal Mapping* does not match users or groups that you have specifically mapped to access SSL VPN portals, you can create a custom SSL VPN portal with both tunnel and web modes disabled, and then set the default portal to that custom portal. This configuration is analogous to the implicit deny policy in firewall policies, in that this custom portal can deny all other users and groups.

Even with a default portal with all modes disabled, users deemed to be part of *All Other Users/Groups* will still be able to access the web portal. Once these users try to log into the web portal, access will be denied. Users deemed to be part of *All Other Users/Groups* should not be able to successfully establish tunnel mode connections in this case.

See How to disable SSL VPN Web Mode or Tunnel Mode in SSL VPN portal for more information.

Limit incoming access to specific hosts or geography based addresses

The simplest method for limiting incoming access is specifying source addresses in the SSL VPN settings.

- If you require schedules and geography based addresses, and are comfortable using the CLI, then consider configuring local-in policies as described in To limit incoming access to specific hosts based on their source IP addresses in the CLI.
- If you require Internet Services using ISDB or threat feeds, or schedules and geography based addresses, and are more comfortable using the GUI, then consider configuring a VIP, loopback, and firewall policy as described in To limit incoming access to specific hosts based on their source IP addresses in the GUI.

To limit incoming access to specific hosts based on their source IP addresses in the GUI:

1. Create address objects or groups with the source IP addresses you need to allow access to SSL VPN modes.

2. In *VPN > SSL-VPN Settings* under *Restrict Access*, select *Limit access to specific hosts* and in the *Hosts* field select address objects or groups corresponding to specific source IP addresses for hosts that you need to allow.

You can block incoming access for specific hosts by following the same configuration steps with the address objects or groups being of hosts to block and instead selecting Negate Source. See How to block SSL VPN connection from a certain source IP Address for more information.

To limit incoming access to specific hosts based on their source IP addresses in the CLI:

```
config vpn ssl settings
    set source-address <source address 1> ... <source address n>
    set source-address-negate {disable | enable}
end
```

With this CLI, you can limit incoming access to hosts from specific countries by specifying geography based addresses as the source addresses. See Geography based addresses on page 1634 and Restricting SSL VPN connectivity from certain countries using firewall geography address for more information.

Limit incoming access using local-in policies with specific hosts, geography based addresses, or schedules

As an alternative to configuring source addresses in the SSL VPN settings, you can configure local-in policies to allow and deny specific source addresses. Local-in policies must be defined in the CLI, so this approach requires familiarity with CLI commands.

The configuration workflow is:

1. Create a new custom service corresponding to the SSL VPN listening TCP port.
2. (Optional) Create new geography based addresses that can be specified as the source addresses for the allow and deny local-in policies that are created.
3. (Optional) Configure new schedules that can be specified as the schedule for the allow and deny local-in policies that are created.
4. Create a local-in policy using the SSL VPN custom service to allow specific source addresses.
5. Create a local-in policy using the SSL VPN custom service to deny specific source addresses. This is required since there is no implicit deny local-in policy defined by default.

Note that extra care should be taken when configuring a local-in policy, as an incorrect configuration could inadvertently deny traffic for IPsec VPN, dynamic routing protocols, HA, and other FortiGate features.

The source IP address objects that are used can be address objects or groups, or geography based address objects. New schedules can be created and applied to the local-in policies to impose schedule-based access restrictions.

You can also deny all access to SSL VPN by creating a deny local-in policy using source address `all` and SSL VPN custom service without creating a corresponding local-in policy to allow the SSL VPN custom service.

See Local-in policy on page 1506, Restricting/Allowing access to the FortiGate SSL-VPN from specific countries or IP addresses with local-in-policy, and Scheduled SSL-VPN connectivity via Local-in-Policy for more information.

Limit incoming access using a virtual IP, loopback interface, and firewall policy with Internet Services or a threat feed or schedule

SSL VPN access can be moved to a secondary IP address or any other WAN IP address defined on a FortiGate interface by using a virtual IP (VIP), loopback interface, and WAN-to-loopback firewall policy. This method can be configured entirely in the GUI and is much easier to configure than local-in policies.

The configuration workflow is as follows:

1. Configure the SSL VPN firewall policy from the `ssl.<VDOM>` interface to the internal interface or interfaces, ensuring that you specify the users and groups (required), and addresses or address groups (optional) in the policy's *Source* field. See SSL VPN split tunnel for remote user on page 2630.
2. Create a new loopback interface and specify an IP address that is not being used by any other interface on the FortiGate. This IP address can be a private IP address within the RFC 1918 range.
3. Create a new VIP with the following settings:
   - *External IP address/range* configured as the secondary WAN IP address, or any other WAN IP address that is available for the WAN interface.
   - *IPv4 address/range* configured as the IP address assigned to the loopback interface.
   - *Port forwarding* enabled with *External service port* and *Map to IPv4 port* with the SSL VPN listening port.
4. Create a new WAN interface to loopback interface firewall policy with the VIP as the destination address.
5. In the SSL VPN settings set *Listen on Interface(s)* to the newly created loopback interface.
6. (Optional) Create a new deny firewall policy, configure Internet Services as source addresses in the new policy, and place it above the WAN-to-loopback firewall policy.
7. (Optional) Create a new deny firewall policy, configure an IP address threat feed, configure the threat feed as a source address in the new policy, and place it above the WAN-to-loopback firewall policy.
8. (Optional) Configure a new schedule and apply it to the WAN-to-loopback firewall policy.

This configuration gives you the option to deny access to SSL VPN from specified hosts. You can create a new deny firewall policy, apply Internet Services using the ISDB or threat feed objects as source addresses and place the deny policy above the WAN-to-loopback firewall policy.

You also have the option of creating a new schedule and applying it to the WAN-to-loopback firewall policy to allow SSL VPN access during a specified time or days of the week.

Finally, you can disable all SSL VPN access by disabling the WAN-to-loopback firewall policy.

See Access SSL VPN from Secondary IP only, Using Internet Service in a policy on page 1739, IP address threat feed on page 3895, and Firewall policy on page 1463 for more information.

See Prevent TOR IP addresses from accessing SSL-VPN with brute-force attacks on FortiGate and How to use a Threat Feed with SSL VPN for specific examples.

SSL VPN quick start

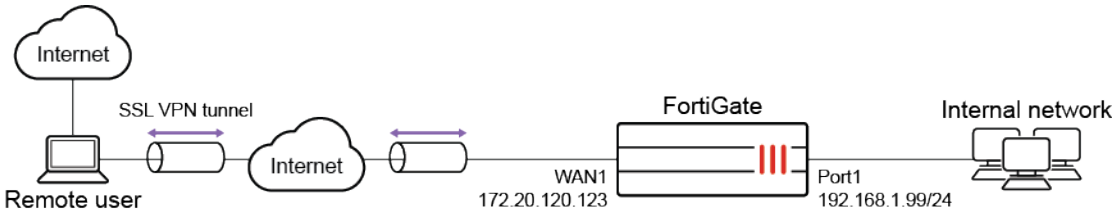
The following topics provide introductory instructions on configuring SSL VPN:

- SSL VPN split tunnel for remote user on page 2630
- Connecting from FortiClient VPN client on page 2634
- Set up FortiToken multi-factor authentication on page 2636
- Connecting from FortiClient with FortiToken on page 2637

SSL VPN split tunnel for remote user

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient but accessing the Internet without going through the SSL VPN tunnel.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface. Ensure that SSL VPN feature visibility is enabled before starting the configuration.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Enable SSL VPN feature visibility:
   a. Go to *System* > *Feature Visibility*.
   b. In the *Core Features* section, enable *SSL-VPN*.
   c. Click *Apply*.
2. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internal subnet *192.168.1.0*.

3. Configure user and user group.
   a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
4. Configure SSL VPN web portal.
   a. Go to *VPN > SSL-VPN Portals* to create a tunnel mode only portal *my-split-tunnel-portal*.
   b. Enable *Tunnel Mode* and select one of the *Split tunneling* settings. See Split tunneling settings on page 2648 for more information.
   c. Select *Routing Address Override* to define the destination network (usually the corporate network) that will be routed through the tunnel.

      Leave *Routing Address Override* undefined to use the destination in the respective firewall policies.

   d. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
5. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-split-tunnel-portal*.
6. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn split tunnel access*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Choose an *Outgoing Interface*. In this example, *port1*.
   e. Set the *Source* to *all* and group to *sslvpngroup*.
   f. In this example, the *Destination* is the internal protected subnet 192.168.1.0.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Click *OK*.

Avoid setting *all* as the destination address in a firewall policy when the user or group associated with that policy is using a portal with *Split tunneling* enabled. Setting *all* as the destination address will cause portal to function as a full tunnel, potentially leading to misconfigurations and complicating troubleshooting efforts.

To configure SSL VPN using the CLI:

1. Enable SSL VPN feature visibility:

```
config system settings
    set gui-sslvpn enable
end
```

2. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

3. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

4. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "my-split-tunnel-portal"
        set tunnel-mode enable
```

```
        set split-tunneling  enable
        set split-tunneling-routing-address "192.168.1.0"
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-split-tunnel-portal"
        next
    next
end
```

7. Configure one SSL VPN firewall policy to allow the remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn split tunnel access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

Avoid setting *all* as the destination address in a firewall policy when the user or group associated with that policy is using a portal with *Split tunneling* enabled. Setting *all* as the destination address will cause portal to function as a full tunnel, potentially leading to misconfigurations and complicating troubleshooting efforts.

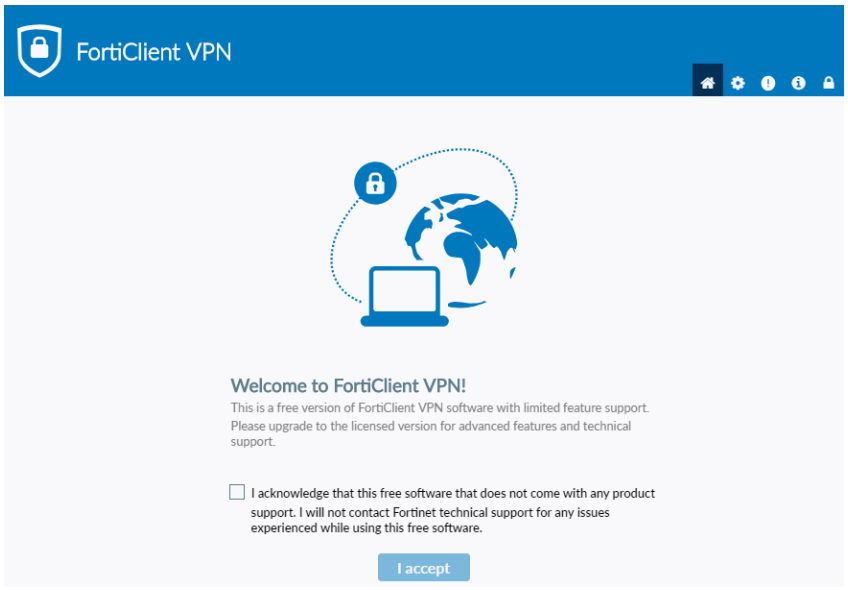
Connecting from FortiClient VPN client

For FortiGate administrators, a free version of FortiClient VPN is available which supports basic IPsec and SSL VPN and does not require registration with EMS. This version does not include central management, technical support, or some advanced features.

Downloading and installing the standalone FortiClient VPN client

You can download the free VPN client from FNDN or FortiClient.com.

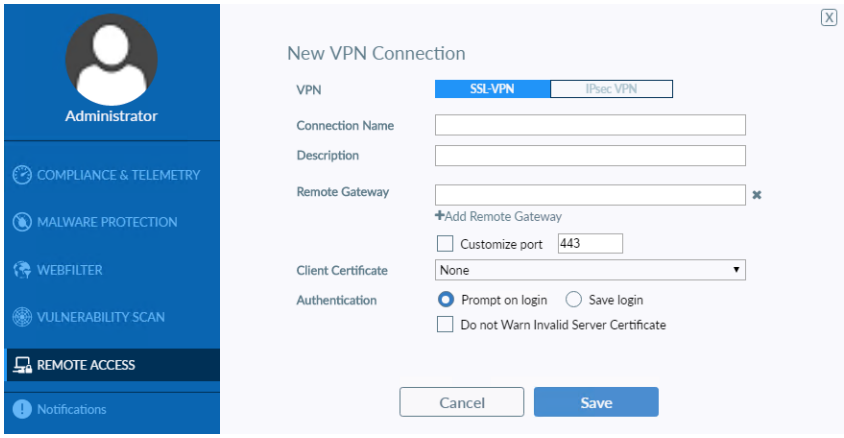
When the free VPN client is run for the first time, it displays a disclaimer. You cannot configure or create a VPN connection until you accept the disclaimer and click *I accept*:



Configuring an SSL VPN connection

To configure an SSL VPN connection:

1. On the *Remote Access* tab, click on the settings icon and then *Add a New Connection*.



2. Select *SSL-VPN*, then configure the following settings:

Connection Name	SSLVPNtoHQ
Description	(Optional)
Remote Gateway	172.20.120.123
Customize port	10443
Client Certificate	Select *Prompt on connect* or the certificate from the dropdown list.
Authentication	Select *Prompt on login* for a prompt on the connection screen

3. Click *Save* to save the VPN connection.

Connecting to SSL VPN

To connect to SSL VPN:

1. On the *Remote Access* tab, select the VPN connection from the dropdown list.
   Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the *Connect* button.
4. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
5. Click the *Disconnect* button when you are ready to terminate the VPN session.

Checking the SSL VPN connection

To check the SSL VPN connection using the GUI:

1. On the FortiGate, go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
2. On the FortiGate, go to *Log & Report > Forward Traffic* to view the details of the SSL entry.

To check the tunnel log in using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type    Timeout   From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)         291       10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User          Source IP      Duration   I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9          22099/43228    10.212.134.200
```

Set up FortiToken multi-factor authentication

This configuration adds multi-factor authentication (MFA) to the split tunnel configuration (SSL VPN split tunnel for remote user on page 2630). It uses one of the two free mobile FortiTokens that is already installed on the FortiGate.

To configure MFA using the GUI:

1. Configure a user and user group:
   a. Go to *User & Authentication > User Definition* and edit local user *sslvpnuser1*.
   b. Enable *Two-factor Authentication*.
   c. For *Authentication Type*, click *FortiToken* and select one mobile *Token* from the list.
   d. Enter the user's *Email Address*.
   e. Enable *Send Activation Code* and select *Email*.
   f. Click *Next* and click *Submit*.
2. Activate the mobile token.
   When a FortiToken is added to user *sslvpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

To configure MFA using the CLI:

1. Configure a user and user group:

```
config user local
    edit "sslvpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
```

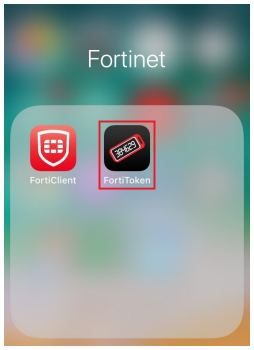
```
        set email-to <user's email address>
        set passwd <user's password>
    next
end
config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

2. Activate the mobile token.
   When a FortiToken is added to user *sslvpnuser1*, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.

Connecting from FortiClient with FortiToken

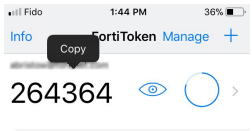
To activate your FortiToken:

1. On your device, open FortiToken Mobile. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.



2. You should have received your notification via email, select + and use the device camera to scan the token QR code in your email.

3. FortiToken Mobile provisions and activates your token and generates token codes immediately. To view the OTP's digits, select the eye icon. After you open the application, FortiToken Mobile generates a new six-digit OTP every 30 seconds.



To connect to SSL VPN:

1. On the *Remote Access* tab, select the VPN connection from the dropdown list.
   Optionally, you can right-click the FortiTray icon in the system tray and select a VPN configuration to connect.
2. Enter your username and password.
3. Click the *Connect* button.

4. A Token field will appear, prompting you for the FortiToken code. Enter the FortiToken code from your Mobile device.
5. After connecting, you can now browse your remote network. Traffic to 192.168.1.0 goes through the tunnel, while other traffic goes through the local gateway. FortiClient displays the connection status, duration, and other relevant information.
6. Click the *Disconnect* button when you are ready to terminate the VPN session.

SSL VPN tunnel mode

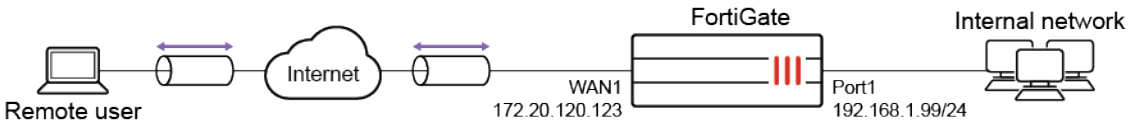
The following topics provide instructions on configuring SSL VPN tunnel mode:

- SSL VPN full tunnel for remote user
- SSL VPN tunnel mode host check
- SSL VPN split DNS on page 2646
- Split tunneling settings on page 2648
- Augmenting VPN security with ZTNA tags on page 2650
- Enhancing VPN security using EMS SN verification on page 2663

SSL VPN full tunnel for remote user

This is a sample configuration of remote users accessing the corporate network and internet through an SSL VPN by tunnel mode using FortiClient.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface. Ensure that SSL VPN feature visibility is enabled before starting the configuration.

To configure SSL VPN using the GUI:

1. Enable SSL VPN feature visibility:
   a. Go to *System* > *Feature Visibility*.
   b. In the *Core Features* section, enable *SSL-VPN*.
   c. Click *Apply*.

2. Configure the interface and firewall address:
   a. Go to *Network > Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
3. Configure user and user group:
   a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
4. Configure SSL VPN web portal:
   a. Go to *VPN > SSL-VPN Portals* to create a tunnel mode only portal *my-full-tunnel-portal*.
   b. Disable *Split Tunneling*.
5. Configure SSL VPN settings:
   a. Go to *VPN > SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-full-tunnel-portal*.
6. Configure SSL VPN firewall policies to allow remote user to access the internal network:
   a. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
   b. Set *Name* to *sslvpn tunnel mode access*.
   c. Set *Incoming Interface* to *SSL-VPN tunnel interface(ssl.root)*.
   d. Set *Outgoing Interface* to *port1*.
   e. Set the *Source* Address to *all* and User to *sslvpngroup*.
   f. Set *Destination* to *all*, *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   g. Click *OK*.
   h. Click *Create New*.
   i. Set *Name* to *sslvpn tunnel mode outgoing*.
   j. Configure the same settings as the previous policy, except set *Outgoing Interface* to *wan1*.
   k. Click *OK*.

To configure SSL VPN using the CLI:

1. Enable SSL VPN feature visibility:

```
config system settings
    set gui-sslvpn enable
end
```

2. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
```

```
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

3. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

4. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

5. Configure SSL VPN web portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "my-full-tunnel-portal"
        set tunnel-mode enable
        set split-tunneling disable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
```

```
            set groups "sslvpngroup"
            set portal "my-full-tunnel-portal"
        next
    end
end
```

7. Configure SSL VPN firewall policies to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn tunnel mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "sslvpn tunnel mode outgoing"
        set srcintf "ssl.root"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set groups "sslvpngroup"
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

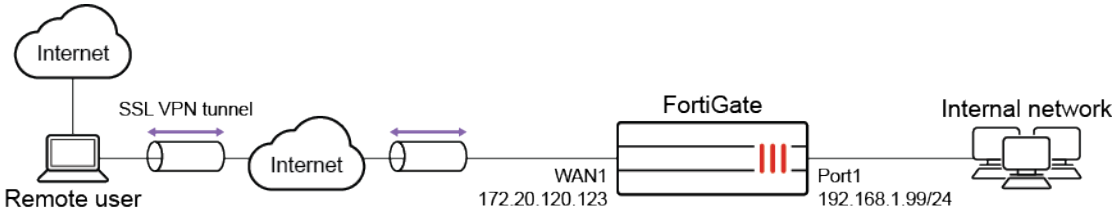
To see the results:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
7. After connection, all traffic except the local subnet will go through the tunnel *FGT*.
8. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
9. On the FortiGate, go to *Log & Report > Forward Traffic* and view the details for the SSL entry.

SSL VPN tunnel mode host check

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by tunnel mode using FortiClient with AV host check.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication* > *User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
   a. Go to *VPN* > *SSL-VPN Portals* to create a tunnel mode only portal *my-split-tunnel-portal*.
   b. Enable *Tunnel Mode* and select one of the *Split tunneling* settings. See Split tunneling settings on page 2648 for more information.
   c. Select *Routing Address Override*.
   d. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.

4. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*.

   It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 2619 and learn how to Procuring and importing a signed SSL certificate on page 3438.

   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *tunnel-access*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-split-tunnel-portal*.
5. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn tunnel access with av check*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Choose an *Outgoing Interface*. In this example, *port1*.
   e. Set the *Source* to *all* and group to *sslvpngroup*.
   f. In this example, the *Destination* is *all*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Click *OK*.
6. Use CLI to configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user's computer.

```
config vpn ssl web portal
    edit my-split-tunnel-access
        set host-check av
    next
end
```

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
```

```
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "vpnuser1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "my-split-tunnel-portal"
        set tunnel-mode enable
        set split-tunneling  enable
        set split-tunneling-routing-address "192.168.1.0"
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-split-tunnel-portal"
        next
```

```
    end
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

7. Configure SSL VPN web portal to enable the host to check for compliant antivirus software on the user’s computer:

```
config vpn ssl web portal
    edit my-split-tunnel-access
        set host-check av
    next
end
```

To see the results:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Use the credentials you've set up to connect to the SSL VPN tunnel.
   If the user's computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to *192.168.1.0* goes through the tunnel. Other traffic goes through local gateway.
8. On the FortiGate, go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
9. On the FortiGate, go to *Log & Report > Forward Traffic* and view the details for the SSL entry.

SSL VPN split DNS

SSL VPN clients in tunnel mode can enable the following settings to split DNS traffic:

- Resolve DNS requests for a specific domain, or suffix, using specific DNS servers.
- Resolve all other DNS requests using a DNS server configured in the SSL VPN settings. This DNS server can be the same as the client system DNS server, or another DNS server.

Administrators typically configure SSL VPN clients to use DNS servers that are behind the FortiGate on the internal network. This will require DNS traffic to traverse the SSL VPN tunnel.

Configuring SSL VPN DNS servers to use DNS suffixes

The `dns-suffix` setting under `config vpn ssl settings` is used to specify domains for SSL VPN DNS servers in the tunnel mode configuration. This setting can only be configured in the CLI.

The DNS servers and suffixes configured under `config vpn ssl settings` have a global scope, and apply only to SSL VPN portals that do not have their own DNS server configuration.

To configure DNS servers for all SSL VPN portals:

```
config vpn ssl settings
    set dns-suffix domain1.com
    set dns-server1 10.10.10.10
    set dns-server2 10.10.10.11
end
```

SSL VPN portals configured with their own DNS servers and suffixes under `config vpn ssl web portal` override the settings configured under `config vpn ssl settings`.

To configure DNS servers for a specific SSL VPN portal in split tunnel mode:

```
config vpn ssl web portal
    edit "full-access"
        set dns-suffix domain2.com
        set dns-server1 10.10.10.12
        set dns-server2 10.10.10.13
        set split-tunneling enable
    next
end
```

Only DNS requests that match DNS suffixes use the DNS servers configured in the VPN. Due to iOS limitations, the DNS suffixes are not used for searching as in Windows. Using short (non-FQDN) names may not be possible.

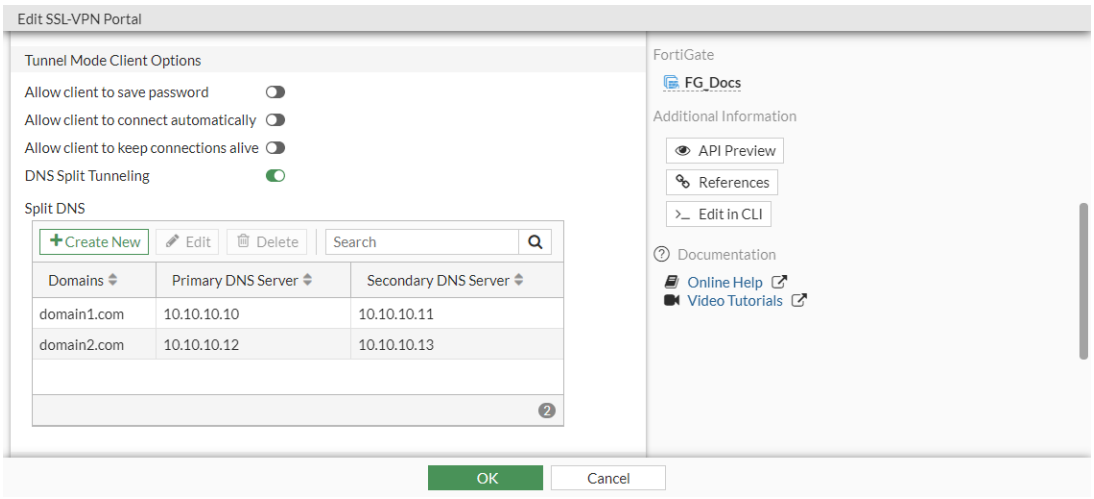
Configuring SSL VPN DNS servers for tunnel mode using DNS split tunneling

The DNS split tunneling setting can be used to configure domains that apply to a specific SSL VPN portal by specifying primary and secondary DNS servers to be used to resolve specific suffixes. This setting can be configured in the GUI and CLI. In the following example, DNS split tunneling is configured on the default tunnel-access portal with two DNS entries.

To configure DNS split tunneling in the GUI:

1. Go to *VPN* > *SSL-VPN Portals* and double-click *tunnel-access* to edit the portal.
2. In the *Tunnel Mode Client Options* section, enable *DNS Split Tunneling*.
3. In the *Split DNS* table, click *Create New*. The *New DNS Entry* pane opens.
4. Configure the first DNS entry:
   a. For *Domains*, enter *domain1.com*.
   b. Set the *Primary DNS Server* to *10.10.10.10*.
   c. Set the *Secondary DNS Server* to *10.10.10.11*.

   d. Click *OK*.
5. Configure the second DNS entry:
   a. Click *Create New*.
   b. For *Domains*, enter *domain2.com*.
   c. Set the *Primary DNS Server* to *10.10.10.12*.
   d. Set the *Secondary DNS Server* to *10.10.10.13*.
   e. Click *OK*.



6. Click *OK* to save the portal settings.

To configure DNS split tunneling in the CLI:

```
config vpn ssl web portal
    edit "tunnel-access"
        set dns-suffix "domain0.com"
        set dns-server1 10.10.10.8
        set dns-server2 10.10.10.9
        set split-tunneling enable
        config split-dns
            edit 1
                set domains "domain1.com"
                set dns-server1 10.10.10.10
                set dns-server2 10.10.10.11
            next
            edit 2
                set domains "domain2.com"
                set dns-server1 10.10.10.12
                set dns-server2 10.10.10.13
            next
        end
    next
end
```

Split tunneling settings

SSL VPN clients in tunnel mode can choose between the following settings to split the traffic:

Option	Description
Tunnel mode	• *Disabled*: All client traffic will be directed over the SSL-VPN tunnel. • *Enabled Based on Policy Destination*: Only client traffic in which the

Option	Description
	destination matches the destination of the configured firewall polices will be directed over the SSL-VPN tunnel. • *Enabled for Trusted Destinations*: Only client traffic which does not match explicitly trusted destination will be directed over the SSL-VPN tunnel.

To configure split tunneling in the GUI:

1. Go to *VPN > SSL-VPN Portals*.
2. Click *Create New* or *Edit* an existing portal.
3. Enable *Tunnel Mode* and select one of the *Split tunneling* settings.
4. Select *Routing Address Override* to define the destination network (usually the corporate network) that will be routed through the tunnel.

Leave *Routing Address Override* undefined to use the destination in the respective firewall policies.

5. Select *Source IP Pools* for users to acquire an IP address when connecting to the portal. There is always a default pool available if you do not create your own.
6. Configure other necessary parameters as required.
7. Click *OK*.

To configure split tunneling in the CLI:

```
config vpn ssl web portal
    edit "tunnel-access"
        set tunnel-mode enable
        set split-tunneling {enable | disable}
        set split-tunneling-routing-negate {enable | disable}
        set split-tunneling-routing-address <name1> <name2> …
        set ip-pools <name1> <name2> …
    next
end
```

The command `split-tunneling-routing-negate` is only available on the CLI after `split-tunneling` is enabled.

`split-tunneling-routing-negate` is disabled by default and corresponds to the *Enabled Based on Policy Destination* option on the GUI.

`split-tunneling-routing-negate enable` corresponds to the *Enabled for Trusted Destinations* option on the GUI.

Augmenting VPN security with ZTNA tags

FortiGate's integration of ZTNA tags into the VPN infrastructure offers a powerful solution to enhance VPN security. ZTNA tags are a feature exclusively offered with the licensed FortiClient versions (FortiClient EMS). ZTNA tags are objects that are assigned to the FortiClient endpoints in real-time. ZTNA tags are used in the firewall policies on the FortiGate to allow or deny access to the VPN and network resources based on the organization's security compliance regulations. These compliance regulations are enforced in real-time, thereby safeguarding the organization against constantly evolving security threats.

The following table compares features of the free VPN-only standalone FortiClient versus a licensed FortiClient managed by EMS for security compliance.

Feature	Free VPN-only standalone FortiClient	Licensed FortiClient
Basic VPN connection	Yes	Yes
Managed remote access profiles	No	Yes
Compliance using ZTNA tags: • Allow or block VPN connections based on ZTNA security posture • Per-firewall policy security posture checks using ZTNA tags	No	Yes

For more detailed information, see Feature comparison of FortiClient standalone and licensed versions in the FortiClient Administration Guide.

This topic contains the following sections:

- ZTNA tags on page 2650
- Security Fabric configuration on page 2651
- Creating ZTNA tags and ZTNA rules in FortiClient EMS
- Connecting FortiClient to FortiClient EMS using telemetry on page 2653
- Monitoring ZTNA tags on the FortiGate on page 2654
- Monitoring ZTNA tags in FortiClient and FortiClient EMS on page 2655
- Example: using ZTNA tags to augment VPN security on page 2656
  - Scenario 1: using ZTNA tags to restrict access to FortiClient endpoints connecting to the VPN on page 2657
  - Scenario 2: using ZTNA tags in firewall policies for role-based network access control on page 2659

ZTNA tags

ZTNA tags (formerly FortiClient EMS tags in FortiOS 6.4 and earlier) are tags synchronized from FortiClient EMS as dynamic address objects on the FortiGate. FortiClient EMS uses zero-trust tagging rules to automatically tag managed endpoints based on various attributes detected by the FortiClient. When the FortiGate establishes a connection with the FortiClient EMS server through the EMS Fabric connector, it pulls zero-trust tags containing device IP and MAC addresses and converts them to read-only dynamic

address objects. It also establishes a persistent WebSocket connection to monitor for changes in zero-trust tags, which keeps the device information current. These zero-trust tags can then be used in SSL VPN firewall rules to perform security posture checks to restrict or allow access to network resources, enabling role-based access control.

Security Fabric configuration

The FortiGate needs to be connected to FortiClient EMS in order to retrieve the ZTNA tags so they can be used in firewall policies. This is done by configuring a FortiClient EMS Security Fabric connector on the FortiGate to connect to FortiClient EMS. See Configuring FortiClient EMS on page 3542 for more information.

Creating ZTNA tags and ZTNA rules in FortiClient EMS

You can create, edit, and delete zero-trust tagging rules for endpoints. You can also view and manage the tags used to dynamically group endpoints.

The following process occurs when using zero-trust tagging rules with EMS and FortiClient:

1. EMS sends zero-trust tagging rules to endpoints through telemetry communication.
2. FortiClient checks endpoints using the provided rules and sends the results to EMS.
3. EMS receives the results from FortiClient.
4. EMS dynamically groups endpoints together using the tag configured for each rule. The dynamic endpoint groups can be viewed on the *Zero Trust Tags > Zero Trust Tag Monitor* page. See Zero Trust Tag Monitor in the FortiClient EMS Administration Guide for more information.

In this topic, two zero-trust tagging rule sets are created:

ZTNA tag	ZTNA tagging rule
AD-Joined	Apply if a remote user has OS version Windows 8.1 or Windows 10 and is a part of the AD group, FORTI-ARBUTUS.LOCAL/IT/IT.
Vulnerable	Apply if critical vulnerabilities are detected on a remote user.

These tags will be applied in two scenario examples (see Scenario 1 and Scenario 2). For more information about zero-trust tagging rule settings, see Adding a Zero Trust tagging rule set and Zero Trust tagging rule types in the FortiClient EMS Administration Guide.

To create a zero-trust tagging rule set in FortiClient EMS:

1. Go to *Zero Trust Tags > Zero Trust Tagging Rules*, and click *Add*.
2. Create the AD-Joined tagging rule set:
   a. In the *Name* field, enter *AD-Joined*.
   b. In the *Tag Endpoint As* dropdown list, enter *AD-Joined* and press `Enter`.
      EMS uses this tag to dynamically group together endpoints that satisfy the rule, as well as any other rules that are configured to use this tag.
   c. Toggle *Enabled* on to enable the rule.
   d. Configure the user in AD group rule:

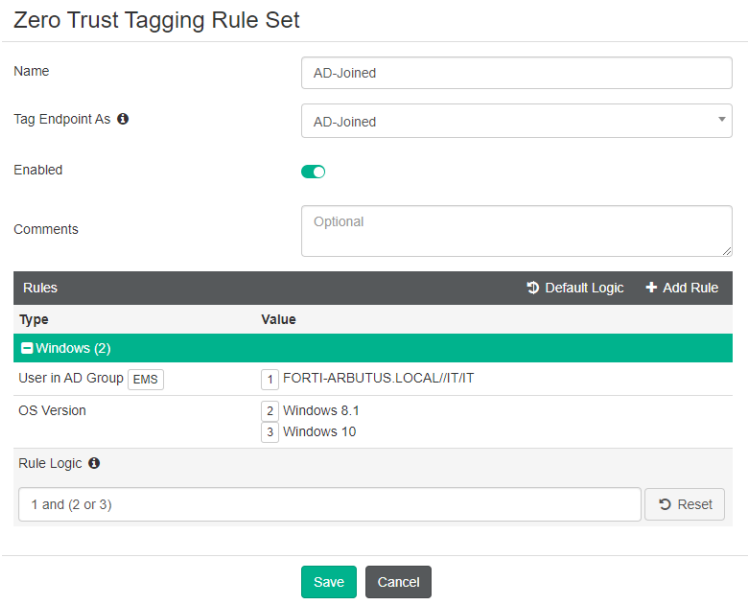
i. Click *Add Rule*.
ii. Set *OS* to *Windows*.
iii. Set the *Rule Type* to *User in AD Group*.
iv. Set the *AD Group* to *FORTI-ARBUTUS.LOCAL/IT/IT*.
v. Click *Save*.

e. Configure the OS rule:
i. Click *Add Rule*.
ii. Set *OS* to *Windows*.
iii. Set the *Rule Type* to *OS Version* and select *Windows 8.1*.
iv. Click the + button and select *Windows 10*.
v. Click *Save*.

f. By default, an endpoint must satisfy all configured rules to be eligible for the rule set. You may want to apply the tag to endpoints that satisfy some, but not all, of the configured rules. In this example, you need to modify the rule set logic to apply the same tag to endpoints that fulfill one of the following criteria:
- Running Windows 8.1 or 10
- Is part of an AD group called FORTI-ARBUTUS.LOCAL/IT/IT

With the default rule set logic, an endpoint would be eligible for the rule set if it is running Windows 8.1 or 10 and is part of an AD group called IT. To modify the rule set logic, do the following:
i. Click *Edit Logic*.
ii. Clicking *Edit Logic* assigns numerical values to each configured rule. You can use *and* and *or* to define the rule logic. You cannot use *not* when defining the rule logic. You can also use parentheses to group rules.

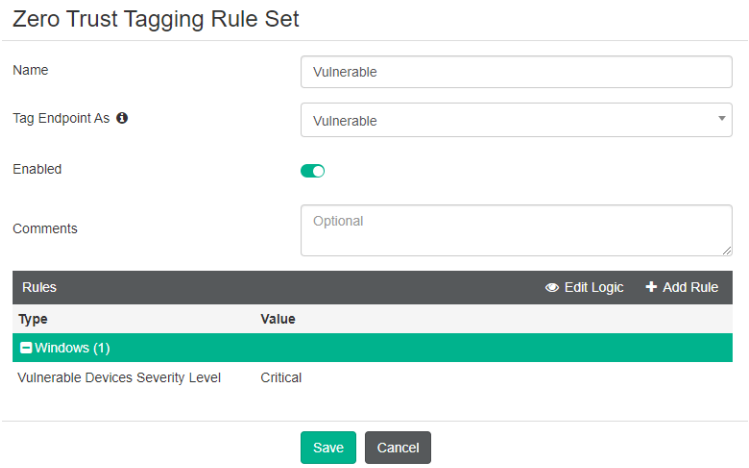
In the *Rule Logic* field, enter *1 and (2 or 3)* to indicate that endpoints that satisfy that they are part of the AD IT group (rule 1) and Windows 8.1 (rule 2) or Windows 10 (rule 3) satisfy the rule set.



g. Click *Save*.

3. Create the Vulnerable tagging rule set:

a. Click *Add*.
b. In the *Name* field, enter *Vulnerable*.
c. In the *Tag Endpoint As* dropdown list, enter *Vulnerable* and press `Enter`.
d. Toggle *Enabled* on to enable the rule.
e. Configure the vulnerable devices rule:
   i. Click *Add Rule*.
   ii. Set *OS* to *Windows*.
   iii. Set the *Rule Type* to *Vulnerable Devices*.
   iv. Set the *Security Level* to *Critical*.
   v. Click *Save*.



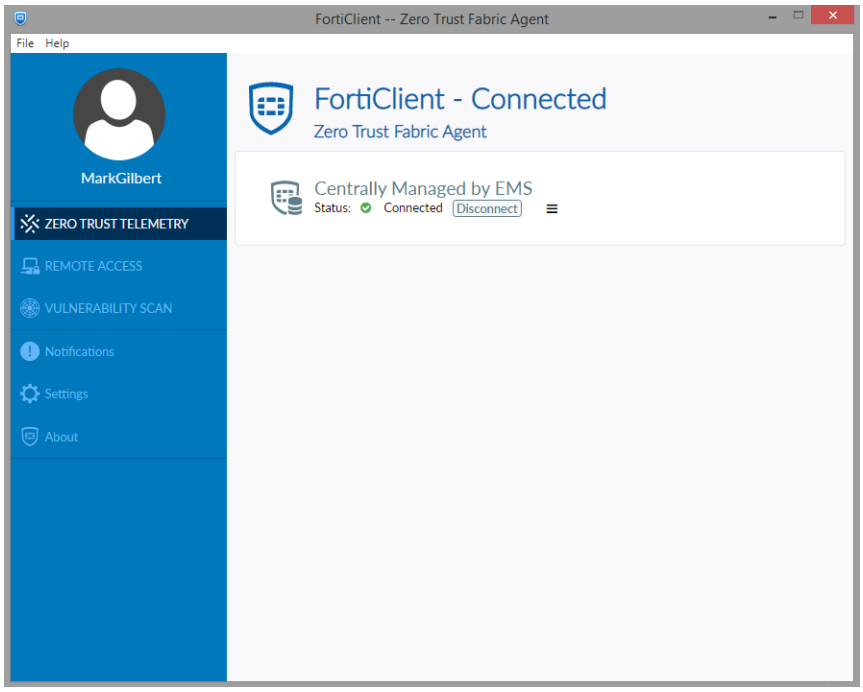
f. Click *Save*.

For more information about editing, deleting, and importing ZTNA rules, see Zero Trust Tagging Rules in the FortiClient EMS Administration Guide.

Connecting FortiClient to FortiClient EMS using telemetry

After FortiClient software installation is complete on an endpoint, you can connect FortiClient to FortiClient EMS. Depending on the way the FortiClient installation is performed, you can either manually or automatically connect to FortiClient EMS, see Connecting FortiClient Telemetry after installation in the FortiClient Administration Guide for more details.

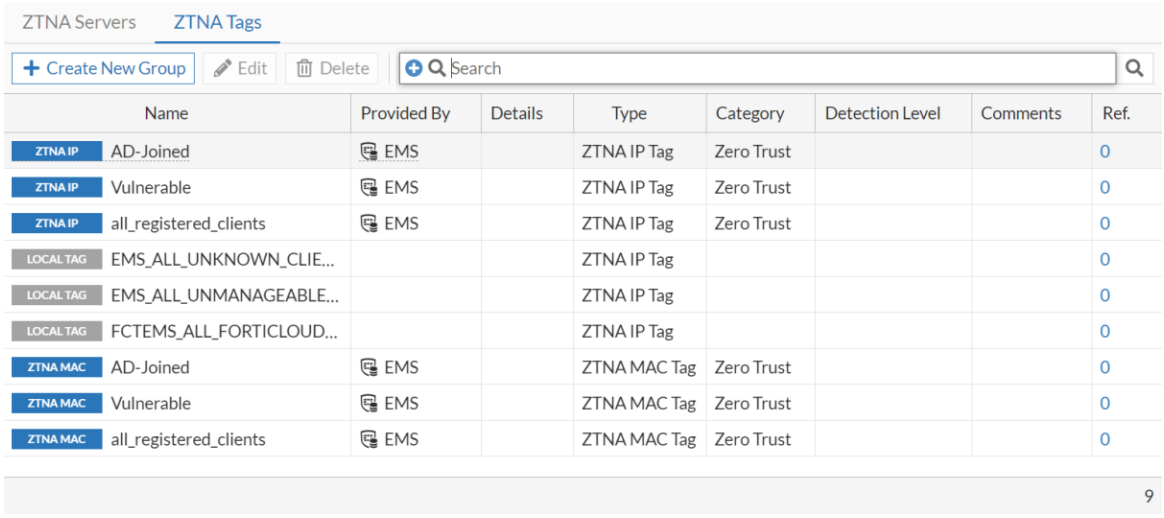
Once FortiClient connects to the FortiClient EMS, the *Status* shows up as *Connected* in the *Zero Trust Telemetry* tab.



After FortiClient telemetry connects to EMS, FortiClient endpoints receive the ZTNA tags if they satisfy any of the required ZTNA rules configured on the FortiClient EMS.

Monitoring ZTNA tags on the FortiGate

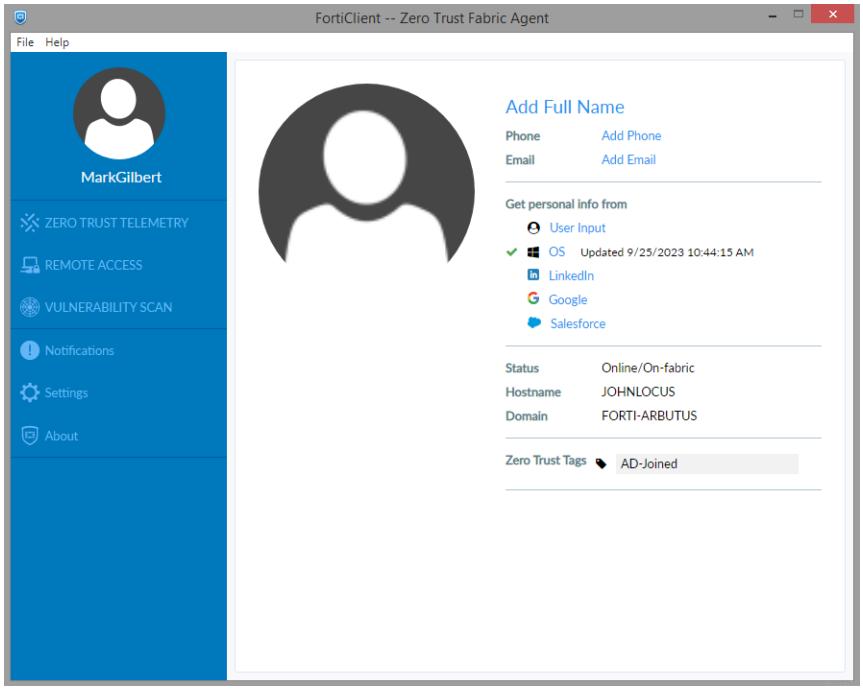
After the FortiGate is connected and authorized to and by FortiClient EMS, the ZTNA tags that were created in the zero-trust tagging rules are retrieved by the FortiGate. To view the tags on the FortiGate, go to *Policy & Objects* > *ZTNA* and select the *ZTNA Tags* tab.



If the tags are not visible on the FortiGate, ensure that the FortiClient EMS is configured to share tagging information with the FortiGate. See Configuring EMS to share tagging information with multiple FortiGates in the FortiClient EMS Administration Guide for more details.

Monitoring ZTNA tags in FortiClient and FortiClient EMS

To view the ZTNA tags assigned to the FortiClient endpoints by FortiClient EMS, click the user avatar and locate the *Zero Trust Tags* section. The following FortiClient endpoint is assigned the *AD-Joined* tag.

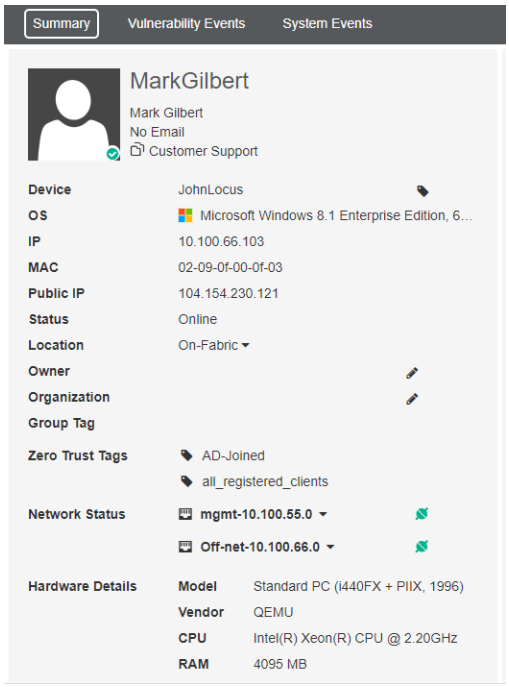


Ensure that the *Show Zero Trust Tag on FortiClient GUI* is enabled on FortiClient EMS (*Endpoint Profiles* > *System Settings* in the profile's *Advanced* view) so the tags are visible in FortiClient. See System Settings in the FortiClient EMS Administration Guide for more details.

ZTNA tags can also be monitored on FortiClient EMS from the endpoint's details in the *Endpoints* pane.

To view ZTNA tag information in the endpoint details:

1. Go to *Endpoints*, and select *All Endpoints*, a domain, or workgroup. The list of endpoints for the selected domain or workgroup displays.
2. Click an endpoint to display details about it in the content pane.
3. In the *Summary* pane, you can see the *Zero Trust Tags* associated with the endpoint. For example, this user has the *AD-Joined* and *all_registered_clients* tags.



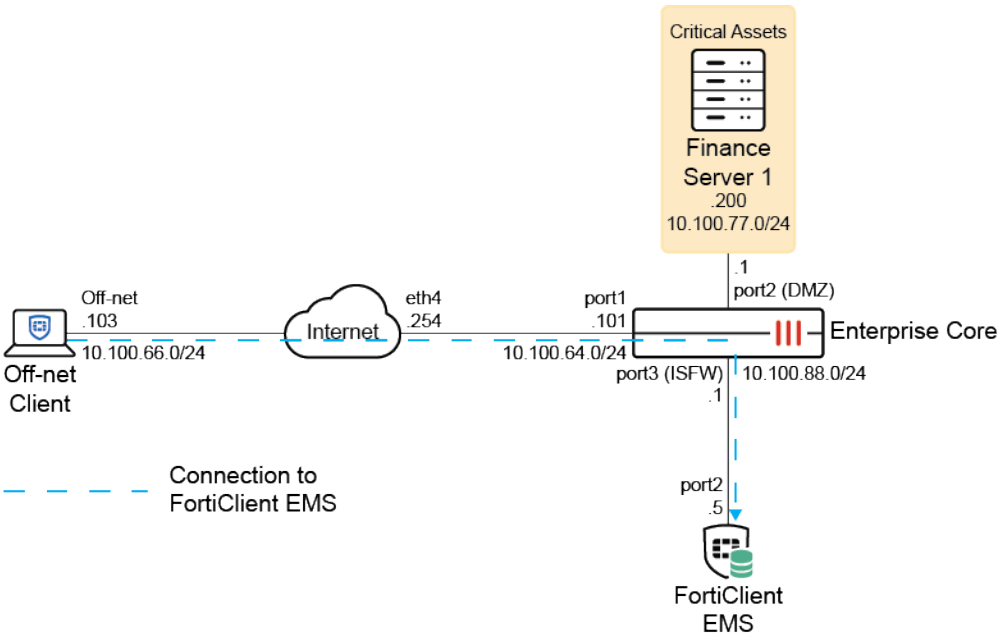
For detailed descriptions of the options in the *Endpoints* content pane, see Viewing the Endpoints pane in the FortiClient EMS Administration Guide.

Example: using ZTNA tags to augment VPN security

ZTNA tags can be used to augment VPN security using the following methods:

- Restrict an endpoint to connect to the VPN tunnel based on the ZTNA tag (see Scenario 1).
- Control access to network resources by allowing or denying traffic passing through the FortiGate using the *IP/MAC Based Access Control* field in the firewall policy (also known as ZTNA IP MAC based access control, see Scenario 2).

Both methods are demonstrated in the following example.



In this example, Off-net-Client is the FortiClient endpoint connected to and managed by FortiClient EMS. The telemetry traffic passes through the FortiGate using a virtual IP. The two ZTNA rule tagging sets configured previously (AD-Joined and Vulnerable) are applied.

Enterprise Core is the FortiGate that acts as the SSL VPN server. To configure SSL VPN, refer to SSL VPN on page 2618 and SSL VPN security best practices on page 2622. Critical Assets are network resources that the off-net user tries to access after connecting to the VPN. SSL VPN is used in this example, but a similar configuration also applies to dialup IPsec VPN where the FortiGate acts as a dialup server.

Scenario 1: using ZTNA tags to restrict access to FortiClient endpoints connecting to the VPN

FortiClient endpoint profiles can be configured to allow or block an endpoint from connecting to a VPN tunnel based on its applied zero-trust tag. This feature is only available for Windows endpoints.

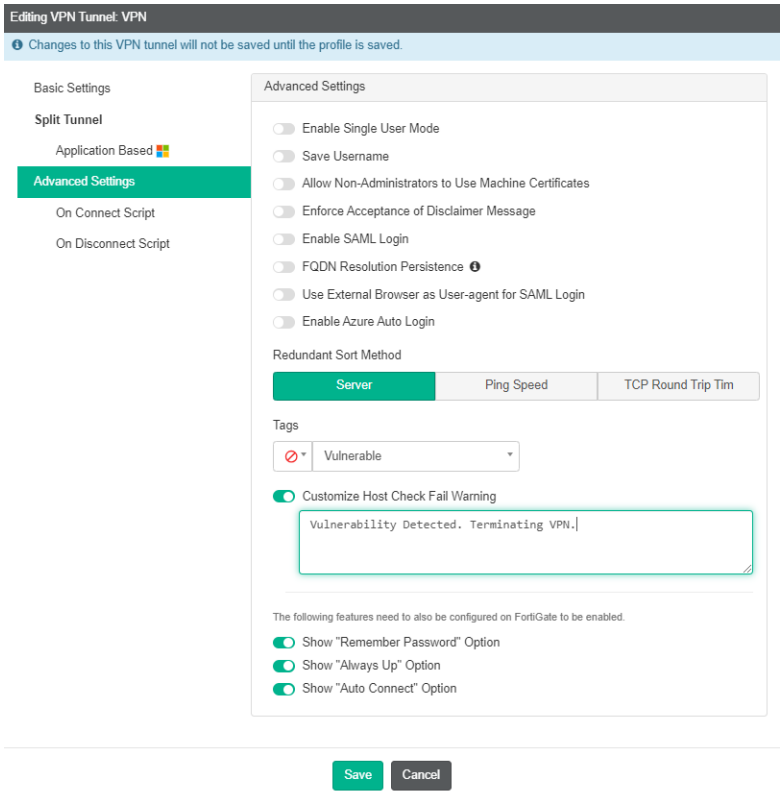
In this scenario, the endpoint profile is configured to prohibit the Off-net-Client (with a Windows OS) from connecting to the VPN if the endpoint has a Vulnerable ZTNA tag. The Vulnerable tag was configured previously (see Creating ZTNA tags and ZTNA rules in FortiClient EMS).

To configure the remote access profile in FortiClient EMS:

1. Go to *Endpoint Profiles* > *Remote Access*, and edit an existing profile or add a new one.
2. In the *General* section, enable *Enable Secure Remote Access*.
3. In the *VPN Tunnels* section, edit an existing VPN tunnel or add a new one.
4. Configure the following under *Advanced Settings*:
   a. For the *Tag* field, select *Prohibit* from the first dropdown.
   b. Select the *Vulnerable* tag from the second dropdown.
   c. Enable *Customize Host Check Fail Warning*.

d. Enter a message to display to users when their connection to the VPN tunnel is prohibited due to critical vulnerabilities on their device.

e. Configure the other VPN tunnel settings as needed.



f. Click *Save*.

5. Configure the other remote access profile settings as needed.
6. Click *Save*.

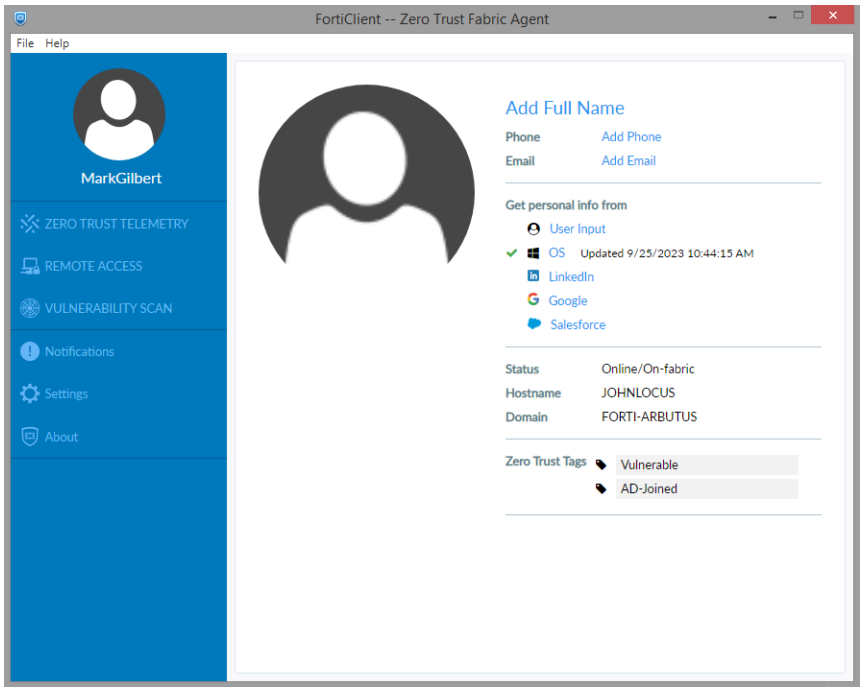
   After the next communication between FortiClient EMS and FortiClient, endpoints with this profile applied are unable to connect to this VPN tunnel if they have critical vulnerabilities.

To verify the configuration using a vulnerable endpoint:

1. On the Off-net-Client endpoint, open FortiClient.
2. Click *Vulnerability Scan*, then click *Scan Now* to initiate a manual scan.

   Vulnerability scans can also be scheduled. See Vulnerability Scan in the FortiClient EMS Administration Guide for more details.
3. Wait a few minutes for the scan to complete.
4. Click the user avatar and locate the *Zero Trust Tags* section.

   FortiClient discovered the vulnerability and added a *Vulnerable* ZTNA tag in addition to the existing *AD-Joined* tag.



5. Click *Remote Access* to try to connect to the VPN:
   a. Enter the *Username* and *Password*.
   b. Click *Connect*.

      Based on the remote access profile configuration, the endpoint's access is denied due to the assigned *Vulnerable* ZTNA tag. The message configured in the remote access profile appears as a notification above the FortiTray icon (in the Windows system tray).

      
      See FortiTray in the FortiClient Administration Guide for more details about this icon.

Scenario 2: using ZTNA tags in firewall policies for role-based network access control

ZTNA tags are used in firewall policies to control access to network resources with the *IP/MAC Based Access Control* field.

In this scenario, if the Off-net Client is tagged with a Vulnerable tag, then it is not allowed to access Finance Server 1 (10.100.77.200). If the Off-net Client is tagged with an AD-Joined tag and no Vulnerable tag, then it is allowed to access Finance Server 1. Two firewall policies are configured as follows.

- Deny Vulnerable Endpoints: use IP/MAC based access control with the Vulnerable ZTNA IP tag to deny access.
- SSL VPN to DMZ: use IP/MAC based access control with the AD-Joined ZTNA IP tag to allow access.

These polices use a source address and group that have already be configured for SSL VPN users and authentication. See User groups on page 2837 for more information.

To configure the Deny Vulnerable Endpoints policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following settings:

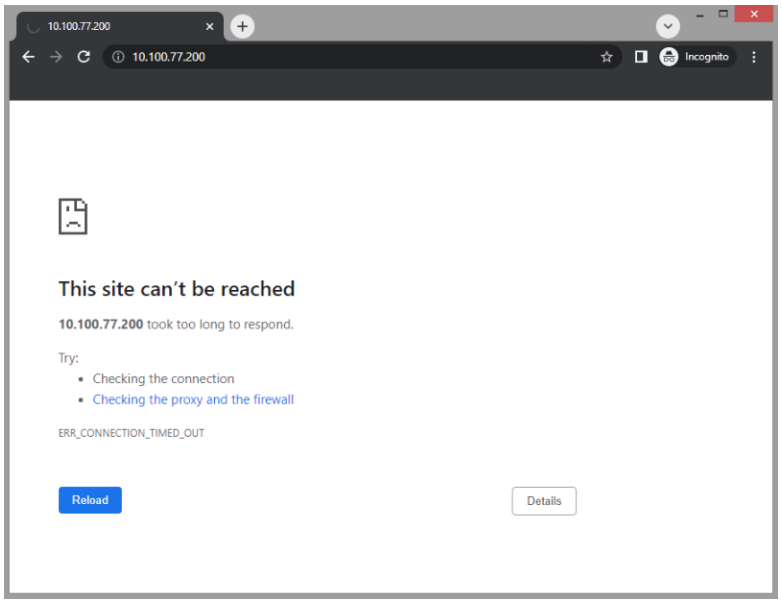
Name	*Deny Vulnerable Endpoints*
Type	*Standard*
Incoming Interface	*ssl.root*
Outgoing Interface	*port2*
Source	*SSLVPN_TUNNEL_ADDR1*, *AD-Joined VPN Users*
IP/MAC Based Access Control	*Vulnerable*
Destination	*DMZ Subnet*
Schedule	*always*
Service	*ALL*
Action	*DENY*
Log Violation Traffic	Enable this setting.
Enable this policy	Enable this setting.

3. Click *OK*.

To verify the configuration using an off-net client with a Vulnerable tag:

This verification assumes that a vulnerability scan was performed, the endpoint has a critical vulnerability, and the Vulnerable zero-trust tag was added.

1. On the endpoint, open FortiClient and click *Remote Access* to connect to the VPN:
   a. Enter the *Username* and *Password*.
   b. Click *Connect*.
2. Once the FortiClient endpoint is connected to the VPN, try to access Finance Server 1 using the web server. The connection times out because the traffic is denied by the firewall policy.



3. Verify the forward traffic log:
   a. In the GUI, go to *Log & Report > Forward Traffic*.
   b. In the CLI, enter the following:

```
# execute log filter category 0
# execute log filter field policyname "Deny Vulnerable Endpoints"
# execute log display

date=2023-10-24 time=17:04:19 eventtime=1698192258985043569 tz="-0700" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="root" srcip=10.212.134.200
srcport=53801 srcintf="ssl.root" srcintfrole="undefined" dstip=10.100.77.200 dstport=80
dstintf="port2" dstintfrole="dmz" srcuuid="697b0036-37db-51ee-162f-5fed6735b06e"
dstuuid="2e024fe8-57d2-51ee-73a7-63e15a078456" srccountry="Reserved" dstcountry="Reserved"
sessionid=25809 proto=6 action="deny" policyid=3 policytype="policy" poluuid="c715492c-
72aa-51ee-481d-09eef1adf713" policyname="Deny Vulnerable Endpoints" user="markgilbert"
service="HTTP" trandisp="noop" duration=0 sentbyte=0 rcvdbyte=0 sentpkt=0 rcvdpkt=0
appcat="unscanned" crscore=30 craction=131072 crlevel="high"
```

To configure the SSL VPN to DMZ policy:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Configure the following settings:

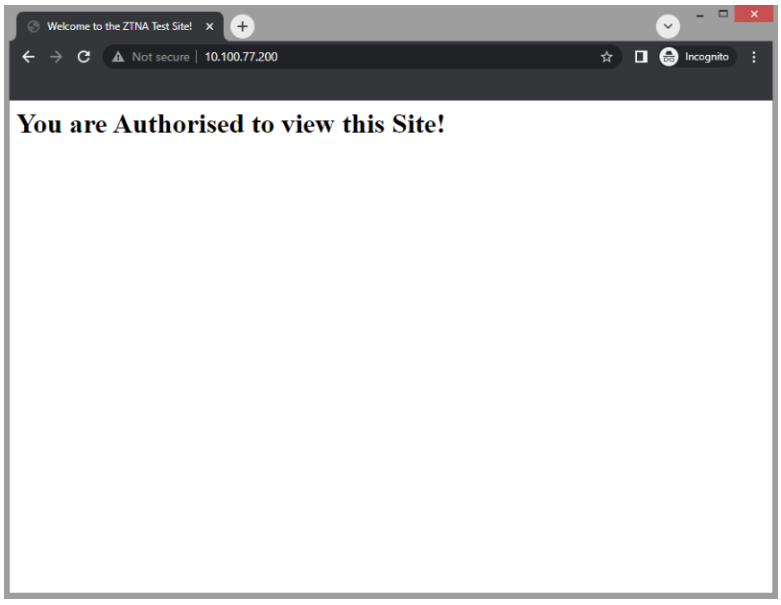
Name	*SSL VPN to DMZ*
Type	*Standard*
Incoming Interface	*ssl.root*
Outgoing Interface	*port2*
Source	*SSLVPN_TUNNEL_ADDR1, AD-Joined VPN Users*

IP/MAC Based Access Control	*AD-Joined*
Destination	*DMZ Subnet*
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*
Log Allowed Traffic	Enable this setting and select *All Sessions*.
Enable this policy	Enable this setting.

3. Configure the other settings as needed.
4. Click *OK*.

To verify the configuration using an off-net client with an AD-Joined tag:

1. On the endpoint, open FortiClient, click *Remote Access* to connect to the VPN:
   a. Enter the *Username* and *Password*.
   b. Click *Connect*.
2. Once the FortiClient endpoint is connected to the VPN, try to access Finance Server 1 using the web server. The traffic is allowed by the firewall policy, and the server is accessible.



3. Verify the forward traffic log:
   a. In the GUI, go to *Log & Report* > *Forward Traffic*.
   b. In the CLI, enter the following:

```
# execute log  filter category 0
# execute log filter field policyname "SSL VPN to DMZ"
# execute log display
```

```
date=2023-10-24 time=14:07:05 eventtime=1698181625479969117 tz="-0700" logid="0000000020"

```

Enhancing VPN security using EMS SN verification

The EMS serial number (SN) verification feature restricts establishing a VPN connection to the FortiGate to only licensed FortiClient endpoints. The EMS SN verification is performed by the FortiGate and the feature requires that the FortiGate and FortiClient endpoints both must be connected to the same FortiClient EMS.

EMS SN verification is performed when a FortiClient user attempts to establish a VPN connection to the FortiGate. During the VPN establishment process:

- FortiClient sends the SN of the FortiClient EMS that manages it to the FortiGate.
- The FortiGate performs a check to confirm whether the EMS SN sent by the FortiClient corresponds to same FortiClient EMS to which the FortiGate itself is connected to.
- The FortiGate allows the user to connect to the VPN only if the EMS SN match.

This feature prevents the free VPN-only standalone FortiClient users from connecting to VPN, thus enhancing VPN security. This setting can only be enabled from the CLI.

To enable the EMS SN verification in the CLI:

```
config system global
    set vpn-ems-sn-check {enable | disable}
end
```

Command	Description
`set vpn-ems-sn-check {enable | disable}`	Enable/disable verification of EMS serial number in SSL-VPN connection.

SSL VPN web mode

By default, SSL VPN tunnel mode settings and the *VPN > SSL-VPN* menus are hidden from the GUI.

To enable SSL VPN feature visibility in the GUI:

1. Go to *System* > *Feature Visibility*.
2. In the *Core Features* section, enable *SSL-VPN*.
3. Click *Apply*.

To enable SSL VPN feature visibility in the CLI:

```
config system settings
    set gui-sslvpn enable
end
```

By default, SSL VPN web mode settings are disabled and hidden from the GUI and the CLI.

To enable SSL VPN web mode:

```
config system global
    set sslvpn-web-mode enable
end
```

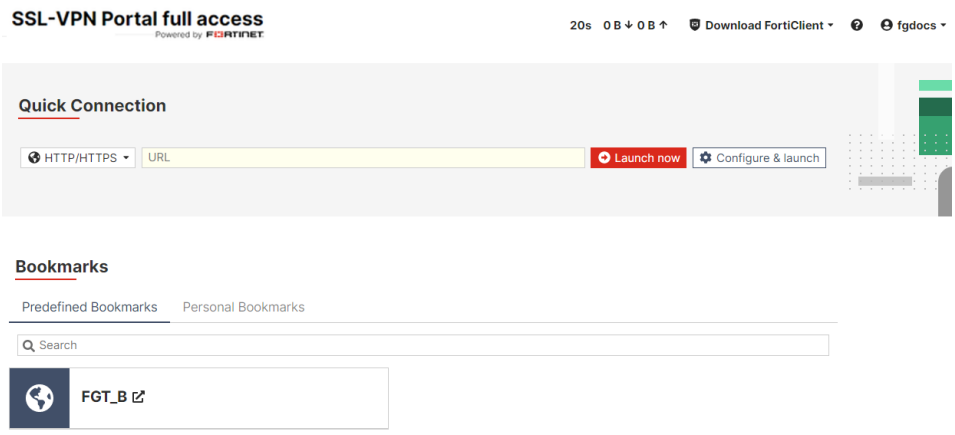
If this setting is disabled, even though SSL VPN tunnel mode can be correctly configured, when trying to access SSL VPN web mode using the SSL VPN portal by navigating to the listening IP address, domain, and port using a web browser, an error message will appear.

A user must have valid username and password credentials to log in to an SSL VPN web portal in addition to other multi-factor authentication components that may be configured, such as FortiTokens.

Web-only mode provides clientless network access using a web browser with built-in SSL encryption. Use this mode if you require:

- A clientless solution where all remote services are accessed through a web portal
- Tight control over the contents of the web portal
- Limited services provided to the remote users

After logging in, the web portal page appears:



A web portal includes the following features:

- The session information is displayed in the right corner of the top banner. This includes the elapsed time since logging in, and the volume of inbound and outbound HTTP and HTTPS traffic.
- The *Launch FortiClient* button appears if FortiClient is installed. Clicking the button opens the FortiClient *Remote Access* tab, but FortiClient does not automatically create a VPN connection based on the web mode connection information.
- The *Download FortiClient* button provides access to download the FortiClient application for various operating systems.
- The *Bookmarks* widget includes links to network resources (administrator-defined bookmarks), and users can create their own bookmarks.
- The *Quick Connection* dropdown menu enables a connection to network resources without using or creating a bookmark.

The following topics provide information about SSL VPN web mode:

- Web portal configurations on page 2665
- Quick Connection tool on page 2668
- SSL VPN bookmarks on page 2670
- SSL VPN web mode for remote user on page 2672
- Customizing the RDP display size on page 2677
- Showing the SSL VPN portal login page in the browser's language on page 2680
- SSL VPN custom landing page on page 2682

Web portal configurations

An SSL VPN web portal enables users to access network resources through a secure channel using a web browser. System administrators can configure log in privileges for users and which network resources are available to these users. The portal configuration determines what the user sees when they log in to the portal. Both system administrators and the users have the ability to customize the SSL VPN portal.

There are three predefined default web portal configurations available:

- full-access: connecting clients can either access protected resources through the SSL VPN web portal, or use FortiClient to connect through tunnel mode.
- tunnel-access: connecting clients can only access protected resources with FortiClient connecting through tunnel mode.
- web-access: connecting clients can only access protected resources through the SSL VPN web portal.

Custom web portals can also be configured.

To configure a custom web portal:

1. Go to *VPN* > *SSL-VPN Portals* and click *Create New*.
2. Configure the following settings as needed:

GUI option	Description
Name	Enter the portal name.

GUI option		Description
Limit Users to One SSL-VPN Connection at a Time		This option is disabled by default. When enabled, once a user logs in to the portal, they cannot go to another system and log in with the same credentials again.
Tunnel Mode		
	Split tunneling	There are three options: • *Disabled*: all client traffic will be directed over the SSL VPN tunnel. • *Enabled Based on Policy Destination*: only client traffic where the destination matches the destination of the configured firewall policies will be directed over the SSL VPN tunnel. • *Enabled for Trusted Destinations*: only client traffic that does not match explicitly trusted destinations will be directed over the SSL VPN tunnel.
	Routing Address Override	When *Split tunneling* is set to *Enabled Based on Policy Destination*, the IPv4 firewall address selected overrides the firewall policy destination addresses to control split tunnel access. When *Split tunneling* is set to *Enabled for Trusted Destinations*, the IPv4 firewall address selected becomes a trusted destination that will not be tunneled through SSL VPN. All other destinations will be tunneled through SSL VPN.
	Source IP Pools	Select an IP pool for users to acquire an IP address when connecting to the portal.
IPv6 Tunnel Mode		When enabled, these settings determine how tunnel mode clients are assigned IPv6 addresses.
	IPv6 split tunneling	The same three options are available as in *Tunnel Mode*.
	IPv6 Routing Address Override	When *Split tunneling* is set to *Enabled Based on Policy Destination*, the IPv6 firewall address selected overrides the firewall policy destination addresses to control split tunnel access. When *Split tunneling* is set to *Enabled for Trusted Destinations*, the IPv6 firewall address selected becomes a trusted destination that will not be tunneled through SSL VPN. All other destinations will be tunneled through SSL VPN.

GUI option		Description
	Source IPv6 Pools	Select an IP pool for users to acquire an IP address when connecting to the portal.
Tunnel Mode Client Options		The following options affect how FortiClient behaves when connected to the VPN tunnel.
	Allow client to save password	When enabled and if the user selects this option, their password is stored on the their computer and will automatically populate each time they connect to the VPN.
	Allow client to connect automatically	When enabled and if the user selects this option, when FortiClient launches (such as after a reboot or system start up), FortiClient will automatically attempt to connect to the VPN.
	Allow client to keep connections alive	When enabled and if the user selects this option, FortiClient will try to reconnect once it detects that the VPN connection is unexpectedly down (not manually disconnected by the user).
	DNS Split Tunneling	When enabled, the *Split DNS* table is visible, where new DNS entries can be created. See SSL VPN split DNS on page 2646 for more details.
Host Check		When enabled, the type of host checking performed on endpoints can be configured (see Configuring OS and host check on page 2791).
	Type	There are three options: • *Realtime AntiVirus*: check for antivirus software recognized by the Windows Security Center. • *Firewall*: check for firewall software recognized by the Windows Security Center. • *Enable both*: check for antivirus and firewall software recognized by the Windows Security Center.
Restrict to Specific OS Versions		When enabled, access to certain operating systems can be denied or forced to check for an update. By default, all operating systems in the table are allowed (see Configuring OS and host check on page 2791).
Web Mode		Enable this option to configure the web portal settings.
	Portal Message	Enter a message that appears at the top of the web portal screen (default = *SSL-VPN Portal*).

GUI option		Description
	Theme	Select a color theme from the dropdown.
	Show Session Information	Enable to display session information in the top banner of the web portal (username, amount of time logged in, and traffic statistics).
	Show Connection Launcher	Enable to display the *Quick Connection* button.
	Show Login History	Enable to display the user's login history (*History*).
	User Bookmarks	Enable to allow users to add their own bookmarks (*New Bookmark*).
	Rewrite Content IP/UI/	Enable contents rewrite for URIs containing `IP-address/ui/`.
	RDP/VNC clipboard	Enable to support RDP/VPC clipboard functionality.
	Predefined Bookmarks	Use the table to create and edit predefined bookmarks. See To create a predefined administrator bookmark in FortiOS: on page 2671 for more details.
FortiClient Download		Enable this option to display the *Download FortiClient* button.
	Download Method	Select either *Direct* or *SSL-VPN Proxy* as the method to download FortiClient.
	Customize Download Location	Enable to configure a custom download location for *Windows* or *Mac*.

3. Click *OK*.

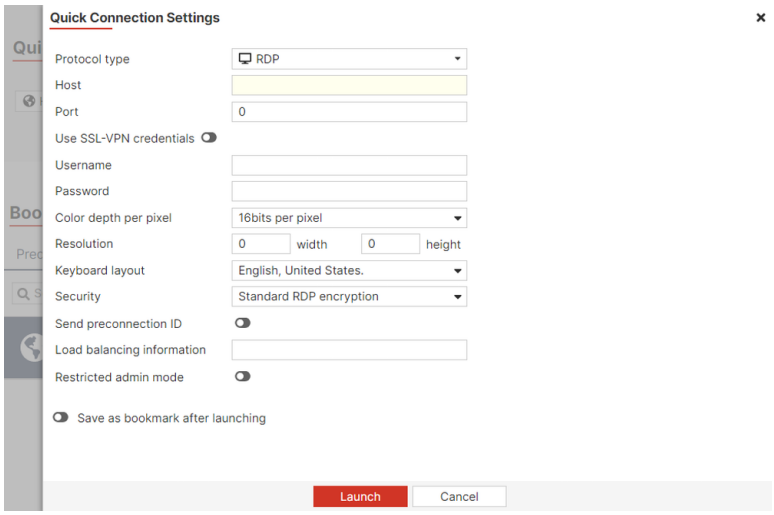
By default, the browser's language preference is automatically detected and used by the SSL VPN portal login page. The system language can still be used by changing the settings on the *SSL-VPN Settings* page of the GUI, or disabling browser-language detection in the CLI. See Showing the SSL VPN portal login page in the browser's language on page 2680 for more details.

Quick Connection tool

The *Quick Connection* tool allows a user to connect to a resource when it is not a predefined bookmark. The tool allows the user to specify the type of server and the URL or IP address of the host.

To connect to a resource:

1. Select the connection type.
2. Enter the required information, such as the IP address or URL of the host.
3. Click *Configure & launch*.



In a VNC session, to send Ctrl+Alt+Del, press *F8* then select *Send Ctrl-Alt-Delete*.

RDP sessions

Some Windows servers require that a specific security be set for RDP sessions, as opposed to the standard RDP encryption security. For example, Windows 10 requires that TLS be used.

You can specify a location option if the remote computer does not use the same keyboard layout as your computer by appending it to the *Host* field using the following format: `<IP address> -m <locale>`

The available options are:

ar	Arabic	fr-be	Belgian French	no	Norwegian
da	Danish	fr-ca	Canadian French	pl	Polish
de	German	fr-ch	Swiss French	pt	Portuguese
de-ch	Swiss German	hr	Croatian	pt-br	Brazilian Portuguese
en-gb	British English	hu	Hungarian	ru	Russian
en-uk	UK English	it	Italian	sl	Slovenian
en-us	US English	ja	Japanese	sv	Sudanese

es	Spanish	lt	Lithuanian	tk	Turkmen
fi	Finnish	lv	Latvian	tr	Turkish
fr	French	mk	Macedonian		

SSL VPN bookmarks

The *Bookmarks* widget displays bookmarks configured by administrators and users. Administrator bookmarks cannot be edited, and they are configured in FortiOS. Users can add, edit, and delete their own bookmarks within the web portal.

The FortiGate forwards client requests to servers on the internet or internal network. To use the web portal applications, add the URL, IP address, or name of the server application to the *Bookmarks* list. Once a bookmark is created, click the bookmark icon to initiate a session.

To access a destination without adding a bookmark to the *Your Bookmarks* list, use the Quick Connection tool. See Quick Connection tool on page 2668 for more details.

Configuring bookmarks

The following table summarizes which options can be configured based on the bookmark type in the SSL VPN web portal:

Setting	HTTP/ HTTPS	FTP	SMB	SFTP	RDP	VNC	SSH	Telnet
URL	✓							
Folder		✓	✓	✓				
Host					✓	✓	✓	✓
Domain			✓					
Port					✓	✓		
Description	✓	✓	✓	✓	✓	✓	✓	✓

Setting	HTTP/ HTTPS	FTP	SMB	SFTP	RDP	VNC	SSH	Telnet
Password						✓		
SSO Credentials	✓	✓	✓	✓				
SSL-VPN Login	✓	✓	✓	✓				
SSO Form Data	✓							
Form Key	✓							
Form Value	✓							
Alternative	✓	✓	✓	✓				
Username	✓	✓	✓	✓				
Password	✓	✓	✓	✓				
Use SSL-VPN Credentials					✓			
Username					✓			
Password					✓			
*Color Depth Per Pixel**					✓			
*Screen Width**					✓			
*Screen Height**					✓			
Keyboard Layout					✓			
Security					✓			
Preconnection ID					✓			
Preconnection Blob					✓			
Load Balancing Information					✓			
Restricted Admin Mode					✓			

* = This setting can only be configured by an administrator.

To create a user bookmark in the web portal:

1. In the *Personal Bookmarks* section, click *Create new bookmark*.
2. Enter a *Name*.
3. Select a bookmark type and configure the type-based settings.
4. Click *Save*.

To create a predefined administrator bookmark in FortiOS:

1. Go to *VPN > SSL-VPN Portals* and double-click a portal to edit it.
2. In the *Predefined Bookmarks* table, click *Create New*. The *New Bookmark* pane appears.

3. Enter a *Name*.
4. Select a bookmark type and configure the type-based settings.
5. Click *OK* to save the bookmark settings.
6. Click *OK* to save the portal settings.

Configuring group-based SSL VPN bookmarks

Administrators can add bookmarks for users in the same user group. SSL VPN will only output the matched group name entry to the client. This setting can only be configured in the CLI.

To add bookmarks for users in the same user group:

1. Enable group bookmarks in the web portal settings:

```
config vpn ssl web portal
    edit <name>
        set user-group-bookmark enable
    next
end
```

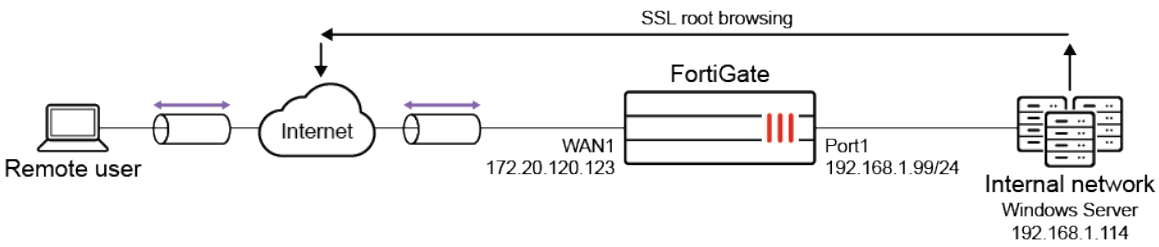
2. Configure the user group bookmark:

```
config vpn ssl web user-group-bookmark
    edit <name>
        config bookmarks
            edit <name>
                ...
            next
        end
    next
end
```

SSL VPN web mode for remote user

This is a sample configuration of remote users accessing the corporate network through an SSL VPN by web mode using a web browser.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface. Ensure that SSL VPN web mode and SSL VPN feature visibility are enabled before starting the configuration.

For FortiOS 7.4.0, SSL VPN web mode, explicit web proxy, and interface mode IPsec VPN features will not work with the following configuration:

1. An IP pool with ARP reply enabled is configured.
2. This IP pool is configured as the source IP address in a firewall policy for SSL VPN web mode, in a proxy policy for explicit web proxy, or as the local gateway in the Phase 1 settings for an interface mode IPsec VPN.
3. A matching blackhole route is configured for IP pool reply traffic.

Configuring an IP pool as the source NAT IP address in a regular firewall policy works as before.

For details, see Technical Tip: IP pool and virtual IP behaviour changes in FortiOS 6.4, 7.0, 7.2, and 7.4.

To enable SSL VPN web mode and SSL VPN feature visibility in FortiOS:

1. Enable SSL VPN web mode:

```
config system global
    set sslvpn-web-mode enable
end
```

2. Enable SSL VPN feature visibility.
   a. In the GUI:
      i. Go to *System* > *Feature Visibility*.
      ii. In the *Core Features* section, enable *SSL-VPN*.
      iii. Click *Apply*.
   b. In the CLI:

```
config system settings
    set gui-sslvpn enable
end
```

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.

2. Configure user and user group.
   a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
   b. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
3. Configure SSL VPN web portal.
   a. Go to *VPN > SSL-VPN Portals* to create a web mode only portal *my-web-portal*.
   b. Set *Predefined Bookmarks for Windows server* to type *RDP*.
4. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*.

It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 2619 and learn how to Procuring and importing a signed SSL certificate on page 3438.

   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *web-access*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *my-Web-portal*.
5. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn web mode access*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Choose an *Outgoing Interface*. In this example, *port1*.
   e. Set the *Source* to *all* and group to *sslvpngroup*.
   f. In this example, the *Destination* is the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Click *OK*.

Do not set the virtual IP addresses as the destination address in a firewall policy when using SSL VPN web mode, as it will result in no destination address being accessible. Please note that the FortiOS SSL VPN web mode does not support mapping the virtual IP to the actual one.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure the internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "vpnuser1"
    next
end
```

4. Configure SSL VPN web portal and predefine RDP bookmark for windows server.

```
config vpn ssl web portal
    edit "my-web-portal"
        set web-mode enable
        config bookmark-group
            edit "gui-bookmarks"
                config bookmarks
                    edit "Windows Server"
                        set apptype rdp
                        set host "192.168.1.114"
                        set port 3389
                        set logon-user "your-windows-server-user-name"
                        set logon-password your-windows-server-password
                    next
                end
            next
        end
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "my-web-portal"
        next
    end
end
```

6. Configure one SSL VPN firewall policy to allow the remote user to access the internal network. Traffic is dropped from internal to remote client.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

Do not set the virtual IP addresses as the destination address in a firewall policy when using SSL VPN web mode, as it will result in no destination address being accessible. Please note that the FortiOS SSL VPN web mode does not support mapping the virtual IP to the actual one.

To see the results:

1. In a web browser, log into the portal *https://172.20.120.123:10443* using the credentials you've set up.
2. In the portal with the predefined bookmark, select the bookmark to begin an RDP session. If there are no predefined bookmarks, the Quick Connection tool can be used; see Quick Connection tool on page 2668 for more information.
3. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
4. Go to *Log & Report > Forward Traffic* to view the details for the SSL entry.

Customizing the RDP display size

The RDP display size (width and height settings) can be customized for SSL VPN web mode when creating a new connection or bookmark. Administrators can also specify the display size when preconfiguring bookmarks.

To configure the default window dimensions in an RDP web portal:

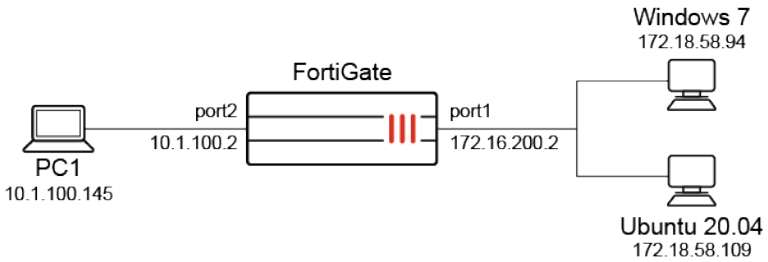
```
config vpn ssl web portal
    edit <name>
        set default-window-width <integer>
        set default-window-height <integer>
    next
end
```

`default-window-width <integer>`	Set the default RDP screen width, in pixels (0 - 65535, default = 1024).
`default-window-height <integer>`	Set the default RDP screen height, in pixels (0 - 65535, default = 768).

Example

In this example, a user has a monitor with a resolution of 1920 × 1080. The user creates two bookmarks for RDP servers with different resolutions:

- Windows 7: 1360 × 768
- Ubuntu 20.04: 800 × 600

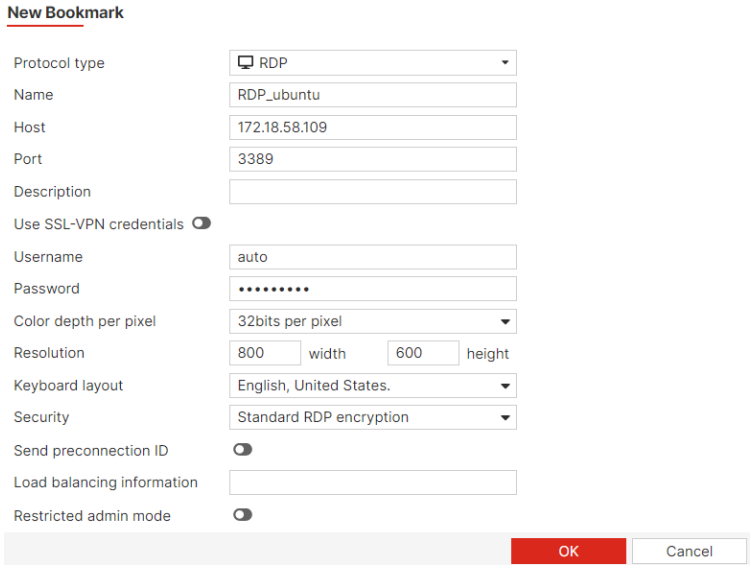


To customize the RDP bookmark display size:

1. Log in to the SSL VPN web portal.
2. Create a new personal RDP bookmark (*+ New Bookmark*), or hover over an existing bookmark and click the edit (pencil) icon.

3. Set the *Resolition width* and *height* fields as required.
   a. Windows 7: 1360 width and 768 height.

   b. Ubuntu 20.04: 800 width and 600 height.

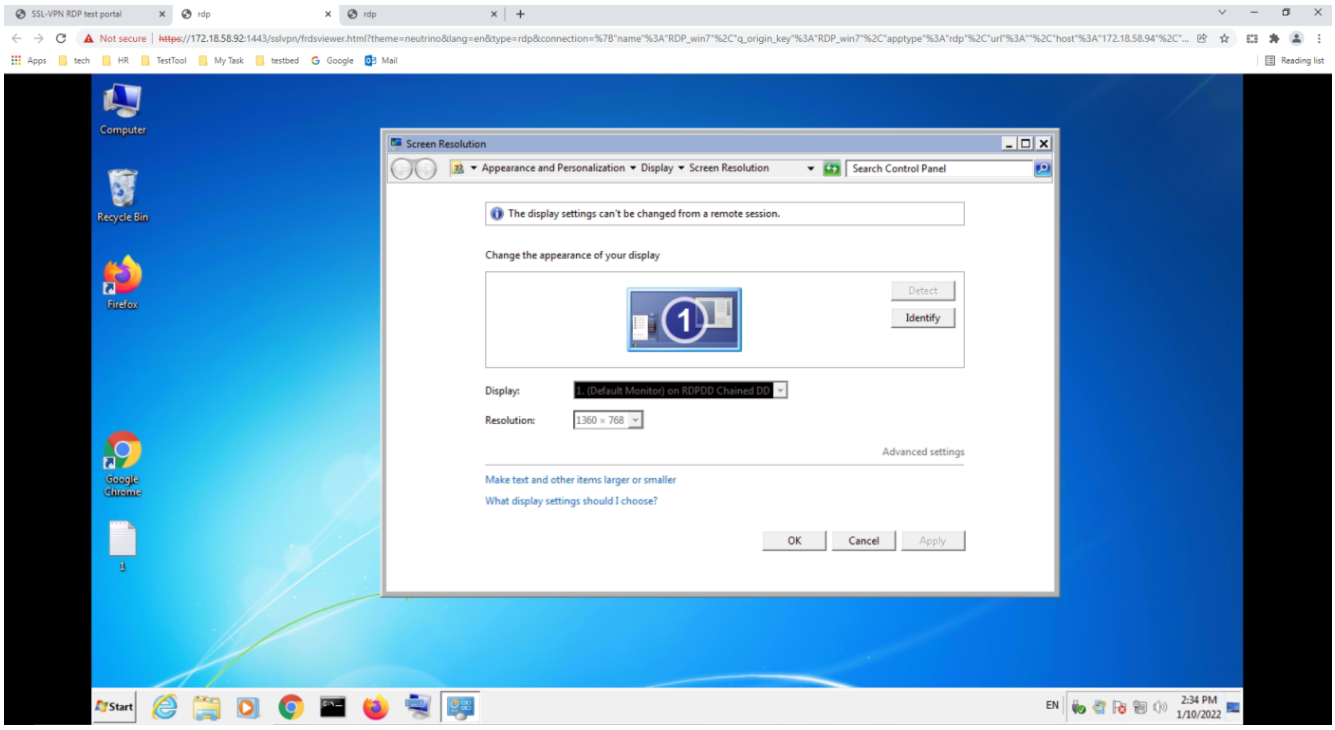


4. Click *Save*.

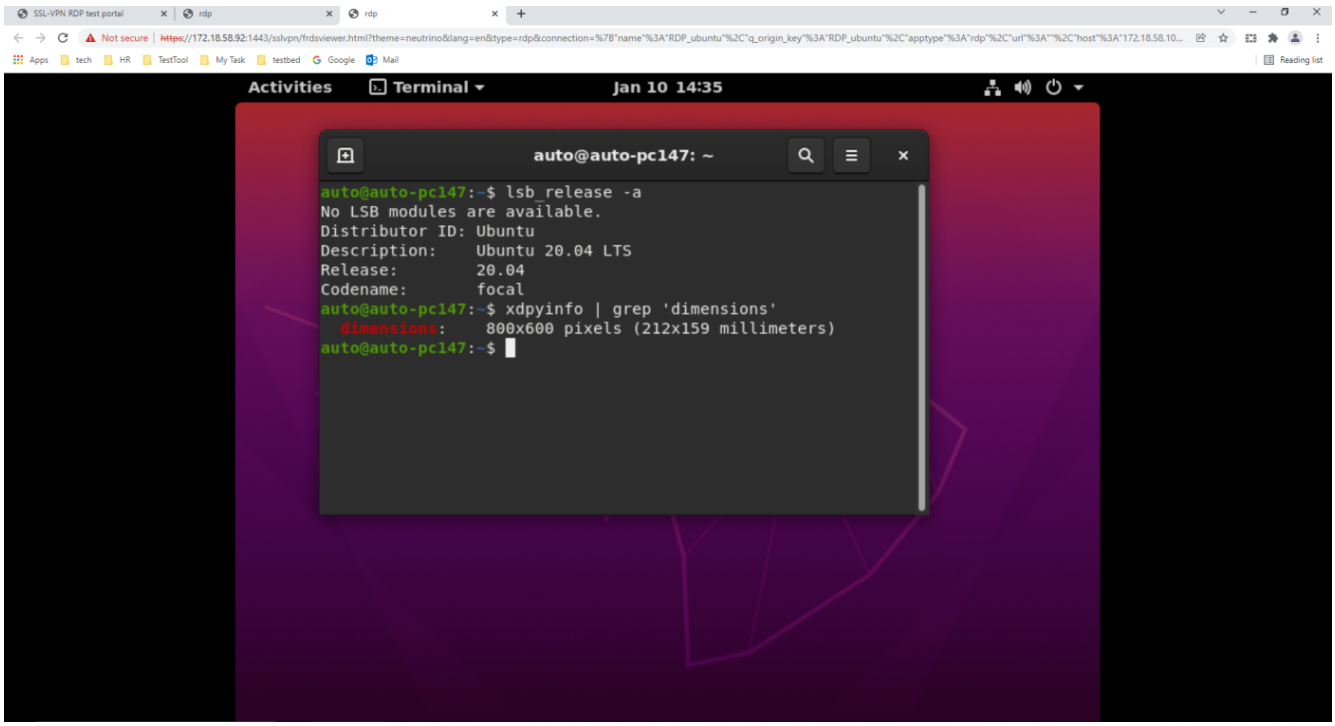
Verification:

When the user connects to the RDP servers using the bookmarks, the customized screen resolutions are applied regardless of the client PC's screen resolution (1920 × 1080).

Windows 7:



Ubuntu 20.04:



To view the bookmarks created by the user:

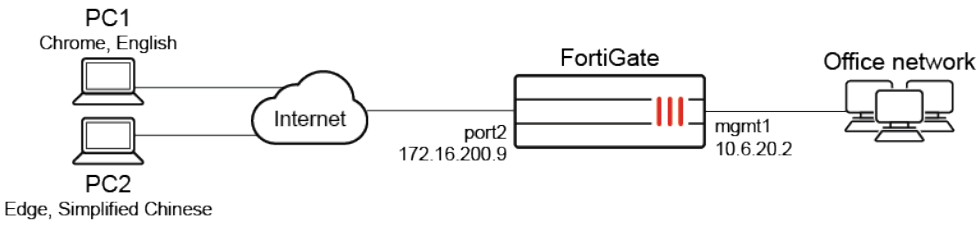
```
show vpn ssl web user-bookmark
config vpn ssl web user-bookmark
```

```
    edit "rdp_user#"
        config bookmarks
            edit "RDP_win7"
                set apptype rdp
                set host "172.18.58.94"
                set port 3389
                set logon-user "fosqa"
                set logon-password ********
                set color-depth 32
                set width 1360
                set height 768
            next
            edit "RDP_ubuntu"
                set apptype rdp
                set host "172.18.58.109"
                set port 3389
                set logon-user "auto"
                set logon-password ********
                set color-depth 32
                set width 800
                set height 600
            next
        end
    next
end
```

Showing the SSL VPN portal login page in the browser's language

By default, the browser's language preference is automatically detected and used by the SSL VPN portal login page. The system language can still be used by changing the settings on the *SSL-VPN Settings* page of the GUI, or disabling `browser-language-detection` in the CLI:

```
config vpn ssl settings
    set browser-language-detection disable
end
```



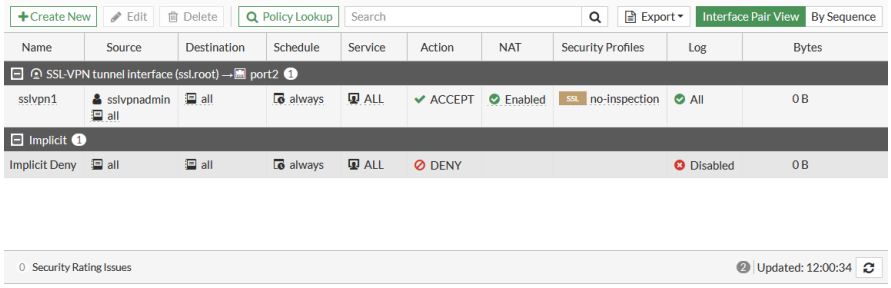
In this example, the *sslvpnadmin* user account is used for SSL VPN connections on the *testportal1* SSL VPN portal. The account is shared by users from different countries that use different browsers and different languages in their browsers. The user on PC1 uses Chrome in English, and the user on PC2 uses Edge in Simplified Chinese. When a user logs in to the SSL VPN web portal, all of the pages are shown in the same language as their browser.

To configure the SSL VPN portal to use the client's browser language:

1. Configure the SSL VPN portal:
   a. Go to *VPN* > *SSL-VPN Portals* and edit the SSL VPN portal.
      For information about configuring SSL VPN portals, see SSL VPN on page 2618.
   b. Enable *Web Mode*.

   c. Click *OK*.
2. Set the language preference:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Under *Web Mode Settings*, set *Language* to *Browser Preference*.

   c. Click *Apply*.
3. Add the *sslvpnadmin* user to the policy used by the SSL VPN portal.



4. Confirm that the configuration works:
   - When the user on PC1 logs in to the SSL VPN portal using Chrome in English, all of the pages are shown in English.
   - When the user on PC2 logs in to the SSL VPN portal using Edge in Simplified Chinese, all of the pages are shown in Simplified Chinese.

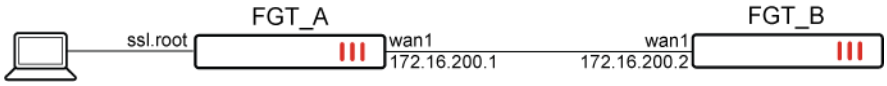
SSL VPN custom landing page

An SSL VPN web mode user can log in to the web portal and be redirected to a custom landing page. The custom landing page can be configured in *VPN > SSL-VPN Portals* by setting the portal *Landing page* to *Custom* or by using the command `config landing-page`.

The landing page can accept SSO credentials as well as SSO from form data. This allows administrators to streamline web application access for their users. The custom redirected portal has a logout button so that when users log out from the web application, they are also logged out from the SSL VPN web connection.

Example

In the following example, the SSL VPN web portal settings are configured so that the URL of the custom landing page of FGT_A is set to the FGT_B login page. Therefore, when a web user is logging into FGT_A's SSL VPN web portal, they will automatically be redirected to FGT_B, where the SSO username and password are passed into the username and password input fields. This allows for single sign on of the connecting user into FGT_B through the SSL VPN.



To configure a custom landing page from the CLI:

1. Configure the user and user group:

```
config user local
    edit "custom_landing_user"
        set type password
        set passwd ********
    next
end
config user group
    edit "ssl-web-group"
        set member "custom_landing_user"
    next
end
```

2. Configure the SSL VPN web portal:

```
config vpn ssl web portal
    edit "custom_landing"
        set web-mode enable
        set landing-page-mode enable
        config landing-page
            set url "https://172.16.200.2/login"
            set sso static
            config form-data
                edit "username"
                    set value "admin"
```

```
                next
                edit "secretkey"
                    set value "1"
                next
            end
            set sso-credential alternative
            set sso-username "admin"
            set sso-password ********
        end
    next
end
```

3. Configure the SSL VPN settings:

```
config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set port 1443
    set source-interface "port1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
        edit 2
            set users "custom_landing_user"
            set portal "custom_landing"
        next
    end
    set encrypt-and-store-password enable
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "testpolicy"
        set srcintf "ssl.root"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set groups "ssl-web-group"
        set users "custom_landing_user"
    next
end
```

To configure a custom landing page from the GUI:

1. Configure the user and user group:
   a. Go to *User & Authentication* > *User Definition* to create the `custom_landing_user` user.
   b. Go to *User & Authentication* > *User Groups* to create the `ssl-web-group` user group with the member `custom_landing_user`.
2. Configure the SSL VPN web portal:
   a. Go to *VPN* > *SSL-VPN Portals*.
   b. Click *Create New*.
   c. Enter `custom_landing` as the *Name*.
   d. Enable custom *Web Mode* features:
      i. Enable *Web Mode*.
      ii. Set *Landing Page* to *Custom*.
      iii. Enter the FGT_B login page *URL*.
      iv. Enable *SSO Credentials* and select *Alternative*.
      v. Enable *SSO form data* and enter the form keys and values.

   e. Click *OK*.
3. Configure the SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Set *Listen on Interface(s)* to *port1*.
   c. Set *Listen on Port* to *1443*.
   d. Set *Server Certificate* to *fgt_gui_automation*.
   e. Create a new *Authentication/Portal Mapping* for group *ssl-web-group* mapping the portal *custom-landing*.
   f. Click *Apply*.
4. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Configure the following settings:

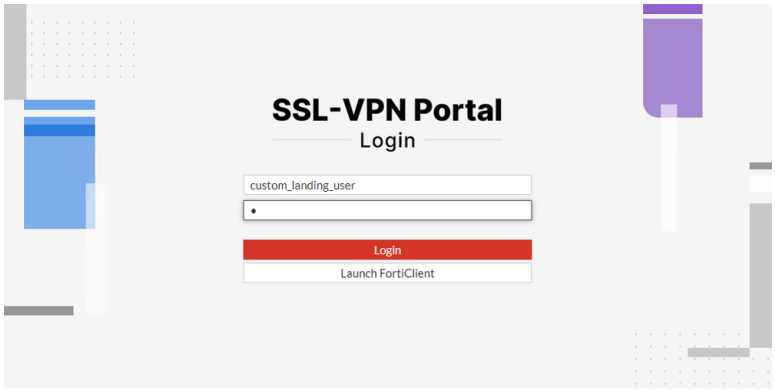
Name	testpolicy
Incoming Interface	ssl.root
Outgoing Interface	wan1
Source	all custom_landing_user ssl-web-group
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

c. Enable *NAT*.
d. Enable *Log Allowed Traffic* and set it to *All Sessions*.
e. Click *OK*.

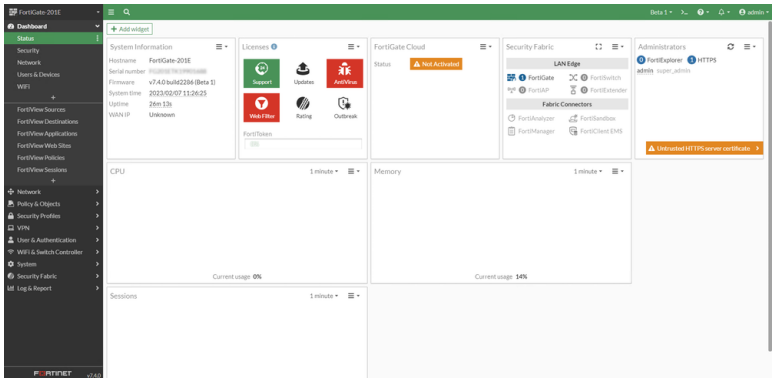
Once the SSL VPN web portal is configured, the connected user can access FGT_B through the FGT_A SSL VPN web portal.

To access FGT_B through the FGT_A SSL VPN web portal:

1. Enter your SSO credentials in the SSL VPN login fields.



The landing page is redirected to the FGT_B GUI automatically.



SSL VPN authentication

The following topics provide instructions on configuring SSL VPN authentication:

- SSL VPN with LDAP user authentication on page 2686
- SSL VPN with LDAP user password renew on page 2691
- SSL VPN with certificate authentication on page 2697
- SSL VPN with LDAP-integrated certificate authentication on page 2702
- SSL VPN for remote users with MFA and user sensitivity on page 2708
- SSL VPN with FortiToken mobile push authentication on page 2716
- SSL VPN with RADIUS on FortiAuthenticator on page 2721
- SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator on page 2726
- SSL VPN with RADIUS password renew on FortiAuthenticator on page 2731
- SSL VPN with RADIUS on Windows NPS on page 2736
- SSL VPN with multiple RADIUS servers on page 2741
- SSL VPN with local user password policy on page 2750
- Dynamic address support for SSL VPN policies on page 2756
- SSL VPN multi-realm on page 2765

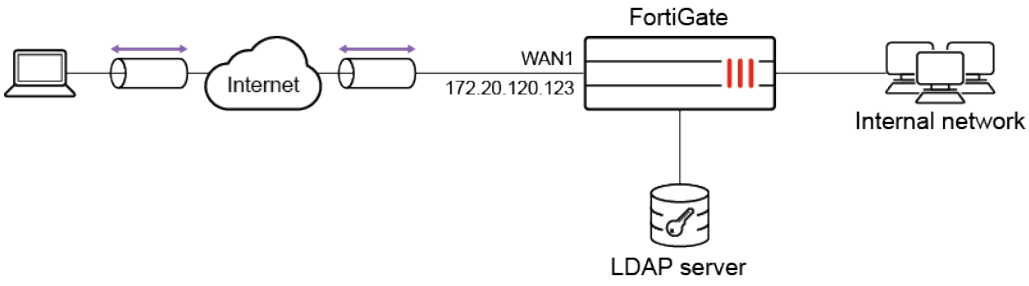
- SSL VPN with Microsoft Entra SSO integration on page 2779

SSL VPN with LDAP user authentication

This is a sample configuration of SSL VPN for LDAP users. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network:
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Specify *Common Name Identifier* and *Distinguished Name*.
   d. Set *Bind Type* to *Regular*.
   e. Specify *Username* and *Password*.
   f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
   g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
4. Configure user group:
   a. Go to *User & Authentication* > *User Groups* to create a user group.
   b. Enter a *Name*.
   c. In *Remote Groups*, click *Add* to add *ldaps-server*.
5. Configure SSL VPN web portal:
   a. Go to *VPN* > *SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings:
   a. Go to *VPN* > *SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.

   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *ldaps-group* mapping portal *full-access*.
7. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *ldaps-group*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Import CA certificate into FortiGate:
   a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System > Certificates* and select *Import > CA Certificate*.
   c. Select *Local PC* and then select the certificate file.

The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.

d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

4. Configure the LDAP server:

```
config user ldap
    edit "ldaps-server"
        set server "172.20.120.161"
        set cnid "cn"
        set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
        set type regular
        set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
        set password **********
        set group-member-check group-object
        set secure ldaps
        set ca-cert "LDAPS-CA"
        set port 636
    next
end
```

5. Configure user group:

```
config user group
    edit "ldaps-group"
        set member "ldaps-server"
    next
end
```

6. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

7. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
```

```
    config authentication-rule
        edit 1
            set groups "ldaps-group"
            set portal "full-access"
        next
    end
end
```

8. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “ldaps-group”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Enter the *ldu1* user credentials, then click *Login*.
3. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *ldu1* credentials.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         229        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         291        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration    I/O Bytes      Tunnel/Dest IP
 0       ldu1    10.1.100.254   9           22099/43228    10.212.134.200
```

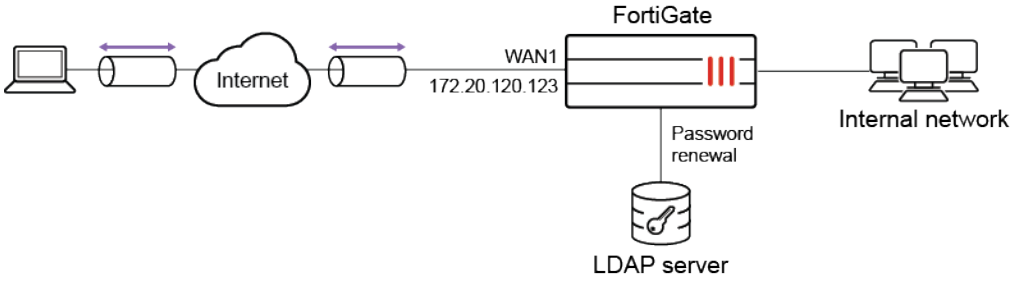
SSL VPN with LDAP user password renew

This is a sample configuration of SSL VPN for LDAP users with *Force Password Change on next logon*. In this example, the LDAP server is a Windows 2012 AD server. A user *ldu1* is configured on Windows 2012 AD server with *Force password change on next logon*.

The LDAP renewal method is designed to replace (reset) the user password, meaning that the Active Directory password policy will not be enforced. For example, users can reuse the same password or use old ones.

You must have generated and exported a CA certificate from the AD server and then have imported it as an external CA certificate into the FortiGate.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Import CA certificate into FortiGate:
   a. Go to *System* > *Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:

The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Specify *Common Name Identifier* and *Distinguished Name*.
   d. Set *Bind Type* to *Regular*.
   e. Specify *Username* and *Password*.
   f. Enable *Secure Connection* and set *Protocol* to *LDAPS*.
   g. For *Certificate*, select *LDAP server CA LDAPS-CA* from the list.
   h. To enable the `password-renew` option, use these CLI commands.

```
config user ldap
    edit "ldaps-server"
        set password-expiry-warning enable
        set password-renewal enable
```

```
    next
end
```

4. Configure user group:
   a. Go to *User & Authentication > User Groups* to create a user group.
   b. Enter a *Name*.
   c. In *Remote Groups*, click *Add* to add *ldaps-server*.
5. Configure SSL VPN web portal:
   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings:
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *ldaps-group* mapping portal *full-access*.
7. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *ldaps-group*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Import CA certificate into FortiGate:
   a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System > Certificates* and select *Import > CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
      The CA certificate now appears in the list of *External CA Certificates*. In the example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

      ```
      config vpn certificate ca
          rename CA_Cert_1 to LDAPS-CA
      end
      ```

4. Configure the LDAP server:

   The LDAP user must either be an administrator, or have the proper permissions delegated to it, to be able to change passwords of other registered users on the LDAP server.

   ```
   config user ldap
       edit "ldaps-server"
           set server "172.20.120.161"
           set cnid "cn"
           set dn "cn=Users,dc=qa,dc=fortinet,dc=com"
           set type regular
           set username "CN=Administrator,cn=users,DC=qa,DC=fortinet,DC=com"
           set password **********
           set group-member-check group-object
           set secure ldaps
           set ca-cert "LDAPS-CA"
           set port 636
           set password-expiry-warning enable
           set password-renewal enable
       next
   end
   ```

5. Configure user group:

```
config user group
    edit "ldaps-group"
        set member "ldaps-server"
    next
end
```

6. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

7. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "ldaps-group"
            set portal "full-access"
        next
    end
end
```

8. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “ldaps-group”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *ldu1* credentials.
   Use a user that is configured on FortiAuthenticator with *Force password change on next logon*.
3. Click *Login*. You are prompted to enter a new password. The prompt will timeout after 90 seconds.
4. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *ldu1* credentials.
   You are prompted to enter a new password. The prompt will timeout after 90 seconds.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         229        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       ldu1    1(1)         291        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration    I/O Bytes      Tunnel/Dest IP
 0       ldu1    10.1.100.254   9           22099/43228    10.212.134.200
```

SSL VPN with certificate authentication

This is an example configuration of SSL VPN that requires users to authenticate using a client certificate. The client certificate is issued by the company Certificate Authority (CA). Each user is issued a certificate with their username in the subject.

There are two ways to configure certificate authentication:

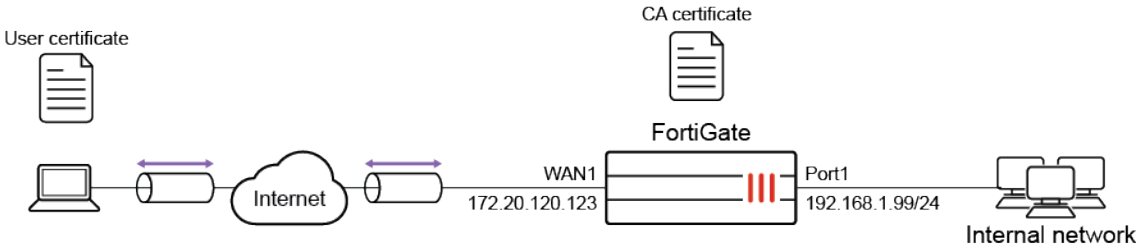
1. Using PKI users
2. Configuring the SSL VPN settings to require a client certificate

In this example, the server and client certificates are signed by the same Certificate Authority (CA).

Self-signed certificates are provided by default to simplify initial installation and testing. It is **HIGHLY** recommended that you acquire a signed certificate for your installation.

Continuing to use these certificates can result in your connection being compromised, allowing attackers to steal your information, such as credit card details.

For more information, please review the Use a non-factory SSL certificate for the SSL VPN portal on page 2625 and learn how to Procuring and importing a signed SSL certificate on page 3438.



Using PKI users

When using PKI users, the FortiGate authenticates the user based on there identity in the subject or the common name on the certificate. The certificate must be signed by a CA that is known by the FortiGate, either through the default CA certificates or through importing a CA certificate.

The user can either match a static subject or common name defined in the PKI user settings, or match an LDAP user in the LDAP server defined in the PKI user settings. Multi-factor authentication can also be enabled with the password as the second factor.

Configuring the SSL VPN settings to require a client certificate

Using this method, the user is authenticated based on their regular username and password, but SSL VPN will still require an additional certificate check. The client certificate only needs to be signed by a known CA in order to pass authentication.

This method can be configured by enabling *Require Client Certificate* (`reqclientcert`) in the SSL-VPN settings.

Configuration

In the following example, SSL VPN users are authenticated using the first method. A PKI user is configured with multi-factor authentication

Pre-requisites:

- The CA has already issued a client certificate to the user.
- The CA has issued a server certificate for the FortiGate's SSL VPN portal.
- The CA certificate is available to be imported on the FortiGate.

To configure SSL VPN in the GUI:

1. Install the server certificate. The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic.
   a. Go to *System* > *Feature Visibility* and ensure *Certificates* is enabled.
   b. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
      - Set *Type* to *Certificate*.
      - Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
      - If required, you can change the *Certificate Name*.

   The server certificate now appears in the list of *Certificates*.
2. Install the CA certificate.
   The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.
   a. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
   b. Select *Local PC* and then select the certificate file.

   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
3. Configure PKI users and a user group.
   To use certificate authentication, use the CLI to create PKI users.

```
config user peer
    edit pki01
        set ca CA_Cert_1
        set subject "CN=User01"
    next
end
```

   Ensure that the subject matches the name of the user certificate. In this example, *User01*.
4. After you have create a PKI user, a new menu is added to the GUI:
   a. Go to *User & Authentication* > *PKI* to see the new user.
   b. Edit the user account.
   c. Enable *Two-factor authentication* and set a password for the account.
   d. Go to *User & Authentication* > *User Groups* and create a group called *sslvpngroup*.
   e. Add the PKI user *pki01* to the group.

5. Configure SSL VPN web portal.
   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
6. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings* and enable SSL-VPN.
   b. Set the *Listen on Interface(s)* to *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the local certificate that was imported.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
7. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as needed.
   j. Click *OK*.

To configure SSL VPN in the CLI:

1. Configure the protected subnet:

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

2. Install the server certificate:
   The server certificate allows the clients to authenticate the server and to encrypt the SSL VPN traffic. While it is easier to install the server certificate in the GUI, the CLI can be used to import a p12 certificate from a TFTP server.
   To import a p12 certificate, put the certificate *server_certificate.p12* on your TFTP server, then run following command on the FortiGate:

```
execute vpn certificate local import tftp server_certificate.p12 <your tftp_server> p12 <your
password for PKCS12 file>
```

   To check that the server certificate is installed:

```
show vpn certificate local server_certificate
```

3. Install the CA certificate:

   The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users. While it is easier to install the CA certificate from GUI, the CLI can be used to import a CA certificates from a TFTP server.

   To import a CA certificate, put the CA certificate on your TFTP server, then run following command on the FortiGate:

   ```
   execute vpn certificate ca import tftp <your CA certificate name> <your tftp server>
   ```

   To check that a new CA certificate is installed:

   ```
   show vpn certificate ca
   ```

4. Configure PKI users and a user group:

   ```
   config user peer
       edit pki01
           set ca CA_Cert_1
           set subject "CN=User01"
           set two-factor enable
           set passwd **********
       next
   end
   ```

   ```
   config user group
       edit "sslvpngroup"
           set member "pki01"
       next
   end
   ```

5. Configure SSL VPN web portal:

   ```
   config vpn ssl web portal
       edit "full-access"
           set tunnel-mode enable
           set web-mode enable
           set ip-pools "SSLVPN_TUNNEL_ADDR1"
           set split-tunneling disable
        next
   end
   ```

6. Configure SSL VPN settings:

   ```
   config vpn ssl settings
       set servercert "server_certificate"
       set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
       set source-interface "wan1"
       set source-address "all"
       set default-portal "web-access"
       config authentication-rule
           edit 1
               set groups "sslvpngroup"
   ```

```
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Installation

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the user certificate on Windows 7, 8, and 10:

1. Double-click the certificate file to open the *Import Wizard*.
2. Use the *Import Wizard* to import the certificate into the *Personal store* of the current user.

To install the user certificate on Mac OS X:

1. Open the certificate file, to open *Keychain Access*.
2. Double-click the certificate.
3. Expand *Trust* and select *Always Trust*.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Enable *Client Certificate* and select the authentication certificate.

6. Save your settings.
7. Use the credentials you've set up to connect to the SSL VPN tunnel.
   If the certificate is correct, you can connect.

To see the results of web portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.
   A message requests a certificate for authentication.
2. Select the user certificate.
3. Enter your user credentials.
   If the certificate is correct, you can connect to the SSL VPN web portal.

To check the SSL VPN connection using the GUI:

1. Go to *VPN > Monitor > SSL-VPN Monitor* to verify the list of SSL users.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details for the SSL connection log.

To check the SSL VPN connection using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type      Timeout         From     HTTP in/out    HTTPS in/out
 0       pki01,cn=User01          1(1)            229     10.1.100.254   0/0     0/0
 1       pki01,cn=User01          1(1)            291     10.1.100.254   0/0     0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       pki01,cn=User01          10.1.100.254    9       22099/43228    10.212.134.200
```

SSL VPN with LDAP-integrated certificate authentication

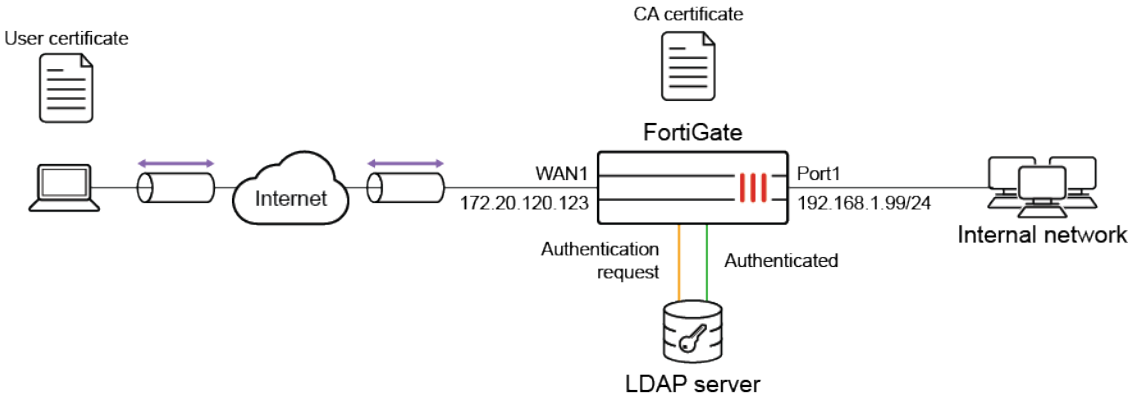
This is a sample configuration of SSL VPN that requires users to authenticate using a certificate with LDAP `UserPrincipalName` checking.

This sample uses Windows 2012R2 Active Directory acting as both the user certificate issuer, the certificate authority, and the LDAP server.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 2858 and Configuring client certificate authentication on the LDAP server on page 2873.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 2866.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

In this sample, the *User Principal Name* is included in the subject name of the issued certificate. This is the user field we use to search LDAP in the connection attempt.

To use the user certificate, you must first install it on the user's PC. When the user tries to authenticate, the user certificate is checked against the CA certificate to verify that they match.

Every user should have a unique user certificate. This allows you to distinguish each user and revoke a specific user's certificate, such as if a user no longer has VPN access.

To install the server certificate:

The server certificate is used for authentication and for encrypting SSL VPN traffic.

1. Go to *System* > *Feature Visibility* and ensure *Certificates* is enabled.
2. Go to *System* > *Certificates* and select *Import* > *Local Certificate*.
3. Set *Type* to *Certificate*.
4. Choose the *Certificate file* and the *Key file* for your certificate, and enter the *Password*.
5. If required, change the *Certificate Name*.
   The server certificate now appears in the list of *Certificates*.

To install the CA certificate:

The CA certificate is the certificate that signed both the server certificate and the user certificate. In this example, it is used to authenticate SSL VPN users.

1. Go to *System* > *Certificates* and select *Import* > *CA Certificate*.
2. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network > Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Configure the LDAP server:
   a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
   b. Specify *Name* and *Server IP/Name*.
   c. Set *Distinguished Name* to *dc=fortinet-fsso,dc=com*.
   d. Set *Bind Type* to *Regular*.
   e. Set *Username* to *cn=admin,ou=testing,dc=fortinet-fsso,dc=com*.
   f. Set *Password*.
   g. Click *OK*.
3. Configure PKI users and a user group:
   To use certificate authentication, use the CLI to create PKI users.

```
config user peer
    edit user1
        set ca CA_Cert_1
        set mfa-server "ldap-AD"
        set mfa-mode subject-identity
    next
end
```

   When you have create a PKI user, a new menu is added to the GUI:
   a. Go to *User & Authentication > PKI* to see the new user.
   b. Go to *User & Authentication > User > User Groups* and create a group *sslvpn-group*.
   c. Add the PKI peer object you created as a local member of the group.
   d. Add a remote group on the LDAP server and select the group of interest.
      You need these users to be members using the LDAP browser window.
4. Configure SSL VPN web portal:
   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings:
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpn-group* mapping portal *full-access*.

6. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpn-group*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure the LDAP server:

```
config user ldap
    edit "ldap-AD"
        set server "172.18.60.206"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=admin,ou=testing,dc=fortinet-fsso,dc=com"
        set password ldap-server-password
```

```
    next
end
```

4. Configure PKI users and a user group:

```
config user peer
    edit user1
        set ca CA_Cert_1
        set mfa-server "ldap-AD"
        set mfa-mode subject-identity
    next
end
```

```
config user group
    edit "sslvpn-group"
        set member "ldap-AD" "user1"
        config match
            edit 1
                set server-name "ldap-AD"
                set group-name "CN=group3,OU=Testing,DC=Fortinet-FSSO,DC=COM"
            next
        end
    next
end
```

5. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

6. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpn-group"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpn-group”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection.
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
   d. Enable *Client Certificate* and select the authentication certificate.
4. Save your settings.
   Connecting to the VPN only requires the user's certificate. It does not require username or password.

To see the results of web portal:

1. In a web browser, log into the portal *http://172.20.120.123:10443*.
   A message requests a certificate for authentication.
2. Select the user certificate.
   You can connect to the SSL VPN web portal.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user’s connection.
2. Go to *Log & Report* > *VPN Events* to view the details of the SSL VPN connection event log.
3. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the SSL VPN connection using the CLI:

Below is a sample output of `diagnose debug application fnbamd -1` while the user connects. This is a shortened output sample of a few locations to show the important parts. This sample shows lookups to find the group memberships (three groups total) of the user and that the correct group being found results in a match.

```
[1148] fnbamd_ldap_recv-Response len: 16, svr: 172.18.60.206
[829] fnbamd_ldap_parse_response-Got one MESSAGE. ID:4, type:search-result
[864] fnbamd_ldap_parse_response-ret=0

[2091] fnbamd_auth_cert_check-Group 'sslvpn-group' matched
[2120] fnbamd_auth_cert_result-Result for ldap svr[0] 'ldap-AD' is SUCCESS
[2126] fnbamd_auth_cert_result-matched user 'test3', matched group 'sslvpn-group'
```

You can also use `diagnose firewall auth list` to validate that a firewall user entry exists for the SSL VPN user and is part of the right groups.

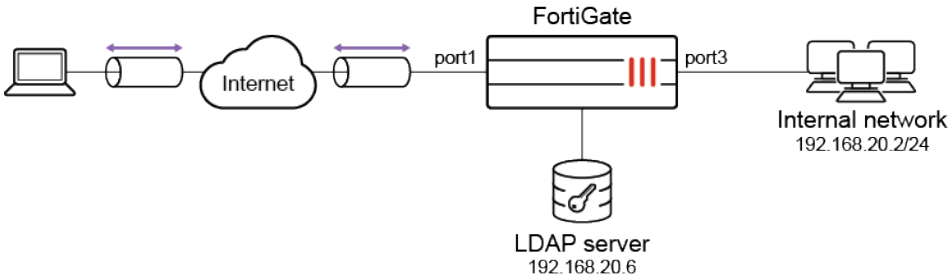
SSL VPN for remote users with MFA and user sensitivity

By default, remote LDAP and RADIUS user names are case sensitive. When a remote user object is applied to SSL VPN authentication, the user must type the exact case that is used in the user definition on the FortiGate.

Case sensitivity and accents can be ignored by disabling the `username-sensitivity` CLI command, allowing the remote user object to match any case or accents that the end user types in.

In this example, a remote user is configured with multi-factor authentication (MFA). The user group includes the LDAP user and server, and is applied to SSL VPN authentication and the policy.

Topology



Example configuration

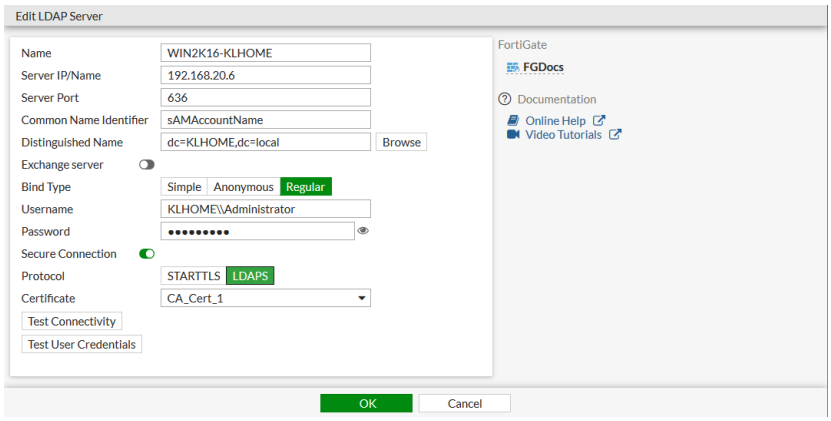
To configure the LDAP server:

1. Generate and export a CA certificate from the AD server .
2. Import the CA certificate into FortiGate:
   a. Go to *System > Features Visibility* and ensure *Certificates* is enabled.
   b. Go to *System > Certificates* and select *Import > CA Certificate*.
   c. Select *Local PC* and then select the certificate file.
   The CA certificate now appears in the list of *External CA Certificates*. In this example, it is called *CA_Cert_1*.
   d. If you want, you can use CLI commands to rename the system-generated *CA_Cert_1* to be more descriptive:

```
config vpn certificate ca
    rename CA_Cert_1 to LDAPS-CA
end
```

3. Configure the LDAP user:
   a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
   b. Configure the following options for this example:

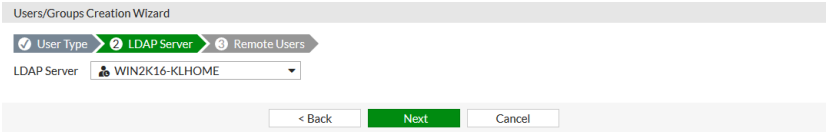
Name	WIN2K16-KLHOME
Server IP/Name	192.168.20.6
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=KLHOME,dc=local
Bind Type	Regular
Username	KLHOME\\Administrator
Password	*********
Secure Connection	Enable
Protocol	LDAPS
Certificate	CA_Cert_1 This is the CA certificate that you imported in step 2.



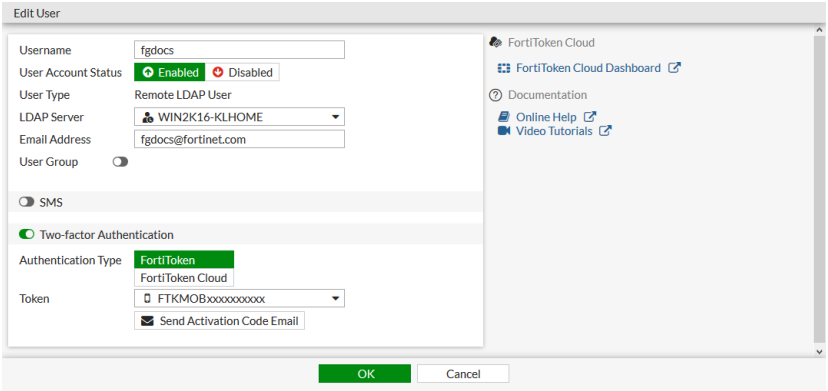
c. Click *OK*.

To configure an LDAP user with MFA:

1. Go to *User & Authentication* > *User Definition* and click *Create New*.
2. Select *Remote LDAP User*, then click *Next*.
3. Select the just created LDAP server, then click *Next*.



4. Right click to add the selected user, then click *Submit*.
5. Edit the user that you just created.
   The username will be pulled from the LDAP server with the same case as it has on the server.
6. Set the *Email Address* to the address that FortiGate will send the FortiToken to.
7. Enable *Two-factor Authentication*.
8. Set *Authentication Type* to *FortiToken*.
9. Set *Token* to a FortiToken device. See for more information.



10. Click *OK*.

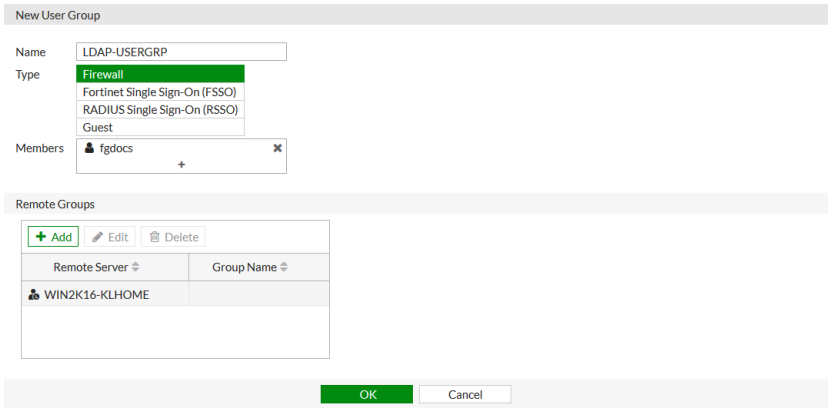
To disable case and accent sensitivity on the remote user:

This can only be configured in the CLI.

```
config user local
    edit "fgdocs"
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to "fgdocs@fortinet.com"
        set username-sensitivity disable
        set ldap-server "WIN2K16-KLHOME"
    next
end
```

To configure a user group with the remote user and the LDAP server:

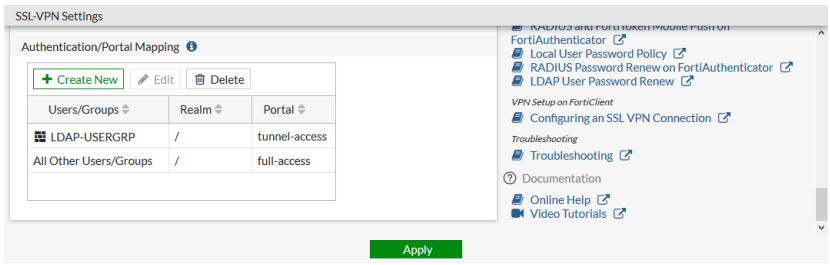
1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Set the *Name* to *LDAP-USERGRP*.
3. Set *Members* to the just created remote user.
4. In the *Remote Groups* table, click *Add*:
   a. Set *Remote Server* to the LDAP server.
   b. Set the group or groups that apply, and right click to add them.
   c. Click *OK*.



5. Click *OK*.

To apply the user group to the SSL VPN portal:

1. Go to *VPN* > *SSL-VPN Settings*.
2. In the *Authentication/Portal Mapping* table, click *Create New*.
   a. Set *Users/Groups* to the just created user group.
   b. Configure the remaining settings as required.
   c. Click *OK*.

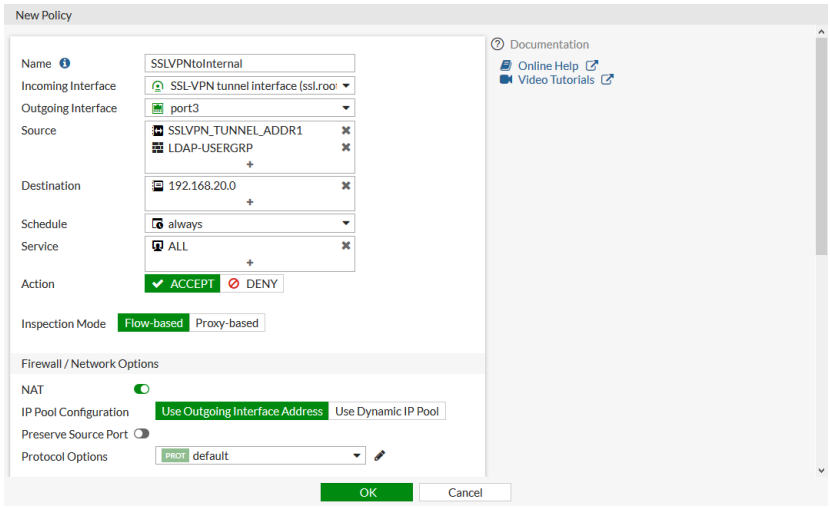


3. Click *Apply*.

To apply the user group to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

Name	SSLVPNtoInteral
Incoming Interface	SSL-VPN tunnel interface (ssl.root)
Outgoing Interface	port3
Source	Address - SSLVPN_TUNNEL_ADDR1 User - LDAP-USERGRP
Destination	The address of the internal network. In this case: 192.168.20.0.
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled



3. Configuring the remaining settings as required.
4. Click *OK*.

To configure this example in the CLI:

1. Configure the LDAP server:

```
config user ldap
    edit "WIN2K16-KLHOME"
        set server "192.168.20.6"
        set cnid "sAMAccountName"
        set dn "dc=KLHOME,dc=local"
        set type regular
        set username "KLHOME\\Administrator"
        set password *********
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
    next
end
```

2. Configure an LDAP user with MFA and disable case and accent sensitivity on the remote user:

```
config user local
    edit "fgdocs"
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to "fgdocs@fortinet.com"
        set username-sensitivity disable
        set ldap-server "WIN2K16-KLHOME"
    next
end
```

3. Configure a user group with the remote user and the LDAP server:

```
config user group
    edit "LDAP-USERGRP"
        set member "fgdocs" "WIN2K16-KLHOME"
    next
end
```

4. Apply the user group to the SSL VPN portal:

```
config vpn ssl settings
    set servercert <server certificate>
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "LDAP-USERGRP"
            set portal "full-access"
        next
```

```
    end
end
```

5. Apply the user group to a firewall policy:

```
config firewall policy
    edit 5
        set name "SSLVPNtoInternal"
        set srcintf "ssl.root"
        set dstintf "port3"
        set srcaddr "SSLVPN_TUNNEL_ADDR1"
        set dstaddr "192.168.20.0"
        set action accept
        set schedule "always"
        set service "ALL"
        set groups "LDAP-USERGRP"
        set nat enable
    next
end
```

Verification

To setup the VPN connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface.
   c. If required, set the *Customize Port*.
4. Save your settings.

To test the connection with case sensitivity disabled:

1. Connect to the VPN:
   a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
   b. When prompted, enter your FortiToken code.
   You should now be connected.
2. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       fgdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       fgdocs          LDAP-USERGRP    192.168.2.202   45      99883/5572    10.212.134.200
```

3. Disconnect from the VPN connection.
4. Reconnect to the VPN:
   a. Log in to the tunnel with the username, using a different case than on the FortiGate.
   b. When prompted, enter your FortiToken code.
   You should now be connected.
5. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       FGDOCS          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       FGDOCS          LDAP-USERGRP    192.168.2.202   45      99883/5572    10.212.134.200
```

In both cases, the remote user is matched against the remote LDAP user object and prompted for multi-factor authentication.

To test the connection with case and accent sensitivity enabled:

1. Enable case and accent sensitivity for the user:

```
config user local
    edit "fgdocs"
        set username-sensitivity enable
    next
end
```

2. Connect to the VPN
   a. Log in to the tunnel with the username, using the same case that it is on the FortiGate.
   b. When prompted, enter your FortiToken code.
   You should now be connected.
3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       fgdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       fgdocs          LDAP-USERGRP    192.168.2.202   45      99883/5572    10.212.134.200
```

1. Disconnect from the VPN connection.
2. Reconnect to the VPN:
   a. Log in to the tunnel with the username, using a different case than on the FortiGate.
   You will not be prompted for your FortiToken code. You should now be connected.

3. Check the web portal log in using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out   HTTPS in/out
 0       FGdocs          LDAP-USERGRP    16(1)           289     192.168.2.202 0/0      0/0

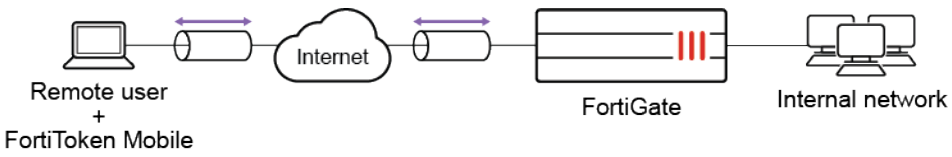
SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       FGdocs          LDAP-USERGRP    192.168.2.202   45      99883/5572    10.212.134.200
```

In this case, the user is allowed to log in without a FortiToken code because the entered user name did not match the name defined on the remote LDAP user object. Authentication continues to be evaluated against the LDAP server though, which is not case sensitive.

SSL VPN with FortiToken mobile push authentication

This is a sample configuration of SSL VPN that uses FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Register FortiGate for FortiCare Support:
   To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.
   a. Go to *Dashboard* > *Licenses*.
   b. Hover the pointer on *Support* to check if FortiCare registered. If not, click it and select *Register*.

3. Add FortiToken mobile to FortiGate:
   If your FortiGate has FortiToken installed, skip this step.
   a. Go to *User & Authentication > FortiTokens* and click *Create New*.
   b. Select *Mobile Token* and type in *Activation Code*.
   c. Every FortiGate has two free mobile tokens. Go to *User & Authentication > FortiTokens* and click *Import Free Trial Tokens*.
4. Enable FortiToken mobile push:
   To use FTM-push authentication, use CLI to enable FTM-Push on the FortiGate.
   a. Ensure `server` is reachable from the Internet and enter the following CLI commands:

```
config system ftm-push
    set server 172.20.120.123
    set status enable
end
```

   b. Go to *Network > Interfaces*.
   c. Edit the *wan1* interface.
   d. Under *Administrative Access > IPv4*, select *FTM*.
   e. Click *OK*.
5. Configure user and user group:
   a. Go to *User & Authentication > User Definition* to create a local user *sslvpnuser1*.
   b. Enter the user's *Email Address*.
   c. Enable *Two-factor Authentication* and select one mobile *Token* from the list,
   d. Enable *Send Activation Code* and select *Email*.
   e. Click *Next* and click *Submit*.
   f. Go to *User & Authentication > User Groups* to create a group *sslvpngroup* with the member *sslvpnuser1*.
6. Activate the mobile token:
   a. When the user *sslvpnuser1* is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.
7. Configure SSL VPN web portal:
   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
8. Configure SSL VPN settings:
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
9. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.

c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
h. Enable *NAT*.
i. Configure any remaining firewall and security options as desired.
j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Register FortiGate for FortiCare Support.
   To add or download a mobile token on FortiGate, FortiGate must be registered for FortiCare Support. If your FortiGate is registered, skip this step.

```
diagnose forticare direct-registration product-registration -a "your account@xxx.com" -p "your
password" -T "Your Country/Region" -R "Your Reseller" -e 1
```

4. Add FortiToken mobile to FortiGate:

```
execute fortitoken-mobile import <your FTM code>
```

   If your FortiGate has FortiToken installed, skip this step.
   Every FortiGate has two free mobile Tokens. You can download the free token.

```
execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

5. Enable FortiToken mobile push:
   a. To use FTM-push authentication, ensure server is reachable from the Internet and enable FTM-push in the FortiGate:

```
config system ftm-push
    set server 172.20.120.123
    set status enable
end
```

   b. Enable FTM service on WAN interface:

```
config system interface
    edit "wan1"
        append allowaccess ftm
    next
end
```

6. Configure user and user group:

```
config user local
    edit "sslvpnuser1"
        set type password
        set two-factor fortitoken
        set fortitoken <select mobile token for the option list>
        set email-to <user's email address>
        set passwd <user's password>
    next
end
config user group
    edit "sslvpngroup"
        set member "sslvpnuser1"
    next
end
```

7. Activate the mobile token.
   When the user *sslvpnuser1* is created, an email is sent to the user's email address. Follow the instructions to install your FortiToken mobile application on your device and activate your token.
8. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

9. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

10. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
   The FortiGate pushes a login request notification through the FortiToken mobile application.
3. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN portal.
4. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.

4. Save your settings.
5. Log in using the *sslvpnuser1* credentials and click *FTM Push*.
   The FortiGate pushes a login request notification through the FortiToken mobile application.
6. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User           Auth Type    Timeout   From           HTTP in/out   HTTPS in/out
 0       sslvpnuser1    1(1)         229       10.1.100.254   0/0           0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

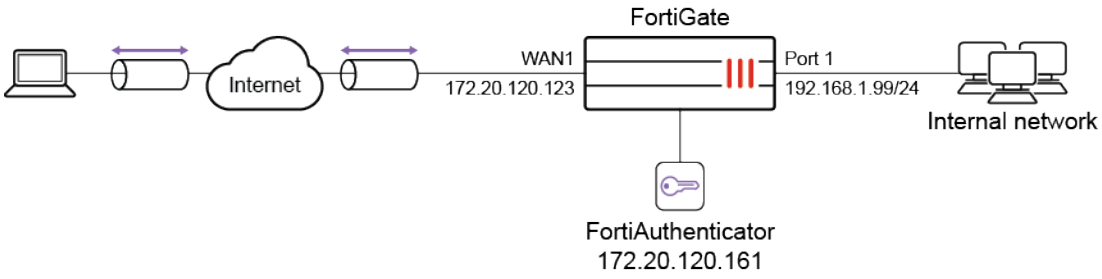
```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type    Timeout   From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)         291       10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User          Source IP      Duration   I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9          22099/43228    10.212.134.200
```

SSL VPN with RADIUS on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. Create a user on the FortiAuthenticator.
   a. On the FortiAuthenticator, go to *Authentication > User Management > Local Users* to create a user *sslvpnuser1*.
   b. Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
   c. Go to *Authentication > User Management > User Groups* to create a group *sslvpngroup*.
   d. Add *sslvpnuser1* to the group by moving the user from *Available users* to *Selected users*.
2. Create the RADIUS client (FortiGate) on the FortiAuthenticator.
   a. On the FortiAuthenticator, go to *Authentication > RADIUS Service > Clients* to add the FortiGate as a RADIUS client *OfficeServer*).
   b. Enter the FortiGate IP address and set a *Secret*.
      The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
   c. Set *Realms* to *local | Local users*.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network > Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects > Addresses* and create an address for internal subnet *192.168.1.0*.
2. Create a RADIUS user and user group .
   a. On the FortiGate, go to *User & Authentication > RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
   b. For *Name*, use *FAC-RADIUS*.
   c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.
   d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
   e. Select *Test User Credentials* and enter the credentials for *sslvpnuser1*.
      The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
   f. Go to *User & Authentication > User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
   g. For *Name*, use *SSLVPNGroup*.
   h. In *Remote Groups*, click *Add*.
   i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
   j. Leave the *Groups* field blank.
3. Configure SSL VPN web portal.

   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
4. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
5. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. *Incoming Interface* must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example: *port1*.
   e. Set the *Source > Address* to *all* and *Source > User* to *sslvpngroup*.
   f. Set *Destination > Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure the remaining options as required.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
```

```
    next
end
```

3. Create a RADIUS user and user group.

```
config user radius
    edit "FAC-RADIUS"
        set server "172.20.120.161"
        set secret <FAC client secret>
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "FAC-RADIUS"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

5. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
```

```
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
3. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
   - Set the connection name.
   - Set *Remote Gateway* to *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *sslvpnuser1* credentials and check that you are logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type    Timeout    From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)         229        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

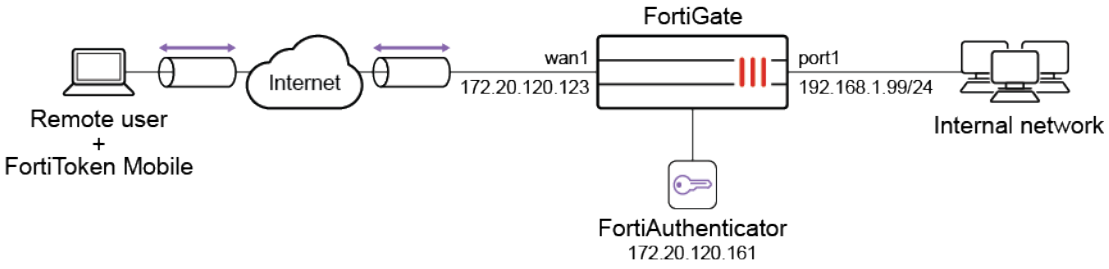
```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type   Timeout    From           HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)        291        10.1.100.254   0/0          0/0

SSL VPN sessions:
 Index   User          Source IP      Duration     I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9            22099/43228    10.212.134.200
```

SSL VPN with RADIUS and FortiToken mobile push on FortiAuthenticator

This is a sample configuration of SSL VPN that uses FortiAuthenticator as a RADIUS authentication server and FortiToken mobile push two-factor authentication. If you enable push notifications, users can accept or deny the authentication request.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure FortiAuthenticator using the GUI:

1. On the FortiAuthenticator, go to *System* > *Administration* > *System Access* and configure a *Public IP/FQDN for FortiToken Mobile*. If the FortiAuthenticator is behind a firewall, the public IP/FQDN will be an IP/port forwarding rule directed to one of the FortiAuthenticator interfaces. The interface that receives the approve/deny FTM push responses must have the *FortiToken Mobile API* service enabled.
2. Add a FortiToken mobile license on the FortiAuthenticator:
   a. Go to *Authentication* > *User Management* > *FortiTokens*.
   b. Click *Create New*.
   c. Set *Token type* to *FortiToken Mobile* and enter the *FortiToken Activation codes*.

3. Create the RADIUS client (FortiGate) on the FortiAuthenticator:
   a. Go to *Authentication > RADIUS Service > Clients* to add the FortiGate as a RADIUS client *OfficeServer*).
   b. Enter the FortiGate IP address and set a *Secret*.
      The secret is a pre-shared secure password that the FortiGate uses to authenticate to the FortiAuthenticator.
   c. Set *Authentication method* to *Enforce two-factor authentication*.
   d. Select *Enable FortiToken Mobile push notifications authentication*.
   e. Set *Realms* to *local | Local users*.
4. Create a user and assign FortiToken mobile to the user on the FortiAuthenticator:
   a. Go to *Authentication > User Management > Local Users* to create a user *sslvpnuser1*.
   b. Enable *Allow RADIUS authentication* and click *OK* to access additional settings.
   c. Enable *Token-based authentication* and select to deliver the token code by *FortiToken*.
   d. Select the FortiToken added from the FortiToken Mobile dropdown menu.
   e. Set *Delivery method* to *Email* and fill in the *User Information* section.
   f. Go to *Authentication > User Management > User Groups* to create a group *sslvpngroup*.
   g. Add *sslvpnuser1* to the group by moving the user from *Available users* to *Selected users*.
5. Install the FortiToken mobile application on your Android or iOS smartphone.
   The FortiAuthenticator sends the FortiToken mobile activation to the user's email address.
6. Activate the FortiToken mobile through the FortiToken mobile application by entering the activation code or scanning the QR code.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network > Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Create a RADIUS user and user group:
   a. On the FortiGate, go to *User & Authentication > RADIUS Servers* to create a user to connect to the RADIUS server (FortiAuthenticator).
   b. For *Name*, use *FAC-RADIUS*.
   c. Enter the IP address of the FortiAuthenticator, and enter the *Secret* created above.
   d. Click *Test Connectivity* to ensure you can connect to the RADIUS server.
   e. Select *Test User Credentials* and enter the credentials for *sslvpnuser1*.
      The FortiGate can now connect to the FortiAuthenticator as the RADIUS client.
   f. Go to *User & Authentication > User Groups* and click *Create New* to map authenticated remote users to a user group on the FortiGate.
   g. For *Name*, use *SSLVPNGroup*.
   h. In *Remote Groups*, click *Add*.
   i. In the *Remote Server* dropdown list, select *FAC-RADIUS*.
   j. Leave the *Groups* field blank.

3. Configure SSL VPN web portal:
   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
4. Configure SSL VPN settings:
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
5. Configure SSL VPN firewall policy:
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example: *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address:

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
```

```
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Create a RADIUS user and user group:

```
config user radius
    edit "FAC-RADIUS"
        set server "172.20.120.161"
        set secret <FAC client secret>
    next
end
```

```
config user group
    edit "sslvpngroup"
        set member "FAC-RADIUS"
    next
end
```

4. Configure SSL VPN web portal:

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

5. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

6. Configure one SSL VPN firewall policy to allow remote user to access the internal network:

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
```

```
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
   The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
3. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN portal.
4. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example: *172.20.120.123*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the *sslvpnuser1* credentials and click *FTM Push*.
   The FortiAuthenticator pushes a login request notification through the FortiToken Mobile application.
6. Check your mobile device and select *Approve*.
   When the authentication is approved, *sslvpnuser1* is logged into the SSL VPN tunnel.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type   Timeout   From           HTTP in/out   HTTPS in/out
 0       sslvpnuser1   1(1)        229       10.1.100.254   0/0           0/0
```

```
SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login on CLI:

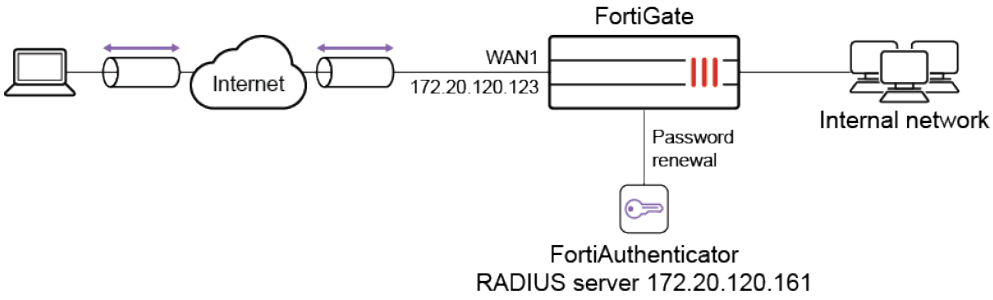
```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type    Timeout   From          HTTP in/out  HTTPS in/out
 0       sslvpnuser1   1(1)         291       10.1.100.254  0/0          0/0

SSL VPN sessions:
 Index   User          Source IP      Duration    I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9           22099/43228    10.212.134.200
```

SSL VPN with RADIUS password renew on FortiAuthenticator

This is a sample configuration of SSL VPN for RADIUS users with *Force Password Change on next logon*. In this example, the RADIUS server is a FortiAuthenticator. A user *test1* is configured on FortiAuthenticator with *Force password change on next logon*.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.

   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects > Address* and create an address for internet subnet *192.168.1.0*.
2. Create a RADIUS user.
   a. Go to *User & Authentication > RADIUS Servers* to create a user.
   b. Set *Authentication method* to *MS-CHAP-v2*.
   c. Enter the *IP/Name* and *Secret*.
   d. Click *Create*.
      Password renewal only works with the MS-CHAP-v2 authentication method.
   e. To enable the `password-renew` option, use these CLI commands.

```
config user radius
    edit "fac"
        set server "172.20.120.161"
        set secret <fac radius password>
        set auth-type ms_chap_v2
        set password-renewal enable
    next
end
```

3. Configure user group.
   a. Go to *User & Authentication > User Groups* to create a user group.
   b. For the *Name*, enter *fac-group*.
   c. In *Remote Groups*, click *Add* to add *Remote Server* you just created.
4. Configure SSL VPN web portal.
   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
      This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *fac-group* mapping portal *full-access*.
6. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name, in this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *fac-group*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network, in this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.

i. Configure any remaining firewall and security options as desired.
j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure the RADIUS server.

```
config user radius
    edit "fac"
        set server "172.18.58.107"
        set secret <fac radius password>
        set auth-type ms_chap_v2
        set password-renewal enable
    next
end
```

4. Configure user group.

```
config user group
    edit "fac-group"
        set member "fac"
    next
end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
    next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "fac-group"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “fac-group”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *test1* credentials.
   Use a user which is configured on FortiAuthenticator with *Force password change on next logon*.
3. Click *Login*. You are prompted to enter a new password.

4. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
   - Set the connection name.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *test1* credentials.
   You are prompted to enter a new password.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
3. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout    From           HTTP in/out   HTTPS in/out
 0       test1   1(1)         229        10.1.100.254   0/0           0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Auth Type    Timeout   From           HTTP in/out  HTTPS in/out
 0       test1   1(1)         291       10.1.100.254   0/0          0/0

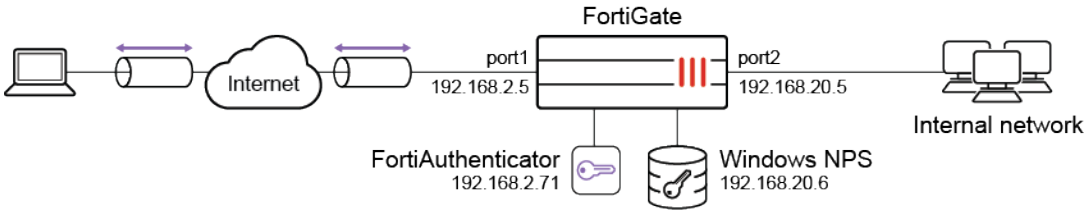
SSL VPN sessions:
 Index   User    Source IP      Duration   I/O Bytes      Tunnel/Dest IP
 0       test1   10.1.100.254   9          22099/43228    10.212.134.200
```

SSL VPN with RADIUS on Windows NPS

This is an example configuration of SSL VPN that uses Windows Network Policy Server (NPS) as a RADIUS authentication server.

The NPS must already be configured to accept the FortiGate as a RADIUS client and the choice of authentication method, such as MS-CHAPv2. A shared key must also have been created.

Example



The user is connecting from their PC to the FortiGate's port1 interface. RADIUS authentication occurs between the FortiGate and the Windows NPS, and the SSL-VPN connection is established once the authentication is successful.

Configure SSL-VPN with RADIUS on Windows NPS in the GUI

To configure the internal and external interfaces:

1. Go to *Network* > *Interfaces*
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

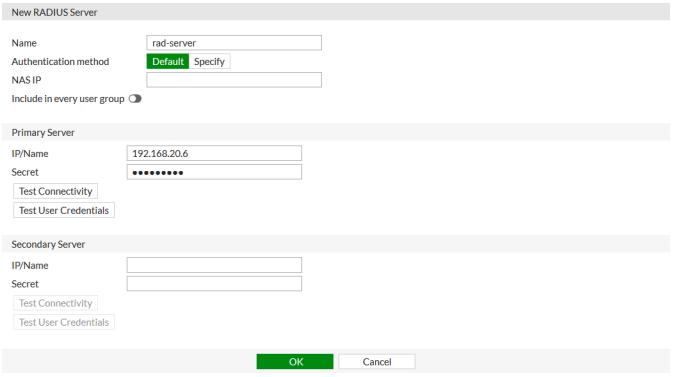
To create a firewall address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *192.168.20.0*.
4. Leave *Type* as *Subnet*
5. Set *IP/Netmask* to *192.168.20.0/24*.
6. Click *OK*.

To add the RADIUS server:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Set *Name* to *rad-server*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.

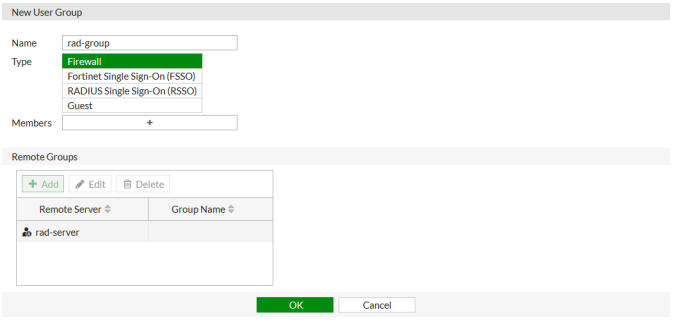
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Optionally, click *Test User Credentials* to test user credentials. Testing from the GUI is limited to PAP.



7. Click *OK*.

To configure a user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. Set *Name* to *rad-group*.
3. Under *Remote Groups*, click *Add* and add the *rad-server*.



4. Click *OK*.

To configure SSL VPN settings:

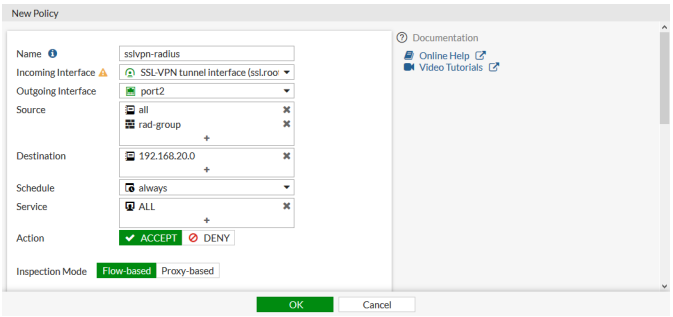
1. Go to *VPN > SSL-VPN Settings*.
2. Select the *Listen on Interface(s)*, in this example, *port1*.
3. Set *Listen on Port* to *10443*.
4. If you have a server certificate, set *Server Certificate* to the authentication certificate.

5. Under *Authentication/Portal Mapping*:
   a. Edit *All Other Users/Groups* and set *Portal* to *web-access*.
   b. Click *Create New* and create a mapping for the *rad-group* user group with *Portal* set to *full-access*.

   c. Click *OK*.
6. Click *Apply*.

To configure an SSL VPN firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set the policy name, in this example, *sslvpn-radius*.
3. Set *Incoming Interface* to *SSL-VPN tunnel interface(ssl.root)*.
4. Set *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port2*.
5. Set the *Source* > *Address* to *all* and *Source* > *User* to *rad-group*.
6. Set *Destination* > *Address* to the internal protected subnet *192.168.20.0*.
7. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
8. Enable *NAT*.



9. Configure the remaining options as required.
10. Click *OK*.

Configure SSL-VPN with RADIUS on Windows NPS in the CLI

To configure SSL VPN using the CLI:

1. Configure the internal and external interfaces:

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.2.5 255.255.255.0
        set alias internal
    next
```

```
    edit "port2"
        set vdom "root"
        set ip 192.168.20.5 255.255.255.0
        set alias external
    next
end
```

2. Configure the firewall address:

```
config firewall address
    edit "192.168.20.0"
        set subnet 192.168.20.0 255.255.255.0
    next
end
```

3. Add the RADIUS server:

```
config user radius
    edit "rad-server"
        set server "192.168.20.6"
        set secret *********
    next
end
```

4. Create a user group and add the RADIUS server to it:.

```
config user group
    edit "rad-group"
        set member "rad-server"
    next
end
```

5. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "rad-group"
            set portal "full-access"
        next
    end
end
```

6. Configure an SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn-radius"
```

```
        set srcintf "ssl.root"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "192.168.20.0"
        set groups “rad-group”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Results

To connect with FortiClient in tunnel mode:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access* > *Configure VPN*.
3. Add a new connection:
   a. Set the connection name.
   b. Set *Remote Gateway* to *192.168.2.5*.
   c. Select *Customize Port* and set it to *10443*.
4. Save your settings.
5. Log in using the RADIUS user credentials.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the user’s connection.
2. Go to *Log & Report* > *System Events* and select the *VPN Events* card to view the details of the SSL VPN connection event log.
3. Go to *Log & Report* > *Forward Traffic* to view the details of the SSL VPN traffic.

To check the login using the CLI:

```
# get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         From     HTTP in/out    HTTPS in/out
 0       radkeith        rad-group        2(1)            295     192.168.2.202  0/0     0/0

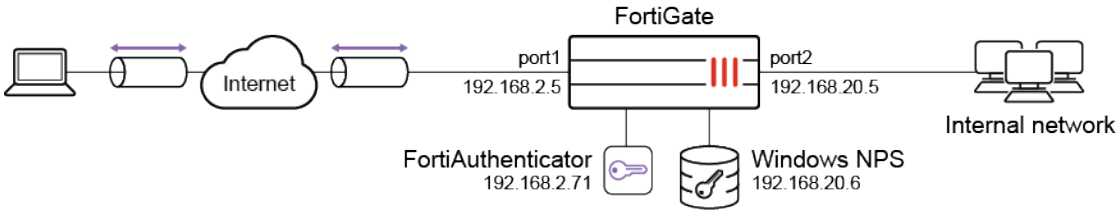
SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       radkeith        rad-group        192.168.2.202   18      28502/4966     10.212.134.200
```

SSL VPN with multiple RADIUS servers

When configuring two or more RADIUS servers, you can configure a Primary and Secondary server within the same RADIUS server configurations for backup purposes. You can also configure multiple RADIUS servers within the same User Group to service the access request at the same time.

A tertiary server can be configured in the CLI.

Sample topology



Sample configurations

- Configure a Primary and Secondary server for backup on page 2741
- Authenticating to two RADIUS servers concurrently on page 2745

Configure a Primary and Secondary server for backup

When you define a Primary and Secondary RADIUS server, the access request will always be sent to the Primary server first. If the request is denied with an Access-Reject, then the user authentication fails. However, if there is no response from the Primary server after another attempt, the access request will be sent to the Secondary server.

In this example, you will use a Windows NPS server as the Primary server and a FortiAuthenticator as the Secondary server. It is assumed that users are synchronized between the two servers.

To configure the internal and external interfaces:

1. Go to *Network* > *Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects > Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *192.168.20.0*.
4. Leave *Type* as *Subnet*
5. Set IP/*Netmask* to *192.168.20.0/24*.
6. Click *OK*.

To add the RADIUS servers:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *PrimarySecondary*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. Under *Secondary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
7. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
8. *Click OK*.

To configure the user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. In the *Name* field, enter *PrimarySecondaryGroup*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *PrimarySecondary*.
4. Click *OK*, and then click *OK* again.

To configure the SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. From the *Listen on Interface(s)* dropdown select *port1*.
3. In the *Listen on Port* field enter *10443*.
4. Optionally, from the *Server Certificate* dropdown, select the authentication certificate if you have one for this SSL VPN portal.
5. Under *Authentication/Portal Mapping*, set the default portal web-access.
   a. Select *All Other Users/Groups* and click *Edit*.
   b. From the *Portal* dropdown, select *web-access*.
   c. Click *OK*.
6. Create a web portal for *PrimarySecondaryGroup*.
   a. Under *Authentication/Portal Mapping*, click *Create New*.
   b. Click *Users/Groups* and select *PrimarySecondaryGroup*.

c. From the *Portal* dropdown, select *full-access*.
d. Click *OK*.

To configure SSL VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* to create a new policy, or double-click an existing policy to edit it and configure the following settings:

Name	Enter a name for the policy.
Incoming Interface	*SSL-VPN tunnel interface (ssl.root)*
Outgoing interface	Set to the local network interface so that the remote user can access the internal network. For this example, select *port3*.
Source	In the *Address* tab, select *SSLVPN_TUNNEL_ADDR1* In the *User* tab, select *PrimarySecondaryGroup*
Destination	Select the internal protected subnet *192.168.20.0*.
Schedule	*always*
Service	*All*
Action	*Accept*
NAT	*Enable*

3. Configure any remaining firewall and security options as required.
4. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the internal interface and firewall address:

```
config system interface
   edit "port3"
      set vdom "root"
      set ip 192.168.20.5 255.255.255.0
      set alias "internal"
   next
end
config firewall address
   edit "192.168.20.0"
      set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
      set subnet 192.168.20.0 255.255.255.0
   next
end
```

2. Configure the RADIUS server:

```
config user radius
   edit "PrimarySecondary"
      set server "192.168.20.6"
      set secret <secret>
      set secondary-server "192.168.2.71"
```

```
      set secondary-secret <secret>
    next
end
```

3. Add the RADIUS user to the user group:

```
config user group
    edit "PrimarySecondaryGroup"
      set member "PrimarySecondary "
    next
end
```

4. Configure SSL VPN settings:

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "port1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
      edit 1
        set groups "PrimarySecondaryGroup "
        set portal "full-access"
      next
    end
end
```

5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:

```
config firewall policy
    edit 1
      set name "sslvpn-radius"
      set srcintf "ssl.root"
      set dstintf "port3"
      set srcaddr "all"
      set dstaddr "192.168.20.0"
      set groups “PrimarySecondaryGroup”
      set action accept
      set schedule "always"
      set service "ALL"
      set nat enable
    next
end
```

To verify the connection:

User *radkeith* is a member of both the NPS server and the FAC server.

When the Primary server is up, it will connect to the SSL VPN tunnel using FortiClient.

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 16:26:50.838453 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 118
2020-05-15 16:26:50.883166 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 20
2020-05-15 16:26:50.883374 port3 out 192.168.20.5.2374 -> 192.168.20.6.1812: udp 182
2020-05-15 16:26:50.884683 port3 in 192.168.20.6.1812 -> 192.168.20.5.2374: udp 228
```

The access request is sent to the Primary NPS server 192.168.20.6, and the connection is successful.

```
# get vpn ssl monitor
SSL VPN Login Users:
```

```
Index   User            Group                   Auth Type      Timeout         From     HTTP
in/out    HTTPS in/out

0       radkeith       PrimarySecondaryGroup   2(1)           285     192.168.2.202          0/0
   0/0
```

```
SSL VPN sessions:

Index   User       Group                  Source IP      Duration        I/O Bytes
Tunnel/Dest IP

0       radkeith   PrimarySecondaryGroup   192.168.2.202   62              132477/4966
10.212.134.200
```

When the Primary server is down, and the Secondary server is up, the connection is made to the SSLVPN tunnel again:

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 16:31:23.016875 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:28.019470 port3 out 192.168.20.5.7989 -> 192.168.20.6.1812: udp 118
2020-05-15 16:31:30.011874 port1 out 192.168.2.5.23848 -> 192.168.2.71.1812: udp 118
2020-05-15 16:31:30.087564 port1 in 192.168.2.71.1812 -> 192.168.2.5.23848: udp 20
```

Access request is sent to the Primary NPS server 192.168.20.6, but there was no response. RADIUS authentication falls through to the Secondary FortiAuthenticator 192.168.2.71, and the authentication was accepted. The VPN connection is established.

```
# get vpn ssl monitor
SSL VPN Login Users:
```

```
Index   User            Group                  Auth Type      Timeout         From     HTTP in/out

10.212.134.200
```

Authenticating to two RADIUS servers concurrently

There are times where users are located on separate RADIUS servers. This may be the case when migrating from an old server to a new one for example. In this scenario, a Windows NPS server and a FortiAuthenticator are configured in the same User Group. The access-request is sent to both servers concurrently. If FortiGate receives an access-accept from either server, authentication is successful.

To configure the internal and external interfaces:

1. Go to *Network > Interfaces*.
2. Edit the *port1* interface and set *IP/Network Mask* to *192.168.2.5/24*.
3. Edit the *port2* interface and set *IP/Network Mask* to *192.168.20.5/24*.
4. Click *OK*.

To create a firewall address:

1. Go to *Policy & Objects > Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *192.168.20.0*.
4. Leave *Type* as *Subnet*
5. Set IP/*Netmask* to *192.168.20.0/24*.
6. Click *OK*.

To configure the first RADIUS server:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *win2k16*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.20.6* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. *Click OK*.

To configure the second RADIUS server:

1. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
2. Set *Name* to *fac*.
3. Leave *Authentication method* set to *Default*. The PAP, MS-CHAPv2, and CHAP methods will be tried in order.
4. Under *Primary Server*, set *IP/Name* to *192.168.2.71* and *Secret* to the shared secret configured on the RADIUS server.
5. Click *Test Connectivity* to test the connection to the server, and ensure that *Connection status* is *Successful*.
6. *Click OK*.

To configure the user group:

1. Go to *User & Authentication > User Groups* and click *Create New*.
2. In the *Name* field, enter *dualPrimaryGroup.*.
3. In the *Remote Groups* area, click *Add*, and from the *Remote Server* dropdown, select *fac*.
4. Click *Add* again. From the *Remote Server* dropdown select *win2k16* and click *OK*.

5. Click *OK*, and then click *OK* again.

To configure the SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. From the *Listen on Interface(s)* dropdown select *port1*.
3. In the *Listen on Port* field enter *10443*.
4. Optionally, from the *Server Certificate* dropdown, select the authentication certificate if you have one for this SSL VPN portal.
5. Under *Authentication/Portal Mapping*, set the default portal web-access.
   a. Select *All Other Users/Groups* and click Edit.
   b. From the *Portal* dropdown, select *web-access*.
   c. Click *OK*.
6. Create a web portal for *PrimarySecondaryGroup*.
   a. Under *Authentication/Portal Mapping*, click *Create New*.
   b. Click *Users/Groups* and select *dualPrimaryGroup*.
   c. From the *Portal* dropdown, select *full-access*.
   d. Click *OK*.

To configure SSL VPN firewall policy:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* to create a new policy, or double-click an existing policy to edit it.

Name	Enter a name for the policy.
Incoming Interface	*SSL-VPN tunnel interface (ssl.root)*
Outgoing interface	Set to the local network interface so that the remote user can access the internal network. For this example, select *port3*.
Source	In the *Address* tab, select *SSLVPN_TUNNEL_ADDR1* In the *User* tab, select *dualPrimaryGroup*
Destination	Select the internal protected subnet *192.168.20.0*.
Schedule	*always*
Service	*All*
Action	*Accept*
NAT	*Enable*

3. Configure any remaining firewall and security options as required.
4. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the internal interface and firewall address:
```
config system interface
```

```
      edit "port3"
         set vdom "root"
         set ip 192.168.20.5 255.255.255.0
         set alias "internal"
      next
   end
   config firewall address
      edit "192.168.20.0"
         set uuid cc41eec2-9645-51ea-d481-5c5317f865d0
         set subnet 192.168.20.0 255.255.255.0
      next
   end
```

2. Configure the RADIUS server:

```
config user radius
   edit "win2k16"
      set server "192.168.20.6"
      set secret <secret>
   next
   edit "fac"
      set server "192.168.2.71"
      set secret <secret>
   next
end
```

3. Add the RADIUS user to the user group:

```
config user group
   edit "dualPrimaryGroup"
      set member "win2k16" “fac”
   next
end
```

4. Configure SSL VPN settings:

```
config vpn ssl settings
   set servercert "server_certificate"
   set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
   set source-interface "port1"
   set source-address "all"
   set default-portal "web-access"
   config authentication-rule
      edit 1
         set groups "dualPrimaryGroup"
         set portal "full-access"
      next
   end
end
```

5. Configure one SSL VPN firewall policy to allow remote users to access the internal network:

```
config firewall policy
   edit 1
      set name "sslvpn-radius"
      set srcintf "ssl.root"
      set dstintf "port3"
      set srcaddr "all"
      set dstaddr "192.168.20.0"
      set groups “dualPrimaryGroup”
      set action accept
      set schedule "always"
      set service "ALL"
      set nat enable
```

```
    next
end
```

To verify the connection:

User *fackeith* is a member of the FortiAuthenticator server only.

User *radkeith* is a member of both the NPS server and the FortiAuthenticator server, but has different passwords on each server.

Case 1: Connect to the SSLVPN tunnel using FortiClient with user FacAdmin:

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 17:21:31.217985 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 118
2020-05-15 17:21:31.218091 port1 out 192.168.2.5.11490 -> 192.168.2.71.1812: udp 118
2020-05-15 17:21:31.219314 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 20 <-- access-
      reject
2020-05-15 17:21:31.219519 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 182
2020-05-15 17:21:31.220219 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 42
2020-05-15 17:21:31.220325 port3 out 192.168.20.5.11490 -> 192.168.20.6.1812: udp 119
2020-05-15 17:21:31.220801 port3 in 192.168.20.6.1812 -> 192.168.20.5.11490: udp 20
2020-05-15 17:21:31.236009 port1 in 192.168.2.71.1812 -> 192.168.2.5.11490: udp 20 <--access-
      accept
```

Access is denied by the NPS server because the user does not exist. However, access is accepted by FortiAuthenticator. The end result is the authentication is successful.

```
# get vpn ssl monitor
SSL VPN Login Users:
```

```
Index   User       Group             Auth Type      Timeout         From       HTTP in/out
HTTPS in/out

0       fackeith  dualPrimaryGroup   2(1)            292        192.168.2.202      0/0
0/0
```

```
SSL VPN sessions:
```

```
Index   User       Group                 Source IP      Duration        I/O Bytes
Tunnel/Dest IP

0       fackeith  dualPrimaryGroup        192.168.2.202   149             70236/4966
10.212.134.200
```

Case 2: Connect to the SSLVPN tunnel using FortiClient with user radkeith:

```
# diagnose sniffer packet any 'port 1812' 4 0 l
interfaces=[any]
filters=[port 1812]
2020-05-15 17:26:07.335791 port1 out 192.168.2.5.17988 -> 192.168.2.71.1812: udp 118
2020-05-15 17:26:07.335911 port3 out 192.168.20.5.17988 -> 192.168.20.6.1812: udp 118
2020-05-15 17:26:07.337659 port3 in 192.168.20.6.1812 -> 192.168.20.5.17988: udp 20 <--access-
      accept
2020-05-15 17:26:07.337914 port3 out 192.168.20.5.17988 -> 192.168.20.6.1812: udp 182
```

```
2020-05-15 17:26:07.339451 port3 in 192.168.20.6.1812 -> 192.168.20.5.17988: udp 228
2020-05-15 17:26:08.352597 port1 in 192.168.2.71.1812 -> 192.168.2.5.17988: udp 20 <--access-
      reject
```

There is a password mismatch for this user on the Secondary RADIUS server. However, even though the authentication was rejected by FortiAuthenticator, it was accepted by Windows NPS. Therefore, the end result is authentication successful.

```
# get vpn ssl monitor
SSL VPN Login Users:
```

```
Index   User       Group            Auth Type      Timeout         From        HTTP in/out

```

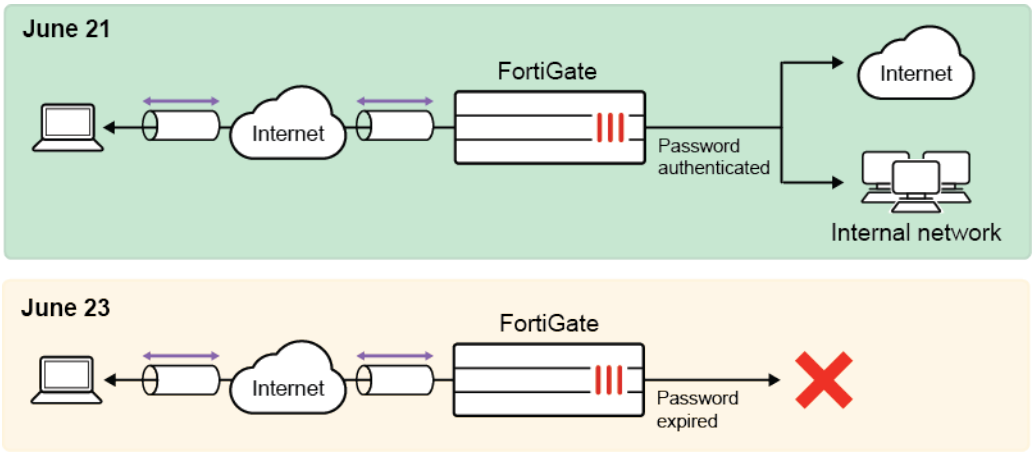
SSL VPN with local user password policy

This is a sample configuration of SSL VPN for users with passwords that expire after two days. Users are warned after one day about the password expiring. The password policy can be applied to any local user password. The password policy cannot be applied to a user group or a local remote user such as LDAP/RADIUS/TACACS+.

In FortiOS 6.2, users are warned after one day about the password expiring and have one day to renew it. If the password expires, the user cannot renew the password and must contact the administrator for assistance.

In FortiOS 6.0/5.6, users are warned after one day about the password expiring and have to renew it. If the password expires, the user can still renew the password.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet subnet *192.168.1.0*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create a local user.
   b. Go to *User & Authentication* > *User Groups* to create a user group and add that local user to it.
3. Configure and assign the password policy using the CLI.
   a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
    edit "pwpolicy1"
        set expire-days 2
        set warn-days 1
    next
end
```

b. Assign the password policy to the user you just created.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd-policy "pwpolicy1"
    next
end
```

4. Configure SSL VPN web portal.
   a. Go to *VPN > SSL-VPN Portals* to edit the *full-access* portal.
   This portal supports both web and tunnel mode.
   b. Disable *Enable Split Tunneling* so that all SSL VPN traffic goes through the FortiGate.
5. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. Select the *Listen on Interface(s)*, in this example, *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Set *Server Certificate* to the authentication certificate.
   e. Under *Authentication/Portal Mapping*, set default Portal *web-access* for *All Other Users/Groups*.
   f. Create new *Authentication/Portal Mapping* for group *sslvpngroup* mapping portal *full-access*.
6. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Fill in the firewall policy name. In this example, *sslvpn certificate auth*.
   c. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   d. Set the *Source Address* to *all* and *Source User* to *sslvpngroup*.
   e. Set the *Outgoing Interface* to the local network interface so that the remote user can access the internal network. In this example, *port1*.
   f. Set *Destination Address* to the internal protected subnet *192.168.1.0*.
   g. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   h. Enable *NAT*.
   i. Configure any remaining firewall and security options as desired.
   j. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "192.168.1.0"
        set subnet 192.168.1.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "sslvpngroup"
        set member "vpnuser1"
    next
end
```

4. Configure and assign the password policy.
   a. Configure a password policy that includes an expiry date and warning time. The default start time for the password is the time the user was created.

```
config user password-policy
    edit "pwpolicy1"
        set expire-days 2
        set warn-days 1
    next
end
```

   b. Assign the password policy to the user you just created.

```
config user local
    edit "sslvpnuser1"
        set type password
        set passwd-policy "pwpolicy1"
    next
end
```

5. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "full-access"
        set tunnel-mode enable
```

```
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling disable
     next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "server_certificate"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set default-portal "web-access"
    config authentication-rule
        edit 1
            set groups "sslvpngroup"
            set portal "full-access"
        next
    end
end
```

7. Configure one SSL VPN firewall policy to allow remote user to access the internal network.

```
config firewall policy
    edit 1
        set name "sslvpn web mode access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "192.168.1.0"
        set groups “sslvpngroup”
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

To see the results of web portal:

1. From a remote device, use a web browser to log into the SSL VPN web portal *http://172.20.120.123:10443*.
2. Log in using the *sslvpnuser1* credentials.
   When the warning time is reached, the user is prompted to enter a new password.
   In FortiOS 6.2, when the password expires, the user cannot renew the password and must contact the administrator.
   In FortiOS 6.0/5.6, when the password expires, the user can still renew the password.
3. On the FortiGate, go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.

To see the results of tunnel connection:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access > Configure VPN*.
3. Add a new connection.
   - Set the connection name.
   - Set *Remote Gateway* to the IP of the listening FortiGate interface, in this example, *172.20.120.123*.
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.
6. Log in using the *sslvpnuser1* credentials.
   When the warning time is reached, the user is prompted to enter a new password.

To check the SSL VPN connection using the GUI:

1. Go to *Dashboard > Network* and expand the *SSL-VPN* widget to verify the user's connection.
2. Go to *Log & Report > Forward Traffic* to view the details of the SSL VPN traffic.

To check that login failed due to password expired on GUI:

1. Go to *Log & Report > System Events* and select the *VPN Events* card to see the SSL VPN alert labeled `ssl-login-fail`.
2. Click *Details* to see the log details about the *Reason* `sslvpn_login_password_expired`.

To check the web portal login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User         Auth Type   Timeout    From           HTTP in/out   HTTPS in/out
 0       sslvpnuser1  1(1)        229        10.1.100.254   0/0           0/0

SSL VPN sessions:
 Index   User    Source IP      Duration        I/O Bytes       Tunnel/Dest IP
```

To check the tunnel login using the CLI:

```
get vpn ssl monitor
SSL VPN Login Users:
 Index   User          Auth Type   Timeout    From           HTTP in/out   HTTPS in/out
 0       sslvpnuser1   1(1)        291        10.1.100.254   0/0           0/0

SSL VPN sessions:
 Index   User          Source IP      Duration   I/O Bytes      Tunnel/Dest IP
 0       sslvpnuser1   10.1.100.254   9          22099/43228    10.212.134.200
```

To check the FortiOS 6.2 login password expired event log:

```
FG201E4Q17901354 # execute log  filter category event
```

```
FG201E4Q17901354 # execute log  filter field subtype vpn

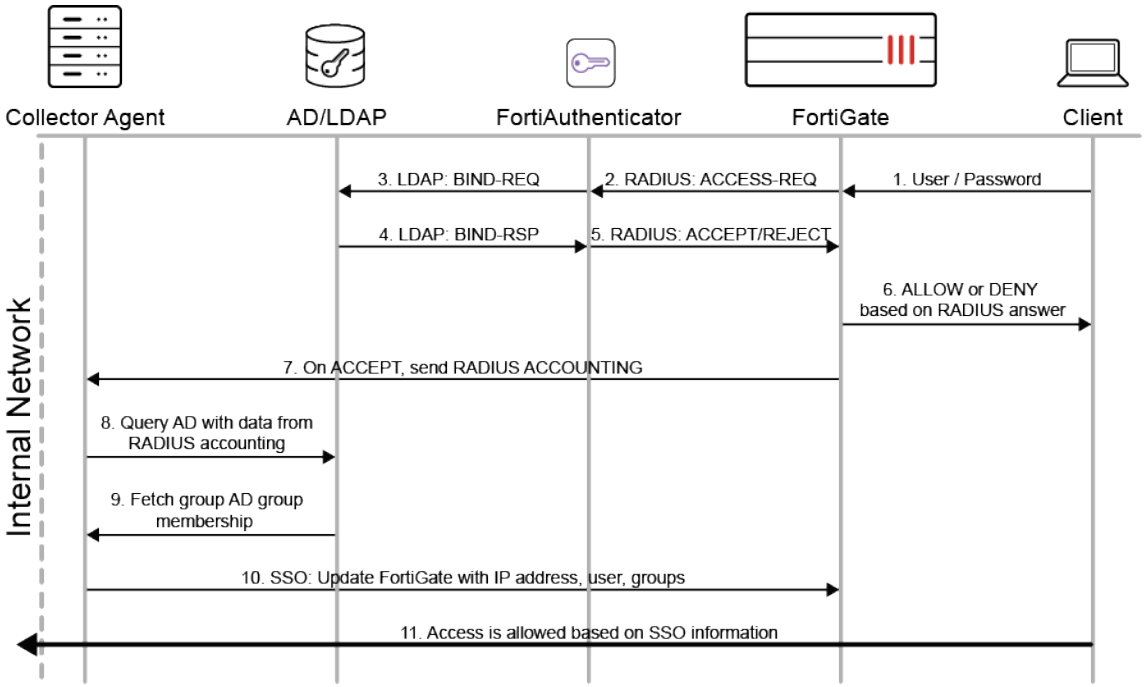
FG201E4Q17901354 # execute log  filter field action ssl-login-fail

FG201E4Q17901354 # execute log  display
1: date=2019-02-15 time=10:57:56 logid="0101039426" type="event" subtype="vpn" level="alert"
vd="root" eventtime=1550257076 logdesc="SSL VPN login fail" action="ssl-login-fail"
tunneltype="ssl-web" tunnelid=0 remip=10.1.100.254 user="u1" group="g1" dst_host="N/A"
reason="sslvpn_login_password_expired" msg="SSL user failed to logged in"
```

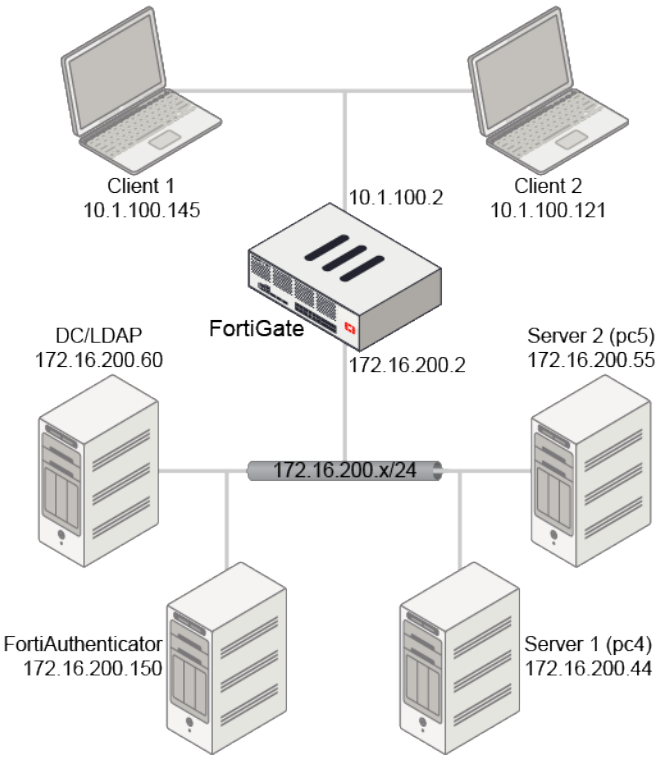
Dynamic address support for SSL VPN policies

Dynamic SSO user groups can be used in place of address objects when configuring SSL VPN policies. This allows dynamic IP addresses to be used in SSL VPN policies. A remote user group can be used for authentication while an FSSO group is separately used for authorization. Using a dummy policy for remote user authentication and a policy for FSSO group authorization, FSSO can be used with SSL VPN tunnels.

This image shows the authentication and authorization flow:



In this example, FortiAuthenticator is used as a RADIUS server. It uses a remote AD/LDAP server for authentication, then returns the authentication results to the FortiGate. This allows the client to have a dynamic IP address after successful authentication.

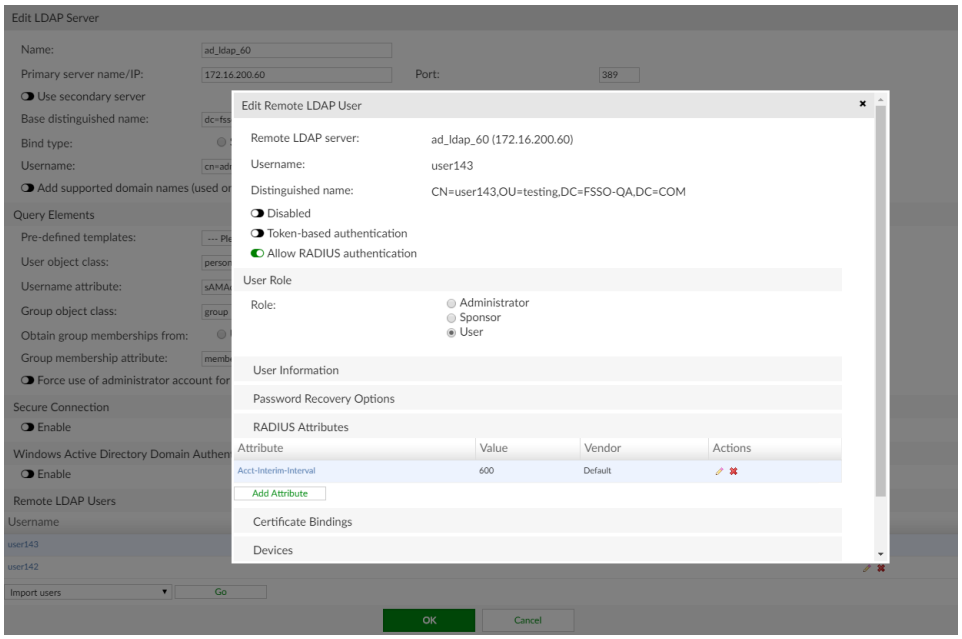


First, on the LDAP server, create two users each in their own group, *user142* in group *pc_group1*, and *user143* in group *pc_group2*.

Configure the FortiAuthenticator

To add a remote LDAP server and users on the FortiAuthenticator:

1. Go to *Authentication* > *Remote Auth. Servers* > *LDAP*.
2. Click *Create New*.
3. Set the following:
   - *Name*: *ad_ldap_60*
   - *Primary server name/IP*: *172.16.200.60*
   - *Base distinguished name*: *dc=fsso-qa,dc=com*
   - *Bind type*: Regular
   - *Username*: *cn=administrator,cn=User*
   - *Password*: <enter a password>
4. Click *OK*.
5. Edit the new LDAP server.
6. Import the remote LDAP users.
7. Edit each user to confirm that they have the RADIUS attribute *Acct-Interim-Interval*. This attribute is used by FortiGate to send interim update account messages to the RADIUS server.



To create a RADIUS client for FortiGate as a remote authentication server:

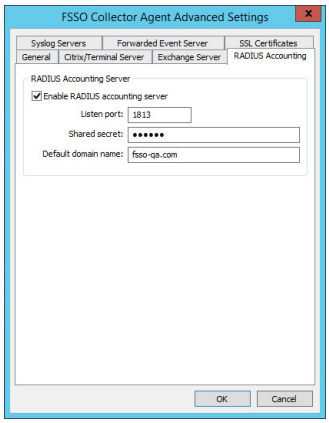
1. Go to *Authentication* > *RADIUS Service* > *Clients*.
2. Click *Create New*.
3. Set the following:
   - *Name*: *fsso_ldap*
   - *Client address*: *Range 172.16.200.1~172.16.200.10*
   - *Secret*: <enter a password>
4. In the *Realms* table, set the realm to the LDAP server that was just added: *ad_ldap_60*.
5. Click *OK*.
   FortiAuthenticator can now be used as a RADIUS server, and the authentication credentials all come from the DC/LDAP server.

Fortinet Single Sign-On Collector Agent

To configure the Fortinet Single Sign-On Collector Agent:

1. Select *Require authenticated connection from FortiGate* and enter a *Password*.
2. Click *Advanced Settings*.
3. Select the *RADIUS Accounting* tab.

4. Select *Enable RADIUS accounting server* and set the *Shared secret*.



5. Click *OK*, then click *Save&close*.
   The collector agent can now accept accounting requests from FortiGate, and retrieve the IP addresses and usernames of SSL VPN client from the FortiGate with accounting request messages.

Configure the FortiGate

To configure the FortiGate in the CLI:

1. Create a Fortinet Single Sign-On Agent fabric connector:

```
config user fsso
    edit "AD_CollectAgent"
        set server "172.16.200.60"
        set password 123456
    next
end
```

2. Add the RADIUS server:

```
config user radius
    edit "rad150"
        set server "172.16.200.150"
        set secret 123456
        set acct-interim-interval 600
        config accounting-server
            edit 1
                set status enable
                set server "172.16.200.60"
                set secret 123456
            next
        end
    next
end
```

3. Create a user group for the RADIUS server:

```
config user group
    edit "rad_group"
        set member "rad150"
    next
end
```

4. Create user groups for each of the FSSO groups:

```
config user group
    edit "fsso_group1"
        set group-type fsso-service
        set member "CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM"
    next
    edit "fsso_group2"
        set group-type fsso-service
        set member "CN=PC_GROUP2,OU=TESTING,DC=FSSO-QA,DC=COM"
    next
end
```

5. Create an SSL VPN portal and assign the RADIUS user group to it:

```
config vpn ssl web portal
    edit "testportal"
        set tunnel-mode enable
        set ipv6-tunnel-mode enable
        set web-mode enable
        ...
    next
end
config vpn ssl settings
    ...
    set default-portal "full-access"
    config authentication-rule
        edit 1
            set groups "rad_group"
            set portal "testportal"
        next
    end
end
```

6. Create firewall addresses:

```
config firewall address
    edit "none"
        set subnet 0.0.0.0 255.255.255.255
    next
    edit "pc4"
        set subnet 172.16.200.44 255.255.255.255
    next
    edit "pc5"
        set subnet 172.16.200.55 255.255.255.255
```

```
    next
end
```

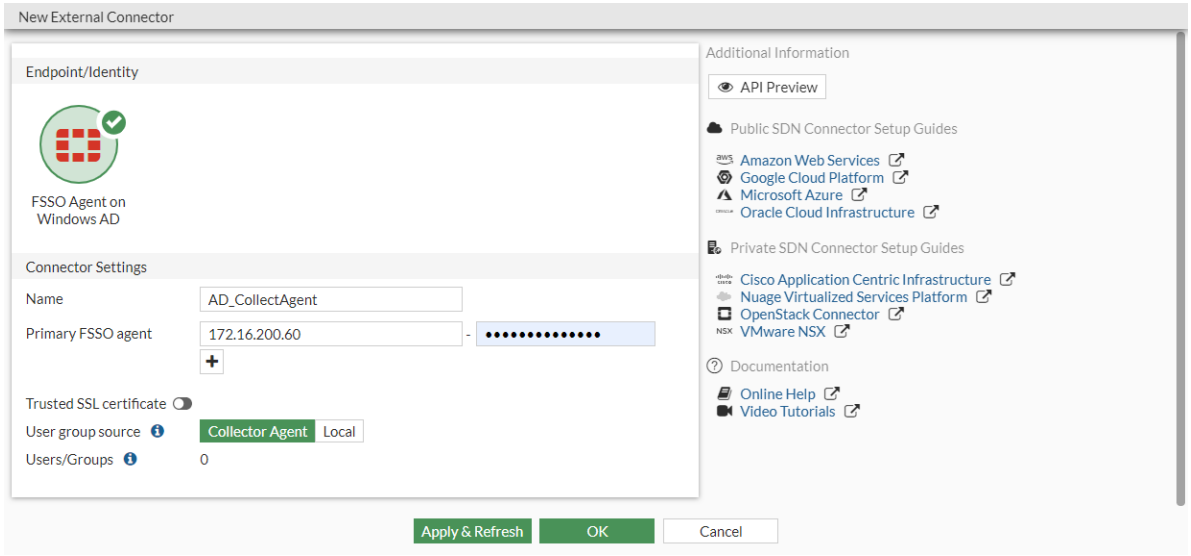
7. Create one dummy policy for authentication only, and two normal policies for authorization:

```
config firewall policy
    edit 1
        set name "sslvpn_authentication"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "none"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "rad_group"
        set nat enable
    next
    edit 3
        set name "sslvpn_authorization1"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "pc4"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "fsso_group1"
        set nat enable
    next
    edit 4
        set name "sslvpn_authorization2"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "pc5"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set groups "fsso_group2"
        set nat enable
    next
end
```

To create an FSSO agent fabric connector in the GUI:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. Click *FSSO Agent on Windows AD*.

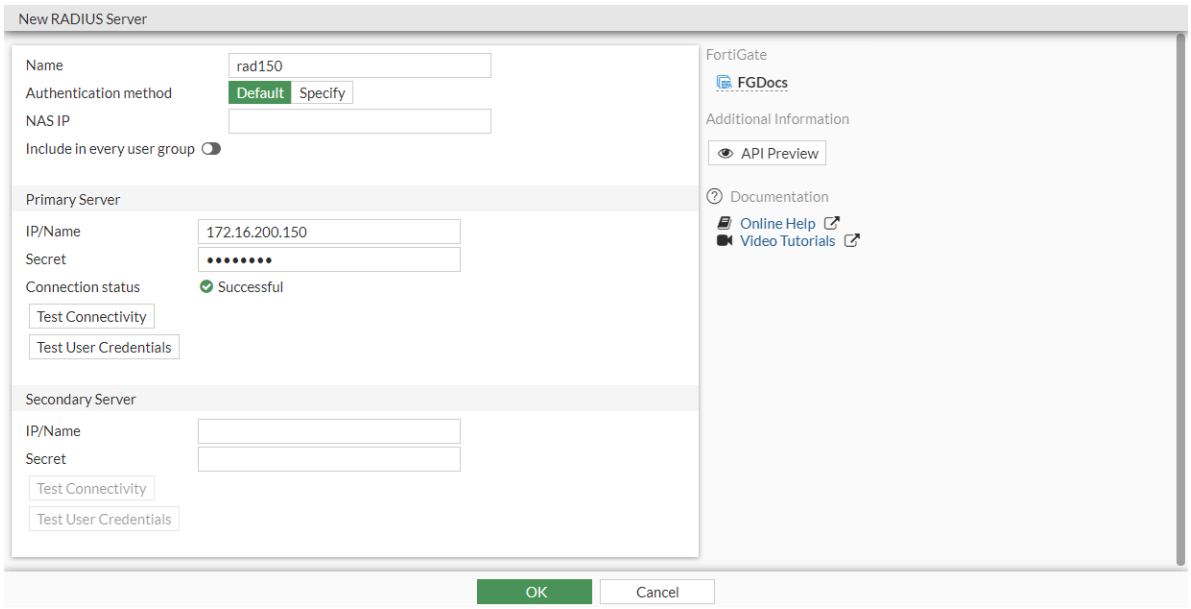
4. Enter the name and *Primary FSSO agent* information.



5. Click *Apply & Refresh*.
   The FSSO groups are retrieved from the collector agent.

To add the RADIUS server in the GUI:

1. Go to *User & Authentication* > *RADIUS Servers*.
2. Click *Create New*.
3. Enter a name for the server.
4. Enter the *IP/Name* and *Secret* for the primary server.
5. Click *Test Connectivity* to ensure that there is a successful connection.



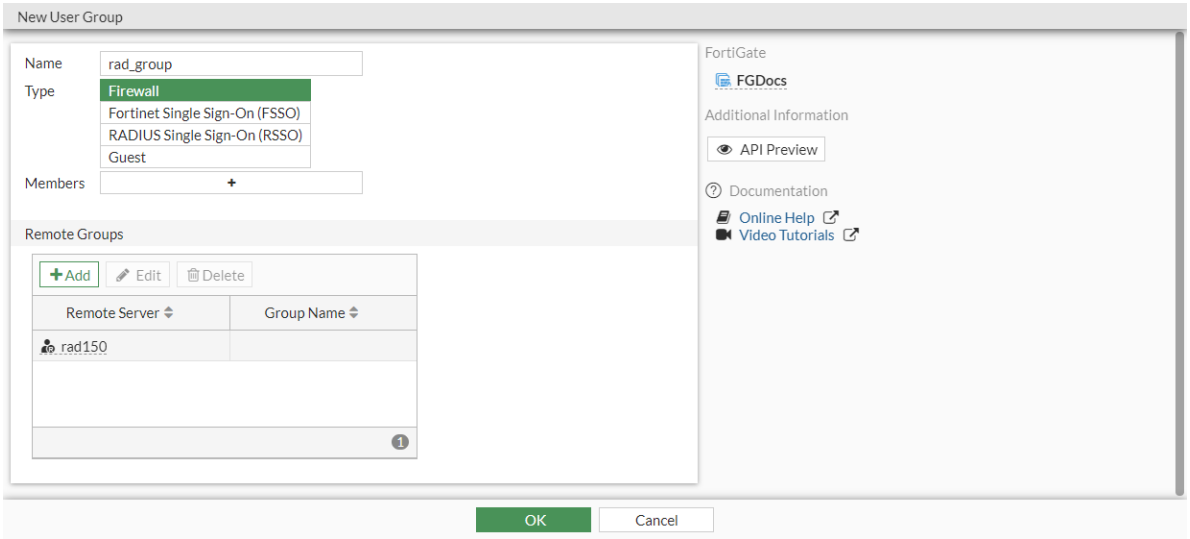
6. Click *OK*.

7. Configure an accounting server with the following CLI command:

```
config user radius
    edit rad150
        set acct-interim-interval 600
        config accounting-server
            edit 1
                set status enable
                set server 172.16.200.60
                set secret *********
            next
        end
    next
end
```

To create a user group for the RADIUS server in the GUI:

1. Go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set the *Type* to *Firewall*.
4. Add the RADIUS server as a remote group.



5. Click *OK*.

To create user groups for each of the FSSO groups in the GUI:

1. Go to *User & Authentication* > *User Groups*.
2. Click *Create New*.
3. Enter a name for the group and set the *Type* to *Fortinet Single Sign-On (FSSO)*.
4. Add PC_GROUP1 as a member:
   `CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM`
5. Click *OK*.
6. Add a second user group with PC_GROUP2 as a member:
   `CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM`

7. Click *OK*.

To create an SSL VPN portal and assign the RADIUS user group to it in the GUI:

1. Go to *VPN > SSL VPN Portals*.
2. Click *Create New*.
3. Configure the portal, then click *OK*.
4. Go to *VPN > SSL VPN Settings*.
5. Configure the required settings.
6. Create an *Authentication/Portal Mapping* table entry:
   a. Click *Create New*.
   b. Set *User/Groups* to *rad_group*.
   c. Set *Portal* to *testportal*.
   d. Click *OK*.
7. Click *OK*.

To create policies for authentication and authorization in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Configure a dummy policy for authentication. Set the destination to *none* so that traffic is not allowed through the FortiGate, and add *rad_group* as a source.
3. Configure two authorization policies, with the FSSO groups as sources.

Confirmation

On *Client 1*, log in to FortiClient using *user142*. Traffic can go to *pc4* (172.16.200.44), but cannot go to *pc5* (172.16.200.55).

On *Client 2*, log in to FortiClient using *user143*. Traffic can go to *pc5* (172.16.200.55), but cannot go to *pc4* (172.16.200.44).

On the FortiGate, check the authenticated users list and the SSL VPN status:

```
# diagnose firewall auth list

10.212.134.200, USER142
        type: fsso, id: 0, duration: 173, idled: 173
        server: AD_CollectAgent
        packets: in 0 out 0, bytes: in 0 out 0
        user_id: 16777229
        group_id: 3 33554434
        group_name: fsso_group1 CN=PC_GROUP1,OU=TESTING,DC=FSSO-QA,DC=COM

10.212.134.200, user142
        type: fw, id: 0, duration: 174, idled: 174

```

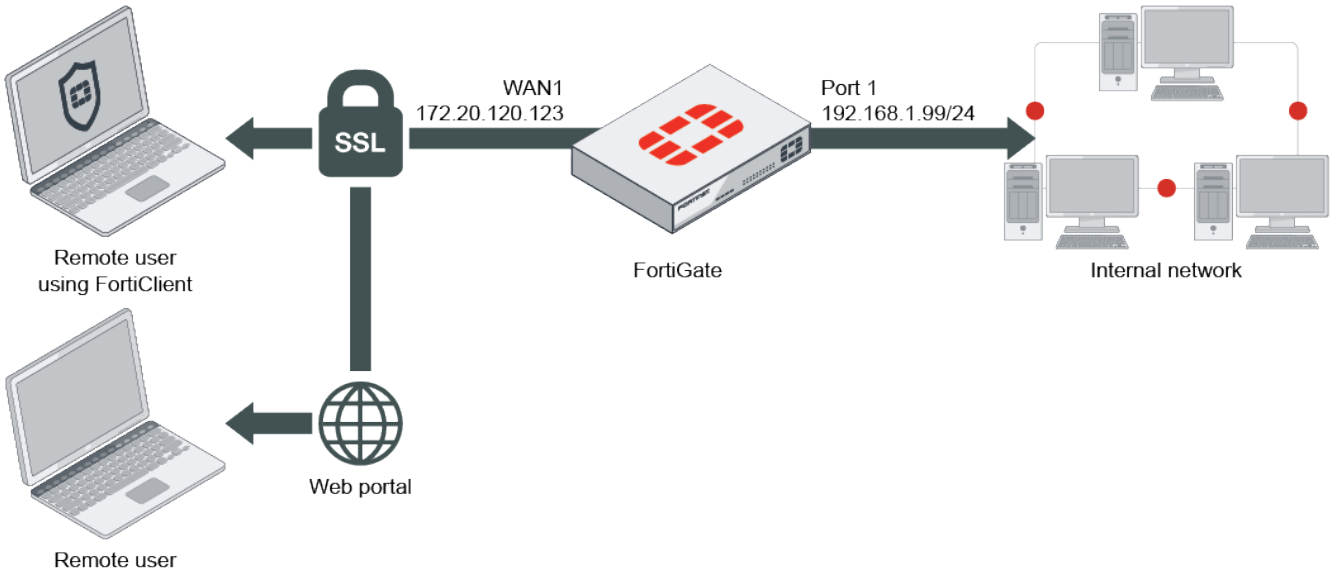
SSL VPN multi-realm

This sample shows how to create a multi-realm SSL VPN that provides different portals for different user groups.

Sample topology



Sample configuration

WAN interface is the interface connected to ISP. This example shows static mode. You can also use DHCP or PPPoE mode. The SSL VPN connection is established over the WAN interface.

The split tunneling routing address cannot explicitly use an FQDN or an address group that includes an FQDN. To use an FQDN, leave the routing address blank and apply the FQDN as the destination address of the firewall policy.

To configure SSL VPN using the GUI:

1. Configure the interface and firewall address. The port1 interface connects to the internal network.
   a. Go to *Network* > *Interfaces* and edit the *wan1* interface.
   b. Set *IP/Network Mask* to *172.20.120.123/255.255.255.0*.
   c. Edit *port1* interface and set *IP/Network Mask* to *192.168.1.99/255.255.255.0*.
   d. Click *OK*.
   e. Go to *Policy & Objects* > *Address* and create an address for internet *QA_subnet* with subnet *192.168.1.0/24* and *HR_subnet* with subnet *10.1.100.0/24*.
2. Configure user and user group.
   a. Go to *User & Authentication* > *User Definition* to create local users *qa-user1* and *hr-user1*.
   b. Go to *User & Authentication* > *User Groups* to create separate user groups for web-only and full-access portals:
      - *QA_group* with member *qa-user1*.
      - *HR_group* with the member *hr-user1*.

3. Configure SSL VPN web portal.
   a. Go to *VPN > SSL-VPN Portals* to create portal *qa-tunnel*.
   b. Enable *Tunnel Mode*.
   c. Create a portal *hr-web* with *Web Mode* enabled.
4. Configure SSL VPN realms.
   a. Go to *System > Feature Visibility* to enable *SSL-VPN Realms*.
   b. Go to *VPN > SSL-VPN Realms* to create realms for *qa* and *hr*.
   c. (Optional) To access each realm with FQDN instead of the default URLs *https://172.20.120.123:10443/hr* and *https://172.20.120.123:10443/qa*, you can configure a virtual-host for the realm in the CLI.
   ```
   config vpn ssl web realm
      edit hr
         set virtual-host hr.mydomain.com
      next
      edit qa
         set virtual-host qa.mydomain.com
      next
   end
   ```
   Where `mydomain.com` is the name of your domain. Ensure FQDN resolves to the FortiGate wan1 interface and that your certificate is a wildcard certificate.
5. Configure SSL VPN settings.
   a. Go to *VPN > SSL-VPN Settings*.
   b. For *Listen on Interface(s)*, select *wan1*.
   c. Set *Listen on Port* to *10443*.
   d. Choose a certificate for *Server Certificate*. The default is *Fortinet_Factory*.
   e. In *Authentication/Portal Mapping All Other Users/Groups*, set the *Portal* to *web-access*.
   f. Create new *Authentication/Portal Mapping* for group *QA_group* mapping portal *qa-tunnel*.
   g. Specify the realm *qa*.
   h. Add another entry for group *HR_group* mapping portal *hr-web*.
   i. Specify the realm *hr*.
6. Configure SSL VPN firewall policy.
   a. Go to *Policy & Objects > Firewall Policy*.
   b. Create a firewall policy for QA access.
   c. Fill in the firewall policy name. In this example, *QA sslvpn tunnel mode access*.
   d. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   e. Choose an *Outgoing Interface*. In this example, *port1*.
   f. Set the *Source* to *all* and group to *QA_group*.
   g. In this example, the *Destination* is the internal protected subnet *QA_subnet*.
   h. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
   i. Click *OK*.
   j. Create a firewall policy for HR access.
   k. Fill in the firewall policy name. In this example, *HR sslvpn web mode access*.
   l. Incoming interface must be *SSL-VPN tunnel interface(ssl.root)*.
   m. Choose an *Outgoing Interface*. In this example, *port1*.
   n. Set the *Source* to *all* and group to *HR_group*.

o. In this example, the *Destination* is the internal protected subnet *HR_subnet*.
p. Set *Schedule* to *always*, *Service* to *ALL*, and *Action* to *Accept*.
q. Click *OK*.

To configure SSL VPN using the CLI:

1. Configure the interface and firewall address.

```
config system interface
    edit "wan1"
        set vdom "root"
        set ip 172.20.120.123 255.255.255.0
    next
end
```

2. Configure internal interface and protected subnet, then connect the port1 interface to the internal network.

```
config system interface
    edit "port1"
        set vdom "root"
        set ip 192.168.1.99 255.255.255.0
    next
end
```

```
config firewall address
    edit "QA_subnet"
        set subnet 192.168.1.0 255.255.255.0
    next
    edit "HR_subnet"
        set subnet 10.1.100.0 255.255.255.0
    next
end
```

3. Configure user and user group.

```
config user local
    edit "qa_user1"
        set type password
        set passwd your-password
    next
end
config user group
    edit "QA_group"
        set member "qa_user1"
    next
end
```

```
config user local
    edit "hr_user1"
        set type password
        set passwd your-password
```

```
    next
end
config user group
    edit "HR_group"
        set member "hr_user1"
    next
end
```

4. Configure SSL VPN web portal.

```
config vpn ssl web portal
    edit "qa-tunnel"
        set tunnel-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling enable
        set split-tunneling-routing-address "QA_subnet"
    next
end
```

```
config vpn ssl web portal
    edit "hr-web"
        set web-mode enable
    next
end
```

5. Configure SSL VPN realms.

```
config vpn ssl web realm
   edit hr
      set virtual-host hr.mydomain.com
   next
   edit qa
         set virtual-host qa.mydomain.com
   next
end
```

The `set virtual-host` setting is optional. For example:

```
config vpn ssl web realm
   edit hr
   next
   edit qa
   next
end
```

6. Configure SSL VPN settings.

```
config vpn ssl settings
    set servercert "Fortinet_Factory"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set source-interface "wan1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "full-access"
    config authentication-rule
```

```
        edit 1
            set groups "QA_group"
            set portal "qa-tunnel"
            set realm qa
        next
        edit 2
            set groups "HR_group"
            set portal "hr-web"
            set realm hr
        next
    end
end
```

7. Configure two SSL VPN firewall policies to allow remote QA user to access internal QA network and HR user to access HR network.

```
config firewall policy
    edit 1
        set name "QA sslvnpn tunnel access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "QA_subnet"
        set groups “QA_group”
        set action accept
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "HR sslvpn web access"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "HR_subnet"
        set groups “HR_group”
        set action accept
        set schedule "always"
        set service "ALL"
    next
end
```

To see the results for QA user:

1. Download FortiClient from www.forticlient.com.
2. Open the FortiClient Console and go to *Remote Access*.
3. Add a new connection.
   - Set *VPN Type* to *SSL VPN*.
   - Set *Remote Gateway* to *https://172.20.120.123:10443/qa.*.
   - If a virtual-host is specified, use the FQDN defined for the realm (*qa.mydomain.com*).
4. Select *Customize Port* and set it to *10443*.
5. Save your settings.

6. Use the credentials you've set up to connect to the SSL VPN tunnel.
   If the user's computer has antivirus software, a connection is established; otherwise FortiClient shows a compliance warning.
7. After connection, traffic to subnet *192.168.1.0* goes through the tunnel.
8. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the list of SSL users.
9. On the FortiGate, go to *VPN* > *Monitor* > *SSL-VPN Monitor* to verify the list of SSL users.
10. On the FortiGate, go to *Log & Report* > *Forward Traffic* and view the details of the traffic.

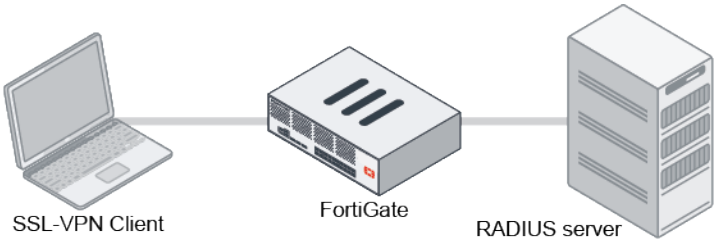
To see the results for HR user:

1. In a web browser, log into the portal *https://172.20.120.123:10443/hr* using the credentials you've set up.
2. Alternatively, if a virtual-host is specified, use the FQDN defined for the realm (*hr.mydomain.com*).
3. On the FortiGate, go to *Dashboard* > *Network* and expand the *SSL-VPN* widget to verify the list of SSL users.
4. Go to *Log & Report* > *Forward Traffic* and view the details of the traffic.

NAS-IP support per SSL-VPN realm

For RADIUS authentication and authorization, the RADIUS client (the FortiGate) passes the username, password, and NAS-IP to the RADIUS server in its access request. The RADIUS server authenticates and authorizes based on this information. Each RADIUS server can be configured with multiple NAS-IPs for authenticating different groups and NAS clients.

On the FortiGate, configuring the NAS-IP in the realm settings overrides the RADIUS server setting, allowing multiple NAS-IPs to be mapped to the same RADIUS server.



In this example, the user wants to present one FortiGate VDOM with different NAS-IPs to a single RADIUS server based on specific rules.

To configure the SSL-VPN to use the NAS-IP in the realm settings:

1. Configure a RADIUS user and add it to a group:

```
config user radius
    edit "fac150"
        set server "172.16.200.150"
        set secret ********
        set nas-ip 172.16.200.2
        config accounting-server
```

```
            edit 1
                set status enable
                set server "172.16.200.150"
                set secret ********
            next
        end
    next
end
config user group
    edit "radgrp"
        set member "fac150"
    next
end
```

2. Configure a realm for the user with a different NAS-IP:

```
config vpn ssl web realm
    edit "realm1"
        set login-page '.......'
        set radius-server "fac150"
        set nas-ip 10.1.100.2
    next
end
```

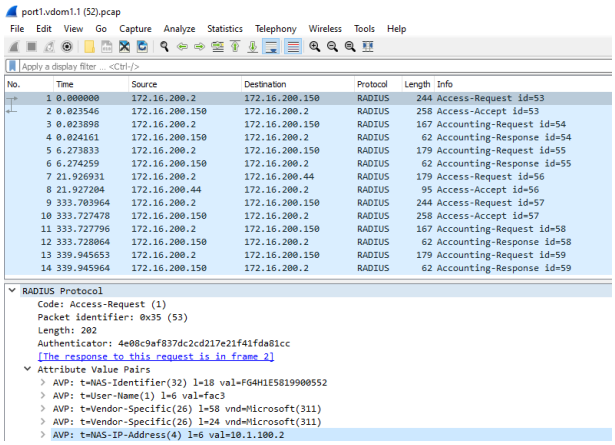
3. Configure SSL-VPN with an authentication rule that includes the user group and the realm:

```
config vpn ssl settings
    ...
    config authentication-rule
        edit 1
            set groupd "radgrp"
            set portal "testportal1"
            set realm "realm1"
        next
    end
end
```

4. Create a firewall policy:

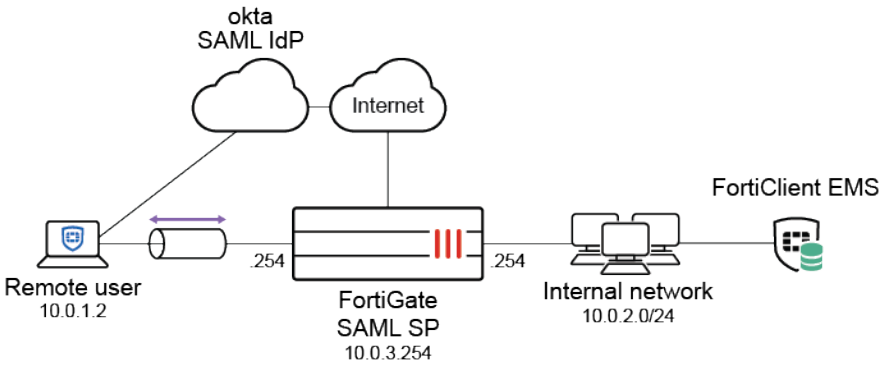
```
config firewall policy
    edit 1
        set name "sslvpn1"
        ...
        set srcintf "ssl.vdom1"
        set groups "radgrp"
    next
end
```

Because the RADIUS server and NAS-IP are specified in realm1, its NAS-IP is used for authentication.



SSL VPN with Okta as SAML IdP

In this configuration, the FortiGate acts as a SAML service provider (SP) requesting authentication from Okta, which acts as a SAML identity provider (IdP). The following shows the topology in this configuration:



The authentication process is as follows in this deployment:

1. The user initiates an SSL VPN request to the FortiGate.
2. The FortiGate sends the browser POST redirect to FortiClient.
3. FortiClient redirects the SAML authentication request to Okta.
4. The user authenticates with Okta using their credentials.
5. Okta sends a SAML assertion that contains the user and group authentication in a POST redirect to the SSL VPN login page.
6. FortiClient sends the redirected Okta request that contains the SAML assertion to the FortiGate.
7. The FortiGate consumes the assertion and provides the user with access to resources based on the defined firewall security policy.

The example assumes that you already have an Okta account. This example uses users locally defined within the Okta directory and does not include LDAP mapping. The instructions describe the steps that you take if using the free Okta developer edition.

The following certificates are used:

Certificate	Description

SP certificate	This is the certificate used to sign the SAML messages originating from the SP to the IdP. This is configured on the FortiGate by the following CLI setting:
	
	`config user saml`
	`edit <profile>`
	`set cert <local certificate>`
	`next`
	`end`
	
	The certificate will be used by the SAML IdP (Okta) to verify the SP connection, so the certificate must be uploaded into Okta.

IdP certificate	This is the certificate used to sign the SAML response originating from the IdP. This must be trusted by the SP in order to verify the identity of the messages from the IdP.
	In this example, the certificate is provided by Okta. To upload this remote certificate into the FortiGate, follow the instructions in Remote certificate on page 3431.
	To use the certificate in your SAML SSO settings:
	
	`config user saml`
	`edit <profile>`
	`set idp-cert <Okta certificate>`
	`next`
	`end`

SSl VPN server certificate	This certificate identifies the SSL VPN portal when a SSL VPN client connects to the FortiGate.
	This is configured in the CLI as follows:
	
	`config vpn ssl settings`
	`set servercert <server certificate>`
	`end`
	
	When this is not specified, then the Fortinet factory self-signed certificate is used.

To configure Okta for SSL VPN with FortiOS:

1. Log in to the Okta portal as the registered admin user.
2. Add the FortiGate application:
   a. Go to *Applications*.
   b. Click *Applications*, then click *Create App Integration*.
   c. Click *SAML 2.0*, then *Next*.
   d. Configure SAML settings:
      i. Proceed through the application creation wizard. In the *Single sign on URL* field, enter https://<FortiGate IP address>:<port>/remote/saml/login/. In this example, it is

https://10.0.3.254:10443/remote/saml/login/.

ii. Enable *Use this for Recipient URL and Destination URL*.

iii. In the *Audience URI (SP Entity ID)* field, enter the https://<FortiGate IP address>:<port>/remote/saml/metadata/. In this example, it is https://10.0.3.254:10443/remote/saml/metadata/.

iv. Click *Download Okta Certificate* to download the Okta certificate to your machine. You will provide this certificate to the FortiGate.

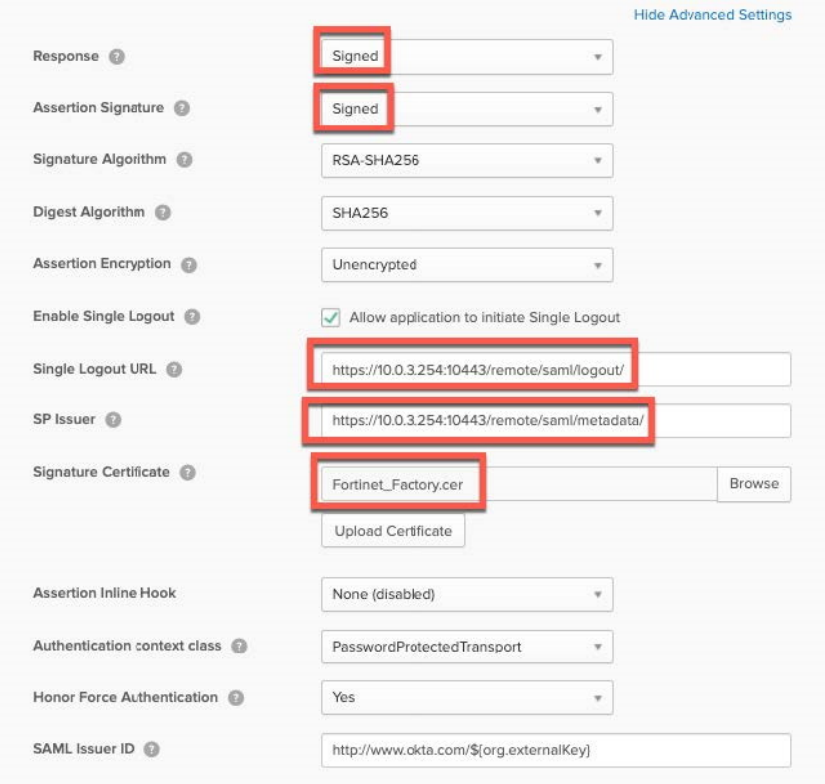
v. Click *Show Advanced Settings*. From the *Response* dropdown list, select *Signed*.

vi. From the *Assertion Signature* dropdown list, select *Signed*.

vii. In the *Single Logout URL* field, enter https://<FortiGate IP address>:<port>/remote/saml/logout/. In this example, it is https://10.0.3.254:10443/remote/saml/logout/.

viii. In the *SP Issuer* field, enter https://<FortiGate IP address>:<port>/remote/saml/metadata/. In this example, it is https://10.0.3.254:10443/remote/saml/metadata/.

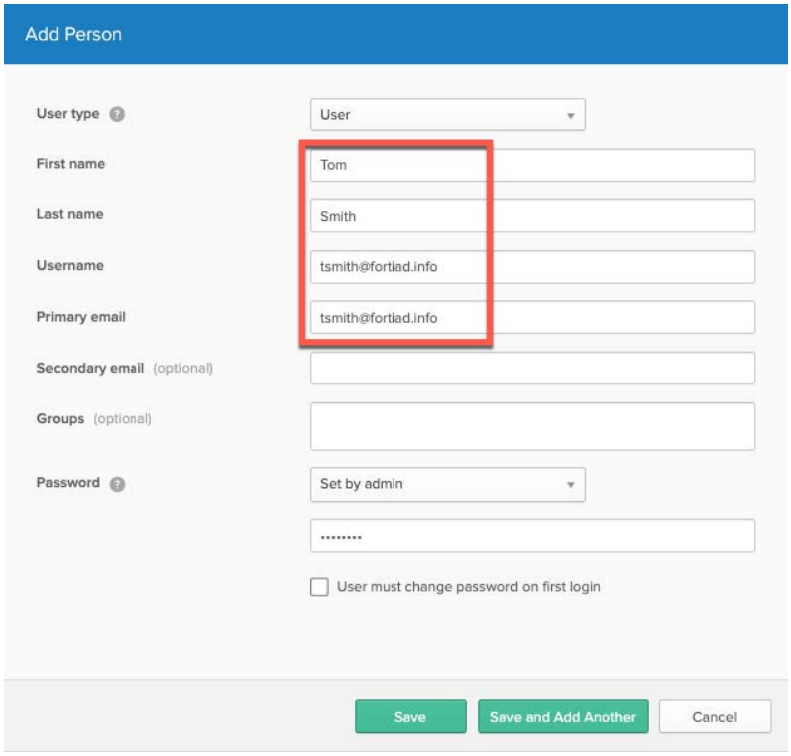
ix. In the *Signature Certificate* field, first download the Fortinet_Factory certificate by logging into FortiOS, going to *System > Local Certificate*, then browsing to and uploading the FortiGate certificate. Okta uses this to authenticate the SAML SP.



e. Under *ATTRIBUTE STATEMENTS* and *GROUP ATTRIBUTE STATEMENTS*, define attribute mappings for Okta to use in SAML assertion. In this example, the following is entered as a attribute statement and a group attribute statement, respectively:

- username, with value user.login
- group, with *Matches regex* filter

   f. On the *Feedback* step, select *I'm an Okta customer adding an internal app*.
   g. Select *This is an internal app that we have created*.
   h. Click *Finish*.
3. Go to *Directory* > *People*.
4. Click *Add Person*.
5. Enter the person's details as desired. Click *Save*.

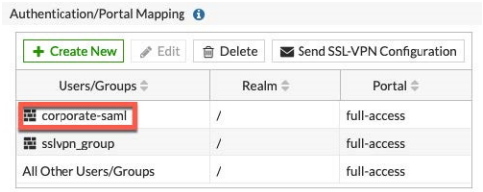


6. Add a group:
   a. Go to *Directory* > *Groups*.
   b. Click *Add Group*.
   c. Enter the desired name, then click *Add Group*. In this example, the name is corporate-saml.
   d. Select the newly added group, then click *Assign People*.
   e. Add the person that you created as a member of the new group. Click *Save*.

7. Assign the group to the FortiGate application:
   a. Go to *Applications* > *FortiGate application* > *Assignments*.
   b. From the *Assign* dropdown list, select *Assign to Groups*.
   c. Assign the group that you created to the FortiGate application.
8. To view the SAML setup instructions, do the following:
   a. Click the newly created application's name.
   b. Click *Sign On*.
   c. Go to *View SAML Setup Instructions*. Note down the *Identity Provider Single Sign-On URL*, *Identity Provider Single Logout URL*, and *Identity Provider Issuer* values.
9. Download the Okta certificate and upload it to FortiOS:
   a. From *View SAML Setup Instructions*, download the certificate.
   b. In FortiOS, go to *System* > *Certificates*.
   c. From the *Create/Import* dropdown list, select *Remote Certificate*.
   d. Click *Upload* and upload the downloaded Okta certificate.

To configure the FortiGate:

1. Configure the FortiGate SP to be a SAML user:
```
config user saml
   edit "okta-idp"
      set cert "Fortinet_Factory"
      set entity-id "https://10.0.3.254:10443/remote/saml/metadata/"
      set single-sign-on-url "https://10.0.3.254:10443/remote/saml/login"
      set single-logout-url "https://10.0.3.254:10443/remote/saml/logout"
      set idp-entity-id "http://www.okta.com/exk103foxaa8gk5qy4x7"
      set idp-single-sign-on-url "https://fortinet01.okta.com/app/fortinetorg878484_fortigate_
            1/exk103foxaa8gk5qy4x7/sso/saml"
      set idp-single-logout-url "https://fortinet01.okta.com/app/fortinetorg878484_fortigate_
            1/exk103foxaa8gk5qy4x7/slo/saml"
      set idp-cert "Okta-IDP_Certificate"
      set user-name "username"
      set group-name "group"
   next
end
```
2. Configure user group assertion on Okta as part of the SAML assertion attributes. It is important that the group attribute value received is locally matched with the `group-name` value:
```
config user group
   edit "corporate-saml"
      set member "okta-idp"
      config match
         edit 1
            set server-name "okta-idp"
            set group-name "corporate-saml"
         next
      end
   next
end
```
3. Go to *VPN* > *SSL-VPN Settings*. Configure VPN settings as desired. When testing the VPN solution, starting with a web-based configuration, then moving to a tunnel-based configuration is recommended. Web-based testing can help in troubleshooting.

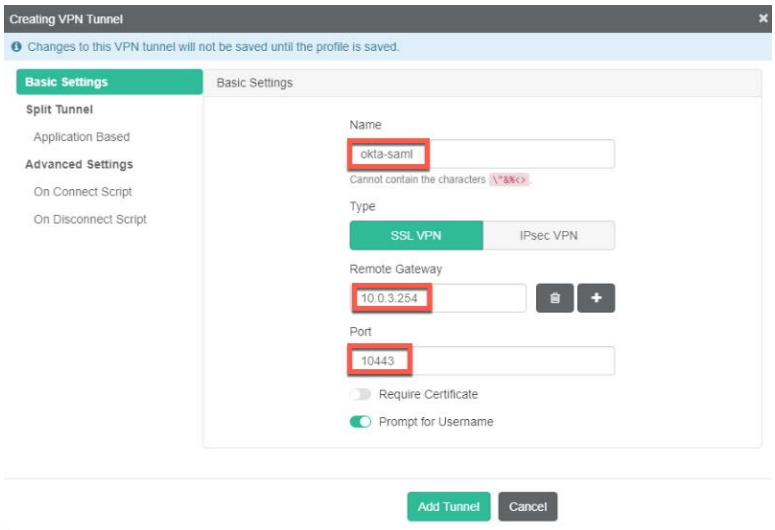


4. Configure a local or RADIUS user as a backup. This setting also provides a login web user with a choice of local or SSO login.
5. Go to *Policy and Objects* > *Firewall Policies*. Configure a policy as desired.
6. Increase the global authentication timeout period to allow users to fill in their credentials in time. The default timeout is five seconds:

```
config system global
   set remoteauthtimeout 60
end
```

To configure EMS:

1. In EMS, go to *Endpoint Profiles* > *Manage Profiles*. Edit a VPN profile.
2. Under *VPN Tunnels*, click *Add Tunnel*.
3. In the *Remote Gateway* field, enter the FortiGate IP address. In this example, it is 10.0.3.254.
4. In the *Port* field, enter the port number. In this example, it is 10443.

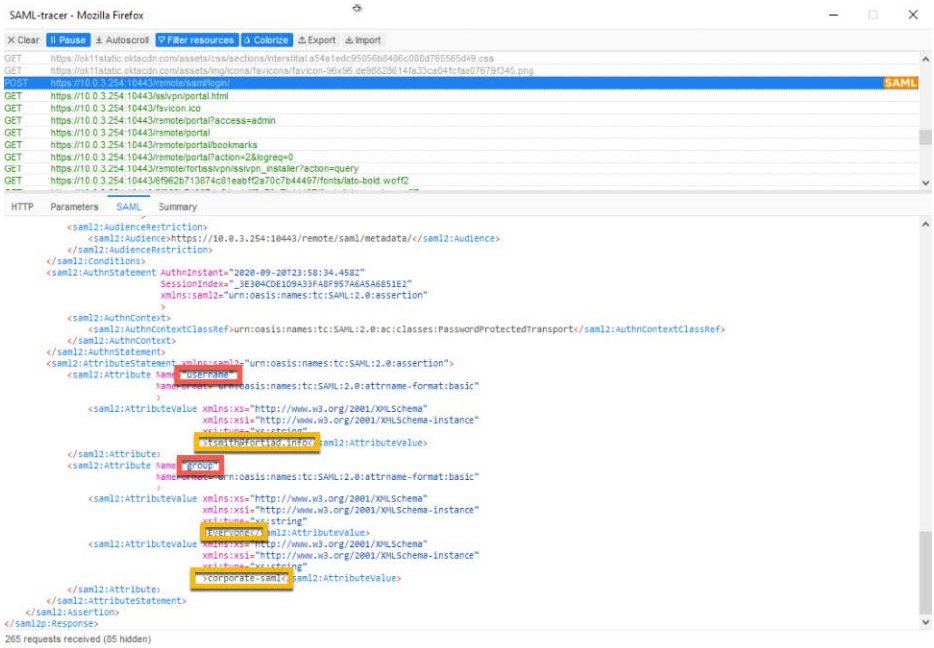


5. In *Advanced Settings*, enable *Enable SAML Login*.
6. Click *Add Tunnel*.
7. Save the profile.
8. After the policy synchronizes to the endpoint, the *SAML Login* button is visible on the Remote Access tab in FortiClient.

To test the configuration:

1. You will first test web-based SSL VPN authentication using Firefox with the SAML tracer plugin enabled. Install the SAML-tracer plugin to Firefox.
2. In Firefox, go to the FortiOS SSL VPN login page. In this example, this is https://10.0.3.254:10443.
3. Open the SAML tracer.

4. The browser redirects to the Okta SAML login page. Enter the Okta credentials, then click *Sign in*.
5. Upon successful authentication, the browser redirects to the authenticated SSL VPN page. If authentication does not succeed, review the SAML tracer to confirm the SAML assertion attributes that are passed during the authentication session. Select the POST message with the SAML information. On the SAML tab, confirm the username and group attributes.

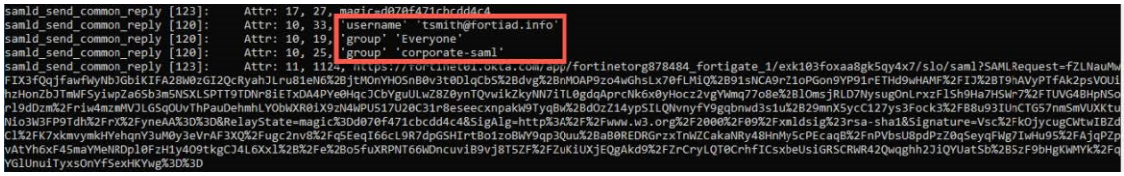


6. To test tunnel mode, go to the *Remote Access* tab in FortiClient. Click the *SAML Login* button.
7. A FortiAuthenticator web login page opens within FortiClient. Enter the Okta credentials, then log in to connect to the VPN tunnel.

To troubleshoot the configuration:

You can view FortiOS event logs in *Log & Report* > *Events* to verify successful authentication and user group allocation.

You can also run the `diagnose debug application samld -1` command to verify that the SAML IdP sent the correct information. The following shows example output for this scenario:



SSL VPN with Microsoft Entra SSO integration

You can use SAML single sign-on to authenticate against Microsoft Entra ID with SSL VPN SAML users who are using tunnel and web modes. See:

- Configuring SAML SSO login for SSL VPN with Entra ID acting as SAML IdP
- Tutorial: Microsoft Entra SSO integration with FortiGate SSL VPN

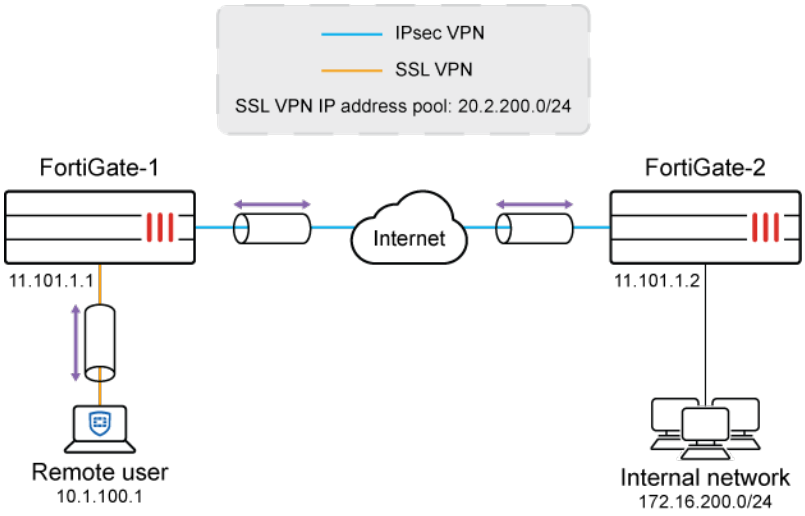
SSL VPN to IPsec VPN

This is a sample configuration of a remote endpoint connecting to FortiGate-1 over SSL VPN, and then connecting over site-to-site IPsec VPN to an internal network behind FortiGate-2.

This example uses a pre-existing user group, a tunnel mode SSL VPN with split tunneling, and a route-based IPsec VPN between two FortiGates. All sessions must start from the SSL VPN interface.

If you want sessions to start from the FGT_2 subnet, you need more policies. Also, if the remote subnet is beyond FGT_2 (if there are multiple hops), you need to include the SSL VPN subnet in those routers as well.

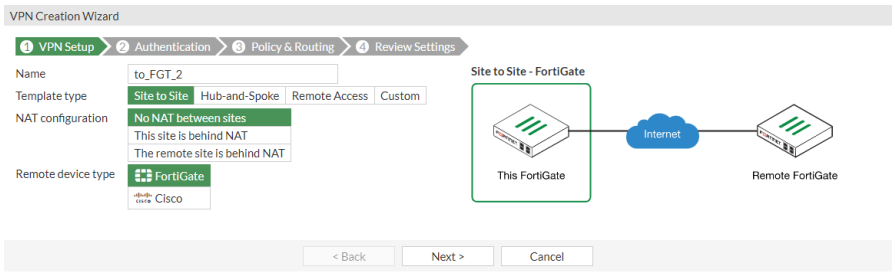
Sample topology



Sample configuration

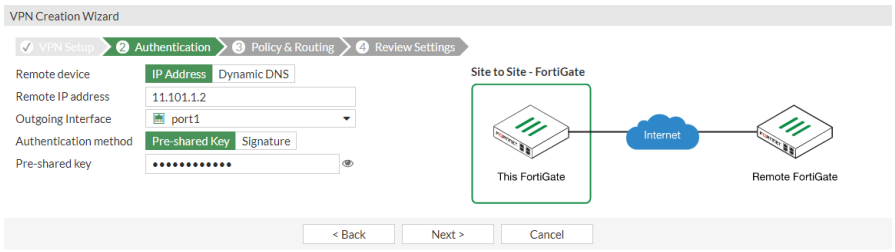
To configure the site-to-site IPsec VPN on FGT_1:

1. Go to *VPN* > *IPsec Wizard*.
2. In the *VPN Setup* pane:
   a. Specify the VPN connection *Name* as *to_FGT_2*.
   b. Select *Site to Site*.



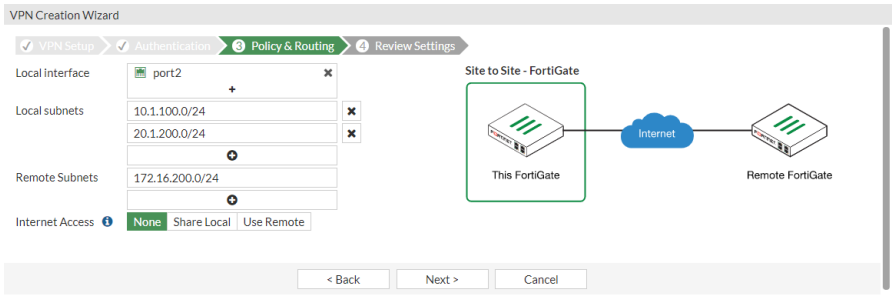
c. Click *Next*.

3. In the *Authentication* pane:
   a. Enter the *IP Address* to the Internet-facing interface.
   b. For *Authentication Method*, click *Pre-shared Key* and enter the *Pre-shared Key*.

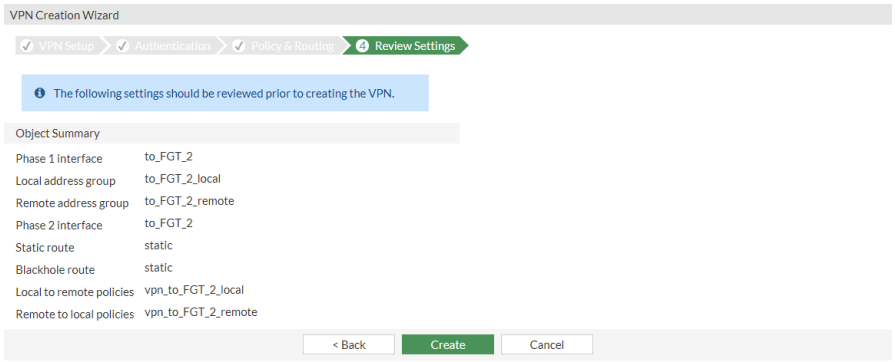


c. Click *Next*.

4. In the *Policy & Routing* pane:
   a. Set the *Local Interface* to the internal interface.
   b. Set the *Local Subnets* to include the internal and SSL VPN subnets for FGT_1.
   c. Set *Remote Subnets* to include the internal subnet for FGT_2.

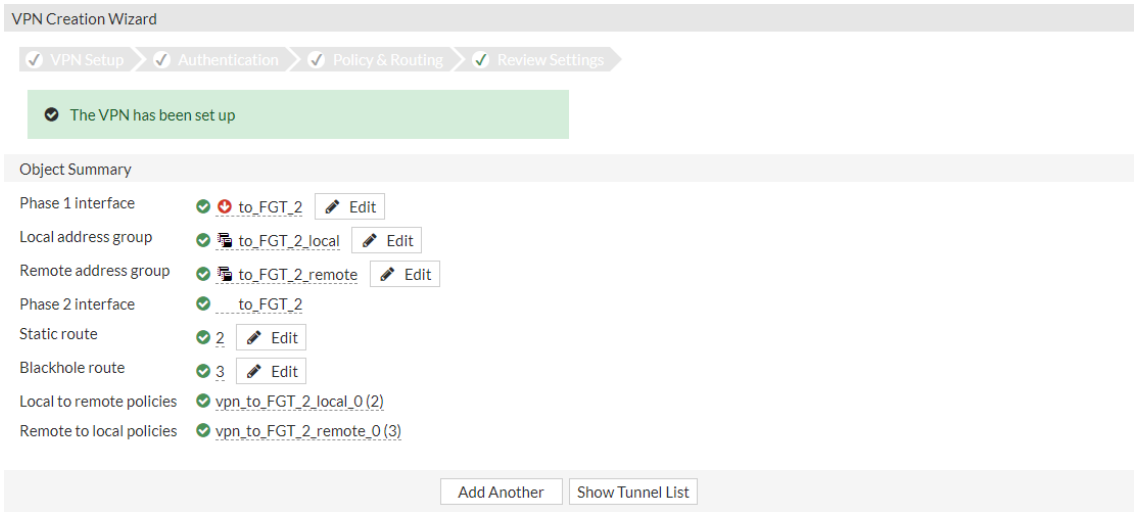


d. Click *Next*.



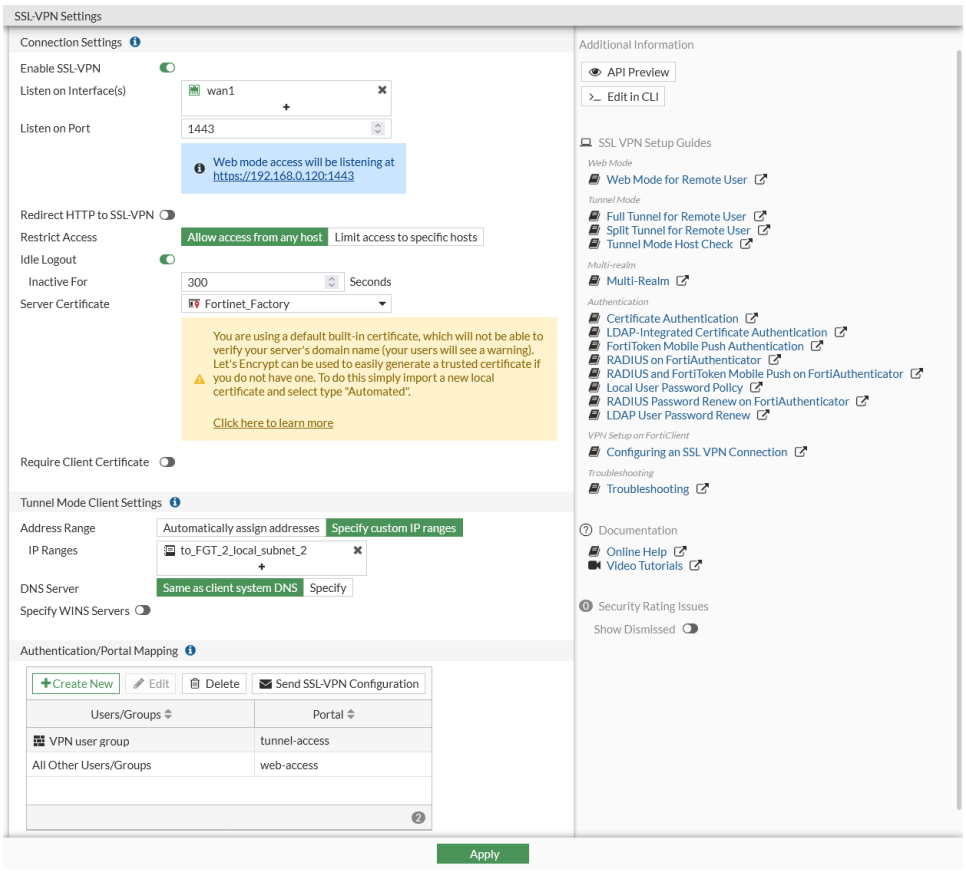
5. Review the VPN settings and click *Create*.

A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.



To configure SSL VPN settings:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Listen on Interface(s)* to *wan1*.
3. To avoid port conflicts, set *Listen on Port* to *10443*.
4. Set *Restrict Access* to *Allow access from any host*.
5. In the Tunnel Mode Client Settings section, select *Specify custom IP ranges* and include the SSL VPN subnet range created by the *IPsec Wizard*.
6. In the *Authentication/Portal Mapping* section, add the *VPN user group* to the *tunnel-access Portal*. Set *All Other Users/Groups* to the *web-access Portal*.

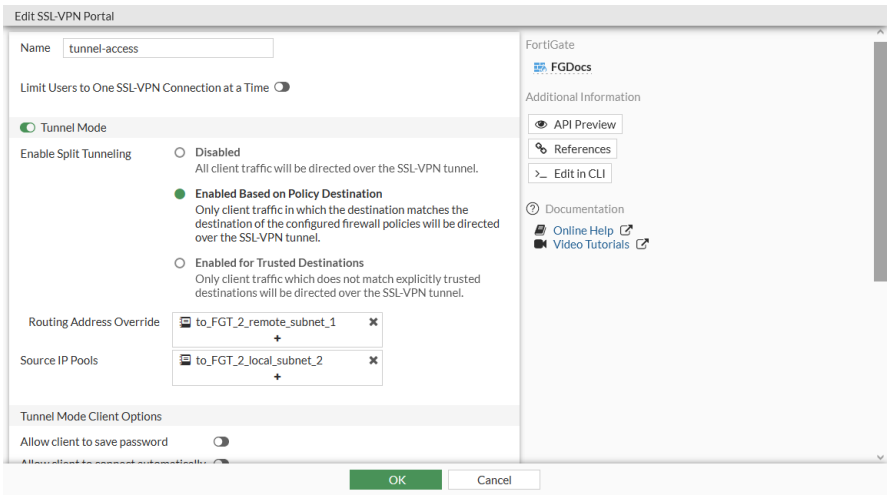


It is **HIGHLY** recommended that you acquire a signed certificate for your installation. Please review the SSL VPN best practices on page 2619 and learn how to Procuring and importing a signed SSL certificate on page 3438.

7. Click *Apply*.

To configure SSL VPN portal:

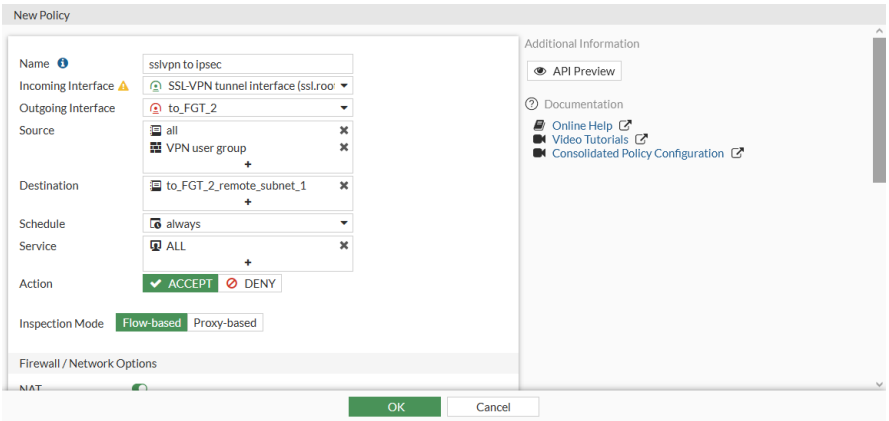
1. Go to *VPN > SSL-VPN Portals*.
2. Select *tunnel-access* and click *Edit*.
3. Turn on *Enable Split Tunneling* so that only traffic intended for the local or remote networks flow through FGT_1 and follows corporate security profiles.
4. For *Routing Address*, add the local and remote IPsec VPN subnets created by the *IPsec Wizard*.
5. For *Source IP Pools*, add the SSL VPN subnet range created by the *IPsec Wizard*.



6. Click *OK*.

To add policies to FGT_1:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New* to create a policy that allows SSL VPN users access to the IPsec VPN tunnel.
3. For *Incoming Interface*, select *ssl.root*.
4. For *Outgoing Interface*, select the IPsec tunnel interface *to_FGT_2*.
5. Set the *Source* to *all* and the *VPN user group*.
6. Set *Destination* to the remote IPsec VPN subnet.
7. Specify the *Schedule*.
8. Set the *Service* to *ALL*.
9. In the *Firewall/Network Options* section, disable *NAT*.



10. Click *OK*.

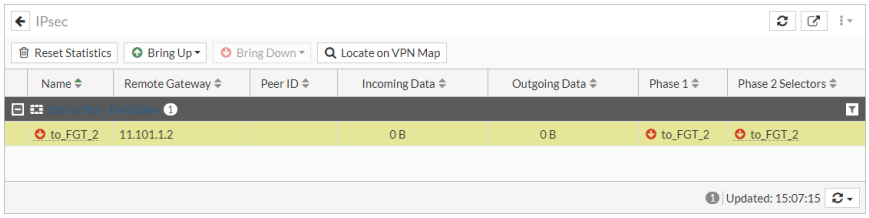
To configure the site-to-site IPsec VPN on FGT_2:

1. Go to *VPN* > *IPsec Wizard*.
2. In the *VPN Setup* pane:
   a. Specify the VPN connection *Name* as *to FGT_1*.
   b. Select *Site to Site*.
   c. Click *Next*.
3. In the *Authentication* pane:
   a. Enter the *IP Address* to the Internet-facing interface.
   b. For *Authentication Method*, click *Pre-shared Key* and enter the *Pre-shared Key* of the FGT_1.
   c. Click *Next*.
4. In the *Policy & Routing* pane:
   a. Set the *Local Interface* to the internal interface.
   b. Set the *Local Subnets* to include the internal and SSL VPN subnets for FGT_2.
   c. Set *Remote Subnets* to include the internal subnet for FGT_1.
   d. Click *Create*.

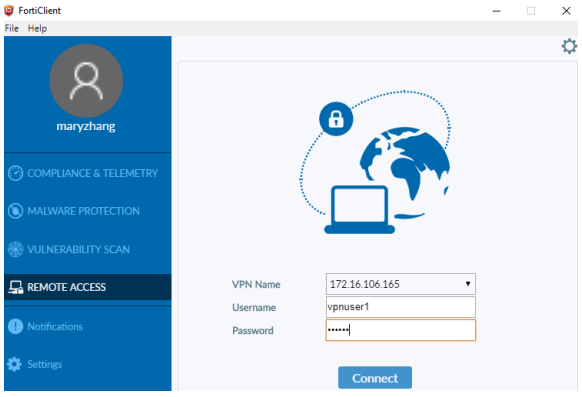
A confirmation screen shows a summary of the configuration including the firewall address groups for both the local and remote subnets, static routes, and security policies.

To check the results:

1. Go to *Dashboard* > *Network* and click the *IPsec* widget to expand to full screen view.
2. Select the tunnel and click *Bring Up*.



3. Verify that the *Status* changes to *Up*.
4. Configure the SSL VPN connection on the user's FortiClient and connect to the tunnel.



5. On the user's computer, send a ping though the tunnel to the remote endpoint to confirm access:

```
C:\>ping 172.16.200.55

Pinging 172.16.200.55 with 32 bytes of data:
Replay from 172.16.200.55: bytes=32 times=2ms TTL=62
Replay from 172.16.200.55: bytes=32 times=1ms TTL=62
Replay from 172.16.200.55: bytes=32 times=1ms TTL=62
Replay from 172.16.200.55: bytes=32 times=1ms TTL=62

Ping statistics for 172.16.200.55:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip time in milli-seconds:
    Minimum = 1ms, Maximum = 2ms, Average = 1ms
```

6. In FortiOS, go to the following pages for further verification:
   a. Go to *Dashboard* > *Network* and click the *Routing* widget to verify the IPsec and SSL VPNs are added.
   b. Go to *VPN* > *SSL-VPN Clients* to verify the connected users.
   c. Go to *VPN* > *VPN Location Map* to view the connection activity.
   d. Go to *Log & Report* > *System Events* and select the *VPN Events* card to view tunnel statistics.
   e. Go to *Dashboard* > *FortiView Policies* to view the policy usage.

Troubleshooting

To troubleshoot on FGT_1, use the following CLI commands:

```
diagnose debug reset
diagnose debug flow show function-name enable
diagnose debug flow show iprope enable
diagnose debug flow filter addr 172.16.200.55
diagnose debug flow filter proto 1
diagnose debug flow trace start 2
diagnose debug enable
```

To troubleshoot using ping:

1. Send a ping through the SSL VPN tunnel to 172.16.200.55 and analyze the output of the debug.
2. Disable the debug output with: `diagnose debug disable`.

If traffic is entering the correct VPN tunnel on FGT_1, then run the same commands on FGT_2 to check whether the traffic is reaching the correct tunnel. If it is reaching the correct tunnel, confirm that the SSL VPN tunnel range is configured in the remote side quick mode selectors.

To troubleshoot using a sniffer command:

```
diagnose sniff packet any "host 172.16.200.44 and icmp" 4
```

To troubleshoot IPsec VPN issues, use the following commands on either FortiGate:

```
diagnose debug reset
diagnose vpn ike gateway clear
diagnose debug application ike -1
diagnose debug enable
```

SSL VPN protocols

The following topics provide information about SSL VPN protocols:

- TLS 1.3 support on page 2787
- SMBv2 support on page 2788
- DTLS support on page 2788

TLS 1.3 support

FortiOS supports TLS 1.3 for SSL VPN.

TLS 1.3 support requires IPS engine 4.205 or later and endpoints running FortiClient 6.2.0 or later.

To establish a client SSL VPN connection with TLS 1.3 to the FortiGate:

1. Enable TLS 1.3 support using the CLI:
   ```
   config vpn ssl setting
      set ssl-max-proto-ver tls1-3
      set ssl-min-proto-ver tls1-3
   end
   ```
2. Configure the SSL VPN settings (see SSL VPN full tunnel for remote user on page 2638).
3. Configure the firewall policy (see Firewall policy on page 1463).
4. For Linux clients, ensure OpenSSL 1.1.1a is installed:
   a. Run the following commands in the Linux client terminal:
      ```
      root@PC1:~/tools# openssl
      OpenSSL> version
      ```
      If OpenSSL 1.1.1a is installed, the system displays a response like the following:
      ```
      OpenSSL 1.1.1a 20 Nov 2018
      ```
5. For Linux clients, use OpenSSL with the TLS 1.3 option to connect to SSL VPN:
   a. Run the following command in the Linux client terminal:
      ```
      #openssl s_client -connect 10.1.100.10:10443 -tls1_3
      ```
6. Ensure the SSL VPN connection is established with TLS 1.3 using the CLI:
   ```
   # diagnose debug application sslvpn -1
   # diagnose debug enable
   ```

The system displays a response like the following:

```
[207:root:1d]SSL established: TLSv1.3 TLS_AES_256_GCM_SHA384
```

Deep inspection (flow-based)

FortiOS supports TLS 1.3 for policies that have the following security profiles applied:

- Web filter profile with flow-based inspection mode enabled.
- Deep inspection SSL/SSH inspection profile.

For example, when a client attempts to access a website that supports TLS 1.3, FortiOS sends the traffic to the IPS engine. The IPS engine then decodes TLS 1.3 and the client is able to access the website.

SMBv2 support

On all FortiGate models, SMBv2 is enabled by default for SSL VPN. Client PCs can access the SMBv2 server using SSL VPN web-only mode.

To configure SMBv2:

1. Set the minimum and maximum SMB versions.

```
config vpn ssl web portal
    edit portal-name
       set smb-min-version smbv2
       set smb-max-version smbv3
    next
end
```

2. Configure the SSL VPN settings (see SSL VPN full tunnel for remote user on page 2638).
3. Configure the firewall policy (see Firewall policy on page 1463).
4. Connect to the SSL VPN web portal and create an SMB bookmark for the SMBv2 server.
5. Click the bookmark to connect to the SMBv2 server.
6. On the FortiGate, use package capture to verify that SMBv2 works:

DTLS support

FortiOS Datagram Transport Layer Security (DTLS) allows SSL VPN to encrypt traffic using TLS and uses UDP as the transport layer instead of TCP. This avoids retransmission problems that can occur with TCP-in-TCP.

To establish a client SSL VPN connection with DTLS to the FortiGate:

1. Enable the DTLS tunnel in the CLI:

```
config vpn ssl setting
    set dtls-tunnel enable
end
```

2. Configure the SSL VPN settings (see SSL VPN full tunnel for remote user on page 2638).
3. Configure the firewall policy (see Firewall policy on page 1463).
4. In FortiClient, use the *Preferred DTLS Tunnel* option to connect to SSL VPN with DTLS:
   a. Go to *Settings* and expand the *VPN Options* section.
   b. Enable *Preferred DTLS Tunnel*.

FortiClient 5.4.0 to 5.4.3 uses DTLS by default. FortiClient 5.4.4 and later uses normal TLS, regardless of the DTLS setting on the FortiGate.

   c. Click *Save*.
5. In FortiOS, run diagnostics to ensure the SSL VPN connection is established with DTLS:

```
# diagnose debug application sslvpn -1
# diagnose debug enable
```

The system displays a response like the following:

```
[304:vdom1:7]DTLS established: DTLSv1 ECDHE-RSA-AES256-GCM-SHA384
```

Configuring the DTLS heartbeat parameters

The DTLS heartbeat parameters for SSL VPN can be adjusted. This improves the success rate of establishing a DTLS tunnel in networks with congestion or jitter.

```
config vpn ssl settings
    set dtls-heartbeat-idle-timeout <integer>
    set dtls-heartbeat-interval <integer>
    set dtls-heartbeat-fail-count <integer>
end
```

`dtls-heartbeat-idle-timeout <integer>`	Set the idle timeout before the DTLS heartbeat is sent, in seconds (3 - 10, default = 3).
`dtls-heartbeat-interval <integer>`	Set the interval between DTLS heartbeats, in seconds (3 - 10, default = 3).
`dtls-heartbeat-fail-count <integer>`	Set the number of missing heartbeats before the connection is considered dropped, in seconds (3 - 10, default = 3).

To configure the DTLS heartbeat parameters:

```
config vpn ssl settings
    set dtls-heartbeat-idle-timeout 3
    set dtls-heartbeat-interval 3
    set dtls-heartbeat-fail-count 3
end
```

To verify the configuration:

1. Run diagnostics on the server side:

```
# diagnose debug console timestamp enable
# diagnose debug application sslvpn -1
# diagnose debug enable
```

```
2023-04-26 12:01:40 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message: heartbeat
 10.1.100.147
2023-04-26 12:01:41 [304:vdom1:5]sslvpn_dtls_handle_client_data:758 0x7f1f2743e800 got
heartbeat
2023-04-26 12:01:44 [304:vdom1:5]sslvpn_dtls_handle_client_data:758 0x7f1f2743e800 got
heartbeat
2023-04-26 12:01:46 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message: heartbeat
 10.1.100.147
2023-04-26 12:01:50 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message: heartbeat
 10.1.100.147
2023-04-26 12:01:54 [304:vdom1:5]sslvpn_send_ctrl_msg:987 0x7f1f2743e800 message: heartbeat
 10.1.100.147
2023-04-26 12:01:54 [304:vdom1:5]sslvpn_dtls_timeout_check:358 no heartbeat received for 9
seconds.
2023-04-26 12:01:54 [304:vdom1:5]fsv_disassociate_fd_to_ipaddr:2367 deassociate 10.11.12.1
from tun (ssl.vdom1:12)
2023-04-26 12:01:54 [304:vdom1:5]dtls_tun_link_down:1884 tunnel device (12) closed
2023-04-26 12:01:54 [304:vdom1:5]tunnel is down, wait for next connection.
2023-04-26 12:01:54 [304:vdom1:5]sslvpn_release_dynip:1597 free app session, idx[0]
2023-04-26 12:01:54 [304:vdom1:5]release dyip
2023-04-26 12:01:54 [304:vdom1:5]Destroy sconn 0x7f1f2743e800, connSize=0. (vdom1)
```

   The heartbeat starts being sent after the idle timeout, and the heartbeat is sent every three seconds. The tunnel is disconnected once the `dtls-heartbeat-fail-count` is reached.

2. Use a Linux traffic control (tc) utility to introduce packet loss of 30% on the interface connected to the FortiGate (ens192):

```
root@auto-pc147:~# tc qdisc add dev ens192 root netem loss 30%
```

3. Run a ping test. The results show that the network has jitter/congestion as 33% of packets are being lost:

```
root@auto-pc147:~# ping 10.1.100.2 -c 100
PING 10.1.100.2 (10.1.100.2) 56(84) bytes of data.
64 bytes from 10.1.100.2: icmp_seq=1 ttl=255 time=0.111 ms
```

```
64 bytes from 10.1.100.2: icmp_seq=2 ttl=255 time=0.106 ms
...
64 bytes from 10.1.100.2: icmp_seq=99 ttl=255 time=0.103 ms
64 bytes from 10.1.100.2: icmp_seq=100 ttl=255 time=0.097 ms

--- 10.1.100.2 ping statistics ---
100 packets transmitted, 67 received, 33% packet loss, time 101382ms
rtt min/avg/max/mdev = 0.088/0.104/0.141/0.009 ms
```

4. Run diagnostics again on the server side to verify that the DTLS tunnel is established:

```
# diagnose debug application sslvpn -1
# diagnose debug enable
```

```
[307:vdom1:9]form_ipv4_pol_split_tunnel_addr:113 Matched policy (id = 14) to add ipv4 split

Configuring OS and host check

Beyond the basics of setting up the SSL VPN, you can configure a number of other options that can help to ensure your internal network is secure and can limit the possibility of attacks and viruses entering the

network from an outside source. These include verifying OS and performing host checks on software running on the remote device.

Verifying remote user OS

To verify that remote users are using devices with up-to-date Operating Systems to connect to your network, you can configure a host check for Windows and Mac OS. You can configure an OS host check for specific OS versions, such as Windows 7, 8.1, 10, and 11.

To configure an OS host check for specific OS versions:

1. Go to *VPN > SSL-VPN*.
2. Click *Create New*.
3. Enable *Restrict to Specific OS Versions*.
4. Select an OS version and click *Edit* to change the action.
5. Select the action:
   - *Allow*: The selected OS version is allowed to connect. This is the default action.
   - *Block*: The selected OS version is not allowed to connect.
   - *Check up to date*: Specify a *Tolerance* and *Latest patch level* that is allowed for the selected OS version.
6. Click *OK*.
7. Configure other parameters as needed.
8. Click *OK*.

Host check

Host check verifies whether the client device has AntiVirus, firewall, both, or other custom security software enabled on their Windows device. Admins may also define their own custom host check software, which supports Windows and Mac OS. See Creating a custom host check list on page 2794.

Host Check is only available for SSL VPN tunnel mode.

To configure host checking:

1. Go to *VPN > SSL-VPN Portal*.
2. Click *Create New*.
3. Enable *Host Check*.
4. Set the *Type*:
   - *Realtime AntiVirus*: Checks that AntiVirus software recognized by Windows Security Center is enabled.
   - *Firewall*: Checks that firewall software recognized by Windows Security Center is enabled.

- *Enable both*: Checks that both *Realtime AntiVirus* and *Firewall* are enabled.
- Custom: Not configurable from the GUI. See CLI settings below.

5. Configure other parameters as needed.
6. Click *OK*.

You can configure the full-access portal to perform a custom host check for FortiClient Host Security AV and firewall software.

To configure custom host checking:

```
config vpn ssl web portal
    edit full-access
        set host-check custom
        set host-check-policy FortiClient-AV FortiClient-FW
    next
end
```

Many other security software can also be configured. Use `set host-check-policy ?` to see a list of software.

Replacing the host check error message

You can add your own host security check error message using either the GUI or the CLI. The default message reads:

```
Your PC does not meet the host checking requirements set by the firewall. Please try again in a
few minutes. If the issue persists check that your OS version meets the minimum requirements, that
your antivirus and firewall applications are installed and running properly, and that you have the
correct network interface.
```

To replace the host check error message in the GUI:

1. Go to *System* > *Replacement Messages*.
2. Select *Extended View* in the upper right corner.
3. Scroll down to *SSL-VPN* and select *Hostcheck Error Message*.
4. Click *Edit*. The *Hostcheck Error Message* pane opens.
5. Edit the text in the right-hand column.
6. Click *Save*.

If you are unhappy with the new message, you can restore the message to its default by selecting *Restore Defaults* instead of *Save*.

MAC address check

Aside from OS and Host check, FortiGate can also perform a MAC address check on the remote host.

To configure a MAC address check on the remote host in the CLI:

```
config vpn ssl web portal
    edit <portal_name>
        set mac-addr-check enable
        config mac-addr-check-rule
            edit <rule_name>
                set mac-addr-list <address> [address]
                set mac-addr-mask <mask between 1-48>
            next
        end
        set mac-addr-action {allow | deny}
    next
end
```

Creating a custom host check list

You can add your own software requirements to the host check list using the CLI. Host integrity checking is only possible with client computers running Microsoft Windows platforms.

To add software requirements to the host check list:

```
config vpn ssl web host-check-software
    edit <software_name>
        set os-type {windows | macos}
        set type {av | fw}
        set version <version_number>
        set guid <guid_value>
        config check-item-list
            edit <ID>
                set action {require | deny}
                set type {file | registry | process}
                set target <target string>
                set version <version string>
                set md5s <hext string>
            next
        end
    next
end
```

If known, enter the Globally Unique Identifier (GUID) for the host check application. Windows uses GUIDs to identify applications in the Windows Registry. The GUID can be found in the Windows registry in the `HKEY_CLASSES_ROOT` section.

To obtain the exact versioning, in Windows, right-click on the .EXE file of the application and select *Properties*, then select the *Version* tab.

Example: Tunnel Mode Host Check - Registry Key Check

The following example configuration checks if a required registry key is present on a Windows device.

```
config vpn ssl web host-check-software
    edit <computer_name>
        config check-item-list
            edit 1
                set target "HKEY_LOCAL_
MACHINE\\SYSTEM\\CurrentControlSet\\Control\\ComputerName\\ActiveComputerName:ComputerName=WINXP32
SP3B62"
                set type registry
            next
        end
    next
end
```

Example: Tunnel Mode Host Check - Application Running Check

The following example configuration checks if a required application is installed and/or running:

```
config vpn ssl web host-check-software
    edit "calc"
        config check-item-list
            edit 1
                set target "calc.exe"
                set type process
            next
        end
    next
end
```

Example: Mac OS host check and process check

The `os-type` option is available under `vpn ssl web host-check-software`; if `os-type` is `macos`, then `type`, `version` and `guid` are hidden. Furthermore, `type` in `check-item-list` can only be set to `file` or `process`.

```
config vpn ssl web portal
    edit <portal_name>
        set os-check enable
        config os-check-list macos-bigsur-11
            set action {allow | deny | check-up-to-date}
            set tolerance <value>
            set latest-patch-level <value>
        end
```

```
    next
end
config vpn ssl web host-check-software
    edit <name>
        set os-type macos
        config check-item-list
            edit <name>
                set type process
                set target <target process>
            next
        end
    next
end
```

Example: Configuring Windows OS Check with patch version

The Windows patch check enables you to define the minimum Windows version and patch level allowed when connecting to the SSL VPN portal. When the user attempts to connect to the web portal, FortiOS performs a query on the version of Windows the user has installed. If it does not match the minimum requirement, the connection is denied. The Windows patch check is configured in the CLI.

To specify the acceptable patch level, you set the `latest-patch-level` and the `tolerance`. The lowest acceptable patch level is `latest-patch-level` minus *tolerance*. In this case, *latest-patch-level* is three and *tolerance* is one, so two is the lowest acceptable patch level.

To configure OS check:

```
config vpn ssl web portal
    edit <portal_name>
        set os-check enable
        config os-check-list <windows OS version>
            set action {allow | check-up-to-date | deny}
            set latest-patch-level {disable | 0 - 65535}
            set tolerance <tolerance_num>
        end
    next
end
```

Example: Host check for Windows firewall

The Windows built-in firewall does not have a GUID in root\securitycenter or root\securitycenter2, but you can use a registry value to detect the firewall status.

If Windows firewall is on, the following registry value will be set to one:

- **KeyName**: HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\SharedAccess\Parameters\FirewallPolicy\StandardProfile
- **ValueName**: EnableFirewall

In FortiOS, use the `registry-value-check` feature to define the Windows firewall software.

To define the Windows firewall software:

```
config vpn ssl web host-check-software
    edit "Microsoft-Windows-Firewall"
        set type fw
        config check-item-list
            edit 1
                set target
"HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\FirewallPolicy\\StandardProf
ile:EnableFirewall==1"
                set type registry
            next
            edit 2
                set target
"HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\FirewallPolicy\\PublicProfil
e:EnableFirewall==1"
                set type registry
            next
            edit 3
                set target
"HKLM\\SYSTEM\\CurrentControlSet\\Services\\SharedAccess\\Parameters\\FirewallPolicy\\DomainProfil
e:EnableFirewall==1"
                set type registry
            next
        end
    next
end
config vpn ssl web portal
    edit <portal_name>
        set host-check custom
        set host-check-policy Microsoft-Windows-Firewall
    next
end
```

Troubleshooting

To troubleshoot OS and host check, enable the following real-time debugs from the CLI:

```
# diagnose debug app sslvpn -1
```

```
# diagnose debug enable
```

From the remote client, connect to SSL VPN. Look for debug output similar to the following:

```
[263:root:3cca1]host check result:4 0100,10.0.19042,74:78:27:4d:81:93|84:1b:77:3a:95:84
```

To interpret the above output:

Field	Description
`host check result: 4`	This is the hex number of portal's host check value: • `0`: None • `1`: Check antivirus • `2`: Check firewall • `3`: Check antivirus and firewall • `4`: Custom check
`0100`	The 4 bytes shows the result of host check checking in the FortiGate Settings. Position counts from left to right, zero to three: • Position zero means result of third party firewall. • Position one means result of third party antivirus. • Position two means result of FortiClient firewall. • Position three means result of FortiClient antivirus. `0` means not in use. `1` means in use.
`10.0.19042`	This is the OS version.
`74:78:27:4d:81:93|84:1b:77:3a:95:84`	The MAC address of the client machine's network interface, that is used for the mac address check. Multiple MAC address are separately by '|'.

FortiGate as SSL VPN Client

The FortiGate can be configured as an SSL VPN client, using an *SSL-VPN Tunnel* interface type. When an SSL VPN client connection is established, the client dynamically adds a route to the subnets that are returned by the SSL VPN server. Policies can be defined to allow users that are behind the client to be tunneled through SSL VPN to destinations on the SSL VPN server.

FortiOS can be configured as an SSL VPN server that allows IP-level connectivity in tunnel mode, and can act as an SSL VPN client that uses the protocol used by the FortiOS SSL VPN server. This allows hub-and-spoke topologies to be configured with FortiGates as both the SSL VPN hub and spokes.

For an IP-level VPN between a device and a VPN server, this can be useful to avoid issues caused by intermediate devices, such as:

- ESP packets being blocked.
- UDP ports 500 or 4500 being blocked.
- Fragments being dropped, causing IKE negotiation that uses large certificates to fail if the peer does not support IKE fragmentation.

If the client specified destination is *all*, a default route is effectively dynamically created on the SSL VPN client, and the new default route is added to the existing default route in the form of ECMP. Some examples how to configure routing are:

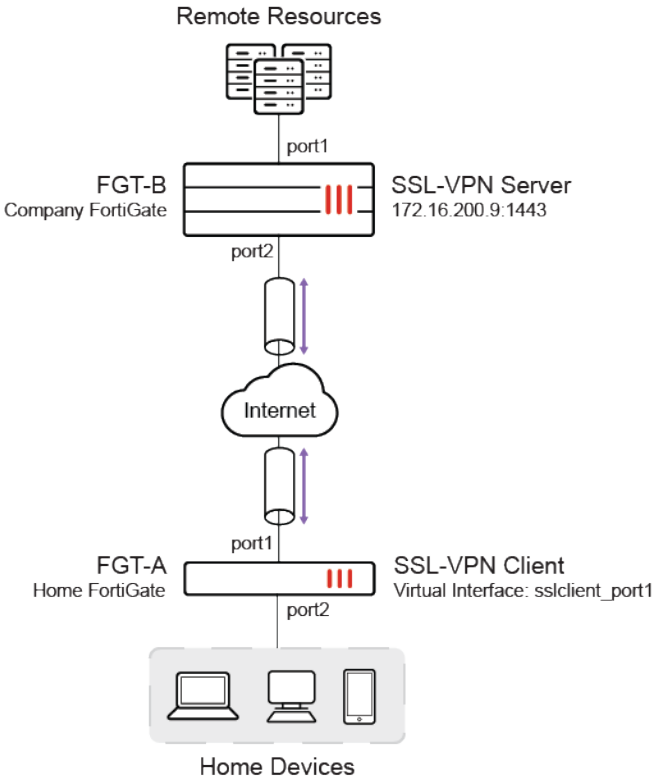
- To make all traffic default to the SSL VPN server and still have a route to the server's listening interface, on the SSL VPN client set a lower distance for the default route that is learned from the server.
- To include both default routes in the routing table, with the route learned from the SSL VPN server taking priority, on the SSL VPN client set a lower distance for the route learned from the server. If the distance is already zero, then increase the priority on the default route.
- To avoid a default being learned on the SSL VPN client, on the SSL VPN server define a specific destination.

Example

In this example, the home FortiGate (FGT-A) is configured as an SSL VPN client, and the company FortiGate (FGT-B) is configured as an SSL VPN server. After FGT-A connects to FGT-B, the devices that are connected to FGT-A can access the resources behind FGT-B.

The SSL VPN server has a custom server certificate defined, and the SSL VPN client user uses PSK and a PKI client certificate to authenticate. The FortiGates must have the proper CA certificate installed to verify the certificate chain to the root CA that signed the certificate.

Split tunneling is used so that only the destination addresses defined in the server's firewall policies are routed to the server, and all other traffic is connected directly to the internet.



Configure the SSL VPN server

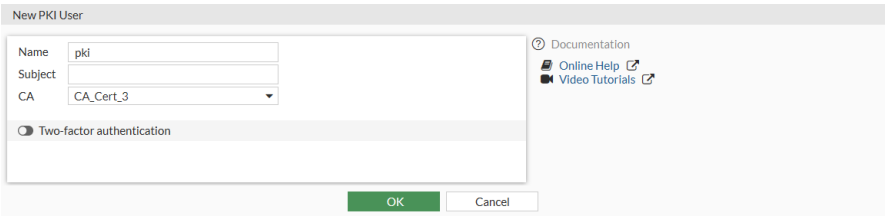
To create a local user in the GUI:

1. Go to *User & Authentication* > *User Definition* and click *Create New*.
2. Use the wizard to create a local user named *client2*.

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to *User & Authentication* > *PKI* and click *Create New*.
2. Set the *Name* to *pki*.
3. Set *CA* to the CA certificate that is used to verify the client certificate.



4. Click *OK*.
5. In the CLI, specify the CN that must be matched. If no CN is specified, then any certificate that is signed by the CA will be valid and matched.

```
config user peer
    edit "pki"
        set cn "*.fos.automation.com"
    next
end
```

To create an SSL VPN portal in the GUI:

1. Go to *VPN* > *SSL-VPN Portals* and click *Create New*.
2. Set the *Name* to *testportal2*.
3. Set *Enable Split Tunneling* to *Enabled Based on Policy Destination*.
4. Set *Source IP Pools* to *SSLVPN_TUNNEL_ADDR1*.
5. Click *OK*.

To configure SSL VPN settings in the GUI:

1. Go to *VPN* > *SSL-VPN Settings* and enable *Enable SSL-VPN*.
2. Set *Listen on Interface(s)* to *port2*.
3. Set *Listen on Port* to *1443*.
4. Set *Server Certificate* to *fgt_gui_automation*.

5. In the *Authentication/Portal Mapping* table click *Create New*:
   a. Set *Users/Groups* to *client2*.
   b. Set *Portal* to *testportal2*.
   c. Click *OK*.
6. Click *OK*.
7. In the CLI, enable SSL VPN client certificate restrictive and set the user peer to *pki*:

```
config vpn ssl settings
    config authentication-rule
        edit 1
            set client-cert enable
            set user-peer "pki"
        next
    end
end
```

To create a firewall address in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. click *Create new*.
3. Set the *Name* to *bing.com*.
4. Set *Type* to *FQDN*.
5. Set *FQDN* to *www.bing.com*.
6. Click *OK*.

To create a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the policy:

Name	*sslvpn2*
Incoming Interface	*SSL-VPN tunnel interface (ssl.root)*
Outgoing Interface	*port1*
Source	*Address*: *all* *User*: *client2*
Destination	*bing.com*: This FQDN resolves to 13.107.21.200 and 204.79.197.200. Traffic to these addresses is directed to the SSL VPN, while other traffic is routed to the remote devices' default adapters or interfaces. *mantis*
Schedule	*always*
Service	*ALL*
Action	*Accept*

3. Click *OK*.

To configure the SSL VPN server (FGT-B) in the CLI:

1. Create a local user:

```
config user local
    edit "client2"
        set passwd **********
    next
end
```

2. Create a PKI user:

```
config user peer
    edit "pki"
        set ca "CA_Cert_3"
        set cn "*.fos.automation.com"
    next
end
```

3. Create a new SSL VPN portal:

```
config vpn ssl web portal
    edit "testportal2"
        set tunnel-mode enable
        set ipv6-tunnel-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set split-tunneling enable
        set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
        set ipv6-split-tunneling enable
        ....
    next
end
```

4. Configure SSL VPN settings, including the authentication rule for user mapping:

```
config vpn ssl settings
    set ssl-min-proto-ver tls1-1
    set servercert "fgt_gui_automation"
    set auth-timeout 0
    set login-attempt-limit 10
    set login-timeout 180
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set dns-suffix "sslvpn.com"
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "testportal1"
    config authentication-rule
        edit 1
            set users "client2"
            set portal "testportal2"
```

```
            set client-cert enable
            set user-peer "pki"
        next
    end
end
```

5. Create a firewall address and policy. The destination addresses used in the policy are routed to the SSL VPN server.

```
config firewall address
    edit "bing.com"
        set type fqdn
        set fqdn "www.bing.com"
    next
end
```

```
config firewall policy
    edit 2
        set name "sslvpn2"
        set srcintf "ssl.root"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "mantis" "bing.com"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "client2"
    next
end
```

Configure the SSL VPN client

To create a PKI user in the GUI:

The PKI menu is only available in the GUI after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

1. Go to *User & Authentication* > *PKI* and click *Create New*.
2. Set the *Name* to *fgt_gui_automation*.
3. Set *CA* to the CA certificate. The CA certificate allows the FortiGate to complete the certificate chain and verify the server 's certificate, and is assumed to already be installed on the FortiGate.
4. Click *OK*.
5. In the CLI, specify the CN of the certificate on the SSL VPN server:

```
config user peer
    edit "fgt_gui_automation"
```

```
        set cn "*.fos.automation.com"
    next
end
```

To create an SSL VPN client and virtual interface in the GUI:

1. Go to *VPN > SSL-VPN Clients* and click *Create New*.
2. Expand the *Interface* drop down and click *Create* to create a new virtual interface:
   a. Set the *Name* to *sslclient_port1*.
   b. Set *Interface* to *port1*.
   c. Under *Administrative Access*, select *HTTPS* and *PING*.

   d. Click *OK*.
3. Configure the SSL VPN client:

Name	*sslclientTo9*
Interface	*sslclient_port1*
Server	*172.16.200.9*
Port	*1443*
Username	*client2*
Pre-shared Key	**********
Client Certificate	*fgtb_gui_automation* This is the local certificate that is used to identify this client, and is assumed to already be installed on the FortiGate. The SSL VPN server requires it for authentication.
Peer	*fgt_gui_automation*
Administrative Distance	Configure as needed.
Priority	Configure as needed.
Status	Enabled

4. Click *OK*.

To create a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the policy:

Name	*policy_to_sslvpn_tunnel*
Incoming Interface	*port2*
Outgoing Interface	*sslclient_port1*
Source	*all*
Destination	*all*
Schedule	*always*
Service	*ALL*
Action	*Accept*

3. Click *OK*.

To configure the SSL VPN client (FGT-A) in the CLI:

1. Create the PKI user. Use the CA that signed the certificate *fgt_gui_automation*, and the CN of that certificate on the SSL VPN server.

```
config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Create the SSL interface that is used for the SSL VPN connection:

```
config system interface
    edit "sslclient_port1"
        set vdom "vdom1"
        set allowaccess ping https
        set type ssl
        set role lan
        set snmp-index 46
        set interface "port1"
    next
end
```

3. Create the SSL VPN client to use the PKI user and the client certificate *fgtb_gui_automation*:

```
config vpn ssl client
    edit "sslclientTo9"
        set interface "sslclient_port1"
```

```
        set user "client2"
        set psk 123456
        set peer "fgt_gui_automation"
        set server "172.16.200.9"
        set port 1443
        set certificate "fgtb_gui_automation"
    next
end
```

4. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "policy_to_sslvpn_tunnel"
        set srcintf "port2"
        set dstintf "sslclient_port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Verification

After the tunnel is established, the route to 13.107.21.200 and 204.79.197.200 on FGT-A connects through the SSL VPN virtual interface *sslclient_port1*.

To check the routing table details:

```
(vdom1) # get router info routing-table details
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default

Routing table for VRF=0
S*      0.0.0.0/0 [10/0] via 172.16.200.254, port1
C       10.0.1.0/24 is directly connected, link_11
C       10.1.100.0/24 is directly connected, port2
                      is directly connected, port2
C       10.212.134.200/32 is directly connected, sslclient_port1
S       13.107.21.200/32 [10/0] is directly connected, sslclient_port1
C       172.16.200.0/24 is directly connected, port1
S       192.168.100.126/32 [10/0] is directly connected, sslclient_port1
S       204.79.197.200/32 [10/0] is directly connected, sslclient_port1
```

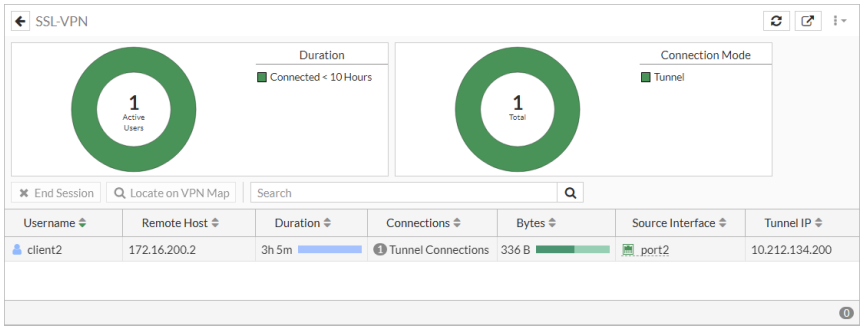
To check the added routing for an IPv6 tunnel:

```
(vdom1) # get router info6 routing-table database
IPv6 Routing Table
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
       IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, B - BGP
       > - selected route, * - FIB route, p - stale info
Timers: Uptime

S    *> ::/0 [10/0] via 2000:172:16:200::254, port1, 00:00:01, [1024/0]
     *>      [10/0] via ::, sslclient_port1, 00:00:01, [1024/0]
C    *> ::1/128 via ::, vdom1, 03:26:35
C    *> 2000:10:0:1::/64 via ::, link_11, 03:26:35
C    *> 2000:10:1:100::/64 via ::, port2, 03:26:35
C    *> 2000:172:16:200::/64 via ::, port1, 03:26:35
C    *> 2001:1::1:100/128 via ::, sslclient_port1, 00:00:01
C    *> fe80::/64 via ::, port2, 03:26:35
```

To check the connection in the GUI:

1. On the SSL VPN server FortiGate (FGT-B), go to *Dashboard* > *Network* and expand the *SSL-VPN* widget.



2. On the SSL VPN client FortiGate (FGT-A), go to *VPN* > *SSL-VPN Clients* to see the tunnel list.

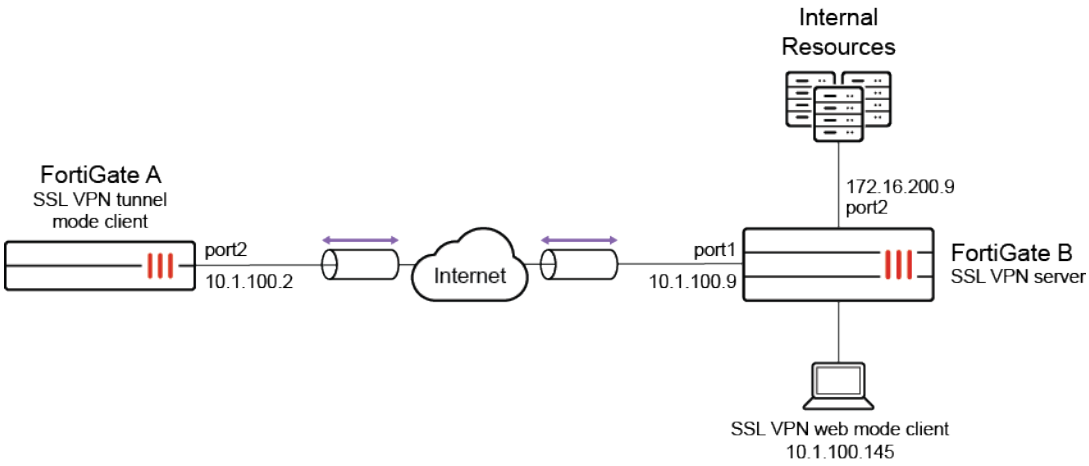
Dual stack IPv4 and IPv6 support for SSL VPN

Dual stack IPv4 and IPv6 support for SSL VPN servers and clients enables a client to establish a dual stack tunnel to allow both IPv4 and IPv6 traffic to pass through. FortiGate SSL VPN clients also support dual stack, which allows it to establish dual stack tunnels with other FortiGates.

Users connecting in web mode can connect to the web portal over IPv4 or IPv6. They can access bookmarks in either IPv4 or IPv6, depending on the preferred DNS setting of the web portal.

Example

In this example, FortiGate B works as an SSL VPN server with dual stack enabled. A test portal is configured to support tunnel mode and web mode SSL VPN.



FortiGate A is an SSL VPN client that connects to FortiGate B to establish an SSL VPN tunnel connection. It attempts to access www.bing.com and www.apple.com via separate IPv4 and IPv6 connections. Two addresses are configured on FortiGate B:

- *bing.com* uses IPv4 FQDN and resolves to 13.107.21.200 and 204.79.197.200.
- *apple_v6* uses IPv6 FQDN and resolves to 2600:140a:c000:385::1aca and 2600:140a:c000:398::1aca.

The server certificate used is fgt_gui_automation, and the CN is *.fos.automation.com.

A PC serves as a client to connect to FortiGate B in SSL VPN web mode. The PC can connect to the SSL VPN server over IPv4 or IPv6. Based on the preferred DNS setting, it will access the destination website over IPv4 or IPv6.

Dual stack tunnel mode support requires a supported client. In 7.0.0, a FortiGate in SSL VPN client mode can support dual stack tunnels. FortiClient 7.0.1 and later releases support dual stack.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the GUI:

1. Create a local user:
   a. Go to *User & Authentication* > *User Definition* and click *Create New*. The *Users/Groups Creation Wizard* opens.
   b. Set the *User Type* to *Local User* and click *Next*.
   c. Enter the *Username* (*client2*) and password, then click *Next*.
   d. Optionally, configure the contact information and click *Next*.
   e. Click *Submit*.
2. Configure the addresses:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.

c. Enter the following for the IPv4 address:

Name	bing.com
Type	FQDN
FQDN	www.bing.com

d. Click *OK*.
e. Select *IPv6 Address*.
f. Click *Create new* and enter the following for the IPv6 address:

Name	apple_v6
Type	IPv6 FQDN
FQDN	www.apple.com

g. Click *OK*.

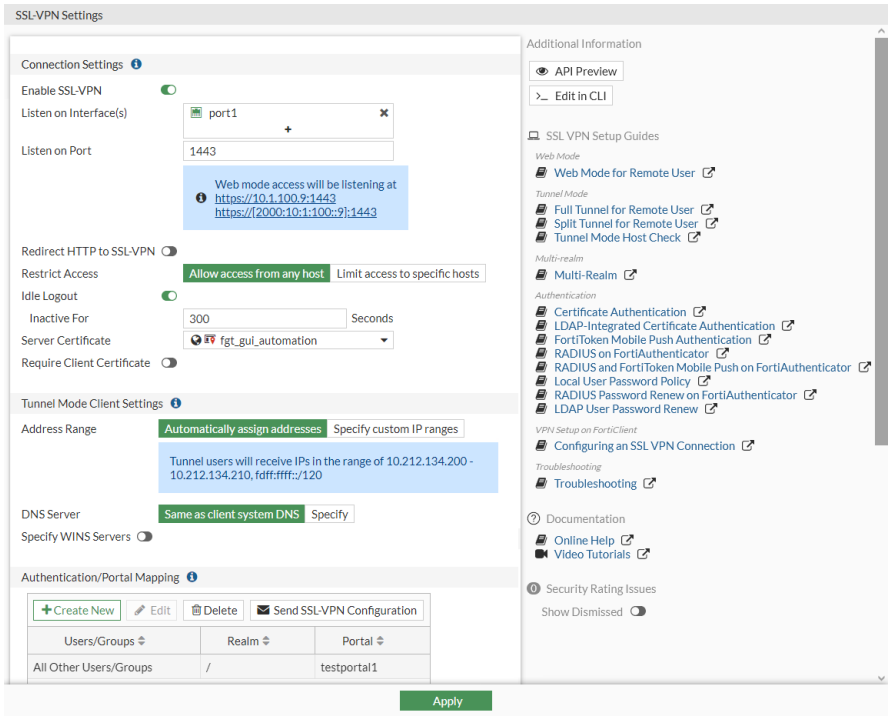
3. Configure the SSL VPN portal:
   a. Go to *VPN > SSL-VPN Portals* and click *Create New*.
   b. Enter a name (*testportal1*).
   c. Enable *Tunnel Mode* and for *Enable Split Tunneling*, select *Enable Based on Policy Destination*.
   d. For *Source IP Pools*, add *SSLVPN_TUNNEL_ADDR1*.
   e. Enable *IPv6 Tunnel Mode* and for *Enable Split Tunneling*, select *Enable Based on Policy Destination*.
   f. For *Source IP Pools*, add *SSLVPN_TUNNEL_IPv6_ADDR1*.
   g. Enable *Enable Web Mode*.

   h. Click *OK*.

4. Configure the SSL VPN settings:

a. Go to *VPN* > *SSL-VPN Settings* and configure the following:

Listen on Interface(s)	port1
Listen on Port	1443
Restrict Access	Allow access from any host
Server Certificate	fgt_gui_automation
Address Range	Automatically assign addresses
DNS Server	Same as client system DNS
Authentication/Portal Mapping	Edit the *All Other Users/Groups* entry to use *testportal1*.



b. Click *Apply*.

c. Enable dual stack in the CLI:

```
config vpn ssl settings
    set dual-stack-mode enable
end
```

5. Configure the firewall policy:

a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.

b. Enter the following:

Name	sslvpn
Incoming Interface	ssl.root

Outgoing Interface	port2
Source	all (IPv4), all (IPv6), client2
Destination	bing.com, apple_v6
Schedule	Always
Service	All
NAT	Enabled

c. Click *OK*.

To configure FortiGate A as an SSL VPN client in the GUI:

1. Create a peer to verify the server certificate:

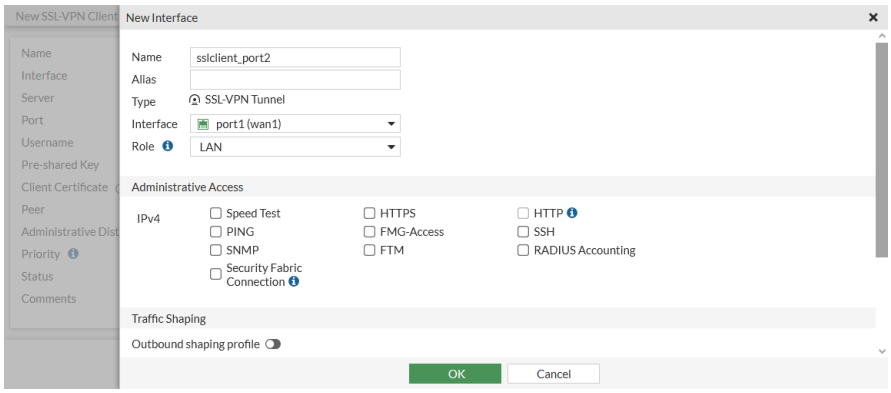
The PKI menu is only available in the GUI (*User & Authentication > PKI*) after a PKI user has been created using the CLI, and a CN can only be configured in the CLI.

If the CA is not known or is public, import the CA that signed the server certificate.

   a. Go to *User & Authentication > PKI* and click *Create New*.
   b. Set the *Name* to *fgt_gui_automation*.
   c. Set *CA* to the CA certificate that is used to verify the server certificate.
   d. Click *OK*.
   e. In the CLI, specify the CN that must be matched:

```
config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Configure the SSL VPN client:
   a. Go to *VPN > SSL-VPN Clients* and click *Create New*.
   b. In the *Interface* dropdown, click *Create*.
      i. Enter a Name (*sslclient_port2*).
      ii. Set *Interface* to *port2*.
      iii. Set *Role* to *LAN*.



iv. Click *OK*.

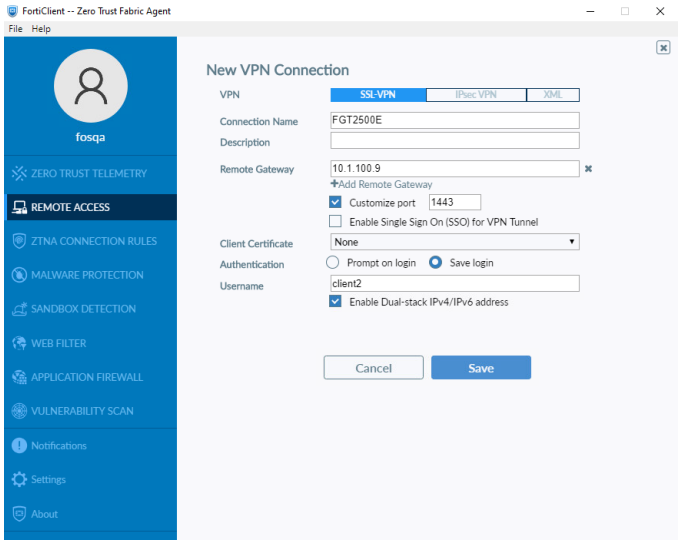
c. Configure the SSL VPN client:

Name	sslclientTo9
Interface	sslclient_port2
Server	Either IPv4 address *10.1.100.9* or IPv6 address *2000:10:1:100::9* can be used and will have the same results.
Port	1443
Username	client2
Pre-shared Key	******
Peer	fgt_gui_automation
Status	Enabled

d. Click *OK*.

To configure FortiClient and connect to the VPN:

1. On the *Remote Access* tab and click *Configure VPN*, or if other connections have already been configured, click the sandwich icon and select *Add a new connection*.
2. Set *Connection Name* to *FGT2500E*, and *Remote Gateway* to *10.1.100.9*.
3. Enable *Customize port* and enter the port number *1443*.
4. Set *Username* to *client2*.
5. Enable *Enable Dual-stack IPv6/IPv6 address*.



6. Click *Save*.
7. Enter the password, then click *Connect*.

To configure an SSL VPN server in tunnel and web mode with dual stack support in the CLI:

1. Create a local user:

```
config user local
    edit "client1"
        set type password
        set passwd ******
    next
end
```

2. Configure the addresses:

```
config firewall address
    edit "bing.com"
        set type fqdn
        set fqdn "www.bing.com"
    next
end
```

```
config firewall address6
    edit "apple_v6"
        set type fqdn
        set fqdn "www.apple.com"
    next
end
```

3. Configure the SSL VPN portal:

```
config vpn ssl web portal
    edit "testportal1"
        set tunnel-mode enable
```

```
        set ipv6-tunnel-mode enable
        set web-mode enable
        set ip-pools "SSLVPN_TUNNEL_ADDR1"
        set ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
        set split-tunneling enable
        set ipv6-split-tunneling enable
    next
end
```

4. Configure the SSL VPN settings:

```
config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set port 1443
    set source-interface "port1"
    set source-address "all"
    set source-address6 "all"
    set default-portal "testportal1"
    set dual-stack-mode enable
end
```

5. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "sslvpn"
        set srcintf "ssl.root"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "bing.com"
        set srcaddr6 "all"
        set dstaddr6 "apple_v6"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "client2"
    next
end
```

To configure FortiGate A as an SSL VPN client in the CLI:

1. Create a peer to verify the server certificate:

```
config user peer
    edit "fgt_gui_automation"
        set ca "GUI_CA"
        set cn "*.fos.automation.com"
    next
end
```

2. Configure the interface:

```
config system interface
    edit "sslclient_port2"
        set vdom "vdom1"
        set type ssl
        set role lan
        set snmp-index 46
        set interface "port2"
    next
end
```

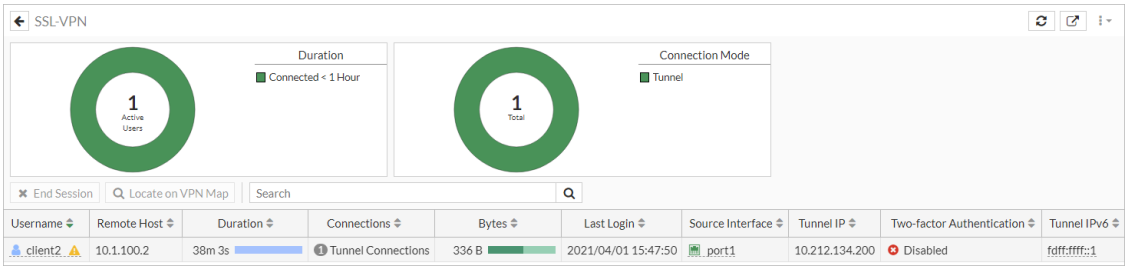
3. Configure the SSL VPN client. Either IPv4 address 10.1.100.9 or IPv6 address 2000:10:1:100::9 can be used and will have the same results:

```
config vpn ssl client
    edit "sslclientTo9"
        set interface "sslclient_port2"
        set user "client2"
        set psk ******
        set peer "fgt_gui_automation"
        set server {10.1.100.9 | 2000:10:1:100::9}
        set port 1443
    next
end
```

Testing dual stack with tunnel mode

To verify the SSL VPN tunnel connection in the GUI:

1. On FortiGate B, go to *Dashboard* > *Network*.
2. Expand the *SSL-VPN* widget.



To verify the SSL VPN tunnel connection in the CLI:

1. On FortiGate B, verify that the client is assigned with both IPv4 and IPv6 addresses:

```
(root) # get vpn ssl monitor
SSL VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
 0       client2               1(1)             292    2147483647       10.1.100.2     0/0
```

```
 0/0     0

SSL VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       client2                10.1.100.2       5427    1756/1772
10.212.134.200,fdff:ffff::1
```

2. On FortiGate A, verify the routing tables.
   a. IPv4 with resolved addresses for www.bing.com:

```
(vdom1) # get router info routing-table database
...
Routing table for VRF=0
S    *> 0.0.0.0/0 [10/0] via 172.16.200.254, port1
C    *> 10.0.1.0/24 is directly connected, link_11
C    *> 10.1.100.0/24 is directly connected, port2
C    *> 10.212.134.200/32 is directly connected, sslclient_port2
S    *> 13.107.21.200/32 [10/0] is directly connected, sslclient_port2
C    *> 172.16.200.0/24 is directly connected, port1
S    *> 204.79.197.200/32 [10/0] is directly connected, sslclient_port2
```

   b. IPv6 with resolved addresses for www.apple.com:

```
(vdom1) # get router info6 routing-table database
...
S    *> ::/0 [10/0] via 2000:172:16:200::254, port1, 01:57:23, [1024/0]
C    *> ::1/128 via ::, vdom1, 06:12:54
C    *> 2000:10:0:1::/64 via ::, link_11, 06:12:54
C    *> 2000:10:1:100::/64 via ::, port2, 06:12:54
C    *> 2000:172:16:200::/64 via ::, port1, 06:12:54
S    *> 2600:140a:c000:385::1aca/128 [10/0] via ::, sslclient_port2, 01:33:08, [1024/0]
S    *> 2600:140a:c000:398::1aca/128 [10/0] via ::, sslclient_port2, 01:33:08, [1024/0]
C    *> fdff:ffff::/120 via ::, sslclient_port2, 01:33:08
C    *> fe80::/64 via ::, port2, 06:12:54
```

To test the address connections using ping:

1. On FortiGate A, ping www.bing.com using IPv4 ping:

```
# execute ping www.bing.com
PING www-bing-com.dual-a-0001.a-msedge.net (13.107.21.200): 56 data bytes
64 bytes from 13.107.21.200: icmp_seq=0 ttl=117 time=1.8 ms
...
```

2. On FortiGate B, sniff for IPv4 ICMP packets and observe the results:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
9.675101 ssl.root in 10.212.134.200 -> 13.107.21.200: icmp: echo request
9.675219 port2 out 172.16.200.9 -> 13.107.21.200: icmp: echo request
9.676698 port2 in 13.107.21.200 -> 172.16.200.9: icmp: echo reply
```

```
9.676708 ssl.root out 13.107.21.200 -> 10.212.134.200: icmp: echo reply
...
```

3. On FortiGate A, ping www.apple.com using IPv6 ping:

```
# execute ping6 www.apple.com
PING www.apple.com (2600:140a:c000:385::1aca): 56 data bytes
64 bytes from 2600:140a:c000:385::1aca: icmp_seq=1 ttl=52 time=1.88 ms
...
```

4. On FortiGate B, sniff for IPv6 ICMP packets and observe the results:

```
# diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
3.564296 ssl.root in fdff:fff::1 -> 2600:140a:c000:385::1aca: icmp6: echo request seq 1
3.564435 port2 out 2000:172:16:200::9 -> 2600:140a:c000:385::1aca: icmp6: echo request seq 1
3.565929 port2 in 2600:140a:c000:385::1aca -> 2000:172:16:200::9: icmp6: echo reply seq 1
[flowlabel 0x1fdff]
3.565953 ssl.root out 2600:140a:c000:385::1aca -> fdff:fff::1: icmp6: echo reply seq 1
[flowlabel 0x1fdff]
...
```

Testing dual stack with web mode

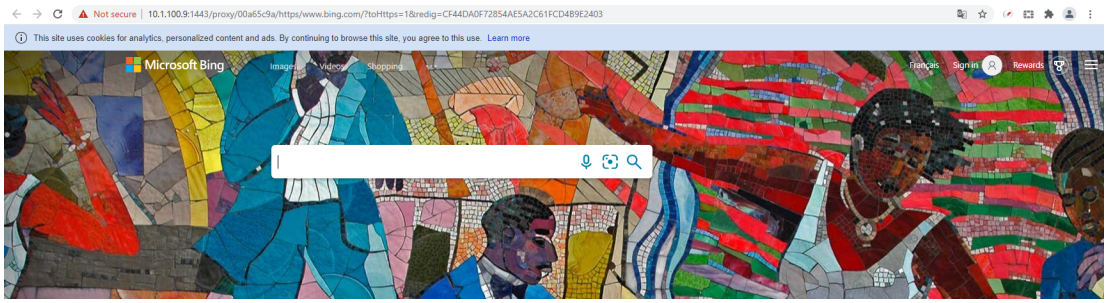
In SSL VPN web mode, users can access both IPv4 and IPv6 bookmarks in the portal. The attribute, `prefer-ipv6-dns` can be enabled to prefer querying IPv6 DNS first, or disabled to prefer querying IPv4.

To test an IPv4 connection to the web portal and access www.bing.com over IPv6:

1. On FortiGate B, prioritize resolving IPv6 addresses:

```
config vpn ssl web portal
    edit "testportal1"
        set prefer-ipv6-dns enable
    next
end
```

2. Log in to the web portal in the browser over the IPv4 address 10.1.100.9.
3. Create a new HTTP/HTTPS bookmark named *bing* for the URL www.bing.com.
4. Click the *bing* bookmark. The bing page will open over IPv6.

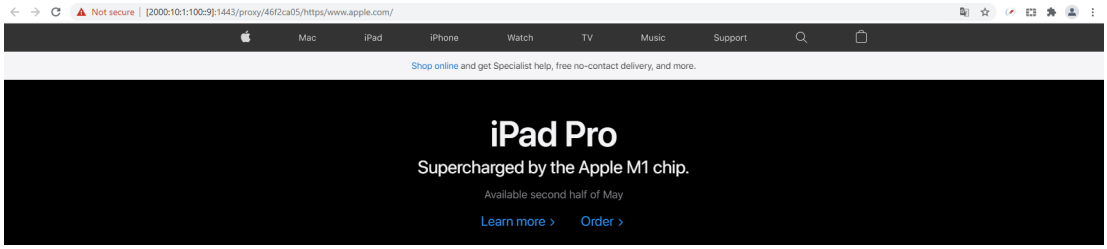


To test an IPv6 connection to the web portal and access www.apple.com over IPv4:

1. On FortiGate B, prioritize resolving IPv4 addresses:

```
config vpn ssl web portal
    edit "testportal1"
        set prefer-ipv6-dns disable
    next
end
```

2. Log in to the web portal in the browser over the IPv6 address [2000:10:1:100::9].
3. Create a new HTTP/HTTPS bookmark named *apple* for the URL www.apple.com.
4. Click the *apple* bookmark. The apple page will open over IPv4.

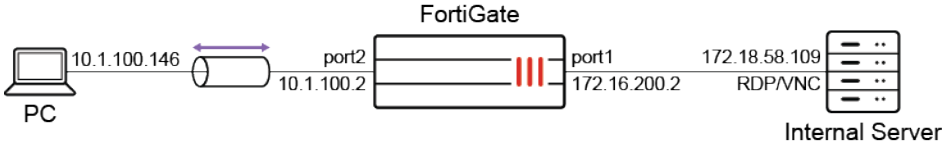


Disable the clipboard in SSL VPN web mode RDP connections

In web portal profiles, the clipboard can be disabled for SSL VPN web mode RDP/VNC connections. User will not be able to copy and paste content to or from the internal server.

Example

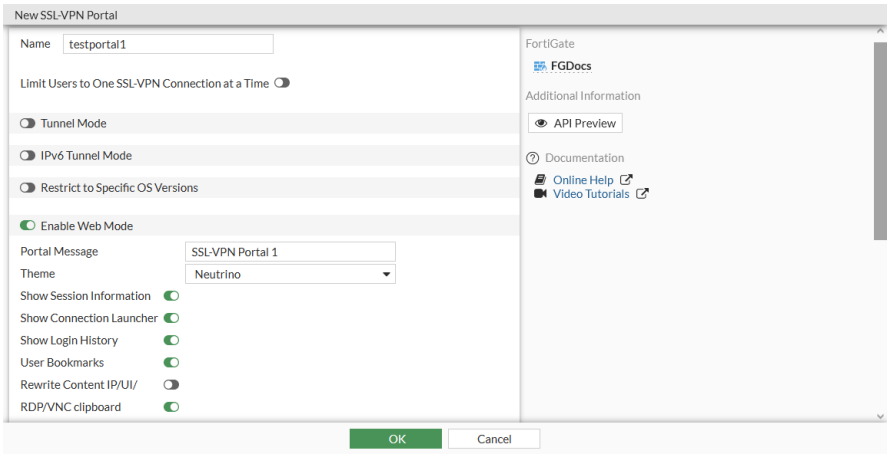
In this example, two groups of users are using SSL VPN web mode to access internal servers with RDP/VNC. One group is allowed to copy and paste content to and from the internal server using the clipboard, while the other is not.



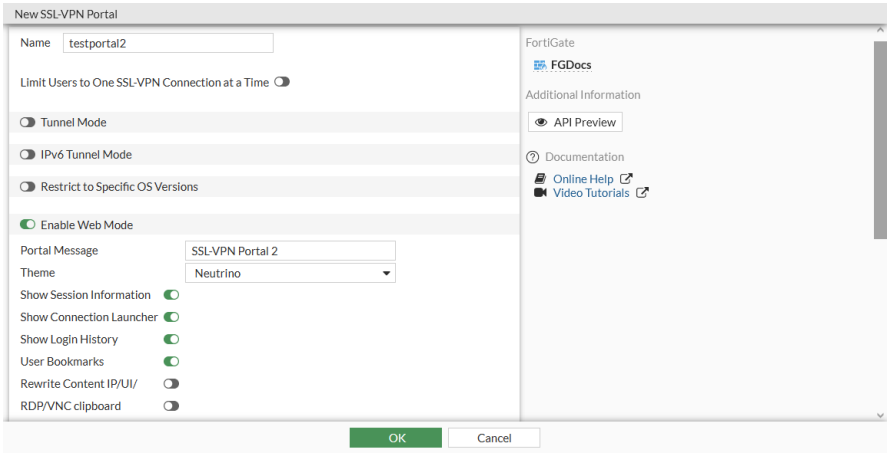
To configure the SSL VPN portals in the GUI:

1. Go to *VPN > SSL-VPN Portals* and click *Create New*.
2. Enter a name for the portal, such as *testportal1*.
3. Enable *Enable Web Mode* and enable *RDP/VNC clipboard* to allow copying and pasting.

4. Configure the remaining settings as needed.



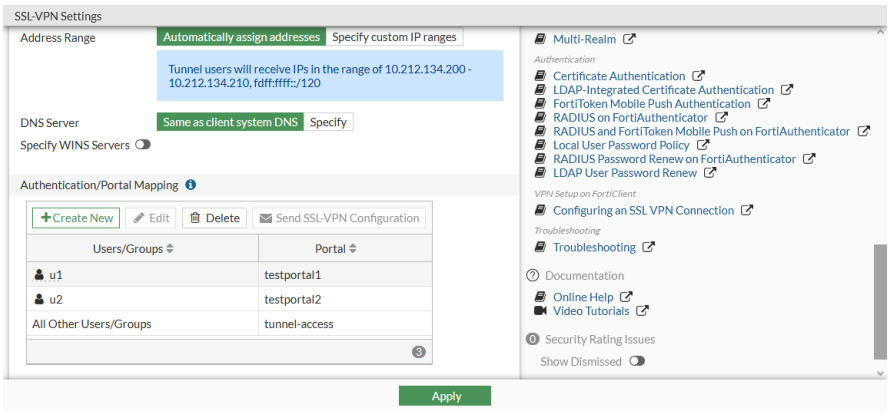
5. Click *OK*.
6. Click *Create New* again.
7. Enter a name for the portal, such as *testportal2*.
8. Enable *Enable Web Mode* and disable *RDP/VNC clipboard* to prevent copying and pasting.
9. Configure the remaining settings as needed.



10. Click *OK*.

To configure the SSL VPN settings in the GUI:

1. Go to *VPN > SSL-VPN Settings*.
2. Set *Listen on Interface* to port2.
3. In the *Authentication/Portal Mapping* table, add the users to each of the portals:
   a. Click *Create New*.
   b. Set *Users/Groups* to *u1* and *Portal* to *testportal1*.
   c. Click *OK*, then click *Create New* again.
   d. Set *Users/Groups* to *u2* and *Portal* to *testportal2*.
   e. Click *OK*.
4. Configure the remaining settings as needed.



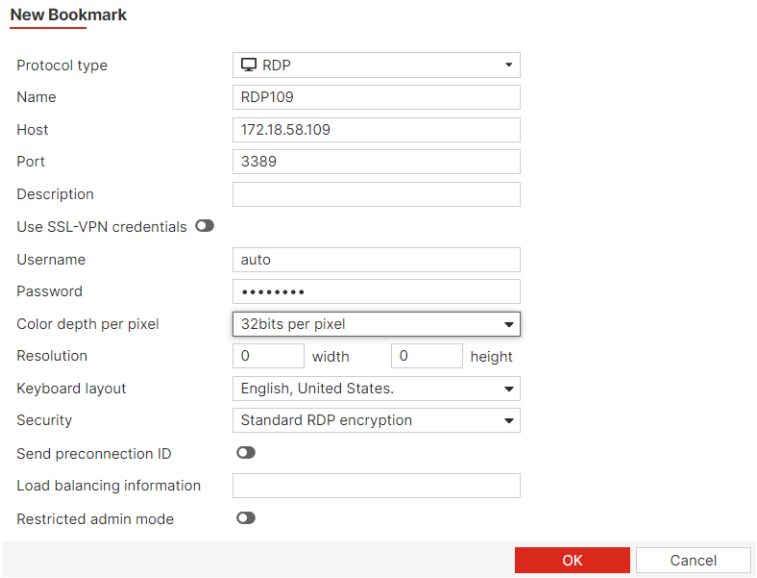
5. Click *Apply*.

To configure a firewall policy for SSL VPN in the GUI:

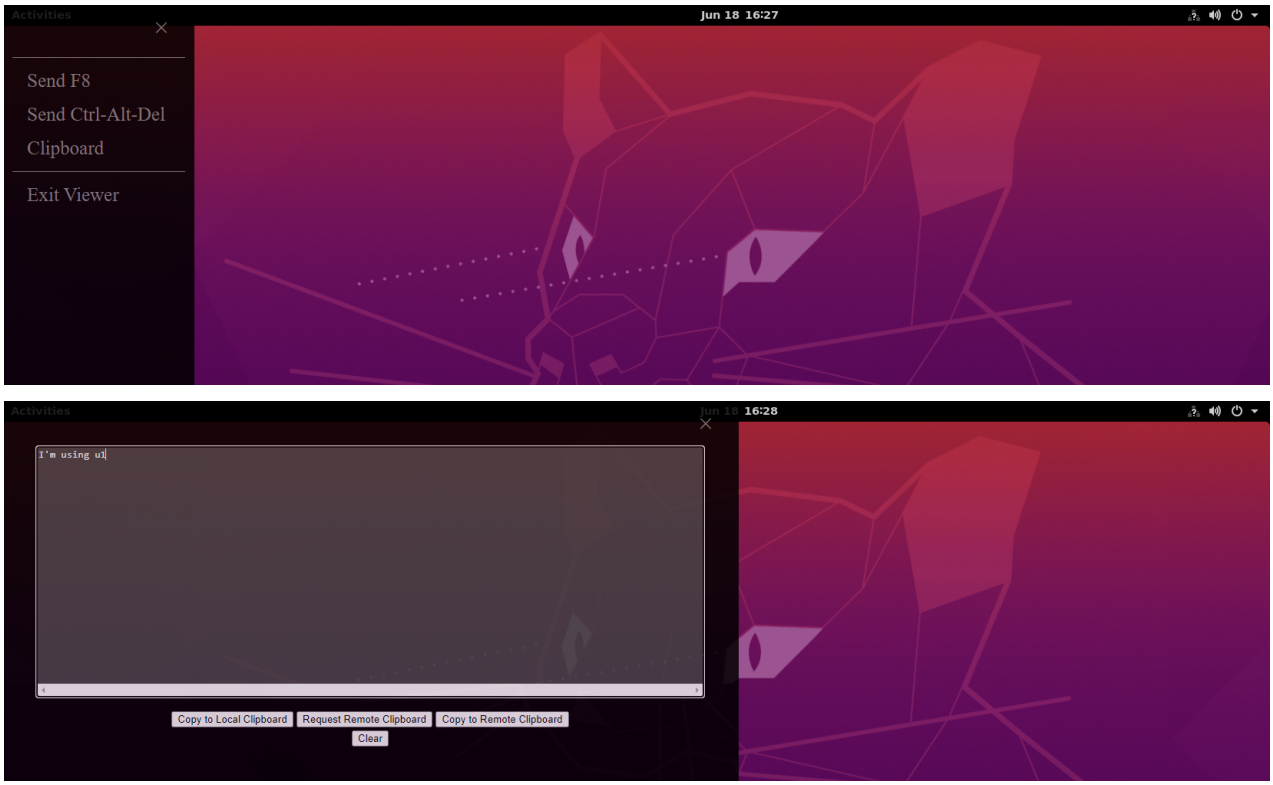
1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set a name for the policy, such as *policy_to_sslvpn_tunnel*.
3. Set *Incoming Interface* to the SSL VPN tunnel interface and *Outgoing Interface* to port1.
4. Set *Source* to the users, *u1* and *u2*, and all addresses.
5. Set *Destination* to all addresses.
6. Set *Schedule* to *always*, *Service* to *All*, and *Action* to *Accept*.
7. Configure the remaining settings as needed.
8. Click *OK*.

To test the if the users can use the clipboard:

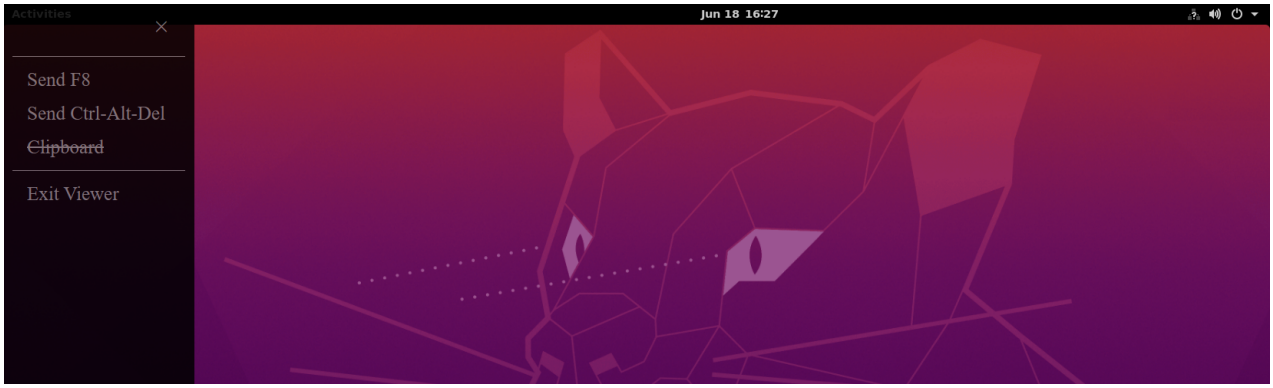
1. On the PC, open a web browser and log in to the web portal as user *u1*.
2. Access the internal server using RDP/VNC.



3. The clipboard is available and you can copy and paste content to and from the remote server.



4. Log out of the web portal, then log back in as user *u2* and access the internal server using RDP/VNC. The clipboard is disabled.



To configure the SSL-VPN portals and settings in the CLI:

1. Configure the SSL VPN portals:

```
config vpn ssl web portal
    edit "testportal1"
        set web-mode enable
        set clipboard enable
        ...
    next
    edit "testportal2"
        set web-mode enable
```

```
        set clipboard disable
        ...
    next
end
```

2. Configure the SSL VPN settings:

```
config vpn ssl settings
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "tunnel-access"
    config authentication-rule
        edit 1
            set users "u1"
            set portal "testportal1"
        next
        edit 2
            set users "u2"
            set portal "testportal2"
        next
    end
end
```

3. Configure a firewall policy for SSL VPN:

```
config firewall policy
    edit 1
        set name "policy_to_sslvpn_tunnel"
        set srcintf "ssl.vdom1"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "u1" "u2"
    next
end
```

4. On the PC, open a web browser, log in to the web portal as user *u1*, access the internal server using RDP/VNC, and use the clipboard.
5. Check the SSL VPN session monitor:

```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
```

```
 0       u1             1(1)             N/A     10.1.100.146   0/0     0/364   0

SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       u1             10.1.100.146     64      0/700  RDP 172.18.58.109
```

6. On the PC, open a web browser, log in to the web portal as user *u2*, access the internal server using RDP/VNC, and note that the clipboard is not available.
7. Check the SSL VPN session monitor:

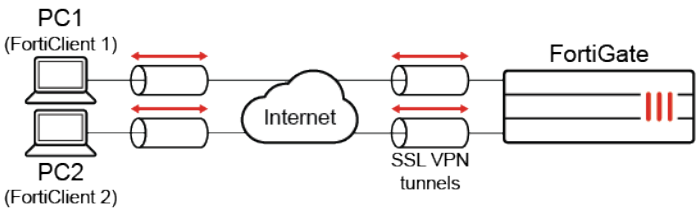
```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
 0       u2             1(1)             N/A     10.1.100.146   0/0     0/2681  0

SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       u2             10.1.100.146     7       0/553  RDP 172.18.58.109
```

SSL VPN IP address assignments

When a user disconnects from a VPN tunnel, it is not always desirable for the released IP address to be used immediately. In SSL VPN, IP addresses can be assigned from the pool in a round robin fashion, instead of the default first-available address method.

Example



In this example, two PCs connect to the VPN. SSL VPN is configured to use round robin IP address assignment. Dual stack address assignment (both IPv4 and IPv6) is used.

After a tunnel is disconnected, freeing a low IP address, the next client that connects gets the next address in the round robin instead of the lowest address.

To configure SSL VPN with round robin and dual stack:

1. Create IPv4 and IPv6 address ranges:

```
config firewall address
    edit "sslvpn_ipv4_pool"
        set type iprange
        set start-ip 173.10.1.1
        set end-ip 173.10.1.3
    next
end
```

```
config firewall address6
    edit "sslvpn_ipv6_pool"
        set type iprange
        set start-ip 2000::ad0a:101
        set end-ip 2000::ad0a:103
    next
end
```

2. Set the address ranges as IP pools in the SSL VPN settings:

```
config vpn ssl settings
    set tunnel-ip-pools "sslvpn_ipv4_pool"
    set tunnel-ipv6-pools "sslvpn_ipv6_pool"
end
```

   When round-robin is used, any address pools defined in the web portal are ignored and the tunnel IPv4 and IPv6 pool addresses in the SSL VPN settings are used. Only one set of IP pool addresses can be applied.

3. Enable round-robin and dual stack in the SSL VPN settings:

```
config vpn ssl settings
    set dual-stack-mode enable
    set tunnel-addr-assigned-method round-robin
end
```

   By default, the IP pool assignment follows the first available rule.

4. Create two users and assign them to an SSL VPN policy:

```
config user local
    edit "u1"
        set type password
        set passwd **********
    next
    edit "u2"
        set type password
        set passwd **********
    next
end
```

```
config firewall policy
    edit 1
        set name "sslvpnd"
        set srcintf "ssl.vdom1"
        set dstintf "link_11" "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set users "u1" "u2"
    next
end
```

To test the results:

1. Log in to the SSL VPN on PC1 using user u1 and then check its assigned IP address:

```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
 0       u1              1(1)             N/A     10.1.100.145   0/0     0/0     0

SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       u1              10.1.100.145     13      49935/35251    173.10.1.1,2000::ad0a:101
```

2. Log in to the SSL VPN on PC1 using user u2 and then check its assigned IP address:

```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
 0       u1              1(1)             N/A     10.1.100.145   0/0     0/0     0
 1       u2              1(1)             N/A     10.1.100.254   0/0     0/0     0

SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       u1              10.1.100.145     44      90126/70405    173.10.1.1,2000::ad0a:101
 1       u2              10.1.100.254     10      10563/8158     173.10.1.2,2000::ad0a:102
```

3. Log user u1 off of PC1, then log them back in and check that the assigned IP address is not the same as was previously assigned:

```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
 HTTPS in/out    Two-factor Auth
```

```
 0       u1             1(1)             N/A     10.1.100.145   0/0     0/0     0
 1       u2             1(1)             N/A     10.1.100.254   0/0     0/0     0

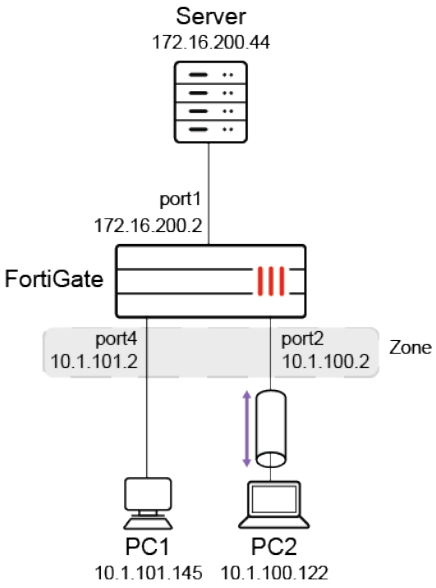
SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       u1              10.1.100.145     10      50992/41159    173.10.1.3,2000::ad0a:103
 1       u2              10.1.100.254     43      30374/21860    173.10.1.2,2000::ad0a:102
```

Using SSL VPN interfaces in zones

SSL VPN interfaces can be used in zones, simplifying firewall policy configuration in some scenarios.

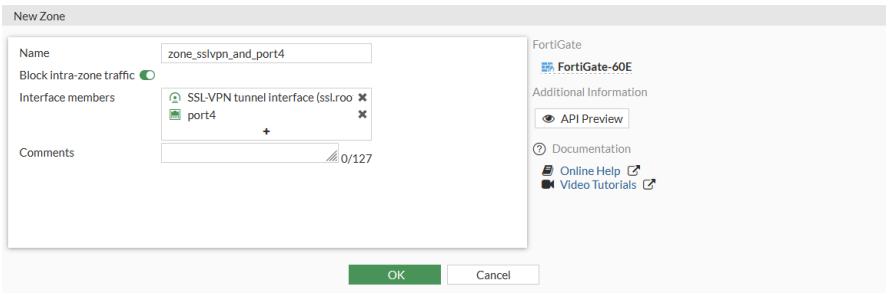
Example

In this example, a zone is created that includes a physical interface (port4) and an SSL VPN interface. The zone is used as the source interface in a firewall policy. PC1 is used for regular access with a firewall policy, and PC2 uses the SSL VPN for access.



To create a zone that includes the port4 and ssl.root interfaces in the GUI:

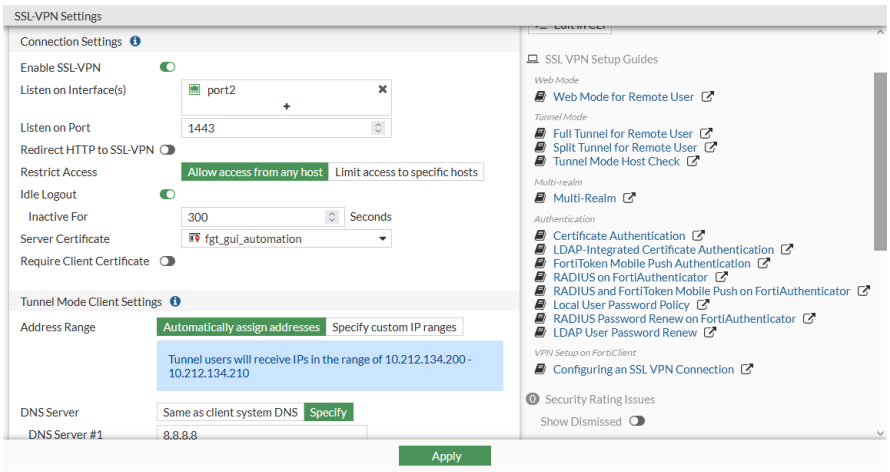
1. Go to *Network* > *Interfaces* and click *Create New* > *Zone*.
2. Set the name of the zone, such as *zone_sslvpn_and_port4*.
3. Add *port4* and *ssl.root* to the *Interface members*.



4. Click *OK*.

To configure SSL VPN settings in the GUI:

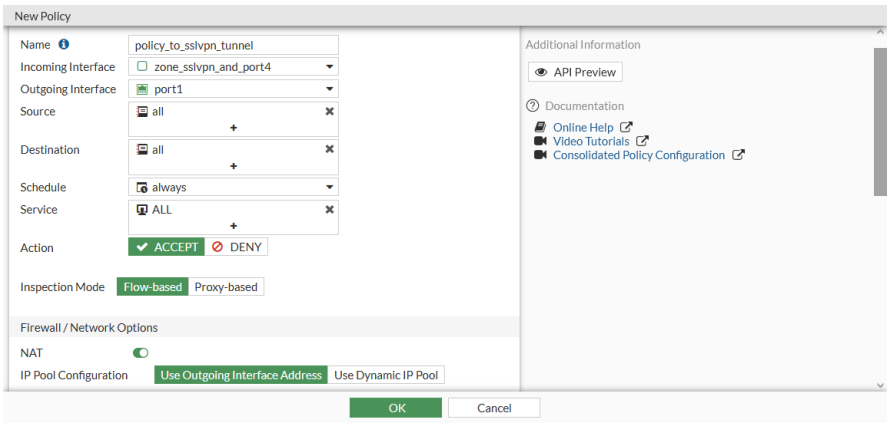
1. Go to *VPN* > *SSL-VPN Settings*.
2. Set *Listen on Interface(s)* to *port2*.
3. Set *Listen on Port* to *1443*.
4. Select a *Server Certificate* (*fgt_gui_automation* is used in this example).
5. Configure the remaining settings as required.



6. Click *Apply*.

To configure a firewall policy with the zone as the source interface in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set the policy name, such as *policy_to_sslvpn_tunnel*.
3. Set *Incoming Interface* to *zone_sslvpn_and_port4*.
4. Set *Outgoing Interface* to *port1*.
5. Configure the remaining settings as required.



6. Click *OK*.

To configure the zone, SSL VPN, and policy in the CLI:

1. Create a zone that includes the port4 and ssl.root interfaces:

```
config system zone
    edit "zone_sslvpn_and_port4"
        set interface "port4" "ssl.root"
    next
end
```

2. Configure SSL VPN settings with port2 as the source interface:

```
config vpn ssl settings
    set servercert "fgt_gui_automation"
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set dns-server1 8.8.8.8
    set dns-server2 8.8.4.4
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "web-access"
end
```

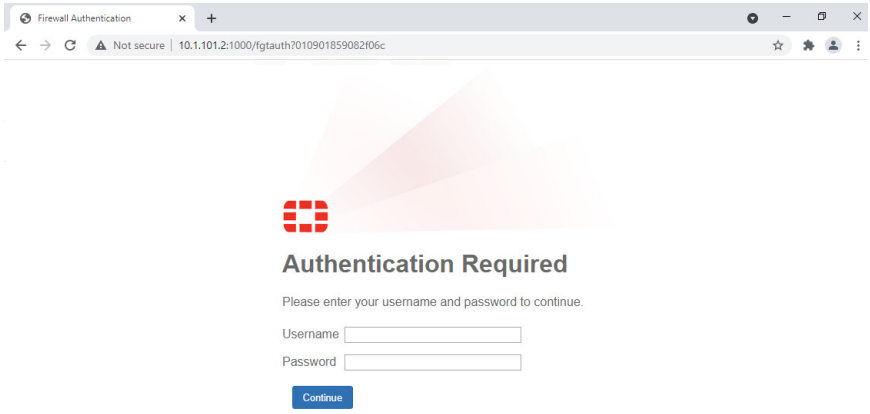
3. Configure a firewall policy with the zone as the source interface:

```
config firewall policy
    edit 2
        set name "policy_to_sslvpn_tunnel"
        set srcintf "zone_sslvpn_and_port4"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
```

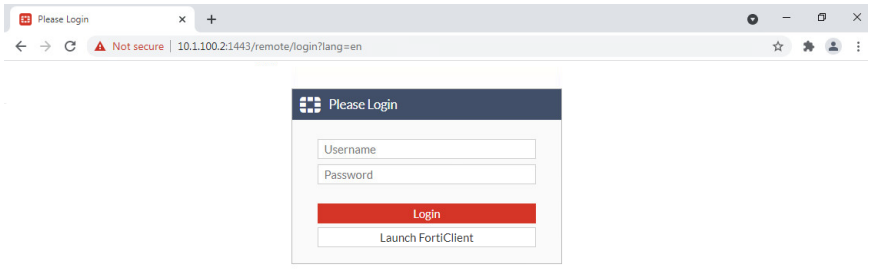
```
        set logtraffic all
        set nat enable
        set users "u1"
    next
end
```

To test the configuration:

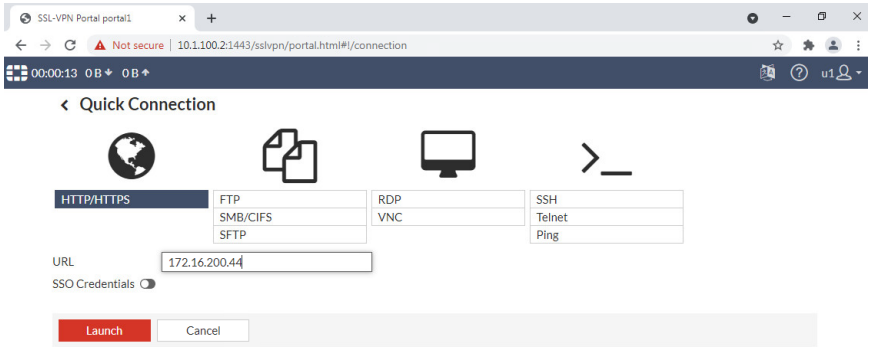
1. On PC1, open a browser and try to access the server at 172.16.200.44.
   You are redirected to the authentication page.



2. Enter the *Username* and *Password*, then click *Continue*.
   You are redirected back to the server.
3. On PC2, access the SSL VPN web portal.



4. Enter the *Username* and *Password*, then click *Login*.
5. Access the server using the bookmark.



SSL VPN troubleshooting

The following topics provide information about SSL VPN troubleshooting:

- Debug commands on page 2830
- Troubleshooting common issues on page 2831

Debug commands

SSL VPN debug command

Use the following diagnose commands to identify SSL VPN issues. These commands enable debugging of SSL VPN with a debug level of -1 for detailed results.

```
diagnose debug application sslvpn -1
diagnose debug enable
```

The CLI displays debug output similar to the following:

```
FGT60C3G10002814 # [282:root]SSL state:before/accept initialization (172.20.120.12)
[282:root]SSL state:SSLv3 read client hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write server hello A (172.20.120.12)
[282:root]SSL state:SSLv3 write change cipher spec A (172.20.120.12)
[282:root]SSL state:SSLv3 write finished B (172.20.120.12)
[282:root]SSL state:SSLv3 flush data (172.20.120.12)
[282:root]SSL state:SSLv3 read finished A:system lib(172.20.120.12)
[282:root]SSL state:SSLv3 read finished A (172.20.120.12)
[282:root]SSL state:SSL negotiation finished successfully (172.20.120.12)
[282:root]SSL established: DHE-RSA-AES256-SHA SSLv3 Kx=DH Au=RSA Enc=AES(256) Mac=SHA1
```

To disable the debug:

```
diagnose debug disable
diagnose debug reset
```

Remote user authentication debug command

Use the following diagnose commands to identify remote user authentication issues.

```
diagnose debug application fnbamd -1
diagnose debug reset
```

Troubleshooting common issues

To troubleshoot no visible SSL VPN menus or tunnel mode options in the GUI:

Enable the feature visibility in the GUI or CLI.

In the GUI:

1. Go to *System* > *Feature Visibility*.
2. In the *Core Features* section, enable *SSL-VPN*.
3. Click *Apply*.

In the CLI:

```
config system settings
    set gui-sslvpn enable
end
```

To troubleshoot no visible SSL VPN web mode options in the GUI or CLI:

```
config system global
    set sslvpn-web-mode enable
end
```

To troubleshoot getting no response from the SSL VPN URL:

1. Go to *VPN* > *SSL-VPN Settings*.
   a. Confirm that SSL VPN is enabled.
   b. Check the SSL VPN port assignment.
   c. Check the *Restrict Access* setting to ensure the host you are connecting from is allowed.
2. Go to *Policy* > *Firewall Policy*.
   a. Check that the policy for SSL VPN traffic is configured correctly.
   b. Check the URL you are attempting to connect to. It should follow this pattern:

      ```
      https://<FortiGate IP>:<Port>
      ```

   c. Check that you are using the correct port number in the URL. Ensure FortiGate is reachable from the computer.

      ```
      ping <FortiGate IP>
      ```

   d. Check the browser has *TLS 1.1*, *TLS 1.2*, and *TLS 1.3* enabled.

To troubleshoot FortiGate connection issues:

1. Check the Release Notes to ensure that the FortiClient version is compatible with your version of FortiOS.
2. FortiClient uses IE security setting, In IE *Internet options* > *Advanced* > *Security*, check that *Use TLS 1.1* and *Use TLS 1.2* are enabled.

3. Check that SSL VPN *ip-pools* has free IPs to sign out. The default *ip-poolsSSLVPN_TUNNEL_ADDR1* has 10 IP addresses.
4. Export and check FortiClient debug logs.
   a. Go to *File > Settings*.
   b. In the *Logging* section, enable *Export logs*.
   c. Set the *Log Level* to *Debug* and select *Clear logs*.
   d. Try to connect to the VPN.
   e. When you get a connection error, select *Export logs*.

To troubleshoot SSL VPN hanging or disconnecting at 98%:

1. A new SSL VPN driver was added to FortiClient 5.6.0 and later to resolve SSL VPN connection issues. If your FortiOS version is compatible, upgrade to use one of these versions.
2. Latency or poor network connectivity can cause the login timeout on the FortiGate. In FortiOS 5.6.0 and later, use the following commands to allow a user to increase the SSL VPN login timeout setting.

```
config vpn ssl settings
  set login-timeout 180 (default is 30)
  set dtls-hello-timeout 60 (default is 10)
end
```

To troubleshoot tunnel mode connections shutting down after a few seconds:

This might occur if there are multiple interfaces connected to the Internet, for example, SD-WAN. This can cause the session to become “dirty”. To allow multiple interfaces to connect, use the following CLI commands.

If you are using a FortiOS 6.0.1 or later:

```
config system interface
  edit <name>
    set preserve-session-route enable
  next
end
```

If you are using a FortiOS 6.0.0 or earlier:

```
config vpn ssl settings
   set route-source-interface enable
end
```

To troubleshoot users being assigned to the wrong IP range:

1. Go to *VPN > SSL-VPN Portals* and *VPN > SSL-VPN Settings* and ensure the same *IP Pool* is used in both places.
   Using the same *IP Pool* prevents conflicts. If there is a conflict, the portal settings are used.

To troubleshoot slow SSL VPN throughput:

Many factors can contribute to slow throughput.

This recommendation tries to improve throughput by using the FortiOS Datagram Transport Layer Security (DTLS) tunnel option, available in FortiOS 5.4 and above.

DTLS allows SSL VPN to encrypt traffic using TLS and uses UDP as the transport layer instead of TCP. This avoids retransmission problems that can occur with TCP-in-TCP.

FortiClient 5.4.0 to 5.4.3 uses DTLS by default. FortiClient 5.4.4 and later uses normal TLS, regardless of the DTLS setting on the FortiGate.

To use DTLS with FortiClient:

1. Go to *File > Settings* and enable *Preferred DTLS Tunnel*.

To enable DTLS tunnel on FortiGate, use the following CLI commands:

```
config vpn ssl settings
  set dtls-tunnel enable
end
```

User & Authentication

In *User & Authentication*, you can control network access for different users and devices in your network. FortiGate authentication controls system access by user group. By assigning individual users to the appropriate user groups you can control each user's access to network resources. You can define local users and peer users on the FortiGate unit. You can also define user accounts on remote authentication servers and connect them to FortiOS.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 2858 and Configuring client certificate authentication on the LDAP server on page 2873.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 2866.

To secure RADIUS connections, consider using RADSEC over TLS instead. See Configuring a RADSEC client on page 2914.

You can control network access for different device types in your network by doing the following:

- Identifying and monitoring the types of devices connecting to your network
- Using MAC address based access control to allow or deny individual devices
- Using Telemetry data received from FortiClient endpoints to construct a policy to deny access to endpoints with known vulnerabilities or to quarantine compromised endpoints

The following sections provide information about users and devices:

- User definition, groups, and settings on page 2835
- Basic authentication with cached client certificates on page 2856
- LDAP servers on page 2858
- RADIUS servers on page 2876
- SAML on page 2921
- TACACS+ servers on page 2953
- FortiTokens on page 2954
- PKI on page 2981
- FSSO on page 2989
- Include usernames in logs on page 3007

User definition, groups, and settings

FortiGate authentication controls system access by user groups. By assigning individual users to the appropriate user groups, this controls each user's access to network resources. The user groups members are user accounts, of which there are several types. Local and peer users are defined in FortiOS. User accounts can also be defined on remote authentication servers.

This section contains information about configuring the following:

- Users on page 2835
- User groups on page 2837
- Authentication settings on page 2845
- Retail environment guest access on page 2849
- Customizing complexity options for the local user password policy on page 2852

For information about configuring authentication servers, see the LDAP servers on page 2858, RADIUS servers on page 2876, TACACS+ servers on page 2953, and SAML on page 2921 sections.

Users

A user is a user account consisting of a username, password, and sometimes other information, that is configured in FortiOS or on an external authentication server. There are several types of user accounts with slightly different methods of authentication.

User type	Authentication method
Local	The username and password must match a user account stored in FortiOS. Authentication is done by a firewall policy.
Remote	Remote users consist of usernames defined in FortiOS that are authenticated by a remote server. For example, RADIUS, TACACS+, LDAP, or FortiNAC. The server must be configured in FortiOS before creating a user.
FSSO	Users on a Microsoft Windows, Citrix, or Novell network can use their network authentication to access resources through the FortiGate. Access is controlled through FSSO user groups, which contain Windows, Citrix, or Novell user groups as members. The FSSO agent must be configured in FortiOS before creating a user (see FSSO on page 2989).
PKI or peer	A PKI or peer user is a digital certificate holder that authenticates using a client certificate. No password is required, unless two-factor authentication is enabled. In the GUI, the *User & Authentication* > *PKI* menu is only available after a PKI user is configured in the CLI (see Configuring a PKI user on page 2981).

Some user types have an option to enable multi-factor authentication using FortiToken or FortiToken Cloud. In some cases, the user must be defined first, and then can be edited to add multi-factor authentication. See FortiTokens on page 2954 for more information.

To create a user:

1. Go to User Authentication > User Definition and click Create New. The *Users/Groups Creation Wizard* appears.
2. Select a *User Type* and click *Next*.
3. The remaining wizard steps depend on the user type:
   - *Local User*:
     i. Enter a *Username* and *Password*, then click *Next*.
     ii. Optionally, enable *Two-factor Authentication* and configure the following:

Authentication Type	Select *FortiToken Cloud* or *FortiToken*.
Token	If using FortiToken to authenticate, select a token.
Email Address	Enter an email address.
SMS	Enable to send an SMS message to activate the token.
Country Dial Code	Select the country code.
Phone Number	Enter a phone number.

     iii. Click *Next*, then click *Submit*.
   - *Remote LDAP User*:
     i. Select an *LDAP Server*, then click *Next*.
     ii. Select the users to add from the LDAP server. If the user ID matches an existing configured username, it cannot be added.

     iii. Click *Submit*.

- *Remote RADIUS User* and *Remote TACACS+ User*:
  i. Enter a *Username* and select the server.
  ii. Click *Next*.
  iii. Optionally, enable *Two-factor Authentication* and configure the settings as needed.
  iv. Click *Next*, then click *Submit*.
- *FSSO*:
  i. Select an *FSSO Agent*, click the *+* to add *AD Groups*, then click *Next*.
  ii. Select an FSSO group to add the *AD Groups* to. If an FSSO group already exists (see Configuring FSSO user groups on page 2842), click *Choose Existing* and select the group. Otherwise, click *Create New*, enter a name, and click *OK*.
  iii. Click *Submit*.

User groups

A user group is a list of user identities. A user identity can be a:

- Local user account (username/password) stored on the FortiGate
- Remote user account (password stored on a RADIUS, LDAP, or TACACS+ server)
- PKI user account with a digital client authentication certificate stored on the FortiGate
- RADIUS, LDAP, or TACACS+ server, optionally specifying particular user groups on that server
- User group defined on an FSSO server

User groups provide the ability to combine users that require the same permissions so they can be referenced at once, which enables consistency in configurations. User groups allow for remote servers to be referenced by leveraging the pre-existing user accounts, instead of redefining them on the FortiGate.

For example, when a new employee joins a department, they can be added to their respective group, whether in the remote authentication server or local group, and be subject to the same access as their colleagues in the same department. In FortiOS, user groups can be used when configuring firewall policies, traffic shaping policies, proxy policies, SSL VPN portals, IPsec VPN XAUTH, ZTNA, wireless networks (SSIDs), web filtering profiles, identity-based routing, and system administrators with remote authentication.

In most cases, the FortiGate authenticates users by requesting their username and password. The FortiGate checks local user accounts first. If a match is not found, the FortiGate checks the RADIUS, LDAP, or TACACS+ servers that belong to the user group. Authentication succeeds when a matching username and password are found. If the user belongs to multiple groups on a server, those groups will also be matched.

Four types of user groups can be configured:

- Firewall
- FSSO
- RSSO
- Guest

Configuring firewall user groups

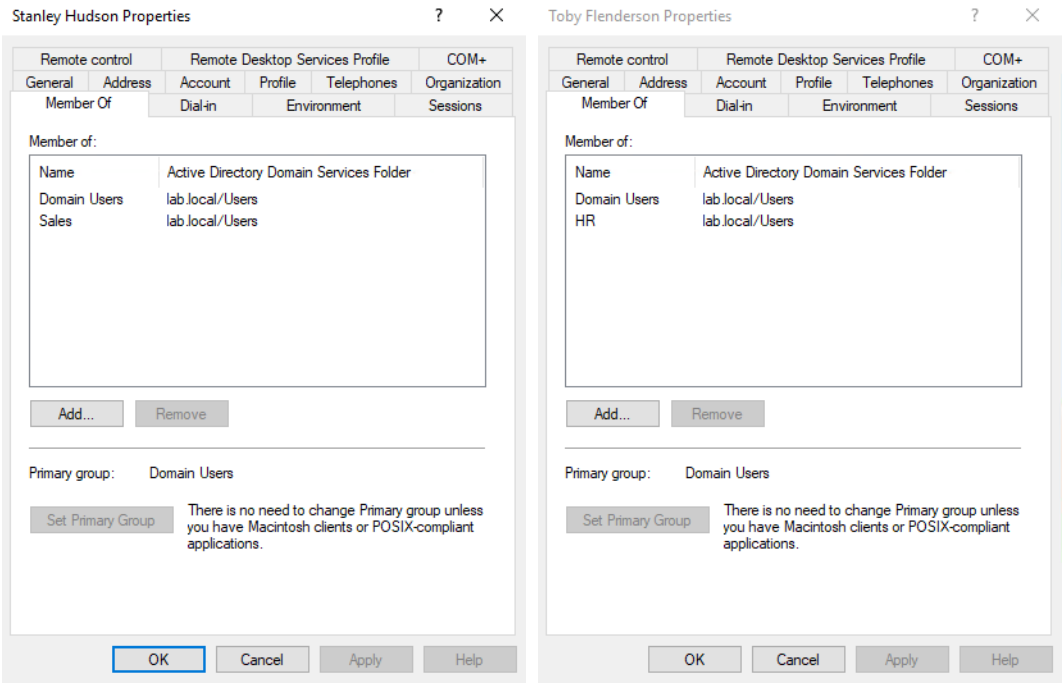
Firewall user groups are used locally as part of authentication. For example, when a firewall policy allows access only to specified user groups, users must authenticate before matching the policy. If the user authenticates successfully and is a member of one of the permitted groups, the policy is applied to the user. A firewall user group may contain local users (defined locally or authenticated remotely), PKI users, or authentication servers.

There are two options to add users in a firewall group configuration: members or remote groups. Members are the individual users who have been defined in FortiOS. Remote groups are remote server that users may authenticate to. One or more user groups can be specified within that server to limit which users can authenticate to the firewall user group. Both options may be used at the same time. The FortiGate attempts to authenticate users in the members list first, and then the remote groups if the initial authentication does not succeed.

When adding remote groups to user groups, FortiTokens cannot be applied to the users. To use remote authentication servers and FortiToken for multi-factor authentication, a remote user type must be created and then added as a user group member.

The following user group configuration examples have local members and a remote authentication server user group. There are two LDAP users, but the principle applies to other remote authentication server types.

Both LDAP users (shudson and tflenderson) belong to the primary group, Domain Users. The user, shudson belongs to the Sales group; tflenderson belongs to the HR group.

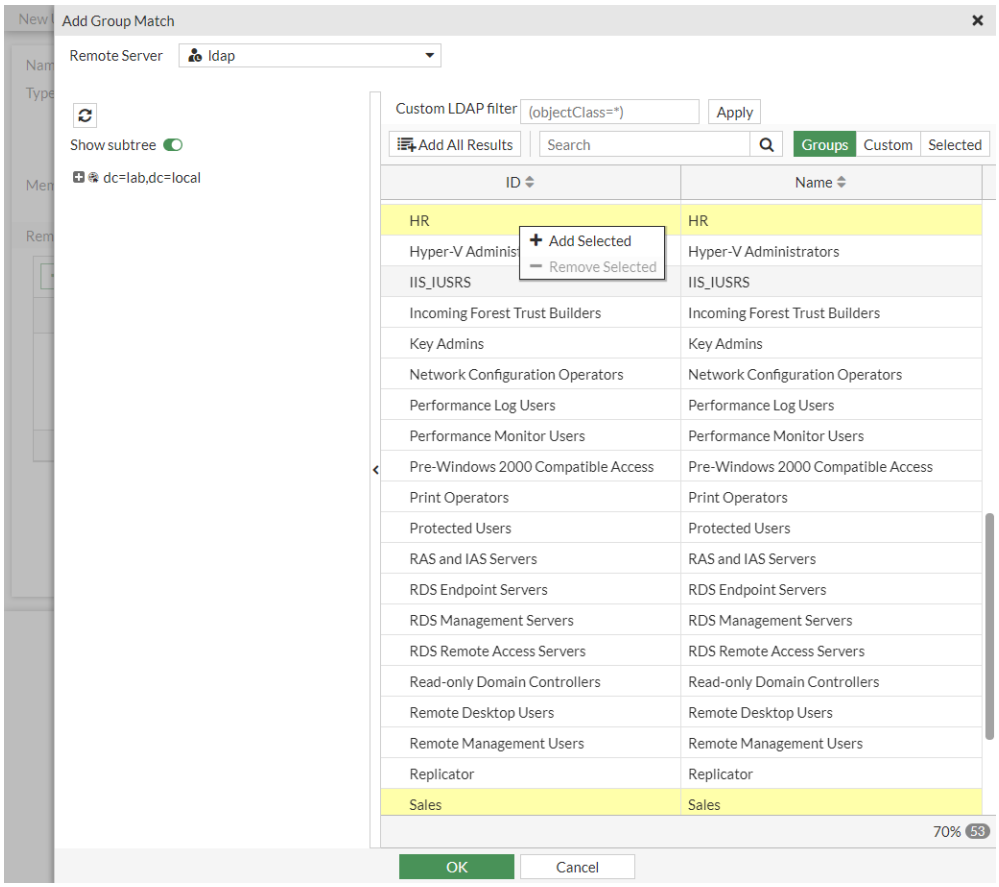


Example 1: Adding multiple remote groups to a user group

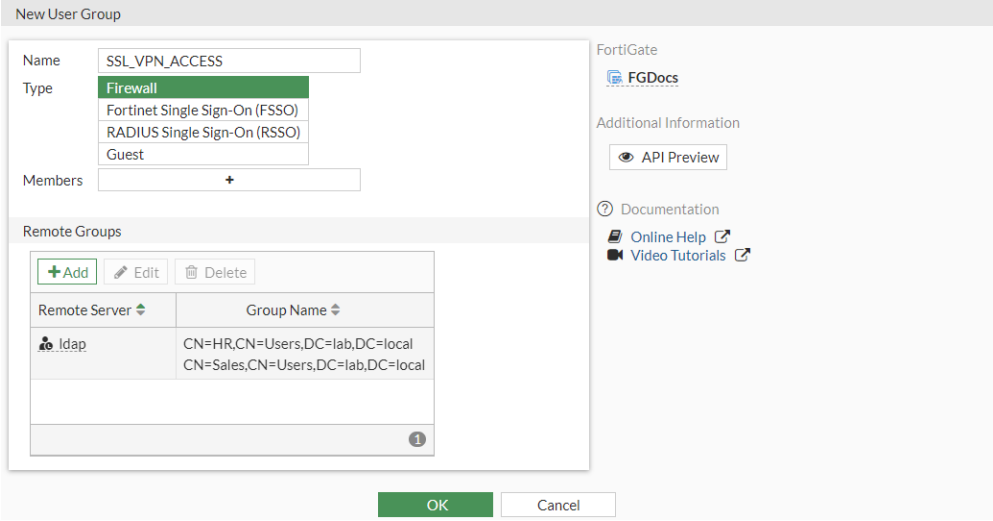
In this example, two remote groups (HR and Sales) are added to a firewall group called SSL_VPN_ACCESS.

To add multiple remote groups to a user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, *SSL_VPN_ACCESS*.
3. In the *Remote Groups Section*, click *Add*.
4. Set *Remote Server* to the LDAP server (*ldap*).
5. In the *Groups* table, select *Sales*, then right-click and select *Add Selected*.
6. Select *HR*, then right-click and select *Add Selected*.



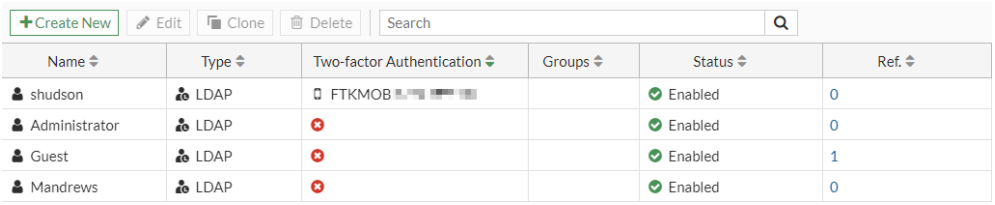
7. Click *OK*.
   Both user group paths are specified under the *Group Name*.



8. Click *OK*.
   In this configuration, shudson and tflenderson would be able to authenticate to this group.

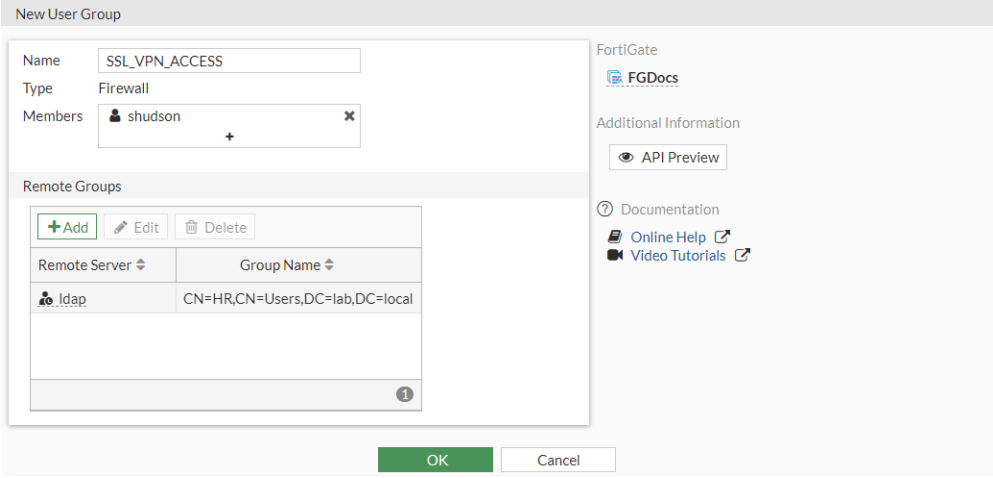
Example 2: combining remote groups and local users in a user group

In this example, the firewall group (SSL_VPN_ACCESS) is configured to contain the HR remote group and a local LDAP user (shudson) with multi-factor authentication.



To combine remote groups and local users in a user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*. *Firewall* is selected as the default *Type*.
2. Enter the group name, *SSL_VPN_ACCESS*.
3. In the *Remote Groups Section*, click *Add*.
4. Set *Remote Server* to the LDAP server (*ldap*).
5. In the *Groups* table, select *HR*, then right-click and select *Add Selected*.
6. Click *OK*.
7. In the *Members* field, click the *+* and add *shudson*.



8. Click *OK*.

   In this configuration, shudson, tflenderson, and any members of the HR LDAP group would be able to authenticate to the user group. Other users in the Sales group are not allowed.

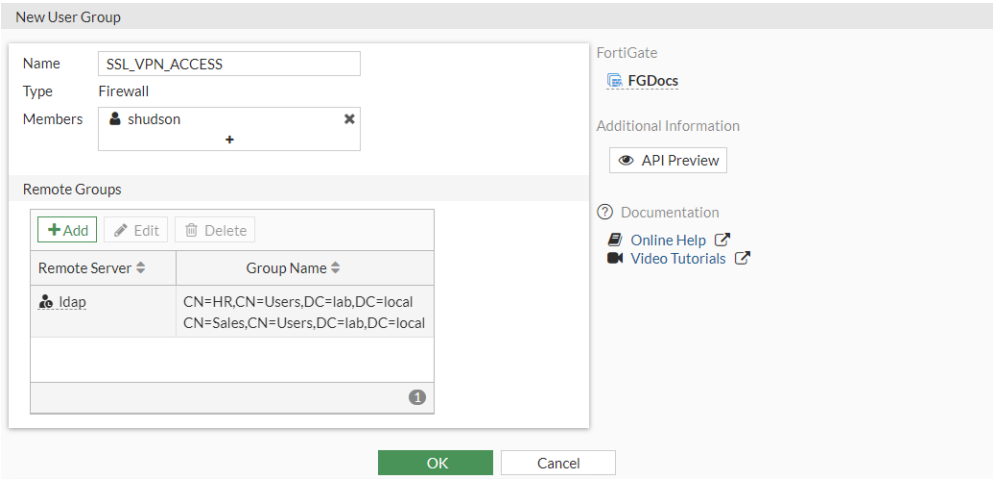
Example 3: adding a user as a member and their group as a remote groups

This example uses a combination of the previous examples. The HR and Sales groups are added as remote groups similar to example 1. The local LDAP user, shudson (using a FortiToken), from example 2 is added as a group member.

This example is for demonstration only. It may cause unwanted results, so this configuration is not advised.

To add a user as a member and their group as a remote groups:

1. Refer to example 1 to configure the two remote groups.
2. In the *Members* field, click the *+* and add *shudson*.



3. Click *OK*.

One unwanted scenario from this configuration is that a user might be able to bypass multi-factor authentication on LDAP by changing the username case (see the related PSIRT advisory). By default, the username of the remote LDAP user is case sensitive. This means the username has to match what is configured (shudson). If a user types sHudson, for example, this will not match the user shudson, so it falls through to remote group authentication. It will match the Sales group in this example. To prevent this, disable username case sensitivity (see SSL VPN for remote users with MFA and user sensitivity on page 2708 for more details).

To disable case sensitivity on the remote user:

```
config user local
    edit <name>
        set type ldap
        set two-factor fortitoken
        set fortitoken "FTKMOBxxxxxxxxxx"
        set email-to <email_address>
        set username-sensitivity disable
        set ldap-server <server_name>
    next
end
```

There is another unwanted scenario from this configuration than can occur to bypass multi-factor authentication. The LDAP server, ldap, has a user named shudson. Another LDAP server, ldap2, also has a user named shudson, but with a different password. If the ldap and ldap2 servers are added to the user group in addition to the remote shudson user, if a user tries to log in using shudson and the password on the ldap2 server, they would be able to bypass multi-factor authentication.

Configuring FSSO user groups

FSSO user groups contain only Windows, Citrix, and Novell network users. Information about these user groups and their member logon activities are provided by the corresponding FSSO connector. See the FSSO on page 2989 section for more information.

Configuring RSSO user groups

RADIUS single sign-on user groups leverage a RADIUS server to authenticate connecting users. This requires users to log in to their computer using their RADIUS account. The FortiGate does not interact with the remote RADIUS server. It only monitors RADIUS accounting records that the server forwards (originating from the RADIUS client). These records include the user IP address and user group. See RADIUS single sign-on agent on page 3872 for more information.

Configuring guest user groups

In some scenarios, an administrator might need to create temporary user accounts with a defined expiry time to access network resources. For example, if there is a large conference and may attendees require temporary network access for a few days. *Guest Management* can be used to combine many guest users

into a group. Many guest accounts can be created at once using randomly-generated user IDs and passwords.

A guest group must be configured first. The guest user account user ID can be an email address, a randomly generated string, or an ID that the assigned by the administrator. The password can be assigned by the administrator or randomly generated. The guest group configuration determines the fields that are provided when creating guest user accounts in *Guest Management*.

To create a guest user group:

1. Go to *User & User & Authentication* > *User Groups* and click *Create New*.
2. Enter a name, and set the *Type* to *Guest*.
3. Configure the following:

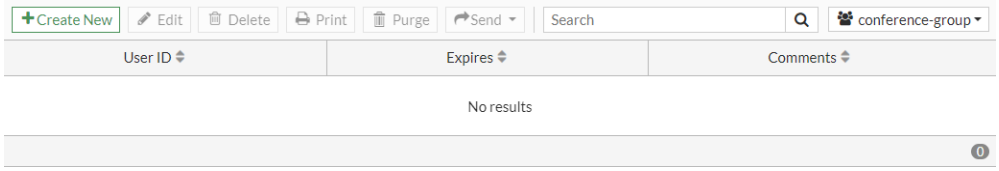
Batch Guest Account Creation	Create multiple accounts automatically. When enabled: • The user ID and password are automatically generated. • The accounts only have user ID, password, and expiration fields. The expiration field is editable in the GUI in the *Start Countdown* and *Time* settings. • An administrator can print the account information. • Users do not receive an email or SMS notification.
User ID	Select one of the following: • *Email*: use the user's email address • *Auto Generate*: FortiOS creates a random user ID • *Specify*: the administrator assigns a user ID
Maximum Accounts	Enable to set a maximum number of guest accounts that can be created for this group (disabled = unlimited).
Guest Details	
Enable Name	If enabled, the user form has a field to enter a name.
Enable Email	If enabled, the user is notified by email.
Enable SMS	If enabled, the user is notified by SMS.
Password	Select one of the following: • *Auto Generate*: FortiOS creates a random password • *Specify*: the administrator assigns a password If the setting is disabled, no password is used.
Sponsor	If enabled, the user form has a field to enter a sponsor (*Optional*). Select *Required* if the sponsor field is mandatory.
Company	If enabled, the user form has a field to enter a company (*Optional*). Select *Required* if the company field is mandatory.
Expiration	
Start Countdown	Select one of the following: • *On Account Creation*: the countdown starts from the time the account is created

	• *After First Login*: the countdown starts from the time the first time the user logs in
Time	Set the expiry time. There are fields to enter values for *Days*, *Hours*, *Minutes*, and *Seconds*.

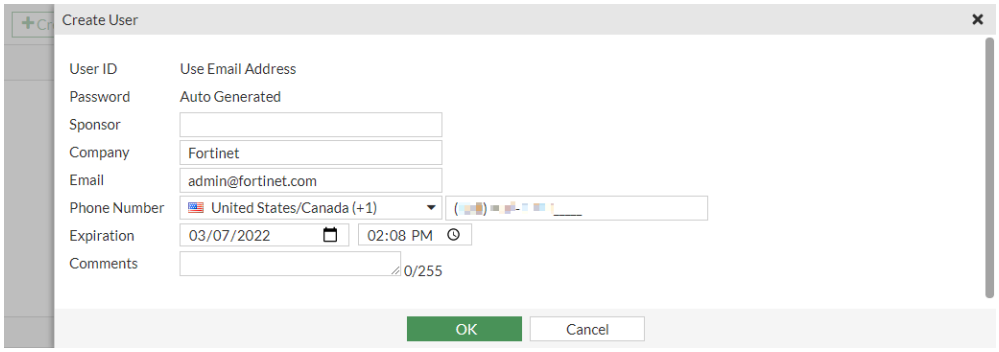
4. Click *OK*.

To manually create a guest user account:

1. Go to *User & User & Authentication > Guest Management*.
2. If more than one guest user group is configured, select the group from the dropdown beside the search box.



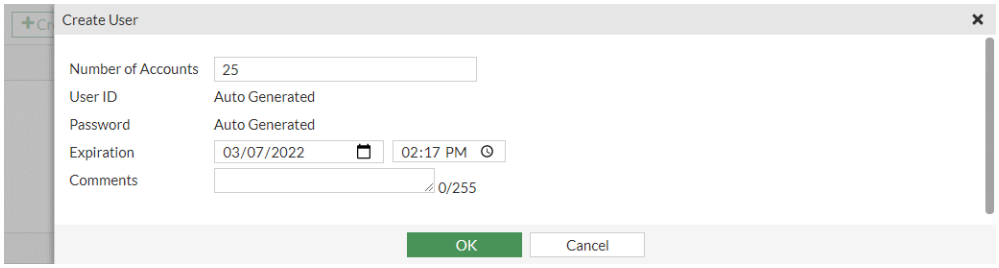
3. Click *Create New* and enter the information in the *Create User* pane. The fields are based on the guest group configuration. Optional fields can be left blank, such as *Sponsor* in this example.



4. Click *OK*.

To automatically create multiple guest user accounts:

1. Go to *User & User & Authentication > Guest Management*.
2. If more than one guest user group is configured, select the group from the dropdown beside the search box. The group must have *Batch Guest Account Creation* enabled.
3. Click *Create New > Multiple Users* and enter the *Number of Accounts*.
4. Optionally, edit the *Expiration* date and time.



5. Click *OK*.

Authentication settings

General authentication settings include:

- Timeout on page 2845
- Protocols on page 2846
- Certificates on page 2847
- Lockouts on page 2847
- Authentication policy extensions on page 2848

Only some of the settings can be configured in the GUI.

To configure authentication settings in the GUI:

1. Go to *User & Authentication* > *Authentication Settings*.
2. Configure the following settings:

Setting	Description
Authentication Timeout	Enter the desired timeout, in minutes, from 1 to 1440 (24 hours). The default time is 5 minutes. Only idle timeout can be configured in the GUI.
Protocol support	Select the protocols to challenge during firewall user authentication.
HTTP redirect	Redirect HTTP challenge to a secure channel (HTTPS). This option is only available if *HTTP* is selected in the *Protocol Support* options.
Certificate	Select the local certificate to use for authentication.

3. Click *OK*.

Timeout

Authenticated users and user groups can have timeout values per user or group, in addition to FortiGate-wide timeouts. Three types of user timeouts can be configured:

Timeout type	Description
Idle	The idle timer starts when a user initiates a session. As long as data are transferred in this session, the timer continually resets. If the data flow stops, the timer is allowed to advance until it reaches its limit. When the user has been idle for too long, they must re-authenticate before traffic is allowed to continue in that session. This is the default setting. It can be configured in the GUI and CLI.
Hard	The hard timer starts when a user initiates a session. When the timeout is reached, all the sessions for that user must be re-authenticated. This timeout is not affected by any events. This setting can be configured in the CLI.

Timeout type	Description
Session	The session timer starts when a user initiates a session. When the timeout is reached, existing sessions may continue. New sessions are not allowed until the user re-authenticates. This timeout is not affected by any events. This setting can be configured in the CLI.

The authentication timeout time is configured in minutes. The default is five minutes. If VDOMs are enabled, the global level `auth-timeout` user setting is the default that all VDOMs inherit. If the timeout time is set to zero,

To configure timeout for authenticated users:

```
config user setting
    set auth-timeout-type {idle-timeout | hard-timeout | new-session}
    set auth-timeout <integer>
end
```

To configure the authentication timeout for a user group:

```
config user group
    edit <name>
        set authtimeout <integer>
    next
end
```

If the group timeout time is zero (the default) or the user belongs to multiple RADIUS groups, then the user group timeout values are ignored and the global user timeout value is used.

Protocols

When you enable user authentication within a security policy, the authentication challenge is normally issued for any of four protocols, depending on the connection protocol:

- HTTP (you can set this to redirect to HTTPS)
- HTTPS
- FTP
- Telnet

The selected protocols control which protocols support the authentication challenge. Users must connect with a supported protocol first so that they can subsequently connect with other protocols. If HTTPS is selected as a protocol support method, it allows the user to authenticate with a customized local certificate.

When you enable user authentication within a security policy, FortiOS challenges the security policy user to authenticate. For user ID and password authentication, the user must provide their username and password. For certificate authentication (HTTPS, or HTTP redirected to HTTPS only), you can install customized certificates on the unit and the user can also install customized certificates on their browser. Otherwise, users see a warning message and must accept a default Fortinet certificate. The network user's web browser may deem the default certificate invalid.

Enable `auth-secure-http` to redirect HTTP challenges to a secure channel. Enable `auth-ssl-allow-renegotiation` to allow SSL re-negotiation for HTTPS authentication.

Enable `auth-http-basic` to use HTTP basic authentication for identity-based firewall policies. HTTP basic authentication usually causes a browser to display a pop-up authentication window instead of an authentication web page. Some basic web browsers, such as those on older mobile devices, may only support HTTP basic authentication.

FTP and Telnet authentication replacement messages cannot be customized.

To configure the protocols to challenge during firewall user authentication:

```
config user setting
    set auth-type {http https ftp telnet}
    set auth-secure-http {enable | disable}
    set auth-http-basic {enable | disable}
    set auth-ssl-allow-renegotiation  {enable | disable}
end
```

Certificates

Configure the HTTPS certificate and CA certificate to use for policy authentication.

To configure certificates for policy authentication:

```
config user setting
    set auth-cert <certificate>
    set auth-ca-cert <CA certificate>
end
```

Lockouts

Failed log in attempts can indicate malicious attempts to gain access to your network. To prevent this security risk, you can limit the number of failed log in attempts. After the configured maximum number of failed log in attempts is reached (1 - 10, default = 3), access to the account is blocked for the configured lockout duration (0 - 4294967295 seconds, default = 0)

To configure the maximum failed log in attempts and the lockout duration:

```
config user setting
    set auth-lockout-threshold <integer>
    set auth-lockout-duration <integer>
end
```

Authentication policy extensions

By default, unauthenticated traffic is permitted to fall to the next policy. This means that unauthenticated users are only forced to authenticate against a policy when there are no other matching policies. To avoid this, you can force authentication to always take place.

To set that authentication requirement:

```
config user setting
    set auth-on-demand {always | implicitly}
end
```

Where:

`always`	Always trigger firewall authentication on demand.
`implicitly`	Implicitly trigger firewall authentication on demand. This is the default setting (and the behavior in FortiOS 6.0 and earlier).

In the following example, authentication is required; traffic that would otherwise be allowed by the second policy is instead blocked by the first policy.

To use forced authentication:

```
config user setting
    set auth-on-demand always
end
```

```
config firewall policy
    edit 1
        set name "QA to Database"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "Database"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set groups "qa_group"
        set nat enable
    next
    edit 2
        set name "QA to Internet"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "QA_subnet"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
        set fsso disable
        set nat enable
    next
end
```

Retail environment guest access

Businesses such as coffee shops provide free Internet access for customers. In this scenario, you do not need to configure guest management, as customers can access the WiFi access point without logon credentials.

However, consider that the business wants to contact customers with promotional offers to encourage future patronage. You can configure an email collection portal to collect customer email addresses for this purpose. You can configure a firewall policy to grant network access only to users who provide a valid email address. The first time a customer's device attempts WiFi connection, FortiOS requests an email address, which it validates. The customers' subsequent connections go directly to the Internet without interruption.

This configuration consists of the following steps:

1. Creating an email collection portal on page 2849
2. Creating a firewall policy on page 2850
3. Checking for collected emails on page 2850

Creating an email collection portal

The customer's first contact with your network is a captive portal that presents a webpage requesting an email address. When FortiOS has validated the email address, the customer's device MAC address is added to the collected emails device group.

This example modifies the freewifi WiFi interface to present an email collection captive portal.

To configure the freewifi SSID to use an email collection portal in the GUI:

1. Enable email collection:
   a. Go to *System* > *Feature Visibility*.
   b. In the *Additional Features* section, enable *Email Collection*.
   c. Click *Apply*.
2. Edit the freewifi SSID:
   a. Go to *WiFi & Switch Controller* > *SSIDs* and edit the *freewifi* SSID.
   b. In the *Security Mode Settings* section, set the *Security mode* to *Captive Portal*.
   c. Set the *Portal type* to *Email Collection*.
   d. Click *OK*.

To configure the freewifi SSID to use an email collection portal in the CLI:

```
config wireless-controller vap
    edit freewifi
```

```
        set security captive-portal
        set portal-type email-collect
    next
end
```

Creating a firewall policy

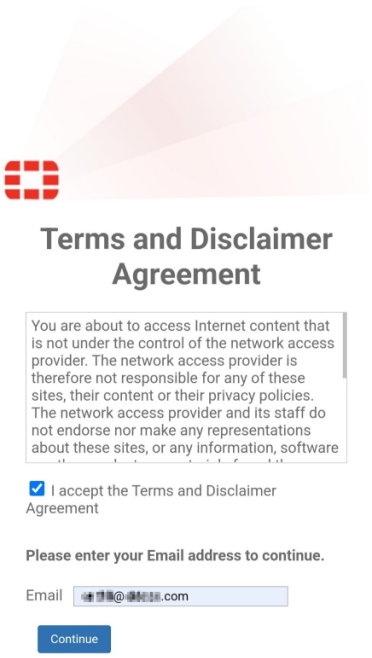
You must configure a firewall policy that allows traffic to flow from the WiFi SSID to the internet interface only for members of the collected emails device group. This policy must be listed first. Unknown devices are not members of the collected emails device group, so they do not match the policy.

To create a firewall policy:

```
config firewall policy
    edit 3
        set srcintf "freewifi"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set email-collect enable
    next
end
```

Checking for collected emails

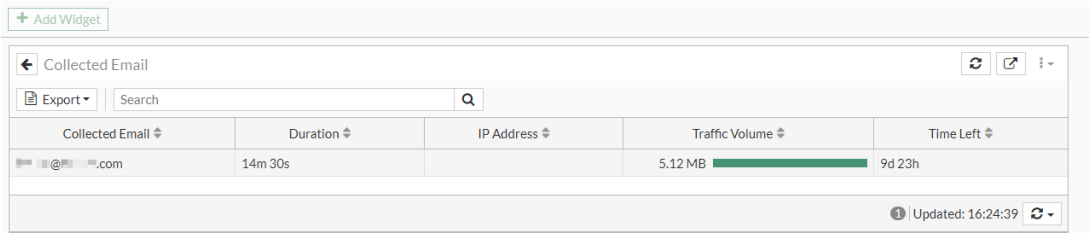
When a WiFi user connects to the freewifi SSID, they are presented with a captive portal to enter their email address.



Once the user enters their email and clicks *Continue*, they will have access to the Internet. The collected emails can be verified in FortiOS.

To check for collected emails in the GUI:

1. Go to *Dashboard* > *Assets & Identities* and click *Add Widget*.
2. In the *User & Authentication* section, select *Collected Email* and click *Add Widget*.
3. Click *Close*.
4. Click the *Collected Email* to expand to full view. The list of emails is displayed.



5. Optionally, click *Export* to export the data as a CSV or JSON file.

To check for collected emails in the CLI:

```
# diagnose firewall auth mac list

72:4d:e1:**:**:**, admin@fortinet.com

```

Customizing complexity options for the local user password policy

The local firewall user password policy can be customized with various settings, such as minimum length, character types, and password reuse. These settings are similar to the ones available for the system administrator password policy, which offer more security and flexibility than the previous local user password policy.

```
config user password-policy
    edit <name>
        set minimum-length <integer>
        set min-lower-case-letter <integer>
        set min-upper-case-letter <integer>
        set min-non-alphanumeric <integer>
        set min-number <integer>
        set min-change-characters <integer>
        set expire-status {enable | disable}
        set reuse-password {enable | disable}
    next
end
```

`minimum-length <integer>`	Set the minimum password length (8 - 128, default = 8).
`min-lower-case-letter <integer>`	Set the minimum number of lowercase characters in the password (0 - 128, default = 0).
`min-upper-case-letter <integer>`	Set the minimum number of uppercase characters in the password (0 - 128, default = 0).
`min-non-alphanumeric <integer>`	Set the minimum number of non-alphanumeric in the password (0 - 128, default = 0).
`min-number <integer>`	Set the minimum number of numeric characters in the password (0 - 128, default = 0).
`min-change-characters <integer>`	Set the minimum number of unique characters in new password, which do not exist in the old password (0 - 128, default = 0). This attribute overrides `reuse-password` if both are enabled.
`set expire-status {enable | disable}`	Enable/disable password expiration (default = disable).
`set reuse-password {enable | disable}`	Enable/disable password reuse (default = enable. If both `reuse-password` and `min-change-characters` are enabled, `min-change-characters` overrides it.

After upgrading to 7.4.1 from 7.4.0, users must activate the user password policy using the CLI. The previous password policy settings will remain valid, but they will not be effective unless the password policy password expiration is enabled (`expire-status`). If the password policy password expiration is not enabled, the `expire-days <integer>` option will not force users to change their password after number of specified days.

Example

The following user password policy is configured before upgrading to 7.4.1:

```
config user password-policy
    edit "1"
        set expire-days 1
        set warn-days 1
        set expired-password-renewal enable
    next
end
```

To configure the user password policy options:

1. Check the user password policy settings after the upgrade:

```
config user password-policy
    edit 1
        get
            name                : 1
            expire-days         : 1
            warn-days           : 1
            expired-password-renewal: enable
            minimum-length      : 8
            min-lower-case-letter: 0
            min-upper-case-letter: 0
            min-non-alphanumeric: 0
            min-number          : 0
            min-change-characters: 0
            expire-status       : disable
            reuse-password      : enable
    next
end
```

2. Edit the user password policy settings, including enabling password expiration:

```
config user password-policy
    edit "1"
        set expire-days 1
        set warn-days 1
        set expired-password-renewal enable
        set min-lower-case-letter 1
        set min-upper-case-letter 1
        set min-non-alphanumeric 3
        set min-number 3
        set min-change-characters 2
        set expire-status enable
        set reuse-password disable
    next
end
```

3. Change a password for a local user.

a. In the CLI when the password meets the criteria:

```
config user local
    edit pwd-test1
        set passwd CCbcset123!!!
    next
end
```

b. In the CLI when the password does not meet the criteria (only two numbers, so an error message appears):

```
config user local
    edit pwd-test1
        set passwd CCbXsetp23!!!
New password must conform to the password policy enforced on this user:
Password must:
        Be a minimum length of 8
        Include at least 1 lower case letter(s) (a-z)
        Include at least 1 upper case letter(s) (A-Z)
        Include at least 3 non-alphanumeric character(s)
        Include at least 3 number(s) (0-9)
        Have at least 2 unique character(s) which don't exist in the old password
        Not be same as last two passwords

node_check_object fail! for passwd CCbXsetp23!!!

value parse error before 'CCbXsetp23!!!'
Command fail. Return code -49
```

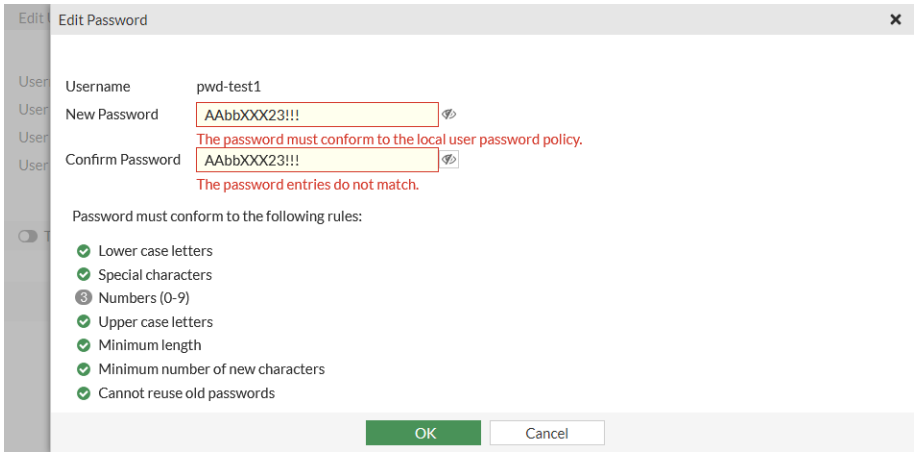
c. In the GUI:

i. Go to *User & Authentication* > *User Definition* and edit a local user.

ii. Click *Change Password*.

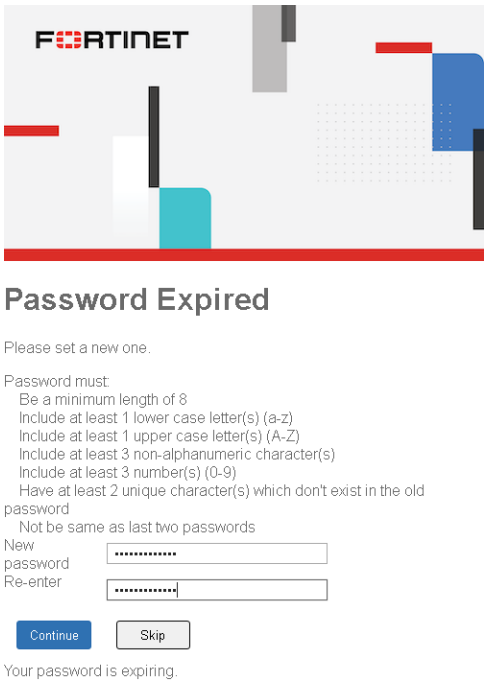
iii. Enter the *New Password*.

iv. Enter the password again (*Confirm Password*). A warning will appear when the password does not match the criteria and indicates which parameters must be fixed. In this example, there are less than three numbers used.

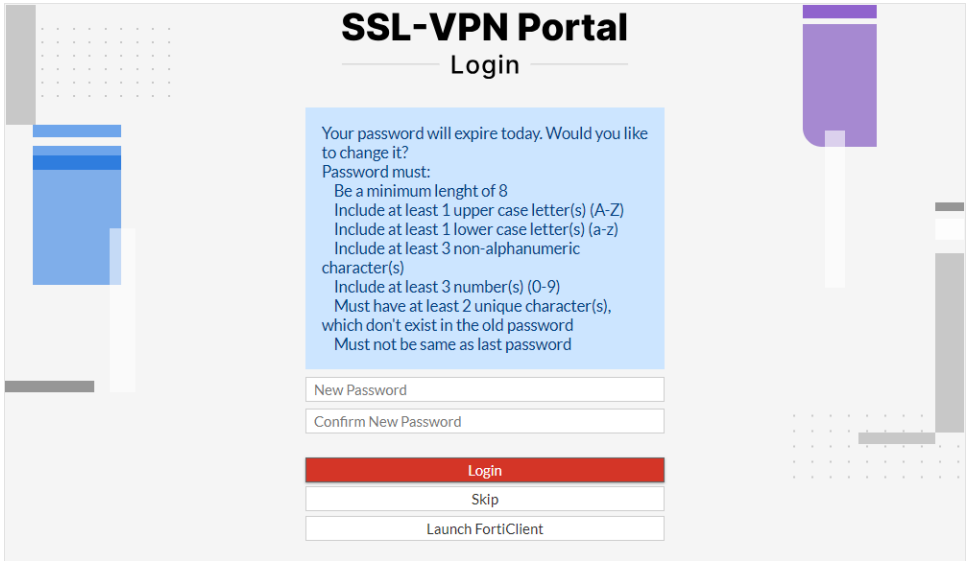


v. Click *OK*.

Sample prompt when a local user needs to update their password for firewall authentication:



Sample prompt when a local user needs to update their password for SSL VPN portal access:



Basic authentication with cached client certificates

With basic authentication, client certificates can be cached and used as authentication cookies, eliminating the need for repeated user authentication.

In this example, a CA signs a client certificate. The client certificate is installed on two endpoints, and the root CA certificate is imported to FortiGate.

During the authentication process, the client certificate from the endpoint is verified against the CA certificate. Once this verification is successful, the user is prompted to enter login credentials for user authentication. Once authenticated, the client certificate is stored as an authentication cookie so that subsequent access does not require any user authentication as long as the client certificate remains present on the endpoint.

To configure client certificates as authentication cookies:

1. Prepare the certificate:
   a. Use a CA to sign the client certificate.
   b. Import the root CA certificate that signed the client certificate to FortiGate.
   c. Install the client certificate on all endpoints.
2. In FortiOS, configure an authentication scheme to apply authentication against the local user database.

```
config authentication scheme
    edit "test"
        set method basic
        set user-database "local-user-db"
    next
end
```

3. Configure an authentication rule to enable the client certificate to be cached.

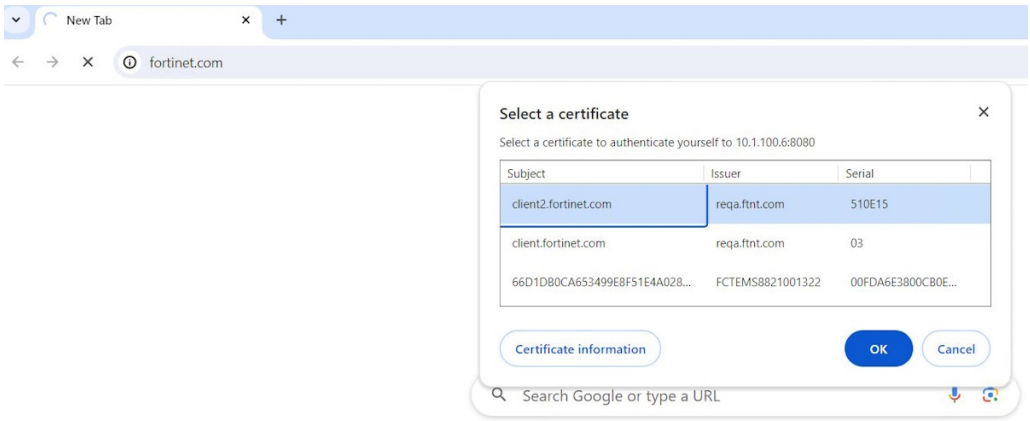
```
config authentication rule
    edit "test"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "test"
        set cert-auth-cookie enable
    next
end
```

4. Configure verification of the client certificate with the root CA.

```
config authentication setting
    set user-cert-ca "root_ca"
end
```

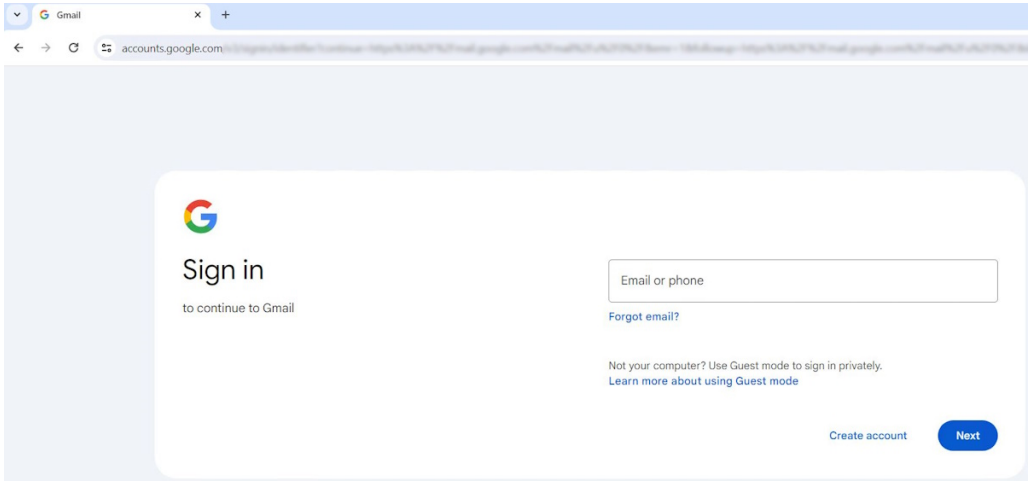
When the user accesses a resource, such as a web site, for the first time:

1. The browser prompts the user for a client certificate. The user selects the certificate (client2.fortinet.com), and clicks *OK*. Then the endpoint device (IP address 10.1.100.59) presents the client certificate to FortiGate for verification.



2. Once the certificate verification passes, an authentication dialog box is displayed.

3. The user enters their username and password to authenticate with FortiGate and successfully access the web site.



FortiGate also logs the first access in the traffic log:

```
9: date=2024-04-24 time=12:28:51 eventtime=1713918531092354265 tz="+1200" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="vdom1" srcip=10.1.100.59 srcport=63615
```

```
srcintf="port2" srcintfrole="undefined" dstcountry="United States" srccountry="Reserved"
dstip=142.251.33.69 dstport=443 dstintf="port3" dstintfrole="undefined" sessionid=51442
service="web" proxyapptype="http" proto=6 action="accept" policyid=10 policytype="proxy-
policy" poluuid="e272fe7e-00d2-51ef-5fe0-09d157495e71" duration=73 user="localuser"
group="localgroup" authserver="localuser" gatewayid=1 realserverid=1 vip="ztna"
accessproxy="ztna" clientdevicemanageable="manageable" clientcert="yes" wanin=5734
rcvdbyte=5734 wanout=1505 lanin=3226 sentbyte=3226 lanout=42588 appcat="unscanned"
```

When the user accesses the resource from the same endpoint device for the second and subsequent times, FortiGate uses the cached authentication cookie to grant access, as long as the client certificate remains present on the endpoint.

When the user has multiple endpoint devices with the same certificate installed, the certificate will match the cached authentication cookie on the FortiGate, and the user can access resources without additional authentication.

This log shows a user accessing a website from a different PC (IP address 10.1.100.78) without needing to provide user credentials.

```
2: date=2024-04-24 time=12:30:42 eventtime=1713918642320943415 tz="+1200" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="vdom1" srcip=10.1.100.78 srcport=63799
srcintf="port2" srcintfrole="undefined" dstcountry="United States" srccountry="Reserved"

gatewayid=1 realserverid=1 vip="ztna" accessproxy="ztna" clientdevicemanageable="manageable"
clientcert="yes" wanin=5737 rcvdbyte=5737 wanout=1295 lanin=3102 sentbyte=3102 lanout=7651
appcat="unscanned"
```

LDAP servers

The following topics provide information about LDAP servers:

- Configuring an LDAP server on page 2858
- Enabling Active Directory recursive search on page 2862
- Configuring LDAP dial-in using a member attribute on page 2863
- Configuring wildcard admin accounts on page 2864
- Configuring least privileges for LDAP admin account authentication in Active Directory on page 2866
- Tracking users in each Active Directory LDAP group on page 2867
- Tracking rolling historical records of LDAP user logins on page 2870
- Configuring client certificate authentication on the LDAP server on page 2873

Configuring an LDAP server

FortiOS can be configured to use an LDAP server for authentication.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See relevant LDAPS information in this topic and Configuring client certificate authentication on the LDAP server on page 2873.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 2866.

To configure an LDAP server on the FortiGate:

1. Go to *User & Authentication > LDAP Servers*.
2. Click *Create New*.
3. Configure the following:

Name	This connection name is for reference within the FortiGate only.
Server IP/Name	LDAP server IP address or FQDN resolvable by the FortiGate.
Server Port	By default, LDAP uses port 389 and LDAPS uses 636. Use this field to specify a custom port if necessary.
Common Name Identifier	Attribute field of the object in LDAP that the FortiGate uses to identify the connecting user. The identifier is case sensitive. Common attributes are: • *cn* (Common Name) • *sAMAccountName* (SAMAccountName) • *uid* (User ID)
Distinguished Name	Used to look up user account entries on the LDAP server. It reflects the hierarchy of LDAP database object classes above the CN identifier in which you are doing the lookup. Enter *dc=COMPANY,dc=com* to specify the root of the domain to include all objects. Enter *ou=VPN-Users,dc=COMPANY,dc=com* to look up users under a specific organization unit.
Exchange server	Enable to specify the exchange server connector to collect information about authenticated users from a corporate exchange server. See Exchange Server connector on page 3876 for more details.
Bind Type	Select one of the following options: • *Simple*: bind using simple password authentication using the client name. The LDAP server only looks up against the distinguished name (DN), but does not search on the subtree. • *Anonymous*: bind using an anonymous user, and search starting from the DN and recurse over the subtrees. Many LDAP servers do not allow this.

	• *Regular*: bind using the username and password provided, and search starting from the DN and recurse over the subtrees.
Username	If using regular bind, enter a username with sufficient privileges to access the LDAP server. The following formats are supported: • *username\administrator* • *administrator@domain* • *cn=administrator,cn=users,dc=domain,dc=com*
Password	If using regular bind, enter the password associated with the username.
Secure Connection	Enable to apply security to the LDAP connection through STARTTLS or LDAPS.
Protocol	If *Secure Connection* is enabled, select *STARTTLS* or *LDAPS*. Selecting *STARTTLS* changes the port to 389 and selecting *LDAPS* changes the port to 636.
Certificate	Enable and select the root CA certificate so that the FortiGate will only accept a certificate from the LDAP server that is signed by this CA. The root CA certificate should be in the Remote CA Certificate store on the FortiGate. If this setting is not enabled (meaning that no certificate is chosen), the server certificate validation will not be performed even if *Secure Connection* is enabled. If the wrong certificate is chosen, which is not the issuing CA for the server certificate, then the LDAP connection will fail.
Server identity check	This check verifies the server domain or IP address against the server certificate. This option is enabled by default when *Certificate* is chosen and it is recommended to leave it enabled for a secure configuration.

When specifying a secure connection, there are some considerations for the certificate used by LDAP to secure the connection. The FortiGate checks the certificate presented by the LDAP server for the IP address or FQDN as specified in the *Server IP/Name* field with the following logic:

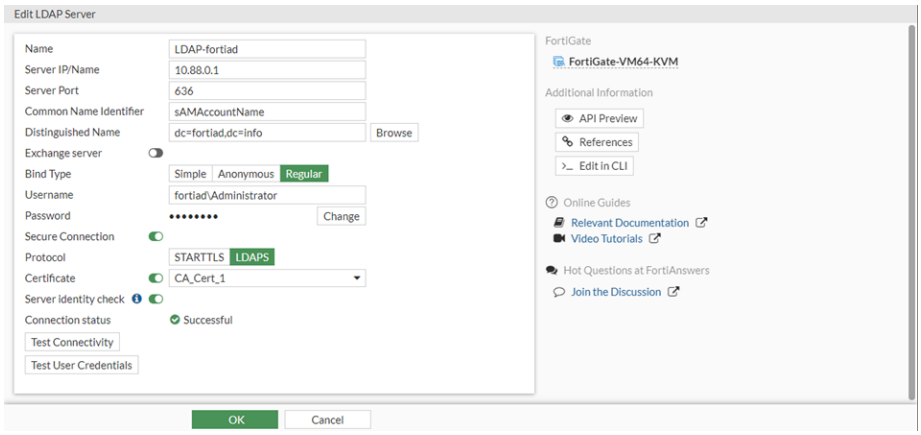
- If there is a Subject Alternative Name (SAN), it will ignore any Common Name (CN) value and look for a match in any of the SAN fields.
- If there is no SAN, it will check the CN for a match.

4. Optionally, click *Test User Credentials* to ensure that the account has sufficient access rights.
5. Click *OK*.
   The FortiGate checks the connection and updates the *Connection Status*.

To configure a secure connection to the LDAP server in the GUI:

1. Go to *User & Authentication > LDAP Servers*.
2. Click *Create New*.
3. Configure the following:

Name	LDAP-fortiad
Server IP/Name	10.88.0.1
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=fortiad,dc=info
Exchange server	Disabled
Bind Type	Regular Enter the *Username* and *Password* for LDAP binding and lookup.
Secure Connection	Enabled • Set *Protocol* to *LDAPS*. • Enable *Certificate* and select the CA certificate to validate the server certificate.
Server identity check	Enable to verify the domain name or IP address against the server certificate.



4. Click *Test Connectivity* to verify the connection to the server.
5. Click *OK*.

To configure a secure connection to the LDAP server in the CLI:

```
config user ldap
    edit "LDAP-fortiad"
        set server "10.88.0.1"
        set cnid "sAMAccountName"
        set dn "dc=fortiad,dc=info"
        set type regular
        set username "fortiad\\Administrator"
        set password <password>
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
```

```
    next
end
```

Enabling Active Directory recursive search

By default, nested groups (groups that are members or other groups) are not searched in Windows Active Directory (AD) LDAP servers because this can slow down the group membership search. There is an option in FortiOS to enable the searching of nested groups for user group memberships on AD LDAP servers.

This option is not available for other LDAP servers, such as OpenLDAP-based servers.

The default behavior does not include nested groups:

```
config user ldap
    edit "ldap-ad"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
    next
end
```

The default search results only show groups that have the user as member, and no groups that have groups as members:

```
diagnose test authserver ldap ldap-ad nuser nuser
    authenticate 'nuser' against 'ldap-ad' succeeded!
    Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
```

To enable recursive search to include nested groups in the results:

```
config user ldap
    edit "ldap-ad"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXXX
        set search-type recursive
    next
end
```

The search results now include groups that have other groups as members:

```
diagnose test authserver ldap ldap-ad nuser nuser
    authenticate 'nuser' against 'ldap-ad' succeeded!
    Group membership(s) - CN=nested3,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=Domain Users,CN=Users,DC=Fortinet-FSSO,DC=COM
                          CN=nested2,OU=Testing,DC=Fortinet-FSSO,DC=COM
                          CN=nested1,OU=Testing,DC=Fortinet-FSSO,DC=COM
```

The group nested3 is a member of the group nested2, which is a member of the group nested1.

Configuring LDAP dial-in using a member attribute

In this configuration, users defined in Microsoft AD can set up a VPN connection based on an attribute that is set to `TRUE`, instead of their user group. You can activate the *Allow Dialin* property in AD user properties, which sets the `msNPAllowDialin` attribute to *TRUE*. You can use this procedure for other member attributes as your system requires.

This configuration consists of the following steps:

1. Ensure that the AD server has the `msNPAllowDialin` attribute set to *TRUE* for the desired users.
2. Configure user LDAP member attribute settings.
3. Configure LDAP group settings.
4. Ensure that you configured the settings correctly.

To configure user LDAP member attribute settings:

```
config user ldap
   edit "ldap_server"
      set server "192.168.201.3"
      set cnid "sAMAccountName"
      set dn "DC=fortilabanz,DC=com,DC=au"
      set type regular
      set username "fortigate@sample.com"
      set password ******
      set member-attr "msNPAllowDialin"
   next
end
```

To configure LDAP group settings:

```
config user group
   edit "ldap_grp"
      set member "ldap_server"
      config match
         edit 1
            set server-name "ldap_server"
            set group-name "TRUE"
         next
      end
   next
end
```

To ensure that you configured the settings correctly:

Users that are members of the `ldap_grp` user group should be able to authenticate. The following shows sample `diagnose debug` output when the `Allow Dial-in` attribute is set to `TRUE`:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='TRUE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Passed group matching
```

If the attribute is not set to `TRUE` but is expected, you may see the following output:

```
get_member_of_groups-Get the memberOf groups.
get_member_of_groups- attr='msNPAllowDialin', found 1 values
get_member_of_groups-val[0]='FALSE'
fnbamd_ldap_get_result-Auth accepted
fnbamd_ldap_get_result-Going to DONE state res=0
fnbamd_auth_poll_ldap-Result for ldap svr 192.168.201.3 is SUCCESS
fnbamd_auth_poll_ldap-Failed group matching
```

The difference between the two outputs is the last line, which shows passed or failed depending on whether the member attribute is set to the expected value.

Configuring wildcard admin accounts

To avoid setting up individual admin accounts in FortiOS, you can configure an admin account with the wildcard option enabled, allowing multiple remote admin accounts to match one local admin account. This way, multiple LDAP admin accounts can use one FortiOS admin account.

You can create one global wildcard system admin account or one wildcard system admin account for each VDOM but not both.

Benefits include:

- Fast configuration of the FortiOS admin account to work with your LDAP network, saving effort and avoiding potential errors incurred when setting up multiple admin accounts
- Reduced ongoing maintenance. As long as LDAP users belong to the same group and you do not modify the wildcard admin account in FortiOS, you do not need to configure changes on the LDAP accounts. If you add or remove a user from the LDAP group, you do not need to perform changes in FortiOS.

Potential issues include:

- Multiple users may be logged in to the same account simultaneously. This may cause issues if both users make changes simultaneously.
- Security is reduced since multiple users have login access to the same account, as opposed to an account for each user.

Wildcard admin configuration also applies to RADIUS. If configuring for RADIUS, configure the RADIUS server and RADIUS user group instead of LDAP. When using the GUI, wildcard admin is the only remote

admin account that does not require you to enter a password on account creation. That password is normally used when the remote authentication server is unavailable during authentication.

This example uses default values where possible. If a specific value is not mentioned, the example sets it to its default value.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials. To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 2858 and Configuring client certificate authentication on the LDAP server on page 2873.

To secure RADIUS connections, consider using RADSEC over TLS. See Configuring a RADSEC client on page 2914.

You can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 2866.

To configure the LDAP server:

The important parts of this configuration are the username and group lines. The username is the domain administrator account. The group binding allows only the GRP group access.

This example uses an example domain name. Configure as appropriate for your own network.

```
config user ldap
   edit "ldap_server"
      set server "192.168.201.3"
      set cnid "sAMAccountName"
      set dn "DC=example,DC=com,DC=au"
      set type regular
      set username "CN=Administrator,CN=Users,DC=example,DC=COM”
      set password *
      set group-member-check group-object
      set group-object-filter (&
            (objectcategory=group)member="CN=GRP,OU=training,DC=example,DC=COM"))
   next
end
```

To configure the user group and add the LDAP server:

```
config user group
   edit "ldap_grp"
      set member "ldap_server"
         config match
                  edit 1
                     set server-name "ldap_server"
                     set group-name "CN=GRP,OU=training,DC=example,DC=COM"
                  next
               end
            next
```

```
        end
      end
   end
end
```

To configure the wildcard admin account:

```
config system admin
   edit "test"
      set remote-auth enable
      set accprofile "super_admin"
      set wildcard enable
      set remote-group "ldap_grp"
   next
end
```

Configuring least privileges for LDAP admin account authentication in Active Directory

An administrator should only have sufficient privileges for their role. In the case of LDAP admin bind, you can configure an admin account in Active Directory for LDAP authentication to allow an admin to perform lookups and reset passwords without being a member of the Account Operators or Domain Administrators built-in groups.

For information about Active Directory, see the product documentation.

To configure account privileges for LDAP authentication in Active Directory:

1. In the *Active Directory Users and Computers* administrative console, right-click the Organizational Unit (OU) or the top-level domain you want to configure and select *Delegate Control*.
2. In the *Delegation of Control Wizard* dialog, click *Next*.
3. In the *Users or Groups* dialog, click *Add...* and search Active Directory for the users or groups.
4. Click *OK* and then click *Next*.
5. In the *Tasks to Delegate* dialog, select *Create a custom task to delegate* and click *Next*.
6. Select *Only the following objects in the folder* and scroll to the bottom of the list. Select *User objects* and click *Next*.
7. In the *Permissions* dialog, select *General*.
8. From the *Permissions* list, select the following:
   - *Change password*
   - *Reset password*
9. Clear the *General* checkbox and select *Property-specific*.
10. From the *Permissions* list, select the following:
    - *Write lockoutTime*
    - *Read lockoutTime*
    - *Write pwdLastSet*
    - *Read pwdLastSet*
    - *Write UserAccountControl*

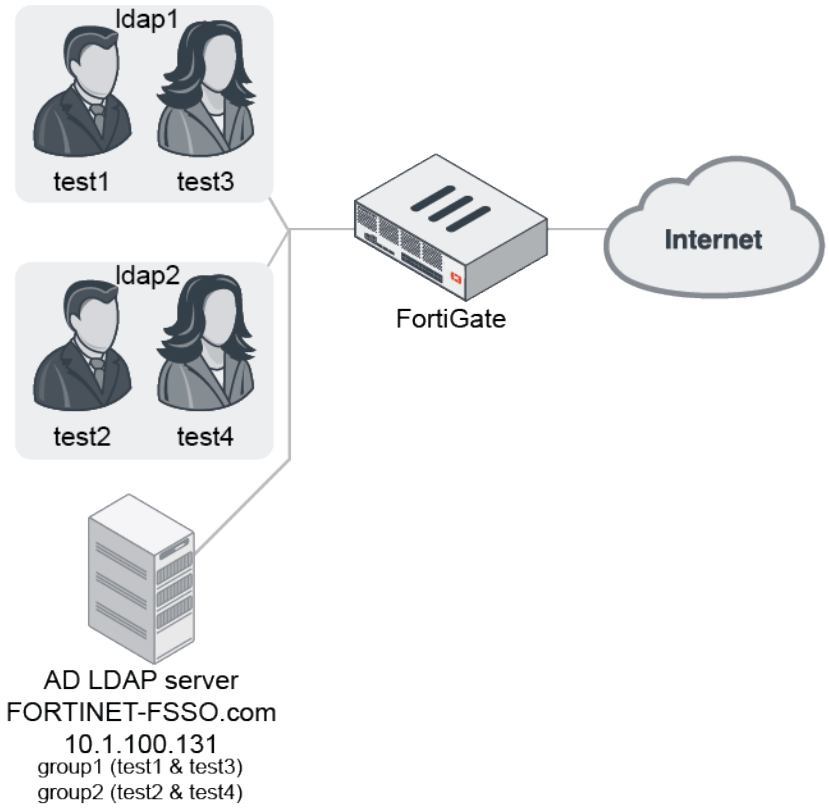
- *Read UserAccountControl*

11. Click *Next* and click *Finish*.

Tracking users in each Active Directory LDAP group

When LDAP users log on through firewall authentication, the active users per Active Directory LDAP group is counted and displayed in the *Firewall Users* widget and the CLI.

Example



The Active Directory LDAP server, FORTINET-FSSO.com, is configured with two groups that contain two users each: group1 consists of users test1 and test3; group2 consists of users test2 and test4.

To configure AD LDAP user groups in the GUI:

1. Configure the Active Directory LDAP server, FORTINET-FSSO:
   a. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
   b. Enter the following:

Name	*FORTINET-FSSO*
Server IP/Name	*10.1.100.131*

Distinguished Name	*dc=FORTINET-FSSO,dc=com*
Bind Type	*Regular*
Username	*cn=administrator,cn=users,dc=FORTINET-FSSO,dc=com*
Password	Enter the password.

c. Click *OK*.

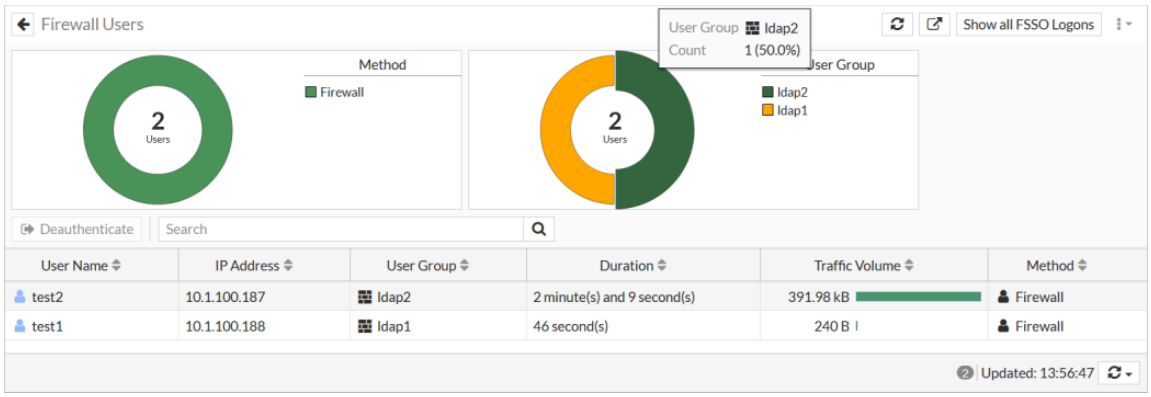
2. Configure the LDAP user groups:
   a. Go to *User & Authentication* > *User Groups* and click *Create New*.
   b. Enter the name, *ldap1*.
   c. In the *Remote Groups* table, click *Add*. The *Add Group Match* pane opens.
   d. For *Remote Server*, select *FORTINET-FSSO*.
   e. In the search box, enter *group1*, and select the result in the table.
   f. Click *OK*.

   g. Repeat these steps to configure *ldap2* with the FORTINET-FSSO *group2*.
   h. Click *OK*.

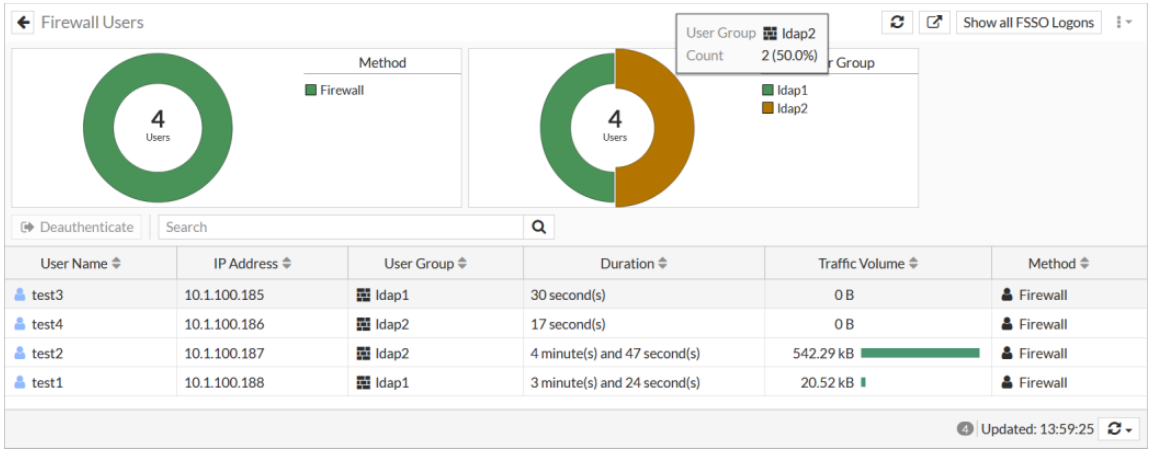
3. Configure a firewall policy with both LDAP groups:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Source*, select *ldap1* and *ldap2*.
   c. Configure the other settings as needed.
   d. Click *OK*.

4. Get users test1 and test2 to log in.

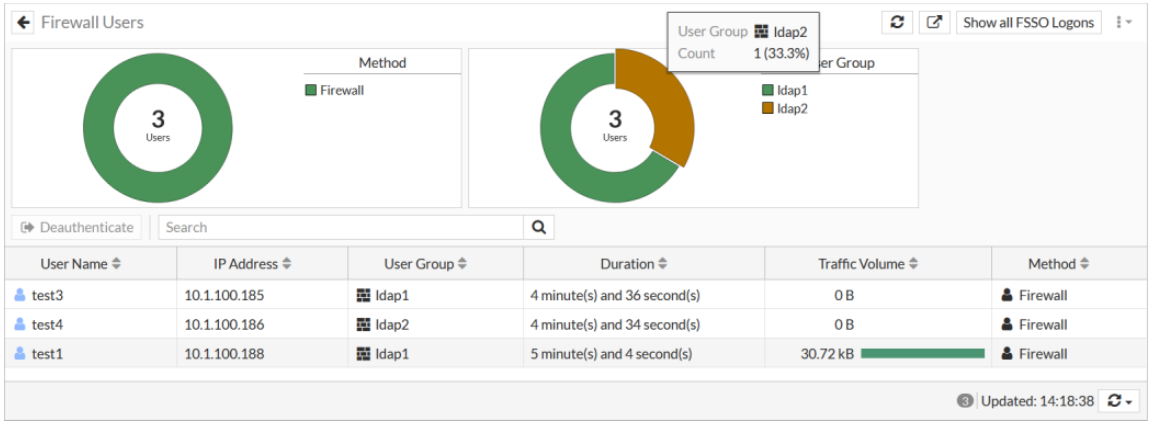
5. In FortiOS, go to *Dashboard* > *Assets & Identities* and click the *Firewall Users* widget to expand to full screen view.
   Hover over a group in the *User Group* donut chart to view how many users are logged on from that group, and the number of users as a percentage of all logged on users. The chart shows that two users are logged in.



6. Get users test3 and test4 to log in, and refresh the *Firewall Users* widget. Each LDAP group has two users logged in, with a total of four active users.



7. Get user test2 to log out, and refresh the *Firewall Users* widget. There is a total of three active users, and the ldap2 group only has one user that is logged in.



To verify the user group count in the CLI:

```
# diagnose user-device-store user-count list <integer>
# diagnose user-device-store user-count query <FQDN of AD group>
```

Tracking rolling historical records of LDAP user logins

Authenticated LDAP users can be tracked by logging the users' group memberships, logon timestamps, and logout timestamps into local files on a log disk over a rolling four-week period. The historical records can be queried from the CLI. This feature is only enabled on FortiGate models with a log disk.

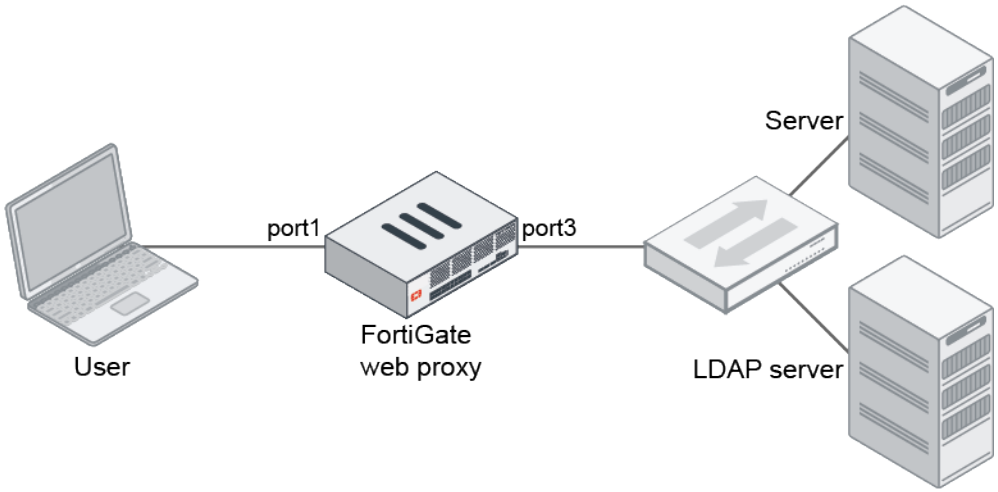
To view active user logged information:

```
# diagnose user-device-store user-stats query <yyyy-mm-dd> <range_in_days>
```

Example

In this example, the FortiGate is configured with an explicit web proxy and an LDAP server. When an LDAP user is authenticated by an IP-based authentication method in WAD, the WAD user is considered to be in an active logon status. This WAD user is listed in the `diagnose wad user list` output. If the user is removed from WAD as an authenticated, such as when the IP-based authentication expires, then the user is considered to become inactive (logout status). The user is no longer listed in the `diagnose wad user list` output.

The WAD user's group membership information and their logon and logout timestamps are written into local files on the FortiGate's disk. There is one log file for each day, and the FortiGate can maintain up to 28 log files over a rolling period of 28 days (four weeks). This means after 28 days with 28 files stored, on the 29th day, the first file will be removed and a new file will be created for the 29th day.



This feature works on other configurations such as firewall authentication, transparent web proxy, ZTNA, and SSL VPN where an LDAP server is used.

To configure the FortiGate:

1. Enable the explicit web proxy on port1:

```
config system interface
    edit "port1"
        set explicit-web-proxy enable
        set explicit-ftp-proxy enable
        set snmp-index 3
    next
end
```

2. Configure the LDAP server:

```
config user ldap
    edit "ldap-test"
        set server "172.16.200.98"
        set cnid "cn"
        set dn "dc=fortinetqa,dc=local"
        set type regular
        set username "CN=root,CN=Users,DC=fortinetqa,DC=local"
        set password **********
    next
end
```

3. Configure the authentication scheme:

```
config authentication scheme
    edit "basic-ldap"
        set method basic
        set user-database "ldap-test"
    next
end
```

4. Configure the authentication rule:

```
config authentication rule
    edit "basic-ldap"
        set srcaddr "all"
        set active-auth-method "basic-ldap"
        set web-portal disable
    next
end
```

5. Configure the user group:

```
config user group
    edit "ldap-group"
        set member "ldap" "ldap-test"
    next
end
```

6. Configure the proxy policy:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set service "web"
        set action accept
        set schedule "always"
        set groups "ldap-group"
        set utm-status enable
        set ssl-ssh-profile "deep-custom"
        set av-profile "av"
    next
end
```

When users pass through the explicit proxy and log in and out through LDAP, their login and logout records will be logged to the disk.

In this example, there are two LDAP users, test1 and test3, with the following activity:

1. test3 logs on at 22:30:22 on February 23, 2022, then logs out at 22:31:09 on the same day.
2. test1 logs on at 23:55:02 on February 23, 2022, then logs out at 00:05:02 on February 24, 2022.
3. test3 logs on at 16:29:44 on February 24, 2022, then logs out at 16:39:44 on the same day.

The logon and logout timestamp information, and the group membership information for users test1 and test3 will be logged into two local files on the log disk.

To view the active user logged information for two days back from February 24, 2022:

```
# diagnose user-device-store user-stats query 2022-02-24 2

Record #0:
        'username' = 'test3'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'logon' = '2022-02-23 22:30:22'
        'logout' = '2022-02-23 22:31:09'

Record #1:
        'username' = 'test1'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=mytest-grp,OU=QA,DC=FORTINETQA,DC=local'
        'logon' = '2022-02-23 23:55:02'

Record #2:
        'username' = 'test1'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=mytest-grp,OU=QA,DC=FORTINETQA,DC=local'
```

```
        'logon' = '2022-02-23 23:55:02'
        'logout' = '2022-02-24 00:05:02'

Record #3:
        'username' = 'test3'
        'groupname' = 'CN=Domain Admins,CN=Users,DC=FORTINETQA,DC=local'
        'groupname' = 'CN=FSSO,OU=QA,DC=FORTINETQA,DC=local'
        'logon' = '2022-02-24 16:29:44'
        'logout' = '2022-02-24 16:39:44'

Returned 4 records.
```

There is one record (logon) for test1 on 2022-02-23 because they remained active after midnight (until 00:05:02). There is another record for 2022-02-24 with logon and logout timestamps for test1.

Configuring client certificate authentication on the LDAP server

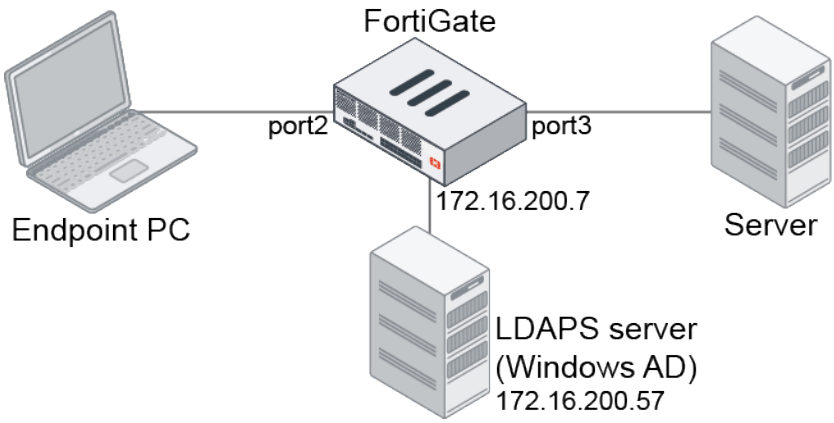
Administrators can configure a FortiGate client certificate in the LDAP server configuration when the FortiGate connects to an LDAPS server that requires client certificate authentication.

```
config user ldap
    edit <ldap_server>
        set client-cert-auth {enable | disable}
        set client-cert <source>
    next
end
```

Example

In this example, the FortiGate is configured as an explicit web proxy. It connects to the Windows AD server through LDAPS, where the Windows server requires a client certificate to connect. The client certificate is configured in the CLI.

The endpoint PC connecting to the web server will first need to authenticate to the explicit web proxy before accessing the server.



While this example demonstrates an LDAP client certificate for an explicit proxy configuration, LDAP client certificates can be used in firewall authentication, transparent proxy, ZTNA, and where ever LDAP configurations are used on the FortiGate.

To configure a client certificate on the LDAP server:

1. Enable the explicit web proxy on port2:

```
config system interface
    edit "port2"
        set explicit-web-proxy enable
    next
end
```

2. Upload the client certificate to the FortiGate:

```
config vpn certificate local
    edit "Zach"
        set password **********
        set private-key <private key>
        set certificate <certificate>
    next
end
```

3. Configure the LDAP server settings:

```
config user ldap
    edit "ldaps"
        set server "172.16.200.57"
        set server-identity-check disable
        set cnid "CN"
        set dn "CN=Users,DC=ftnt,DC=com"
        set secure ldaps
        set port 636
        set client-cert-auth enable
        set client-cert "Zach"
    next
end
```

To ensure the proper operation of LDAPS authentication, make sure that the CA that signed the server certificate for the LDAPS server, typically a private CA, is trusted by the FortiGate by uploading the private CA certificate. This is especially important for an existing configuration where this was not previously done to ensure proper operation after upgrades. See CA certificate on page 3430.

4. Configure the authentication scheme:

```
config authentication scheme
    edit "1"
        set method basic
        set user-database "ldaps"
    next
end
```

5. Configure the authentication rule:

```
config authentication rule
    edit "1"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set active-auth-method "1"
    next
end
```

6. Configure the user group:

```
config user group
    edit "test"
        set member "ldaps"
    next
end
```

7. Configure the proxy policy with the user group:

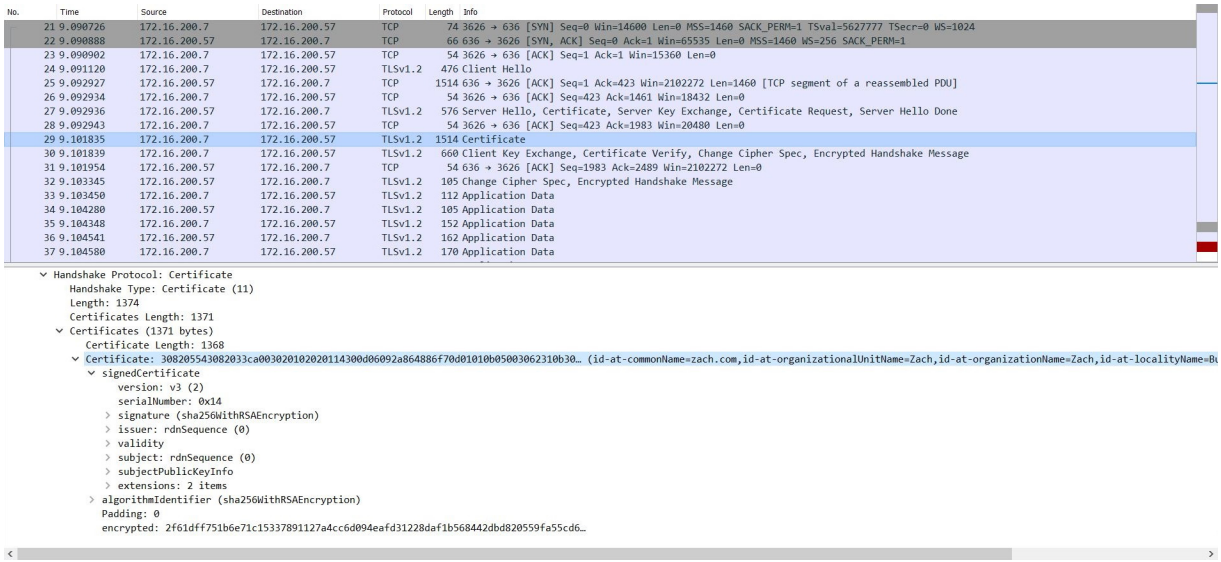
```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set groups "test"
        set utm-status enable
        set ssl-ssh-profile "deep-inspection-clone"
        set av-profile "av"
```

```
    next
end
```

Testing and verification

When traffic from the endpoint PC matches a policy and triggers authentication, the FortiGate starts the LDAPS TLS connection handshake with the Windows AD. The LDAPS server requests a client certificate to identify the FortiGate as a client. The FortiGate provides a configured client certificate, issued to zach.com, to the LDAPS server.

The following communication between the FortiGate and the LDAPS server shows the client certificate is sent by the FortiGate:



RADIUS servers

Remote Authentication and Dial-In User Service (RADIUS) is a broadly supported client-server protocol that provides centralized authentication, authorization, and accounting functions. RADIUS clients are built into gateways that allow access to networks such a VPN server, network access server (NAS), and a network switch or firewall that uses authentication.

RADIUS servers use UDP packets to communicate with the RADIUS clients on the network to authenticate users before allowing them access to the network, authorize access to resources by appropriate users, and account or bill for those resources that are used. RADIUS servers are currently defined by RFC 2865 (RADIUS) and RFC 2866 (RADIUS Accounting), and listen on either UDP ports 1812 (authentication) and 1813 (accounting), or ports 1645 (authentication) and 1646 (accounting) requests. RADIUS servers exist for all major operating systems.

The RADIUS server must be configured to accept the FortiGate as a client so it can use the authentication and accounting functions of the RADIUS server.

To secure RADIUS connections, consider using RADSEC over TLS. See Configuring a RADSEC client on page 2914.

RADIUS authentication with a FortiGate requires the following:

- Configuring one or more RADIUS server profiles on the FortiGate.
- Assigning the RADIUS server profile to a user or user group.
- Applying the user or user group to a firewall policy.

RADIUS authentication can be applied to many FortiGate functions, such as firewall authentication, SSL and IPsec VPNs, administrator profiles, ZTNA, explicit proxy, wireless, 802.1X, and more.

The RADIUS server uses a shared secret key with MD5 hashing to encrypt information passed between RADIUS servers and clients. Typically, only user credentials are encrypted. Additional security can be configured through IPsec tunnels by placing the RADIUS server behind another VPN gateway.

The following topics provide more information about RADIUS servers:

- Configuring a RADIUS server on page 2877
- Using multiple RADIUS servers on page 2880
- RADIUS AVPs and VSAs on page 2883
- RADIUS VSAs for captive portal redirects on page 2885
- Restricting RADIUS user groups to match selective users on the RADIUS server on page 2887
- Configuring RADIUS SSO authentication on page 2888
- RSA ACE (SecurID) servers on page 2895
- Support for Okta RADIUS attributes filter-Id and class on page 2899
- Sending multiple RADIUS attribute values in a single RADIUS Access-Request on page 2900
- Traffic shaping based on dynamic RADIUS VSAs on page 2901
- RADIUS Termination-Action AVP in wired and wireless scenarios on page 2909
- Configuring a RADSEC client on page 2914
- RADIUS integrated certificate authentication for SSL VPN on page 2918

Configuring a RADIUS server

A RADIUS server can be configured in the GUI by going to *User & Authentication* > *RADIUS Servers*, or in the CLI under `config user radius`.

Basic configuration

The following table summarizes the common RADIUS settings that can be configured in the GUI and CLI.

GUI field	CLI setting	Description
Name	`edit <name>`	Define the RADIUS server object within FortiOS.

GUI field	CLI setting	Description
Authentication method	`set auth-type {auto | ms_chap_v2 | ms_chap | chap | pap}`	Specify the authentication method, or select *Default*/`auto` to negotiate PAP, MSCHAP_v2, and CHAP in that order.
NAS IP	`set nas-ip <IPv4_address>`	Optional setting, also known as Calling-Station-Id. Specify the IP address the FortiGate uses to communicate with the RADIUS server. If left unconfigured, the FortiGate will use the IP address of the interface that communicates with the RADIUS server.
Include in every user group	`set all-usergroup {enable | disable}`	Optional setting to add the RADIUS server to each user group. This allows each user group to try and authenticate users against the RADIUS server if local authentication fails.
Primary Server		
IP/Name	`set server <string>`	Enter the IP address or resolvable FQDN of the RADIUS server.
Secret	`set secret <password>`	Enter the password used to connect to the RADIUS server.

There is an option in the GUI to configure a second server, and a third server can be configured in the CLI (see Using multiple RADIUS servers on page 2880).

Advanced settings

Advanced settings for RADIUS servers can be configured in the CLI. The following are some commonly used settings.

To edit the port used to connect with the RADIUS server:

```
config system global
    set radius-port <integer>
end
```

To edit the default setting for password encoding and username case sensitivity:

```
config user radius
    edit <name>
        set password-encoding {auto | ISO-8859-1}
        set username-case-sensitive {enable | disable}
    next
end
```

Command	Description
`password-encoding {auto | ISO-8859-1}`	Set the password encoding to use the original encoding or ISO-8859-1 (default = auto). The `auth-type` must be `auto` or `pap` to change this setting.
`username-case-sensitive {enable | disable}`	Enable/disable case sensitive usernames (default = disable).

To configure different transport protocols:

```
config user radius
    edit <name>
        set transport-protocol {udp | tcp | tls}
    next
end
```

Command	Description
`transport-protocol {udp | tcp | tls}`	Set the type of transport protocol to use: • `udp`: use UDP (default) • `tcp`: use TCP, but no TLS security • `tls`: use TLS over TCP

To configure a RADSEC client with TLS:

```
config user radius
    edit <name>
        set transport-protocol tls
        set ca-cert <string>
        set client-cert <string>
        set tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
        set server-identity-check {enable | disable}
    next
end
```

Command	Description
`ca-cert <string>`	Set the CA certificate of server to trust under TLS.
`client-cert <string>`	Set the client certificate to use under TLS.
`tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}`	Set the minimum supported protocol version for TLS connections: • `default`: follow the system global setting • `SSLv3`: use SSLv3 • `TLSv1`: use TLSv1 • `TLSv1-1`: use TLSv1.1 • `TLSv1-2`: use TLSv1.2
`server-identity-check {enable | disable}`	Enable/disable RADIUS server identity check, which verifies the server domain name/IP address against the server certificate (default = enable).

For RADSEC over TLS example configuration, see Configuring a RADSEC client on page 2914.

It is best practice to enable RadSec over TLS whenever the FortiGate and RADIUS connection must pass through unencrypted transport. When using TCP and UDP transport modes, it is recommended to ensure the FortiGate and RADIUS connection passes through a trusted network or the connection passes through an encrypted tunnel over untrusted networks.

RADIUS Connection

When using TCP or UDP as transport, it is possible for the RADIUS protocol to be compromised by the vulnerability described in CVE-2024-3596. In order to protect against this RADIUS vulnerability, as a RADIUS client, FortiGate will:

1. Force the validation of message authenticator.
2. Reject RADIUS response with unrecognized `proxy-state` attribute.

Message authenticator checking is made mandatory under UDP/TCP. It is not mandatory when using TLS.

Therefore, if FortiGate is using UDP/TCP mode without RADSEC, the RADIUS server should be patched to ensure the message authenticator attribute is used in its RADIUS messages. Check with your RADIUS server vendor for information about support for the message authenticator attribute.

In the case that the RADIUS server cannot be immediately patched, you may optionally disable message authenticator checking from the CLI under your RADIUS server configurations:

```
config user radius
    edit <server>
        set require-message-authenticator disable
    next
end
```

The `require-message-authenticator` setting is enable by default.

It is best practice to enable RadSec over TLS whenever the FortiGate and RADIUS connection must pass through unencrypted transport. When using TCP and UDP transport modes, it is recommended to ensure the FortiGate and RADIUS connection passes through a trusted network or the connection passes through an encrypted tunnel over untrusted networks.

Using multiple RADIUS servers

There are several ways to implement multiple RADIUS servers, and each has a different effect on user authentication. The three main options available are:

- Add a second (or third) RADIUS server in the same profile.
- Add a second RADIUS server profile, and add both to the same user group.
- Use two RADIUS server profiles for two user groups (one for each).

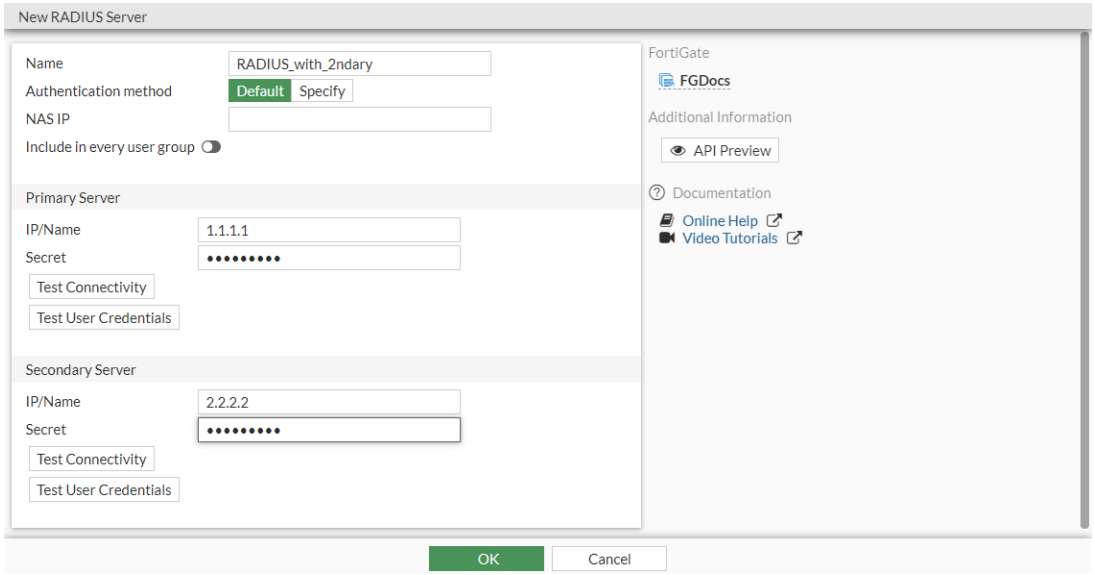
Adding a second server in a RADIUS profile

A second RADIUS server can be configured in the same RADIUS profile so in the event the first RADIUS server does not respond, the second server can be checked. If the first RADIUS server responds with an Access-Reject, no further servers are queried.

To add a second server in a RADIUS profile:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Enter the following:

Name	*RADIUS_with_2ndary*
Authentication method	*Default*
Primary Server	
IP/Name	*1.1.1.1*
Secret	Enter the password used to connect to the RADIUS server.
Secondary Server	
IP/Name	*2.2.2.2*
Secret	Enter the password used to connect to the RADIUS server.



3. Click *OK*.

Adding two RADIUS server profiles in the same user group

When two separate RADIUS profiles are added to a user group, the FortiGate sends an Access-Request simultaneously to both RADIUS servers, and authentication succeeds if either server sends back an Access-Accept. This example includes the settings from the previous example where one or more of the RADIUS server profiles has a secondary server configured.In this case, the secondary server in the *RADIUS_*

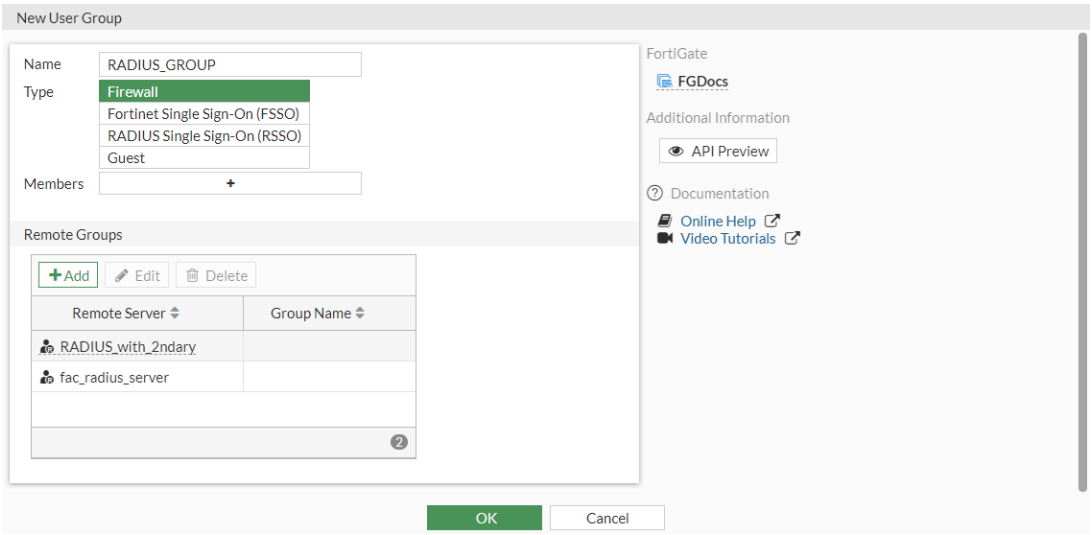
with_2ndary profile, 2.2.2.2, is only checked if the primary server of this profile times out and the *fac_radius_server* profile does not return an Access-Accept.

To add two RADIUS server profiles in the same user group:

1. Go to *User & Authentication* > *RADIUS Servers*, click *Create New*, and configure the RADIUS servers as needed (refer to the previous example).
2. Go to *User & Authentication* > *User Groups* and click *Create New*.
3. Enter the following:

Name	*RADIUS_GROUP*
Type	*Firewall*

4. In the *Remote Groups* table, click *Add*.
5. Select *RADIUS_with_2ndary* and click *OK*.
6. Click *Add*, select *fac_radius_server*, then click *OK*.



7. Click *OK*.

Using separate RADIUS server profiles for separate user groups

In this example, the FortiGate first evaluates if the user belongs to the first listed group (*radius_group*) in the policy. If the user fails to authenticate to this group, then the FortiGate checks if the user can successfully authenticate to the second user group (*radius_group_2*). Refer to the first and second examples for detailed instructions.

To use separate RADIUS server profiles for separate user groups:

1. Configure the RADIUS server profiles:
   a. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
   b. Configure two RADIUS servers, *fac_radius_server* and *RADIUS_with_2ndary*, as needed (refer to the previous example).

2. Configure the firewall groups:
   a. Go to *User & Authentication* > *User Groups* and click *Create New*.
   b. Configure two firewall groups, one named *radius_group* with remote server member *fac_radius_server*, and one named *radius_group_2* with remote server member *RADIUS_with_2ndary* (refer to the previous example).

Group Name	Group Type	Members	Ref.
radius_group	Firewall	fac_radius_server	1
radius_group_2	Firewall	RADIUS_with_2ndary	1

3. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Source*, click *User* then select *radius_group* and *radius_group_2*. Click *Address* and select *LAN address*.
   c. Configure the other settings as needed.
   d. Click *OK*.

Name	From	To	Source	Destination	Schedule	Service	Action	NAT
LAN to WAN	LAN (LAN)	WAN	radius_group radius_group_2 LAN address	all	always	ALL	ACCEPT	Enabled

RADIUS AVPs and VSAs

This topic describes RADIUS Attribute Value Pairs (AVPs) and Vendor-Specific Attributes (VSAs).

AVPs

RADIUS packets include a set of AVPs to identify information about the user, their location, and other information. The IETF defined a set of 255 standard attributes, which are well known and come in the form of Type, Length, Value (for more details, refer to RFC 2865). Of the standard 255, the FortiGate sends the following RADIUS attributes:

RADIUS attribute number	Name	Description
1	User-Name	Name of the user being authenticated by the RADIUS server.
4	NAS-IP-Address	IP address of the network access server (NAS) that is requesting authentication. The NAS is the FortiGate.
8	Framed-IP-Address	IP address to be configured for the user, by sending the IP address of a user to the RADIUS server in the Access-Request packet.
25	Class	Used in accounting packets and requests for firewall, WiFi, and proxy authentication. The attribute is returned in the Access-Accept message and is added to all accounting packets.
26	Fortinet-VSA	See VSAs.

RADIUS attribute number	Name	Description
32	NAS-Identifier	Identifier or IP address of the NAS that is requesting authentication. The NAS is the FortiGate.
42	Acct-Input-Octets	Number of octets received from the port over the course of this service being provided. Used to charge the user for the amount of traffic they used.
43	Acct-Output-Octets	Number of octets sent to the port while delivering this service. Used to charge the user for the amount of traffic they used.
44	Acct-Session-Id	Unique number assigned to each start and stop record to make it easy to match them, and to eliminate duplicate records.
55	Event-Timestamp	Records the time that the event occurred on the NAS. The timestamp is measured in seconds since January 1, 1970 00:00 UTC. Before the Event-Timestamp attribute can be sent in a packet, make sure that the correct time is set on the FortiGate.

VSAs

Some vendors want or need to send attributes that do not match any of the defined IETF attributes. This can be accomplished by using RADIUS attribute type 26, which allows a vendor to encapsulate their own specific attributes in this standard AVP.

In order to support VSAs, the RADIUS server requires a dictionary to define the VSAs. This dictionary is typically supplied by the client or server vendor.

The Fortinet RADIUS vendor ID is 12356 and contains the following attributes:

Attribute name	Attribute number	Attribute value format
Fortinet-Group-Name	1	String
Fortinet-Client-IP-Address	2	IP address
Fortinet-Vdom-Name*	3	String
Fortinet-Client-IPv6-Address	4	Octets
Fortinet-Interface-Name	5	String

* For Fortinet-Vdom-Name, users can be tied to a specific VDOM on the FortiGate. Refer to the documentation provided by your RADIUS server for configuration details.

RADIUS VSAs for captive portal redirects

RADIUS Vendor-Specific Attributes (VSA) for captive portal redirects provide a smoother user experience during captive portal redirects, especially in environments where vendor-specific attributes are heavily used, such as corporate networks or public Wi-Fi hotspots.

To configure RADIUS VSA for captive portal redirects:

1. Configure a RADIUS user:

```
config user radius
    edit "pc05"
        set server "172.16.200.55"
        set secret ***************
    next
end
```

2. Add the user to a group:

```
config user group
    edit "radius-group"
        set member "pc05"
    next
end
```

3. Configure the interface to use captive portal authentication and the group:

```
config system interface
    edit "port2"
        set security-mode captive-portal
        set security-groups "radius-group"
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "port2"
        set dstintf "mgmt"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set logtraffic all
        set nat enable
    next
end
```

5. To check the configuration, on a client PC:
   a. Use a browser to access a web server.
   b. Authenticate using RADIUS.
   c. Browse the redirect to https://www.fortinet.com.
   d. Check the list of authenticated users:

```
# diagnose firewall auth list

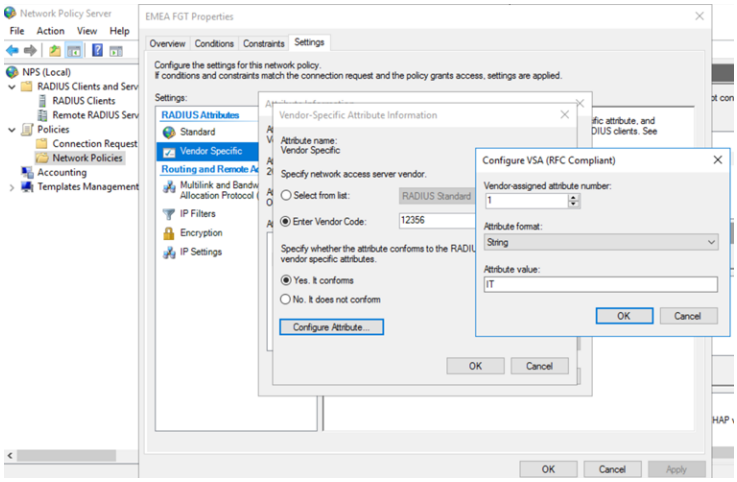
10.1.100.11, 962341
        src_mac: 00:0c:29:61:d4:13
        type: fw, id: 0, duration: 752, idled: 2
        expire: 298, allow-idle: 300
        flag(10): radius
        server: pc05
        packets: in 8531 out 7654, bytes: in 7972540 out 1104574
        group_id: 1
        group_name: radius-group

----- 1 listed, 0 filtered ------
```

Restricting RADIUS user groups to match selective users on the RADIUS server

When a user group is configured in FortiOS to authenticate against a RADIUS server, it will allow any valid user account on the RADIUS server to match that user group. Sometimes you might want to specify which users on the RADIUS server should match a particular user group on the FortiGate. This can be accomplished using the RADIUS attribute value pair (AVP) 26, known as a Vendor-Specific Attribute (VSA). This attribute allows the Fortinet-Group-Name VSA to be included in the RADIUS response. In FortiOS, the user group must be configured to specifically match this group.

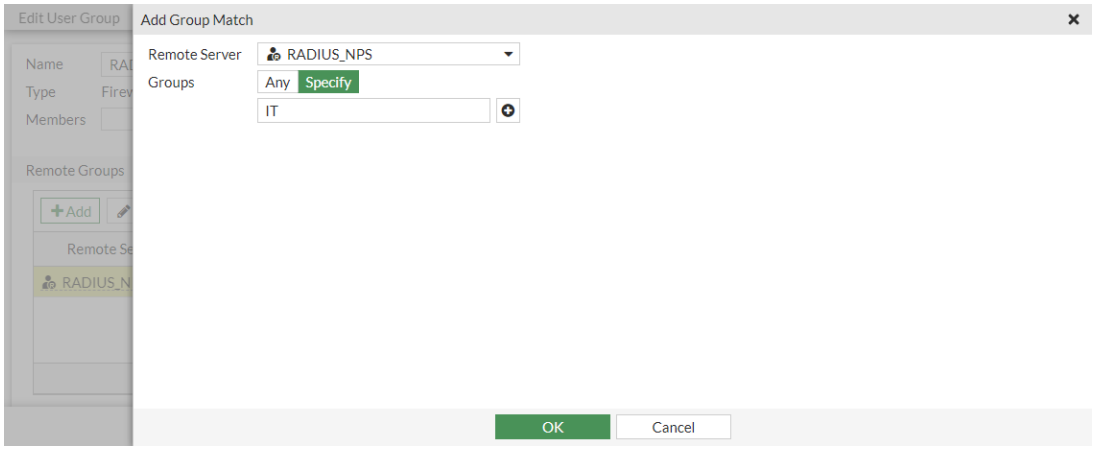
In the following example, a RADIUS Network Policy Server (NPS) has been configured to have the Fortinet-Group-Name be *IT*, and assumes that the user group, *RADIUS_IT* has been created, which authenticates to the *RADIUS_NPS* server.



To configure specific group matching in the GUI:

1. Go to *User & Authentication* > *User Groups* and edit the *RADIUS_IT* group.
2. In the *Remote Groups* table, select the *RADIUS_NPS* server and click *Edit*. The *Add Group Match* pane opens.

3. For *Groups*, select *Specify* and enter the group name configured on the RADIUS server (*IT*).
4. Click *OK*.



5. Click *OK*.

To configure specific group matching in the CLI:

```
config user group
    edit "RADIUS_IT"
        set member "RADIUS_NPS"
        config match
            edit 1
                set server-name "RADIUS_NPS"
                set group-name "IT"
            next
        end
    next
end
```

To change the matching back to any group, under `config match`, enter `delete 1`. Changing the `group-name` to `"Any"` will cause the FortiGate to match the Fortinet-Group-Name with the literal string, `Any`.

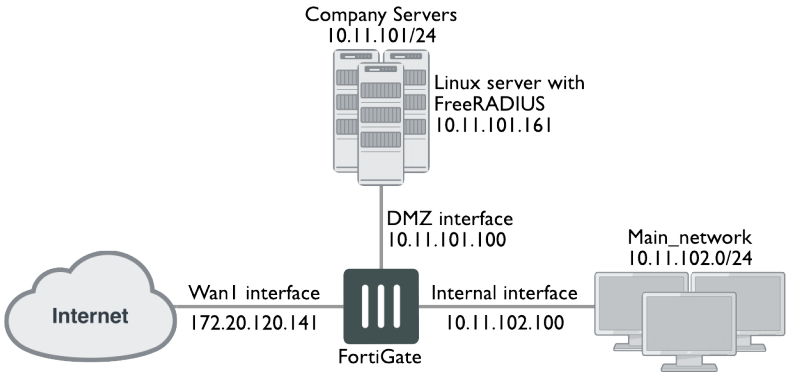
Configuring RADIUS SSO authentication

A common RADIUS SSO (RSSO) topology involves a medium-sized company network of users connecting to the Internet through the FortiGate and authenticating with a RADIUS server. The following describes how to configure FortiOS for this scenario. The example makes the following assumptions:

- VDOMs are not enabled.
- The super_admin account is used for all FortiGate configuration.
- A RADIUS server is installed on a server or FortiAuthenticator and uses default attributes.
- BGP is used for any dynamic routing.
- You have configured authentication event logging under *Log & Report*.

Example.com has an office with 20 users on the internal network who need access to the Internet. The office network is protected by a FortiGate-60C with access to the Internet through the wan1 interface, the user network on the internal interface, and all servers are on the DMZ interface. This includes an Ubuntu sever running FreeRADIUS. This example configures two users:

User	Account
Pat Lee	plee@example.com
Kelly Green	kgreen@example.com



Configuring this example consists of the following steps:

1. Configure RADIUS.
2. Configure FortiGate interfaces.
3. Configure a RSSO agent.
4. Create a RSSO user group.
5. Configure security policies.
6. Test the configuration.

To configure RADIUS:

Configuring RADIUS includes configuring a RADIUS server such as FreeRADIUS on user's computers and configuring users in the system. In this example, Pat and Kelly belong to the exampledotcom_employees group. After completing the configuration, you must start the RADIUS daemon. The users have a RADIUS client installed on their PCs that allow them to authenticate through the RADIUS server.

For any problems installing FreeRADIUS, see the FreeRADIUS documentation.

To configure FortiGate interfaces:

You must define a DHCP server for the internal network, as this network type typically uses DHCP. The wan1 and dmz interfaces are assigned static IP addresses and do not need a DHCP server. The following table shows the FortiGate interfaces used in this example:

Interface	Subnet	Act as DHCP server	Devices
wan1	172.20.120.141	No	Internet service provider

Interface	Subnet	Act as DHCP server	Devices
dmz	10.11.101.100	No	Servers including RADIUS server
internal	10.11.102.100	Yes: x.x.x.110-250	Internal user network

1. Go to *Network* > *Interfaces*.
2. Edit wan1:

Alias	Internet
Addressing Mode	Manual
IP/Network Mask	172.20.120.141/255.255.255.0
Administrative Access	HTTPS, SSH
Enable DHCP Server	Not selected
Comments	Internet
Administrative Status	Up

3. Click *OK*.
4. Edit dmz:

Alias	Servers
Addressing Mode	Manual
IP/Network Mask	10.11.101.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING, SNMP
Enable DHCP Server	Not selected
Listen for RADIUS Accounting Messages	Select
Comments	Servers
Administrative Status	Up

5. Click *OK*.
6. Edit internal:

Alias	Internal network
Addressing Mode	Manual
IP/Network Mask	10.11.102.100/255.255.255.0
Administrative Access	HTTPS, SSH, PING
Enable DHCP Server	Select
Address Range	10.11.102.110 - 10.11.102.250

Netmask	255.255.255.0
Default Gateway	Same as Interface IP
Comments	Internal network
Administrative Status	Up

To create a RADIUS SSO agent:

1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. Under *Endpoint/Identity*, select *RADIUS Single Sign-On Agent*.
4. Enable *Use RADIUS Shared Secret*. Enter the RADIUS server's shared secret.
5. Enable *Send RADIUS Responses*. Click *OK*.

To create a RADIUS SSO user group:

1. Go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. For *Type*, select *RADIUS Single Sign-On (RSSO)*.
4. In *RADIUS Attribute Value*, enter the name of the RADIUS user group that this local user group represents.
5. Click *OK*.

Configuring security policies

The following security policies are required for RADIUS SSO:

Sequence Number	From	To	Type	Schedule	Description
1	internal	wan1	RADIUS SSO	Business hours	Authenticate outgoing user traffic
2	internal	wan1	Regular	Always	Allow essential network services and VoIP
3	dmz	wan1	Regular	Always	Allow servers to access the Internet
4	internal	dmz	Regular	Always	Allow users to access servers
5	any	any	Deny	Always	Implicit policy denying all traffic that has not been matched

You must place the RADIUS SSO policy at the top of the policy list so that it is matched first. The only exception to this is if you have a policy to deny access to a list of banned users. In this case, you must put that policy at the top so that the RADIUS SSO does not mistakenly match a banned user or IP address.

You must configure lists before creating security policies.

Schedule

You must configure a business_hours schedule. You can configure a standard Monday to Friday 8 AM to 5 PM schedule, or whatever days and hours covers standard work hours at the company.

Address groups

You must configure the following address groups:

Name	Interface	Address range included
internal_network	internal	10.11.102.110 to 10.11.102.250
company_servers	dmz	10.11.101.110 to 10.11.101.250

Service groups

You must configure the service groups. The services listed are suggestions and you may include more or less as required:

Name	Interface	Description of services to be included
essential_network_services	internal	Any network protocols required for normal network operation such as DNS, NTP, BGP
essential_server_services	dmz	All the protocols required by the company servers such as BGP, HTTP, HTTPS, FTP, IMAP, POP3, SMTP, IKE, SQL, MYSQL, NTP, TRACEROUTE, SOCKs, and SNMP
user_services	internal	Any protocols required by users such as HTTP, HTTPS, FTP

The following security policy configurations are basic and only include logging and default AV and IPS. These policies allow or deny access to non-RADIUS SSO traffic. These are essential as network services including DNS, NTP, and FortiGuard require access to the Internet.

To configure security policies:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Configure the policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	wan1

Destination Address	all
Schedule	always
Service	essential_network_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	ON
Comments	Essential network services

4. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	dmz
Source Address	company_servers
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	essential_server_services
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Company servers accessing the Internet

5. Click *Create New*, and configure the new policy as follows, then click *OK*:

Incoming Interface	Internal
Source Address	internal_network
Outgoing Interface	dmz
Destination Address	company_servers
Schedule	always
Service	all
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, IPS
Log Allowed Traffic	enable
Comments	Access company servers

6. Click *Create New*, and configure the RADIUS SSO policy as follows, then click *OK*. This policy allows access for members of specific RADIUS groups.

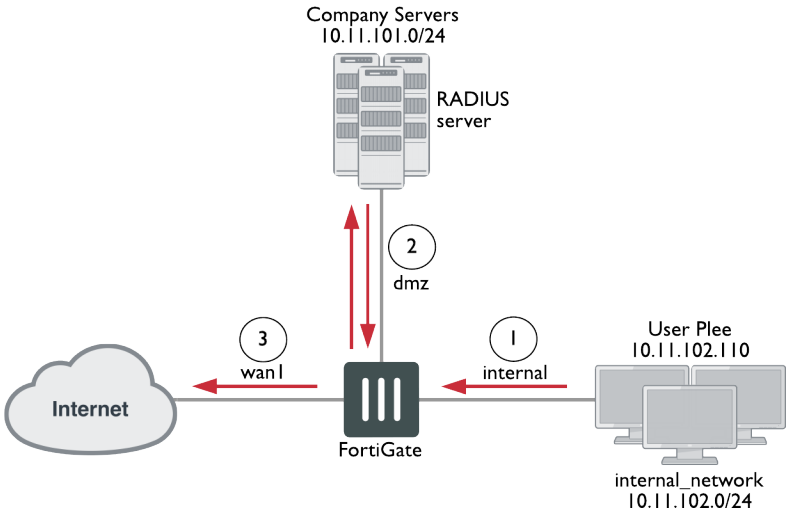
Incoming Interface	Internal
Source Address	internal_network
Source User(s)	Select the user groups that you created for RSSO.
Outgoing Interface	wan1
Destination Address	all
Schedule	business_hours
Service	ALL
Action	ACCEPT
NAT	ON
Security Profiles	ON: AntiVirus, Web Filter, IPS, and Email Filter. In each case, select the default profile.

7. Place the RSSO policy higher in the security policy list than more general policies for the same interfaces. Click *OK*.

To test the configuration:

Once configured, a user only needs to log in to their PC using their RADIUS account. After that, when they attempt to access the Internet, the FortiGate uses their session information to get their RADIUS information. Once the user is verified, they can access the website.

1. The user logs on to their PC and tries to access the Internet.
2. The FortiGate contacts the RADIUS server for the user's information. Once confirmed, the user can access the Internet. Each step generates logs that enable you to verify that each step succeeded.
3. If a step does not succeed, confirm that your configuration is correct.



RSA ACE (SecurID) servers

SecurID is a two-factor system produced by the company RSA that uses one-time password (OTP) authentication. This system consists of the following:

- Portable tokens that users carry
- RSA ACE/Server
- Agent host (the FortiGate)

When using SecurID, users carry a small device or "token" that generates and displays a pseudo-random password. According to RSA, each SecurID authenticator token has a unique 64-bit symmetric key that is combined with a powerful algorithm to generate a new code every 60 seconds. The token is time-synchronized with the SecurID RSA ACE/Server.

The RSA ACE/Server is the SecurID system's management component. It stores and validates the information about the SecurID tokens allowed on your network. Alternately, the server can be an RSA SecurID 130 appliance.

The agent host is the server on your network. In this case, this is the FortiGate, which intercepts user logon attempts. The agent host gathers the user ID and password entered from the SecurID token and sends the information to the RSA ACE/Server for validation. If valid, the RSA ACE/Server returns a reply indicating that it is a valid logon and FortiOS allows the user access to the network resources specified in the associated security policy.

Configuring SecurID with FortiOS consists of the following:

1. Configure the RSA and RADIUS servers to work with each other. See RSA server documentation.
2. Do one of the following:
   a. Configure the RSA SecurID 130 appliance.
   b. Configure the FortiGate as an agent host on the RSA ACE/Server.
3. Configure the RADIUS server in FortiOS.
4. Create a SecurID user group.
5. Create a SecurID user.
6. Configure authentication with SecurID.

The following instructions are based on RSA ACE/Server 5.1 and RSA SecurID 130 appliance. They assume that you have successfully completed all external RSA and RADIUS server configuration.

In this example, the RSA server is on the internal network and has an IP address of 192.168.100.102. The FortiOS internal interface address is 192.168.100.3. The RADIUS shared secret is fortinet123, and the RADIUS server is at IP address 192.168.100.202.

To configure the RSA SecurID 130 appliance:

1. Log on to the SecurID IMS console.
2. Go to *RADIUS* > *RADIUS clients*, then select *Add New*.

RADIUS Client Basics	
Client Name	FortiGate

	Associated RSA Agent	FortiGate
RADIUS Client Settings		
	IP Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
	Make / Model	Select *Standard Radius*.
	Shared Secret	Enter the RADIUS shared secret. In this example, it is fortinet123.
	Accounting	Leave unselected.
	Client Status	Leave unselected.

3. Configure your FortiGate as a SecurID client:
4. Click *Save*.

To configure the FortiGate as an agent host on the RSA ACE/Server:

1. On the RSA ACE/Server, go to *Start > Programs > RSA ACE/Server*, then *Database Administration - Host Mode*.
2. From the *Agent Host* menu, select *Add Agent Host*.
3. Configure the following:

Name	FortiGate
Network Address	Enter the FortiOS internal interface. In this example, it is 192.168.100.3.
Secondary Nodes	You can optionally enter other IP addresses that resolve to the FortiGate.

For more information, see the RSA ACE/Server documentation.

To configure the RADIUS server in FortiOS:

1. Go to *User & Authentication > RADIUS Servers*, then click *Create New*.
2. Configure the following:

Name		RSA
Authentication method		Select *Default*.
Primary Server		
	IP/Name	192.168.100.102. You can click *Test* to ensure the IP address is correct and that FortiOS can contact the RADIUS server.
	Secret	fortinet123

3. Click *OK*.

To create a SecurID user group:

1. Go to *User & Authentication* > *User Groups*. Click *Create New*.
2. Configure the following:

Name	RSA_group
Type	Firewall

3. In *Remote Groups*, click *Add*, then select the RSA server.
4. Click *OK*.

To create a SecurID user:

1. Go to *User & Authentication* > *User Definition*. Click *Create New*.
2. Configure the following:

User Type	Remote RADIUS User
Type	wloman
RADIUS Server	RSA
Contact Info	(Optional) Enter email or SMS information.
User Group	RSA_group

3. Click *Create*.

You can test the configuration by entering the `diagnose test authserver radius RSA auto wloman 111111111` command. The series of 1s is the OTP that your RSA SecurID token generates that you enter for access.

Configuring authentication with SecurID

You can use the SecurID user group in several FortiOS features that authenticate by user group:

- Security policy on page 2897
- IPsec VPN XAuth on page 2898
- PPTP VPN on page 2898
- SSL VPN

Unless stated otherwise, the following examples use default values.

Security policy

The example creates a security policy that allows HTTP, FTP, and POP3 traffic from the internal interface to WAN1. If these interfaces are not available in FortiOS, substitute other similar interfaces.

To configure a security policy with SecurID authentication:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.

3. Configure the following:

Incoming Interface	internal
Source Address	all
Source User(s)	RSA_group
Outgoing Interface	wan1
Destination Address	all
Schedule	always
Service	HTTP, FTP, POP3
Action	ACCEPT
NAT	On
Shared Shaper	If you want to limit traffic or guarantee minimum bandwidth for traffic that uses the SecurID security policy, enable and use the default shaper, guarantee-100kbps.
Log Allowed Traffic	Enable if you want to generate usage reports on traffic that this policy has authenticated.

4. Click *OK*.

IPsec VPN XAuth

In *VPN > IPsec Wizard*, select the SecurID user group on the *Authentication* page. The SecurID user group members must enter their SecurID code to authenticate.

PPTP VPN

When configuring PPTP in the CLI, set `usrgrp` to the SecurID user group.

SSL VPN

You must map the SecurID user group to the portal that will serve SecurID users and include the SecurID user group in the security policy's *Source User(s)* field.

To map the SecurID group to an SSL VPN portal:

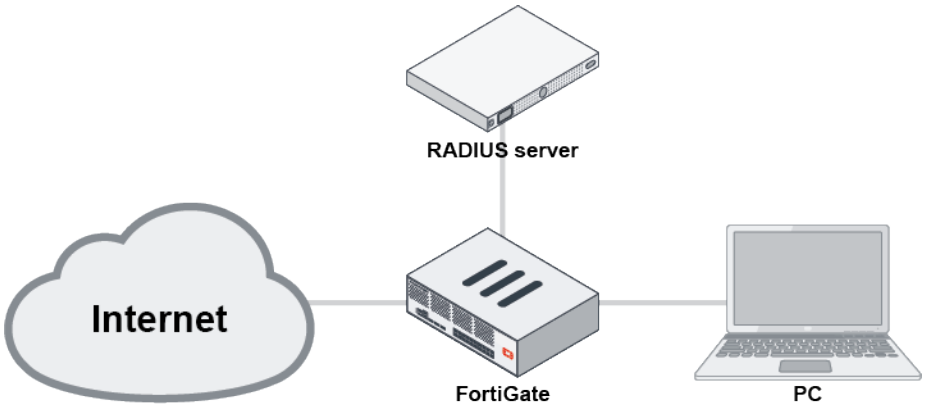
1. Go to *VPN > SSL-VPN Settings*.
2. Under *Authentication/Portal Mapping*, click *Create New*.
3. Configure the following:

Users/Groups	RSA_group
Portal	Select the desired portal.

4. Click *OK*.

Support for Okta RADIUS attributes filter-Id and class

RADIUS user group membership information can be returned in the filter-Id (11) and class (25) attributes in RADIUS Access-Accept messages. The group membership information can be used for group matching in FortiGate user groups in firewall policies and for FortiGate wildcard administrators with remote RADIUS authentication.



In this example, a FortiAuthenticator is used as the RADIUS server. A local RADIUS user on the FortiAuthenticator is configure with two groups in the filter-Id attribute: *okta-group1* and *okta-group2*.

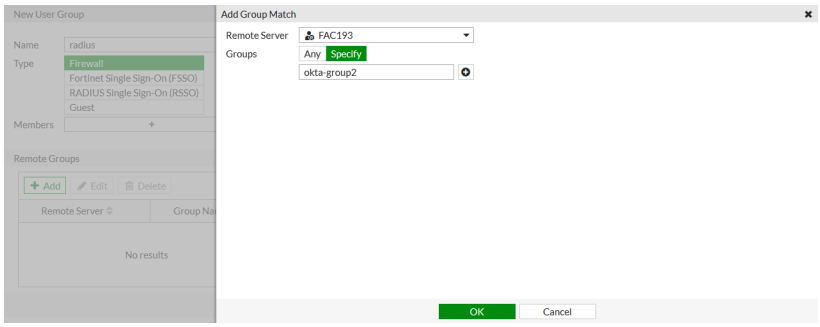
To create the RADIUS user and set the attribute type to override group information:

```
config user radius
    edit "FAC193"
        set server "10.1.100.189"
        set secret **********
        set group-override-attr-type filter-Id
    next
end
```

FortiOS will only use the configured filter-Id attribute, even if the RADIUS server sends group names in both class and filter-id attributes. To return group membership information from the class attribute instead, set `group-override-attr-type` to `class`.

To configure group match in the user group:

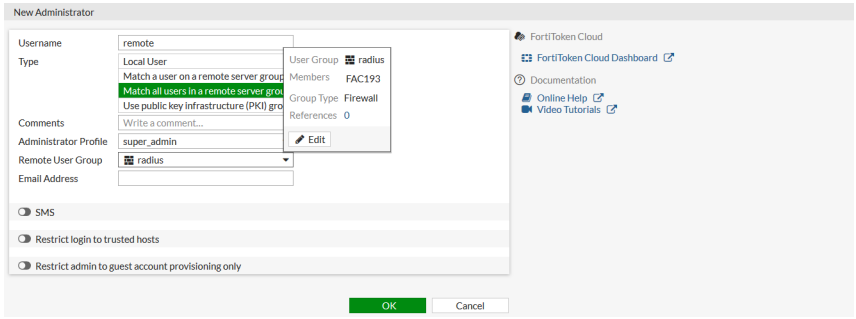
1. Go to *User & Authentication > User Groups*.
2. Click *Create New*.
3. Enter a name for the group, and set *Type* to *Firewall*.
4. In the *Remote Groups* table, click *Add*.
5. Set *Remote Server* to the just created RADIUS server, *FAC193*.
6. Set *Groups* to *Specify*, and enter the group name, `okta-group2`. The string must match the group name configured on the RADIUS server for the filter-Id attribute.



7. Click *OK*.
   The remote server is added to the *Remote Groups* table.
8. Click *OK*.
9. Add the new user group to a firewall policy and generate traffic on the client PC that requires firewall authentication, such as connecting to an external web server.
10. After authentication, on the FortiGate, verify that traffic is authorized in the traffic log:
    a. Go to *Log & Report* > *Forward Traffic*.
    b. Verify that the traffic was authorized.

To use the remote user group with group match in a system wildcard administrator configuration:

1. Go to *System* > *Administrators*.
2. Edit an existing administrator, or create a new one.
3. Set *Type* to *Match all users in a remote server group*.
4. Set *Remote User Group* to the remote server.



5. Configure the remaining settings as required.
6. Click *OK*.
7. Log in to the FortiGate using the remote user credentials on the RADIUS server.
   If the correct group name is returned in the filter-Id attribute, administrative access is allowed.

Sending multiple RADIUS attribute values in a single RADIUS Access-Request

A managed FortiSwitch can be configured to send multiple RADIUS attribute values in a single RADIUS Access-Request. This option is configured per RADIUS user, and is set to none by default.

The available service type options are:

login	User should be connected to a host.
framed	User use Framed Protocol.
callback-login	User disconnected and called back.
callback-framed	User disconnected and called back, then a Framed Protocol.
outbound	User granted access to outgoing devices.
administrative	User granted access to the administrative unsigned interface.
nas-prompt	User provided a command prompt on the NAS.
authenticate-only	Authentication requested, and no authentication information needs to be returned.
callback-nas-prompt	User disconnected and called back, then provided a command prompt.
call-check	Used by the NAS in an Access-Request packet, Access-Accept to answer the call.
callback-administrative	User disconnected and called back, granted access to the admin unsigned interface.

To configure a managed FortiSwitch to the RADIUS attributes login, framed, and authenticate-only all at the same time:

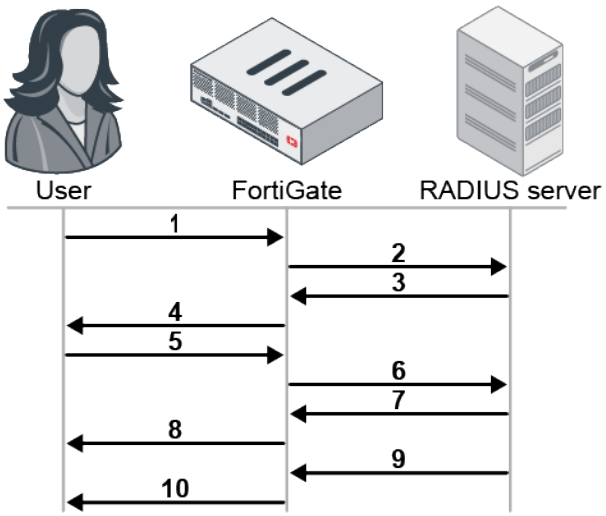
```
config user radius
    edit "Radius_Server"
        set switch-controller-service-type login framed authenticate-only
        ....
    next
end
```

Traffic shaping based on dynamic RADIUS VSAs

A FortiGate can use the WISPr-Bandwidth-Max-Down and WISPr-Bandwidth-Max-Up dynamic RADIUS VSAs (vendor-specific attributes) to control the traffic rates permitted for a certain device. The FortiGate can apply different traffic shaping to different users who authenticate with RADIUS based on the returned RADIUS VSA values. When the same user logs in from an additional device, the RADIUS server will send a CoA (change of authorization) message to update the bandwidth values to 1/*N* of the total values, where *N* is the number of logged in devices from the same user.

This feature is not supported on NP hardware. NP offloading is automatically disabled on the policy if this feature is enabled.

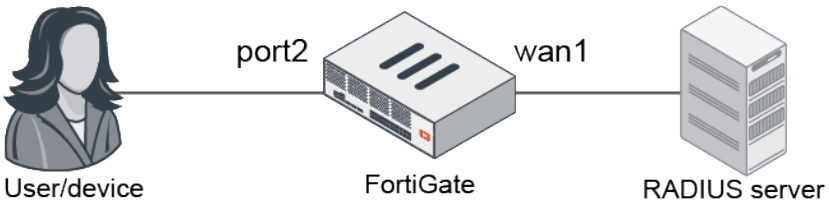
When a user logs in to two devices through RADIUS authentication. The authentication and authorization flow is as follows:



1. The user logs in to a device and the authentication is sent to the FortiGate.
2. The FortiGate sends the Access-Request message to the RADIUS server.
3. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs.
4. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds based on its IP.
5. The user logs in to a second device and the authentication is sent to the FortiGate.
6. The FortiGate sends the Access-Request message to the RADIUS server.
7. The RADIUS server sends the Access-Accept message to the FortiGate. The server also returns the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs at half the value from the first device.
8. Based on the VSA values, the FortiGate applies traffic shaping for the upload and download speeds on the second device based on its IP.
9. The RADIUS server sends a CoA message and returns WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs for the first device at half the value.
10. Based on the VSA values, the FortiGate updates traffic shaping for the upload and download speeds on the first device based on its IP.

Example

In this example, the FortiGate is configured to dynamically shape user traffic based on the WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down VSAs returned by the RADIUS server when the user logs in through firewall authentication.



To configure traffic shaping based on dynamic RADIUS VSAs:

1. Configure the RADIUS server users file to identify WISPr-Bandwidth-Max-Up and WISPr-Bandwidth-Max-Down:

The WISPr-Bandwidth is measured in bps, and the FortiOS dynamic shaper is measured in Bps.

```
WISPr-Bandwidth-Max-Up = 1004857,
WISPr-Bandwidth-Max-Down = 504857,
```

2. In FortiOS, configure the RADIUS server:

```
config user radius
    edit "rad1"
        set server "172.16.200.44"
        set secret ************
        set radius-coa enable
        set acct-all-servers enable
        config accounting-server
            edit 1
                set status enable
                set server "172.16.200.44"
                set secret ************
            next
        end
    next
end
```

3. Configure the RADIUS user group:

```
config user group
    edit "group_radius"
        set member "rad1"
    next
end
```

4. Configure the firewall policy with dynamic shaping and the RADIUS group:

```
config firewall policy
    edit 2
        set srcintf "port2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all6"
        set dstaddr6 "all6"
        set action accept
        set schedule "always"
        set service "ALL"
        set dynamic-shaping enable
```

```
        set groups "group_radius"
        set nat enable
    next
end
```

Verification

After a client PC is authenticated by the RADIUS server, dynamic shaping is applied to the client based on the IP address.

Use the following commands to monitor the dynamic shaper:

```
# diagnose firewall shaper dynamic-shaper stats
```

```
# diagnose firewall shaper dynamic-shaper list {ip | ipv6 | user} <address or username>
```

Use case 1

User1 is paying for rate plan A that limits their maximum bandwidth to 10 Mbps download and 5 Mbps upload. User2 is paying for rate plan B that limits their maximum bandwidth to 5 Mbps download and 5 Mbps upload. The speeds in both plans are provided by best effort, so there is no guaranteed minimum bandwidth.

User1 logs in to pc1 with RADIUS authentication and IP-based dynamic shaping is applied. User2 logs in to pc2 with RADIUS authentication and IP-based dynamic shaping is applied.

To verify the dynamic shaping:

1. On pc1, verify the bandwidth and transfer speed:

```
root@pc1:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
------------------------------------------------------------
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size:  208 KByte (default)
------------------------------------------------------------
[  3] local 10.1.100.11 port 50510 connected with 172.16.200.44 port 5001
[ ID] Interval       Transfer     Bandwidth
[  3]  0.0-25.0 sec  59.6 MBytes  20.0 Mbits/sec
[  3] Sent 42518 datagrams
[  3] Server Report:
[  3]  0.0-25.3 sec  30.1 MBytes  9.99 Mbits/sec  15.651 ms 21058/42518 (50%)
```

2. On pc2, verify the bandwidth and transfer speed:

```
root@pc2:~# iperf -c 172.16.200.44 -u -t 25 -b 20M
------------------------------------------------------------
Client connecting to 172.16.200.44, UDP port 5001
Sending 1470 byte datagrams
UDP buffer size:  208 KByte (default)
```

```
------------------------------------------------------------
[  3] local 10.1.100.22 port 52814 connected with 172.16.200.44 port 5001
[ ID] Interval       Transfer     Bandwidth
[  3]  0.0-25.0 sec  59.6 MBytes  20.0 Mbits/sec
[  3] Sent 42518 datagrams
[  3] Server Report:
[  3]  0.0-25.3 sec  15.1 MBytes  5.03 Mbits/sec  15.652 ms 31710/42514 (75%)
```

3. In FortiOS, check the authentication list:

```
# diagnose firewall auth  list
10.1.100.11, test-shaper1
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 38, idled: 16
        expire: 562
        flag(814): hard radius no_idle
        server: rad1
        packets: in 8207 out 3999, bytes: in 12306164 out 226963
        group_id: 3
        group_name: group_radius
10.1.100.22, test-shaper2
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 24, idled: 24
        expire: 156, max-life: 35976
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 5, bytes: in 0 out 300
        group_id: 3
        group_name: group_radius
----- 2 listed, 0 filtered ------
```

4. Check the dynamic shaper list:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 1237072 Bps/0 Bps
allow packets(original/reply): 38524/14
allow bytes(original/reply): 55270378/11285
drop packets(original/reply): 10136/0
drop bytes(original/reply): 13516198/0
life: 441
idle: 0/40
idle time limit: 600 s

addr: 10.1.100.22
bandwidth(original/reply): 625000 Bps/625000 Bps
current bandwidth(original/reply): 622909 Bps/0 Bps
allow packets(original/reply): 3232/3
allow bytes(original/reply): 4841536/243
drop packets(original/reply): 2753/0
drop bytes(original/reply): 4123994/0
```

```
life: 10
idle: 0/10
idle time limit: 36000 s
```

5. Check the session list:

```
# diagnose sys session list
session info: proto=6 proto_state=05 duration=3 expire=116 timeout=3600 flags=00000004
socktype=4 sockport=10001 av_idx=0 use=4

        [0:0x0:0/(0,65535)->(0,65535)] helper:auto
```

Use case 2

A user logs in to a device (pc1, 10.1.100.11) and has a maximum bandwidth of 10 Mbps download and 5 Mbps upload. The same user logs in to a second device (pc2, 10.1.100.22) and the RADIUS server sends a CoA request with the WISPr-Bandwidth-Max to pc1. The maximum bandwidth on pc1 changes to 5 Mbps download and 2.5Mbps upload. On pc2, the maximum bandwidth is also 5 Mbps download and 2.5Mbps upload.

When the user logs out from pc1, the RADIUS server sends CoA request with the new WISPr-Bandwidth-Max for pc2. The FortiGate updates the authentication user list and dynamic shaper for pc2. The maximum bandwidth on pc2 changes to 10 Mbps download and 5 Mbps upload.

To verify the dynamic shaping:

1. Check the dynamic shaper list after the user logs in to pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 491
idle: 4/4
idle time limit: 86400 s
```

2. Check the dynamic shaper list after the user logs in to pc2:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.11
bandwidth(original/reply): 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
```

```
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 652
idle: 5/5
idle time limit: 600 s

addr: 10.1.100.22
bandwidth(original/reply): 625000 Bps/312500 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/3
allow bytes(original/reply): 0/243
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
life: 3
idle: 3/3
idle time limit: 86400 s
```

3. Check the authentication list:

```
# diagnose firewall auth list
10.1.100.11, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 171, idled: 11
        expire: 589, max-life: 589
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 15
        group_name: group_radius
10.1.100.22, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 9, idled: 9
        expire: 86391
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 15
        group_name: group_radius
----- 2 listed, 0 filtered ------
```

4. Check the dynamic shaper list after the user logs out from pc1:

```
# diagnose firewall shaper dynamic-shaper list
addr: 10.1.100.22
bandwidth(original/reply): 1250000 Bps/625000 Bps
current bandwidth(original/reply): 0 Bps/0 Bps
allow packets(original/reply): 0/0
allow bytes(original/reply): 0/0
drop packets(original/reply): 0/0
drop bytes(original/reply): 0/0
```

```
life: 414
idle: 9/9
idle time limit: 600 s
```

5. Check the authentication list again:

```
# diagnose firewall auth  list
10.1.100.22, test
        src_mac: **:**:**:**:**:**
        type: fw, id: 0, duration: 453, idled: 49
        expire: 551, max-life: 551
        flag(814): hard radius no_idle
        server: rad1
        packets: in 0 out 0, bytes: in 0 out 0
        group_id: 15
        group_name: group_radius
----- 1 listed, 0 filtered ------
```

RADIUS Termination-Action AVP in wired and wireless scenarios

When authenticating with RADIUS in a wired or wireless scenario, the FortiGate can support proper handling of the Termination-Action AVP.

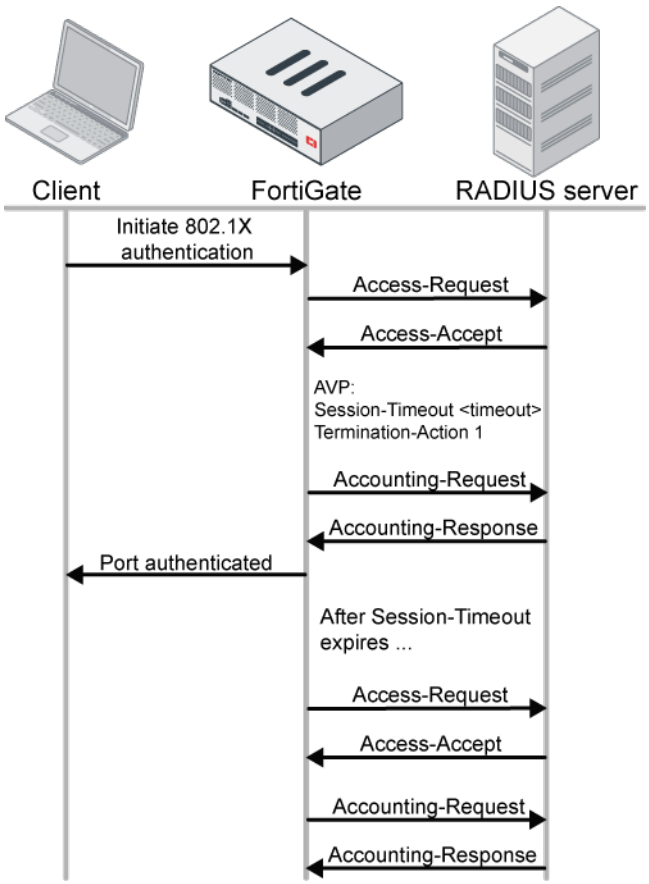
In a wired scenario, a hardware switch configured with 802.1X security authentication can read the Termination-Action attribute value from the RADIUS Access-Accept response. If the Termination-Action is 1, the FortiGate will initiate re-authentication when the session time has expired. During re-authentication, the port stays authorized. If the Termination-Action is 0, the session will be terminated.

In a wireless scenario, when a virtual AP is configured with WPA2-Enterprise security with RADIUS and has CoA enabled, it processes the RADIUS CoA request immediately upon receiving it and re-authenticates when the Termination-Action is 1.

Wired example

This example has a FortiGate configured with a hardware switch with two ports: port3 and port5. The hardware switch is enabled with 802.1X security and assigned to a RADIUS user group. Upon a successful authentication, the RADIUS server responds with an Access-Accept containing the authentication Session-Timeout and Termination-Action attributes. In this example, the Termination-Action value is 1, which informs the client to re-authenticate when the session time expires. During this time, the FortiGate keeps the client/port authorized while it initiates the re-authentication with the RADIUS server.

The message exchange is as follows:



To configure the RADIUS server and the FortiGate to handle the Termination-Action AVP:

1. On the RADIUS server, configure the Termination-Action AVP with the value `RADIUS-Request (1)` to indicate that re-authentication should occur upon expiration of the Session-Time.
2. On the FortiGate, configure the RADIUS server:

```
config user radius
    edit "rad1"
        set server "172.18.60.203"
        set secret ENC **********
        set radius-coa enable
        config accounting-server
            edit 1
                set status enable
                set server "172.18.60.203"
                set secret ENC **********
            next
        end
    next
end
```

3. Configure the RADIUS user group:

```
config user group
    edit "group_radius"
        set member "rad1"
    next
end
```

4. Configure the hardware switch with 802.1X enabled.
   a. Configure the virtual switch settings:

```
config system virtual-switch
    edit hw2
        set physical-switch "sw0"
        config port
            edit port3
            next
            edit port5
            next
        end
    next
end
```

   b. Configure the interface settings:

```
config system interface
    edit hw2
        set vdom vdom1
        set ip 6.6.6.1 255.255.255.0
        set allowaccess ping https ssh
        set stp enable
        set security-mode 802.1X
        set security-groups "group_radius"
    next
end

WARNING: Changing 802.1X could interrupt network connectivity on affected interfaces.
Do you want to continue? (y/n)y
```

5. On the client device, initiate 802.1X authentication, then verify that the switch port shows as authorized:

```
# diagnose sys 802-1x status
Virtual switch 'hw2' (default mode) 802.1x member status:
  port3: Link up, 802.1X state: unauthorized
  port5: Link up, 802.1X state: authorized
```

6. After successful authentication, wait for the session to timeout.
7. The FortiGate will keep the 802.1X port authenticated, and initiate re-authentication with the same Acct-Session-Id to the RADIUS server. The 802.1X status of the port remains unchanged:

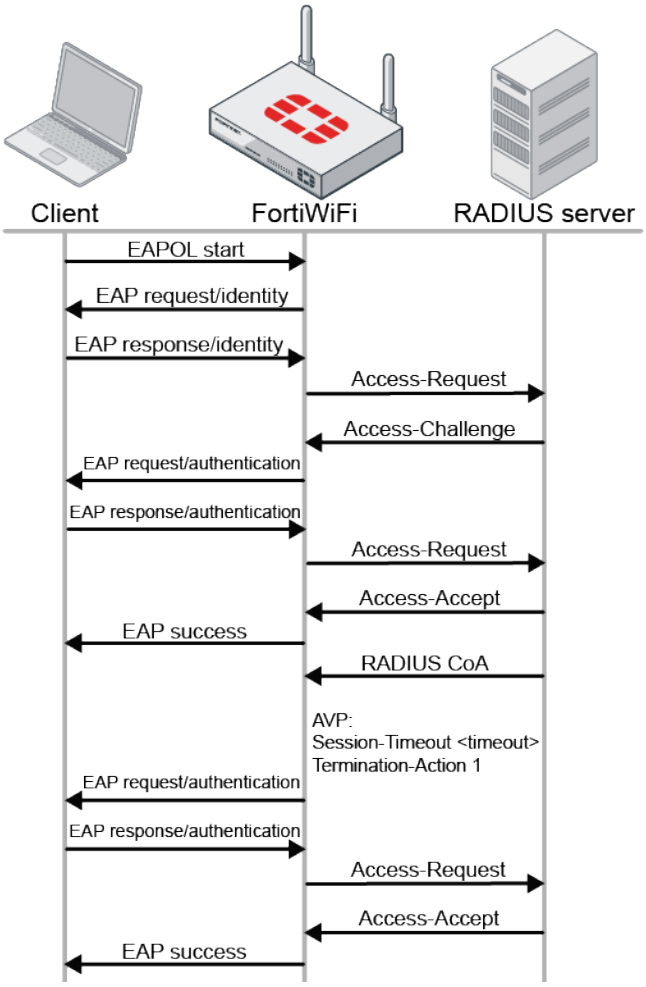
```
# diagnose sys 802-1x status
Virtual switch 'hw2' (default mode) 802.1x member status:
```

```
port3: Link up, 802.1X state: unauthorized
port5: Link up, 802.1X state: authorized
```

Wireless example

In this example, a virtual AP is configured with WPA2-Enterprise security with RADIUS and has CoA enabled. After a wireless user authenticates and connects to the wireless SSID, the RADIUS server triggers a CoA event with AVPs Session-timeout and a Termination-Action of 1. This signals the FortiGate to trigger re-authentication of the client, which the client immediately performs to stay connected to the wireless SSID.

The message exchange is as follows:



To configure the FortiGate to handle the Termination-Action AVP:

1. Configure the RADIUS server:

```
config user radius
    edit "peap"
```

```
        set server "172.16.200.55"
        set secret **********
        set radius-coa enable
    next
end
```

2. Configure the VAP:

```
config wireless-controller vap
    edit "wifi"
        set ssid "FWF-60E-coa"
        set security wpa2-only-enterprise
        set auth radius
        set radius-server "peap"
        set schedule "always"
    next
end
```

3. Verify that the wireless station connects to the SSID:

```
# diagnose wireless-controller wlac -d sta online
   vf=0 wtp=1 rId=1 wlan=wifi vlan_id=0 ip=10.10.80.2 ip6=:: mac=**:**:**:**:**:** vci=
host=wifi-qa-01 user=test1 group=group1 signal=-28 noise=-95 idle=1 bw=0 use=6 chan=149 radio_
type=11AC security=wpa2_only_enterprise mpsk= encrypt=aes cp_authed=no online=yes mimo=2
```

4. From the RADIUS server, manually trigger a RADIUS CoA event.
   a. RADIUS CoA sent to the FortiGate:

```
Sent CoA-Request Id 7 from 0.0.0.0:54158 to 172.16.200.201:3799 length 39
    User-Name = "test1"
    Session-Timeout = 120
    Termination-Action = RADIUS-Request
```

   b. RADIUS CoA-ACK received from the FortiGate:

```
Received CoA-ACK Id 7 from 172.16.200.201:3799 to 0.0.0.0:0 length 44
    Event-Timestamp = "Jan  5 2022 14:43:12 PST"
    Message-Authenticator = 0x3311ba3b763d68da653ab34351b0308
```

5. On the wireless station console, verify that the re-authentication happens immediately:

```
root@wifi-qa-01:/home/wpa-test# wlan1: CTRL-EVENT-EAP-STARTED EAP authentication started
wlan1: CTRL-EVENT-EAP-PROPOSED-METHOD vendor=0 method=25
wlan1: CTRL-EVENT-EAP-METHOD EAP vendor 0 method 25 (PEAP) selected
EAP-TLV: TLV Result - Success - EAP-TLV/Phase2 Completed
wlan1: CTRL-EVENT-EAP-SUCCESS EAP authentication completed successfully
wlan1: PMKSA-CACHE-REMOVED **:**:**:**:**:** 0
wlan1: PMKSA-CACHE-ADDED **:**:**:**:**:** 0
wlan1: WPA: Key negotiation completed with **:**:**:**:**:** [PTK=CCMP GTK=CCMP]
```

Configuring a RADSEC client

FortiOS supports RADSEC clients in order to secure the communication channel over TLS for all RADIUS traffic, including RADIUS authentication and RADIUS accounting over port 2083. A FortiGate acting as a TLS client can initiate the TLS handshake with a remote RADIUS server. Administrators can specify a client certificate, perform a server identity check (enabled by default), and verify against a particular trust anchor (CA certificate). During a TLS handshake, the SNI check will use the RADIUS server FQDN if configured.

TCP connections are also supported, which use port 1812 for authentication and port 1813 for accounting.

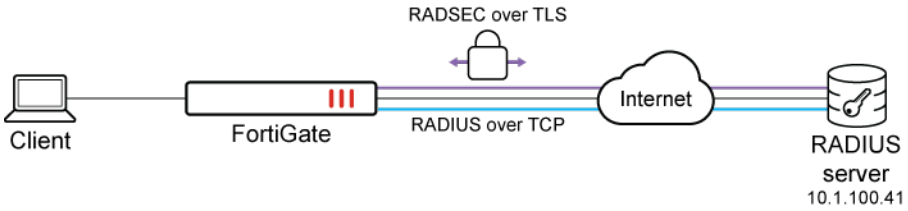
```
config user radius
    edit <name>
        set transport-protocol {udp | tcp | tls}
        set ca-cert <string>
        set client-cert <string>
        set tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}
        set server-identity-check {enable | disable}
    next
end
```

`transport-protocol {udp | tcp | tls}`	Set the type of transport protocol to use: • `udp`: use UDP (default) • `tcp`: use TCP, but no TLS security • `tls`: use TLS over TCP
`ca-cert <string>`	Set the CA certificate of server to trust under TLS.
`client-cert <string>`	Set the client certificate to use under TLS.
`tls-min-proto-version {default | SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2}`	Set the minimum supported protocol version for TLS connections: • `default`: follow the system global setting • `SSLv3`: use SSLv3 • `TLSv1`: use TLSv1 • `TLSv1-1`: use TLSv1.1 • `TLSv1-2`: use TLSv1.2
`server-identity-check {enable | disable}`	Enable/disable RADIUS server identity check, which verifies the server domain name/IP address against the server certificate (default = enable).

It is best practice to enable RadSec over TLS whenever the FortiGate and RADIUS connection must pass through unencrypted transport. When using TCP and UDP transport modes, it is recommended to ensure the FortiGate and RADIUS connection passes through a trusted network or the connection passes through an encrypted tunnel over untrusted networks.

Examples

The following topology is used to demonstrate configurations using RADSEC over TLS and RADIUS over TCP.



Example 1: RADSEC over TLS

When using TLS, FortiOS uses port 2083 for RADIUS authentication and RADIUS accounting. There is no need to configure the RADIUS accounting separately.

Before configuring RADSEC over TLS, make sure that the CA certificate (which issues the remote RADIUS server certificate) is imported into the FortiGate trusted root store. If a customized local FortiGate client certificate is used, both the certificate and private key are imported into local FortiGate certificate store.

To configure RADSEC over TLS:

1. Configure the RADIUS server:

```
config user radius
    edit "radius-tls"
        set server "10.1.100.41"
        set secret ********
        set acct-interim-interval 600
        set radius-port 2083
        set auth-type pap
        set transport-protocol tls
        set ca-cert "CA_Cert_2"
        set client-cert "portal.fortinet-fsso"
        config accounting-server
            edit 1
                set status enable
                set server "10.1.100.41"
                set secret ********
            next
        end
    next
end
```

2. Enable fnbamd debug messages on the FortiGate to verify the RADIUS authentication triggered by client traffic requesting access to external networks, which requires user authentication by the firewall policy. Note the highlighted initial RADSEC TLS authentication, successfully completed TLS handshake, and RADIUS accounting using TLS over port 2083:

```
# diagnose debug application fnbamd -1
Debug messages will be on for 30 minutes.

# diagnose debug enable
...
[629] __fnbamd_cfg_add_radius_by_user-
[1726] fnbamd_match_and_update_auth_user-Found a matching user in CMDB 'test1'
[462] fnbamd_rad_get-vfid=0, name='radius-tls'
[635] __fnbamd_cfg_add_radius_by_user-Loaded RADIUS server 'radius-tls' for user 'test1'
(16777236)
[905] fnbamd_cfg_get_radius_list-Total rad servers to try: 1
...
[806] __fnbamd_rad_get_next_addr-Next available address of rad 'radius-tls': 10.1.100.41:2083.

[758] __rad_rxtx-Start rad conn timer.
...
```

Example 2: RADIUS over TCP

When using TCP, the default RADIUS ports remain same as with UDP: 1812 for authentication and 1813 for accounting.

To configure RADIUS over TCP:

1. Configure the RADIUS server:

```
config user radius
    edit "radius-tcp"
        set server "10.1.100.41"
        set secret ********
        set acct-interim-interval 600
        set transport-protocol tcp
        config accounting-server
            edit 1
                set status enable
                set server "10.1.100.41"
                set secret ********
            next
        end
    next
end
```

2. Enable fnbamd debug messages on the FortiGate to verify the RADIUS authentication triggered by client traffic requesting access to external networks, which requires user authentication by the firewall policy. Note the highlighted initial RADIUS authentication over TCP: 1812 and initial RADIUS accounting over TCP: 1813:

```
# diagnose debug application fnbamd -1
Debug messages will be on for 30 minutes.

# diagnose debug enable
...

[806] __fnbamd_rad_get_next_addr-Next available address of rad 'radius-tcp': 10.1.100.41:1812.
[981] __auth_ctx_start-Connection starts radius-tcp:10.1.100.41, addr 10.1.100.41:1812 proto:
TCP
[449] __rad_tcps_open-vfid 0, addr 10.1.100.41, src_ip (null), ssl_opt 0
...
[1772] handle_req-r=4
[418] __rad_tcps_connect-tcps_connect(10.1.100.41) is established.
[716] __rad_rxtx-fd 10, state 1(Auth)
...
[565] fnbamd_rad_make_access_request-
[329] __create_access_request-Compose RADIUS request
[549] __create_access_request-Created RADIUS Access-Request. Len: 139.
[572] __rad_tcps_send-Sent 139/139.
[574] __rad_tcps_send-Sent all. Total 139.
[749] __rad_rxtx-Sent radius req to server 'radius-tcp': fd=10, IP=10.1.100.41
```

```
(10.1.100.41:1812) code=1 id=40 len=139
[758] __rad_rxtx-Start rad conn timer.
...
[806] __fnbamd_rad_get_next_addr-Next available address of rad 'radius-tcp': 10.1.100.41:1813.
[981] __auth_ctx_start-Connection starts radius-tcp:10.1.100.41, addr 10.1.100.41:1813 proto:
TCP
[449] __rad_tcps_open-vfid 0, addr 10.1.100.41, src_ip (null), ssl_opt 0
...
[1393] create_acct_session-Acct type 6 session created, 0x982b280
[418] __rad_tcps_connect-tcps_connect(10.1.100.41) is established.

[758] __rad_rxtx-Start rad conn timer.
...
```

RADIUS integrated certificate authentication for SSL VPN

Secure connections to SSL VPNs can be established using certificate-based authentication. Access can be granted to the user by using the content inside the Subject Alternative Name (SAN) of the user certificate to authenticate to the RADIUS server. An extra layer of security is added by ensuring that only users with valid certificates can access the VPN.

Certificate-based authentication with RADIUS supports UserPrincipalName (UPN), RFC822 Name (corporate email address) defined in the SAN extension of the certificate, the DNS defined in the user certificate as the unique identifier in the SAN field for peer user certificates, and the Subject Common Name (CN) defined in the certificate.

```
config user radius
    edit <name>
        set account-key-processing {same | strip}
        set account-key-cert-field {othername | rfc822name | dnsname | cn}
    next
end
```

`account-key-processing {same | strip}`	Account key processing operation. The FortiGate will keep either the whole domain or strip the domain from the subject identity. • `same`: Same as subject identity field (default). • `strip`: Strip domain string from subject identity field.
`account-key-cert-field {othername | rfc822name | dnsname}`	Define subject identity field in certificate for user access right checking. • `othername`: match to UPN in SAN (default). • `rfc822name`: match to RFC822 email address in SAN. • `dnsname`: match to DNS name in SAN. • `cn`: match to CN in subject.

The RADIUS server configurations are applied to the user peer configuration when the PKI user is configured.

```
config user peer
    edit <name>
        set ca <string>
        set subject <string>
        set cn <string>
        set mfa-mode subject-identity
        set mfa-server <string>
    next
end
```

When a user authenticates to FortiGate over SSL VPN, the user presents a user certificate signed by a trusted CA to FortiGate. This CA should also be trusted by the FortiGate. See CA certificate for more information about importing a CA certificate to FortiGate trusted CA store. The following sequence of events occurs as the FortiGate processes the certificate for authentication:

1. The FortiGate checks whether the certificate is issued by a trusted CA. If the CA is not a public CA, FortiGate ensures that the CA certificate is uploaded and trusted by the FortiGate, and applies it to the user peer configurations (`set ca <string>`).
2. The FortiGate verifies that the CN field of the certificate matches the CN specified in the user peer configurations (`set cn <string>`).
3. If the user peer configuration has `mfa-mode` set to `subject-identity` and the `mfa-server` is configured, then the FortiGate uses a unique identifier in the certificate to authenticate against the RADIUS server.
   - If `account-key-cert-field` is set to `othername` (the default setting), then the FortiGate uses the UPN in the certificate's SAN field to authenticate against RADIUS.
   - If `account-key-cert-field` is set to `rfc822name`, then the FortiGate uses the RFC822 Name in the certificate's SAN field to authenticate against RADIUS.
   - If `account-key-cert-field` is set to `dnsname`, then the FortiGate uses the DNS name in the certificate's SAN field to authenticate against RADIUS.
   - If `account-key-cert-field` is set to `cn`, then the FortiGate uses the CN in the certificate's subject to authenticate against RADIUS.

Some RADIUS servers do not require a password in an Access Request, while others need a valid password to return an ACCESS ACCEPT. If your RADIUS server requires a valid password to return an ACCESS ACCEPT, then you can configure an MFA password for each peer user using the `set mfa-password` command.

When you configure a user MFA password in a user peer, you must need to have a user peer configuration on the FortiGate for each user with `cn=USER`.

Example

In this example, a user certificate is issued to a user by a customer's CA. The certificate is used to authenticate the user to the SSL VPN web portal. The administrator uses the RFC822 Name in the SAN field to authenticate against their corporate RADIUS. The Active Directory mail attribute is used to check against the RFC822 Name field.

The configuration used in this example assumes the following:

- The CA certificate has already been uploaded to the FortiGate.
- SSL VPN has already been configured, pending the assignment of the PKI user group.

To configure the authentication settings:

1. Configure the RADIUS server:

```
config user radius
    edit "NPS-MFA"
        set server "172.18.60.214"
        set secret  XXXXXXXXXX
        set auth-type pap
        set password-encoding ISO-8859-1
        set account-key-processing strip
        set account-key-cert-field rfc822name
    next
end
```

2. Configure the local peer user:

```
config user peer
    edit "peer2"
        set ca "CA_Cert_1"
        set subject "L = Burnaby"
        set cn "test2"
        set mfa-mode subject-identity
        set mfa-server "NPS-MFA"
    next
end
```

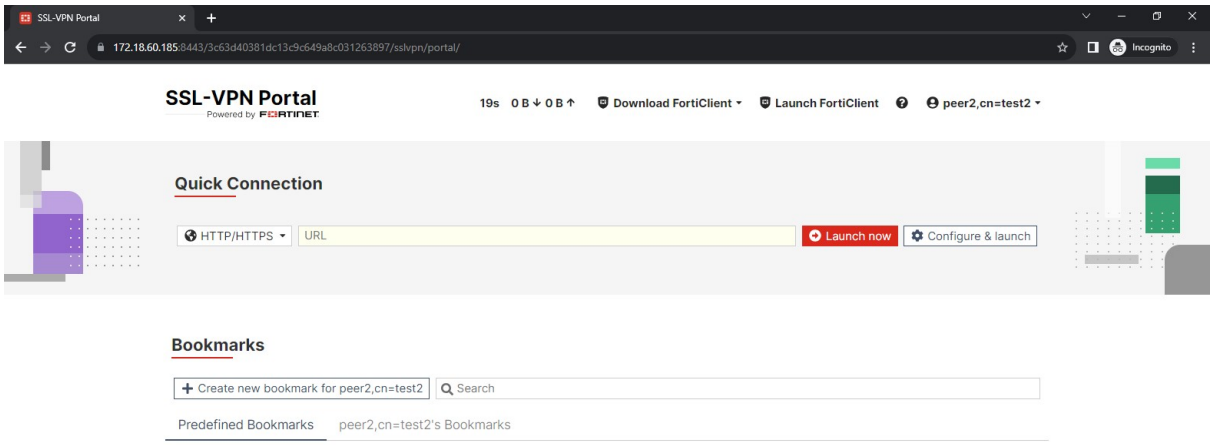
3. Configure the firewall user group for SSL VPN authentication:

```
config user group
    edit "sslvpn-mfa"
        set member  "peer2"
    next
end
```

4. Apply the user group to the SSL VPN configuration and firewall policy.

To verify the configuration:

When a user authenticates to Web mode SSL VPN using their browser, the FortiOS fnbamd daemon first validates the certificate supplied by the user. If the certificate check is successful, the information in the SAN field of the user certificate is used to find a matching user record on the RADIUS server. See SSL VPN web mode for information about configuring web mode SSL VPN.

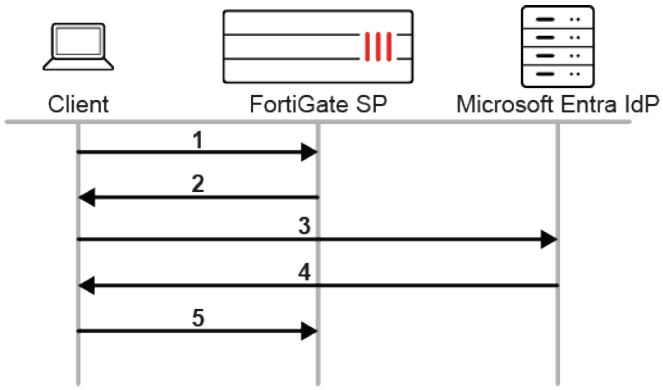


SAML

SAML authentication allows a user to complete authentication and authorization between a Service Provider (SP) and an Identity Provider (IdP). It enables Single Sign-On (SSO) by allowing users who have been authenticated against an IdP to be allowed access to different applications (the SPs providing a service such as a web application).

A FortiGate (SP) can provide a web service, such as an SSL VPN connection, that requires users to be authenticated through SAML. The user identities for the company can be stored remotely in an IdP, such as Microsoft Entra ID. Other applications might also require authentication from the same IdP, so after a user is authenticated once, the same SAML assertion carrying user and group information can be used to authorize the user access to the FortiGate SSL VPN, as well as other applications.

To illustrate the communication between the user or browser, SP, and IdP:



1. The user initiates an SSL VPN connection to the FortiGate.
2. The FortiGate SP redirects the user to the SAML IdP.
3. The user connects to the Microsoft log in page for the SAML authentication request.
4. The SAML IdP authenticates the user and sends the SAML assertion containing the user and group within the SAML response.

5. The browser forwards the SAML response to the FortiGate SP. If the user and group are allowed by the FortiGate, the user is allowed to access the application, in this case, connecting to SSL VPN.

Usage

There are many practical uses and applications for SAML authentication on the FortiGate. For example:

- Authentication for SSL VPN
- Authentication for IPsec VPN (with compatible FortiClient endpoint 7.2.4 and above)
- Firewall authentication for firewall policy access
- Authentication for ZTNA
- Authentication for Explicit Proxy
- Authentication for Administrative Access

Identity providers

FortiGate's SAML SSO configurations can be integrated with any common Identity providers, such as Microsoft Entra ID, Okta, Google Workspace, Onelogin, and others. You can also use FortiAuthenticator as an identity provider with local or remote user integration, or as an IdP Proxy to other IdP providers.

For more information on using FortiAuthenticator, see the FortiAuthenticator Administration Guide and FortiAuthenticator Examples Guide.

Response and assertion signing

For security purposes, FortiGate can perform signature verification for both the SAML response message and the SAML assertion carried inside the SAML response. This means that the SAML response must have a valid signature, and the SAML assertion must also have a valid signature. If the Identity Provider (IdP) provides an invalid signature, or fails to sign one of these, the FortiGate will reject the SAML response.

This check is disabled by default but can be enabled using the following configuration:

```
config user saml
    edit <name>
        set require-signed-resp-and-asrt {enable | disable}
    next
end
```

Option	Description
enable	Both response and assertion must be signed and valid.
disable	At least one of response or assertion must be signed and valid (default).

When disabled, the FortiGate performs a signature check using the following logic:

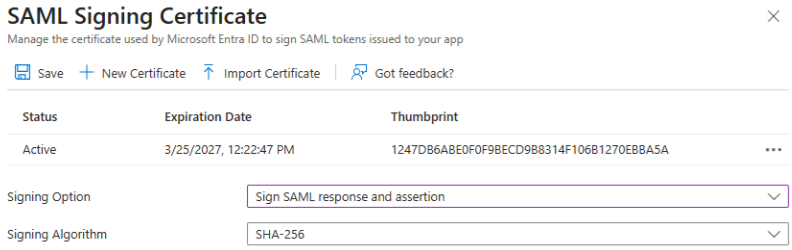
1. If the SAML response is missing signature, each SAML assertion must have a valid signature.
2. If the SAML response signature is invalid, check fails.
3. If the SAML response signature is valid, check the following:
   a. If the SAML assertion signature is missing, check passes.
   b. If the SAML assertion signature is invalid, check fails.
   c. If the SAML assertion signature is valid, check passes.

Example

Some SAML IdPs defaults to signing the SAML assertions only. To increase security, you can enable signing both the SAML response and assertion to work natively with the FortiGate.

To enable Sign SAML response and assertion in Microsoft Entra ID:

1. Go to the *Microsoft Entra admin center*.
2. Navigate to *Enterprise Applications*.
3. Select your application.
4. Go to *Single sign-on* > *SAML*.
5. Scroll to *SAML Signing Certificate* and click *Edit* (the pencil icon).
6. For *Signing Option*, choose *Sign SAML response and assertion*.



7. Click *Save*.
   For details, see Certificate signing options in a SAML token - Microsoft Entra ID | Microsoft Learn.

For other SAML IdP vendors, check the setting to enable signing both the SAML response and assertion.

If the SAML IdP vendor does not have a setting to sign both the SAML response and assertion, or fails to sign both even when configured, you can considering loosening up the requirement on the FortiGate per Response and assertion signing on page 2922.

Configuring SAML SSO

SAML Single Sign-On (SSO) can be configured from the GUI or CLI. The configurations allow administrators to set up the FortiGate as a SAML Service Provider (SP) while inputting the necessary settings for the Identity Provider (IdP).

There are many use cases for applying SAML authentication, as explained in the SAML introduction. For each use case, the configuration steps vary slightly. In general, to successfully configure SAML authentication for an application, you will need to perform the following:

1. Obtain IdP configurations from the Identity Provider. This is outside the scope of the FortiGate.
2. Create a Single Sign-On object in *User & Authentication > Single Sign-On*.
3. Apply the FortiGate SP URLs to the IdP.
4. Install appropriate IdP and SP certificates.
5. Configure user group with the SSO object as member.

After these steps are completed, the user group object can be applied to whatever type of policy is applicable to the use case.

Common SAML SSO settings

Configuring the IdP is outside the scope of this topic, but to successfully configure SAML on the FortiGate the following information must be obtained from the Identity Provider:

From IdP	Description
Entity ID	The identifier URL for the IdP used to identify the issuer of the SAML response or assertion.
Assertion consumer service (ACS) URL	The ACS URL, sometimes called the Login URL, informs the SP and end user where to send the Login request to the IdP.
Single logout service URL	The Single logout service URL, sometimes called the Logout URL, informs the SP and end user where to send the Logout request to the IdP.
SAML Signing Certificate	The certificate used to sign the SAML response originating from the IdP. This must be trusted by the SP in order to verify the identity of the messages from the IdP. To upload a remote certificate from the IdP, follow the instructions in Remote certificate on page 3431. Starting in FortiOS 7.6.4, the SAML IdP must sign both the SAML assertion and response. See Identity providers on page 2922.

At the same time, to complete the configurations on the IdP, it will require information about the SP from the FortiGate. The following describes the settings configured on the FortiGate, including the information needed for the IdP configuration.

To configure the FortiGate SP settings for SSO in the GUI:

1. Go to *User & Authentication > Single Sign-On* and click *Create new*.
2. Configure the SP settings:

Setting	Description
Name	Name of the SSO object.
Address	FQDN or IP address that clients will be connecting to. If this requires a non-standard port (eg. 443), specify the port in this format *<address>:<port>*.

Setting	Description
Entity ID	The identifier URL for the SP used to identify the issuer of the SAML request. This URL must be provided to the IdP. Modifying the URL must be done in CLI.
Assertion consumer service URL	The ACS URL, sometimes referred to as the reply URL or the single sign-on URL, informs the IdP and end user the URL to send the SAML Assertion for login to. This URL must be provided to the IdP. Modifying the URL must be done in CLI.
Single logout service URL	The logout URL informs the IdP and end user the URL to send the request to logout to. This URL must be provided to the IdP. Modifying the URL must be done in CLI.
Certificate	The certificate used to sign the SAML messages originating from the SP to the IdP. This is typically an optional configuration.

3. Click *Next*.
4. Configure the IdP settings:

Setting	Description
Type	• *Fortinet Product*: If the IdP is a FortiAuthenticator or FortiTrust-ID, IdP configurations are simplified. See FortiAuthenticator Admin Guide > Authentication > SAML IdP for more information • *Custom*: If the IdP is any other vendor, or you want to configure each field manually, select this option.
Fortinet Product setup	
Address	Enter the address of the FortiAuthenticator or FortiTrust-ID that users will access to authenticate to the IdP.
Prefix	Enter the prefix specified by the FortiAuthenticator or FortiTrust-ID.
Certificate	Select the SAML Signing certificate from the IdP. If this is not yet uploaded, use the *Import* option to import the remote certificate.
Custom setup	
Entity ID	Input the Entity ID URL from the IdP. See Entity ID on page 2924.
Assertion consumer service URL	Input the ACS URL from the IdP. See Assertion consumer service (ACS) URL on page 2924.
Single logout service URL	Input the Single logout service URL from the IdP. See Single logout service URL on page 2924.
Certificate	Select the SAML Signing certificate from the IdP. If this is not yet uploaded, use the *Import* option to import the remote certificate. See SAML Signing Certificate on page 2924.
Additional SAML Attributes	

Setting	Description
AD FS claim	This setting is only available after the initial SSO object has been configured. Enable this setting to select the attribute names based on Active Directory Federated Services (AD FS) claim types.
User claim type	Select the AD FS claim type that will be used to match the user within the SAML assertion statement.
Group claim type	Select the AD FS claim type that will be used to match the group within the SAML assertion statement.
Attribute used to identify users	Specify the name of the attribute for a user within the SAML assertion statement. This value is case sensitive. If AD FS claim is enabled, this field will be auto-populated to reflect the claim type.
Attribute used to identify groups	Specify the name of the attribute for a group within the SAML assertion statement. This value is case-sensitive. If AD FS claim is enabled, this field will be auto-populated to reflect the claim type.

5. Click *Submit*.

To configure the FortiGate SP settings for SSO in the CLI:

```
config user saml
    edit <name>
        set adfs-claim [enable|disable]
        set cert {string}
        set clock-tolerance {integer}
        set digest-method [sha1|sha256]
        set entity-id {string}
        set group-claim-type [email|given-name|...]
        set group-name {string}
        set idp-cert {string}
        set idp-entity-id {string}
        set idp-single-logout-url {string}
        set idp-single-sign-on-url {string}
        set limit-relaystate [enable|disable]
        set reauth [enable|disable]
        set single-logout-url {string}
        set single-sign-on-url {string}
        set user-claim-type [email|given-name|...]
        set user-name {string}
    next
end
```

Setting	Description
`adfs-claim`	See AD FS claim on page 2926.

Setting	Description
cert	The SP certificate used to sign SAML messages.
clock-tolerance	A SAML assertion is only valid for a specific duration. When the FortiGate SP and the SAML IdP clocks are not in synchronization, use clock-tolerance to define the number of seconds that the skew in time is tolerated. The setting is only available in the CLI.
digest-method	The type of hash used to compute the hash value of the content of the SAML assertion. The setting is only available in the CLI.
entity-id	The SP Entity ID.
group-claim-type	Specify the group claim type when adfs-claim is enabled.
group-name	The attribute used to identify a group within the SAML assertion statement.
idp-cert	The SAML Signing certificate from the IdP.
idp-entity-id	The Entity ID from the IdP.
idp-single-logout-url	The Single logout service URL from the IdP.
idp-single-sign-on-url	The ACS URL, sometimes called the Login URL, from the IdP.
limit-relaystate	Enable/disable limiting the relay-state parameter when it exceeds SAML 2.0 specification limits (80 bytes). The setting is only available in the CLI.
reauth	Enable/disable signaling the IdP to force user re-authentication. The SAML AuthnRequest is set to ForceAuthn="true". The setting is only available in the CLI.
single-logout-url	The Single logout service URL from the SP.
single-sign-on-url	The ACS URL, sometimes referred to as the reply URL or the single sign-on URL, from the SP.
user-claim-type	Specify the user claim type when adfs-claim is enabled.
user-name	The attribute used to identify a user within the SAML assertion statement.

Other SAML related global settings

Authentication port

By default, the FortiGate listens on port 1003 for incoming authentication requests when traffic matches an identity based firewall policy. As a SAML SP with an identity based firewall policy configured for the SAML user group, the FortiGate will use the same port to listen for SAML authentication requests and redirect them to the IdP.

To change the default port:

```
config system global
    set auth-https-port <port>
end
```

Configuring the user authentication setting

When the FortiGate receives an authentication request in an identity based firewall policy, the authentication daemon uses a local server certificate to secure the connection. The client making the authentication request must trust the certificate presented by the FortiGate that is acting as the TLS server.

In SAML authentication, when a user initiates traffic to the SP, the traffic matches the identity based firewall policy which triggers the authentication request to hit the authentication daemon. The server certificate used by the authentication daemon must be trusted by the user, otherwise they will receive a certificate warning. To avoid a certificate warning, use a custom certificate that the user trusts.

To configure a custom certificate in the GUI:

1. Go to *User & Authentication* > *Authentication Settings*.
2. Set *Certificate* to the custom certificate.
   If the certificate is not available, click *Create* to create or import a new custom certificate.
   The custom certificate's SAN field should have the FQDN or IP address from the SP URL.

To configure a custom certificate in the CLI:

```
config user setting
    set auth-cert <custom certificate name>
end
```

Alternatively, assigning a CA certificate allows the FortiGate to automatically generate and sign a certificate for the authentication daemon. This will override any assigned server certificate.

To assign a CA certificate:

1. Edit the user setting :

   ```
   config user setting
       set auth-ca-cert <CA certificate name>
   end
   ```

2. Go to *System* > *Certificates* and download the certificate.
3. Install the certificate into the client's certificate store.

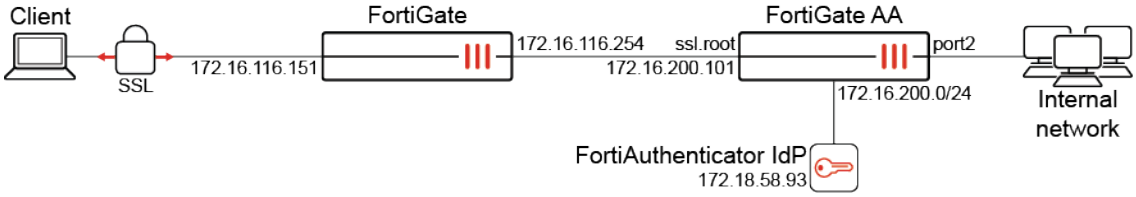
SSL VPN with FortiAuthenticator as a SAML IdP

A FortiGate can act as a SAML service provider (SP) for SSL VPN that requests authentication from a a SAML identity provider (IdP), such as Entra ID, Okta, Fortinet's FortiAuthenticator, or others. The following

example shows the use of FortiAuthenticator as the IdP.

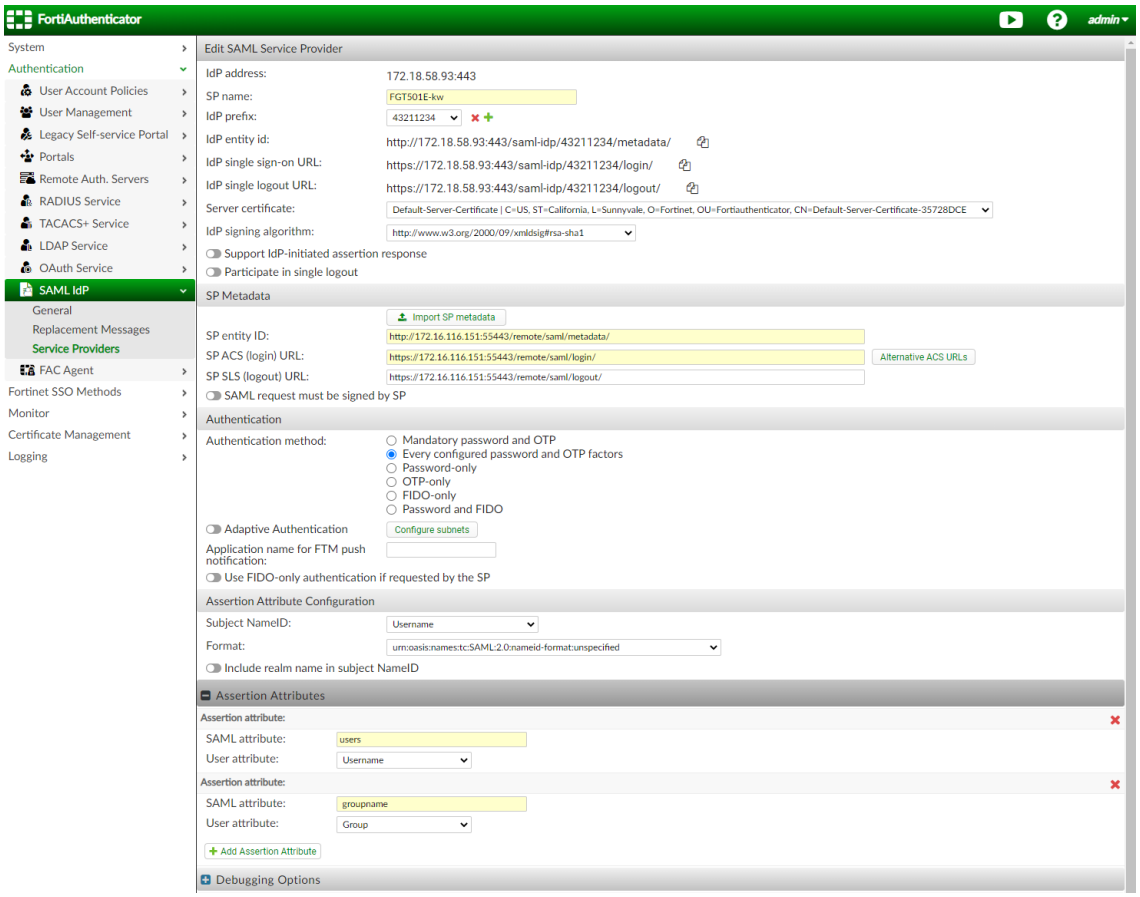
Using FortiAuthenticator as an IdP

In this example, FortiGate AA is the inside firewall (172.16.200.101). The other FortiGate is the outside firewall that only does port forwarding from 172.16.116.151:55443 to 172.16.200.101:443. FortiGate AA is configured to allow full SSL VPN access to the network in port2.



This SSL VPN portal allows users from the user group *saml_grp* and SAML server *saml_test* to log in. The FortiAuthenticator acts as the SAML identity provider (IdP), while the FortiGate is the SAML SP. External users are directed to the FortiAuthenticator IdP login URL to authenticate.

The FortiAuthenticator in this example has the following configuration:

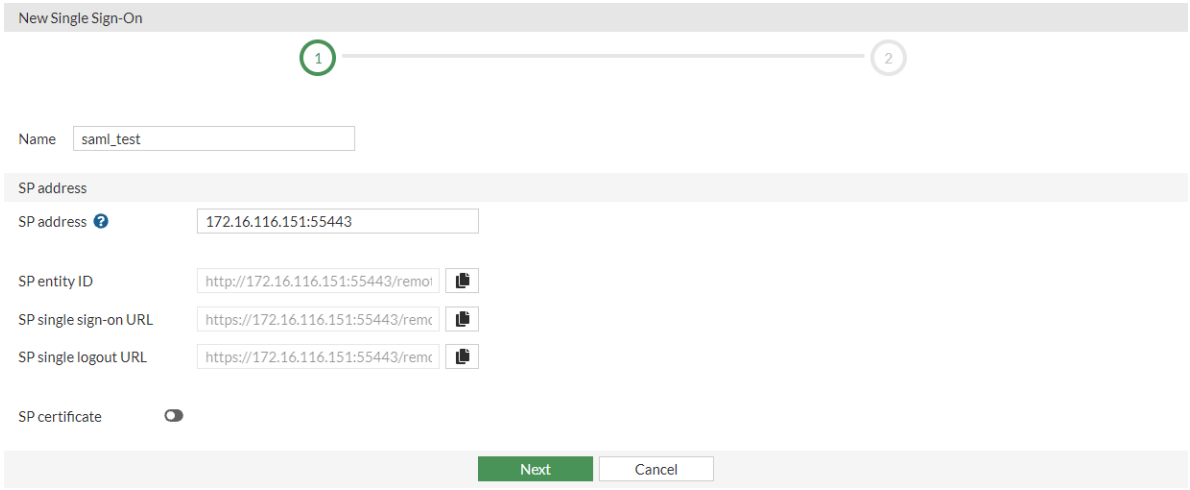


For a deep-dive into how to configure FortiAuthenticator as an IdP, including integration with Windows AD via LDAP for user authentication, see the FortiGate SSL VPN with FortiAuthenticator as SAML IdP section in the FortiAuthenticator Examples Guide.

This example also demonstrates using FortiAuthenticator to act as a root CA to sign certificates for the SP, IdP, and SSL VPN portal.

To configure FortiGate AA as an SP:

1. Create a new SAML server entry:
   a. Go to *User & Authentication* > *Single Sign-On* and click *Create New*. The single-sign on wizard opens.
   b. Enter a name (*saml_test*). The other fields will automatically populate based on the FortiGate's WAN IP and port.



Click the icon beside the *SP entity ID*, *SP single sign-on URL*, and *SP single logout URL* fields to copy the text.

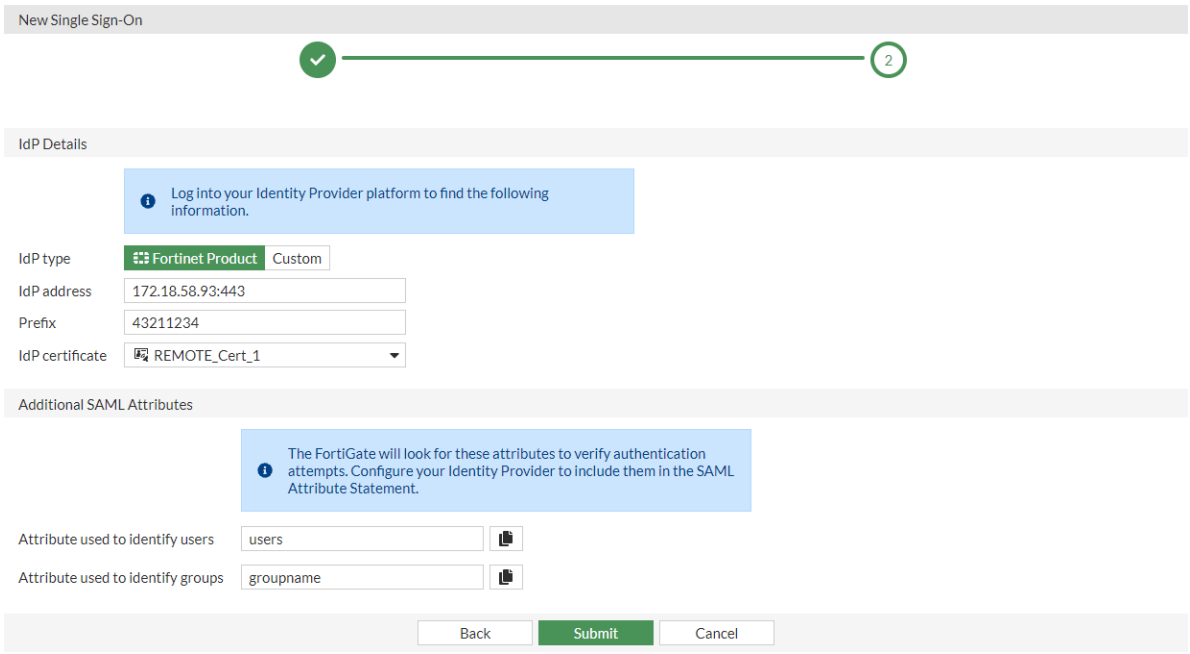
   c. Click *Next*.
   d. Enter the FortiAuthenticator IdP details:

IdP address	172.18.58.93:443
Prefix	43211234
IdP certificate	REMOTE_Cert_1

   e. Enter the additional SAML attributes that will be used to verify authentication attempts:

Attribute used to identify users	users
Attribute used to identify groups	groupname

   The IdP must be configured to include these attributes in the SAML attribute statement. In FortiAuthenticator, this is configured in the *Assertion Attributes* section.



f. Click *Submit*.

The following is created in the backend:

```
config user saml
    edit "saml_test"
        set cert "fgt_gui_automation"
        set entity-id "http://172.16.116.151:55443/remote/saml/metadata/"
        set single-sign-on-url "https://172.16.116.151:55443/remote/saml/login/"
        set single-logout-url "https://172.16.116.151:55443/remote/saml/logout/"
        set idp-entity-id "http://172.18.58.93:443/saml-idp/43211234/metadata/"
        set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/43211234/login/"
        set idp-single-logout-url "https://172.18.58.93:443/saml-idp/43211234/logout/"
        set idp-cert "REMOTE_Cert_1"
        set user-name "users"
        set group-name "groupname"
        set digest-method sha1
    next
end
```

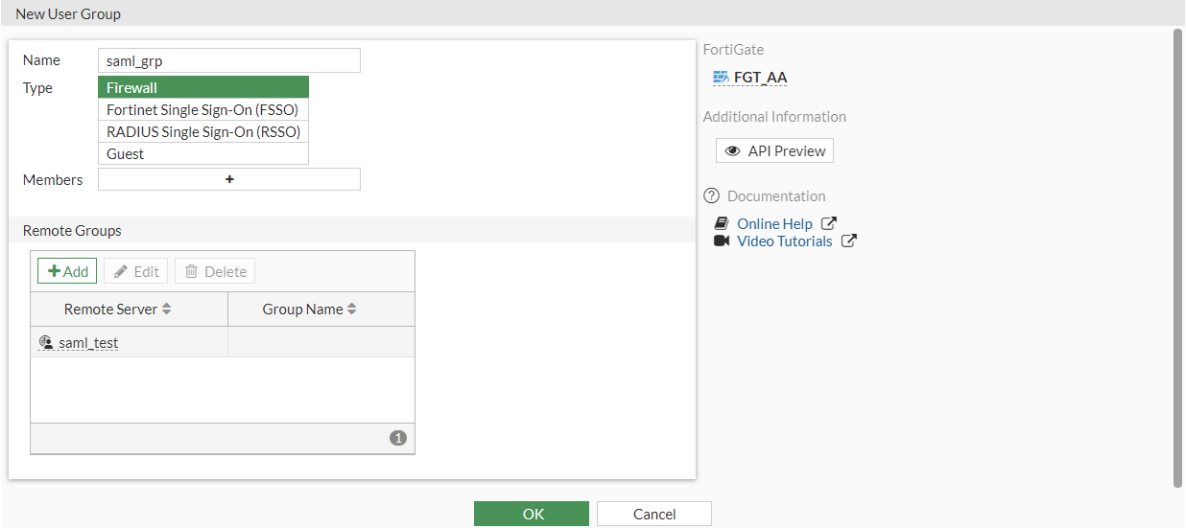
2. Create the SAML group:

a. Go to *User & Authentication* > *User Groups* and click *Create New*.

b. Enter a name, *saml_grp*.

c. In the *Remote Groups* table, click *Add*.

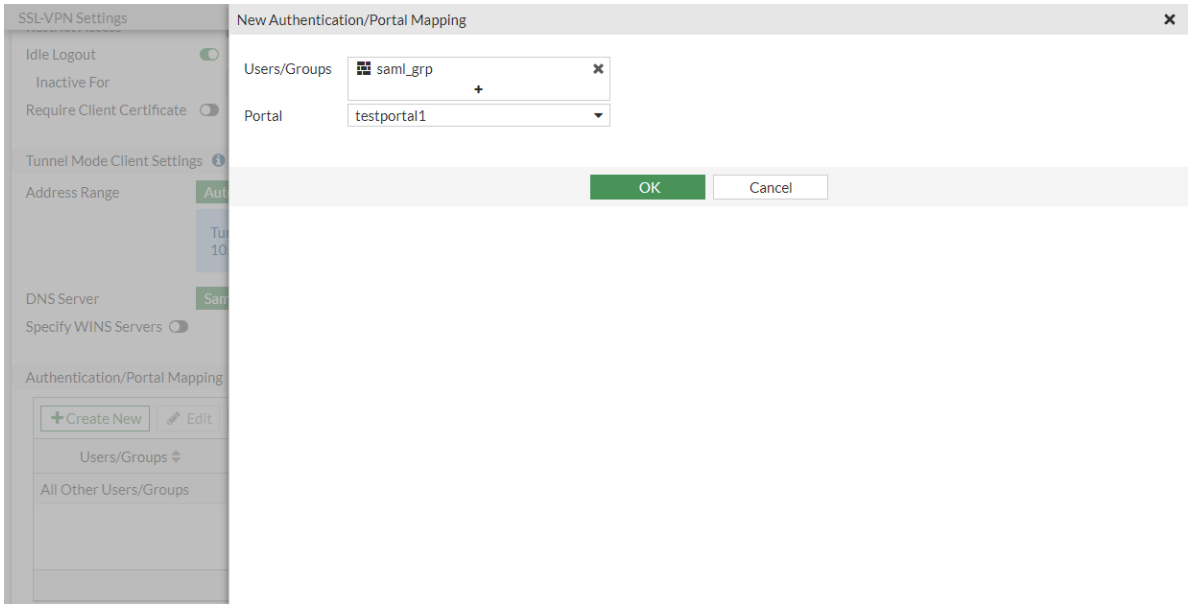
d. In the *Remote Server* dropdown, select *saml_test* and click *OK*.



e. Click *OK*.
The following is created in the backend:

```
config user group
    edit "saml_grp"
        set member "saml_test"
    next
end
```

3. Add the SAML group in the SSL VPN settings:
   a. Go to *VPN > SSL-VPN Settings*.
   b. In the *Authentication/Portal Mapping* table, click *Create New*.
   c. For *Users/Groups*, click the *+* and select *saml_grp*.
   d. Select the *Portal* (*testportal1*).
   e. Click *OK*.



f. Click *Apply*.

4. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Incoming Interface	ssl.root
Outgoing Interface	port2
Source	all, saml_grp, saml_test

   c. Configure the other settings as needed.
   d. Click *OK*.
5. On the client, log in with SAML using the SSL VPN web portal.

If you are using FortiClient for tunnel mode access, enable *Enable Single Sign On (SSO) for VPN Tunnel* in the *SSL-VPN* connection settings to use the SAML log in. See Configuring an SSL VPN connection for more information.

6. In FortiOS, go to *Dashboard* > *Network* and click the *SSL-VPN* widget to expand to full view and verify the connection information.

Using a browser as an external user-agent for SAML authentication in an SSL VPN connection

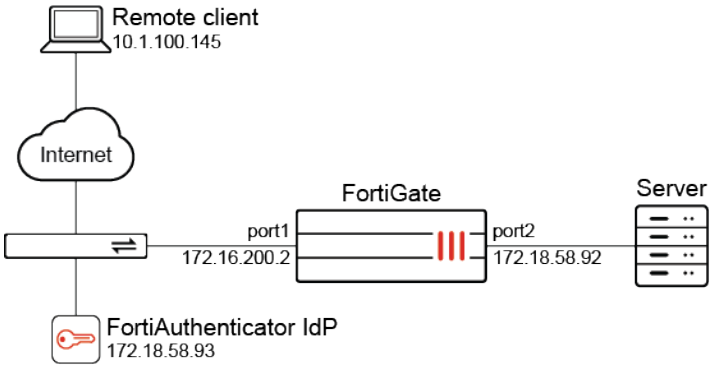
FortiClient can use a browser as an external user-agent to perform SAML authentication for SSL VPN tunnel mode, instead of the FortiClient embedded log in window. If a user has already done SAML authentication in the default browser, they do not need to authenticate again in the FortiClient built-in browser. FortiClient 7.0.1 and later is required.

The following CLI is used to set the SAML local redirect port on the FortiClient endpoint after successful SAML authentication:

```
config vpn ssl settings
    set saml-redirect-port <port>
end
```

Example

In this example, a user wants to use their default browser to connect to IdP for SAML authentication, without needing to separately authenticate in the FortiClient built-in browser. After authenticating in the browser, FortiClient obtains the authentication cookie directly from the browser.



The authentication process proceeds as follows:

1. The remote client uses FortiClient to connect to the FortiGate SSL VPN on 172.16.58.92:1443 with the *Use external browser as user-agent for saml user authentication* option enabled.
2. The SSL VPN redirects FortiClient to complete SAML authentication using the Identity Provider (IdP).
3. FortiClient opens the default browser to authenticate the IdP server.
4. After a successful authentication, the browser redirects to localhost:<port>, where the port is defined by the `saml-redirect-port` variable on the FortiGate.
5. FortiClient reads the authentication ID passed by the successful authentication, then requests that the SAML authentication process continues on the FortiGate with this ID.
6. The FortiGate continues with the remaining SSL-VPN host-check and other steps until it receives the authentication cookie. It then allow the SSL VPN user to connect using tunnel mode.

To configure the VPN:

1. Configure a SAML user:

```
config user saml
    edit "su1"
        set cert "fgt_gui_automation"
        set entity-id "http://172.18.58.92:1443/remote/saml/metadata/"
        set single-sign-on-url "https://172.18.58.92:1443/remote/saml/login/"
        set single-logout-url "https://172.18.58.92:1443/remote/saml/logout/"
        set idp-entity-id "http://172.18.58.93:443/saml-idp/222222/metadata/"
        set idp-single-sign-on-url "https://172.18.58.93:443/saml-idp/222222/login/"
        set idp-single-logout-url "https://172.18.58.93:443/saml-idp/222222/logout/"
        set idp-cert "REMOTE_Cert_1"
        set user-name "Username"
        set group-name "Groupname"
        set digest-method sha1
    next
end
```

2. Add the SAML user to a user group:

```
config user group
    edit "saml_grp"
        set member "su1"
```

```
   next
end
```

3. Create an SSL VPN web portal:

```
config vpn ssl web portal
    edit "testportal1"
        set tunnel-mode enable
        set ipv6-tunnel-mode enable
        set web-mode enable
        ...
    next
end
```

4. Configure the SSL VPN:

```
config vpn ssl settings
    set tunnel-ip-pools "SSLVPN_TUNNEL_ADDR1"
    set tunnel-ipv6-pools "SSLVPN_TUNNEL_IPv6_ADDR1"
    set port 1443
    set source-interface "port2"
    set source-address "all"
    set source-address6 "all"
    set default-portal "testportal1"
    ...
end
```

5. Configure a firewall policy for the SSL VPN and assign the SAML group and a local user to it:

```
config firewall policy
    edit 1
        set name "policy_to_sslvpn_tunnel"
        set srcintf "ssl.root"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set groups "saml_grp"
        set users "u1"
    next
end
```

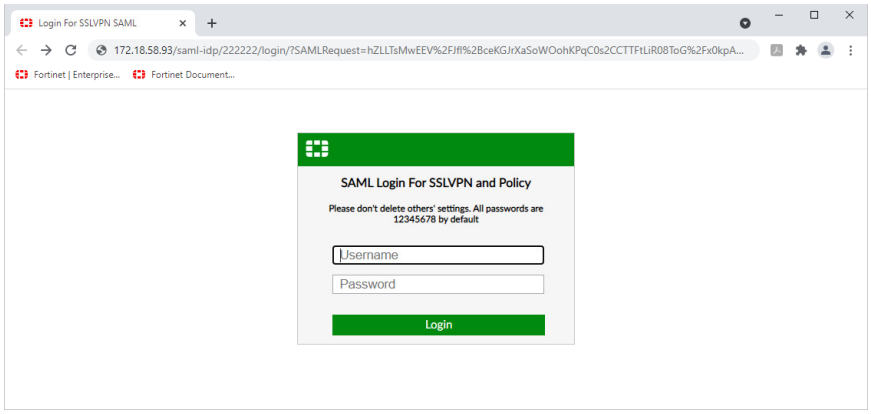
6. Enable the SAML redirect port:

```
config vpn ssl settings
    set saml-redirect-port 8020
end
```

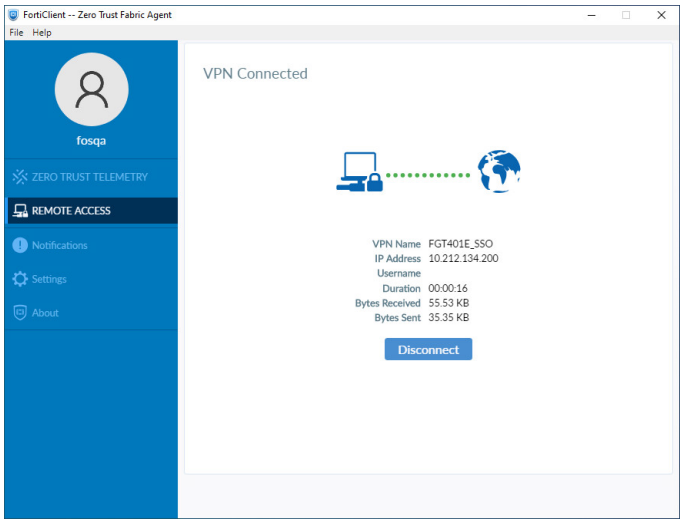
To connect to the VPN using FortiClient:

1. Configure the SSL VPN connection:
   a. Open FortiClient and go to the *Remote Access* tab and click *Configure VPN*.
   b. Enter a name for the connection.
   c. Set the *Remote Gateway* to the FortiGate port *172.18.58.92*.
   d. Enable *Customize port* and set the port to *1443*.
   e. Enable *Enable Single Sign On (SSO) for VPN Tunnel* and *Use external browser as user-agent for saml user authentication*.

   f. Click *Save*.
2. On the *Remote Access* tab select the *FGT401E_SSO* VPN connection from the dropdown list.
3. Click *SAML Login*.
   The default browser opens to the IdP authentication page.



4. Enter the username and password, then click *Login*.
   The authenticated result is sent back to FortiClient and the connection is established.



To check the connection on the FortiGate:

```
# get vpn ssl monitor
SSL-VPN Login Users:
 Index   User    Group   Auth Type      Timeout         Auth-Timeout    From     HTTP in/out
HTTPS in/out    Two-factor Auth
 1       fac3    saml_grp       256(1)           N/A     10.1.100.254   0/0     0/0     0

SSL-VPN sessions:
 Index   User    Group   Source IP      Duration        I/O Bytes       Tunnel/Dest IP
 0       fac3    saml_grp       10.1.100.254     5       9990/8449
10.212.134.200,fdff:ffff::1
```

```
# diagnose firewall auth list

10.212.134.200, fac3
        type: fw, id: 0, duration: 6, idled: 0
        expire: 259199, allow-idle: 259200
        flag(80): sslvpn
        server: su1
        packets: in 28 out 28, bytes: in 23042 out 8561
        group_id: 5
        group_name: saml_grp
```

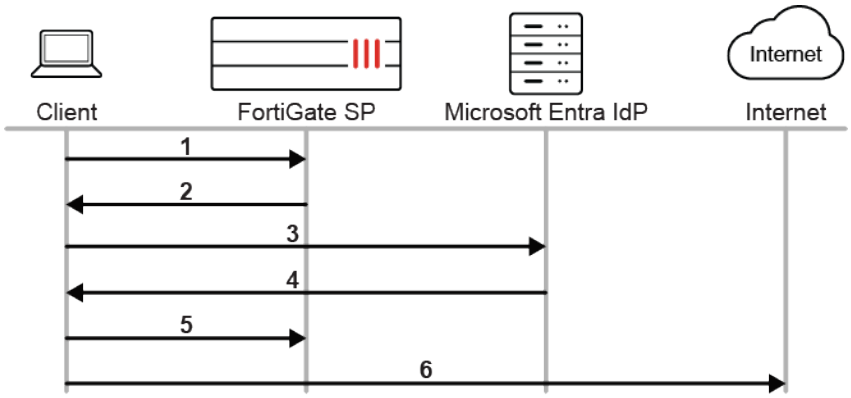
IPsec VPN with SAML IdP

For information about configuring IPsec VPN with SAML IdP, see SAML-based authentication for FortiClient remote access dialup IPsec VPN clients on page 2379.

Outbound firewall authentication with Microsoft Entra ID as a SAML IdP

In this example, users are managed through Microsoft Entra ID (formerly Azure Active Directory). The FortiGate is configured for SSO firewall authentication for outbound traffic, with authentication performed by the Microsoft Entra ID as a SAML identity provider (IdP).

The SAML interaction occurs as follows:

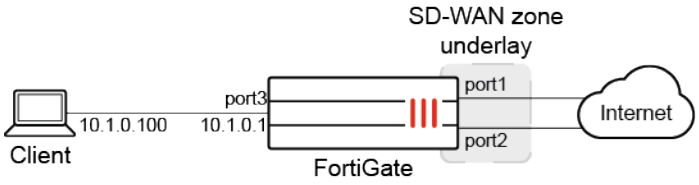


1. The user initiates web traffic to the internet.
2. The FortiGate redirects to the local captive portal port (default is 1003), then redirects the user to the SAML IdP.
3. The user connects to the Microsoft log in page for the SAML authentication request.
4. The SAML IdP sends the SAML assertion containing the user and group.
5. The browser forwards the SAML assertion to the SAML SP.
6. If the user and group are allowed by the FortiGate, the user is allowed to access the internet.

In this example environment, a user is added in the Microsoft Entra ID belonging to the security group called Firewall.

- Username: John Locus
- User login: jlocus@azure.kldocs.com
- Group: Firewall (ID 62b699ce-4f80-48c0-846e-c1dfde2dc667)

The goal is to allow users in the Firewall group to access the internet after passing firewall authentication.



Configuring the Microsoft Entra ID

The following Microsoft Entra ID configuration demonstrates how to add the FortiGate as an enterprise non-gallery application. This application provides SAML SSO connectivity to the Microsoft Entra IdP. Some steps

are performed concurrently on the FortiGate.

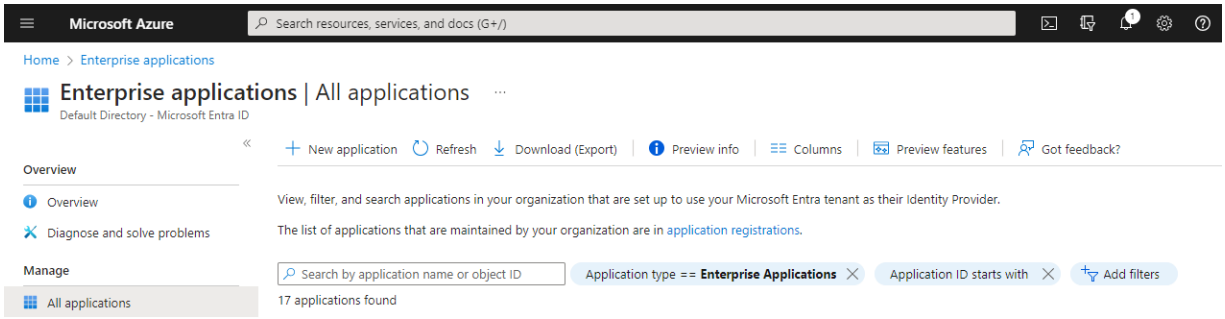
This example is configured with an Microsoft Entra ID free-tier directory. There may be limitations to managing users in Azure in this tier that are not limited in other tiers. Consult the Microsoft Entra ID documentation for more information.

There are three steps to configure the Microsoft Entra ID:

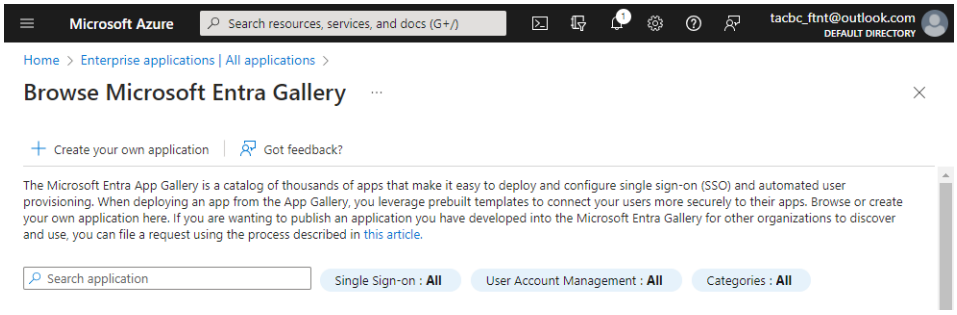
1. Create a new enterprise application.
2. Configure the SAML SSO settings on the application and FortiGate.
3. Assign Microsoft Entra ID users and groups to the application.

To create a new enterprise application:

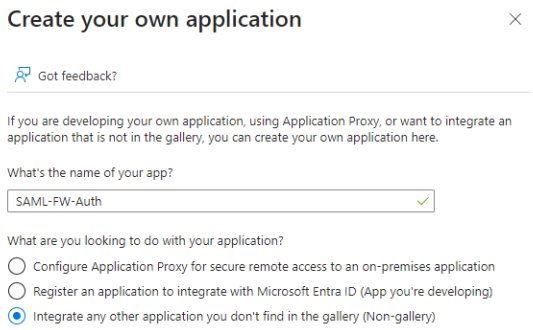
1. Log in to the Azure portal.
2. In the Azure portal menu, click *Microsoft Entra ID*.
3. In the left-side menu go *Manage* > *Enterprise applications*.
4. Click *New application*.



5. Click *Create your own application*.



6. Enter a name for the application (*SAML-FW-Auth*) and select *Integrate any other application you don't find in the gallery (Non-gallery)*.

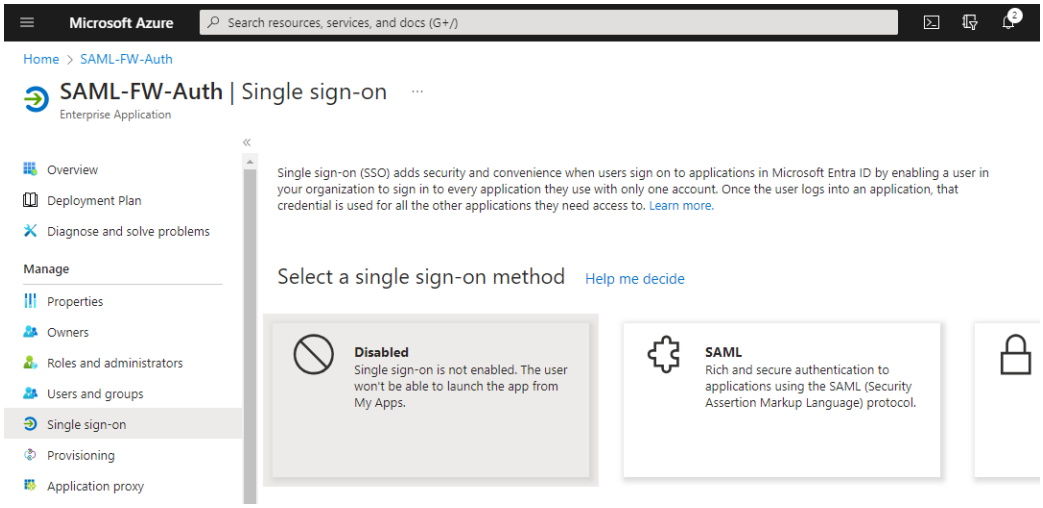


7. Click *Create*.

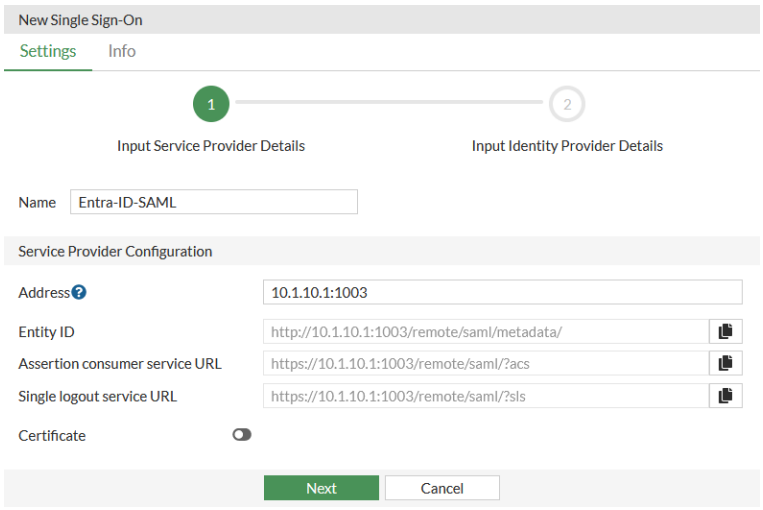
To configure the SAML SSO settings on the application and FortiGate:

This procedure requires going back and forth between Azure and the FortiGate GUI. Leave the FortiGate GUI open for the entire procedure.

1. On the *Overview* page for your new application, go to *Manage* > *Single sign-on* and select *SAML* as the single sign-on method.



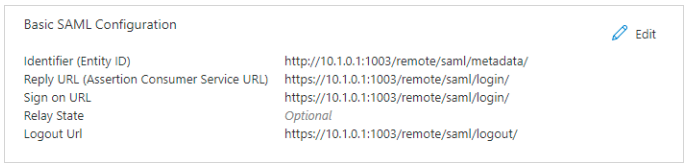
2. The *Basic SAML Configuration* section in Azure describes the SAML SP entity and links that Azure will reference. Configure these settings on the FortiGate by creating a new SAML server object and defining the SP address. The SP (IP or FQDN) address should be accessible by the user who is authenticating against the firewall. The port used should match the port used by the FortiGate firewall authentication captive portal. By default, this is port 1003 for HTTPS. A captive portal does not need to be configured separately.
   a. Go to *User & Authentication* > *Single Sign-On* and click *Create New*.
   b. Enter a *Name* for the SAML object, *Entra-ID-SAML*.
   c. Enter the *SP address*, *10.1.0.1:1003*. The three SP URLs are automatically populated.



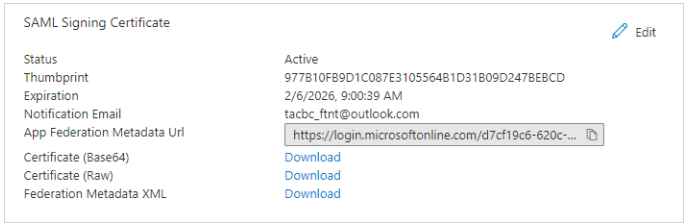
3. In Azure on the *Set up Single Sign-On with SAML* page, copy the following URLs from the FortiGate to the *Basic SAML Configuration* section:

From FortiGate	To Azure field
Entity ID (http://10.1.0.1:1003/remote/saml/metadata/)	*Identifier (Entity ID)*, set to *Default*
Assertion consumer service URL (https://10.1.0.1:1003/remote/saml/login/)	*Reply URL* and *Sign on URL*
Single logout service URL (https://10.1.0.1:1003/remote/saml/logout/)	*Logout URL*

4. Click *Save*.



5. Under the *SAML Signing Certificate* section, download the Base64 certificate.



6. Import the certificate from Azure on the FortiGate as the IdP certificate:
   a. Go to *System* > *Certificates* and click *Create/Import* > *Remote Certificate*.
   b. Upload the certificate from Azure and click *OK*. The new certificate appears under the *Remote Certificate* section with the name *REMOTE_Cert_(N)*.
   c. Optionally, rename the certificate in the CLI to give it a more recognizable name:

```
config vpn certificate remote
    rename REMOTE_Cert_3 to ENTRA_ID_SAML_FW
end
```

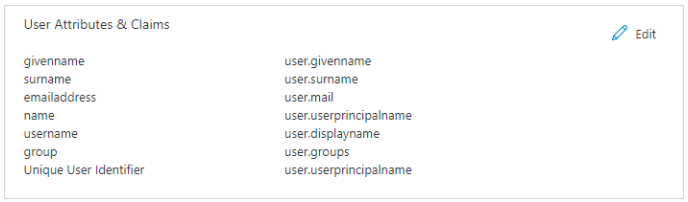
7. In the *Set up <application name>* section, copy the URLs from Azure to the FortiGate in the *IdP Details* section:

   a. On the FortiGate, click *Next*.
   b. For *IdP type*, select *Custom* and copy the following from Azure to the corresponding field:

From Azure	To FortiGate field
Microsoft Entra Identifier	*Entity ID*
Login URL	*Assertion consumer service URL*
Logout URL	*Single logout service URL*

   c. For *Certificate*, select the remote certificate imported earlier.
8. In Azure, edit the *User Attributes & Claims* section. The attributes are returned in the SAML assertion, which the FortiGate uses to verify the user and group. Configuring group matching is optional.
   a. Click *Add new claim*, name it *username*, and set the *Source attribute* to *user.displayname*. The source attribute can be any of the related username fields. The value of the username returned to the FortiGate will be used in logs and monitors to identify the user.
   b. Click *Save*.
   c. Click *Add a group claim* and in the *Group Claims* pane, select *All groups*.
   d. In *Advanced Options*, select *Customize the name of the group claim*. Set the name to *group*.

   e. Click *Save*. The *User Attributes & Claims* section displays the update settings.

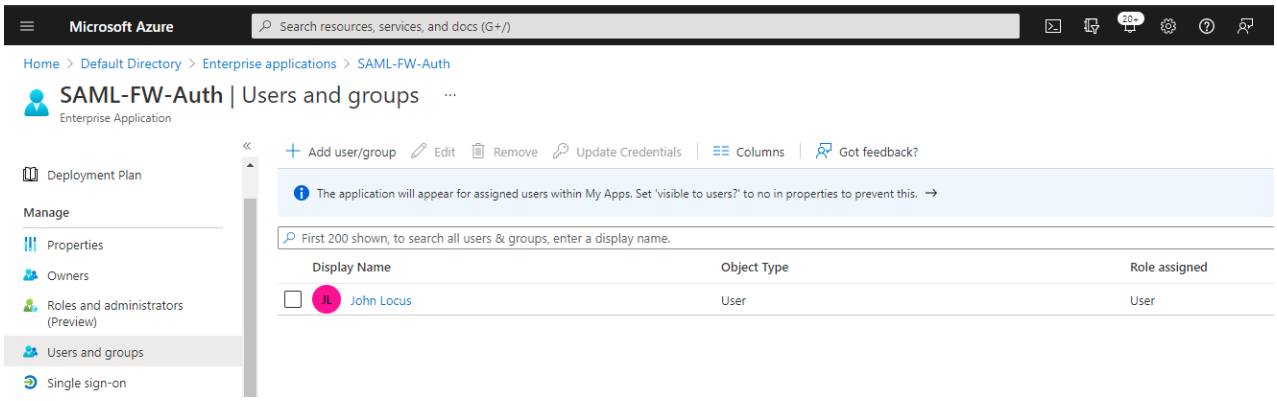


9. On the FortiGate, update the *Additional SAML Attributes* section with the username and group created in Azure:
   a. For *Attribute used to identify users*, enter *username*.
   b. For *Attribute used to identify groups*, enter *group*.

   c. Click *Submit*.

To assign Microsoft Entra users and groups to the application:

1. In Azure, go to the application's *Overview* page.
2. Go to *Manage* > *Users and groups* and click *Add user/group*.
3. Click *Users* to select the users or groups (*John Locus* is selected in this example).
4. Click *Assign* to add the assignment.



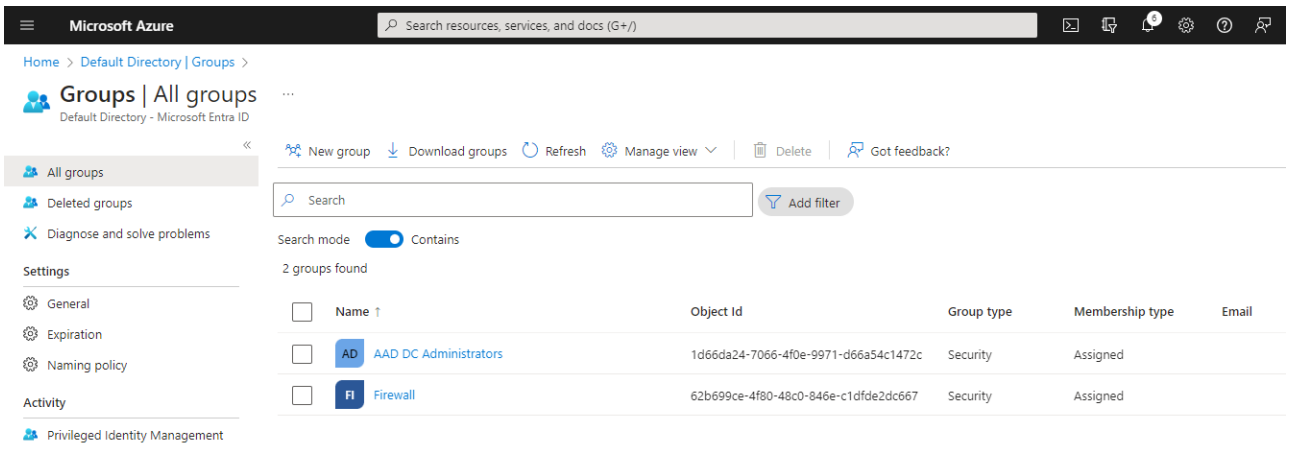
Configuring the FortiGate

The user group, user authentication settings, and firewall policies must be configured on the FortiGate.

Configuring the user group

A user group named *Azure-FW-Auth* is created with the member *Entra-ID-SAML*.

Configuring group matching is optional, and the *Object ID* from Azure is needed for the `config match` settings. In the Azure default directory, go to *Manage* > *Groups* and locate the *Object ID* for the *Firewall* group.



To configure the user group:

```
config user group
    edit "Azure-FW-Auth"
        set member "Entra-ID-SAML"
        config match
            edit 1
                set server-name "Entra-ID-SAML"
                set group-name "62b699ce-4f80-48c0-846e-c1dfde2dc667"
            next
```

```
        end
    next
end
```

Configuring the user authentication setting

When a user initiates traffic, the FortiGate will redirect the user to the firewall authentication captive portal before redirecting them to the SAML IdP portal. After the SAML IdP responds with the SAML assertion, the user is again redirected to the firewall authentication captive portal. If the firewall portal's certificate is not trusted by the user, they will receive a certificate warning. Use a custom certificate that the user trusts to avoid the certificate warning.

To configure a custom certificate:

1. Go to *User & Authentication* > *Authentication Settings*.
2. For *Certificate*, select the custom certificate. The custom certificate's SAN field should have the FQDN or IP from the SP URL.

Alternatively, assigning a CA certificate allows the FortiGate to automatically generate and sign a certificate for the portal page. This will override any assigned server certificate. In this example, the built-in Fortinet_CA_SSL is used.

To assign a CA certificate:

1. Edit the user setting:

```
config user setting
    set auth-ca-cert "Fortinet_CA_SSL"
end
```

2. Go to *System* > *Certificates* and download the certificate.
3. Install the certificate into the client's certificate store.

Configuring the firewall policies

Firewall policies must be configured to apply user authentication and still allow users behind the FortiGate to access the Microsoft log in portal without authentication.

To configure the firewall policies:

1. Configure a policy to allow traffic to the Microsoft Azure internet service:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enter the following:

Name	*LAN-to-AuthPortal*
Incoming Interface	*port3*
Outgoing Interface	*Underlay*
Source	*all*

Destination	*Microsoft-Azure* (under *Internet Service*)
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*
NAT	Enable and select *NAT*.
Log Allowed Traffic	Enable and select *All Sessions*.

c. Configure the other settings as needed.
d. Click *OK*.

2. Configure a policy to apply user authentication:
   a. Click *Create New* and enter the following:

Name	*LAN-auth-policy*
Incoming Interface	*port3*
Outgoing Interface	*Underlay*
Source	*all*, *Azure-FW-Auth*
Destination	*all*
Schedule	*always*
Service	*ALL*
Action	*ACCEPT*
NAT	Enable and select *NAT*.
Log Allowed Traffic	Enable and select *All Sessions*.

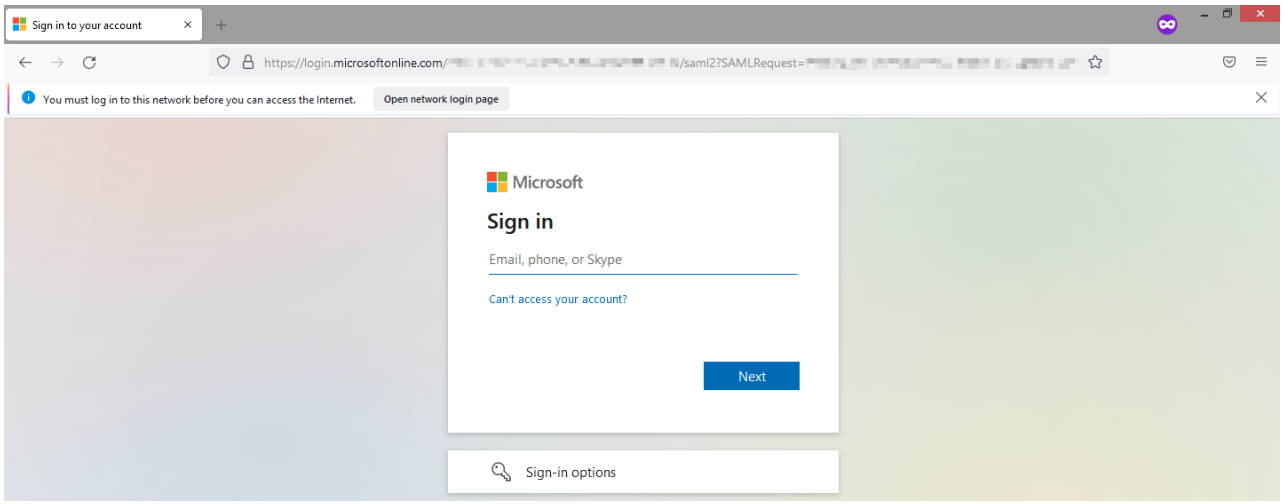
   b. Configure the other settings as needed.
   c. Click *OK*.

Connecting from the client

When the client connects to the internet from a browser, they will be redirected to the Microsoft log in page to authenticate against the Microsoft Entra ID. The FortiGate's authentication portal certificate should be installed on the client.

To connect from the client:

1. On the client, open a browser (such as Firefox) and go to a website. The user is redirected to the Microsoft log in page.
2. Enter the user credentials.



3. If the log in attempt is successful, the user is allowed to access the internet

Viewing logs and diagnostics

To verify user logins, go to the *Dashboard* > *Assets & Identities* and expand the *Firewall Users* widget, or enter the following in the CLI:

```
# diagnose firewall auth list
10.1.0.100, John Locus
        src_mac: 02:09:0f:00:03:03
        type: fw, id: 0, duration: 152, idled: 7
        expire: 292, allow-idle: 300
        server: Entra-ID-SAML
        packets: in 2097 out 932, bytes: in 2208241 out 143741
        group_id: 2
        group_name: Azure-FW-Auth
----- 1 listed, 0 filtered ------
```

To verify user login logs, go to *Log & Report* > *System Events* and select the *User Events* card, or enter the following in the CLI:

```
# execute log filter category event
# execute log filter field subtype user
# execute log display
17 logs found.
10 logs returned.
7: date=2021-09-30 time=09:49:25 eventtime=1633020565577584390 tz="-0700" logid="0102043039"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication logon"
srcip=10.1.0.100 user="John Locus" authserver="Entra-ID-SAML" action="auth-logon" status="logon"
msg="User John Locus added to auth logon"

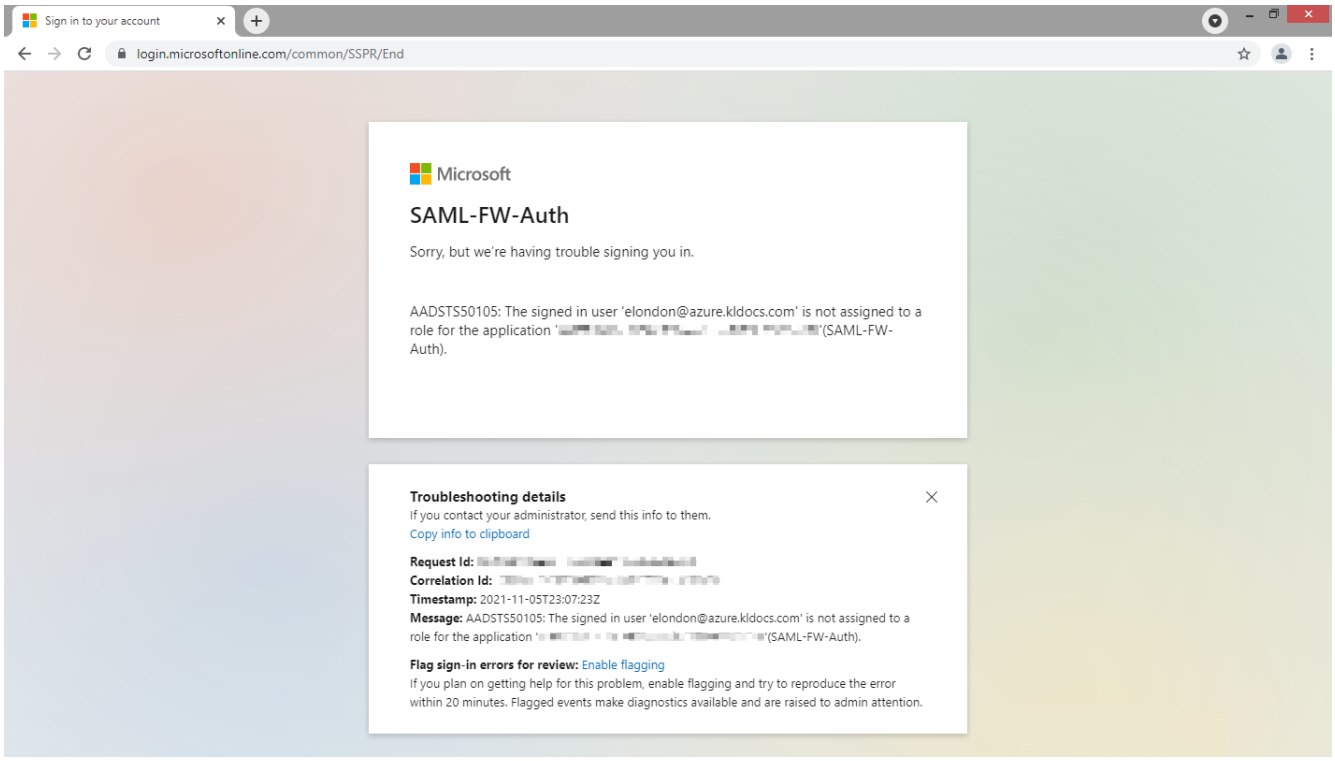
8: date=2021-09-30 time=09:49:25 eventtime=1633020565577075629 tz="-0700" logid="0102043008"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication success"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="John Locus" group="Azure-FW-
```

```
Auth" authproto="HTTPS(10.1.0.100)" action="authentication" status="success" reason="N/A"
msg="User John Locus succeeded in authentication"
```

If user authentication is successful in Microsoft Entra ID, but their group does not match the one defined in the FortiGate user group, the user will receive a *Firewall Authentication Failed* message in the browser. A log is also recorded:

```
# execute log filter category event
# execute log filter field subtype user
# execute log display
1: date=2021-09-30 time=10:39:35 eventtime=1633023575381139214 tz="-0700" logid="0102043009"
type="event" subtype="user" level="notice" vd="root" logdesc="Authentication failed"
srcip=10.1.0.100 dstip=10.1.0.1 policyid=11 interface="port3" user="Adam Thompson" group="N/A"
authproto="HTTPS(10.1.0.100)" action="authentication" status="failure" reason="No matched SAML
user or group name in auth resp" msg="User Adam Thompson failed in authentication"
```

If a user receives the following error message, this means the user is not assigned to the enterprise application *SAML-FW-Auth* in Azure.



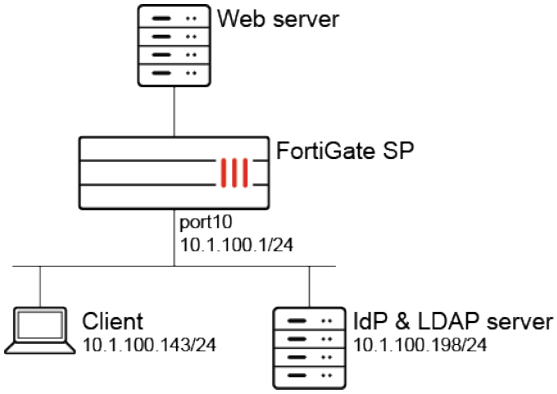
To troubleshoot SAML issues:

```
# diagnose debug application samld -1
# diagnose debug enable
```

SAML authentication in a proxy policy

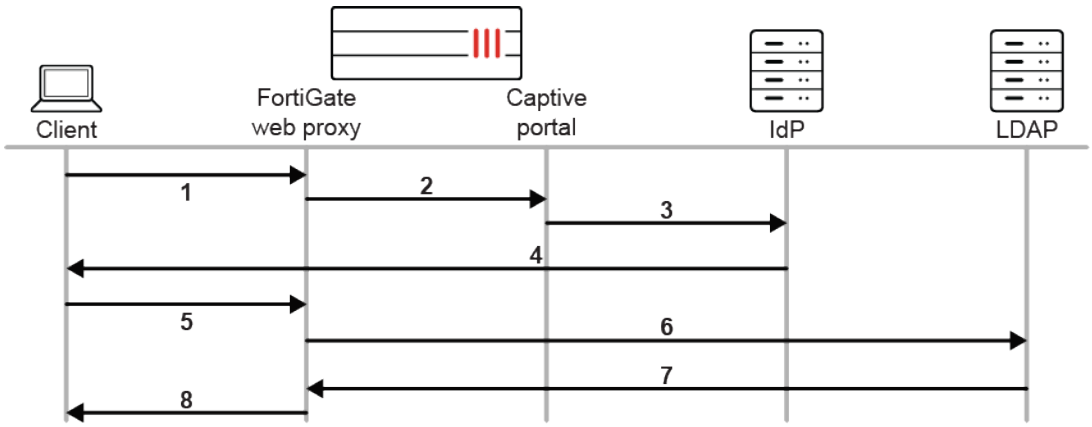
SAML user authentication can be used in explicit web proxies and transparent web proxies with the FortiGate acting as a SAML SP. SAML can be used as an authentication method for an authentication scheme that requires using a captive portal.

Topology



In this configuration, SAML authentication is used with an explicit web proxy. The IdP is a Windows 2016 server configured with ADFS. The LDAP and IdP servers are on the same server. The LDAP server is used as the user backend for the IdP to perform authentication; however, they are not required to be on the same server.

The authentication and authorization flow is as follows:



1. The client opens a browser and visits https://www.google.com.
2. The browser is redirected by the web proxy the captive portal.
3. The request is redirected to the IdP's sign-in page.
4. If the user signs in, the IdP authenticates the user and sends back a SAML assertion message to the user's browser with the user group information.
5. The browser forwards the SAML assertion response as a HTTP POST to the FortiGate SAML assertion consumer service URL (https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/).

6. If the FortiGate authentication scheme has a user database configured, the FortiGate will query the LDAP server for the user group information and ignore the user group information from the SAML message.
7. The user group information is returned. The FortiGate matches the user group information against the LDAP group in the proxy policy group settings. If there is a match, the request is authorized and the proxy policy is matched.
8. If all policy criteria match successfully, then the webpage is returned to the client.

To configure SAML authentication with an explicit web proxy:

1. Enable the web proxy:

```
config web-proxy explicit
    set status enable
    set http-incoming-port 8080
end
```

2. Enable the proxy captive portal:

```
config system interface
    edit "port10"
        set vdom "vdom1"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
        set type physical
        set explicit-web-proxy enable
        set explicit-ftp-proxy enable
        set proxy-captive-portal enable
        set snmp-index 12
    next
end
```

3. Configure the LDAP server:

```
config user ldap
    edit "ldap-10.1.100.198"
        set server "10.1.100.198"
        set cnid "cn"
        set dn "dc=myqalab,dc=local"
        set type regular
        set username "cn=fosqa1,cn=users,dc=myqalab,dc=local"
        set password ************
        set group-search-base "dc=myqalab,dc=local"
    next
end
```

4. Configure the user group:

```
config user group
    edit "ldap-group-saml"
        set member "ldap-10.1.100.198"
```

```
    next
end
```

5. Configure SAML:

```
config user saml
    edit "saml_user"
        set cert "Fortinet_CA_SSL"
        set entity-id "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/metadata/"
        set single-sign-on-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/login/"
        set single-logout-url "https://fgt9.myqalab.local:7831/XX/YY/ZZ/saml/logout/"
        set idp-entity-id "http://MYQALAB.LOCAL/adfs/services/trust"
        set idp-single-sign-on-url "https://myqalab.local/adfs/ls"
        set idp-single-logout-url "https://myqalab.local/adfs/ls"
        set idp-cert "REMOTE_Cert_4"
        set digest-method sha256
        set adfs-claim enable
        set user-claim-type name
        set group-claim-type group
    next
end
```

6. Configure the authentication scheme, rule, and setting:

```
config authentication scheme
    edit "saml"
        set method saml
        set saml-server "saml_user"
        set user-database "ldap-10.1.100.198"
    next
end
```

```
config authentication rule
    edit "saml"
        set srcaddr "all"
        set active-auth-method "saml"
    next
end
```

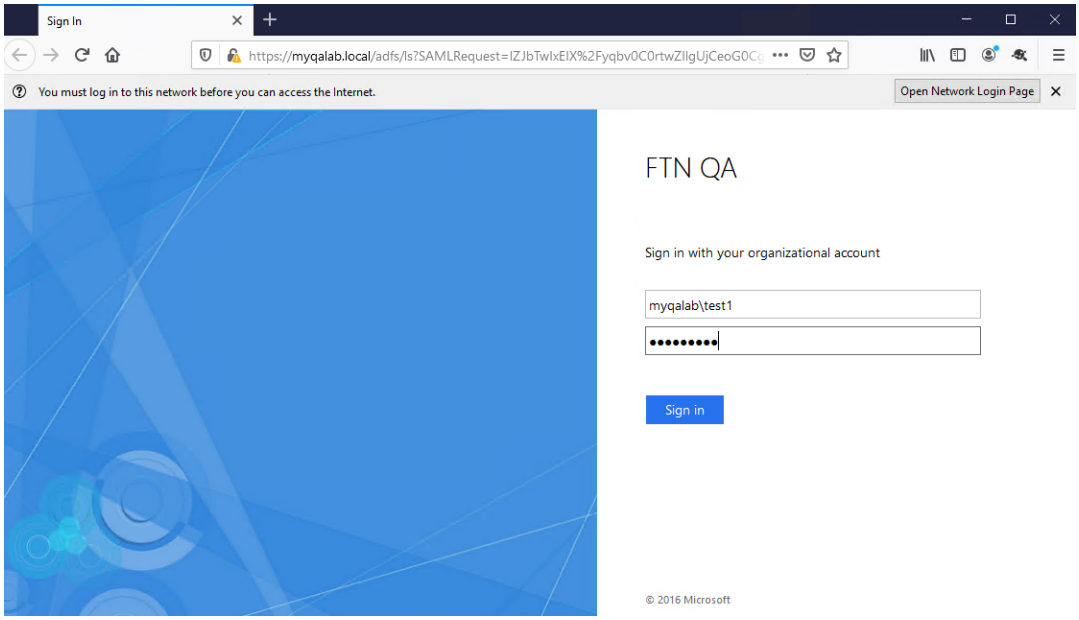
```
config authentication setting
    set captive-portal "fgt9.myqalab.local"
end
```

7. Configure the proxy policy:

```
config firewall proxy-policy
    edit 3
        set proxy explicit-web
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
```

```
        set action accept
        set schedule "always"
        set logtraffic all
        set groups "ldap-group-saml"
        set utm-status enable
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "deep-custom"
        set av-profile "av"
    next
end
```

When a user goes to www.google.com in a browser that is configured to use the FortiGate as a proxy, the IdP sign-in page appears.



Sample log

```

```

TACACS+ servers

TACACS+ is a remote authentication protocol that provides access control for routers, network access servers, and other network devices through one or more centralized servers.

FortiOS sends the following proprietary TACACS+ attributes to the TACACS+ server during authorization requests:

Attribute	Description
`service=<name>`	User must be authorized to access the specified service.
`memberof`	Group that the user belongs to.
`admin_prof`	Administrator profile (admin access only).

Only `memberof` and `admin_prof` attributes are parsed in authentication replies.

You can configure up to ten remote TACACS+ servers in FortiOS. You must configure at least one server before you can configure remote users.

A TACACS+ server must first be added in the CLI to make the option visible in the GUI.

To configure TACACS+ authentication in the CLI:

1. Configure the TACACS+ server entry:

```
config user tacacs+
    edit "TACACS-SERVER"
        set server <IP address>
        set key <string>
        set authen-type ascii
        set source-ip <IP address>
    next
end
```

2. Configure the remote user group:

```
config user group
    edit "TACACS-GROUP"
        set group-type firewall
        set member "TACACS-SERVER"
    next
end
```

3. Configure the remote user:

```
config system admin
    edit TACACS-USER
        set remote-auth enable
        set accprofile "super_admin"
        set vdom "root"
        set wildcard enable
        set remote-group "TACACS-GROUP"
    next
end
```

To configure a TACACS+ server in the GUI:

1. Go to *User & Authentication* > *TACACS+ Servers*.
2. Click *Create New*.
3. Configure the following settings:

Name	Enter the TACACS+ server name.
Authentication Type	Select the authentication type used for the TACACS+ server. Selecting *Auto* tries PAP, MSCHAP, and CHAP, in that order.
Server IP/Name	Enter the domain name or IP address for the primary server.
Server Secret	Enter the key to access the primary server.

4. Click *OK*.

FortiTokens

FortiTokens are security tokens used as part of a multi-factor authentication (MFA) system on FortiGate and FortiAuthenticator. A security token is a 6-digit or 8-digit (configurable) one-time password (OTP) that is used to authenticate one's identity electronically as a prerequisite for accessing network resources. FortiToken is available as either a mobile or a physical (hard) token. Mobile tokens can be purchased as a license, or consumed with points as part of the FortiToken Cloud service.

FortiToken Mobile and physical FortiTokens store their encryption seeds on the cloud. FortiToken Mobile seeds are generated dynamically when the token is provisioned. They are always encrypted whether in motion or at rest.

You can only register FortiTokens to a single FortiGate or FortiAuthenticator for security purposes. This prevents malicious third parties from making fraudulent requests to hijack your FortiTokens by registering them on another FortiGate or FortiAuthenticator. If re-registering a FortiToken Mobile or Hard Token on another FortiGate is required, you must contact Fortinet Customer Support.

To migrate FortiToken Mobile tokens from FortiAuthenticator to FortiToken Cloud, see Migrate FTM tokens from FortiGate in the latest FortiToken Cloud Admin Guide.

Common usage for FortiTokens includes:

- Applying MFA to a VPN dialup user connecting to the corporate network
- Applying MFA to FortiGate administrators
- Applying MFA to firewall authentication and captive portal authentication

The MFA process commonly involves:

- **Something you know**: User password
- **Something you have**: The FortiToken OTP

A third factor of authentication is added to the authentication process:

- **Something you are**: Your fingerprint or face

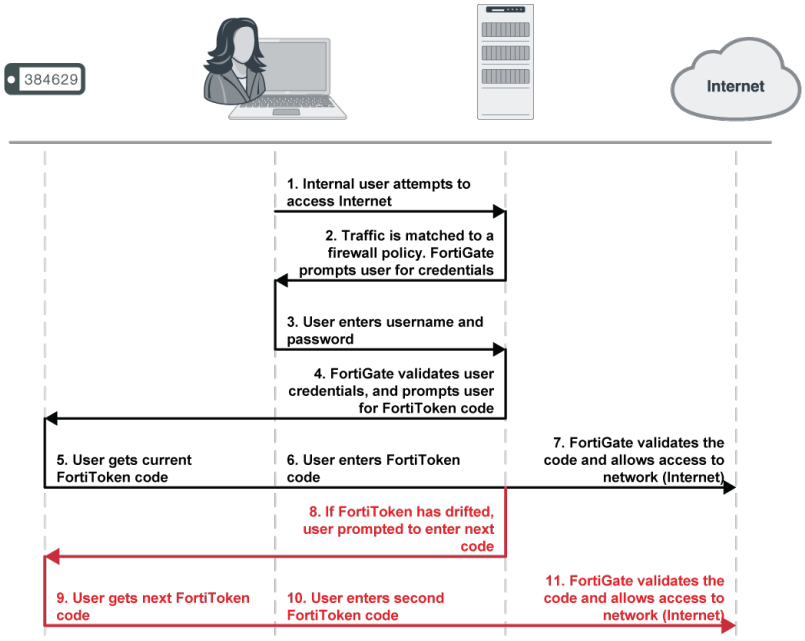
To enable the third factor, refer to the Activating FortiToken Mobile on a mobile phone on page 2959 section.

The following illustrates the FortiToken MFA process:

1. The user attempts to access a network resource.
2. FortiOS matches the traffic to an authentication security policy and prompts the user for their username and password.
3. The user enters their username and password.
4. FortiOS verifies their credentials. If valid, it prompts the user for the FortiToken code.
5. The user views the current code on their FortiToken. They enter the code at the prompt.
6. FortiOS verifies the FortiToken code. If valid, it allows the user access to network resources.

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.



This section includes the following topics to quickly get started with FortiTokens:

- FortiToken Mobile quick start on page 2956
- FortiIdentity Cloud on page 2964
- Registering hard tokens on page 2964
- Managing FortiTokens on page 2967
- FortiToken Mobile Push on page 2969
- Synchronizing LDAP Active Directory users to FortiToken Cloud using the two-factor filter on page 2970
- Enable the FortiToken Cloud free trial directly from the FortiGate on page 2974
- FortiGuard distribution of updated Apple certificates for push notifications on page 2976
- Troubleshooting and diagnosis on page 2977

FortiToken Mobile quick start

FortiToken Mobile is an OATH compliant, event- and time-based one-time password (OTP) generator for mobile devices. It provides an easy and flexible way to deploy and provision FortiTokens to your end users through mobile devices. FortiToken Mobile produces its OTP codes in an application that you can download onto your Android or iOS mobile device without the need for a physical token.

You can download the free FortiToken Mobile application for Android from the Google Play Store, and for iOS from the Apple App Store.

This section focuses on quickly getting started and setting up FortiToken Mobile for use on a FortiGate:

- Registering FortiToken Mobile on page 2956
- Provisioning FortiToken Mobile on page 2957
- Activating FortiToken Mobile on a mobile phone on page 2959
- Applying multi-factor authentication on page 2963

Registering FortiToken Mobile

To deploy FortiToken Mobile for your end users, you must first register the tokens on your FortiGate. After registering the tokens, you can assign them to your end users.

Each FortiGate comes with two free FortiToken Mobile tokens. These tokens should appear under *User & Authentication > FortiTokens*. If no tokens appear, you may import them. Ensure that your FortiGate is registered and has internet access to connect to the FortiToken servers to import the tokens.

To import FortiTokens from the FortiGate GUI:

1. Go to *User & Authentication > FortiTokens*.
2. Click the *Import Free Trial Tokens* icon at the top. The two free tokens are imported.

To import FortiTokens from the FortiGate CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
# show user fortitoken
```

If only one free token appears, you can first delete that token and then follow the procedure to import the two free tokens from either the GUI or the CLI.

If you have the FortiToken Mobile redemption certificate, you can register FortiToken Mobile on a FortiGate.

To register FortiToken Mobile from the FortiGate GUI:

1. Go to *User & Authentication* > *FortiTokens* and click *Create New*. The *New FortiToken* dialog appears.
2. For the *Type* field, select *Mobile Token*.
3. Locate the 20-digit code on the redemption certificate and type it in the *Activation Code* field.
4. Click *OK*. The token is successfully registered.

If you attempt to add invalid FortiToken serial numbers, there is no error message. FortiOS does not add invalid serial numbers to the list.

To register FortiToken Mobile from the FortiGate CLI:

```
# execute fortitoken-mobile import <20-digit activation code>
# show user fortitoken
```

FortiToken Mobile stores its encryption seeds on the cloud. You can only register it to a single FortiGate or FortiAuthenticator.

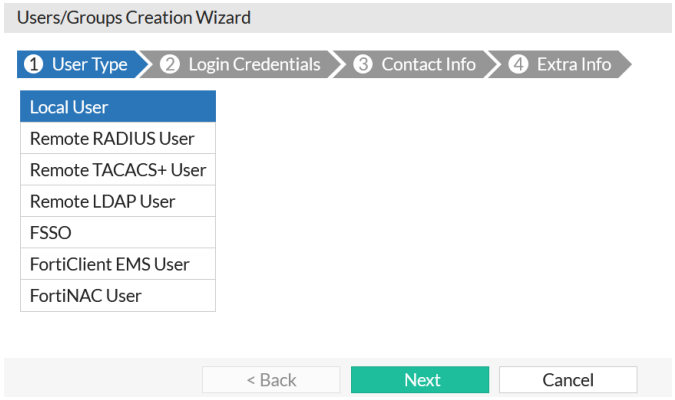
Provisioning FortiToken Mobile

Once registered, FortiTokens need to be provisioned for users before they can be activated. In this example, you will provision a mobile token for a local user. Similar steps can be taken to assign FortiTokens to other types of users.

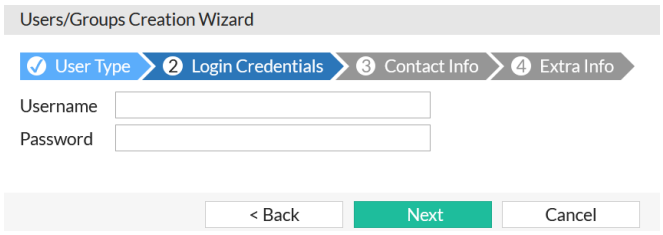
To create a local user and assign a FortiToken in the FortiGate GUI:

1. Go to *User & Authentication* > *User Definition*, and click *Create New*. The *Users/Groups Creation Wizard* appears.

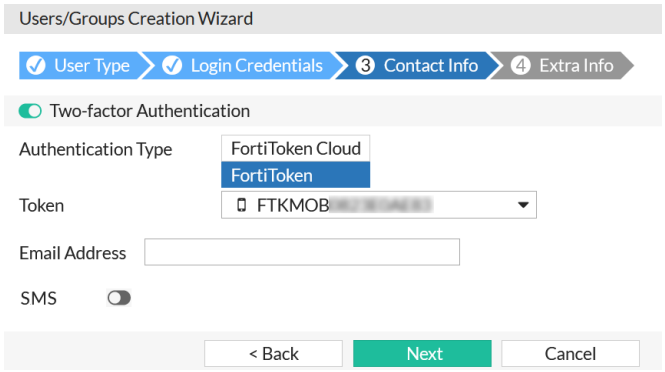
2. In the *User Type* tab, select *Local User*, and click *Next*.



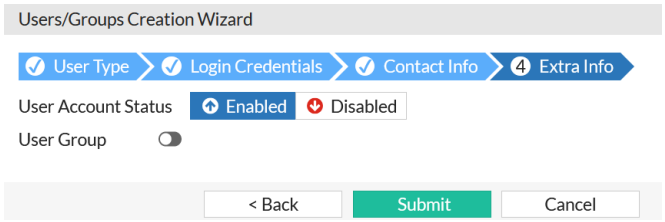
3. In the *Login Credentials* tab, enter a *Username* and *Password* for the user, and click *Next*.



4. In the *Contact Info* tab:
   a. Enable the *Two-factor Authentication* toggle.
   b. Select *FortiToken* for *Authentication Type*.
   c. Select a *Token* to assign to the user from the drop-down list.
   d. Enter the user's email address in the *Email Address* field. This is the email where the user will receive the QR code for activation of the FortiToken.
   e. Click *Next*.



5. In the *Extra Info* tab, make sure the *User Account Status* field is set to Enabled. You can also optionally assign the user to a user group by enabling the *User Group* toggle.



6. Click *Submit*. An activation code should be sent to the created user by email or SMS, depending upon the delivery method configured above.

FortiGate has the *Email Service* setting configured using the server *notifications.fortinet.net* by default. To see configuration, go to *System* > *Settings* > *Email Service*.

The activation code expires if not activated within the 3-day time period by default. However, the expiry time period is configurable.

To configure the time period (in hours) for FortiToken Mobile, using the CLI:

```
config system global
   set two-factor-ftm-expiry <1-168>
end
```

To resend the email or SMS with the activation code, refer to the Managing FortiTokens on page 2967 section.

Activating FortiToken Mobile on a mobile phone

After your system administrator provisions your token, you receive a notification with an activation code and expiry date via SMS or email. If you do not activate your token by the expiry date, you must contact your system administrator so that they can reassign your token for activation.

Platforms that support FortiToken Mobile:

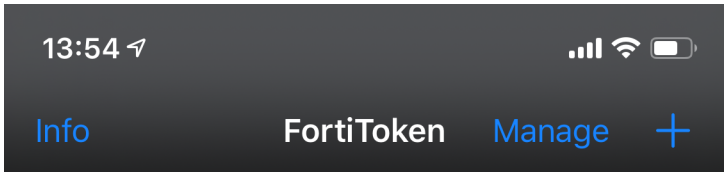
Platform	Device and firmware support
iOS	iPhone, iPad, and iPod Touch with iOS 6.0 and later.
Android	Phones and tablets with Android Jellybean 4.1 and later.
Windows	Windows 10 (desktop and mobile), Windows Phone 8.1, and Windows Phone 8. FortiToken is a Windows Universal Platform (UWP) application. To download FortiToken for Windows 10 desktop and mobile platforms, see FortiToken for Windows on the Microsoft Store.

The following instructions describe procedures when using FortiToken Mobile for iOS on an iPhone. Procedures may vary depending on your device and firmware.

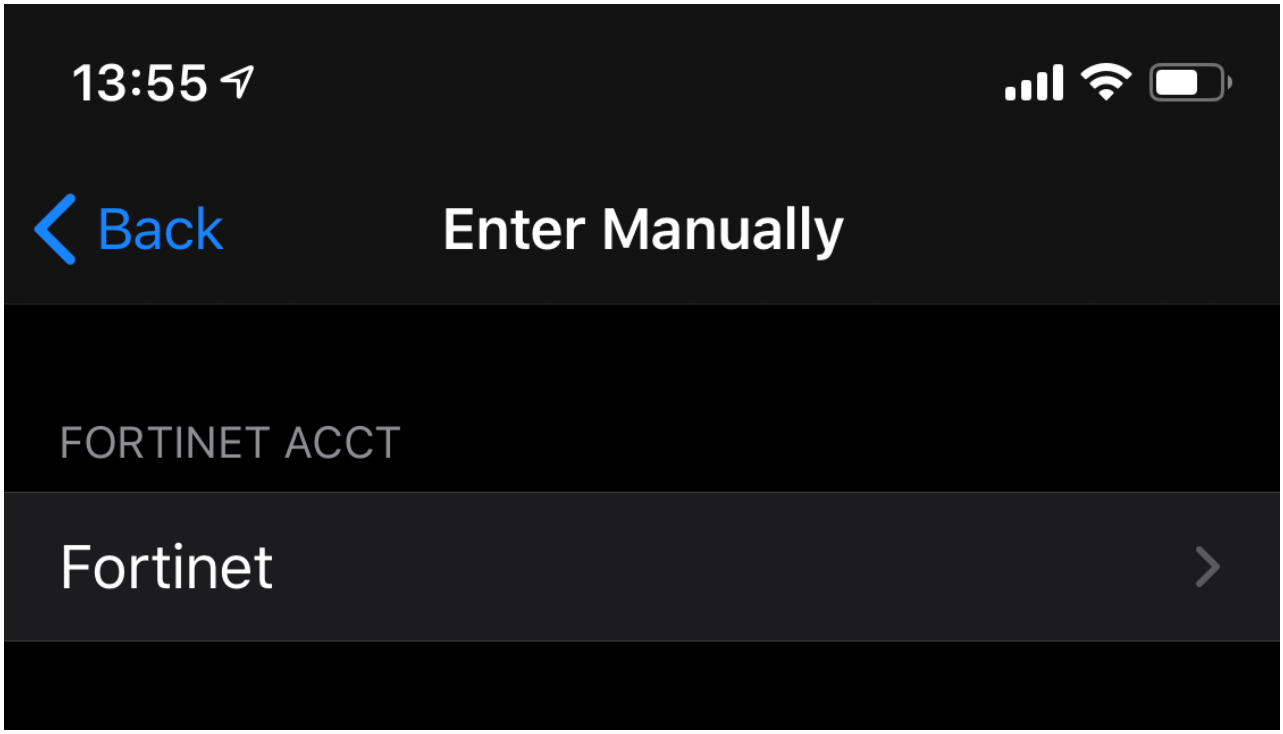
To activate FortiToken Mobile on iOS:

1. On your iOS device, tap on the FortiToken application icon to open the application. If this is your first time opening the application, it may prompt you to create a PIN for secure access to the application and tokens.

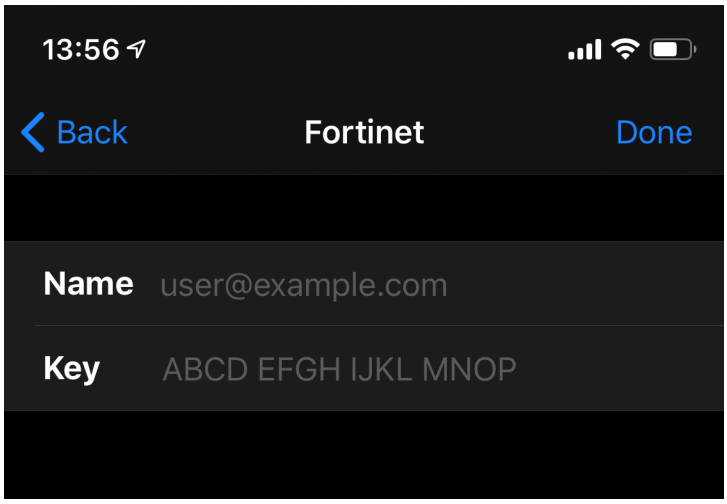
2. Tap on the + icon. The *Scan Barcode* screen appears.



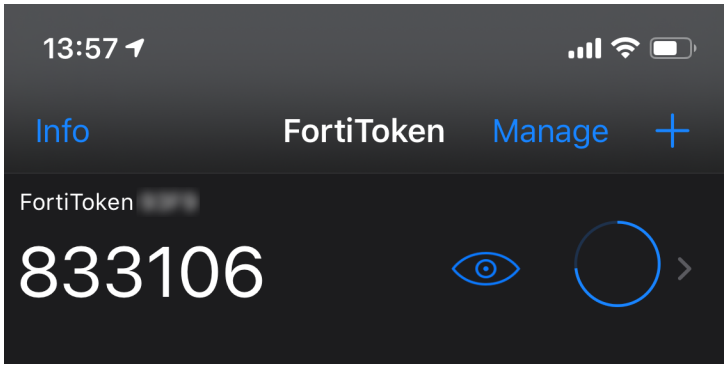
3. If you received the QR code via email, locate and scan the QR code in your email.
OR
If you received the activation key via SMS, tap on *Enter Manually* at the bottom of the screen, and tap on *Fortinet*.



Enter your email address in the *Name* field, the activation key in the *Key* field, and tap *Done*.



4. FortiToken Mobile activates your token, and starts generating OTP digits immediately. To view or hide the OTP digits, tap the eye icon.

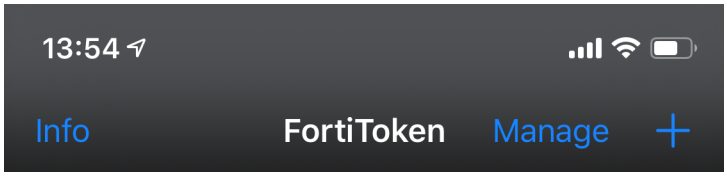


After you open the application, FortiToken Mobile generates a new 6-digit OTP every 30 seconds. All configured tokens display on the application homescreen.

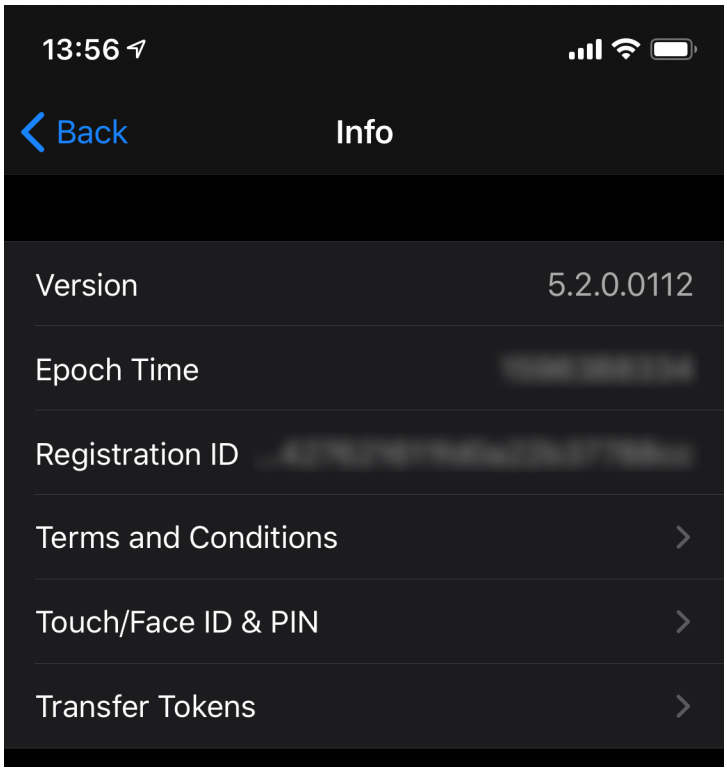
The FortiToken Mobile activation process described above caters to the MFA process that involves two factors (password and OTP) of the authentication process. A third factor (fingerprint or face) can be enabled as well.

To enable *Touch/Face ID* on iOS for FortiToken Mobile:

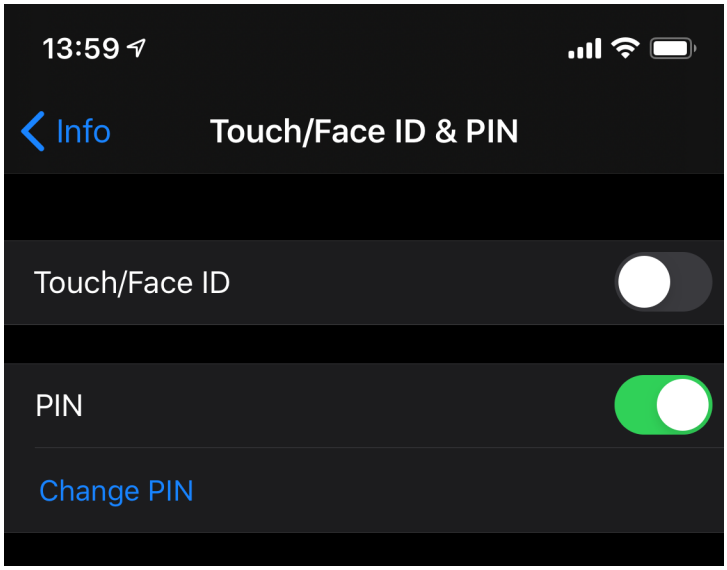
1. Open the FortiToken application and tap on *Info*.



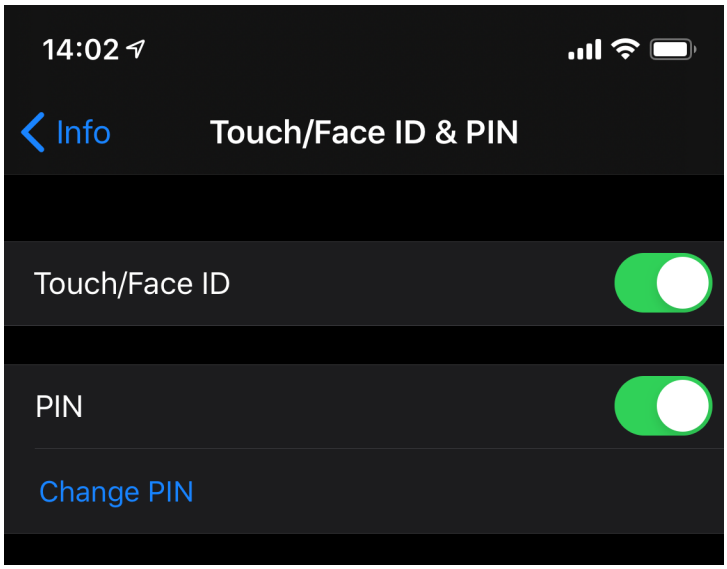
2. Tap on *Touch/Face ID & PIN*.



3. Enable and set up a 4-digit *PIN* for the application. The *PIN* is required to be enabled before you can enable *Touch/Face ID*.

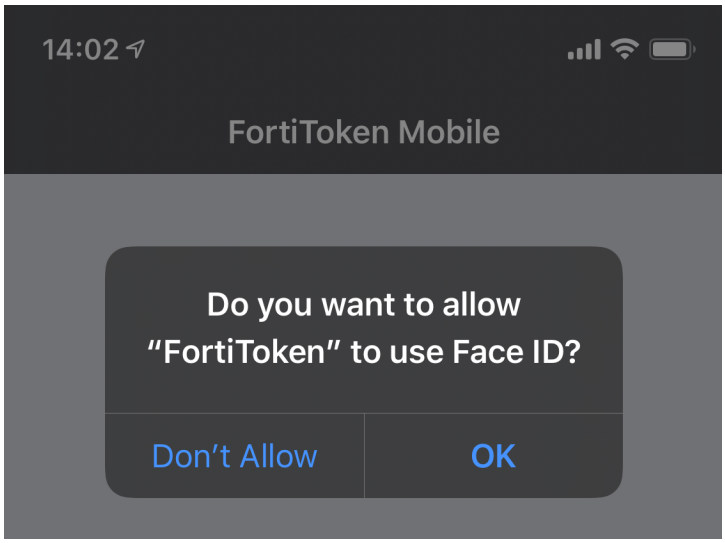


4. Enable *Touch/Face ID*.



You cannot enable *Touch/Face ID* for FortiToken if *Touch/Face ID* is not set up and enabled for device unlock (*iPhone Unlock* in this case) on iOS. You must first set up and enable *Touch/Face ID* from *Settings* on your iOS device.

5. When prompted by iOS, allow the FortiToken application to use *Touch/Face ID* by tapping on *OK* in the prompt.



Applying multi-factor authentication

Multi-factor authentication (MFA) may also be set up for SSL VPN users, administrators, firewall policy, wireless users, and so on. The following topics explain more about how you may use the newly created user in such scenarios:

- MFA for SSL VPN: Set up FortiToken multi-factor authentication on page 2636
- MFA for IPsec VPN: Add FortiToken multi-factor authentication on page 2347
- MFA for Administrators: Administrator account options on page 3024
- MFA with Captive Portal
- MFA for wireless users via Captive Portal
- Configuring FSSO firewall authentication on page 3000

FortiIdentity Cloud

FortiToken Cloud is now called FortiIdentity Cloud.

FortiIdentity Cloud is an Identity and Access Management as a Service (IDaaS) cloud service offering by Fortinet. It enables FortiGate and FortiAuthenticator customers to add MFA for their respective users, through the use of Mobile tokens or Hard tokens. It protects local and remote administrators as well as firewall and VPN users.

For information, see Getting started—FGT-FIC users in the FortiIdentity Cloud Administration Guide.

Registering hard tokens

Registering FortiTokens consists of the following steps:

1. Adding FortiTokens to FortiOS.
2. Activating FortiTokens.
3. Associating FortiTokens with user accounts.

Adding FortiTokens to FortiOS

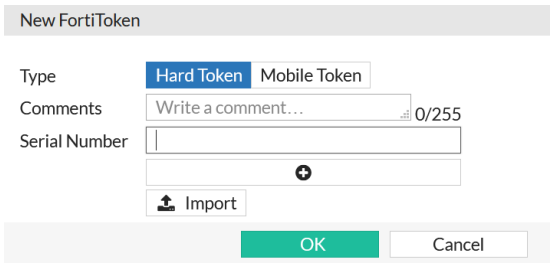
You can add FortiTokens to FortiOS in the following ways:

- Add FortiToken serial numbers using the GUI
- Add FortiToken serial numbers using the CLI
- Import FortiTokens using a serial number or seed file using the GUI

To manually add single hard token to FortiOS using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. In the *Serial Number* field, enter one or more FortiToken serial numbers.

5. Click *OK*.

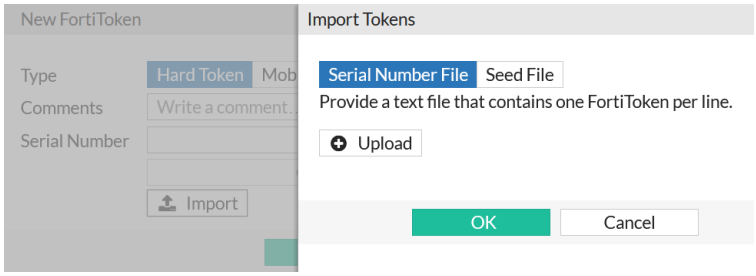


To add multiple FortiTokens to FortiOS using the CLI:

```
config user fortitoken
   edit <serial_number>
   next
   edit <serial_number2>
   next
end
```

To import multiple FortiTokens to FortiOS using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click *Create New*.
3. For *Type*, select *Hard Token*.
4. Click *Import*. The *Import Tokens* section slides in on the screen.



5. Select *Serial Number File*.

Seed files are only used with FortiToken-200CD. These are special hardware tokens that come with FortiToken seeds on a CD. See the FortiToken Comprehensive Guide for details.

6. Click *Upload*.
7. Browse to the file's location on your local machine, select the file, then click *OK*.
8. Click *OK*.

Activating FortiTokens

You must activate the FortiTokens before starting to use them. FortiOS requires connection to FortiGuard servers for FortiToken activation. During activation, FortiOS queries FortiGuard servers about each token's validity. Each token can only be used on a single FortiGate or FortiAuthenticator. If tokens are already

registered, they are deemed invalid for re-activation on another device. FortiOS encrypts the serial number and information before sending for added security.

To activate a FortiToken using the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Select the desired FortiTokens that have an *Available* status.
3. Click *Activate* from the menu above.
4. Click *Refresh*. The selected FortiTokens are activated.

To activate a FortiToken using the CLI:

```
config user fortitoken
   edit <token_serial_num>
      set status activate
   next
end
```

Associating FortiTokens with user accounts

You can associate FortiTokens with local user or administrator accounts.

To associate a FortiToken to a local user account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.
2. Go to *User & Authentication* > *User Definition*. Edit the desired user account.
3. Enable *Two-factor Authentication*.
4. From the *Token* dropdown list, select the desired FortiToken serial number.
5. In the *Email Address* field, enter the user's email address.
6. Click *OK*.

To associate a FortiToken to a local user account using the CLI:

```
config user local
   edit <username>
      set type password
      set passwd "myPassword"
      set two-factor fortitoken
      set fortitoken <serial_number>
      set email-to "username@example.com"
      set status enable
   next
end
```

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

To associate a FortiToken to an administrator account, refer to the Administrator account options on page 3024 section.

Managing FortiTokens

This section focuses on the following:

- Resending an activation email on page 2967
- Locking/unlocking FortiTokens on page 2967
- Managing FortiTokens drift on page 2967
- Deactivating FortiTokens on page 2968
- Moving FortiTokens to another device on page 2968

Resending an activation email

To resend an activation email/SMS for a mobile token on a FortiGate:

1. Go to *User & Authentication* > *User Definition* and edit the user.
2. Click *Send Activation Code Email* from the *Two-factor Authentication* section.

Locking/unlocking FortiTokens

To change FortiToken status to active or to lock:

```
config user fortitoken
   edit <token_serial_num>
      set status <active | lock>
   next
end
```

A user attempting to log in using a locked FortiToken cannot successfully authenticate.

Managing FortiTokens drift

If the FortiToken has drifted, the following must take place for the FortiToken to resynchronize with FortiOS:

1. FortiOS prompts the user to enter a second code to confirm.
2. The user gets the next code from the FortiToken. They enter the code at the prompt.
3. FortiOS uses both codes to update its clock to match the FortiToken.

If you still experience clock drift, it may be the result of incorrect time settings on your mobile device. If so, make sure that the mobile device clock is accurate by confirming the network time and the correct timezone.

If the device clock is set correctly, the issue could be the result of the FortiGate and FortiTokens being initialized prior to setting an NTP server. This will result in a time difference that is too large to correct with the synchronize function. To avoid this, selected Tokens can be manually drift adjusted.

To show current drift and status for each FortiToken:

```
diagnose fortitoken info
FORTITOKEN DRIFT STATUS
FTK200XXXXXXXXXC 0 token already activated, and seed won't be returned
FTK200XXXXXXXXXE 0 token already activated, and seed won't be returned
FTKMOBXXXXXXXXXA 0 provisioned
FTKMOBXXXXXXXXX4 0 new
Total activated token: 0
Total global activated token: 0
Token server status: reachable
```

This command lists the serial number and drift for each configured FortiToken. You can check if it is necessary to synchronize the FortiGate and any particular FortiTokens.

To adjust Mobile FortiToken for drift:

```
# execute fortitoken sync <FortiToken_ID> <token_code1> <next_token_code2>
```

Deactivating FortiTokens

To deactivate FortiToken on a FortiGate:

1. Go to *User & Authentication* > *User Definition*.
2. Select and edit the user for which you want to deactivate the token.
3. Disable the *Two-factor Authentication* toggle.
4. Click *OK*. The token will be removed from the user's *Two-factor Authentication* column. The user will also be removed from the token's *User* column under *User & Authentication* > *FortiTokens*.

Moving FortiTokens to another device

FortiTokens can only be activated on a single FortiGate or FortiAuthenticator. To move FortiTokens to another device, you would first have to reset the registered FortiTokens on a device and then reactivate them on another device.

To reset Hard tokens registered to a FortiGate appliance (non-VM model), you can reset all hardware FTK200 tokens from the Support Portal, or during RMA transfer. See the Migrating users and FortiTokens to another FortiGate KB article, for more information.

The above process will reset all Hard tokens and you cannot select individual tokens to reset.

To reset FortiToken Mobile, a single Hard token, a Hard token registered to a VM, and so on, an administrator must contact Customer Support and/or open a ticket on the Support Portal.

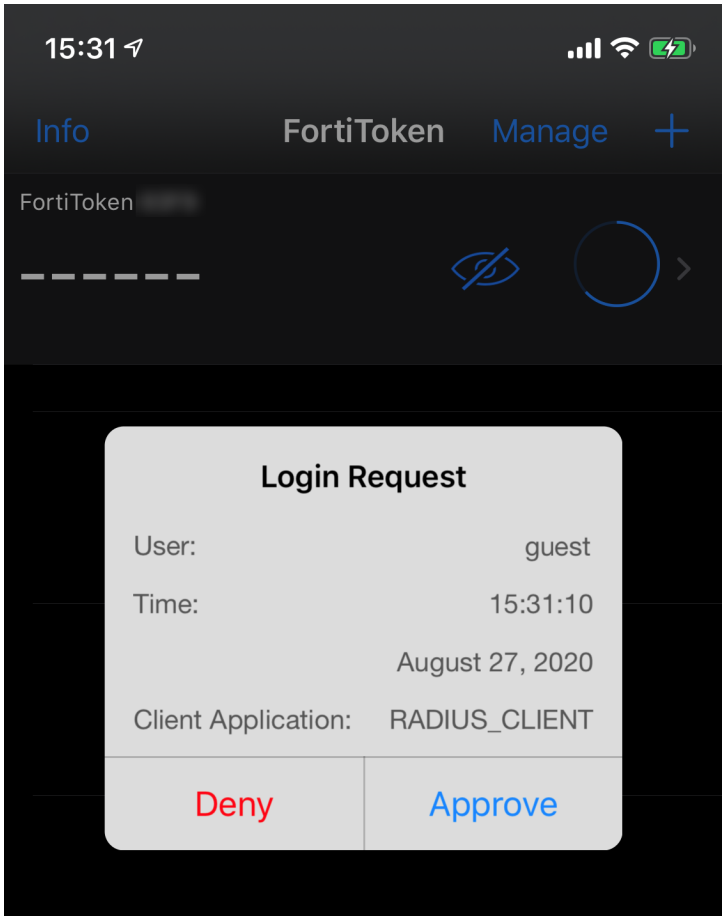
Once reset, the FortiTokens can be activated on another FortiGate or FortiAuthenticator.

FortiToken Mobile Push

FortiToken Mobile Push allows authentication requests to be sent as push notifications to the end user's FortiToken Mobile application.

The FortiToken Mobile push service operates as follows:

1. FortiGate sends a DNS query to the FortiToken Mobile Push proxy server (*push.fortinet.com*).
2. FortiGate connects to the proxy server via an encrypted connection over TCP/443.
3. The proxy server handles the notification request by making a TLS connection with either Apple (for iOS) or Google (for Android) notification servers. Notification data may include the recipient, session, FortiGate callback IP and port, and so on.
4. The notification service from either Apple or Google notifies the user's mobile device of the push request.
5. The FortiToken Mobile application on the user's mobile displays a prompt for the user to either *Approve* or *Deny* the request.



To configure FortiToken Mobile push services using the CLI:

```
config system ftm-push
    set proxy {enable | disable}
```

```
    set server-port [1-65535]
    set server <ip-address>
    set status enable
end
```

The default server port is 4433.

The server IP address is the public IP address of the FortiOS interface that FortiToken Mobile calls back to. FortiOS uses this IP address for incoming FortiToken Mobile calls.

If an SSL VPN user authenticates with their token, then logs out and attempts to reauthenticate within a minute, a *Please wait x seconds to login again* message displays. This replaces a previous error/permission denied message. The x value depends on the calculation of how much time is left in the current time step.

```
config system interface
    edit "guest"
        set allowaccess ftm
    next
end
```

FortiOS supports FortiAuthenticator-initiated FortiToken Mobile Push notifications for users attempting to authenticate through an SSL VPN and/or RADIUS server (with FortiAuthenticator as the RADIUS server).

Synchronizing LDAP Active Directory users to FortiToken Cloud using the two-factor filter

To synchronize Active Directory users and apply two-factor authentication using FortiToken Cloud, two-factor authentication can be enabled in the `user ldap` object definition in FortiOS. By default, FortiOS retrieves all Active Directory users in the LDAP server with a valid email or mobile number (`mail` and `mobile` attributes), and synchronizes the users to FortiToken Cloud. Users are then created on FortiToken Cloud and activation is sent out using email or SMS.

Two-factor filters can be used to reduce the number of the Active Directory users returned, and only synchronize the users who meet the filter criteria.

```
config user ldap
    edit <name>
        set dn <string>
        set two-factor {disable | fortitoken-cloud}
        set two-factor-filter <string>
    next
end
```

`dn <string>`	Set the distinguished name used to look up entries on the LDAP server. The search for users and groups starts here based on what is defined.
`two-factor {disable | fortitoken-cloud}`	Enable/disable two-factor authentication:

	• `disable`: disable two-factor authentication • `fortitoken-cloud`: use the FortiToken Cloud service
`two-factor-filter <string>`	Set the filter used to synchronize users to FortiToken Cloud.

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 2858 and Configuring client certificate authentication on the LDAP server on page 2873.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 2866.

Two-factor filter examples

In the following examples, a `user ldap` object is defined to connect to an Active Directory on a Windows server. The search will begin in the root of the fortinet-fsso.com directory.

To configure a default LDAP server configuration without a two-factor filter:

```
config user ldap
    edit "ad-ldap-auth"
        set server <ip_address>
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set two-factor fortitoken-cloud
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password **********
    next
end
```

When a two-factor filter is not used, all users in the Active Directory with a valid email or mobile number will be retrieved.

Example 1: specific users and email address with wildcard

With this `two-factor-filter`, users under fortinet-fsso.com that have oliver* in their username and *fortinet* in their email will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(SAMAccountName=oliver*)(mail=*fortinet*))"
    next
end
```

Example 2: all users with matching email

With this `two-factor-filter`, all users under fortinet-fsso.com with *fortinet* in their email will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(SAMAccountName=*)(mail=*fortinet*))"
    next
end
```

Example 3: all users in a group

With this `two-factor-filter`, all users within the group fortinet-fsso.com > Testing > ftc-users will be matched.

```
config user ldap
    edit "ad-ldap-auth"
        set two-factor-filter "(&(objectCategory=Person)(sAMAccountName=*)( memberOf=cn=ftc-
users,ou=Testing,dc=fortinet-fsso,DC=com))"
    next
end
```

Example configuration

In this example, Active Directory users are configured to be synchronized to FortiToken Cloud. The same two-factor filter is used from example 1 and searches the Active Directory for users named oliver* with email *fortinet*.

Before configuring the FortiGate:

1. Gather the information to connect to the Active Directory server through LDAP. Include all necessary fields, such as the server IP, port, CN name identifier, DN for the start of the search, bind type, and username associated with a regular bind.
2. Consider the users or groups that require two-factor authentication and should be synchronized. If necessary, group the users under the same group in the Active Directory.
3. If using a two-factor filter, formulate the `two-factor-filter` string to limit the match. For this example, `(&(SAMAccountName=oliver*)(mail=*fortinet*))`.
4. Test the filter by using the FortiOS CLI to perform a quick LDAP search:

   ```
   # diagnose test authserver ldap-search <server_ip> 389 "ou=Testing,dc=fortinet-fsso,DC=com" cn
   Administrator@fortinet-fsso.com PASSWORD 0 '(&(SAMAccountName=oliver*)(mail=*fortinet*))' 2

   searching 'ou=Testing,dc=fortinet-fsso,DC=com, cn=cn' on 10.1.100.131:389 for
   (Administrator@fortinet-fsso.com, PASSWORD), secure(0), filter((&(SAMAccountName=oliver*)
   (mail=*fortinet*))), flag(0x2), page_no(0)...
   CN=oliver2022,OU=Testing,DC=Fortinet-FSSO,DC=COM (oliver2022, 0 entries)
   ```

   The user, `oliver2022`, was found.
5. Estimate how many users will be retrieved, and ensure that the FortiToken Cloud account has enough user licenses to support the number of users.

To configure Active Directory users to be synchronized to FortiToken Cloud:

1. Configure the user LDAP settings:

```
config user ldap
    edit "ad-ldap-auth"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set two-factor fortitoken-cloud
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password **********
        set two-factor-filter "(&(SAMAccountName=oliver*)(mail=*fortinet*))"
    next
end
```

2. In the background, the FortiGate FAS daemon scans the LDAP server for users to be synchronized based on the two-factor filter pattern, but will not send them to the FortiToken Cloud server yet. Optionally, verify the users that are retrieved from the Active Directory based on the filter:

```
# diagnose fortitoken-cloud debug enable
# diagnose debug enable
# diagnose fortitoken-cloud sync
...
fas_sync_ftc[2788]: Sending packet to FTC server: "IP-of-FTC-server" Port: 8686(length:444)
fas_sync_ftc[2792]: FTC User Sync Packet(length:444):
POST /api/v1/user_sync HTTP/1.1
Host: ftc.fortinet.com
Connection: keep-alive
User-Agent: FortiGate-401E v7.0.6,build****
Content-Type: application/json
Content-Length: 246
{"users":[{"username":"oliver2022","vdom":"vdom1","email":"o****@fortinet.com","mobile_
number":"XXXXXXXXXXX","user_data":1,"action":"create"}],"sn":"FG4H1E5819900000","cluster_
members":[ "FG4H1E5819900000" ],"group_name":"FGT400D","group_id":"0"}
Reminder: User sync packet not actually sent out because of diagnose purpose!
```

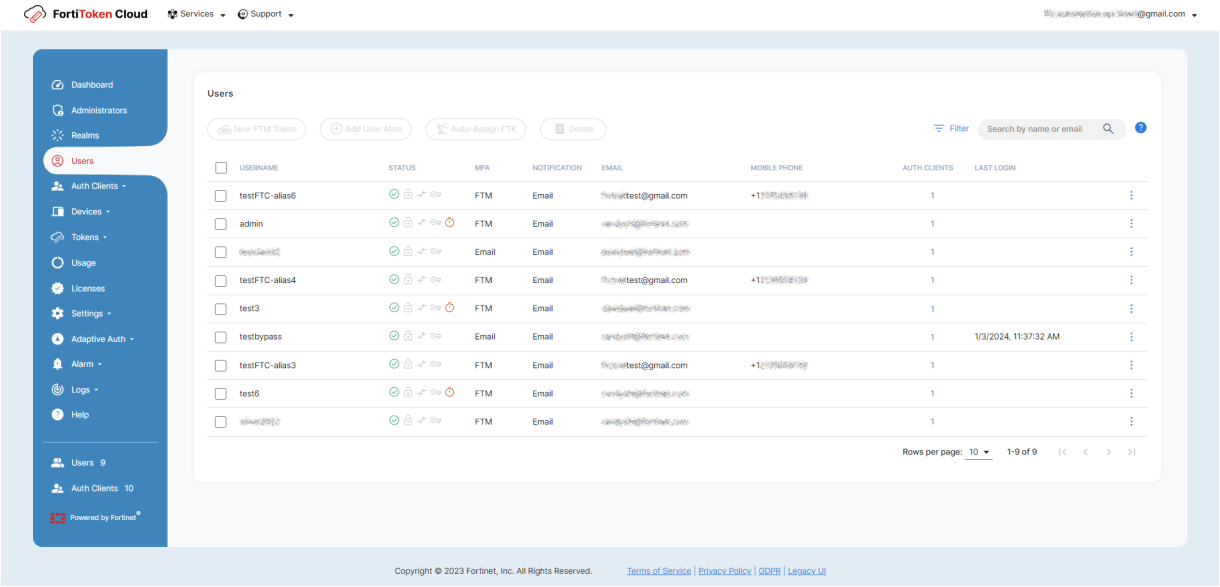
   As expected, only the user that matches the current filter is returned.

3. Manually trigger the synchronization process with FortiToken Cloud:

```
# execute fortitoken-cloud sync
```

   The user is added to FortiToken Cloud, and an activation email or SMS message is sent to the user.

4. In FortiToken Cloud, go to *Users* to verify that the user was added.



If the activation email was sent, but user has not downloaded and activated the mobile token yet, a pending symbol appears in the *Status* column (such as for the *admin*, *test6*, and *test3* users).

5. In FortiOS, add the `ad-ldap-auth` object in a user group. The user group can be used for VPN, firewall authentication, and so on.

The `ldap user` object should not be used in remote LDAP user groups that require group matching because it is not supported.

Enable the FortiToken Cloud free trial directly from the FortiGate

---

The FortiToken Cloud product is now named FortiIdentity Cloud.

A free trial of FortiToken Cloud with a maximum of three seats is available from FortiGates with a valid support contract registered to a FortiCare/FortiCloud account with Fortinet Technical Support. See Product registration with FortiCare on page 96 for more information.

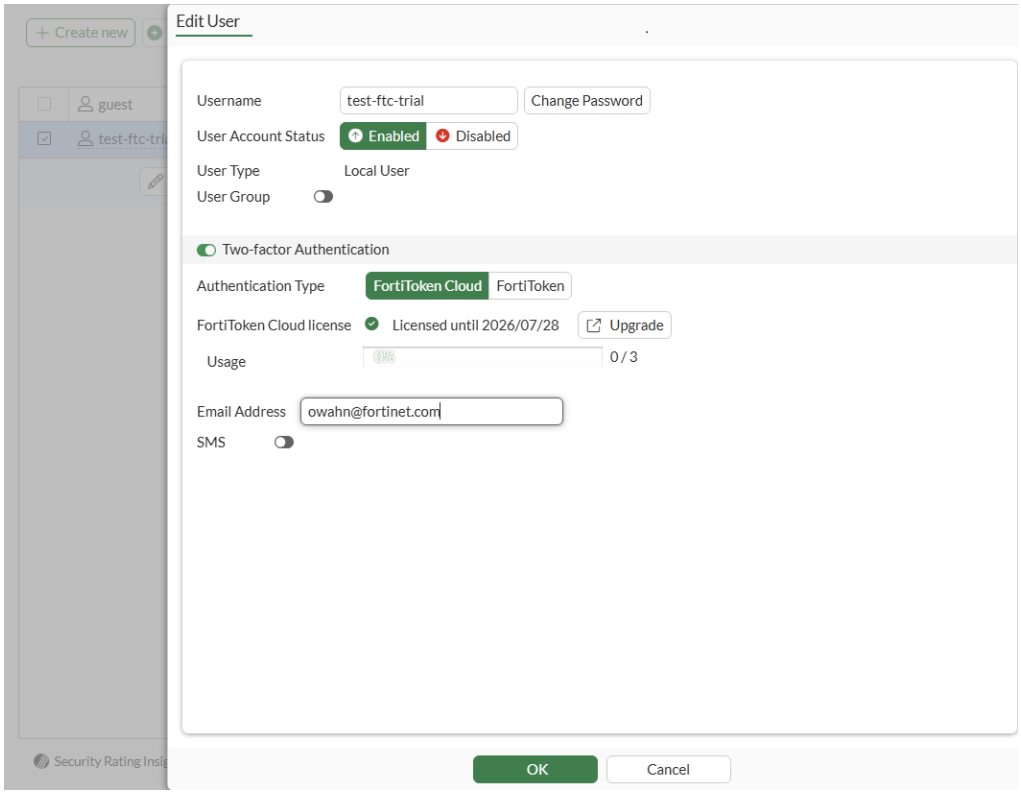
You can access the free trial by enabling two-factor authentication within a user or administrator configuration.

The free trail of FortiToken Cloud remains active as long as the support contract is valid.

To enable the FortiToken Cloud free trial for a local user:

1. Go to *User & Authentication* > *User Definition*.
2. Click *Create new*.

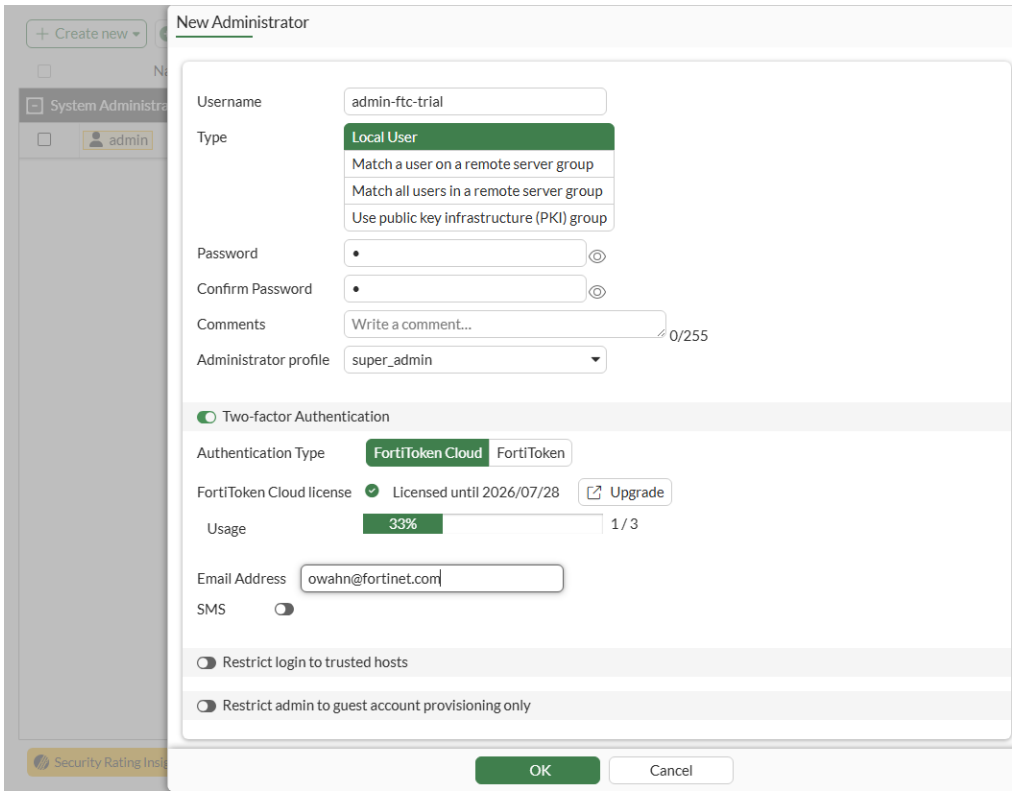
3. Configure settings as needed.
4. Enable *Two-factor Authentication*.
5. Set *Authentication Type* to *FortiToken Cloud*.
   The *FortiToken Cloud license* field displays *Licensed* and the expiration date of the license.
   The *Usage* field displays the number of available and used seats. In this example, 0 of 3 (*0/3*) seats are used because the user configuration hasn't been saved yet.



6. Complete the remaining fields, and click *OK*.
   A FortiToken Cloud enrollment email is sent to the provided email.

To enable the FortiToken Cloud free trial for an Administrator:

1. Go to *System* > *Administrators*.
2. Click *Create new* > *Administrator*.
3. Enable *Two-factor Authentication*.
4. Set *Authentication Type* to *FortiToken Cloud*.
   The *FortiToken Cloud license* field displays *Licensed* and the expiration date of the license.
   The *Usage* field displays the number of available and used seats. In this example, 1 of 3 (*1/3*) seats are used. After this administrator configuration is saved, a second seat will be used.



5. Complete the remaining fields, and click *OK*.
   A FortiToken Cloud enrollment email is sent to the provided email.

To view the FortiToken Cloud status in the CLI:

```
# execute fortitoken-cloud show
FortiToken Cloud service status: licensed. Region code: 01. Region name: eu.
Service balance: 1.00 users. Expiration date: 2026-07-29. Customer ID: 1336761.
FortiToken Cloud account number of users: 2, max number of users: 3.
```

FortiGuard distribution of updated Apple certificates for push notifications

Push notifications for iPhone (for the purpose of two-factor authentication) require a TLS server certificate to authenticate to Apple. As this certificate is only valid for one year, a service extension allows FortiGuard to distribute updated TLS server certificates to FortiGate when needed.

FortiGuard update service updates local Apple push notification TLS server certificates when the local certificate is expired. FortiGuard update service also reinstalls certificates when the certificates are lost.

You can verify that the feature is working on the FortiGate by using the CLI shell.

To verify certificate updates:

1. Using FortiOS CLI shell, verify that all certificates are installed:

```
/data/etc/apns # ls -al
drwxr-xr-x    2 0        0       Tue Jan 15 08:42:39 2019          1024 .
drwxr-xr-x   12 0        0       Tue Jan 15 08:45:00 2019          2048 ..
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          2377 apn-dev-cert.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          1859 apn-dev-key.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          8964 apn-dis-cert.pem
-rw-r--r--    1 0        0       Sat Jan 12 00:06:30 2019          4482 apn-dis-key.pem
```

2. Rename all current Apple certificates.
   Apple push notification no longer works after you rename the certificates.

```
/data/etc/apns # mv apn-dis-cert.pem apn-dis-cert.pem.save
/data/etc/apns # mv apn-dev-key.pem apn-dev-key.pem.save
/data/etc/apns # mv apn-dev-cert.pem apn-dev-cert.pem.save
/data/etc/apns # mv apn-dis-key.pem apn-dis-key.pem.save
/data/etc/apns # ls -al
drwxr-xr-x   2 0  0   Tue Jan 15 08:51:15 2019   1024 .
drwxr-xr-x  12 0  0   Tue Jan 15 08:45:00 2019   2048 ..
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   2377 apn-dev-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   1859 apn-dev-key.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   8964 apn-dis-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   4482 apn-dis-key.pem.save
```

3. Run a FortiGuard update, and verify that all certificates are installed again:

```
/data/etc/apns # ls -al
drwxr-xr-x   2 0  0   Tue Jan 15 08:56:20 2019   1024 .
drwxr-xr-x  12 0  0   Tue Jan 15 08:56:15 2019   2048 ..
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   2377 apn-dev-cert.pem.save
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   1859 apn-dev-key.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019   2167 apn-dis-cert.pem  <-- downloaded from
FortiGuard
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   8964 apn-dis-cert.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019   1704 apn-dis-key.pem   <-- downloaded from
FortiGuard
-rw-r--r--   1 0  0   Sat Jan 12 00:06:30 2019   4482 apn-dis-key.pem.save
-rw-r--r--   1 0  0   Tue Jan 15 08:56:20 2019     41 apn-version.dat   <-- downloaded from
FortiGuard
/data/etc/apns #
```

Troubleshooting and diagnosis

This section contains some common scenarios for FortiTokens troubleshooting and diagnosis:

- FortiToken Statuses on page 2978
- Recovering trial FortiTokens on page 2979
- Recovering lost Administrator FortiTokens on page 2979

- SSL VPN with multi-factor authentication expiry timers on page 2980

FortiToken Statuses

When troubleshooting FortiToken issues, it is important to understand different FortiToken statuses. FortiToken status may be retrieved either from the CLI or the GUI, with a slightly different naming convention.

Before you begin, verify that the FortiGate has Internet connectivity and is also connected to both the FortiGuard and registration servers:

```
# execute ping fds1.fortinet.com
# execute ping directregistration.fortinet.com
# execute ping globalftm.fortinet.net
```

The `globalftm.fortinet.net` server is the Fortinet Anycast server added in FortiOS 6.4.2.

If there are connectivity issues, retrieving FortiToken statuses or performing FortiToken activation could fail. Therefore, troubleshoot connectivity issues before continuing.

To retrieve FortiToken statuses:

- In the CLI:
  `# diagnose fortitoken info`
- In the GUI:
  Go to *User & Authentication* > *FortiTokens*.

Various FortiToken statuses in either the CLI or the GUI may be described as follows:

CLI	GUI	Description
`new`	*Available*	Newly added, not pending, not activated, not yet assigned.
`active`	*Assigned*	Assigned to a user, hardware token.
`provisioning`	*Pending*	Assigned to a user and waiting for activation on the FortiToken Mobile app.
`provisioned`	*Assigned*	Assigned to user and activated on the FortiToken Mobile app.
`provision timeout`		Token provided to user but not activated on the FortiToken Mobile app. To fix, the token needs to be re-provisioned and activated in time.
`token already activated, and seed won't be returned`	*Error*	Token is locked by FortiGuard FDS. The hardware token was already activated on another device and locked by FDS.
`locked`		Either manually locked by an Administrator (`set status lock`), or locked automatically, for example, when the token is unassigned and the FortiCare FTM provisioning server was unreachable to process that change.

Recovering trial FortiTokens

You can recover trial FortiTokens if deleted from a FortiGate, or if stuck in a state where it is not possible to provision to a user.

When a token is stuck in an unusual state or with errors, delete the FortiTokens from the unit and proceed to recover trial FortiTokens.

To recover trial tokens via the GUI:

1. Go to *User & Authentication* > *FortiTokens*.
2. Click the *Import Free Trial Tokens* button at the top. The two free trial tokens are recovered.

To recover trial tokens via the CLI:

```
# execute fortitoken-mobile import 0000-0000-0000-0000-0000
```

- Before attempting to recover the trial tokens, both the tokens should be deleted from the unit first.
- If VDOMs are enabled, trial tokens are in the management VDOM (`root` by default).

Following error codes might come up in the CLI:

- If the device is not registered:
  ```
  # execute fortitoken-mobile import 0000-0000-0000-0000-0000
  import fortitoken license error: -7571
  ```
- If the serial number format is incorrect:
  ```
  # execute fortitoken-mobile import 0000-0000-0000-0000-00
  import fortitoken license error: -7566
  ```

Recovering lost Administrator FortiTokens

If an Administrator loses their FortiToken or the FortiToken is not working, they will not be able to log into the admin console through the GUI or the CLI. If there is another Administrator that can log into the device, they may be able to reset the two-factor settings configured for the first Administrator, or create a new Admin user for them. Note that a *super_admin* user will be able to edit other admin user settings, but a *prof_admin* user will not be able to edit *super_admin* settings.

In the case where there are no other administrators configured, the only option is to flash format the device and reload a backup config file. You must have console access to the device in order to format and flash the device. It is recommended to be physically on site to perform this operation.

Before formatting the device, verify that you have a backup config file. You may or may not have the latest config file backed up, though you should consider using a backed up config file, and reconfigure the rest of the recent changes manually. Otherwise, you may need to configure your device starting from the default factory settings.

To recover lost Administrator FortiTokens:

1. If you have a backed up config file:
   a. Open the config file and search for the specific admin user. For representational purposes we will use `Test` in our example.
   ```
   # edit "Test"
      set accprofile "super_admin"
      set vdom "root"
      set two-factor fortitoken
      set fortitoken "FTKXXXXXXXXXX"
      set email-to "admin@email.com"
      set password *********
      next
   end
   ```
   b. Once you find the settings for the `Test` user, delete the `fortitoken`-related settings:
   ```
   # edit "Test"
      set accprofile "super_admin"
      set vdom "root"
      set password *********
      next
   end
   ```
2. Format the boot device during a maintenance window and reload the firmware image using instructions in the Formatting and loading FortiGate firmware image using TFTP KB article.
3. Once the reload is complete, log into the admin console from the GUI using the default admin user credentials, and go to *Configuration > Restore* from the top right corner to reload your config file created in Step 1 above.
4. Once the FortiGate reboots and your configuration is restored, you can log in with your admin user credentials.

SSL VPN with multi-factor authentication expiry timers

When SSL VPN is configured with multi-factor authentication (MFA), sometimes you may require a longer token expiry time than the default 60 seconds.

To configure token expiry timers using the CLI:

```
config system global
    set two-factor-ftk-expiry <number of seconds>
    set two-factor-ftm-expiry <number of seconds>
    set two-factor-sms-expiry <number of seconds>
    set two-factor-fac-expiry <number of seconds>
    set two-factor-email-expiry <number of seconds>
end
```

These timers apply to the tokens themselves and remain valid for as long as configured above. However, SSL VPN does not necessarily accept tokens for the entire duration they are valid. To ensure SSLVPN accepts the token for longer durations, you need to configure the remote authentication timeout setting accordingly.

To configure the remote authentication timeout:

```
config system global
    set remoteauthtimeout <1-300 seconds>
end
```

SSL VPN waits for a maximum of five minutes for a valid token code to be provided before closing down the connection, even if the token code is valid for longer.

The `remoteauthtimout` setting shows how long SSL VPN waits not only for a valid token to be provided before closing down the connection, but also for other remote authentication like LDAP, RADIUS, and so on.

PKI

The following topics include information about public key infrastructure (PKI):

- Configuring a PKI user on page 2981
- Using the SAN field for LDAP-integrated certificate authentication on page 2985
- SSL VPN with certificate authentication on page 2697
- SSL VPN with LDAP-integrated certificate authentication on page 2702

Configuring a PKI user

PKI users are users who are identified by a digital certificate they hold. Defining a PKI user in FortiOS specifies:

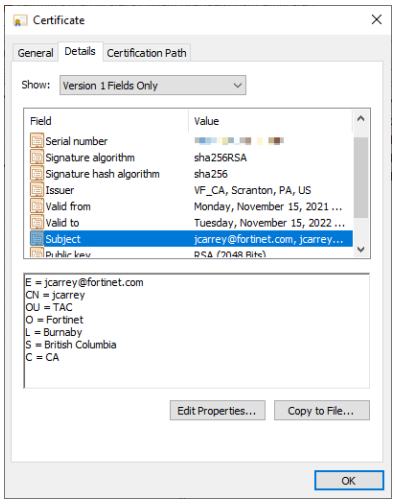
- Which CA certificate to use to validate the user's certificate
- The field and value of the user's certificate that FortiOS will check to verify a user

These peer users can then be used in a FortiGate user group, or as a peer certificate group used for IPsec VPN configurations that accept RSA certificate authentication.

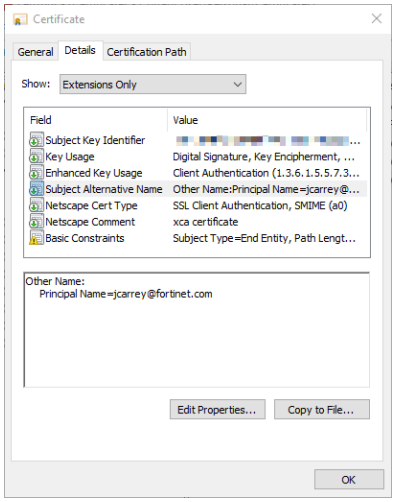
Example X.509 certificate

The following certificate demonstrates which FortiGate settings can be used to match on different fields.

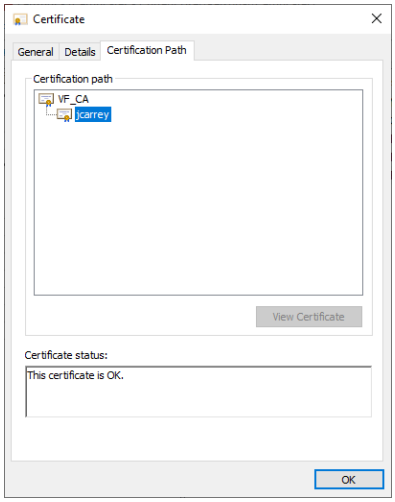
Subject:



Subject Alternative Name:



Certification path:



To configure a PKI user:

```
config user peer
    edit <name>
        set ca <string>
        set mandatory-ca-verify {enable | disable}
        set subject <string>
        set cn <string>
        set cn-type {string | email | FQDN | ipv4 | ipv6}
        set mfa-server <string>
        set mfa-username <string>
        set mfa-password <string>
        set mfa-mode {none | password | subject-identity}
    next
end
```

`ca <string>`	Specify which certificate on the FortiGate is used to validate the client's certificate. This can be any CA in the client's certificate chain. You may need to upload a CA certificate to the FortiGate specifically to identify PKI peer users (see CA certificate on page 3430).
`mandatory-ca-verify {enable | disable}`	Control the action if the CA certificate used to sign the client's certificate is not installed on the FortiGate (default = enable). Disabling this setting makes the FortiGate consider any certificate presented by the peer as valid. In the example certificate, the certification path shows that VF_CA signed jcarrey's certificate.
`subject <string>`	Enter the peer certificate name constraints.
`cn <string>`	Enter the peer certificate common name.
`cn-type {string | email | FQDN | ipv4 | ipv6}`	Set the peer certificate common name type: string, email, FQDN, IPv4 address, or IPv6 address. See CN on page 2985 for more details.
`mfa-server <string>`	Enter the name of a multi-factor authentication server defined under `config user ldap` for performing client access rights checks. See LDAP servers on page 2858 for more details.
`mfa-mode {none | password | subject-identity}`	Set the mode for remote peer authentication, either by password or subject identity extracted from certificate. See LDAP on page 2985 for more details.
`mfa-username <string>`	Enter the username for the remote multi-factor authentication server bind when the MFA mode is password.
`mfa-password <string>`	Enter the password for the multi-factor authentication server bind when the MFA mode is password.

Identifying users based on their client certificate

When the client's certificate is valid, or `mandatory-ca-verify` is disabled, the FortiGate can then inspect the certificate to check specific fields for matching values. There are three ways of specifying which certificate field to verify: by subject, CN, or LDAP. All string comparisons are case sensitive.

Subject

This basic method verifies that the subject string defined in the PKI user setting matches a value or substring in the subject field of the user certificate. Further matching is controlled in the following VPN certificate settings.

```
config vpn certificate setting
    set subject-match {substring | value}
    set subject-set {superset | subset}
    set cn-match {substring | value}
    set cn-allow-multi {enable | disable}
end
```

`subject-match {substring | value}`	Control how to do relative distinguished name (RDN) value matching with the certificate subject name: • substring: find a match if any string in the certificate subject name matches the name being searched for (such as `set subject jcarrey`). • value: find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for (such as `set subject "OU=TAC"` or `set subject "C=CA, CN=jcarrey, OU=TAC"`).
`set subject-set {superset | subset}`	Control how to do RDN value matching with the certificate subject name: • superset: a certificate only passes verification if it contains all the RDNs defined in the subject settings (such as `set subject "E = jcarrey@fortinet.com, CN = jcarrey, OU = TAC, O = Fortinet, L = Burnaby, S = British Columbia, C = CA"`). • subset: a certificate passes verification if the RDN is a subset of the certificate subject (such as `set subject "CN = jcarrey, OU = TAC"`).
`cn-match {substring | value}`	Control how to do CN value matching with the certificate subject name: • substring: find a match if any string in the certificate subject name matches the name being searched for. • value: find a match if any attribute value string in a certificate subject name is an exact match with the name being searched for.
`cn-allow-multi {enable | disable}`	Enable/disable allowing multiple CN entries with the certificate subject name (default = enable).

CN

Common name (CN) certificate verification compares the CN in the subject field with the configured string (such as `set cn "jcarrey"`. The following logic is used when configuring different CN types:

Type	Action
`string`	Based on the `cn-match` setting, perform a substring or exact match in the certificate subject.
`email`	Look for a match in the certificate subject.
`FQDN`	Look for a match in the certificate subject, then compare the mapped IP and client IP. The FQDN is only retrieved from the CN.
`ipv4`	Look for a match in the certificate subject, then compare the IP.
`ipv6`	Look for a match in the certificate subject, then compare the IP.

The CN type also controls the format checking of the CN string. In this example, if the CN type is set to email, the CN must be in email format (`set cn "jcarrey@fortinet.com"`).

LDAP

LDAP-integrated user authentication allows the FortiGate to check the connecting user against an LDAP server in two ways: through a username and password, or the certificate's principal name. The `password` method requires the username and password of each authenticating user to be entered, so it is not recommended when configuring PKI users. The `subject-identity` method is recommended.

The UPN in the user certificate's Subject Alternative Name (SAN) field is used to look up the user in the LDAP directory. The SAN in the certificate for UPN matching can the UPN on the AD LDAP server (default), RFC 822 Name (corporate email address), or DNS name. If a match is found, then authentication succeeds. This type of configuration scales well since only one PKI user needs to be created on the FortiGate. Connecting clients use their unique user certificate to match within the configured LDAP server. See Using the SAN field for LDAP-integrated certificate authentication on page 2985 for an example.

Using the SAN field for LDAP-integrated certificate authentication

Certificate-based authentication against Active Directory LDAP (AD LDAP) supports the UserPrincipalName (UPN), RFC822 Name (corporate email address) defined in the Subject Alternative Name (SAN) extension of the certificate, the DNS defined in the user certificate as the unique identifier in the SAN field for peer user certificates, and the Subject Common Name (CN) defined in the certificate.

```
config user ldap
    edit <name>
        set account-key-cert-field {othername | rfc822name | dnsname | cn}
    next
end
```

`account-key-cert-field {othername | rfc822name | dnsname | cn}`	Define subject identity field in certificate for user access right checking: • `othername`: match to UPN in SAN (default). • `rfc822name`: match to RFC822 email address in SAN. • `dnsname`: match to DNS name in SAN. • `cn`: match to CN in subject.

The LDAP server configurations are applied to the user peer configuration when the PKI user is configured.

```
config user peer
    edit <name>
        set ca <string>
        set cn <string>
        set mfa-server <string>
        set mfa-mode subject-identity
    next
end
```

When a user authenticates to the FortiGate for an administrative log in, SSL VPN, IPsec dialup, or firewall authentication using a user certificate, it presents a signed certificate issued by a trusted CA to the FortiGate. The following sequence of events occurs as the FortiGate processes the certificate for authentication:

1. The FortiGate verifies if the certificate is issued by a trusted CA. If the CA is not a public CA, ensure that the CA certificate is uploaded and trusted by the FortiGate, and is applied to the user peer configurations (`set ca <string>`).
2. The FortiGate verifies that the CN field of the certificate matches the CN specified in the user peer configurations (`set cn <string>`).
3. If the `user peer` configuration has `mfa-server` configured and the `mfa-mode` is set to `subject-identity`, the FortiGate uses the unique identifier in the certificate to authenticate against the LDAP server.
   - If `set account-key-cert-field othername` is configured (the default setting), the FortiGate uses the UPN in the certificate's SAN field to authenticate against LDAP.
   - If `set account-key-cert-field rfc822name` is configured, the FortiGate uses the RFC822 Name in the certificate's SAN field to authenticate against LDAP.
   - If `set account-key-cert-field dnsname` is configured, the FortiGate uses the DNS name in the certificate's SAN field to authenticate against LDAP.
   - If `account-key-cert-field` is set to `cn`, then the FortiGate uses the CN in the certificate's subject to authenticate against LDAP.
4. By default, the FortiGate tries to match the UPN attribute on the AD LDAP. If this needs to be changed to another field, configure the `account-key-filter` setting on the LDAP configuration:

   ```
   config user ldap
       edit <name>
           set account-key-filter <string>
       next
   end
   ```

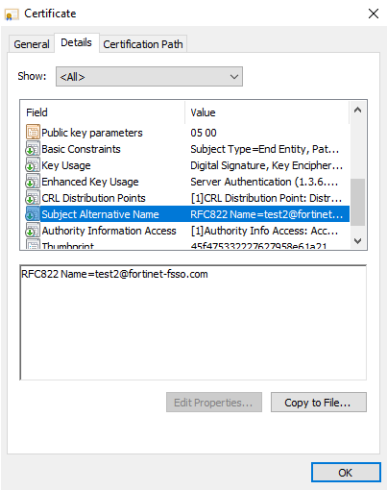
When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 2858 and Configuring client certificate authentication on the LDAP server on page 2873.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 2866.

Example

In this example, a user certificate is issued by a customer's CA to a user. The user uses this certificate to authenticate to the SSL VPN web portal. The administrator decides to use the RFC822 Name in the SAN field to authenticate against their corporate AD LDAP. The Active Directory attribute to check against the RFC822 Name field is the mail attribute.

User certificate information:



The configuration used in this example assumes the following:

- The CA certificate has already been uploaded to the FortiGate.
- The SSL VPN configurations have already been configured, pending the assignment of the PKI user group.

To configure the authentication settings:

1. Configure the LDAP server:

```
config user ldap
    edit "ad-ldap-peer-user"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
```

```
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password ENC XXXXXXXXXXXXXXXX
        set password-renewal enable
        set account-key-cert-field rfc822name
        set account-key-filter "(&(mail=%s)(!(UserAccountControl:1.2.840.113556.1.4.803:=2)))"
    next
end
```

By default, the `account-key-filter` filters on the UPN attribute uses the following string: (& (**userPrincipalName=%s**)(!(UserAccountControl:1.2.840.113556.1.4.803:=2))).

- (userPrincipalName=%s) matches the UPN attribute on the AD LDAP.
- (!(UserAccountControl:1.2.840.113556.1.4.803:=2)) filters out inactive and locked AD accounts.

2. Configure the local peer user:

```
config user peer
    edit "peer-RFC822-name"
        set ca "CA_Cert_2"
        set cn "test2"
        set mfa-server "ad-ldap-peer-user"
        set mfa-mode subject-identity
    next
end
```

3. Configure the firewall user group for SSL VPN authentication:

```
config user group
    edit "vpn-group"
        set member "peer-RFC822-name"
    next
end
```

4. Apply the user group to the SSL VPN configuration and firewall policy.

Verification

When the SSL VPN user authenticates in a browser, the FortiOS fnbamd daemon first validates the certificate supplied by the user. If the certificate check is successful, the information in the SAN field of the user certificate is used to find a matching user record on the AD LDAP.

To verify the configuration:

```
# diagnose debug app fnbamd -1
# diagnose debug enable
```

The output includes the following information.

- Validate the certificate:

```
...
    __check_crl-***CERTIFICATE IS GOOD***
```

```
[567] fnbamd_cert_verify-Issuer found: CA_Cert_2 (SSL_DPI opt 1)
[500] fnbamd_cert_verify-Following cert chain depth 1
[675] fnbamd_cert_check_group_list-checking group with name 'vpn-group'
[490] __check_add_peer-check 'peer-RFC822-name'
[366] peer_subject_cn_check-Cert subject 'C = CA, ST = BC, L = Burnaby, CN = test2'
[294] __RDN_match-Checking 'CN' val 'test2' -- match.
[404] peer_subject_cn_check-CN is good.
```

- Bind to LDAP and try to match the content of the SAN in the user certificate with the user record in the AD LDAP:

```
...
_cert_ldap_query-LDAP query, idx 0
[448] __cert_ldap_query-UPN = 'test2@fortinet-fsso.com'
[1717] fnbamd_ldap_init-search filter is: (&(mail=test2@fortinet-fsso.com)(!
(UserAccountControl:1.2.840.113556.1.4.803:=2)))
```

- Confirm the successful match:

```
...
     __cert_ldap_query_cb-LDAP ret=0, server='ad-ldap-peer-user', req_id=269178889
[388] __cert_ldap_query_cb-Matched peer 'peer-RFC822-name'
...
[1066] fnbamd_cert_auth_copy_cert_status-req_id=269178889
[1074] fnbamd_cert_auth_copy_cert_status-Matched peer user 'peer-RFC822-name'
[833] fnbamd_cert_check_matched_groups-checking group with name 'vpn-group'
[895] fnbamd_cert_check_matched_groups-matched
[1193] fnbamd_cert_auth_copy_cert_status-Cert st 290, req_id=269178889
[209] fnbamd_comm_send_result-Sending result 0 (nid 672) for req 269178889, len=2155
```

FSSO

FortiOS can provide single sign-on capabilities to Windows AD, Citrix, VMware Horizon, Novell eDirectory, Microsoft Exchange, and third-party access point users with the help of FortiAuthenticator or agent software installed on these networks. These entities send information about user logons to the FortiGate unit. With user information such as IP address and user group memberships from the network, FortiGate security policies can allow authenticated network access to users who belong to the appropriate user groups without requesting their credentials again.

Fortinet Single Sign-On (FSSO), through FortiAuthenticator or agents installed on the network, monitors user logons and passes that information to the FortiGate unit. When a user logs on at a workstation in a monitored domain, FSSO:

- Detects the logon event and records the workstation name, domain, and user,
- Resolves the workstation name to an IP address,
- Determines which user groups the user belongs to,
- Sends the user logon information, including IP address and groups list, to the FortiGate unit, and
- Creates one or more log entries on the FortiGate unit for this logon event as appropriate.

When the user tries to access network resources, the FortiGate unit selects the appropriate security policy for the destination. If the user belongs to one of the permitted user groups associated with that policy then the connection is allowed, otherwise the connection is denied.

FortiAuthenticator

One or more FortiAuthenticator devices can act as the central source for FSSO on the network. They can collect real-time user logon/logoff information from the widest variety of sources, distill that information into FSSO events, and distribute these FSSO events to one or a large number of FortiOS devices. On busy networks, it can relieve FortiOS devices from the burden of processing the heavy user activity from many network devices into a single authoritative source and supports redundancy options when high availability is required.

FortiAuthenticator can collect user events from:

- SSO Mobility Agent (SSOMA): Standalone agent installed on endpoints reporting real-time user logon/logoff events to the FortiAuthenticator. This is the only FSSO method that allows quick and reliable detection of endpoints going offline.
- FortiClient: Include an SSOMA sub-component that can be enabled for FSSO.
- Third-party network access devices: FortiAuthenticator is able to receive Syslog and/or RADIUS accounting messages from network devices to extract real-time user logon/logoff events.
- Domain Controllers (DC): In a Windows AD network, FortiAuthenticator can optionally obtain logon information by polling the AD domain controllers.
- Domain Controller and Terminal Server agents: Gather information from one or many agents on the network.
- Web-based portals: FortiAuthenticator offer a variety of friendly user portals that can be integrated within a network as a central point of authentication for the network users.

Agent-based FSSO

Several different FSSO agents can be used in an FSSO implementation:

- Domain Controller (DC) agent
- eDirectory agent
- Citrix/Terminal Server (TS) agent
- Collector Agent

Consult the latest FortiOS Release Notes for operating system compatibility information.

Domain Controller agent

The Domain Controller (DC) agent must be installed on every domain controller when you use DC Agent mode. The DC agents monitor user logon events and pass the information to the Collector agent, which stores the information and sends it to the FortiGate unit.

eDirectory agent

The eDirectory agent is installed on a Novell network to monitor user logons and send the required information to the FortiGate unit. It functions much like the Collector agent on a Windows AD domain controller. The agent can obtain information from the Novell eDirectory using either the Novell API or LDAP.

Terminal Server agent

The Terminal Server (TS) agent can be installed on a Citrix, VMware Horizon 7.4, or Windows Terminal Server to monitor user logons in real time. It functions much like the DC Agent on a Windows AD domain controller.

Collector agent

The Collector Agent (CA) is installed as a service on a server in the Windows AD network to monitor user logons and send the required information to the FortiGate unit. The Collector agent can collect information from a DC agent (Windows AD) and TS agent (Citrix or VMware Horizon Terminal Server).

In a Windows AD network, the Collector agent can optionally obtain logon information by polling the AD domain controllers. In this case, DC agents are not needed.

The CA is responsible for DNS lookups, group verification, workstation checks, and updating FortiGates on logon records. The FSSO CA sends Domain Local Security Group and Global Security Group information to FortiGate units. The CA communicates with the FortiGate over TCP port 8000 and it listens on UDP port 8002 for updates from the DC agents.

The FortiGate device can have up to five CAs configured for redundancy. If the first CA on the list is unreachable, the next is attempted, and so on down the list until one is contacted.

All DC agents must point to the correct CA port number and IP address on domains with multiple DCs.

A FortiAuthenticator device can act much like a CA, collecting Windows AD user logon information and sending it to the FortiGate device. It is particularly useful in large installations with several FortiGate units. For more information, see the FortiAuthenticator Administration Guide.

Agentless FSSO

For Windows AD networks, FortiGate devices can also provide SSO capability by directly polling Windows Security Event log entries on Windows DC for user log in information. This configuration does not require a CA or DC agent.

FortiGate configuration

To configure FSSO on a FortiGate, go to *Security Fabric > External Connectors*.

When creating a new connector, several options for connectors are available under Endpoint/Identity:

- Fortinet single sign-on agent on page 3863

  For most FSSO Agent-based deployments, this connector option will be used. Specify either Collector Agent or Local as User Group Source to collect user groups from the Collector Agent, or to match users to user groups from a LDAP server.
- Poll Active Directory server on page 3864

  This connection option directly polls Windows Security Event log entries on Windows DC for user log in information.
- RADIUS single sign-on agent on page 3872

  FortiGate can authenticate users who have authenticated on a remote RADIUS server by monitoring the RADIUS accounting records forwarded by the RADIUS server to the FortiGate.
- Exchange Server connector on page 3876

  FortiGate collects information about authenticated users from corporate Microsoft Exchange Servers.
- Symantec endpoint connector on page 3865

  This connector uses client IP information from Symantec Endpoint Protection Manager (SEPM) to assign dynamic IP addresses on FortiOS.

  Since FSSO is commonly associated with Agent-based FSSO and Agentless FSSO, this chapter will primarily focus on the first two Security Fabric External Connector options.

FSSO polling connector agent installation

This topic gives an example of configuring a local FSSO agent on the FortiGate. The agent actively polls Windows Security Event log entries on Windows Domain Controller (DC) for user login information. The FSSO user groups can then be used in a firewall policy.

This method does not require any additional software components, and all the configuration can be done on the FortiGate.

To configure a local FSSO agent on the FortiGate:

1. Configure an LDAP server on the FortiGate on page 2992
2. Configure a local FSSO polling connector on page 2992
3. Add the FSSO groups to a policy on page 2993

Configure an LDAP server on the FortiGate

Refer to Configuring an LDAP server on page 2858. The connection must be successful before configuring the FSSO polling connector.

Configure a local FSSO polling connector

To configure a local FSSO polling connector:

1. Go to *Security Fabric* > *External Connectors* and click *Create New*.
2. In the *Endpoint/Identity* section, select *Poll Active Directory Server*.

3. Fill in the required information.
4. For *LDAP Server*, select the server you just created.
5. Configure the group settings:
   a. For *Users/Groups*, click *Edit*. The structure of the LDAP tree is shown in the *Users/Groups* window.
   b. Click the *Groups* tab.
   c. Select the required groups, right-click on them, and select *Add Selected*. Multiple groups can be selected at one time by holding the CTRL or SHIFT keys. The groups list can be filtered or searched to limit the number of groups that are displayed.
   d. Click the *Selected* tab and verify that the required groups are listed. To remove a group, right-click and select *Remove Selected*.
   e. Click *OK* to save the group settings.
6. Click *OK* to save the connector settings.
7. Go back to *Security Fabric* > *External Connectors*.
8. There should be two new connectors:

   - The *Local FSSO Agent* is the backend process that is automatically created when the first FSSO polling connector is created.
   - The *Active Directory Connector* is the front end connector that can be configured by FortiGate administrators.

   To verify the configuration, hover the cursor over the top right corner of the connector; a popup window will show the currently selected groups. A successful connection is also shown by a green up arrow in the lower right corner of the connector.

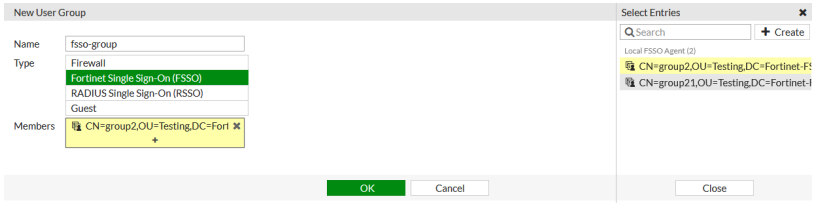
   If you need to get log in information from multiple DCs, then you must configure other Active Directory connectors for each additional DC to be monitored.

Add the FSSO groups to a policy

FSSO groups can be used in a policy by either adding them to the policy directly, or by adding them to a local user group and then adding the group to a policy.

To add the FSSO groups to a local user group:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Enter a name for the group in the *Name* field.
3. Set the *Type* to *Fortinet Single Sign-On (FSSO)*.
4. In the *Members* field, click the + and add the FSSO groups.



5. Click *OK*.
6. Add the local FSSO group to a policy.

To add the FSSO groups directly to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. In the *Source* field, click the *+*. In the *Select Entries* pane, select the *User* tab.
3. Select the FSSO groups.
4. Configure the remaining settings as required.
5. Click *OK*.

Troubleshooting

If an authenticated AD user cannot access the internet or pass the firewall policy, verify the local FSSO user list:

```
# diagnose debug authd fsso list
----FSSO logons----
IP: 10.1.100.188 User: test2 Groups: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM Workstation:
MemberOf: CN=group2,OU=Testing,DC=Fortinet-FSSO,DC=COM
Total number of logons listed: 1, filtered: 0
----end of FSSO logons----
```

1. Check that the group in *MemberOf* is allowed by the policy.
2. If the expected AD user is not in list, but other users are, it means that either:
   - The FortiGate missed the log in event, which can happen if many users log in at the same time, or
   - The user's workstation is unable to connect to the DC, and is currently logged in with cached credentials, so there is no entry in the DC security event log.
3. If there are no users in the local FSSO user list:
   a. Ensure that the local FSSO agent is working correctly:

      ```
      # diagnose debug enable
      # diagnose debug authd fsso server-status

      Server Name                         Connection Status    Version            Address
      -----------                         -----------------    -------            -------
      FGT_A (vdom1) # Local FSSO Agent    connected            FSAE server 1.1    127.0.0.1
      ```

      The connection status must be `connected`.

   b. Verify the Active Directory connection status:

      ```
      # diagnose debug fsso-polling detail 1
      AD Server Status (connected):
      ID=1, name(10.1.100.131),ip=10.1.100.131,source(security),users(0)
      port=auto username=Administrator
      read log eof=1, latest logon timestamp: Fri Jul 26 10:36:20 2019

      polling frequency: every 10 second(s) success(274), fail(0)
      ```

```
LDAP query: success(0), fail(0)
LDAP max group query period(seconds): 0
LDAP status: connected

Group Filter: CN=group2,OU=Testing,DC=Fortinet-
FSSO,DC=com+CN=group21,OU=Testing,DC=Fortinet-FSSO,DC=COM
```

If the polling frequency shows successes and failures, that indicates sporadic network problems or a very busy DC. If it indicates no successes or failures, then incorrect credentials could be the issue.

If the LDAP status is connected, then the FortiGate can access the configured LDAP server. This is required for AD group membership lookup of authenticated users because the Windows Security Event log does not include group membership information. The FortiGate sends an LDAP search for group membership of authenticated users to the configure LDAP server.

FortiGate adds authenticated users to the local FSSO user list only if the group membership is one of the groups in `Group Filter`.

4. If necessary, capture the output of the local FortiGate daemon that polls Windows Security Event logs:

```
# diagnose debug application fssod -1
```

This output contains a lot of detailed information which can be captured to a text file.

Limitations

- NTLM based authentication is not supported.
- If there are a large number of user log ins at the same time, the FSSO daemon may miss some. Consider using FSSO agent mode if this will be an issue. See Public and private SDN connectors on page 3790 for information.
- The FSSO daemon does not support all of the security log events that are supported by other FSSO scenarios. For example, only Kerberos log in events 4768 and 4769 are supported.

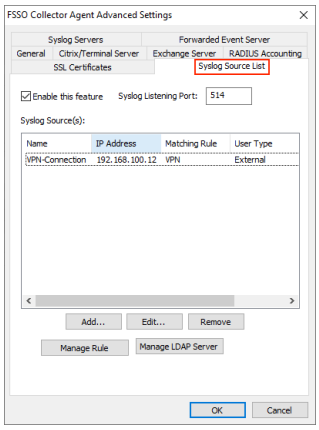
FSSO using Syslog as source

This example describes how to configure Fortinet Single Sign-On (FSSO) agent on Windows using syslog as the source and a custom syslog matching rule.

The FSSO collector agent must be build 0291 or later, and in advanced mode (see How to switch FSSO operation mode from Standard Mode to Advanced Mode).

To configure the FSSO agent on Windows:

1. Open the FSSO agent on Windows.
2. Click *Advanced Settings*.
3. Go to the *Syslog Source List* tab.
4. Select *Enable this feature*.
5. Set *Syslog Listening Port*, or use the default port.

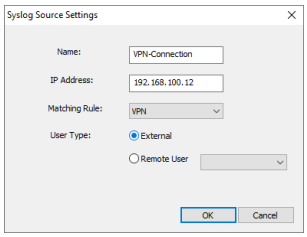


6. Click *Manage Rule*.
7. Create a new syslog rule:
   a. Click *Add*.
   b. Configure the rule:

Trigger	*722051*
Logon	*assigned to session*
Username Field	*User <{{:username}}>*
Client IPv4 Field	*IPv4 Address <{{:client_ip}}>*
Client IPv6 Field	*IPv6 Address <{{:client_ipv6}}>*
Group Field	*Group <{{:group}}>*
Groups List Separator	,

   c. To test the rule, enter a sample log line, then click *Test*.
   d. Click *OK*.
8. Create a new syslog source:
   a. On the *Advanced Settings* window, click *Add*.
   b. Configure the source:

Name	*VPN-Connection*
IP Address	*192.168.100.12*
Matching Rule	*VPN*
User Type	*External*: Users are not defined on the CA and user groups come from the source. *Remote User*: Users are defined on a remote LDAP server and user groups are retrieved from the specified LDAP server. Any group from the syslog messages are ignored. See Connect to a remote LDAP server on page 2997.



c. Click *OK*.

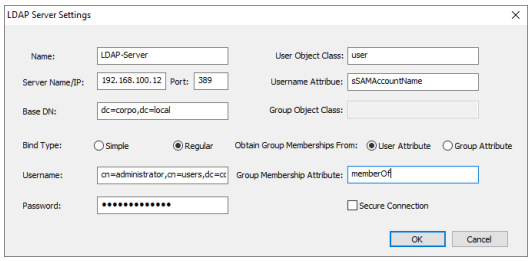
9. Click *OK*.

Connect to a remote LDAP server

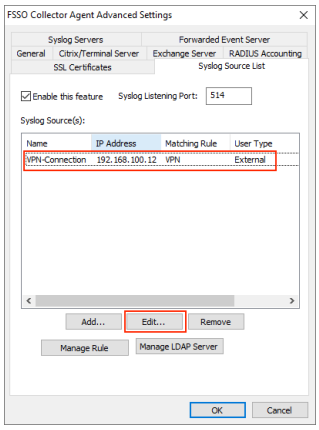
This section describes how to connect to a remote LDAP server to match the user identity from the syslog server with an LDAP server.

To connect to a remote LDAP server:

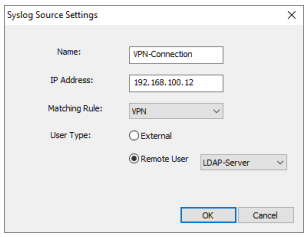
1. Open the FSSO agent on Windows.
2. Click *Advanced Settings*.
3. Go to the *Syslog Source List* tab.
4. Click *Manage LDAP Server*.
5. Click *Add* and configure the LDAP server settings:



6. Click *OK*.
7. Select the syslog source and click *Edit*.



8. Set *User Type* to *Remote User*, and select the LDAP server from the drop-down list.



9. Click *OK*.

Managing collector agent connection failures

Maintaining a stable connection to the collector agent is vital to the operations of FSSO. However, it is also important to plan for failures and mitigate against connection issues.

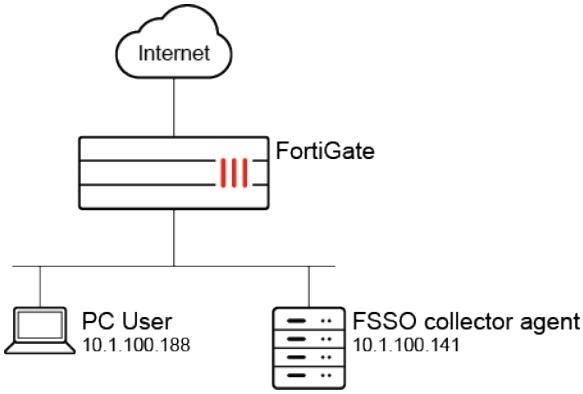
One option is to configure multiple collector agent servers. The primary server (first server in the configuration) will be preferred. If it is offline, then the second server will be polled and so on down the list of five servers. The FortiGate polls every 10 seconds to check connectivity. If the FortiGate fails over to the next server, there is no automatic fail back mechanism when a preferred server comes back online. You must disconnect the current server for the preferred server to become primary.

Another method to mitigate against connection issues is to configure the `logon-timeout` option. This option is used to manage how long authenticated FSSO users on the FortiGate will remain on the list of authenticated FSSO users when a network connection to the collector agent is lost.

```
config user fsso
    edit <name>
        set server <string>
        set password <string>
        set logon-timeout <integer>
    next
end
```

Option	Description
`logon-timeout <integer>`	Enter the interval to keep logons after the FSSO server is down, in minutes (1 - 2880, default = 5).

Example



In this example, the logon timeout is set for four minutes.

To configure the FSSO logon timeout:

1. Set the timeout value:

```
config user fsso
    edit "ad"
        set server "10.1.100.141"
        set password ********
        set logon-timeout 4
    next
end
```

2. Log on to a PC with a valid FSSO user account.
3. Enable real-time debugging and check for authd polling collector agent information. During this time, the connection to the collector agent is lost:

```
# diagnose debug enable
# diagnose debug application authd -1
# diagnose debug application fssod -1
021-06-10 16:20:41 authd_timer_run: 2 expired
2021-06-10 16:20:41 authd_epoll_work: timeout 39970
2021-06-10 16:20:46 fsae_io_ctx_process_msg[ad]: received heartbeat 100031
2021-06-10 16:20:46 authd_epoll_work: timeout 1690
2021-06-10 16:20:47 authd_timer_run: 1 expired
2021-06-10 16:20:47 authd_epoll_work: timeout 39990
2021-06-10 16:20:56 fsae_io_ctx_process_msg[ad]: received heartbeat 100032
2021-06-10 16:20:56 authd_epoll_work: timeout 31550
2021-06-10 16:21:00 _event_error[ad]: error occurred in epoll_in: Success
2021-06-10 16:21:00 disconnect_server_only[ad]: disconnecting
2021-06-10 16:21:00 authd_timer_run: 1 expired
2021-06-10 16:21:00 authd_epoll_work: timeout 9620
```

4. After about three minutes, check that the FSSO user is still in the list of authenticated users and can connect to the internet:

```
# diagnose firewall auth l
10.1.100.188, TEST1
        type: fsso, id: 0, duration: 229, idled: 229
        server: ad
        packets: in 0 out 0, bytes: in 0 out 0
        user_id: 16777219
        group_id: 3 33554433
        group_name: ad CN=GROUP1,OU=TESTING,DC=FORTINET-FSSO,DC=COM

----- 1 listed, 0 filtered ------
```

5. After four minutes, check the debugs again. Note that the FSSO users are cleared:

```
...
2021-06-10 16:24:57 authd_timer_run: 3 expired
2021-06-10 16:24:57 authd_epoll_work: timeout 60000
2021-06-10 16:24:59 [fsae_db_logoff:248]: vfid 0, ip 10.1.100.188, id(0), port_range_sz(0)
2021-06-10 16:24:59 [authd_fp_notify_logoff:444]: vfid 0, ip 10.1.100.188, id 0
2021-06-10 16:24:59 [authd_fp_on_user_logoff:412]: vfid 0, ip 10.1.100.188

```
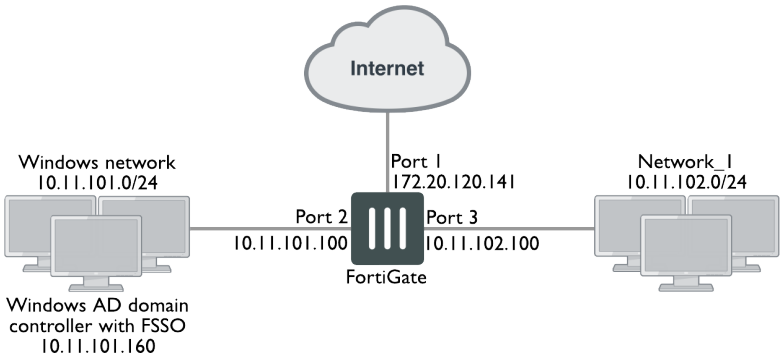
# diagnose firewall auth l

----- 0 listed, 0 filtered ------
```

After the connection to the collector agent is restored, all users remain in the list of authenticated users and are synchronized to the FortiGate. The users do not need to log in again for authentication.

Configuring FSSO firewall authentication

In this example, a Windows network is connected to the FortiGate on port 2, and another LAN, Network_1, is connected on port 3.



All Windows network users authenticate when they log on to their network. Engineering and Sales groups members can access the Internet without reentering their authentication credentials. The example assumes that you have already installed and configured FSSO on the domain controller.

LAN users who belong to the Internet_users group can access the Internet after entering their username and password. The example shows two users: User1, authenticated by a password stored in FortiOS; and User 2, authenticated on an external authentication server. Both users are local users since you create the user accounts in FortiOS.

1. Create a locally authenticated user account
2. Create a RADIUS-authenticated user account
3. Create an FSSO user group
4. Create a firewall user group
5. Define policy addresses
6. Create security policies

Creating a locally authenticated user account

User1 is authenticated by a password stored in FortiOS.

To create a locally authenticated user account in the GUI:

1. Go to *User & Authentication* > *User Definition* and click *Create New*.
2. Configure the following settings:

User Type	Local User
User Name	User1
Password	hardtoguess1@@1
User Account Status	Enabled

3. Click *Submit*.

To create a locally authenticated user account in the CLI:

```
config user local
   edit user1
      set type password
      set passwd hardtoguess1@@1
   next
end
```

Creating a RADIUS-authenticated user account

You must first configure FortiOS to access the external authentication server, then create the user account.

To create a RADIUS-authenticated user account in the GUI:

1. Go to *User & Authentication* > *RADIUS Servers* and click *Create New*.
2. Configure the following settings:

Name	OurRADIUSsrv
Authentication method	Default
Primary Server	
IP/Name	10.11.101.15
Secret	OurSecret

3. Click *OK*.
4. Go to *User & Authentication* > *User Definition* and click *Create New*.
5. Configure the following settings:

User Type	Remote RADIUS User
User Name	User2
RADIUS Server	OurRADIUSsrv
User Account Status	Enabled

6. Click *Submit*.

To create a RADIUS-authenticated user account in the CLI:

```
   config user radius
   edit OurRADIUSsrv
      set server 10.11.102.15
      set secret OurSecret
      set auth-type auto
   next
end
config user local
   edit User2
      set name User2
      set type radius
      set radius-server OurRADIUSsrv
   next
end
```

Creating an FSSO user group

This example assumes that you have already set up FSSO on the Windows network and that it used advanced mode, meaning that it uses LDAP to access user group information. You must do the following:

- Configure LDAP access to the Windows AD global catalog
- Specify the collector agent that sends user log in information to FortiOS
- Select Windows user groups to monitor
- Select and add the Engineering and Sales groups to an FSSO user group

To create an FSSO user group in the GUI:

1. Configure LDAP for FSSO:
   a. Go to *User & Authentication > LDAP Servers* and click *Create New*.
   b. Configure the following settings:

Name	ADserver
Server Name / IP	10.11.101.160
Distinguished Name	dc=office,dc=example,dc=com
Bind Type	Regular
Username	cn=FSSO_Admin,cn=users,dc=office,dc=example,dc=com
Password	Enter a secure password.

   c. Leave other fields as-is. Click *OK*.
2. Specify the collector agent for FSSO;
   a. Go to *Security Fabric > External Connectors* and click *Create New*.
   b. Under *Endpoint/Identity*, select *FSSO Agent on Windows AD*.
   c. Configure the following settings:

Name	Enter the Windows AD server name. This name appears in the Windows AD server list when you create user groups. In this example, the name is WinGroups.
Server IP/Name	Enter the IP address or name of the server where the agent is installed. The maximum name length is 63 characters. In this example, the IP address is 10.11.101.160.
Password	Enter the password of the server where the agent is installed. You only need to enter a password for the collector agent if you configured the agent to require authenticated access. If the TCP port used for FSSO is not the default, 8000, you can run the `config user fsso` command to change the setting in the CLI.
Collector Agent AD access mode	Advanced
LDAP Server	Select the previously configured LDAP server. In this example, it is ADserver.
User/Groups/Organization Units	Select the users, groups, and OUs to monitor.

   d. Click *OK*.
3. Create the FSSO_Internet_users user group:
   a. Go to *User & Authentication > User Groups* and click *Create New*.
   b. Configure the following settings:

Name	FSSO_Internet_users

Type	Fortinet Single Sign-On (FSSO)
Members	Engineering, Sales

c. Click *OK*.

To create an FSSO user group in the CLI:

```
config user ldap
   edit "ADserver"
      set server "10.11.101.160"
      set dn "cn=users,dc=office,dc=example,dc=com"
      set type regular
      set username "cn=administrator,cn=users,dc=office,dc=example,dc=com"
      set password set_a_secure_password
   next
end
config user fsso
   edit "WinGroups"
      set ldap-server "ADserver"
      set password ********
      set server "10.11.101.160"
   next
end
config user group
   edit FSSO_Internet_users
      set group-type fsso-service
      set member CN=Engineering,cn=users,dc=office,dc=example,dc=com
            CN=Sales,cn=users,dc=office,dc=example,dc=com
   next
end
```

Creating a firewall user group

This example shows a firewall user group with only two users. You can add additional members.

To create a firewall user group in the GUI:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Configure the following settings:

Name	Internet_users
Type	Firewall
Members	User1, User2

3. Click *OK*.

To create a firewall user group in the CLI:

```
config user group
   edit Internet_users
         set group-type firewall
```

```
        set member User1 User2
    next
end
```

Defining policy addresses

To define policy addresses:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create New*.
3. Configure the following settings:

Name	Internal_net
Type	Subnet
IP/Netmask	10.11.102.0/24
Interface	Port 3

4. Click *OK*.
5. Create another new address by repeating steps 2-4 using the following settings:

Name	Windows_net
Type	Subnet
IP/Netmask	10.11.101.0/24
Interface	Port 2

Creating security policies

You must create two security policies: one for the firewall group connecting through port 3, and one for the FSSO group connecting through port 2.

To create security policies using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Configure the following settings:

Incoming Interface	Port2
Source Address	Windows_net
Source User(s)	FSSO_Internet_users
Outgoing Interface	Port1
Destination Address	all

Schedule	always
Service	ALL
NAT	Enabled.
Security Profiles	You can enable security profiles as desired.

4. Click *OK*.
5. Create another new policy by repeating steps 2-4 using the following settings:

Incoming Interface	Port3
Source Address	Internal_net
Source User(s)	Internet_users
Outgoing Interface	Port1
Destination Address	all
Schedule	always
Service	ALL
NAT	Enabled.
Security Profiles	You can enable security profiles as desired.

6. Click *OK*.

To create security policies using the CLI:

```
config firewall policy
    edit 0
        set srcintf port2
        set dstintf port1
        set srcaddr Windows_net
        set dstaddr all
        set action accept
        set groups FSSO_Internet_users
        set schedule always
        set service ANY
        set nat enable
    next
    edit 1
        set srcintf port3
        set dstintf port1
        set srcaddr internal_net
        set dstaddr all
        set action accept
        set schedule always
        set groups Internet_users
        set service ANY
        set nat enable
```

```
    next
end
```

Include usernames in logs

Usernames can be included in logs, instead of just IP addresses. The benefits of doing this include:

- FortiOS monitors and FortiAnalyzer reports display usernames instead of IP addresses, allowing you to quickly determine who the information pertains to. Without the usernames, it is difficult to correlate the IP addresses with specific users.
- User activity can be correlated across multiple IP addresses.

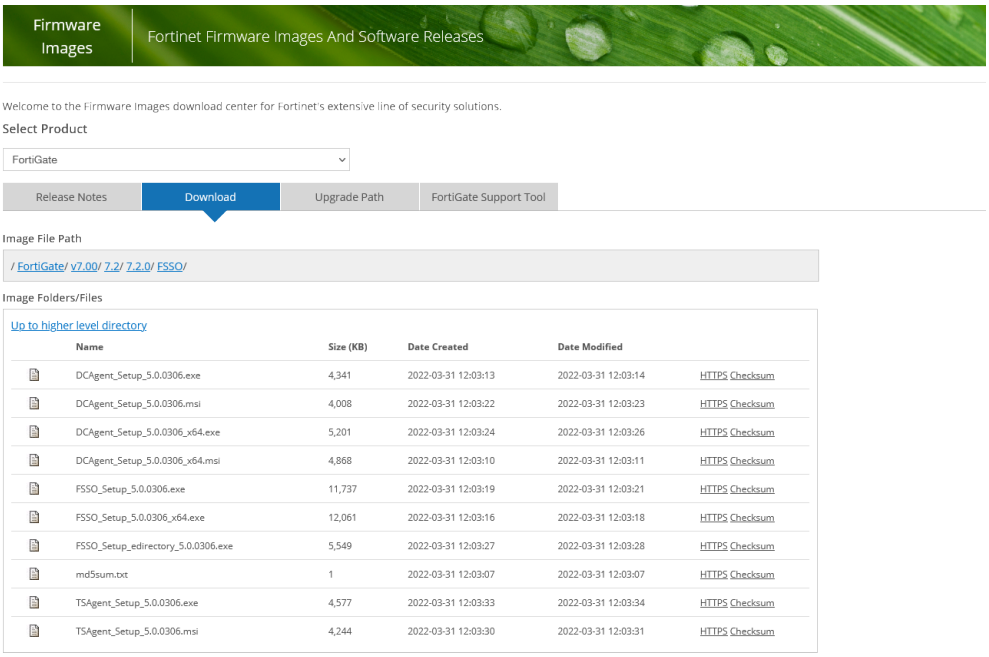
  For example, if DHCP is used a user might receive different IP addresses every day, making it difficult to track a specific user by specifying an IP address as the match criterion.

In this example, a collector agent (CA) is installed on a Windows machine to poll a domain controller (DC) agent (seeFSSO on page 2989 for more information). On the FortiGate, an external connector to the CA is configured to receives user groups from the DC agent. The received group or groups are used in a policy, and some examples of the usernames in logs, monitors, and reports are shown.

Install and configure FSSO Agent

To download the FSSO agent:

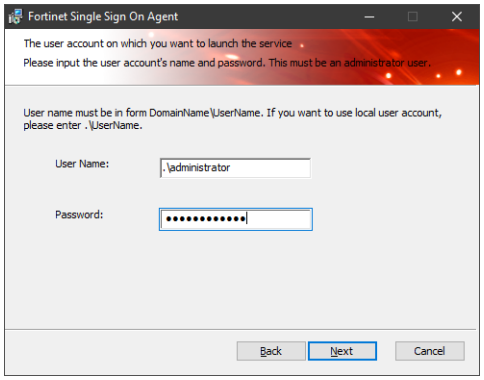
1. Sign in to your FortiCloud account.
2. Go to *Support* > *Firmware Download* and select the *Download* tab.
3. Browse to the appropriate directory for the version of the FSSO agent that you need to download.



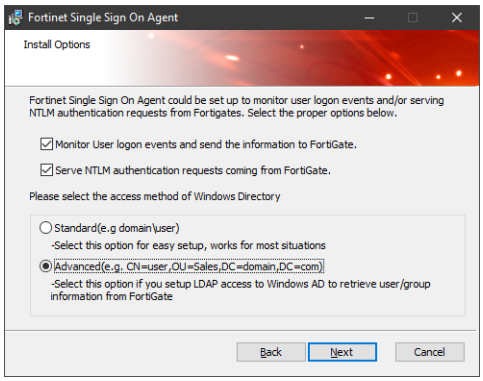
4. Click *HTTPS* to download the appropriate *FSSO_Setup* file.

To install the FSSO agent:

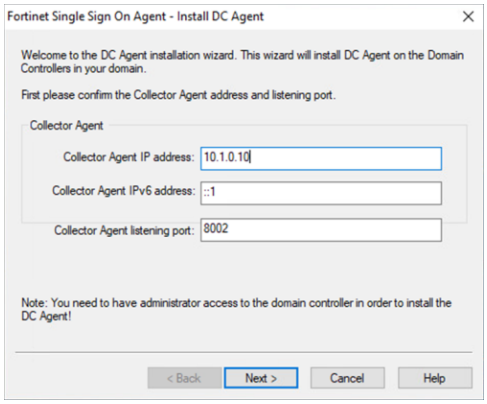
1. Run the *FSSO_Setup* file with administrator privileges.
2. Click *Next*, accept the terms of the license agreement, and click *Next* again.
3. Select the installation directory, or use the default location, then click *Next*.
4. Enter the User Name and Password, then click *Next*.



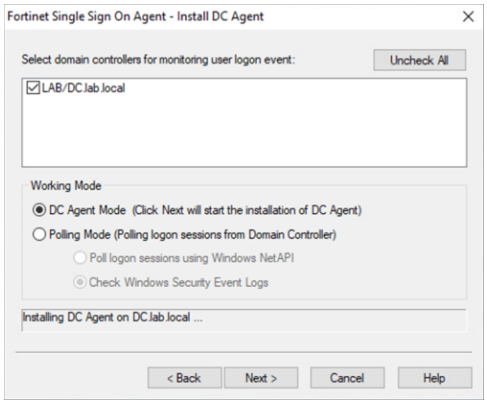
5. On the *Install Options*, select *Advanced*, then click *Next*.



6. Click *Install*.
7. After the FSSO Agent installs, run *Install DC Agent*.
8. Update the Collector Agent IP address and listening port as needed, then click *Next*.



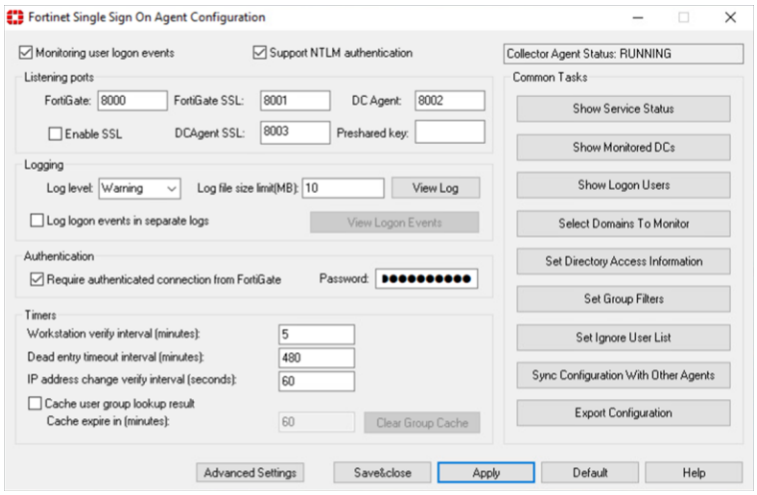
9. Select the domain, in this example *LAB:lab.local*, then click *Next*.
10. Set the *Working Mode* to *DC Agent Mode*, then click *Next* to install the agent.



11. After the DC agent mode installation finishes, Reboot the DC to complete the setup.

To configure the FSSO agent:

1. Open the FSSO agent.
2. Enable *Require authentication from FortiGate* and enter a password for FortiGate authentication.



3. Click *Set Group Filters*, and create a default group filter to limit the groups that are sent to the FortiGate.
4. Click *Save&close*.

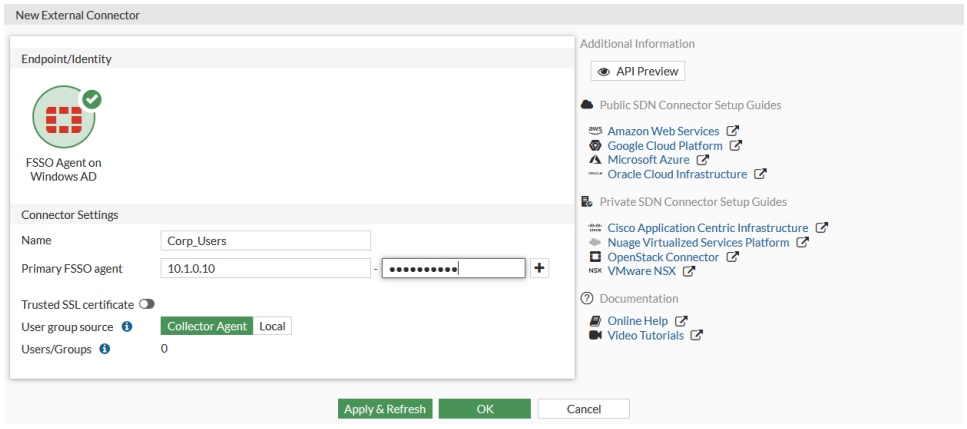
Configure the FortiGate

Create an external connector to the FSSO agent to receive the AD user groups. Add the user group or groups as the source in a firewall policy to include usernames in traffic logs. Enable security profiles, such as web filter or antivirus, in the policy to include the usernames in UTM logs.

Event logs include usernames when the log is created for a user action or interaction, such as logging in or an SSL VPN connection.

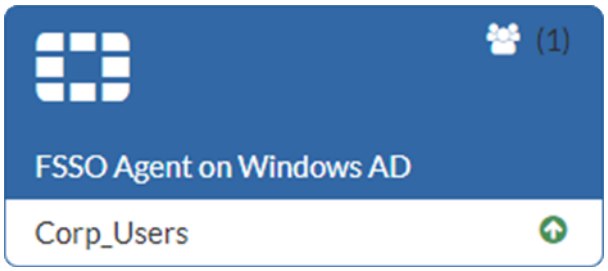
To create an external connector:

1. On the FortiGate, go to *Security Fabric > External Connectors*.
2. Click *Create New* and select *FSSO Agent on Windows AD*.
3. Set the *Primary FSSO agent* to the previously configured *Collector Agent IP address* and authentication password.



4. Click *OK*

The connector shows a green arrow when the connection is established, and a number in the top right indicating the number of AD groups received from the DC agent. Edit the connector to view the user groups.



To configure a policy with an imported user group and web filter in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit an existing policy, or create a new one. See Firewall policy on page 1463 for information.
3. Add the FSSO groups or groups as sources:
   a. Click in the *Source* field.
   b. Select the *User* tab.
   c. Select the group or groups.

   d. Click *Close*.
4. Under *Security Profiles*, enable *Web Filter* and select a profile that monitors or blocks traffic, such as the *monitor-all* profile. See Web filter on page 1829 for information.
5. Click *OK*.

To configure a policy with an imported user group and web filter in the CLI:

```
config firewall policy
    edit 0
        set name "LAN to WAN"
        set srcintf "port5"
        set dstintf "port1"
        set action accept
        set srcaddr "LAN"
        set dstaddr "all"
```

```
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set webfilter-profile "monitor-all"
        set logtraffic all
        set nat enable
        set fsso-groups "CN=USERS,DC=LAB,DC=LOCAL"
    next
end
```

Log, monitor, and report examples

For more information about logs, see the FortiOS Log Message Reference.

```

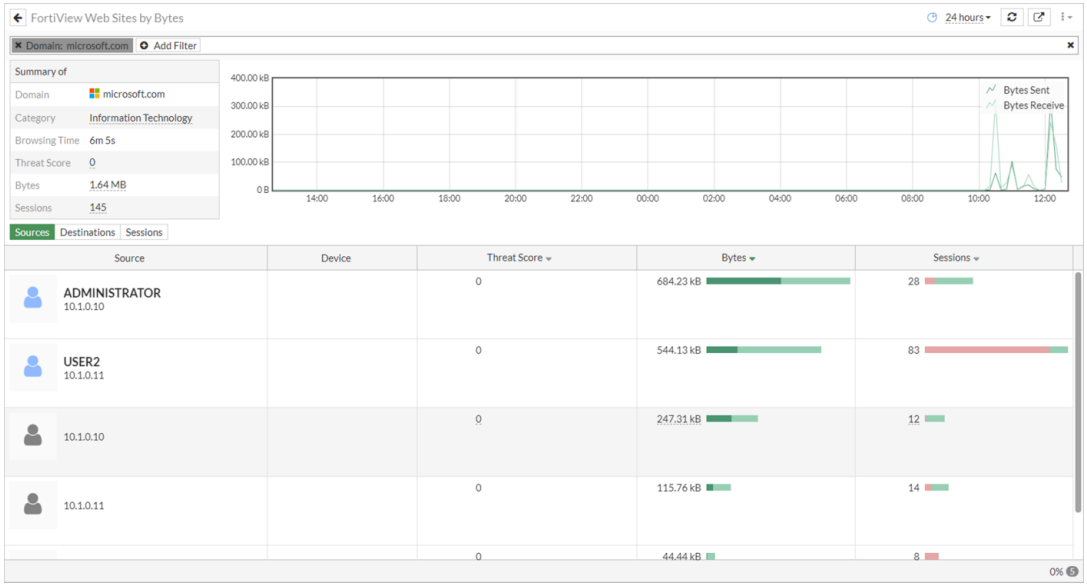
FortiOS monitors:

The *FortiView Web Sites by Bytes* monitor shows a list of visited websites. Double click a specific domain (or manually create a filter), such as *microsoft.com*, to see a breakdown of the usernames and IP addresses that visited that domain. See Monitors on page 147 for more information.



FortiAnalyzer reports:

The *User Detailed Browsing Log* report require a username or IP address to run. If a username is used, the report includes logs related to that user regardless of their IP address. For example, the following report show two source IP addresses:

FORTINET

User: USER2
Source IP: 10.1.0.11, 10.1.0.222
Hostname (MAC): 00:0c:29:5e:f5:25, LAB, PC1
Source Interface: port5
Devices: FGVM01TM22000459

See Reports in the FortiAnalyzer Administration guide for more information.

Wireless configuration

See the FortiWiFi and FortiAP Configuration Guide.

Switch Controller

Use the Switch Controller function, also known as FortiLink, to remotely manage FortiSwitch units. In the commonly-used layer 2 scenario, the FortiGate that is acting as a switch controller is connected to distribution FortiSwitch units. The distribution FortiSwitch units are in the top tier of stacks of FortiSwitch units and connected downwards with Convergent or Access layer FortiSwitch units. To leverage CAPWAP and the Fortinet proprietary FortiLink protocol, set up data and control planes between the FortiGate and FortiSwitch units.

FortiLink allows administrators to create and manage different VLANs, and apply the full-fledged security functions of FortiOS to them, such as 802.1X authentication and firewall policies. Most of the security control capabilities on the FortiGate are extended to the edge of the entire network, combining FortiGate, FortiSwitch, and FortiAP devices, and providing secure, seamless, and unified access control to users.

FortiLink is not supported if there is a 3rd party switch in between the FortiGate and FortiSwitch in a layer 2 network. However, FortiLink is supported over a layer 3 network. See FortiLink mode over a layer-3 network in the FortiLink Guide.

See FortiSwitch devices managed by FortiOS.

System

This topic contains information about FortiGate administration and system configuration that you can do after installing the FortiGate in your network.

Basic system settings

Administrators

By default, FortiGate has an administrator account with the username *admin* and no password. See Administrators on page 3020 for more information.

Administrator profiles

An administrator profile defines what the administrator can see and do on the FortiGate. See Administrator profiles on page 3049 for more information.

Password policy

Set up a password policy to enforce password criteria and change frequency. See Password policy on page 3039 for more information.

Interfaces

Physical and virtual interface allow traffic to flow between internal networks, and between the internet and internal networks. See Interfaces on page 177 for more information.

Advanced system settings

SNMP

The simple network management protocol (SNMP) allows you to monitor hardware on your network. See SNMP on page 3355 for more information.

DHCP server

You can configure one or more DHCP servers on any FortiGate interface. See DHCP servers and relays on page 447 for more information.

VDOM

You can use virtual domains (VDOMs) to divide a FortiGate into multiple virtual devices that function independently. See Virtual Domains on page 3126 for more information.

High availability

You can configure multiple FortiGate devices, including private and public cloud VMs, in HA mode. See High Availability on page 3169 for more information.

Certificates

You can manage certificates on the FortiGate. See Certificates on page 3417 for more information.

Operating modes

A FortiGate or VDOM (in multi-vdom mode) can operate in either NAT/route mode or transparent mode.

NAT/route mode

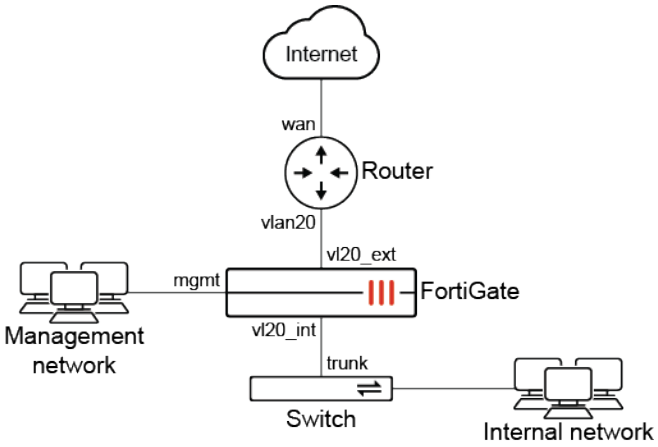
The FortiGate or VDOM is installed as a gateway or router between multiple networks, such as a private network and the internet. One function of NAT/route mode is to allow the FortiGate to hide the IP addresses on the private network using NAT. NAT/route mode can also be used to connect to multiple ISPs in an SD-WAN setup, and to route traffic between different networks. .

By default, new VDOMs are set to NAT/route operation mode.

Transparent mode

The FortiGate or VDOM operates in layer 2 to forward traffic between network devices such as routers, firewalls, and switches. For example. it can be installed inline between a router and a switch to perform security scanning without changing the network topology or modifying the IP addresses. When you add a FortiGate that is in transparent mode to a network, it only needs to be provided with a management IP address in order to access the device. It is recommended that a dedicated interface is used to connect to the management network in transparent mode.

The following topology is an example of a transparent mode FortiGate inserted inline between a router and a switch:



Using transparent mode VDOMs is recommended when multiple VLANs pass through the FortiGate. Otherwise, they must be separated into different forwarding domains within the same VDOM.

Changing modes

The following is a sample configuration for changing from NAT/route operation mode to transparent operation mode in the CLI:

```
config system settings
    set opmode transparent
    set manageip <IP_address>
    set gateway <gateway_address>
end
```

The gateway setting is optional. However, once the operation mode is changed from NAT/route to transparent, the gateway configuration is found under the static router settings:

```
config router static
    edit <seq-num>
        set gateway <IP_address>
    next
end
```

The following is a sample configuration for changing from transparent operation to NAT/route operation mode in the CLI:

```
config system settings
    set opmode nat
    set ip <IP_address>
    set device <interface>
    set gateway <gateway_address>
end
```

The IP and device settings are mandatory. Once the operation mode is changed from transparent to NAT/route, the IP address configuration is found under the corresponding interface settings:

```
config system interface
    edit <interface>
        set ip <IP_address>
    next
end
```

The gateway setting is optional. However, once the operation mode is changed, the gateway configuration is found under the static router settings:

```
config router static
    edit <seq-num>
        set gateway <IP_address>
        device <interface>
    next
end
```

Administrators

By default, FortiGate has an administrator account with the username *admin* and no password. To prevent unauthorized access to the FortiGate, this account must be protected with a password. Additional administrators can be added for various functions, each with a unique username, password, and set of access privileges.

The following topics provide information about administrators:

- Local authentication on page 3021
- Remote authentication for administrators on page 3021
- Administrator account options on page 3024
- REST API administrator on page 3030
- SSO administrators on page 3032
- FortiCloud SSO on page 3032
- Allowing the FortiGate to override FortiCloud SSO administrator user permissions on page 3034
- Password policy on page 3039
- Public key SSH access on page 3040
- Separating the SSHD host key from the administration server certificate on page 3043
- Restricting SSH and Telnet jump host capabilities on page 3044
- Remote administrators with TACACS+ VSA attributes on page 3045

Local authentication

By default, FortiGate has one super admin named `admin`. You can create more administrator accounts with different privileges.

To create an administrator account in the GUI:

1. Go to *System* > *Administrators*.
2. Select *Create New* > *Administrator*.
3. Specify the *Username*.

- Usernames can include lower and upper case letters (a-z, A-Z), numbers (0-9), underscores (_), and dashes (-)
- Usernames cannot start with a dash (-)
- Usernames can end with dollar symbol ($)
- Usernames must not use the following characters: `< > ( ) # " '`. Using these characters in an administrator username might have a cross site scripting (XSS) vulnerability.

4. Set *Type* to *Local User*.
5. Set the password and other fields.
6. Click *OK*.

To create an administrator account in the CLI:

```
config system admin
    edit <admin_name>
        set accprofile <profile_name>
        set vdom <vdom_name>
        set password <password for this admin>
    next
end
```

Remote authentication for administrators

Administrators can use remote authentication, such as LDAP, RADIUS, and TACACS+ to connect to the FortiGate.

Configuring remote authentication with an LDAP server is shown. For more information about configuring LDAP, see Configuring an LDAP server on page 2858.

For information about configuring RADIUS or TACACS+ servers, see Configuring a RADIUS server on page 2877 and TACACS+ servers on page 2953. To use a RADIUS or TACACS+ server for remote authentication, configure the server, and then add it to the user group instead of the LDAP server.

Local logins can also be restricted when remote authentication servers are available, see Restricting logins from local administrator accounts when remote servers are available on page 3024.

Configuring remote authentication for administrators using LDAP includes the following steps:

1. Configuring the LDAP server on page 3022
2. Adding the LDAP server to a user group on page 3022
3. Configuring the administrator account on page 3023

Configuring the LDAP server

To configure the LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
2. Enter the server *Name* and *Server IP/Name*.
3. Enter the *Common Name Identifier* and *Distinguished Name*.
4. Set the *Bind Type* to *Regular* and enter the *Username* and *Password*.
5. Click *OK*.

To configure the LDAP server in the CLI:

```
config user ldap
    edit <name>
        set server <server_ip>
        set cnid "cn"
        set dn "dc=XYZ,dc=fortinet,dc=COM"
        set type regular
        set username "cn=Administrator,dc=XYA, dc=COM"
        set password <password>
    next
end
```

Adding the LDAP server to a user group

After configuring the LDAP server, create a user group that includes that LDAP server.

To create a user group in the GUI:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Enter a *Name* for the group.
3. In the *Remote groups* section, select *Create New*.
4. Select the *Remote Server* from the dropdown list.
5. Click *OK*.

To create a user group in the CLI:

```
config user group
    edit <name>
        set member <ldap_server_name>
```

```
    next
end
```

Configuring the administrator account

After configuring the LDAP server and adding it to a user group, create a new administrator. For this administrator, instead of entering a password, use the new user group for authentication.

A remote authentication server can allow authentication of either a single user or any user from a specified group.

Public key infrastructure (PKI) administrator authentication requires a PKI user instead of a remote server. For information about creating a PKI user, see Configuring a PKI user on page 2981.

To create an administrator to match a single user in the GUI:

1. Go to *System* > *Administrators* and click *Create New* > *Administrator*.
2. Specify the *Username*.
   This username is used when the administrator logs in, and is what FortiOS sends to the remote authentication server for authorization.
3. Set *Type* to *Match a user on a remote server group*.
4. In *Remote User Group*, select the user group that you created.
5. Select an *Administrator Profile*.
6. Enter a *Backup Password*, to be used if the remote authentication server is unreachable.
7. Click *OK*.

To create an administrator match a single user in the CLI:

```
config system admin
    edit <name>
        set remote-auth enable
        set accprofile super_admin
        set remote-group <ldap_group_name>
        set password **********
    next
end
```

To create an administrator to match all users in a remote server group in the GUI:

1. Go to *System* > *Administrators* and click *Create New* > *Administrator*.
2. Specify the *Username*.
   This username is only used to identify this administrator group. Administrators can log in with any username in the remote user group.
3. Set *Type* to *Match all users in a remote server group*.
4. In *Remote User Group*, select the user group that you created.
5. Select an *Administrator Profile*.
6. Click *OK*.

To create an administrator to match all users in a remote server group in the CLI:

```
config system admin
    edit <name>
        set remote-auth enable
        set accprofile super_admin
        set wildcard enable
        set remote-group <ldap_group_name>
    next
end
```

To create an administrator that uses a PKI group in the GUI:

1. Go to *System* > *Administrators* and click *Create New* > *Administrator*.
2. Specify the *Username*.
3. Set *Type* to *Use public key infrastructure (PKI) group*.
4. In *Remote User Group*, select the user group that you created.
5. Select an *Administrator Profile*.
6. Click *OK*.

To create an administrator that uses a PKI group in the CLI:

```
config system admin
    edit <name>
        set remote-auth enable
        set accprofile super_admin
        set peer-group <pki_group_name>
    next
end
```

Restricting logins from local administrator accounts when remote servers are available

Logins from local administrator accounts can be restricted when remote servers are available. When enabled, FortiOS will check if all of the remote servers used by administrators are down before allowing a local administrator to log in. This option is applied globally, and is disabled by default.

To restrict local administrator authentication when a remote authentication server available:

```
config system global
    set admin-restrict-local enable
end
```

Administrator account options

Options to further define the access and abilities of an administrator account include:

- Multi-factor authentication on page 3025
- Restricting logins to trusted hosts on page 3026
- Restricting administrators to guest account provisioning on page 3027
- Global and VDOM administrators on page 3027
- Using FortiAuthenticator and FortiToken for 2FA on page 3027

Multi-factor authentication

Multi-factor authentication (MFA) requires authenticating administrators to supply more than one factor to identify themselves in addition to their password, such as a FortiToken.

Before enabling MFA, it is recommended that you create second administrator account that is configured to guarantee administrator access to the FortiGate if you are unable to authenticate on the main account for any reason.

Multi-factor authentication options include:

- FortiToken
- FortiIdentity Cloud
- Email
- SMS

FortiToken

To associate a FortiToken to an administrator account using the GUI:

1. Ensure that you have successfully added your FortiToken serial number to FortiOS and that its status is *Available*.
2. Go to *System* > *Administrators*. Edit the admin account. This example assumes that the account is fully configured except forMFA.
3. Enable *Two-factor Authentication* and for *Authentication Type*, select *FortiToken*.
4. From the *Token* dropdown list, select the FortiToken serial number.
5. In the *Email Address* field, enter the administrator's email address.
6. Click *OK*.

For a mobile token, click *Send Activation Code* to send the activation code to the configured email address. The admin uses this code to activate their mobile token. You must have configured an email service in *System* > *Settings* to send the activation code.

To associate a FortiToken to an administrator account using the CLI:

```
config system admin
    edit <username>
        set password "myPassword"
```

```
        set two-factor fortitoken
        set fortitoken <serial_number>
        set email-to "username@example.com"
    next
end
```

The `fortitoken` keyword is not visible until you select `fortitoken` for the `two-factor` option.

Before you can use a new FortiToken, you may need to synchronize it due to clock drift.

FortiIdentity Cloud

FortiIdentity Cloud (formerly FortiToken Cloud) is an Identity and Access Management as a Service (IDaaS) cloud service provided by Fortinet. It enables FortiGate and FortiAuthenticator customers to add MFA for their users using Mobile or Hard tokens.

For more information, see Getting started—FGT-FTC users in the FortiIdentity Cloud Administration Guide.

Email

Enter an email address to send an MFA code to that address.

SMS

Enable *SMS* then select the *Country Dial Code* and enter the *Phone Number* (`sms-phone` in the CLI) to send an MFA code to.

SMS messages can also be sent to the FortiGuard SMS server or a custom server.

```
config system admin
    edit "admin"
        ...
        set sms-server {fortiguard | custom}
        set sms-server-custom <string>
        ...
    next
end
```

Restricting logins to trusted hosts

Administrator accounts can be configured to only be accessible to a user using a trusted host. You can set a specific IP address for the trusted host, or use a subnet. Up to ten trusted hosts can be specified for an administrator.

When trusted hosts are defined for all of the administrators on the FortiGate, the administrative access on each interface will be restricted to the trusted hosts that are defined for the administrator, except for ping. If ping is enabled on an interface, it works regardless of the trusted hosts.

Configuring a trusted host for SSO administrator accounts

Trusted Hosts can only be configured for local and REST API administrator accounts. It is not possible to directly configure trusted hosts on SAML-based SSO administrator accounts, but an SSO administrator account must be able to access the FortiGate GUI in order to login.

A scenario could arise where local administrators all have trusted hosts defined for a particular management subnet and an SSO administrator needs to log in from a different subnet but is unable to define a trusted host.

Instead, create another local administrator account that has trusted hosts configured but no actual administrative access to anything (that is, a dummy account). The general steps to do this are:

1. Create an administrator profile in *System > Admin Profile* called *no-access* that has all of its permissions set to *None*.
2. Create a dummy local administrator account in *System > Administrator* and assign it the *no-access* administrator profile. Give the administrator a long, random password to secure the account, even though this account does not have access to anything.
3. Configure trusted hosts (enable *Restrict login to trusted hosts*) and add the source subnets/addresses that the SSO administrator will access the FortiGate from.
4. Save the configuration.

Restricting administrators to guest account provisioning

To simplify guest account creation, an administrator account can be created exclusively for guest user management. This allows new accounts to be created without requiring full administrative access to FortiOS.

When enabling this option, a guest group must be specified for the administrator to provision new accounts to. See Configuring guest user groups on page 2842 for information about creating such a group.

Global and VDOM administrators

When a FortiGate is in multi-VDOM mode, it can be managed by either global or per-VDOM administrators. Each type of administrator will have a different view of the GUI that corresponds to their role. For more information, see Administrator roles and views on page 3128.

For information about configuring per-VDOM administrators, see Create per-VDOM administrators on page 3135.

Using FortiAuthenticator and FortiToken for 2FA

FortiAuthenticator can be used to centralize identity and access management and to enforce 2FA with FortiTokens.

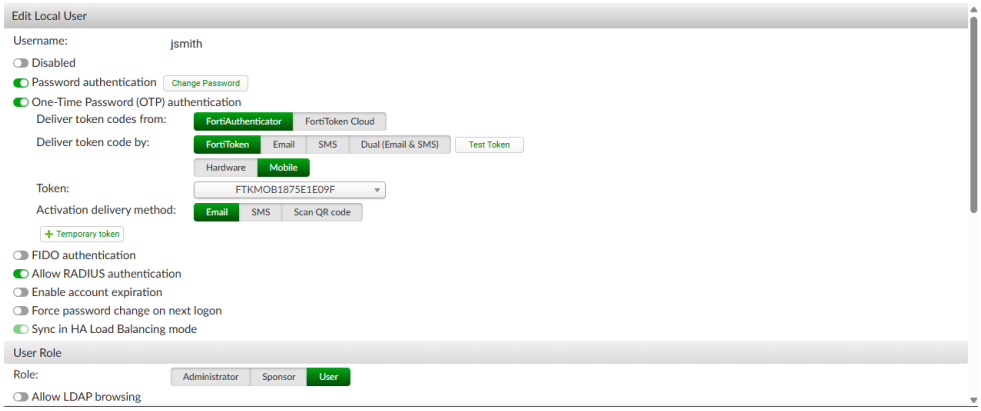
In this example, FortiAuthenticator has local users configured with a FortiToken applied to each user. A remote user group is configured on the FortiGate to connect to the FortiAuthenticator via MSCHAPv2. This user group is applied to the Administrator account.

If you encounter the error *No Message-Authenticator attribute* when you test your RADIUS connection, ensure that your FortiAuthenticator is running a version that resolves CVE-2024-3596.

See RADIUS Connection on page 2880 for details.

To configure the FortiAuthenticator:

1. Go to *Authentication > User Management > Local Users* to define a *Local User*.
2. Enable *One-Time Password (OTP) authentication*.



3. Save the user.
4. Go to *Authentication > RADIUS Service > Clients* to create a new client:
   a. Enter the IP of the connecting FortiGate.
   b. Create a Secret.
   c. Save the client.
5. Go to *Authentication > RADIUS Service > Policies* to create a new policy:
   a. Select the newly created *RADIUS Client*.
   b. Set *Identity Source* to *local* for *Local Users*.
   c. Save the policy.

To configure the FortiGate:

1. Add a RADIUS server:
   a. Go to *User & Authentication > RADIUS Servers* and click *Create New*.
   b. Optionally, specify your *Authentication method*. For example, specify *MS-CHAP-v2*.
   c. For the *Primary Server*, set *IP/Name* to the IP address of the FortiAuthenticator and enter the *Secret*.
   d. Click *OK*.
2. Create a user group:
   a. Go to *User & Authentication > User Groups* and click *Create New*.
   b. In the *Remote Groups* table, click *Add*.
   c. Add the *Remote Server* that was just created and click *OK*.
   d. Click *OK*.
3. Create a new admin user:

   a. Go to *System* > *Administrators* and click *Create New* > *Administrator*.
   b. Set *Type* to *Match all users in a remote server group*.
   c. Choose an *Administrator profile*.
   d. Set *Remote User Group* to the new group that was just created.
   e. Click *OK*.
4. Log out and then back into the FortiGate.
5. When prompted, enter the user credentials for the FAC users.
6. If the password is correct, you will be prompted for the FortiToken key.
7. Enter the key or approve the push notification.
   You are now logged into the FortiGate.
8. Go to *Log & Events* > *System Events* and find the user logs indicating the remote user has logged in successfully.

```
FGT-Corp $ execute log filter category event

 FGT-Corp $ execute log display
 1028 logs found.
 10 logs returned.

 1: date=2025-12-11 time=19:38:34 eventtime=1765510714165848638 tz="-0800" logid="0100032001"
type="event" subtype="system" level="information" vd="root" logdesc="Admin login successful"
sn="1765510714" user="jsmith" ui="jsconsole(172.16.7.254)" method="jsconsole"
srcip=172.16.7.254 dstip=172.16.7.1 action="login" status="success" reason="none"
profile="prof_admin" msg="Administrator jsmith logged in successfully from jsconsole
(172.16.7.254)"
```

When using MSCHAP or MSCHAPv2, the FortiToken must be managed by the FortiAuthenticator. It will not function when using FortiTokens managed by FortiIdentity Cloud.

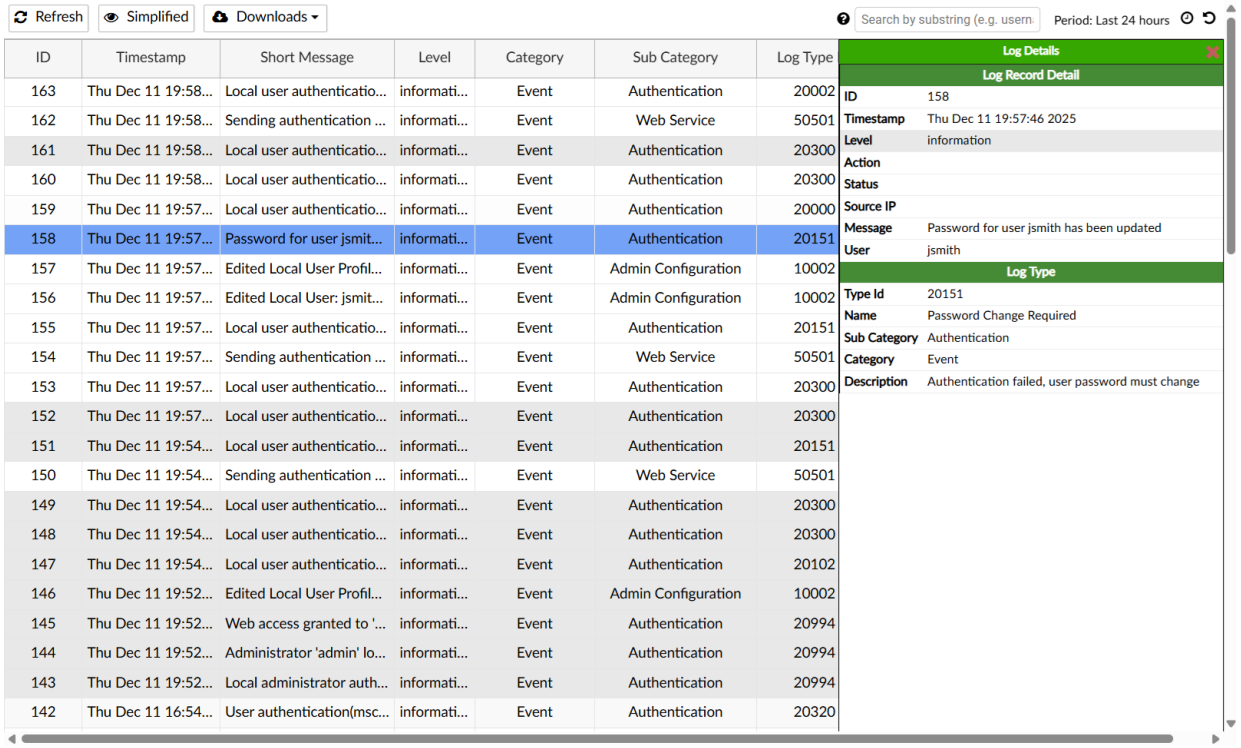
When the token code is entered by the user, this code is encoded into the MSCHAP message as it is sent to FortiAuthenticator. FortiAuthenticator cannot decode the original code, but it can perform a comparison by calculating the hash from the FortiToken seed that resides on the FortiAuthenticator. To work with FortiIdentity Cloud, PAP must be used, preferably with RadSec.

Changing your remote user password after expiry

When a user password expires on the FortiAuthenticator, the FortiGate can force the admin user to change their password. To support this feature, the FortiGate must use MSCHAP or MSCHAPv2 to communicate with the FortiAuthenticator.

When a password is expired and an administrator logs into the FortiGate, after passing authentication and 2FA, they will be prompted to change their password.

On the FortiAuthenticator, find the logs for the password change in *Logging* > *Log Access* > *Logs*.



REST API administrator

REST API administrator accounts are used for automated configuration, backup creation, and monitoring of the FortiGate.

For more information about the REST API, see the Fortinet Development Network (FNDN). Note that an account is required to access the FNDN.

Only an administrator with the *super_admin* profile can create a REST API administrator by using the GUI or CLI.

To create a REST API administrator in the GUI:

1. Go to *System* > *Administrators*.
2. Select *Create New* > *REST API Admin*.
3. Configure the administrator:

Username	The username of the administrator. Do not use the characters < > ( ) # " ' in the administrator username. Using these characters in an administrator username might have a cross site scripting (XSS) vulnerability.
Administrator Profile	Where permissions for the REST API administrator are defined.

	A REST API administrator should have the minimum permissions required to complete the request.
PKI Group	Certificate matching is supported as an extra layer of security. Both the client certificate and token must match to be granted access to the API.
CORS Allow Origin	Cross Origin Resource Sharing (CORS) allows third-party web apps to make API requests to the FortiGate using the token.
Trusted Hosts	The following can be used to restrict access to FortiGate API: • Multiple trusted hosts/subnets can be configured • IPv6 hosts are supported • Allow all (0.0.0.0/0) is not allowed You need your *Source Address* to create the trusted host.

4. Click *OK*.
   An API token is generated. Make note of the token, as it is only shown once.

To create a REST API administrator in the CLI:

1. Create the REST API administrator:

```
config system api-user
    edit "api-admin"
        set comments <string>
        set api-key ************
        set accprofile "API profile"
        set vdom "root"
        set peer-auth enable
        set peer-group <group>
        config trusthost
            edit 1
                set ipv4-trusthost <class_ip&net_netmask>
            next
            ...
        end
    next
end
```

2. Generate the API token:

```
# execute api-user generate-key <API username>
```

   Make note of the token, as it is only shown once.

It is highly recommended to apply the principle of least privilege to the REST API administrator account and avoid using the generic *super_admin* profile for permissions. The profiles *admin_no_access* or *super_admin_readonly* can be used for generic read-only access. However, consider defining a new administrator profile with the required permissions for the account. For example, you could use a specific API user to query the FortiGate for just their own status. In that case, the profile would be configured as read-only.

SSO administrators

SSO administrators are automatically created when the FortiGate acts as a SAML service provider (SP) with *SAML Single Sign-On* enabled in the Security Fabric settings.

On the system login page, an administrator can log in with their username and password against the root FortiGate acting as the identity provider (IdP) in the Security Fabric. After the first successful log in, this user is added to the administrators table (*System > Administrators* under *Single Sign-On Administrator*). The default profile selected is based on the SP settings (*Default admin profile*). See Configuring a downstream FortiGate as an SP on page 3659 for more information.

SSO administrators can be manually configured in FortiOS.

To manually configure an SSO administrator in the GUI:

1. Go to *System > Administrators* and click *Create New > SSO Admin*.
2. Enter the username.
3. Select an administrator profile.
4. Click *OK*.

To manually configure an SSO administrator in the CLI:

```
config system sso-admin
    edit <name>
        set accprofile <profile>
        set vdom <vdom>
    next
end
```

FortiCloud SSO

This feature has been disabled from the server side due to a vulnerability described in FG-IR-26-060. Please upgrade to a patched version to resume secured functionality of this feature.

FortiGate can be configured to allow administrators to log in using FortiCloud single sign-on. Both IAM and non-IAM users on the FortiCloud support portal are supported. Non-IAM users must be the FortiCloud account that the FortiGate is registered to.

It is recommended to only allow administrative access through a non-public facing interface. In addition, use the principle of least privileges when determining user permissions. If a public interface must be used, apply local-in policy to allow only trusted hosts.

To configure an IAM user in FortiCloud:

1. Log in to your FortiCloud account at support.fortinet.com.
2. Select *Services* > *IAM*.
3. See the FortiCloud Identity & Access Management (IAM) guide for more information.

To manually enable FortiCloud single sign-on in the GUI:

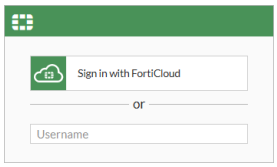
1. Log in to the FortiGate and go to *System* > *Settings*.
2. In the *Administration Settings* section, enable *Allow administrative login using FortiCloud SSO*.
3. Click *Apply*.

To manually enable FortiCloud single sign-on in the CLI:

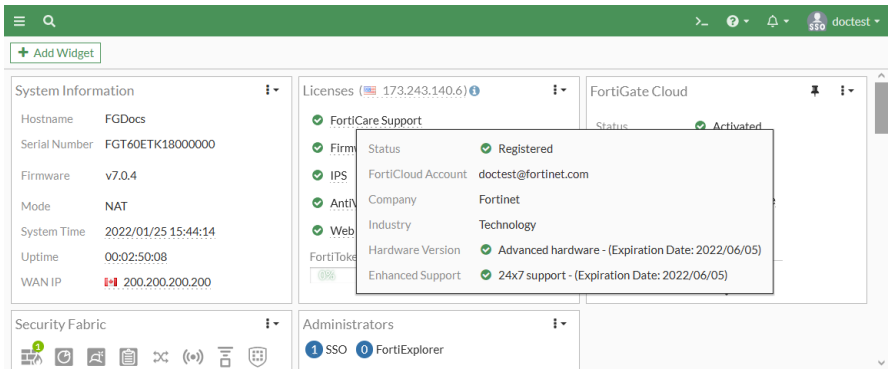
```
config system global
    set admin-forticloud-sso-login {enable | disable}
end
```

To log in to the FortiGate with the FortiCloud user:

1. Go to the FortiGate log in screen.



2. Click *Sign in with FortiCloud*. The FortiCloud log in page opens.
3. Enter the FortiCloud account credentials and click *Login*.
   You are logged in to the FortiOS GUI. The SSO username is shown in the top right corner of the GUI.



Allowing the FortiGate to override FortiCloud SSO administrator user permissions

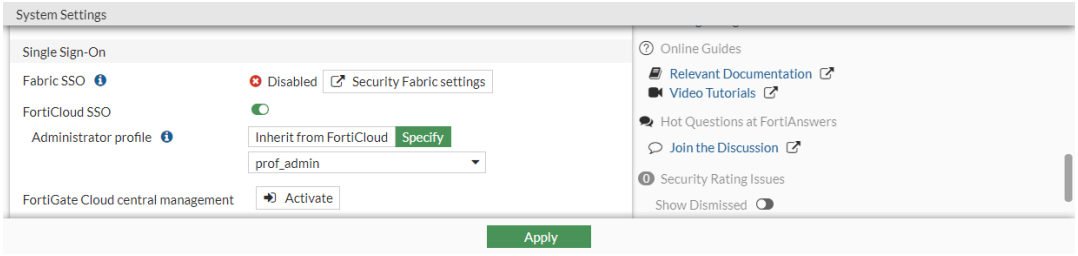
This feature has been disabled from the server side due to a vulnerability described in FG-IR-26-060. Please upgrade to a patched version to resume secured functionality of this feature.

The FortiGate can allow single sign-on (SSO) from FortiCloud and FortiCloud IAM users with administrator profiles inherited from FortiCloud or overridden locally by the FortiGate. Similarly, users accessing the FortiGate remotely from FortiGate Cloud can have their permissions inherited or overridden by the FortiGate.

It is recommended to only allow administrative access through a non-public facing interface. In addition, use the principle of least privileges when determining user permissions. If a public interface must be used, apply local-in policy to allow only trusted hosts.

To enable FortiCloud SSO in the GUI:

1. Go to *System* > *Settings*.
2. In the *Single Sign-On* section, enable *FortiCloud SSO*.
3. Set the default *Administrator profile* to assign: *Inherit from FortiCloud*, or *Specify* and select a profile from the dropdown.



4. Click *Apply*.

To enable FortiCloud SSO in the CLI:

```
config system global
    set admin-forticloud-sso-login enable
    set admin-forticloud-sso-default-profile <profile>
end
```

The following administrator profiles are assigned based on the inherited or overwritten permissions:

User type	Inherited from FortiCloud/FortiGate Cloud	Specify
FortiCloud	Uses the super_admin profile.	Local user profile

User type	Inherited from FortiCloud/FortiGate Cloud	Specify
FortiCloud IAM	Is based on the IAM permission profile's FortiOS SSO portal settings: • If *Access* is disabled = no access • If *Access* is enabled and the *Access Type* is set to *SuperAdmin* = super_admin profile • If *Access* is enabled and the *Access Type* is set to *Read Only*= super_admin_readonly profile	Local user profile
FortiGate Cloud subscription tier	Uses the super_admin profile.	Local user profile
FortiGate Cloud free tier	Has read-only access.	Cannot override

This topic includes four use case examples:

- Example 1: specifying permissions for a FortiCloud SSO user
- Example 2: inheriting FortiCloud permissions for a FortiCloud SSO user
- Example 3: specifying a local user profile for a FortiCloud IAM user
- Example 4: accessing a FortiGate remotely from FortiGate Cloud

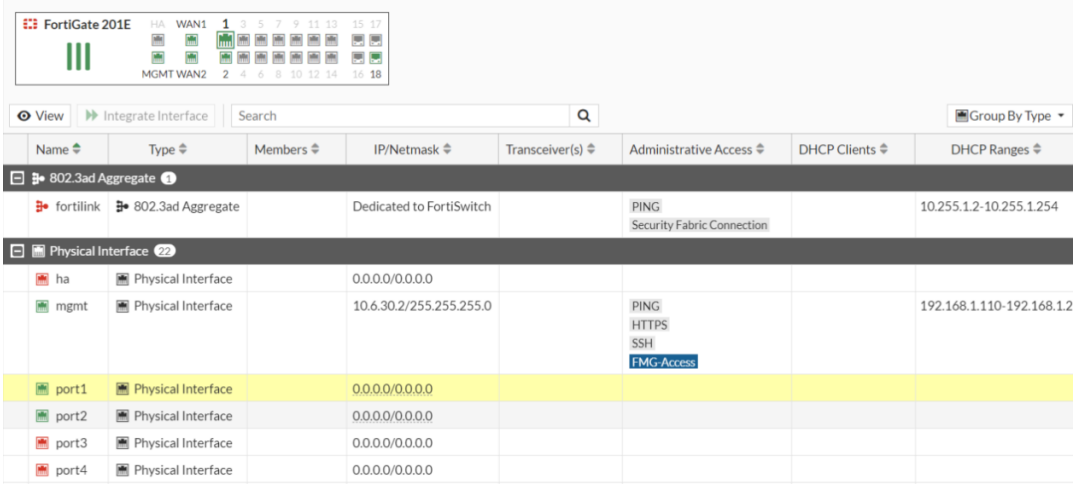
Example 1: specifying permissions for a FortiCloud SSO user

In this example, a FortiCloud SSO user is configured to override permissions and use the prof_admin profile, which is a local read-only profile.

To configure the FortiCloud SSO user:

1. Go to *System* > *Settings*.
2. In the *Single Sign-On* section, enable *FortiCloud SSO*.
3. Set *Administrator profile* to *Specify*, and select *prof_admin*. The FortiCloud SSO user will be created upon the first login.
4. Get the user to log in to the FortiGate:
   a. On the FortiOS login screen, click *Sign in with FortiCloud*. The FortiCloud log in page opens.
   b. Click *Email Login*.
   c. Enter the FortiCloud account credentials and click *Log In*.
   The new SSO user is created.

   Since the profile has read-only access, the SSO user can only view items (such as interfaces) and cannot edit them.

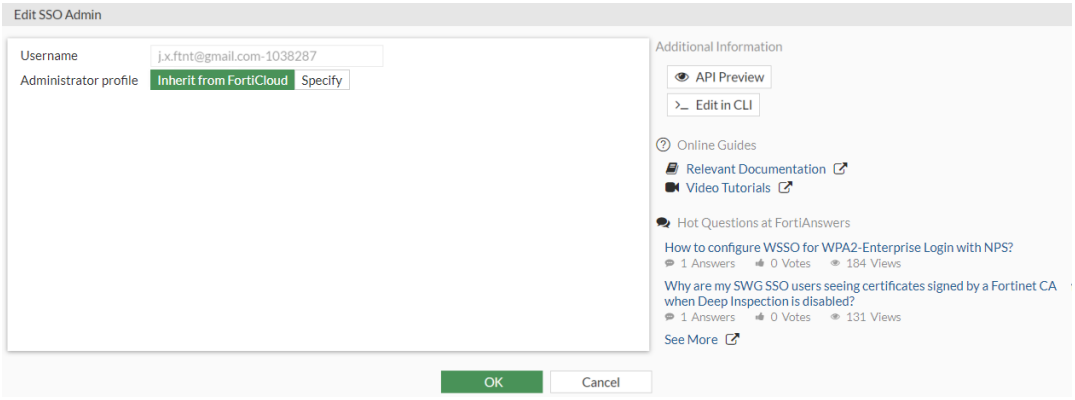


Example 2: inheriting FortiCloud permissions for a FortiCloud SSO user

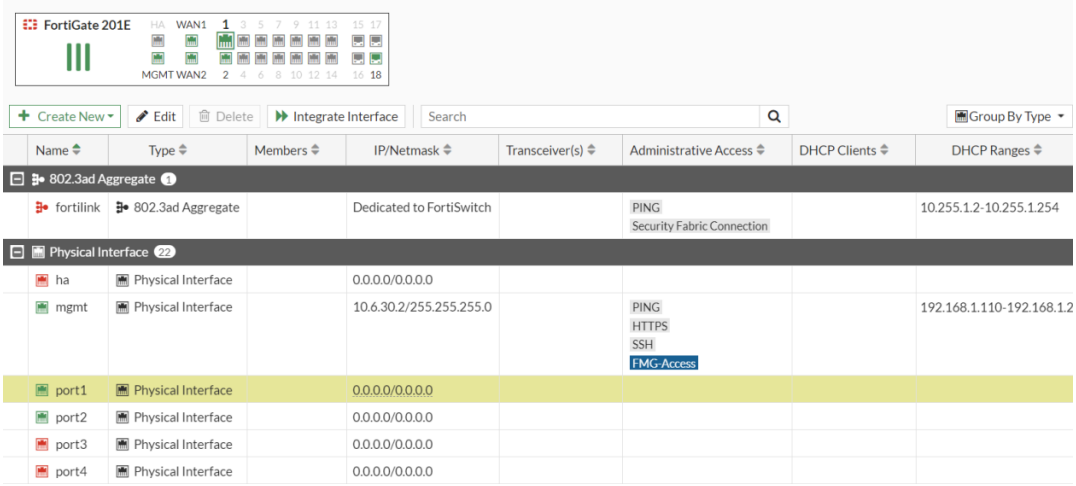
In this example, a local administrator changes the permissions of an existing FortiCloud SSO user (created in the previous example) to *Inherit from FortiCloud*, which means the super_admin profile will be used.

To configure the existing SSO user:

1. Go to *System* > *Administrators* and edit the user in the *FortiCloud SSO Administrator* section (*********@gmail.com*).
2. Set *Administrator profile* to *Inherit from FortiCloud*.



3. Click *OK*.
4. Get the user to log in to the FortiGate. Since the profile changed to super_admin, they can modify items (such as interfaces).



Example 3: specifying a local user profile for a FortiCloud IAM user

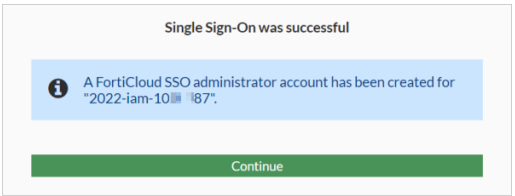
In this example, a FortiCloud IAM user is configured to have read-only SSO access based on the settings in the FortiOS SSO portal. Once the FortiCloud IAM user logs in, an administrator with super_admin access changes the permission of the IAM user to have super_admin access.

This example assumes the *FortiOS SSO* portal has already been added to the IAM permission profile. See Creating a permission profile and Managing permission profiles in the Identity & Access Management (IAM) Guide for more information about configuring permission profiles in FortiCloud.

To configure the FortiCloud IAM user:

1. In FortiCloud, configure the permission profile:
   a. Go to *Services* > *IAM*, then click *Permission Profiles*.
   b. Select a profile and click *Edit*.
   c. In the *FortiOS SSO* portal, enable *Access*. Set the *Access Type* to *Read Only*.

   d. Click *Update*.
2. Get the user to log in to the FortiGate:
   a. On the FortiOS login screen, click *Sign in with FortiCloud*. The FortiCloud log in page opens.
   b. Click *IAM Login*.
   c. Enter the IAM account credentials and click *Log In*.
   The new SSO user is created with a super_admin_readonly profile.



3. Update the IAM user permission to have super_admin access:
   a. Log in to the FortiGate with a super_admin administrator account.
   b. Go to *System > Administrators* and edit the IAM user (*2022*).
   c. Set *Administrator profile* to *Specify* and select *super_admin*.
   d. Click *OK*.
4. Get the user to log in to the FortiGate again. Since the profile changed to super_admin, they can modify items.

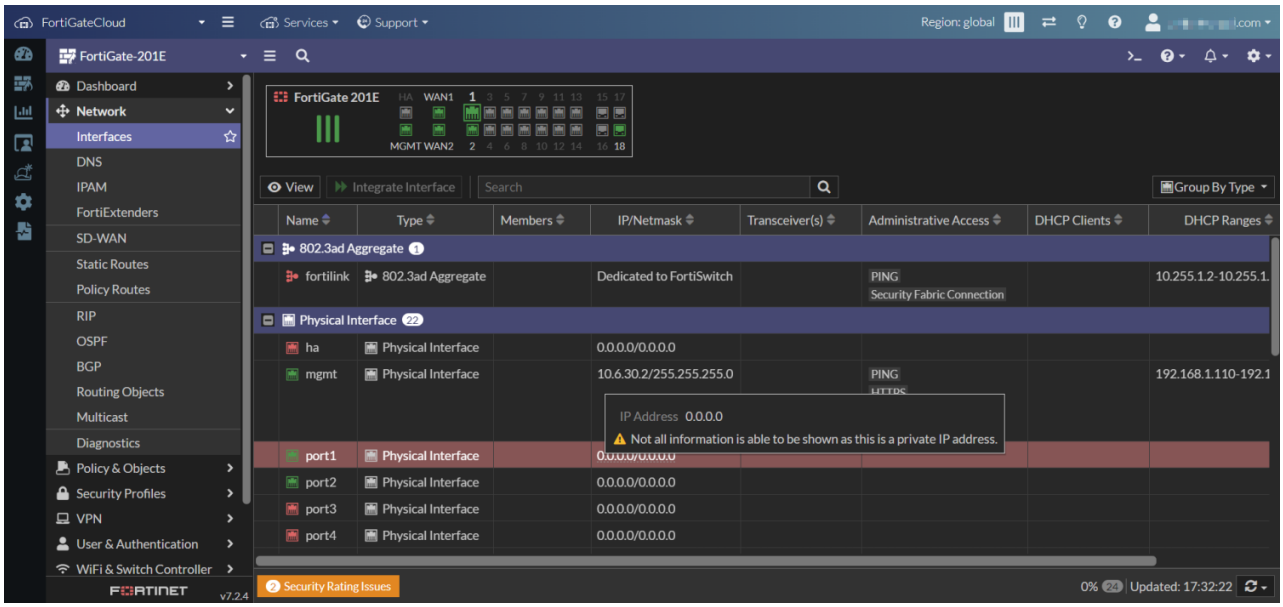
Example 4: accessing a FortiGate remotely from FortiGate Cloud

In this example, a FortiGate Cloud user with a paid subscription accesses the FortiGate remotely from FortiGate Cloud. When the user logs in with SSO, the profile has super_admin access. After the FortiGate Cloud user logs in, an administrator with super_admin access changes the permission of the FortiGate Cloud user to have prof_admin (read-only) access.

FortiGate Cloud must be accessed from a FortiGate Cloud 2.0 portal (also called FortiGate Cloud Premium) in order to have remote access using the FortiGate Cloud proxy. See Getting started with FortiGate Cloud 2.0 for more details.

To access a FortiGate remotely from FortiGate Cloud:

1. Log in to the FortiGate Cloud 2.0 portal.
2. Go to *Inventory > Asset List*. Select the desired FortiGate, then click *Remote Access*.
   FortiGate Cloud accesses the FortiGate using the FortiGate Cloud proxy and creates a super_admin user. The FortiOS interface is displayed in the current browser window.
3. Log out of FortiGate Cloud.
4. Update the FortiGate Cloud user permission to have prof_admin access:
   a. Log in to the FortiGate with a super_admin administrator account.
   b. Go to *System > Administrators* and edit the user in the *FortiGate Cloud SSO Administrator* section (*********@gmail.com*).
   c. Set *Administrator profile* to *Specify* and select *prof_admin*.
   d. Click *OK*.
5. Log in to the FortiGate Cloud 2.0 portal and access the FortiGate remotely again. Since the profile changed to prof_admin, they can only view items (such as interfaces).



Password policy

Brute force password software can launch more than just dictionary attacks. It can discover common passwords where a letter is replaced by a number. For example, if `p4ssw0rd` is used as a password, it can be cracked.

Using secure passwords is vital for preventing unauthorized access to your FortiGate. When changing the password, consider the following to ensure better security:

- Do not use passwords that are obvious, such as the company name, administrator names, or other obvious words or phrases.
- Use numbers in place of letters, for example: `passw0rd`.
- Administrator passwords can be up to 64 characters.
- Include a mixture of numbers, symbols, and upper and lower case letters.
- Use multiple words together, or possibly even a sentence, for example: `correcthorsebatterystaple`.
- Use a password generator.
- Change the password regularly and always make the new password unique and not a variation of the existing password. For example, do not change from `password` to `password1`.
- Make note of the password and store it in a safe place away from the management computer, in case you forget it; or ensure at least two people know the password in the event one person becomes unavailable. Alternatively, have two different admin logins.

FortiGate allows you to create a password policy for administrators and IPsec pre-shared keys. With this policy, you can enforce regular changes and specific criteria for a password policy, including:

- The minimum length, between 8 and 128 characters.
- If the password must contain uppercase (A, B, C) and/or lowercase (a, b, c) characters.
- If the password must contain numbers (1, 2, 3).
- If the password must contain special or non-alphanumeric characters: !, @, #, $, %, ^, &, *, (, and)
- Where the password applies (admin or IPsec or both).

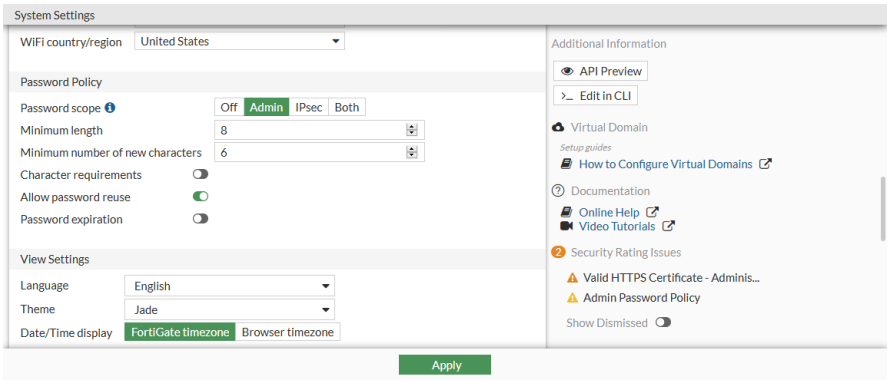
- The duration of the password before a new one must be specified.
- The minimum number of unique characters that a new password must include.

If you add a password policy or change the requirements on an existing policy, the next time that administrator logs into the FortiGate, the administrator is prompted to update the password to meet the new requirements before proceeding to log in.

For information about setting passwords, see Default administrator password on page 3098.

To create a system password policy the GUI:

1. Go to *System* > *Settings*.
2. In the *Password Policy* section, change the *Password scope* to *Admin*, *IPsec*, or *Both*.
3. Configure the password policy options.



4. Click *Apply*.

To create a system password policy the CLI:

```
config system password-policy
    set status {enable | disable}
    set apply-to {admin-password | ipsec-preshared-key}
    set minimum-length <8-128>
    set min-lower-case-letter <0-128>
    set min-upper-case-letter <0-128>
    set min-non-alphanumeric <0-128>
    set min-number <0-128>
    set min-change-characters <0-128>
    set expire-status {enable | disable}
    set expire-day <1-999>
    set reuse-password {enable | disable}
end
```

Public key SSH access

Public-private key pairs can be used to authenticate administrators connecting to the CLI using an SSH client. These keys can be RSA, ECDSA, or EdDSA.

Weigh the pros and cons of using key-pair authentication, versus passwords, when considering their use:

	Key-pair	Password
Pros	More secure (higher complexity)	Easy to remember
	Restricts logon to hosts that have the private key	Easy to update
	Never sent to the FortiGate	Can log in from any system
	Can add a password in addition to the key	
Cons	More complex to implement	Might be guessable or brute forced
	The private key is only as secure as the system storing it	Could be reused and compromised on another system
	More complicated to train users and administrators to use keys	Might be stored in plain text on an authenticating device (This does not apply to FortiGates)
		Can be phished or observed if written down

Key-pair authentication is often implemented when connecting to the FortiGate without any human interaction, such as when using a script. The script can leverage existing mechanisms to secure private keys, instead of trying to develop a way to securely store a username and password.

Generating the key pair

Key pairs can be generated and added in multiple different ways. This example shows generating a key pair using *PuTTY Key Generator* and adding the private key to the endpoint using *PuTTY Pageant*.

To create the key pair using PuTTY:

1. Download and install PuTTY.
2. Run *PuTTYgen.exe*.
3. Set *Type of key to generate* to *RSA*, *ECDSA*, or *EdDSA*.
4. Click *Generate*, then move the mouse cursor around in the blank space to generate randomness while the keys are generated.
5. Save both the public and private keys. Optionally, a key passphrase can be entered to protect the private key. This passphrase will be requested during login.

To add the public key to the FortiGate:

1. Ensure that you have configured an appropriate admin account profile for this new user, that only has the permissions that this admin will use to satisfy the rule of least privileges.
2. Delete the *Key comment*, then copy the public key from the *PuTTY Key Generator*.
   Conversely, you can also open the saved public key in Notepad, remove the line breaks from the key, then remove extraneous lines:

```
---- BEGIN SSH2 PUBLIC KEY ----
Comment: "rsa-key-2022XXXX"
```

```
---- END SSH2 PUBLIC KEY ----
```

3. Add the key to the FortiGate:

```
config system admin
    edit <admin>
        set vdom <vdom>
        set accprofile <profile>
        set ssh-public-key1 "<key_type> <key_value>"
        set password <password>
    next
end
```

Where <key_value> is the copied key, and <key_type> depends on the type of key that was generated:

RSA	ssh-rsa
ECDSA	ecdsa-sha2-nistp256 ecdsa-sha2-nistp384 ecdsa-sha2-nistp521
EdDSA	ssh-ed25519

When creating the user, several requirements must be met:

- When multi-vdom mode is enabled, a VDOM must be specified.
- An admin account profile must be selected. Use the rule of least privileges.
- A password must be set for backup. Since the objective is to login with a private key, you may want to assign a long random string as the password.

To add the private key to the endpoint:

1. Open *PuTTY Pageant*.
2. Click *Add Key* or *Add Key (encrypted)* and select the previously saved private key.
3. Click *Close*.

You can now log in to the FortiGate on an SSH connection without using a password.

If using PuTTY, the username can be entered under *Connection > Data* in the *Auto-login username* field. The key can be applied under *Connection > SSH > Auth > Credentials*.

If a key passphrase was specified during key creation, then the SSH session will require the user to enter the passphrase during login:

```
Using username "ssh-user".
Authenticating with public key "rsa-key-20251215"
```

```
Passphrase for key "rsa-key-20251215": <enter the passphrase here>
FGDocs $
```

The generated keys can also be used in a certificate to authenticate with the FortiGate.

See Administrative access using certificates on page 3445 for information about generating and using certificates for administrative authentication.

Separating the SSHD host key from the administration server certificate

Separating the SSHD host key from the administration server certificate addresses the issue where the administration server key tends to overwrite one of the key files, which can lead to complications. This resolves the problem where the SSH module regenerates the host key files after a factory reset. This action previously prompted a warning message when an older SSH client attempted to log in to the FortiGate using SSH.

```
config system global
    set ssh-hostkey-override {enable | disable}
    set ssh-hostkey-password <password>
    set ssh-hostkey <encrypted_private_key>
end
```

The `ssh-hostkey-algo` option under `config system global` supports ECDSA 384 and ECDSA 256, allowing the SSHD to accommodate the most commonly used host key algorithms.

To configure SSH host key override in SSHD:

1. Using the ssh-keygen tool, generate the host key (ecdsa-sha2-nistp384 is used in this example).
2. Configure the SSH host key override settings:

```
config system global
    set ssh-hostkey-override enable
    set ssh-hostkey-algo ecdsa-sha2-nistp384
    set ssh-hostkey-password **********
    set ssh-hostkey <encrypted_private_key>
end
```

3. On a PC, attempt to log in to the FortiGate with the defined ecdsa-sha2-nistp384 algorithm:

```
root@PC05:~# ssh admin@172.16.200.1
The authenticity of host '172.16.200.1 (172.16.200.1)' can't be established.
ECDSA key fingerprint is SHA256:mcrMXSjtN/YjY3zQgZpxk77ezxPVGGGOL/GUOG8Oijs.
Are you sure you want to continue connecting (yes/no)? yes
Warning: Permanently added '172.16.200.1' (ECDSA) to the list of known hosts.
```

4. Verify the server host key algorithms:

```
root@PC05:~# nmap -sV --script ssh2-enum-algos 172.16.200.1
Starting Nmap 7.01 ( https://nmap.org ) at 2023-11-07 15:47 PST
Nmap scan report for FGT_A (172.16.200.1)
Host is up (0.00013s latency).
Not shown: 995 filtered ports
PORT    STATE  SERVICE      VERSION

```

Restricting SSH and Telnet jump host capabilities

Jump hosts are used to access devices in separate security zones, such as the internet and an internal network. Administrator access profiles can be configured to prevent administrators from using the FortiGate as a jump host for SSH and Telnet connections.

To configure permission to execute SSH or Telnet commands in an access profile:

```
config system accprofile
    edit <name>
        set system-execute-ssh {enable | disable}
        set system-execute-telnet {enable | disable}
    next
end
```

To block SSH and Telnet connections for an administrator:

1. Disable permission to execute SSH or Telnet commands in an administrator access profile:

```
config system accprofile
    edit "test_accprofile"
        set system-execute-ssh disable
        set system-execute-telnet disable
    next
end
```

2. Configure an administrator in the profile:

```
config system admin
    edit "admin1"
        set accprofile "test_accprofile"
        set vdom "root"
        set password **********
    next
end
```

3. Log in as the new administrator, and attempt to connect to another host using SSH or Telnet:

```
# execute ssh root@172.16.200.55
You are not entitled to run the command.
Command fail. Return code -37
```

```
# execute ssh6 root@2000:172:16:200::55
You are not entitled to run the command.
Command fail. Return code -37
```

```
# execute telnet 172.16.200.55
You are not entitled to run the command.
Command fail. Return code -37
```

Remote administrators with TACACS+ VSA attributes

Vendor-Specific Attributes (VSAs) can be used with TACACS+ authentication and authorization in wildcard system administrator access to FortiGates from browsers and SSH. The `memberof` VSA can be used in remote TACACS+ user group for group matching. The `vdom` VSA returned from TACACS+ can be used to overwrite the VDOM in the `system admin` settings. The `admin_prof` VSA returned from TACACS+ can be used to overwrite the `accprofile` in the `system admin` settings.

Example

In this example, a FortiGate is configured with multiple VDOMs, and the root acts as the management VDOM. Administrators attempt to log in with SSH or HTTPS through each VDOM.

Using the VSA values for the `vdom` and `admin_prof` attributes returned from the TACACS+ server, the FortiGate can allow access only to the VDOMs returned with the permissions from the corresponding administrator profile. If no VSA values are returned from TACACS+ , then the FortiGate uses the default values under the `config system admin` settings.

The TACACS+ server settings are configured as follows:

```
user = admin-all-vdom {
    default service = permit
    member = sys_admin_all_vdom
    …
}
user = admin-vdom1 {
    default service = permit
```

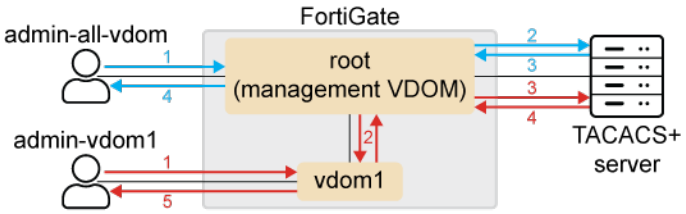
```
    member = sys_admin_vdom1
    …
}
group = sys_admin_all_vdom {
default service = permit
    service = fortigate {
        memberof = group3
        admin_prof = admin_all_vdom
    }
}
group = sys_admin_vdom1 {
default service = permit
    service = fortigate {
        memberof = group3
        admin_prof = admin_vdom1
        vdom = vdom1
    }
}
```

For multiple VDOMs, each VDOM must be specified in a separate field. For example, for access to vdom1 and vdom2:

```
vdom = vdom1
vdom = vdom2
```

Some TACACS+ servers, such as Linux TACACS+ servers, may only return the last VDOM specified.

The authentication process is as follows:



Authentication for admin-all-vdom:

1. The administrator attempts to log in to the FortiGate over the remote TACACS+ user group, `remote-tacacs`.
2. The FortiGate sends an authorization request to the TACACS+ server.
3. TACACS+ authenticates the admin-all-vdom user. The user matches the `sys_admin_all_vdom` TACACS+ group. TACACS+ returns following VSA values:
   - `memberof = group3`
   - `admin_prof = admin_all_vdom`
4. The FortiGate authenticates and authorizes the user based on the returned `memberof` group. The admin_prof value overwrites the `accprofile` setting configured under `system admin`. Since no other VDOM

VSA is returned, the FortiGate matches the user to the default VDOM configured under `system admin`, which is `admin_no_access`.

Authentication for admin-vdom1:

1. The administrator attempts to log in to the FortiGate over the remote TACACS+ user group, `remote-tacacs`.
2. vdom1 forwards the request to the management VDOM, which is the root.
3. The FortiGate sends an authorization request to the TACACS+ server through the management VDOM.
4. TACACS+ authenticates the admin-vdom1 user. The user matches the `sys_admin_vdom1` TACACS+ group. TACACS+ returns following VSA values:
   - `memberof = group3`
   - `admin_prof = admin_vdom1`
   - `vdom = vdom1`
5. The FortiGate authenticates and authorizes the user based on the returned `memberof` group. The other VSA values overwrite the `accprofile` and VDOM settings configured under `system admin`. The user is only allowed to access vdom1 with the administrative permissions allowed for admin_vdom1.

To configure the FortiGate:

1. Create two system administrator profiles.
   a. Configure admin_vdom1 who has read-write access to vdom1 (except for firewall policies) and is redistricted from using diagnose commands in the CLI:

```
config system accprofile
    edit "admin_vdom1"
        set secfabgrp read-write
        set ftviewgrp read-write
        set authgrp read-write
        set fwgrp custom
        set cli-diagnose disable
        config fwgrp-permission
            set policy read
            set address read
            set service read
            set schedule read
            set others read
        end
    next
end
```

   b. Configure admin_all_vdom who has read-write access to all VDOMs, but not with super_admin permissions:

```
config system accprofile
    edit "admin_all_vdom"
        set secfabgrp read-write
        set ftviewgrp read-write
        set authgrp read-write
        set sysgrp read
```

```
        set netgrp read-write
        set loggrp read-write
        set fwgrp read-write
        set vpngrp read
        set utmgrp read
        set wanoptgrp read
        set wifi read
    next
end
```

2. Configure the TACACS+ server:

```
config user tacacs+
    edit "tac1"
        set server "10.1.100.34"
        set key XXXXXXXXXXXX
        set authorization enable
    next
end
```

3. Configure the remote TACACS+ group with group matching:

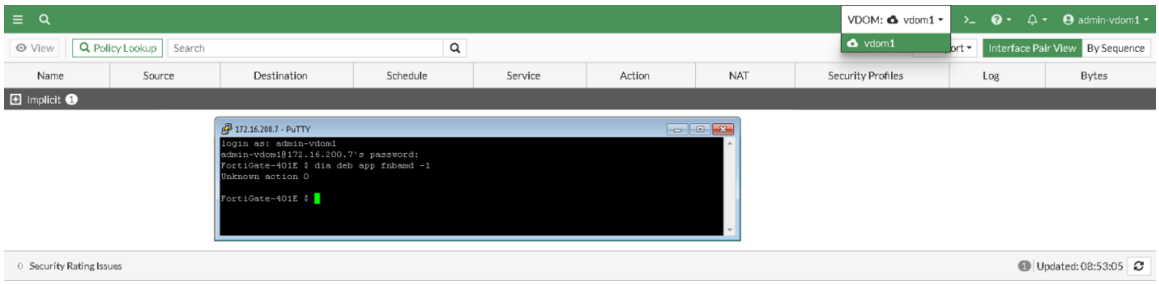
```
config user group
    edit "remote-tacacs"
        set member "tac1"
        config match
            edit 1
                set server-name "tac1"
                set group-name "group3"
            next
        end
    next
end
```

4. Configure the wildcard administrative user assigned to the remote TACACS+ group:

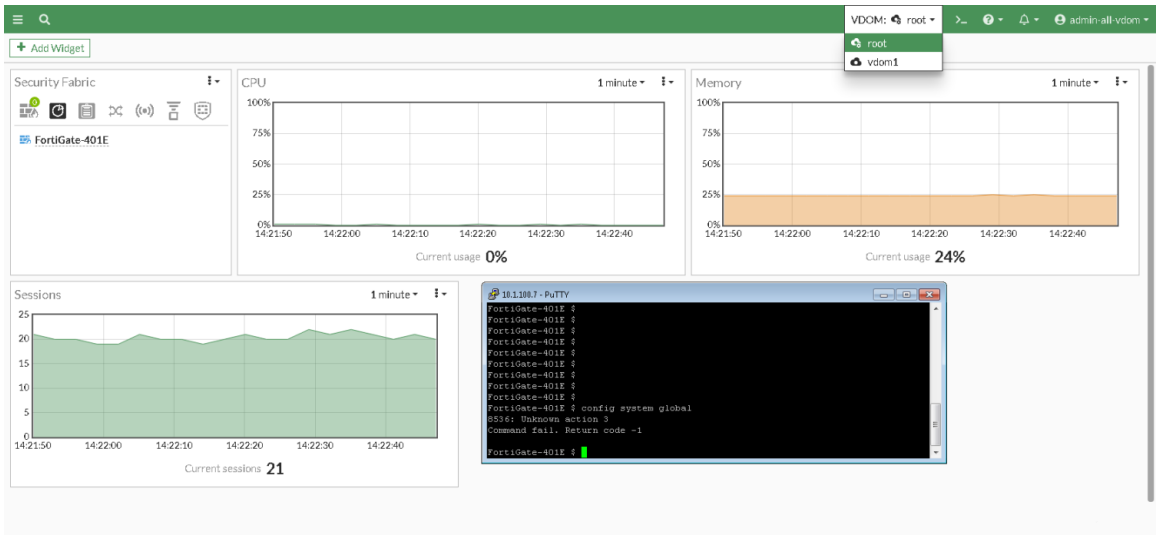
```
config system admin
    edit "remote-admin"
        set remote-auth enable
        set accprofile "admin_no_access"
        set vdom "root" "vdom1"
        set wildcard enable
        set remote-group "remote-tacacs"
        set accprofile-override enable
        set vdom-override enable
    next
end
```

To verify the configuration:

1. Log in as admin-vdom1 using a browser and SSH. The following behavior is expected:
   - The user can only access vdom1 (returned by TACACS+ in the `vdom` VSA).
   - The user can view firewall policies, but they cannot not create new policies.
   - The user cannot run `diagnose debug application` commands in the PuTTY SSH session.



2. Log in as admin_all_vdom using a browser and SSH. The following behavior is expected:
   - The user has no VSA VDOM configured on the TACACS+ server, so the default setting in the `system admin` configuration should apply. The user can access the root and vdom1 VDOMs.
   - The user has no access to `system global` in the CLI, and the prompt symbol is a `$` instead of a `#`.



Administrator profiles

Administrator profiles define what the administrator can do when logged into the FortiGate. When you set up an administrator account, you also assign an administrator profile which dictates what the administrator sees. Depending on the nature of the administrator's work, access level or seniority, you can allow them to view and configure as much or as little as is required. Access to CLI diagnose commands can also be disabled for global and VDOM level administrators.

By default, the FortiGate has an *admin* administrator account that uses the *super_admin* profile.

super_admin profile

This profile has access to all components of FortiOS, including the ability to add and remove other system administrators. For certain administrative functions, such as backing up and restoring the configuration, super_admin access is required. To ensure that there is always a method to administer the FortiGate, the super_admin profile cannot be deleted or modified.

Lower level administrator profiles cannot backup or restore the FortiOS configuration.

The super_admin profile is used by the default admin account. It is recommended that you add a password and rename this account once you have set up your FortiGate. In order to rename the default account, a second admin account is required.

Creating customized profiles

To create a profile in the GUI:

1. Go to *System* > *Admin Profiles* and click *Create New*.
2. Configure the following settings:
   - Name
   - Access permissions
   - Usage of CLI diagnose commands
   - Override idle timeout
3. Click *OK*.

To create a profile in the CLI:

```
config system accprofile
    edit <name>
        set secfabgrp {none | read | read-write}
        set ftviewgrp {none | read | read-write}
        set authgrp {none | read | read-write}
        set sysgrp {none | read | read-write | custom}
        set netgrp {none | read | read-write | custom}
        set loggrp {none | read | read-write | custom}
        set fwgrp {none | read | read-write | custom}
        set vpngrp {none | read | read-write}
        set utmgrp {none | read | read-write | custom}
        set wanoptgrp {none | read | read-write}
        set wifi {none | read | read-write}
        set admintimeout-override {enable | disable}
        set cli-diagnose {enable | disable}
        set cli-get {enable | disable}
        set cli-show {enable | disable}
```

```
        set cli-exec {enable | disable}
        set cli-config {enable | disable}
    next
end
```

The CLI profile configuration includes additional options to allow usage of the `get`, `show`, `execute`, and `config` CLI commands.

Many diagnostic commands have privileged access. As a result, using them could unintentionally grant unexpected access or cause serious problems, so understanding the risks involved is crucial.

Controlling CLI system permissions

Administrator profiles can control administrator access to CLI commands based on role, access level, or seniority.

To configure CLI command access in administrative profiles:

```
config system accprofile
    edit <name>
        set cli-diagnose {enable | disable}
        set cli-get {enable | disable}
        set cli-show {enable | disable}
        set cli-exec {enable | disable}
        set cli-config {enable | disable}
    next
end
```

This command allows the administrator to configure the administrator profiles by enabling specific CLI commands as needed. The default setting for all the CLI command options is `disable`.

Displaying execute commands for custom system permissions

A custom access profile can have customized system permissions. In this example, a profile is created for maintenance read access, and the profile is applied to a new system administrator account. Once the administrator logs in, they can view the available execute commands by entering `execute ?` in the CLI.

To create the profile:

1. Configure the access profile:

```
config system accprofile
    edit "mnt test"
```

```
        set sysgrp custom
        config sysgrp-permission
            set mnt read
        end
    next
end
```

2. Configure the system administrator account:

```
config system admin
    edit "mnt"
        set accprofile "mnt test"
        set vdom "root"
        set password ********
    next
end
```

To display the list of the execute commands:

```
$ execute ?
backup                backup
fctems                fctems
ping                  PING command.
ping-options          ping-options
ping6                 PINGv6 command. [Take 0-100 arg(s)]
ping6-options         ping6-options
ssh-options           SSH options.
ssh6-options          IPv6 SSH options.
telnet-options        telnet-options
traceroute            Traceroute {IP|hostname}.
traceroute-options    traceroute-options
tracert6              Traceroute for IPv6. [Take 0-32 arg(s)]
usb-device            usb-device
usb-disk              usb-disk
vm-license-options    VM license options.
```

The output will vary based on the FortiGate model. A FortiGate VM is used in this example. For more information about using the CLI, see CLI basics on page 69.

Editing profiles

To edit a profile in the GUI:

1. Go to *System* > *Admin Profiles*.
2. Select the profile to be edited and click *Edit*.
3. Make the required changes.
4. Click *OK* to save any changes.

To edit a profile in the CLI:

```
config system accprofile
    edit "sample"
        set secfabgrp read
    next
end
```

Deleting profiles

To delete a profile in the GUI:

1. Go to *System* > *Admin Profiles*.
2. Select the profile to be deleted and click *Delete*.
3. Click *OK*.

To delete a profile in the CLI:

```
config system accprofile
    delete "sample"
end
```

Firmware & Registration

The *Firmware & Registration* page allows administrators to manage the firmware running on each FortiGate, FortiAP, and FortiSwitch in the Security Fabric, and to authorize and register these Fabric devices.

The *Firmware & Registration* page displays a summary of devices in the Security Fabric that includes:

- Total number of devices in the Fortinet Security Fabric and the types of devices
- Upgrade status
- Device name
- Device status
- Registration status
- Firmware version and maturity level
- Upgrade status

If the *Firmware & General Updates* (FMWR) license is invalid or the FortiGate appliance has reached End of Support (EOS), the FortiGate will enforce an automatic update to the latest patch of the current minor version. A valid FMWR license is required to update to the next minor or major version; without it, the FortiGate cannot be upgraded to these versions. See Automatic firmware upgrades for FortiGate appliances with invalid support contracts or that have reached EOES on page 3074.

From the *Firmware & Registration* page, administrators can perform the following actions:

Upgrade	Use to upgrade firmware for the selected device. The *Upgrade* option uses released firmware images from FortiGuard. Alternately you can download a firmware file from the Fortinet Customer Service & Support website, and upload it for the upgrade process. See Upgrading individual devices on page 3062.
Fabric Upgrade	Use to upgrade firmware for the root FortiGate as well as all Fabric devices. You can also use this option to upgrade firmware for a non-Security Fabric FortiGate with managed FortiSwitch and FortiAP devices. The *Fabric Upgrade* option uses released firmware images from FortiGuard. See Upgrading Fabric or managed devices on page 3064.
Register	Use the *Register* option to register a selected device to FortiCare. The FortiGate, and then its service contract, must be registered to have full access to Fortinet Customer Service and Support, and FortiGuard services. The FortiGate can be registered in either the FortiGate GUI or the FortiCloud support portal. The service contract can be registered from the FortiCloud support portal. See also Registering FortiGate on page 37.
Authorization	Use the *Authorization* option to authorize, deauthorize, or reject the selected device. See Authorizing devices on page 3080.

Before you upgrade FortiGate firmware, it is recommended to learn about firmware updates, firmware maturity levels, Special Technical Support (STS) firmware, and selected availability (SA) versions. See About firmware installations on page 3054 and Firmware labels on page 3055.

This section also includes the following topics:

- Enabling automatic firmware upgrades on page 3069
- Firmware upgrade notifications on page 3081
- Downloading a firmware image on page 3082
- Testing a firmware version on page 3083
- Installing firmware from system reboot on page 3084
- Restoring from a USB drive on page 3087
- Using controlled upgrades on page 3088
- Downgrading individual device firmware on page 3088
- Downloading the EOS support package for supported Fabric devices on page 3090
- How the FortiGate firmware license works on page 3094

About firmware installations

Fortinet periodically updates the FortiGate firmware to include new features and resolve important issues. After successful registration of your FortiGate unit, firmware updates are available from FortiGuard and from the Fortinet Customer Service & Support website. See Registering FortiGate on page 37 for more information.

If the *Firmware & General Updates* (FMWR) license is invalid or the FortiGate appliance has reached End of Support (EOS), the FortiGate will enforce an automatic update to the latest patch of the current minor version. A valid FMWR license is required to update to the next minor or major version; without it, the FortiGate cannot be upgraded to these versions. See Automatic firmware upgrades for FortiGate appliances with invalid support contracts or that have reached EOES on page 3074.

Installing a new firmware image replaces the current antivirus and attack definitions, along with the definitions included with the firmware release that is being installing. After you install new firmware, make sure that the antivirus and attack definitions are up to date.

It is recommended to back up your configuration before making any firmware changes. You will be prompted to back up your configuration as part of the upgrade process. See also Configuration backups and reset on page 3505.

Before you install any new firmware, follow the below steps:

1. Understand the maturity level of the current and target firmware releases to help you determine whether to upgrade. See Firmware maturity levels on page 3056. See also Selected availability (SA) versions on page 3061.
2. Review the Release Notes for a new firmware release.
3. Review the Supported Upgrade Paths.
4. Download a copy of the currently installed firmware, in case you need to revert to it. See Downloading a firmware image on page 3082 and Downgrading individual device firmware on page 3088 for details.
5. Have a plan in place in case there is a critical failure, such as the FortiGate not coming back online after the update.
   This could include having console access to the device (Connecting to the CLI on page 66), ensuring that your TFTP server is working (Installing firmware from system reboot on page 3084), and preparing a USB drive (Restoring from a USB drive on page 3087).
6. Back up the current configuration, including local certificates. The upgrade process prompts you to back up the current configuration. See also Configuration backups and reset on page 3505 for details.
7. Test the new firmware until you are satisfied that it applies to your configuration. See Testing a firmware version on page 3083 and Using controlled upgrades on page 3088 for details.

Installing new firmware without reviewing release notes or testing the firmware may result in changes to settings and unexpected issues.

Only FortiGate admin users and administrators whose access profiles contain system read and write privileges can change the FortiGate firmware.

Firmware labels

Fortinet uses the following labels to communicate important information about the version of FortiOS firmware running on FortiGate:

Maturity level	Identifies whether the firmware includes new, major features in addition to bug fixes and vulnerability patches. See Firmware maturity levels on page 3056.
Special Technical Support	Identifies a non-GA build of firmware issued by Fortinet support. See Special Technical Support firmware on page 3059.
Selected Availability	Identifies a special build of firmware issued by Fortinet to use for a long time. See Selected availability (SA) versions on page 3061.

Firmware maturity levels

Starting with FortiOS 7.2.0, released FortiOS firmware images use tags to indicate the following maturity levels:

- The *Feature* tag indicates that the firmware release includes new features. It can also include bug fixes and vulnerability patches where applicable.
- The *Mature* tag indicates that the firmware release includes no new, major features. Mature firmware will contain bug fixes and vulnerability patches where applicable.

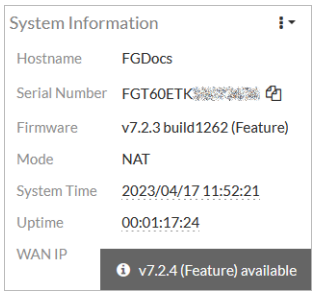
Administrators can use the tags to identify the maturity level of the current firmware in the GUI or CLI.

Administrators can view the maturity level of each firmware image that is available for upgrade on the *Firmware & Registration* page. When upgrading from mature firmware to feature firmware, a warning message is displayed.

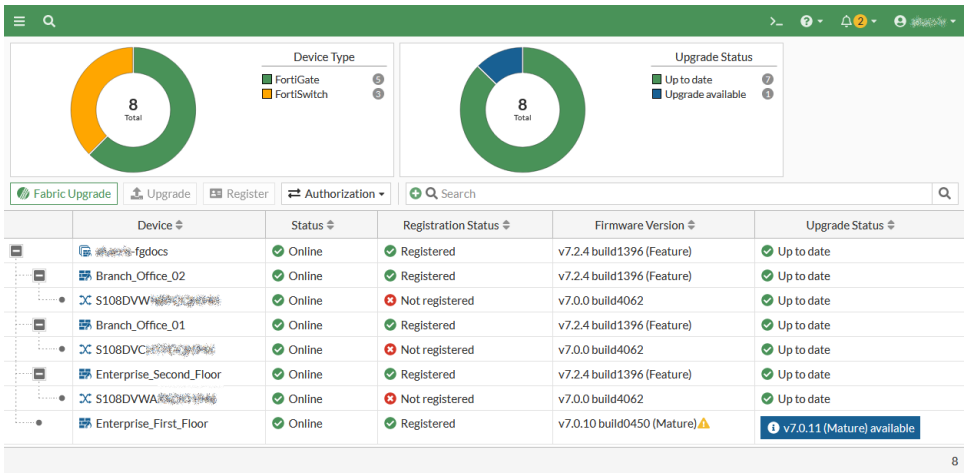
To view maturity levels for firmware in the GUI:

1. Go to *Dashboard* > *Status*. The *Firmware* field in the *System Information* widget displays the version with build number and either *(Mature)* or *(Feature)*.
   The following is an example of firmware with the *(Mature)* tag:

   The following is an example of firmware with the *(Feature)* tag:



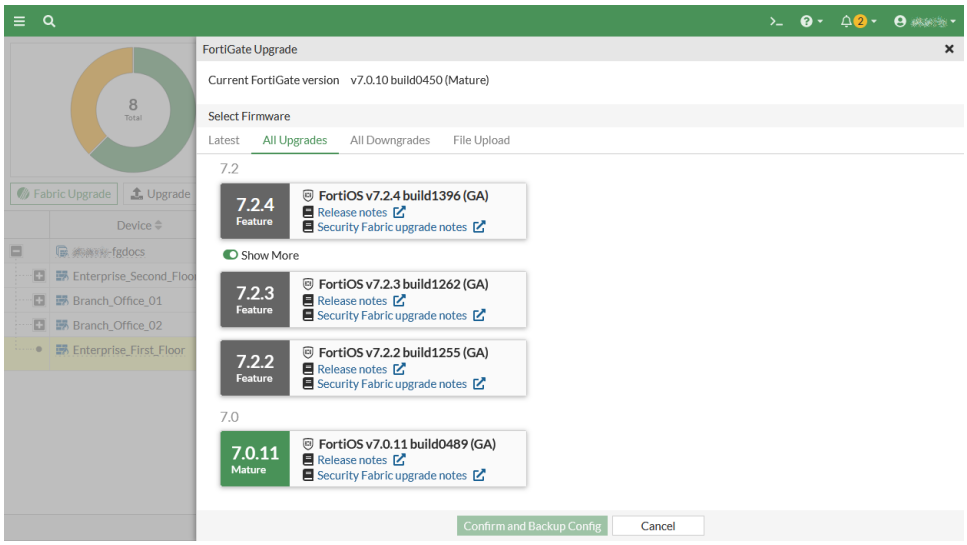
2. Go to *System* > *Firmware & Registration*. The *Firmware Version* column displays the version with build number and either *(Mature)* or *(Feature)*.



3. Select a device and click *Upgrade*. The *FortiGate Upgrade* pane is displayed.
   - Click the *Latest* tab to view the latest available firmware version with its maturity level.

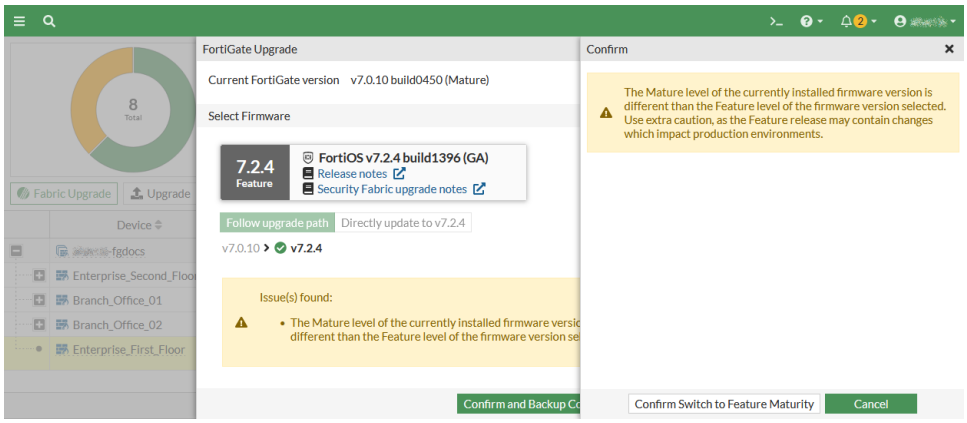
   - Click the *All Upgrades* tab to view all available firmware versions and their maturity levels.

     A gray box around the version number and the label *Feature* identifies feature firmware version. A green box around the version with the label *Mature* identifies a mature firmware version.



4. Select a version and click *Confirm and Backup Config*.

   When the firmware version is a feature release, a warning is displayed; click *Confirm Switch to Feature Maturity*.



To view maturity levels for firmware in the CLI:

In this example, the `Version` field includes `.F` to indicate that the maturity level is feature:

```
# get system status
Version: FortiWiFi-81F-2R-POE v7.2.4,build1396,230131 (GA.F)
...
```

In this example, the `Version` field includes `.M` to indicate that the maturity level is mature:

```
# get system status
Version: FortiWiFi-81F-2R-POE v7.0.10,build0450,230221 (GA.M)
...
```

Special Technical Support firmware

Special Technical Support firmware was formerly known as Top3 builds. When Special Technical Support (STS) firmware is running on FortiGate instead of General Availability (GA) firmware, it is labeled as STS in the FortiOS GUI and CLI, and warning messages about the risks are displayed. STS builds are signed by Fortinet.

The STS firmware warning message does not apply to FIPS-CC certified builds.

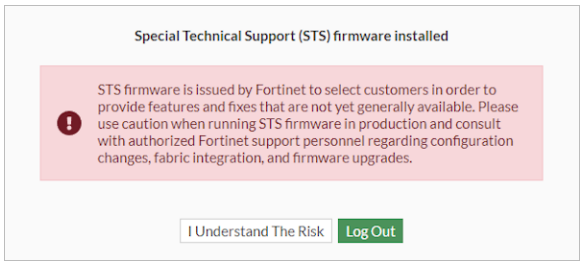
FIPS-CC certified builds (non-GA) are categorized as STS builds, which means that the warning message might be displayed upon login even though, unlike STS builds, FIPS-CC certified builds are available to all customers and the warning does not apply.

This example shows how to use the FortiOS GUI and CLI to identify when FortiGate is running an STS build of firmware.

See also BIOS-level signature and file integrity checking on page 3465.

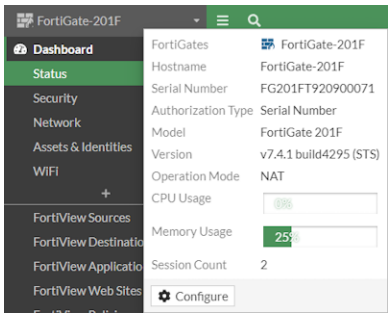
To view an STS build in the GUI:

1. Log in to FortiOS. A warning message is displayed.

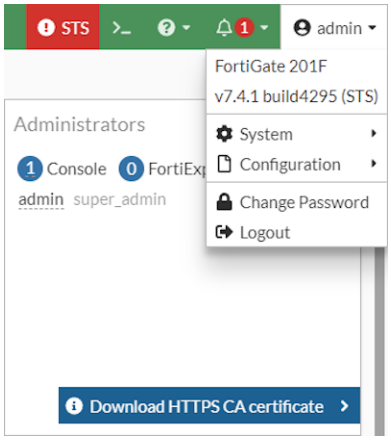


2. Click *I Understand The Risk* to acknowledge the warning and complete the login process.
3. View the STS build label and warnings:
   - Go to *Dashboard > Status > System Information* widget to view the red (STS) label in the *Firmware* field, for example, *7.4.1 build4291 (STS)*.

   - Hover over the FortiGate name on the left corner of the banner to display a tooltip. The *Version* fields displays *(STS)*, for example, *7.4.1 build4295 (STS)*.



- Click *admin* on the top-right of the banner to display a menu. The *(STS)* label appears at the end of the version, for example, *7.4.1 build4295 (STS)*.



- Hover over the exclamation mark beside *STS* on the top-right of the banner. A *Special Technical Support (STS) firmware installed* warning is displayed.

To view an STS build in the CLI:

1. Log in to the CLI. The console prints the following warning message:

```
Login: admin
Password
******WARNING: This is a Special Technical Support (STS) firmware.******
STS firmware is issued by Fortinet to select customers in order to provide features and fixes
that are not yet generally available. Plesae use caution when running STS firmware in
production and consult with authorized Fortinet support personnel regarding configuration
changes, fabric integration, and firmware upgrades.

Welcome!
```

2. Get the system status.
   In this example, the STS build is identified by (STS) and a certified firmware signature.

```
# get system status
Version: FortiGate-201F v7.4.1,build4295,230817 (STS)
Security Level: 2
```

```
Firmware Signature: certified
...
```

Selected availability (SA) versions

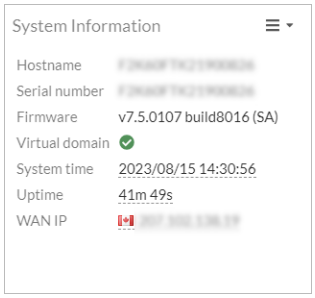
A selected availability (SA) version and label identifies special builds that are provided to customers to use for a long time. The SA version uses an odd number as the minor version and a four digit number for the patch version. The SA version and label are visible in the GUI and CLI.

SA builds are dual-signed by the Fortinet CA and a third-party CA.

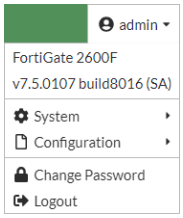
In the following example, special build 0107 is based on FortiOS 7.4.0 build 8016 and is labeled *v7.5.0107 build8016 (SA)*.

To view the SA version and label in the GUI:

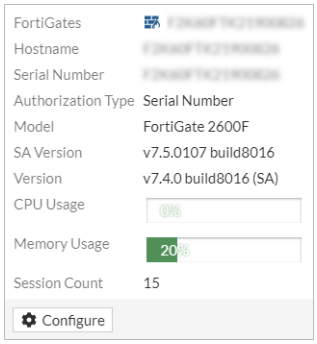
1. Go to *Dashboard* > *Status* > *System Information*. The *Firmware* option displays the SA version and label of *v7.5.0107 build8016 (SA)*.



2. On the top-right of the banner, click *<administrator name>*, such as *admin*. The SA version and label is displayed.



3. On the top-left corner of the banner, click the FortiGate name. A tooltip displays the SA version and label.



To view the SA version and label in the CLI:

```
# get system  status
Version: FortiGate-2600F v7.4.0,build8016,230711 (SA)
SA Version: v7.5.0107,build8016
Security Level: 0
Firmware Signature: certified
...
```

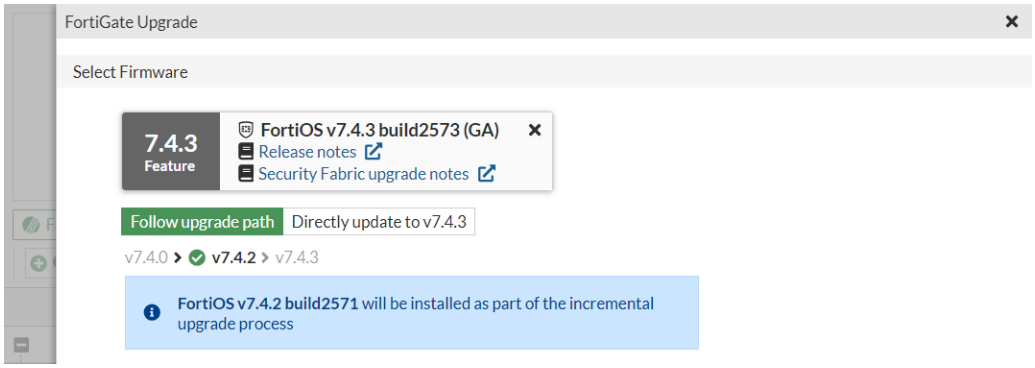
The `SA Version` is displayed as `v7.5.0107, build8016`.

Upgrading individual devices

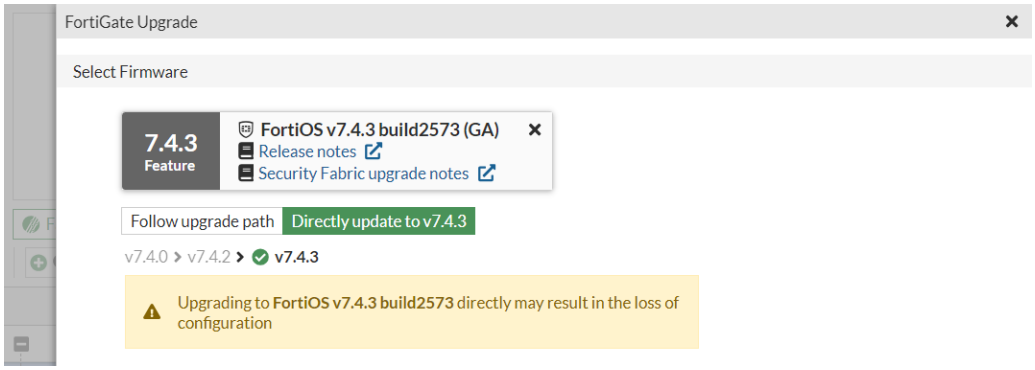
On the *System* > *Fabric Management* page, use the *Upgrade* button to upgrade firmware for an individual device. The upgrade is performed immediately.

When the upgrade requires multiple builds in the upgrade path, you can choose to follow the upgrade path or to upgrade directly from the current version to the selected version.

When you follow the upgrade path, FortiGate automatically completes the upgrades, including any required reboots, by downloading the chosen firmware directly from FortiGuard. In this example, FortiGate automatically upgrades to each firmware in the upgrade path, which is 7.4.2 and then 7.4.3.



When you choose to skip the upgrade path and directly upgrade to a firmware available on FortiGuard, a message is displayed.



If you are moving from a mature to a feature firmware release, a warning displays. See Firmware maturity levels on page 3056.

To upgrade individual device firmware in the GUI:

1. Log into the FortiGate GUI as an administrative user.
2. Go to *System > Firmware & Registration*.
   The *Firmware Version* column displays the version and either *(Feature)* or *(Mature)*.
3. Select the FortiGate, and click *Upgrade*. The *FortiGate Upgrade* pane opens, and the following tabs are available:

Latest	Displays the latest, available firmware from FortiGuard. When FortiGate is running the latest firmware from FortiGuard, the following message is displayed: *The firmware is up to date*.
All Upgrades	Displays all available firmware from FortiGuard. When FortiGate is running the latest firmware from FortiGuard, the following message is displayed: *No upgrades available*.
File Upload	Click the *File Upload* tab to upload a firmware file that you previously downloaded from the Fortinet Customer Service & Support website. See Downloading a firmware image on page 3082.

4. Select a firmware version:
   a. From the *Latest* or *All Upgrades* tab, select a firmware version.
   a. If the selected firmware version spans multiple builds in the upgrade path, choose one of the following options:

Follow upgrade path	Automatically upgrade FortiGate to each firmware in the upgrade path before upgrade to the selected version. Recommended.
Directly update to v<version and build number>	Bypass the upgrade path to immediately upgrade FortiGate to the selected firmware. A warning message is displayed: *Upgrading to FortiOS v<version and build number> directly may result in the loss of configuration*.

   When upgrading from mature firmware to feature firmware, a warning message appears about the maturity level of the selected firmware for the upgrade.
5. Click *Confirm and Backup Config*.
   If you are upgrading from a mature to a feature firmware version, the *Confirm* pane opens with a warning message. Click *Confirm* to proceed.
   A warning displays: *Upgrading the firmware will cause the system to reboot. Are you sure you want to continue?*
6. Click *Continue* to initiate the upgrade.
   The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, upgrades to the new firmware version, and restarts. This process takes a few minutes.

To upgrade individual device firmware in the CLI:

1. Make sure that the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log in to the CLI.

4. Ping the TFTP server to ensure that the FortiGate can connect to it:
   ```
   execute ping <tftp_ipv4>
   ```
5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:
   ```
   execute restore image tftp <filename> <tftp_ipv4>
   ```
   The FortiGate unit responds with the message:
   ```
   This operation will replace the current firmware version!
   Do you want to continue? (y/n)
   ```
6. Type y. The FortiGate unit uploads the firmware image file, verifies the signature of the firmware image, and determines the firmware maturity level.
   When you are upgrading to a feature firmware image, you are asked to confirm whether to continue with the upgrade.
   When you proceed with the upgrade, the upgrade image is installed and FortiGate restarts. This process takes a few minutes.

   ```
   Please wait...
   Connect to tftp server 172.16.200.55 ...
   ##################################################################################
   Get image from tftp server OK.
   Verifying the signature of the firmware image.

   Warning: Upgrading to an image with Feature maturity notation.
   Image file uploaded is marked as a Feature image, are you sure you want to upgrade?
   Do you want to continue? (y/n)y
   Please confirm again. Are you sure you want to upgrade using uploaded file?
   Do you want to continue? (y/n)y
   Checking new firmware integrity ... pass
   Please wait for system to restart.
   Firmware upgrade in progress ...
   Done.
   The system is going down NOW !!
   ```
7. Reconnect to the CLI.
8. Update the antivirus and attack definitions:
   ```
   execute update-now
   ```

Upgrading Fabric or managed devices

On the *System > Fabric Management* page, use the *Fabric Upgrade* button to select a firmware version from FortiGuard for the FortiGate:

- When FortiGate is part of a Security Fabric, the selected target firmware is for the root FortiGate as well as all Fabric devices.
- When the device is a non-Security Fabric FortiGate with managed devices, the selected target firmware version is used to automatically upgrade firmware for all managed devices, such as FortiAP and FortiSwitch devices.

Fabric members or managed devices download the chosen firmware directly from FortiGuard.

When the upgrade requires multiple builds in the upgrade path, you can choose to follow the upgrade path or to upgrade directly from the current version to the selected version.

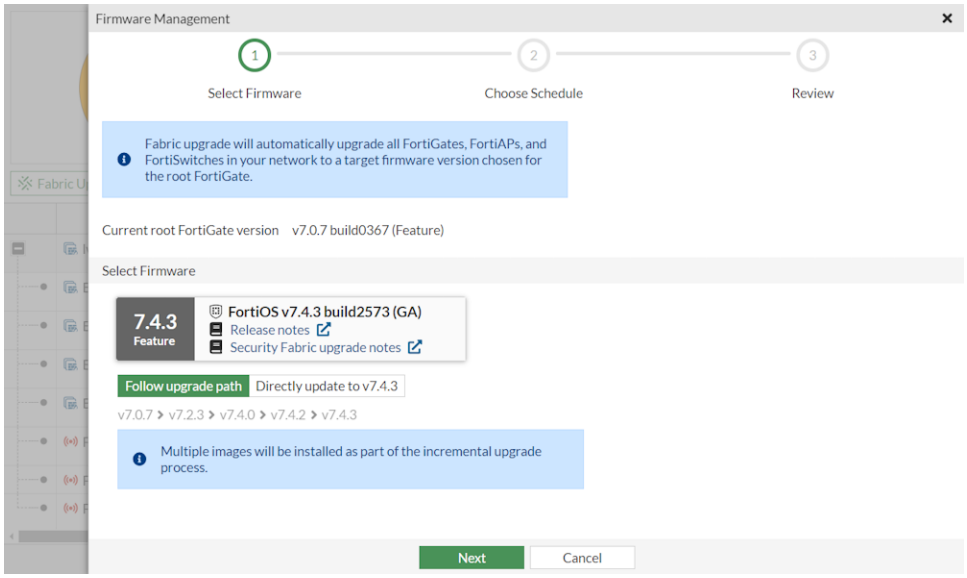
When you follow the upgrade path, FortiGate automatically completes the upgrades for the Security Fabric or for the managed devices, including any required reboots. For managed devices, FortiGate upgrades devices by groups in the following order:

1. PoE PD (Power over Ethernet Powered Devices)
2. PoE PSE (Power Source Equipment) and non-PoE devices
3. FortiGate itself

Group 2 (PoE PSE and non-POE devices) waits until group 1 (PoE PD) finishes upgrading to new firmware before starting its upgrade.

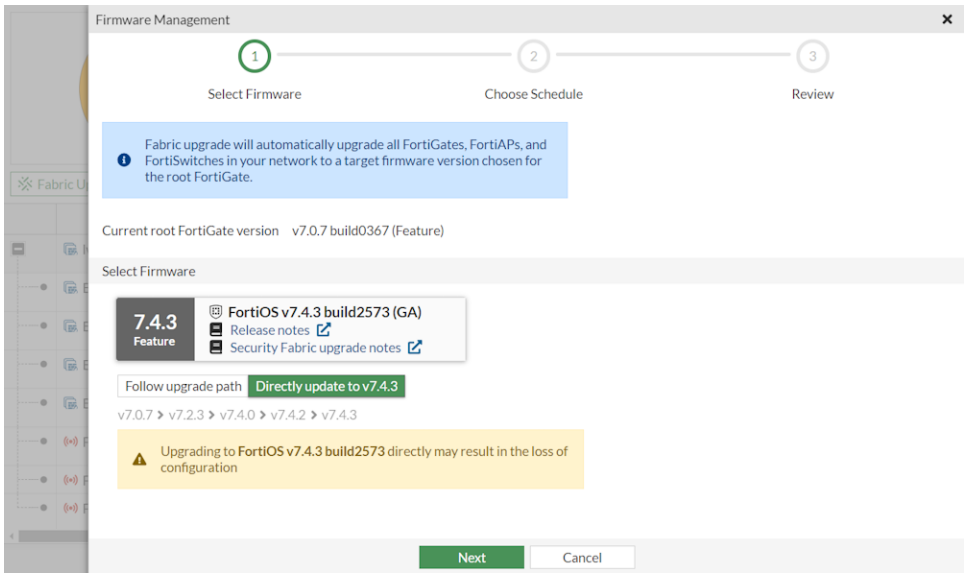
Once all upgrades are complete, and the FortiGate is back up, it verifies that all devices are using the new firmware version before labeling the upgrade as done.

This coordinated process is sometimes called a *federated update*. In this example, the devices automatically upgrade to each firmware in the upgrade path, which is 7.0.7, 7.2.3, 7.4.0, 7.4.2, and then 7.4.3.



On managed FortiAP and FortiSwitch devices, the federated upgrade adheres to the respective compatibility matrix information maintained on the FortiGuard Distribution Network (FDN).

When you choose to skip the upgrade path and directly upgrade to the selected firmware, a message is displayed.



A *Fabric Upgrade* can be performed immediately or during a scheduled time.

If you are moving from a mature to a feature firmware release, a warning displays. See Firmware maturity levels on page 3056.

The following options are available in `execute federated-upgrade <option>`:

Option	Description
`cancel`	Cancel the currently configured upgrade.
`initialize`	Set up a federated upgrade.
`status`	Show the current status of a federated upgrade.
`restart`	Restart the currently configured federated upgrade.

The `config system federated-upgrade` command is read-only. Attempting to configure federated upgrade using the `config` command will show the following error message:

```
Federated upgrade cannot be configured directly.
Please use 'execute federated-upgrade ...' to configure.
```

To upgrade Fabric or managed devices:

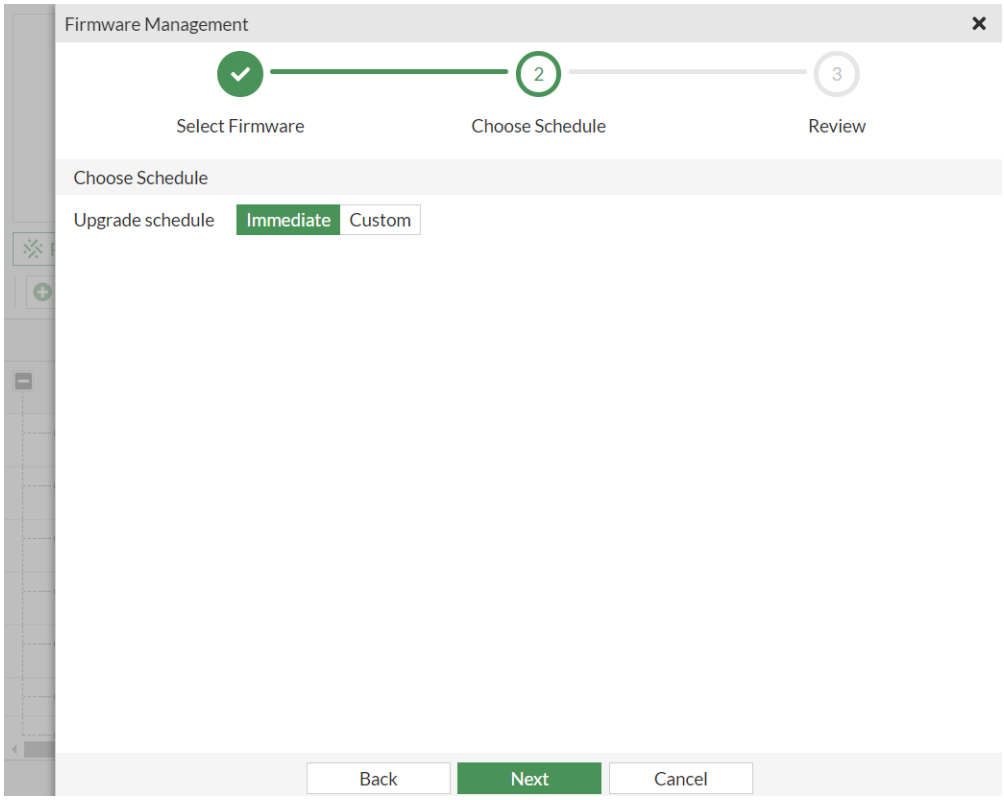
1. Log in to the FortiGate GUI as an administrative user.
   When you are upgrading the Security Fabric, you must log in to the root FortiGate.
2. Go to *System* > *Firmware & Registration* and click *Fabric Upgrade*. The *Fabric Upgrade* pane opens, and the following tabs are available:

Latest	Displays the latest, available firmware from FortiGuard.
All Upgrades	Displays all available firmware from FortiGuard.

3. Select a firmware version:
   a. From the *Latest* or *All Upgrades* tabs, select a firmware version.
   b. If the selected firmware version spans multiple builds in the upgrade path, choose one of the following options:

Follow upgrade path	Automatically upgrade devices to each firmware in the upgrade path before upgrade to the selected version. Recommended.
Directly update to v<version and build number>	Bypass the upgrade path to immediately upgrade devices to the selected firmware. A warning message is displayed: *Upgrading to FortiOS v<version and build number> directly may result in the loss of configuration*.

   When upgrading from mature firmware to feature firmware, a warning message appears about the maturity level of the selected firmware for the upgrade.
   c. Click *Next*.
   If you are upgrading from a mature to a feature firmware version, the *Confirm* pane opens with a warning message. Click *Confirm* to proceed to the *Choose Schedule* options.
   The *Choose Schedule* options are displayed.



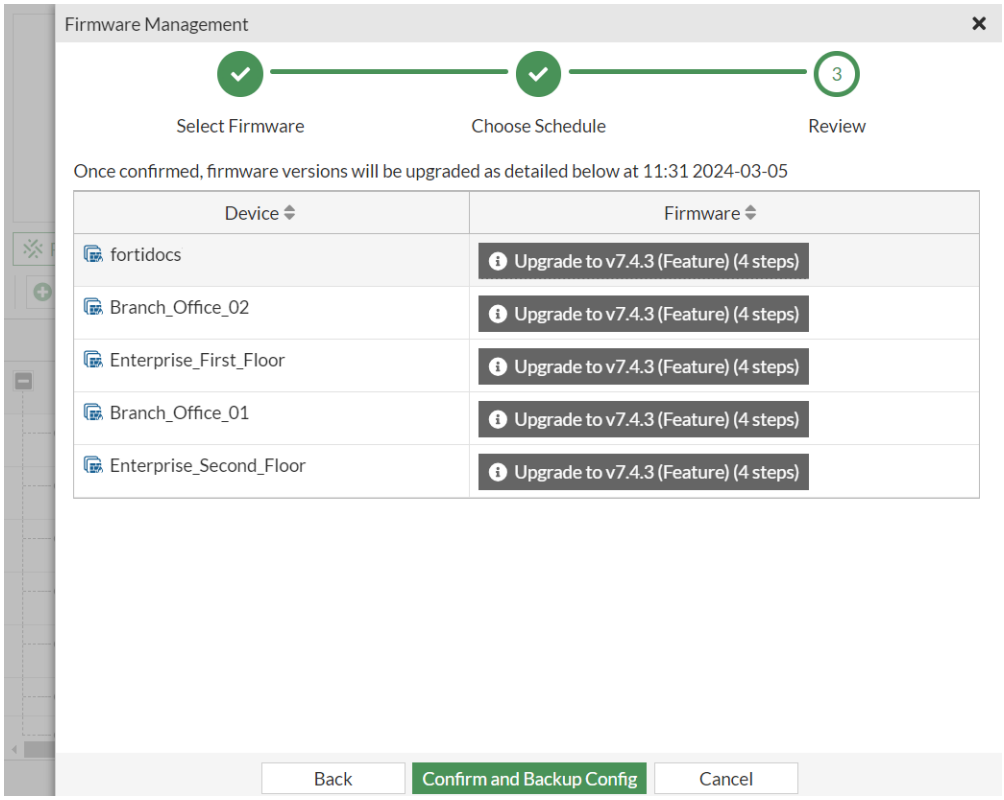
4. Choose when to start the upgrade process.

a. Set *Upgrade schedule* to *Immediate* or *Custom*:

Immediate	Select to start the upgrade process immediately.
Custom	Select to display the *Upgrade date and time* options to schedule when to start the upgrade process.

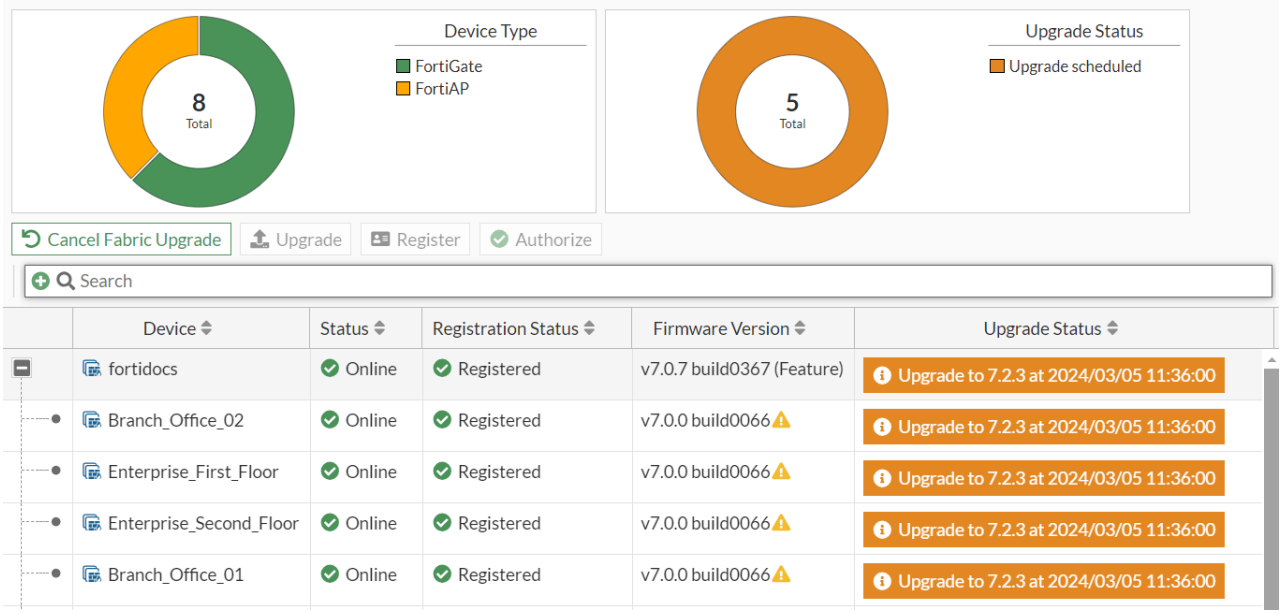
In a custom upgrade, the configuration backups are saved when the administrator schedules the upgrade. If the scheduled upgrade occurs after further configuration changes are made, the latest changes will not be saved in a new backup configuration file.

b. Click *Next*. The *Review* pane is displayed.



5. Review the firmware updates, and click *Confirm and Backup Config* to initiate the upgrade process.

The pane enters a loading state to wait for all FortiGate configurations to save. Once completed, the pane closes and the device list refreshes to reflect the latest changes. In this example, the next step is to start the first step in the upgrade path on a schedule.



The *Cancel Fabric Upgrade* button is also displayed if you want to cancel the upgrade.

Enabling automatic firmware upgrades

Automatic firmware upgrades are enabled by default on all FortiGate models, including FortiGate VMs, for increased device security. The FortiGate automatically upgrades when a new FortiOS patch release is available.

Automatic firmware upgrades can be configured from the *FortiGate Setup* wizard, the *System > Firmware & Registration* pane, or in the CLI with the following commands:

```
config system fortiguard
    set auto-firmware-upgrade {enable | disable}
    set auto-firmware-upgrade-day {sunday monday tuesday wednesday thursday friday saturday}
    set auto-firmware-upgrade-delay <integer>
    set auto-firmware-upgrade-start-hour <integer>
    set auto-firmware-upgrade-end-hour <integer>
end
```

`auto-firmware-upgrade {enable | disable}`	Enable/disable automatic patch-level firmware upgrades from FortiGuard.
`auto-firmware-upgrade-day {sunday monday tuesday wednesday thursday friday saturday}`	Enter the allowed day or days of the week to start the automatic patch-level firmware upgrade from FortiGuard.
`auto-firmware-upgrade-delay <integer>`	Enter the number of days to wait before automatically installing the automatic patch-level firmware upgrade from FortiGuard (default = 3).

`auto-firmware-upgrade-start-hour <integer>`	Set the start time of the designated time window for the automatic patch-level firmware upgrade from FortiGuard (in hours, 0 - 23, default = 2). The actual upgrade time is randomly selected in the time window. See Reviewing upgrade status on page 3071 for more information on confirming the scheduled upgrade time.
`auto-firmware-upgrade-end-hour <integer>`	Set the end time of the designated time window for the automatic patch-level firmware upgrade from FortiGuard (in hours, 0 - 23, default = 4). When this value it is smaller than the start time, it will be treated as the same time in the next day. The actual upgrade time is randomly selected in the time window. See Reviewing upgrade status on page 3071 for more information on confirming the scheduled upgrade time.

The `auto-firmware-upgrade-delay` and `auto-firmware-upgrade-day` commands are mutually exclusive. The `auto-firmware-upgrade-delay` command overrides the `auto-firmware-upgrade-day` command. Disable `auto-firmware-upgrade-delay` by setting it to zero if you would rather use the `auto-firmware-upgrade-day` command to select a day of the week for automatic installation, regardless of when the patch release is detected.

When enabled, FortiGates use the FortiGuard upgrade path to check FortiGuard for firmware updates within the same minor release. Checks are performed within a specified time period. When a new patch release is available, a firmware upgrade is scheduled.

After the patch release is successfully installed, an email is sent to the FortiCloud account that the FortiGate is registered to.

- Automatic firmware upgrades cannot be enabled for FortiGates that are part of a Security Fabric, managed by FortiManager, or serving as a secondary unit in a high availability (HA) pair. However, HA groups will still receive automatic firmware upgrades through the primary FortiGate. In such cases, the enforced upgrade proceeds as intended on the primary unit, while the secondary FortiGate receives the upgrade through a cluster upgrade initiated by the primary, since automatic upgrades are disabled on secondary units.
- Automatic upgrades will only upgrade to a newer patch within that minor version. For example, a FortiOS version 7.2.x image will only auto-upgrade to another 7.2.x image. It will not upgrade to a 7.4.x image.

For information on special considerations when upgrading with an invalid FMWR license or a FortiGate at End of Support, see Automatic firmware upgrades for FortiGate appliances with invalid support contracts or that have reached EOES on page 3074.

For FortiGates managed by FortiGate Cloud, automatic firmware patch may be enabled depending on the FortiGate Cloud version and portal in use. See the Administration Guide for the applicable FortiGate Cloud version and portal:

- Standard Portal Administration Guide
- 25.1.a Portal (Beta) Administration Guide
- Premium Portal Administration Guide

Reviewing upgrade status

The following commands can be used to review the status of the automatic upgrade.

The `diagnose test application forticldd 13` command lists when the most recent firmware image upgrade check occurred as well as when the next check is scheduled.

If the FortiGate is part of a Fabric or managed by FortiManager, the `Automatic image upgrade` option will be set to `disabled`.

```
# diagnose test application forticldd 13
...
Automatic image upgrade: disabled.
```

If a newer, valid firmware patch is detected, the `show sys federated-upgrade` command will list when the firmware upgrade will occur. The firmware upgrade schedule will depend on the configured automatic upgrade settings. If the settings are changed before the upgrade occurs, the image installation will be rescheduled to respect the new requirements.

The `show sys federated-upgrade` command also lists previous firmware upgrades.

The following debug commands are available for troubleshooting:

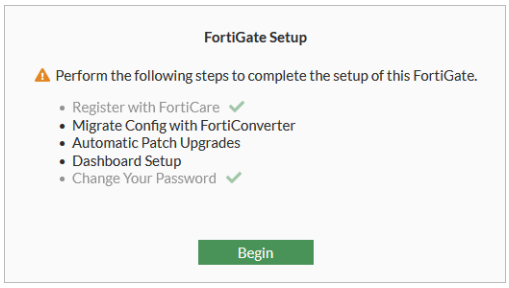
```
# diagnose debug en
# diagnose debug application forticldd -1
# diagnose debug application sfupgraded -1
```

Example

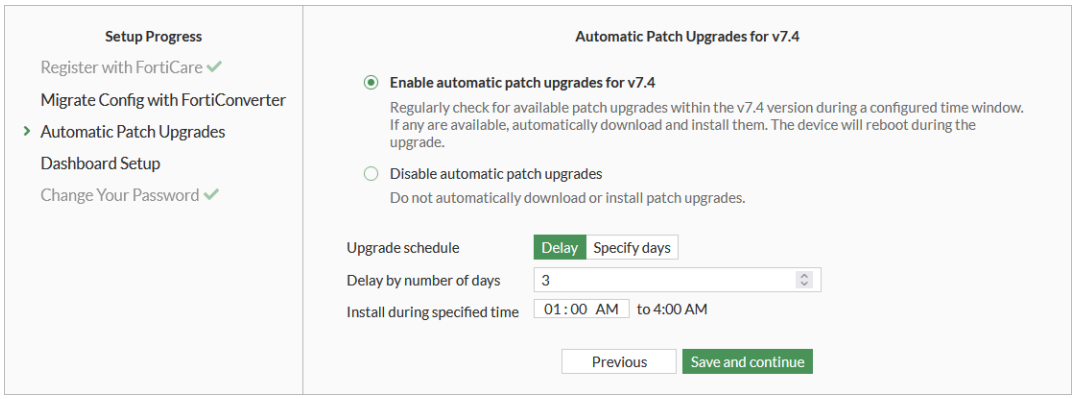
The following example demonstrates setting automatic firmware upgrades after a delay of three days.

To configure automatic firmware upgrades in the GUI:

1. Log in to the FortiGate GUI and click *Begin*.

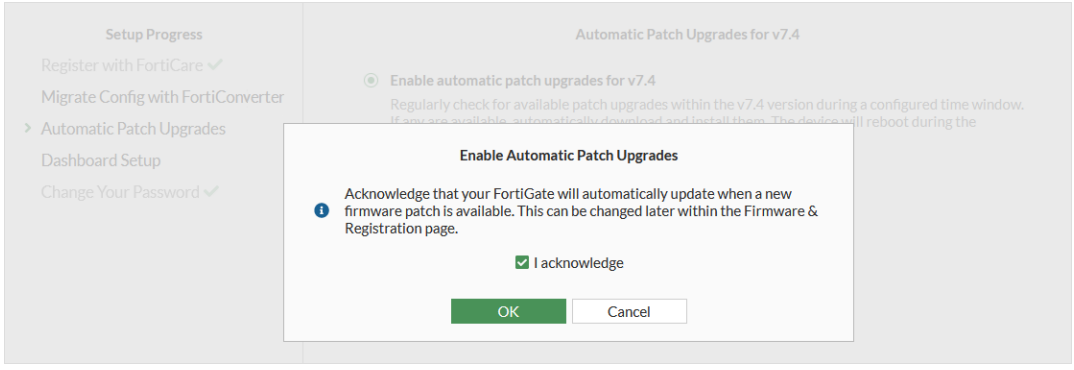


2. Select *Enable automatic patch upgrades for v7.4* (default setting).
3. Edit the upgrade and installation settings as needed (*Upgrade schedule*, *Delay by number of days*, *Install during specified time*), then click *Save and continue*.



If *Disable automatic patch upgrades* is selected, this can be changed later from the *System > Firmware & Registration* page by clicking the *Automatic patch upgrades disabled* notification.

4. The *Enable Automatic Patch Upgrades* dialog opens. Select *I acknowledge* and click *OK* to proceed.



The FortiGate will be updated based on the configured schedule when a new patch is available.

5. An email is sent to alert the administrator that the firmware upgrade schedule has changed.

Sample email after configuring automatic firmware upgrades:

```
From: DoNotReply@fortinet-notifications.com <DoNotReply@fortinet-notifications.com>
Sent: Tuesday, July 25, 2023 11:08 AM
To: ********** <*****@fortinet.com>
Subject: Automatic firmware upgrade schedule changed

date=2023-07-25 time=11:07:34 devid="FG81EPTK19000000" devname="FortiGate-81E-POE"
eventtime=1690308454221334719 tz="-0700" logid="0100032263" type="event" subtype="system"
level="notice" vd="root" logdesc="Automatic firmware upgrade schedule changed" user="system"
msg="System patch-level auto-upgrade regular check enabled."
```

6. Once a patch is detected, an email is sent to alert the administrator that a new image installation is scheduled.

   Sample email after a new image installation is scheduled:

```

Subject: A federated upgrade was completed by the root FortiGate

date=2023-07-22 time=14:00:09 devid="FG81EPTK19000000" devname="FortiGate-81E-POE"
eventtime=1689973183346851869 tz="-0700" logid="0100022094" type="event" subtype="system"
level="information" vd="root" logdesc="A federated upgrade was completed by the root
FortiGate" msg="Federated upgrade complete" version="7.4.2"
```

To configure automatic firmware upgrades in the CLI:

1. Configure the automatic firmware upgrade schedule:

```
config system fortiguard
    set auto-firmware-upgrade enable
    set auto-firmware-upgrade-delay 3
    set auto-firmware-upgrade-start-hour 2
    set auto-firmware-upgrade-end-hour 4
end
```

   The FortiGate will perform a check between the start and end hours set for the firmware upgrade to review if there is an upgrade available.

2. Review the firmware upgrade check schedule:

```
# diagnose test application forticldd 13
Scheduled push image upgrade: no
Scheduled Config Restore: no
Scheduled Script Restore: no
Automatic image upgrade: Enabled.
        Next upgrade check scheduled at (local time) Thu Mar 29 03:10:56 2023
```

When an available patch upgrade is detected, the automatic firmware update will be scheduled based on the set upgrade delay.

Sample event log after a new patch upgrade is detected:

```
date=2023-03-29 time=03:10:56 eventtime=1679336380720695924 tz="-0700"
logid="0100032263" type="event" subtype="system" level="notice" vd="vdom1"
logdesc="Automatic firmware upgrade schedule changed" user="system"
msg="System patch-level auto-upgrade new image installation scheduled
     between local time Sat Apr 01 03:10:56 2023 and local time Sat Apr 01 04:00:00 2023."
```

3. Review the installation window of the new patch release:

```
# diagnose test application forticldd 13
Scheduled push image upgrade: no
Scheduled Config Restore: no
Scheduled Script Restore: no
Automatic image upgrade: Enabled.
        Next upgrade check scheduled at (local time) Mon Mar 30 03:10:56 2023
        New image 7.4.1b2305(07004000FIMG0021204001) installation is scheduled to
                start at Sat Apr 01 03:10:56:21 2023
                end by Sat Apr 01 04:00:00 2023
```

Once the firmware patch is successfully installed, an event log is created to track the change and an email is sent to the FortiCloud account under which the FortiGate is registered.

Sample event log after successfully updating firmware:

```
date=2023-04-01 time=03:13:04 devid="FG3H1E5819904039" devname="D"
eventtime=1679590383750408029 tz="-0700"
logid="0100022094" type="event" subtype="system" level="information" vd="vdom1"
logdesc="A federated upgrade was completed by the root FortiGate"
msg="Federated upgrade complete" version="7.4.1"
```

Automatic firmware upgrades for FortiGate appliances with invalid support contracts or that have reached EOES

To enhance security and reduce vulnerabilities, FortiGates that are no longer under a valid Firmware & General Updates (FMWR) license or that have reached End of Engineering Support (EOES) will automatically upgrade to the latest patch within their current minor version. This proactive measure ensures that all devices remain protected with the most up-to-date security features.

The FortiGate checks for a new patch upgrade on FortiGuard daily. If a new patch is discovered and the firmware license is invalid or the FortiGate has reached EOES, it will schedule an upgrade to the new firmware image. While this enforced compliance upgrade cannot be canceled, the installation schedule can be adjusted in two ways:

- Modify the upgrade schedule using the `config system fortiguard auto-firmware-upgrade-day` or `auto-firmware-upgrade-delay` commands. This allows rescheduling multiple times within a 14-day window after the new patch is detected. See Enabling automatic firmware upgrades for more information.
- Use the `execute auto-upgrade delay-installation` command to postpone the installation for a fixed 7-day period.

The firmware will upgrade to the latest patch in its current minor version. For example, if the current version is FortiOS 7.4.8, the firmware will automatically upgrade to the latest 7.4.x version. It will not upgrade to another minor version, such as 7.6.x.

Example

The following example demonstrates the process of an automatic firmware upgrade from 7.4.8 to 7.4.9 when the current license is found to be invalid. It would also apply if the firmware had passed its EOES date.

At the time that this example was created, FortiOS 7.4.9 was the latest GA build for the 7.4 minor version. If a higher patch is available for this minor version, such as 7.4.10 or later, the firmware would be updated to that version instead.

To review the automatic firmware update:

1. The FortiGate will check the license status and for new firmware images daily:
   a. Review the configured firmware check schedule:

```
# show full system fortiguard
set auto-firmware-upgrade-start-hour 1
set auto-firmware-upgrade-end-hour 4
```

   b. Determine when the next firmware check will occur:

```
# diagnose test application forticldd 13
Scheduled push image upgrade: no
Scheduled Config Restore: no
Scheduled Script Restore: no
Automatic image upgrade: Enabled.
        New image information may be fetched.
        Next new image info fetch scheduled at (local time) Mon Oct 20 01:04:11 2025
        New image installation may be cancelled by the user.
        Last new image info fetch executed at (local time) Sun Oct 19 01:34:44 2025
```

2. The FortiGate determines that the license has expired and that a new firmware image is available for a later patch of the current minor version:
   a. Review the status of the firmware license:

```
# diagnose test update info
...
```

```
System contracts:
    FMWR,Fri Jan  2 2009
```

The license has expired.

b. Review the current firmware image version:

```
# get system status | grep Version
Version: FortiGate-40F v7.4.8,build2702,250513 (GA.M)
```

c. Check if there is a new firmware image available:

```
# diagnose fdsm image-list
...
07004000FIMGXXXXXXXX  v7.4 MR4-GA-M P9 b2829 (upgrade)
```

d. The FortiGate will determine if an automatic upgrade is needed.

```
# diagnose debug application forticldd -1
...
2025-10-21 08:37:20 [206] fmwr_contract_expired: Contract expired!
2025-10-21 08:37:20 [1705] auto_upg_img_check: News from FGT: FMWR contract expired? 1
2025-10-21 08:37:20 [1706] auto_upg_img_check: News: Should we force it? 1
```

In this instance, 1 represents an affirmative to the posed questions, so the automatic firmware upgrade should occur due to the expired license. Once the upgrade has been scheduled, it cannot be canceled.

If you were reviewing the procedure for automatically upgrading the firmware when the FortiGate has reached EOES, the debug will display as follows:

```
# diagnose debug app forticloudd -1
....
[1704] auto_upg_img_check: News from FDS: EOL reached? 1
[1706] auto_upg_img_check: News: Should we force it? 1
```

3. The FortiGate schedules the firmware upgrade based on the defined FortiGuard system configurations.

```
# diagnose test application forticldd 13
Scheduled push image upgrade: no
Scheduled Config Restore: no
Scheduled Script Restore: no
Automatic image upgrade: Enabled (Forced).
        New image information may be fetched.
        Next new image info fetch scheduled at (local time) Tue Oct 28 11:21:40 2025
        New image installation will be forced.
        New image 7.4.9b2829(XXXXXXXX) installation is scheduled to:
                start at Thu Oct 30 11:28:44 2025
                end by Thu Oct 30 12:00:00 2025
        Last new image info fetch executed at (local time) Mon Oct 27 11:45:18 2025
```

The schedule defined by the FortiGuard system configurations can be a day set numerically using `auto-firmware-upgrade` or on any specific days for Monday to Sunday using `auto-firmware-day`. These settings are mutually exclusive. See Enabling automatic firmware upgrades on page 3069 for more information.

4. Postpone the firmware installation by one week:

```
# execute auto-upgrade delay-installation
Postponing auto-upgrade image installation to a week later...
Auto-upgrade image installation rescheduled to: start at local time Thu Nov  6 11:29:55 2025
        end by local time Thu Nov  6 12:00:00 2025
```

5. Review the new installation time:

```
# diagnose test application forticldd 13
Scheduled push image upgrade: no
Scheduled Config Restore: no
Scheduled Script Restore: no
Automatic image upgrade: Enabled (Forced).
        New image information may be fetched.
        Next new image info fetch scheduled at (local time) Tue Oct 28 11:21:40 2025
        New image installation will be forced.
        New image 7.4.9b2829(XXXXXXXX) installation is scheduled to:
                start at Thu Nov  6 11:29:55 2025
                end by Thu Nov  6 12:00:00 2025
        Last new image info fetch executed at (local time) Mon Oct 27 11:45:18 2025
```

6. Attempt to cancel the scheduled upgrade:

```
# execute federated-upgrade cancel
The existing upgrades cannot be cancelled.
Command fail. Return code 1
```

The upgrade cannot be canceled once it has been scheduled.

7. During the scheduled upgrade window, the FortiGate will upgrade the firmware.
The `federated-upgrade` configuration will update for the automatic firmware upgrade.

```
config system federated-upgrade
    set status initialized
    set source forced-upgrade
    set upgrade-id 1
    set ha-reboot-controller "FGT40FXXXXXXXX"
    config node-list
        edit "FGT40FXXXXXXXX"
            set timing immediate
            set maximum-minutes 45
            set setup-time 07:14 2025/10/16 UTC
            set upgrade-path 7-4-7
        next
    end
end
```

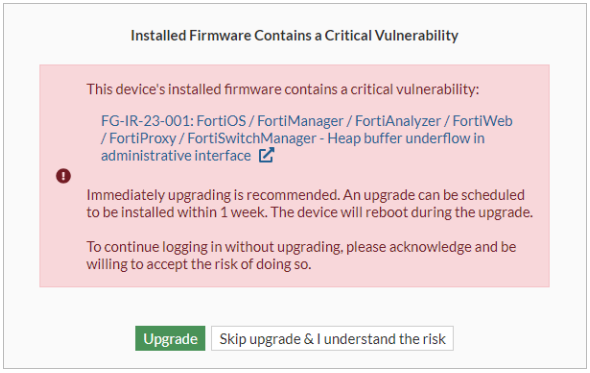
Special considerations

The status of the FortiGate may affect the automatic upgrade as follows:

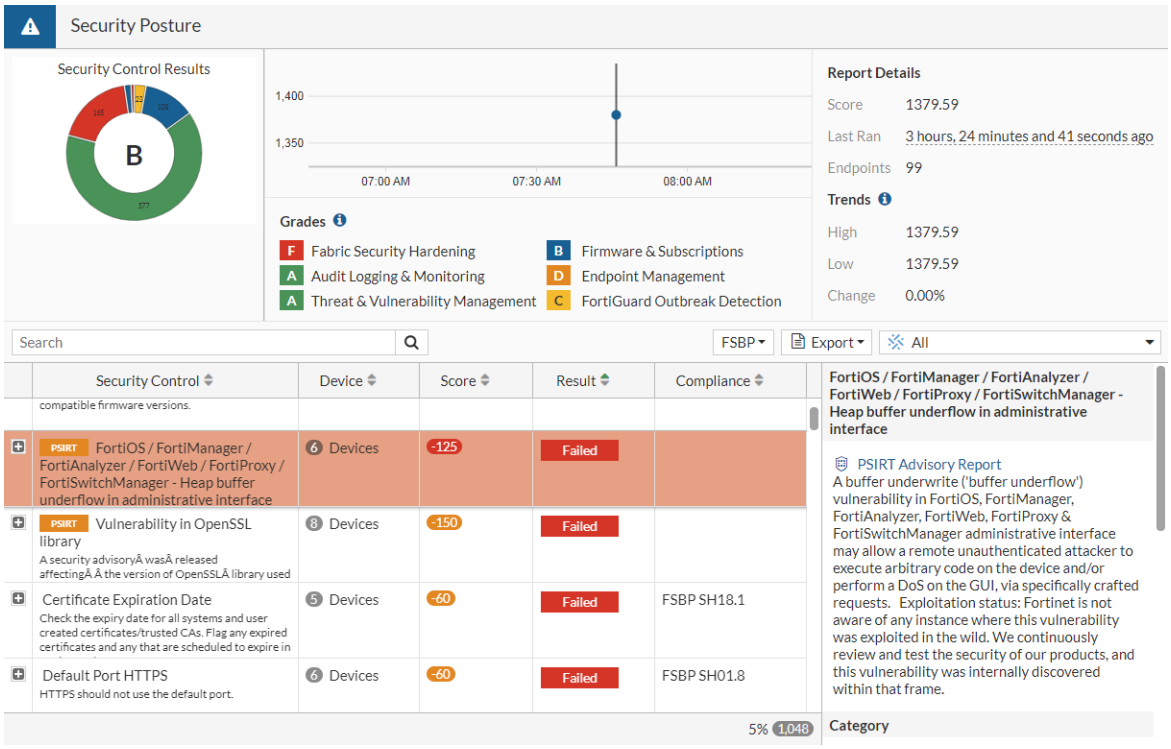
- If the FortiGate is a part of the Security Fabric, it will not automatically upgrade the firmware. Alternatively, if an upgrade is scheduled, the FortiGate will be unable to join a Security Fabric.
- If the FortiGate is connected to a FortiManager, it will not automatically upgrade the firmware. Likewise, if an upgrade is scheduled, the FortiGate will still be able to connect with the FortiManager and the automatic firmware upgrade will be canceled.
- If a FortiGate is part of an HA pair, the enforced, automatic firmware upgrade will proceed as intended for the primary FortiGate. The secondary FortiGate will not perform an enforced, automatic firmware upgrade on its own because the automatic upgrade is disabled on secondary; however, it will receive the upgrade through a cluster upgrade initiated by the primary FortiGate.
- If an automatic firmware upgrade has been scheduled, it will block any new federated upgrades from occurring.

Upgrade prompt when a critical vulnerability is detected upon login

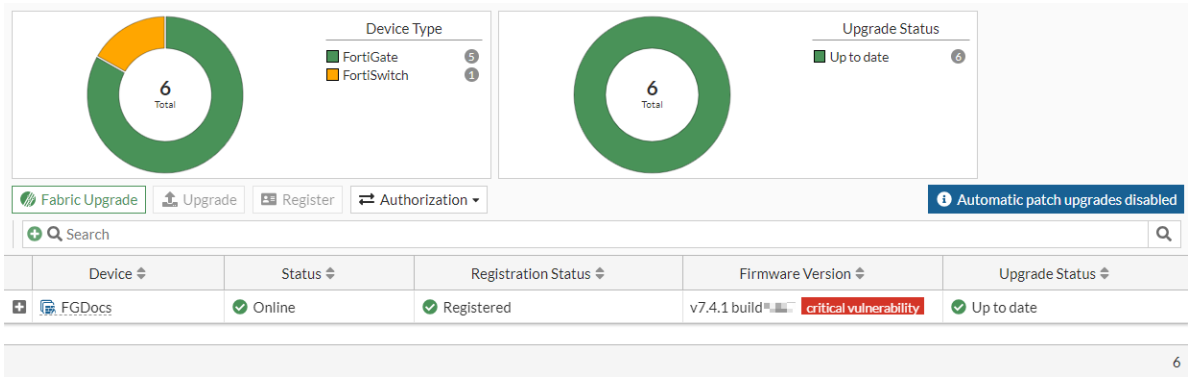
When FortiOS detects a critical vulnerability, an upgrade prompt is shown after logging into the FortiGate. A warning message is displayed in the GUI about the critical vulnerability and allows the administrator to either upgrade or skip it. This ensures that the administrator is aware of any potential security risks and can take immediate action to address them.



Clicking the hyperlinked vulnerability name opens the *Security Fabric > Security Rating* page, which displays more information about the vulnerability. See PSIRT-related notifications on page 3675 for more information.



Clicking the *Upgrade* button opens the *System > Firmware & Registration* page where the administrator can upgrade the device. See Firmware & Registration on page 3053 for more information.



Clicking the *Skip upgrade & I understand the risk* button continues the log in process as usual.

Diagnostics

To view vulnerability results after performing security rating scan:

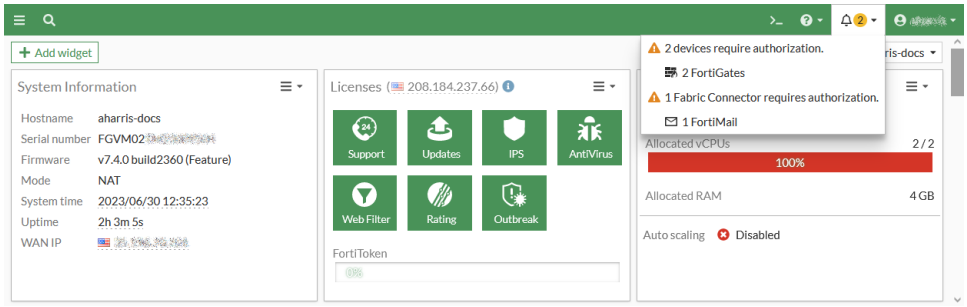
```
# diagnose report-runner vuln-read
Index: 0
Name: FG-IR-23-001: FortiOS / FortiManager / FortiAnalyzer / FortiWeb / FortiProxy /
FortiSwitchManager - Heap buffer underflow in administrative interface
FortiGate Serial: FGVM02TM23000000
```

To clear the vulnerability result:

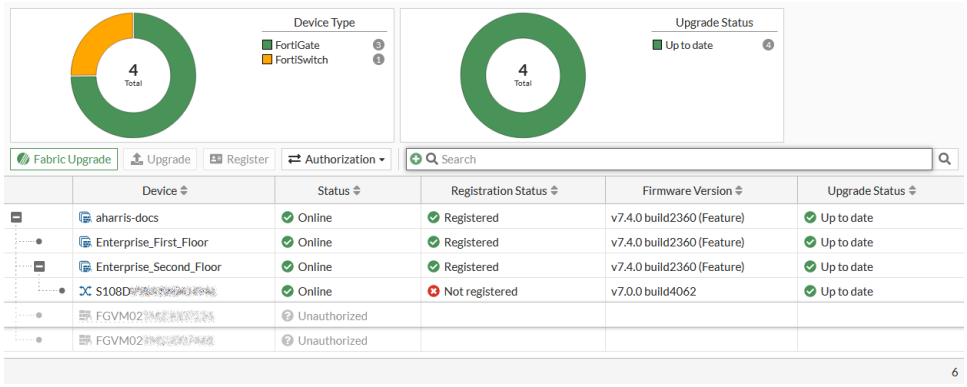
```
# diagnose report-runner vuln-clean
Deleted temporary critical vulnerability file
```

Authorizing devices

If there are any notifications in the top banner dropdown for unauthorized devices or devices that require authorization, clicking the notification redirects the user to the *System > Firmware & Registration* page. In this example, two devices require authorization.



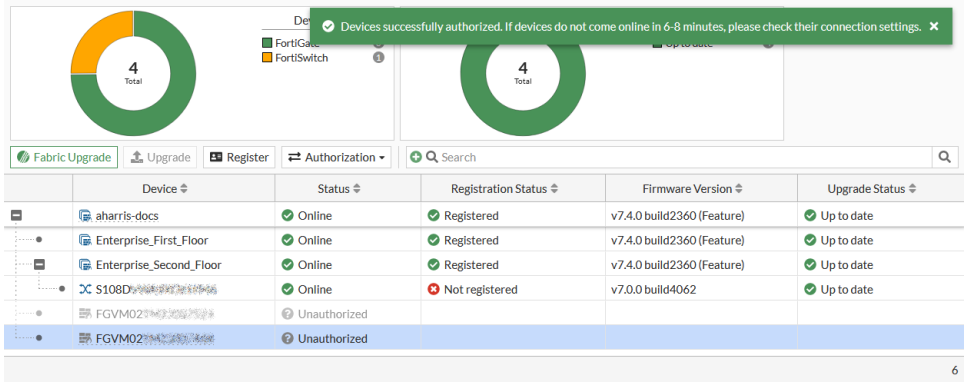
On the *Firmware & Registration* page, the unauthorized devices are grayed out, and their status is *Unauthorized*.



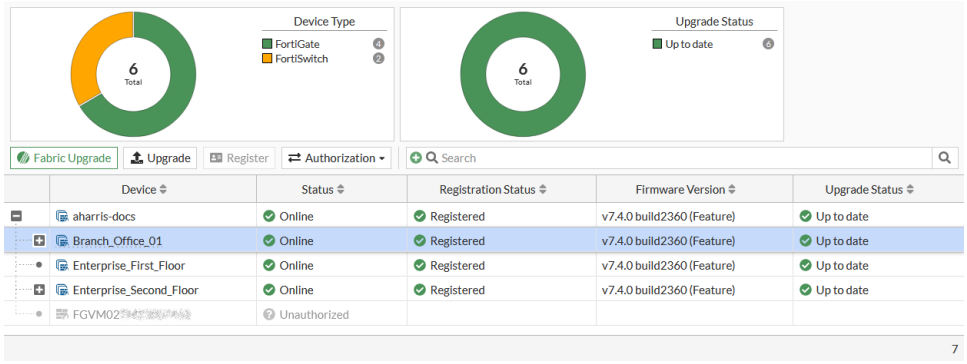
To authorize a Security Fabric device from the Firmware & Registration page:

1. Go to *System > Firmware & Registration*, and select an unauthorized device.
2. Click *Authorization > Authorize* (below the donut charts), or right-click and select *Authorization > Authorize*.

   A notification appears when the device is authorized.

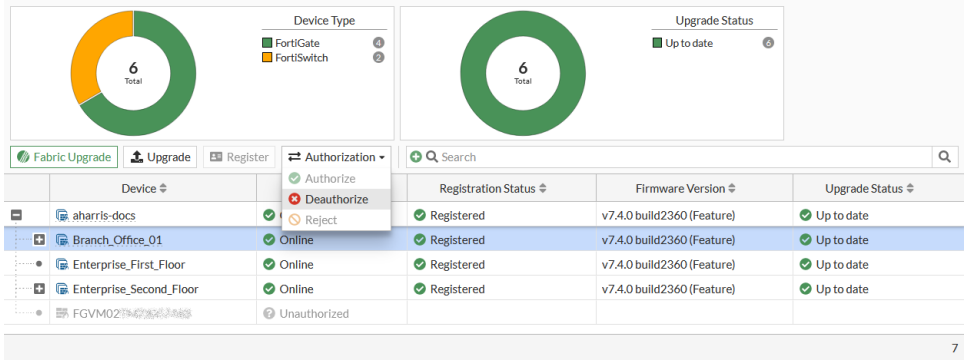


3. Refresh the page. The device's status should now be *Online*.



To deauthorize a Security Fabric device from the Firmware & Registration page:

1. Go to the *System* > *Firmware & Registration* page, and select a device.
2. Click *Authorization* > *Deauthorize*.



3. Refresh the page to see that the device has been deauthorized.

Firmware upgrade notifications

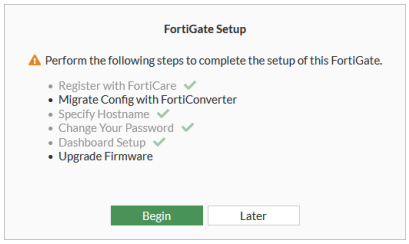
FortiGates with a firmware upgrade license that are connected to FortiGuard display upgrade notifications in the setup window, banner, and FortiGuard menu. The firmware notifications are enabled by default.

To configure firmware notifications in the CLI:

```
config system global
    set gui-firmware-upgrade-warning {enable | disable}
end
```

To use the firmware upgrade notifications in the GUI:

1. When you log in to FortiGate, the *FortiGate Setup* window includes an *Upgrade firmware* step. Click *Begin*.



2. Follow the steps in the *Setup Progress*, then click *Review Firmware Upgrade*.

   The *System* > *Firmware & Registration* page opens.
3. Notifications appear below the *Notification* icon in the banner, and beside *Firmware & Registration* in the tree menu.

Downloading a firmware image

Firmware images for all FortiGate units are available on the Fortinet Customer Service & Support website.

To download firmware:

1. Log into the support site with your user name and password.
2. Go to *Support* > *Firmware Download*.
   A list of Release Notes is shown. If you have not already done so, download and review the Release Notes for the firmware version that you are upgrading your FortiGate unit to.
3. Select the *Download* tab.
4. Navigate to the folder for the firmware version that you are upgrading to.
5. Find your device model on the list. FortiWiFi devices have file names that start with *FWF*.
6. Click *HTTPS* in the far right column to download the firmware image to your computer.

Firmware can also be downloaded using FTP, but as FTP is not an encrypted file transferring protocol, HTTPS downloading is recommended.

Security levels are pre-configured on the BIOS. See BIOS-level signature and file integrity checking on page 3465 and Real-time file system integrity checking on page 3469 for more information.

Testing a firmware version

The integrity of firmware images downloaded from Fortinet's support portal can be verified using a file checksum. A file checksum that does not match the expected value indicates a corrupt file. The corruption could be caused by errors in transfer or by file modification. A list of expected checksum values for each build of released code is available on Fortinet's support portal.

Image integrity is also verified when the FortiGate is booting up. This integrity check is done through a cyclic redundancy check (CRC). If the CRC fails, the FortiGate unit will encounter an error during the boot process.

Firmware images are signed and the signature is attached to the code as it is built. When upgrading an image, the running OS will generate a signature and compare it with the signature attached to the image. If the signatures do not match, the new OS will not load.

Testing before installation

FortiOS lets you test a new firmware image by installing the firmware image from a system reboot and saving it to system memory. After completing this procedure, the FortiGate unit operates using the new firmware image with the current configuration. The new firmware image is not permanently installed. The next time the FortiGate unit restarts, it operates with the originally installed firmware image using the current configuration. If the new firmware image operates successfully, you can install it permanently using the procedure explained in Upgrading individual devices.

For this procedure, you must install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

To test the new firmware version:

1. Connect to the CLI using an RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory on the TFTP server.
4. Ensure that the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Restart the FortiGate unit: `execute reboot`. The following message is shown:
   ```
   This operation will reboot the system!
   Do you want to continue? (y/n)
   ```
6. Type `y`. As the FortiGate unit starts, a series of system startup messages appears.
7. When the following messages appears:
   ```
   Press any key to display configuration menu.........
   ```

Immediately press any key to interrupt the system startup.

You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `execute reboot` command.

If you successfully interrupt the startup process, the following messages appears:

```
[G]: Get firmware image from TFTP server.
[F]: Format boot device.
[B]: Boot with backup firmware and set as default
[C]: Configuration and information
[Q]: Quit menu and continue to boot with default firmware.
[H]: Display this list of options.
Enter G, F, Q, or H:
```

8. Type *G* to get the new firmware image from the TFTP server. The following message appears: `Enter TFTP server address [192.168.1.168]:`
9. Type the address of the TFTP server, then press *Enter*. The following message appears: `Enter Local Address [192.168.1.188]:`
10. Type the IP address of the FortiGate unit to connect to the TFTP server.

The IP address must be on the same network as the TFTP server.

Make sure that you do not enter the IP address of another device on this network.

The following message appears:

```
Enter File Name [image.out]:
```

11. Enter the firmware image file name then press *Enter*. The TFTP server uploads the firmware image file to the FortiGate unit and the following message appears:
    ```
    Save as Default firmware/Backup firmware/Run image without saving: [D/B/R]
    ```
12. Type *R*. The FortiGate image is installed to system memory and the FortiGate unit starts running the new firmware image, but with its current configuration.

Test the new firmware image as required. When done testing, reboot the FortiGate unit, and the it will resume using the firmware that was running before you installed the test firmware.

Installing firmware from system reboot

In the event that the firmware upgrade does not load properly and the FortiGate unit will not boot, or continuously reboots, it is best to perform a fresh install of the firmware from a reboot using the CLI. If configured, the firmware can also be automatically installed from a USB drive; see Restoring from a USB drive on page 3087 for details.

This procedure installs a firmware image and resets the FortiGate unit to factory default settings. You can use this procedure to upgrade to a new firmware version, revert to an older firmware version, or re-install the current firmware.

To use this procedure, you must connect to the CLI using the FortiGate console port and a RJ-45 to USB (or DB-9), or null modem cable. You must also install a TFTP server that you can connect to from the FortiGate internal interface. The TFTP server should be on the same subnet as the internal interface.

Before beginning this procedure, ensure that you backup the FortiGate unit configuration. See Configuration backups and reset on page 3505 for details. If you are reverting to a previous FortiOS version, you might not be able to restore the previous configuration from the backup configuration file.

Installing firmware replaces your current antivirus and attack definitions, along with the definitions included with the firmware release you are installing. After you install new firmware, make sure that antivirus and attack definitions are up to date.

To install firmware from a system reboot:

1. Connect to the CLI using the RJ-45 to USB (or DB-9) or null modem cable.
2. Ensure that the TFTP server is running.
3. Copy the new firmware image file to the root directory of the TFTP server.
4. Ensure that the FortiGate unit can connect to the TFTP server using the `execute ping` command.
5. Restart the FortiGate unit: `execute reboot`. The following message is shown:
   ```
   This operation will reboot the system!
   Do you want to continue? (y/n)
   ```
6. Type `y`. As the FortiGate unit starts, a series of system startup messages appears.
7. When the following messages appears:
   ```
   Press any key to display configuration menu.....
   ```
   Immediately press any key to interrupt the system startup.

   You have only three seconds to press any key. If you do not press a key during this time, the FortiGate will reboot, and you will have to log in and repeat the `execute reboot` command.

   If you successfully interrupt the startup process, the following messages appears:

   ```
   [C]: Configure TFTP parameters.
   [R]: Review TFTP parameters.
   [T]: Initiate TFTP firmware transfer.
   [F]: Format boot device.
   [I]: System information.
   [B]: Boot with backup firmware and set as default.
   [Q]: Quit menu and continue to boot.
   [H]: Display this list of options.

   Enter C,R,T,F,I,B,Q,or H:
   ```
8. If necessary, type `C` to configure the TFTP parameters, then type `Q` to return to the previous menu:

   ```
   [P]: Set firmware download port.
   [D]: Set DHCP mode.
   [I]: Set local IP address.
   [S]: Set local subnet mask.
   [G]: Set local gateway.
   [V]: Set local VLAN ID.
   [T]: Set remote TFTP server IP address.
   [F]: Set firmware file name.
   [E]: Reset TFTP parameters to factory defaults.
   [R]: Review TFTP parameters.
   [N]: Diagnose networking(ping).
   [Q]: Quit this menu.
   [H]: Display this list of options.

   Enter P,D,I,S,G,V,T,F,E,R,N,Q,or H:
   ```

The IP address must be on the same network as the TFTP server.

Make sure that you do not enter the IP address of another device on this network.

9. Type `T` get the new firmware image from the TFTP server.
   The FortiGate unit loads the firmware.
10. Save the firmware as the default (`D`) or backup (`B`) firmware image, or run the image without saving it (`R`).
    The FortiGate unit installs the new firmware image and restarts. The installation might take a few minutes to complete.

Factory resetting the FortiGate when the password is lost

For security reasons, users who lose their password must have physical access to the FortiGate and perform a TFTP restore of the firmware in order to regain access to the FortiGate. They will not have access to the current running configurations through the FortiGate. Configurations will be reset to the factory default once the firmware is reloaded. This process requires a connection to the TFTP server where the firmware image is stored.

To restore the FortiGate:

This procedure may vary depending on whether the FortiGate is a physical appliance or a VM.

1. Connect to the console port.
2. Ensure you can see the FortiGate prompt from the console terminal.
3. Physically power off the device, then power on the device.
4. Boot into the boot menu by pressing a key when prompted.
5. Follow the steps in the previous procedure to reload the firmware. Configurations will be reset to the factory default once the firmware is installed.
6. Once the firmware reload is complete, log in to the FortiGate to reconfigure the settings.

It is recommended to preform regular configuration backups and to store the backup on a secure server (see Configuration changes in the FortiOS Best Practices for more details). In the event that a password is lost, the configuration backup can be used to restore a configuration after the user completes the firmware installation process. This assumes the user knows the password from the previous backed up configuration. If the user does not know the password, they can still reload the configuration if it is not encrypted.

The following procedure describes how to edit an unencrypted backup configuration file so that the administrator password can be replaced before restoring the file.

To edit the configuration file when a password is lost:

1. Locate the line in the configuration file where `config system admin` is defined.
2. Edit an administrator account with an `accprofile` set to `super_admin`. This will ensure you can log in and perform any operations afterward.
3. Locate the line with `set password ENC xxxxxx`, and edit it to set a temporary new password in clear text (such as `set password cleartextpassword`).
4. Reload the configuration file.
5. Log in to the console using the temporary password, and then change the password.

The configuration backup allows the administrator to confirm the firmware that the FortiGate is running, so the same firmware can be restored. This information is listed in the first line of the configuration: `config-version=FGT61F-7.2.4-FW-build1396-230131:opmode=0:vdom=0:user=admin`.

Restoring from a USB drive

The FortiGate firmware can be manually restored from a USB drive, or installed automatically from a USB drive after a reboot.

To restore the firmware from a USB drive:

1. Copy the firmware file to the root directory on the USB drive.
2. Connect the USB drive to the USB port of the FortiGate device.
3. Connect to the FortiGate CLI using the RJ-45 to USB (or DB-9) or null modem cable.
4. Enter the following command:
   ```
   execute restore image usb <filename>
   ```
   The FortiGate unit responds with the following message:
   ```
   This operation will replace the current firmware version! Do you want to continue? (y/n)
   ```
5. Type `y`. The FortiGate unit restores the firmware and restarts. This process takes a few minutes.
6. Update the antivirus and attack definitions:
   ```
   execute update-now
   ```

To install firmware automatically from a USB drive:

1. Go to *System* > *Settings*.
2. In the *Start Up Settings* section, enable *Detect firmware* and enter the name of the firmware file.
3. Copy the firmware file to the root directory on the USB drive.
4. Connect the USB drive to the USB port of the FortiGate device.
5. Reboot the FortiGate device.

Using controlled upgrades

Using a controlled upgrade, you can upload a new version of the FortiOS firmware to a separate partition in the FortiGate memory for later upgrade. The FortiGate unit can be configured so that when it is rebooted, it will automatically load the new firmware. Using this option, you can stage multiple FortiGate units to upgrade simultaneously using FortiManager or a script.

To load the firmware for later installation:

```
execute restore secondary-image {ftp | tftp | usb} <filename_str>
```

To set the FortiGate unit so that when it reboots, the new firmware is loaded:

```
execute set-next-reboot {primary | secondary}
```

where `{primary | secondary}` is the partition with the preloaded firmware.

Downgrading individual device firmware

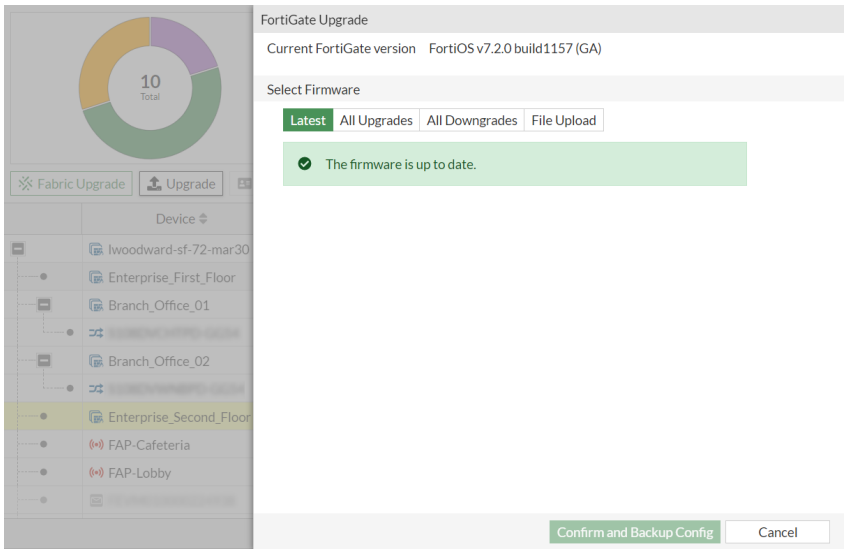
Downgrading the firmware is not recommended.

Downgrading FortiGates in an HA cluster causes all cluster members to be downgraded simultaneously. This process, also known as an interrupted downgrade, leads to a temporary interruption in the cluster's communication.

This procedure downgrades the FortiGate to a previous firmware version. After downgrading, you may be unable to restore the backup configuration.

To downgrade to a previous firmware version in the GUI:

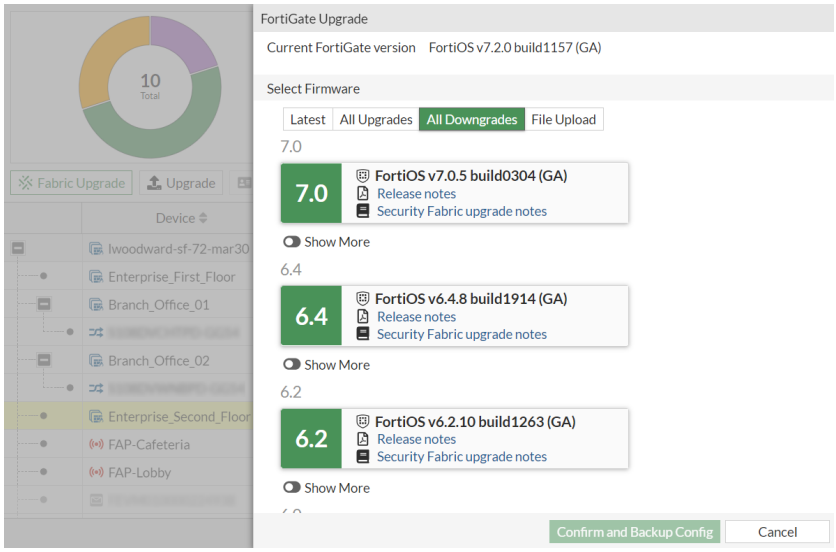
1. Log into the FortiGate GUI as the admin administrative user.
2. Go to *System > Firmware & Registration*. The *Firmware Version* column displays the version and either *(Feature)* or *(Mature)*.
3. Select the FortiGate, and click *Upgrade*. The *FortiGate Upgrade* pane opens.



4. Click one of the following tabs to select a downgrade method:

All Downgrades	Click the *All Downgrades* tab to view and select all firmware versions that are available from FortiGuard for downgrade.
File Upload	Click the *File Upload* tab to upload a firmware file that you previously downloaded from the Fortinet Customer Service & Support website. See Downloading a firmware image on page 3082.

In this example, the *All Downgrades* tab is selected.



5. Select a firmware version and click *Confirm and Backup Config*. A warning message is displayed.
6. Click *Continue* to continue with the downgrade.

   The FortiGate unit backs up the current configuration to the management computer, uploads the firmware image file, downgrades to the firmware version, and restarts. This process takes a few minutes.

To downgrade to a previous firmware version in the CLI:

1. Make sure that the TFTP server is running.
2. Copy the new firmware image file to the root directory of the TFTP server.
3. Log into the CLI.
4. Ping the TFTP server to ensure that the FortiGate can connect to it:

```
execute ping <tftp_ipv4>
```

5. Enter the following command to copy the firmware image from the TFTP server to the FortiGate unit:

```
execute restore image tftp <filename> <tftp_ipv4>
```

   The FortiGate unit responds with the message:

```
This operation will replace the current firmware version!
Do you want to continue? (y/n)
```

6. Type y. The FortiGate unit uploads the firmware image file, then a message similar to the following is shown:

```
Get image from tftp server OK.
Check image OK.
This operation will downgrade the current firmware version!
Do you want to continue? (y/n)
```

7. Type y. The FortiGate unit downgrades to the old firmware version and restarts. This process takes a few minutes.
8. Reconnect to the CLI.
9. Update the antivirus and attack definitions:

```
execute update-now
```

Downloading the EOS support package for supported Fabric devices

FortiGates, FortiSwitches, FortiAPs, and FortiExtenders can download an EOS (end of support) package automatically from FortiGuard during the bootup process or by using manual commands. Based on the downloaded EOS package files, when a device passes the EOS date, a warning message is displayed in the device's tooltip. The device is also highlighted in the following GUI locations:

- *System > Firmware & Registration* page
- *Security Fabric > Physical Topology* and *Logical Topology* pages
- *Dashboard > Status > System Information* widget

FortiGuard updates

The EOS packages can be downloaded automatically from FortiGuard, but they can also be downloaded manually.

To manually download the EOS package from the FortiGuard server:

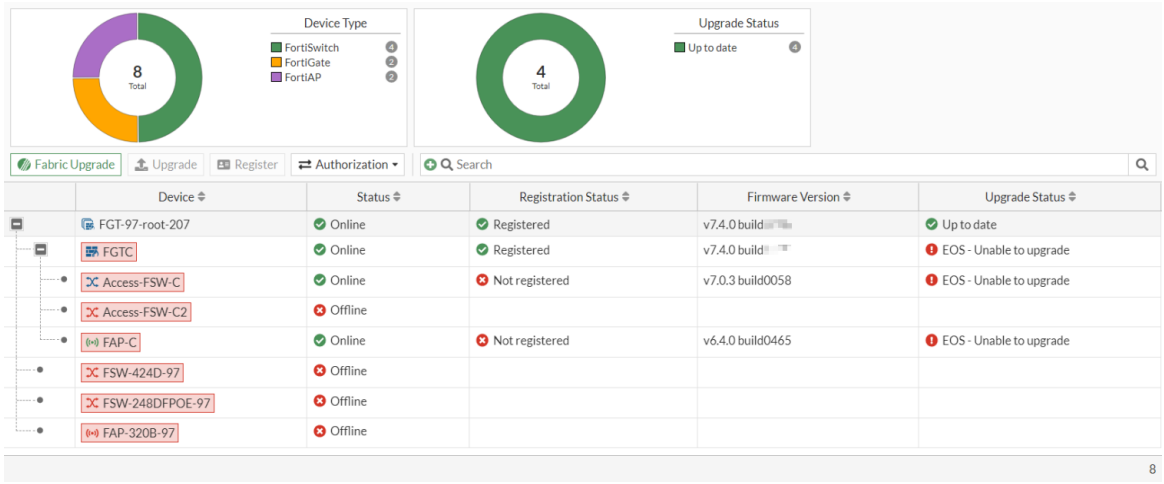
```
# diagnose fortiguard-resources update <product>-end-of-support
```

Product	Description
`fortigate-end-of-support`	FortiGate product life cycle information.
`fortiswitch-end-of-support`	FortiSwitch product life cycle information.
`fortiap-end-of-support`	FortiAP product life cycle information.
`fortiextender-end-of-support`	FortiExtender product life cycle information.

In the event the EOS package files are not downloaded due to a connection issue, use `diagnose fortiguard-resources update <product>-end-of-support` to download the package files.

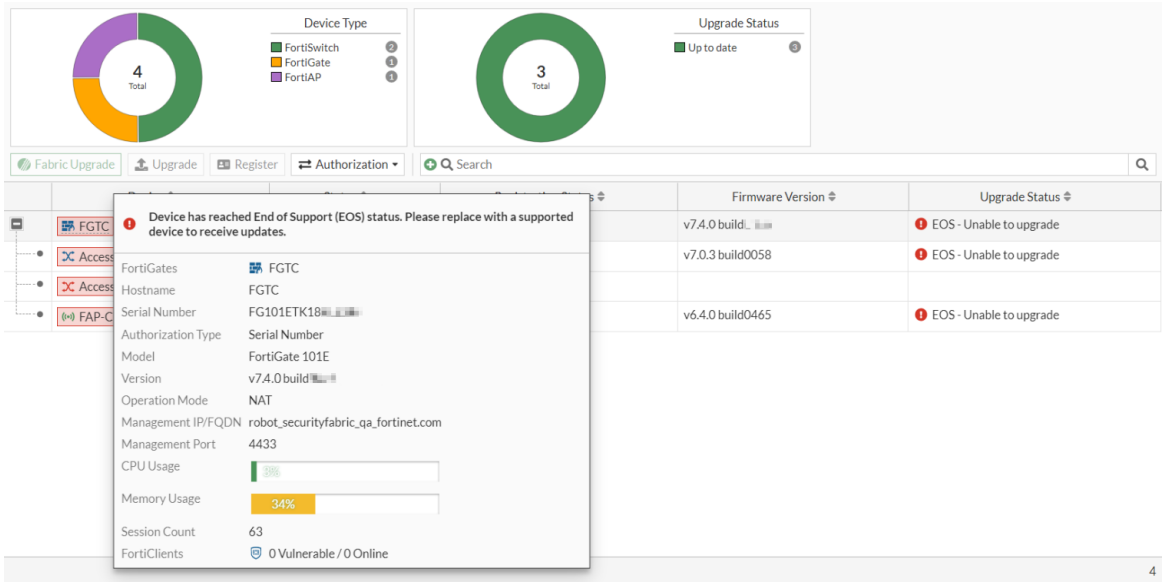
GUI warnings

On the *System > Firmware & Registration* page, devices that have reached EOS are highlighted in red, and their *Status* is *EOS - Unable to upgrade*.

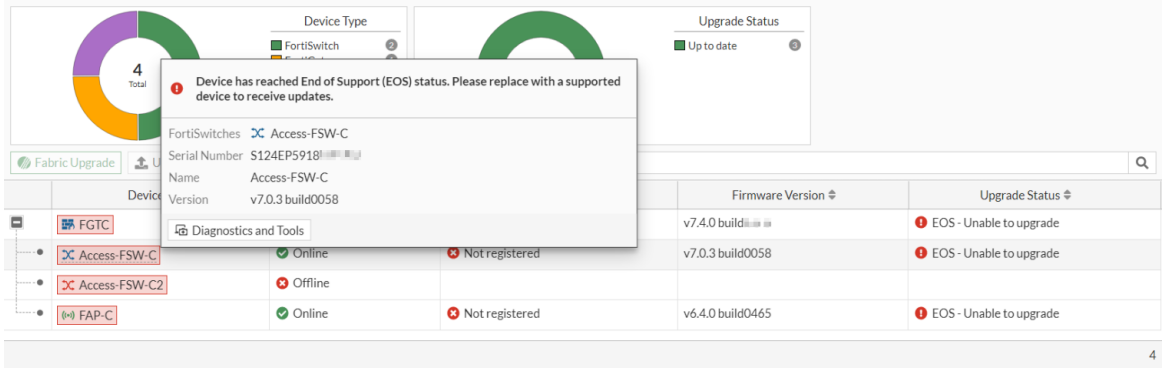


Hover over a device name to view the tooltip, which includes an EOS warning.

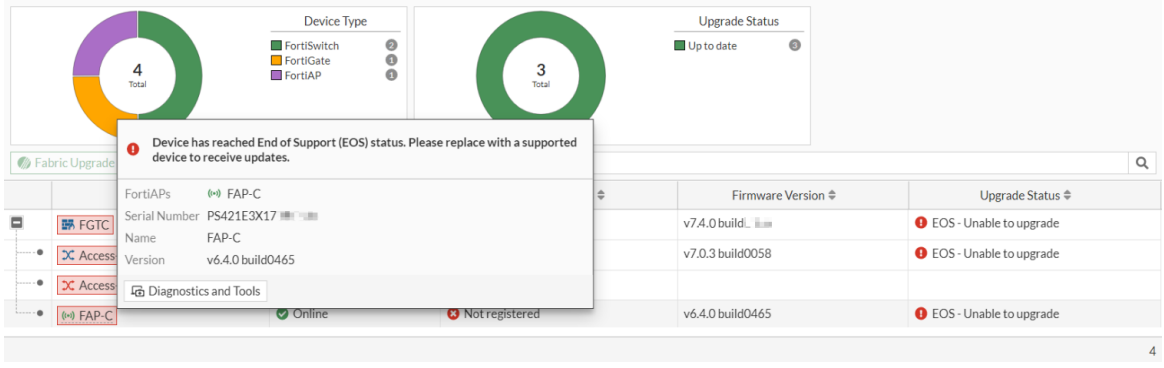
- Sample FortiGate tooltip:



- Sample FortiSwitch tooltip:

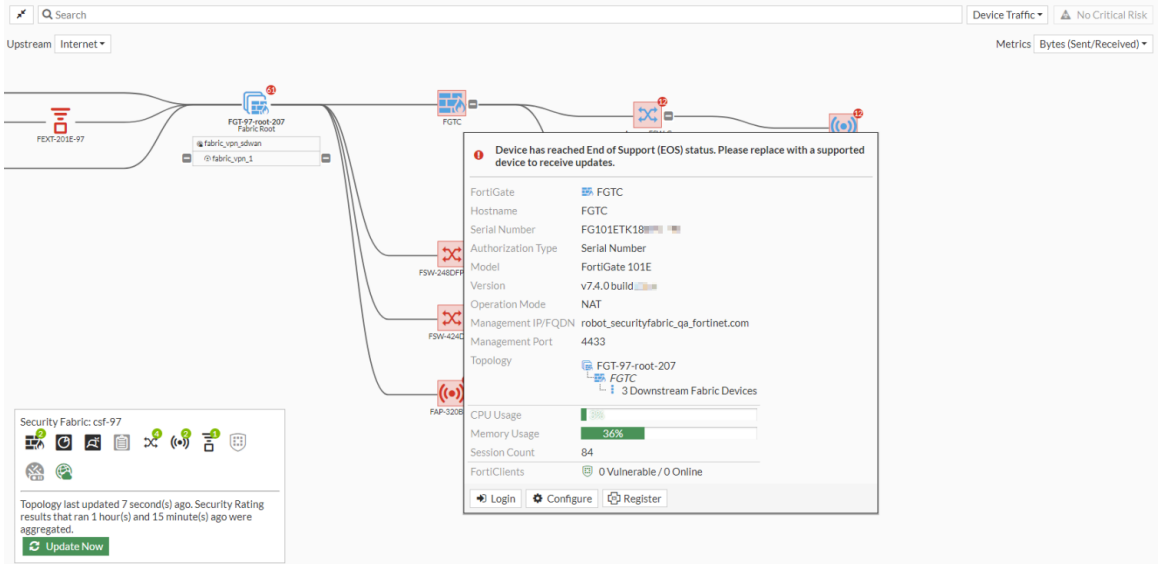


- Sample FortiAP tooltip:

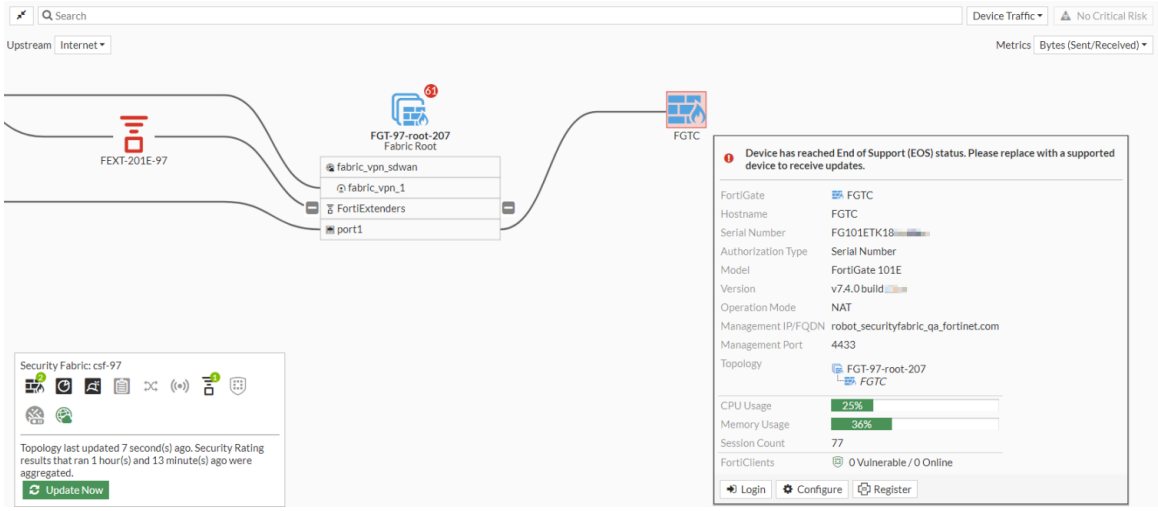


On the *Security Fabric > Physical Topology* and *Logical Topology* pages, devices that have reached EOS are highlighted in red. The device tooltips also include an EOS warning.

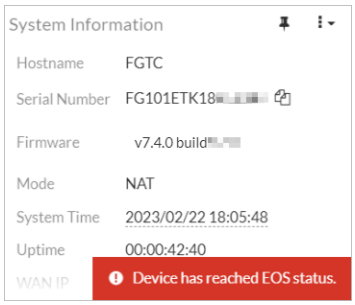
- Sample *Security Fabric > Physical Topology* page with tooltip:



- Sample *Security Fabric > Logical Topology* page with tooltip:



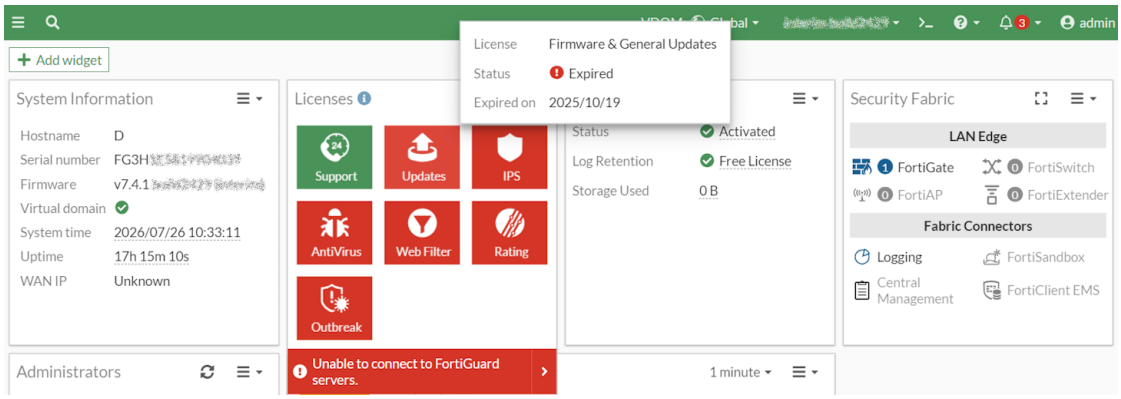
The *Dashboard > Status > System Information* widget includes a warning at the bottom of the widget that the *Device has reached EOS status*.



How the FortiGate firmware license works

Firmware upgrades are performed in the *System > Firmware & Registration* page or in the CLI. To demonstrate the functionality of this feature, the following explanations and examples use FortiGates that are running and upgrading to fictitious build numbers with fictitious release dates. For more information on performing an upgrade, see Upgrading individual devices on page 3062.

You can confirm the *Firmware & General Updates* (FMWR) contract expiry date in the *System > FortiGuard* page, by using the `diagnose test update info contract | grep FMWR` command, or by hovering your mouse over the *Updates* tile in the *Licenses* widget in *Dashboard > Status*.



Maintaining an active support contract for your FortiGate allows you to access the latest firmware upgrades and downgrades including:

- Updates between major versions, such as upgrading from FortiOS 7.0 to 8.0
- Updates between minor versions, such as upgrading from FortiOS 7.4 to 7.6
- Updates between patch versions, such as upgrading from FortiOS 7.4.5 to 7.4.6

If you have an invalid support contract or the FortiGate version is End of Support, enforced, automatic firmware upgrades will upgrade the FortiGate to the latest patch of the current, minor version. For example, if the current version is FortiOS 7.4.3, the firmware will automatically upgrade to the latest 7.4.x version. It will not upgrade to another minor version, such as 7.6.x. See Automatic firmware upgrades for FortiGate appliances with invalid support contracts or that have reached EOES on page 3074.

In FortiOS 7.4.2 and above, enforcement is based on the expiry date of the current firmware license compared to the release date of the first GA release of a major or minor version. For example, for FortiOS 7.4.x firmware upgrades, enforcement is based on the expiry date of the current support contract compared to the release date of FortiOS 7.4.0 GA.

Therefore, upgrades and downgrades between major and minor versions are only allowed if the firmware license is valid relative to the release date of the first GA release of a major or minor version. If the firmware license expiry date is earlier than the firmware first GA major or minor release date, then the firmware update to that version will not be allowed.

For example, the release dates of minor versions are as follows:

- 7.4.0 GA release on May 8, 2023
- 7.6.0 GA release on March 31, 2024

- 7.8.0 GA release on March 31, 2025

This example is using fictitious GA release dates of future versions for illustrative purposes only. These dates do not indicate the official FortiOS release schedule.

Firmware license expiry date	Is a FortiGate firmware upgrade allowed to the target version?		
	7.4.x	7.6.x	7.8.x
March 31, 2025 or later	Yes	Yes	Yes
March 25, 2025	Yes	Yes	No
March 25, 2024	Yes	No	No
May 2, 2023	No	No	No

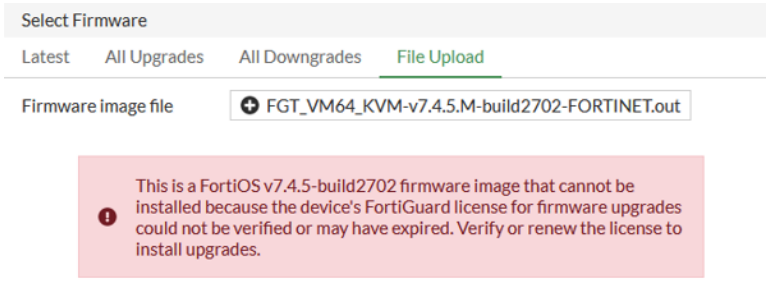
Downgrades from one major or minor version to another are not blocked because the FortiGate should have had a firmware expiry date that is later than the release date of the older firmware major or minor version.

For example, if the firmware license expiry date was March 25, 2024, the FortiGate is currently running 7.4.2 and you wanted to downgrade to 7.2.7, since the release date of 7.2.0 GA was March 31, 2022 then this firmware downgrade would be allowed. The firmware license expiry date is later than the release date of the older firmware minor version, 7.2.0 GA.

Upgrading firmware in the GUI through file upload

If the contract is expired relative to the major firmware GA .0 version release date, the following upgrade attempt will be blocked in the GUI *System > Firmware & Registration* page.

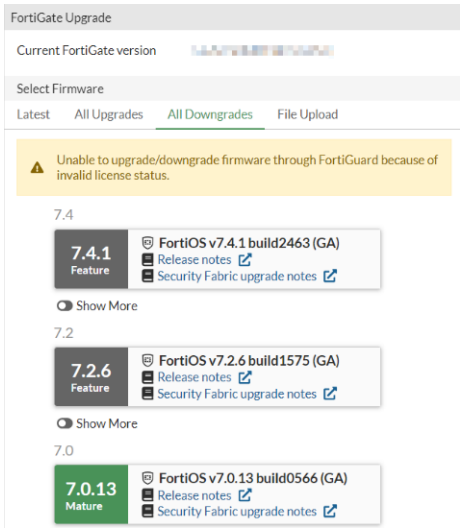
If the contract expiry date is earlier than the release date for the GA .0 version of a higher major, minor, or patch version of firmware that is being uploaded, then the upgrade is denied and an error is displayed.



Upgrading firmware in the GUI through FortiGuard

Until the support contract is renewed, FortiGuard upgrades will be unavailable, namely, the *Confirm and Backup Config* button will be grayed out. However, you will be able to view the FortiGate firmware images

available on FortiGuard using *Latest*, *All Upgrades*, and *All Downgrades* tabs and this functionality will be restored upon support contract renewal.



Upgrading firmware in the CLI

The following example demonstrates what occurs when upgrading the firmware to a patch build and to a higher version with a license expiry date that is earlier than the major GA .0 version release date in the CLI. The major upgrade attempts and fails to upgrade the firmware from FortiOS 7.4.0 to 7.6.3.

This behavior is also observed for minor and patch upgrades with a license expiry date that is earlier than the major GA .0 version release date of the minor or patch firmware targeted for the upgrade.

To upgrade the firmware to a higher major version:

1. Confirm the current firmware version:

```
# get system status
Version: FortiGate-301E v7.4.0,build2303,230307 (interim)
```

2. Upgrade the firmware:

```
# execute restore image tftp  v763-B1505-GA-F_B234847_FGT_301E.out 172.16.200.55
......
Firmware update licence is expired! Please update to a valid licence.
Command fail. Return code -180
```

If your firmware support contract has expired, please contact your Fortinet Sales/Partner for details on renewing it.

Troubleshooting

To verify the presence of the FMWR license:

```
# diagnose test update info contract
…
System contracts:
    ENHN,Thu May  1 2025
    COMP,Thu May  1 2025
    FMWR,Thu May  1 2025
…
Support contract: pending_registration=255 got_contract_info=1
    account_id=[xxxxxxxx@fortinet.com] company=[Fortinet] industry=[Technology]

SerialNumber=FGVMxxxxxxxxxx|Contract=AVDB-1-06-20250503:0:1:1:0*AVEN-1-06-20250503:0:1:1:0*NIDS-1-
06-20250503:0:1:1:0*SPRT-1-20-202
50503:0:1:1:0*ZHVO-1-06-20250503:0:1:1:0*SWNO-1-06-20250503:0:1:1:0*SWNM-1-06-
20250503:0:1:1:0*SWNC-1-06-20250503:0:1:1:0*FGSA-1-06-2
0250503:0:1:1:0*SPAM-1-06-20250503:0:1:1:0*ISSS-1-06-20250503:0:1:1:0*IPMC-1-06-
20250503:0:1:1:0*IOTH-1-06-20250503:0:1:1:0*FURL-1-06
-20250503:0:1:1:0*FRVS-1-06-20250503:0:1:1:0*FMWR-1-06-20250503:0:1:1:0*FMGC-1-06-
20250503:0:1:1:0*FCSS-1-10-20250503:0:1:1:0*FAZC-1-
06-20250503:0:1:1:0*DLDB-1-06-20250516:0:1:1:0*ENHN-1-20-20250503:0:1:1:0*COMP-1-20-
20250503:0:1:1:0|
…
```

In the special scenario where the FMWR license information is missing, the FortiGate will not be allowed to upgrade. This scenario may occur when running on an EVAL license, where FMWR license is not supported.

Settings

The default administrator password should be configured immediately after the FortiGate is installed, see Default administrator password on page 3098.

After that, there are several system settings that should also be configured in *System* > *Settings*:

- Changing the host name on page 3099
- Setting the system time on page 3100
- Configuring ports on page 3104
- Setting the idle timeout time on page 3105
- Setting the password policy on page 3106
- Changing the view settings on page 3106
- Setting the administrator password retries and lockout time on page 3107
- TLS configuration on page 3107
- Controlling return path with auxiliary session on page 3108

- Email alerts on page 3112
- Using configuration save mode on page 3117
- Trusted platform module support on page 3118
- Using the default certificate for HTTPS administrative access on page 3120
- Configure TCP NPU session delay globally on page 3124

Default administrator password

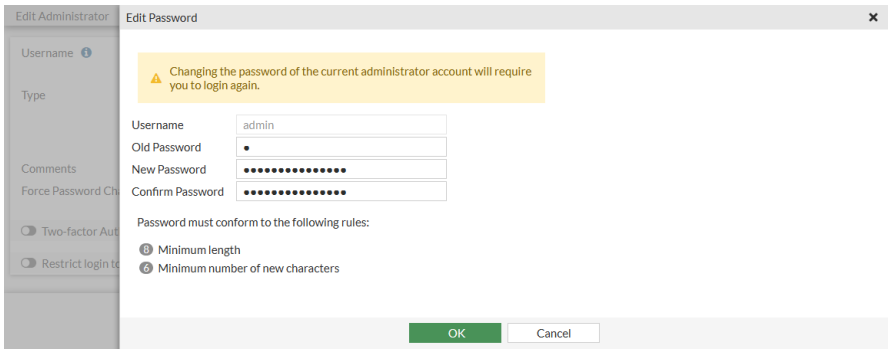
By default, your FortiGate has an administrator account set up with the username `admin` and no password. In order to prevent unauthorized access to the FortiGate, it is highly recommended that you add a password to this account.

Adding a password to the *admin* administrator is mandatory. You will be prompted to configured it the first time you log in to the FortiGate using that account, after a factory reset, and after a new image installation.

To change the default password in the GUI:

1. Go to *System* > *Administrators*.
2. Edit the *admin* account.
3. Click *Change Password*.
4. If applicable, enter the current password in the *Old Password* field.
5. Enter a password in the *New Password* field, then enter it again in the *Confirm Password* field.
   If the password does not conform to the password policy, an error is shown:

   If the password conforms to the password policy, no error message is shown:



6. Click *OK*.

To change the default password in the CLI:

```
config system admin
    edit admin
        set password <old password> <old password>
New password must conform to the password policy enforced on this device:
minimum-length=8; the new password must have at least 1 unique character(s) which don't exist in
the old password.; must not be same as last two passwords

node_check_object fail! for password *

value parse error before '*'
Command fail. Return code -49

        set password <new password> <old password>
    next
end
```

It is also recommended that you change the user name of this account; however, since you cannot change the user name of an account that is currently in use, a second administrator account must be created in order to do this.

Changing the host name

The FortiGate host name is shown in the *Hostname* field in the *System Information* widget on a dashboard, as the command prompt in the CLI, as the SNMP system name, as the device name on FortiGate Cloud, and other places. If the FortiGate is in an HA cluster, use a unique host name to distinguish it from the other devices in the cluster.

An administrator requires *System* > *Configuration* read/write access to edit the host name. See Administrator profiles on page 3049 for details.

To change the host name in the GUI:

1. Go to *System* > *Settings*.
2. In the *Host name* field, enter a new name.

3. Click *Apply*.

To change the host name in the CLI:

```
config system global
    set hostname <hostname>
end
```

Setting the system time

You can either manually set the FortiOS system time, or configure the device to automatically keep its system time correct by synchronizing with a Network Time Protocol (NTP) or Precision Time Protocol (PTP) server.

For many features to work, including scheduling, logging, and SSL-dependent features, the FortiOS system time must be accurate.

To configure the date and time in the GUI:

1. Go to *System* > *Settings*.
2. In the *System Time* section, configure the following settings to either manually set the time or use an NTP server:

Time Zone	Select a time zone from the list. This should be the time zone that the FortiGate is in.
Set Time	Select either *NTP*, *PTP*, or *Manual settings*.
NTP	To use an NTP server other than FortiGuard, the CLI must be used. In the *Sync interval* field, enter how often, in minutes, that the device synchronizes its time with the NTP server.
PTP	• Set the *Mode* to *Multicast* or *Hybrid*. • Select the *Delay mechanism*: *E2E* or *P2P*. • Set the *Request interval*, in seconds. • Select the *Interface*.
Manual settings	Manually enter the *Date*, and *Time*.
Setup device as local NTP server	Enable to configure the FortiGate as a local NTP server. This option is not available if *Set Time* is *PTP*. In the *Listen on Interfaces* field, set the interface or interfaces that the FortiGate will listen for NTP requests on.

3. Click *Apply*.

To configure the date and time in the CLI:

1. Configure the timezone:

```
config system global
    set timezone <integer>
end
```

2. Either manually configure the date and time, or configure an NTP or PTP server:
   - Manual:

```
execute date <yyyy-mm-dd>
execute time <hh:mm:ss>
```

   - NTP server:

```
config system ntp
    set ntpsync enable
    set type {fortiguard | custom}
    set syncinterval <integer>
    set source-ip <ip_address>
    set source-ip6 <ip6_address>
    set server-mode {enable | disable}
    set interface <interface>
    set authentication {enable | disable}
    set key-type {MD5 | SHA1}
    set key <password>
    set key-id <integer>
    config ntpserver
        edit <server_id>
            set server <ip_address or hostname>
            set ntpv3 {enable | disable}
            set authentication {enable | disable}
            set interface-select-method {auto | sdwan | specify}
            set key <password>
            set key-id <integer>
        next
    end
end
```

   - PTP server:

```
config system ptp
    set status enable
    set mode {multicast | hybrid}
    set delay-mechanism {E2E | P2P}
    set request-interval <integer>
    set interface <string>
end
```

Cryptographic hash function authentication support

Cryptographic hash function authentication support allows the NTP client to verify that severs are known and trusted and not intruders masquerading (accidentally or intentionally) as legitimate servers.

The supported cryptographic hash functions include:

- MD5: Supported by NTPv3 for authentication.
- MD5, SHA-1, and SHA-256: Supported by NTPv4, providing stronger security and greater flexibility.

Cryptographic hash function authentication support is only available for NTP clients, not NTP servers.

To configure authentication on a FortiGate NTP client:

```
config system ntp
    set ntpsync enable
    set type custom
    set syncinterval 1
    config ntpserver
        edit "883502"
            set server "10.1.100.11"
            set authentication enable
            set key-type MD5
            set key **********
            set key-id 1
        next
    end
end
```

Command	Description
`authentication <enable | disable>`	Enable/disable MD5/SHA1/SHA256 authentication (default = disable).
`key-type`	Select NTP authentication type (default = MD5): • `MD5`: Enable MD5(NTPv3) authentication. • `SHA1`: Enable SHA1(NTPv4) authentication. • `SHA256`: Enable SHA256(NTPv4) authentication.
`key <passwd>`	Key for MD5(NTPv3)/SHA1(NTPv4)/SHA256(NTPv4) authentication. Enter a password value.
`key-id <integer>`	Key ID for authentication. Enter an integer value from 0 to 4294967295.

To confirm that NTP authentication is set up correctly:

```
# diagnose sys ntp status
synchronized: yes, ntpsync: enabled, server-mode: disabled
ipv4 server(10.1.100.11) 10.1.100.11 -- reachable(0xff) S:4 T:6 selected
server-version=4, stratum=3
```

If NTP authentication is set up correctly, the server version is equal to 4.

PTPv2

The Precision Time Protocol (PTP) is used to synchronize network clocks. It is best suited to situations where time accuracy is of the utmost importance, as it supports accuracy in the sub-microsecond range. Conversely, NTP accuracy is in the range of milliseconds or tens of milliseconds.

Before configuring the PTP settings, ensure that NTP synchronization is disabled. Otherwise, the `config system ptp` command is not available.

```
config system ntp
    set ntpsync disable
end
```

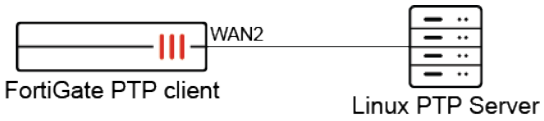
The following CLI commands are available:

```
config system ptp
    set status {enable | disable}
    set mode {multicast | hybrid}
    set delay-mechanism {E2E | P2P}
    set request-interval <integer>
    set interface <interface>
end
```

Command	Description
`status {enable | disable}`	Enable or disable the FortiGate system time by synchronizing with a PTP server (default = disable).
`mode {multicast | hybrid}`	Use multicast or hybrid transmission (default = multicast).
`delay-mechanism {E2E | P2P}`	Use end-to-end (E2E) or peer-to-peer (P2P) delay detection (default = E2E).
`request-interval <integer>`	The logarithmic mean interval between the delay request messages sent by the client to the server in seconds (default = 1).
`interface <interface>`	The interface that the PTP client will reply through.

Sample configuration

This example uses the following topology:



To configure a FortiGate to act as a PTP client that synchronizes itself with a Linux PTP server:

1. Enable debug messages:

```
# diagnose debug application ptpd -1
```

   This command will provide details to debug the PTP communication with the server.
2. Check the system date:

```
# execute date
current date is: 2021-04-01
```

3. Configure PTP in global mode:

```
config system ptp
    set status enable
    set interface wan2
end
```

4. Check the system date again after synchronization with the PTP server:

```
# execute date
current date is: 2021-04-27
```

Configuring ports

To improve security, the default ports for administrative connections to the FortiGate can be changed. Port numbers must be unique. If a conflict exists with a particular port, a warning message is shown.

When connecting to the FortiGate after a port has been changed, the port number be included, for example: `https://192.168.1.99:100`.

To configure the ports in the GUI:

1. Go to *System* > *Settings*.
2. In the *Administration Settings* section, set the HTTP, HTTPS, SSH, and Telnet ports.
3. Enable *Redirect to HTTPS* to prevent HTTP from being used by administrators.
4. Click *Apply*.

To configure the ports in the CLI:

```
config system global
    set admin-port <port>
    set admin-sport <port>
```

```
    set admin-https-redirect {enable | disable}
    set admin-ssh-port <port>
    set admin-telnet-port <port>
end
```

Custom default service port range

The default service port range can be customized using the following CLI command:

```
config system global
    set default-service-source-port <port range>
end
```

Where `<port range>` is the new default service port range, that can have a minimum value of 0 and a maximum value up to 65535. The default value is 1 to 65535.

This change effects the TCP/UDP protocol.

Setting the idle timeout time

The idle timeout period is the amount of time that an administrator will stay logged in to the GUI without any activity. This is to prevent someone from accessing the FortiGate if the management PC is left unattended. By default, it is set to five minutes.

A setting of higher than 15 minutes will have a negative effect on a security rating score. See Security rating on page 3671 for more information.

To change the idle timeout in the GUI:

1. Go to *System* > *Settings*.
2. In the *Administration Settings* section, set the *Idle timeout* to up to 480 minutes.
3. Click *Apply*.

To change the idle timeout in the CLI:

```
config system global
    set admintimeout <1-480>
end
```

Setting the password policy

A password policy can be created for administrators and IPsec pre-shared keys. See Password policy on page 3039 for information.

Changing the view settings

The view settings change the look and language of the FortiOS GUI.

To change the view settings in the GUI:

1. Go to *System* > *Settings*.
2. In the *View Settings* section, configure the following settings:

Language	Set the GUI language: *English*, *French*, *Spanish*, *Portuguese*, *Japanese*, *Traditional Chinese*, *Simplifies Chinese*, *Korean*.
Theme	Set the theme color: *Jade*, *Neutrino*, *Mariner*, *Graphite*, *Melongene*, *Retro*, *Dark Matter*, *Onyx*, or *Eclipse*.
Date/Time Display	Set the date and time to display using the FortiGate's or the browser's timezone.
NGFW Mode	Set the NGFW mode to either *Profile-based* (default) or *Policy-based*.
Central SNAT	Optionally, enable central SNAT. This option is only available in *Profile-based* mode.

3. Click *Apply*.

To change the view settings in the CLI:

```
config system global
    set language {english | french | spanish | portuguese | japanese | trach | simch | korean}
    set gui-theme {jade | neutrino | mariner | graphite | melongene | retro | dark-matter | onyx |
eclipse}
    set gui-date-time-source {system | browser}
end
```

```
config system settings
    set ngfw-mode {profile-based | policy-based}
    set central-nat {enable | disable}
end
```

Setting the administrator password retries and lockout time

By default, the number password retry attempts is set to three, allowing the administrator a maximum of three attempts at logging in to their account before they are locked out for a set amount of time (by default, 60 seconds).

The number of attempts and the default wait time before the administrator can try to enter a password again can be configured using the CLI.

A maximum of ten retry attempts can be configured, and the lockout period can be 1 to 2147483647 seconds (over 68 years). The higher the retry attempts, the higher the risk that someone might be able to guess the password.

To configure the lockout options:

```
config system global
    set admin-lockout-threshold <failed_attempts>
    set admin-lockout-duration <seconds>
end
```

For example, to set the number of retry attempts to 1, and the lockout time to 5 minutes:

```
config system global
    set admin-lockout-threshold 1
    set admin-lockout-duration 300
end
```

If the time span between the first failed log in attempt and the lockout threshold failed attempt is less than lockout time, the lockout will be triggered.

TLS configuration

The minimum TLS version that is used for local out connections from the FortiGate can be configured in the CLI:

```
config system global
    set ssl-min-proto-version {SSLv3 | TLSv1 | TLSv1-1 | TLSv1-2 | TLSv1-3}
end
```

By default, the minimum version is TLSv1.2. The FortiGate will try to negotiate a connection using the configured version or higher. If the server that FortiGate is connecting to does not support the version, then the connection will not be made. Some FortiCloud and FortiGuard services do not support TLSv1.3.

Minimum SSL/TLS versions can also be configured individually for the following settings, not all of which support TLSv1.3:

Setting	CLI
Email server	`config system email-server`
Certificate	`config vpn certificate setting`
FortiSandbox	`config system fortisandbox`
FortiGuard	`config log fortiguard setting`
FortiAnalyzer	`config log fortianalyzer setting`
Syslog	`config log syslogd setting`
User Authentication	`config user setting`
LDAP server	`config user ldap`
POP3 server	`config user pop3`
Exchange server	`config user exchange`

A minimum (`ssl-min-proto-ver`) and a maximum (`ssl-max-proto-ver`) version can be configured for SSL VPN. See TLS 1.3 support on page 2787

Controlling return path with auxiliary session

When multiple incoming or outgoing interfaces are used in ECMP or for load balancing, changes to routing, incoming, or return traffic interfaces impacts how an existing sessions handles the traffic. Auxiliary sessions can be used to handle these changes to traffic patterns.

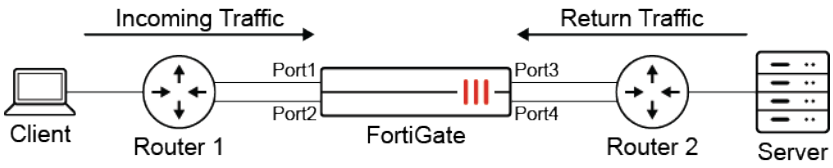
- In FortiOS 6.0 and earlier, the auxiliary session feature is not supported.
- In FortiOS 6.2.0 to 6.2.2, the auxiliary session feature is permanently enabled.
- In FortiOS 6.2.3 and later, the auxiliary session feature is disabled by default, and can be enabled if required.

To enable or disable the auxiliary session feature:

```
config system settings
    set auxiliary-session {enable | disable*}
end
```

When enabling auxiliary sessions, consider the impact of routing in both traffic directions. In topologies such as SD-WAN hub and spoke or ADVPN deployments, the symmetry of the return traffic is important for maintaining the stability of the session. It is expected that the spoke selects the outbound interface and path, and the other nodes obey and reply symmetrically. It is recommended to disable auxiliary in these scenarios, and others where incoming and return traffic symmetry is expected.

Scenarios



Incoming traffic is from the client to the server. Return traffic is from the server to the client.

Scenario 1 - Return traffic returns on the original outgoing interface

In this scenario, a session is established between port1 and port3. When the return traffic hits port3:

Auxiliary sessions disabled:

The reply to the client egresses on the original incoming interface, port1. If policy routes or SD-WAN rules are configured, the next hop gateway is applied if the output device is the same as the original incoming interface.

Auxiliary sessions enabled:

The reply to the client egresses on the best route in the routing table:

- If the best route is port1, then it will egress on port1.
- If the best route is port2, then it will egress on port2.

If policy routes or SD-WAN rules are configured, they must be matched to determine the egress interface. If both are configured, policy routes have higher priority.

Scenario 2 - Return traffic returns on an interfaces other than the original outgoing interfaces

In this scenario, a session is established between port1 and port3. When the return traffic hits port4:

Auxiliary sessions disabled:

- The session is dirtied and then gets refreshed, and interfaces on the session are updated. This continuous state change to dirty prevents the session from being offloaded.
- If there is a high traffic volume or flapping between the interfaces, the CPU usage increases.

Auxiliary sessions enabled:

An auxiliary session is created for the existing session, and traffic returns to the client as normal on the auxiliary session.

Scenario 3 - Incoming traffic enters on an interfaces other than the original incoming interfaces

In this scenario, a session is established between port1 and port3. When the incoming traffic hits port2:

Auxiliary sessions disabled:

The session is dirtied and then gets refreshed, and interfaces on the session are updated. This continuous state change to dirty prevents the session from being offloaded.

Auxiliary sessions enabled:

An auxiliary session is created for the existing session, and traffic is forwarded to the server as normal on the auxiliary session.

Scenario 4 - the routing table is changed

In this scenario, a session has been established between port1 and port3, when a new route on port4 is updated as the route to the server.

Auxiliary sessions disabled:

As long as there is a route to the destination, the session will not be dirtied or refreshed. Even though there is a better route, traffic continues on the original path between port1 and port3.

Auxiliary sessions enabled:

The session is dirtied and then gets refreshed, and interfaces on the session are updated. This continuous state change to dirty prevents the session from being offloaded.

Effect on NPU offloading sessions

When the auxiliary session feature is disabled, there is always one session. If the incoming or return interface changes, the FortiGate marks the session as dirty and updates the session's interfaces. This cannot be done by the NPU, so the session is not offloaded to the NPU, and is processed by the CPU instead. If Equal-Cost Multi-Path (ECMP) causes the interface to keep changing, then it will use significant CPU resources.

When the auxiliary session feature is enabled and the incoming or return interface changes, it creates an auxiliary session, and all traffic can continue to be processed by the NPU.

Verification

When an auxiliary, or reflect, session is created, it will appear as a reflect session below the existing session:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=111 expire=175 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=4
origin-shaper=

```

Email alerts

Alert emails are used to notify administrators about events on the FortiGate device, allowing a quick response to any issues.

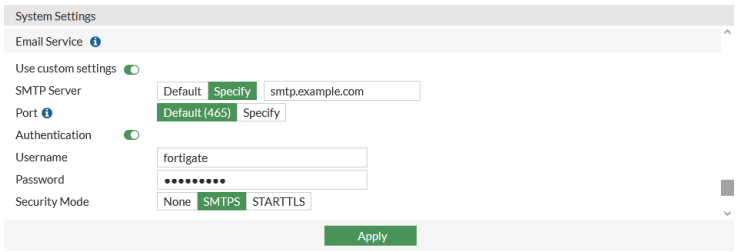
There are two methods that can be used to configure email alerts:

- Automation stitches on page 3113
- Alert emails on page 3116

The FortiGate has a default SMTP server, *fortinet-notifications.com*, that provides secure mail service with SMTPS. It is used for all emails that are sent by the FortiGate, including alert emails, automation stitch emails, and FortiToken Mobile activations. You can also configure a custom email service.

To configure a custom email service in the GUI:

1. Go to *System* > *Settings*.
2. In the *Email Service* section, enable *Use custom settings*.
3. Configure the following settings:



SMTP Server	If required, select *Specify* and enter the address or name of the SMTP server, such as *smtp.example.com*.
Port	If required, select *Specify* and enter a specific port number. The default is port depends on the selected security mode: *None* and *STARTTLS* default to port 25 and *SMTPS* defaults to 465.
Authentication	If required by the email server, enable authentication. If enabled, enter the *Username* and *Password*.
Security Mode	Set the security mode: *None*, *SMTPS*, or *STARTTLS*.

4. Click *Apply*.

To configure a custom email service in the CLI:

```
config system email-server
    set server "smtp.example.com"
    set port 465
    set authenticate enable
    set username "fortigate"
    set password *********
    set security smtps
end
```

The reply-to address for the source email is automatically set to *DoNotReply@fortinet-notifications.com* for all servers, including custom servers. For custom servers, if a username is configured, then MAIL FROM is set to the username, but if no username is configured, then MAIL FROM is the same as MAIL TO. You cannot customize the address when configuring a custom email server in the GUI or CLI.

Automation stitches

Automation stitches can be configured to send emails based on a variety of triggers, giving you control over the events that cause an alert, and who gets alerted. For more information, see Automation stitches on page 3682.

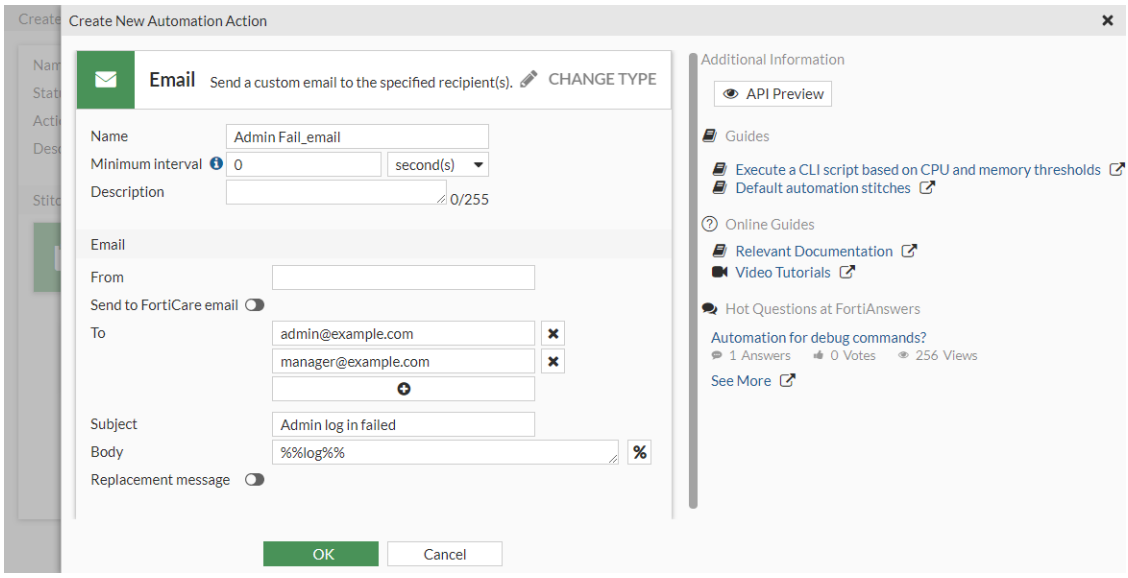
In this example, the default mail service sends an email to two recipients when an Admin login failed event occurs or there is a configuration change.

To configure the automation stitch in the GUI:

1. On the root FortiGate, go to *Security Fabric > Automation* and click *Create New*.
2. Enter a name for the stitch, such as *Admin Fail*.
3. Configure the trigger:
   a. Click *Add Trigger*.
   b. Click *Create* and select *FortiOS Event Log*.
   c. Enter a name for the trigger, such as *Admin Fail*.
   d. Click in the *Event* field, and in the slide out pane, search for and select *Admin login failed*.

   e. Click *OK*.
   f. Select the trigger in the list and click *Apply*.
4. Configure the action:
   a. Click *Add Action*.
   b. Click *Create* and select *Email*.
   c. Configure the following settings:

Name	Enter a name for the action, such as *Admin Fail_email*.
To	Enter the two email recipients' addresses, such as *admin@example.com* and *manager@example.com*.
Subject	Enter an subject, such as *Admin log in failed*.
Body	Edit as required. By default, the email body will include all the fields from the log event that triggered the stitch.



d. Click *OK*.

e. Select the action in the list and click *Apply*.

5. Click *OK*.
6. Create a second stitch with *Configuration Change* as the trigger, and an email action with a different subject line (such as *Configuration Change Detected*).

To configure the automation stitch in the CLI:

1. Create the automation triggers:

```
config system automation-trigger
    edit "Admin Fail"
        set event-type event-log
        set logid 32002
    next
    edit "Config Change"
        set event-type config-change
    next
end
```

2. Create automation actions to send the email messages:

```
config system automation-action
    edit "Admin Fail_email"
        set action-type email
        set email-to "admin@example.com" "manager@example.com"
        set email-subject "Admin log in failed"
    next
    edit "Config Change_email"
        set action-type email
        set email-to "admin@example.com" "manager@example.com"
        set email-subject "Configuration Change Detected"
```

```
    next
end
```

3. Create the automation stitches:

```
config system automation-stitch
    edit "Admin Fail"
        set trigger "Admin Fail"
        config actions
            edit 1
                set action "Admin Fail_email"
                set required enable
            next
        end
    next
    edit "Config Change"
        set trigger "Config Change"
        config actions
            edit 1
                set action "Config Change_email"
                set required enable
            next
        end
    next
end
```

Alert emails

When configuring an alert email, you can define the threshold when an issue becomes critical and requires attention. When the threshold is reached, an email is sent to up to three recipients on the configured schedule to notify them of the issue.

Alert email messages can be configured in the CLI. For more information on the available CLI commands, see Configure alert email settings.

Alert email messages (under `config alertemail setting`) cannot monitor and notify users of the current logging status or the status of the miglogd daemon. In the event that the miglogd daemon is unresponsive, alert email messages cannot be triggered.

IPS, SSH, violation traffic, antivirus, and web filter logs are supported as triggers in automation stitches. For more information, see Event log category triggers on page 3714.

In this example, the FortiGate is configured to send email messages to two addresses, admin@example.com and manager@example.com, every two minutes when multiple intrusions, administrator log in or out events, or configuration changes occur.

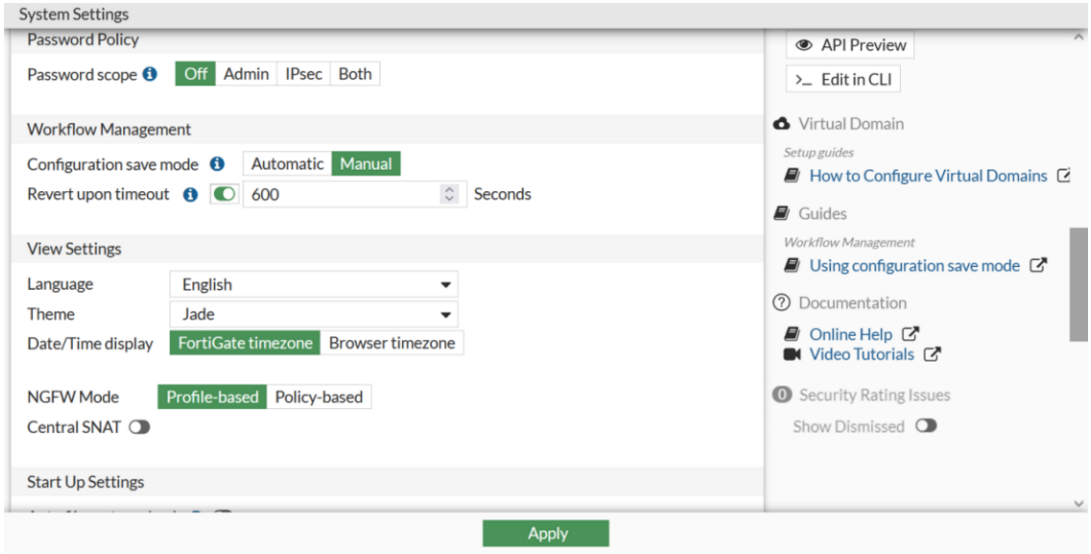
To configure an alert email:

```
config alertemail setting
    set username fortigate@example.com
```

```
    set mailto1 admin@example.com
    set mailto2 manager@example.com
    set filter-mode category
    set email-interval 2
    set IPS-logs enable
    set configuration-changes-logs enable
    set admin-login-logs enable
end
```

Using configuration save mode

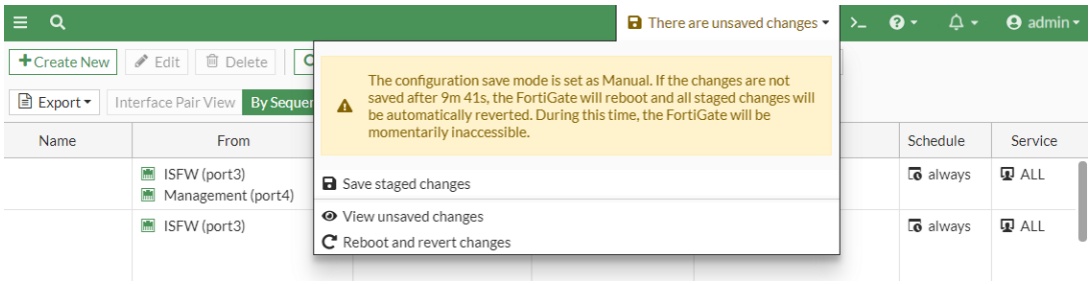
Administrators can use configuration save mode set to *Manual* to implement strict change control by requiring changes to be manually committed to the flash. To configure the setting in the GUI, go to *System* > *Settings*.



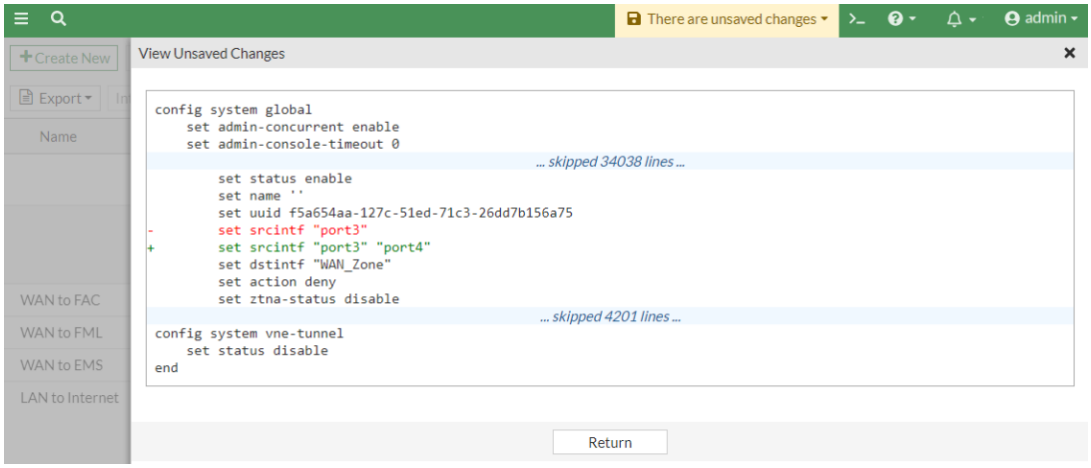
When *Configuration save mode* is set to *Automatic* (default), configuration changes are automatically saved to both memory and flash.

When *Configuration save mode* is set to *Manual*, configuration changes are saved to memory, but not to flash. The changes take effect immediately, but must be manually saved to flash. Unsaved changes are reverted when the device is rebooted. If *Revert upon timeout* is enabled, the system might be unresponsive for a short time after the configured timeout while it reverts the changes back to the previous save point. Prior to the timeout expiring, a pop-up warning gives you the option to postpone reverting the configuration by one minute, revert the configuration immediately, or save the configuration changes.

In *Manual* mode, a warning is shown in the banner when there are unsaved changes. Click the warning to save, view, or revert the changes. When *Reboot and revert changes* is clicked, the system might be unresponsive for a short time while it reverts the changes back to the previous save point.



Clicking *View Unsaved Changes* opens a pane highlighting the changes that have not been committed.



This feature is also available in the CLI:

```
config system global
    set cfg-save {automatic | manual | revert}
    set cfg-revert-timeout <integer>
end
```

```
# execute cfg {reload | save}
```

Trusted platform module support

On supported FortiGate hardware devices, the Trusted Platform Module (TPM) can be used to protect your password and key against malicious software and phishing attacks. The dedicated module hardens the FortiGate by generating, storing, and authenticating cryptographic keys. To help prevent tampering, the chip is soldered on the motherboard to reduce the risk of data transaction interceptions from attackers.

By default, the TPM is disabled. To enable it, you must set the 32 hexadecimal digit master-encryption-password which encrypts sensitive data on the FortiGate using AES128-CBC. With the password, TPM generates a 2048-bit primary key to secure the master-encryption-password through RSA-2048 encryption. The master-encryption-password protects the data. The primary key protects the master-encryption-password.

The TPM module does not encrypt the disk drive of eligible FortiGates.

The primary key binds the encrypted configuration file to a specific FortiGate unit and never leaves the TPM. When backing up the configuration, the TPM uses the primary key to encrypt the master-encryption-password in the configuration file. When restoring a configuration that includes a TPM protected master-encryption-password:

- If TPM is disabled, then the configuration cannot be restored.
- If TPM is enabled but has a different master-encryption-password than the configuration file, then the configuration cannot be restored.
- If TPM is enabled and the master-encryption-password is the same in the configuration file, then the configuration can be restored.

For information on backing up and restoring the configuration, see Configuration backups and reset on page 3505.

Passwords and keys that can be encrypted by the master-encryption-key include:

- Alert email user's password
- BGP and other routing related configurations
- External resource
- FortiGuard proxy password
- FortiToken/FortiToken Mobile’s seed
- HA password
- IPsec pre-shared key
- Link Monitor, server side password
- Local certificate's private key
- Local, LDAP. RADIUS, FSSO, and other user category related passwords
- Modem/PPPoE
- NST password
- NTP Password
- SDN connector, server side password
- SNMP
- Wireless Security related password

In HA configurations, each cluster member must use the same master-encryption-key so that the HA cluster can form and its members can synchronize their configurations.

To check if your FortiGate device has a TPM:

Verify all the following commands exist. Otherwise, the platform does not support it.

```
# diagnose hardware test info
List of test cases:
```

```
    bios: sysid
    bios: checksum
    bios: license
    bios: detect

# diagnose hardware deviceinfo tpm
TPM capability information of fixed properties:
============================================================
TPM_PT_FAMILY_INDICATOR: 2.0
TPM_PT_LEVEL: 0
TPM_PT_REVISION: 138
TPM_PT_DAY_OF_YEAR: 8
TPM_PT_YEAR: 2018
TPM_PT_MANUFACTURER: NTC
# diagnose hardware test tpm
========== Fortinet Hardware Test Report ==================
TPM
TPM Device Detection..................................... PASS
================ Fortinet Hardware Test PASSED ==============
# diagnose tpm
get-property Get TPM properties. [Take 0-1 arg(s)]
get-var-property Get TPM var properties.
read-clock Read TPM internal clock.
shutdown-prepare Prepare for TPM power cycle.
selftest Perform self tests.
generate-random-number Generate a 4-byte random number
SHA-1 HASH a sequence of num with SHA-1 algo
SHA-256 HASH a sequence of num with SHA-256 algo
```

To enable TPM and input the master-encryption-password:

```
config system global
    set private-data-encryption enable
end
Please type your private data encryption key (32 hexadecimal numbers):
********************************
Please re-enter your private data encryption key (32 hexadecimal numbers) again:
********************************
Your private data encryption key is accepted.
```

Using the default certificate for HTTPS administrative access

By default, the FortiGate uses the certificate named Fortinet_GUI_Server for HTTPS administrative access. This certificate is generated and signed by the built-in Fortinet_CA_SSL certificate, which dynamically updates the SAN field of the Fortinet_GUI_Server certificate with the IP addresses of all interfaces enabled for HTTPS. After installing the Fortinet_CA_SSL CA certificate on a PC, administrators can access the FortiGate GUI through a browser without any warnings.

How the certificate works

The Fortinet_GUI_Server certificate is generated by the built-in certificate authority (CA) with the Fortinet_CA_SSL certificate, which is unique to each FortiGate. This CA certificate is also used in SSL deep inspection. When the Fortinet_GUI_Server certificate is generated, the SAN (Subject Alternative Name) extension field is populated with the IP addresses of all physical and logical (VLAN, loopback, and so on) interfaces enabled for HTTPS. It is also populated with the management IP address whenever this field is an IP address and not an FQDN. If there are any changes to the IP addresses on the interface or management IP, the Fortinet_GUI_Server certificate is updated and regenerated with the new IP. If the Fortinet_CA_SSL certificate itself is updated, the Fortinet_GUI_Server certificate is regenerated.

Because the root CA is not a public CA, the Fortinet_CA_SSL CA certificate must be installed in the trusted certificate store on the client PC in order for the trusted certificate chain to be recognized by a browser. This certificate can be downloaded from the FortiGate in several ways.

The Fortinet_GUI_Server certificate can only be used for HTTPS administrative access. It cannot be used anywhere else.

Example

The HTTPS server certificate can be configured in the GUI or CLI.

To configure the HTTPS server certificate in the GUI:

1. On an administrative PC, log in to the FortiGate GUI and go to *System > Settings*.
2. In the *Administration Settings* section, set the *HTTPS server certificate* to *Fortinet_GUI_Server*.
3. Download the Fortinet_CA_SSL certificate using one of the following methods:
   - On the *System > Settings* page, click *Download HTTPS CA certificate* (below the *HTTPS server certificate* option).
   - Go to *System > Certificates*. In the *Local CA Certificate* section, select *Fortinet_CA_SSL*, and click *Download*.
   - Go to *Dashboard > Status*. In the *Administrator* widget, click *Download HTTPS CA certificate*.
4. Install the certificate in the PC's trusted certificate store. Refer to your OS documentation if needed.
5. Reload the FortiGate GUI. The browser now trusts the certificate and does not display a certificate warning.
6. If you are connecting to the FortiGate over DNAT or port forwarding, the certificate needs to add the NATed management IP into the SAN field so that the browser does not display a warning about an invalid CN. Configure the management IP in the global settings:

```
config system global
    set management-ip <IP_address>
end
```

To configure the HTTPS server certificate in the CLI:

1. Configure the HTTPS server certificate:

```
config system global
    set admin-server-cert Fortinet_GUI_Server
end
```

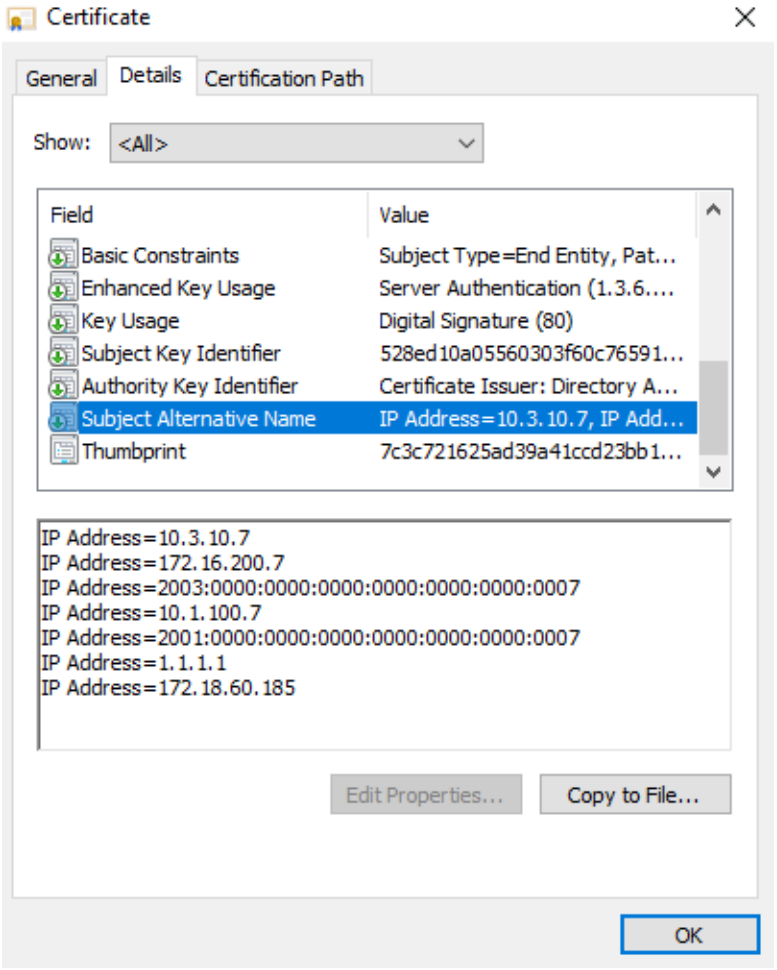
2. Download the Fortinet_CA_SSL certificate on the administrative PC through TFTP:

```
# execute vpn certificate local export tftp Fortinet_CA_SSL cer <file_name> <server_IP>

Done.
```

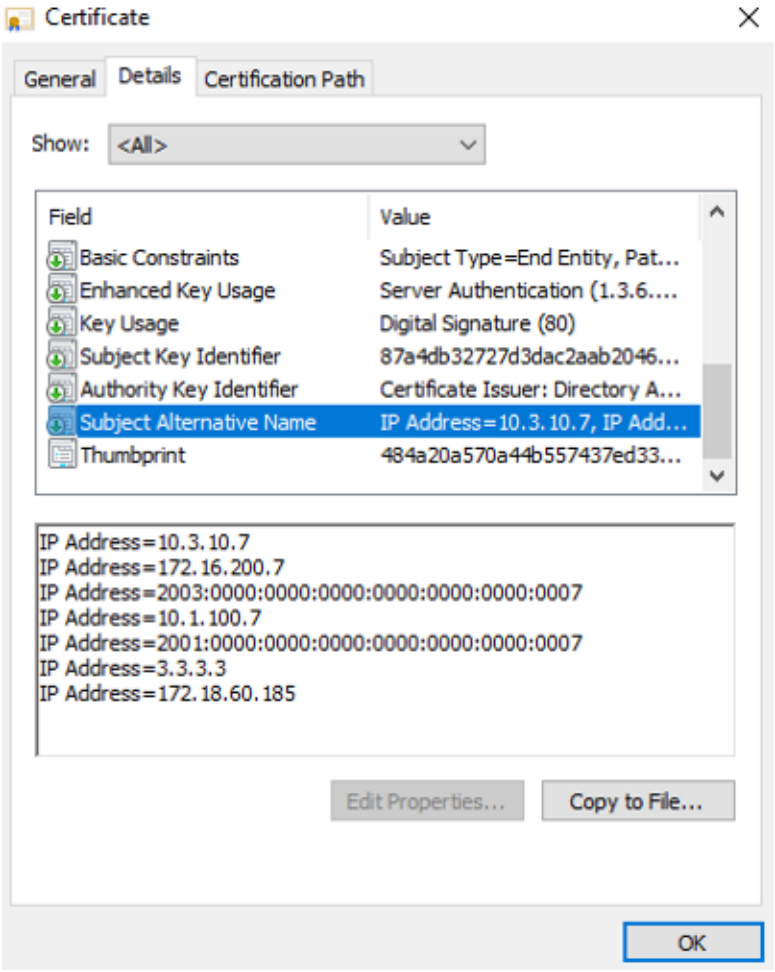
To verify the connection:

1. Access the FortiGate from a browser and verify the certificate information. For example, in Chrome:
   a. In the left side of the address bar, click the icon to view the site information.
   b. Click *Certificate*.
   c. Click the *Details* tab.
   d. Locate the *Subject Alternative Name* (SAN) field, and note the IP addresses that are listed (*1.1.1.1*).



e. Click *OK*.

2. In FortiOS, change one of the interface addresses. In this example, the port11 address is changed from 1.1.1.1 to 3.3.3.3.
3. Reload the browser and review the certificate information again. The IP 1.1.1.1 in the SAN field is updated to *3.3.3.3*.



4. In FortiOS, go to *System > Certificates* and double-click *Fortinet_GUI_Server* to view the *Certificate Details*.
5. At the bottom of the pane, the *X509v3 Subject Alternative Name* field displays the IP addresses from the certificate.
6. Verify the logs when the certificate is regenerated:

```
# execute log filter category 1
# execute log display
12 logs found.
10 logs returned.
```

```
1: date=2022-06-23 time=09:11:44 eventtime=1656000704674434910 tz="-0700" logid="0100022205"

Configure TCP NPU session delay globally

The TCP NPU session delay can be applied globally, eliminating the need to set this command for each firewall policy.

```
config system global
    set delay-tcp-npu-session {enable | disable}
end
```

This global setting is disabled by default. When it is disabled, if the host interface is busy, it is possible that the third TCP session establishment ACK received from the client is transmitted to the server after the data packets. When it is enabled, the packet order of the three-way handshake is guaranteed.

A sniffer trace will display the following when the setting is disabled:

```
# diagnose sniffer packet port1 'tcp' 6 0 a
interfaces=[port1]
filters=[tcp]

Virtual Domains

Virtual Domains (VDOMs) are used to divide a FortiGate into two or more virtual units that function independently. VDOMs can provide separate security policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network.

Multiple VDOMs can be created and managed as independent units in multi-VDOM mode.

By default, most FortiGate units support 10 VDOMs, and many FortiGate models support purchasing a license key to increase the maximum number. Some exceptions may apply.

The following topics provide an overview of VDOM concepts, topologies, best practices, and the general configurations involved when working with multi-VDOM mode:

- VDOM overview on page 3126
- General configurations on page 3131
- Backing up and restoring configurations in multi-VDOM mode on page 3141

The following topics provide examples of configuring VDOMs:

- Inter-VDOM routing configuration example: Internet access on page 3145
- Inter-VDOM routing configuration example: Partial-mesh VDOMs on page 3155

VDOM overview

The following sections provide conceptual information on VDOMs:

- Multi-VDOM mode on page 3127
- Global settings on page 3127
- Global and per-VDOM resources on page 3127
- Management VDOM on page 3127
- VDOM types on page 3127
- Administrator roles and views on page 3128
- Inter-VDOM routing on page 3128

The following sections provide information on methods of VDOM configuration:

- Topologies on page 3129
- Best practices on page 3130

Multi-VDOM mode

In multi-VDOM mode, the FortiGate can have multiple VDOMs that function as independent units. When multi-VDOM mode is first enabled, all VDOM configurations will move to the root VDOM by default. The root VDOM cannot be deleted, and remains in the configuration even if it is not processing any traffic. New VDOMs can be created, up to the VDOM limit allowable on your device.

Global settings

Global settings are configured outside of a VDOM. They affect the entire FortiGate, and include settings such as interfaces, firmware, DNS, some logging and sandboxing options, and so on. Global settings should only be changed by top level administrators.

Global and per-VDOM resources

Global and per-VDOM resources can be configured when the FortiGate is in multi-VDOM mode. Global resources apply to resources that are shared by the whole FortiGate, while per-VDOM resources are specific to each VDOM.

By default, all per-VDOM resource settings are set to have no limits. This means that any single VDOM can use all of the FortiGate device's resources. This could deprive other VDOMs of the resources that they require, to the point that could be unable to function. We recommend setting maximum values on the resources that are vital to you.

Management VDOM

The management VDOM refers to the specific role that must be designated to one of the VDOMs. By default, the root VDOM is the management VDOM, and management-related services such as FortiGuard updates and other local out (self-originating) traffic such as logs to remote servers originate from the management VDOM. The management VDOM cannot be deleted. See Management VDOM on page 3132 for configuration details.

VDOM types

When a FortiGate is in multi-VDOM mode, a VDOM can be configured as an *Admin*, *Traffic*, or LAN extension type VDOM.

When the VDOM type is set to *Admin*, the VDOM is used to administer and manage the FortiGate. Usually, the *Admin* VDOM resides in a management network which is only accessible by administrators. Global and VDOM administrators can log in to the FortiGate using SSH, HTTPS, and so on but traffic cannot pass through this *Admin* VDOM. A FortiGate does not need to have an *Admin* VDOM and, at most, there can only be one *Admin* VDOM per FortiGate.

When VDOM type is set to *Traffic*, the VDOM can pass traffic like a regular firewall. Most VDOMs will be *Traffic* type VDOMs. Network interfaces on a *Traffic* VDOM can also enable SSH, HTTPS, and so on for administrative and management purposes.

In general, an *Admin* VDOM has a subset of a *Traffic* VDOM's capabilities. See Configure an administrative VDOM type on page 3135 for configuration details.

A LAN extension mode VDOM allows a remote FortiGate to provide remote connectivity to a local FortiGate over a backhaul connection. It can only be configured in the CLI. See FortiGate LAN extension on page 825 for details.

FortiGate-VM supports having at least two VDOMs; one that supports an administrative VDOM and another that supports a traffic VDOM.

Administrator roles and views

When a FortiGate has been configured in multi-VDOM mode, the device can be managed by global administrators and per-VDOM administrators. Each type of administrator will have a different view of the GUI in multi-VDOM mode which corresponds to their role.

Global administrators

Global administrators have complete visibility and access because the scope of their role is to manage the entire physical FortiGate device. An example of a global administrator is an administrator working for a managed security services provider (MSSP) providing the FortiGate as a multi-tenant environment to its clients.

When global administrators log into the GUI, from the *VDOM: Global* view they will see all pages for global settings shared between VDOMs, and VDOM-specific settings.

To create a global administrator that has access to all VDOMs and access to global settings, it must be created at the global level and must use the *super_admin* administrator profile.

See Administrator profiles on page 3049 and Local authentication on page 3021 for configuration details.

VDOM administrators

VDOM administrators will be unable to view global settings or VDOMs not assigned to them because the scope of their role is restricted to managing specific VDOMs only. An example of a VDOM administrator is the administrator working for a company which is a client, or tenant, of an MSSP's multi-tenant FortiGate.

When VDOM administrators log into the GUI, from the *VDOM:<VDOM>* view they will see pages for settings specific to the VDOM they have been configured to administer such as interfaces, routes, firewall policies, and security profiles.

See Create per-VDOM administrators on page 3135 for configuration details.

Inter-VDOM routing

VDOM links are virtual interfaces that allow VDOMs to communicate internally without using additional physical interfaces. A VDOM link contains a pair of interfaces, each one connected to a VDOM to form each end of the inter-VDOM connection. Inter-VDOM routing can be configured in order to communicate between one VDOM to another.

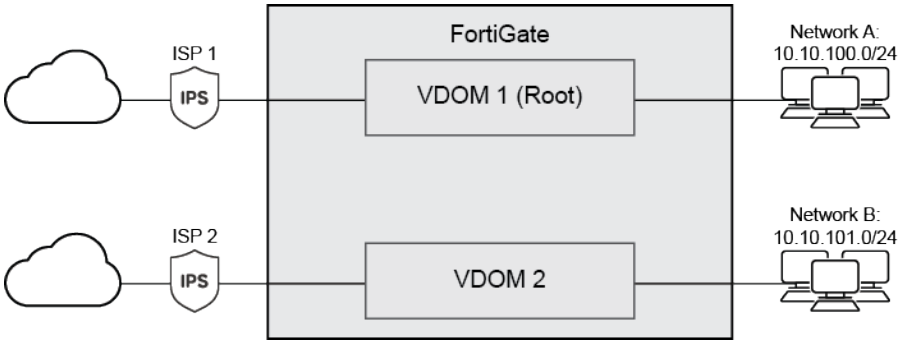
When VDOMs are configured on your FortiGate unit, configuring inter-VDOM routing and VDOM links is similar to creating a VLAN interface. VDOM links can be managed in either the CLI or in the network interface list in the GUI.

See Inter-VDOM routing configuration example: Internet access on page 3145 for more information.

Topologies

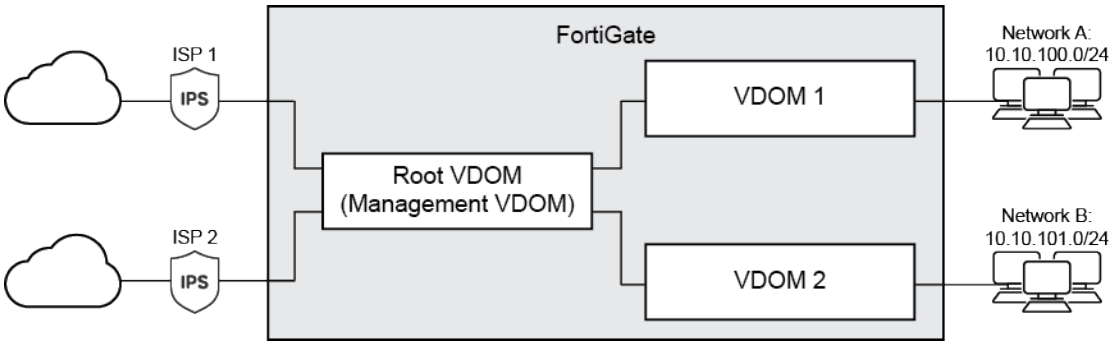
These are the main configuration types in multi-VDOM mode:

Independent VDOMs



Multiple, completely separate VDOMs are created. Any VDOM can be the management VDOM, as long as it has Internet access to connect to FortiGuard services and other management resources. There are no inter-VDOM links, and each VDOM is independently managed.

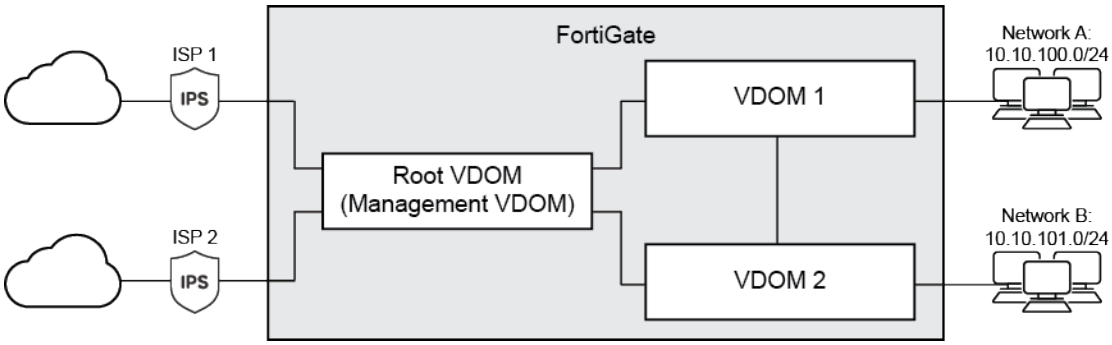
Internet access VDOM



In the Internet access VDOM configuration, Internet access is provided primarily by a single VDOM; for example, the management VDOM (depicted as root VDOM in the preceding diagram). Each tenant connects to the management VDOM via an inter-VDOM link. The management VDOM has complete control over Internet access, including the types of traffic that are allowed in both directions. This can improve security, as there is only one point of ingress and egress.

There is no communication between the other VDOMs.

Meshed VDOMs

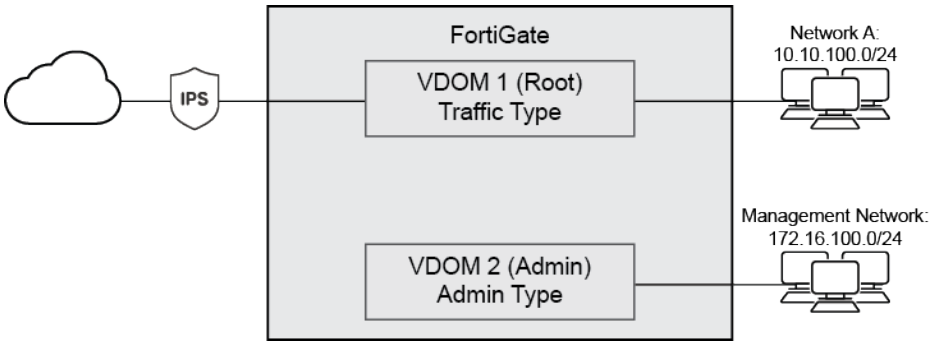


VDOMs can communicate with inter-VDOM links. In full-mesh configurations, all the VDOMs are interconnected. In partial-mesh configurations, only some of the VDOMs are interconnected.

In this configuration, inter-vdom links between tenants are created by the global administrator, but each tenant controls the firewall policies to allow access to other tenants.

See Inter-VDOM routing on page 3137 and Inter-VDOM routing configuration example: Internet access on page 3145 for configuration details.

Administrative VDOM on a management network



The administrative VDOM type can be used to limit administrative access to the FortiGate using SSH, HTTPS and so on to administrators working from a management network. Administrators may be limited to management settings or may have global privileges to access other VDOMs. The user or tenant network (depicted as Network A in the diagram) uses a traffic type VDOM, which allows traffic to pass through it like a regular firewall and allows configuration of firewall-related settings. This configuration can improve security if the management network is a closed network and administrative access is not enabled on any interfaces on the traffic VDOM.

Best practices

VDOMs can provide separate firewall policies and, in NAT mode, completely separate configurations for routing and VPN services for each connected network or organization. This section provides a list of best practices for configuring VDOMs.

Per-VDOM resource setting

All per-VDOM resource settings are set to no limit by default. To ensure proper functionality of all VDOMs, it is recommended that you set some maximum values for the most vital resources. See Global and per-VDOM resources on page 3133 for configuration details.

Virtual domains in NAT mode

Once the virtual domains have been enabled and one or more VDOMs have been created, they must be configured. The following steps provide a general overview of the configuration process.

To configure VDOMs:

1. Change the management virtual domain.
2. Configure FortiGate interfaces for your VDOMs in NAT mode.
3. Configure VDOM routing.
4. Configure security policies for VDOMs in NAT mode.
5. Configure UTM profiles for VDOMs in NAT mode.
6. Test the configuration.

While you may not require all of the steps for your network topology, it is recommended that you perform them in the order given.

See General configurations on page 3131 for configuration details.

Virtual clustering

Virtual clustering is an extension of FGCP HA that provides failover protection between two instances of one or more VDOMs operating on two FortiGates that are in a virtual cluster. A standard virtual cluster consists of FortiGates that are operating in active-passive HA mode with multiple VDOMs enabled. See HA virtual cluster setup on page 3196 for more details.

Typically, virtual clustering is configured with override enabled and uses device priorities to distribute traffic between the primary and secondary FortiGates.

If you decide to disable override for clustering, as a result of persistent renegotiating, you should disable it for both cluster units.

General configurations

VDOMs can be configured in the GUI and the CLI. To ensure that no VDOMs are accidentally configured in the CLI, prompts can be enabled. These prompts will display to ask for confirmation that the VDOM is meant to be configured in the CLI.

To configure confirmation prompts:

```
config system global
    set edit-vdom-prompt enable
end
```

The following topics provide information on general VDOM configurations:

- Enable multi-VDOM mode on page 3132
- Management VDOM on page 3132
- Global and per-VDOM resources on page 3133
- Create per-VDOM administrators on page 3135
- Configure an administrative VDOM type on page 3135
- Assign interfaces to a VDOM on page 3136
- Inter-VDOM routing on page 3137
- Allow FortiGuard services and updates to initiate from a traffic VDOM on page 3138

Enable multi-VDOM mode

Enable multi-VDOM mode and create the VDOMs in the GUI and CLI.

On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

To enable VDOMs in the GUI:

1. Go to *System* > *Settings*.
2. In the *System Operation Settings* sections, enable *Virtual Domains*.
3. Click *OK*.

To enable VDOMs in the CLI:

```
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the device when the VDOM mode is enabled.

Management VDOM

By default, the management VDOM is *root*. The management VDOM can be manually assigned from the GUI or the CLI.

To assign the management VDOM in the GUI:

1. In the *Global* VDOM, go to *System* > *VDOM*.
2. Select the VDOM you want to assign as the management VDOM.
3. Click *Switch Management*.
4. Click *OK*.

To assign the management VDOM in the CLI:

```
config global
    config system global
        set management-vdom <vdom>
    end
end
```

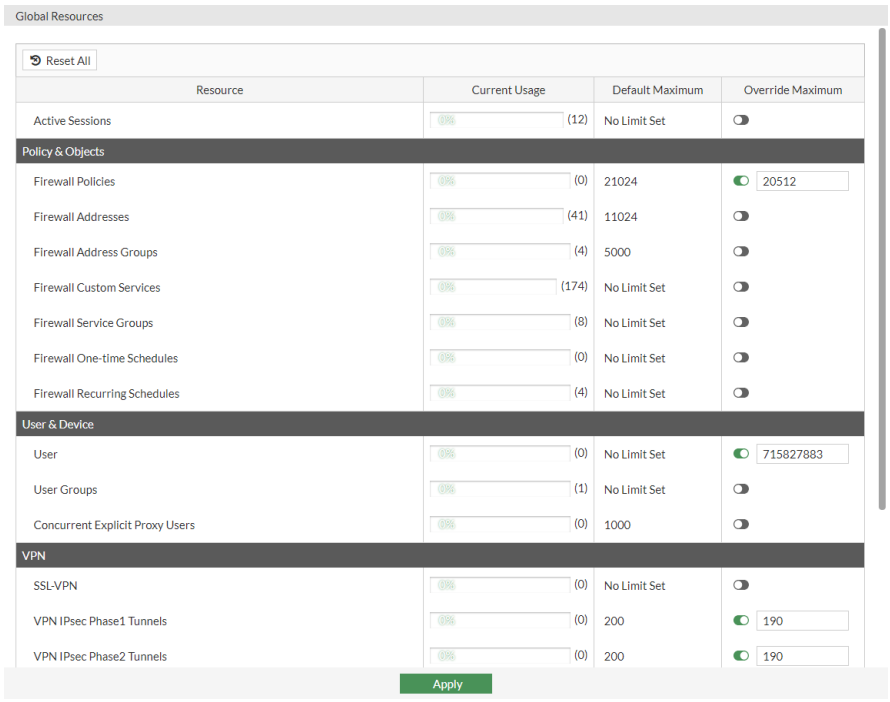
Only one management VDOM can exist at a time. It is strongly recommended that the management VDOM have Internet access otherwise management-related services, such as FortiGuard updates and queries, will not work.

Global and per-VDOM resources

Global resources apply to resources that are shared by the whole FortiGate, while per-VDOM resources are specific to each VDOM.

To configure global resources:

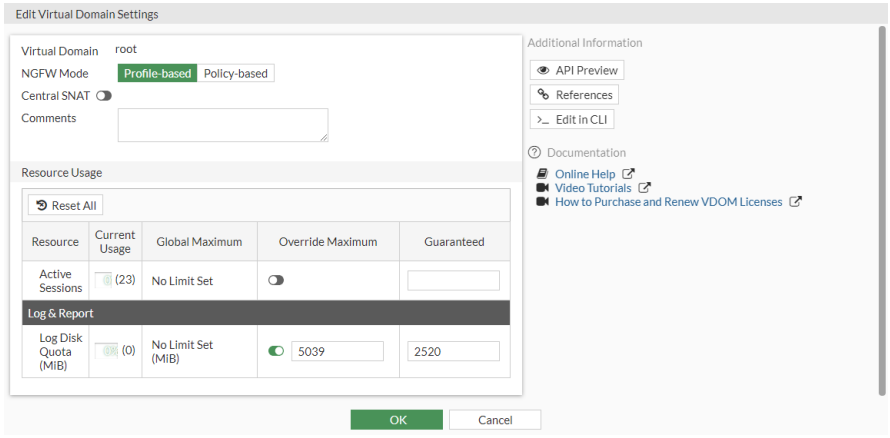
1. In the *Global* VDOM, go to *System* > *Global Resources*.
2. Enable the resource's override in the *Override Maximum* column, then enter the override value.



3. Click *Apply*.
   To reset all of the override values, click *Reset All*.

To configure per-VDOM resources:

1. In the *Global* VDOM, go to *System* > *VDOM*.
2. Select the VDOM whose resources need to be configured and click *Edit*.
3. Enable the resource's override in the *Override Maximum* column, then enter the override value.
4. Optionally, enter a value in the *Guaranteed* column.



5. Click *OK*.
   To reset all of the override values, click *Reset All*.

Create per-VDOM administrators

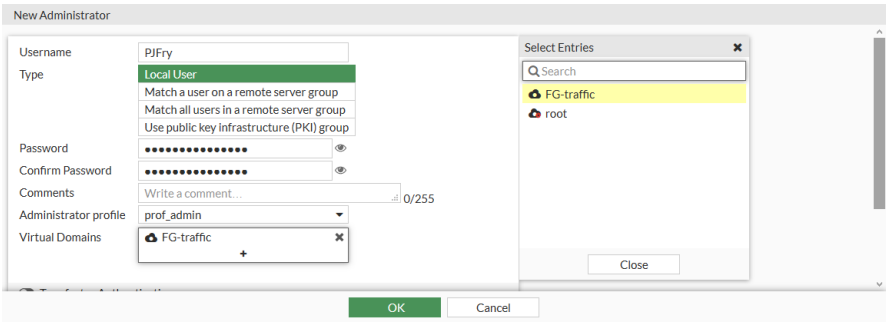
Per-VDOM administrators can be created that can access only the administrative or traffic VDOM. These administrators must use either the *prof_admin* administrator profile, or a custom profile.

A per-VDOM administrator can only access the FortiGate through a network interface that is assigned to the VDOM that they are assigned to. The interface must also be configured to allow management access. They can also connect to the FortiGate using the console port.

To assign an administrator to multiple VDOMs, they must be created at the global level. When creating an administrator at the VDOM level, the *super_admin* administrator profile cannot be used.

To create a per-VDOM administrator in the GUI:

1. On the FortiGate, connect to the *Global* VDOM.
2. Go to *System* > *Administrators* and click *Create New* > *Administrator*.
3. Fill in the required information, setting the *Type* as *Local User*.
4. In the *Virtual Domains* field, add the VDOM that the administrator will be assigned to, and if necessary, remove the other VDOM from the list.



5. Click *OK*.

To create a per-VDOM administrator using the CLI:

```
config global
    config system admin
        edit <name>
            set vdom <VDOM_name>
            set password <password>
            set accprofile <admin_profile>
            ...
        next
    end
end
```

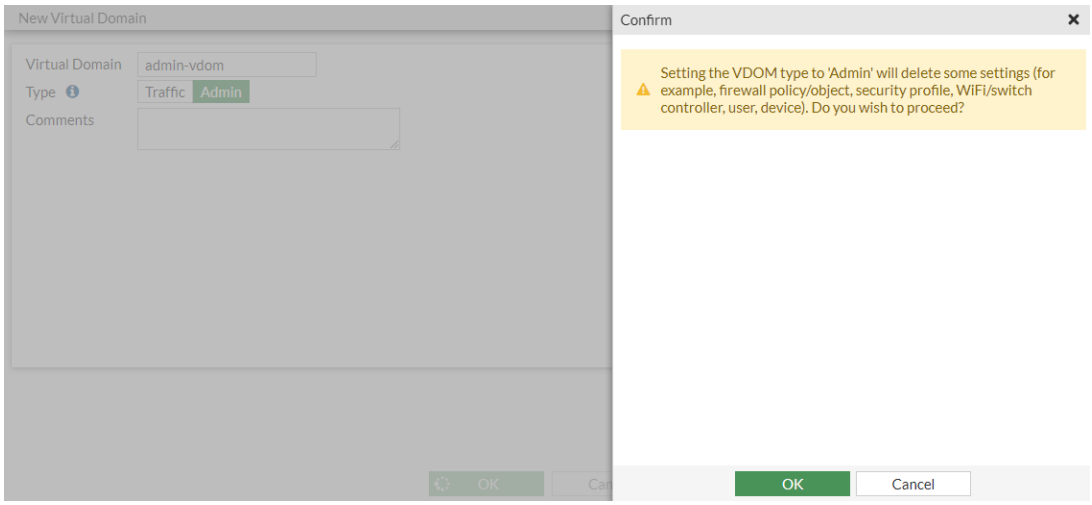
Configure an administrative VDOM type

Individual VDOMs can be configured as an administrative type in multi-VDOM mode.

Only one administrative VDOM can exist at a time and cannot be set on a FortiWifi. A VDOM cannot be an administrative type and in transparent mode at the same time.

To configure an administrative VDOM in the GUI:

1. Go to *System* > *VDOM*.
2. Click *Create New*.
3. Enter a *Virtual Domain* name and set the *Type* to *Admin*.
4. Click *OK*.



5. Click *OK* in the confirmation pane. The administrative VDOM is created.

To configure the VDOM type in the CLI:

```
config system settings
    set vdom-type {traffic | admin}
end
```

Assign interfaces to a VDOM

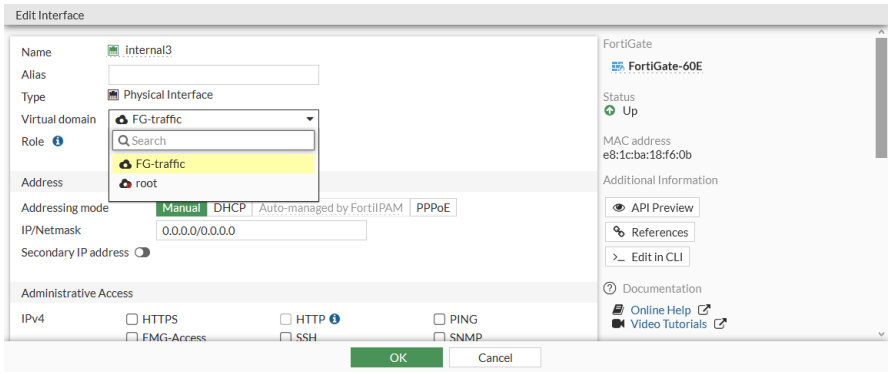
An interface can only be assigned to one of the VDOMs. An interface cannot be moved if it is referenced in an existing configuration.

In the GUI, the interface list *Ref.* column shows if the interface is referenced in an existing configuration, and allows you to quickly access and edit those references.

To assign an interface to a VDOM in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select the interface that will be assigned to a VDOM and click *Edit*.

3. Select the VDOM that the interface will be assigned to from the *Virtual Domain* list.



4. Click *OK*.

To assign an interface to a VDOM using the CLI:

```
config global
    config system interface
        edit <interface>
            set vdom <VDOM_name>
        next
    end
end
```

Inter-VDOM routing

VDOM links allow VDOMs to communicate internally without using additional physical interfaces.

A VDOM link cannot share the same name as a VDOM.

VDOM link does not support traffic offload. If you want to use traffic offload, use NPU-VDOM-LINK. See Configuring inter-VDOM link acceleration with NP6 processors in the Hardware Acceleration guide for details.

To configure a VDOM link in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Click *Create New* > *VDOM Link*.
3. Configure the fields, including the *Name*, *Virtual Domain*, IP information, *Administrative Access*, and so on, then click *OK*.

By default, VDOM links are created as point-to-point (ppp) links. If required, the link type can be changed in the CLI.

For example, when running OSPF in IPv6, a link-local address is required in order to communicate with OSPF neighbors. For a VDOM link to obtain a link-local address, its type must be set to `ethernet`.

To configure a VDOM link in the CLI:

```
config global
    config system vdom-link
        edit "<vdom-link-name>"
            set type {ppp | ethernet}
        next
    end
    config system interface
        edit "<vdom-link-name0>"
            set vdom "<VDOM Name>"
            set type vdom-link
        next
        edit "<vdom-link-name1>"
            set vdom "<VDOM Name>"
            set type vdom-link
        next
    end
end
```

To delete a VDOM link in the GUI:

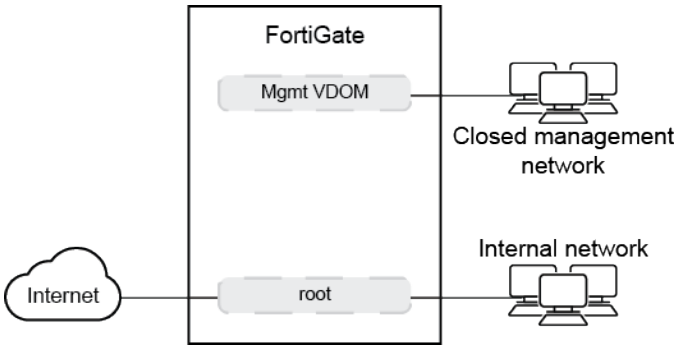
1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select a *VDOM Link* and click *Delete*.

To delete a VDOM link in the CLI:

```
config global
    config system vdom-link
        delete <VDOM-LINK-Name>
    end
end
```

Allow FortiGuard services and updates to initiate from a traffic VDOM

In multi-VDOM mode, users can choose from which VDOM FortiGuard services and updates are initiated from, instead of being locked to the management VDOM. This allows deployment scenarios where the management VDOM resides in a closed management network.



When the management VDOM resides in a closed network, it does not have internet access. FortiGuard services (FortiGuard updates, web filters, DNS proxy, DDNS, and so on) must be configured in a VDOM with Internet access in order to work. Therefore, in the example above, change the FortiGuard settings to initiate from the root VDOM.

To configure FortiGuard services on a traffic VDOM:

1. Set up a traffic VDOM for FortiGuard services:

```
config global
    config system fortiguard
        set vdom "root"
    end
end
```

2. Ensure the traffic VDOM has the correct gateway to reach the internet:

```
config vdom
    edit root
        config router static
            edit 1
                set gateway 172.16.200.254
                set device "wan1"
            next
        end
    next
end
```

3. Configure the DNS servers to ensure the FortiGuard services can resolve the server name through the traffic VDOM:

```
config vdom
    edit root
        config system vdom-dns
            set vdom-dns enable
            set primary 208.91.112.53
            set secondary 208.91.112.52
        end
    next
end
```

Configuring global profiles

Global profiles can be configured globally across multiple VDOMs, even when multi-VDOM mode is disabled. When used in multi-VDOM mode, some or all profiles may be commonly-shared across VDOMs. Global profiles are available as read-only for VDOM-level administrators and can only be edited or deleted from within the global settings. The name for any global profile must begin with *g-* for identification. Each security feature has at least one default global profile, available for all VDOMs to use.

Some security profile features, such as URL filters under web-filter, are not available for use in a global profile.

External threat feeds also support global profile setting by specifying the *g-* prefix. When the FortiGate is in multi-VDOM mode, a global threat feed will connect to the feed through one of the management VDOM's interfaces. A per-VDOM threat feed will connect to the feed through the specific VDOM's interfaces.

In a non-VDOM setup, a profile with a *g-* prefix is accepted and, when created, is applied in the root VDOM. If the FortiGate is changed to multi-VDOM mode, the *g-* profile will automatically be moved to the global VDOM.

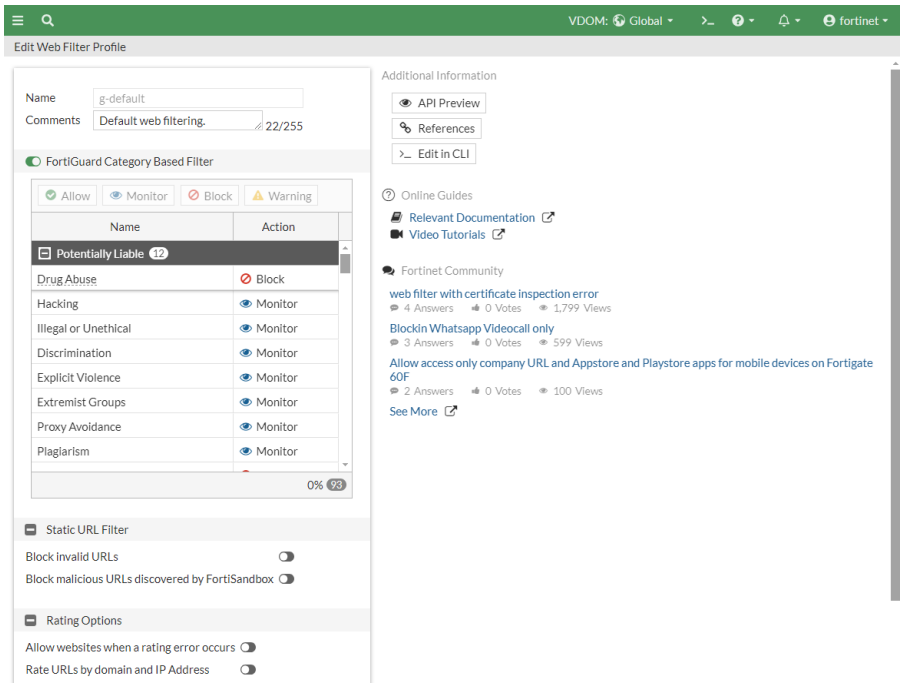
The following examples demonstrate configuring and editing Web Filter global security profiles. Similarly, you can view, edit, and configure other global security profiles for Antivirus, Application Control, Intrusion Prevention, and File Filter.

To configure a global security profile:

1. Go to *Security Profile* > *Web Filter*.
2. Click *Create new*.
3. Enter any suitable name that begins with *g-* and configure the web-filter settings required.
4. Click *OK*. This global web-filter is now available to be used in different VDOMs as required.

To view and edit a global security profile:

1. In the Global VDOM, go to *Security Profiles* > *Web Filter*. The names of the global web-filter security profile begins with *g-* for identification.
2. Select the default global web-filter profile named *g-default* and click *Edit*.
3. Under *FortiGuard Category Based Filter* select *Drug Abuse* and set the *Action* to *Block*.



4. Click *OK*.

Backing up and restoring configurations in multi-VDOM mode

When a FortiGate is in multi-VDOM mode, the configuration can be backed up or restored using the GUI or the CLI. Back up and restoration permissions depend on the VDOM administrator when in multi-VDOM mode:

- A global *super_admin* can back up and restore the global configuration or the configuration of a specific VDOM.
- A VDOM administrator of one VDOM can only back up and restore the configuration of the current VDOM.
- A VDOM administrator of multiple VDOMs can back up and restore the configuration of multiple VDOMs.

To back up the configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration* > *Backup*.
2. Select *VDOM* for the *Scope*. The *VDOM* dropdown menu is displayed.
3. Select the VDOM you want to back up.
4. Direct the backup to your *Local PC* or to a *USB Disk*.

5. Enable *Encryption*.

This is recommended to secure your backup configurations and prevent unauthorized parties from reloading your configuration.

6. Enter a password, and enter it again to confirm it. This password will be required to restore the configuration.
7. Click *OK*.
8. When prompted, select a location on the PC or USB disk to save the configuration file. The configuration file will have a .conf extension.

To restore the FortiGate configuration using the GUI:

1. Click on the user name in the upper right-hand corner of the screen and select *Configuration* > *Restore*.
2. Select *VDOM* for the *Scope*. The *VDOM* dropdown menu is displayed.
3. Select the VDOM that you want to restore the configuration for.
4. Identify the source of the configuration file to be restored: your *Local PC* or a *USB Disk*.
   The *USB Disk* option will not be available if no USB drive is inserted in the USB port. You can restore from the FortiManager using the CLI.
5. Click *Upload*, locate the configuration file, and click *Open*.

Confirm that the configuration file you are uploading is for the same VDOM selected from the dropdown menu.

6. Enter the password if required.
7. Click *OK*.

Backing up configurations in the CLI

Configuration backups can be performed in the CLI using the `execute backup` commands. If you are backing up a VDOM configuration instead of the global configuration, first enter the commands:

```
config vdom
    edit <vdom_name>
```

Configurations can be backed up in FortiOS and YAML format.

Configuration files can be backed up to various locations depending on the command:

- `flash`: Backup the configuration file to the flash drive.
- `ftp`: Backup the configuration file to an FTP server.
- `sftp`: Backup the configuration file to a SFTP server.
- `tftp`: Backup the configuration file to a TFTP server.
- `usb`: Backup the configuration file to an external USB drive.

Command	Description
`# execute backup config`	Back up the configuration in FortiOS format. Backup your configuration file to: • `flash` • `ftp` • `sftp` • `tftp` • `usb`
`# execute backup full-config`	Backup the configuration, including backups of default configuration settings. Backup your configuration file to: • `ftp` • `sftp` • `tftp` • `usb`
`# execute backup yaml-config`	Backup the configuration in YAML format. Backup your configuration file to: • `ftp` • `tftp`

To back up the configuration in FortiOS format using the CLI:

For FTP, note that port number and username are optional depending on the FTP site:

```
config vdom
    edit <vdom_name>
        execute backup config ftp <backup_filename> <ftp_server>[<:ftp_port>] [<user_name>]
[<password>] [<backup_password>]
```

or for TFTP:

```
config vdom
    edit <vdom_name>
        execute backup config tftp <backup_filename> <tftp_servers> [<backup_password>]
```

or for SFTP:

```
config vdom
    edit <vdom_name>
        execute backup config sftp <backup_filename> <sftp_server>[<:sftp_port>] <user> <password>
[<backup_password>]
```

or for an external USB:

```
config vdom
    edit <vdom_name>
        execute backup config usb <backup_filename> [<backup_password>]
```

To back up the configuration in YAML format using the CLI:

For FTP:

```
config vdom
    edit <vdom_name>
        execute backup yaml-config ftp <file_path> <ftp_server>[<:port>] [<user_name>] [<FTP
password>]
```

or for TFTP:

```
config vdom
    edit <vdom_name>
        execute backup yaml-config tftp <file_path> <tftp_server>
```

Restoring configurations in the CLI

Restoring configurations can be performed in the CLI using the `execute restore` command. If you are restoring a VDOM configuration instead of the global configuration, first enter the commands:

```
config vdom
    edit <vdom_name>
```

When restoring a VDOM configuration, ensure that the configuration file is for the correct VDOM specified.

Command	Description
`# execute restore config`	Restore a configuration that is in FortiOS or YAML format. Configurations can be loaded from: • `dhcp`: Load the configuration though DHCP. • `flash`: Load the configuration file from flash to firewall. • `ftp`: Load the configuration file from an FTP server. • `tftp`: Load the configuration from a TFTP server. • `usb`: Load the configuration file from an external USB disk to firewall.

To restore the FortiGate configuration in FortiOS or YAML format using the CLI:

For FTP, note that port number and username are optional depending on the FTP site:

```
config vdom
    edit <vdom_name>
        execute restore config ftp <file_path> <ftp_server>[<:port>] [<user_name>] [<FTP
password>] [<password>]
```

or for TFTP:

```
config vdom
    edit <vdom_name>
        execute restore config tftp <file_name> <tftp_server> [<password>]
```

or for DHCP:

```
config vdom
    edit <vdom_name>
        execute restore config dhcp <port> [<VLAN_ID>]
```

or for flash:

```
config vdom
    edit <vdom_name>
        execute restore config flash <revision_ID>
```

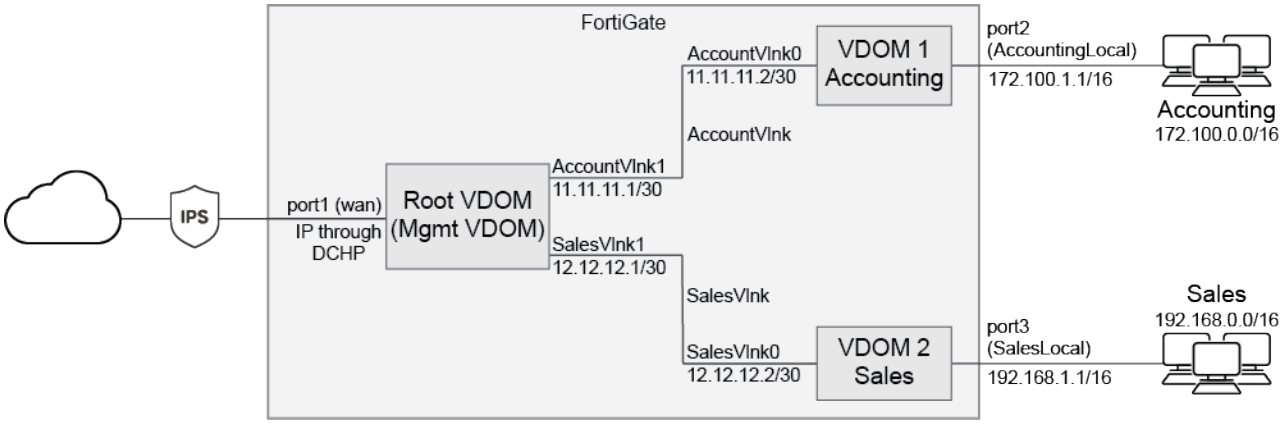
or for an external USB:

```
config vdom
    edit <vdom_name>
        execute restore config usb <file_name> [<password>]
```

Inter-VDOM routing configuration example: Internet access

This example shows how to configure a FortiGate unit to use inter-VDOM routing to route outgoing traffic from individual VDOMs to a root VDOM with Internet access. See Inter-VDOM routing on page 3137 for more information.

Two departments of a company, Accounting and Sales, are connected to one FortiGate. The company uses a single ISP to connect to the Internet. This is an example of the Internet access configuration. See Topologies on page 3129 for details.



This example assumes that the interfaces of the FortiGate have already been configured with the IP addresses depicted in the preceding diagram.

General steps for this example

This example includes the following general steps. We recommend following the steps in the order below:

1. Enable multi-VDOM mode and create the VDOMs on page 3146
2. Assign interfaces to VDOMs on page 3146
3. Configure the VDOM links on page 3147

4. Configure inter-VDOM routing on page 3148
5. Configure the firewall policies on page 3149
6. Test the configuration on page 3151

This example demonstrates how to configure these steps first using the GUI and then, at the end of the section, using the CLI. See Configuration with the CLI on page 3151 for details.

Enable multi-VDOM mode and create the VDOMs

Create the Accounting and Sales VDOMs.

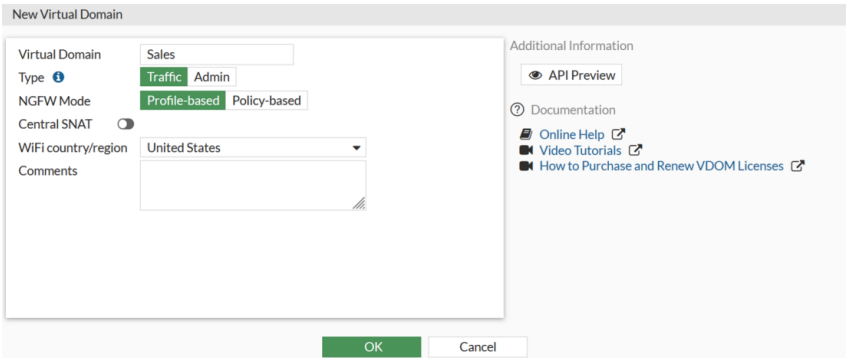
To enable VDOMs in the GUI:

1. Go to *System* > *Settings*.
2. In the *System Operation Settings* section, enable *Virtual Domains*.
3. Click *OK*.

On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

To create the Sales and Accounting VDOMs in the GUI:

1. In the *Global* VDOM, go to *System* > *VDOM*.
2. Click *Create New*.
3. In the *Virtual Domain* field, enter *Sales*.



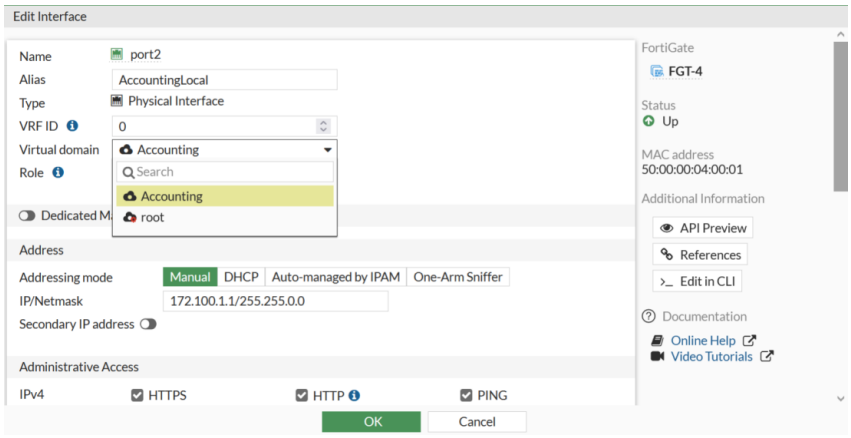
4. If required, set the *NGFW Mode*. If the *NGFW Mode* is *Profile-based*, *Central SNAT* can be enabled.
5. Click *OK* to create the VDOM.
6. Repeat the above steps for *Accounting*.

Assign interfaces to VDOMs

This example uses three interfaces on the FortiGate unit: port2 (AccountingLocal), port3 (SalesLocal), and port1 (WAN). Port2 and port3 interfaces each have a department's network connected. Port1 is for all traffic to and from the Internet and uses DHCP to configure its IP address, which is common with many ISPs.

To assign interfaces to VDOMs in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select *port2* and click *Edit*.
3. From the *Virtual domain* list, select *Accounting*.



4. Click *OK*.
5. Repeat the preceding steps to assign *port3* to the *Sales* VDOM.
6. Repeat the preceding steps to assign *port1* to the *root* VDOM.

Configure the VDOM links

To complete the connection between each VDOM and the management VDOM, add the two VDOM links. One pair is the Accounting – management link and the other is the Sales – management link. Each side of these links will be assigned IP addresses since they will be handy in configuring inter-VDOM routing in the next step.

To configure the Accounting and management VDOM link in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select *Create New* > *VDOM Link*.
3. Enter the following information:

Name		AccountVlnk
Interface 0		
	Virtual Domain	Accounting
	IP/Netmask	11.11.11.2/255.255.255.252
	Administrative Access	HTTPS, PING, SSH
	Comment	Accounting side of the VDOM link
Interface 1		
	Virtual Domain	root

	IP/Netmask	11.11.11.1/255.255.255.252
	Administrative Access	HTTPS, PING, SSH
	Comment	Management side of the VDOM link

4. Click *OK*.

To configure the Sales and management VDOM link in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select *Create New* > *VDOM link*.
3. Enter the following information:

Name		SalesVlnk
Interface 0		
	Virtual Domain	Sales
	IP/Netmask	12.12.12.2/255.255.255.252
	Administrative Access	HTTPS, PING, SSH
	Comment	Accounting side of the VDOM link
Interface 1		
	Virtual Domain	root
	IP/Netmask	12.12.12.1/255.255.255.252
	Administrative Access	HTTPS, PING, SSH
	Comment	Management side of the VDOM link

4. Click *OK*.

Configure inter-VDOM routing

A default static route can be configured on each VDOM to provide Internet access. In other words, this static route would provide inter-VDOM routing between each department VDOM and the root VDOM.

For this static route, these settings are used:

- Default Gateway: IP address of the management side of the VDOM link
  - Accounting VDOM: 11.11.11.1
  - Sales VDOM: 12.12.12.1
- Interface: Interface on the department VDOM side of the VDOM link
  - Accounting VDOM: AccountVlnk0
  - Sales VDOM: SalesVlnk0
- IP address: 0.0.0.0/0.0.0.0 (default)

To configure the default static route to the Internet in the Accounting VDOM:

1. In the *Accounting* VDOM, go to *Network* > *Static Routes*.
2. Click on *Create New* and select the version you need.
3. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	11.11.11.1
Interface	AccountVlink0
Administrative Distance	10

4. Click *OK*.

To configure the default static route to the Internet in the Sales VDOM:

1. In the *Sales* VDOM, go to *Network* > *Static Routes*.
2. Click on *Create New* and select the version you need.
3. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	12.12.12.1
Interface	SalesVlink0
Administrative Distance	10

4. Click *OK*.

Configure the firewall policies

With the VDOMs, physical interfaces, VDOM links, and static routes configured, the firewall must now be configured to allow the proper traffic. Firewalls are configured per-VDOM, and firewall objects and routes must be created for each VDOM separately.

To configure the firewall policies from AccountingLocal to Internet in the GUI:

1. In the *Accounting* VDOM, go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Account-Local-to-Management
Incoming Interface	port2
Outgoing Interface	AccountVlnk0

Source	All
Destination	All
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

4. Click *OK*.
5. In the *root* VDOM, go to *Policy & Objects > Firewall Policy*.
6. Click *Create New*.
7. Enter the following information:

Name	Account-VDOM-to-Internet
Incoming Interface	AccountVlnk1
Outgoing Interface	port1
Source	All
Destination	All
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

8. Click *OK*.

To configure the firewall policies from SalesLocal to Internet in the GUI:

1. In the *Sales* VDOM, go to *Policy & Objects > Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Sales-Local-to-Management
Incoming Interface	port3
Outgoing Interface	SalesVlnk0
Source	All
Destination	All
Schedule	always
Service	ALL
Action	ACCEPT

NAT	enabled

4. Click *OK*.
5. In the *root* VDOM, go to *Policy & Objects* > *Firewall Policy*.
6. Click *Create New*.
7. Enter the following information:

Name	Sales-VDOM-to-Internet
Incoming Interface	SalesVlnk1
Outgoing Interface	port1
Source	All
Destination	All
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

8. Click *OK*.

Test the configuration

When the inter-VDOM routing has been configured, test the configuration to confirm proper operation. Testing connectivity ensures that physical networking connections, FortiGate unit interface configurations, and firewall policies are properly configured.

The easiest way to test connectivity is to use the `ping` and `traceroute` commands on hosts in the Accounting and Sales networks, respectively, to confirm the connectivity of different routes on the network. Test connectivity with hosts connected to port2 (AccountingLocal) in the Accounting VDOM to the internet and hosts connected to port3 (SalesLocal) in the Sales VDOM to the internet.

Configuration with the CLI

The example can also be configured in the CLI.

To configure inter-VDOM routing in the CLI:

1. Enable multi-VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the device when VDOM mode is enabled.

2. Create the Sales and Accounting VDOMs:

```
config vdom
    edit Accounting
    next
    edit Sales
    next
end
```

3. Assign interfaces to the VDOMs:

```
config global
    config system interface
        edit port2
            set vdom Accounting
        next
        edit port3
            set vdom Sales
        next
        edit port1
            set vdom root
        next
    end
end
```

4. Configure the Accounting and management VDOM link:

```
config global
    config system vdom-link
        edit AccountVlnk
        next
    end
    config system interface
        edit AccountVlnk0
            set vdom Accounting
            set ip 11.11.11.2 255.255.255.252
            set allowaccess https ping ssh
            set description "Accounting side of the VDOM link"
        next
        edit AccountVlnk1
            set vdom root
            set ip 11.11.11.1 255.255.255.252
            set allowaccess https ping ssh
            set description "Management side of the VDOM link"
        next
    end
end
```

5. Configure the Sales and management VDOM link:

```
config global
    config system vdom-link
        edit SalesVlnk
        next
```

```
    end
    config system interface
        edit SalesVlnk0
            set vdom Sales
            set ip 12.12.12.2 255.255.255.252
            set allowaccess https ping ssh
            set description "Sales side of the VDOM link"
        next
        edit SalesVlnk1
            set vdom root
            set ip 12.12.12.1 255.255.255.252
            set allowaccess https ping ssh
            set description "Management side of the VDOM link"
        next
    end
end
```

6. Configure the default static route to the Internet in the Accounting VDOM:

```
config vdom
    edit Accounting
    config router static
        edit 1
            set gateway 11.11.11.1
            set device "AccountVlnk0"
        next
    end
end
```

7. Configure the default statis route to the Internet in the Sales VDOM:

```
config vdom
    edit Sales
    config router static
        edit 1
            set gateway 12.12.12.1
            set device "SalesVlnk0"
        next
    end
end
```

8. Configure the firewall policies from AccountingLocal to the Internet:

```
config vdom
    edit Accounting
        config firewall policy
            edit 1
                set name "Accounting-Local-to-Management"
                set srcintf port2
                set dstintf AccountVlnk0
                set srcaddr all
                set dstaddr all
```

```
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
    edit root
        config firewall policy
            edit 2
                set name "Accounting-VDOM-to-Internet"
                set srcintf AccountVlnk1
                set dstintf port1
                set srcaddr all
                set dstaddr all
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
end
```

9. Configure the firewall policies from SalesLocal to the Internet:

```
config vdom
    edit Sales
        config firewall policy
            edit 3
                set name "Sales-local-to-Management"
                set srcintf port3
                set dstintf SalesVlnk0
                set srcaddr all
                set dstaddr all
                set action accept
                set schedule always
                set service ALL
                set nat enable
            next
        end
    next
    edit root
        config firewall policy
            edit 4
                set name "Sales-VDOM-to-Internet"
                set srcintf SalesVlnk1
                set dstintf port1
                set srcaddr all
                set dstaddr all
                set action accept
                set schedule always
```

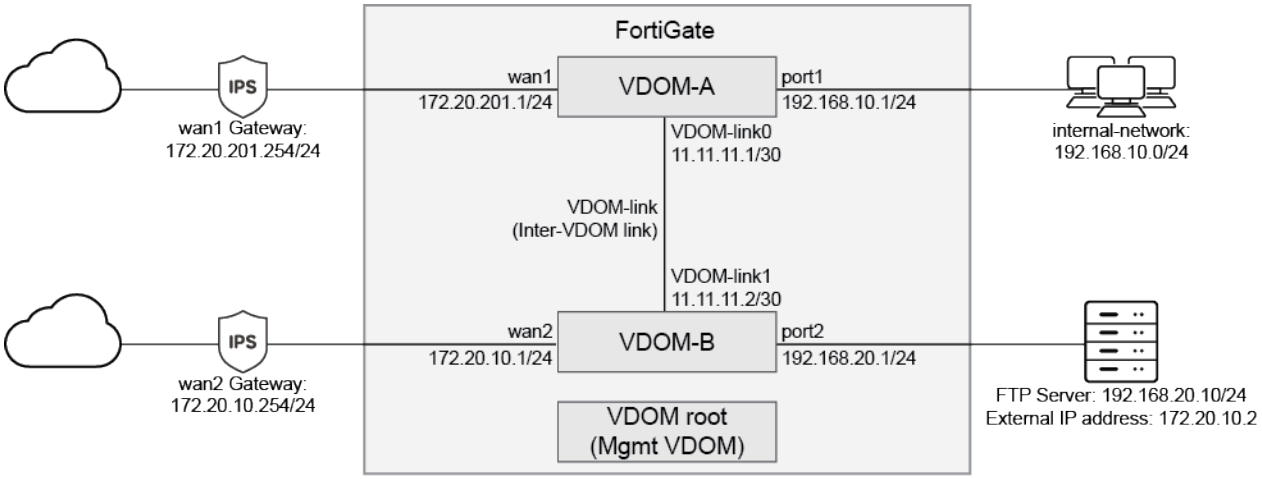
```
                set service ALL
                set nat enable
            next
        end
    next
end
```

Inter-VDOM routing configuration example: Partial-mesh VDOMs

This example shows how to configure a FortiGate unit to use inter-VDOM routing to route traffic between an internal network and FTP server that are each behind separate VDOMs. See Inter-VDOM routing on page 3137 for more information.

The following example shows how to configure per-VDOM settings, such as operation mode, routing, and firewall policies, in a network that includes the following VDOMs:

- VDOM-A: allows the internal network to access the Internet.
- VDOM-B: allows external connections to an FTP server.
- root: the management VDOM.



You can use VDOMs in either NAT or transparent mode on the same FortiGate. By default, VDOMs operate in NAT mode. In this example, both VDOM-A and VDOM-B use NAT mode. An inter-VDOM link is created and inter-VDOM routes configured to allow users on the internal network to access the FTP server.

This is an example of the partial-mesh VDOMs configuration since only VDOM-A is connected to VDOM-B but neither of those VDOMs are connected to the root VDOM. See Topologies on page 3129 for details.

This example assumes that the interfaces of the FortiGate have already been configured with the IP addresses depicted in the preceding diagram.

General steps for this example

This configuration requires the following general steps:

1. Enable Multi-VDOM mode and create the VDOMs on page 3156
2. Assign interfaces to VDOMs on page 3157
3. Configure VDOM-A on page 3157
4. Configure VDOM-B on page 3158
5. Configure the VDOM link on page 3160
6. Configure inter-VDOM routing on page 3161
7. Configure firewall policies using the VDOM link on page 3162

This example demonstrates how to configure these steps first using the GUI and then, at the end of the section, using the CLI. See Configuration with the CLI on page 3163 for details.

Enable Multi-VDOM mode and create the VDOMs

Multi-VDOM mode can be enabled in the GUI or CLI. Enabling it does not require a reboot, but does log you out of the device. The current configuration is assigned to the root VDOM.

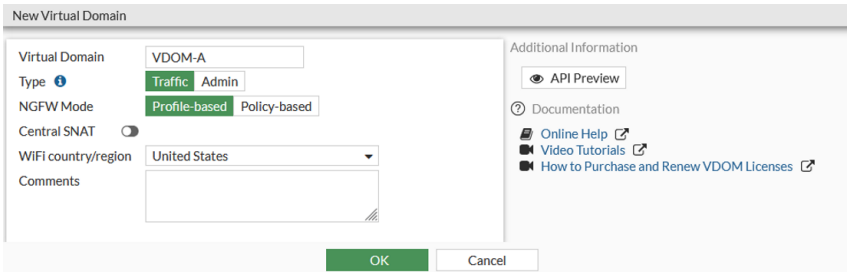
On FortiGate 90 series models and lower, VDOMs can only be enabled using the CLI.

To enable multi-VDOM mode in the GUI:

1. On the FortiGate, go to *System* > *Settings*.
2. In the *System Operation Settings* section, enable *Virtual Domains*.
3. Click *OK*.

To create the VDOMs in the GUI:

1. In the *Global* VDOM, go to *System* > *VDOM*.
   Click *Create New*.
2. In the *Virtual Domain* field, enter *VDOM-A*.



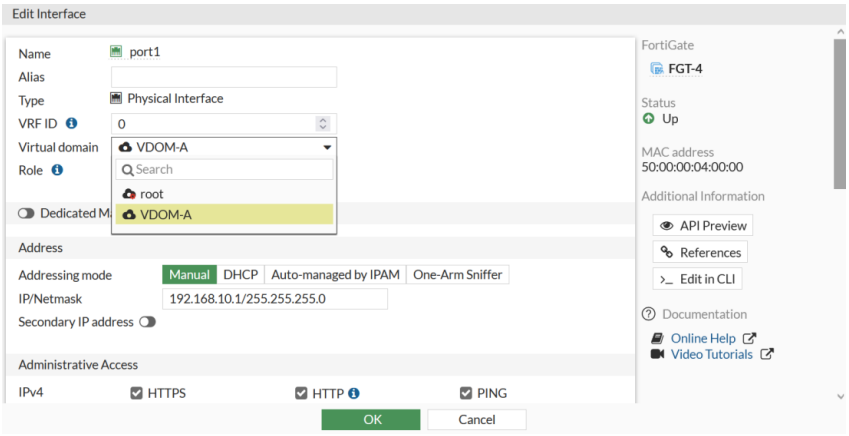
3. If required, set the *NGFW Mode*. If the *NGFW Mode* is *Profile-based*, *Central SNAT* can be enabled.
4. Click *OK* to create the VDOM.
5. Repeat the above steps for *VDOM-B*.

Assign interfaces to VDOMs

This example uses three interfaces on the FortiGate unit: port1 (internal network), port2 (FTP server), wan1 (WAN link for VDOM-A), and wan2 (WAN link for VDOM-B). The port1 and port2 interfaces are connected to the internal network and FTP server, respectively. The wan1 and wan2 interfaces are static assigned with IP addresses and default gateways provided by the ISPs for those WAN links.

To assign interfaces to VDOMs in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Select *port1* and click *Edit*.
3. From the *Virtual domain* list, select *VDOM-A*.



4. Click *OK*.
5. Repeat the preceding steps to assign *port2* to *VDOM-B*.
6. Repeat the preceding steps to assign *wan1* to *VDOM-A*.
7. Repeat the preceding steps to assign *wan2* to *VDOM-B*.

Configure VDOM-A

VDOM-A allows connections from devices on the internal network to the Internet. WAN1 and port1 are assigned to this VDOM.

The per-VDOM configuration for VDOM-A includes the following:

- A firewall address for the internal network
- A static route to the ISP gateway
- A firewall policy allowing the internal network to access the Internet

All procedures in this section require you to connect to VDOM-A, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Enter the following information:

Name	internal-network
Type	Subnet
IP/Netmask	192.168.10.0/255.255.255.0
Interface	port1

4. Click *OK*.

To add a default route in the GUI:

1. Go to *Network* > *Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.201.254
Interface	wan1
Administrative Distance	10

3. Click *OK*.

To add the firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	VDOM-A-Internet
Incoming Interface	port1
Outgoing Interface	wan1
Source	internal-network
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT
NAT	enabled

4. Click *OK*.

Configure VDOM-B

VDOM-B allows external connections to reach an internal FTP server. WAN2 and port2 are assigned to this VDOM.

The per-VDOM configuration for VDOM-B includes the following:

- A firewall address for the FTP server
- A virtual IP address for the FTP server
- A static route to the ISP gateway
- A firewall policy allowing external traffic to reach the FTP server

The procedures described above require you to connect to VDOM-B, either using a global or per-VDOM administrator account.

To add the firewall addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Enter the following information:

Name	FTP-server
Type	Subnet
IP/Netmask	192.168.20.10/255.255.255.255
Interface	port2

4. Click *OK*.

To add the virtual IP address in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* and navigate to the *Virtual IP* tab.
2. Click *Create new*.
3. Enter the following information:

Name	FTP-server-VIP
Interface	wan2
External IP address/range	172.20.10.2
Map To	192.168.20.10

4. Click *OK*.

To add a default route in the GUI:

1. Go to *Network* > *Static Routes* and create a new route.
2. Enter the following information:

Destination	Subnet
IP address	0.0.0.0/0.0.0.0
Gateway	172.20.201.254
Interface	wan2

Administrative Distance	10

3. Click *OK*.

To add the firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Access-server
Incoming Interface	wan2
Outgoing Interface	port2
Source	all
Destination	FTP-server-VIP
Schedule	always
Service	FTP
Action	ACCEPT
NAT	enabled

4. Click *OK*.

Configure the VDOM link

The VDOM link allows connections from VDOM-A to VDOM-B. The VDOM link interface configured in this step will be used for inter-VDOM routing.

This step requires you to connect to the global VDOM using a global administrator account.

To add the VDOM link in the GUI:

1. In the *Global* VDOM, go to *Network* > *Interfaces*.
2. Create *New* > *VDOM link*.
3. Enter the following information:

Name	VDOM-link
Interface 0	
Virtual Domain	VDOM-A
IP/Netmask	11.11.11.1/255.255.255.252
Interface 1	
Virtual Domain	VDOM-B
IP/Netmask	11.11.11.2/255.255.255.252

4. Click *OK*.

Configure inter-VDOM routing

Inter-VDOM routing allows users on the internal network to route traffic to the FTP server through the FortiGate.

The configuration of inter-VDOM routing includes the following:

- Firewall addresses for the FTP server on VDOM-A and for the internal network on VDOM-B
- Inter-VDOM routing using static routes for the FTP server on VDOM-A and for the internal network on VDOM-B
- Policies allowing traffic using the VDOM link

The procedures described above require you to connect to both VDOM-A and VDOM-B, either using a global or per-VDOM administrator account.

To add the firewall address on VDOM-A in the GUI:

1. In the *VDOM-A* VDOM, go to *Policy & Objects* > *Addresses* and select Address.
2. Click *Create new*.
3. Enter the following information:

Name	FTP-server
Type	Subnet
IP/Netmask	192.168.20.10/32
Interface	VDOM-link2
Static route configuration	enabled

4. Click *OK*.

To add the static route on VDOM-A in the GUI:

1. Connect to *VDOM-A*.
2. Go to *Network* > *Static Routes* and create a new route.
3. Enter the following information:

Destination	Named Address
Named Address	FTP-server
Gateway	11.11.11.2
Interface	VDOM-link0

4. Click *OK*.

To add the firewall address on VDOM-B in the GUI:

1. In the *VDOM-B* VDOM, go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Enter the following information:

Name	internal-network
Type	Subnet
IP/Netmask	192.168.10.0/24
Interface	VDOM-link1
Static route configuration	enabled

4. Click *OK*.

To add the static route on VDOM-B in the GUI:

1. In the *VDOM-B* VDOM, go to *Network* > *Static Routes* and create a new route.
2. Enter the following information:

Destination	Named Address
Named Address	internal-network
Gateway	11.11.11.1
Interface	VDOM-link1

3. Click *OK*.

Configure firewall policies using the VDOM link

Firewall policies using the VDOM link allows users on the internal network to access the FTP server through the FortiGate.

Configuring policies allowing traffic using the VDOM link require you to connect to both VDOM-A and VDOM-B, respectively, either using a global or per-VDOM administrator account.

To add the firewall policy on VDOM-A in the GUI:

1. In the *VDOM-A* VDOM, go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Access-FTP-server
Incoming Interface	port1
Outgoing Interface	VDOM-link0
Source	internal-network

Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT
NAT	disabled

4. Click *OK*.

To add the firewall policy on VDOM-B in the GUI:

1. In the *VDOM-B* VDOM, go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter the following information:

Name	Internal-server-access
Incoming Interface	VDOM-link1
Outgoing Interface	port2
Source	internal-network
Destination	FTP-server
Schedule	always
Service	FTP
Action	ACCEPT
NAT	disabled

4. Click *OK*.

Configuration with the CLI

The example can also be configured in the CLI.

To configure the two VDOMs:

1. Enable multi-VDOM mode:

```
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the device when VDOM mode is enabled.

2. Create the VDOMs:

```
config vdom
    edit VDOM-A
```

```
    next
    edit VDOM-B
    next
end
```

3. Assign interfaces to the VDOMs:

```
config global
    config system interface
        edit port1
            set vdom VDOM-A
        next
        edit port2
            set vdom VDOM-B
        next
        edit wan1
            set vdom VDOM-A
        next
        edit wan2
            set vdom VDOM-B
        next
    end
end
```

4. Add the firewall addresses to VDOM-A:

```
config vdom
    edit VDOM-A
        config firewall address
            edit internal-network
                set associated-interface port1
                set subnet 192.168.10.0 255.255.255.0
            next
        end
    next
end
```

5. Add a default route to VDOM-A:

```
config vdom
    edit VDOM-A
        config router static
            edit 0
                set gateway 172.20.201.254
                set device wan1
            next
        end
    next
end
```

6. Add the firewall policy to VDOM-A:

```
config vdom
    edit VDOM-A
        config firewall policy
            edit 1
                set name "VDOM-A-Internet"
                set srcintf "port1"
                set dstintf "wan1"
                set srcaddr "internal-network"
                set dstaddr "all"
                set action accept
                set schedule "always"
                set service "ALL"
                set nat enable
            next
        end
    next
end
```

7. Add the firewall addresses to VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall address
            edit FTP-server
                set associated-interface port2
                set subnet 192.168.20.10 255.255.255.255
            next
        end
    next
end
```

8. Add the virtual IP address to VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall vip
            edit FTP-server-VIP
                set extip 172.20.10.2
                set extintf wan2
                set mappedip 192.168.20.10
            next
        end
    next
end
```

9. Add a default route to VDOM-B:

```
config vdom
    edit VDOM-B
        config router static
            edit 0
                set gateway 172.20.10.254
```

```
                set device wan2
            next
        end
    next
end
```

10. Add the firewall policy to VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall policy
            edit 1
                set name "Access-server"
                set srcintf "wan2"
                set dstintf "port2"
                set srcaddr "all"
                set dstaddr "FTP-server-VIP"
                set action accept
                set schedule "always"
                set service "FTP"
                set nat enable
            next
        end
    next
end
```

To configure the VDOM link:

1. Configure the VDOM link:

```
config global
    config system vdom-link
        edit "VDOM-link"
        next
    end
    config system interface
        edit VDOM-link0
            set vdom VDOM-A
            set ip 11.11.11.1 255.255.255.252
            set allowaccess https ping ssh
            set description "VDOM-A side of the VDOM link"
        next
        edit VDOM-link1
            set vdom VDOM-B
            set ip 11.11.11.2 255.255.255.252
            set allowaccess https ping ssh
            set description "VDOM-A side of the VDOM link"
        next
    end
end
```

2. Configure the firewall addresses on VDOM-A:

```
config vdom
    edit VDOM-A
        config firewall address
            edit "FTP-server"
                set associated-interface "VDOM-link0"
                set allow-routing enable
                set subnet 192.168.20.10 255.255.255.255
            next
        end
    next
end
```

3. Add the firewall policy to VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall policy
            edit 1
                set name "Access-server"
                set srcintf "wan2"
                set dstintf "port2"
                set srcaddr "all"
                set dstaddr "FTP-server-VIP"
                set action accept
                set schedule "always"
                set service "FTP"
                set nat enable
            next
        end
    next
end
```

4. Add the static route on VDOM-A:

```
config vdom
    edit VDOM-A
        config router static
            edit 0
                set device VDOM-link0
                set dstaddr FTP-server
                set gateway 11.11.11.2
            next
        end
    next
end
```

5. Configure the firewall addresses on VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall address
            edit internal-network
```

```
                set associated-interface VDOM-link1
                set allow-routing enable
                set subnet 192.168.10.0 255.255.255.0
            next
        end
    next
end
```

6. Add the static route on VDOM-B:

```
config vdom
    edit VDOM-B
        config router static
            edit 0
                set device VDOM-link1
                set dstaddr internal-network
                set gateway 11.11.11.1
            next
        end
    next
end
```

7. Add the security policy on VDOM-A:

```
config vdom
    edit VDOM-A
        config firewall policy
            edit 0
                set name Access-FTP-server
                set srcintf port1
                set dstintf VDOM-link0
                set srcaddr internal-network
                set dstaddr FTP-server
                set action accept
                set schedule always
                set service FTP
            next
        end
    next
end
```

8. Add the firewall policy on VDOM-B:

```
config vdom
    edit VDOM-B
        config firewall policy
            edit 0
                set name Internal-server-access
                set srcintf VDOM-link1
                set dstintf port2
                set srcaddr internal-network
                set dstaddr FTP-server
```

```
                set action accept
                set schedule always
                set service FTP
            next
        end
    next
end
```

High Availability

Whether your FortiGate is used as a security gateway, an internal segmentation firewall, in the cloud, or in an MSSP environment, as long as there is critical traffic passing through it, there is risk of it being a single point of failure. Physical outages can occur due to power failures, physical link failures, transceiver failures, or power supply failures. Non-physical outages can be caused by routing, resource issues, or kernel panic.

Network outages cause disruptions to business operations, downtime, and frustration for users and in some situations may have financial setbacks. In designing your network and architecture, it is important to weigh the risks and consequences associated with unexpected outages.

There are many ways to build redundancy and resiliency. In a switching network, you can accomplish this by adding redundant links and switches in partial or full mesh topologies. Using redundant and aggregate links, you can avoid a single link failure causing a network to go down. Using SD-WAN, you can build redundant and intelligent WAN load balancing and failover architectures.

FortiGate HA offers several solutions for adding redundancy in the case where a failure occurs on the FortiGate, or is detected by the FortiGate through monitored links, routes, and other health checks. These solutions support fast failover to avoid lengthy network outages and disruptions to your traffic.

FortiGate Clustering Protocol (FGCP)

FGCP provides a solution for two key requirements of critical enterprise networking components: enhanced reliability and increased performance. Enhanced reliability is achieved through device failover protection, link failover protection, and remote link failover protection. Session failover protection for most IPv4 and IPv6 sessions also contributes to enhanced reliability. Increased performance is achieved though active-active HA load balancing.

FortiGate Session Life Support Protocol (FGSP)

In a network that already includes load balancing (either with load balancers or routers) for traffic redundancy, two entities (either standalone FortiGates or FGCP clusters) can be integrated into the load balancing configuration using the FortiGate Session Life Support Protocol (FGSP). The external load balancers or routers can distribute sessions among the FortiGates and the FGSP performs session synchronization of IPv4 and IPv6 TCP, SCTP, UDP, ICMP, expectation, and NAT sessions to keep the

session tables of both entities synchronized. In the event of a failure, the load balancer can detect the failed unit and failover the sessions to other active members to continue processing the traffic.

VRRP

FortiGates can function as primary or backup Virtual Router Redundancy Protocol (VRRP) routers. The FortiGates can quickly and easily integrate into a network that has already deployed VRRP. A FortiGate can be integrated into a VRRP group with any third-party VRRP devices, and VRRP can provide redundancy between multiple FortiGates. FortiOS supports VRRP version 2 and 3.

The following topics provide more information about each HA solution and other HA related topics:

- FGCP on page 3170

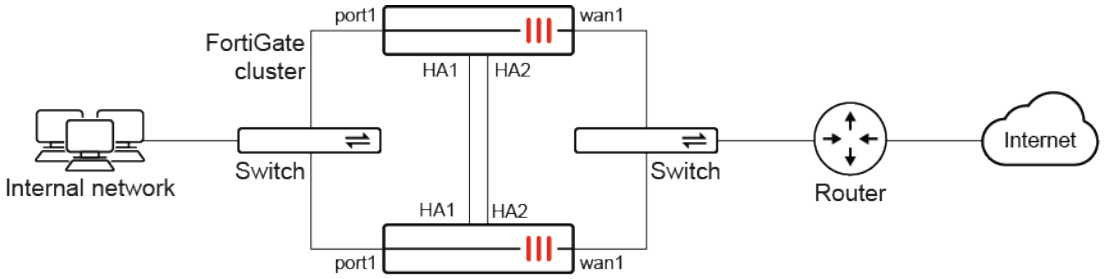
FGCP

High availability (HA) is usually required in a system where there is high demand for little downtime. There are usually hot-swaps, backup routes, or standby backup units and as soon as the active entity fails, backup entities will start functioning. This results in minimal interruption for the users.

The FortiGate Clustering Protocol (FGCP) is a proprietary HA solution whereby FortiGates can find other member FortiGates to negotiate and create a cluster. A FortiGate HA cluster consists of at least two FortiGates (members) configured for HA operation. All FortiGates in the cluster must be the same model and have the same firmware installed. Cluster members must also have the same hardware configuration (such as the same number of hard disks). All cluster members share the same configurations except for their host name and priority in the HA settings. The cluster works like a device but always has a hot backup device.



All FortiGates that are in the same HA cluster must be registered under the same FortiCare account. Registering cluster members to different FortiCare accounts will result in licensing issues and potential downtime.

Critical cluster components

The following are critical components in an HA cluster:

- Identical heartbeat connections and interfaces: members will use this to communicate with each other. In general, a two-member cluster is most common. We recommend double back-to-back heartbeat connections (as demonstrated in the topology).
- Identical connections for internal and external interfaces: we recommend similar connections from each member to the switches for the cluster to function properly (as demonstrated in the topology).

The HA heartbeat interface communicates with each unit in the cluster using the same heartbeat interface for each member.

For example, if port1 and port2 are the heartbeat interfaces for the HA cluster, then in a cluster consisting of two members:

- port1 of the primary FortiGate should be connected to port1 of the secondary FortiGate.
- port2 of the primary FortiGate should be connected to port2 of the secondary FortiGate.

General operation

The following are best practices for general cluster operation:

- Ensure that heartbeat communication is present (see HA heartbeat interface on page 3175).
- Enable the session synchronization option in daily operation (see FGSP basic peer setup on page 3276).
- Monitor traffic flowing in and out of the interfaces.

Failover

FGCP provides failover protection in the following scenarios:

- The active device loses power.
- A monitored interface loses a connection.

After failover occurs, the user will not notice any difference, except that the active device has changed. See Failover protection on page 3173 for more information.

Synchronizing the configuration

FGCP uses a combination of incremental and periodic synchronization to make sure that the configuration of all cluster units is synchronized to that of the primary unit.

The following settings are not synchronized between cluster units:

- The FortiGate host name
- GUI Dashboard widgets
- HA override
- HA device priority
- The virtual cluster priority
- The HA priority setting for a ping server (or dead gateway detection) configuration

- The system interface settings of the HA reserved management interface
- The HA default route for the reserved management interface, set using the `ha-mgmt-interface-gateway` option of the `config system ha` command

Most subscriptions and licenses are not synchronized, as each FortiGate must be licensed individually. FortiToken Mobile is an exception; they are registered to the primary unit and synchronized to the secondary units.

The primary unit synchronizes all other configuration settings, including the other HA configuration settings.

All synchronization activity takes place over the HA heartbeat link using TCP/703 and UDP/703 packets.

Failover protection

The FortiGate Clustering Protocol (FGCP) provides failover protection, meaning that a cluster can provide FortiGate services even when one of the devices in the cluster encounters a problem that would result in the complete loss of connectivity for a stand-alone FortiGate unit. Failover protection provides a backup mechanism that can be used to reduce the risk of unexpected downtime, especially in mission-critical environments.

FGCP supports failover protection in four ways:

1. If a link fails.
2. If a device loses power.
3. If an SSD fails.
4. If memory utilization exceeds the threshold for a specified amount of time.

When session-pickup is enabled in the HA settings, existing TCP session are kept, and users on the network are not impacted by downtime as the traffic can be passed without reestablishing the sessions.

When and how the failover happens

1. Link fails

Before triggering a failover when a link fails, the administrator must ensure that monitor interfaces are configured. Normally, the internal interface that connects to the internal network, and an outgoing interface for traffic to the internet or outside the network, should be monitored. Any of those links going down will trigger a failover.

2. Loss of power for active unit

When an active (primary) unit loses power, a backup (secondary) unit automatically becomes the active, and the impact on traffic is minimal. There are no settings for this kind of fail over.

3. SSD failure

An HA failover can be triggered by an SSD failure.

To enable an SSD failure triggering HA fail over:

```
config system ha
    set ssd-failover enable
end
```

4. Memory utilization

An HA failover can be triggered when memory utilization exceeds the threshold for a specific amount of time.

Memory utilization is checked at the configured sample rate (`memory-failover-sample-rate`). If the utilization is above the threshold (`memory-failover-threshold`) every time that it is sampled for the entire monitor period (`memory-failover-monitor-period`), then a failover is triggered.

If the FortiGate meets the memory utilization conditions to cause failover, but the last memory triggered failover happened within the timeout period (`memory-failover-flip-timeout`), then the failover does not occur. Other HA cluster members can still trigger memory based failovers if they meet the criteria and have not already failed within the timeout period.

After a memory based failover from FortiGate A to FortiGate B, if the memory usage on FortiGate A goes down below the threshold but the memory usage on FortiGate B is still below the threshold, then a failover is triggered, and FortiGate A becomes the primary device.

When you disable memory based failover, a new HA primary selection occurs to determine the primary device.

To configure memory based HA failover:

```
config system ha
    set memory-based-failover {enable | disable}
    set memory-failover-threshold <integer>
    set memory-failover-monitor-period <integer>
    set memory-failover-sample-rate <integer>
    set memory-failover-flip-timeout <integer>
end
```

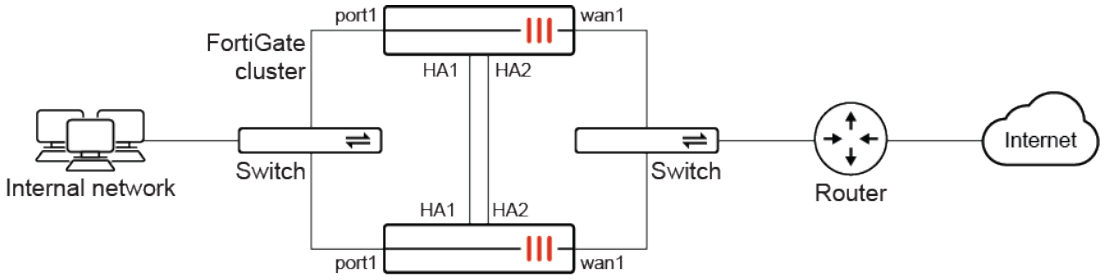
`memory-based-failover {enable | disable}`	Enable/disable memory based failover (default = disable).
`memory-failover-threshold <integer>`	The memory usage threshold to trigger a memory based failover, in percentage (0 - 95, 0 = use the conserve mode threshold, default = 0).
`memory-failover-monitor-period <integer>`	The duration of the high memory usage before a memory based failover is triggered, in seconds (1 - 300, default = 60).
`memory-failover-sample-rate <integer>`	The rate at which memory usage is sampled in order to measure memory usage, in seconds (1 - 60, default = 1).
`memory-failover-flip-timeout <integer>`	The time to wait between subsequent memory based failovers, in minutes (6 - 2147483647, default = 6).

Configuring HA failover time

On supported models, the HA heartbeat interval unit can be changed from the 100ms default to 10ms. This allows for a failover time of less than 50ms, depending on the configuration and the network.

```
config system ha
    set hb-interval-in-milliseconds {100ms | 10ms}
end
```

In this example, the HA heartbeat interval unit is changed from 100ms to 10ms. As the default heartbeat interval is two, this means that a heartbeat is sent every 20ms. The number of lost heartbeats that signal a failure is also changed to two. So, after two consecutive heartbeats are lost, a failover will be detected in 40ms.



To configure the HA failover time:

```
config system ha
    set group-id 240
    set group-name "300D"
    set mode a-p
    set hbdev "port3" 50 "port5" 100
    set hb-interval 2
    set hb-interval-in-milliseconds 10ms
    set hb-lost-threshold 2
    set override enable
    set priority 200
end
```

HA heartbeat interface

The HA heartbeat allows cluster units to communicate with each other. The heartbeat consists of hello packets that are sent at regular intervals by the heartbeat interface of all cluster units. The hello packets describe the state of the cluster unit (including communication sessions) and are used by other cluster units to keep the cluster synchronized. While the cluster is operating, the HA heartbeat confirms that all cluster units are functioning normally.

HA heartbeat packets are Layer 2 Ethernet frames that use EtherType values of 0x8890 and 0x8891 rather than 0x0800 for normal 802.3 IP packets. The default time interval between HA heartbeats is 200 ms.

As a best practice, it is recommended to isolate the heartbeat devices from the user networks by connecting the heartbeat devices to a dedicated switch that is not connected to any network. The heartbeat packets contain sensitive information about the cluster configuration and may use a considerable amount of network bandwidth. If the cluster consists of two FortiGates, connect the heartbeat device interfaces back-to back using a crossover cable. If there are more than two FortiGates, each heartbeat interface should be connected to a dedicated switch. For example, in a four-member HA cluster with two heartbeat interfaces, there would be two switches (one switch dedicated to each interface).

Upon starting up, a FortiGate configured for HA broadcasts HA heartbeat hello packets from its HA heartbeat interface to find other FortiGates configured to operate in HA mode. If two or more FortiGates operating in HA mode connect with each other, they compare HA configurations (mode, password, and group ID). If the HA configurations match, then the units negotiate to form a cluster.

The HA heartbeat interface communicates with each unit in the cluster using the same heartbeat interface for each member.

For example, if port1 and port2 are the heartbeat interfaces for the HA cluster, then in a cluster consisting of two members:

- port1 of the primary FortiGate should be connected to port1 of the secondary FortiGate.
- port2 of the primary FortiGate should be connected to port2 of the secondary FortiGate.

Configuring an HA heartbeat interface

A heartbeat interface is an Ethernet network interface in a cluster that is used by the FGCP for HA heartbeat communications between cluster units.

By default, two interfaces are configured to be heartbeat interfaces on most FortiGate models. The heartbeat interface configuration can be changed to select an additional or different heartbeat interface. It is possible to select only one heartbeat interface; however, this is not a recommended configuration (see Split brain scenario on page 3177).

Another important setting in the HA configuration is the heartbeat interface priority. In all cases, the heartbeat interface with the highest priority is used for all HA heartbeat communication. If the interface fails or becomes disconnected, then the selected heartbeat interface with the next highest priority handles all HA heartbeat communication.

If more than one heartbeat interface has the same priority, the heartbeat interface with the highest priority that is also highest in the heartbeat interface list is used for all HA heartbeat communication. If this interface fails or becomes disconnected, then the selected heartbeat interface with the highest priority that is next highest in the list handles all heartbeat communication (see Selecting heartbeat packets and interfaces on page 3177).

The default heartbeat interface configuration sets the priority of both heartbeat interfaces to 50, and the range is 0 to 512. When selecting a new heartbeat interface, the default priority is 0. The higher the number, the higher the priority.

In most cases, the default heartbeat interface configuration can be maintained as long the heartbeat interfaces are connected. Configuring HA heartbeat interfaces is the same for virtual clustering and for standard HA clustering. Up to eight heartbeat interface can be selected. This limit only applies to FortiGates with more than eight physical interfaces.

Heartbeat communications can be enabled on physical interfaces, but not on switch ports, VLAN subinterfaces, IPsec VPN interfaces, redundant interfaces, or 802.3ad aggregate interfaces.

To change the heartbeat interfaces in the GUI:

1. Go to *System* > *HA* and select a *Mode*.
2. Click the *+* in the *Heartbeat interfaces* field to select an interface.
3. Click *OK*.

To configure two interfaces as heartbeat interfaces with the same priority in the CLI:

```
config system ha
    set hbdev port4 150 port5 150
end
```

In this example, port4 and port5 are configured as the HA heartbeat interfaces and they both have a priority of 150.

To configure two interfaces as heartbeat interfaces with different priorities in the CLI:

```
config system ha
    set hbdev port4 100 port1 50
end
```

In this example, port4 and port1 are configured as the HA heartbeat interfaces. The priority for port4 is higher (100) than port1 (50), so port4 is the preferred HA heartbeat interface.

Split brain scenario

At least one heartbeat interface must be selected for the HA cluster to function correctly. This interface must be connected to all the units in the cluster. If heartbeat communication is interrupted and cannot fail over to a second heartbeat interface, then the cluster units will not be able to communicate with each other and more than one cluster unit may become a primary unit. As a result, the cluster stops functioning normally because multiple devices on the network may be operating as primary units with the same IP and MAC addresses creating a split brain scenario. See Split brain scenario: on page 3272 for more information.

Sharing heartbeat interfaces with traffic ports

HA heartbeat and data traffic is supported on the same cluster interface. In NAT mode, if the heartbeat interfaces are used for processing network traffic, then the interface can be assigned any IP address. The IP address does not affect HA heartbeat traffic.

In transparent mode, the heartbeat interface can be connected to the network with management access enabled on the same interface. A management connection would then be established to the interface using the transparent mode management IP address. This configuration does not affect HA heartbeat traffic.

While these configurations are allowable, they are not recommended. When possible, use dedicated interfaces for heartbeat traffic.

Selecting heartbeat packets and interfaces

HA heartbeat hello packets are sent constantly by all of the enabled heartbeat interfaces. Using these hello packets, each cluster unit confirms that the other cluster units are still operating. The FGCP selects one of the heartbeat interfaces to be used for communication between the cluster units. This interface is used for heartbeat communication and is based on the linkfail states of the heartbeat interfaces, the heartbeat interface priority, and the interface index. The connected heartbeat interface with the highest priority is selected for heartbeat communication.

If more than one connected heartbeat interface has the highest priority, then the FGCP selects the heartbeat interface with the lowest interface index. The interface index order is visible in the CLI by running the `diagnose netlink interface list` command.

If the interface that is processing heartbeat traffic fails or becomes disconnected, the FGCP uses the same criteria to select another heartbeat interface for heartbeat communication. If the original heartbeat interface is fixed or reconnected, the FGCP selects this interface again for heartbeat communication.

The HA heartbeat interface communicates cluster session information, synchronizes the cluster configuration, synchronizes the cluster kernel routing table, and reports individual cluster member statuses. The HA heartbeat constantly communicates HA status information to make sure that the cluster is operating properly.

Modifying heartbeat timing

The heartbeat interval and heartbeat lost threshold are two variables that dictate the length of time one cluster unit will wait before determining a peer is dead.

```
config system ha
    set hb-interval <integer>
    set hb-interval-in-milliseconds {100 | 10}
    set hb-lost-threshold <integer>
end
```

`hb-interval <integer>`	Set the time between sending heartbeat packets; increase to reduce false positives (1 - 20, default = 2).
`hb-interval-in-milliseconds {100 | 10}`	Set the number of milliseconds for each heartbeat interval (100 or 10, default = 100).
`hb-lost-threshold <integer>`	Set the number of lost heartbeats to signal a failure; increase to reduce false positives (1 - 60, default = 20).

Heartbeats are sent out every 2 × 100 ms, and it takes 20 consecutive lost heartbeats for a cluster member to be detected as dead. Therefore, it takes by default 2 × 100 ms × 20 = 4000 ms, or 4 seconds, for a failure to be detected.

Sub-second heartbeat failure detection can be achieved by lowering the interval and threshold or lowering the heartbeat interval unit of measurement from 100 ms to 10 ms.

If the primary unit does not receive a heartbeat packet from a subordinate unit before the heartbeat threshold expires, the primary unit assumes that the subordinate unit has failed.

If a subordinate unit does not receive a heartbeat packet from the primary unit before the heartbeat threshold expires, the subordinate unit assumes that the primary unit has failed. The subordinate unit then begins negotiating to become the new primary unit.

The HA heartbeat packets consume more bandwidth if the heartbeat interval is short. But if the heartbeat interval is very long, the cluster is not as sensitive to topology and other network changes. Therefore, gauge your settings based on the amount of traffic and CPU usage sustainable by the cluster units versus the tolerance for an outage when the primary unit fails. Avoid using the heartbeat interfaces as traffic ports to prevent congesting the interfaces.

Changing the time to wait in the hello state

The hello state hold down time is the number of seconds that a cluster unit waits before changing from hello state to work state. After a failure or when starting up, cluster units operate in the hello state to send and receive heartbeat packets so that all the cluster units can find each other and form a cluster. A cluster unit should change from the hello state to work state after it finds all the other FortiGates to form a cluster with.

If all cluster units cannot find each other during the hello state, then some cluster units may join the cluster after it has formed. This can cause disruptions to the cluster and affect how it operates. A delay could occur if the cluster units are located at different sites or if communication is delayed between the heartbeat interfaces. If delays occur, increase the cluster units wait time in the hello state.

```
config system ha
    set hello-holddown <integer>
end
```

`hello-holddown <integer>`	Set the time to wait before changing from hello to work state, in seconds (5 - 300, default = 20).

Configuring HA heartbeat encryption and authentication

HA heartbeat encryption and authentication to encrypt and authenticate HA heartbeat packets can be enabled. HA heartbeat packets should be encrypted and authenticated if the cluster interfaces that send HA heartbeat packets are also connected to the networks. HA heartbeat encryption and authentication are disabled by default. Note that enabling these settings could reduce cluster performance.

```
config system ha
    set authentication {enable | disable}
    set encryption {enable | disable}
end
```

If HA heartbeat packets are not encrypted, the cluster password and changes to the cluster configuration could be exposed. An attacker may be able to sniff HA packets to get cluster information. Enabling HA heartbeat message authentication prevents an attacker from creating false HA heartbeat messages. False HA heartbeat messages could affect the stability of the cluster.

HA authentication and encryption uses AES-128 for encryption and SHA1 for authentication. Heartbeat messages are encrypted and encapsulated in ESP packets for transfer in an IPsec tunnel between the cluster members.

Heartbeat bandwidth requirements

The majority of the traffic processed by the HA heartbeat interface is session synchronization traffic. Other heartbeat interface traffic required to synchronize IPsec states, IPsec keys, routing tables, configuration changes, and so on is usually negligible.

The amount of traffic required for session synchronization depends on the connections per second (CPS) that the cluster is processing, since only new sessions (and session table updates) need to be synchronized.

Another factor to consider is that if session pickup is enabled, the traffic on the heartbeat interface surges during a failover or when a unit joins or re-joins the cluster. When one of these events occurs, the entire

session table needs to be synchronized. Lower throughput HA heartbeat interfaces may increase failover time if they cannot handle the higher demand during these events.

The amount of heartbeat traffic can also be reduced by:

- Turning off session pickup if it is not needed
- Enabling `session-pickup-delay` to reduce the number of sessions that are synchronized
- Using the `session-sync-dev` option to move session synchronization traffic off of the heartbeat link

Heartbeat packet EtherTypes

Normal 802.3 IP packets have an EtherType field value of 0x0800. EtherType values other than 0x0800 are understood as Layer 2 frames rather than IP packets.

HA heartbeat packets use the following EtherTypes:

Field value	Function	Description
0x8890	Heartbeat	Heartbeat packets are used by cluster units to find other cluster units, and to verify the status of other cluster units while the cluster is operating. Use the `ha-eth-type` option to change the EtherType.
0x8891	Traffic redistribution from primary to subordinate	These are used when the HA primary needs to redistribute traffic packets and the corresponding session information to the subordinate units in A-A mode. Use the `hc-eth-type` option to change the EtherType.
0x8892	Session synchronization	Session synchronization uses the heartbeat interfaces for communication, unless session synchronization devices are specified. See Session synchronization on page 3180 for more information.
0x8893	HA Telnet sessions (configuration synchronization)	The Telnet sessions are used to synchronize the cluster configurations, and to connect from one cluster unit's CLI to another when an administrator uses the `execute ha manage` command. Use the `l2ep-eth-type` option to change the EtherType.

Session synchronization

Since large amounts of session synchronization traffic can increase network congestion, it is recommended to keep this traffic off of the network and separate from the HA heartbeat interfaces by using dedicated connections for it. The interfaces are configured in the `session-sync-dev` setting.

The session synchronization device interfaces must be connected together by directly using the appropriate cable or using switches. If one of the interfaces becomes disconnected, then the cluster uses

the remaining interfaces for session synchronization. If all the session synchronization interfaces become disconnected, then session synchronization reverts to using the HA heartbeat link.

All session synchronization traffic is between the primary unit and each subordinate unit. Session synchronization always uses UDP/708, but this will be encapsulated differently depending on the `session-sync-dev` setting. If `session-sync-dev` is specified, the packets will use 0x8892 and will exit over the mentioned port. If `session-sync-dev` is not specified, the packets will use 0x8893 and will exit the heartbeat port.

Session synchronization packets are typically processed by a single CPU core because all source and destination MAC addresses of the L2 frames are the same. Hashing based on the L2 addresses maps the processing of the frames to the same core. When large amounts of session synchronization traffic must be processed, enable the `sync-packet-balance` setting to distribute the processing to more cores. This effectively uses a larger set of MAC addresses for the hashing to map to multiple cores.

Troubleshooting heartbeat packets

Understanding the different types of heartbeat packets will ease troubleshooting. Heartbeat packets are recognized as Layer 2 frames. The switches and routers on the heartbeat network that connect to heartbeat interfaces must be configured to allow them to pass through. If Layer 2 frames are dropped by these network devices, then the heartbeat traffic will not be allowed between the cluster units.

For example, some third-party network equipment may not allow EtherType 0x8893. The unit can still be found in the HA cluster, but you would be unable to run `execute ha manage` to manage the other unit. Use the following settings to change the EtherTypes of the HA heartbeat packets, if they require changing them for the traffic to be forwarded on the connected switch.

```
config system ha
    set ha-eth-type <hex_value>
    set hc-eth-type <hex_value>
    set l2ep-eth-type <hex_value>
end
```

To change the EtherType values of the heartbeat and HA Telnet session packets:

```
config system ha
    set ha-eth-type 8895
    set l2ep-eth-type 889f
end
```

For troubleshooting issues with packets sent or received on the HA heartbeat ports, use the following diagnostic command to sniff the traffic by EtherType.

```
# diagnose sniffer packet any 'ether proto <EtherType_in_hex>' 6 0 1
```

To sniff the traffic on EtherType 0x8890:

```
# diagnose sniffer packet any 'ether proto 0x8890' 6 0 l
Using Original Sniffing Mode
interfaces=[any]
filters=[ether proto 0x8890]
```

```
2022-10-19 16:22:26.512813 port5 out Ether type 0x8890 printer hasn't been added to sniffer.

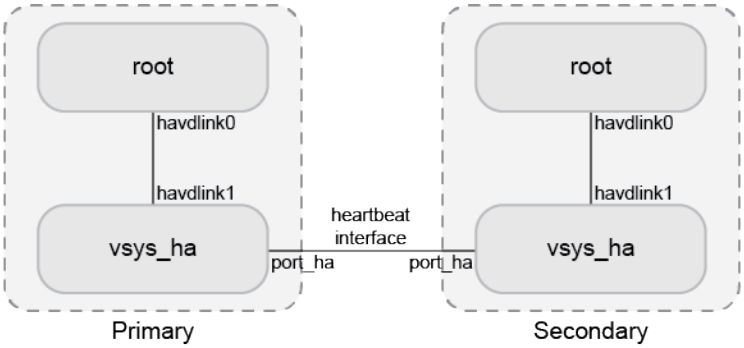
Interface IP addresses

An FGCP cluster communicates heartbeat packets using Layer 2 frames over the physical heartbeat interface, but it also communicates other synchronization traffic, logs, and locally generated traffic from subordinate devices over Layer 3 IP packets. Additional virtual interfaces are created in the hidden vsys_ha VDOM, which need to be addressed with IPv4 addresses.



The FGCP uses link-local IPv4 addresses (see RFC 3927) in the 169.254.0.x range for the virtual HA heartbeat interface (port_ha) and for the inter-VDOM link interfaces between the vsys_ha and management VDOM. When members join an HA cluster, each member's heartbeat interface (port_ha) is assigned an IP address from the range of 169.254.0.1 to 169.254.0.63/26. HA inter-VDOM link interfaces (havdlink0 and havdlink1) are assigned IP address from the range of 169.254.0.65 to 169.254.0.66/26.

The IP address that is assigned to a virtual heartbeat interface depends on the serial number priority of the member. Higher serial numbers have a higher priority, and therefore a lower `serialno_prio` number, for example:

```
# diagnose sys ha status
...
FGVM08TM20002002:    Secondary, serialno_prio=0, usr_priority=128, hostname=FGVM08TM20002002
FGVM08TM19003001:      Primary, serialno_prio=1, usr_priority=128, hostname=FGVM08TM19003001
```

The member with `serialno_prio=0` is assigned IP address 169.254.0.1, `serialno_prio=1` is assigned 169.254.0.2, and so forth.

To view the HA heartbeat interface IP address of the primary unit:

```
# get system ha status
...
vcluster 1: work 169.254.0.2
...
```

To view all the assigned IP addresses of a device:

```
# diagnose ip address list
IP=172.16.151.84->172.16.151.84/255.255.255.0 index=3 devname=port1
IP=192.168.2.204->192.168.2.204/255.255.255.0 index=6 devname=port2
IP=10.10.10.1->10.10.10.1/255.255.255.0 index=9 devname=port3
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=13 devname=root
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=16 devname=vsys_ha
IP=169.254.0.2->169.254.0.2/255.255.255.192 index=17 devname=port_ha
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=18 devname=vsys_fgfm
IP=169.254.0.65->169.254.0.65/255.255.255.192 index=19 devname=havdlink0
IP=169.254.0.66->169.254.0.66/255.255.255.192 index=20 devname=havdlink1
```

When generating traffic from a subordinate unit, traffic will be routed to the primary unit's port_ha virtual heartbeat interface. From there, if traffic is destined to another network, the traffic is routed from the vsys_ha VDOM to the management VDOM by the havdlink interfaces.

Use the `execute traceroute` command on the subordinate unit to display HA heartbeat IP addresses and the HA inter-VDOM link IP addresses.

To trace the route to an IP address on a subordinate unit:

```
# execute ha manage 1
# execute traceroute 172.20.20.10
traceroute to 172.20.20.10 (172.20.20.10), 32 hops max, 72 byte packets
1 169.254.0.1 0 ms 0 ms 0 ms
2 169.254.0.66 0 ms 0 ms 0 ms
3 172.20.20.10 0 ms 0 ms 0 ms
```

To run a sniffer trace on the primary unit to view the traffic flow:

```
# diagnose sniffer packet any 'net 169.254.0.0/24' 4 0 l
```

Unicast HA heartbeat

In virtual machine (VM) and cloud environments that do not support heartbeat communication with Layer 2 Ethernet frames (see HA heartbeat interface on page 3175), you can set up a Layer 3 unicast HA heartbeat when configuring HA. This consists of enabling the feature and adding a peer IP address. The peer IP address is the IP address of the HA heartbeat interface of the other FortiGate VM in the HA cluster.

Unicast HA is only supported between two FortiGate VMs in active-passive (A-P) mode. The heartbeat interfaces must be connected to the same network, and the IP addresses must be added to these interfaces.

In the following example, unicast HA heartbeat is enabled over the port3 interface.

To enable unicast HA heartbeat in the GUI:

1. Go to *System* > *HA*.
2. Enable *Unicast Heartbeat* and enter the *Peer IP*, such as *172.30.3.12*.

3. Click *OK*.

To enable unicast HA heartbeat in the CLI:

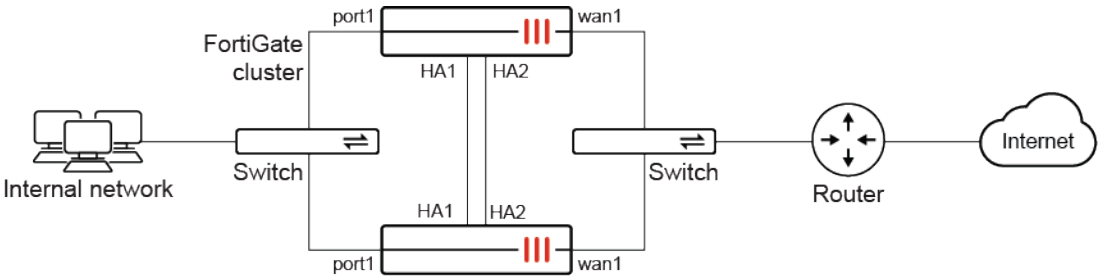
```
config system ha
    set hbdev port3 50
    set unicast-hb enable
    set unicast-hb-peerip 172.30.3.12
end
```

HA active-passive cluster setup

An HA Active-Passive (A-P) cluster can be set up using the GUI or CLI.

FortiGate A-P HA cluster supports sharing a single FortiGuard service license for both cluster units. See Single FortiGuard license for FortiGate A-P HA cluster on page 3187.

This example uses the following network topology:



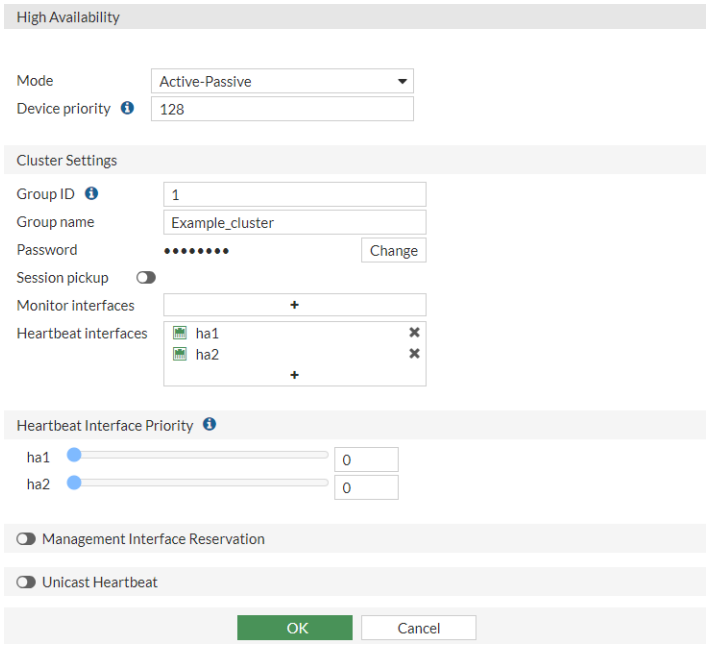
To set up an HA A-P cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to *System* > *HA* and set the following options:

Mode	Active-Passive
Device priority	128 or higher
Group ID	1 The group ID must be the same in all HA members in order to form a cluster. The group ID can impact the definition of the virtual MAC addresses of interfaces. See Determining VMAC addresses for more details.
Group name	Example_cluster

Password	********
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.



4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click *OK*.

   The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.
6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.

To set up an HA A-P cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Change the hostname of the FortiGate:

```
config system global
    set hostname Example1_host
end
```

   Changing the host name makes it easier to identify individual cluster units in the cluster operations.
4. Enable HA:

```
config system ha
    set mode a-p
    set group-id 1
```

```
    set group-name Example_cluster
    set password ********
    set hbdev ha1 10 ha2 20
end
```

5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster, giving each device a unique hostname.

Single FortiGuard license for FortiGate A-P HA cluster

FortiGate A-P HA cluster supports sharing a single FortiGuard service license for both cluster units for the following models:

- 40F and variants
- 60F and variants
- 70F and variants
- 80F and variants
- 100F and variants

When a customer purchases two units with the HA SKU (such as 2 x FG-40F-HA), they can further purchase a single order of the following subscriptions:

- Enterprise Protection
- Unified Threat Protection (UTP)
- Advanced Threat Protection (ATP)

The two FortiGate serial numbers will be associated together on FortiCare to create one virtual serial number (vSN). If multiple pairs of devices are ordered, each pair will be together in its own box to help identify the associated devices. The aforementioned services will then be registered to the vSN. A la carte SKUs are not supported, and cannot be registered to the vSN.

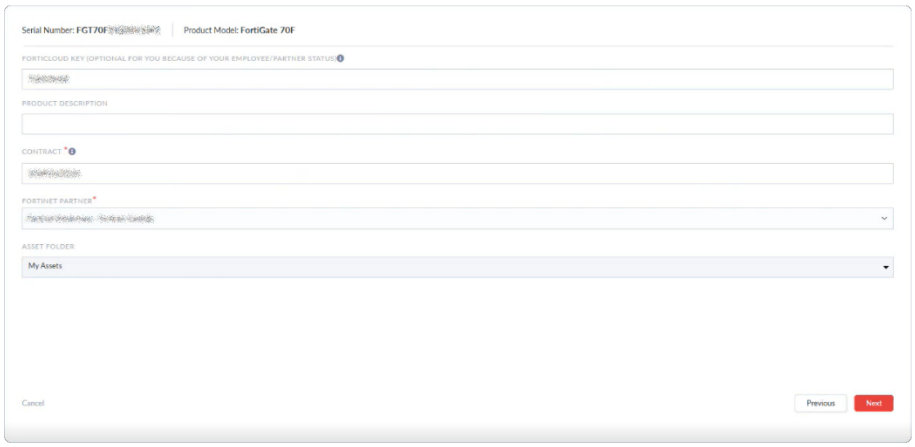
Deploying the FortiGates in HA to support vSN requires two steps:

1. Register the FortiGate and associated service contract
2. Provision the FortiGate HA configurations either through FortiGate Cloud or manually

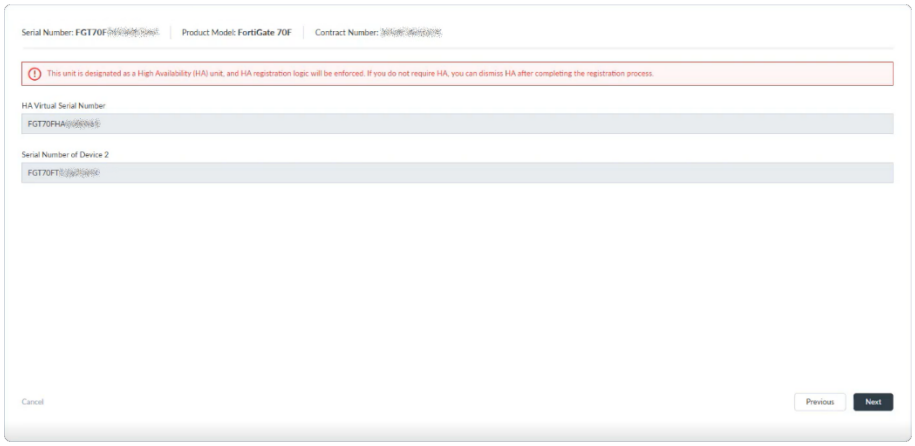
For information about RMAing the HA cluster, see RMA the FortiGate virtual HA on page 3191.

To register the FortiGates and associated contract:

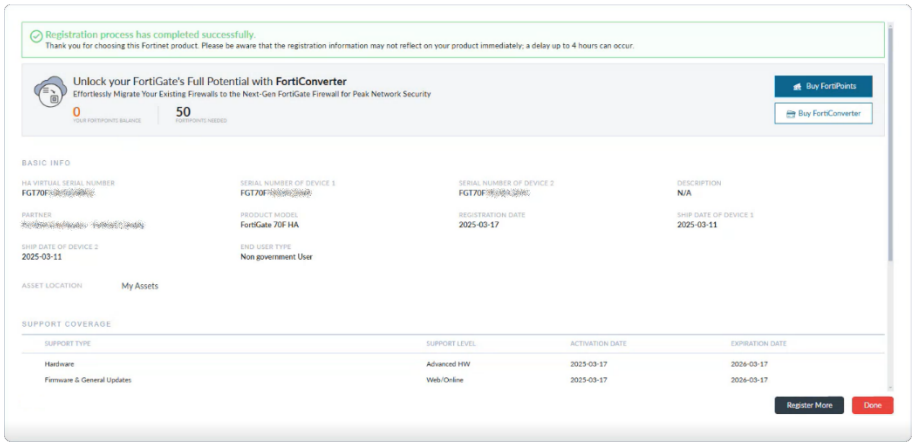
1. Log in to the FortiCloud support portal.
2. In the *Dashboard*, click *Register Now* to register a device and contract.
3. In the *Registration* field, enter the one of the FortiGate's serial numbers. Do not enter the service contract registration code, license certificate number, or asset transfer token.
4. Set the end user type, then click *Next*.
5. Enter the FortiCloud key from the FortiGate in the *FortiCloud Key* field, and the Registration Code from the service entitlement document in the *Contract* field.



6. Configure the remaining settings as needed then click *Next*.



7. Check the HA vSN and the serial number of the second device, then click *Next*.
8. Review the configuration, then click *Done* to complete the registration.



The vSN is registered in *Asset Management* with service entitlement. The individual FortiGates cannot be managed.

To configure the FortiGates in HA using FortiGate Cloud:

1. In the FortiGate Cloud portal, provision the FortiGate:
   a. In the FortiCloud support portal, go to *Services* > *FortiGate Cloud* to open the portal.
   b. Go to *Assets* > *Asset list* and click *Add FortiGate*.
   c. Select the FortiGate vSN from the inventory table and click *Provision* > *Provision to FortiGate Cloud*.
2. Unpack the boxes and connect the HA interfaces back to back using the highest physical port number that is not a fabric port (portA and portB) as indicated:

Model	HA interface
FortiGate 40F series	port3
FortiGate 60F series	port5
FortiGate 70F series	port4 and/or 5
FortiGate 80F series	port5 and/or 6
FortiGate 100F series	ha1 and/or ha2

   Some models have 2 HA interfaces. In these cases, both interfaces will be provisioned by FortiGate Cloud as heartbeat interfaces, but one or both of the interfaces can be connected. It is recommended to connect 2 heartbeat interfaces whenever possible for redundancy.
3. Connect the WAN interface to an upstream gateway that is providing DHCP service.
4. Connect internal interfaces to an internal switch as required.
5. Power on both FortiGates.
   Shortly after, the boxes will receive the vSN and their HA configuration from FortiGate Cloud, as follows:

```
config system ha
    set group-id <id>
    set group-name <group-name>
    set mode a-p
    set password ********
    set hbdev <HA interface 1> <priority 1> [HA interface 2] [priority 2]
    set override disable
    set logical-sn enable
end
```

To configure the FortiGates in HA manually using the CLI:

1. Unpack the two boxes, and connect to each unit through the CLI or the default management interface.
2. Configure the following basic HA settings on each unit:

```
config system ha
    set mode a-p
    set group-id <id>
    set group-name <group-name>
    set password ********
    set hbdev <HA interface 1> <priority 1> [HA interface 2] [priority 2]
```

```
    set logical-sn enable
end
```

3. Connect the HA interfaces back to back using your preferred interfaces.
4. Power on both FortiGates.
   Shortly after, the boxes will receive the vSN.

To verify the HA status and vSN (or Logical Serial) after the HA cluster registration is complete:

1. In the GUI, go to the *System > HA* page.
2. In the CLI use these commands:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-80F
Mode: HA A-P
Group Name: Branch1-HA
Group ID: 100
Debug: 0
Cluster Uptime: 0 days 2h:33m:2s
Cluster state change time: 2024-11-19 13:57:31
Primary selected using:
    <2024/11/19 13:57:31> vcluster-1: FGT80FTK22023xxx is selected as the primary because its
override priority is larger than peer member FGT80FTK20000xxx.
    <2024/11/19 11:26:06> vcluster-1: FGT80FTK22023xxx is selected as the primary because it's
the only member in the cluster.
ses_pickup: enable, ses_pickup_delay=disable
override: enable
Configuration Status:
    FGT80FTK22023xxx(updated 1 seconds ago): in-sync
    FGT80FTK22023xxx chksum dump: 0e 4c b5 56 80 be bf 20 8e e5 ad d5 59 ea 5d b3

```

```
Secondary: FGT80FTK20000xxx, HA operating index = 1
Logical Serial Number: FGT80FHA24090xxx
```

```
# diagnose system ha dump-by debug-zone
            HA information.
is_manage_primary=1,manage_vd=root,ip=169.254.0.1,num=2,nvcluster=1,jiffies=938038.
logical serial number is FGT80FHA24090xxx,
local serial number is FGT80FTK22023xxx,
member's serial number is FGT80FTK20000xxx
```

3. Furthermore, the service contract will be associated with the vSN and can be viewed on the *System* > *FortiGuard* page.

Do not change the HA mode from A-P to A-A when `logical-sn` is enabled. This will result in the FortiGate losing its vSN. Disabling `logical-sn` will also result in losing the vSN. As a result, service entitlements will no longer be registered to the HA cluster.

RMA the FortiGate virtual HA

In the event that one of the FortiGate HA units requires an RMA, the RMA transfer can be completed from the FortiCloud support portal.

To RMA a FortiGate HA unit:

1. Go to the *Products* > *Product List* and click the HA vSN.
2. In the *Registration* widget click RMA Transfer.
3. Continue the RMA process as needed.

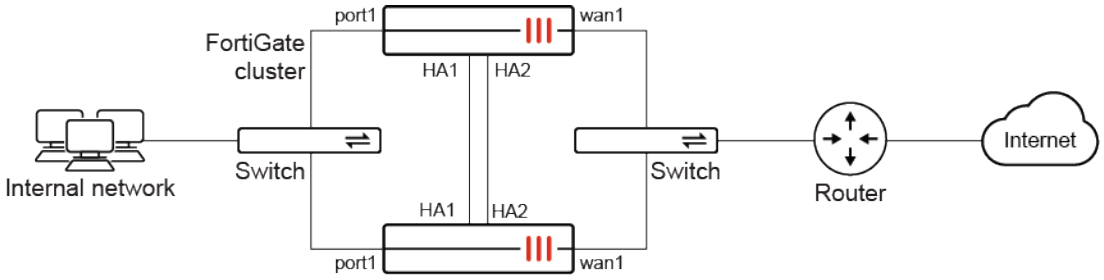
HA active-active cluster setup

An HA Active-Active (A-A) cluster can be set up using the GUI or CLI.

An A-A cluster supports interfaces in DHCP mode, but not interfaces in PPPoE mode. If an interface is in PPPoE mode, then the Active-Active option will not appear in the *Mode* selection.

FGCP in Active-Active mode cannot load balance any sessions that traverse NPU VDOM links or regular VDOM links. If Active-Active session load balancing between VDOMs is required, use an external router to handle the inter-VDOM routing.

This example uses the following network topology:

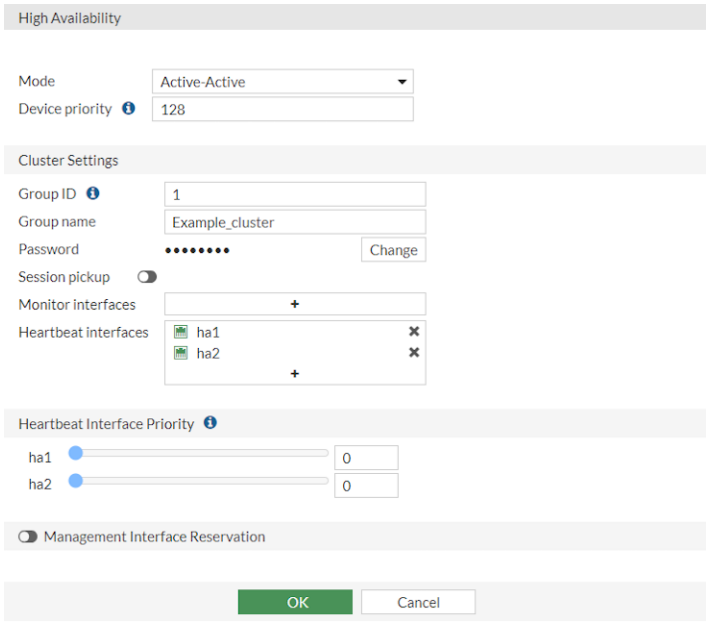


To set up an HA A-A cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Go to *System* > *HA* and set the following options:

Mode	Active-Active
Device priority	128 or higher
Group ID	1 The group ID must be the same in all HA members in order to form a cluster. The group ID can impact the definition of the virtual MAC addresses of interfaces. See Determining VMAC addresses for more details.
Group name	Example_cluster
Password	********
Heartbeat interfaces	ha1 and ha2

Except for the device priority, these settings must be the same on all FortiGates in the cluster.



4. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
5. Click *OK*.

   The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.
6. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat steps 1 to 5, omitting setting the device priority, to join the cluster.

To set up an HA A-A cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Log into one of the FortiGates.
3. Change the hostname of the FortiGate:

   ```
   config system global
       set hostname Example1_host
   end
   ```

   Changing the host name makes it easier to identify individual cluster units in the cluster operations.
4. Enable HA:

   ```
   config system ha
       set mode a-a
       set group-id 1
       set group-name Example_cluster
       set password ********
       set hbdev ha1 10 ha2 20
   end
   ```
5. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
6. Repeat steps 1 to 5 on the other FortiGate devices to join the cluster.

HA and load balancing

FGCP active-active HA uses a technique similar to unicast load balancing where the primary unit is associated with the cluster HA virtual MAC addresses and cluster IP addresses. The primary unit is the only cluster unit that receives packets sent to the cluster. The primary unit uses a load balancing schedule to distribute sessions to all cluster units (including the primary unit). Subordinate unit interfaces retain their actual MAC addresses, and the primary unit communicates with the subordinate units using these MAC addresses. Packets exiting the subordinate units proceed directly to their destination and do not pass through the primary unit.

By default, active-active HA load balancing distributes proxy-based security profile processing to all cluster units. Proxy-based security profile processing is CPU and memory-intensive, so FGCP load balancing may result in higher throughput because resource-intensive processing is distributed among all cluster units.

The following proxy-based security profile processing is load balanced:

- Virus scanning
- Web filtering
- Email filtering
- Data Loss prevention (DLP) of HTTP, FTP, IMAP, IMAPS, POP3, POP3S, SMTP, SMTPS, IM, and NNTP sessions accepted by firewall policies

Other features enabled in firewall policies such as endpoint security, traffic shaping, and authentication have no effect on active-active load balancing.

Active-active HA load balancing does not support software switches. See Software switch on page 230.

The `load-balance-all` option can be enabled to have the primary unit load balance all TCP sessions. Load balancing TCP sessions increases overhead and may actually reduce performance. This setting is disabled by default.

To configure TCP session load balancing:

```
config system ha
    set load-balance-all {enable | disable}
end
```

NP6 and NP7 processors can offload and accelerate load balancing. See NP session offloading in HA active-active configuration for more information.

During active-active HA load balancing, the primary unit uses the configured load balancing schedule to determine which cluster unit will process a session. The primary unit stores the load balancing information for each load balanced session in the cluster load balancing session table. Using the information in this table, the primary unit can then forward all of the remaining packets in each session to the appropriate cluster unit. The load balancing session table is synchronized among all cluster units.

ICMP, multicast, and broadcast sessions are never load balanced and are always processed by the primary unit. The following sessions are only processed by the primary unit:

- IPS
- Application control
- Flow-based virus scanning
- Flow-based web filtering
- Flow-based DLP
- Flow-based email filtering
- VoIP
- IM
- P2P
- IPsec VPN
- SSL VPN
- HTTP multiplexing

- SSL offloading
- WAN optimization
- Explicit web proxy
- WCCP

In addition to load balancing, active-active HA provides the same session, device, and link failover protection as active-passive HA. If the primary unit fails, a subordinate unit becomes the primary unit and resumes operating the cluster. Active-active HA maintains as many load balanced sessions as possible after a failover by continuing to process the load balanced sessions that were being processed by the cluster units that are still operating.

Load balancing schedules

The load balancing schedule controls how the primary unit distributes packets to all cluster units.

To configure the load balancing schedule:

```
config system ha
    set schedule {none | leastconnection | round-robin | weight-round-robin | random | ip | ipport}
end
```

The following table outlines the load balancing schedule options.

Schedule	Description
None	Use no load balancing. Select this option when the cluster interfaces are connected to load balancing switches. The primary unit does not load balance traffic, and the subordinate units process incoming traffic that does not come from the primary unit. For all other load balancing schedules, all traffic is received first by the primary unit and then forwarded to the subordinate units. The subordinate units only receive and process packets sent from the primary unit.
Least connection	Distribute network traffic to the cluster unit currently processing the fewest connections.
Round robin	Distribute network traffic to the next available cluster unit.
Weighted round robin	This is similar to round robin, but weighted values are assigned to each cluster unit based on their capacity and how many connections they are currently processing. For example, the primary unit should have a lower weighted value because it handles scheduling and forwards traffic. Weighted round robin distributes traffic more evenly because units that are not processing traffic will be more likely to receive new connections than units that are very busy.
Random	Randomly distribute traffic to cluster units.
IP	Distribute traffic to cluster units based on the source and destination IP of the packet.

Schedule	Description
IP port	Distribute traffic to cluster units based on based on the source IP, source port, destination IP, and destination port of the packet.

Once a packet has been propagated to a subordinate unit, all packets are part of that same communication session are propagated to that same subordinate unit. Traffic is distributed according to the communication session, not just an individual packet.

Any subordinate unit that receives a forwarded packet processes it without applying load balancing. Note that subordinate units are still considered to be active because they perform routing, virus scanning, and other tasks on their share of the traffic. Active subordinate units share their session and link status information with all cluster units. Active subordinate units do not make load balancing decisions.

The primary unit is responsible for the load balancing process, and still performs other FortiGate tasks. Depending on the load balancing schedule used, the primary unit may assign itself a smaller share of the total load.

Active-active failover

If a subordinate unit fails, the primary unit redistributes the sessions that the subordinate was processing among the remaining active cluster members. If the primary unit fails, the subordinate units negotiate to select a new primary unit. The new primary unit continues to distribute packets among the remaining active cluster units.

Failover works in a similar way if the cluster consists of only two units. If the primary unit fails, the subordinate unit negotiates and becomes the new primary unit. If the subordinate unit fails, the primary unit processes all traffic. In both cases, the single remaining unit continues to function as a primary unit, maintaining the HA virtual MAC address for all of its interfaces.

HTTPS sessions and active-active load balancing

In proxy inspection mode, active-active HA does not load balance HTTPS sessions that have SSL deep packet scanning or certificate inspection enabled. For example, when proxy inspection is triggered for HTTPS traffic in web or AV filtering, the traffic must be processed by the primary HA unti in proxy inspection mode.

FortiGate identifies HTTPS sessions as all sessions received on the HTTPS TCP port. The default HTTPS port is 443. If the HTTPS port is changed in the SSL/SSH inspection profile applied in the firewall policy, FGCP stops load balancing all sessions that use the custom HTTPS port.

HTTPS traffic passing through a firewall policy that does not meet the proxy inspection mode criteria can still be load balanced when `load-balance-all` is enabled. HTTPS traffic passing through flow-based inspection does not have this limitation.

HA virtual cluster setup

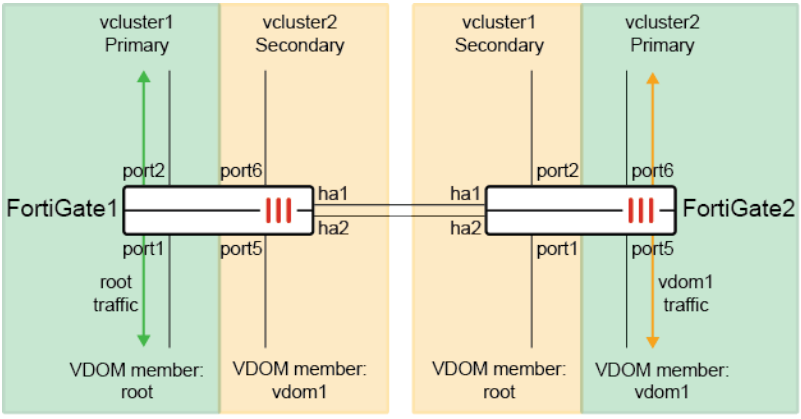
Virtual clustering is an extension of FGCP HA to allow multiple clusters to be formed between your HA members. In effect, each cluster consists of the same HA members, with the option to prioritize different members as the primary unit. Each cluster operates as its on active-passive FGCP HA cluster, with different virtual domains residing in the virtual cluster. The following custom settings can be configured per cluster:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit <id>
            set override {enable | disable}
            set priority <integer>
            set vdom <vdom_1>, ... [vdom_n]
            set monitor <interface_1>, ... [interface_n]
            set pingserver-monitor-interface <interface_1>, ... [interface_n]
        next
    end
end
```

`override {enable | disable}`	Enable/disable override and increase the priority of the unit that should always be the primary.
`priority <integer>`	Increase the priority to select the primary unit (0 - 255, default = 128).
`vdom <vdom_1>, ... [vdom_n]`	Set the virtual domains in the virtual cluster.
`monitor <interface_1>, ... [interface_n]`	Set the interfaces to check for port monitoring (or link failure).
`pingserver-monitor-interface <interface_1>, ... [interface_n]`	Set the interfaces to check for remote IP monitoring.

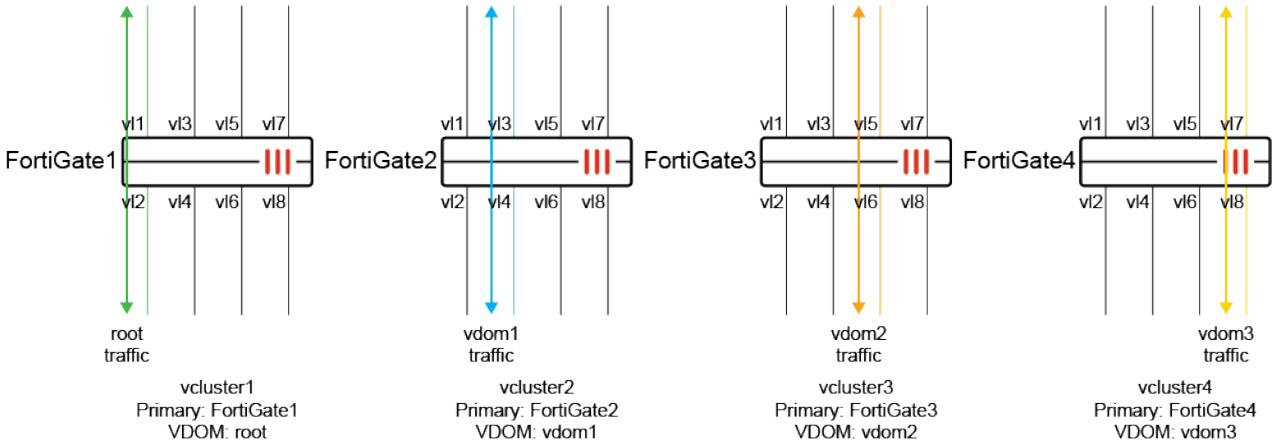
Active-passive virtual clustering uses VDOM partitioning to send traffic for some VDOMs to the primary FortiGate and traffic for other VDOMs to the secondary FortiGates. Traffic distribution between FortiGates can potentially improve throughput. If a failure occurs and only one FortiGate continues to operate, all traffic fails over to that FortiGate, similar to normal HA. If the failed FortiGates rejoin the cluster, the configured traffic distribution is restored.

In an active-passive virtual cluster of two FortiGates, the first and second FortiGates share traffic processing according to the VDOM partitioning configuration. The following is an example of two virtual clusters, with each member acting as primary for different vclusters.



If you add a third or fourth FortiGate, the first and second FortiGates process all traffic and the other one or two FortiGates operate in standby mode. If the first or second FortiGate fails, one of the other FortiGates becomes the new primary or secondary FortiGate and begins processing traffic.

For better load balancing, it is recommended to have as many vclusters as there are HA members. This way, each HA member can be a primary unit for each cluster, thereby processing traffic while standing by for the other vcluster as secondary. The following is an example of four FortiGates in an FGCP cluster, with four vclusters and four VDOMs. Each FortiGate is the primary unit for a vcluster and actively processes traffic as the primary member.



Virtual clustering and heartbeat interfaces

The HA heartbeat provides the same HA services in a virtual clustering configuration as in a standard HA configuration. One set of HA heartbeat interfaces provides HA heartbeat services for all of the VDOMs in the cluster. You do not have to add a heartbeat interface for each VDOM.

Special considerations for NPU-based VLANs in a virtual cluster

In an FGCP cluster, the primary FortiGate uses virtual MAC addresses when forwarding traffic, and the secondary uses the physical MAC addresses when forwarding traffic. In a virtual cluster, packets are sent with the cluster's virtual MAC addresses. However, in the case of NPU offloading on a non-root VDOM, traffic that leaves an NPU-based VLAN will use the physical MAC address of its parent interface rather than the virtual MAC address. If this behavior is not desired, disable `auto-asic-offload` in the firewall policy where the VLAN interface is used.

Support up to 30 virtual clusters

FortiOS supports up to 30 virtual clusters, which allows more VDOMs to be spread across different virtual clusters without overlapping. Each virtual cluster supports its own failover conditions. Prior to 7.2.0, only two virtual clusters were supported.

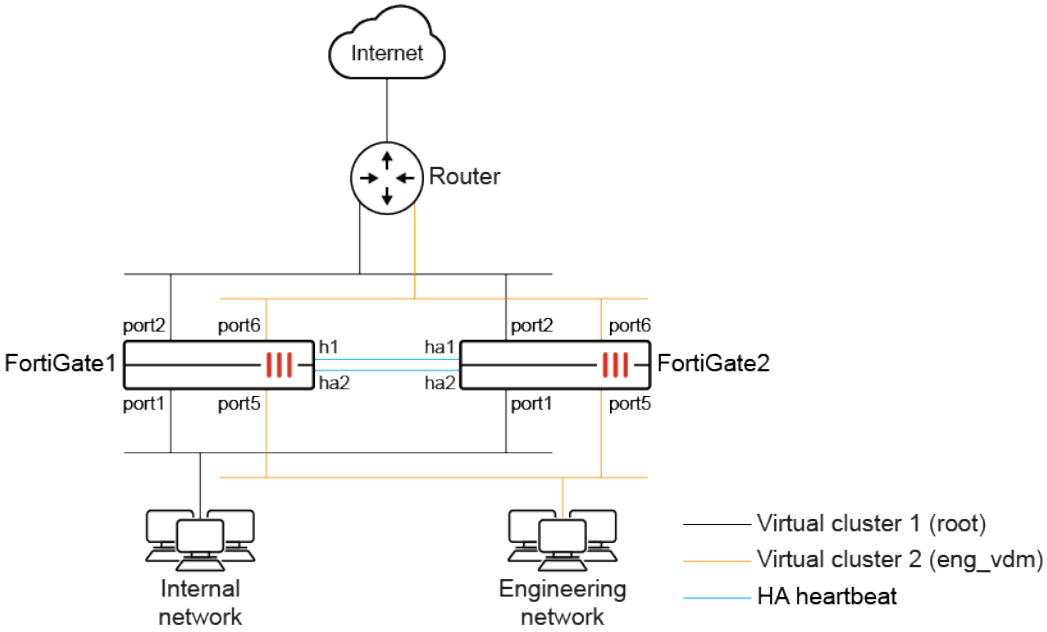
When configuring virtual clusters, the `group-id` is limited to a value from 0 to 7. If the HA `group-id` is greater than 7, use the command line first to change the `group-id` before enabling virtual clusters.

```
config system ha
    set group-id <integer>
end
```

When upgrading from 7.0 or earlier, old virtual clusters will be lost if the `group-id` is larger than 7.

Basic configuration

This example shows a virtual cluster configuration consisting of two FortiGates. The virtual cluster has two VDOMs, root and eng_vdm.



The root VDOM can only be associated with virtual cluster 1.

The VDOM that is assigned as the management VDOM can also only be associated with virtual cluster 1.

To set up an HA virtual cluster using the GUI:

1. Make all the necessary connections as shown in the topology diagram.
2. Configure a regular A-P cluster:
   a. Log in to one of the FortiGates.
   b. Go to *System* > *HA* and set the following options:

Mode	Active-Passive
Device priority	128 or higher
Group name	Example_cluster
Heartbeat interfaces	ha1 and ha2

   Except for the device priority, these settings must be the same on all FortiGates in the cluster.
   c. Leave the remaining settings as their default values. They can be changed after the cluster is in operation.
   d. Click *OK*.
   The FortiGate negotiates to establish an HA cluster. Connectivity with the FortiGate may be temporarily lost as the HA cluster negotiates and the FGCP changes the MAC addresses of the FortiGate's interfaces.

e. Factory reset the other FortiGate that will be in the cluster, configure GUI access, then repeat step 2 (omitting setting the device priority) to join the cluster.

3. On the primary FortiGate, go to *System > Settings* and enable *Virtual Domains*.
4. Click *Apply*. You will be logged out of the FortiGate.
5. Log back in to the FortiGate, and ensure that you are in the global VDOM.
6. Create the eng_vdm VDOM:
   a. Go to *System > VDOM* and click *Create New*. The *New Virtual Domain* pane opens.
   b. Enter the name in the *Virtual Domain* field, then click *OK*.
7. Implement a virtual cluster by moving the new VDOM to virtual cluster 2:
   a. Go to *System > HA* and enable *VDOM Partitioning*.
   b. In the table, click *Create New*. The *New Virtual Cluster* pane opens.
   c. Click the *+* and add the *eng_vdm* VDOM.
   d. Click *OK* to save the virtual cluster.

   e. Click *OK* to save the HA configuration.

To set up an HA virtual cluster using the CLI:

1. Make all the necessary connections as shown in the topology diagram.
2. Configure a regular A-P cluster. See HA active-passive cluster setup on page 3185.
3. Enable VDOMs:

```
config system global
    set vdom-mode multi-vdom
end
```

You will be logged out of the FortiGate.

4. Create the eng_vdm VDOM:

```
config vdom
    edit eng_vdm
    next
end
```

5. Reconfigure the HA settings to be a virtual cluster:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit 1
            set vdom root
            set override disable
        next
        edit 2
            set vdom eng_vdm
            set override disable
        next
    end
end
```

Configuration with 30 virtual clusters

In this example, there are 30 customers managed by an MSSP on an HA cluster, and each customer VDOM needs to failover independently of other customer VDOMs. Each customer is assigned to a different virtual cluster with its own virtual cluster configurations. This may include different monitored interfaces, ping servers, and priority for the primary and secondary cluster members. Each virtual cluster will fail over according to their own virtual cluster configurations.

This example assumes an A-P cluster and VDOMs have already been configured. See HA active-passive cluster setup on page 3185 and Virtual Domains on page 3126 for more information.

For each virtual cluster, this example assumes that unit 1 has an HA priority of 200, while unit 2 has an HA priority of 100. By default, unit 1 will be the primary cluster member of all the virtual clusters.

To configure multiple virtual clusters in the GUI:

1. Go to *System* > *HA* and enable *VDOM Partitioning*.
2. Create a virtual cluster:
   a. In the table, click *Create New*. The *New Virtual Cluster* pane opens.
   b. Set the *Device priority* to *200*.
   c. Click the *+* and add the *Virtual domains*.
   d. Optionally, click the *+* and add the *Monitor interfaces*.
   e. Click *OK*.
3. Repeat step 2 to create the remaining virtual clusters.
4. Click *OK* to save the HA configuration. The *HA* page summary displays the multiple virtual clusters, each with a *Primary* and *Secondary* HA member.

5. Edit the priority settings for the secondary members to be 100:
   a. Select the *Secondary* member in the table, and click *Edit*.
   b. Set the *Priority* to *100*.
   c. Click *OK*.
6. Repeat step 5 for the remaining secondary members.

To configure multiple virtual clusters in the CLI:

1. Configure the primary FortiGate:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit 1
            set override disable
            set priority 200
            set vdom "vdom1"
        next
        edit 2
            set override disable
            set priority 200
            set vdom "vdom2"
        next
        ...
        edit 30
            set override disable
            set priority 200
            set vdom "vdom30"
        next
    end
end
```

2. Configure the secondary FortiGate:

```
config system ha
    set vcluster-status enable
    config vcluster
        edit 1
            set override disable
            set priority 100
            set vdom "vdom1"
        next
        edit 2
            set override disable
            set priority 100
            set vdom "vdom2"
        next
        ...
        edit 30
            set override disable
            set priority 100
```

```
            set vdom "vdom30"
        next
    end
end
```

HA primary unit selection criteria

In a FGCP HA setup, cluster members must negotiate to determine who will become the primary unit upon connecting to the HA cluster. Once a primary unit is identified, all other members become subordinate (or secondary) members.

When does primary unit selection occur?

Primary unit selection occurs whenever a new unit joins the HA cluster or the primary unit leaves the HA cluster. It also occurs whenever a monitored interface status changes.

This can occur when:

- Two or more units initially form a new HA cluster.
- A new unit joins an existing HA cluster.
- A device failover takes place, where the primary unit fails due to a device failure.
- A link failover takes place, where a monitored interface on any unit either fails or is restored.

Relevant configurations

Configurations that can impact the HA primary unit section are listed below:

Priority	A value between 0-255 assigned to this unit. A higher number indicates higher priority. By default, priority is 128. Priority value does not get synchronized to other HA members.
Monitor	Interface(s) to check for a physical link failure.
Override	Enable to prioritize priority value over uptime in HA primary unit selection. Disable to prioritize uptime over priority value. This setting is disabled by default. To ensure optimal performance and consistent behavior in your FortiGate HA cluster, it is strongly recommended that you standardize the override configuration across all cluster members. Specifically, override should be either uniformly enabled or disabled on all cluster units. Mixed configurations can lead to conflicts and unpredictable primary unit elections, which may impact cluster stability and manageability.

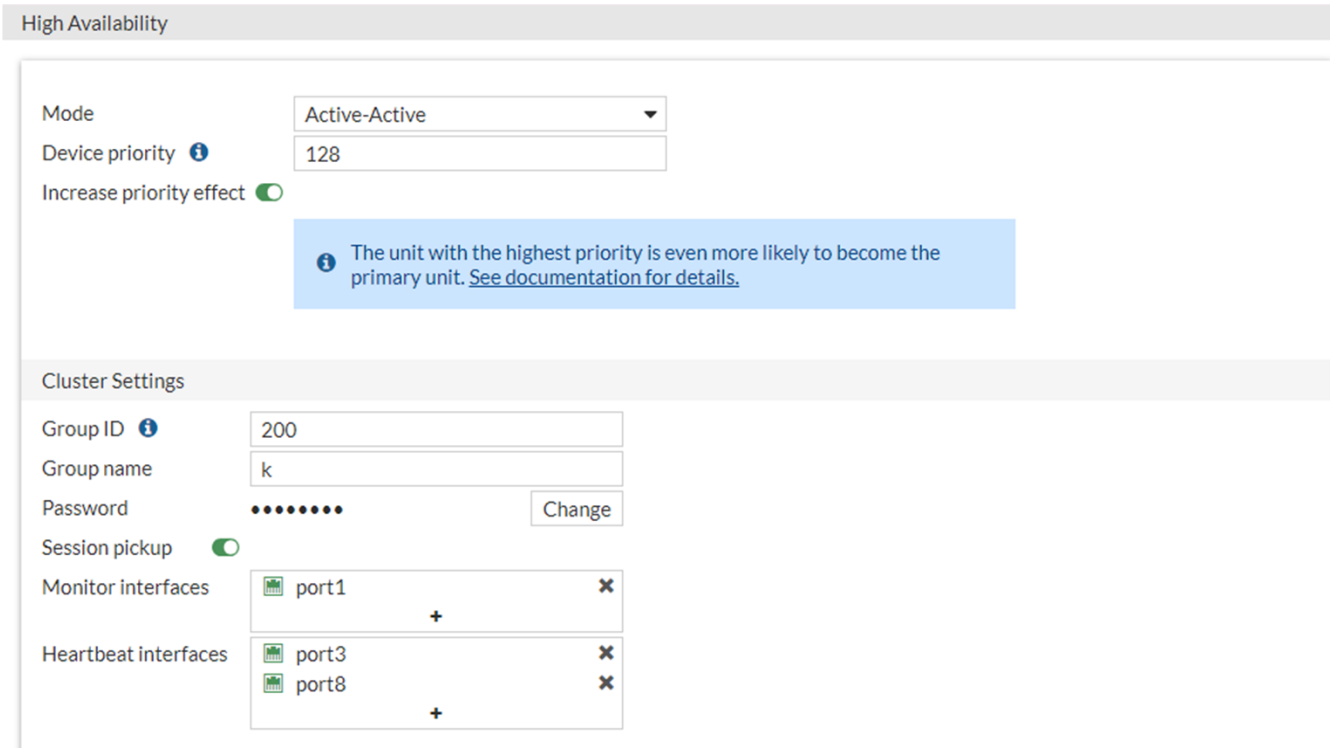
From CLI:

```
config system ha
    set priority <integer>
    set monitor <interface list>
```

```
    set override {enable | disable}
end
```

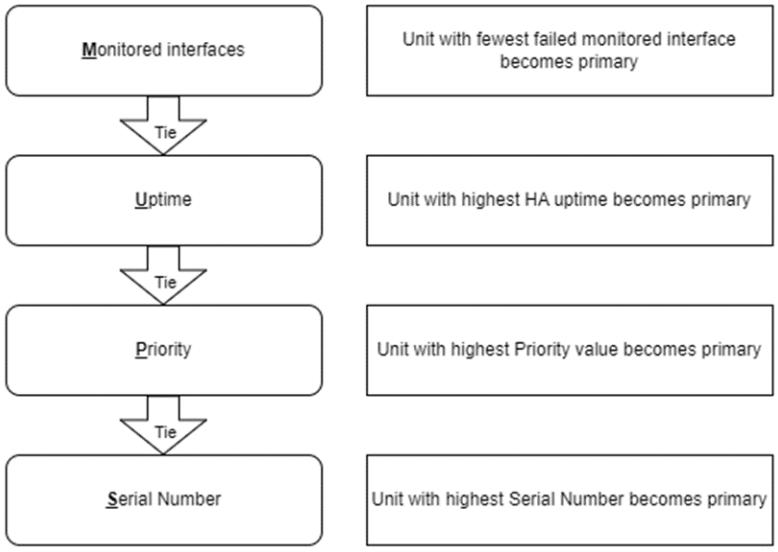
From GUI:

On the *System* > *HA* page:

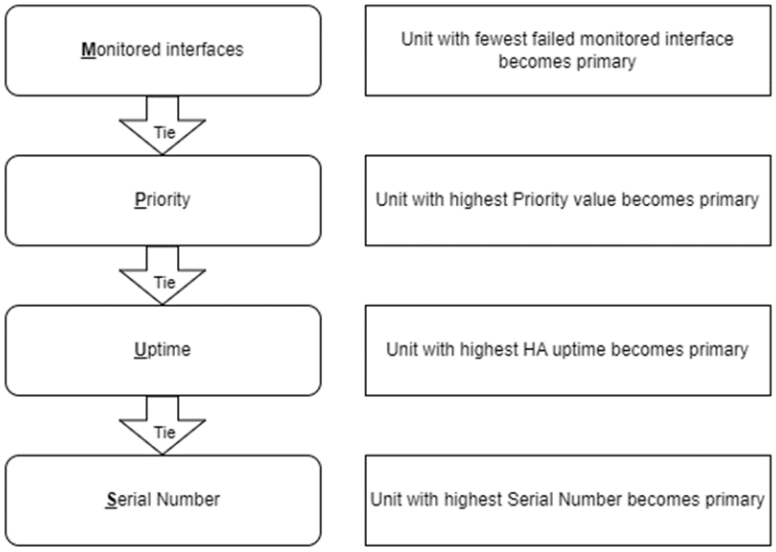


Primary unit selection criteria

If the HA override setting is *disabled* on all cluster members, the primary unit will be selected based on the following order:



If the HA override setting is *enabled* on all cluster members, the primary unit will be selected based on the following order:



For each criteria, if the value is the same, then it is considered a tie, and the next criteria is evaluated.

For the HA uptime criteria:

- If the difference between HA uptime is more than five (5) minutes (300 seconds), the cluster unit that is operating longer becomes the primary unit.
- If the difference between HA uptime is less than five (5) minutes (300 seconds), then the criteria is considered a tie.
- If a monitored interface fails on a HA unit, its HA uptime is reset to zero (0).
- If a cluster member restarts, the HA uptime is reset to zero (0).

In some documents, the terms MUPS and MPUS, which are based on the first letters of each criteria, are used to describe the order in which the criteria are considered during the HA primary unit selection process.

Viewing the role of the unit

After HA primary unit selection has completed, you can view the HA role of each unit in various ways.

- In the GUI, go to *System* > *HA* to view the members in the cluster and the role for each member.
- From the CLI, run `get system ha status`. The role of each unit is displayed:

```
# get system ha status
…
Primary: FG101FTK19xxxxx7, HA operating index = 0
Secondary: FG101FTK19xxxxx8, HA operating index = 1
```

- Similarly, from the CLI, run `diagnose sys ha status`. The role of each unit is displayed.

Viewing how the primary unit was selected

You can use the `get system ha status` command to see how the primary unit was selected. The output of this command contains a section called `Primary selected using` that shows a history of how the primary unit was selected.

```
# get system ha status
HA Health Status:
    WARNING: FG101FTK19xxxxx7 has hbdev down;
    WARNING: FG101FTK19xxxxx8 has hbdev down;
Model: FortiGate-101F
Mode: HA A-A
Group Name: FGT_HA
Group ID: 0
Debug: 0
Cluster Uptime: 5 days 8h:30m:57s
Cluster state change time: 2024-04-12 02:25:05
Primary selected using:
    <2024/04/12 02:25:05> vcluster-1: FG101FTK19xxxxx7 is selected as the primary because its
override priority is larger than peer member FG101FTK19xxxxx8.
    <2024/04/12 02:25:04> vcluster-1: FG101FTK19xxxxx7 is selected as the primary because it's the
only member in the cluster.
    <2024/04/12 02:13:34> vcluster-1: FG101FTK19xxxxx7 is selected as the primary because its
override priority is larger than peer member FG101FTK19xxxxx8.
    <2024/04/12 02:09:28> vcluster-1: FG101FTK19xxxxx7 is selected as the primary because it's the
only member in the cluster.
```

Comparing the HA uptime between cluster members

You can use the CLI command `diagnose sys ha dump-by group` to display the age difference of the units in a cluster. This command also displays information about a number of HA related parameters for each cluster unit.

For example, consider a cluster of two FortiGate units. Entering the `diagnose sys ha dump-by group` command from the primary unit CLI displays information similar to the following:

```
# diagnose sys ha dump-by group
...
vcluster_nr=1
vcluster-1: start_time=1712913904(2024-04-12 02:25:04), state/o/chg_time=2(work)/2
(work)/1712913904(2024-04-12 02:25:04)
        pingsvr_flip_timeout/expire=3600s/0s
        'FG101FTK19xxxxx8': ha_prio/o=1/1, link_failure=0, pingsvr_failure=0, flag=0x00000000,
mem_failover=0, uptime/reset_cnt=0/2
        'FG101FTK19xxxxx7': ha_prio/o=0/0, link_failure=0, pingsvr_failure=0, flag=0x00000001,
mem_failover=0, uptime/reset_cnt=189/2
```

The last two lines of the output display status information about each cluster unit including the `uptime`. The `uptime` is the age difference in seconds between the two units in the cluster.

In the example, the age of the subordinate unit is 189 seconds more than the age of the primary unit. The age difference is less than five (5) minutes (less than 300 seconds), so age has no effect on primary unit selection.

Changing the cluster age difference margin

You can change the cluster age difference margin using the following command:

```
config system ha
    set ha-uptime-diff-margin <margin>
end
```

Where the `<margin>` can be from 1 to 65535 seconds (default = 300).

Resetting the uptime of a unit

For debugging purpose, you may want to reset the HA member's uptime without restarting the unit or changing the status of a monitored interface.

To manually change the uptime:

```
# diagnose sys ha reset-uptime
```

The command resets the HA age internally and does not affect the up time displayed for cluster units using the `diagnose sys ha dump-by all-vcluster` or `diagnose sys ha dump-by all-vcluster` command. It also does not affect the time displayed on the Dashboard or cluster members list.

Check HA synchronization status

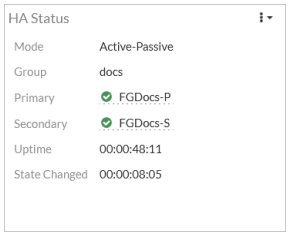
The HA synchronization status can be viewed in the GUI through either a widget on the *Dashboard* or on the *System > HA* page. It can also be confirmed through the CLI. When a cluster is out of synchronization, administrators should correct the issue as soon as possible as it affects the configuration integrity and can cause issues to occur.

When units are out of synchronization in an HA cluster, the GUI will compare the HA checksums and display the tables that caused HA to be out of synchronization. This can be visualized on the HA monitor page and in the HA status widget.

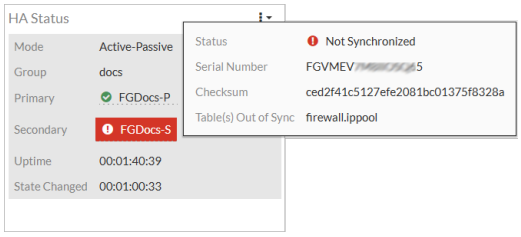
HA synchronization status in the GUI

Following HA setup, the *HA Status* widget can be added to the *Dashboard* that shows the HA synchronization statuses of the members.

A green checkmark is shown next to each member that is in synchronization.

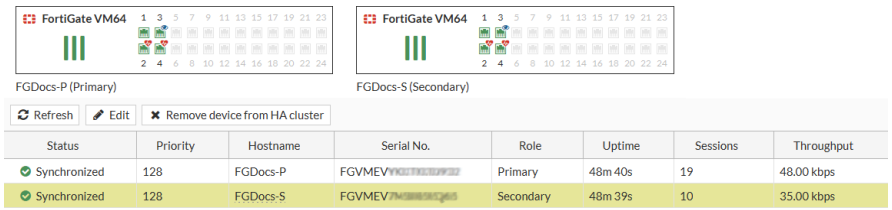


A member that is out of synchronization is highlighted in red. Hover the cursor over the unsynchronized device to see the tables that are out of synchronization and the checksum values.

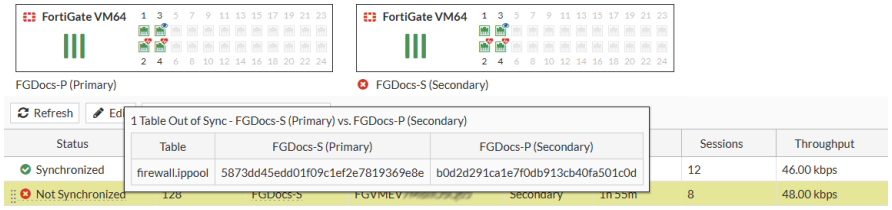


You can also go to *System* > *HA* to see the synchronization statuses of the members. A member that is out of synchronization will have a red icon next to its name. Hover the cursor over the unsynchronized device to see the tables that are out of synchronization and the checksum values.

Synchronized:



Unsynchronized:



HA synchronization status in the CLI

In the CLI, run the `get system ha status` command to see if the cluster is in synchronization . The synchronization status is reported under *Configuration Status*.

When both members are in synchronization:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: HA A-P
Group Name: docs
Group ID: 0

Filtering the synchronization status by virtual cluster ID

The HA status information can be filtered for a specific virtual cluster in the CLI. The following example HA configuration has 10 virtual clusters, and the status information is filtered for virtual cluster 8.

To view the HA synchronization status of the entire cluster:

```
# get system ha status
HA Health Status:
    WARNING: FG101FTK19000007 has hbdev down;
    WARNING: FG101FTK19000009 has hbdev down;

Out-of-band management with reserved management interfaces

As part of an HA configuration, you can reserve up to four management interfaces to provide direct management access to all cluster units. For each reserved management interface, you can configure a different IP address, administrative access, and other interface settings, for each cluster unit. By connecting these interfaces to your network, you can separately manage each cluster unit from different IP addresses.

- Reserved management interfaces provide direct management access to each cluster unit, and give each cluster unit a different identity on your network. This simplifies using external services, such as SNMP, to monitor separate cluster units.
- Reserved management interfaces are not assigned HA virtual MAC addresses. They retain the permanent hardware address of the physical interface, unless you manually change it using the `config system interface` command.
- Reserved management interfaces and their IP addresses should not be used for managing a cluster using FortiManager. To manage a FortiGate HA cluster with FortiManager, use the IP address of one of the cluster unit interfaces.
- Configuration changes to a reserved management interface are not synchronized to other cluster units. Other configuration changes are automatically synchronized to all cluster units.

You can configure an in-band management interface for a cluster unit. See In-band management on page 3219 for information. In-band management does not reserve the interface exclusively for HA management.

Management interface

Enable HTTPS or HTTP administrative access on the reserved management interfaces to connect to the GUI of each cluster unit. On secondary units, the GUI has the same features as the primary unit, except for unit specific information, for example:

- The System Information widget on the Status dashboard shows the secondary unit's serial number.
- In the cluster members list at *System > HA*, you can change the HA configuration of the unit that you are logged into. You can only change the host name and device priority of the primary and other secondary units.
- The system events logs show logs for the device that you are logged into. Use the HA device drop down to view the log messages for other cluster units, including the primary unit.

Enable SSH administrative access on the reserved management interfaces to connect to the CLI of each cluster unit. The CLI prompt includes the host of the cluster unit that you are connected to. Use the `execute ha manage` command to connect to other cluster unit CLIs.

Enable SNMP administrative access on a reserved management interface to use SNMP to monitor each cluster unit using the interface's IP address. Direct management of cluster members must also be enabled, see Configuration examples on page 3215.

Reserved management interfaces are available in both NAT and transparent mode, and when the cluster is operating with multiple VDOMs.

FortiCloud, FortiSandbox, and other management services

By default, management services such as FortiCloud, FortiSandbox, SNMP, remote logging, and remote authentication, use a cluster interface. This means that communication from each cluster unit will come from a cluster interface of the primary unit, and not from the individual cluster unit's interface.

You can configure HA reserved management interfaces to be used for communication with management services by enabling the `ha-direct` option. This separates management traffic for each cluster unit, and allows each unit to be individually managed. This is especially useful when cluster units are in different physical locations.

The following management features will then use the HA reserved management interface:

- SSH, HTTP, HTTPS administration
- Remote logging, including syslog, FortiAnalyzer, and FortiCloud
- SNMP queries and traps
- Remote authentication and certificate verification using LDAP, RADIUS, or TACACS+
- Communication with FortiSandbox
- Netflow and sflow, see Routing NetFlow data over the HA management interface on page 3235 for information.

Any other management function not explicitly listed above is not supported, such as Security Fabric connectivity and new device registration.

Syntax for HA reserved management interfaces is as follows:

```
config system ha
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface <interface>
            set dst <destination IP>
            set gateway <IPv4 gateway>
            set gateway6 <IPv6 gateway>
        next
```

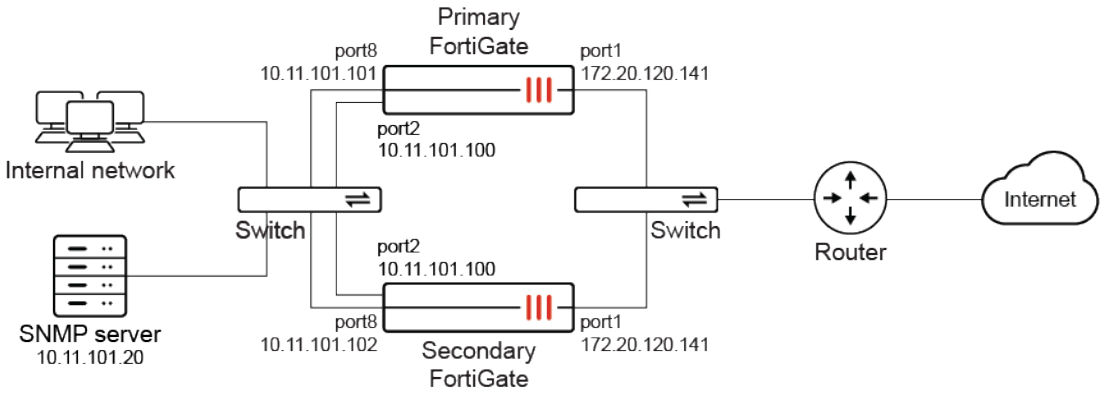
```
    end
    set ha-direct enable
end
```

The `ha-direct` option is a pre-requisite for allowing communication on each HA reserved management interface for various management services listed above. Once enabled, all `source-ip` settings will be unset from log related, netflow and sflow management services.

SNMP requires `ha-direct` to be configured under SNMP settings only. See below for more configuration options.

Configuration examples

The configuration examples below will use the following topology:



Two FortiGate units are already operating in a cluster. On each unit, port8 is connected to the internal network through a switch and configured as an out-of-band reserved management interface.

Configuration changes to the reserved management interface are not synchronized to other cluster units.

Administrative access and default route for HA management interface

To configure the primary unit's reserved management interface, configure an IP address and management access on port8. Then, configure the necessary HA settings to enable the HA reserved management interface and its route. To configure the secondary unit's reserved management interface, access the unit's CLI through the primary unit, and configure an IP address, management access on port8, and the necessary HA settings. Configuration changes to the reserved management interface are not synchronized to other cluster units.

To configure the primary unit reserved management interface to allow HTTPS, SSH, and ICMP access:

1. From a computer on the internal network, connect to the CLI at 10.11.101.100 on port2.
2. Change the port8 IP address and management access:

```
config system interface
    edit port8
        set ip 10.11.101.101/24
        set allowaccess https ping ssh
    next
end
```

3. Configure the HA settings for the HA reserved management interface by defining a default route to route to the gateway 10.11.101.2:

```
config system ha
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface port8
            set gateway 10.11.101.2
        next
    end
end
```

You can now log into the primary unit's GUI by browsing to https://10.11.101.101. You can also log into the primary unit's CLI by using an SSH client to connect to 10.11.101.101.

To configure secondary unit reserved management interfaces to allow HTTPS, SSH, and ICMP access:

1. From a computer on the internal network, connect to the primary unit's CLI.
2. Connect to the secondary unit with the following command:

```
execute ha manage <unit id> <username> <password>
```

3. Change the port8 IP address and management access:

```
config system interface
    edit port8
        set ip 10.11.101.102/24
        set allowaccess https ping ssh
    next
end
```

```
exit
```

4. Configure the HA settings for the HA reserved management interface by defining a default route to route to the gateway 10.11.101.2:

```
config system ha
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface port8
            set gateway 10.11.101.2
        next
```

```
    end
end
```

You can now log into the secondary unit's GUI by browsing to https://10.11.101.102. You can also log into the secondary unit's CLI by using an SSH client to connect to 10.11.101.102.

SNMP monitoring

The SNMP server can get status information from the cluster members. To use the reserved management interfaces, you must add at least one HA direct management host to an SNMP community. If the SNMP configuration includes SNMP users with user names and passwords, HA direct management must be enabled for the users.

To configure the cluster for SNMP management using the reserved management interfaces in the CLI:

1. Allow SNMP on port8 on both primary and secondary units:

```
config system interface
    edit port8
        append allowaccess snmp
    next
end
```

2. Add an SNMP community with a host for the reserved management interface of each cluster member. The host includes the IP address of the SNMP server.

```
config system snmp community
    edit 1
        set name "Community"
        config hosts
            edit 1
                set ip 10.11.101.20 255.255.255.255
                set ha-direct enable
            next
        end
    next
end
```

Enabling `ha-direct` in a non-HA environment will make SNMP unusable.

3. Add an SNMP user for the reserved management interface:

```
config system snmp user
    edit "1"
        set notify-hosts 10.11.101.20
        set ha-direct enable
    next
end
```

The SNMP configuration is synchronized to all cluster units.

To get CPU, memory, and network usage information from the SNMP manager for each cluster unit using the reserved management IP addresses:

1. Connect to the SNMP manager CLI.
2. Get resource usage information for the primary unit using the MIB fields:

```
snmpget -v2c -c Community 10.11.101.101 fgHaStatsCpuUsage
snmpget -v2c -c Community 10.11.101.101 fgHaStatsMemUsage
snmpget -v2c -c Community 10.11.101.101 fgHaStatsNetUsage
```

3. Get resource usage information for the primary unit using the OIDs:

```
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.3.1
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.4.1
snmpget -v2c -c Community 10.11.101.101 1.3.6.1.4.1.12356.101.13.2.1.1.5.1
```

4. Get resource usage information for the secondary unit using the MIB fields:

```
snmpget -v2c -c Community 10.11.101.102 fgHaStatsCpuUsage
snmpget -v2c -c Community 10.11.101.102 fgHaStatsMemUsage
snmpget -v2c -c Community 10.11.101.102 fgHaStatsNetUsage
```

5. Get resource usage information for the primary unit using the OIDs:

```
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.3.1
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.4.1
snmpget -v2c -c Community 10.11.101.102 1.3.6.1.4.1.12356.101.13.2.1.1.5.1
```

Firewall local-in policies for the reserved management interface

Enabling `ha-mgmt-intf-only` applies the local-in policy only to the VDOM that contains the reserved management interface. The incoming interface is set to match any interface in the VDOM.

To add local-in policies for the reserved management interface:

```
config firewall local-in-policy
    edit 0
        set ha-mgmt-intf-only enable
        set intf any
        set srcaddr internal-net
        set dstaddr mgmt-int
        set action accept
        set service HTTPS
        set schedule weekdays
    next
end
```

NTP over reserved management interfaces

When NTP is enabled in an HA cluster, the primary unit will always be the unit to contact the NTP server and synchronize system time to the secondary units over the HA heartbeat interface. However, in the event that the primary should contact the NTP server over the HA reserved management interface, then the `ha-direct` option should be enabled under the `config system ha` settings.

```
config system interface
    edit port5
        set ip 172.16.79.46 255.255.255.0
    next
end
```

```
config system ha
    set group-name FGT-HA
    set mode a-p
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface port5
            set gateway 172.16.79.1
        next
    end
    set ha-direct enable
end
```

```
config system ntp
    set ntpsync enable
    set syncinterval 5
end
```

In-band management

In-band management IP addresses are an alternative to reserved HA management interfaces, and do not require reserving an interface exclusively for management access. They can be added to multiple interfaces on each cluster unit.

The in-band management IP address is accessible from the network that the cluster interface is connected to. It should be in the same subnet as the interface that you are adding it to. It cannot be in the same subnet as other interface IP addresses.

In-band management interfaces support ping, HTTP, HTTPS, and SNMP administrative access options.

Primary and secondary units can respond on the management IP to traffic from different networks by using the routing table. The secondary unit uses the kernel routing table synchronized from the primary to route the traffic.

In-band management IP address configuration is not synchronized to other cluster units.

To add an in-band management IP address to port23 with HTTPS, SSH, and SNMP access:

```
config system interface
    edit port23
        set ip 172.25.12.1/24
        set management-ip 172.25.12.5/24
        set allowaccess https ssh snmp
    next
end
```

Upgrading FortiGates in an HA cluster

You can upgrade the firmware on an HA cluster in the same way as on a standalone FortiGate. During a firmware upgrade, the cluster upgrades the primary unit and all of the subordinate units to the new firmware image.

Before upgrading a cluster, back up your configuration (Configuration backups and reset on page 3505), schedule a maintenance window, and make sure that you are using a supported upgrade path (https://docs.fortinet.com/upgrade-tool).

Uninterrupted upgrade

An uninterrupted upgrade occurs without interrupting communication in the physical or virtual cluster.

To upgrade the cluster firmware without interrupting communication, use the following steps. These steps are transparent to the user and the network, and might result in the cluster selecting a new primary unit.

1. The administrator uploads a new firmware image using the GUI or CLI. See Upgrading individual devices on page 3062 for details.
2. The firmware is upgraded on all of the subordinate units.
3. A new primary unit is selected from the upgraded subordinates.
4. The firmware is upgraded on the former primary unit.
5. Primary unit selection occurs, according to the standard primary unit selection process.

If all of the subordinate units crash or otherwise stop responding during the upgrade process, the primary unit will continue to operate normally, and will not be upgraded until at least one subordinate rejoins the cluster.

Uninterrupted upgrade does not guarantee that reboots will stagger after changes to CLI settings that require a reboot. Changing settings in the CLI that require a reboot will typically display a warning, such as:

```
The configuration will take effect after system reboot.
Do you want to continue? (y/n)
```

This can result in all of the cluster units rebooting at the same time.

Interrupted upgrade

An interrupted upgrade upgrades all cluster members at the same time. This takes less time than an uninterrupted upgrade, but it interrupts communication in the cluster. Interrupted upgrade is disabled by default.

To enable interrupted upgrade:

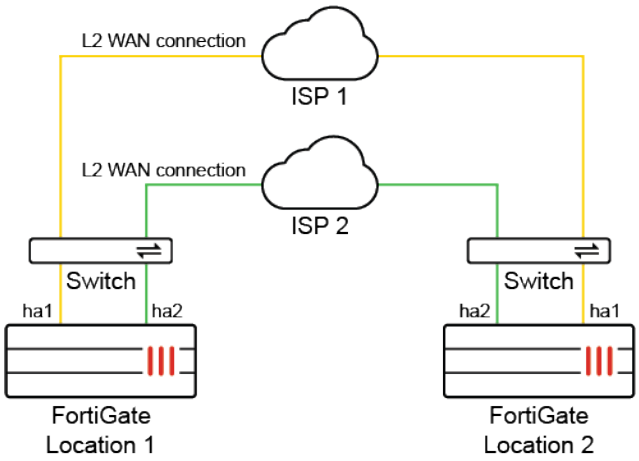
```
config system ha
    set upgrade-mode simultaneous
end
```

Distributed HA clusters

FGCP HA supports cluster units installed in different physical locations to achieve geo-redundancy. This may be desirable in large enterprises that deploy multiple data centers and network infrastructure to prevent interruptions caused by downtime in one location or region. Distributed clusters (or geographically distributed clusters) can have cluster units in different rooms in the same building, different buildings in the same location, or different geographical regions (cities, countries, or continents). When disruption is detected in one location, traffic can be routed to another location and failed over to the HA unit in the same cluster to prevent major downtime.

Just like any FGCP HA cluster, distributed clusters require heartbeat communication between cluster units over a Layer 2 network. In a distributed cluster, this heartbeat communication can take place over a dedicated lease-line, MPLS, or other L2 WAN solutions. Most Data Center Interconnect (DCI) or MPLS-based solutions that support Layer 2 extensions between the remote data centers should also support HA heartbeat communication between the FortiGates in the distributed locations.

For more information about FGCP HA heartbeats, see HA heartbeat interface on page 3175.



Because of the possible distance between the cluster members, it may take longer for heartbeat packets to be transmitted between cluster units. If the time it takes and the possible latency and packet losses cause the configured heartbeat lost threshold to be exceeded, then a split brain scenario can occur (see Split brain scenario).

To avoid this, you can increase the heartbeat interval (the time between the sending of heartbeat packets) so that the cluster expects extra time between heartbeat packets. A general rule is to configure the failover time to be longer than the maximum latency. You could also increase the `hb-lost-threshold`, which is the number of lost heartbeats to signal a failure, in order to tolerate losing more heartbeat packets if the network connection is less reliable.

To configure the heartbeat interval and lost threshold:

```
config system ha
    set hb-interval <integer>
    set hb-lost-threshold <integer>
end
```

A longer interval and threshold can lead to slower failover time, and a shorter interval and threshold may lead to false positives. Therefore, these settings should be fine-tuned based on individual network scenarios. Additional options include:

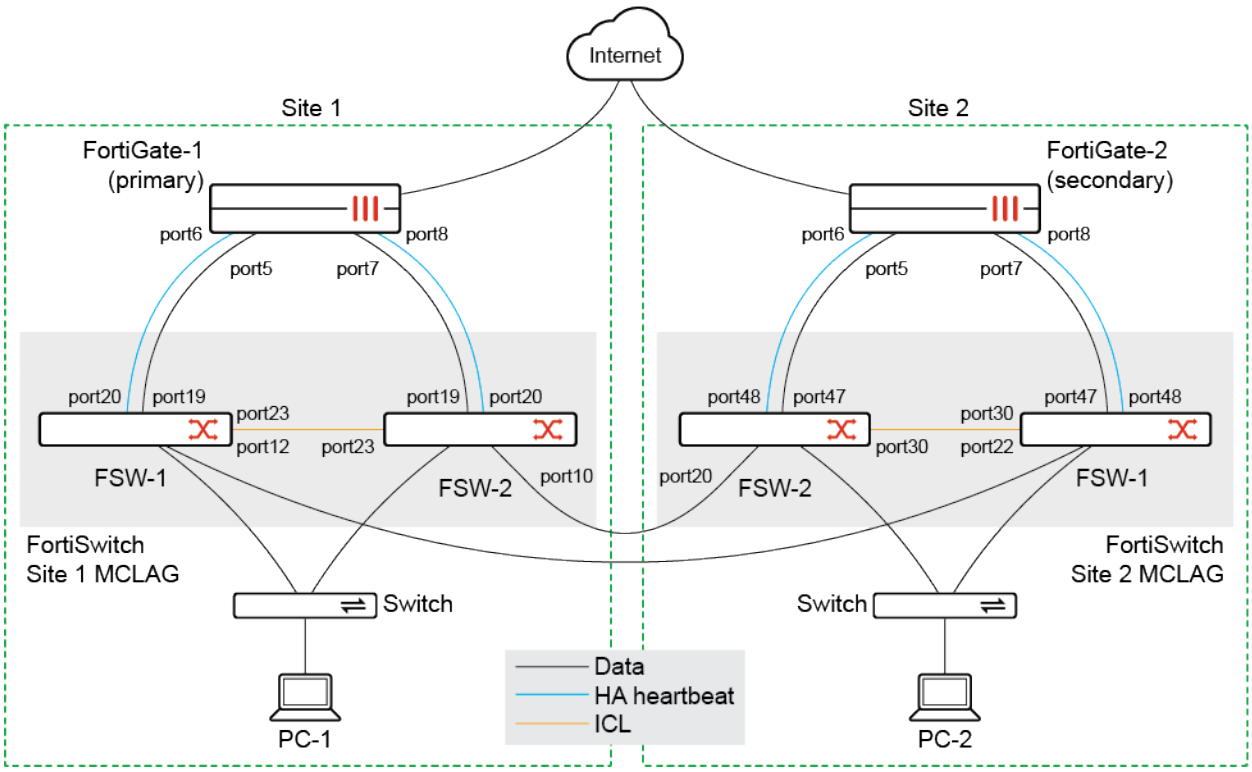
- Using multiple heartbeat interfaces and different link paths for heartbeat packets to optimize HA heartbeat communication.
- Configuring QoS on the links used for HA heartbeat traffic to make sure heartbeat communication has the highest priority.

For information about changing the heartbeat interval and other heartbeat related settings, see Modifying heartbeat timing.

HA between remote sites over managed FortiSwitches

In a multi-site FortiGate HA topology that uses managed FortiSwitches in a multi-chassis link aggregation group (MCLAG) to connect between sites, HA heartbeat signals can be sent through the switch layer of the FortiSwitches, instead of through back-to-back links between the heartbeat interfaces. This means that two fiber connections can be used, instead of four (two back-to-back heartbeat fiber connections and two connections for the FortiSwitches). The FortiSwitches can be different models, but must all support MCLAG and be running version 6.4.2 or later.

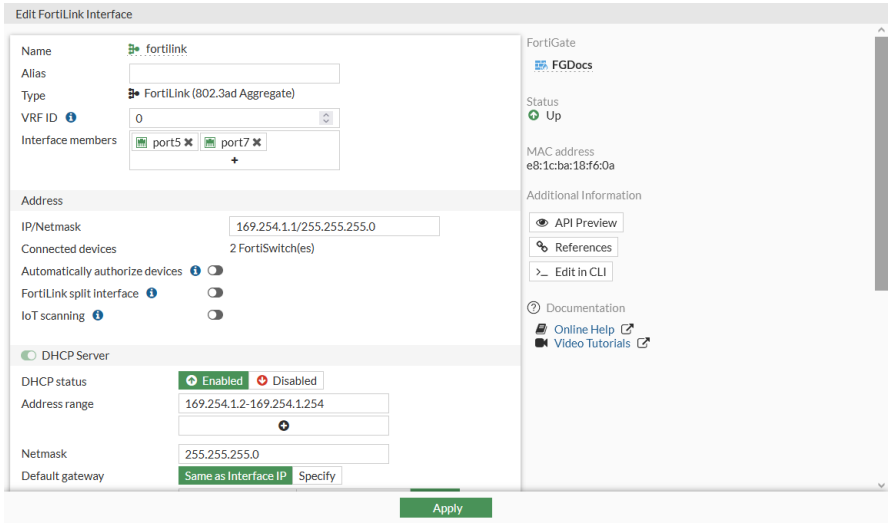
This example shows how to configure heartbeat VLANs to assign to the access ports that the heartbeat interfaces connect to, passing over the trunk between the FortiSwitches on the two sites.



FortiGate HA is with two FortiGates in separate locations and the switch layer connection between the FortiSwitches is used for the heartbeat signal.

To configure the example:

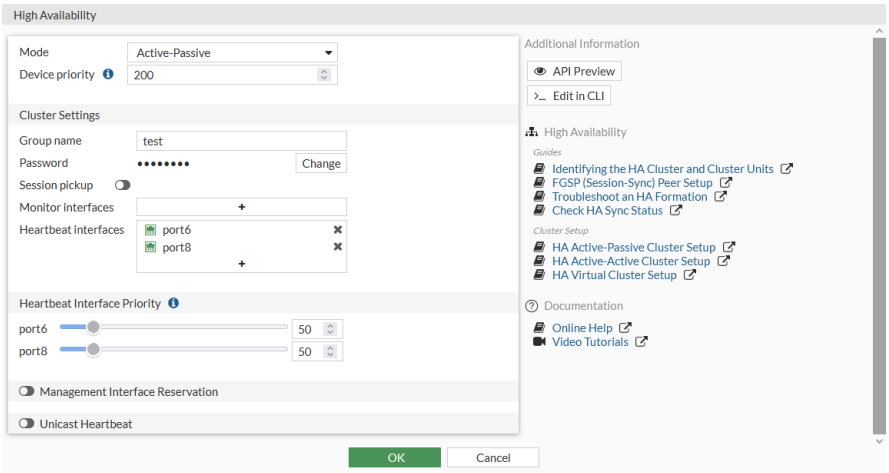
1. Disconnect the physical connections between Site 1 and Site 2:
   - Disconnect the cable on Site 1 FSW-1 port 12.
   - Disconnect the cable on Site 1 FSW-2 port 10.
2. Configure Site 1:
   a. On the FortiGate, go to *WiFi & Switch Controller* > *FortiLink Interface* and configure FortiLink:



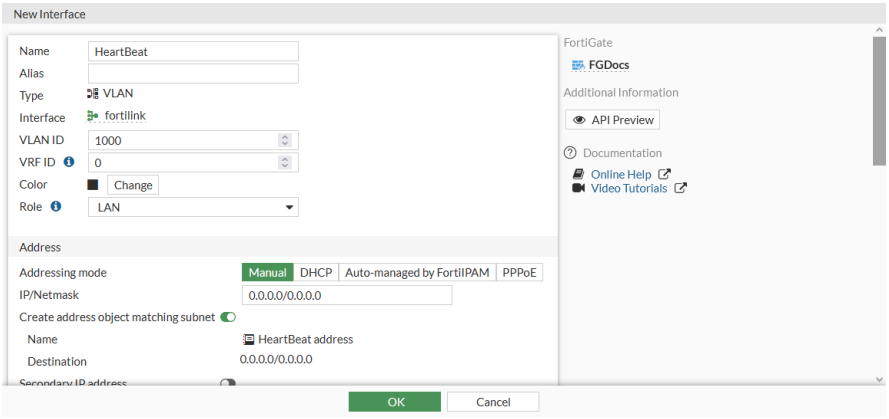
b. Go to *System* > *HA* and configure HA:

i. Set the heartbeat ports to the ports that are connected to FortiSwitch.

ii. Adjust the priority and enable override so that this FortiGate becomes the primary.



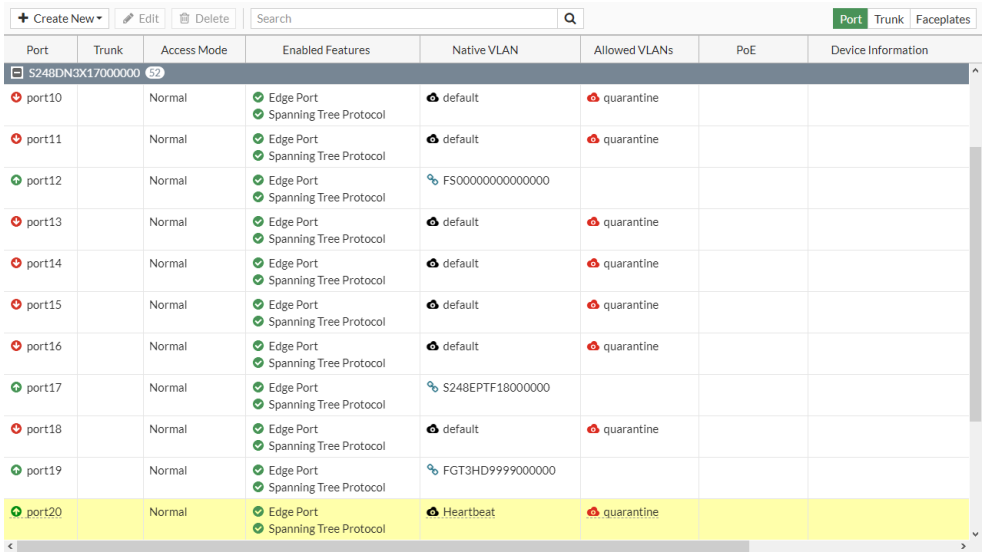
c. Go to *WiFi & Switch Controller* > *FortiSwitch VLANs* and create switch VLANs that are dedicated to each FortiGate HA heartbeat interface between the two FortiGates: Heartbeat VLAN 1000 and Heartbeat VLAN 1100.



d. Assign the native VLAN of the switch ports that are connected to the heartbeat ports to the created VLAN. Each HA heartbeat should be in its own VLAN.

i. Go to *WiFi & Switch Controller* > *FortiSwitch Ports*.

ii. In the *Native VLAN* column for the heartbeat port that is connected to FSW-1, click the edit icon and select the *Heartbeat* VLAN.



iii. In the *Native VLAN* column for the heartbeat port that is connected to FSW-2, click the edit icon and select the *Heartbeat2* VLAN.

e. On each FortiSwitch, enable MCLAG-ICL on the trunk port:

```
config switch trunk
    edit D243Z17000032-0
        set mclag-icl enable
    next
end
```

3. Configure Site 2 the same as Site 1, except set the HA priority so that the FortiGate becomes the secondary.
4. Disconnect the physical connections for FortiGate HA and FortiLink interfaces on Site 2:
   - Disconnect the cable on Site 2 FSW-1 ports 47 and 48.
   - Disconnect the cable on Site 2 FSW-2 ports 47 and 48.
5. Connect cables between the FortiSwitch MCLAG in Site 1 and Site 2:
   - Connect a cable from Site 1 FSW-1 port 12 to Site 2 FSW-1 port 22.
   - Connect a cable from Site 1 FSW-2 port 10 to Site 2 FSW-2 port 20.
6. On all of the FortiSwitches, configure the `auto-isl-port-group`. The group must match on both sides.
   a. Site 1 FSW-1:

      Set `members` to the port that is connected to Site 2 FSW-1:

```
config switch auto-isl-port-group
    edit 1
        set members port12
    next
end
```

   b. Site 1 FSW-2:

      Set `members` to the port that is connected to Site 1 FSW-1:

```
config switch auto-isl-port-group
    edit 1
        set members port22
    next
end
```

c. Site 2 FSW-1:

Set `members` to the port that is connected to Site 2 FSW-2:

```
config switch auto-isl-port-group
    edit 1
        set members port10
    next
end
```

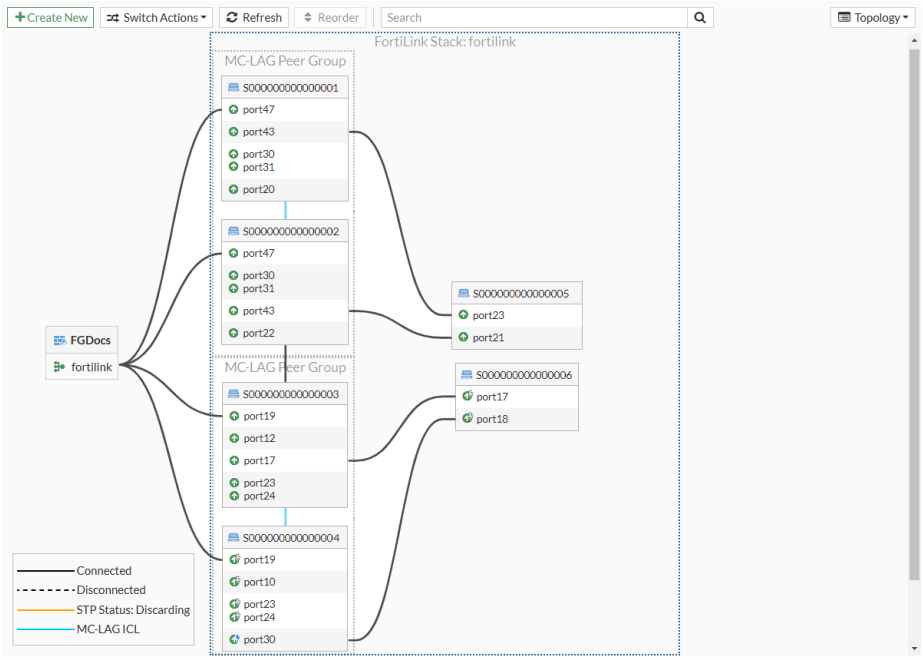
d. Site 2 FSW-2:

Set `members` to the port that is connected to Site 1 FSW-2:

```
config switch auto-isl-port-group
    edit 1
        set members port20
    next
end
```

7. Connect the FortiGate HA and FortiLink interface connections on Site 2.
8. Configure a firewall policy and route for traffic so that the client can reach the internet.
9. Wait for HA to finish synchronizing and for all of the FortiSwitches to come online, then on FortiGate-1, go to *WiFi & Switch Controller* > *Managed FortiSwitches* and select the Topology view from the drop-down on the right.

   The page should look similar to the following:



To test the configuration to confirm what happens when there is a failover:

1. On both PC-1 and PC-2, access the internet and monitor traffic. The traffic should be going through the primary FortiGate.
2. Perform a continuous ping to an outside IP address, then reboot any one of the FortiSwitches.
   Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.
3. Perform a continuous ping to an outside IP address, then force an HA failover (see Force HA failover for testing and demonstrations on page 3237).
   Traffic from both Site 1 and Site 2 to the internet should be recovered in approximately five seconds.
4. After an HA failover, on the new primary FortiGate, go to *WiFi & Switch Controller* > *Managed FortiSwitch*.
   The switch layer tiering will be changed so that the directly connected FortiSwitches are at the top of the topology.

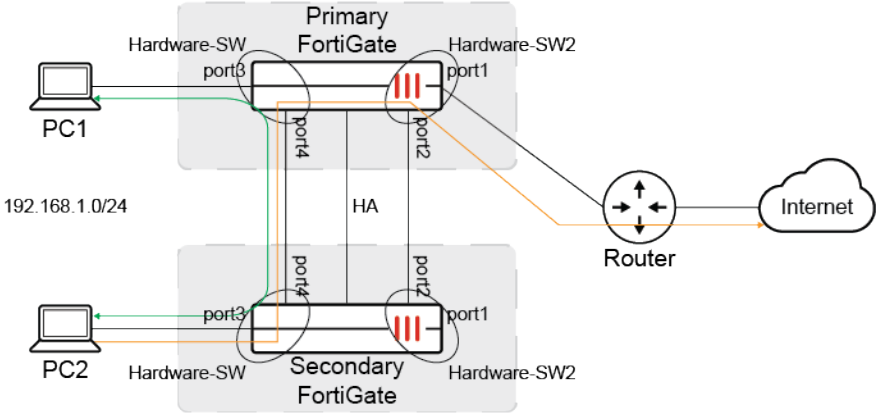
HA using a hardware switch to replace a physical switch

An HA cluster can be deployed without physical switches connecting the traffic interfaces on the primary and secondary members. This setup may be desirable in certain environments where the network infrastructure must be kept to a bare minimum.

Generally, using a hardware switch to replace a physical switch is not recommended, as it offers no redundancy or interface monitoring. If one FortiGate loses power, all of the clients connected to that FortiGate device cannot go to another device until that FortiGate recovers. A hardware switch cannot be used as a monitor interface in HA. Any incoming or outgoing link failures on hardware member interfaces will not trigger failover; this can affect traffic. Therefore, assess your environment thoroughly before applying this solution.

Examples

The examples use the following topology:



Traffic between hardware switches

When using Hardware switch in HA environment, a client device connected to the hardware switch on the primary FortiGate can communicate with client devices connected to the hardware switch on secondary FortiGates as long as there is a direct connection between the two switches.

To configure the FortiGate devices:

1. Connect the LAN side of the FortiGate cluster as shown in the topology diagram.
2. On each FortiGate, configure HA:

```
config system ha
    set mode a-a
    set group-name Example_cluster
    set hbdev ha1 10 ha2 20
end
```

3. On the primary FortiGate, configure the hardware switch:

```
config system virtual-switch
    edit Hardware-SW
        set physical-switch sw0
        config port
            edit port3
            next
            edit port4
            next
        end
    next
end
```

4. On each FortiGate, configure the IP addresses on the hardware switches:

```
config system interface
    edit Hardware-SW
        set ip 192.168.10.1 255.255.255.0
        set allowaccess ping ssh http https
    next
end
```

After configuring the hardware switches, PC1 and PC2 can now communicate with each other.

Traffic passes through FortiGate

If client device needs to send traffic through the FortiGate, additional firewall configuration on the FortiGate is required.

All traffic from the hardware switches on either the primary or secondary FortiGate reaches the primary FortiGate first. The traffic is then directed according to the HA mode and firewall configuration.

On the WAN side, in order for both HA members to reach the upstream router without connecting to a switch, a hardware switch must be configured with a direct connection between the cluster members.

To configure the FortiGate devices:

1. Connect the WAN side of the FortiGate cluster as shown in the topology diagram.
2. On the primary FortiGate, configure another hardware switch for the WAN connection:

```
config system virtual-switch
    edit Hardware-SW2
        set physical-switch sw0
        config port
            edit port1
            next
            edit port2
            next
        end
    next
end
```

3. On each FortiGate, configure the IP addresses on the hardware switch:

```
config system interface
    edit Hardware-SW2
        set ip 172.16.200.1 255.255.255.0
        set allowaccess ping ssh http https
    next
end
```

4. On each FortiGate, configure a firewall policy:

```
config firewall policy
    edit 1
        set srcintf Hardware-SW
        set dstintf Hardware-SW2
        set srcaddr all
        set dstaddr all
        set service ALL
        set action accept
        set schedule always
        set nat enable
    next
end
```

5. On each FortiGate, configure a static route:

```
config router static
    edit 1
        set device Hardware-SW2
        set gateway 172.16.200.254
    next
end
```

Traffic from PC1 and PC2 can now reach destinations outside of the FortiGate cluster.

VDOM exceptions

VDOM exceptions are settings that can be selected for specific VDOMs or all VDOMs that are not synchronized to other HA members. This can be required when cluster members are not in the same physical location, subnets, or availability zones in a cloud environment.

Some examples of possible use cases include:

- You use different source IP addresses for FortiAnalyzer logging from each cluster member. See Override FortiAnalyzer and syslog server settings on page 3231 for more information.
- You need to keep management interfaces that have specific VIPs or local subnets that cannot transfer from being synchronized.
- In a unicast HA cluster in the cloud, you use NAT with different IP pools in different subnets, so IP pools must be exempt.
- In a unicast HA cluster in the cloud, when HA members have different interface IPs, the local gateway (`local-gw`) used to define the local end of the VPN tunnel may need to be specified individually for IPsec tunnel failover to occur.

When a VDOM exception is configured, the object will not be synchronized between the primary and secondary devices when the HA forms. Different options can be configured for every object.

When VDOM mode is disabled, the configured object is excluded for the entire device. To define a scope, VDOM mode must be enabled and the object must be configurable in a VDOM.

VDOM exceptions are synchronized to other HA cluster members.

To configure VDOM exceptions:

```
config global
    config system vdom-exception
        edit 1
            set object <object name>
            set scope {all* | inclusive | exclusive}
            set vdom <vdom name>
        next
    end
end
```

`object`	The name of the configuration object that can be configured independently for some or all of the VDOMs. See Objects on page 3230 for a list of available settings and resources.
`scope`	Determine if the specified object is configured independently for all VDOMs or a subset of VDOMs. • `all`: Configure the object independently on all VDOMs. • `inclusive`: Configure the object independently only on the specified VDOMs. • `exclusive`: Configure the object independently on all of the VDOMs that are not specified.
`vdom`	The names of the VDOMs that are included or excluded.

Objects

The following settings and resources can be exempt from synchronization in an HA cluster:

log.fortianalyzer.setting	user.radius

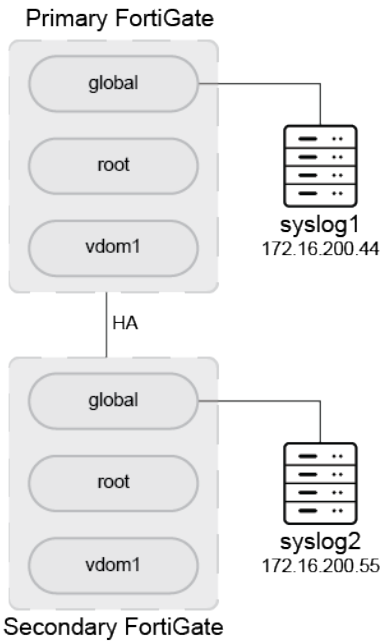
log.fortianalyzer.override-setting	system.interface*
log.fortianalyzer2.setting	vpn.ipsec.phase1-interface*
log.fortianalyzer2.override-setting	vpn.ipsec.phase2-interface*
log.fortianalyzer3.setting	router.bgp*
log.fortianalyzer3.override-setting	router.route-map*
log.fortianalyzer-cloud.setting	router.prefix-list*
log.fortianalyzer-cloud.override-setting	firewall.ippool*
log.syslogd.setting	firewall.ippool6*
log.syslogd.override-setting	router.static*
log.syslogd2.setting	router.static6*
log.syslogd2.override-setting	firewall.vip*
log.syslogd3.setting	firewall.vip6*
log.syslogd3.override-setting	system.sdwan*
log.syslogd4.setting	system.saml*
log.syslogd4.override-setting	router.policy*
system.central-management	router.policy6*
system.csf	

* This setting can only be configured on cloud VMs.

Override FortiAnalyzer and syslog server settings

In an HA cluster, secondary devices can be configured to use different FortiAnalyzer devices and syslog servers than the primary device. VDOMs can also override global syslog server settings.

Configure a different syslog server on a secondary HA device



To configure the primary HA device:

1. Configure a global syslog server:

```
config global
    config log syslog setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

2. Set up a VDOM exception to enable setting the global syslog server on the secondary HA device:

```
config global
    config system vdom-exception
        edit 1
            set object log.syslogd.setting
        next
    end
end
```

To configure the secondary HA device:

1. Configure a global syslog server:

```
config global
    config log syslogd setting
        set status enable
        set server 172.16.200.55
        set facility local5
    end
end
```

2. After the primary and secondary device synchronize, generate logs on the secondary device.

To confirm that logs are been sent to the syslog server configured on the secondary device:

1. On the primary device, retrieve the following packet capture from the secondary device's syslog server:

```
# diagnose sniffer packet any "host 172.16.200.55" 6
interfaces=[any]
filters=[host 172.16.200.55]

266.859494 port2 out 172.16.200.2.7434 -> 172.16.200.55.514: udp 278
0x0000   0000 0000 0000 0009 0f09 0004 0800 4500        ..............E.
0x0010   0132 f3c7 0000 4011 9d98 ac10 c802 ac10        .2....@.........

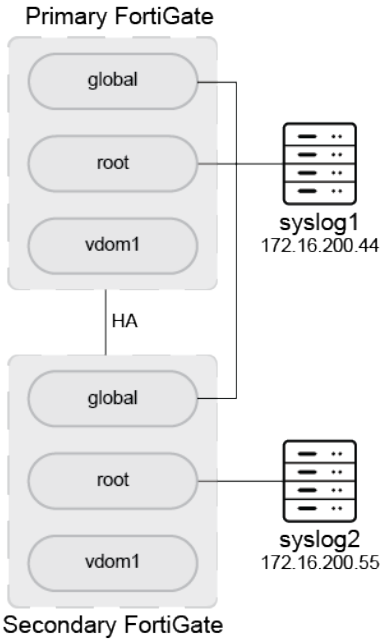
0x0130   6c64 2072 6570 6f72 7420 6669 6c65 7322        ld.report.files"
```

Configure a different syslog server in the root VDOM on a secondary HA device



To configure the primary HA device:

1. Configure a global syslog server:

```
config global
    config log syslog setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

2. Set up a VDOM exception to enable `syslog-override` in the secondary HA device root VDOM:

```
config global
    config system vdom-exception
        edit 1
            set object log.syslogd.override-setting
            set scope inclusive
            set vdom root
        next
    end
end
```

3. In the VDOM, enable `syslog-override` in the log settings, and set up the override syslog server:

```
config root
    config log setting
        set syslog-override enable
    end
    config log syslog override-setting
        set status enable
        set server 172.16.200.44
        set facility local6
        set format default
    end
end
```

After `syslog-override` is enabled, an override syslog server must be configured, as logs will not be sent to the global syslog server.

To configure the secondary HA device:

1. Configure an override syslog server in the root VDOM:

```
config root
    config log syslogd override-setting
        set status enable
        set server 172.16.200.55
        set facility local5
        set format default
    end
end
```

2. After the primary and secondary device synchronize, generate logs in the root VDOM on the secondary device.

To confirm that logs are been sent to the syslog server configured for the root VDOM on the secondary device:

1. On the primary device, retrieve the following packet capture from the syslog server configured in the root VDOM on the secondary device:

```
# diagnose sniffer packet any "host 172.16.200.55" 6
interfaces=[any]
filters=[host 172.16.200.55]
```

```
156.759696 port2 out 172.16.200.2.1165 -> 172.16.200.55.514: udp 277
0x0000   0000 0000 0000 0009 0f09 0004 0800 4500        ..............E.

Routing NetFlow data over the HA management interface

In an HA environment, the `ha-direct` option allows data from services such as syslog, FortiAnalyzer, SNMP, and NetFlow to be routed over the outgoing interface.

The following example shows how NetFlow data can be routed over the HA management interface mgmt1.

To route NetFlow data over the HA management interface:

1. On the primary unit (FortiGate A), configure the HA and mgmt1 interface settings:

```
(global) # config system ha
    set group-name "test-ha"
    set mode a-p
    set password *********
    set hbdev "port6" 50
    set hb-interval 4
    set hb-lost-threshold 10
    set session-pickup enable
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface "mgmt1"
        next
    end
    set override enable
    set priority 200
```

```
   set ha-direct enable
end
```

```
(global) # config system interface
    edit "mgmt1"
        set ip 10.6.30.111 255.255.255.0
        set allowaccess ping https ssh http telnet fgfm
        set type physical
        set dedicated-to management
        set role lan
        set snmp-index 1
    next
end
```

2. On the secondary unit (FortiGate B), configure the HA and mgmt1 interface settings:

```
(global) # config system ha
    set group-name "test-ha"
    set mode a-p
    set password *********
    set hbdev "port6" 50
    set hb-interval 4
    set hb-lost-threshold 10
    set session-pickup enable
    set ha-mgmt-status enable
    config ha-mgmt-interfaces
        edit 1
            set interface "mgmt1"
        next
    end
    set override enable
    set priority 100
    set ha-direct enable
end
```

```
(global) # config system interface
    edit "mgmt1"
        set ip 10.6.30.112 255.255.255.0
        set allowaccess ping https ssh http telnet fgfm
        set type physical
        set dedicated-to management
        set role lan
        set snmp-index 1
    next
end
```

3. On the primary unit (FortiGate A), configure the NetFlow setting:

```
(global) # config system netflow
    set collector-ip 10.6.30.59
end
```

4. Verify that NetFlow uses the mgmt1 IP:

```
(global) # diagnose test application sflowd 3
```

5. Verify that the NetFlow packets are being sent by the mgmt1 IP:

```
(vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
interfaces=[any]
filters=[udp and port 2055]
8.397265 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
23.392175 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 188
23.392189 mgmt1 out 10.6.30.111.1992 -> 10.6.30.59.2055: udp 60
...
3 packets received by filter
0 packets dropped by kernel
```

6. On the secondary device (FortiGate B), change the priority so that it becomes the primary:

```
(global) # config system ha
    set priority 250
end
```

7. Verify the NetFlow status on FortiGate A, which is using the new primary's mgmt1 IP:

```
(global) # diagnose test application sflowd 3
```

8. Verify that the NetFlow packets use the new source IP on FortiGate B:

```
(vdom1) # diagnose sniffer packet any 'udp and port 2055' 4
interfaces=[any]
filters=[udp and port 2055]
7.579574 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
22.581830 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 60
29.038336 mgmt1 out 10.6.30.112.3579 -> 10.6.30.59.2055: udp 1140
^C
3 packets received by filter
0 packets dropped by kernel
```

Force HA failover for testing and demonstrations

This command should only be used for testing, troubleshooting, maintenance, and demonstrations.

Do not use it in a live production environment outside of an active maintenance window.

HA failover can be forced on an HA primary device. The device will stay in a failover state (secondary) regardless of the conditions. The only way to remove the failover status is by manually turning it off.

Syntax

```
execute ha failover set <cluster_id>
execute ha failover unset <cluster_id>
```

Variable	Description
<cluster_id>	The cluster ID is 1 for any cluster that is not in virtual cluster mode, and can be 1 or 2 if virtual cluster mode is enabled.

Example

To manually force an HA failover:

```
# execute ha failover set 1
Caution: This command will trigger an HA failover.
It is intended for testing purposes.
Do you want to continue? (y/n)y
```

To view the failover status:

```
# execute ha failover status
failover status: set
```

To view the system status of a device in forced HA failover:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-300D
Group Name:
Group ID: 240
Debug: 0
Cluster Uptime: 0 days 2:11:46
Cluster state change time: 2020-03-12 17:38:04
Primary selected using:
    <2020/03/12 17:38:04> FGT3HD3914800153 is selected as the primary because EXE_FAIL_OVER flag
is set on peer member FGT3HD3914800069.
    <2020/03/12 15:27:26> FGT3HD3914800069 is selected as the primary because it has the largest
value of override priority.

```

Disabling stateful SCTP inspection

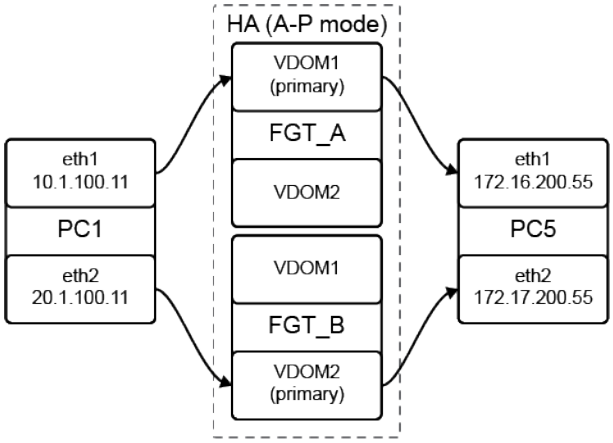
There is an option in FortiOS to disable stateful SCTP inspection. This option is useful when FortiGates are deployed in a high availability (HA) cluster that uses the FortiGate Clustering Protocol (FGCP) and virtual clustering in a multihoming topology. In this configuration, the primary stream control transmission protocol (SCTP) path traverses the primary FortiGate node by using its active VDOM (for example, VDOM1), and the backup SCTP path traverses the other passive FortiGate node by using its active VDOM (for example, VDOM2).

When stateful SCTP inspection is enabled, SCTP heartbeat traffic fails by means of the backup path because the primary path goes through a different platform and VDOM. Since there is no state sharing between VDOMs, the passive FortiGate is unaware of the original SCTP session and drops the heartbeats because of no associated sessions. When stateful SCTP inspection is disabled, the passive node permits the SCTP heartbeats to pass.

When set to `enable`, SCTP session creation without SCTP INIT is enabled. When set to `disable`, SCTP session creation without SCTP INIT is disabled (this is the default setting):

```
config system settings
    set sctp-session-without-init {enable | disable}
end
```

The following is an example topology and scenario:



In this example, FGT_A and FGT_B are in HA a-p mode with two virtual clusters. Two primaries exist on different FortiGate units. PC1 eth1 can access PC5 eth1 through VDOM1, and PC1 eth2 can access PC5 eth2 through VDOM2.

On PC5, to listen for an SCTP connection:

```
sctp_darn -H 172.16.200.55  -B 172.17.200.55 -P 2500 -l
```

On PC1, to start an SCTP connection:

```
sctp_darn -H 10.1.100.11 -B 20.1.100.11 -P 2600 -c 172.16.200.55 -c 172.17.200.55 -p 2500 -s
```

An SCTP four-way handshake is on one VDOM, and a session is created on that VDOM. With the default configuration, there is no session on any other VDOM, and the heartbeat on another path (another VDOM) is dropped. After enabling `sctp-session-without-init`, the other VDOM creates the session when it receives the heartbeat, and the heartbeat is forwarded:

```
config system settings
  set sctp-session-without-init enable
end
```

Resume IPS scanning of ICCP traffic after HA failover

After HA failover occurs, the IPS engine will resume processing ICCP sessions and keep the traffic going on the new primary unit. `session-pickup` must be enabled in an active-passive cluster to pick up the ICCP sessions.

Example

The following example uses an active-passive cluster. See HA active-passive cluster setup on page 3185 for more information.

To configure HA:

```
config system ha
    set group-name "HA-APP"
    set mode a-p
    set password ************
    set hbdev "port3" 100
    set session-pickup enable
    set override enable
end
```

Session states before failover

When HA is working, the ICCP session information is stored in the HA session cache on the secondary FortiGate.

To verify the HA session cache on the secondary FortiGate:

```
# diagnose ips share list
 HA Session Cache
  client=10.1.100.178:57218 server=172.16.200.177:102
    service=39, ignore_app_after=0, last_app=76919, buffer_len=32
    stock tags: nr=981, hash=e68dc8120970448
    custom tags: nr=0, hash=1a49b996b6a42aa2
    tags [count=2]: s-737, s-828,
```

The ICCP session information can be found in the IPS session list and the session table on the primary FortiGate.

To verify the IPS session information on the primary FortiGate:

```
# diagnose ips session list
SESSION id:1 serial:35487 proto:6 group:6 age:134 idle:1 flag:0x800012a6
        feature:0x4 encap:0 ignore:0,0 ignore_after:204800,0
        tunnel:0 children:0 flag:..s.-....-....
  C-10.1.100.178:57218, S-172.16.200.177:102
  state: C-ESTABLISHED/13749/0/0/0/0, S-ESTABLISHED/48951/0/0/0/0 pause:0, paws:0
  expire: 3599
  app: unknown:0 last:44684 unknown-size:0
  cnfm: cotp
  set: cotp
  asm: cotp
```

To verify the system information on the primary FortiGate:

```
# diagnose sys session list
session info: proto=6 proto_state=11 duration=209 expire=3585 timeout=3600 flags=00000000

```

Session states after failover

After HA failover, the IPS engine on the new primary picks up the related ICCP sessions and continues passing the traffic. The HA session cache disappears on the new primary. The ICCP session now appears on the IPS session list and session table on the new primary.

To verify the IPS session information on the new primary FortiGate:

```
# diagnose ips session list
SESSION id:1 serial:35487 proto:6 group:6 age:90 idle:2 flag:0x820012a3
        feature:0x4 encap:0 ignore:1,0 ignore_after:204800,0
        tunnel:0 children:0 flag:....-....-..i.
  C-10.1.100.178:57218, S-172.16.200.177:102
  state: C-ESTABLISHED/9114/0/0/0/0, S-ESTABLISHED/0/0/0/0/0 pause:0, paws:0
  expire: 28
  app: unknown:0 last:44684 unknown-size:0
```

The server and client IPs, ports, and protocols remain the same.

To verify the system information on the primary FortiGate:

```
# diagnose sys session list
session info: proto=6 proto_state=11 duration=569 expire=3577 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=5
origin-shaper=

```

Querying autoscale clusters for FortiGate VM

When a FortiGate VM secondary device is added to a cluster, the new secondary member can query the cluster about its autoscale environment. FortiManager can then run this query on the new secondary member to update its autoscale record.

To view cluster information from a secondary member:

```
# diagnose sys ha checksum autoscale-cluster
```

Cluster information sample

Sample cloud topology:

```
FGT_BYOL; primary; 10.0.0.6; FGVM04TM00000066
FGT_BYOL; secondary; 10.0.0.7; FGVM00000000056
FGT_PAYG; secondary; 10.0.0.4; FGTAZ000000000CD
FGT_PAYG; secondary; 10.0.0.5; FGTAZ0000000003D
```

From the secondary device, you can see cluster checksums and the primary device:

```
 # diagnose sys ha checksum autoscale-cluster
```

```

To get ha sync information from the secondary device:

```
# get test hasync 50
autoscale_count=69. current_jiffies=41235125
    10.0.0.6, timeo=31430, serial_no=FGVM04TM19001766
    10.0.0.7, timeo=31430, serial_no=FGVM04TM19008156
    10.0.0.5, timeo=31430, serial_no=FGTAZR7UZRKKNR3D
```

Cluster virtual MAC addresses

In a cluster, the FGCP assigns virtual MAC addresses (VMACs) to each primary device interface. HA uses VMAC addresses so that if a failover occurs, the new primary device interfaces will have the same VMAC

addresses and IP addresses as the failed primary device. As a result, most network equipment will identify the new primary device as the same device as the failed primary device and still be able to communicate with the cluster.

If a cluster is operating in NAT mode, the FGCP assigns a different VMAC address to each primary device interface. VLAN subinterfaces are assigned the same VMAC address as the physical interface that the VLAN subinterface is added to. Redundant or 802.3ad aggregate interfaces are assigned the VMAC address of the first interface in the redundant or aggregate list.

If a cluster is operating in transparent mode, the FGCP assigns a VMAC address to the primary device's management IP address. Since you can connect to the management IP address from any interface, all FortiGate interfaces appear to have the same VMAC address.

The MAC address of a reserved management interface does not change to a VMAC address; it keeps its original MAC address.

Subordinate device MAC addresses do not change. Use `diagnose hardware deviceinfo nic <interface>` on the subordinate device to display the MAC addresses of each interface.

A MAC address conflict can occur when two clusters are operating on the same network using the same group ID (see Diagnosing packet loss). It is recommended that each cluster in the same network and broadcast domain uses a unique group ID.

Failover

When the new primary device is selected after a failover, the primary device sends gratuitous ARP packets to update the devices connected to the cluster interfaces (usually layer 2 switches) with the VMAC addresses. This is sometimes called using gratuitous ARP packets (or GARP packets) to train the network. The gratuitous ARP packets sent from the primary unit are intended to make sure that the layer 2 switch forwarding databases (FDBs) are updated as quickly as possible.

Sending gratuitous ARP packets is not a requirement because connected devices will eventually learn of the new ports to forward the packets to. However, many network switches will update their FDBs more quickly after a failover if the new primary device sends gratuitous ARP packets.

Configuring ARP packet settings

The following settings can be configured.

```
config system ha
    set arps <integer>
    set arps-interval <integer>
    set gratuitous-arps {enable | disable}
    set link-failed-signal {enable | disable}
end
```

`arps <integer>`	Set the number of gratuitous ARPs; lower the value to reduce traffic, and increase the value to reduce failover time (1 - 60, default = 5).

`arps-interval <integer>`	Set the time between gratuitous ARPs; lower the value to reduce failover time, and increase the value to reduce traffic, in seconds (1 - 20, default = 8).
`gratuitous-arps {enable | disable}`	Enable/disable gratuitous ARPs (default = enable).
`link-failed-signal {enable | disable}`	Enable/disable shutting down all interfaces for one second after a failover. Use if gratuitous ARPs do not update the network (default = disable).

If you disable sending gratuitous ARP packets, it is recommended to enable the `link-failed-signal` setting. The `linked-fail-signal` alerts the connected switches of a failed link, which triggers them to react immediately to the changes.

For more information about gratuitous ARP packets see RFC 826 and RFC 3927.

Determining VMAC addresses

A VMAC address is determined using specific logic and variables. The variables are:

- **Virtual cluster (vcluster) ID**: What is the vcluster ID that the interface belongs to?

  The vcluster ID used in the following logic is the number configured in the FortiGate minus 1. In this example the cluster ID is 0:

  ```
  config vcluster
      edit 1
  ```

- **Group ID**: What is the group ID that the interface belongs to?
- **Physical index**: What is the value of the physical index receiving the VMAC?
  The following command can be used to locate the physical index number:

  ```
  # diagnose sys ha dump-by debug-zone
  (…)
  <hatalk>              mgmt    ifindex=4       phyindex=0              mac=04.d5…
  <hatalk>              ha      ifindex=3       phyindex=1              mac=04.d5…
  <hatalk>              wan1    ifindex=17      phyindex=2              mac=04.d5…
  <hatalk>              wan2    ifindex=18      phyindex=3              mac=04.d5…
  ```

The physical indexes used in this document are examples and may not match your interface indexes.

The logic uses the vcluster ID, group ID, and physical index variables to determine VMAC addresses as summarized in the following table:

Logic	Vcluster ID	Group ID	Physical index
Logic 1	0 or 1	Greater than 255	Less than 128

Logic	Vcluster ID	Group ID	Physical index
Logic 2	0 or 1	Less than 256	Less than 128
Logic 3	0 or 1	Less than 256	Greater than 127
Logic 4	Greater than 1	0-7	Less than 1024

Logic 1: vcluster ID 0 or 1, group ID > 255, and physical index < 128

The start of the VMAC address is always `e0:23:ff:--:--:--` with the last 24 bits defined as follows:

Preset bits	Group ID	Vcluster ID	Physical index
1 1 1 1 1 1	- - : - - - - - - - - :	-	- - - - - - -

This example uses group ID = 500 and vcluster ID = 0:

- Group ID
  - 500 – 256 = 244
  - $244_{10} = 011110100_2$
  - Group ID = 0011110100
- Vcluster ID
  - $0_{10} = 0_2$
  - Vcluster ID = 0
- Physical index
  - port7 physical index = 10
    - $10_{10} = 0001010_2$
  - port8 physical index = 12
    - $12_{10} = 0001100_2$
  - port9 physical index = 14
    - $14_{10} = 0001110_2$

Resulting in these VMAC addresses:

Interface	VMAC binary (last 24 bits)				VMAC hex (full)
	Preset bits	Group ID	Vcluster ID	Physical index	
port1	1 1 1 1 1 1	0 0 1 1 1 1 0 1 0 0	0	0 0 0 1 0 1 0	e0:23:ff:fc:f4:0a
port2	1 1 1 1 1 1	0 0 1 1 1 1 0 1 0 0	0	0 0 0 1 1 0 0	e0:23:ff:fc:f4:0c
port3	1 1 1 1 1 1	0 0 1 1 1 1 0 1 0 0	0	0 0 0 1 1 1 0	e0:23:ff:fc:f4:0e

Logic 2: vcluster ID 0 & 1, group ID < 256, and physical index < 128

The start of the VMAC address is always `00:09:0f:09:--:--` with the last 16 bits defined as follows:

Group ID	Vcluster ID	Physical index
- - - - - - - - : -	-	- - - - - - -

This example uses group ID = 200, vcluster ID = 1, and interfaces with physical indexes less than 128:

- Group ID:
  - $200_{10} = 11001000_2$
  - Group ID = 11001000
- Vcluster ID:
  - $1_{10} = 1_2$
  - Vcluster ID = 1
- Interfaces:
  - port25 physical index = 100
    - $100_{10} = 1100100_2$
  - port31 physical index = 120
    - $120_{10} = 1111000_2$
  - port38 physical index = 127
    - $127_{10} = 1111111_2$

Resulting in these VMAC addresses:

Interface	VMAC binary (last 16 bits)			VMAC hex (full)
	Group ID	Vcluster ID	Physical index	
port1	1 1 0 0 1 0 0 0	1	1 1 0 0 1 0 0	00:09:0f:09:c8:e4
port2	1 1 0 0 1 0 0 0	1	1 1 1 1 0 0 0	00:09:0f:09:c8:f8
port3	1 1 0 0 1 0 0 0	1	1 1 1 1 1 1 1	00:09:0f:09:c8:ff

Logic 3: vcluster ID 0 & 1, group ID < 256, and physical index > 127

The start of the VMAC address is always `70:4c:a5:--:--:--` with the last 24 bits defined as follows:

Physical index	Vcluster ID	Group ID
- - - - - - - - : - - - - - - - -	- :	- - - - - - - -

This example uses group ID = 25, vcluster ID = 1, and interfaces with physical indexes above 127:

- Group ID:
  - $25_{10} = 11001_2$
  - Group ID = 00011001
- Vcluster ID:
  - $1_{10} = 1_2$
  - Vcluster ID = 1
- Interfaces:

- port40 physical index = 230
  - 230 – 128 = 102
  - $102_{10} = 1100110_2$
- port45 physical index = 240
  - 240 – 128 = 112
  - $112_{10} = 1110000_2$
- port50 physical index = 250
  - 250 – 128 = 122
  - $122_{10} = 1111010_2$

Resulting in these VMAC addresses:

Interface	VMAC binary (last 24 bits)			VMAC hex (full)
	Physical index	Vcluster ID	Group ID	
port1	0 0 0 0 0 0 0 0 1 1 0 0 1 1 0	1	0 0 0 1 1 0 0 1	70:4c:a5:00:cd:19
port2	0 0 0 0 0 0 0 0 1 1 1 0 0 0 0	1	0 0 0 1 1 0 0 1	70:4c:a5:00:e1:19
port3	0 0 0 0 0 0 0 0 1 1 1 1 0 1 0	1	0 0 0 1 1 0 0 1	70:4c:a5:00:f5:19

Logic 4: vcluster ID >= 2

When the vcluster ID is 2 or greater, the group ID must be between 0 and 7.

The start of the VMAC address is always `e0:23:ff:--:--:--` with the last 24 bits defined as follows:

Preset bits	Physical index	Vcluster ID	Group ID
1 1 1 1 1 1	- - : - - - - - - - - :	- - - - -	- - -

This example uses group ID = 6 and vcluster ID = 9:

- Group ID
  - $6_{10} = 110_2$
  - Group ID = 110
- Vcluster ID
  - $9_{10} = 1001_2$
  - Vcluster ID = 01001
- Interfaces
  - port1 physical index = 3_{10}
    - $3_{10} = 0000000011_2$
  - port2 physical index = 6_{10}
    - $6_{10} = 0000000110_2$
  - port3 physical index = 9_{10}
    - $9_{10} = 0000001001_2$

Resulting in these VMAC addresses:

Interface	VMAC binary (last 24 bits)				VMAC hex (full)
	Preset bits	Physical index	Vcluster ID	Group ID	
port1	1 1 1 1 1 1	0 0 0 0 0 0 0 0 1 1	0 1 0 0 1	1 1 0	e0:23:ff:fc:03:4e
port2	1 1 1 1 1 1	0 0 0 0 0 0 0 1 1 0	0 1 0 0 1	1 1 0	e0:23:ff:fc:06:4e
port3	1 1 1 1 1 1	0 0 0 0 0 0 1 0 0 1	0 1 0 0 1	1 1 0	e0:23:ff:fc:09:4e

Displaying VMAC addresses

Each FortiGate physical interface has two MAC addresses: the permanent and current hardware addresses. The permanent hardware address cannot be changed, as it is the actual MAC address of the interface hardware. The current hardware address can be changed, as it is the address seen by the network.

To change the current hardware address on a FortiGate not operating in HA:

```
config system interface
    edit <name>
        set macaddr <address>
    next
end
```

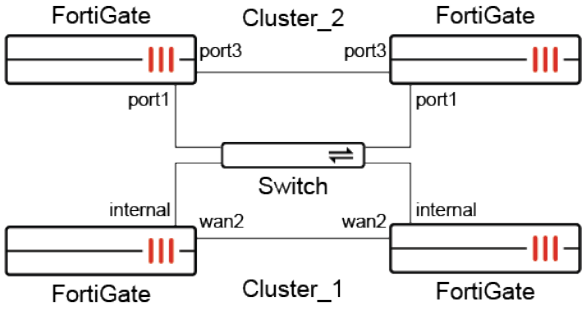
In an operating cluster, the current hardware address of each cluster device interface is changed to the HA virtual MAC address by the FGCP. The `macaddr` option is not available for a functioning cluster.

To display MAC addresses on a FortiGate operating in HA:

```
# diagnose hardware deviceinfo nic port1
...
Current_HWaddr 00:09:0f:09:ff:02
Permanent_HWaddr 08:5b:0e:72:3b:b2
```

Diagnosing packet loss

A network can experience packet loss when two FortiGate HA clusters are deployed in the same broadcast domain due to MAC address conflicts. You can resolve the MAC address conflict by changing the HA group ID (or cluster ID) configuration of the two clusters.



You can diagnose packet loss by pinging from one cluster to the other, or by pinging both of the clusters from a device within the broadcast domain.

To check for a MAC address conflict in a HA cluster:

1. On Cluster_1 and Cluster_2, check the VMAC address (`Current_HWaddr`) used in an interface on the primary device:

   ```
   # diagnose hardware deviceinfo nic <interface>
   ```

   If the group prefix and group hexadecimal ID are identical, there will be MAC address conflicts.
2. Change one of the clusters to use a different group ID:

   ```
   config system ha
       set group-id <integer>
   end
   ```

Abbreviated TLS handshake after HA failover

TLS sessions that pass through an HA A-A or A-P cluster can use an abbreviated TLS handshake instead of a full TLS handshake upon failover from a primary HA unit to a secondary HA unit. This reduces session pickup delays by reducing the time needed to renegotiate the TLS session, given that the TLS session ticket can be re-used.

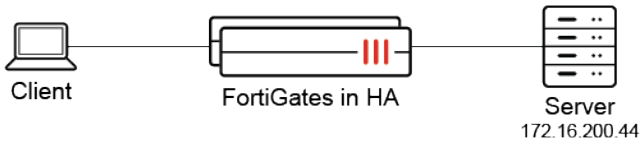
To accomplish this, FortiOS uses the web proxy global `ssl-ca-cert` to generate the key used in the TLS session ticket:

```
config web-proxy global
    set ssl-ca-cert "Fortinet_CA_SSL"
end
```

The certificate can be synchronized to the secondary HA unit, which allows the secondary unit to generate the same session key for a TLS session. When a TLS session reconnects after HA failover using the same session ticket as the first session, the new primary unit is able to generate the same key matching that session ticket and allow an abbreviated handshake.

Example

In this example, OpenSSL is used to create a TLS session between the client and the server through the primary FortiGate. The session ticket is outputted and saved. Upon failover, the same session ticket is reused to create a TLS session through the new primary unit. Because the new primary unit uses the same certificate to generate the key for the TLS session ticket, it allows the connection to be made using an abbreviated TLS handshake.



This example is for demonstration purposes only. In a normal failover, TLS sessions from clients will automatically be able to re-establish using an abbreviated handshake through the new primary unit.

To verify if an abbreviated TLS handshake is used after HA failover:

1. On the client using OpenSSL, open a new session to 172.16.200.44:443 and output the session ticket to a file called aaa.txt. This session will pass through the current HA primary unit:

```
# openssl s_client -connect 172.16.200.44:443 -sess_out aaa.txt
```

2. Fail over the primary unit to the secondary unit. The HA secondary unit starts handling the traffic.
3. On the client, try connecting to 172.16.200.44:443 using the same saved session ticket as before (aaa.txt):

```
# openssl s_client -connect 172.16.200.44:443 -sess_in aaa.txt
```

4. Verify whether the session succeeds in using the original session ticket:

```
Reused, TLSv1.3, Cipher is TLS_AES_256_GCM_SHA384
Server public key is 4096 bit
Secure Renegotiation IS NOT supported
Compression: NONE
Expansion: NONE
No ALPN negotiated
Early data was not sent
Verify return code: 19 (self signed certificate in certificate chain)
...
```

If the session is established using the same ticket, `Reused, TLSv1.3, Cipher is <name>` is displayed. If session is established using a new ticket, `New, TLSv1.3, Cipher is <name>` is displayed.

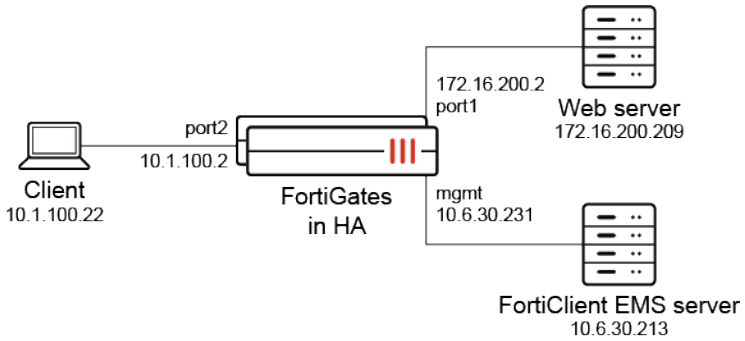
The new primary is able to use the web proxy global `ssl-ca-cert` to generate the same key as the old primary that was used in the session ticket. So, the second TLS connection that reuses the TLS session ticket from the first session can complete an abbreviated TLS handshake.

Session synchronization during HA failover for ZTNA proxy sessions

User information and TLS sessions are synchronized between HA members for ZTNA proxy sessions. When a failover occurs, the new primary unit will continue allowing sessions from the logged in users without asking for the client certificate and re-authentication again.

Example

In this example, a FortiGate HA pair is acting as a ZTNA access proxy. Clients that are trying to access the web server on qa.test.com are proxied by the ZTNA access proxy. Remote clients must be registered to the EMS server, and pass a client certificate check and user authentication in order to connect. Upon HA member failure, a failover occurs and the new primary unit will continue to allow connections without requesting client certificate check and user authentication for existing users and devices.



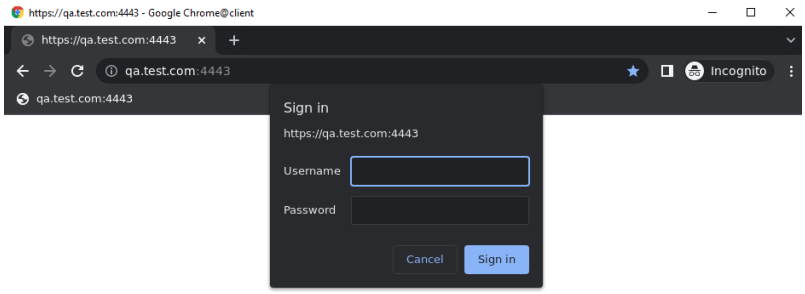
This example assumes ZTNA and EMS server settings are already configured.

To configure the HA settings:

```
config system ha
    set group-name "501E"
    set mode a-p
    set password **********
    set hbdev "ha" 0
    set session-pickup enable
    set override disable
    set monitor "port1" "port2"
end
```

To verify that the proxy sessions are synchronized between HA members:

1. On the client, access the web server. The ZTNA access proxy challenges the user for a client certificate and user authentication.



2. On the primary FortiGate, verify that the user information and TLS sessions are synchronized between HA members.
   a. Verify the list of proxy users:

```
501E-primary # diagnose wad user list
ID: 1, VDOM: root, IPv4: 10.1.100.22
  user name   : localuser1
  worker      : 0
  duration    : 8
  auth_type   : IP
  auth_method : Basic
  pol_id      : 1
```

```
  g_id        : 0
  user_based  : 1
  expire      : 597
  LAN:
    bytes_in=2093 bytes_out=5753
  WAN:
    bytes_in=2024 bytes_out=1235
```

b. Apply a filter to WAD debug to diagnose the wad informer process:

```
501E-primary # diagnose test application wad 2400
Set diagnosis process: type=informer index=0 pid=305
```

c. Show the user cache from the WAD informer. Verify that the localuser1 entry exists:

```
501E-primary # diagnose test application wad 110
users:
[1]     localuser1@10.1.100.22:0 upn_domain= from:worker worker:6 vf:0 ref:1 stale=0
ntlm:0, has_fsae:0, guest:0
                user_node:(0x7fe18dcf0048) user:1[max=65536](0x7fe18dd08048) ip:1
(0x7fe18dd00048) scheme:0 outofsync:0(0) id:1
...
```

d. Verify using WAD real-time debugs on the secondary FortiGate. The user information is synchronized to the secondary FortiGate:

```
501E-secondary # diagnose wad debug enable category all
501E-secondary # diagnose wad debug enable level verbose
501E-secondary # diagnose debug enable
[I][p:296]              wad_proc_informer_ha_dgram_on_read:2811  Got HA msg: type=0,
sizeof(msg)=8, dlen=80, sz=88
[I][p:296]              wad_proc_informer_on_ha_user_add  :1493  reader:

mapping user_node:0x7fc1c84dd048, user_ip:0x7fc1c84ed048(0), user:0x7fc1c84f5048(0).
```

3. Verify the user cache from the WAD informer:

```
501E-secondary # diagnose test application wad 110
users:
[1]     localuser1@10.1.100.22:0 upn_domain= from:worker worker:-126 vf:0 ref:1 stale=0
ntlm:0, has_fsae:0, guest:0
               user_node:(0x7fa3eb07d048) user:1[max=65536](0x7fa3eb095048) ip:1

...
```

If the client tries to access the web server again after failover occurs, the client certificate check and authentication prompt does not appear. ZTNA allows the traffic to pass.

The ZTNA logs for both FortiGates contain the same user information.

Primary FortiGate log:

```

```

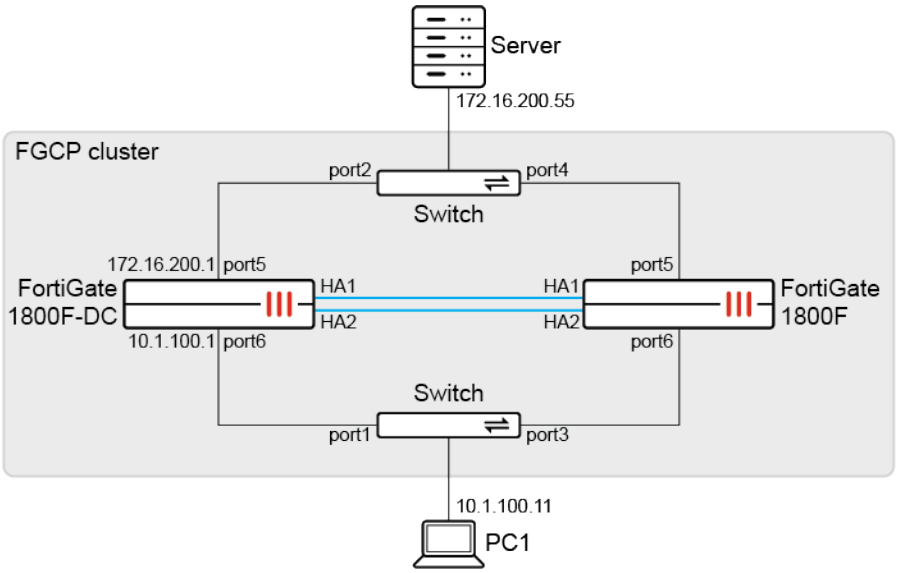
FGCP HA between FortiGates of the same model with different AC and DC PSUs

To improve power redundancy, FGCP HA clusters can support forming HA between units of the same model but with different AC PSU and DC PSU power supplies. This enables redundancy in a situation where power is completely lost on the AC grid, but traffic can fail over to a cluster member running on an independent DC grid.

The cluster members must be the same model with the same firmware installed, and must have the same hardware configuration other than the PSU.

In the following examples, there is an FGCP cluster with AC and DC PSU members: a FortiGate 1800F-DC (primary) and FortiGate 1800F (secondary).



Basic configuration

To configure the FGCP cluster in the GUI:

1. On the primary FortiGate (FG-1800F-DC), go to *System* > *HA*.
2. Configure the following settings:

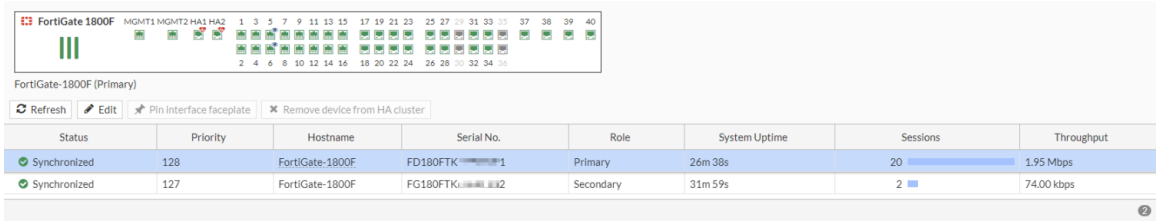
Mode	*Active-Passive*
Device priority	*128*
Group ID	*0*
Group name	*Example_cluster*
Password	Enter a password.
Session pickup	Enable this setting.
Monitor interfaces	Click the + to add *port5* and *port6*.
Heartbeat interfaces	Click the + to add *ha1* and *ha2*.

3. Click *OK*.
4. On the secondary FortiGate (FG-1800F), go to *System* > *HA*.
5. Configure the following settings:

Mode	*Active-Passive*
Device priority	*127*
Group ID	*0*
Group name	*Example_cluster*
Password	Enter a password.

Session pickup	Enable this setting.
Monitor interfaces	Click the + to add *port5* and *port6*.
Heartbeat interfaces	Click the + to add *ha1* and *ha2*.

6. Click *OK*.
7. Verify that the cluster status is *Synchronized*.



To configure the FGCP cluster in the CLI:

1. Configure the primary FortiGate (FG-1800F-DC):

```
config system ha
    set group-name "Example_cluster"
    set mode a-p
    set password **********
    set hbdev "ha2" 0 "ha1" 0
    set session-pickup enable
    set override disable
    set monitor "port5" "port6"
end
```

2. Configure the secondary FortiGate (FG-1800F):

```
config system ha
    set group-name "Example_cluster"
    set mode a-p
    set password **********
    set hbdev "ha2" 0 "ha1" 0
    set session-pickup enable
    set override disable
    set priority 127
    set monitor "port5" "port6"
end
```

3. Verify the cluster status on the primary FortiGate:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-1800F
Mode: HA A-P
Group Name: Example_cluster
Group ID: 0
Debug: 0
Cluster Uptime: 0 days 0:56:11
```

```
Cluster state change time: 2023-05-29 19:11:14

...
Secondary   : FortiGate-1800F , FG180FTK*******2, HA cluster index = 0
Primary     : FortiGate-1800F , FG180FTK*******1, HA cluster index = 1
number of vcluster: 1
vcluster 1: standby 169.254.0.2
Secondary: FG180FTK*******2, HA operating index = 1
Primary: FG180FTK*******1, HA operating index = 0
```

Testing synchronization in the cluster

Based on the preceding example, the interface and firewall policy configurations are changed on the primary FortiGate. These configuration changes and sessions are synchronized to the secondary FortiGate. If the switch interface connected to the primary's port5 is down (port2), this triggers the monitor interface to be down, and the PC1 traffic will fail over to the secondary FortiGate.

To test configuration synchronization in the FGCP cluster:

1. Modify configurations on the primary FortiGate (FG-1800F-DC).
   a. Edit the interface settings:

```
config system interface
    edit "port5"
        set ip 10.1.100.1 255.255.255.0
        set allowaccess ping https ssh http telnet
        set alias "To_Client_PC"
        config ipv6
            set ip6-address 2000:10:1:100::1/64
            set ip6-allowaccess ping https ssh http
        end
    next
    edit "port6"
```

```
        set ip 172.16.200.1 255.255.255.0
        set allowaccess ping https ssh http fgfm
        set alias "To_Server"
        config ipv6
            set ip6-address 2000:172:16:200::1/64
            set ip6-allowaccess ping https ssh http
        end
    next
end
```

b. Edit the firewall policy settings:

```
config firewall policy
    edit 1
        set name "to_server_policy"
        set srcintf "port5"
        set dstintf "port6"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic-start enable
    next
end
```

2. On the secondary FortiGate (FG-1800F), verify that the settings were synchronized.

a. Verify the interface settings:

```
show system interface
    config system interface
        ...
        edit "port5"
            set vdom "root"
            set ip 10.1.100.1 255.255.255.0
            set allowaccess ping https ssh http telnet
            set type physical
            set alias "To_Client_PC"
            set snmp-index 9
            config ipv6
                set ip6-address 2000:10:1:100::1/64
                set ip6-allowaccess ping https ssh http
            end
        next
        edit "port6"
            set vdom "root"
            set ip 172.16.200.1 255.255.255.0
            set allowaccess ping https ssh http fgfm
            set type physical
            set alias "To_Server"
            set snmp-index 10
            config ipv6
```

```
                set ip6-address 2000:172:16:200::1/64
                set ip6-allowaccess ping https ssh http
            end
        next
    end
```

b. Verify the firewall policy settings:

```
show firewall policy
    config firewall policy
            edit 1
            set name "to_server_policy"
            set uuid 82a05e78-fe90-51ed-eb16-ee7bdea60de0
            set srcintf "port5"
            set dstintf "port6"
            set action accept
            set srcaddr "all"
            set dstaddr "all"
            set schedule "always"
            set service "ALL"
            set logtraffic-start enable
        next
    end
```

c. Verify the HA checksum:

```
# diagnose sys ha checksum show
is_manage_primary()=0, is_root_primary()=0
debugzone
global: 4e 15 af c3 c6 87 32 f5 69 5c b7 33 b1 8b 27 12
root: 4a 52 e4 f1 6a 2b eb 7d 84 7d f1 48 50 93 fe d9
all: 95 4e 92 c3 39 75 8e 0e db 83 8d b7 b2 b1 9f 04

checksum
global: 4e 15 af c3 c6 87 32 f5 69 5c b7 33 b1 8b 27 12
root: 4a 52 e4 f1 6a 2b eb 7d 84 7d f1 48 50 93 fe d9
all: 95 4e 92 c3 39 75 8e 0e db 83 8d b7 b2 b1 9f 04
```

To test session synchronization in the FGCP cluster:

1. On PC1, verify the IP address and gateway:

```
root@pc1:~# ifconfig eth1
eth1      Link encap:Ethernet  HWaddr 00:0c:29:a0:60:d6
          inet addr:10.1.100.11  Bcast:10.1.100.255  Mask:255.255.255.0
          ...

root@pc1:~# route -n
Kernel IP routing table
Destination     Gateway         Genmask         Flags Metric Ref    Use Iface
0.0.0.0         10.1.100.1      0.0.0.0         UG    0      0        0 eth1
10.1.100.0      0.0.0.0         255.255.255.0   U     0      0        0 eth1
```

```
10.6.30.0       0.0.0.0         255.255.255.0   U     0      0        0 eth0
169.254.0.0     0.0.0.0         255.255.0.0     U     1000   0        0 eth0
```

2. Using Wget, initiate a large file download with HTTP that will maintain a long session:

```
root@pc1:~# wget http://172.16.200.55/big100MB.html   --keep-session-cookies --limit-rate=128k
--progress=dot -S -r --delete-after
--2023-05-29 14:55:33--  http://172.16.200.55/big100MB.html
Connecting to 172.16.200.55:80... connected.
HTTP request sent, awaiting response...

total session: 1
```

To test failover in the FGCP cluster:

1. On the switch connected to port5 of the primary FortiGate, change port2's status to be down:

```
config switch physical-port
    edit port2
        set status down
    next
end
```

2. Check the HA status on the primary FortiGate (FG-1800F-DC), which now becomes the secondary device:

```
# get system ha status
HA Health Status:
    WARNING: FG180FTK*******1 has mondev down;
Model: FortiGate-1800F
Mode: HA A-P
Group Name: Example_cluster
```

```
Group ID: 0
Debug: 0
Cluster Uptime: 0 days 1:16:13
Cluster state change time: 2023-05-29 20:08:56
Primary selected using:
    <2023/05/29 20:08:56> vcluster-1: FG180FTK*******2 is selected as the primary because the
value 0 of link-failure + pingsvr-failure is less than peer member FG180FTK*******1.
    <2023/05/29 19:11:14> vcluster-1: FG180FTK*******1 is selected as the primary because its
uptime is larger than peer member FG180FTK*******2.
    <2023/05/29 18:59:45> vcluster-1: FG180FTK*******2 is selected as the primary because its
uptime is larger than peer member FG180FTK*******1.
    <2023/05/29 18:59:45> vcluster-1: FG180FTK*******1 is selected as the primary because its
override priority is larger than peer member FG180FTK*******2.
ses_pickup: enable, ses_pickup_delay=disable
override: disable
...
Secondary   : FortiGate-1800F , FG180FTK*******1, HA cluster index = 1
Primary     : FortiGate-1800F , FG180FTK*******2, HA cluster index = 0
number of vcluster: 1
vcluster 1: standby 169.254.0.1
Secondary: FG180FTK*******1, HA operating index = 1
Primary: FG180FTK*******2, HA operating index = 0
```

3. Check the HA status on the new primary FortiGate (FG-1800F):

```
# get system ha status
HA Health Status:
    WARNING: FG180FTK*******1 has mondev down;
Model: FortiGate-1800F
Mode: HA A-P
Group Name: Example_cluster
Group ID: 0
Debug: 0
Cluster Uptime: 0 days 1:19:9
Cluster state change time: 2023-05-29 20:08:56
Primary selected using:
    <2023/05/29 20:08:56> vcluster-1: FG180FTK*******2 is selected as the primary because the
value 0 of link-failure + pingsvr-failure is less than peer member FG180FTK*******1.
    <2023/05/29 19:11:14> vcluster-1: FG180FTK*******1 is selected as the primary because its
uptime is larger than peer member FG180FTK*******2.
    <2023/05/29 18:59:45> vcluster-1: FG180FTK*******2 is selected as the primary because its
uptime is larger than peer member FG180FTK*******1.
    <2023/05/29 18:55:03> vcluster-1: FG180FTK*******2 is selected as the primary because it's
the only member in the cluster.
ses_pickup: enable, ses_pickup_delay=disable
override: disable
...
Primary     : FortiGate-1800F , FG180FTK*******2, HA cluster index = 0
Secondary   : FortiGate-1800F , FG180FTK*******1, HA cluster index = 1
number of vcluster: 1
vcluster 1: work 169.254.0.1
```

```
Primary: FG180FTK*******2, HA operating index = 0
Secondary: FG180FTK*******1, HA operating index = 1
```

4. On PC1, verify that the HTTP traffic remains uninterrupted:

```
...
74700K .......... .......... .......... .......... .......... 75%  100K 3m13s
74750K .......... .......... .......... .......... .......... 75%  200K 3m13s
74800K .......... .......... .......... .......... .......... 75%  100K 3m12s
74850K .......... .......... .......... .......... .......... 75%  200K 3m12s
74900K .......... .......... .......... .......... .......... 75%  100K 3m12s
74950K .......... .......... .......... .......... .......... 75%  100K 3m11s
75000K .......... .......... .......... .......... .......... 75%  200K 3m11s
75050K .......... .......... .......... .......... .......... 75%  100K 3m10s
75100K .......... .......... .......... .......... .......... 75%  200K 3m10s
75150K .......... .......... .......... .......... .......... 75%  100K 3m10s
```

FGCP multi-version cluster upgrade

The FGCP multi-version cluster (MVC) upgrade mode allows manual control over the cluster member that is being upgraded. HA members can temporarily run in an MVC while administrators perform tests to confirm traffic can pass through the upgraded member smoothly.

The syntax of the existing upgrade mode has been updated starting in 7.4.1:

```
config system ha
    set upgrade-mode {simultaneous | uninterruptible | local-only | secondary-only}
end
```

`upgrade-mode {simultaneous | uninterruptible | local-only | secondary-only}`	Set the mode to upgrade a cluster. • `simultaneous`: all HA members upgrade at the same time (`set uninterruptible-upgrade disable` in 7.4.0 and earlier). • `uninterruptible`: secondary HA members are upgraded first, followed by the primary member (`set uninterruptible-upgrade enable` in 7.4.0 and earlier). • `local-only`: only upgrade the local member in which the firmware is uploaded. • `secondary-only`: only upgrade the secondary members.

The `local-only` and `secondary-only` upgrade options are advanced configurations that should only be used to temporarily put the HA cluster in MVC operation mode. While in this operation, states and sessions (such as the session table and routing table) are synchronized, but configuration changes are not synchronized between cluster members in different builds. If more than two members are in the cluster, the configurations between members in the same builds will be synchronized. The configurations for the entire cluster will be synchronized once the upgrade process has completed.

How it works

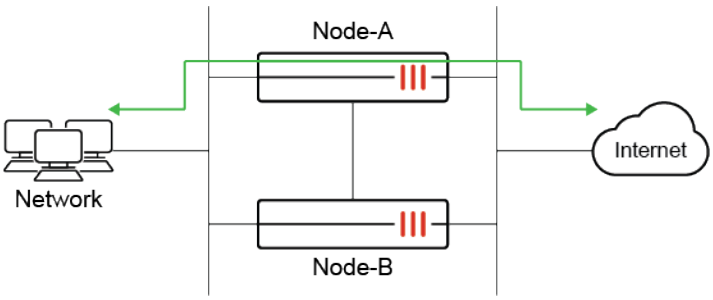
In `local-only` and `secondary-only` modes, the specific cluster member is upgraded and sessions are synchronized to it. The following tables show which members are upgraded based on the mode and where the upgrade is initiated.

local-only		
Upgrade method	**Outcome**	**Recommendation**
Initiate the upload or upgrade on the primary.	The primary member is upgraded.	Not recommended.
Initiate the upload or upgrade on the secondary member.	The secondary member where the image is uploaded is upgraded.	Recommended when selecting a specific HA member to upgrade.

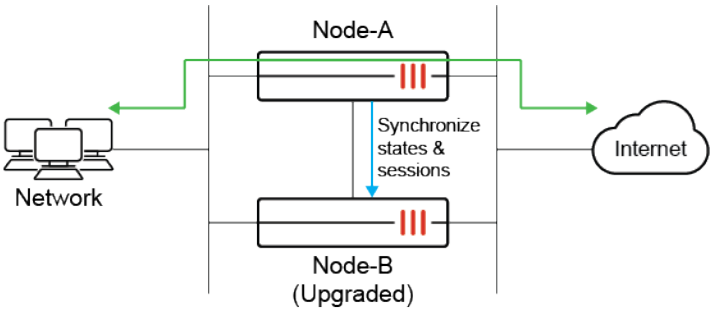
secondary-only		
Upgrade method	**Outcome**	**Recommendation**
Initiate the upload or upgrade on the primary.	All non-primary members are upgraded.	Recommended for scenarios where there is more than one secondary HA member.
Initiate the upload or upgrade on the secondary member.	The secondary member where the image is uploaded is upgraded.	Same result as initiating an upgrade on a secondary member in `local-only` mode.

This can apply to any HA clusters with two or more members. Administrators can initiate an upgrade on a secondary member by using its CLI console or accessing the device's GUI from its HA management interface.

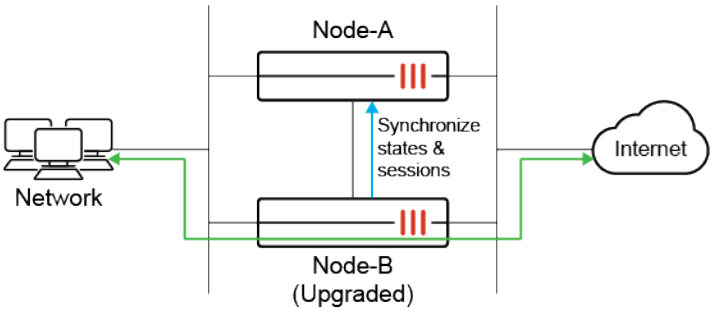
Initially, when you prepare an HA cluster in A-P mode for upgrade, traffic passes through the primary unit (Node-A) as the secondary unit (Node-B) sits on standby.



After the upgrade is completed on a secondary unit, states and sessions are synchronized. The members are now operating in MVC mode; however, traffic continues to pass through Node-A.



Administrators can manually trigger failover to make Node-B the new primary when ready. This can be done by resetting the HA uptime or changing device priorities, whichever method is desired. Traffic now passes through Node-B.

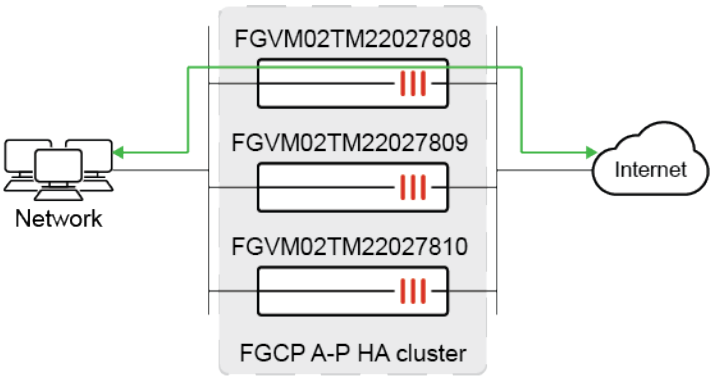


The upgraded system (Node-B) can be tested to verify that traffic can pass smoothly. If verification fails, administrators can trigger a failover to fail back to Node-A to avoid any downtime.

If verification is successful, administrators can manually trigger an upgrade on Node-A to bring the HA member up to the same version as Node-B to complete the HA upgrade procedure. This can be performed by accessing Node-A's GUI from its HA management interface or using its CLI console.

Example 1: upgrade a single secondary member using the local-only upgrade option

In this example, three HA members are running in an FGCP A-P HA cluster.



The member FGVM02TM22027808 is acting as the primary and forwarding traffic. The member FGVM02TM22027810 is chosen for upgrade.

The cluster is originally running build 2456. The secondary unit is upgraded to build 2461. Fictitious build numbers are used in this example to demonstrate functionality of the feature.

To configure the HA cluster:

```
config system ha
    set group-id 260
    set group-name "hagroup"
    set mode a-p
    set hbdev "port3" 0
    set session-pickup enable
    set upgrade-mode local-only
end
```

To perform the upgrade:

1. On the secondary member (FGVM02TM22027810), log in to the CLI console.
2. Execute a TFTP upgrade:

```
FGVM02TM22027810 # execute restore image tftp /home/Images/FortiOS/v7.00/images/build2461/FGT_
VM64-v7-build2461-FORTINET.out 172.16.100.71
This operation will replace the current firmware version!
Do you want to continue? (y/n)y

Please wait...

Connect to ftp server 172.16.100.71 ...
Get image from ftp server OK.
Verifying the signature of the firmware image.

Please wait for system to restart.
```

3. After the upgrade is complete, verify the version running on the secondary member:

```
FGVM02TM22027810 # get system status
Version: FortiGate-VM64 v7.4.1,build2461,230828 (interim)
…
```

4. On the primary unit, verify that HA is still formed between the three members:

```
FGVM02TM22027808 # diagnose sys ha dump-by group
<hatalk> vcluster_1: ha_prio=0(primary), state/chg_time/now=2(work)/1692750721/1693262149
            HA information.
group-id=260, group-name='hagroup'
has_no_aes128_gcm_sha256_member=0

gmember_nr=3
'FGVM02TM22027808': ha_ip_idx=2, hb_packet_version=10, last_hb_jiffies=0, linkfails=0,
weight/o=0/0, support_aes128_gcm_sha256=1
'FGVM02TM22027809': ha_ip_idx=1, hb_packet_version=12, last_hb_jiffies=51142842, linkfails=3,
weight/o=0/0, support_aes128_gcm_sha256=1
        hbdev_nr=1: port3(mac=000c..de, last_hb_jiffies=51142842, hb_lost=0),
'FGVM02TM22027810': ha_ip_idx=0, hb_packet_version=4, last_hb_jiffies=51142858, linkfails=3,
weight/o=0/0, support_aes128_gcm_sha256=1
        hbdev_nr=1: port3(mac=000c..1a, last_hb_jiffies=51142858, hb_lost=0),
```

```
vcluster_nr=1
vcluster-1: start_time=1692750718(2023-08-22 17:31:58), state/o/chg_time=2(work)/2
(work)/1692750721(2023-08-22 17:32:01)
        pingsvr_flip_timeout/expire=3600s/0s
        mondev: port1(prio=50,is_aggr=0,status=1) port7(prio=50,is_aggr=0,status=1) port8
(prio=50,is_aggr=0,status=1)
        'FGVM02TM22027808': ha_prio/o=0/0, link_failure=0, pingsvr_failure=0, flag=0x00000001,
mem_failover=0, uptime/reset_cnt=510868/0
        'FGVM02TM22027809': ha_prio/o=1/1, link_failure=0, pingsvr_failure=0, flag=0x00000000,
mem_failover=0, uptime/reset_cnt=510857/0
        'FGVM02TM22027810': ha_prio/o=2/2, link_failure=0, pingsvr_failure=0, flag=0x00000000,
mem_failover=0, uptime/reset_cnt=0/0
```

5. Fail over the HA cluster so that the secondary member, FGVM02TM22027810, becomes the primary. Since override is not enabled and the HA primary is determined by uptime, you can reset the HA uptime on the units that were not upgraded:

```
# diagnose sys ha reset-uptime
```

6. Once verification on the upgraded member is successful, repeat step 2 to perform upgrades on the remaining units.

Example 2: upgrade multiple secondary members using the secondary-only upgrade option

Using the same topology as example 1, the three HA cluster members are originally running build 2456. Both secondary units are upgraded using the `secondary-only` upgrade option. Fictitious build numbers are used in this example to demonstrate functionality of the feature.

To configure the HA cluster:

```
config system ha
    set group-id 260
    set group-name "hagroup"
    set mode a-p
    set hbdev "port3" 0
    set session-pickup enable
    set upgrade-mode secondary-only
end
```

To perform the upgrade:

1. On the primary unit (FGVM02TM22027808), log in to the CLI console.
2. Execute a TFTP upgrade:

```
FGVM02TM22027808 # execute restore image tftp /home/Images/FortiOS/v7.00/images/build2461/FGT_
VM64-v7-build2461-FORTINET.out 172.16.100.71
```

3. After the upgrade is complete, verify the version running on the secondary members.

a. Member 1:

```
FGVM02TM22027809 # get system status
Version: FortiGate-VM64 v7.4.1,build2461,230828 (interim)
…
```

b. Member 2:

```
FGVM02TM22027810 # get system status
Version: FortiGate-VM64 v7.4.1,build2461,230828 (interim)
…
```

4. On the primary unit, verify that HA is still formed between the three members:

```
FGVM02TM22027808 # diagnose sys ha dump-by group
            HA information.
group-id=260, group-name='hagroup'
has_no_aes128_gcm_sha256_member=0

gmember_nr=3
'FGVM02TM22027808': ha_ip_idx=2, hb_packet_version=19, last_hb_jiffies=0, linkfails=0,
weight/o=0/0, support_aes128_gcm_sha256=1
'FGVM02TM22027809': ha_ip_idx=1, hb_packet_version=4, last_hb_jiffies=51358055, linkfails=3,
weight/o=0/0, support_aes128_gcm_sha256=1
        hbdev_nr=1: port3(mac=000c..de, last_hb_jiffies=51358055, hb_lost=0),
'FGVM02TM22027810': ha_ip_idx=0, hb_packet_version=5, last_hb_jiffies=51358057, linkfails=3,
weight/o=0/0, support_aes128_gcm_sha256=1
        hbdev_nr=1: port3(mac=000c..1a, last_hb_jiffies=51358057, hb_lost=0),

vcluster_nr=1
vcluster-1: start_time=1692750718(2023-08-22 17:31:58), state/o/chg_time=2(work)/2
(work)/1692750721(2023-08-22 17:32:01)
        pingsvr_flip_timeout/expire=3600s/0s
        mondev: port1(prio=50,is_aggr=0,status=1) port7(prio=50,is_aggr=0,status=1) port8
(prio=50,is_aggr=0,status=1)
        'FGVM02TM22027808': ha_prio/o=0/0, link_failure=0, pingsvr_failure=0, flag=0x00000001,
mem_failover=0, uptime/reset_cnt=512775/0
        'FGVM02TM22027809': ha_prio/o=2/2, link_failure=0, pingsvr_failure=0, flag=0x00000000,
mem_failover=0, uptime/reset_cnt=0/0
        'FGVM02TM22027810': ha_prio/o=1/1, link_failure=0, pingsvr_failure=0, flag=0x00000000,
mem_failover=0, uptime/reset_cnt=1/0
```

Troubleshoot an HA formation

The following are requirements for setting up an HA cluster or FGSP peers.

Cluster members must have:

- The same model.
- The same hardware configuration.
- The same connections.
- The same generation.

The requirement to have the same generation is done as a best practice as it avoids issues that can occur later on. If you are unsure if the FortiGates are from the same generation, please contact customer service.

Troubleshooting common HA formation errors

One member keeps shutting down during HA setup (hard drive failure):

If one member has a hard drive failure but the other does not, the one with the hard drive failure will be shut down during HA setup. In this case, RMA the member to resolve the issue.

Split brain scenario:

A split brain scenario occurs when two or more members of a cluster cannot communicate with each other on the heartbeat interface, causing each member to think it is the primary. As a result, each member assumes the primary HA role and applies the same IP and virtual MAC addresses on its interfaces. This causes IP and MAC conflicts on the network, and causes flapping on L2 devices when they learn the same MAC address on ports connected to different FortiGates.

A split brain scenario is usually caused by a complete lost of the heartbeat link or links. This can be a physical connectivity issue, or less commonly, something blocking the heartbeat packets between the HA members. Another cause is congestion and latency in the heartbeat links that exceeds the heartbeat lost intervals and thresholds.

The following are common symptoms of a split brain scenario:

- The connections to the FortiGates in the cluster work intermittently when trying to connect with administrative access.
- Sessions cannot be established through the FortiGate, and the traffic drops.
- When logging in to the FortiGates using the console, `get system ha status` shows each FortiGate as the primary.

To resolve a split brain scenario:

- Be physically on-site with the FortiGates (recommended). If this is not possible, connect to the FortiGates using console access.
- Identify the heartbeat ports, and verify that they are physically connected and up.
- Verify that heartbeat packets are being sent and received on the heartbeat ports.
- Verify that the HA configurations match between the HA members. The HA `mode`, `group-name`, `group-id`, and `password` settings should be the same. Different `group-id` values will result in different virtual MAC addresses, which might not cause a MAC conflict. However, an IP conflict can still occur.
- If everything seems to be in working order, run `get system ha status` to verify that HA has formed successfully.

To avoid a split brain scenario:

- In a two-member HA configuration, use back-to-back links for heartbeat interface instead of connecting through a switch.
- Use redundant HA heartbeat interfaces.

- In a configuration where members are in different locations, ensure the heartbeat lost intervals and thresholds are longer than the possible latency in the links.

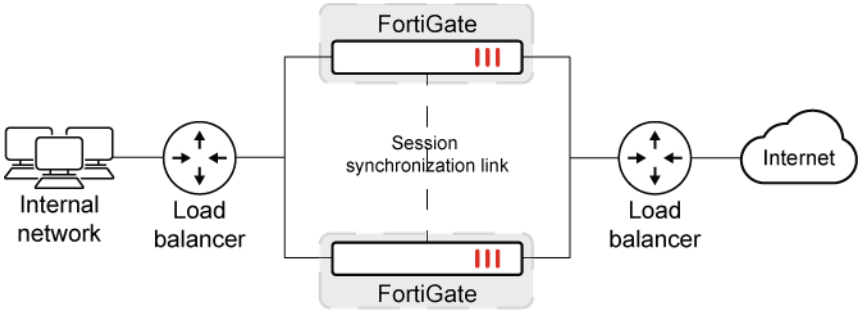
FGSP

Standalone FortiGates or FGCP clusters can be integrated into the load balancing configuration using the FortiGate Session Life Support Protocol (FGSP) in a network where traffic is load balanced by an upstream load balancer and scanned by downstream FortiGates. FGSP can perform session synchronization of IPv4 and IPv6 TCP, SCTP, UDP, ICMP, expectation, and NAT sessions to keep the session tables synchronized on all entities. If one of the FortiGates fails, the upstream load balancer should detect the failed member and stop distributing sessions to it. Session failover occurs and active sessions fail over to the peers that are still operating. Traffic continues to flow on the new peer without data loss because the sessions are synchronized.

The FortiGates in FGSP operate as peers that process traffic and synchronize sessions. An FGSP deployment can include two to 16 standalone FortiGates, or two to 16 FortiGate FGCP clusters of two members each. Adding more FortiGates increases the CPU and memory required to keep all of the FortiGates synchronized, and it increases network synchronization traffic. Exceeding the numbers of members is not recommended and may reduce overall performance. By default, FGSP synchronizes all IPv4 and IPv6 TCP sessions, and IPsec tunnels. You can optionally add filters to control which sessions are synchronized, such as synchronizing packets from specific source and destination addresses, source and destination interfaces, or services.

FGSP is also compatible with FortiGate VRRP.

FGSP is primarily used instead of FGCP when external load balancers are part of the topology, and they are responsible for distributing traffic amongst the downstream FortiGates. FGSP provides the means to synchronize sessions between the FortiGate peers without needing a primary member to distribute the sessions like in FGCP active-active mode. If the external load balancers direct all sessions to one peer, the effect is similar to active-passive FGCP HA. If external load balancers balance traffic to both peers, the effect is similar to active-active FGCP HA. The load balancers should be configured so that all packets for any given session are processed by the same peer, including return packets whenever possible.



Session pickup

Session pickup is an optional setting that can be enabled to synchronize connectionless (UDP and ICMP) sessions, expectation sessions, and NAT sessions. If session pickup is not enabled, the FGSP does not share session tables for the particular session type, and sessions do not resume after a failover. All sessions are interrupted by the failover and must be re-established at the application level. Many protocols can successfully restart sessions with little, or no, loss of data. Others may not recover as easily. Enable session pickup for sessions that may be difficult to reestablish. Since session pickup requires FortiGate memory and CPU resources, only enable this feature for sessions that need to synchronize.

Session synchronization link

The session synchronization link is an optional configuration that allows peers to synchronize sessions over a dedicated interface instead of the interface in which the peer IP is routed. In this configuration, communications occur over L2 instead of L3. Configuring session synchronization links is recommended when you want to minimize traffic over the peering interface when there are many sessions that need to be synchronized.

Expectation sessions

FortiOS session helpers keep track of the communication of layer 7 protocols, such as FTP and SIP, that have control sessions and expectation sessions. The control sessions establish the link between the server and client, and negotiate the ports and protocols that will be used for data communications. The session helpers then create expectation sessions through the FortiGate for the ports and protocols negotiated by the control session.

The expectation sessions are the sessions that actually communicate data. For FTP, the expectation sessions transmit files being uploaded or downloaded. For SIP, the expectation sessions transmit voice and video data. Expectation sessions usually have a timeout value of 30 seconds. If the communication from the server is not initiated within 30 seconds, the expectation session times out and traffic will be denied.

By default, FGSP does not synchronize expectation sessions; if a failover occurs, the sessions will have to be restarted.

To synchronize expectation sessions so they continue after a failover:

```
config system ha
    set session-pickup enable
    set session-pickup-expectation enable
end
```

NAT session synchronization

NAT sessions are not synchronized by default. You can enable NAT session synchronization by entering the following command:

```
config system ha
    set session-pickup enable
    set session-pickup-nat enable
end
```

When deploying FGCP over FGSP, the `session-pickup-nat` setting is hidden and enabled by default. It cannot be modified. See FGCP over FGSP per-tunnel failover for IPsec on page 3312 for more information.

After a failover with this configuration, all sessions that include the IP addresses of interfaces on the failed FortiGate unit will have nowhere to go since the IP addresses of the failed FortiGate unit will no longer be on the network. If you want NAT sessions to resume after a failover you should not configure NAT to use the destination interface IP address, since the FGSP FortiGate units have different IP addresses. To avoid this issue, you should use IP pools with the type set to overload (which is the default IP pool type), as shown in this example:

```
config firewall ippool
    edit FGSP-pool
        set type overload
        set startip 172.20.120.10
        set endip 172.20.120.20
    next
end
```

In NAT mode, only sessions for route mode security policies are synchronized. FGSP is also available for FortiGate units or virtual domains operating in transparent mode. Only sessions for normal transparent mode policies are synchronized.

The following topics provide more information about FGSP:

- FGSP basic peer setup on page 3276
- Synchronizing sessions between FGCP clusters on page 3280
- Session synchronization interfaces in FGSP on page 3282

- FGCP over FGSP per-tunnel failover for IPsec on page 3312
- Allow IPsec DPD in FGSP members to support failovers on page 3322

FGSP basic peer setup

The FortiGate Session Life Support Protocol (FGSP) is a proprietary HA solution for only sharing sessions between entities based on peer-to-peer communications. The entities could be standalone FortiGates or an FGCP cluster. Sessions are load balanced by an upstream load balancer. Each peer will synchronize its sessions with the other peers so that if a failure occurs, sessions will continue to flow as the load balancer redirects the traffic to the other peers.

Basic requirements and limitations

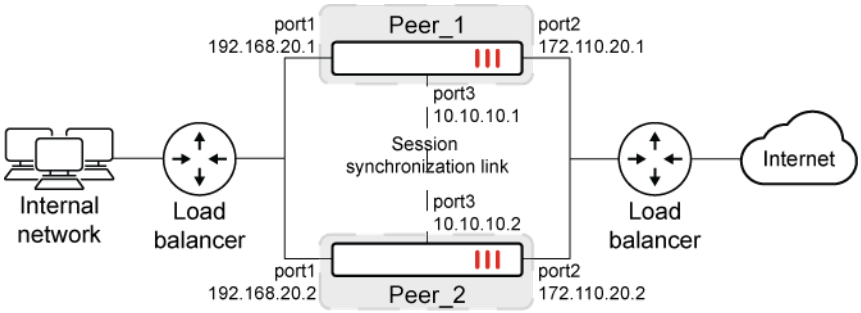
In most production environments, the following requirements should be met:

- The peers are FortiGates of the same model.
- The peers are running the same firmware version.
- There are 2 to 16 standalone FortiGates, or 2 to 16 FortiGate FGCP clusters of two members each.
- The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

Two FortiGates must have similar capabilities so that data structures used in session synchronization will match, and are capable of delivering similar performance. Therefore, the same model and firmware version is highly recommended for most production deployments. The limitation on the number of FortiGates in FGSP also ensures that session synchronization will occur smoothly.

Example

This example uses two peer FortiGates. The load balancer is configured to send all sessions to Peer_1, and if Peer_1 fails, all traffic is sent to Peer_2.



To configure a basic FGSP peer setup:

These instructions assume that all FortiGates have been factory reset.

1. Make all the necessary connections as shown in the topology diagram.
2. On Peer_1, configure the peer IP in which this device will peer with:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.10.10.2
        next
```

```
    end
    set standalone-group-id 1
    set group-member-id 1
end
```

If there are multiple peer IPs from the same peer, enter them as separate entries. If there are multiple peers, enter the IP of each peer in separate entries. See Optimizing FGSP session synchronization and redundancy on page 3290 for an example.

Sessions by default will be synchronized over layer 3 on the interface in which the current unit connects to the peer's IP.

3. On Peer_2, configure session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.10.10.1
        next
    end
    set standalone-group-id 1
    set group-member-id 2
end
```

4. Configure identical firewall policies on each peer, such as for traffic going from the same incoming interface (port1) to the outgoing interface (port2).

To test the FGSP peer setup:

1. Initiate TCP traffic (like HTTP access) to go through Peer_1.
2. Check the session information:

```
# diagnose sys session filter src <IP_address>
```

```
# diagnose sys session list
```

3. Enter the same commands on Peer_2 to verify if the same session information appears.

Optional filters

Filters can be added to synchronize certain types of sessions that meet the filter criteria.

To add filters for session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit <id>
            config session-sync-filter
                set srcintf <interface>
                set dstintf <interface>
                set srcaddr <IPv4_address>
                set dstaddr <IPv4_address>
```

```
                set srcaddr6 <IPv6_address>
                set dstaddr6 <IPv6_address>
            end
        next
    end
end
```

Filter examples

To synchronize only sessions with a particular source subnet:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            config session-sync-filter
                set srcaddr 192.168.20.0/24
            end
        next
    end
end
```

To synchronize only sessions with a particular source address range:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            config session-sync-filter
                set srcaddr 192.168.20.10 192.168.20.20
            end
        next
    end
end
```

To synchronize only sessions with a particular destination address range:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            config session-sync-filter
                set dstaddr6 2001:db8:0:2::/64
            end
        next
    end
end
```

Session pickup

You can enable this setting to synchronize connectionless (UDP and ICMP) sessions, expectation sessions, and NAT sessions. If session pickup is not enabled, the FGSP does not share session tables for the

particular session type, and sessions do not resume after a failover.

To enable UDP and ICMP session synchronization:

```
config system ha
    set session-pickup enable
    set session-pickup-connectionless enable
end
```

Session synchronization

You can specify interfaces used to synchronize sessions in L2 instead of L3 using the `session-sync-dev` setting. For more information about using session synchronization, see Session synchronization interfaces in FGSP on page 3282.

To configure session synchronization over redundant L2 connections:

```
config system standalone-cluster
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
end
```

VDOM synchronization

When multi-VDOM mode is enabled, you can specify the peer VDOM and the synchronized VDOMs. The peer VDOM contains the session synchronization link interface on the peer unit. The synchronized VDOMs' sessions are synchronized using this session synchronization configuration.

To synchronize between VDOMs:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip <IP address>
            set peervd <vdom>
            set syncvd <vdom 1> [<vdom 2>] ... [<vdom n>]
        next
    end
end
```

Configuring unique group and member ID

FGSP can function between standalone FortiGates or between FGCP clusters. In either case, the `standalone-group-id` must match between FGSP members, and the `group-member-id` must be unique for each FGCP cluster. This allows each member to actively process traffic without any conflict.

To configure FGSP peering between standalone FortiGates, follow the steps under To configure a basic FGSP peer setup.

To configure FGSP peering between different FGCP clusters:

These instructions assume Peer_1 and Peer_2 are in cluster 1, and Peer_3 and Peer_4 are in cluster 2.

1. On Peer_1, configure the first group ID:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
end
```

2. On Peer_2, configure the same group ID but a different member ID:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 2
end
```

3. On Peer_3, configure the second group ID:

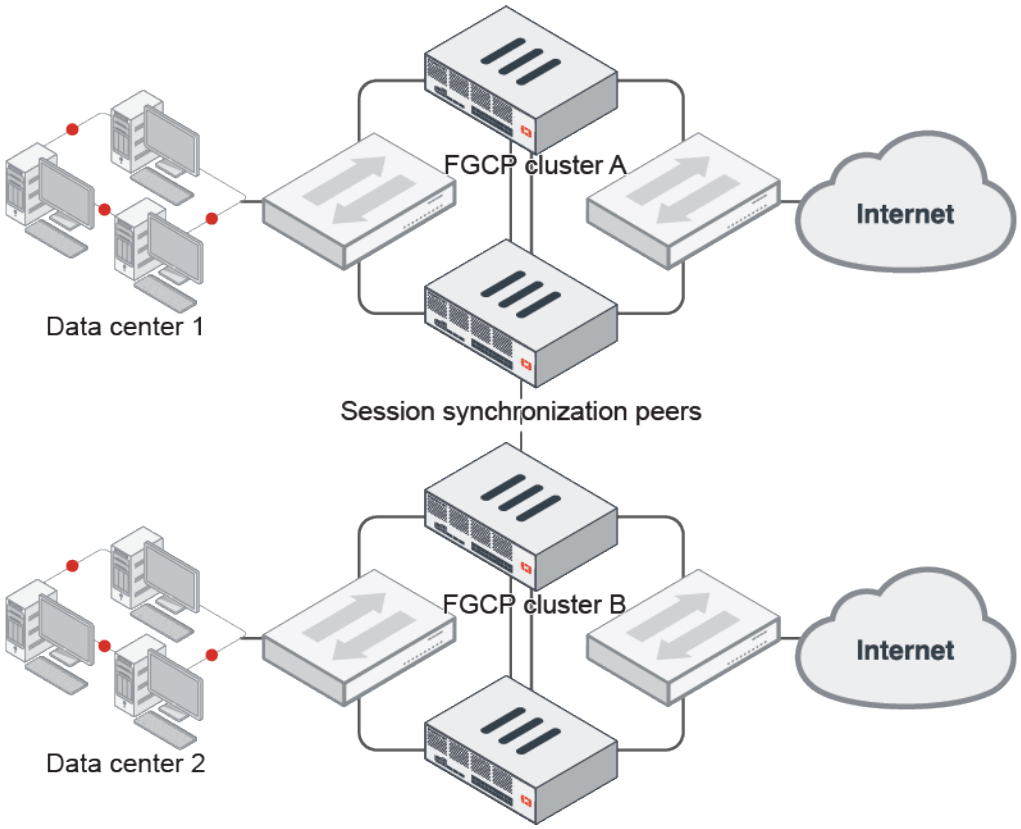
```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 1
end
```

4. On Peer_4, configure the same group ID but a different member ID:

```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 2
end
```

Synchronizing sessions between FGCP clusters

Synchronizing sessions between FGCP clusters is useful when data centers in different locations are used for load balancing, and traffic must be shared and flow freely based on demand.



There are some limitations when synchronizing sessions between FGCP clusters:

- All FortiGates must have the same model and generation, hardware configuration, and FortiOS version.
- A total of 16 clusters can share sessions.
- The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

To configure session synchronization between two clusters:

1. Configure the two clusters (see HA active-passive cluster setup on page 3185 or HA active-active cluster setup on page 3191).
2. On cluster A, configure the peer IP for the interface:

```
config system interface
    edit "port5"
        set vdom "root"
        set ip 10.10.10.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
    next
end
```

In this example, cluster A uses port5 and its IP address, 10.10.10.1, is reachable from another cluster.

3. On cluster A, configure FGSP, including cluster and session synchronization:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
    set session-sync-dev <interface>
    config cluster-peer
        edit 1
            set peerip 10.10.10.2
        next
    end
end
```

   The `standalone-group-id` must match between FGSP members. The `group-member-id` is unique for each FGCP cluster. `session-sync-dev` is an optional command to specify the interfaces to sync sessions.

4. On cluster B, configure the peer IP for the interface:

```
config system interface
    edit "port5"
        set vdom "root"
        set ip 10.10.10.2 255.255.255.0
        set allowaccess ping https ssh snmp http telnet
    next
end
```

   In this example, cluster B uses port5 and its IP address, 10.10.10.2, is reachable from another cluster.

5. On cluster B, configure FGSP, including cluster and session synchronization:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set session-sync-dev <interface>
    config cluster-peer
        edit 1
            set peerip 10.10.10.1
        next
    end
end
```

Session synchronization interfaces in FGSP

When peering over FGSP, by default, the FortiGates or FGCP clusters share information over L3 between the interfaces that are configured with Peer IP addresses. When a session synchronization interface is configured and FGSP peers are directly connected on this interface, then session synchronization is done over L2, only falling back to L3 if the session synchronization interface becomes unavailable.

When FGSP peers are formed between standalone FortiGates, the session synchronization process is performed by the kernel with UDP encapsulation. When using a FGSP session synchronization interface, the synchronization process is also offloaded to the kernel, albeit more efficiently without the UDP encapsulation. Therefore, a fast, dedicated, and stable L2 connection is recommended for the session

synchronization interface between the FGSP peers. For redundancy, multiple synchronization interfaces can be configured. The session synchronization interface or interfaces should always be the same on each FGSP peer.

The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

To configure session-sync interfaces:

```
config system standalone-cluster
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
    set layer2-connection {available | unavailable}
    set encryption {enable | disable}
end
```

The `layer2-connection` setting is for forwarded traffic between FGSP peers. Set it to `available` if the peer interface user for traffic forwarding is directly connected and supports L2 forwarding. See UTM inspection on asymmetric traffic in FGSP on page 3285 for more information.

Session synchronization in FGCP over FGSP

To provide full redundancy, FGCP clusters can be used in FGSP peering. This is called FGCP over FGSP. In these complex environments, as well as in high performance, low latency data centers, using the FGCP session synchronization interface is recommended, as it offloads the session synchronization process to the kernel. If FGCP uses session synchronization interfaces, FGSP must also be configured to use the same session synchronization interfaces.

To offload the session synchronization process to the kernel and synchronize sessions using connected interfaces directly:

```
config system ha
    set session-sync-dev <interface 1> [<interface 2>] ... [<interface n>]
end
```

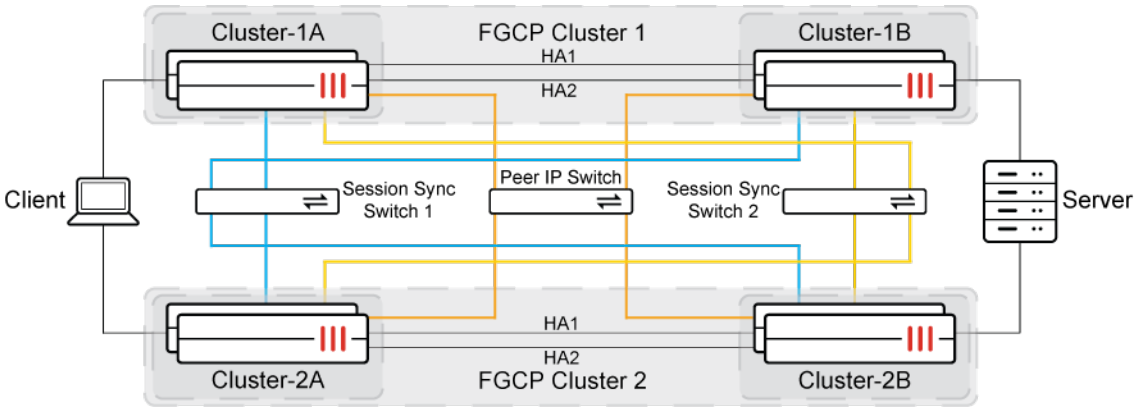
This is optimal when any of the following conditions apply:

- The session rate is high.
- Low network latency is required.
- There is a complex environment with FGCP clusters synchronizing over FGSP using L3 only in the presence of asymmetric traffic.

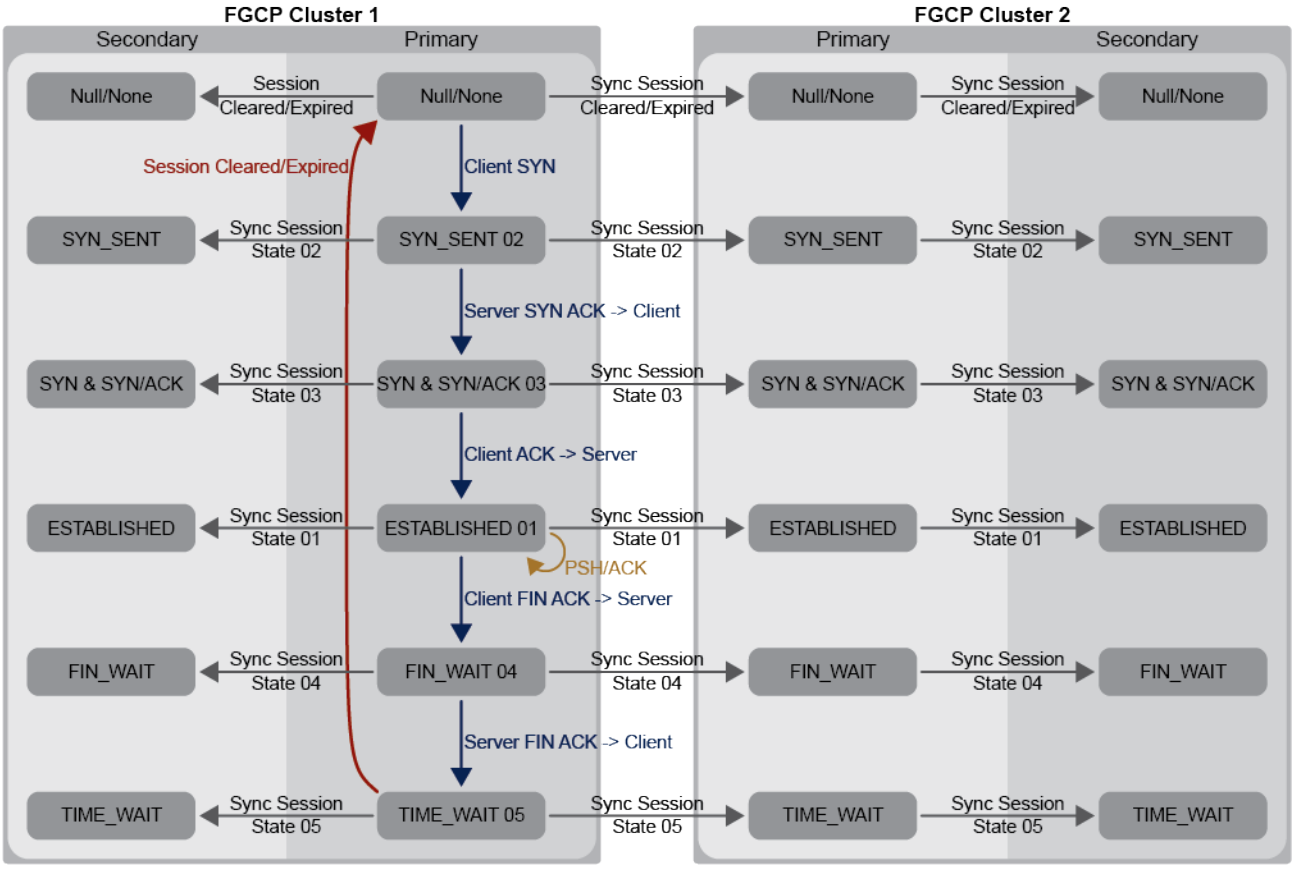
Configuring the FGCP `session-sync-dev` effectively offloads the session synchronization from the sessionsync daemon into the kernel and reduces the session synchronization latency.

When configuring both `system.standalone-cluster.session-sync-dev` and `system.ha.session-sync-dev` in FGCP over FGSP mode, the interfaces configured should be the same.

The following topology uses multiple session synchronization interfaces with a full mesh backbone to prevent any single point of failure.



The state diagram summarizes the session synchronization of a TCP session. It assumes that the session is connected over FGCP Cluster 1 and processed entirely by the primary unit, Cluster-1A.



1. The session starts with the Client SYN packet.
2. As the session is established, Cluster-1A synchronizes the session with Cluster-1B over the heartbeat interface, and with Cluster-2A over the session synchronization interface.
3. Cluster-2A then synchronizes the session with Cluster-2B over its heartbeat interface.
4. The process then repeats as it transitions to different states.

Session synchronization if links fail

In the previous topology, if any single session synchronization link fails on the primary member of each cluster, session synchronization will continue on the second link from the pair of session of session synchronization interfaces.

If the second link on the primary member of the same cluster then fails, L2 session synchronization over the session synchronization interface stops, and synchronization fails over to L3 between the peer IP links.

If the Peer IP link then fails, the FGSP peers are effectively disconnected, and no session synchronization will occur.

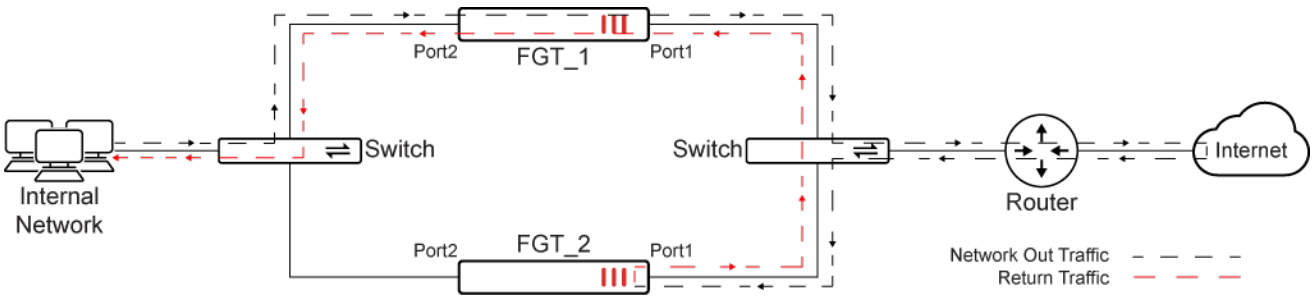
UTM inspection on asymmetric traffic in FGSP

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the session.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, traffic bounces from FGT_2 port1 to FGT_1 port1 using FGT_1's MAC address. Traffic is then inspected by FGT_1.

This example requires the following settings:

- The internal and outgoing interfaces of both FortiGates in the FGSP pair are in the same subnet.
- Both peers have layer 2 access with each other.



Due to the bouncing of traffic back to the session owner, performance degradation is expected.

To configure FGT_1:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_2:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
    set layer2-connection available
    unset session-sync-dev
    config cluster-peer
```

```
        edit 1
            set peerip 10.2.2.2
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

To configure FGT_2:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_1:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set layer2-connection available
    unset session-sync-dev
    config cluster-peer
        edit 1
            set peerip 10.2.2.1
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
```

```
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

Results

Capture packets on FGT_2 to see that traffic bounced from FGT_2 to FGT_1 over the traffic interface.

```
FGT_2 # diagnose sniffer packet any 'host 10.1.100.15 and host 172.6.200.55' 4
interfaces=[any]
filters=[host 10.1.100.15 and host 172.16.200.55]
91.803816 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800480 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800486 port1 out 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800816 port1 in 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
92.800818 port1 out 172.16.200.55.80 -> 10.1.100.15.40008: syn 2572073713 ack 261949279
```

When defining a logical interface such as a Link Aggregate interface, all FGSP peers must define the interface in the same configuration order. If the configuration order does not match, the `phyindex` used by the HA module may not match, causing asymmetric traffic destined for an interface to be dropped.

To view the `phyindex` number for an interface, use the following command:

```
# diagnose system ha standalone-peers
```

FortiGates running FGSP in transparent mode are also able to do UTM inspection on asymmetric TCP traffic. Other protocols such as UDP and ICMP are not supported.

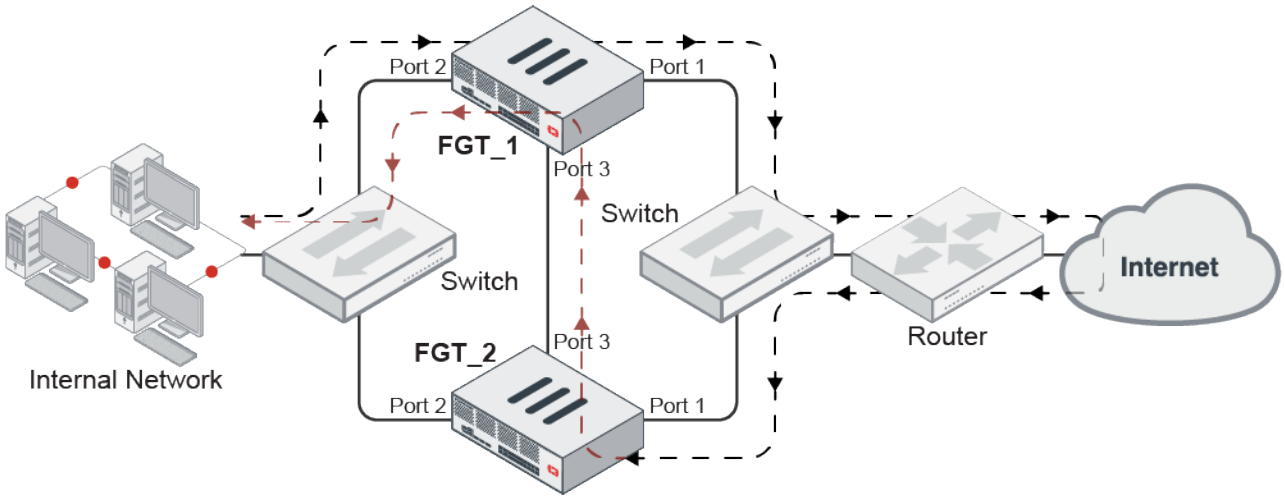
UTM inspection on asymmetric traffic on L3

When traffic passes asymmetrically through FGSP peers, UTM inspection can be supported by always forwarding traffic back to the session owner for processing. The session owner is the FortiGate that receives the first packet of the session.

For networks where L2 connectivity is not available, such as cloud environments, traffic bound for the session owner are forwarded through the peer interface using a UDP connection.

In this example, traffic from the internal network first hits FGT_1, but the return traffic is routed to FGT_2. Consequently, return traffic is packed and sent from FGT_2 to FGT_1 using UDP encapsulation between two peer interfaces (port 3). Traffic is then inspected by FGT_1.

Both of the FortiGates in this example are peering on interfaces in the same subnet, but the solution does not require the FortiGate peers to be on the same subnet or connected back-to-back.



Due to the bouncing of traffic back to the session owner, performance degradation is expected.

To configure FGT_1:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_2:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 0
    set layer2-connection unavailable
    unset session-sync-dev
    config cluster-peer
        edit 1
            set peerip 10.2.2.2
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
```

```
    next
end
```

To configure FGT_2:

1. Configure FGSP cluster attributes, including setting the peer IP to the IP address of FGT_1:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    set layer2-connection unavailable
    unset session-sync-dev
    config cluster-peer
        edit 1
            set peerip 10.2.2.1
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set av-profile "default"
        set logtraffic all
        set nat enable
    next
end
```

FortiGates running FGSP in transparent mode are also able to do UTM inspection on asymmetric TCP traffic. Other protocols such as UDP and ICMP are not supported.

Encryption for L3 on asymmetric traffic in FGSP

In scenarios where asymmetric routing between FGSP members occurs, the return traffic can be encrypted and routed back to the session owner on Layer 3 (L3).

To encrypt L3 traffic in FGSP:

1. Run the following on both FortiGates:

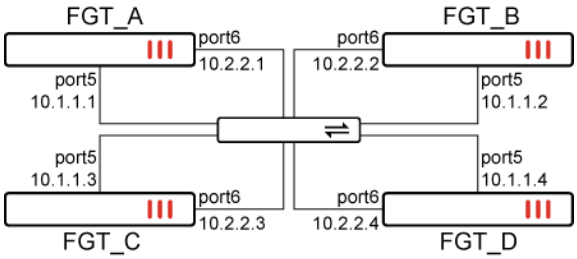
```
config system standalone-cluster
    set encryption enable
    set psksecret xxxxxxxxx
end
```

Optimizing FGSP session synchronization and redundancy

In this example where standalone FortiGates are peered in FGSP, using `session-sync-dev` optimizes session synchronization as it eliminates UDP encapsulation and offloads session synchronization processing to the kernel. FGSP session synchronization can be supported to handle heavy loads.

For more information about session synchronization, see Session synchronization interfaces in FGSP on page 3282.

Topology



In this topology, there are three FGSP peer groups for each FortiGate. Sessions are synchronized between each FortiGate and its peer groups. Redundancy is achieved by using two dedicated session sync device links for each peer setup. There are a total of six peer IPs for each session synchronization device link in each FGSP peer. When one link is fails, session synchronization is not affected.

For optimization, `sync-packet-balance` is enabled to distribute synchronization packets processing to multiple CPUs. The session synchronization process is offloaded to the kernel, and sessions are synchronized over layer 2 over the connected interfaces (`set session-sync-dev "port5" "port6"`). Jumbo frame MTU 9216 is configured on each session synchronization device link to reduce the number of packets; however, setting MTU to 9216 is entirely optional.

To configure FGT_A:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.1/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.1/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.1.1.2
        next
        edit 2
            set peerip 10.2.2.2
        next
        edit 3
            set peerip 10.1.1.3
        next
        edit 4
            set peerip 10.2.2.3
        next
        edit 5
            set peerip 10.1.1.4
        next
        edit 6
            set peerip 10.2.2.4
        next
    end
end
```

To configure FGT_B:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.2/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.2/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.1.1.1
        next
        edit 2
            set peerip 10.2.2.1
        next
        edit 3
            set peerip 10.1.1.3
        next
        edit 4
```

```
            set peerip 10.2.2.3
        next
        edit 5
            set peerip 10.1.1.4
        next
        edit 6
            set peerip 10.2.2.4
        next
    end
end
```

To configure FGT_C:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
        set ip 10.1.1.3/24
        set mtu-override enable
    set mtu 9216
    next
    edit port6
        set ip 10.2.2.3/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.1.1.1
        next
        edit 2
            set peerip 10.2.2.1
        next
        edit 3
            set peerip 10.1.1.2
        next
        edit 4
            set peerip 10.2.2.2
        next
        edit 5
            set peerip 10.1.1.4
        next
        edit 6
            set peerip 10.2.2.4
        next
    end
end
```

To configure FGT_D:

1. Configure HA:

```
config system ha
    set sync-packet-balance enable
    set session-pickup enable
    set session-pickup-connectionless enable
    set session-pickup-expectation enable
    set session-pickup-nat enable
end
```

2. Configure the layer 2 session synchronization links:

```
config system standalone-cluster
    set session-sync-dev "port5" "port6"
end
```

3. Configure the session TTL default timeout:

```
config system session-ttl
    set default 300
end
```

4. Configure the interfaces:

```
config system interface
    edit port5
```

```
        set ip 10.1.1.4/24
        set mtu-override enable
        set mtu 9216
    next
    edit port6
        set ip 10.2.2.4/24
        set mtu-override enable
        set mtu 9216
    next
end
```

5. Configure FGSP session synchronization:

```
config system standalone-cluster
    config cluster-peer
        edit 1
            set peerip 10.1.1.1
        next
        edit 2
            set peerip 10.2.2.1
        next
        edit 3
            set peerip 10.1.1.2
        next
        edit 4
            set peerip 10.2.2.2
        next
        edit 5
            set peerip 10.1.1.3
        next
        edit 6
            set peerip 10.2.2.3
        next
    end
end
```

Firmware upgrades in FGSP

FGSP supports cluster members using different firmware versions with some limitations. This allows for cluster members to be upgraded without needing to remove them from the cluster or network. You can find details on the requirements to support different firmware versions in the cluster in Different FortiGate models on page 3296.

If your cluster's current and target firmware are supported, you may upgrade each member one by one without any need to disconnect the member.

Otherwise, the following steps are recommended to upgrade the firmware of FortiGates in an FGSP deployment. Follow these steps whether or not you have enabled standalone configuration synchronization.

This example FGSP deployment has two FortiGates, FGT-1 and FGT-2.

To upgrade the firmware in an FGSP deployment:

1. Switch all traffic to FGT-1:
   a. Configure the load balancer or router that distributes traffic between the FortiGates to send all traffic to FGT-1.
2. Disconnect FGT-2 from the network.
   Make sure to also disconnect the interfaces that allow heartbeat and synchronization communication with FGT-1. This is to prevent FGT-2 from communicating with FGT-1.
3. Upgrade the firmware on FGT-2.
4. Reconnect the traffic interfaces on FGT-2, but not the interfaces used for heartbeat and synchronization communication with FGT-1.
5. Switch all traffic to the newly upgraded FGT-2:
   a. Configure the load balancer or router that distributes traffic between the FortiGates to send all traffic to FGT-2.
6. Upgrade the firmware on FGT-1 (while heartbeat and synchronization communication with FGT-2 remains disconnected).
7. Reconnect the FGT-2 interfaces that allow heartbeat and synchronization communication between FGT-1 and FGT-2.
8. Restore the original traffic distribution between FGT-1 and FGT-2:
   a. Configure the load balancer or router to distribute traffic to both FortiGates in the FGSP deployment.

FGSP session synchronization between different FortiGate models or firmware versions

FGSP HA deployments are generally meant for interoperating between FortiGates with the same model and firmware version. However, situations may arise where individual members or FGCP clusters running over FGSP use different models or firmware versions. For example, to avoid downtime while upgrading the members, some FGSP members or clusters may be upgraded first and then re-join the FGSP peers after a successful upgrade. Or while performing maintenance, sessions may need to be offloaded to a temporary member or FGCP cluster of a different model.

Being able to perform FGSP session synchronization between members of different models or firmware versions is helpful to transition the traffic smoothly and causes minimal disruptions. This topic outlines requirements to be aware of before assessing whether FGSP session synchronization may work between members with different models or firmware versions.

Different FortiGate models

The general guideline is to only use FortiGate models in a similar tier and family. Vastly different models have different performance and capabilities, which may not be compatible. The goal is for two models to have similar capabilities so that data structures used in session synchronization will match, and are capable of delivering similar performance.

When considering FGSP session synchronization between two FortiGates, ensure that:

- The FortiGates use the same 32-bit kernel or 64-bit kernel.
- The FortiGates use the same type of CPU (such as ARM or x86).

- For network interfaces:
  - The same type of physical interface should be used on each member.
  - The physical interfaces should be capable of the same speeds.
- The device memory should be similar in size. If the FortiGates have vastly different memory sizes, their performance may be different if one device supports more sessions than the other.
- The configurations related to session tables should match. For example, the logical names used in firewall policies, IPsec interface names, VDOM names, firewall policy tables, and so on.

Different firmware versions

When operating in FGSP, the firmware needs to have compatible data structures and session synchronization packet headers. The firmware is generally able to handle different data structures between old and new FortiOS sessions. Session synchronization packets are typically the same between versions.

Note the following exceptions and guidelines when assessing FGSP session synchronization compatibility between different firmware versions:

- FortiOS 7.0.2 added support for widening the HA virtual MAC address range. This change updated the session synchronization packet header structure.
  - FortiGates running 7.0.2 or later, and FortiGates running 7.0.1 or earlier will not accept session synchronization packets from each other.
- If the traffic uses a new feature only available in a newer FortiOS version, it may not work when synchronized to an older FortiOS version.
  - For example, PFCP (Packet Forwarding Control Protocol) support was added in 7.0.1, and a PFCP profile name was added to the sessions. When the sessions are synchronized to an older firmware version, the PFCP profile name will be lost and the sessions will not be able to handle the traffic as they would in 7.0.1.
- FortiOS 7.2.1 added `group-id` into the protocol header. This means that FortiGates running 7.2.1 and later cannot perform session synchronization with FortiGates running earlier versions.

Session synchronization interfaces

Session synchronization between FGSP members uses an L3 connection over the peer IP by default.

Session synchronization between FGSP members uses an L2 connection when a session synchronization interface (`session-sync-dev`) is used. The synchronization process is also offloaded to the kernel.

FGSP is also compatible with FortiGate VRRP.

Applying the session synchronization filter only between FGSP peers in an FGCP over FGSP topology

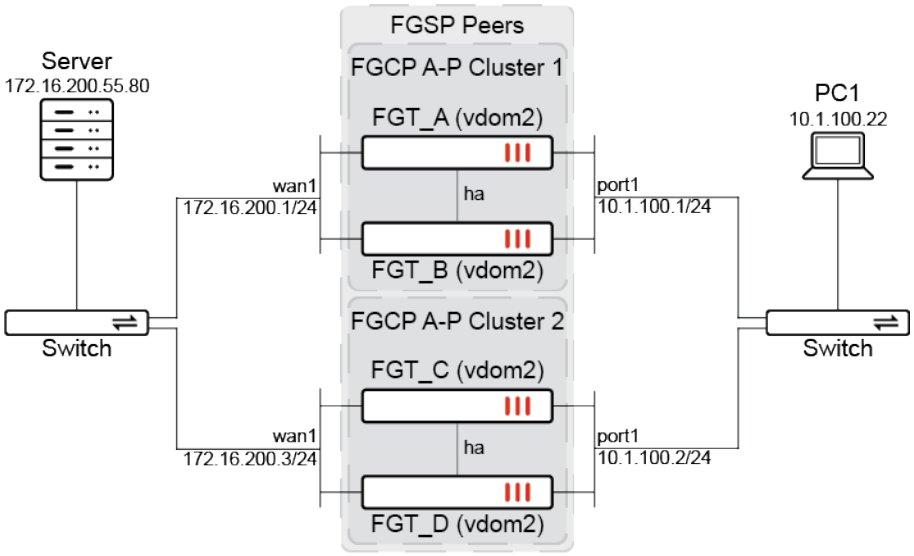
When the session synchronization filter is applied on FGSP, the filter will only affect sessions synchronized between the FGSP peers. When virtual clustering is used, sessions synchronized between each virtual cluster can also be synchronized to FGSP peers. All peers' `syncvd` must be in the same HA virtual cluster.

Example

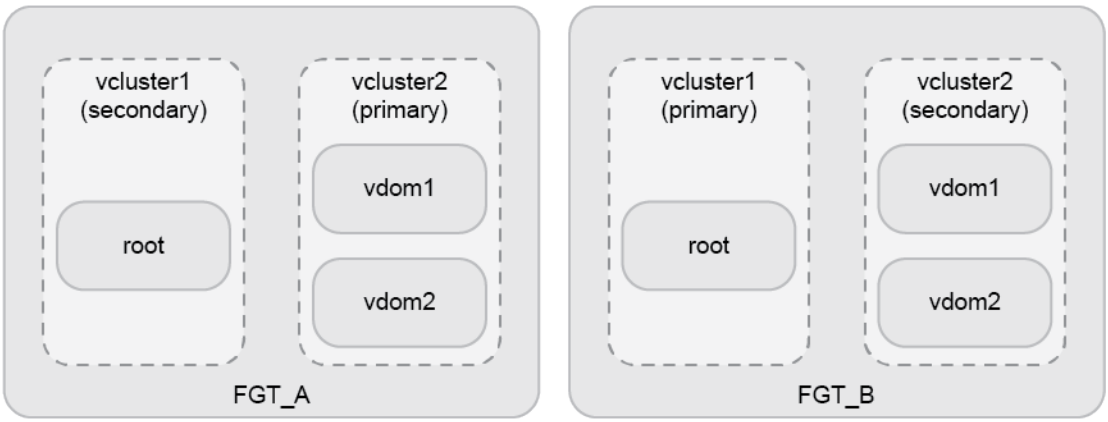
In this example, there is a simplified configuration where there is no router or load balancer performing balancing between the FGSP peers, but it demonstrates the following:

- When sessions pass through FGCP A-P Cluster 1, all sessions are synchronized between the FGT_A and FGT_B regardless of the session synchronization filter.
- Session synchronization between the FGSP peers (FGCP A-P Cluster 1 and 2) only occurs for the service specified in the filter, which is HTTP/80.
- The preceding behavior is applicable when virtual clustering is configured. This example focuses on vdom2, which belongs to vcluster2. FGT_A is the primary for vcluster2.

Each FGSP A-P cluster is connected on ha as the FGCP cluster heartbeat device. The FGSP peers are connected on mgmt over 10.1.1.1-2/24.



Virtual clustering between FGT_A and FGT_B:



Interface	FGT_A	FGT_B	FGT_C	FGT_D
wan1	172.16.200.1/24	172.16.200.1/24	172.16.200.3/24	172.16.200.3/24
port1	10.1.100.1/24	10.1.100.1/24	10.1.100.2/24	10.1.100.2/24

Interface	FGT_A	FGT_B	FGT_C	FGT_D
mgmt	10.1.1.1/24	10.1.1.1/24	10.1.1.2/24	10.1.1.2/24
ha	FGCP cluster heartbeat device		FGCP cluster heartbeat device	

To configure the HA clusters:

1. Configure FGCP A-P Cluster 1 (use the same configuration for FGT_A and FGT_B):

```
config system ha
    set group-id 146
    set group-name "FGT_HA1"
    set mode a-p
    set hbdev "wan2" 100 "ha" 50
    set session-pickup enable
    set session-pickup-nat enable
    set vcluster-status enable
    config vcluster
        edit 1
            set override enable
            set priority 25
            set monitor "wan1" "port1"
            set vdom "root"
        next
        edit 2
            set override disable
            set priority 150
            set monitor "wan1"
            set vdom "vdom2" "vdom1"
        next
    end
end
```

2. Configure FGCP A-P Cluster 2 (use the same configuration for FGT_C and FGT_D):

```
config system ha
    set group-id 200
    set group-name "FGT_HA2"
    set mode a-p
    set hbdev "wan2" 100 "ha" 50
    set session-pickup enable
    set session-pickup-nat enable
    set vcluster-status enable
    config vcluster
        edit 1
            set override enable
            set priority 120
            set monitor "wan1" "port1"
            set vdom "root"
        next
        edit 2
```

```
            set override disable
            set priority 150
            set monitor "wan1"
            set vdom "vdom2" "vdom1"
        next
    end
end
```

To configure the FGSP peers:

1. Configure FGT_A:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    config cluster-peer
        edit 1
            set peervd "vdom2"
            set peerip 10.1.1.2
            set syncvd "vdom2"
            config session-sync-filter
                config custom-service
                    edit 1
                        set dst-port-range 80-80
                    next
                end
            end
        next
    end
end
```

   The configuration is automatically synchronized to FGT_B.

2. Configure FGT_C:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 2
    config cluster-peer
        edit 1
            set peervd "vdom2"
            set peerip 10.1.1.1
            set syncvd "vdom2"
            config session-sync-filter
                config custom-service
                    edit 1
                        set dst-port-range 80-80
                    next
                end
            end
        next
```

```
    end
end
```

The configuration is automatically synchronized to FGT_D.

To verify the configuration:

1. Verify the FGSP peer information on Cluster 1:

```
FGT_A (global) # diagnose sys ha fgsp-zone
Local standalone-member-id: 1
FGSP peer_num = 1
        peer[1]: standalone-member-id=2, IP=10.1.1.2, vd=vdom2, prio=1
```

2. Verify the FGSP peer information on Cluster 2:

```
FGT_C (global) # diagnose sys ha fgsp-zone
Local standalone-member-id: 1
FGSP peer_num = 1
        peer[1]: standalone-member-id=1, IP=10.1.1.1, vd=vdom2, prio=1
```

3. Initiate two sessions, HTTP and SSH.
4. Verify that the HTTP session is synchronized from Cluster 1 to Cluster 2.
   a. Verify the session list of vdom2 on FGT_A:

```
FGT_A (vdom2) # diagnose sys session list

session info: proto=6 proto_state=01 duration=693 expire=3593 timeout=3600 flags=00000000

total session 1
```

Session synchronization filters are designed to be configured symmetrically on all of the FGSP peers. In cases where the filters are configured asymmetrically, note the following differences:

- In an FGCP over FGSP topology, session filtering will be applied on the FGSP peer that has the filtering configured and is receiving the session synchronization.
- In an FGSP topology between standalone peers, the filtering will be applied on the FGSP peer that has the filtering configured and is sending out the session synchronization.

FGSP static site-to-site IPsec VPN setup

When configuring static site-to-site IPsec VPN between FGSP FortiGates and a remote gateway, the FGSP peers must have the `passive-mode` setting enabled in the `vpn ipsec phase1-interface` configuration to function as an IPsec responder. This is a required configuration in this setup. If the FGSP peers act as initiators for tunnel setup when `passive-mode` is disabled and both FGSP peers initiate the tunnel with the same gateway IP, the remote IPsec gateway will be unable to process this, and the tunnel negotiation will fail. Likewise, when a failover occurs in FGSP and a new peer begins to initiate tunnel traffic, the remote IPsec gateway will be unable to handle the traffic initiated from the new peer.

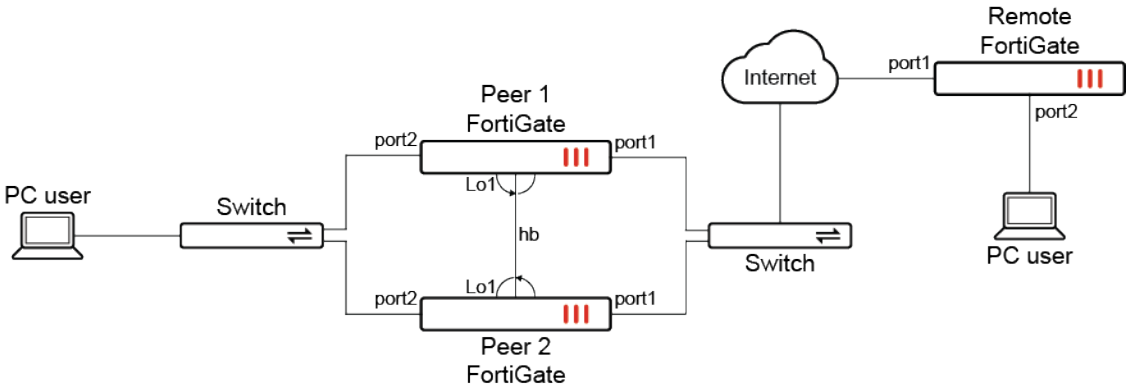
Enabling `passive-mode` ensures the FGSP peers only respond to tunnel initiations from the remote IPsec gateway and do not initiate tunnel negotiations. This way, the preceding situations will not occur.

For dynamic tunnel configuration examples on FGSP peers, see the following topics:

- FGSP per-tunnel failover for IPsec on page 3306
- FGCP over FGSP per-tunnel failover for IPsec on page 3312
- Allow IPsec DPD in FGSP members to support failovers on page 3322

Example

In this example, the FGSP peer has a loopback interface (Lo1) configured with the same IP address (192.168.202.31/32). All other interface IP addresses are different between the peers.



To configure IPsec on the FGSP peer FortiGates:

1. Configure the phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "IPsec"
        set type static
        set interface "port1"
        set ike-version 2
        set local-gw 192.168.202.31
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set passive-mode enable
        set remote-gw 10.10.100.100
    next
end
```

2. Configure the phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "IPSec"
        set phase1name "IPsec"
        set proposal aes256-sha256
        set dhgrp 14
    next
end
```

To configure IPsec on the remote FortiGate:

1. Configure the phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "IPsec"
```

```
        set type static
        set interface "port1"
        set ike-version 2
        set net-device disable
        set proposal aes256-sha256
        set dhgrp 14
        set remote-gw 192.168.202.31
    next
end
```

2. Configure the phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "IPSec"
        set phase1name "IPsec"
        set proposal aes256-sha256
        set dhgrp 14
    next
end
```

FGSP per-tunnel failover for IPsec

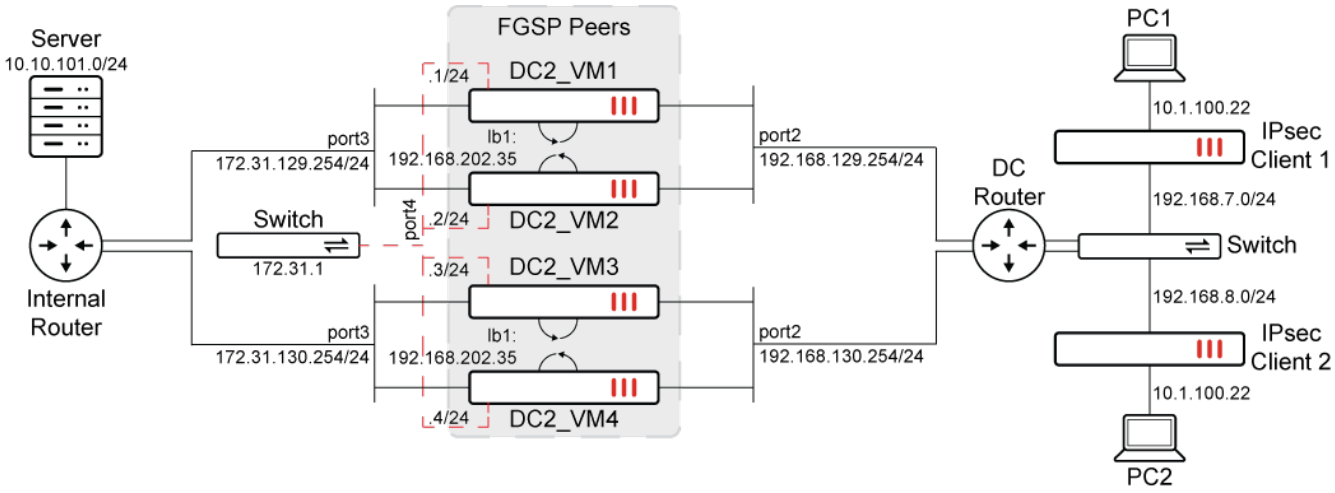
During FGSP per-tunnel failover for IPsec, the same IPsec dialup server configured on each FGSP member may establish tunnels with dialup clients as the primary gateway. The IPsec SAs are synchronized to all other FGSP peers that have FGSP synchronization for IPsec enabled. Other FGSP members may establish a tunnel with other clients on the same dialup server and synchronize their SAs to other peers.

Upon the failure of the FGSP member that is the primary gateway for a tunnel, the upstream router will fail over the tunnel traffic to another FGSP member. The other FGSP member will move from standby to the primary gateway for that tunnel and continue to forward traffic.

```
config vpn ipsec phase1-interface
    edit <name>
        set fgsp-sync {enable | disable}
    next
end
```

Example

In this example, the FGSP peers are connected on port4 over 172.31.1.1-4/24. Each peer has a loopback interface, lb1, with the same IP address. This loopback interface is used as the local gateway on each of the phase 1 connections to avoid each FGSP member having different IPs on port2. The DC Router uses ECMP to distribute traffic to each FGSP peer. It is assumed that the networking addresses are already configured properly.



Interface/setting	DC1_VM1	DC1_VM2	DC1_VM3	DC1_VM4
port2	192.168.125.254/24	192.168.126.254/24	192.168.127.254/24	192.168.128.254/24
port3	172.31.125.254/24	172.31.126.254/24	172.31.127.254/24	172.31.128.254/24
port4	172.31.1.1/24	172.31.1.2/24	172.31.1.3/24	172.31.1.4/24
lb1	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32
`fgsp-sync`	Enabled	Enabled	Enabled	Disabled

Out of the four FGSP peers, DC1_VM1, DC1_VM2, and DC1_VM3 have `fgsp-sync` enabled in their IPsec phase 1 configurations. This allows the three FGSP members to synchronize IPsec SAs as clients establish dialup tunnels to them individually. DC1_VM4, which does not have `fgsp-sync` configured, will not participate in synchronizing IPsec SAs or establishing tunnels. The DC Router uses ECMP to route traffic to the destination 192.168.202.31 through each of the participating FGSP peers.

In a larger scale there may be many more IPsec dialup clients connecting, with each eligible FGSP peer being the primary gateway for a set of dialup tunnels, and is in standby for the rest of the tunnels. If an FGSP peer fails, traffic will fail over to other peers, and these peers will become primary gateways for the respective dialup tunnels.

To configure the FGSP peers (DC1_VM1):

The following steps are to configure DC1_VM1. The other peers have similar configurations based on the preceding table. In the `config vpn ipsec phase1-interface` settings, all peers should have the same local gateway external interface (192.168.202.31).

1. Configure the FGSP settings:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
```

```
    config cluster-peer
        edit 1
            set peerip 172.31.1.2
        next
        edit 2
            set peerip 172.31.1.3
        next
        edit 3
            set peerip 172.31.1.4
        next
    end
end
```

2. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "vpn1"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set local-gw 192.168.202.31
        set keylife 90000
        set peertype one
        set net-device disable
        set proposal aes128-sha1
        set dpd on-idle
        set dhgrp 2
        set fgsp-sync enable
        set nattraversal disable
        set peerid "Nokia_Peer"
        set psksecret xxxxx
        set dpd-retryinterval 60
    next
end
```

3. Configure the VPN tunnel phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "vpn1"
        set phase1name "vpn1"
        set proposal aes128-sha1
        set keylifeseconds 10800
    next
end
```

To verify the configuration:

1. Once the FGSP members establish peering with each other, verify the standalone peers on DC1_VM1:

```
DC1_VM1 # diagnose sys ha standalone-peers
Group=1, ID=1
Detected-peers=3
```

```
Kernel standalone-peers: num=3.
peer0: vfid=0, peerip:port = 172.31.1.2:708, standalone_id=2
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
peer1: vfid=0, peerip:port = 172.31.1.3:708, standalone_id=3
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
peer2: vfid=0, peerip:port = 172.31.1.4:708, standalone_id=4
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
Kernel standalone dev_base:

```

2. Initiate a dialup tunnel connection from the IPsec Client 2 FortiGate (192.168.1.2).
3. Verify the tunnel list for vpn1_1 on each peer. The output shows the bi-directional SAs for that particular tunnel are synchronized to all participating FGSP peers.

```
DC1_VM4 # diagnose vpn tunnel list name vpn1_1
list ipsec tunnel by names in vd 0
```

The IPsec tunnel `role=sync-primary`on DC1_VM1 indicates that the IPsec tunnel was established on the FortiGate and traffic is being forwarded. On DC1_VM2 and DC1_VM3, the IPsec tunnel `role=standby` indicates that they are synchronized from the FGSP peer and are in standby for traffic forwarding.

The IPsec SAs do not synchronize to DC1_VM4 because `fgsp-sync` is disabled.

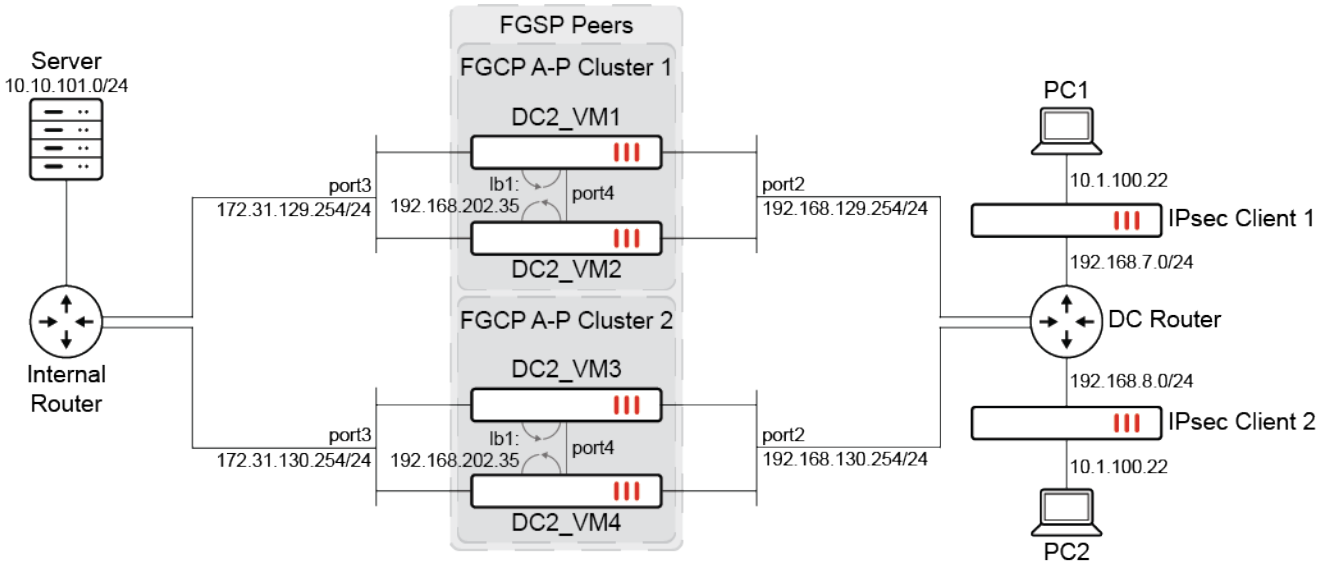
4. When a failure occurs on DC1_VM1, the tunnel traffic will fail over to either DC1_VM2 or DC1_VM3. Its tunnel role will become `role=sync-primary`.

FGCP over FGSP per-tunnel failover for IPsec

For additional redundancy, an FGCP cluster on one site may form FGSP peering with FGCP clusters on other sites. The FGCP over FGSP peers can still synchronize IPsec SAs and act as the primary gateway for individual tunnels for the same dialup servers. When failover happens within an FGCP cluster, tunnel traffic will failover to the other FGCP cluster member. When an FGCP cluster fails, tunnel traffic will failover to the other FGSP peer.

Example

In this example, each FGCP A-P cluster is connected on port4 as the heartbeat interface. The FGSP peers are connected on port5 over 172.31.2.1-2/24. Each FGSP peer and FGCP cluster has a loopback interface, lb1, with the same IP address. This loopback interface is used as the local gateway on each of the phase 1 connections to avoid each FGSP member having different IPs on port2. The DC Router uses ECMP to distribute traffic to each FGSP peer. It is assumed that the networking addresses are already configured properly.



Interface/setting	DC2_VM1	DC2_VM2	DC2_VM3	DC2_VM4
port2	192.168.129.254/24	192.168.129.254/24	192.168.130.254/24	192.168.130.254/24
port3	172.31.129.254/24	172.31.129.254/24	172.31.130.254/24	172.31.130.254/24
port4	FGCP HA heartbeat interface	FGCP HA heartbeat interface	FGCP HA heartbeat interface	FGCP HA heartbeat interface
port5	172.31.2.1/24	172.31.2.1/24	172.31.2.2/24	172.31.2.2/24
lb1	192.168.202.35/32	192.168.202.35/32	192.168.202.35/32	192.168.205.35/32
`fgsp-sync`	Enabled	Enabled	Enabled	Enabled

There are two pairs of FGCP A-P HA clusters that form FGSP peering with each other. This is a typical FGCP over FGSP configuration used in large enterprises and service provider environments where high redundancy is needed. Each cluster uses the same loopback address for the local gateway. The DC Router uses ECMP to route traffic to the destination 192.168.202.31 through each of the participating FGSP peers.

In a larger scale there may be many more members in the FGCP clusters, more FGSP peers, and more IPsec dialup clients connecting. Each eligible FGSP peer will be the primary gateway for a set of dialup tunnels, and is in standby for the rest of the tunnels. When the FGCP cluster is configured in A-P mode, the tunnels will be established on the primary unit and synchronized to the standby unit.

The following configurations and example demonstrates PC1 initiating traffic to the Server. First, a dialup tunnel is formed between FortiGate IPsec Client 1 and DC2_VM1, which allows traffic to go through. IPsec SAs are synchronized to the FGCP standby unit, and to the FGSP peer. Upon failure of DC2_VM1, DC2_VM2 takes over as the primary of the HA cluster, and assumes the primary role for the failover tunnels.

If both DC2_VM1 and DC2_VM2 fail, the tunnels that were formed on this FGSP peer will now be re-routed to the other FGSP peer. The primary FGCP cluster member, DC2_VM3, will now pick up the tunnel traffic and assume the primary role for the failover tunnels.

To configure the HA clusters:

1. Configure FGCP A-P Cluster 1 (use the same configuration for DC2_VM1 and DC2_VM2):

```
config system ha
    set group-id 1
    set group-name "DC2_VM12"
    set mode a-p
    set password ********
    set hbdev "port4" 50
    set session-pickup enable
    set upgrade-mode simultaneous
    set override disable
    set priority 100
end
```

2. Configure FGCP A-P Cluster 2 (use the same configuration for DC2_VM3 and DC2_VM4):

```
config system ha
    set group-id 2
    set group-name "DC2_VM34"
    set mode a-p
    set password ********
    set hbdev "port4" 50
    set session-pickup enable
    set upgrade-mode simultaneou
    set override disable
    set priority 100
end
```

To configure the FGSP peers:

1. Configure DC2_VM1:

```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 1
    config cluster-peer
        edit 1
            set peerip 172.31.2.2
        next
    end
end
```

   The configuration is automatically synchronized to DC2_VM2.

2. Configure DC2_VM3:

```
config system standalone-cluster
    set standalone-group-id 2
    set group-member-id 2
    config cluster-peer
        edit 1
            set peerip 172.31.2.1
        next
    end
end
```

   The configuration is automatically synchronized to DC2_VM4.

3. To configure the IPsec VPN settings (use the same configuration for DC2_VM1 and DC2_VM3).
   a. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "vpn1"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set local-gw 192.168.202.35
        set keylife 90000
        set peertype one
```

```
        set net-device disable
        set proposal aes128-sha1
        set add-route disable
        set dpd on-idle
        set dhgrp 2
        set fgsp-sync enable
        set nattraversal disable
        set peerid "Nokia_Peer"
        set psksecret ********
        set dpd-retryinterval 60
    next
end
```

b. Configure the VPN tunnel phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "vpn1"
        set phase1name "vpn1"
        set proposal aes128-sha1
        set keylifeseconds 10800
    next
end
```

To verify the configuration:

1. The FGCP HA cluster and the FGSP peering have formed. Verify the respective HA statuses.
   a. Verify the FGCP cluster status on DC2_VM1:

```
DC2_VM1 # diagnose sys ha status

HA information
Statistics
        traffic.local = s:0 p:439253 b:89121494
        traffic.total = s:0 p:440309 b:89242174
        activity.ha_id_changes = 2
        activity.fdb  = c:0 q:0

npuid=0
```

The IPsec tunnel `role=sync-primary`on DC2_VM1 indicates that it is being used to carry IPsec traffic. On DC2_VM2, DC2_VM3, and DC2_VM4, the IPsec tunnel `role=standby` indicates that they are in standby for traffic forwarding.

To test failover scenarios:

1. Verify the sniffer trace on DC2_VM1 before FGCP HA failover:

```
DC2_VM1 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.171753 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.171763 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.171941 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.171947 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
```

   Traffic passes through DC2_VM1.
2. Reboot the primary FortiGate, DC2_VM1.
3. Verify the sniffer trace on DC2_VM2 after FGCP HA failover:

```
DC2_VM2 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.111107 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.111118 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.111293 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.111298 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
^C
16 packets received by filter
0 packets dropped by kernel
```

   Traffic passes through DC2_VM2.
4. Verify the tunnel list for vpn1_1 on DC2_VM2:

```
DC2_VM2 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=vpn1_1 ver=2 serial=4 192.168.202.35:0->192.168.7.2:0 tun_id=192.168.7.2 tun_
id6=::10.0.0.4 dst_mtu=1500 dpd-link=on weight=1
bound_if=6 lgwy=static/1 tun=intf/0 mode=dial_inst/3 encap=none/8840 options[2288]=npu rgwy-
chg frag-rfc  run_state=0 role=sync-primary accept_traffic=1 overlay_id=0
```

```
parent=vpn1 index=1
proxyid_num=1 child_num=0 refcnt=5 ilast=0 olast=0 ad=/0
stat: rxp=58 txp=31 rxb=4872 txb=2604
dpd: mode=on-idle on=1 idle=60000ms retry=3 count=0 seqno=169
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
proxyid=vpn1 proto=0 sa=1 ref=3 serial=3
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:10.10.1.0-10.10.1.255:0
  SA:  ref=3 options=602 type=00 soft=0 mtu=1438 expire=10730/0B replaywin=2048
       seqno=20 esn=0 replaywin_lastseq=0000003b qat=0 rekey=0 hash_search_len=1
  life: type=01 bytes=0/0 timeout=10790/10800
  dec: spi=37f426c1 esp=aes key=16 ef61b49078b6ab3e00a4d3a048d779f5
       ah=sha1 key=20 ee2e8de9c522d89b6481c37faa73a7bb54163645
  enc: spi=10aa4d58 esp=aes key=16 4cb95f12657ca8e269b9f8a25f9b19c1
       ah=sha1 key=20 326744c4e5b4a0758397725464593d94ba9390dc
  dec:pkts/bytes=116/9744, enc:pkts/bytes=62/7316
  npu_flag=00 npu_rgwy=192.168.7.2 npu_lgwy=192.168.202.35 npu_selid=1e dec_npuid=0 enc_
npuid=0
```

The role has changed to `role=sync-primary`.

5. Shut down DC2_VM1 and the DC2_VM2 IPsec uplink interface.
6. Verify the sniffer trace on DC2_VM3. As expected, traffic now passes through DC2_VM3:

```
DC2_VM3 # diagnose sniffer packet any icmp 4
Using Original Sniffing Mode
interfaces=[any]
filters=[icmp]
0.165088 vpn1 in 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.165102 port3 out 10.10.1.2 -> 10.10.101.2: icmp: echo request
0.165294 port3 in 10.10.101.2 -> 10.10.1.2: icmp: echo reply
0.165301 vpn1 out 10.10.101.2 -> 10.10.1.2: icmp: echo reply
^C
14 packets received by filter
0 packets dropped by kernel
```

7. Verify the tunnel list for vpn1_1 on DC2_VM3:

```
DC2_VM3 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=vpn1_1 ver=2 serial=4 192.168.202.35:0->192.168.7.2:0 tun_id=192.168.7.2 tun_
id6=::10.0.0.4 dst_mtu=1500 dpd-link=on weight=1
bound_if=6 lgwy=static/1 tun=intf/0 mode=dial_inst/3 encap=none/8712 options[2208]=npu frag-
rfc  run_state=0 role=sync-primary accept_traffic=1 overlay_id=0

parent=vpn1 index=1
proxyid_num=1 child_num=0 refcnt=5 ilast=0 olast=0 ad=/0
stat: rxp=53 txp=53 rxb=4452 txb=4452
dpd: mode=on-idle on=1 idle=60000ms retry=3 count=0 seqno=0
natt: mode=none draft=0 interval=0 remote_port=0
fec: egress=0 ingress=0
```

```
proxyid=vpn1 proto=0 sa=1 ref=3 serial=3
  src: 0:0.0.0.0-255.255.255.255:0
  dst: 0:10.10.1.0-10.10.1.255:0
  SA:  ref=3 options=602 type=00 soft=0 mtu=1438 expire=10347/0B replaywin=2048
       seqno=10000155 esn=0 replaywin_lastseq=000001b0 qat=0 rekey=0 hash_search_len=1

npuid=0
```

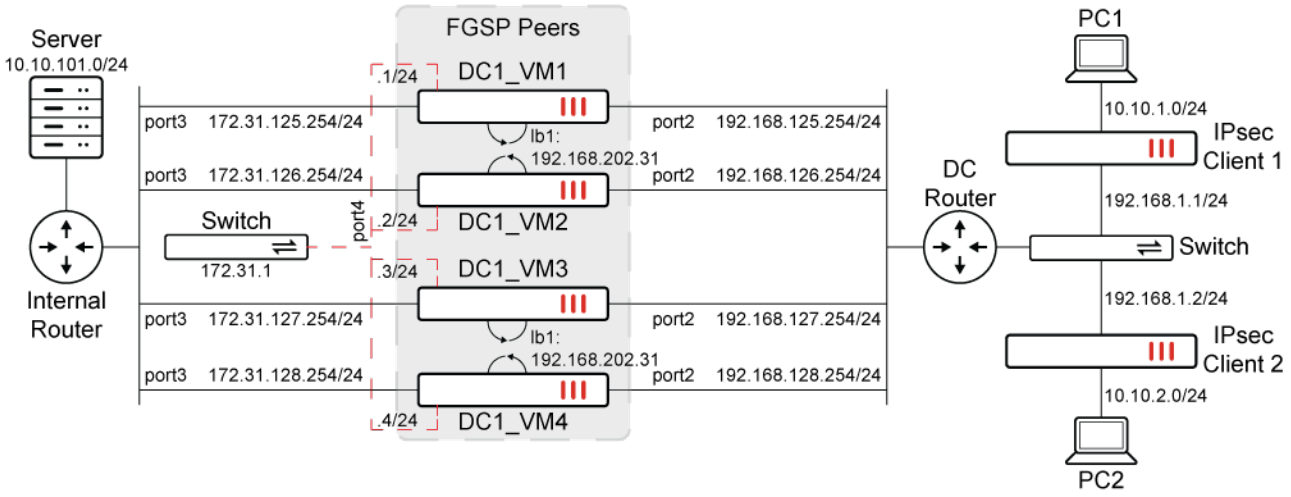
The role has changed to `role=sync-primary`.

Allow IPsec DPD in FGSP members to support failovers

In conjunction with support for FGSP per-tunnel failover for IPsec on page 3306, configuring DPD (dead peer detection) on an FGSP member is permitted. This allows a failed FGSP member to send out DPD probes during failover to detect unreachable remote peers and to flush the corresponding tunnels.

Example

In this example, using the same configuration as in FGSP per-tunnel failover for IPsec on page 3306, a tunnel can be established from one of the remote IPsec clients to one of the FGSP members (DC1_VM1). DPD can be set to `on-idle`, with a configured `dpd-retryinterval` of 60 seconds. When a client disappears, whether it is due to remote client failures or server-side routing failures, the FGSP member or gateway (DC1_VM1) will send out DPD probes for detection. Once the three iterations are complete and no responses are detected, the FGSP member will flush the tunnel and remove any routing to that peer.



Interface/setting	DC1_VM1	DC1_VM2	DC1_VM3	DC1_VM4
port2	192.168.125.254/24	192.168.126.254/24	192.168.127.254/24	192.168.128.254/24
port3	172.31.125.254/24	172.31.126.254/24	172.31.127.254/24	172.31.128.254/24
port4	172.31.1.1/24	172.31.1.2/24	172.31.1.3/24	172.31.1.4/24
lb1	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32	192.168.202.31/32
`fgsp-sync`	Enabled	Enabled	Enabled	Disabled

To configure the FGSP peers (DC1_VM1):

The following steps are to configure DC1_VM1. The other peers have similar configurations based on the preceding table. In the `config vpn ipsec phase1-interface` settings, all peers should have the same local gateway external interface (192.168.202.31). For DC1_VM4, `fgsp-sync` is disabled in the VPN tunnel phase 1 settings.

1. Configure the FGSP settings:

```
config system standalone-cluster
    set standalone-group-id 1
    set group-member-id 1
    config cluster-peer
        edit 1
            set peerip 172.31.1.2
        next
        edit 2
            set peerip 172.31.1.3
        next
        edit 3
            set peerip 172.31.1.4
        next
    end
end
```

2. Configure the VPN tunnel phase 1 settings:

```
config vpn ipsec phase1-interface
    edit "vpn1"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set local-gw 192.168.202.31
        set keylife 90000
        set peertype one
        set net-device disable
        set proposal aes128-sha1
        set dpd on-idle
```

```
        set dhgrp 2
        set fgsp-sync enable
        set nattraversal disable
        set peerid "Nokia_Peer"
        set psksecret xxxxx
        set dpd-retryinterval 60
    next
end
```

3. Configure the VPN tunnel phase 2 settings:

```
config vpn ipsec phase2-interface
    edit "vpn1"
        set phase1name "vpn1"
        set proposal aes128-sha1
        set keylifeseconds 10800
    next
end
```

To verify the configuration:

1. Once the FGSP members establish peering with each other, verify the standalone peers on DC1_VM1:

```
DC1_VM1 # diagnose sys ha standalone-peers
Group=1, ID=1
Detected-peers=3
Kernel standalone-peers: num=3.
peer0: vfid=0, peerip:port = 172.31.1.2:708, standalone_id=2
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
peer1: vfid=0, peerip:port = 172.31.1.3:708, standalone_id=3
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
peer2: vfid=0, peerip:port = 172.31.1.4:708, standalone_id=4
        session-type: send=0, recv=0
         packet-type: send=0, recv=0
Kernel standalone dev_base:
        standalone_id=0:

Standalone configuration synchronization

You can configure synchronization from one standalone FortiGate to another standalone FortiGate (`standalone-config-sync`). With the exception of some configurations that do not sync (settings that identify the FortiGate to the network), the rest of the configurations are synced, such as firewall policies, firewall addresses, and UTM profiles.

This option is useful in situations when you need to set up FGSP peers, or when you want to quickly deploy several FortiGates with the same configurations. You can set up `standalone-config-sync` for multiple members.

`standalone-config-sync` is an independent feature and should be used with caution as there are some limitations. We recommend disabling it once the configurations have been synced over.

Limitations

When standalone configuration synchronization is enabled, there are some limitations, including but not limited to the following:

- Network interruptions occur during firmware upgrades: when upgrading the firmware, all members in the `standalone-config-sync` group are upgraded simultaneously. This creates downtime if the FortiGates are the only outgoing gateway in the network. We recommend disabling the option before upgrading firmware.
- Some unwanted configurations might be synced: the current design and implementation of `standalone-config-sync` is based on requirements from specific customers. Thus, some users may find that unwanted parts of the configurations are synced. Should this occur, we recommend disabling the option and modifying those configurations manually.
- The wrong primary device might be selected accidentally: `standalone-config-sync` is derived from the HA primary unit selection mechanism. All members in the group will join the selection process in the same way as a the HA cluster selection process. It is important to select the correct device as the primary, otherwise the wrong device could be selected and existing configurations could be overwritten.

Setting up standalone configuration synchronization

Two or more standalone FortiGates should be connected to each other with one or more heartbeat interfaces, either back-to-back or via a switch. In the following example, the device supplying the configurations is called "conf-prim," and the devices receiving the configurations are called "conf-secos."

To set up standalone configuration synchronization:

1. Configure the conf-prim device for the group:

```
config system ha
    set hbdev ha1 50 ha2 100
    set priority 255
    set override enable
    set standalone-config-sync enable
end
```

2. Configure the conf-prim device as needed to be functional.
3. Configure the other group members as conf-secos:

```
config system ha
    set standalone-config-sync enable
end
```

4. Wait 10–15 minutes for the configurations to sync over.
5. Verify the synchronization status:

```
# get system ha status
path=system, objname=ha, tablename=(null), size=5912
HA Health Status:
  WARNING: FG201E4Q17900771 has hbdev down;

number of vcluster: 1
vcluster 1: work 169.254.0.1
Secondary: FG201E4Q17900771, HA operating index = 1
Primary: FG201ETK19900991, HA operating index = 0
```

If all members are `in-sync`, this means all members share the same configurations, except those that should not be synced. If any members are `out-of-sync`, this means the member failed to sync with the primary device.

Debugging is similar when a cluster is out of sync.

The following topic provides more information about standalone configuration synchronization:

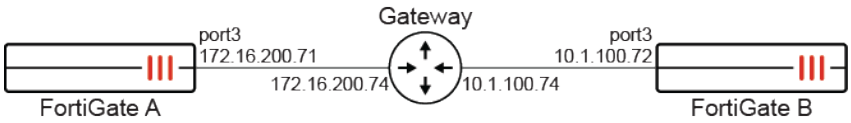
- Layer 3 unicast standalone configuration synchronization on page 3330

Layer 3 unicast standalone configuration synchronization

Unicast standalone configuration synchronization is supported on layer 3, allowing peers to be synchronized in cloud environments that do not support layer 2 networking. Configuring a unicast gateway allows peers to be in different subnets.

Example

In this example, two FortiGates in different subnets are connected through a unicast gateway. Both cluster members use the same port for the heartbeat interface.



To configure unicast synchronization between peers:

1. Configure FortiGate A:

```
config system ha
    set group-name "testcs"
    set hbdev "port3" 50
    set standalone-config-sync enable
    set unicast-status enable
    config unicast-peers
        edit 1
            set peer-ip 10.1.100.72
        next
    end
    set override enable
    set priority 200
    set unicast-gateway 172.16.200.74
end
```

2. Configure FortiGate B:

```
config system ha
    set group-name "testcs"
    set hbdev "port3" 50
    set standalone-config-sync enable
    set unicast-status enable
    config unicast-peers
        edit 1
            set peer-ip 172.16.200.71
        next
    end
    set override enable
    set priority 100
    set unicast-gateway 10.1.100.74
end
```

3. Check the HA status on FortiGate A:

```
# get system ha status
HA Health Status: OK
Model: FortiGate-VM64
Mode: ConfigSync
Group Name: testcs
Group ID: 0
Debug: 0
Cluster Uptime: 2 days 3:40:25
Cluster state change time: 2021-03-08 12:00:38
Primary selected using:
    <2021/03/08 12:00:38> FGVMSLTM00000001 is selected as the primary because its override
priority is larger than peer member FGVMSLTM00000002.
    <2021/03/06 11:50:35> FGVMSLTM00000001 is selected as the primary because it's the only
member in the cluster.
ses_pickup: disable
```

```
override: enable
Configuration Status:
    FGVMSLTM21000151(updated 5 seconds ago): in-sync
    FGVMSLTM21000152(updated 5 seconds ago): in-sync
System Usage stats:
    FGVMSLTM21000151(updated 5 seconds ago):
        sessions=7, average-cpu-user/nice/system/idle=0%/0%/0%/100%, memory=24%
    FGVMSLTM21000152(updated 5 seconds ago):
        sessions=5, average-cpu-user/nice/system/idle=0%/0%/0%/100%, memory=23%
HBDEV stats:
    FGVMSLTM21000151(updated 5 seconds ago):
        port3: physical/1000auto, up, rx-bytes/packets/dropped/errors=466060007/1049137/0/0,
tx=429538329/953028/0/0
    FGVMSLTM21000152(updated 5 seconds ago):
        port3: physical/1000auto, up, rx-bytes/packets/dropped/errors=48805199/85441/0/0,
tx=33470286/81425/0/0
Primary     : FGT-71          , FGVMSLTM00000001, HA cluster index = 1
Secondary   : FGT-72          , FGVMSLTM00000002, HA cluster index = 0
number of vcluster: 1
vcluster 1: work 0.0.0.0
Primary: FGVMSLTM00000001, HA operating index = 0
Secondary: FGVMSLTM00000002, HA operating index = 1
```

4. Check the HA checksums on FortiGate A:

```
# diagnose sys ha checksum cluster

================== FGVMSLTM00000001 ==================

is_manage_primary()=1, is_root_primary()=1
debugzone
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd

checksum
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd

================== FGVMSLTM00000002 ==================

is_manage_primary()=0, is_root_primary()=1
debugzone
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd

checksum
global: 4f 2c a2 04 07 57 46 c4 47 28 ca d2 5a c5 98 ee
root: 16 af 5d a4 ac cf a5 4b b7 22 93 ce f9 02 68 bc
all: 6e 28 7f 8a 74 f7 37 43 8f 32 73 68 1e d6 ca cd
```

5. Verify that configuration changes on the primary FortiGate are synchronized to the secondary FortiGate:
   a. Adjust the administrator timeout value on FortiGate A:

```
config system global
    set admintimeout 100
end
```

   b. Check the debug messages on FortiGate B:

```
# diagnose debug cli 7
Debug messages will be on for 30 minutes.

# diagnose debug enable

create pid=15639, clictxno=0, last=1615246288
0: conf sys global
0: set admintimeout 100
0: end
```

VRRP

A Virtual Router Redundancy Protocol (VRRP) configuration can be used as a high availability solution to ensure that a network maintains connectivity with the internet (or with other networks) even if the default router for the network fails. If a router or a FortiGate fails, all traffic to this device transparently fails over to another router or FortiGate that takes over the role of the failed device. If the failed device is restored, it will take over processing the network traffic.

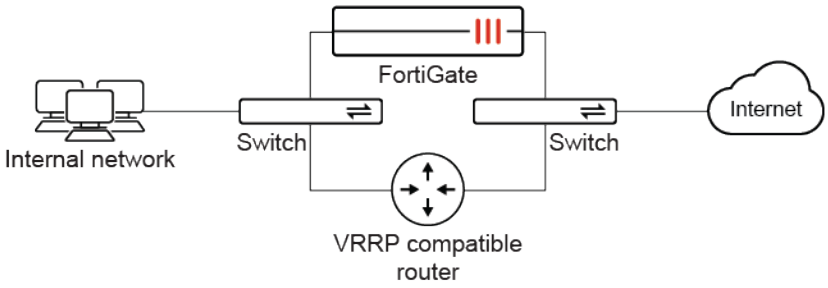
FortiOS supports VRRP versions 2 and 3. VRRP domains can be created, which can include multiple FortiGates and other VRRP-compatible routers. Different FortiGate models can be added to the same VRRP domain.

FortiOS supports IPv4 and IPv6 VRRP, so IPv4 and IPv6 VRRP virtual routers can be added to the same interface. FortiGates can quickly and easily integrate into a network that has already deployed VRRP.

Basic VRRP configuration

The most common VRRP application is to provide redundant default routers between an internal network and the internet. The default routers can be FortiGates or any routers that support VRRP.

Two or more FortiGate interfaces or routers must be configured with the same virtual router ID and IP address so they can automatically join the same VRRP domain. Priorities must be assigned to each FortiGate interface or router in the VRRP domain. All of the routers in the VRRP domain should have different priorities. One FortiGate interface or router must have the highest priority to become the primary router. The other FortiGates or routers in the domain are assigned lower priorities and become backups. If the primary router fails, VRRP automatically fails over to the router in the domain with the next highest priority.



To configure VRRP:

1. Add a virtual VRRP router to the internal interface of each FortiGate and/or router. This adds the FortiGates and routers to the same VRRP domain.
2. Set the VRRP IP address of the domain to the internal network default gateway IP address.
3. Set the priorities.

See Adding IPv4 and IPv6 virtual routers to an interface on page 3334 Single-domain VRRP example on page 3342, and Multi-domain VRRP example on page 3343 for configuration examples.

During normal operations, all traffic from the internal network to the internet passes through the primary VRRP router. The primary router also sends VRRP advertisement messages to the backup routers. A backup router will not attempt to become a primary router while receiving these messages. If the primary router fails, the backup router with the highest priority becomes the new primary router after a short delay. All packets sent to the default route are now sent to the new primary router. If the new primary router is a FortiGate, the network continues to benefit from FortiOS security features. If the new primary router is just a router, traffic continues to flow, but FortiOS security features are unavailable until the FortiGate is back online.

If the backup router is a FortiGate, during a VRRP failover as the FortiGate begins operating as the new primary router, it will not have session information for all of the failed over in-progress sessions. So, it would normally not be able to forward in-progress session traffic.

Adding IPv4 and IPv6 virtual routers to an interface

This topic describes to how to add IPv4 and IPv6 virtual routers to an interface. VRRP can only be configured on physical or VLAN interfaces. VRRP cannot be configured on hardware switch interfaces where multiple physical interfaces are combined into a hardware switch interface.

IPv4 virtual router

In this example, an IPv4 VRRP router is added to port10 on the FortiGate. The VRRP virtual router has a virtual router ID of 200, uses IP address 10.31.101.200, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.

To configure the interface settings:

```
config system interface
    edit port10
        config vrrp
```

```
            edit 200
                set vrip 10.31.101.200
                set priority 255
            next
        end
    next
end
```

IPv6 virtual router

In this example, an IPv6 VRRP router is added to port20 on the FortiGate. The VRRP virtual router has a virtual router ID of 220, uses IP address 2001:db8:1::12, and has a priority of 255. Since this is the highest priority in the configuration, this interface is configured to be the primary router of the VRRP domain.

To configure the interface settings:

```
config system interface
    edit port20
        config ipv6
            set vrip6_link_local <IPv6_address>
            config vrrp6
                edit 220
                    set vrip 2001:db8:1::12
                    set priority 255
                next
            end
        end
    next
end
```

VRRP failover

VRRP routers in a VRRP domain periodically send VRRP advertisement messages to all routers in the domain to maintain one router as the primary router and the others as backup routers. The primary router has the highest priority. If the backup routers stop receiving these packets from the primary router, the backup router with the highest priority becomes the new primary router.

The primary router stops sending VRRP advertisement messages if it fails or becomes disconnected. Up to two VRRP destination addresses can be configured to be monitored by the primary router. As a best practice, the destination addresses should be remote addresses. If the primary router is unable to connect to these destination addresses, it stops sending VRRP advertisement messages, and the backup router with the highest priority becomes the primary router.

To configure IPv4 VRRP with two destination addresses for monitoring:

```
config system interface
    edit port14
        config vrrp
            edit 12
```

```
                set vrdst 10.10.10.20 10.20.20.10
            next
        end
    next
end
```

To configure IPv6 VRRP with one destination address for monitoring:

```
config system interface
    edit port23
        config ipv6
            config vrrp6
                edit 223
                    set vrdst 2001:db8:1::12
                next
            end
        end
    next
end
```

IPv4 VRRP active failover

The `vrdst-priority` option can be used to reduce IPv4 VRRP failover times. This option causes the primary router to actively signal to the backup routers when the primary router cannot reach its configured destination addresses. The primary router sends a lower priority for itself in the VRRP advertisement messages. The backup router with the highest priority becomes the new primary router and takes over traffic processing.

In this example, the primary router is configured to have a priority of 255, so it should always become the primary router. The `vrdst-priority` is set to 10. If the primary router cannot connect to the 10.10.10.1 destination address, then the primary router informs the VRRP group that its priority is now 10.

To set the priority of the virtual router when the destination address is unreachable:

```
config system interface
    edit port10
        config vrrp
            edit 12
                set vrip 10.31.101.200
                set priority 255
                set vrdst 10.10.10.1
                set vrdst-priority 10
            next
        end
    next
end
```

IPv4 VIP and IP pool failover

The `proxy-arp` option can be used to map VIPs and IP pool address ranges to each router's VMAC (virtual MAC). After failover, the IP or ranges configured in the VRRP settings are routed to the new primary router's VMAC. In this example, a single IP and an address range are added for proxy ARP.

To configure the IP addresses for proxy ARP:

```
config system interface
    edit port5
        set vrrp-virtual-mac enable
        config vrrp
            edit 1
                config proxy-arp
                    edit 1
                        set ip 192.168.62.100-192.168.62.200
                    next
                    edit 2
                        set ip 192.168.62.225
                    next
                end
            next
        end
    next
end
```

Changing the advertisement message interval

By default, VRRP advertisement messages are sent once every second. The frequency can be changed with the `adv-interval` option to change the frequency of sending these messages (1 - 255 seconds).

The `adv-interval` also affects the period of time that a backup VRRP router waits before assuming the primary router has failed. The waiting period is three times the `adv-interval`. For example, if the `adv-interval` is set to 5, then the backup router waits for up to 15 seconds to receive a VRRP advertisement from the current primary router before taking over the role as the primary router.

To configure IPv4 VRRP to send advertisement messages every 10 seconds:

```
config system interface
    edit port14
        config vrrp
            edit 12
                set adv-interval 10
            next
        end
    next
end
```

To configure IPv6 VRRP to send advertisement messages every 20 seconds:

```
config system interface
    edit port23
        config ipv6
            config vrrp6
                edit 223
                set adv-interval 20
            next
        end
    next
end
```

Changing the VRRP startup time

The VRRP startup time is the time a backup or primary VRRP router waits before sending or receiving VRRP advertisements before potentially changing state (`start-time` in seconds, 1 - 255, default = 3). This timer is mainly visible when VRRP-monitored interfaces become up after previously been down. When this occurs, the device will wait for the time period before considering, and potentially changing its status.

There are some instances when the advertisement messages might be delayed. For example, some switches with spanning tree enabled may delay some of the advertisement message packets. If backup routers are attempting to become primary routers even though the primary router has not failed, extend the start time to ensure that the backup routers wait long enough for the advertisement messages.

To configure the IPv4 VRRP startup time to 10 seconds:

```
config system interface
    edit port14
        config vrrp
            edit 12
                set start-time 10
            next
        end
    next
end
```

To configure the IPv6 VRRP startup time to 15 seconds:

```
config system interface
    edit port23
        config ipv6
            config vrrp6
                edit 223
                set start-time 15
            next
        end
    next
end
```

VRRP groups

If VRRP routers are added to multiple interfaces of the same FortiGate, each router will be in a different VRRP domain. If one of the VRRP routers fails, it is useful if all of the VRRP routers added to the FortiGate also fail.

VRRP can only check the routers' status in a single VRRP domain and cannot track the status of routers in other domains. For multiple VRRP domains on a single FortiGate, only one can switch to being a backup, and the others remain operating normally. Using VRRP groups resolves this issue.

All the VRRP virtual routers on the FortiGate can be added to a VRRP group. If one of the virtual routers in a VRRP group switches to the backup, the VRRP group forces all members to switch to backups. All VRRP traffic being processed by the FortiGate fails over to other devices in the network.

The status of the virtual routers in a VRRP group only changes when one or more of the virtual routers in the group changes status. A VRRP group should not be used to manually change the status of the virtual routers in the group.

To configure two IPv4 VRRP routers in a VRRP group:

```
config system interface
    edit port10
        config vrrp
            edit 200
                set vrip 10.31.101.200
                set priority 255
                set vrgrp 10
            next
        end
    next
    edit port20
        config vrrp
            edit 100
                set vrip 10.23.1.223
                set priority 20
                set vrgrp 10
            next
        end
    next
end
```

To configure two IPv6 VRRP routers in a VRRP group:

```
config system interface
    edit port11
        config ipv6
            set vrip6_link_local <IPv6_address>
            config vrrp6
                edit 220
                    set vrip 2001:db8:1::12
```

```
                    set priority 255
                    set vrgrp 90
                next
            end
        end
    next
    edit port12
        config ipv6
            set vrip6_link_local <IPv6_address>
            config vrrp6
                edit 220
                    set vrip 2001:db8:1::14
                    set priority 100
                    set vrgrp 90
                next
            end
        end
    next
end
```

VRRP virtual MACs

The VRRP virtual MAC address (or virtual router MAC address) is a shared MAC address adopted by the primary router. If the primary router fails, the same virtual MAC address is picked up by the new primary router, allowing all devices on the network to transparently connect to the default route using the same virtual MAC address. This feature must be enabled on all members in a VRRP domain.

Each VRRP router has its own virtual MAC address. The last part octet is based on the VRRP router ID using the following format:

```
00-00-5E-00-01-<VRID_hex>
```

Where <VRID_hex> is the VRRP router ID in hexadecimal format in internet standard bit-order. For more information about virtual MAC formatting, see RFC 3768.

For example:

- If the VRRP router ID is 10, then the virtual MAC is 00-00-5E-00-01-0a.
- If the VRRP router ID is 200, then the virtual MAC is 00-00-5E-00-01-c8.

If the VRRP virtual MAC address feature is disabled (the default setting), the VRRP domain uses the MAC address of the primary router. On a FortiGate VRRP virtual router, this is the MAC address of the FortiGate interface that the VRRP router is added to. If the primary fails, when the new primary takes over, it sends gratuitous ARPs to associate the VRRP router IP address with the MAC address of the new primary (or the FortiGate interface that became the new primary).

When a VRRP virtual MAC address is enabled, the new primary uses the same MAC address as the old primary.

Since devices on the LAN do not have to learn a new MAC address for a new VRRP router in the event of a failover, this feature can improve network efficiency, especially in large and complex networks.

To enable virtual MAC addresses in IPv4 VRRP:

```
config system interface
    edit <name>
        set vrrp-virtual-mac enable
    next
end
```

To enable virtual MAC addresses in IPv6 VRRP:

```
config system interface
    edit <name>
        config ipv6
            set vrrp-virtual-mac6 enable
        end
    next
end
```

Preempt mode

When preempt mode is enabled (the default setting), a higher priority backup router can preempt a lower priority primary router. This can happen if the primary router fails, the backup router becomes the primary router, and the failed primary router restarts. Since the restarted router has a higher priority, if preempt mode is enabled, the restarted router replaces the current primary router becoming the new primary router. If preempt mode is disabled, a restarted router that has a higher priority would not take over as the primary router.

Based on RFC 3768 Section 5.3.4, "The priority value for the VRRP router that owns the IP address(es) associated with the virtual router MUST be 255 (decimal). VRRP routers backing up a virtual router MUST use priority values between 1-254 (decimal)."

Therefore, in cases where preempt mode is disabled, but the priority is set to 255, the restarted unit will take over as the primary router.

To configure preempt mode in IPv4 VRRP:

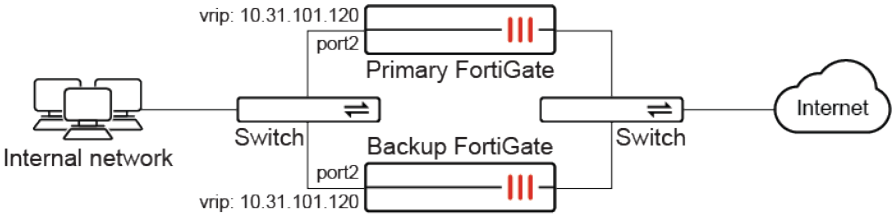
```
config system interface
    edit <name>
        config vrrp
            edit <vrid>
                set preempt {enable | disable}
            next
        end
    next
end
```

To configure preempt mode in IPv6 VRRP:

```
config system interface
    edit <name>
        config ipv6
            config vrrp6
                edit <vrid>
                    set preempt {enable | disable}
                next
            end
        end
    next
end
```

Single-domain VRRP example

This example consists of a VRRP domain with two FortiGates that connect an internal network to the internet. The FortiGate port2 interfaces connect to the internal network, and a VRRP virtual router is added to each port2 interface with VRRP virtual MAC addresses enabled. The internal network default route is 10.31.101.120. Each FortiGate port2 interface has an IP address that is different from the virtual router IP address. Since `vrrp-virtual-mac` is enabled, upon failover, the new primary VRRP router will use the same VMAC as the previous router.



To configure the primary FortiGate:

```
config system interface
    edit port2
        set vrrp-virtual-mac enable
        config vrrp
            edit 5
                set vrip 10.31.101.120
                set priority 255
            next
        end
    next
end
```

To configure the backup FortiGate:

```
config system interface
    edit port2
        set vrrp-virtual-mac enable
```

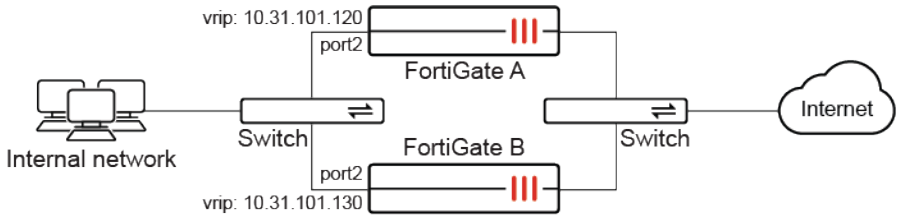
```
        config vrrp
            edit 5
                set vrip 10.31.101.120
                set priority 50
            next
        end
    next
end
```

Multi-domain VRRP example

This example consists of two VRRP domains, and both FortiGates participate in the domains that connect an internal network to the internet. One FortiGate is the primary router of one domain and the other FortiGate is the primary router of the other domain. The network distributes traffic between two different default routes (10.31.101.120 and 10.31.101.130). One VRRP domain is configured with one of the default route IP addresses and the other VRRP domain gets the other default route IP address. During normal operation, both FortiGates process traffic, and the VRRP domains are used to load balance the traffic between the two FortiGates.

If one of the FortiGates fails, the remaining FortiGate becomes the primary router of both VRRP domains. The network sends all traffic for both default routes to this FortiGate. The result is a configuration that (under normal operational load) balances traffic between two FortiGates, but if one of the FortiGates fails, all traffic fails over to the FortiGate that is still operating.

VRRP virtual MAC address are enabled on both FortiGates' port2 interfaces so that the VRRP domains use their VRRP virtual MAC addresses.



Device	VRRP primary			VRRP backup		
	Virtual router IP	ID	Priority	Virtual router IP	ID	Priority
FortiGate A	10.31.101.120	50	255	10.31.101.130	100	50
FortiGate B	10.31.101.130	100	255	10.31.101.120	50	50

To configure FortiGate A:

```
config system interface
    edit port2
        set vrrp-virtual-mac enable
        config vrrp
            edit 50
                set vrip 10.31.101.120
```

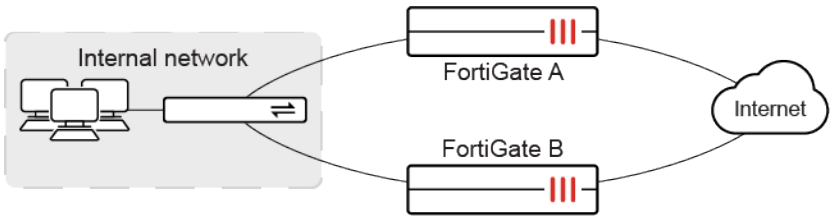
```
                set priority 255
            next
            edit 100
                set vrip 10.31.101.130
                set priority 50
            next
        end
    next
end
```

To configure FortiGate B:

```
config system interface
    edit port2
        set vrrp-virtual-mac enable
        config vrrp
            edit 50
                set vrip 10.31.101.120
                set priority 50
            next
            edit 100
                set vrip 10.31.101.130
                set priority 255
            next
        end
    next
end
```

VRRP on EMAC-VLAN interfaces

Virtual Router Redundancy Protocol (VRRP) can be configured on EMAC-VLAN interfaces.



To configure the interfaces:

1. Configure FortiGate A:

```
config system interface
    edit "emac"
        set vdom "root"
        set ip 172.16.209.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet fgfm
        set type emac-vlan
```

```
        set vrrp-virtual-mac enable
        config vrrp
            edit 1
                set vrip 172.16.209.111
                set priority 200
            next
        end
        set snmp-index 61
        set interface "port1"
    next
end
```

2. Configure FortiGate B:

```
config system interface
    edit "emac"
        set vdom "root"
        set ip 172.16.209.2 255.255.255.0
        set allowaccess ping https ssh snmp http telnet fgfm
        set type emac-vlan
        set vrrp-virtual-mac enable
        config vrrp
            edit 1
                set vrip 172.16.209.111
                set priority 222
            next
        end
        set snmp-index 32
        set interface "port1"
    next
end
```

Check the VRRP information on the FortiGates:

Because FortiGate B has a higher priority, it is the primary device and FortiGate A is the backup.

1. FortiGate A:

```
# get router info vrrp
Interface: emac, primary IP address: 172.16.209.1
  UseVMAC: 1, SoftSW: 0, EmacVlan: 1 BrPortIdx: 0, PromiscCount: 0
  HA mode: primary (0:0:1) VRRP master number: 0
  VRID: 1 verion: 2
    vrip: 172.16.209.111, priority: 200 (200,0), state: BACKUP
    adv_interval: 1, preempt: 1, ignore_dft: 0 start_time: 3
    master_adv_interval: 100, accept: 1
    vrmac: 00:00:5e:00:01:01
    vrdst:
    vrgrp: 0
```

2. FortiGate B:

```
# get router info vrrp
Interface: emac, primary IP address: 172.16.209.2
  UseVMAC: 1, SoftSW: 0, EmacVlan: 1 BrPortIdx: 0, PromiscCount: 1
  HA mode: primary (0:0:1) VRRP master number: 1
  VRID: 1 verion: 2
    vrip: 172.16.209.111, priority: 222 (222,0), state: PRIMARY
    adv_interval: 1, preempt: 1, ignore_dft: 0 start_time: 3
    master_adv_interval: 100, accept: 1
    vrmac: 00:00:5e:00:01:01
    vrdst:
    vrgrp: 0
```

Ignore VRRP default route

Administrators can choose to exclude the default route from the calculation of available routes to the IPv6 VRRP destination, to better manage and control the VRRP states. Previously, the VRRP state would be `Primary` as long as any route, including the default route, could reach the IPv6 VRRP destination.

```
config system interface
    edit <name>
        config ipv6
            config vrrp6
                edit <id>
                    set ignore-default-route {enable | disable}
                next
            end
        end
    next
end
```

`set ignore-default-route {enable | disable}`	Set the default route to be ignored: • `enable`: Ignore the default route when checking the VRRP destination. • `disable`: Include the default route when checking the VRRP destination (default).

Example

In this example, the IPv6 VRRP destination (`vrdst6`) is set with an IPv6 address of `2000:172:22:20::22`, and `ignore-default-route` is enabled for the destination. As long as non-default routes exist to the VRRP destination, the VRRP state is `Primary`. When only the default route to the VRRP destination exists, the VRRP state changes to `Backup`.

To ignore the default route when checking the IPv6 VRRP destination:

1. Enable the default route to be ignored for IPv6 VRRP.
   The IPv6 VRRP destination (`vrdst6`) is set with an IPv6 address of `2000:172:22:20::22`, and `ignore-default-route` is enabled for the destination.

```
config system interface
    edit "port2"
        config ipv6
            set vrrp-virtual-mac6 enable
            set vrip6_link_local fe80::926c:acff:2222:2222
            config vrrp6
                edit 100
                    set vrgrp 100
                    set vrip6 2000:10:1:100::222
                    set priority 200
                    set vrdst6 2000:172:22:20::22
                    set ignore-default-route enable
                next
            end
        end
    next
end
```

2. Check the route for IPv6 VRRP destination.

   The routing table shows an active route through `port1` to the IPv6 VRRP destination of `2000:172:22:20::22`. The active route is not a default route.

```
# get router info6 routing-table 2000:172:22:20::22
Routing entry for 2000:172:22:20::/80
  Known via "static", distance 10, metric 0
  Last update 00:00:15 ago
    via 2000:172:16:200::55, port1
```

3. Check VRRP group information for IPv6.

   The VRRP state is `Primary` because non-default routes to the IPv6 VRRP destination exist as shown in the previous step.

```
# get router info6 vrrp
Interface: port2, primary IPv6 address: 2000:10:1:100::1
link-local IPv6 address: fe80::96f3:92ff:fe15:1ecd
Virtual link-local IPv6 address: fe80::926c:acff:2222:2222
  UseVMAC: 1, SoftSW: 0, EmacVlan: 0 BrPortIdx: 0, PromiscCount: 1
  HA mode: primary (0:0:1)
  VRT primary count: 1
  VRID: 100 version: 3
    vrip: 2000:10:1:100::222, priority: 200, state: PRIMARY
    adv_interval: 1, preempt: 1, ignore_dft: 0, start_time: 3
    primary_adv_interval: 100, accept: 1
    vrmac: 00:00:5e:00:02:64
    vrdst: 2000:172:22:20::22
    vrgrp: 100
```

4. Delete the non-default routes to the IPv6 VRRP destination (`vrdst6`), and check the routes again.

   The routing table shows only the default route (`::/0`) is available to the IPv6 VRRP destination of `2000:172:22:20::22`.

```
# get router info6 routing-table 2000:172:22:20::22
Routing entry for ::/0
  Known via "static", distance 10, metric 0, best
  Last update 02:02:09 ago
  * via 2000:172:16:200::254, port1
```

5. Check VRRP group information for IPv6.

   The VRRP state is Backup because only the default route is available to the IPv6 VRRP destination as shown in the previous step.

```
#get router info6 vrrp
Interface: port2, primary IPv6 address: 2000:10:1:100::1
link-local IPv6 address: fe80::96f3:92ff:fe15:1ecd

    vrdst: 2000:172:22:20::22
    vrgrp: 100
```

Session failover

Session failover means that after the primary unit fails, communications sessions resume on the new primary unit with minimal or no interruption. Two categories of sessions need to be resumed after a failover:

- Sessions passing through the cluster
- Sessions terminated by the cluster

Session failover (also called session-pickup) is not enabled by default for FortiGate. See Session pickup on page 3349 for more information

Using the `session-sync-dev` option, you can select one or more FortiGate interfaces to use for synchronizing sessions as required for session pickup. See Improving session sync performance on page 3354 for more information.

After a failover the new primary unit recognizes open sessions that were being handled by the cluster. The sessions continue to be processed by the new primary unit and are handled according to their last known state.

Session-pickup has some limitations. For example, session failover is not supported for sessions being scanned by proxy-based security profiles. Session failover is supported for sessions being scanned by flow-based security profiles; however, flow-based sessions that fail over are not inspected after they fail over. For more limitations, see Pass-through sessions on page 3350.

Sessions terminated by the cluster do not failover and have to be restarted. There are some exceptions though, particularly for IPsec and SSL VPN. For more information, see Terminated sessions on page 3353.

Session pickup

When session-pickup is enabled, the FGCP synchronizes the primary unit's TCP session table to all cluster units. As soon as a new TCP session is added to the primary unit's session table, that session is synchronized to all cluster units. This synchronization happens as quickly as possible to ensure the session tables remain synchronized.

If the primary unit fails, the new primary unit uses its synchronized session table to resume all TCP sessions that were being processed by the former primary unit, resulting in only minimal interruption. Under ideal conditions, all TCP sessions should be resumed. However, this is not guaranteed, and under less than ideal conditions, some TCP sessions may need to be restarted.

To enable session pickup in the GUI:

1. Go to *System* > *HA*.
2. Select the Primary FortiGate and click *Edit*.
3. Under *Cluster Settings*, enable *Session pickup*.
4. Click *OK* to save the setting.

To enable session pickup in the CLI:

```
config system ha
    set session-pickup enable
end
```

Enabling UDP, ICMP and broadcast packet session failover

By default, the FGCP does not maintain a session table for UDP, ICMP, or broadcast packets, even when session pickup is enabled. This means that the cluster does not specifically support the failover of these types of packets. However, it is possible to enable session pickup for UDP and ICMP packets. To do this, you must first enable session pickup for TCP sessions. After that, you can enable session pickup for connectionless sessions:

```
config system ha
    set session-pickup enable
    set session-pickup-connectionless enable
end
```

This configuration causes the cluster units to synchronize UDP and ICMP session tables and if a failover occurs UDP and ICMP sessions are maintained.

Enabling multicast session failover

HA supports IPv4 multicast route and session failover to ensure minimal interruption to multicast traffic. To adjust how often to synchronize the multicast routes to the secondary unit, use the following command to

change the multicast TTL timer. The recommended setting to support multicast session failover is 120 seconds (2 minutes). The default setting is 600 seconds (10 minutes).

```
config system ha
    set multicast-ttl 120
end
```

The multicast TTL timer controls how long to keep synchronized multicast routes on the backup unit, ensuring they are present on the backup unit when it becomes the new primary unit after a failover. If you set the multicast TTL lower, the multicast routes on the backup unit are refreshed more often, and are therefore more likely to be accurate. However reducing this time causes route synchronization to happen more often, which could affect performance.

IPv4 multicast route and session failover can be supported in multicast-forwarding mode or multicast-routing mode.

Disabling session pickup

If you leave session pickup disabled, the cluster doesn't track sessions, and active sessions must be restarted or resumed after a failover. This is usually handled by TCP/IP communications.

The `session-pickup` setting does not affect session failover for sessions terminated by the cluster.

Disabling session pickup can reduce CPU and network bandwidth usage, especially if your cluster is mainly used for unsynchronized traffic. However, if session pickup is not enabled, sessions won't resume after a failover, causing a brief interruption. Most protocols can restart sessions with minimal data loss. For instance, web users can refresh their browsers to resume browsing, but large file downloads may need to be restarted. Some protocols may require manual session restarts, like FTP file downloads.

Pass-through sessions

This section contains information about session failover for communication sessions passing through the cluster. In general, if session pickup is enabled, session failover is supported for most TCP traffic.

Protocol	Session failover
Most TCP sessions	Supported if session-pickup is enabled. See TCP session failover on page 3351 for more information.
Multicast sessions	Supported if multicast session-pickup is enabled. See Enabling multicast session failover on page 3349 for more information.
IPv6, NAT64, and NAT66	Supported if session-pickup is enabled.
Proxy-based security profile sessions	Not Supported; sessions have to be restarted.

Protocol	Session failover
	Proxy-based features require the FortiGate to maintain very large amounts of internal state information for each session. The FGCP does not synchronize this internal state information. As a result, proxy-based sessions are not failed over. Active-active clusters can resume some of these sessions after a failover. See Resume active-active HA subordinate units sessions after failover on page 3352 for more information.
Flow-based security profile sessions	Supported if session-pickup is enabled; however, internal state information is not synchronized so flow-based sessions that fail over are not inspected after they fail over. If both flow-based and proxy-based security profile features are applied to a TCP session, that session will not resume after a failover.
UDP, ICMP, or broadcast sessions	Supported if connectionless session-pickup is enabled. See Enabling UDP, ICMP and broadcast packet session failover on page 3349 for more information.
GPRS Tunneling Protocol (GTP)	Supported with limitations. See FortiOS Carrier GTP session failover on page 3352 for more information.
SIP	Supported for active-passive HA only. See SIP session failover on page 3351 for more information.
SIMPLE or SCCP signal session	Not supported; sessions have to be restarted.
SSL offloading and HTTP multiplexing	Not supported; sessions have to be restarted. See SSL offloading and HTTP multiplexing session failover on page 3352 for more information.

TCP session failover

TCP sessions that are not being processed by security profile features resume after a failover even if these sessions are accepted by security policies with security profiles. Only TCP sessions that are actually being processed by these security profile features do not resume after a failover.

- TCP sessions that are not virus scanned, web filtered, spam filtered, content archived, or are not SIP, SIMPLE, or SCCP signal traffic resume after a failover, even if they are accepted by a security policy with security profile options enabled. For example, SNMP TCP sessions through the FortiGate resume after a failover because FortiOS does not apply any security profile options to SNMP sessions.
- TCP sessions for a protocol for which security profile features have not been enabled resume after a failover even if they are accepted by a security policy with security profile features enabled. For example, if you have not enabled any antivirus or content archiving settings for FTP, FTP sessions resume after a failover.

SIP session failover

If session pickup is enabled, the FGCP supports SIP session failover (also called stateful failover) for active passive HA.

SIP session failover replicates SIP states to all cluster units. If an HA failover occurs, all in-progress SIP calls (setup complete) and their RTP flows are maintained and the calls will continue after the failover with minimal or no interruption.

SIP calls being set up at the time of a failover may lose signaling messages. In most cases the SIP clients and servers should use message retransmission to complete the call setup after the failover has completed. As a result, SIP users may experience a delay if their calls are being set up when an HA a failover occurs. But in most cases the call setup should be able to continue after the failover.

FortiOS Carrier GTP session failover

FortiOS Carrier HA supports GTP session failover. Once the GTP tunnel setup is completed, the primary unit synchronizes the GTP tunnel state across all cluster units. Although HA does not synchronize UDP sessions used by GTP, the new primary unit retains the GTP tunnel state information after a failover. This allows GTP UDP sessions using the same tunnel to continue to flow, albeit with certain limitations.

The limitation on packets continuing to flow is that there has to be a security policy to accept the packets. For example, if the FortiOS Carrier unit has an internal to external security policy, GTP UDP sessions using an established tunnel that are received by the internal interface are accepted by the security policy and can continue to flow. However, GTP UDP packets for an established tunnel that are received at the external interface cannot flow until packets from the same tunnel are received at the internal interface.

If you have bi-directional policies that accept GTP UDP sessions then traffic in either direction that uses an established tunnel can continue to flow after a failover without interruption.

SSL offloading and HTTP multiplexing session failover

SSL offloading and HTTP multiplexing requires the FortiGate to maintain very large amounts of internal state information for each session. Sessions accepted by security policies containing virtual IPs or virtual servers with SSL offloading or HTTP multiplexing enabled do not resume after a failover.

Resume active-active HA subordinate units sessions after failover

In an active-active cluster, subordinate units process sessions. After a failover, all cluster units that are still operating may be able to continue processing the sessions that they were processing before the failover. These sessions are maintained because after the failover the new primary unit uses the HA session table to continue to send session packets to the cluster units that were processing the sessions before the failover. Cluster units maintain their own information about the sessions that they are processing and this information is not affected by the failover. In this way, the cluster units that are still operating can continue processing their own sessions without loss of data.

The cluster keeps processing as many sessions as it can. But some sessions can be lost. Depending on what caused the failover, sessions can be lost in the following ways:

- A cluster unit (subordinate unit) fails. All sessions that were being processed by that cluster unit are lost.
- A link failure occurs. All sessions that were being processed through the network interface that failed are lost.

Terminated sessions

This section contains information about session failover for communication sessions terminated by the cluster. Sessions terminated by the cluster include management sessions as well as IPsec and SSL VPN, WAN Optimization and so on between the cluster and a client.

In general, most sessions terminated by the cluster have to be restarted after a failover. There are some exceptions though. For example, the FGCP provides failover for IPsec and SSL VPN sessions terminated by the cluster.

The session pickup setting does not affect session failover for sessions terminated by the cluster. Also other cluster settings such as active-active or active-passive mode do not affect session failover for sessions terminated by the cluster.

Protocol	Session failover
Administrative or management connections such as connecting to the GUI or CLI, SNMP, syslog, communication with FortiManager, FortiAnalyzer and so on	Not supported, sessions have to be restarted.
Explicit web proxy, WCCP, WAN Optimization and Web Caching	Not supported, sessions have to be restarted. See Explicit web proxy, explicit FTP proxy, WCCP, WAN optimization and Web Caching session failover on page 3353 for more information.
IPsec VPN tunnels terminating at the FortiGate	Supported. Security associations (SAs) and related IPsec VPN tunnel data is synchronized to cluster members. See IPsec VPN SA sync on page 3354 for more information.
SSL VPN tunnels terminating at the FortiGate	Partially supported. Sessions are not synchronized and have to be restarted. Authentication failover and cookie failover is supported for SSL VPN web mode sessions. Authentication failover is not supported for FortiClient SSL VPN sessions. See SSL VPN session failover and SSL VPN authentication failover on page 3354 for more information.
PPTP and L2TP VPN terminating at the FortiGate	Not supported; sessions have to be restarted. See PPTP and L2TP VPN sessions on page 3354 for more information.

Explicit web proxy, explicit FTP proxy, WCCP, WAN optimization and Web Caching session failover

Explicit web proxy, explicit FTP proxy, WCCP, WAN optimization and web caching sessions all require the FortiGate to maintain very large amounts of internal state information for each session. This information is not maintained and these sessions do not resume after a failover.

The active-passive HA clustering is recommended for WAN optimization. All WAN optimization sessions are processed by the primary unit only. Even if the cluster is operating in active-active mode, HA does not load-balance WAN optimization sessions.

Web cache and byte cache databases are only stored on the primary unit. These databases are not synchronized to the cluster. So, after a failover, the new primary unit must rebuild its web and byte caches. The new primary unit cannot connect to a SAS partition that the failed primary unit used.

Rebuilding the byte caches can happen relatively quickly because the new primary unit gets byte cache data from the other FortiGates that it is participating with in WAN optimization tunnels.

IPsec VPN SA sync

The FGCP synchronizes IPsec SAs between cluster members so that if a failover occurs, the cluster can resume IPsec sessions without having to establish new SAs. The result is improved failover performance because IPsec sessions are not interrupted to establish new SAs. Also, establishing a large number of SAs can reduce cluster performance.

SSL VPN session failover and SSL VPN authentication failover

Session failover is not supported for SSL VPN tunnels. However, authentication failover is supported for SSL VPN web mode sessions. This means that after a failover, SSL VPN web mode sessions can re-establish the SSL VPN session between the SSL VPN client and the FortiGate without having to authenticate again.

Authentication failover is not supported for FortiClient SSL VPN sessions.

All sessions inside the SSL VPN tunnel that were running before the failover are stopped and have to be restarted. For example, file transfers that were in progress would have to be restarted. As well, any communication sessions with resources behind the FortiGate that are started by an SSL VPN session have to be restarted.

To support SSL VPN cookie failover, when an SSL VPN session starts, the FGCP distributes the cookie created to identify the SSL VPN session to all cluster units.

PPTP and L2TP VPN sessions

PPTP and L2TP VPNs are supported in HA mode. For a cluster you can configure PPTP and L2TP settings and you can also add security policies to allow PPTP and L2TP pass through. However, the FGCP does not provide session failover for PPTP or L2TP. After a failover, all active PPTP and L2TP sessions are lost and must be restarted.

Improving session sync performance

Two HA configuration options are available to reduce the performance impact of enabling session-pickup:

- Reducing the number of sessions that are synchronized.
- Using more FortiGate interfaces for session synchronization.

Reducing the number of sessions that are synchronized

When session pickup is enabled, new sessions are synced across cluster units. To reduce the number of synced sessions, enable the `session-pickup-delay` option, which only syncs sessions active for more than 30 seconds. This can reduce syncs for clusters with many short sessions, like HTTP traffic.

Use the following commands to enable a 30-second delay:

```
config system ha
    set session-pickup-delay enable
end
```

This may result in more sessions not resuming after a failover, but most short sessions can restart with minor interruption.

Using multiple FortiGate interfaces for session synchronization

The `session-sync-dev` option allows you to choose one or more FortiGate interfaces for session synchronization, which is necessary for session pickup. Typically, session synchronization takes place over the HA heartbeat link. However, with this HA option, only the chosen interfaces are used for session synchronization, not the HA heartbeat link. If multiple interfaces are selected, the session synchronization traffic is load balanced among the selected interfaces.

Shifting session synchronization away from the HA heartbeat interface can reduce the bandwidth needed for HA heartbeat traffic, potentially enhancing the cluster's efficiency and performance. This is particularly true if the cluster is synchronizing a large volume of sessions. Load balancing session synchronization across multiple interfaces can further boost performance and efficiency when dealing with a large number of sessions.

To perform cluster session synchronization using the port10 and port12 interfaces:

```
config system ha
    set session-sync-dev port10 port12
end
```

The interfaces chosen for session synchronization must be interconnected, either directly with the appropriate cable (if the cluster only contains two units) or through switches. If one of the interfaces becomes disconnected the cluster uses the remaining interfaces for session synchronization. If all of the session synchronization interfaces become disconnected, session synchronization reverts back to using the HA heartbeat link. All session synchronization traffic is between the primary unit and each subordinate unit.

Since large amounts of session synchronization traffic can increase network congestion, it is recommended to isolate this traffic from your network by using dedicated connections.

SNMP

SNMP enables you to monitor hardware on your network. You can configure the hardware, such as the FortiGate SNMP agent, to report system information and send traps (alarms or event messages) to SNMP managers. SNMP traps alert you to events that happen, such as when a log disk is full or a virus is detected.

The FortiGate SNMP implementation is read-only. SNMP v1/v2c and v3 compliant SNMP managers have read-only access to FortiGate system information through queries, and can receive trap messages from the FortiGate unit. See SNMP Overview for more information.

- Basic configuration on page 3356
- MIB files on page 3359

- Access control for SNMP on page 3360
- Important SNMP traps on page 3362
- SNMP traps and automation-stitch notifications for DIO module on page 3365
- SNMP examples on page 3368

Basic configuration

SNMP configuration has four steps that should be configured in order:

1. Configure interface access

   Before a remote SNMP manager can connect to the FortiGate SNMP agent, you must configure one or more FortiGate interfaces to accept SNMP connections.
2. Configure the SNMP agent

   The SNMP agent sends SNMP traps originating on the FortiGate to an external monitoring SNMP manager defined in an SNMP community. The SNMP manager can monitor the FortiGate system to determine if it is operating properly or if any critical events are occurring.

   The description, location, and contact information for this FortiGate system will be part of the information that the SNMP manager receives. This information is useful if the SNMP manager is monitoring many devices, and enables faster responses when the FortiGate system requires attention.
3. Configure SNMP v1/v2c communities

   An SNMP community is a grouping of equipment for network administration purposes. A single device can belong to multiple communities. It is not mandatory if SNMP v3 is configured.

   You must add an SNMP community to the FortiGate so that the SNMP manager can receive traps and system information. Up to three communities can be added.
4. Configure SNMP v3 users

   Authentication is used to ensure the identity of users. Privacy allows for the encryption of SNMP v3 messages to ensure the confidentiality of data. These protocols provide a higher level of security than is available in SNMP v1/v2c, which use community strings for security. Both authentication and privacy are optional.

To configure SNMP in the GUI:

1. Configure interface access:
   a. Go to *Network* > *Interfaces* and edit an interface.
   b. In the *Administrative Access* options, enable *SNMP*.
   c. Click *OK*.
2. Configure the SNMP agent:
   a. Go to *System* > *SNMP*.
   b. Enable *SNMP Agent* and configure the following:

Description	A description of the agent.
Location	The location of the FortiGate.
Contact Info	A contact or administrator for the SNMP agent or FortiGate.

   c. Click *Apply*.

3. Configure an SNMP v1/v2c community:
   a. Go to *System > SNMP*.
   b. In the *SNMP v1/v2c* table, click *Create New*.
   c. Configure the following:

Community Name	The name of the community.
Hosts	Enter the *IP Address* and select the *Host Type* for each SNMP manager.
Queries	Enable or disable v1 and v2c queries, then enter the port numbers that the SNMP managers in this community use for them.
Traps	Enable or disable v1 and v2c traps, then enter the local and remote port numbers that the SNMP managers in this community use for them.
SNMP Events	Enable or disable the events that activate traps in this community.

   d. Click *OK*.
4. Configure an SNMP v3 user:
   a. Go to *System > SNMP*.
   b. In the *SNMP v3* table, click *Create New*.
   c. Configure the following:

User Name	The name of the user.
Security Level	Configure the security level: • *No Authentication*: No authentication or encryption. • *Authentication*: Select the authentication algorithm and password. • *Authentication and Private*: Select both the authentication and encryption algorithms and password.
Hosts	The *IP Address* for each SNMP manager.
Queries	Enable or disable queries, then enter the port number that the SNMP managers use for them.
Traps	Enable or disable traps, then enter the local and remote port numbers that the SNMP managers use for them
SNMP Events	Enable or disable the events that activate traps.

   d. Click *OK*.

To configure SNMP in the CLI:

1. Configure the Interface access:

```
config system interface
    edit <interface>
        append allowaccess snmp
```

```
        config ipv6
            append ip6-allowaccess snmp
        end
    next
end
```

2. Configure the SNMP agent:

```
config system snmp sysinfo
    set status enable
    set description <string>
    set contact-info <string>
    set location <string>
end
```

3. Configure an SNMP v1/v2c community:

```
config system snmp community
    edit <id>
        set name <string>
        set status {enable | disable}
        config hosts
            edit <host_id>
                set ip <ip/mask>
                set source-ip <class_ip>
                set ha-direct {enable | disable}
                set host-type {any | query | trap}
            next
        end
        set query-v1-port <port_number>
        set query-v1-status {enable | disable}
        set query-v2c-port <port_number>
        set query-v2c-status {enable | disable}
        set trap-v1-lport <port_number>
        set trap-v1-rport <port_number>
        set trap-v1-status {enable | disable}
        set trap-v2c-lport <port_number>
        set trap-v2c-rport <port_number>
        set trap-v2c-status {enable | disable}
        set events <events>
    next
end
```

4. Configure an SNMP v3 user:

```
config system snmp user
    edit <user>
        set status {enable | disable}
        set trap-status {enable | disable}
        set trap-lport <port_number>
        set trap-rport <port_number>
        set queries {enable | disable}
```

```
        set query-port <port_number>
        set notify-hosts <class_ip> ... <class_ip>
        set source-ip <class_ip>
        set ha-direct {enable | disable}
        set events <events>
        set security-level {no-auth-no-priv | auth-no-priv | auth-priv}
        set auth-proto {md5 | sha | sha224 | sha256 | sha384 | sha512}
        set auth-pwd <password>
        set priv-proto {aes | des | aes256 | aes256cisco}
        set priv-pwd <password>
    next
end
```

See SNMP examples on page 3368 for sample configurations.

MIB files

The FortiGate SNMP agent supports Fortinet proprietary MIBs, as well as the parts of RFC 2665 and RFC 1213 that apply to FortiGate unit configuration.

Your SNMP manager may already include standard and private MIBs in a compiled database that is ready to use. You must add the Fortinet proprietary MIBs to this database to have access to Fortinet specific information.

MIB file or RFC	Description
FORTINET-CORE-MIB.mib	The Fortinet core MIB includes all system configuration and trap information that is common to all Fortinet products. Your SNMP manager requires this information to monitor Fortinet device settings and receive traps from the FortiGate SNMP agent.
FORTINET-FORTIGATE-MIB.mib	The FortiGate MIB includes all system configuration information and trap information that is specific to FortiGate units. Your SNMP manager requires this information to monitor FortiGate settings and receive traps from the FortiGate SNMP agent.
RFC-1213 (MIB II)	The FortiGate SNMP agent supports MIB II groups with the following exceptions: • No support for the EGP group from MIB II (RFC 1213, section 3.11 and 6.10). • Protocol statistics returned for MIB II groups (IP/ICMP/TCP/UDP/etc.) do not accurately capture all Fortinet traffic activity. More accurate information can be obtained from the information reported by the Fortinet MIB.
RFC-2665 (Ethernet-like MIB)	The FortiGate SNMP agent supports Ethernet-like MIB information. FortiGate SNMP does not support for the dot3Tests and dot3Errors groups.

To download the MIB files:

1. Go to *System* > *SNMP*.
2. Click *Download FortiGate MIB File* and save the file to the management computer.
3. Click *Download Fortinet Core MIB File* and save the file to the management computer.

Access control for SNMP

Administrators can provide access control to SNMP users and communities based on restricting a MIB view to specific OID subtrees. They can also define access based on the VDOM. This allows multi-tenant FortiGate deployments to provide restricted access per VDOM.

- MIB view access control allows the SNMP clients to query specific OIDs that are filtered by the MIB view settings.
- VDOM access control allows the SNMP clients to query data from specific VDOMs that are filtered by the VDOM settings.

When access control is enabled, the users can only access the information that is allowed by the access control, and all other information is inaccessible. Administrators have granular control, and can easily restrict specific information based on access control.

To configure MIB views:

```
config system snmp mib-view
    edit <name>
        set include <OIDs>
        set exclude <OIDs>
    next
end
```

`include <OIDs>`	Enter the OID subtrees to be included in the view. A maximum of 16 subtrees can be added.
`exclude <OIDs>`	Enter the OID subtrees to be excluded in the view. A maximum of 64 subtrees can be added.

To configure access control based on MIB views and VDOMs for SNMP users and communities:

```
config system snmp user
    edit <user>
        set mib-view <view>
        set vdoms <vdoms>
    next
end
```

```
config system snmp community
    edit <community>
        set mib-view <view>
        set vdoms <vdoms>
```

```
    next
end
```

`mib-view <view>`	Set the SNMP access control MIB view.
`vdoms <vdoms>`	Set the SNMP access control VDOMs.

Example

In this example, two MIB views are created and, with VDOMs, used to control access for SNMP users and communities.

To configure access control for SNMP users and communities:

1. Configure two MIB views:

```
config system snmp mib-view
    edit "view1"
        set include "1.3.6.1.2"
    next
    edit "view2"
        set include "1.3.6.1.2.1"
        set exclude "1.3.6.1.2.1.2.1" "1.3.6.1.2.1.4.31" "1.3.6.1.2.1.1.9.1"
    next
end
```

2. Add the MIB view and VDOM restrictions to SNMP users:

```
config system snmp user
    edit "v3user"
        set mib-view "view1"
    next
    edit "v3user1"
        set vdom "vdom1"
    next
    edit "v3user2"
        set mib-view "view1"
        set vdoms "root" "vdom1"
    next
end
```

3. Add the MIB view and VDOM restrictions to SNMP communities:

```
config system snmp community
    edit 1
        set name "REGR-SYS"
        set vdoms "vdom1"
    next
    edit 2
        set name "REGR-SYS1"
        set mib-view "view2"
```

```
    next
    edit 3
       set name "REGR-SYS2"
       set mib-view "view1"
       set vdoms "root" "vdom1"
    next
end
```

Important SNMP traps

Link Down and Link Up traps

This trap is sent when a FortiGate port either goes down or is brought up.

For example, the following traps are generated when the state of port34 is set to down using `set status down`, and then brought up using `set status up`:

```
NET-SNMP version 5.7.3 2019-01-31 14:11:48 10.1.100.1(via UDP: [10.1.100.1]:162->
[10.1.100.11]:162) TRAP, SNMP v1, community REGR-SYS SNMPv2-MIB::snmpTraps Link Down Trap (0)
Uptime: 0:14:44.95 IF-MIB::ifIndex.42 = INTEGER: 42 IF-MIB::ifAdminStatus.42 = INTEGER: down(2)

SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE
```

fgFmTrapIfChange trap

This trap is sent when any changes are detected on the interface. The change can be very simple, such as giving an IPV4 address.

For example, the user has given the IP address of 1.2.3.4/24 to port 1 and the EMS Manager has detected the following trap:

```
DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (7975058) 22:09:10.58 SNMPv2-
MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgFmTrapIfChange FORTINET-CORE-
MIB::fnSysSerial.0 = STRING: FG140P3G15800330 IF-MIB::ifName.45 = STRING: port1 FORTINET-
FORTIGATE-MIB::fgManIfIp.0 = IpAddress: 1.2.3.4 FORTINET-FORTIGATE-MIB::fgManIfMask.0 = IpAddress:
255.255.255.0 FORTINET-FORTIGATE-MIB::fgManIfIp6.0 = STRING: 0:0:0:0:0:0:0:0
```

entConfigChange trap

The change to the interface in the previous example has also triggered the *ConfChange Trap* which is sent along with the *fgFmTrapIfChange* trap:

```
2018-11-15 09:30:23 FGT_A [UDP: [172.16.200.1]:162->[172.16.200.55]:162]: DISMAN-EXPRESSION-
MIB::sysUpTimeInstance = Timeticks: (8035097) 22:19:10.97 SNMPv2-MIB::snmpTrapOID.0 = OID: ENTITY-
MIB::entConfigChange
```

fgTrapDeviceNew trap

This trap is triggered when a new device, like a FortiSwitch, is connected to the FortiGate.

For example, the following scenario has given the device a new trap for adding FortiAP on a PoE interface a FortiGate 140D-POE. The trap has important information about the device name, device MAC address, and when it was last seen.

```
2018-11-15 11:17:43 UDP/IPv6: [2000:172:16:200::1]:162 [UDP/IPv6: [2000:172:16:200::1]:162]:
DISMAN-EXPRESSION-MIB::sysUpTimeInstance = Timeticks: (520817) 1:26:48.17 SNMPv2-
MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgTrapDeviceNew FORTINET-CORE-MIB::fnSysSerial.0
= STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FGT_A IF-MIB::ifIndex.0 = INTEGER: 0
FORTINET-FORTIGATE-MIB::fgVdEntIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgDeviceCreated.0 =
Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceLastSeen.0 = Gauge32: 5 FORTINET-FORTIGATE-
MIB::fgDeviceMacAddress.0 = STRING: 90:6c:ac:f9:97:a0
```

```
2018-11-15 11:17:43 FGT_A [UDP: [172.16.200.1]:162->[172.16.200.55]:162]: DISMAN-EXPRESSION-
MIB::sysUpTimeInstance = Timeticks: (520817) 1:26:48.17 SNMPv2-MIB::snmpTrapOID.0 = OID: FORTINET-
FORTIGATE-MIB::fgTrapDeviceNew FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-
MIB::sysName.0 = STRING: FGT_A IF-MIB::ifIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-
MIB::fgVdEntIndex.0 = INTEGER: 0 FORTINET-FORTIGATE-MIB::fgDeviceCreated.0 = Gauge32: 5 FORTINET-
FORTIGATE-MIB::fgDeviceLastSeen.0 = Gauge32: 5 FORTINET-FORTIGATE-MIB::fgDeviceMacAddress.0 =
STRING: 90:6c:ac:f9:97:a0
```

fgTrapAvOversize trap

The `fgTrapAvOversize` trap is generated when the antivirus scanner detects an oversized file:

```
019-01-31 13:22:04 10.1.100.1(via UDP: [10.1.100.1]:162->[10.1.100.11]:162) TRAP, SNMP v1,
community REGR-SYS FORTINET-FORTIGATE-MIB::fgt140P Enterprise Specific Trap (602) Uptime: 1 day,
3:41:10.31 FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 =
STRING: FortiGate-140D-POE 2019-01-31 13:22:29 <UNKNOWN> [UDP: [10.1.100.1]:162->
[10.1.100.11]:162]: DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks: (9967031) 1 day, 3:41:10.31
```

```
SNMPv2-MIB::snmpTrapOID.0 = OID: FORTINET-FORTIGATE-MIB::fgTrapAvOversize FORTINET-CORE-
MIB::fnSysSerial.0 = STRING: FG140P3G15800330 SNMPv2-MIB::sysName.0 = STRING: FortiGate-140D-POE
```

Memory usage traps

Both free memory usage and freeable memory of FortiGate devices can be monitored through the Simple Network Management Protocol (SNMP). SNMP object identifier (OID) entries are available in Fortinet MIB files to show the percentage of free memory usage and freeable memory in an SNMP manager:

- `1.3.6.1.4.1.12356.101.4.1.36 .fgSysFreeMemUsage`
- `1.3.6.1.4.1.12356.101.4.1.37 .fgSysFreeableMemUsage`

The following commands are available to configure memory thresholds to trigger SNMP traps:

```
config system snmp sysinfo
    set trap-free-memory-threshold <integer>
    set trap-freeable-memory-threshold <integer>
end
```

`set trap-free-memory-threshold <integer>`	Use an integer from 1 to 100 (default 5) to identify what percentage of free memory usage will trigger an SNMP trap. SNMP traps are sent when the free memory is *lower* than the specified threshold. For example, the free memory threshold is set to 5, and SNMP traps are sent when free memory is lower than 5%.
`set trap-freeable-memory-threshold <integer>`	Use an integer from 1 to 100 (default 60) to identify what percentage of freeable memory will trigger an SNMP trap. SNMP traps are sent when the freeable memory is *higher* than the specified threshold. For example, the freeable memory threshold is set to 60, and SNMP traps are sent when freeable memory is higher than 60%.

Example

In this example, the SNMP agent is configured to monitor FortiGate memory and send traps. The `trap-free-memory-threshold` is set to `10`, and the `trap-freeable-memory-threshold` is set to `50`. SNMP traps are triggered for both thresholds because:

- The free memory on the FortiGate is 9%, which is lower than the threshold of 10.
- The freeable memory on the FortiGate is 56%, which is higher than the threshold of 50.

To configure SNMP for monitoring memory usage on FortiGates:

1. Configure the SNMP agent to monitor FortiGate memory usage and freeable memory.
   In this example, the `trap-free-memory-threshold` is set to `10`, and the `trap-freeable-memory-threshold` is set to `50`.

   ```
   config system snmp sysinfo
       set status enable
   ```

```
    set engine-id <string for local SNMP engine ID>
    set description <string>
    set contact-info <string>
    set location <string>
    set trap-high-cpu-threshold 60
    set trap-free-memory-threshold 10
    set trap-freeable-memory-threshold 50
end
```

2. Verify that the SNMP manager can successfully query and receive a response on the current memory status of the FortiGate.

   In the following example, the free memory on the FortiGate is reported as 9%, and the freeable memory on the FortiGate is reported as 56%.

```
# snmpwalk -v2c -c REGR-SYS 172.16.200.1 1.3.6.1.4.1.12356.101.4.1.36
FORTINET-FORTIGATE-MIB::fgSystemInfo.36.0 = Gauge32: 9
fosqa@pc05:~$ snmpwalk -v2c -c REGR-SYS 172.16.200.1 1.3.6.1.4.1.12356.101.4.1.37
FORTINET-FORTIGATE-MIB::fgSystemInfo.37.0 = Gauge32: 56
```

3. Use the SNMP manager to monitor memory usage on the FortiGate.

   Following is an example of the SNMP trap messages sent when thresholds are surpassed for freeable memory and free memory usage on FortiGates:

```
2023-12-08 19:53:14 172.16.200.1(via UDP: [172.16.200.1]:162->[172.16.200.55]:162) TRAP, SNMP
v1, community REGR-SYS
        FORTINET-FORTIGATE-MIB::fgModel.1001 Enterprise Specific Trap (102) Uptime: 1 day,

        FORTINET-CORE-MIB::fnSysSerial.0 = STRING: FG101FTK20006858     SNMPv2-MIB::sysName.0
= STRING: FGT_A   FORTINET-CORE-MIB::fnGenTrapMsg = STRING: freeable memory percentage is too
high
2023-12-08 19:56:33 <UNKNOWN> [UDP: [172.16.200.1]:162->[172.16.200.55]:162]:
DISMAN-EVENT-MIB::sysUpTimeInstance = Timeticks: (12198187) 1 day, 9:53:01.87   SNMPv2-
MIB::snmpTrapOID.0 = OID: FORTINET-CORE-MIB::fnTrapMemThreshold       FORTINET-CORE-
MIB::fnSysSerial.0 = STRING: FG101FTK20006858     SNMPv2-MIB::sysName.0 = STRING: FGT_A
 FORTINET-CORE-MIB::fnGenTrapMsg = STRING: free memory percentage is too low
```

SNMP traps and automation-stitch notifications for DIO module

FortiGate Rugged 70F and FortiGate Rugged 70F-3G4G include a general purpose input output (GPIO) module, also known as a digital I/O (DIO) module. The module supports SNMP traps and automation-stitch notifications when DIO module alarm functionality is activated. The DIO module triggers an alarm when it detects a change in any digital input, and the digital output is activated. Notification support depends on previously configured `config system digital-io` and `execute digital-io set-output` settings prior to event notification. See FGR-70F/FGR-70F-3G4G GPIO/DIO module on page 109 for more information.

CLI for configuring SNMP traps and automation-stitch notifications is available only on FortiGate Rugged 70F and FortiGate Rugged 70F-3G4G devices.

The `config system automation-condition` command includes the following relevant options:

```
config system automation-condition
    edit <name>
        set condition-type input
        set input-state {open|close}
    next
end
```

`set condition-type input`	Configure the type of condition to `input` for the DIO module on the FortiGate 70F series.
`set input-state {open|close}`	Configure the input state: • `open`: Input switch is open. • `close`: Input switch is closed.

The `config system snmp community` command includes the following relevant option:

```
config system snmp community
    edit <id>
        set events dio
    next
end
```

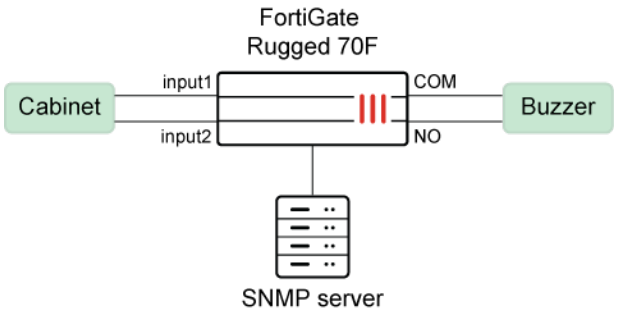
`set events dio`	Configure the SNMP trap event for the DIO module of the FortiGate Rugged 70F series. When enabled, system events are also logged.

For more information about the DIO module, see the FortiGate Rugged 70F Series QuickStart Guide and the Technical Tip: Overview of the Digital Input/Output (DIO) Module in FortiGate Rugged 70F Series community article.

Example

In this example, a FortiGate Rugged 70F is configured to monitor the open/close status of a cabinet door, and the output is connected to a buzzer. An automation stitch and SNMP trap are also configured.

When the status of the cabinet door changes from open to closed or closed to open, FortiGate triggers the buzzer, automation stitch, and SNMP trap. A system event is also logged when SNMP traps are sent.



Before you configure automation stitches and SNMP traps for DIO module alarms, you must configure the alarms using the `config system digital-io` and `execute digital-io set-output` settings. See FGR-70F/FGR-70F-3G4G GPIO/DIO module on page 109 for more information.

To configure an automation stitch for DIO module alarms:

1. Configure an automation-stitch condition for when the DIO module detects an input state of open:
   In this example, the condition type is set to `input`, and the input state is set to `open`.

```
config system automation-condition
    edit "Cabinet-Open"
        set description "Cabinet open"
        set condition-type input
        set input-state open
    next
end
```

2. Configure an automation-stitch trigger:

```
config system automation-trigger
    edit "DIO-trigger"
        set description "DIO-trigger"
    next
end
```

3. Configure a stitch to use the condition to trigger an action, such as an email notification:
   In this example, the automation stitch uses the previously configured trigger (DIO-trigger) and condition (Cabinet-Open) to trigger an email notification.

```
config system automation-stitch
    edit "dio"
        set description "DIO-stitch"
        set trigger "DIO-trigger"
        set condition "Cabinet-Open"
        config actions
            edit 1
                set action "Email Notification"
                set required enable
            next
        end
    next
end
```

To configure an SNMP trap for DIO module alarms:

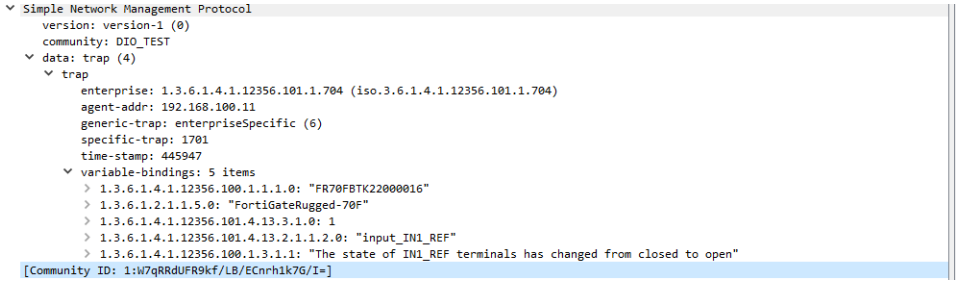
1. Configure a DIO module event in an SNMP community:
   With `set events dio` configured, SNMP traps are triggered for DIO module alarms.

```
config system snmp community
    edit 1
        set name "DIO_TEST"
        config hosts
            edit 1
                set ip 172.16.200.55 255.255.255.255
            next
        end
```

```
        set events dio
    next
end
```

Results:

When the cabinet door being monitored by the DIO module opens unexpectedly, it triggers an SNMP event:



It also triggers a system log:

```
9: date=2024-11-18 time=17:26:13 eventtime=1731979573581176380 tz="-0800" logid="0100022907"
type="event" subtype="system" level="notice" vd="root" logdesc="Digital-IO input state change"
connector="input_IN1_REF" mode="default" state="open" msg="The state of IN1_REF terminals has
changed from closed to open"
```

When the cabinet door is opened, it also triggers an email notification as configured by the automation stitch.

SNMP examples

This topic includes examples that incorporate several SNMP settings:

- Example 1: SNMP traps for monitoring interface status using SNMP v3 user on page 3368
- Example 2: SNMP traps and query for monitoring DHCP pool using SNMP v3 user on page 3371
- Example 3: Enabling the INDEX extension on page 3373

Example 1: SNMP traps for monitoring interface status using SNMP v3 user

This configuration enables the SNMP manager (172.16.200.55) to receive notifications when a FortiGate port either goes down or is brought up. The SNMP manager can also query the current status of the FortiGate port.

To configure SNMP for monitoring interface status in the GUI:

1. Configure interface access:
   a. Go to *Network* > *Interfaces* and edit *port1*.
   b. In the *Administrative Access* options, enable *SNMP*.

   c. Click *OK*.
2. Configure the SNMP agent:
   a. Go to *System* > *SNMP*.
   b. Enable *SNMP Agent* and enter the following:

Description	Branch
Location	Burnaby
Contact Info	Jane Doe

   c. Click *Apply*.
3. Configure an SNMP v3 user:
   a. Go to *System* > *SNMP*.
   b. In the *SNMP v3* table, click *Create New*.
   c. Configure the following:

User Name	Interface_Status
Security Level	Authentication
Authentication Algorithm	SHA1
Password	*******
Hosts IP Address	172.16.200.55

   d. Click *OK*.

To configure SNMP for monitoring interface status in the CLI:

1. Configure interface access:

```
config system interface
    edit port1
        append allowaccess snmp
    next
end
```

2. Configure the SNMP agent:

```
config system snmp sysinfo
    set status enable
    set description Branch
    set contact-info Jane Doe
    set location Burnaby
end
```

3. Configure an SNMP v3 user:

```
config system snmp user
    edit "Interface_Status"
        set notify-hosts 172.16.200.55
        set security-level auth-no-priv
```

```
        set auth-proto sha
        set auth-pwd ********************
    next
end
```

Verification

1. Start the packet capture on interface port1 with the filter set to port 162. See Using the packet capture tool on page 855 for more information.
2. Turn off one of the FortiGate interface statuses to down, in this case, port2.
3. Save the packet capture.

   The SNMP v3 trap is transmitted from port1 to the SNMP manager. Note that `msgAuthenticationParameters` is configured, indicating that authentication is active. The absence of `msgPrivacyParameters` suggests that encryption is not configured. This is further confirmed by `plaintext` in `msgData`.
4. Verify that the SNMP manager has received the trap. See Important SNMP traps on page 3362 for an example of a trap.
5. Verify that the SNMP manager can successfully query and receive receive a response on the current status of the FortiGate ports:

```
# snmpwalk -v3 -u Interface_Status  -l authNoPriv -a SHA -A xxxxxxxx 172.16.200.1
1.3.6.1.2.1.2.2.1.8
iso.3.6.1.2.1.2.2.1.8.1 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.2 = INTEGER: 2
iso.3.6.1.2.1.2.2.1.8.3 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.4 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.5 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.6 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.7 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.8 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.9 = INTEGER: 1
iso.3.6.1.2.1.2.2.1.8.10 = INTEGER: 1
```

Example 2: SNMP traps and query for monitoring DHCP pool using SNMP v3 user

This configuration enables the SNMP manager (172.16.200.55) to receive DHCP-related notifications from FortiGate.

The SNMP DHCP event contains three traps and one query.

Traps are sent when:

- DHCP server IP pool usage reaches 90%
- DHCP server detect an IP address that is already in use
- DHCP client receives DHCP NAK

SNMP queries are accepted for DHCP lease usage information (OID = 1.3.6.1.4.1.12356.101.23). The query result is based on the leased out percentage.

To configure SNMP for monitoring DHCP pool in the GUI:

1. Configure interface access:
   a. Go to *Network* > *Interfaces* and edit *port1*.
   b. In the *Administrative Access* options, enable *SNMP*.
   c. Click *OK*.
2. Configure the SNMP agent:
   a. Go to *System* > *SNMP*.
   b. Enable *SNMP Agent* and enter the following:

Description	Branch
Location	Burnaby
Contact Info	Jane Doe

   c. Click *Apply*.
3. Configure an SNMP v3 user:
   a. Go to *System* > *SNMP*.
   b. In the *SNMP v3* table, click *Create New*.
   c. Configure the following:

User Name	DHCP_Status
Security Level	Authentication
Authentication Algorithm	SHA384
Password	*******
Private	Enabled
Encryption Algorithm	AES256
Password	*******

Hosts IP Address	172.16.200.55

d. Click *OK*.

To configure SNMP for monitoring the DHCP pool in the CLI:

1. Configure interface access:

```
config system interface
    edit port1
        append allowaccess snmp
    next
end
```

2. Configure the SNMP agent:

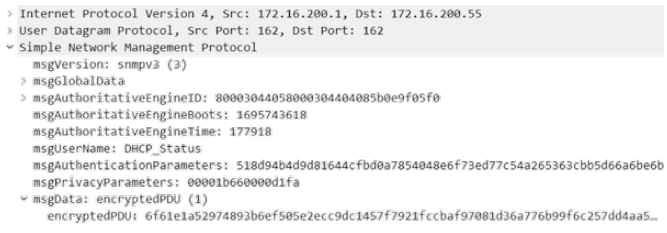
```
config system snmp sysinfo
    set status enable
    set description Branch
    set contact-info Jane Doe
    set location Burnaby
end
```

3. Configure an SNMP v3 user:

```
config system snmp user
    edit "DHCP_Status"
        set notify-hosts 172.16.200.55
        set security-level auth-priv
        set auth-proto sha384
        set auth-pwd ********************
        set priv-proto aes256
        set priv-pwd *********************
    next
end
```

Verification

1. Start the packet capture on interface port1 with the filter set to port 162. See Using the packet capture tool on page 855 for more information.
2. Overload the DHCP server IP pool.
3. Save the packet capture.



The SNMP v3 trap is transmitted from port1 to the SNMP manager. Note that both `msgAuthenticationParameters` and `msgPrivacyParameters` are set up, indicating that authentication and

encryption are active. This is further confirmed by `encryptedPDU` in `msgData`.

4. Verify that the SNMP manager has received the trap. See Important SNMP traps on page 3362 for an example of a trap.
5. Verify that the SNMP manager can successfully query and receive DHCP lease usage information for FortiGate:

```
# snmpwalk -v3 -u DHCP_Status  -l authPriv -a SHA384 -A xxxxxxxx -x AES256 -X xxxxxxxx
172.16.200.1 1.3.6.1.4.1.12356.101.23
iso.3.6.1.4.1.12356.101.23.1.1.0 = INTEGER: 6
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.1 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.2 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.3 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.4 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.5 = INTEGER: 0
iso.3.6.1.4.1.12356.101.23.2.1.1.2.1.6 = INTEGER: 100
```

Example 3: Enabling the INDEX extension

In the following example, the same IP address will be set on different ports in two VDOMs. The ipAddrTable SNMP Tree output will then be reviewed before and after enabling the *append-index* command.

When the `append-index` command is enabled:

- VDOM and interface indexes are appended as the INDEX extension in RFC tables.
- In multi-VDOM mode, duplicated IP addresses in different VDOMs will result in multiple entries in the RFC table.

When the `append-index` command is disabled:

- VDOM and interface indexes are not appended in RFC tables.
- In multi-VDOM mode, duplicated IP addresses in different VDOMs will only be presented once in the RFC table.

To enable the INDEX extension:

1. In two different VDOMs, set the same address on two different ports.

```
config system interface
    edit "port3"
        set vdom "vdom1"
        set ip 10.1.1.1 255.255.255.0
        set type physical
        set snmp-index 5
    next
end
config system interface
    edit "port4"
        set vdom "root"
        set ip 10.1.1.1 255.255.255.0
        set type physical
```

```
        set snmp-index 6
    next
end
```

2. Configure the SNMP information but do not enable the INDEX extension.

```
config system snmp sysinfo
    set status enable
    set description "REGR-SYS"
end
```

3. On your PC, review the ipAddrTable SNMP Tree (OID 1.3.6.1.2.1.4.20). The IP address 10.1.1.1 is only displayed once.

```
snmpwalk -v2c -c REGR-SYS 172.16.200.1 1.3.6.1.2.1.4.20

IP-MIB::ipAdEntAddr.10.1.1.1 = IpAddress: 10.1.1.1
IP-MIB::ipAdEntAddr.10.255.1.1 = IpAddress: 10.255.1.1
IP-MIB::ipAdEntAddr.172.16.200.1 = IpAddress: 172.16.200.1
IP-MIB::ipAdEntAddr.192.168.1.99 = IpAddress: 192.168.1.99
IP-MIB::ipAdEntIfIndex.10.1.1.1 = INTEGER: 5
IP-MIB::ipAdEntIfIndex.10.255.1.1 = INTEGER: 39
IP-MIB::ipAdEntIfIndex.172.16.200.1 = INTEGER: 3
IP-MIB::ipAdEntIfIndex.192.168.1.99 = INTEGER: 2
IP-MIB::ipAdEntNetMask.10.1.1.1 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.10.255.1.1 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.172.16.200.1 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.192.168.1.99 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntBcastAddr.10.1.1.1 = INTEGER: 1
IP-MIB::ipAdEntBcastAddr.10.255.1.1 = INTEGER: 1
IP-MIB::ipAdEntBcastAddr.172.16.200.1 = INTEGER: 1
IP-MIB::ipAdEntBcastAddr.192.168.1.99 = INTEGER: 1
IP-MIB::ipAdEntReasmMaxSize.10.1.1.1 = INTEGER: 65535
IP-MIB::ipAdEntReasmMaxSize.10.255.1.1 = INTEGER: 65535
IP-MIB::ipAdEntReasmMaxSize.172.16.200.1 = INTEGER: 65535
IP-MIB::ipAdEntReasmMaxSize.192.168.1.99 = INTEGER: 65535
```

4. Enable the INDEX extension.

```
config system snmp sysinfo
    set status enable
    set description "REGR-SYS"
    set append-index enable
end
```

5. Review the ipAddrTable SNMP Tree (OID 1.3.6.1.2.1.4.20) again. The IP address 10.1.1.1 is now displayed twice.

```
snmpwalk -v2c -c REGR-SYS 172.16.200.1 1.3.6.1.2.1.4.20

IP-MIB::ipAdEntAddr.10.1.1.1.1 = IpAddress: 10.1.1.1
IP-MIB::ipAdEntAddr.10.1.1.1.2 = IpAddress: 10.1.1.1
```

```
IP-MIB::ipAdEntAddr.10.255.1.1.1 = IpAddress: 10.255.1.1
IP-MIB::ipAdEntAddr.172.16.200.1.2 = IpAddress: 172.16.200.1
IP-MIB::ipAdEntAddr.192.168.1.99.1 = IpAddress: 192.168.1.99
IP-MIB::ipAdEntIfIndex.10.1.1.1.1 = INTEGER: 6
IP-MIB::ipAdEntIfIndex.10.1.1.1.2 = INTEGER: 5
IP-MIB::ipAdEntIfIndex.10.255.1.1.1 = INTEGER: 39
IP-MIB::ipAdEntIfIndex.172.16.200.1.2 = INTEGER: 3
IP-MIB::ipAdEntIfIndex.192.168.1.99.1 = INTEGER: 2
IP-MIB::ipAdEntNetMask.10.1.1.1.1 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.10.1.1.1.2 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.10.255.1.1.1 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.172.16.200.1.2 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntNetMask.192.168.1.99.1 = IpAddress: 255.255.255.0
IP-MIB::ipAdEntBcastAddr.10.1.1.1.1 = INTEGER: 1
IP-MIB::ipAdEntBcastAddr.10.1.1.1.2 = INTEGER: 1
IP-MIB::ipAdEntBcastAddr.10.255.1.1.1 = INTEGER: 1
IP-MIB::ipAdEntBcastAddr.172.16.200.1.2 = INTEGER: 1
IP-MIB::ipAdEntBcastAddr.192.168.1.99.1 = INTEGER: 1
IP-MIB::ipAdEntReasmMaxSize.10.1.1.1.1 = INTEGER: 65535
IP-MIB::ipAdEntReasmMaxSize.10.1.1.1.2 = INTEGER: 65535
IP-MIB::ipAdEntReasmMaxSize.10.255.1.1.1 = INTEGER: 65535
IP-MIB::ipAdEntReasmMaxSize.172.16.200.1.2 = INTEGER: 65535
IP-MIB::ipAdEntReasmMaxSize.192.168.1.99.1 = INTEGER: 65535
```

Replacement messages

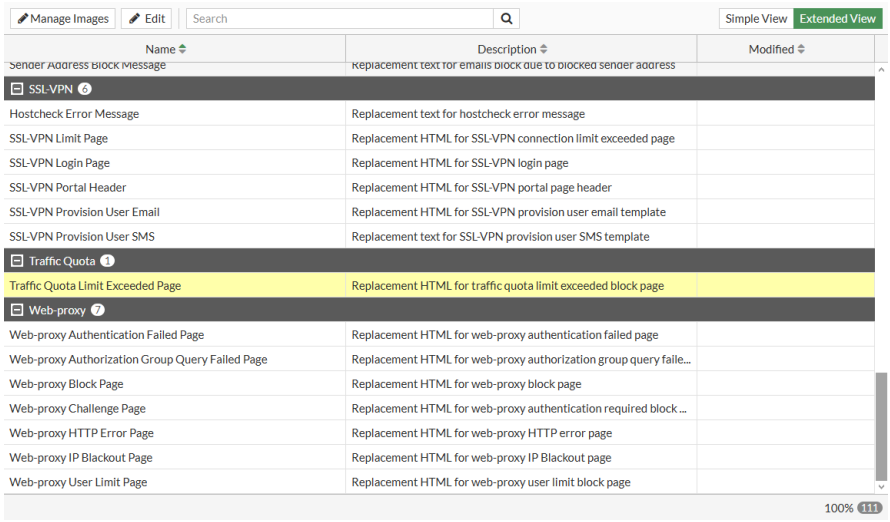
FortiOS has replacement messages that are HTML and text files. These messages can be customized to meet user requirements. The content can be modified, and images can be added.

Modifying replacement messages

The *Replacement Messages* page has two views. *Simple View* (the default view) shows the most commonly used replacement messages. *Extended View* shows the entire list and all replacement message categories.

To modify a replacement message in the GUI:

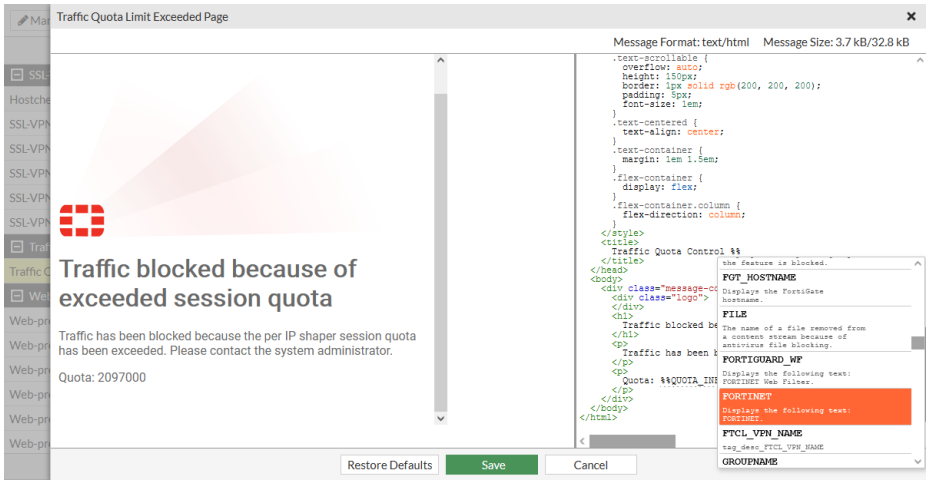
1. Go to *System* > *Replacement Messages*.
2. Select a replacement message and click *Edit*.
   If the message you want to edit is not visible, click *Extended View* in the upper right-hand corner of the top menu.



3. Edit the HTML code.

   The message is visible on the left alongside the HTML code on the right. The message view updates in real-time as you edit the content.

   When adding a variable to the code, right-click and select *Insert Tag* or type *%%* to view a list of the available variables, or start typing the variable name then press *Enter* or *TAB* to auto-complete the variable name.



4. Click *Save*.

Click *Restore Defaults* to return to the original message and code base.

To modify a replacement message in the CLI:

For example, to modify the *Traffic Quota Limit Exceeded Page* message:

```
config system replacemsg traffic-quota "per-ip-shaper-block"
    set buffer "<html>
  <head>
```

```
    <title>
      Traffic Quota Control
    </title>
  </head>
  <body>
    <font size=2>
      <table width=\"100%\">
        <tr>
          <td bgcolor=#3300cc align=\"center\" colspan=2>
            <font color=#ffffff>
              <b>
                Traffic blocked because exceeded session quota
              </b>
            </font>
          </td>
        </tr>
      </table>
      <br>
      <br>
      Traffic blocked because it exceeded the per IP shaper session quota. Please contact the
system administrator.
      <br>
      %%QUOTA_INFO%%
      <br>
      <br>
      <hr>
    </font>
  </body>
</html>"
    set header http
    set format html
end
```

Replacement message images

Images can be added to replacement messages on:

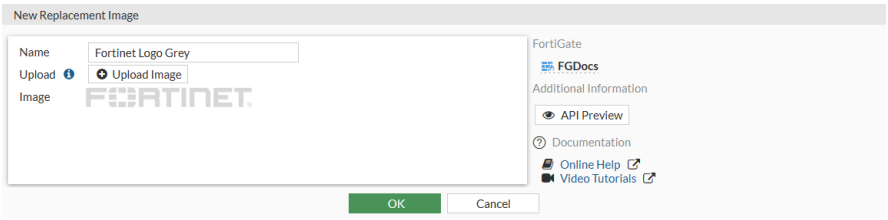
- Disclaimer pages
- Login pages
- Declined disclaimer pages
- Login failed pages
- Login challenge pages
- Keepalive pages

The supported image formats are GIF, JPEG, TIFF, and PNG. The maximum file size supported is 24 KB.

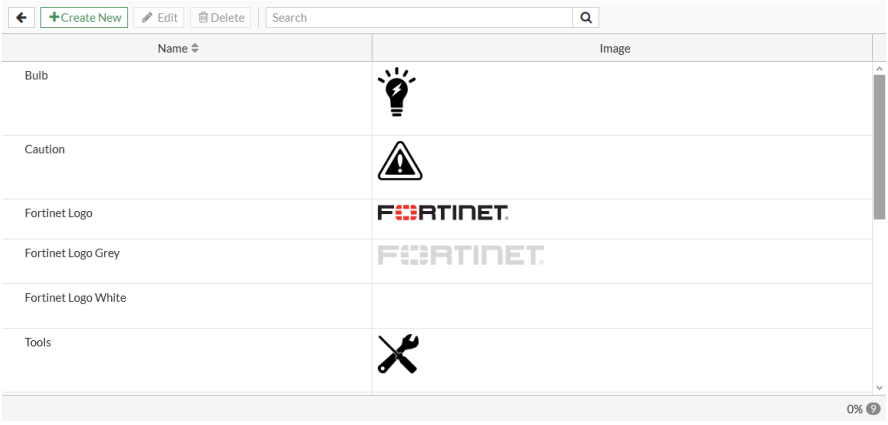
Adding images to replacement messages

To add images to replacement messages in the GUI:

1. Go to *System* > *Replacement Messages*.
2. In the top menu, click *Manage Images*.
3. Click *Create New*.
4. Enter a name for the image.
5. Click *Upload Image* and locate the file.



6. Click *OK*.
   The file is now visible in the list.



7. Return to the replacement message list and edit a message.
8. Right-click in the message code where you want to add the image, and select *Insert Image*.
9. Select the image from the list then press *Enter*, or double-click on the image to add it to the message.
10. Click *Save*.

To add images to replacement messages in the CLI:

1. Add the image to the FortiGate:

```
config system replacemsg-image
    edit <image_name>
        set image-type {gif | jpg | tiff | png}
        set image-base64 <string>
    next
end
```

2. Edit the replacement message, and include `%%IMAGE:<image name>%%` in the code to add the image.

Replacement message groups

Replacement message groups allow users to customize replacement messages for individual policies and profiles.

There are two types of replacement message groups:

Type	Usage	Customizable categories
utm	Used with UTM settings in firewall policies.	• admin • alertmail • custom-message • fortiguard-wf • ftp • http • icap • mail • nac-quar • spam • sslvpn • traffic-quota • utm • webproxy
auth	Used with authentication pages in firewall policies.	• auth • webproxy

The messages added to a group do not need to be customized. The message body content, header type, and format will use the default values if not customized.

To make replacement message groups visible in the GUI:

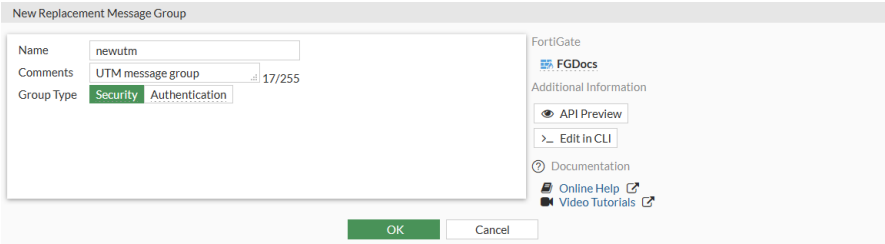
```
config system global
    set gui-replacement-message-groups enable
end
```

In the following example, two replacement message groups are created. The UTM message group includes custom mail-related messages and is assigned to an email filter profile. The authentication message group has a custom authentication success message that is applied to a proxy-based firewall policy that has an assigned email filter profile.

To create replacement message groups in the GUI:

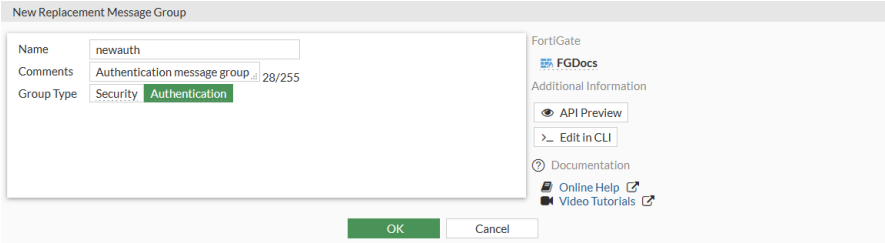
1. Create the *Security* replacement message group:
   a. Go to *System* > *Replacement Message Groups*.
   b. Click *Create New*.
   c. For *Name*, enter *newutm*.
   d. In the *Comments* field, enter *UTM message group*.

e. For *Group Type*, select *Security*.
f. Click *OK*.



2. Customize the replacement messages in the *newutm* group:
   a. Go to *System* > *Replacement Message Groups*.
   b. Edit the *newutm* group.
   c. Select the *Partial Email Block Message*.

   d. Edit the message and click *Save*.
   e. Select the *ASE Block Message*.
   f. Edit the message and click *Save*.
3. Create the *Authentication* replacement message group:
   a. Go to *System* > *Replacement Message Groups*.
   b. Click *Create New*.
   c. For *Name*, enter *newauth*.
   d. In the *Comments* field, enter *Authentication message group*.
   e. For *Group Type*, select *Authentication*.
   f. Click *OK*.



4. Apply the *newutm* replacement message group to an email filter profile in the CLI:

```
config emailfilter profile
    edit "newmsgs"
        set replacemsg-group "newutm"
    next
end
```

5. Apply the *newauth* replacement message group and the email filter profile to a firewall policy in the CLI:

```
config firewall policy
    edit 1
        ...
        set replacemsg-override-group "newauth"
        set inspection-mode proxy
        set emailfilter-profile "newmsgs"
        ...
    next
end
```

To create replacement message groups in the CLI:

1. Create the replacement message groups:

```
config system replacemsg-group
    edit "newutm"
        set comment "UTM message group"
        set group-type utm
        config mail
            edit "partial"
                set buffer "Fragmented emails are blocked, sorry."
            next
        end
        config spam
            edit "smtp-spam-ase"
                set buffer "This message has been blocked because ASE reports it as spam.
You\'re welcome."
            next
        end
    next
    edit "newauth"
        set comment 'Authentication message group'
        set group-type auth
        config auth
            edit "auth-success-msg"
                set buffer "Welcome to the firewall. Your authentication has been accepted,
please reconnect."
            next
        end
    next
end
```

2. Apply the message group to the email filter:

```
config emailfilter profile
    edit "newmsgs"
        set replacemsg-group "newutm"
    next
end
```

3. Apply the email filter and message group to the policy:

```
config firewall policy
    edit 1
        ...
        set replacemsg-override-group "newauth"
        set inspection-mode proxy
        set emailfilter-profile "newmsgs"
        ...
    next
end
```

FortiGuard

FortiGuard services comprise of signature packages and querying services that provide content, web and device security. It is delivered via various types of FortiGuard servers that are part of the FortiGuard Distribution Network (FDN).

FortiGuard service subscriptions can be purchased and registered to your FortiGate unit. The FortiGate must be connected to the Internet in order to automatically connect to the FDN to validate the license and download FDN updates or perform real-time queries.

To view FDN support contract information, go to *System* > *FortiGuard*. The *License Information* table shows the status of your FortiGate's entitlements and breaks down the status of each service.

License Information widget

The service entitlements and the license statuses are listed on the *System* > *FortiGuard* page. Upon expanding each entitlement, the corresponding definitions associated with the service are listed.

The following table list the available FortiGuard services and entitlements with a brief description.

Entitlement	FortiGuard service description
Advanced Malware Protection AI Malware Detection Model AntiVirus Definitions AntiVirus Engine Mobile Malware Outbreak Prevention	The Advanced Malware Protection service includes various engines, databases, and definitions used in the AV profile. In order to download updated AV definitions, at least 1 policy with a security profile that has Antivirus scanning must be enabled. SeeAntivirus on page 1771 for details.
Attack Surface Security Rating IoT Detection Definitions	The Attack Surface Security service includes: • Running all the built-in free and paid security rating rules • Displaying CIS compliance information within security ratings • IoT Detection and IoT Query

Entitlement	FortiGuard service description
Outbreak Package Definitions Security Rating & CIS Compliance	
Data Loss Prevention (DLP) DLP Signatures	The Data Loss Prevention service offers a database of predefined DLP patterns such as data types, dictionaries, and sensors that are used in the DLP profile.
Email Filtering	Email Filtering includes spam and DNS filtering by FortiGuard.
Intrusion Prevention IPS Definitions IPS Engine Malicious URLs Botnet IPs Botnet Domains	The IPS service includes engines, databases, and definitions used in the IPS and application control profiles. In order to download updated IPS definitions, at least 1 policy with a security profile that has IPS scanning must be enabled. See Intrusion prevention on page 1970 and Application control on page 1934 for details.
Operational Technology (OT) Security Service OT Threat Definitions OT Detection Definitions OT Virtual Patching Signatures	The OT Security service includes OT-related threat definitions used in IPS and application control profiles. It also includes OT Detection Definitions and Virtual Patching Signatures used in the virtual patching profile. See Virtual patching on page 2146 for details.
Web Filtering Blocked Certificates DNS Filtering Video Filtering	The Web Security service includes: • FortiGuard categories used in web filter profiles • Malicious certificates used in SSL/SSH inspection profiles • FortiGuard categories used in DNS filter profiles • FortiGuard categories used in video filter profiles
SD-WAN Network Monitor	SD-WAN Underlay Bandwidth and Quality Monitoring service
SD-WAN Overlay as a Service	SD-WAN Overlay as a Service
FortiSASE SPA Service Connection	SD-WAN Connector for FortiSASE Secure Private Access
FortiSASE Secure Edge Management	Allows the FortiGate to act as the FortiSASE Secure Edge
FortiGate Cloud	FortiGate Cloud management, analysis, and log retention services
FortiAnalyzer Cloud SoCaaS	FortiAnalyzer Cloud service The SoCaaS entitlement includes cloud-based managed log monitoring, incident triage, and SOC escalation services.

Entitlement	FortiGuard service description
FortiManager Cloud	FortiManager Cloud service
FortiToken Cloud	FortiToken Cloud service
Firmware & General Updates Application Control Signatures Device & OS Identification FortiGate Virtual Patch Signatures Inline-CASB Application Definitions Internet Service Database Definitions PSIRT Package Definitions FortiCare Support FortiCloud Account Enhanced Support	The FortiCare support entitlement includes firmware and general updates that come with various default signatures and definitions: • Application control signatures used in application control profiles • Device & OS identification used for device detection and asset management • Virtual patch signatures used in local-in policies • Inline CASB application definitions used in inline CASB profiles • ISDB destinations that can be applied in various policies and rules • PSIRT vulnerability definitions used in security ratings
FortiConverter	FortiConverter service

Trusted CA certificate definitions

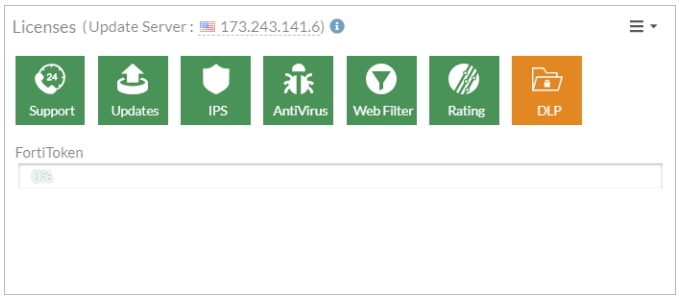
The Trusted CA certificate bundle follows Mozilla's published trusted CA list for updating its certificate bundle.

To view the version of the Trusted CA certificate bundle, execute the command `diagnose autoupdate versions | grep Certificate\ B -A 6`.

To view the built-in and bundled CA certificates supported by your FortiGate, execute the command `get vpn certificate ca | grep ==`.

Licenses widget

On the *Dashboard* > *Status* page, the *Licenses* widget lists the status of major entitlements. Licensed entitlement icons are green, and unlicensed entitlement icons are orange.



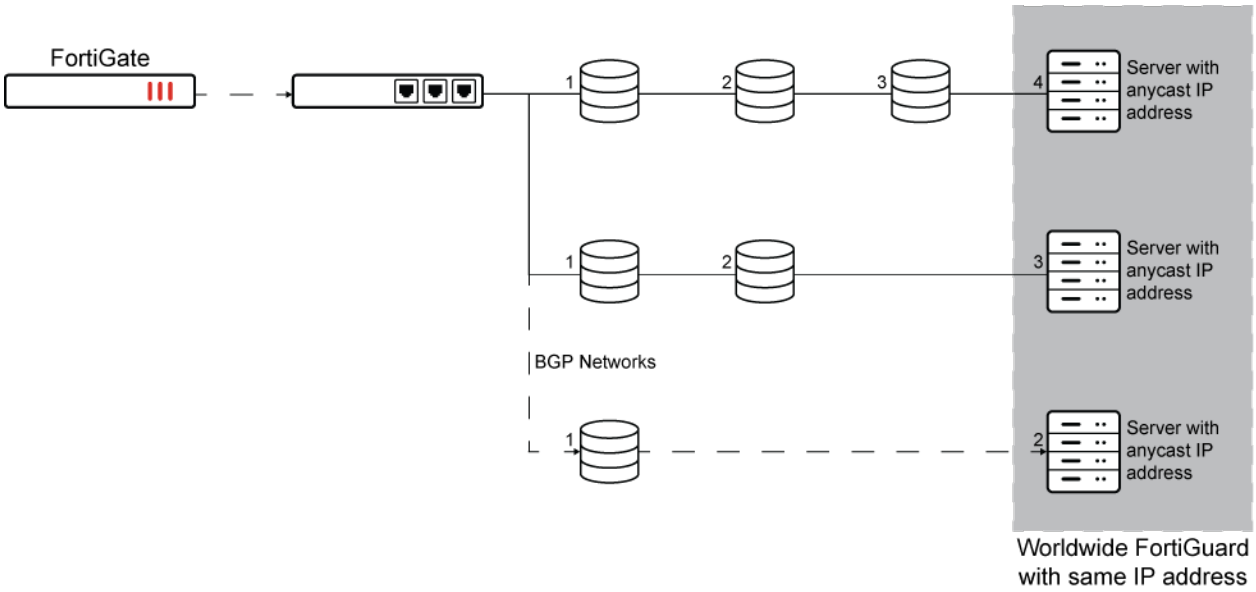
The following topics contain more information:

- Anycast on page 3385
- Connection and OCSP stapling on page 3386
- Configuring FortiGuard updates on page 3388
- Using a proxy server to connect to the FortiGuard Distribution Network on page 3389
- Manual updates on page 3390
- Automatic updates on page 3391
- Scheduled updates on page 3392
- Sending malware statistics to FortiGuard on page 3393
- Update server location on page 3394
- Filtering on page 3395
- Online security tools on page 3396
- Anycast and unicast services on page 3396
- Using FortiManager as a local FortiGuard server on page 3397
- Cloud service communication statistics on page 3400
- IoT detection service on page 3402
- FortiAP query to FortiGuard IoT service to determine device details on page 3407
- FortiGate Cloud / FDN communication through an explicit proxy on page 3407
- FDS-only ISDB package in firmware images on page 3409
- Licensing in air-gap environments on page 3410
- License expiration on page 3412
- Disable all cloud communication on page 3415

Anycast

FortiGuard servers use Anycast addresses in order to optimize and distribute traffic across many servers. Anycast is the default access mode for FortiGates when connecting to FortiGuard which by default utilizes HTTPS and port 443.

Each type of FortiGuard servers and services have a FortiGuard domain name that resolves to a single Anycast IP address. Regardless of where the FortiGate is located, the resolution is still the same. Fortinet maintains the network in the background to ensure routes to the FortiGuard servers are optimized. In the below diagram, several servers have the same Anycast IP, but the FortiGate will connect to the one with the least hops.



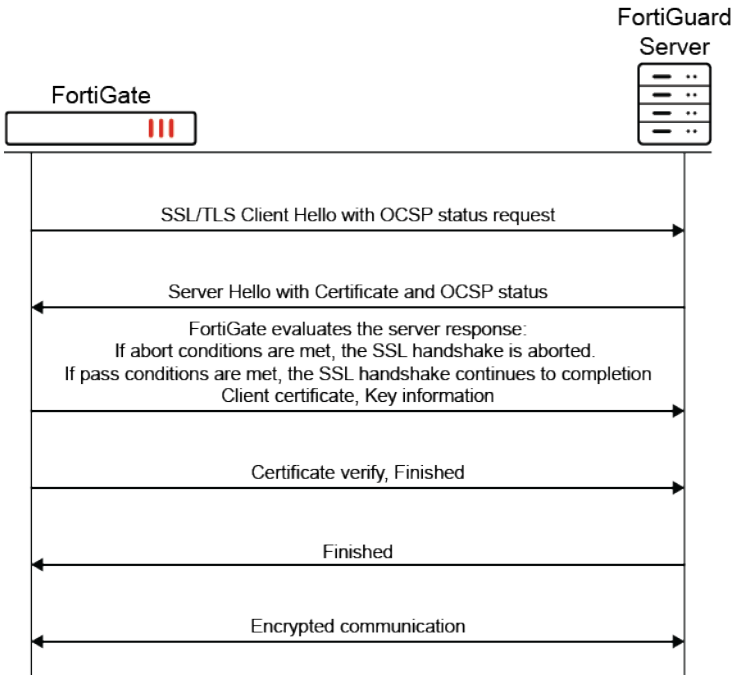
Connection and OCSP stapling

When the FortiGate connects to a FortiGuard server, it is important for it to validate the server is indeed a real FortiGuard server. Hence, FortiGuard servers provide the following security:

- The domain name of each FortiGuard service is the common name in that service's certificate, which is signed by a third-party intermediate CA.
- The FortiGuard server also applies Online Certificate Status Protocol (OCSP) stapling check, in which it attaches a time-stamped OCSP status of the server certificate from the OCSP server to the TLS response.

This ensures FortiGate can validate the FortiGuard server certificate efficiently during the TLS handshake.

The following illustrates the connection process:



FortiGate will only complete the TLS handshake with an anycast server when abort conditions are not met. Abort conditions include:

- The CN in the server's certificate does not match the domain name resolved from the DNS.
- The OCSP status is revoked or unknown.
- The issuer-CA is revoked by the root-CA.

To configure the anycast FortiGuard access mode:

```
config system fortiguard
    set fortiguard-anycast enable
end
```

If FortiGuard is not reachable via Anycast, choose between the following options to work around this issue:

1. Switch to other Anycast servers:

   ```
   config system fortiguard
       set fortiguard-anycast enable
       set fortiguard-anycast-source aws
   end
   ```

2. Disable Anycast and use HTTPS:

   ```
   config system fortiguard
       set fortiguard-anycast disable
       set protocol https
       set port 8888
   end
   ```

3. Disable Anycast and use UDP:

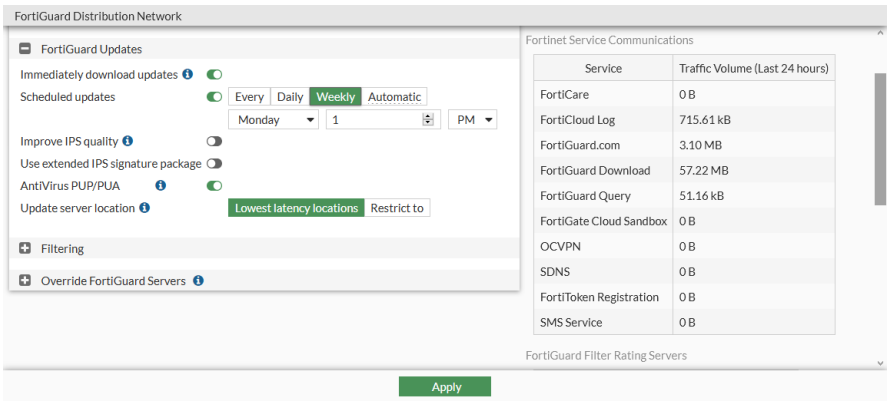
```
config system fortiguard
    set fortiguard-anycast disable
    set protocol udp
    set port 53
end
```

Configuring FortiGuard updates

To configure FortiGuard updates:

1. Go to *System* > *FortiGuard*
2. Scroll down to the *FortiGuard Updates* section.
3. Configure the options for connecting and downloading definition files:

Immediately download updates	The option can be enabled on 2U and larger hardware models when the FortiGuard are servers are connected in anycast mode. The FortiGate forms a secure, persistent connection with FortiGuard to get notifications of new updates through an HTTPS connection. The FortiGate uses the fds_notify daemon to wait for the notification, then makes another connection to the FortiGuard server to download the updates.
Scheduled Updates	Enable to schedule updates to be sent to the FortiGate at the specified time or automatically. See Scheduled updates on page 3392 and Automatic updates on page 3391.
Improve IPS quality	Enable to send information to the FortiGuard servers when an attack occurs. This can help keep the FortiGuard database current as attacks evolve, and improve IPS signatures.
Use extended IPS signature package	Enable to use the extended IPS database, that includes protection from legacy attacks, along with the regular IPS database that protects against the latest common and in-the-wild attacks.
AntiVirus PUP/PUA	Enable antivirus grayware checks for potentially unwanted applications.
Update server location	The FortiGuard update server location. See Update server location on page 3394 for details.



4. Click *Apply*.

Using a proxy server to connect to the FortiGuard Distribution Network

You can configure FortiOS to use a proxy server to connect to the FortiGuard Distribution Network (FDN).

Proxy tunneling is supported only for registration, AV, and IPS updates. For FortiGate virtual machines, proxy tunneling can also be used for license validation. For web filtering or spam filtering, UDP protocol is used on ports 53 or 8888. UDP protocol traffic cannot be directed over a proxy server, even if you are using versions of FortiOS that support web filtering over port 443.

Consider the following before configuring FortiOS to use a proxy server to connect to FDN:

- FortiOS connects to the proxy server using the HTTP CONNECT method. For information about the HTTP CONNECT method, see RFC 2616.
- The proxy server must not inspect the HTTPS traffic used for FortiOS communication.
- FortiOS sends to the proxy server an HTTP CONNECT request that specifies the IP address and port required for the FDN connection. Authentication information is optional for the request.
- FortiOS or the proxy server must be configured to use DNS servers that resolve the addresses of FDN servers to support AV and IPS updates.
- The proxy server establishes the connection to FDN and passes information between FortiOS and FDN.

Use the following syntax to configure a proxy server in the CLI:

```
config system autoupdate tunneling
    set address <proxy_address>
    set port <proxy_port>
    set username <username>
    set password <password>
    set status {enable | disable}
end
```

In the following example, a proxy server with IP address 10.1.1.1 is configured to listen on port TCP/3128 without authentication.

To configure a proxy server:

```
config system autoupdate tunneling
    set address 10.1.1.1
    set port 3128
    set status enable
end
```

Alternatively, in a closed network without direct internet connection for web filtering or spam filtering, you can use FortiManager as a local FortiGuard server. FortiManager supports allowing FortiOS to retrieve its updates and ratings through FortiManager. See Using FortiManager as a local FortiGuard server on page 3397.

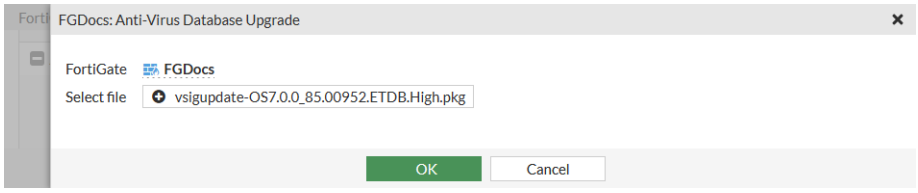
Manual updates

In order to download updated AV definitions, at least 1 policy with a security profile that has Antivirus scanning must be enabled. To download updated IPS definitions, at least 1 policy with a security profile that has IPS scanning must be enabled.

When needed, FortiGuard Distribution Network (FDN) updates can be manually uploaded.

To manually update the signature definitions files:

1. Log in to the Fortinet Support website.
2. Go to *Support* > *Service Updates*.
3. Select your *OS Version* from the dropdown list.
4. Locate your device in the table, and download the signature definitions files.
5. On the FortiGate, go to *System* > *FortiGuard*.
6. In the *License Information* table, locate and expand the definitions that you are updating.
7. From the *Actions* menu in the rightmost column, select *Upgrade Database*.
8. In the pane that opens, click *Upload*, locate the downloaded definitions file on your computer, then click *Open*.
   The download may take a few minutes to complete.



9. Click *OK*.

AV and IPS manual updates

To execute the update:

```
# execute restore ips tftp nids-720-19.261.pkg 172.16.200.55
```

To verify the manual AV and IPS package updates:

```
# diagnose debug app updated -1
# diagnose debug enable
```

Security levels are pre-configured on the BIOS. See BIOS-level signature and file integrity checking on page 3465 and Real-time file system integrity checking on page 3469 for more information.

Automatic updates

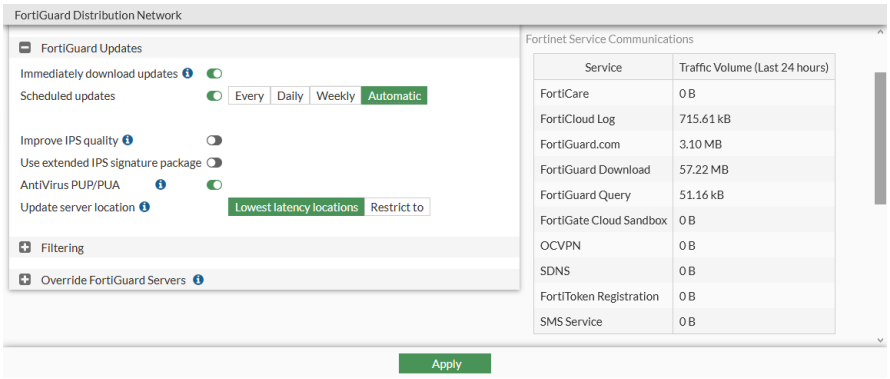
In order to download updated AV definitions, at least 1 policy with a security profile that has Antivirus scanning must be enabled. To download updated IPS definitions, at least 1 policy with a security profile that has IPS scanning must be enabled.

The default auto-update schedule for FortiGuard packages is automatic. The update interval is calculated based on the model and percentage of valid subscriptions, within one hour.

For example, if a FortiGate 501E has 78% valid contracts, then based on this device model, the update schedule is calculated to be every 10 minutes. If you verify the system event logs (ID 0100041000), they are generated approximately every 10 minutes.

To configure automatic updates in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates* and select *Automatic*.



3. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency automatic
end
```

Scheduled updates

In order to download updated AV definitions, at least 1 policy with a security profile that has Antivirus scanning must be enabled. To download updated IPS definitions, at least 1 policy with a security profile that has IPS scanning must be enabled.

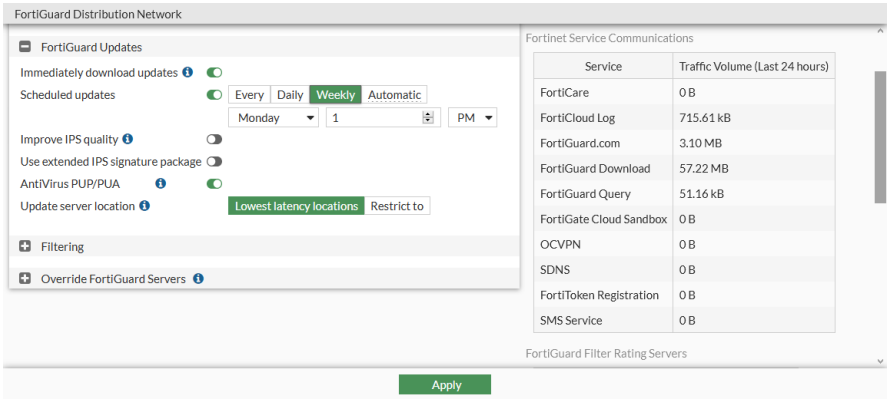
Scheduling updates ensures that the virus and IPS definitions are downloaded to your FortiGate on a regular basis.

Updating definitions can cause a brief disruption in traffic that is currently being scanned while the FortiGate unit applies the new signature database. Updates should be scheduled during off-peak hours when network usage is at a minimum to ensure that network activity will not be affected by downloading the definitions files.

A schedule of once a week means any urgent updates will not be pushed until the scheduled time. If an urgent update is required, click the *Update Licenses & Definitions Now* button to manually update the definitions.

To configure scheduled updates in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *FortiGuard Updates* section, enable *Scheduled Updates*.
3. Configure the update schedule:



4. Click *Apply*.

To configure scheduled updates in the CLI:

```
config system autoupdate schedule
    set status enable
    set frequency {every | daily | weekly}
    set time <hh:mm>
    set day <day_of_week>
end
```

Sending malware statistics to FortiGuard

FortiGate devices periodically send encrypted antivirus, IPS, botnet IP list, and application control statistics to FortiGuard. Included with these data is the IP address and serial number of the FortiGate, and the country that it is in. This information is never shared with external parties, Fortinet Privacy Policy.

The malware statistics are used to improve various aspects of FortiGate malware protection. For example, antivirus data allow FortiGuard to determine what viruses are currently active. Signatures for those viruses are kept in the Active AV Signature Database that is used by multiple Fortinet products.Inactive virus signatures are moved to the Extended AV Signature Database (see Configuring FortiGuard updates on page 3388). When events for inactive viruses start appearing in the malware data, the signatures are moved back into the AV Signature Database.

The FortiGate and FortiGuard servers go through a 2-way SSL/TLS 1.2 authentication before any data is transmitted. The certificates used in this process must be trusted by each other and signed by the Fortinet CA server.

The FortiGate only accepts data from authorized FortiGuard severs. Fortinet products use DNS to find FortiGuard servers and periodically update their FortiGate server list. All other servers are provided by a list that is updated through the encrypted channel.

Malware statistics are accumulated and sent every 60 minutes by default.

To configure sharing this information, use the following CLI command:

```
config system global
    set fds-statistics {enable | disable}
    set fds-statistics-period <minutes>
end
```

The submission of malware data is in accordance with the Fortinet Privacy Policy.

There is no sensitive or personal information included in these submissions. Only malware statistics are sent.

Fortinet uses the malware statistics collected in this manner to improve the performance of the FortiGate services and to display statistics on the Fortinet Support website for customers registered FortiGate devices.

Fortinet may also publish or share statistics or results derived from this malware data with various audiences. The malware statistics shared in this way do not include any customer data.

Update server location

Administrators can specify the location of the FortiGuard update server used by FortiGate. You can can set the location to only servers in the USA, only servers in the European Union (EU), or to servers with the lowest latency.

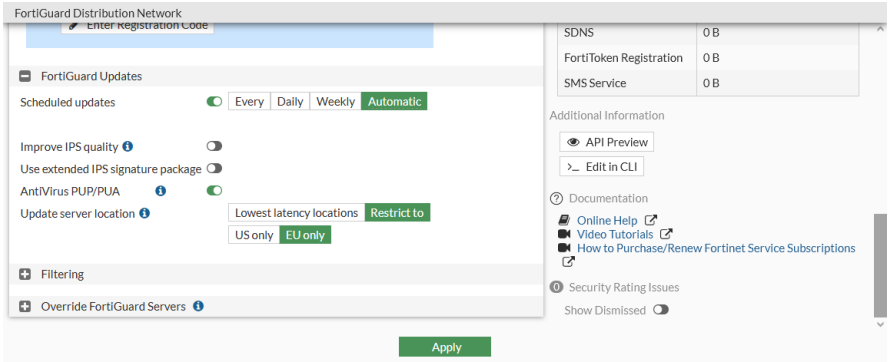
In EU locations, it can be required that certain traffic is only handled by servers located in the EU. By setting the update server location to EU only, the FortiGate will use EU domains to resolve to EU servers for FortiGuard traffic to update, URL rating, and IoT servers.

Server location	Anycast domain name	Non-Anycast FQDN addresses
EU only	euupdate.fortinet.net euguardservice.fortinet.net	
US only	usupdate.fortinet.net usguardservice.fortinet.net	usupdate.fortiguard.net UDP: usservice.fortiguard.net HTTPS: ussecurewf.fortiguard.net
Lowest latency (automatic)	globalupdate.fortinet.net globalguardservice.fortinet.net	update.fortiguard.net UDP: service.fortiguard.net HTTPS: securewf.fortiguard.net

On hardware FortiGate devices, the default is *Lowest latency locations*. On VM devices, the default is *US only*.

To configure the update server location in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *FortiGuard Updates* section, set *Update server location* to *Lowest latency locations* or *Restrict to*.
3. If *Restrict to* is selected, choose *US only* or *EU only*.



4. Click *Apply*.

To configure the update server location in the CLI:

```
config system fortiguard
    set update-server-location {automatic | usa | eu}
end
```

Filtering

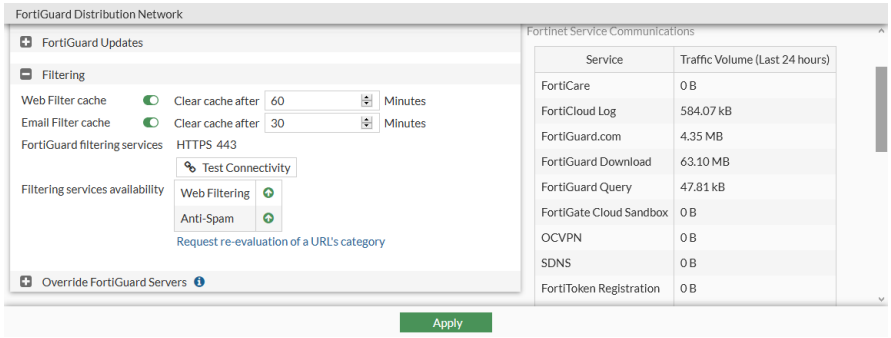
Web filtering is used to block access to harmful, inappropriate, and dangerous web sites (see FortiGuard filter on page 1834).

Email filtering is used to detect and block spam messages (see FortiGuard-based filters on page 2022).

To configure filtering in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *Filtering* section configure the settings as needed:

Web Filter Cache	Enable/disable web filter cache, and set the amount of time that the FortiGate will store a blocked IP address or URL locally. After the time expires, the FortiGate contacts the FDN to verify the address.
Email Filter Cache	Enable/disable email filter cache, and set the amount of time that the FortiGate will store an email address locally.
FortiGuard filtering services	The protocol and port used to contact the FortiGuard servers. These options can be changed in the CLI.
Filtering service availability	The status of the filtering service. Click *Test Connectivity* if the filtering service is not available.
Request re-evaluation of a URL's category	Click to re-evaluate a URL category rating on the FortiGuard web filter service.



3. Click *Apply*.

To configure filtering in the CLI:

```
config system fortiguard
    set protocol {https | udp}
    set port {443 | 53 | 8888}
    set antispam-force-off {enable | disable}
    set antispam-cache {enable | disable}
    set antispam-cache-ttl <integer>
    set antispam-cache-mpercent <percent>
    set antispam-timeout <integer>
    set webfilter-force-off {enable | disable}
```

```
    set webfilter-cache {enable | disable}
    set webfilter-cache-ttl <integer>
    set webfilter-timeout <integer>
end
```

When anycast is enabled (by default) the protocol is HTTPS and the port is 443.

Online security tools

FortiGuard Labs provides a number of online security tools, including but not limited to:

- **URL lookup**
  Enter a website address to see if it has been rated and what category and classification it is filed as. If you find a site that has been wrongly categorized, use this page to request that the site be re-evaluated: https://www.fortiguard.com/webfilter
- **Threat Encyclopedia**
  Browse FortiGuard Labs extensive encyclopedia of threats. Search for viruses, botnet C&C, IPS, endpoint vulnerabilities, and mobile malware: https://www.fortiguard.com/encyclopedia
- **Application Control**
  Browse FortiGuard Labs extensive encyclopedia of applications: https://www.fortiguard.com/appcontrol

Anycast and unicast services

The following services are accessed by FortiGate:

Service	Non-Anycast FQDN addresses	Anycast Domain name
FortiGuard Object download	update.fortiguard.net	globalupdate.fortinet.net
Querying service (web-filtering, anti-spam ratings) over HTTPS	securewf.fortiguard.net	globalguardservice.fortinet.net
Querying service (web-filtering, anti-spam ratings) over UDP	service.fortiguard.net	Service only in Unicast
Device info Collection	Service only in Anycast	globaldevcollect.fortinet.net
Device info Query	Service only in Anycast	globaldevquery.fortinet.net
FortiGate Cloud logging	logctrl1.fortinet.com	globallogctrl.fortinet.net
FortiGate Cloud management	mgrctrl1.fortinet.com	globalmgrctrl.fortinet.net
FortiGate Cloud messaging	msgctrl1.fortinet.com	globalmsgctrl.fortinet.net

Service	Non-Anycast FQDN addresses	Anycast Domain name
FortiGate Cloud sandbox	aptctrl1.fortinet.com	globalaptctrl.fortinet.net
FortiCare registration	directregistration.fortinet.com	globalregistration.fortinet.net
Secure DNS	sdns.fortinet.net	globalsdns.fortinet.net
FortiCloud FortiClient	forticlient.fortinet.net	globalfctupdate.fortinet.net
FortiMobile Tokens	directregistration.fortinet.com	globalftm.fortinet.net
EMS cloud	forticlient-emsproxy.forticloud.com	Service only in Unicast
DDNS	ddns.fortinet.net	globalddns.fortinet.net
GeoIP	gip.fortinet.net	globalgip.fortinet.net
IP blocklist	ipbl.fortinet.net	N/A

Using FortiManager as a local FortiGuard server

FortiManager can provide a local FortiGuard server with port 443 access.

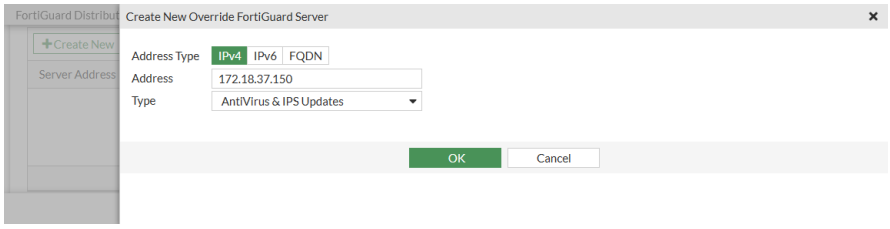
Anycast FortiGuard settings force the rating process to use port 443, even with an override server. Using a unique address in the same subnet as the FortiManager access IP address, the FortiManager can provide local FortiGuard updates and rating access with a dedicated IP address and port 443.

On FortiManager, use the *Bind to IP* addresses for the update and rating services over TCP/443.

The *Bind to IP* address does not need to be configured for update services if the default port was not changed to TCP/443. See Configuring network interfaces in the FortiManager Administration Guide for more information.

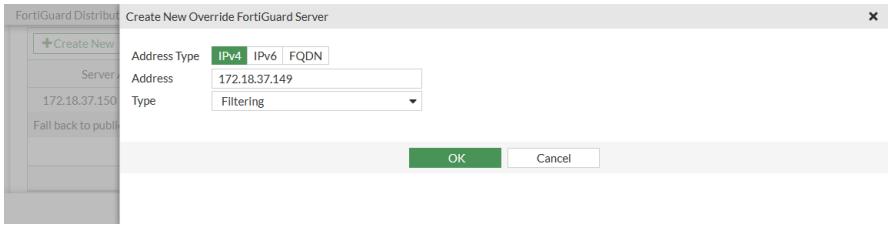
To use a FortiManager as a local FortiGuard server in the GUI:

1. Go to *System* > *FortiGuard*
2. In the *Override FortiGuard Servers* table, click *Create New*. The *Create New Override FortiGuard Server* pane opens.
3. Select the server address type: *IPv4*, *IPv6*, or *FQDN*.
4. Enter the FortiManager address in the *Address* field.
5. Select the type of server: *AntiVirus & IPS Updates*, *Filtering*, or *Both*.



6. Click *OK*.

7. Click *Create New* again to add a second override FortiManager for filtering.



8. Click *OK*, then click *Apply*.

To use a FortiManager as a local FortiGuard server in the CLI:

```
config system central-management
    set type fortimanager
    set fmg "172.18.37.148"
    config server-list
        edit 1
            set server-type update
            set server-address 172.18.37.150
        next
        edit 2
            set server-type rating
            set server-address 172.18.37.149
        next
    end
    set fmg-update-port 443
    set include-default-servers enable
end
```

When `fmg-update-port` is set to `443`, the update process will use port 443 to connect to the override update server, which is the local FortiGuard server in the FortiManager. If this is not set, the update process will use port 8890, and the server address setting must be the FortiManager access IP address. Override FortiGuard services come from the server list that is the local FortiGuard server in the FortiManager, and use the traditional, non-OCSP TLS handshake. If override servers in the FortiManager are not available, the default FortiGuard servers are connected, and the anycast OCSP TLS handshake is used.

The FortiManager IP address used in `set server-address` (for example, `set server-address 172.18.37.149`) corresponds to the *Bind to IP* setting configured on the FortiManager interface.

HA considerations

When FortiGate and FortiManager units are both in high availability (HA) clusters, and FortiGate is using FortiManager as an update server, you must configure the following secondary IP addresses:

- Configure secondary IP addresses for the service on both FortiManager units in the HA cluster
- Configure FortiGate to use the secondary FortiManager IP addresses.

In this example, the primary FortiManager unit is configured to use the secondary IP address of `10.4.1.204` for the rating service, and the secondary FortiManager unit is configured to use the secondary IP address of `10.4.1.205` for the rating service. FortiGate is configured to use the secondary IP addresses on FortiManager.

To configure FortiManager units in an HA cluster as web filter rating servers:

1. On the primary FortiManager in the HA cluster, configure a secondary IP address for the rating service:
   The `set rating-service-ip` is set to the secondary IP address for the rating query.

```
config system interface
    edit "port1"
        set ip 10.4.1.104 255.255.0.0
        set allowaccess ping https ssh snmp http webservice
        set serviceaccess fgtupdates fclupdates webfilter-antispam
        set rating-service-ip 10.4.1.204 255.255.0.0
        set type physical
    next
end
```

2. On the secondary FortiManager in the HA cluster, configure a secondary IP address for the rating service:
   The `set rating-service-ip` is set to the secondary IP address for the rating query.

```
config system interface
    edit "port1"
        set ip 10.4.1.105 255.255.0.0
        set allowaccess ping https ssh snmp http webservice
        set serviceaccess fgtupdates fclupdates webfilter-antispam
        set rating-service-ip 10.4.1.205 255.255.0.0
        set type physical
    next
end
```

3. On both the primary and secondary FortiManager units in the HA cluster, enable web filter query:

```
config fmupdate service
    set query-webfilter enable
end
```

4. On both the primary and secondary FortiManager units in the HA cluster, enable all web filter logs:

```
config fmupdate web-spam fgd-setting
    set wf-log all
end
```

5. As needed, run the `diagnose debug application fgdsvr 255` command.
   For additional details, use shell and run `bash$ tail -f /var/log/fgdsvr.log` to display the incoming URL queries.

To configure FortiGate:

1. On FortiGate, configure central management to use the secondary FortiManager IP addresses for the rating service:
   The `set rating-service-ip` is set to the secondary IP address on the primary and secondary FortiManager units in the HA cluster.

```
config system central-management
    set type fortimanager
    config server-list
        edit 1
            set server-type update
            set server-address 10.4.1.104
        next
        edit 3
            set server-type update
            set server-address 10.4.1.105
        next
        edit 2
            set server-type rating
            set server-address 10.4.1.204
        next
        edit 4
            set server-type rating
            set server-address 10.4.1.205
        next
    end
    set include-default-servers disable
end
```

2. Disable Anycast:

```
config system fortiguard
    set fortiguard-anycast disable
end
```

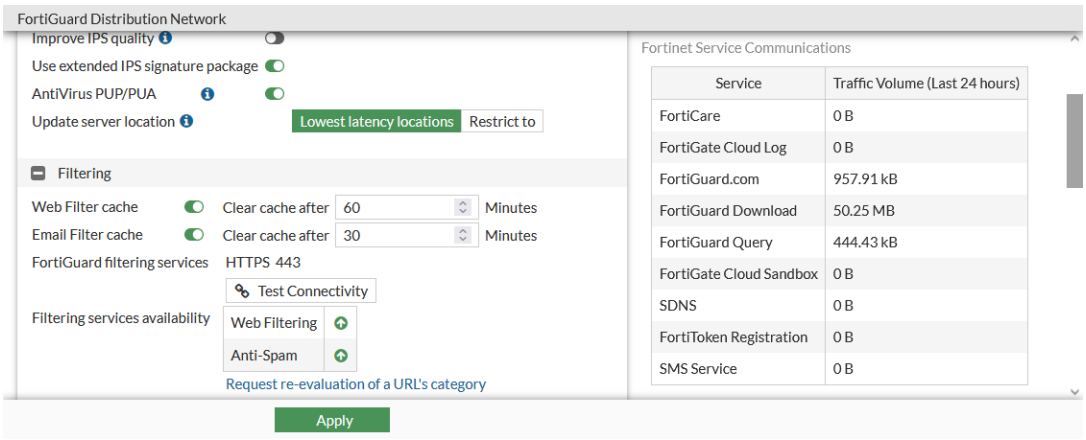
3. As needed, run the following diagnose commands:
   - Run `diagnose debug app urlfilter -1` to show the rating query response.
   - Run `diagnose debug rating` to show the rating service information.

Cloud service communication statistics

Fortinet service communications statistics are displayed on the *FortiGuard* page. The statistics correspond with the output from `diagnose sys service-communication`. The traffic volume values in the GUI are the sums of data from the last 24 hours.

To view Fortinet service communications statistics:

1. Go to *System* > *FortiGuard*.
   The *Fortinet Service Communications* statistics are displayed on the right side of the screen:



2. Enter the following CLI command:

```
# diagnose sys service-communication
FortiCare:
The last 1 hour(in bytes):  0 0 0 0 0 0 0 0 0 0 0 0
The last 24 hours(in bytes):  0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0
The last 7 days(in bytes):  0 0 0 0 0 0 0
FortiGuard Download:
The last 1 hour(in bytes):  0 648 3024 0 0 3056744 0 0 3024 0 0 3336
The last 24 hours(in bytes):  3066776 2960576 47616 71768 102384 68864 48224 82368 95376 70984
68048 75360 75112 83496
69848 51640 128360 20437472 99456 104384 48376 143024 25238104 73992
The last 7 days(in bytes):  6758344 120704952 0 0 0 0 0

```

IoT detection service

Internet of Things (IoT) detection is part of the Attack Surface Security Rating service that allows FortiGate to:

- Download an IoT Detection signature package (IOTD), which is used to detect and extract metadata of IoT devices
- Query FortiGuard IoT Query service for devices that are not detected by the local Device Database (CIDB) or by the IoT Detection signatures
- Query the FortiGuard vulnerability lookup server to look up vulnerabilities for a device

The service allows the FortiGate to accurately detect and identify connected IoT devices and to identify vulnerabilities that apply to these devices.

Applications

A subscription to the IoT detection service provides many practical applications.

Device information	Enable the FortiGate to obtain updated device information, store the information in the asset inventory, and display the information in various places, such as the *Dashboard > Asset and Identities* widget.
Vulnerability information	Enable the FortiGate to query and display vulnerabilities associated with a device on the *Asset and Identities* widget.
Allow managed FortiSwitch and FortiAP devices to query device info	Device detection is effective when devices are connected on an interface. As such, when devices are connected to managed FortiSwitch and FortiAP devices, they can utilize IoT detection to gather information about the connected devices. See FortiAP query to FortiGuard IoT service to determine device details on page 3407 for more information. See also FortiSwitch Devices Managed by FortiOS guide.
Perform NAC on IoT devices with vulnerabilities	NAC policies can be configured to detect devices with different levels of vulnerabilities and assign these devices dynamically to a quarantine VLAN. See OT and IoT virtual patching on NAC policies on page 2157.

Perform IoT Vulnerability rating check in Security Rating	Using the *Security Fabric > Security Rating* feature, perform a FortiGuard IoT Vulnerability check to identify devices with detected vulnerabilities.
Detect and log IoT devices in Application Control	IoT signatures are used in application control to detect and log IoT devices. In *Security Profiles > Application Signatures*, filter on the IoT category to see the list of IoT application signatures. Alternatively, view the signatures using the following command: `# get application name status | grep IoT -B2 -A10`

Device detection

When device detection is enabled on an interface, FortiGate will perform passive scanning on incoming traffic to collect information about devices such as their MAC address, IP address, Operating System, Hostname, username, endpoint tags and interface in which it entered . The firewall is able to scan different protocols to obtain basic device information. FortiGates by default comes with a built-in local Device Database (CIDB) containing information about known devices which can be used to obtain more detailed information.

When the CIDB cannot identify the device, FortiGate can utilize the IoT Query service by sending some device information to the FortiGuard collection server. If a new device is detected, FortiGate obtains the results from the FortiGuard query for more information about the device.

Device detection is intended for devices directly connected to your LAN and DMZ ports. Since the IoT detection service relies on device detection, the device must be on the same Layer 2 network as the FortiGate.

Configurations

This feature requires an Attack Surface Security Rating service license.

FortiGate device requirements:

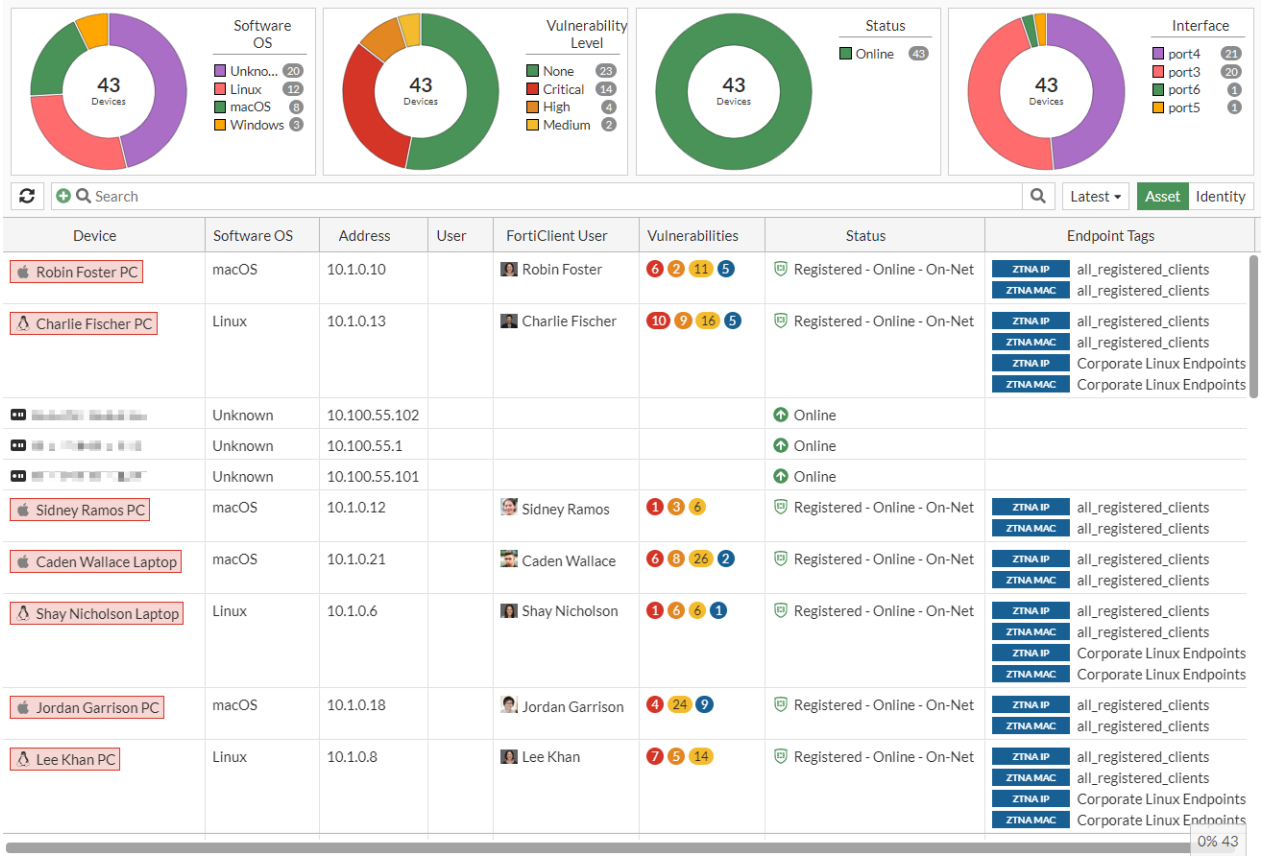
The FortiGate device must be:

- Registered with FortiCare
- Connected to an anycast FortiGuard server

How the service works:

1. Enable Device Detection on an interface.
2. FortiGate uses the interface to detect device traffic flow.
3. Upon detecting traffic from an unknown device, FortiGate sends the device data to the FortiGuard collection server.
4. The collection server returns data about the new device to the FortiGuard query server.
5. If the device signature does not appear in the local Device Database (CIDB) or some fields are not complete, FortiGate queries FortiGuard for more information about the device.

To view the latest device information in the GUI, go to *Dashboard* > *Assets & Identities* and expand the *Assets* widget. For more information, see Asset Identity Center page on page 3611.



To debug the IoT daemon in the CLI:

1. Enable iotd real-time debugs to collect information about the communication between FortiGate and the FortiGuard server:

```
# diagnose debug application iotd -1
# diagnose debug enable
```

2. Optionally, disable the local device database to force all queries to go to FortiGuard.

```
# diagnose cid sigs disable
```

3. View the debug output.

   FortiGate sends the device data to the FortiGuard collection server:

```
# [iotd] recv request from caller size:61
[iotd] service:collect hostname: ip: fd:-1 request tlv_len:41
[iotd] txt(.....y...w.....Jasons-iPhone6....579=23..)
[iotd] hex(020100070179030 60f77fc0203000e4a61736f6e732d6950686f6e65360204000835373 93d32330cff)
[iotd] service:collect hostname:globaldevcollect.fortinet.net ip: fd:-1 got server hostname
[iotd] service:collect hostname:globaldevcollect.fortinet.net ip:173.243.138.29 fd:-1 got
server ip
```

```
[iotd] service:collect hostname:globaldevcollect.fortinet.net ip:173.243.138.29 fd:13 socket
created
[iotd] service:collect hostname:globaldevcollect.fortinet.net ip:173.243.138.29 fd:13
connecting
[iotd] fd:13 monitor event:pollout
[iotd] service:collect hostname:globaldevcollect.fortinet.net ip:173.243.138.29 fd:13 build
req packet
[iotd] service:collect hostname:globaldevcollect.fortinet.net ip:173.243.138.29 fd:13 collect
resp:1(pending)
```

The FortiGuard collection server returns new device data to the FortiGuard query server:

```
[iotd] service:query hostname:globaldevquery.fortinet.net ip:173.243.140.16 fd:17 got query
resp
[iotd] service:query hostname:globaldevquery.fortinet.net ip:173.243.140.16 fd:17 id:0 total_

(good)
```

4. Upon completion of the FortiGuard query, the query server returns the device information including the information source (`src fortiguard`).

```
# diagnose user device list
    vd root/0  f8:87:f1:1f:ab:95  gen 26  req OUA/34
        created 503s  gen 23  seen 102s  lan  gen 7
        ip 192.168.1.110  src arp
```

```
        hardware vendor 'Apple'  src fortiguard  id 0  weight 100
        type 'Mobile'  src fortiguard  id 0  weight 100
        family 'Mobile'  src fortiguard  id 0  weight 100
        os 'iOS'  src fortiguard  id 0  weight 100
        host 'Jasons-iPhone6'  src dhcp
```

Using FortiManager as an override server for IoT query services

FortiGate can use FortiManager as an override server for IoT query services. The FortiManager must be running 7.2.1 or later.

All IoT daemon query and collected data can be sent to a FortiManager, instead of directly to FortiGuard. This is useful when there are strict policies controlling the kind of traffic that can go to the internet.

To send all IoT daemon query and collected data to a FortiManager:

```
config system central-management
    config server-list
        edit 1
            set server-type vpatch-query iot-collect
            set server-address <x.x.x.x>
        next
    end
end
```

Option	Description
`server-type vpatch-query iot-collect`	Set the FortiGuard service types: • `vpatch-query`: Virtual patch query server. • `iot-collect`: IoT device collection server.
`server-address <x.x.x.x>`	Enter the IPv4 address of the FortiManager.

When vpatch-query is not configured, the following debug command will show productapi.fortinet.com as the destination server:

```
# diagnose test application ipsmonitor 45
2025-06-29 14:37:25 cloud-communication: enabled
server: productapi.fortinet.com:443
```

When vpatch-query is configured, the override server address is displayed:

```
# diagnose test application ipsmonitor 45
2025-06-29 14:39:01 cloud-communication: enabled
server: 192.168.77.121:443
```

FortiAP query to FortiGuard IoT service to determine device details

A FortiAP collects packets from devices and queries FortiGuard with the help of the FortiGate. Device detection results are reported back to the FortiGate where this information is displayed. Querying the FortiGuard service requires an Attack Surface Security Rating service license.

The following attributes can be configured in `wireless-controller setting`:

Attribute	Description
device-weight <integer>	Set the device upper limit of confidence (0 - 255, default = 1, 0 = disable).
device-holdoff <integer>	Set the device lower limit of creation time, in minutes (0 - 60, default = 5).
device-idle <integer>	Set the device upper limit of idle time, in minutes (0 - 14400, default = 1440).

To query the FortiGuard IoT service:

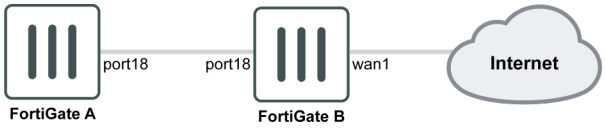
```
config wireless-controller setting
    ...
    set device-weight 1
    set device-holdoff 5
    set device-idle 1440
    ...
end
```

```
# diagnose user device list
  vd root/0  54:27:1e:e6:26:3d  gen 89  req OUA/34
    created 70s  gen 86  seen 2s  port29  gen 28
    ip 10.29.1.214  src mac
    hardware vendor 'Asustek compute'  src fortiguard  id 0  weight 21
    type 'Home & Office'  src fortiguard  id 0  weight 21
    family 'Computer'  src fortiguard  id 0  weight 21
    os 'Linux'  src dhcp  id 822  weight 128
    host 'test-wifi'  src dhcp
```

FortiGate Cloud / FDN communication through an explicit proxy

Explicit proxy communication to FortiGate Cloud and FortiGuard servers from FortiGate is enabled. A proxy server can be configured in the FortiGuard settings so that all FortiGuard connections under the `forticldd` process can be established through the proxy server.

Not all FortiGuard services are supported by these proxy settings. For example, web filter service traffic to FortiGuard will not be directed to the configured proxy.



To configure a proxy server and communicate with FortiGate Cloud though it:

1. Configure FortiGate B as a proxy server:

```
config firewall proxy-policy
    edit 1
        set proxy explicit-web
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set users "guest1"
    next
end
config user local
    edit "guest1"
        set type password
        set passwd 123456
    next
end
config authentication scheme
    edit "local-basic"
        set method basic
        set user-database "local-user-db"
    next
end
config authentication rule
    edit "local-basic-rule"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "local-basic"
    next
end
```

2. Configure a firewall policy on FortiGate B to allow FortiGate A to get DNS resolution:

```
config firewall policy
    edit 1
        set name "dns"
```

```
        set srcintf "port18"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "DNS"
        set fsso disable
        set nat enable
    next
end
```

3. Configure the FortiGuard proxy settings on FortiGate A:

```
config system fortiguard
    set proxy-server-ip 10.2.2.2
    set proxy-server-port 8080
    set proxy-username "guest1"
    set proxy-password 123456
end
```

4. On FortiGate A, log in to FortiGate Cloud to activate the logging service:

```
execute fortiguard-log login <username> <password>
```

5. On FortiGate A, view the `forticldd` debug message to see the connection to the log controller through the proxy server:

```
# diagnose test application forticldd 1
```

FDS-only ISDB package in firmware images

FortiOS firmware images include Fortinet objects in the built-in Internet Service Database (ISDB).

```
# diagnose firewall internet-service list
List internet service in kernel(global):
Internet Service Database Kernel Table: size 14974 bytes, Entry size 5844 bytes, number of index
table entries 165 number of IP range table entries 0

Group(0): Weight(15), number of entries(162)
......
```

This lightweight ISDB package allows firewall rules and policy routes that use ISDB to access FortiGuard servers to continue working after upgrading FortiOS. For example, the following policy will work after an upgrade:

```
config firewall policy
    edit 440
        set name "Fortinet Updates"
        set srcintf "port25"
        set dstintf "port1"
```

```
        set srcaddr "FortiAnalyzer" "FortiAuthenticator" "Tesla Management Interface"
"BackupFortinet" "SipFW" "ConnectVPNMgmt"
        set internet-service enable
        set internet-service-id 1245187 1245326 1245324 1245325 1245193 1245192 1245190 1245185
        set action accept
        set schedule "always"
        set logtraffic all
        set fsso disable
    next
end
```

After the FortiGate reboots after a firmware update, an automatic update will run in five minutes so that the FortiGate can get the ISDB, whether or not scheduled update is enabled.

```
# diagnose autoupdate versions | grep Internet -A 6

Internet-service Full Database
---------
Version: 7.02217 signed

```

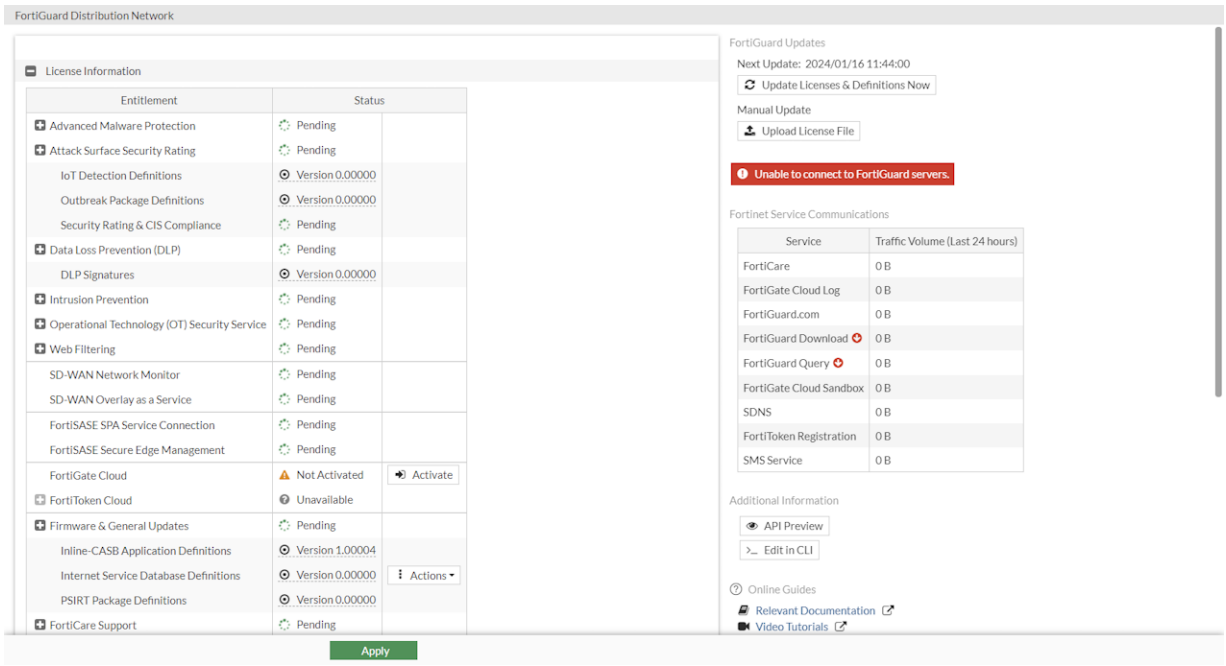
Licensing in air-gap environments

In the Operational Technology industry, industrial equipment is critical and must not be connected to the internet. However, the equipment is still required to be protected by a firewall in this air-gap environment. Without a gateway to FortiGuard in air-gap environments, FortiGuard packages, such as AntiVirus and IPS, must be manually uploaded to the FortiGate. FortiGate licenses can be downloaded from FortiCloud and uploaded manually to the FortiGate.

Manual licensing for air-gap environments is supported on FortiGate hardware appliances and FortiGate virtual machine (VM) appliances running FortiOS 7.2.0 or later. When running on a Virtual appliance, the VM licensing still needs to connect to a licensing FortiManager or FortiGuard server. See VM license on page 4053 for details

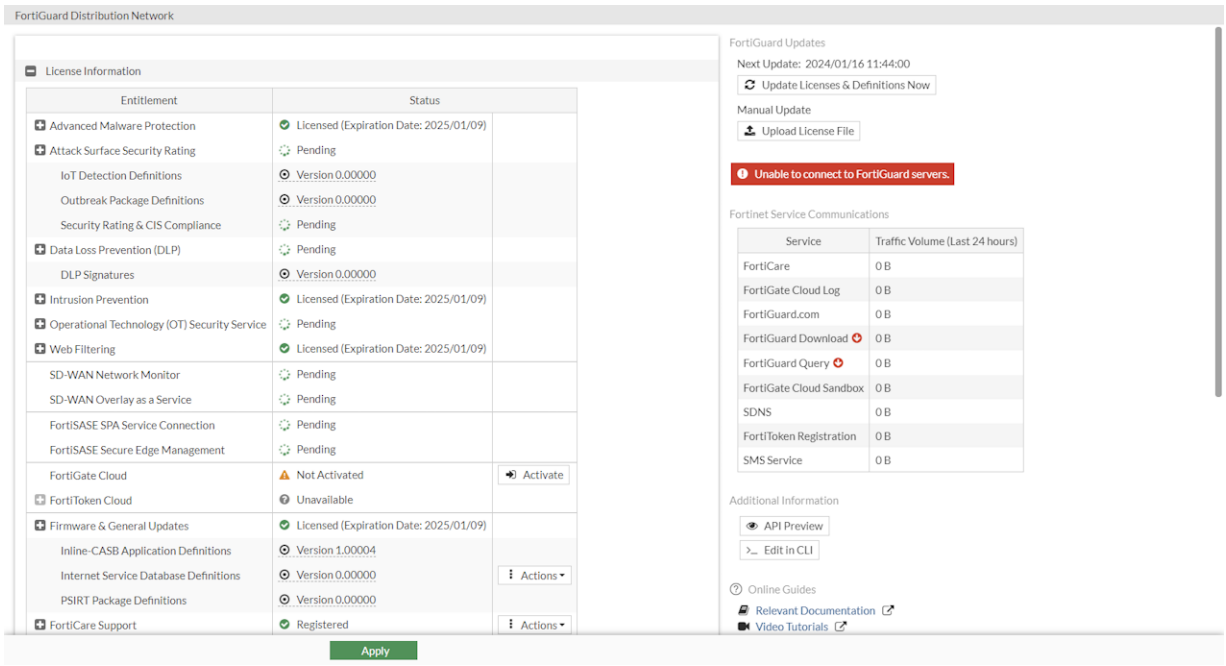
To manually upload FortiGate licenses in the GUI:

1. Register the FortiGuard license on FortiCloud. See Registration for more information.
2. Download the product entitlement file in FortiCloud:
   a. Go to *Products* > *Product List*.
   b. Select the serial number of the FortiGate. The product page opens.
   c. In the *License & Key* section, click *Get The License File*. The file downloads to your device in the format `FG201E*********ProductEntitlement.lic`.
3. In FortiOS, go to *System* > *FortiGuard*. Currently, the status for all services is *Pending*.



4. Click *Upload License File*. The file explorer opens.
5. Navigate to the product entitlement file and click *Open*.

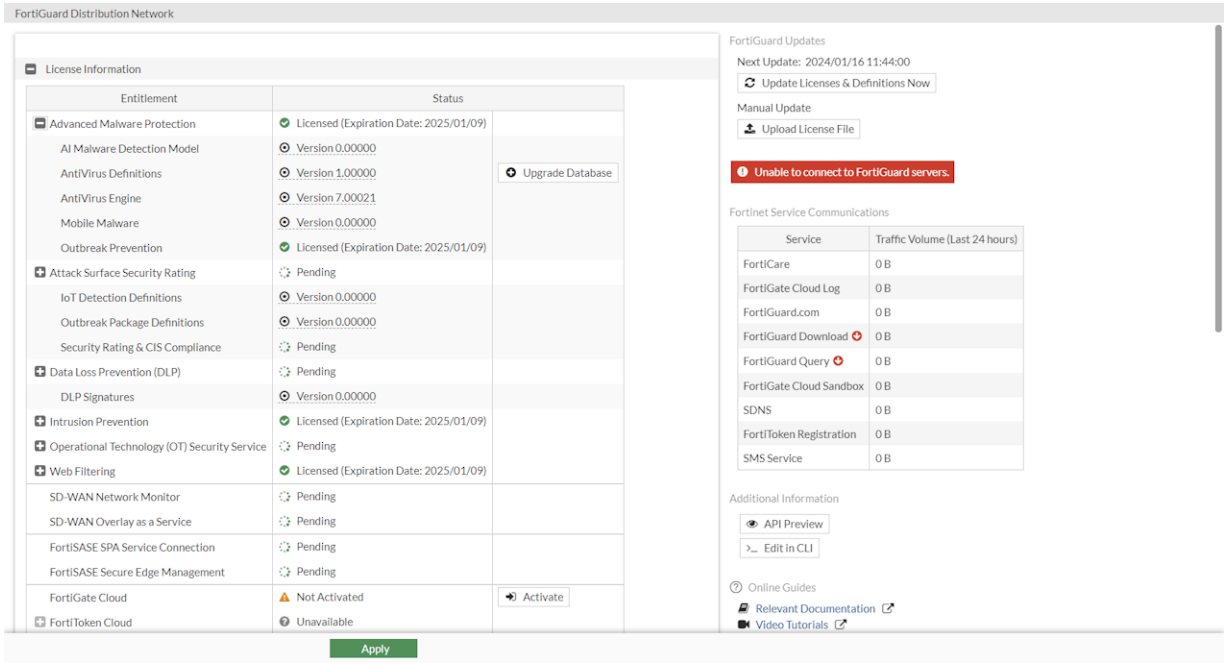
   The license file uploads to the FortiGate. This operation does not require reboot. Once the upload is complete, the FortiGate shows that it is registered and licensed.



6. Click *Apply*.

To manually upgrade the AntiVirus Database in the GUI:

1. Download the static upgrade file from FortiCloud:
   a. Go to support.fortinet.com.
   b. Go to *Download* > *Download FortiGuard Service Updates* > *FortiGate*.
   c. Select the FortiOS version from the *OS Version* dropdown.
   d. Select the file from the appropriate FortiGate product model section. The file downloads to your device.
2. In FortiOS, go to *System* > *FortiGuard* and expand the *Advanced Malware Protection* section to view the current licenses.



3. Click *Upgrade Database*. The *Anti-Virus Database Upgrade* pane opens.
4. Click *Upload*. The file explorer opens.
5. Navigate to the static upgrade file and click *Open*.
6. Click *OK*.
7. Click *Apply*.
   The AntiVirus Database is upgraded.

To manually upload FortiGate licenses in the CLI:

```
# execute restore manual-license {ftp | tftp} <license file name> <server> [args]
```

License expiration

The FortiGate will still function as a firewall if any or all of the FortiGuard licenses are expired. Valid FortiGuard licenses are required to receive database and signature updates, and to perform real-time or

near-real-time security lookups to detect and quickly adjust your security posture for newly discovered attacks.

FortiGuard services are designed to be continuous. Any lapses in the service will require coverage back to the contract expiration date. For more information, see FortiCare/FortiGuard Renewal Continuous Service Policy.

License type	Expiration impact
Firmware & General Updates	Application Control Signatures, Device & OS Identification, FortiGate Virtual Patch Signatures, Inline-CASB Application Definitions, Internet Service Database Definitions, and PSIRT Package Definitions continue to work, but the databases are not updated and no new signatures are added. For example, if application control is used in a firewall policy that has an internet service applied to the source or destination addresses, then the policy will continue to inspect matching traffic using the FortiGate's existing application control signatures and ISDB definitions. Application Control Signatures, Device & OS Identification, FortiGate Virtual Patch Signatures, Inline-CASB Application Definitions, Internet Service Database Definitions, and PSIRT Package Definitions are included in the base services that are included with all FortiCare support contracts See FortiGuard Security Services for details. The FortiGate will automatically schedule an upgrade to the latest patch of the current minor version. The upgrade can be postponed by one week but cannot be cancelled. See Automatic firmware upgrades for FortiGate appliances with invalid support contracts or that have reached EOES on page 3074.
Intrusion Prevention	IPS scanning continues to work, but the IPS databases are not updated and no new signatures are added. For example, if an IPS sensor with *Block malicious URLs* enabled is used in a firewall policy, then the policy will continue to inspect matching traffic using the FortiGate's existing IPS signatures and malicious URLs database. An active IPS license is critical for stopping sophisticated and zero-day attacks, as FortiGuard IPS provides near-real-time intelligence with thousands of intrusion prevention rules to detect and block known and zero-day threats. For more information, see Intrusion prevention on page 1970.
Botnet IPs/Domains	IPS sensors and DNS Filter profiles with Botnet C&C configured continue to work, but the Botnet IPs and Botnet Domain databases are not updated and no new signatures are added. While Botnet IPs and Domain are listed in the Intrusion Prevention category, they are actually part of the Firmware & General Updates contract.

License type	Expiration impact
	For more information, see Botnet C&C domain blocking on page 1905 and IPS with botnet C&C IP blocking on page 1996.
AntiVirus	Antivirus scanning continues to work, but the antivirus database is not updated and no new signatures are added. For more information, see Antivirus on page 1771.
Web and DNS Filtering	Category-based Web and DNS filtering stops working, as URLs and domains are sent to FortiGuard in real-time to determine the category. By default, all web and DNS traffic is dropped. If allowing website or DNS requests when a rating error occurs is enabled, then all web and DNS traffic passes through without filtering. If static URL or domain filtering is applied in a filter profile, those filters continue to work. Configurations where only specific URLs and domains are allowed and all others are blocked continue to work, but this is not a scalable solution blocking websites or performing category filtering. For more information, see FortiGuard filter on page 1834 and FortiGuard category-based DNS domain filtering on page 1902.
Email Filtering	Spam filtering stops working, as it queries the FortiGuard spam filtering server in real-time to check spammer IP addresses and emails (except those that are locally configured), phishing URLs, spam URLs, spam email checksums, and spam submissions. Anti-spam signatures are not updated. Profile options based on local spam filtering continue to work. For more information, see Email filter on page 2012.
Outbreak Prevention	Outbreak prevention stops working, as it uses real-time lookups to the FortiGuard Global Threat Intelligence database. For more information, see FortiGuard outbreak prevention on page 1822.
Security Rating & CIS Compliance	Paid security rating checks stop working. CIS security control mappings are also disabled. The Security Rating & CIS Compliance component of the Attack Surface Security Rating entitlement is required to run paid security rating checks across all of the devices in the Security Fabric. They allow rating scores to be submitted to and received from FortiGuard for network ranking. Without the Security Rating entitlement, only built-in security rating rules can be run. PSIRT-related vulnerability rules depend on the Firmware license support. For more information, see Security rating on page 3671.
Operational Technology (OT) Threat Definitions	OT Security Services signatures continue to work, but the database attack definitions are not updated and no new signatures are added. OT Security Services include application control and IPS signatures for OT applications and protocols.

License type	Expiration impact
	For example, if an IPS sensor enabled with OT Security Service signatures is used in a firewall policy, then the policy will continue to inspect matching traffic using the FortiGate's existing OT threat definition IPS signatures. For more information, see OT threat definitions on page 1983.

Disable all cloud communication

The FortiGate communicates with various services, such as FortiGuard download and query services and FortiCloud and other cloud related services to download service packages. It also makes queries for various real-time filtering capabilities, and performs logging and synchronization tasks.

The communication statistics can be viewed in the GUI at *System* > *FortiGuard*. The statistics can also be retrieved from the CLI:

```
# diagnose sys service-communication
```

To disable these communications, use the following CLI command::

```
config system global
    set cloud-communication disable
end
```

When cloud-communication is disabled, the forticldd and updated daemons are shutdown and multiple settings are disabled.

The following settings are automatically changed:

```
config system global
    set fds-statistics disable
end
config system central-management
    set type none
    set include-default-servers disable
end
config system fortiguard
    set antispam-force-off enable
    set outbreak-prevention-force-off enable
    set webfilter-force-off enable
end
config system email-server
    set server ''
end
config system ntp
    set ntpsync disable
end
config system autoupdate schedule
    set status disable
end
```

```
config system autoupdate tunneling
    set status disable
end
config log fortiguard setting
    set status disable
end
```

To reenable cloud communications, each individual setting must be changed after running the following CLI command:

```
config system global
    set cloud-communication enable
end
```

For example, to reenable automatically connecting and logging in to FortiCloud:

```
config system fortiguard
    set auto-join-forticloud enable
end
```

To reenable the email server:

```
config system email-server
    set server "fortinet-notifications.com"
    set port 465
    set security smtps
end
```

To reenable NTP synchronization:

```
config system ntp
    set ntpsync enable
end
```

Feature visibility

Feature visibility is used to control which features are visible in the GUI. This allows features that are not in use to be hidden. Some features are also invisible by default and must be made visible before they can be configure in the GUI.

The visibility of a feature does not affect its functionality or configuration. Invisible features can still be configured using the CLI.

To change the visibility of features:

1. Go to *System* > *Feature Visibility*.
2. Change the visibility of the features as required.
   For information about what settings each option affects, click on the + icon to the right of the feature name.

Changes are listed on the right side of the content pane.

3. Click *Apply*.

Certificates

This section contains topics about uploading certificates and provides examples of how certificates may be used to encrypt and decrypt communications, and represent the identity of the FortiGate. This sections assumes that you have a high level understanding of the public key infrastructure (PKI) system, particularly how entities leverage trusted certificate authorities (CAs) to verify the authenticating party, and how public and private certificate keys work to secure communications.

The certificates feature is hidden by default in FortiOS. In the GUI, go to *System* > *Feature Visibility* and enable *Certificates*.

Common certificate uses in FortiOS

Type	How to generate/import certificate	FortiGate Use Examples	Private Key[1]
Local Certificate	ACME, Self Sign, CSR, File Upload (PKCS #12 & CER+PEM)	Client certificates: • Site-to-Site VPN • Dialup SSL VPN • Dialup IPsec VPN Server certificates: • HTTPS admin access • Protecting an SSL Server	Yes
Remote Certificate	File Upload	SAML • SP: Security Fabric > Fabric Connectors > Security Fabric Setup > Advanced Options > SP certificate • IdP: Security Fabric > Fabric Connectors > Security Fabric Setup > Edit/create a SP > IdP certificate	No
Local CA (and sub-CA)	Online SCEP, File Upload	SSL Inspection Multiple Clients Connecting to Multiple Servers • Security Profiles > SSL/SSH Inspection > *profile_name* > CA certificate	Yes
Remote CA	Online SCEP, File Upload	Enable FortiGate to trust certificates signed by the remote CA. Example uses: • LDAPS connection	No

Type	How to generate/import certificate	FortiGate Use Examples	Private Key[1]
		• User authentication (policy & admin access) • FortiAnalyzer OFTP tunnel	

[1]Certificates with a private key are uploaded in the following common formats:

- Certificate and private key in one file (PKCS #12)
  - .PFX
- Certificate and private key in separate files
  - Certificate: .CER, .DER
  - Key: .PEM
- When using Certificate Signing Request (CSR), the private key remains on the FortiGate and the signed CSR is returned to the FortiGate to complete the cert+key pair.
  - .CER

  See Import a certificate on page 3425 for more details.

For additional capabilities and enhanced certificate management, please review the FortiAuthenticator Administration Guide and Examples. FortiManager can integrate with FortiAuthenticator to provide large scale FortiGate certificate deployment and management; see FortiManager Examples.

The following topics provide information about certificates:

- Automatically provision a certificate on page 3419
- Generate a new certificate on page 3423
- Regenerate default certificates on page 3424
- Import a certificate on page 3425
- Generate a CSR on page 3427
- CA certificate on page 3430
- Remote certificate on page 3431
- Certificate revocation list on page 3431
- Export a certificate on page 3432
- Uploading certificates using an API on page 3433
- Enrollment over Secure Transport for automatic certificate management on page 3453

The following topics provide examples of how to use certificates:

- Procuring and importing a signed SSL certificate on page 3438
- Microsoft CA deep packet inspection on page 3440
- Administrative access using certificates on page 3445
- Creating certificates with XCA on page 3446
- Site-to-site VPN with digital certificate on page 2283
- Configuring FortiClient EMS on page 3542
- SSL VPN with certificate authentication on page 2697
- SSL VPN with LDAP-integrated certificate authentication on page 2702
- Configuring certificates for SAML SSO on page 3661

- Protecting an SSL server on page 2171
- Using the default certificate for HTTPS administrative access on page 3120

Automatically provision a certificate

The Automated Certificate Management Environment (ACME), as defined in RFC 8555, is used by the public Let's Encrypt certificate authority (https://letsencrypt.org) to provide free SSL server certificates. The FortiGate can be configured to use certificates that are managed by Let's Encrypt, and other certificate management services, that use the ACME protocol. The server certificates can be used for secure administrator log in to the FortiGate.

ACME certificates do not support loopback interfaces.

- The FortiGate must have a public IP address and a hostname in DNS (FQDN) that resolves to the public IP address.
- The configured ACME interface must be publicly reachable, and port TCP/443 or TCP/80 must not be used by other services.
- By default, the challenge is sent on TCP/80. By default, port 80 on the FortiGate redirects to TCP/443 for security purposes.
- If TCP/443 is in use by a process on the FortiGate (such as HTTPS daemon), the ACME daemon will fall back to TCP/80 for the challenge.
- If TCP/80 is also used by another service, the ACME process will fail.
- If a VIP is in use on any of these ports, then the incoming ACME challenge will be processed by the VIP rather than the system/ACME daemon.

  A VIP can be intentionally used to allow servers behind the FortiGate to participate in the ACME process, and can also be used to forward ACME challenges to a management VDOM that is not directly reachable by the ACME service.
- The Subject Alternative Name (SAN) field is automatically filled with the FortiGate DNS hostname. It cannot be edited, wildcards cannot be used, and multiple SANs cannot be added.

Security

FortiOS supports two forms of ACME challenge for Let's Encrypt: TLS-ALPN-01 (on TCP/443) and HTTP-01 (on TCP/80). By default, it uses the TLS-ALPN-01 challenge. See Challenge Types for an overview of the Let's Encrypt challenge types.

TLS-ALPN-01

This challenge requires the FortiGate to provide a self-signed certificate that includes specific requirements for ACME, such as SAN and acmeIdentifier. This self-signed certificate is often identified by security scans as an issue, but this is expected behavior for the TLS-ALPN-01 challenge. See RFC 8737 for details.

HTTP-01

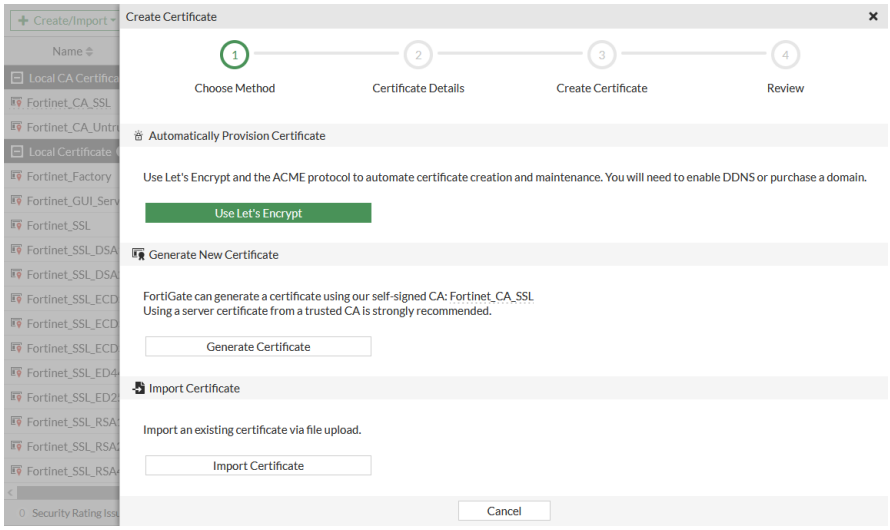
As indicated by the lack of an *s* in the protocol name, HTTP-01 uses an unencrypted protocol (HTTP) to complete the challenge on TCP/80. This is often identified by security scans as an issue, but this is expected behavior.

Example

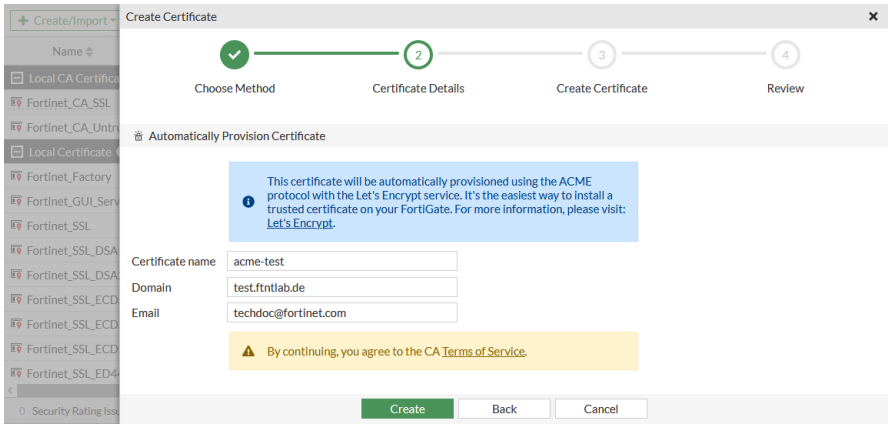
This example shows how to import an ACME certificate from Let's Encrypt, and use it for secured remote administrator access to the FortiGate.

To generate a certificate using ACME and Let's Encrypt:

1. Go to *System* > *Certificates* and click *Create/Import* > *Certificate*.

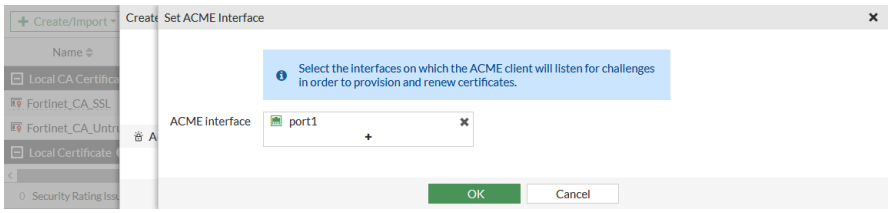


2. Click *Use Let's Encrypt*.
3. Set *Certificate name* to an appropriate name for the certificate. This is what is referenced when using the certificate in FortiGate configurations.
4. Set *Domain* to the public FQDN of the FortiGate.
5. Set *Email* to a valid email address. The email is not used during the enrollment process.

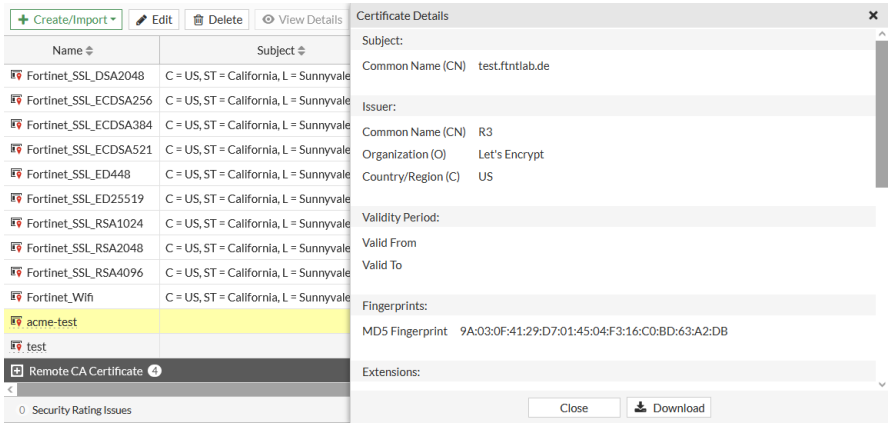


6. Click *Create*.

7. Set the *ACME interface*, on which the ACME client will listen for challenges in order to provision and renew certificates. The challenge is how the certificate signing request is validated by Let's Encrypt.



8. Click *OK*. Let's Encrypt provisions the certificate and the certificate is added to the certificate list in the *Local Certificates* section.
9. Click *View Details* to verify that the FortiGate's FQDN is in the certificate's *Subject: Common Name (CN)*.



To import an ACME certificate in the CLI:

1. Set the interface that the FortiGate communicates with Let's Encrypt on:

```
config system acme
    set interface "port1"
end
```

2. Make sure that the FortiGate can contact the Let's Encrypt enrollment server:

```
# execute ping acme-v02.api.letsencrypt.org
PING ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com (172.65.32.248): 56 data bytes
64 bytes from 172.65.32.248: icmp_seq=0 ttl=60 time=2.0 ms
64 bytes from 172.65.32.248: icmp_seq=1 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=2 ttl=60 time=1.7 ms
64 bytes from 172.65.32.248: icmp_seq=3 ttl=60 time=2.1 ms
64 bytes from 172.65.32.248: icmp_seq=4 ttl=60 time=2.0 ms

--- ca80a1adb12a4fbdac5ffcbc944e9a61.pacloudflare.com ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 1.7/1.9/2.1 ms
```

3. Configure the local certificate request:

```
config vpn certificate local
    edit "acme-test"
```

```
        set enroll-protocol acme2
        set acme-domain "test.ftntlab.de"
        set acme-email "techdoc@fortinet.com"
    next
By enabling this feature you declare that you agree to the Terms of Service at https://acme-
v02.api.letsencrypt.org/directory
Do you want to continue? (y/n)y
end
```

4. Verify that the enrollment was successful:

```
# get vpn certificate local details acme-test
path=vpn.certificate, objname=local, tablename=(null), size=2632
== [ acme-test ]
        Name:        acme-test
        Subject:     CN = test.ftntlab.de
        Issuer:      C = US, O = Let's Encrypt, CN = R3
        Valid from:  2021-03-11 17:43:04  GMT
        Valid to:    2021-06-09 17:43:04  GMT
        Fingerprint: 9A:03:0F:41:29:D7:01:45:04:F3:16:C0:BD:63:A2:DB
        Serial Num:  03:d3:55:80:d2:e9:01:b4:ca:80:3f:2e:fc:24:65:ad:7c:0c
ACME details:
        Status: The certificate for the managed domain has been renewed successfully and can
be used (valid since Thu, 11 Mar 2021 17:43:04 GMT).
        Staging status: Nothing in staging
```

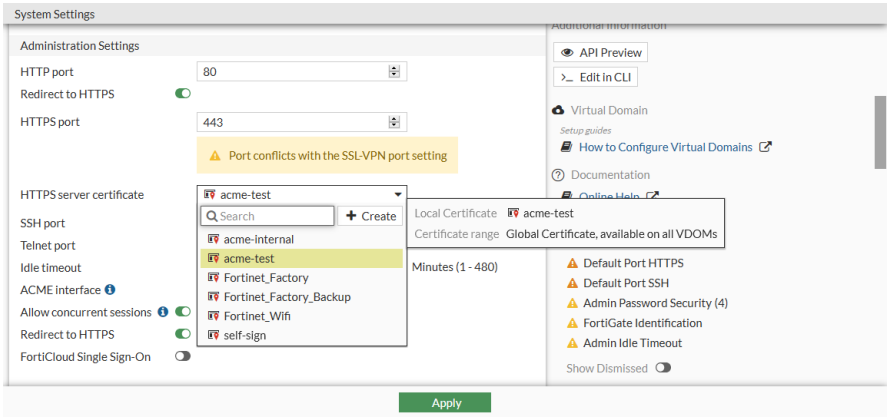
5. Check the ACME client full status log for the CN domain:

```
# diagnose sys acme status-full test.ftntlab.de
{
  "name": "test.ftntlab.de",
  "finished": true,
  "notified": false,
  "last-run": "Thu, 11 Mar 2021 18:43:02 GMT",
  "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT",
  "errors": 0,
  "last": {
    "status": 0,
    "detail": "The certificate for the managed domain has been renewed successfully and can be
used (valid since Thu, 11 Mar 2021 17:43:04 GMT). A graceful server restart now is
recommended.",
    "valid-from": "Thu, 11 Mar 2021 17:43:04 GMT"
  },
  "log": {
    "entries": [
      {
        "when": "Thu, 11 Mar 2021 18:43:05 GMT",
        "type": "message-renewed"
      },
      ...
      {
        "when": "Thu, 11 Mar 2021 18:43:02 GMT",
```

```
        "type": "starting"
      }
    ]
  }
}
```

To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the GUI:

1. Go to *System* > *Settings*.
2. Set *HTTPS server certificate* to the new certificate.



3. Click *Apply*.
4. Log in to the FortiGate using an administrator account from any internet browser. There should be no warnings related to non-trusted certificates, and the certificate path should be valid.

To exchange the default FortiGate administration server certificate for the new public Let's Encrypt server certificate in the CLI:

```
config system global
    set admin-server-cert "acme-test"
end
```

When you log in to the FortiGate using an administrator account there should be no warnings related to non-trusted certificates, and the certificate path should be valid.

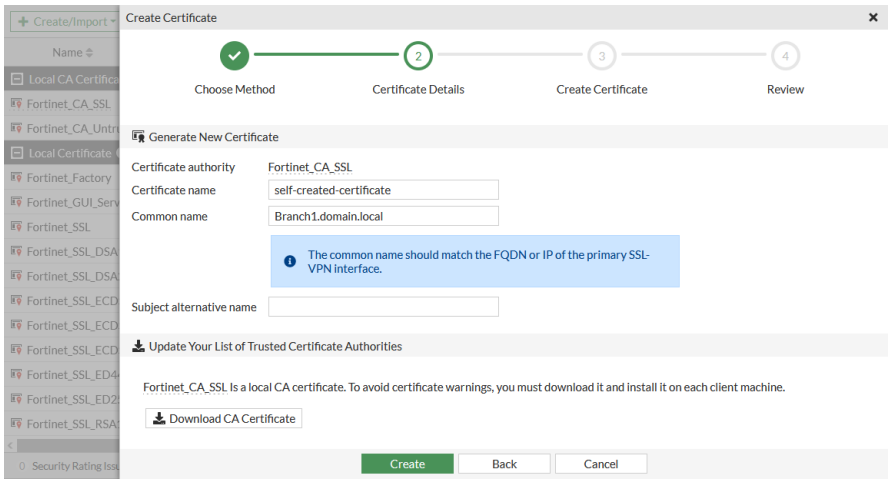
Generate a new certificate

The FortiGate can generate a certificate using a pre-loaded, self-signed CA certificate: *Fortinet_CA_SSL*, instead of generating a CSR and providing it to a CA for signing. It is recommended that a server certificate from a well-known and trusted CA is used.

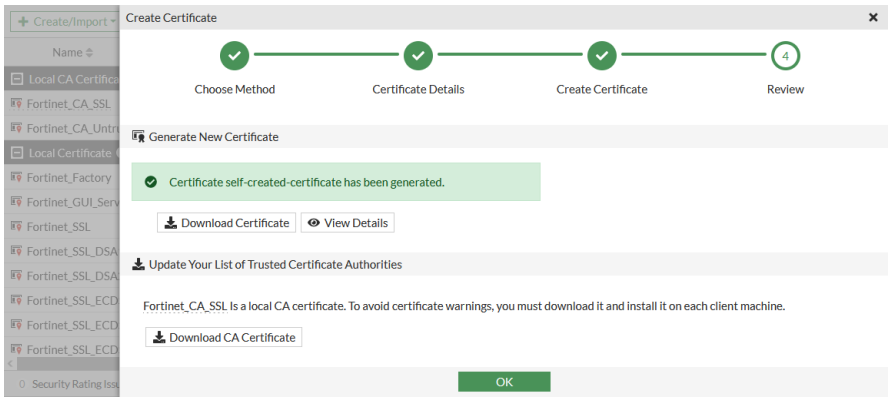
To generate a new certificate:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Generate Certificate*.

3. Set *Certificate name* to the name of the certificate. This is what is referenced when using the certificate in FortiGate configurations.
4. Set the *Common name* (CN) for the certificate. The common name should match the FQDN or IP of the primary SSL-VPN interface.
5. Optionally, set the *Subject alternative name*.
6. Click *Download CA Certificate* to download the CA certificate so that it can be installed or imported to all the machines that need to trust this certificate.



7. Click *Create*.
8. After the certificate is created, click *Download Certificate* to download the certificate. Click *View Details* to review the certificate details.



9. Click *OK*.

Regenerate default certificates

The FortiGate includes default certificates that are generated the first time that the FortiGate is booted up. In some circumstances, it can be necessary to regenerate these certificates, such as when they are nearing expiry, or if the key becomes compromised.

To regenerate default certificates:

```
# execute vpn certificate local generate default-gui-mgmt-cert
```

```
# execute vpn certificate local generate default-ssl-ca
```

```
# execute vpn certificate local generate default-ssl-ca-untrusted
```

```
# execute vpn certificate local generate default-ssl-key-certs
```

```
# execute vpn certificate local generate default-ssl-serv-key
```

default-gui-mgmt-cert	Regenerate the default GUI management admin-server (Fortinet_GUI_Server) certificate.
default-ssl-ca	Regenerate the default CA certificate (Fortinet_CA_SSL) used by SSL Inspection.
default-ssl-ca-untrusted	Regenerate the default untrusted CA certificate (Fortinet_CA_Untrusted) used by SSL Inspection.
default-ssl-key-certs	Regenerate the default RSA, DSA, ECDSA, and EdDSA key certificates for SSL resign: • Fortinet_SSL_DSA1024 • Fortinet_SSL_DSA2048 • Fortinet_SSL_ECDSA256 • Fortinet_SSL_ECDSA384 • Fortinet_SSL_ECDSA521 • Fortinet_SSL_ED448 • Fortinet_SSL_ED25519 • Fortinet_SSL_RSA1024 • Fortinet_SSL_RSA2048 • Fortinet_SSL_RSA4096
default-ssl-serv-key	Regenerate the default server key (Fortinet_SSL) used by SSL Inspection.

Import a certificate

You can upload a certificate to the FortiGate that was generated on its own. This is typical of wildcard certificates (*.domain.tld) where the same certificate is used across multiple devices (FGT.domain.tld, FAZ.domain.tld, and so on), but can also be used for individual certificates as long as the information provided to the signing CA matches that of the FortiGate.

Any certificate uploaded to a VDOM is only accessible to that VDOM. Any certificate uploaded to the Global VDOM is globally accessible by all VDOMs.

A signed certificate that is created using a CSR that was generated by the FortiGate does not include a private key, and can be imported to the FortiGate from a the management computer or a TFTP file server.

There are three options:

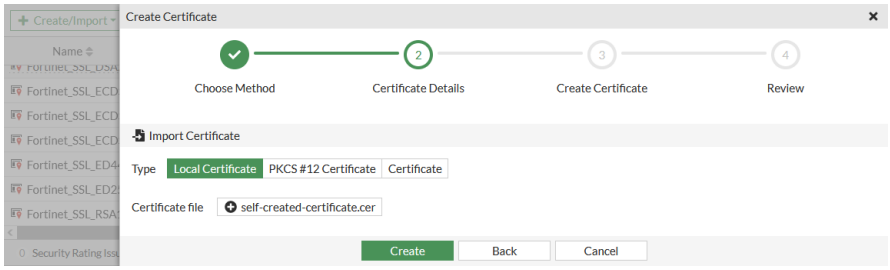
- Local certificate on page 3426
- PKCS #12 certificate on page 3426
- Certificate on page 3427

Local certificate

This option allows you to upload a single file and no key. Use it when you have created a CSR on the FortiGate (Generate a CSR on page 3427), as the key is generated as part of the CSR process and remains on the FortiGate. You must upload a .CER file.

To import a local certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *Local Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.



5. Click *Create*, then click *OK* on the confirmation page.

To import a local certificate in the CLI:

```
execute vpn certificate local import tftp <filename> <tftp_IP> cer
```

PKCS #12 certificate

This option takes a specific certificate file type that contains the private key. The certificate is encrypted and a password must be supplied with the certificate file. PKCS #12 certificates are .PFX files.

To import a PKCS #12 certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *PKCS #12 Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.
5. Enter the password, then confirm the password.
6. Optionally, customize the *Certificate name*.
7. Click *Create*, then click *OK* on the confirmation page.

To import a PKCS #12 certificate in the CLI:

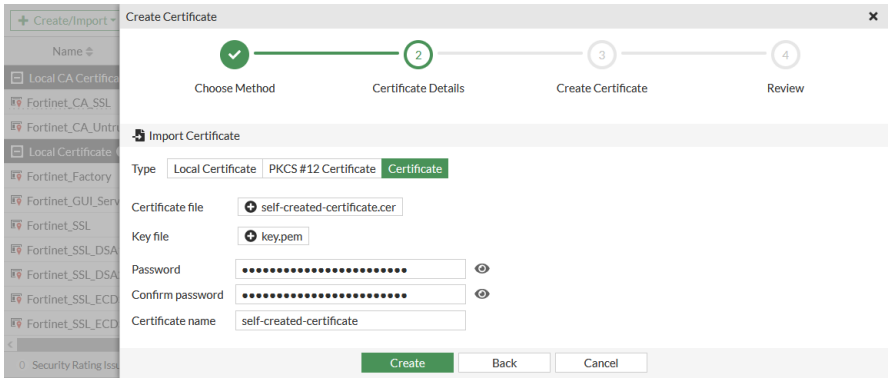
```
execute vpn certificate local import tftp <filename> <tftp_IP> p12 <password>
```

Certificate

This option is intended for certificates that were generated without using the FortiGate's CSR. Because the certificate private key is being uploaded, a password is required. This option is similar to PKCS #12 certificate, but the certificate and key file are separate files, usually .CER and .PEM files.

To import a certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *Certificate*.
4. In the *Certificate* field, click *Upload*, and locate the certificate on the management computer.
5. In the *Key file* field, click *Upload*, and locate the key file on the management computer.
6. Enter the password, then confirm the password.



7. Optionally, customize the *Certificate name*.
8. Click *Create*, then click *OK* on the confirmation page.

To import a certificate that requires a private key to a VDOM, or when VDOMs are disabled:

```
config vpn certificate {local | ca | remote | ocsp-server | crl}
```

Refer to the FortiOS CLI Reference for detailed options for each certificate type (local, CA, remote, OSCP server, CRL).

To import a global certificate that requires a private key when VDOMs are enabled:

```
config certificate {local | ca | remote | crl}
```

This command is only available when VDOMs are enabled. For details, see the FortiOS CLI Reference.

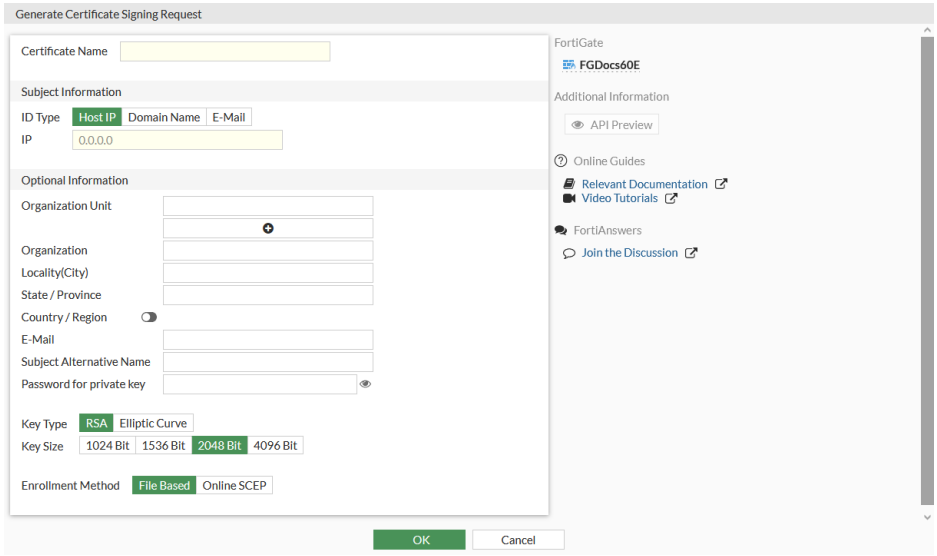
Generate a CSR

Certificate signing requests (CSRs) are used to generate a certificate which is then signed by a CA to create a chain of trust. The CSR includes details about the FortiGate and its public key. A CSR is not strictly

necessary; some CAs allow you to provide the details of the FortiGate manually, but a CSR helps streamline the process.

To generate a CSR in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Generate CSR*.



2. Enter the following information:

Certificate Name	Enter the certificate name; this is how it will appear in the *Local Certificates* list.
Subject Information	Specify an ID type: host IP address, domain name (FQDN), or email address.
Optional Information	Although listed as optional, we recommended entering the information for each field in this section. If you are generating a CSR for a third-party CA, you need to insure that these values reflect those listed for your company or organization at said certificate authority. If you are generating a certificate for a Microsoft CA, you need to check with the administrator regarding these values.
Organization Unit	Enter the name of the organizational unit under which the certificate will be issued.
Organization	Enter the overall name of the organization.
Locality(City)	Enter the city where the SSL certificate is located.
State / Province	Some issuers will reject a CSR that has an abbreviated state or province, so enter the full name of the state or province.
Country / Region	Enable the option and select the country from the dropdown.
E-Mail	Enter the email address of the technical contact for the SSL certificate that is being requested.

Subject Alternative Name	This field allows multiple domains to be used in an SSL certificate. Select from email addresses, IP addresses, URIs, DNS names, and so on.
Password for private key	If supplied, this is used as an encryption password for the private key file.
Key Type	Select *RSA* or *Elliptic Curve*.
Key Size	When *Key Type* is *RSA*, select 1024, 1536, 2048, or 4096 for bit-size/strength. We recommend using at least 2048 if your CA can issue certificates of that size.
Curve Name	When *Key Type* is *Elliptic Curve*, select the elliptic curve type: secp256r1, secp384r1, or secp521r1.

Enrollment Method	Select one of the following methods that determines how the CSR will be signed.
	• *File Based*: this will generate a certificate in the certificate menu under *Local Certificate*, which differs from the existing ones because it has no *Subject*, *Comments*, *Issuer*, or *Expires* values in the table. It will also show a *Pending* status because it is only a CSR at the moment and cannot function as a certificate just yet. You can download the CSR to provide to a CA for signing. If you open the CSR file, it should look similar to this:
	`-----BEGIN CERTIFICATE REQUEST-----`
	`MIIC7jCCAdYCAQAwgZUxCzAJBgNVBAYT (… )HEKjDX+Hg==`
	`-----END CERTIFICATE REQUEST-----`
	Next. the CSR file is supplied to a CA for signing and the returned file from the CA should be in .CER format. This file is then uploaded to the FortiGate by going to *System > Certificates > Import > Local Certificate* and uploading the CER file.
	• *Online SCEP*: the Simple Certificate Enrollment Protocol (SCEP) allows devices to enroll for a certificate by using a URL and a password. The SCEP server works as a proxy to forward the FortiGate's request to the CA and returns the result to the FortiGate (setting up an SCEP server is beyond the scope of this topic). Once the request is approved by the SCEP server, the FortiGate will have a signed certificate containing the details provided in the CSR.

3. Click *OK*.
   The CSR generated, and can be downloaded from the local certificate list.

To generate a CSR in the CLI:

```
# execute vpn certificate local generate cmp-ec <certificate_name> <key_size> <server> <path>
<server_certificate> <auth_certificate> <user> <password> <subject> [SANs] [source_IP]
```

```
# execute vpn certificate local generate cmp-rsa <certificate_name> <key_size> <server> <path>
<server_certificate> <auth_certificate> <user> <password> <subject> [SANs] [source_IP]
```

```
# execute vpn certificate local generate ec <certificate_name> <curve_name> <subject> <country>
<state/province> <city> <organization> <OU> <email> [SANs] [options]
```

```
# execute vpn certificate local generate rsa <certificate_name> <key_size> <subject> <country>
<state/province> <city> <organization> <OU> <email> [SANs] [options]
```

cmp-ec	Generate a ECDSA certificate request over CMPv2. To enable SSL/TLS, append `https://` to the server address.
cmp-rsa	Generate a RSA certificate request over CMPv2. To enable SSL/TLS, append `https://` to the server address.
ec	Generate an elliptic curve certificate request.
rsa	Generate a RSA certificate request.

CA certificate

FortiGates come with many CA certificates from well-known certificate authorities pre-installed, just as most modern operating systems like Windows and MacOS. Use this option to add private CA certificates to the FortiGate so that certificates signed by this private CA are trusted by the FortiGate.

For example, a private CA can be used when two FortiGates are establishing a site-to-site VPN tunnel using a certificate not signed by a public or trustworthy CA, or for your LDAPS connection to your corporate AD server that also uses a certificate signed with a private CA in your domain. It is very common to upload a private CA when using PKI user authentication, since most PKI user certificates will be signed by an internal CA.

To import a CA certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *CA Certificate*.
2. Set the *Type* to *Online SCEP* or *File*.
   - *Online SCEP*: Enter the *URL of the SCEP server* and optionally, the *Optional CA Identifier*. The FortiGate contacts an SCEP server to request the CA certificate.
   - *File*: Upload the CA certificate file directly from the management computer.
3. Click *OK*.

To import a CA certificate in the CLI:

```
# execute vpn certificate ca import auto <CA_server> [identifier] [source_ip] [fingerprint]
```

```
# execute vpn certificate ca import bundle <filename> <tftp_IP>
```

```
# execute vpn certificate ca import tftp <filename> <server_address>
```

```
# execute vpn certificate ems_ca import tftp <filename> <server_address>
```

Command	Description
auto	Import CA certificate via SCEP.
bundle	Import certificate bundle from a TFTP server.
tftp	Import CA certificate from a TFTP server.

In proxy mode, when building a certificate chain, WAD will consider user-installed CA certificates before falling back to searching CA certificates from FortiGuard or built-in certificates.

Remote certificate

Remote certificates are public certificates and contain only the public key. They are used to identify a remote device. For example, when configuring your FortiGate for SAML authentication with the FortiGate as an identity provider (IdP), you can optionally specify the service provider (SP) certificate. However, when configuring your FortiGate as a SP, you must specify the certificate used by the IdP. Both these certificates can be uploaded to the FortiGate as a remote certificate, since the private key is not necessary for its implementation.

To upload a remote certificate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Remote Certificate*.
2. Upload the remote certificate file directly from the management computer.
3. Click *OK*.

To upload a remote certificate in the CLI:

```
# execute vpn certificate remote import tftp <file_name> <server_address>
```

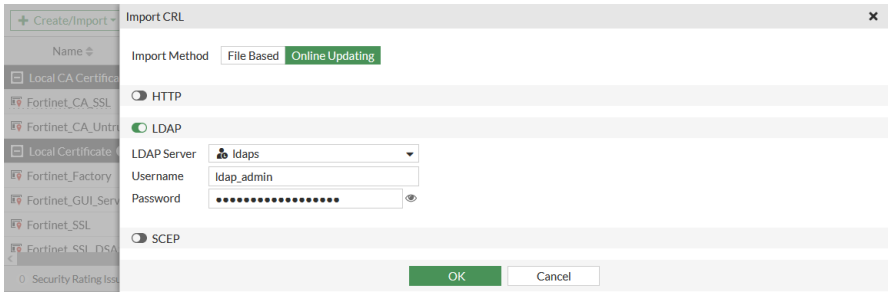
Certificate revocation list

Because it is not possible to recall a certificate, the certificate revocation list (CRL) details certificates signed by valid CAs that should no longer be trusted. Certificates may be revoked for many reasons, such as if the certificate was issued erroneously or if the private key of a valid certificate has been compromised.

To import a CRL in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *CRL*.
2. Set the *Import Method* to *File Based* or *Online Updating*.
   - *File Based*: Upload the CRL file directly from the management computer. CAs publish files containing the list of certificates that should no longer be trusted.

- *Online Updating*: This is the preferred method to keep the list of revoked certificates up to date. Configure the protocols as required.
  - *HTTP*: Enter the *URL of the HTTP server*.
  - *LDAP*: Select the *LDAP Server* and enter the *Username* and *Password*.
  - *SCEP*: Select the *Certificate* and enter the *URL of the SCEP server*.



3. Click *OK*.

To import a CRL in the CLI:

```
# execute vpn certificate crl import auto <CRL_name>
```

Export a certificate

Certificates can be downloaded to the management computer in the GUI and exported to a TFTP server in the CLI.

To back up a certificate in the GUI:

1. Go to *System* > *Certificates*.
2. Select the certificate from the list.
3. Click *Download*.
4. Save the file to the management computer.

To export the certificate in the CLI:

```
# execute vpn certificate ca export tftp <certificate_name> <filename> <tftp_IP>
```

```
# execute vpn certificate local export tftp <certificate_name> <file_type> <filename> <tftp_
server>
```

```
# execute vpn certificate remote export tftp <certificate_name> <filename> <tftp_server>
```

Uploading certificates using an API

There are several API methods to upload a certificate based on the type and purpose of the certificate. The parameters of each method are available options, and some methods do not require all parameters to upload the certificate.

When uploading a certificate to the FortiGate using API, the certificate must be provided to the FortiGate in Base64 encoding. You must create a REST API user to authenticate to the FortiGate and use the generated API token in the request.

api/v2/monitor/vpn-certificate/ca/import

```
{
  "import_method": "[file|scep]",
  "scep_url": "string",
  "scep_ca_id": "string",
  "scope": "[vdom*|global]",
  "file_content": "string"
}
```

api/v2/monitor/vpn-certificate/crl/import

```
{
  "scope": "[vdom*|global]",
  "file_content": "string"
}
```

api/v2/monitor/vpn-certificate/local/import

```
{
  "type": "[local|pkcs12|regular]",
  "certname": "string",
  "password": "string",
  "key_file_content": "string",
  "scope": "[vdom*|global]",
  "acme-domain": "string",
  "acme-email": "string",
  "acme-ca-url": "string",
  "acme-rsa-key-size": 0,
  "acme-renew-window": 0,
  "file_content": "string"
}
```

api/v2/monitor/vpn-certificate/remote/import

```
{
  "scope": "[vdom*|global]",
```

```
  "file_content": "string"
}
```

api/v2/monitor/vpn-certificate/csr/generate

```
{
  "certname": "string",
  "subject": "string",
  "keytype": "[rsa|ec]",
  "keysize": [1024|1536|2048|4096],
  "curvename": "[secp256r1|secp384r1|secp521r1]",
  "orgunits": [
    "string"
  ],
  "org": "string",
  "city": "string",
  "state": "string",
  "countrycode": "string",
  "email": "string",
  "sub_alt_name": "string",
  "password": "string",
  "scep_url": "string",
  "scep_password": "string",
  "scope": "[vdom*|global]"
}
```

Example

In this example, a PKCS 12 certificate is uploaded as a local certificate using Postman as the API client. PowerShell is used for the Base64 encoding.

To upload a PKCS 12 certificate using an API:

1. In PowerShell , encode the PKCS 12 certificate to Base64:

   ```
   cd C:\users\username\desktop
   $pkcs12cert = get-content 'C:\users\path\to\certificate\certificatename.p12' -Encoding Byte
   [System.Convert]::ToBase64String($pkcs12cert) | Out-File ‘base12encodedcert.txt’
   ```

   These three lines of code do the following:

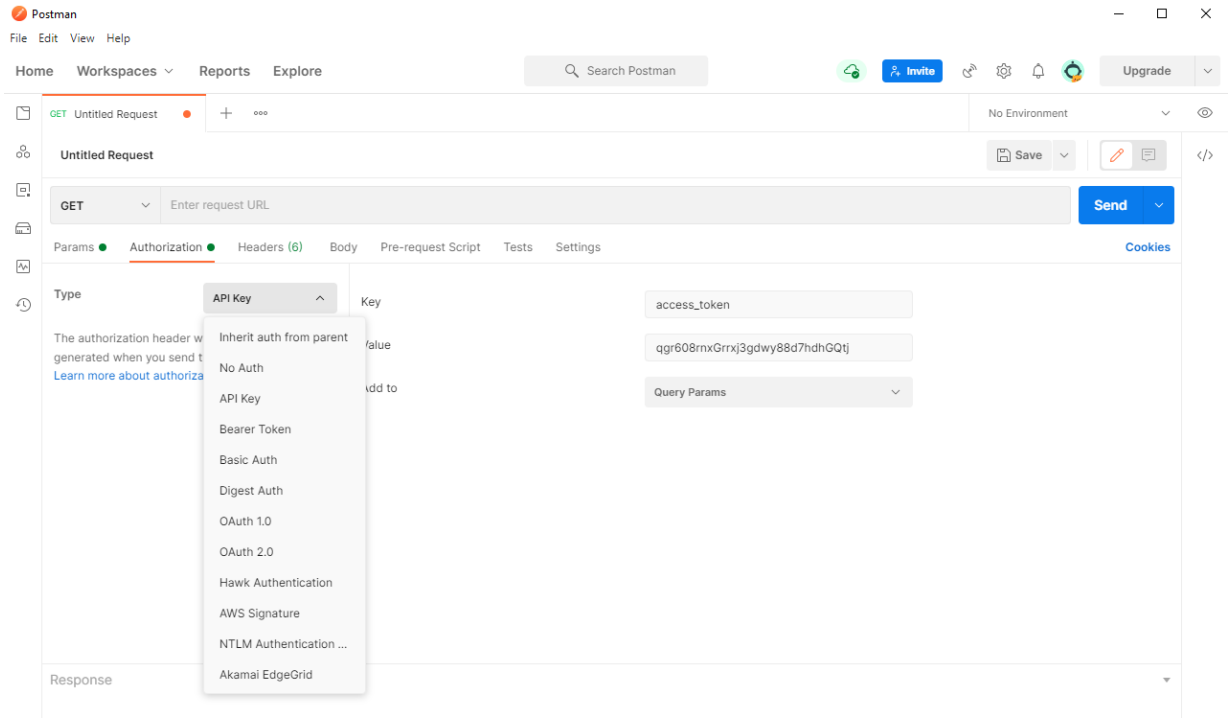
   a. Changes to working directory to the location where the encoded certificate will be created. In this example, it is the desktop.

   b. Creates a variable called `pkcs12cert` and defines it as the certificate file by specifying the full path to the certificate.

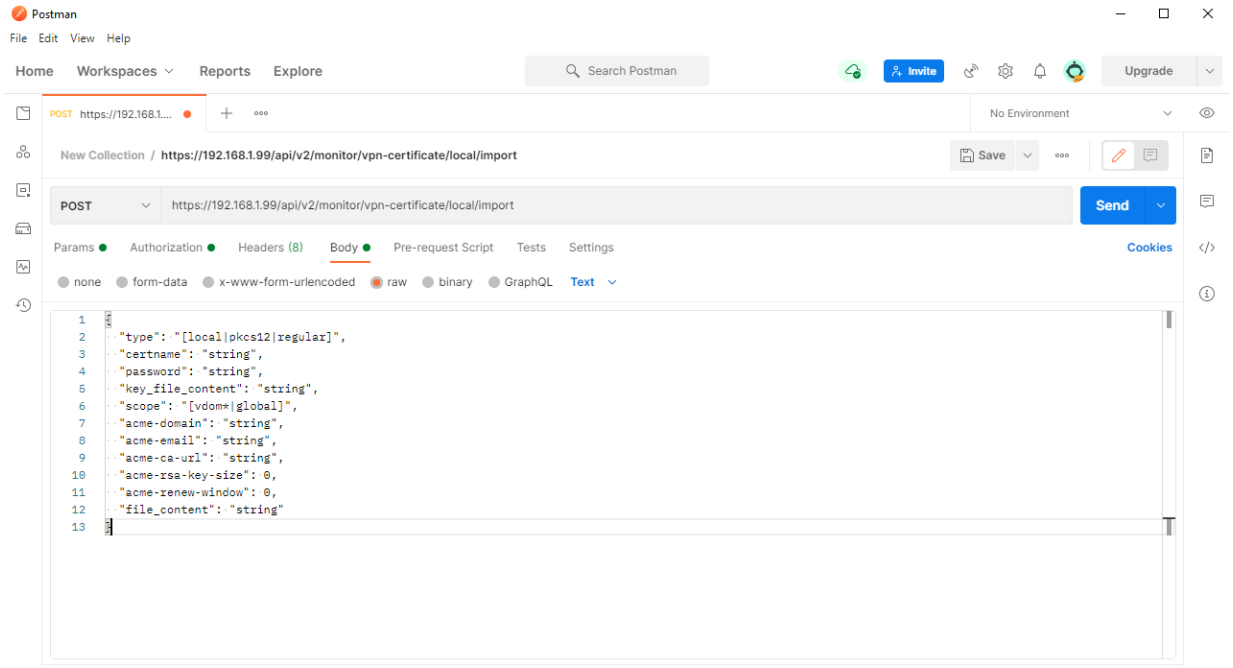
   c. Creates a text file called `base12encodedcert` at the location specified in the first step. You will copy and paste the contents of this as `file_content` later in Postman.

2. Generate an API token on the FortiGate by creating a REST API user. See Generate an API token on the Fortinet Developer Network. A subscription to the Fortinet Developer Network is required to view this topic.

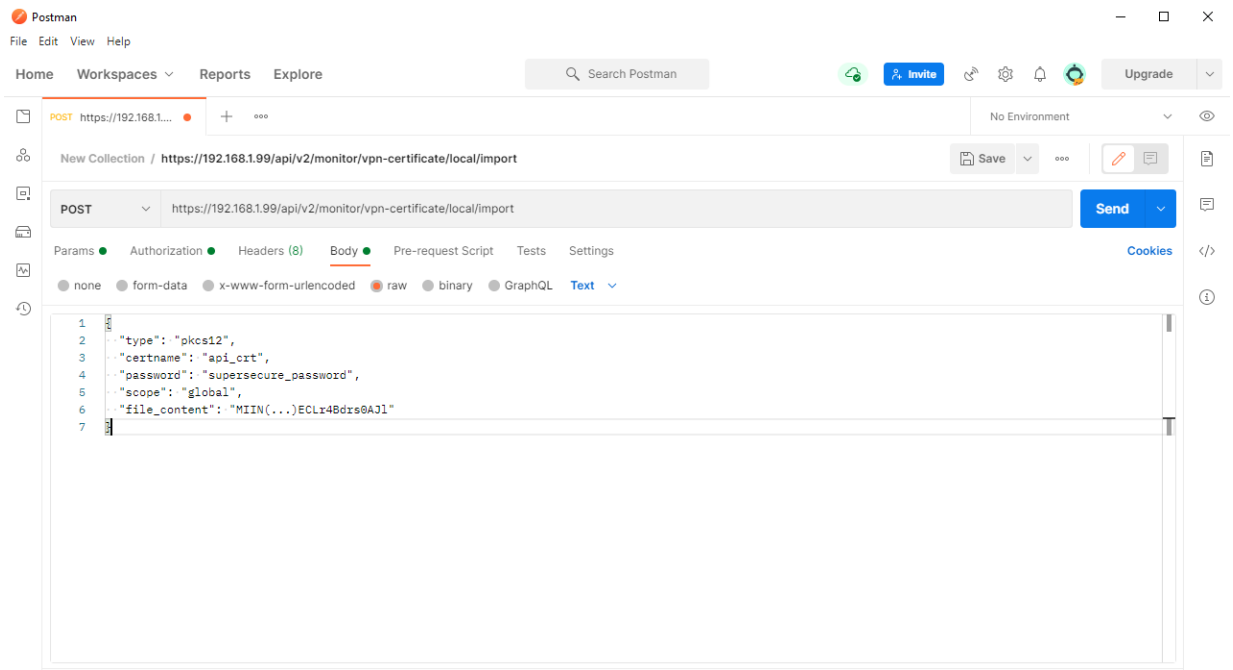
3. Open Postman and create a new request:
   a. Click the *+*.
   b. Click the *Authorization* tab and in the *Type* dropdown, select *API Key*.
   c. For *Key*, enter *access_token* and enter the *Value* for the API user.
   d. For *Add to*, select *Query Params*.



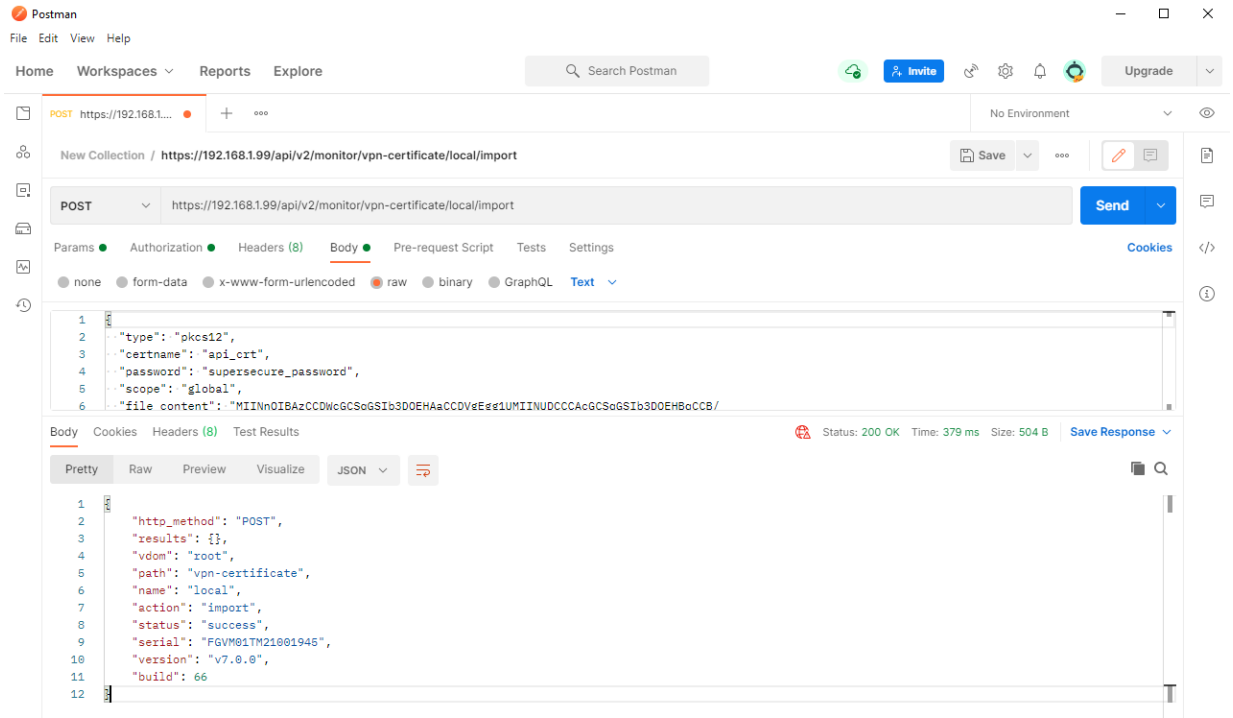
4. In the HTTP request dropdown, change the request from *GET* to *POST*, and enter the FortiGate's IP address and the URL of the API call.
5. Click the *Body* tab, and copy and paste the API parameters.



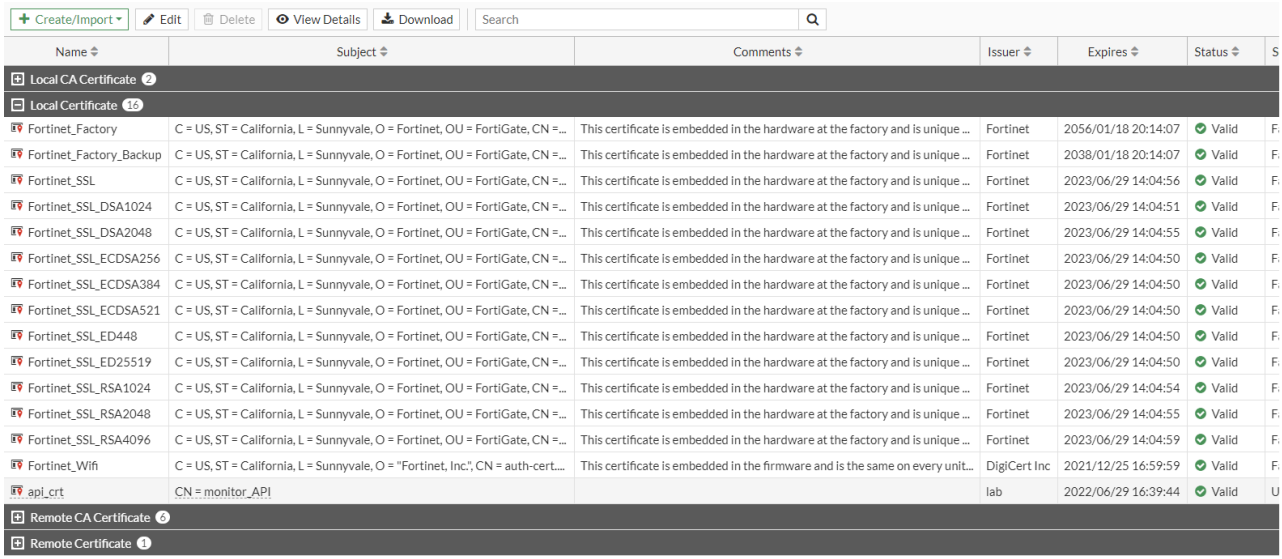
6. Remove unnecessary parameters (ACME related parameters and `key_file_content`) and enter the correct settings for your certificate. Copy and paste the contents of the file generated by PowerShell earlier into `file_content`.



7. Click *Send*. The lower window will return the results.



8. In FortiOS, go to *System* > *Certificates* and verify that the uploaded certificate is shown in the table (*api_crt*).



Name	Subject	Comments	Issuer	Expires	Status
Local CA Certificate 2					
Local Certificate 16

Remote Certificate 1					

To debug using the HTTPS daemon:

```
# diagnose debug reset
# diagnose debug enable
# diagnose debug application httpsd -1
<output>
# diagnose debug disable
```

Procuring and importing a signed SSL certificate

A signed SSL certificate can be used when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

Before creating a certificate, you must have a registered domain. With a valid FortiGuard subscription, FortiDDNS can be used to register a domain; see DDNS on page 308 for more information.

Follow these instructions to purchase, import, and use a signed SSL certificate:

- Obtain, setup, and download an SSL certificate package from a certificate authority
- Generate a CSR
- Import the signed certificate into your FortiGate
- Configure your FortiGate to use the signed certificate

Obtain, setup, and download an SSL certificate package from a certificate authority

SSL certificate packages can be purchased from any Certificate Authority (CA), such as DigiCert, GoDaddy, or GlobalSign.

Let's Encrypt can be used to generate a free, trusted SSL certificate. See Automatically provision a certificate on page 3419 for more information.

A third party CA might not sign a certificate with an intranet name or IP address. For details, see Can I request a certificate for an intranet name or IP address?

The process for purchasing, setting up, and downloading a certificate will vary depending on the CA that is used, and if a CSR must be generated on the FortiGate.

To purchase a certificate package:

1. Create an account with your chosen vendor, or use the account that you used to purchase your domain.
2. Locate the SSL Certificates page.
3. Purchase a basic SSL certificate for domain validation only. If required, a more secure SSL certificate can be purchased.
4. If required, load the CSR, either by uploaded the text file or copying and pasting the contents into the requisite text box. See Generate a CSR on page 3439 for information on generating the CSR on the FortiGate.
5. If required, set the server type to *Other*.
6. Verify the certificate per the requirements of the CA.
7. Download the signed certificate to your computer.

8. Import the signed certificate into your FortiGate; see Import the signed certificate into your FortiGate on page 3439.

Generate a CSR

Some CAs can auto-generate the CSR during the signing process, or provide tools for creating CSRs. If necessary, a CSR can be created in your FortiGate device's GUI.

To generate a CSR on your FortiGate:

1. Go to *System* > *Certificates* and select *Create/Import* > *Generate CSR*.
2. Configure the CSR:
   - Ensure that the certificate has a unique name.
   - Set the *ID Type* to *Domain Name* and enter a *Domain Name*.
   - An email address is required.
   - Ensure that the *Key Size* is set to *2048 Bit*.
   - Set the *Enrollment Method* to *File Based*.
3. Click *OK*.
   The CSR will be added to the certificate list with a status of *PENDING*.
4. In the certificate list, select the new CSR then click *Download* to save the CSR to your computer.
   The CSR file can be opened in any text editor, and will resemble the following:

```
-----BEGIN CERTIFICATE REQUEST-----
MIICuTCCAaECAQAwSzEcMBoGA1UEAxMTZm9ydGlzc2x2cG5kZW1vLmNvbTErMCkG

-----END CERTIFICATE REQUEST-----
```

Import the signed certificate into your FortiGate

To import the signed certificate into your FortiGate:

1. Unzip the file downloaded from the CA.
   There should be two CRT files: a CA certificate with *bundle* in the file name, and a local certificate.
2. Import the local certificate:

   a. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
   b. Click *Import Certificate*.
   c. Set *Type* to *Local Certificate*, upload the local certificate file, then click *Create*. See Local certificate on page 3426 for more information.

      The status of the certificate will change from *PENDING* to *OK*.
3. Import the CA certificate:
   a. Go to *System* > *Certificates* and select *Create/Import* > *CA Certificate*.
   b. Set the *Type* to *File*, upload the CA certificate file, then click *OK*. See CA certificate on page 3430 for more information.

      The CA certificate will be listed in the *CA Certificates* section of the certificates list.

Configure your FortiGate to use the signed certificate

After the signed certificates have been imported, you can use it when configuring SSL VPN, for administrator GUI access, and for other functions that require a certificate.

To configure your FortiGate to use the signed certificate for SSL VPN:

1. Go to *VPN* > *SSL-VPN Settings*.
2. Set *Server Certificate* to the new certificate.
3. Configure other settings as needed.
4. Click *Apply*.

For more information on configuring SSL VPN, see SSL VPN on page 2618 and the Setup SSL VPN video in the Fortinet Video Library.

To configure using the certificate for administrator GUI access in the CLI:

```
config system global
    set admin-server-cert fortisslvpndemo
end
```

To change the certificate that is used for administrator GUI access in the GUI:

1. Go to *System* > *Settings*.
2. In the *Administration Settings* section, change *HTTPS server certificate* as needed.
3. Click *Apply*. You will be logged out of FortiOS.

Microsoft CA deep packet inspection

In most production environments, you want to use a certificate issued be your own PKI for deep packet inspection (DPI). This is due to the trust relationship involved with certificates and the access (trust) they are given. As such, it is extremely important to take precautions that these certificates are not misused and in the event that they are compromised, you retain the ability to revoke their validity.

Microsoft PKI best practice utilizes a two-tier system where a Root CA signs a sub-CA (or Issuing CA, named after its role), and this Sub-CA is used to sign (sometimes referred to as *generate*) end-entity certificates, such as the certificate used by FortiGates for DPI. The purpose of this two tier system is to keep the Root CA offline so that the private key of the Root CA is better protected from being compromised.

If a sub-CA becomes compromised, it can be removed from the PKI. If the Root CA becomes compromised, the entire PKI must be replaced. Therefore, the following steps take place on a sub-CA of the Root CA for your organization.

Complete the following steps to create your own sub-CA certificate and use it for DPI:

1. Create a Microsoft sub-CA certificate
2. Export the certificate and private key
3. Import the certificate and private key into the FortiGate
4. Configure a firewall policy for DPI
5. Verify that the sub CA certificate is being used for DPI

The FortiGate firewall uses information in the original web server certificate (e.g. www.google.com), then issues a new certificate signed by the DPI certificate. The FortiGate then sends this new certificate along with the issuing DPI certificate to the client's web browser when the SSL session is being established.

The browser verifies that the web server certificate (e.g.www.google.com) was issued by a valid CA, then looks for the issuing CA of the DPI certificate in its local trusted Root-CA store to complete the path to trusted Root-CA. In this case, the issuing CA is a sub-CA of the Root-CA. The end device will need a trust chain to ensure it understands that this sub-CA is approved by the Root-CA that the device trusts.

The Root-CA certificate is normally deployed to all client PCs in the Windows domain, so the client can complete the certificate path up to a trusted root CA. Note that this is the public key of the Root-CA. The FortiGate now controls and can inspect the two HTTPS sessions: one with the external web server, and one with the client PC.

Create a Microsoft sub-CA certificate

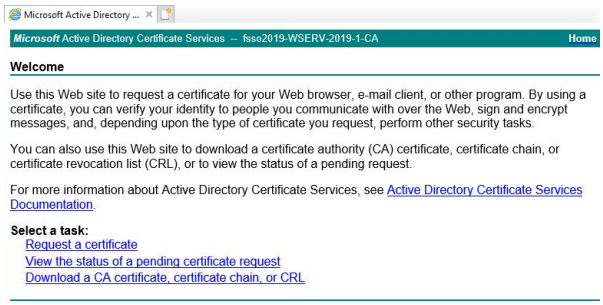
A Microsoft sub-CA certificate can be created directly on a Microsoft sub-CA server, or remotely using a web browser.

Creating a certificate remotely requires that the web enrollment option is configured on the Microsoft sub-CA server. Remote certificate requests require HTTPS; requests are not allowed with HTTP.

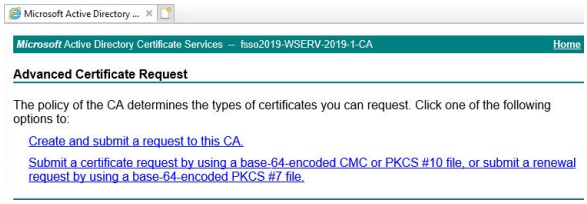
To create a Microsoft sub CA certificate remotely:

1. Open a web browser and go to one of the following URLs:
   - *https://<FQDN-CA-server>/CertSrv*
   - *https://<IP-CA-server>/CertSrv*

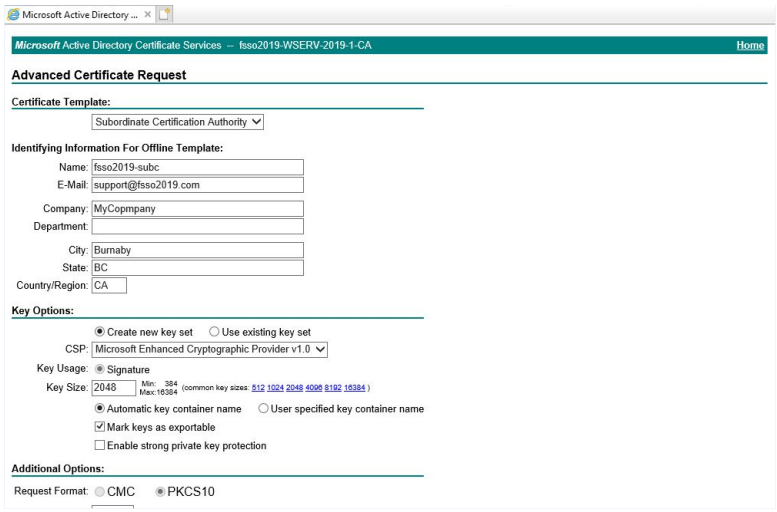
2. Log in to a domain administrator account that has web enrollment rights.



3. Click *Request a certificate*.
4. Click *advanced certificate request*.



5. Click *Create and submit a request to this CA*, then click *Yes* in the *Web Access Confirmation* warning.
6. For the *Certificate Template*, select *Subordinate Certification Authority*.
7. Enable *Mark keys as exportable*.
8. Fill out the remaining information according to your security policy.

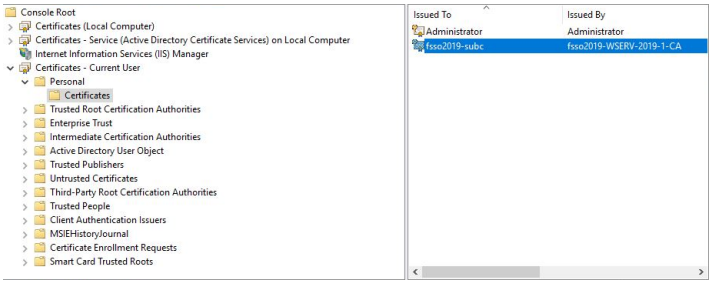


9. Submit the request.
10. Click *Yes* in the *Web Access Confirmation* warning.
11. Click *Install this certificate*.
    The certificate and private key are located in the current user's certificate store.

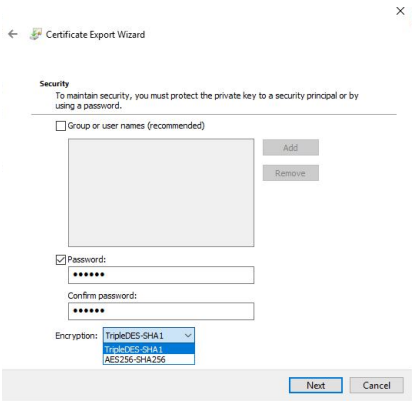
Export the certificate and private key

To export the certificate and private key:

1. Open the Microsoft Management Console (MMC) and add the *Certificate Snap-in*.
2. Go to the user's certificate store to locate the sub CA certificate that you just installed.



3. Right-click the certificate and select *All Tasks* > *Export*.
4. Click *Next* to start the *Microsoft Certificate Export Wizard*.
5. Follow the steps in the wizard:
   - When asked, select *Yes, export the private key*.
   - Only the PKCS #12 (.PFX) format is available, and it requires a password.
   - When selecting the encryption type, select *TripleDES-SHA1* if you are using an older version of FortiOS (5.6.9 and earlier). Otherwise, select *AES256-SHA256*.



6. Complete the wizard, and save the DPI certificate to a local folder.

Import the certificate and private key into the FortiGate

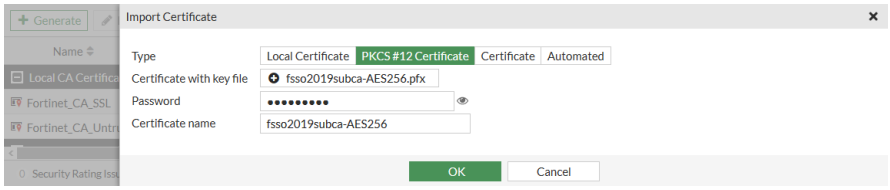
The certificate can be imported from the local computer using the GUI, or from a TFTP server using the CLI.

After importing the certificate, you can view it in the GUI to verify that it was successfully imported.

To import the certificate and private key into the FortiGate in the GUI:

1. Go to *System* > *Certificates* and select *Create/Import* > *Certificate*.
2. Click *Import Certificate*.
3. Set *Type* to *PKCS #12 Certificate*.
4. Click *Upload*, and locate the certificate on the management computer.

5. Enter the password, then confirm the password.
6. Optionally, customize the *Certificate name*.



7. Click *OK*.

To import the certificate and private key into the FortiGate in the CLI:

```
execute vpn certificate local import tftp fsso2019subca-AES256.pfx <tftp_IP> p12 <password>
```

To verify that the certificate was imported:

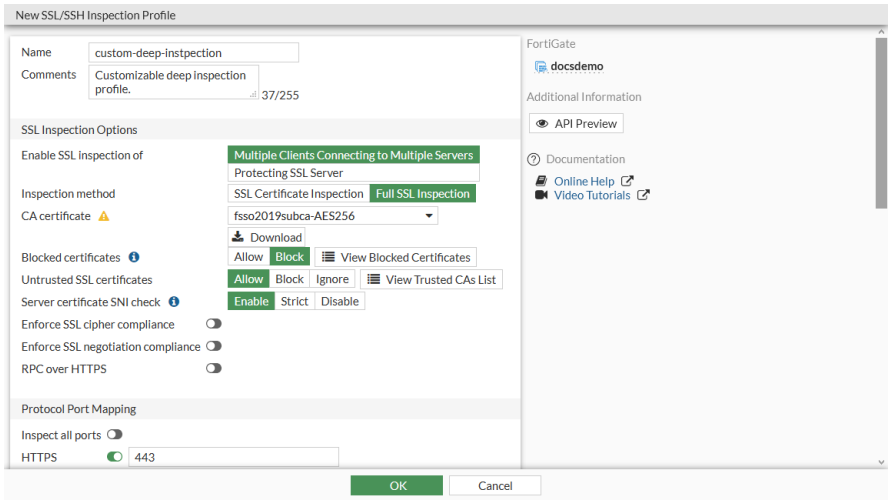
1. Go to *System* > *Certificates*.
2. Locate the newly imported certificate in the table.
3. Select the certificate and click *View Details* to view the certificate details.

Configure a firewall policy for DPI

The certificate is used in an SSL/SSH inspection profile that is then used in a firewall policy.

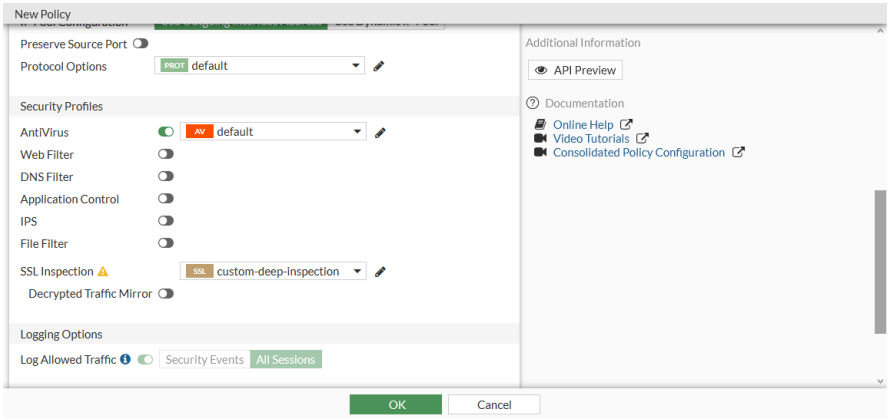
To configure a firewall policy for DPI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
2. Configure the inspection profile, selecting the new certificate



3. Click *Apply*.
4. Go to *Policy & Objects* > *Firewall Policy*.
5. Create a new policy, or edit an existing policy.

6. In the *SSL Inspection* field, select the new SSL inspection profile.



7. Configure the remaining settings as needed.
8. Click *OK*.

Verify that the sub CA certificate is being used for DPI

You can verify that the certificate is being used for resigning web server certificates when a user connects to an external HTTPS website.

To verify that the certificate is being used:

1. On a client PC that is behind the FortiGate, go to an external HTTPS website.
   When connecting to the website, no certificate warning should be shown.
2. In your web browser, view the certificate and certificate path.
   The methods for doing this vary depending on the browser. See your browsers documentation for information.

Administrative access using certificates

Certificates can be used for administrative authentication.

Generated key pairs can also be used for this authentication. See Public key SSH access on page 3040 for information about generating a key pair.

To log in to the FortiGate with a certificate private key:

1. On the PC, generate a certificate.
2. In FortiOS, import the PEM file for the remote certificate:

```
# execute vpn certificate remote import tftp certificate.pem 172.16.200.55
```

3. Display the imported remote certificate:

```
config certificate remote
    edit "REMOTE_Cert_1"
    next
end
```

4. Apply the remote certificate to the administrative user:

```
config system admin
    edit "admin1"
        set accprofile "prof_admin"
        set vdom "root"
        set ssh-certificate "REMOTE_Cert_1"
        set password ************
    next
end
```

5. On the PC, verify that the administrator can log in to the FortiGate with the SSH certificate:

```
root@PC05:~# ssh -i certificate-private.pem admin1@172.16.200.1
FortiGate-101F $ get system status
Version: FortiGate-101F v7.0.2,build0234,211019 (GA)
```

Creating certificates with XCA

This topic explains how to generate various certificates to be used in conjunction with a FortiGate, including:

- CA certificate
  - Signing server and client certificates
  - Issuing subordinate CAs for deep inspection
- Server certificate
  - SSL/TLS web administration authentication
  - VPN authentication
  - Internal SSL server protection
- Client certificate
  - End user authentication for SSL or IPsec VPN

XCA is an x509 certificate generation tool that handles RSA, DSA, and EC keys, as well as certificate signing requests (PKCS #10) and CRLs.

There are several options for generating and managing certificates. This topic covers basic certificate generation for XCA. It is not a comprehensive guide to its application and does not explore all options available when generating a certificate.

Creating the XCA database

Before creating any certificates, you must create an XCA database to group the certificates in. You should use a different database for each PKI you create.

To create the database:

1. Go to *File* > *New Database*.
2. Select a directory to store the created certificates and keys.
3. Enter a name. The provided password encrypts the private keys and is used to access the XCA database in the future.

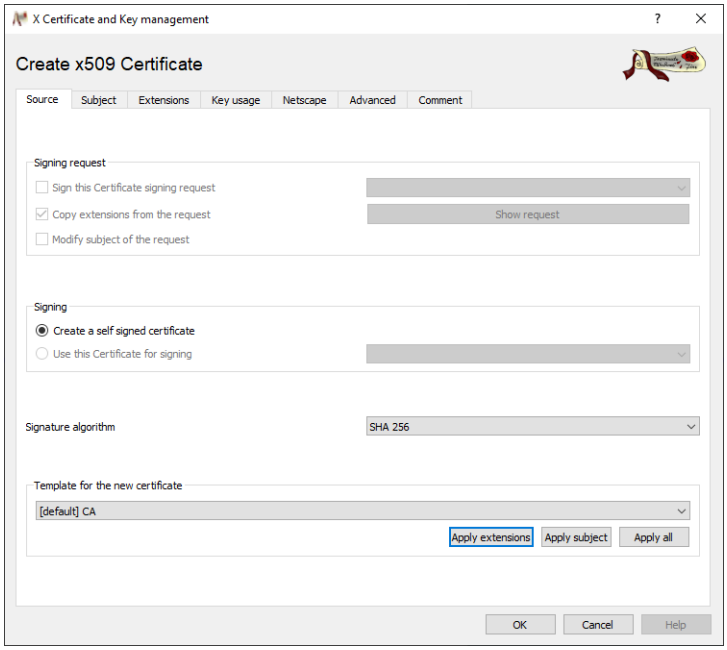
The remaining procedures in this topic assume you are using this XCA database.

Creating a CA certificate

A CA certificate marks the root of a certificate chain. If this CA certificate is trusted by an end entity, any certificates signed by the CA certificate are also trusted.

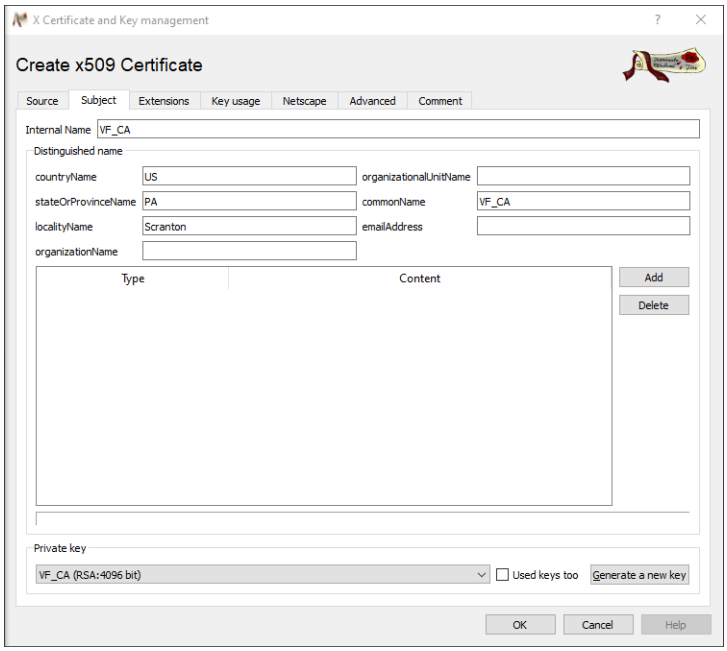
To create a CA certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. Set *Template for the new certificate* to *[default] CA*.
   b. Click *Apply extensions*.



3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter a *commonName*.

c. Optionally, click *Add* to add other distinguished name fields.
d. Since this XCA database does not contain any keys yet, click *Generate a new key*. The *Private key* field is now populated.



4. Optionally, edit the *Extensions* tab:
   a. Adjust the *Time range* if needed.
   b. Click *Apply*.
5. Click *OK*.

Issuing a subordinate CA certificate for deep inspection

Subordinate CA certificates are similar to CA certificates because they are used to sign other certificates to establish trust of the signed certificate's content. This trust of the signed certificate is only valid if the subordinate CA is also trusted by the client.

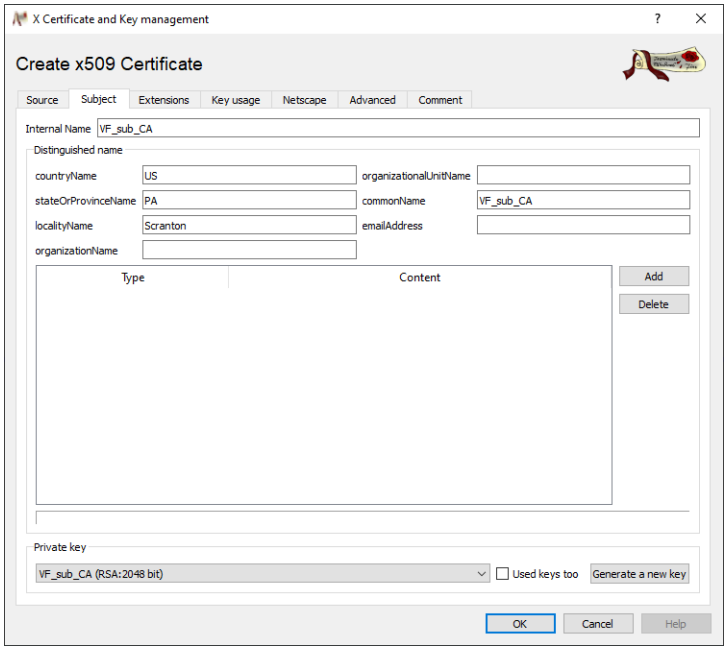
When performing deep inspection on a FortiGate, the FortiGate proxies the connection between the endpoint and the server. This is done transparently so that the end user believes they are communicating with the server, and the server with the client. To do this, when the webpage is requested by a client, the FortiGate must present a certificate that matches the requested website and is trusted by the client.

The certificate presented by the FortiGate is generated on-demand to match the requested website and is signed by this subordinate CA to establish trust with the requesting endpoint. The subordinate CA must be installed on the ForitGate (with the private key) and on the client device (without the private key).

A subordinate CA is used in place of a CA so that it may be revoked as necessary. This is critical since the subordinate CA's private key is exported and becomes susceptible of being compromised. If the CA private key becomes compromised, you would be forced to re-create your entire PKI with a new root CA because root CAs cannot be revoked. See Microsoft CA deep packet inspection on page 3440 for more information about using subordinate CA certificates.

To issue a subordinate CA certificate for deep inspection:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. Set *Use this Certificate for signing* to the CA created previously.
   b. Set *Template for the new certificate* to *[default] CA*.
   c. Click *Apply extensions*.
3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter a *commonName*.
   c. Optionally, click *Add* to add other distinguished name fields.
   d. Click *Generate a new key* to create a new private key for the subordinate CA.



4. Optionally, edit the *Extensions* tab:
   a. Adjust the *Time range* if needed.
   b. Click *Apply*.
5. Click *OK*.

Creating a server host certificate

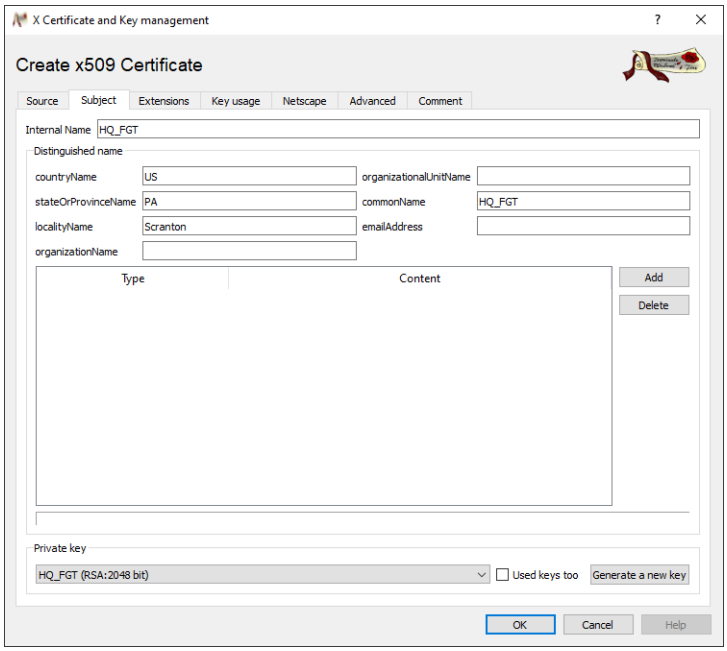
When a CA signs a host certificate, that CA is vouching for the credentials in the certificate. These credentials are what identifies the host.

Some endpoints can generate a certificate signing request (CSR). A CSR is a certificate outline that specifies the details of the endpoint, including its public key. This allows the CA to review the details and sign the request if they are true. This request is then returned or uploaded to the generating endpoint to be used.

Since some endpoints cannot generate their own CSR, you can create the certificate manually in XCA. If you already have a CSR, use the *Certificate signing requests* tab to import and then sign it.

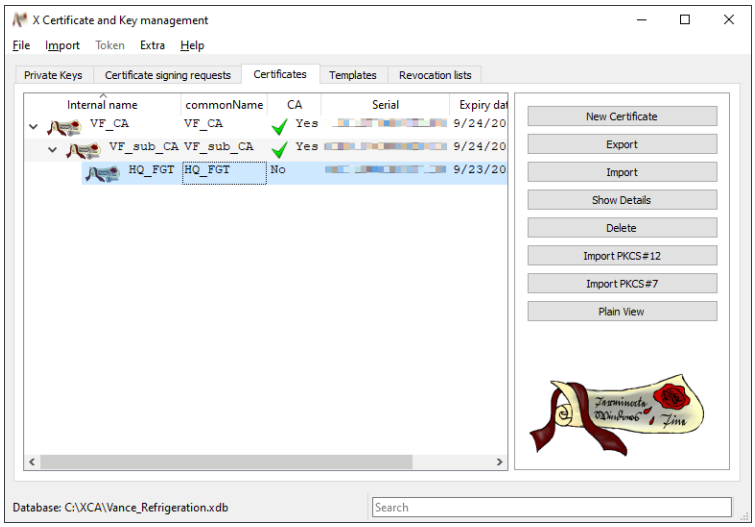
To create a server host certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. Set *Template for the new certificate* to *[default] TLS_server*.
   b. Click *Apply extensions*.
   c. In the *Signing* section, select *Use this Certificate for signing* and select the subordinate CA certificate.
3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter the distinguished name fields as needed.
   c. Click *Generate a new key*.



4. Edit the *Extensions* tab:
   a. For *X509v3 Subject Alternative Name*, enter *email:user@domain.tld*.
5. Click *OK*.

6. Click the *Certificates* tab to view the certificate.



This certificate may be used to identify an SSL or TLS server by uploading the certificate and key pair to the server, such as when the FortiGate presents the administrative webpage or for SSL VPN authentication (see Configure your FortiGate to use the signed certificate on page 3440). Another use case for a server host certificate is to enable SSL server protection so the FortiGate simulates the real server and brokers the connection (see Protecting an SSL server on page 2171).

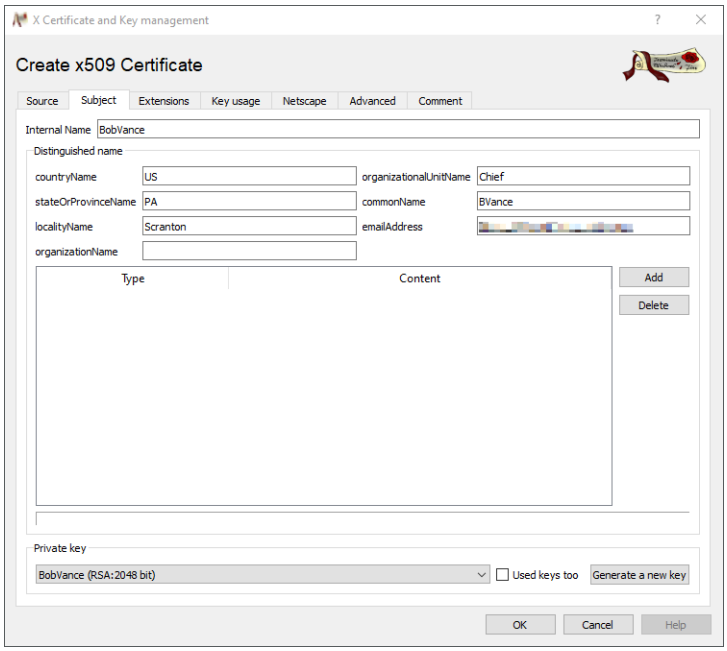
Creating a client host certificate

A client host certificate is used to identify an end entity in a more secure way than a username and password. Once the client host certificate is generated, see SSL VPN with certificate authentication on page 2697 for more information about using the certificate.

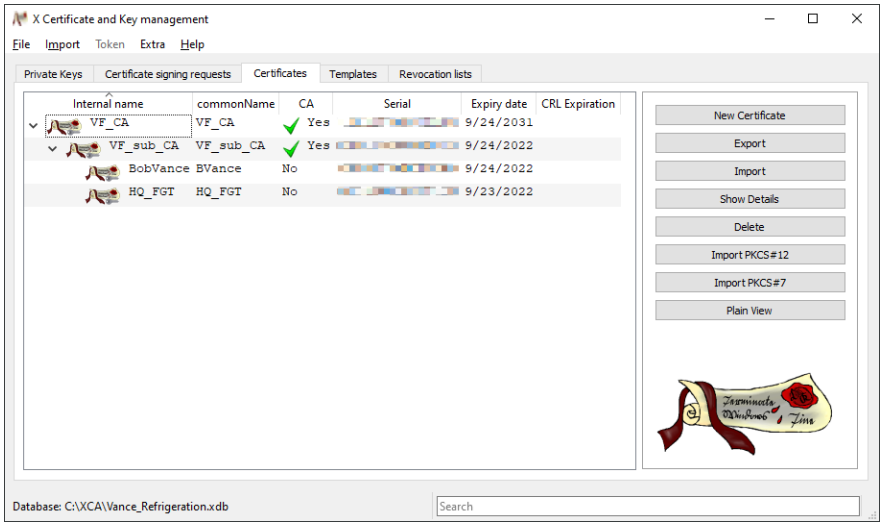
To create a client host certificate:

1. Click the *Certificates* tab, then click *New Certificate*.
2. Edit the *Source* tab:
   a. In the *Signing* section, select *Use this Certificate for signing* and select the CA or subordinate CA.
   b. Set *Template for the new certificate* to *[default] TLS_client*.
   c. Click *Apply extensions*.
3. Edit the *Subject* tab:
   a. Enter an *Internal Name* to reference this certificate within XCA.
   b. Enter the distinguished name fields as needed.

c. Click *Generate a new key*.



4. Click *OK*.
5. Click the *Certificates* tab. The FortiGate and client certificates are listed under the signing CA certificate and are ready to be exported.



6. Select a certificate and click *Export*.
7. Enter the file name and select an export format.
8. Click *OK*.

Certificate formats

Certificate file formats indicate what is contained in the file, how it is formatted, and how it is encoded. See Import a certificate on page 3425 for more information about which formats the FortiGate expects for a given certificate type.

Enrollment over Secure Transport for automatic certificate management

The FortiGate supports Enrollment over Secure Transport (EST) and the RFC 7030 standards when generating a new CSR request, performing automatic renewals, or manually regenerating a certificate. EST provides more security for automatic certificate management than Simple Certificate Enrollment Protocol (SCEP), which is commonly used for certificate enrollment.

Background

SCEP helps automate and simplify the process for obtaining a digital certificate from a certificate authority (CA). However, SCEP does not natively support secure connections, and instead relies on the underlying transport protocol to provide security. EST was developed, which uses TLS to establish a secure communication channel over which subsequent certificate management protocol messages like initial certificate enroll and certificate renewal messages are exchanged.

On the FortiGate, when generating a certificate signing request (CSR), you can use the SCEP method to send the request to an SCEP server, or use EST to send the request to an EST server to be signed by a CA.

To configure the enrollment protocol settings for a local certificate:

```
config vpn certificate local
    edit <name>
        set enroll-protocol est
        set est-server <string>
        set est-ca-id <string>
        set est-http-username <string>
        set est-http-password <string>
        set est-client-cert <certificate>
        set est-server-cert <certificate>
        set est-srp-username <string>
        set est-srp-password <string>
        set est-regeneration-method {create-new-key |use-existing-key}
    next
end
```

`est-server <string>`	Enter the address and port for EST server (such as https://example.com:1234).
`est-ca-id <string>`	Enter the CA identifier of the CA server for signing with EST.
`est-http-username <string>`	Enter the HTTP Authentication username for signing with EST.
`est-http-password <string>`	Enter the HTTP Authentication password for signing with EST.
`est-client-cert <certificate>`	Enter the certificate used to authenticate this FortiGate to the EST server.

`est-server-cert <certificate>`	Enter the EST server's certificate that has to be verifiable by the specified certificate on the FortiGate.
`est-srp-username <string>`	Enter the EST SRP authentication username.
`est-srp-password <string>`	Enter the EST SRP authentication password.
`est-regeneration-method {create-new-key |use-existing-key}`	EST behavioral options during re-enrollment. • `create-new-key`: Create new private key during re-enrollment. • `use-existing-key`: Reuse existing private key during re-enrollment.

To manually generate a CSR for the EST server to be signed by a CA:

```
# execute vpn certificate local generate est {reqired_1} {reqired_2} {reqired_3} [options]
```

option 1 (required)	Name of the local server certificate.
option 2 (required)	Cryptography algorithm: `rsa-1024`, `rsa-1536`, `rsa-2048`, `rsa-4096`, `ec-secp256r1`, `ec-secp384r1`, or `ec-secp521r1`.
option 3 (required)	URL and listening port of the remote EST responder.
option 4 (optional)	Server certificate subject in the certificate enroll request. Separate fields by a comma (,).
option 5 (optional)	Subject Alternative Name (SAN). This can be an FQDN and/or IP. Use DNS:<FQDN>,IP:<IP_address> for example. If the issuing CA does not support SAN, this option will be ignored. Separate fields by a comma (,).
option 6 (optional)	HTTP authentication username.
option 7 (optional)	HTTP authentication password.
option 8 (optional)	CA identifier.
option 9 (optional)	CA certificate used to verify the remote EST responder server certificate and certificates issued by a remote PKI.
option 10 (optional)	Password for the private key.
option 11 (optional)	Client certificate.
option 12 (optional)	Source IP for communications to the CA server.
option 13 (optional)	TLS-SRP username.
option 14 (optional)	TLS-SRP password.

Example 1: enrolling for a new FortiGate server certificate with EST

To enroll for a new FortiGate server certificate with EST:

1. Verify that the FortiGate can communicate with remote EST responder (testrfc7030.com):

```
# execute ping testrfc7030.com
PING testrfc7030.com (54.70.32.33): 56 data bytes
64 bytes from 54.70.32.33: icmp_seq=0 ttl=31 time=13.6 ms
64 bytes from 54.70.32.33: icmp_seq=1 ttl=31 time=19.1 ms
64 bytes from 54.70.32.33: icmp_seq=2 ttl=31 time=16.5 ms
^C
--- testrfc7030.com ping statistics ---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip min/avg/max = 13.6/16.4/19.1 ms
```

2. Start running debugs to track the progress of the enrollment:

```
# diagnose debug application est -1
# diagnose debug enable
```

3. Create a new server CSR file locally and send it to the remote EST responder:

```
# execute vpn certificate local generate est est-test101 ec-secp256r1
https://testrfc7030.com:8443 CN=firewall-portal1,DC=local,DC=COM DNS:firewall-
portal1.local.ca,IP:172.18.60.184 estuser estpwd G_CA_Cert_1
```

The CA certificate (G_CA_Cert_1) is used to verify the remote EST responder server certificate and certificates issued by a remote PKI.

testrfc7030.com is a self-signed CA, which by default is not in the local trusted root store and must be imported prior to enrollment.

If the CA that issues the server certificate is not in the local root store, an error would appear in the debug messages:

```
# diagnose debug application est -1
# diagnose debug enable
...
[1795] est_curl_req: Error buf: SSL certificate problem: self-signed
certificate in certificate chain,
[2402] est_simple_enroll: Failed to get ca certs: -1.
...
```

4. If the enrollment was successful, in a few seconds, a `Done` message appears. Verify the debugs to view the enrollment process.
   a. The remote CA's certificate is retrieved and stored locally in the EST configuration after being verified with the CA in the trusted root store:

```
[1962] __est_curl_set_auth: trace
[2046] __est_curl_set_auth: HTTP Authentication username is set
[2050] __est_curl_set_auth: HTTP Authentication password is set
```

```
[2075] __est_get_ca_certs: ============STARTED============
[1728] est_curl_req: URL: https://testrfc7030.com:8443/.well-known/est/cacerts
[1776] est_curl_req: HTTP GET
[143] __curl_ssl_ctx_finalizer: global CAs are loaded.
[165] __curl_ssl_ctx_finalizer: SSL_CTX ex data is set.
[1651] curl_header_debug_func: Header received:HTTP/1.1 200 OK
```

b. The debug displays the CA used by the remote EST responder:

```
[1191] save_pkcs7_certs: Saving pkcs7 response
[505] est_print_pkcs7: Certs: (1 in total)
[507] est_print_pkcs7: Cert 1:
[427] est_print_x509:         Version: 3 (0x2)
        Serial Number:
            ab:e8:32:e1:f6:6a:6b:43
        Issuer: CN=estExampleCA
        Subject: CN=estExampleCA
        X509v3 extensions:
            X509v3 Basic Constraints:
                CA:TRUE
            X509v3 Subject Key Identifier:
                1A:DF:39:84:C2:56:E6:6C:CF:2A:B4:26:A5:FD:0C:D2:43:F5:3D:3E

[1220] save_pkcs7_certs: Received 1 certs
[1228] save_pkcs7_certs: Saving cert(s):
        is_global:1
        est_url:https://testrfc7030.com:8443
        source_ip:NULL
        ca_identifier:NULL
```

c. The CA certificate is imported. FortiOS sends a query to learn about the attributes supported by the CA in the certificate request and will then create the CSR accordingly:

```
[1288] save_pkcs7_certs: CA certs imported!
[2101] __est_get_csr_attrs: ============STARTED============
[1728] est_curl_req: URL: https://testrfc7030.com:8443/.well-known/est/csrattrs
[1776] est_curl_req: HTTP GET
[1651] curl_header_debug_func: Header received:HTTP/1.1 200 OK
[1651] curl_header_debug_func: Header received:Status: 200 OK
[1651] curl_header_debug_func: Header received:Content-Type: application/csrattrs
[1651] curl_header_debug_func: Header received:Content-Transfer-Encoding: base64
[1651] curl_header_debug_func: Header received:Content-Length: 57
[1651] curl_header_debug_func: Header received:
[1787] est_curl_req: Response 200
[1788] est_curl_req: Buffer:MCYGBysGAQEBARYGCSqGSIb3DQEJAQYFK4EEACIGCWCGSAFlAwQCAg==
[1439] decode_csrattrs_callback: Decoding csrattrs, resp->len: 57
[1474] decode_csrattrs_callback: Object: 1.3.6.1.1.1.1.22 undefined
[1474] decode_csrattrs_callback: Object: 1.2.840.113549.1.9.1 emailAddress
[1474] decode_csrattrs_callback: Object: 1.3.132.0.34 secp384r1
[1474] decode_csrattrs_callback: Object: 2.16.840.1.101.3.4.2.2 sha384
```

d. The CSR information is generated, which is sent to the remote EST responder:

```
        est_ctx: is_global:1
        vfid:0
        svr_original_url:https://testrfc7030.com:8443
        svr_hostinfo:Exists
        ca_identifier:(null)
        http_username:estuser
        http_password:*
        clt_cert:(null)
        svr_cert:(null)
        srp_username:(null)
        srp_password:(null)
        source_ip:(null)
        need_pop:0
        newcert_name:est-test101
        passwd:(null)
        rsa_keysize:0
        ec_curvename:secp256r1
        subject:CN=firewall-portal1,DC=local,DC=COM
        sub_alt_name:DNS:firewall-portal1.local.ca,IP:172.18.60.184
        svr_cert_x509:NULL
        csr_attrs:Exists
        csr:NULL
        pkey:NULL
        header_ptr:NULL
        tmp_p10:NULL
[2259] __est_simple_enroll: ============STARTED============
```

e. The CSR is sent to the EST responder:

```
[1728] est_curl_req: URL: https://testrfc7030.com:8443/.well-known/est/simpleenroll
[1753] est_curl_req: HTTP POST
[1651] curl_header_debug_func: Header received:HTTP/1.1 200 OK
[1651] curl_header_debug_func: Header received:Status: 200 OK
[1651] curl_header_debug_func: Header received:Content-Type: application/pkcs7-mime;
smime-type=certs-only
[1651] curl_header_debug_func: Header received:Content-Transfer-Encoding: base64
[1651] curl_header_debug_func: Header received:Content-Length: 585
[1651] curl_header_debug_func: Header received:
```

f. The CA issues the certificate and sends it back in a PKCS #7 structure:

```
[1787] est_curl_req: Response 200
[1788] est_curl_req:
Buffer:MIIBqwYJKoZIhvcNAQcCoIIBnDCCAZgCAQExADALBgkqhkiG9w0BBwGgggGAMIIB
fDCCASOgAwIBAgIDB0aXMAoGCCqGSM49BAMCMBcxFTATBgNVBAMTDGVzdEV4YW1w
...
```

g. The FortiGate decodes and displays the attributes of the certificate, then saves the certificate:

```
[1191] save_pkcs7_certs: Saving pkcs7 response
[505] est_print_pkcs7: Certs: (1 in total)
[507] est_print_pkcs7: Cert 1:
[427] est_print_x509:         Version: 3 (0x2)
```

```
        Serial Number: 476823 (0x74697)
        Issuer: CN=estExampleCA
        Subject: CN=firewall-portal1
        X509v3 extensions:
            X509v3 Basic Constraints:
                CA:FALSE
            X509v3 Key Usage:
                Digital Signature
            X509v3 Subject Key Identifier:
                9B:F8:39:D5:21:E6:FF:49:FF:AC:02:57:5B:FC:4C:1A:8B:1E:5D:8F
            X509v3 Authority Key Identifier:

[2408] est_simple_enroll: POST ret:0
[592] est_ctx_clear_tmp_data: trace
Done.
```

Example 2: automatically renewing a FortiGate server certificate with EST

When the time for certificate renewal is up, the FortiGate will use the existing EST parameters to perform an automatic renewal. This example demonstrates the renewal process through debugs.

To automatically renew a FortiGate server certificate with EST:

1. Verify the current local certificate configuration:

```
config vpn certificate local
(local) # get est-test101
name                : est-test101
password            : *
comments            :
private-key         : *
certificate         :
        Subject:     CN = firewall-portal1
        Issuer:      CN = estExampleCA
        Valid from:  2023-04-06 22:37:34  GMT
        Valid to:    2024-04-05 22:37:34  GMT
        Fingerprint: AE:67:11:CF:7D:F9:57:A4:09:8B:55:0A:F1:B1:7A:CF
...
state               : OK
range               : global
source              : user
source-ip           : 0.0.0.0
ike-localid-type    : asn1dn
enroll-protocol     : est
est-server          : https://testrfc7030.com:8443
est-ca-id           :
est-http-username   : estuser
est-http-password   : *
est-client-cert     :
est-server-cert     :
est-srp-username    :
est-srp-password    :
auto-regenerate-days: 0
auto-regenerate-days-warning: 0
```

   Note that the current `Valid to` date and time is `2024-04-05 22:37:34 GMT`, which is one year from the issue date.

2. Start running debugs to track the progress of the renewal:

```
# diagnose debug application est -1
# diagnose debug enable
```

3. For demonstration purposes, update the `auto-regenerate-days` setting to 364 days to trigger the automatic renewal on the FortiGate:

```
config vpn certificate local
    edit est-test101
        set auto-regenerate-days 364
    next
end
```

4. Verify the debugs to confirm that the certificate was renewed.
   a. The FortiGate uses the content of the current certificate to create a new CSR. User credentials used for the initial enrollment are stored in local certificate configuration, but they are not used for

renewal:

```
[1024] reconstruct_est_ctx: Reconstruction succeeded
est_ctx:        is_global:1
        vfid:0
        svr_original_url:https://testrfc7030.com:8443
        svr_hostinfo:NULL
        ca_identifier:
        http_username:estuser
        http_password:*
        clt_cert:
        svr_cert:
        srp_username:
        srp_password:
        source_ip:(null)
        need_pop:0
        newcert_name:est-test101
        passwd:f51da8548af5fef820edfe6267b0c178e76f7c3eae40ee0900318fc77ab6bd
        rsa_keysize:0
        ec_curvename:(null)
        subject:(null)
        sub_alt_name:(null)
        svr_cert_x509:NULL
        csr_attrs:NULL
        csr:NULL
        pkey:NULL
        header_ptr:NULL
        tmp_p10:NULL
```

b. The FortiGate sends the current server certificate for authentication/authorization and not the username/password used for initial enrollment:

```
[2453] est_simple_reenroll: Try to use est-test101 as client cert to authenticate
[1962] __est_curl_set_auth: trace
[2011] __est_curl_set_auth: Warning: cert est-test101 may not have the correct key usage
for TLS client authentication
[2014] __est_curl_set_auth: Will use cert est-test101 to prove my identity
...
[1651] curl_header_debug_func: Header received:
[1787] est_curl_req: Response 200

[1474] decode_csrattrs_callback: Object: 1.3.132.0.34 secp384r1
[1474] decode_csrattrs_callback: Object: 2.16.840.1.101.3.4.2.2 sha384
est_ctx:        is_global:1
        vfid:0
        svr_original_url:https://testrfc7030.com:8443
        svr_hostinfo:Exists
        ca_identifier:
        http_username:estuser
        http_password:*
```

```
        clt_cert:est-test101
        svr_cert:
        srp_username:
        srp_password:
        source_ip:(null)
        need_pop:0
        newcert_name:est-test101
        passwd:f51da8548af5fef820edfe6267b0c178e76f7c3eae40ee0900318fc77ab6bd
        rsa_keysize:0
        ec_curvename:(null)
        subject:(null)
        sub_alt_name:(null)
        svr_cert_x509:NULL
        csr_attrs:Exists
        csr:NULL
        pkey:NULL
        header_ptr:NULL
        tmp_p10:NULL
[2274] __est_simple_reenroll: ============STARTED============
```

c. The CSR for renewal is successfully generated:

```
[965] est_generate_csr_from_cert: Successfully generated CSR for est-test101

            X509v3 Authority Key Identifier:
                1A:DF:39:84:C2:56:E6:6C:CF:2A:B4:26:A5:FD:0C:D2:43:F5:3D:3E

[827] est_cmdb_update_cert: Cert est-test101 updated in CMDB
[1276] save_pkcs7_certs: The cert is saved!
[592] est_ctx_clear_tmp_data: trace
[2477] est_simple_reenroll: POST ret:0
[592] est_ctx_clear_tmp_data: trace
```

5. Verify the renewed local certificate configuration:

```
config vpn certificate local
(local) # get est-test101
name                : est-test101
password            : *
comments            :
private-key         : *
certificate         :
        Subject:     CN = firewall-portal1
        Issuer:      CN = estExampleCA
        Valid from:  2023-04-06 22:55:09  GMT
        Valid to:    2024-04-05 22:55:09  GMT
        Fingerprint: D9:51:6C:EF:04:E9:79:8D:A0:EE:10:23:4A:F4:46:B7
        Root CA:     No
        Version:     3
        Serial Num:
                07:46:a5
        Extensions:
                Name:     X509v3 Basic Constraints
                Critical: no
                Content:
```

Note that the `Valid to` date and time is now `2024-04-05 22:55:09 GMT`.

Example 3: manually regenerating a local certificate with EST

Note that manually regenerating the certificate will not generate a new server key pair.

To manually regenerate a local certificate with EST:

1. Run the following command:

```
# execute vpn certificate local generate est est-test101
Certificate 'est-test101' already exists, re-generate will ignore all the options you have
provided.
Are you sure to re-generate the certificate?
Do you want to continue? (y/n) y
```

2. Verify the debugs to confirm that the certificate was generated:

```
# diagnose debug application est -1
# diagnose debug enable
...
[1024] reconstruct_est_ctx: Reconstruction succeeded
est_ctx:        is_global:1
        vfid:0
        svr_original_url:https://testrfc7030.com:8443
        svr_hostinfo:NULL
        ca_identifier:
        http_username:estuser
        http_password:*
        clt_cert:
        svr_cert:
        srp_username:
        srp_password:
        source_ip:(null)
        need_pop:0
        newcert_name:est-test101
        passwd:f51da8548af5fef820edfe6267b0c178e76f7c3eae40ee0900318fc77ab6bd
        rsa_keysize:0
        ec_curvename:(null)
        subject:(null)
        sub_alt_name:(null)
        svr_cert_x509:NULL
        csr_attrs:NULL
        csr:NULL
        pkey:NULL
        header_ptr:NULL
        tmp_p10:NULL
[2453] est_simple_reenroll: Try to use est-test101 as client cert to authenticate
[1962] __est_curl_set_auth: trace
...
```

3. Once the certificate is saved, verify the local certificate configuration:

```
config vpn certificate local
(local) # get est-test101
name                : est-test101
password            : *
comments            :
private-key         : *
certificate         :
        Subject:     CN = firewall-portal1
        Issuer:      CN = estExampleCA
        Valid from:  2023-04-13 17:23:40  GMT
        Valid to:    2024-04-12 17:23:40  GMT
        Fingerprint: 4A:96:E1:73:6D:D3:64:FE:A3:A8:28:56:1D:39:05:37
        Root CA:     No
        Version:     3
        Serial Num:
                07:47:02
        Extensions:
                Name:     X509v3 Basic Constraints
                Critical: no
                Content:
                CA:FALSE

Security

The following topics provide information about security:

- BIOS-level signature and file integrity checking on page 3465
- Real-time file system integrity checking on page 3469
- Running a file system check automatically on page 3473
- Built-in entropy source on page 3474
- FortiGate VM unique certificate on page 3475
- Enhanced administrator password security on page 3476
- FortiGate identity stored in TPM on page 3479

BIOS-level signature and file integrity checking

The BIOS-level signature and integrity checking includes several checks that occur during different stages.

Stage	Checks
BIOS-level signature and integrity check during file upload	Dually-signed images such as the firmware image, AV engine file and IPS engine file are verified during file upload while FortiOS is running.
BIOS-level signature and integrity check during the boot process	Dually-signed images such as the firmware image, AV engine file and IPS engine file are verified during the boot process before the kernel is mounted.
BIOS-level file integrity check during bootup as files are mounted	Signed hashes of important files related to the kernel, filesystems and AV/IPS engines and executables are verified during bootup as they are mounted and loaded into user space.

Each FortiOS GA firmware image, AV engine file, and IPS engine file are dually-signed by the Fortinet CA and a third-party CA.

Signature checking occurs when the FortiOS firmware, AV, and IPS engine files are uploaded. This allows the FortiGate to either warn users of potential risks involved with uploading an unauthenticated file, or block the file upload depending on the BIOS security level.

During the boot process before the kernel is loaded, the BIOS also verifies that each file matches their secure hash as indicated by their certificates. Users are warned when there is a failed integrity check, and the system may be prevented from booting depending on the severity and the BIOS security level.

Once the signature check passes, important files are extracted, mounted and loaded into user space during the bootup. All the important files are verified against their signed hashes to validate the integrity of the files before they can be mounted or loaded into user space. The hash file containing hashes of all executables and shared libraries is also verified to ensure the integrity of the file before the individual hashes are loaded into memory.

When the system is started, real-time protection kicks in. See Real-time file system integrity checking on page 3469 for more details.

BIOS-level signature and integrity check on firmware images

The outcome of the signature and integrity check during file upload and boot process depends on the security level configured in BIOS and the certificate authority that signed the file.

The security levels on the BIOS are:

FortiOS level	Behavior
High	FortiOS and BIOS only accept certified images.
Low	FortiOS and BIOS only accept certified images without a warning and un-certified images with a warning

The following table summarizes the use cases and the potential outcome based on the security level.

Use case	Certificate signed by		Outcome based on security level	
	Fortinet CA	Third-party CA	Level High	Level Low
GA-Certified (GA firmware, Beta firmware, Special Technical Support final builds)	Yes	Yes	Accept	Accept
Non-GA certified (Special builds: Special Technical Support and NPI quick builds)	Yes	No	Warning	Accept
Interim and Dev builds, or unknown build	No	Yes or No	Reject	Warning

On newer device models, there is a Signed Firmware LED light indicating High or Low BIOS security level.

On FortiGates without supported BIOS security levels, the device acts like security level High. For example, on a FortiGate-VM that does not have BIOS, the security level is defaulted to level High.

Platforms with old BIOS versions will support security levels 0, 1, and 2, while FortiOS will support levels High and Low. BIOS level 2 will correspond to the behaviors in Level High, and BIOS level 0 and 1 will correspond to behaviors in Level Low.

Security levels can be verified using the command `get system status`.

Examples of BIOS-level signature and integrity check during file upload

The following examples outline the different use cases when upgrading firmware and AV files on a FortiGate model that supports BIOS security levels, and a FortiGate model that does not support BIOS security levels.

For more information, see the Firmware & Registration on page 3053 section and Manual updates on page 3390.

Upgrading on a device with BIOS security levels

The following use cases are applicable when upgrading firmware and AV files on a FortiGate with BIOS security levels. Firmware is upgraded using the *System > Firmware & Registration* page, and AV files are upgraded using the *System > FortiGuard* page.

Security Level	Use case	Behavior
High	Load certified GA image in TFTP in boot menu	FortiGate boots up without warning messages.
High	Restore certified GA image in CLI	FortiGate boots up without warning messages.
High	Load certified non-GA image in TFTP in boot menu	FortiGate boots up with a warning message: `Warning: Non GA FOS image!`

High	Restore certified non-GA image in CLI	FortiGate displays a warning upon upload:
		`Warning: This firmware image is no GA certified!`
		FortiGate boots up with a warning message:
		`Warning: Non GA FOS image!`

High	Load un-certified interim image in TFTP in boot menu	The upload is blocked.
		A warning is displayed:
		`Checking image… This firmware image is not certified!`
		`Aborting firmware installation. Please power cycle.`
		`System halted.`

High	Restore un-certified interim image in CLI	The upload is blocked. A warning is displayed: `Image verification failed!` …
Low	Load certified GA or non-GA	FortiGate boots up without warning messages.

Security Level	Use case	Behavior
	image in TFTP in boot menu	
Low	Restore certified GA or non-GA image in CLI	FortiGate boots up without warning messages.

Low	Load un-certified interim image in TFTP in boot menu	FortiGate outputs a warning message, but the upload is allowed to proceed:
		`Warning: Image decode failed. Try to continue under security level 1…`
		`OK`
		`This firmware image is not certified!`
		`Save as Default firmware/Backup firmware/Run image without saving [D/B/R]?`
		After boot up:
		`System file integrity init check failed!`

Low	Restore un-certified interim image in CLI	FortiGate outputs a warning message, but the upload is allowed to proceed:
		`Image verification failed!`
		`...`
		`Please continue only if you understand and are willing to accept the risks.`
		`Do you want to continue? (y/n)`
		During boot up:
		`Warning: FOS is not authenticated! Continue booting under security level 1...`
		`Initializing firewall...`
		After boot up:
		`System file integrity init check failed!`

Upgrading on a device without BIOS security levels

The following use cases are applicable when upgrading firmware and AV files on a FortiGate without BIOS security levels. Firmware is upgraded using the *System* > *Firmware & Registration* page, and AV files are upgraded using the *System* > *FortiGuard* page. A FortiGate 60E is used in these examples and acts like it has security level 1.

When upgrading from 7.2.4 to 7.4.0 with a dually-signed firmware image, FortiOS verifies the certificates and accepts the image.

When upgrading from 7.2.4 to 7.4.0 with an unsigned firmware image in the GUI, FortiOS is unable to verify the certificates and the image fails verification. A warning dialog is displayed indicating that *This firmware failed signature validation*, but the user can click *Continue* to use the firmware.

When running 7.4.0 and uploading an unsigned AV engine file on the *System > FortiGuard* page, FortiOS is unable to verify the certificates and the file fails verification. A warning dialog is displayed indicating that *This package file has no signature for validation*, but the user can click *OK* to use the file.

BIOS-level file integrity check on important file-system and object files

During bootup, the kernel is required to verify the signed hashes of important file-system and object files. This prevents unauthorized changes to file-systems to be mounted and other unauthorized objects to be loaded into user space on bootup.
