<b>Appendix: FortiSwitch QoS template.....</b>	<b>386</b>

## Change log

Date	Change Description
December 23, 2019	Initial version for FortiSwitchOS 6.2.3
January 7, 2020	Updated the “config switch phy-mode” section.
January 27, 2021	Updated the “config switch interface” section.
February 3, 2021	Removed the “get system auto-update” section.

# Introduction

This manual describes the command line interface (CLI) commands for FortiSwitchOS.

## FortiSwitch models

This guide is applicable to all FortiSwitch models that are supported by FortiSwitchOS.

See the Release Notes for information about the software features supported on each of the models.

## How this guide is organized

The chapters in this document describe the commands available for each of the top-level CLI commands:

- `config`—commands that allow you to configure various components of the FortiSwitch unit.
- `diagnose`—commands that help with troubleshooting.
- `execute`—commands that perform immediate operations.
- `get`—commands that provide information about FortiSwitch operation.

## Typographical conventions

This document uses the following typographical conventions:

Convention	Example
CLI input	<pre>config system dns   set primary &lt;address_ipv4&gt; end</pre>
CLI output	<pre>FGT-602803030703 # get system setting comments          : (No default) opmode            : nat</pre>
Emphasis	HTTP connections are <b>not</b> secure and can be intercepted by a third party.
File content	<pre>&lt;HTML&gt;&lt;HEAD&gt;&lt;TITLE&gt;Firewall Authentication&lt;/TITLE&gt;&lt;/HEAD&gt; &lt;BODY&gt;&lt;H4&gt;You must authenticate to use this service.&lt;/H4&gt;</pre>

Convention	Example
<b>Hyperlink</b>	Visit the Fortinet Technical Support web site: <a href="https://support.fortinet.com/">https://support.fortinet.com/</a>
<b>Keyboard entry</b>	Type a name for the remote VPN peer or client, such as <code>Central_Office_1</code> .
<b>Publication</b>	For details, see the <a href="#">FortiOS Handbook</a> .

## CLI command syntax conventions

This guide uses the following conventions to describe the syntax to use when entering commands in the Command Line Interface (CLI).

Convention	Description
Angle brackets <code>&lt; &gt;</code>	A word constrained by data type. To define acceptable input, the angled brackets contain a descriptive name followed by an underscore ( <code>_</code> ) and suffix that indicates the valid data type. For example: <code>&lt;retries_int&gt;</code> indicates that you should enter a number of retries, such as 5.
Data types include:	
<code>&lt;xxx_name&gt;</code>	A name referring to another part of the configuration, such as <code>policy_A</code> .
<code>&lt;xxx_index&gt;</code>	An index number referring to another part of the configuration, such as 0 for the first static route.
<code>&lt;xxx_pattern&gt;</code>	A regular expression or word with wild cards that matches possible variations, such as <code>*@example.com</code> to match all email addresses ending in <code>@example.com</code> .
<code>&lt;xxx_fqdn&gt;</code>	A fully qualified domain name (FQDN), such as <code>mail.example.com</code> .
<code>&lt;xxx_email&gt;</code>	An email address, such as <code>admin@mail.example.com</code> .
<code>&lt;xxx_ipv4&gt;</code>	An IPv4 address, such as <code>192.168.1.99</code> .
<code>&lt;xxx_v4mask&gt;</code>	A dotted decimal IPv4 netmask, such as <code>255.255.255.0</code> .
<code>&lt;xxx_ipv4mask&gt;</code>	A dotted decimal IPv4 address and netmask separated by a space, such as <code>192.168.1.99 255.255.255.0</code> .

Convention	Description
<xxx_ipv4/mask>	A dotted decimal IPv4 address and CIDR-notation netmask separated by a slash, such as <code>192.168.1.99/24</code> .
<xxx_ipv6>	A colon( : )-delimited hexadecimal IPv6 address, such as <code>3f2e:6a8b:78a3:0d82:1725:6a2f:0370:6234</code> .
<xxx_ipv6mask>	An IPv6 netmask, such as <code>/96</code> .
<xxx_ipv6/mask>	An IPv6 address and netmask separated by a space.
<xxx_int>	An integer number that is <b>not</b> another data type, such as <code>15</code> for the number of minutes.
<xxx_url>	A uniform resource locator (URL) and its associated protocol and host name prefix, which together form a uniform resource identifier (URI), such as <code>http://www.fortinet./com/</code> .
Square brackets [ ]	A non-required word or series of words. For example: <code>[verbose {1   2   3}]</code> indicates that you can either omit or type both the <code>verbose</code> word and its accompanying option, such as: <code>verbose 3</code>
Curly braces { }	A word or series of words that is constrained to a set of options delimited by either vertical bars or spaces. You must enter at least one of the options, unless the set of options is surrounded by square brackets [ ].
Options delimited by vertical bars	Mutually exclusive options. For example: <code>{enable   disable}</code> indicates that you must enter either <code>enable</code> or <code>disable</code> but must not enter both.
Options delimited by spaces	Non-mutually exclusive options. For example: <code>{http https ping snmp ssh telnet}</code> indicates that you may enter all or a subset of those options, in any order, in a space-delimited list, such as: <code>ping https ssh</code>  <b>NOTE:</b> To change the options, you must re-type the entire list. For example, to add <code>snmp</code> to the previous example, you would type:  <code>ping https snmp ssh</code>  If the option adds to or subtracts from the existing list of options, instead of replacing it, or if the list is comma-delimited, the exception will be noted.

## Entering configuration data

The switch configuration is stored as a series of configuration settings in the FortiSwitchOS configuration database. To change the configuration, you can use the CLI to add, delete, or change configuration settings. These configuration changes are stored in the configuration database as they are made.

Individual settings in the configuration database can be text strings, numeric values, selections from a list of allowed options, or on/off (enable/disable).

### Entering text strings (names)

Text strings are used to name entities in the configuration, such as an administrative user name. You can enter any character in a text string with the following exceptions (to prevent cross-site scripting vulnerabilities):

- " (double quote)
- & (ampersand)
- ' (single quote)
- < (less than)
- > (greater than)

You can determine the limit to the number of characters that are allowed in a text string by determining how many characters the CLI allows for a given name field. From the CLI, you can also use the `tree` command to view the number of characters that are allowed. For example, firewall address names can contain up to 64 characters. From the CLI, you can do the following to confirm that the firewall address name field allows 64 characters:

```
config firewall address
  tree
    -- [address] --*name (64)
    |- subnet
    |- type
    |- start-ip
    |- end-ip
    |- fqdn (256)
    |- cache-ttl (0,86400)
    |- wildcard
    |- comment (64 xss)
    |- associated-interface (16)
    +- color (0,32)
```

**NOTE:** The `tree` command output also shows the number of characters allowed for other firewall address name settings. For example, the fully qualified domain name (`fqdn`) field can contain up to 256 characters.

### Entering numeric values

Numeric values are used to configure various sizes, rates, numeric addresses, or other numeric values. For example, a static routing priority of 10, a port number of 8080, or an IP address of 10.10.10.1. Numeric values can be entered as a series of digits without spaces or commas (for example, 10 or 64400), in dotted decimal format (for example, the IP address 10.10.10.1) or, as in the case of MAC or IPv6 addresses, separated by colons (for example, the MAC address 00:09:0F:B7:37:00). Most numeric values are standard base-10 numbers, but some fields (such as MAC addresses) require hexadecimal numbers.

CLI help includes information about allowed numeric value ranges. The CLI prevents you from entering invalid numbers.

# config

Use the `config` commands to configure various components of the FortiSwitch unit:

- [config log on page 19](#)
- [config router on page 27](#)
- [config switch on page 71](#)
- [config switch-controller global on page 137](#)
- [config system on page 138](#)
- [config user on page 197](#)

## config log

Use the `config log` commands to set the logging type, the logging severity level, and the logging location for the system:

- [config log custom-field on page 19](#)
- [config log eventfilter on page 20](#)
- [config log gui on page 21](#)
- [config log memory filter on page 21](#)
- [config log memory global-setting on page 22](#)
- [config log memory setting on page 23](#)
- [config log {syslogd | syslogd2 | syslogd3} filter on page 23](#)
- [config log {syslogd | syslogd2 | syslogd3} setting on page 24](#)

## config log custom-field

Use the following command to customize the log fields with a name and/or value. The custom name and/or value will appear in the log message.

### Syntax

```
config log custom-field
  edit <id>
    set name <name>
    set value <int>
  end
```

Variable	Description	Default
<id >	Enter the identification string for the custom log.	No default

Variable	Description	Default
name <name>	Enter a name to identify the log. You can use letters, numbers, ('_'), but no special characters such as the number symbol (#). The name cannot exceed 16 characters.	No default
value <int>	Enter an integer value to associate with the log.	No default

### Example

This example shows how to configure a customized field for a log:

```
config log custom-field
  edit 1
    set name "Vlan"
    set value 3
  end
```

## config log eventfilter

Use this command to configure event logging.

### Syntax

```
config log eventfilter
  set event {enable | disable}
  set router {enable | disable}
  set system {enable | disable}
  set user {enable | disable}
end
```

Variable	Description	Default
event {enable   disable}	Log event messages. Must be enabled to make the following fields available.	enable
router {enable   disable}	Log router activity messages.	enable
system {enable   disable}	Log system activity messages.	enable
user {enable   disable}	Log user activity messages.	enable

### Example

This example shows how to configure event logging:

```
config log eventfilter
  set event enable
  set router enable
  set system enable
  set user enable
end
```

## config log gui

Use this command to select the device from which logs are displayed in the Web-based manager.

### Syntax

```
config log gui
    set log-device memory
end
```

Variable	Description	Default
log-device memory	Select the device from which logs are displayed in the Web-based manager. Currently, only logging to memory is available.	memory

## config log memory filter

Use this command to configure the filter for the memory buffer.

### Syntax

```
config log memory filter
    set severity {alert | critical | debug | emergency | error |
        information | notification | warning}
end
```

Variable	Description	Default
severity {alert   critical   debug   emergency   error   information   notification   warning}	Select the logging severity level. The system logs all messages at and above the logging severity level you select. For example, if you select <code>error</code> , the system logs <code>error</code> , <code>critical</code> , <code>alert</code> and <code>emergency</code> level messages. <ul style="list-style-type: none"> <li><code>emergency</code> — The system is unusable.</li> <li><code>alert</code> — Immediate action is required.</li> <li><code>critical</code> — Functionality is affected.</li> <li><code>error</code> — An erroneous condition exists and functionality is probably affected.</li> <li><code>warning</code> — Functionality might be affected.</li> <li><code>notification</code> — Information about normal events.</li> <li><code>information</code> — General information about system operations.</li> <li><code>debug</code> — Information used for diagnosing or debugging the system.</li> </ul>	information

## Example

This example shows how to configure the memory log filter:

```
config log memory filter
  set severity alert
end
```

## config log memory global-setting

Use this command to configure log threshold warnings, as well as the maximum buffer lines, for the FortiSwitch system memory.

The FortiSwitch system memory has a limited capacity and displays only the most recent log entries. Traffic logs are not stored in the memory buffer, due to the high volume of traffic information. After all available memory is used, by default, the system begins to overwrite the oldest log messages. All log entries are deleted when the system restarts.

## Syntax

```
config log memory global-setting
  set full-final-warning-threshold <int>
  set full-first-warning-threshold <int>
  set full-second-warning-threshold <int>
  set hourly-upload {disable | enable}
  set max-size <int>
end
```

Variable	Description	Default
full-final-warning-threshold <int>	Enter to configure the final warning before reaching the threshold. You can enter a number between 3 and 100.	95
full-first-warning-threshold <int>	Enter to configure the first warning before reaching the threshold. You can enter a number between 1 and 98.	75
full-second-warning-threshold <int>	Enter to configure the second warning before reaching the threshold. You can enter a number between 2 and 99.	90
hourly-upload {disable   enable}	Enter <i>enable</i> to have log uploads occur hourly.	disable
max-size <int>	Enter the maximum size of the memory buffer log, in bytes.	98304

## Example

This example shows how to configure log threshold warnings and the maximum buffer lines:

```
config log memory global-setting
  set full-final-warning-threshold 45
  set full-first-warning-threshold 25
  set full-second-warning-threshold 45
  set hourly-upload enable
```

```
    set max-size 12288
end
```

## config log memory setting

Use this command to configure log settings for logging to the system memory.

The system memory has a limited capacity and only displays the most recent log entries. Traffic logs are not stored in the memory buffer, due to the high volume of traffic information. After all available memory is used, by default, the system begins to overwrite the oldest messages. All log entries are deleted when the system restarts.

### Syntax

```
config log memory setting
    set status {disable | enable}
    set diskfull overwrite
end
```

Variable	Description	Default
status {disable   enable}	Enter <code>enable</code> to enable logging to system memory.	disable
diskfull overwrite	Overwrite the oldest log when the log device is full.	No default

### Example

This example shows how to configure log settings:

```
config log memory setting
    set status enable
    set diskfull overwrite
end
```

## config log {syslogd | syslogd2 | syslogd3} filter

Use this command to configure log filter options. Log filters define the types of log messages sent to each log location.

### Syntax

```
config log {syslogd | syslogd2 | syslogd3} filter
    set severity {alert | critical | debug | emergency | error |
    information | notification | warning}
end
```

Variable	Description	Default
severity {alert   critical   debug   emergency   error   information   notification   warning}	Select the logging severity level. The system logs all messages at and above the logging severity level you select. For example, if you select <code>error</code> , the system logs <code>error</code> , <code>critical</code> , <code>alert</code> and <code>emergency</code> level messages. <ul style="list-style-type: none"> <li>• <code>emergency</code> — The system is unusable.</li> <li>• <code>alert</code> — Immediate action is required.</li> <li>• <code>critical</code> — Functionality is affected.</li> <li>• <code>error</code> — An erroneous condition exists and functionality is probably affected.</li> <li>• <code>warning</code> — Functionality might be affected.</li> <li>• <code>notification</code> — Information about normal events.</li> <li>• <code>information</code> — General information about system operations.</li> <li>• <code>debug</code> — Information used for diagnosing or debugging the system.</li> </ul>	information
status {enable   disable}	Enable or disable remote syslog logging.	disable

### Example

This example shows how to configure log filter options:

```
config log syslogd filter
    set severity information
end
```

## config log {syslogd | syslogd2 | syslogd3} setting

Use this command to configure log settings for logging to the system memory.

The system memory has a limited capacity and only displays the most recent log entries. Traffic logs are not stored in the memory buffer, due to the high volume of traffic information. After all available memory is used, by default, the system begins to overwrite the oldest messages. All log entries are deleted when the system restarts.

### Syntax

```
config log {syslogd | syslogd2 | syslogd3} setting
    set status {disable | enable}
    set enc-algorithm {disable | high | high-medium | low}
    set certificate <certificate_name>
    set server <server_name>
    set mode {legacy-reliable | reliable | udp}
    set port <port_number>
    set csv {enable | disable}
    set facility {alert | audit | auth | authpriv | clock | cron | daemon | ftp | kernel |
        local0 | local1 | local2 | local3 | local4 | local5 | local6 | local7 | lpr | mail
        | news | ntp | syslog | user | uucp}
    set source-ip <IPv4_address>
```

end

Variable	Description	Default
status {disable   enable}	Enter <code>enable</code> to start logging to system memory.	disable
enc-algorithm {disable   high   high-medium   low}	Set to <code>high</code> , <code>high-medium</code> , or <code>low</code> to specify which encryption algorithm that SSL communication uses for reliable syslog. Set to <code>disable</code> if you do not want to use reliable syslog.	disable
certificate <certificate_name>	Specify the certificate to use to communicate with the syslog server.	No default
server <server_name>	This field is available with <code>status</code> is set to <code>enable</code> . Enter the address of the remote syslog server.	No default
mode {legacy-reliable   reliable   udp}	Set to <code>legacy-reliable</code> to use RFC 3195 for reliable syslog. Set to <code>reliable</code> to use RFC 6587 for reliable syslog. Set to <code>udp</code> to use syslog over UDP.  This field is available with <code>status</code> is set to <code>enable</code> . This field was previously named <code>reliable</code> .	udp
port <port_number>	Set the port number that the server listens to.  If the mode is set to <code>reliable</code> , the default port is 514. If the mode is set to <code>legacy-reliable</code> , the default port is 601. If the mode is set to <code>udp</code> , the default port is 6514.  This field is available with <code>status</code> is set to <code>enable</code> .	514
csv {enable   disable}	Enable or disable comma-separated values.  This field is available with <code>status</code> is set to <code>enable</code> .	disable

Variable	Description	Default
<pre>set facility {alert   audit   auth   authpriv   clock   cron   daemon   ftp   kernel   local0   local1   local2   local3   local4   local5   local6   local7   lpr   mail   news   ntp   syslog   user   uucp}</pre>	<p>This field is available with <code>status</code> is set to <code>enable</code>.  Select the facility for remote syslog:</p> <ul style="list-style-type: none"> <li>• <code>alert</code>—Use the log alert.</li> <li>• <code>audit</code>—Use the log audit.</li> <li>• <code>auth</code>—Use the security/authorization messages.</li> <li>• <code>authpriv</code>—Use the private security/authorization messages.</li> <li>• <code>clock</code>—Use the clock daemon.</li> <li>• <code>cron</code>—Use the clock daemon.</li> <li>• <code>daemon</code>—Use the system daemon.</li> <li>• <code>ftp</code>—Use the FTP daemon.</li> <li>• <code>kernel</code>—Use kernel messages.</li> <li>• <code>local0</code>—Reserved for local use.</li> <li>• <code>local1</code>—Reserved for local use.</li> <li>• <code>local2</code>—Reserved for local use.</li> <li>• <code>local3</code>—Reserved for local use.</li> <li>• <code>local4</code>—Reserved for local use.</li> <li>• <code>local5</code>—Reserved for local use.</li> <li>• <code>local6</code>—Reserved for local use.</li> <li>• <code>local7</code>—Reserved for local use.</li> <li>• <code>lpr</code>—Use the line printer subsystem.</li> <li>• <code>mail</code>—Use the mail system.</li> <li>• <code>news</code>—Use the network news subsystem.</li> <li>• <code>ntp</code>—Use the NTP system.</li> <li>• <code>syslog</code>—Use memssages generated internally by the syslog daemon.</li> <li>• <code>user</code>—Use random user-level messages.</li> <li>• <code>uucp</code>—Use the network news subsystem.</li> </ul>	local7
<pre>source-ip &lt;IPv4_address&gt;</pre>	<p>This field is available with <code>status</code> is set to <code>enable</code>.  Enter the source IPv4 address of the syslog.</p>	0.0.0.0

### Example

This example shows how to configure log settings:

```
config log syslogd setting
  set status enable
  set server "1.2.3.4"
  set port 5
end
```

## config router

Use the `config router` commands to configure options related to routing protocols and packet forwarding:

- [config router access-list on page 27](#)
- [config router access-list6 on page 28](#)
- [config router aspath-list on page 29](#)
- [config router bgp on page 30](#)
- [config router community-list on page 40](#)
- [config router isis on page 41](#)
- [config router key-chain on page 46](#)
- [config router multicast on page 48](#)
- [config router multicast-flow on page 49](#)
- [config router ospf on page 50](#)
- [config router prefix-list on page 56](#)
- [config router prefix-list6 on page 57](#)
- [config router rip on page 58](#)
- [config router route-map on page 63](#)
- [config router setting on page 67](#)
- [config router static on page 68](#)
- [config router static6 on page 70](#)

### config router access-list

Use this command to configure an IPv4 access list. An access list is a list of IP addresses and the action to take for each one. Access lists provide basic route and network filtering.

#### Syntax

```
config router access-list
  edit <list_str>
    set comments <comment_str>
    config rule
      edit <rule_int>
        set action {deny | permit}
        set prefix {<xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx> | any}
        set wildcard <IP_address>
        set exact-match {enable | disable}
      end
    end
  end
```

Variable	Description	Default
<list_str>	Enter the name of the access list. <ul style="list-style-type: none"> <li>If the name is a number in the range of 1-99, you can define Cisco-style wildcard filter criteria with the <code>set wildcard &lt;ip&gt;</code> command.</li> <li>If the name has at least one alphabetic character, you can set the prefix to define regular filter criteria using the <code>set prefix {&lt;xxx.xxx.xxx.xxx&gt; &lt;xxx.xxx.xxx.xxx&gt;   any}</code> command.</li> </ul>	No default
comments <comment_str>	Enter a descriptive comment.	No default
<rule_int>	The rule identifier.	No default
action {deny   permit}	Set whether the rule allows or denies the IPv4 address.	permit
prefix {<xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx>   any}	Set the prefix to define regular filter criteria, such as <code>any</code> or subnets.  <b>NOTE:</b> The access list name must be a digit in the range of 1-99. Strings are not supported.	any
wildcard <IP_address>	Define Cisco-style wildcard filter criteria.  <b>NOTE:</b> The access list name must contain at least one alphabetic character.	No default
exact-match {enable   disable}	Set whether the rule looks for an exact match with the value in the prefix field.	disable

## Example

This example shows how to configure an access list:

```
config router access-list
  edit mylist
    set comments "access list for RIP 1"
  config rule
    edit 1
      set action permit
      set prefix xxx.xx.xx.xx xxx.xxx.xxx.x
    end
  end
end
```

## config router access-list6

Use this command to configure an IPv6 access list. An access list is a list of IP addresses and the action to take for each one. Access lists provide basic route and network filtering.

## Syntax

```

config router access-list6
  edit <name_of_IPv6_access_list>
    set comments <string>
    config rule
      edit <rule_ID>
        set action {deny | permit}
        set prefix6 {<xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx> | any}
        set exact-match {enable | disable}
      next
    end
  end
end

```

Variable	Description	Default
<name_of_IPv6_access_list>	Enter the name of the IPv6 access list.	No default
comments <string>	Enter a descriptive comment.	No default
<rule_ID>	The rule identifier.	No default
action {deny   permit}	Set whether the rule allows or denies the IPv6 address.	permit
prefix6 {<xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx>   any}	Set the IPv6 prefix to define regular filter criteria, such as any or X::X:X/M.	No default
exact-match {enable   disable}	Set whether the rule looks for an exact match with the value in the prefix field.	disable

## Example

This example shows how to configure an IPv6 access list:

```

config router access-list6
  edit accesslist1
    set comments "IPv6 access list"
    config rule
      edit 1
        set action permit
        set prefix6 fe80::a5b:eff:fef1:95e5
        set exact-match disable
      next
    end
  end
end

```

## config router aspath-list

Use this command to set or unset Border Gateway Protocol (BGP) AS-path list parameters. By default, BGP uses an ordered list of Autonomous System (AS) numbers to describe the route that a packet takes to reach its destination. A list of these AS numbers is called the AS path. You can filter BGP routes using AS path lists.

Use the `config router aspath-list` command to define an access list that examines the `AS_PATH` attributes of BGP routes to match routes. Each entry in the list defines a rule for matching and selecting routes based on the setting of the `AS_PATH` attribute.

### Syntax

```
config router aspath-list
  edit <AS_path_list_name>
    config rule
      edit <rule_identifier>
        set action {deny | permit}
        set regexp <string>
      end
    end
  end
```

Variable	Description	Default
<AS_path_list_name>	Enter the name of the AS path list.	No default
<rule_identifier>	Enter a rule identifier.	No default
action {deny   permit}	Set whether to permit or deny route-based operations, based on the route's <code>AS_PATH</code> attribute.	No default
regexp <string>	Specify the regular expression that will be compared to the <code>AS_PATH</code> attribute (for example, <code>^730\$</code> ). The value is used to match AS numbers. Enclose a complex regular expression value within double-quotation marks.	No default

## config router bgp

Use this command to configure Border Gateway Protocol version-4 (BGP-4) routing parameters. BGP can be used to perform Classless Interdomain Routing (CIDR) and to route traffic between different autonomous systems or domains using an alternative route if a link between a FortiSwitch unit and a BGP peer (such as an ISP router) fails.

The following RFCs are supported:

- RFC1771—A Border Gateway Protocol 4 (BGP-4)
- RFC1965—Autonomous System Confederations for BGP
- RFC1997—BGP Communities Attribute
- RFC2545—Use of BGP-4 Multiprotocol Extensions for IPv6 Inter-Domain Routing
- RFC2796—BGP Route Reflection An alternative to full mesh IBGP
- RFC2858—Multiprotocol Extensions for BGP-4
- RFC2842—Capabilities Advertisement with BGP-4
- RFC2439—BGP Route Flap Damping

### Syntax

```
config router bgp
  set as <MANDATORY_router_AS_number>
```

```
set router-id <MANDATORY_IP_address>
set keepalive-timer <0-65535>
set holdtime-timer <0, 3-65535>
set always-compare-med {disable | enable}
set bestpath-as-path-ignore {disable | enable}
set bestpath-cmp-confed-aspath {disable | enable}
set bestpath-cmp-routerid {disable | enable}
set bestpath-med-confed {disable | enable}
set bestpath-med-missing-as-worst {disable | enable}
set client-to-client-reflection {disable | enable}
set dampening {disable | enable}
    set dampening-reachability-half-life <1-45>
    set dampening-reuse <1-20000>
    set dampening-suppress <1-20000>
    set dampening-max-suppress-time <1-255>
set deterministic-med {disable | enable}
set enforce-first-as {disable | enable}
set fast-external-failover {disable | enable}
set log-neighbor-changes {disable | enable}
set cluster-id <IP_address>
set confederation-identifier <1-4294967295>
set default-local-preference <0-4294967295>
set scan-time <5-60>
set maximum-paths-ebgp <1-64>
set bestpath-aspath-multipath-relax {disable | enable}
set maximum-paths-ibgp <1-64>
set distance-external <1-255>
set distance-internal <1-255>
set distance-local <1-255>
set graceful-stalepath-time <1-3600>
config admin-distance
    edit <identifier>
        set distance <1-255>
        set neighbour-prefix <IP_address_netmask>
        set route-list <string>
config aggregate-address
    edit <identifier>
        set as-set {disable | enable}
        set prefix <IP_address_netmask>
        set summary-only {disable | enable}
config neighbor
    edit <IPv4_address>
        set advertisement-interval <0-600>
        set allowas-in-enable {disable | enable}
            set allowas-in <1-10>
        set attribute-unchanged {as-path | MED | next-hop}
        set activate {disable | enable}
        set bfd {disable | enable}
        set capability-dynamic {disable | enable}

set connect-timer <0-65535>
set unsuppress-map <string>
set update-source {interface_name}
set weight <0-65535>
set password <string>
config network
  edit <identifier>
    set backdoor {disable | enable}
    set prefix <IP_address_netmask>
    set route-map <string>
  config redistribute {connected | isis | ospf | rip | static}
    set status {disable | enable}
    set route-map <string>
end
end

```

Variable	Description	Default
as <MANDATORY_router_AS_number>	Mandatory. Enter an integer to specify the local autonomous system (AS) number of the FortiSwitch unit. The range is from 1 to 4 294 967 295. A value of 0 disables BGP (disabled by default).	0
router-id <MANDATORY_IP_address>	Mandatory. Specify a fixed identifier for the FortiSwitch unit. A value of 0.0.0.0 is not allowed.	0.0.0.0
keepalive-timer <0-65535>	How often (in seconds) the router sends out keepalive messages to neighbor routers to maintain those sessions.	60

Variable	Description	Default
holdtime-timer <0, 3-65535>	How long (in seconds) the router will wait for a keepalive message before declaring a router offline. A shorter time will find an off-line router faster.	180
always-compare-med {disable   enable}	Always compare Multi-Exit Discriminator (MED).	disable
bestpath-as-path-ignore {disable   enable}	AS_PATH is the BGP attribute that keeps track of each AS that a route advertisement has passed through; it helps prevent routing loops. Enable this option if you want BGP to not use the best AS path. Disable this option if you want BGP to use the best AS path.	disable
bestpath-cmp-confed-aspash {disable   enable}	Enable or disable the comparison of the AS_CONFED_SEQUENCE attribute, which defines an ordered list of AS numbers representing a path from the FortiSwitch unit through autonomous systems within the local confederation.	disable
bestpath-cmp-routerid {disable   enable}	Compare router ID for identical external BGP (EBGP) paths.	disable
bestpath-med-confed {disable   enable}	Compare MED among confederation paths.	disable
bestpath-med-missing-as-worst {disable   enable}	Enable or disable (by default) treating any confederation path with a missing MED metric as the least preferred path.	disable
client-to-client-reflection {disable   enable}	Enable (by default) or disable client-to-client route reflection between internal BGP (IBGP) peers. If the clients are fully meshed, route reflection may be disabled.	enable
dampening {disable   enable}	Enable or disable (by default) route-flap dampening on all BGP routes. A flapping route is unstable and continually transitions down and up (see RFC 2439).	disable
dampening-reachability-half-life <1-45>	If you enable dampening, set the maximum time that a route can be suppressed (in minutes). A route can continue to accumulate penalties while it is suppressed. However, the route cannot be suppressed longer than the maximum time.	15

Variable	Description	Default
dampening-reuse <1-20000>	If you enable dampening, set a dampening reuse limit based on the number of accumulated penalties. If the penalty assigned to a flapping route decreases enough to fall below the specified limit, the route is not suppressed.	750
dampening-suppress <1-20000>	If you enable dampening, set a dampening-suppression limit based on the number of accumulated penalties. A route is suppressed (not advertised) when its penalty exceeds the specified limit.	2000
dampening-max-suppress-time <1-255>	If you enable dampening, set the maximum time that a route can be suppressed. A route can continue to accumulate penalties while it is suppressed. However, the route cannot be suppressed longer than the maximum time.	60
deterministic-med {disable   enable}	Enforce deterministic comparison of MED.	disable
enforce-first-as {disable   enable}	Enforce first AS for EBGp routes.	disable
fast-external-failover {disable   enable}	Reset peer BGP session if link goes down.	enable
log-neighbor-changes {disable   enable}	Enable or disable logging of BGP neighbor's changes.	enable
cluster-id <IP_address>	Route reflector cluster ID.	0.0.0.0
confederation-identifier <1-4294967295>	Confederation identifier.	0
default-local-preference <0-4294967295>	Default local preference.	100
scan-time <5-60>	Background scanner interval (seconds).	60
maximum-paths-ebgp <1-64>	Set the maximum number of paths for equal-cost multi-path (ECMP) routing using the External Border Gateway Protocol (EBGP).	1
bestpath-asp-path-multipath-relax {disable   enable}	Enable or disable load sharing across routes that are the same length but have different autonomous system (AS) paths.	disable

Variable	Description	Default
maximum-paths-ibgp <1-64>	Set the maximum number of paths for equal-cost multi-path (ECMP) routing using the Internal Border Gateway Protocol (IBGP).	1
distance-external <1-255>	Distance for routes external to the AS.	20
distance-internal <1-255>	Distance for routes internal to the AS.	200
distance-local <1-255>	Distance for routes local to the AS.	200
graceful-stalepath-time <1-3600>	Time to hold stale paths of restarting neighbor (sec).	360
<b>config admin-distance</b>		
<identifier>	Enter an identifier to set administrative distance modifications for BGP routes.	No default
distance <1-255>	Set the administrative distance to apply.	0
neighbour-prefix <IP_address_netmask>	Neighbor address prefix. Enter the class IP address and netmask with correction.	0.0.0.0 0.0.0.0
route-list <string>	The list of routes this distance will be applied to.	No default
<b>config aggregate-address</b>		
<identifier>	<p>Enter a BGP aggregate entry in the routing table.</p> <p>When you aggregate routes, routing becomes less precise because path details are not readily available for routing purposes. The aggregate address represents addresses in several autonomous systems. Aggregation reduces the length of the network mask until it masks only the bits that are common to all of the addresses being summarized.</p>	No default
as-set {disable   enable}	Enable or disable the generation of an unordered list of AS numbers to include in the path information.	disable
prefix <IP_address_netmask>	Aggregate prefix. The prefix 0.0.0.0 0.0.0.0 is not allowed.	0.0.0.0 0.0.0.0
summary-only {disable   enable}	Filter more specific routes from updates.	disable
<b>config neighbor</b>		

Variable	Description	Default
<IPv4_address>	Enter the IPv4 address of the BGP neighbor.	No default
advertisement-interval <0-600>	Set the minimum amount of time (in seconds) that the FortiSwitch unit waits before sending a BGP routing update to the BGP neighbor.	30
allowas-in-enable {disable   enable}	Enable to allow my AS in AS path (IPv4).	disable
allowas-in <1-10>	If you enable allowas-in-enable, set the maximum number of occurrences of my AS numbers allowed (IPv4).	No default
attribute-unchanged {as-path   MED   next-hop}	Propagate unchanged BGP attributes to the BGP neighbor using one of the following methods (IPv4): <ul style="list-style-type: none"> <li>To advertise unchanged next-hop attributes, select <code>as-path</code>.</li> <li>To advertise unchanged MULTI_EXIT_DISC attributes, select <code>med</code>.</li> <li>To keep the next-hop attribute as is, select <code>next-hop</code>.</li> <li>An empty set (default) is a supported value.</li> </ul>	No default
activate {disable   enable}	Enable address family IPv4 for this neighbor.	enable
bfd {disable   enable}	Enable BFD for this neighbor.	disable
capability-dynamic {disable   enable}	Advertise dynamic capability to this neighbor.	disable
capability-orf {both   none   receive   send}	Enable advertising of Outbound Routing Filter (ORF) prefix-list capability to the BGP neighbor using one of the following methods (IPv4): <ul style="list-style-type: none"> <li><code>none</code>: disable the advertising of ORF prefix-list capability.</li> <li><code>receive</code>: enable receive capability.</li> <li><code>send</code>: enable send capability.</li> <li><code>both</code>: enable send and receive capability.</li> </ul>	none
capability-default-originate {disable   enable}	Advertise default IPv4 route to this neighbor.	disable
dont-capability-negotiate {disable   enable}	Do not negotiate capabilities with this neighbor.	disable
ebgp-enforce-multihop {disable   enable}	Allow multi-hop EBGp neighbors.	disable

Variable	Description	Default
ebgp-multihop-ttl <1-255>	If you enable ebgp-enforce-multihop, define a TTL value for BGP packets sent to the BGP neighbor.	255
ebgp-ttl-security-hops <1-254>	If you enable ebgp-enforce-multihop, specify the maximum number of hops to the EBGp peer.	0
next-hop-self {disable   enable}	Disable IPv4 next-hop calculation for this neighbor.	disable
override-capability {disable   enable}	Override result of capability negotiation.	disable
passive {disable   enable}	Disable sending of open messages to this neighbor.	disable
remove-private-as {disable   enable}	Remove private AS number from IPv4 outbound updates.	disable
route-server-client {disable   enable}	Configure IPv4 AS route server client.	disable
shutdown {disable   enable}	Shutdown this neighbor.	disable
soft-reconfiguration {disable   enable}	Allow IPv4 inbound soft reconfiguration.	disable
strict-capability-match {disable   enable}	Enable strict capability matching.	disable
description <string>	Description of this neighbor.	No default
distribute-list-in <string>	Limit route updates from the BGP neighbor based on the Network Layer Reachability Information (NLRI) IP prefixes defined in the specified access list (IPv4). You must create the access list before it can be selected here. See <a href="#">config router access-list on page 27</a> .	No default
distribute-list-out <string>	Limit route updates to the BGP neighbor based on the NLRI defined in the specified access list (IPv4). You must create the access list before it can be selected here. See <a href="#">config router access-list on page 27</a> .	No default
aspath-filter-list-in <string>	BGP AS path filter for IPv4 inbound routes. You must create the AS path list before it can be selected here. See <a href="#">config router aspath-list on page 29</a> .	No default

Variable	Description	Default
aspath-filter-list-out <string>	BGP AS path filter for IPv4 outbound routes. You must create the AS path list before it can be selected here. See <a href="#">config router aspath-list on page 29</a> .	No default
maximum-prefix <1-4294967295>	Maximum number of IPv4 prefixes to accept from this peer.	No default
prefix-list-in <string>	Limit route updates from a BGP neighbor based on the Network Layer Reachability Information (NLRI) in the specified prefix list (IPv4). The prefix list defines the NLRI prefix and length advertised in a route. You must create the prefix list before it can be selected here. See <a href="#">config router prefix-list on page 56</a> .	No default
prefix-list-out <string>	Limit route updates to a BGP neighbor based on the NLRI in the specified prefix list (IPv4). The prefix list defines the NLRI prefix and length advertised in a route. You must create the prefix list before it can be selected here. See <a href="#">config router prefix-list on page 56</a> .	No default
remote-as <MANDATORY_1-4294967295>	Mandatory. Adds a BGP neighbor to the FortiSwitch configuration and sets the AS number of the neighbor. If the number is identical to the AS number of the FortiSwitch unit, the FortiSwitch unit communicates with the neighbor using internal BGP (IBGP). Otherwise, the neighbor is an external peer, and the FortiSwitch unit uses EBGP to communicate with the neighbor.	0
route-map-in <string>	Limit route updates or change the attributes of route updates from the BGP neighbor according to the specified route map (IPv4). You must create the route map before it can be selected here. See <a href="#">config router route-map on page 63</a> .	No default
route-map-out <string>	Limit route updates or change the attributes of route updates to the BGP neighbor according to the specified route map (IPv4). You must create the route map before it can be selected here. See <a href="#">config router route-map on page 63</a> .	No default

Variable	Description	Default
send-community {both   disable   extended   standard}	<p>Enable sending the COMMUNITY attribute to the BGP neighbor using one of the following methods (IPv4):</p> <ul style="list-style-type: none"> <li>standard: advertise standard capabilities</li> <li>extended: advertise extended capabilities</li> <li>both: advertise extended and standard capabilities (default)</li> <li>disable: disable the advertising of the COMMUNITY attribute</li> </ul>	both
keep-alive-timer <0-65535>	How often (in seconds) the router sends out keepalive messages to neighbor routers to maintain those sessions.	No default
holdtime-timer <0, 3-65535>	How long (in seconds) the router will wait for a keepalive message before declaring a router offline. A shorter time will find an off-line router faster.	No default
connect-timer <0-65535>	Interval (in seconds) for connect timer.	No default
unsuppress-map <string>	Specify the name of the route map to selectively unsuppress suppressed routes (IPv4). You must create the route map before it can be selected here. See <a href="#">config router route-map on page 63</a> .	No default
update-source {interface_name}	Interface to use as source IP/IPv6 address of TCP connections.	No default
weight <0-65535>	Neighbor weight.	No default
password <string>	Password used in MD5 authentication.	No default
<b>config network</b>		
<identifier>	Enter an identifier.	No default
backdoor {disable   enable}	Enable route as backdoor.	disable
prefix <IP_address_netmask>	Set the network prefix. Use the class IP address and netmask with correction.	0.0.0.0 0.0.0.0

Variable	Description	Default
route-map <string>	Specify the name of the route map that will be used to modify the attributes of the route before it is advertised. You must create the route map before it can be selected here. See <a href="#">config router route-map on page 63</a> .	No default
<b>config redistribute {connected   isis   ospf   rip   static}</b>		
status {disable   enable}	You can enable BGP to provide connectivity between connected, static, RIP, and/or OSPF routes. BGP redistributes the routes from one protocol to another. When a large internetwork is divided into multiple routing domains, use the subcommand to redistribute routes to the various domains.	disable
route-map <string>	Specify the name of the route map that identifies the routes to redistribute. If a route map is not specified, all routes are redistributed to BGP. You must create the route map before it can be selected here. See <a href="#">config router route-map on page 63</a> .	No default

## config router community-list

Use this command to identify BGP routes according to their COMMUNITY attributes (see RFC 1997). Each entry in the community list defines a rule for matching and selecting routes based on the setting of the COMMUNITY attribute.

### Syntax

```

config router community-list
  edit <community_list_name>
    set type {expanded | standard}
    config rule
      edit <rule_identifier>
        set action {deny | permit}
        set regexp <regular_expression>
        set match <community_number | internet | local-AS | no-advertise | no-export>
      end
    end
  end
end

```

Variable	Description	Default
<community_list_name>	Enter a name for the community list.	No default
type {expanded   standard}	Specify the type of community to match.	standard
<rule_identifier>	Enter a rule identifier.	No default

Variable	Description	Default
<code>action {deny   permit}</code>	Permit or deny route-based operations, based on the route's COMMUNITY attribute.	No default
<code>regex &lt;regular_expression&gt;</code>	If you select an expanded community, specify an ordered list of COMMUNITY attributes as a regular expression. The value or values are used to match a community. Delimit a complex regular expression value using double-quotation marks.	No default
<code>match &lt;community_number   internet   local-AS   no-advertise   no-export&gt;</code>	<p>If you select a standard community, specify the criteria for matching a reserved community:</p> <ul style="list-style-type: none"> <li>• Use decimal notation to match one or more COMMUNITY attributes having the syntax AA:NN, where AA represents an AS, and NN is the community identifier. Delimit complex expressions with double-quotation marks (for example, "123:234 345:456").</li> <li>• To match all routes in the Internet community, type <code>internet</code>.</li> <li>• To match all routes in the LOCAL_AS community, type <code>local-AS</code>. Matched routes are not advertised locally.</li> <li>• To select all routes in the NO_ADVERTISE community, type <code>no-advertise</code>. Matched routes are not advertised.</li> <li>• To select all routes in the NO_EXPORT community, type <code>no-export</code>. Matched routes are not advertised to EBGp peers. If a confederation is configured, the routes are advertised within the confederation.</li> </ul>	No default

## config router isis

Intermediate System to Intermediate System Protocol (IS-IS) allows routing of ISO's OSI protocol stack Connectionless Network Service (CLNS). IS-IS is an Interior Gateway Protocol (IGP) that is not intended to be used between Autonomous Systems (AS).

IS-IS is a link state protocol that is well-suited to smaller networks. It is quick to configure and works well if there are no redundant paths. However, IS-IS updates are sent out node-by-node, so it can be slow to find a path around network outages. IS-IS also lacks good authentication, can not choose routes based on different quality-of-service methods, and can create network loops if you are not careful. IS-IS uses Dijkstra's algorithm to find the best path, like OSPF.

While OSPF is more widely known, IS-IS is a viable alternative to OSPF in enterprise networks and ISP infrastructures, largely due to its native support for IPv6 and its nondisruptive methods for splitting, merging, migrating, and renumbering network areas.

## Syntax

```

config router isis
  set auth-keychain-area <string>
  set auth-keychain-domain <string>
  set auth-mode-area {md5 | password}
  set auth-mode-domain {md5 | password}
  set auth-password-area <password>
  set auth-password-domain <password>
  set auth-sendonly-area {enable | disable}
  set auth-sendonly-domain {enable | disable}
  set default-information-level {level-1 | level-1-2 | level-2}
  set default-information-metric <0-4261412864>
  set default-information-originate {always | disable | enable}
  set default-information-route-map <string>
  set ignore-attached-bit {disable | enable}
  set is-type {level-1 | level-1-2 | level-2-only}
  set log-neighbour-changes {disable | enable}
  set lsp-gen-interval-l1 <1-120>
  set lsp-gen-interval-l2 <1-120>
  set lsp-refresh-interval <1-65535>
  set max-lsp-lifetime <350-65535>
  set metric-style {narrow | transition | wide}
  set overload-bit {disable | enable}
  set redistribute-l1 {disable | enable}
  set redistribute-l1-list <string>
  set router-id <IP_address>
  set spf-interval-exp-l1 <1-120>
  set spf-interval-exp-l2 <1-120>
config isis-interface
  edit {IS-IS interface name}
    set auth-keychain-hello <string>
    set auth-mode-hello {md5 | password}
    set auth-password-hello <password>
    set bfd {enable | disable}
    set circuit-type {level-1 | level-1-2 | level-2}
    set csnp-interval-l1 <1-65535 seconds>
    set csnp-interval-l2 <1-65535 seconds>
    set hello-interval-l1 <1-65535 seconds; 0 to use 1-second hold time>
    set hello-interval-l2 <1-65535 seconds; 0 to use 1-second hold time>
    set hello-multiplier-l1 <2-100>
    set hello-multiplier-l2 <2-100>
    set hello-padding {disable | enable}
    set metric-l1 <1-63>
    set metric-l2 <1-63>
    set passive {disable | enable}
    set priority-l1 <0-127>
    set priority-l2 <0-127>
    set status {disable | enable}
    set wide-metric-l1 <1-16777214>
    set wide-metric-l2 <1-16777214>
config isis-net
  edit <identifier>

config redistribute {bgp | connected | ospf | rip | static}
  set status {disable | enable}
  set metric <0-4261412864>

```

```

    set metric-type {external | internal}
    set level {level-1 | level-1-2 | level-2}
    set routemap <string>
config summary-address
    edit <summary address entry identifier>
        set level {level-1 | level-1-2 | level-2}
        set prefix <IP address and netmask>
    end
end
end

```

Variable	Description	Default
auth-keychain-area <string>	IS-IS area authentication keychain. This command is applicable when the area's authentication mode is <code>md5</code> .	No default
auth-keychain-domain <string>	IS-IS domain authentication key-chain. This command is applicable when domain's auth mode is <code>md5</code> .	No default
auth-mode-area {md5   password}	IS-IS area (level-1) authentication mode.	password
auth-mode-domain {md5   password}	IS-IS domain (level-2) authentication mode.	password
auth-password-area <password>	IS-IS area (level-1) authentication password. This command is applicable when area's authentication mode is <code>password</code> .	No default
auth-password-domain <password>	IS-IS domain (level-2) authentication password. This command is applicable when domain's authentication mode is <code>password</code> .	No default
auth-sendonly-area {enable   disable}	IS-IS area (level-1) authentication send-only.	disable
auth-sendonly-domain {enable   disable}	IS-IS domain (level-2) authentication send-only.	disable
default-information-level {level-1   level-1-2   level-2}	Distribute default route into level's link-state packet (LSP).	level-2
default-information-metric <0-4261412864>	Default information metric.	10
default-information-originate {always   disable   enable}	Enable or disable the generation of a default route.	disable
default-information-route-map <string>	The default information route map.	No default

Variable	Description	Default
ignore-attached-bit {disable   enable}	Ignore attached bit on incoming level-1 LSP.	disable
is-type {level-1   level-1-2   level-2-only}	Set the IS-IS level to use: <ul style="list-style-type: none"> <li>level-1: intra-area</li> <li>level-1-2: both intra-area and inter-area</li> <li>level-2-only: inter-area</li> </ul>	level-1-2
log-neighbour-changes {disable   enable}	Enable logging of IS-IS neighbor's changes	enable
isp-gen-interval-l1 <1-120>	Minimum interval for level-1 LSP regenerating.	30
isp-gen-interval-l2 <1-120>	Minimum interval for level-2 LSP regenerating.	30
isp-refresh-interval <1-65535>	LSP refresh time in seconds.	900
max-isp-lifetime <350-65535>	Maximum LSP lifetime in seconds.	1200
metric-style {narrow   transition   wide}	Use old-style (ISO 10589) or new-style packet formats. <ul style="list-style-type: none"> <li>narrow: Use the old style of TLVs with narrow metric (default)</li> <li>transition: Send and accept both styles of TLVs during the transition.</li> <li>wide: Use the new style of TLVs to carry a wider metric.</li> </ul>	narrow
overload-bit {disable   enable}	Signal other routers not to use this bit in shortest-path-first (SPF).	disable
redistribute-l1 {disable   enable}	Redistribute level-1 routes into level 2.	enable
redistribute-l1-list <string>	Access-list for redistributing level-1 routes to level 2.	No default
router-id <IP_address>	Router identifier.	0.0.0.0
spf-interval-exp-l1 <1-120>	Level-1 SPF minimum calculation delay in seconds.	1
spf-interval-exp-l2 <1-120>	Level-2 SPF minimum calculation delay in seconds.	1
<b>config isis-interface</b>		
{IS-IS interface name}	Select the IS-IS interface name to configure.	No default

Variable	Description	Default
auth-keychain-hello <string>	Hello protocol data unit (PDU) authentication keychain. This command is applicable when the hello packet's authentication mode is <code>md5</code> .	No default
auth-mode-hello {md5   password}	Hello PDU authentication mode.	password
auth-password-hello <password>	Hello PDU authentication password. This command is applicable when hello's authentication mode is <code>password</code> .	No default
bfd {enable   disable}	Enable or disable bidirectional forwarding detection (BFD).	enable
circuit-type {level-1   level-1-2   level-2}	Set the IS-IS circuit type to use for this interface: <ul style="list-style-type: none"> <li>level-1: intra-area</li> <li>level-1-2: both intra-area and inter-area</li> <li>level-2-only: inter-area</li> </ul>	level-1-2
csnp-interval-l1 <1-65535>	Level-1 complete sequence number PDU (CSNP) interval, in number of seconds.	10
csnp-interval-l2 <1-6553>	Level-2 CSNP interval, in number of seconds.	10
hello-interval-l1 <1-65535>	Level-1 hello packet interval, in number of seconds. Use 0 for a 1-second hold time.	10
hello-interval-l2 <1-65535>	Level-2 hello packet interval, in number of seconds. Use 0 for a 1-second hold time.	10
hello-multiplier-l1 <2-100>	Level-1 multiplier for hello packet holding time.	3
hello-multiplier-l2 <2-100>	Level-2 multiplier for hello packet holding time.	3
hello-padding {disable   enable}	Enable padding to IS-IS hello packets.	enable
metric-l1 <1-63>	Level-1 metric for interface.	10
metric-l2 <1-63>	Level-2 metric for interface.	10
passive {disable   enable}	Set this interface as passive.	disable
priority-l1 <0-127>	Level-1 priority.	64
priority-l2 <0-127>	Level-2 priority.	64
status {disable   enable}	Enable or disable the interface for IS-IS.	enable

Variable	Description	Default
wide-metric-l1 <1-16777214>	Level-1 wide metric for interface.	10
wide-metric-l2 <1-16777214>	Level-2 wide metric for interface.	10
<b>config isis-net</b>		
<identifier>	An integer identifier; 0 is the lowest available identifier.	No default
<IS-IS net xx.xxxx. ... .xxxx.xx>	Set the IS-IS network.	No default
<b>config redistribute {bgp   connected   ospf   rip   static}</b>		
status {disable   enable}	Enable or disable the redistribution of routes from other routing protocols using IS-IS.	disable
metric <0-4261412864>	Redistribution metric.	10
metric-type {external   internal}	Select <code>external</code> or <code>internal</code> for the metric type.	external
level {level-1   level-1-2   level-2}	Set the IS-IS level to use for redistributing routes: <ul style="list-style-type: none"> <li>level-1: intra-area</li> <li>level-1-2: both intra-area and inter-area</li> <li>level-2-only: inter-area</li> </ul>	level1-2
route-map <string>	Enter the route map name. You must create the route map before selecting it. See <a href="#">config router route-map on page 63</a> .	No default
<b>config summary-address</b>		
<summary address entry identifier>	Enter the summary address entry ID. The value range is 0-4294967295.	
level {level-1   level-1-2   level-2}	Set the IS-IS level to use for the summary database: <ul style="list-style-type: none"> <li>level-1: intra-area</li> <li>level-1-2: both intra-area and inter-area</li> <li>level-2-only: inter-area</li> </ul>	level-2
prefix <IP address and netmask>	Set the IP address and netmask for the prefix.	0.0.0.0 0.0.0.0

## config router key-chain

Use this command to configure a keychain. A keychain is a list of one or more authentication keys including its lifetime, which is how long each key is valid. Use keys with overlapping lifetimes to prevent the failure of routing updates.

## Syntax

```

config router key-chain
  edit <keychain_name>
    config key
      edit <keychain_int>
        set key-string <key_str>
        set accept-lifetime <START> <END>
        set send-lifetime <START> <END>
      end
    end
  end
end

```

Variable	Description	Default
<keychain_name>	Enter a name for your keychain.	No default
<keychain_int>	Enter the keychain identifier.	No default
key-string <key_str>	Enter a password string for the key.	No default
accept-lifetime <START> <END>	<p>Enter the lifetime of a received authentication key. START and END use the format of HH:MM:SS DAY MONTH YEAR where:</p> <ul style="list-style-type: none"> <li>• HH:MM:SS is the time of day then the lifetime starts in hours, minutes, and seconds.</li> <li>• DAY is the day of the month to start. The range is 1-31.</li> <li>• MONTH is the month of the year to start. The range is 1-12.</li> <li>• YEAR is the year to start. The range is 1993-2035.</li> </ul> <p>END can also be set to <i>infinite</i> or &lt;duration&gt;, which is the number of seconds that the key is valid. the range of &lt;duration&gt; is 1-2147483646.</p>	No default
send-lifetime <START> <END>	<p>Enter the lifetime of a sent authentication key. START and END use the format of HH:MM:SS DAY MONTH YEAR where:</p> <ul style="list-style-type: none"> <li>• HH:MM:SS is the time of day then the lifetime starts in hours, minutes, and seconds.</li> <li>• DAY is the day of the month to start. The range is 1-31.</li> <li>• MONTH is the month of the year to start. The range is 1-12.</li> <li>• YEAR is the year to start. The range is 1993-2035.</li> </ul> <p>END can also be set to <i>infinite</i> or &lt;duration&gt;, which is the number of seconds that the key is valid. the range of &lt;duration&gt; is 1-2147483646.</p>	No default

## Example

This example shows how to add a key to a new keychain:

```
config router key-chain
  edit keychain1
    config key
      edit 1
        set key-string 1234567890
        set accept-lifetime 01:02:03 1 8 2017 infinite
        set send-lifetime 01:02:03 1 8 2017 infinite
      end
    end
  end
```

## config router multicast

A FortiSwitch unit can operate as a Protocol Independent Multicast (PIM) version-4 router. FortiSwitchOS supports PIM source-specific multicast (SSM) and version 3 of Internet Group Management Protocol (IGMP).

You can configure a FortiSwitch unit to support PIM using the `config router multicast` CLI command. When PIM is enabled, the FortiSwitch unit allocates memory to manage mapping information. The FortiSwitch unit communicates with neighboring PIM routers to acquire mapping information and, if required, processes the multicast traffic associated with specific multicast groups.

### Syntax

```
config router multicast
  set multicast-routing {disable | enable}
  config interface
    edit {interface_name | internal | mgmt}
      set pim-mode ssm-mode
      set hello-interval <1-180>
      set dr-priority <1-4294967295>
      set multicast-flow <string>
    config igmp
      set query-interval <1-65535>
      set query-max-response-time <1-25>
    end
  end
end
```

Variable	Description	Default
multicast-routing {disable   enable}	Enable or disable multicast routing.	disable
{interface_name   internal   mgmt}	Set which interface to configure for multicast routing.	No default
pim-mode ssm-mode	Set the PIM operation mode to SSM mode.	ssm-mode
hello-interval <1-180>	Specify the amount of time that the FortiSwitch unit waits between sending hello messages to neighboring PIM routers.	30

Variable	Description	Default
dr-priority <1-4294967295>	Assign a priority to the FortiSwitch unit Designated Router (DR) candidacy. The value is compared to that of other DR interfaces connected to the same network segment, and the router having the highest DR priority is selected to be the DR. If two DR priority values are the same, the interface having the highest IP address is selected.	1
multicast-flow <string>	Connect the named multicast flow to this interface. You must create the multicast flow before it can be selected here. See <a href="#">config router multicast-flow on page 49</a> .	No default
query-interval <1-65535>	Set the interval between queries to IGMP hosts (in seconds).	125
query-max-response-time <1-25>	Set the maximum time to wait for an IGMP query response (in seconds).	10

## config router multicast-flow

Use this command to configure the source allowed for a multicast flow when using PIM-SM or PIM-SSM.

### Syntax

```
config router multicast-flow
  edit <name>
    set comments <string>
    config flows
      edit <multicast-flow_entry_identifier>
        set group-addr <224-239.xxx.xxx.xxx>
        set source-addr <IP_address>
      end
    end
  end
```

Variable	Description	Default
<name>	Name of the multicast flow.	No default
<string>	Enter an optional description of the multicast flow.	No default
<multicast-flow_entry_identifier>	Enter the multicast-flow entry identifier.	No default
group-addr <224-239.xxx.xxx.xxx>	Enter the multicast group address (IPv4).	0.0.0.0
source-addr <IP_address>	Enter an IP address for the multicast source (IPv4).	0.0.0.0

## config router ospf

Use this command to configure OSPF routing.

**NOTE:** You must have an advanced features license to use OSPF routing.

Open shortest path first (OSPF) is a link-state interior routing protocol that is widely used in large enterprise organizations. OSPF provides routing within a single autonomous system (AS). This differs from BGP, which provides routing between autonomous systems.

An OSPF AS can contain only one area, or it may consist of a group of areas connected to a backbone area. A router connected to more than one area is an area border router (ABR). Routing information is contained in a link state database. Routing information is communicated between routers using link state advertisements (LSAs).

You can enable bidirectional forwarding detection (BFD) with OSPF. BFD is used to quickly locate hardware failures in the network. Routers running BFD communicate with each other, and, if a timer runs out on a connection, that router is declared to be down. BFD then communicates this information to OSPF, and the routing information is updated.

### Syntax

```
config router ospf
  set router-id <MANDATORY_router_ipv4>

Variable	Description	Default
router-id <MANDATORY_router_ipv4>	Mandatory. Enter the IPv4 address of the OSPF router.	No default
abr-type {cisco   ibm   shortcut   standard}	Enter the area border router (ABR) type. Set <code>abr-type</code> to <code>cisco</code> or <code>ibm</code> to allow routes through nonbackbone area when links to the backbone are down. For more information about this option, see RFC 3509, Alternative Implementations of OSPF Area Border Routers.	cisco
distance-external <external_int>	Set the OSPF route administrative external distance. The value range is from 0 to 255.	0
distance-inter-area <inter_int>	Set the OSPF route administrative inter-area distance. The value range is from 0 to 255.	0
distance-intra-area <intra_int>	Set the OSPF route administrative intra-area distance. The value range is from 0 to 255.	0
default-information-originate {always   disable   enable}	Enable or disable the generation of the default route into all external routing capable areas using the metric specified by the <code>default-information-metric</code> value and the metric type specified by the <code>default-information-metric-type</code> value. Set the value to <code>always</code> for the default to always be advertised, even when the routing table contains no default.	disable
default-information-metric <metric_int>	Set the metric value for the default route. The value range is from 1 to 16777214.	10
default-information-metric-type {1   2}	Set the metric type for the default route.	2
default-information-route-map <map_str>	Enter the name of the route map.	No default
distance <distance_int>	Enter the distance of the route. The value range is from 1 to 255.	<b>110</b>
rfc1583-compatible {disable   enable}	Enable or disable RFC1583 compatibility.	disable
spf-timers <delay_int> <hold_int>	Set the number of seconds before the shortest path first (SPF) is calculated and the number of seconds between consecutive SPF calculations. The range for each value is from 0 to 600.	5 10

Variable	Description	Default
bfd {disable   enable}	Enable or disable bidirectional forwarding detection (BFD).	disable
log-neighbour-changes {disable   enable}	Enable or disable the logging of changes to the OSPF neighbor	enable
passive-interface <name_str>	Select which interface to set to passive mode.	No default
<b>config area</b>		
<area_ipv4>	Enter the IP address for the area.	No default
shortcut {default   disable   enable}	Enable or disable whether shortcuts are allowed in the area.	default
type {nssa   regular   stub}	Set the area type.	regular
default-cost <cost_int>	If the area type is stub or not-so-stubby area (NSSA), set the cost of default-summary link state advertisements (LSAs) announced to stubby areas. The value range is 0-2147483647.	1
stub-type {no-summary   summary}	If the area type is stub or NSSA, set whether inter-area summaries can be used.	summary
nssa-translator-role {always   candidate   never}	If the area type is NSSA, set the type of NSSA translator role.	candidate
<b>config filter-list</b>		
<filter_int>	Enter the filter list identifier.	No default
direction {in   out}	Set the direction to or from the area for the prefix list and access list.	out
list <list_str>	Enter the access-list name or prefix-list name for the area.	No default
<b>config range</b>		
<range_int>	Enter the range list identifier.	No default
advertise {enable   disable}	Enable or disable the advertise status. If this option is set to <code>disable</code> , the intra area paths from this range are not advertised in other areas.	enable
prefix <xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx>	Enter the summary prefix.	0.0.0.0 0.0.0.0

Variable	Description	Default
substitute <xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx>	Enter the substitute prefix.	0.0.0.0 0.0.0.0
substitute-status {enable   disable}	Enable or disable whether the substitute prefix is used instead of the prefix.	disable
<b>config virtual-link</b>		
<virtual_int>	Enter the virtual-link identifier.	No default
authentication {md5   none   text}	Set the authentication type.	none
dead-interval <dead_int>	Enter the dead interval.	40
hello-interval <hello_int>	Enter the hello interval.	10
peer <peer_ipv4>	Enter the IP address of the virtual link neighbor.	0.0.0.0
retransmit-interval <retransmit_int>	Enter the retransmit interval.	5
transmit-delay <transmit_int>	Enter the transmit delay.	1
<b>config md5-keys</b>		
<key_ID>	Enter the MD5 key identifier.	No default
<MD5_key>	Enter a string up to 16 characters.	No default
<b>config ospf-interface</b>		
<interface_str>	Enter the OSPF interface name.	No default
authentication {md5   none   text}	Set the authentication type for OSPF packets.	none
bfd {disable   enable   global}	Enable or disable BFD on this interface. Set this option to <code>global</code> to use the global configuration.	global
cost <cost_int>	Enter the link cost on this interface. The value range is 0-65535. Set this option to 0 for auto-cost.	10
dead-interval <dead_int>	Enter the dead interval.	40
hello-interval <hello_int>	Enter the hello interval.	10
interface <string>	Set the interface.	No default

Variable	Description	Default
mtu <mtu_int>	Enter the maximum transmission unit (MTU) size in bytes for the database description packets. The value range is 576-65535.	1500
mtu-ignore {disable   enable}	Set whether to use the MTU size.	disable
priority <priority_int>	Set the router priority for this interface. the router with the highest priority is more eligible to become the designated router. Setting the option to 0 makes the router ineligible to become the designated router. The value range is 0-255.	1
retransmit-interval <retransmit_int>	Enter the retransmit interval.	5
transmit-delay <transmit_int>	Enter the transmit delay.	1
<b>config md5-keys</b>		
<key_ID>	Enter the MD5 key identifier.	No default
<MD5_key>	Enter a string up to 16 characters.	No default
<b>config network</b>		
<network_int>	Enter the network identifier.	No default
<area_ipv4>	Enter the IP address for the area.	No default
prefix <xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx>	Enter the prefix.	0.0.0.0 0.0.0.0
<b>config distribute-list</b>		
<distribute_int>	Enter the distribute list identifier.	No default
access-list <access_str>	Enter the access list name.	No default
protocol {bgp   connected   isis   rip   static}	Set the protocol type.	connected
<b>config redistribute {bgp   connected   isis   rip   static}</b>		
redistribute {bgp   connected   isis   rip   static}	Set the type of network to redistribute.	No default
status {disable   enable}	Enable or disable the redistribution.	disable

Variable	Description	Default
metric <metric_int>	Enter the metric for redistributed routes.	10
routermap <routermap_str>	Enter the route map name to filter the redistributed routes.	No default
metric-type {1   2}	Set the metric type of redistributed routes.	2
tag <0-2147483647>	Set the tag value.	0

### Example

This example shows how to set the router identifier, create an area, create the network (set the network prefix and associate with an area), configure the OSPF interface, and redistribute the routes:

```

config router ospf

    set router-id 10.11.101.1

    config area
        edit 0.0.0.0
        next
    end

    config network
        edit 1
            set area 0.0.0.0
            set prefix 10.11.101.0 255.255.255.0
        next
    end

    config ospf-interface
        edit "1"
            set cost 100
            set interface "vlan10"
            set priority 100
        next
    end

    config redistribute connected
        set status enable
    end

end

```

### config router prefix-list

Use this command to configure IPv4 prefix-based filtering.

**NOTE:** You must have an advanced features license.

#### Syntax

```

config router prefix-list
    edit <list_int>

```

```

set comments <comment_str>
config rule
  edit <rule_int>
    set action {deny | permit}
    set prefix {<xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx> | any}
    set ge <ge_int>
    set le <le_int>
  end
end
end
end

```

Variable	Description	Default
<list_int>	Enter the prefix list identifier.	No default
comments <comment_str>	Enter a descriptive comment.	No default
rule_int	Enter the rule identifier.	No default
action {deny   permit}	Set the action to deny or permit.	permit
prefix {<xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx>   any}	Set the prefix to define regular filter criteria, such as any or subnets.	0.0.0.0 0.0.0.0
ge <ge_int>	Enter the minimum IPv4 prefix length to be matched. The value range is between 0 and 32. The prefix list is used if the prefix length is greater than or equal to this value.	No default
le <le_int>	Enter the maximum IPv4 prefix length to be matched. The value range is between 0 and 32. The prefix list is used if the prefix length is less than or equal to this value.	No default

## config router prefix-list6

Use this command to configure IPv6 prefix-based filtering.

### Syntax

```

config router prefix-list6
  edit <name_of_IPv6_prefix_list>
    set comments <string>
    config rule
      edit <rule_ID>
        set action {deny | permit}
        set prefix6 {<IPv6_prefix> | any}
        set ge <0-128>
        set le <0-128>
      next
    end
  end
end
end

```

Variable	Description	Default
<name_of_IPv6_prefix_list>	Enter the name of the IPv6 prefix list.	No default
comments <string>	Enter a descriptive comment.	No default
<rule_ID>	Enter the rule identifier.	No default
action {deny   permit}	Set the action to <code>deny</code> or <code>permit</code> .	permit
prefix6 {<IPv6_prefix>   any}	Enter the IPV6 prefix to match or <code>any</code> .	No default
ge <0-128>	Enter the minimum IPv6 prefix length to be matched. The IPv6 prefix list is used if the prefix length is greater than or equal to this value.	No default
le <0-128>	Enter the maximum IPv6 prefix length to be matched. The IPv6 prefix list is used if the prefix length is less than or equal to this value.	No default

### Example

This example shows how to specify which IPv6 prefixes are allowed in RA messages:

```
config router prefix-list6
  edit prefixlist1
    set comments "IPv6 prefix list"
  config rule
    edit 1
      set action permit
      set prefix6 any
      set ge 50
      set le 50
    next
  end
end
```

## config router rip

Use these commands to configure RIP routing.

**NOTE:** You must have an advanced features license to use RIP routing.

The Routing Information Protocol (RIP) is a distance-vector routing protocol that works best in small networks that have no more than 15 hops. Each router maintains a routing table by sending out its routing updates and by asking neighbors for their routes. RIP is relatively simple to configure on FortiSwitch units but slow to respond to network outages. RIP is better than static routing but less scalable than open shortest path first (OSPF).

FortiSwitch supports RIP version 1 and RIP version 2:

- RIP version 1 uses classful addressing and broadcasting to send out updates to router neighbors. It does not support different sized subnets or classless inter-domain routing (CIDR) addressing.
- RIP version 2 supports classless routing and subnets of various sizes. Router authentication supports MD5 and authentication keys. Version 2 uses multicasting to reduce network traffic.

RIP uses three timers:

- The update timer determines the interval between routing updates. The default setting is 30 seconds.
- The timeout timer is the maximum time that a route is considered reachable while no updates are received for the route. The default setting is 180 seconds. The timeout timer setting should be at least three times longer than the update timer setting.
- The garbage timer is the how long that the FortiSwitch advertises a route as being unreachable before deleting the route from the routing table. The default setting is 120 seconds.

You can enable bidirectional forwarding detection (BFD) with RIP. BFD is used to quickly locate hardware failures in the network. Routers running BFD communicate with each other, and, if a timer runs out on a connection, that router is declared to be down. BFD then communicates this information to RIP, and the routing information is updated.

## Syntax

```
config router rip
  set bfd {disable | enable}
  set default-information-originate {disable | enable}
  set default-metric <defaultmetric_int>
  set garbage-timer <garbage_int>
  set passive-interface <name_str>
  set timeout-timer <timeout_int>
  set update-timer <update_int>
  set version {1 | 2}
  config distance
    edit <distanceid_int>
      set access-list <access_string>
      set distance <distance_int>
      set prefix <xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx>
    end
  config distribute-list
    edit <distribute_int>
      set direction {in | out}
      set interface <interface_str>
      set listname <listname_str>
      set status {disable | enable}
    end
  config interface
    edit <interface_str>
      set auth-keychain <keychain_str>
      set auth-mode {md5 | none |text}
      set auth-string <password_str>
      set receive-version {1 | 2 | both | global}
      set send-version {1 | 2 | both | global}
      set split-horizon-status {disable | enable}
      set split-horizon {poisoned | regular}
    end
  config neighbor
    edit <neighbor_int>
      set <neighbor_ipv4>
    end
  config network
    edit <network_int>
      set prefix <xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx>
    end
```

```

config offset-list
  edit <offsetlist_int>
    set access-list <accesslist_str>
    set direction {in | out}
    set interface {in | out}
    set offset <offset_int>
    set status {disable | enable}
  end
config redistribute {bgp | connected | isis | ospf | static}
  set status {disable | enable}
  set metric <metric_int> (between 0 and 16)
  set routemap <routemap_str>
end
end

```

Variable	Description	Default
bfd {disable   enable}	Enable or disable BFD.	disable
default-information-originate {disable   enable}	Enable or disable whether a default route is advertised.	disable
default-metric <defaultmetric_int>	Enter the default metric for redistributed routes. This setting does not affect connected routes. Use the <code>config redistribute connected</code> or <code>config offset-list</code> command to set the metric value for connected routes.	1
garbage-timer <garbage_int>	Enter the number of seconds before a route is removed from the routing table.	120
passive-interface <name_str>	Specify which interface to set to passive mode. In passive mode, multicast and unicast RIP packets are sent only to RIP neighbors.	No default
timeout-timer <timeout_int>	Enter the number of seconds before a route is no longer valid. The route is not removed from the routing table until the neighboring RIP routers are notified that the route has been dropped.	180
update-timer <update_int>	Enter the number of seconds between when the complete routing table is sent to neighboring RIP routers.	30
version {1   2}	Set the RIP version for receiving and sending RIP packets.	2
<b>config distance</b>		
<distanceid_int>	Enter the distance identifier.	No default

Variable	Description	Default
access-list <access_string>	Enter the access list for the route destination. The default RIP distance is used only when the route's source IP address matches the specified prefix <i>and</i> the specified access list.	No default
distance <distance_int>	Enter the default RIP distance. The value range is from 1 to 255. The default RIP distance is used only when the route's source IP address matches the specified prefix <i>and</i> the specified access list.	120
prefix <xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx>	Enter the prefix.	0.0.0.0 0.0.0.0
<b>config distribute-list</b>		
<distribute_int>	Enter the distribute list identifier.	No default
direction {in   out}	Set the list direction.	out
interface <interface_str>	Enter the RIP interface name for the distribute list.	No default
listname <listname_str>	Enter the access or prefix list name.	No default
status {disable   enable}	Enable or disable whether the distribute list is used.	disable
<b>config interface</b>		
<interface_str>	Enter the interface name.	No default
auth-keychain <keychain_str>	Enter the name of the keychain to use for this interface.	No default
auth-mode {md5   none   text}	Set the authentication mode used for packets.  RIP version 1 does not use authentication. If <code>auth-mode</code> is set to <code>md5</code> or <code>text</code> for RIP version 1, routing updates are ignored.  <b>NOTE:</b> You must create a keychain first before you can use the MD5 authentication mode with RIP version 2.	none
auth-string <password_str>	If the <code>auth-mode</code> is set to <code>text</code> , enter a password that is less than 16 characters long.	No default
receive-version {1   2   both   global}	Set which version of RIP packets are accepted on this interface. Setting this option to <code>both</code> accepts RIP version 1 and 2. Setting this option to <code>global</code> uses the global RIP version. This setting overrides the global RIP version setting.	global

Variable	Description	Default
send-version {1   2   both   global}	Set which version of RIP packets are sent for this interface. Setting this option to <code>both</code> sends RIP version 1 and 2. Setting this option to <code>global</code> uses the global RIP version. This setting overrides the global RIP version setting.	global
split-horizon-status {disable   enable}	Enable or disable split horizon.	enable
split-horizon {poisoned   regular}	Set the split-horizon type.	regular
<b>config neighbor</b>		
<neighbor_int>	Enter a RIP neighbor identifier.	No default
<neighbor_ipv4>	Enter an IP address for a RIP neighbor. Use this command if a RIP neighbor does not accept multicast packets.	0.0.0.0
<b>config network</b>		
<network_int>	Enter a network identifier.	No default
prefix <xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx>	Enter the prefix.	0.0.0.0 0.0.0.0
<b>config offset-list</b>		
<offsetlist_int>	Enter the offset list identifier.	No default
<accesslist_str>	Enter the name of the access list.	No default
direction {in   out}	Set the list direction.	out
interface {in   out}	Set whether to filter incoming or outgoing packets.	No default
offset <offset_int>	Enter the offset for incoming and outgoing metrics to routes learned using RIP. The value range is between 1 and 16.	0
status {disable   enable}	Enable or disable whether the offset list is used.	disable
<b>config redistribute {bgp   connected   isis   ospf   static}</b>		
redistribute {bgp   connected   isis   ospf   static}	Redistribute routes so that they are included in RIP routing.	connected
status {disable   enable}	Enable or disable whether the routes are redistributed.	disable

Variable	Description	Default
metric <metric_int>	Enter the metric of the redistributed routes. The value range is between 0 and 16.	0
routemap <routemap_str>	Enter the route map name to filter the redistributed routes.	No default

### Example

This example shows how to configure the RIP router and add authentication:

```

config router rip
  config network
    edit 1
      set prefix 170.38.65.0/24
    next
    edit 2
      set prefix 128.8.0.0/16
    next
  end
  config interface
    edit "vlan35"
      set auth-mode text
      set auth-string simplepw1
    next
  end
end

```

## config router route-map

Use this command to configure a route map for BGP, IS-IS, OSPF, or RIP routing.

**NOTE:** You must have an advanced features license to use OSPF or RIP routing.

### Syntax

```

config router route-map
  edit <routemap_str>
    set comments <comments_str>
    set protocol {bgp | isis | ospf | rip}
    config rule
      edit <rule_int>
        set action {deny | permit}
        set match-as-path <string>
        set match-community <string>
        set match-interface {<interface_str> | internal | mgmt}
        set match-ip-address <address_str>
        set match-ip-nexthop <nexthop_str>
        set match-metric <metric_int>
        set match-origin {egp | igp | incomplete | none}
        set match-tag <tag_int>
        set set-aggregator-as <1-4294967295>
        set set-aspath <1-4294967295>
        set set-atomic-aggregate {enable | disable}
        set set-community-delete <string>
        set set-community <community>
      end
    end
  end
end

```

```

    set set-extcommunity-rt <community>
    set set-extcommunity-soo <community>
    set set-ip-nexthop <class_ipv4>
    set set-local-preference <1-4294967295>
    set set-metric <setmetric_int>
    set set-metric-type {1 | 2}
    set set-origin {egp | igp | incomplete | none}
    set set-originator-id <IP_address>
    set set-tag <settag_int>
    set set-weight <0-2147483647>
  end
end
end

```

Variable	Description	Default
<routemap_str>	Enter the name for the individual route map.	No default
comments <comments_str>	Enter a descriptive comment.	No default
protocol {bgp   isis   ospf   rip}	Set the protocol to BGP, IS-IS, OSPF, or RIP.	No default
<rule_int>	Enter the rule identifier.	No default
action {deny   permit}	Set whether the rule permits or denies routes that match this rule.	permit
match-as-path <string>	BGP only. Match the BGP Autonomous System (AS) path list.	No default
match-community <string>	BGP only. Match the BGP community list.	No default
match-interface {<interface_str>   internal   mgmt}	Set which interface will be matched.	No default
match-ip-address <address_str>	Match the IP address permitted by the access list or prefix list.	No default
match-ip-nexthop <nexthop_str>	Match the next-hop IP address passed by the access list or prefix list.	No default
match-metric <metric_int>	BGP and RIP only. Enter the metric to be matched for redistributed routes. The value range is 0-2147483647.	0

Variable	Description	Default
match-origin {egp   igp   incomplete   none}	<p>BGP only. Match the BGP origin code:</p> <ul style="list-style-type: none"> <li>egp—Set the value to the NLRI learned from the Exterior Gateway Protocol (EGP).</li> <li>igp—Set the value to the NLRI learned from a protocol internal to the originating AS.</li> <li>incomplete—Match routes that were learned some other way (for example, through redistribution).</li> <li>none—Disable the matching of BGP routes based on the origin of the route.</li> </ul>	none
match-tag <tag_int>	RIP only. Enter the tag to be matched. The value range is 0-2147483647.	0
set-aggregator-as <1-4294967295>	BGP only. Set the BGP aggregator AS.	No default
set-aspath <1-4294967295>	BGP only. Prepend the BGP AS path attribute. Use quotation marks for repeating numbers, for example: "1 1 2"	No default
set-atomic-aggregate {enable   disable}	BGP only. Enable or disable the BGP atomic aggregate attribute.	disable
set-community-delete <string>	BGP only. Delete communities matching the community list.	No default

Variable	Description	Default
set-community <community>	<p>BGP only. Set the BGP community attribute:</p> <ul style="list-style-type: none"> <li>Use decimal notation to set a specific COMMUNITY attribute for the route. The value has the syntax AA:NN, where AA represents an AS, and NN is the community identifier. Delimit complex expressions with double-quotation marks (for example, "123:234 345:456").</li> <li>To make the route part of the Internet community, select internet.</li> <li>To make the route part of the LOCAL_AS community, select local-AS.</li> <li>To make the route part of the NO_ADVERTISE community, select no-advertise.</li> <li>To make the route part of the NO_EXPORT community, select no-export.</li> </ul>	No default
set-extcommunity-rt <community>	BGP only. Set the Route-Target extended community: AA:NN	No default
set-extcommunity-soo <community>	BGP only. Set the Site-of-Origin extended community: AA:NN	No default
set-ip-nexthop <class_ipv4>	BGP and RIP only. Enter the IP address of the next hop.	0.0.0.0
set-local-preference <1-4294967295>	BGP only. Set the BGP local-preference path attribute.	0
set-metric <setmetric_int>	Enter the route metric value. The value range is 0-2147483647.	0
set-metric-type {1   2}	BGP and OSPF only. Set the metric type to external-type1 or external-type2.	external-type1
set-origin {egp   igp   incomplete   none}	<p>BGP only. Set the BGP origin code:</p> <ul style="list-style-type: none"> <li>egp—Set the value to the NLRI learned from the Exterior Gateway Protocol (EGP).</li> <li>igp—Set the value to the NLRI learned from a protocol internal to the originating AS.</li> <li>incomplete—If not egp or igp.</li> <li>none—Disable the ORIGIN attribute.</li> </ul>	none

Variable	Description	Default
set-originator-id <IP_address>	BGP only. Set the BGP originator ID attribute.	0.0.0.0
set-tag <settag_int>	BGP and RIP only. Enter the route tag value. The value range is 0-2147483647.	0
set-weight <0-2147483647>	BGP only. Set the BGP weight for the routing table.	0

## Example

This example shows how to configure the RIP router and add authentication:

```

config router route-map
  edit myroutemap
    set comments "route map for RIP routing"
    set protocol rip
    config rule
      edit 1
        set action permit
        set match-interface internal
        set match-metric 12
        set match-tag 36
        set set-ip-nextHop 128.8.0.0
        set auth-mode text
        set set-metric 48
        set set-tag 72
      end
    end
  end
end

```

## config router setting

Use this command to set which routing table to use.

**NOTE:** You must have an advanced features license to use OSPF or RIP routing.

### Syntax

```

config router setting
  config filter-list
    edit <routemap_int>
      set protocol {any | bgp | connected | isis | ospf | rip | static}
      set route-map <routemap_str>
    end
  end
end

```

Variable	Description	Default
<routemap_int>	Enter a route map identifier.	No default

Variable	Description	Default
protocol {any   bgp   connected   isis   ospf   rip   static}	Set which protocol this route map applies to.	connected
route-map <routemap_str>	Enter the route map name.	No default

### Example

This example shows how to configure the RIP router and add authentication:

```
config router setting
  config filter-list
    edit 2
      set protocol ospf
      set route-map myroutemap
    end
  end
end
```

### config router static

Use this command to add, edit, or delete static routes for IPv4 traffic.

You add static routes to manually control traffic exiting the FortiSwitch unit. You configure routes by specifying destination IP addresses and network masks and adding gateways for these destination addresses. Gateways are the next-hop routers to which traffic that matches the destination addresses in the route are forwarded.

You can adjust the administrative distance of a route to indicate preference when more than one route to the same destination is available. The lower the administrative distance, the greater the preferability of the route. If the routing table contains several entries that point to the same destination (the entries may have different gateways or interface associations), the system compares the administrative distances of those entries, selects the entries having the lowest distances, and installs them as routes in the FortiSwitch forwarding table. Any ties are resolved by comparing the routes' priority, with lowest priority being preferred. As a result, the forwarding table only contains routes having the lowest distances to every possible destination.

After the system selects static routes for the forwarding table based on their administrative distances, the sequence numbers of those routes determines routing priority. When two routes to the same destination exist in the forwarding table, the system selects the route having the lowest sequence number.

### Syntax

```
config router static
  edit <sequence_number>
    set bfd {enable | disable | global}
    set blackhole {enable | disable}
    set comment <comment_str>
    set device <interface_name>
    set distance <1-255>
    set dst <destination-address_IPv4mask>
    set dynamic-gateway {enable | disable}
    set gateway <gateway-address_IPv4>
    set status {enable | disable}
  end
```

The `dst` and `gateway` fields are required when `blackhole` is disabled. When `blackhole` is enabled, the `dst` field is required. All other fields are optional.

Variable	Description	Default
<sequence_number>	Enter a sequence number for the static route. The sequence number may influence routing priority in the forwarding table.	No default
bfd {enable   disable   global}	Enable or disable Bidirectional Forwarding on this interface. If you set the value to global, the BFD value for this interface is the same as the global BFD value.	disable
blackhole {enable   disable}	Enable or disable dropping all packets that match this route. This route is advertised to neighbors through dynamic routing protocols as any other static route.	disable
comment <comment_str>	Optionally enter a descriptive comment.	No default
device <interface_name>	This field is available when <code>blackhole</code> is set to <code>disable</code> . Enter the name of the interface through which to route traffic. Enter '?' to see a list of interfaces.	mgmt
distance <1-255>	Enter the administrative distance for the route. The distance value may influence route preference in the routing table. The range is an integer from 1-255.	10
dst <destination-address_ IPv4mask>	Enter the destination IPv4 address and network mask for this route. You can enter <code>0.0.0.0/0</code> to create a new static default route.	0.0.0.0 0.0.0.0
dynamic-gateway {enable   disable}	When enabled, <code>dynamic-gateway</code> hides the <code>gateway</code> variable for a dynamic interface, such as a DHCP or PPPoE interface. When the interface connects or disconnects, the corresponding routing entries are updated to reflect the change.	disable
gateway <gateway-address_ IPv4>	This field is available when <code>blackhole</code> is set to <code>disable</code> . Enter the IPv4 address of the next-hop router to which traffic is forwarded.	0.0.0.0
status {enable   disable}	Enable this setting for the route to be added to the routing table.	enable

### Example

This example shows how to configure a static route:

```
config router static
  edit 1
    set device mgmt
```

```

    set gateway 192.168.0.10
    set status enable
end
end

```

## config router static6

Use this command to add, edit, or delete static routes for IPv6 traffic.

You add static routes to manually control traffic exiting the FortiSwitch unit. You configure routes by specifying destination IP addresses and network masks and adding gateways for these destination addresses. Gateways are the next-hop routers to which traffic that matches the destination addresses in the route are forwarded.

You can adjust the administrative distance of a route to indicate preference when more than one route to the same destination is available. The lower the administrative distance, the greater the preferability of the route. If the routing table contains several entries that point to the same destination (the entries may have different gateways or interface associations), the system compares the administrative distances of those entries, selects the entries having the lowest distances, and installs them as routes in the FortiSwitch forwarding table. As a result, the forwarding table only contains routes having the lowest distances to every possible destination.

### Syntax

```

config router static6
  edit <sequence_number>
    set blackhole {enable | disable}
    set comment <comment_str>
    set device <interface_name>
    set distance <1-255>
    set dst <destination-address_IPv6mask>
    set gateway <gateway-address_IPv6>
    set status {enable | disable}
  end
end

```

The `dst` and `gateway` fields are required when `blackhole` is disabled. When `blackhole` is enabled, the `dst` field is required. All other fields are optional.

Variable	Description	Default
<sequence_number>	Enter a sequence number for the static route.	No default
blackhole {enable   disable}	Enable or disable dropping all packets that match this route.	disable
comment <comment_str>	Optionally enter a descriptive comment.	No default
device <interface_name>	Enter the name of the interface through which to route traffic. Enter '?' to see a list of interfaces.	No default

Variable	Description	Default
distance <1-255>	Enter the administrative distance for the route. The distance value may influence route preference in the routing table. The range is an integer from 1-255.	10
dst <destination-address_ IPv6mask>	Enter the destination IPv6 address and network mask for this route.	::/0
gateway <gateway-address_ IPv6>	Enter the IPv6 address of the next-hop router to which traffic is forwarded.	::
status {enable   disable}	Enable this setting for the route to be added to the routing table.	enable

### Example

This example shows how to configure a static route for IPv6 traffic:

```

config router static6
  edit 1
    set dst 5555::/64
    set gateway 4000::2
    set status enable
  end
end

```

## config switch

Use the `config switch` commands to configure options related to switching functionality:

- [config switch acl egress on page 72](#)
- [config switch acl ingress on page 74](#)
- [config switch acl policer on page 77](#)
- [config switch acl prelookup on page 78](#)

- [config switch vlan on page 131](#)
- [config switch vlan-tpid on page 136](#)

## config switch acl egress

Use this command to configure an access control list (ACL) for an egress policy.

### Syntax

```
config switch acl egress
edit <policy_ID>
  set description <string>
  set interface <port_name>
  set schedule <schedule_name>
  set status {active | inactive}
  config classifier
    set cos <802.1Q CoS value to match>
    set dscp <DSCP value to match>
    set dst-ip-prefix <IP_address> <mask>
    set dst-mac <MAC_address>
    set ether-type <integer>
    set service <service_ID>
    set src-ip-prefix <IP_address> <mask>
    set src-mac <MAC_address>
    set vlan-id <VLAN_ID>
  end
  config action
    set count {enable | disable}
    set drop {enable | disable}
    set mirror <mirror_session>
    set outer-vlan-tag <integer>
    set policer <policer>
    set redirect <interface_name>
    set remark-dscp <0-63>
  end
end
```

Variable	Description	Default
<policy-id>	Enter the unique ID number of this policy.	No default
description <string>	Enter a description or other information about the policy. The description is limited to 63 characters. Enclose the string in single quotes to enter special characters or spaces.	No default
interface <port_name>	Interface that the policy applies to.	No default
schedule <schedule_name>	Select a schedule for when the ACL policy will be enforced. The schedule must have been defined already with the <code>config system schedule</code> command.	No default
status {active   inactive}	Make the egress ACL policy active or inactive.	active
<b>config classifier</b>		
cos <802.1Q CoS value to match>	Enter the 802.1Q CoS value to match.	No default
dscp <DSCP value to match>	Enter the DSCP value to match.	No default
dst-ip-prefix <IP_address> <mask>	Destination IP addresses to be matched.	0.0.0.0 0.0.0.0
dst-mac <MAC_address>	Destination MAC address to be matched.	00:00:00:00:00:00
ether-type <integer>	Ether type to be matched.	0x0000
service <service_ID>	Service name to be matched.	No default
src-ip-prefix <IP_address> <mask>	Source IP addresses to be matched.	0.0.0.0 0.0.0.0
src-mac <MAC_address>	Source MAC address to be matched.	00:00:00:00:00:00
vlan-id <VLAN_ID>	VLAN identifier to be matched.	0
<b>config action</b>		
count {enable   disable}	Enable or disable the <b>count</b> action.	disable
drop {enable   disable}	Enable or disable the <b>drop</b> action.	disable
mirror <mirror_session>	Mirror session name.	No default

Variable	Description	Default
outer-vlan-tag <integer>	Outer VLAN tag.	0
policer <policer>	Identifier of the policer to associate with this policy. To create a policer, see <a href="#">config switch acl policer on page 77</a> .	0
redirect <interface_name>	Redirect interface name.	No default
remark-dscp <0-63>	Set the DSCP marking value.	No default

## config switch acl ingress

Use this command to configure an ACL for an ingress policy. Starting in FortiSwitchOS 6.2.0, you can create groups for multiple ingress ACLs.

### Syntax

```

config switch acl ingress
edit <policy-id>
  set description <string>
  set group <group_ID>
  set ingress-interface <port > [<port > ... <port >]
  set ingress-interface-all {enable | disable}
  set schedule <schedule_name>
  set status {active | inactive}
  config classifier
    set cos <802.1Q CoS value to match>
    set dscp <DSCP value to match>
    set src-mac <mac>
    set dst-mac <mac>
    set ether-type <integer>
    set src-ip-prefix <IP address> <mask>
    set dst-ip-prefix <IP address> <mask>
    set service <service-id>
    set vlan-id <vlan-id>
  end
  config action
    set cos-queue <0 - 7>
    set count {enable | disable}
    set cpu-cos-queue <integer>
    set drop {enable | disable}
    set egress-mask {{physical_port_name} | internal}
    set mirror <mirror_session>
    set outer-vlan-tag <integer>
    set policer <policer>
    set redirect <interface_name>
    set redirect-bcast-cpu {enable | disable}
    set redirect-bcast-no-cpu {enable | disable}
    set redirect-physical-port <list of physical ports to redirect>
    set remark-cos <0-7>
    set remark-dscp <0-63>
  end
end

```

end

Variable	Description	Default
<policy-id>	Enter the unique ID number of this policy.	No default
description <string>	Enter a description or other information about the policy. The description is limited to 63 characters. Enclose the string in single quotes to enter special characters or spaces.	No default
group <group_ID>	Enter the group identifier of the policy. The range of group identifiers varies among the different platforms.  Starting in FortiSwitchOS 6.2.0, you can create groups for multiple ingress ACLs.	1
ingress-interface <port > [<port > ... <port >]	If ingress-interface-all is disabled, enter the interface list to which the policy is bound on the ingress.	No default
ingress-interface-all {enable   disable}	If enabled, policy is bound to all interfaces.	disable
schedule <schedule_name>	Select a schedule for when the ACL policy will be enforced.  The schedule must have been defined already with the <code>config system schedule</code> command.	No default
status {active   inactive}	Make the ingress ACL policy active or inactive.	active
<b>config classifier</b>		
cos <802.1Q CoS value to match>	Enter the 802.1Q CoS value to match.	No default
dscp <DSCP value to match>	Enter the DSCP value to match.	No default
src-mac	Source MAC address to be matched.	00:00:00:00:00:00
dst-mac	Destination MAC address to be matched.	00:00:00:00:00:00
ether-type	Ether type to be matched.	0x0000
src-ip-prefix	Source IP addresses to be matched.	0.0.0.0 0.0.0.0
dst-ip-prefix	Destination IP addresses to be matched.	0.0.0.0 0.0.0.0
service	Service name to be matched.	No default

Variable	Description	Default
vlan-id	VLAN identifier to be matched.	0
<b>config action</b>		
cos-queue <0 - 7>	CoS queue number (0 - 7).	0
count	Enable or disable the <b>count</b> action.	disable
cpu-cos-queue <integer>	CPU CoS queue number. This CoS queue is only used if the packets reach the CPU. Enter <code>set cpu-cos-queue ?</code> to see the value range.	disabled
drop	Enable or disable the <b>drop</b> action.	disable
egress-mask {<physical_port_name>   internal}	List of physical ports to be configured in egress mask.	No default
mirror <mirror_session>	Mirror session name.	No default
outer-vlan-tag	Outer VLAN tag.	4093
policer	Identifier of the policer to associate with this policy. To create a policer, see <a href="#">config switch acl policer on page 77</a> .	1
redirect <interface_name>	Redirect interface name.	No default
redirect-bcast-cpu	Redirect broadcast to all ports including the CPU.	disable
redirect-bcast-no-cpu	Redirect broadcast to all ports excluding the CPU.	disable
redirect-physical-port	List of ports to redirect the packet.	No default
remark-cos <0-7>	Set the CoS marking value. The range is 0-7.	No default
remark-dscp <0-63>	Set the DSCP marking value. The range is 0-63.	No default

## Examples

In the following example, traffic from VLAN 3 is blocked to a specified destination IP subnet (10.10.0.0/16) but allowed to all other destinations:

```
config switch acl ingress
  edit 1
    config action
      set count enable
      set drop enable
    end
    config classifier
      set dst-ip-prefix 10.10.0.0 255.255.0.0
      set vlan-id 3
```

```

    end
    set ingress-interface-all enable
    set status inactive
  next
  edit 2
    config classifier
      set vlan-id 3
    end
    set ingress-interface-all enable
    set status active
  next
end

```

In the following example, packets are classified by matching both the CoS and DSCP values. Both the CoS and DSCP marking values are set:

```

config switch acl ingress
  edit 1
    config classifier
      set src-mac 11:22:33:aa:bb:cc
      set cos 2
      set dscp 10
    end
    config action
      set count enable
      set remark-cos 4
      set remark-dscp 20
    end
    set ingress-interface port2
    set status active
  end
end

```

## config switch acl policer

Use this command to configure an ACL policer for egress or ingress policies.

### Syntax

```

config switch acl policer
  edit <policer index>
    set description <string>
    set guaranteed-bandwidth <bandwidth_value>
    set guaranteed-burst <in_bytes>
    set maximum-burst <in_bytes>
    set type {egress | ingress}
  end
end

```

Variable	Description	Default
<policer index>	Enter the index for this ACL policer	No default
description <string>	Enter a text description for the policer.	No default

Variable	Description	Default
guaranteed-bandwidth <bandwidth_value>	Enter the amount of bandwidth guaranteed to be available for traffic controlled by the policy. The value range is 0 to 16 776 000 Kbits/second.	0
guaranteed-burst <in_bytes>	Guaranteed burst size in bytes (max value = 4294967295)	0
maximum-burst <in_bytes>	Maximum burst size in bytes (max value = 4294967295)	0
type {egress   ingress}	Specify whether the policer is for egress or ingress policies.	ingress

### Example

This example shows how to configure an ACL policer for egress policies.

```
config switch acl policer
  edit 1
    set description policer1
    set guaranteed-bandwidth 8776000
    set guaranteed-burst 858993459
    set maximum-burst 4294967295
    set type egress
  end
```

### config switch acl prelookup

Use this command to configure an ACL for a lookup policy.

#### Syntax

```
config switch acl prelookup
  edit <policy_ID>
    set description <string>
    set interface <port_name>
    set schedule <schedule_name>
    set status {active | inactive}
  config classifier
    set cos <802.1Q CoS value to match>
    set dscp <DSCP value to match>
    set dst-ip-prefix <IP_address> <mask>
    set dst-mac <MAC_address>
    set ether-type <integer>
    set service <service_ID>
    set src-ip-prefix <IP_address> <mask>
    set src-mac <MAC_address>
    set vlan-id <VLAN_ID>
  end
  config action
    set count {enable | disable}
    set cos-queue <0-7>
    set drop {enable | disable}
    set outer-vlan-tag <integer>
    set remark-cos <0-7>
```

```

end
end

```

Variable	Description	Default
<policy-id>	Enter the unique ID number of this policy.	No default
description <string>	Enter a description or other information about the policy. The description is limited to 63 characters. Enclose the string in single quotes to enter special characters or spaces.	No default
interface <port_name>	Interface that the policy applies to.	No default
schedule <schedule_name>	Select a schedule for when the ACL policy will be enforced.  The schedule must have been defined already with the <code>config system schedule</code> command.	No default
status {active   inactive}	Make the prelookup ACL policy active or inactive.	active
<b>config classifier</b>		
cos <802.1Q CoS value to match>	Enter the 802.1Q CoS value to match.	No default
dscp <DSCP value to match>	Enter the DSCP value to match.	No default
dst-ip-prefix <IP_address> <mask>	Destination IP addresses to be matched.	0.0.0.0 0.0.0.0
dst-mac <MAC_address>	Destination MAC address to be matched.	00:00:00:00:00:00
ether-type <integer>	Ether type to be matched.	0x0000
service <service_ID>	Service name to be matched.	No default
src-ip-prefix <IP_address> <mask>	Source IP addresses to be matched.	0.0.0.0 0.0.0.0
src-mac <MAC_address>	Source MAC address to be matched.	00:00:00:00:00:00
vlan-id <VLAN_ID>	VLAN identifier to be matched.	0
<b>config action</b>		
count {enable   disable}	Enable or disable the <i>count</i> action.	disable

Variable	Description	Default
cos-queue <0-7>	CPU CoS queue number (20-29). Only if packets reach to CPU. The value range is 20-29.	No default
drop {enable   disable}	Enable or disable the <i>drop</i> action.	disable
outer-vlan-tag <integer>	Outer VLAN tag.	0
remark-cos <0-7>	Set the CoS marking value. The range is 0-7.	No default

## config switch acl service custom

Use this command to customize one of the ACL services.

### Syntax

```

config switch acl service custom
  edit <service name>
    set comment <string>
    set color <0-32>
    set protocol {ICMP | IP | TCP/UDP/SCTP}
    set icmptype <0-255>
    set icmpcode <0-255>
    set protocol-number <IP protocol number>
    set sctp-portrange <dstportlow_int>[-<dstporthigh_int>: <srcportlow_int>-<srcporthigh_int>]
    set tcp-portrange <dstportlow_int>[-<dstporthigh_int>:<srcportlow_int>-<srcporthigh_int>]
    set udp-portrange <dstportlow_int>[-<dstporthigh_int>:<srcportlow_int>-<srcporthigh_int>]
  end
end

```

Variable	Description	Default
<service name>	Enter the name of this custom service.	No default
comment <string>	Add comments for the custom service.	No default
color <0-32>	Set the icon color to use in the Web-based manager. A value of zero sets the default color (1).	0
protocol {ICMP   IP   TCP/UDP/SCTP}	Select the protocol used by the service. These protocols are available when explicit-proxy is enabled.	TCP/UDP/SCTP
icmptype <0-255>	If you set the protocol to ICMP, set the ICMP type.	0
icmpcode <0-255>	If you set the protocol to ICMP, set the ICMP code.	0

Variable	Description	Default
protocol-number	For an IP service, enter the IP protocol number.	0
sctp-portrange	For SCTP services, enter the destination and source port ranges.	No default
tcp-portrange	For TCP services, enter the destination and source port ranges.	No default
udp-portrange	For UDP services, enter the destination and source port ranges.	No default

Notes:

- **srcport\_low** and **srcport\_high** can be omitted if the value pair is 1-65535
- **dstport\_high** can be omitted if **dstport\_low** is equal to **dstport\_high**
- **srcport\_low** and **srcport\_high** can be omitted if the value pair is 1-65535
- **dstport\_high** can be omitted if **dstport\_low** is equal to **dstport\_high**

### Example

In the following example, Server Message Block (SMB) traffic received on port 1 is mirrored to port 3. SMB protocol uses port 445:

```

config switch acl service custom
  edit "SMB"
    set tcp-portrange 445
  next
end
config switch acl ingress # apply policy to port 1 ingress and send to port 3
  edit 1
    set description "cnt_n_mirror_smb"
    set ingress-interface "port1"
    config action
      set count enable
      set mirror "port3"
    end
    config classifier
      set service "SMB"
      set src-ip-prefix 20.20.20.100 255.255.255.255
      set dst-ip-prefix 100.100.100.0 255.255.255.0
    end
  next
end

```

## config switch acl settings

Use this command to configure the global ACL settings

### Syntax

```

config switch acl settings
  set density-mode {disable | enable}

```

```

    set trunk-load-balance {disable | enable}
end

```

Variable	Description	Default
density-mode	Enable or disable density mode.	disable
trunk-load-balance	Enable or disable trunk-load-balancing for ACL actions.	enable

### Example

The following example configures the global ACL settings:

```

config switch acl settings
    set density-mode enable
    set trunk-load-balance enable
end

```

## config switch auto-isl-port-group

Use this command to create a multi-tiered MCLAG trunk when the FortiSwitch unit is managed by a FortiGate unit.

### Syntax

```

config switch auto-isl-port-group
    edit <trunk_name>
        set members <one or more ports>
    end

```

### Example

The following example creates two trunks for a multi-tiered MCLAG:

```

config switch auto-isl-port-group
    edit "mclag-core1"
        set members "port1" "port2"
    next
    edit "mclag-core2"
        set members "port3" "port4"
    end

```

## config switch global

Use this command to configure system-wide FortiSwitch settings.

### Syntax

```

config switch global
    set auto-fortilink-discovery {enable | disable}
    set auto-isl {enable | disable}
    set auto-isl-port-group <0-9>
    set auto-stp-priority {enable | disable}
    set dhcp-snooping-database-export {disable | enable}
    set dmi-global-all {enable | disable}

```

```

set flapguard-retain-trigger {enable | disable}
set fortilink-heartbeat-timeout <0-300>
set fortilink-vlan-optimization {enable | disable}
set forti-trunk-dmac <xx:xx:xx:xx:xx:xx>
set ip-mac-binding {enable | disable}
set log-mac-limit-violations {enable | disable}
set loop-guard-tx-interval <0-30>
set mac-aging-interval <seconds>
set mac-violation-timer <integer>
set max-frame-size <bytes_int>
set max-path-in-ecmp-group <integer>
set mclag-igmpsnooping-aware {enable | disable}
set mclag-peer-info-timeout <integer>
set mclag-stp-aware {enable | disable}
set name <string>
set neighbor-discovery-to-cpu {enable | disable}
set packet-buffer-mode {store-forward | cut-through}
set poe-alarm-threshold <threshold (percent of total power budget) above which an alarm
    event is generated>
set poe-guard-band <integer>
set poe-power-budget <integer>
set poe-power-mode {first-come-first-served | priority}
set poe-pre-standard-detect {disable | enable}
set reserved-mcast-to-cpu {enable | disable}
set trunk-hash-mode {default| enhanced}
set trunk-hash-unicast-src-port {enable | disable}
set trunk-hash-unkunicast-src-dst {enable | disable}
set virtual-wire-tpid <0x0001-0xffff>
config port-security
    set link-down-auth {no-action | set-unauth}
    set mab-reauth {enable | disable}
    set max-reauth-attempt <0-15>
    set quarantine-vlan {enable | disable}
    set reauth-period <1-1440>
end
end

```

Variable	Description	Default
auto-fortilink-discovery {enable   disable}	Enable or disable the capability for the FortiGate unit to automatically discover the FortiLink interface on the switch.	enable
auto-isl {enable   disable}	Enable or disable the capability to automatically form an inter-switch LAG.	enable
auto-isl-port-group <0-9>	Set the ISL port group. The range is 0-9.	0
auto-stp-priority {enable   disable}	Enable or disable the automatic assigned STP switch priority.	enable
dhcp-snooping-database-export {disable   enable}	Enable or disable whether the DHCP snooping database is exported to file.	disable

Variable	Description	Default
dmi-global-all {enable   disable}	Enable or disable DMI globally.	enable
flapguard-retain-trigger {enable   disable}	<p>Enable this setting to keep the “triggered” status in the output of the <code>diagnose flapguard status</code> command after a switch has been rebooted until the port has been reset with the <code>execute flapguard reset &lt;port_name&gt;</code> command.</p> <p>Disable this setting to reset the “triggered” status when the switch is rebooted.</p>	disable
fortilink-heartbeat-timeout <0-300>	Set how long before the FortiLink heartbeat times out. Set the value to 0 to disable the FortiLink heartbeat.	60
fortilink-vlan-optimization {enable   disable}	Enable or disable FortiLink VLAN optimization.	disable
forti-trunk-dmac <xx:xx:xx:xx:xx:xx>	Enter the destination MAC address to be used for FortiTrunk heartbeat packets.	02:80:c2:00:00:02
ip-mac-binding {enable   disable}	Enable or disable IP-MAC binding for the switch	disable
log-mac-limit-violations {enable   disable}	<p>Enable or disable the logging of layer-2 learning limit violations for an interface or VLAN. The most recent violation that occurred on each interface or VLAN is logged. After that, no more violations are logged until the log is reset for the triggered interface or VLAN. Only the most recent 128 violations are displayed in the console.</p> <p><b>NOTE:</b> This command is only displayed if your FortiSwitch model supports it.</p>	disable
loop-guard-tx-interval <0-30>	Enter the loop guard transmit interval. Value range is 1-30. The units is seconds.	3
mac-aging-interval <seconds>	Specify how often the learning-limit violation log is reset. The range is 10 to 1,000,000 seconds. Set to 0 to disable.	300
mac-violation-timer <integer>	How long (in minutes) violations of the layer-2 learning limit are kept in the log. The value range is 0-1500. Set to 0 to disable the timer.	0

Variable	Description	Default
max-frame-size <bytes_int>	Set the maximum frame size. The range is 68 to 16360.  <b>NOTE:</b> For non-1xxE FortiSwitch units, this command is under the <code>config switch physical-port</code> command.	9216
max-path-in-ecmp-group <integer>	Set the maximum path in one ECMP group.	8
mclag-igmpsnooping-aware {enable   disable}	Enable this option to synchronize both query ports and group entries across peer MLAG trunks. This option can be used in standalone mode and in FortiLink mode.  <b>NOTE:</b> For IGMP snooping to work correctly in an MLAG, you need to use the <code>set mclag-igmpsnooping-aware enable</code> command on all FortiSwitch units in the network topology and use the <code>set igmps-flood-reports enable</code> command on each MLAG core FortiSwitch unit.	disable
mclag-peer-info-timeout <integer>	Enter the MLAG peer info timeout. The value range is 30 to 600 seconds.	30
mclag-stp-aware {enable   disable}	Enable or disable whether the STP can be used within the MLAG.	enable
name <string>	Enter a name for the switch.	No default
neighbor-discovery-to-cpu {enable   disable}	Enable or disable the forwarding of reserved multicast packets to the CPU. Applies only to the 200 Series and 400 Series.	enable
packet-buffer-mode {store-forward   cut-through}	Set the switching mode to store-and-forward or cut-through for the main buffer of the FSW-1024D, FSW-1048D, or FSW-3032D model.	store-forward
poe-alarm-threshold <threshold (percent of total power budget) above which an alarm event is generated>	Enter the threshold (a specified percentage of the total power budget) above which an alarm event is generated.	80
poe-guard-band <integer>	Enter the power (W) to reserve in case of a spike in PoE consumption.	19
poe-power-budget <integer>	Set or override the maximum power budget.	400

Variable	Description	Default
poe-power-mode {first-come-first-served   priority}	Set the PoE power mode to priority based or first-come, first-served.	priority
poe-pre-standard-detect {disable   enable}	<p>Enable or disable PoE pre-standard detection.</p> <p><b>NOTE:</b> PoE pre-standard detection is a global setting for the following FortiSwitch models: FSR-112D-POE, FSW-548D-FPOE, FSW-524D-FPOE, FSW-108D-POE, FSW-224D-POE, FSW-108E-POE, FSW-108E-FPOE, FSW-124E-POE, and FSW-124E-FPOE. For the other FortiSwitch PoE models, PoE pre-standard detection is set on each port.</p>	enable
reserved-mcast-to-cpu {enable   disable}	Enable or disable the forwarding of IPv6 neighbor-discovery packets to the CPU. Applies only to the 200 Series and 400 Series.	enable
trunk-hash-mode {default  enhanced}	Set the trunk hash mode to default or enhanced	default
trunk-hash-unicast-src-port {enable   disable}	Enable or disable whether the trunk hashing algorithm for unicast packets uses the source port.	disable
trunk-hash-unkunicast-src-dst {enable   disable}	Enable or disable trunk hash for unknown unicast src-dst.	enable
virtual-wire-tpid <0x0001-0xffff>	TPID value used by virtual-wires. The value range is from 0x0001 to 0xffff. Choose a value unlikely to be seen as a TPID or ethertype in your network.	0xdee5
<b>config port-security</b>		
link-down-auth	<p>If a link goes down, this setting determines if the affected devices needs to reauthenticate.</p> <ul style="list-style-type: none"> <li><code>set-unauth</code> — revert all devices to the unauthenticated state. Each device will need to reauthenticate.</li> <li><code>no-action</code> — if reauthentication is not required.</li> </ul>	set-unauth
mab-reauth {enable   disable}	Enable or disable whether MAB retries authentication before assigning a device to a guest VLAN for unauthorized users.	disable

Variable	Description	Default
max-reauth-attempt	If 802.1x authentication fails, this setting caps the number of attempts that the system will initiate. The range is from 0 to 15 where "0" disables the reauthentication attempts.	3
quarantine-vlan {enable   disable}	Enable or disable quarantine VLAN detection. Enable this setting to use quarantines with 802.1x MAC-based authentication in FortiLink mode.	enable
reauth-period	Defines how often the device needs to reauthenticate. If a session remains active beyond this number of minutes, the system requires the device to reauthenticate.	60

### Example

The following example configures system-wide FortiSwitch settings:

```
config switch global
  set auto-isl enable
  set dhcp-snooping-database-export enable
  set dmi-global-all enable
  set ip-mac-binding enable
  set loop-guard-tx-interval 15
  set mac-aging-interval 150
  set max-path-in-ecmp-group 4
  set mclag-peer-info-timeout 300
  set poe-alarm-threshold 40
  set poe-power-mode first-come-first-served
  set poe-guard-band 10
  set poe-pre-standard-detect enable
  set poe-power-budget 200
  set trunk-hash-mode enhanced
  set trunk-hash-unkunicast-src-dst enable
end
```

### config switch igmp-snooping globals

Use this command to configure IGMP snooping on the FortiSwitch unit.

#### Syntax

```
config switch igmp-snooping globals
  set aging-time <integer>
  set flood-unknown-multicast {enable | disable}
  set query-interval <10-1200>
end
```

Variable	Description	Default
aging-time	The maximum number of seconds to retain a multicast snooping entry for which no packets have been seen (15-3600).	300
flood-unknown-multicast	Enable or disable whether to flood the VLAN with unknown multicast messages.	disable
query-interval <10-1200>	Enter the maximum number of seconds between IGMP queries.	120

## Example

The following example configures IGMP snooping on the FortiSwitch unit:

```
config switch igmp-snooping globals
  set aging-time 150
  set flood-unknown-multicast enable
  set query-interval 200
end
```

## config switch interface

Use this command to configure FortiSwitch features on an interface.

**NOTE:** Settings under `config qnq` are for customer VLANs (C-VLANs). Other settings such as `set allowed-vlans`, `set native-vlan`, and `set vlan-tpid` are for service-provider VLANs (S-VLANs).

## Command

```
config switch interface
  edit <interface_name>
    set allowed-vlans {vlan1 vlan2 ...}
    set arp-inspection-trust {trusted | untrusted}
    set auto-discovery-fortilink {enable | disable}
    set auto-discovery-fortilink-packet-interval <3-300>
    set default-cos <0 - 7>
    set discard-mode {all-tagged | all-untagged | none}
    set dhcp-snooping {trusted | untrusted}
    set dhcp-snooping-learning-limit-check {disable | enable}
    set dhcp-snooping-option82-trust {enable | disable}
    set edge-port {enabled | disabled}
    set igmp-snooping {allowed | not-allowed}
    set igmps-flood-reports {enable | disable}
    set igmps-flood-traffic {enable | disable}
    set ip-mac-binding {enable | disable | global}
    set ip-source-guard {enable | disable}
    set learning-limit <1 - 128>
    set log-mac-event {enable | disable}
    set loop-guard {enable | disable}
    set native-vlan <vlan_int>
    set packet-sampler {enabled | disabled}
      set sample-direction {both | rx | tx}
    set packet-sample-rate <0-99999>
```

```
set private-vlan {disabled | promiscuous sub-vlan}
set qos-policy {<string> | default}
set rpvst-port {enabled | disabled}
set security-groups <security-group-name>
set sflow-counter-interval <0-255>
set snmp-index <integer>
set sticky-mac {disable | enable}
set stp-bpdu-guard {disabled | enabled}
set stp-loop-protection {enabled | disabled}
set stp-root-guard {disabled | enabled}
set stp-state {enabled | disabled}
set trust-dot1p-map <string>
set trust-ip-dscp-map <string>
set untagged-vlans {vlan1 vlan2 ...}
set vlan-mapping-miss-drop {enable | disable}
set vlan-tpid <default | string>
config port-security
  set mab-eapol-request <0-10>
  set port-security-mode {none | 802.1X | 802.1X-mac-based}
  set framevid-apply {disable | enable}
  set auth-fail-vlan {enable | disable}
  set auth-fail-vlanid <VLAN_id>
  set eap-passthru {disable | enable}
  set guest-auth-delay <integer>
  set guest-vlan {enable | disable}
  set guest-vlanid <VLAN_id>
  set mac-auth-bypass {enable | disable}
  set open-auth {enable | disable}
  set quarantine-vlan {enable | disable}
  set radius-timeout-overwrite {enable | disable}
  next
end
config raguard
  edit <ID>
    set raguard-policy <name_of_RA_guard_policy>
    set vlan-list <list_of_VLANs>
  next
end
config qnq
  set status {enable | disable}
  set add-inner <1-4095>
  set edge-type customer
  set stp-qnq-admin {enable | disable}
  set priority {follow-c-tag | follow-s-tag}
  set remove-inner {enable | disable}
  set vlan-mapping-miss-drop {enable | disable}
  config vlan-mapping
    edit <id>
      set description <string>
      set match-c-vlan <1-4094>
      set new-s-vlan <1-4094>
    next
  end
end
config vlan-mapping
  edit <id>
    set description <string>
```

```

        set direction {egress | ingress}
        set match-s-vlan <1-4094>
        set match-c-vlan <1-4094>
        set action {add | delete | replace}
        set new-s-vlan <1-4094>
    next
end
next
end

```

Variable	Description	Default
<interface_name>	Enter the name of the interface.	No default
allowed-vlans {vlan1 vlan2 ...}	Enter the names of the VLANs permitted on this interface.	No default
arp-inspection-trust {trusted   untrusted}	Set the interface to trusted or untrusted.	untrusted
auto-discovery-fortilink {enable   disable}	Enable or disable automatic discovery of the port used for FortiLink.	disable
auto-discovery-fortilink-packet-interval <3-300>	Enter the FortiLink packet interval for automatic discovery. The value range is 3 to 300 seconds.	5
default-cos <0 - 7>	<p>Set the default CoS value for untagged packets. Integer in the range of 0 to 7.</p> <p>The configured default CoS only applies if you also set <code>trust-dot1p-map</code> on the interface.</p> <p><b>NOTE:</b> The <code>set default-cos</code> command is not available on the following FortiSwitch models: 224D-FPOE, 248D, 424D, 424D-POE, 424D-FPOE, 448D, 448D-POE, 448D-FPOE, 224E, 224E-POE, 248E-POE, and 248E-FPOE.</p>	0
discard-mode {all-tagged   all-untagged   none}	Set the discard mode for this interface.	none
dhcp-snooping {trusted   untrusted}	Set the interface to trusted or untrusted.	untrusted
dhcp-snoop-learning-limit-check {disable   enable}	Enable or disable whether there is a limit for how many IP addresses are in the DHCP snooping binding database for this interface.	disable
dhcp-snooping-option82-trust {enable   disable}	Enable or disable (allow/disallow) DHCP packets with option-82 on an untrusted interface.	disable

Variable	Description	Default
edge-port {enabled   disabled}	Enable if the port does not have another switch connected to it.	disable
igmp-snooping {allowed   not-allowed }	Allow or disallow this interface from taking part in IGMP snooping.	not-allowed
igmps-flood-reports {enable   disable}	<p>Enable or disable whether to flood IGMP reports to this interface.</p> <p><b>NOTE:</b> For IGMP snooping to work correctly in an MCLAG, you need to use the <code>set mclag-igmpsnooping-aware enable</code> command on all FortiSwitch units in the network topology and use the <code>set igmps-flood-reports enable</code> command on each MCLAG core FortiSwitch unit.</p>	enable
igmps-flood-traffic {enable   disable}	Enable or disable whether to flood multicast traffic to this interface.	disable
ip-mac-binding {enable   disable   global}	Enable or disable IP-MAC binding for this interface. Set the value to 'global', the interface inherits the global ip-mac-binding configuration value.	disable
ip-source-guard {enable   disable}	Enable or disable IP source guard for this interface. After you enable this feature, use the <code>config switch ip-source-guard</code> command to configure it.	disable
learning-limit <1 - 128>	<p>Limit the number of dynamic MAC addresses on this port. The value range is between 0 and 128 (0 = no limit).</p> <p><b>NOTE:</b> You cannot set the learning-limit on the internal interface.</p>	0
log-mac-event {enable   disable}	Enable or disable the logging of dynamic MAC address events.	disable
loop-guard {enable   disable}	Enable or disable loop guard for this interface.	disable
native-vlan <vlan_int>	Enter the native (untagged) VLAN for this interface.	1
packet-sampler {enabled   disabled}	Enable or disable packet sampling for flow export.	disabled
sample-direction {both   rx  tx}	<p>Set the sFlow sample direction to monitor received traffic (rx), monitor transmitted traffic (tx), or monitor both.</p> <p>This option is only available when the packet-sampler is enabled.</p>	both

Variable	Description	Default
packet-sample-rate <0-99999>	If packet-sampler is set to enabled, you can change the packet sample rate.	512
private-vlan {disabled   promiscuous   sub-vlan}	Enable private VLAN functionality. <b>NOTE:</b> Private VLANs are not supported on the FortiSwitch-28C.	disabled
qos-policy {<string>   default}	Enter the name of the QoS egress CoS queue policy.	default
rpvst-port {enabled   disabled}	Enable or disable whether the interface can interoperate with a network that is running RPVST+.	disabled
security-groups <security-group-name>	Enter the security group name if you are using port-based authentication or MAC-based authentication.	No default
sflow-counter-interval <0-255>	Set the polling interval for the sFlow sampler counter. Set to 0 to disable polling.	0
snmp-index <integer>	Enter the SNMP index for this interface.	Default is the port number
sticky-mac {disable   enable}	Enable or disable whether dynamically learned MAC addresses are persistent when the status of a FortiSwitch port changes (goes down or up).	disable
stp-bpdu-guard {disabled   enabled}	Enable or disable STP BPDU guard protection. To use STP BPDU guard on this interface, you must enable stp-state and edge-port.	disabled
stp-loop-protection {enabled   disabled}	Enable or disable STP loop protection on this interface.	disabled
stp-root-guard {disabled   enabled}	Enable or disable STP root guard protection. To use STP root guard, you must enable stp-state.	disabled
stp-state {enabled   disabled}	Enable or disable Spanning Tree Protocol (STP) on this interface.	enabled
trust-dot1p-map	Whether to trust the dot1p CoS value in the incoming packets. Specify a map to map the CoS value to an egress queue value.	No default
trust-ip-dscp-map	Whether to trust the DSCP QoS value in the incoming packets. Specify a map to map the DSCP value to an egress queue value.	No default
untagged-vlans	Select the allowed-vlans to be transmitted without VLAN tags	No default

Variable	Description	Default
vlan-mapping-miss-drop {enable   disable}	Enable or disable whether a packet is dropped if the VLAN ID in the packet's tag is not defined in the vlan-mapping configuration.	disable
vlan-tpid <default   string>	Select which VLAN TPID profile to use. The default VLAN TPID profile has a value of 0x8100 and cannot be deleted or changed.  <b>NOTE:</b> If you are not using the default VLAN TPID profile, you must have already defined the VLAN TPID profile with the <code>config switch vlan-tpid</code> command.	default
<b>config port-security</b>		
mab-eapol-request <0-10>	Set how many EAP packets are sent to trigger EAP authentication for "silent supplicants" (such as end devices running Windows 7) that send non-EAP packets when they wake up from sleep mode.  To disable this feature, set <code>mab-eapol-request</code> to 0 or disable <code>mac-auth-bypass</code> .	3
port-security-mode {none   802.1X   802.1X-mac-based}	Set the security mode for the port. Set the security mode to <code>802.1X</code> for port-based authentication or <code>802.1Xmac-based</code> for MAC-based authentication. If you change the security mode from <code>none</code> , you must set the security group with the <code>set security-groups</code> command.	none
framevid-apply {disable   enable}	Enable or disable the capability to apply the EAP/MAB frame VLAN to the port native VLAN.  <b>NOTE:</b> For phone and PC configuration only, disable <code>framevid-apply</code> to preserve the native VLAN when the data traffic is expected to be untagged.	enable
auth-fail-vlan {enable   disable}	When enabled, the system assigns the <code>auth-fail-vlanid</code> to users who attempted to authenticate but failed to provide valid credentials.	disable
auth-fail-vlanid <VLAN_id>	VLAN identifier. Mandatory field when auth-fail VLAN is enabled.	200
eap-passthru {disable   enable}	Enable or disable the EAP pass-through mode.	enable
guest-auth-delay <integer>	If a device does not attempt to authenticate within this timeframe (in seconds), the guest VLAN is assigned.	5

Variable	Description	Default
guest-vlan {enable   disable}	When enabled, the system assigns the <code>guest-vlanid</code> to unauthorized users.	disable
guest-vlanid <VLAN_id>	VLAN identifier. Mandatory field when guest VLAN is enabled.	100
mac-auth-bypass {enable   disable}	Enable or disable MAC auth bypass.	disable
open-auth {enable   disable}	Enable or disable open authentication (monitor mode) on this interface.	disable
quarantine-vlan {enable   disable}	Enable or disable quarantine VLAN detection. Enable this setting to use quarantines with 802.1x MAC-based authentication in FortiLink mode.	enable
radius-timeout-overwrite {enable   disable}	Enable this option to use the value of the <code>session-timeout</code> attribute, which is part of the <code>Fortinet-Host-Port-AVPair</code> attribute. The <code>session-timeout</code> attribute specifies how many seconds of idleness are allowed before the FortiSwitch unit disconnects a session. The value must be more than 60 seconds.	disable
<b>config raguard</b>		
<ID>	Enter an identifier for the IPv6 RA-guard configuration.	No default
raguard-policy <name_of_RA_guard_policy>	Enter the name of the RA-guard policy to use for this interface.  The RA-guard policy must be created (with the <code>config switch raguard-policy</code> command) before it is applied to an interface.	No default
vlan-list <list_of_VLANS>	Enter a VLAN or a range of VLANs to apply this policy to. Use less than 4,096 characters for the <code>vlan-list</code> value. Separate the VLANs and VLAN ranges with commas, for example:  1,3-4,6,7,9-100	All allowed VLANs on this port
<b>config qnq</b>		
status {enable   disable}	Enable or disable VLAN stacking (QinQ) mode.	disable
add-inner <1-4095>	If the QinQ mode is enabled, add the inner tag for untagged packets upon ingress.	No default

Variable	Description	Default
edge-type customer	If the QinQ mode is enabled, the edge type is set to customer.	customer
stp-qnq-admin {enable   disable}	Enable or disable VLAN stacking (QinQ) to manage the STP administration state.	enable
priority {follow-c-tag   follow-s-tag}	If the QinQ mode is enabled, select whether to follow the priority of the S-tag (service tag) or C-tag (customer tag).	follow-s-tag
remove-inner {enable   disable}	If the QinQ mode is enabled, enable or disable whether the inner tag is removed upon egress.	disable
vlan-mapping-miss-drop {enable   disable}	If the QinQ mode is enabled, enable or disable whether a packet is dropped if the VLAN ID in the packet's tag is not defined in the vlan-mapping configuration.	disable
<id>	Enter a mapping entry identifier.	No default
description <string>	Enter a description of the mapping entry.	No default
match-c-vlan <1-4094>	Enter a matching customer (inner) VLAN.	0
new-s-vlan <1-4094>	Enter a new service (outer) VLAN.  <b>NOTE:</b> The VLAN must be in the port's allowed VLAN list.  This option is only available after you set the value for <code>match-c-vlan</code> .	No default
<b>config vlan-mapping (not available when QinQ is enabled)</b>		
<id>	Enter an identifier for the VLAN mapping entry.	No default
description <string>	Enter a description of the VLAN mapping entry.	No default
direction {egress   ingress}	Select the ingress or egress direction.	No default
match-s-vlan <1-4094>	If the direction is set to egress, enter the service (outer) VLAN to match.	0
match-c-vlan <1-4094>	If the direction is set to ingress, enter the customer (inner) VLAN to match.	0

Variable	Description	Default
action {add   delete   replace}	<p>Select what happens when the packet is matched:</p> <ul style="list-style-type: none"> <li>- <b>add</b>—When the packet is matched, add the service VLAN. You cannot set the <code>action</code> to <code>add</code> for the egress direction.</li> <li>- <b>delete</b>—When the packet is matched, delete the service VLAN. You cannot set the <code>action</code> to <code>delete</code> for the ingress direction.</li> <li>- <b>replace</b>—When the packet is matched, replace the customer VLAN or service VLAN.</li> </ul> <p>This option is only available after you set a value for <code>match-c-vlan</code> or <code>match-s-vlan</code>.</p>	No default
new-s-vlan <1-4094>	<p>Set the new service (outer) VLAN.</p> <p>This option is only available after you set the <code>action</code> to <code>add</code> or <code>replace</code> for the ingress direction or after you set the <code>action</code> to <code>replace</code> for the egress direction.</p>	No default

### Example

The following example shows QoS configuration on a trunk interface:

```
config switch interface
  edit "tr1"
    set snmp-index 56
    set trust-dot1p-map "dot1p_map1"
    set default-cos 1
    set qos-policy "p1"
  next
end
```

## config switch ip-mac-binding

Use IP-MAC binding to prevent ARP spoofing.

The port accepts a packet only if the source IP address and source MAC address in the packet match an entry in the IP-MAC binding table.

You can enable or disable IP-MAC binding for the whole switch, and you can override this global setting for each port.

### Syntax

```
config switch ip-mac-binding
  edit <sequence_int>
    set ip <xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx>
    set mac <xx:xx:xx:xx:xx:xx>
    set status {enable | disable}
  next
end
```

Variable	Description	Default
<sequence_int>	Enter a sequence number for the IP-MAC binding entry.	No default
ip <xxx.xxx.xxx.xxx> <xxx.xxx.xxx.xxx>	Enter the source IP address and network mask for this rule.	0.0.0.0 0.0.0.0
mac <xx:xx:xx:xx:xx:xx>	Enter the MAC address for this rule.	00:00:00:00:00:00
status {enable   disable}	Enable or disable the IP-MAC binding.	disable

### Example

The following example configures the IP-MAC binding for the FortiSwitch unit:

```
config switch ip-mac-binding
  edit 1
    set ip 172.168.20.1 255.255.255.255
    set mac 00:21:cc:d2:76:72
    set status enable
  next
end
```

## config switch ip-source-guard

Use this command to configure IP source guard for a port by binding IPv4 addresses to MAC addresses.

### Syntax

```
config switch ip-source-guard
  edit <port_name>
    config binding-entry
      edit <id>
        set ip <xxx.xxx.xxx.xxx>
        set mac <XX:XX:XX:XX:XX:XX>
      next
    end
  next
end
```

Variable	Description	Default
<port_name>	Enter the name of the port.	No default
<id>	Enter a unique integer to create a new entry.	No default
ip <xxx.xxx.xxx.xxx>	Required. Enter the IPv4 address to bind to the MAC address. Masks are not supported.	0.0.0.0
mac <XX:XX:XX:XX:XX:XX>	Required. Enter the MAC address to bind to the IPv4 address.	00:00:00:00:00:00

## Example

The following example binds an IPv4 address to a MAC address so that traffic from that IP address will be allowed on port4:

```
config switch ip-source-guard
  edit port4
    config binding-entry
      edit 1
        set ip 172.168.20
        set mac 00:21:cc:d2:76:72
      next
    end
  next
end
```

## config switch lldp profile

Use this command to configure LLDP profile settings. The LLDP profile contains most of the port-specific configuration. Profiles are designed to provide a central point of configuration for LLDP settings that are likely to be the same for multiple ports.

There are two static LLDP profiles: `default` and `default-auto-isl`. These profiles are created automatically. They can be modified but cannot be deleted. The `default-auto-isl` profile always has auto-isl enabled, and rejects any configurations which attempt to disable it.

## Syntax

```
config switch lldp profile
  edit <profile>
    set 802.1-tlvs port-vlan-id
    set 802.3-tlvs max-frame-size
    set auto-isl {enable | disable}
    set auto-isl-hello-timer <1-30>
    set auto-isl-port-group <0-9>
    set auto-isl-receive-timeout <3-90>
    set auto-mclag-icl {enable | disable}
    set med-tlvs (inventory-management | location-identification | network-policy |
      power-management)
    config custom-tlvs
      edit <TLVname_str>
        set information-string <hex-bytes>
        set oui <hex-bytes>
        set subtype <integer>
      next
    config med-location-service
      edit address-civic
        set status {enable | disable}
        set sys-location-id <string>
      next
      edit coordinates
        set status {enable | disable}
        set sys-location-id <string>
      next
      edit elin-number
        set status {enable | disable}
```

```

        set sys-location-id <string>
    next
config med-network-policy
    edit {guest-voice | guest-voice-signaling | softphone-voice |
        streaming-video | video-conferencing | video-signaling |
        voice | voice-signaling}
        set status {enable | disable}
        set assign-vlan {enable | disable}
        set dscp <0 - 63>
        set priority <0 - 7>
        set vlan <0 - 4094>
    next
end

```

Variable	Description	Default
profile	Enter a name for the LLDP profile.	No default
802.1-tlvs	The only 802.1 TLV that can be enabled or disabled is <code>port-vlan-id</code> . This TLV will send the native VLAN of the port. If the value is changed, the sent value will reflect the updated value.	no TLV enabled
802.3-tlvs	The only 802.3 TLV that can be enabled or disabled is <code>max-frame-size</code> . This TLV will send the maximum frame size value of the port. If the value is changed, the sent value will reflect the updated value.	no TLV enabled
auto-isl	Enable or disable the auto ISL capability.	Disabled
auto-isl-hello-timer <1-30>	Enter a value (in seconds) for the hello timer. The range is 1 to 30.	3
auto-isl-port-group <0-9>	Enter a value for the port group. The range is 0 to 9.	0
auto-isl-receive-timeout	Enter a value (in seconds) for the receive timeout. The range is 3 to 90.	9
auto-mclag-icl {enable   disable}	Enable or disable the MCLAG inter-chassis link.	disable
med-tlvs (inventory-management   location-identification   network-policy   power-management)	Enable the inventory-management TLVs, location-identification TLVs, network-policy TLVs, and/or power-management TLVs.	inventory-management network-policy location-identification
<b>config custom-tlvs</b>		
<TLVname_str>	Enter the TLV name.	No default

Variable	Description	Default
information-string	Organizationally defined information string. Enter up to 507 bytes in hexadecimal notation.	No default
oui	Organizationally unique identifier. Enter 3 hexadecimal bytes (000000 - FFFFFFFF). At least one byte must have a non-zero value.	000000
subtype	Organizationally defined subtype. Enter an integer in the range of 0 to 255.	0
<b>config med-location-service</b>		
address-civic	Civic address and postal information.	No default
status {enable   disable}	Enable the status to transmit the type-length-value (TLV) if the LLDP-MED profile has been enabled on a port.	disable
sys-location-id <string>	Use the specified location entry that was already entered with the <code>config system location</code> command.	No default
coordinates	Coordinates of the location.	No default
status {enable   disable}	Enable the status to transmit the type-length-value (TLV) if the LLDP-MED profile has been enabled on a port.	disable
sys-location-id <string>	Use the specified location entry that was already entered with the <code>config system location</code> command.	No default
elin-number	Emergency location identifier number (ELIN).	No default
status {enable   disable}	Enable the status to transmit the type-length-value (TLV) if the LLDP-MED profile has been enabled on a port.	disable
sys-location-id <string>	Use the specified location entry that was already entered with the <code>config system location</code> command.	No default
<b>config med-network-policy</b>		

Variable	Description	Default
{guest-voice   guest-voice-signaling   softphone-voice   streaming-video   video-conferencing   video-signaling   voice   voice-signaling}	Enter one of the policy type names.	No default
status {enable   disable}	Enable or disable the policy for the policy type.	disable
assign-vlan {enable   disable}	Enable or disable whether the VLAN is added as one of the allowed-vlans for this port.	disable
dscp <0-63>	DSCP value to send.	0
priority <0-7>	CoS priority value to send.	0
vlan <0-4094>	VLAN value to send.	0
	Setting this option to 0 will advertise the network policy as priority tagged, rather than VLAN tagged. Priority tagged network policies are always transmitted, whereas VLAN tagged are only transmitted if the VLAN is present on the switch interface sending the LLDP packet.	

**NOTE:** LLDP-MED network policies cannot be deleted or added. To use a policy, the `med-tlvs` field must include `network-policy`, and you must set the policy to `enabled`. The VLAN values on the policy are cross-checked against the `VLAN native`, `allowed`, and `untagged` attributes for any interfaces that contain physical-ports using this profile. The cross-check determines if the policy TLV should be sent (VLAN must be native or allowed), and if the TLV should mark the VLAN as tagged or untagged (VLAN is native, or is in untagged). The network policy TLV is automatically updated when a switch interface changes VLAN configuration, or if a physical port is added to, or removed from, a trunk.

### Example

The following example configures an LLDP-MED profile:

```
config switch lldp profile
  edit "Forti670i"
    config med-network-policy
      edit "voice"
        set dscp 46
        set priority 5
        set status enable
        set vlan 400
      next
      edit "guest-voice"
      next
      edit "guest-voice-signaling"
      next
      edit "softphone-voice"
```

```

    next
    edit "video-conferencing"
    next
    edit "streaming-video"
        set dscp 40
        set priority 3
        set status enable
        set vlan 400
    next
    edit "video-signaling"
    next
end
set med-tlvs inventory-management network-policy
next
end

```

## config switch lldp settings

Configure the global LLDP settings.

### Syntax

```

config switch lldp settings
    set status {enable| disable}
    set tx-hold <1-16>
    set tx-interval <5-4095>
    set fast-start-interval <0 or 2-5>
    set management-interface (internal | <string>)
end

```

Variable	Description	Default
status	Enable or disable	Enabled
tx-hold	Number of tx-intervals before the local LLDP data expires. Therefore, the packet TTL (in seconds) is <b>tx-hold</b> times <b>tx-interval</b> . The range for tx-hold is 1 to 16.	4
tx-interval	How often the FortiSwitch transmits the LLDP PDU. The range is 5 to 4095 seconds.	30
fast-start-interval	How often the FortiSwitch transmits the first 4 LLDP packets when a link comes up. The range is 2 to 5 seconds. Set this variable to zero to disable fast start.	2
management-interface	Primary management interface to be advertised in LLDP and CDP PDUs.	<b>mgmt</b> or <b>internal</b> , depending on FortiSwitch model.

## Example

The following example configures the global LLDP settings:

```
config switch lldp settings
  set status enable
  set tx-hold 8
  set tx-interval 2000
  set fast-start-interval 3
  set management-interface internal
end
```

## config switch mirror

Use this command to configure the packet mirror. Packet mirroring allows you to collect packets on specified ports and then send them to another port to be collected and analyzed.

All FortiSwitch models support switched port analyzer (SPAN) mode, which mirrors traffic to the specified destination interface without encapsulation.

The following FortiSwitch models support SPAN, remote SPAN (RSPAN), and encapsulated RSPAN (ERSPAN):

124D, 224D-FPOE, 248D, 424D, 424D-POE, 424D-FPOE, 448D, 448D-POE, 448D-FPOE, 224E, 224E-POE, 248E-POE, 248E-FPOE, 524D, 524D-FPOE, 548D, 548D-FPOE, 1024D, 1048D, 1048E, 3032D, 3032E

**NOTE:** When there are multiple mirror sessions in the FSW-108D-POE, FSW-224D-POE, and FSR-112D-POE models, some traffic might not be mirrored to the destination ports.

Using RSPAN or ERSPAN allows you to send the collected packets across layer-2 domains. You can have multiple RSPAN sessions but only one ERSPAN session.

In RSPAN mode, traffic is encapsulated in a VLAN. In ERSPAN mode, traffic is encapsulated in Ethernet, IPv4, and generic routing encapsulation (GRE) headers.

## Syntax

```
config switch mirror
  edit <mirror session name>
    set dst <interface>
    set encap-gre-protocol <hexadecimal_integer>
    set encap-ipv4-src <IPv4_address>
    set encap-ipv4-tos <hexadecimal_integer>
    set encap-ipv4-ttl <0-255>
    set encap-mac-dst <MAC_address>
    set encap-mac-src <MAC_address>
    set encap-vlan {tagged | untagged}
    set encap-vlan-cfi <0-1>
    set encap-vlan-id <1-4094>
    set encap-vlan-priority <0-7>
    set encap-vlan-tpid <0x0001-0xffffe>
    set erspan-collector-ip <IPv4_address>
    set mode {ERSPAN-auto | ERSPAN-manual | RSPAN | SPAN}
    set rspan-ip <IPv4_address>
    set src-egress <interface_name>
    set src-ingress <interface_name>
    set status {active | inactive}
```

```

set strip-mirrored-traffic-tags {disable | enable}
set switching-packet {enable | disable}
end

```

Variable	Description	Default
<mirror session name>	Enter the name of the mirror session to edit (or enter a new mirror session name).	No default
	Required when the mode is set to ERSPAN-manual, RSPAN (when the switch is not in FortiLink mode), or SPAN.	
dst <interface>	On FortiSwitch models that support RSPAN and ERSPAN, set the trunk or physical port that will act as a mirror. The physical port cannot be part of a trunk.  On FortiSwitch models that do <i>not</i> support RSPAN and ERSPAN, set the physical port that will act as a mirror. The physical port can be part of a trunk.	No default
encap-gre-protocol <hexadecimal_integer>	Set the protocol value in the ERSPAN GRE header.  This option is available when the mode is ERSPAN-auto or ERSPAN-manual.	0x88be
	Required when the mode is set to ERSPAN-manual and the status is active.	
encap-ipv4-src <IPv4_address>	Set the IPv4 source address in the ERSPAN IP header. The range is 0.0.0.1-255.255.255.254.  This option is available when the mode is ERSPAN-manual.	0.0.0.0
encap-ipv4-tos <hexadecimal_integer>	Set the type of service (ToS) value or enter the DSCP and ECN values in the ERSPAN IP header.  This option is available when the mode is ERSPAN-auto or ERSPAN-manual.	0x00
encap-ipv4-ttl <0-255>	Set the IPv4 time-to-live (TTL) value in the ERSPAN IP header.  This option is available when the mode is ERSPAN-auto or ERSPAN-manual.	16

Variable	Description	Default
encap-mac-dst <MAC_address>	<p>Required when the mode is set to ERSPAN-manual and the status is active.</p> <p>Set the MAC address of the next-hop or gateway on the path to the ERSPAN collector IP address. The range is 00:00:00:00:00:01-FF:FF:FF:FF:FF:FF.</p> <p>This option is available only when the mode is ERSPAN-manual.</p>	00:00:00:00:00:00
encap-mac-src <MAC_address>	<p>Required when the mode is set to ERSPAN-manual and the status is active.</p> <p>Set the source MAC address in the ERSPAN Ethernet header. The range is 00:00:00:00:00:01-FF:FF:FF:FF:FF:FE.</p> <p>This option is available when the mode is ERSPAN-manual.</p>	00:00:00:00:00:00
encap-vlan {tagged   untagged}	<p>Set the status of ERSPAN encapsulation headers to tagged or untagged to control whether the VLAN header is added to the encapsulated traffic.</p> <p>This option is available if the mode is ERSPAN-manual.</p>	untagged
encap-vlan-cfi <0-1>	<p>Set the canonical format identifier (CFI) or drop eligible indicator (DEI) bit in the ERSPAN or RSPAN VLAN header.</p> <p>This option is available when the mode is RSPAN or ERSPAN-auto. This option is available for the ERSPAN-manual mode if <code>encap-vlan</code> is set to <code>tagged</code>.</p> <p>When the mode is RSPAN, this option is not available on the 248D, 248D-POE, 248D-FPOE, 248E, 248E-POE, 248E-FPOE, 448D, 448D-POE, and 448D-FPOE models.</p>	0
encap-vlan-id <1-4094>	<p>Set the VLAN identifier in the ERSPAN or RSPAN VLAN header.</p> <p>This option is available when the mode is RSPAN. This option is available for the ERSPAN-manual mode if <code>encap-vlan</code> is set to <code>tagged</code>.</p>	1

Variable	Description	Default
<code>encap-vlan-priority &lt;0-7&gt;</code>	<p>Set the class of service (CoS) bits in the ERSPAN or RSPAN VLAN header.</p> <p>This option is available when the mode is RSPAN or ERSPAN-auto. This option is available for the ERSPAN-manual mode if <code>encap-vlan</code> is set to <code>tagged</code>.</p> <p>When the mode is RSPAN, this option is not available on the 248D, 248D-POE, 248D-FPOE, 248E, 248E-POE, 248E-FPOE, 448D, 448D-POE, and 448D-FPOE models.</p>	0
<code>encap-vlan-tpid &lt;0x0001-0xfffe&gt;</code>	<p>Set the tag protocol identifier (TPID) for the encapsulating VLAN header. The default value, 0x8100, is for an IEEE 802.1Q-tagged frame.</p> <p>This option is available when the mode is RSPAN or ERSPAN-auto. This option is available for the ERSPAN-manual mode if <code>encap-vlan</code> is set to <code>tagged</code>.</p>	0x8100
<code>erspan-collector-ip &lt;IPv4_address&gt;</code>	<p>Required when the status is active and the mode is set to ERSPAN-auto or ERSPAN-manual.</p> <p>Set the IPv4 address for the ERSPAN collector. The range is 0.0.0.1-255.255.255.255.</p> <p>This option is available only when the mode is ERSPAN-auto or ERSPAN-manual.</p>	0.0.0.0

Variable	Description	Default
mode {ERSPAN-auto   ERSPAN-manual   RSPAN   SPAN}	<p>Select the mirroring mode:</p> <ul style="list-style-type: none"> <li>- <code>ERSPAN-auto</code>—Mirror traffic to the specified destination interface using ERSPAN encapsulation. The header contents are automatically configured.</li> <li>- <code>ERSPAN-manual</code>—Mirror traffic to the specified destination interface using ERSPAN encapsulation. The header contents are manually configured.</li> <li>- <code>RSPAN</code>—Mirror traffic to the specified destination interface using RSPAN encapsulation.</li> <li>- <code>SPAN</code>—Mirror traffic to the specified destination interface without encapsulation.</li> </ul> <p>SPAN is supported on all FortiSwitch models. RSPAN and ERSPAN are supported on 124D, 224D-FPOE, 248D, 424D, 424D-POE, 424D-FPOE, 448D, 448D-POE, 448D-FPOE, 224E, 224E-POE, 248E-POE, 248E-FPOE, 524D, 524D-FPOE, 548D, 548D-FPOE, 1024D, 1048D, 1048E, 3032D, and 3032E.</p>	SPAN
rspan-ip <IPv4_address>	<p>Required when the mode is RSPAN, the status is active, and the switch is in FortiLink mode.</p> <p>Enter the destination IP address for the RSPAN collector. The range is 0.0.0.1-255.255.255.255.</p> <p>This option is available only when the mode is RSPAN and the switch is in FortiLink mode.</p>	0.0.0.0
src-egress <interface_name>	Optional. Set the source egress physical ports that will be mirrored. Only one active egress mirror session is allowed.	No default
src-ingress <interface_name>	Optional. Specify the source ingress physical ports that will be mirrored.	No default
status {active   inactive}	Set the mirror session to active or inactive.	inactive
strip-mirrored-traffic-tags {disable   enable}	<p>Enable or disable the removal of VLAN tags from mirrored traffic.</p> <p>This option is available if the mode is ERSPAN-auto or ERSPAN-manual.</p>	disable
switching-packet {enable   disable}	Enable or disable the switching functionality on the dst interface when mirroring.	disable

## Example

The following example configures a port mirror:

```
config switch mirror
  edit "m1"
    set mode SPAN
    set dst "port5"
    set src-egress "port2" "port3"
    set src-ingress "port2" "port4"
    set status active
    set switching-packet enable
  end
```

## config switch network-monitor directed

Use this command to configure a static entry for network monitoring on the FortiSwitch unit.

### Syntax

```
config switch network-monitor directed
  edit <unused network monitor>
    set monitor-mac <xx:xx:xx:xx:xx:xx>
  end
```

Variable	Description	Default
<unused network monitor>	Enter the number of an unused network monitor.	No default
monitor-mac <xx:xx:xx:xx:xx:xx>	Enter the MAC address to be monitored.	00:00:00:00:00:00

### Example

The following example specifies a MAC address to be monitored:

```
config switch network-monitor directed
  edit 1
    set monitor-mac 00:25:00:61:64:6d
  next
end
```

## config switch network-monitor settings

Use this command to configure global settings for network monitoring on the FortiSwitch unit.

### Syntax

```
config switch network-monitor settings
  set db-aging-interval <integer>
  set status {disable | enable}
  set survey-mode {disable | enable}
  set survey-mode-interval <integer>
end
```

Variable	Description	Default
db-aging-interval <integer>	Enter the network monitor database aging interval. The value range is 3600-86400 seconds. Set the option to 0 to disable it.	3600
status {disable   enable}	Enable or disable the network monitor.	disable
survey-mode {disable   enable}	Enable or disable the network monitor survey mode.	disable
survey-mode-interval <integer>	Enter the duration for which a network monitor is programmed in hardware in the survey mode. The value range is 120-3600 seconds.	120

### Example

The following example starts network monitoring in survey mode:

```
config switch network-monitor settings
  set status enable
  set survey-mode enable
  set survey-mode-interval 480
end
```

## config switch phy-mode

On FortiSwitch models that provide 40G QSFP (quad small form-factor pluggable) interfaces, you can install a breakout cable to convert one 40G interface into four 10G interfaces. Use this command to configure split ports.

### Notes

- Splitting ports is supported on the following FortiSwitch models:
  - 3032D (ports 5 to 28 are splittable)
  - 3032E (ports can be split into 4 x 25G when configured in 100G QSFP28 mode or can be split into 4 x 10G when configured in 40G QSFP mode)
  - 524D, 524D-FPOE (ports 29 and 30 are splittable)
  - 548D, 548D-FPOE (ports 53 and 54 are splittable)
  - 1048E (In the 4 x 100G configuration, ports 49, 50, 51, and 52 are splittable as 4 x 25G, 4 x 10G, 4 x 1G, or 2 x 50G. Only two of the available ports can be split.)
  - 1048E (In the 4 x 4 x 25G configuration, ports 49, 50, 51, and 52 are splittable as 4 x 4 x 25G or 2 x 50G. All four ports can be split, but ports 47 and 48 are disabled.)
  - 1048E (In the 6 x 40G configuration, ports 49, 50, 51, 52, 53, 54 are splittable as 4 x 10G or 4 x 1G.)

Use the `set port-configuration ?` command to check which ports are supported for each model.

- Currently, the maximum number of ports supported in software is 64 (including the management port). Therefore, only 10 QSFP ports can be split. This limitation applies to all of the models, but only the 3032D and the 1048E models have enough ports to encounter this limit.
- Starting in FortiOS 6.2.0, splitting ports is supported in FortiLink mode (that is, the FortiSwitch unit managed by a FortiGate unit).

## Syntax

```

config switch phy-mode
  set port-configuration {default | disable-port54 | disable-port41-48 | 4x100G | 6x40G |
  4x4x25G}
  set {<port-name>-phy-mode <single-port| 4x25G | 4x10G | 4x1G | 2x50G}
  ...
end

```

Variable	Description	Default
port-configuration {default   disable-port54   disable-port41-48   4x100G   6x40G   4x4x25G}	<p>For 548D and 548D-FPOE, set this option to <code>disable-port54</code> if only port 53 is splittable and port 54 is unavailable.</p> <p>For 548D and 548D-FPOE, set this option to <code>disable-port41-48</code> if ports 41 to 48 are unavailable, but ports 53 and 54 are splittable.</p> <p>For 1048E, set this option to <code>4x100G</code> to enable the maximum speed (100G) of ports 49 through 52. Ports 53 and 54 are disabled.</p> <p>For 1048E, set this option to <code>6x40G</code> to enable the maximum speed (40G) of ports 49 through 54.</p> <p>For 1048E, set this option to <code>4x4x25G</code> to enable the maximum speed (25G) of ports 49 through 52. Ports 47 and 48 are disabled.</p>	default
port<number>-phy-mode {<port-name>-phy-mode <single-port  4x25G   4x10G   4x1G   2x50G}	<p>Use one entry for each port that supports split ports.</p> <p>Set this option to <code>single-port</code> to use the port at the full base speed without splitting it.</p> <p>For 100G QSFP only, set this option to <code>4x25G</code> to split one port into four subports of 25 Gbps each.</p> <p>For 40G or 100G QSFP only, set this option to <code>4x10G</code> to split one port into four subports of 10Gbps each.</p> <p>For 40G or 100G QSFP only, set this option to <code>4x1G</code> to split one port into four subports of 1 Gbps each.</p> <p>For 100G QSFP only, set this option to <code>2x50G</code> to split one port into two subports of 50 Gbps each.</p>	1x40G

## Example

In the following example, a FortiSwitch 3032D is configured with ports 10, 14, and 28 set to 4x10G:

```

config switch phy-mode
  set port5-phy-mode 1x40G
  set port6-phy-mode 1x40G

```

```
set port7-phy-mode 1x40G
set port8-phy-mode 1x40G
set port9-phy-mode 1x40G
set port10-phy-mode 4x10G
set port11-phy-mode 1x40G
set port12-phy-mode 1x40G
set port13-phy-mode 1x40G
set port14-phy-mode 4x10G
set port15-phy-mode 1x40G
set port16-phy-mode 1x40G
set port17-phy-mode 1x40G
set port18-phy-mode 1x40G
set port19-phy-mode 1x40G
set port20-phy-mode 1x40G
set port21-phy-mode 1x40G
set port22-phy-mode 1x40G
set port23-phy-mode 1x40G
set port24-phy-mode 1x40G
set port25-phy-mode 1x40G
set port26-phy-mode 1x40G
set port27-phy-mode 1x40G
set port28-phy-mode 4x10G
end
```

In the following example, a FortiSwitch 1048E model is configured so that each port is split into four subports of 25 Gbps each.

```
config switch phy-mode
set port-configuration 4x4x25G
set port49-phy-mode 4x25G
set port50-phy-mode 4x25G
set port51-phy-mode 4x25G
set port52-phy-mode 4x25G
end
```

## config switch physical-port

Use this command to configure a physical port.

### Syntax

```
config switch physical-port
edit <port_name>
set cdp-status {disable | rx-only | tx-only | tx-rx}
set description <description_str>
set dmi-status {disable | enable | global}
set egress-drop-mode {disabled | enabled}
set energy-efficient-ethernet {enable | disable}
set flapguard {enabled | disabled}
    set flap-duration <5-300>
    set flap-rate <1-30>
set flow-control {tx | rx | both | disable}
set l2-learning {enable | disable}
set lldp-profile <profile name>
set lldp-status {tx-only | rx-only | tx-rx | disable}
set max-frame-size <bytes_int>
set poe-lldp-detection {enable | disable}
```

```

set poe-port-mode {IEEE802_3AF | IEEE802_3AT}
set poe-port-priority {critical-priority | high-priority | low-priority}
set poe-pre-standard-detect {disable | enable}
set poe-status {enable | disable}
set priority-based-flow-control {enable | disable}
set qsfp-low-power-mode {enabled | disabled}
set speed <speed_str>
set status {down | up}
set storm-control-mode {disabled | global | override}
config storm-control
  set broadcast {enable | disable}
  set rate [0 | 2-10000000]
  set unknown-multicast {enable | disable}
  set unknown-unicast {enable | disable}
end

```

Variable	Description	Default
<port_name>	Enter the port name.	No default
cdp-status {disable   rx-only   tx-only   tx-rx}	Set the CDP transmit and receive status (LLDP must be enabled in LLDP settings). <ul style="list-style-type: none"> <li>• <code>disable</code> disables CDP transmit and receive.</li> <li>• <code>rx-only</code> enables CDP as receive only.</li> <li>• <code>tx-only</code> enables CDP as transmit only.</li> <li>• <code>tx-rx</code> enables CDP transmit and receive.</li> </ul>	disable
description <description_str>	Optionally enter a description.	No default
dmi-status	Enable or disable DMI access. Set to <code>global</code> to use the global switch setting.	global
egress-drop-mode {disabled   enabled>	Enable or disable egress drop.	enabled
energy-efficient-ethernet {enable   disable}	Enable or disable energy-efficient Ethernet.	disable
flapguard {enabled   disabled}	Enable or disable flap guard for this port.	disabled
flap-duration <5-300>	After enabling the port flap guard, set the number of seconds during which the flap rate is counted.	30
flap-rate <1-30>	After enabling the port flap guard, set how many times that a port's status changes during a specified number of seconds before the flap guard is triggered.	5

Variable	Description	Default
flow-control {tx   rx   both   disable}	Set flow control: <ul style="list-style-type: none"> <li>tx — enable transmit pause only</li> <li>rx — enable receive pause only</li> <li>both — enable both transmit and receive pause</li> <li>disable — disable flow control</li> </ul>	disable
l2-learning	Enable or disable dynamic IP learning for this interface	enabled
lldp-profile	Enter the LLDP profile name for this port.	default
lldp-status	Set LLDP status for this port: <ul style="list-style-type: none"> <li>tx-only — enable transmit only</li> <li>rx-only — enable receive only</li> <li>tx-rx — enable both transmit and receive</li> <li>disable — disable LLDP</li> </ul>	tx-rx
max-frame-size <bytes_int>	Set the maximum frame size. The range is 68 to 16360. <b>NOTE:</b> For the eight models in the 1xxE series, this command is under the <code>config switch global</code> command.	9216
poe-lldp-detection {enable   disable}	Enable or disable support of power over Ethernet (PoE) negotiation in LLDP-MED.  <b>NOTE:</b> This command is only available on 548D-FPOE, 524D-FPOE, 108E-POE, 108E-FPOE, 124E-POE, 124E-FPOE, and 112D-POE.	disable
poe-port-mode {IEEE802_3AF   IEEE802_3AT}	Set the PoE port mode to IEEE802.3AF or IEEE802.3AT.	IEEE802_3AT
poe-port-priority {critical-priority   high-priority   low-priority}	Set the port priority. If there is not enough power, power is alloted first to critical-priority ports, then to high-priority ports, and then to low-priority ports.	low-priority
poe-pre-standard-detect {disable   enable}	Enable or disable PoE pre-standard detection.  <b>NOTE:</b> PoE pre-standard detection is a global setting for the following FortiSwitch models: FSR-112D-POE, FSW-548D-FPOE, FSW-524D-FPOE, FSW-108D-POE, FSW-224D-POE, FSW-108E-POE, FSW-108E-FPOE, FSW-124E-POE, and FSW-124E-FPOE. For the other FortiSwitch PoE models, PoE pre-standard detection is set on each port.	enable

Variable	Description	Default
poe-status {enable   disable}	Enable Power over Ethernet. This option is only available with the FortiSwitch-324B-POE.	enable
priority-based-flow-control {enable   disable}	Enable priority-based flow control to avoid frame loss by stopping incoming traffic when a queue is congested. When priority-based flow control is disabled, 802.3 flow control can be used.	disable
qsfp-low-power-mode {enabled   disabled}	Enable or disable the low-power mode on FortiSwitch models with QSFP (quad small form-factor pluggable) ports.	disabled
speed <speed_str>	<p>Set the speed of this port. Values depend on the switch model and port. For example:</p> <ul style="list-style-type: none"> <li>1000auto—Auto-negotiation (1 Gbps full-duplex only).</li> <li>100full—100 Mbps full-duplex.</li> <li>100half—100 Mbps half-duplex.</li> <li>10full—10 Mbps full-duplex.</li> <li>10half—10 Mbps half-duplex.</li> <li>auto—Auto-negotiation.</li> <li>10000cr—10 Gbps copper interface.</li> <li>10000full—10 Gbps full-duplex.</li> <li>10000sr—10 Gbps SFI interface.</li> <li>1000full—1 Gbps full-duplex.</li> <li>auto-module—Maximum speed supported by module.</li> </ul>	auto
status {down   up}	Set the administrative status of this interface: up or down.	up
storm-control-mode {disabled   global   override}	By default, you configure storm control on a system-wide level. Set this option to <code>override</code> if you want to configure storm control on a per-port level using the <code>config storm-control</code> command, which is only available when the <code>storm-control-mode</code> is set to <code>override</code> . Set this option to <code>disabled</code> to deactivate port-level storm-control configuration.	global
<b>config storm-control</b>		
broadcast {enable   disable}	Enable or disable storm control for broadcast traffic.	disable
rate [0   2-10000000]	If the Specify the rate as packets-per-second. If you set the rate to zero, the system drops all packets (for the enabled traffic types).	500

Variable	Description	Default
unknown-multicast {enable   disable}	Enable or disable storm control for unknown multicast traffic.	disable
unknown-unicast {enable   disable}	Enable or disable storm control for unknown unicast traffic.	disable

### Example

In the following example, port 4 is configured:

```
config switch physical-port
  edit "port4"
    set lldp-profile "Forti670i"
    set speed auto
  next
end
```

## config switch qos dot1p-map

Use this command to configure a dot1p map. A dot1p map defines a mapping between IEEE 802.1p CoS values (from incoming packets on a trusted interface) and the egress queue values. For an example, see [Appendix: FortiSwitch QoS template on page 386](#).

### Syntax

```
config switch qos dot1p-map
  edit <dot1p map name>
    set description <text>
    set [priority-0|priority-1|priority-2|...priority-7] <queue number>
    set egress-pri-tagging {disable | enable}
  next
end
```

Variable	Description	Default
<dot1p map name>	Enter the name of a dot1p map.	No default
<text>	Enter a description of the dot1p map.	No default
[priority-0 priority-1 priority-2 ...priority-7] <queue number>	Set the priority of each queue.	queue-0
egress-pri-tagging {disable   enable}	Enable or disable priority tagging on outgoing frames	disable

### Example

```
config switch qos dot1p-map
  edit "test1"
    set priority-0 queue-2
    set priority-1 queue-0
```

```

    set priority-2 queue-1
    set priority-3 queue-3
    set priority-4 queue-4
    set priority-5 queue-5
    set priority-6 queue-6
    set priority-7 queue-7
    set egress-pri-tagging enable
  next
end

```

Values that are not explicitly included in the map will follow the default mapping, which maps each priority (0-7) to queue 0.

If an incoming packet contains no CoS value, the switch assigns a CoS value of zero. Use the `set default-cos <interface>` command to configure a different default CoS value. The valid range is from 0 to 7. The configured default CoS only applies if you also set `trust-dot1p-map` on the interface.

## config switch qos ip-dscp-map

Use this command to configure a DSCP map. A DSCP map defines a mapping between IP Precedence or Differentiated Services Code Point (DSCP) values and the egress queue values. For an example, see [Appendix: FortiSwitch QoS template on page 386](#).

### Syntax

```

config switch qos ip-dscp-map
  edit <ip-dscp map name>
    set description <text>
    config map
      edit <entry-name>
        set dffserv [ [ AF11 | AF12 | AF13 | AF21 | AF22 | AF23 | AF31 | AF32 | AF33 |
                    AF41 | AF42 | AF43 | CS0 | CS1 | CS2 | CS3 | CS4 | CS5 | CS6 | CS7 | EF ]
        set ip-precedence [ Network Control | Internetwork Control | Critic/ECP | Flash
                          Override | Flash, Immediate | Priority | Routine ]
        set value <dscp raw value>
        set cos-queue <queue number>
      next
    end
  next
end

```

Variable	Description	Default
<ip-dscp map name>	Enter the name of a DSCP map.	No default
<text>	Enter a description of the DSCP map.	No default
<entry-name>	Enter a unique integer to create a new entry.	No default

Variable	Description	Default
diffserv [ [ AF11   AF12   AF13   AF21   AF22   AF23   AF31   AF32   AF33   AF41   AF42   AF43   CS0   CS1   CS2   CS3   CS4   CS5   CS6   CS7   EF ]	Set the differentiated service.	No default
ip-precedence [ Network Control   Internetwork Control   Critic/ECP   Flash Override   Flash, Immediate   Priority   Routine ]	Set the IP precedence.	No default
value <dscp raw value>	enter the raw value of DSCP (0 - 63).	No default
cos-queue <queue number>	Enter the CoS queue number.	0

### Example

The following example defines a mapping for two of the DSCP values:

```
config switch qos ip-dscp-map
  edit "m1"
    config map
      edit "e1"
        set cos-queue 0
        set ip-precedence Immediate
      next
      edit "e2"
        set cos-queue 3
        set value 13
      next
    end
  next
end
```

Values that are not explicitly included in the map will follow the default mapping, which assigns queue 0 for all DSCP values.

### config switch qos qos-policy

Use this command to configure QoS policies. For an example, see [Appendix: FortiSwitch QoS template on page 386](#).

In a QoS policy, you set the scheduling mode (Strict, Round Robin, Weighted Round Robin) for the policy, and configure one or more CoS queues.

#### Syntax

```
config switch qos qos-policy
  edit <policy_name>
    set rate-by {kbps | percent}
    set schedule {strict | round-robin | weighted}
```

```

config cos-queue
  edit [queue-0 ... queue-7]
    set description <text>
    set drop-policy {taildrop | weighted-random-early-detection}
    set max-rate <rate kbps>
    set min-rate <rate kbps>
    set max-rate-percent <percentage>
    set min-rate-percent <percentage>
    set weight <value>
    set wred-slope <value>
  next
end
next
end

```

Variable	Description	Default
<policy_name>	Enter the name of the QoS policy.	No default
rate-by {kbps   percent}	Set whether the CoS queue rate is measured in kbps or by percentage.	kbps
schedule {strict   round-robin   weighted}	<p>Set the CoS queue scheduling.</p> <ul style="list-style-type: none"> <li>strict — The queues are served in descending order (of queue number), so higher number queues receive higher priority. The purpose of the strict scheduling mode is to provide lower latency service to higher classes of traffic. However, if the interface experiences congestion, the lower priority traffic could be starved.</li> <li>round-robin — In round robin mode, the scheduler visits each backlogged queue, servicing a single packet from each queue before moving on to the next one. The purpose of round robin scheduling is to provide fair access to the egress port bandwidth.</li> <li>weighted — Each of the eight egress queues is assigned a weight value ranging from 0 to 63. The purpose of weighted round robin scheduling is to provide prioritized access to the egress port bandwidth, such that queues with higher weight get more of the bandwidth, but lower priority traffic is not starved.</li> </ul>	round-robin
[queue-0 ... queue-7]	Set the CoS queue to update.	No default
description <text>	Enter a description of the CoS queue.	No default

Variable	Description	Default
drop-policy {taildrop   weighted-random-early-detection}	Set the CoS queue drop policy. <ul style="list-style-type: none"> <li>taildrop — When the queue is full, new packets are dropped.</li> <li>weighted-random-early-detection — When the queue is full, lower priority packets are dropped.</li> </ul>	taildrop
max-rate <rate kbps>	If you set the rate-by to kbps, enter the maximum rate in kbps. Set the value to 0 to disable.	0
min-rate <rate kbps>	If you set the rate-by to kbps, enter the minimum rate in kbps. Set the value to 0 to disable.	0
max-rate-percent <percentage>	If you set the rate-by to percent, enter the maximum rate as a percentage of the link speed.	0
min-rate-percent <percentage>	If you set the rate-by to percent, enter the minimum rate as a percentage of the link speed.	0
weight <value>	Enter the weight of weighted round robin scheduling. (applicable if the policy schedule is weighted )	1
wred-slope <value>	Enter the slope of WRED drop probability.	45

### Example

The following example defines a QoS policy for queue 0:

```

config switch qos qos-policy
  edit policy1
    set rate-by kbps
    set schedule weighted
    config cos-queue
      edit queue-0
        set description "QoS policy for queue 0"
        set drop-policy weighted-random-early-detection
        set max-rate 20
        set min-rate 10
        set weight 5
        set wred-slope 15
      end
    end
  end
end

```

### config switch regard-policy

Use this command to specify the criteria that router advertisement (RA) messages must match before the RA messages are forwarded. If the RA messages match the criteria in the RA-guard policy, they are forwarded. If the RA messages do not match the criteria in the RA-guard policy, they are dropped.

IPv6 RA guard is supported on 2xx models and higher.

## Syntax

```

config switch raguard-policy
  edit <RA-guard policy name>
    set device-role {host | router}
    set managed-flag {Off | On}
    set other-flag {Off | On}
    set max-hop-limit <0-255>
    set min-hop-limit <0-255>
    set max-router-preference {high | medium | low}
    set match-src-addr <name_of_IPv6_access_list>
    set match-prefix <name_of_IPv6_prefix_list>
  next
end

```

Variable	Description	Default
<RA-guard policy name>	Enter the name of the RA-guard policy.	No default
device-role {host   router}	Set whether this policy applies to hosts or routers. If this option is set to <code>host</code> , all RA messages are dropped. If this option is set to <code>router</code> , the policy checks the other specified criteria.	host
managed-flag {Off   On}	Set to <code>On</code> for the policy to accept RA messages that are flagged with the M (managed address configuration) flag; if the RA messages are not flagged, they are dropped.  Set to <code>Off</code> for the policy to accept RA messages that are <i>not</i> flagged with the M flag; if the RA messages are flagged, they are dropped.  If this option is not set, the policy skips this check.	No default
other-flag {Off   On}	Set to <code>On</code> for the policy to accept RA messages that are flagged with the O (other configuration) flag; if the RA messages are not flagged, they are dropped.  Set to <code>Off</code> for the policy to accept RA messages that are <i>not</i> flagged with the O flag; if the RA messages are flagged, they are dropped.  If this option is not set, the policy skips this check.	No default
max-hop-limit <0-255>	Enter the maximum hop number for the policy to accept RA messages with a hop number equal or less than this value.  If this option is not set, the policy skips this check.	0

Variable	Description	Default
<code>min-hop-limit &lt;0-255&gt;</code>	Enter the minimum hop number for the policy to accept RA messages with a hop number equal or more than this value.  If this option is not set, the policy skips this check.	0
<code>max-router-preference {high   medium   low}</code>	Set the default router preference for the policy to accept RA messages with the router preference equal or less than this setting. When the router preference of RA messages is not set as high, medium, or low, RA guard acts as if the router preference was set to medium.  If this option is not set, the policy skips this check.	No default
<code>match-src-addr &lt;name_of_IPv6_access_list&gt;</code>	Enter the name of the IPv6 access list for the policy to check if the source IPv6 address of the RA message matches an allowed address. The IPv6 access list must be created (with the <code>config router access-list6</code> command) before it is used in a policy.	No default
<code>match-prefix &lt;name_of_IPv6_prefix_list&gt;</code>	Enter the name of the IPv6 prefix list for the policy to check if the IPv6 address prefix of the RA message matches an allowed prefix. The IPv6 prefix list must be created (with the <code>config router prefix-list6</code> command) before it is used in a policy.	No default

## Example

The following example creates an IPv6 RA-guard policy:

```
config switch raguard-policy
  edit RApolicy1
    set device-role router
    set managed-flag On
    set other-flag On
    set max-hop-limit 100
    set min-hop-limit 5
    set max-router-preference medium
    set match-src-addr accesslist1
    set match-prefix prefixlist1
  next
end
```

## config switch security-feature

Use this command to configure security checks for incoming TCP/UDP packets. The packet is dropped if the system detects the specified condition.

### Syntax (for models FS108D-POE, FS112D-POE, FS224D-POE)

```
config switch security-feature
  set tcp-syn-data {enable | disable}
```

```

set tcp-udp-port-zero {enable | disable}
set tcp_flag_zero {enable | disable}
set tcp_flag_FUP {enable | disable}
set tcp_flag_SF {enable | disable}
set tcp_flag_SR {enable | disable}
set tcp_frag_ipv4_icmp {enable | disable}
set tcp_arp_mac_mismatch {enable | disable}
end

```

Variable	Description	Default
tcp-syn-data	TCP SYN packet contains additional data (possible DoS attack).	disable
tcp-udp-port-zero	TCP or UDP packet has source or destination port set to zero.	disable
tcp_flag_zero	TCP packet with all flags set to zero.	disable
tcp_flag_FUP	TCP packet with FIN, URG and PSH flag set.	disable
tcp_flag_SF	TCP packet with SYN and FIN flag set.	disable
tcp_flag_SR	TCP packet with SYN and RST flag set.	disable
tcp_frag_ipv4_icmp	Fragmented ICMPv4 packet.	disable
tcp_arp_mac_mismatch	ARP packet with MAC source address mismatch between the Layer 2 header and the ARP packet payload.	disable

### Syntax (for all other models)

```

config switch security-feature
set sip-eq-dip {enable | disable}
set tcp-flag {enable | disable}
set tcp-port-eq {enable | disable}
set tcp-flag-FUP {enable | disable}
set tcp-flag-SF {enable | disable}
set v4-first-frag {enable | disable}
set udp-port-eq {enable | disable}
set tcp-hdr-partial {enable | disable}
set macsa-eq-macda {enable | disable}
set allow-mcast-sa {enable | disable}
set allow-sa-mac-all-zero {enable | disable}
end

```

Variable	Description	Default
sip-eq-dip	TCP packet with a source IP address equal to the destination IP address.	disable
tcp_flag	DoS attack checking for TCP flags.	disable

Variable	Description	Default
tcp-port-eq	TCP packet with source and destination TCP ports equal.	disable
tcp-flag-FUP	TCP packet with FIN, URG and PSH flags set, and sequence number is zero.	disable
tcp-flag-SF	TCP packet with SYN and FIN flag set.	disable
v4-first-frag	DoS attack checking for IPv4 first fragment.	disable
udp-port-eq	IP packet with source and destination UDP ports equal.	disable
tcp-hdr-partial	TCP packet with partial header.	disable
macsa-eq-macda	Packet with source MAC address equal to destination MAC address.	disable
allow-mcast-sa	Ethernet packet whose source MAC address is multicast.	enable
allow-sa-mac-all-zero	Ethernet packet whose source MAC address is all zeros.	enable

### Example

The following example configures security checks for incoming TCP/UDP packets:

```

config switch security-feature
  set sip-eq-di enable
  set tcp-flag enable
  set tcp-port-eq enable
  set tcp-flag-FUP enable
  set tcp-flag-SF enable
  set v4-first-frag enable
  set udp-port-eq enable
  set tcp-hdr-partial enable
  set macsa-eq-macda enable
  set allow-mcast-sa disable
  set allow-sa-mac-all-zero disable
end

```

## config switch static-mac

Use this command to configure one (or more) static MAC address on an interface.

### Syntax

```

config switch static-mac
  edit <sequence number>
    set description <optional_string>
    set interface <interface_name>
    set mac <static_MAC_address>
    set type {sticky | static}
    set vlan-id <1-4095>
  end

```

Variable	Description	Default
<sequence number>	Enter a sequence number.	No default
description <optional_string>	Optional. Enter a description of the static MAC address.	No default
interface <interface_name>	Enter the interface name.	No default
mac <static_MAC_address>	Enter the static MAC address.	00:00:00:00:00:00
type {sticky   static}	Set the MAC address as a persistent (sticky) address or a static address.	static
vlan-id <1-4095>	Enter the VLAN identifier.	1

### Example

```

config switch static-mac
  edit 1
    set description "first static MAC address"
    set interface port10
    set mac d6:dd:25:be:2c:43
    set type static
    set vlan-id 10
  end

```

## config switch storm-control

Use this command to configure storm control.

### Syntax

```

config switch storm-control
  set broadcast {enable | disable}
  set rate [0 | 2-10000000]
  set unknown-multicast {enable | disable}
  set unknown-unicast {enable | disable}

```

Variable	Description	Default
broadcast	Enable or disable storm control for broadcast traffic.	disable
rate [0   2-10000000]	Specify the rate as packets-per-second. If you set the rate to zero, the system drops all packets (for the enabled traffic types).	500
unknown-multicast	Enable or disable storm control for unknown multicast traffic.	disable

Variable	Description	Default
unknown-unicast {enable   disable}	Enable or disable storm control for unknown unicast traffic.	disable

### Example

```

config switch storm-control
  set broadcast enable
  set rate 1000
  set unknown-multicast enable
  set unknown-unicast enable
end

```

## config switch stp instance

Use this command to configure an STP instance.

### Syntax

```

config switch stp instance
  edit <instance_id>
    set priority <priority_int>
    set vlan-range <vlan_map>
    config stp-port
      edit <port name>
        set cost <cost_int>
        set priority <priority_int>
      end
    end
  end
end

```

Variable	Description	Default
<instance_id>	Enter an instance identifier. The range is 0-32 for 5xx models and higher. For all other models, the range is 0 - 15.	No default
priority <priority_int>	Set the STP priority. The acceptable priority values are 0, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 4096, 40960, 45056, 49152, 53248, 57344, 61440, and 8192.	32768
vlan-range <vlan_map>	Enter the VLANs to which STP applies. <vlan_map> is a comma-separated list of VLAN IDs or VLAN ID ranges, for example "1,3-4,6,7,9-100".	No default
<b>config stp-port</b>		
<port name>	Enter the name of the port.	No default
cost <cost_int>	Enter the cost of using this interface. Use <code>set cost ?</code> for suggested cost values based on link speed.	0

Variable	Description	Default
priority <priority_int>	Enter the priority of this interface. Use <code>set priority ?</code> to list the acceptable priority values.	128

### Example

```

config switch stp instance
  edit "1"
    set priority 8192
  config stp-port
    edit "port18"
      set cost 0
      set priority 128
    next
    edit "port19"
      set cost 0
      set priority 128
    next
  end
  set vlan-range 5 7 11-20
end

```

## config switch stp settings

Use this command to configure STP settings.

### Syntax

```

config switch stp settings
  set flood {enable | disable}
  set forward-time <fseconds_int>
  set hello-time <hseconds_int>
  set max-age <age>
  set max-hops <hops_int>
  set mclag-stp-bpdu {both | single}
  set name <name_str>
  set revision <rev_int>
  set status {enable | disable}
end

```

Variable	Description	Default
flood {enable   disable}	Set to <code>enable</code> if you want the STP packets arriving at any port to pass through the switch without being processed. Set to <code>disable</code> if you want to block STP packets arriving at any port.  This command is available only when <code>status</code> is set to <code>disable</code> .	disable
forward-time <fseconds_int>	Enter the forwarding delay in seconds. Range 4 to 30.	15

Variable	Description	Default
hello-time <hseconds_int>	Enter the hello time in seconds. Range 1 to 10.	2
max-age <age>	Enter the maximum age. Range 6 to 40.	20
max-hops <hops_int>	Enter the maximum number of hops. Range 1 to 40.	20
mclag-stp-bpdu {both   single}	Set to <code>both</code> to allow both core switches of an MCLAG to transmit STP BPDUs. Set to <code>single</code> to prevent both core switches of an MCLAG from transmitting STP BPDUs.	both
name <name_str>	Enter a string value for the name.	No default
revision <rev_int>	Range 0 to 65535.	0
status {enable   disable}	Enable or disable status report.	enable

### Example

```

config switch stp settings
  set forward-time 15
  set hello-time 5
  set max-age 20
  set max-hops 20
  set name "region1"
  set revision 1
  set status enable
end

```

## config switch trunk

Use this command to configure link aggregation.

### Syntax

```

config switch trunk
  edit <trunk name>
    set auto-isl <integer>
    set bundle [enable|disable]
      set min_bundle <integer>
      set max_bundle <integer>
    set description <description_str>
    set mclag {disable | enable}
    set mclag-icl {disable | enable}
    set members <intf1 ... intfN>
    set mode {fortinet-trunk | lacp-active | lacp-passive | static}
    set port-selection-criteria {src-ip | src-mac | dst-ip | dst-mac | src-dst-ip | src-
      dst-mac}

```

Variable	Description	Default
<trunk name>	Enter a name for the trunk.	No default
auto-isl <integer>	Automatically forms an ISL-encapsulated trunk, up to the specified maximum size.	0
bundle [enable disable]	Enable or disable bundling	disable
min_bundle	Set the minimum size of the bundle. This option is available only when <code>bundle</code> has been enabled.	1
max_bundle	Set the maximum size of the bundle. This option is available only when <code>bundle</code> has been enabled.	24
description <description_str>	Optionally, enter a description.	No default
mclag {disable   enable}	Enable or disable multichassis LAG (MCLAG).	disable
mclag-icl {disable   enable}	Enable or disable the MCLAG inter-chassis link (ICL).	disable
members <intf1 ... intfN>	Enter the names of the interfaces that belong to this trunk. Separate the names with spaces.	No default
mode {fortinet-trunk   lacp-active   lacp-passive   static}	Select the link aggregation mode: <ul style="list-style-type: none"> <li><code>fortinet-trunk</code> — use heartbeat packets to detect whether trunk members are available.</li> <li><code>lacp-active</code> — use active LACP 802.3ad aggregation</li> <li><code>lacp-passive</code> — use passive LACP 802.3ad aggregation</li> <li><code>static</code> — use static aggregation, ignoring and not sending control messages</li> </ul>	static
port-selection-criteria {src-ip   src-mac   dst-ip   dst-mac   src-dst-ip   src-dst-mac}	Select the port selection criteria: <ul style="list-style-type: none"> <li><code>src-ip</code> — source IP address</li> <li><code>src-mac</code> — source MAC address</li> <li><code>dst-ip</code> — destination IP address</li> <li><code>dst-mac</code> — destination MAC address</li> <li><code>src-dst-ip</code> — both source and destination IP addresses</li> <li><code>src-dst-mac</code> — both source and destination MAC addresses</li> </ul>	src-dst-ip

## Heartbeat Trunk

When you set the trunk mode to `fortinet-trunk`, the following configuration fields are available:

```
config switch trunk
edit hb-trunk
```

```

set mode fortinet-trunk
set port-selection-criteria {src-ip | src-mac | dst-ip | dst-mac | src-dst-ip | src-
dst-mac}
set description <description_str>
set members <port> [<port>] ... [<port>]
set member-withdrawal-behavior {block | forward}
set max-miss-heartbeats <3-32>
set hb-out-vlan <int>
set hb-in-vlan <int>
set hb-src-ip <x.x.x.x>
set hb-dst-ip <x.x.x.x>
set hb-src-udp-port <int>
set hb-dst-udp-port <int>
set hb-verify {enable | disable}
end

```

Variable	Description	Default
port-selection-criteria {src-ip   src-mac   dst-ip   dst-mac   src-dst-ip   src-dst-mac}	Select the port selection criteria: <ul style="list-style-type: none"> <li>• src-ip — source IP address</li> <li>• src-mac — source MAC address</li> <li>• dst-ip — destination IP address</li> <li>• dst-mac — destination MAC address</li> <li>• src-dst-ip — both source and destination IP addresses</li> <li>• src-dst-mac — both source and destination MAC addresses</li> </ul>	src-dst-ip
description <description_str>	Optionally, enter a description.	No default
members <port> [<port>] ... [<port>]	Enter the names of the ports that belong to this trunk. Separate the names with spaces.	No default
member-withdrawal-behavior {block   forward}	Set the port behavior after it withdraws because of the loss of control packets.	block
max-miss-heartbeats <3-32>	Enter the maximum number of heartbeat messages that can be lost before the FortiGate is deemed to be unavailable. Set a value between 3 and 32.	10
hb-out-vlan	Enter the outgoing VLAN value.	0
hb-in-vlan	Enter the incoming VLAN value.	0
hb-src-ip	Enter the source IP address for the heartbeat packet.	0.0.0.0
hb-dst-ip	Enter the destination IP address for the heartbeat packet.	0.0.0.0
hb-src-udp-port	Enter the source UDP port value for the heartbeat packet.	0

Variable	Description	Default
hb-dst-udp-port	Enter the destination UDP port value for the heartbeat packet.	0
hb-verify	Enable or disable heartbeat packet verification.	disable

### Example

The following example creates trunk tr1 with heartbeat capability:

```
config switch trunk
  edit "tr1"
    set mode fortinet-trunk
    set members "port1" "port2"
    set hb-out-vlan 300
    set hb-in-vlan 500
    set hb-src-ip 10.105.7.200
    set hb-dst-ip 10.105.7.199
    set hb-src-udp-port 12345
    set hb-dst-udp-port 54321
    set hb-verify enable
  next
end
```

### config switch virtual-wire

Use this command to forward traffic between two ports with minimal filtering or packet modifications. The VLAN setting is optional.

**NOTE:** Virtual-wire ports will not be able to transmit or receive packets from other members of the VLAN or other virtual-wires that use the same VLAN. The VLAN should not have complex configurations such as private VLAN.

### Syntax

```
config switch virtual-wire
  edit <id>
    set first-member <port>
    set second-member <port>
    set vlan <1-4095>
  next
end
```

Variable	Description	Default
<id>	Enter a unique integer to create a new entry.	No default
first-member <port>	first member in the virtual-wire pair	No default
second-member <port>	second member in the virtual-wire pair	No default
vlan <1-4095>	VLAN used. The VLAN can be shared between virtual-wires and non-virtual-wire ports	4011

## Example

The following example creates a virtual wire between ports 7 and 8:

```
config switch virtual-wire
  edit 1
    set first-member "port7"
    set second-member "port8"
    set vlan 70
  next
end
```

## config switch vlan

Use this command to configure VLANs.

### Syntax

```
config switch vlan
  edit <vlan id>
    set access-vlan {enable | disable}
    set cos-queue <0-7>
    set description <description_str>
    set dhcp-snooping {enable | disable}
      set dhcp-snooping-verify-mac {enable | disable}
      set dhcp-snooping-option82 {enable | disable}
      set arp-inspection {enable | disable}
    set igmp-snooping {enable | disable}
      set igmp-snooping-querier {enable | disable}
        set querier-addr <IPv4_address>
      set igmp-fast-leave {enable | disable}
      set igmp-proxy {enable | disable}
      config igmp-static-group
        edit <group_name>
          set mcast-addr <IPv4_address>
          set members <interface_name1> <interface_name2>...
    set learning {enable | disable}
    set learning-limit <integer>
    set policer <integer>
    set private-vlan {enable | disable}
      set isolated-vlan <integer>
      set community-vlans <vlan_map>
    set rspan-mode {enable | disable}
    config member-by-mac
    config member-by-ipv4
    config member-by-ipv6
    config member-by-proto
    config dhcp-server-access-list
```

Variable	Description	Default
<vlan id>	Enter a VLAN identifier.	No default

Variable	Description	Default
access-vlan {enable   disable}	Set to <code>enable</code> to block FortiSwitch port-to-port traffic on this VLAN while allowing traffic to and from the FortiGate unit. Set to <code>disable</code> to allow normal VLAN traffic.	disable
cos-queue <0-7>	Specify which class of service (CoS) queue is used for traffic on this VLAN or use the <code>unset cos-queue</code> command to disable this setting.  This command is available only in in FortiLink mode.	No default
description <description_str>	Optionally, enter a description.  If the Tunnel-Private-Group-Id attribute on the RADIUS server was set to the VLAN name, set the description to the same string. For example:  <pre>set description "newvlan"</pre>	No default
dhcp-snooping {enable   disable}	Enable or disable DHCP snooping for this VLAN.	disable
dhcp-snooping-verify-mac {enable   disable}	Enable or disable whether to verify the source MAC address. This field is available only if <code>dhcp-snooping</code> is enabled.	disable
dhcp-snooping-option82 {enable   disable}	Enable or disable whether to insert option-82 fields. This field is available only if <code>dhcp-snooping</code> is enabled.	disable
arp-inspection {enable   disable}	Enable or disable dynamic ARP inspection.	disable
igmp-snooping {enable   disable}	Enable or disable IGMP snooping on the VLAN.	disable
igmp-fast-leave {enable   disable}	Enable or disable IGMP fast-leave on this VLAN. This field is only available if <code>igmp-snooping</code> is enabled.	enable
igmp-snooping-querier {enable   disable}	Enable or disable whether periodic IGMP queries are sent to get IGMP reports. This field is only available if <code>igmp-snooping</code> is enabled.	disable
querier-addr <IPv4_address>	Enter the IPv4 address for the IGMP querier. This field is only available if <code>igmp-snooping</code> and <code>igmp-snooping-querier</code> are enabled.	0.0.0.0
igmp-proxy {enable   disable}	Enable or disable the IGMP proxy on this VLAN. When IGMP proxy is enabled, this VLAN sends IGMP reports. This field is only available if <code>igmp-snooping</code> is enabled.	disable

Variable	Description	Default
<b>config igmp-static-group</b>		
<group_name>	Enter the static group name.	No default
mcast-addr <IPv4_address>	Enter the multicast address for the static group.	0.0.0.0
members <interface_name1> <interface_name2>...	Enter the interfaces that belong to the static group.	No default
learning {enable   disable}	Enable or disable layer-2 learning on this VLAN.	enable
learning-limit <integer>	Limit the number of dynamic MAC addresses on this VLAN. The per-VLAN MAC address learning limit is between 1 and 128. Set the value to 0 for no limit.	0
policer <integer>	Set the policer for the traffic on this VLAN.	0
	This command is available only in in FortiLink mode.	
private-vlan {enable   disable}	Set to enable if this is a private VLAN.	disable
isolated-vlan <integer>	(Valid if private VLAN is enabled) Enter the isolated VLAN.	0
community-vlans <vlan_map>	(Valid if private VLAN is enabled) Enter the communities within this private VLAN. Enter single VLANs or ranges of VLANS separated by commas without white space. For example: 1,3-4,6,7,9-100	No default
rspan-mode {enable   disable}	Enable or disable port mirroring using the remote switch port analyzer (RSPAN) on this VLAN.	disable

### config member-by

Use this command to assign VLANs based on specific fields in the packet (source MAC address, source IP address, or layer-2 protocol).

```

config switch vlan
  edit <vlan id>
    config member-by-mac
      edit <id>
        set mac XX:XX:XX:XX:XX:XX
        set description <128 byte string>
      next
    end
    config member-by-ipv4
      edit <id>
        set address a.b.c.d/e
        set description <128-byte string>
      next
    end
    config member-by-ipv6
      edit <id>

```

```

        set prefix xx:xx:xx:xx::/prefix
        set description <128-byte string>
    next
end
config member-by-PROTO
    edit <id>
        set frametypes {ethernet2 | 802.3d | 11c}
        set protocol <6-digit hex value>
    end

```

Variable	Description	Default
<b>config member-by-mac</b>		
edit <id>	For a new entry, enter an unused ID.	No default
mac XX:XX:XX:XX:XX:XX	Enter a MAC address. If the source MAC address of an incoming packet matches this value, the associated VLAN will be assigned to the packet.	00:00:00:00:00:00
description	Enter up to 128 characters.	No default
<b>config member-by-ipv4</b>		
edit <id>	For a new entry, enter an unused ID.	No default
address a.b.c.d/e	Enter an IPv4 address and network mask. If the source IP address of an incoming packet matches this value, the associated VLAN will be assigned to the packet. The subnet mask must be a value in the range of 1-32.	0.0.0.0 0.0.0.0
description	Enter up to 128 characters.	No default
<b>config member-by-ipv6</b>		
edit <id>	For a new entry, enter an unused ID.	No default
prefix xx:xx:xx:xx::/prefix	Enter an IPv6 prefix. If the source IP address of an incoming packet matches this value, the associated VLAN will be assigned to the packet. The /prefix must in the range of 1-64.	::/0
description	Enter up to 128 characters.	No default
<b>config member-by-PROTO</b>		
edit <id>	For a new entry, enter an unused ID.	No default

Variable	Description	Default
frametypes {ethernet2   802.3d   llc}	Enter one or more Ethernet frame type. Set this value to llc for logical link control. Set this value to 802.3d for 802.3d and SNAP.	ethernet2 802.3d llc
protocol <6-digit hex value>	Enter an Ethernet protocol value If the frametype and Ethernet protocol value of an incoming packet matches these values, the associated VLAN will be assigned to the packet. The value range is 0-65535.	0x0000

### Example

The following example configures a VLAN:

```
config switch vlan
  edit 100
    config member-by-mac
      edit 1
        set description "pc2"
        set mac 00:21:cc:d2:76:72
      next
    end
  end
end
```

The following example configures the IGMP querier:

```
config switch vlan
  edit 100
    set igmp-snooping enable
    set igmp-snooping-querier enable
    set querier-addr 1.2.3.4
  next
end
```

### config dhcp-server-access-list

Use this command to create a list of DHCP servers that DHCP snooping will include in the allowed server list. This list is used only if the `set dhcp-server-access-list` command has been enabled; see [config system global on page 160](#).

```
config switch vlan
  edit <vlan id>
    set dhcp-snooping enable
    config dhcp-server-access-list
      edit <string>
        set server-ip <xxx.xxx.xxx.xxx>
      next
    end
  next
end
```

Variable	Description	Default
edit <vlan id>	Enter a VLAN identifier.	No default
dhcp-snooping enable	The <code>config dhcp-server-access-list</code> command is available only after the <code>set dhcp-snooping</code> command has been enabled for that VLAN.	disable
edit <string>	Enter name of DHCP server access list	No default
server-ip <xxx.xxx.xxx.xxx>	Enter Class A, B, or C IPv4 address for the DHCP server.	0.0.0.0

### Example

The following example configures DHCP snooping to include the specified DHCP server in the allowed server list:

```
config switch vlan
  edit 100
    set dhcp-snooping enable
    config dhcp-server-access-list
      edit "DHCPserver1"
        set server-ip 128.8.0.0
      next
    end
  next
end
```

### config switch vlan-tpid

Use this command to configure the VLAN TPID profile for VLAN stacking (QinQ). Each VLAN TPID profile contains one value for the EtherType field.

The FortiSwitch unit supports a maximum of four VLAN TPID profiles, including the default (0x8100). The default VLAN TPID profile (0x8100) cannot be deleted or changed.

To configure VLAN stacking and to select which VLAN TPID profile to use, see [config switch interface on page 88](#).

### Syntax

```
config switch vlan-tpid
  edit <VLAN_TPID_profile_name>
    set ether-type <0x0001-0xffff>
  next
end
```

Variable	Description	Default
<VLAN_TPID_profile_name>	Enter a name for the VLAN TPID profile name.	No default
ether-type <0x0001-0xffff>	Enter a hexadecimal value for the EtherType field.	0x8100

## config switch-controller global

Use this command to configure system-wide switch options in FortiLink mode.

### Syntax

```
config switch-controller global
  set ac-data-port <1024-49150>
  set ac-dhcp-option-code <integer>
  set ac-discovery-mc-addr <Class-D IPv4 address>
  set ac-discovery-type {broadcast | dhcp | multicast | static}
  set ac-port <1024-49150>
  set echo-interval <1-600>
  set location <string>
  set name <string>
  set max-discoveries <0-64>
  set max-retransmit <0-64>
  config ac-list
    edit <id>
      set ipv4-address <IPv4_address>
    next
  end
end
```

Variable	Description	Default
ac-data-port <1024-49150>	Set the switch-controller control port. Valid values are 1024-49150.	15250
ac-dhcp-option-code <integer>	Set the DHCP option code for CAPUTP AC.	138
ac-discovery-mc-addr <Class-D IPv4 address>	Set the discovery multicast address.	224.0.1.140
ac-discovery-type {broadcast   dhcp   multicast   static}	Select the AC discovery type: broadcast discovery, DHCP discovery, multicast discovery, or static configuration.	broadcast
ac-port <1024-49150>	Set the switch-controller control port.	5246
echo-interval <1-600>	Set the number of seconds before SWTP sends an echo request after joining AC.	30
location <string>	Enter the location.	No default
name <string>	Enter a name for the configuration.	No default
max-discoveries <0-64>	Set the maximum number of discovery request messages for every round.	3
max-retransmit <0-64>	Set the maximum number of retransmissions for the tunnel packet.	6

Variable	Description	Default
ac-list	Create a list of IPv4 addresses for AC static discovery.  This command is only available when the <code>ac-discovery-type</code> is set to <code>static</code> .	No default.
<id>	Enter a unique integer to create a new entry.	No default.
ipv4-address <IPv4_address>	Enter a Class A, B, or C IPv4 address in the following format: <code>xxx.xxx.xxx.xxx</code>	No default.

### Example

The following example configures static discovery to find the IP address of the FortiGate unit (switch controller) that manages the FortiSwitch unit:

```
config switch-controller global
  set ac-discovery-type static
  config ac-list
    edit 1
      set ipv4-address <IPv4_address>
    next
  end
end
```

## config system

Use the `config system` commands to configure options related to the overall operation of the FortiSwitch unit:

- [config system accprofile](#) on page 139
- [config system admin](#) on page 140
- [config system arp-table](#) on page 143
- [config system bug-report](#) on page 143
- [config system certificate ca](#) on page 144
- [config system certificate crl](#) on page 145
- [config system certificate local](#) on page 146
- [config system certificate ocsp](#) on page 147
- [config system certificate remote](#) on page 148
- [config system console](#) on page 148
- [config system dhcp server](#) on page 149
- [config system dns](#) on page 156
- [config system flow-export](#) on page 157
- [config system fsw-cloud](#) on page 159
- [config system global](#) on page 160
- [config system interface](#) on page 169

- [config system ipv6-neighbor-cache on page 179](#)
- [config system link-monitor on page 180](#)
- [config system location on page 181](#)
- [config system ntp on page 186](#)
- [config system password-policy on page 187](#)
- [config system schedule group on page 188](#)
- [config system schedule onetime on page 189](#)
- [config system schedule recurring on page 189](#)
- [config system settings on page 190](#)
- [config system sflow on page 191](#)
- [config system sniffer-profile on page 192](#)
- [config system snmp community on page 193](#)
- [config system snmp sysinfo on page 195](#)
- [config system snmp user on page 196](#)

## config system accprofile

Use this command to add access profile groups that control administrator access to FortiSwitch features. Each FortiSwitch administrator account must include an access profile. You can create access profiles that deny access, allow read only, or allow both read and write access to FortiSwitch features.

### Syntax

```
config system accprofile
  edit <profile-name>
    set admingrp {none | read | read-write}
    set loggrp {none | read | read-write}
    set netgrp {none | read | read-write}
    set routegrp {none | read | read-write}
    set sysgrp {none | read | read-write}
  end
```

Variable	Description	Default
<profile-name>	Enter the name for the profile.	No default
admingrp {none   read   read-write}	Set the access permission for admingrp.	none
loggrp {none   read   read-write}	Set the access permission for loggrp.	none
netgrp {none   read   read-write}	Set the access permission for netgrp.	none
routegrp {none   read   read-write}	Set the access permission for routegrp.	none

Variable	Description	Default
sysgrp {none   read   read-write}	Set the access permission for sysgrp.	none

### Example

This example shows how to configure an access profile with just read-only permission:

```
config system accprofile
  edit profile1
    set admingrp read
    set loggrp read
    set netgrp read
    set routegrp read
    set sysgrp read
  end
```

## config system admin

Use the default admin account or an account with system configuration read and write privileges to add new administrator accounts and control their permission levels. Each administrator account except the default admin must include an access profile. You cannot delete the default super admin account or change the access profile (super\_admin). In addition, there is also an access profile that allows read-only super admin privileges, super\_admin\_readonly. The super\_admin\_readonly profile cannot be deleted or changed, similar to the super\_admin profile. This read-only super-admin may be used in a situation where it is necessary to troubleshoot a customer configuration without making changes.

You can authenticate administrators using a password stored on the FortiSwitch unit or you can use a RADIUS server to perform authentication. When you use RADIUS authentication, you can authenticate specific administrators or you can allow any account on the RADIUS server to access the FortiSwitch unit as an administrator.

### Syntax

```
config system admin
  edit <admin_name>
    set accprofile <profile-name>
    set accprofile-override {enable | disable}
    set allow-remove-admin-session {enable | disable}
    set comments <comments_string>
    set gui-detail-panel-location {bottom | ide | side}
    set {ip6-trusthost1 | ip6-trusthost2 | ip6-trusthost3 |
ip6-trusthost4 | ip6-tru sthost5 | ip6-trusthost6 |
ip6-trusthost7 | ip6-trusthost8 | ip6-trusthost9 |
ip6-trusthost10} <address_ipv6mask>
    set password <admin_password>
    set peer-auth {disable | enable}
      set peer-group <peer-grp>
    set remote-auth {enable | disable}
      set remote-group <name>
      set wildcard {enable | disable}
    set schedule <schedule-name>
    set ssh-public-key1 "<key-type> <key-value>"
    set ssh-public-key2 "<key-type> <key-value>"
```

```

set ssh-public-key3 "<key-type> <key-value>"
set {trusthost1 | trusthost2 | trusthost3 | trusthost4 |
trusthost5 | trusthost6 | trusthost7 | trusthost8 | trusthost9
| trusthost10} <address_ipv4mask>
end
end

```

Variable	Description	Default
<admin_name>	Enter the name for the admin account.	No default
accprofile <profile-name>	Enter the name of the access profile to assign to this administrator account. Access profiles control administrator access to FortiSwitch features.	No default
accprofile-override {enable   disable}	Enable or disable whether the remote authentication server can override the access profile.	disable
allow-remove-admin-session {enable   disable}	Allow admin session to be removed by privileged admin users	disable
comments <comments_string>	Enter the last name, first name, email address, phone number, mobile phone number, and pager number for this administrator. Separate each attribute with a comma, and enclose the string in double-quotes. The total length of the string can be up to 128 characters. (Optional)	No default
gui-detail-panel-location {bottom   hide   side}	Choose the position of the log detail window.	bottom
{ip6-trusthost1   ip6-trusthost2   ip6-trusthost3   ip6-trusthost4   ip6-trusthost5   ip6-trusthost6   ip6-trusthost7   ip6-trusthost8   ip6-trusthost9   ip6-trusthost10} <address_ipv6mask>	Any IPv6 address and netmask from which the administrator can connect to the FortiSwitch unit. If you want the administrator to be able to access the system from any address, set the trusted hosts to ::/0.	::/0
password <admin_password>	Enter the password for this administrator. It can be up to 256 characters in length.	No default
peer-auth {disable   enable}	Set to enable peer certificate authentication (for HTTPS admin access).	disable
peer-group <peer-grp>	Name of peer group defined under <code>config user peergrp</code> or user group defined under <code>config user group</code> . Used for peer certificate authentication (for HTTPS admin access). This option is available only when <code>peer-auth</code> has been enabled.	No default

Variable	Description	Default
remote-auth {enable   disable}	Enable or disable authentication of this administrator using a remote RADIUS, LDAP, or TACACS+ server.	disable
remote-group <name>	Enter the administrator user group name, if you are using RADIUS, LDAP, or TACACS+ authentication. This is available only when <code>remote-auth</code> is enabled.	No default
wildcard {enable   disable}	Enable or disable wildcard RADIUS authentication. This option is available only when <code>remote-auth</code> is enabled.	disable
schedule <schedule-name>	Restrict times that an administrator can log in. Defined in <code>config firewall schedule</code> . No default indicates that the administrator can log in at any time.	No default
ssh-public-key1 "<key-type> <key-value>"	You can specify the public keys of up to three SSH clients. These clients are authenticated without being asked for the administrator password. You must create the public-private key pair in the SSH client application. <key type> is <code>ssh-dss</code> for a DSA key or <code>ssh-rsa</code> for an RSA key. <key-value> is the public key string of the SSH client.	No default
ssh-public-key2 "<key-type> <key-value>"		No default
ssh-public-key3 "<key-type> <key-value>"		No default
{trusthost1   trusthost2   trusthost3   trusthost4   trusthost5   trusthost6   trusthost7   trusthost8   trusthost9   trusthost10} <address_ipv4mask>	Any IPv4 address or subnet address and netmask from which the administrator can connect to the system. If you want the administrator to be able to access the system from any address, set the trusted hosts to 0.0.0.0 and the netmask to 0.0.0.0.	0.0.0.0 0.0.0.0

### Example

The following example creates a RADIUS system admin group:

```
config system admin
  edit "RADIUS_Admins"
    set remote-auth enable
    set accprofile "super_admin"
    set wildcard enable
    set remote-group "RADIUS_Admins"
  next
end
```

## config system arp-table

Use this command to manually add ARP table entries to the FortiSwitch unit. ARP table entries consist of a interface name, an IP address, and a MAC address.

### Syntax

```
config system arp-table
  edit <table_value>
    set interface {<string> | internal | mgmt}
    set ip <address_ipv4>
    set mac <mac_address>
  end
```

Variable	Description	Default
<table_value>	Enter the identification number for the table.	No default
interface {<string>   internal   mgmt}	Enter the interface to associate with this ARP entry	No default
ip <address_ipv4>	Enter the IP address of the ARP entry.	0.0.0.0
mac <mac_address>	Enter the MAC address of the device entered in the table, in the form of xx:xx:xx:xx:xx:xx.	00:00:00:00:00:00

### Example

This example shows how to add an entry to an ARP table:

```
config system arp-table
  edit 1
    set interface internal
    set ip 172.168.20.1
    set mac 00:21:cc:d2:76:72
  end
```

## config system bug-report

Use this command to configure a custom email relay for sending problem reports to Fortinet customer support.

### Syntax

```
config system bug-report
  set auth {no | yes}
  set mailto <email_address>
  set password <password>
  set server <servername>
  set username <name>
  set username-smtp <account_name>
end
```

Variable	Description	Default
auth {no   yes}	Enter <code>yes</code> if the SMTP server requires authentication or <code>no</code> if it does not.	no
mailto <email_address>	The email address for bug reports.	fortiswitch@fortinet.com
password <password>	If the SMTP server requires authentication, enter the required password.	No default
server <servername>	The SMTP server to use for sending bug report email.	fortinet.com
username <name>	A valid user name on the specified SMTP server.	bug_report
username-smtp <account_name>	A valid user name for authentication on the specified SMTP server.	bug_report

### Example

This example shows how to configure a custom email relay:

```
config system bug-report
  set auth yes
  set mailto techdocs@fortinet.com
  set password 123abc
  set server fortinet.com
  set username techdocs
  set username-smtp techdocs
end
```

## config system certificate ca

Use this command to configure CA certificates.

FortiSwitch includes a reserved entry named `Fortinet_CA`. You cannot modify this entry.

### Syntax

```
config system certificate ca
  edit <name>
    set ca <certificate>
    set scep-url <string>
  next
end
```

Variable	Description	Default
name	Enter the name of the certificate.	No default

Variable	Description	Default
certificate	PEM format CA certificate. Paste the contents of a CA certificate file between quotation marks as shown in the example.	No default
set scep-url	Full URL (such as http://www.test.com)	No default

### Example

```
# config system certificate ca
# get
== [ Fortinet_CA ]
== [ OracleSSLCA ]
== [ ca ]
FortiCore-VM # config system certificate ca
FortiCore-VM (ca) # edit ca-new
FortiCore-VM (ca-new) # set certificate "-----BEGIN CERTIFICATE-----

> -----END CERTIFICATE-----"
```

## config system certificate crl

Use this command to configure the certificate revocation list.

### Syntax

```
config system certificate crl
edit <name>
  set crl <crl>
  set http-url <string>
  set ldap-server <LDAP>
```

```

set scep-cert <certificate>
set scep-url <string>
end

```

Variable	Description	Default
name	Name of the certificate revocation list	No default
crl	PEM format CRL. Paste the contents of a CRL file between quotation marks.	No default
http-url	URL of HTTP server for CRL update	No default
ldap-server	LDAP server	No default
scep-cert	Local certificate used for CRL update using SCEP	Fortinet_Factory
scep-url	URL of CA server for CRL update using SCEP	No default

## config system certificate local

Use this command to manage local certificates. FortiSwitch includes a reserved entry named "Factory". You cannot modify this entry.

### Syntax

```

config system certificate local
edit <name>
set comments <string>
set password <passwd>
set private-key <key>
set scep-url <string>
next
end

```

Variable	Description	Default
name	Enter the name of the certificate.	No default
comments	Optional administrator note.	No default
password	Password that was used to encrypt the file. The FortiCore system uses the password to decrypt and install the certificate.	*
private-key	Paste the contents of a key file between quotation marks as shown in the example.	No default
scep-url	URL of SCEP server	No default

Variable	Description	Default
cert {<string>   Entrust_802.1x_CA   Entrust_802.1x_G2_CA   Entrust_802.1x_L1K_CA   Fortinet_CA   Fortinet_CA2}	Enter the name of the certificate or select one of the listed certificates.	No default
unavail-action {ignore   revoke}	Set if the FortiSwitch should ignore the OCSP check or revoke the certificate if the server is unavailable.	revoke
url <string>	Enter the URL for the OCSP server.	No default

### Example

This example shows how to configure the OCSP server certificate:

```
config system certificate oosp
  set cert Fortinet_CA
  set unavail-action ignore
  set url https://www.fortinet.com
end
```

### config system certificate remote

Use this command to install remote certificates. The remote certificates are public certificates without a private key.

```
config system certificate remote
  edit <name>
    set remote "<cert>"
  end
```

Variable	Description	Default
name	Name for the certificate	No default
remote "<cert>"	PEM-format certificate	No default

### config system console

Use this command to set the console command mode, the number of lines displayed by the console, and the baud rate.

#### Syntax

```
config system console
  set baudrate <speed>
  set mode {batch | line}
  set output {standard | more}
end
```

Variable	Description	Default
baudrate <speed>	Set the console port baudrate. Select one of 9600, 19200, 38400, 57600, or 115200.	115200
mode {batch   line}	Set the console mode to line or batch. Used for autotesting only.	line
output {standard   more}	Set console output to standard (no pause) or more (pause after each screen is full and resume when a key is pressed).  This setting applies to <code>show</code> or <code>get</code> commands only.	more

### Example

This example shows how to configure the console:

```
config system console
  set baudrate 57600
  set mode batch
  set output standard
end
```

## config system dhcp server

Use this command to configure DHCP servers.

### Syntax

```
config system dhcp server
  edit <id>
    set auto-configuration {enable | disable}
    set conflicted-ip-timeout <integer>
    set default-gateway <xxx.xxx.xxx.xxx>
    set dns-server1 <xxx.xxx.xxx.xxx>
    set dns-server2 <xxx.xxx.xxx.xxx>
    set dns-server3 <xxx.xxx.xxx.xxx>
    set dns-service {default | local | specify}
    set domain <string>
    set filename <string>
    set interface <string>
    set lease-time <integer>
    set netmask <xxx.xxx.xxx.xxx>
    set next-server <xxx.xxx.xxx.xxx>
    set ntp-server1 <xxx.xxx.xxx.xxx>
    set ntp-server2 <xxx.xxx.xxx.xxx>
    set ntp-server3 <xxx.xxx.xxx.xxx>
    set ntp-service {default | local | specify}
    set status {enable | disable}
    set tftp-server <xxx.xxx.xxx.xxx>
    set timezone <00-75>
    set timezone-option {default | disable | specify}
    set vci-match {enable | disable}
    set vci-string <VCI_strings>
```

```

set wifi-ac1 <xxx.xxx.xxx.xxx>
set wifi-ac2 <xxx.xxx.xxx.xxx>
set wifi-ac3 <xxx.xxx.xxx.xxx>
set wins-server1 <xxx.xxx.xxx.xxx>
set wins-server2 <xxx.xxx.xxx.xxx>
config exclude-range
  edit <id>
    set end-ip <xxx.xxx.xxx.xxx>
    set start-ip <xxx.xxx.xxx.xxx>
  next
end
config ip-range
  edit <id>
    set end-ip <xxx.xxx.xxx.xxx>
    set start-ip <xxx.xxx.xxx.xxx>
  next
end
config options
  edit <id>
    set code <integer>
    set ip <IP_addresses>
    set type {fqdn | hex | ip | string}
    set value <string>
  next
end
config reserved-address
  edit <id>1
    set action {assign | block | reserved}
    set description <string>
    set ip <xxx.xxx.xxx.xxx>
    set mac <xx:xx:xx:xx:xx:xx>
    set type {mac | option82}
  next
end
next
end

```

Variable	Description	Default
<id>	Enter the identifier.	No default
auto-configuration {enable   disable}	Enable or disable automatic configuration.	enable
conflicted-ip-timeout <integer>	Enter the number of seconds before a conflicted IP address is removed from the DHCP range and is available to be reused. The range is 60-8640000 seconds.	1800
default-gateway <xxx.xxx.xxx.xxx>	Enter the IP address of the default gateway that the DHCP server assigns to DHCP clients..	0.0.0.0

Variable	Description	Default
dns-server1 <xxx.xxx.xxx.xxx>	Enter the IPv4 address for the DNS server 1. This option is only available when <code>dns-service</code> is set to <code>specify</code> .	0.0.0.0
dns-server2 <xxx.xxx.xxx.xxx>	Enter the IPv4 address for the DNS server 2. This option is only available when <code>dns-service</code> is set to <code>specify</code> .	0.0.0.0
dns-server3 <xxx.xxx.xxx.xxx>	Enter the IPv4 address for the DNS server 3. This option is only available when <code>dns-service</code> is set to <code>specify</code> .	0.0.0.0
dns-service {default   local   specify}	Select how DNS servers are assigned to DHCP clients. Select <code>local</code> to use the IP address of the DHCP server interface for the client's DNS server IP address. Select <code>default</code> for clients to be assigned the FortiSwitch unit's configured DNS servers. Select <code>specify</code> to enter the IPv4 address for up to three DNS servers.	specify
domain <string>	Enter the domain name suffix for the IP addresses that the DHCP server assigns to the clients.	No default
filename <string>	Enter the name of the boot file on the TFTP server.	No default
interface <string>	Enter the name of the interface. The DHCP server can assign IP configurations to clients connected to this interface.	No default
lease-time <integer>	<p>The lease time determines the length of time an IP address remains assigned to a client. After the lease expires, the address is released for allocation to the next client that requests an IP address.</p> <p>Enter the lease time in seconds. The range is 300-8640000. The default lease time is seven days. To have an unlimited lease time, set the value to zero.</p>	604800

Variable	Description	Default
netmask <xxx.xxx.xxx.xxx>	Enter the netmask of the addresses that the DHCP server assigns.	0.0.0.0
next-server <xxx.xxx.xxx.xxx>	Enter the IPv4 address of a server (for example, a TFTP sever) that DHCP clients can download a boot file from.	0.0.0.0
ntp-server1 <xxx.xxx.xxx.xxx>	Enter the IPv4 address for the NTP server 1. This option is only available when <code>ntp-service</code> is set to <code>specify</code> .	0.0.0.0
ntp-server2 <xxx.xxx.xxx.xxx>	Enter the IPv4 address for the NTP server 2. This option is only available when <code>ntp-service</code> is set to <code>specify</code> .	0.0.0.0
ntp-server3 <xxx.xxx.xxx.xxx>	Enter the IPv4 address for the NTP server 3. This option is only available when <code>ntp-service</code> is set to <code>specify</code> .	0.0.0.0
ntp-service {default   local   specify}	Select how Network Time Protocol (NTP) servers are assigned to DHCP clients. Select <code>local</code> to use the IP address of the DHCP server interface for the client's NTP server IP address. Select <code>default</code> for clients to be assigned the FortiSwitch unit's configured NTP servers. Select <code>specify</code> to enter the IPv4 address for up to three NTP servers.	specify
status {enable   disable}	Enable or disable this DHCP configuration.	enable
tftp-server <string>	<p>You can configure multiple Trivial File Transfer Protocol (TFTP) servers for a Dynamic Host Configuration Protocol (DHCP) server. For example, you may want to configure a main TFTP server and a backup TFTP server.</p> <p>Enter the hostname or IP address of each TFTP server in quotes. Separate multiple server entries with spaces.</p>	No default

Variable	Description	Default
timezone <00-75>	Enter the time zone to be assigned to DHCP clients. This option is only available if <code>timezone-option</code> is set to <code>specify</code> .	(GMT+12:00)Eniwetok,Kwajalein)
timezone-option {default   disable   specify}	Select how the DHCP server sets the client's time zone. Select <code>disable</code> for the DHCP server to not set the client's time zone. Select <code>default</code> for clients to be assigned the FortiSwitch unit's configured time zone. Select <code>specify</code> to enter the time zone to be assigned to DHCP clients.	disable
vci-match {enable   disable}	Enable or disable vendor class identifier (VCI) matching. When enabled, only DHCP requests with a matching VCI are served.	disable
vci-string <VCI_strings>	Enter one or more VCI strings. This option is only available if <code>vci-match</code> is set to <code>enable</code> .	No default
wifi-ac1 <xxx.xxx.xxx.xxx>	Enter the IPv4 address for the WiFi Access Controller 1 (DHCP option 138, RFC 5417).	0.0.0.0
wifi-ac2 <xxx.xxx.xxx.xxx>	Enter the IPv4 address for the WiFi Access Controller 2 (DHCP option 138, RFC 5417).	0.0.0.0
wifi-ac3 <xxx.xxx.xxx.xxx>	Enter the IPv4 address for the WiFi Access Controller 3 (DHCP option 138, RFC 5417).	0.0.0.0
wins-server1 <xxx.xxx.xxx.xxx>	Enter the IPv4 address for the WINS server 1.	0.0.0.0
wins-server2 <xxx.xxx.xxx.xxx>	Enter the IPv4 address for the WINS server 2.	0.0.0.0
<b>config exclude-range</b>		
<id>	Enter the identifier.	No default
end-ip <xxx.xxx.xxx.xxx>	Enter the end of the IP range that will not be assigned to clients.	0.0.0.0

Variable	Description	Default
start-ip <xxx.xxx.xxx.xxx>	Enter the start of the IP range that will not be assigned to clients.	0.0.0.0
<b>config ip-range</b>		
<id>	Enter the identifier.	No default
end-ip <xxx.xxx.xxx.xxx>	Enter the end of the DHCP IP range.	0.0.0.0
start-ip <xxx.xxx.xxx.xxx>	Enter the start of the DHCP IP range.	0.0.0.0
<b>config options</b>		
<id>	Enter the identifier.	No default
code <integer>	Select the DHCP option code. The range is 0-255.	9
ip <IP_addresses>	If <code>type</code> is set to <code>ip</code> , enter the IP addresses.	No default
type {fqdn   hex   ip   string}	Select the DHCP option type: domain search option format, hexadecimal, IP address, or string.	hex
value <string>	Enter the DHCP option value. This option is available when <code>type</code> is set to <code>fqdn</code> , <code>hex</code> , or <code>string</code> .	No default
<b>config reserved-address</b>		
<id>	Enter the identifier.	No default
action {assign   block   reserved}	Select how the DHCP server configures the client with the reserved MAC address. Select <code>assign</code> for the DHCP server to configure the client with this MAC address like any other client. Select <code>block</code> to block the DHCP server from assigning IP settings to the client with this MAC address. Select <code>reserved</code> for the DHCP server to assign the reserved IP address to the client with this MAC address.	reserved
description <string>	Enter a description of this entry.	No default

Variable	Description	Default
ip <xxx.xxx.xxx.xxx>	Enter the IPv4 address to be reserved for the MAC address.	0.0.0.0
mac <xx:xx:xx:xx:xx:xx>	Enter the MAC address of the client that will get the reserved IP address.	00:00:00:00:00:00
type {mac   option82}	Select whether to match with the MAC address or DHCP option 82.	mac

## Example

This example shows how to configure a DHCP server:

```

config system dhcp server
  edit 1
    set default-gateway 50.50.50.2
    set domain "FortiswitchTest.com"
    set filename "text1.conf"
    set interface "svi10"
    config ip-range
      edit 1
        set end-ip 50.50.0.10
        set start-ip 50.50.0.5
      next
    end
    set lease-time 360
    set netmask 255.255.0.0
    set next-server 60.60.60.2
    config options
      edit 1
        set value "dddd"
      next
    end
    set tftp-server "1.2.3.4"
    set timezone-option specify
    set wifi-ac1 5.5.5.1
    set wifi-ac2 5.5.5.2
    set wifi-ac3 5.5.5.3
    set wins-server1 6.6.6.1
    set wins-server2 6.6.6.2
    set dns-server1 7.7.7.1
    set dns-server2 7.7.7.2
    set dns-server3 7.7.7.3
    set ntp-server1 8.8.8.1
    set ntp-server2 8.8.8.2
    set ntp-server3 8.8.8.3
  next
end

```

## config system dns

Use this command to set the DNS server addresses. Several FortiSwitch functions, including sending email alerts and URL blocking, use DNS.

### Syntax

```
config system dns
  set cache-notfound-responses {enable | disable}
  set dns-cache-limit <integer>
  set dns-cache-ttl <int>
  set domain <domain_name>
  set ip6-primary <dns_ipv6>
  set ip6-secondary <dns_ip6>
  set primary <dns_ipv4>
  set secondary <dns_ip4>
  set source-ip <ipv4_addr>
end
```

Variable	Description	Default
cache-notfound-responses {enable   disable}	Enable to cache NOTFOUND responses from the DNS server.	disable
dns-cache-limit <integer>	Set maximum number of entries in the DNS cache.	5000
dns-cache-ttl <int>	Enter the duration, in seconds, that the DNS cache retains information.	1800
domain <domain_name>	Set the local domain name (optional).	No default
ip6-primary <dns_ipv6>	Enter the primary IPv6 DNS server IP address.	::
ip6-secondary <dns_ip6>	Enter the secondary IPv6 DNS server IP address.	::
primary <dns_ipv4>	Enter the primary DNS server IP address.	0.0.0.0
secondary <dns_ip4>	Enter the secondary DNS IP server address.	0.0.0.0
source-ip <ipv4_addr>	Enter the IP address for communications to DNS server.	0.0.0.0

### Example

This example shows how to set the DNS server addresses:

```
config system dns
  set cache-notfound-responses enable
  set dns-cache-limit 2000
  set dns-cache-ttl 900
  set domain fortinet.com
  set primary 172.91.112.53
  set secondary 172.91.112.52
end
```

## config system flow-export

You can sample IP packets on a FortiSwitch unit and then export the data in NetFlow format or Internet Protocol Flow Information Export (IPFIX) format.

The maximum number of concurrent flows is defined by the FortiSwitch model. When this limit is exceeded, the oldest flow expires and is exported.

### NOTE:

- Flow export is supported on FortiSwitch models 2xx and higher.
- To use flow export, you must first enable packet sampling for each switch port and trunk:

```
config switch interface
  edit <interface>
    set packet-sampler enabled
    set packet-sample-rate <0-99999>
  end
```

### Syntax

```
config system flow-export
  set collector-ip <IPv4_address>
  set collector-port <port_number>
  set format {netflow1 | netflow5 | netflow9 | ipfix}
  set identity <hexadecimal>
  set level {ip | mac | port | proto | vlan}
  set max-export-pkt-size <integer>
  set timeout-general <integer>
  set timeout-icmp <integer>
  set timeout-max <integer>
  set timeout-tcp <integer>
  set timeout-tcp-fin <integer>
  set timeout-tcp-rst <integer>
  set timeout-udp <integer>
  set transport {sctp | tcp | udp}
  config aggregates
    edit <id>
      set ip <IPv4_address_mask>
    end
  end
```

Variable	Description	Default
collector-ip <IPv4_address>	Enter the IP address for the collector.  The default is 0.0.0.0. Setting the value to "0.0.0.0" or "" disables this feature. The format is xxx.xxx.xxx.xxx.	0.0.0.0
collector-port <port_number>	Enter the port number for the collector.  The range of values is 0-65535. The default port for NetFlow is 2055; the default port for IPFIX is 4739.	0

Variable	Description	Default
format {netflow1   netflow5   netflow9   ipfix}	<p>You can set the format of the exported flow data as NetFlow version 1, NetFlow version 5, NetFlow version 9, or IPFIX sampling.</p> <p><b>NOTE:</b> When the export format is NetFlow version 5, the sample rate used in the exported packets is derived from the lowest port number where sampling is enabled. Fortinet recommends that administrators using NetFlow v5 set the sample rate consistently across all ports.</p>	netflow9
identity <hexadecimal>	<p>Required. Enter a unique number to identify which FortiSwitch unit the data originates from. The range of values is 0x00000000-0xFFFFFFFF. If <code>identity</code> is not specified, the “Burn in MAC” value is used instead (see <code>get system status</code>).</p>	0x00000000
level {ip   mac   port   proto   vlan}	<p>You can set the flow-tracking level to one of the following:</p> <ul style="list-style-type: none"> <li>- <code>ip</code>—The FortiSwitch unit collects the source IP address and destination IP address from the sample packet.</li> <li>- <code>mac</code>—The FortiSwitch unit collects the source MAC address and destination MAC address from the sample packet.</li> <li>- <code>port</code>—The FortiSwitch unit collects the source IP address, destination IP address, source port, destination port, and protocol from the sample packet.</li> <li>- <code>proto</code>—The FortiSwitch unit collects the source IP address, destination IP address, and protocol from the sample packet.</li> <li>- <code>vlan</code>—The FortiSwitch unit collects the source IP address, destination IP address, source port, destination port, protocol, and VLAN from the sample packet.</li> </ul>	ip
max-export-pkt-size <integer>	Set the maximum size in bytes of exported packets in the application level. The range of values is 512-9216.	512
timeout-general <integer>	Set the general timeout in seconds for the flow session. The range of values is 60-604800.	3600
timeout-icmp <integer>	Set the ICMP timeout for the flow session. The range of values is 60-604800.	300
timeout-max <integer>	Set the maximum number of seconds before the flow session times out. The range of values is 60-604800.	604800
timeout-tcp <integer>	Set the TCP timeout for the flow session. The range of values is 60-604800.	3600
timeout-tcp-fin <integer>	Set the TCP FIN flag timeout for the flow session. The range of values is 60-604800.	300

Variable	Description	Default
timeout-tcp-rst <integer>	Set the TCP RST flag timeout for the flow session. The range of values is 60-604800.	120
timeout-udp <integer>	Set the UDP timeout for the flow session. The range of values is 60-604800.	300
transport {sctp   tcp   udp}	You can set exported packets to use UDP, TCP, or SCTP for transport.	udp
<id>	Enter the identifier.	No default
<IPv4_address_mask>	Enter the IPv4 address and mask to match. All matching sessions will be aggregated into the same flow.	No default

### Example

This example shows how to configure flow export:

```
config system flow-export
  set collector-ip 169.254.3.1
  set collector-port 5
  set format ipfix
  set level ip
  set transport tcp
end
```

## config system fsw-cloud

Use this command to configure the FortiSwitch Cloud. The FortiSwitch Cloud allows you to quickly check the status and to configure multiple FortiSwitch units through a single management portal.

**NOTE:** To use the FortiSwitch Cloud, you must have a Cloud Management license, and your FortiSwitch unit must be in standalone mode, connected to the Internet, and the system time must be accurate. To set the time on your FortiSwitch unit, see [config system ntp on page 186](#).

### Syntax

```
config system fsw-cloud
  set interval <integer>
  set name <string>
  set port <port_number>
  set status {enable | disable}
end
```

Variable	Description	Default
interval <integer>	The time in seconds allowed for domain name system (DNS) resolution. The value range is 3-300 seconds.	45

Variable	Description	Default
name <string>	The domain name for the FortiSwitch Cloud.	fortiswitch-dispatch.forticloud.com
port <port_number>	Port number used to connect to the FortiSwitch Cloud.	443
status {enable   disable}	Whether the FortiSwitch Cloud is enabled or disabled.	disable

### Example

This example shows how to configure the FortiSwitch Cloud:

```
config system fsw-cloud
  set interval 150
  set name fortiswitch-dispatch.forticloud.com
  set port 443
  set status enable
end
```

## config system global

Use this command to configure global settings that affect various FortiSwitch systems and configurations.

### Syntax

```
config system global
  set 802.1x-ca-certificate {Entrust_802.1x_CA | Entrust_802.1x_G2_CA | Entrust_802.1x_L1K_CA | Fortinet_CA | Fortinet_CA2}
  set 802.1x-certificate {Entrust_802.1x | Fortinet_Factory | Fortinet_Factory2 | Fortinet_Firmware}
  set admin-concurrent {enable | disable}
  set admin-https-pki-required {enable | disable}
  set admin-https-ssl-versions {tls1-0 | tls1-1 | tls1-2 | tls1-3}
  set admin-lockout-duration <time_int>
  set admin-lockout-threshold <failed_int>
  set admin-port <port_number>
  set admin-scp {enable | disable}
  set admin-server-cert {self-sign | Entrust_802.1x | Fortinet_Factory | Fortinet_Factory2 | Fortinet_Firmware}
  set admin-sport <port_number>
  set admin-ssh-grace-time <time_int>
  set admin-ssh-port <port_number>
  set admin-ssh-v1 {enable | disable}
  set admin-telnet-port <port_number>
  set admintimeout <admin_timeout_minutes>
  set alertrd-relog {enable | disable}
  set alert-interval <1-1440 minutes>
  set allow-subnet-overlap {enable | disable}
  set arp-timeout <seconds>
  set asset-tag <string>
  set cfg-save {automatic | manual | revert}
  set clt-cert-req {enable | disable}
```

```

set csr-ca-attribute {enable | disable}
set daily-restart {enable | disable}
set detect_ip_conflict {enable | disable}
set dhcp-option82-hostname {enable | disable}
set dhcp-server-access-list {enable | disable}
set dhcp-snoop-client-req {drop-untrusted | forward-untrusted}
set dhcp-snoop-mode {blocking | tracking}
set dhcps-db-exp <number_of_seconds>
set dhcps-db-per-port-learn-limit <number_of_entries>
set dst {enable | disable}
set gui-lines-per-page <gui_lines>
set hostname <unithostname>
set image-rotation {enable | disable}
set ip-conflict-ignore-default {enable | disable}
set ipv6-accept-dad <0 | 1 | 2>
set ipv6-all-forwarding {enable | disable}
set kernel-crashlog {enable | disable}
set l3-host-expiry {enable | disable}

set private-data-encryption {enable | disable}
set radius-coa-port <port_number>
set radius-port <radius_port>
set refresh <refresh_seconds>
set remoteauthtimeout <timeout_sec>
set revision-backup-on-logout {enable | disable}
set revision-backup-on-upgrade {enable | disable}
set strong-crypto {enable | disable}
set switch-mgmt-mode {fortilink | local}
set tcp-mss-min <48-10000>.....default 48.....
set tcp6-mss-min<48-10000>.....default 48.....
set timezone <timezone_number>
set user-server-cert {self-sign | Entrust_802.1x | Fortinet_Factory | Fortinet_
  Firmware}
end

```

Variable	Description	Default
802.1x-ca-certificate {Entrust_802.1x_CA   Entrust_802.1x_G2_CA   Entrust_802.1x_L1K_CA   Fortinet_CA   Fortinet_CA2}	Set the CA certificate for port security (802.1x): <ul style="list-style-type: none"> <li>• Entrust_802.1x_CA—Select this CA if you are using 802.1x authentication.</li> <li>• Entrust_802.1x_G2_CA—Select this CA if you want to use the Google Internet Authority G2.</li> <li>• Entrust_802.1x_L1K_CA—Select this CA if you want to use http://ocsp.entrust.net.</li> <li>• Fortinet_CA—Select this CA if you want to use the factory-installed certificate.</li> <li>• Fortinet_CA2—Select this CA if you want to use the factory-installed certificate.</li> </ul>	Entrust_802.1x_CA

Variable	Description	Default
802.1x-certificate {Entrust_802.1x   Fortinet_Factory   Fortinet_Factory2   Fortinet_Firmware}	<p>Set the certificate for port security (802.1x):</p> <ul style="list-style-type: none"> <li><code>Entrust_802.1x</code>—This certificate is embedded in the firmware and is the same on every unit (not unique). It has been signed by a public CA. This is the default certificate for 802.1x authentication.</li> <li><code>Fortinet_Factory</code>—This certificate is embedded in the hardware at the factory and is unique to this unit. It has been signed by a proper CA.</li> <li><code>Fortinet_Factory2</code>—This certificate is embedded in the hardware at the factory and is unique to this unit. It has been signed by a proper CA.</li> <li><code>Fortinet_Firmware</code>—This certificate is embedded in the firmware and is the same on every unit (not unique). It has been signed by a proper CA. It is not recommended to use it for server-type functionality since any other unit could use this same certificate to spoof the identity of this unit.</li> </ul>	Entrust_802.1x
admin-concurrent {enable   disable}	Enable to enforce concurrent administrator logins. When enabled, the FortiSwitch restricts concurrent access from the same admin user name but on different IP addresses. Use <code>policy-auth-concurrent</code> for firewall authenticated users.	enable
admin-https-pki-required {enable   disable}	Enable to allow user to login by providing a valid certificate if PKI is enabled for HTTPS administrative access. The default setting of <code>disable</code> allows admin users to log in by providing a valid certificate or password.	disable
admin-https-ssl-versions {tls1-0   tls1-1   tls1-2   tls1-3}	Set the allowed SSL/TLS versions for Web administration.	tls1-1 tls1-2 tls1-3
admin-lockout-duration <time_int>	Set the administration account's lockout duration in seconds for the firewall. Repeated failed login attempts will enable the lockout. Use <code>admin-lockout-threshold</code> to set the number of failed attempts that will trigger the lockout.	60
admin-lockout-threshold <failed_int>	Set the threshold, or number of failed attempts, before the account is locked out for the <code>admin-lockout-duration</code> .	3

Variable	Description	Default
admin-port <port_number>	Enter the port to use for HTTP administrative access.	80
admin-scp {enable   disable}	Enable to allow system configuration download by the secure copy (SCP) protocol.	disable
admin-server-cert {self-sign   Entrust_802.1x   Fortinet_Factory   Fortinet_Factory2   Fortinet_Firmware}	<p>Select the administration HTTPS server certificate to use:</p> <ul style="list-style-type: none"> <li>• <code>self-sign</code>—Use a self-signed security certificate. Self-signed certificates are free and will encrypt the data just as securely as a purchased certificate. Self-signed certificates, however, are not likely to be recognized by the CA certificate store so will be considered by any checks against that store as invalid.</li> <li>• <code>Entrust_802.1x</code>—This certificate is embedded in the firmware and is the same on every unit (not unique). It has been signed by a public CA.</li> <li>• <code>Fortinet_Factory</code>—This certificate is embedded in the hardware at the factory and is unique to this unit. It has been signed by a proper CA.</li> <li>• <code>Fortinet_Factory2</code>—This certificate is embedded in the hardware at the factory and is unique to this unit. It has been signed by a proper CA.</li> <li>• <code>Fortinet_Firmware</code>—This certificate is embedded in the firmware and is the same on every unit (not unique). It has been signed by a proper CA. It is not recommended to use it for server-type functionality since any other unit could use this same certificate to spoof the identity of this unit.</li> </ul>	Fortinet_Firmware
admin-sport <port_number>	Enter the port to use for HTTPS administrative access.	443
admin-ssh-grace-time <time_int>	Enter the maximum time permitted between making an SSH connection to the FortiSwitch and authenticating. Range is 10 to 3600 seconds.	120
admin-ssh-port <port_number>	Enter the port to use for SSH administrative access.	22
admin-ssh-v1 {enable   disable}	Enable compatibility with SSH v1.0.	disable

Variable	Description	Default
admin-telnet-port <port_number>	Enter the port to use for telnet administrative access.	23
admintimeout <admin_timeout_minutes>	Set the number of minutes before an idle administrator times out. This controls the amount of inactive time before the administrator must log in again. The maximum <code>admintimeout</code> interval is 480 minutes (8 hours). To improve security, keep the idle timeout at the default value of 5 minutes.	5
alertd-relog {enable   disable}	Enable or disable re-logs when a sensor exceeds its threshold.	disable
alert-interval	<b>NOTE:</b> This command is only available after the <code>alertd-relog</code> option has been enabled.  Set how often an alert is generated for temperature sensors when they exceed their set thresholds.	30
allow-subnet-overlap {enable   disable}	Use this command to allow two interfaces to include the same IP address in the same subnet. The command applies only between the mgmt interface and an internal interface.  <b>Note:</b> Different interfaces cannot have overlapping IP addresses or subnets.  <b>Caution: for advanced users only.</b> Use this only for existing network configurations that cannot be changed to eliminate IP address overlapping.	disable
arp-timeout <seconds>	Set the number of seconds before dynamic ARP entries are removed from the cache.	300
asset-tag	LLDP uses the asset tag to help identify the unit. The asset tag can be up to 32 characters, and will be added to the LLDP-MED inventory TLV (when that TLV is enabled).	No default

Variable	Description	Default
<code>cfg-save {automatic   manual   revert}</code>	<p>Set the method for saving the FortiSwitch system configuration and enter into runtime-only configuration mode. Methods for saving the configuration are:</p> <p><code>automatic</code> automatically save the configuration after every change.  <code>manual</code> manually save the configuration using the <a href="#">execute acl key-compact on page 294</a> command.  <code>revert</code> manually save the current configuration and then revert to that saved configuration after <code>cfg-revert-timeout</code> expires.</p> <p>Switching to automatic mode disconnects your session.  This command is used as part of the runtime-only configuration mode.</p>	automatic
<code>clt-cert-req {enable   disable}</code>	Enable or disable the requirement to have a client certificate to log in to the GUI.	disable
<code>csr-ca-attribute {enable   disable}</code>	Enable to use the CA attribute in your certificate. Some CA servers reject CSRs that have the CA attribute.	enable
<code>daily-restart {enable   disable}</code>	Enable to restart the FortiSwitch every day. The time of the restart is controlled by <code>restart-time</code> .	disable
<code>detect_ip_conflict {enable   disable}</code>	Enable the Detect IP Conflict feature.	enable
<code>dhcp-option82-hostname {enable   disable}</code>	<p>Enable to add the switch's host name in the circuit ID field when DHCP option 82 is enabled.</p> <p>For example, if you are using port5 and VLAN8 of a switch with the host name fsw1, the circuit ID field would be fsw1-00080105 when this setting is enabled.</p>	disable
<code>dhcp-server-access-list {enable   disable}</code>	Set to <code>disable</code> for DHCP snooping to allow any DHCP server from trusted interfaces. Set to <code>enable</code> for DHCP snooping to allow only DHCP servers that are included in the allowed server list.	disable

Variable	Description	Default
dhcp-snoop-client-req {drop-untrusted   forward-untrusted}	<p>Select which transmission mode to use for broadcasting client DHCP packets:</p> <ul style="list-style-type: none"> <li>drop-untrusted—Client packets are broadcasted on trusted ports in the VLAN.</li> <li>forward-untrusted—By default, client packets are broadcasted on all ports in the VLAN.</li> </ul>	forward-untrusted
dhcp-snoop-mode {blocking   tracking}	<p>Select which DHCP snooping mode to use:</p> <ul style="list-style-type: none"> <li>tracking—By default, DHCP packets coming from a DHCP server from untrusted ports are processed by the DHCP-snooping daemon. This mode is ideal when the DHCP servers need to be tracked on untrusted ports.</li> <li>blocking—DHCP packets coming from a DHCP server from untrusted ports are dropped. This mode is useful when users do not want to track DHCP servers on untrusted ports..</li> </ul>	tracking
dhcps-db-exp <number_of_seconds>	Set the number of seconds for a DHCP-snooping server database entry to be kept. The range of values is 300-259200.	86400
dhcps-db-per-port-learn-limit <number_of_entries>	Set the maximum number of DHCP server entries that are learned per interface. The range of values is 0-1024.	64
dst {enable   disable}	<p>Enable or disable daylight saving time. If you enable daylight saving time, the FortiSwitch unit adjusts the system time when the time zone changes to daylight saving time and back to standard time.</p>	enable
gui-lines-per-page <gui_lines>	Set the number of lines displayed on table lists. Range is from 20 - 1000 lines per page.	50
hostname <unithostname>	<p>Enter a name to identify this FortiSwitch unit. A hostname can only include letters, numbers, hyphens, and underlines. No spaces are allowed. While the hostname can be longer than 16 characters, if it is longer than 16 characters it will be truncated and end with a “~” to indicate it has been truncated. This shortened hostname will be displayed in the CLI, and other locations the hostname is used. Some models support hostnames up to 35 characters. By default the hostname of your system is its serial number which includes the model.</p>	FortiSwitch serial number.

Variable	Description	Default
image-rotation {enable   disable}	Enable or disable the rotation of the partition used to upgrade the FortiSwitch image.	enable
ip-conflict-ignore-default {enable   disable}	Enable or disable IP conflict detection for the default IP address.	enable
ipv6-accept-dad <0   1   2>	Specify whether to accept IPv6 duplicate address detection (DAD). Set to 0 to disable DAD. Set to 1 to enable DAD. Set to 2 to enable DAD and disable IPv6 operation if a MAC-based duplicate link-local address is found.	1
ipv6-all-forwarding {enable   disable}	Enable or disable IPv6 forwarding.	enable
kernel-crashlog {enable   disable}	Enable or disable whether to log a kernel crash.	enable
l3-host-expiry {enable   disable}	Enable or disable layer-3 host expiry.	disable
language <language>	Set the display language. You can set <language> to one of <code>english</code> , <code>french</code> , <code>japanese</code> , <code>korean</code> , <code>portuguese</code> , <code>spanish</code> , <code>simch</code> (Simplified Chinese) or <code>trach</code> (Traditional Chinese).	english
ldapconntimeout <ldaptimeout_msec>	LDAP connection timeout in msec	500
private-data-encryption {enable   disable}	Enable or disable private data encryption using an AES 128-bit key.	disable
radius-coa-port <port_number>	Set the port number to be used for the RADIUS change of authorization (CoA).	3799
radius-port <radius_port>	Change the default RADIUS port. The default port for RADIUS traffic is 1812. If your RADIUS server is using port 1645 you can use the CLI to change the default RADIUS port on your system.	1812
refresh <refresh_seconds>	Set the Automatic Refresh Interval, in seconds, for the System Status Monitor. Enter 0 for no automatic refresh.	0

Variable	Description	Default
remoteauthtimeout <timeout_sec>	The number of seconds that the FortiSwitch waits for responses from remote RADIUS, LDAP, or TACACS+ authentication servers. The range is 0 to 300 seconds, 0 means no timeout. To improve security keep the remote authentication timeout at the default value of 5 seconds. However, if a RADIUS request needs to traverse multiple hops or several RADIUS requests are made, the default timeout of 5 seconds may not be long enough to receive a response.	5
revision-backup-on-logout {disable   enable}	Enable or disable backing up the latest configuration revision when the administrator logs out of the CLI or Web GUI.	enable
revision-backup-on-upgrade {enable   disable}	Enable or disable backing up the latest configuration revision when the administrator starts an upgrade.	enable
strong-crypto {enable   disable}	Strong encryption and only allow strong ciphers (AES, 3DES) and digest (SHA1) for HTTPS/SSH admin access. When strong encryption is enabled, HTTPS is supported by the following web browsers: Netscape 7.2, Netscape 8.0, Firefox, and Microsoft Internet Explorer 7.0 (beta). Note that Microsoft Internet Explorer 5.0 and 6.0 are not supported in strong encryption.	disable
switch-mgmt-mode {fortilink   local}	Determines whether the switch is being managed locally, or managed by a FortiGate through a FortiLink connection.	local
tcp-mss-min <48-10000>	Enter the minimum allowed TCP MSS value in bytes.	48
tcp6-mss-min <48-10000>	Enter the minimum allowed TCP MSS value in bytes.	48
timezone <timezone_number>	The number corresponding to your time zone from 00 to 72. Press ? to list time zones and their numbers. Choose the time zone for the FortiSwitch from the list and enter the correct number.	00

### Example

This example shows how to set your private data encryption key:

```
S548DN5018000535 # config system global

S548DN5018000535 (global) # set private-data-encryption enable

S548DN5018000535 (global) # end
Please type your private data encryption key (32 hexadecimal numbers):
0123456789abcdefabcdef0123456789
```

```
Please re-enter your private data encryption key (32 hexadecimal numbers) again:
0123456789abcdefabcdef0123456789
Your private data encryption key is accepted.
```

This example shows how to set the lockout threshold to one attempt and the duration before the administrator can try again to log in to five minutes:

```
config system global
  set admin-lockout-threshold 1
  set admin-lockout-duration 300
end
```

## config system interface

Use this command to edit the configuration of an interface.

If you enter a name string in the `edit` command that is not the name of a physical interface, the command creates a VLAN subinterface.

### Syntax

```
config system interface
edit <interface_name>
  set allowaccess <access_types>
  set alias <name_string>
  set bfd {enable | disable | global}
    set bfd-desired-min-tx <interval_msec>
    set bfd-detect-mult <multiplier>
    set bfd-required-min-rx <interval_msec>
  set description <text>
  set dhcp-relay-service {enable | disable}
    set dhcp-relay-ip <dhcp_relay1_ipv4> {... <dhcp_relay8_ipv4>}
    set dhcp-relay-option82 {enable | disable}
  set dhcp-vendor-specific-option <string>
  set external {enable | disable}
  set fail-detect {enable | disable}
    set fail-detect-option {link-down | detectserver}
    set fail-alert-method {link-down | link-failed-signal}
    set fail-alert-interfaces {port1 port2 ...}
  set icmp-redirect {enable | disable}
  set ip <interface_ipv4mask>
  set log {enable | disable}
  set mode <static | dhcp>
    set dhcp-client-identifier <client_name_str>
    set distance <1-255>
    set defaultgw {enable | disable}
    set dns-server-override {enable | disable}
  set mtu-override {enable | disable}
  set secondary-IP {enable | disable}
  set snmp-index <integer>
  set src-check {disable | loose | strict}
  set src-check-allow-default {enable | disable}
  set status {down | up}
  set type {loopback | vlan}
```

```
set vlanid <id_number>
set vrrp-virtual-mac {enable | disable}
config ipv6
  set ip6-address <ipv6_netmask>
  set ip6-allowaccess <access_types>
  set autoconf {disable | enable}
  set ip6-unknown-mcast-to-cpu {disable | enable}
  set ip6-mode {dhcp | static}
  set ip6-dns-server-override {disable | enable}
  set dhcp6-information-request {disable | enable}
  set ip6-send-adv {disable | enable}
  set ip6-manage-flag {disable | enable}
  set ip6-other-flag {disable | enable}
  set ip6-max-interval <4-1800>
  set ip6-min-interval <3-1350>
  set ip6-link-mtu <integer>
  set ip6-reachable-time <0-3600000>
  set ip6-retrans-time <0-2147483647>
  set ip6-default-life <0-9000>
  set ip6-hop-limit <0-255>
  config ip6-extra-address
    edit <prefix_ipv6>
  end
  config ip6-prefix-list
    edit <prefix_ipv6>
      set autonomous-flag {disable | enable}
      set onlink-flag {disable | enable}
      set preferred-life-time <0-2147483647>
      set valid-life-time <0-2147483647>
    end
  end
config secondaryip
  edit <id>
    set ip <IP_address_and_netmask>
    set allowaccess <access_types>
config vrrp
  edit <VRID_int>
    set adv-interval <seconds_int>
    set preempt {enable | disable}
    set priority <prio_int>
    set start-time <seconds_int>
    set status {enable | disable}
    set vrdst <ipv4_addr>
    set vrgrp <integer>
    set vrip <ipv4_addr>
```

A VLAN cannot have the same name as a zone or a virtual domain.

---

Variable	Description	Default
<interface_name>	Edit an existing interface or create a new VLAN interface.	No default
allowaccess <access_types>	Enter the types of management access permitted on this interface or secondary IP address. Valid types are: http https ping radius-acct snmp ssh telnet. Separate each type with a space. To add or remove an option from the list, retype the complete list as required.	Varies for each interface.
alias <name_string>	Enter an alias name for the interface. Once configured, the alias will be displayed with the interface name to make it easier to distinguish. The alias can be a maximum of 25 characters. This option is only available when interface type is <code>physical</code> .	No default.
bfd {enable   disable   global}	The status of bidirectional forwarding detection (bfd) on this interface: <ul style="list-style-type: none"> <li><code>enable</code> — enable BFD and ignore global BFD configuration.</li> <li><code>disable</code> — disable BFD on this interface.</li> <li><code>global</code> — use the BFD configuration in <code>system settings</code> for the virtual domain to which this interface belongs.</li> </ul>	global
bfd-desired-min-tx <interval_msec>	Enter the minimum desired interval for the BFD transmit interval. Valid range is from 1 to 100 000 msec. This option is available only when <code>bfd</code> is enabled.	50
bfd-detect-mult <multiplier>	Select the BFD detection multiplier. This option is available only when <code>bfd</code> is enabled.	3
bfd-required-min-rx <interval_msec>	Enter the minimum required interface for the BFD receive interval. Valid range is from 1 to 100 000 msec. This is available only when <code>bfd</code> is enabled.	50
description <text>	Optionally, enter up to 63 characters to describe this interface.	No default
dhcp-relay-service {enable   disable}	Enable to provide DHCP relay service on this interface. The DHCP type relayed depends on the setting of <code>dhcp-relay-type</code> . There must be no other DHCP server of the same type (regular or ipsec) configured on this interface.	disable

Variable	Description	Default
<code>dhcp-relay-ip &lt;dhcp_relay1_ipv4&gt; {... &lt;dhcp_relay8_ipv4&gt;}</code>	Set DHCP relay IP addresses. You can specify up to eight DHCP relay servers for DHCP coverage of subnets. Replies from all DHCP servers are forwarded back to the client. The client responds to the offer it wants to accept. Do not set <code>dhcp-relay-ip</code> to 0.0.0.0. This option is available only when <code>dhcp-relay-service</code> is enabled.	No default
<code>dhcp-relay-option82 {enable   disable}</code>	Enable to allow option-82 insertion in the DHCP relay. This option is available only when <code>dhcp-relay-service</code> is enabled.	disable
<code>dhcp-vendor-specific-option &lt;string&gt;</code>	Set the value for DHCP vendor-specific option 43.	No default
<code>external {enable   disable}</code>	Enable to indicate that an interface is an external interface connected to an external network. This option is used for SIP NAT when the <code>config VoIP profile SIP contact-fixup</code> option is disabled.	disable
<code>fail-detect {enable   disable}</code>	Enable interface failure detection.	disable
<code>fail-detect-option {link-down   detectserver}</code>	Select whether the system detects interface failure by port detection ( <code>link-down</code> ) or ping server ( <code>detectserver</code> ). This option is available only when <code>fail-detect</code> is enabled.	link-down
<code>fail-alert-method {link-down   link-failed-signal}</code>	Select the signal that the system uses to signal the link failure: Link Down or Link Failed. This option is available only when <code>fail-detect</code> is enabled.	link-down
<code>fail-alert-interfaces {port1 port2 ...}</code>	Select the interfaces to which failure detection applies. This option is available only when <code>fail-detect</code> is enabled.	No default
<code>icmp-redirect {enable   disable}</code>	Disable to stop ICMP redirect from sending from this interface. ICMP redirect messages are sent by a router to notify the original sender of packets that there is a better route available.	enable
<code>ip &lt;interface_ipv4mask&gt;</code>	Enter the interface IP address and netmask. This option is not available if <code>mode</code> is set to <code>dhcp</code> . You can set the IP and netmask, but they are not displayed. This is only available in NAT/Route mode. The IP address cannot be on the same subnet as any other interface.	Varies for each interface.

Variable	Description	Default
log {enable   disable}	Enable or disable traffic logging of connections to this interface. Traffic will be logged only when it is on an administrative port. All other traffic will not be logged. Enabling this setting may reduce system performance, and is normally used only for troubleshooting.	disable
mode <interface_mode>	Configure the connection mode for the interface as one of: <i>static</i> — configure a static IP address for the interface. <i>dhcp</i> — configure the interface to receive its IP address from an external DHCP server.	static
dhcp-client-identifier	Override the default DHCP client identifier used by this interface. The DHCP client identifier is used by DHCP to identify individual DHCP clients (in this case individual interfaces). By default, the DHCP client identifier for each interface is created based on the model name and the interface MAC address. In some cases, you might want to specify your own DHCP client identifier using this command. This option is available only when the <i>mode</i> is set to <i>dhcp</i> .	No default
distance <1-255>	Enter the distance of learned routes.  This command is available only when <i>mode</i> is set to <i>dhcp</i> .	5
defaultgw {enable   disable}	Enable to get the gateway IP address from the DHCP server. This option is available only when the <i>mode</i> is set to <i>dhcp</i> .	disable
dns-server-override {enable   disable}	Disable to prevent this interface from using DNS server addresses it acquires by DHCP. This option is available only when the <i>mode</i> is set to <i>dhcp</i> .	enable
mtu-override {enable   disable}	Select enable to use custom MTU size instead of default (1 500). This is available only for physical interfaces and some tunnel interfaces (not IPsec). If you change the MTU size, you must reboot the FortiSwitch to update the MTU values of the VLANs on this interface. Some models support MTU sizes larger than the standard 1 500 bytes.	disable
secondary-IP {enable   disable}	Enable to add a secondary IP address to the interface. This option must be enabled before configuring a secondary IP address. When disabled, the Web-based manager interface displays only the option to enable secondary IP.	disable
snmp-index <integer>	Configure the SNMP index	

Variable	Description	Default
src-check {disable   loose   strict}	<p>Set to <code>disable</code> if you do not want to use unicast reverse-path forwarding (uRPF).</p> <p>Set to <code>strict</code> to ensure that the packet was received on the same interface that the router uses to forward the return packet.</p> <p>Set to <code>loose</code> to ensure that the routing table includes the source IP address of the packet.</p>	disable
src-check-allow-default {enable   disable}	<p>If you disable the <code>src-default-route-check</code> option, the packet is dropped if the source IP address is not found in the routing table. If you enable the <code>src-default-route-check</code> option, the packet is allowed even if the source IP address is not found in the routing table, but the default route is found in the routing table.</p> <p>This option is available only when <code>src-check</code> is set to <code>loose</code>.</p>	disable
status {down   up}	Start or stop the interface. If the interface is stopped, it does not accept or send packets. If you stop a physical interface, associated virtual interfaces such as VLAN interfaces will also stop.	up (down for VLANs)
type {loopback   vlan}	<p>Enter the type of interface. <b>NOTE:</b> Some types are read only, and are set automatically by hardware.</p> <ul style="list-style-type: none"> <li><code>loopback</code> — a virtual interface that is always up. This interface's status and link status are not affected by external changes. It is primarily used for blackhole routing - dropping all packets that match this route. This route is advertised to neighbors through dynamic routing protocols as any other static route. loopback interfaces have no dhcp settings, no forwarding, no mode, or dns settings. You can create a loopback interface from the CLI or Web-based manager.</li> <li><code>vlan</code> — a virtual LAN interface. This is the type of interface created by default on any existing physical interface. VLANs increase the number of network interfaces beyond the physical connections on the system. VLANs cannot be configured on a switch mode interface in Transparent mode.</li> </ul>	vlan

Variable	Description	Default
vlanid <id_number>	Enter a VLAN ID that matches the VLAN ID of the packets to be received by this VLAN subinterface. The VLAN ID can be any number between 1 and 4094, as 0 and 4095 are reserved, but it must match the VLAN ID added by the IEEE 802.1Q-compliant router on the other end of the connection. Two VLAN subinterfaces added to the same physical interface cannot have the same VLAN ID. However, you can add two or more VLAN subinterfaces with the same VLAN ID to different physical interfaces, and you can add more multiple VLANs with different VLAN IDs to the same physical interface. This is available only when editing an interface with a type of <code>VLAN</code> .	No default
vrrp-virtual-mac {enable   disable}	Enable VRRP virtual MAC addresses for the VRRP routers added to this interface. See <a href="#">RFC 3768</a> for information about the VRRP virtual MAC addresses.	disable

## config ipv6

Configure IPv6 settings for the interface.

### Syntax

```
config system interface
edit <interface_name>
  config ipv6
    set ip6-address <ipv6_netmask>
    set ip6-allowaccess <access_types>
    set autoconf {disable | enable}
    set ip6-unknown-mcast-to-cpu {disable | enable}
    set ip6-mode {dhcp | static}
    set ip6-dns-server-override {disable | enable}
    set dhcp6-information-request {disable | enable}
    set ip6-send-adv {disable | enable}
    set ip6-manage-flag {disable | enable}
    set ip6-other-flag {disable | enable}
    set ip6-max-interval <4-1800>
    set ip6-min-interval <3-1350>
    set ip6-link-mtu <integer>
    set ip6-reachable-time <0-3600000>
    set ip6-retrans-time <0-2147483647>
    set ip6-default-life <0-9000>
    set ip6-hop-limit <0-255>
    config ip6-extra-address
      edit <prefix_ipv6>
    end
    config ip6-prefix-list
      edit <prefix_ipv6>
        set autonomous-flag {disable | enable}
        set onlink-flag {disable | enable}
        set preferred-life-time <0-2147483647>
        set valid-life-time <0-2147483647>
      end
    end
  end
```

```

end
end

```

Variable	Description	Default
<interface_name>	Edit an existing interface or create a new VLAN interface.	No default
ip6-address <ipv6_netmask>	The interface IPv6 address and netmask. The format for IPv6 addresses and netmasks is described in RFC 3513.  This command is only available in NAT/Route mode.	::/0
ip6-allowaccess <access_types>	Enter the types of management access permitted on this IPv6 interface. Valid types are: <i>fgfm</i> , <i>http</i> , <i>https</i> , <i>ping</i> , <i>snmp</i> , <i>ssh</i> , and <i>telnet</i> . Separate the types with spaces. If you want to add or remove an option from the list, retype the list as required.	Varies for each interface.
autoconf {disable   enable}	Enable or disable the automatic address configuration.	disable
ip6-unknown-mcast-to-cpu {disable   enable}	Enable or disable the sending of unknown multicast addresses to the CPU.	disable
ip6-mode {dhcp   static}	Set the addressing mode to be static or DHCP.  DHCP addressing mode is available only when autoconf is disabled.	static
ip6-dns-server-override {disable   enable}	Enable or disable using the DNS server acquired by DHCP.  This command is available only when the ip6-mode is set to dhcp.	enable
dhcp6-information-request {disable   enable}	Enable or disable the DHCPv6 information request.	disable
ip6-send-adv {disable   enable}	Enable or disable the sending of the IPv6 router advertisement.  This command is only available when autoconf is disabled.	disable
ip6-manage-flag {disable   enable}	Enable or disable the sending of the IPv6 managed flag.	disable
ip6-other-flag {disable   enable}	Enable or disable the sending of the IPv6 other flag.	disable
ip6-max-interval <4-1800>	Specify the maximum number of seconds before the RA is sent.	600

Variable	Description	Default
ip6-min-interval <3-1350>	Specify the minium number of seconds before the RA is sent.	198
ip6-link-mtu <integer>	Specify the IPv6 link maximum transmission unit.	0
ip6-reachable-time <0-3600000>	Specify the IPv6 reachable time in milliseconds.	0
ip6-retrans-time <0-2147483647>	Specify the IPv6 retransmit time in milliseconds.	0
ip6-default-life <0-9000>	Specify the IPv6 default life in seconds.	1800
ip6-hop-limit <0-255>	Specify the maximum number of IPv6 hops.	0
<b>config ip6-extra-addr</b>		
<prefix_ipv6>	IPv6 address prefix. Configure additonal IPv6 prefixes for this IPv6 interface.	No default
<b>config ip6-prefix-list</b>		
<prefix_ipv6>	IPv6 advertised prefix list. Configure which IPv6 prefixes are advertised..	No default
autonomous-flag {disable   enable}	Enable or disable the autonomous flag.	enable
onlink-flag {disable   enable}	Enable or disable the onlink flag.	disable
preferred-life-time <0-2147483647>	Specify the preferred lifetime in seconds for the advertised IPv6 prefix.	604800
valid-life-time <0-2147483647>	Specify the valid lifetime in seconds for the advertised IPv6 prefix.	2592000

## config secondaryip

Configure a second IP address for the interface.

### Syntax

```

config system interface
edit <interface_name>
  config secondaryip
    edit <id>
      set ip <IP_address_and_netmask>
      set allowaccess <access_types>
    end
  end
end

```

Variable	Description	Default
<interface_name>	Edit an existing interface or create a new VLAN interface.	No default
<id>	Identifier.	No default
ip <IP_address_and_netmask>	Enter the IP address and netmask.	0.0.0.0 0.0.0.0
allowaccess <access_types>	Enter the types of management access permitted on this interface or secondary IP address. Valid types are: http https ping radius-acct snmp ssh telnet. Separate each type with a space. To add or remove an option from the list, retype the complete list as required.	No default

## config vrrp

Add one or more VRRP virtual routers to a interface. For information about VRRP, see [RFC 3768](#).

### Syntax

```

config system interface
edit <interface_name>
config vrrp
edit <VRID_int>
set adv-interval <seconds_int>
set preempt {enable | disable}
set priority <prio_int>
set start-time <seconds_int>
set status {enable | disable}
set vrdst <ipv4_addr>
set vrgrp <integer>
set vrip <ipv4_addr>
end

```

Variable	Description	Default
<interface_name>	Edit an existing interface or create a new VLAN interface.	No default
<VRID_int>	VRRP virtual router ID (1 to 255). Identifies the VRRP virtual router.	None
adv-interval <seconds_int>	VRRP advertisement interval (1-255 seconds).	1
preempt {enable   disable}	Enable or disable VRRP preempt mode. In preempt mode a higher priority backup system can preempt a lower priority master system.	enable

Variable	Description	Default
priority <prio_int>	Priority of this virtual router (1-255). The VRRP virtual router on a network with the highest priority becomes the master.	100
start-time <seconds_int>	The startup time of this virtual router (1-255 seconds). The startup time is the maximum time that the backup system waits between receiving advertisement messages from the master system.	3
status {enable   disable}	Enable or disable this virtual router.	enable
vrdst <ipv4_addr>	Monitor the route to this destination.	0.0.0.0
vrgrp <integer>	VRRP group identifier. The value range is 1-65535.	0
vrip <ipv4_addr>	IP address of the virtual router.	0.0.0.0

### Example

This example shows how to configure VRRP:

```

config system interface
  edit "vlan-8"
    set ip 10.10.10.1 255.255.255.0
    set allowaccess ping https http ssh
    set vrrp-virtual-mac enable
    config vrrp
      edit 5
        set priority 255
        set vrgrp 50
        set vrip 11.1.1.100
      next
      edit 6
        set priority 200
        set vrgrp 50
        set vrip 11.1.1.100
      next
      edit 7
        set priority 150
        set vrgrp 50
        set vrip 11.1.1.100
      next
    end
    set snmp-index 20
    set vlanid 8
    set interface "internal"
  next
end

```

### config system ipv6-neighbor-cache

Use this command to configure the IPv6 neighbor cache table.

```

config system ipv6-neighbor-cache
  edit <id>
    set interface {<string> | internal | mgmt}
    set ipv6 <IPv6_address>
    set mac <MAC_address>
  end

```

Variable	Description	Default
<id>	Enter a unique integer to create a new entry.	No default
interface <interface_name>	Required. Enter the interface.	No default
ipv6 <IPv6_address>	Enter the IPv6 addresss in the following format:  xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx	::
mac <MAC_address>	Enter the MAC address in the following format:  xx:xx:xx:xx:xx:xx	00:00:00:00:00:00

### Example

This example shows how to configure an entry in the IPv6 neighbor cache table.

```

config system ipv6-neighbor-cache
  edit id
    set interface internal
    set ipv6 e80::a5b:eff:fef1:95e4
    set mac 00:21:cc:d2:76:72
  end

```

## config system link-monitor

Use this command to configure the link health monitor.

```

config system link-monitor
  edit <link monitor name>
    set srcintf <string>
    set protocol (arp | ping)
    set gateway-ip <IP address>
    set source-ip <IP address>
    set interval <integer>
    set timeout <integer>
    set failtime <integer>
    set recoverytime <integer>
    set update-cascade-interface (enable | disable)
    set update-static-route (enable | disable)
    set status (enable | disable)
  next
end

```

Variable	Description	Default
<link monitor name>	Enter the link monitor name.	No default
srcintf	Interface where the monitor traffic is sent.	No default
protocol	Protocols used to detect the server. Select ARP or ping.	arp
gateway-ip	Gateway IP used to PING the server.	0.0.0.0
source-ip	Source IP used in packet to the server.	0.0.0.0
interval	Detection interval in seconds. The range is 1-3600.	5
timeout	Detect request timeout in seconds. The range is 1-255.	1
failtime	Number of retry attempts before bringing server down. The range is 1-10.	5
recoverytime	Number of retry attempts before bringing server up. The range is 1-10.	5
update-cascade-interface	Enable or disable update cascade interface.	enable
update-static-route	Enable or disable update static route.	enable
status	Enable or disable link monitor administrative status.	enable

## config system location

Use this command to configure the location table used by LLDP-MED for enhanced 911 emergency calls.

```

config system location
  edit <name>
    config address-civic
      set additional <string>
      set additional-code <string>
      set block <string>
      set branch-road <string>
      set building <string>
      set city <string>
      set city-division <string>
      set country <string>
      set country-subdivision <string>
      set county <string>
      set direction <string>
      set floor <string>
      set landmark <string>
      set language <string>
      set name <string>
      set number <string>

```

```

    set number-suffix <string>
    set place-type <string>
    set post-office-box <string>
    set postal-community <string>
    set primary-road <string>
    set road-section <string>
    set room <string>
    set script <string>
    set seat <string>
    set street <string>
    set street-name-post-mod <string>
    set street-name-pre-mod <string>
    set street-suffix <string>
    set sub-branch-road <string>
    set trailing-str-suffix <string>
    set unit <string>
    set zip <string>
end
config coordinates
    set altitude <string>
    set altitude-unit {f | m}
    set datum {NAD83 | NAD83/MLLW | WGS84}
    set latitude <string>
    set longitude <string>
end
config elin-number
    set elin-number <number>
end

```

Variable	Description	Default
<name>	Enter a unique name for the location entry.	No default
<b>config address-civic</b>		
additional <string>	Enter additional location information, for example, west wing.	No default
additional-code <string>	Enter the additional country-specific code for the location. In Japan, use the Japan Industry Standard (JIS) address code.	No default
block <string>	Enter the neighborhood (Korea) or block.	No default
branch-road <string>	Enter the branch road name. This value is used when side streets do not have unique names so that both the primary road and side street are used to identify the correct road.	No default
building <string>	Enter the name of the building (structure) if the address includes more than one building, for example, Law Library.	No default

Variable	Description	Default
city <string>	Enter the city (Germany), township, or shi (Japan).	No default
city-division <string>	Enter the city division, borough, city district (Germany), ward, or chou (Japan).	No default
country <string>	Enter the two-letter ISO 3166 country code in capital ASCII letters, for example, US, CA, DK, and DE.	No default
country-subdivision <string>	Enter the national subdivision (such as state, canton, region, province, or prefecture). In Canada, the subdivision is province. In Germany, the subdivision is state. In Japan, the subdivision is metropolis. In Korea, the subdivision is province. In the United States, the subdivision is state.	No default
county <string>	Enter the county (Canada, Germany, Korea, and United States), parish, gun (Japan), or district (India).	No default
direction <string>	Enter N, E, S, W, NE, NW, SE, or SW for the leading street direction.	No default
floor <string>	Enter the floor number, for example, 4.	No default
landmark <string>	Enter the nickname, landmark, or vanity address, for example, UC Berkeley.	No default
language <string>	Enter the ISO 639 language code used for the address information.	No default
name <string>	Enter the person or organization associated with the address, for example, Fortinet or Textures Beauty Salon.	No default
number <string>	Enter the street address, for example, 1560.	No default
number-suffix <string>	Enter any modifier to the street address. For example, if the full street address is 1560A, enter 1560 for the number and A for the number-suffix.	No default
place-type <string>	Enter the type of place, for example, home, office, or street.	No default
post-office-box <string>	Enter the post office box, for example, P.O. Box 1543. When the post-office-box value is set, the street address components are replaced with this value.	No default
postal-community <string>	Enter the postal community name, for example, Alviso. When the postal-community name is set, the civic community name is replaced by this value.	No default

Variable	Description	Default
primary-road <string>	Enter the primary road or street name for the address	No default
road-section <string>	Enter the specific section or stretch of a primary road. This field is used when the same street number appears more than once on the primary road.	No default
room <string>	Enter the room number, for example, 7A	No default
script <string>	Enter the script used to present the address information, for example, Latn.	No default
seat <string>	Enter the seat number in a stadium or theater or a cubicle number in an office or a booth in a trade show.	No default
street <string>	Enter the street (Canada, Germany, Korea, and United States).	No default
street-name-post-mod <string>	Enter an optional part of the street name that appears after the actual street name. If the full street name is <code>East End Avenue Extended</code> , the <code>street-name-post-mod</code> is <code>Extended</code> .	No default
street-name-pre-mod <string>	Enter an optional part of the street name that appears before the actual street name. If the full street name is <code>Old North First Street</code> , the <code>street-name-pre-mod</code> is <code>Old</code> .	No default
street-suffix <string>	Enter the type of street, for example, Ave or Place. Valid values are listed in the United States Postal Service Publication 28 [18], Appendix C.	No default
sub-branch-road <string>	Enter the name of a street that branches off of a branch road. This value is used when the primary road, branch road, and subbranch road names are needed to identify the correct street.	No default
trailing-str-suffix <string>	Enter N, E, S, W, NE, NW, SE, or SW for the trailing street direction.	No default
unit <string>	Enter the unit (apartment or suite), for example, Apt 27.	No default
zip <string>	Enter the postal or zip code for the address, for example, 94089-1345.	No default
<b>config coordinates</b>		

Variable	Description	Default
altitude <string>	Enter the vertical height of a location using the altitude-unit to specify the unit used. The format is +/- floating point number, for example, 117.47.	No default
altitude-unit {f   m}	Select whether the altitude is measured in m (meters) or f (floors).	m
datum {NAD83   NAD83/MLLW   WGS84}	Select which map is used for the location: WGS84, NAD83, or NAD83/MLLW.	WGS84
latitude <string>	Enter the latitude. The format is floating point starting with +/- or ending with N/S, for example. +/-16.67 or 16.67N.	No default
longitude <string>	Enter the longitude. The format is floating point starting with +/- or ending with E/W, for example, +/-26.789 or 26.789E.	No default
<b>config elin-number</b>		
elin-number <number>	Enter the emergency location identification number (ELIN), which is a unique phone number. The value is a 10 to 20 byte numeral string.	No default

## Example

This example shows how to configure the location table for Fortinet.

```

config system location
  edit Fortinet
    config address-civic
      set country "US"
      set language "English"
      set county "Santa Clara"
      set city "Sunnyvale"
      set street "Kifer"
      set street-suffix "Road"
      set number "899"
      set zip "94086"
      set building "1"
      set floor "1"
      set seat "1293"
    end
  next
  edit "Fortinet"
    config elin-number
      set elin-number "14082357700"
    end
  end
end

```

## config system ntp

Use this command to configure Network Time Protocol (NTP) servers.

### Syntax

```
config system ntp
  set allow-unsync-source {enable | disable}
  set ntpsync {enable | disable}
  set source-ip <ipv4_addr>
  set syncinterval <interval_int>
  config ntpserver
    edit <serverid_int>
      set ntpv3 {enable | disable}
      set server <ipv4_addr>[/<hostname_str>]
    end
  end
end
```

Variable	Description	Default
allow-unsync-source	Allow or do not allow an unsynchronized NTP source.	disable
ntpsync {enable   disable}	Enable to synchronize system time with the ntp server.	enable
source-ip <ipv4_addr>	Enter the source IP for communications to the NTP server.	0.0.0.0
syncinterval <interval_int>	Enter the interval in minutes between contacting NTP server to synchronize time. The range is from 1 to 1440 minutes. Only valid when <code>ntpsync</code> is enabled.	1
<serverid_int>	Enter the number for this NTP server	No default
ntpv3 {enable   disable}	Use NTPv3 protocol instead of NTPv4.	disable
server <ipv4_addr> [/<hostname_str>]	Enter the IPv4 address and hostname (optional) for this NTP server.	ntp1.fortinet.net

### Example

This example shows how to configure an NTP server:

```
config system ntp
  set ntpsyn enable
  set syncinterval 5
  set source-ip 192.168.4.5
end
```

## config system password-policy

Use this command to configure higher security requirements for administrator passwords and IPsec VPN pre-shared keys.

### Syntax

```

config system password-policy
  set status enable
  set apply-to [admin-password ipsec-preshared-key]
  set change-4-characters {enable | disable}
  set minimum-length <chars>
  set min-lower-case-letter <num_int>
  set min-upper-case-letter <num_int>
  set min-non-alphanumeric <num_int>
  set min-number <num_int>
  set expire-status {enable | disable}
  set expire-day <num_int>
end

```

Variable	Description	Default
status enable	Enable password policy. The password policy cannot be disabled.	enable
apply-to [admin-password ipsec-preshared-key]	Select where the policy applies: administrator passwords or IPsec pre-shared keys. This option is available only when <code>status</code> is enabled.	admin-password
change-4-characters {enable   disable}	Enable to require the new password to differ from the old password by at least four characters. This option is available only when <code>status</code> is enabled.	disable
minimum-length <chars>	Set the minimum length of password in characters. Range 8 to 32. This option is available only when <code>status</code> is enabled.	8
min-lower-case-letter <num_int>	Enter the minimum number of required lower case letters in every password. This option is available only when <code>status</code> is enabled.	0
min-upper-case-letter <num_int>	Enter the minimum number of required upper case letters in every password. This option is available only when <code>status</code> is enabled.	0
min-non-alphanumeric <num_int>	Enter the minimum number of required non-alphanumeric characters in every password. This option is available only when <code>status</code> is enabled.	0

Variable	Description	Default
min-number <num_int>	Enter the minimum number of number characters required in every password. This option is available only when <code>status</code> is enabled.	0
expire-status {enable   disable}	Enable to have passwords expire. This option is available only when <code>status</code> is enabled.	enable
expire-day <num_int>	Enter the number of days before the current password is expired and the user will be required to change their password. This option is available only when <code>status</code> is enabled and <code>expire-status</code> is enabled.	90

### Example

This example shows how to configure a password policy for administrator passwords:

```
config system password-policy
  set status enable
  set apply-to admin-password
  set change-4-characters enable
  set minimum-length 10
  set min-lower-case-letter 1
  set min-upper-case-letter 1
  set min-non-alphanumeric 1
  set min-number 1
  set expire-status enable
  set expire-day 30
end
```

### config system schedule group

Use this command to define a schedule group. A schedule group can contain both one-time schedules and recurring schedules. To create one-time and recurring schedules, see [config system schedule onetime on page 189](#) and [config system schedule recurring on page 189](#).

#### Syntax

```
config system schedule group
  edit <schedule_group_name>
    set member <schedule_name1> <schedule_name2> ...
  end
```

Variable	Description	Default
<schedule_group_name>	Enter the name of the schedule group.	No default

Variable	Description	Default
member <schedule_name1> <schedule_name2> ...	Enter the names of the schedules to include. Separate multiple names with a space.  The schedules must already be defined with the <a href="#">config system schedule onetime</a> or <a href="#">config system schedule recurring</a> command.	No default

### Example

This example shows how to create a schedule group:

```
config system schedule group
  edit group1
    set member schedule1 schedule2
  end
```

## config system schedule onetime

Use this command to define a one-time schedule for when a policy will be enforced.

### Syntax

```
config system schedule onetime
  edit <schedule_name>
    set start <time_date>
    set end <time_date>
  end
```

Variable	Description	Default
<schedule_name>	Enter the name of the schedule.	No default
start <time_date>	Enter the start time and date for the schedule in the following format: hh:mm yyyy/mm/dd	00:00 1900/01/01
end <time_date>	Enter the end time and date for the schedule in the following format: hh:mm yyyy/mm/dd	00:00 1900/01/01

### Example

This example shows how to create a one-time schedule:

```
config system schedule onetime
  edit schedule1
    set start 07:00 2019/03/22
    set end 07:00 2019/03/29
  end
```

## config system schedule recurring

Use this command to define a schedule for specified hours every week.

## Syntax

```
config system schedule recurring
  edit <schedule_name>
    set day {monday | tuesday | wednesday | thursday | friday | saturday | sunday}
    set start <time>
    set end <time>
  end
```

Variable	Description	Default
<schedule_name>	Enter the name of the schedule.	No default
day {monday   tuesday   wednesday   thursday   friday   saturday   sunday}	Enter one or more days for the ACL to be enforced. Separate days with a space.	monday tuesday wednesday thursday friday
start <time>	Enter the start time for the schedule in the following format: hh:mm	24:00
end <time>	Enter the end time for the schedule in the following format: hh:mm	24:00

## Example

This example shows how to create a recurring schedule:

```
config system schedule recurring
  edit schedule2
    set day monday wednesday friday
    set start 07:00
    set end 08:00
  end
```

## config system settings

Use this command to configure equal cost multi-path (ECMP) routing.

ECMP is a forwarding mechanism that enables load-sharing of traffic to multiple paths of equal cost. An ECMP set is formed when the routing table contains multiple next-hop address for the same destination with equal cost. Routes of equal cost have the same preference and metric value. If there is an ECMP set for an active route, the switch uses a hash algorithm to choose one of the next-hop addresses. As input to the hash, the switch uses one or more of the following fields in the packet to be routed:

- Source IP
- Destination IP
- Input port

## Syntax

```
config system settings
  set v4-ecmp-mode {source-ip-based | dst-ip-based | port-based}
end
```

Variable	Description	Default
v4-ecmp-mode {source-ip-based   dst-ip-based   port-based}	Select the IPv4 ECMP mode: <ul style="list-style-type: none"> <li>dst-ip-based — Select the next hop based on the destination IP address.</li> <li>port-based — Select the next hop based on the TCP/UDP port.</li> <li>source-ip-based — Select the next hop based on the source IP address.</li> </ul>	source-ip-based

### Example

This example shows how to configure ECMP:

```
config system settings
    set v4-ecmp-mode port-based
end
```

## config system sflow

Use this command to add or change the IP address and UDP port that FortiSwitch sFlow agents use to send sFlow datagrams to an sFlow collector.

sFlow is a network monitoring protocol described in <http://www.sflow.org>. FortiSwitch implements sFlow version 5. You can configure one or more FortiSwitch interfaces as sFlow agents that monitor network traffic and send sFlow datagrams containing information about traffic flow to an sFlow collector.

sFlow is normally used to provide an overall traffic flow picture of your network. You would usually operate sFlow agents on switches, routers, and firewall on your network, collect traffic data from all of them and use a collector to show traffic flows and patterns.

### Syntax

```
config system sflow
    set collector-ip <collector_ipv4>
    set collector_port <port_int>
end
```

Variable	Description	Default
collector-ip <collector_ipv4>	The sFlow agents send sFlow datagrams to the sFlow collector at this IP address.	0.0.0.0
collector_port <port_int>	The UDP port number used for sending sFlow datagrams. Change this setting only if required by your sFlow collector or your network configuration. The value range is 0-65535.	6343

### Example

This example shows how to configure sFlow:

```
config system sflow
```

```

set collector-ip 20.20.20.0
set collector_port 200
end

```

## config system sniffer-profile

Use this command to define a packet-capture profile to select which packets to examine. To start, stop, and pause the packet capture, see the `execute system sniffer-profile` commands.

### Syntax

```

config system sniffer-profile
edit <profile_name>
set filter {<string> | none}
set max-pkt-count <1-maximum>
set max-pkt-len <64-1534>
set switch-interface <switch_interface_name>
set system-interface <system_interface_name>
end

```

Variable	Description	Default
<profile_name>	The name of the packet-capture profile.	No default
filter {<string>   none}	Enter <code>none</code> or enter the filter for selecting which packets to capture. For example, if you want packets using UDP port 1812 between hosts named <code>forti1</code> and either <code>forti2</code> or <code>forti3</code> :  'udp and port 1812 and host forti1 and \ ( forti2 or forti3 \)'	none
max-pkt-count <1-maximum>	Enter how many packets to be captured on the selected interface. The maximum number of packets that can be captured differs according to platform. See the <i>FortiSwitchOS Administration Guide</i> for details.	4000
max-pkt-len <64-1534>	Enter the maximum packet length in bytes to be captured on the interface.	128
switch-interface <switch_interface_name>	Enter the switch interface name that you want to capture packets on. You cannot select both a switch interface and a system interface.	No default
system-interface <system_interface_name>	Enter the system interface name that you want to capture packets on. You cannot select both a switch interface and a system interface.	No default

### Example

This example shows how to create a packet-capture profile:

```

config system sniffer-profile
edit profile1

```

```
set filter none
set max-pkt-count 100
set max-pkt-len 100
set system-interface mgmt
end
```

## config system snmp community

Use this command to configure SNMP communities on your FortiSwitch unit. You add SNMP communities so that SNMP managers can connect to the system to view system information and receive SNMP traps. SNMP traps are triggered when system events occur.

You can add up to three SNMP communities. Each community can have a different configuration for SNMP queries and traps. Each community can be configured to monitor the system for a different set of events. You can also add IP addresses of up to 8 SNMP managers for each community.

When you configure an SNMP manager, ensure that you list it as a host in a community on the FortiSwitch that it will be monitoring. Otherwise, the SNMP monitor will not receive any traps from that FortiSwitch unit, and will not be able to query it.

### Syntax

```
config system snmp community
  edit <index_number>
    set events <events_list>
    set name <community_name>
    set query-v1-port <port_number>
    set query-v1-status {enable | disable}
    set query-v2c-port <port_number>
    set query-v2c-status {enable | disable}
    set status {enable | disable}
    set trap-v1-lport <port_number>
    set trap-v1-rport <port_number>
    set trap-v1-status {enable | disable}
    set trap-v2c-lport <port_number>
    set trap-v2c-rport <port_number>
    set trap-v2c-status {enable | disable}
  config hosts
    edit <host_number>
      set interface <if_name>
      set ip <address_ipv4>
      set source-ip <address_ipv4/mask>
    end
  config hosts6
    edit <host_number>
      set interface <if_name>
      set ip6 <address_ipv6>
      set source-ip6 <address_ipv6>
    end
  end
end
```

Variable	Description	Default
<index_number>	Enter the index number of the community in the SNMP communities table. Enter an unused index number to create a new SNMP community.	No default
events <events_list>	Enable the events for which the system should send traps to the SNMP managers in this community.	All events enabled.
name <community_name>	Enter the name of the SNMP community.	No default
query-v1-port <port_number>	Enter the SNMP v1 query port number used for SNMP manager queries.	161
query-v1-status {enable   disable}	Enable or disable SNMP v1 queries for this SNMP community.	enable
query-v2c-port <port_number>	Enter the SNMP v2c query port number used for SNMP manager queries.	161
query-v2c-status {enable   disable}	Enable or disable SNMP v2c queries for this SNMP community.	enable
status {enable   disable}	Enable or disable the SNMP community.	enable
trap-v1-lport <port_number>	Enter the SNMP v1 local port number used for sending traps to the SNMP managers.	162
trap-v1-rport <port_number>	Enter the SNMP v1 remote port number used for sending traps to the SNMP managers.	162
trap-v1-status {enable   disable}	Enable or disable SNMP v1 traps for this SNMP community.	enable
trap-v2c-lport <port_number>	Enter the SNMP v2c local port number used for sending traps to the SNMP managers.	162
trap-v2c-rport <port_number>	Enter the SNMP v2c remote port number used for sending traps to the SNMP managers.	162
trap-v2c-status {enable   disable}	Enable or disable SNMP v2c traps for this SNMP community.	enable
<b>config hosts and hosts6</b>		
<host_number>	Enter the index number of the host in the table. Enter an unused index number to create a new host.	No Default
interface <if_name>	Enter the name of the FortiSwitch interface to which the SNMP manager connects.	No default

Variable	Description	Default
ip <address_ipv4>	Enter the IPv4 IP address of the SNMP manager (for <code>hosts</code> ).	0.0.0.0
ip6 <address_ipv6>	Enter the IPv6 IP address of the SNMP manager (for <code>hosts6</code> ).	::
source-ip <address_ipv4/mask>	Enter the source IPv4 IP address for SNMP traps sent by the FortiSwitch (for <code>hosts</code> ).	0.0.0.0/ 0.0.0.0
source-ip6 <address_ipv6>	Enter the source IPv6 IP address for SNMP traps sent by the FortiSwitch (for <code>hosts6</code> ).	::

## config system snmp sysinfo

Use this command to enable the FortiSwitch SNMP agent and to enter basic system information used by the SNMP agent. Enter information about the system to identify it. When your SNMP manager receives traps from this FortiSwitch unit, you will know which system sent the information. Some SNMP traps indicate high CPU usage, log full, or low memory.

### Syntax

```
config system snmp sysinfo
  set contact-info <info_str>
  set description <description>
  set engine-id <engine-id_str>
  set location <location>
  set status {enable | disable}
  set trap-high-cpu-threshold <percentage>
  set trap-log-full-threshold <percentage>
  set trap-low-memory-threshold <percentage>
  set trap-temp-alarm-threshold <temperature in degrees Celsius>
  set trap-temp-warning-threshold <temperature in degrees Celsius>
end
```

Variable	Description	Default
contact-info <info_str>	Add the contact information for the person responsible for this FortiSwitch unit. The contact information can be up to 35 characters long.	No default
description <description>	Add a name or description of the system. The description can be up to 35 characters long.	No default

Variable	Description	Default
engine-id <engine-id_str>	Each SNMP engine maintains a value, snmpEngineID, which uniquely identifies the SNMP engine. This value is included in each message sent to or from the SNMP engine. In FortiOS, the snmpEngineID is composed of two parts: <ul style="list-style-type: none"> <li>Fortinet prefix 0x8000304404</li> <li>the optional engine-id string, 24 characters maximum, defined in this command</li> </ul> Optionally, enter an engine-id value.	No default
location <location>	Describe the physical location of the system. The system location description can be up to 35 characters long.	No default
status {enable   disable}	Enable or disable the FortiSwitch SNMP agent.	disable
trap-high-cpu-threshold <percentage>	Enter the percentage of CPU used that will trigger the threshold SNMP trap for the high-cpu. There is some smoothing of the high CPU trap to ensure the CPU usage is constant rather than a momentary spike. This feature prevents frequent and unnecessary traps.	80
trap-log-full-threshold <percentage>	Enter the percentage of disk space used that will trigger the threshold SNMP trap for the log-full.	90
trap-low-memory-threshold <percentage>	Enter the percentage of memory used that will be the threshold SNMP trap for the low-memory.	80
trap-temp-alarm-threshold <temperature in degrees Celsius>	Set an alarm for when the system temperature reaches the specified temperature.	60
trap-temp-warning-threshold <temperature in degrees Celsius>	Set a warning for when the system temperature reaches the specified temperature. The warning threshold must be lower than the alarm threshold.	50

### Example

This example shows how to set a warning and an alarm for specified system temperatures:

```
config system snmp sysinfo
  set status enable
  set trap-temp-alarm-threshold 80
  set trap-temp-warning-threshold 70
end
```

### config system snmp user

Use this command to configure an SNMP user including which SNMP events the user wants to be notified about, which hosts will be notified, and if queries are enabled which port to listen on for them.

FortiSwitchOS implements the user security model of RFC 3414. You can require the user to authenticate with a password and you can use encryption to protect the communication with the user.

### Syntax

```
config system snmp user
  edit <user_name>
    set queries {enable | disable}
    set query-port <port_int>
    set security-level <slevel>
  end
```

Variable	Description	Default
<user_name>	Edit or add selected user.	No default
queries {enable   disable}	Enable or disable SNMP v3 queries for this user. Queries are used to determine the status of SNMP variables.	enable
query-port <port_int>	Enter the number of the port used for SNMP v3 queries. If multiple versions of SNMP are being supported, each version should listen on a different port.	161
security-level <slevel>	Set the security level to one of: <ul style="list-style-type: none"> <li>no-auth-no-priv—no authentication or privacy</li> <li>auth-no-priv—authentication but no privacy</li> <li>auth-priv—authentication and privacy</li> </ul>	no-auth-no-priv

## config user

The `config user` commands provide configuration of user accounts and user groups for firewall policy authentication, administrator authentication, and some types of VPN authentication:

- [config user group on page 197](#)
- [config user ldap on page 199](#)
- [config user local on page 201](#)
- [config user radius on page 202](#)
- [config user setting on page 205](#)
- [config user tacacs+ on page 207](#)

### config user group

Use this command to add or edit user groups.

#### Syntax

```
config user group
  edit <group_name>
```

```

set group-type <grp_type>
set authtimeout <timeout>
set http-digest-realm <attribute>
set member <names>
config match
  edit <match_id>
    set group-name <gname_str>
    set server-name <srvname_str>
  end
end

```

Variable	Description	Default
<group_name>	Enter a new name to create a new group or enter an existing group name to edit that group.	No default
group-type <grp_type>	Enter the group type. <grp_type> determines the type of users and is one of the following: <i>firewall</i> - FortiSwitch users defined in user local, user ldap or user radius <i>fsso-service</i> - Directory Service users	firewall
authtimeout <timeout>	Set the authentication timeout for the user group, range 1 to 480 minutes. If set to 0, the global authentication timeout value is used.	0
http-digest-realm <attribute>	Enter the realm attribute for MD5-digest authentication	No default
member <names>	Enter the names of users, peers, LDAP servers, or RADIUS servers to add to the user group. Separate the names with spaces. To add or remove names from the group you must re-enter the whole list with the additions or deletions required.	No default
<b>config match</b>		
<match_id>	Enter an ID for the entry.	No default
group-name <gname_str>	The name of the matching group on the remote authentication server. Specify the user group names on the authentication servers that are members of this FortiSwitch user group. If no matches are specified, all users on the server can authenticate.	No default
server-name <srvname_str>	The name of the remote authentication server.	No default

## Example

This example shows how to create a user group:

```

config user group
  edit "Radius_group"
    set member "FortiAuthenticator"
  end
end

```

```
end
```

## config user ldap

Use this command to add or edit the definition of an LDAP server for user authentication.

To authenticate with the FortiSwitch unit, the user enters a user name and password. The system sends this user name and password to the LDAP server. If the LDAP server can authenticate the user, the user is successfully authenticated with the FortiSwitch unit. If the LDAP server cannot authenticate the user, the connection is refused by the FortiSwitch unit.

### Syntax

```
config user ldap
edit <server_name>
  set cnid <id>
  set dn <dnname>
  set group-member-check {user-attr | group-object}
  set member-attr <attr_name>
  set port <number>
  set server <domain>
  set type <auth_type>
    set username <ldap_username>
    set password <ldap_passwd>
  set password-expiry-warning {disable | enable}
  set password-renewal {disable | enable}
  set secure <auth_port>
end
```

Variable	Description	Default
<server_name>	Enter a name to identify the LDAP server. Enter a new name to create a new server definition or enter an existing server name to edit that server definition.	No default
cnid <id>	Enter the common name identifier for the LDAP server. The common name identifier for most LDAP servers is cn. However some servers use other common name identifiers such as uid. Maximum 20 characters.	cn
dn <dnname>	Enter the distinguished name used to look up entries on the LDAP server. It reflects the hierarchy of LDAP database object classes above the Common Name Identifier. The FortiSwitch passes this distinguished name unchanged to the server. You must provide a dn value if type is simple. Maximum 512 characters.	No default
group-member-check {user-attr   group-object}	Select the group membership checking method: user attribute or group object.	user-attr

Variable	Description	Default
member-attr <attr_name>	An attribute of the group that is used to authenticate users.	No default
port <number>	Enter the port number for communication with the LDAP server.	389
server <domain>	Enter the LDAP server domain name or IP address.	No default
type <auth_type>	Enter the authentication type for LDAP searches. One of: <code>anonymous</code> , <code>regular</code> or <code>simple</code> See the notes below the table for additional information.	simple
username <ldap_username>	This field is available only if <code>type</code> is <code>regular</code> . For <code>regular</code> authentication, you need a user name and password. See your server administrator for more information.	No default
password <ldap_passwd>	This field is available only if <code>type</code> is <code>regular</code> . For <code>regular</code> authentication, you need a user name and password. See your server administrator for more information.	No default
password-expiry-warning {disable   enable}	Enable or disable password expiry warnings.	disable
password-renewal {disable   enable}	Enable or disable online password renewal.	disable
secure <auth_port>{disable   starttls   ldaps}	Select the port to be used in authentication: <ul style="list-style-type: none"> <li><code>disable</code> — port 389</li> <li><code>ldaps</code> — port 636</li> <li><code>starttls</code> — port 389</li> </ul>	disable

### Notes on Authentication Type

The following are the authentication types for LDAP searches:

- `anonymous` — bind using anonymous user search
- `regular` — bind using user name and password and then search
- `simple` — simple password authentication without search

You can use `simple` authentication if the user records are all under one `dn` that you know. If the users are under more than one `dn`, use the `anonymous` or `regular` type, which can search the entire LDAP database for the required user name.

If your LDAP server requires authentication to perform searches, use the `regular` type and provide values for `username` and `password`.

## config user local

Use this command to add local user names and configure user authentication for the system. To add authentication by LDAP or RADIUS server you must first add servers using the `config user ldap` and `config user radius` commands.

### Syntax

```
config user local
  edit <user_name>
    set ldap-server <server_name>
    set passwd <password_str>
    set radius-server <server_name>
    set tacacs+-server <server_name>
    set status {enable | disable}
    set type <auth-type>
  end
```

Variable	Description	Default
<user_name>	Enter the user name. Enter a new name to create a new user account or enter an existing user name to edit that account.	No default
ldap-server <server_name>	Enter the name of the LDAP server with which the user must authenticate. You can only select an LDAP server that has been added to the list of LDAP servers. This option is available when <code>type</code> is set to <code>ldap</code> .	No default
passwd <password_str>	Enter the password with which the user must authenticate. Passwords at least 6 characters long provide better security than shorter passwords. This option is available when <code>type</code> is set to <code>password</code> .	No default
radius-server <server_name>	Enter the name of the RADIUS server with which the user must authenticate. You can only select a RADIUS server that has been added to the list of RADIUS servers. This option is available when <code>type</code> is set to <code>radius</code> .	No default
tacacs+-server <server_name>	Enter the name of the TACACS+ server with which the user must authenticate. This option is available when <code>type</code> is set to <code>tacacs+</code> .	No default
status {enable   disable}	Enter <code>enable</code> to allow the local user to authenticate with the FortiSwitch unit.	enable

Variable	Description	Default
type <auth-type>	<p>Enter one of the following to specify how this user's password is verified:</p> <ul style="list-style-type: none"> <li>• <code>ldap</code>: The LDAP server specified in <code>ldap-server</code> verifies the password.</li> <li>• <code>password</code>: The system verifies the password against the value of the password.</li> <li>• <code>radius</code>: The RADIUS server specified in <code>radius-server</code> verifies the password.</li> <li>• <code>tacacs+</code>: The TACACS+ server specified in <code>tacacs+-server</code> verifies the password.</li> </ul>	No default

## config user radius

Use this command to add or edit the information used for RADIUS authentication.

The default port for RADIUS traffic is 1812. If your RADIUS server is using a different port you can change the default RADIUS port. You may set a different port for each of your RADIUS servers. The maximum number of remote RADIUS servers that can be configured for authentication is 10.

The RADIUS server is provided with more information to make authentication decisions, based on values in `server`, `nas-ip`, and the `config user group` subcommand `config match`. Attributes include:

- **NAS-IP-Address** — RADIUS setting or IP address of FortiSwitch interface used to talk to RADIUS server, if not configured
- **NAS-Port** — physical interface number of the traffic that triggered the authentication
- **Called-Station-ID** — same value as NAS-IP Address but in text format
- **Fortinet-Vdom-Name** — name of VDOM of the traffic that triggered the authentication
- **NAS-Identifier** — configured hostname in non-HA mode; HA cluster group name in HA mode
- **Acct-Session-ID** — unique ID identifying the authentication session
- **Connect-Info** — identifies the service for which the authentication is being performed (`web-auth`, `vpn-ipsec`, `vpn-pptp`, `vpn-l2tp`, `vpn-ssl`, `admin-login`, `test`)

You can select an alternative authentication method for each server. These include CHAP, PAP, MS-CHAP, and MS-CHAP-v2.

### Syntax

```
config user radius
  edit <RADIUS_user_name>
    set acct-fast-framedip-detect <integer>
    set acct-interim-interval <integer>
    set all-usergroup {enable | disable}
    set auth-type {auto | chap | ms_chap | ms_chap_v2 | pap}
    set frame-mtu-size <integer>
    set nas-ip <use_ip>
    set radius-coa {enable | disable}
    set radius-port <radius_port_num>
    set secret <server_password>
    set server <domain>
```

```

set service-type {administrative | authenticate-only | call-check | callback-
  administrative | callback-framed | callback-login | callback-nas-prompt | framed
  | login | nas-prompt | note | outbound}
set source-ip <ipv4_addr>
config acct-server
  edit <accounting_server_ID>
    set status {enable | disable}
    set server <accounting_server_ipv4_addr>
    set secret <accounting_server_secret>
    set port <accounting_server_port>
  end
end

```

Variable	Description	Default
<server_name>	Enter a name of the RADIUS user group. Enter a new name to create a new group definition or enter an existing group name to edit that group definition.	No default
acct-fast-framedip-detect <integer>	Enter the number of seconds allowed for the first-time detection of the Framed-IP-Address attribute from DHCP snooping. The range is 2-600 seconds.	2
acct-interim-interval <integer>	Enter the number of seconds between each interim accounting message sent to the RADIUS server. The value range is 60-86400.	600
all-usergroup {enable   disable}	Enable to automatically include this RADIUS server in all user groups.	disable
auth-type {auto   chap   ms_chap   ms_chap_v2   pap}	Select the authentication method for this RADIUS server. auto uses pap, ms_chap_v2, and chap.	auto
frame-mtu-size <integer>	Enter the maximum frame size in octets used to advertise to the authentication server. The range is 600-1500.	1500
nas-ip <use_ip>	IP address used as NAS-IP-Address and Called-Station-ID attribute in RADIUS access requests. RADIUS setting or IP address of FGT interface used to talk with RADIUS server, if not configured.	No default
radius-coa {enable   disable}	Enable or disable whether this server will use RADIUS change of authorization (CoA).	disable
radius-port <radius_port_num>	Change the default RADIUS port for this server. Range is 0-65535	1812
secret <server_password>	Enter the RADIUS server shared secret. The server secret key should be a maximum of 16 characters in length.	No default
server <domain>	Enter the RADIUS server domain name or IP address.	No default

Variable	Description	Default
source-ip <ipv4_addr>	Enter the source IP for communications to RADIUS server.	0.0.0.0
<b>config acct-server</b>		
<accounting_server_ID>	Enter the identifier for the accounting server. The value range is 0-4294967295.	No default
status {enable   disable}	Enable or disable RADIUS accounting.	disable
secret <accounting_server_secret>	Enter the shared secret key for the RADIUS accounting server.	*
server <accounting_server_ipv4_addr>	Enter the IPv4 address of the RADIUS server that will be receiving the accounting messages.	No default
service-type {administrative   authenticate-only   call-check   callback-administrative   callback-framed   callback-login   callback-nas-prompt   framed   login   nas-prompt   note   outbound}	Select the Service-Type value.	none
port <accounting_server_port>	Enter the port number for the RADIUS accounting server to receive accounting messages from the FortiSwitch unit.	1813

### Notes on context timeout

The number of seconds that a user context entry can remain in the user context list without the system receiving a communication session from the carrier end point. If a user context entry is not being looked up, then the user must no longer be connected to the network.

This timeout is only required if the system doesn't receive the RADIUS Stop record. However, even if the accounting system does send RADIUS Stop records this timeout should be set in case the FortiSwitch misses a Stop record.

The default user context entry timeout is 28800 seconds (8 hours). You can keep this timeout relatively high because its not usually a problem to have a long list, but entries that are no longer used should be removed regularly.

You might want to reduce this timeout if the accounting server does not send RADIUS Stop records. Also if customer IP addresses change often you might want to set this timeout lower so that out of date entries are removed from the list.

If this timeout is too low the FortiSwitch could remove user context entries for users who are still connected.

## Dynamic Flag values

- `none` — Disable writing event log messages for dynamic profile events.
- `accounting-event` — Enable to write an event log message when the system does not find the expected information in a RADIUS Record. For example, if a RADIUS record contains more than the expected number of addresses.
- `accounting-stop-missed` — Enable to write an event log message whenever a user context entry timeout expires indicating that the system removed an entry from the user context list without receiving a RADIUS Stop message.
- `context-missing` — Enable to write an event log message whenever a user context creation timeout expires indicating that the system was not able to match a communication session because a matching entry was not found in the user context list.
- `profile-missing` — Enable to write an event log message whenever the system cannot find a profile group name in a RADIUS start message that matches the name of a profile group added to the system.
- `protocol-error` — Enable to write an event log message if RADIUS protocol errors occur. For example, if a RADIUS record contains a RADIUS secret that does not match the one added to the dynamic profile.
- `radiusd-other` — Enable to write event log messages for other events. The event is described in the log message. For example, write a log message if the memory limit for the user context list is reached and the oldest entries in the table have been dropped.

## Example

This example shows how to set up RADIUS accounting:

```
config user radius
  edit "local-RADIUS"
    set server 10.0.23.5
    set secret djfhde;rkjfkrekdfjeke
    set auth-type ms_chap_v2
    set acct-interim-interval 1200
    config acct-server
      edit 1
        set status enable
        set server 10.0.23.5
        set secret djfhde;rkjfkrekdfjeke
        set port 1813
      next
    end
  next
end
```

## config user setting

Use this command to change user authorization settings.

### Syntax

```
config user setting
  set auth-blackout-time <blackout_time_int>
  set auth-cert <cert_name>
  set auth-http-basic {disable | enable}
  set auth-invalid-max <int>
  set auth-multi-group {enable | disable}
```

```

set auth-secure-http {enable | disable}
set auth-type {ftp | http | https | telnet}
set auth-timeout <auth_timeout_minutes>
set auth-timeout-type {idle-timeout | hard-timeout | new-session}
config auth-ports
  edit <auth-table-entry-id>
    set port <port_int>
    set type {ftp | http | https | telnet}
  end
end

```

Variable	Description	Default
auth-blackout-time <blackout_time_int>	When a firewall authentication attempt fails 5 times within one minute the IP address that is the source of the authentication attempts is denied access for the <blackout_time_int> period in seconds. The range is 0 to 3600 seconds.	0
auth-cert <cert_name>	HTTPS server certificate for policy authentication. Fortinet_Factory, Fortinet_Firmware (if applicable to your FortiSwitch), and self-sign are built-in certificates but others will be listed as you add them.	self-sign
auth-http-basic {disable   enable}	Enable or disable support for HTTP basic authentication for identity-based firewall policies. HTTP basic authentication usually causes a browser to display a pop-up authentication window instead of displaying an authentication web page. Some basic web browsers, for example, web browsers on mobile devices, may only support HTTP basic authentication.	disable
auth-invalid-max <int>	Enter the maximum number of failed authentication attempts to allow before the client is blocked. Range: 1-100.	5
auth-multi-group {enable   disable}	This option can be disabled if the Active Directory structure is setup such that users belong to only 1 group for purpose of firewall authentication.	enable
auth-secure-http {enable   disable}	Enable to have http user authentication redirected to secure channel - https.	disable
auth-type {ftp   http   https   telnet}	Set the user authentication protocol support for firewall policy authentication. User controls which protocols should support the authentication challenge.	No Default

Variable	Description	Default
auth-timeout <auth_timeout_minutes>	Set the number of minutes before the firewall user authentication timeout requires the user to authenticate again. The maximum authtimeout interval is 480 minutes (8 hours). To improve security, keep the authentication timeout at the default value of 5 minutes.	5
auth-timeout-type {idle-timeout   hard-timeout   new-session}	Set the type of authentication timeout. <code>idle-timeout</code> — applies only to idle session <code>hard-timeout</code> — applies to all sessions <code>new-session</code> — applies only to new sessions	idle-timeout
<b>config auth-ports</b>		
<auth-table-entry-id>	Create an entry in the authentication port table if you are using non-standard ports.	No Default
port <port_int>	Specify the authentication port. Range 1 to 65535.	1024
type {ftp   http   https   telnet}	Specify the protocol to which <code>port</code> applies.	http

## config user tacacs+

Use this command to add or edit the information used for TACACS+ authentication.

### Syntax

```
config user tacacs+
  edit <user name>
    set authen-type {ascii | auto | chap | mschap | pap}
    set authorization {enable | disable}
    set key <passwd>
    set port <port number>
    set server <domain>
    set source-ip <ipv4_addr>
```

Variable	Description	Default
<user name>	Enter the name of the user.	No default
authen-type{ascii   auto   chap   mschap   pap}	Set the authentication type. Auto will use PAP, MSCHAP, and CHAP (in that order).	auto
authorization {disable   enable}	Enable TACACS+ authorization (service=fortigate)	disable
key <passwd>	Password value for the server.	*

Variable	Description	Default
port <port_int>	Specify the authentication port. Range 1 to 65535.	49
server <domain>	Specify the domain name of the server	No default
source-ip <ipv4_addr>	Set the source IP address.	0.0.0.0

### Example

This example shows how to configure a TACACS user account for login authentication::

```
config user tacacs+
  edit tacserver
    set authen-type ascii
    set authorization enable
    set key temporary
    set server tacacs_server
  end
```

# diagnose

Use the `diagnose` commands to help with troubleshooting:

## diagnose bpdu-guard display status

Use this command to display the status of the spanning tree protocol (STP) bridge protocol data unit (BPDU) guard:

```
diagnose bpdu-guard display status
```

To configure STP BPDU guard, see [config switch interface on page 88](#).

### Example output

Portname	State	Status	Timeout (m)	Count	Last-Event
port1	disabled	-	-	-	-
port2	disabled	-	-	-	-
port3	disabled	-	-	-	-
port4	disabled	-	-	-	-
port5	disabled	-	-	-	-
port6	disabled	-	-	-	-

## diagnose debug application

Use this command to set the debug level for application daemons. Some applications must be set to level 8 or higher to enable output for other diagnose debug commands. If you do not specify the debugging level, the current debugging level is returned.

```
diagnose debug application <application> [<debugging_level>]
```

The following applications are supported:

- alertrd — Monitor and alert daemon
- authd — Authentication control daemon
- bfd — Bidirectional forwarding detection (BFD) daemon
- bgpd — Border Gateway Protocol (BGP) daemon
- ctrld — General FortiSwitch control daemon
- cu\_swtpd — Switch-controller CAPWAP control daemon
- dhcp6c — DHCPv6 client module
- dhcpc — DHCP client module
- dhcprelay — DHCP relay daemon
- dnsproxy — DNS proxy module
- eap\_proxy — EAP proxy daemon
- flcmd — FortiLink command daemon
- fnbamd — FortiGate nonblocking authentication daemon
- fortlinkd — FortiLink daemon
- fpm — Hardware routing daemon
- fsmgr — FortiSwitch Cloud daemon
- gui — GUI service
- httpsd — HTTP and HTTPS daemon
- igmp\_snooping — IGMP snooping debugging
- ipconflict — IP conflict detection daemon
- isisd — Intermediate System to Intermediate System Protocol (IS-IS) daemon
- l2d — Daemon for layer-2 features
- l2dbg — Daemon for hardware-related operations needed by layer 2
- l3 — Layer-3 debugging
- lacpd — Link Aggregation Control Protocol (LACP) daemon
- libswitchd — FortiSwitch library daemon
- link-monitor — Link monitor daemon
- lldpmedd — Link Layer Discovery Protocol-Media Endpoint Discovery (LLPD-MED) daemon

- miglogd — Logging daemon
- ntpd — Network Time Protocol (NTP) daemon
- nwmcfgd — Daemon for network-monitoring configuration
- nwmonitord — Packet-handling and parsing daemon for network monitoring
- ospfd — Open shortest path first (OSPF) routing daemon
- pimd — Protocol Independent Multicast (PIM) daemon
- portspeedd — Port speed daemon
- radius\_das — RADIUS CoA daemon
- radiusd — RADIUS daemon
- radvd — Router advertisement daemon
- ripd — Routing Information Protocol (RIP) routing daemon
- router-launcher — Daemon for launching the routing system
- rsyslogd — Remote SYSLOG daemon
- sflowd — sFlow daemon
- snmpd — Simple Network Management Protocol (SNMP) daemon
- sshd — Secure Sockets Shell (SSH) daemon
- stpd — Spanning Tree Protocol (STP) daemon
- switch-launcher — Daemon for launching the FortiSwitch system
- trunkd — Trunk daemon
- vrrpd — Virtual Router Redundancy Protocol (VRRP) daemon
- wiredap — Daemon for 802.1x port-based authentication
- zebra — Core router daemon

### Example output

```
S524DF4K15000024 # diagnose debug application flgd
flgd debug level is 8 (0x8)
```

## diagnose debug authd

Use these commands to manage the authentication daemon:

```
diagnose debug authd clear
diagnose debug authd fsso clear-logons
diagnose debug authd fsso filter clear
diagnose debug authd fsso filter group <group_name>
diagnose debug authd fsso filter server <FSSO_agent_name>
diagnose debug authd fsso filter source <IPv4_address> <IPv4_address>
diagnose debug authd fsso filter user <user_name>
diagnose debug authd fsso list
diagnose debug authd fsso refresh-groups
diagnose debug authd fsso refresh-logons
diagnose debug authd fsso server-status
diagnose debug authd fsso summary
```

Variable	Description
clear	Delete internal data structures and keepalive sessions.
fssso clear-logons	Delete Fortinet Single Sign on (FSSO) logon information.
fssso filter clear	Delete all FSSO filters.
fssso filter group <group_name>	List only the logons by the specified FSSO group.
fssso filter server <FSSO_agent_name>	List only the logons for the specified FSSO agent.
fssso filter source <IPv4_address> <IPv4_address>	List only the logons for the specified range of IPv4 addresses.
fssso filter user <user_name>	List only the logons by the specified user.
fssso list	Display the current FSSO logons.
fssso refresh-groups	Refresh the FSSO group mappings.
fssso refresh-logons	Synchronize the FSSO logon database.
fssso server-status	Display the status of the FSSO agent connection.
fssso summary	Display a summary of current FSSO logons.

### Example output

```
diag debug authd fssso server-status
```

```
Server Name      Connection Status      Version
-----
fssso            connected              FSSO 5.0.0237
```

```
diagnose debug authd fssso list
```

```
IP: 10.1.1.5  User: ADM_FWCHECK  Groups: FW_OPERATORS/ADMINISTRATORS
```

## diagnose debug cli

Use this command to set or find the debug level for the CLI:

```
diagnose debug cli [<0-8>]
```

### Example output

```
S524DF4K15000024 # diagnose debug cli
```

```
Cli debug level is 8
```

## diagnose debug config-error-log

Use this command to display information about the configuration error log:

```
diagnose debug config-error-log {clear | read}
```

Variable	Description
clear	Clear the configuration error log.
fssso	Display configuration errors on the console.

## diagnose debug console

Use these commands to display information about the console:

```
diagnose debug console no-user-log-msg {enable | disable}
diagnose debug console send <AT command>
diagnose debug console timestamp {enable | disable}
```

Variable	Description
no-user-log-msg {enable   disable}	Enable or disable the display of user log messages on the console.
send <AT command>	Send out the specified modem AT command.
timestamp {enable   disable}	Enable or disable the time stamp.

## diagnose debug crashlog

Use this command to display or erase the crash log:

```
diagnose debug crashlog {clear | get}
```

Variable	Description
clear	Clear the crash log.
get	Display the crash log on the console.

### Example output

```
S524DF4K15000024 # diagnose debug crashlog get
```

```
Rk9SVP94nDK0NLPUNTTSTZUMDSzMjCwMjVXSErOjc9IzEvJSY3PTM8tKI5Pzk2x

```

## diagnose debug disable

Use this command to disable debugging output:

```
diagnose debug disable
```

## diagnose debug enable

Use this command to enable debugging output:

```
diagnose debug enable
```

## diagnose debug info

Use this command to display the debugging level:

```
diagnose debug info
```

### Example output

```

S524DF4K15000024 # diagnose debug info
debug output:          enable
console timestamp:     disable
console no user log message:  disable
fsmgr debug level:    16 (0x10)
CLI debug level:      8

```

## diagnose debug kernel level

Use this command to display or set the debugging level for the kernel:

```
diagnose debug kernel level [<integer>]
```

### Example output

```
S524DF4K15000024 # diagnose debug kernel level
Kernel debug level is 0
```

## diagnose debug packet\_test

Use this command to display a report about the specified port for technical support:

```
diagnose debug packet_test <port_ID>
```

### Example output

```
S524DF4K15000024 # diagnose debug packet_test 30

RX: port:0(tx port 30) len:0
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00

RX: port:0(tx port 30) len:0
00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00

Send: 2, Recv: 2
```

## diagnose debug port-mac

**NOTE:** This command is available only on FortiSwitch units that have the split-port feature available.

Use this command to display the mapping between MAC addresses and ports:

```
diagnose debug port-mac {check-mac | list}
```

Variable	Description
check-mac	Check to see if the specified MAC address is valid.
list	List the mapping between MAC addresses and ports.

### Example output

```
S524DF4K15000024 # diagnose debug port-mac check-mac 08:5b:0e:f1:95:e4
Input MAC address 08:5b:0e:f1:95:e4 found in range
08:5b:0e:e5:4f:d6--08:5b:0e:f1:9b:a4
90:6c:ac:30:19:22--90:6c:ac:7b:d6:d0
Allocated split-port MAC for port 32 is 00:00:00:00:00:00.

S524DF4K15000024 # diagnose debug port-mac list
Base MAC: 08:5b:0e:f1:95:e4
```

Port Name	Port #	Split Port Idx	MAC
port1	1	0	08:5b:0e:f1:95:e6

## diagnose debug reset

Use this command to reset all debugging levels to the default levels:

```
diagnose debug reset
```

## diagnose flapguard status

Use this command to get flap-guard information for all switch ports:

```
diagnose flapguard status
```

## Example output

```
S524DF4K15000024 # diagnose flapguard status
```

Portname	State	Status	flap-rate	flap-duration	flaps/duration	Last-Event
port1	disabled	-	5	30	0	-
port2	disabled	-	5	30	0	-
port3	disabled	-	5	30	0	-

## diagnose hardware

Use these commands to diagnose the hardware. You must be logged in as a super user for these commands.

```
diagnose hardware certificate
diagnose hardware ioport {byte <value> | long <arguments> | word <arguments>}
diagnose hardware switchinfo {l3-ecmp-table | l3-egress-table | l3-host-table | l3-intf-
table | l3-summary | l3-v6-host-table | routing-table | v6-routing-table}
diagnose hardware sysinfo {bootenv | cpu | interrupts | iomem | memory | slab}
```

Variable	Description
certificate	Verify which certificates are present on the FortiSwitch unit and that all installed certificates are valid.
ioport {byte <value>   long <arguments>   word <arguments>}	Read and write data using the input/output port.

Variable	Description
switchinfo {I3-ecmp-table   I3-egress-table   I3-host-table   I3-intf-table   I3-summary   I3-v6-host-table   routing-table   v6-routing-table}	Get information about the FortiSwitch hardware.
sysinfo {bootenv   cpu   interrupts   iomem   memory   slab}	Get system information.

### Example output

```
S524DF4K15000024 # diagnose hardware certificate

Checking Fortinet_CA.cer integrity .....Passed
Checking Fortinet_Factory.cer integrity .....Passed
Checking Fortinet_Factory.cer key-pair integrity .....Passed
Checking Fortinet_Factory.cer Serial-No. ....Passed
Checking Fortinet_Factory.cer timeliness .....Passed
Checking Fortinet_Factory.key integrity .....Passed
Checking Fortinet_CA2.cer existent .....[Not Exist]
Checking Fortinet_Factory2.cer existent .....[Not Exist]
Checking Fortinet_Factory2.key existent .....[Not Exist]
```

## diagnose ip address

Use these commands to manage IP addresses:

```
diagnose ip address add <interface_name> <IPv4_address> <IP_network_mask>
diagnose ip address delete <interface_name> <IPv4_address>
diagnose ip address flush
diagnose ip address list
```

Variable	Description
add <interface_name> <IPv4_address> <IP_network_mask>	Add an IPv4 address to the specified interface.
delete <interface_name> <IPv4_address>	Delete an IPv4 address from the specified interface.
flush	Delete all IP addresses.
list	List all IP addresses and which interfaces they are assigned to.

### Example output

```
S524DF4K15000024 # diagnose ip address list

IP=127.0.0.1->127.0.0.1/255.0.0.0 index=1 devname=lo
```

```

IP=192.168.1.99->192.168.1.99/255.255.255.0 index=2 devname=mgmt
IP=10.105.19.3->10.105.19.3/255.255.252.0 index=2 devname=mgmt
IP=170.38.65.1->170.38.65.1/255.255.255.0 index=71 devname=vlan35
IP=180.1.1.1->180.1.1.1/255.255.255.0 index=72 devname=vlan85
IP=127.0.0.1->127.0.0.1/255.0.0.0 index=73 devname=int1
IP=10.10.10.1->10.10.10.1/255.255.255.0 index=74 devname=vlan-8
IP=11.1.1.100->11.1.1.100/255.255.255.255 index=74 devname=vlan-8

```

## diagnose ip arp

Use these commands to manage the Address Resolution Protocol (ARP) table:

```

diagnose ip arp add <interface_name> <IPv4_address> <MAC_address>
diagnose ip arp delete <interface_name> <IPv4_address>
diagnose ip arp flush <interface_name>
diagnose ip arp list

```

Variable	Description
arp add <interface_name> <IPv4_address>	Add an Address Resolution Protocol (ARP) entry for the IP address on the specified interface.
arp delete <interface_name> <IPv4_address>	Delete an Address Resolution Protocol (ARP) entry for the IP address on the specified interface.
arp flush <interface_name>	Delete the ARP table for the specified interface.
arp list	Display the ARP table.

### Example output

```

S524DF4K15000024 # diagnose ip arp list

index=2 ifname=mgmt 10.105.16.1 90:6c:ac:15:2f:94 state=00000002 use=117606 confirm=537 update=67371 ref=1
index=70 ifname=internal 192.168.0.10 state=00000001 use=24 confirm=178601 update=124 ref=1
index=74 ifname=vlan-8 11.1.1.100 00:00:5e:00:01:05 (proxy)

```

## diagnose ip route

Use these commands to manage static routes and the routing table:

```

diagnose ip route add <interface_name> <IPv4_address> <IP_network_mask>
diagnose ip route delete <interface_name> <IPv4_address>
diagnose ip route flush
diagnose ip route list [<arguments>]
diagnose ip route verify <interface_name> <IPv4_address> <IP_network_mask>

```

Variable	Description
add <interface_name> <IPv4_address> <IP_network_mask>	Add a static route to the specified interface.
delete <interface_name> <IPv4_address>	Delete a static route from the specified interface.
flush	Delete the routing table.
list [<arguments>]	Display the routing table.
verify <interface_name> <IPv4_address> <IP_network_mask>	Verify a static route on the specified interface.

## Example output

```
S524DF4K15000024 # diagnose ip route list

```

## diagnose ip router bfd

**NOTE:** To enable bidirectional forwarding detection (BFD) debugging, you must use the `diagnose debug application bfdd` to set the debugging level to 8 or higher. To configure BFD, see [config system interface on page 169](#).

Use these commands to manage BFD debugging:

```

diagnose ip router bfd cpu-usage show
diagnose ip router bfd debug all {enable | disable}
diagnose ip router bfd debug fsm {enable | disable}
diagnose ip router bfd debug net {enable | disable}
diagnose ip router bfd debug show
diagnose ip router bfd debug zebra {enable | disable}
diagnose ip router bfd memory-usage show
diagnose ip router bfd work-queues show

```

Variable	Description
cpu-usage show	Display statistics for CPU usage.

Variable	Description
debug all {enable   disable}	Enable or disable all BFD debugging.
debug fsm {enable   disable}	Enable or disable BFD FortiGate Storage Modules (FSM) debugging.
debug net {enable   disable}	Enable or disable BFD network debugging.
debug show	Display the BFD debugging level and which kinds of BFD debugging are enabled.
debug zebra {enable   disable}	Enable or disable communication with the core router daemon.
memory-usage show	Display statistics for memory usage.
work-queues show	Display information about work queues.

### Example output

```
S524DF4K15000024 # diagnose ip router bfd cpu-usage show
                    CPU (user+system): Real (wall-clock):
Runtime(ms)   Invoked Avg uSec Max uSecs Avg uSec Max uSecs   Type  Thread
      0.000         1      0      0      181      181    E   zclient_connect
      0.000        91      0      0       64      125    R   zclient_read

## diagnose ip router bgp

Use these commands for debugging BGP routing:

```

diagnose ip router bgp cpu-usage show
diagnose ip router bgp crash-backtrace {clear | read}
diagnose ip router bgp debug {all | appl | as4 | bfd | events | filters | fsm | keepalives
    | normal | show | updates | zebra}
diagnose ip router bgp memory-usage show
diagnose ip router bgp work-queues show

```

Variable	Description
cpu-usage show	Display information about thread CPU use.
crash-backtrace {clear   read}	Delete or display BGP crash backtrace information.

Variable	Description
debug {all   appl   as4   bfd   events   filters   fsm   keepalives   normal   show   updates   zebra}	Display BGP debugging information: <ul style="list-style-type: none"> <li>• all—Enable or disable all BGP debugging.</li> <li>• appl—Enable or disable most applicable BGP debugging.</li> <li>• as4—Enable or disable BGP AS version-4 debugging.</li> <li>• bfd—Enable or disable BGP BFD debugging.</li> <li>• events—Enable or disable BGP event debugging.</li> <li>• filters—Enable or disable BGP filters debugging.</li> <li>• fsm—Enable or disable BGP FSM debugging.</li> <li>• keepalives—Enable or disable BGP keepalives debugging.</li> <li>• normal—Enable or disable normal BGP debugging.</li> <li>• show—Display the BGP debugging level and which kinds of BGP debugging are enabled.</li> <li>• updates—Enable or disable BGP updates debugging.</li> <li>• zebra—Enable or disable communication with the core router daemon.</li> </ul>
memory-usage show	Display statistics for memory usage.
work-queues show	Display information about work queues.

## diagnose ip router command

Use these commands to send commands to various daemons:

```
diagnose ip router command bfd {cmd <arguments>| cmd-conf-term <arguments>}
diagnose ip router command bgp {cmd <arguments>| cmd-conf-term <arguments>}
diagnose ip router command isis {cmd <arguments>| cmd-conf-term <arguments>}
diagnose ip router command ospf {cmd <arguments>| cmd-conf-term <arguments>}
diagnose ip router command pim {cmd <arguments>| cmd-conf-term <arguments>}
diagnose ip router command rip {cmd <arguments>| cmd-conf-term <arguments>}
diagnose ip router command zebra {cmd <arguments>| cmd-conf-term <arguments>}
```

Variable	Description
bfd {cmd <arguments>  cmd-conf-term <arguments>}	Send commands to the BFD daemon in enable mode (cmd) or in configure terminal mode (cmd-conf-term).
bgp {cmd <arguments>  cmd-conf-term <arguments>}	Send commands to the BGP daemon in enable mode (cmd) or in configure terminal mode (cmd-conf-term).
isis {cmd <arguments>  cmd-conf-term <arguments>}	Send commands to the IS-IS daemon in enable mode (cmd) or in configure terminal mode (cmd-conf-term).

Variable	Description
ospf {cmd <arguments>  cmd-conf-term <arguments>}	Send commands to the OSPF daemon in enable mode (cmd) or in configure terminal mode (cmd-conf-term).
pim {cmd <arguments>  cmd-conf-term <arguments>}	Send commands to the PIM daemon in enable mode (cmd) or in configure terminal mode (cmd-conf-term).
rip {cmd <arguments>  cmd-conf-term <arguments>}	Send commands to the RIP daemon in enable mode (cmd) or in configure terminal mode (cmd-conf-term).
zebra {cmd <arguments>  cmd-conf-term <arguments>}	Send commands to the core router daemon in enable mode (cmd) or in configure terminal mode (cmd-conf-term).

## diagnose ip router isis

Use these commands for debugging IS-IS routing:

```
diagnose ip router isis cpu-usage show
diagnose ip router isis crash-backtrace {clear | read}
diagnose ip router isis debug {adj-packets | all | appl | checksum-errors | events |
    local-updates | lsp-gen | lsp-sched | packet-dump | protocol-errors | route-events |
    show | snp-packets | spf-events | spf-statistics | spf-triggers | update-packets}
diagnose ip router isis memory-usage show
diagnose ip router isis work-queues show
```

Variable	Description
cpu-usage show	Display information about thread CPU use.
crash-backtrace {clear   read}	Delete or display IS-IS crash backtrace information.

Variable	Description
debug {adj-packets   all   appl   checksum-errors   events   local-updates   lsp-gen   lsp-sched   packet-dump   protocol-errors   route-events   show   snp-packets   spf-events   spf-statistics   spf-triggers   update-packets}	Display ISIS debugging information: <ul style="list-style-type: none"> <li>• adj-packets—Enable or disable the debugging of IS-IS adjacency-related packets.</li> <li>• all—Enable or disable all IS-IS debugging.</li> <li>• appl—Enable or disable most applicable IS-IS debugging.</li> <li>• checksum-errors—Enable or disable the debugging of IS-IS LSP checksum errors.</li> <li>• events—Enable or disable IS-IS event debugging.</li> <li>• local-updates—Enable or disable the debugging of IS-IS local update packets.</li> <li>• lsp-gen—Enable or disable the debugging of IS-IS generation of own LSPs.</li> <li>• lsp-sched—Enable or disable the debugging of IS-IS scheduling of LSP generation.</li> <li>• packet-dump—Enable or disable the debugging of IS-IS packet dumps.</li> <li>• protocol-errors—Enable or disable the debugging of IS-IS LSP protocol errors.</li> <li>• route-events—Enable or disable the debugging of IS-IS route-related events.</li> <li>• show—Display the IS-IS debugging level and which kinds of IS-IS debugging are enabled.</li> <li>• snp-packets—Enable or disable the debugging of IS-IS CSNP/PSNP packets.</li> <li>• spf-events—Enable or disable the debugging of IS-IS shortest-path-first (SPF) events.</li> <li>• spf-statistics—Enable or disable the debugging of IS-IS SPF timing and statistic data.</li> <li>• spf-triggers—Enable or disable the debugging of IS-IS SPF triggering events.</li> <li>• update-packets—Enable or disable the debugging of IS-IS update-related packets.</li> </ul>
memory-usage show	Display statistics for memory usage.
work-queues show	Display information about work queues.

## diagnose ip router launch-info show

Use this command to display information about the process launch of the BFD daemon, OSPF daemon, RIP daemon, and core routing daemon:

```
diagnose ip router launch-info show
```

## Example output

```
S524DF4K15000024 # diagnose ip router launch-info show
```

```
/bin/zebra Pid: 770 Ready: 0x1 NumRestart: 0  
/bin/ospfd Pid: 824 Ready: 0x1 NumRestart: 0  
/bin/bfdd Pid: 825 Ready: 0x1 NumRestart: 0  
/bin/ripd Pid: 826 Ready: 0x1 NumRestart: 0
```

## diagnose ip router ospf

**NOTE:** To enable open shortest path first (OSPF) debugging, you must use the `diagnose debug application ospfd` to set the debugging level to 8 or higher. To configure OSPF routing, see [config router ospf on page 50](#).

Use these commands to manage OSPF debugging:

```
diagnose ip router ospf cpu-usage show  
diagnose ip router ospf crash-backtrace {clear | read}  
diagnose ip router ospf debug all {enable | disable}  
diagnose ip router ospf debug event {enable | disable}  
diagnose ip router ospf debug ism {enable | disable}  
diagnose ip router ospf debug lsa {enable | disable}  
diagnose ip router ospf debug nsm {enable | disable}  
diagnose ip router ospf debug nssa {enable | disable}  
diagnose ip router ospf debug packet {enable | disable}  
diagnose ip router ospf debug show  
diagnose ip router ospf debug zebra {enable | disable}  
diagnose ip router ospf ism-debug all {enable | disable}  
diagnose ip router ospf ism-debug events {enable | disable}  
diagnose ip router ospf ism-debug status {enable | disable}  
diagnose ip router ospf ism-debug timers {enable | disable}  
diagnose ip router ospf lsa-debug all {enable | disable}  
diagnose ip router ospf lsa-debug flooding {enable | disable}  
diagnose ip router ospf lsa-debug generate {enable | disable}  
diagnose ip router ospf lsa-debug install {enable | disable}  
diagnose ip router ospf lsa-debug refresh {enable | disable}  
diagnose ip router ospf memory-usage show  
diagnose ip router ospf nsm-debug all {enable | disable}  
diagnose ip router ospf nsm-debug events {enable | disable}  
diagnose ip router ospf nsm-debug status {enable | disable}  
diagnose ip router ospf nsm-debug timers {enable | disable}  
diagnose ip router ospf packet-debug all {enable | disable}  
diagnose ip router ospf packet-debug dd {enable | disable}  
diagnose ip router ospf packet-debug hello {enable | disable}  
diagnose ip router ospf packet-debug ls-ack {enable | disable}  
diagnose ip router ospf packet-debug ls-request {enable | disable}  
diagnose ip router ospf packet-debug ls-update {enable | disable}  
diagnose ip router ospf work-queues show  
diagnose ip router ospf zebra-debug all {enable | disable}  
diagnose ip router ospf zebra-debug interface {enable | disable}  
diagnose ip router ospf zebra-debug redistribute {enable | disable}
```

Variable	Description
cpu-usage show	Display statistics for CPU usage.
crash-backtrace {clear   read}	Erase or display the OSPF crash backtrace information.
debug all {enable   disable}	Enable or disable all OSPF debugging.
debug event {enable   disable}	Enable or disable OSPF event debugging.
debug ism {enable   disable}	Enable or disable OSPF interface state machine (ISM) debugging.
debug lsa {enable   disable}	Enable or disable OSPF link state advertisement (LSA) debugging.
debug nsm {enable   disable}	Enable or disable OSPF neighbor state machine (NSM) debugging.
debug nssa {enable   disable}	Enable or disable OSPF Not So Stubby areas (NSSA) debugging.
debug packet {enable   disable}	Enable or disable OSPF packet debugging.
debug show	Display the OSPF debugging level and which kinds of OSPF debugging are enabled.
debug zebra {enable   disable}	Enable or disable communication with the core router daemon.
ism-debug all {enable   disable}	Enable or disable all OSPF ISM debugging.
ism-debug events {enable   disable}	Enable or disable OSPF ISM event debugging.
ism-debug status {enable   disable}	Enable or disable OSPF ISM status debugging.
ism-debug timers {enable   disable}	Enable or disable OSPF ISM timers debugging.
lsa-debug all {enable   disable}	Enable or disable all OSPF LSA debugging.
lsa-debug flooding {enable   disable}	Enable or disable OSPF LSA flooding debugging.
lsa-debug generate {enable   disable}	Enable or disable OSPF LSA generation debugging.
lsa-debug install {enable   disable}	Enable or disable OSPF LSA installation and removal debugging.
lsa-debug refresh {enable   disable}	Enable or disable OSPF LSA refresh debugging.
memory-usage show	Display statistics for memory usage.
nsm-debug all {enable   disable}	Enable or disable all OSPF NSM debugging.
nsm-debug events {enable   disable}	Enable or disable OSPF NSM event debugging.

Variable	Description
nsm-debug status {enable   disable}	Enable or disable OSPF NSM status debugging.
nsm-debug timers {enable   disable}	Enable or disable OSPF NSM timers debugging.
packet-debug all {enable   disable}	Enable or disable all OSPF packet debugging.
packet-debug dd {enable   disable}	Enable or disable database description packet debugging.
packet-debug hello {enable   disable}	Enable or disable hello packet debugging.
packet-debug ls-ack {enable   disable}	Enable or disable link state acknowledgment packet debugging.
packet-debug ls-request {enable   disable}	Enable or disable link state request packet debugging.
packet-debug ls-update {enable   disable}	Enable or disable link statue update packet debugging.
work-queues show	Display information about work queues.
zebra-debug all {enable   disable}	Enable or disable all OSPF core router debugging.
zebra-debug interface {enable   disable}	Enable or disable OSPF core router interface debugging.
zebra-debug redistribute {enable   disable}	Enable or disable OSPF core router redistribution debugging.

## Example output

```

## diagnose ip router pim

Use these commands for debugging PIM routing:

```

diagnose ip router pim cpu-usage show
diagnose ip router pim crash-backtrace {clear | read}
diagnose ip router pim debug {all | appl | events | igmp-events | igmp-packets | igmp-
    trace | mroute | packet-dump | packets | show | static | trace | zebra}
diagnose ip router pim memory-usage show
diagnose ip router pim work-queues show

```

Variable	Description
cpu-usage show	Display information about thread CPU use.
crash-backtrace {clear   read}	Delete or display PIM crash backtrace information.

Variable	Description
debug {all   appl   events   igmp-events   igmp-packets   igmp-trace   mroute   packet-dump   packets   show   static   trace   zebra}	Display PIM debugging information: <ul style="list-style-type: none"> <li>• all—Enable or disable all PIM debugging.</li> <li>• appl—Enable or disable most applicable PIM debugging.</li> <li>• events—Enable or disable PIM event debugging.</li> <li>• igmp-events—Enable or disable the debugging of PIM IGMP events.</li> <li>• igmp-packets—Enable or disable the debugging of PIM IGMP packets.</li> <li>• igmp-trace—Enable or disable the debugging of PIM IGMP tracing.</li> <li>• mroute—Enable or disable the debugging of PIM multicast routes.</li> <li>• packet-dump—Enable or disable the debugging of PIM packet dumps.</li> <li>• packets—Enable or disable the debugging of PIM packets.</li> <li>• show—Display the PIM debugging level and which kinds of PIM debugging are enabled.</li> <li>• static—Enable or disable the debugging of PIM static multicast routes.</li> <li>• trace—Enable or disable the debugging of PIM tracing.</li> <li>• zebra—Enable or disable communication with the core router daemon.</li> </ul>
memory-usage show	Display statistics for memory usage.
work-queues show	Display information about work queues.

## diagnose ip router rip

**NOTE:** To enable RIP debugging, you must use the `diagnose debug application ripd` to set the debugging level to 8 or higher. To configure RIP routing, see ["config router" on page 58](#).

Use these commands to manage RIP debugging:

```
diagnose ip router rip cpu-usage show
diagnose ip router rip crash-backtrace {clear | read}
diagnose ip router rip debug all {enable | disable}
diagnose ip router rip debug events {enable | disable}
diagnose ip router rip debug packet-rx {enable | disable}
diagnose ip router rip debug packet-tx {enable | disable}
diagnose ip router rip debug show
diagnose ip router rip debug zebra {enable | disable}
diagnose ip router rip memory-usage show
diagnose ip router rip work-queues show
```

Variable	Description
cpu-usage show	Display statistics for CPU usage.
crash-backtrace {clear   read}	Erase or display the RIP crash backtrace information.
debug all {enable   disable}	Enable or disable all RIP debugging.
debug events {enable   disable}	Enable or disable RIP event debugging.
debug packet-rx {enable   disable}	Enable or disable received RIP packet debugging.
debug packet-tx {enable   disable}	Enable or disable transmitted RIP packet debugging.
debug show	Display the RIP debugging level and which kinds of RIP debugging are enabled.
debug zebra {enable   disable}	Enable or disable communication with the core router daemon.
memory-usage show	Display statistics for memory usage.
work-queues show	Display information about work queues.

### Example output

```
S524DF4K15000024 # diagnose ip router rip cpu-usage show
CPU (user+system): Real (wall-clock):

## diagnose ip router terminal monitor

Use this command to enable or disable the display of router information on the terminal:

```
diagnose ip router terminal monitor {enable | disable}
```

## diagnose ip router zebra

**NOTE:** To enable debugging of the core router daemon, you must use the `diagnose debug application zebra` to set the debugging level to 8 or higher.

Use these commands to manage the core router daemon:

```
diagnose ip router zebra cpu-usage show
diagnose ip router zebra crash-backtrace {clear | read}
diagnose ip router zebra debug all {enable | disable}
diagnose ip router zebra debug events {enable | disable}
diagnose ip router zebra debug fpm {enable | disable}
diagnose ip router zebra debug kernel {enable | disable}
diagnose ip router zebra debug packet-rx {enable | disable}
diagnose ip router zebra debug packet-rx-detail {enable | disable}
diagnose ip router zebra debug packet-tx {enable | disable}
diagnose ip router zebra debug packet-tx-detail {enable | disable}
diagnose ip router zebra debug rib {enable | disable}
diagnose ip router zebra debug rib-queue {enable | disable}
diagnose ip router zebra debug show
diagnose ip router zebra fpm-counters {clear | show}
diagnose ip router zebra memory-usage show
diagnose ip router zebra work-queues show
```

Variable	Description
cpu-usage show	Display statistics for CPU usage.
crash-backtrace {clear   read}	Erase or display the crash backtrace information for the core router daemon.
debug all {enable   disable}	Enable or disable all debugging for the core router daemon.
debug events {enable   disable}	Enable or disable event debugging for the core router daemon.
debug fpm {enable   disable}	Enable or disable hardware offload debugging for the core router daemon.
debug kernel {enable   disable}	Enable or disable kernel interaction debugging for the core router daemon.
debug packet-rx {enable   disable}	Enable or disable general debugging of received packets for the core router daemon.

Variable	Description
debug packet-rx-detail {enable   disable}	Enable or disable detailed debugging of received packets for the core router daemon.
packet-tx {enable   disable}	Enable or disable general debugging of transmitted packets for the core router daemon.
debug packet-tx-detail {enable   disable}	Enable or disable detailed debugging of transmitted packets for the core router daemon.
debug rib {enable   disable}	Enable or disable routing table debugging for the core router daemon.
debug rib-queue {enable   disable}	Enable or disable routing queue debugging for the core router daemon.
debug show	Display the debugging level of the core router daemon and which kinds of debugging of the core router daemon are enabled.
fpm-counters {clear   show}	Erase or display the hardware offload counters.
memory-usage show	Display statistics for memory usage.
work-queues show	Display information about work queues.

```

## diagnose ipv6 address

Use these commands to manage IPv6 addresses:

```

diagnose ipv6 address add <interface_name> <IPv6_address>
diagnose ipv6 address anycast <arguments>
diagnose ipv6 address delete <interface_name> <IPv6_address>
diagnose ipv6 address flush
diagnose ipv6 address list
diagnose ipv6 address multicast <interface_name> <IPv6_address>

```

Variable	Description
add <interface_name> <IPv6_address>	Add an IPv6 address to the specified interface. Use the following format for the IPv6 address: xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxx
anycast <arguments>	Add an IPv6 anycast address.

Variable	Description
delete <interface_name> <IPv4_address>	Delete an IPv6 address from the specified interface. Use the following format for the IPv6 address: xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx/xxx
flush	Delete all IPv6 addresses.
list	List all IPv6 addresses and which interfaces they are assigned to.
multicast <interface_name> <IPv6_address>	Add an IPv6 multicast address to the specified interface. Use the following format for the IPv6 address: xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx/xxx

### Example output

```
S524DF4K15000024 # diagnose ipv6 address list

dev=1 devname=lo flag=P scope=254 prefix=128 addr>:::1 preferred=-1 valid=-1
dev=2 devname=mgmt flag=P scope=253 prefix=64 addr=fe80::a5b:eff:fef1:95e4 preferred=-1 valid=-1
dev=70 devname=internal flag=P scope=253 prefix=64 addr=fe80::a5b:eff:fef1:95e5 preferred=-1 valid=-1
dev=71 devname=vlan35 flag=P scope=253 prefix=64 addr=fe80::a5b:eff:fef1:95e5 preferred=-1 valid=-1
dev=72 devname=vlan85 flag=P scope=253 prefix=64 addr=fe80::a5b:eff:fef1:95e5 preferred=-1 valid=-1
dev=74 devname=vlan-8 flag=P scope=253 prefix=64 addr=fe80::a5b:eff:fef1:95e5 preferred=-1 valid=-1
```

## diagnose ipv6 devconf

Use these commands to configure IPv6 devices:

```
diagnose ipv6 address devconf accept-dad {0 | 1 | 2}
diagnose ipv6 address devconf disable_ipv6 {0 | 1 }
```

Variable	Description
accept-dad {0   1   2}	Configure the detection of duplicate IPv6 address: <ul style="list-style-type: none"> <li>0 — disable duplicate address detection.</li> <li>1 — enable duplicate address detection.</li> <li>2 — enable duplicate address detection and disable IPv6 operation if duplicate MAC-based link-local addresses are found.</li> </ul>
disable_ipv6 {0   1 }	Configure IPv6 operation: <ul style="list-style-type: none"> <li>0 — enable IPv6 operation.</li> <li>1 — disable IPv6 operation.</li> </ul>

## diagnose ipv6 ipv6-tunnel

Use these commands to manage IPv6 tunnels:

```
diagnose ipv6 ipv6-tunnel add <tunnel_name> <interface_name> <source_IPv6_address>
    <destination_IPv6_address>
diagnose ipv6 ipv6-tunnel delete <tunnel_name>
diagnose ipv6 ipv6-tunnel list
```

Variable	Description
add <tunnel_name> <interface_name> <source_IPv6_address> <destination_IPv6_address>	Create a tunnel between two IPv6 addresses on the specified interface. Use the following format for the IPv6 addresses: xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx
delete <tunnel_name>	Delete the specified IPv6 tunnel.
delete <interface_name> <IPv4_address>	List all IPv6 tunnels.

### Example output

```
S524DF4K15000024 # diagnose ipv6 ipv6-tunnel list
sys_list_tunnel6:233 not implemented
```

## diagnose ipv6 neighbor-cache

Use these commands to manage the IPv6 Address Resolution Protocol (ARP) table:

```
diagnose ipv6 neighbor-cache add <interface_name> <IPv6_address> <MAC_address>
diagnose ipv6 neighbor-cache delete <interface_name> <IPv4_address>
diagnose ipv6 neighbor-cache flush <interface_name>
diagnose ipv6 neighbor-cache list
```

Variable	Description
add <interface_name> <IPv6_address>	Add an ARP entry for the IPv6 address on the specified interface.
delete <interface_name> <IPv6_address>	Delete an ARP entry for the IPv6 address on the specified interface.
flush <interface_name>	Delete the ARP table for the specified interface.
list	Display the ARP table.

## Example output

```
S524DF4K15000024 # diagnose ipv6 neighbor-cache list

ifindex=1 ifname=lo :: 00:00:00:00:00:00 state=00000040 use=1096280 con-
firm=1102281 update=1096280 ref=6
```

## diagnose ipv6 route

Use these commands to manage the IPv6 routing table:

```
diagnose ipv6 route flush
diagnose ipv6 route list
```

Variable	Description
flush	Delete the routing table.
list	Display the routing table.

## Example output

```
S524DF4K15000024 # diagnose ipv6 route list

```

## diagnose ipv6 sit-tunnel

Use these commands to manage IPv4 tunnels:

```
diagnose ipv6 sit-tunnel add <tunnel_name> <interface_name> <source_IPv4_address>
    <destination_IPv4_address>
diagnose ipv6 sit-tunnel delete <tunnel_name>
diagnose ipv6 sit-tunnel list
```

Variable	Description
add <tunnel_name> <interface_name> <source_IPv4_address> <destination_IPv4_address>	Create a tunnel between two IPv4 addresses on the specified interface. Use the following format for the IPv4 addresses: XXX.XXX.XXX.XXX
delete <tunnel_name>	Delete the specified IPv4 tunnel.
delete <interface_name> <IPv4_address>	List all IPv4 tunnels.

### Example output

```
S524DF4K15000024 # diagnose ipv6 sit-tunnel list
sys_list_tunnel6:263 not implemented
```

## diagnose log alertconsole

Use the following commands to manage alert console messages:

```
diagnose log alertconsole clear
diagnose log alertconsole fgd-retrieve
diagnose log alertconsole list
diagnose log alertconsole test
```

Variable	Description
clear	Clear alert console messages.
fgd-retrieve	Retrieve FortiGuard alert console messages.
list	List current alert console messages.
test	Generate alert console messages.

### Example output

```
S524DF4K15000024 # diagnose log alertconsole list
```

## diagnose loop-guard instance status

Use this command to display which ports have loop guard enabled:

```
diagnose loop-guard instance status
```

To enable loop guard on a port, see [config switch interface on page 88](#).

### Example output

```
S524DF4K15000024 # diagnose loop-guard instance status
```

Portname	State	Status	Timeout (m)	Count	Last-Event
port1	lo	disabled	-	-	-

## diagnose option82-mapping relay

Use this command to display the option-82 setting for DHCP relay for each valid system interface:

```
diagnose option82-mapping relay <valid_system_interface>
```

## Example output

```
S524DF4K15000024 # diagnose option82-mapping relay internal

Interface Name Remote-ID(hex) Circuit-ID(hex)
internal 085B0EF195E5 00000000
```

## diagnose option82-mapping snooping

Use this command to display the option-82 settings for DHCP snooping for a specific VLAN and FortiSwitch interface:

```
diagnose option82-mapping snooping <VLAN_ID> <valid_switch_interface>
```

## Example output

```
S524DF4K15000024 # diagnose option82-mapping snooping 100 port2

Interface Name Remote-ID(hex) Circuit-ID(hex)
port2 085B0EF195E5 00640102
```

## diagnose settings

Use these commands to manage diagnostic settings:

```
diagnose settings info
diagnose settings reset
```

Variable	Description
info	List all diagnostic settings.
reset	Reset all diagnostic settings to their default settings.

## Example output

```
S524DF4K15000024 # diagnose settings info

debug output:          disable
console timestamp:     disable
console no user log message:  disable
fsmgr debug level:    16 (0x10)
CLI debug level:      3
```

## diagnose sniffer packet

Use this command to examine packets received on a specific interface:

```
diagnose sniffer packet <interface_name | any> <logical_filter | none> <verbose | 1-6>
<sniffer_count> <timestamp_format>
```

Variable	Description
<interface_name   any>	Enter the name of a network interface or enter <code>any</code> to examine packets received on all interfaces.
<logical_filter   none>	<p>Enter a logical filter or <code>none</code>. Use the following format for the filter:  <code>'[[src dst] host&lt;IP_address&gt;] [[src dst] host&lt;IP_address&gt;] [[arp ip gre esp udp tcp] [port_number]] [[arp ip gre esp udp tcp] [port_number]]'</code></p> <p>For example, to examine UDP packets received at port 1812 from host <code>forti1</code> and host <code>forti2</code> or <code>forti3</code>:  <code>'udp and port 1812 and host forti1 and \( forti2 or forti3 \)'</code></p> <p>To examine TCP packets between two PCs through port 80:  <code>diag sniffer packet internal 'host 192.168.0.130 and 192.168.0.1 and tcp port 80' 1</code></p> <p>To examine packets with the RST flag set:  <code>diagnose sniffer packet internal "tcp[13] &amp; 4 != 0"</code></p> <p>To examine packets with the destination MAC address of <code>00:09:0f:89:10:ea</code>:  <code>diagnose sniffer packet internal "(ether [0:4]=0x00090f89) and (ether[4:2]=0x10ea)"</code></p>
<verbose   1-6>	<p>Set the level of detail for the results:</p> <ul style="list-style-type: none"> <li>• <code>verbose</code> — Display all details.</li> <li>• <code>1</code> — Include the packet header.</li> <li>• <code>2</code> — Include the packet header and IP address data.</li> <li>• <code>3</code> — Include the packet header and Ethernet address data (if available).</li> <li>• <code>4</code> — Include the packet header and interface name.</li> <li>• <code>5</code> — Include the packet header, interface name, and IP address data.</li> <li>• <code>6</code> — Include the packet header, interface name, and Ethernet address data (if available).</li> </ul>
<sniffer_count>	Enter the number of packets to examine.

Variable	Description
<timestamp_format>	Enter a for UTC time (yyyy-mm-dd hh:mm:ss.ms) or enter the number of minutes and seconds after the start of the packet examination (ss.ms).

### Example output

```
S524DF4K15000024 # diagnose sniffer packet any

## diagnose snmp

Use these commands to display SNMP information:

```
diagnose snmp ip frags
diagnose snmp trap send
```

Variable	Description
ip frags	Display fragmentation and reassembly information
trap send	Generate a trap event and send it to the SNMP daemon.

### Example output

```
S524DF4K15000024 # diagnose snmp ip frags
```

```
ReasmTimeout = 0
ReasmReqds   = 0
ReasmOKs     = 0
ReasmFails   = 0
FragOKs      = 0
FragFails    = 0
FragCreates  = 0
```

## diagnose stp instance list

Use this command to display information about Multiple Spanning Tree Protocol (MSTP) instances:

```
diagnose stp instance list <STP_ID> <port_number>
```

To create an STP instance, see [config switch stp instance on page 125](#).

Variable	Description
<STP_ID>	Enter the STP identifier. If you enter a higher number than the valid range, the results for all STP instances are displayed. If no STP identifier is specified, results for all STP instances are displayed.
<port_number>	Enter the port number. If no port number is specified, results for all physical ports are displayed.

### Example output

```
S524DF4K15000024 # diagnose stp instance list 0

MST Instance Information, primary-Channel:

Instance ID 0 (CST)
```

```

Config          Priority 32768

## diagnose stp mst-config list

Use this command to display the MSTP configuration:

```
diagnose snmp mst-config list
```

To configure an MSTP instance, see [config switch stp settings on page 126](#).

### Example output

```
S524DF4K15000024 # diagnose stp mst-config list
```

```
MST Configuration Identification Information
```

```
Unit: primary
MST Configuration Name: region1
MST Configuration Revision: 1
MST Configuration Digest: ac36177f50283cd4b83821d8ab26de62
```

Instance ID	Mapped VLANs	Priority
0		32768
1		8192

## diagnose stp rapid-pvst-port

Use these commands to diagnose the interoperability with per-VLAN RSTP (Rapid PVST+ or RPVST+):

```
diagnose stp rapid-pvst-port clear [<port_name>]
diagnose stp rapid-pvst-port list [<port_name>]
```

Variable	Description
clear [<port_name>]	Clear all flags and timers on the RPVST+ port.
list [<port_name>]	Show the status of one port or all ports. If any of the ports is in the "IC" state, the command output gives the reason: VLAN priority inconsistent, VLAN configuration mismatch, or both.

## diagnose stp vlan list

Use this command to display the MSTP information for a specific VLAN:

```
diagnose stp vlan list <VLAN_ID>
```

Variable	Description
<VLAN_ID>	Enter the VLAN identifier. The value range is 1-4095.

### Example output

```
S524DF4K15000024 # diagnose stp vlan list 10

MST Instance Information, primary-Channel:

Instance ID : 0

Switch Priority : 32768

Root MAC Address : 085b0ef195e4
Root Priority: 32768
Root Pathcost: 0
Regional Root MAC Address : 085b0ef195e4
Regional Root Priority: 32768
Regional Root Path Cost: 0
Remaining Hops: 20
```

```
This Bridge MAC Address : 085b0ef195e4
This bridge is the root
```

## diagnose switch 802-1x status

Use this command to display the status of a port using IEEE 802.1x authentication:

```
diagnose switch 802-1x status [<port_name>]
```

Variable	Description
[<port_name>]	Enter the port name. If the port is not specified, the status of all 802.1x-authenticated ports is returned. In the output, the value in the "Traffic-Vlan" column is the VLAN where the client was successfully authenticated.

To enable IEEE 802.1x authentication on a port, see [config switch interface on page 88](#).

### Example output

```
S548DF4K15000195 # diagnose switch 802-1x status

port3 : Mode: mac-based (mac-by-pass disable)
        Link: Link up
        Port State: authorized: ( )
        EAP pass-through : Enable
```

```

EAP auto-untagged-vlans : Disable
Quarantine VLAN (4093) detection : Enable
Native Vlan : 10
Allowed Vlan list: 10,15
Untagged Vlan list: 10
Guest VLAN :
Auth-Fail Vlan :

```

## diagnose switch acl counter

Use these commands to display information about access control lists (ACLs):

```

diagnose switch acl counter all
diagnose switch acl counter app <name>
diagnose switch acl counter id <policy_ID>
diagnose switch acl counter list-apps

```

Variable	Description
all	List all applications using ACL counters.
app <name>	List ACL counters for this application.
id <policy_ID>	List the ACL counter for this ACL policy identifier.
list-apps	List application names that use ACL counters.

### Example output

```
S524DF4K15000024 # diagnose switch acl counter list-apps
```

```

Application                Policy ID Range
-----
loop-gaurd                 (2049-2049)

access-vlan         (145793-149889)
network-monitor     (149890-149930)

```

## diagnose switch arp-inspection stats clear

Use this command to delete dynamic ARP inspection statistics:

```
diagnose switch arp-inspection stats clear <VLAN_ID>
```

Variable	Description
<VLAN_ID>	Enter a single VLAN identifier or a range of VLAN identifiers separated by commas. For example: 1,3-4,6,7,9-100

To enable dynamic ARP inspection on a VLAN, see [config switch vlan](#) on page 131.

## diagnose switch egress list

Use this command to display the port egress map:

```
diagnose switch egress list <port_name>
```

Variable	Description
<port_name>	Enter the port name.

## Example output

```
S524DF4K15000024 # diagnose switch egress list port1
```

```
Switch Interface Egress Map, primary-Channel
Port Map: Name(Id):
```

```
port1(1)          port2(2)          port3(3)
port4(4)          port5(5)          port6(6)

cpu0(31)
```

```
Source Interface  Destination Ports
```

```
-----
port1             1-6,9-31
```

## diagnose switch ip-mac-binding entry

Use this command to display the counters for an IP-MAC binding entry:

```
diagnose switch ip-mac-binding entry <entry_ID>
```

Variable	Description
<entry_ID>	Enter an IP-MAC binding entry identifier.

To enable IP-MAC binding, see [config switch global on page 82](#).

## Example output

```
S524DF4K15000024 # diagnose switch ip-mac-binding entry 1
```

```
Binding Entry: 1
Binding IP: 1.20.168.172 255.255.255.255
Binding MAC: 00:21:CC:D2:76:72
Status: Enabled
Statistic:
Permit packets: 0x00
Drop packets: 0x00
-----
```

## diagnose switch ip-source-guard hardware entry filter

Use these commands to select which IP source-guard entries to display:

```
diagnose switch ip-source-guard hardware entry filter clear
diagnose switch ip-source-guard hardware entry filter interface <interface_name>
diagnose switch ip-source-guard hardware entry filter ip <IPv4_address>
diagnose switch ip-source-guard hardware entry filter mac <MAC_address>
diagnose switch ip-source-guard hardware entry filter print
```

Variable	Description
clear	Remove the current filter.
interface <port_name>	Display entries for the specified port.
ip <IPv4_address>	Display entries for the specified IPv4 address.
mac <MAC_address> <mask>	Delete entries for the specified MAC address and mask.
print	Display the current filter.

## diagnose switch ip-source-guard hardware entry list

Use this command to display all IP source-guard entries. Static entries were manually added by the `config switch ip-source-guard` command. Dynamic entries were added by DHCP snooping.

```
diagnose switch ip-source-guard hardware entry list
```

## diagnose switch mac-address

Use these commands to manage the MAC address table:

```
diagnose switch mac-address delete {all | entry <xx:xx:xx:xx:xx:xx>}
diagnose switch mac-address filter clear
diagnose switch mac-address filter flags <flag bit pattern>
diagnose switch mac-address filter port-id-map <port-ID list>
diagnose switch mac-address filter show
diagnose switch mac-address filter trunk-id-map <trunk-ID list>
diagnose switch mac-address filter vlan-map <VLAN_list>
diagnose switch mac-address list
diagnose switch mac-address switch-port-macs-db
```

Variable	Description
delete {all   entry <xx:xx:xx:xx:xx:xx>}	Delete all MAC address entries or a specific MAC address entry.
filter clear	Delete the filter for the MAC address table list.
filter flags <flag bit pattern>	Specify the flag bit pattern to match. Use this pattern to mask important bits. This value is hexadecimal.
filter port-id-map <port-ID list>	List the port identifiers to display MAC addresses for. Separate the port identifiers with commas. For example: 1,3,5-17,19
filter show	Display the filter for the MAC address table list.
filter trunk-id-map <trunk-ID list>	List the trunk identifiers to display MAC addresses for. Separate the trunk identifiers with commas. For example: 1,2-4,77
filter vlan-map <VLAN_list>	List the VLAN identifiers to display MAC addresses for. Separate the VLAN identifiers with commas. For example: 1,2-4,77
list	List the MAC address entries and the total number of entries.
switch-port-macs-db	List which MAC addresses are assigned to local ports.

### Example output

```
S524DF4K15000024 # diagnose switch mac-address filter show

flag bit pattern: 0x00000000
flag bit Mask:    0x00000000

```

## diagnose switch managed-switch

Use this command to display information about the FortiSwitch unit when it is managed by a FortiGate unit:

```
diagnose switch managed-switch dump xlate-vlan
```

## diagnose switch mclag

Use these commands to manage information about MCLAGs:

```

diagnose switch mclag clear-stats {all | icl | mclag <trunk_name>}
diagnose switch mclag icl
diagnose switch mclag list <trunk_name>

```

Variable	Description
clear-stats {all   icl   mclag}	Delete statistics for all MCLAGs, delete MCLAG ICLs, or delete the statistics for the MCLAG with the specified trunk.
icl	List all inter-chassis links (ICLs).
list <trunk_name>	Display statistics for the MCLAG with the specified trunk.

To set up an MCLAG, see [config switch trunk on page 127](#).

### Example output

```
S524DF4K15000024 # diagnose switch mclag icl

MCLAG-ICL-trunk
  icl-ports          port15 port16
  egress-block-ports none

  keepalive interval 1
  keepalive timeout  30
```

Counters

## diagnose switch mirror auto-config

Use these commands to manage switch mirroring using ERSPAN encapsulation with automatically configured header contents:

```
diagnose switch mirror auto-config restart
diagnose switch mirror auto-config status
```

Variable	Description
restart	Restart the ERSPAN mirroring daemon.
status	Display the status of the ERSPAN mirroring.

### Example output

```
S524DF4K15000024 # diagnose switch mirror auto-config status
Session name:

## diagnose switch mirror hardware status

Use this command to display information about the driver-level and hardware-level switch mirroring:

```
diagnose switch mirror hardware status
```

### Example output

```

S524DF4K15000024 # diagnose switch mirror hardware status

[flink.sniffer]=====
    Installed           : no ( inactive)

```

## diagnose switch modules

Use these commands to display information about physical layer (PHY) modules:

```

diagnose switch modules eeprom <physical_port_name>
diagnose switch modules state-machine <physical_port_name>

```

Variable	Description
eeprom	Display fragmentation and reassembly information
trap send	Generate a trap event and send it to the SNMP daemon.

**Example output**

S524DF4K15000024 # diagnose switch modules state-machine port10

DMI Status

## diagnose switch network-monitor

Use these commands to manage information produced by network monitoring:

```
diagnose switch network-monitor cfg-stats
diagnose switch network-monitor clear-db
diagnose switch network-monitor dump-l2-db
diagnose switch network-monitor dump-l3-db
diagnose switch network-monitor dump-monitors
diagnose switch network-monitor parser-stats
```

Variable	Description
cfg-stats	Display network-monitoring configuration statistics.
clear-db	Delete all network-monitoring database entries.
dump-l2-db	List all detected devices from the layer-2 database.
dump-l3-db	List all detected devices from the layer-3 database.
dump-monitors	List the monitors used for survey-mode network monitoring.
parser-stats	List the network-monitoring parser statistics.

### Example output

```
S524DF4K15000024 # diagnose switch network-monitor cfg-stats
Network Monitor Configuration Statistics:
-----
Adds          : 1
Deletes       : 0
Free Entries  : 19

S524DF4K15000024 # diagnose switch network-monitor dump-monitors

## diagnose switch pdu-counters

Use these commands to manage information from switch packet PDU counters:

```
diagnose switch pdu-counters clear
diagnose switch pdu-counters list
```

Variable	Description
clear	Clear switch packet PDU counters.
list	List nonzero switch packet PDU counters.

### Example output

```
S548DN5018000377 # diagnose switch pdu-counters list
primary CPU counters:
  packet receive error : 0
  Non-zero port counters:
  port1:
    IGMP Membership Report : 45
    IGMP Membership Leave : 3
    IGMPv3 Membership Report : 69002
  port13:
    IGMP Query packet : 50794
    IGMPv3 Membership Report : 50794
  port47:
    LACP packet : 15474
    STP packet : 237919
    LLDP packet : 168194
    IGMP Query packet : 50757

    IGMP Membership Leave : 1
  port48:
    LACP packet : 15475
    STP packet : 6
    LLDP packet : 168192
  port51:
    IGMP Membership Report : 19
    IGMP Membership Leave : 4
    IGMPv3 Membership Report : 4
```

## diagnose switch physical-ports

Use these commands to display information about physical ports:

```
diagnose switch physical-ports cable-diag <port_name>
diagnose switch physical-ports datarate [<port_list>]
diagnose switch physical-ports eee-status [<port_name>]
diagnose switch physical-ports hw-counter add {rx | tx} <counter_id>
    <counter|counter|counter...>
diagnose switch physical-ports hw-counter clear {rx | tx} <counter_id>
diagnose switch physical-ports hw-counter info
diagnose switch physical-ports hw-counter remove {rx | tx} <counter_id>
    <counter|counter|counter...>
diagnose switch physical-ports hw-counter search <port_name> <interval_seconds>
    <counter|counter|counter...>
diagnose switch physical-ports hw-counter search-cancel
diagnose switch physical-ports hw-counter search-results
diagnose switch physical-ports hw-counter show {rx | tx | all} <port_name>
diagnose switch physical-ports io-stats clear-local <port_list>
diagnose switch physical-ports io-stats cumulative
diagnose switch physical-ports io-stats list [<port_list>]
diagnose switch physical-ports led-flash <disable | time>
diagnose switch physical-ports linerate [<port_list>]
diagnose switch physical-ports list [<port_name>]
diagnose switch physical-ports mapping
diagnose switch physical-ports mdix-status <port_name>
diagnose switch physical-ports port-stats [<port_list> | non-zero]
diagnose switch physical-ports qos-stats clear <port_list>
diagnose switch physical-ports qos-stats list [<port_list>]
diagnose switch physical-ports qos-stats non-zero
diagnose switch physical-ports qos-stats set-qos-counter-revert [<port_list>]
diagnose switch physical-ports qos-stats set-qos-counter-zero [<port_list>]
diagnose switch physical-ports queue-bandwidth-setting [<port_list>]
diagnose switch physical-ports set-counter-revert [<port_list>]
diagnose switch physical-ports set-counter-zero [<port_list>]
diagnose switch physical-ports split-status
diagnose switch physical-ports stats clear-local <port_list>
diagnose switch physical-ports stats list [<port_list>]
diagnose switch physical-ports stats non-zero
diagnose switch physical-ports summary [<port_name>]
diagnose switch physical-ports virtual-wire list
```

Variable	Description
cable-diag <port_name>	Display the results of a time-domain reflectometer (TDR) diagnostic test on the specified port.
datarate [<port_list>]	Display the number of packets received and transmitted on the specified ports as well as the data rate. Use commas to separate ports. If the ports are not specified, the statistics for all ports are displayed.

Variable	Description
eee-status [<port_name>]	Display whether the specified port has energy-efficient Ethernet (EEE) enabled. If the port is not specified, the status of all ports is displayed.
hw-counter add {rx   tx} <counter_id> <counter counter counter...>	Add trigger flags to a specified counter.
hw-counter clear {rx   tx} <counter_id>	Clear a specific counter.
hw-counter info	Display the supported trigger flags (RX and TX).
hw-counter remove {rx   tx} <counter_id> <counter counter counter...>	Remove trigger flags from the specified counters.
hw-counter search <port_name> <interval_seconds> <counter counter counter...>	Retrieve the data for the specified triggers on a specified port within the interval in seconds.
hw-counter search-cancel	Cancel the currently running search.
hw-counter search-results	Display the last search results.
hw-counter show {rx   tx   all} <port_name>	Show all trigger flags and statistics on a specified port.
io-stats clear-local <port_list>	Delete the statistics for input and output packets for the specified ports. Use commas to separate ports. For example: 1,3,4-6
io-stats cumulative	Display the cumulative statistics for input and output packets for all ports.
io-stats list [<port_list>]	List the statistics for input and output packets for the specified ports. If the ports are not specified, the statistics for all ports are displayed.
led-flash <disable   time>	Flash all port LEDs on and off for a specified number of minutes so that a particular switch can be identified. Valid times are 5, 15, 30, or 60 minutes. Use <code>disable</code> to stop the LEDs from flashing.
literate [<port_list>]	Display the number of packets received and transmitted on the specified ports as well as the line rate. Use commas to separate ports. If the ports are not specified, the statistics for all ports are displayed.
list [<port_name>]	Display the details for the specified port. If the port is not specified, the details for all ports are displayed.
mapping	Display which drivers are associated with which ports.

Variable	Description
mdix-status <port_name>	Display whether a specified port is a medium-dependent interface crossover (MDIX) port.
port-stats [<port_list>   non-zero]	List port statistics for the specified ports or list port statistics that are not zero. Use commas to separate ports. If the ports are not specified, the statistics for all ports are displayed.
qos-stats clear [<port_list>]	Delete the QoS statistics for the specified ports. If the ports are not specified, the statistics for all ports are deleted.
qos-stats list [<port_list>]	Display the QoS statistics for the specified ports. If the ports are not specified, the statistics for all ports are displayed.
qos-stats non-zero	List only QoS statistics that are not zero.
qos-stats set-qos-counter-revert [<port_list>]	Restore QoS counters to direct hardware values for the specified ports. Use commas to separate ports. If the ports are not specified, the command affects all ports.
qos-stats set-qos-counter-zero [<port_list>]	Clear QoS counters (applies to all applications except SNMP) for the specified ports. Use commas to separate ports. If the ports are not specified, the command affects all ports.
queue-bandwidth-setting [<port_list>]	Display the bandwidth setting (kbps or percentage) for the egress queues. If the ports are not specified, the bandwidth setting for all egress queues are displayed.
set-counter-revert [<port_list>]	Restore hardware counters (except for QoS, SNMP, and web GUI counters) on the specified ports. Use commas to separate ports. If the ports are not specified, the command affects all ports.
set-counter-zero [<port_list>]	Clear all hardware counters (except for QoS, SNMP, and web GUI counters) on the specified ports. Use commas to separate ports. If the ports are not specified, the command affects all ports.
split-status	Display information about split ports.
stats clear-local <port_list>	Delete the statistics for received and transmitted packets for the specified ports for only the local session. Use commas to separate ports. For example: 1,3,4-6
stats list [<port_list>]	List the statistics for received and transmitted packets for the specified ports. Use commas to separate ports. If the ports are not specified, the statistics for all ports are displayed.
stats non-zero	List the statistics for counters that are not zero.

Variable	Description
summary [<port_name>]	Display a summary about the specified physical port. If the port is not specified, summaries for all ports are displayed.
virtual-wire list	List all virtual wires.

### Example output

```
S524DF4K15000024 # diagnose switch physical-ports cable-diag port1
port1: cable (4 pairs, length +/- 10 meters)

S524DF4K15000024 # diagnose switch physical-ports summary port1

Portname	Status	Tpid	Vlan	Duplex	Speed	Flags	Discard
port1	down	8100	1	half	-	, ,	none

Flags: QS(802.1Q) QE(802.1Q-in-Q,external) QI(802.1Q-in-Q,internal)  
 TS(static trunk) TF(forti trunk) TL(lacp trunk); MD(mirror dst)

MI(mirror ingress) ME(mirror egress) MB(mirror ingress and egress) CF (Combo Fiber), CC (Combo Copper)

```
S524DF4K15000024 # diagnose switch physical-ports virtual-wire list
port7(7) to port8(8) TPID: 0xdee5 VLAN: 70
```

## diagnose switch poe status

Use this command to display power over Ethernet (PoE) information for a specific port:

```
diagnose switch poe status <physical_port_name>
```

Variable	Description
<physical_port_name>	Enter the port name.

### Example output

```
S524DF4K15000024 # diagnose switch poe status port1

Port(1) Power:0.00W,      Power-Status: Searching
Power-Up Mode: Normal Mode
Remote Power Device Type: PD None
Power Class: 0
Defined Max Power: 0.00W, Priority: Low.
Voltage: 54.90V
Current: 0mA
```

## diagnose switch qnq dtag-cfg

Use this command to display information about the VLAN stacking (QinQ) configuration:

```
diagnose switch qnq dtag-cfg
```

### Example output

```
S548DF5018000776 # diagnose switch qnq dtag-cfg

Port Name | QinQ Mode          | Add Inner-Tag | Remove Inner-Tag | Priority
| Ether-Type
=====
=====
port39    | customer           | add (vid 456) | enable            | follow-s-tag
| 0x8100
```

## diagnose switch trunk list

Use this command to display link aggregation information:

```
diagnose switch trunk list [<trunk_name>]
```

Variable	Description
[<trunk_name>]	Display link aggregation information for the specified trunk. If the trunk is not specified, link aggregation information for all trunks is displayed.

### Example output

```
S524DF4K15000024 # diagnose switch trunk list trunk1
```

```
Switch Trunk Information, primary-Channel
```

```
Trunk Name: trunk1
Mode: fortinet-trunk

## diagnose switch trunk summary

Use this command to display a summary of the link aggregation information:

```
diagnose switch trunk summary [<trunk_name>]
```

Variable	Description
[<trunk_name>]	Display a summary of the link aggregation information for the specified trunk. If the trunk is not specified, a summary for all trunks is displayed.

### Example output

```
S524DF4K15000024 # diagnose switch trunk summary
```

Trunk Name	Mode	PSC	MAC	Status	Up Time
Mclag-icl-trunk	lACP-active (mclag-icl)	N/A	08:5B:0E:F1:95:F4	down (0/2)	N/A
first-mclag	static (mclag)	N/A	08:5B:0E:F1:95:E7	down (0/1)	N/A
8DN3X16000001-0	lACP-active (auto-isl)	src-dst-ip	08:5B:0E:F0:9B:90	up (1/1)	0 days, 0 hours, 1 mins, 35 secs

```
S524DF4K15000024 # diagnose switch trunk summary first-mclag
```

Trunk Name	Mode	PSC	MAC	Status	Up Time
first-mclag	static (mclag)	N/A	08:5B:0E:F1:95:E7	down (0/1)	N/A

## diagnose switch vlan

Use these commands to display information about virtual LANs:

```
diagnose switch vlan assignment capabilities
diagnose switch vlan assignment ether-proto flush
diagnose switch vlan assignment ether-proto list [{sorted-by-protocol | sorted-by-vlan}]
diagnose switch vlan assignment ipv4 flush
diagnose switch vlan assignment ipv4 list [{sorted-by-address | sorted-by-vlan}]
diagnose switch vlan assignment ipv6 flush
diagnose switch vlan assignment ipv6 list [{sorted-by-address | sorted-by-vlan}]
diagnose switch vlan assignment mac flush
diagnose switch vlan assignment mac list [{sorted-by-mac | sorted-by-vlan}]
diagnose switch vlan info dump
diagnose switch vlan list [<VLAN_ID>]
```

Variable	Description
assignment capabilities	Display information about hardware capabilities for VLAN assignments.
assignment ether-proto flush	Delete all VLAN entries assigned by Ethernet frame type and protocol.
assignment ether-proto list [{sorted-by-protocol   sorted-by-vlan}]	Display VLAN assignments by Ethernet frame type and protocol. Use <code>sorted-by-protocol</code> to list VLAN entries by protocol. Use <code>sorted-by-vlan</code> to list VLAN entries by the VLAN identifier.
assignment ipv4 flush	Delete all VLAN entries assigned by IPv4 address or subnet.

Variable	Description
assignment ipv4 list [{sorted-by-address   sorted-by-vlan}]	Display VLAN assignments by IPv4 address or subnet. Use <code>sorted-by-address</code> to list VLAN entries by the mask length and IP address. Use <code>sorted-by-vlan</code> to list VLAN entries by the VLAN identifier.
assignment ipv6 flush	Delete all VLAN entries assigned by IPv6 address or subnet.
assignment ipv6 list [{sorted-by-address   sorted-by-vlan}]	Display VLAN assignments by IPv6 address or subnet. Use <code>sorted-by-address</code> to list VLAN entries by the mask length and IP address. Use <code>sorted-by-vlan</code> to list VLAN entries by the VLAN identifier.
assignment mac flush	Delete all VLAN entries assigned by MAC address.
assignment mac list [{sorted-by-mac   sorted-by-vlan}]	Display VLAN assignments by MAC address. Use <code>sorted-by-mac</code> to list VLAN entries by the MAC address. Use <code>sorted-by-vlan</code> to list VLAN entries by the VLAN identifier.
info dump	Display VLAN-related information.
list [<VLAN_ID>]	Display which ports are assigned to the specified VLAN identifier. If the VLAN identifier is not specified, the information for all VLAN identifiers is displayed.

### Example output

```
S524DF4K15000024 # diagnose switch vlan assignment capabilities
Assignment modes supported:
Port based assignment
IPv4 address/subnet based assignment
IPv6 address/subnet based assignment
MAC address based assignment
Ethernet Protocol based assignment

S524DF4K15000024 # diagnose switch vlan info dump

```

## diagnose switch vlan-mapping egress hardware-entry

Use the following command to check the VLAN mapping on an interface for the egress direction:

```
diagnose switch vlan-mapping egress hardware-entry
```

## diagnose switch vlan-mapping ingress hardware-entry

Use the following command to check the VLAN mapping on an interface for the ingress direction:

```
diagnose switch vlan-mapping ingress hardware-entry
```

## diagnose sys checkused

Use the following command to check which tables are using the entry:

```
diagnose sys checkused <path.object.mkey>
```

Variable	Description
<path.object.mkey>	Display which tables use this entry.

## Example output

```
S524DF4K15000024 # diagnose sys checkused switch.physical-port.name

may be used by table switch.trunk.members.member-name
may be used by table switch.mirror.dst
may be used by table switch.mirror.src-ingress.name
may be used by table switch.mirror.src-egress.name
may be used by table switch.acl.policy.ingress-interface.member-name
may be used by table switch.acl.policy.action.mirror
may be used by table switch.acl.policy.action.redirect
may be used by table switch.acl.policy.action.redirect-physical-port.member-name
may be used by table switch.acl.policy.action.egress-mask.member-name
may be used by table switch.virtual-wire.first-member
may be used by table switch.virtual-wire.second-member
may be used by table switch.auto-isl-port-group.members.member-name
may be used by table system.admin.dashboard.interface
```

## diagnose sys cpuset

Use this command to display information about which CPU set uses a specific process:

```
diagnose sys cpuset <process_ID> <CPU_set_mask>
```

Variable	Description
<process_ID> <CPU_set_mask>	Specify the process identifier and CPU set mask to find out which CPU set uses the process.

## diagnose sys dayst-info

Use this command to display information about daylight saving time:

```
diagnose sys dayst-info
```

### Example output

```
S524DF4K15000024 # diagnose sys dayst-info
The current timezone '(GMT-8:00)Pacific Time(US&Canada).' daylight saving time
starts at Sun Mar 8 02:00:00 1970, ends at Sun Nov 1 01:00:00 1970
```

## diagnose sys fan status

Use this command to display fan information:

```
diagnose sys fan status
```

## Example output

```
S524DF4K15000024 # diagnose sys fan status
```

```
Module      Status
```

```
-----
```

```
Fan         OK
```

```
Fan speed is set to 50.0%.
```

## diagnose sys flash

Use these commands to manage flash memory:

```
diagnose sys flash format
diagnose sys flash list [<file>]
```

Variable	Description
format	Format the shared data partition (flash partition 2).
list [<file>]	Display statistics for a file or directory in flash memory. If no file or directory is specified, statistics for all flash memory are returned.

## Example output

```
S524DF4K15000024 # diagnose sys flash list
```

Partition	Image	TotalSize(KB)	Used(KB)	Use%	Active
(*) 1	S524DF-3.6.3-FW-build0390-171020	53248	22922	43%	Yes
		4096	448	11%	Yes
2		53248	0	0%	No

```
Flag * : next-boot partition
```

```
Image build at Oct 20 2017 17:10:54 for b0390
```

## diagnose sys flow-export

Use these commands to manage flow-export data:

```
diagnose sys flow-export delete-flows-all
diagnose sys flow-export expire-flows-all
```

Variable	Description
delete-flows-all	Delete all flow-export data.
expire-flows-all	Expire all flow-export data.

## diagnose sys fsw-cloud-mgr

Use these commands to manage the SSL tunnel for FortiSwitch cloud management:

```
diagnose sys fsw-cloud-mgr close-access-socket
diagnose sys fsw-cloud-mgr shutdown-ssl
```

Variable	Description
close-access-socket	Restart the SSL tunnel between a FortiSwitch and FortiSwitch cloud management by closing the socket.
shutdown-ssl	Restart the SSL tunnel between a FortiSwitch and FortiSwitch cloud management by sending a SSL_SHUTDOWN request.

## diagnose sys kill

Use this command to end a specified process:

```
diagnose sys kill <signal_number> <process_ID>
```

Variable	Description
<signal_number> <process_ID>	End the process with the specified signal.

To find out which processes are currently running, see [diagnose sys vlan list on page 288](#).

## diagnose sys link-monitor

Use these commands to manage the link monitor:

```
diagnose sys link-monitor interface <entry>
diagnose sys link-monitor launch <entry>
diagnose sys link-monitor status {entry | all}
```

To configure the link health monitor, see [config system link-monitor on page 180](#).

Variable	Description
interface <entry>	Display information about the specified link-monitor entry.
launch <entry>	Manually launch the specified link-monitor entry.
status {entry   all}	Display information about a specified link-monitor entry or all link-monitor entries.

## diagnose sys mpstat

Use this command to display information about CPU use:

```
diagnose sys mpstat <delay> <loops>
```

Variable	Description
<delay> <loops>	Display information about the CPU use after the specified number of seconds (default is 5) and for the specified number of loops (default is 1,000,000). If the values for <delay> <loops> are not specified, there is no delay, and the output continues until a key is pressed.

### Example output

```
S524DF4K15000024 # diagnose sys mpstat

Gathering data, wait 5 sec, press any key to quit.
..0..1..2..3..4
TIME          CPU    %usr   %nice   %sys   %idle
04:02:59 PM   all    0.00   0.00    5.73   94.27
                0    0.00   0.00   10.87   89.13
                1    0.00   0.00    0.59   99.41
04:02:59 PM                   0.00   0.00    0.00    0.00

04:03:04 PM                   0.00   0.00    0.00    0.00
```

## diagnose sys ntp status

Use this command to display the configuration of the Network Time Protocol (NTP) servers:

```
diagnose sys ntp status
```

To configure the NTP servers, see [config system ntp on page 186](#).

## diagnose sys pcb temp

Use this command to display the printed circuit board (PCB) temperature:

```
diagnose sys pcb temp
```

## Example output

```
S524DF4K15000024 # diagnose sys pcb temp
```

```
Module      Status
```

```
-----  
Sensor1    42.0 C
```

## diagnose sys process

Use this command to display information about a specific process:

```
diagnose sys process <process_ID>
```

Variable	Description
<process_ID>	Display information about the specified process identifier.

To find out which processes are currently running, see [diagnose sys vlan list on page 288](#).

## diagnose sys psu status

Use this command to display information about the power supply unit (PSU):

```
diagnose sys psu status
```

### Example output

```
S524DF4K15000024 # diagnose sys psu status
```

```
PSU1 is OK.
```

```
PSU2 is not present.
```

## diagnose sys top

Use this command to list the processes currently running on your FortiSwitch unit:

```
diagnose sys top <delay> <lines>
```

Variable	Description
<delay> <lines>	Enter the number of seconds to delay (the default is 5) and the maximum lines of output (the default is 20).

In the output, the codes displayed on the second output line mean the following:

- U is % of user space applications using CPU. In the example, 0U means 0% of the user space applications are using CPU.
- S is % of system processes (or kernel processes) using CPU. In the example, 0S means 0% of the system processes are using the CPU.
- I is % of idle CPU. In the example, 98I means the CPU is 98% idle.
- T is the total FortiOS system memory in Mb. In the example, 123T means there are 123 Mb of system memory.
- F is free memory in Mb. In the example, 25F means there is 25 Mb of free memory.

Each additional line of the command output displays the following information for each of the processes running on the FortiSwitch (from left to right):

- Process name
- Process identifier
- State that the process is running in. The process state can be:
  - R for running
  - S for sleep
  - Z for zombie
  - D for disk sleep
- Amount of CPU that the process is using. CPU usage can range from 0.0 for a process that is sleeping to higher values for a process that is taking a lot of CPU time.
- Amount of memory that the process is using. Memory usage can range from 0.1 to 5.5 and higher.

### Example output

```
S524DF4K15000024 # diagnose sys top 5 5

Run Time: 3 days, 0 hours and 40 minutes
0U, 6S, 94I; 1978T, 1744F
pyfcgid      695      S      0.0      0.7
pyfcgid      791      S      0.0      0.7
pyfcgid      792      S      0.0      0.7
httpsd       696      S      0.0      0.6
cmdbsvr      611      S      0.0      0.6
```

## diagnose sys vlan list

Use these commands to display information about configured VLANs:

```
diagnose syst vlan list
```

To configure a VLAN, see [config switch vlan on page 131](#).

## diagnose test application

Use these commands to test specific daemons:

```
diagnose test application dnsproxy <test_level>
diagnose test application fpm <test_level>
diagnose test application radiusd <test_level>
```

```
diagnose test application sflowd <test_level>
diagnose test application snmpd <test_level>
```

Variable	Description
dnsproxy <test_level>	Specify the test level for the DNS proxy daemon: <ol style="list-style-type: none"> <li>1. Clear DNS cache</li> <li>2. Show statistics</li> <li>3. Dump DNS setting</li> <li>4. Reload the fully qualified domain name (FQDN)</li> <li>5. Requery the FQDN</li> <li>6. Dump the FQDN</li> </ol>
fpmdd <test_level>	Specify the test level for the hardware offload daemon.
radiusd <test_level>	Specify the test level for the RADIUS daemon: <ul style="list-style-type: none"> <li>• 2: Clear the RADIUS server database</li> <li>• 3: Show the RADIUS server database</li> <li>• 33: Show the RADIUS server database (with start time)</li> <li>• 4: Show the RADIUS server database information</li> <li>• 9: Check the high availability (HA) context table checksums</li> <li>• 11: Show the HA synchronization connection status</li> <li>• 20: Show the RADIUS server configuration cache</li> <li>• 21: Show the RADIUS server interface configuration cache</li> <li>• 99: Restart</li> </ul>
sflowd <test_level>	Specify the test level for the sFlow daemon: <ul style="list-style-type: none"> <li>• 1: Show collector setting</li> <li>• 2: Show state</li> </ul>
snmpd <test_level>	Specify the test level for the SNMP daemon: <ul style="list-style-type: none"> <li>• 1: Display daemon process identifier</li> <li>• 2: Display SNMP statistics</li> <li>• 3: Clear SNMP statistics</li> <li>• 4: Generate test trap</li> <li>• 99: Restart daemon</li> </ul>

### Example output

```
S524DF4K15000024 # diagnose test application dnsproxy 2
config: alloc=1
DNS_CACHE: alloc=0
DNS UDP: req=6680, res=0, fwd=26720, hits=0, alloc=0
cur=90 v6_cur=0
DNS TCP: req=0, alloc=0

S524DF4K15000024 # diagnose test application fpmdd 2
```

```
L3 egr obj Num: 0 Max: 8192 LastFoundEgrId: 0
Valid: 0 Gw: 0.0.0.0 IfIndex: 0 RefCount: 0 EgrObj: 0 Status: 0
```

## diagnose test authserver

Use these commands to test the authentication server:

```
diagnose test authserver cert <arguments>
diagnose test authserver ldap <server_name> <user_name> <password>
diagnose test authserver ldap-digest <arguments>
diagnose test authserver ldap-direct <arguments>
diagnose test authserver ldap-search <arguments>
diagnose test authserver local <arguments>
diagnose test authserver radius <server_name> <chap | pap | mschap | mschap2> <user_name>
    <password>
diagnose test authserver radius-direct <server_name_or_IP_address> <port_number> <secret>
diagnose test authserver tacacs+ <server_name> <user_name> <password>
diagnose test authserver tacacs+-direct <arguments>
```

Variable	Description
cert <arguments>	Test the certificate authentication.
ldap <server_name> <user_name> <password>	Test the connection to an LDAP server. For the server_name, use the name of the LDAP object, not the LDAP server name. Use credentials that you have used in the LDAP object itself.
ldap-digest <arguments>	Test the LDAP HA1 password query.
ldap-direct <arguments>	Test the connection to an LDAP server.
ldap-search <arguments>	Search for an LDAP server.
local <arguments>	Test the local user.
radius <server_name> <chap   pap   mschap   mschap2> <user_name> <password>	Test the connection to the RADIUS server.
radius-direct <server_name_or_IP_address> <port_number> <secret>	Test the connection to the RADIUS server. For the port number, enter -1 to use the default port. Otherwise, enter the port number to check.
tacacs+ <server_name> <user_name> <password>	Test the connection to the TACACS+ server.
tacacs+-direct <arguments>	Test the connection to the TACACS+ server.

## diagnose user radius coa

Use this command to display information about RADIUS authentication and RADIUS accounting:

```
diagnose user radius coa
```

To configure RADIUS authentication and RADIUS accounting, see [config user radius on page 202](#).

## execute

Use the `execute` commands perform immediate operations on the FortiSwitch unit:

- `execute 802-1x clear interface` on page 293
- `execute acl clear-counter` on page 294
- `execute acl key-compaction` on page 294
- `execute backup config` on page 295
- `execute acl key-compaction` on page 294
- `execute backup memory` on page 296
- `execute batch` on page 297
- `execute bpdu-guard` on page 298
- `execute cfg reload` on page 298
- `execute cfg save` on page 299
- `execute clear switch igmp-snoop` on page 299
- `execute clear system arp table` on page 300
- `execute cli check-template-status` on page 300
- `execute cli status-msg-only` on page 300
- `execute date` on page 300
- `execute dhcp lease-clear` on page 301
- `execute dhcp lease-list` on page 301
- `execute dhcp-snooping` on page 302
- `execute disconnect-admin-session` on page 302

## execute 802-1x clear interface

Use this command to clear all authorizations on a specified interface:

```
execute 802-1x clear interface {internal | port<integer>}
```

### Example

This example shows how to remove all authorizations from port 1:

```
execute 802-1x clear interface port1
```

## execute acl clear-counter

Use this command to clear the ACL counters associated with the specified policy:

```
execute acl clear-counter {all | ingress | egress | prelookup}
```

Variable	Description
all	Delete the ACL counters for all policies.
ingress	Delete the ACL counters for ingress policies.
egress	Delete the ACL counters for egress policies.
prelookup	Delete the ACL counters for lookup policies.

### Example

This example deletes all ACL counters:

```
execute acl clear-counter all
```

## execute acl key-compaction

**NOTE:** This command currently only works on the ingress policy.

Use the following command to clear the unused classifiers on ASIC hardware associated with ingress, egress, prelookup, or all policies for a particular group:

```
execute acl key-compaction {all | ingress | egress | prelookup} <group_ID>
```

Variable	Description
all	Delete all unused classifiers for the specified group.
ingress	Delete the unused classifiers for ingress policies for the specified group.
egress	Delete the unused classifiers for egress policies for the specified group.
prelookup	Delete the unused classifiers for lookup policies for the specified group.

Variable	Description
<group_ID>	Enter the group identifier.  Group identifiers are defined in the <code>config switch acl ingress</code> command.

### Example

This example deletes all unused classifiers from group 5:

```
execute acl key-compact all 5
```

## execute backup config

Use the `execute backup config` commands to perform a partial backup of the FortiSwitch configuration to a flash disk, FTP server, or TFTP server.

### Syntax

```
execute backup config flash <comment>
execute backup config ftp <filename_str> <server_ipv4[:port_int] | server_fqdn[:port_int]>
    [<username_str> [<password_str>]] [<backup_password_str>]
execute backup config tftp <filename_str> <server_ipv4> [<backup_password_str>]
```

Variable	Description
<code>config flash &lt;comment&gt;</code>	Back up the system configuration to the flash disk. Optionally, include a comment.
<code>config ftp &lt;filename_str&gt; &lt;server_ipv4[:port_int]   server_fqdn[:port_int]&gt; [&lt;username_str&gt; [&lt;password_str&gt;]] [&lt;backup_password_str&gt;]</code>	Back up the system configuration to an FTP server. Optionally, you can specify a password to protect the saved data.
<code>config tftp &lt;filename_str&gt; &lt;server_ipv4&gt; [&lt;backup_password_str&gt;]</code>	Back up the system configuration to a file on a TFTP server. Optionally, you can specify a password to protect the saved data.

### Example

This example shows how to perform a partial backup of the FortiSwitch configuration to a file named `fgt.cfg` on a TFTP server at IP address 192.168.1.23.

```
execute backup config tftp fgt.cfg 192.168.1.23
```

## execute backup full-config

Use the `execute backup full-config` commands to back up the full FortiSwitch configuration to a TFTP or FTP server.

### Syntax

```
execute backup full-config ftp <filename_str> <server_ipv4[:port_int] | server_fqdn[:port_int]> [<username_str> [<password_str>]] [<backup_password_str>]
execute backup full-config tftp <filename_str> <server_ipv4> [<backup_password_str>]
```

Variable	Description
full-config ftp <filename_str> <server_ipv4[:port_int]   server_fqdn[:port_int]> [<username_str> [<password_str>]] [<backup_password_str>]	Back up the full system configuration to a file on an FTP server. You can optionally specify a password to protect the saved data.
full-config tftp <filename_str> <server_ipv4> [<backup_password_str>]	Back up the full system configuration to a file on a TFTP server. You can optionally specify a password to protect the saved data.

### Example

This example shows how to back up the full FortiSwitch configuration to a file named `fgt.cfg` on a TFTP server at IP address 192.168.1.23.

```
execute backup full-config tftp fgt.cfg 192.168.1.23
```

## execute backup memory

Use the `execute backup memory` commands to back up the FortiSwitch logs to a TFTP or FTP server.

### Syntax

```
execute backup memory alllogs ftp <server_ipv4[:port_int] | server_fqdn[:port_int]> [<username_str> <password_str>]
execute backup memory alllogs tftp <server_ipv4>
execute backup memory log ftp <server_ipv4[:port_int] | server_fqdn[:port_int]> <username_str> <password_str> {app-ctrl | event | ids | im | spam | virus | voip | webfilter}
execute backup memory log tftp <server_ipv4> {app-ctrl | event | ids | im | spam | virus | voip | webfilter}
```

Variable	Description
memory alllogs ftp <server_ipv4[:port_int]   server_fqdn[:port_int]> [<username_str> <password_str>]	Back up either all memory or all hard disk log files for to an FTP server. The disk option is available on FortiSwitch models that log to a hard disk.
memory alllogs tftp <server_ipv4>	Back up either all memory or all hard disk log files for this FortiSwitch to a TFTP server. he disk option is available on FortiSwitch models that log to a hard disk.
memory log ftp <server_ipv4[:port_int]   server_fqdn[:port_int]> <username_str> <password_str> {app-ctrl   event   ids   im   spam   virus   voip   webfilter}	Back up the specified type of log file from either hard disk or memory to an FTP server. The disk option is available on FortiSwitch models that log to a hard disk.
memory log tftp <server_ipv4> {app-ctrl   event   ids   im   spam   virus   voip   webfilter}	Back up the specified type of log file from either hard disk or memory to an FTP server. The disk option is available on FortiSwitch models that log to a hard disk.

## Example

This example shows how to back up all FortiSwitch log files to a file named `fgt.cfg` on a TFTP server at IP address 192.168.1.23.

```
execute backup memory alllogs tftp fgt.cfg 192.168.1.23
```

## execute batch

Use the `execute batch` commands to execute a series of CLI commands.

The `execute batch` commands are controlled by the Maintenance (**mntgrp**) access control group.

## Syntax

```
execute batch [<cmd_cue>]
```

The parameter `<cmd_cue>` includes the following values:

- `end` — exit session and run the batch commands
- `lastlog` — read the result of the last batch commands
- `start` — start batch mode
- `status` — batch mode status reporting if batch mode is running or stopped

## Example

### To start batch mode:

```
execute batch start
Enter batch mode...
```

### To enter commands to run in batch mode:

```
config system global
set refresh 5
end
```

### To execute the batch commands:

```
execute batch end
Exit and run batch commands...
```

## execute bpdu-guard

Use this command to reset a port that goes down after receiving a BPDU:

```
execute bpdu-guard reset {internal | port<number>}
```

### Example

This example shows how to reset port 1 after it receives a BPDU and goes down:

```
execute bpdu-guard reset port1
```

## execute cfg reload

Use this command to restore the saved configuration when the configuration change mode is `manual` or `revert`. This command has no effect if the mode is `automatic`, the default. The `set cfg-save` command in `system global` sets the configuration change mode.

When you reload the saved system configuration, the your session ends and the FortiSwitch performs a restart.

In the default configuration change mode, `automatic`, CLI commands become part of the saved system configuration when you execute them by entering either `next` or `end`.

In `manual` mode, commands take effect but do not become part of the saved configuration unless you execute the `execute cfg save` command. When the system restarts, the saved configuration is loaded. Configuration changes that were not saved are lost.

The `revert` mode is similar to `manual` mode, except that configuration changes are saved automatically if the administrative session is idle for more than a specified timeout period. This provides a way to recover from an erroneous configuration change, such as changing the IP address of the interface you are using for administration. You set the timeout in `system global` using the `set cfg-revert-timeout` command.

### Syntax

```
execute cfg reload
```

## Example

This is sample output from the command when successful:

```
# execute cfg reload
configs reloaded. system will reboot. This is sample output from the command when not in
runtime-only configuration mode:
# execute cfg reload
no config to be reloaded.
```

## execute cfg save

Use this command to save configuration changes when the configuration change mode is `manual` or `revert`. If the mode is `automatic`, the default, all changes are added to the saved configuration as you make them and this command has no effect. The `set cfg-save` command in `system global` sets the configuration change mode.

In `manual` mode, commands take effect but do not become part of the saved configuration unless you execute the `execute cfg save` command. When the system restarts, the saved configuration is loaded. Configuration changes that were not saved are lost.

The `revert` mode is similar to `manual` mode, except that configuration changes are reverted automatically if the administrative session is idle for more than a specified timeout period. This provides a way to recover from an erroneous configuration change, such as changing the IP address of the interface you are using for administration. To change the timeout from the default of 600 seconds, go to `system global` and use the `set cfg-revert-timeout` command.

## Syntax

```
execute cfg save
```

## Example

This is sample output from the command:

```
# execute cfg save
config saved.
This is sample output when not in runtime-only configuration mode. It also occurs when in
runtime-only configuration mode and no changes have been made:
# execute cfg save
no config to be saved.
```

## execute clear switch igmp-snoop

Use this command to clear the learned and configured multicast groups from the FortiSwitch unit.

## Syntax

```
execute clear switch igmp-snoop
```

## execute clear system arp table

Use this command to clear all the entries in the ARP table.

### Syntax

```
execute clear system arp table
```

## execute cli check-template-status

Use this command to report the status of the secure copy protocol (SCP) script template.

### Syntax

```
execute cli check-template-status
```

## execute cli status-msg-only

Use this command to enable or disable the display of standardized CLI error output messages. If executed, this command stops other debug messages from displaying in the current CLI session.

### Syntax

```
execute cli status-msg-only {enable | disable}
```

Variable	Description	Default
status-msg-only {enable   disable}	Enable or disable standardized CLI error output messages. Entering the command without enable or disable disables displaying standardized output.	enable

## execute date

Use this command to display or set the system date.

### Syntax

```
execute date [<date_str>]
```

**date\_str** has the form `yyyy-mm-dd`, where:

- **yyyy** is the year. The range is: 2001 to 2037
- **mm** is the month. The range is 01 to 12
- **dd** is the day of the month. The range is 01 to 31

If you do not specify a date, the command returns the current system date. Shortened values, such as “06” instead of “2006” for the year or “1” instead of “01” for month or day, are not valid.

### Example

This example sets the date to 17 September 2016:

```
execute date 2016-09-17
```

## execute dhcp lease-clear

Use these commands to clear DHCP leases:

```
execute dhcp lease-clear all
execute dhcp lease-clear <xxx.xxx.xxx.xxx,yyy.yyy.yyy.yyy,...>
```

Variable	Description	Default
lease-clear all	Clear all DHCP leases.	No default
lease-clear <xxx.xxx.xxx.xxx,yyy.yyy.yyy.yyy,...>	Clear the DHCP leases for the specified IPv4 addresses. Use a comma to separate IPv4 addresses.	No default

### Example

This example shows how to clear all DHCP leases on the specified IPv4 addresses:

```
execute dhcp lease-clear 1.2.3.4,5.6.7.8
```

## execute dhcp lease-list

Use these commands to list DHCP leases:

```
execute dhcp lease-list
execute dhcp lease-list <interface>
```

Variable	Description	Default
lease-list	List all DHCP leases.	No default
lease-list <interface>	List the DHCP leases for the specified interface.	No default

### Example

This example shows how to list all DHCP leases:

```
execute dhcp lease-list
```

## execute dhcp-snooping

Use this command to remove an IP address from the DHCP-snooping client or server database on a specific VLAN:

```
execute dhcp-snooping expire-client <VLAN-ID> <xx:xx:xx:xx:xx:xx>
execute dhcp-snooping expire-server <VLAN-ID> <xx:xx:xx:xx:xx:xx>
```

Variable	Description	Default
<VLAN-ID>	Enter the VLAN identifier. The value range is 1-4095.	No default
<xx:xx:xx:xx:xx:xx>	Enter the MAC address for the IP address to remove.	No default

### Example

This example shows how to remove the IP address that corresponds to VLAN 100 and to the MAC address 01:23:45:67:89:01 from the DHCP-snooping client database:

```
execute dhcp-snooping expire-client 100 01:23:45:67:89:01
```

## execute disconnect-admin-session

Use this command to disconnect an administrator who is logged in.

### Syntax

```
execute disconnect-admin-session <index_number>
```

To determine the index of the administrator that you want to disconnect, view the list of logged-in administrators with the following command:

```
execute disconnect-admin-session ?
```

The list of logged-in administrators looks like this:

```
Connected:
INDEX  USERNAME  TYPE  FROM  TIME
  0      admin     WEB   172.20.120.51  Mon Aug 14 12:57:23 2006
  1      admin2    CLI   ssh(172.20.120.54) Mon Aug 14 12:57:23 2006
```

### Example

This example shows how to disconnect the logged administrator `admin2`:

```
execute disconnect-admin-session 1
```

## execute factoryreset

Use this command to reset the FortiSwitch configuration to factory default settings.

## Syntax

```
execute factoryreset
```

This procedure deletes all changes that you have made to the FortiSwitch configuration and reverts the system to its original configuration, including resetting interface addresses.

---

## execute factoryresetfull

Use this command to fully reset the FortiSwitch configuration to factory default settings.

### Syntax

```
execute factoryreset
```

This procedure removes all configurations, saved user and application data, and licenses and resets the BIOS environment to the default. Images saved to the partitions are not removed.

---

## execute flapguard reset

Use this command to reset the specified port if flap guard was triggered on that port:

```
execute flapguard reset <port_name>
```

### Example

This example shows how to reset port 1 after flap guard was triggered on it:

```
execute flapguard reset port1
```

## execute interface dhcpclient-renew

Use this command to renew the DHCP client for the specified DHCP interface and close the CLI session. If there is no DHCP connection on the specified port, there is no output.

### Syntax

```
execute interface dhcpclient-renew <interface>
```

### Example output

This is the output for renewing the DHCP client on port 1 before the session closes:

```
# execute interface dhcpclient-renew port1
renewing dhcp lease on port1
```

## execute interface dhcp6client-renew

Use this command to renew the DHCPv6 client for the specified DHCPv6 interface and close the CLI session. If there is no DHCPv6 connection on the specified port, there is no output.

### Syntax

```
execute interface dhcp6client-renew <interface>
```

## execute interface pppoe-reconnect

Use this command to reconnect to the PPPoE service on the specified PPPoE interface and close the CLI session. If there is no PPPoE connection on the specified port, there is no output.

### Syntax

```
execute interface pppoe-reconnect <interface>
```

## execute license add

Use this command to add a new license.

### Syntax

```
execute license add <key>
```

## execute license enhanced-debugging

Use this command to get information about the enhanced debugging license or to remove it.

### Syntax

```
execute license enhanced-debugging {clear | description | get | status}
```

Variable	Description
clear	Remove the current enhanced debugging license key.
description	Get a general description of the enhanced debugging license key.
get	Retrieve the enhanced debugging license key.
status	Check whether the enhanced debugging license is active.

### Example output

```
S524DF4K15000024 # execute license enhanced-debugging description
This license will enable potentially hazardous debug, such as shells and other features.
```

```
S524DF4K15000024 # execute license enhanced-debugging status
enhanced-debugging: Active
Debug license flags: 0x01
```

## execute license status

Use this command to display the status of all installed licenses.

### Syntax

```
execute license status
```

### Example output

```
S524DF4K15000024 # execute license status
License           | Status
enhanced-debugging : Active
FS-SW-LIC-500     : Active
```

## execute log delete

Use this command to clear all traffic log entries in memory. You will be prompted to confirm the command.

### Syntax

```
execute log delete
```

## execute log delete-all

Use this command to clear all log entries in memory and current log files on hard disk. If your system has no hard disk, only log entries in system memory are cleared. You will be prompted to confirm the command.

### Syntax

```
execute log delete-all
```

## execute log display

Use this command to display log messages that you have selected with the `execute log filter` command.

## Syntax

```
execute log display
```

The console displays the first 10 log messages. To view more messages, run the command again. You can do this until you have seen all of the selected log messages. To restart viewing the list from the beginning, use the following commands:

```
execute log filter start-line 1
execute log display
```

You can restore the log filters to their default values using the following command:

```
execute log filter reset
```

## execute log filter

Use this command to select log messages for viewing or deletion. You can view one log category on one device at a time. Optionally, you can filter the messages to select only specified date ranges or severities of log messages. For traffic logs, you can filter log messages by source or destination IP address.

Commands are cumulative. If you omit a required variable, the command displays the current setting.

Use as many `execute log filter` commands as you need to define the log messages that you want to view.

```
execute log filter category <category_name>
execute log filter device {memory | faz | fds}
execute log filter dump
execute log filter field <name>
execute log filter ha-member <unitsn_str>
execute log filter max-checklines <int>
execute log filter reset
execute log filter start-line <line_number>
execute log filter view-lines <count>
```

Variable	Description	Default
category <category_name>	Enter the type of log you want to select. For SQL logging and memory logging, one of: utm, content, event, or traffic	event
device {memory   faz   fds}	Device where the logs are stored.	memory
dump	Display current filter settings.	No default
field <name>	Press Enter to view the fields that are available for the associated category. Enter the fields you want, using commas to separate multiple fields.	No default
ha-member <unitsn_str>	Select logs from the specified HA cluster member. Enter the serial number of the system.	No default

Variable	Description	Default
max-checklines <int>	Set maximum number lines to check. Range 100 to 1,000,000. A value of 0 disables the feature.	No default
reset	Execute this command to reset all filter settings.	No default
start-line <line_number>	Select logs starting at specified line number. The value must be 1 or higher.	1
view-lines <count>	Set lines per view. The value range is 5 to 1000.	10

## execute log-report reset

Use this command to delete all logs, archives, and user configured report templates.

### Syntax

```
execute log-report reset
```

## execute loop-guard reset

Use this command to reset a port that has been put out of service by loop-guard.

```
execute loop-guard reset <interface>
```

### Example

This example shows how to reset port 1 after loop guard was triggered on it:

```
execute loop-guard reset port1
```

## execute mac clear

Use this command to clear MAC addresses.

### Syntax

```
execute mac clear all
execute mac clear by-interface <interface>
execute mac clear by-mac-address <mac_address>
execute mac clear by-vlan <vlan_int>
execute mac clear by-vlan-and-interface <vlan_int> <interface>
execute mac clear by-vlan-and-mac-address <vlan_int> <mac_address>
```

Variable	Description
all	Clear all MAC entries.
by-interface <interface>	Clear all MAC entries on the specified interface.
by-mac-address <mac_address>	Clear all MAC entries for a specified MAC address.
by-vlan <vlan_int>	Clear all MAC entries for a specified VLAN.
by-vlan-and-interface <vlan_int> <interface>	Clear all MAC entries for a specified VLAN on a specified interface.
by-vlan-and-mac-address <vlan_int> <mac_address>	Clear all MAC entries for a specified VLAN that match the specified MAC address.

## execute mac-limit-violation reset

Use these commands to reset the learning limit violation log.

To enable or disable the learning limit violation log for a FortiSwitch unit, see [config switch global on page 82](#).

### Syntax

```
execute mac-limit-violation reset all
execute mac-limit-violation reset interface <interface_name>
execute mac-limit-violation reset vlan <VLAN_ID>
```

Variable	Description
all	Clear all learning limit violation logs.
interface <interface_name>	Clear the learning limit violation log for a specific interface.
vlan <VLAN_ID>	Clear the learning limit violation log for a specific VLAN.

### Example

This example shows how to clear the learning limit violation log for VLAN 5:

```
execute mac-limit-violation reset vlan 5
```

## execute ping

The `execute ping` command sends one or more ICMP echo request (ping) to test the network connection between the FortiSwitch and another network device.

## Syntax

```
execute ping <address_ipv4>
```

<address\_ipv4> is an IP address.

## Example

This example shows how to ping a host with the IP address 172.20.120.16.

```
#execute ping 172.20.120.16

PING 172.20.120.16 (172.20.120.16): 56 data bytes
64 bytes from 172.20.120.16: icmp_seq=0 ttl=128 time=0.5 ms
64 bytes from 172.20.120.16: icmp_seq=1 ttl=128 time=0.2 ms
64 bytes from 172.20.120.16: icmp_seq=2 ttl=128 time=0.2 ms
64 bytes from 172.20.120.16: icmp_seq=3 ttl=128 time=0.2 ms
64 bytes from 172.20.120.16: icmp_seq=4 ttl=128 time=0.2 ms

--- 172.20.120.16 ping statistics ---

5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 0.2/0.2/0.5 ms
```

## execute ping-options

Use this command to set ICMP echo request (ping) options to control the way ping tests the network connection between the FortiSwitch and another network device.

## Syntax

```
execute ping-options data-size <bytes>
execute ping-options df-bit {yes | no}
execute ping-options interval <seconds>
execute ping-options pattern <2-byte_hex>
execute ping-options repeat-count <repeats>
execute ping-options source {auto | <source-intf_ip>}
execute ping-options timeout <seconds>
execute ping-options tos <service_type>
execute ping-options ttl <hops>
execute ping-options validate-reply {yes | no}
execute ping-options view-settings
```

Variable	Description	Default
data-size <bytes>	Specify the datagram size in bytes.	56
df-bit {yes   no}	Set <code>df-bit</code> to <code>yes</code> to prevent the ICMP packet from being fragmented. Set <code>df-bit</code> to <code>no</code> to allow the ICMP packet to be fragmented.	no

Variable	Description	Default
interval <seconds>	Specify the number of seconds between two pings. The value must be greater than 0.	No default
pattern <2-byte_hex>	Used to fill in the optional data buffer at the end of the ICMP packet. The size of the buffer is specified using the <code>data_size</code> parameter. This allows you to send out packets of different sizes for testing the effect of packet size on the connection.	No default
repeat-count <repeats>	Specify how many times to repeat ping.	5
source {auto   <source-intf_ip>}	Specify the FortiSwitch interface from which to send the ping. If you specify <code>auto</code> , the system selects the source address and interface based on the route to the <host-name_str> or <host_ip>. Specifying the IP address of a FortiSwitch interface tests connections to different network segments from the specified interface.	auto
timeout <seconds>	Specify, in seconds, how long to wait until ping times out.	2
tos <service_type>	Set the ToS (Type of Service) field in the packet header to provide an indication of the quality of service wanted: <ul style="list-style-type: none"> <li>• lowdelay — minimize delay</li> <li>• throughput — maximize throughput</li> <li>• reliability — maximize reliability</li> <li>• lowcost — minimize cost</li> </ul>	0
ttl <hops>	Specify the time to live. Time to live is the number of hops the ping packet should be allowed to make before being discarded or returned.	64
validate-reply {yes   no}	Select <code>yes</code> to validate reply data.	no
view-settings	Display the current ping option settings.	No default

## Example

Use the following command to increase the number of pings sent:

```
execute ping-options repeat-count 10
```

Use the following command to send all pings from the FortiSwitch interface with IP address 192.168.10.23:

```
execute ping-options source 192.168.10.23
```

## execute ping6

The ping6 command sends one or more ICMP echo request (ping) to test the network connection between the FortiSwitch and an IPv6-capable network device.

### Syntax

```
execute ping6 {<address_ipv6> | <host-name_str>}
```

### Example

This example shows how to ping a host with the IPv6 address 12AB:0:0:CD30:123:4567:89AB:CDEF.

```
execute ping6 12AB:0:0:CD30:123:4567:89AB:CDEF
```

## execute ping6-options

Use this command to set ICMP echo request (ping) options to control the way ping tests the network connection between the FortiSwitch and an IPv6-capable network device.

### Syntax

```
execute ping6-options data-size <bytes>
execute ping6-options interval <seconds>
execute ping6-options pattern <2-byte_hex>
execute ping6-options repeat-count <repeats>
execute ping6-options source {auto | <source-intf_ip>}
execute ping6-options timeout <seconds>
execute ping6-options tos <service_type>
execute ping6-options ttl <hops>
execute ping6-options validate-reply {yes | no}
execute ping6-options view-settings
```

Variable	Description	Default
data-size <bytes>	Specify the datagram size in bytes.	56
df-bit {yes   no}	Set <code>df-bit</code> to <code>yes</code> to prevent the ICMP packet from being fragmented. Set <code>df-bit</code> to <code>no</code> to allow the ICMP packet to be fragmented.	no
interval <seconds>	Specify the number of seconds between two pings. The value must be greater than 0.	No default
pattern <2-byte_hex>	Used to fill in the optional data buffer at the end of the ICMP packet. The size of the buffer is specified using the <code>data_size</code> parameter. This allows you to send out packets of different sizes for testing the effect of packet size on the connection.	No default

Variable	Description	Default
repeat-count <repeats>	Specify how many times to repeat ping.	5
source {auto   <source-intf_ip>}	Specify the FortiSwitch interface from which to send the ping. If you specify <code>auto</code> , the system selects the source address and interface based on the route to the <host-name_str> or <host_ip>. Specifying the IP address of a FortiSwitch interface tests connections to different network segments from the specified interface.	auto
timeout <seconds>	Specify, in seconds, how long to wait until ping times out.	2
tos <service_type>	Set the ToS (Type of Service) field in the packet header to provide an indication of the quality of service wanted: <ul style="list-style-type: none"> <li>• <code>lowdelay</code> — minimize delay</li> <li>• <code>throughput</code> — maximize throughput</li> <li>• <code>reliability</code> — maximize reliability</li> <li>• <code>lowcost</code> — minimize cost</li> </ul>	0
ttl <hops>	Specify the time to live. Time to live is the number of hops the ping packet should be allowed to make before being discarded or returned.	64
validate-reply {yes   no}	Select <code>yes</code> to validate reply data.	no
view-settings	Display the current ping option settings.	No default

### Example

Use the following command to validate reply data:

```
execute ping6-options validate-reply yes
```

## execute poe-reset

This command performs a PoE reset on the specified port.

### Syntax

```
execute poe-reset <port_number>
```

### Example

Use the following command to reset the PoE power on port 1:

```
execute poe-reset port1
```

## execute reboot

Use this command to restart the system.

Abruptly powering off your system may corrupt its configuration. Use the `reboot` or `shutdown` commands to ensure proper shutdown procedures are followed to prevent any loss of configuration.

### Syntax

```
execute reboot [comment "comment_string"]
```

[comment <"comment\_string">] enables you to optionally add a message that will appear in the hard disk log indicating the reason for the reboot. If the message is more than one word it must be enclosed in quotation marks.

### Example

This example shows the reboot command with a message included:

```
execute reboot comment "December monthly maintenance"
```

## execute restore

Use this command to restore a configuration, firmware, or IPS signature file. The following options are available:

- restore the configuration from a file
- change the FortiSwitch firmware
- restore the bios from a file

When virtual domain configuration is enabled, the content of the backup file depends on the administrator account that created it.

A backup of the system configuration from the super admin account contains the global settings and the settings for all of the VDOMs. Only the super admin account can restore the configuration from this file.

A backup file from a regular administrator account contains the global settings and the settings for the VDOM to which the administrator belongs. Only a regular administrator account can restore the configuration from this file.

### Syntax

```
execute restore bios tftp <filename_str> <server_ipv4[:port_int]>
execute restore config flash <revision>
execute restore config ftp <filename_str> <server_ipv4[:port_int] | server_fqdn[:port_
int]> [<username_str> <password_str>] [<backup_password_str>]
execute restore config tftp <filename_str> <server_ipv4> [<backup_password_str>]
execute restore image ftp <filename_str> <server_ipv4[:port_int] | server_fqdn[:port_int]>
[<username_str> <password_str>]
execute restore image management-station <version_int>
execute restore image tftp <filename_str> <server_ipv4>
execute restore secondary-image ftp <filename_str> <server_ipv4[:port_int] | server_fqdn
[:port_int]> [<username_str> <password_str>]
execute restore secondary-image tftp <filename_str> <server_ipv4>
```

Variable	Description
bios tftp <filename_str> <server_ipv4 [:port_int]>	Restore the BIOS. Download the restore file from a TFTP server.
config flash <revision>	Restore the specified revision of the system configuration from the flash disk.
config ftp <filename_str> <server_ipv4 [:port_int]   server_fqdn[:port_int]> [<username_str> <password_str>] [<backup_password_str>]	Restore the system configuration from an FTP server. The new configuration replaces the existing configuration, including administrator accounts and passwords. If the backup file was created with a password, you must specify the password.
config tftp <filename_str> <server_ipv4> [<backup_password_str>]	Restore the system configuration from a file on a TFTP server. The new configuration replaces the existing configuration, including administrator accounts and passwords. If the backup file was created with a password, you must specify the password.
image ftp <filename_str> <server_ipv4 [:port_int]   server_fqdn[:port_int]> [<username_str> <password_str>]	Download a firmware image from an FTP server to the FortiSwitch unit. The FortiSwitch unit reboots, loading the new firmware. This command is not available in multiple VDOM mode.
image management-station <version_int>	Download a firmware image from the central management station. This is available if you have configured a FortiManager unit as a central management server. This is also available if your account with FortiGuard Analysis and Management Service allows you to upload firmware images.
image tftp <filename_str> <server_ipv4>	Download a firmware image from a TFTP server to the FortiSwitch unit. The FortiSwitch unit reboots, loading the new firmware.
secondary-image ftp <filename_str> <server_ipv4[:port_int]   server_fqdn[:port_int]> [<username_str> <password_str>]	Download a firmware image from an FTP server to the FortiSwitch unit. The FortiSwitch unit saves the new firmware image in the secondary image partition.
secondary-image tftp <filename_str> <server_ipv4>	Download a firmware image from a TFTP server to the FortiSwitch unit. The FortiSwitch unit saves the new firmware image in the secondary image partition.

## Example

This example shows how to upload a configuration file from a TFTP server to the FortiSwitch and restart the FortiSwitch with this configuration. The name of the configuration file on the TFTP server is `backupconfig`. The IP address of the TFTP server is `192.168.1.23`.

```
execute restore config tftp backupconfig 192.168.1.23
```

## execute revision

Use this command to manage configuration and firmware image files on the local disk.

### Syntax

```
execute revision delete config <revision>
execute revision list config
execute revision show config
```

Variable	Description
delete config <revision>	Delete the specified configuration revision on the local disk.
list config	List the configuration revisions on the local disk.
show config	Display the details of the configuration revision on the local disk.

### Example

Use the following command to delete revision 1 of the configuration file on the local disk:

```
execute revision delete config 1
```

## execute router clear bgp

Use this command to clear the BGP routing configuration.

### Syntax

```
execute router clear bgp {all | as | dampening | external | ip}
```

Variable	Description
all <arguments>	Clear all BGP peers
as <arguments>	Clear a BGP peer by AS number.
dampening {<IP_address>   <IP_address/length>}	Clear the BGP flap-dampening information.
external <arguments>	Clear all external BGP peers.
ip <arguments>	Clear a BGP peer by IP address.

### Example

Use the following command to delete the BGP flap-dampening information:

```
execute router clear bgp dampening 1.2.3.4
```

## execute router clear ospf

Use this command to clear the OSPF routing configuration from the specified interface.

### Syntax

```
execute router clear ospf interface <interface_name>
```

### Example

Use the following command to delete the OSPF routing configuration from the VLAN interface:

```
execute router clear ospf interface vlan20
```

## execute router restart

Use this command to restart the router software:

```
execute router restart
```

## execute router tech-support

Use this command to display the specified routing configuration and troubleshooting information.

### Syntax

```
execute router tech-support {ospf | rip | bgp | isis | static}
```

### Example

Use the following command to display the BGP routing configuration and troubleshooting information:

```
execute router tech-support bgp
```

## execute set-next-reboot

Use this command to specify the flash partition for the next reboot. The system can use the boot image from either the primary or the secondary flash partition.

**NOTE:** You must disable image rotation before you can use the execute set-next-reboot command.

### Syntax

```
execute set-next-reboot <primary | secondary>
```

### Example

This example specifies that the next reboot will use the secondary flash partition:

```
execute set-next-reboot secondary
```

---

Set next reboot partition to secondary

## execute shutdown

Use this command to shut down the system immediately. You will be prompted to confirm this command.

Abruptly powering off your system might corrupt its configuration. Using the reboot and shutdown options in the CLI or in the Web-based manager ensure proper shutdown procedures are followed to prevent any loss of configuration.

### Syntax

```
execute shutdown [comment <"comment_string">]
```

The comment field is optional. Use it to add a message that will appear in the event log message that records the shutdown. The comment message does not appear on the Alert Message console. If the message is more than one word it must be enclosed in quotation marks.

### Example

This example shows the reboot command with a message included:

```
execute shutdown comment "emergency facility shutdown"
```

An event log message similar to the following is recorded:

```
2009-09-08 11:12:31 critical admin 41986 ssh(172.20.120.11) shutdown User admin shutdown
the device from ssh(172.20.120.11). The reason is 'emergency facility shutdown'
```

## execute ssh

Use this command to establish an SSH session with another system.

### Syntax

```
execute ssh <destination>
```

<destination> is the destination in the form user@IPv4\_address, user@IPv6\_address, or user@DNS\_name. If the IPv6 address is a link-local address, you must specify an output interface using %.

### Examples

```
execute ssh admin@fe80::926c:acff:fe7b:e059%vlan20 // vlan20 is the output interface.
execute ssh admin@172.20.120.122
execute ssh 1002::21
execute ssh 12.345.6.78
```

To end an SSH session, type `exit`:

```
S524DF4K15000024 # exit
Connection to 172.20.120.122 closed.
```

```
S524DF4K15000024 #
```

## execute stage

Use this command to stage an image from an FTP or TFTP server.

### Syntax

```
execute stage image ftp <string> <ftp server>[:ftp port]
execute stage image tftp <string> <ip>
```

`image` is the image file name (including path) on the remote server.

## execute sticky-mac

Use this command to manage MAC addresses that were dynamically learned and are persistent when the status of a FortiSwitch port changes (goes down or up).

### Syntax

```
execute sticky-mac delete-unsaved {all | interface <interface_name>}
execute sticky-mac save {all | interface <interface_name>}
```

Variable	Description
delete-unsaved {all   interface <interface_name>}	Delete all persistent MAC entries (instead of saving them in the FortiSwitch configuration file) for all interfaces or for the specified interface.
save {all   interface <interface_name>}	Save all persistent MAC entries in the FortiSwitch configuration file for all interfaces or for the specified interface.

## execute switch-controller get-conn-status

Use this command to display the status of the FortiLink connection. This command is valid only when the FortiSwitch is managed by a FortiGate.

### Syntax

```
execute switch-controller get-conn-status
```

### Example

```
S524DF4K15000024 # execute switch-controller get-conn-status
```

```
Get managed-switch S524DF4K15000024 connection status:
```

```

Connection: Connected
Image Version: FG100D-v6.2-build849
Remote Address: xxx.xxx.x.x
Join Time: Wed Mar 13 08:38:57 2019
DTLS Version: DTLSv1.2

```

## execute system certificate ca

Use this command to import a CA certificate from a TFTP or SCEP server to the FortiSwitch or to export a CA certificate from the FortiSwitch to a TFTP server.

Before using this command, you must obtain a CA certificate issued by a Certificate Authority.

### Syntax

```

execute system certificate ca export tftp <name> <file-name> <tftp_ip>
execute system certificate ca import auto <ca_server_url> [ca_identifier_str]
execute system certificate ca import tftp <file-name> <tftp_ip>

```

Variable	Description	Default
import	Import the CA certificate from a TFTP server to the FortiSwitch unit.	
export	Export or copy the CA certificate from the FortiSwitch to a file on the TFTP server. The available CA certificates are Entrust_802.1x_CA, Entrust_802.1x_G2_CA, Entrust_802.1x_L1K_CA, Fortinet_CA, and Fortinet_CA2.	
<name>	Enter the name of the CA certificate.	
<file-name>	Enter the file name on the TFTP server.	
<tftp_ip>	Enter the TFTP server address.	
auto	Retrieve a CA certificate from a SCEP server.	
tftp	Import the CA certificate to the FortiSwitch from a file on a TFTP server (local administrator PC).	
<ca_server_url>	Enter the URL of the CA certificate server.	
<ca_identifier_str>	CA identifier on CA certificate server (optional).	

## execute system certificate crl import auto

Use this command to get a certificate revocation list via LDAP, HTTP, or SCEP protocol, depending on the `autoupdate` configuration.

To use this command, the authentication servers must already be configured.

## Syntax

```
execute system certificate crl import auto <crl-name>
```

Variable	Description	Default
import	Import the CRL from the configured LDAP, HTTP, or SCEP authentication server to the FortiSwitch unit.	
<crl-name>	Enter the name of the CRL.	
auto	Trigger an auto-update of the CRL from the configured authentication server.	

## execute system certificate local export tftp

Use this command to export a local certificate from the FortiSwitch to a TFTP server.

### Syntax

```
execute system certificate local export tftp <name> <file-name> <tftp_ip>
```

Variable	Description
export	Export or copy the local certificate from the FortiSwitch unit to a file on the TFTP server.
<name>	Enter the name of the local certificate. Available local certificates are Entrust_802.1x, Fortinet_Factory, and Fortinet_Firmware.
<file-name>	Enter the file name on the TFTP server.
<tftp_ip>	Enter the TFTP server address.

## execute system certificate local generate

Use this command to generate a local certificate.

When you generate a certificate request, you create a private and public key pair for the local FortiSwitch unit. The public key accompanies the certificate request. The private key remains confidential.

When you receive the signed certificate from the CA, use the `system certificate local import` command to install it on the FortiSwitch unit.

### Syntax

```
execute system certificate local generate <name> <key-length> <subject_str> <country>
<state> <city> <organization> <bu> <email> <SAN> <URL> <challenge> <source_IP> <CA_id>
<password>
```

Variable	Description
<name>	Enter the local certificate name.
<key-length>	Enter the key size, which can be 1024, 1536, or 2048.
<subject_str>	Enter the subject (host IP address/domain name/e-mail address).
<country>	Enter the country name (such as <i>canada</i> ), country code (such as <i>ca</i> ), or <i>null</i> for none.
<state>	Enter the state.
<city>	Enter the city.
<organization>	Enter the company name.
<bu>	Enter the business unit.
<email>	Enter the email address.
<SAN>	This field is optional. Enter a subject alternative name.
<URL>	This field is optional. Enter the URL of the CA server for signing using SCEP.
<challenge>	Enter the challenge password for signing using SCEP.
<source_IP>	This field is optional. Enter the source IP address for communicating with the CA server.
<CA_id>	This field is optional. Enter the CA identifier of the CA server for sign using SCEP.
<password>	This field is optional. Enter the password if you are using a private key.

## execute system certificate local import tftp

Use this command to import a local certificate to the FortiSwitch from a TFTP server.

### Syntax

```
execute system certificate local import tftp <file-name> <tftp_ip>
```

Variable	Description	Default
<name>	Enter the name of the local certificate.	

Variable	Description	Default
<file-name>	Enter the file name on the TFTP server.	
<tftp_ip>	Enter the TFTP server address.	

## execute system certificate remote

Use this command to import a remote certificate from a TFTP server or to export a remote certificate from the FortiSwitch unit to a TFTP server. The remote certificates are public certificates without a private key. They are used as OCSP (Online Certificate Status Protocol) server certificates.

### Syntax

```
execute system certificate remote import tftp <file-name> <tftp_ip>
execute system certificate remote export tftp <name> <file-name> <tftp_ip>
```

Variable	Description	Default
import	Import the remote certificate from the TFTP server to the FortiSwitch unit.	
export	Export or copy the remote certificate from the FortiSwitch to a file on the TFTP server. To view a list of the certificates, use the following command: <code>execute system certificate remote export tftp ?</code>	
<name>	Enter the name of the local certificate.	
<file-name>	Enter the file name on the TFTP server.	
<tftp_ip>	Enter the TFTP server address.	

## execute system sniffer-profile delete-capture

Use this command to delete the .pcap file for a specific packet-capture profile. To create a packet-capture profile, see [config system sniffer-profile](#) on page 192.

### Syntax

```
execute system sniffer-profile delete-capture <profile_name>
```

### Example

```
execute system sniffer-profile delete-capture profile1
```

## execute system sniffer-profile pause

Use this command to pause a packet capture for a specific packet-capture profile. To create a packet-capture profile, see [config system sniffer-profile on page 192](#).

### Syntax

```
execute system sniffer-profile pause <profile_name>
```

### Example

```
execute system sniffer-profile pause profile1
```

## execute system sniffer-profile start

Use this command to start a packet capture for a specific packet-capture profile. To create a packet-capture profile, see [config system sniffer-profile on page 192](#).

### Syntax

```
execute system sniffer-profile start <profile-name>
```

### Example

```
execute system sniffer-profile start profile1
```

## execute system sniffer-profile stop

Use this command to stop a packet capture for a specific packet-capture profile. To create a packet-capture profile, see [config system sniffer-profile on page 192](#).

### Syntax

```
execute system sniffer-profile stop <profile-name>
```

### Examples

```
execute system sniffer-profile stop profile1
```

## execute system sniffer-profile upload

Use this command to upload the .pcap file for a specific packet-capture profile to a TFTP or FTP server. To create a packet-capture profile, see [config system sniffer-profile on page 192](#).

### Syntax

```
execute system sniffer-profile upload ftp <profile_name> <file_name> <FTP_server_IP_
address:<optional_port>>
```

```
execute system sniffer-profile upload tftp <profile_name> <file_name> <TFTP_server_IP_
address:<optional_port>>
```

Variable	Description
<profile_name>	Enter the name of the packet-capture profile.
<file_name>	Enter the name of the .pcap file and the path where it is located.
<FTP_server_IP_address:<optional_port>>	Enter the IP address of the FTP server and optionally enter the port number.
<TFTP_server_IP_address:<optional_port>>	Enter the IP address of the TFTP server and optionally enter the port number.

## Examples

```
execute system sniffer-profile upload ftp profile profile1.pcap 192.168.1.23
```

## execute telnet

Use this command to create a Telnet client. You can use this tool to test network connectivity.

### Syntax

```
execute telnet <telnet_ipv4 or telnet_ipv6>
```

<telnet\_ipv4 or telnet\_ipv6> is the IPv4 or IPv6 address to connect with. If the IPv6 address is a link-local address, you must specify an output interface using %.

Type `exit` to close the Telnet session.

### Examples

```
execute telnet fe80::926c:acff:fe7b:e059%vlan20 // vlan20 is the output interface.
execute telnet 1002::21
execute telnet 12.345.6.78
```

## execute time

Use this command to display or set the system time.

### Syntax

```
execute time [<time_str>]
```

**time\_str** has the form **hh:mm:ss**, where:

- **hh** is the hour. The range is 00 to 23.
- **mm** is the minutes. The range is 00 to 59.

- **ss** is the seconds. The range is 00 to 59.

If you do not specify a time, the command returns the current system time.

You are allowed to shorten numbers to only one digit when setting the time. For example both 01:01:01 and 1:1:1 are allowed.

### Example

This example sets the system time to 15:31:03:

```
execute time 15:31:03
```

## execute traceroute

Use this command to test the connection between the FortiSwitch and another network device, and display information about the network hops between the FortiSwitch and the device.

### Syntax

```
execute traceroute {<ip_address> | <host-name>}
```

### Example

This example shows how to test the connection with <http://docs.forticare.com>. In this example, the traceroute command times out after the first hop indicating a possible problem.

```
#execute traceoute docs.fortinet.com
traceroute to docs.fortinet.com (65.39.139.196), 30 hops max, 38 byte packets
 1 172.20.120.2 (172.20.120.2) 0.324 ms 0.427 ms 0.360 ms
 2 * * *
```

If your FortiSwitch is not connected to a working DNS server, you will not be able to connect to remote host-named locations with traceroute.

## execute tracert6

Use this command to test the connection between the FortiSwitch and another network device using the IPv6 protocol and to display information about the network hops between the FortiSwitch and the device.

### Syntax

```
tracert6 [-Fdn] [-f first_ttl] [-i interface] [-m max_ttl]
[-s src_addr] [-q nprobes] [-w waittime] [-z sendwait]
host [paddatalen]
```

Variable	Description
-F	Set the Don't Fragment bit.

Variable	Description
-d	Enable debugging.
-n	Do not resolve numeric address to domain name.
-f <first_ttl>	Set the initial time-to-live used in the first outgoing probe packet.
-i <interface>	Select interface to use for tracer.
-m <max_ttl>	Set the max time-to-live (max number of hops) used in outgoing probe packets.
-s <src_addr>	Set the source IP address to use in outgoing probe packets.
-q <nprobes>	Set the number probes per hop.
-w <waittime>	Set the time in seconds to wait for response to a probe. Default is 5.
-z <sendwait>	Set the time in milliseconds to pause between probes.
host	Enter the IP address or FQDN to probe.
<paddatalen>	Set the packet size to use when probing.

## execute upload config

Use this command to upload system configurations to the flash disk from FTP or TFTP sources.

### Syntax

```
execute upload config ftp <filename_str> <comment> <server_ipv4[:port_int] | server_fqdn
[:port_int]> [<username_str> [<password_str>]] [<backup_password_str>]
execute upload config tftp <filename_str> <comment> <server_ipv4>
```

Variable	Description
<comment>	Comment string.
<filename_str>	Filename to upload.
<server_fqdn[:port_int]>	Server fully qualified domain name and optional port.
<server_ipv4[:port_int]>	Server IP address and optional port number.

Variable	Description
<username_str>	User name required on server.
<password_str>	Password required on server.
<backup_password_str>	Password for backup file.

## execute verify image

Use this command to verify the integrity of the image in the primary or secondary (if applicable) flash partition.

### Syntax

```
execute verify image {primary | secondary}
```

### Example

```
execute verify image primary

Verifying the image in flash.....100%
No issue found!

execute verify image secondary

Verifying the image in flash.....100%
Bad/corrupted image found in flash!
Command fail. Return code -1
```

## get

The `get` commands provide information about the operation of the FortiSwitch unit:

- [get hardware cpu on page 330](#)
- [get hardware memory on page 331](#)
- [get hardware status on page 332](#)
- [get log custom-field on page 332](#)
- [get log eventfilter on page 332](#)
- [get log gui on page 333](#)
- [get log memory on page 333](#)
- [get log syslogd on page 335](#)
- [get log syslogd2 on page 335](#)
- [get log syslogd3 on page 336](#)
- [get router access-list on page 337](#)
- [get router info bfd neighbor on page 338](#)
- [get router info bgp on page 338](#)
- [get router info fwd on page 339](#)
- [get router info gwdetect on page 339](#)
- [get router info isis on page 339](#)
- [get router info kernel on page 340](#)
- [get router info multicast on page 340](#)
- [get router info ospf on page 341](#)
- [get router info rip on page 342](#)
- [get router info routing-table on page 343](#)
- [get router info v6-routing-table on page 344](#)
- [get router info vrrp on page 345](#)
- [get router key-chain on page 346](#)
- [get router ospf on page 346](#)
- [get router prefix-list on page 347](#)
- [get router rip on page 347](#)
- [get router route-map on page 348](#)
- [get router setting on page 349](#)
- [get router static on page 349](#)
- [get switch acl on page 349](#)
- [get switch dhcp-snooping on page 351](#)
- [get switch flapguard settings on page 352](#)
- [get switch global on page 352](#)
- [get switch igmp-snooping on page 353](#)
- [get switch interface on page 354](#)

## get hardware cpu

Use this command to display detailed information about the CPUs installed in your FortiSwitch unit.

### Syntax

```
get hardware cpu
```

### Example output

```
S524DF4K15000024 # get hardware cpu

Processor      : ARMv7 Processor rev 0 (v7l)
processor      : 0
BogoMIPS      : 1993.93

processor      : 1
BogoMIPS      : 1993.93

Features       : swp half thumb fastmult edsp tls
CPU implementer : 0x41
CPU architecture: 7
CPU variant    : 0x3
CPU part       : 0xc09
CPU revision   : 0

Hardware       : Broadcom iProc
```

```
Revision      : 0000
Serial        : 000000000000000000
```

## get hardware memory

Use this command to display information about FortiSwitch memory use. Information includes the total memory, memory in use, and free memory.

### Syntax

```
get hardware memory
```

### Example output

```
S524DF4K15000024 # get hardware memory
```

```
MemTotal:      2026080 kB
MemFree:       1725840 kB

VmallocChunk:    163772 kB
```

## get hardware status

Report information about the FortiSwitch hardware including ASIC version, CPU type, amount of memory, flash drive size, hard disk size (if present), and USB flash size (if present). Use this information to troubleshoot, to provide to Fortinet Support, or to confirm the features that your FortiSwitch model supports.

### Syntax

```
get hardware status
```

### Example output

```
S524DF4K15000024 # get hardware status

Model name: FortiSwitch-524D-FPOE
CPU: ARMv7 Processor rev 0 (v7l)
RAM: 1978 MB
MTD Flash: 52 MB /dev/mtd
Hard disk: not available
Switch CPLD Version: V0.4
Poe Firmware Version:2.6.3
```

## get log custom-field

Use this command to get information about custom log fields that have been created. To create custom log fields, see [config log custom-field on page 19](#).

### Syntax

```
get log custom-field
```

### Example output

```
S524DF4K15000024 # get log custom-field

== [ 1 ]
id: 1
== [ 2 ]
id: 2
```

This output shows that two custom fields have been created.

## get log eventfilter

Use this command to find out which logs are enabled:

- Event logs show configuration changes and allow you to monitor the activities administrators perform.
- Router logs allow you to review all router activity. Router logs are available only on supported platforms if you have the advanced features license.
- System logs show system-level activity such as IP conflicts.
- User logs show user activity such as who is logged on and when.

To enable event logging, see [config log eventfilter](#) on page 20.

## Syntax

```
get log eventfilter
```

## Example output

```
S524DF4K15000024 # get log eventfilter

event           : enable
router          : enable
system         : enable
user           : enable
```

## get log gui

Use this command to find out which device is being used to display logs in the Web-based manager.

## Syntax

```
get log gui
```

## Example output

```
S524DF4K15000024 # get log gui

log-device      : memory
```

This output shows that logs are being displayed from memory.

## get log memory

Use this command to find out the current settings for logging to system memory.

## Syntax

```
get log memory filter
get log memory global-setting
get log memory setting
```

Variable	Description
filter	<p>Find out the severity level of log entries made in system memory. The system logs all messages at and above the selected severity level. For example, if the severity is <code>error</code>, the system logs <code>error</code>, <code>critical</code>, <code>alert</code>, and emergency level messages.</p> <ul style="list-style-type: none"> <li>• <code>emergency</code> — The system is unusable.</li> <li>• <code>alert</code> — Immediate action is required.</li> <li>• <code>critical</code> — Functionality is affected.</li> <li>• <code>error</code> — An erroneous condition exists and functionality is probably affected.</li> <li>• <code>warning</code> — Functionality might be affected.</li> <li>• <code>notification</code> — Information about normal events.</li> <li>• <code>information</code> — General information about system operations.</li> <li>• <code>debug</code> — Information used for diagnosing or debugging the system.</li> </ul>
global-setting	<p>Find out the global settings for logging to system memory:</p> <ul style="list-style-type: none"> <li>• <code>full-final-warning-threshold</code> — the number of log entries saved before a final warning is sent. When all memory is filled, the system overwrites the oldest log entries.</li> <li>• <code>full-first-warning-threshold</code> — the number of log entries saved before receiving the first warning.</li> <li>• <code>full-second-warning-threshold</code> — the number of log entries saved for receiving the second warning.</li> <li>• <code>hourly-upload</code> — whether the log is uploaded hourly.</li> <li>• <code>max-size</code> — the maximum size of the memory buffer log, in bytes.</li> </ul>
setting	<p>Find out the general settings for logging to system memory:</p> <ul style="list-style-type: none"> <li>• <code>diskfull</code> — whether the oldest log entries are overwritten when the system memory is full.</li> <li>• <code>status</code> — whether logging to system memory is enabled.</li> </ul>

### Example output

```
S524DF4K15000024 # get log memory filter
severity           : information

S524DF4K15000024 # get log memory global-setting
full-final-warning-threshold: 95
full-first-warning-threshold: 75
full-second-warning-threshold: 90
hourly-upload       : disable
max-size            : 98304

S524DF4K15000024 # get log memory setting
diskfull           : overwrite
status             : enable
```

## get log syslogd

Use this command to get information about your system log 1 settings.

### Syntax

```
get log syslogd {filter | setting}
```

Variable	Description
filter	<p>Find out the severity level of system log 1 entries. The system logs all messages at and above the selected severity level. For example, if the severity is <code>error</code>, the system logs <code>error</code>, <code>critical</code>, <code>alert</code>, and <code>emergency</code> level messages.</p> <ul style="list-style-type: none"> <li>• <code>emergency</code> — The system is unusable.</li> <li>• <code>alert</code> — Immediate action is required.</li> <li>• <code>critical</code> — Functionality is affected.</li> <li>• <code>error</code> — An erroneous condition exists and functionality is probably affected.</li> <li>• <code>warning</code> — Functionality might be affected.</li> <li>• <code>notification</code> — Information about normal events.</li> <li>• <code>information</code> — General information about system operations.</li> <li>• <code>debug</code> — Information used for diagnosing or debugging the system.</li> </ul>
setting	<p>Find out the general settings for the system log 1:</p> <ul style="list-style-type: none"> <li>• <code>diskfull</code> — whether the oldest log entries are overwritten when the system memory is full.</li> <li>• <code>status</code> — whether logging to system memory is enabled.</li> </ul>

### Example output

```
S524DF4K15000024 # get log syslogd filter
severity           : information
```

```
S524DF4K15000024 # get log syslogd setting
status            : disable
```

## get log syslogd2

Use this command to get information about your system log 2 settings.

### Syntax

```
get log syslogd2 {filter | setting}
```

Variable	Description
filter	<p>Find out the severity level of system log 2 entries. The system logs all messages at and above the selected severity level. For example, if the severity is <code>error</code>, the system logs <code>error</code>, <code>critical</code>, <code>alert</code>, and <code>emergency</code> level messages.</p> <ul style="list-style-type: none"> <li>• <code>emergency</code> — The system is unusable.</li> <li>• <code>alert</code> — Immediate action is required.</li> <li>• <code>critical</code> — Functionality is affected.</li> <li>• <code>error</code> — An erroneous condition exists and functionality is probably affected.</li> <li>• <code>warning</code> — Functionality might be affected.</li> <li>• <code>notification</code> — Information about normal events.</li> <li>• <code>information</code> — General information about system operations.</li> <li>• <code>debug</code> — Information used for diagnosing or debugging the system.</li> </ul>
setting	<p>Find out the general settings for the system log 2:</p> <ul style="list-style-type: none"> <li>• <code>diskfull</code> — whether the oldest log entries are overwritten when the system memory is full.</li> <li>• <code>status</code> — whether logging to system memory is enabled.</li> </ul>

### Example output

```
S524DF4K15000024 # get log syslogd2 filter
severity           : information

S524DF4K15000024 # get log syslogd2 setting
status            : disable
```

## get log syslogd3

Use this command to get information about your system log 3 settings.

### Syntax

```
get log syslogd3 {filter | setting}
```

Variable	Description
filter	<p>Find out the severity level of system log 3 entries. The system logs all messages at and above the selected severity level. For example, if the severity is <code>error</code>, the system logs <code>error</code>, <code>critical</code>, <code>alert</code>, and <code>emergency</code> level messages.</p> <ul style="list-style-type: none"> <li>• <code>emergency</code> — The system is unusable.</li> <li>• <code>alert</code> — Immediate action is required.</li> <li>• <code>critical</code> — Functionality is affected.</li> <li>• <code>error</code> — An erroneous condition exists and functionality is probably affected.</li> <li>• <code>warning</code> — Functionality might be affected.</li> <li>• <code>notification</code> — Information about normal events.</li> <li>• <code>information</code> — General information about system operations.</li> <li>• <code>debug</code> — Information used for diagnosing or debugging the system.</li> </ul>
setting	<p>Find out the general settings for the system log 3:</p> <ul style="list-style-type: none"> <li>• <code>diskfull</code> — whether the oldest log entries are overwritten when the system memory is full.</li> <li>• <code>status</code> — whether logging to system memory is enabled.</li> </ul>

### Example output

```
S524DF4K15000024 # get log syslogd3 filter
severity           : information

S524DF4K15000024 # get log syslogd3 setting
status             : disable
```

## get router access-list

Use this command to find out if there are any access lists for RIP routing. An access list is a list of IP addresses and the action to take for each one. Access lists provide basic route and network filtering. To create an access list, see [config router access-list on page 27](#).

### Syntax

```
get router info access-list
```

### Example output

```
S524DF4K15000024 # get router access-list
== [ 1 ]
name: 1
== [ router1 ]
name: router1
== [ mylist ]
name: mylist
```

```
== [ list1 ]
name: list1
```

This output shows that two access lists have been created for router1.

## get router info bfd neighbor

Use this command to find out where bidirectional forwarding detection (BFD) has been enabled.

### Syntax

```
get router info bfd neighbor [detail]
```

Use `detail` to get more detailed output.

### Example output

```
S524DF4K15000024 # get router info bfd neighbor

OurAddr      NeighAddr      LD/RD  State  Int
192.168.15.2  192.168.15.1  1/4    UP     vlan2000
192.168.16.2  192.168.16.1  2/2    UP     vlan2001
```

## get router info bgp

Use this command to get information about the Border Gateway Protocol (BGP) routing configuration.

```
get router info bgp {cidr-only | community | community-info | community-list | dampening |
  filter-list | inconsistent-as | neighbors | network | network-longer-prefixes | paths
  | prefix-list | regexp | quote-regexp | route-map | scan | summary | memory}
```

Variable	Description
cidr-only	Display routes with nonnatural netmasks.
community	Display routes matching the communities.
community-info	List all BGP community information.
community-list	Display routes matching the community list.
dampening	Display router dampening information.
filter-list	Display routes conforming to the filter list.
inconsistent-as	Display routes with inconsistent AS paths.
neighbors	Show BGP neighbors.

Variable	Description
network	Show the BGP information for the network.
network-longer-prefixes	Show the BGP information for routes and more specific routes.
paths	Display the BGP path information.
prefix-list	Display routes conforming to the prefix list.
regexp	Display routes matching the AS path with regular expressions.
quote-regexp	Display routes matching the AS path with regular expressions within quotation marks.
route-map	Display routes conforming to the route map.
scan	Display the BGP scan status.
summary	Display a summary of the BGP neighbor status.
memory	Display the BGP memory table.

## get router info fwd

Use this command to get information about layer-3 forwarding.

### Syntax

```
get router info fwd
```

## get router info gwdetect

Use this command to get information about the gwdetect status.

### Syntax

```
get router info gwdetect
```

## get router info isis

Use this command to get information about the Intermediate System to Intermediate System Protocol (IS-IS) routing configuration.

## Syntax

```
get router info isis {interface | neighbor | database | route | summary | summary-table | topology}
```

Variable	Description
interface	Show the IS-IS interfaces.
neighbor	Show the IS-IS neighbor adjacencies.
database	Show the IS-IS link state database.
route	Show the IS-IS IP routing table.
summary	Show the IS-IS summary.
summary-table	Show the IS-IS summary table.
topology	Show the IS-IS paths.

## get router info kernel

Use this command to get information about the kernel routing table. The kernel routing table displays information about all of the routes in the kernel.

### Syntax

```
get router info kernel <routing type>
```

## get router info multicast

Use this command to get information about the Protocol Independent Multicast (PIM) routing configuration.

### Syntax

```
get router info multicast {config | igmp | pim | table | table-count}
```

Variable	Description
config	Show the multicast routing configuration.
igmp	Show the multicast routing IGMP information.
pim	Show PIM information.
table	Show the multicast routing table.

Variable	Description
table-count	Show the multicast route and packet count.

## get router info ospf

Use this command to get information about any open shortest path first (OSPF) routing that has been configured. To set up OSPF routing, see [config router ospf on page 50](#).

### Syntax

```
get router info ospf {config | database | interface | route | neighbor | border-routers |
status}
```

Variable	Description
config	Display detailed information about the current OSPF configuration, including interfaces, areas, access lists, and IP addresses.
database	Display information about the OSPF database.
interface	Display information about the OSPF interface.
route	Display the OSPF routing table.
neighbor	Display information about OSPF neighbors.
border-routers	Display information about OSPF border routers.
status	Display the current status of the OSPF routing, including router identifier, flags, timers, and areas.

### Example output

```
S524DF4K15000024 # get router info ospf status

OSPF Routing Process, OSPF Router ID: 1.1.1.2
Supports only single TOS (TOS0) routes
This implementation conforms to RFC2328
RFC1583Compatibility flag is disabled
OpaqueCapability flag is disabled
Initial SPF scheduling delay 5000 millise(c)s
Minimum hold time between consecutive SPF(s) 10000 millise(c)s
Maximum hold time between consecutive SPF(s) 10000 millise(c)s
Hold time multiplier is currently 1
SPF algorithm last executed 2d07h22m ago
Last SPF duration 105 usecs
SPF timer is inactive
Refresh timer 10 secs  PacketsSent: 0 PacketsRecv: 0
Number of external LSA 0. Checksum Sum 0x00000000
```

```

Number of opaque AS LSA 0. Checksum Sum 0x00000000
Number of areas attached to this router: 1
Adjacency changes are logged

Area ID: 0.0.0.4 (NSSA)
Shortcutting mode: Default, S-bit consensus: ok
Number of interfaces in this area: Total: 0, Active: 0
It is an NSSA configuration.
Elected NSSA/ABR performs type-7/type-5 LSA translation.
It is not ABR, therefore not Translator.
Number of fully adjacent neighbors in this area: 0
Area has message digest authentication
Number of full virtual adjacencies going through this area: 0
SPF algorithm executed 1 times
Default-Route Cost: 1
Number of LSA 1
Number of router LSA 1. Checksum Sum 0x0000ebf8
Number of network LSA 0. Checksum Sum 0x00000000
Number of summary LSA 0. Checksum Sum 0x00000000
Number of ASBR summary LSA 0. Checksum Sum 0x00000000
Number of NSSA LSA 0. Checksum Sum 0x00000000
Number of opaque link LSA 0. Checksum Sum 0x00000000
Number of opaque area LSA 0. Checksum Sum 0x00000000

```

## get router info rip

Use this command to get information about any Routing Information Protocol (RIP) routing that has been configured. To set up RIP routing, see [config router rip on page 58](#).

### Syntax

```
get router info rip {config | database | status}
```

Variable	Description
config	Display detailed information about the current RIP configuration, including keys in the keychain, interfaces, access lists, and IP addresses.
database	Display information about the RIP database.
status	Display the current status of the RIP routing, including filter lists, redistribution, RIP version, and interfaces.

### Example output

```
S524DF4K15000024 # get router info rip status
```

```

Routing Protocol is "rip"
Sending updates every 30 seconds with +/-50%, next due in 21 seconds
Timeout after 180 seconds, garbage collect after 120 seconds

```

```

Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing: static
Default version control: send version 2, receive version 2
Interface          Send  Recv  UpdSend Key-chain
vlan35             2    2    9
vlan85             2    2    8
Routing for Networks:
170.38.65.0/24
180.1.1.0/24
0.0.0.0
Distance: (default is 120)

```

## get router info routing-table

Use this command to get information about the IPv4 routing table.

### Syntax

```

get router info routing-table {details <A.B.C.D>| all | rip | ospf | static | connected |
dump <a.b.c.d>}

```

Variable	Description
details <A.B.C.D>	Display the routing table entries that include the specified IP address or route prefix.
all	Display all routing table entries.
rip	Display the RIP routing table.
ospf	Display the OSPF routing table.
static	Display the routing table entries for static routes.
connected	Display the routing table entries for connected routes.
dump <a.b.c.d>	Display the details of routing table entries that include the specified IP address or route prefix.

### Example output

```

S524DF4K15000024 # get router info routing-table details 39.3.2.0
Routing entry for 39.3.2.0/24 using Unicast RIB
Known via "static", distance 10, metric 0, best
* 180.1.1.2, via vlan85

```

```

S524DF4K15000024 # get router info routing-table all

```

## get router info v6-routing-table

Use this command to get information about the IPv6 routing table.

### Syntax

```

get router info routing-table {details <xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx/xxx>| all
| static | connected}

```

Variable	Description
details <xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx:xxxx/xxx>	Display the IPv6 routing table entries that include the specified IPv6 address or route prefix.

Variable	Description
all	Display all IPv6 routing table entries.
static	Display the IPv6 routing table entries for static routes.
connected	Display the IPv6 routing table entries for connected routes.

### Example output

```
S524DF4K15000024 # get router info v6-routing-table all
Codes: K - kernel route, C - connected, S - static, R - RIPng,
       O - OSPFv6, I - IS-IS, B - BGP, A - Babel, N - NHRP,
       > - selected route, * - FIB route, ^ - HW install failed

C>*  ::1/128 is directly connected, lo

C *  fe80::/64 is directly connected, mgmt
C *  fe80::/64 is directly connected, sniffer
C>*  fe80::/64 is directly connected, internal
```

## get router info vrrp

Use this command to get information about Virtual Router Redundancy Protocol (VRRP) groups.

### Syntax

```
get router info vrrp
```

### Example output

```
S524DF4K15000024 # get router info vrrp

Interface: vlan-8, primary IP address: 10.10.10.1
UseVMAC: 1
VRID: 5
vrip: 11.1.1.100, priority: 255, state: MASTER
adv_interval: 1, preempt: 1, start_time: 3
vrmac: 00:00:5e:00:01:05
```

```
vrdst:
vrgrp: 50
```

## get router key-chain

Use this command to get a list of keychains for RIP version 2 routing.

To create a keychain, see [config router key-chain on page 46](#).

### Syntax

```
get router key-chain
```

### Example output

```
S524DF4K15000024 # get router key-chain
== [ keychain1 ]
name: keychain1
```

## get router ospf

Use this command to get information about any open shortest path first (OSPF) routing that has been configured.

To set up OSPF routing, see [config router ospf on page 50](#).

### Syntax

```
get router ospf
```

### Example output

```
S524DF4K15000024 # get router ospf
router-id          : 1.1.1.2
abr-type           : cisco

```

## get router prefix-list

Use this command to find out which prefix lists are available for RIP routing. A prefix is an IP address and netmask. A prefix lists specifies the prefixes to allow or deny. To create a prefix list, see [config router prefix-list on page 56](#).

### Syntax

```
get router prefix-list
```

### Example output

```

S524DF4K15000024 # get router prefix-list
== [ 2 ]
name: 2
== [ 3 ]
name: 3

```

## get router rip

Use this command to get information about any Routing Information Protocol (RIP) routing that has been configured. To set up RIP routing, see [config router rip on page 58](#).

### Syntax

```
get router rip
```

### Example output

```

S524DF4K15000024 # get router rip
bfd                : disable
default-information-originate: disable

update-timer       : 30
version            : 2

```

## get router route-map

Use this command to list available route maps for OSPF or RIP routing. To create a route map, see [config router route-map on page 63](#).

### Syntax

```
get router route-map
```

### Example output

```

S524DF4K15000024 # get router route-map
== [ myroutemap ]
name: myroutemap      protocol: rip

```

## get router setting

Use this command to find out which routing protocol is being used by each route map. To assign a route map, see [config router setting on page 67](#).

### Syntax

```
get router setting
```

### Example output

```
S524DF4K15000024 # get router setting

filter-list:
== [ 1 ]
id: 1          protocol: rip          route-map: myroutemap
== [ 2 ]
id: 2          protocol: ospf         route-map: myroutemap
```

## get router static

Use this command to list static routes. To create a static route, see [config router static on page 68](#).

### Syntax

```
get router static
```

### Example output

```
S524DF4K15000024 # get router static

== [ 1 ]
seq-num: 1
```

## get switch acl

Use these commands to display the ACL settings.

### Syntax

```
get switch acl counters {all | egress | ingress | prelookup}
get switch acl egress
get switch acl ingress
get switch acl policer
get switch acl prelookup
get switch acl service custom
get switch acl settings
get switch acl usage
```

```
usage}
```

Variable	Description
counters {all   egress   ingress   prelookup}	Display information about all ACL policies, egress ACL policies, ingress ACL policies, or lookup ACL policies.
egress	Display information about the ACL policy for the egress stage.
ingress	Display information about the ACL policy for the ingress stage.
policer	List which ACL policers are available for different types of traffic.
prelookup	Display information about the ACL policy for the lookup stage.
service custom	Display a list of preconfigured service entries .
settings	Display the global ACL settings for the FortiSwitch unit.
usage	Display how much of available resources are used by ACL.

### Example output

```
S524DF4K15000024 # get switch acl policer
== [ 1 ]
id: 1   description: policer1
```

```
S524DF4K15000024 # get switch acl settings
density-mode      : disable
trunk-load-balance : enable
```

```
S524DF4K15000024 # get switch acl usage
Device  RULES          COUNTERS          POLICERS          STAGE
(total/free) (total/free) (total/free)

0       512  /511   1024 /1024   768  /768   egress
0       768  /767   0    /0       0    /0       prelookup
```

```
S524DF4K15000024 # get switch acl counters ingress
ingress:
ID      Packets          Bytes          description
-----
0001 0                0              cnt_n_mirror13
0002 0                0              cnt_n_mirror31
0003 0                0              cnt_n_mirror41
```

## get switch dhcp-snooping

Use this command to display more information about the DHCP-snooping database.

### Syntax

```
get switch dhcp-snooping {allowed-sever-list | client-db-details | database-summary |
limit-db-details | server-db-details | status}
```

Variable	Description
allowed-sever-list	Display the allowed DHCP server list.
client-db-details	Display details about the DHCP-snooping client database.
database-summary	List the number of VLANs with various features enabled, list trusted and untrusted ports, and report how much of the databases are used.
limit-db-details	Display details about the DHCP-snooping lease-count database.
server-db-details	Display details about the DHCP-snooping server database.  If the dhcp-server-access-list is enabled globally and the server is configured for the dhcp-server-access-list, the svr-list column displays <code>allowed</code> for that server. If the dhcp-server-access-list is enabled globally and the server is not configured in the dhcp-server-access-list, the svr-list column displays <code>blocked</code> for that server.
status	Display details about the DHCP-snooping client and server database.

### Example output

```
S548DF5018000776 # get switch dhcp-snooping allowed-server-list
```

```
      vlan          ip
      10            xxx.x.x.x
```

```
S548DF5018000776 # get switch dhcp-snooping database-summary
```

## get switch flapguard settings

Use this command to display the flap guard settings.

### Syntax

```
get switch flapguard settings
```

### Example output

```
S524DF4K15000024 # get switch flapguard settings
```

```
flap-duration      : 30
flap-rate          : 5
status             : disable
```

## get switch global

Use this command to get information about the global settings of your FortiSwitch unit.

### Syntax

```
get switch global
```

### Example output

```
S524DF4K15000024 # get switch global
```

```

```

## get switch igmp-snooping

Use this command to get the IGMP-snooping settings of your FortiSwitch unit.

### Syntax

```
get switch igmp-snooping {globals | group | interface | static-group}
```

Variable	Description
globals	Display the global IGMP-snooping configuration on the FortiSwitch unit.
group	Display a list of learned multicast groups.
interface	Display the configured IGMP-snooping interfaces and their current state
static-group	Display the list of configured static groups.

### Example output

```

FS1D243Z13000023 # get switch igmp-snooping globals
aging-time : 300
flood-unknown-multicast: disabled

FS1D243Z13000023 # get switch igmp-snooping group

40	g239-2	239:2:2:2	port25 port26

## get switch interface

Use this command to get information about the interfaces, including the class of service (CoS) value, whether sFlow is enabled on the interface, and whether dynamically learned MAC addresses are persistent on the interface.

### Syntax

```
get switch interface
```

### Example output

```
S524DF4K15000024 # get switch interface

== [ port1 ]
name: port1      sflow-sampler: disabled   port-security:
default-cos: 0  sticky-mac: disable
== [ port2 ]
name: port2      sflow-sampler: disabled   port-security:
default-cos: 0  sticky-mac: disable
== [ port3 ]
name: port3      sflow-sampler: disabled   port-security:
default-cos: 0  sticky-mac: disable
...
```

## get switch ip-mac-binding

Use this command to get information about IP MAC binding.

### Syntax

```
get switch ip-mac-binding
```

## Example output

```
get switch ip-mac-binding

== [ 1 ]
seq-num: 1
```

## get switch lldp

Use this command to get information about LLDP.

### Syntax

```
get switch lldp {auto-isl-status | neighbors-detail <physical port name>| neighbors-
summary | profile | settings | stats}
```

Variable	Description
auto-isl-status	Display statistics and status for the automatic ISL configuration.
neighbors-detail <physical port name>	Display details about a specific LLDP port.
neighbors-summary	Display a summary of LLDP neighbors.
profile	Display the name of available LLDP profiles.
settings	Display whether LLDP is enabled globally, the number of tx-intervals before the local LLDP data expires, the frequency of LLDP PDU transmission, how often the FortiSwitch transmits the first four LLDP packets when a link comes up, and the primary management interface advertised in LLDP and CDP PDUs.
stats	Display the number of packets transmitted, received, and discarded; the number of neighbors added, deleted, and expired; and the number of unknown TLVs.

### Example output

```
S524DF4K15000024 # get switch lldp profile
== [ default ]
name: default      802.1-tlvs:      802.3-tlvs:      med-tlvs: inventory-management network-policy
== [ default-auto-isl ]
name: default-auto-isl  802.1-tlvs:      802.3-tlvs:      med-tlvs:
== [ 1 ]
name: 1      802.1-tlvs:      802.3-tlvs:      med-tlvs: inventory-management network-policy
== [ Forti670i ]
name: Forti670i  802.1-tlvs:      802.3-tlvs:      med-tlvs: inventory-management network-policy
```

```
S524DF4K15000024 # get switch lldp settings
status           : enable
tx-hold          : 8
tx-interval      : 2000
fast-start-interval : 3
management-interface: internal
```

## get switch mac-limit-violations

Use this command to see the first MAC address that exceeded the learning limit for an interface or VLAN.

To enable the learning limit violation log for a FortiSwitch unit, see [config switch global](#) on page 82.

### Syntax

```
get switch mac-limit-violations {all | interface <interface_name> | vlan <VLAN_ID>}
```

Variable	Description
all	Display the first MAC address that exceeded the learning limit on any interface or VLAN. An asterisk by the interface name indicates that the interface-based learning limit was exceeded. An asterisk by the VLAN identifier indicates the VLAN-based learning limit was exceeded.
interface <interface_name>	Display the first MAC address that exceeded the learning limit on a specific interface
vlan <VLAN_ID>	Display the first MAC address that exceeded the learning limit on a specific VLAN.

### Example output

```
S524DF4K16000028 # get switch mac-limit-violations all
Port          VLAN ID      MAC Address          Timestamp
-----
port3*        5            00:00:01:00:00:01   2017-12-05 15:55:20

S524DF4K16000028 # get switch mac-limit-violations interface port3
Port          VLAN ID      MAC Address          Timestamp
-----
port3*        5            00:00:01:00:00:01   2017-12-05 15:55:20

S524DF4K16000028 # get switch mac-limit-violations vlan 9
Port          VLAN ID      MAC Address          Timestamp
-----
port15        9*           0a:c1:08:bf:cc:80   2017-12-05 15:55:44
```

## get switch mirror status

Use this command to get information about the ERSPAN-auto mirror sessions of your FortiSwitch unit. To configure a packet mirror, see [config switch mirror on page 103](#).

### Syntax

```
get switch mirror status <session>
```

### Example output

```
# get switch mirror status flink.sniffer

flink.sniffer
Mode : ERSPAN-auto
Status : Inactive
Source-Ports:
  Ingress: port2, port3
  Egress : port8, port9
Used-by-ACLs : False
Auto-config-state : N/A
Last-update : never
Issues : None
Collector-IP : 0.0.0.0
Source-IP : N/A
Source-MAC : N/A
Next-Hop :
  IP : N/A
  MAC : N/A
  Via-System-Interface : N/A
  VLAN : N/A
  Via-Switch-Interface : N/A
```

## get switch modules

Use this command to get information about the modules in your FortiSwitch unit.

### Syntax

```
get switch modules {detail | limits | status | summary} [<port>]
```

Variable	Description
detail [<port>]	Display module details for a specific port, split port, or all available ports.
limits [<port>]	Display module limits for a specific port, split port, or all available ports.
status [<port>]	Display module status for a specific port, split port, or all available ports.
summary [<port>]	Display summary information of all modules for a specific port or all available ports and split ports.

## Example output

```
FS108D3W14000720 # get switch modules detail port10
-----
Port (port10)
identifier SFP/SFP+
connector Unk (0x00)
transceiver 1000-Base-T
encoding 8B/10B
Length Decode Common
length_smf_1km N/A

## get switch network-monitor

Use this command to get information about network monitoring on the FortiSwitch unit.

### Syntax

```
get switch network-monitor {directed | settings}
```

Variable	Description
directed	List the static entries for network monitoring on the switch.
settings	Display the global settings for network monitoring on the switch.

## Example output

```
S524DF4K15000024 # get switch network-monitor directed
== [ 1 ]
id: 1

S524DF4K15000024 # get switch network-monitor settings
db-aging-interval    : 3600
status               : disable
survey-mode          : disable
survey-mode-interval: 120
```

## get switch phy-mode

Use this command to find out which split ports have been configured. to configure split ports, see [config switch phy-mode on page 109](#).

### Syntax

```
get switch phy-mode
```

### Example output

```
S524DF4K15000024 # get switch phy-mode
port29-phy-mode    : 1x40G
port30-phy-mode    : 1x40G
```

## get switch physical-port

Use this command to get information about the physical ports of your FortiSwitch unit. To configure physical ports, see [config switch physical-port on page 111](#).

### Syntax

```
get switch physical-port
```

### Example output

```
S524DF4K15000024 # get switch physical-port
== [ port1 ]
name: port1    egress-drop-mode: enabled    link-status: down    status: up
== [ port2 ]
name: port2    egress-drop-mode: enabled    link-status: down    status: up
== [ port3 ]
name: port3    egress-drop-mode: enabled    link-status: down    status: up
...
```

## get switch poe inline

Use this command to get information about the system's power over Ethernet (PoE) functions.

### Syntax

```
get switch poe inline
```

### Example output

```
S524DF4K15000024 # get switch poe inline
```

```
Unit Power Budget: 10.00W
```

```
Unit Guard Band: 10.00W
```

```
Unit Power Consumption: 0.00W
```

```
Unit Poe Power Mode : First come first served based.
```

## get switch qos

Use this command to get information about the QoS configuration:

### Syntax

```
get switch qos (dot1p-map | ip-dscp-map | qos-policy)
```

Variable	Description
dot1p-map	List the available dot1p maps, as well as the CoS values.
ip-dscp-map	List the available DSCP maps.
qos-policy	List the available QoS policies.

### Example output

```
S524DF4K15000024 # get switch qos dot1p-map
== [ test1 ]
name: test1    priority-0: queue-2    priority-1: queue-0    priority-2: queue-1
               priority-3: queue-3    priority-4: queue-4    priority-5: queue-5    priority-6:
queue-6    priority-7: queue-7

S524DF4K15000024 # get switch qos ip-dscp-map
== [ m1 ]
name: m1

S524DF4K15000024 # get switch qos qos-policy
== [ default ]
name: default
== [ policy1 ]
name: policy1
```

## get switch rguard-policy

Use the following command to list the available IPv6 RA-guard policies. To create an IPv6 RA-guard policy, see [config switch rguard-policy on page 119](#).

### Syntax

```
get switch rguard-policy
```

### Example output

```
S524DF4K15000024 # get switch rguard-policy
== [ RApolicy1 ]
name: RApolicy1
```

## get switch security-feature

Use this command to display the security-feature settings. To configure security checks for incoming TCP/UDP packets, see [config switch security-feature on page 121](#).

### Syntax

```
get switch security-feature
```

## Example output

```
S524DF4K15000024 # get switch security-feature
sip-eq-dip           : enable
tcp-flag            : enable
tcp-port-eq        : enable
tcp-flag-FUP       : enable
tcp-flag-SF        : enable
v4-first-frag      : enable
udp-port-eq        : enable
tcp-hdr-partial    : enable
macsa-eq-macda     : enable
allow-mcast-sa     : enable
allow-sa-mac-all-zero: enable
```

## get switch static-mac

Use this command to display the static MAC addresses.

### Syntax

```
get switch static-mac
```

### Example output

```
S524DF4K15000024 # get switch static-mac

== [ 1 ]
seq-num: 1   interface: port5   mac: 00:21:cc:d2:76:72   vlan-id: 35
```

## get switch storm-control

Use this command to display storm control settings on your FortiSwitch unit. To configure storm control, see [config switch storm-control on page 124](#).

### Syntax

```
get switch storm-control
```

### Example output

```
S524DF4K15000024 # get switch storm-control

broadcast      : enable
rate           : 1000
unknown-multicast : enable
unknown-unicast : enable
```

## get switch stp instance

Use this command to get information about STP instances on your FortiSwitch unit. To configure an STP instance, see [config switch stp instance on page 125](#).

### Syntax

```
get switch stp instance
```

### Example output

```
# get switch stp instance
== [ 0 ]
id: 0
== [ 1 ]
id: 1
```

## get switch stp settings

Use this command to get information about STP settings on your FortiSwitch unit. To configure STP settings, see [config switch stp settings on page 126](#).

### Syntax

```
get switch stp settings
```

### Example output

```
S524DF4K15000024 # get switch stp settings

forward-time      : 15
hello-time        : 5
max-age           : 20
max-hops          : 20
name              : region1
revision          : 1
status            : enable
```

## get switch trunk

Use this command to get information about which trunks on the FortiSwitch unit have been configured for link aggregation. To configure link aggregation, see [config switch trunk on page 127](#).

### Syntax

```
get switch trunk
```

### Example output

```
# get switch trunk
```

```
== [ 1 ]
name: 1 members:
== [ port3 ]
member-name: port3
== [ port10 ]
member-name: port10
== [ port1 ]
member-name: port1
```

## get switch virtual-wire

Virtual wire allows you to forward traffic between two ports with minimal filtering or packet modifications. To configure a virtual wire, see [config switch virtual-wire on page 130](#).

### Syntax

```
get switch virtual-wire
```

### Example output

```
S524DF4K15000024 # get switch virtual-wire

== [ 1 ]
name: 1
```

## get switch vlan

Use this command to get information about VLANs on the FortiSwitch unit. To configure a VLAN, see [config switch vlan on page 131](#).

### Syntax

```
get switch vlan
```

### Example output

```
# get switch vlan
== [ 1 ]
id: 1 private-vlan-type: primary isolated-vlan: 2 community-vlans: 3
== [ 2 ]
id: 2 private-vlan-type: isolated sub-VLAN primary-vlan: 1
== [ 3 ]
id: 3 private-vlan-type: community sub-VLAN primary-vlan: 1
```

## get system accprofile

Use this command to view a list of all the system administration access groups. To add an access profile group, see [config system accprofile on page 139](#).

## Syntax

```
get system admin accprofile
```

## Example output

```
S524DF4K15000024 # get system accprofile

== [ prof_admin ]
name: prof_admin
== [ profile1 ]
name: profile1
```

## get system admin list

Use this command to view a list of all the current administration sessions.

## Syntax

```
get system admin list
```

## Example output

```
# get system admin list

username local device remote started
admin sshv2 port1:172.20.120.148:22 172.20.120.16:4167 2006-08-09 12:24:20
admin https port1:172.20.120.148:443 172.20.120.161:56365 2006-08-09 12:24:20
admin https port1:172.20.120.148:443 172.20.120.16:4214 2006-08-09 12:25:29
```

Variable	Description
username	Name of the admin account for this session
local	The protocol this session used to connect to the system.
device	The interface, IP address, and port used by this session to connect to the system.
remote	The IP address and port used by the originating computer to connect to the system.
started	The time the current session started.

## get system admin status

Use this command to view the status of the currently logged in admin and their session. To configure an administrator account, see [config system admin on page 140](#).

## Syntax

```
get system admin status
```

## Example Output

```
# get system admin status

username: admin
login local: sshv2
login device: port1:172.20.120.148:22
login remote: 172.20.120.16:4167
login vdom: root
login started: 2006-08-09 12:24:20
current time: 2006-08-09 12:32:12
```

Variable	Description
username	Name of the admin account currently logged in.
login local	The protocol used to start the current session.
login device	The login information from the FortiSwitch including interface, IP address, and port number.
login remote	The computer the user is logging in from including the IP address and port number.
login vdom	The virtual domain the admin is current logged into.
login started	The time the current session started.
current time	The current time of day on the system

## get system arp

Use this command to view the ARP table entries on the FortiSwitch unit. To manually add ARP table entries to the FortiSwitch unit, see [config system arp-table on page 143](#).

### Syntax

```
get system arp
```

### Example output

```
S524DF4K15000024 # get system arp

Address          Age(min)  Hardware Addr  Interface
10.105.16.1      0         90:6c:ac:15:2f:94  mgmt
11.1.1.100       -         00:00:5e:00:01:05  vlan-8 (proxy)
```

## get system arp-table

Use this command to view the ARP tables on the FortiSwitch unit.

## Syntax

```
get system arp-table
```

## Example output

```
# get system arp-table
== [ 1 ]
id: 1 interface: internal ip: 10.10.10.10 mac: 01:02:03:04:05:aa
```

## get system bug-report

Use this command to get information about configuration related to bug reporting. To configure a custom email relay for sending problem reports to Fortinet customer support, see [config system bug-report on page 143](#).

## Syntax

```
get system bug-report
```

## Example output

```
S524DF4K15000024 # get system bug-report
auth                : no
mailto              : fortiswitch@fortinet.com
password            : (null)
server              : fortinet.com
username            : bug_report
username-smtp       : bug_report
```

## get system certificate

Use this command to display configuration related to central management service:

## Syntax

```
get system certificate (ca | crl | local | ocsd | remote)
```

Variable	Description
ca	List available CA certificates.
crl	Display the certificate revocation lists available.
local	List available local keys and certificates.
ocsp	Display the OCSP (Online Certificate Status Protocol) server certificate, the action to take when the server is unavailable, and the URL to the OCSP server.

Variable	Description
remote	List available remote certificates.

### Example output

```
S524DF4K15000024 # get system certificate ca
== [ Fortinet_CA ]
name: Fortinet_CA
== [ Fortinet_CA2 ]
name: Fortinet_CA2
== [ Entrust_802.1x_CA ]
name: Entrust_802.1x_CA
== [ Entrust_802.1x_L1K_CA ]
name: Entrust_802.1x_L1K_CA
== [ Entrust_802.1x_G2_CA ]
name: Entrust_802.1x_G2_CA

S524DF4K15000024 # get system certificate crl
== [ 1 ]
name: 1

S524DF4K15000024 # get system certificate local
== [ Fortinet_Factory ]
name: Fortinet_Factory
== [ Fortinet_Firmware ]
name: Fortinet_Firmware
== [ Entrust_802.1x ]
name: Entrust_802.1x

S524DF4K15000024 # get system certificate oosp
cert          : (null)
unavail-action : revoke
url           : (null)

S524DF4K15000024 # get system certificate remote
== [ 1 ]
name: 1
```

## get system cmdb status

Use this command to view information about configuration management database (CMDB) on the FortiSwitch unit.

### Syntax

```
get system cmdb status
```

Variable	Description
version	Version of the CMDB software.
owner id	Process identifier of the CMDB server daemon.
update index	The updated index shows how many changes have been made in the CMDB.
config checksum	The configuration file version used by FortiManager.
last request pid	The last process to access the CMDB.
last request type	Type of the last attempted access of the CMDB.
last request	The number of the last attempted access of the CMDB.

### Example output

```
# get system cmdb status
version: 1
owner id: 18
update index: 6070
config checksum: 12879299049430971535
last request pid: 68
last request type: 29
last request: 78
```

## get system console

Use this command to get information about the console connection. To configure the console, see [config system console](#) on page 148.

### Syntax

```
get system console
```

### Example output

```
S524DF4K15000024 # get system console

baudrate           : 115200
mode               : line
output             : more
```

## get system dns

Use this command to get information about the DNS settings. To configure DNS, see [config system dns](#) on page 156.

## Syntax

```
get system dns
```

## Example output

```
S524DF4K15000024 # get system dns
primary           : 208.91.112.53
secondary        : 208.91.112.52
domain           : (null)
ip6-primary      : ::
ip6-secondary   : ::
dns-cache-limit  : 5000
dns-cache-ttl    : 1800
cache-notfound-responses: disable
source-ip        : 0.0.0.0
```

## get system flow-export

Use this command to display the flow-export configuration. To configure flow export, see [config system flow-export](#) on page 157.

## Syntax

```
get system flow-export
```

## Example output

```
S524DF4K15000024 # get system flow-export
aggregates:
collector-ip      : 0.0.0.0
collector-port    : 0
format           : ipfix
identity         : 0x00000000
level            : ip
max-export-pkt-size : 512
timeout-general  : 3600
timeout-icmp     : 300
timeout-max      : 604800
timeout-tcp      : 3600
timeout-tcp-fin  : 300
timeout-tcp-rst  : 120
timeout-udp      : 300
transport        : tcp
```

## get system flow-export-data

Use this command to display the flow-export data. To configure flow export, see [config system flow-export](#) on page 157.

## Syntax

```
get system flow-export-data flows {all | <count>} {ip | subnet | mac | all} <switch_
interface_name>
get system flow-export-data flows-raw {all | <count>} {ip | subnet | mac | all} <switch_
interface_name>
get system flow-export-data statistics
```

**NOTE:** Layer-2 flows for netflow 1 and netflow 5 are not supported. For the output of the `get system flow-export-data statistics` command, the Incompatible Type field displays how many flows are not exported because they are not supported.

Variable	Description
flows {all   <count>} {ip   subnet   mac   all} <switch_interface_name>	Display the specified number of records or all records of flow data for the specified IP address, subnet (class IP address and netmask), MAC address, or all.
flows-raw {all   <count>} {ip   subnet   mac   all} <switch_interface_name>	Display the specified number of records or all records of raw flow data for the specified IP address, subnet (class IP address and netmask), MAC address, or all.
statistics	Display the statistics for the flow data.

## get system fsw-cloud

Use this command to display the configuration of the FortiSwitch Cloud. To configure the FortiSwitch Cloud, see [config system fsw-cloud](#) on page 159.

### Syntax

```
get system fsw-cloud
```

### Example output

```
S524DF4K15000024 # get system fsw-cloud

interval          : 15
name              : fortiswitch-dispatch.forticloud.com
port              : 443
status           : enable
```

## get system fsw-cloud-mgr connection-info

Use this command to check your connections to the FortiSwitch Cloud.

### Syntax

```
get system fsw-cloud-mgr connection-info
```

## Example output

```
S1D243Z14000027 # get system fsw-cloud-mgr connection-info

## get system global

Use this command to get the global settings of your FortiSwitch unit. To configure global settings, [config system global](#) on page 160.

### Syntax

```
get system global
```

### Example output

```
S524DF4K15000024 # get system global

## get system info admin ssh

Use this command to display information about the SSH configuration on the FortiSwitch unit such as:

- the SSH port number
- the interfaces with SSH enabled
- the hostkey DSA fingerprint
- the hostkey RSA fingerprint

### Syntax

```
get system info admin ssh
```

### Example output

```
# get system info admin ssh
SSH v2 is enabled on port 22
SSH is enabled on the following 1 interfaces:
mgmt
```

```
SSH hostkey DSA fingerprint = cd:e1:87:70:bb:f0:9c:7d:e3:7b:73:f7:44:23:a5:99
SSH hostkey RSA fingerprint = c9:5b:49:1d:7c:ba:be:f3:9d:39:33:4d:48:9d:b8:49
```

## get system info admin status

Use this command to display administrators that are logged into the FortiSwitch unit.

### Syntax

```
get system info admin status
```

Variable	Description
Index	The order the administrators logged in.
User name	The name of the user account logged in.
Login type	Which interface was used to log in.
From	The IP address this user logged in from.

### Example output

```
Index User name Login type From
0 admin CLI ssh(172.20.120.16)
1 admin WEB 172.20.120.16
```

## get system interface physical

Use this command to list information about the physical network interfaces.

### Syntax

```
get system interface physical
```

### Example output

```
S524DF4K15000024 # get system interface physical
== [onboard]
  ==[internal]
    mode: static
    ip: 0.0.0.0 0.0.0.0
    ipv6: ::/0
    status: up
    speed: n/a (Duplex: n/a)
    rx : 0 bytes 0 packets
    tx : 8405158 bytes 160742 packets
```

```
== [mgmt]
  mode: dhcp
  ip: 10.105.19.3 255.255.252.0
  ipv6: ::/0
  status: up
  speed: 1000Mbps (Duplex: full)
  rx : 11558117 bytes  85986 packets
  tx : 7048800 bytes  39380 packet
```

## get system ipv6-neighbor-cache

Use this command to list information about the IPv6 neighbor cache table. To configure the IPv6 neighbor cache table, see [config system ipv6-neighbor-cache on page 179](#).

### Syntax

```
get system ipv6-neighbor-cache
```

## get system link-monitor

Use this command to list information about the physical network interfaces. To configure the link health monitor, see [config system link-monitor on page 180](#).

### Syntax

```
get system link-monitor
```

## get system location

Use this command to get information about the location table used by LLDP-MED for enhanced 911 emergency calls. To configure a location table, see [config system location on page 181](#).

### Syntax

```
get system location
```

### Example output

```
S548DF5018000776 # get system location
== [ Fortinet ]
name: Fortinet
```

## get system ntp

Use this command to get information about the NTP settings. To configure an NTP server, see [config system ntp on page 186](#).

## Syntax

```
get system ntp
```

## Example output

```
ntpserver:
== [ 1 ]
id: 1
== [ 2 ]
id: 2
ntpsync : enable
source-ip : 0.0.0.0
syncinterval : 1
```

## get system password-policy

Use this command to view the password policy. To create a password policy, see [config system password-policy](#) on page 187.

## Syntax

```
get system password-policy
```

## Example output

```
# get system password-policy
status : enable
apply-to : admin-password
minimum-length : 8
min-lower-case-letter: 2
min-upper-case-letter: 2
min-non-alphanumeric: 0
min-number : 2
    change-4-characters : disable
expire-status : disable
```

## get system performance firewall statistics

Use this command to display a list of traffic types (such as browsing, email, and DNS) and the number of packets and number of payload bytes accepted by the firewall for each type since the system was restarted.

## Syntax

```
get system performance firewall statistics
```

## Example output

```
get system performance firewall statistics
getting traffic statistics...
Browsing: 623738 packets, 484357448 bytes
DNS: 5129187383836672 packets, 182703613804544 bytes
```

```

E-Mail: 23053606 packets, 2 bytes
FTP: 0 packets, 0 bytes
Gaming: 0 packets, 0 bytes
IM: 0 packets, 0 bytes
Newsgroups: 0 packets, 0 bytes
P2P: 0 packets, 0 bytes
Streaming: 0 packets, 0 bytes
TFTP: 654722117362778112 packets, 674223966126080 bytes
VoIP: 16834455 packets, 10 bytes
Generic TCP: 266287972352 packets, 8521215115264 bytes
Generic UDP: 0 packets, 0 bytes
Generic ICMP: 0 packets, 0 bytes
Generic IP: 0 packets, 0 bytes

```

## get system performance status

Use this command to display FortiSwitch CPU usage, memory usage, network usage, sessions, virus, IPS attacks, and system up time.

### Syntax

```
get system performance status
```

### Example output

```

S524DF4K15000024 # get system performance status

CPU states: 0% user 16% system 0% nice 84% idle
Memory states: 10% used
Average network usage: 0 kbps in 1 minute, 0 kbps in 10 minutes, 0 kbps in 30
minutes
Uptime: 0 days, 22 hours, 5 minutes

```

Variable	Description
CPU states	<p>The percentages of CPU cycles used by user, system, nice and idle categories of processes. These categories are:</p> <ul style="list-style-type: none"> <li><code>user</code> -CPU usage of normal user-space processes</li> <li><code>system</code> -CPU usage of kernel</li> <li><code>nice</code> - CPU usage of user-space processes having other-than-normal running priority</li> <li><code>idle</code> - Idle CPU cycles</li> </ul> <p>Adding user, system, and nice produces the total CPU usage as seen on the CPU widget on the web-based system status dashboard.</p>

Variable	Description
Memory states	The percentage of memory used.
Average network usage	The average amount of network traffic in kbps in the last 1, 10 and 30 minutes.
Uptime	How long since the system has been restarted.

## get system performance top

Use this command to display the list of processes running on the system (similar to the Linux `top` command).

The following commands are available when `get system performance top` is running:

- Press Q or Ctrl+C to quit.
- Press P to sort the processes by the amount of CPU that the processes are using.
- Press M to sort the processes by the amount of memory that the processes are using.

### Syntax

```
get system performance top [<delay_int>] <max_lines_int>]]
```

Variable	Description
<delay_int>	The delay, in seconds, between updating the process list. The default is 5 seconds.
<max_lines_int>	The maximum number of processes displayed in the output. The default is 20 lines.

```
S524DF4K15000024 # get system performance top
```

```
Run Time: 0 days, 22 hours and 13 minutes

## get system schedule group

Use this command to list available schedule groups for when an access control list (ACL) will be active. To configure a schedule group, see [config system schedule group on page 188](#).

### Syntax

```
get system schedule group
```

### Example output

```
S548DF5018000776 # get system schedule group
== [ group1 ]
name: group1
```

## get system schedule onetime

Use this command to list available one-time schedules for when an access control list (ACL) will be active. To configure a one-time schedule, see [config system schedule onetime on page 189](#).

### Syntax

```
get system schedule onetime
```

### Example output

```
S548DF5018000776 # get system schedule onetime
== [ schedule1 ]
name: schedule1
```

## get system schedule recurring

Use this command to list schedules for when an access control list (ACL) will be active every week. To configure a recurring schedule, see [config system schedule recurring on page 189](#).

### Syntax

```
get system schedule recurring
```

### Example output

```
S548DF5018000776 # get system schedule recurring
== [ schedule2 ]
name: schedule2
```

## get system settings

Use this command to get information about equal cost multi-path (ECMP) routing. To configure ECMP routing, see [config system settings on page 190](#).

### Syntax

```
get system settings
```

### Example output

```
#get system settings
v4-ecmp-mode : source-ip-based
```

## get system sflow

Use this command to display the sFlow settings. To configure sFlow, see [config system sflow on page 191](#).

### Syntax

```
get system sflow
```

### Example output

```
S524DF4K15000024 # get system sflow
collector-ip      : 0.0.0.0
collector-port    : 6343
```

## get system sniffer-profile capture

Use this command to display the packet capture for a specific packet-capture profile. To create a packet-capture profile, see [config system sniffer-profile on page 192](#).

### Syntax

```
get system sniffer-profile capture <profile_name>
```

## get system sniffer-profile summary

Use this command to display the status of all configured packet-capture profiles. To create a packet-capture profile, see [config system sniffer-profile on page 192](#).

### Syntax

```
get system sniffer-profile summary
```

## Example output

```
S524DF4K15000024 # get system sniffer-profile summary
```

```
Maximum memory available for storing packet-capture: 100 MB.
```

```
Name | Status | Pkt-Count | Snap Len | Size (KB) | Filter
```

```
=====
```

Name	Status	Pkt-Count	Snap Len	Size (KB)	Filter
profile1	Stop	No Capture	100	0.00	none

## get system snmp sysinfo

Use this command to get information about your system's SNMP settings. To configure the SNMP agent, see [config system snmp sysinfo on page 195](#).

### Syntax

```
get system snmp sysinfo
```

### Example output

```
S524DF4K15000024 # get system snmp sysinfo
```

```
contact-info          : (null)
description           : (null)
engine-id             : (null)
location              : (null)
status                : disable
trap-high-cpu-threshold: 80
trap-log-full-threshold: 90
trap-low-memory-threshold: 80
trap-temp-alarm-threshold: 60
trap-temp-warning-threshold: 50
```

## get system source-ip status

Use this command to list defined source IP addresses.

### Syntax

```
get system source-ip status
```

### Example output

```
# get sys source-ip status
The following services force their communication to use
a specific source IP address:

service=NTP source-ip=172.18.19.101
service=DNS source-ip=172.18.19.101
vdom=root service=RADIUS name=server-pc25 source-ip=10.1.100.101
vdom=root service=TACACS+ name=tac_plus_pc25 source-ip=10.1.100.101
```

```
vdom=root service=FSAE name=pc26 source-ip=172.18.19.101
vdom=V1 service=RADIUS name=pc25-Radius source-ip=172.16.200.101
vdom=V1 service=TACACS+ name=pc25-tacacs+ source-ip=172.16.200.101
vdom=V1 service=FSAE name=pc16 source-ip=172.16.200.101
```

## get system startup-error-log

Use this command to display information about system startup errors. This command only displays information if an error occurs when the system starts up.

### Syntax

```
get system startup-error-log
```

## get system status

Use this command to display FortiSwitch status information including:

- firmware version, build number, and branch point
- serial number
- host name
- system time and date and related settings

### Syntax

```
get system status
```

### Example output

```
S524DF4K15000024 # get system status

Version: FortiSwitch-524D-FPOE v3.6.2,build0382,170829 (GA)
Serial-Number: S524DF4K15000024
BIOS version: 04000013
System Part-Number: P18045-04
Burn in MAC: 08:5b:0e:f1:95:e4
Hostname: S524DF4K15000024
Distribution: International
Branch point: 382
System time: Tue Sep 12 16:16:40 2017
```

## get test

Use this command to display information about applications on this FortiSwitch unit:

### Syntax

```
get test {dnsproxy | fpmd | radiusd | sflowd | snmpd} <test_level_int>
```

Variable	Description
{dnsproxy   fpm   radiusd   sflowd   snmpd}	<p>Set the application to be tested. Tests can be run on the following applications:</p> <ul style="list-style-type: none"> <li>• dnsproxy — DNS proxy</li> <li>• fpm — FPM daemon</li> <li>• radiusd — RADIUS daemon</li> <li>• sflowd — sFlow daemon</li> <li>• snmpd — SNMP daemon</li> </ul>
<test_level_int>	Set the level for the test.

### Example output

```
S524DF4K15000024 # get test fpm 1
ROUTE_V4_ADD : 9
INTF_V4_ADDR_ADD : 14
ROUTE_V4_MGMT_FWD_DISABLED : 4
ROUTE_ADD_INVALID_FAMILY : 3
ROUTE_ADD_INET127 : 1

S524DF4K15000024 # get test sflowd 1
cmf sflow collector:0.0.0.0:[6343]
sflowd collector:0.0.0.0:[6343]
```

## get user group

Use this command to list all user groups. To add a user group, see [config user group on page 197](#).

### Syntax

```
get user group
```

### Example output

```
S524DF4K15000024 # get user group
== [ group1 ]
name: group1
== [ radgroup ]
name: radgroup
```

## get user ldap

Use this command to list LDAP users. To add an LDAP user, see [config user ldap on page 199](#).

### Syntax

```
get user ldap
```

## get user local

Use this command to list local users. To add a local user, see [config user local on page 201](#).

### Syntax

```
get user local
```

### Example output

```
S524DF4K15000024 # get user local

== [ user1 ]
name: user1
```

## get user radius

Use this command to list RADIUS users. To add a RADIUS user, see [config user radius on page 202](#).

### Syntax

```
get user radius
```

### Example output

```
S524DF4K15000024 # get user radius

== [ serve2 ]
name: serve2
== [ radone ]
name: radone
```

## get user setting

Use this command to get information about all the system's user settings.

### Syntax

```
get user setting
```

### Example output

```
S524DF4K15000024 # get user setting

auth-blackout-time : 0
```

```
auth-cert          : (null)
auth-http-basic   : disable
auth-invalid-max  : 5
auth-multi-group  : enable
auth-ports:
  == [ 1 ]
  id: 1
auth-secure-http  : disable
auth-timeout      : 5
auth-timeout-type : idle-timeout
auth-type         : http https ftp telnet
```

## get user tacacs+

Use this command to get information about tacacs+ users.

### Syntax

```
get user tacacs+
```

### Example output

```
S524DF4K15000024 # get user tacacs+
```

```
== [ tacserver ]
name: tacserver
```

## Appendix: FortiSwitch QoS template

The following is a template for setting up QoS on a FortiSwitch unit:

```
config switch qos dot1p-map
  edit "voice-dot1p"
    set priority-0 queue-4
    set priority-1 queue-4
    set priority-2 queue-3
    set priority-3 queue-2
    set priority-4 queue-3
    set priority-5 queue-1
    set priority-6 queue-2
    set priority-7 queue-2
  next
end

config switch qos ip-dscp-map
  edit "voice-dscp"
    config map
      edit "1"
        set cos-queue 1
        set value 46
      next
      edit "2"
        set cos-queue 2
        set value 24,26,48,56
      next
      edit "5"
        set cos-queue 3
        set value 34
      next
    end
  next
end

config switch qos qos-policy
  edit "default" // you can ignore this portion, this is default policy
    config cos-queue
      edit "queue-0"
      next
      edit "queue-1"
      next
      edit "queue-2"
      next
      edit "queue-3"
      next
      edit "queue-4"
      next
      edit "queue-5"
```

```
                next
                edit "queue-6"
                next
                edit "queue-7"
                next
            end
        set schedule round-robin
    next
    edit "voice_egr_policy"
        config cos-queue
            edit "queue-0"
            next
            edit "queue-1"
                set weight 0
            next
            edit "queue-2"
                set weight 6
            next
            edit "queue-3"
                set weight 37
            next
            edit "queue-4"
                set weight 12
            next
            edit "queue-5"
            next
            edit "queue-6"
            next
            edit "queue-7"
            next
        end
    set schedule weighted
    next
end

edit "port5"
    ...
    set trust-dot1p-map " voice-dot1p "
    set trust-ip-dscp-map " voice-dscp "
next
edit "port6"
    ...
    set trust-dot1p-map " voice-dot1p "
    set trust-ip-dscp-map " voice-dscp "
next
edit "port7"
    ...
    set trust-dot1p-map " voice-dot1p "
    set trust-ip-dscp-map " voice-dscp "
next
end
```

```
edit "port14"  
    ...  
    set qos-policy "voice_egr_policy"  
end
```
