# About FortiManager for AWS

FortiManager's security-operationalized visibility across your Fortinet Security Fabric enables true security effectiveness and foresight to identify and understand the scope of threats and facilitates actionable responses and risk remediation.

Quantifiable security solution information produces measurable accountability and uses those ratings to compare your security preparedness internally and to that of your industry peers.

Centralized change management helps you update policies and objects, maintain provisioning templates and easily configure changes to your APs, switches, SD-WAN and SDN connectors and more, to mitigate security events and apply configuration changes and policy updates.

Network administrators can better control their network by logically grouping devices into administrative domains (ADOMs), effectively applying policies and distributing content security/firmware updates. FortiManager is one of several versatile network security management products that provide diversity of deployment types, growth flexibility, advanced customization through APIs, and simple licensing, all through central management and configuration.

## Instance type support

You can deploy FortiManager for AWS as a virtual machine.

The following lists supported instance types for each FortiManager listing on the AWS marketplace. Supported instances may change without notice.

## Bring your own license (BYOL)

The BYOL listing supports the following instance types. The m4.large instance type is recommended.

- c4.2xlarge
- c4.4xlarge
- c4.8xlarge
- c4.large
- c4.xlarge
- c5.2xlarge
- c5.4xlarge
- c5.9xlarge
- c5.18xlarge
- c5.large
- c5.xlarge
- d2.2xlarge
- d2.4xlarge
- d2.8xlarge
- d2.xlarge
- h1.2xlarge

- h1.4xlarge
- h1.8xlarge
- h1.16xlarge
- m4.2xlarge
- m4.4xlarge
- m4.10xlarge
- m4.16xlarge
- m4.large
- m4.xlarge
- m5.2xlarge
- m5.4xlarge
- m5.12xlarge
- m5.24xlarge
- m5.large
- m5.xlarge
- c5.12xlarge
- c5.24xlarge
- m5.16xlarge
- m5.8xlarge

## On-demand

Listing name	Supported instance types	Recommended instance type
FortiManager Centralized Security Management (Max 2 managed devices)	<ul style="list-style-type: none"> <li>• m5.large</li> <li>• m5.xlarge</li> <li>• t2.medium</li> </ul>	m5.large
FortiManager Centralized Security Management (Max 10 managed devices)	<ul style="list-style-type: none"> <li>• h1.2xlarge</li> <li>• h1.4xlarge</li> <li>• h1.8xlarge</li> <li>• m5.2xlarge</li> <li>• m5.4xlarge</li> <li>• m5.12xlarge</li> <li>• m5.large</li> <li>• m5.xlarge</li> <li>• t2.large</li> <li>• t2.xlarge</li> <li>• m5.8xlarge</li> </ul>	
FortiManager Centralized Security Management (Max 30 managed devices)	<ul style="list-style-type: none"> <li>• h1.2xlarge</li> <li>• h1.4xlarge</li> <li>• h1.8xlarge</li> <li>• h1.16xlarge</li> <li>• m5.2xlarge</li> <li>• m5.4xlarge</li> </ul>	

Listing name	Supported instance types	Recommended instance type
	<ul style="list-style-type: none"> <li>• m5.12xlarge</li> <li>• m5.24xlarge</li> <li>• m5.large</li> <li>• m5.xlarge</li> <li>• t2.2xlarge</li> <li>• t2.large</li> <li>• t2.xlarge</li> <li>• m5.16xlarge</li> <li>• m5.8xlarge</li> </ul>	
FortiManager Centralized Security Management (Max 100 managed devices)	<ul style="list-style-type: none"> <li>• h1.2xlarge</li> <li>• h1.4xlarge</li> <li>• h1.8xlarge</li> <li>• h1.16xlarge</li> <li>• m5.2xlarge</li> <li>• m5.4xlarge</li> <li>• m5.12xlarge</li> <li>• m5.24xlarge</li> <li>• m5.large</li> <li>• m5.xlarge</li> <li>• t2.2xlarge</li> <li>• t2.large</li> <li>• t2.xlarge</li> <li>• m5.16xlarge</li> <li>• m5.8xlarge</li> </ul>	m5.xlarge
FortiManager Centralized Security Management (Max 500 managed devices)	<ul style="list-style-type: none"> <li>• h1.2xlarge</li> <li>• h1.4xlarge</li> <li>• h1.8xlarge</li> <li>• h1.16xlarge</li> <li>• m5.2xlarge</li> <li>• m5.4xlarge</li> <li>• m5.12xlarge</li> <li>• m5.24xlarge</li> <li>• m5.large</li> <li>• m5.xlarge</li> <li>• t2.2xlarge</li> <li>• t2.xlarge</li> <li>• m5.16xlarge</li> <li>• m5.8xlarge</li> </ul>	m5.2xlarge

## Models

FortiManager-VM is licensed based on the number of managed devices, amount of logging per day, and storage capacity. Refer to price lists and order SKUs available through your resellers/distributors. These are also referred to as BYOL models.

You can deploy FortiManager-VM using different CPU and RAM sizes and launch them on various private and public cloud platforms.

## Licensing

You must have a license to deploy FortiManager-VM for AWS.

## Order types

On AWS, there are usually two order types: BYOL and on-demand.

BYOL offers perpetual (normal series and v-series) licensing as opposed to on-demand, which is an hourly subscription available with marketplace-listed products. BYOL licenses are available for purchase from resellers or your distributors, and prices are listed in the publicly available price list which is updated quarterly. BYOL licensing provides the same ordering practice across all private and public clouds, no matter what the platform is. You must activate a license for the first time you access the instance from the GUI or CLI before you can start using various features.

With an on-demand subscription, the FortiGate-VM becomes available for use immediately after you create the instance. Different tiers on number of managed devices with term-based prices (hourly or annually) are mentioned in the marketplace product page.

For BYOL and on-demand deployments, cloud vendors charge separately for resource consumption on computing instances, storage, and so on, without use of software running on top of it (in this case the FortiGate-VM).

For BYOL, you typically order a combination of products and services including support entitlement. On-demand includes support, for which you must contact [Fortinet Support](#) with your customer information. See *Support Information* on the [marketplace product page](#).

To purchase on-demand, all you need to do is subscribe to the product on the marketplace. However, you must contact Fortinet Support with your customer information to obtain support entitlement. See [Creating a support account on page 8](#). For the latest on-demand pricing and support details, see the following marketplace product pages:

- [FortiManager Centralized Security Management \(Max 2 managed devices\)](#)
- [FortiManager Centralized Security Management \(Max 10 managed devices\)](#)
- [FortiManager Centralized Security Management \(Max 30 managed devices\)](#)
- [FortiManager Centralized Security Management \(Max 100 managed devices\)](#)
- [FortiManager Centralized Security Management \(Max 500 managed devices\)](#)

On-demand FortiGate-VM instances do not support the use of virtual domains (VDMs). If you plan to use VDMs, deploy BYOL instances instead.

---

## Creating a support account

FortiManager-VM for AWS supports on-demand and BYOL licensing models. See [Order types on page 7](#).

To make use of Fortinet technical support and ensure products function properly, you must complete certain steps to activate your entitlement. The Fortinet support team can identify your registration in the system thereafter.

First, if you do not have a Fortinet account, create one at [Customer Service & Support](#).

### BYOL

You must obtain a license to activate the FortiManager-VM. If you have not activated the license, you see the license upload screen when you log in to the FortiManager-VM and cannot proceed to configure the FortiManager-VM.

You can obtain licenses for the BYOL licensing model through any Fortinet partner. If you do not have a partner, contact [awssales@fortinet.com](mailto:awssales@fortinet.com) for assistance in purchasing a license.

After you purchase a license or obtain an evaluation license (60-day term), you receive a PDF with an activation code.

#### To register a BYOL license:

1. Go to [Customer Service & Support](#) and create a new account or log in with an existing account.
2. Go to *Asset > Register/Activate* to start the registration process. In the *Specify Registration Code* field, enter your license activation code and select *Next* to continue registering the product. Enter your details in the other fields.
3. At the end of the registration process, download the license (.lic) file to your computer. You will upload this license later to activate the FortiManager-VM.  
After registering a license, Fortinet servers may take up to 30 minutes to fully recognize the new license. When you upload the license (.lic) file to activate the FortiManager-VM, if you get an error that the license is invalid, wait 30 minutes and try again.

### On-demand

1. Deploy and boot the FortiManager-VM on-demand Elastic Compute Cloud (EC2) instance and log in to the FortiManager-VM GUI management console.
2. From the Dashboard, copy the FortiManager-VM serial number.
3. Go to [Customer Service & Support](#) and create a new account or log in with an existing account.
4. Go to *Asset > Register/Activate* to start the registration process.
5. In the *Specify Registration Code* field, enter the serial number, and select *Next* to continue registering the product. Enter your details in the other fields.
6. After completing registration, contact [Fortinet Customer Support](#) and provide your FortiManager instance's serial number and the email address associated with your Fortinet account.

# Deploying FortiManager on AWS

Bring your own license (BYOL) is perpetual licensing as opposed to on-demand, which is an hourly subscription. The BYOL license is available from resellers or your distributors.

You can deploy FortiManager-VMs on the AWS Elastic Compute Cloud (EC2). You must have an Amazon Elastic Compute Cloud (EC2) account prior to deploying the VM. You can deploy the FortiManager-VM using AWS marketplace launch or directly from the EC2 console.

With BYOL licensing, deploying FortiManager on AWS consists of the following steps:

1. [Initial deployment on page 10](#)
2. [Registering and downloading your license on page 14](#)
3. [Connecting to FortiManager on page 15](#)
4. [Adding additional storage \(optional\) on page 15](#)

With on-demand licensing, deploying FortiManager on AWS consists of the following steps:

1. [Initial deployment on page 10](#)
2. [Adding additional storage \(optional\) on page 15](#)

## Initial deployment

This example deploys a FortiManager instance from the EC2 console.

### To deploy a FortiManager instance from the EC2 console:

1. Launch the FortiManager-VM instance:
  - a. Find the FortiManager [listing](#) on the AWS marketplace. Choose the FortiManager version based on the number of devices you want to manage.
  - b. After configuring the software, click *Continue to Launch*. For a BYOL instance, select *Launch through EC2*, then click *Launch*.

2. Select one of the supported instance types. Click *Next: Configure Instance Details*.

Instance Type	General purpose	Compute optimized	EBS only	Yes	Yes	Yes	Yes
m5.24xlarge	96	384	EBS only	Yes	25 Gigabit	Yes	
m4.large	2	8	EBS only	Yes	Moderate	Yes	
m4.xlarge	4	16	EBS only	Yes	High	Yes	
m4.2xlarge	8	32	EBS only	Yes	High	Yes	
m4.4xlarge	16	64	EBS only	Yes	High	Yes	
m4.10xlarge	40	160	EBS only	Yes	10 Gigabit	Yes	
m4.16xlarge	64	256	EBS only	Yes	25 Gigabit	Yes	
c5d.large	2	4	1 x 50 (SSD)	Yes	Up to 10 Gigabit	Yes	
c5d.xlarge	4	8	1 x 100 (SSD)	Yes	Up to 10 Gigabit	Yes	

Buttons: Cancel, Previous, Review and Launch, Next: Configure Instance Details

3. Configure the various attributes:

- Network:** Ensure to select a VPC connected to the Internet gateway. By default, VPCs are connected to the Internet gateway.
- Subnet**
- Enable *Auto-assign public IP*
- Other as needed depending on your IT infrastructure requirements

Click *Next: Add Storage*.

Number of instances: 1 Launch into Auto Scaling Group

Purchasing option: ☐ Request Spot instances

Network: vpc-52c0cb30 (default) Create new VPC

Subnet: No preference (default subnet in any Availability Zone) Create new subnet

Auto-assign Public IP: Use subnet setting (Enable)

Placement group: ☐ Add instance to placement group

IAM role: None Create new IAM role

Shutdown behavior: Stop

Enable termination protection: ☐ Protect against accidental termination

Monitoring: ☐ Enable CloudWatch detailed monitoring Additional charges apply.

EBS-optimized instance: ☒ Launch as EBS-optimized instance

Tenancy: Shared - Run a shared hardware instance Additional charges will apply for dedicated tenancy.

Advanced Details

Buttons: Cancel, Previous, Review and Launch, Next: Add Storage

4. You can configure disks by choosing one of the following options:
  - a. Leave the disks at default values. You can add additional disks later.
  - b. Increase the second volume's disk size. The second volume is used for logging.
  - c. Add additional disks.

You can configure the volume type as *EBS*, the device as */dev/sdb*, and the size based on your requirements. You are entitled to consume disks according to the licensed limit of the purchased BYOL license.

For more detail about disk sizes and the maximum limit of licensed numbers of devices, see the product listing page.

The FortiManager system reserves a certain portion of disk space for system use and unexpected quota overflow. The remaining space is available for allocation to devices. Reports are stored in the reserved space. The following describes the reserved disk quota relative to the total available disk size (other than the root device):

- **Small disk** (less than or equal to 500 GB): system reserves 20% or 50 GB of disk space, whichever is smaller.
- **Medium disk** (less than or equal to 1 TB): system reserves 15% or 100 GB of disk space, whichever is smaller.
- **Large disk** (less than or equal to 5 TB): system reserves 10% or 200 GB of disk space, whichever is smaller.
- **Very large disk** (greater than 5 TB): system reserves 5% or 300 GB of disk space, whichever is smaller.

To add additional storage at this point, follow the instructions in [Adding additional storage \(optional\)](#).

Click *Next: Add Tags*.

**Step 4: Add Storage**

Your instance will be launched with the following storage device settings. You can attach additional EBS volumes and instance store volumes to your instance, or edit the settings of the root volume. You can also attach additional EBS volumes after launching an instance, but not instance store volumes. [Learn more](#) about storage options in Amazon EC2.

Volume Type ⓘ	Device ⓘ	Snapshot ⓘ	Size (GiB) ⓘ	Volume Type ⓘ	IOPS ⓘ	Throughput (MB/s) ⓘ	Delete on Termination ⓘ	Encrypted ⓘ
Root	/dev/sda1	snap-0cc8ba45dc61e1191	3	Magnetic	N/A	N/A	<input checked="" type="checkbox"/>	Not Encrypted
EBS	/dev/sdb	Search (case-insensit)	500	General Purpose ss	1500 / 3000	N/A	<input checked="" type="checkbox"/>	Not Encrypted

[Add New Volume](#)

General Purpose (SSD) volumes provide the ability to burst to 3000 IOPS per volume, independent of volume size, to meet the performance needs of most applications and also deliver a consistent baseline of 3 IOPS/GiB. [Set my root volume to General Purpose \(SSD\)](#).

Free tier eligible customers can get up to 30 GB of EBS General Purpose (SSD) or Magnetic storage. [Learn more](#) about free usage tier eligibility and usage restrictions.

[Cancel](#) [Previous](#) [Review and Launch](#) [Next: Add Tags](#)

5. Create or add tags as required. Name tags are convenient to use to distinguish EC2 instance names. You can also leave this section blank and continue by clicking *Next: Configure Security Group*.

**Step 5: Add Tags**

A tag consists of a case-sensitive key-value pair. For example, you could define a tag with key = Name and value = Webserver. [Learn more](#) about tagging your Amazon EC2 resources.

Key (127 characters maximum)	Value (255 characters maximum)
Name	jkat0-fmg563-0008

[Add another tag](#) (Up to 50 tags maximum)

[Cancel](#) [Previous](#) [Review and Launch](#) [Next: Configure Security Group](#)

6. Review all open ports configured by default. Usually, these can stay as-is. Most strict configuration is to allow SSH or HTTPS to access the FortiManager management console. Accessing the GUI requires the HTTPS port to be open. Refer [here](#) to see each port's purpose.

**Step 6: Configure Security Group**

A security group is a set of firewall rules that control the traffic for your instance. On this page, you can add rules to allow specific traffic to reach your instance. For example, if you want to set up a web server and allow Internet traffic to reach your instance, add rules that allow unrestricted access to the HTTP and HTTPS ports. You can create a new security group or select from an existing one below. [Learn more](#) about Amazon EC2 security groups.

Assign a security group: ☒ Create a new security group ☐ Select an existing security group

Security group name:

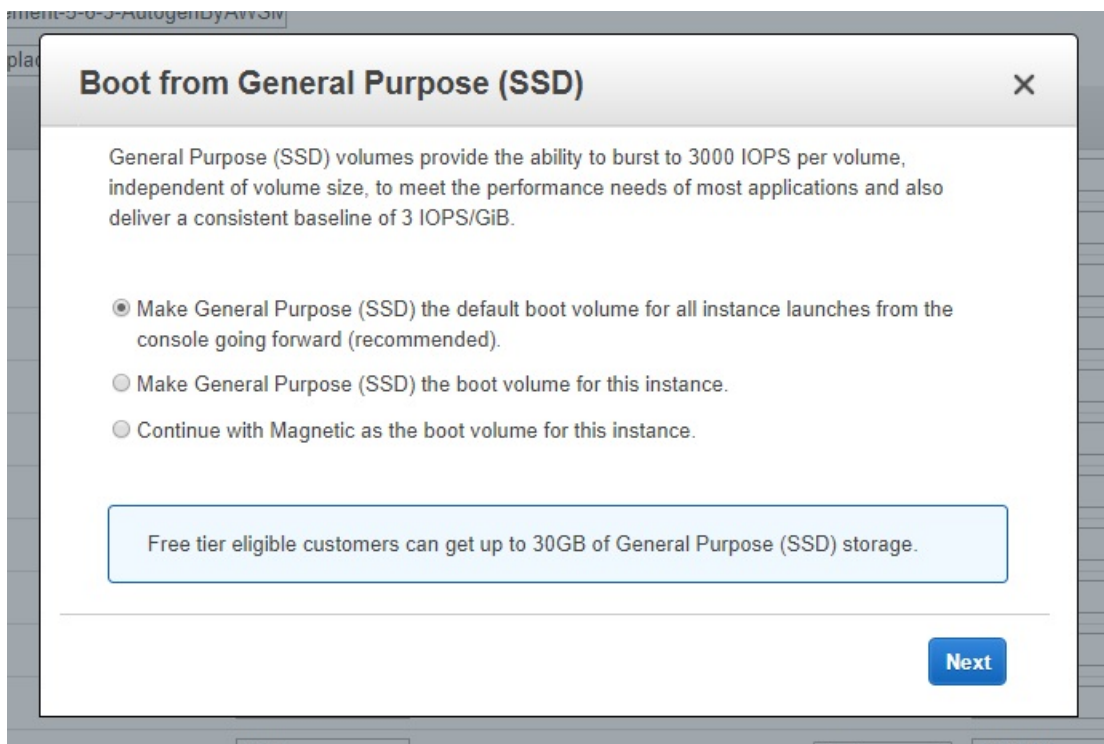

Description:

Type	Protocol	Port Range	Source	Description
SSH	TCP	22	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
HTTP	TCP	80	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
Custom UDP	UDP	9443	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
HTTPS	TCP	443	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
Custom TCP	TCP	514	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
Custom TCP	TCP	541	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
Custom TCP	TCP	2032	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
Custom TCP	TCP	3000	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
Custom TCP	TCP	5199	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
Custom TCP	TCP	6020	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
Custom TCP	TCP	6028	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop
Custom TCP	TCP	8080	Custom 0.0.0.0/0	e.g. SSH for Admin Desktop

[Add Rule](#)

[Cancel](#) [Previous](#) [Review and Launch](#)

7. Review the configuration and launch the instance:
  - a. Click **Review and Launch**. A popup may ask if you want to make General Purpose (SSD) the default boot volume. Select the desired option, then click **Next**.

- b. Review the configuration and click *Launch Instance*.
- c. Select a key pair, check the acknowledgment checkbox, then click *Launch Instance*.
8. An on-demand FortiManager-VM instance requires connectivity to FortiCare to obtain a valid license. Otherwise, the FortiManager-VM shuts down for self-protection. Ensure the following:
  - Outgoing connectivity to <https://directregistration.fortinet.com:443> is allowed in security groups and ACLs.
  - A public IP address (either default or EIP) is assigned.

## Registering and downloading your license

You can obtain licenses for the BYOL licensing model through any Fortinet partner. If you do not have a partner, contact [awssales@fortinet.com](mailto:awssales@fortinet.com) for assistance in purchasing a license.

After you purchase a license or obtain an evaluation license (60-day term), you receive a PDF with an activation code.

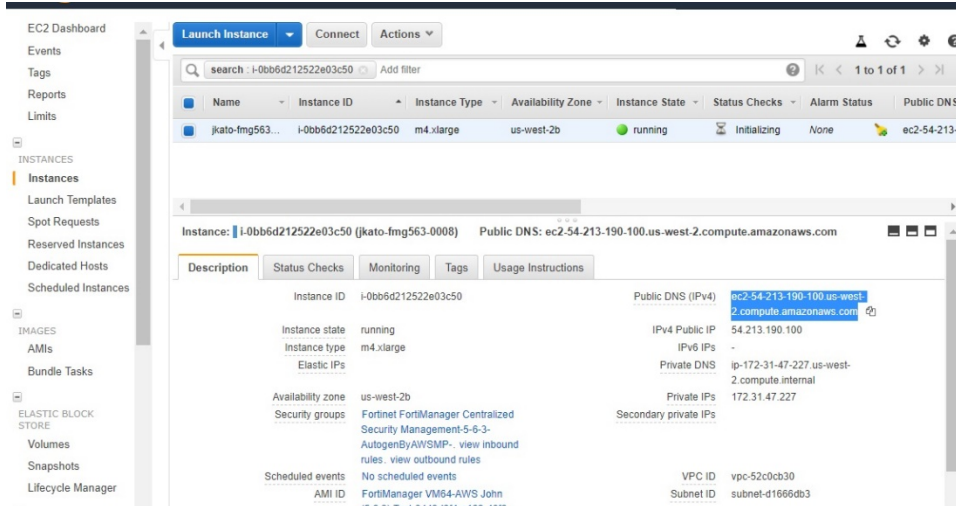

### To register and download your license:

1. Go to [Customer Service & Support](#) and create a new account or log in with an existing account.
2. Go to *Asset > Register/Activate* to start the registration process. In the *Specify Registration Code* field, enter your license activation code and select *Next* to continue registering the product. Enter your details in the other fields.
3. At the end of the registration process, download the license (.lic) file to your computer. You will upload this license later to activate the FortiManager-VM.
4. After registering a license, Fortinet servers may take up to 30 minutes to fully recognize the new license. When you upload the license (.lic) file to activate the FortiManager-VM, if you get an error that the license is invalid, wait 30 minutes and try again.

## Connecting to FortiManager

To connect to FortiManager:

1. Log in to the EC2 console and navigate to the FortiManager instance. Find the public DNS or elastic IP address that you can access over the Internet.

2. In a browser, go to `https://<public DNS or elastic IP address>`.
3. Once deployed, log in to FortiManager with the username "admin". The initial password is the instance ID. Changing the initial password at the first login is highly encouraged.
4. Go to *System Settings* to see the system status on the dashboard. Check if you have sufficient disk space. Otherwise, you must add a disk/volume.

## Adding additional storage (optional)

You can add additional storage to FortiManager after launch. Create an EBS storage and attach it to the FortiManager instance on EC2 console, then access FortiManager via the CLI window on the GUI or SSH to run the `exec lvm extend` command to add storage.

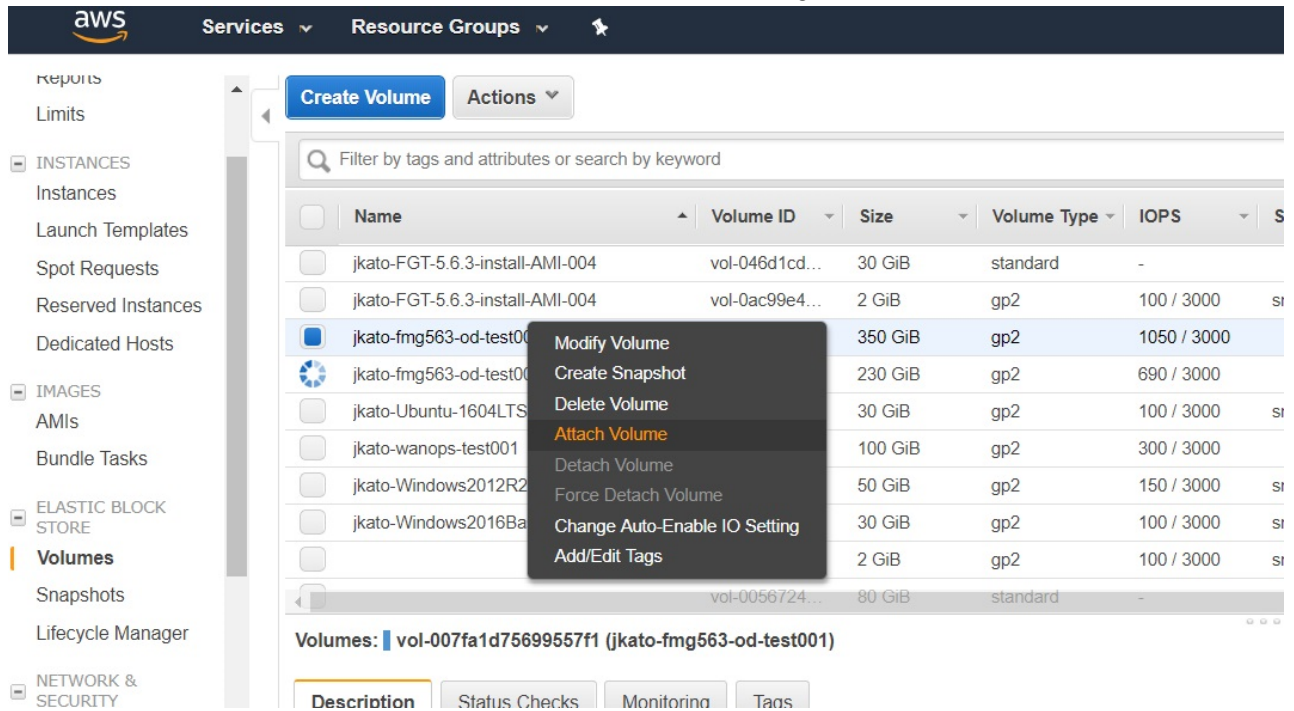

For details, refer to [Technical Note: Extending disk space in FortiAnalyzer VM / FortiManager VM](#).

This example creates and attaches two volumes.

**To add additional storage:**

1. In the EC2 console, create a disk volume and attach it to the FortiManager EC2 instance.

2. Log in to FortiManager using the GUI or SSH. If using the GUI, open the CLI.
3. Run `exec lvm info` to check the disk status. Two volumes have been added and are *Unused*.

4. Run `exec lvm extend`. Reboot the system as instructed.

5. Log in to the FortiManager GUI. Go to the Dashboard and verify you now have enlarged disk space under *System Resources > Disk Usage*.

# Security Fabric connector integration with AWS

You can use FortiManager to create Fabric connectors for AWS and install the Fabric connectors to FortiOS.

The Fabric connectors in FortiManager define the connector type and include information for FortiOS to communicate with and authenticate with the products. In some cases the FortiGate must communicate with products through the Fabric connector, and in other cases the FortiGate communicates directly with the products.

FortiOS works without the Fabric connector to communicate directly with AWS.

Following is an overview of creating Fabric connectors for AWS using FortiManager:

1. Create a Fabric connector object for AWS. See [Creating Fabric connector objects for AWS on page 18](#).
2. Import address names from AWS to the Fabric connector object. See [Importing address names to fabric connectors on page 20](#).  
The address names are imported and converted to firewall address objects. The objects do not yet include IP addresses. The objects are displayed on the *Firewall Objects > Addresses* pane.
3. In the policy package in which you will be creating the new policy, create an IPv4 policy and include the firewall address objects for AWS. See [Creating an IP address policy on page 21](#).
4. Install the policy package to FortiGate. See [Installing a policy package on page 22](#).  
FortiGate communicates with AWS to dynamically populate the firewall address objects with IP addresses.

If the filter names change in AWS after you import them to FortiManager, you must modify the filter again.

## Creating Fabric connector objects for AWS

With FortiManager, you can create a fabric connector for Amazon Web Services (AWS), and then import address names from AWS to automatically create dynamic objects that you can use in policies. When you install the policies to one or more FortiGate units, FortiGate uses the information to communicate with AWS and dynamically populate the objects with IP addresses. Fortinet SDN Connector is not required for this configuration.

When you create a fabric connector for AWS, you are specifying how FortiGate can communicate directly with AWS.

If ADOMs are enabled, you can create one fabric connector per ADOM.

Requirements:

- FortiManager version 6.0 ADOM or later
- FortiGate is managed by FortiManager.
- The managed FortiGate unit is configured to work with AWS.

Following is a high-level overview of the configuration procedure:

### To create a fabric connector object for AWS:

1. Go to *Fabric View > Fabric Connectors*.
2. Click *Create New*. The *Create New Fabric Connector* wizard is displayed.

3. Under *SDN*, select *AWS*, and click *Next*.
4. Configure the following options, and then click *OK*:

<b>Name</b>	Type a name for the fabric connector object.
<b>Type</b>	Displays <i>Amazon Web Services (AWS)</i> .
<b>AWS access key ID</b>	Type the access key ID from AWS.
<b>AWS secret access key</b>	Type the secret access key from AWS.
<b>AWS region name</b>	Type the region name from AWS.
<b>AWS VPC ID</b>	Type the AWS VPC ID.
<b>Update Interval (s)</b>	Specify how often in seconds that the dynamic firewall objects should be updated.
<b>Status</b>	Toggle <i>On</i> to enable the fabric connector object. Toggle <i>OFF</i> to disable the fabric connector object.

## Configuring dynamic firewall addresses for Fabric connectors

You cannot import address names to fabric connectors created for Microsoft Azure and Nuage Virtualized Services Platform. Instead you must create dynamic firewall objects that can be dynamically populated when FortiGate communicates with Microsoft Azure and Nuage Virtualized Services Platform.

### To configure dynamic firewall addresses for Microsoft Azure fabric connectors:

1. Go to *Policy & Objects > Object Configurations*.
2. In the tree menu, go to *Firewall Objects > Addresses*.
3. In the content pane, click *Create New* and select *Address*.
4. Complete the following options for Microsoft Azure fabric connectors:

<b>Address Name</b>	Type a name for the firewall address object.
<b>Type</b>	Select <i>Fabric Connector Address</i> .
<b>SDN</b>	Select the Microsoft Azure fabric connector.
<b>Filter</b>	Type the name of the filter for the AWS instance.

5. Set the remaining options as required, and click *OK*

### To configure dynamic firewall addresses for Nuage fabric connectors:

1. Go to *Policy & Objects > Object Configurations*.
2. In the tree menu, go to *Firewall Objects > Addresses*.
3. In the content pane, click *Create New* and select *Address*.

4. Complete the following options for Nuage fabric connectors:

<b>Address Name</b>	Type a name for the firewall address object.
<b>Type</b>	Select <i>Fabric Connector Address</i> .
<b>SDN</b>	Select the Nuage Virtualized Services Platform fabric connector.
<b>Organization</b>	Type the name of the organization for the Nuage Virtualized Services Platform.
<b>Subnet Name</b>	Type the name of the subnet for the Nuage Virtualized Services Platform.
<b>Policy Group</b>	Type the name of the policy group for the Nuage Virtualized Services Platform.

5. Set the remaining options as required, and click **OK**

## Importing address names to fabric connectors

After you configure a Fabric connector, you can import dynamic objects from cloud platforms, such as AWS, to the Fabric connector, and dynamic firewall address objects are automatically created.

When you import address names from AWS, you must add filters to display the correct instances before importing address names.

### To import address names for AWS:

1. Go to *Policy & Objects > Object Configurations*.
2. In the tree menu, go to *Security Fabric > Fabric Connectors*.
3. In the content pane, right-click the fabric connector, and select *Import*.

The *Import SDN Connector* dialog box is displayed.

4. Create a filter to select the correct AWS instances:

- a. Click *Add Filter*.

The *Filter Generator* dialog box is displayed.

- b.** Click *Add Filter*, and select a filter.  
A filtered list of instances is displayed.
- c.** Click *OK*.  
The *Import SDN Connector* dialog box is displayed, and it contains the filter.  
You can add additional filters, or edit and delete filters.
- d.** (Optional) Repeat this procedure to add additional filters.

**5.** Select the filters, and click *Import*.

The address names are imported and converted to dynamic firewall address objects that are displayed on the *Firewall Objects > Addresses* pane. The name of the dynamic firewall address uses the following naming convention: `AWS-<random identifier>`. Use the *Details* column and the instance ID to identify the object.

## Creating an IP address policy

The section describes how to create new IPv4 and IPv6 policies.

IPv6 security policies are created both for an IPv6 network and a transitional network. A transitional network is a network that is transitioning over to IPv6, but must still have access to the Internet or must connect over an IPv4 network. IPv6 policies allow for this specific type of traffic to travel between the IPv6 and IPv4 networks.

On the *Policy & Objects* tab, from the *Tools* menu, select *Display Options*. In the *Policy* section, select the *IPv6 Policy* checkbox to display this option.

**To create a new IPv4 or IPv6 policy:**

1. Ensure that you are in the correct ADOM.
2. Go to *Policy & Objects > Policy Packages*.
3. In the tree menu for the policy package in which you will be creating the new policy, select *IPv4 Policy* or *IPv6 Policy*. If you are in the Global Database ADOM, select *IPv4 Header Policy*, *IPv4 Footer Policy*, *IPv6 Header Policy*, or *IPv6 Footer Policy*.
4. Click *Create New*, or, from the *Create New* menu, select *Insert Above* or *Insert Below*. By default, policies will be added to the bottom of the list, but above the implicit policy. The *Create New Policy* pane opens.

5. Complete the options.

6. Click **OK** to create the policy.

You can select to enable or disable the policy in the right-click menu. When disabled, a disabled icon will be displayed in the *Seq.#* column to the left of the number.

## Installing a policy package

When installing a policy package, objects that the policy references are installed to the target device. Default or per-device mapping must exist or the installation will fail.

Some objects that are not directly referenced in the policy will also be installed to the target device, such as FSSO polling objects, address and profile groups, and CA certificates.

### To install a policy package to a target device:

1. Ensure you are in the ADOM that contains the policy package.
2. Go to *Policy & Objects > Policy Packages*.
3. Select a policy package and from the *Install* menu or right-click menu select *Install Wizard*. The *Install Wizard* opens.
4. Follow the steps in the install wizard to install the policy package. You can select to install policy package and device settings or install the interface policy only.

## Change log

Date	Change Description
2019-10-03	Initial release.
2019-10-16	Updated <a href="#">Deploying FortiManager on AWS</a> on page 10.
2019-10-22	Updated Initial Deployment.
