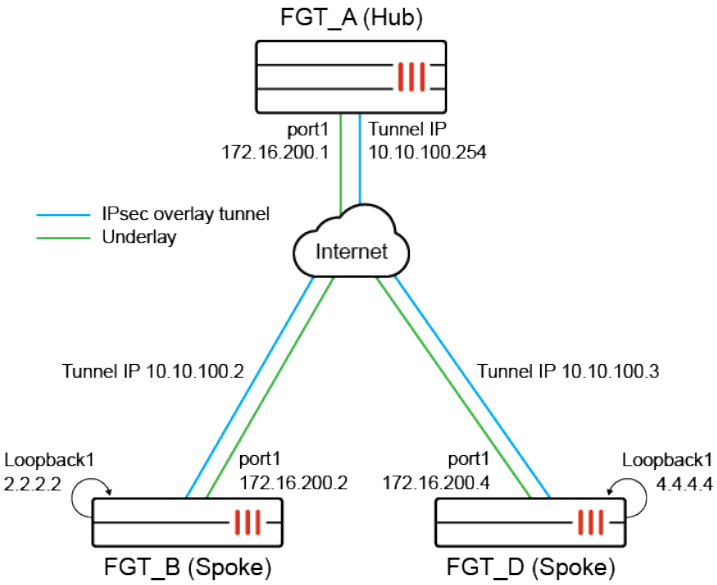
`schedules <schedule_name>`	Select the name of a firewall recurring schedule.
`server-name <name>`	Select the speedtest server from a list. Use show system speed-test-server to display the list.
`update-inbandwidth enable {enable | disable}`	Enable/disable bypassing the interface's inbound bandwidth setting.
`update-outbandwidth enable {enable | disable}`	Enable/disable bypassing the interface's outbound bandwidth setting.
`update-inbandwidth-maximum <integer>`	Set the maximum downloading bandwidth to be used in a speed test, in Kbps (0 - 16776000).

Command	Description
`update-outbandwidth-maximum <integer>`	Set the maximum uploading bandwidth to be used in a speed test, in Kbps (0 - 16776000).
`retries <integer>`	Maximum retry times for the same server when speed test fails.
`retry-pause <integer>`	Pause in seconds when switching servers due to speed failing.

See Example 4 for a sample configuration.

Hub and spoke speed tests

In an SD-WAN hub and spoke topology, connections between sites are typically made through VPN overlays. The hub usually acts as the VPN gateway with spokes connecting as dial-up VPN clients. In order to estimate the speed of the connection to each spoke, speed tests can be performed between the hub and each spoke. The results of the speed test can be used for egress traffic shaping on the VPN overlay tunnel. Hub and spoke speed test can only be used when ADVPN is enabled.



A speed test server can be enabled on the hub or spoke with custom speed-test listening ports. The test measures the speeds of the link to each spoke so that QoS can be applied on the hub to the egress traffic shaping profile assigned to the IPsec overlay tunnel interface and the respective tunnel. An egress-shaping profile can be applied to local, remote, or both local and remote IPsec tunnels or no IPsec tunnels. Tests can be in upload or download direction and support both TCP and UDP protocols.

Speed test results are cached for future use. When speed tests are initiated from the hub, the results are cached on the hub. When speed tests are initiated from the spoke, the results are cached on the spoke, but sent to the hub.

When a speed-test server is enabled on a hub or spoke, two speed test daemons are started and listen on different ports for different purposes:

- The controller speed test daemon listens on the IPsec overlay interfaces to assign an access token to each incoming speed test for authentication.

- The speed test daemon listens on the IPsec underlay interfaces to handle the speed tests.

Each incoming speed test request must present the obtained access token to prevent random, unauthorized requests. Otherwise, the connection is closed immediately. As such, speed test access must be enabled on both the underlay and the IPsec overlay tunnel interfaces.

```
config system interface
    edit <interface>
        set allowaccess speed-test [other access] ...
    next
end
```

If the IPsec tunnel has a configured `exchange-ip`, speed test access must also be configured on the associated interface, such as the loopback interface.

The speed test client can be a hub or a spoke and must have `system speed-test-schedule` configured and the `dynamic-server` setting enabled. The speed-test schedule initiates the test.

On the speed test client, specify whether and how to apply the test results in a shaping profile. The shaping profile must be configured in the phase1 interface before it can be used with a speed test.

```
config system speed-test-schedule
    edit <interface>
        set server-port <integer>
        set ctrl-port <integer>
        set update-shaper {disable | local | remote | both}
    next
end
```

Command	Description
`server-port <integer>`	Specify the port number for the speed-test server used for speed tests (1 - 65535, default = 5201).
`ctrl-port <integer>`	Specify the port number for the controller on the speed-test server used for authentication (1 - 65535, default = 5200).
`update-shaper {disable | local | remote | both}`	Set the egress shaper to use the speed test results: • `disable`: Disable updating the egress shaper (default). • `local`: Update the speed-test client egress shaper. • `remote`: Update the speed-test server egress shaper. • `both`: Update both the local and remote egress shapers.

CLI commands

Enable the speed-test server:

```
config system global
    set speedtest-server {enable | disable}
    set speedtestd-server-port <integer>
```

```
    set speedtestd-ctrl-port <integer>
end
```

Command	Description
`speedtest-server {enable | disable}`	Enable/disable the speed test server on the hub or spoke (default = disable).This enables iPerf in server mode, which listens on the default iPerf TCP port 5201.
`speedtestd-server-port <integer>`	Specify a custom port number (1024 - 65535, default = 5201) for the speed test daemon. The port is used to perform the speed test.
`speedtestd-ctrl-port <integer>`	Specify a custom port number (1024 - 65535. default = 5200) for the controller speed test daemon. The port is used to assign access tokens for authentication prior to performing the speed test.

Enable the speed test client:

```
config system speed-test-schedule
     edit <interface>
        set dynamic-server {enable | disable}
        set ctrl-port <integer>
        set server-port <integer>
        set update-shaper {disable | local | remote | both}
     next
 end
```

Command	Description
`<interface>`	The dial-up IPsec tunnel interface on the speed test client. The speed test client can be the hub or the spokes.
`dynamic-server {enable | disable}`	Enable/disable the dynamic speed test server (default = disable).
`ctrl-port <integer>`	Specify the port number for the controller on the speed-test server used for authentication (1 - 65535, default = 5200).
`server-port <integer>`	Specify the port number for the speed-test server used for speed tests (1 - 65535, default = 5201).
`update-shaper {disable | local | remote | both}`	Set the egress shaper to use the speed test results: • `disable`: Disable updating the egress shaper (default). • `local`: Update the speed-test client egress shaper. • `remote`: Update the speed-test server egress shaper. • `both`: Update both the local and remote egress shapers.

To limit the maximum bandwidth used in the speed test, enable `set update-inbandwidth` and `set update-outbandwidth`. See Scheduled interface speed test on page 1188 for more information.

Enable speed test access on both the underlay and the IPsec overlay tunnel interfaces on the speed test server:

```
config system interface
    edit <interface>
        set allowaccess speed-test [other access] ...
    next
end
```

Command	Description
`<interface>`	The dial-up IPsec tunnel interface on the speed test server.
`allowaccess {speed-test | [other access]}`	Enable speed-test access on the underlay and IPsec overlay interfaces.

Allow an SD-WAN member on the spoke to switch routes when on speed test from the hub to spokes:

```
config system sdwan
    set speedtest-bypass-routing {enable | disable}
    config neighbor
        edit <bgp neighbor>
            set mode speedtest
        next
    end
end
```

Command	Description
`speedtest-bypass-routing {enable | disable}`	Enable/disable bypass routing when doing a speed test on an SD-WAN member (default = disable).
`mode speedtest`	Use the speed test to select the neighbor.

Manually run uploading speed test on the physical interfaces of each tunnel of a dial-up IPsec interface:

```
execute speed-test-ipsec <interface> <tunnel_name>
```

Command	Description
`<interface>`	IPsec phase1 interface name.
`<tunnel_name>`	The tunnel name, or `all` for all tunnels.

Manually run a non-blocking uploading speed test:

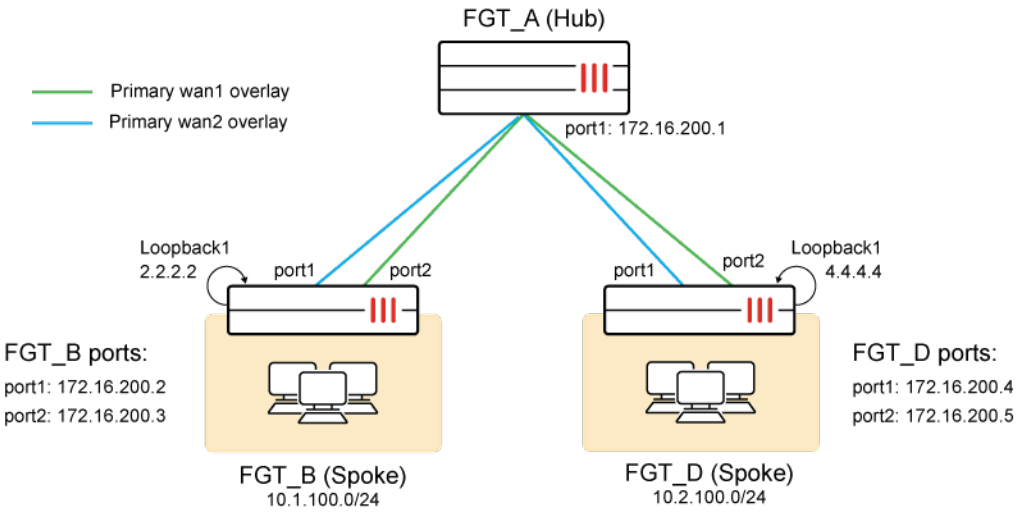
```
diagnose netlink interface speed-test-tunnel <interface> <tunnel_name>
```

Debug and test commands:

`diagnose debug application speedtest <int>`	Enable debug of the speed test module in the forticron daemon.
`diagnose debug application speedtestd <int>`	Enable debug of the speed test server daemon.
`diagnose test application forticron 9`	List the scheduled speed tests.
`diagnose test application forticron 10`	Show the cached speed test results.
`diagnose test application forticron 11`	Write the cached speed test results to disk.
`diagnose test application forticron 12`	Load the speed test results from disk.
`diagnose test application forticron 99`	Cancel all pending speed tests.

Running speed tests from the hub to the spokes in dial-up IPsec tunnels

In this example, the hub is configured as a VPN dial-up server, and both of the spokes are connected to the hub. It is assumed that the VPN configuration is already done, with a dynamic gateway type and kernel device creation (`net-device`) disabled. Speed tests are configured on only one interface for the branch devices. Speed tests may be configured for all underlay interfaces, but care must be taken to avoid tests running at the same time when utilizing `speedtest-bypass-routing` to ensure there remains a viable path from Hub to Spokes.



The VPN interfaces and IP addresses are:

FortiGate	Interface	IP Address
FGT_A (Hub)	hub-phase1 hub-phase11	10.10.100.254 10.10.100.253
FGT_B (Spoke)	spoke11-p1 spoke12-p1	10.10.100.2 10.10.100.3

FortiGate	Interface	IP Address
FGT_D (Spoke)	spoke21-p1	10.10.100.4
	spoke22-p1	10.10.100.5

A recurring speed test is configured that runs on the hub over the dial-up interfaces. The speed tests are performed over the underlay interface from the hub to the spoke. Each spoke is configured to operate as a speed test server and to allow the speed test to run on its underlay interface. The spokes establish a BGP peering with the hub (can be BGP per overlay or BGP on loopback) and advertises its loopback network to the hub. The specific configuration is only shown for FGT_B.

To configure the spoke FortiGates (FGT_B) as a speed test server:

1. Enable a speed test server with custom speed-test listening ports:

   A speed test server is enabled on the hub. Port 7000 will run speed tests, and port 6000 will be the controller used to issue access tokens for speed test authentication.

```
config system global
     set speedtest-server enable
     set speedtestd-ctrl-port 6000
     set speedtestd-server-port 7000
end
```

2. Allow speed tests on one underlay:

```
config system interface
    edit "port1"
        append allowaccess speed-test
    next
end
```

3. Allow speed tests on one overlay:

```
config system interface
    edit "hub-spoke11-p1"
        set allowaccess ping speed-test
        ...
        set interface "port1"
    next
end
```

4. Configure SD-WAN with bypass routing enabled for speed tests on member *spoke11-p1*:

```
config system sdwan
    set speedtest-bypass-routing enable
    config members
        edit 1
            set interface "spoke11-p1"
        next
        edit 2
            set interface "spoke12-p1"
        next
```

```
    end
    config neighbor
        edit "10.10.100.254"
            set member 1
            set mode speedtest
        next
       edit "10.10.100.253"
            set member 2
        next

    end
end
```

5. Configure BGP routing:

```
config router route-map
    edit "No_Speed-Test"
        config rule
            edit 1
                set action permit
            next
        end
    next
    edit "Start_Speed-Test"
        config rule
            edit 1
                set action deny
            next
        end
    next
end
config router bgp
    set as 65412
    config neighbor
        edit "10.10.100.254"
            set advertisement-interval 1
            set remote-as 65412
            set route-map-out "Start_Speed-Test"
            set route-map-out-preferable "No_Speed-Test"
        next
    end
    config network
        edit 1
            set prefix 2.2.2.2 255.255.255.255
        next
        edit 2
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

Results

1. Before the speed test starts, FGT_A can receive the route from FGT_B by BGP from both overlays:

```
# get router info routing-table bgp
Routing table for VRF=0
B       2.2.2.2/32 [200/0] via 10.10.100.2 (recursive via 172.16.200.2, hub-phase1), 00:00:10
                           [200/0] via 10.10.100.3 (recursive via 172.16.200.3, hub-phase11), 00:00:10
B       10.1.100.0/24 [200/0] via 10.10.100.2 (recursive via 172.16.200.2, hub-phase1),
00:00:10
                         [200/0] via 10.10.100.3 (recursive via 172.16.200.3, hub-phase11),
00:00:10
```

2. At the scheduled time, the speed test starts for the hub-phase1 interface from hub to spoke:

```
# diagnose test application forticron 9
Speed test schedules:
    Interface     Server     Update    Up/Down-limit (kbps)                Days        H:M
TOS     Schedule
-------------------------------------------------------------------------------------------------
-----------------------------
    hub-phase1    dynamic                                                 1111111    14:41
0x00    speedtest_recurring
Active schedules:
        64002f: hub-phase1(port1) 172.16.200.2     hub-phase1_1
        64002e: hub-phase1(port1) 172.16.200.4     hub-phase1_0
```

   The `diagnose debug application speedtest -1` command can be used on both the hub and spokes to check the speed test execution.

3. While the speed test is running, FGT_A does not receive the route from FGT_B over that interface by BGP:

```
#  get router info routing-table bgp
Routing table for VRF=0
B       2.2.2.2/32 [200/0] via 10.10.100.3 (recursive via 172.16.200.3, hub-phase11), 00:00:20
B       10.1.100.0/24 [200/0] via 10.10.100.3 (recursive via 172.16.200.3, hub-phase11),
00:00:20
```

4. Speed tests results can be dynamically applied to the dial-up tunnel for egress traffic shaping:

```
# diagnose vpn tunnel list
------------------------------------------------------
name=hub-phase1_0 ver=2 serial=c 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=737210(kbps) lock_hit=0 default_class=2 n_active_class=3
        class-id=2      allocated-bandwidth=73720(kbps)         guaranteed-bandwidth=73720
(kbps)
                        max-bandwidth=73720(kbps)       current-bandwidth=0(kbps)
                        priority=low    forwarded_bytes=52
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=221163(kbps)        guaranteed-bandwidth=221162
(kbps)
```

```
                        max-bandwidth=294883(kbps)      current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=442325(kbps)        guaranteed-bandwidth=147441
(kbps)
                        max-bandwidth=442325(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
---------------------------------------------------------
name=hub-phase1_1 ver=2 serial=d 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=726813(kbps) lock_hit=0 default_class=2 n_active_class=3
        class-id=2      allocated-bandwidth=72681(kbps)         guaranteed-bandwidth=72681
(kbps)
                        max-bandwidth=72681(kbps)       current-bandwidth=0(kbps)
                        priority=low    forwarded_bytes=123
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=218044(kbps)        guaranteed-bandwidth=218043
(kbps)
                        max-bandwidth=290725(kbps)      current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=436087(kbps)        guaranteed-bandwidth=145362
(kbps)
                        max-bandwidth=436087(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
```

5. Speed test results can be cached, indexed, and written to disk:

```
# diagnose test application forticron 10
Speed test results:
1: vdom=root, phase1intf=hub-phase1, peer-id='spoke11-p1', bandwidth=737210, last_
log=1624226603
2: vdom=root, phase1intf=hub-phase1, peer-id='spoke21-p1', bandwidth=726813, last_
log=1624226614
```

```
# diagnose test application forticron 11
Write 2 logs to disk.
```

```
# diagnose test application forticron 12
load 2 results.
```

Disable then reenable the IPsec VPN tunnel and the cached speed test results can be applied to the tunnel again:

```
# diagnose vpn tunnel list
---------------------------------------------------------
name=hub-phase1_0 ver=2 serial=c 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
```

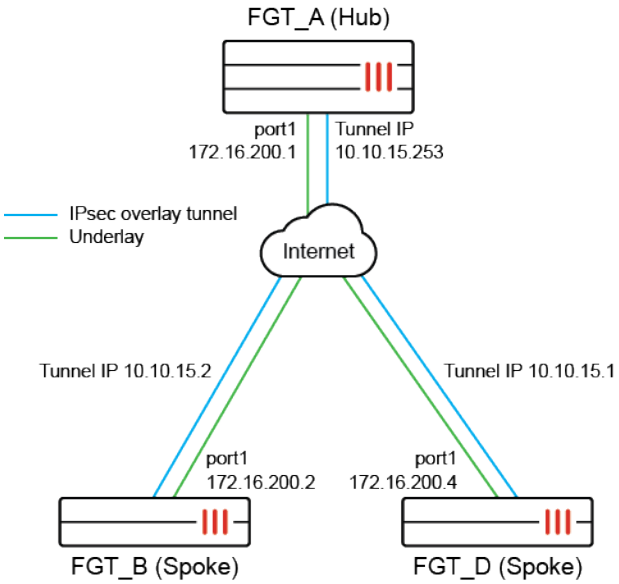
```
...
egress traffic control:
        bandwidth=737210(kbps) lock_hit=0 default_class=2 n_active_class=3
-----------------------------------------------------
name=hub-phase1_1 ver=2 serial=d 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=726813(kbps) lock_hit=0 default_class=2 n_active_class=3
```

Running speed tests from spokes to the hub in dial-up IPsec tunnels

In this hub and spoke example, the hub is configured as an IPsec VPN dial-up server with two IPsec tunnels, and each tunnel is connected to a spoke. The VPN interfaces and IP addresses are:

FortiGate	Interface	IP Address
FGT_A (Hub)	hub-phase1	10.10.15.253
FGT_B (Spoke)	spoke11-p1	10.10.15.2
FGT_D (Spoke)	spoke21-p1	10.10.15.1

The hub (FGT_A) is configured as a speed-test server to listen on custom ports (6000 and 7000), and the spokes (FGT_B and FGT_D) are configured as speed-test clients. This setup allows speed tests to successfully perform when spokes are behind NAT devices. The results of the speed test will be applied to the hub-phase1 overlay tunnel(s) as specified by the speed-test clients.



The spokes are configured to initiate speed tests on a schedule on UDP. After the speed test completes, the results are sent to the hub, and the hub applies the results on its IPsec tunnels as egress traffic shaping. The results are also cached and can be used if an IPsec tunnel is disconnected and reconnected again.

To configure the hub FortiGate (FGT_A) as the speed test server:

1. Configure a shaping profile:
   In this example, the shaping profile is named profile_1.

```
config firewall shaping-profile
    edit "profile_1"
        set default-class-id 2
        config shaping-entries
            edit 1
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 10
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 40
            next
            edit 3
                set class-id 4
                set guaranteed-bandwidth-percentage 20
                set maximum-bandwidth-percentage 60
            next
        end
    end
end
```

   Three classes are used in the profile for low, medium, and high priority traffic. Each class is assigned a guaranteed and maximum bandwidth as a percentage of the measured bandwidth from the speed test.
2. Configure a shaping policy to assign certain traffic as a class ID:
   In this example, all traffic destined to the dialup tunnels are assigned class 3.

```
config firewall shaping-policy
    edit 2
        set service "ALL"
        set schedule "always"
        set dstintf "hub-phase1" "hub2-phase1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

3. Enable a speed test server with custom speed-test listening ports:
   A speed test server is enabled on the hub. Port 7000 will run speed tests, and port 6000 will be the controller used to issue access tokens for speed test authentication.

```
config system global
    ...
```

```
    set speedtest-server enable
    set speedtestd-ctrl-port 6000
    set speedtestd-server-port 7000
end
```

4. Allow the speed test on the underlay:

```
config system interface
    edit "port1"
        set ip 172.16.200.1 255.255.255.0
        set allowaccess ping https ssh snmp http telnet fgfm radius-acct probe-response fabric
speed-test
        ...
    next
end
```

5. Allow the speed test on the overlay and use the shaping profile in the interface:
   In this example, speed tests are allowed on the overlay, and the shaping profile (profile_1) is used on the hub phase1 interface (port1).

```
config system interface
    edit "hub-phase1"
        set ip 10.10.15.253 255.255.255.255
        set allowaccess ping speed-test
        set egress-shaping-profile "profile_1"
        ...
        set interface "port1"
    next
end
```

To configure the first spoke FortiGate (FGT_B) as a speed test client:

1. Configure `system speed-test-schedule`:
   The protocol mode is set to UDP. The custom controller port used for authentication is set to 6000, and the custom port used to run the speed tests is set to 7000. The shaping profile is set to remote.

```
config system speed-test-schedule
    edit "spoke11-p1"
        set mode UDP
        set schedules "1"
        set dynamic-server enable
        set ctrl-port 6000
        set server-port 7000
        set update-shaper remote
    next
end
```

2. Configure a recurring schedule for the speed tests:
   Schedule 1 is set to start at 08:37 every day of the week.

```
config firewall schedule recurring
    edit "1"
        set start 08:37
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

To configure the second spoke FortiGate (FGT_D) as a speed test client:

1. Configure a speed test schedule:
   The protocol mode is set to UDP. The custom controller port used for authentication is set to 6000, and the custom port used to run the speed tests is set to 7000. The shaping profile is set to remote.

```
config system speed-test-schedule
    edit "spoke21-p1"
        set mode UDP
        set schedules "1"
        set dynamic-server enable
        set ctrl-port 6000
        set server-port 7000
        set update-shaper remote
    next
end
```

2. Configure a recurring schedule for the speed tests:
   Schedule 1 is set to start at 08:37 every day of the week.

```
config firewall schedule recurring
    edit "1"
        set start 08:37
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

To view the speed test results:

1. After the speed test schedule runs, view the result on spoke FGT_B:
   On spoke FGT_B, authentication succeeds through port 6000, and the test runs on port 7000. UDP mode is used, and the test is successful.

```
# diagnose debug application speedtest -1

[speedtest(4309)] client(recver): down_speed:  471 Mbits/sec
[speedtest(4309)]
```

```
[speedtest(4309)] speed test Done.
fcron_speedtest_notify_func()-1275: Speed test pid=4309 done

fcron_speedtest_on_test_finish()-1211: Test 380011 for 'spoke21-p1' succeed with up=454398,
down=470794
fcron_speedtest_save_results()-1144: Write logs to disk: succ=1, fail=0
fcron_speedtest_sync_results()-1172: Sync cached results to secondary devices.
```

3. After the speed test schedule runs, view the result on the hub (FGT_A):

   The server side uses `speedtestd`, while the client side uses `speedtest`.

   The speed test results are applied on hub-phase1_0 and hub_phase1_1 as egress traffic shaping.

```
# diagnose debug application speedtestd -1

......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.2 port 17553
......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.2 port 7998
......
[sptestd::ctrl(0377):root] set shaper: if=hub-phase1, tun=hub-phase1_0, sp=profile_1,
bw=459745
......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.4 port 15349
......
[speedtest(2771)] [  7] local 172.16.200.1 port 7000 connected to 172.16.200.4 port 19586
......
[sptestd::ctrl(0377):root] set shaper: if=hub-phase1, tun=hub-phase1_1, sp=profile_1,
bw=470855
......
```

4. Verify the result is cached on the spokes.
   - On FGT_B, the speed test results are cached:

```
#  diagnose test application forticron 10
Speed test results:
1: vdom=root, phase1intf=spoke11-p1, peer-id='172.16.200.1', up=454043, dw=459694,
time=12/13 12:32:19
```

   - On FGT_D, the speed test results are cached:

```
#   diagnose test application forticron 10
Speed test results:
1: vdom=root, phase1intf=spoke21-p1, peer-id='172.16.200.1', up=454398, dw=470794,
time=12/12 16:33:18
```

5. On the hub (FGT_A), verify the speed test results are applied to the hub's IPsec tunnels as egress traffic shaping:

   On hub-phase1_0 and hub-phase1_1, the correct traffic control is displayed.

```
# diagnose vpn tunnel list
list all ipsec tunnel in vd 0
......

```
                    dropped_packets=0       dropped_bytes=0
```

Hub learns egress shaping value from spoke over IKE

With peer egress shaping for IPsec tunnels enabled, IKE bandwidth negotiation is used for traffic shaping. This configuration is useful for speed tests of large-scale SD-WAN deployments with thousands of sites using diverse connections (4G/5G, satellite, broadband).

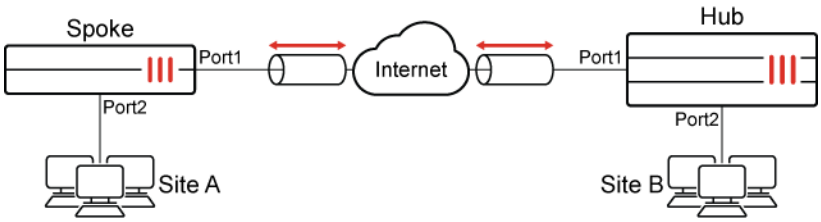
A static configuration of per-tunnel egress shaping values on spokes is automatically communicated to hubs during IKEv2 negotiation. The hub then immediately applies persistent policing based on these spoke-defined values, ensuring consistent QoS without performance overhead for variable-connectivity scenarios.

```
config vpn ipsec phase1-interface
    edit <tunnel_name>
        set ike-version 2
        set peer-egress-shaping {enable | disable}
        set peer-egress-shaping-value <integer>
    next
end
```

Command	Description
`peer-egress-shaping {enable | disable}`	Enable/disable peer egress shaping.
`peer-egress-shaping-value <integer>`	Configure outbound bandwidth to use for peer egress shaping, in kbps (0 - 80000000, default = 0).

Example

In this hub and spoke example, a peer-egress-shaping-value is configured on the spoke, and the hub learns the value through IKE negotiations. Subsequently, the hub applies the shaping value to its shaping profile, which enforces egress traffic policing on the overlay tunnel to the spoke.



The IP addresses are:

FortiGate	Interface	IP Address
Spoke	Port2	10.1.100.1
	Port1	172.16.200.1
Hub	Port1	172.16.200.4
	Port2	192.168.5.4

The basic configuration steps are:

1. Configure the hub:
   a. Configure IPsec VPN
   b. Configure a static route
   c. Configure firewall policies
   d. Configure the shaping class
   e. Configure the shaping profile
   f. Apply the shaping profile to the hub's tunnel interface
2. Configure the spoke:
   a. Configure IPsec VPN
   b. Configure a static route
   c. Configure firewall policies

Configure the hub

To configure IPsec VPN on the hub:

```
config vpn ipsec phase1-interface
    edit "tospokes"
        set type dynamic
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set peer-egress-shaping enable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set npu-offload disable
        set auto-discovery-sender enable
        set transport auto
        set ipv4-start-ip 100.100.100.10
        set ipv4-end-ip 100.100.100.20
        set ipv4-netmask 255.255.255.0
        set psksecret ******
        set dpd-retryinterval 60
    next
end
config vpn ipsec phase2-interface
    edit "tospokes"
        set phase1name "tospokes"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

To configure a static route on the hub:

```
config router static
    edit 1
        set device "tospokes"
    next
end
```

To configure firewall policies on the hub:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "tospokes"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "tospokes"
        set dstintf "port2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
end
```

To configure the shaping class on the hub:

```
config firewall traffic-class
    edit 2
        set class-name "class_id_2"
    next
end
```

To configure the shaping profile on the hub:

```
config firewall shaping-profile
    edit "hub_spoke"
        set type policing
        set default-class-id 2
        config shaping-entries
            edit 1
                set class-id 2
                set guaranteed-bandwidth-percentage 100
                set maximum-bandwidth-percentage 100
```

```
            next
        end
    next
end
```

To apply the shaping profile to the hub's tunnel interface:

```
config system interface
    edit "tospokes"
        set egress-shaping-profile "hub_spoke"
        set outbandwidth 0
    next
end
```

When configuring egress shaping on a tunnel interface, do not manually set the `outbandwidth` value. It is dynamically obtained from the `PEER_EGRESS_SHAPING_VALUE` for each tunnel and should be left at its default value of `0`.

Configure the spoke

To configure IPsec VPN on the spoke:

```
config vpn ipsec phase1-interface
    edit "tohub-d"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set peer-egress-shaping enable
        set peer-egress-shaping-value 500
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set auto-discovery-receiver enable
        set auto-discovery-shortcuts dependent
        set transport auto
        set remote-gw 172.16.200.4
        set psksecret ******
    next
end
config vpn ipsec phase2-interface
    edit "tohub-d"
        set phase1name "tohub-d"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
end
```

To configure a static route on the spoke:

```
config router static
    edit 1
        set device "tohub-d"
    next
end
```

To configure firewall policies on the spoke:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "tohub-d"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "tohub-d"
        set dstintf "port2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
end
```

Verification

1. Verify that traffic can be sent from Site A to Site B:

```
# ping 192.168.5.55
Pinging 192.168.5.55 with 32 bytes of data:
Reply from 192.168.5.55: bytes=32 time=2ms TTL=62
Reply from 192.168.5.55: bytes=32 time=2ms TTL=62
Reply from 192.168.5.55: bytes=32 time=1ms TTL=62
Reply from 192.168.5.55: bytes=32 time<1ms TTL=62

Ping statistics for 192.168.5.55:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 2ms, Average = 1ms
```

2. Check the hub tunnel shaping:

```
# diagnose vpn tunnel list | grep -A 5 "egress traffic control"
egress traffic control:
```

```
        bandwidth=500(kbps) lock_hit=0 default_class=2 n_active_class=1
        class-id=2      allocated-bandwidth=500(kbps)   guaranteed-bandwidth=500(kbps)
                        max-bandwidth=500(kbps)         current-bandwidth=1(kbps)
                        priority=high   forwarded_bytes=1512
                        dropped_packets=0       dropped_bytes=0
```

3. Confirm IKE negotiation on the hub:

```
# diagnose debug application ike -1
ike V=root:0:ac59d6f4e4dc005e/0000000000000000:6: responder received SA_INIT msg
ike V=root:0:ac59d6f4e4dc005e/0000000000000000:6: received notify type NAT_DETECTION_SOURCE_IP
ike V=root:0:ac59d6f4e4dc005e/0000000000000000:6: received notify type NAT_DETECTION_
DESTINATION_IP
ike V=root:0:ac59d6f4e4dc005e/0000000000000000:6: received notify type FRAGMENTATION_SUPPORTED
ike V=root:0:ac59d6f4e4dc005e/0000000000000000:6: received notify type AUTO_DISCOVERY_RECEIVER

```

```
ike V=root:0:tohub-d:3: processing notify type INTERFACE_ADDR4
ike V=root:0:tohub-d:3: INTERFACE-ADDR4 100.100.100.4
ike V=root:0:tohub-d:3: processing notify type PEER_EGRESS_SHAPING_VALUE
ike V=root:0:tohub-d:3: received peer egress shaping value=0
ike V=root:0:tohub-d:3: processing notify type ADVPN_EXT_IP4
ike V=root:0:tohub-d:3: ext IP = 172.16.200.1
```

Spoke learns egress shaping value from other spoke over ADVPN shortcut

With peer egress shaping for IPsec tunnels enabled, IKE bandwidth negotiation is used for traffic shaping. This configuration is useful for speed tests of large-scale SD-WAN deployments with thousands of sites using diverse connections (4G/5G, satellite, broadband).

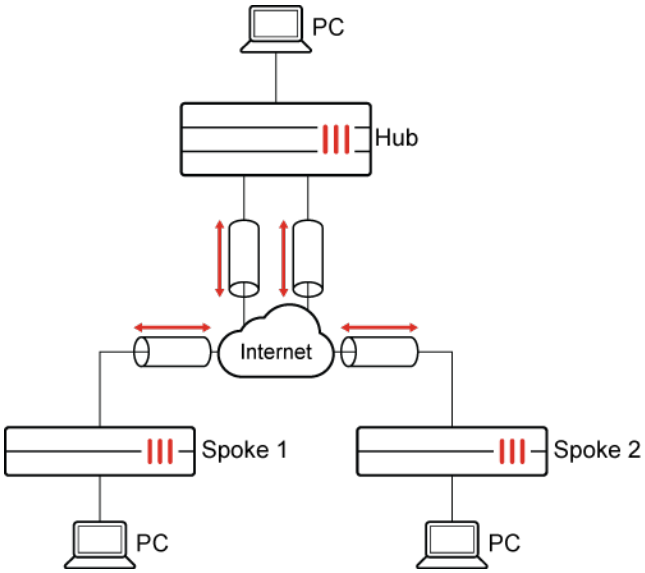
ADVPN spoke-to-spoke shaping evaluates both the local and remote peers' egress shaping values and applies the lower of the two to optimize traffic flow. Additionally, this update enables the synchronization of the `peer-egress-shaping-value` during ADVPN shortcut reply messages sent to the shortcut initiator. Subsequently, during the regular IPsec negotiation, the initiator shares its shaping value with the responder, allowing shaping to be applied accordingly.

```
config vpn ipsec phase1-interface
    edit <tunnel_name>
        set ike-version 2
        set peer-egress-shaping {enable | disable}
        set peer-egress-shaping-value <integer>
    next
end
```

Command	Description
`peer-egress-shaping {enable | disable}`	Enable/disable peer egress shaping.
`peer-egress-shaping-value <integer>`	Configure outbound bandwidth to use for peer egress shaping, in kbps (0 - 80000000, default = 0).

Example

This example shows the configuration of a hub with two spokes.



A peer-egress-shaping-value is configured on both Spoke 1 and Spoke 2, and the peer spoke learns the value through ADVPN's shortcut-reply. Subsequently, each spoke applies the egress bandwidth limit to their overlay tunnel.

The IP addresses are as follows:

FortiGate	Interface	IP adress
Spoke1	Port1	172.16.200.1
Spoke1 PC	Port2	10.1.100.1
Spoke2	Port1	172.16.200.3
Spoke2 PC	Port2	192.168.4.3
Hub	Port1	172.16.200.4
Hub PC	Port2	192.168.5.4

The configuration steps are:

1. Configure the Hub:
   a. Configure the IPsec VPN
   b. Configure the static route
   c. Configure the firewall policies
2. Configure Spoke1:
   a. Configure the IPsec VPN
   b. Configure the static route
   c. Configure the firewall policies
   d. Configure the shaping class
   e. Configure the shaping profile
   f. Apply shaping profile to Spoke1's tunnel interface
3. Configure Spoke2:

a. Configure the IPsec VPN
b. Configure the static route
c. Configure the firewall policies
d. Configure the shaping class
e. Configure the shaping profile
f. Apply shaping profile to Spoke2's tunnel interface

To configure the hub:

1. Configure the IPsec VPN:

```
config vpn ipsec phase1-interface
    edit "tospokes"
        set type dynamic
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set npu-offload disable
        set auto-discovery-sender enable
        set transport auto
        set ipv4-start-ip 100.100.100.10
        set ipv4-end-ip 100.100.100.20
        set ipv4-netmask 255.255.255.0
        set psksecret ******
        set dpd-retryinterval 60
    next
end
```

```
config vpn ipsec phase2-interface
    edit "tospokes"
        set phase1name "tospokes"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

2. Configure the static route:

```
config router static
    edit 1
        set device "tospokes"
    next
end
```

3. Configure the firewall policies:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "tospokes"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "tospokes"
        set dstintf "port2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
    edit 3
        set srcintf "tospokes"
        set dstintf "tospokes"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
end
```

To configure spoke1:

1. Configure the IPsec VPN:

```
config vpn ipsec phase1-interface
    edit "tohub-d"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set peer-egress-shaping enable
        set peer-egress-shaping-value 500
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set auto-discovery-shortcuts enable
        set auto-discovery-receiver enable
        set transport auto
        set remote-gw 172.16.200.4
        set psksecret ******
```

```
   next
end
```

```
config vpn ipsec phase2-interface
    edit "tohub-d"
        set phase1name "tohub-d"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
end
```

2. Configure the static route:

```
config router static
    edit 1
        set device "tohub-d"
    next
end
```

3. Configure the firewall policies:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "tohub-d"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "tohub-d"
        set dstintf "port2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
end
```

4. Configure the shaping class:

```
config firewall traffic-class
    edit 2
        set class-name "class_id_2"
    next
end
```

5. Configure the shaping profile:

```
config firewall shaping-profile
    edit "spoke_spoke"
        set type policing
        set default-class-id 2
        config shaping-entries
            edit 1
                set class-id 2
                set guaranteed-bandwidth-percentage 100
                set maximum-bandwidth-percentage 100
            next
        end
    next
end
```

6. Apply shaping profile to Spoke1's tunnel interface:

```
config system interface
    edit "tospokes"
        set egress-shaping-profile "hub_spoke"
    next
end
```

> When configuring egress shaping on a tunnel interface, do not manually set the `outbandwidth` value. This value is dynamically obtained from the PEER_EGRESS_SHAPING_VALUE for each tunnel and should be left at its default value of 0.

To configure spoke2:

1. Configure the IPsec VPN:

```
config vpn ipsec phase1-interface
    edit "tohub-d"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set peer-egress-shaping enable
        set peer-egress-shaping-value 500
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set auto-discovery-receiver enable
        set auto-discovery-shortcuts dependent
        set transport auto
        set remote-gw 172.16.200.4
        set psksecret ******
    next
end
```

```
config vpn ipsec phase2-interface
    edit "tohub-d"
        set phase1name "tohub-d"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
end
```

2. Configure the static route:

```
config router static
    edit 1
        set device "tohub-d"
    next
end
```

3. Configure the firewall policies:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "tohub-d"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set srcintf "tohub-d"
        set dstintf "port2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
end
```

4. Configure the shaping class:

```
config firewall traffic-class
    edit 2
        set class-name "class_id_2"
    next
end
```

5. Configure the shaping profile:

```
config firewall shaping-profile
    edit "spoke_spoke"
```

```
        set type policing
        set default-class-id 2
        config shaping-entries
            edit 1
                set class-id 2
                set guaranteed-bandwidth-percentage 100
                set maximum-bandwidth-percentage 100
            next
        end
    next
end
```

6. Apply shaping profile to Spoke2's tunnel interface:

```
config system interface
    edit "tospokes"
        set egress-shaping-profile "hub_spoke"
    next
end
```

To verify the configuration:

1. Verify that traffic can be send from Spoke1 to Spoke2:

```
# ping 192.168.4.3
Pinging 192.168.4.3 with 32 bytes of data:
Reply from 192.168.4.3: bytes=32 time=2ms TTL=62
Reply from 192.168.4.3: bytes=32 time=2ms TTL=62
Reply from 192.168.4.3: bytes=32 time=1ms TTL=62
Reply from 192.168.4.3: bytes=32 time<1ms TTL=62

Ping statistics for 192.168.4.3:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 2ms, Average = 1ms
```

2. Check Spoke1 tunnel shaping:

```
# diagnose vpn tunnel list | grep -A 5 "egress traffic control"
egress traffic control:
        bandwidth=500(kbps) lock_hit=1 default_class=2 n_active_class=1
        class-id=2      allocated-bandwidth=500(kbps)   guaranteed-bandwidth=500(kbps)
                        max-bandwidth=500(kbps)         current-bandwidth=1(kbps)
                        priority=high   forwarded_bytes=84
                        dropped_packets=0       dropped_bytes=0
```

3. Check Spoke2 tunnel shaping:

```
# diagnose vpn tunnel list | grep -A 5 "egress traffic control"
egress traffic control:
        bandwidth=500(kbps) lock_hit=0 default_class=2 n_active_class=1
        class-id=2      allocated-bandwidth=500(kbps)   guaranteed-bandwidth=500(kbps)
```

```
                        max-bandwidth=500(kbps)         current-bandwidth=1(kbps)
                        priority=high   forwarded_bytes=824
                        dropped_packets=0       dropped_bytes=0
```

4. Confirm IKE negotiation on Spoke1:

```
# diagnose debug application ike -1
ike V=root:0:tohub-d:7: received informational request
ike V=root:0:tohub-d:7: processing notify type SHORTCUT_REPLY

```

Speed test usage

Using speed test results with SD-WAN

The interface speed test can be used to populate the bandwidth values based on the results.

To manually configure the upstream and downstream interface bandwidth values in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit a WAN interface.
3. Input the results from the speed test in the *Estimated bandwidth* section, specifically into the appropriate *kbps Upstream* or *kbps Downstream* fields.
4. Click *OK*.

Alternatively, use the GUI speed test on page 1187 to add the speed test results to the interface's estimated bandwidth with one click.

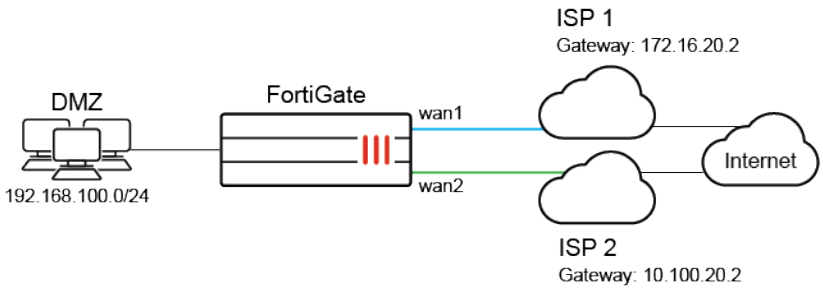
To manually configure the upstream and downstream interface bandwidth values in the CLI:

```
config system interface
    edit <interface>
        set estimated-upstream-bandwidth <speed in kbps>
        set estimated-downstream-bandwidth <speed in kbps>
    next
end
```

The populated bandwidth values can be employed in conjunction with various WAN intelligence strategies such as load balancing without SLA targets, load balancing with SLA targets, and best quality. These strategies are used to select an SD-WAN interface in SD-WAN service rules.

Example

In this example, SD-WAN interfaces, wan1 and wan2, are connected to two different internet service providers (ISPs), both providing access to the public internet. The preference is for Gmail services to use the link with the highest bandwidth.



To apply speed test results to a best quality SD-WAN rule:

1. Run theGUI speed test on page 1187 on wan1 and wan2:
   a. When the test is complete, click *OK* in the *Confirm* pane to apply the results to the estimated bandwidth.
2. Add wan1 and wan2 as SD-WAN members, then add a policy and static route. See SD-WAN quick start on page 989 for more information.
3. Configure the health check:
   a. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, and click *Create New*.
   b. Enter a name for the performance SLA, such as *google*, and set the *Server* to *google.com*. See Health checks for more information.
   c. Click *OK*.
4. Configure an SD-WAN rule to use best quality with bandwidth set as the quality criteria:
   a. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
   b. Enter a name for the rule, such as *gmail*.
   c. Configure the following settings:

Internet service	*Google-Gmail*
Interface selection strategy	*Best quality*
Interface preference	*wan1* and *wan2*
Measured SLA	*google*
Quality criteria	*Bandwidth*

   d. Click *OK*.

5. Verify that the *Estimated bandwidth* values are used to select an SD-WAN interface in SD-WAN service rules.
   a. Verify the health check status:

```
# diagnose sys sdwan health-check status
Health Check(google):
Seq(1 wan1): state(alive), packet-loss(0.000%) latency(4.996), jitter(0.824), mos(4.401),
bandwidth-up(414400), bandwidth-dw(405115), bandwidth-bi(819515) sla_map=0x0
Seq(2 wan2): state(alive), packet-loss(0.000%) latency(4.634), jitter(0.340), mos(4.402),
bandwidth-up(443975), bandwidth-dw(699264), bandwidth-bi(1143239) sla_map=0x0
```

   b. Verify the service rule 1 diagnostics:

```
# diagnose sys sdwan service4 1

Service(1): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
 Tie break: cfg
  Gen(1), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(priority), link-
cost-factor(bibandwidth), link-cost-threshold(10), health-check(google)
  Members(2):
    1: Seq_num(2 wan2 virtual-wan-link), alive, bibandwidth: 1143239Kbps, selected
    2: Seq_num(1 wan1 virtual-wan-link), alive, bibandwidth: 819506Kbps, selected
  Internet Service(1): Google-Gmail(65646,0,0,0,0)
```

   Since wan2 has superior bandwidth, SD-WAN will prioritize Seq_num(2) over Seq_num(1), and wan2 will be utilized to route Gmail traffic. The bandwidth is automatically determined by the *Estimated bandwidth* values, which were populated by running a speed test in the GUI.

Using speed test results with traffic shaping

The interface speed test can be used to populate the bandwidth values based on the results.

To configure the outbandwidth value in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit an interface.
3. In the *Traffic Shaping* section, enable *Outbound bandwidth* and enter the result obtained from the speed test's uploading mode.
4. Click *OK*.

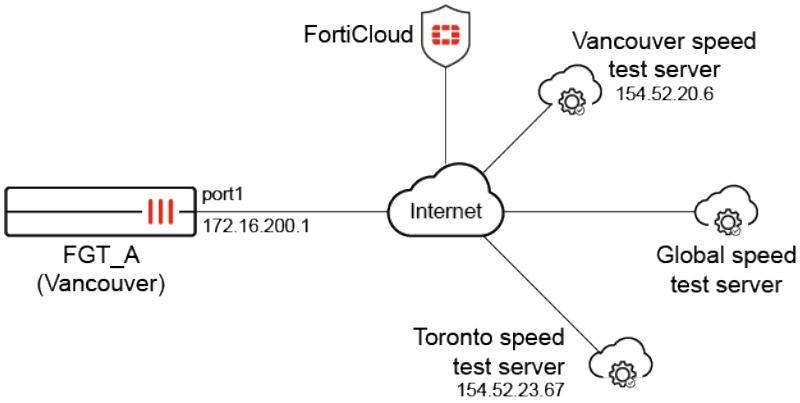
To configure the outbandwidth and inbandwidth values in the CLI:

```
config system interface
    edit <interface>
        set outbandwidth <speed_in_kbps>
        set inbandwidth <speed_in_kbps>
    next
end
```

The populated bandwidth values can be used in conjunction with either an egress or ingress traffic shaping profile.

Speed test examples

This topic includes examples that show various tests based on different modes (auto, TCP, UDP), latency thresholds, and test servers. Some test protocols and servers are manually configured, while others are chosen by the FortiGate.



These examples assume the FortiGate is connected to the internet, has a valid SD-WAN Underlay and Application Monitoring license, and has downloaded the server list of speed tests from FortiCloud. See CLI speed test on page 1186 for more information.

- Example 1: executing a speed test without specifying the interface, server, and mode
- Example 2: executing a speed test with a lower latency threshold setting
- Example 3: executing the speed test with diagnose netlink interface speed-test
- Example 4: executing the speed test according to the schedule
- Example 5: executing multiple speed tests with TCP and UDP connections
- Example 6: executing a manual speed test for debugging

Example 1: executing a speed test without specifying the interface, server, and mode

Geographically, the Vancouver server (154.52.20.6) has the smallest latency (around 7 ms) to FGT_A, so it will be automatically selected for the speed test because the latency 7 ms to 154.52.20.6 is less than the default `latency-threshold` of 60 ms. Meanwhile, four TCP connections will be initiated to perform the test since the default `multiple-tcp-stream` is 4.

To execute the speed test without specifying parameters:

1. Configure the speed test settings:

```
config system speed-test-setting
    set latency-threshold 60
    set multiple-tcp-stream 4
end
```

2. Execute a ping to the closest test server, 154.52.20.6, to learn the latency for the connection:

```
# execute ping 154.52.20.6
PING 154.52.20.6 (154.52.20.6): 56 data bytes
64 bytes from 154.52.20.6: icmp_seq=0 ttl=50 time=7.5 ms
64 bytes from 154.52.20.6: icmp_seq=1 ttl=50 time=7.2 ms
64 bytes from 154.52.20.6: icmp_seq=2 ttl=50 time=7.1 ms
64 bytes from 154.52.20.6: icmp_seq=3 ttl=50 time=7.1 ms
64 bytes from 154.52.20.6: icmp_seq=4 ttl=50 time=9.1 ms

--- 154.52.20.6 ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss
round-trip min/avg/max = 7.1/7.6/9.1 ms
```

3. Run the speed test with no parameters:

```
# execute speed-test
Initializing speed test.
current vdom=root
Run in uploading mode.
Connecting to host 154.52.20.6, port 5203
[  7] local 172.16.200.1 port 21219 connected to 154.52.20.6 port 5203
[  9] local 172.16.200.1 port 21220 connected to 154.52.20.6 port 5203
[ 11] local 172.16.200.1 port 21221 connected to 154.52.20.6 port 5203
[ 13] local 172.16.200.1 port 21222 connected to 154.52.20.6 port 5203
[ ID] Interval           Transfer     Bitrate         Retr  Cwnd
[  7]   0.00-1.00   sec  22.4 MBytes   188 Mbits/sec   17    140 KBytes
[  9]   0.00-1.00   sec  9.71 MBytes  81.4 Mbits/sec    6   73.5 KBytes
[ 11]   0.00-1.00   sec  18.5 MBytes   155 Mbits/sec   12    117 KBytes
...
[SUM]   0.00-5.02   sec   321 MBytes   536 Mbits/sec                  receiver

speed test Done.
Run in reverse downloading mode.
Connecting to host 154.52.20.6, port 5203
Reverse mode, remote host 154.52.20.6 is sending
[  7] local 172.16.200.1 port 21228 connected to 154.52.20.6 port 5203
[ 11] local 172.16.200.1 port 21229 connected to 154.52.20.6 port 5203
...
[SUM]   0.00-5.00   sec   331 MBytes   555 Mbits/sec                  receiver

speed test Done.
```

The tested upload/download speed for port1 is 536 Mbps/555 Mbps when connecting to the closest server with four TCP connections.

Example 2: executing a speed test with a lower latency threshold setting

The `latency-threshold` setting is changed to 5 ms, which is less than the latency 7 ms to 154.52.20.6. When executing the speed test, one UDP connection will be initiated as expected.

To execute the speed test with a lower latency threshold setting:

1. Edit the speed test settings:

```
config system speed-test-setting
    set latency-threshold 5
end
```

2. Run the speed test:

```
# execute speed-test
Speed test quota for 7/19 is 4
current vdom=root
Run in uploading mode.
Connecting to host 154.52.20.6, port 5202
[  7] local 172.16.200.1 port 5315 connected to 154.52.20.6 port 5202

speed test Done.
```

The tested upload/download speed for port1 is 917 Mbps/595 Mbps when connecting to the closest server with one UDP connection.

Example 3: executing the speed test with diagnose netlink interface speed-test

After running this diagnose command, the results are recorded in the interface settings for reference as `measured-upstream-bandwidth` and `measured-downstream-bandwidth`.

To execute the speed test:

```
# diagnose netlink interface speed-test port1 FTNT_CA_Vancouver TCP
speed-test test ID is b0066
...
```

To view the interface settings:

```
show system interface port1
config system interface
    edit "port1"
        ...
        set measured-upstream-bandwidth 735682
        set measured-downstream-bandwidth 746573
        set bandwidth-measure-time 1689811319
        ...
    next
end
```

Example 4: executing the speed test according to the schedule

In this example, a speed test is configure to occur within a three hour window, with a specific server group selected to prioritize that server (the default is FTNT_Auto). A retry mechanism is configured for failed speed tests, and minimum in and out bandwidths are specified for the speed test results. The results of the speed test are then applied to the in and out bandwidths in memory so that QoS can use them.

To execute the speed test according to the schedule:

1. Configure the recurring schedule:

   ```
   config firewall schedule recurring
       edit "speedtest_recurring"
           set start 17:07
           set day sunday monday tuesday wednesday thursday friday saturday
           set label-day midday
       next
   end
   ```

   Midday is configured as the three hour window to run the speed test. The test will be initiated between 10 AM and 1 PM.
2. Configure the speed test schedule:

   ```
   config system speed-test-schedule
       edit "port1"
           set server-name “FTNT_CA_Burnaby”
           set schedules "speedtest_recurring"
           set retries 2
           set retry-pause 60
           set update-interface-shaping enable
           set update-inbandwidth-minimum 80000
   ```

```
        set update-outbandwidth-minimum 400000
    next
end
```

The speed test server `FTNT_CA_Burnaby` is configured as the first server that the speed test will be performed against.

> Use the `diagnose test app forticron 9` command to display the list of speed-test servers and the order in which they will be tested.

The speed test will attempt 2 connections (`retries`), then wait 60 seconds (`retry-pause`). This repeats 3 times for a total of 6 connection attempts. If all 6 connections fail, select the next server from the list and repeat the 6 attempts, then continue to the next server if that server fails all tests.

3. Check the results of the speed test applied to the interface:

```
# show sys interface port1
config system interface
    edit "port1"
       ...
        set measured-upstream-bandwidth 425252
        set measured-downstream-bandwidth 97319
        set bandwidth-measure-time 1689811759
        ...
    next
end
```

The interface reflects the results of the speed test. The actual test results are applied because they are more than the minimum considered downloading/uploading bandwidth.

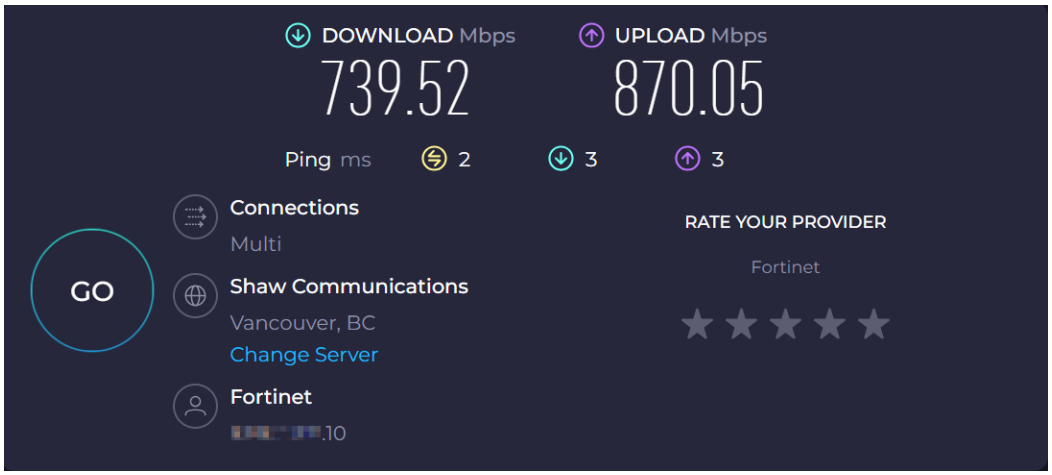
4. Verify that the bandwidth is applied in memory so that QoS can utilize the values:

```
# diagnose netlink interface list port1
...
inbandwidth=97319(kbps)         total_bytes=587645K     drop_bytes=522341K
outbandwidth=425252(kbps)

        priority=0      allocated-bandwidth=13(kbps)    total_bytes=517765K     drop_
bytes=235786K
        priority=1      allocated-bandwidth=0(kbps)     total_bytes=0   drop_bytes=0
        priority=2      allocated-bandwidth=0(kbps)     total_bytes=0   drop_bytes=0
        priority=3      allocated-bandwidth=0(kbps)     total_bytes=1330        drop_bytes=0
        priority=4      allocated-bandwidth=425238(kbps)        total_bytes=0   drop_bytes=0
...
```

Example 5: executing multiple speed tests with TCP and UDP connections

A speed test is executed to the closest server using 64 TCP connections and another speed test is executed using one UDP connection. The results can be checked with a third-party platform (such as Ookla), which returns comparable results.



To execute multiple speed tests with TCP and UDP connections:

1. Edit the speed test settings:

```
config system speed-test-setting
    set multiple-tcp-stream 64
end
```

2. Run the TCP speed test:

```
# execute speed-test port1 FTNT_CA_Vancouver TCP
...
Run in uploading mode.
...
[SUM]   0.00-5.00   sec   559 MBytes   938 Mbits/sec  2165             sender
[SUM]   0.00-5.01   sec   558 MBytes   933 Mbits/sec                  receiver

speed test Done.
Run in reverse downloading mode.
...
[SUM]   0.00-5.01   sec   505 MBytes   846 Mbits/sec  9329             sender
[SUM]   0.00-5.00   sec   491 MBytes   823 Mbits/sec                  receiver
```

3. Run the UDP speed test:

```
# execute speed-test port1 FTNT_CA_Vancouver UDP
...
Run in uploading mode.
...
[  7]   0.00-5.00   sec   556 MBytes   933 Mbits/sec  0.000 ms  0/402727 (0%)  sender
[  7]   0.00-5.04   sec   556 MBytes   925 Mbits/sec  0.020 ms  393/402717 (0.098%)  receiver
...
Run in reverse downloading mode.
...
[  7]   0.00-5.04   sec   869 MBytes  1.45 Gbits/sec  0.000 ms  0/629383 (0%)  sender
[SUM]  0.0- 5.0 sec  2 datagrams received out-of-order
[  7]   0.00-5.00   sec   489 MBytes   821 Mbits/sec  0.005 ms  274103/628393 (44%)  receiver
```

```
speed test Done.
```

Example 6: executing a manual speed test for debugging

This example provides the steps to enable debug output and manually initiate a speed-test. The debug process is reset to avoid debug output from other applications.

To execute a manual speed test with debugging:

1. Enable debug for speed test:

```
# diagnose debug reset
# diagnose debug application speedtest -1
# diagnose debug enable
```

2. Execute a manual speed test and review the debug output:

```
# diagnose netlink interface speed-test port1 FTNT_US_Miami UDP
speed-test test ID is 630000
[speedtest(8798)] [ 26]   1.00-2.00   sec  96.2 MBytes   807 Mbits/sec  69680
[speedtest(8798)] [ 26]   2.00-3.00   sec  96.5 MBytes   809 Mbits/sec  69848
[speedtest(8798)] [ 26]   3.00-4.00   sec  96.2 MBytes   807 Mbits/sec  69670
[speedtest(8798)] [ 26]   4.00-5.00   sec  96.4 MBytes   809 Mbits/sec  69830
[speedtest(8798)] [ ID] Interval           Transfer     Bitrate         Jitter    Lost/Total
Datagrams
[speedtest(8798)] [ 26]   0.00-5.00   sec   480 MBytes   804 Mbits/sec  0.000 ms  0/347479
(0%)  sender
[speedtest(8798)] [ 26]   0.00-5.13   sec   260 MBytes   425 Mbits/sec  0.015 ms

[speedtest(8798)] [ 26]   0.00-5.00   sec  58.1 MBytes  97.3 Mbits/sec  0.013 ms
476813/518854 (92%)  receiver
[speedtest(8798)] client(recver): bytes_recv=60875368, bytes_sent=766840528, sender_
time=5.121, recver_time=5.004
[speedtest(8798)] client(recver): down_speed: 97.3 Mbits/sec
[speedtest(8798)]
[speedtest(8798)] speed test Done.
fcron_speedtest_notify_func()-1592: Speed test pid=8798 done

fcron_speedtest_on_test_finish()-1519: Test 630000 for 'port1' succeed with up=425252,
down=97319
```

3. Disable and reset the debug once finished:

```
# diagnose debug reset
# diagnose debug disable
```

Overlay

The following topics provide instructions on SD-WAN VPN overlays:

- VPN on page 1231
- ADVPN on page 1237
- ADVPN 2.0 on page 1296
- Self-healing and application protection on page 1336

VPN

This section introduces some options available when creating your overlay VPN tunnels, such as the VPN tunnel wizard, and SD-WAN Overlay-as-a-Service. VPN enhancements, such as Forward Error Correction, are introduced as options to increase resiliency or provide QoS traffic shaping:

- Dual VPN tunnel wizard on page 1231
- SD-WAN Overlay-as-a-Service on page 1232
- Interface based QoS on individual child tunnels based on speed test results on page 1234

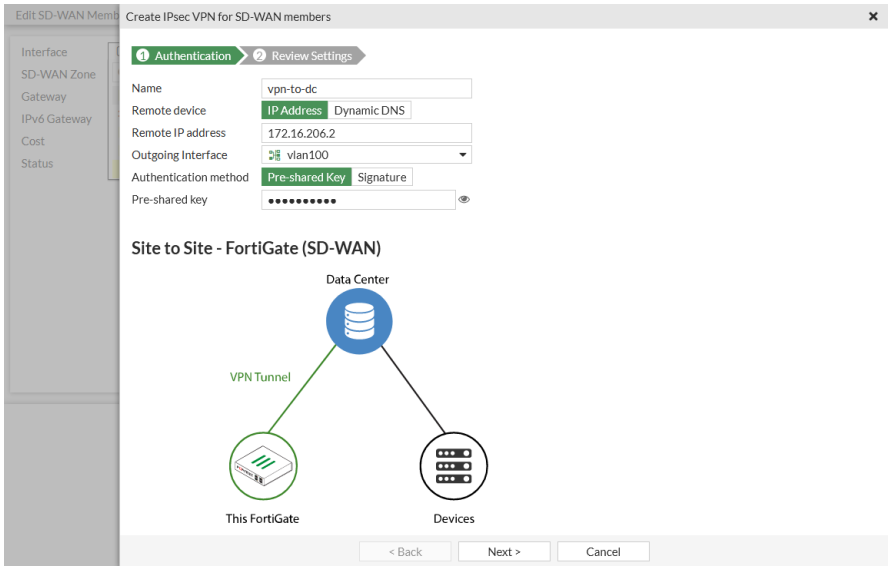
Dual VPN tunnel wizard

This wizard is used to automatically set up multiple VPN tunnels to the same destination over multiple outgoing interfaces. This includes automatically configuring IPsec, routing, and firewall settings, avoiding cumbersome

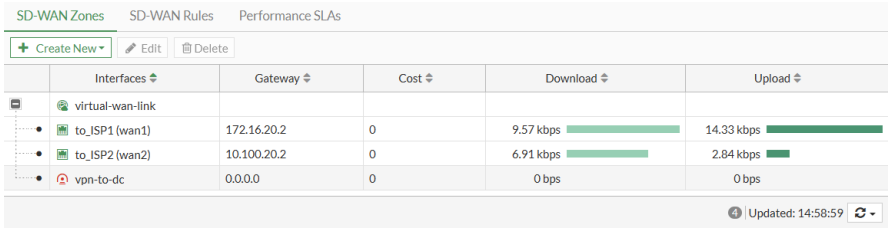
and error-prone configuration steps.

To create a new SD-WAN VPN interface using the tunnel wizard:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. In the *Interface* drop-down, click *+VPN*. The *Create IPsec VPN for SD-WAN members* pane opens.



3. Enter the required information, then click *Next*.
4. Review the settings then click *Create*.
5. Click *Close* to return to the SD-WAN page.
   The newly created VPN interface will be highlighted in the *Interface* drop-down list.
6. Select the VPN interface to add it as an SD-WAN member, then click *OK*.



SD-WAN Overlay-as-a-Service

The FortiCloud Overlay-as-a-Service portal and the FortiGate Cloud Advanced license support SD-WAN overlay.

SD-WAN overlay is supported through an Overlay-as-a-Service (OaaS) license displayed as *SD-WAN Overlay as a Service* on the *System* > *FortiGuard* page. Each FortiGate used by the FortiCloud Overlay-as-a-Service or FortiGate Cloud portal for SD-WAN overlay must have this license applied to it.

See the Overlay-as-a-Service Administration Guide and SD-WAN Overlay in the FortiGate Cloud Administration Guide for more information on SD-WAN overlay.

To view the status of the OaaS license in the GUI:

1. Go to *System* > *FortiGuard*.
2. Expand *License Information*. The *SD-WAN Overlay as a Service* license status is listed as:
   - *Licensed*: OaaS is currently licensed and will expire on the provided date.
   - *Expires Soon*: OaaS is currently licensed but will expire soon on the provided date.
   - *Expired*: The OaaS license has already expired on the provided date.
   - *Not Licensed*: OaaS has not been licensed.

To view the status of the OaaS license in the CLI:

1. Verify that the entitlement can be updated:

   The SD-WAN Overlay-as-a-Service license is listed as `SWOS` in the CLI.

```
# diagnose test update info

System contracts:
    FMWR,Wed Dec 20 16:00:00 2023
    SPAM,Wed Dec 20 16:00:00 2023
    SBCL,Wed Dec 20 16:00:00 2023
    SWNO,Wed Dec 20 16:00:00 2023
    SWNM,Wed Sep 27 17:00:00 2023
    SWOS,Mon Aug 14 17:00:00 2023
    SPRT,Wed Dec 20 16:00:00 2023
    SDWN,Sun Dec 10 16:00:00 2023
    SBCL,Wed Dec 20 16:00:00 2023
    SBEN,Wed Dec 20 16:00:00 2023
```

2. Verify that the expiration date log can be generated:

```
# execute log display

1: date=2023-08-10 time=00:00:01 eventtime=1691650800645347120 tz="-0700" logid="0100020138"
type="event" subtype="system" level="warning" vd="root" logdesc="FortiGuard SD-WAN Overlay as
a Service license expiring" msg="FortiGuard SD-WAN Overlay Service license will expire in 4
day(s)"
```

To ensure FortiGate spoke traffic remains uninterrupted when configuration is orchestrated from SD-WAN Overlay-as-a-Service (OaaS) or FortiGate Cloud, support for an OaaS agent on the FortiGate is available. The OaaS agent communicates with the OaaS controller in FortiCloud, validates and compares the FortiOS configuration, and applies the FortiOS configuration to the FortiGate as a transaction when it has been orchestrated from the OaaS or FortiGate Cloud portal. Secure communication between the OaaS agent and the OaaS controller is achieved using the FGFM management tunnel.

If any configuration change fails to be applied, then the OaaS agent rolls back all configuration changes that were orchestrated. The OaaS status can be acquired using `get oaas status`.

To determine the status of OaaS:

```
# get oaas status
Account ID: 78992
Account: admin@domain.com
Site: site1
Configuration version: 4
Configuration sync status: SUCCESS
    Target version: 4
    Task ID: xxxxxxxxx
    Error:
```

Interface based QoS on individual child tunnels based on speed test results

In a hub and spoke SD-WAN topology that uses dial-up VPN overlays, QoS can be applied on individual tunnels based on the measured bandwidth between the hub and spokes. The FortiGate can use the built in speed test to dynamically populate the egress bandwidth to individual dial-up tunnels from the hub.

A bandwidth limit, derived from the speed test, and a traffic shaping profile can be applied on the dial-up IPsec tunnel interface on the hub. A class ID and percentage based QoS settings can be applied to individual child tunnels using a traffic shaping policy and profile.

CLI commands

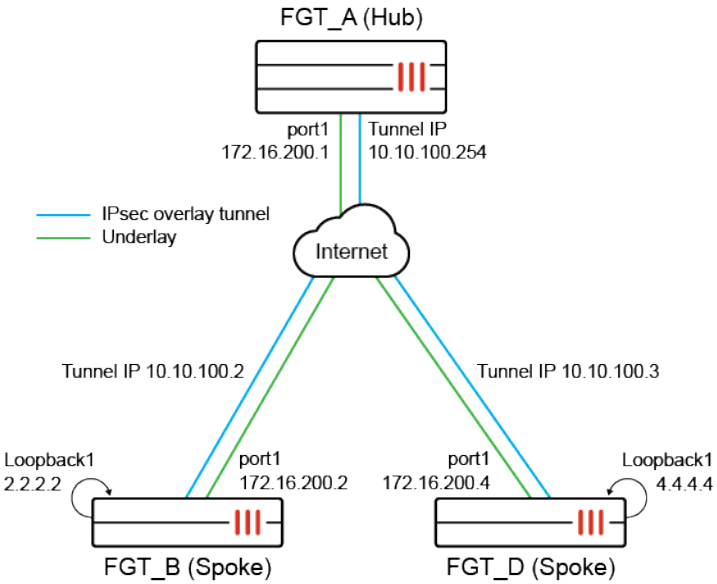
If the interface is an IPsec dial-up server, then egress shaping profile type can only be set to `policing`; it cannot be set to `queuing`:

```
config firewall shaping-profile
    edit <profile-name>
        set type policing
    next
end
```

The outbandwidth value is dynamically obtained from the speed test results for each individual child tunnel, and should not be set manually:

```
config system interface
    edit <dialup-server-phase1-name>
        set egress-shaping-profile <profile-name>
        set outbandwidth <bandwidth>
    next
end
```

Example



In this example, the hub is configured as a VPN dial-up server and both of the spokes are connected to the hub. It is assumed that the VPN configuration is already done, with a dynamic gateway type and kernel device creation (`net-device`) disabled. Only one SD-WAN interface is used, so there is only one VPN overlay member in the SD-WAN zone. Multiple WAN interfaces and VPN overlays could be used.

The VPN interfaces and IP addresses are:

FortiGate	Interface	IP Address
FGT_A (Hub)	hub-phase1	10.10.100.254
FGT_B (Spoke)	spoke11-p1	10.10.100.2
FGT_D (Spoke)	spoke21-p1	10.10.100.3

The hub VPN has two child tunnels, one to each spoke.

The speed test configuration is shown in Running speed tests from the hub to the spokes in dial-up IPsec tunnels on page 1193. This example shows applying a shaping profile to the hub's tunnel interface in order to apply interface based traffic shaping to the child tunnels.

A traffic shaping policy is used to match and assign traffic to the classes in the shaping profile.

To configure the hub FortiGate (FGT_A) and check the results:

1. Configure the hub FortiGate (FGT_A) as in Running speed tests from the hub to the spokes in dial-up IPsec tunnels on page 1193.
2. Configure the shaping profile:

```
config firewall shaping-profile
    edit "profile_1"
        config shaping-entries
            edit 1
```

```
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 10
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 40
            next
            edit 3
                set class-id 4
                set priority high
                set guaranteed-bandwidth-percentage 20
                set maximum-bandwidth-percentage 60
            next
        end
        set default-class-id 2
    next
end
```

3. Configure a traffic shaping policy:

```
config firewall shaping-policy
    edit 2
        set service "ALL"
        set schedule "always"
        set dstintf "hub-phase1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

In this example, all traffic through the hub-phase1 interface is put into class ID 3. Class IDs an be assigned based on your traffic requirements.

4. At the schedules time, the speed test will start for the hub-phase1 interface from the hub to the spokes. The speed test results can then be dynamically applied on individual child tunnels as egress traffic shaping, and the class ID percentage based QoS settings is applicable on them as templates.

```
# diagnose vpn tunnel list
------------------------------------------------------
name=hub-phase1_0 ver=2 serial=c 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=737210(kbps) lock_hit=0 default_class=2 n_active_class=3

                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=442325(kbps)        guaranteed-bandwidth=147441
(kbps)
                        max-bandwidth=442325(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
---------------------------------------------------
name=hub-phase1_1 ver=2 serial=d 172.16.200.1:0->172.16.200.2:0 tun_id=172.16.200.2 dst_
mtu=1500 dpd-link=on remote_location=0.0.0.0 weight=1
...
egress traffic control:
        bandwidth=726813(kbps) lock_hit=0 default_class=2 n_active_class=3
        class-id=2      allocated-bandwidth=72681(kbps)         guaranteed-bandwidth=72681
(kbps)
                        max-bandwidth=72681(kbps)       current-bandwidth=0(kbps)
                        priority=low    forwarded_bytes=123
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=218044(kbps)        guaranteed-bandwidth=218043
(kbps)
                        max-bandwidth=290725(kbps)      current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=436087(kbps)        guaranteed-bandwidth=145362
(kbps)
                        max-bandwidth=436087(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
```

The guaranteed and maximum bandwidths equal 10% of the speed test result, as expected.

ADVPN

ADVPN (Auto Discovery VPN) is an IPsec technology that allows a traditional hub-and-spoke VPN's spokes to establish dynamic, on-demand, direct tunnels between each other to avoid routing through the topology's hub device. The primary advantage is that it provides full meshing capabilities to a standard hub-and-spoke topology. This greatly reduces the provisioning effort for full spoke-to-spoke low delay reachability and addresses the scalability issues associated with very large fully meshed VPN networks.

The following topics provide information on ADVPN for SD-WAN:

- ADVPN and shortcut paths on page 1238
- Active dynamic BGP neighbor triggered by ADVPN shortcut on page 1251
- SD-WAN monitor on ADVPN shortcuts on page 1262
- Hold down time to support SD-WAN service strategies on page 1263
- Keeping sessions in established ADVPN shortcuts while they remain in SLA on page 1265

- Using a single IKE elector in ADVPN to match all SD-WAN control plane traffic on page 1276
- SD-WAN in large scale deployments on page 1284

ADVPN and shortcut paths

This topic provides an example of how to use SD-WAN and ADVPN together.

ADVPN (Auto Discovery VPN) is an IPsec technology that allows a traditional hub-and-spoke VPN's spokes to establish dynamic, on-demand, direct tunnels between each other to avoid routing through the topology's hub device. The primary advantage is that it provides full meshing capabilities to a standard hub-and-spoke topology. This greatly reduces the provisioning effort for full spoke-to-spoke low delay reachability, and addresses the scalability issues associated with very large fully meshed VPN networks.

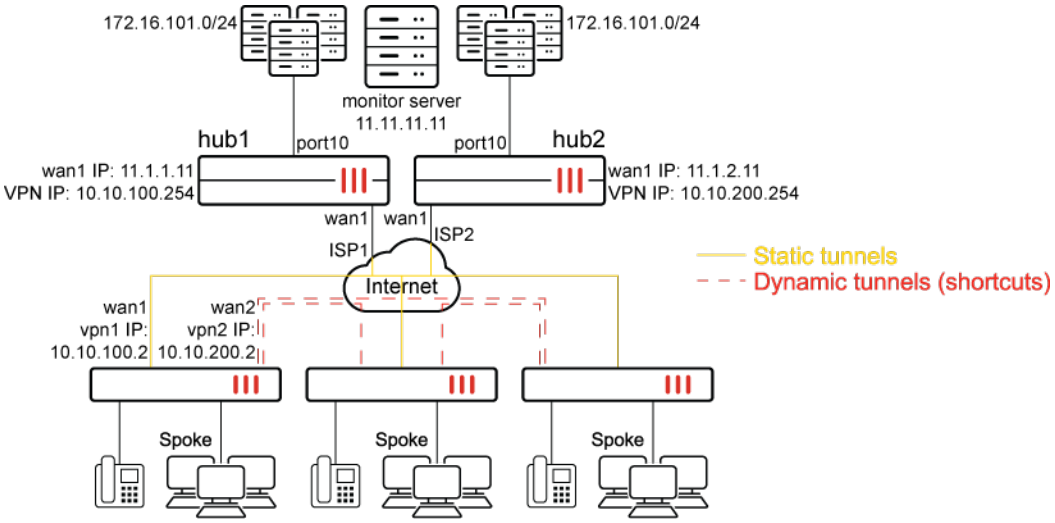
If a customer's head office and branch offices all have two or more internet connections, they can build a dual-hub ADVPN network. Combined with SD-WAN technology, the customer can load-balance traffic to other offices on multiple dynamic tunnels, control specific traffic using specific connections, or choose better performance connections dynamically.

SD-WAN load-balance mode rules (or services) do not support ADVPN members. Other modes' rules, such as SLA and priority, support ADVPN members.

This topic covers three parts:

1. Configure dual-hub ADVPN with multiple branches.
2. Configure BGP to exchange routing information among hubs and spokes.
3. Configure SD-WAN on spoke to do load-balancing and control traffic.

Configuration example



A typical ADVPN configuration with SD-WAN usually has two hubs, and each spoke connects to two ISPs and establishes VPN tunnels with both hubs.

This example shows a hub-and-spoke configuration using two hubs and one spoke:

- Hub1 and Hub2 both use wan1 to connect to the ISPs and port10 to connect to internal network.
- Spoke1 uses wan1 to connect to ISP1 and wan2 to connect to ISP2.
- wan1 sets up VPN to hub1.
- wan2 sets up VPN to hub2.

The SD-WAN is configured on the spoke. It uses the two VPN interfaces as members and two rules to control traffic to headquarters or other spokes using ADVPN VPN interfaces. You can create more rules if required.

For this example:

- Use SD-WAN member 1 (via ISP1) and its dynamic shortcuts for financial department traffic if member 1 meets SLA requirements. If it doesn't meet SLA requirements, it will use SD-WAN member 2 (via ISP2).
- Use SD-WAN member 2 (via ISP2) and its dynamic shortcuts for engineering department traffic.
- Load balance other traffic going to hubs and other spokes between these two members.
- Set up all other traffic to go with their original ISP connection. All other traffic does not go through SD-WAN.
- Set up basic network configuration to let all hubs and spokes connect to their ISPs and the Internet.

Hub internal network	172.16.101.0/24
Spoke1 internal network	10.1.100.0/24
ADVPN 1 network	10.10.100.0/24
ADVPN 2 network	10.10.200.0/24
Hub1 wan1 IP	11.1.1.11
Hub2 wan1 IP	11.1.2.11
Hub1 VPN IP	10.10.100.254
Hub2 VPN IP	10.10.200.254
Spoke1 to hub1 VPN IP	10.10.100.2
Spoke1 to hub2 VPN IP	10.10.200.2
Ping server in Headquarters	11.11.11.11
Internal subnet of spoke1	22.1.1.0/24
Internal subnet of spoke2	33.1.1.0/24
Firewall addresses	Configure hub_subnets and spoke_subnets before using in policies. These can be customized.

The GUI does not support some ADVPN related options, such as auto-discovery-sender, auto-discovery-receiver, auto-discovery-forwarder, and IBGP neighbor-group setting, so this example only provides CLI configuration commands.

Hub1 sample configuration

To configure the IPsec phase1 and phase2 interface:

```
config vpn ipsec phase1-interface
    edit "hub-phase1"
        set type dynamic
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "hub-phase2"
        set phase1name "hub-phase1"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-sha256
    next
end
```

When `net-device` is disabled, a tunnel ID is generated for each dynamic tunnel. This ID, in the form of an IP address, is used as the gateway in the route entry to that tunnel. The `tunnel-search` option is removed in FortiOS 7.0.0 and later.

To configure the VPN interface and BGP:

```
config system interface
    edit "hub-phase1"
        set ip 10.10.100.254 255.255.255.255
        set remote-ip 10.10.100.253 255.255.255.0
    next
end
config router bgp
    set as 65505
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65505
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.100.0 255.255.255.0
```

```
            set neighbor-group "advpn"
        next
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
        edit 2
            set prefix 11.11.11.0 255.255.255.0
         next
    end
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "hub-phase1"
        set dstintf "port10"
        set srcaddr "spoke_subnets"
        set dstaddr "hub_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from spokes to headquarter"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "hub-phase1"
        set dstintf "hub-phase1"
        set srcaddr "spoke_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from spokes to spokes"
    next
    edit 3
        set name "internal2spoke"
        set srcintf "port10"
        set dstintf "hub-phase1"
        set srcaddr "hub_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from headquarter to spokes"
    next
end
```

Hub2 sample configuration

Hub2 configuration is the same as hub1 except the wan1 IP address, VPN interface IP address, and BGP neighbor-range prefix.

To configure the IPsec phase1 and phase2 interface:

```
config vpn ipsec phase1-interface
    edit "hub-phase1"
        set type dynamic
        set interface "wan1"
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 3des-sha256 aes128-sha1 aes256-sha1 3des-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "hub-phase2"
        set phase1name "hub-phase1"
        set proposal aes128-sha1 aes256-sha1 3des-sha1 aes128-sha256 aes256-sha256 3des-sha256
    next
end
```

To configure the VPN interface and BGP:

```
config system interface
    edit "hub-phase1"
        set ip 10.10.200.254 255.255.255.255
        set remote-ip 10.10.200.253 255.255.255.0
    next
end
config router bgp
    set as 65505
    config neighbor-group
        edit "advpn"
            set link-down-failover enable
            set remote-as 65505
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.200.0 255.255.255.0
            set neighbor-group "advpn"
        next
```

```
    end
    config network
        edit 1
            set prefix 172.16.101.0 255.255.255.0
        next
        edit 2
            set prefix 11.11.11.0 255.255.255.0
         next
    end
end
```

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "spoke2hub"
        set srcintf "hub-phase1"
        set dstintf "port10"
        set srcaddr "spoke_subnets"
        set dstaddr "hub_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from spokes to headquarter"
    next
    edit 2
        set name "spoke2spoke"
        set srcintf "hub-phase1"
        set dstintf "hub-phase1"
        set srcaddr "spoke_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from spokes to spokes"
    next
    edit 3
        set name "internal2spoke"
        set srcintf "port10"
        set dstintf "hub-phase1"
        set srcaddr "hub_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow traffic from headquarter to spokes"
    next
end
```

Spoke1 sample configuration

To configure the IPsec phase1 and phase2 interface:

```
config vpn ipsec phase1-interface
    edit "spoke1-phase1"
        set interface "wan1"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 11.1.1.11
        set psksecret sample
        set dpd-retryinterval 5
    next
    edit "spoke1-2-phase1"
        set interface "wan2"
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128-sha1 aes256-sha1
        set add-route disable
        set dpd on-idle
        set auto-discovery-receiver enable
        set remote-gw 11.1.2.11
        set psksecret sample
        set dpd-retryinterval 5
    next
end
config vpn ipsec phase2-interface
    edit "spoke1-phase2"
        set phase1name "spoke1-phase1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
    edit "spoke1-2-phase2"
        set phase1name "spoke1-2-phase1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
        set auto-negotiate enable
    next
end
```

To configure the VPN interface and BGP:

```
config system interface
    edit "spoke1-phase1"
        set ip 10.10.100.2 255.255.255.255
        set remote-ip 10.10.100.254 255.255.255.0
```

```
    next
    edit "spoke1-2-phase1"
        set ip 10.10.200.2 255.255.255.255
        set remote-ip 10.10.200.254 255.255.255.0
    next
end
config router bgp
    set as 65505
    config neighbor
        edit "10.10.100.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65505
        next
        edit "10.10.200.254"
            set advertisement-interval 1
            set link-down-failover enable
            set remote-as 65505
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

To configure SD-WAN:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "spoke1-phase1"
        next
        edit 2
            set interface "spoke1-2-phase1"
        next
    end
    config health-check
        edit "ping"
            set server "11.11.11.11"
            set members 1 2
            config sla
                edit 1
                    set latency-threshold 200
                    set jitter-threshold 50
                    set packetloss-threshold 5
                next
            end
        next
    end
```

```
    config service
        edit 1
            set mode sla
            set dst "financial-department"
            config sla
                edit "ping"
                    set id 1
                next
            end
            set priority-members 1 2
        next
        edit 2
            set priority-members 2
            set dst "engineering-department"
        next
    end
end
```

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

To configure the firewall policy:

```
config firewall policy
    edit 1
        set name "outbound_advpn"
        set srcintf "internal"
        set dstintf "virtual-wan-link"
        set srcaddr "spoke_subnets"
        set dstaddr "spoke_subnets" "hub_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow internal traffic going out to headquarter and other spokes"
    next
    edit 2
        set name "inbound_advpn"
        set srcintf "virtual-wan-link"
        set dstintf "internal"
        set srcaddr "spoke_subnets" "hub_subnets"
        set dstaddr "spoke_subnets"
        set action accept
        set schedule "always"
        set service "ALL"
        set comments "allow headquarter and other spokes traffic coming in"
    next
end
```

Troubleshooting ADVPN and shortcut paths

Before spoke vs spoke shortcut VPN is established

Use the following CLI commands to check status before spoke vs spoke shortcut VPN is established.

```
# get router info bgp summary
BGP router identifier 2.2.2.2, local AS number 65505
BGP table version is 13
3 BGP AS-PATH entries
0 BGP community entries

Neighbor        V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.100.254   4      65505    3286    3270       11    0    0 00:02:15        5
10.10.200.254   4      65505    3365    3319       12    0    0 00:02:14        5

Total number of neighbors 2
```

```

Active dynamic BGP neighbor triggered by ADVPN shortcut

When a customer using SD-WAN with ADVPN has numerous IPv4 and IPv6 routes per spoke and there are many spokes in the topology, using ADVPN with a route reflector-based design poses the following challenges:

- The hub FortiGate will experience high CPU usage due to the amount of processing required to reflect the routes to the spoke FortiGates.

- Spoke FortiGates will learn many unnecessary routes.

For such cases, it is more suitable to deploy an IPv4- and IPv6-supported solution without a route-reflector that involves an active dynamic BGP neighbor triggered by an ADVPN shortcut. This solution allows a spoke FortiGate to form a BGP neighbor with another spoke FortiGate only after the shortcut tunnel between them has been established. As a result, the spoke only learns routes from its BGP neighbors.

How this solution differs from typical SD-WAN with ADVPN

In a topology where the Spoke 1 and Spoke 2 FortiGates are connected directly to the Hub FortiGate, route reflection will not be enabled. The Hub FortiGate is only configured with each spoke's summary route. An ADVPN shortcut tunnel is established between the Spoke 1 and Spoke 2 FortiGates. The valid routing between the Spoke 1 and Spoke 2 FortiGate is still through the Hub FortiGate at this point.

When a host behind Spoke 1 tries to connect to a host behind Spoke 2, Spoke 1 first reaches the Hub based on the valid routing table. The Hub determines that the destination is reachable, and the ADVPN shortcut tunnel between the spokes is established. Then, Spoke 1 and Spoke 2 will actively initiate a BGP connection to each other over the shortcut. Once established, they will exchange their routing information using BGP. On both spokes, BGP will resolve those routes on the shortcut and update the routing table accordingly.

For this solution, the following IPv4/IPv6 BGP configuration settings are required:

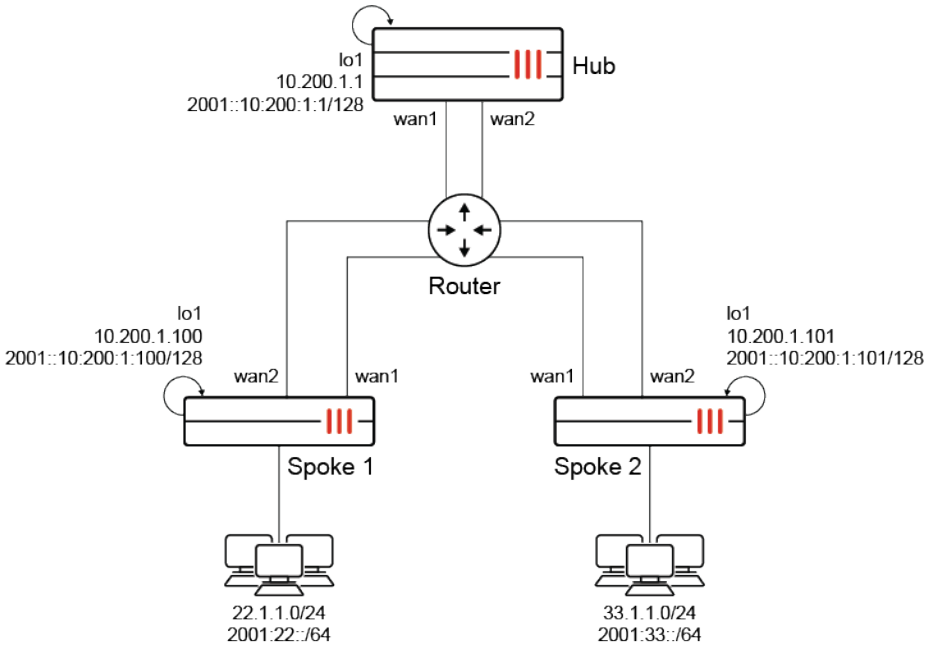
- The hub FortiGate should be configured with `neighbor-group` and `neighbor-range`/`neighbor-range6`.
- Each spoke FortiGate should be configured with `neighbor-group` and `neighbor-range`/`neighbor-range6` like the hub. More importantly, each spoke should be configured with `set passive disable` to ensure spokes are able to initiate dynamic BGP connections between each other.
- The hub FortiGate should have route reflection disabled (by default) where each `neighbor-group` setting should have `set route-reflector-client disable`.

In the configuration, each of the spokes will form a BGP neighbor relationship with the hub. This is unchanged from the typical SD-WAN with ADVPN configuration.

Example

This example configuration contains the following structure:

- Use SD-WAN member 1 (via ISP1) and its dynamic shortcuts for Financial Department traffic.
- Use SD-WAN member 2 (via ISP2) and its dynamic shortcuts for Engineering Department traffic.
- Internal subnets of Spoke 1:
  - IPv4: 22.1.1.0/24
  - IPv6: 2001:22::/64
- Internal subnets of Spoke 2:
  - IPv4: 33.1.1.0/24
    - Financial Department: 33.1.1.1 to 33.1.1.100
    - Engineering Department: 33.1.1.101 to 33.1.1.200
  - IPv6: 2001:33::/64
    - Financial Department: 2001:33::1 to 2001:33::100
    - Engineering Department: 2001:33::101 to 2001:33::200



To configure the Hub FortiGate:

1. Configure the BGP settings (neighbor group and ranges):

```
config router bgp
    set as 65100
    set router-id 10.200.1.1
    set ibgp-multipath enable
    config neighbor-group
        edit "EDGE"
            set activate6 disable
            set remote-as 65100
            set update-source "lo1"
            set route-reflector-client disable
        next
        edit "EDGEv6"
            set activate disable
            set remote-as 65100
            set update-source "lo1"
            set route-reflector-client disable
        next
    end
    config neighbor-range
        edit 2
            set prefix 10.200.1.0 255.255.255.0
            set neighbor-group "EDGE"
        next
    end
    config neighbor-range6
        edit 2
            set prefix6 2001::10:200:1:0/112
```

```
            set neighbor-group "EDGEv6"
        next
    end
    config network
        edit 2
            set prefix 10.200.1.0 255.255.255.0
        next
        edit 4
            set prefix 33.0.0.0 255.0.0.0
        next
        edit 5
            set prefix 22.0.0.0 255.0.0.0
        next
    end
    config network6
        edit 4
            set prefix6 2001:33::/32
        next
        edit 2
            set prefix6 2001:22::/32
        next
    end
end
```

2. Configure the static routes.
   a. For IPv4:

```
config router static
    edit 33
        set dst 33.0.0.0 255.0.0.0
        set blackhole enable
        set vrf 0
    next
    edit 22
        set dst 22.0.0.0 255.0.0.0
        set blackhole enable
        set vrf 0
    next
end
```

   b. For IPv6:

```
config router static6
    edit 33
        set dst 2001:33::/32
        set blackhole enable
        set vrf 0
    next
    edit 22
        set dst 2001:22::/32
        set blackhole enable
        set vrf 0
```

```
    next
end
```

The following IPv4 summary routes are advertised:

- 33.0.0.0/8
- 22.0.0.0/8

The following IPv6 summary routes are advertised:

- 2001:33::/32
- 2001:22::/32

Because route reflection has been disabled in this example, initially, Spoke 1 will not know the local subnet of Spoke 2, and Spoke 2 will not know the local subnet of Spoke 1. Therefore, for traffic routing, summary routes are configured on the hub as blackhole routes and then advertised to the spokes using BGP.

For example, for traffic from the local subnet of Spoke 2 destined for the local subnet of Spoke 1:

- For the IPv4 case, the summary route 22.0.0.0/8, which includes the local subnet of Spoke 1 (22.1.1.0/24), is advertised to Spoke 2. When Spoke 2 sends traffic destined for 22.1.1.0/24 to the Hub, the Hub forwards this traffic to Spoke 1 since they are BGP neighbors.
- For the IPv6 case, the summary route 2001:22::/32, which includes the local subnet of Spoke 1 (2001:22::/64), is advertised to Spoke 2. When Spoke 2 sends traffic destined for 2001:22::/64 to the Hub, the Hub forwards this traffic to Spoke 1 since they are BGP neighbors.

Although traffic from spoke-to-spoke goes through the hub first, it is expected that the spoke will eventually go through the shortcut tunnel.

To configure the Spoke 1 FortiGate:

1. Configure the SD-WAN settings:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "spoke1-1"
            set cost 10
        next
        edit 2
            set interface "spoke-2"
            set cost 20
        next
    end
    config health-check
        edit "ping"
            set server "11.11.11.11"
            set source 10.200.1.100
            set members 1 2
```

```
            config sla
                edit 1
                    set latency-threshold 200
                    set jitter-threshold 50
                next
            end
        next
    end
    config service
        edit 1
            set dst "financial-department"
            set priority-members 1
        next
        edit 2
            set dst "engineering-department"
            set priority-members 2
        next
        edit 61
            set addr-mode ipv6
            set priority-members 1
            set dst6 "financial-department-IPv6"
        next
        edit 62
            set addr-mode ipv6
            set priority-members 2
            set dst6 "engineering-department-IPv6"
        next
    end
end
```

2. Configure the BGP settings (neighbor group and ranges):

```
config router bgp
    set as 65100
    set router-id 10.200.1.100
    set ibgp-multipath enable
    config neighbor
        edit "10.200.1.1"
            set activate6 disable
            set remote-as 65100
            set connect-timer 10
            set update-source "lo1"
        next
        edit "2001::10:200:1:1"
            set advertisement-interval 1
            set activate disable
            set remote-as 65100
            set update-source "lo1"
        next
    end
    config neighbor-group
        edit "spokes"
```

```
            set activate6 disable
            set passive disable
            set remote-as 65100
            set update-source "lo1"
        next
        edit "spokesv6"
            set activate disable
            set passive disable
            set remote-as 65100
            set update-source "lo1"
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.200.1.0 255.255.255.0
            set neighbor-group "spokes"
        next
    end
    config neighbor-range6
        edit 1
            set prefix6 2001::10:200:1:0/112
            set neighbor-group "spokesv6"
        next
    end
    config network
        edit 3
            set prefix 22.1.1.0 255.255.255.0
        next
    end
    config network6
        edit 1
            set prefix6 2001:22::/64
        next
    end
end
```

Verifying the configuration before a spoke-to-spoke shortcut VPN is established

IPv4 use case

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
BGP table version is 5
1 BGP AS-PATH entries
0 BGP community entries
Neighbor   V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
```

```
10.200.1.1 4      65100     222     225        3    0    0 00:15:14        3
Total number of neighbors 1
```

2. Verify the BGP routing table:

```
# get router info routing-table bgp
Routing table for VRF=0
B       11.11.11.11/32 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11),
00:15:19
                                              (recursive via spoke1-2 tunnel 111.1.1.11),
00:15:19, [1/0]
B       22.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:15:19
                                          (recursive via spoke1-2 tunnel 111.1.1.11),
00:15:19, [1/0]
B       33.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:15:19
                                          (recursive via spoke1-2 tunnel 111.1.1.11),
00:15:19, [1/0]
```

IPv6 use case

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info6 bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
BGP table version is 6
1 BGP AS-PATH entries
0 BGP community entries
Neighbor         V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
2001::10:200:1:1 4      65100     223     224        4    0    0 00:15:21        3
Total number of neighbors 1
```

2. Verify the BGP routing table:

```
# get router info6 routing-table bgp
Routing table for VRF=0
B       2001::11:11:11:11/128 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel
::11.1.1.11), 00:15:29
                                                           (recursive via spoke1-2 tunnel
::111.1.1.11), 00:15:29, [1024/0]
B       2001:22::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:15:29
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:15:29, [1024/0]
B       2001:33::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:15:29
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:15:29, [1024/0]
```

Verifying the configuration after a single spoke-to-spoke shortcut VPN is established

IPv4 use case

To trigger a single spoke-to-spoke shortcut VPN, on host 22.1.1.22, ping the host 33.1.1.33 in the Financial Department. Because of the SD-WAN rule, use SD-WAN member 1 (via ISP1) and its dynamic shortcuts to reach hosts in the Financial Department.

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
BGP table version is 6
1 BGP AS-PATH entries
0 BGP community entries
Neighbor     V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.200.1.1   4      65100     252     254        3    0    0 00:17:22        3
10.200.1.101 4      65100       6       6        5    0    0 00:00:14        1
Total number of neighbors 2
```

   Spoke 1 has as its BGP neighbors:
   - Hub FortiGate at 10.200.1.1
   - Spoke 2 FortiGate at 10.200.1.101

2. Verify the BGP routing table:

```
# get router info routing-table bgp
Routing table for VRF=0
B       11.11.11.11/32 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11),
00:17:26
                                              (recursive via spoke1-2 tunnel 111.1.1.11),
00:17:26, [1/0]
B       22.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:17:26
                                          (recursive via spoke1-2 tunnel 111.1.1.11),
00:17:26, [1/0]
B       33.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:17:26
                                          (recursive via spoke1-2 tunnel 111.1.1.11),
00:17:26, [1/0]
B       33.1.1.0/24 [200/0] via 10.200.1.101 (recursive via spoke1-1_0 tunnel 13.1.1.3),
00:00:18, [1/0]
```

   The remote route learned from Spoke 2 through the spoke1_1_0 tunnel and using BGP is 33.1.1.0/24.

IPv6 use case

To trigger a single spoke-to-spoke shortcut VPN over IPv6, on host 2001:22::22/64, ping the host 2001:33::33/64 in the Financial Department. Because of the SD-WAN rule, use SD-WAN member 1 (via ISP1) and its dynamic shortcuts to reach hosts in the Financial Department.

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info6 bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
BGP table version is 7
1 BGP AS-PATH entries
0 BGP community entries
Neighbor           V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
2001::10:200:1:1   4      65100     253     254        4    0    0 00:17:28        3
2001::10:200:1:101 4      65100       7       7        6    0    0 00:00:21        1
Total number of neighbors 2
```

   Spoke 1 has as its BGP neighbors:
   - Hub FortiGate at 2001::10:200:1:1
   - Spoke 2 FortiGate at 2001::10:200:1:101

2. Verify the BGP routing table:

```
# get router info6 routing-table bgp
Routing table for VRF=0
B       2001::11:11:11:11/128 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel
::11.1.1.11), 00:17:30
                                                           (recursive via spoke1-2 tunnel
::111.1.1.11), 00:17:30, [1024/0]
B       2001:22::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:17:30
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:17:30, [1024/0]
B       2001:33::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:17:30
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:17:30, [1024/0]
B       2001:33::/64 [200/0] via 2001::10:200:1:101 (recursive via spoke1-1_0 tunnel
::13.1.1.3), 00:00:24, [1024/0]
```

   The remote route learned from Spoke 2 through the spoke1-1_0 tunnel and using BGP is 2001:33::/64.

Verifying the configuration after a second spoke-to-spoke shortcut VPN is established

IPv4 use case

To trigger a second spoke-to-spoke shortcut VPN, on host 22.1.1.22, ping the host 33.1.1.133 in the Engineering Department. Because of the SD-WAN rule, use SD-WAN member 2 (via ISP2) and its dynamic shortcuts to reach hosts in the Engineering Department.

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
BGP table version is 6
1 BGP AS-PATH entries
0 BGP community entries
Neighbor     V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.200.1.1   4      65100     263     265        3    0    0 00:18:12        3
10.200.1.101 4      65100      17      17        5    0    0 00:01:04        1
Total number of neighbors
```

   Spoke 1 continues to have its BGP neighbors:
   - Hub FortiGate at 10.200.1.1
   - Spoke 2 FortiGate at 10.200.1.101

2. Verify the BGP routing table:

```
# get router info routing-table bgp
Routing table for VRF=0
B       11.11.11.11/32 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11),
00:18:17
                                              (recursive via spoke1-2 tunnel 111.1.1.11),
00:18:17, [1/0]
B       22.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:18:17
                                          (recursive via spoke1-2 tunnel 111.1.1.11),
00:18:17, [1/0]
B       33.0.0.0/8 [200/0] via 10.200.1.1 (recursive via spoke1-1 tunnel 11.1.1.11), 00:18:17
                                          (recursive via spoke1-2 tunnel 111.1.1.11),
00:18:17, [1/0]
B       33.1.1.0/24 [200/0] via 10.200.1.101 (recursive via spoke1-1_0 tunnel 13.1.1.3),
00:01:09
                                             (recursive via spoke1-2_0 tunnel 113.1.1.3),
00:01:09, [1/0]
```

   The remote route learned from Spoke 2 through the spoke1-2_0 tunnel and using BGP is 33.1.1.0/24.

IPv6 use case

To trigger a second spoke-to-spoke shortcut VPN over IPv6, on host 2001:22::22/64, ping the host 2001:33::133/64 in the Engineering Department. Because of the SD-WAN rule, use SD-WAN member 2 (via ISP2) and its dynamic shortcuts to reach hosts in the Engineering Department.

To verify the status on Spoke 1:

1. Verify the BGP status:

```
# get router info6 bgp summary
VRF 0 BGP router identifier 10.200.1.100, local AS number 65100
```

```
BGP table version is 7
1 BGP AS-PATH entries
0 BGP community entries
Neighbor           V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
2001::10:200:1:1   4      65100     264     265        4    0    0 00:18:18        3
2001::10:200:1:101 4      65100      19      19        6    0    0 00:01:11        1
Total number of neighbors 2
```

Spoke 1 continues to have its BGP neighbors:

- Hub FortiGate at 2001::10:200:1:1
- Spoke 2 FortiGate at 2001::10:200:1:101

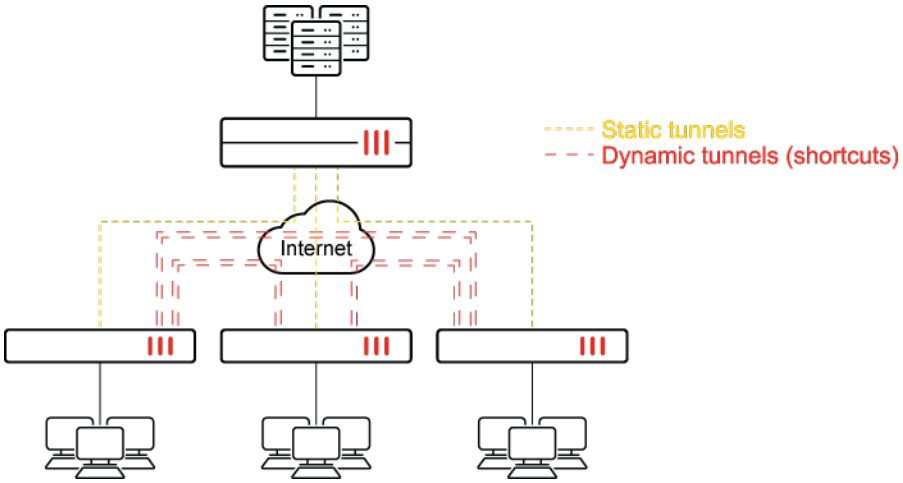
2. Verify the BGP routing table:

```
# get router info6 routing-table bgp
Routing table for VRF=0
B       2001::11:11:11:11/128 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel
::11.1.1.11), 00:18:20
                                                           (recursive via spoke1-2 tunnel
::111.1.1.11), 00:18:20, [1024/0]
B       2001:22::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:18:20
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:18:20, [1024/0]
B       2001:33::/32 [200/0] via 2001::10:200:1:1 (recursive via spoke1-1 tunnel ::11.1.1.11),
00:18:20
                                                  (recursive via spoke1-2 tunnel
::111.1.1.11), 00:18:20, [1024/0]
B       2001:33::/64 [200/0] via 2001::10:200:1:101 (recursive via spoke1-1_0 tunnel
::13.1.1.3), 00:01:14
                                                    (recursive via spoke1-2_0 tunnel
::113.1.1.3), 00:01:14, [1024/0]
```

The remote route learned from Spoke 2 through the spoke1-2_0 tunnel and using BGP is 2001:33::/64.

SD-WAN monitor on ADVPN shortcuts

SD-WAN monitors ADVPN shortcut link quality by dynamically creating link monitors for each ADVPN link. The dynamic link monitor on the spoke will use ICMP probes and the IP address of the gateway as the monitored server. These ICMP probes will not be counted as actual user traffic that keeps the spoke-to-spoke tunnel alive.



- When no shortcut is established:

```
# diagnose sys sdwan health-check
Health Check(ping):
Seq(1 tunnel-1): state(alive), packet-loss(0.000%) latency(0.038), jitter(0.006) sla_map=0x3
Seq(2 tunnel-2): state(alive), packet-loss(0.000%) latency(0.035), jitter(0.004) sla_map=0x3
```

- When one shortcut is established:

```
# diagnose sys sdwan health-check
Health Check(ping):
Seq(1 tunnel-1): state(alive), packet-loss(0.000%) latency(0.039), jitter(0.003) sla_map=0x3
Seq(1 tunnel-1_0): state(alive), packet-loss(0.000%) latency(0.060), jitter(0.023) sla_map=0x3
Seq(2 tunnel-2): state(alive), packet-loss(0.000%) latency(0.035), jitter(0.002) sla_map=0x3
```

- When more than one shortcut is established:

```
# diagnose sys sdwan health-check
Health Check(ping):
Seq(1 tunnel-1): state(alive), packet-loss(0.000%) latency(0.036), jitter(0.004) sla_map=0x3
Seq(1 tunnel-1_0): state(alive), packet-loss(0.000%) latency(0.041), jitter(0.009) sla_map=0x3
Seq(2 tunnel-2): state(alive), packet-loss(0.000%) latency(0.030), jitter(0.005) sla_map=0x3
Seq(2 tunnel-2_0): state(alive), packet-loss(0.000%) latency(0.031), jitter(0.004) sla_map=0x3
```

Hold down time to support SD-WAN service strategies

In a hub and spoke SD-WAN topology with shortcuts created over ADVPN, a downed or recovered shortcut can affect which member is selected by an SD-WAN service strategy. When a downed shortcut tunnel recovers and the shortcut is added back into the service strategy, the shortcut is held at a low priority until the hold down time has elapsed.

By default, the hold down time is zero seconds. It can be set to 0 - 10000000 seconds.

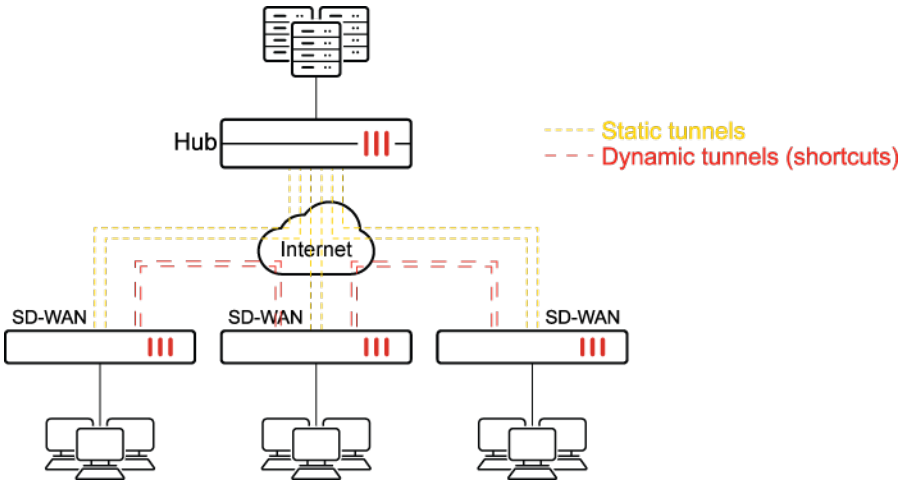
The hold down time also applies to the primary VPN tunnels between hub and spoke devices.

To configure the hold down time:

```
config system sdwan
    config service
        edit 1
            set hold-down-time <integer>
        next
    end
end
```

Example

In this example, the hold down time is set to 15 seconds, and then the SD-WAN service is looked at before and after the hold down elapses after a downed shortcut recovers.



To configure the hold down time:

```
config system sdwan
    config service
        edit 1
            set hold-down-time 15
        next
    end
end
```

To view which SD-WAN member is selected before and after the hold down time elapses:

Before the hold down time has elapsed:

```
# diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(34), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor(packet-loss),
link-cost-threshold(0), health-check(ping)
Hold down time(15) seconds, Hold start at 2003 second, now 2010
  Member sub interface(4):
```

```
    1: seq_num(1), interface(vd2-1):
       1: vd2-1_0(86)
    3: seq_num(2), interface(vd2-2):
       1: vd2-2_0(88)

  Members(4):
    1: Seq_num(1 vd2-1), alive, packet loss: 27.000%, selected
    2: Seq_num(2 vd2-2_0), alive, packet loss: 0.000%, selected
    3: Seq_num(2 vd2-2), alive, packet loss: 0.000%, selected
    4: Seq_num(1 vd2-1_0), alive, packet loss: 61.000%, selected
  Dst address(1):
        33.1.1.101-33.1.1.200
```

After the hold down time has elapsed:

```
# diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(35), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor(packet-loss),
link-cost-threshold(0), health-check(ping)
Hold down time(15) seconds, Hold start at 2018 second, now 2019
  Member sub interface(4):

    2: seq_num(2), interface(vd2-2):
       1: vd2-2_0(88)
    3: seq_num(1), interface(vd2-1):
       1: vd2-1_0(86)
  Members(4):
    1: Seq_num(2 vd2-2_0), alive, packet loss: 0.000%, selected
    2: Seq_num(2 vd2-2), alive, packet loss: 0.000%, selected
    3: Seq_num(1 vd2-1), alive, packet loss: 24.000%, selected
    4: Seq_num(1 vd2-1_0), alive, packet loss: 44.000%, selected
  Dst address(1):
        33.1.1.101-33.1.1.200\
```

Keeping sessions in established ADVPN shortcuts while they remain in SLA

In an SD-WAN hub and spoke configuration where ADVPN is used, when a primary shortcut goes out of SLA, traffic switches to the backup shortcut. During idle timeout, sessions will prefer using the primary parent tunnel and try to establish a new primary shortcut. However, because it is out of SLA, traffic switches back to the backup shortcut, which causes unnecessary traffic interruption.

The `sla-stickiness` option keeps existing sessions on the established ADVPN shortcuts while they remain in SLA instead of switching to a new link every idle timeout. New sessions will be routed through the primary shortcut if it is in SLA.

```
config system sdwan
    config service
        edit <id>
            set mode sla
            set sla-stickiness {enable | disable}
```

```
        next
    end
end
```

The `sla-stickiness` option can be applied in the following use cases.

Use case 1:

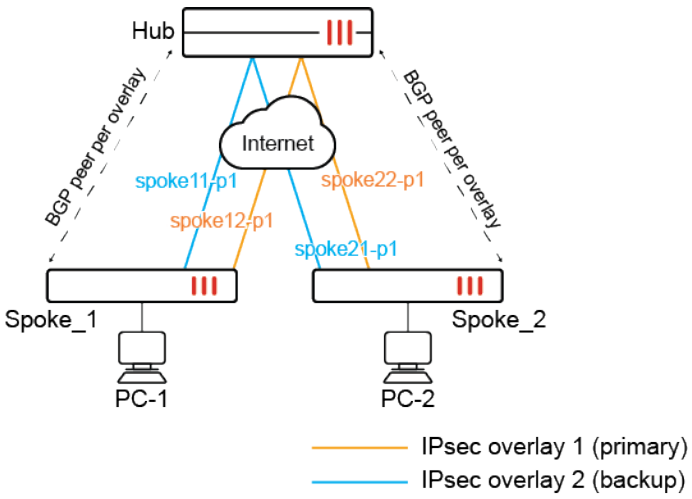
1. The sessions will switch over to the backup shortcut due to the primary shortcut being out of SLA.
2. After an idle timeout, the primary shortcut is torn down, and the routes will be reinstalled on the primary parent tunnel.
3. When `sla-stickiness` is enabled, even though the primary parent tunnel is preferred, established ADVPN sessions will remain on the backup shortcut (stickiness) instead of switching to the primary parent tunnel.
4. New sessions will be routed to the primary parent tunnel and trigger the primary shortcut, then traffic switches to the primary shortcut if it is in SLA.

Use case 2:

1. The sessions will switch over to the backup shortcut due to the primary shortcut being out of SLA.
2. After some time, the primary shortcut becomes in SLA.
3. When `sla-stickiness` is enabled, even though primary shortcut is preferred, established ADVPN sessions will remain on the backup shortcut (stickiness) instead of switching to the primary shortcut.
4. New sessions will be routed through the primary shortcut.

Example topology

The following examples demonstrates using the `sla-stickiness` option.



After an idle timeout occurs, existing sessions remain on the spoke12-p1_0 backup shortcut tunnel. New sessions will try to create a shortcut over spoke11-p1, but will fall back to spoke12-p1_0 when it detects spoke11-p1 is out of SLA.

Only use case 2 is applicable in ADVPN 2.0 with shortcut stickiness.

Use case 1 example

To configure shortcut stickiness for ADVPN shortcuts:

1. Configure SD-WAN on the Spoke_1 FortiGate:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "spoke11-p1"
        next
        edit 2
            set interface "spoke12-p1"
        next
    end
    config health-check
        edit "1"
            set server "9.0.0.1"
            set members 1 2
            config sla
                edit 1
                next
            end
        next
    end
    config service
        edit 1
            set name "1"
            set mode sla
            set sla-stickiness enable
            set dst "all"
            set src "10.1.100.0"
            config sla
                edit "1"
                    set id 1
                next
            end
            set priority-members 1 2
        next
    end
end
```

2. Verify the SD-WAN configuration.
   a. Verify the health check status:

```
# diagnose sys sdwan health-check
Health Check(1):
```

```
Seq(1 spoke11-p1): state(alive), packet-loss(0.000%) latency(0.368), jitter(0.051), mos
(4.404), bandwidth-up(999999), bandwidth-dw(1000000), bandwidth-bi(1999999) sla_map=0x1
Seq(2 spoke12-p1): state(alive), packet-loss(0.000%) latency(0.211), jitter(0.019), mos
(4.404), bandwidth-up(999999), bandwidth-dw(999979), bandwidth-bi(1999978) sla_map=0x1
```

b. Verify the service status:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x2200 use-shortcut-sla sla-stickiness
 Tie break: cfg
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
  Src address(1):
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

The SD-WAN service rule prefers the primary parent tunnel (spoke11-p1) over the backup parent tunnel (spoke12-p1) before shortcuts are established.

3. Send traffic from PC-1 to PC-2 to trigger the primary shortcut. Verify the diagnostics.

a. Run a sniffer trace:

```
# diagnose sniffer packet any 'host 192.168.5.44' 4
interfaces=[any]
filters=[host 192.168.5.44]
14.878761 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
14.878905 spoke11-p1 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
14.879842 spoke11-p1 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
14.880082 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
15.879761 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
15.879882 spoke11-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
15.880433 spoke11-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
15.880496 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

The SD-WAN service rule sends traffic to the parent tunnel (spoke11-p1) initially, and then switches to the primary shortcut tunnel (spoke11-p1_0) once it is established.

b. Verify the service status:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x2200 use-shortcut-sla sla-stickiness
 Tie break: cfg
  Gen(2), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(3):
    2: seq_num(1), interface(spoke11-p1):
```

```
      1: spoke11-p1_0(57)
  Members(3):
    1: Seq_num(1 spoke11-p1_0), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    3: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
  Src address(1):
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

The SD-WAN service rule prefers the primary shortcut tunnel (spoke11-p1_0) over other tunnels.

4. Make the primary shortcut be out of SLA. The traffic will switch to the backup parent tunnel and trigger the backup shortcut. Verify the diagnostics.
   a. Run a sniffer trace:

```
# diagnose sniffer packet any 'host 192.168.5.44' 4
interfaces=[any]
filters=[host 192.168.5.44]
20.588046 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
20.588157 spoke12-p1 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
20.588791 spoke12-p1 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
20.588876 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
21.589079 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
21.589190 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
21.589661 spoke12-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
21.589733 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

When the primary shortcut tunnel goes out of SLA (spoke11-p1_0, alive, sla(0x0)), traffic reroutes to the backup parent tunnel (spoke12-p1) and then to the backup shortcut tunnel (spoke12-p1_0) once established.

   b. Verify the service status:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x2200 use-shortcut-sla sla-stickiness
 Tie break: cfg
  Gen(23), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(4):
    1: seq_num(1), interface(spoke11-p1):
       1: spoke11-p1_0(62)
    3: seq_num(2), interface(spoke12-p1):
       1: spoke12-p1_0(63)
  Members(4):
    1: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(2 spoke12-p1_0), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
```

```
    3: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
    4: Seq_num(1 spoke11-p1_0), alive, sla(0x0), gid(0), cfg_order(0), local cost(0),
selected
  Src address(1):
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

The backup shortcut tunnel (spoke12-p1_0) is now preferred.

5. After an idle timeout, the primary shortcut is torn down. The primary parent tunnel is now preferred, but traffic is still kept on the backup shortcut due to `sla-stickiness` being enabled. Verify the diagnostics.
   a. Verify the service status:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x2200 use-shortcut-sla sla-stickiness
 Tie break: cfg
  Gen(24), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(3):
    3: seq_num(2), interface(spoke12-p1):
       1: spoke12-p1_0(63)
  Members(3):
    1: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(2 spoke12-p1_0), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
    3: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
  Src address(1):
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

   b. Run a sniffer trace:

```
# diagnose sniffer packet any 'host 192.168.5.44' 4
interfaces=[any]
filters=[host 192.168.5.44]
1.065143 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
1.065218 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
1.065471 spoke12-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
1.065508 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
2.066155 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
2.066198 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
2.066442 spoke12-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
2.066480 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
3.067201 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
3.067255 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
```

```
3.067507 spoke12-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
3.067544 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

6. Send new traffic from PC1 to PC2. The traffic is routed to the primary parent tunnel and triggers the primary shortcut, then traffic will switch to the primary shortcut if it is in SLA. Verify the connection.
   a. Run a sniffer trace:

```
# diagnose sniffer packet any 'host 192.168.5.4' 4
interfaces=[any]
filters=[host 192.168.5.4]
17.120310 port2 in 10.1.100.22 -> 192.168.5.4: icmp: echo request
17.120475 spoke11-p1 out 10.1.100.22 -> 192.168.5.4: icmp: echo request
17.121096 spoke11-p1 in 192.168.5.4 -> 10.1.100.22: icmp: echo reply
17.121151 port2 out 192.168.5.4 -> 10.1.100.22: icmp: echo reply
18.121331 port2 in 10.1.100.22 -> 192.168.5.4: icmp: echo request
18.121480 spoke11-p1_0 out 10.1.100.22 -> 192.168.5.4: icmp: echo request
18.121954 spoke11-p1_0 in 192.168.5.4 -> 10.1.100.22: icmp: echo reply
18.122007 port2 out 192.168.5.4 -> 10.1.100.22: icmp: echo reply
...
```

   At first, traffic tries to go to the primary parent tunnel so that it can trigger the primary shortcut to establish. The primary shortcut (spoke11-p1_0) is in SLA and new traffic flows through it.

```
...
14.194066 port2 in 10.1.100.22 -> 192.168.5.4: icmp: echo request
14.194247 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.4: icmp: echo request
14.194499 spoke12-p1_0 in 192.168.5.4 -> 10.1.100.22: icmp: echo reply
14.194565 port2 out 192.168.5.4 -> 10.1.100.22: icmp: echo reply
15.195093 port2 in 10.1.100.22 -> 192.168.5.4: icmp: echo request
15.195174 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.4: icmp: echo request
15.195326 spoke12-p1_0 in 192.168.5.4 -> 10.1.100.22: icmp: echo reply
15.195361 port2 out 192.168.5.4 -> 10.1.100.22: icmp: echo reply
```

   After the primary shortcut goes out of SLA, the traffic switches to the backup shortcut (spoke12-p1_0).
   b. Verify the service status:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x2200 use-shortcut-sla sla-stickiness
 Tie break: cfg
  Gen(36), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(4):
    1: seq_num(1), interface(spoke11-p1):
       1: spoke11-p1_0(67)
    3: seq_num(2), interface(spoke12-p1):
       1: spoke12-p1_0(66)
  Members(4):
    1: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(2 spoke12-p1_0), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
```

```
    3: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected
    4: Seq_num(1 spoke11-p1_0), alive, sla(0x0), gid(0), cfg_order(0), local cost(0),
selected
  Src address(1):
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

New traffic switches back to the backup shortcut while the primary shortcut is still out of SLA.

Use case 2 example

To configure shortcut stickiness for ADVPN shortcuts:

1. Configure SD-WAN on the Spoke_1 FortiGate:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
            set advpn-select enable
            set advpn-health-check "1"
        next
    end
    config members
        edit 1
            set interface "spoke11-p1"
            set transport-group 1
        next
        edit 2
            set interface "spoke12-p1"
            set transport-group 2
        next
    end
    config health-check
        edit "1"
            set server "9.0.0.1"
            set members 1 2
            config sla
                edit 1
                next
            end
        next
    end
    config service
        edit 1
            set name "1"
            set mode sla
            set dst "all"
            set src "10.1.100.0"
```

```
            set sla-stickiness enable
            config sla
                edit "1"
                    set id 1
                next
            end
            set priority-members 1 2
        next
    end
end
```

2. Verify the SD-WAN configuration.
   a. Verify the health check status:

```
# diagnose sys sdwan health-check
Health Check(1):
Seq(1 spoke11-p1): state(alive), packet-loss(0.000%), latency(0.186), jitter(0.040), mos
(4.404), custom_profile(0.000), bandwidth-up(999999), bandwidth-dw(999996), bandwidth-bi
(1999995), sla_map=0x1
Seq(2 spoke12-p1): state(alive), packet-loss(0.000%), latency(0.131), jitter(0.018), mos
(4.404), custom_profile(0.000), bandwidth-up(999999), bandwidth-dw(999996), bandwidth-bi
(1999995), sla_map=0x1
```

   b. Verify the service status:

```
# diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0xc200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
 Shortcut priority: 3
  Gen(1), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
  Members(2):
    1: Seq_num(1 spoke11-p1 virtual-wan-link), alive, sla(0x1), gid(0), cfg_order(0),
local cost(0), selected
    2: Seq_num(2 spoke12-p1 virtual-wan-link), alive, sla(0x1), gid(0), cfg_order(1),
local cost(0), selected
  Src address(1):
        10.1.100.0-10.1.100.255
  Dst address(1):
        0.0.0.0-255.255.255.255
```

   The SD-WAN service rule prefers the primary parent tunnel (spoke11-p1) over the backup parent tunnel (spoke12-p1) before shortcuts are established.

3. Send traffic from PC-1 to PC-2 to trigger the primary shortcut. Verify the diagnostics.
   a. Run a sniffer trace:

```
# diagnose sniffer packet any 'host 192.168.5.44' 4interfaces=[any]
filters=[host 192.168.5.44]
3.323508 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
3.323600 spoke11-p1 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
3.324079 spoke11-p1 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

```
3.324246 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
4.324515 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
4.324576 spoke11-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
4.325037 spoke11-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
4.325066 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

The SD-WAN service rule sends traffic to the parent tunnel (spoke11-p1) initially, and then switches to the primary shortcut tunnel (spoke11-p1_0) once it is established.

b. Verify the service status:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0xc200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
 Shortcut priority: 3

  Src address(1):
        10.1.100.0-10.1.100.255
  Dst address(1):
        0.0.0.0-255.255.255.255
```

The SD-WAN service rule prefers the primary shortcut tunnel (spoke11-p1_0) over other tunnels.

4. Make the primary shortcut be out of SLA. The traffic will switch to the backup parent tunnel and trigger the backup shortcut. Verify the diagnostics.

a. Run a sniffer trace:

```
# diagnose sniffer packet any 'host 192.168.5.44' 4
interfaces=[any]
filters=[host 192.168.5.44]
27.299268 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
27.299331 spoke12-p1 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
27.299862 spoke12-p1 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
27.299889 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
28.300301 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
28.300372 spoke12-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
28.300938 spoke12-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
28.300970 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

When the primary shortcut tunnel goes out of SLA (spoke11-p1_0, alive, sla(0x0)), traffic reroutes to the backup parent tunnel (spoke12-p1) and then to the backup shortcut tunnel (spoke12-p1_0) once established.

b. Verify the service status:

```
# diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0xc200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
 Shortcut priority: 3
  Gen(38), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
  Member sub interface(4):
    2: seq_num(1), interface(spoke11-p1):
       1: spoke11-p1_0(84)
    3: seq_num(2), interface(spoke12-p1):
       1: spoke12-p1_0(85)
  Members(4):
    1: Seq_num(2 spoke12-p1_0 virtual-wan-link), alive, sla(0x1), gid(0), cfg_order(1),
local cost(0), selected
    2: Seq_num(1 spoke11-p1 virtual-wan-link), alive, sla(0x1), gid(0), cfg_order(0),
local cost(0), selected
    3: Seq_num(2 spoke12-p1 virtual-wan-link), alive, sla(0x1), gid(0), cfg_order(1),
local cost(0), selected
    4: Seq_num(1 spoke11-p1_0 virtual-wan-link), alive, sla(0x0), gid(0), cfg_order(0),
local cost(0), selected
  Src address(1):
        10.1.100.0-10.1.100.255
  Dst address(1):
        0.0.0.0-255.255.255.255
```

The backup shortcut tunnel (spoke12-p1_0) is now preferred.

5. After an idle timeout, the primary shortcut is torn down. The primary parent tunnel is now preferred, but traffic is still kept on the backup shortcut due to `sla-stickiness` being enabled. Verify the diagnostics.

   a. Verify the service status:

```
# diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0xc200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
 Shortcut priority: 3
  Gen(42), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
  Member sub interface(4):
    3: seq_num(1), interface(spoke11-p1):
       1: spoke11-p1_0(84)
    4: seq_num(2), interface(spoke12-p1):
       1: spoke12-p1_0(85)
  Members(4):
    1: Seq_num(1 spoke11-p1_0 virtual-wan-link), alive, sla(0x1), gid(0), cfg_order(0),

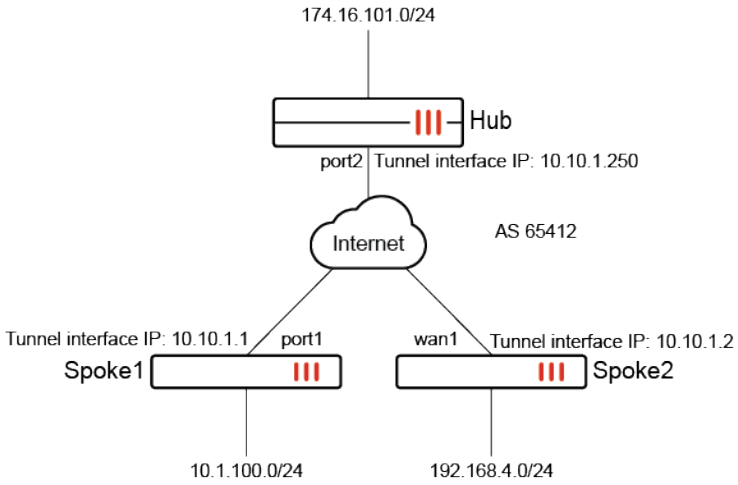
3.793273 spoke11-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
3.793522 spoke11-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
3.793560 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

Using a single IKE elector in ADVPN to match all SD-WAN control plane traffic

In the SD-WAN with ADVPN use case, two spokes can communicate with each other on the control plane by an ADVPN shortcut. In order to separate the control traffic from data traffic, the IKE creates a dynamic selector for health check packets sent between the spokes. BGP traffic is also matched by this dynamic IKE selector. Therefore, when spokes establish BGP peering with other spokes, the BGP traffic does not count towards the data traffic and will not impact IPsec idle timeout and shortcut tunnel tear down.

Example

In this example, SD-WAN with ADVPN is configured. The IPsec ADVPN shortcut tunnel is required to tear down when it is idle. SD-WAN health checks are configured, and BGP neighbors established between the spokes is required.



To configure the Hub FortiGate:

1. Configure the phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "Hub"
        set type dynamic
        set interface "port2"
        set ike-version 2
        set peertype any
        set net-device disable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set auto-discovery-sender enable
        set psksecret ************
        set dpd-retryinterval 60
    next
end
```

2. Configure the phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "Hub"
        set phase1name "Hub"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

3. Configure the VPN interface:

```
config system interface
    edit "Hub"
        set vdom "root"
```

```
        set ip 10.10.1.250 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 10.10.1.254 255.255.255.0
        set snmp-index 50
        set interface "port2"
    next
end
```

4. Configure the BGP settings:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.1.1"
            set advertisement-interval 0
            set remote-as 65412
            set route-reflector-client enable
        next
        edit "10.10.1.2"
            set advertisement-interval 0
            set remote-as 65412
            set route-reflector-client enable
        next
    end
    config network
        edit 1
            set prefix 174.16.101.0 255.255.255.0
        next
    end
end
```

To configure the Spoke1 FortiGate:

1. Configure the phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "Spoke1"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set npu-offload disable
        set idle-timeout enable
        set idle-timeoutinterval 5
        set auto-discovery-receiver enable
        set remote-gw 172.16.200.4
        set psksecret ************
```

```
   next
end
```

2. Configure the phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "Spoke1"
        set phase1name "Spoke1"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

3. Configure the VPN interface:

```
config system interface
    edit "Spoke1"
        set vdom "root"
        set ip 10.10.1.1 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 10.10.1.254 255.255.255.0
        set snmp-index 28
        set interface "port1"
    next
end
```

4. Configure the BGP settings:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.1.250"
            set advertisement-interval 0
            set remote-as 65412
        next
        edit "10.10.1.2"
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 10.1.100.0 255.255.255.0
        next
    end
end
```

5. Configure the SD-WAN settings:

```
config system sdwan
    set status enable
    config zone
```

```
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "Spoke1"
        next
    end
    config health-check
        edit "1"
            set server "174.16.101.44"
            set members 0
        next
    end
end
```

To configure the Spoke2 FortiGate:

1. Configure the phase 1 interface:

```
config vpn ipsec phase1-interface
    edit "Spoke2"
        set interface "wan1"
        set ike-version 2
        set peertype any
        set net-device enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set npu-offload disable
        set idle-timeout enable
        set idle-timeoutinterval 5
        set auto-discovery-receiver enable
        set remote-gw 172.16.200.4
        set psksecret ************
    next
end
```

2. Configure the phase 2 interface:

```
config vpn ipsec phase2-interface
    edit "Spoke2"
        set phase1name "Spoke2"
        set proposal aes128-sha1 aes256-sha1 aes128-sha256 aes256-sha256 aes128gcm aes256gcm
chacha20poly1305
    next
end
```

3. Configure the VPN interface:

```
config system interface
    edit "Spoke2"
```

```
        set vdom "root"
        set ip 10.10.1.2 255.255.255.255
        set allowaccess ping
        set type tunnel
        set remote-ip 10.10.1.254 255.255.255.0
        set snmp-index 15
        set interface "wan1"
    next
end
```

4. Configure the BGP settings:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.1.250"
            set advertisement-interval 0
            set remote-as 65412
        next
        edit "10.10.1.1"
            set remote-as 65412
        next
    end
    config network
        edit 1
            set prefix 192.168.4.0 255.255.255.0
        next
    end
end
```

5. Configure the SD-WAN settings:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "Spoke2"
        next
    end
    config health-check
        edit "1"
            set server "174.16.101.44"
            set members 0
        next
    end
end
```

To verify the configuration:

1. Send traffic between the spokes to establish the ADVPN shortcut.
2. Verify the IPsec tunnel state on the Spoke1 FortiGate:

```
Spoke1 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=Spoke1_0 ver=2 serial=7 172.16.200.1:0->172.16.200.3:0 tun_id=10.10.1.2 tun_

  dec: spi=17a473bc esp=aes key=16 eff2dc03b48968bb55b9e3950ebde431
       ah=sha1 key=20 5db42a32aec15bc8a5fe392c256d1ae8ab3b4ef8
  enc: spi=bdc3bd80 esp=aes key=16 d0ec06b61ad572cc8813b599edde8c68
       ah=sha1 key=20 0306850f0184d957e9475da33d7971653a95c233
  dec:pkts/bytes=1084/44234, enc:pkts/bytes=1106/80932
  npu_flag=00 npu_rgwy=172.16.200.4 npu_lgwy=172.16.200.1 npu_selid=0 dec_npuid=0 enc_npuid=0
```

The dynamic selector is created (highlighted) for SD-WAN control traffic, SD-WAN health checks, and BGP between spokes traffic.

3. Verify the BGP neighbors and check the routing table:

```
Spoke1 # get router info bgp summary

VRF 0 BGP router identifier 172.16.200.1, local AS number 65412
BGP table version is 8
1 BGP AS-PATH entries
0 BGP community entries

Neighbor    V         AS MsgRcvd MsgSent   TblVer  InQ OutQ Up/Down  State/PfxRcd
10.10.1.2   4      65412      52      76        7    0    0 00:06:27        1
10.10.1.250 4      65412      70      69        1    0    0 00:58:44        2

Total number of neighbors 2
```

4. Stop sending traffic between the spokes, and wait for a few minutes (idle timeout).
5. Verify the IPsec tunnel state on the Spoke1 FortiGate:

```
Spoke1 # diagnose vpn tunnel list
list all ipsec tunnel in vd 0
------------------------------------------------------
name=Spoke1 ver=2 serial=1 172.16.200.1:0->172.16.200.4:0 tun_id=172.16.200.4 tun_

```

The shortcut tunnel between the spokes has been torn down. When data traffic is idle, the BGP traffic does not get sent on the data traffic selector, so the tunnel is not kept alive. This behavior is the expected, which consequently allows the shortcut tunnel to be torn down when idle.

6. Verify the IKE debugs messages to confirm the ADVPN shortcut was torn down:

```
Spoke1 # diagnose debug enable
Spoke1 # diagnose debug application ike -1
...
ike 0:Spoke1_0: connection idle time-out
ike 0:Spoke1_0: deleting
ike 0:Spoke1_0: flushing

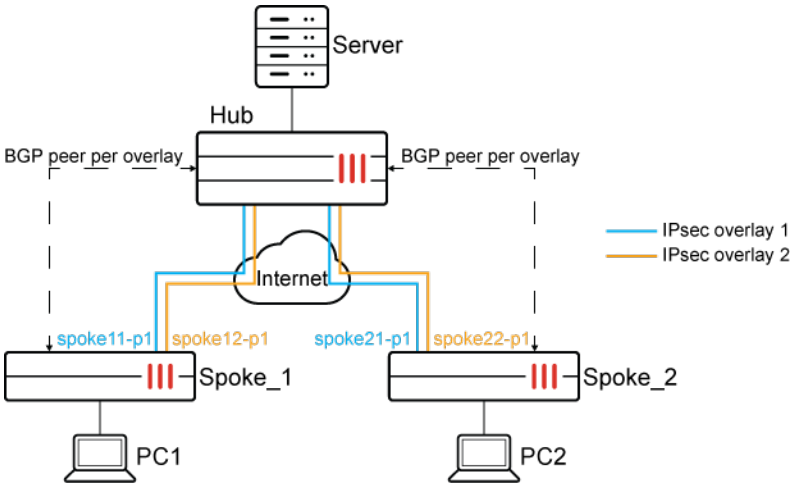
```

SD-WAN in large scale deployments

Phase 2 selectors can be used to inject IKE routes on the ADVPN shortcut tunnel. When configuration method (`mode-cfg`) is enabled in IPsec phase 1 configuration, enabling `mode-cfg-allow-client-selector` allows custom phase 2 selectors to be configured. By also enabling the addition of a route to the peer destination selector (`add-route`) in the phase 1 configuration, IKE routes based on the phase 2 selectors can be injected. This means that routes do not need to be reflected on the hub to propagate them between spokes, avoiding possible BGP daemon process load issues and improving network scalability in a large-scale ADVPN network.

Route map rules can apply priorities to BGP routes. On the hub, priorities can be set in a route map's rules, and the route map can be applied on BGP routes. This allows the hub to mark the preferred path learned from the spokes with a priority value (lower priority is preferred), instead of using multiple SD-WAN policy routes on the hub. When a preferred outbound route map (`route-map-out-preferable`) is also configured in an SD-WAN neighbor on the spoke, deploying SD-WAN rules on the hub to steer traffic from the hub to a spoke is unnecessary.

SD-WAN members' local cost can be exchanged on the ADVPN shortcut tunnel so that spokes can use the remote cost as tiebreak to select a preferred shortcut. If multiple shortcuts originate from the same member to different members on the same remote spoke, then the remote cost on the shortcuts is used as the tiebreak to decide which shortcut is preferred.



In this example, SD-WAN is configured on an ADVPN network with a BGP neighbor per overlay.

Instead of reflecting BGP routes with the route-reflector on the hub, when the shortcuts are triggered, IKE routes on the shortcuts are directly injected based on the configured phase 2 selectors to allow routes to be exchanged between spokes.

Routes between the hub and the spokes are exchanged by BGP, and the spokes use the default route to send spoke-to-spoke traffic to the hub and trigger the shortcuts.

Instead of configuring SD-WAN rules on the hub, different priorities are configured on the BGP routes by matching different BGP communities to steer traffic from the hub to the spokes.

To configure Spoke 1:

1. Configure phase 1:

```
config vpn ipsec phase1-interface
    edit "spoke11-p1"
        ...
        set ike-version 2
        set net-device enable
        set add-route enable
        set mode-cfg enable
        set auto-discovery-receiver enable
        set mode-cfg-allow-client-selector enable
        set link-cost 11
```

```
        ...
    next
    edit "spoke12-p1"
       ...
        set ike-version 2
        set net-device enable
        set add-route enable
        set mode-cfg enable
        set auto-discovery-receiver enable
        set mode-cfg-allow-client-selector enable
        set link-cost 21
    next
end
```

2. Configure phase 2:

```
config vpn ipsec phase2-interface
    edit "spoke11-p2"
        ...
        set src-name "LAN_Net"
        set dst-name "all"
    next
    edit "spoke12-p2"
        ...
        set src-name "LAN_Net"
        set dst-name "all"
    next
end
```

3. Configure an address group:
   Spoke 1 uses LAN subnet 10.1-3.100.0/24.

```
config firewall addrgrp
    edit "LAN_Net"
        set member "10.1.100.0" "10.2.100.0" "10.3.100.0"
    next
end
```

4. Configure route maps:
   - If overlay 1 to the hub is in SLA, attach "65000:1" to the BGP routes advertised to the hub over overlay 1.
   - If overlay 2 to the hub is in SLA, attach "65000:2" to the BGP routes advertised to the hub over overlay 2.
   - If any overlay to the hub is out of SLA, attach "65000:9999" to the BGP routes advertised to the hub over any overlay.

```
config router route-map
    edit "HUB_CARRIER1"
        config rule
            edit 1
                set set-community "65000:1"
```

```
                ...
            next
        end
        ...
    next
    edit "HUB_CARRIER2"
        config rule
            edit 1
                set set-community "65000:2"
                ...
            next
        end
        ...
    next
    edit "HUB_BAD"
        config rule
            edit 1
                set set-community "65000:9999"
                ...
            next
        end
        ...
    next
end
```

5. Configure BGP and SD-WAN members and neighbors:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.15.253"
            set remote-as 65412
            set route-map-out "HUB_BAD"
            set route-map-out-preferable "HUB_CARRIER1"
            ...
        next
        edit "10.10.16.253"
            set remote-as 65412
            set route-map-out "HUB_BAD"
            set route-map-out-preferable "HUB_CARRIER2"
            ...
        next
    end
end
```

```
config system sdwan
    config members
        edit 1
            set interface "spoke11-p1"
            set cost 10
        next
        edit 2
```

```
            set interface "spoke12-p1"
            set cost 20
        next
    end
    config neighbor
        edit "10.10.15.253"
            set member 1
            set health-check "1"
            set sla-id 1
        next
        edit "10.10.16.253"
            set member 2
            set health-check "11"
            set sla-id 1
        next
    end
end
```

To configure Spoke 2:

1. Configure phase 1:

```
config vpn ipsec phase1-interface
    edit "spoke21-p1"
        ...
        set ike-version 2
        set net-device enable
        set add-route enable
        set mode-cfg enable
        set auto-discovery-receiver enable
        set mode-cfg-allow-client-selector enable
        set link-cost 101
        ...
    next
    edit "spoke22-p1"
       ...
        set ike-version 2
        set net-device enable
        set add-route enable
        set mode-cfg enable
        set auto-discovery-receiver enable
        set mode-cfg-allow-client-selector enable
        set link-cost 201
    next
end
```

2. Configure phase 2:

```
config vpn ipsec phase2-interface
    edit "spoke21-p2"
        ...
        set src-name "LAN_Net"
```

```
        set dst-name "all"
    next
    edit "spoke22-p2"
        ...
        set src-name "LAN_Net"
        set dst-name "all"
    next
end
```

3. Configure an address group:
   Spoke 2 uses LAN subnet 192.168.5-7.0/24.

```
config firewall addrgrp
    edit "LAN_Net"
        set member "192.168.5.0" "192.168.6.0" "192.168.7.0"
    next
end
```

4. Configure route maps:
   - If overlay 1 to the hub is in SLA, attach "65000:1" to the BGP routes advertised to the hub over overlay 1.
   - If overlay 2 to the hub is in SLA, attach "65000:2" to the BGP routes advertised to the hub over overlay 2.
   - If any overlay to the hub is out of SLA, attach "65000:9999" to the BGP routes advertised to the hub over any overlay.

```
config router route-map
    edit "HUB_CARRIER1"
        config rule
            edit 1
                set set-community "65000:1"
                ...
            next
        end
        ...
    next
    edit "HUB_CARRIER2"
        config rule
            edit 1
                set set-community "65000:2"
                ...
            next
        end
        ...
    next
    edit "HUB_BAD"
        config rule
            edit 1
                set set-community "65000:9999"
                ...
            next
```

```
        end
        ...
    next
end
```

5. Configure BGP and SD-WAN members and neighbors:

```
config router bgp
    set as 65412
    config neighbor
        edit "10.10.15.253"
            set remote-as 65412
            set route-map-out "HUB_BAD"
            set route-map-out-preferable "HUB_CARRIER1"
            ...
        next
        edit "10.10.16.253"
            set remote-as 65412
            set route-map-out "HUB_BAD"
            set route-map-out-preferable "HUB_CARRIER2"
            ...
        next
    end
end
```

```
config system sdwan
    config members
        edit 1
            set interface "spoke21-p1"
            set cost 10
        next
        edit 2
            set interface "spoke22-p1"
            set cost 20
        next
    end
    config neighbor
        edit "10.10.15.253"
            set member 1
            set health-check "1"
            set sla-id 1
        next
        edit "10.10.16.253"
            set member 2
            set health-check "11"
            set sla-id 1
        next
    end
end
```

To configure the hub:

1. Configure the route maps:
   - Set the priority to 100 for routes with community 65000:1, indicating that they are in SLA for overlay 1.
   - Set the priority to 200 for routes with community 65000:2, indicating that they are in SLA for overlay 2.
   - Set the priority to 9999 for routes with community 65000:9999, indicating that they are out of SLA for any overlay.

```
config router route-map
     edit "Set_Pri"
        config rule
            edit 1
                set match-community "comm_65000:1"
                set set-priority 100
            next
            edit 2
                set match-community "comm_65000:2"
                set set-priority 200
            next
            edit 3
                set match-community "comm_65000:9999"
                set set-priority 9999
            next
        end
    next
end
```

2. Configure BGP:

```
config router bgp
    set as 65412
    config neighbor-group
        edit "advpn"
            set remote-as 65412
            set route-map-in "Set_Pri"
            ...
        next
        edit "advpn2"
            set remote-as 65412
            set route-map-in "Set_Pri"
            ...
        next
    end
    config neighbor-range
        edit 1
            set prefix 10.10.15.0 255.255.255.0
            set neighbor-group "advpn"
        next
        edit 2
            set prefix 10.10.16.0 255.255.255.0
            set neighbor-group "advpn2"
        next
```

```
    end
end
```

To test the configuration:

1. Check the routing tables on the spokes:
   Spoke 1:

```
spoke-1 (root) # get router info routing-table all
B*      0.0.0.0/0 [200/0] via 10.10.15.253 (recursive is directly connected, spoke11-p1),
00:01:17, [1/0]         // default route to hub
                         [200/0] via 10.10.16.253 (recursive is directly connected, spoke12-
p1), 00:01:17, [1/0]
B       9.0.0.0/24 [200/0] via 10.10.15.253 (recursive is directly connected, spoke11-p1),
00:01:17, [1/0]        // route to the server behind hub
                          [200/0] via 10.10.16.253 (recursive is directly connected, spoke12-
p1), 00:01:17, [1/0]
C       10.1.100.0/24 is directly connected, port2             // route to PC 1
C       10.10.15.0/24 is directly connected, spoke11-p1        // overlay 1
C       10.10.15.1/32 is directly connected, spoke11-p1
C       10.10.16.0/24 is directly connected, spoke12-p1        // overlay 2
C       10.10.16.1/32 is directly connected, spoke12-p1
```

   Spoke 2:

```
spoke-2 (root) # get router info routing-table all
B*      0.0.0.0/0 [200/0] via 10.10.15.253 (recursive is directly connected, spoke21-p1),
00:46:14, [1/0]         // default route to hub
                         [200/0] via 10.10.16.253 (recursive is directly connected, spoke22-
p1), 00:46:14, [1/0]
B       9.0.0.0/24 [200/0] via 10.10.15.253 (recursive is directly connected, spoke21-p1),
00:46:18, [1/0]        // route to the server behind hub
                          [200/0] via 10.10.16.253 (recursive is directly connected, spoke22-
p1), 00:46:18, [1/0]
C       10.10.15.0/24 is directly connected, spoke21-p1        // overlay 1
C       10.10.15.2/32 is directly connected, spoke21-p1
C       10.10.16.0/24 is directly connected, spoke22-p1        // overlay 2
C       10.10.16.2/32 is directly connected, spoke22-p1
C       192.168.5.0/24 is directly connected, port2            // route to PC 2
```

2. Send traffic from PC 1 to PC 2 and trigger the shortcut:
   The IKE routes on the shortcut are directly injected based on the phase 2 selectors, and spoke-to-spoke traffic then goes directly through the shortcut instead of going through the hub.
   Spoke 1:

```
spoke-1 (root) # get router info routing-table static
S       192.168.5.0/24 [15/0] via spoke11-p1_0 tunnel 172.16.200.4 vrf 0, [1/0]
S       192.168.6.0/24 [15/0] via spoke11-p1_0 tunnel 172.16.200.4 vrf 0, [1/0]
S       192.168.7.0/24 [15/0] via spoke11-p1_0 tunnel 172.16.200.4 vrf 0, [1/0]
```

```
spoke-1 (root) # diagnose sniffer packet any 'host 192.168.5.44' 4
interfaces=[any]
filters=[host 192.168.5.44]
1.446306 port2 in 10.1.100.22 -> 192.168.5.44: icmp: echo request
1.446327 spoke11-p1_0 out 10.1.100.22 -> 192.168.5.44: icmp: echo request
1.446521 spoke11-p1_0 in 192.168.5.44 -> 10.1.100.22: icmp: echo reply
1.446536 port2 out 192.168.5.44 -> 10.1.100.22: icmp: echo reply
```

Spoke 2:

```
spoke-2 (root) # get router info routing-table static
S       10.1.100.0/24 [15/0] via spoke21-p1_0 tunnel 10.10.15.1 vrf 0, [1/0]
S       10.2.100.0/24 [15/0] via spoke21-p1_0 tunnel 10.10.15.1 vrf 0, [1/0]
S       10.3.100.0/24 [15/0] via spoke21-p1_0 tunnel 10.10.15.1 vrf 0, [1/0]
```

3. Confirm that the overlays are in SLA on the spokes:
   Spoke 1:

```
spoke-1 (root) # diagnose sys sdwan  neighbor
Neighbor(10.10.15.253): member(1)role(standalone)
        Health-check(1:1)  sla-pass selected alive
Neighbor(10.10.16.253): member(2)role(standalone)
        Health-check(11:1)  sla-pass selected alive
```

   Spoke 2:

```
spoke-2 (root) # diagnose sys sdwan neighbor
Neighbor(10.10.15.253): member(1)role(standalone)
        Health-check(1:1)  sla-pass selected alive
Neighbor(10.10.16.253): member(2)role(standalone)
        Health-check(11:1)  sla-pass selected alive
```

4. On the hub, check that the routes received from the spokes have the expected priorities:

```
hub (root) # diagnose ip route list | grep proto=11
tab=254 vf=0 scope=0 type=1 proto=11 prio=100 0.0.0.0/0.0.0.0/0->10.1.100.0/24 pref=0.0.0.0
gwy=10.10.15.1 dev=101(hub-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=200 0.0.0.0/0.0.0.0/0->10.1.100.0/24 pref=0.0.0.0
gwy=10.10.16.1 dev=102(hub2-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=100 0.0.0.0/0.0.0.0/0->192.168.5.0/24 pref=0.0.0.0
gwy=10.10.15.2 dev=101(hub-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=200 0.0.0.0/0.0.0.0/0->192.168.5.0/24 pref=0.0.0.0
gwy=10.10.16.2 dev=102(hub2-phase1)
```

   The priority set by the hub's route map is based on the community string received from the spoke. The route with a lower priority value is selected, so traffic to Spoke 1 goes out on the hub-phase1 tunnel:

```
hub (root) # diagnose sniffer packet any 'host 9.0.0.2' 4
interfaces=[any]
filters=[host 9.0.0.2]
2.735456 R190 in 9.0.0.2 -> 10.1.100.22: icmp: echo request
2.735508 hub-phase1 out 9.0.0.2 -> 10.1.100.22: icmp: echo request
```

```
2.735813 hub-phase1 in 10.1.100.22 -> 9.0.0.2: icmp: echo reply
2.735854 R190 out 10.1.100.22 -> 9.0.0.2: icmp: echo reply
```

5. If overlay 1 goes out of SLA, the priorities of the routes on the hub are updated and traffic from the hub to Spoke 1 goes through overlay 2:

   Spoke 1:

```
spoke-1 (root) # diagnose sys sdwan  neighbor
Neighbor(10.10.15.253): member(1)role(standalone)
        Health-check(1:1)  sla-fail alive
Neighbor(10.10.16.253): member(2)role(standalone)
        Health-check(11:1)  sla-pass selected alive
```

   Spoke 2:

```
spoke-2 (root) # diagnose sys sdwan neighbor
Neighbor(10.10.15.253): member(1)role(standalone)
        Health-check(1:1)  sla-fail alive
Neighbor(10.10.16.253): member(2)role(standalone)
        Health-check(11:1)  sla-pass selected alive
```

   Hub:

```
hub (root) # diagnose ip route list | grep proto=11
tab=254 vf=0 scope=0 type=1 proto=11 prio=200 0.0.0.0/0.0.0.0/0->10.1.100.0/24 pref=0.0.0.0
gwy=10.10.16.1 dev=102(hub2-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=9999 0.0.0.0/0.0.0.0/0->10.1.100.0/24 pref=0.0.0.0
gwy=10.10.15.1 dev=101(hub-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=200 0.0.0.0/0.0.0.0/0->192.168.5.0/24 pref=0.0.0.0
gwy=10.10.16.2 dev=102(hub2-phase1)
tab=254 vf=0 scope=0 type=1 proto=11 prio=9999 0.0.0.0/0.0.0.0/0->192.168.5.0/24 pref=0.0.0.0
gwy=10.10.15.2 dev=101(hub-phase1)
```

```
hub (root) # diagnose sniffer packet any 'host 9.0.0.2' 4
interfaces=[any]
filters=[host 9.0.0.2]
3.550181 R190 in 9.0.0.2 -> 10.1.100.22: icmp: echo request
3.550234 hub2-phase1 out 9.0.0.2 -> 10.1.100.22: icmp: echo request
3.550713 hub2-phase1 in 10.1.100.22 -> 9.0.0.2: icmp: echo reply
3.550735 R190 out 10.1.100.22 -> 9.0.0.2: icmp: echo reply
```

6. Verify the service diagnostics on Spoke 1:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
 Tie break: cfg
  Gen(4), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(10), selected
    2: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(20), selected
  Src address(1):
```

```
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

7. Verify the service diagnostics on Spoke 2:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
 Tie break: cfg
  Gen(2), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 spoke21-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(10), selected
    2: Seq_num(2 spoke22-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(20), selected
  Src address(1):
        192.168.5.0-192.168.5.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

8. Trigger shortcuts between Spoke 1 and Spoke 2:
   - Shortcuts spoke11-p1_1 and spoke11-p1_0 originate from spoke11-p1.
   - spoke11-p1_1 corresponds to spoke21-p1_0 on Spoke 2.
   - spoke11-p1_0 corresponds to spoke22-p1_0 on Spoke 2.

   Spoke 1:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
 Tie break: cfg
  Gen(11), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(4):
    3: seq_num(1), interface(spoke11-p1):
       1: spoke11-p1_0(80)
       2: spoke11-p1_1(81)
  Members(4):
    1: Seq_num(1 spoke11-p1_1), alive, sla(0x1), gid(0), remote cost(101), cfg_order(0), local
cost(10), selected
    2: Seq_num(1 spoke11-p1_0), alive, sla(0x1), gid(0), remote cost(201), cfg_order(0), local
cost(10), selected
    3: Seq_num(1 spoke11-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(10), selected
    4: Seq_num(2 spoke12-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(20), selected
  Src address(1):
        10.1.100.0-10.1.100.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

   Spoke 2:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
 Tie break: cfg
  Gen(15), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Member sub interface(4):
    2: seq_num(1), interface(spoke21-p1):
       1: spoke21-p1_0(75)
    4: seq_num(2), interface(spoke22-p1):
       1: spoke22-p1_0(74)
  Members(4):
    1: Seq_num(1 spoke21-p1_0), alive, sla(0x1), gid(0), remote cost(11), cfg_order(0), local
cost(10), selected
    2: Seq_num(1 spoke21-p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(10), selected
    3: Seq_num(2 spoke22-p1_0), alive, sla(0x1), gid(0), remote cost(11), cfg_order(1), local
cost(20), selected
    4: Seq_num(2 spoke22-p1), alive, sla(0x1), gid(0), cfg_order(1), local cost(20), selected
  Src address(1):
        192.168.5.0-192.168.5.255

  Dst address(1):
        0.0.0.0-255.255.255.255
```

The spoke11-p1_1 shortcut on Spoke 1 is preferred over spoke11-p1_0 due to the lower remote link cost of 101 when they have the same local SD-WAN member cost of 10.

9. Verify the policy route list on Spoke 1:

```
# diagnose firewall proute list
list route policy info(vf=root):

id=2131755009(0x7f100001) vwl_service=1(1) vwl_mbr_seq=1 1 1 2 dscp_tag=0xfc 0xfc flags=0x0
tos=0x00 tos_mask=0x00 protocol=0 sport=0-65535 iif=0(any) dport=1-65535 path(4) oif=81
(spoke11-p1_1) oif=80(spoke11-p1_0) oif=54(spoke11-p1) oif=55(spoke12-p1)
source(1): 10.1.100.0-10.1.100.255
destination(1): 0.0.0.0-255.255.255.255
hit_count=176 last_used=2022-07-12 11:56:08
```

ADVPN 2.0

The SD-WAN with ADVPN solution has evolved to version 2.0 with major changes to ADVPN design and operation, including the introduction of edge discovery and path management for ADVPN spokes.

ADVPN 2.0 incorporates intelligence into the spokes to ensure shortcut tunnels (also known as shortcuts) are established using underlays available on both spokes and chosen based on matching certain link health criteria. In unique circumstances where spokes use different transports than the hub, ADVPN 2.0 can use overlay placeholders to trigger shortcuts between spokes over transports to which hubs are not connected.

ADVPN 2.0 provides a more flexible SD-WAN solution than the original ADVPN to achieve resiliency against underlay outages or degraded underlay performance because it no longer depends on specific BGP routing designs or mechanisms, including route reflection, BGP next hop recursive resolution, BGP per overlay, and BGP on loopback.

Currently, ADVPN 2.0 only supports IPv4.

The following topics describe further details about ADVPN 2.0:

- SD-WAN with ADVPN 2.0 versus previous ADVPN on page 1297
- SD-WAN CLI configuration on page 1297
- Example SD-WAN configurations using ADVPN 2.0 on page 1299

SD-WAN with ADVPN 2.0 versus previous ADVPN

With the previous version of ADVPN and SD-WAN, shortcut path selection relied entirely on the overlays between the spokes. The hub and overlays were used to exchange IKE shortcut messages, and policy routes were configured on the hub to ensure shortcuts were established on the same overlay. In addition, user traffic was needed to trigger the process of establishing shortcuts.

With the latest version of ADVPN and SD-WAN, shortcut path selection is achieved through edge discovery and path management functionality on the ADVPN spokes.

1. Edge discovery:
   - Expand IKE Shortcut-Reply message to allow the local spoke (spoke where user traffic is initiated) to obtain the remote spoke (destination spoke for user traffic) WAN link information, which includes IP address, transport group, link quality, link cost, and member configuration order.
   - After shortcut establishment, WAN link information can be exchanged on the shortcut regularly every 5 seconds through UDP traffic. The path management function on the local spoke is regularly updated to pick up changes to remote or local overlays and select the best shortcut path accordingly.
2. Path management:

   The local spoke handles the remote spoke WAN link information, calculates the best shortcut path per SD-WAN service or rule, and then advises IKE to establish a shortcut using the selected path.
   - The local spoke directly sends a shortcut-query to a remote spoke to trigger a shortcut after path management chooses a path.
   - Path management can trigger multiple shortcuts for load balancing SD-WAN rules. All created shortcuts use unique underlay paths. Traffic can be load balanced over these multiple shortcuts to use as much of the available WAN bandwidth as possible without wasting idle links if they are healthy. The algorithm to calculate multiple shortcuts for the load balancing service will consider transport group and in-SLA status for local overlays.
   - Spokes can automatically deactivate all shortcuts connecting to the same spoke when user traffic is not observed for a specified time interval. This is achieved by enabling a shared idle timeout setting in the IPsec VPN Phase 1 interface settings for associated overlays.
   - When overlay placeholders are enabled, spokes can use overlay placeholders to trigger shortcuts between spokes over transports to which hubs are not connected.

Currently, ADVPN 2.0 only supports IPv4.

SD-WAN CLI configuration

The `config system sdwan` command is used to configure ADVPN 2.0 on the spokes:

```
config system sdwan
    config zone
        edit <zone-name>
            set advpn-select {enable | disable}
            set advpn-health-check <health-check name>
        next
    end
    config members
        edit <integer>
            set transport-group <integer>
        next
    end
    config service
        edit <integer>
            set shortcut-priority {enable | disable | auto}
        next
    end
end
```

Command	Description
`advpn-select {enable | disable}`	Enable or disable SDWAN/ADVPN-2.0 (default=disabled).
`advpn-health-check <health-check name>`	Specify the health check for the spoke whose info will be sent to the peer spoke.
`transport-group <integer>`	Specify different group ID between (1 -255) to differentiate link-type, such as Internet, MPLS, LTE, Satellite.
`shortcut-priority {enable | disable | auto}`	Enable or disable making ADVPN shortcut a high priority over overlay parent interfaces, if SLA mode or link cost factor mode conditions are met: • `enable`: enable a high priority of ADVPN shortcut for this service. • `disable`: disable a high priority of ADVPN shortcut for this service. • `auto`: automatically enable a high priority of ADVPN shortcut for this service if ADVPN2.0 is enabled.
`diagnose sys sdwan advpn-session`	Diagnostic command run on local spoke to view remote spoke WAN link information and path manager shortcut path selection. The displayed name is the hostname or HA group name, if in HA.

As with the previous version of ADVPN, on the hub, you must enable ADVPN and configure firewall policies between spokes.

The `config vpn ipsec phase1-interface` command is used to configure the shared idle timeout for overlays used by ADVPN.

```
config vpn ipsec phase1-interface
   edit <phase1-interface name>
      set idle-timeout {enable | disable}
      set shared-idle-timeout {enable | disable}
      set idle-timeoutinterval <integer>
```

```
  next
end
```

Command	Description
`idle-timeout {enable | disable}`	Enable/disable IPsec tunnel idle timeout (default = `disable`). Must be set to `enable` when `shared-idle-timeout` is enabled.
`shared-idle-timeout {enable | disable}`	Enable/disable `shared-idle-timeout` on involved overlays (default = `disable`).
`idle-timeoutinterval <integer>`	IPsec tunnel idle timeout, in minutes (5 - 43200, default = 5).

The `config vpn ipsec phase1-interface` command is used to configure overlay placeholders, and shortcut tunnels require each spoke to be configured with these settings:

```
config vpn ipsec phase1-interface
    edit <placeholder_phase1_interface_name>
        set type dynamic
        ...
        set net-device enable
        ...
        set auto-discovery-dialup-placeholder {enable | disable}
    next
end
```

Command	Description
`auto-discovery-dialup-placeholder {enable | disable}`	Enable/disable overlay placeholder tunnels (default = disable).

Currently, ADVPN 2.0 only supports IPv4.

Example SD-WAN configurations using ADVPN 2.0

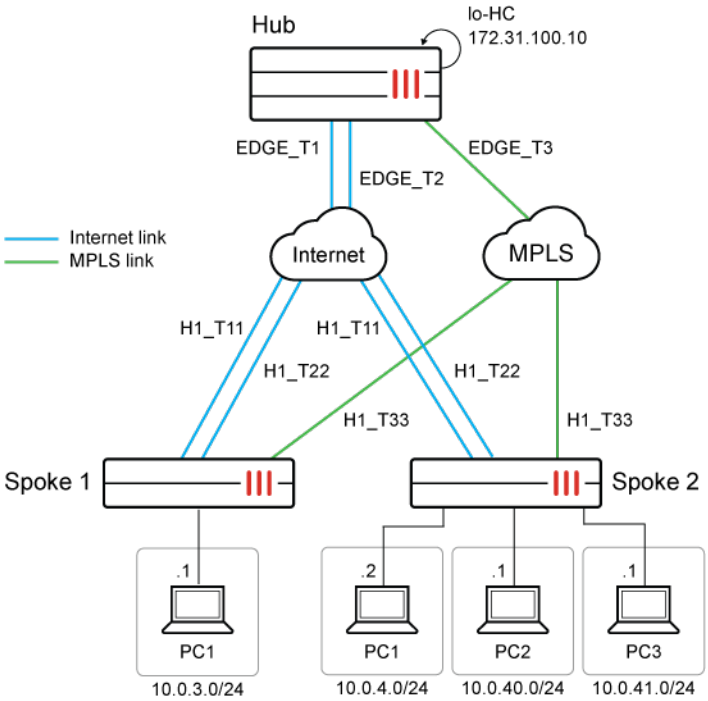
The configuration example illustrates the edge discovery and path management processes for a typical hub and spoke topology. This example focuses on SD-WAN configuration for steering traffic and establishing shortcuts in the direction from Spoke 1 to Spoke 2.

- Network Topology on page 1300
- SD-WAN configuration and health check status on page 1301
- Scenario 1: Traffic matching SD-WAN rule 1 on page 1304
- Scenario 2: Traffic matching SD-WAN rule 2 on page 1305
- Scenario 3: Traffic matching SD-WAN rule 3 on page 1307
- Scenario 4: Spoke 2 H1_T22 overlay link out-of-SLA on page 1309
- Scenario 5: Traffic matching SD-WAN rule configured for load balancing on page 1311

Currently, ADVPN 2.0 only supports IPv4.

Network Topology

In this example, BGP per overlay was used for dynamic routing to distribute the LAN routes behind each spoke to the other spoke. However, this was a design choice. You can also use BGP on loopback for this example.



Spokes 1 and 2 have the following VPN overlays between themselves and the hub:

VPN Overlays	IP address on Spoke 1	IP address on Spoke 2
H1_T11	172.31.80.1/32	172.31.80.2/32
H1_T22	172.31.81.1/32	172.31.81.2/32
H1_T33	172.31.82.1/32	172.31.82.2/32

SD-WAN Rules/Services defined on Spoke 1:

	SD-WAN Rule/Service 1	SD-WAN Rule/Service 2	SD-WAN Rule/Service 3
	H1_T11	H1_T22	H1_T33
	H1_T22	H1_T11	H1_T11
	H1_T33	H1_T33	H1_T22
Strategy for choosing outgoing interfaces	Lowest cost (SLA)	Lowest cost (SLA)	Best quality, link cost factor: packet loss

Throughout this example, transport group 1 is used for VPN overlays over Internet links while transport group 2 is used for the VPN overlay over an MPLS link.

In this example, user traffic is initiated behind Spoke 1 and destined to Spoke 2. Because of this, Spoke 1 is considered the local spoke, and Spoke 2 is considered the remote spoke.

SD-WAN configuration and health check status

This section includes:

- SD-WAN configuration and health check status on Spoke 1: on page 1301
- SD-WAN configuration and health check status on Spoke 2: on page 1303

SD-WAN configuration and health check status on Spoke 1:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "overlay"
            set advpn-select enable
            set advpn-health-check "HUB"
        next
    end
    config members
        edit 1
            set interface "H1_T11"
            set zone "overlay"
            set transport-group 1
        next
        edit 2
            set interface "H1_T22"
            set zone "overlay"
            set transport-group 1
        next
        edit 3
            set interface "H1_T33"
            set zone "overlay"
            set transport-group 2
        next
    end
    config health-check
        edit "HUB"
            set server "172.31.100.100"
            set members 1 2 3
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 100
                next
            end
```

```
        next
    end
    config service
        edit 1
            set name "1"
            set mode sla
            set shortcut-priority enable

```

Scenario 1: Traffic matching SD-WAN rule 1

In this scenario, PC1 connected to Spoke 1 initiates an ICMP ping destined for PC1 connected to Spoke 2. Therefore, this user traffic matches SD-WAN rule 1 and triggers shortcut path selection and establishment.

The Path Manager of Spoke 1 calculates the best shortcut path by comparing transport group, link quality (for SLA mode), link cost, and member configuration order between Spoke 1 and Spoke 2.

For an SLA mode service, the following algorithm is used to consider endpoints of the best shortcut path:

1. Overlays with the same transport group
2. In-SLA overlays
3. Lowest link-cost overlays
4. Member configuration order as a final tiebreaker

Based on this algorithm, the Path Manager on Spoke 1 selects Spoke 1 H1_T11 because it is first in the priority-members order for SD-WAN rule 1, it has the lowest link cost, and it is within SLA. Likewise, the Path Manager on Spoke 1 selects Spoke 2 H1_T22 since it has the lowest link cost compared to Spoke 2 H1_T11 (which has a cost of 100), it is within SLA, and has the same transport group as Spoke 1 H1_T11. Therefore, the Path Manager of Spoke 1 calculates the best shortcut path as Spoke 1 H1_T11 to Spoke 2 H1_T22.

The Path Manager will advise IKE to establish the best shortcut and add it to SD-WAN rule 1 as follows:

```
Branch1_FGT# diagnose sys sdwan service4
 Service(1): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
  Tie break: cfg
  Shortcut priority: 1
   Gen(11), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-order
   Member sub interface(4):
     2: seq_num(1), interface(H1_T11):
        1: H1_T11_0(71)
   Members(4):
     1: Seq_num(1 H1_T11_0 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected     2: Seq_num(1 H1_T11 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
     3: Seq_num(2 H1_T22 overlay), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
     4: Seq_num(3 H1_T33 overlay), alive, sla(0x1), gid(0), cfg_order(2), local cost(0), selected
   Src address(2):
         172.31.0.0-172.31.255.255
         10.0.3.0-10.0.3.255
   Dst address(2):
         172.31.0.0-172.31.255.255
         10.0.4.0-10.0.4.255 …
```

Since shortcut-priority is enabled, we observe that the shortcut is formed over the selected overlay path and prioritized over the parent overlay.

From the diagnostic command on Spoke 1, we observe the selected shortcut path in **bold**. (Note that the remote IP matches Spoke 2 H1_T22 in the corresponding table above.)

```
Branch1_FGT# diagnose sys sdwan advpn-session

```

Scenario 2: Traffic matching SD-WAN rule 2

In this scenario, PC1 connected to Spoke 1 initiates an ICMP ping destined for PC2 connected to Spoke 2. Therefore, this user traffic matches SD-WAN rule 2, and traffic will go through shortcut H1_T11_0 of Spoke 1 previously established in Scenario 1 above.

The local spoke sends a shortcut-query to the remote spoke to trigger a shortcut after ADVPN 2.0 path management makes a path decision with updated remote spoke WAN link information, which is received periodically (5 seconds) on the established shortcuts.

For an SLA mode service, the following algorithm is followed for considering endpoints of the best shortcut path:

1. Overlays with the same transport group
2. In-SLA overlays
3. Lowest link-cost overlays
4. Member configuration order as a final tiebreaker

Based on this algorithm, the Path Manager on Spoke 1 selects Spoke 1 H1_T22 because it is the first in the priority-members order for SD-WAN rule 2, it has the lowest link cost, and it is within SLA. Likewise, the Path Manager on Spoke 1 selects Spoke 2 H1_T22 since it has the lowest link cost compared to Spoke 2 H1_T11 (which has a cost of 100), it is within SLA, and has the same transport group as Spoke 1 H1_T11. Therefore, the Path Manager of Spoke 1 calculates the best shortcut path as Spoke 1 H1_T22 to Spoke 2 H1_T22.

The Path Manager will advise IKE to establish the best shortcut and add it to SD-WAN rule 2 as follows:

```
Branch1_FGT# diagnose sys sdwan service4
…
Service(2): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
```

```
 Tie break: cfg
 Shortcut priority: 1
  Gen(12), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-order
  Member sub interface(5):
    3: seq_num(2), interface(H1_T22):
       1: H1_T22_0(72)
    4: seq_num(1), interface(H1_T11):
       1: H1_T11_0(71)
  Members(5):
    1: Seq_num(2 H1_T22_0 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    2: Seq_num(1 H1_T11_0 overlay), alive, sla(0x1), gid(0), cfg_order(1), local cost(0),
selected, last_used=2023-12-05 14:34:07
    3: Seq_num(2 H1_T22 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    4: Seq_num(1 H1_T11 overlay), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    5: Seq_num(3 H1_T33 overlay), alive, sla(0x1), gid(0), cfg_order(2), local cost(0), selected
  Src address(2):
        172.31.0.0-172.31.255.255
        10.0.3.0-10.0.3.255

```

Scenario 3: Traffic matching SD-WAN rule 3

In this scenario, PC1 connected to Spoke 1 initiates an ICMP ping destined for PC3 connected to Spoke 2. Therefore, this user traffic matches SD-WAN rule 3, and traffic will go through shortcut H1_T11_0 of Spoke 1 previously established in Scenario 1 above.

The local spoke sends a shortcut-query to the remote spoke to trigger a shortcut after ADVPN 2.0 path management makes a path decision with updated remote spoke WAN link information, which is received periodically (5 seconds) on the established shortcuts.

For a best quality mode service, the following algorithm is followed for considering endpoints of the best shortcut path:

1. Overlays with the same transport group
2. Best quality overlays (link cost factor of packet loss, in this scenario)
3. Member configuration order as a final tiebreaker

Based on this algorithm, the Path Manager on Spoke 1 selects Spoke 1 H1_T33 because it is the first in the priority-members order for SD-WAN rule 3, and it has the best quality link. Likewise, the Path Manager on Spoke 1 selects Spoke 2 H1_T33 since it has the same transport group as Spoke 1 H1_T33. Therefore, the Path Manager of Spoke 1 calculates the best shortcut path as Spoke 1 H1_T33 to Spoke 2 H1_T33.

The Path Manager will advise IKE to establish the best shortcut and add it to SD-WAN rule 3 as follows:

```
Branch1_FGT# diagnose sys sdwan service4
…
Service(3): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
 Tie break: cfg
 Shortcut priority: 3
  Gen(13), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(priority), link-cost-
factor(packet-loss), link-cost-threshold(10), health-check(HUB)
  Member sub interface(6):
    4: seq_num(3), interface(H1_T33):
       1: H1_T33_0(73)
```

```
    5: seq_num(1), interface(H1_T11):
       1: H1_T11_0(71)
    6: seq_num(2), interface(H1_T22):
       1: H1_T22_0(72)
  Members(6):
    1: Seq_num(3 H1_T33_0 overlay), alive, packet loss: 0.000%, selected

```

Scenario 4: Spoke 2 H1_T22 overlay link out-of-SLA

In this scenario, we place remote Spoke 2 H1_T22 out-of-SLA and observe that this link quality change is sensed by the local spoke through regular WAN link information updates on shortcuts. Because service 1 and 2 are the only rules that have new best shortcut paths when Spoke 2 H1_T22 is out-of-SLA, the local Spoke 1 will directly send shortcut-queries to the remote Spoke 2 to trigger shortcuts for service 1 and 2 after ADVPN 2.0 path management makes path decisions with updated remote spoke WAN link information.

For an SLA mode service, the following algorithm is followed for considering endpoints of the best shortcut path:

1. Overlays with the same transport group
2. In-SLA overlays
3. Lowest link-cost overlays
4. Member configuration order as a final tiebreaker

Based on this algorithm, the Path Manager on Spoke 1 still selects these Spoke 1 interfaces:

- SD-WAN Rule 1: H1_T11
- SD-WAN Rule 2: H1_T22

These are the first in the priority-members order for SD-WAN rules 1 and 2, respectively.

Based on the updated WAN link information, the Path Manager on Spoke 1 selects these Spoke 2 interfaces because they are the only remaining in-SLA VPN overlays over Internet links (transport group 1):

- SD-WAN Rule 1: H1_T11
- SD-WAN Rule 2: H1_T11

Therefore, the Path Manager of Spoke 1 calculates the best shortcut paths as follows:

- SD-WAN Rule 1: Spoke 1 H1_T11 to Spoke 2 H1_T11
- SD-WAN Rule 2: Spoke 1 H1_T22 to Spoke 2 H1_T11

The Path Manager will advise IKE to establish the best shortcuts and add them to SD-WAN rules 1 and 2 as follows:

- For SD-WAN Rule 1, H1_T11_1 is the new best shortcut.
- For SD-WAN Rule 2, H1_T22_1 is the new best shortcut.

Scenario 5: Traffic matching SD-WAN rule configured for load balancing

This example relies on the same Network Topology on page 1300 used above, except Spoke 1 has a single SD-WAN rule/service that uses the load balancing strategy with SLA targets. For details, see Load balancing

strategy with SLA targets on page 1077.

This section shows the SD-WAN configuration, selected IPsec configuration, and health check status on Spoke 1: on page 1312 and Spoke 2: on page 1314:

Spoke 1:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "overlay"

Seq(2 H1_T22): state(alive), packet-loss(0.000%) latency(0.163), jitter(0.005), mos(4.404),
bandwidth-up(999994), bandwidth-dw(999998), bandwidth-bi(1999992) sla_map=0x1
```

In this scenario, PC1 connected to Spoke 1 initiates an ICMP ping destined for PC1 connected to Spoke 2. Therefore, this user traffic matches SD-WAN rule 1 and triggers shortcut path selection and establishment.

On Spoke 1, in the IKE debug (diagnose debug application ike -1), debug messages indicate that multiple direct shortcut-query packets are being sent to Spoke 2:

```
ike :VWL_ADVPN_MSG_T_TRIGGER
ike V=root:0 looking up shortcut by addr 172.31.80.2, resp-name:H1_T11, name H1_T22, peer-addr
172.31.3.101:0
ike V=root:0:H1_T22: send shortcut-query
...
ike :VWL_ADVPN_MSG_T_TRIGGER
ike V=root:0 looking up shortcut by addr 172.31.81.2, resp-name:H1_T22, name H1_T22, peer-addr
172.31.3.105:0
ike V=root:0:H1_T22: send shortcut-query
...
ike :VWL_ADVPN_MSG_T_TRIGGER
ike V=root:0 looking up shortcut by addr 172.31.82.2, resp-name:H1_T33, name H1_T33, peer-addr
172.31.4.101:0
ike V=root:0:H1_T33: send shortcut-query
...
```

From the diagnostic command on Spoke 1, observe that multiple shortcuts are triggered in **bold** based on the ADVPN 2.0 path management calculation where in-SLA overlays within the same transport group were selected.

```

  Dst address(1):
        10.0.0.0-10.255.255.255
```

Example SD-WAN overlay placeholders using ADVPN 2.0

In a typical hub and spoke SD-WAN configuration, the hub uses the same underlay transports as the spokes. However, in unique circumstances, spokes may use different transports than the hub. For example, spokes may have direct MPLS connections that are not connected to the hub. Hubs are not necessarily connected to all the

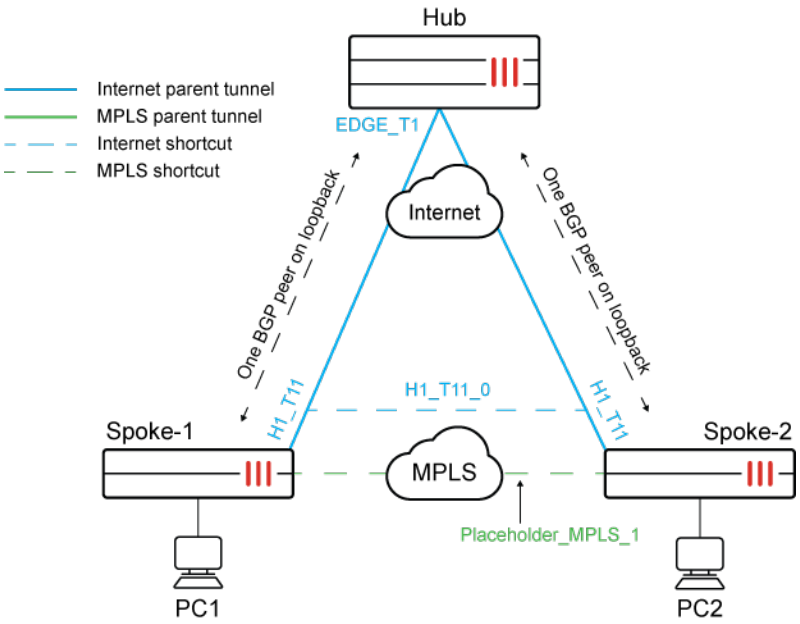
same underlay transports as spokes. In these instances, ADVPN 2.0 can use overlay placeholders to trigger shortcuts between spokes over transports to which hubs are not connected. Once the regular shortcut and placeholder shortcuts are established, SD-WAN will steer traffic based on the service rule, such as which link has the best quality.

In this SD-WAN example, the Hub, Spoke-1, and Spoke-2 all have broadband WAN connections. However, Spoke-1 and Spoke-2 have an additional MPLS connection between them. With ADVPN 2.0 enabled, Spoke-1 and Spoke-2 have regular parent tunnels (H1_T11) to the Hub. Spoke-1 and Spoke-2 also have placeholder parent tunnels configured (Placeholder_MPLS_1), where `auto-discovery-dialup-placeholder` is enabled and `remote-gateway` isn't statically specified. As a placeholder tunnel, no connection is established between the spoke and the hub. Instead, the tunnel interface is utilized in the SD-WAN configurations as if it were a regular overlay because shortcuts can be established between spokes in a placeholder overlay.

Traffic is sent from PC-1 to PC-2. This traffic matches an SD-WAN rule that include two interfaces: a VPN tunnel to the Hub, and a placeholder tunnel. As only the first tunnel is alive, the first bit of traffic goes through this tunnel to the Hub and triggers `SHORTCUT_QUERY/SHORTCUT_REPLY` exchange with the Hub. When Spoke-1 receives `SHORTCUT_REPLY` message, which includes WAN and SD-WAN information about Spoke-2's eligible shortcut interfaces, Spoke-1 calculates and creates the shortcut between regular parent tunnels and triggers a shortcut between the placeholder parent tunnels too.

As the `SHORTCUT_REPLY` from the Hub contains additional information for a second WAN interface on Spoke-2, a `SHORTCUT_QUERY` is triggered on Spoke-1 to see if another shortcut can be established. This `SHORTCUT_QUERY` utilizes the H1_T11 tunnel to facilitate the `SHORTCUT_QUERY/SHORTCUT_REPLY` exchange with the Hub.

Health-checks, which are automatically running on the regular shortcut and the placeholder shortcut, help decide which interface to use for forwarding the remaining traffic.



Settings on the spoke relevant to the example:

```
config vpn ipsec phase1-interface
    edit <placeholder_phase1_interface_name>
        set type dynamic
        ...
```

```
        set net-device enable
        ...
        set auto-discovery-dialup-placeholder enable
    next
end
```

To enable overlay placeholder tunnels on Spoke-1 and Spoke-2:

1. Configure key components on Spoke-1:
   a. Configure a parent tunnel and a placeholder tunnel:
   Tunnel H1_T11 is the parent tunnel, and tunnel Placeholder_MPLS_1 is the placeholder tunnel:

```
config vpn ipsec phase1-interface
    edit "H1_T11"
        set interface "port1"
        set ike-version 2
        set keylife 28800
        set peertype any
        set net-device enable
        set exchange-ip-addr4 172.31.0.65
        set proposal aes256gcm-prfsha384
        set add-route disable
        set dpd on-idle
        set idle-timeout enable
        set idle-timeoutinterval 5
        set auto-discovery-receiver enable
        set encapsulation vpn-id-ipip
        set network-overlay enable
        set network-id 11
        set transport udp
        set remote-gw 172.31.1.1
        set psksecret ENC
fRkYaHGx3MoAASxMsHoJSObbOfphOmBntEpKhZAY8/9OjjqJxbmTehe4Z7LOGTvjFRXTULiPBkfPupnr0JtBo0KJb0

lm4+64ccLHG/3X/Ha1lmMjY3dkVA
        set dpd-retryinterval 5
    next
    edit "Placeholder_MPLS_1"
        set type dynamic
        set interface "port3"
        set ike-version 2
        set keylife 28800
        set peertype any
        set net-device enable
        set exchange-ip-addr4 172.31.0.65
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set idle-timeout enable
        set idle-timeoutinterval 5
```

```
        set auto-discovery-receiver enable
        set auto-discovery-dialup-placeholder enable
        set encapsulation vpn-id-ipip
        set network-overlay enable
        set network-id 250
        set transport udp
        set psksecret ENC
e3XlBFTNA+fk4Kn7NMLfzJLgU0Pk6ssX9oJ7VSA2Q371x+oqIRSomFhRyZiErb1j07FmGT/lPUFHAB2BJG7vhNIh0S
SjEqThai8rIKWqHsIpjHwUAM0/maBzH1iTXZAyjEX0vFiu65QSLAoQzfgXkfX16P82Q1gjIim/GX4phzA+cIYJnfeg
bqXylFg4fxkqCrYFGFlmMjY3dkVA
        set dpd-retryinterval 60
    next
end
```

b. Configure SD-WAN:

Enable ADVPN 2.0 and health-checks for the overlay. Configure the SD-WAN members and their transport groups.

```
config system sdwan
    set status enable
    config zone
        edit "overlay"
            set advpn-select enable
            set advpn-health-check "HUB"
        next
    end
    config members
        edit 4
            set interface "H1_T11"
            set zone "overlay"
            set source 172.31.0.65
            set priority 10
            set transport-group 1
        next
        edit 13
            set interface "Placeholder_MPLS_1"
            set zone "overlay"
            set source 172.31.0.65
            set priority 10
            set transport-group 2
        next
    end
    config health-check
        edit "HUB"
            set server "172.31.100.100"
            set members 4 13
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 100
                next
            end
```

```
        next
    end
    config service
        edit 1
            set name "1"
            set mode sla
            set dst "spoke-2_LAN-1"
            set src "spoke-1_LAN-1"
            config sla
                edit "HUB"
                    set id 1
                next
            end
            set priority-members 4 13
        next
    end
end
```

2. Configure key components on Spoke-2:
   a. Configure a parent tunnel and a placeholder tunnel:
   Tunnel H1_T11 is the parent tunnel, and tunnel Placeholder_MPLS_1 is the placeholder tunnel:

```
   config vpn ipsec phase1-interface
   edit "H1_T11"
        set interface "port1"
        set ike-version 2
        set keylife 28800
        set peertype any
        set net-device enable
        set exchange-ip-addr4 172.31.0.66
        set proposal aes256gcm-prfsha384
        set add-route disable
        set dpd on-idle
        set idle-timeout enable
        set idle-timeoutinterval 5
        set auto-discovery-receiver enable
        set encapsulation vpn-id-ipip
        set network-overlay enable
        set network-id 11
        set transport udp
        set remote-gw 172.31.1.1
        set psksecret ENC

UnAtrdFMGN/3BrLNyllmMjY3dkVA
        set dpd-retryinterval 5
    next
    edit "Placeholder_MPLS_1"
        set type dynamic
        set interface "port3"
        set ike-version 2
```

```
        set keylife 28800
        set peertype any
        set net-device enable
        set exchange-ip-addr4 172.31.0.66
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set idle-timeout enable
        set idle-timeoutinterval 5
        set auto-discovery-receiver enable
        set auto-discovery-dialup-placeholder enable
        set encapsulation vpn-id-ipip
        set network-overlay enable
        set network-id 250
        set transport udp
        set psksecret ENC
Un++iggqXo1wU8fAArjS9JY5rsAcd8+Xw3WR7MtRVLU0BpXT56bAwrP6wQ4gpMt32ABTQ/mAddlq1Mq5LxCV0X+lYa

rekAXOtSvxLJfju/7FlmMjY3dkVA
        set dpd-retryinterval 60
    next
end
```

b. Configure SD-WAN:

Enable ADVPN 2.0 and health-checks for the overlay. Configure the SD-WAN members and their transport groups. The internet overlay (H1_T11) is added to transport group 1, and the MPLS overlay (Placeholder_MPLS_1) is added to transport group 2.

```
config system sdwan
    set status enable
    config zone
        edit "overlay"
            set advpn-select enable
            set advpn-health-check "HUB"
        next
    end
    config members
        edit 4
            set interface "H1_T11"
            set zone "overlay"
            set source 172.31.0.66
            set priority 10
            set transport-group 1
        next
        edit 13
            set interface "Placeholder_MPLS_1"
            set zone "overlay"
            set source 172.31.0.66
            set priority 10
            set transport-group 2
        next
```

```
    end
    config health-check
        edit "HUB"
            set server "172.31.100.100"
            set members 4 13
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 100
                next
            end
        next
    end
end
```

To check the health status and traffic:

1. Check the health status on Spoke-1 and Spoke-2, and check the SD-WAN status of Spoke-1:
   a. Check the health of Spoke-1:
   The placeholder tunnel (Placeholder_MPLS_1) is dead.

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(0.235), jitter(0.011), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996), sla_map=0x1
Seq(13 Placeholder_MPLS_1): state(dead), packet-loss(100.000%), sla_map=0x0
```

   b. Check the health of Spoke-2:
   The placeholder tunnel (Placeholder_MPLS_1) is dead.

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(0.250), jitter(0.041), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996), sla_map=0x1
Seq(13 Placeholder_MPLS_1): state(dead), packet-loss(100.000%), sla_map=0x0
```

   c. Check the SD-WAN status of Spoke-1:

```
# diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
 Tie break: cfg
 Shortcut priority: 3
  Gen(21), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
  Members(2):
    1: Seq_num(4 H1_T11 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(13 Placeholder_MPLS_1 overlay), dead, sla(0x0), gid(0), cfg_order(1), local
cost(0)
  Src address(1):
        10.0.3.0-10.0.3.255
```

```
  Dst address(1):
        10.0.4.0-10.0.4.255
```

2. Send traffic from PC-1 to PC-2:

   When Spoke-1 receives SHORTCUT_REPLY message, which includes SD-WAN information about Spoke-2, Spoke-1 calculates and creates the shortcut between regular parent tunnels, and it triggers a shortcut between the placeholder tunnels too.

   a. Check the health of Spoke-1:

      The health-check is automatically running on the regular shortcut (H1_T11_0) and on the placeholder shortcut (Placeholder_MPLS_1_0).

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(0.239), jitter(0.017), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996), sla_map=0x1
Seq(4 H1_T11_0): state(alive), packet-loss(0.000%), latency(0.260), jitter(0.010), mos
(4.404), bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998), sla_map=0x1

Seq(13 Placeholder_MPLS_1): state(dead), packet-loss(100.000%), sla_map=0x0
Seq(13 Placeholder_MPLS_1_0): state(alive), packet-loss(0.000%), latency(0.139), jitter
(0.006), mos(4.404), bandwidth-up(1000000), bandwidth-dw(1000000), bandwidth-bi(2000000),
sla_map=0x1
```

   b. Check the health of Spoke-2:

      The health-check is automatically running on the regular shortcut (H1_T11_0) and on the placeholder shortcut (Placeholder_MPLS_1_0).

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(0.214), jitter(0.012), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995), sla_map=0x1
Seq(4 H1_T11_0): state(alive), packet-loss(0.000%), latency(0.296), jitter(0.030), mos
(4.404), bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997), sla_map=0x1

Seq(13 Placeholder_MPLS_1): state(dead), packet-loss(100.000%), sla_map=0x0
Seq(13 Placeholder_MPLS_1_0): state(alive), packet-loss(0.000%), latency(0.159), jitter
(0.023), mos(4.404), bandwidth-up(1000000), bandwidth-dw(1000000), bandwidth-bi(2000000),
sla_map=0x1
```

   c. Check the SD-WAN status of Spoke-1:

      The regular shortcut (H1_T11_0 overlay) is preferred, because it is the better performing link, as determined by SD-WAN intelligence.

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
 Tie break: cfg
 Shortcut priority: 3
  Gen(33), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
  Member sub interface(4):
```

```
    3: seq_num(4), interface(H1_T11):
       1: H1_T11_0(1152)
    4: seq_num(13), interface(dummy_MPLS_1):
       1: dummy_MPLS_1_0(1153)
  Members(4):
    1: Seq_num(4 H1_T11_0 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    2: Seq_num(13 Placeholder_MPLS_1_0 overlay), alive, sla(0x1), gid(0), cfg_order(1),
local cost(0), selected
    3: Seq_num(4 H1_T11 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    4: Seq_num(13 Placeholder_MPLS_1 overlay), dead, sla(0x0), gid(0), cfg_order(1), local
cost(0)
  Src address(1):
        10.0.3.0-10.0.3.255
  Dst address(1):
        10.0.4.0-10.0.4.255
```

3. Diagnose the sniffer packet:

   The first few packets travel over the regular parent tunnel (H1_T11), and then the packets switch to the regular shortcut tunnel (H1_T11_0).

```
# diagnose sniffer packet any 'host 10.0.4.2' 4
interfaces=[any]
filters=[host 10.0.4.2]
4.967575 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
4.967976 H1_T11 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
4.969587 H1_T11 in 10.0.4.2 -> 10.0.3.2: icmp: echo reply
4.969629 port4 out 10.0.4.2 -> 10.0.3.2: icmp: echo reply
5.968744 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
5.968838 H1_T11 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
5.969785 H1_T11 in 10.0.4.2 -> 10.0.3.2: icmp: echo reply
5.969842 port4 out 10.0.4.2 -> 10.0.3.2: icmp: echo reply
6.969970 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
6.970187 H1_T11 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
9.969251 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
9.969366 H1_T11_0 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
9.970229 H1_T11_0 in 10.0.4.2 -> 10.0.3.2: icmp: echo reply
9.970278 port4 out 10.0.4.2 -> 10.0.3.2: icmp: echo reply
10.969982 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
10.970199 H1_T11_0 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
```

4. When the regular shortcut tunnel (H1_T11_0) is out of SLA, traffic switches to the placeholder shortcut tunnel (Placeholder_MPLS_1).

   a. Diagnose the SD-WAN service:

      The placeholder shortcut tunnel (Placeholder_MPLS_1) is preferred, and the regular shortcut tunnel (H1_T11_0 overlay) is out of SLA.

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x4200 use-shortcut-sla use-shortcut
```

```
 Tie break: cfg
 Shortcut priority: 3
  Gen(87), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
  Member sub interface(4):
    2: seq_num(4), interface(H1_T11):
       1: H1_T11_0(1167)
    4: seq_num(13), interface(Placeholder_MPLS_1):
       1: Placeholder_MPLS_1_0(1168)
  Members(4):
    1: Seq_num(13 Placeholder_MPLS_1_0 overlay), alive, sla(0x1), gid(0), cfg_order(1),
local cost(0), selected
    2: Seq_num(4 H1_T11 overlay), alive, sla(0x1), gid(0), cfg_order(0), local cost(0),
selected
    3: Seq_num(4 H1_T11_0 overlay), alive, sla(0x0), gid(0), cfg_order(0), local cost(0),
selected
    4: Seq_num(13 Placeholder_MPLS_1 overlay), dead, sla(0x0), gid(0), cfg_order(1), local
cost(0)
  Src address(1):
        10.0.3.0-10.0.3.255
  Dst address(1):
        10.0.4.0-10.0.4.255
```

b. Sniff the packet to see the traffic switch to the placeholder shortcut tunnel (Placeholder_MPLS_1_0):

```
# diagnose sniffer packet any 'host 10.0.4.2' 4
interfaces=[any]
filters=[host 10.0.4.2]

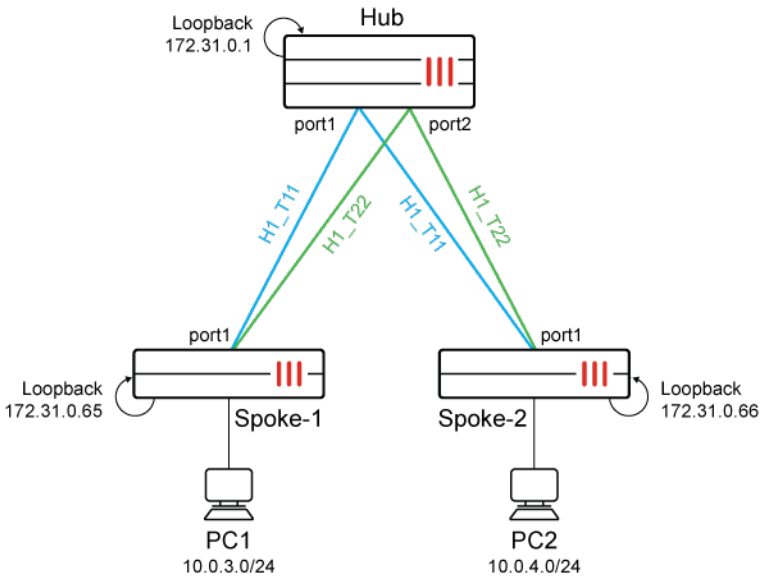
17.356165 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
17.356261 Placeholder_MPLS_1_0 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
17.356857 Placeholder_MPLS_1_0 in 10.0.4.2 -> 10.0.3.2: icmp: echo reply
17.356913 port4 out 10.0.4.2 -> 10.0.3.2: icmp: echo reply
18.361038 port4 in 10.0.3.2 -> 10.0.4.2: icmp: echo request
18.361247 Placeholder_MPLS_1_0 out 10.0.3.2 -> 10.0.4.2: icmp: echo request
```

Example shortcut over distinct underlay path using ADVPN 2.0

When ADVPN 2.0 was introduced, path management between spokes was enhanced to enable each spoke to learn the links from other spokes and use the information to more efficiently build shortcuts. When applied to a service rule that utilizes SLA mode with load-balancing, SD-WAN attempts to build all possible shortcuts using priority members in the service rule and overlays learned from the peer spoke. All created shortcuts use unique underlay paths. Once shortcuts are created on all distinct underlay paths, user traffic is load-balanced between in-SLA shortcuts, rather than between in-SLA shortcuts and parents.

Example

In this example with one hub and two spokes, each spoke has one underlay link, and the hub has two underlay links. For redundancy, each spoke builds two overlays to hub:



In a service rule named Corporate-H1 on Spoke-1, both H1_T11 and H1_T22 are named as priority members for this load-balancing rule. Likewise, Spoke-2 has two overlay paths to the hub. Instead of creating 2x2 shortcut paths based on the overlays, this enhancement identifies the single unique underlay path over port1 and creates a shortcut on this path.

This section reviews the following settings to demonstrate how the ADVPN 2.0 enhancement works:

- Settings on spokes and hub relevant to the example on page 1327
- Routing and SD-WAN status on spokes on page 1332

Settings on spokes and hub relevant to the example

Settings on spoke-1 relevant to the example:

```
config vpn ipsec phase1-interface
    edit "H1_T11"

Routing and SD-WAN status on spokes

To view the routing and SD-WAN status on spokes:

1. Check the routing and SD-WAN status on the spokes before the shortcut is initiated.
   a. On spoke-1, the service rule has two equal, viable paths over the parent overlay tunnels to reach the 10.0.4.0/24 network on Spoke-2:

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(0.288), jitter(0.034), mos
(4.404), custom_profile(0.000), bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi
(1999997), sla_map=0x1
Seq(5 H1_T22): state(alive), packet-loss(0.000%), latency(0.215), jitter(0.017), mos
(4.404), custom_profile(0.000), bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi
(1999997), sla_map=0x1

Branch1_A_FGT (root) (Interim)# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x24200 use-shortcut-sla use-shortcut
 Tie break: cfg
```

```
 Shortcut priority: 3
  Gen(5), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla hash-
mode=round-robin)
  Members(2):
    1: Seq_num(4 H1_T11 overlay), alive, sla(0x1), gid(2), num of pass(1), selected
    2: Seq_num(5 H1_T22 overlay), alive, sla(0x1), gid(2), num of pass(1), selected
  Src address(1):
        10.0.0.0-10.255.255.255
  Dst address(1):
        10.0.0.0-10.255.255.255

Branch1_A_FGT (root) (Interim)# get router info routing-table details 10.0.4.0/24

  Known via "bgp", distance 200, metric 0, best
  Last update 00:20:22 ago
  * vrf 0 172.31.0.65, tag 1 priority 1 (recursive via H1_T11 tunnel 172.31.1.1), tag-
match
                                                          (recursive via H1_T22 tunnel
172.31.1.5), tag-match
```

2. Initiate a ping from PC1 to PC2 to match SLA load-balance service 1 on Spoke-1. This initiates the shortcut path negotiations.

Instead of triggering all four possible shortcuts on all four overlay paths:

- local H1_T11 -- remote H1_T11
- local H1_T11 -- remote H1_T22
- local H1_T22 -- remote H1_T11
- local H1_T22 -- remote H1_T22

Only one shortcut is triggered on the distinct underlay path between two spokes:

- local port1 -- remote port1

On spoke-1:

A bigger gid value (33554434) is assigned to the shortcut, resulting in this path being the preferred for service rule 1.

```
Branch1_A_FGT (root) (Interim)# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x24200 use-shortcut-sla use-shortcut
 Tie break: cfg
 Shortcut priority: 3
  Gen(7), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla hash-mode=round-
robin)
  Member sub interface(3):
    3: seq_num(4), interface(H1_T11):
       1: H1_T11_0(56)
  Members(3):
    1: Seq_num(4 H1_T11_0 overlay), alive, sla(0x1), gid(33554434), num of pass(1), selected
    2: Seq_num(5 H1_T22 overlay), alive, sla(0x1), gid(2), num of pass(1), selected
    3: Seq_num(4 H1_T11 overlay), alive, sla(0x1), gid(2), num of pass(1), selected
  Src address(1):
        10.0.0.0-10.255.255.255
  Dst address(1):
        10.0.0.0-10.255.255.255
```

This diagnostic command shows that only one path is calculated to avoid multiple duplicate paths.

```
Branch1_A_FGT (root) (Interim)# diagnose sys sdwan advpn-session
Session head(Branch2_FGT-0-overlay:1)
(1) Service ID(1), last access(233927), remote health check info(2)
Selected path: local(H1_T11, port1) gw: 172.31.3.1  remote IP: 172.31.3.101(172.31.0.66)

Self-healing and application protection

In order to remediate network connectivity problems, SD-WAN proactively measures network conditions such as latency, jitter, and packet loss on WAN links and use these metrics to adjust traffic according to the application service-level agreements (SLAs). This is often referred to as SLA-based path steering and is discussed in SD-WAN rules on page 1053.

In the same way that applications are evaluated against their specific SLAs, SD-WAN overlay members can be evaluated to determine whether they are healthy or not using SLAs of their own. This enables the SD-WAN to leverage BGP to signal to other nodes in the SD-WAN network that one or more of their members is unhealthy, or out-of-SLA. The nodes can then use this SLA status to prioritize IKE and BGP routes, favoring those that meet performance thresholds (within SLA). This real-time health signaling across nodes improves link visibility, which is especially critical in hub-and-spoke topologies with many connections. By offloading the SLA reporting task to spokes, the processing load on hubs is reduced, allowing for increased efficiency and scaling.

In some situations, there may be no healthy (or in-SLA) links for SD-WAN to direct traffic over. In this case, FortiGate has advanced techniques, such as forward error correction (FEC) and packet duplication, to boost resilience when multiple paths fail. This preserves the user experience and provides business continuity when there would be an outage otherwise.

This section contains the following topics:

- Embedded SD-WAN SLA priorities in ICMP probes on page 1336
- Map SD-WAN member priorities to BGP MED attribute when spoke advertises routes using iBGP to hub on page 1348
- Adaptive Forward Error Correction on page 1356
- Duplicate packets based on SD-WAN rules on page 1375
- Duplicate packets on other zone members on page 1377

Embedded SD-WAN SLA priorities in ICMP probes

In SD-WAN hub-and-spoke topologies, each spoke can embed an SLA priority (`priority-in-sla` and `priority-out-sla`) in ICMP probes and send them to the hub. The hub can use the received SLA priorities from each spoke to manage route priority for hub-to-spoke traffic. By offloading the evaluation of the spoke and hub routes to each spoke, the processing is spread amongst many FortiGates, instead of all on the hub.

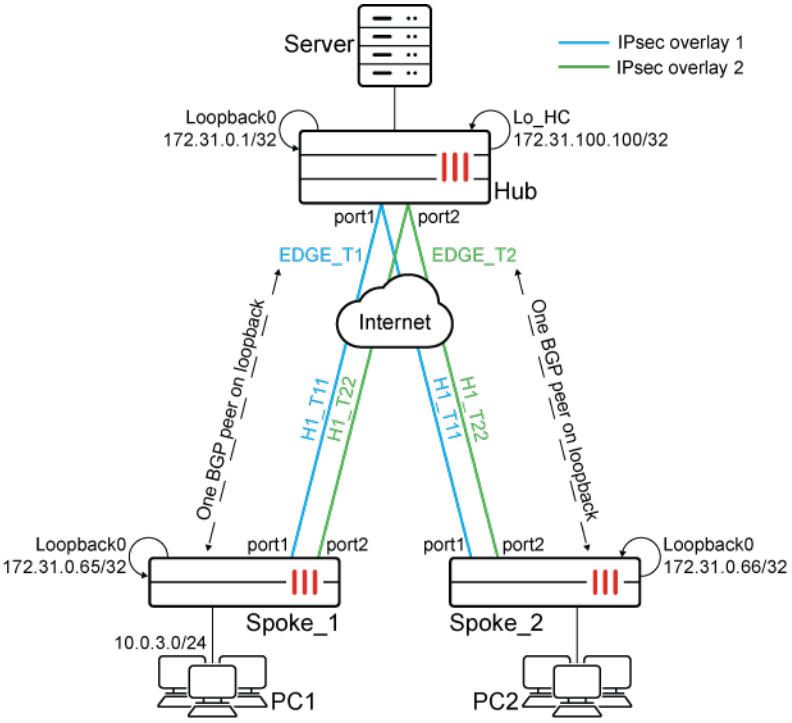
The `priority-in-sla` and `priority-out-sla` settings can be customized for each member of a spoke, allowing different members to have different values when in or out of SLA. This is particularly useful when a spoke has underlays of different types and uses. For example, a spoke that has a broadband connection and an LTE connection will typically prefer to send traffic across the broadband underlay when both are in SLA.

Spoke-initiated speed tests can also use the embedded information. When configured, a spoke will continually embed an out-of SLA priority into ICMP probes on the overlay during a speed test. The hub will use the received out-of SLA priority information to manage route priorities and detour hub-to-spoke user traffic to other tunnels. This is to ensure that the speed test is not affected by any traffic for the duration of the test.

Examples

The SD-WAN topology with ADVPN and BGP neighbor on loopback is used for the following two examples:

- Example 1: Embedded priority configuration on page 1337
- Example 2: Speed test rerouting based on embedded SLA priorities on page 1344



Example 1: Embedded priority configuration

In this example, a health check named hub is configured to embed its measured health status. When the health check is in SLA, the spoke sends an in-SLA priority of 10. When it is out of SLA, the spoke sends an out-of-SLA priority of 100. As there are two link-cost-factor thresholds (latency: 100, packet-loss: 50), the spoke sends in-SLA only if both factors are satisfied.

To configure the example:

1. Configure SD-WAN and BGP on Spoke_1:
   a. Configure SD-WAN:

```
config system sdwan
    set status enable
    config zone
        edit "overlay"
```

```
        next
    end
    config members
        edit 4
            set interface "H1_T11"
            set zone "overlay"
            set source 172.31.0.65
            set priority 10
            set priority-in-sla 10
            set priority-out-sla 20
        next
        edit 5
            set interface "H1_T22"
            set zone "overlay"
            set source 172.31.0.65
            set priority 10
            set priority-in-sla 15
            set priority-out-sla 25
        next
    end
    config health-check
        edit "HUB"
            set embed-measured-health enable
            set sla-id-redistribute 1
            set members 4 5
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 50
                next
            end
        next
    end
end
```

b. Configure BGP:

```
config router bgp
    set as 65001
    set router-id 172.31.0.65
    ...
    config neighbor
        edit "172.31.0.1"
            ...
            set remote-as 65001
            set update-source "Loopback0"
        next
    end
    config network
        edit 1
            set prefix 10.0.3.0 255.255.255.0
        next
```

```
    end
    ...
end
```

c. View the health-check settings:

```
# diagnose sys sdwan health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%) latency(0.230), jitter(0.040), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999996), bandwidth-bi(1999994) sla_map=0x1
Seq(5 H1_T22): state(alive), packet-loss(0.000%) latency(0.188), jitter(0.007), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999996), bandwidth-bi(1999994) sla_map=0x1
```

2. Configure SD-WAN and BGP on Spoke_2:

a. Configure SD-WAN:

```
config system sdwan
    set status enable
    config zone
        edit "overlay"
        next
    end
    config members
        edit 4
            set interface "H1_T11"
            set zone "overlay"
            set source 172.31.0.65
            set priority 10
            set priority-in-sla 30
            set priority-out-sla 40
        next
        edit 5
            set interface "H1_T22"
            set zone "overlay"
            set source 172.31.0.65
            set priority 10
            set priority-in-sla 35
            set priority-out-sla 45
        next
    end
    config health-check
        edit "HUB"
            set embed-measured-health enable
            set sla-id-redistribute 1
            set members 4 5
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 70
                next
            end
        next
```

```
    end
end
```

b. Configure BGP:

```
config router bgp
    set as 65001
    set router-id 172.31.0.65
    ...
    config neighbor
        edit "172.31.0.1"
            ...
            set remote-as 65001
            set update-source "Loopback0"
        next
    end
    config network
        edit 1
            set prefix 10.0.4.0 255.255.255.0
        next
    end
    ...
end
```

c. View the health-check settings:

```
# diagnose sys sdwan health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%) latency(0.230), jitter(0.040), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999996), bandwidth-bi(1999994) sla_map=0x1
Seq(5 H1_T22): state(alive), packet-loss(0.000%) latency(0.188), jitter(0.007), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999996), bandwidth-bi(1999994) sla_map=0x1
```

3. Configure SD-WAN and BGP on the Hub:

a. Configure SD-WAN:

```
config system sdwan
    set status enable
    config zone
        edit "overlay"
        next
    end
    config members
        edit 1
            set interface "EDGE_T1"
            set zone "overlay"
        next
        edit 2
            set interface "EDGE_T2"
            set zone "overlay"
        next
    end
```

```
    config health-check
        edit "Remote_HC"
            set detect-mode remote
            set sla-id-redistribute 1
            set members 1 2
            config sla
                edit 1
                    set link-cost-factor remote
                next
            end
        next
    end
end
```

In mixed deployments where some spokes may not send the SLA priority and only send SLA status (such as SLA-in or SLA-out), the hub can be configured to set default in-SLA and out-SLA values for routes. The following bold lines could added to the hub configuration:

```
config sla
    edit 1
        set link-cost-factor remote
        set link-cost-factor-default latency
        set priority-in-sla 11
        set priority-out-sla 101
    next
end
```

b. Configure BGP:

```
config router bgp
    set as 65001
    set router-id 172.31.0.1
    set recursive-inherit-priority enable
    ...
    config neighbor-group
        edit "EDGE"
            set remote-as 65001
            set update-source "Loopback0"
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 172.31.0.64 255.255.255.192
            set neighbor-group "EDGE"
        next
    end
    ...
end
```

c. View the health-check settings:
The following example shows:

- `rmt_ver=2` indicates that SLA information, SLA status, and overlay priority have been received.
- `rmt_sla=out` indicates that received SLA status is out of SLA.
- `rmt_sla=in` indicates that received SLA status is in SLA.
- `rmt_prio` indicates the received overlay priority value.
- `EDGE_T1_0` is to `H1_T11` on Spoke_1, and `EDGE_T1_1` is to `H1_T11` on Spoke_2.
- `EDGE_T2_1` is to `H1_T22` on Spoke_1, and `EDGE_T1_0` is to `H1_T22` on Spoke_2.

```
# diagnose sys sdwan health-check remote

Remote Health Check: Remote_HC(1)
  Passive remote statistics of EDGE_T1(46):
    EDGE_T1_0(10.0.0.20): timestamp=06-12 14:04:29, src=172.31.0.65, latency=0.247,
jitter=0.028, pktloss=0.000%, mos=4.404, SLA id=1(pass), rmt_ver=2, rmt_sla=in, rmt_
prio=10
    EDGE_T1_1(172.31.0.66): timestamp=06-12 14:04:30, src=172.31.0.66, latency=0.246,
jitter=0.031, pktloss=0.000%, mos=4.404, SLA id=1(pass), rmt_ver=2, rmt_sla=in, rmt_
prio=30

Remote Health Check: Remote_HC(2)
  Passive remote statistics of EDGE_T2(47):
    EDGE_T2_0(10.0.0.15): timestamp=06-12 14:04:30, src=172.31.0.66, latency=0.191,
jitter=0.008, pktloss=0.000%, mos=4.404, SLA id=1(pass), rmt_ver=2, rmt_sla=in, rmt_
prio=35
    EDGE_T2_1(172.31.0.65): timestamp=06-12 14:04:29, src=172.31.0.65, latency=0.201,
jitter=0.008, pktloss=0.000%, mos=4.404, SLA id=1(pass), rmt_ver=2, rmt_sla=in, rmt_
prio=15
```

4. After the spokes' overlay priorities are embedded in ICMP probes and transported to the hub, view the routing tables on the hub.

   The hub sets overlay priorities on IKE routes over EDGE_T1 and EDGE_T2. Meanwhile, recursively resolved BGP routes inherit the priorities from those IKE routes.

   a. On the hub, get the static routing table:

```
# get router info routing-table static
Routing table for VRF=0
S       172.31.0.65/32 [15/0] via EDGE_T1 tunnel 10.0.0.20, [10/0]
                       [15/0] via EDGE_T2 tunnel 172.31.0.65, [15/0]
S       172.31.0.66/32 [15/0] via EDGE_T1 tunnel 172.31.0.66, [30/0]
                       [15/0] via EDGE_T2 tunnel 10.0.0.15, [35/0]
```

   b. On the hub, get the BGP routing table:

```
# get router info routing-table bgp
Routing table for VRF=0
B       10.0.3.0/24 [200/0] via 172.31.0.65 (recursive via EDGE_T1 tunnel 10.0.0.20 [10]),
01:15:46
                                            (recursive via EDGE_T2 tunnel 172.31.0.65
[15]), 01:15:46, [1/0]
B       10.0.4.0/24 [200/0] via 172.31.0.66 (recursive via EDGE_T1 tunnel 172.31.0.66
[30]), 01:13:46
```

```
                                                (recursive via EDGE_T2 tunnel 10.0.0.15 [35]),
01:13:46, [1/0]
```

5. Change the latency on Spoke_1 and Spoke_2, and view the results.
   a. On Spoke_1, increase H1_T11's latency to 60 to make it out of SLA.
   b. On Spoke_2, increase H1_T11's latency to 80 to make it out of SLA.
   c. On Spoke_1, run a health check:

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%) latency(60.247), jitter(0.036), mos
(4.373), bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995) sla_map=0x0
Seq(5 H1_T22): state(alive), packet-loss(0.000%) latency(0.218), jitter(0.016), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996) sla_map=0x
```

   d. On Spoke_2, run a health check:

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%) latency(80.217), jitter(0.022), mos
(4.361), bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996) sla_map=0x0
Seq(5 H1_T22): state(alive), packet-loss(0.000%) latency(0.202), jitter(0.016), mos
(4.404), bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995) sla_map=0x1
```

6. After the hub receives the updated overlay priorities, run a health check on the hub and view the routing tables.

   The hub has updated the route priorities.

   a. Run a health check:

```
# diagnose sys sdwan health-check remote

Remote Health Check: Remote_HC(1)
  Passive remote statistics of EDGE_T1(46):
  EDGE_T1_0(10.0.0.20): timestamp=06-12 14:19:26, src=172.31.0.65, latency=60.249,
jitter=0.031, pktloss=0.000%, mos=4.373, SLA id=1(remote), rmt_ver=2, rmt_sla=out, rmt_
prio=20
EDGE_T1_1(172.31.0.66): timestamp=06-12 14:19:26, src=172.31.0.66, latency=80.222,
jitter=0.021, pktloss=0.000%, mos=4.361, SLA id=1(remote), rmt_ver=2, rmt_sla=out, rmt_
prio=40

Remote Health Check: Remote_HC(2)
  Passive remote statistics of EDGE_T2(47):
  EDGE_T2_0(10.0.0.15): timestamp=06-12 14:19:26, src=172.31.0.66, latency=0.205,
jitter=0.011, pktloss=0.000%, mos=4.404, SLA id=1(pass), rmt_ver=2, rmt_sla=in, rmt_
prio=35
  EDGE_T2_1(172.31.0.65): timestamp=06-12 14:19:26, src=172.31.0.65, latency=0.215,
jitter=0.009, pktloss=0.000%, mos=4.404, SLA id=1(pass), rmt_ver=2, rmt_sla=in, rmt_
prio=15
```

   b. View the static routing table:

   For EDGE_T1, the priority changed from 10 to 20 and from 30 to 40 because it is out of SLA.

```
# get router info routing-table static
Routing table for VRF=0
S       172.31.0.65/32 [15/0] via EDGE_T2 tunnel 172.31.0.65, [15/0]
                              [15/0] via EDGE_T1 tunnel 10.0.0.20, [20/0]
S       172.31.0.66/32 [15/0] via EDGE_T2 tunnel 10.0.0.15, [35/0]
                              [15/0] via EDGE_T1 tunnel 172.31.0.66, [40/0]
```

c. View the BGP routing table:

- For 10.0.3.0/24, EDGE_T2 is preferred. Priority for EDGE_T1 changed from 10 to 20.
- For 10.0.4.0/24, EDGE_T2 is preferred. Priority for EDGE_T1 changed from 30 to 40.

```
# get router info routing-table  bgp
Routing table for VRF=0
B       10.0.3.0/24 [200/0] via 172.31.0.65 (recursive via EDGE_T2 tunnel 172.31.0.65
[15]), 00:07:28
                                            (recursive via EDGE_T1 tunnel 10.0.0.20 [20]),
00:07:28, [1/0]
B       10.0.4.0/24 [200/0] via 172.31.0.66 (recursive via EDGE_T2 tunnel 10.0.0.15 [35]),
00:07:28                                                          (recursive via EDGE_T1
tunnel 172.31.0.66 [40]), 00:07:28, [1/0]
```

Example 2: Speed test rerouting based on embedded SLA priorities

When spoke-initiated speed tests are enabled for this configuration, the out-of SLA priority is used by the hub to choose other routes during the speed test.

To configure speed tests:

1. On the hub, enable speed tests and allow them on the underlays and overlays.
   a. Enable speed tests:

```
config system global
    set speedtest-server enable
    set speedtestd-ctrl-port 6000
    set speedtestd-server-port 7000
end
```

   b. Allow speed tests on the underlays:

```
config system interface
    edit "port1"
       ...
        set allowaccess ping speed-test
      ...
    next
    edit "port2"
        ...
        set allowaccess ping speed-test
       ...
    next
end
```

c. Allow speed tests on the overlay, and specify a shaping profile:
Update the interface to use measured values reported by the speed test for in and out bandwidth.

```
config system interface
    edit "EDGE_T1"
        ...
        set allowaccess ping speed-test
        set type tunnel
        set egress-shaping-profile "profile_1"
        set outbandwidth-source measured
        set inbandwidth-source measured
        ...
        set interface "port1"
    next
    edit "EDGE_T2"
        ...
        set allowaccess ping speed-test
        set type tunnel
        set egress-shaping-profile "profile_1"
        set outbandwidth-source measured
        set inbandwidth-source measured
        ...
        set interface "port2"
    next
end
```

d. View the shaping profile:

```
config firewall shaping-profile
    edit "profile_1"
        set default-class-id 2
        config shaping-entries
            edit 1
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 10
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 40
            next
            edit 3
                set class-id 4
                set guaranteed-bandwidth-percentage 20
                set maximum-bandwidth-percentage 50
            next
        end
    next
end
```

2. On Spoke_1, schedule speed tests:

```
config system speed-test-schedule
    edit "H1_T11"
        set mode TCP
        set schedules "speed-test"
        set dynamic-server enable
        set ctrl-port 6000
        set server-port 7000
    next
    edit "H1_T22"
        set mode UDP
        set schedules "speed-test"
        set dynamic-server enable
        set ctrl-port 6000
        set server-port 7000
    next
end
```

Before starting the speed test on Spoke_1, route priorities are based on the received overlay priorities on both H1_T11 and H1_T22

```
HUB (root) (Interim)# get router info routing-table bgp
Routing table for VRF=0
B       10.0.3.0/24 [200/0] via 172.31.0.65 (recursive via EDGE_T1 tunnel 10.0.0.20 [10]),
00:11:56
                                            (recursive via EDGE_T2 tunnel 172.31.0.65 [15]),
00:11:56, [1/0]
```

While the speed test is running on H1_T11 of Spoke_1, Spoke_1 will constantly embed out-of SLA overlay priority into probes on H1_T11 and send them to the hub. Then the Hub updates route priorities accordingly and detours hub-to-spoke traffic to H1_T22 to avoid the impact on speed test of H1_T11. EDGE_T2 is preferred, and the EDGE_T1 priority changed from 10 to 20.

```
HUB (root) (Interim)# get router info routing-table  bgp
Routing table for VRF=0Routing table for VRF=0
B       10.0.3.0/24 [200/0] via 172.31.0.65 (recursive via EDGE_T2 tunnel 172.31.0.65 [15]),
00:03:49
                                            (recursive via EDGE_T1 tunnel 10.0.0.20 [20]),
00:03:49, [1/0]
```

During the speed test on H1_T22 of Spoke_1, Spoke_1 constantly embeds out-of SLA overlay priority into probes on H1_T22 and sends them to the hub. Then the Hub updates route priorities accordingly and detours hub-to-spoke traffic to H1_T11 to avoid the impact on speed test of H1_T22. EDGE_T1 is preferred, and the EDGE_T2 priority changed from 15 to 25.

```
HUB (root) (Interim)# get router info routing-table  bgp
Routing table for VRF=0
B       10.0.3.0/24 [200/0] via 172.31.0.65 (recursive via EDGE_T1 tunnel 10.0.0.20 [10]),
00:04:06
                                                                    (recursive via EDGE_T2 tunnel
172.31.0.65 [25]), 00:04:06, [1/0]
```

Once speed test completes, the results are applied on child tunnels as egress-shaping-profile on the hub.

```
HUB (root) (Interim)# diagnose vpn tunnel  list
list all ipsec tunnel in vd 0
------------------------------------------------------

                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
```

```
        class-id=4      allocated-bandwidth=187438(kbps)        guaranteed-bandwidth=74975(kbps)
                        max-bandwidth=187438(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
```

Map SD-WAN member priorities to BGP MED attribute when spoke advertises routes using iBGP to hub

When a spoke advertises routes using iBGP to a hub, SD-WAN member priorities are mapped into the BGP multiple exit discriminator (MED) attribute using the following CLI commands:

```
config system sdwan
    config neighbor
        edit <bgp-peer-IP>
            set member <num_1> ... <num_n>
            set route-metric {preferable | priority}
            set health-check <health-check-name>
        next
    end
end
```

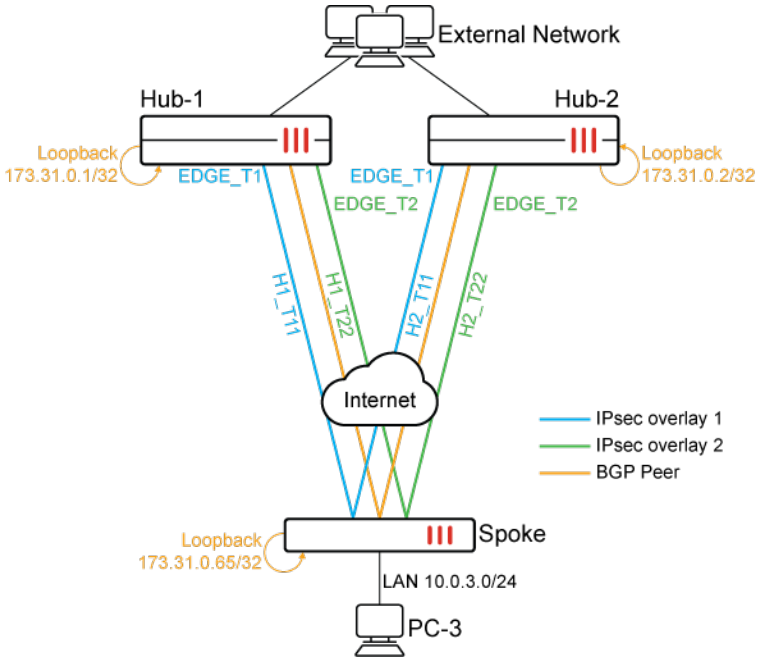
Option	Description
preferable	Select neighbor based on its HC to match BGP preferable/unpreferable route_map.
priority	Select neighbor based on its members' priority-in-sla/priority-out-sla value.

Routes to prefixes behind spokes are advertised by the SD-WAN hub to eBGP peers on an external network. The relative values of the BGP MED attribute for each hub are used to indicate to eBGP peers the more preferred paths, that is, the preferred hub used to route to spoke prefixes.

Example

This example includes one spoke and two hubs:

- The spoke has two overlays to Hub-1 and Hub-2 respectively.
- BGP neighbors between the spoke and hubs are over loopback IP addresses
- SD-WAN is configured on the spoke.



To configure and test the example:

1. Configure Hub-1:

   The Hub-2 configuration is identical except for the `router-id`, which reflects the different loopback IP address.

   a. Configure SD-WAN:

```
config system sdwan
    set status enable
    config zone
        edit "overlay"
        next
    end
    config members
        edit 1
            set interface "EDGE_T1"
            set zone "overlay"
        next
        edit 2
            set interface "EDGE_T2"
            set zone "overlay"
        next
    end
    config health-check
        edit "Remote_HC"
            set detect-mode remote
            set sla-id-redistribute 1
            set members 1 2
            config sla
                edit 1
```

```
                    set link-cost-factor remote
                    set priority-in-sla 100
                    set priority-out-sla 200
                next
            end
        next
    end
end
```

The `priority-[in|out]-sla` settings are used if a spoke does not send a priority. This is used in legacy configurations where spokes only send in or out for the SLA status.

b. Configure BGP:

```
config router bgp
    set as 65001
    set router-id 172.31.0.1        //172.31.0.2 for Hub-2
    set recursive-inherit-priority enable
    ...
    config neighbor-group
        edit "EDGE"
            set remote-as 65001
            set update-source "Loopback0"
            set route-reflector-client enable
        next
    end
    config neighbor-range
        edit 1
            set prefix 172.31.0.64 255.255.255.192
            set neighbor-group "EDGE"
        next
    end
    ...
end
```

2. Configure the spoke:
   a. Configure SD-WAN:

```
config system sdwan
    set status enable
    config zone
        edit "overlay"
        next
    end
    config members
        edit 4
            set interface "H1_T11"
            set zone "overlay"
            set source 172.31.0.65
            set priority-in-sla 50
            set priority-out-sla 100
```

```
        next
        edit 5
            set interface "H1_T22"
            set zone "overlay"
            set source 172.31.0.65
            set priority-in-sla 70
            set priority-out-sla 120
        next
        edit 7
            set interface "H2_T11"
            set zone "overlay"
            set source 172.31.0.65
            set priority-in-sla 60
            set priority-out-sla 110
        next
        edit 8
            set interface "H2_T22"
            set zone "overlay"
            set source 172.31.0.65
            set priority-in-sla 80
            set priority-out-sla 130
        next
    end
    config health-check
        edit "HUB"
            set server "172.31.100.100"
            set embed-measured-health enable
            set sla-id-redistribute 1
            set sla-fail-log-period 10
            set sla-pass-log-period 10
            set members 4 5 7 8
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 100
                next
            end
        next
    end
    config neighbor
        edit "172.31.0.1"
            set member 4 5
            set route-metric priority
            set health-check "HUB"
        next
        edit "172.31.0.2"
            set member 7 8
            set route-metric priority
            set health-check "HUB"
        next
    end
```

```
end
```

b. Configure BGP:

```
config router bgp
    set as 65001
    set router-id 172.31.0.65
    ...
    config neighbor
        edit "172.31.0.1"
            ......
            set remote-as 65001
            set update-source "Loopback0"
        next
        edit "172.31.0.2"
            ...
            set remote-as 65001
            set update-source "Loopback0"
        next

    end
    config network
        edit 1
            set prefix 10.0.3.0 255.255.255.0
        next
    end
    ...
end
```

The routes with MEDs are advertised to a router on the external network that establishes a BGP neighbor relationship with Hub-1 and Hub-2. When sending traffic destined for 10.0.3.0/24, the router on the external network will prefer to send traffic to the hub with the lower MED.

3. All overlays are in SLA:

```
Spoke # diagnose sys sdwan health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(0.225), jitter(0.035), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995), sla_map=0x1
Seq(5 H1_T22): state(alive), packet-loss(0.000%), latency(0.203), jitter(0.016), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996), sla_map=0x1
Seq(7 H2_T11): state(alive), packet-loss(0.000%), latency(0.260), jitter(0.035), mos(4.404),
bandwidth-up(999997), bandwidth-dw(999997), bandwidth-bi(1999994), sla_map=0x1
Seq(8 H2_T22): state(alive), packet-loss(0.000%), latency(0.201), jitter(0.018), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996), sla_map=0x1
```

When sending traffic destined for 10.0.3.0/24, the router on the external network will prefer to send traffic to Hub-1 with lower MED 50 over Hub-2 with higher MED 60.

a. Check Hub-1 metric from the external network router:

```
External_Network_Router # get router info bgp neighbors 172.31.0.1 advertised-routes
VRF 0 BGP table version is 31, local router ID is 172.31.0.65
```

```
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network             Next Hop         Metric     LocPrf Weight RouteTag Path
*>i10.0.3.0/24      172.31.0.65     50            100  32768        0 i <-/->

Total number of prefixes 1
```

b. Check Hub-2 metric from the external network router:

```
External_Network_Router # get router info bgp neighbors 172.31.0.2 advertised-routes
VRF 0 BGP table version is 31, local router ID is 172.31.0.65
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network             Next Hop        Metric     LocPrf Weight RouteTag Path
*>i10.0.3.0/24      172.31.0.65     60            100  32768        0 i <-/->

Total number of prefixes 1
```

4. Verify that the metric updates when a link becomes out of SLA.

When sending traffic destined for 10.0.3.0/24, the router on the external network will prefer to send traffic to Hub-2 with lower MED 60 over Hub-1 with higher MED 70.

```
# diagnose sys sdwan health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(120.225), jitter(0.037), mos(4.338),
bandwidth-up(999997), bandwidth-dw(999996), bandwidth-bi(1999993), sla_map=0x0
Seq(5 H1_T22): state(alive), packet-loss(0.000%), latency(0.203), jitter(0.015), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995), sla_map=0x1
Seq(7 H2_T11): state(alive), packet-loss(0.000%), latency(0.249), jitter(0.026), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999996), bandwidth-bi(1999994), sla_map=0x1
Seq(8 H2_T22): state(alive), packet-loss(0.000%), latency(0.205), jitter(0.018), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995), sla_map=0x1
```

a. Check Hub-1 metric from the external network router:

```
External_Network_Router # get router info bgp neighbors 172.31.0.1 advertised-routes
VRF 0 BGP table version is 31, local router ID is 172.31.0.65
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network             Next Hop        Metric     LocPrf Weight RouteTag Path
*>i10.0.3.0/24      172.31.0.65     70            100  32768        0 i <-/->

Total number of prefixes 1
```

b. Check Hub-2 metric from the external network router:

```
External_Network_Router # get router info bgp neighbors 172.31.0.2 advertised-routes
VRF 0 BGP table version is 31, local router ID is 172.31.0.65
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
```

```
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network             Next Hop        Metric     LocPrf Weight RouteTag Path
*>i10.0.3.0/24      172.31.0.65     60            100  32768        0 i <-/->

Total number of prefixes 1
```

5. H1_T11 and H2_T11 are out of SLA.

   When sending traffic destined for 10.0.3.0/24, the router on the external network will prefer to send traffic to Hub-1 with lower MED 70 over Hub-2 with higher MED 80.

```
Spoke # diagnose sys sdwan  health-check
Health Check(HUB):
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(120.194), jitter(0.011), mos(4.338),
bandwidth-up(999997), bandwidth-dw(999997), bandwidth-bi(1999994), sla_map=0x0
Seq(5 H1_T22): state(alive), packet-loss(0.000%), latency(0.191), jitter(0.008), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996), sla_map=0x1
Seq(7 H2_T11): state(alive), packet-loss(0.000%), latency(120.235), jitter(0.029), mos(4.338),
bandwidth-up(999997), bandwidth-dw(999997), bandwidth-bi(1999994), sla_map=0x0
Seq(8 H2_T22): state(alive), packet-loss(0.000%), latency(0.215), jitter(0.016), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999998), bandwidth-bi(1999996), sla_map=0x1
```

   a. Check Hub-1 metric from the external network router:

```
External_Network_Router # get router info bgp neighbors 172.31.0.1 advertised-routes
VRF 0 BGP table version is 31, local router ID is 172.31.0.65
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network             Next Hop        Metric     LocPrf Weight RouteTag Path
*>i10.0.3.0/24      172.31.0.65     70            100  32768        0 i <-/->

Total number of prefixes 1
```

   b. Check Hub-2 metric from the external network router:

```
External_Network_Router # get router info bgp neighbors 172.31.0.2 advertised-routes
VRF 0 BGP table version is 31, local router ID is 172.31.0.65
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network             Next Hop        Metric     LocPrf Weight RouteTag Path
*>i10.0.3.0/24      172.31.0.65     80            100  32768        0 i <-/->

Total number of prefixes 1
```

6. H1_T11, H2_T11, and H1_T22 are out of SLA.

   When sending traffic destined for 10.0.3.0/24, the router on the external network will prefer to send traffic to Hub-2 with lower MED 80 over Hub-1 with higher MED 100.

```
Spoke # diagnose sys sdwan  health-check
Health Check(HUB):
```

```
Seq(4 H1_T11): state(alive), packet-loss(0.000%), latency(120.199), jitter(0.016), mos(4.338),

Total number of prefixes 1
```

Adaptive Forward Error Correction

Forward Error Correction (FEC) is used to control and correct errors in data transmission by sending redundant data across the VPN in anticipation of dropped packets occurring during transit. The mechanism sends out *x* number of redundant packets for every *y* number of base packets.

Adaptive FEC considers link conditions and dynamically adjusts the FEC packet ratio.

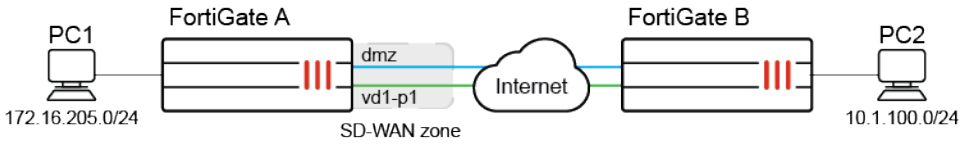
- The FEC base and redundant packet relationship is dynamically adjusted based on changes to the network SLA metrics defined in the SD-WAN SLA health checks. For example, when there is no or low packet loss in the network, FEC can work on a low redundant level sending only one redundant packet for every 10 base packets. As packet loss increases, the number of redundant packets sent can rise accordingly.
- The ToS/DSCP value is taken into consideration when mapping the FEC profile. In the first round of matching, traffic will be matched against packet-loss, latency, and bandwidth. In the second round of matching, the ToS value and mask will be used. See ToS matching and negate options on adaptive FEC profiles NEW on page 1361.
- Negate options allow users to match against the negative of a threshold. For example, negate packet-loss of 5% means any packet-loss less than 5% will be matched. See ToS matching and negate options on adaptive FEC profiles NEW on page 1361.
- FEC can be applied only to streams that are sensitive to packet loss. For Example, policies that allow the UDP based VoIP protocol can enable FEC, while TCP based traffic policies do not. This reduces unnecessary bandwidth consumption by FEC.
- FEC parity packets can be sent in a secondary overlay tunnel that is associated with the same destination as the overlay tunnel. See Use secondary tunnel for FEC redundant parity packets NEW on page 1368.
- In 8.0.0 and later, FEC can be offloaded to the NPU. This requires both the sending and receiving FortiGates to be on 8.0.0 or later.

NPU offload and anti-replay should not be used at the same time when FEC is enabled.

Basic example

In this example, an IPsec tunnel is configured between two FortiGates that have FEC enabled and supporting configuration to protect traffic that egresses FortiGate A and ingresses FortiGate B. The tunnel is an SD-WAN zone, and an SLA health-check is used to monitor the quality of the VPN overlay. The intention is to apply FEC to UDP traffic that is passing through the VPN overlay, while allowing all other traffic to pass through without FEC. An FEC profile is configured to adaptively increase redundant levels if the link quality exceeds a 10% packet loss threshold, or the bandwidth exceeds 950 Mbps.

The DMZ interface and IPsec tunnel vd1-p1 are SD-WAN members. FEC is enabled on vd1-p1, and health-check works on vd1-p1.



To configure the FortiGates:

1. On FortiGate A, enable FEC for egress traffic and NPU offloading on the IPsec tunnel vd1-p1:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set npu-offload enable
        set fec-egress enable
    next
end
```

2. On FortiGate B, enable FEC for ingress traffic and NPU offloading on the IPsec tunnel vd1-p1:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set npu-offload enable
        set fec-ingress enable
    next
end
```

3. On FortiGate A, configure SD-WAN:

   The VPN overlay member (vd1-p1) must be included in the health-check and configured as the higher priority member in the SD-WAN rule.

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "dmz"
            set gateway 172.16.208.2
        next
```

```
        edit 2
            set interface "vd1-p1"
        next
    end
    config health-check
        edit "1"
            set server "2.2.2.2"
            set members 2
            config sla
                edit 1
                next
            end
        next
    end
    config service
        edit 1
            set name "1"
            set dst "all"
            set src "172.16.205.0"
            set priority-members 2 1
        next
    end
end
```

4. On FortiGate A, create a policy to specify performing FEC on UDP traffic, and a policy for other traffic:

```
config firewall policy
    edit 1
        set srcintf "port5"
        set dstintf "virtual-wan-link"
        set action accept
        set srcaddr "172.16.205.0"
        set dstaddr "all"
        set schedule "always"
        set service "ALL_UDP"
        set fec enable
    next
    edit 2
        set srcintf "any"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set fec enable
    next
end
```

5. On FortiGate A, configure FEC mapping to bind network SLA metrics and FEC base and redundant packets:

```
config vpn ipsec fec
    edit "m1"
        config mappings
            edit 1
                set base 8
                set redundant 2
                set packet-loss-threshold 10
            next
            edit 2
                set base 9
                set redundant 3
                set bandwidth-up-threshold 950000
            next
        end
    next
end
```

The mappings are matched from top to bottom: packet loss greater than 10% with eight base and two redundant packets, and then uploading bandwidth greater than 950 Mbps with nine base and three redundant packets.

6. On FortiGate A, apply the FEC mappings on vd1-p1:

```
config vpn ipsec phase1-interface
    edit "vd1-p1"
        set fec-health-check "1"
        set fec-mapping-profile "m1"
        set fec-base 10
        set fec-redundant 1
    next
end
```

The FEC base and redundant values are used when the link quality has not exceeded the limits specified in the FEC profile mapping. If `fec-codec` is set to `xor` the base and redundant packet values will not be updated.

To verify the results:

1. Send TCP and UDP traffic from PC1 to PC2, then check the sessions on FortiGate A:

```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=12 expire=3587 timeout=3600 flags=00000000

hrx info: valid=1/1, qid=11/11, npuid=1/1, sublink=1/1
```

Non-FEC protected TCP traffic is offloaded, while FEC protected UDP traffic is not offloaded

2. On FortiGate A, check the health-check result and the corresponding FEC base and redundant packets:

```
# diagnose sys sdwan health-check
Health Check(1):
Seq(2 vd1-p1): state(alive), packet-loss(0.000%) latency(0.168), jitter(0.021), bandwidth-up
(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1
```

Because bandwidth-up is more than 950000kbps, base and redundant are set to 9 and 3:

```
# diagnose vpn tunnel fec vd1-p1
egress:
    enabled=1 base=9 redundant=3 codec=0 timeout=10(ms)
    encode=6621 encode_timeout=6621 encode_fail=0
    tx_data=6880 tx_parity=18601
ingress:
    enabled=0 timeout=0(ms)
    fasm_cnt=0 fasm_full=0
```

```
    ipsec_fec_chk_fail=0 complete=0
    rx_data=0 rx_parity=0
    recover=0 recover_timeout=0 recover_fail=0
    rx=0 rx_fail=0
```

3. Make packet loss more than 10%, then check the health-check result and the corresponding FEC base and redundant packets again on FortiGate A:

```
# diagnose sys sdwan  health-check
Health Check(1):
Seq(2 vd1-p1): state(alive), packet-loss(15.000%) latency(0.168), jitter(0.017), bandwidth-up
(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0
```

Because packet loss is more than 10%, entry one in FEC mapping is first matched, and base and redundant are set to 8 and 2:

```
# diagnose vpn tunnel fec  vd1-p1
egress:
    enabled=1 base=8 redundant=2 codec=0 timeout=10(ms)
    encode=6670 encode_timeout=6670 encode_fail=0
    tx_data=6976 tx_parity=18748
ingress:
    enabled=0 timeout=0(ms)
    fasm_cnt=0 fasm_full=0
    ipsec_fec_chk_fail=0 complete=0
    rx_data=0 rx_parity=0
    recover=0 recover_timeout=0 recover_fail=0
    rx=0 rx_fail=0
```

ToS matching and negate options on adaptive FEC profiles NEW

Adaptive FEC can take the ToS/DSCP value into consideration when mapping the FEC profile. In the first round of matching, traffic will be matched against packet-loss, latency, and bandwidth. In the second round of matching, the TOS value and mask will be used.

Negate options allow users to match against the negative of a threshold. For example, negate packet-loss of 5% means any packet-loss less than 5% will be matched.

For more information about how to configure ToS value and netmask and how it maps to DSCP values, please see Configuring SD-WAN rules.

To configure ToS matching:

```
config vpn ipsec fec
    edit <name>
        config mappings
            edit <id>
                config tos
                    edit <id>
                        set tos <value>
                        set tos-mask <value>
```

```
                        set base <value>
                        set redundant <value>
                    next
                end
            next
        end
    next
end
```

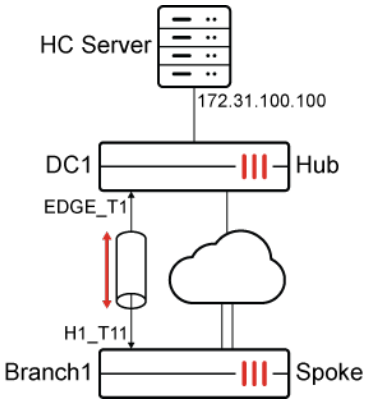
Command	Description
tos <value>	Type of service bit pattern (0x00 - 0xFF).
tos-mask <value>	Type of service evaluated bits (0x01 - 0xFF).
base <value>	Number of base FEC packets (1 - 40).
redundant <value>	Number of redundant FEC packets (0 - 20).

To configure negate options:

```
config vpn ipsec fec
    edit <name>
        config mappings
            edit <id>
                set packet-loss-threshold-negate {enable | disable}
                set latency-threshold-negate {enable | disable}
                set bandwidth-up-threshold-negate {enable | disable}
                set bandwidth-down-threshold-negate {enable | disable}
                set bandwidth-bi-threshold-negate {enable | disable}
            next
        end
    next
end
```

Command	Description
packet-loss-threshold-negate {enable | disable}	Negate packet loss threshold (default = disable).
latency-threshold-negate {enable | disable}	Negate latency threshold (default = disable).
bandwidth-up-threshold-negate {enable | disable}	Negate up bandwidth threshold (default = disable).
bandwidth-down-threshold-negate {enable | disable}	Negate down bandwidth threshold (default = disable).
bandwidth-bi-threshold-negate {enable | disable}	Negate bi-bandwidth threshold (default = disable).

Example



In this single-hub SD-WAN deployment, the spoke has defined a performance health-check targeting the HC Server behind the Hub. Adaptive FEC is configured based on the health-checks using the following criteria:

	Health Check	Matching tos 0x01 mask 0xff	Matching tos 0x02 mask 0xff	Not matching either traffic class
Rule 1	Packet-loss is above the threshold of 5%	Apply base 5 redundant 1	Apply base 5 redundant 2	Apply default base 11 redundant 1
Rule 2	Latency is less than the threshold of 20ms	Apply base 6 redundant 1	Apply base 6 redundant 2	Apply default base 12 redundant 2
Rule 3	Available upstream bandwidth is more than 50Mbps	Apply base 7 redundant 1	Apply base 7 redundant 2	Apply default base 13 redundant 3
Rule 4	Packet-loss is below the threshold of 5%	Do not send any redundant packets		

The rules are examined in the order that they are configured.

To configure the spoke:

1. Configure SD-WAN:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "overlay"
        next
        edit "underlay"
        next
    end
    config members
        ...
        edit 3
```

```
            set interface "H1_T11"
            set zone "overlay"
            set source 172.31.0.65
        next
        ...
    end
    config health-check
        edit "HUB"
            set server "172.31.100.100"
            set update-static-route disable
            set members 3
            config sla
                edit 1
                next
            end
        next
    end
    config service
        edit 1
            set dst "CORP_LAN"
            set priority-members 3
        next
    end
end
```

2. Configure VPN:

```
config vpn ipsec fec
    edit "fec_mapping"
        config mappings
            edit 1
                set base 11
                set redundant 1
                set packet-loss-threshold 5
                config tos
                    edit 1
                        set tos 0x01
                        set tos-mask 0xff
                        set base 5
                        set redundant 1
                    next
                    edit 2
                        set tos 0x02
                        set tos-mask 0xff
                        set base 5
                        set redundant 2
                    next
                end
            next
            edit 2
                set base 12
                set redundant 2
```

```
                set latency-threshold 20
                config tos
                    edit 1
                        set tos 0x01
                        set tos-mask 0xff
                        set base 6
                        set redundant 1
                    next
                    edit 2
                        set tos 0x02
                        set tos-mask 0xff
                        set base 6
                        set redundant 2
                    next
                end
            next
            edit 3
                set base 13
                set redundant 3
                set bandwidth-up-threshold 50000
                config tos
                    edit 1
                        set tos 0x01
                        set tos-mask 0xff
                        set base 7
                        set redundant 1
                    next
                    edit 2
                        set tos 0x02
                        set tos-mask 0xff
                        set base 7
                        set redundant 2
                    next
                end
            next
            edit 4
                set base 40
                set redundant 0
                set packet-loss-threshold 5
                set packet-loss-threshold-negate enable
            next
        end
    next
end
```

```
config vpn ipsec phase1-interface
    edit "H1_T11"
        ...
        set fec-egress enable
        set fec-codec rs
        set fec-health-check "HUB"
        set fec-mapping-profile "fec_mapping"
```

```
        ...
    next
end
```

3. Configure a firewall policy:

```
config firewall policy
    edit 1
       ...
        set fec enable
    next
end
```

To configure the hub:

```
config vpn ipsec phase1-interface
    edit "EDGE_T1"
        ...
        set fec-ingress enable
        ...
    next
end
```

To test the configuration:

1. Check SD-WAN metrics on H1_T11 and the applied FEC settings:
   In this first scenario, the first 3 rules were not matched. Therefore, the 4th rule implies that no redundant packets are sent.

```
Branch1_A_FGT (root) (Interim)# diagnose sys sdwan health-check
Health Check(HUB):
Seq(3 H1_T11): state(alive), packet-loss(0.000%), latency(30.247), jitter(0.016), mos(4.389),
custom_profile(0.000), bandwidth-up(49758), bandwidth-dw(89990), bandwidth-bi(139748), sla_
map=0x0

Branch1_A_FGT# diagnose vpn  tunnel  fec  H1_T11
egress:  enabled=1
        base=40 redundant=0 codec=0 timeout=10(ms)
        encode=0 encode_timeout=0 encode_fail=0
        tx_data=0 tx_parity=0
        total_tx_data=0 total_tx_parity=0
ingress: enabled=0
        timeout=0(ms) fasm_cnt=0 fasm_full=0
        ipsec_fec_chk_fail=0 complete=0
        recover=0 recover_timeout=0 recover_fail=0
        rx_data=0 rx_parity=0
        rx=0 rx_fail=0
```

2. Make the available upstream bandwidth more than 50M by decreasing traffic on H1_T11, then check the applied FEC settings. The third rule is matched:

```
# diagnose sys sdwan health-check
Health Check(HUB):
Seq(3 H1_T11): state(alive), packet-loss(0.000%), latency(30.234), jitter(0.022), mos(4.389),
custom_profile(0.000), bandwidth-up(63244), bandwidth-dw(89993), bandwidth-bi(153237), sla_
map=0x0

Branch1_A_FGT (root) (Interim)# diagnose vpn  tunnel  fec  H1_T11
egress:  enabled=1
        base=13 redundant=3 codec=0 timeout=10(ms)
        encode=0 encode_timeout=0 encode_fail=0
        tx_data=0 tx_parity=0
        tos/mask=0x01/0xFF:
                base=7 redundant=1
                encode=0 encode_timeout=0 encode_fail=0
                tx_data=0 tx_parity=0
        tos/mask=0x02/0xFF:
                base=7 redundant=2
                encode=0 encode_timeout=0 encode_fail=0
                tx_data=0 tx_parity=0
        total_tx_data=0 total_tx_parity=0
ingress: enabled=0
        timeout=0(ms) fasm_cnt=0 fasm_full=0
        ipsec_fec_chk_fail=0 complete=0
        recover=0 recover_timeout=0 recover_fail=0
        rx_data=0 rx_parity=0
        rx=0 rx_fail=0
```

3. Make latency on H1_T11 less than 20ms, then check the applied FEC settings again. Both the latency and upstream bandwidth are above the threshold, so because rule 2 comes first, rule 2 is applied:

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(3 H1_T11): state(alive), packet-loss(0.000%), latency(0.247), jitter(0.027), mos(4.404),
custom_profile(0.000), bandwidth-up(89999), bandwidth-dw(89997), bandwidth-bi(179996), sla_
map=0x1

Branch1_A_FGT (root) (Interim)# diagnose vpn  tunnel  fec  H1_T11
egress:  enabled=1
        base=12 redundant=2 codec=0 timeout=10(ms)
        encode=0 encode_timeout=0 encode_fail=0
        tx_data=0 tx_parity=0
        tos/mask=0x01/0xFF:
                base=6 redundant=1
                encode=0 encode_timeout=0 encode_fail=0
                tx_data=0 tx_parity=0
        tos/mask=0x02/0xFF:
                base=6 redundant=2
                encode=0 encode_timeout=0 encode_fail=0
                tx_data=0 tx_parity=0
        total_tx_data=0 total_tx_parity=0
ingress: enabled=0
        timeout=0(ms) fasm_cnt=0 fasm_full=0
```

```
        ipsec_fec_chk_fail=0 complete=0
        recover=0 recover_timeout=0 recover_fail=0
        rx_data=0 rx_parity=0
        rx=0 rx_fail=0
```

4. Make packet-loss on H1_T11 more than 5%, then check the applied FEC settings again. All 3 rules match since health checks are above the threshold, so because rule 1 comes first, rule 1 is applied.

```
# diagnose sys sdwan  health-check
Health Check(HUB):
Seq(3 H1_T11): state(alive), packet-loss(6.000%), latency(0.254), jitter(0.029), mos(4.401),
custom_profile(0.000), bandwidth-up(89999), bandwidth-dw(89997), bandwidth-bi(179996), sla_
map=0x0

Branch1_A_FGT (root) (Interim)# diagnose vpn  tunnel  fec  H1_T11
egress:  enabled=1
        base=11 redundant=1 codec=0 timeout=10(ms)
        encode=0 encode_timeout=0 encode_fail=0
        tx_data=0 tx_parity=0
        tos/mask=0x01/0xFF:
                base=5 redundant=1
                encode=0 encode_timeout=0 encode_fail=0
                tx_data=0 tx_parity=0
        tos/mask=0x02/0xFF:
                base=5 redundant=2
                encode=0 encode_timeout=0 encode_fail=0
                tx_data=0 tx_parity=0
        total_tx_data=0 total_tx_parity=0
ingress: enabled=0
        timeout=0(ms) fasm_cnt=0 fasm_full=0
        ipsec_fec_chk_fail=0 complete=0
        recover=0 recover_timeout=0 recover_fail=0
        rx_data=0 rx_parity=0
        rx=0 rx_fail=0
```

Use secondary tunnel for FEC redundant parity packets NEW

In the original implementation of adaptive FEC, FEC parity packets are sent inside the same overlay tunnel. However, the parity packets are susceptible to being dropped at the same rate as other VPN packets.

This enhancement to adaptive FEC introduces the capability to send FEC parity packets in a secondary overlay tunnel that is associated with the same destination. The following setting can be configured on the primary tunnel that requires parity packets to be sent on a redundant tunnel:

```
config vpn ipsec phase1-interface
    edit <tunnel>
        set fec-separate-redundant-tunnel enable
    next
end
```

The redundant tunnel must have the same destination `location-id` as the original tunnel.

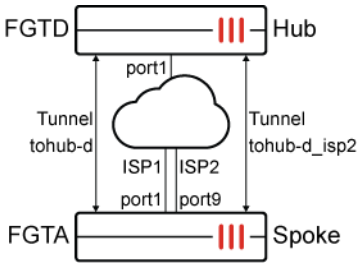
Example

In the following example, a VPN Hub (FGTD) is configured as a dialup VPN gateway. A spoke has two underlays going to different ISPs, where the primary (port1) has 10G bandwidth and the secondary (port9) has 1G bandwidth. Two tunnels are established from the Spoke to the Hub over the two underlays. The intention is to send data over the primary tunnel while using the secondary tunnel for redundancy and parity packets for the primary tunnel.

The FEC mappings are configured to send two parity packets per 8 base packets upon packet-loss threshold above 2%. Additionally, it will send three parity packets per nine base packets when bandwidth exceeds 950Mbps.

This example utilizes one Hub/destination, so the default location-id will be shared between the tunnels without any conflicts. When multiple Hubs are in use, and you need to apply the parity packet duplication on the same Hub and destination, use a different location-id for each hub.

```
config system settings
    set location-id <unique id for each hub>
end
```



To configure the hub, FGTD:

```
config vpn ipsec phase1-interface
    edit "tospokes"
        set type dynamic
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set dhgrp 20 21
        set auto-discovery-sender enable
        set fec-ingress enable
        set transport auto
        set ipv4-start-ip 100.100.100.10
        set ipv4-end-ip 100.100.100.20
        set ipv4-netmask 255.255.255.0
        set psksecret ****************
        set dpd-retryinterval 60
```

```
    next
end
```

```
config vpn ipsec phase2-interface
    edit "tospokes"
        set phase1name "tospokes"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
    next
end
```

To configure the spoke, FGTA:

1. Configure FEC mapping to bind network SLA metrics and FEC base and redundant packets:

```
config vpn ipsec fec
    edit "m1"
        config mappings
            edit 1
                set base 8
                set redundant 2
                set packet-loss-threshold 2
            next
            edit 2
                set base 9
                set redundant 3
                set bandwidth-up-threshold 950000
            next
        end
    next
end
```

2. Configure the IPsec tunnels:

   On the primary tunnel, enable FEC enabled and apply FEC mapping. The redundant tunnel does not need FEC enabled, or the fec-separate-redundant-tunnel setting.

```
config vpn ipsec phase1-interface
    edit "tohub-d"
        set interface "port1"
        set ike-version 2
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dhgrp 20 21
        set auto-discovery-receiver enable
        set auto-discovery-shortcuts dependent
        set fec-egress enable
        set fec-separate-redundant-tunnel enable
```

```
        set fec-codec rs
        set fec-health-check "1"
        set fec-mapping-profile "m1"
        set transport auto
        set remote-gw 172.16.200.4
        set psksecret ****************
    next
    edit "tohub-d_isp2"
        set interface "port9"
        set ike-version 2
        set peertype any
        set net-device disable
        set mode-cfg enable
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dhgrp 20 21
        set auto-discovery-receiver enable
        set auto-discovery-shortcuts dependent
        set transport auto
        set remote-gw 172.16.200.4
        set psksecret ****************
    next
end
```

```
config vpn ipsec phase2-interface
    edit "tohub-d"
        set phase1name "tohub-d"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
        set auto-negotiate enable
    next
    edit "tohub-d_isp2"
        set phase1name "tohub-d_isp2"
        set proposal aes128-sha256 aes256-sha256 aes128gcm aes256gcm chacha20poly1305
        set dhgrp 20 21
        set auto-negotiate enable
    next
end
```

3. Configure SD-WAN:

   Assign the overlay interface as an SD-WAN member and attach it to a zone. Configure health-check on the overlay member in order to detect packet-loss and bandwidth utilization.

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
```

```
        edit 1
            set interface "port1"
            set gateway 172.16.200.3
        next
        edit 4
            set interface "tohub-d"
        next
        edit 5
            set interface "port9"
            set gateway 11.101.1.2
        next
    end
    config health-check
            edit "1"
            set server "192.168.5.44"
            set members 4
            config sla
                edit 1
                next
            end
        next
    end
    config service
        edit 2
            set name "1_clone"
            set dst "all"
            set src "10.1.100.0"
            set priority-members 4 1
        next
    end
end
```

To verify the results:

1. Confirm that both tunnels are established on their respective interfaces on FGTA:

```
# diagnose vpn ike gateway list

vd: root/0
name: tohub-d_isp2
version: 2
interface: port9 15
addr: 11.101.1.1:5929 -> 172.16.200.4:4500

```

Duplicate packets based on SD-WAN rules

SD-WAN duplication rules can specify SD-WAN service rules to trigger packet duplication. This allows the duplication to occur based on an SD-WAN rule instead of the source, destination, and service parameters in the duplication rule.

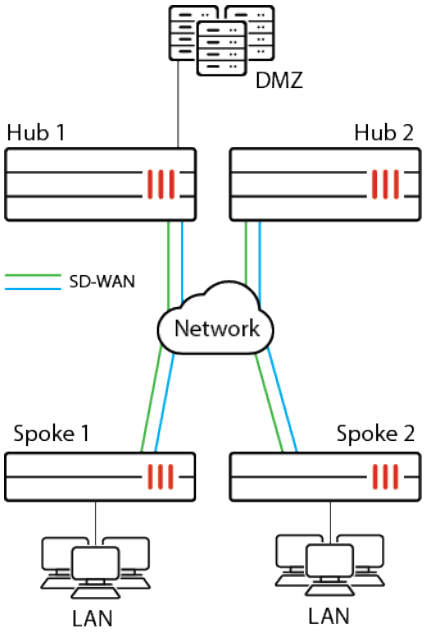
1. Packets can be forced to duplicate to all members of the same SD-WAN zone. See Duplicate packets on other zone members on page 1377 for details.

   For example, in Spoke 1 set `packet-duplication` to `force` so that when a client sends a packet to the server, it is duplicated to all members of the same zone as long as its health check is alive. If a members health check is dead, then the member is removed from the SD-WAN duplication zone.
2. Packets can be duplicated to other members of the SD-WAN zone on-demand only when the condition of the link is not good enough.

   Set `packet-duplication` to `on-demand`. If `sla-match-service` is disabled, when all the SLAs of the member exceed threshold (sla_map=0), the packet is duplicated. But when the SLAs are within threshold (sla_map!=0), the packet is not duplicated.

   If `sla-match-service` is enabled, then only the SLA health checks and targets used in the service rule need to exceed threshold in order to trigger packet duplication.
3. Packets can be duplicated to all members of the same SD-WAN zone when the traffic matches one or more regular SD-WAN service rules.

The following example shows the third type of packet duplication.



In this example, SD-WAN is configured with three members: vpn1, vpn2, and vpn3. Service rule 1 controls all traffic from 10.100.20.0/24 to 172.16.100.0/24 using member 1.

To send a duplicate of the traffic that matches service rule 1 using member 2, members 1 and 2 are added to the same SD-WAN zone, and a duplication rule is configured with service-id set to 1.

To send a duplicate of the traffic that matches service rule 1 using member 2:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "zone2"
        next
    end
    config members
        edit 1
            set interface "vpn1"
        next
        edit 2
            set interface "vpn2"
        next
        edit 3
            set interface "vpn3"
            set zone "zone2"
        next
    end
    config service
        edit 1
            set dst "172.16.100.0"
            set src "10.100.20.0"
```

```
            set priority-members 1
        next
    end
    config duplication
        edit 1
            set service-id 1
            set packet-duplication force
        next
    end
end
```

Duplicate packets on other zone members

When duplication rules are used, packets are duplicated on other good links within the SD-WAN zone and de-duplicated on the destination FortiGate. Use `force` mode to force duplication on other links within the SD-WAN zone, or use `on-demand` mode to trigger duplication only when SLA fails on the selected member.

The duplication rule is configured in the CLI by using the `config duplication` command. The following options can be configured:

Parameter	Description
srcaddr	Source address or address group names.
dstaddr	Destination address or address group names.
srcaddr6	Source IPv6 address or IPv6 address group names.
dstaddr6	Destination IPv6 address or IPv6 address group names.
srcintf	Incoming (ingress) interfaces or zones.
dstintf	Outgoing (egress) interfaces or zones.
service	Service and service group names.
packet-duplication	Configure packet duplication method. • disable: Disable packet duplication (default). • force: Duplicate packets across all interface members of the SD-WAN zone. • on-demand: Duplicate packets across all interface members of the SD-WAN zone based on the link quality.
packet-de-duplication	Enable/disable discarding of packets that have been duplicated (default = disable).

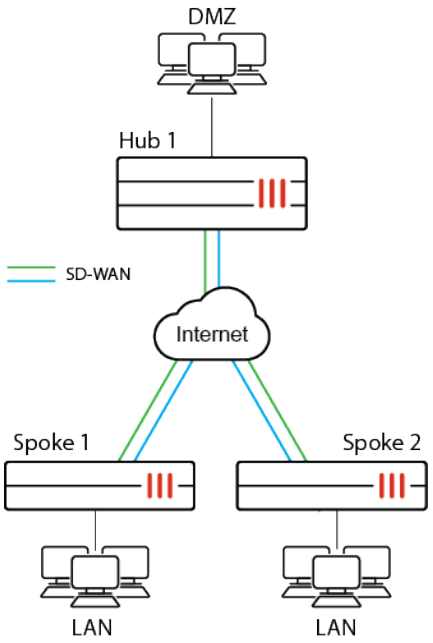
Additional settings under `config system sdwan`

The `duplication-max-num <integer>` option under `config system sdwan` is the maximum number of interface members that a packet is duplicated on in the SD-WAN zone (2 - 4, default = 2). If this value is set to 3, the original packet plus two more copies are created. If there are three member interfaces in the SD-WAN zone and the `duplication-max-num` is set to 2, the packet duplication follows the configuration order, so the packets are duplicated on the second member.

The `duplication-max-discrepancy <latency>` option under `config system sdwan` is configured to be 250ms by default and accepts a value from 250-1000ms. This latency setting defines the interval in which a duplicate packet received will be dropped when `packet-de-duplication` is enabled. It is recommended to keep this value at 250ms to minimize the packets cached in memory. However, if the discrepancy in latency between members is high, such as when one transport is through a satellite link, then this value can be adjusted upwards.

Example

The packet duplication feature works best in a spoke-spoke or hub-and-spoke topology. In this example, a hub-and-spoke ADVPN topology is used. Before shortcuts are established, Hub 1 forwards the duplicate packets from Spoke 1 to Spoke 2. Once shortcuts are established, Hub 1 is transparent, and duplicate packets are exchanged directly between the spokes.



To configure packet duplication between Spoke 1 and Spoke 2:

1. Configure Spoke 1:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "sdwanzone_v4"
        next
    end
    config members
        edit 1
            set interface "t1"
            set zone "sdwanzone_v4"
        next
        edit 4
```

```
            set interface "t21"
            set zone "sdwanzone_v4"
        next
        edit 2
            set interface "t2"
            set zone "sdwanzone_v4"
        next
    end
    config health-check
        edit "h1"
            set server "10.34.1.1"
            set interval 1000
            set failtime 10
            set members 1 2
            config sla
                edit 1
                    set packetloss-threshold 40
                next
            end
        next
    end
    config duplication
        edit 1
            set srcaddr "all"
            set dstaddr "all"
            set srcintf "port1"
            set dstintf "sdwanzone_v4"
            set service "ALL"
            set packet-duplication force
            set packet-de-duplication enable
        next
    end
end
```

2. Configure Spoke 2 with similar settings.

Routing

The following topics provide instructions on SD-WAN advanced routing:

- Routing overview on page 1380
  - Dynamic BGP on loopback dual hub example on page 1381
  - Add ADVPN to dynamic BGP on loopback example on page 1386
- Advanced BGP settings on page 1387
  - Using BGP tags with SD-WAN rules on page 1387
  - BGP multiple path support on page 1391
  - Controlling traffic with BGP route mapping and service rules on page 1393
  - Applying BGP route-map to multiple BGP neighbors on page 1401

- Using multiple members per SD-WAN neighbor configuration on page 1407

Routing overview

In a conventional (non-SD-WAN) design, routing oversees the steering of traffic. It is, therefore, the responsibility of routing to select the best path out of all available options. While different routing techniques to steer traffic are compatible with Fortinet's SD-WAN implementation, it is recommended to use the SD-WAN intelligence to select the best path to steer traffic. This is the purpose of SD-WAN, as it accounts for various types of link and application qualities, like the health of each path and the type of applications, before steering traffic towards an SD-WAN member.

In the case of direct internet access on a single site, it is recommended to implement ECMP (Equal cost multi-path) routes over all available paths, and allow SD-WAN rules to then specify the traffic steering. For more information about ECMP, see Equal cost multi-path on page 566.

In multi-site Hub and Spoke SD-WAN deployments, routes over your SD-WAN overlay network can be learned several ways. Static routing is supported; however, most routing implementations will leverage dynamic routing to ensure their network scales and can respond to changes in the environment. BGP is recommended to exchange routes between all sites over the overlays. When utilizing BGP for dynamic routing, several options for BGP peering are available.

BGP per overlay

This is the traditional way of sharing routes between all SD-WAN nodes. BGP per overlay builds an iBGP session using each end of the tunnel as a peer. This reduces the complexity of the deployment but results in a large number of iBGP sessions and routing table updates on the hub device(s). This method of routing is still supported, however it is not recommended.

BGP on loopback

In the BGP on loopback design, every Spoke establishes a single iBGP session towards the hub(s). This single iBGP session is terminated on the loopback interface, which uniquely identifies each SD-WAN node (Hub and Spokes). The Spoke advertises its LAN prefix(es) over this single iBGP session per Hub. This method of routing reduces the load on the Hub(s) and is required for ADVPN 2.0.

Dynamic BGP versus route reflection

Starting from FOS 7.4, a new method to exchange routes directly between a pair of Spokes by dynamically building a BGP session between them over an ADVPN shortcut was added. This new mechanism is called "Dynamic BGP". While the Hubs learn all the Spoke routes, they no longer have to re-advertise them to other Spokes, meaning BGP Route Reflection (RR) on the Hubs is no longer required.

Routing method	BGP per overlay	BGP on loopback
BGP add-path	Required	No

Routing method	BGP per overlay	BGP on loopback
Route exchange method	Route Reflector or Dynamic BGP	Route Reflector or Dynamic BGP
Main advantage	Simplicity	Reduced routing table ADVPN 2.0 support
Main limitations	Limited scalability Does not work with ADVPN 2.0	None

Dynamic BGP on loopback dual hub example

This example shows how to configure SD-WAN for a dual hub topology using dynamic BGP on loopback. The steps assume the spoke and hub FortiGates have configured LAN & WAN interfaces and default routing in place.

The FortiGates will require further SD-WAN configuration relevant to your business, such as SD-WAN rules for various applications, and firewall policies to permit and deny traffic as required. Similarly, security profiles are not discussed but should be implemented in accordance to the business's security requirements.

Note that both hubs share the same IP address for HUB-Lo. This is one of the benefits of BGP on loopback.

Spoke

To configure the spoke:

1. Configure the Loopback interface to be used for BGP peering.

```
config system interface
    edit "Branch-Lo"
        set vdom "root"
        set ip 172.16.0.1 255.255.255.255
        set allowaccess ping
        set type loopback
    next
end
```

2. Configure a unique location ID.

```
config system settings
    set location-id 172.16.0.1
end
```

3. Configure IKE to inject a static route to reach the loopback on all phase1-interfaces toward the hubs. Note, additional VPN configuration required. See Site-to-site VPN.

```
config vpn ipsec phase1-interface
    edit HUB1_VPN1
        set exchange-ip-addr4 172.16.0.1
    next
    edit HUB1_VPN2
        set exchange-ip-addr4 172.16.0.1
```

```
    next
    edit HUB2_VPN1
        set exchange-ip-addr4 172.16.0.1
    next
    edit HUB2_VPN2
        set exchange-ip-addr4 172.16.0.1
    next
end
```

4. Configure BGP:

```
config router bgp
    set as 65000
    set router-id 172.16.0.1
    set ibgp-multipath enable
    set recursive-next-hop enable
    set graceful-restart enable
    config neighbor
        edit 172.16.255.250
            set soft-reconfiguration enable
            set capability-graceful-restart enable
            set advertisement-interval 1
            set interface " Branch-Lo"
            set update-source " Branch-Lo"
            set connect-timer 1
            set remote-as 65000
        next
        edit 172.16.255.252
            set soft-reconfiguration enable
            set capability-graceful-restart enable
            set advertisement-interval 1
            set interface " Branch-Lo"
            set update-source " Branch-Lo"
            set connect-timer 1
            set remote-as 65000
        next
end
config network
    edit 1
        set prefix 10.1.1.0/24
    next
end
end
```

5. Configure SD-WAN members to utilize the loopback as the source for health checks. Extra configuration provided to define SD-WAN interfaces referenced in later steps. This is required as the VPN tunnel interfaces do not have IP addresses assigned.

```
config system sdwan
config zone
        edit "virtual-wan-link"
        next
```

```
        edit "WAN1"
        next
        edit "WAN2"
        next
        edit "HUB1"
        next
        edit "HUB2"
        next
    end
config members
    edit 1
        set interface "port1"
            set zone "WAN1"
        next
        edit 2
            set interface "port2"
            set zone "WAN2"
        next
        edit 3
            set interface "HUB1-VPN1"
            set zone "HUB1"
            set source 172.16.0.1
        next
        edit 4
            set interface "HUB1-VPN2"
            set zone "HUB1"
            set source 172.16.0.1
        next
        edit 5
            set interface "HUB2-VPN1"
            set zone "HUB2"
            set source 172.16.0.1
        next
        edit 6
            set interface "HUB2-VPN2"
            set zone "HUB2"
            set source 172.16.0.1
        next
    end
end
```

6. Configure a firewall policy to permit health check probes.

```
edit 4
    set name "Health Check Access"
    set srcintf "Branch-Lo"
    set dstintf "HUB1" "HUB2"
    set action accept
    set srcaddr "all"
    set dstaddr "all"
    set schedule "always"
```

```
   set service "PING BGP"
next
```

Hub

To configure the hub:

1. 1. Configure the Loopback interfaces to be used for BGP peering and health checks.

```
edit "HUB-Lo"
    set vdom "root"
    set ip 172.16.255.251 255.255.255.255
    set allowaccess ping
    set type loopback
    next
    edit "BGP-Lo"
        set vdom "root"
        set ip 172.16.255.252 255.255.255.255
        set allowaccess ping
        set type loopback
    next
```

2. Configure a unique location ID.

```
config system settings
    set location-id 172.16.255.252
end
```

3. Configure IKE to inject a static route to reach the loopback on all phase1-interfaces toward the spokes.

```
config vpn ipsec phase1-interface
    edit VPN1
        set exchange-ip-addr4 172.16.255.252
    next
    edit VPN2
        set exchange-ip-addr4 172.16.255.252
    next
end
```

4. Configure BGP:

```
config router bgp
    set as 65000
    set router-id 172.16.0.1
    set ibgp-multipath enable
    set recursive-next-hop enable
    set graceful-restart enable
    config neighbor group
        edit “EDGE”
            set soft-reconfiguration enable
            set capability-graceful-restart enable
            set advertisement-interval 1
```

```
            set next-hop-self enable
            set interface " BGP-Lo"
            set update-source " BGP-Lo"
            set remote-as 65000
        next
    end
       config neighbor-range
        edit 1
            set prefix 172.16.0.0 255.255.224.0
            set neighbor-group "DYN_BRANCH"
    next
    end
    config network
        edit 1
            set prefix 172.16.0.0 255.255.0.0
            set route-map "LOCAL_REGION"
        next
        edit 10
            set prefix 10.1.0.0 255.255.0.0
        next
    end
end
```

5. Configure VPN tunnels to be SD-WAN members:

```
config system sdwan
    set status enable
    config zone
        edit "OVERLAYS"
        next
    end
    config members
        edit 1
            set interface "VPN1"
            set zone "OVERLAYS"
        next
        edit 2
            set interface "VPN2"
            set zone "OVERLAYS"
        next
    end
end
```

6. Configure a firewall policy to permit health check probes and BGP peering.

```
config firewall policy
    edit 4
        set name "Health Check Access"
        set srcintf "VPN1" "VPN2"
        set dstintf "HUB-Lo"
        set action accept
        set srcaddr "all"
```

```
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
    next
    edit 5
        set name "Peering"
        set srcintf "VPN1" "VPN2"
        set dstintf "BGP-Lo"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "PING" "BGP"
    next
end
```

Add ADVPN to dynamic BGP on loopback example

Spoke

To configure the spoke:

1. 1. Define a health check for spoke to hub. Example settings provided for SLA metrics.

```
config system sdwan
    config health-check
        edit "HUB_HC"
            set server “172.16.255.251”
            set update-cascade-interface disable
            set update-static-route disable
            set sla-fail-log-period 10
            set sla-pass-log-period 10
            set members 3 4 5 6
            config sla
                edit 1
                    set latency-threshold 255
                    set jitter-threshold 55
                    set packetloss-threshold 1
                next
            end
        next
    next
end
```

2. Enable ADVPN 2.0 on the HUB SD-WAN Zones and assign the HUB_HC health-check.

```
config system sdwan
    config zone
        edit "HUB1"
            set advpn-select enable
```

```
            set advpn-health-check "HUB_HC"
        next
        edit "HUB2"
            set advpn-select enable
            set advpn-health-check "HUB_HC"
        next
    end
end
```

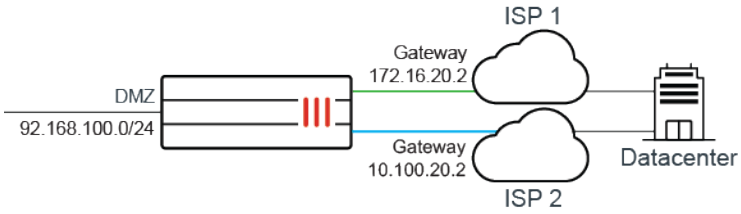
Advanced BGP settings

This section includes the following topics about advanced BGP settings:

- Using BGP tags with SD-WAN rules on page 1387
- BGP multiple path support on page 1391
- Controlling traffic with BGP route mapping and service rules on page 1393
- Applying BGP route-map to multiple BGP neighbors on page 1401
- Using multiple members per SD-WAN neighbor configuration on page 1407
- Allow SD-WAN hubs to suppress BGP routes when all links to a spoke are down on page 1413

Using BGP tags with SD-WAN rules

SD-WAN rules can use Border Gateway Protocol (BGP) learned routes as dynamic destinations.



In this example, a customer has two ISP connections, wan1 and wan2. wan1 is used primarily for direct access to internet applications, and wan2 is used primarily for traffic to the customer's data center.

The customer could create an SD-WAN rule using the data center's IP address range as the destination to force that traffic to use wan2, but the data center's IP range is not static. Instead, a BGP tag can be used.

For this example, wan2's BGP neighbor advertises the data center's network range with a community number of 30:5.

This example assumes that SD-WAN is enabled on the FortiGate, wan1 and wan2 are added as SD-WAN members in the *virtual-wan-link* SD-WAN zone, and a policy and static route have been created. See SD-WAN quick start on page 989 for details.

FortiOS supports IPv4 and IPv6 route tags.

To configure BGP tags with SD-WAN rules:

1. Configure the community list:

```
config router community-list
    edit "30:5"
        config rule
            edit 1
                set action permit
                set match "30:5"
            next
        end
    next
end
```

2. Configure the route map:

```
config router route-map
    edit "comm1"
        config rule
            edit 1
                set match-community "30:5"
                set set-route-tag 15
            next
        end
    next
end
```

3. Configure BGP:

```
config router bgp
    set as xxxxx
    set router-id xxxx
    config neighbor
        edit "10.100.20.2"
            set soft-reconfiguration enable
            set remote-as xxxxx
            set route-map-in "comm1"
        next
    end
end
```

4. Configure the route tag address object:

```
config firewall address
    edit "DataCenter_route_tag_15"
        set type route-tag
        set route-tag 15
    next
end
```

5. Configure a firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf "virtual-wan-link"
        set srcaddr "all"
        set dstaddr "DataCenter_route_tag_15"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

6. Edit the SD-WAN configuration:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "wan1"
            set gateway 172.16.20.2
        next
        edit 2
            set interface "wan2"
        next
    end
    config service
        edit 1
            set name "DataCenter"
            set mode manual
            set priority-members 2
            set dst "DataCenter_route_tag_15"
        next
    end
end
```

Troubleshooting BGP tags with SD-WAN rules

Check the network community

Use the `get router info bgp network` command to check the network community:

```
# get router info bgp network
BGP table version is 5, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
              S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network Next Hop Metric LocPrf Weight RouteTag Path
```

```
*> 0.0.0.0/0 10.100.1.5 32768 0 ?
*> 1.1.1.1/32 0.0.0.0 32768 0 ?
*> 10.1.100.0/24 172.16.203.2 32768 0 ?
*> 10.100.1.0/30 0.0.0.0 32768 0 ?

Check dynamic BGP addresses used in policy routes

Use the `diagnose firewall proute list` command to check dynamic BGP addresses used in policy routes:

```
# diagnose firewall proute list
list route policy info(vf=root):

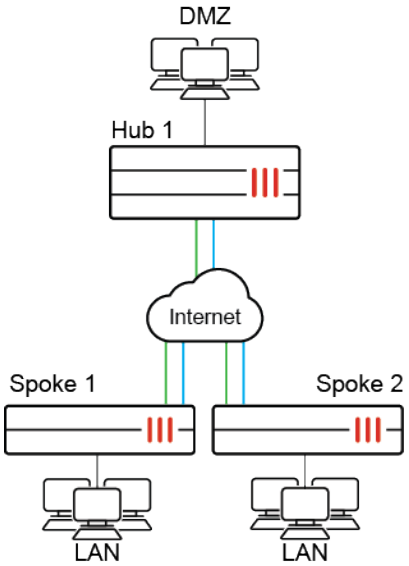
id=4278779905 vwl_service=1(DataCenter) flags=0x0 tos=0x00 tos_mask=0x00 protocol=0 sport=0:65535
```

```
iif=0 dport=1-65535 oif=16
source wildcard(1): 0.0.0.0/0.0.0.0
destination wildcard(1): 10.100.11.0/255.255.255.0
```

BGP multiple path support

BGP supports multiple paths, allowing an ADVPN to advertise multiple paths. This allows BGP to extend and keep additional network paths according to RFC 7911.

In this example, Spoke1 and Spoke2 each have four VPN tunnels that are connected to the Hub with ADVPN. The Spoke-Hub has established four BGP neighbors on all four tunnels.



Spoke 1 and Spoke 2 can learn four different routes from each other.

To configure the hub:

```
config router bgp
    set as 65505
    set router-id 11.11.11.11
    set ibgp-multipath enable
    set additional-path enable
    set additional-path-select 4
    config neighbor-group
        edit "gr1"
            set capability-default-originate enable
            set remote-as 65505
            set additional-path both
            set adv-additional-path 4
            set route-reflector-client enable
        next
    end
    config neighbor-range
```

```
        edit 1
            set prefix 10.10.0.0 255.255.0.0
            set neighbor-group "gr1"
        next
    end
    config network
        edit 12
            set prefix 11.11.11.11 255.255.255.255
        next
    end
end
```

To configure a spoke:

```
config router bgp
    set as 65505
    set router-id 2.2.2.2
    set ibgp-multipath enable
    set additional-path enable
    set additional-path-select 4
    config neighbor
        edit "10.10.100.254"
            set soft-reconfiguration enable
            set remote-as 65505
            set additional-path both
            set adv-additional-path 4
        next
        edit "10.10.200.254"
            set soft-reconfiguration enable
            set remote-as 65505
            set additional-path both
            set adv-additional-path 4
        next
        edit "10.10.203.254"
            set soft-reconfiguration enable
            set remote-as 65505
            set additional-path both
            set adv-additional-path 4
        next
        edit "10.10.204.254"
            set soft-reconfiguration enable
            set remote-as 65505
            set additional-path both
            set adv-additional-path 4
        next
    end
    config network
        edit 3
            set prefix 22.1.1.0 255.255.255.0
        next
    end
end
```

To view the BGP routing table on a spoke:

```
Spoke1 # get router info routing-table bgp
    Routing table for VRF=0
    B*      0.0.0.0/0 [200/0] via 10.10.200.254, vd2-2, 03:57:26
        [200/0] via 10.10.203.254, vd2-3, 03:57:26
        [200/0] via 10.10.204.254, vd2-4, 03:57:26
        [200/0] via 10.10.100.254, vd2-1, 03:57:26
    B       1.1.1.1/32 [200/0] via 11.1.1.1 (recursive via 12.1.1.1), 03:57:51

        [200/0] via 10.10.204.3, vd2-4, 03:57:26
        [200/0] via 10.10.203.3, vd2-3, 03:57:26
        [200/0] via 10.10.200.3, vd2-2, 03:57:26
        [200/0] via 10.10.100.3, vd2-1, 03:57:26
```

Controlling traffic with BGP route mapping and service rules

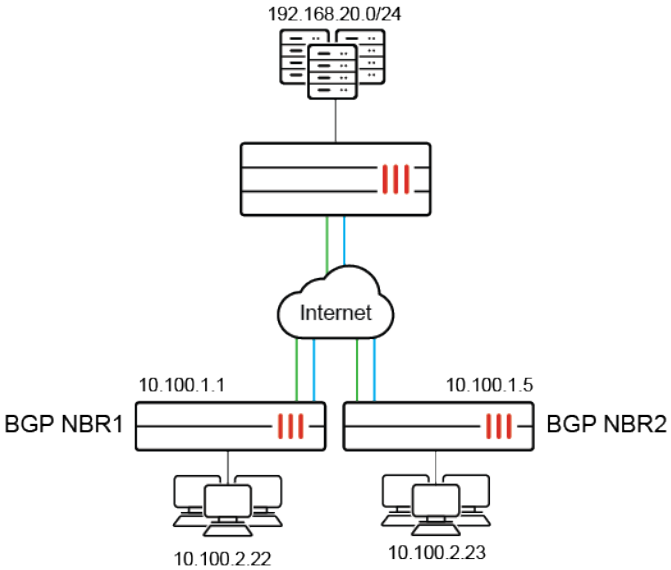
SD-WAN allows you to select different outbound WAN links based on performance SLAs. It is important that BGP neighbors are aware of these settings, and changes to them.

BGP can adapt to changes in SD-WAN link SLAs in the following ways:

- Applying different route-maps based on the SD-WAN's health checks. For example, different BGP community strings can be advertised to BGP neighbors when SLAs are not met.
- Traffic can be selectively forwarded based on the active BGP neighbor. If the SD-WAN service's role matches the active SD-WAN neighbor, the service is enabled. If there is no match, then the service is disabled.

Example

In this topology, a branch FortiGate has two SD-WAN gateways serving as the primary and secondary gateways. The gateways reside in different datacenters, but have a full mesh network between them.



This example shows how route-maps and service rules are selected based on performance SLAs and the member that is currently active. Traffic flows through the primary gateway unless the neighbor's health check is outside of its SLA. If that happens, traffic routes to the secondary gateway.

BGP NBR1 is the primary neighbor and BGP NBR2 is the secondary neighbor.

The branch FortiGate's wan1 and wan2 interfaces are members of the SD-WAN. When the SD-WAN neighbor status is primary, it will advertise community *20:1* to BGP NBR1 and *20:5* to BGP NBR2. When the SD-WAN neighbor status is secondary, it will advertise *20:5* to BGP NBR1 and *20:2* to BGP NBR2.

Only one of the primary or secondary neighbors can be active at one time. The SD-WAN neighbor status is used to decide which neighbor is selected:

- **Primary**: The primary neighbor takes precedence if its SLAs are met.
- **Secondary**: If the primary neighbor's SLAs are not met, the secondary neighbor becomes active if its SLAs are met.
- **Standalone**: If neither the primary or secondary neighbor's SLAs are met, the SD-WAN neighbor status becomes standalone.

Route map

SD-WAN is configured to let BGP advertise different communities when the SLA status changes. When the SLA is missed, it triggers BGP to advertise a different community to its BGP neighbor based on its route-map. The BGP neighbors can use the received community string to select the best path to reach the branch.

To configure BGP route-maps and neighbors:

1. Configure an access for the routes to be matched:

```
config router access-list
    edit "net192"
        config rule
            edit 1
                set prefix 192.168.20.0 255.255.255.0
            next
        end
    next
end
```

2. Configure the primary neighbor's preferred route-map:

```
config router route-map
    edit "comm1"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "20:1"
            next
        end
    next
end
```

3. Configure the secondary neighbor's preferred route-map:

```
config router route-map
    edit "comm2"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "20:2"
            next
        end
    next
end
```

4. Configure the failed route-map:

```
config router route-map
    edit "comm5"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "20:5"
            next
        end
    next
end
```

5. Configure BGP neighbors:

```
config router bgp
    set as 65412
    set router-id 1.1.1.1
    set ibgp-multipath enable
    config neighbor
        edit "10.100.1.1"
            set soft-reconfiguration enable
            set remote-as 20
            set route-map-out "comm5"
            set route-map-out-preferable "comm1"
        next
        edit "10.100.1.5"
            set soft-reconfiguration enable
            set remote-as 20
            set route-map-out "comm5"
            set route-map-out-preferable "comm2"
        next
    end
end
```

When SLAs are met, `route-map-out-preferable` is used. When SLAs are missed, `route-map-out` is used.

To configure SD-WAN:

1. Configure the SD-WAN members:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "port1"
        next
        edit 2
            set interface "port2"
        next
    end
end
```

2. Configure health checks for each member:

```
config system sdwan
    config health-check
        edit "ping"
            set server "10.100.2.22"
            set members 1
            config sla
                edit 1
                    set link-cost-factor packet-loss
                    set packetloss-threshold 1
                next
            end
```

```
        next
        edit "ping2"
            set server "10.100.2.23"
            set members 2
            config sla
                edit 1
                    set link-cost-factor packet-loss
                    set packetloss-threshold 1
                next
            end
        next
    end
end
```

3. Configure the SD-WAN neighbors and assign them a role and the health checks used to determine if the neighbor meets the SLA:
   SD-WAN neighbors can only be configured in the CLI.

```
config system sdwan
    config neighbor
        edit "10.100.1.1"
            set member 1
            set role primary
            set health-check "ping"
            set sla-id 1
        next
        edit "10.100.1.5"
            set member 2
            set role secondary
            set health-check "ping2"
            set sla-id 1
        next
    end
end
```

Service rules

Create SD-WAN service rules to direct traffic to the primary neighbor when its SLAs are met, and to the secondary neighbor when the primary neighbor's SLAs are missed.

To configure the SD-WAN service rules:

```
config system sdwan
    config service
        edit 1
            set name "Primary-Out"
            set role primary
            set dst "all"
            set src "all"
            set priority-members 1
        next
```

```
        edit 2
            set name "Secondary-Out"
            set role secondary
            set dst "all"
            set src "all"
            set priority-members 2
        next
    end
end
```

If neither the primary nor secondary neighbors are active, the SD-WAN neighbor status becomes standalone. Only service rules with `standalone-action` enabled will continue to pass traffic. This option is disabled by default.

Verification

To verify when the primary neighbor is passing traffic:

1. Verify the health check status:

```
FortiGate-Branch # diagnose sys sdwan health-check
Health Check(ping):
Seq(1 port1): state(alive), packet-loss(0.000%) latency(0.569), jitter(0.061) sla_map=0x1
Health Check(ping2):
Seq(2 port2): state(alive), packet-loss(0.000%) latency(3.916), jitter(2.373) sla_map=0x1
```

2. Verify SD-WAN neighbor status:

```
FortiGate-Branch # diagnose sys sdwan neighbor
SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
        Selected role(primary) last_secondary_select_time/current_time in seconds 0/572
Neighbor(10.100.1.1): member(1) role(primary)
        Health-check(ping:1)  sla-pass selected alive
Neighbor(10.100.1.5): member(2) role(secondary)
        Health-check(ping2:1)  sla-pass alive
```

3. Verify service rules status:

```
FortiGate-Branch # diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x0
  Gen(3), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Service role: primary
  Members:
    1: Seq_num(1 port1), alive, selected
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255
```

```
Service(2): Address Mode(IPV4) flags=0x0
  Gen(6), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Service role: secondary, disabled by unselected.
  Members:
    1: Seq_num(2 port2), alive, selected
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255
```

4. Verify neighbor routers:
   a. Primary neighbor router:

```
FGT-NBR1 # get router info bgp network 192.168.20.0
BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  64512
    10.100.1.2 from 10.100.1.2 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 20:1
      Last update: Thu Apr 30 13:41:40 2020
```

   b. Secondary neighbor router:

```
FGT-NBR2 # get router info bgp network 192.168.20.0
VRF 0 BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  64512
    10.100.1.6 from 10.100.1.6 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 20:5
      Last update: Thu Apr 30 13:41:39 2020
```

To verify when the secondary neighbor is passing traffic:

1. Verify the health check status:

```
FortiGate-Branch # diagnose sys sdwan health-check
Health Check(ping):
Seq(1 port1): state(dead), packet-loss(54.000%) sla_map=0x0
Health Check(ping2):
Seq(2 port2): state(alive), packet-loss(0.000%) latency(4.339), jitter(3.701) sla_map=0x1
```

2. Verify SD-WAN neighbor status:

```
FortiGate-Branch # diagnose sys sdwan neighbor
SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
        Selected role(secondary) last_secondary_select_time/current_time in seconds 936/936
```

```
Neighbor(10.100.1.1): member(1) role(primary)
        Health-check(ping:1)  sla-fail dead
Neighbor(10.100.1.5): member(2) role(secondary)
        Health-check(ping2:1)  sla-pass selected alive
```

3. Verify service rules status:

```
FortiGate-Branch # diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x0
  Gen(4), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Service role: primary, disabled by unselected.
  Members:
    1: Seq_num(1 port1), alive, selected
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255

Service(2): Address Mode(IPV4) flags=0x0
  Gen(7), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Service role: secondary
  Members:
    1: Seq_num(2 port2), alive, selected
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255
```

4. Verify neighbor routers:
   a. Primary neighbor router:

```
FGT-NBR1 # get router info bgp network 192.168.20.0
BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  64512
    10.100.1.2 from 10.100.1.2 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 20:5
      Last update: Thu Apr 30 15:41:58 2020
```

   b. Secondary neighbor router:

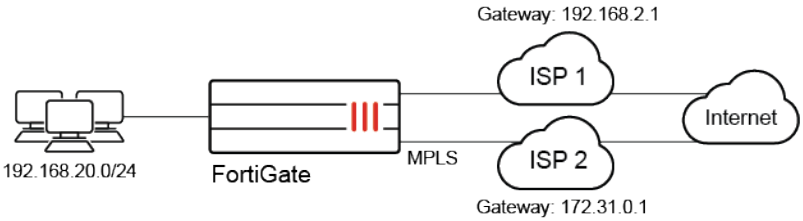
```
FGT-NBR2 # get router info bgp network 192.168.20.0
VRF 0 BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  64512
```

```
    10.100.1.6 from 10.100.1.6 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 20:2
      Last update: Thu Apr 30 15:42:07 2020
```

Applying BGP route-map to multiple BGP neighbors

Controlling traffic with BGP route mapping and service rules explained how BGP can apply different route-maps to the primary and secondary SD-WAN neighbors based on SLA health checks.

In this example, SD-WAN neighbors that are not bound to primary and secondary roles are configured.



The FortiGate has multiple SD-WAN links and has formed BGP neighbors with both ISPs.

ISP1 is used primarily for outbound traffic, and has an SD-WAN service rule using the lowest cost algorithm applied to it. When SLAs for ISP1 are not met, it will fail over to the MPLS line.

Inbound traffic is allowed by both WAN links, with each WAN advertising a community string when SLAs are met. When SLAs are not met, the WAN links advertise a different community string.

This example uses two SD-WAN links. The topology can be expanded to include more links as needed.

To configure BGP route-maps and neighbors:

1. Configure an access list for routes to be matched:

```
config router access-list
    edit "net192"
        config rule
            edit 1
                set prefix 192.168.20.0 255.255.255.0
            next
        end
    next
end
```

2. Configure route-maps for neighbor ISP1:

```
config router route-map
    edit "comm1"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "64511:1"
            next
```

```
        end
    next
    edit "comm-fail1"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "64511:5"
            next
        end
    next
end
```

3. Configure route-maps for neighbor ISP2:

```
config router route-map
    edit "comm2"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "64522:1"
            next
        end
    next
    edit "comm-fail2"
        config rule
            edit 1
                set match-ip-address "net192"
                set set-community "64522:5"
            next
        end
    next
end
```

4. Configure the BGP neighbors:

```
config router bgp
    set as 64512
    set keepalive-timer 1
    set holdtime-timer 3
    config neighbor
        edit "192.168.2.1"
            set soft-reconfiguration enable
            set remote-as 64511
            set route-map-out "comm-fail1"
            set route-map-out-preferable "comm1"
        next
        edit "172.31.0.1"
            set soft-reconfiguration enable
            set remote-as 64522
            set route-map-out "comm-fail2"
            set route-map-out-preferable "comm2"
        next
```

```
    end
    config network
        edit 1
            set prefix 192.168.20.0 255.255.255.0
        next
    end
end
```

When SLAs are met, `route-map-out-preferable` is used. When SLAs are missed, `route-map-out` is used.

To configure SD-WAN:

1. Configure the SD-WAN members:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "port1"
            set gateway 192.168.2.1
        next
        edit 2
            set interface "MPLS"
            set cost 20
        next
    end
end
```

2. Configure the health checks that must be met:

```
config system sdwan
    config health-check
        edit "pingserver"
            set server "8.8.8.8"
            set members 2 1
            config sla
                edit 1
                    set link-cost-factor packet-loss
                    set packetloss-threshold 2
                next
            end
        next
    end
end
```

3. Configure the SD-WAN neighbors and assign them a role and the health checks used to determine if the neighbor meets the SLA:
   When no role is defined, the default role, `standalone`, is used.

```
config system sdwan
    config neighbor
        edit "192.168.2.1"
```

```
            set member 1
            set health-check "pingserver"
            set sla-id 1
        next
        edit "172.31.0.1"
            set member 2
            set health-check "pingserver"
            set sla-id 1
        next
    end
end
```

Service rules

Create SD-WAN service rules to direct traffic to the SD-WAN links based on the lowest cost algorithm The same SLA health check and criteria that are used for the SD-WAN neighbor are used for this SD-WAN service rule.

When no roles are defined in the service rule, the default role, `standalone`, is used.

To configure the SD-WAN service rule:

```
config system sdwan
    config service
        edit 1
            set name "OutboundAll"
            set mode sla
            set dst "all"
            set src "all"
            config sla
                edit "pingserver"
                    set id 1
                next
            end
            set priority-members 1 2
        next
    end
end
```

Verification

To verify that when both SLAs are met, port1 is selected due to its lower cost:

1. Verify the health check status:

```
FortiGate-Branch # diagnose sys sdwan health-check
Health Check(pingserver):
Seq(2 MPLS): state(alive), packet-loss(0.000%) latency(24.709), jitter(14.996) sla_map=0x1
Seq(1 port1): state(alive), packet-loss(0.000%) latency(28.771), jitter(14.840) sla_map=0x1
```

2. Verify SD-WAN neighbor status:

```
FortiGate-Branch # diagnose sys sdwan neighbor
Neighbor(192.168.2.1): member(1) role(standalone)
        Health-check(pingserver:1)  sla-pass selected alive
Neighbor(172.31.0.1): member(2) role(standalone)
        Health-check(pingserver:1)  sla-pass selected alive
```

3. Verify service rules status:
   Because the service role is `standalone`, it matches both neighbors. The mode (SLA) determines that port1 is lower cost.

```
FortiGate-Branch # diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x0
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Service role: standalone
  Members:
    1: Seq_num(1 port1), alive, sla(0x1), cfg_order(0), cost(0), selected
    2: Seq_num(2 MPLS), alive, sla(0x1), cfg_order(1), cost(20), selected
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255
```

4. Verify neighbor routers:
   a. Primary neighbor router:

```
FGT-NBR1 # get router info bgp network 192.168.20.0
BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  64512
    192.168.2.5 from 192.168.2.5 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 64511:1
      Last update: Thu Apr 30 23:59:05 2020
```

   b. Secondary neighbor router:

```
FGT-NBR2 # get router info bgp network 192.168.20.0
VRF 0 BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  64512
    172.31.0.2 from 172.31.0.2 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 64522:1
      Last update: Fri May  1 00:11:28 2020
```

To verify that when neighbor ISP1 misses SLAs, MPLS is selected and BGP advertises a different community string for ISP1:

1. Verify the health check status:

```
FortiGate-Branch # diagnose sys sdwan health-check
Health Check(pingserver):
Seq(2 MPLS): state(alive), packet-loss(0.000%) latency(25.637), jitter(17.820) sla_map=0x1
Seq(1 port1): state(dead), packet-loss(16.000%) sla_map=0x0
```

2. Verify SD-WAN neighbor status:

```
FortiGate-Branch # diagnose sys sdwan neighbor
Neighbor(192.168.2.1): member(1) role(standalone)
        Health-check(pingserver:1)  sla-fail dead
Neighbor(172.31.0.1): member(2) role(standalone)
        Health-check(pingserver:1)  sla-pass selected alive
```

3. Verify service rules status:
   As SLA failed for neighbor ISP1, MPLS is preferred.

```
FortiGate-Branch # diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x0
  Gen(3), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Service role: standalone
  Members:
    1: Seq_num(2 MPLS), alive, sla(0x1), cfg_order(1), cost(20), selected
    2: Seq_num(1 port1), dead, sla(0x0), cfg_order(0), cost(0)
  Src address:
        0.0.0.0-255.255.255.255

  Dst address:
        0.0.0.0-255.255.255.255
```

4. Verify neighbor routers:
   The community received on ISP1 is updated.
   a. Primary neighbor router:

```
FGT-NBR1 # get router info bgp network 192.168.20.0
BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  64512
    192.168.2.5 from 192.168.2.5 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 64511:5
      Last update: Fri May  1 00:33:26 2020
```

b. Secondary neighbor router:

```
FGT-NBR2 # get router info bgp network 192.168.20.0
VRF 0 BGP routing table entry for 192.168.20.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  64512
    172.31.0.2 from 172.31.0.2 (192.168.122.98)
      Origin IGP metric 0, localpref 100, valid, external, best
      Community: 64522:1
      Last update: Fri May  1 00:22:42 2020
```

Using multiple members per SD-WAN neighbor configuration

SD-WAN BGP neighbor configurations are used to define the SLA health check in which an SD-WAN member must meet to qualify as being up. When the SD-WAN member meets the SLA threshold, the FortiGate will apply the route map defined in the BGP neighbor's `route-map-out-preferable` option. If the SD-WAN member fails to meet the SLA, the FortiGate will apply the route map defined in the BGP neighbor's `route-map-out` option instead. This allows the FortiGate to advertise the health of the SD-WAN member to its BGP neighbor by advertising different community strings based on its SLA status.

For more information, refer to the following BGP examples: Controlling traffic with BGP route mapping and service rules on page 1393 and Applying BGP route-map to multiple BGP neighbors on page 1401.

Selecting multiple SD-WAN members allows the SD-WAN neighbor feature to support topologies where there are multiple SD-WAN overlays and/or underlays to a neighbor. The `minimum-sla-meet-members` option is used to configure the minimum number of members that must be in an SLA per neighbor for the preferable route map to be used.

```
config system sdwan
    config neighbor
        edit <ip>
            set member {<seq-num_1>} [<seq-num_2>] ... [<seq-num_n>]
            set minimum-sla-meet-members <integer>
        next
    end
end
```

`member {<seq-num_1>} [<seq-num_2>] ... [<seq-num_n>]`	Enter the member sequence number list. Multiple members can be defined.
`minimum-sla-meet-members <integer>`	Set the minimum number of members that meet SLA when the neighbor is preferred (1 - 255, default = 1). • If the number of in SLA members is less than the `minimum-sla-meet-members` value, the default route map will be used. • If the number of in SLA members is equal or larger than the `minimum-sla-meet-members` value, the preferable route map will be used.

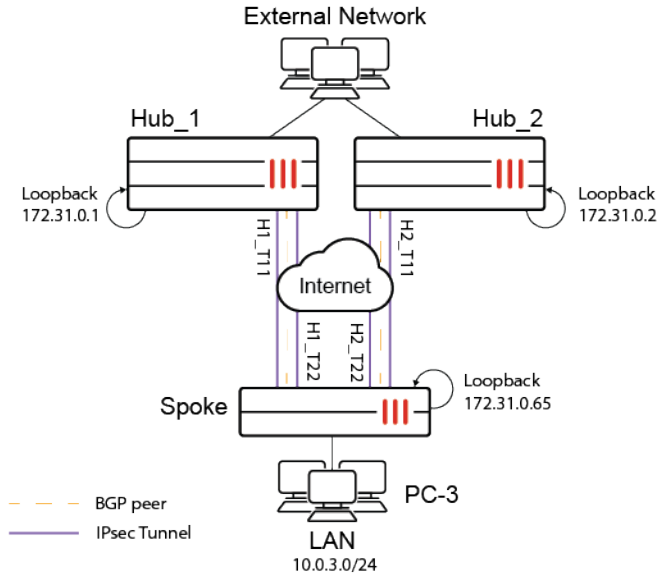
Example

In the following example, the spoke FortiGate has four tunnels: two tunnels to Hub_1 and two tunnels to Hub_2. The spoke has two BGP neighbors: one to Hub_1 and one to Hub-2. BGP neighbors are established on loopback IPs.

The SD-WAN neighbor plus `route-map-out-preferable`configuration is deployed on the spoke to achieve the following:

- If any tunnel to Hub_1 or Hub_2 is in SLA, the preferable route map will be applied on the BGP neighbor to Hub_1 or Hub_2.
- If both tunnels to Hub_1 or Hub_2 are out of SLA, the default route map will be applied on the BGP neighbor to Hub_1 or Hub_2.

The preferable route map and default route map are used to set different custom BGP communities as the spoke advertises its LAN routes to the hub. Each hub can translate communities into different BGP MED or AS prepends and signal them to the external peers to manipulate inbound traffic, thereby routing traffic to the spoke only when the SLAs are met on at least one of two VPN overlays. In this example, community string 10:1 signals to the neighbor that SLAs are met, and 10:2 signals that SLAs are not met.



To configure the BGP route maps and neighbors:

1. Configure an access list of prefixes to be matched:

```
config router access-list
    edit "net10"
        config rule
            edit 1
                set prefix 10.0.3.0 255.255.255.0
            next
        end
    next
end
```

2. Configure route maps for neighbors in SLA (preferable) and out of SLA (default):

```
config router route-map
    edit "in_sla"
        config rule
            edit 1
                set match-ip-address "net10"
                set set-community "10:1"
            next
        end
    next
    edit "out_sla"
        config rule
            edit 1
                set match-ip-address "net10"
                set set-community "10:2"
            next
        end
    next
end
```

3. Configure the BGP neighbors:

```
config router bgp
    set router-id 172.31.0.65
    config neighbor
        edit "172.31.0.1"
            set route-map-out "out_sla"
            set route-map-out-preferable "in_sla"
            set update-source "Loopback0"
        next
        edit "172.31.0.2"
            set route-map-out "out_sla"
            set route-map-out-preferable "in_sla"
            set update-source "Loopback0"
        next
    end
    config network
        edit 1
            set prefix 10.0.3.0 255.255.255.0
        next
    end
end
```

To configure SD-WAN:

1. Configure the SD-WAN members:

```
config system sdwan
    set status enable
    config members
        edit 1
```

```
            set interface "H1_T11"
            set source 172.31.0.65
        next
        edit 4
            set interface "H1_T22"
            set source 172.31.0.65
        next
        edit 6
            set interface "H2_T11"
            set source 172.31.0.65
        next
        edit 9
            set interface "H2_T22"
            set source 172.31.0.65
        next
    end
end
```

2. Configure the health check that must be met:

```
config system sdwan
    config health-check
        edit "HUB"
            set server "172.31.100.100"
            set members 0
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 100
                next
            end
        next
    end
end
```

3. Configure the SD-WAN neighbors:

```
config system sdwan
    config neighbor
        edit "172.31.0.1"
            set member 1 4
            set health-check "HUB"
            set sla-id 1
            set minimum-sla-meet-members 1
        next
        edit "172.31.0.2"
            set member 6 9
            set health-check "HUB"
            set sla-id 1
            set minimum-sla-meet-members 1
        next
```

```
    end
end
```

To verify that when two members to Hub_1/Hub_2 are in SLA, the preferable route map is be applied on BGP neighbors to Hub_1/Hub_2:

```
Branch1_A_FGT (root) # diagnose sys sdwan health-check
Health Check(HUB):
Seq(1 H1_T11): state(alive), packet-loss(0.000%) latency(0.209), jitter(0.017), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(4 H1_T22): state(alive), packet-loss(0.000%) latency(0.171), jitter(0.004), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1
Seq(6 H2_T11): state(alive), packet-loss(0.000%) latency(0.175), jitter(0.014), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(9 H2_T22): state(alive), packet-loss(0.000%) latency(0.176), jitter(0.019), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1
```

```
# diagnose sys sdwan neighbor
Neighbor(172.31.0.1): member(1 4 )role(standalone)
        Health-check(HUB:1)  sla-pass selected alive
Neighbor(172.31.0.2): member(6 9 )role(standalone)
        Health-check(HUB:1)  sla-pass selected alive
```

On Hub_1 and Hub_2, the expected communities have been attached into the spoke's LAN route:

```
Hub_1_FGT (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Wed Dec 29 22:38:29 2021
```

```
Hub_2_FGT (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Wed Dec 29 22:43:10 2021
```

If one member for each neighbor becomes out of SLA, the preferable route map is still applied:

```
Branch1_A_FGT (root) # diagnose sys sdwan health-check
Health Check(HUB):
```

```
Seq(1 H1_T11): state(alive), packet-loss(0.000%) latency(120.207), jitter(0.018), mos(4.338),
bandwidth-up(999999), bandwidth-dw(999997), bandwidth-bi(1999996) sla_map=0x0
Seq(4 H1_T22): state(alive), packet-loss(0.000%) latency(0.182), jitter(0.008), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1
Seq(6 H2_T11): state(alive), packet-loss(0.000%) latency(120.102), jitter(0.009), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0
Seq(9 H2_T22): state(alive), packet-loss(0.000%) latency(0.176), jitter(0.009), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999997), bandwidth-bi(1999996) sla_map=0x1
```

```
# diagnose sys sdwan neighbor
Neighbor(172.31.0.1): member(1 4 )role(standalone)
        Health-check(HUB:1)  sla-pass selected alive
Neighbor(172.31.0.2): member(6 9 )role(standalone)
        Health-check(HUB:1)  sla-pass selected alive
```

```
Hub_1_FGT (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Thu Dec 30 10:44:47 2021
```

```
Hub_2_FGT (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Wed Dec 29 22:43:10 2021
```

If both members for Hub_1 become out of SLA, the default route map is applied:

```
Branch1_A_FGT (root) # diagnose sys sdwan health-check
Health Check(HUB):
Seq(1 H1_T11): state(alive), packet-loss(0.000%) latency(120.194), jitter(0.018), mos(4.338),
bandwidth-up(999999), bandwidth-dw(999997), bandwidth-bi(1999996) sla_map=0x0
Seq(4 H1_T22): state(alive), packet-loss(0.000%) latency(120.167), jitter(0.006), mos(4.338),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0
Seq(6 H2_T11): state(alive), packet-loss(0.000%) latency(120.180), jitter(0.012), mos(4.338),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0
Seq(9 H2_T22): state(alive), packet-loss(0.000%) latency(0.170), jitter(0.005), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999997), bandwidth-bi(1999996) sla_map=0x1
```

```
# diagnose sys sdwan  neighbor
Neighbor(172.31.0.1): member(1 4 )role(standalone)
```

```
        Health-check(HUB:1)  sla-fail alive
Neighbor(172.31.0.2): member(6 9 )role(standalone)
        Health-check(HUB:1)  sla-pass selected alive
```

```
Hub_1_FGT (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:2
      Last update: Thu Dec 30 10:57:33 2021
```

```
Hub_2_FGT (root) # get router info bgp network 10.0.3.0/24

Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Wed Dec 29 22:43:10 2021
```

Allow SD-WAN hubs to suppress BGP routes when all links to a spoke are down

The feature enables hubs to detect when a spoke is dead (no SLA probes over a configurable duration) and suppress routes to that spoke. A BGP route-map-out is used to match this suppression status, and adjusts the multiple exit discriminator (MED) to inform BGP peers of the hub to direct traffic to the spoke through another hub.

```
config system sdwan
    config health-check
        edit <name>
            set update-bgp-route {enable | disable}
        next
    end
end
```

```
config router route-map
    edit <name>
        config rule
            edit 1
                set match-suppress {enable | disable}
            next
        end
```

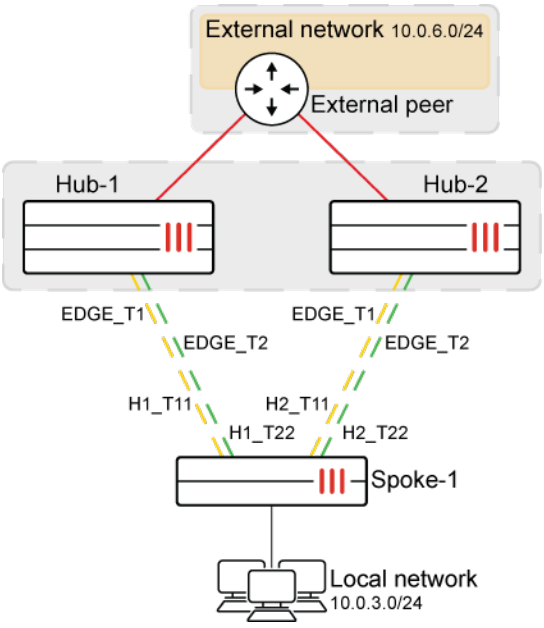
```
    next
end
```

```
config router bgp
    config neighbor
        edit <BGP peer IP>
            set attribute-unchanged med
            set route-map-out "suppress_dead_spoke"
        next
    end
end
```

Example

In this example:

- Spoke-1 has two tunnels, H1_T11 and H1_T22, to Hub-1 and traffic from the external network to spoke-1 normally goes through Hub-1.
- Spoke-1 has two other tunnels, H2_T11 and H2_T22, to Hub-2 and, if all links and tunnels between Spoke-1 and Hub-1 fail, it is expected that traffic from the external network to Spoke-1 will switchover to Hub-2 by advertising Spoke-1's routes with a higher MED from Hub-1 to the external network.



To configure Spoke-1:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "overlay"
        next
```

```
        ...
    end
    config members
        ...
        edit 4
            set interface "H1_T11"
            set zone "overlay"
            set source 172.31.0.65
            ...
        next
        edit 5
            set interface "H1_T22"
            set zone "overlay"
            set source 172.31.0.65
            ...
        next
        ...
        edit 7
            set interface "H2_T11"
            set zone "overlay"
            set source 172.31.0.65
            ...
        next
        edit 8
            set interface "H2_T22"
            set zone "overlay"
            set source 172.31.0.65
            ...
        next
        ...
    end
    config health-check
        edit "HUB"
            set server "172.31.100.100"
            set embed-measured-health enable
            set sla-id-redistribute 1
            ...
            set members 4 5 7 8
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 100
                next
            end
        next
    end
end
```

To configure Hub-1:

1. Configure SD-WAN:
   As long as one probe packet on a member is not received, the member will be considered as *dead*. If all members to Spoke-1 are *dead*, then Spoke-1's routes will be flagged as *suppressed*. `failtime` can be used to control convergence time.

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        ...
        edit "overlay"
        next
    end
    config members
        edit 1
            set interface "EDGE_T1"
            set zone "overlay"
        next
        edit 2
            set interface "EDGE_T2"
            set zone "overlay"
        next
        ...
    end
    config health-check
        edit "rmt"
            set detect-mode remote
            set remote-probe-timeout 1000
            set failtime 1
            set recoverytime 1
            set update-bgp-route enable
            set sla-id-redistribute 1
            set members 1 2
            config sla
                edit 1
                    set link-cost-factor remote
                    ...
                next
            end
        next
    end
end
```

2. Configure route maps:
   Suppressed routes are set with an MED of 999, and normal routes with an MED of 10.

```
config router route-map
    edit "ACTION_SUPPRESS"
        config rule
```

```
            edit 1
                set match-suppress enable
                set set-metric 999
            next
            edit 2
                set set-metric 10
            next
        end
    next
end
```

3. Configure BGP settings:

```
config router bgp
   ...
    config neighbor
        edit "172.31.0.129"
            ...
            set attribute-unchanged med
            ...
            set route-map-out "ACTION_SUPPRESS"
        next
    end
end
```

To configure Hub-2:

1. Configure SD-WAN:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        ...
        edit "overlay"
        next
    end
    config members
        edit 1
            set interface "EDGE_T1"
            set zone "overlay"
        next
        edit 2
            set interface "EDGE_T2"
            set zone "overlay"
        next
        ...
    end
    config health-check
        edit "rmt"
            set detect-mode remote
```

```
            set remote-probe-timeout 1000
            set failtime 1
            set recoverytime 1
            set update-bgp-route enable
            set sla-id-redistribute 1
            set members 1 2
            config sla
                edit 1
                    set link-cost-factor remote
                    ...
                next
            end
        next
    end
end
```

2. Configure route maps:
   Suppressed routes are set with an MED of 999, and normal routes with an MED of 20.

```
config router route-map
    edit "ACTION_SUPPRESS"
        config rule
            edit 1
                set match-suppress enable
                set set-metric 999
            next
            edit 2
                set set-metric 20
            next
        end
    next
end
```

3. Configure BGP settings:

```
config router bgp
   ...
    config neighbor
        edit "172.31.0.129"
            ...
            set attribute-unchanged med
            ...
            set route-map-out "ACTION_SUPPRESS"
        next
    end
end
```

To test the configuration:

1. The SLA status detected by the remote health-check on Hub-1 indicates that the two connections between Hub-1 and Spoke-1 are alive:

```
# diagnose sys sdwan  health-check remote
Remote Health Check: rmt(2)
  Passive remote statistics of EDGE_T2(46):
EDGE_T2_0(10.0.0.14): timestamp=10-15 15:59:46.694, src=172.31.0.65, latency=0.233,
jitter=0.010, pktloss=0.000%, mos=4.404, SLA id=1(pass), rmt_ver=2, rmt_sla=in, rmt_prio=150,
last_sla_change=10-15 15:06:36.610
Remote Health Check: rmt(1)
  Passive remote statistics of EDGE_T1(45):
EDGE_T1_0(172.31.0.65): timestamp=10-15 15:59:46.694, src=172.31.0.65, latency=0.276,
jitter=0.029, pktloss=0.000%, mos=4.404, SLA id=1(pass), rmt_ver=2, rmt_sla=in, rmt_prio=100,
last_sla_change=10-15 15:06:36.609

DC1_A_FGT (root) (Interim)# diagnose sys link-monitor dynamic-bgp-peers
172.31.0.65(0): alive-count=2, total=2, route-suppressed=0, last_route_change=10-15
15:06:33.999
```

2. The external peer receives Spoke-1's routes from Hub-1 and Hub-2.

   The route received from Hub-1 is set as MED 10 and preferred. The route received from Hub-2 is set as MED 20.

```
# get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (2 available, best #1, table Default-IP-Routing-Table)
  Advertised to non peer-group peers:
   172.31.0.2
  Advertised to peer-groups:
  "EDGE"
  Original VRF 0
  65001
    172.31.0.1 from 172.31.0.1 (172.31.0.1)

      Origin IGP distance 20 metric 10, localpref 100, valid, external, best
      Community: 10:2
      Last update: Wed Oct 15 15:06:52 2025

  Original VRF 0
  65001
    172.31.0.2 from 172.31.0.2 (172.31.0.2)
      Origin IGP distance 20 metric 20, localpref 100, valid, external
      Community: 10:2
      Last update: Wed Oct 15 15:00:54 2025
```

3. Send traffic from external network to Spoke-1's network. The traffic will go through Hub-1 and reach Spoke-1 on H1_T11:

```
# diagnose sniffer packet any 'host 10.0.6.1' 4
interfaces=[any]
filters=[host 10.0.6.1]
9.053176 H1_T11 in 10.0.6.1 -> 10.0.3.2: icmp: echo request
9.053584 port4 out 10.0.6.1 -> 10.0.3.2: icmp: echo request
9.053689 port4 in 10.0.3.2 -> 10.0.6.1: icmp: echo reply
9.053760 H1_T11 out 10.0.3.2 -> 10.0.6.1: icmp: echo reply
```

```
10.077224 H1_T11 in 10.0.6.1 -> 10.0.3.2: icmp: echo request
10.077354 port4 out 10.0.6.1 -> 10.0.3.2: icmp: echo request
10.077463 port4 in 10.0.3.2 -> 10.0.6.1: icmp: echo reply
10.077526 H1_T11 out 10.0.3.2 -> 10.0.6.1: icmp: echo reply
...
```

4. Disable H1_T11 on Spoke-1. Hub-1 will detect it and consider it as dead, as a result, traffic will switch to H1_T22.

   Once probe packet cannot be received on the member from Spoke-1, no statistics will be shown, and the `alive-count` is changed from `2` to `1`.

```
# diagnose sys sdwan  health-check remote
Remote Health Check: rmt(2)
  Passive remote statistics of EDGE_T2(46):

543.113468 H1_T22 in 10.0.6.1 -> 10.0.3.2: icmp: echo request
543.113602 port4 out 10.0.6.1 -> 10.0.3.2: icmp: echo request
```

5. Disable H1_T22 on Spoke-1 as well. All connections between Hub-1 and Spoke-1 are dead. At this point, Spoke-1's routes will be flagged as `suppressed` and set as `med 999`, then advertised to the external peer. As a result, traffic will switch over to Hub-2 and reach Spoke-1 on H2_T11.

   The `alive-count` is also changed from `1` to `0` and the route received from Hub-2 is set as med 20 and preferred.

Local out traffic

Local out, or self-originating, traffic is traffic that originates from the FortiGate going to external servers and services. The traffic can be from Syslog, FortiAnalyzer logging, FortiGuard services, remote authentication, and others.

By default, local out traffic relies on routing table lookups to determine the egress interface that is used to initiate the connection. However, many types of local out traffic support selecting the egress interface based on SD-WAN or manually specified interfaces. When manually specifying the egress interface, ensure it is the actual

physical interface through which traffic exits the FortiGate. In such cases, the source IP address may also be manually configured, even if it is not assigned to that interface.

Go to *Network* > *Local Out Routing* to configure the available types of local out traffic. Some types of traffic can only be configured in the CLI.

By default *Local Out Routing* is not visible in the GUI. Go to *System* > *Feature Visibility* to enable it. See Feature visibility on page 3820 for more information.

When VDOMs are enabled, the following entries are available on the local out routing page:

Global view	VDOM view
External Resources	**LDAP Servers**
AWS_IP_Blacklist	ldap
AWS_Malware_Hash	**Log**
Log	Log FortiAnalyzer Override Settings
Log FortiAnalyzer Setting	Log Syslogd Override Settings
Log FortiAnalyzer Cloud Setting	**RADIUS Servers**
FortiGate Cloud Log Settings	fac_radius_server
Log Syslogd Setting	**TACACS+**
System	TACACS
System DNS	
System FortiGuard	
System FortiSandbox	

If a service is disabled, it is grayed out. To enable it, select the service and click *Enable Service*. If a service is enabled, there is a *Local Out Setting* button in the gutter of that service's edit page to directly configure the local-out settings.

Examples

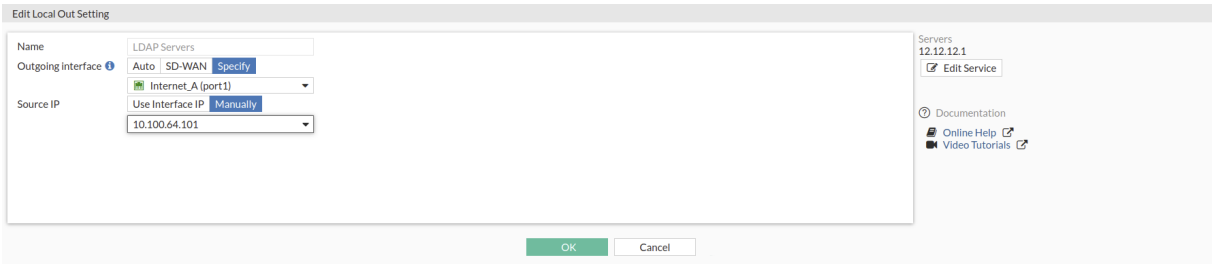
To configure DNS local-out routing:

1. Go to *Network* > *Local Out Routing* and double-click *System DNS*.
2. For *Outgoing interface*, select one of the following:

Auto	Select the outgoing interface automatically based on the routing table.
SD-WAN	Select the outgoing interface using the configured SD-WAN interfaces and rules.
Specify	Select the outgoing interface from the dropdown.

Use Interface IP	Use the primary IP, which cannot be configured by the user.
Manually	Selected an IP from the list, if the selected interface has multiple IPs configured.

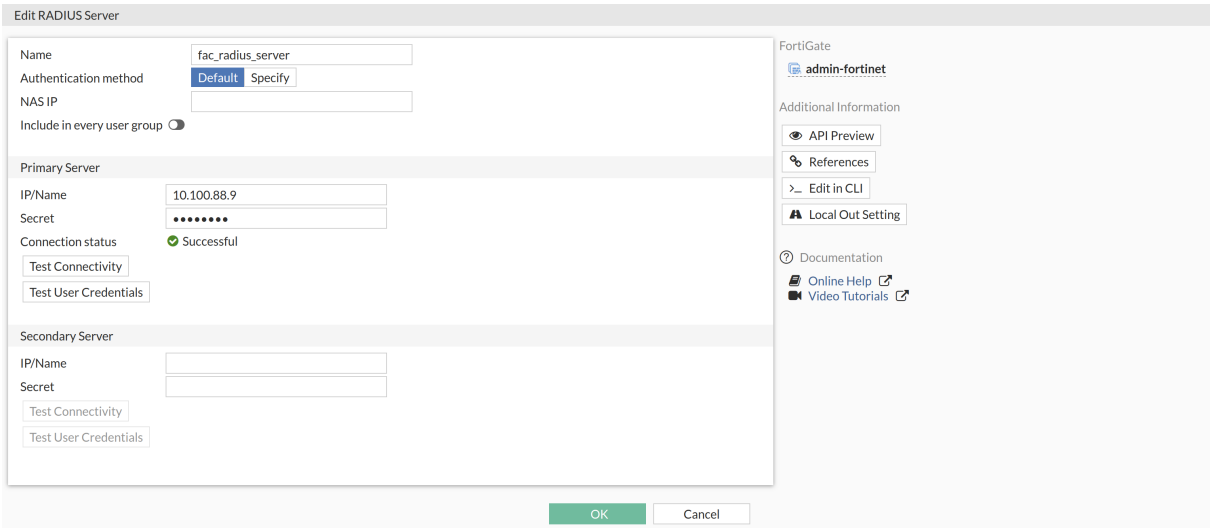
3. If *Specify* is selected, select a setting for *Source IP*:



4. Click *OK*.

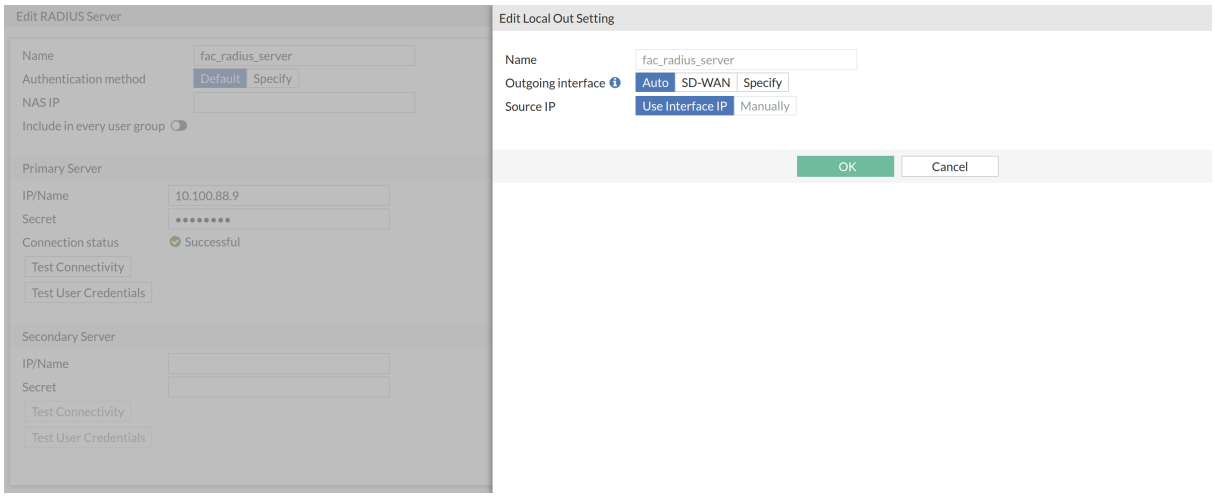
To edit local-out settings from a RADIUS server entry:

1. Go to *User & Authentication* > *RADIUS Servers* and double-click an entry to edit it.
2. Click *Local Out Setting*.



The *Edit Local Out Setting* pane opens.

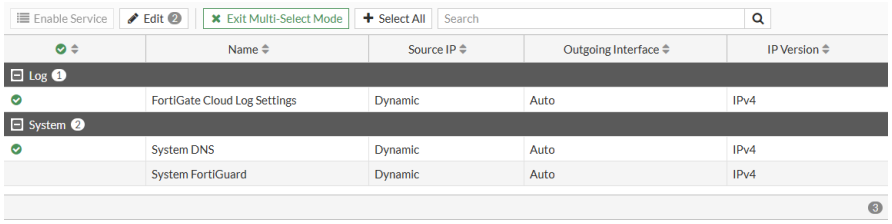
3. Configure the settings for *Outgoing interface* and *Source IP*.



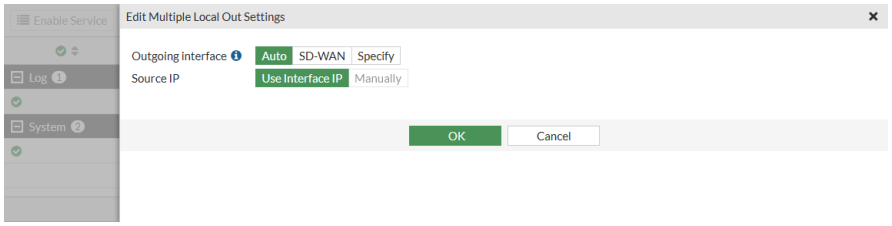
4. Click *OK*.

To edit multiple entries concurrently:

1. Go to *Network* > *Local Out Routing*.
2. If applicable, select *IPv4* or *IPv6*. *IPv4+IPv6* does not support multi-select.
3. Click *Multi-Select Mode*. All of the local out settings that can be edited concurrently are shown.
4. Select the specific entries, or click *Select All* to select all of the entries.



5. Click *Edit* and configure the local out settings as required.



6. Click *OK*.
7. Click *Exit Multi-Select Mode* to return to the normal view.

Configuring local out routing in the CLI

Some local out routing settings can only be configured using the CLI.

PING

IPv4 and IPv6 pings can be configured to use SD-WAN rules:

```
execute ping-options use-sdwan {yes | no}
execute ping6-options use-sd-wan {yes | no}
```

Traceroute

IPv4 traceroute can be configured to use SD-WAN rules:

```
execute traceroute-options use-sdwan {yes | no}
```

Central management

Central management traffic can use SD-WAN rules or a specific interface:

```
config system central-management
    set interface-select-method {auto | sdwan | specify}
    set interface <interface>
end
```

NTP server

NTP server traffic can use SD-WAN rules or a specific interface:

```
config system ntp
    config ntpserver
        edit <id>
            set interface-select-method {auto | sdwan | specify}
            set interface <interface>
        next
    end
end
```

DHCP proxy

DHCP proxy traffic can use SD-WAN rules or a specific interface:

```
config system settings
    set dhcp-proxy-interface-select-method {auto | sdwan | specify}
    set dhcp-proxy-interface <interface>
end
```

dhcp-proxy-interface-select-method {auto | sdwan | specify}	Select the interface selection method: • `auto`: Set the outgoing interface automatically (default). • `sdwan`: Set the interface by SD-WAN or policy routing rules. • `specify`: Set the interface manually.
dhcp-proxy-interface <interface>	Specify the outgoing interface. This option is only available and must be configured when `interface-select-method` is `specify`.

DHCP relay

DHCP relay traffic can use SD-WAN rules or a specific interface:

```
config system interface
    edit <interface>
        set dhcp-relay-interface-select-method {auto | sdwan | specify}
        set dhcp-relay-interface <interface>
    next
end
```

dhcp-relay-interface-select-method {auto | sdwan | specify}	Select the interface selection method: • `auto`: Set the outgoing interface automatically (default). • `sdwan`: Set the interface by SD-WAN or policy routing rules. • `specify`: Set the interface manually.
dhcp-relay-interface <interface>	Specify the outgoing interface. This option is only available and must be configured when `interface-select-method` is `specify`.

CA and local certificate renewal with SCEP

Certificate renewal with SCEP traffic can use SD-WAN rules or a specific interface:

```
config vpn certificate setting
    set interface-select-method {auto | sdwan | specify}
    set interface <interface>
end
```

IPS TLS protocol active probing

TLS active probing can use SD-WAN rules or a specific interface:

```
config ips global
    config tls-active-probe
        set interface-selection-method {auto | sdwan | specify}
        set interface <interface>
        set vdom <VDOM>
        set source-ip <IPv4 address>
        set source-ip6 <IPv6 address>
    end
end
```

interface-select-method {auto | sdwan | specify}	Select the interface selection method: • `auto`: Set the outgoing interface automatically (default). • `sdwan`: Set the interface by SD-WAN or policy routing rules. • `specify`: Set the interface manually.
interface <interface>	Specify the outgoing interface. This option is only available and must be configured when `interface-select-method` is `specify`.
vdom <VDOM>	Specify the VDOM. This option is only available and must be configured when `interface-select-method` is `sdwan` or `specify`.

source-ip <IPv4 address>	Specify the source IPv4 address. This option is only available and must be configured when `interface-select-method` is `sdwan` or `specify`.
source-ip6 <IPv6 address>	Specify the source IPv6 address. This option is only available and must be configured when `interface-select-method` is `sdwan` or `specify`.

NetFlow and sFlow

NetFlow and sFlow can use SD-WAN rules or a specific interface.

The `netflow` command is global, and utilized by the management VDOM. The `vdom-netflow` command is only available for non-management VDOMs.

```
config system {netflow | vdom-netflow}
    set interface-select-method {auto | sdwan | specify}
    set interface <interface>
end
```

```
config system {sflow | vdom-sflow}
    config collectors
        edit <id>
            set interface-select-method {auto | sdwan | specify}
            set interface <interface>
        next
    end
end
```

interface-select-method {auto | sdwan | specify}	Select the interface selection method: • `auto`: Set the outgoing interface automatically (default). • `sdwan`: Set the interface by SD-WAN or policy routing rules. • `specify`: Set the interface manually.
interface <interface>	Specify the outgoing interface. This option is only available and must be configured when `interface-select-method` is `specify`.

FortiClient EMS

FortiClient EMS endpoint control traffic can use SD-WAN rules or a specific interface:

```
config endpoint-control fctems
    edit 1
        set status enable
        set name fctems1
        set interface-select-method {auto | sdwan | specify}
        set interface <interface>
    next
end
```

TACACS+

System log entries can be sent to external TACACS+ accounting servers. TACACS+ traffic can use SD-WAN rules or a specific IP address:

```
config log tacacs+accounting setting
    set interface-select-method {auto | sdwan | specify}
    set source-ip <IP address>
end
```

SNMP

SNMP Trap traffic can use SD-WAN rules or a specific interface:

```
config system snmp community
    edit <id>
        config hosts
            edit <id>
                set interface-select-method {auto | sdwan | specify}
            next
        end

config system snmp user
    edit <user>
        set interface-select-method {auto | sdwan | specify}
    next
end
```

Security

Effective security within Fortinet's SD-WAN architecture begins with grouping interfaces into logical zones, such as “overlay” and “underlay.” These zones allow administrators to apply tailored firewall rules and security profiles to sets of interfaces serving similar functions. Not only does this simplify configuration, but it also ensures consistency and clarity in enforcing security policies across the network. An additional benefit is a reduction in the needed firewall policies to secure the traffic. As SD-WAN intelligence will steer application traffic between multiple interfaces as link performance fluctuates, the member interfaces grouped into zones are then used as the destination in firewall policies.

A critical principle of SD-WAN security is applying security at the originating site, particularly in hub-and-spoke topologies. This “shift-left” approach helps organizations address vulnerabilities at the earliest stage possible, reducing both cost and risk. By catching threats before they propagate downstream, you minimize potential damage to connected systems and users. This is particularly clear when implementing ADVPN, where spoke to spoke traffic may bypass the hub FortiGate completely. Often hubs typically maintain permissive policies for transit traffic, but will still implement security for policies that protect and provide access to hosted workloads.

Different traffic paths (e.g., direct internet access vs. corporate datacenter access) call for distinct security treatments. Rather than deploying a one-size-fits-all profiles, using purpose-built security profiles ensures that inspections are efficient and relevant. Mismatching security measures and traffic flows wastes resources and can create blind spots or increase false positives. Similarly, tuning each profile to reflect its target traffic type is

essential. For example, a profile designed to protect a high-volume application server will have different thresholds, protocols, and inspection requirements compared to one safeguarding user web browsing.

Advanced configuration

The following topics provide instructions on SD-WAN advanced configuration:

- HA on page 1429
  - SD-WAN with FGCP HA on page 1429
  - Configuring SD-WAN in an HA cluster using virtual VLAN switch on page 1436
  - Configuring SD-WAN in an HA cluster using internal hardware switches on page 1439
- SD-WAN configuration portability on page 1443
- SD-WAN segmentation over a single overlay on page 1448
- SD-WAN segmentation over a single overlay using IPv6 on page 1465
- Copying the DSCP value from the session original direction to its reply direction on page 1473
- Matching BGP extended community route targets in route maps on page 1477
- SD-WAN multi-PoP multi-hub large scale design and failover on page 1483
- SD-WAN traffic shaping and QoS on page 1502

See also Packet distribution for aggregate static IPsec tunnels in SD-WAN on page 3086.

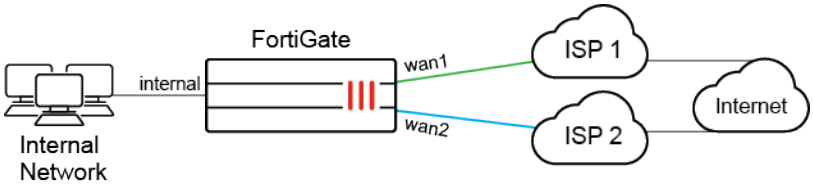
HA

SD-WAN with FGCP HA

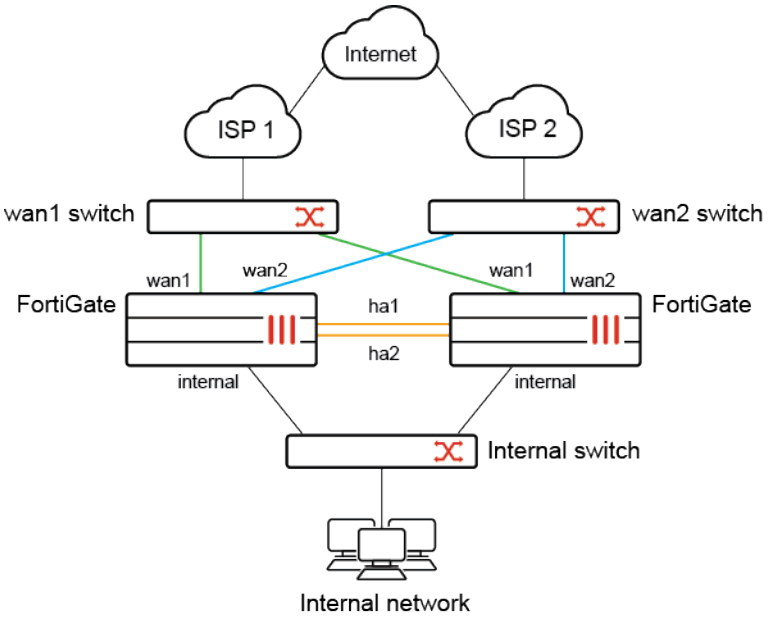
This example shows how to convert a standalone FortiGate SD-WAN solution to a FGCP HA cluster with full-mesh WAN set up. This configuration allows you to load balance your internet traffic between multiple ISP links. It also provides redundancy for your internet connection if your primary ISP in unavailable, or if one of the FortiGates in the HA cluster fails.

This example assumes that a standalone FortiGate has already been configured for SD-WAN by following the SD-WAN quick start on page 989.

Standalone FortiGate:



FGCP HA cluster:



The following devices are required to convert the topology to HA:

- A second FortiGate that is the same model running the same firmware version.
- Two switches for connecting each FortiGate's WAN interface to the corresponding ISP modem.

Before you begin:

- Ensure that the licenses and subscriptions on both HA members match.
- Ensure that there are one or more ports reserved for HA heartbeat.
- Ensure you have physical access to both HA members.

> ⚠ Enabling HA and re-cabling the WAN interfaces will cause network interruptions.
> This procedure should be performed during a maintenance window.

Configuring the standalone FortiGate for HA

After running the following commands, the FortiGate negotiates to establish an HA cluster. You might temporarily lose connectivity with the FortiGate as FGCP negotiations take place and the MAC addresses of the FortiGate interfaces are changed to HA virtual MAC addresses.

This configurations sets the HA mode to active-passive.

The ha1 and ha2 interfaces are configured as the heartbeat interfaces, with priorities set to 200 and 100 respectively. Setting different priorities for the heartbeat interfaces is a best practice, but is not required.

If you have more than one cluster on the same network, each cluster should have a different group ID. Changing the group ID changes the cluster interface's virtual MAC addresses. If the group IP causes a MAC address conflict on your network, select a different group ID.

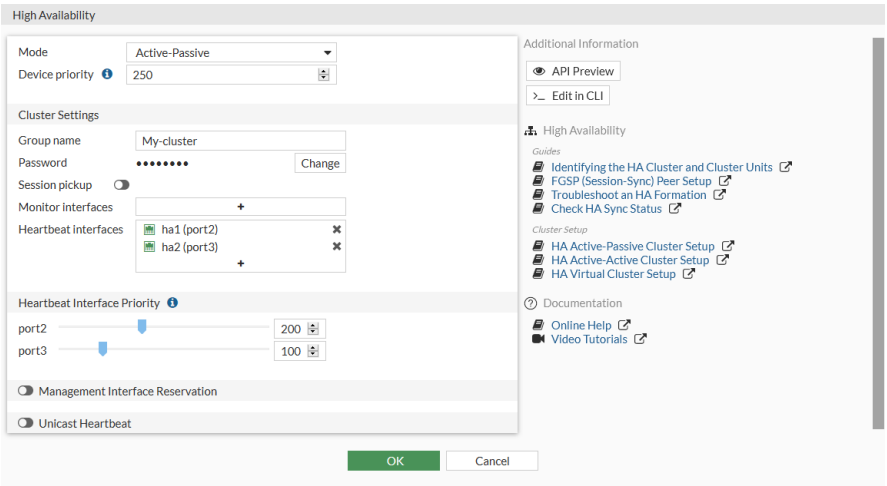
Enabling override and increasing the device priority means that this FortiGate always becomes the primary unit.

To configure the standalone FortiGate for HA in the GUI:

1. Go to *System* > *Settings* and change the *Host name* so that the FortiGate can be easily identified as the primary unit.
2. Go to *System* > *HA* and configure the following options:

Mode	Active-Passive
Device priority	250
Group name	My-cluster
Password	<password>
Heartbeat interfaces	ha1 and ha2
Heartbeat Interface Priority	**port2** (ha1): 200 **port3** (ha2): 100

Override and the group ID can only be configured from the CLI.



3. Click *OK*.
   Connectivity with the FortiGate will temporarily be lost.

To configure the standalone FortiGate for HA in the CLI:

1. Change the host name so that the FortiGate can be easily identified:

```
config system global
    set hostname primary_FG
end
```

2. Configure HA:

```
config system ha
    set mode a-p
    set group-id 100
```

```
    set group-name My-cluster
    set password <password>
    set priority 250
    set override enable
    set hbdev ha1 200 ha2 100
end
```

If HA mode does not start after running the above steps, ensure that none of the FortiGate's interfaces use DHCP or PPPoE addressing.

Configuring the secondary FortiGate for HA

The secondary FortiGate must be the same model and running the same firmware version as the primary FortiGate. The HA settings are the same as the for the primary unit, except the secondary device has a lower priority and override is not enabled.

It is best practice to reset the FortiGate to factory default settings prior to configuring HA. This reduces the chance of synchronization problems.

```
# execute factoryreset
This operation will reset the system to factory default!
Do you want to continue? (y/n) y
```

This is unnecessary if the device is new from the factory.

To configure the secondary FortiGate for HA in the GUI:

1. Go to *System* > *Settings* and change the *Host name* so that the FortiGate can be easily identified as the backup unit.
2. Go to *System* > *HA* and configure the options the same as for the primary FortiGate, except with a lower priority:

Mode	Active-Passive
Device priority	128
Group name	My-cluster
Password	<password>
Heartbeat interfaces	ha1 and ha2
Heartbeat Interface Priority	**port2** (ha1): 200 **port3** (ha2): 100

3. Click *OK*.

To configure the secondary FortiGate for HA in the CLI:

1. Change the host name so that the secondary FortiGate can be easily identified:

```
config system global
    set hostname secondary_FG
end
```

2. Configure HA:

```
config system ha
    set mode a-p
    set group-id 100
    set group-name My-cluster
    set password <password>
    set priority 128
    set hbdev ha1 200 ha2 100
end
```

Connecting the heartbeat interfaces between the FortiGates

To connect and check the heartbeat interfaces:

1. Connect the heartbeat interfaces ha1 and ha2 between the primary and secondary FortiGate.
   a. An HA primary device is selected. Because the primary FortiGate has a higher priority and override enabled, it assumes the role of HA primary.
   b. The secondary FortiGate synchronizes its configuration from the primary device.
2. Verify that the checksums match between the primary and secondary FortiGates:

```
# diagnose sys ha checksum cluster

================== FG5H0XXXXXXXXX0 ==================

is_manage_primary()=1, is_root_primary()=1
debugzone
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad

checksum
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad

================== FG5H0XXXXXXXXX1 ==================

is_manage_primary()=0, is_root_primary()=0
debugzone
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad
```

```
checksum
global: 2b e9 81 38 c2 9d 4f db b7 0e 1f 49 42 c6 1e fb
root: af a6 48 c5 c2 9a 8b 81 a5 53 fb 27 e9 ae 01 6a
all: 89 1f 63 77 48 8a 30 ee 57 06 ca eb 71 e6 8e ad
```

If all of the cluster members have identical checksums, then their configurations are synchronized. If the checksums are not the same, wait for a few minutes, then repeat the command. Some parts of the configuration might take a significant amount of time to synchronize (tens of minutes).

Connecting other traffic interfaces

After the device configurations are synchronized, you can connect the rest of the traffic interfaces. Making these connections will disrupt traffic as cables are disconnected and reconnected.

Switches must be used between the cluster and the ISPs, and between the cluster and the internal network, as shown in the topology diagram.

Checking cluster operations

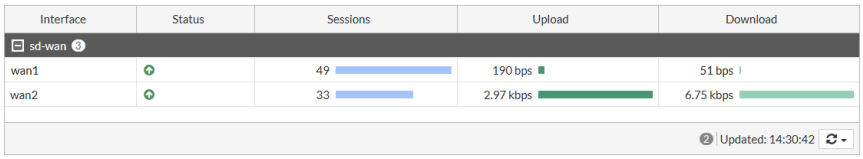
The *HA Status* dashboard widget shows the synchronization status. Hover over the host names of each FortiGate in the widget to verify that they are synchronized and have the same checksum.

To view more information about the cluster status, including the number of sessions passing through the cluster members, go to *System* > *HA*.

See Check HA synchronization status on page 4061 for more information.

Results

1. Browse the internet on a computer in the internal network.
2. Go to *Network* > *SD-WAN* > *SD-WAN Zones* to see the bandwidth, volume, and sessions for traffic on the SD-WAN interfaces. See Results on page 995 for details.
3. Go to *Dashboard* > *Network Monitor* > *SD-WAN* to see information about each interface, such as the number of sessions and the bit rate.



Testing HA failover

All traffic should currently be flowing through the primary FortiGate. If it becomes unavailable, traffic fails over to the secondary FortiGate. When the primary FortiGate rejoins the cluster, the secondary FortiGate continues to operate as the primary FortiGate.

To test this, ping a reliable IP address from a computer in the internal network, and then power off the primary FortiGate.

There will be a momentary pause in the ping results until traffic diverts to the backup FortiGate, allowing the ping traffic to continue:

```
64 bytes from 184.25.76.114: icmp_seq=69 ttl=52 time=8.719 ms\
64 bytes from 184.25.76.114: icmp_seq=70 ttl=52 time=8.822 ms\
64 bytes from 184.25.76.114: icmp_seq=74 ttl=52 time=8.901 ms\
Request timeout for icmp_seq 75\
64 bytes from 184.25.76.114: icmp_seq=76 ttl=52 time=8.860 ms\
64 bytes from 184.25.76.114: icmp_seq=77 ttl=52 time=9.174 ms\
64 bytes from 184.25.76.114: icmp_seq=83 ttl=52 time=8.639 ms}
```

If you are using port monitoring, you can also unplug the primary FortiGate's internet facing interface to test failover.

After the secondary FortiGate becomes the primary, you can log into the cluster using the same IP address as before the fail over. If the primary FortiGate is powered off, you will be logged into the backup FortiGate. Check the host name to verify what device you have logged into. The FortiGate continues to operate in HA mode, and if you restart the primary FortiGate, it will rejoin the cluster and act as the backup FortiGate. Traffic is not disrupted when the restarted FortiGate rejoins the cluster.

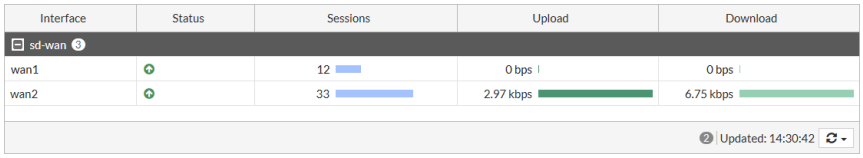
You can also use the CLI to force an HA failover. See Force HA failover for testing and demonstrations on page 4059 for information.

Testing ISP failover

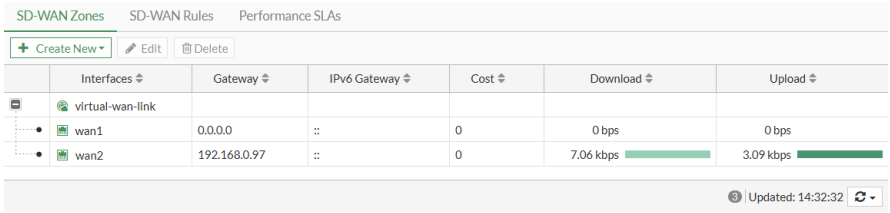
To test a failover of the redundant internet configuration, you need to simulate a failed internet connection to one of the ports. You can do this by disconnecting power from the wan1 switch, or by disconnecting the wan1 interfaces of both FortiGates from ISP1.

After disconnecting, verify that users still have internet access

- Go to *Dashboard* > *Network Monitor* > *SD-WAN*. The *Upload* and *Download* columns for wan1 show that traffic is not going through that interface.



- Go to *Network* > *SD-WAN* > *SD-WAN Zones*. The *Bandwidth*, *Volume*, and *Sessions* tabs show that traffic is entirely diverted to wan2.



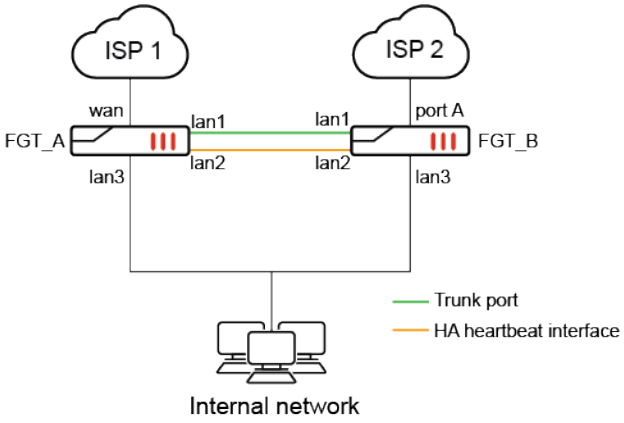
Users on the network should not notice the wan1 failure. If you are using the wan1 gateway IP address to connect to the administrator dashboard, it will appear as though you are still connecting through wan1.

After verifying a successful failover, reestablish the connection to ISP1.

Configuring SD-WAN in an HA cluster using virtual VLAN switch

In this SD-WAN configuration, two FortiGates in an active-passive (A-P) HA pair are used to provide hardware redundancy. Instead of using external switches to provide a mesh network connection to the ISP routers, each FortiGate connects to an ISP and uses a virtual VLAN switch to connect to each other. Virtual VLAN switch mode allows 802.1Q VLANs to be assigned to it, and the configuration of one interface as a trunk port.

Only FortiGate models that support the virtual VLAN switch feature can be used for this solution. See Virtual VLAN switch on page 258 for details.



In this topology:

- An HA cluster of two FortiGate 40Fs is used as an example
- The lan interface is broken up into lan1, lan2 and lan3
- lan1 is connected between FGT_A and FGT_B and designated as a virtual VLAN switch trunk port
- lan2 is used for HA heartbeat, connecting the two FortiGates in HA
- lan3 is connected to the internal network
- wan is connected to ISP1 on FGT_A
- port A is connected to ISP on FGT_B

Two VLANs are created (VLAN 10 and VLAN 20), and assigned to two VLAN switches. Each VLAN switch has the WAN interfaces (wan and port A) as its member.

When FGT_A is the primary device, it reaches ISP1 directly via the local wan interface and reaches ISP2 via the trunk port towards FGT_B. Packets are tagged/untagged as VLAN 10 as it passes through the trunk before egressing on port A on FGT_B.

When FGT_B is the primary device, it reaches ISP2 directly via the local port A interface and reaches ISP1 via the trunk port towards FGT_A. Packets are tagged/untagged as VLAN 20 as it passes through the trunk before egressing on the wan interface on FGT_A.

Using virtual VLAN switches for an SD-WAN HA configuration, as described in this example, requires fewer interfaces than the hardware switch configuration described in Configuring SD-WAN in an HA cluster using internal hardware switches on page 1439

A virtual VLAN switch configuration with 2 WAN connections requires 5 interfaces. With 3 WAN connections, a total of 6 interfaces are required.

For the internal hardware switch solution, each WAN connection requires a corresponding hardware switch interface. With 2 WAN connections, a total of 6 interfaces are needed. With 3 WAN connections, a total of 8 interfaces are needed.

HA failover

This is not a standard HA configuration with external switches. In the case of a device failure, one of the ISPs will no longer be available because the switch that is connected to it will be down.

For example, if FGT_A loses power, HA failover will occur and FGT_B will become the primary unit. Its connection to VLAN 10 over the trunk port will be down, so it will be unable to connect to ISP 1. Its SD-WAN SLAs will be broken, and traffic will only be routed through ISP 2.

SD-WAN SLA health checks should be used to monitor the health of each ISP. HA link monitoring will not be possible, since at least one of the WAN interfaces will be down on each FortiGate at all times.

Configuration

In the configuration example, it is assumed HA A-P mode is already configured and FGT_A and FGT_B are in sync.

To configure the virtual VLAN switch, VLANs and interface settings in the GUI:

1. Enable Virtual VLAN switch from the GUI under the *System* > *Settings* > *General* page. In the *System operation settings* section, enable *VLAN switch mode*. Click *Apply*.
2. Create a new VLAN switch and assign the wan interface in the GUI.
   a. Go to *Network* > *Interfaces* and click *Create New* > *Interface*.
   b. Enter the name *ISP1*
   c. Set the *Type* to *VLAN Switch*.
   d. Enter the *VLAN ID 10*.
   e. Click the + and add the Interface Members. Select the interface *wan*.
   f. Configure the *Address* (192.168.10.99/24) and *Administrative Access* settings as needed.
   g. Click *OK*.
3. Repeat the same steps for a new VLAN switch and assign the port A interface in the GUI.
   a. Go to *Network* > *Interfaces* and click *Create New* > *Interface*.
   b. Enter the name ISP2
   c. Set the Type to VLAN Switch.
   d. Enter the VLAN ID 20.
   e. Click the + and add the Interface Members. Select the interface ‘a’.
   f. Configure the Address (192.168.20.99/24) and Administrative Access settings as needed.

g. Click OK

4. Designate an interface as the trunk port from the CLI:

```
config system interface
    edit lan1
        set trunk enable
    next
end
```

To configure the virtual VLAN switch, VLANs and interface settings in the CLI:

```
config system global
    set virtual-switch-vlan enable
end
config system virtual-switch
    edit "ISP1"
        set physical-switch "sw0"
        set vlan 10
        config port
            edit "wan"
            next
        end
    next
    edit "ISP2"
        set physical-switch "sw0"
        set vlan 20
        config port
            edit "a"
            next
        end
    next
end
config system interface
    edit "ISP1"
        set vdom "root"
        set ip 192.168.10.99 255.255.255.0
        set allowaccess ping
        set type hard-switch
    next
    edit "ISP2"
        set vdom "root"
        set ip 192.168.20.99 255.255.255.0
        set allowaccess ping
        set type hard-switch
    next
end
config system interface
    edit lan1
        set trunk enable
    next
end
```

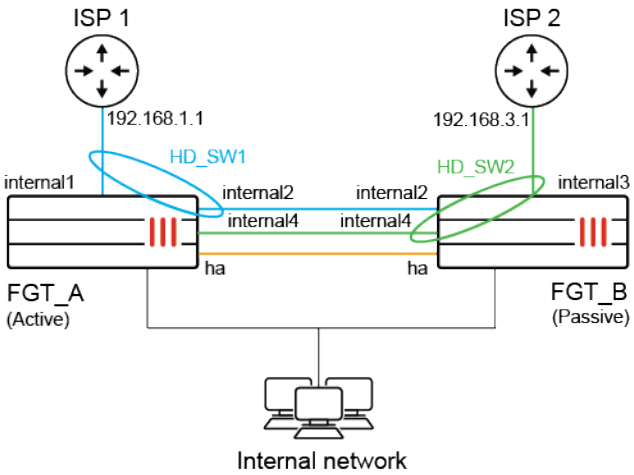
To configure SD-WAN in the GUI:

1. On the FortiGate, go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. In the *Interface* dropdown, select *ISP1*.
3. Leave *SD-WAN Zone* set to *virtual-wan-link*.
4. Enter the *Gateway* address *192.168.10.1*.
5. Click *OK*.
6. Repeat these steps to add the second interface (*ISP2*) with the gateway *192.168.20.1*.
7. Click *Apply*.
8. Create a health check:
   a. Go to *Network* > *SD-WAN*, select the *Performance SLA* tab, and click *Create New*.
   b. Set *Name* to *GW_HC*.
   c. Set *Protocol* to *Ping* and *Servers* to *8.8.8.8*.
   d. Set *Participants* to *All SD-WAN Members*.
   e. Enable *SLA Target* and leave the default values.
   f. Click *OK*.
9. Create SD-WAN rules as needed. The SLA health check can be used to determine when the ISP connections are in or out of SLA, and to failover accordingly.
10. Configure your firewall policy as needed for the virtual-wan-link SD-WAN zone.

Configuring SD-WAN in an HA cluster using internal hardware switches

In this SD-WAN configuration, two FortiGates in an active-passive (A-P) HA pair are used to provide hardware redundancy. Instead of using external switches to provide a mesh network connection to the ISP routers, the FortiGates use their built-in hardware switches to connect to the ISP routers.

> ⚠ Only FortiGate models that have hardware switches can be used for this solution. Ports in a software switch are not in a forwarding state when a FortiGate is acting as a secondary device in a A-P cluster.



In this topology:

- Two hardware switches are created, HD_SW1 and HD_SW2.
- HD_SW1 is used to connect to ISP 1 Router and includes the internal1 and internal2 ports.
- HD_SW2 is used to connect to ISP 2 Router and includes the internal3 and internal4 ports.
- Another interface on each device is used as the HA heartbeat interface, connecting the two FortiGates in HA.

The FortiGates create two hardware switches to connect to ISP 1 and ISP2. When FGT_A is the primary device, it reaches ISP 1 on internal1 in HD_SW1 and ISP 2 on internal4 in HD_SW2. When FGT_B is the primary device, it reaches ISP 1 on internal2 in HD_SW1 and ISP 2 on internal3 on HD_SW2.

HA failover

This is not a standard HA configuration with external switches. In the case of a device failure, one of the ISPs will no longer be available because the switch that is connected to it will be down.

For example, If FGT_A loses power, HA failover will occur and FGT_B will become the primary unit. Its connection to internal2 on HD_SW1 will also be down, so it will be unable to connect to ISP 1. Its SD-WAN SLAs will be broken, and traffic will only be routed through ISP 2.

> ⚠ A link on a hardware switch cannot be monitored in HA monitor, so it is impossible to perform link failure when a port in either of the hardware switches fails. Performing a link failure is unnecessary in this configuration though, because any link failure on the hardware switch will be experienced by both cluster members. SD-WAN SLA health checks should be used to monitor the health of each ISP.

Failure on a hardware switch or ISP router

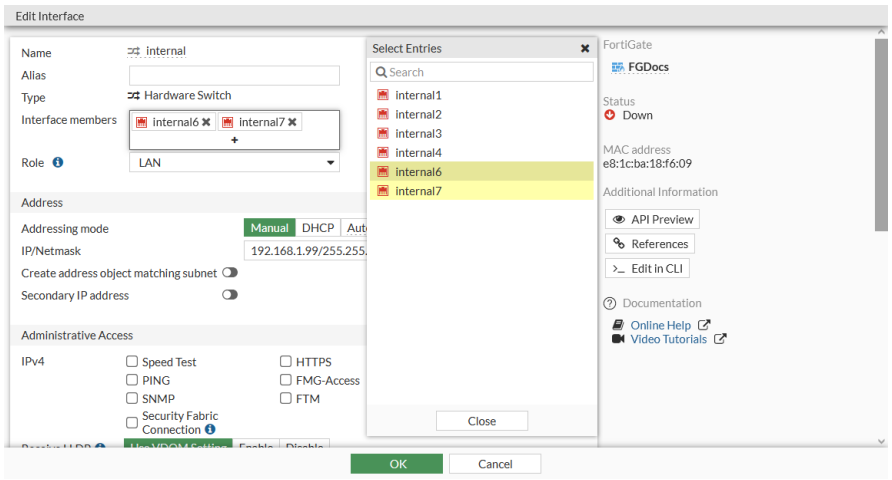
If a hardware switch or switch interface is down, or the ISP router is down, the SD-WAN can detect the broken SLA and continue routing to the other ISP.

For example, if FGT_A is the primary unit, and ISP 2 Router becomes unreachable, the SLA health checks on SD-WAN will detect the broken SLA and cause traffic to stop routing to ISP 2.

Configuration

To configure the HA A-P cluster with internal hardware switches:

1. Configure two FortiGates with internal switches in an A-P HA cluster (follow the steps in HA active-passive cluster setup on page 3940), starting by connecting the heartbeat interface.
2. When the HA cluster is up, connect to the primary FortiGate's GUI.
3. Remove the existing interface members from the default hardware switch:
   a. Go to *Network* > *Interfaces*.
   b. In the *LAN* section, double-click the *internal* interface to edit it.
   c. In *Interface Members*, remove all of the interfaces



d. Click *OK*.

4. Configure the hardware switch interfaces for the two ISPs:

a. Go to *Network* > *Interfaces* and click *Create New* > *Interface*.

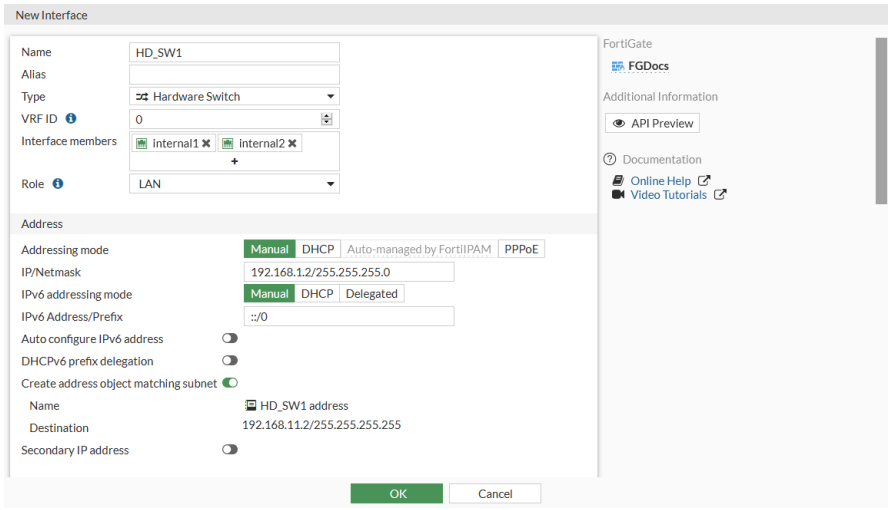
b. Enter a name (*HD_SW1*).

c. Set *Type* to *Hardware Switch*.

d. In *Interface Members*, add two interfaces (*internal1* and *internal2*).

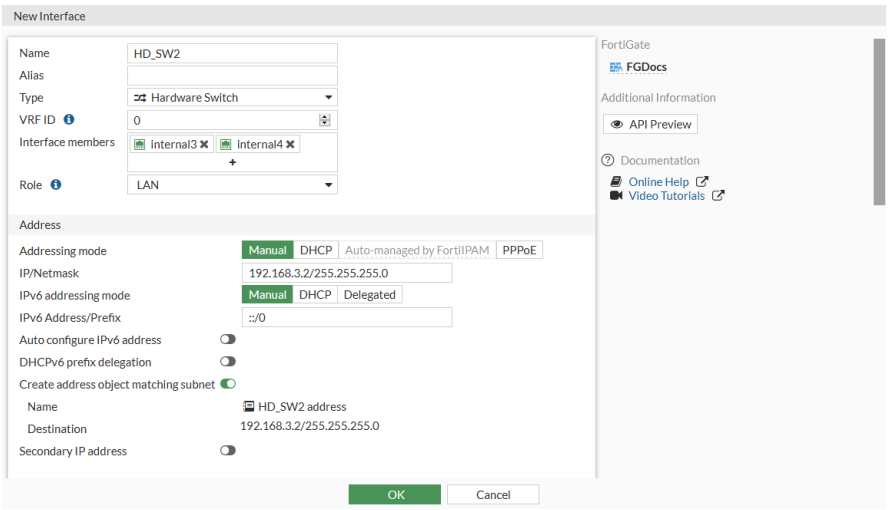
e. Set *IP/Netmask* to 192.168.1.2/24.

f. Configure the remaining settings as needed.



g. Click *OK*.

h. Repeat these steps to create a second hardware switch interface (*HD_SW2*) with two interface members (*internal3* and *internal4*) and *IP/Netmask* set to *192.168.3.2/24*.



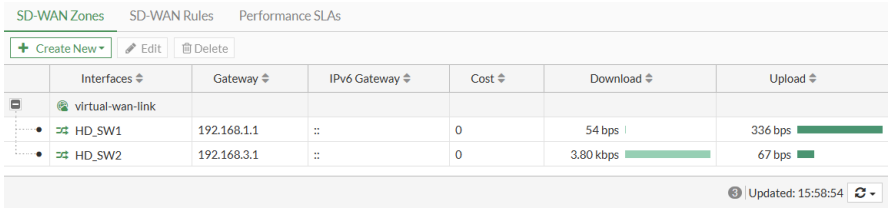
To connect the devices as shown in the topology:

1. Connect the incoming interface to the internal switch on both FortiGates.
2. On FGT_A, connect internal1 of HD_SW1 to ISP 1 Router.
3. On FGT_B, connect internal3 of HD_SW2 to ISP 2 Router.
4. For HD_SW1, connect FGT_A internal2 directly to FGT_B internal2.
5. For HD_SW2, connect FGT_A internal4 directly to FGT_B internal4.

To configure SD-WAN:

> The primary FortiGate makes all the SD-WAN decisions.

1. On the primary FortiGate, go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. In the *Interface* dropdown, select *HD_SW1*.
3. Leave *SD-WAN Zone* set to *virtual-wan-link*.
4. Enter the *Gateway* address *192.168.1.1*.
5. Click *OK*.
6. Repeat these steps to add the second interface (*HD_SW2*) with the gateway *192.168.3.1*.
7. Click *Apply*.



8. Create a health check:
   a. Go to *Network* > *SD-WAN*, select the *Performance SLA* tab, and click *Create New*.
   b. Set *Name* to *GW_HC*.
   c. Set *Protocol* to *Ping* and *Servers* to *8.8.8.8*.

d. Set *Participants* to *All SD-WAN Members*.
e. Enable *SLA Target* and leave the default values.
f. Click *OK*.

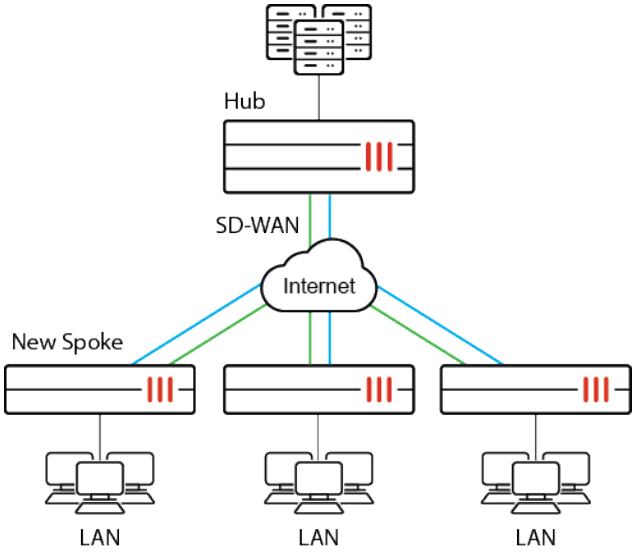
9. Create SD-WAN rules as needed. The SLA health check can be used to determine when the ISP connections are in or out of SLA, and to failover accordingly.

SD-WAN configuration portability

When configuring SD-WAN, adding interfaces to members is optional.

This allows the SD-WAN to be configured without associating any interfaces to SD-WAN members. It also allows a configuration to be copied directly from one device to another, without requiring the devices to have interfaces with the same names.

After the configuration is created, add interfaces to the members make it functional.

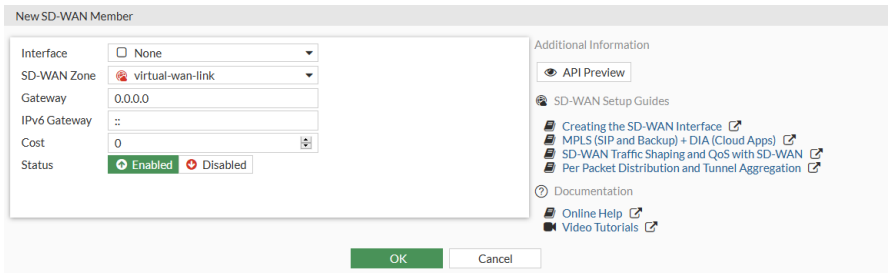


Example 1

In this example, we create a template with two SD-WAN members configured without assigned interfaces that are used in a performance SLA and SD-WAN rule. The template can be used to configure new devices, as in Example 2 on page 1447. Interfaces are then assigned to the members, and the configuration becomes active.

To create the SD-WAN members in the GUI:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. Leave all the settings set to their default values and click *OK*.

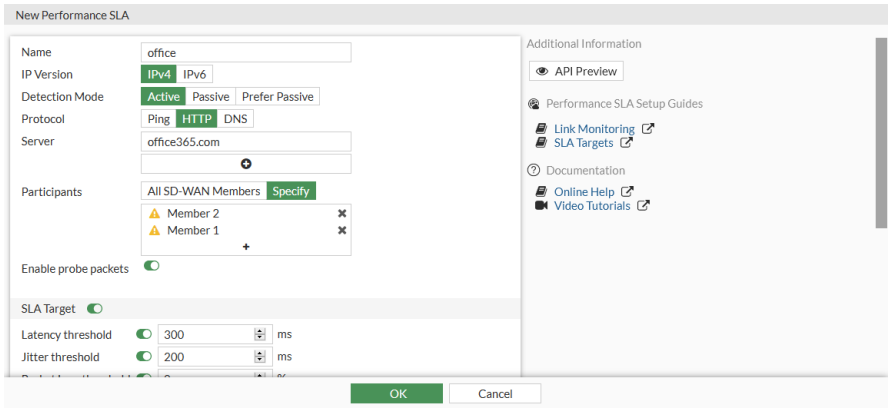


3. Repeat the above steps to create a second member.
   The empty members are listed on the *SD-WAN Zones* tab.

   The members are disabled until interfaces are configured, but can still be used in performance SLAs and SD-WAN rules.

To create a performance SLA in the GUI:

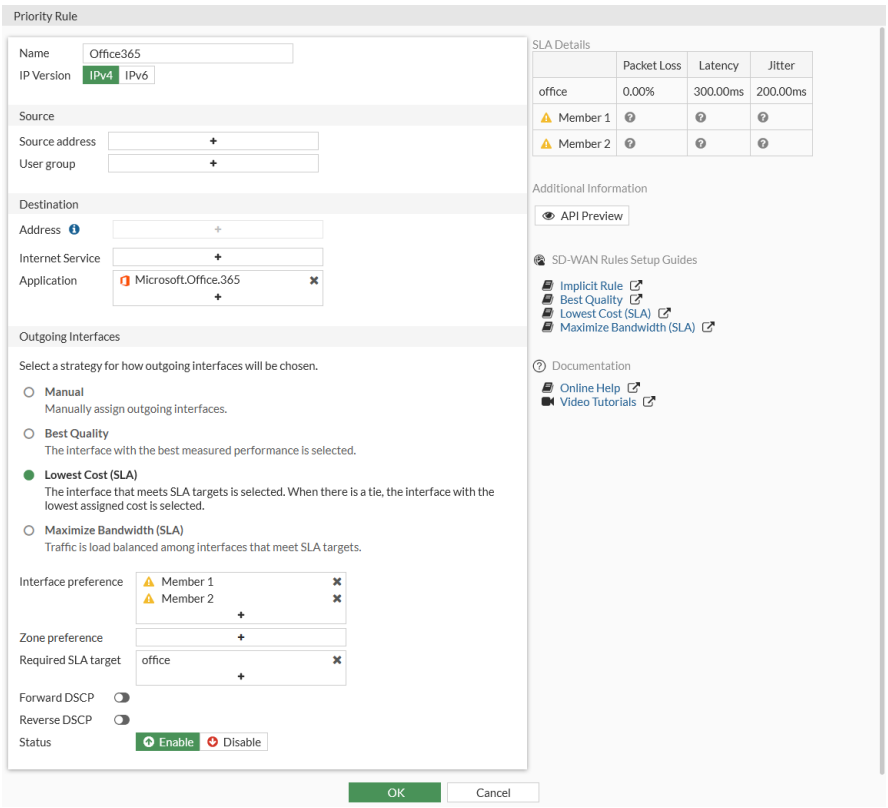
1. Go to *Network* > *SD-WAN* and select the *Performance SLAs* tab.
2. Click *Create New*.
3. Configure the performance SLA, specifying the empty members as participants.



4. Click *OK*.

To create an SD-WAN rule in the GUI:

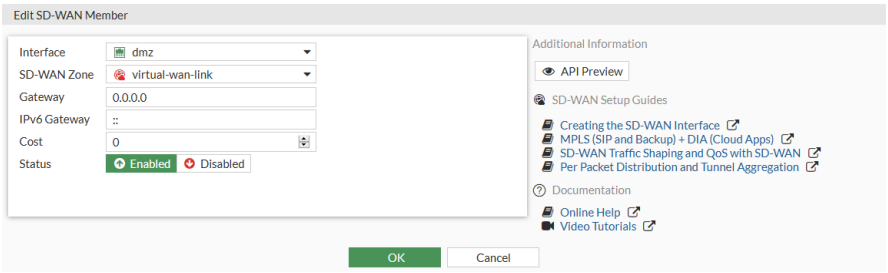
1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Configure the rule, adding both members to the *Interface preference* field:



3. Click *OK*.

To assign interfaces to the SD-WAN members in the GUI:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab.
2. Edit the first member
3. Set *Interface* to an actual interface.



4. Click *OK*.
5. Repeat the above steps to assign an interface to the second member.

To configure the SD-WAN in the CLI:

1. Create SD-WAN members:

```
config system sdwan
    set status enable
    config members
```

```
        edit 1
        next
        edit 2
        next
    end
end
```

2. Create a health check (performance SLA):

```
config system sdwan
    config health-check
        edit "office"
            set server "office365.com"
            set protocol http
            set sla-fail-log-period 300
            set sla-pass-log-period 300
            set members 2 1
            config sla
                edit 1
                    set latency-threshold 300
                    set jitter-threshold 200
                next
                edit 2
                    set link-cost-factor latency
                    set latency-threshold 20
                next
            end
        next
    end
end
```

3. Create a service (rule):

```
config system sdwan
    config service
        edit 3
            set name "Office365"
            set mode sla
            set internet-service enable
            set internet-service-app-ctrl 33182
            config sla
                edit "office"
                    set id 2
                next
            end
            set priority-members 1 2
        next
    end
end
```

The SD-WAN configuration can now be used in as a template for new spokes, as in Example 2 on page 1447.

Example 2

In this example, the configuration from Example 1 is copied onto a new FortiGate.

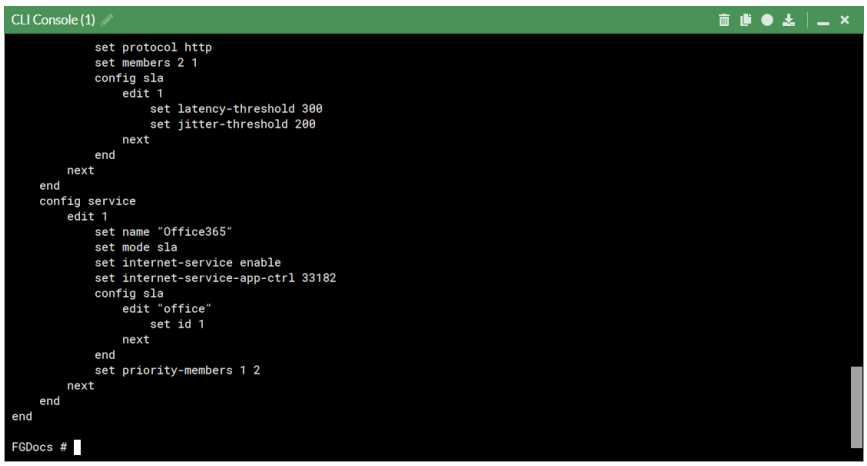
Using the CLI console and the GUI

To copy the SD-WAN configuration from the original FortiGate:

1. Optionally, change the console screen paging setting. See Screen paging on page 81 for details.
2. Open the CLI console.
3. If necessary, click *Clear console* to empty the console.
4. Enter the following command:

```
show system sdwan
```

5. Either click *Download* and open the file in a text editor, or click *Copy to clipboard* and paste the content into a text editor.



6. Edit the CLI configuration as necessary. For example, the first line that shows the `show` command should be deleted, and the default health checks can be removed.
7. If required, save the CLI configuration as a text file.

To paste the SD-WAN configuration onto a new FortiGate:

1. Copy the SD-WAN configuration from the text editor.
2. On the new FortiGate, open the CLI console.
3. Press *Ctrl + v* to paste the CLI commands.
4. In necessary, press *Enter* to apply the last `end` command.

   The SD-WAN configuration is copied to the new FortiGate.

   If the interfaces do not exist, the SD-WAN members are created without interfaces, and are disabled until interfaces are configured.

To assign interfaces to the SD-WAN members:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Zones* tab.
2. Edit the first member
3. Set *Interface* to an actual interface.
4. Click *OK*.
5. Repeat the above steps to assign an interface to the second member.

Using a terminal emulator

The following instructions use PuTTy. The steps may vary in other terminal emulators.

To copy the SD-WAN configuration from the original FortiGate:

1. Connect to the FortiGate. See Connecting to the CLI on page 73 for details.
2. Enter the following command:

```
show system sdwan
```

3. Select the output, press *Ctrl + c* to copy it, and then paste it into a text editor.
4. Edit the CLI configuration as necessary. For example, the default health checks can be removed.
5. If required, save the CLI configuration as a text file.

To paste the SD-WAN configuration onto a new FortiGate:

1. Connect to the new FortiGate. See Connecting to the CLI on page 73 for details.
2. Copy the SD-WAN configuration from the text editor.
3. Right-click to paste the SD-WAN configuration.
4. In necessary, press *Enter* to apply the last `end` command.

   The SD-WAN configuration is copied to the new FortiGate.

   If the interfaces do not exist, the SD-WAN members are created without interfaces, and are disabled until interfaces are configured.

SD-WAN segmentation over a single overlay

SD-WAN, VPN, and BGP configurations support L3 VPN segmentation over a single overlay. In these configurations, a hub and spoke SD-WAN deployment requires that branch sites, or spokes, are able to accommodate multiple companies or departments, and each company's subnet is separated by a different VRF. A subnet on one VRF cannot communicate with a subnet on another VRF between different branches, but can communicate with the same VRF.

SD-WAN options

VRF-aware SD-WAN health checks

SD-WAN on the originating spoke can tag the health check probes with the correct VRF when transmitting to a multi-VRF tunnel. The hub can then forward the probes to the correct health check server in the same VRF as the hub. The IP version (`addr-mode`) can be either IPv4 or IPv6.

```
config system sdwan
   config health-check
       edit <name>
           set vrf <vrf id>
           set source <address>
       next
   end
end
```

Command	Description
`vrf <vrf id>`	Virtual Routing Forwarding ID.
`source <address>`	Source IP address used in the health-check packet to the server.

Overlay stickiness

When a hub has multiple overlays, traffic received on one overlay should egress on the same overlay when possible. The `service-sla-tie-break` option ensures overlay stickiness. In SD-WAN service rules, options are available to ensure that traffic received in a zone stays in that zone.

```
config system sdwan
    config zone
        edit <name>
            set service-sla-tie-break input-device
        next
    end
    config service
        edit <id>
            set input-zone <zone>
            set tie-break input-device
        next
    end
end
```

Command	Description
`service-sla-tie-break input-device`	Members that meet the SLA are selected by matching the input device.
`input-zone <zone>`	Source input-zone name.
`tie-break input-device`	Members that meet the SLA are selected by matching the input device.

IPsec options

Configurable rate limit for shortcut offers sent by the hub

By default, the hub sends a shortcut offer to a spoke every five seconds. If the hub continues to send offers that keep failing, and there are a large number of spokes, this can cause a high load on the hub. This setting makes the interval between shortcut offers configurable.

```
config vpn ipsec phase1-interface
    edit <name>
        set auto-discovery-offer-interval <interval>
    next
end
```

Command	Description
`auto-discovery-offer-interval <interval>`	Interval between shortcut offer messages, in seconds (1 - 300, default = 5).

Segmentation over a single overlay

Segmentation requires that VRF info is encapsulated within the IPsec VPN tunnel. This setting enables multi-VRF IPSEC tunnels. It is only applicable for forwarding traffic, and cannot be used for local-out traffic.

```
config vpn ipsec phase1-interface
    edit <name>
        set encapsulation vpn-id-ipip
    next
end
```

Command	Description
`encapsulation vpn-id-ipip`	VPN ID with IPIP encapsulation.

VPN configuration for BGP

The role of a VRF can be specified, along with other VRF details. Up to 252 VRFs can be configured per VDOM for any device.

```
config router bgp
    config vrf
        edit <vrf>
            set role {standalone | ce | pe}
            set rd <string>
            set export-rt <route_target>
            set import-rt <route_target>
            set import-route-map <route_map>
            config leak-target
                edit <vrf>
```

```
                    set route-map <route-map>
                    set interface <interface>
                next
            end
        next
    end
end
```

Command	Description
`role {standalone | ce | pe}`	VRF role: standalone, customer edge (CE), or provider edge (PE).
`rd <string>`	Route Distinguisher: AA|AA:NN. This option is only available when the role is CE.
`export-rt <route_target>`	List of export route target. This option is only available when the role is CE.
`import-rt <route_target>`	List of import route target. This option is only available when the role is CE.
`import-route-map <route_map>`	Import route map. This option is only available when the role is CE.
`route-map <route-map>`	Route map of VRF leaking.
`interface <interface>`	Interface that is used to leak routes to the target VRF.

In FortiOS 7.0, `config vrf` was `config vrf-leak`, and `config leak-target` was `config target`.

Display BGP routes by VRF and neighbor

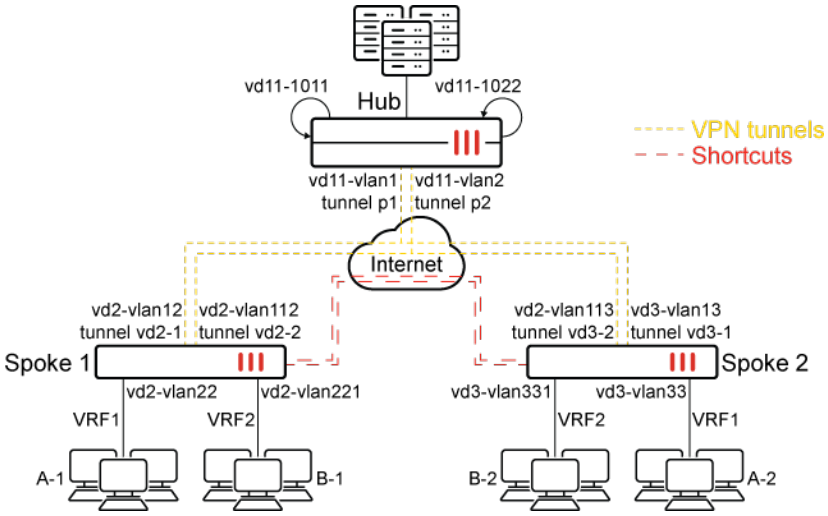
```
# diagnose ip router bgp set-filter vrf <vrf>
# diagnose ip router bgp set-filter neighbor <neighbor address>
# diagnose ip router bgp set-filter reset
# execute router clear bgp vpnv4 unicast soft {in | out}
# get router info filter show
# get router info filter vrf {vrf | all}
```

Examples

In example 1, multiple companies (or departments of a company) share the ADVPN. Company A and company B each have two branches in two different locations. Company A's branches (A-1 and A-2) can talk to each other using the VPN shortcut, but not to company B's branches (B-1 and B-2). Likewise, company B's branches can talk to each other using the VPN shortcut, but not to company A's branches. Traffic can share the tunnels and shortcuts, but cannot be mixed up.

Example 2 shows that performance SLA health checks can be sent from a spoke's VRF to the loopback on the hub that is in the same VRF.

Example 3 shows that when traffic is ingress on the hub on one overlay, it will preferably egress on the same overlay.



Device	Interface	IP Address
Hub	vd11-1011	11.11.11.11
	vd11-1022	11.11.22.11
	vd11-vlan1 tunnel p1	11.1.1.1.11/24 10.10.100.254
	vd11-vlan2 tunnel p2	11.1.2.1.11/24 10.10.200.254
	vd11-vlan10	100.1.1.1/24
Spoke 1	vd2-vlan12 tunnel vd2-1	12.1.1.2 10.10.100.2
	vd2-vlan112 tunnel vd2-2	112.1.1.2 10.10.200.2
	vd2-vlan22	22.1.1.2/24
	vd2-vlan221	22.1.1.2/24
Spoke 2	vd3-vlan13 tunnel vd3-1	13.1.1.3 10.10.100.3
	vd2-vlan113 tunnel vd3-2	113.1.1.3 10.10.200.3
	vd3-vlan33	33.1.1.3/24
	vd3-vlan331	33.1.1.3/24

Example 1

In this example, two spokes each have two tunnels to the hub.

- Each spoke has two VRFs behind it that can use the same IP address or subnets.
- The computers in VRF1 behind spoke 1 can talk to the computers in VRF1 behind spoke 2, but not to any of the computers in the VRF2s behind either spoke.
- The computers in VRF2 behind spoke 1 can talk to the computers in VRF2 behind spoke 2, but not to any of the computers in the VRF1s behind either spoke.

To configure the hub:

```
config router bgp
    set as 65505
    set router-id 11.11.11.11
    set ibgp-multipath enable
    set additional-path enable
    set additional-path-vpnv4 enable
    set cluster-id 11.12.13.14
    set additional-path-select 3

                    [200/0] via 10.10.200.3 [2] (recursive is directly connected, vd2-2_0),
04:44:11, [1/0]
```

To test the configuration on shortcut 1:

1. From VRF1 of spoke 1 ping VRF1 of spoke 2 and from VRF2 of spoke 1 ping VRF2 spoke 2. Both VRF1 and VRF2 source and destination IP addresses are the same, so you can see how the traffic is isolated
2. Check sessions on spoke 1:

   The output `vd=<vdom ID>:<VRF ID>` indicates that sessions are created in and stay in the corresponding VRFs.

   - User at 22.1.1.22 in VRF1 on spoke 1 pings 33.1.1.33 in VRF1 on spoke2.

     ```
     # diagnose sys session list
     session info: proto=1 proto_state=00 duration=21 expire=42 timeout=0 flags=00000000
     socktype=0 sockport=0 av_idx=0 use=3
     origin-shaper=
     reply-shaper=
     ```

```

```

To test the configuration on shortcut 2:

1. From VRF1 of spoke 1 ping VRF1 of spoke 2 and from VRF2 of spoke 1 ping VRF2 spoke 2. Both VRF1 and VRF2 source and destination IP addresses are the same, so you can see how the traffic is isolated
2. Check sessions on spoke 1:

   The output `vd=<vdom ID>:<VRF ID>` indicates that sessions are created in and stay in the corresponding VRFs.

- User at 22.1.1.22 in VRF1 on spoke 1 pings 33.1.1.133 in VRF1 on spoke 2:

```
# diagnose sys session listsession info: proto=1 proto_state=00 duration=17 expire=45

no_ofld_reason:  disabled-by-policy
```

Example 2

In this example, SLA health checks are sent from a spoke's VRF to the loopback on the hub that is in the same VRF.

To configure the health check:

```
config system sdwan
    config health-check
        edit "1"
            set server "11.11.22.11"
            set vrf 1
            set source 22.1.1.2
            set members 1 2
            config sla
                edit 1
                    set latency-threshold 200
                    set jitter-threshold 50
                next
            end
        next
    end
end
```

To check the health check status:

```
# diagnose sys sdwan health-check status  1
Health Check(1):
Seq(1 vd2-1): state(alive), packet-loss(0.000%) latency(0.023), jitter(0.002), mos(4.404),
bandwidth-up(0), bandwidth-dw(0), bandwidth-bi(0) sla_map=0x1
Seq(2 vd2-2): state(alive), packet-loss(0.000%) latency(0.022), jitter(0.002), mos(4.404),
bandwidth-up(0), bandwidth-dw(0), bandwidth-bi(0) sla_map=0x1
```

Example 3

In this example, when traffic from spoke 1 arrives at the hub on tunnel 1, it will egress the hub on tunnel 1 to go to other spokes. If traffic arrives on tunnel 2, it will egress on tunnel 2, and not tunnel 1.

To configure SD-WAN on the hub:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
            set service-sla-tie-break input-device
        next
    end
    config members
        edit 1
            set interface "p1"
        next
        edit 2
            set interface "p2"
        next
    end
```

```
    config health-check
        edit "1"
            set server "22.1.1.2"
            set members 1 2
            config sla
                edit 1
                next
            end
        next
    end
    config service
        edit 1
            set mode sla
            set dst "all"
            config sla
                edit "1"
                    set id 1
                next
            end
            set priority-members 1 2
            set tie-break input-device
        next
    end
end
```

To verify that traffic stays in the same overlay on ingress and egress on the hub:

1. Confirm that the SD-WAN service rule has `Tie break` set to `input-device` so that, when SLAs are met on all of the members, traffic prefers to egress on the same member as the input device:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x200 use-shortcut-sla
 Tie break: input-device
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 p1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    2: Seq_num(2 p2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
  Dst address(1):
        0.0.0.0-255.255.255.255
```

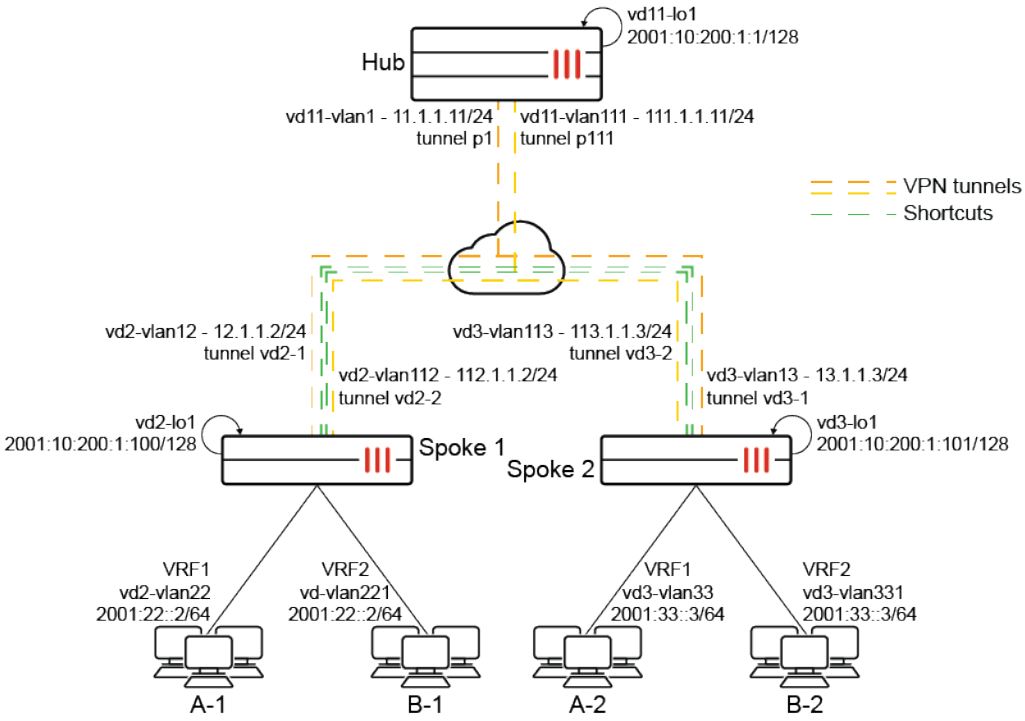
2. Use `diagnose sniffer packet` commands to verify that traffic ingress and egress are on the same overlay.

SD-WAN segmentation over a single overlay using IPv6

IPv6 is supported for SD-WAN segmentation over a single overlay. This allows seamless communication between IPv6 devices within virtual routing and forwarding (VRF) overlay networks, benefiting organizations transitioning to IPv6 or operating in a dual-stack environment.

Example

In this example, multiple companies (or departments of a company) share the ADVPN. Company A and company B each have two branches in two different locations. Company A's branches (A-1 and A-2) can talk to each other using the VPN shortcut, but not to company B's branches (B-1 and B-2). Likewise, company B's branches can talk to each other using the VPN shortcut, but not to company A's branches. Traffic can share the tunnels and shortcuts, but cannot be mixed up.



In this example, two spokes each have two tunnels to the hub.

- Each spoke has two VRFs behind it that can use the same IP address or subnets.
- The computers in VRF1 behind spoke 1 can talk to the computers in VRF1 behind spoke 2, but not to any of the computers in the VRF2s behind either spoke.
- The computers in VRF2 behind spoke 1 can talk to the computers in VRF2 behind spoke 2, but not to any of the computers in the VRF1s behind either spoke.
- Loopback addresses are used for communication between the spokes and the hub instead of tunnel IP address.

> The `exchange-ip-addr6` option allows a loopback IPv6 address to be exchanged between the spokes and the hub in a network. This means that instead of using the tunnel IP address, which is typically used for communication, the loopback IPv6 address is used.

See config router bgp and config router route-map in the CLI Reference for a comprehensive list of commands.

To configure the hub:

1. Configure the BGP settings:

```
config router bgp
    set as 65100
    set router-id 10.200.1.1
    set keepalive-timer 5
    set holdtime-timer 15
    set ibgp-multipath enable
    set network-import-check disable
    set additional-path6 enable
    set additional-path-vpnv6 enable
    set additional-path-select6 4
    config neighbor-group
        edit "EDGEv6"
            set advertisement-interval 1
            set activate disable
            set activate-vpnv4 disable
            set capability-graceful-restart enable
            set next-hop-self-rr6 enable
            set soft-reconfiguration6 enable
            set remote-as 65100
            set update-source "vd11-lo1"
            set additional-path6 both
            set adv-additional-path6 4
            set route-reflector-client6 enable
            set route-reflector-client-vpnv6 enable
        next
    end
    config neighbor-range6
        edit 2
            set prefix6 2001::10:200:1:0/112
            set neighbor-group "EDGEv6"
        next
    end
    config network6
        edit 1
            set prefix6 2001::10:200:1:0/112
        next
    end
    config vrf6
        edit "0"
            set role pe
        next
        edit "1"
            set role ce
            set rd "1:1"
            set export-rt "1:1"
            set import-rt "1:1"
        next
        edit "2"
```

```
            set role ce
            set rd "2:1"
            set export-rt "2:1"
            set import-rt "2:1"
        next
    end
end
```

2. Configure the IPsec phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "p1"
        set type dynamic
        set interface "vd11-vlan1"
        set ike-version 2
        set peertype any
        set net-device disable
        set exchange-ip-addr6 2001::10:200:1:1
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set npu-offload disable
        set dhgrp 5
        set auto-discovery-sender enable
        set encapsulation vpn-id-ipip
        set psksecret **********
        set dpd-retryinterval 60
    next
    edit "p111"
        set type dynamic
        set interface "vd11-vlan111"
        set ike-version 2
        set peertype any
        set net-device disable
        set exchange-ip-addr6 2001::10:200:1:1
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set dpd on-idle
        set npu-offload disable
        set dhgrp 5
        set auto-discovery-sender enable
        set encapsulation vpn-id-ipip
        set psksecret **********
        set dpd-retryinterval 60
    next
end
```

3. Configure the IPsec phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "p1-v6"
        set phase1name "p1"
        set proposal aes128-sha1
        set replay disable
        set src-addr-type subnet6
        set dst-addr-type subnet6
    next
    edit "p111-v6"
        set phase1name "p111"
        set proposal aes128-sha1
        set replay disable
        set src-addr-type subnet6
        set dst-addr-type subnet6
    next
end
```

To configure a spoke:

1. Configure the BGP settings:

```
config router bgp
    set as 65100
    set router-id 10.200.1.100
    set keepalive-timer 5
    set holdtime-timer 15
    set ibgp-multipath enable
    set additional-path6 enable
    set additional-path-vpnv6 enable
    set recursive-next-hop enable
    set tag-resolve-mode merge
    set graceful-restart enable
    set additional-path-select6 4
    config neighbor
        edit "2001::10:200:1:1"
            set advertisement-interval 1
            set activate disable
            set activate-vpnv4 disable
            set capability-dynamic enable
            set capability-graceful-restart6 enable
            set capability-graceful-restart-vpnv6 enable
            set soft-reconfiguration6 enable
            set remote-as 65100
            set route-map-in6 "tag"
            set route-map-in-vpnv6 "tag"
            set connect-timer 10
            set update-source "vd2-lo1"
            set additional-path6 both
            set additional-path-vpnv6 both
        next
    end
    config network6
```

```
        edit 1
            set prefix6 2001:22::/64
        next
        edit 2
            set prefix6 2001::10:200:1:100/128
        next
    end
    config vrf6
        edit "0"
            set role pe
        next
        edit "1"
            set role ce
            set rd "1:1"
            set export-rt "1:1"
            set import-rt "1:1"
        next
        edit "2"
            set role ce
            set rd "2:1"
            set export-rt "2:1"
            set import-rt "2:1"
        next
    end
end
```

2. Configure the IPsec phase 1 interface settings:

```
config vpn ipsec phase1-interface
    edit "vd2-1"
        set interface "vd2-vlan12"
        set ike-version 2
        set peertype any
        set net-device enable
        set exchange-ip-addr6 2001::10:200:1:100
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
chacha20poly1305-prfsha256
        set add-route disable
        set npu-offload disable
        set dhgrp 5
        set auto-discovery-receiver enable
        set encapsulation vpn-id-ipip
        set remote-gw 11.1.1.11
        set psksecret **********
    next
    edit "vd2-2"
        set interface "vd2-vlan112"
        set ike-version 2
        set peertype any
        set net-device enable
        set exchange-ip-addr6 2001::10:200:1:100
        set proposal aes128-sha256 aes256-sha256 aes128gcm-prfsha256 aes256gcm-prfsha384
```

```
chacha20poly1305-prfsha256
        set add-route disable
        set npu-offload disable
        set dhgrp 5
        set auto-discovery-receiver enable
        set encapsulation vpn-id-ipip
        set remote-gw 111.1.1.11
        set psksecret **********
    next
end
```

3. Configure the IPsec phase 2 interface settings:

```
config vpn ipsec phase2-interface
    edit "vd2-1-6"
        set phase1name "vd2-1"
        set proposal aes128-sha1
        set dhgrp 5
        set replay disable
        set auto-negotiate enable
        set src-addr-type subnet6
        set dst-addr-type subnet6
    next
    edit "vd2-2-6"
        set phase1name "vd2-2"
        set proposal aes128-sha1
        set dhgrp 5
        set replay disable
        set auto-negotiate enable
        set src-addr-type subnet6
        set dst-addr-type subnet6
    next
end
```

4. Configure the SD-WAN settings:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "vd2-1"
            set cost 10
        next
        edit 2
            set interface "vd2-2"
            set cost 20
        next
    end
```

```
    config health-check
        edit "ping6"
            set addr-mode ipv6
            set server "2001::10:200:1:1"
            set source6 2001::10:200:1:100
            set members 1 2
            config sla
                edit 1
                next
            end
        next
    end
    config service
        edit 61
            set addr-mode ipv6
            set priority-members 1
            set dst6 "6001-100"
        next
        edit 62
            set addr-mode ipv6
            set priority-members 2
            set dst6 "6100-200"
        next
    end
end
```

To check the spoke 1 routes:

```
# get router info6 routing-table bgp
Routing table for VRF=0
B       2001::10:200:1:0/112 [200/0] via 2001::10:200:1:1 tag 100 (recursive via vd2-1 tunnel
::11.1.1.11), 1d15h41m
(recursive via vd2-2 tunnel ::111.1.1.11), 1d15h41m, [1024/0]
B       2001::10:200:1:101/128 [200/0] via 2001::10:200:1:1 tag 100 (recursive via vd2-1 tunnel
::11.1.1.11), 1d15h41m
(recursive via vd2-2 tunnel ::111.1.1.11), 1d15h41m, [1024/0]

Routing table for VRF=1
B V     2001:33::/64 [200/0] via 2001::10:200:1:101 tag 100 (recursive via vd2-1 tunnel
::11.1.1.11), 1d15h41m
(recursive via vd2-2 tunnel ::111.1.1.11), 1d15h41m, [1024/0]

Routing table for VRF=2
B V     2001:33::/64 [200/0] via 2001::10:200:1:101 tag 100 (recursive via vd2-1 tunnel
::11.1.1.11), 1d15h41m
(recursive via vd2-2 tunnel ::111.1.1.11), 1d15h41m, [1024/0]
```

To test the configuration on shortcut 1:

1. From VRF1 of spoke 1, ping VRF1 of spoke 2.
2. From VRF2 of spoke 1, ping VRF2 spoke 2. Both VRF1 and VRF2 source and destination IP addresses are the same, so you can see how the traffic is isolated.
3. Verify the session list:

```
# diagnose sys session6 list
session6 info: proto=58 proto_state=00 duration=3 expire=59 timeout=0 refresh_dir=both
flags=00000000 sockport=0 socktype=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=may_dirty
statistic(bytes/packets/allow_err): org=416/4/0 reply=416/4/0 tuples=2
tx speed(Bps/kbps): 136/1 rx speed(Bps/kbps): 136/1
orgin->sink: org pre->post, reply pre->post dev=100->223/223->100
hook=pre dir=org act=noop 2001:22::55:398->2001:33::44:128(:::0)
hook=post dir=reply act=noop 2001:33::44:398->2001:22::55:129(:::0)
src_mac=02:4c:a5:fc:77:6f
misc=0 policy_id=1 pol_uuid_idx=1070 auth_info=0 chk_client_info=0 vd=3:2
serial=0001104d tos=ff/ff ips_view=0 app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=61
rpdb_link_id=ff00003d ngfwid=n/a
npu_state=0x1040001 no_offload
no_ofld_reason:  disabled-by-policy non-npu-intf
total session6: 1
```

In the output, `vd=<vdom_ID>:<VRF_ID>` indicates that sessions are created in and stay in the corresponding VRFs.

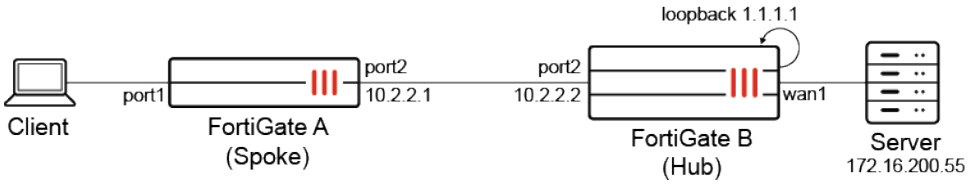
Copying the DSCP value from the session original direction to its reply direction

In an SD-WAN scenario when DSCP tags are used to mark traffic from the spoke to the hub, it is sometimes desirable for the hub to mark the reply traffic with the same DSSP tags. The `diffserv-copy` setting in firewall policy configurations allows the DSCP tag to be copied to the reply direction.

```
config firewall policy
    edit <id>
        set diffserv-copy {enable | disable}
    next
end
```

Example

The use cases in this example are for a hub and spoke SD-WAN deployment. Traffic from the spoke (either real traffic or SLA health check probes) can be marked with a certain DSCP tag when leaving the spoke. QoS may be applied by an upstream device based on the DSCP tag. When the traffic arrives on the hub, the hub may also want to mark the reply traffic to the spoke with the same DSCP tag. This would allow QoS to be applied to the traffic in the reply direction as well, which is traffic in the hub to spoke direction associated with the same session in the spoke to hub direction.



While this topology simplifies the SD-WAN deployment into a single hub and spoke, this feature applies to the following configurations:

- Multiple spokes (branch sites)
- One or more hubs (data center sites)
- Multiple overlays connecting spokes to hubs
- SD-WAN configured on spokes to pick the best overlay

Use case 1: typical forwarding traffic

Traffic originates from the spoke and is destined for a server behind the hub. The spoke marks the traffic with a DSCP tag of 101010. This is done by enabling `diffserv-foward` on the spoke firewall policy. It can also be accomplished by enabling `dscp-forward` in an SD-WAN rule.

The hub allows the traffic in through a firewall policy. By enabling `diffserv-copy` on the firewall policy, it will mark the reply traffic on the corresponding sessions with the same DSCP tag in which it came.

To configure the FortiGates:

1. Configure the firewall policy on the spoke (FortiGate A):

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "virtual-wan-link"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all6"
        set dstaddr6 "all6"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set diffserv-forward enable
        set diffservcode-forward 101010
```

```
    next
end
```

2. Configure the firewall policy on the hub (FortiGate B):

```
config firewall policy
    edit 3
        set srcintf "virtual-wan-link"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set diffserv-copy enable
    next
end
```

To test the configuration:

1. Generate some forwarding traffic.
2. Verify that the session's tos value from the original direction is applied to the reply direction:

```
# diagnose sys session filter policy 3
# diagnose sys session filter dst 172.16.200.55
# diagnose sys session list

session info: proto=1 proto_state=00 duration=35 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=3024/36/1 reply=3024/36/1 tuples=2
tx speed(Bps/kbps): 82/0 rx speed(Bps/kbps): 82/0
orgin->sink: org pre->post, reply pre->post dev=20->17/17->20 gwy=172.16.200.55/10.2.2.1
hook=post dir=org act=snat 10.2.2.1:25290->172.16.200.55:8(172.16.200.2:25290)
hook=pre dir=reply act=dnat 172.16.200.55:25290->172.16.200.2:0(10.2.2.1:25290)
misc=0 policy_id=3 pol_uuid_idx=1097 auth_info=0 chk_client_info=0 vd=3
serial=0000a018 tos=6a/6a app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

Use case 2: local-in traffic destined to a loopback interface

SLA health checks from the spoke are destined for a loopback interface on the hub. The health check is marked with a DSCP tag of 000001 by the spoke. When the hub receives the probes to its loopback, it will mark the replies with the same DSCP tags in which it came.

To configure the FortiGates:

1. Configure the health check on the spoke (FortiGate A):

```
config system sdwan
    config health-check
        edit "ping"
            set server "1.1.1.1"
            set diffservcode 000001
        set members 0
    next
end
```

2. Configure the loopback interface on the hub (FortiGate B):

```
config system interface
    edit "loopback"
        set vdom "vdom1"
        set ip 1.1.1.1 255.255.255.255
        set allowaccess ping https ssh  http telnet
        set type loopback
        set role lan
        set snmp-index 35
    next
end
```

3. Configure the firewall policy on the hub:

```
config firewall policy
    edit 1
        set srcintf "virtual-wan-link"
        set dstintf "loopback"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set diffserv-copy enable
    next
end
```

To test the configuration:

1. Generate some local-in traffic.
2. Verify that the session's tos value from the original direction is applied to the reply direction:

```
# diagnose sys session list

session info: proto=1 proto_state=00 duration=1 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log local may_dirty
statistic(bytes/packets/allow_err): org=80/2/1 reply=80/2/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->in, reply out->post dev=20->42/42->20 gwy=1.1.1.1/0.0.0.0
hook=pre dir=org act=noop 10.2.2.1:15->1.1.1.1:8(0.0.0.0:0)
hook=post dir=reply act=noop 1.1.1.1:15->10.2.2.1:0(0.0.0.0:0)
misc=0 policy_id=1 pol_uuid_idx=0 auth_info=0 chk_client_info=0 vd=3
serial=0001a846 tos=41/41 app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  local disabled-by-policy
total session 1
```

Capture packets can also be used verify that the DSCP value from the original direction is applied to the reply direction.

Matching BGP extended community route targets in route maps

BGP extended community route targets can be matched in route maps. This can be applied in a scenario where the BGP route reflector receives routes from many VRFs, and instead of reflecting all routes from all VRFs, users only want to reflect routes based on a specific extended community route target.

To configure the extended community list:

```
config router extcommunity-list
    edit <name>
        set type {standard | expanded}
        config rule
            edit <id>
                set action {deny | permit}
                set type {rt | soo}
                set match <extended_community_specifications>
                set regexp <ordered_list_of_attributes>
```

```
            next
        end
    next
end
```

`type {standard | expanded}`	Set the extended community list type (standard or expanded).
`action {deny | permit}`	Deny or permit route-based operations based on the route's extended community attribute.
`type {rt | soo}`	Set the extended community type: • rt: route target • soo: site of origin
`match <extended_community_ specifications>`	Set the extended community specifications for matching a reserved extended community (community number in AA:NN format; use quotation marks complex expressions, `"123:234 345:456"`).
`regexp <ordered_list_of_ attributes>`	Set the ordered list of extended community attributes as a regular expression.

To configure the BGP extended community list in the route map:

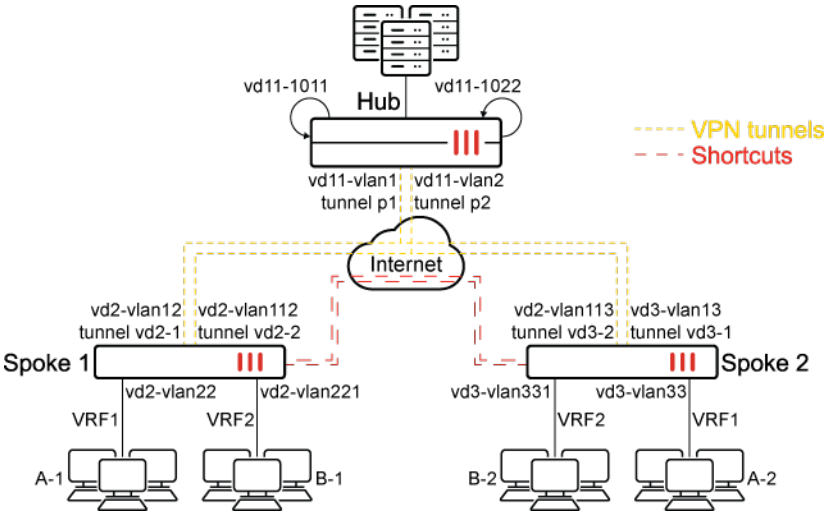
```
config router route-map
    edit <name>
        config rule
            edit <id>
                set match-extcommunity <list>
                set match-extcommunity-exact {enable | disable}
            next
        end
    next
end
```

`match-extcommunity <list>`	Set the BGP extended community list to match to.
`match-extcommunity-exact {enable | disable}`	Enable/disable exact matching of extended communities.

Example

In this example, multiple companies (or departments of a company) share the same hub and spoke VPN infrastructure. Company A and company B each have two branches in two different locations. The goal is for company A's branches (A-1 and A-2) to be able to communicate only with each other over VPN but not with company B's branches. Likewise, company B's branches (B-1 and B-2) can only communicate with each other over VPN but not with company A's. This is accomplished by placing each branch VLAN into their respective VRFs (VRF1 and VRF2), and encapsulating the VRF information within the VPN tunnel. The hub forms BGP peering with its neighbors, spoke 1 and spoke 2, over each IPsec overlay. The hub's BGP route reflector reflects the routes to the corresponding VRFs, allowing each spoke to form ADVPN shortcuts with the other spoke for each VRF.

However, in this scenario, we want A-1 and A-2 to use an ADVPN shortcut, but we do not want B-1 and B-2 to use ADVPN. A route map is configured on the hub to match the desired extended community route target number where only this route target is permitted, and others are denied. This allows the hub's BGP route reflector to only reflect routes associated with VRF1, allowing the spokes to form an ADVPN shortcut for VRF1. Routes associated with VRF2 are not reflected, and each spoke must route traffic through the hub to reach VRF2 on the other spoke.



Device	Interface	IP Address
Hub	vd11-1011	11.11.11.11
	vd11-1022	11.11.22.11
	vd11-vlan1 tunnel p1	11.1.1.1.11/24 10.10.100.254
	vd11-vlan2 tunnel p2	11.1.2.1.11/24 10.10.200.254
	vd11-vlan10	100.1.1.1/24
Spoke 1	vd2-vlan12 tunnel vd2-1	12.1.1.2 10.10.100.2
	vd2-vlan112 tunnel vd2-2	112.1.1.2 10.10.200.2
	vd2-vlan22	22.1.1.2/24
	vd2-vlan221	22.1.1.2/24
Spoke 2	vd3-vlan13 tunnel vd3-1	13.1.1.3 10.10.100.3
	vd2-vlan113 tunnel vd3-2	113.1.1.3 10.10.200.3

Device	Interface	IP Address
	vd3-vlan33	33.1.1.3/24
	vd3-vlan331	33.1.1.3/24

Configure the topology by following the instructions of Example 1 in SD-WAN segmentation over a single overlay on page 1448. Note that when checking the spoke 1 routes in example 1, there is a VRF2 route:

```
Spoke 1 # get router info routing-table bgp
…
Routing table for VRF=2
B V     33.1.1.0/24 [200/0] via 10.10.100.3 [2] (recursive via vd2-1 tunnel 11.1.1.11), 00:00:20,
[1/0]
                    [200/0] via 10.10.200.3 [2] (recursive via vd2-2 tunnel 11.1.2.11), 00:00:20,
[1/0]
```

The following procedure applies a route map on the hub's BGP configurations to limit route reflection to only routes matching the external community target of 1:1. This external community target corresponds to BGP paths for VRF1 learned from spoke 1 and spoke 2. The external community target of 2:1 corresponds to BGP paths for VRF2. By not explicitly permitting this target (2:1) in the community list and denying everything other than the permitted target (1:1) in the route map, the VRF2 BGP paths are essentially omitted from being reflected to the spokes.

To configure BGP filtering for an extended community route target on the hub:

1. Identify the external community target of VRF1 to be permitted:

```
# get router info bgp network 33.1.1.0/24
VRF 0 BGP routing table entry for 33.1.1.0/24
Paths: (2 available, best #2, table Default-IP-Routing-Table)
  Advertised to non peer-group peers:
   11.1.1.1
  Advertised to peer-groups:
  gr1 gr2
…
VRF 1 BGP routing table entry for 33.1.1.0/24
Paths: (2 available, best #2, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0 external duplicated
  Local, (Received from a RR-client)
    0.0.0.0 from 10.10.100.3 (3.3.3.3)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Extended Community: RT:1:1

       Last update: Wed Aug 17 10:31:02 2022
VRF 2 BGP routing table entry for 33.1.1.0/24
Paths: (2 available, best #2, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0 external duplicated
  Local, (Received from a RR-client)
    0.0.0.0 from 10.10.100.3 (3.3.3.3)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Extended Community: RT:2:1
      Receive Path ID: 1
      Advertised Path ID: 1
       Last update: Wed Aug 17 10:31:02 2022
  Original VRF 0 external duplicated
  Local, (Received from a RR-client)
    0.0.0.0 from 10.10.200.3 (3.3.3.3)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Extended Community: RT:2:1
      Receive Path ID: 1
      Advertised Path ID: 2
       Last update: Wed Aug 17 10:31:02 2022
```

2. Configure the extended community list:

```
config router extcommunity-list
    edit "extcomm1"
        config rule
            edit 1
                set action permit
                set match "1:1"
                set type rt
            next
        end
    next
end
```

3. Apply the extended community list to the route map:

```
config router route-map
    edit "rmp11"
        config rule
            edit 1
                set match-extcommunity "extcomm1"
            next
            edit 2
                set action deny
            next
        end
    next
end
```

4. Update the related BGP neighbor group settings:

```
config router bgp
    config neighbor-group
        edit "gr1"
            set route-map-out-vpnv4 "rmp11"
        next
        edit "gr2"
            set route-map-out-vpnv4 "rmp11"
        next
    end
end
```

5. Refresh the routes:

```
# execute router clear bgp all vpnv4 unicast out
```

6. Check the spoke 1 routes. Since the extended community route target is applied, the VFR2 route does not appear in the BGP routing table:

```
# get router info routing-table bgp
Routing table for VRF=0
B*      0.0.0.0/0 [200/0] via 10.10.100.254 (recursive via vd2-1 tunnel 11.1.1.11), 03:47:50,
[1/0]
                  [200/0] via 10.10.200.254 (recursive via vd2-2 tunnel 11.1.2.11), 03:47:50,
[1/0]
B       1.1.1.1/32 [200/0] via 11.1.1.1 [2] (recursive via 12.1.1.1, vd2-vlan12), 03:47:50,
[1/0]

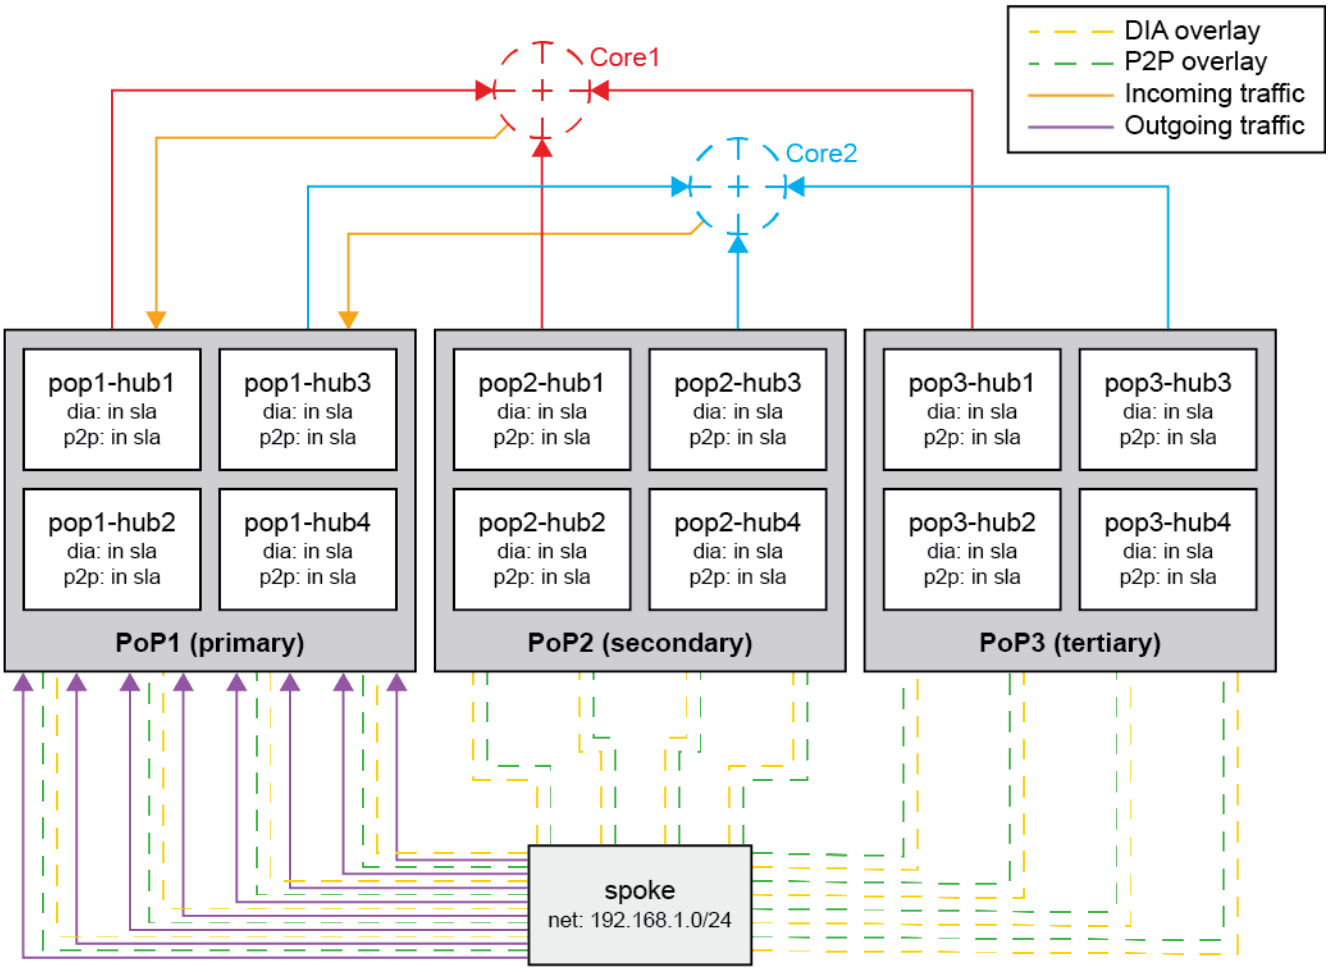
```

SD-WAN multi-PoP multi-hub large scale design and failover

FortiOS 7.2.0 introduced a feature to define the minimum number of SD-WAN interface members that must meet SLA in order for the spoke to select a hub to process its SD-WAN traffic. This design is suitable for a single-PoP multi-hub architecture in order to achieve hub-to-hub failover. See Using multiple members per SD-WAN neighbor configuration on page 1407.

In FortiOS 7.4.1 and later, the design is enhanced to support a multi-PoP multi-hub architecture in which incoming and outgoing traffic failover between PoPs is supported.



Based on the preceding diagram, incoming and outgoing traffic to the spoke is preferred over PoP1. If a single hub within PoP1 goes out of SLA, traffic will continue to flow through the PoP. If the minimum number of members to meet SLA in the PoP cannot be met, then traffic will fail over to PoP2.

The following enhancements have been made to support the multi-PoP failover scenario.

- Add `minimum-sla-meet-members` setting in the SD-WAN zone configurations and `zone-mode` setting in the SD-WAN service configurations:

```
config system sdwan
    config zone
        edit <name>
            set minimum-sla-meet-members <integer>
        next
    end
    config service
        edit <id>
            set mode sla
            set zone-mode {enable | disable}
        next
    end
end
```

When `zone-mode` is enabled on an SD-WAN service rule, the traffic is steered based on the status of the zone.

The state of the health check referenced in the SD-WAN service can be defined as follows:

- If the number of in SLA members in a zone is less than the `minimum-sla-meet-members`, then the zone's state is out of SLA; otherwise, it is in SLA.
- If a zone's state is out of SLA, then all members in the zone are out of SLA.
- If a zone's state is in SLA, then the health check's state of individual members in the zone is determined by its own state.

- Add `service-id` setting in the SD-WAN neighbor configurations:

```
config system sdwan
    config neighbor
        edit <bgp_neighbor_ip>
            set member <member_id>
            set service-id <id>
        next
    end
end
```

The SD-WAN neighbor's behavior can be determined by SD-WAN service and naturally synchronizes with SD-WAN service.

- The SD-WAN service defines priority zones, whose SLA state determines the advertised community preferable string.
- The SD-WAN service defines the `hold-down-time`, which determines how long an advertised community preferable string can be kept when it is expected to be changed.

- Add `sla-stickness` setting in the SD-WAN service configurations:

```
config system sdwan
    config service
        edit <id>
            set mode sla
            set sla-stickiness {enable | disable}
        next
    end
end
```

The switch-over of an existing session is determined as follows:

  - If the outgoing interface of the session is in SLA, then the session can keep its outgoing interface.
  - Otherwise, the session switches to a preferable path if one exists.
- Allow the neighbor group to be configured in the SD-WAN neighbor configurations:

```
config system sdwan
    config neighbor
        edit <bgp_neighbor_group>
            set member <member_id>
            set health-check <name>
            set sla-id <id>
        next
    end
end
```

Outgoing path control

The outgoing path from spoke to hub operates as follows:

1. Overlays to the primary and secondary PoP are assigned separately into an SD-WAN primary and secondary zone on the spoke.
2. One SD-WAN service rule is defined to include these zones as SD-WAN members.
3. When the primary zone is in SLA (`minimum-sla-meet-members` is met), the SD-WAN service rule steers traffic to the in SLA overlay members.
4. When the primary zone is out of SLA (`minimum-sla-meet-members` is not met), the SD-WAN service rule steers traffic to the in SLA overlay members in the secondary zone.
5. When the primary zone SLA is recovered:
   a. If `sla-stickness` is disabled on the SD-WAN service rule, then traffic will wait the duration of the `hold-down-time` before switching back to in SLA overlays in the primary zone.
   b. If `sla-stickness` is enabled on the SD-WAN service rule, then existing traffic will be kept on the in SLA overlays on the secondary zone, but new traffic will be steered to in SLA overlays in the primary zone.

Incoming path control

The incoming traffic from the core/external peers, to PoP, to spoke operates as follows:

1. When the primary zone is in SLA, the spoke uses the preferable route map to advertise local routes with the in SLA community to hubs in the primary and secondary PoPs.
   a. Hubs in the primary PoP translate the in SLA community into a short AS path and advertise it to external peers to attract incoming traffic.
   b. Hubs in the secondary PoP translate the in SLA community into a longer AS path and advertise it to external peers to deflect incoming traffic.
2. If the number of in SLA overlays in the primary zone is less than the `minimum-sla-meet-members`, then the spoke will use the default route map to advertise routes instead of with an out of SLA community to hubs in the primary PoP.
   a. Hubs in the primary PoP translate the out of SLA community into a longest AS path, and advertise it to external peers to deflect incoming traffic.
   b. As a result, inbound traffic is routed to hubs in the secondary PoP.

3. When the primary zone SLA is recovered:
   a. The spoke will wait the duration of the predefined `hold-down-time` in the SD-WAN service rule to use the preferable route map again to advertise routes with the in SLA community to hubs in the primary PoP.
   b. As a result, inbound traffic will be routed back to hubs in the primary PoP.

Neighbor group configuration

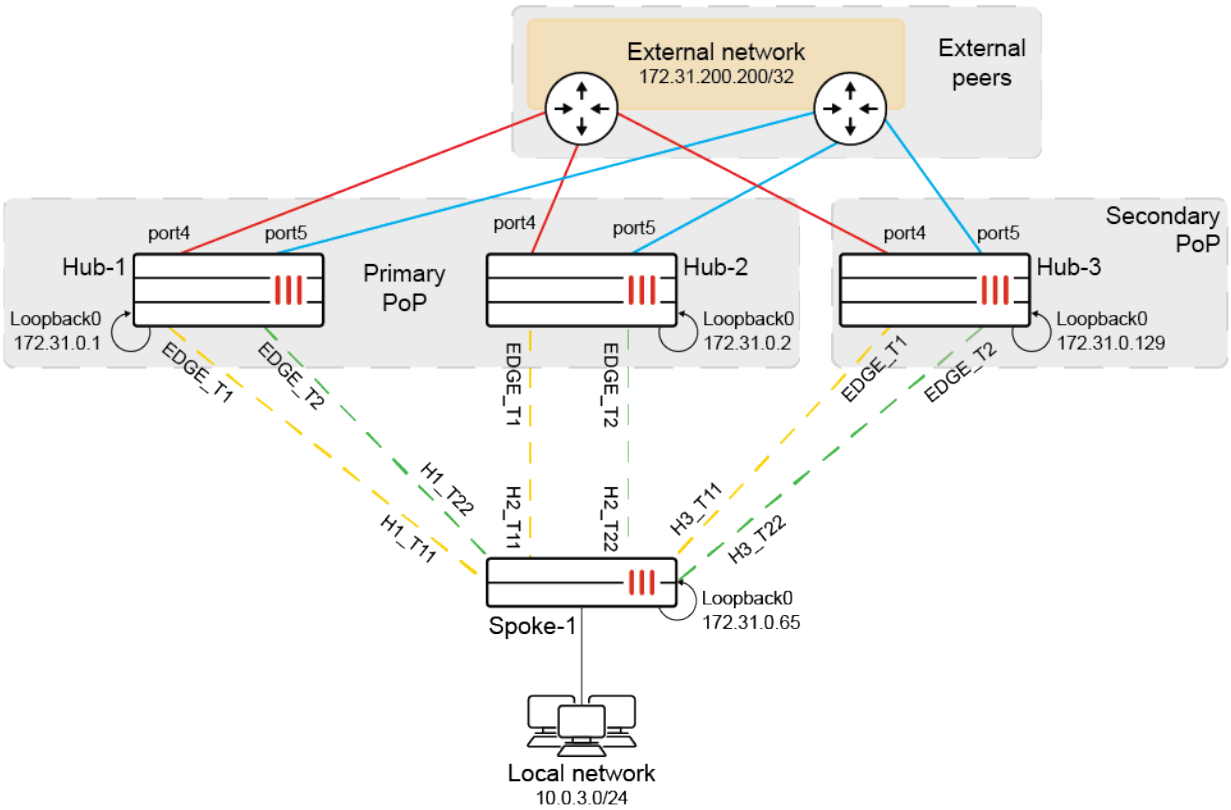
By configuring the neighbor group for spokes under the hub's SD-WAN neighbor configuration, if all paths from the hub to external peers are detected as out of SLA, then the hub will use the default route map to deny external routes to spokes that belong to this neighbor group defined on the hub. As a result, spokes will skip that specific hub and connect to external peers from other hubs.

This allows spokes to only measure overlay quality to each hub, and hubs to manage health checks to services by external peers. This significantly decreases the number of health check probes directly from the spoke to services and decreases the overall complexity. The complexity is further simplified by using multiple VRFs or segmentation where each spoke needs to send health check probes.

Example

This example configuration contains the following components:

- Two PoPs:
  - The primary PoP has two hubs (Hub-1 and Hub-2).
  - The secondary PoP has one hub (Hub-3).
- Spoke-1 has six overlays, with two overlay connections to each hub.
- Spoke-1 has three BGP neighbors, with one BGP neighbor for each hub.
  - All BGP neighbors are established on loopback IPs.
- Each hub has two paths to external peers.



Normally, outbound and inbound traffic go through hubs in the primary PoP. If the number of in SLA overlays to the primary PoP is less than the `minimum-sla-meet-members` (set to 2 in this example), bi-directional traffic needs to be switched to hubs in the secondary PoP. But when the primary PoP recovers and the `minimum-sla-meet-members` is met again, bi-directional traffic is forced back to hubs in the primary PoP after the predefined `hold-down-time` duration.

The hubs do not require SD-WAN configurations to the spokes. However, they use SD-WAN for connections to external peer routers.

Configuring the FortiGates

The following configurations highlight important routing and SD-WAN settings that must be configured on the spoke and the hubs. It is assumed that other configurations such as underlays, IPsec VPN overlays, loopbacks, static routes, and so on are already configured.

To configure Spoke-1:

1. Create the primary (PoP1) and secondary (PoP2) zones, and set the `minimum-sla-meet-members` to 2 on PoP1:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
        edit "PoP1"
```

```
            set minimum-sla-meet-members 2
        next
        edit "PoP2"
        next
    end
end
```

2. Add the overlay members to each zone. Four overlays are defined for PoP1, and two overlays are defined for PoP2:

```
config system sdwan
    config members
        edit 1
            set interface "H1_T11"
            set zone "PoP1"
        next
        edit 2
            set interface "H1_T22"
            set zone "PoP1"
        next
        edit 3
            set interface "H2_T11"
            set zone "PoP1"
        next
        edit 4
            set interface "H2_T22"
            set zone "PoP1"
        next
        edit 5
            set interface "H3_T11"
            set zone "PoP2"
        next
        edit 6
            set interface "H3_T22"
            set zone "PoP2"
        next
    end
end
```

3. Configure a performance SLA health check to a probe server behind the three hubs:

```
config system sdwan
    config health-check
        edit "Hubs"
            set server "172.31.100.100"
            set source 172.31.0.65
            set members 0
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 200
                next
```

```
            end
        next
    end
end
```

4. Configure the service rule with the following settings: use SLA mode, enable zone mode to steer traffic based on the zone statuses, enable `sla-stickiness`, and use a 30-second hold down so that upon a recovery, existing sessions will remain on the secondary PoP while new sessions will switch back to the primary PoP once the 30-second duration ends:

```
config system sdwan
    config service
        edit 1
            set mode sla
            set zone-mode enable
            set dst "all"
            set src "CORP_LAN"
            set hold-down-time 30
            set sla-stickiness enable
            config sla
                edit "Hubs"
                    set id 1
                next
            end
            set priority-zone "PoP1" "PoP2"
        next
    end
end
```

Since the PoP1 zone is specified before PoP2, PoP1 is regarded as the primary and preferred over the PoP2 zone.

5. Configure the in_sla and out_sla route maps that define the communities that are advertised to the hub when the zones are in and out of SLA.
   a. Configure the access list:

```
config router access-list
    edit "net10"
        config rule
            edit 1
                set prefix 10.0.3.0 255.255.255.0
            next
        end
    next
end
```

   b. Configure the route maps:

```
config router route-map
    edit "in_sla"
        config rule
            edit 1
```

```
                set match-ip-address "net10"
                set set-community "10:1"
            next
        end
    next
    edit "out_sla"
        config rule
            edit 1
                set match-ip-address "net10"
                set set-community "10:2"
            next
        end
    next
end
```

6. Configure the default route map for out of SLA scenarios, preferable route map for in SLA scenarios, and the local network to be advertised:

```
config router bgp
    config neighbor
        edit "172.31.0.1"
            ...
            set route-map-out "out_sla"
            set route-map-out-preferable "in_sla"
            ...
        next
        edit "172.31.0.2"
            ...
            set route-map-out "out_sla"
            set route-map-out-preferable "in_sla"
            ...
        next
        edit "172.31.0.129"
            ...
            set route-map-out "out_sla"
            set route-map-out-preferable "in_sla"
            ...
        next
    end
    config network
        edit 1
            set prefix 10.0.3.0 255.255.255.0
        next
    end
    ...
end
```

7. Define SD-WAN neighbors for each hub. The `minimum-sla-meet-members` is configured for the Hub-1 neighbor so that bi-directional traffic goes through Hub-1 as long as the in SLA overlays to Hub-1 are no less than 1. Associate the previously defined service rule to each SD-WAN neighbor:

```
config system sdwan
    config neighbor
        edit "172.31.0.1"
            set member 1 2
            set minimum-sla-meet-members 1
            set service-id 1
        next
        edit "172.31.0.2"
            set member 3 4
            set service-id 1
        next
        edit "172.31.0.129"
            set member 5 6
            set service-id 1
        next
    end
end
```

To configure the hubs:

1. Configure the SD-WAN zone, members, and health check for the external connections to peer routers. Performance SLA health checks are sent to external servers in order to measure the health of the external connections:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "port4"
        next
        edit 2
            set interface "port5"
        next
    end
    config health-check
        edit "external_peers"
            set server "10.0.1.2"
            set members 1 2
            config sla
                edit 1
                    set link-cost-factor latency
                    set latency-threshold 200
                next
            end
        next
    end
end
```

2. Configure the route maps for in and out of SLA scenarios. When out of SLA (one of the external connections is down), external routes are denied to be advertised to the spokes that are part of the neighbor group.
   a. Configure the access list:

```
config router access-list
    edit "net_Lo"
        config rule
            edit 1
                set prefix 172.31.200.200 255.255.255.255
            next
        end
    next
end
```

   b. Configure the route maps:

```
config router route-map
    edit "in_sla"
        config rule
            edit 1
                set match-ip-address "net_Lo"
            next
        end
    next
    edit "out_sla"
        config rule
            edit 1
                set action deny routes
                set match-ip-address "net_Lo"
            next
        end
    next
end
```

3. In the BGP settings, configure the external network prefix to advertise. Then configure the neighbor group and neighbor range for the spokes. Configure the preferable and default route maps to define the behavior when the external connections are in and out of SLA:

```
config router bgp
    ...
    config network
        edit 1
            set prefix 172.31.200.200 255.255.255.255
        next
    end
    config neighbor-group
        edit "EDGE"
            ...
            set route-map-out "out_sla"
            set route-map-out-preferable "in_sla"
            ...
        next
```

```
    end
    config neighbor-range
        edit 1
            set prefix 172.31.0.64 255.255.255.192
            set neighbor-group "EDGE"
        next
    end
    ...
end
```

4. Configure the SD-WAN neighbor to match the neighbor group that includes spokes as members. Specify that at least one of the external peer connections needs to be up to be considered in SLA:

```
config system sdwan
    config neighbor
        edit "EDGE"
            set member 1 2
            set minimum-sla-meet-members 1
            set health-check "external_peers"
            set sla-id 1
        next
    end
end
```

Testing and verification

The following tests use diagnostic commands on various FortiGates to verify the connections in the SD-WAN configuration.

Test case 1: the primary PoP and Hub-1 are in SLA

To verify the configuration:

1. Verify the SD-WAN service rules status on Spoke-1. When all six overlays are in SLA on Spoke-1, the primary PoP and primary zone PoP1 are preferred. In particular, the overlay H1_T11 over PoP1 is preferred:

```
Spoke-1 (root) # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(1), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-order
Hold down time(30) seconds, Hold start at 362646 second, now 362646
  Service role: standalone
  Members(6):
    1: Seq_num(1 H1_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    2: Seq_num(2 H1_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    3: Seq_num(3 H2_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    4: Seq_num(4 H2_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    5: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    6: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
  Src address(1):
        10.0.0.0-10.255.255.255
```

```
  Dst address(1):
        0.0.0.0-255.255.255.255
```

2. Verify the BGP learned routes on Hub-1. The local route with in SLA community 10:1 is advertised to all hubs. Though, the AS paths on Hub-1 and Hub-2 are shorter than Hub-3:

```
PoP1-Hub1 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Mon Jul 17 15:16:57 2023
```

3. Send traffic from a host behind Spoke-1 to 172.31.200.200.
4. Run a sniffer trace on Spoke-1. Traffic leaves and returns on the H1_T11 overlay :

```
Spoke-1 (root) # diagnose sniffer packet any 'host 172.31.200.200' 4
interfaces=[any]
filters=[host 172.31.200.200]
5.098248 port4 in 10.0.3.2 -> 172.31.200.200: icmp: echo request
5.098339 H1_T11 out 10.0.3.2 -> 172.31.200.200: icmp: echo request
5.098618 H1_T11 in 172.31.200.200 -> 10.0.3.2: icmp: echo reply
5.098750 port4 out 172.31.200.200 -> 10.0.3.2: icmp: echo reply
```

Test case 2: a single SD-WAN member on Hub-1 is out of SLA

Hub-1 and PoP1 are still preferred in this scenario.

To verify the configuration:

1. Verify the health check status on Spoke-1. The H1_T11 overlay on Hub-1/PoP1 is out of SLA:

```
Spoke-1 (root) # diagnose sys sdwan health-check
Health Check(Hubs):
Seq(1 H1_T11): state(alive), packet-loss(0.000%) latency(220.214), jitter(0.015), mos(4.104),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0
Seq(2 H1_T22): state(alive), packet-loss(0.000%) latency(0.196), jitter(0.014), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(3 H2_T11): state(alive), packet-loss(0.000%) latency(0.173), jitter(0.008), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995) sla_map=0x1
…
```

2. Verify the SD-WAN neighbor status. The SD-WAN neighbor still displays Hub-1's zone status as pass/alive:

```
Spoke-1 (root) # diagnose sys sdwan neighbor
SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
        Selected role(standalone) last_secondary_select_time/current_time in seconds 0/436439
Neighbor(172.31.0.1): member(1 2)role(standalone)
```

```
        Health-check(:0)  sla-pass selected alive
Neighbor(172.31.0.2): member(3 4)role(standalone)
        Health-check(:0)  sla-pass selected alive
Neighbor(172.31.0.129): member(5 6)role(standalone)
        Health-check(:0)  sla-pass selected alive
```

3. Verify the SD-WAN service rules status. Spoke-1 steers traffic to the H1_T22 overlay through Hub-1:

```
Spoke-1 (root) # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(2), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-order
Hold down time(30) seconds, Hold start at 364162 second, now 364162
  Service role: standalone
  Members(6):
    1: Seq_num(2 H1_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    2: Seq_num(3 H2_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    3: Seq_num(4 H2_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    4: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    5: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    6: Seq_num(1 H1_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
  Src address(1):
        10.0.0.0-10.255.255.255
  Dst address(1):
        0.0.0.0-255.255.255.255
```

4. Verify the BGP learned routes on Hub-1. The hubs continue to receive community 10:1 from the spoke and continue to route incoming traffic through Hub-1:

```
PoP1-Hub1 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Mon Jul 17 15:16:57 2023
```

5. Send traffic from a host behind Spoke-1 to 172.31.200.200.
6. Run a sniffer trace on Spoke-1. Traffic leaves and returns on the H1_T22 overlay:

```
Spoke-1 (root) # diagnose sniffer packet any 'host 172.31.200.200' 4
interfaces=[any]
filters=[host 172.31.200.200]
25.299006 port4 in 10.0.3.2 -> 172.31.200.200: icmp: echo request
25.299080 H1_T22 out 10.0.3.2 -> 172.31.200.200: icmp: echo request
25.299323 H1_T22 in 172.31.200.200 -> 10.0.3.2: icmp: echo reply
25.299349 port4 out 172.31.200.200 -> 10.0.3.2: icmp: echo reply
```

Test case 3: both SD-WAN members on Hub-1 are out of SLA

Other in SLA overlays in zone PoP1 though Hub-2 are still preferred over PoP2 in this scenario.

To verify the configuration:

1. Verify the health check status on Spoke-1. Both H1_T11 and H1_T22 overlays on Hub-1/PoP1 are out of SLA:

```
Spoke-1 (root) # diagnose sys sdwan health-check
Health Check(Hubs):
Seq(1 H1_T11): state(alive), packet-loss(0.000%) latency(220.220), jitter(0.018), mos(4.103),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0
Seq(2 H1_T22): state(alive), packet-loss(0.000%) latency(220.174), jitter(0.007), mos(4.104),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x0
Seq(3 H2_T11): state(alive), packet-loss(0.000%) latency(0.184), jitter(0.015), mos(4.404),
bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995) sla_map=0x1
Seq(4 H2_T22): state(alive), packet-loss(0.000%) latency(0.171), jitter(0.008), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(5 H3_T11): state(alive), packet-loss(0.000%) latency(0.173), jitter(0.011), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(6 H3_T22): state(alive), packet-loss(0.000%) latency(0.179), jitter(0.011), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1
```

2. Verify the SD-WAN neighbor status. The SD-WAN neighbor displays Hub-1's zone status as failed. However, SD-WAN Hub-2 is pass/alive:

```
Spoke-1 (root) # diagnose sys sdwan neighbor
SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
        Selected role(standalone) last_secondary_select_time/current_time in seconds 0/436535
Neighbor(172.31.0.1): member(1 2)role(standalone)
        Health-check(:0)  sla-fail alive
Neighbor(172.31.0.2): member(3 4)role(standalone)
        Health-check(:0)  sla-pass selected alive
Neighbor(172.31.0.129): member(5 6)role(standalone)
        Health-check(:0)  sla-pass selected alive
```

3. Verify the SD-WAN service rules status. Spoke-1 steers traffic to the H2_T11 overlay through Hub-2:

```
Spoke-1 (root) # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(3), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-order
Hold down time(30) seconds, Hold start at 364489 second, now 364490
  Service role: standalone
  Members(6):
    1: Seq_num(3 H2_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    2: Seq_num(4 H2_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    3: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    4: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    5: Seq_num(1 H1_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    6: Seq_num(2 H1_T22 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
  Src address(1):
        10.0.0.0-10.255.255.255
```

```
  Dst address(1):
        0.0.0.0-255.255.255.255
```

4. Verify the BGP learned routes on Hub-1 and Hub-2. Hub-2 and Hub-3 continue to receive community 10:1 from Spoke-1, but Hub-1 receives the out of SLA community of 10:2.
   a. On Hub-1:

```
PoP1-Hub1 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:2
      Last update: Mon Jul 17 18:08:58 2023
```

   b. On Hub-2:

```
PoP1-Hub2 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Mon Jul 17 15:31:43 2023
```

5. Send traffic from a host behind Spoke-1 to 172.31.200.200.
6. Run a sniffer trace on Spoke-1. Traffic leaves and returns on the H2_T11 overlay:

```
Spoke-1 (root) # diagnose sniffer packet any 'host 172.31.200.200' 4
interfaces=[any]
filters=[host 172.31.200.200]
13.726009 port4 in 10.0.3.2 -> 172.31.200.200: icmp: echo request
13.726075 H2_T11 out 10.0.3.2 -> 172.31.200.200: icmp: echo request

13.726354 H2_T11 in 172.31.200.200 -> 10.0.3.2: icmp: echo reply
13.726382 port4 out 172.31.200.200 -> 10.0.3.2: icmp: echo reply
```

Test case 4: three SD-WAN members on PoP1 are out of SLA

The number of in SLA overlays in zone PoP1 is less than the `minimum-sla-meet-members` in zone PoP1. The SD-WAN service rule for Hub-2 is forcibly marked as `sla(0x0)` or out of SLA.

To verify the configuration:

1. Verify the health check status on Spoke-1. All three H1_T11, H1_T22, and H2_T11 overlays on PoP1 are out of SLA:

```
Spoke-1 (root) # diagnose sys sdwan health-check
Health Check(Hubs):
Seq(1 H1_T11): state(alive), packet-loss(0.000%) latency(220.219), jitter(0.019), mos(4.103),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x0
Seq(2 H1_T22): state(alive), packet-loss(0.000%) latency(220.184), jitter(0.008), mos(4.104),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x0
Seq(3 H2_T11): state(alive), packet-loss(0.000%) latency(220.171), jitter(0.009), mos(4.104),
bandwidth-up(999998), bandwidth-dw(999997), bandwidth-bi(1999995) sla_map=0x0
Seq(4 H2_T22): state(alive), packet-loss(0.000%) latency(0.180), jitter(0.013), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(5 H3_T11): state(alive), packet-loss(0.000%) latency(0.174), jitter(0.014), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(6 H3_T22): state(alive), packet-loss(0.000%) latency(0.179), jitter(0.015), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999998), bandwidth-bi(1999997) sla_map=0x1
```

2. Verify the SD-WAN neighbor status. The SD-WAN neighbor displays Hub-1 and Hub-2's zone status as failed:

```
Spoke-1 (root) # diagnose sys sdwan neighbor
SD-WAN neighbor status: hold-down(disable), hold-down-time(0), hold_boot_time(0)
        Selected role(standalone) last_secondary_select_time/current_time in seconds 0/436605
Neighbor(172.31.0.1): member(1 2)role(standalone)
        Health-check(:0)  sla-fail alive
Neighbor(172.31.0.2): member(3 4)role(standalone)
        Health-check(:0)  sla-fail alive
Neighbor(172.31.0.129): member(5 6)role(standalone)
        Health-check(:0)  sla-pass selected alive
```

3. Verify the SD-WAN service rules status. Since the minimum SLA members is not met for the primary zone (PoP1), the remaining overlay in PoP1 associated with the SD-WAN service rule is forcibly set to out of SLA. Spoke-1 steers traffic to the H3_T11 overlay through Hub-3:

```
Spoke-1 (root) # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(6), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-order
Hold down time(30) seconds, Hold start at 365341 second, now 365341
  Service role: standalone
  Members(6):
    1: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    2: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    3: Seq_num(1 H1_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    4: Seq_num(2 H1_T22 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected

    5: Seq_num(3 H2_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    6: Seq_num(4 H2_T22 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
  Src address(1):
        10.0.0.0-10.255.255.255
  Dst address(1):
        0.0.0.0-255.255.255.255
```

4. Verify the BGP learned routes on each hub. Hub-3 continues to receive community 10:1 from Spoke-1, but Hub-1 and Hub-2 receive the out of SLA community of 10:2.
   a. On Hub-1:

```
PoP1-Hub1 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:2
      Last update: Mon Jul 17 18:22:14 2023
```

   b. On Hub-2:

```
PoP1-Hub2 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:2
      Last update: Mon Jul 17 18:37:53 2023
```

   c. On Hub-3:

```
PoP2-Hub3 (root) # get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Mon Jul 17 14:39:04 2023
```

5. Send traffic from a host behind Spoke-1 to 172.31.200.200.
6. Run a sniffer trace on Spoke-1. Traffic leaves and returns on the H3_T11 overlay:

```
Spoke-1 (root) # diagnose sniffer packet any 'host 172.31.200.200' 4
interfaces=[any]
filters=[host 172.31.200.200]
38.501449 port4 in 10.0.3.2 -> 172.31.200.200: icmp: echo request
38.501519 H3_T11 out 10.0.3.2 -> 172.31.200.200: icmp: echo request
38.501818 H3_T11 in 172.31.200.200 -> 10.0.3.2: icmp: echo reply
38.501845 port4 out 172.31.200.200 -> 10.0.3.2: icmp: echo reply
```

Test case 5: an SD-WAN member on PoP1 recovers

SD-WAN member H2_T11 recovers and brings the number of overlays in SLA back to being above the `minimum-sla-meet-members` threshold in PoP1. After the hold down time duration (30 seconds), in SLA overlays in zone PoP1 are preferred over PoP2 again. With `sla-stickiness` enabled, existing traffic is kept on H3_T11, but new traffic is steered to H2_T11.

To verify the configuration:

1. Verify the SD-WAN service rules status on Spoke-1. The hold down timer has not yet passed, so H2_T11 is not yet preferred—even though the SLA status is pass/alive:

```
Spoke-1 (root) # diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(16), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
Hold down time(30) seconds, Hold start at 431972 second, now 432000
  Service role: standalone
  Members(6):
    1: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    2: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    3: Seq_num(1 H1_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    4: Seq_num(2 H1_T22 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    5: Seq_num(3 H2_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    6: Seq_num(4 H2_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
```

2. Verify the SD-WAN service rules status again after the hold down timer passes. H2_T11 and H2_T22 from PoP1 are now preferred:

```
Spoke-1 (root) # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x1c200 use-shortcut-sla use-shortcut sla-stickiness
 Tie break: cfg
  Gen(17), TOS(0x0/0x0), Protocol(0): src(1->65535):dst(1->65535), Mode(sla), sla-compare-
order
Hold down time(30) seconds, Hold start at 432003 second, now 432003
  Service role: standalone
  Members(6):
    1: Seq_num(3 H2_T11 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    2: Seq_num(4 H2_T22 PoP1), alive, sla(0x1), gid(0), cfg_order(0), local cost(0), selected
    3: Seq_num(5 H3_T11 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    4: Seq_num(6 H3_T22 PoP2), alive, sla(0x1), gid(0), cfg_order(1), local cost(0), selected
    5: Seq_num(1 H1_T11 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
    6: Seq_num(2 H1_T22 PoP1), alive, sla(0x0), gid(0), cfg_order(0), local cost(0), selected
```

3. Verify the BGP learned routes on Hub-2, which now receives community 10:1 from Spoke-1:

```
PoP1-Hub2 (root) #  get router info bgp network 10.0.3.0/24
VRF 0 BGP routing table entry for 10.0.3.0/24
Paths: (1 available, best #1, table Default-IP-Routing-Table)
  Not advertised to any peer
```

```
  Original VRF 0
  Local, (Received from a RR-client)
    172.31.0.65 from 172.31.0.65 (172.31.0.65)
      Origin IGP metric 0, localpref 100, valid, internal, best
      Community: 10:1
      Last update: Tue Jul 18 14:41:32 2023
```

4. Send traffic from a host behind Spoke-1 to 172.31.200.200.
5. Run a sniffer trace on Spoke-1. Because of `sla-stickiness`, the existing traffic is kept on H3_T11:

```
Spoke-1 (root) # diagnose sniffer packet any 'host 172.31.200.200' 4
interfaces=[any]
filters=[host 172.31.200.200]

0.202708 port4 in 10.0.3.2 -> 172.31.200.200: icmp: echo request
0.202724 H3_T11 out 10.0.3.2 -> 172.31.200.200: icmp: echo request
0.202911 H3_T11 in 172.31.200.200 -> 10.0.3.2: icmp: echo reply
0.202934 port4 out 172.31.200.200 -> 10.0.3.2: icmp: echo reply
```

Test case 6: Hub-1 has an in SLA path to external peers

Since Hub-1 has an in SLA path to external peers, it will advertise the external route with destination 172.31.200.200/32 to Spoke-1.

To verify the configuration:

1. Verify the health check status on Hub-1. Note that port4 meets SLA, but port5 does not:

```
PoP1-Hub1 (root) # diagnose sys sdwan health-check
Health Check(external_peers):
Seq(1 port4): state(alive), packet-loss(0.000%) latency(0.161), jitter(0.009), mos(4.404),
bandwidth-up(999999), bandwidth-dw(999999), bandwidth-bi(1999998) sla_map=0x1
Seq(2 port5): state(dead), packet-loss(100.000%) sla_map=0x0
```

2. Verify the SD-WAN neighbor status. The `minimum-sla-meet-members` threshold of 1 is still met:

```
PoP1-Hub1 (root) # diagnose sys sdwan neighbor
Neighbor(EDGE): member(1 2)role(standalone)
        Health-check(external_peers:1)  sla-pass selected alive
```

3. Verify the BGP learned routes. Hub-1 still advertises the external route to the Spoke-1 BGP neighbor:

```
PoP1-Hub1 (root) # get router info bgp neighbors 172.31.0.65 advertised-routes
VRF 0 BGP table version is 13, local router ID is 172.31.0.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network                Next Hop      Metric     LocPrf  Weight  RouteTag Path
*>i172.31.200.200/32     172.31.0.1     100        32768        0          i <-/->
Total number of prefixes 1
```

Test case 7: all external peers on Hub-1 are out of SLA

In this case, Hub-1 will now advertise the default route map, which denies the advertisement of the external route. Spoke-1 will now route traffic to the next hub.

To verify the configuration:

1. Verify the health check status on Hub-1. Note that port4 and port5 do not meet SLA:

```
PoP1-Hub1 (root) # diagnose sys sdwan health-check
Health Check(external_peers):
Seq(1 port4): state(dead), packet-loss(100.000%) sla_map=0x0
Seq(2 port5): state(dead), packet-loss(100.000%) sla_map=0x0
```

2. Verify the SD-WAN neighbor status. The `minimum-sla-meet-members` threshold of 1 is not met:

```
PoP1-Hub1 (root) # diagnose sys sdwan neighbor
Neighbor(EDGE): member(1 2)role(standalone)
        Health-check(external_peers:1)  sla-fail dead
```

3. Verify the BGP learned routes. Hub-1 does not advertise any external routes to the Spoke-1 BGP neighbor:

```
PoP1-Hub1 (root) # get router info bgp neighbors 172.31.0.65 advertised-routes
% No prefix for neighbor 172.31.0.65
```

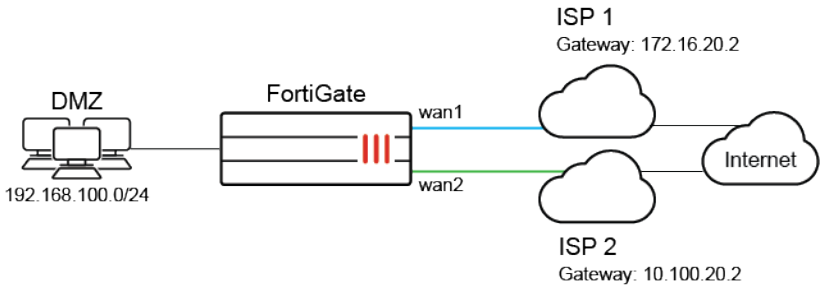
SD-WAN traffic shaping and QoS

Use a traffic shaper in a firewall shaping policy to control traffic flow. You can use it to control maximum and guaranteed bandwidth, or put certain traffic to one of the three different traffic priorities: high, medium, or low.

An advanced shaping policy can classify traffic into 30 groups. Use a shaping profile to define the percentage of the interface bandwidth that is allocated to each group. Each group of traffic is shaped to the assigned speed limit based on the outgoing bandwidth limit configured on the interface.

For more information, see Traffic shaping on page 2034.

Sample topology



Sample configuration

This example shows a typical customer usage where the customer's SD-WAN uses the default zone, and has two member: wan1 and wan2, each set to 10Mb/s.

An overview of the procedures to configure SD-WAN traffic shaping and QoS with SD-WAN includes:

1. Give HTTP/HTTPS traffic high priority and give FTP low priority so that if there are conflicts, FortiGate will forward HTTP/HTTPS traffic first.
2. Even though FTP has low priority, configure FortiGate to give it a 1Mb/s guaranteed bandwidth on each SD-WAN member so that if there is no FTP traffic, other traffic can use all the bandwidth. If there is heavy FTP traffic, it can still be guaranteed a 1Mb/s bandwidth.
3. Traffic going to specific destinations such as a VOIP server uses wan1 to forward, and SD-WAN forwards with an Expedited Forwarding (EF) DSCP tag 101110.

To configure SD-WAN traffic shaping and QoS with SD-WAN in the GUI:

1. On the FortiGate, add wan1 and wan2 as SD-WAN members, then add a policy and static route.
   See SD-WAN quick start on page 989.
2. Add a firewall policy with *Application Control* enabled. See Security on page 992.
3. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaper* tab, and edit *low-priority*.
   a. Enable *Guaranteed Bandwidth* and set it to *1000* kbps.
4. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
   a. Name the traffic shaping policy, for example, *HTTP-HTTPS*.
   b. Set the following:

Source	*all*
Destination	*all*
Service	*HTTP* and *HTTPS*
Outgoing interface	*virtual-wan-link*
Shared Shaper	Enable and set to *high-priority*
Reverse Shaper	Enable and set to *high-priority*

   c. Click *OK*.
5. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
   a. Name the traffic shaping policy, for example, *FTP*.
   b. Set the following:

Source	*all*
Destination	*all*
Service	*FTP*, *FTP_GET*, and *FTP_PUT*
Outgoing interface	*virtual-wan-link*
Shared Shaper	Enable and set to *low-priority*
Reverse Shaper	Enable and set to *low-priority*

   c. Click *OK*
6. Go to *Network > SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
   a. Enter a name for the rule, such as *Internet*.
   b. In the *Destination* section, click *Address* and select the VoIP server that you created in the firewall address.
   c. Under *Outgoing Interfaces* select *Manual*.
   d. For *Interface preference* select *wan1*.
   e. Click *OK*.
7. Use CLI commands to modify DSCP settings. See the DSCP CLI commands below.

To configure the firewall policy using the CLI:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "dmz"
        set dstintf "virtual-wan-link"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set application-list "default"
        set nat enable
    next
end
```

To configure the firewall traffic shaper priority using the CLI:

```
config firewall shaper traffic-shaper
    edit "high-priority"
        set maximum-bandwidth 1048576
        set per-policy enable
    next
    edit "low-priority"
        set guaranteed-bandwidth 1000
        set maximum-bandwidth 1048576
        set priority low
        set per-policy enable
    next
end
```

To configure the firewall traffic shaping policy using the CLI:

```
config firewall shaping-policy
    edit 1
        set name "http-https"
```

```
        set service "HTTP" "HTTPS"
        set dstintf "virtual-wan-link"
        set traffic-shaper "high-priority"
        set traffic-shaper-reverse "high-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 2
        set name "FTP"
        set service "FTP" "FTP_GET" "FTP_PUT"
        set dstintf "virtual-wan-link"
        set traffic-shaper "low-priority"
        set traffic-shaper-reverse "low-priority"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

To configure SD-WAN traffic shaping and QoS with SD-WAN in the CLI:

```
config system sdwan
    set status enable
    config members
        edit 1
            set interface "wan1"
            set gateway 172.16.20.2
        next
        edit 2
            set interface "wan2"
            set gateway 10.100.20.2
        next
    end
    config service
        edit 1
            set name "SIP"
            set priority-members 1
            set dst "voip-server"
            set dscp-forward enable
            set dscp-forward-tag 101110
        next
    end
end
```

If no SD-WAN zone is specified, members are added to the default *virtual-wan-link* zone.

To use the diagnose command to check if specific traffic is attached to the correct traffic shaper:

```
# diagnose firewall iprope list 100015

policy index=1 uuid_idx=0 action=accept
```

```
flag (0):
shapers: orig=high-priority(2/0/134217728) reply=high-priority(2/0/134217728)
cos_fwd=0  cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=0 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -> zone(2): 36 38
source(1): 0.0.0.0-255.255.255.255, uuid_idx=6,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=6,
service(2):
        [6:0x0:0/(1,65535)->(80,80)] helper:auto
        [6:0x0:0/(1,65535)->(443,443)] helper:auto

policy index=2 uuid_idx=0 action=accept
flag (0):
shapers: orig=low-priority(4/128000/134217728) reply=low-priority(4/128000/134217728)
cos_fwd=0  cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=0 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -> zone(2): 36 38
source(1): 0.0.0.0-255.255.255.255, uuid_idx=6,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=6,
service(3):
        [6:0x0:0/(1,65535)->(21,21)] helper:auto
        [6:0x0:0/(1,65535)->(21,21)] helper:auto
        [6:0x0:0/(1,65535)->(21,21)] helper:auto
```

To use the diagnose command to check if the correct traffic shaper is applied to the session:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=11 expire=3599 timeout=3600 flags=00000000
sockflag=00000000 sockport=0 av_idx=0 use=5
origin-shaper=low-priority prio=4 guarantee 128000Bps max 1280000Bps traffic 1050Bps drops 0B
reply-shaper=

```

Troubleshooting SD-WAN

The following topics provide instructions on SD-WAN troubleshooting:

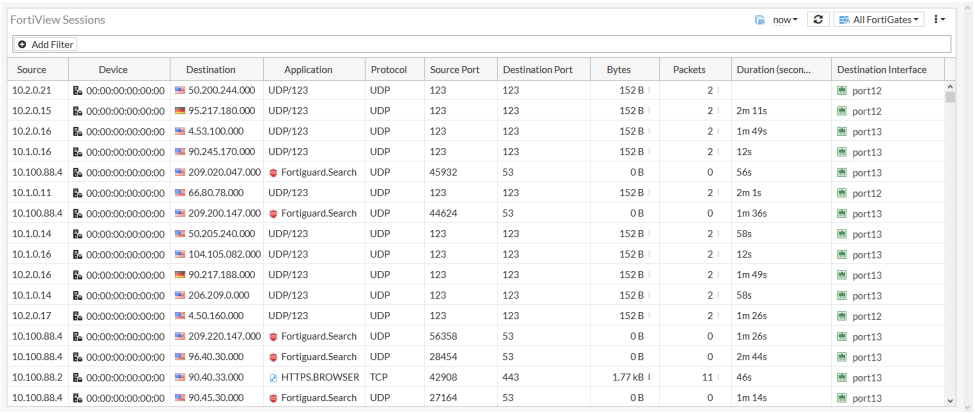
- Tracking SD-WAN sessions on page 1508
- Understanding SD-WAN related logs on page 1508
- SD-WAN related diagnose commands on page 1511
- Using SNMP to monitor health check on page 1516

Tracking SD-WAN sessions

You can check the destination interface in *Dashboard > FortiView Sessions* in order to see which port the traffic is being forwarded to.

The example below demonstrates a source-based load-balance between two SD-WAN members:

- If the source IP address is an *even* number, it will go to *port13*.
- If the source IP address is an *odd* number, it will go to *port12*.



Source	Device	Destination	Application	Protocol	Source Port	Destination Port	Bytes	Packets	Duration (secon...	Destination Interface
10.2.0.21	00:00:00:00:00:00	50.200.244.000	UDP/123	UDP	123	123	152 B	2		port12
10.2.0.15	00:00:00:00:00:00	95.217.180.000	UDP/123	UDP	123	123	152 B	2	2m 11s	port12
10.2.0.16	00:00:00:00:00:00	4.53.100.000	UDP/123	UDP	123	123	152 B	2	1m 49s	port13
10.1.0.16	00:00:00:00:00:00	90.245.170.000	UDP/123	UDP	123	123	152 B	2	12s	port13
10.100.88.4	00:00:00:00:00:00	209.020.047.000	Fortiguard.Search	UDP	45932	53	0 B	0	56s	port13
10.1.0.11	00:00:00:00:00:00	66.80.78.000	UDP/123	UDP	123	123	152 B	2	2m 1s	port12
10.100.88.4	00:00:00:00:00:00	209.200.147.000	Fortiguard.Search	UDP	44624	53	0 B	0	1m 36s	port13

Understanding SD-WAN related logs

This topic lists the SD-WAN related logs and explains when the logs will be triggered.

Health-check detects a failure:

- When health-check detects a failure, it will record a log:

```
1: date=2021-04-20 time=17:06:31 eventtime=1618963591590008160 tz="-0700" logid="0100022921"
type="event" subtype="system" level="critical" vd="root" logdesc="Routing information changed"
name="test" interface="R150" status="down" msg="Static route on interface R150 may be removed
by health-check test. Route:  (10.100.1.2->10.100.2.22 ping-down)"
```

- When health-check detects a recovery, it will record a log:

```
2: date=2021-04-20 time=17:11:46 eventtime=1618963906950174240 tz="-0700" logid="0100022921"
type="event" subtype="system" level="critical" vd="root" logdesc="Routing information changed"
name="test" interface="R150" status="up" msg="Static route on interface R150 may be added by
health-check test. Route:  (10.100.1.2->10.100.2.22 ping-up)"
```

Health-check has an SLA target and detects SLA qualification changes:

- When health-check has an SLA target and detects SLA changes, and changes to fail:

```
1: date=2021-04-20 time=21:32:33 eventtime=1618979553388763760 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Health
Check" healthcheck="test" slatargetid=1 oldvalue="2" newvalue="1" msg="Number of pass member
changed."
```

```
2: date=2021-04-20 time=21:32:33 eventtime=1618979553388751880 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Health
Check" healthcheck="test" slatargetid=1 member="1" msg="Member status changed. Member out-of-
sla."
```

- When health-check has an SLA target and detects SLA changes, and changes to pass:

```
1: date=2021-04-20 time=21:38:49 eventtime=1618979929908765200 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status" eventtype="Health
Check" healthcheck="test" slatargetid=1 oldvalue="1" newvalue="2" msg="Number of pass member
changed."
```

```
2: date=2021-04-20 time=21:38:49 eventtime=1618979929908754060 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="information" vd="root" logdesc="SDWAN status"
eventtype="Health Check" healthcheck="test" slatargetid=1 member="1" msg="Member status
changed. Member in sla."
```

SD-WAN calculates a link's session/bandwidth over/under its ratio and stops/resumes traffic:

- When SD-WAN calculates a link's session/bandwidth over its configured ratio and stops forwarding traffic:

```
1: date=2021-04-20 time=21:55:14 eventtime=1618980914728863220 tz="-0700" logid="0113022924"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN volume status"
eventtype="Volume" interface="R160" member="2" msg="Member enters into conservative status
with limited ablity to receive new sessions for too much traffic."
```

- When SD-WAN calculates a link's session/bandwidth according to its ratio and resumes forwarding traffic:

```
2: date=2021-04-20 time=22:12:52 eventtime=1618981972698753360 tz="-0700" logid="0113022924"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN volume status"
eventtype="Volume" interface="R160" member="2" msg="Member resume normal status to receive new
sessions for internal adjustment"
```

The SLA mode service rule's SLA qualified member changes:

- When the SLA mode service rule's SLA qualified member changes. In this example R150 fails the SLA check, but is still alive:

```
1: date=2021-04-20 time=22:40:46 eventtime=1618983646428803040 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" seq="2,1" msg="Service prioritized by SLA will
be redirected in sequence order."
```

- When the SLA mode service rule's SLA qualified member changes. In this example R150 changes from fail to pass:

```
2: date=2021-04-20 time=22:41:51 eventtime=1618983711678827920 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" seq="1,2" msg="Service prioritized by SLA will
be redirected in sequence order."
```

The priority mode service rule member's link status changes:

- When priority mode service rule member's link status changes. In this example R150 changes to better than R160, and both are still alive:

```
1: date=2021-04-20 time=22:56:55 eventtime=1618984615708804760 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" metric="packet-loss" seq="2,1" msg="Service
prioritized by performance metric will be redirected in sequence order."
```

- When priority mode service rule member's link status changes. In this example R160 changes to better than R150, and both are still alive:

```
2: date=2021-04-20 time=22:56:58 eventtime=1618984618278852140 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" metric="packet-loss" seq="1,2" msg="Service
prioritized by performance metric will be redirected in sequence order."
```

SD-WAN member is used in service and it fails the health-check:

- When SD-WAN member fails the health-check, it will stop forwarding traffic:

```
1: date=2021-04-20 time=23:04:32 eventtime=1618985072898756700 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" interface="R150" member="1" serviceid=1 service="test" gateway=10.100.1.1
msg="Member link is unreachable or miss threshold. Stop forwarding traffic. "
```

- When SD-WAN member passes the health-check again, it will resume forwarding logs:

```
2: date=2021-04-20 time=23:06:08 eventtime=1618985168018789600 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" interface="R150" member="1" serviceid=1 service="test" gateway=10.100.1.1
msg="Member link is available. Start forwarding traffic. "
```

Load-balance mode service rule's SLA qualified member changes:

- When load-balance mode service rule's SLA qualified member changes. In this example R150 changes to not meet SLA:

```
1: date=2021-04-20 time=23:10:24 eventtime=1618985425048820800 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" member="2(R160)" msg="Service will be load
balanced among members with available routing."
```

- When load-balance mode service rule's SLA qualified member changes. In this example R150 changes to meet SLA:

```
2: date=2021-04-20 time=23:11:34 eventtime=1618985494478807100 tz="-0700" logid="0113022923"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN status"
eventtype="Service" serviceid=1 service="test" member="2(R160),1(R150)" msg="Service will be
load balanced among members with available routing."
```

SLA link status logs, generated with interval sla-fail-log-period or sla-pass-log-period:

- When SLA fails, SLA link status logs will be generated with interval sla-fail-log-period:

```
1: date=2021-04-20 time=23:18:10 eventtime=1618985890469018260 tz="-0700" logid="0113022925"
type="event" subtype="sdwan" level="notice" vd="root" logdesc="SDWAN SLA information"
eventtype="SLA" healthcheck="test" slatargetid=1 interface="R150" status="up" latency="0.061"
jitter="0.004" packetloss="2.000%" inbandwidthavailable="0kbps"
outbandwidthavailable="200.00Mbps" bibandwidthavailable="200.00Mbps" inbandwidthused="1kbps"
outbandwidthused="1kbps" bibandwidthused="2kbps" slamap="0x0" metric="packetloss" msg="Health
Check SLA status. SLA failed due to being over the performance metric threshold."
```

- When SLA passes, SLA link status logs will be generated with interval sla-pass-log-period:

```
2: date=2021-04-20 time=23:18:12 eventtime=1618985892509027220 tz="-0700" logid="0113022925"
type="event" subtype="sdwan" level="information" vd="root" logdesc="SDWAN SLA information"
eventtype="SLA" healthcheck="test" slatargetid=1 interface="R150" status="up" latency="0.060"
jitter="0.003" packetloss="0.000%" inbandwidthavailable="0kbps"
outbandwidthavailable="200.00Mbps" bibandwidthavailable="200.00Mbps" inbandwidthused="1kbps"
outbandwidthused="1kbps" bibandwidthused="2kbps" slamap="0x1" msg="Health Check SLA status."
```

SD-WAN related diagnose commands

This topic lists the SD-WAN related diagnose commands and related output.

To check SD-WAN health-check status:

```
FGT # diagnose sys sdwan health-check
Health Check(server):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.110), jitter(0.024) sla_map=0x0
Seq(2 R160): state(alive), packet-loss(0.000%) latency(0.068), jitter(0.009) sla_map=0x0
```

```
FGT # diagnose sys sdwan health-check
Health Check(ping):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.100), jitter(0.017) sla_map=0x0
Seq(2 R160): state(dead), packet-loss(100.000%) sla_map=0x0
```

```
FGT # diagnose sys sdwan health-check google
Health Check(google):
Seq(1 R150): state(alive), packet-loss(0.000%) latency(0.081), jitter(0.019) sla_map=0x0
Seq(2 R160): state(alive), packet-loss(0.000%) latency(0.060), jitter(0.004) sla_map=0x0
```

To check SD-WAN member status:

- When SD-WAN load-balance mode is *source-ip-based*/*source-dest-ip-based*.

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024, weight: 0
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024, weight: 0
```

- When SD-WAN load-balance mode is *weight-based*.

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024, weight: 33
  Session count: 15
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024, weight: 66
  Session count: 1
```

- When SD-WAN load-balance mode is *measured-volume-based*.
  - Both members are under volume and still have room:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 33
  Config volume ratio: 33, last reading: 218067B, volume room 33MB
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 66
  Config volume ratio: 66, last reading: 202317B, volume room 66MB
```

  - Some members are overloaded and some still have room:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 0
  Config volume ratio: 33, last reading: 1287767633B, overload volume 517MB
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 63
  Config volume ratio: 66, last reading: 1686997898B, volume room 63MB
```

- When SD-WAN load balance mode is *usage-based*/*spillover*.
  - When no spillover occurs:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 255
  Egress-spillover-threshold: 400kbit/s, ingress-spillover-threshold: 300kbit/s
  Egress-overbps=0, ingress-overbps=0
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 254
  Egress-spillover-threshold: 0kbit/s, ingress-spillover-threshold: 0kbit/s
  Egress-overbps=0, ingress-overbps=0
```

  - When member has reached limit and spillover occurs:

```
FGT # diagnose sys sdwan member
Member(1): interface: R150, gateway: 10.100.1.1 2000:10:100:1::1, priority: 0 1024,
weight: 255
  Egress-spillover-threshold: 400kbit/s, ingress-spillover-threshold: 300kbit/s
  Egress-overbps=1, ingress-overbps=0
Member(2): interface: R160, gateway: 10.100.1.5 2000:10:100:1::5, priority: 0 1024,
weight: 254
  Egress-spillover-threshold: 0kbit/s, ingress-spillover-threshold: 0kbit/s
  Egress-overbps=0, ingress-overbps=0
```

- You can also use the `diagnose netlink dstmac list` command to check if you are over the limit.

```
FGT # diagnose netlink dstmac list R150
dev=R150 mac=00:00:00:00:00:00 vwl rx_tcp_mss=0 tx_tcp_mss=0 egress_overspill_
threshold=50000 egress_bytes=100982 egress_over_bps=1 ingress_overspill_threshold=37500
ingress_bytes=40 ingress_over_bps=0 sampler_rate=0 vwl_zone_id=1 intf_qua=0
```

To check SD-WAN service rules status:

- *Manual mode* service rules.

```
FGT # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(manual)
  Members(2):
    1: Seq_num(1 R150), alive, selected
    2: Seq_num(2 R160), alive, selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *Auto mode* service rules.

```
FGT # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(auto), link-cost-factor(latency), link-
cost-threshold(10), health-check(ping)
  Members(2):
    1: Seq_num(2 R160), alive, latency: 0.066, selected
    2: Seq_num(1 R150), alive, latency: 0.093
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *Priority mode* service rules.

```
FGT # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(priority), link-cost-factor(latency),
link-cost-threshold(10), health-check(ping)
  Members(2):
    1: Seq_num(2 R160), alive, latency: 0.059, selected
    2: Seq_num(1 R150), alive, latency: 0.077, selected
```

```
 Dst address(1):
       10.100.21.0-10.100.21.255
```

- *Load-balance* mode service rules.

```
FGT # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(load-balance hash-mode=round-robin)
  Members(2):
    1: Seq_num(1 R150), alive, sla(0x1), gid(2), num of pass(1), selected
    2: Seq_num(2 R160), alive, sla(0x1), gid(2), num of pass(1), selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

- *SLA mode* service rules.

```
FGT # diagnose sys sdwan service4
Service(1): Address Mode(IPV4) flags=0x200
  Gen(1), TOS(0x0/0x0), Protocol(0: 1->65535), Mode(sla), sla-compare-order
  Members(2):
    1: Seq_num(1 R150), alive, sla(0x1), gid(0), cfg_order(0), cost(0), selected
    2: Seq_num(2 R160), alive, sla(0x1), gid(0), cfg_order(1), cost(0), selected
  Dst address(1):
        10.100.21.0-10.100.21.255
```

To check interface logs from the past 15 minutes:

```
FGT (root) # diagnose sys sdwan intf-sla-log R150
Timestamp: Wed Apr 21 16:58:27 2021, used inbandwidth: 655bps, used outbandwidth: 81655306bps,
used bibandwidth: 81655961bps, tx bys: 3413479982bytes, rx bytes: 207769bytes.
Timestamp: Wed Apr 21 16:58:37 2021, used inbandwidth: 649bps, used outbandwidth: 81655540bps,

used bibandwidth: 81688830bps, tx bys: 4026141408bytes, rx bytes: 212726bytes.
```

To check SLA logs in the past 10 minutes:

```
FGT (root) # diagnose sys sdwan sla-log ping 1
Timestamp: Wed Apr 21 17:10:11 2021, vdom root, health-check ping, interface: R150, status: up,
latency: 0.079, jitter: 0.023, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:12 2021, vdom root, health-check ping, interface: R150, status: up,
latency: 0.079, jitter: 0.023, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:12 2021, vdom root, health-check ping, interface: R150, status: up,
```

```
latency: 0.081, jitter: 0.024, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:13 2021, vdom root, health-check ping, interface: R150, status: up,
latency: 0.081, jitter: 0.025, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:13 2021, vdom root, health-check ping, interface: R150, status: up,
latency: 0.082, jitter: 0.026, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:14 2021, vdom root, health-check ping, interface: R150, status: up,
latency: 0.083, jitter: 0.026, packet loss: 0.000%.
Timestamp: Wed Apr 21 17:10:14 2021, vdom root, health-check ping, interface: R150, status: up,
latency: 0.084, jitter: 0.026, packet loss: 0.000%.
```

To check Application Control used in SD-WAN and the matching IP addresses:

```
FGT # diagnose sys sdwan internet-service-app-ctrl-list
Gmail(15817 4294836957): 64.233.191.19 6 443 Thu Apr 22 10:10:34 2021
Gmail(15817 4294836957): 142.250.128.83 6 443 Thu Apr 22 10:06:47 2021

```

To check the dynamic tunnel status:

```
# diagnose sys link-monitor interface <name> <name>_0
```

For example:

```
# diagnose sys link-monitor interface vd2-2
Interface(vd2-2): state(up, since Tue Jun 15 12:31:28 2021), bandwidth(up:1299bps, down:0bps),
session count(IPv4:2, IPv6:0), tx(2409919 bytes), rx(5292290 bytes), latency(0.03), jitter(0.00),
packet-loss(0.00).

# diagnose sys link-monitor interface vd2-2 vd2-2_0
Interface(vd2-2_0): state(up, since Tue Jun 15 15:21:52 2021), bandwidth(up:640bps, down:0bps),
session count(IPv4:0, IPv6:0), tx(102242 bytes), rx(16388 bytes), latency(0.03), jitter(0.00),
packet-loss(0.00).
```

To check BGP learned routes and determine if they are used in SD-WAN service:

```
FGT # get router info bgp network 10.100.11.0/24
VRF 0 BGP routing table entry for 10.100.11.0/24
Paths: (2 available, best #2, table Default-IP-Routing-Table)
  Advertised to non peer-group peers:
   10.100.1.1
  Original VRF 0
  20 10
    10.100.1.1 from 10.100.1.1 (5.5.5.5)
      Origin incomplete metric 0, route tag 15, localpref 100, valid, external, best
      Community: 30:5
      Advertised Path ID: 2

Using SNMP to monitor health check

You can monitor SD-WAN health check related statistics using SNMP. The MIB file can be downloaded by going to *System > SNMP* and clicking *Download FortiGate MIB File*.

The following OIDs can be monitored:

Name	OID	Description
fgVWLHealthCheckLinkNumber	.1.3.6.1.4.1.12356.101.4.9.1	The number of health check links in fgVWLHealthCheckLinkTable
fgVWLHealthCheckLinkTable	.1.3.6.1.4.1.12356.101.4.9.2	SD-WAN health check statistics table. This table has a dependent expansion relationship with fgVdTable.Only health checks with a configured member link are present in this table.
fgVWLHealthCheckLinkTableEntry	.1.3.6.1.4.1.12356.101.4.9.2.1	SD-WAN health check statistics on a virtual domain.
fgVWLHealthCheckLinkID	.1.3.6.1.4.1.12356.101.4.9.2.1.1	SD-WAN health check link ID. Only health checks with configured member link are present in this table. Virtual-wan-link health check link IDs are only unique within a virtual domain.
fgVWLHealthCheckLinkName	.1.3.6.1.4.1.12356.101.4.9.2.1.2	Health check name.
fgVWLHealthCheckLinkSeq	.1.3.6.1.4.1.12356.101.4.9.2.1.3	SD-WAN member link sequence.
fgVWLHealthCheckLinkState	.1.3.6.1.4.1.12356.101.4.9.2.1.4	Health check state on a specific member link.
fgVWLHealthCheckLinkLatency	.1.3.6.1.4.1.12356.101.4.9.2.1.5	The average latency of a health check on a specific member link within last 30 probes, in float number.
fgVWLHealthCheckLinkJitter	.1.3.6.1.4.1.12356.101.4.9.2.1.6	The average jitter of a health check on a specific member link within last 30 probes, in float number.
fgVWLHealthCheckLinkPacketSend	.1.3.6.1.4.1.12356.101.4.9.2.1.7	The total number of packets sent by a health check on a specific member link.
fgVWLHealthCheckLinkPacketRecv	.1.3.6.1.4.1.12356.101.4.9.2.1.8	The total number of packets received by a health check on a specific member link.

Name	OID	Description
fgVWLHealthCheckLinkPacketLoss	.1.3.6.1.4.1.12356.101.4.9.2.1.9	The packet loss percentage of a health check on a specific member link within last 30 probes, in float number.
fgVWLHealthCheckLinkVdom	.1.3.6.1.4.1.12356.101.4.9.2.1.10	The VDOM that the link monitor entry exists in. This name corresponds to the fgVdEntName used in fgVdTable.
fgVWLHealthCheckLinkBandwidthIn	.1.3.6.1.4.1.12356.101.4.9.2.1.11	The available bandwidth of incoming traffic detected by a health check on a specific member link, in Mbps,
fgVWLHealthCheckLinkBandwidthOut	.1.3.6.1.4.1.12356.101.4.9.2.1.12	The available bandwidth of outgoing traffic detected by a health check on a specific member link, in Mbps.
fgVWLHealthCheckLinkBandwidthBi	.1.3.6.1.4.1.12356.101.4.9.2.1.13	The available bandwidth of bi-direction traffic detected by a health check on a specific member link, in Mbps.
fgVWLHealthCheckLinkIfName	.1.3.6.1.4.1.12356.101.4.9.2.1.14	SD-WAN member interface name.

Example

This example shows an SD-WAN health check configuration and its collected statistics.

To configure the SD-WAN health check:

```
config system sdwan
    set status enable
    config zone
        edit "virtual-wan-link"
        next
    end
    config members
        edit 1
            set interface "port1"
            set gateway 192.168.2.1
        next
        edit 2
            set interface "MPLS"
            set zone "SD-Zone2"
```

```
            set cost 20
        next
        edit 3
            set interface "port2"
        next
    end
    config health-check
        edit "pingserver"
            set server "8.8.8.8"
            set sla-fail-log-period 10
            set sla-pass-log-period 20
            set members 2 1 3
            config sla
                edit 1
                    set link-cost-factor jitter packet-loss
                    set packetloss-threshold 2
                next
            end
        next
    end
end
```

The collected statistics:

fgVWLHealthCheckLinkID	.1.3.6.1.4.1.12356.101.4.9.2.1.1	1	2	3
fgVWLHealthCheckLinkName	.1.3.6.1.4.1.12356.101.4.9.2.1.2	pingserver	pingserver	pingserver
fgVWLHealthCheckLinkSeq	.1.3.6.1.4.1.12356.101.4.9.2.1.3	2	1	3
fgVWLHealthCheckLinkState	.1.3.6.1.4.1.12356.101.4.9.2.1.4	0	0	0
fgVWLHealthCheckLinkLatency	.1.3.6.1.4.1.12356.101.4.9.2.1.5	39.302	43.124	44.348
fgVWLHealthCheckLinkJitter	.1.3.6.1.4.1.12356.101.4.9.2.1.6	4.346	3.951	5.05
fgVWLHealthCheckLinkPacketSend	.1.3.6.1.4.1.12356.101.4.9.2.1.7	3657689	3657689	3657689
fgVWLHealthCheckLinkPacketRecv	.1.3.6.1.4.1.12356.101.4.9.2.1.8	3196258	3220258	3219466
fgVWLHealthCheckLinkPacketLoss	.1.3.6.1.4.1.12356.101.4.9.2.1.9	0	0	0

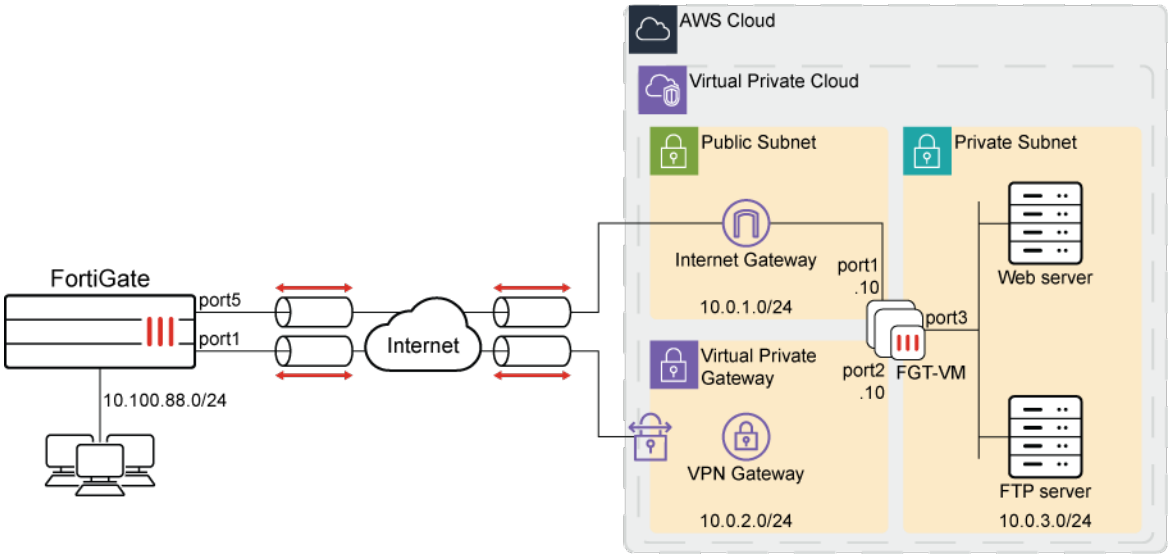
fgVWLHealthCheckLinkIfName	.1.3.6.1.4.1.12356.101.4.9.2.1.14	MPLS	port1	port2

SD-WAN cloud on-ramp

In this example, you configure a connection to a new cloud deployment that has some remote servers. SD-WAN is used to steer traffic through the required overlay tunnel.

The on-premise FortiGate has two internet connections, each with a single VPN connection. The two VPN gateways are configured on the cloud for redundancy, one terminating at the FortiGate-VM, and the other at the native AWS VPN Gateway.

This example uses AWS as the Infrastructure as a Service (IaaS) provider, but the same configuration can also apply to other services. A full mesh VPN setup is not shown, but can be added later if required.



To connect to the servers that are behind the cloud FortiGate-VM, virtual IP addresses (VIPs) are configured on port2 to map to the servers:

- VPN traffic terminating on port1 is routed to the VIP on port2 to access the web servers.
- VPN traffic terminating on the VPN gateway accesses the VIPs on port2 directly.

There are four major steps to configure this setup:

1. Configuring the VPN overlay between the HQ FortiGate and cloud FortiGate-VM on page 1521
2. Configuring the VPN overlay between the HQ FortiGate and AWS native VPN gateway on page 1525
3. Configuring the VIP to access the remote servers on page 1529
4. Configuring the SD-WAN to steer traffic between the overlays on page 1532

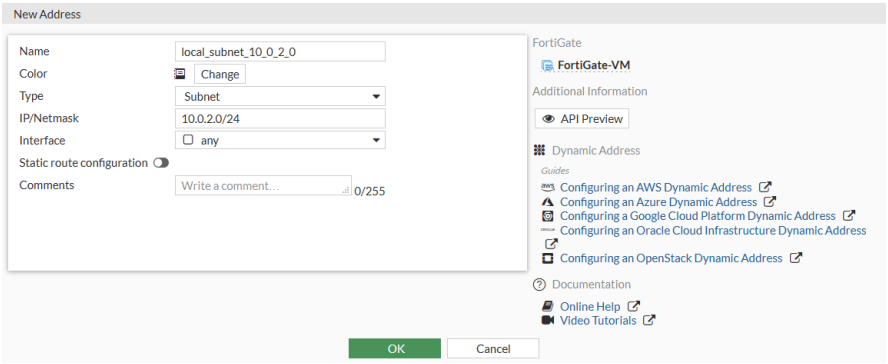
After the configuration is complete, verify the traffic to ensure that the configuration is working as expected, see Verifying the traffic on page 1535.

Configuring the VPN overlay between the HQ FortiGate and cloud FortiGate-VM

Configure the cloud FortiGate-VM

To create an address for the VPN gateway:

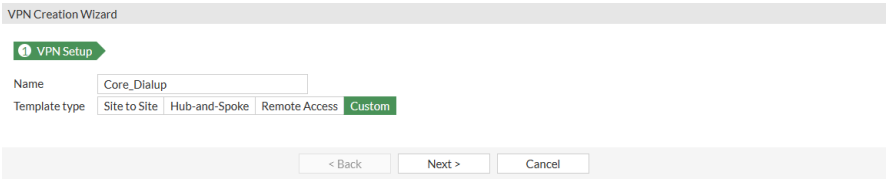
1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *local_subnet_10_0_2_0*.
4. Set *IP/Netmask* to *10.0.2.0/24*.



5. Click *OK*.

To configure a custom IPsec VPN:

1. Go to *VPN* > *IPsec Wizard*.
2. Set *Name* to *Core_Dialup*.
3. Set *Template type* to *Custom*.

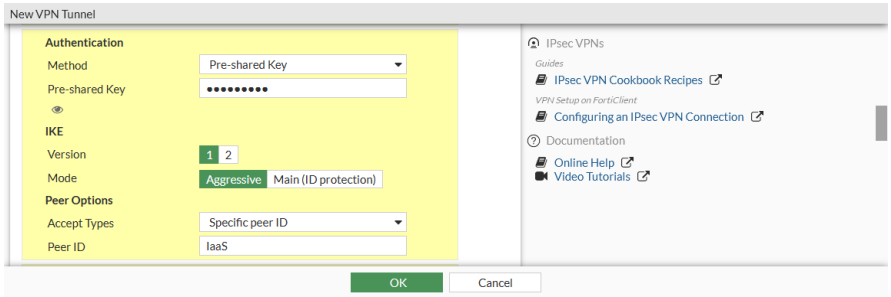


4. Click *Next*.
5. Configure *Network* settings:

Remote Gateway	Dialup User
Interface	port1
NAT Traversal	Enable

6. Configure *Authentication* settings:

Method	Pre-shared Key
Pre-shared Key	Enter the pre-shared key.
Version	1
Mode	Aggressive This setting allows the peer ID to be specified.
Accept Types	Specific peer ID
Peer ID	IaaS The other end of the tunnel needs to have its local ID set to IaaS.



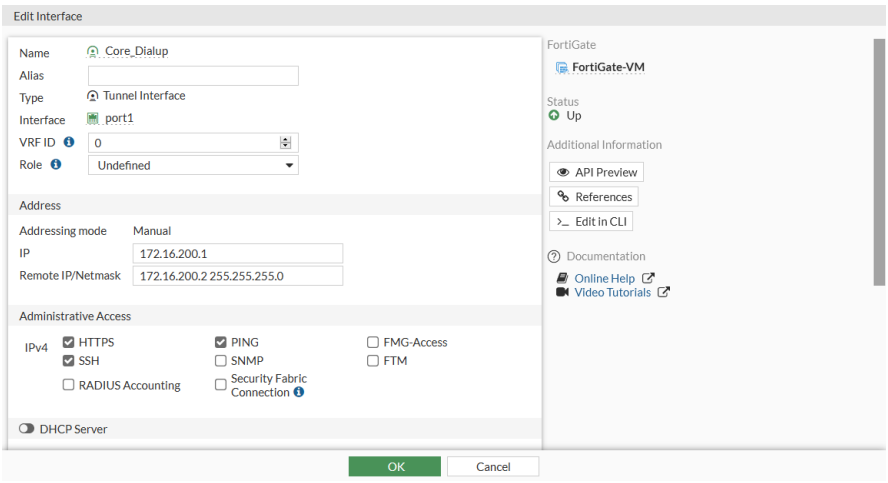
7. Leave the default *Phase 1 Proposal* settings and disable *XAUTH*.
8. Configure the *Phase 2 Selector* settings:

Name	Ent_Core
Local Address	Named Address - *local_subnet_10_0_2_0*
Remote Address	Named Address - *all* This setting allows traffic originating from both the remote subnet 10.100.88.0 and the health checks from the VPN interface on the remote FortiGate. For increased security, each subnet can be specified individually.

9. Click *OK*.

To configure remote and local tunnel IP addresses:

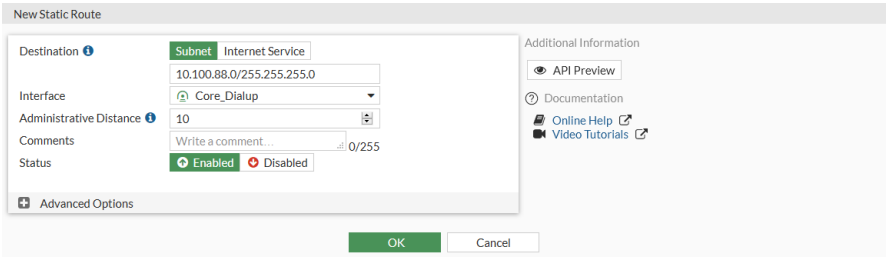
1. Go to *Network* > *Interfaces* and edit the *Core_Dialup* interface under *port1*.
2. Set *IP* to *172.16.200.1*.
3. Set *Remote IP/Netmask* to *172.16.200.2 255.255.255.0*. This is where remote health check traffic will come from.
4. Enable *Administrative access* for *HTTPS*, *PING*, and *SSH*.



5. Click *OK*.

To configure a route to the remote subnet through the tunnel:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Set *Destination* to *Subnet* and enter the IP address and netmask: *10.100.88.0/255.255.255.0*.
3. Set *Interface* to *Core_Dialup*.

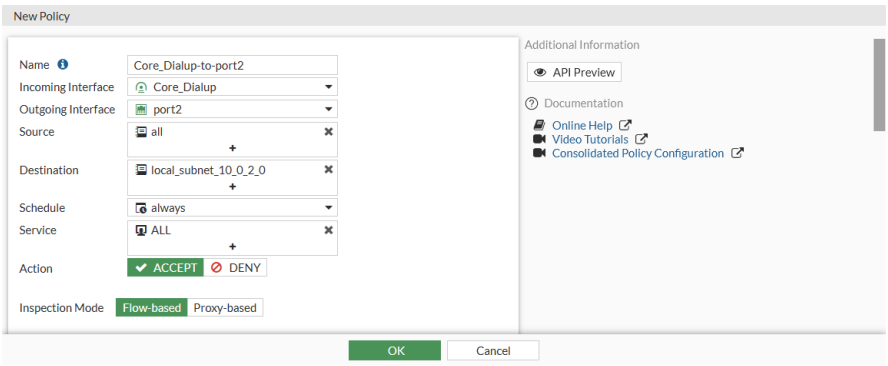


4. Click *OK*.

To configure a firewall policy to allow traffic from the tunnel to port2:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

Name	Core_Dialup-to-port2
Incoming Interface	Core_Dialup
Outgoing Interface	port2
Source	all
Destination	local_subnet_10_0_2_0
Schedule	always
Service	ALL
Action	ACCEPT



3. Configure the remaining settings as required.
4. Click *OK*.

Configure the HQ FortiGate

To create an address for the VPN gateway:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Set *Name* to *remote_subnet_10_0_2_0*.
4. Set *IP/Netmask* to *10.0.2.0/24*.
5. Click *OK*.

To configure a custom IPsec VPN:

1. Go to *VPN* > *IPsec Wizard*.
2. Set *Name* to *FGT_AWS_Tun*.
3. Set *Template type* to *Custom*.
4. Click *Next*.
5. Configure *Network* settings:

Remote Gateway	Static IP Address
IP Address	100.21.29.17
Interface	port5
NAT Traversal	Enable

6. Configure *Authentication* settings:

Method	Pre-shared Key
Pre-shared Key	Enter the pre-shared key.
Version	1
Mode	Aggressive This setting allows the peer ID to be specified.

Accept Types	Any peer ID

7. Leave the default *Phase 1 Proposal* settings, except set *Local ID* to *IaaS*.
8. Disable *XAUTH*.
9. Configure the *Phase 2 Selector* settings:

Name	FGT_AWS_Tun
Local Address	Named Address - *all* This setting allows traffic originating from both the local subnet 10.100.88.0 and the health checks from the VPN interface. For increased security, each subnet can be specified individually.
Remote Address	Named Address - *remote_subnet_10_0_2_0*

10. Click *OK*.

To configure local and remote tunnel IP addresses:

1. Go to *Network* > *Interfaces* and edit the *FGT_AWS_Tun* interface under *port5*.
2. Set *IP* to *172.16.200.2*.
3. Set *Remote IP/Netmask* to *172.16.200.1 255.255.255.0*.
4. Enable *Administrative access* for *HTTPS*, *PING*, and *SSH*.
5. Click *OK*.

Routing is defined when creating the SD-WAN interface. The firewall policy is created after the SD-WAN interface is defined.

Configuring the VPN overlay between the HQ FortiGate and AWS native VPN gateway

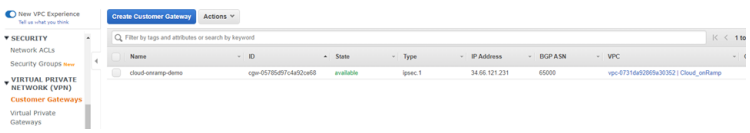
This example uses static routing. It is assumed that the AWS VPN Gateway is already configured, and that proper routing is applied on the corresponding subnet.

Verify the AWS configuration

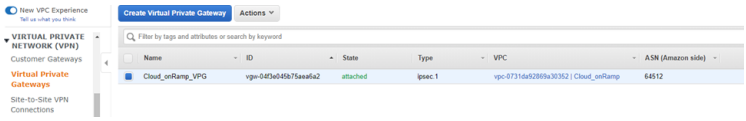
See Creating routing tables and associate subnets in the AWS Administration Guide for configuration details.

To check the AWS configuration:

1. Go to *Virtual Private Network (VPN)* > *Customer Gateways* to confirm that the customer gateway defines the FortiGate IP address as its Gateway IP address, in this case *34.66.121.231*.



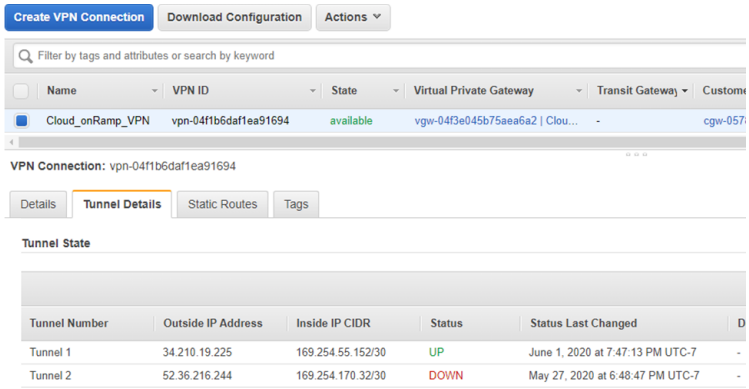
2. Go to *Virtual Private Network (VPN)* > *Virtual Private Gateways* to confirm that a virtual private gateway (VPG) has been created. In this case it is attached to the *Cloud_onRamp* VPC that contains the FortiGate and servers.



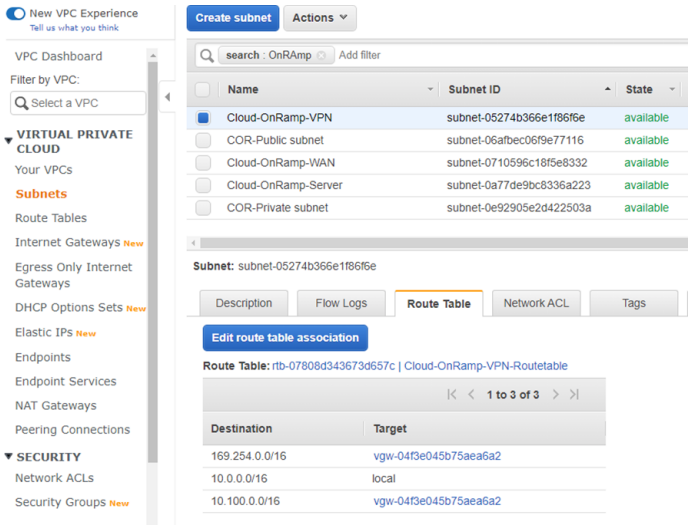
3. Go to *Virtual Private Network (VPN)* > *Site-to-Site VPN Connections* to confirm that site-to-site VPN connections have been created and attached to the customer gateway and virtual private gateway.

   If *Routing Options* is *Static*, the IP prefix of the remote subnet on the HQ FortiGate (10.100.88.0) is entered here.

   AWS site-to-site VPN always creates two VPN tunnels for redundancy. In this example, only Tunnel 1 is used.



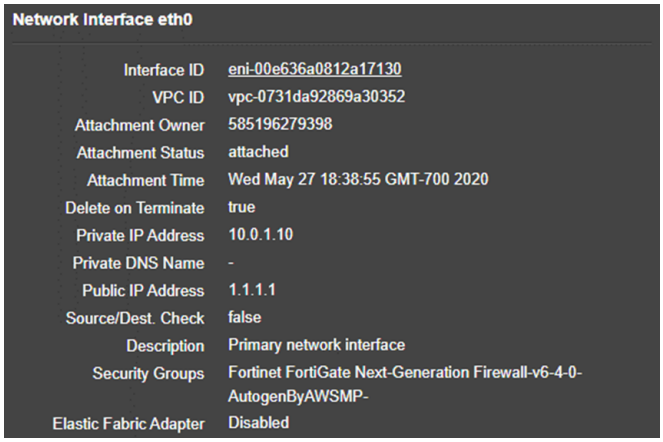
4. Click *Download Configuration* to download the FortiGate's tunnel configurations. The configuration can be referred to when configuring the FortiGate VPN.
5. The new VPG is attached to your VPC, but to successfully route traffic to the VPG, proper routing must be defined. Go to *Virtual Private Cloud* > *Subnets*, select the *Cloud-OnRamp-VPN*, and select the *Route Table* tab to verify that there are at least two routes to send traffic over the VPG.



- *169.254.0.0/24* defines the tunnel IP address. Health check traffic originating from the FortiGate will come from this IP range.
- *10.100.0.0/16* defines the remote subnet from the HQ FortiGate.
- Both routes point to the just created VPG *vgw-04xxxx*.

6. On the cloud FortiGate-VM EC2 instances, ensure that port1 and port2 both have *Source/Dest. Check* set to *false*. This allows the FortiGate to accept and route traffic to and from a different network.

   If you launched the instance from the AWS marketplace, this setting defaults to *true*.



Configure routing to the VPG on the cloud FortiGate-VM

To configure routing to the VPG on the cloud FortiGate-VM:

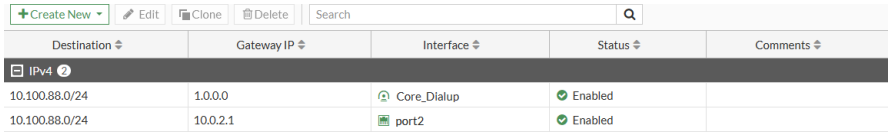
1. Go to *Network* > *Static Routes* and click *Create New*.
2. Set *Destination* to *Subnet* and enter the IP address and netmask: *10.100.88.0/255.255.255.0*.
3. Set *Gateway Address* to *Specify* and enter *10.0.2.1*.
4. Set *Interface* to *port2*.

   The new route must have the same *Administrative Distance* as the route that was created for traffic through the *Core_Dialup* tunnel to ensure that both routes are added to the routing table (see To configure a route

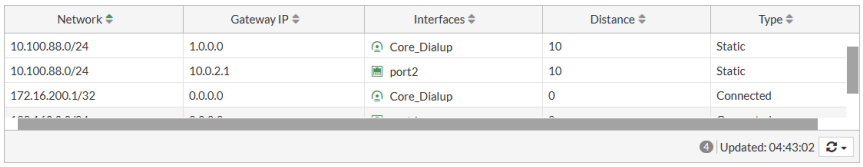
to the remote subnet through the tunnel).

The *Gateway Address* is arbitrarily set to 10.0.2.1. The VPG does not have an IP address, but the address defined here allows the FortiGate to route traffic out of port2, while AWS routes the traffic based on its routing table.

5. Click *OK*.
6. Go to *Network* > *Static Routes* to view the configured static routes:



7. Go to *Dashboard* > *Network Monitor* > *Routing* to view the routing table.



Configure IPsec VPN on the HQ FortiGate

To configure a custom IPsec VPN:

1. Go to *VPN* > *IPsec Wizard*.
2. Set *Name* to *AWS_VPG*.
3. Set *Template type* to *Custom*.
4. Click *Next*.
5. Configure *Network* settings:

Remote Gateway	Static IP Address
IP Address	34.210.19.225 This address is taken from the downloaded AWS configuration file.
Interface	port1
NAT Traversal	Enable

6. Configure *Authentication* settings:

Method	Pre-shared Key
Pre-shared Key	Enter the pre-shared key.
Version	1
Mode	Main

7. Configure the *Phase 1 Proposal* settings using information from the downloaded AWS configuration file.
8. Disable *XAUTH*.
9. Configure the *Phase 2 Selector* settings:

Name	AWS_VPG
Local Address	Named Address - *all* This setting allows traffic originating from both the local subnet 10.100.88.0 and the health checks from the VPN interface. For increased security, each subnet can be specified individually.
Remote Address	Named Address - *remote_subnet_10_0_2_0*

10. Click *OK*.

To configure local and remote tunnel IP addresses:

1. Go to *Network* > *Interfaces* and edit the *AWS_VPG* interface under *port1*.
2. Set *IP* to *169.254.55.154*.
3. Set *Remote IP/Netmask* to *169.254.55.153 255.255.255.0*.
4. Enable *Administrative access* for *HTTPS* and *PING*.
5. Click *OK*.

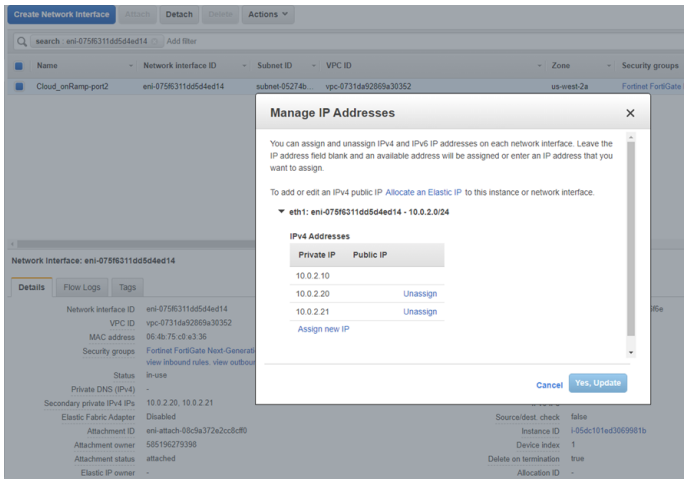
Routing is defined when creating the SD-WAN interface. The firewall policy is created after the SD-WAN interface is defined.

Configuring the VIP to access the remote servers

VIPs, interface IP addresses, and policies are created on the cloud FortiGate-VM to allow access to the remote servers.

To configure additional private IPs on AWS for the FortiGate VIP:

1. On the FortiGate EC2 instance, edit the *Elastic Network Interface* that corresponds to *port2*. In this example, Network Interface *eth1*.
2. Go to *Actions* > *Manage IP Addresses*.
3. Add two private IP address in the 10.0.2.0/24 subnet.
   These address will be used in the VIPs on the FortiGate. This ensures that traffic to these IP addresses is routed to the FortiGate by AWS.

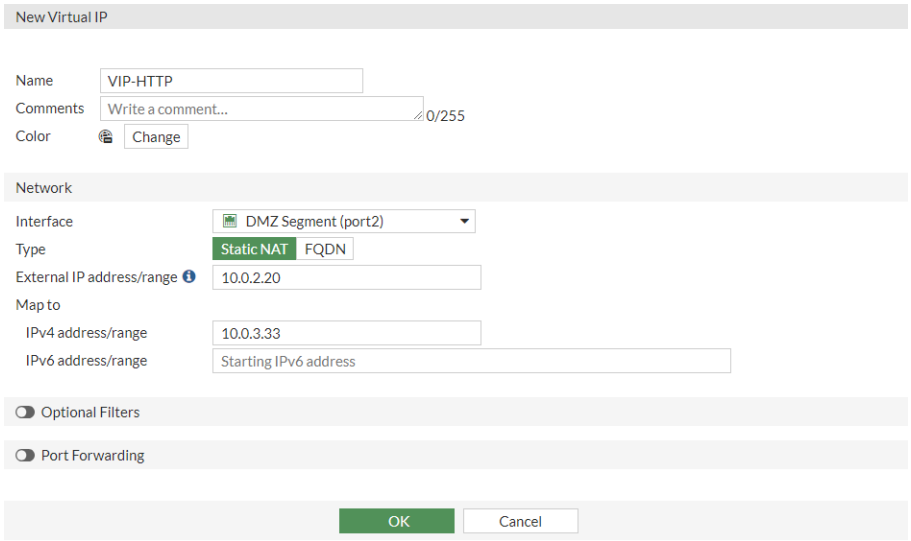


4. Click *Yes, Update*.

To configure VIPs on the cloud FortiGate-VM:

1. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Configure the following:

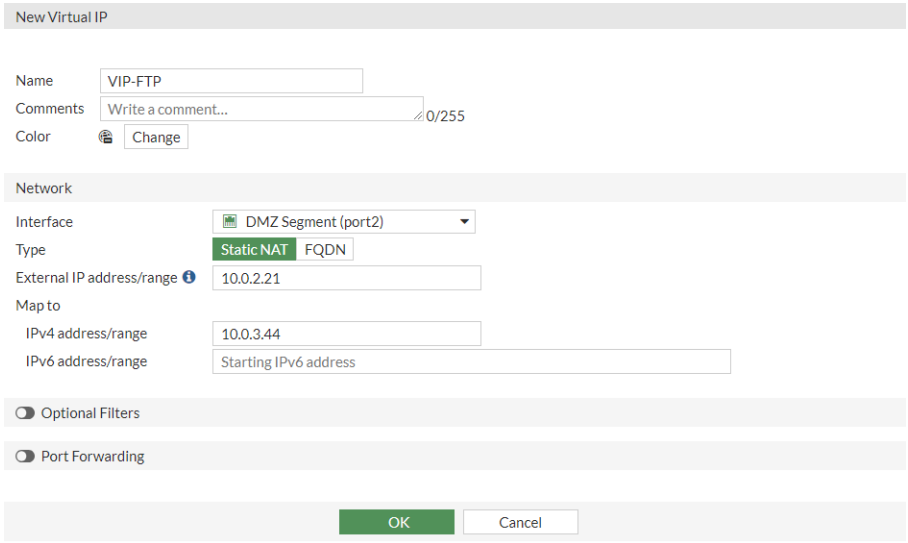
Name	VIP-HTTP
Interface	port2
External IP address/range	10.0.2.20
Map to IPv4 address/range	10.0.3.33



4. Click *OK*.
5. Create a second VIP for the FTP server with the following settings:

Name	VIP-FTP

Interface	port2
External IP address/range	10.0.2.21
Map to IPv4 address/range	10.0.3.44



To configure firewall policies to allow traffic from port2 to port3:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

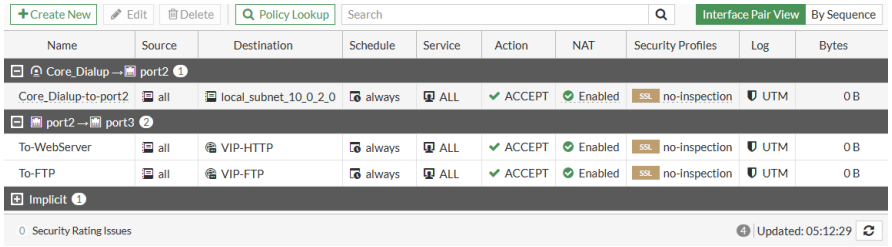
Name	To-WebServer
Incoming Interface	port2
Outgoing Interface	port3
Source	all
Destination	VIP-HTTP
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled

3. Configure the remaining settings as required.
4. Click *OK*.
5. Create a second policy for the FTP VIP with the following settings:

Name	To-FTP
Incoming Interface	port2

Outgoing Interface	port3
Source	all
Destination	VIP-FTP
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled

6. Click *OK*.



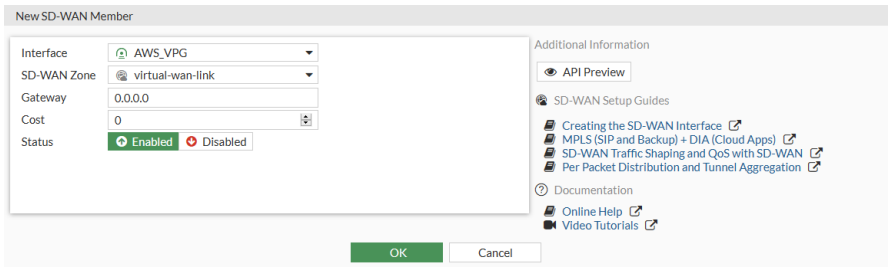
Configuring the SD-WAN to steer traffic between the overlays

Configure the HQ FortiGate to use two overlay tunnels for SD-WAN, steering HTTPS and HTTP traffic through the FGT_AWS_Tun tunnel, and SSH and FTP throguh the AWS_VPG tunnel.

1. Add SD-WAN member interfaces
2. Configure a route to the remote network
3. Configure firewall policies
4. Configure a health check
5. Configure SD-WAN rules

To add SD-WAN member interfaces:

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Zones* tab, and click *Create New* > *SD-WAN Member*.
2. Set *Interface* to *AWS_VPG* then click *OK*.

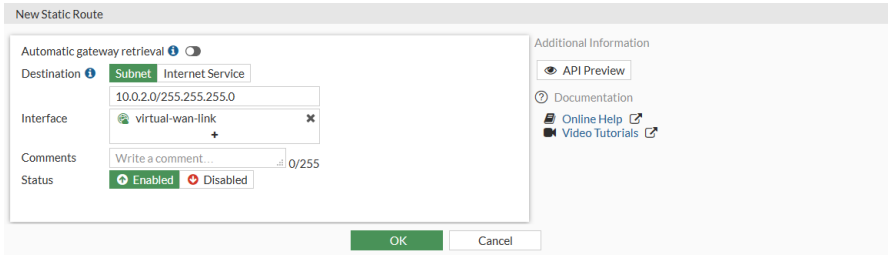


3. Click *Create New* > *SD-WAN Member* again.
4. Set *Interface* to *FGT_AWS_Tun*.

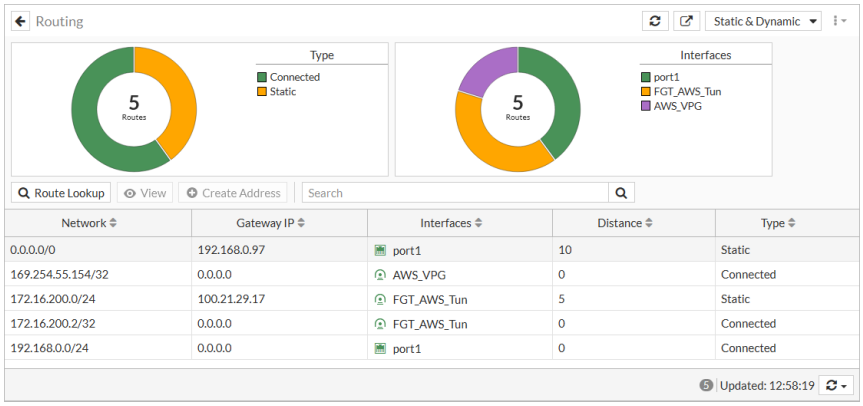
5. Set *Gateway* to *172.16.200.1*.
6. Click *OK*.

To configure a route to the remote network 10.0.2.0/24:

1. Go to *Network* > *Static Routes* and click *Create New*.
2. Set *Destination* to *Subnet* and enter the IP address and netmask: *10.0.2.0/255.255.255.0*.
3. Set *Interface* to *virtual-wan-link*.



4. Click *OK*.
   Individual routes to each tunnel are automatically added to the routing table with the same distance:



To configure firewall policies to allow traffic from the internal subnet to SD-WAN:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following:

Name	ISFW-to-IaaS
Incoming Interface	port3
Outgoing Interface	virtual-wan-link
Source	all

Destination	all
Schedule	always
Service	ALL
Action	ACCEPT
NAT	Enabled

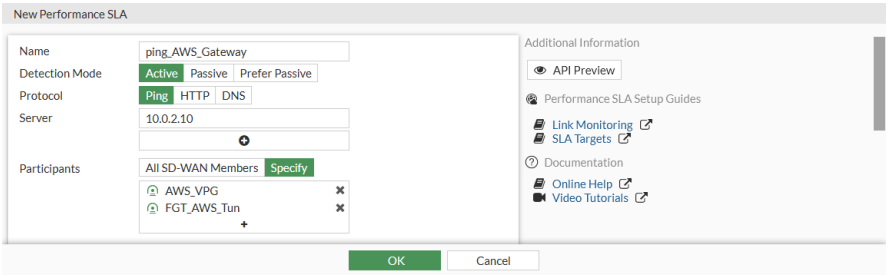
3. Configure the remaining settings as required.
4. Click *OK*.
   Once the firewall policies are configured, the VPN tunnels should come up when there is traffic.

To configure a health check to monitor the status of the tunnels:

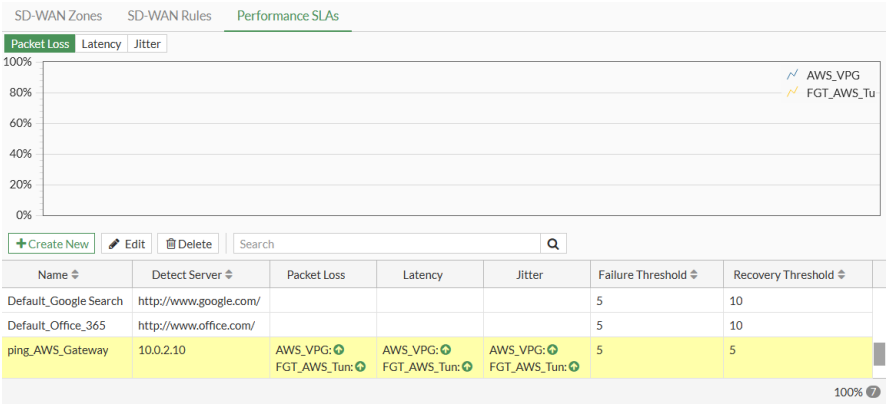
As you are accessing the servers on the 10.0.2.0/24 subnet, it is preferable to use the FortiGate port2 interface as the ping server for detection. This ensures that, if the gateway is not reachable in either tunnel, its routes are brought down and traffic continues on the other tunnel.

1. Go to *Network* > *SD-WAN*, select the *Performance SLAs* tab, and click *Create New*.
2. Configure the following:

Name	ping_AWS_Gateway
Protocol	Ping
Server	10.0.2.10
Participants	Specify Add AWS_VPG and FGT_AWS_Tun as participants.



3. Click *OK*.



Health check probes originate from the VPN interface's IP address. This is why the phase2 selectors are configured with *Local Address* set to *all*.

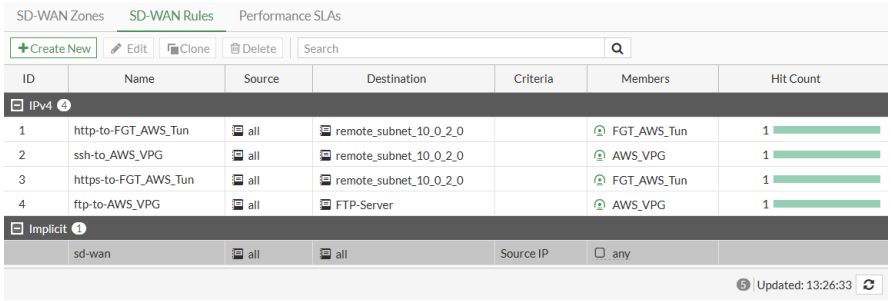
To configure SD-WAN rules to steer traffic:

HTTPS and HTTP traffic is steered to the FGT_AWS_Tun tunnel, and SSH and FTP traffic is steered to the AWS_VPG tunnel. The Manual algorithm is used in this example.

1. Go to *Network* > *SD-WAN*, select the *SD-WAN Rules* tab, and click *Create New*.
2. Configure the following:

Name	http-to-FGT_AWS_Tun
Source Address	all
Address	remote_subnet_10_0_2_0
Protocol	TCP
Port range	80 - 80
Outgoing Interfaces	Manual
Interface preference	FGT_AWS_Tun

3. Click *OK*.
4. Create other SD-WAN rules as required:



Verifying the traffic

To verify that pings are sent across the IPsec VPN tunnels

- On the HQ FortiGate, run the following CLI command:

```
# diagnose sniffer packet any 'host 10.0.2.10' 4 0 1 interfaces=[any]
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.0.2.10]
pcap_snapshot: snaplen raised from 0 to 262144
2021-06-05 11:35:14.822600 AWS_VPG out 169.254.55.154 -> 10.0.2.10: icmp: echo request
2021-06-05 11:35:14.822789 FGT_AWS_Tun out 172.16.200.2 -> 10.0.2.10: icmp: echo request
2021-06-05 11:35:14.877862 FGT_AWS_Tun in 10.0.2.10 -> 172.16.200.2: icmp: echo reply
2021-06-05 11:35:14.878887 AWS_VPG in 10.0.2.10 -> 169.254.55.154: icmp: echo reply
```

- On the cloud FortiGate-VM, run the following CLI command:

```
# diagnose sniffer packet any 'host 10.0.2.10' 4 0 1 interfaces=[any]
Using Original Sniffing Mode
interfaces=[any]
filters=[host 10.0.2.10]
pcap_snapshot: snaplen raised from 0 to 262144
2021-06-05 11:37:57.176329 port2 in 169.254.55.154 -> 10.0.2.10: icmp: echo request
2021-06-05 11:37:57.176363 port2 out 10.0.2.10 -> 169.254.55.154: icmp: echo reply

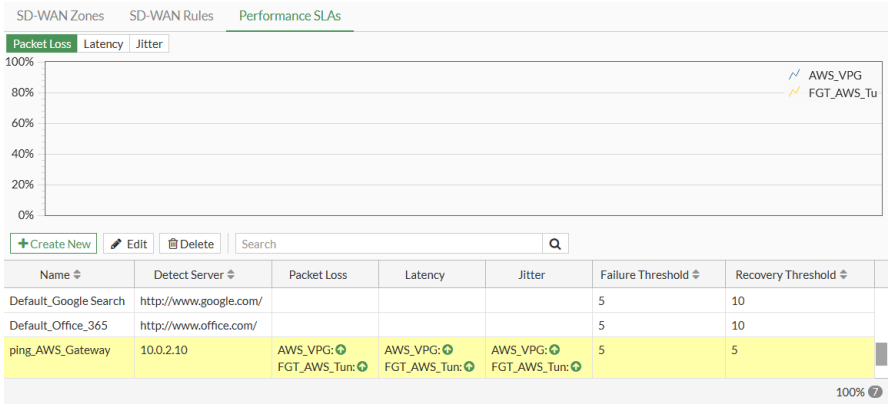
2021-06-05 11:37:57.176514 Core_Dialup out 10.0.2.10 -> 172.16.200.2: icmp: echo reply
```

To verify the SLA health checks on the HQ FortiGate:

1. Go to *Network* > *SD-WAN* > *Performance SLAs*, select *Packet Loss*, and click the *ping_AWS_Gateway* SLA:

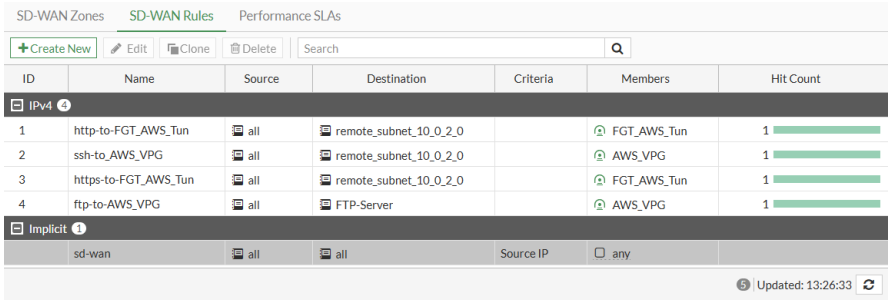


2. Run the following CLI command:

```
# diagnose sys sdwan health-check
…
Seq(1 AWS_VPG): state(alive), packet-loss(0.000%) latency(56.221), jitter(0.290) sla_map=0x0
Seq(2 FGT_AWS_Tun): state(alive), packet-loss(0.000%) latency(55.039), jitter(0.223) sla_
map=0x0
```

To verify service rules:

1. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab:



2. Run the following CLI command:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x0
  Gen(1), TOS(0x0/0x0), Protocol(6: 80->80), Mode(manual)
  Members:
    1: Seq_num(2 FGT_AWS_Tun), alive, selected
  Src address:
        0.0.0.0-255.255.255.255
  Dst address:
        10.0.2.0-10.0.2.255

Service(2): Address Mode(IPV4) flags=0x0
  Gen(1), TOS(0x0/0x0), Protocol(6: 22->22), Mode(manual)
  Members:

```

To verify that sessions are going to the correct tunnel:

1. Run the following CLI command to verify that HTTPS and HTTP traffic destined for the Web server at 10.0.2.20 uses FGT_AWS_Tun:

```
# diagnose sys session filter dst 10.0.2.20
# diagnose sys session list

session info: proto=6 proto_state=11 duration=2 expire=3597 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=FGT_AWS_Tun/ vlan_cos=0/255
```

```
state=log may_dirty npu f00 csf_syncd_log app_valid
statistic(bytes/packets/allow_err): org=593/4/1 reply=3689/5/1 tuples=3

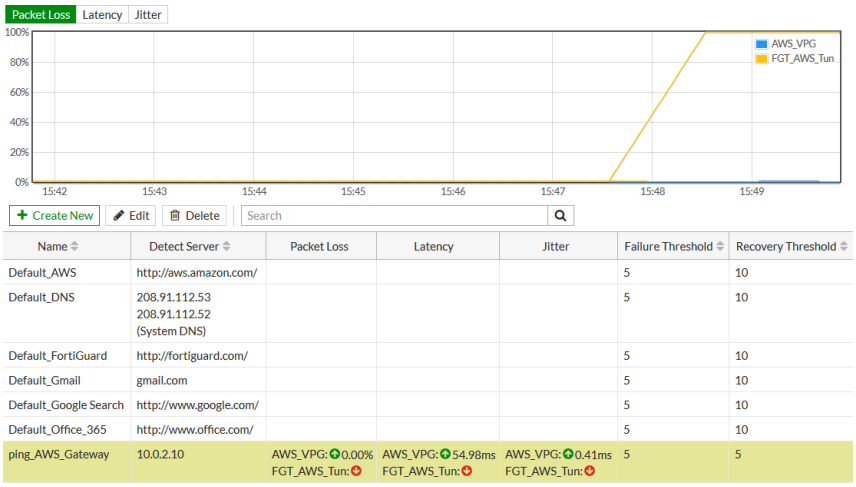
To simulate an issue on an overlay VPN tunnel:

On the cloud FortiGate-VM, disable the firewall policy allowing Core_Dialup to port2.

1. Health-checks through the FGT_AWS_Tun tunnel fail:
   a. Go to *Network > SD-WAN*, select the *Performance SLAs* tab, select *Packet Loss*, and click the *ping_AWS_Gateway* SLA:

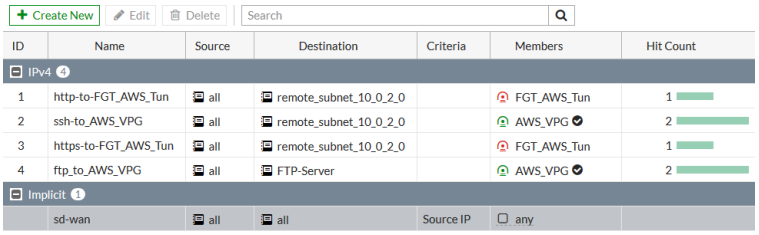


Name	Detect Server	Packet Loss	Latency	Jitter	Failure Threshold	Recovery Threshold
Default_AWS	http://aws.amazon.com/				5	10
Default_DNS	208.91.112.53 208.91.112.52 (System DNS)				5	10
Default_FortiGuard	http://fortiguard.com/				5	10
Default_Gmail	gmail.com				5	10
Default_Google Search	http://www.google.com/				5	10
Default_Office_365	http://www.office.com/				5	10
ping_AWS_Gateway	10.0.2.10	AWS_VPG: 0.00% FGT_AWS_Tun:	AWS_VPG: 54.98ms FGT_AWS_Tun:	AWS_VPG: 0.41ms FGT_AWS_Tun:	5	5

b. Run the following CLI command:

```
# diagnose sys sdwan health-check
…
Seq(1 AWS_VPG): state(alive), packet-loss(0.000%) latency(52.746), jitter(0.713) sla_
map=0x0
Seq(2 FGT_AWS_Tun): state(dead), packet-loss(19.000%) sla_map=0x0
```

2. Service rules show that the member is down:
   a. Go to *Network* > *SD-WAN* and select the *SD-WAN Rules* tab:



ID	Name	Source	Destination	Criteria	Members	Hit Count
IPv4 4						
1	http-to-FGT_AWS_Tun	all	remote_subnet_10_0_2_0		FGT_AWS_Tun	1
2	ssh-to_AWS_VPG	all	remote_subnet_10_0_2_0		AWS_VPG	2
3	https-to-FGT_AWS_Tun	all	remote_subnet_10_0_2_0		FGT_AWS_Tun	1
4	ftp_to_AWS_VPG	all	FTP-Server		AWS_VPG	2
Implicit 1						
	sd-wan	all	all	Source IP	any	

b. Run the following CLI command:

```
# diagnose sys sdwan service4

Service(1): Address Mode(IPV4) flags=0x0
  Gen(2), TOS(0x0/0x0), Protocol(6: 80->80), Mode(manual)
  Members:
    1: Seq_num(2 FGT_AWS_Tun), dead
  Src address:
        0.0.0.0-255.255.255.255
  Dst address:
        10.0.2.0-10.0.2.255

Service(2): Address Mode(IPV4) flags=0x0
  Gen(1), TOS(0x0/0x0), Protocol(6: 22->22), Mode(manual)
  Members:

total session 2
```

4. Routes to the *FGT_AWS_Tun* tunnel are removed:
   a. Go to *Dashboard* > *Network Monitor* > *Routing* to view the routing table.

Network	Gateway IP	Interfaces	Distance	IP Version	Type
IPv4 40					
0.0.0.0/0	10.100.64.254	Internet_A (port1)	1	IPv4	Static
0.0.0.0/0	10.100.65.254	Internet_B (port5)	1	IPv4	Static
10.0.2.0/24	169.254.55.153	AWS_VPG	1	IPv4	Static
10.0.10.0/24	0.0.0.0	VPN_A_Tunnel (Branch-HQ-A)	0	IPv4	Connected
10.0.10.1/32	0.0.0.0	VPN_A_Tunnel (Branch-HQ-A)	0	IPv4	Connected

   b. Run the following CLI command:

```
# get router info routing-table all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default

Routing table for VRF=0
S*      0.0.0.0/0 [1/0] via 10.100.64.254, port1
                  [1/0] via 10.100.65.254, port5
S       10.0.2.0/24 [1/0] via 169.254.55.153, AWS_VPG
C       10.0.10.0/24 is directly connected, Branch-HQ-A
C       10.0.10.1/32 is directly connected, Branch-HQ-A
…
```

Zero Trust Network Access

This section includes information about ZTNA related features:

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 for more information.

Zero Trust Network Access introduction

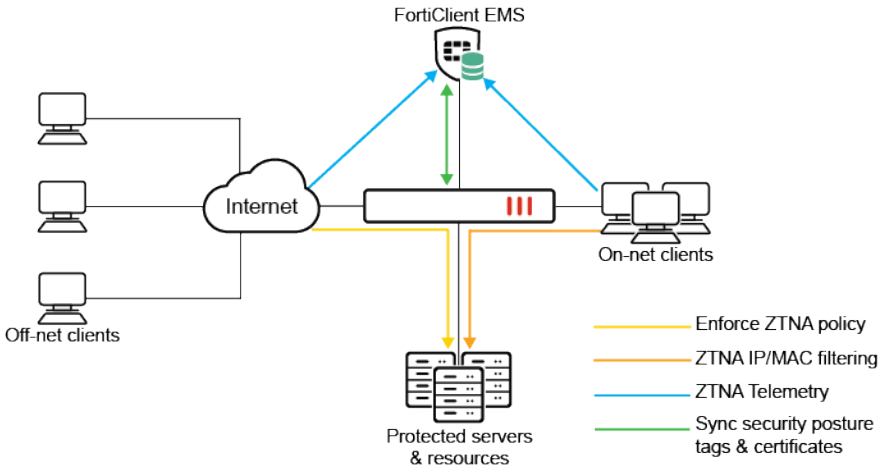
Zero Trust Network Access (ZTNA) is an access control method that uses client device identification, authentication, and security posture tags (formerly ZTNA tags) to provide role-based application access. It gives administrators the flexibility to manage network access for On-net local users and Off-net remote users. Access to applications is granted only after device verification, authenticating the user's identity, authorizing the user, and then performing context based posture checks using security posture tags.

Traditionally, a user and a device have different sets of rules for on-net access and off-net VPN access to company resources. With a distributed workforce and access that spans company networks, data centers, and cloud, managing the rules can become complex. User experience is also affected when multiple VPNs are needed to get to various resources. ZTNA can improve this experience.

ZTNA application gateway and IP/MAC based access control

- ZTNA application gateway allows users to securely access resources through an SSL encrypted access proxy. This simplifies remote access by eliminating the use of VPNs.
- IP/MAC based access control combines IP/MAC with security posture tags for identification and security posture check to implement role-based zero trust access inline with regular firewall policies.

ZTNA telemetry, tags, and policy enforcement

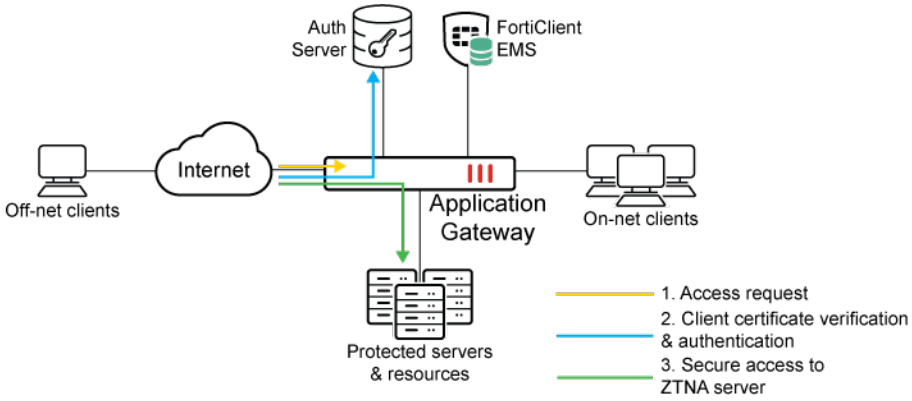


When On-net and Off-net FortiClient endpoints register to FortiClient EMS, device information, log on user information, and security posture are all shared over ZTNA telemetry with the EMS server. Clients also make a certificate signing request to obtain a client certificate from the EMS that is acting as the ZTNA Certificate Authority (CA).

Based on the client information, EMS applies matching Zero Trust tagging rules to tag the clients. These tags, and the client certificate information, are synchronized with the FortiGate in real-time. This allows the FortiGate to verify the client's identity using the client certificate, and grant access based on the security posture tags applied in the ZTNA policy.

For more information, see Establish device identity and trust context with FortiClient EMS on page 1560.

Application gateway



The FortiGate application gateway can proxy HTTP, SSH, RDP, SMB, FTP, and other TCP traffic as well as UDP traffic over secure connections with the client. This enables seamless access from the client to the protected servers, without needing to form IPsec tunnels.

ZTNA web proxy

The FortiGate ZTNA web proxy works as a reverse proxy for the HTTP server. When a client connects to a webpage hosted by the protected server, the address resolves to the FortiGate's access proxy VIP. The FortiGate proxies the connection and takes steps to authenticate the user. It prompts the user for their certificate on the browser, and verifies this against the ZTNA endpoint record that is synchronized from the EMS. If an authentication scheme, such as SAML authentication, is configured, the client is redirected to a captive portal for sign-on. If this passes, traffic is allowed based on ZTNA policies, and the FortiGate returns the webpage to the client.

For example configurations, see ZTNA web proxy example on page 1618, ZTNA web proxy with basic authentication example on page 1633, and ZTNA application gateway with SAML authentication example on page 1671.

ZTNA traffic forwarding proxy

The ZTNA traffic forwarding proxy (formerly TCP forwarding access proxy or TFAP) works as a special type of HTTPS reverse proxy. Instead of proxying traffic to a web server, TCP and UDP traffic is tunneled between the client and the access proxy over HTTPS, and forwarded to the protected resource. The FortiClient on the remote endpoint intercepts traffic destined for the protected resources and routes them to the FortiGate proxy gateway. An HTTPS connection is made to the FortiGate's access proxy VIP, where the client certificate is verified and access is granted based on the ZTNA policies. Traffic is forwarded from the FortiGate to the protected resource, and an end to end connection is established. To reduce overhead, you can disable access proxy encryption on the client, as some TCP protocols, like RDP, are already secure. The traffic forwarding proxy supports UTM scanning and deep inspection for HTTP, HTTPS, SMTP, SMTPS, IMAP, IMAPS, POP3, POP3S, SMB, and CIFS.

For an example configuration, see ZTNA traffic forwarding proxy example on page 1644.

SSH access proxy

The SSH access proxy provides some benefits to proxying SSH connections over traffic forwarding proxy, including allowing SSH deep inspection, performing optional SSH host-key validation, and allowing one-time user authentication to authenticate the ZTNA SSH access proxy connection and SSH server connection.

For an example configuration, see ZTNA SSH traffic forwarding proxy example on page 1662.

Basic ZTNA configuration components

The basic components required to configure ZTNA application gateway on the FortiGate are:

1. FortiClient EMS fabric connector and security posture tags.
2. FortiClient EMS running version 7.0.0 or later or FortiClient EMS Cloud.
3. FortiClient running 7.0.0 or later.
4. ZTNA port
5. ZTNA server (web server or traffic forwarding server)
6. ZTNA policy

7. (Optional) User authentication
8. (Optional) HA configurations

For configuration details, see Basic ZTNA configuration on page 1546.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 for more information.

ZTNA service connector

In certain environments, we may want to prevent users from accessing the FortiGate ZTNA application gateway directly or expose ports and services on the FortiGate to the public. In these scenarios, another layer of ZTNA proxy may be required to serve as the ZTNA Edge.

The FortiGate can act as a ZTNA service connector to reverse proxy service connections upstream to the ZTNA Edge. The ZTNA Edge may be a FortiPAM, FortiProxy, or even a FortiGate that acts as the ZTNA application gateway to the end users. The FortiGate, as the ZTNA service connector, forms a persistent control connection with ZTNA Edge. The ZTNA Edge forwards connection requests through the control tunnel to the FortiGate ZTNA service connector, which proxies the request to the protected server.

Basic ZTNA configuration

To deploy a ZTNA application gateway, configure the following components on the FortiGate:

1. Configure a FortiClient EMS connector on page 1546
2. Configure a ZTNA port on page 1549
3. Configure a ZTNA server on page 1550
4. Configure a ZTNA policy on page 1554
5. Optional authentication on page 1557
6. Optional HA configurations on page 1560

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 for more information.

To configure ZTNA in the GUI, go to *System > Feature Visibility* and enable *Zero Trust Network Access*.

Configure a FortiClient EMS connector

To add an on-premise FortiClient EMS server in the GUI:

1. Go to *Security Fabric > Fabric Connectors* and double-click the *FortiClient EMS* card.
2. Set the *Status* to *Enabled* for one of the EMS servers.
3. Enter a name for the connector and the IP address or FQDN of the EMS.
4. Click *OK*.
5. A window appears to verify the EMS server certificate. Click *Accept*.

See FortiClient EMS for more information.

To add an on-premise FortiClient EMS server in the CLI:

```
config endpoint-control fctems
    edit <ems-id>
        set status enable
        set name <name>
        set server <server IP or domain>
        set verifying-ca <certificate>
    next
end
```

To add FortiClient EMS Cloud in the GUI:

1. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
2. Set the *Status* to *Enabled* for one of the EMS servers.
3. Set the *Type* to *FortiClient EMS Cloud*.
4. Enter a name for the connector.
5. Click *OK*. A window appears to verify the EMS server certificate.
6. Click *Accept*.

   See FortiClient EMS for more information.

To add FortiClient EMS Cloud in the CLI:

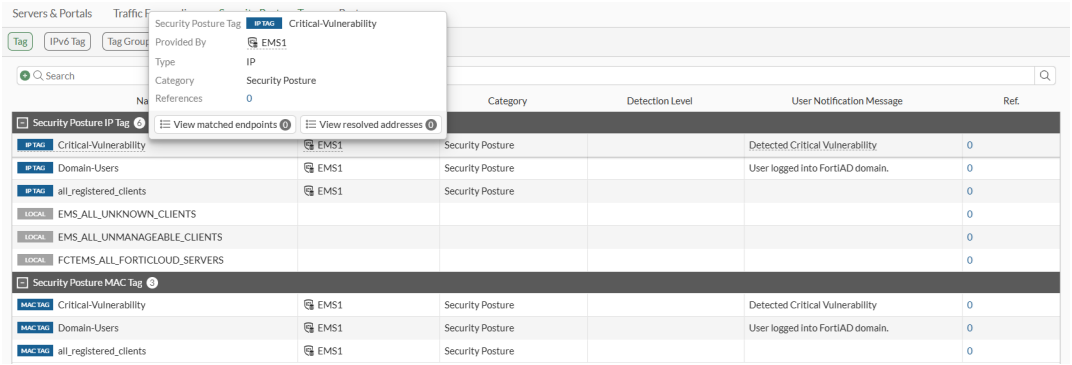
```
config endpoint-control fctems
    edit <ems-id>
        set status enable
        set name <name>
        set fortinetone-cloud-authentication enable
        set certificate <string>
    next
end
```

Security posture tags

After the FortiGate connects to the FortiClient EMS, it automatically synchronizes security posture tags. Security posture tags are generated from tagging rules configured on the FortiClient EMS. These tagging rules are based on various posture checks that can be applied on the endpoints. See Endpoint Posture Check Reference.

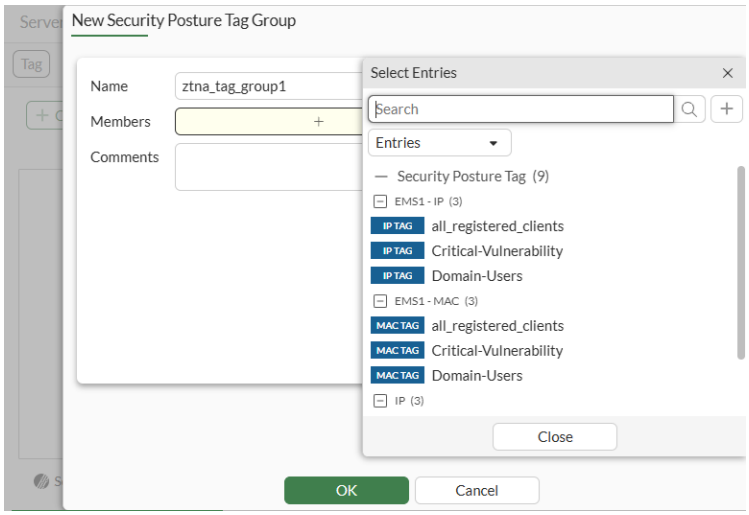
To view the synchronized security posture tags in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *Security Posture Tag* tab.
2. Hover the cursor over a tag name to view more information about the tag, such as its resolved addresses.



To create a security posture tag group in the GUI:

1. Go to *Policy & Objects* > *ZTNA* > *Security Posture Tags* and select the *Tag Group* sub-menu.
2. Click *Create New*.
3. Enter a name for the group and select the group members.



4. Click *OK*.

To view the synchronized security posture tags in the CLI:

```
# diagnose firewall dynamic address
# diagnose firewall dynamic list
```

To create a security posture tag group in the CLI:

```
config firewall addrgrp
    edit <group name>
        set category ztna-ems-tag
        set member <members>
    next
end
```

Configure a ZTNA port

The ZTNA port (formerly access proxy VIP) is the FortiGate ZTNA gateway that clients make HTTPS connections to. Starting in 8.0, the ZTNA port can be configured separately before being mapped to a server. This allows the ZTNA port to be decoupled from the ZTNA real-server(s) and be referenced by more than one set of servers.

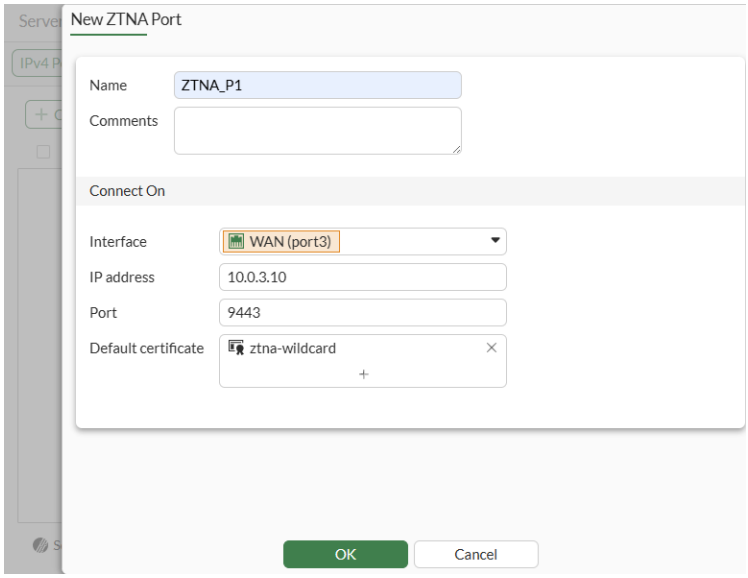
To create a ZTNA port in the GUI:

1. Go to *ZTNA > Ports*, and select *IPv4 Ports* or *IPv6 Ports* (visible when IPv6 is enabled in feature visibility).
2. Click *Create New*.
3. Enter a name for the ZTNA port.
4. Select an *Interface*.
5. Enter an IP address.
6. Enter the port to connect to.

   Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.

   You may specify the IP address as 0.0.0.0 if an interface other than Any is selected. The ZTNA Application Gateway IP address will dynamically use the primary and secondary IPv4 address of the interface as its external IP address.

7. Select the *Default certificate*. Clients will be presented with this certificate when they connect to the access proxy VIP.



8. Click *OK*.

To create a ZTNA port in the CLI:

```
config firewall vip
    edit <name>
```

```
        set type access-proxy
        set server-type https
        set extip <external IP>
        set extintf <external interface>
        set extport <external port>
        set empty-cert-action {accept | block | accept-unmanageable}
        set user-agent-detect {enable | disable}
        set client-cert {enable | disable}
        set ssl-certificate <certificate>
    next
end
```

Configure a ZTNA server

To configure a ZTNA server, map a ZTNA port to the real servers that clients will connect to. If a ZTNA port is not defined, you can also create a new one directly on the ZTNA server definition page.

A ZTNA server can be either a Web server or a traffic forwarding server. In the following example, we will create a ZTNA web server.

In the GUI, the web proxy server can be configured using basic or advanced configuration mode:

- **Basic mode (default)**: use this mode when you need to configure a single destination that is tied to this Web server object and virtual host.
- **Advanced mode**: use this mode when you need to configure multiple destinations tied to this Web server object and virtual host. For example, you plan to specify different paths for various destinations. You will also be able to customize the port for the server, which by default is 443.

To create a ZTNA web server for using the basic method in the GUI:

1. Go to *Policy & Objects* > *ZTNA* > *Servers & Portals*.
2. Go to *Web Server* sub-menu and click *Create New*.
3. Configure the following:

Setting	Description
Name	Name of the web server object.
IP version	Select IPv4 or IPv6. This option only appears if IPv6 is enabled on Feature Select.
Host*	Name of the virtual host that your end users are accessing.
ZTNA port	• *Use existing*: Select a previously configured ZTNA port. • *Create new*: Input settings for a new ZTNA port.
Internal server IP	• *DNS default*: Automatically resolves the virtual host and configure the real server to be the IP of the resolved host. • *Specify*: Configure the real server manually. Select Service (HTTP/HTTPS) and IP. By default, the port will be 443. To change the port, use Advanced mode.

* Host (aka Virtual Host) fields are mandatory, since multiple entries can be paired with the same ZTNA port. To differentiate between different servers, the virtual host field is used for matching.

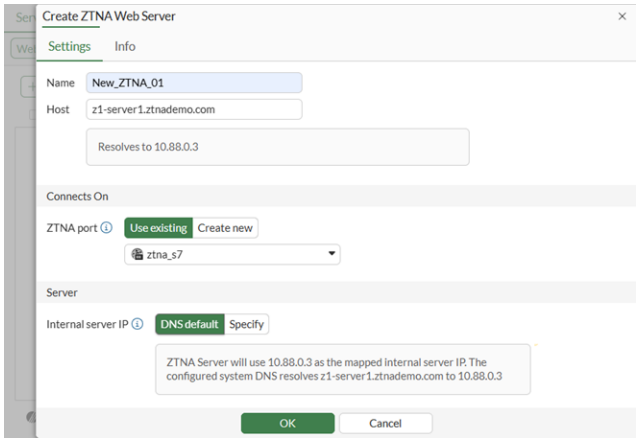
When a host is not specified, any request that resolves to the ZTNA port will be mapped to this ZTNA server. For instance, if both www.example1.com and www.example2.com resolve to the ZTNA port, then both requests are mapped to your real servers of this ZTNA server.

Note that only one ZTNA server entry can have an empty host, and it can only be configured from CLI.

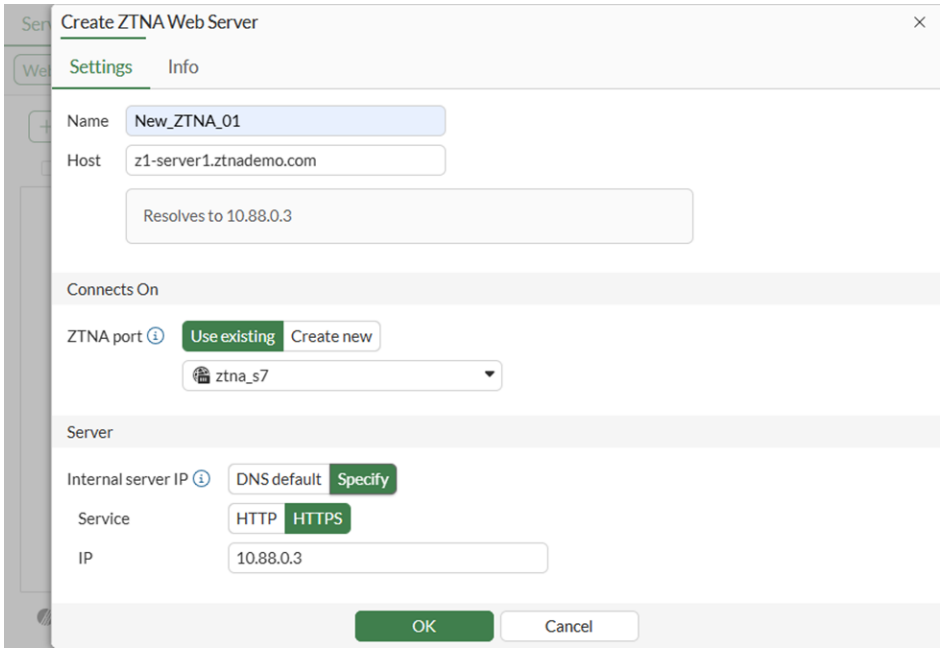
On the other hand, when you enter a name or IP address in the host field, then the request must match this host. For example, if www.example1.com is entered as the host, then only requests to www.example1.com will match this ZTNA server.

As a best practice, an external DNS should be used by remote clients to resolve the virtual-host to the ZTNA port.

Example using DNS default for Internal server IP



Manually specify Internal server IP



4. Click *OK* to save.

This method automatically configures a virtual host object in the CLI and references it in the ZTNA web-proxy object.

```
config firewall access-proxy-virtual-host
    edit "web-proxy_vh_mggshssu"
        set ssl-certificate "ztna-wildcard"
        set host "z1-server1.ztnademo.com"
    next
end
config ztna web-proxy
    edit "New_ZTNA_01"
        set vip "ztna_s7"
        set host "web-proxy_vh_mggshssu"
        config api-gateway
            edit 1
                config realservers
                    edit 1
                        set ip 10.88.0.3
                    next
                end
            next
        end
    next
end
```

For other advanced virtual host settings, use the CLI:

```
config firewall access-proxy-virtual-host
    edit <host>
        set host-type { substring | fqdn* | wildcard }
        set empty-cert-action { accept | block* | accept-unmanageable }
        set client-cert { enable* | disable }
    next
end
```

When using host-type fqdn, the host will only match when the subdomain matches the host. For example, the host test.com will match vhost1.test.com, but will not match test.com.vhost. On the other hand, host-type substring will match both.

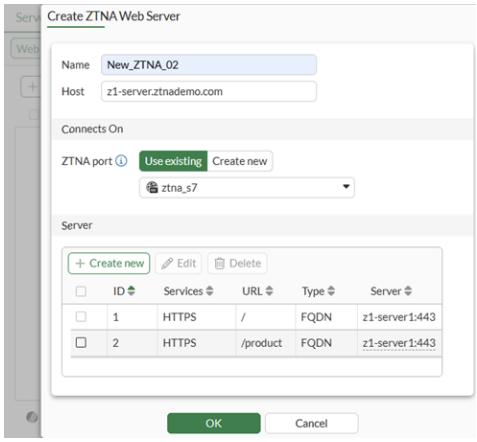
To create a ZTNA web server using the advanced method in the GUI:

1. Go to *Policy & Objects* > *ZTNA* > *Servers & Portals*.
2. Go to the *Web Server* sub-menu and click *Create New*.
3. Enable *Advanced configuration mode*.
4. Enter the *Name*, *IP version*, *Host*, and *ZTNA port* settings as in the Basic method.
5. In the *Server* table, click *Create new* to add a new real server.

Setting	Description
Service	HTTP or HTTPS
Path*	Optional. Specify a specific path for matching. When creating more than one real server, the paths must be distinct.

Setting	Description
Address Type	• *IP*: Input the IP and port of the real server. • *FQDN*: The address of the real server can be chosen from pre-configured FQDN addresses.

*The path can be matched by substring, wildcard, or regular expression when configured from the CLI. In the GUI, the default is substring. For example, if the virtual host is specified as www.example1.com, and the path substring is map1, then www.example1.com/map1 will be matched to this real server.



6. Click *OK* to save.

This method also automatically configures a virtual host object in the CLI and references it in the ZTNA web-proxy object:

```
config firewall access-proxy-virtual-host
        edit "web-proxy_vh_mggsn6e5"
        set ssl-certificate "ztna-wildcard"
        set host "z1-server.ztnademo.com"
    next
end
config ztna web-proxy
    edit "New_ZTNA_02"
        set vip "ztna_s7"
        set host "web-proxy_vh_mggsn6e5"
        config api-gateway
            edit 1
                config realservers
                    edit 1
                        set addr-type fqdn
                        set address "z1-server1"
                    next
                end
            next
            edit 2
                set url-map "/product"
                config realservers
                    edit 1
                        set addr-type fqdn
```

```
                        set address "z1-server1"
                    next
                end
            next
        end
    next
end
```

Starting in FortiOS 7.6.4, certificate verification of the real server is enabled by default. You can manually adjust the setting using the following CLI command:

```
config ztna web-proxy
    edit <server>
        config api-gateway
            edit 1
                config realservers
                    edit 0
                        set ip <real server 2 address>
                        set port <real server 2 port>
                        set verify-cert {enable | disable}
                    next
                end
            next
        end
    next
end
```

Configure a ZTNA policy

A ZTNA policy is used to enforce zero trust role based access control by using security posture tags or tag groups to verify a device's security posture. A ZTNA policy can also utilize security profiles to protect this traffic.

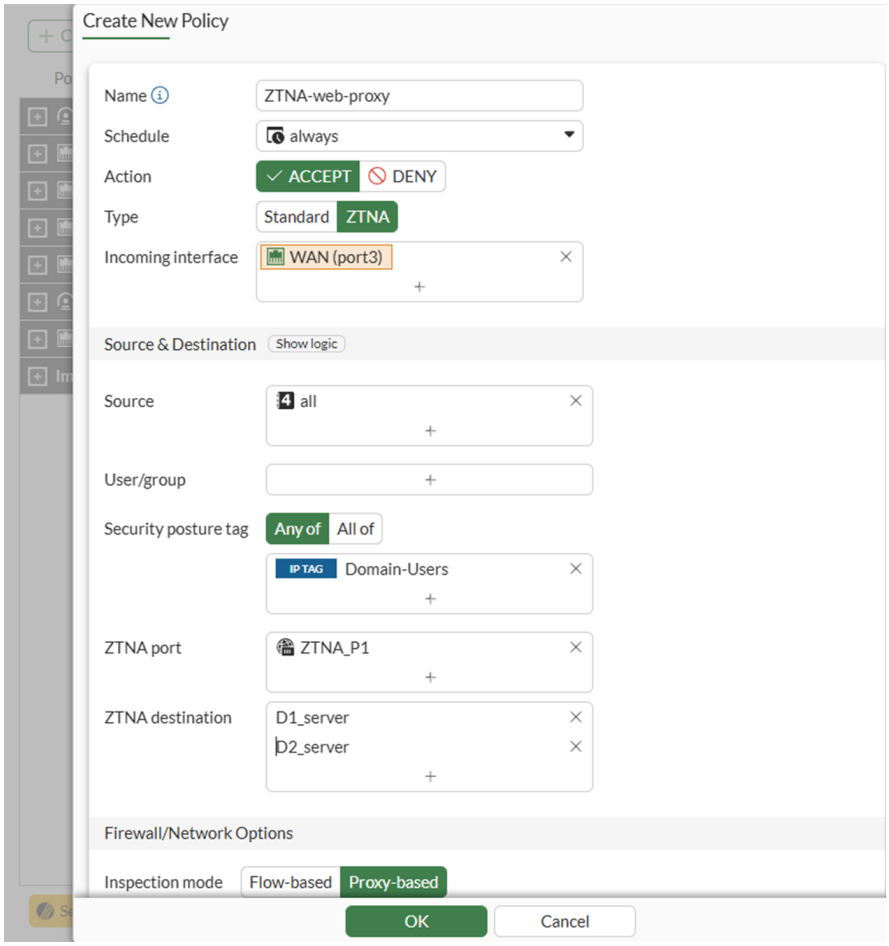
There are two ways to configure ZTNA rules in the GUI by using a full or simple ZTNA policy:

- Full ZTNA policy: The method uses ZTNA type proxy policies. You can granularly define destination addresses beyond the ZTNA server and destination you are allowing.
- Simple ZTNA policy: A simplified method for configuring a ZTNA policy using firewall policies. This method covers most functionality of a Full ZTNA policy, except it cannot control access based on destination interface or real server's destination address.

To configure a simple ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Enter a name for the ZTNA policy.
4. Select the *Schedule*.
5. Select the *Action*.
6. Set *Type* to *ZTNA*.
7. Select an *Incoming Interface*.
8. Set the *Source*.

9. Add the security posture tags or tag groups that are allowed access. If multiple tags are included, the matching method is set to *Any* by default.
10. Select the *ZTNA port*. By selecting the ZTNA port, all ZTNA servers associated with it become accessible.



11. 10.11. If traffic forwarding destinations are configured, select the destinations.
12. Configure the remaining options as needed.
13. Click OK.

To configure a simple ZTNA policy in the CLI:

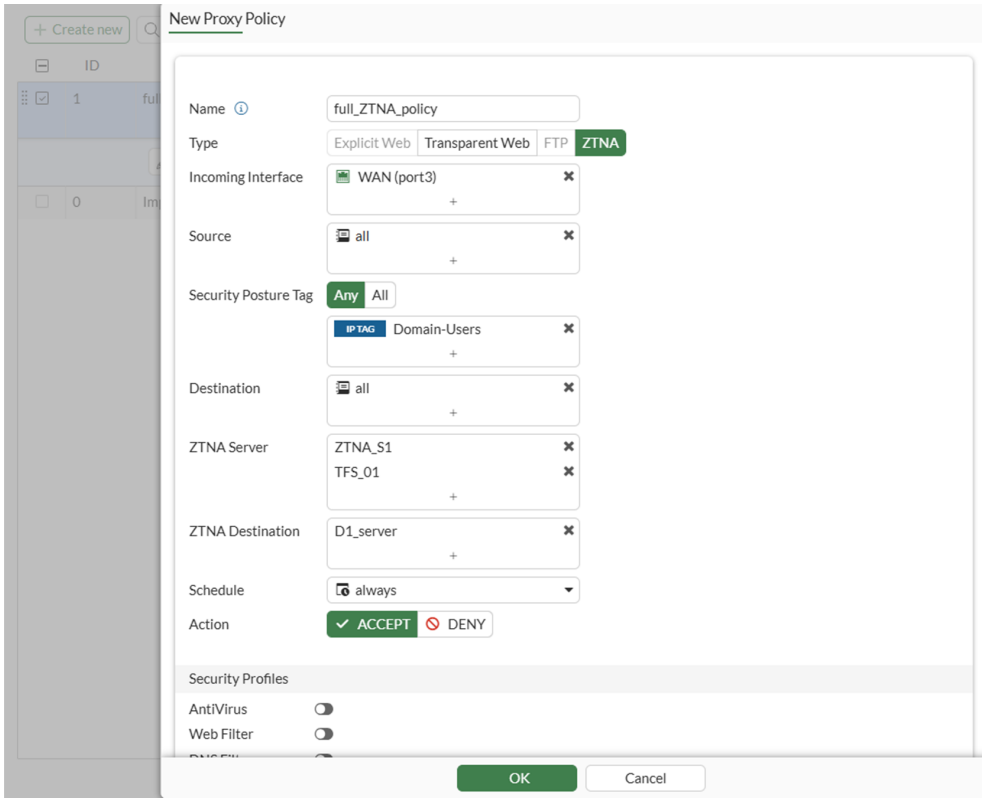
```
cconfig firewall policy
    edit 1
        set name <ZTNA policy name>
        set srcintf <interface>
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "ZTNA port"
        set ztna-ems-tag <security posture tags>
               set ztna-destination <destination 1> <destination 2> …
        set schedule "always"
        set nat enable
```

```
    next
end
```

The `dstintf` command cannot be modified.

To configure a full ZTNA policy in the GUI:

1. Go to *System* > *Feature Visibility*.
2. Under *Security Features*, enable *Explicit Proxy*.
3. Click *Apply*.
4. Go to *Policy & Objects* > *Proxy Policy*.
5. Click *Create New*.
6. Enter a name for the rule.
7. Change *Type* to *ZTNA*.
8. Select an *Incoming Interface* and *Source*.
9. Add the security posture tags or tag groups that are allowed access. If multiple tags are included, the matching method is set to *Any* by default.
10. Select the *Destination*.
11. Select the *ZTNA Server*.
12. If a *Traffic Forwarding Server* is selected, then select a *ZTNA Destination* as well.
13. Select the *Action*.



14. Configure the remaining options as needed.

15. Click *OK*.

To configure a full ZTNA policy in the CLI:

```
config firewall proxy-policy
    edit 1
        set name <ZTNA policy name>
        set proxy ztna-proxy
        set ztna-proxy <proxy server 1> <proxy server 2> …
        set ztna-destination <destination 1> <destination 2> …
        set srcintf <interface>
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag <security posture tag(s)>
        set action accept
        set schedule "always"
        set logtraffic all
    next
end
```

Optional authentication

To configure authentication to the ZTNA application gateway, you must configure an authentication scheme and authentication rule in the GUI or CLI. They are used to authenticate proxy-based policies, similar to configuring authentication for explicit and transparent proxy.

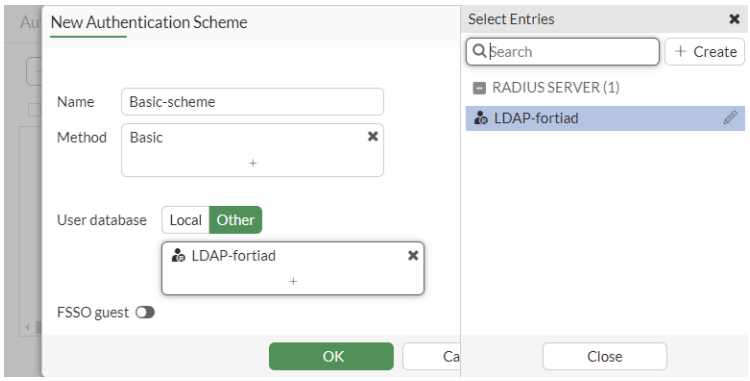
The authentication scheme defines the method of authentication that is applied. For ZTNA, basic HTTP and SAML methods are supported. Each method has additional settings to define the data source to check against. For example, with basic HTTP authentication, a user database can reference an LDAP server, RADIUS server, local database, or other supported authentication servers that the user is authenticated against.

The authentication rule defines the proxy sources and destinations that require authentication, and which authentication scheme to apply. For ZTNA, active authentication method is supported. The active authentication method references a scheme where users are actively prompted for authentication, like with basic authentication.

After the authentication rule triggers the method to authenticate the user, a successful authentication returns the groups that the user belongs to. In the ZTNA policy you can define a user or user group as the allowed source. Only users that match that user or group are allowed through the proxy policy.

To configure a basic authentication scheme in the GUI:

1. Go to *Policy & Objects* > *Authentication*.
2. Go to the *Authentication Schemes* tab.
3. Click *Create New*.
4. Enter a name for the scheme.
5. Set the *Method* as *Basic*.
6. Select the *User database* as required.



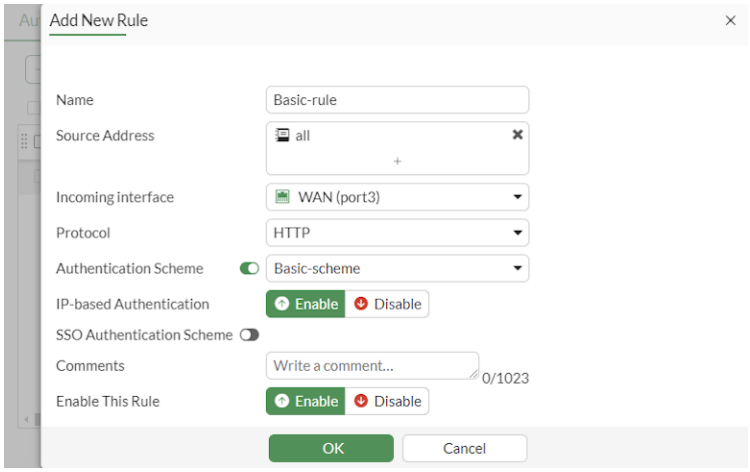
7. Click *OK*.

To configure a basic authentication scheme in the CLI:

```
config authentication scheme
    edit <name>
        set method basic
        set user-database <auth server>
    next
end
```

To configure an authentication rule in the GUI:

1. Go to *Policy & Objects* > *Authentication*.
2. Click *Create New*.
3. Enter a name for the rule.
4. Select the *Source Address*.
5. Select the *Incoming interface*.
6. Select the *Authentication Scheme*.



7. Click *OK*.

To configure an authentication rule in the CLI:

```
config authentication rule
    edit <name>
        set status enable
        set protocol http
        set srcintf <interface>
        set srcaddr <address>
        set dstaddr <address>
        set ip-based enable
        set active-auth-method <active auth scheme>
    next
end
```

To apply a user group to a full ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Proxy Policy*.
2. Edit an existing rule, or click *Create New* to create a new rule.
3. Click in the *Source* field, select the *User* tab, and select the users and user groups that will be allowed access.
4. Configure the remaining settings as required.
5. Click *OK*.

To apply a user group to a full ZTNA policy in the CLI:

```
config firewall proxy-policy
    edit 1
        set name <ZTNA policy name>
        set proxy ztna-proxy
        set ztna-proxy <proxy server 1> <proxy server 2> …
        set ztna-destination <destination 1> <destination 2> …
        set srcintf <interface>
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag <security posture tag(s)>
        set action accept
        set schedule "always"
        set logtraffic all
        set groups <user group(s)>
    next
end
```

The authentication rule and scheme defines the method used to authenticate users. With basic HTTP authentication, a sign in prompt is shown after the client certificate prompt. After the authentication passes, the returned groups that the user is a member of are checked against the user groups that are defined in the ZTNA policy. If a group matches, then the user is allowed access after passing a posture check.

For basic setup information, see ZTNA web proxy with basic authentication example on page 1633.

For advanced setup information, see ZTNA application gateway with SAML authentication example on page 1671 and ZTNA application gateway with SAML and MFA using FortiAuthenticator example on page 1686.

Optional HA configurations

User information and TLS sessions are synchronized between HA members for ZTNA proxy sessions. When a failover occurs, the new primary unit will continue allowing sessions from the logged in users without asking for the client certificate and re-authentication again.

There are no special configurations for HA. Refer to HA active-passive cluster setup on page 3940 and HA active-active cluster setup on page 3942 to configure your HA cluster.

ZTNA web proxy vs traffic forwarding access proxy

In a ZTNA web proxy connection, there is no configurations needed on the client endpoint. Users can simply access the HTTP website on a browser by entering its URL. For traffic forwarding proxy (TFP), a ZTNA rule must be configured on the FortiClient endpoint. This rule instructs FortiClient to listen to traffic to the destination address and port and redirects the traffic to the FortiGate ZTNA application gateway over HTTPS.

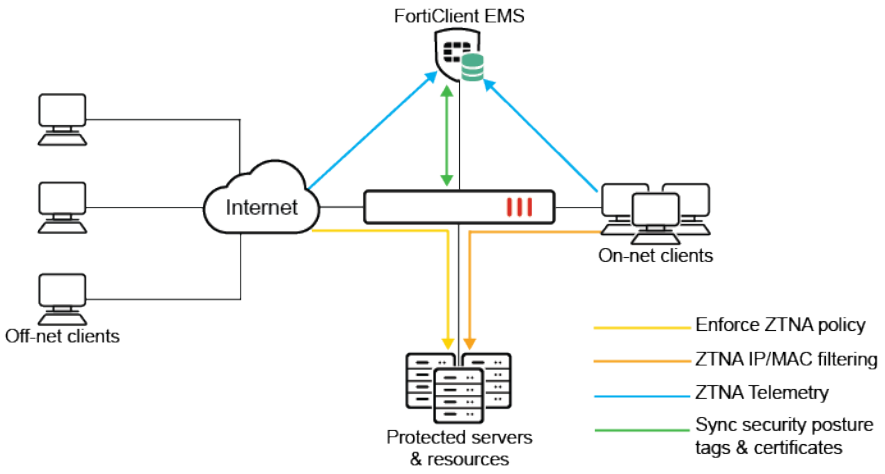
When deciding between using ZTNA web proxy or TFP for accessing web applications, consider the following.

- Use ZTNA web proxy when the protected web application address can be resolved by the remote users publicly.
- Use TFP when the protected application address can only be resolved on the internal network. TCP forwarding rules allow the FortiClient to intercept the request to the destination address and forward them to the application gateway.

For more information, see ZTNA traffic forwarding proxy example on page 1644.

Establish device identity and trust context with FortiClient EMS

How device identity is established through client certificates, and how device trust context is established between FortiClient, FortiClient EMS, and the FortiGate, are integral to ZTNA.



Device roles

FortiClient

FortiClient endpoints provide the following information to FortiClient EMS when they register to the EMS:

- Device information (network details, operating system, model, and others)
- Logged on user information
- Security posture (On-net/Off-net, antivirus software, vulnerability status, and others)

It also requests and obtains a client device certificate from the EMS ZTNA Certificate Authority (CA) when it registers to FortiClient EMS. The client uses this certificate to identify itself to the FortiGate.

FortiClient EMS

FortiClient EMS issues and signs the client certificate with the FortiClient UID, certificate serial number, and EMS serial number. The certificate is then synchronized to the FortiGate. EMS also shares its EMS ZTNA CA certificate with the FortiGate, so that the FortiGate can use it to authenticate the clients.

FortiClient EMS uses zero trust tagging rules to tag endpoints based on the information that it has on each endpoint. The tags are also shared with the FortiGate. See Endpoint Posture Check Reference for a list of the endpoint posture checks that EMS can perform.

Each security posture tag creates two firewall addresses in all VDOMs on a FortiGate. One firewall address is the IP address, and the other firewall address is the MAC address. Because each FortiGate model has a global limit and a per-VDOM limit for the maximum number of supported firewall addresses, the FortiGate model determines the maximum number of security posture tags allowable by that unit, which is the maximum number of firewall address divided by two. For each FortiGate model's limit, see the Maximum Values table.

FortiGate

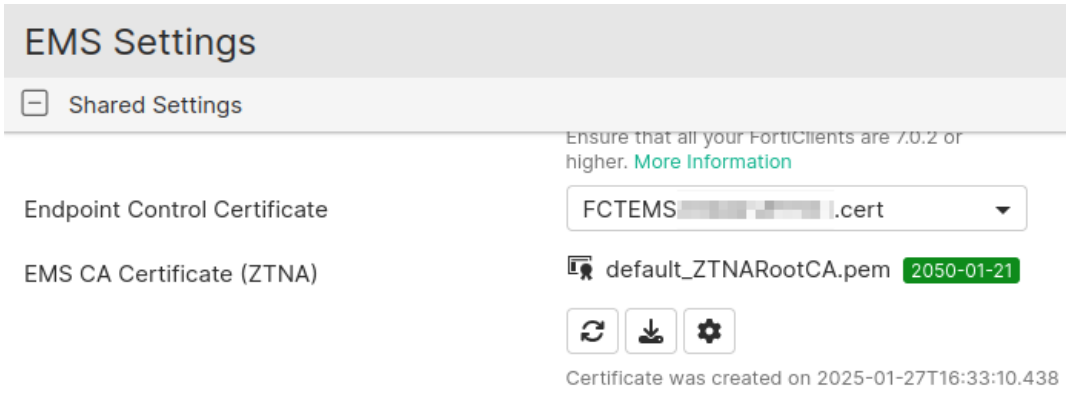
The FortiGate maintains a continuous connection to the EMS server to synchronize endpoint device information, including primarily:

- FortiClient UID
- Client certificate SN
- EMS SN
- Device credentials (user/domain)
- Network details (IP and MAC address and routing to the FortiGate)

When a device's information changes, such as when a client moves from on-net to off-net, or their security posture changes, EMS is updated with the new device information and then updates the FortiGate. The FortiGate's WAD daemon can use this information when processing ZTNA traffic. If an endpoint's security posture change causes it to no longer match the ZTNA policy criteria on an existing session, then the session is terminated.

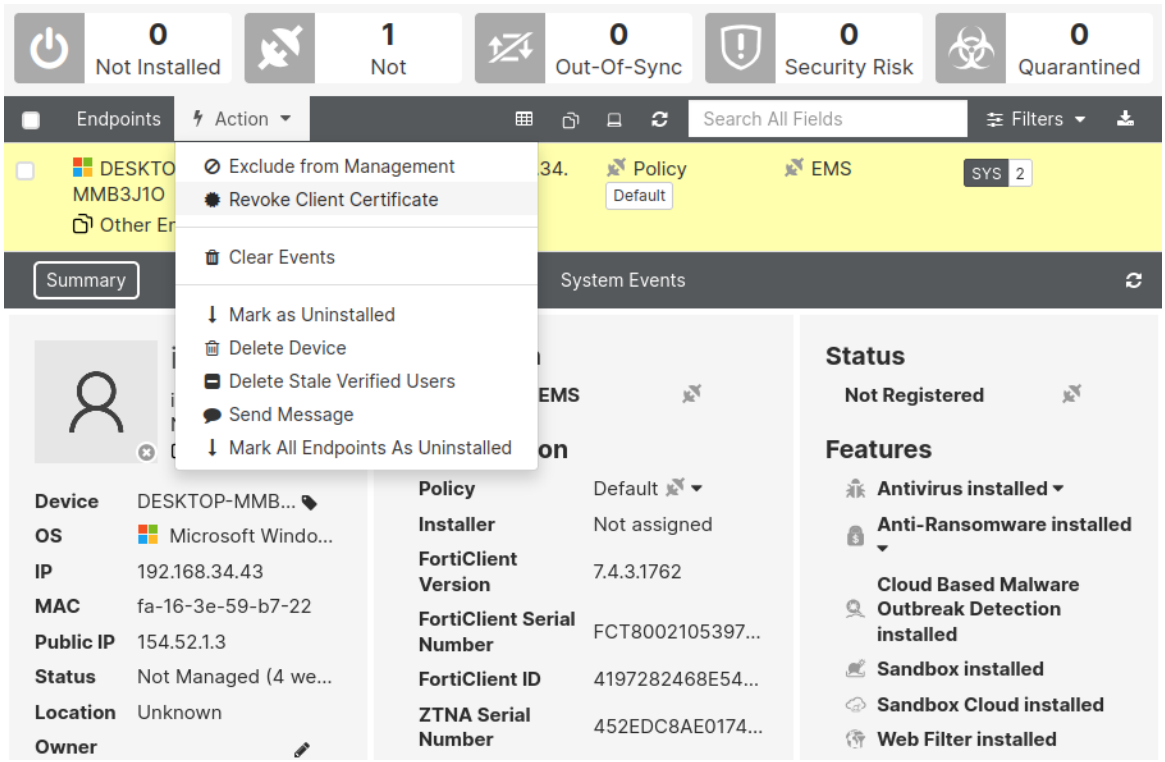
Certificate management on FortiClient EMS

FortiClient EMS has a *default_ZTNARootCA* certificate generated by default that the ZTNA CA uses to sign CSRs from the FortiClient endpoints. Clicking the refresh button revokes and updates the root CA, forcing updates to the FortiGate and FortiClient endpoints by generating new certificates for each client. Starting with FortiClient EMS 7.4.3, a custom root certificate and key can be uploaded to replace the default certificate.



Do not confuse the EMS CA certificate (ZTNA) with the SSL certificate. The latter is the server certificate that is used by EMS for HTTPS access and fabric connectivity to the EMS server.

EMS can also manage individual client certificates. To revoke the current client certificate that is used by the endpoint: go to *Endpoint > All Endpoints*, select the client, and click *Action > Revoke Client Certificate*.



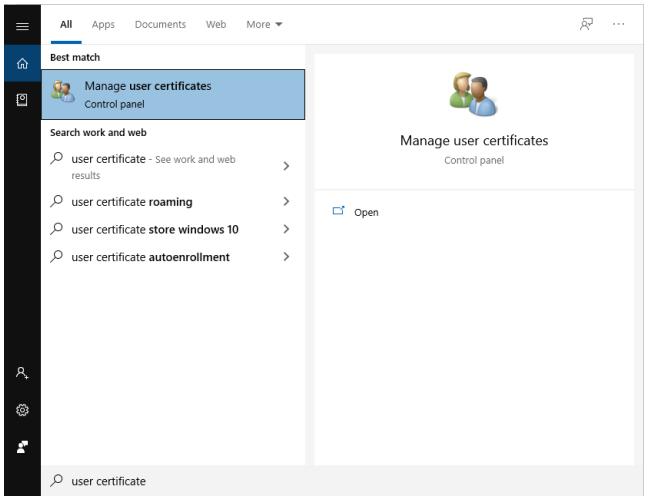
Locating and viewing the client certificate on an endpoint

In Windows, FortiClient automatically installs certificates into the certificate store. The certificate information in the store, such as certificate UID and SN, should match the information on EMS and the FortiGate.

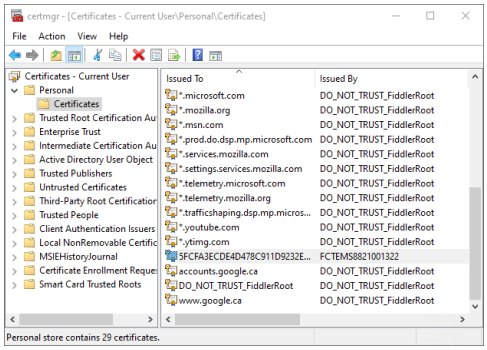
To locate certificates on other operating systems, consult the vendor documentation.

To locate the client certificate and EMS ZTNA CA certificate on a Windows PC:

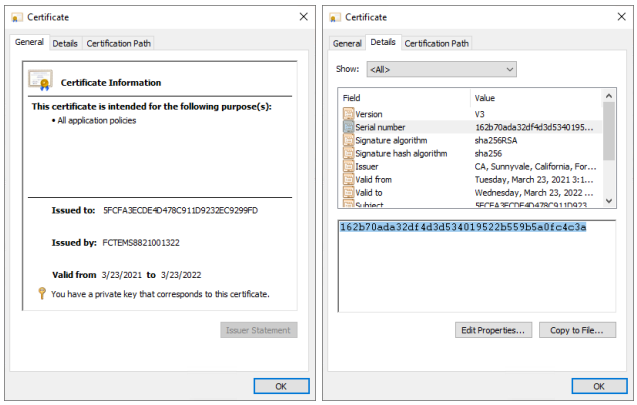
1. In the Windows search box, enter *user certificate* and click *Manage user certificates* from the results.



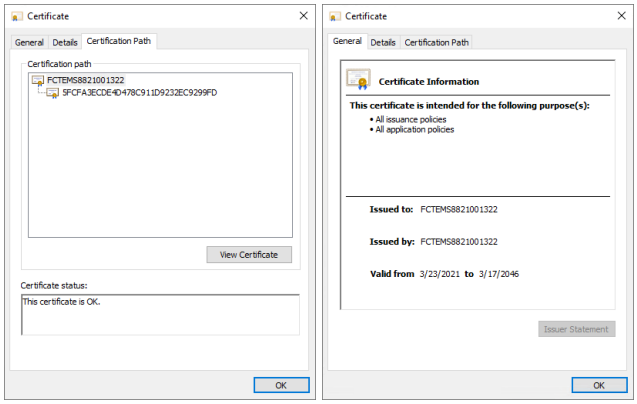
2. In the certificate manager, go to *Certificates - Current User* > *Personal* > *Certificates* and find the certificate that is issued by the FortiClient EMS.



3. Right-click on it and select Properties.
4. The *General* tab shows the client certificate UID and the issue and expiry dates. The *Details* tab show the certificate SN.



5. Go to the *Certificate Path* tab to see the full certificate chain.
6. Select the root CA and click *View Certificate* to view the details about the EMS ZTNA CA certificate.



Verifying that the client information is synchronized to the FortiGate

The following diagnose commands help to verify the presence of matching endpoint record, and information such as the client UID, client certificate SN, and EMS certificate SN on the FortiGate. If any of the information is missing or incomplete, client certificate authentication might fail because the corresponding endpoint entry is not found. More in-depth diagnosis would be needed to determine the reason for the missing records.

Command	Description
`# diagnose endpoint ec-shm list <ip> <mac> <EMS_serial_number> <EMS_tenant_id>`	Show the endpoint record list. Optionally, add filters.
`# diagnose wad dev query-by uid <uid> <ems sn> <ems tenant id>`	Query from WAD diagnose command by UID.
`# diagnose wad dev query-by ipv4 <ip>`	Query from WAD diagnose command by IP address.
`# diagnose test application fcnacd 7`	Check the FortiClient NAC daemon ZTNA and route cache.

Command	Description
`# diagnose test application fcnacd 8`	
`#diagnose test application fcnacd 5`	Force a sync with the FortiClient EMS server.

To check the endpoint record list for IP address 10.0.3.2:

```
# diagnose endpoint ec-shm list
Record #0:
                IP Address = 10.0.3.2
                MAC Address = 02:09:0f:00:03:03
                MAC list =
                VDOM =  (-1)
                EMS serial number: FCTEMS8825007166
                EMS tenant id: 00000000000000000000000000000000
                Client cert SN: 5341B8C01A11C7AB130A07718F1CBD20947E7253
                Public IP address: 148.230.50.179
                Quarantined: no
                Online status: online
                Registration status: registered
                On-net status: on-net
                Gateway Interface:
                FortiClient version: 7.4.3
                AVDB version: 1.0
                FortiClient app signature version: 35.152
                FortiClient vulnerability scan engine version: 3.8
                FortiClient UID: 9A016B5A6E914B42AD4168C066EB04CA
                Host Name: WIN10-01
                OS Type: WIN64
                OS Version: Microsoft Windows 10 Professional Edition, 64-bit (build 19045)
                Domain: fortiad.info
                Last Login User: tsmith
                …
                Number of Routes: (0)
```

To check the tags that are processed by the WAD daemon for a particular device:

```
# diagnose wad dev query-by uid 9A016B5A6E914B42AD4168C066EB04CA FCTEMS8825007166
00000000000000000000000000000

```

SSL certificate based authentication

A client certificate is obtained when an endpoint registers to EMS. FortiClient automatically submits a CSR request and the FortiClient EMS signs and returns the client certificate. This certificate is stored in the operating system's certificate store for subsequent connections. The endpoint information is synchronized between the FortiGate and FortiClient EMS. When an endpoint disconnects or is unregistered from EMS, its certificate is removed from the certificate store and revoked on EMS. The endpoint obtains a certificate again when it reconnects to EMS.

By default, client certificate authentication is enabled on the access proxy, so when the HTTPS request is received the FortiGate's WAD process challenges the client to identify itself with its certificate. The FortiGate makes a decision based on the following possibilities:

1. If the client responds with the correct certificate that the client UID and certificate SN can be extracted from:
   - If the client UID and certificate SN match the record on the FortiGate, the client is allowed to continue with the ZTNA proxy rule processing.
   - If the client UID and certificate SN do not match the record on the FortiGate, the client is blocked from further ZTNA proxy rule processing.
2. If the client cancels and responds with an empty client certificate:
   - If `empty-cert-action` is set to `accept`, the client is allowed to continue with ZTNA proxy rule processing.
   - If `empty-cert-action` is set to `block`, the client is blocked from further ZTNA proxy rule processing.

To configure the client certificate actions:

```
config firewall vip
    edit <name>
        set client-cert {enable | disable}
        set empty-cert-action {accept | block | accept-unmanageable}
```

```
    next
end
```

To override these settings on a virtual host:

```
config firewall access-proy-virtual-host
    edit <host>
        set empty-cert-action {accept | block | accept-unmanageable}
        set client-cert {enable | disable}
    next
end
```

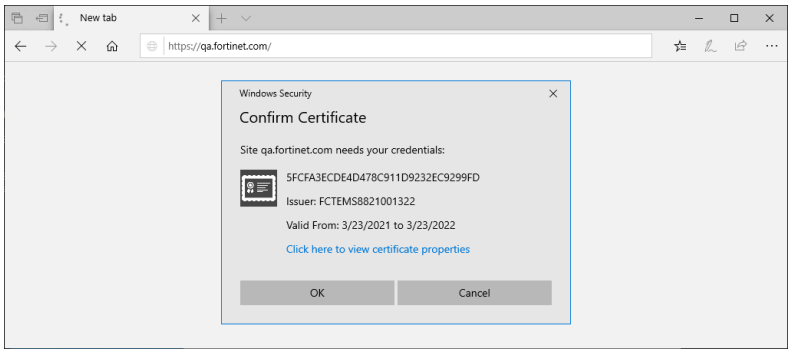
Example

In this example, a client connects to *qa.fortinet.com* and is prompted for a client certificate.

- `client-cert` is set to `enable`, and `empty-cert-action` is set to `block`.
- The ZTNA server is configured, and a ZTNA policy is set to allow this client.
- The domain resolves to the FortiGate access proxy VIP.

Scenario 1:

When prompted for the client certificate, the client clicks *OK* and provides a valid certificate that is verified by the FortiGate.

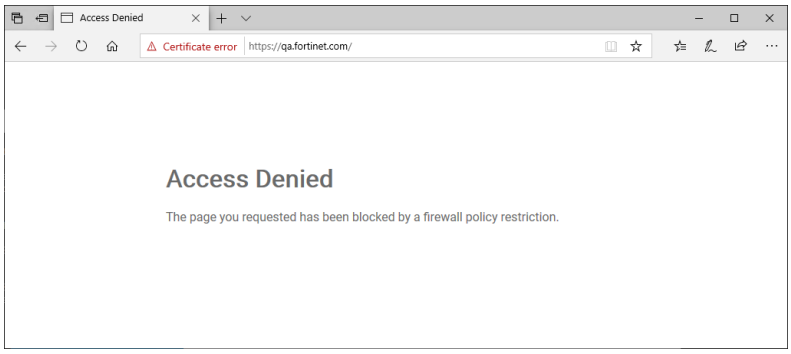


Result:

The client passes SSL certificate authentication and is allowed to access the website.

Scenario 2:

When prompted for the client certificate, the client clicks *Cancel*, resulting in an empty certificate response to the access proxy.



Result:

Because the certificate response is empty and `empty-cert-action` is set to `block`, the WAD daemon blocks the connection.

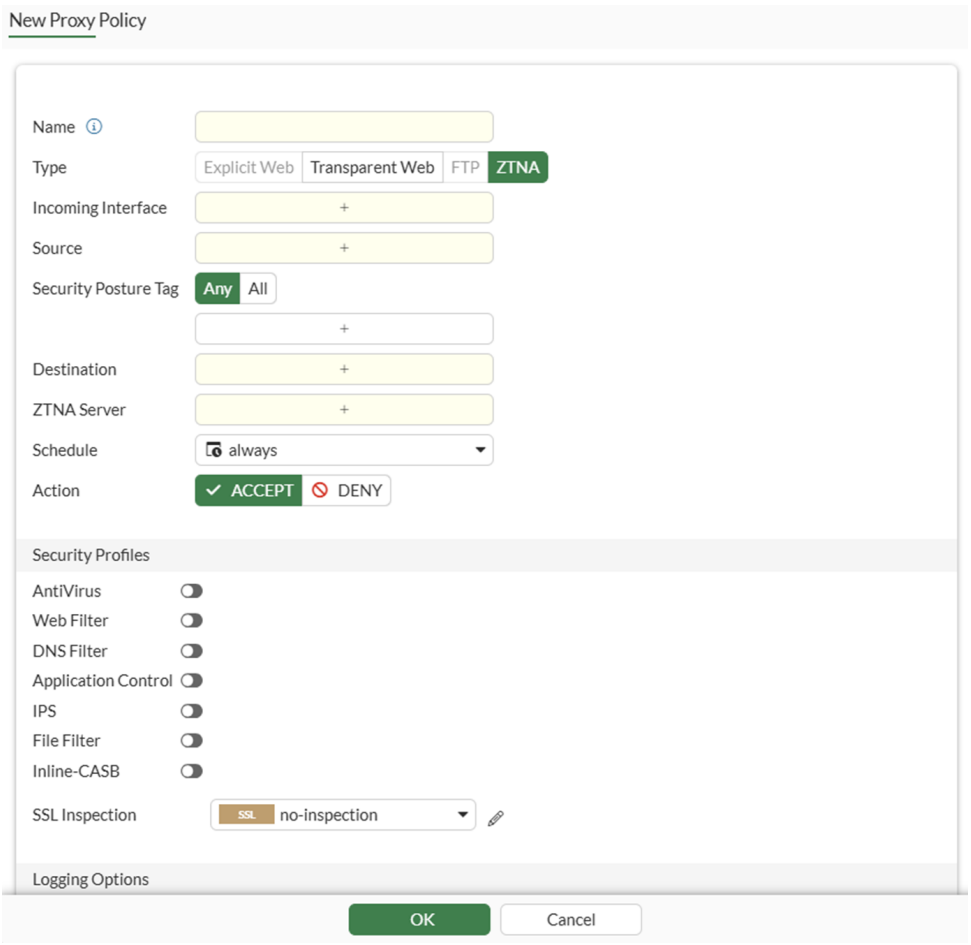
Currently, the Microsoft Edge, Google Chrome, and Safari browsers are supported by ZTNA.

Full versus simple ZTNA policies

There are two ways to configure ZTNA rules in the GUI by using a full or simple ZTNA policy.

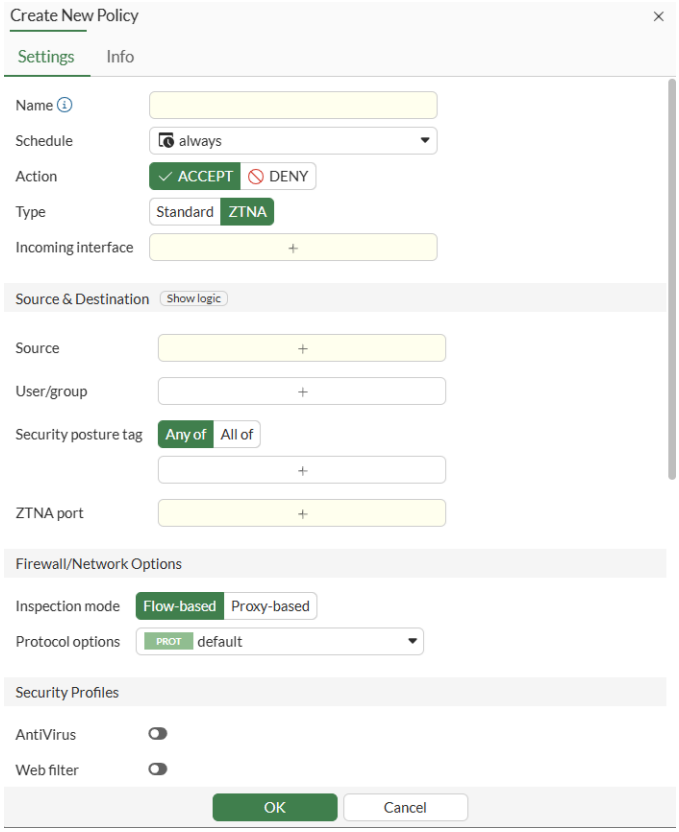
Full ZTNA policy

Administrators can configure ZTNA policies from the *Policy & Objects* > *Proxy Policy* page, and by setting the *Type* to *ZTNA*.



Simple ZTNA policy

In a simple ZTNA policy, a regular firewall policy is used for policy management. When creating a new firewall policy, administrators can configure a ZTNA policy by setting the *Type* to *ZTNA*.



A simple ZTNA policy cannot control access based on the destination interface or the real server's destination address. You can select a ZTNA TFS destination though. See the Examples on page 1571 section for detailed configurations.

Authentication for ZTNA policies

Authentication remains largely the same between both ZTNA policy configuration modes. You can specify user groups under *Source* to define the groups in which the access control applies to. However, the underlying authentication schemes and rules must still be in place to direct the traffic to the ZTNA application gateway.

Authentication for regular firewall policies

Authentication for regular firewall policies is traditionally handled by authd, which does not require an authentication scheme and rules to be configured in order to function. On a ZTNA policy, authentication is handled by WAD so that the authentication scheme and rules are used to determine the type of authentication and the traffic that requires authentication.

Redirecting a simple ZTNA policy to a full ZTNA policy

An option is available so that after matching a simple ZTNA policy, the traffic can be redirected for a full ZTNA policy match. This setting can only be configured from the CLI, and it is disabled by default.

```
config firewall policy
    edit <id>
        set ztna-policy-redirect {enable | disable}
    next
end
```

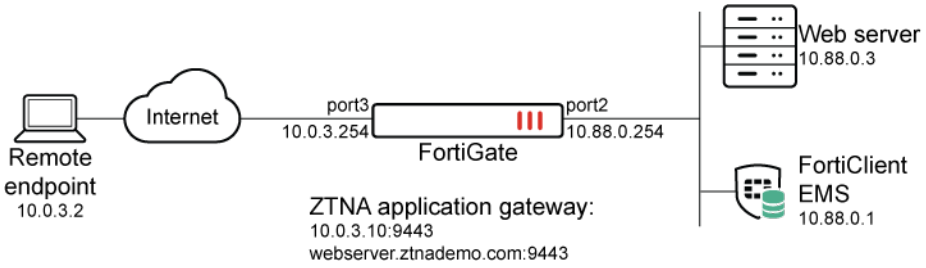
For example, a client has both tag A and tag B. In the simple ZTNA policy, the client matches a policy that requires tag A for a posture check. If they are using the `ztna-policy-redirect` option, then it will also require a full ZTNA policy match.

If a full ZTNA policy allows either tag A or tag B or all traffic in general, then the traffic is allowed. Otherwise, if a full ZTNA policy explicitly denies one of the tags, the traffic will be denied.

If no full ZTNA policy is matched, then the traffic is implicitly denied.

Examples

The following examples demonstrate how to configure a ZTNA policy using the full and simple ZTNA policy modes.



It is assumed that the following settings are already configured:

- EMS connection and EMS tags (Malicious-File-Detected and FortiAD.Info)
- ZTNA server configuration (ZTNA-webserver)
- Authentication scheme and rule

Configuring a full ZTNA policy

To configure a full ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Proxy Policy* and click *Create New*.
2. Configure the following settings:

Name	*ZTNA-webserver*
Type	*ZTNA*

Incoming Interface	*port3*
Source	*all*
Destinations	*Webserver1 (10.88.0.3/32)*
ZTNA Server	*ZTNA-webserver*
Schedule	*always*
Action	*ACCEPT*

3. Click *OK*.

To configure a full ZTNA policy in the CLI:

```
config firewall proxy-policy
    edit 1
        set name "ZTNA-webserver"
        set proxy ztna-proxy
        set ztna-proxy "ZTNA_S1"
        set srcintf "port3"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
    next
end
```

When traffic is allowed, the ZTNA logs show traffic passing through policy 1 on a policy called `ZTNA-webserver`, which is a proxy policy.

To verify the traffic logs:

```
# execute log filter category traffic
# execute log filter field subtype ztna
# execute log display
3: date=2026-02-11 time=17:33:27 eventtime=1770860006215822330 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=28239
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.88.0.3
dstport=9043 dstintf="port2" dstintfrole="dmz" sessionid=9954 srcuuid="b458a65a-f759-51ea-d7df-
ef2e750026d1" dstuuid="b458a65a-f759-51ea-d7df-ef2e750026d1" service="tcp/9043"
proxyapptype="ztna-proxy" proto=6 action="accept" policyid=1 policytype="proxy-policy"
poluuid="bd19e37c-07b0-51f1-8a80-f206d714dad9" policyname="ZTNA-webserver" appcat="unscanned"
duration=126 gatewayid=1 realserverid=1 vip="ZTNA_P1" vipincomingip=10.0.3.10 accessproxy="ZTNA_
S1" clientdevicemanageable="manageable" clientcert="yes" wanin=302884 rcvdbyte=302884 wanout=4424
lanin=4155 sentbyte=4155 lanout=305667
```

Configuring a simple ZTNA policy

To configure a simple ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following settings:

Name	*ZTNA-webserver-fp*
Schedule	*always*
Action	*ACCEPT*
Type	*ZTNA*
Incoming Interface	*port3*
Source	*all*
ZTNA server	*ZTNA-P1*

3. Click *OK*.

To configure a simple ZTNA policy in the CLI:

```
config firewall policy
    edit 17
        set name "ZTNA-webserver-fp"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "ZTNA_P1"
        set schedule "always"
        set logtraffic all
        set nat enable
    next
end
```

When traffic is allowed, the ZTNA logs show traffic passing through policy 9 on a policy called `ZTNA-webserver-fp`, which is a firewall policy.

To verify the traffic logs:

```
# execute log filter category traffic
# execute log filter field subtype ztna
# execute log display
14 logs found.
10 logs returned.
1: date=2026-02-11 time=17:47:54 eventtime=1770860873837986548 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=28375
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.88.0.3
dstport=9043 dstintf="port2" dstintfrole="dmz" sessionid=10345 srcuuid="b458a65a-f759-51ea-d7df-
```

```
ef2e750026d1" service="tcp/9043" proxyapptype="ztna-proxy" proto=6 action="accept" policyid=17
policytype="policy" poluuid="8d902222-ecf0-51f0-8a9d-8b226df29093" policyname="ZTNA-webserver-fp"
appcat="unscanned" duration=128 gatewayid=1 realserverid=1 vip="ZTNA_P1" vipincomingip=10.0.3.10
accessproxy="ZTNA_S1" clientdevicemanageable="manageable" clientcert="yes" wanin=303036
rcvdbyte=303036 wanout=4424 lanin=4187 sentbyte=4187 lanout=305778
```

Configuring a ZTNA simple policy with security posture tags and authentication

In this example, a simple ZTNA policy uses the FortiAD.Info tag for a posture check and authentication against a pre-configured Active Directory server where the user tsmith resides. The authentication scheme and rule have already been configured as follows:

```
config authentication scheme
    edit "ZTNA-Auth-scheme"
        set method basic
        set user-database "LDAP-fortiad"
    next
end
```

```
config authentication rule
    edit "ZTNA-Auth-rule"
        set srcintf "port3"
        set srcaddr "all"
        set active-auth-method "ZTNA-Auth-scheme"
    next
end
```

To append security posture tag and authentication settings to the simple ZTNA policy:

1. Go to *Policy & Objects* > *Firewall Policy* and edit the *ZTNA-webserver-fp* policy.
2. For the *Source* field, click the *+* and add the user group named *LDAP-Remote-Allowed-Group*.
3. For the *Security Posture Tag* field, click the *+* and add the *Domain-Users tag*.
4. Click *OK*.

To verify the configuration:

1. Connect to the web server from a client.
2. After selecting the client certificate, the browser will prompt for a username and password. Enter the username (tsmith) and their password.

   Upon a successful authentication, the user can access the web server.
3. On the FortiGate, verify that the logs for the allowed traffic show the user tsmith and the tag Domain-Users:

```
# execute log filter field subtype ztna
# execute log display
18 logs found.
10 logs returned.
1: date=2026-02-11 time=18:06:50 eventtime=1770862009275387788 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=28457
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.88.0.3
```

```
dstport=9043 dstintf="port2" dstintfrole="dmz" sessionid=10791 srcuuid="b458a65a-f759-51ea-
d7df-ef2e750026d1" dstuuid="06408606-ec26-51f0-9989-f2b848c420fd" service="tcp/9043"
proxyapptype="ztna-proxy" proto=6 action="accept" policyid=17 policytype="policy"
poluuid="8d902222-ecf0-51f0-8a9d-8b226df29093" policyname="ZTNA-webserver-fp"
appcat="unscanned" duration=126 user="tsmith" group="LDAP-Remote-Allowed-Group"
authserver="LDAP-fortiad" gatewayid=1 realserverid=1 vip="ZTNA_P1" vipincomingip=10.0.3.10
accessproxy="ZTNA_S1" clientdeviceid="9A016B5A6E914B42AD4168C066EB04CA"

clientdevicetags="Domain-Users/all_registered_clients" clientcert="yes" emsconnection="online"
wanin=302884 rcvdbyte=302884 wanout=4424 lanin=4187 sentbyte=4187 lanout=305743
fctuid="9A016B5A6E914B42AD4168C066EB04CA"
```

Types of security posture tags

Security posture tags are tags retrieved from FortiClient EMS once a FortiGate is connected to an EMS through the security fabric connector. FortiGate can retrieve different categories of tags from EMS:

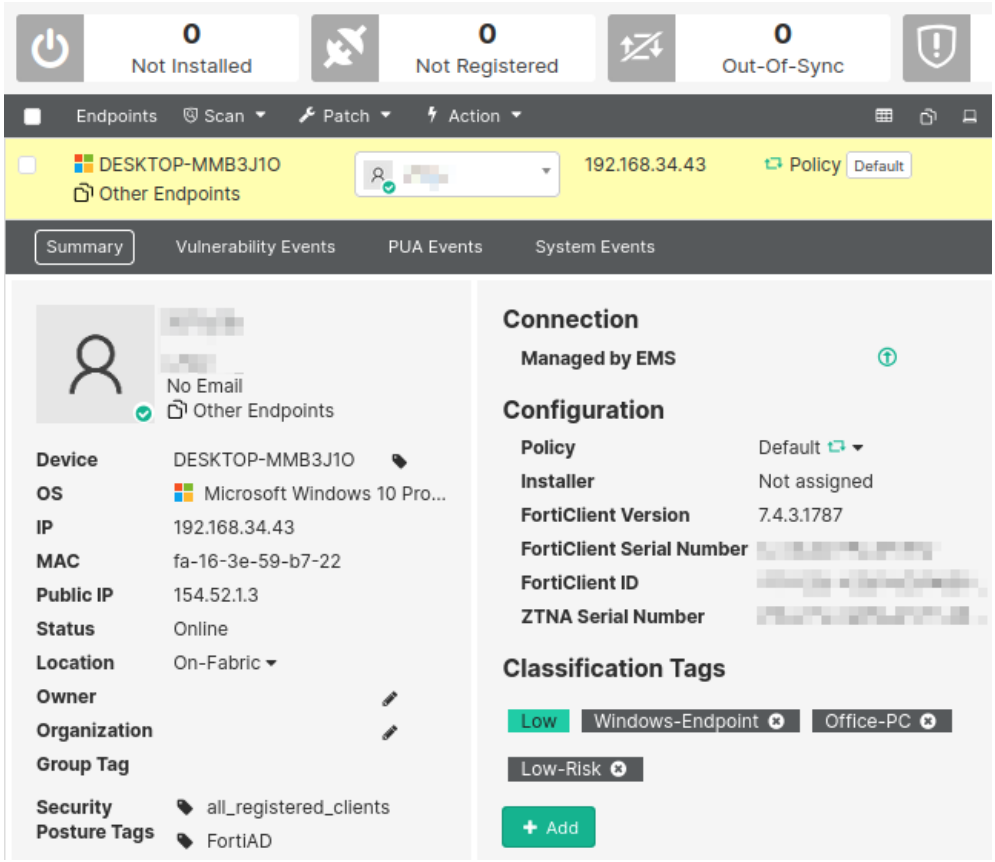
Category	Description
Security posture tags (Zero trust tags in earlier EMS versions)	Generated from tagging rules configured on FortiClient EMS. Tags are based on various posture checks that can be applied to the endpoints. Tags are synchronized from EMS to FortiGate by default.
Classification tags	Custom tags manually assigned by the EMS administrator to endpoints.
FortiGuard outbreak alert tags	Outbreak alerts inform EMS about vulnerabilities on an application or endpoint that is part of a recent outbreak. See FortiGuard Outbreak Alerts.
Fabric tags	Fabric tags are retrieved from FortiAnalyzer to EMS when endpoint logs trigger indicators of compromise (IOC) on a specific endpoint.

For more information about each type of tag on FortiClient EMS, see Fabric Devices.

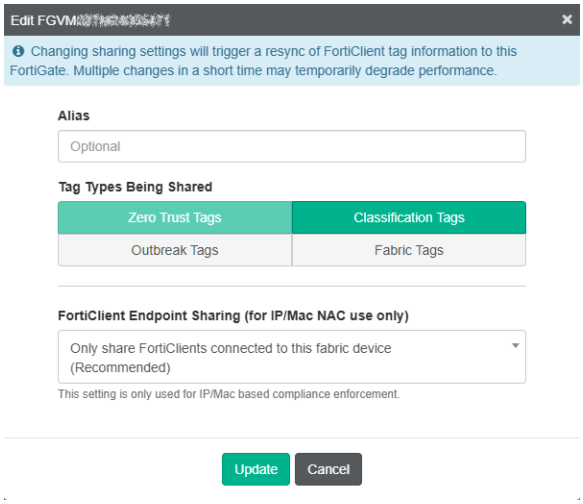
By default, only security posture tags/zero trust tags are synchronized from EMS to FortiGate. On EMS, you can enable other tags to be synchronized.

To synchronize classification tags from EMS:

1. From FortiClient EMS, go to *Endpoints* > *All Endpoints*.
2. Select an endpoint to view its summary.
3. Under *Classification Tags*, click *Add* to add a new custom tag.

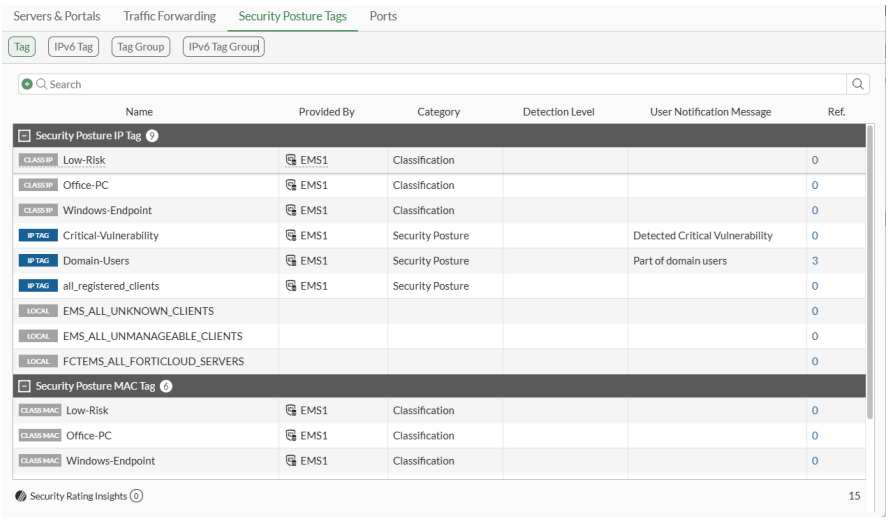


4. From *Fabric & Connectors* > *Fabric Devices*, find the FortiGate that requires the use of these tags.
5. Click *Edit* to update its synchronization settings.
6. Under *Tag Types Being Shared*, select all types that apply. In this example, *Classification Tags* is selected in addition to the default *Zero Trust Tags*.



7. Click *Update* to save.
8. On the FortiGate, go to *Policy & Objects* > *ZTNA*. Switch to the *Security Posture Tags* tab.

   Aside from the Security Posture type tags generated from tagging rules, Classification type tags are also retrieved.



IP versus MAC security posture tags

FortiOS utilizes security posture tags in ZTNA policies and standard firewall policies, however each policy type uses different information from within the tag.

ZTNA policy

ZTNA policies allow users to securely access resources through an encrypted access proxy. This simplifies remote access by reducing the need for remote access VPN and allowing only specific application access. ZTNA policies do not rely on the IP address or MAC address of the connecting clients. Instead, the aim of ZTNA is to provide device identification, user authentication, and role-based application access. This means that using an IP or MAC security posture tag will yield the same result.

Firewall policy

Firewall policies use ZTNA security posture tags in the source and destination fields to provide an additional factor for identification when implementing role-based zero trust access. This means that the tag address type (IP or MAC) is considered by the FortiGate and must be selected appropriately. These policies typically apply to local on-net users, and may also be used for remote users when paired with VPNs.

FortiGate will only learn the IP/MAC address information of directly connected FortiClient endpoints (for example, the gateway of the FortiClient). FortiGates may also learn the IP and MAC address for FortiClient endpoints that are directly connected to another FortiGate when EMS has been configured to share this tagging information with other FortiGates in a Security Fabric. See Configuring EMS to share tagging information with multiple FortiGates for more details.

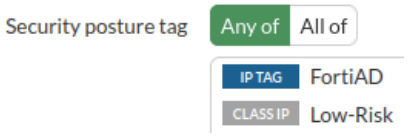
Using any versus all tags inside a ZTNA policy

When configuring the ZTNA policy to control access, the *Security posture tags* option can be set to *Any* or *All*:

- When set to *Any*, an endpoint must satisfy only one of the defined security posture tags to pass this check.
- When set to *All*, an endpoint must satisfy all of the defined security posture tags to pass this check.

Example 1: Using the Any of tag

1. A simple ZTNA policy is configured where the *Security posture tag* is set to *Any of*, with the tags *FortiAD* and *Low-Risk*.

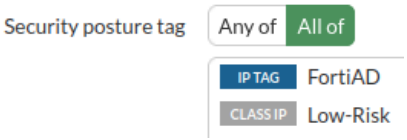


2. An endpoint with only the FortiAD tag connects.
3. The endpoint can connect to the server.
4. From the CLI, ZTNA logs indicate that the traffic was allowed.

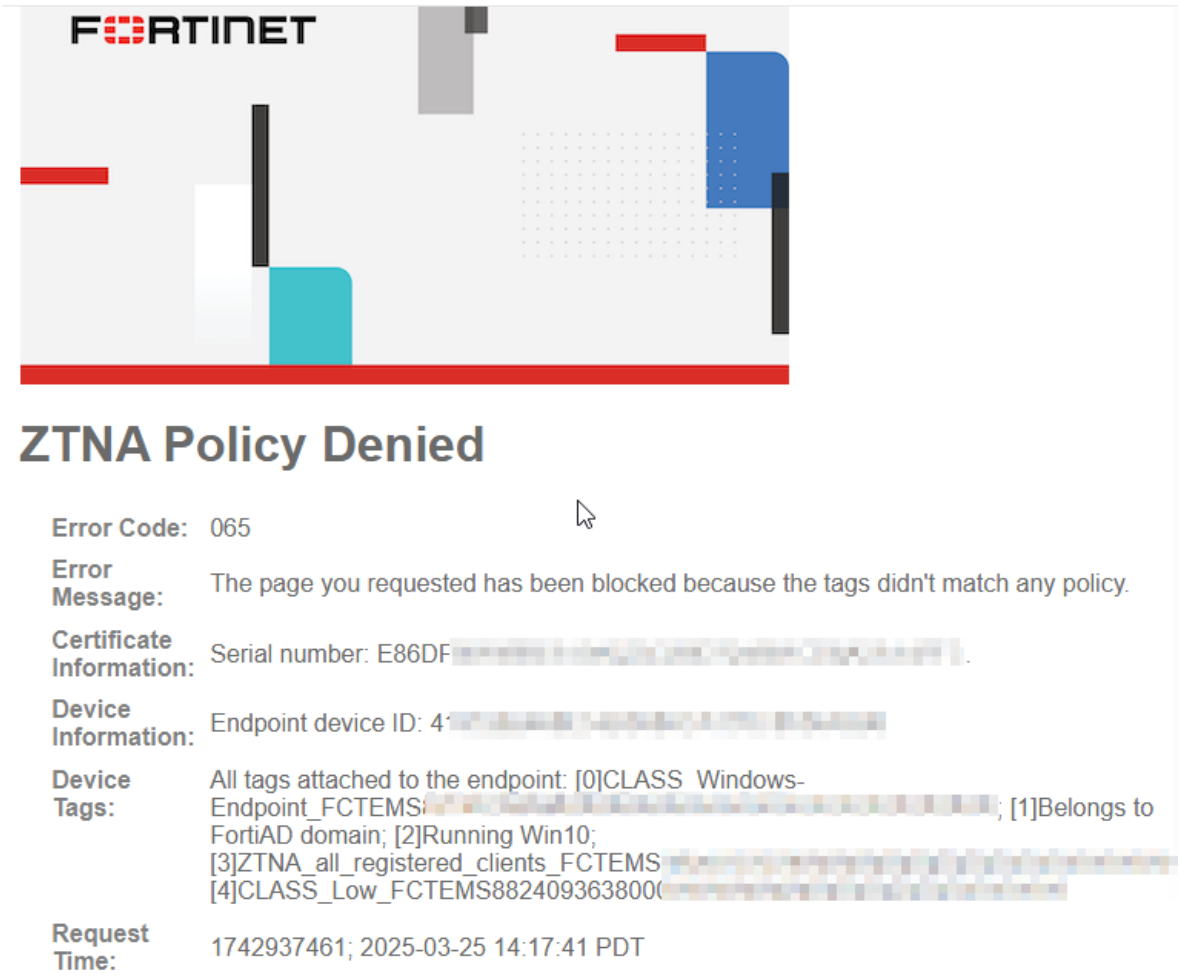
```
# execute log filter field subtype ztna
# execute log display
…
2: date=2025-01-07 time=10:57:00 eventtime=1736276220378088305 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=17322
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.0.3.10
dstport=9043 dstintf="root" dstintfrole="undefined" sessionid=8876 srcuuid="b458a65a-f759-
51ea-d7df-ef2e750026d1" service="tcp/9043" proxyapptype="http" proto=6 action="accept"
policyid=17 policytype="policy" poluuid="8065fc36-cd28-51ef-cd5a-84f5ae253c13"
policyname="ZTNA-webserver-allow" appcat="unscanned" duration=0 vip="ZTNA-webserver"
accessproxy="ZTNA-webserver" clientdevicemanageable="unknown" clientcert="no" wanin=0
rcvdbyte=0 wanout=0 lanin=1764 sentbyte=1764 lanout=3049
```

Example 2: Using the All of tag

1. A simple ZTNA policy is configured where the *Security posture tag* is set to *All of*, with the tags *FortiAD* and *Low-Risk*.



2. An endpoint with the following tags connects:
   - Low (this is a different tag than Low-Risk, the tag configured in the policy)
   - Windows-Endpoint
   - FortiAD
   - Windows10
   - all_registered_clients
3. It is unable to connect to the server, and a denied message appears.



4. From the CLI, ZTNA logs indicate that the implicit policy denied traffic. Tags are logged under `clientdevicetags`, and it indicates the tags registered to the endpoint. *Low-Risk* is not associated with this endpoint.

```
# execute log filter field subtype ztna
# execute log display
5 logs found.
5 logs returned.

7: date=2025-03-25 time=14:17:42 eventtime=1742937461544682088 tz="-0700" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=192.168.34.43 srcport=56662

ZTNA advanced configurations

This section includes the following ZTNA advanced configurations:

- Access control of unmanageable and unknown devices on page 1580
- HTTP2 connection coalescing and concurrent multiplexing for ZTNA on page 1586
- Fabric integration with FortiGSLB on page 1589
- ZTNA agentless web-based application access on page 1594
- ZTNA domain matching on page 1605
- ZTNA service connector NEW on page 1611

Access control of unmanageable and unknown devices

The ZTNA application gateway can determine whether a client device that does not have FortiClient installed is a mobile device that is considered unmanageable, or is a non-mobile device that is considered unknown. The ZTNA application gateway tags the device as either `EMS_ALL_UNMANAGEABLE_CLIENTS` or `EMS_ALL_UNKNOWN_CLIENTS` respectively. The FortiGate WAD process achieves this by either matching device TLS fingerprints against a library or learning information from the HTTP User-Agent header if the `set user-agent-detect` setting is enabled.

Configuring the ZTNA access proxy and proxy policy

The `EMS_ALL_UNMANAGEABLE_CLIENTS` and `EMS_ALL_UNKNOWN_CLIENTS` tags allow for ZTNA access control of unmanageable and unknown devices using a proxy policy. The `accept-unmanageable` option for the `empty-cert-action` setting allows unmanageable clients to continue ZTNA proxy rule processing.

```
config firewall vip
    edit <name>
        set type access-proxy
        set client-cert enable
        set user-agent-detect {enable | disable}
        set empty-cert-action {accept | block | accept-unmanageable}
    next
end
```

Command	Description
`type access-proxy`	Configure an access proxy.
`client-cert enable`	Enable requesting client certificate.
`user-agent-detect {enable | disable}`	Enable/disable detecting the device type by HTTP User-Agent if no client certificate is provided (default = enable).
`empty-cert-action {accept | block | accept-unmanageable}`	Set the action for an empty client certificate: • `accept`: accept the SSL handshake if the client certificate is empty.

Command	Description
	• `block`: block the SSL handshake if the client certificate is empty. • `accept-unmanageable`: accept the SSL handshake only if the end point is unmanageable.

The `user-agent-detect` and `empty-cert-action` settings can only be configured in the CLI.

```
config firewall proxy-policy
    edit <id>
        set ztna-ems-tag {EMS_ALL_UNMANAGEABLE_CLIENTS | EMS_ALL_UNKNOWN_CLIENTS}
    next
end
```

Command	Description
`ztna-ems-tag {EMS_ALL_UNMANAGEABLE_CLIENTS | EMS_ALL_UNKNOWN_CLIENTS}`	Set the EMS tag names: • `EMS_ALL_UNMANAGEABLE_CLIENTS`: match any device that is unmanageable. • `EMS_ALL_UNKNOWN_CLIENTS`: match any device that is not recognized.

Consider the following use cases.

- Case 1: if a client device sends a TLS client hello in a mobile pattern, then WAD will try to match its TLS fingerprint with a WAD original library and mark it with an `EMS_ALL_UNMANAGEABLE_CLIENTS` tag.
- Case 2: if WAD cannot match the TLS fingerprint with an original library but `user-agent-detect` is enabled (under `config firewall access-proxy`), WAD will try to learn the device type from client request's User-Agent header. If it matches a mobile device, then it is still marked with an `EMS_ALL_UNMANAGEABLE_CLIENTS` tag.
- Case 3: if WAD cannot match the TLS fingerprint with an existing original or temporary library, or cannot learn it from User-Agent header, or `user-agent-detect` is disabled, then it will mark the device as `EMS_ALL_UNKNOWN_CLIENTS`.

In the access proxy settings, if `empty-cert-action` is set to `accept-unmanageable`, then only case 1 and 2 would go through the proxy policy. Case 3 would be denied, and a replacement message page would appear.

To configure ZTNA policy access control of unmanageable devices:

1. Configure the client certificate actions:

```
config firewall vip
    edit “ztna_server”
        set client-cert enable
        set user-agent-detect enable
        set empty-cert-action accept
    next
end
```

2. Configure the proxy policy with the ZTNA EMS tag to control device access:

```
config firewall proxy-policy
    edit 1
        set proxy ztna-proxy
        set ztna-proxy "ztna_server"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag "EMS_ALL_UNMANAGEABLE_CLIENTS"
    next
end
```

Configuring dynamic address local tags

Like other security posture tags,`EMS_ALL_UNMANAGEABLE_CLIENTS` and `EMS_ALL_UNKNOWN_CLIENTS` are dynamic addresses on the FortiGate. The following diagnostic commands can be used to view local tag information:

- `diagnose firewall dynamic address`: a list of unmanageable and unknown clients' IP addresses associated with the `EMS_ALL_MANAGEABLE_CLIENTS` and `EMS_ALL_UNKNOWN_CLIENTS` dynamic addresses, respectively, is displayed.
- `diagnose user-device-store device memory list`: when device detection is enabled on a FortiGate interface that has a layer 2 connection to unmanageable and unknown device clients, then a client's device information is displayed.

To verify the list of dynamic firewall addresses in the CLI:

```
(vdom1) # diagnose firewall dynamic address
List all dynamic addresses:
IP dynamic addresses in VDOM vdom1(vfid: 1):
...
CMDB name: EMS_ALL_UNMANAGEABLE_CLIENTS
EMS_ALL_UNMANAGEABLE_CLIENTS: ID(101)
        ADDR(10.1.100.22)
Total IP dynamic range blocks: 1.
Total IP dynamic addresses: 1.
CMDB name: EMS_ALL_UNKNOWN_CLIENTS
EMS_ALL_UNKNOWN_CLIENTS: ID(154)
Total IP dynamic range blocks: 0.
Total IP dynamic addresses: 0.
...
```

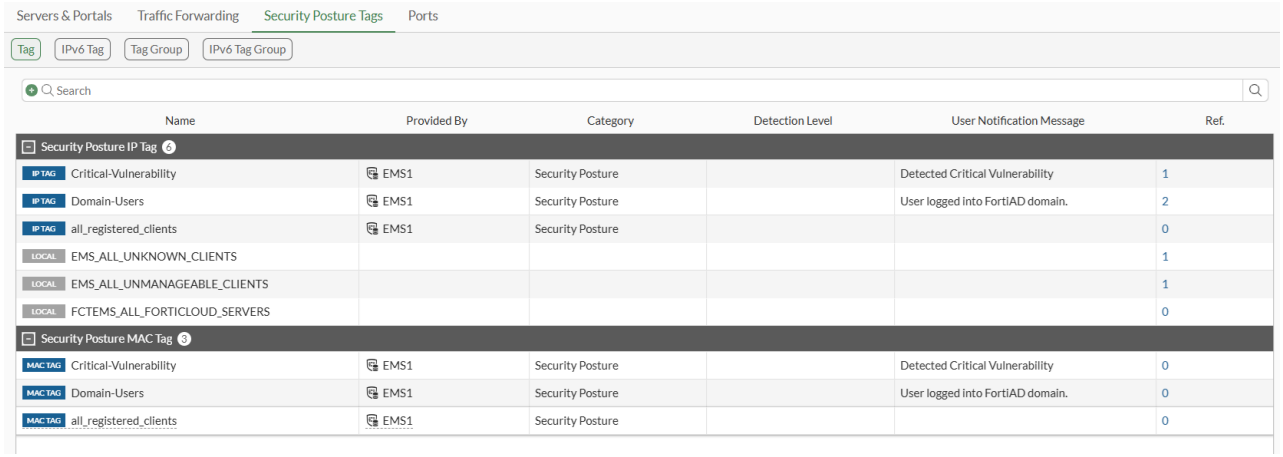
To verify the client device information in the CLI:

```
(vdom1) # diagnose user-device-store device memory list
Record #1:
         ...
        device_info
                ...
                'is_online' = 'true'
                'is_ems_registered' = 'false'
```

```
            'active_start_time' = '1668811449'
            'is_fortiguard_src' = 'false'
            'tags' = 'EMS_ALL_UNMANAGEABLE_CLIENTS'
            ...
        interface_info
        ...
```

To view the local tag information in the GUI:

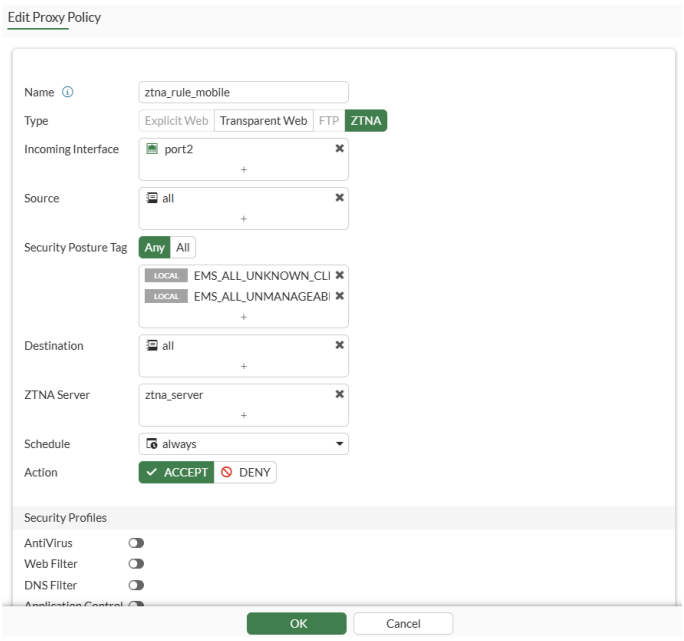
1. Go to *Policy & Objects* > *ZTNA* and select the *Security Posture Tag* tab.



2. Hover over a tag to view the tooltip, which displays matched endpoints and resolved addresses.

To apply a local tag in a full ZTNA policy:

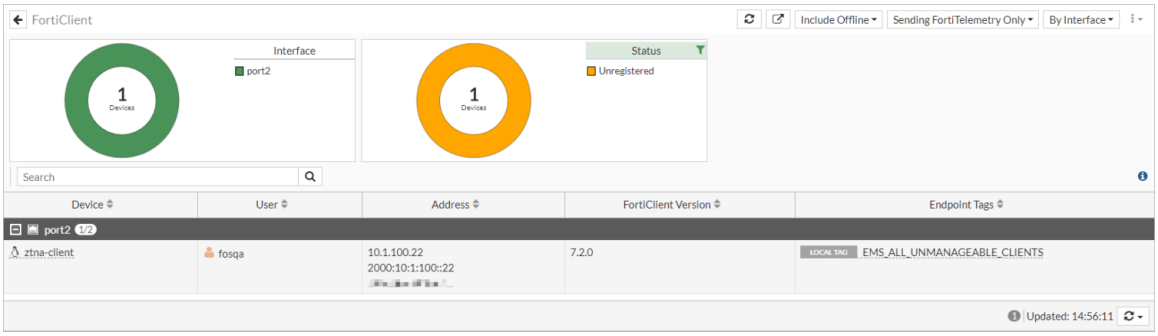
1. Go to *Policy & Objects* > *Proxy Policy*.
2. Click *Create New*, or select and edit an existing entry.
3. In the *Security Posture Tag* field, click the *+* to add tags. The local tags appear in the *IP* section.
4. Configure the other settings as needed.



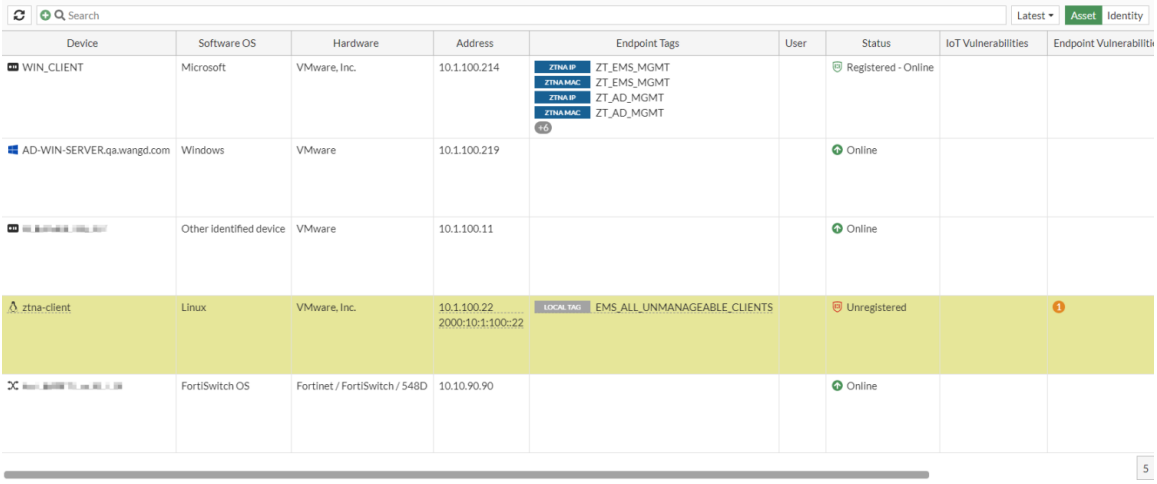
5. Click *OK*.

Local tag information is also available in the following GUI widgets and pages:

- *Dashboard* > *FortiClient* widget



- *Security Fabric* > *Asset Identity Center* page



Viewing ZTNA traffic logs

ZTNA traffic logs include the following fields related to unmanageable and unknown devices.

- Client connection status with EMS server with possible values of unknown, offline, or online:
  - CLI = `emsconnection`
  - GUI = *EMS Connection*
- Device manageability status with possible values of unknown, manageable, or unmanageable:
  - CLI = `clientdevicemanageable`
  - GUI = *Client Device Manageable*

The device manageability status can have one of the following values:

- Unknown: traffic from a client with an unknown TLS fingerprint and where the user agent information is not available for learning.
- Manageable: traffic from a non-mobile device (platform or operating system), with a known TLS fingerprint, or where the user agent information is available for learning.
- Unmanageable: traffic from a mobile device with a known mobile TLS fingerprint or user agent information is available for learning.

To view the ZTNA traffic logs in the CLI:

```
(vdom1)# execute log filter category 0
(vdom1)# execute log filter field subtype ztna
(vdom1)# execute log display

```

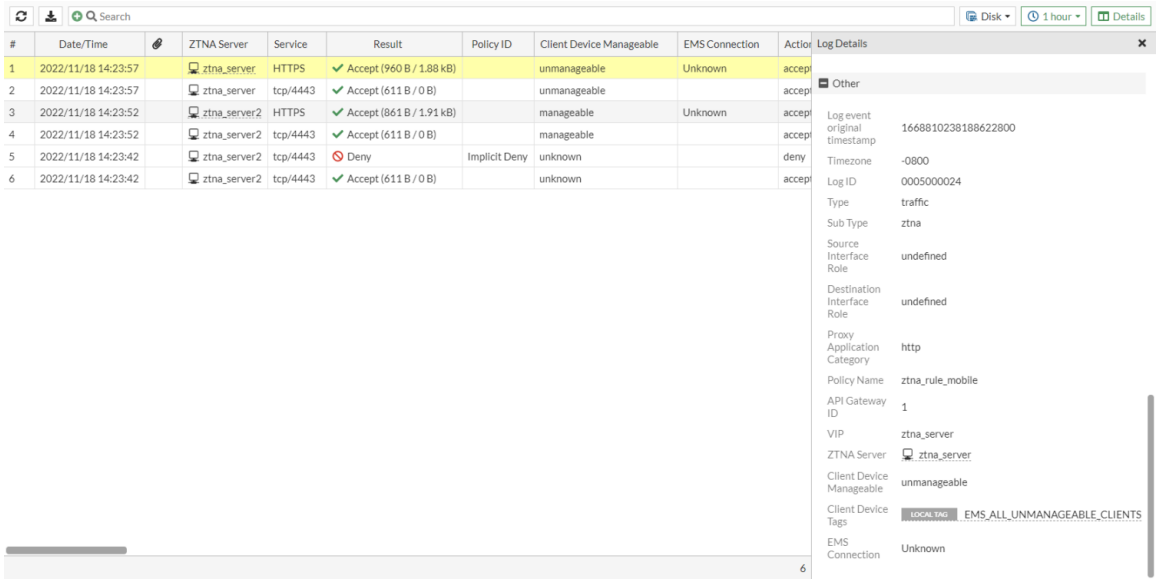
To view the ZTNA traffic logs in the GUI:

1. Go to *Log & Report > ZTNA Traffic*.
2. Select an entry and click *Details*.
3. Check the *Client Device Manageable* and *EMS Connection* fields.



HTTP2 connection coalescing and concurrent multiplexing for ZTNA

HTTP2 connection coalescing and concurrent multiplexing allows multiple HTTP2 requests to share the same TLS connection when the destination IP is the same, and the host names are compatible in the certificate. In ZTNA scenarios, the FortiGate application gateway may accept multiple HTTP2 requests to the same ZTNA server destined to different virtual hosts on the same real server. These HTTP2 requests can share the same TLS connection between the FortiGate and the real server so that the handshake does not need to be performed multiple times for multiple connections.

In order for the FortiGate to match the SNI (Server Name Indication), this SNI value must appear under the SAN extension on the server certificate. Configuring the SNI value under the CN alone will not work.

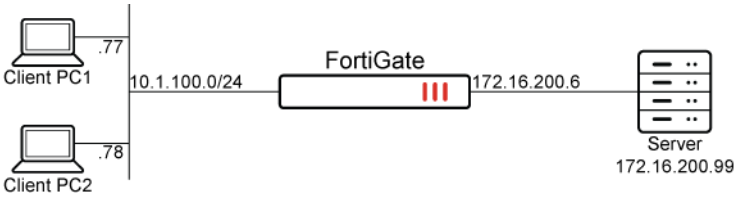
To configure the ZTNA web proxy:

```
config ztna web-proxy
    edit <name>
        set svr-pool-multiplex {enable | disable}
        set svr-pool-ttl <integer>
        set svr-pool-server-max-request <integer>
        set svr-pool-server-max-concurrent-request <integer>
    next
end
```

Command	Description
`svr-pool-multiplex {enable | disable}`	Enable/disable server pool multiplexing. When enabled, share the connected server in HTTP, HTTPS, and web portal API gateway.
`svr-pool-ttl <integer>`	Set the time-to-live in the server pool for idle connections to servers (in seconds, 0 - 2147483647, default = 15).
`svr-pool-server-max-request <integer>`	Set the maximum number of requests that servers in server pool handle before disconnecting (0 - 2147483647, default = 0).
`svr-pool-server-max-concurrent-request <integer>`	Set the maximum number of concurrent requests that servers in the server pool could handle (0 - 2147483647, default = 0).

Example

In this example, multiple clients submit requests in HTTP2. The requests hit the VIP address, and then FortiGate opens a session between itself (172.16.200.6) and the server (172.16.200.99). The coalescing occurs in this session as the multiple streams share the same TLS session to connect to the same destination server.



To configure connection coalescing and concurrent multiplexing with ZTNA:

1. Configure the VIP:

```
config firewall vip
    edit "vip-ztna"
        set type access-proxy
        set extip 10.1.100.223
        set extintf "port2"
        set server-type https
        set client-cert disable
        set h2-support enable
        set extport 443
```

```
        set ssl-certificate "Fortinet_SSL"
    next
end
```

2. Configure the ZTNA server and path mapping:

```
config ztna web-proxy
    edit "ztna"
        set vip "vip-ztna"
        set host “a.ftnt.com”
        set svr-pool-multiplex enable
        config api-gateway
            edit 1
                set url-map "/a"
                config realservers
                    edit 1
                        set ip 172.16.200.99
                    next
                end
            next
        end
    next
end
```

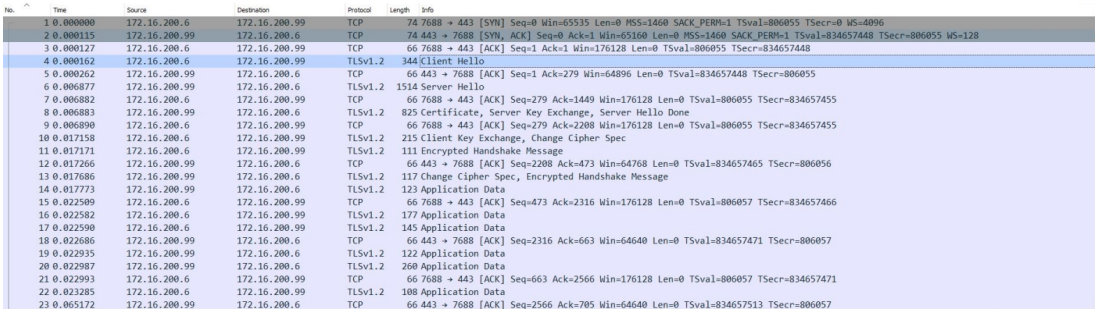
```
config ztna web-proxy
    edit "ztna_b"
        set vip "vip-ztna"
        set host “b.ftnt.com”
        set svr-pool-multiplex enable
        config api-gateway
            edit 1
                set url-map "/b"
                config realservers
                    edit 1
                        set ip 172.16.200.99
                    next
                end
            next
        end
    next
end
```

3. Configure the ZTNA policy:

```
config firewall proxy-policy
    edit 3
        set proxy ztna-proxy
        set ztna-proxy "ztna" "ztna_b"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
```

```
        set schedule "always"
        set logtraffic all
        set utm-status enable
        set ssl-ssh-profile "deep-inspection-clone"
        set av-profile "av"
    next
end
```

4. Get the clients to access a.ftnt.com and b.ftnt.com. The clients share access with the same real server and certificate (CN=*.ftnt.com). The FortiGate shares the first TLS connection with second TLS connection.
5. Verify the sniffer packet capture on the FortiGate server side. There is one client hello.



No.	Time	Source	Destination	Protocol	Length	Info
1	0.000000	172.16.200.6	172.16.200.99	TCP	74	7688 → 443 [SYN] Seq=0 Win=65535 Len=0 MSS=1460 SACK_PERM=1 TSval=806055 TSecr=0 WS=4096

11	0.017171	172.16.200.6	172.16.200.99	TLSv1.2	111	Encrypted Handshake Message
12	0.017266	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2208 Ack=473 Win=64768 Len=0 TSval=834657465 TSecr=806056
13	0.017686	172.16.200.99	172.16.200.6	TLSv1.2	117	Change Cipher Spec, Encrypted Handshake Message
14	0.017773	172.16.200.99	172.16.200.6	TLSv1.2	123	Application Data
15	0.022509	172.16.200.6	172.16.200.99	TCP	66	7688 → 443 [ACK] Seq=473 Ack=2316 Win=176128 Len=0 TSval=806057 TSecr=834657466
16	0.022582	172.16.200.6	172.16.200.99	TLSv1.2	177	Application Data
17	0.022590	172.16.200.6	172.16.200.99	TLSv1.2	145	Application Data
18	0.022686	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2316 Ack=663 Win=64640 Len=0 TSval=834657471 TSecr=806057
19	0.022935	172.16.200.99	172.16.200.6	TLSv1.2	122	Application Data
20	0.022987	172.16.200.99	172.16.200.6	TLSv1.2	260	Application Data
21	0.022993	172.16.200.6	172.16.200.99	TCP	66	7688 → 443 [ACK] Seq=663 Ack=2566 Win=176128 Len=0 TSval=806057 TSecr=834657471
22	0.023285	172.16.200.6	172.16.200.99	TLSv1.2	108	Application Data
23	0.065172	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2566 Ack=705 Win=64640 Len=0 TSval=834657513 TSecr=806057

6. Disable server pool multiplexing:

```
config ztna web-proxy
    edit "ztna"
        set vip "vip-ztna"
        set svr-pool-multiplex disable
    next
    edit "ztna_b"
        set vip "vip-ztna"
        set svr-pool-multiplex disable
    next
end
```

7. Verify the sniffer packet capture. This time, the FortiGate does not coalesce the TLS connection, so there are two client hellos.

No.	Time	Source	Destination	Protocol	Length	Info
27	3.209425	172.16.200.99	172.16.200.6	TLSv1.2	815	Certificate, Server Key Exchange, Server Hello Done

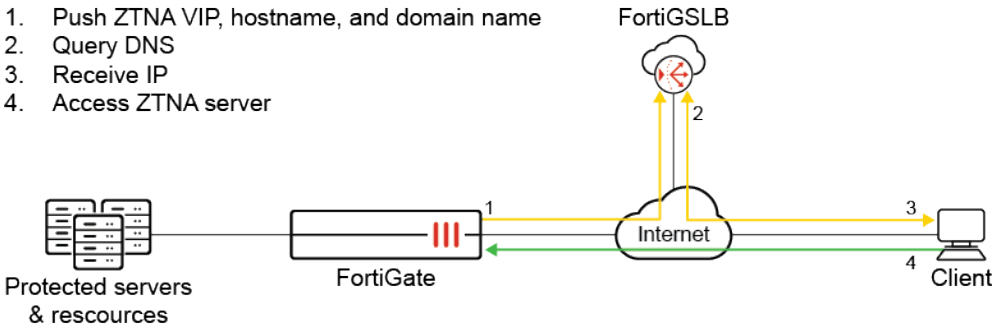
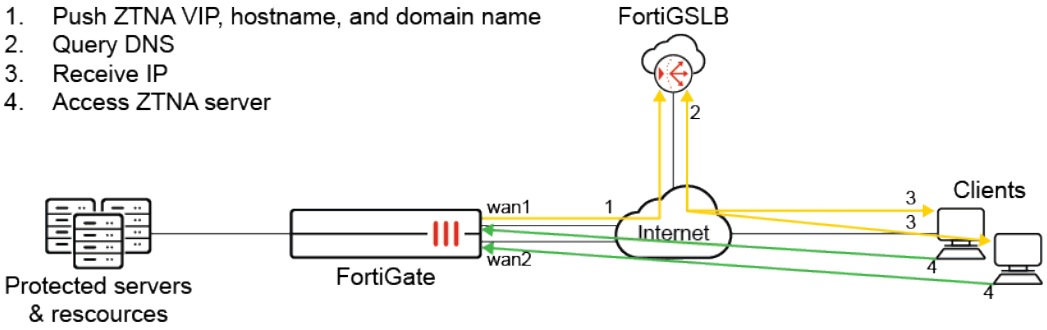
Fabric integration with FortiGSLB

Fabric integration between the FortiGate and FortiGSLB allows a FortiGate to publish custom host and domain names directly to FortiGSLB. This enables external IPs on VIPs used in ZTNA server objects to be published with the host and domain names directly to FortiGSLB, where its DNS service can provide nameserver lookups for the FQDNs.

In a basic use case, the hostname, domain name, and external IP of a ZTNA server can be published, and any subsequent updates to the address are immediately pushed to FortiGSLB.



In more advanced setup, an FQDN may map to different external IPs, which can be load balanced by FortiGSLB.



In addition, FortiGSLB can perform health checks on the external IPs, and then return the link with the better metrics. See How to add FortiGate SD-WAN Inbound Load Balancing to FortiGSLB in the FortiGSLB Handbook for more information.

This feature requires a valid FortiGSLB account contract (FGCS). If no valid FGCS contract is found, the CLI will return a warning message during configurations:

```
No license detected for FortiGSLB.
GSLB configuration and statistics will not be reported unless the account is licensed.
```

To enable VIP and ZTNA server integration with the FortiGSLB Cloud service:

```
config system global
    set fortigslb-integration {enable | disable}
end
```

To configure the FortiGSLB setting in the VIP:

```
config firewall vip
    edit <name>
        set one-click-gslb-server {enable | disable}
        set gslb-hostname <string>
        set gslb-domain-name <string>
        config gslb-public-ips
```

```
            edit <id>
                set ip <IP_address>
            next
        end
    next
end
```

Command	Description
`one-click-gslb-server {enable | disable}`	Enable/disable integration with FortiGSLB.
`gslb-hostname <string>`	Enter the hostname portion of the FQDN that will be used within the configured FortiGSLB domain.
`gslb-domain-name <string>`	Enter the domain name of the FQDN that will be used within the configured FortiGSLB domain.
`ip <IP_address>`	Enter the custom publicly accessible IP address that overrides the external IP address (`extip`). This setting is optional.

Example

In this example, a FortiGate has three WAN interfaces, each configured with different VIPs that are used in ZTNA server objects that point to the same real server. These VIPs are configured with the same GSLB hostname and domain name. As a result, the hostname and domain name are mapped to three different addresses and sent to FortiGSLB. FortiGSLB's default setting will perform load balancing and respond to DNS queries by returning the addresses in a round-robin fashion.

To configure FortiGSLB integration:

1. Enable integration with FortiGSLB in the global settings:

```
config system global
    set fortigslb-integration enable
end
```

2. Enable integration with FortiGSLB on each firewall VIP:

```
config firewall vip
    edit "ztna_vip1"
        set type access-proxy
        set server-type https
        set extip 172.18.62.66
        set extintf "port2"
        set one-click-gslb-server enable
        set gslb-hostname "qa.test"
        set gslb-domain-name "wangd.com"
        set extport 4443
        set ssl-certificate "default.test.com"
    next
```

```
    edit "ztna_vip2"
        set type access-proxy
        set server-type https
        set extip 172.18.62.67
        set extintf "port3"
        set one-click-gslb-server enable
        set gslb-hostname "qa.test"
        set gslb-domain-name "wangd.com"
        set extport 4443
        set ssl-certificate "default.test.com"
    next
    edit "ztna_vip3"
        set type access-proxy
        set server-type https
        set extip 172.18.62.68
        set extintf "port4"
        set one-click-gslb-server enable
        set gslb-hostname "qa.test"
        set gslb-domain-name "wangd.com"
        config gslb-public-ips
            edit 1
                set ip 172.18.62.69
            next
        end
        set extport 4443
        set ssl-certificate "default.test.com"
    next
end
```

3. Enable debugs:

```
# diagnose debug application cloudapid -1
# diagnose debug enable
```

A successful connection will produce output similar to the following:

```
<4234> 10 cloudapi_curl_debug()-19: CURL HEADER OUT: POST /api/v1.0/one-click-glb-
fgt/modifyconfig HTTP/2
Host: 1clickfgt.fortigslb-cloud.com
Accept: application/json
Content-Type: application/json
Content-Length: 553

<4234> 10 cloudapi_curl_debug()-19: CURL DATA OUT: {"members":[{"vdom_name":"vdom1","name_
key":"ztna_vip1","type":"ztna","ip_list":
["172.18.62.66"],"host":"qa.test","domain":"wangd.com"},{"vdom_name":"vdom1","name_key":"ztna_
vip2","type":"ztna","ip_list":["172.18.62.67"],"host":"qa.test","domain":"wangd.com"},{"vdom_
name":"vdom1","name_key":"ztna_vip3","type":"ztna","ip_list":
["172.18.62.69”],"host":"qa.test","domain":"wangd.com"}],"ha_cluster":
[{"sn":"FG181FTK22902632","host_name":"FGT1801F-ZTNA"},{"sn":"FG181FTK22902625","host_
name":"FGT1801F-ZTNA"}],"timestamp":"2023-11-23 00:28:43"}
```

Verification

Upon successfully passing the hostname, domain name, and IP address mappings to FortiGSLB, clients that are using FortiGSLB's DNS for DNS resolution can now get responses to their queries. Results on consecutive queries return the IP addresses in a round-robin fashion.

First query:

```
fosqa@ztna-client4:~/ztna_pytest$ dig @15.197.150.26 qa.test.wangd.com
; <<>> DiG 9.16.1-Ubuntu <<>> @15.197.150.26 qa.test.wangd.com
; (1 server found)

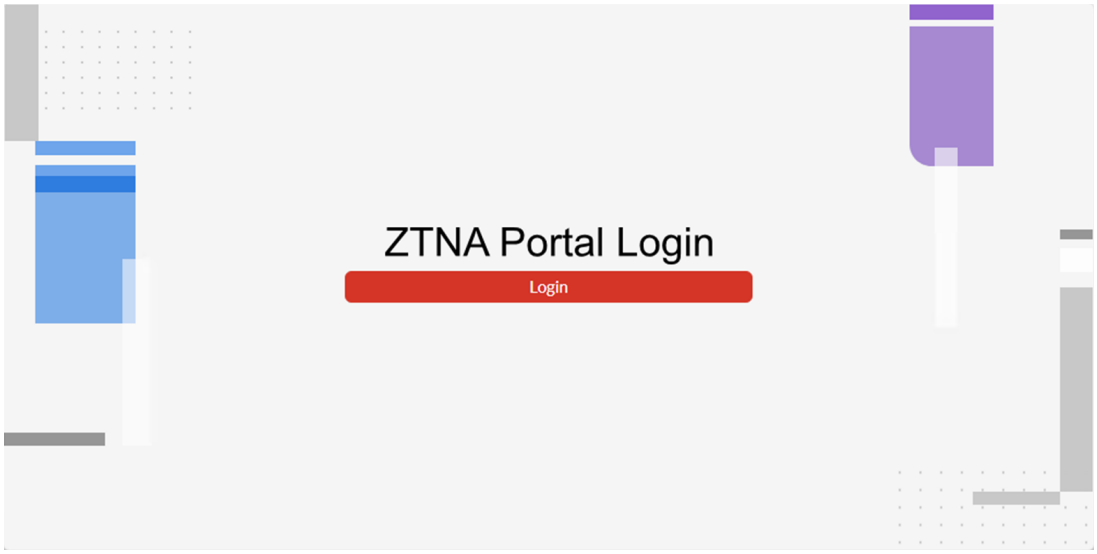
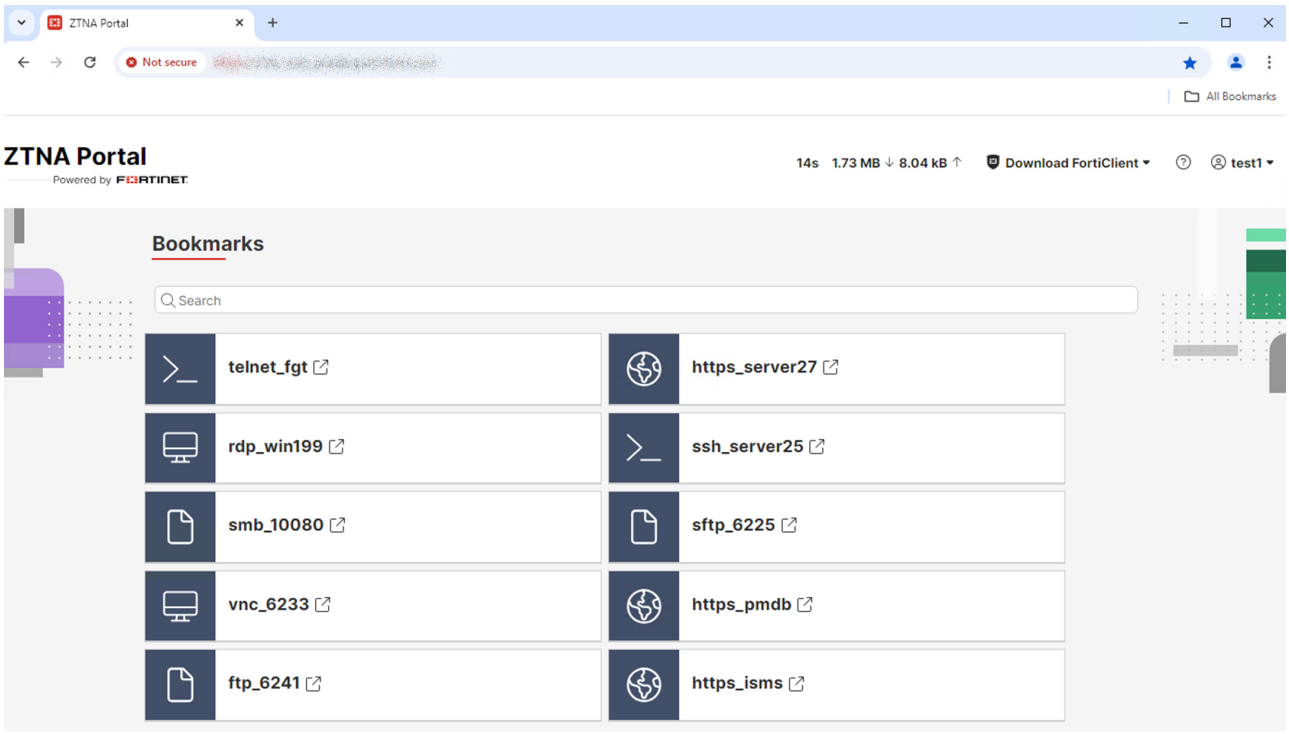
ZTNA agentless web-based application access

A ZTNA web portal is available to provide end-user access to applications without FortiClient or client certificate checks. The ZTNA portal handles authentication and authorization of traffic destined for the protected resources. It is implemented entirely in WAD.

When end-users connect to the ZTNA web portal, they are directed to a login page:



Once logged in, end-users can access bookmarks defined by the administrator:



For web applications, the client must resolve the FQDN to the ZTNA portal VIP. In addition, when accessing the web application, end users are presented with the certificate configured on the ZTNA portal VIP instead of the certificate on the end web server. Hence, the certificate requires the correct Subject Alternate Name(s) to avoid browser certificate errors.

Configuration

To configure a ZTNA port in the GUI:

1. Go to *Policy & Objects* > *ZTNA*, select the *Ports* tab, and click *Create New*.
2. Configure the port:

Option	Description
Name	Name of the ZTNA port
Interface	Listening interface
IP address	External address for the ZTNA Gateway
Port	External port for the ZTNA Gateway
Default certificate	Certificate used for the web portal

3. Click *OK*.

To configure a ZTNA port in the CLI:

Disable `client-cert` to disable the requirement for a client certificate so that agentless clients can connect.

```
config firewall vip
    edit <name>
        set type access-proxy
        set server-type https
        set extip <ip address>
        set extintf <interface>
        set client-cert disable
        set extport <port>
        set ssl-certificate <certificate>
    next
end
```

To create a web portal object in the GUI:

1. Go to *Policy & Objects* > *ZTNA*, select the *Servers & Portals* tab, select *Web Portal*, and click *Create New*.
2. Configure the web portal:

Option	Description
Name	Name of the web portal
Host	Virtual host name that end-users will connect to to access the ZTNA web portal
ZTNA port	Use existing. Select the ZTNA port created in the previous steps.
Authentication scheme	Enable. Create a new authentication scheme that applies to the web portal.
IP-based authentication	Enable to authenticate users per IP

3. Click *OK*.

To create a web portal object in the CLI:

1. Configure an access-proxy virtual host. Disable `client-cert` to allow agentless clients to connect to this destination to access the ZTNA web portal.

```
config firewall access-proxy-virtual-host
    edit "ztna-web-portal-fqdn"
        set host <web portal host name or ip>
        set client-cert disable
    next
end
```

2. After an authentication scheme is created, the authentication rule for the `ztna-portal` is created automatically.

```
config authentication rule
    edit <rule>
        set protocol ztna-portal
        set active-auth-method <auth scheme>
```

```
    next
end
```

3. ZTNA web portal settings:

```
config ztna web-portal
    edit <name>
        set vip <vip name>
        set host <virtual host name>
        set vip6 <virtual IPv6 name>
        set auth-rule <rule>
    next
end
```

Command	Description
vip <vip name>	The access-proxy VIP associated with this portal.
host <virtual host name>	The access-proxy virtual host object and FQDN defined for accessing this portal. This virtual host object should not conflict with other virtual host objects used in Traffic forwarding and ZTNA web proxy or with the SAML SP host.
vip6 <virtual IPv6 name>	The access-proxy VIP6 associated with the ZTNA server and applications that this portal is allowing.

To create a web portal bookmarks:

```
config ztna web-portal-bookmark
    edit <name>
        set users <users>
        set groups <groups>
        config bookmarks
            edit <name>
                set apptype {ftp | rdp | sftp | smb | ssh | telnet | vnc | web}
                set url <string>
                set host <name or IP>
                set description <description>
                set port <remote port>
                set sso {enable | disable}
            next
        end
    next
end
```

Command	Description
users <users>	The user(s) allowed to access the web-portal.
groups <groups>	The group(s) allowed to access the web-portal.

Command	Description
`apptype {ftp | rdp | sftp | smb | ssh | telnet | vnc | web}`	Supported types of bookmarks: ftp, rdp, sftp, smb, ssh, telnet, vnc, web.
`url <url>`	For different types of applications, the URL used to define the destination.
`host <name or ip>`	For different types of applications, the host name or IP used to define the destination.
`port <remote port>`	Where applicable, define the port for the service.
`sso {enable | disable}`	Enable/disable the SSO user login and credentials to connect to the application, where applicable.

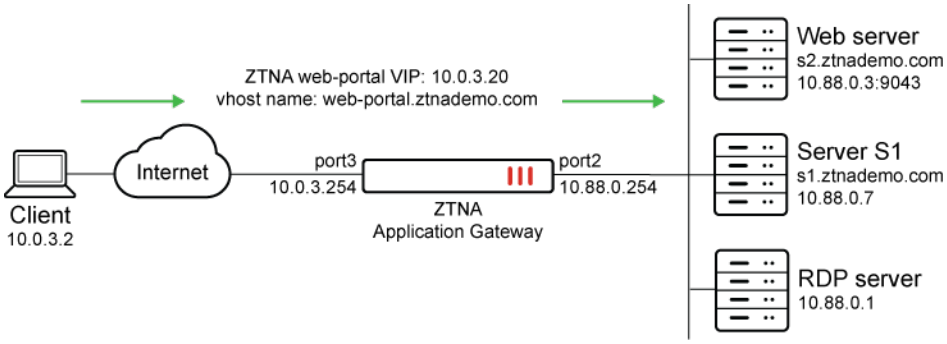
Not all options are listed. Some options are available only for certain types of applications.

To configure your proxy-policy to map to your web-portal:

```
config firewall proxy-policy
    edit <id>
        set proxy ztna-proxy
        set ztna-proxy <web-portal>
        …
    next
end
```

Example

This example demonstrates connecting to a ZTNA web portal to gain access to protected resources. Authentication is performed with LDAPS.



Prerequisites:

- The Client can resolve:
  - The hostname web-portal.ztnademo.com to the VIP address 10.0.3.20
  - The server s1.ztnademo.com to the VIP address 10.0.3.20
  - The server s2.ztnademo.com to the VIP address 10.0.3.20

- The FortiGate resolves:
  - s1.ztnademo.com to the real server IP of 10.88.0.7
  - s2.ztnademo.com to the real server IP of 10.88.0.3
- The FortiGate has an LDAPS connection and user group already created.

To configure from the GUI and CLI:

1. Configure a ZTNA port:
   a. Go to *Policy & Objects* > *ZTNA* >*Ports* and click *Create New*.
   b. Configure the port:

Option	Description
Name	ZTNA-web-proxy
Interface	port3
IP address	10.0.3.20
Port	443
Default certificate	ztna-wildcard

   c. Click *OK*.
   d. Disable client-cert in the CLI:

```
config firewall vip
    edit "ZTNA-web-proxy"
        set client-cert disable
    next
end
```

2. Create a Web Portal object:
   a. Go to *Policy & Objects* > *ZTNA* > *Servers & Portals* > *Web Portal* and click *Create New*.
   b. Configure the web portal:

Option	Description
Name	ztna-web-portal-ldap
Host	web-portal.ztnademo.com
ZTNA port	ZTNA-web-proxy

   c. Enable *Authentication scheme* and, from the drop-down, click the *Create* button.
   d. Configure the authentication scheme:

Option	Description
Name	ztna-web-portal-ldap
Method	Basic
User database	Other

Option	Description
	Select *LDAP-fortiad* from the options.

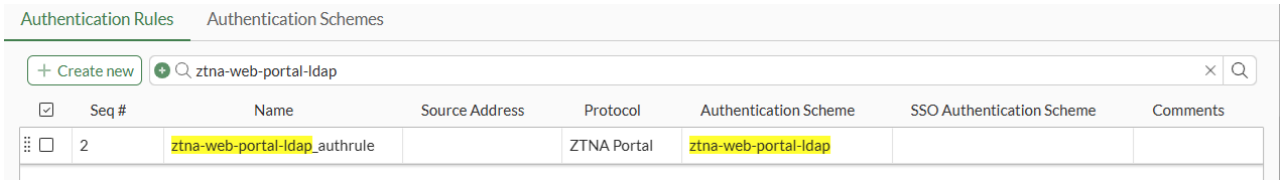
e. Click *OK*.
f. Set *IP-based authentication* to *Enabled* to authenticate users per IP.
g. Click *OK* to save the Web Portal.

3. Update the access-proxy virtual host to disable client-cert:

   The configuration here defines the virtual host used to access the ZTNA web portal, as well as the server certificate for the portal. It overrides the settings in the VIP.

```
config firewall access-proxy-virtual-host
    edit "web-portal_vh_mkrbnyua"
        set host "web-portal.ztnademo.com"
        set client-cert disable
    next
end
```

4. Go to *Policy & Objects* > *Authentication* > *Authentication Rules* and note that a new authentication rule was automatically created with the same prefix as the authentication scheme.



5. In the CLI, create web-portal bookmarks that will point to your internal resources:

```
config ztna web-portal-bookmark
    edit "bookmark"
        set groups "LDAP-Remote-Allowed-Group"
        config bookmarks
            edit "Webserver"
                set url "https://s2.ztnademo.com:9043"
            next
            edit "Server-S1-Web"
                set sso enable
                set url "https://s1.ztnademo.com"
            next
            edit "Server-S1-SSh"
                set apptype ssh
                set sso enable
                set host "10.88.0.7"
                set logon-user "admin"
                set logon-password <password>
            next
            edit "FortiGate-Internal-SSH"
                set apptype ssh
                set host "10.88.0.254"
            next
            edit "RDP"
```

```
                set apptype rdp
                set host "10.88.0.1"
                set port 3389
            next
        end
    next
end
```

The groups setting defines the user group allowed access to the portal.

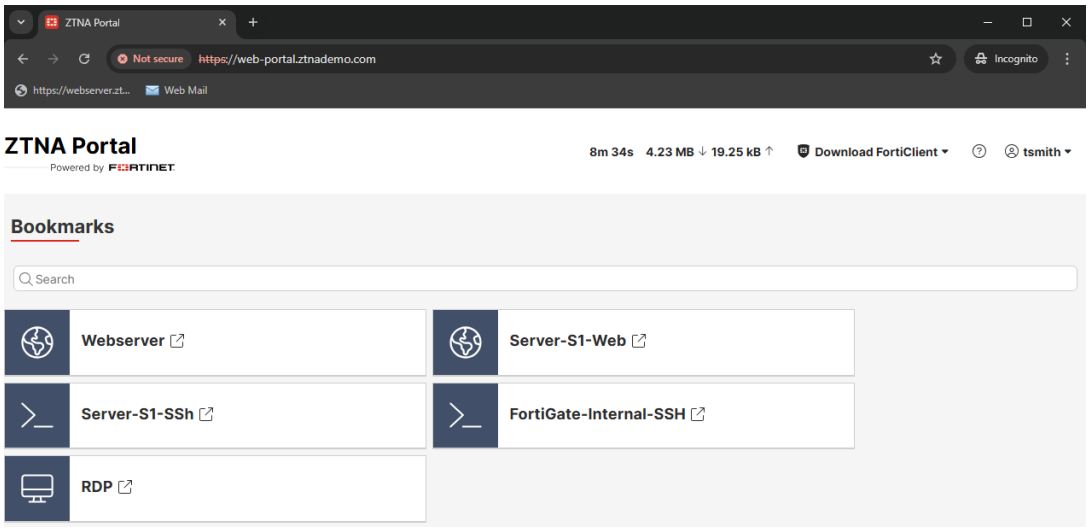
6. Create a full ZTNA policy to allow access to the new VIP:
   a. Go to *Policy & Object* > *Proxy Policy* and click *Create New*.
   b. Configure the policy:

Option	Description
Name	ZTNA-web-portal
Type	ZTNA
Incoming Interface	port3
Source	all
Destination	all
ZTNA Server	ztna-web-portal-ldap
Schedule	always
Action	Accept
Log Allowed Traffic	All Sessions

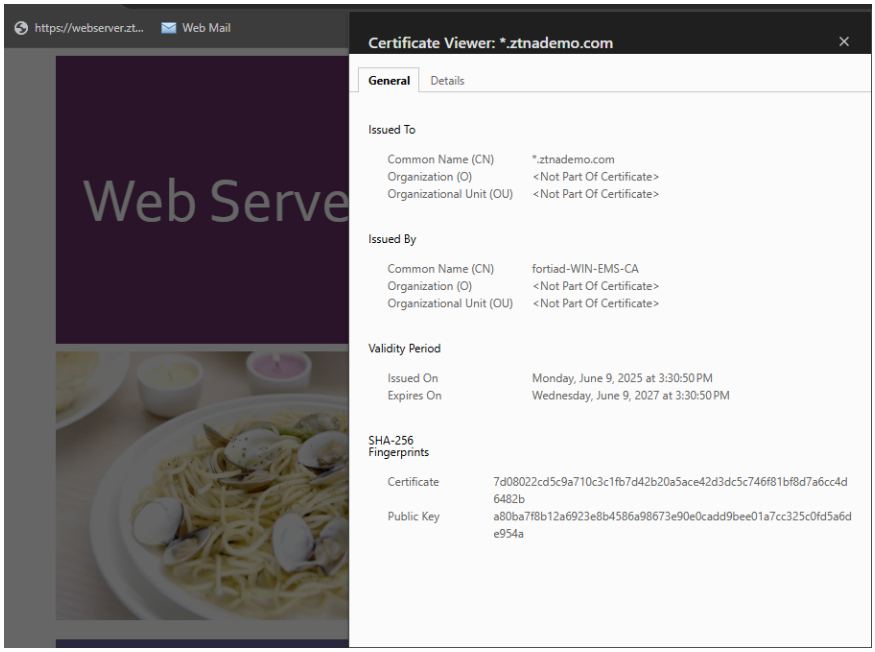
   c. Click *OK*.

Verification:

1. On the Client 10.0.3.2, access the portal on https://web-portal.ztnademo.com.
2. When prompted, enter the LDAP user credentials.
3. Once logged into the ZTNA Portal, choose the application bookmark to connect to.



4. Click *Webserver* to access *s2.ztnademo.com*. A new tab opens up to the web page.
5. Check the certificate to confirm it is signed by the CA certificate used in the VIP configurations.



6. On the FortiGate, go to *Log & Report > ZTNA Traffic* to view the latest traffic log. Alternatively, use these commands to view the logs from CLI:

```
# execute log filter field subtype ztna

# execute log display
32 logs found.
10 logs returned.

1: date=2026-02-18 time=19:30:46 eventtime=1771471846623889083 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=51677

```

Additional troubleshooting and debugs:

If an issue occurs, you can troubleshoot by running these commands:

```
# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable
```

A working connection will output the debugs indicating the web-portal matched the proper gateway. Then accessing the bookmark will output debugs for matching the bookmark.

ZTNA domain matching

A domain filter can be used within ZTNA real server object definitions in the absence of an address, or when you need to match multiple servers in a domain that are not defined in an address or address group. Domain matching is helpful when used with TCP forwarding, where the destinations are configured on the FortiClient but they are not individually configured on the FortiGate ZTNA server configurations. When using domain matching, the destination must be resolvable by the FortiGate.

```
config firewall access-proxy
    edit <name>
        config api-gateway
            edit <ID>
                config realservers
                    edit 1
                        set domain <domain>
                    next
                end
```

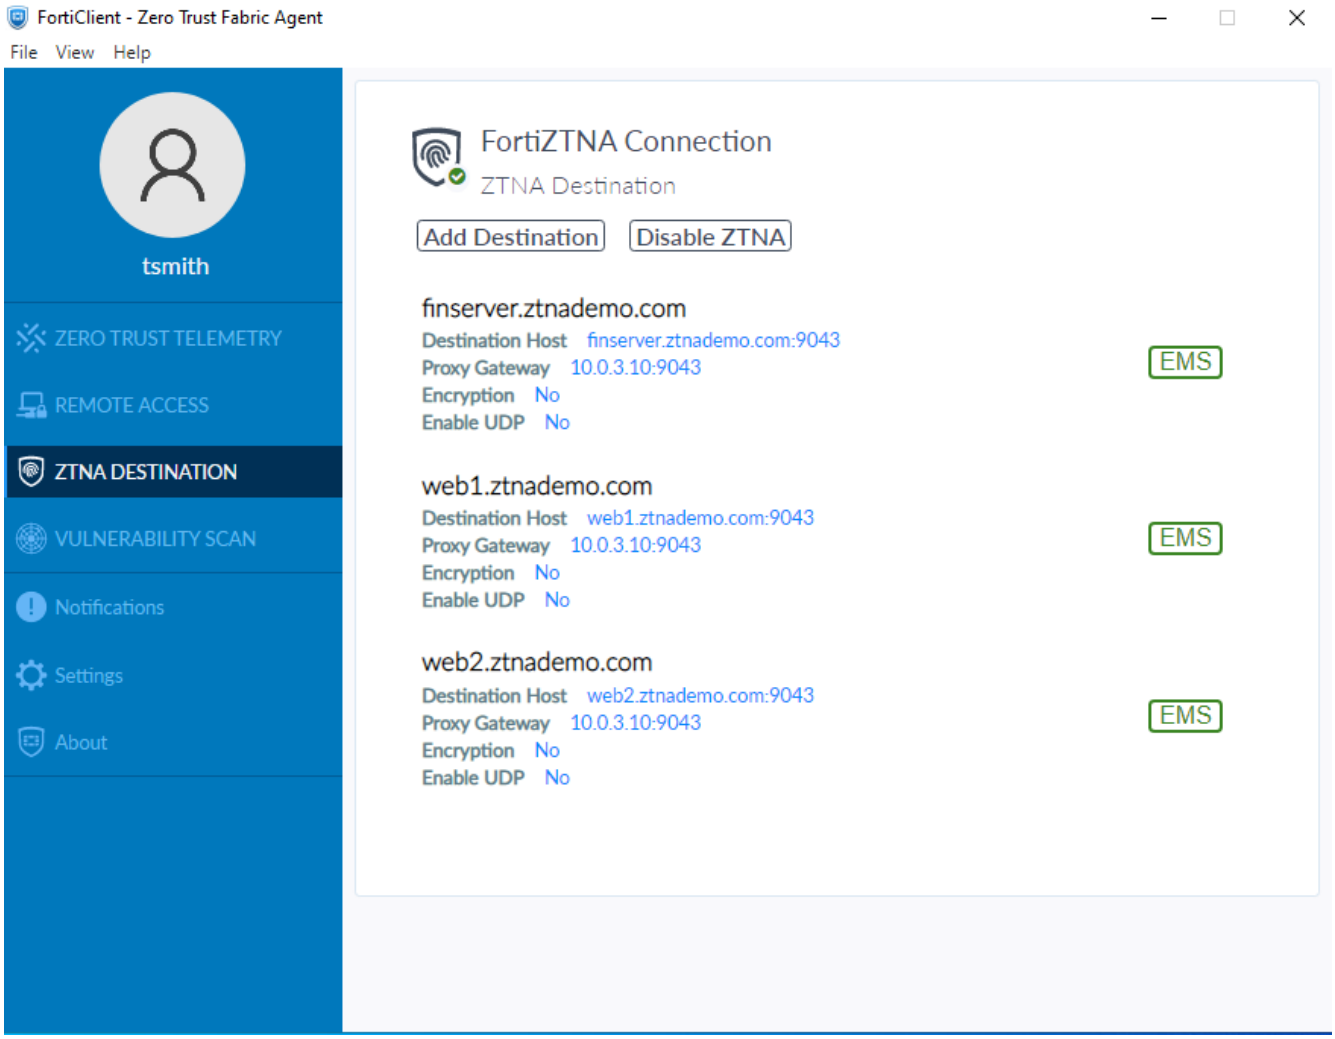
```
            next
        end
    next
end
```

Where <domain> can be a substring of the actual domain. For example, st.com will match test.com or first.com, but will not match trait.com.

Example 1: Wildcard domain match ztnademo.com

In this example, several TCP forwarding entries have been added on the EMS server and pushed to the FortiClient endpoint:

- finserver.ztnademo.com
- web1.ztnademo.com
- web2.ztnademo.com

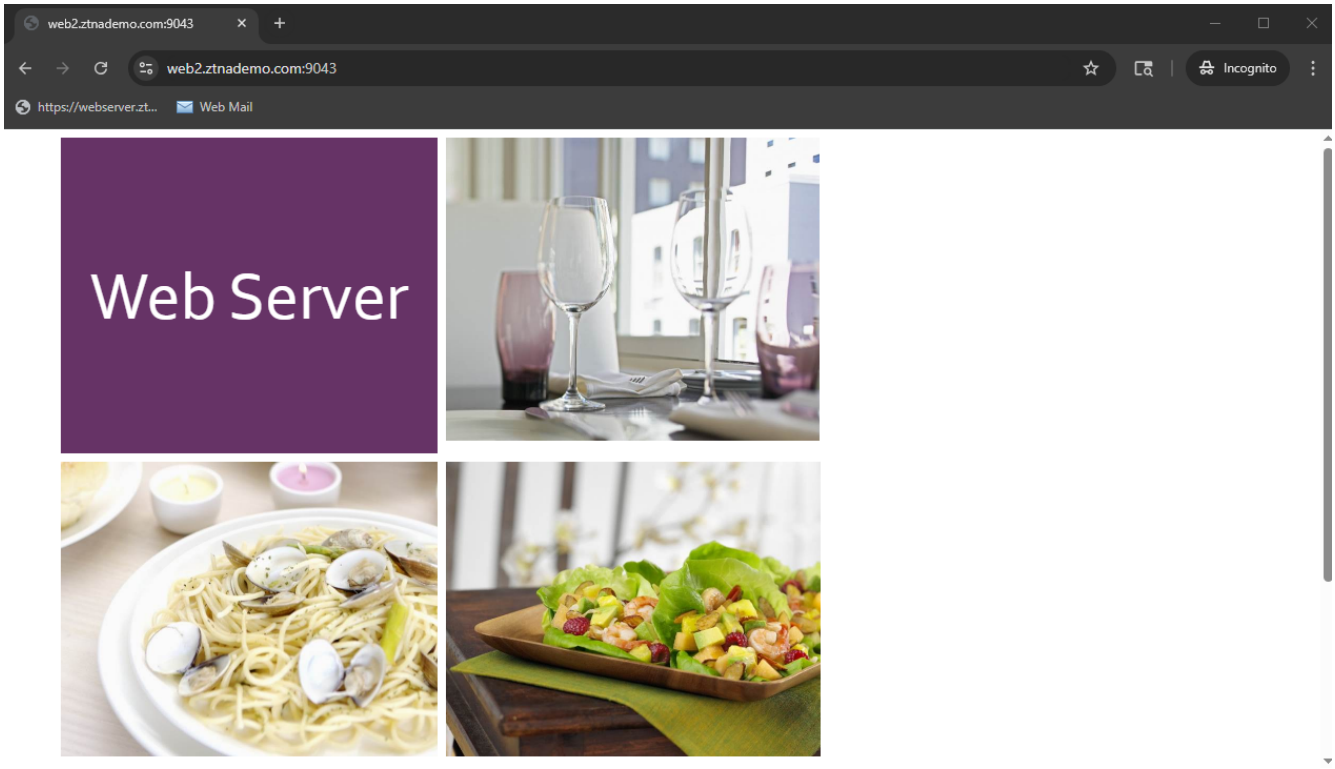


All 3 servers are resolvable on the FortiGate.

On the ZTNA real server definition on the FortiGate, a wildcard domain filter is used to match everything under `ztnademo.com`. No address object is defined.

```
config firewall access-proxy
    edit "ZTNA-server"
        set vip "ZTNA-server"
        config api-gateway
            edit 1
                set url-map "/tcp"
                set service tcp-forwarding
                config realservers
                    edit 1
                        set domain "ztnademo.com"
                        set mappedport 9043
                    next
                end
            next
        end
    next
end
```

When accessing these servers from the remote endpoint, each of these can be accessed.



```
# execute log filter field subtype ztna
# execute log display
164 logs found.
10 logs returned.
```

```

```

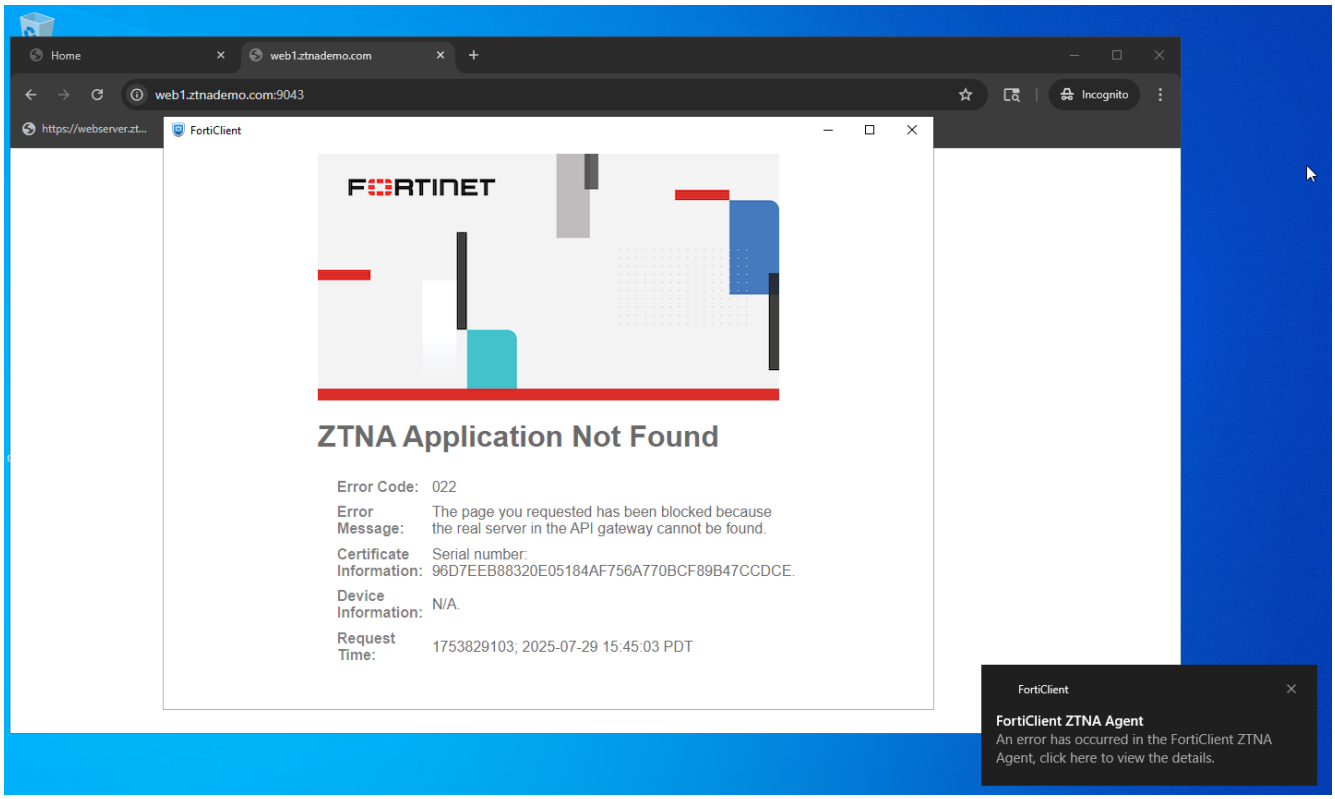
Example 2: Wildcard domain match server.ztnademo.com

In this example, the same servers are pushed to the FortiClient endpoint. However, a more specific domain filter is applied to only allow `*server.ztnademo.com`.

```
config firewall access-proxy
    edit "ZTNA-server"
        set vip "ZTNA-server"
        config api-gateway
            edit 1
                set url-map "/tcp"
                set service tcp-forwarding
                config realservers
                    edit 1
                        set domain "server.ztnademo.com"
                        set mappedport 9043
                    next
                end
            next
        end
```

```
    next
end
```

When accessing these servers, only `finserver.ztnademo.com` can be accessed. Other servers will return with an error.



```
# execute log filter field subtype ztna
# execute log display
189 logs found.
10 logs returned.

1: date=2025-07-29 time=15:46:20 eventtime=1753829180317849279 tz="-0700" logid="0005000024"

craction=131072 crlevel="high"
```

Example 3: Domain match precedence

In this example, an address group is specified in the real server definition, which includes all three server's FQDN. A domain filter is configured to only filter on `web`.

```
config firewall addrgrp
    edit "ztnademo-group"
        set member "web1.ztnademo.com" "web2.ztnademo.com" "finserver.ztnademo.com"
    next
end
```

```
config firewall access-proxy
    edit "ZTNA-server"
        set vip "ZTNA-server"
        config api-gateway
            edit 1
                set url-map "/tcp"
                set service tcp-forwarding
                config realservers
                    edit 1
                        set address "ztnademo-group"
                        set domain "web"
                        set mappedport 9043
                    next
                end
            next
        end
    next
end
```

When accessing `web1.ztnademo.com` or `web2.ztnademo.com`, wad debug shows that domain matching takes precedence over address matching:

```
# diagnose wad debug enable category all
Debug messages will be on for 30 minutes.
# diagnose wad debug enable level verbose
Debug messages will be on for 30 minutes.
# diagnose debug enable

GET /tcp?address=web1.ztnademo.com&port=9043&tls=0 HTTP/1.1

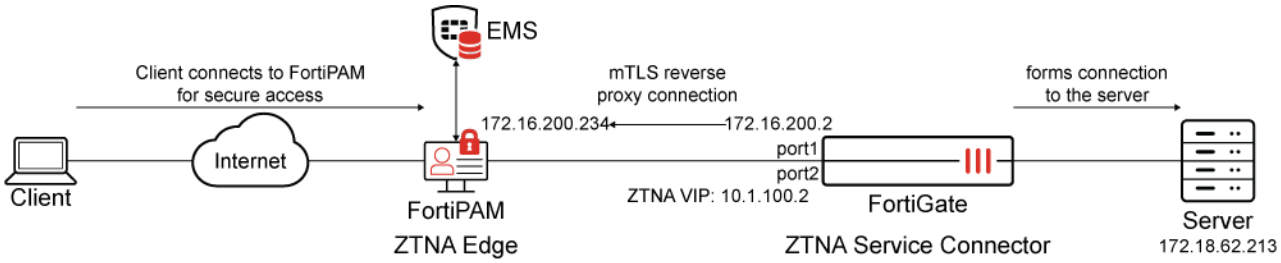
ZTNA service connector NEW

In certain environments, we may want to prevent users from accessing the FortiGate ZTNA access proxy directly or expose ports and services on the FortiGate to the public. In these scenarios, another layer of ZTNA proxy may be required to serve as the ZTNA Edge.

The FortiGate can act as a ZTNA service connector to reverse proxy service connections upstream to the ZTNA Edge. In this scenario, the ZTNA Edge may be a FortiPAM or FortiProxy which acts as the ZTNA access proxy to the end users. The FortiGate, as the ZTNA service connector, forms a persistent control connection with ZTNA Edge. The ZTNA Edge forwards connection requests through the control tunnel to the FortiGate ZTNA service connector, which proxies the request to the protected server.



The ZTNA Edge in this scenario completes the ZTNA checks and enforces the ZTNA policy. If the connection is allowed, the request is forwarded to the ZTNA service connector.

The ZTNA service connector is responsible for proxying the connection and establishing a data connection back to the ZTNA Edge to forward the response. This effectively forms a proxy chain where the FortiGate service connector provides reverse proxy connection back to the ZTNA Edge.

Usage

CLI syntax

The following CLI settings configure the connection with the ZTNA Edge:

```
config ztna reverse-connector
    edit <name>
        set address <IP or FQDN address>
        set port <port number>
        set certificate <local certificate>
        set trusted-server-ca <CA certificate>
    next
end
```

Field	Description
address <IP or FQDN address>	Address of the ZTNA Edge
port <port number>	The port number for connecting to the ZTNA Edge
certificate <local certificate>	The local client certificate used for mTLS negotiation
trusted-server-ca <CA certificate>	The root CA certificate to authenticate the mTLS connection

GUI settings

1. Go to *System* > *Feature Visibility* and enable *Zero Trust Network Access* and *ZTNA Reverse Proxy Connector*.

2. Go to *Policy & Objects* > *ZTNA* and select the *Traffic Forwarding* tab.
3. Select the *Reverse Proxy Connector* sub-menu and click *Create New*.
4. Configure the following, then click *OK*:

Field	Description
Name	Name of the connector
Address	IP or FQDN Address of the ZTNA Edge
Port	The port number for connecting to the ZTNA Edge
CA certificate	The root CA certificate to authenticate the mTLS connection
Default certificate	The local client certificate used for mTLS negotiation

Example

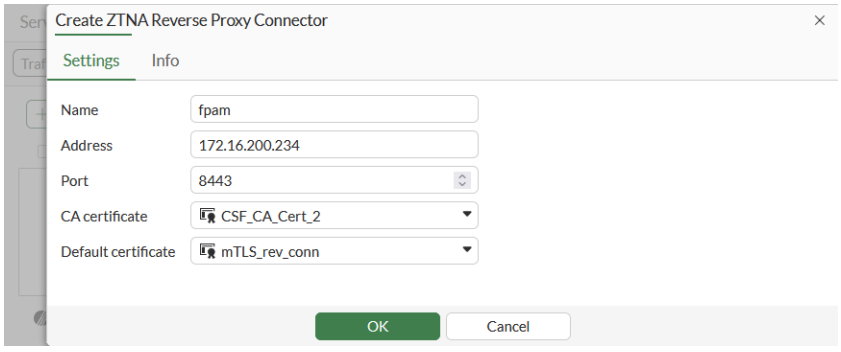
In the example topology shown in the introduction, we will configure a TCP forwarding destination on the FortiGate service connector to allow RDP connection to the Server (172.18.62.213). We will also configure a ZTNA reverse-connector to connect to the upstream FortiPAM.

The FortiPAM will follow the FortiPAM server (ZTNA Edge) configuration as illustrated in the Configuring FortiPAM/FortiGate as reverse gateway example. We will configure a secret on the FortiPAM server to allow users to RDP into the Server.

Alternatively, if deploying using a FortiProxy on the ZTNA Edge, follow the FortiProxy as reverse proxy to service connector example in the FortiProxy admin guide.

To configuring the reverse proxy connection in the FortiOS GUI:

1. Go to *System* > *Feature Visibility* and enable *Zero Trust Network Access* and *ZTNA Reverse Proxy Connector*.
2. Go to *Policy & Objects* > *ZTNA* and select the *Traffic Forwarding* tab.
3. Select the *Reverse Proxy Connector* sub-menu and click *Create New*.
4. Configure the following:



Field	Description
Name	Fpam

Field	Description
Address	172.16.200.234
Port	8443
CA certificate	CSF_CA_Cert_2
Default certificate	mTLS_rev_conn

5. Click *OK*

To configure the ZTNA reverse-connector in the FortiOS CLI:

```
config ztna reverse-connector
    edit "fpam"
        set address "172.16.200.234"
        set port 8443
        set certificate "mTLS_rev_conn"
        set trusted-server-ca "CSF_CA_Cert__2"
    next
end
```

To configure the TCP forwarding proxy, destination, and rules in the FortiOS CLI:

```
config firewall vip
    edit "vip"
        set type access-proxy
        set server-type https
        set extip 10.1.100.2
        set extintf "port2"
        set client-cert disable
        set extport 4443
        set ssl-certificate "Fortinet_SSL"
    next
end
config ztna traffic-forward-proxy
    edit "ztfp"
        set vip "vip"
    next
end

    next
end
```

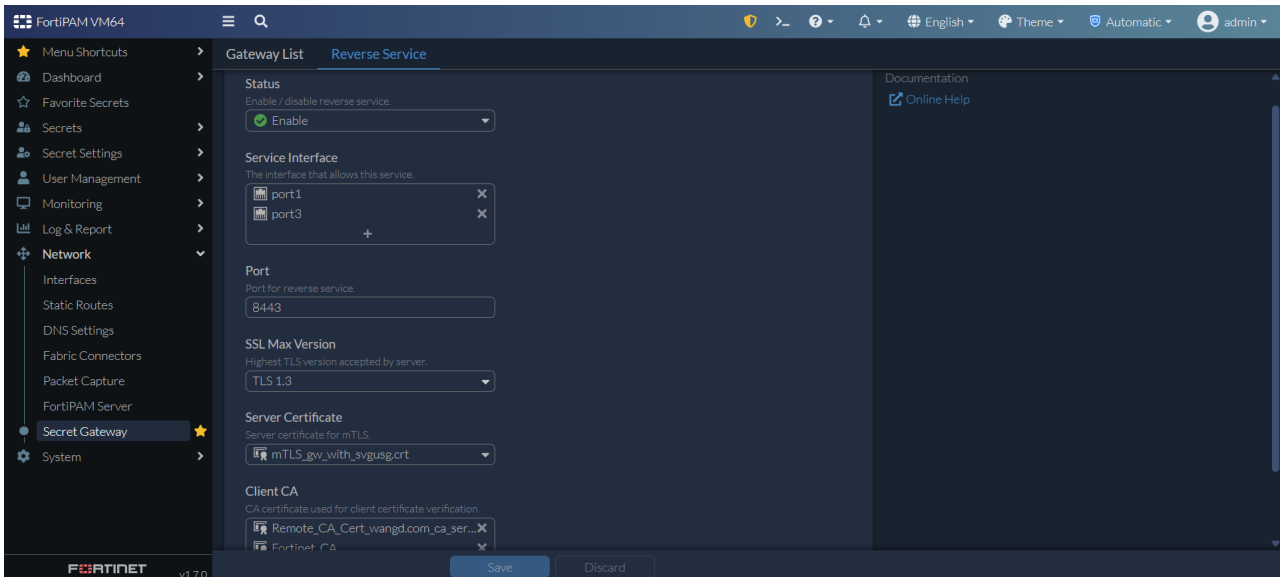
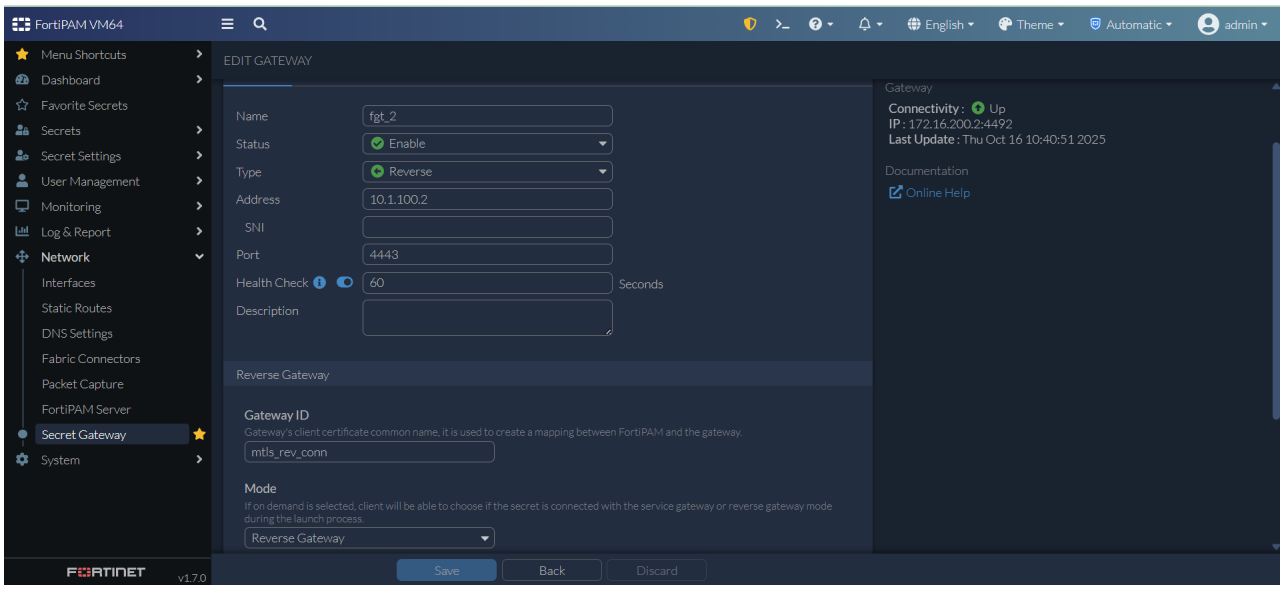
To configure the FortiPAM ZTNA Edge:

1. On the FortiPAM, go to *Network* > *Secret Gateway* > *Reverse Service*.
2. Enable the service and enter the server settings.

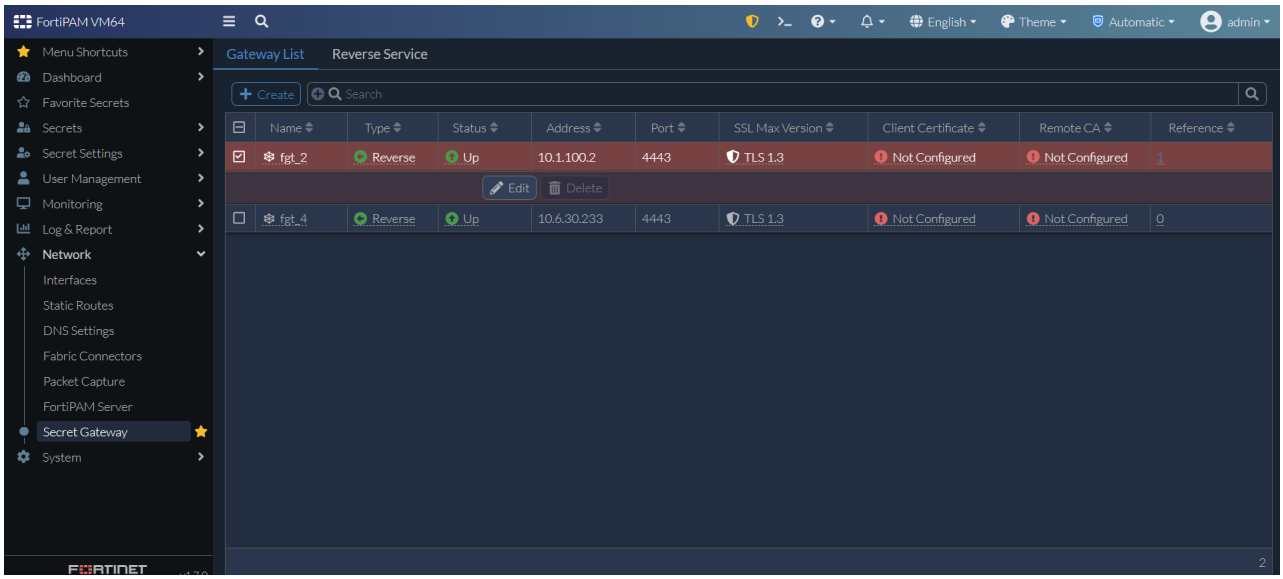


3. Click *Save*.
4. Under *Network* > *Secret Gateway*, create a new *Gateway*.
5. Enter the settings below and input the FortiGate VIP address to identify the desired gateway.

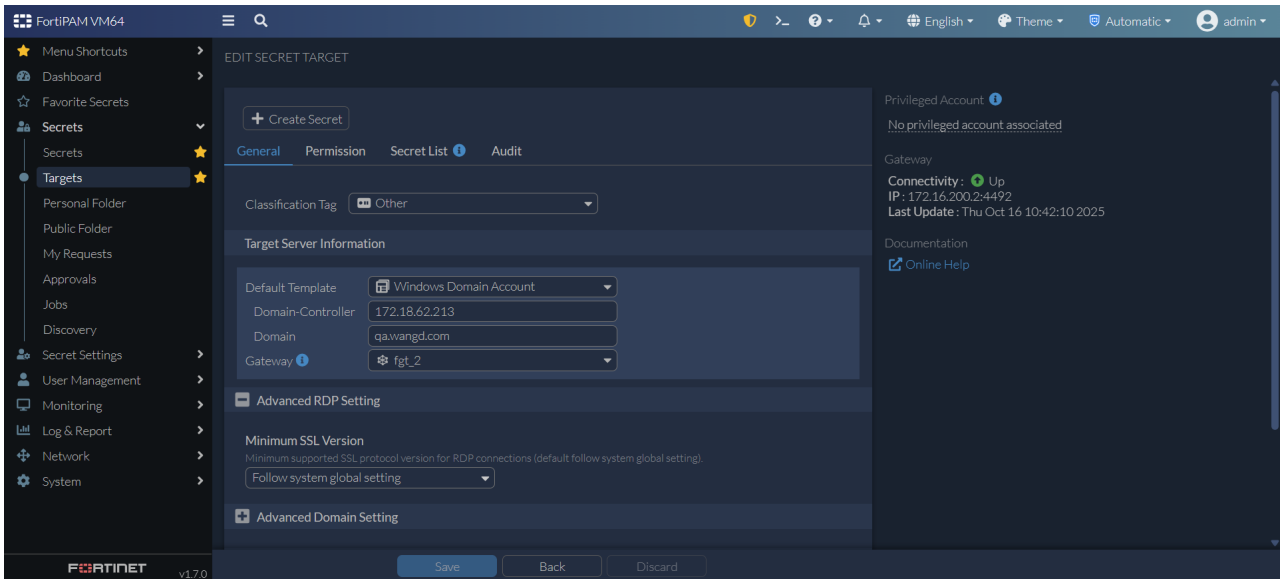
   For the *Gateway ID*, enter the CN string from the FortiGate client certificate (mTLS_rev_conn in this example).



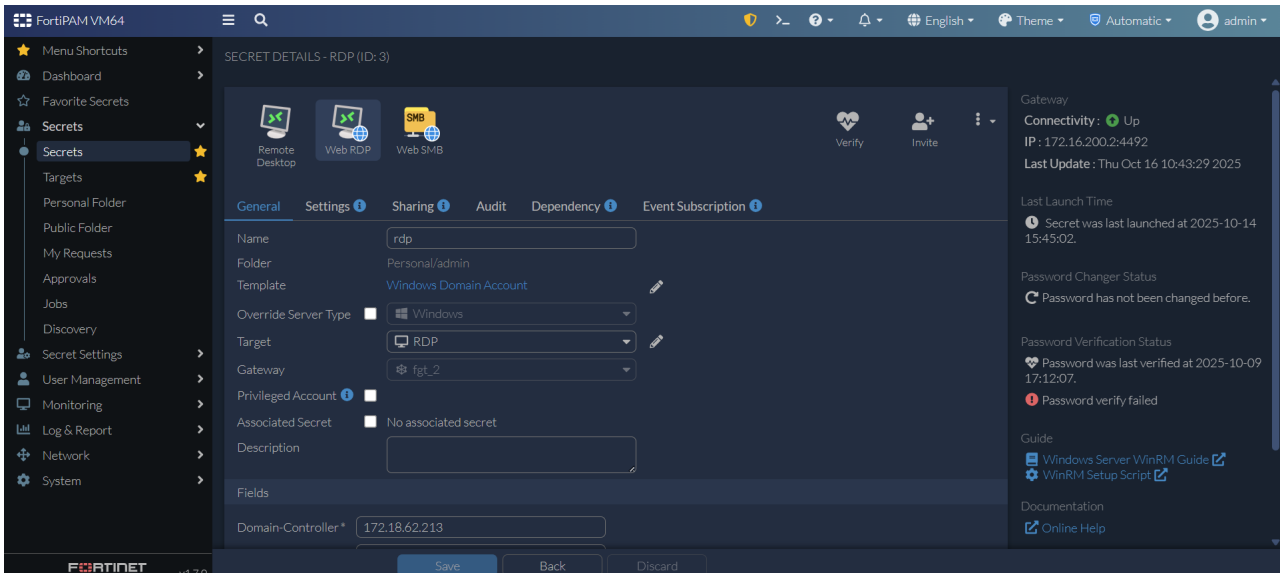
6. Save and view the *Gateway* from the *Gateway List*.



7. Go to *Secrets* > *Targets* and define a *Target* using this *Gateway*. Enter the address of the *Server* as the *Domain-Controller* and select the *Gateway* that was created earlier.



8. Go to *Secrets* > *Secrets* and define a *Secret* using this *Target*.

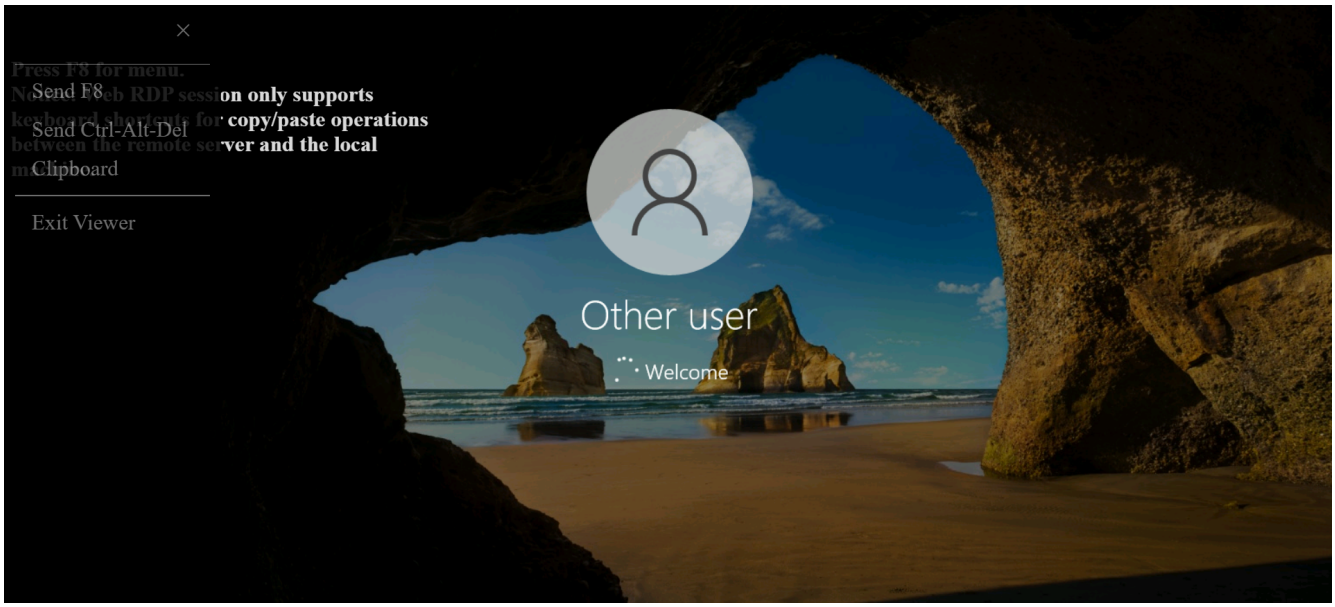


9. Save the settings.

To access the server through RDP:

On the Windows Client, you can login to the FortiPAM as a user, then access a secret from the FortiPAM portal. The client itself will not directly connect to the server itself. In fact, the FortiPAM will not initiate a connection to the server or the ZTNA service connector. It is the FortiGate ZTNA service connector which initiates the control channel and data channel to the FortiPAM to facilicate the communications.

On the client, use the Web RDP button from the FortiPAM GUI to RDP to the server.



ZTNA configuration examples

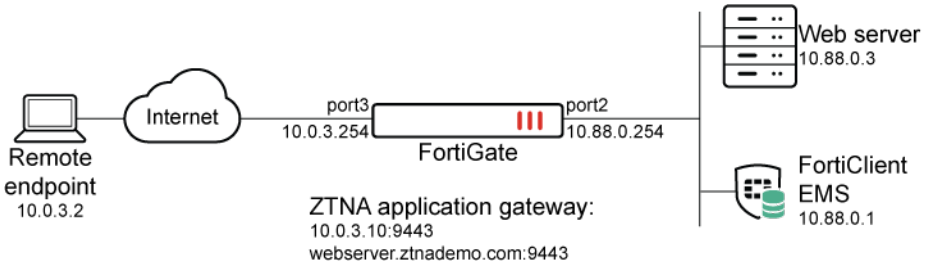
This section includes the following ZTNA configuration examples:

- ZTNA web proxy example on page 1618
- ZTNA web proxy with basic authentication example on page 1633
- ZTNA traffic forwarding proxy example on page 1644
- ZTNA traffic forwarding proxy with FQDN example on page 1655
- ZTNA SSH traffic forwarding proxy example on page 1662
- ZTNA application gateway with SAML authentication example on page 1671
- ZTNA application gateway with SAML and MFA using FortiAuthenticator example on page 1686
- Secure LDAP connection from FortiAuthenticator with zero trust tunnel example on page 1712
- ZTNA IP MAC based access control example on page 1712
- ZTNA IPv6 examples on page 1724
- ZTNA Zero Trust application gateway example on page 1731
- ZTNA SaaS application access control with Inline CASB on page 1731
- ZTNA application gateway with KDC to access shared drives on page 1737
- Custom replacement message for ZTNA virtual hosts on page 1744
- ZTNA single sign-on with Entra ID on page 1747

ZTNA web proxy example

In this example, a web proxy is configured to demonstrate its function as a reverse proxy on behalf of the web server it is protecting. It verifies user identity, device identity, and trust context, before granting access to the

protected source.



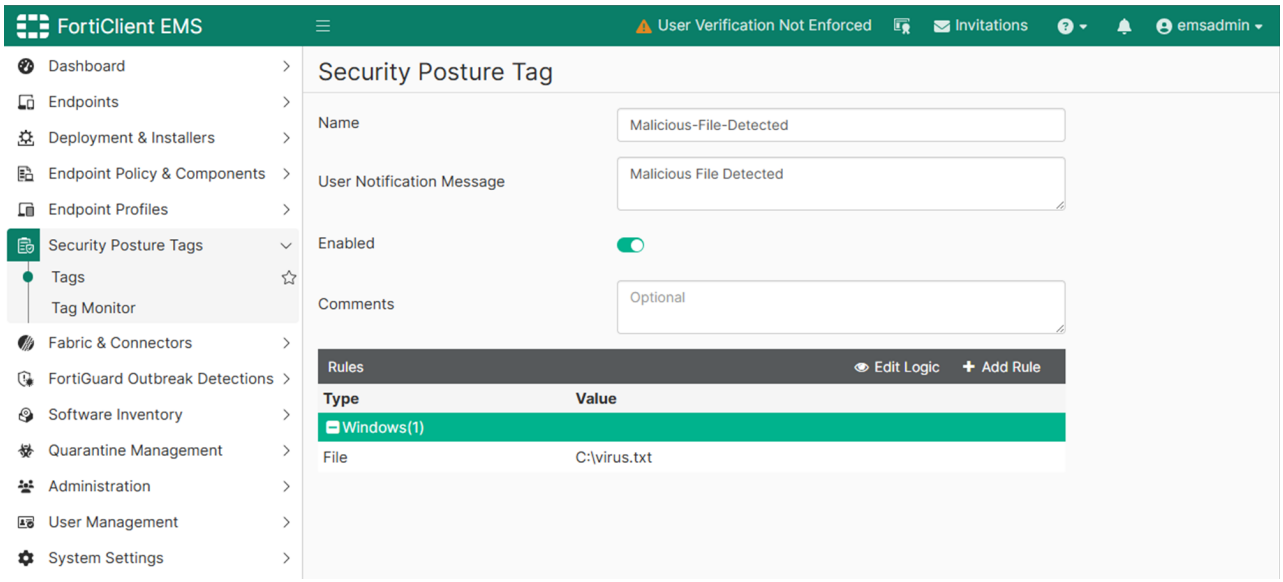
This example shows access control that allows or denies traffic based on security posture tags. Traffic is allowed when the FortiClient endpoint is tagged as *Low Importance* using Classification tags, and denied when the endpoint is tagged with *Malicious-File-Detected*.

This example uses EMS 7.4.5, and assumes that the FortiGate EMS fabric connector is already successfully connected.

> To configure ZTNA in the GUI, go to *System > Feature Visibility* and enable *Zero Trust Network Access*.

To configure a Zero Trust tagging rule on the FortiClient EMS:

1. Log in to the FortiClient EMS.
2. Go to *Security Posture Tags > Tags*, and click *Create*.
3. In the *Name* field, enter *Malicious-File-Detected*.
4. In the *Tag Endpoint As* dropdown list, select *Malicious-File-Detected*.
   EMS uses this tag to dynamically group together endpoints that satisfy the rule, as well as any other rules that are configured to use this tag.
5. Specify a *User Notification Message*, such as *Malicious File Detected*.
6. Click *Add Rule* then configure the rule:
   a. For *OS*, select *Windows*.
   b. From the *Rule Type* dropdown list, select *File*.
   c. Enter a file name, such as *C:\virus.txt*.
   d. Click *Save*.

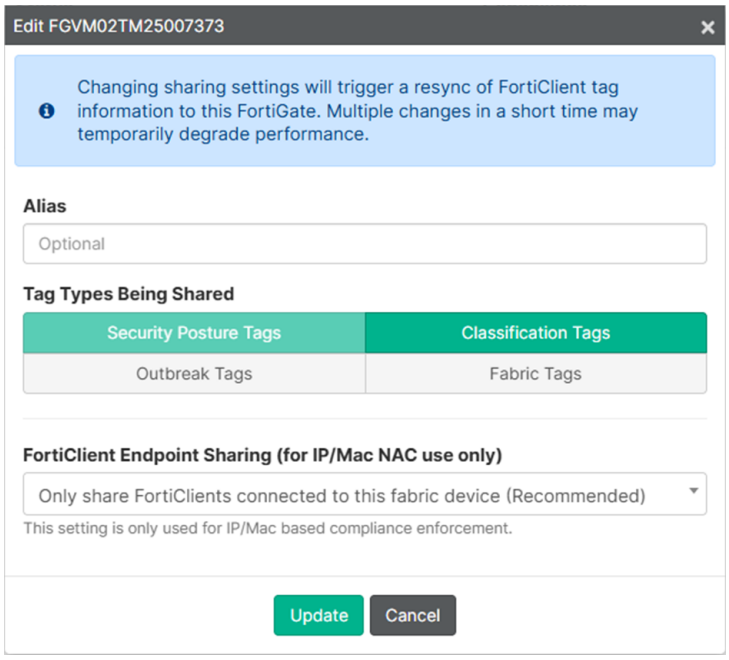


7. Click *Save*.

To configure FortiClient EMS to share classification tags:

This is required for the Low Importance tag to be sent to the FortiGate.

1. Go to *Fabric & Connectors* > *Fabric Devices*.
2. Expand *Standalone devices* and hover over the FortiGate device to select the box with a pencil icon.
3. Click *Edit*.
4. Under *Tag Types Being Shared*, add *Classification Tags*.



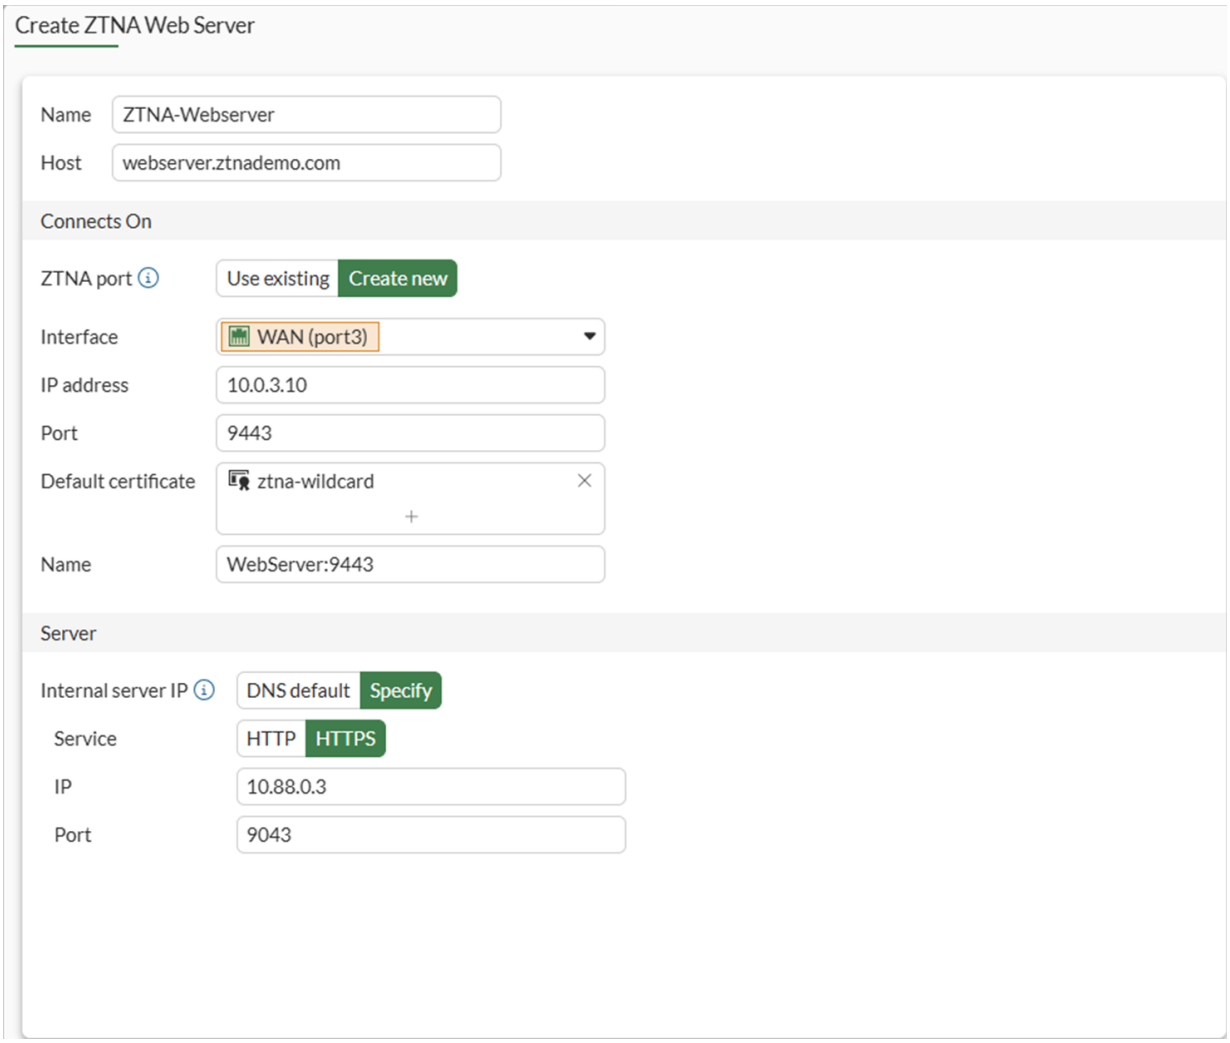
5. Click *Update*.

To configure a ZTNA server for HTTPS access proxy in the FortiGate GUI:

1. Go to *Policy & Objects* > *ZTNA* > *Servers & Portals* > *Web server*.
2. Click *Create New*.
3. Set *Name* to *ZTNA-Webserver*.
4. Set *Host* to the IP address or FQDN that will be used to access the webserver: webserver.ztnademo.com.
5. Under *Connects On*, select *Create new* for ZTNA port to provide the following details:
   a. Set *Interface* to *port3*.
   b. Set *External IP* to *10.0.3.10*.
   c. Set *External port* to *9443*.

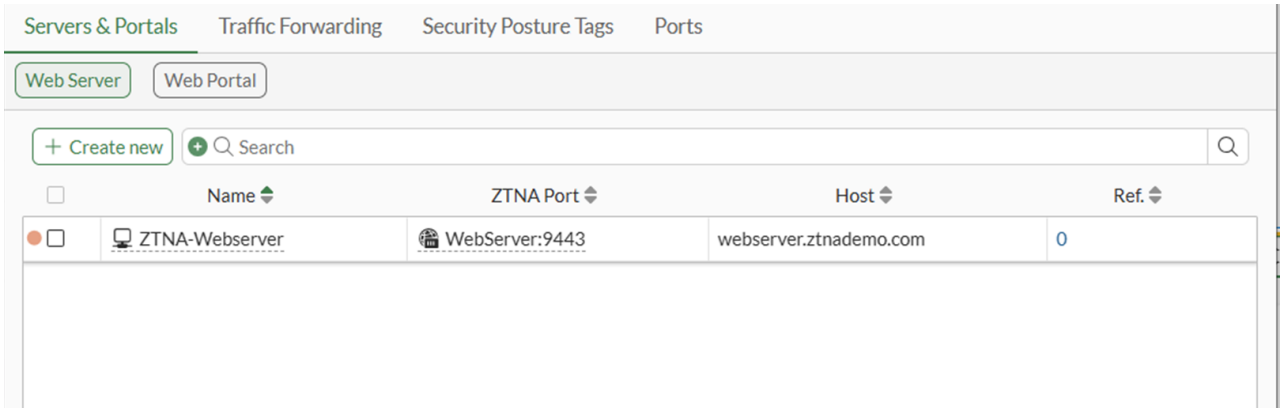
   Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.
6. Select a certificate. Clients will be presented with this certificate when they connect to the ZTNA port.

   This example uses a wildcard certificate with a Common Name (CN): *.ztnademo.com. This certificate is trusted by the endpoints which will access the ZTNA port.
7. Enter a name for the ZTNA port, such as *WebServer:9443*.
8. In the *Server* section, configure the internal server settings:
   a. Switch the *Internal server IP* to *Specify*.
   b. Set *Service* to *HTTPS*.
   c. Set *IP* to the internal IP for the web server: *10.88.0.3*.
   d. Set *Port* to *9043*.



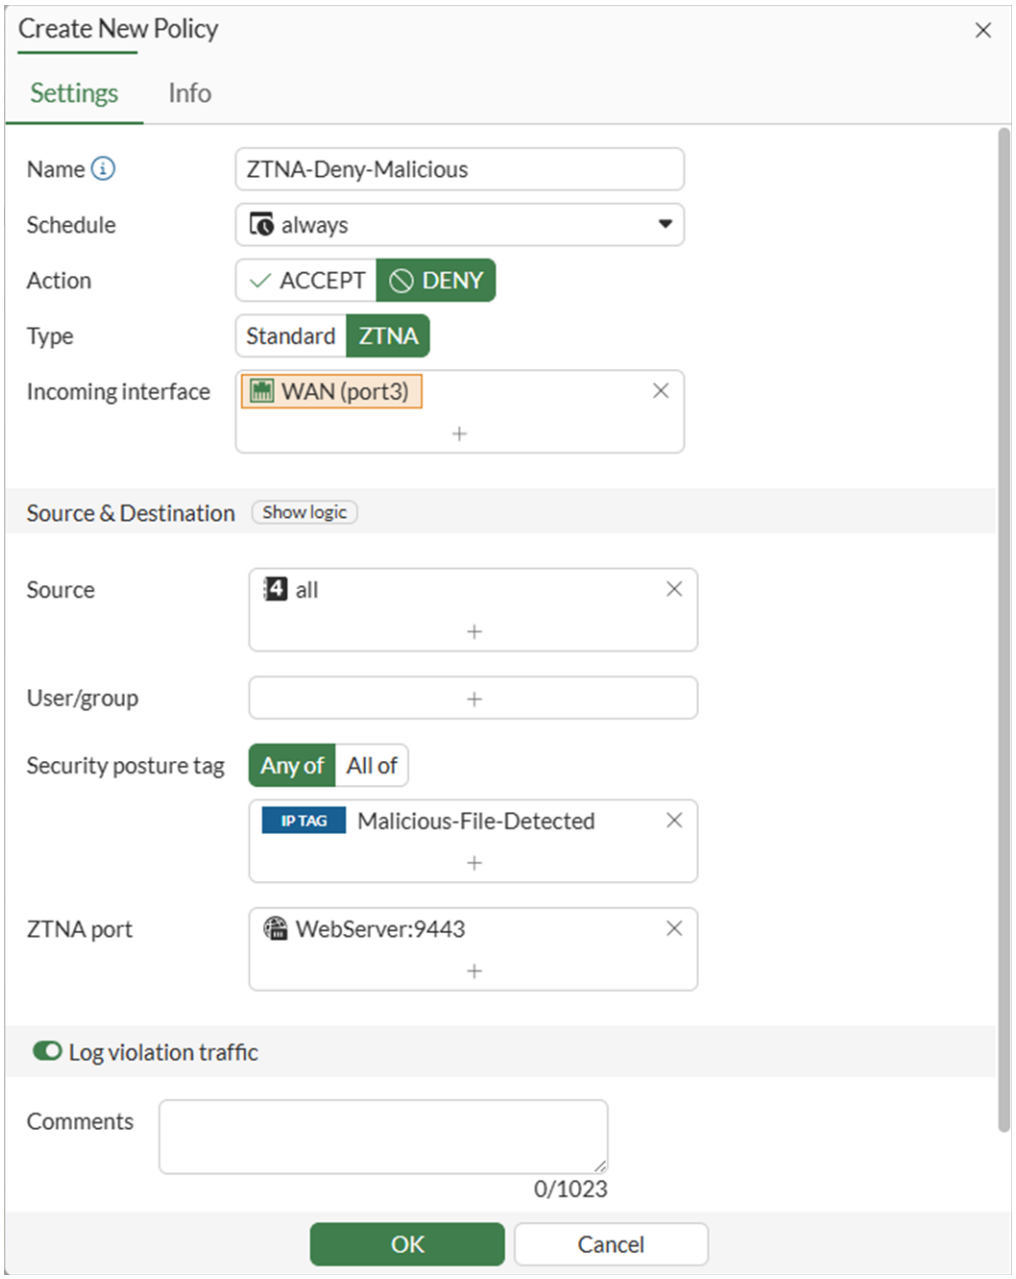
The WebServer service is running on port 9043. This configuration will translate clients accessing TCP/9443 to TCP/9043.

9. Click *OK*. The Web server object is listed.



To configure simple ZTNA policies to allow and deny traffic based on security posture tags in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Create a rule to deny traffic:
   a. Click *Create New*.
   b. Set *Name* to *ZTNA-Deny-Malicious*.
   c. Set *Action* to *DENY*.
   d. Set *Type* to *ZTNA*.
   e. Set *Incoming Interface* to *port3*.
   f. Set *Source* to *all*.
   g. Keep the default of Any of, and add the security posture tag *IP Malicious-File-Detected*.
   This tag is dynamically retrieved from EMS when you first created the Zero Trust Tagging Rule.
   h. Set *ZTNA port* to the *WebServer:9443* port created earlier.
   i. Enable *Log Violation Traffic*.



j. Click *OK*.

3. Create a rule to allow traffic:
   a. Click *Create New*.
   b. Set *Name* to *ZTNA-Allow-Simple*.
   c. Set *Type* to *ZTNA*.
   d. Set *Incoming Interface* to *port3*.
   e. Set *Source* to *all*. This can also be set to specific IP addresses to only allow those addresses to connect to this HTTPS access proxy.
   f. Keep the default of *Any of*, and add the class tag IP Low.
   g. Select the *ZTNA port WebServer:9443*.

h. Configure the remaining options as needed.
i. Click *OK*.

4. On the firewall policy list, make sure that the deny rule (*ZTNA-Deny-Malicious*) is above the allow rule (*ZTNA-Allow-Simple*).

To configure HTTPS access in the CLI:

1. Configure the access proxy VIP:

```
config firewall vip
    edit "WebServer:9443"
        set type access-proxy
        set server-type https
        set extip 10.0.3.10
        set extintf "port3"
        set extport 9443
        set ssl-certificate "ztna-wildcard"
    next
end
```

2. Configure the virtual host:

```
config firewall access-proxy-virtual-host
    edit "WebServer9443"
        set ssl-certificate “ztna-wildcard”
        set host “webserver.ztnademo.com”
    next
end
```

3. Configure the web proxy:

```
config ztna web-proxy
    edit "ZTNA-Webserver"
        set vip "Webserver:9443"
        set host WebServer9443
        config api-gateway
            edit 1
                config realservers
                    edit 1
                        set ip 10.88.0.3
                        set port 9043
                    next
                end
            next
        end
    next
end
```

4. Configure ZTNA policies:

```
config firewall policy
    edit 1
        set name "ZTNA-Deny-Malicious"
        set srcintf "port3"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "WebServer:9443"
        set ztna-ems-tag "EMS1_ZTNA_Malicious-File-Detected"
        set schedule "always"
        set logtraffic all
    next
    edit 2
        set name "ZTNA-Allow-Simple"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "WebServer:9443"
        set ztna-ems-tag "EMS1_CLASS_Low"
        set schedule "always"
        set logtraffic all
    next
end
```

Testing the remote access to the HTTPS access proxy

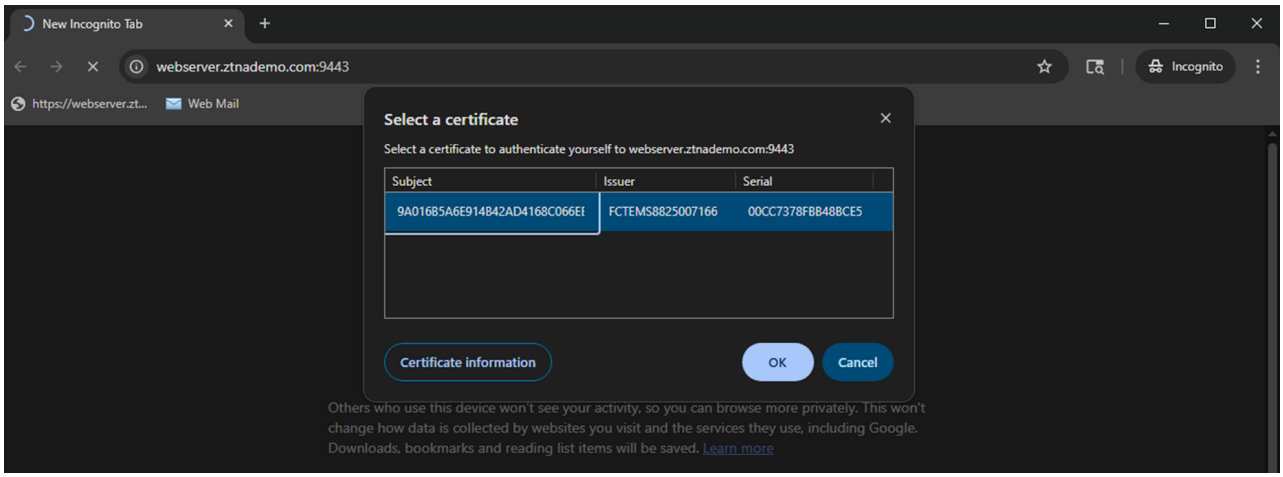
After FortiClient EMS and FortiGate are configured, the HTTPS access proxy remote connection can be tested.

Access allowed:

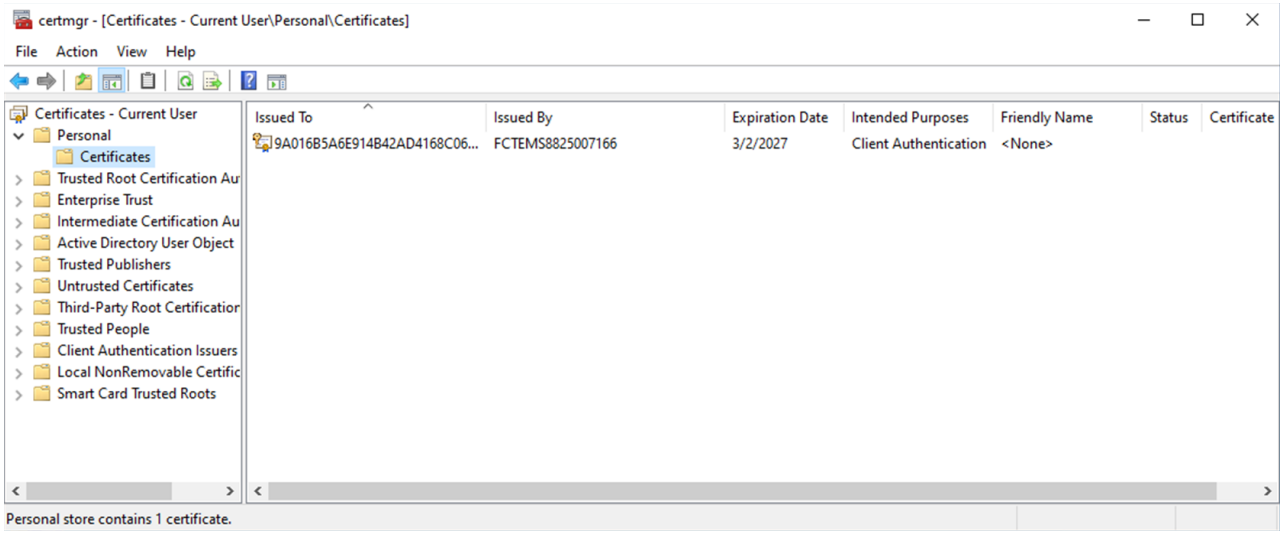
1. On the remote Windows PC, open FortiClient.
2. On the *Zero Trust Telemetry* tab, make sure that you are connected to the EMS server.

   It is not necessary to configure a *ZTNA Destination* on FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

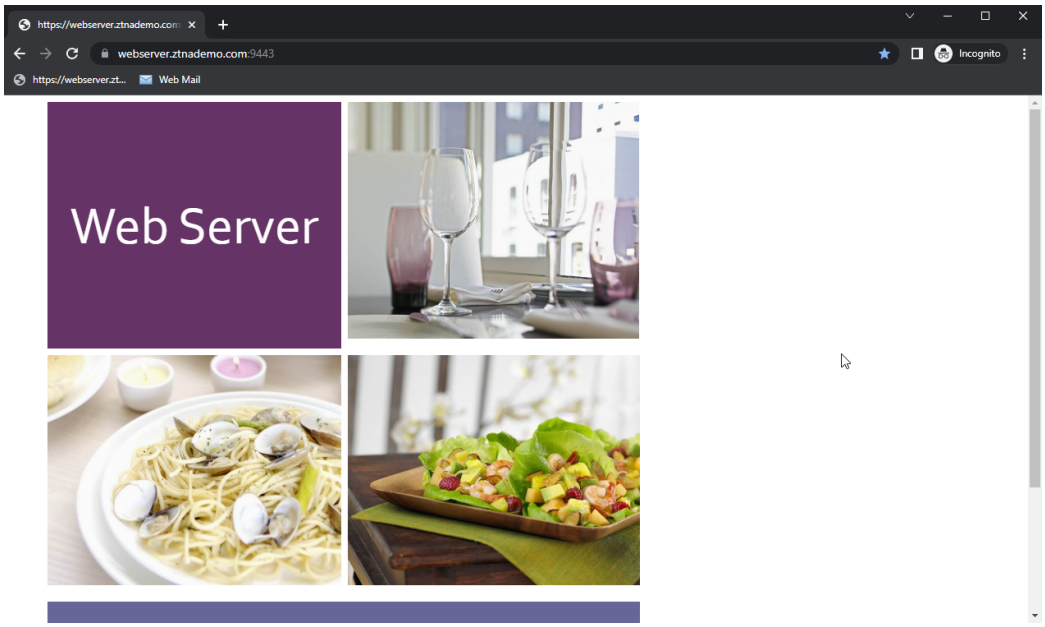
3. Open a browser and enter the address of the server and the access port. When entering the FQDN, make sure that the DNS can resolve the address to the IP address of the FortiGate. In this example, webserver.ztnademo.com resolves to 10.0.3.10.
4. The browser prompts for the client certificate to use. Select the EMS signed certificate, then click *OK*.



The certificate is in the *User Configuration* store, under *Personal* > *Certificates*. The details show the SN of the certificate, which matches the record on the FortiClient EMS and the FortiGate.

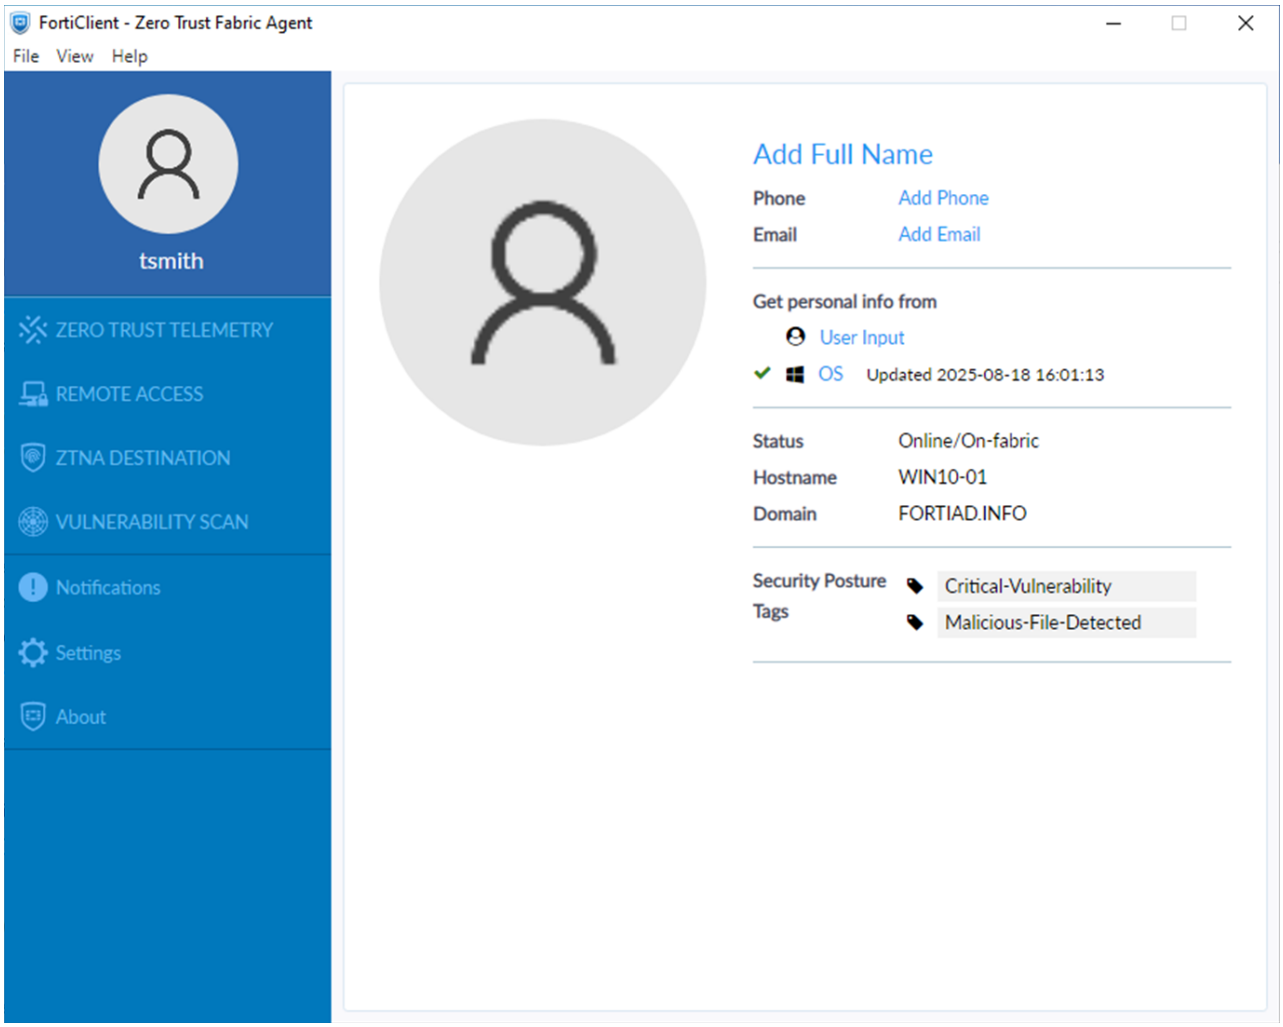


5. The client is verified by the FortiGate to authenticate your identity.
6. The FortiGate matches your security posture by verifying your security posture tag and/or classification tag. The matching ZTNA rule allows access to the web server.

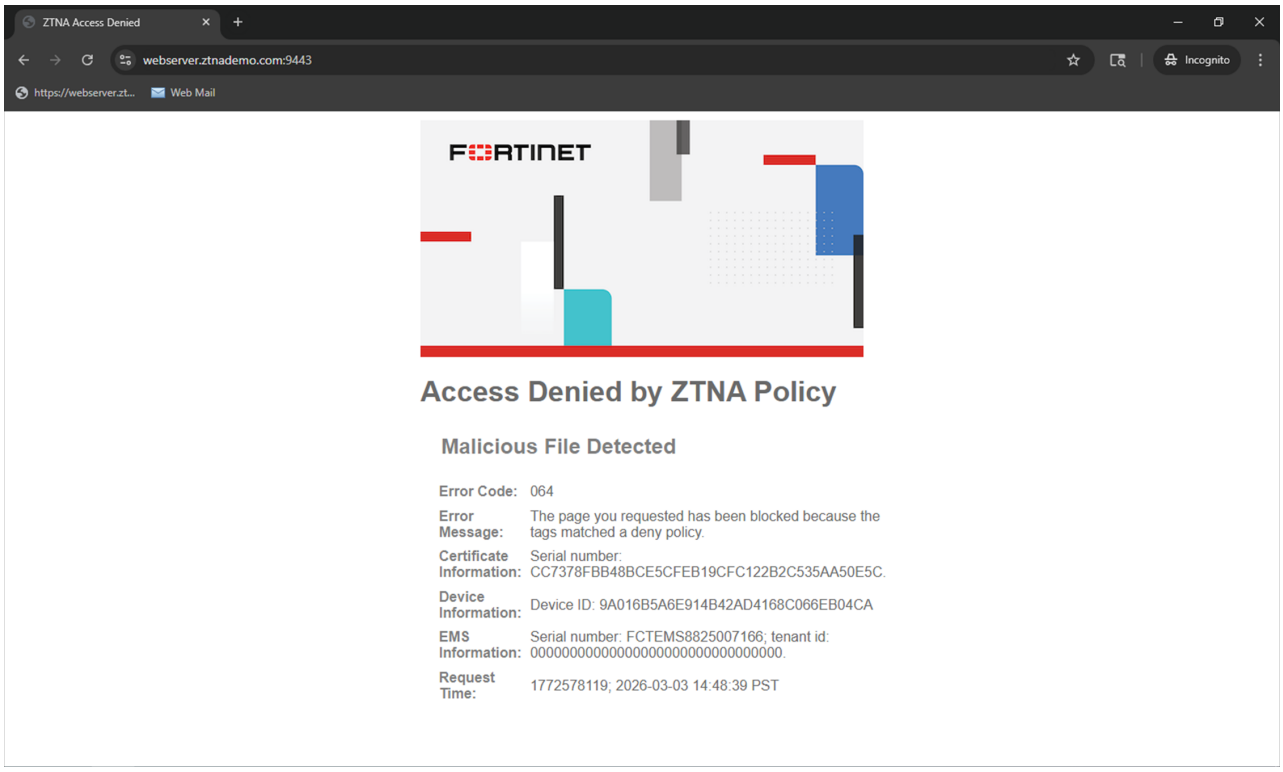


Access denied:

1. On the remote Windows PC, trigger the Zero Trust Tagging Rule by creating the file in C:\virus.txt.
2. Verify that FortiClient has received the *Malicious-File-Detected* tag by opening FortiClient and clicking the portrait in the top left.



3. Open a browser and enter the address http://webserver.ztnademo.com:9443.
4. The client is verified by the FortiGate to authenticate your identity.
5. FortiGate checks your security posture. Because EMS has tagged the PC with the *Malicious-File-Detected* tag, it matches the *ZTNA-Deny-malicious* rule.
6. You are denied access to the web server.



Logs and debugs

Access allowed:

```
# diagnose endpoint ec-shm list

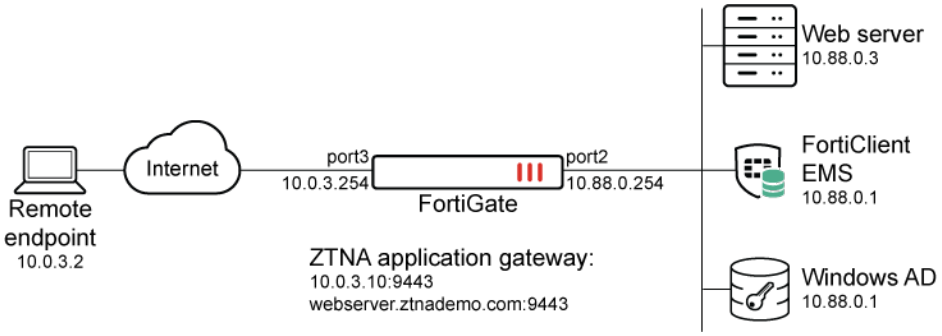
ZTNA web proxy with basic authentication example

This example expands on the previous example (ZTNA web proxy example on page 1618), adding LDAP authentication to the ZTNA rule. Users are allowed based on passing the client certificate authentication check, user authentication, and security posture check.

Users that are in the AD security group *ALLOWED-VPN* are allowed access to the access proxy. Users that are not part of this security group are not allowed access.



This example assumes that the FortiGate EMS fabric connector is already successfully connected.

LDAP/Active Directory Users and Groups:

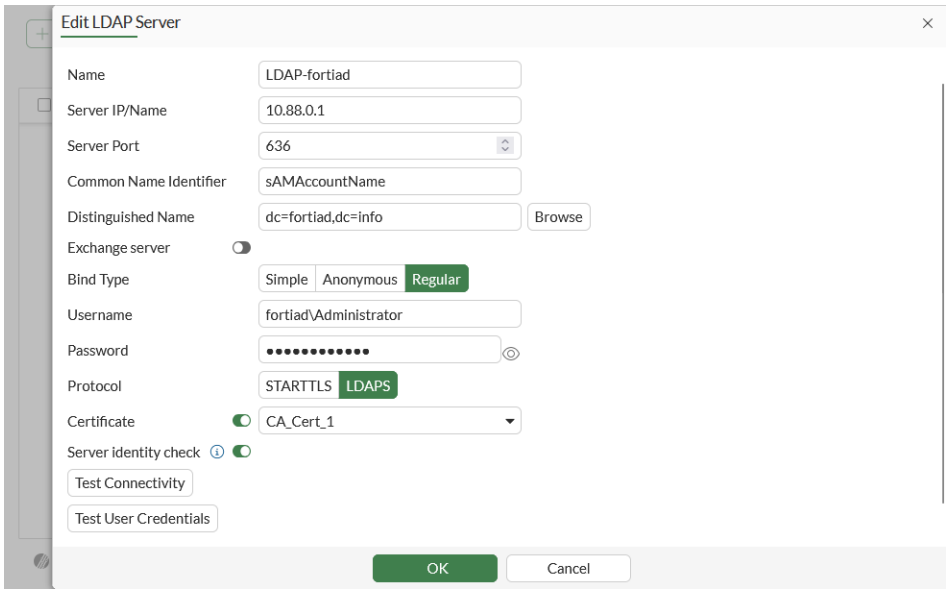
- Domain: fortiad.info
- Users (Groups):
  - tsmith (Domain Users, Remote-Allowed)
  - lhansen (Domain Users)

To configure a secure connection to the LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers* and click *Create New*.
2. Configure the following settings:

Name	LDAP-fortiad

Server IP/Name	10.88.0.1
Server Port	636
Common Name Identifier	sAMAccountName
Distinguished Name	dc=fortiad,dc=info
Exchange server	Disabled
Bind Type	Regular Enter the *Username* and *Password* for LDAP binding and lookup.
Protocol	LDAPS
Certificate	Enable and select the CA certificate to validate the server certificate.
Server identity check	Optionally, enable to verify the domain name or IP address against the server certificate.



3. Click *Test Connectivity* to verify the connection to the server.
4. Click *OK*.

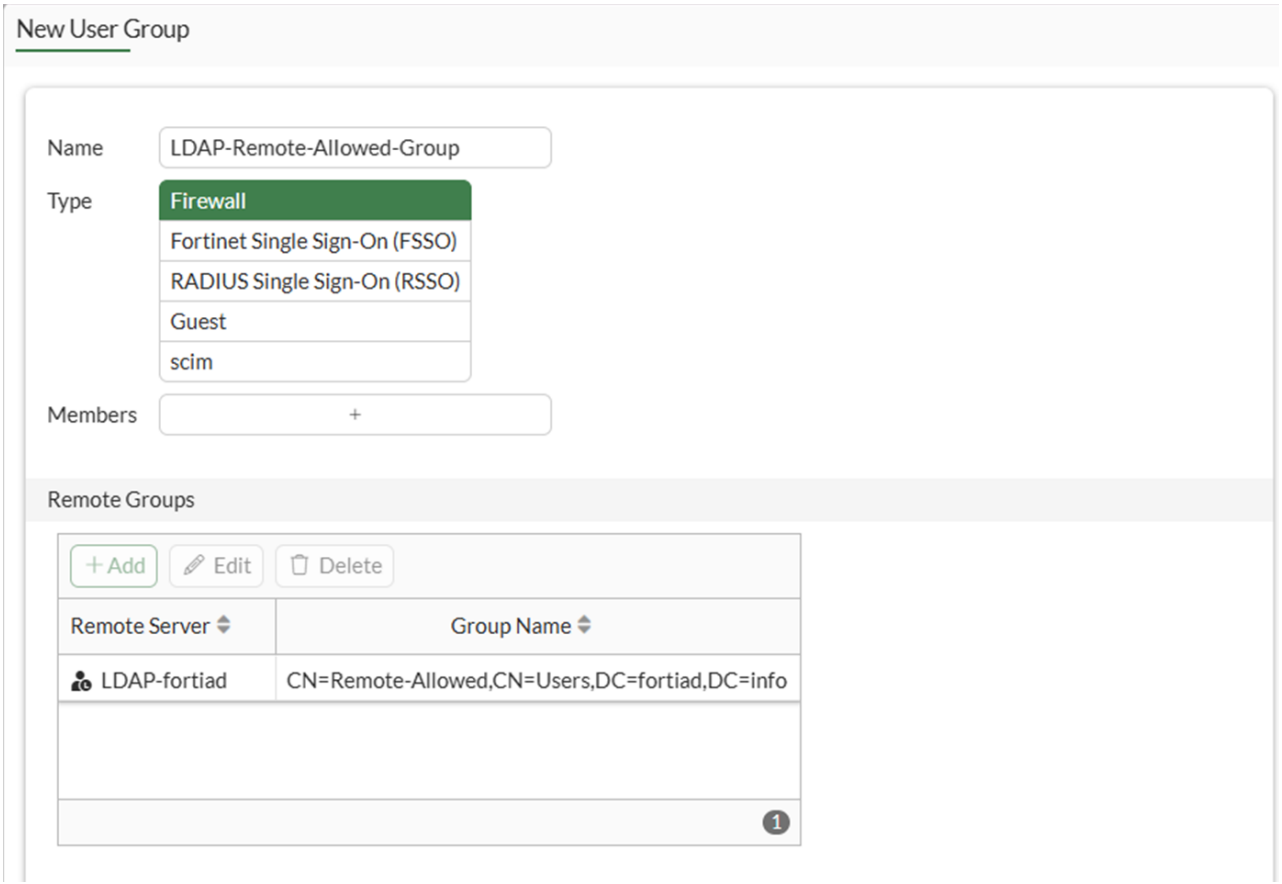
To configure a secure connection to the LDAP server in the CLI:

```
config user ldap
    edit "LDAP-fortiad"
        set server "10.88.0.1"
        set cnid "sAMAccountName"
        set dn "dc=fortiad,dc=info"
        set type regular
        set username "fortiad\\Administrator"
        set password <password>
        set secure ldaps
        set ca-cert "CA_Cert_1"
        set port 636
```

```
    next
end
```

To configure a remote user group from the LDAP server in the GUI:

1. Go to *User & Authentication* > *User Groups* and click *Create New*.
2. Set the name to *LDAP-Remote-Allowed-Group*.
3. Set *Type* to *Firewall*.
4. In the *Remote Groups* table click *Add*:
   a. Set *Remote Server* to *LDAP-fortiad*.
   b. Locate the *Remote-Allowed* group, right-click on it, and click *Add Selected*.
   c. Click *OK*.



5. Click *OK*.

To configure a remote user group from the LDAP server in the CLI:

```
config user group
    edit "LDAP-Remote-Allowed-Group"
        set member "LDAP-fortiad"
        config match
            edit 1
                set server-name "LDAP-fortiad"
```

```
                set group-name "CN=Remote-Allowed,CN=Users,DC=fortiad,DC=info"
            next
        end
    next
end
```

Authentication scheme and rules

After the LDAP server and user group have been configured, an authentication scheme and rule must be configured.

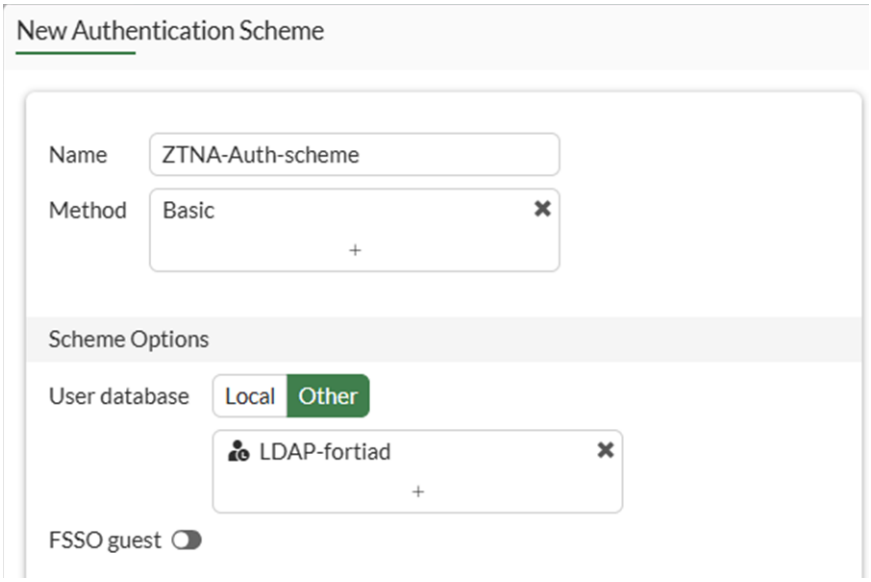
To configure authentication schemes and rules in the GUI, go to *System > Feature Visibility* and enable *Explicit Proxy*.

Authentication scheme

The authentication scheme defines the method of authentication that is applied. In this example, basic HTTP authentication is used so that users are prompted for a username and password the first time that they connect to a website through the HTTPS access proxy.

To configure an authentication scheme in the GUI:

1. Go to *Policy & Objects > Authentication* and select the *Authentication Schemes* tab.
2. Click *Create New*.
3. Set the name to *ZTNA-Auth-scheme*.
4. Set *Method* to *Basic*.
5. Set *User database* to *Other* and select *LDAP-fortiad* as the LDAP server.



6. Click *OK*.

To configure an authentication scheme in the CLI:

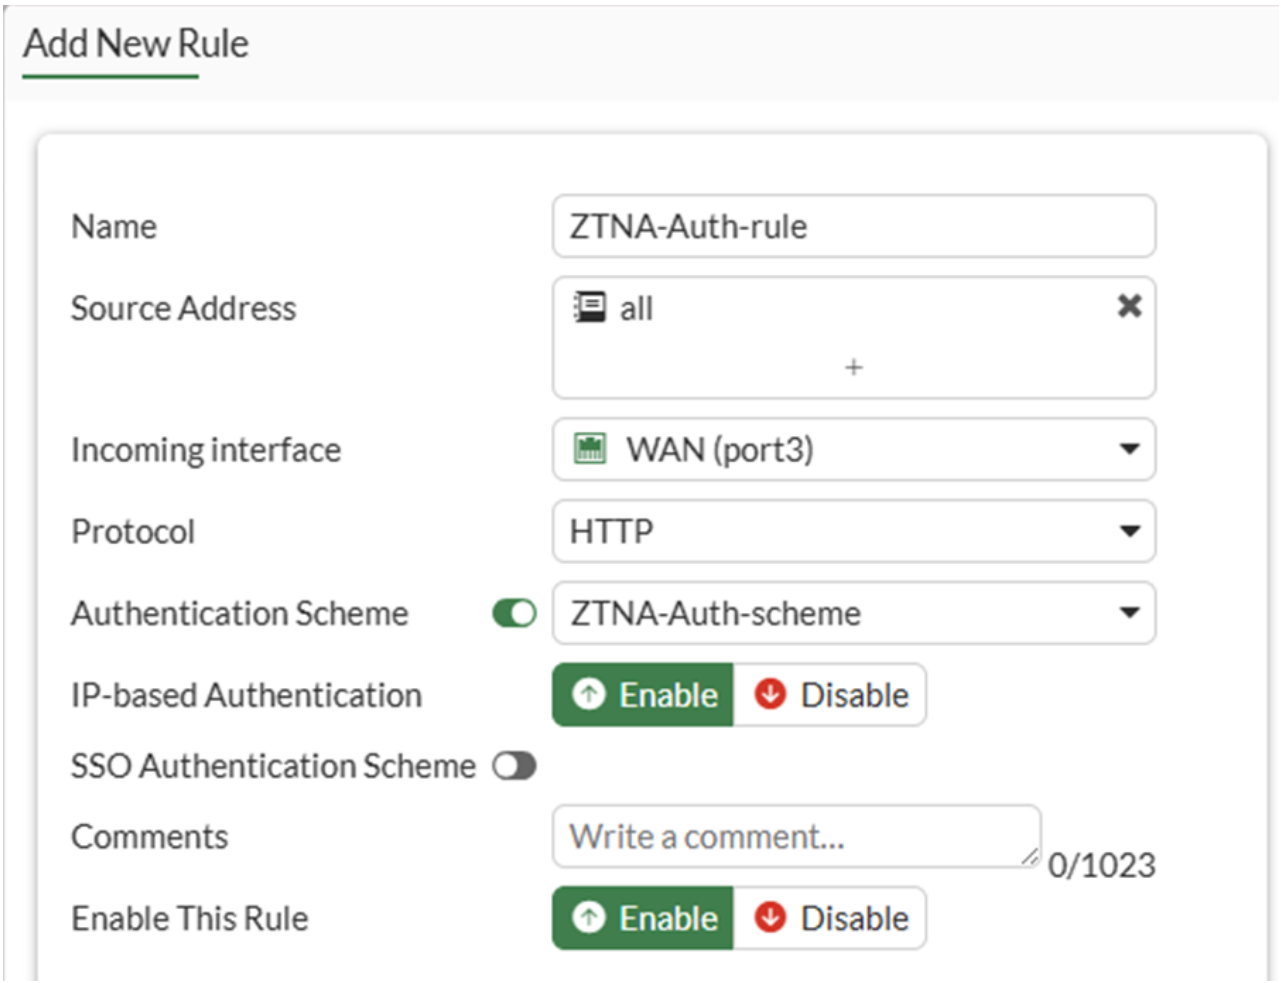
```
config authentication scheme
    edit "ZTNA-Auth-scheme"
        set method basic
        set user-database "LDAP-fortiad"
    next
end
```

Authentication rule

The authentication rule defines the proxy sources and destination that require authentication, and what authentication scheme is applied. In this example, active authentication through the basic HTTP prompt is used and applied to all sources.

To configure an authentication rule in the GUI:

1. Go to *Policy & Objects* > *Authentication* > *Authentication Rules* and click *Create New*.
2. Set the name to *ZTNA-Auth-rule*.
3. Set *Source Address* to *all*.
4. Set *Incoming interface* to *port3*.
5. Set *Protocol* to *HTTP*.
6. Enable *Authentication Scheme* and select *ZTNA-Auth-scheme*.



7. Click *OK*.

To configure an authentication rule in the CLI:

```
config authentication rule
    edit "ZTNA-Auth-rule"
        set srcintf "port3"
        set srcaddr "all"
        set active-auth-method "ZTNA-Auth-scheme"
    next
end
```

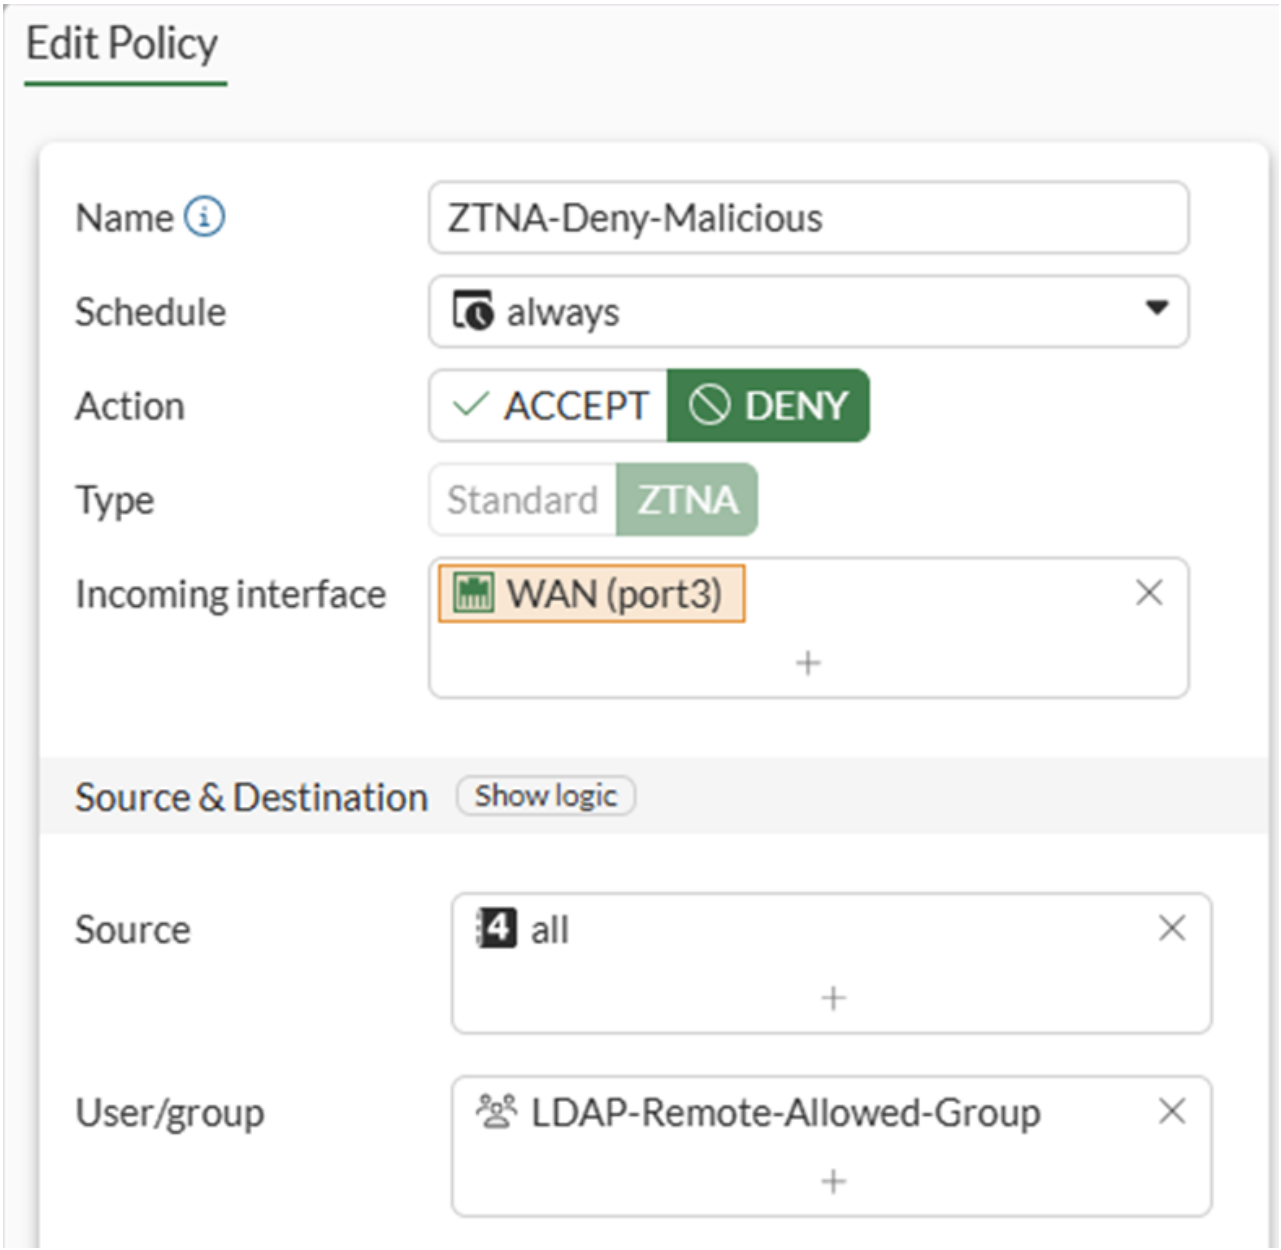
Applying the user group to a ZTNA policy

A user or user group must be applied to the ZTNA policy that you need to control user access to. The authenticated user from the authentication scheme and rule must match the user or user group in the ZTNA policy.

In this example, the user group is applied to the two simple ZTNA policies that were configured in ZTNA web proxy example on page 1618.

To apply a user group to the simple ZTNA policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit the *ZTNA-Deny-Malicious* rule.
3. In the *Source & Destination* section, set *User/group* to *LDAP-Remote-Allowed-Group*.
4. Click *OK*.
5. Edit the *ZTNA-Allow-Simple* rule.
6. In the *Source & Destination* section, set *User/group* to *LDAP-Remote-Allowed-Group*.



7. Click *OK*.

To apply a user group to the simple ZTNA policies in the CLI:

```
config firewall policy
     edit 1
        set name "ZTNA-Deny-Malicious"
        set srcintf "port3"
        set dstintf "any"
        set srcaddr "all"
        set dstaddr "WebServer:9443"
        set ztna-ems-tag "EMS1_ZTNA_Malicious-File-Detected"
        set schedule "always"
        set logtraffic all
        set groups "LDAP-Remote-Allowed-Group"
    next
    edit 2
        set name "ZTNA-Allow-Simple"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "WebServer:9443"
        set ztna-ems-tag "EMS1_CLASS_Low"
        set schedule "always"
        set logtraffic all
        set groups "LDAP-Remote-Allowed-Group"
    next
end
```

For configuration examples using full ZTNA policy, see Configure a ZTNA policy on page 1554.

Testing remote access to the HTTPS access proxy with user authentication

Scenario 1: access allowed - user tsmith

1. On a remote Windows PC, open the FortiClient app, select the *Zero Trust Telemetry* tab, and confirm that you are connected to the EMS server.

   It is not necessary to configure a *ZTNA Destination* on the FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

2. In a browser, enter the address of the server and the access port.

   If entering an FQDN, make sure that DNS can resolve the address to the IP address of the FortiGate. In this example, *webserver.ztnademo.com* resolves to 10.0.3.10.
3. When the browser asks for the client certificate to use, select the EMS signed certificate, then click *OK*.

   The client certificate is verified by the FortiGate to authenticate your identity.
4. When prompted, enter the username *tsmith* and the password, and click *Sign in*.

As *tsmith* is a member of the *Remote-Allowed-Group* group in Active Directory, it will match the *LDAP-Remote-Allowed-Group* user group. After the user authentication passes, the FortiGate performs a posture check on the ZTNA group. When that passes, you are allowed access to the website.

To verify the results:

```
#  diagnose firewall auth list

 10.0.3.2, tsmith
        type: fw, id: 0, duration: 31, idled: 13
        expire: 287, allow-idle: 300
        packets: in 8 out 7, bytes: in 1164 out 1080
        group_id: 4 3
        group_name: LDAP-Administrator LDAP-Remote-Allowed-Group

----- 1 listed, 0 filtered ------
```

```
# diagnose test app fcnacd 7
#ID:0
UID:     9A016B5A6E914B42AD4168C066EB04CA
EMS:     FCTEMS8825007166 00000000000000000000000000000000
State:   sysinfo:1, tag:1, tagsz:1, out-of-sync:0, ref:1
Owner:   @fortiad.info

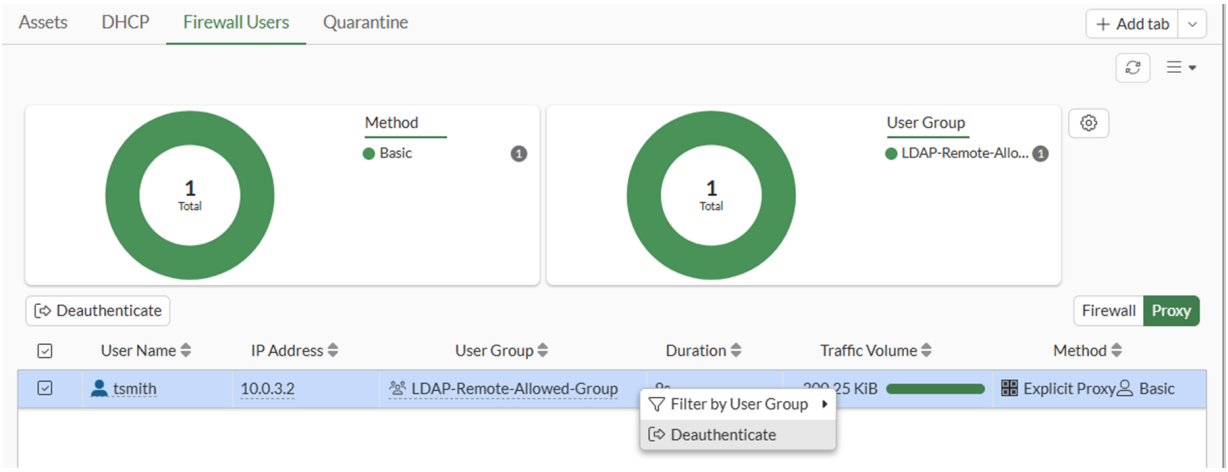
715130a1a107" policyname="ZTNA-Allow-Simple" appcat="unscanned" duration=131 user="tsmith"
group="LDAP-Remote-Allowed-Group" authserver="LDAP-fortiad" gatewayid=1 realserverid=1
vip="WebServer:9443" vipincomingip=10.0.3.10 accessproxy="ZTNA-Webserver"
clientdeviceid="9A016B5A6E914B42AD4168C066EB04CA" clientdevicemanageable="manageable"
clientdeviceems="FCTEMS8825007166" clientdevicetags="CLASS_Low/all_registered_clients"
clientcert="yes" emsconnection="online" wanin=303009 rcvdbyte=303009 wanout=4469 lanin=4247
sentbyte=4247 lanout=340700 fctuid="9A016B5A6E914B42AD4168C066EB04CA"
```

Scenario 2: access denied – user lhansen

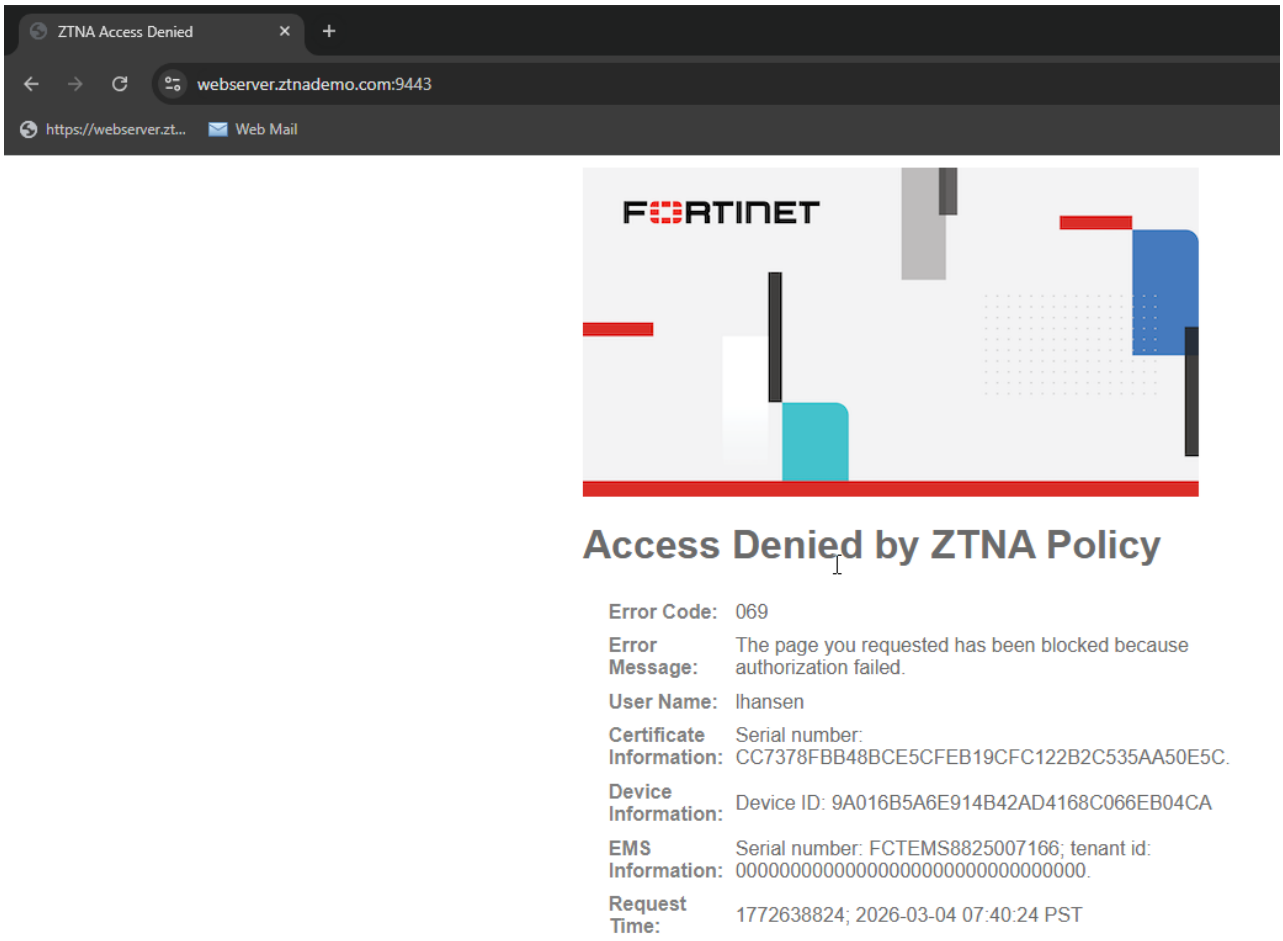
1. If scenario 1 has just been tested, log in to the FortiGate and deauthenticate the user:
   a. Go to *Dashboard* > *Assets & Identities* > *Firewall Users* and select the *Proxy* table.
   b. Right-click on the user *tsmith* and select deauthenticate.



2. On a remote Windows PC, open the FortiClient app, select the *Zero Trust Telemetry* tab, and confirm that you are connected to the EMS server.
3. In a browser, enter the address *webserver.ztnademo.com*.
4. When the browser asks for the client certificate to use, select the EMS signed certificate, then click *OK*. This option might not appear if you have already selected the certificate when testing scenario 1.

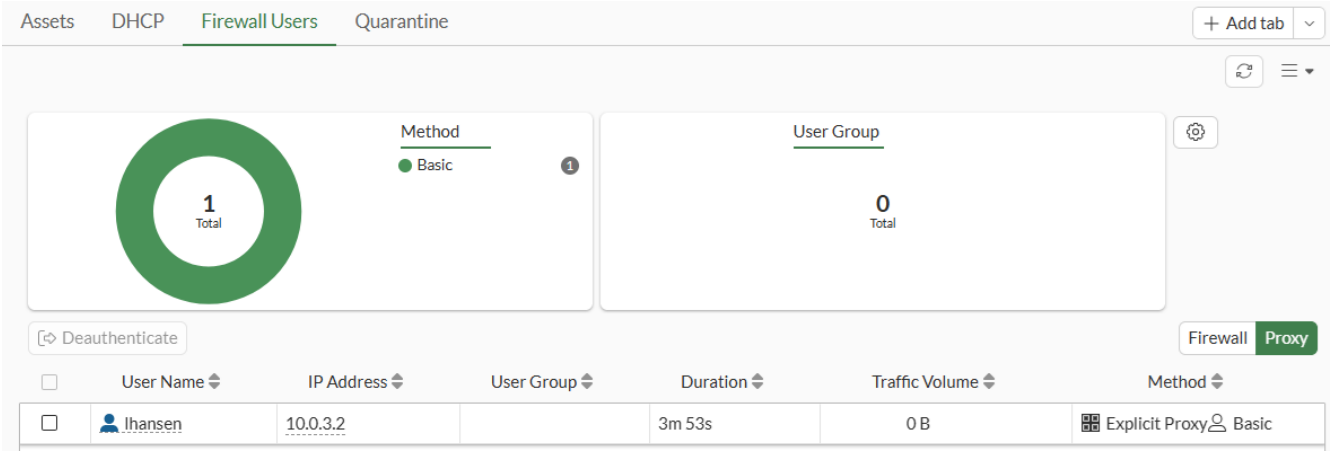
   The client certificate is verified by the FortiGate to authenticate your identity.
5. When prompted, enter the username *lhansen* and the password, and click *Sign in*.

   As *lhansen* is not a member of the *Remote-Allowed* group in Active Directory, it will not match the *LDAP-Remote-Allowed-Group* user group. Because no other policies are matched, this user is implicitly denied



To verify the results:

Go to *Dashboard* > *Assets & Identities* > *Firewall Users* and select the *Proxy* table. Confirm that user *lhansen* is listed, but no applicable user group is returned.



```
# execute log display

1: date=2026-03-04 time=07:41:25 eventtime=1772638885574732337 tz="-0800" logid="0005000024"

```

ZTNA traffic forwarding proxy example

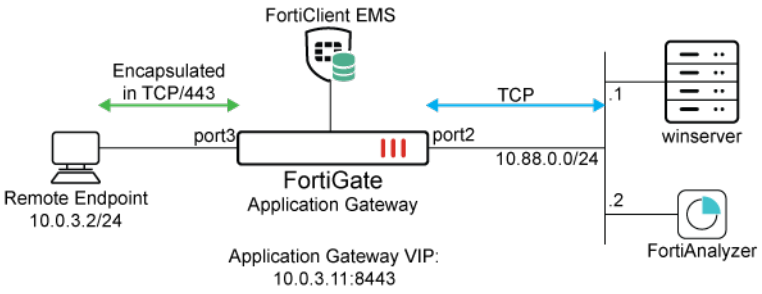
In this example, a traffic forwarding proxy (TFP) is configured to demonstrate an HTTPS reverse proxy that forwards TCP traffic to the designated resource. The access proxy tunnels TCP traffic between the client and the FortiGate over HTTPS, and forwards the TCP traffic to the protected resource. It verifies user identity, device identity, and trust context, before granting access to the protected source.

The TFP supports communication between the client and the access proxy without SSL/TLS encryption. The connection still begins with a TLS handshake. The client uses the HTTP 101 response to switch protocols and remove the HTTPS stack. Further end to end communication between the client and server are encapsulated in the specified TCP port, but not encrypted by the access proxy. This improves performance by reducing the overhead of encrypting an already secured underlying protocol, such as RDP, SSH, or FTPS. Users should still enable the encryption option for end to end protocols that are insecure.

In this example, RDP (Remote Desktop Protocol) and SMB (Server Message Block) protocol access are configured to one server, and SSH access to the other server. Encryption is disabled for RDP and SSH, and enabled for SMB.

FortiClient (Windows) must be running 7.0.3 or later to detect SMB.

You cannot use ZTNA connection rules and TCP forwarding on a Windows 7 endpoint.



This example assumes that the FortiGate EMS fabric connector is already successfully connected.

To configure the ZTNA server for TFP in the GUI:

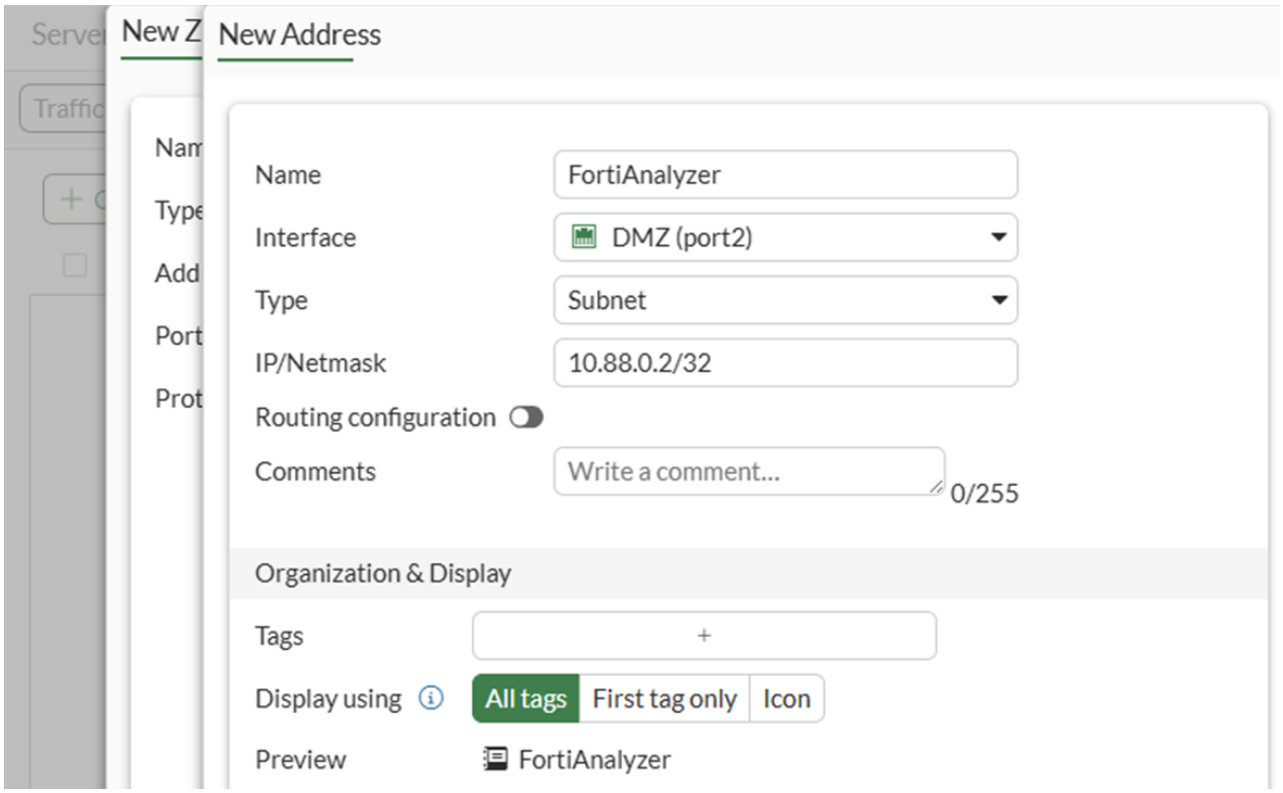
1. Go to *Policy & Objects* > *ZTNA* > *Traffic Forwarding* > *Traffic Forwarding Server*.
2. Click *Create new*.
3. Set *Name* to *ZTNA-tcp-server*.
4. Set *Host* to *10.0.3.11*.
5. Set *ZTNA port* to *Create new* and configure the port:

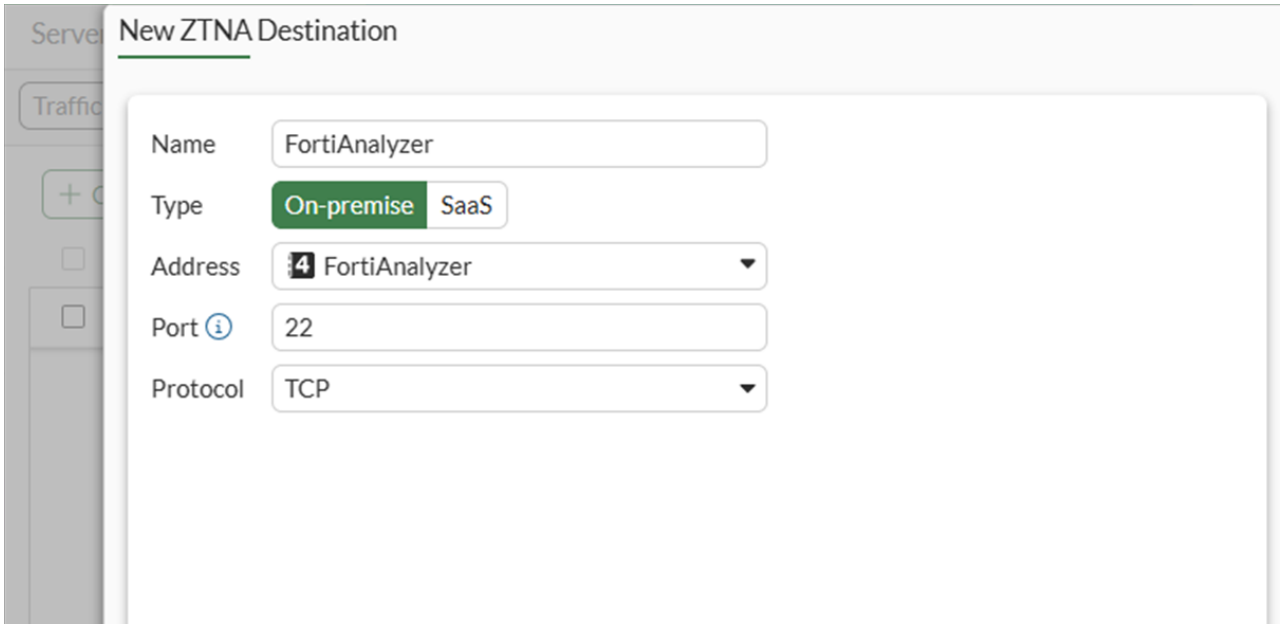
Option	Value
Interface	port3
IP address	10.0.3.11
Port	8443
Default certificate	This example uses a wildcard certificate with a Common Name (CN): *.ztnademo.com. This certificate is trusted by the endpoints which will access the ZTNA port.
Name	TCPserver:8443

Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.

6. Click *OK* to save the traffic forwarding server.
7. Select the *Destination* view to define a destination.
8. Click *Create new*.
9. Configure the ZTNA destination:

Option	Value
Name	FortiAnalyzer
Type	On-premise
Address	Use the dropdown and then the + button to define a new address object with: 10.88.0.2/32.
Port	22
Protocol	TCP

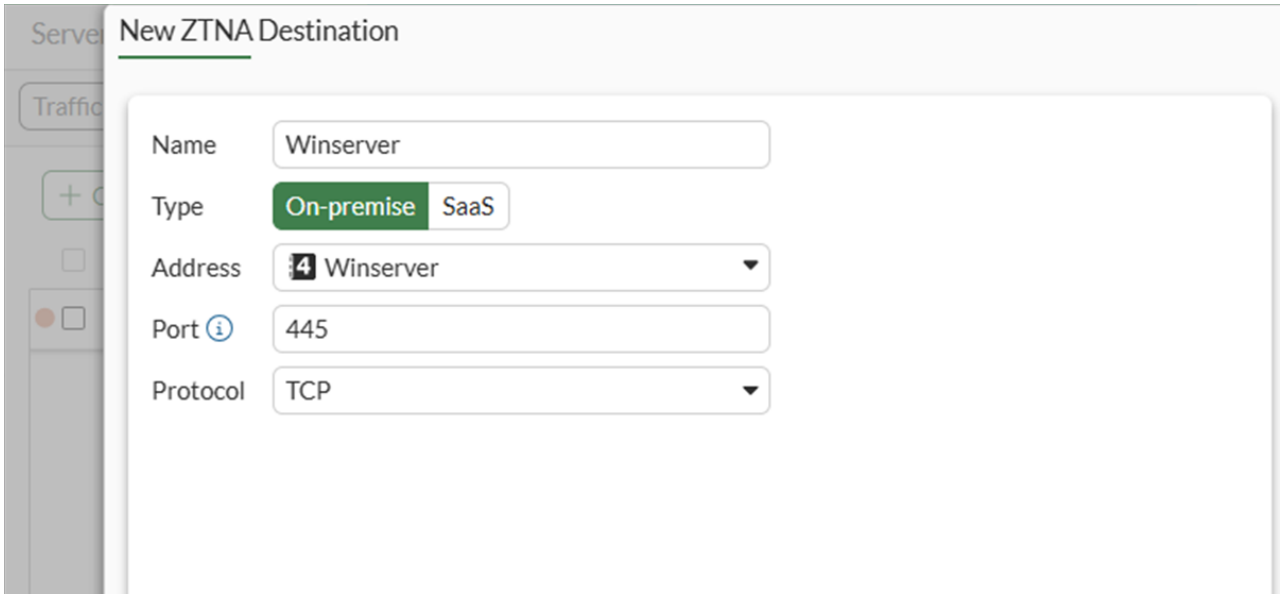




10. Click *OK* to save the ZTNA destination.
11. Click *Create New* again to define a second destination for the winserver server at 10.88.0.1 with ports 445 and 3389 to correspond to SMB and RDP:

Option	Value
Name	Winserver

Option	Value
Type	On-premise
Address	Use the dropdown and then the + button to define a new address object with: 10.88.0.1/32.
Port	445 It is not possible to specify two non-consecutive ports for a destination in the GUI. The second port, 3389, must be appended using the CLI.
Protocol	TCP



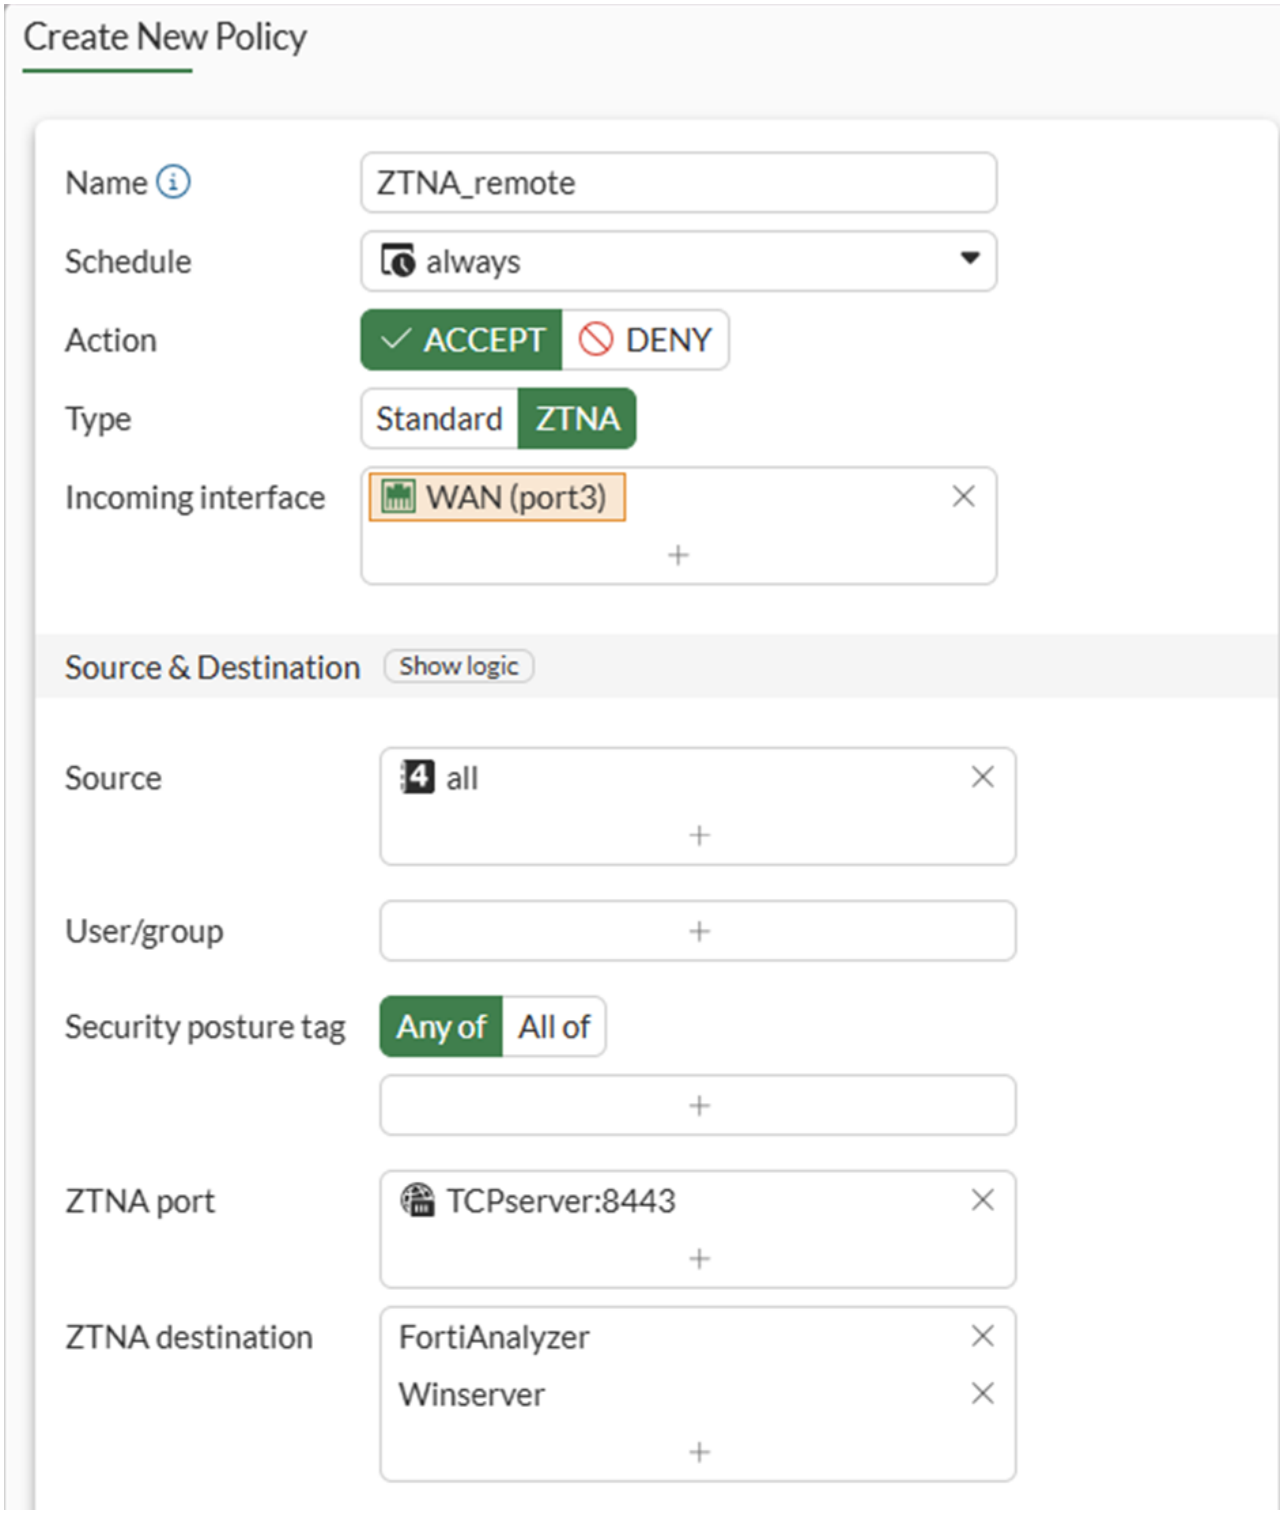
12. Click *OK* to save the ZTNA destination.
13. Use the CLI to add the second port:

```
config ztna destination
     edit "Winserver"
        set mappedport 445 3389
     next
 end
```

To configure a simple ZTNA policy to allow traffic to the TCP access proxy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*.
2. Set *Name* to *ZTNA_remote*.
3. Set *Type* to *ZTNA*.
4. Set *Incoming Interface* to *port3*.
5. Set *Source* to *all*.
6. Set *ZTNA port* to *TCPserver:8443*.

7. Set *ZTNA destination* to *FortiAnalyzer* and *Winserver*.
8. Set *Log allowed traffic* to *All sessions*.
9. Configure the remaining options as needed.



10. Click *OK*.

To configure a ZTNA traffic forwarding proxy in the CLI:

1. Configure the access proxy VIP:

```
config firewall vip
    edit "TCPserver:8443"
        set type access-proxy
        set server-type https
        set extip 10.0.3.11
        set extintf "port3"
        set extport 8443
        set ssl-certificate "ztna-wildcard"
    next
end
```

2. Configure the destinations:

```
config ztna destination
    edit "Winserver"
        set address "Winserver"
        set mappedport 445 3389
        set protocol TCP
    next
    edit "FortiAnalyzer"
        set address "FortiAnalyzer"
        set mappedport 22
        set protocol TCP
    next
end
```

3. Configure the virtual host:

```
config firewall access-proxy-virtual-host
     edit "10.0.3.11_host"
         set ssl-certificate “ztna-wildcard”
         set host “10.0.3.11”
     next
 end
```

> The virtual host is configured automatically when specifying the Host field during the Traffic Forwarding Server creation.

4. Configure the traffic forward proxy:

```
config ztna traffic-forward-proxy
    edit "ZTNA-tcp-server"
        set vip "TCPserver:8443"
        set host "10.0.3.11_host"
    next
end
```

5. Configure Firewall Address Objects and ZTNA policy:

```
config firewall address
     edit "FortiAnalyzer"
         set subnet 10.88.0.2 255.255.255.255
     next
     edit "Winserver"
         set subnet 10.88.0.1 255.255.255.255
     next
end
```

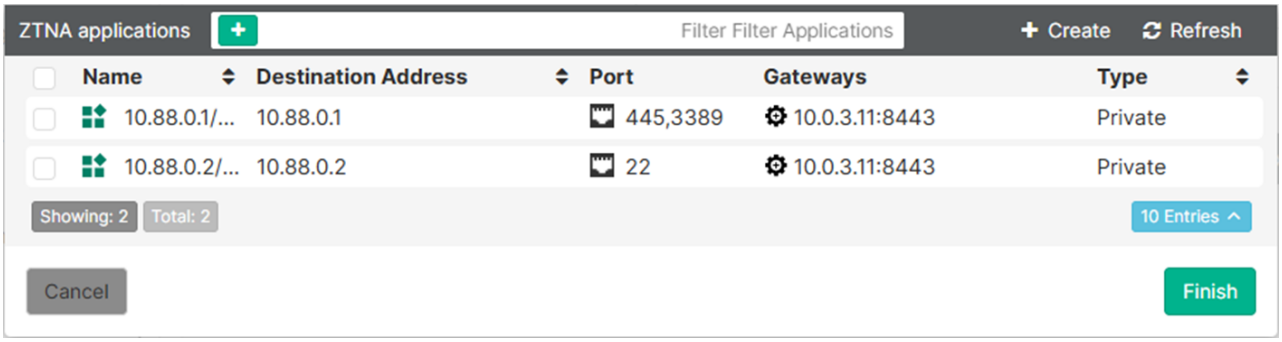
```
config firewall policy
    edit 1
        set name "ZTNA_remote"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "TCPserver:8443"
        set ztna-destination "FortiAnalyzer" "Winserver"
        set schedule "always"
        set logtraffic all
        set nat enable
    next
end
```

Test the connection to the access proxy

Before connecting, users must have a ZTNA connection rule in FortiClient. This will be configured using EMS.

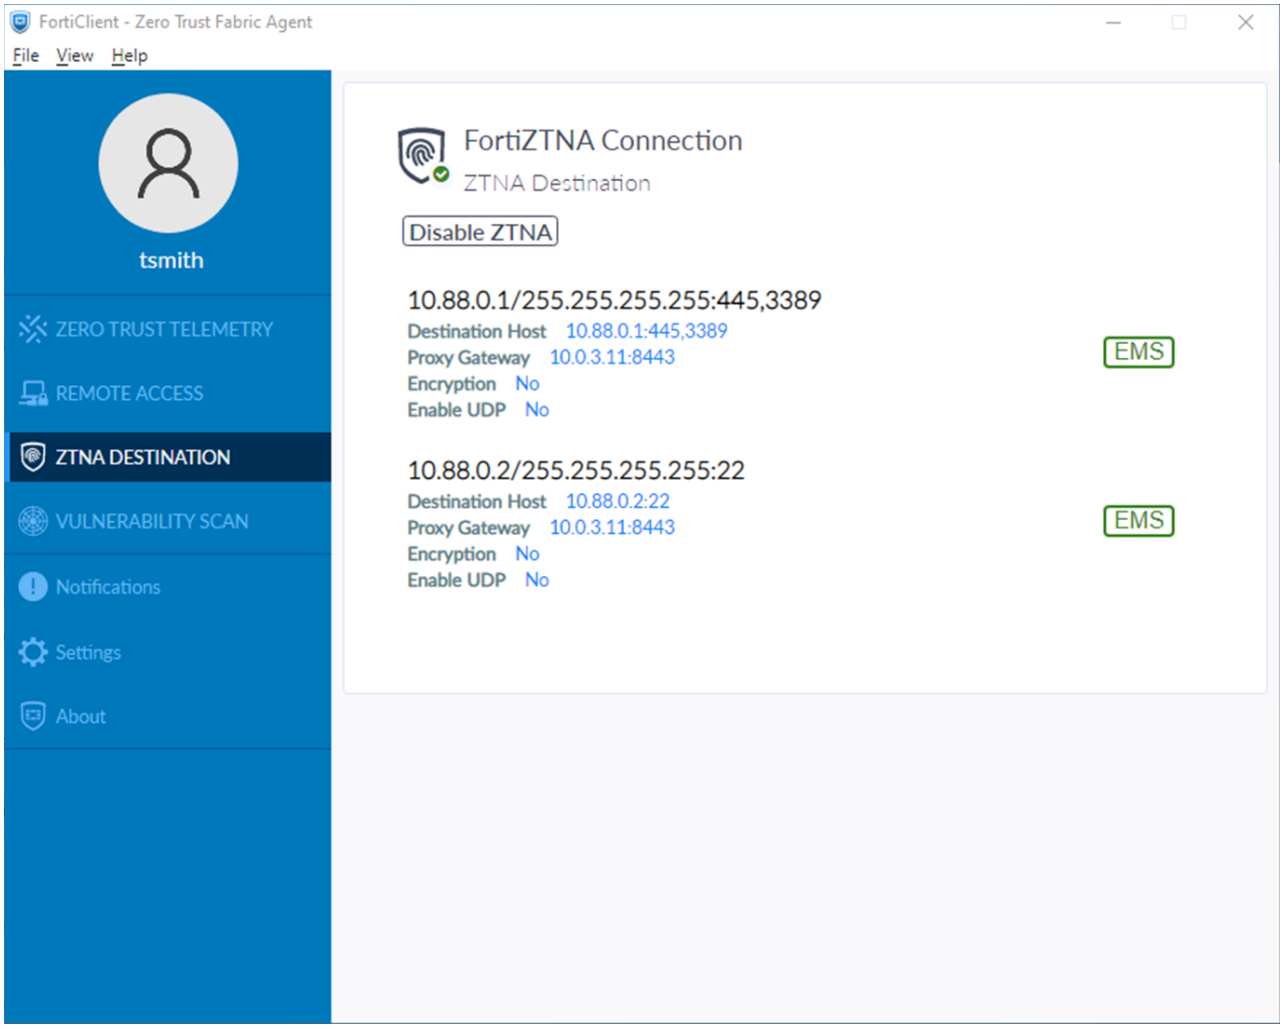
To create a ZTNA Destination in EMS:

1. Go to *Endpoint Profiles* > *ZTNA Destinations*.
2. Select the required profile, or create a new one.
3. Set *Name* to the desired name.
4. In the *Rules* section click *Add*.
   Two ZTNA applications should populate that were learned from the FortiGate.



5. Select both applications then click *Finish*.
   The two destinations now appear as rule entries.
6. Click *Save* to save the ZTNA Destinations profile.

7. Ensure that this profile is applied to the endpoint policy assigned to the remote endpoint.
   After some time, the FortiClient will receive the profile update and the configuration will appear under the ZTNA DESTINATION tab on FortiClient.

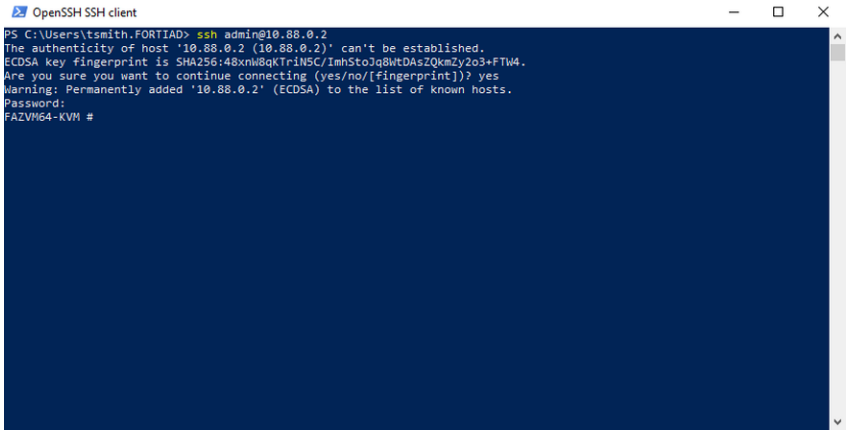


To test the access proxy:

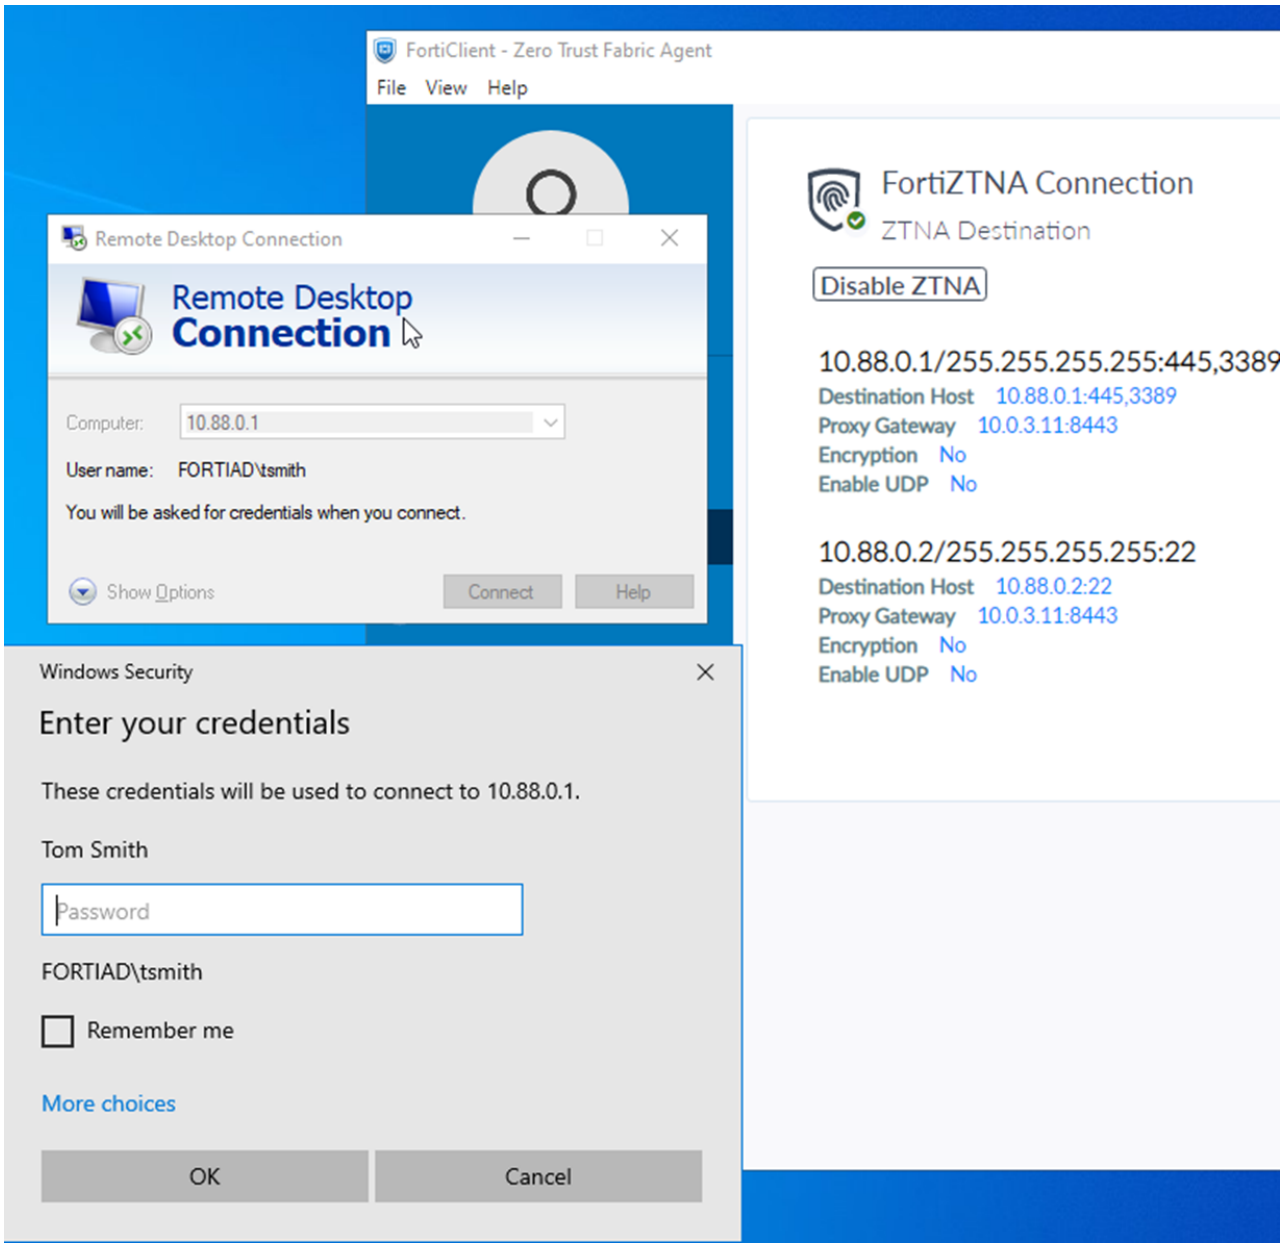
1. Test SSH connectivity to the FortiAnalyzer by opening a SSH client, such as PowerShell:

```
ssh admin@10.88.0.2
```

2. If it is the first time that you are connecting, accept the ECDSA key fingerprint of the FortiAnalyzer.



3. Test RDP by opening the Remote Desktop Connection application and providing the address to RDP to (10.88.0.1) and the username and password:



FortiClient - Zero Trust Fabric Agent
File View Help

ZTNA traffic forwarding proxy with FQDN example

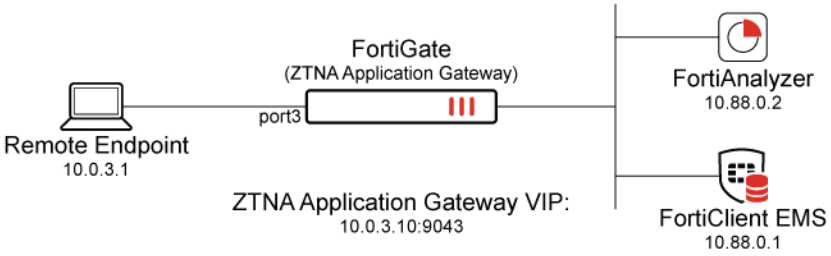
When defining ZTNA connection rules on FortiClient for TCP forwarding, it is sometimes desirable to configure the destination host address as an FQDN address instead of an IP address. Since the real servers are often servers in the corporate network, this layer of obfuscation prevents internal IPs from easily leaking to the public, and also makes the destination more easily recognizable by the end users.

One obstacle to overcome is getting remote hosts to resolve an internal FQDN that is typically only resolvable by an internal DNS in the corporate network. This can be solved with the following:

1. When an FQDN address is added in FortiClient's ZTNA Destination, FortiClient will intercept connections destined for the FQDN address and replace the destination with a special IP address (such as 10.235.0.1).
2. FortiClient listens to any traffic destined for the FQDN and its port and forwards the traffic using the TCP forwarding URL with FQDN to the ZTNA application gateway.
3. The ZTNA application gateway will resolve the FQDN, matching the traffic to the ZTNA real server configuration with the same domain and address.
4. If a valid ZTNA real server entry is found, traffic is forwarded to the real server.

Example

In this example, a FortiAnalyzer in the internal network is added to the FortiGate access proxy for TCP forwarding. A ZTNA Destination is configured on the FortiClient, with the destination host field pointing to the FQDN addresses of the internal servers. The FQDN address is also resolvable by the FortiGate and the same FQDN is used in the real server mapping.



This example assumes that the FortiGate EMS Fabric connector is already successfully connected.

This features requires a minimum FortiClient and FortiClient EMS version of 7.0.3.

To configure the TCP forwarding proxy:

1. Go to *Policy & Objects* > *ZTNA* > *Traffic Forwarding* > *Traffic Forwarding Server*.
2. Click *Create new*.
3. Set *Name* to *10.0.3.11*.
4. Set *Host* to *10.0.3.11*.
   This address must exactly match the Proxy Gateway configured on the FortiClient. It is not possible to use a FQDN or hostname that would resolve to the Proxy Gateway IP address.
5. Set *ZTNA port* to *Create new* and configure the port:

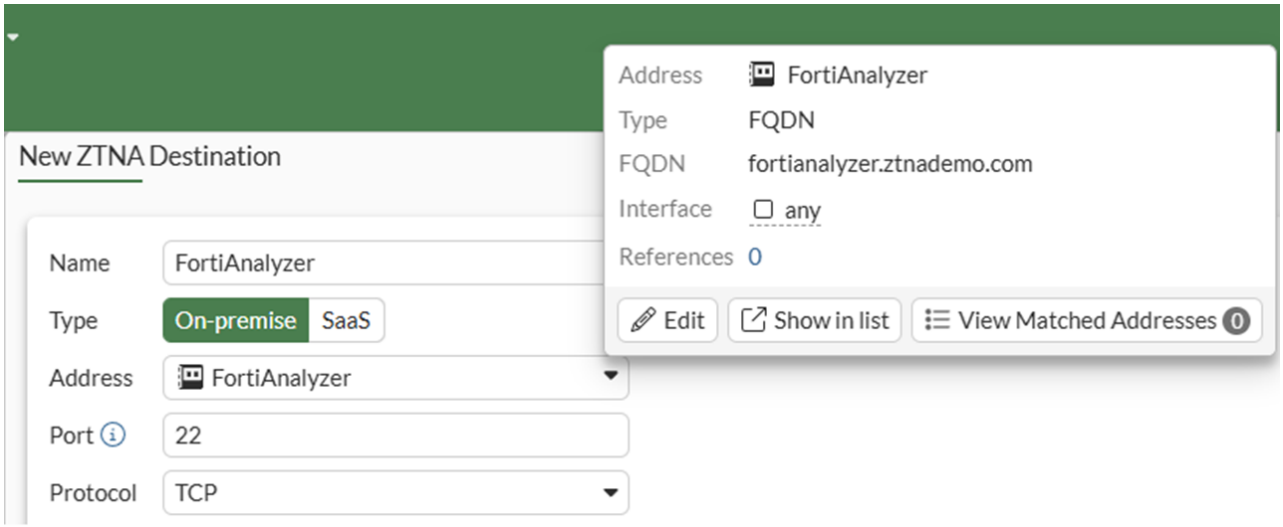
Option	Value
Interface	port3
IP address	10.0.3.11
Port	9043
Default certificate	This example uses a wildcard certificate with a Common Name (CN): **.ztnademo.com*.

Option	Value
	This certificate is trusted by the endpoints which will access the ZTNA port.
Name	10.0.3.11:9043

Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.

6. Click *OK* to save the traffic forwarding server.
7. Select the *Destination* view to define a destination.
8. Click *Create new*.
9. Configure the ZTNA destination:

Option	Value
Name	FortiAnalyzer
Type	On-premise
Address	Use the dropdown and then the + button to define a new address object: • *Type*: *FQDN* • *FQDN*: *FortiAnalyzer*
Port	22
Protocol	TCP



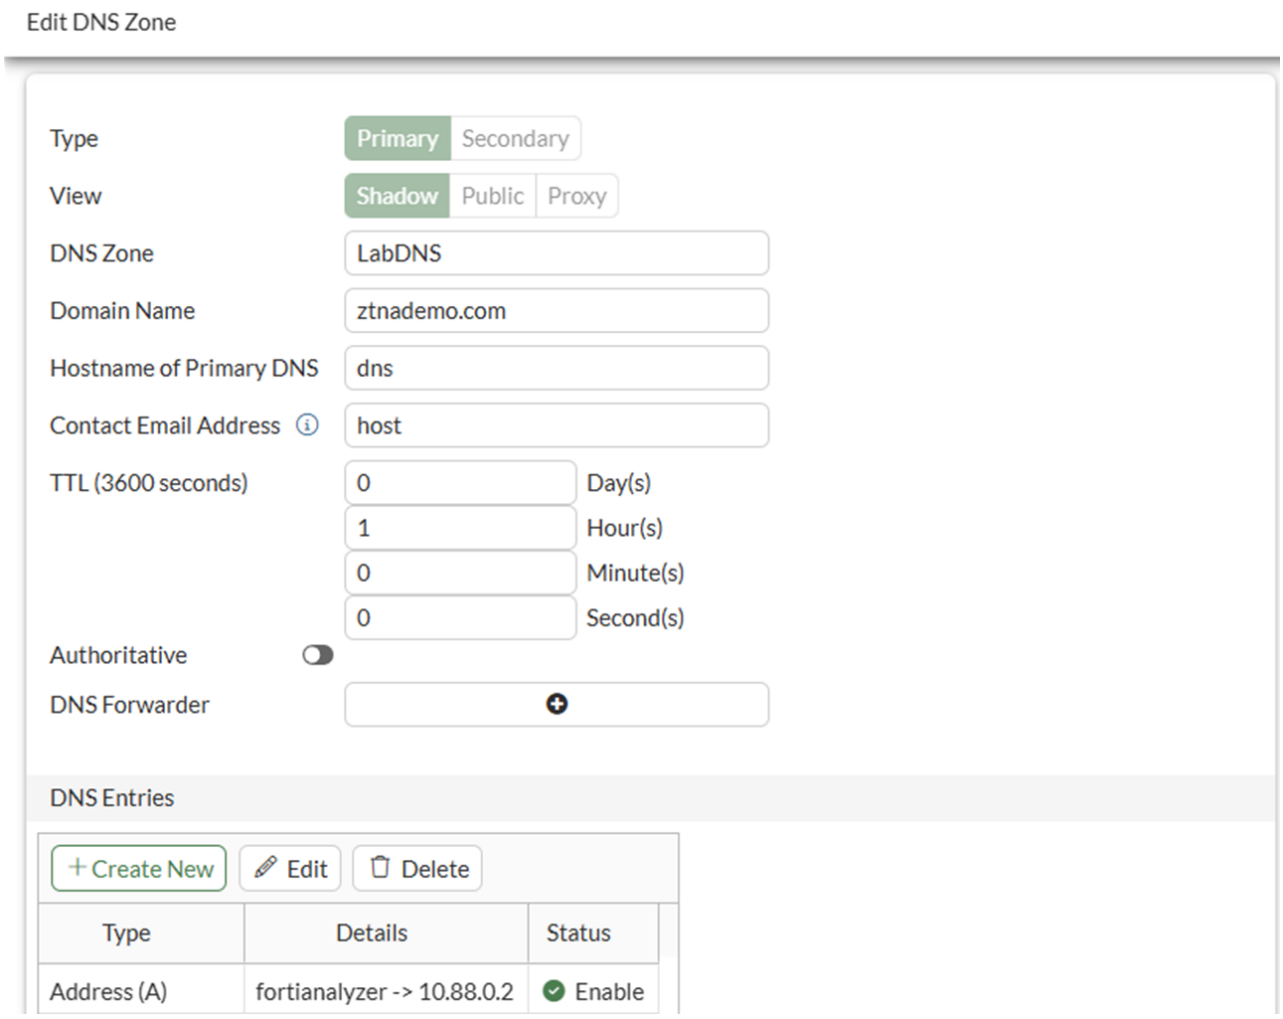
10. Click *OK* to save the ZTNA destination.

To configure the FQDN resolution:

The FQDN *fortianalyzer.ztnademo.com* does not currently resolve to anything. A DNS entry is required for the FortiGate to resolve the FQDN to the FortiAnalyzer IP address of 10.88.0.2. In this example, the FortiGate itself is functioning as the DNS server and a DNS entry must be added to map the FQDN to an IP address.

1. Go to *Network* > *DNS Servers*.
2. Edit the ztnademo.com domain DNS database. If necessary, create a new database for the domain.
3. In the *DNS Entries* table click *Create New*.
4. Configure the DNS entry:

Option	Value
Type	Address (A)
Hostname	fortianalyzer
Fully Qualified Domain Name (FQDN)	(auto-populates)
IP Address	10.88.0.2



5. Click *OK* to save the DNS entry.
6. Click *OK* to save the DNS zone.
7. Verify the resolution using the CLI:

```
# execute ping fortianalyzer.ztnademo.com
PING fortianalyzer.ztnademo.com (10.88.0.2): 56 data bytes
64 bytes from 10.88.0.2: icmp_seq=0 ttl=64 time=0.5 ms
64 bytes from 10.88.0.2: icmp_seq=1 ttl=64 time=0.5 ms
^C
--- fortianalyzer.ztnademo.com ping statistics ---
2 packets transmitted, 2 packets received, 0% packet loss
round-trip min/avg/max = 0.5/0.5/0.5 ms
```

To configure the ZTNA rule:

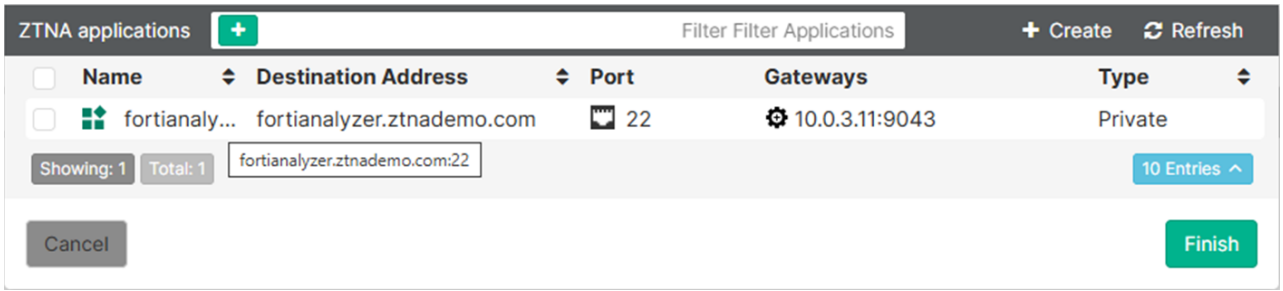
1. Go to *Policy & Objects* > *Firewall Policy* and click *Create new*.
2. Set *Name* to *ZTNA-Admin-Access*.
3. Set *Type* to *ZTNA*.
4. Set *Incoming Interface* to *WAN (port3)*.
5. Set *Source* to *all*.
6. Set *ZTNA port* to *10.0.3.11:9043*.
7. Set *ZTNA destination* to *FortiAnalyzer*.
8. Set *Log allowed traffic* to *All sessions*.
9. Configure the remaining options as needed.
10. Click *OK*.

Testing the connection to the TCP forwarding access proxy

Before connecting, users must have a ZTNA Destination in FortiClient.

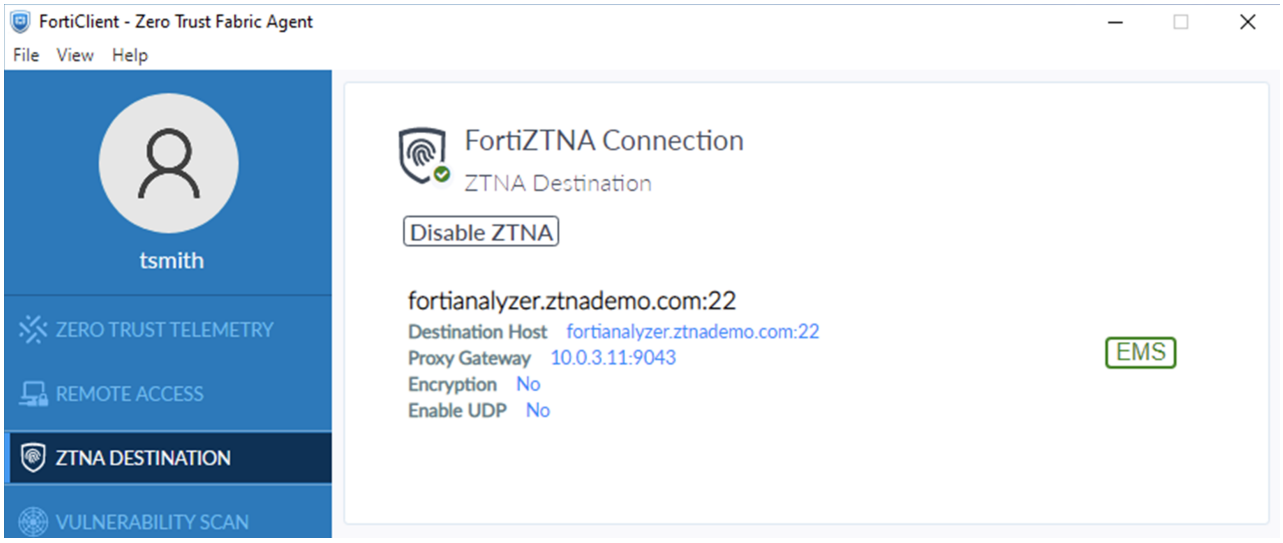
To create the ZTNA rules in EMS:

1. Go to *Endpoint Profiles* > *ZTNA Destinations*.
2. Select the required profile, or create a new one.
3. Set *Name* to the desired name.
4. In the *Rules* section click *Add*.
   The ZTNA applications will display the fortianalyzer.ztnademo.com:22 destination created earlier on the FortiGate. You can hover over the name field to show the full name.



5. Select the entry and click *Finish*.
   The destination now appears as a rule entry.
6. Click *Save* to save the ZTNA Destinations profile.

7. Ensure that this profile is applied to the endpoint policy assigned to the remote endpoint.
   After some time, the FortiClient will receive the profile update and the configuration will appear under the ZTNA DESTINATION tab on FortiClient.



To test the access proxy:

1. Verify the resolution for fortianalyzer.ztnademo.com on the remote endpoint using ping:

```
>ping fortianalyzer.ztnademo.com

Pinging fortianalyzer.ztnademo.com [10.235.0.1] with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 10.235.0.1:
       Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
```

   The FortiClient is resolving fortianalyzer.ztnademo.com to a special address, overriding any DNS resolution for this host. FortiClient will listen to the traffic to this FQDN and forward it to the Proxy Gateway.
2. Test SSH access from the remote endpoint using an SSH client, such as PowerShell:

```
ssh admin@fortianalyzer.ztnademo.com
```

3. Enter the password when prompted.
4. After successfully connecting, ensure that you end the session to generate a log on the FortiGate.

FortiGate logs

On the FortiGate, go to *Log & Report > ZTNA Traffic* to view the logs. Alternatively, use the CLI to display the most recent ZTNA logs:

```
# execute log filter category 0
# execute log filter field subtype ztna
# execute log display
```

Successful log

```
1: date=2026-03-06 time=11:04:00 eventtime=1772823839937353369 tz="-0800" logid="0005000024"

```

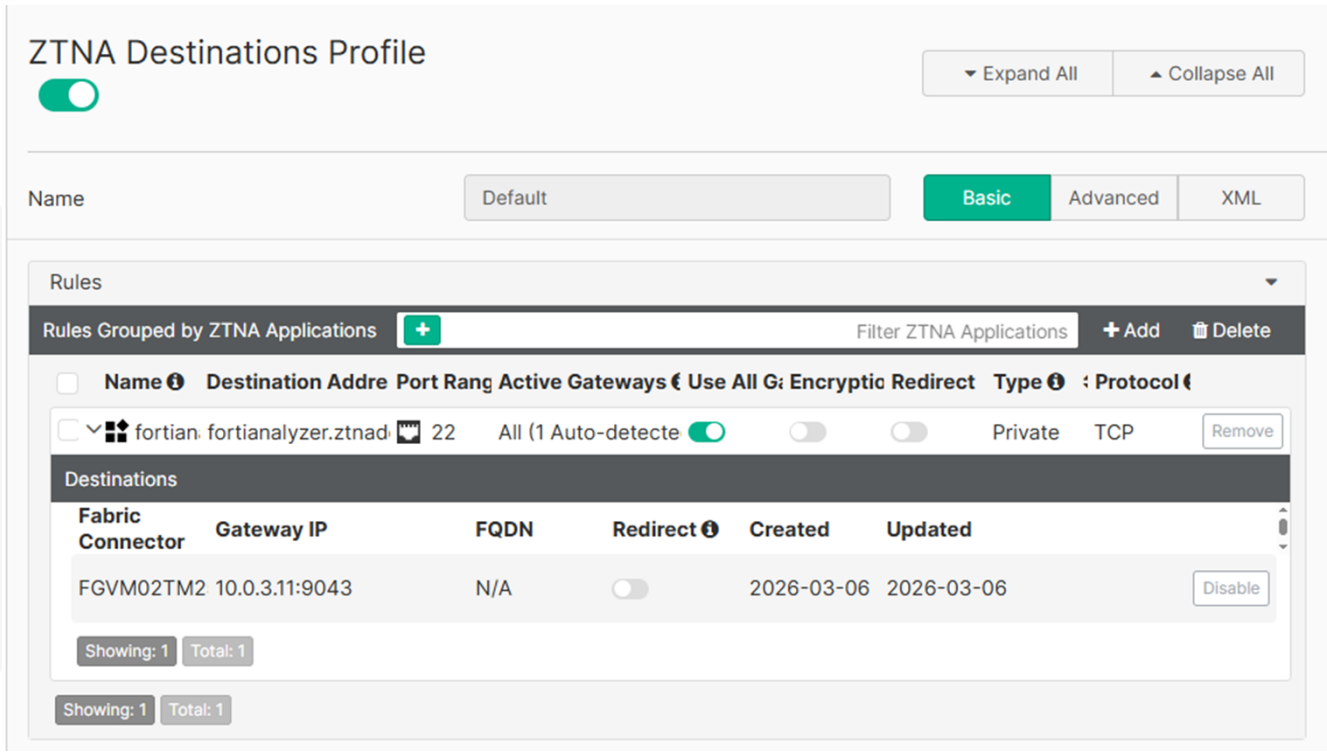
Failed log

This failure is as a result of setting the wrong host when configuring the TCP forwarding proxy. In this case, the host field was set to *fortianalyzer* instead of *10.0.3.11*.

```
1: date=2026-03-06 time=11:13:48 eventtime=1772824427849248121 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.0.3.2 srcport=20949
srcintf="port3" srcintfrole="wan" dstcountry="Reserved" srccountry="Reserved" dstip=10.0.3.11
dstport=9043 dstintf="root" dstintfrole="undefined" sessionid=61384 srcuuid="b458a65a-f759-51ea-
d7df-ef2e750026d1" service="tcp/9043" proxyapptype="ztna-proxy" proto=6 action="deny" policyid=1
policytype="policy" poluuid="6d795be4-1972-51f1-e6ab-ed4c5318bd15" policyname="ZTNA-Admin-Access"
appcat="unscanned" duration=0 vip="10.0.3.11:9043" vipincomingip=10.0.3.11
clientdevicemanageable="manageable" clientcert="yes" wanin=0 rcvdbyte=0 wanout=0 lanin=1970
sentbyte=1970 lanout=3014 msg="Traffic denied because HTTP url
(https://10.0.3.11/tcp?address=fortianalyzer.ztnademo.com&port=22&tls=0) failed to match an API-
gateway with vhost(name/hostname:_def_virtual_host_/_def_virtual_host_)" crscore=30
craction=131072 crlevel="high"
```

This log indicates that the FortiClient sends the request `https://10.0.3.11/tcp?address=fortianalyzer.ztnademo.com&port=22&tls=0`, which does not match the configured virtual host (traffic forwarding server): `https://fortianalyzer/tcp?address=fortianalyzer.ztnademo.com&port=22&tls=0`.

The FortiClient request is defined by the Gateway IP in the *ZTNA Destinations Profile > Rules > Destinations > Gateway IP* on EMS. In this case: 10.0.3.11.



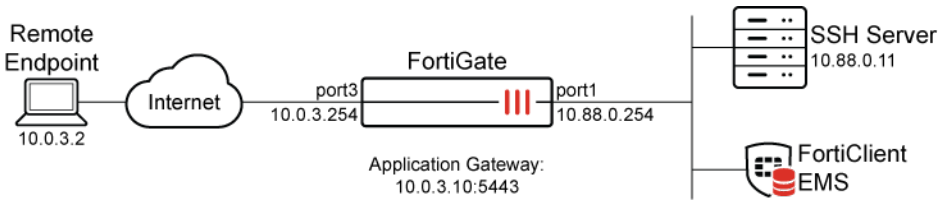
The Gateway IP is defined by the IP address and port combination as configured in the ZTNA port, *ZTNA-10.0.3.11* on the FortiGate. The port must be used in a firewall policy before it is synchronized to the EMS with the fabric connector.

ZTNA SSH traffic forwarding proxy example

ZTNA can be configured with SSH traffic forwarding proxy to provide a seamless SSH connection to the server.

Advantages of using an SSH access proxy instead of a TCP forwarding access proxy include:

- Establishing device trust context with user identity and device identity checks.
- Applying SSH deep inspection to the traffic through the SSH related profile.
- Performing optional SSH host-key validation of the server.
- Using one-time user authentication to authenticate the ZTNA SSH access proxy connection and the SSH server connection.



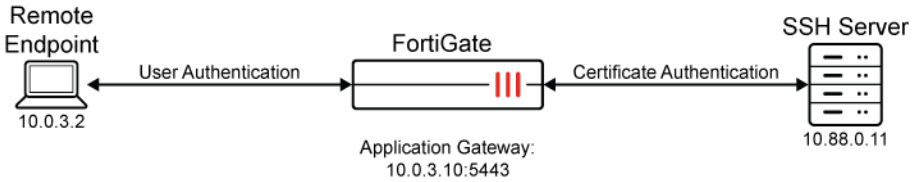
This example assumes that the FortiGate EMS fabric connector is already successfully connected.

Perform SSH host-key validation of the server

To act as a reverse proxy for the SSH server, the FortiGate must perform SSH host-key validation to verify the identity of the SSH server. The FortiGate does this by storing the public key of the SSH server in its SSH host-key configurations. When a connection is made to the SSH server, if the public key matches one that is used by the server, then the connection is established. If there is no match, then the connection fails.

One-time user authentication

SSH access proxy allows user authentication to occur between the client and the access proxy, while using the same user credentials to authenticate with the SSH server. The following illustrates how this works:



1. The remote endpoint registers to FortiClient EMS and receives the client certificate.
2. The remote endpoint tries to connect to the SSH access proxy. It must use the same username that is later used for access proxy authentication.
3. The FortiGate challenges the endpoint with device identity validation.
4. The remote endpoint provides the EMS issued certificate for device identification.
5. The FortiGate challenges the endpoint with user authentication. This example uses an LDAP group to control access.
6. The users enters their credentials on the remote endpoint.
7. The FortiGate authenticates the user and collects the username.
8. Using the FortiGate's CA or the customer's CA certificate, the FortiGate signs an SSH certificate and embeds the username in its principal.
9. The FortiGate attempts to connect to the SSH server using the certificate authentication.
10. The SSH server verifies the authenticity of the certificate, and matches the username principal against its authorized_keys file.
11. If the username matches a record in the file, then the SSH connection is established. If no match is found, then the SSH connection fails.

Example

In this example, an SSH connection is established using SSH access proxy with host-key validation and one-time authentication.

- The SSH server is a Linux based server that uses sshd to provide remote access.
- For SSH host-key validation, the public key of the SSH server has been imported into the FortiGate.
- For one-time authentication using certificate authentication:

- The SSH server must allow certificate authentication.
- The SSH server must have the proper entry in its authorized_keys file that contains the user principal and the FortiGate CA's public key.
- The entry is present in the user directory corresponding to the user that is trying to log in.

To pre-configure the Linux SSH server:

1. Retrieve the public key used for host-key validation:
   a. Locate the public key files in the SSH server:

```
$ ls -la /etc/ssh/*.pub
-rw-r--r-- 1 root root 186 Mar 29  2020 /etc/ssh/ssh_host_ecdsa_key.pub
-rw-r--r-- 1 root root 106 Mar 29  2020 /etc/ssh/ssh_host_ed25519_key.pub
-rw-r--r-- 1 root root 406 Mar 29  2020 /etc/ssh/ssh_host_rsa_key.pub2
```

   b. Choose the public key file based on the hash type (in this case, ECDSA), and show it's content:

```
$ cat /etc/ssh/ssh_host_ecdsa_key.pub
ecdsa-sha2-nistp256 AAAAE2*********IpEik=
```

   This key will be used when configuring the FortiGate.
2. Retrieve the FortiGate CA's public key from the FortiGate:

```
# show full firewall ssh local-ca Fortinet_SSH_CA
config firewall ssh local-ca
    edit "Fortinet_SSH_CA"
        set password <hidden password>
        set private-key "-----BEGIN OPENSSH PRIVATE KEY-----
<hidden private key>
-----END OPENSSH PRIVATE KEY-----"
        set public-key "ssh-rsa AAAAB3**********JLXlxj3"
        set source built-in
    next
end
```

3. On the Linux server, enable the SSH service to use the authorized_keys file:
   a. Locate and edit the */etc/ssh/sshd_config* file.
   b. Ensure that the *AuthorizedKeysFile* line is uncommented, for example:

```
AuthorizedKeysFile      .ssh/authorized_keys .ssh/authorized_keys2
```

4. Allow remote SSH log in with certificate authentication and principal name:
   a. Log in to the SSH server using the account that will be granted remote SSH access (in this example: *tsmith*):
   b. Locate the account's authorized_keys file in the *~/.ssh* directory:

```
$ ls -la ~/.ssh
 total 12
 drwxrwxr-x 2 tsmith tsmith 4096 Aug 10 19:14 .
 drwxr-xr-x 5 tsmith tsmith 4096 Aug 10 19:13 ..
 -rw-rw-r-- 1 tsmith tsmith 419 Aug 10 19:14 authorized_keys
```

c. If the directory and file do not exist, create the directory:

```
$ mkdir ~/.ssh
```

d. Create an entry containing the following keywords and add them to the authorized_keys file:

```
echo 'cert-authority,principals="tsmith" ssh-rsa AAAAB3**********JLXlxj3' >> authorized_
keys
```

Where:

- `cert-authority` - indicates that this entry is used in certificate authentication by validating the certificate using the public key provided in this entry.
- `principals="tsmith"` - indicates the user that must match with the username embedded in the SSH certificate.
- `ssh-rsa AAAAB3**********JLXlxj3` - indicates the FortiGate CA's public key that is used to validate the SSH certificate.

5. Restart the sshd service:

```
$ sudo systemctl stop sshd
$ sudo systemctl start sshd
```

The SSH server can now accept SSH connection from *tsmith@<server IP>*, where the SSH certificate used by the FortiGate to log in contains tsmith embedded as a principal.

When a user connects from a SSH client using *<username>@<server IP>*, sshd will locate the authorized_keys file in the directory */home/<username>/.ssh/authorized_keys*. If the authorized_keys is not in that directory, authentication will fail on the SSH server side.

If you suspect that authentication is failing on the SSH server, use the following commands to manually start sshd in debug mode to troubleshoot:

```
$ sudo systemctl stop sshd
```

```
$ /usr/sbin/sshd -ddd -p 22
```

To configure the FortiGate :

1. Configure a new VIP to allow access to the SSH access proxy over 10.0.3.10:5443:

```
config firewall vip
    edit "ZTNA_SSH"
        set type access-proxy
        set server-type https
        set extip 10.0.3.10
        set extintf "port3"
        set extport 5443
        set ssl-certificate "Fortinet_SSL"
    next
end
```

2. Configure the address object for the SSH server:

```
config firewall address
    edit "SSH_server"
        set subnet 10.88.0.11 255.255.255.255
    next
end
```

3. Configure the host-key that will be used to authenticate the SSH server. The public-key was retrieved during pre-configure the Linux SSH server (step 1b).

```
config firewall ssh host-key
    edit "ed25519"
        set type ECDSA
        set usage access-proxy
        set public-key "AAAAE2**********IpEik="
    next
end
```

4. Configure the access proxy SSH client certificate:

   A CA certificate is assigned to sign the SSH certificate that will be used in the SSH authentication. The SSH certificate will have the username embedded in the certificate principal.

```
config firewall access-proxy-ssh-client-cert
    edit "ssh-access-proxy"
        set source-address enable
        set auth-ca "Fortinet_SSH_CA"
    next
end
```

5. Configure the traffic forward proxy virtual host settings:

```
config firewall access-proxy-virtual-host
    edit "10.0.3.10_host"
        set ssl-certificate “ztna-wildcard”
        set host “10.0.3.10”
    next
end
```

   The virtual host is configured automatically when specifying the Host field during the Traffic Forwarding Server creation in the GUI.

6. Configure the traffic forward proxy:

```
config ztna traffic-forward-proxy
    edit "ZTNA_SSH"
        set vip "ZTNA_SSH"
        set host "10.0.3.10_host"
    next
end
```

7. Configure the destination:

```
config ztna destination
    edit "SSH_Server"
        set address "SSH_server"
        set mappedport 22
        set protocol TCP
        set conn-type ssh
        set ssh-client-cert "ssh-access-proxy"
        set ssh-host-key-validation enable
        set ssh-host-key "ed25519"
    next
end
```

8. Configure the LDAP setting, user setting, and user group to apply user authentication to the access proxy connection using LDAP:

```
config user ldap
    edit "LDAP-fortiad"
        set server "10.88.0.1"
        set cnid "sAMAccountName"
        set dn "dc=fortiad,dc=info"
        set type regular
        set username "fortiad\\Administrator"
        set password *
        set secure ldaps
        set port 636
    next
end
```

```
config user group
    edit "LDAP-Remote-Allowed-Group"
        set member "LDAP-fortiad"
        config match
            edit 1
                set server-name "LDAP-fortiad"
                set group-name "CN=Remote-Allowed,CN=Users,DC=fortiad,DC=info"
            next
        end
    next
end
```

9. Create the authentication scheme and rule to perform the authentication:

```
config authentication scheme
    edit "basic_auth"
        set method basic
        set user-database "LDAP-fortiad"
    next
end
```

```
config authentication rule
    edit "ztna_basic"
        set srcintf "port3"
```

```
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "basic_auth"
        set web-auth-cookie enable
    next
end
```

10. Configure the full ZTNA policy to allow traffic to the SSH server, and apply user authentication, posture check, and a security profile where necessary:

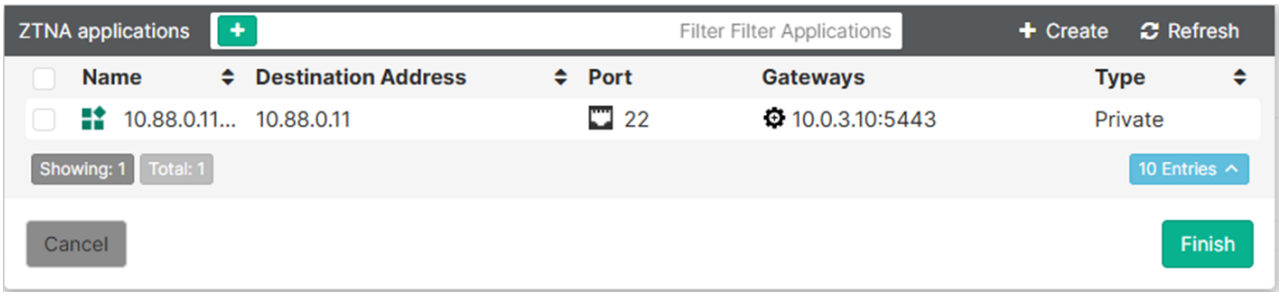
```
config firewall policy
    edit 18
        set name "SSH-proxy"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "ZTNA_SSH"
        set ztna-destination "SSH_Server"
        set schedule "always"
        set ssl-ssh-profile "custom-deep-inspection"
        set logtraffic all
        set nat enable
        set groups "LDAP-Remote-Allowed-Group"
    next
end
```

Results

Before connecting, users must have a ZTNA Destination in FortiClient.

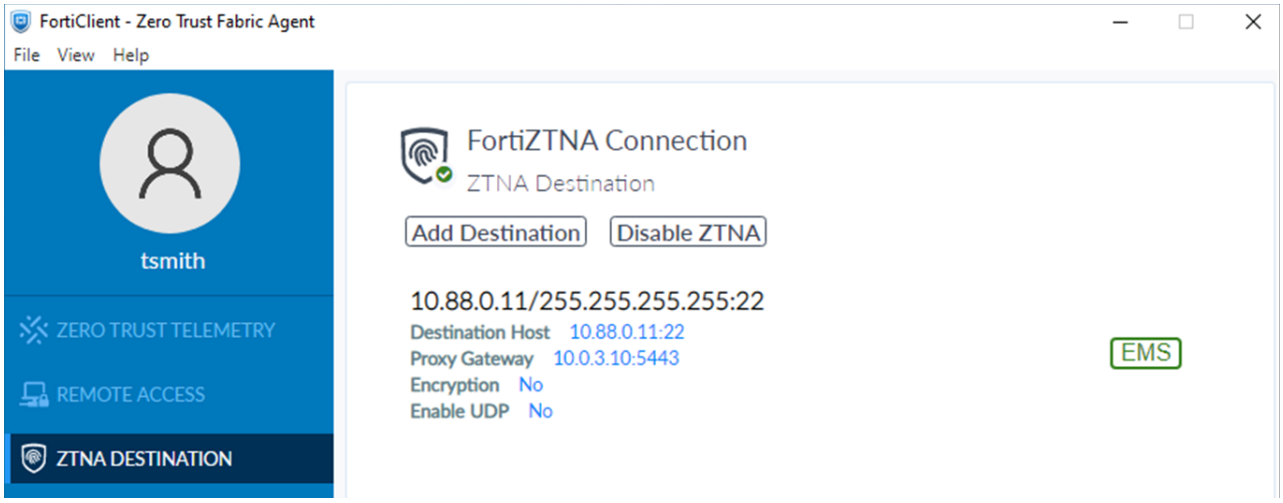
To create the ZTNA rules in EMS:

1. Go to *Endpoint Profiles* > *ZTNA Destinations*.
2. Select the required profile, or create a new one.
3. Set *Name* to the desired name.
4. In the *Rules* section click *Add*.
   The ZTNA destination appears as learned from the FortiGate through the fabric connector.



5. Select the entry and click *Finish*.
   The destination now appears as a rule entry.
6. Click *Save* to save the ZTNA Destinations profile.

7. Ensure that this profile is applied to the endpoint policy that is assigned to the user's endpoint.
   After some time, the FortiClient will receive the profile update and the configuration will appear under the ZTNA DESTINATION tab on FortiClient.



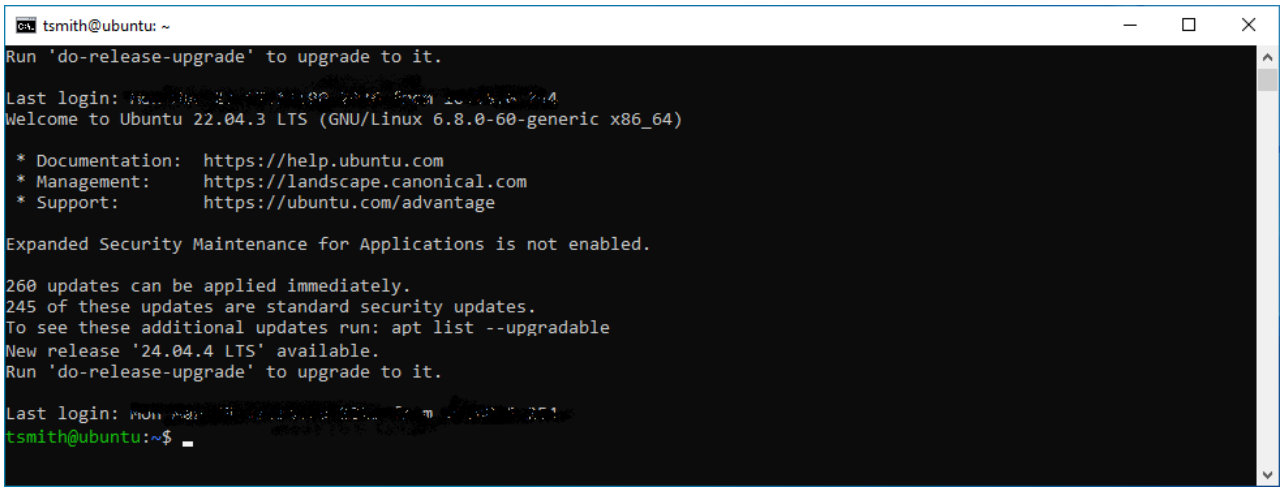
To test the access proxy:

1. Open an SSH client, such as Windows command prompt, and make an SSH connection to tsmith@10.88.0.11. SSH uses port 22 by default.

```
ssh tsmith@10.88.0.11
```

2. After device authentication is performed and passes in the background, FortiClient prompts the user to sign in.
   Enter the username, *tsmith*, and password, then click *Sign in*.

   After successful user authentication, the SSH connection is established without an additional log in.



3. On the FortiGate, check the logged in user:
   a. Go to *Dashboard* > *Assets & Identities* > *Firewall Users* and select the *Proxy* table.

   b. Check the WAD proxy user list:

```
# diagnose wad user list
 ID: 1, VDOM: root, IPv4: 10.0.3.2
  user name    : tsmith
  worker       : 0
  duration     : 200
  auth_type    : Session
  auth_method  : Basic
  pol_id       : 18
  g_id         : 3
  user_based   : 0
  expire       : no
  LAN:
    bytes_in=4727 bytes_out=7494
  WAN:
    bytes_in=4586 bytes_out=4149
```

4. The successful connection is logged in the forward traffic logs after the SSH connection has disconnected. There are two logs as there is a pause for the user to authenticate.

```
# execute log filter category 0
# execute log filter field subtype ztna
# execute log display

1: date=2026-03-23 time=10:27:44 eventtime=1774286864266735556 tz="-0700" logid="0005000024"

exit.
Mar 23 18:31:22 ubuntu systemd-logind[630]: Removed session 1475.
```

ZTNA application gateway with SAML authentication example

SAML can be used with ZTNA as an authentication method. In this setup, user credentials are stored in Active Directory, which is accessed by the Identity Provider (IdP). FortiAuthenticator serves as the IdP, retrieving user identity information from Active Directory, while FortiGate acts as the Service Provider (SP) delivering ZTNA

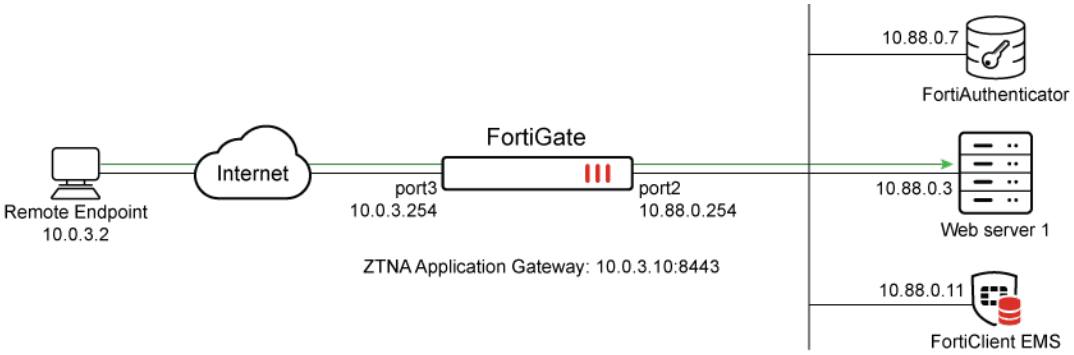
services alongside its security functions. When a user attempts to access a protected resource, the FortiGate redirects them to FortiAuthenticator for authentication. After the user successfully authenticates, FortiAuthenticator returns a SAML assertion to the FortiGate, which then acts as the trust broker to enforce policies and authorize access based on the validated identity and attributes.

For a basic configuration:

1. Configure ZTNA for web server access.
2. Configure a SAML SSO object on the FortiGate.
3. Update the IdP to reflect the SP settings.
4. Apply the SAML SSO object to an authentication scheme.
5. Create a user group that uses the SAML SSO object as its remote authentication server.
6. Create a ZTNA policy that uses the web server ZTNA configuration and SAML user group.

Example

In this example, an HTTPS access proxy is configured, and SAML authentication is applied to authenticate the client. The FortiGate acts as the SAML SP and a SAML authenticator serves as the IdP. In addition to verifying the user and device identity with the client certificate, the user is also authorized based on user credentials to establish a trust context before granting access to the protected resource. A VIP and Firewall policy is created to enable the Remote Endpoint to access the FortiAuthenticator for IdP authentication.



This example assumes that the FortiGate EMS fabric connector is already successfully connected.

Configure ZTNA for the web server

These steps will create a ZTNA application gateway of 10.0.3.10:8443 to proxy connections to 10.88.0.3:9043.

To configure ZTNA for the web server in the GUI:

1. Go to *Policy & Objects* > *ZTNA* and select the *Servers and Portals* tab. Web Server is selected by default.
2. Click *Create New*.
3. Set *Name* to *ZTNA-Webserver*.
4. Set *Host* to the IP address or FQDN that will be used to access the web server: webserver.ztnademo.com.

Endpoints accessing the web server must resolve this FQDN to the ZTNA Application Gateway address (10.0.3.10 in this example).

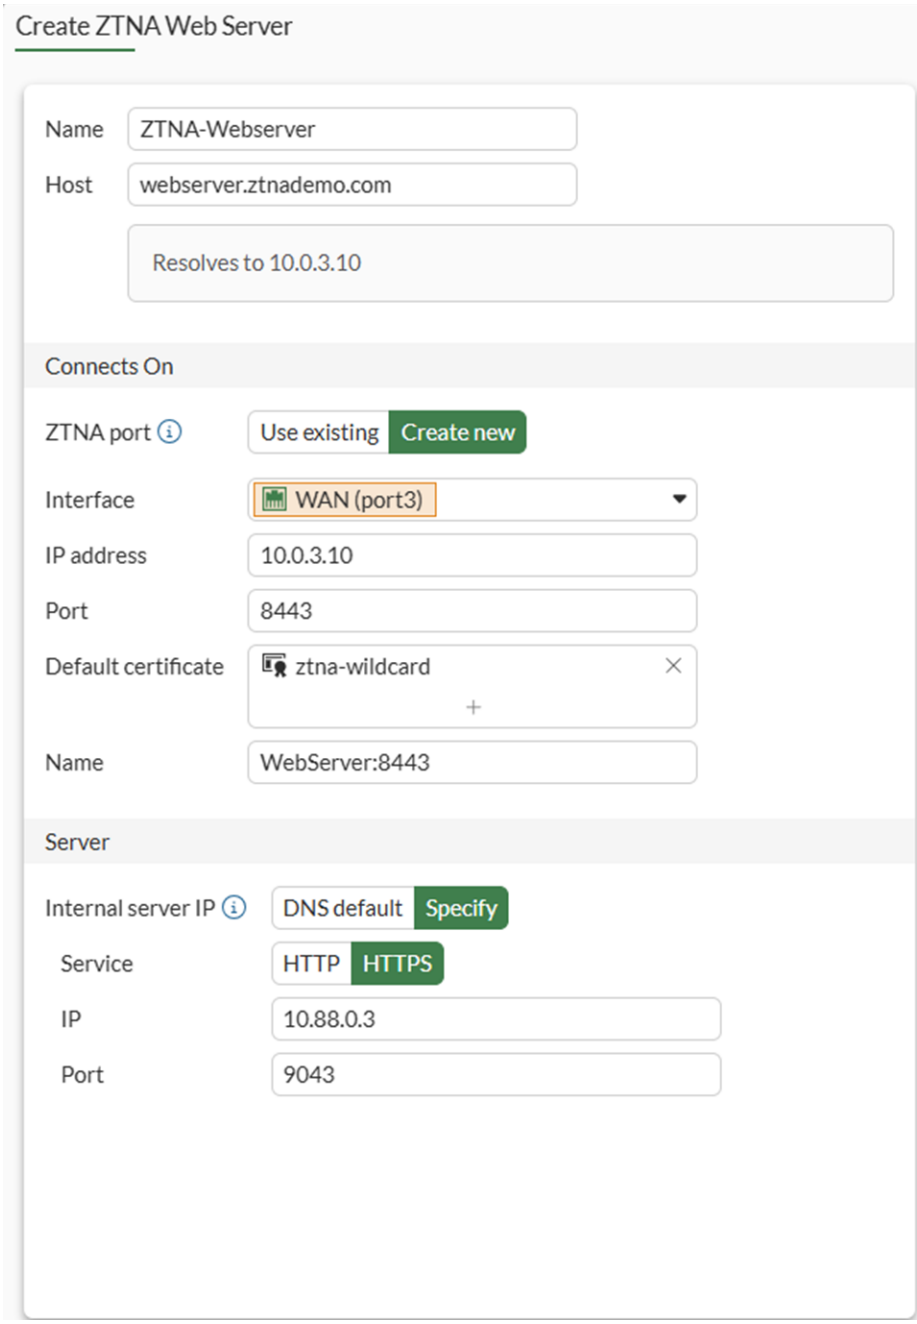
5. Under *Connects On*, select *Create new* for ZTNA port to provide the following details:
   a. Set *Interface* to *port3*.
   b. Set *External IP* to *10.0.3.10*.
   c. Set *External port* to *8443*.

      Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.

6. Select a *certificate*. Clients will be presented with this certificate when they connect to the ZTNA port.

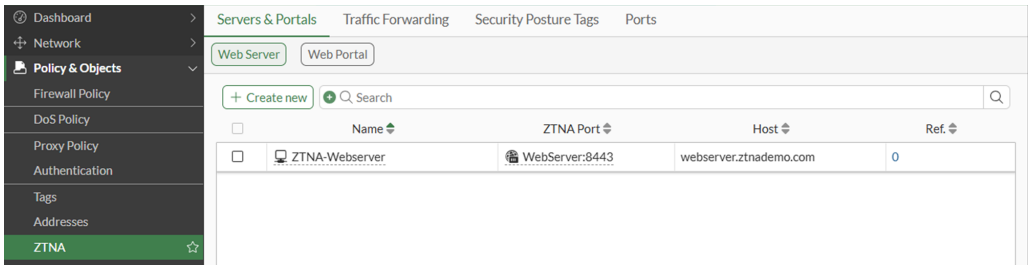
   This example uses a wildcard certificate with a Common Name (CN): *.ztnademo.com. This certificate is trusted by the endpoints which will access the ZTNA port.

7. Provide a name for the ZTNA port, such as WebServer:8443.
8. In the Server section, configure the internal server settings as follows:
   a. Switch the Internal server IP to *Specify*.
   b. Set *Service* to *HTTPS*.
   c. Set *IP* to the internal IP for the web server: 10.88.0.3.
   d. Set *Port* to *9043*.



The WebServer service is running on port 9043. This configuration will translate clients accessing TCP/9443 to TCP/9043.

e. Click *OK*. The Web Server object is listed.



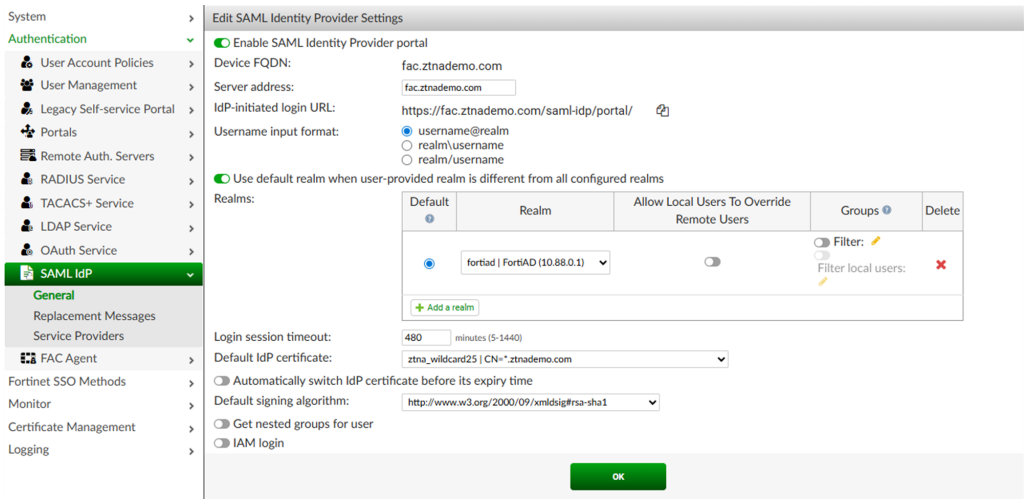
To configure ZTNA for the web server in the CLI:

```
config firewall vip
        edit "WebServer:8443"
        set uuid 55f5f710-1d56-51f1-f6cb-1be820301ca5
        set type access-proxy
        set server-type https
        set extip 10.0.3.10
        set extintf "port3"
        set extport 8443
        set ssl-certificate "ztna-wildcard"
    next
end
```

```
config ztna web-proxy
    edit "ZTNA-Webserver"
        set vip "WebServer:9443"
        set host " WebServer9443"
        config api-gateway
            edit 1
                config realservers
                    edit 1
                        set ip 10.88.0.3
                        set port 9043
                    next
                end
            next
        end
    next
end
```

Configuring SAML server

This must match the settings on the IdP. For this example, the FortiAuthenticator (IdP) has been configured as follows:



To configure FortiGate as the Service Provider:

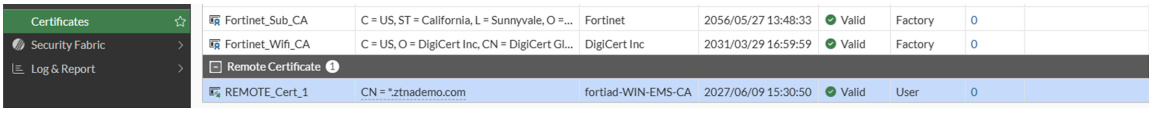
1. Go to *User & Authentication* > *Single Sign-On* and select *Create New*.
2. Set *Name* to saml_ztna.
3. Set *Address* to webserver.ztnademo.com:8443.

   The Entity ID, Assertion consumer service URL and Single logout service URL will be updated. You will need to enter these URLs into FAC in a later step.
4. Enable *Certificate*, then select the certificate used for the client.

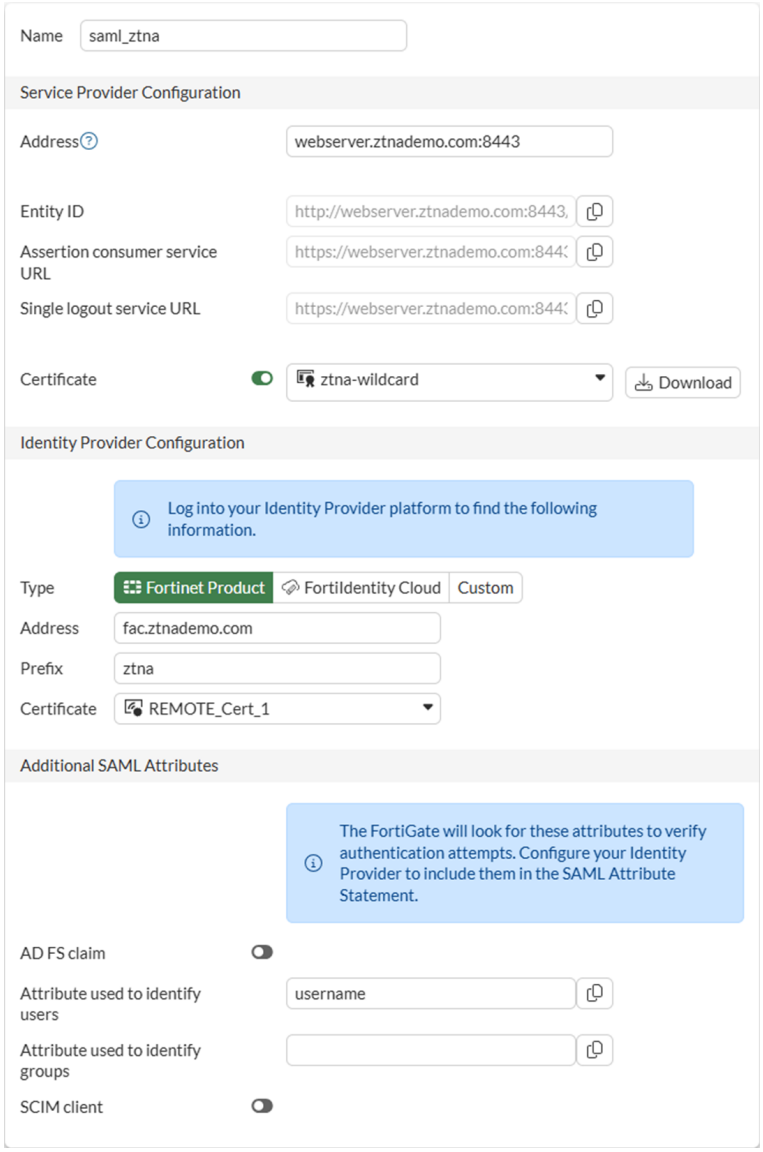
   In this example, the ztna-wildcard certificate is a local certificate that is used to sign SAML messages that are exchanged between the client and the FortiGate SP.
5. Use the settings from the FortiAuthenticator to fill the custom Identity Provider Details. In this example, we select Fortinet Product and fill in the following fields:

Address	fac.ztnademo.com
Prefix	ztna
IdP certificate	REMOTE_Cert_1

   The certificate REMOTE_Cert_1 is the certificate used by the IdP (fac.ztnademo.com). In this example, a wildcard certificate is used.



6. Set Attribute used to identify users to username. Attributes to identify users and groups are case sensitive.



7. Click *OK* to save the settings

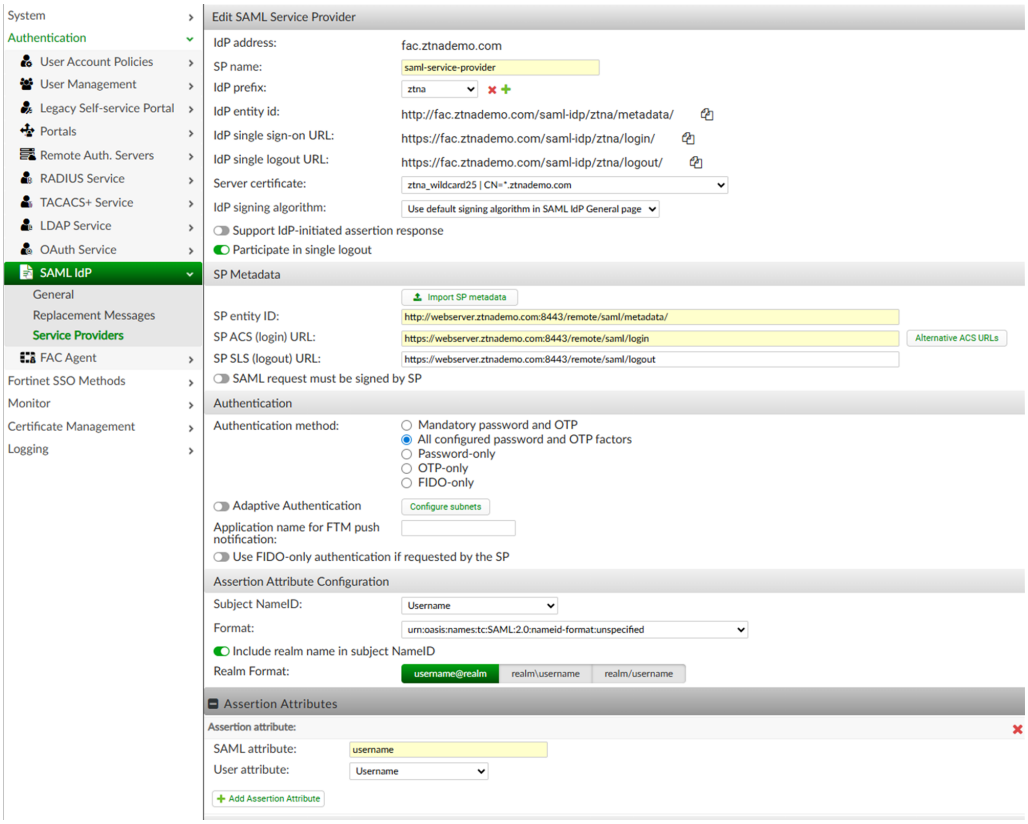
To configure a SAML server in the CLI:

```
config user saml
    edit "saml_ztna"
        set cert "ztna-wildcard"
        set idp-cert "REMOTE_Cert_1"
        set user-name "username"
        set digest-method sha256
        set entity-id "http://webserver.ztnademo.com:8443/remote/saml/metadata/"
        set single-sign-on-url "https://webserver.ztnademo.com:8443/remote/saml/login"
        set single-logout-url "https://webserver.ztnademo.com:8443/remote/saml/logout"
        set idp-entity-id "http://fac.ztnademo.com/saml-idp/ztna/metadata/"
        set idp-single-sign-on-url "https://fac.ztnademo.com/saml-idp/ztna/login/"
        set idp-single-logout-url "https://fac.ztnademo.com/saml-idp/ztna/logout/"
```

```
    next
end
```

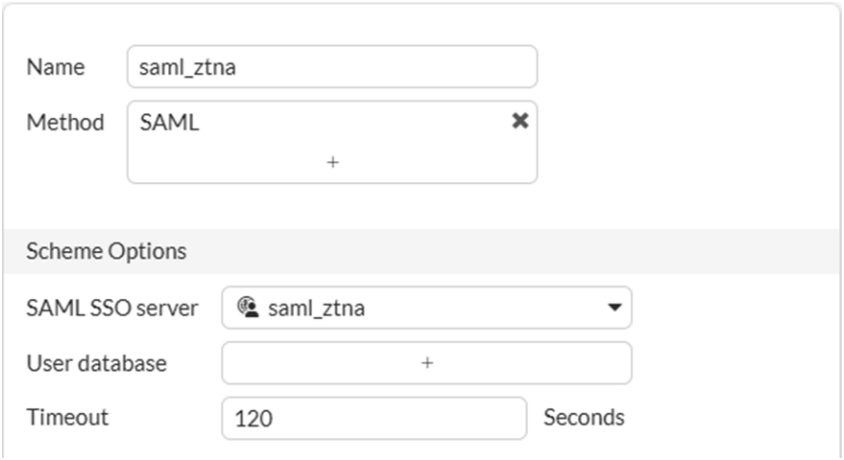
Apply the SP settings in the IdP

The settings configured on the SP must be added to the IdP.

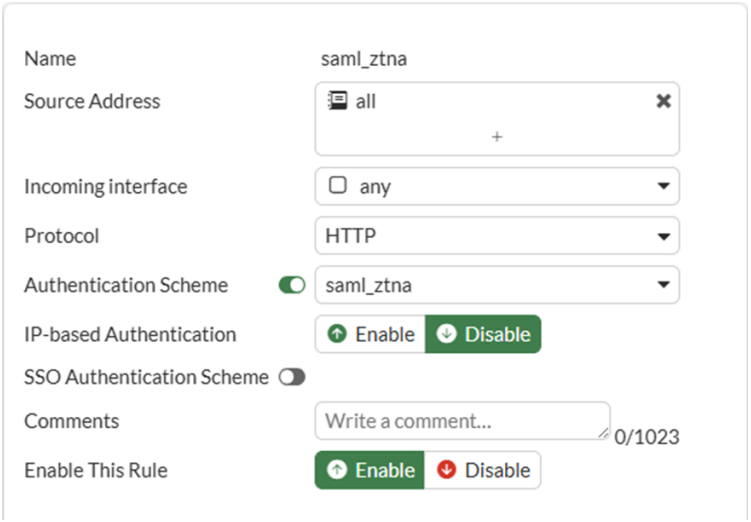


To apply the SAML server to proxy authentication in the GUI:

1. Go to *Policy & Objects* > *Authentication*.
   a. Create a new authentication scheme:
   b. Go to the *Authentication Scheme* tab and click *Create New*.
   c. Set the *Name* to saml_ztna.
   d. Set the *Method* to *SAML*.
   e. Set *SAML SSO server* to saml_ztna.
   f. Click *OK*.



2. Create a new authentication rule:
   a. Select *Authentication Rules* from the top menu bar.
   b. Click *Create New*.
   c. Set the *Name* to saml_ztna.
   d. Set the *Source address* to all.
   e. Set *Incoming interface* to port3.
   f. Set *Protocol* to *HTTP*.
   g. Enable *Authentication Scheme*, and select saml_ztna.
   h. Set *IP-based Authentication* to *Disable*.
   i. Click *OK* to save the rule.



To apply the SAML server to proxy authentication from the CLI:

```
config authentication scheme
     edit "saml_ztna"
         set method saml
         set saml-server "saml_ztna"
```

```
    next
end
```

```
config authentication rule
    edit "saml_ztna"
        set srcintf "port3"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "saml_ztna"
        set web-auth-cookie enable
    next
end
```

To create a user group for the SAML user object:

1. Go to *User & Authentication > User Groups*, and click *Create New*.
2. Set *Name* to saml_group.
3. Under *Remote Groups*, click *Add*.
4. For *Remote Server*, select the SAML user object: saml_ztna and click *OK*.
5. Click *OK* again to save the user group.

To create a user group for the SAML user object in the CLI:

```
config user group
    edit "saml_group"
        set member "saml_ztna"
    next
end
```

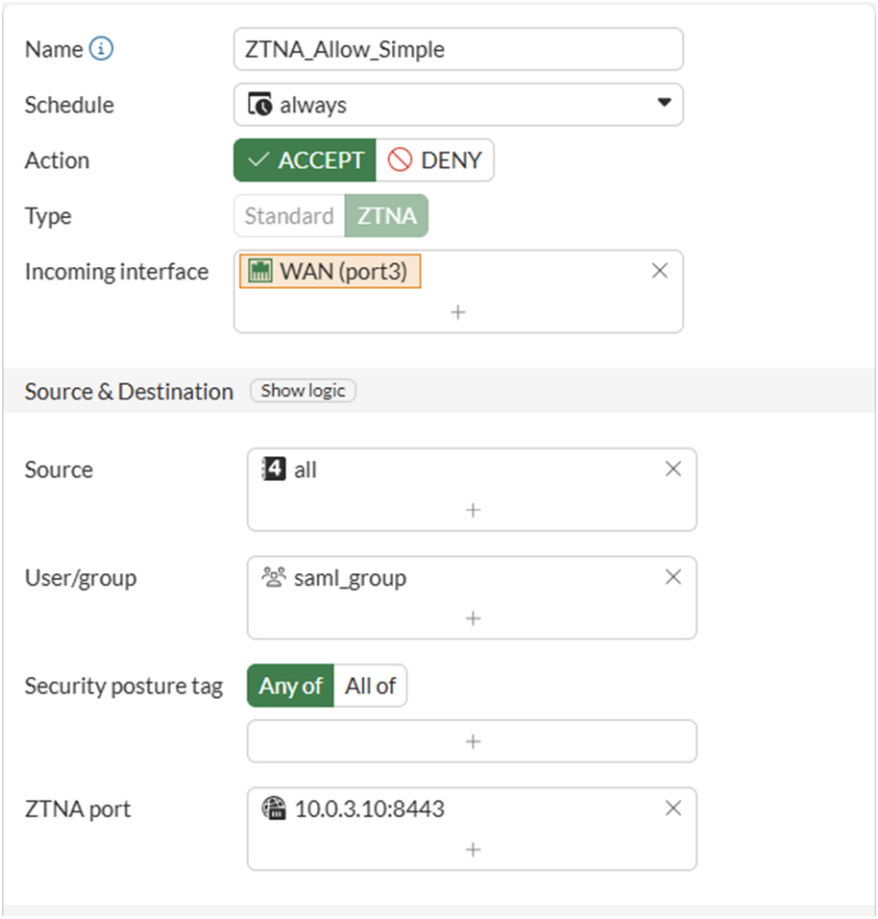
To enable user group authentication in a ZTNA firewall policy:

A simple ZTNA policy is created to apply the SAML authentication.

1. Go to *Policy & Objects > Firewall Policy* and select *Create New*.
2. Configure the following:

Name	ZTNA_Allow_Simple
Action	Accept
Type	ZTNA
Incoming Interface	port3
Source	All
User/group	saml_group
ZTNA port	WebServer:8443
Log allowed traffic	All sessions

3. Click *OK* to save the policy.



To enable user group authentication in a ZTNA firewall policy in the CLI:

```
config firewall policy
    edit 1
        set name "ZTNA_Allow_Simple"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "WebServer:8443"
        set ztna-destination "Webserver:9043"
        set schedule "always"
        set logtraffic all
        set nat enable
        set groups "saml_group"
    next
end
```

To configure a VIP and firewall policy to forward IdP authentication traffic to the FortiAuthenticator

Remote clients connect to the FortiAuthenticator IdP behind the FortiGate using a VIP. In this example, users connect to the FQDN fac.ztnademo.com which resolves to the VIP's external IP address.

1. Configure the VIP to forward traffic to the FortiAuthenticator:
   a. Go to *Policy & Objects* > *Virtual IPs*. The *Virtual IP* tab is selected.
   b. Click *Create New* to define the following:

Name	FAC-VIP
Interface	any
External IP address/range	10.0.3.7
Map to > IPv4 address/range	10.88.0.7

   Additional settings may be configured to limit traffic to TCP/443.
   a. Click *OK* to save the VIP.
2. Configure a firewall policy to allow the VIP traffic:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Configure the following:

Name	WAN_to_FAC
Action	Accept
Type	Standard
Incoming Interface	port3
Outgoing Interface	port2
Source	All
Destination	FAC-VIP
Service	All
NAT	Disabled

   c. Click *OK* to save the policy

To configure a VIP and firewall policy to forward IdP authentication traffic to FortiAuthenticator in the CLI:

```
config firewall vip
    edit "FAC-VIP"
        set uuid a43372f8-06af-51ec-8f86-30b451b2ebe0
        set extip 10.0.3.7
        set mappedip "10.88.0.7"
        set extintf "any"
    next
end
```

```
config firewall policy
    edit 2
        set name "WAN_to_FAC"
        set srcintf "port3"
```

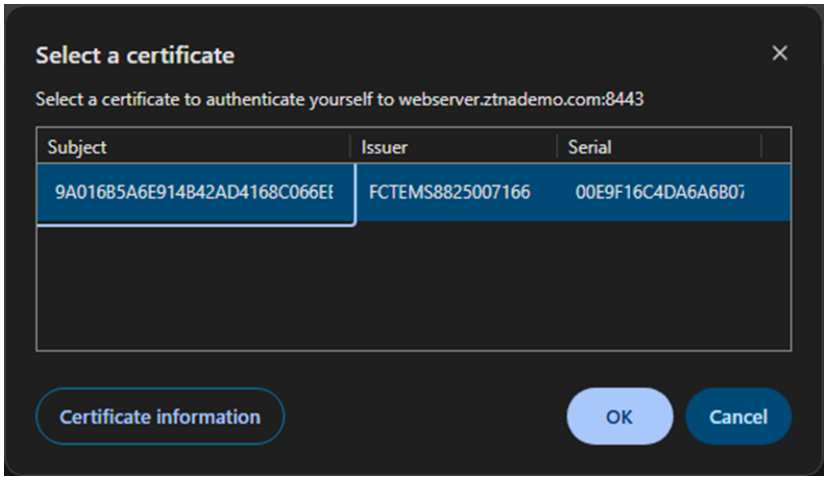
```
        set dstintf "port2"
        set action accept
        set srcaddr "all"
        set dstaddr "FAC-VIP"
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

Testing the connection

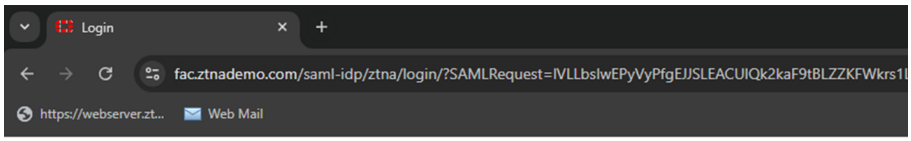
To test the connection:

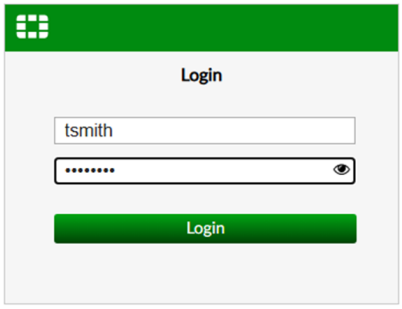
> It is not necessary to configure a *ZTNA Destination* on the FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

1. On the remote Windows computer, open FortiClient and register to the EMS server.
2. Device authentication prompts the user for their device certificate. Select the certificate issued by EMS and click OK.

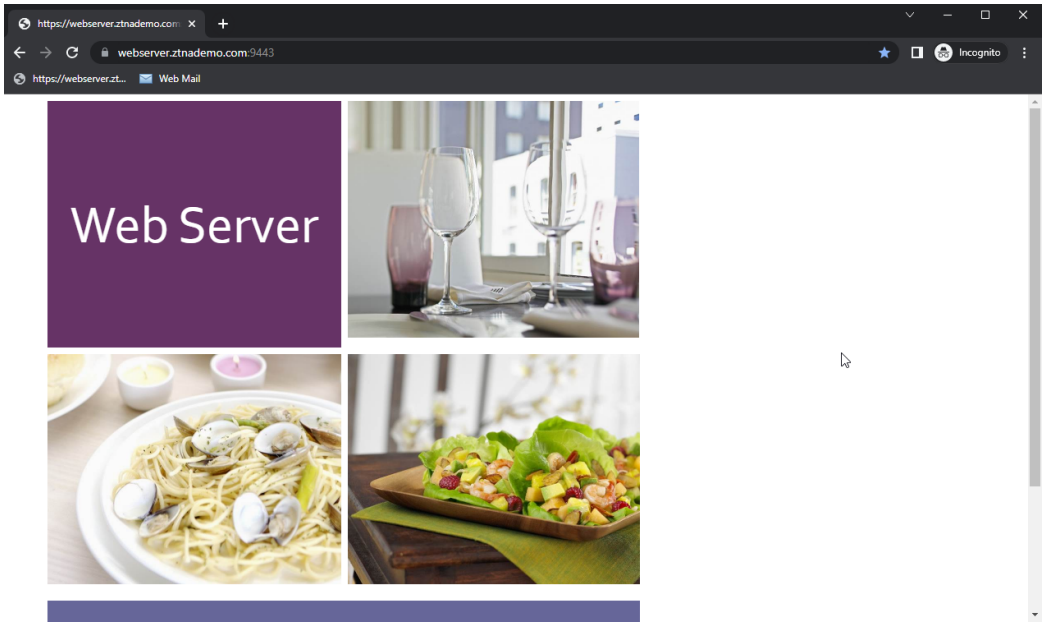


3. The user traffic matches the ZTNA policy and the user is redirected to the IdP for authentication.





4. Enter your user credentials. The SAML server authenticates and sends a SAML assertion response message to the FortiGate.
5. The user is proxied to the webpage on the real web server.



Logs and debugs

Use the following command to check the user information after the user has been authenticated:

```
# diagnose wad user list
ID: 3, VDOM: root, IPv4: 10.0.3.2
  user name    : tsmith
```

```
  worker      : 0
  duration    : 69
  auth_type   : Session
  auth_method : SAML
  pol_id      : 17
  g_id        : 8
  user_based  : 0
  expire      : no
  LAN:
    bytes_in=28146 bytes_out=309763
  WAN:
    bytes_in=303009 bytes_out=4474
```

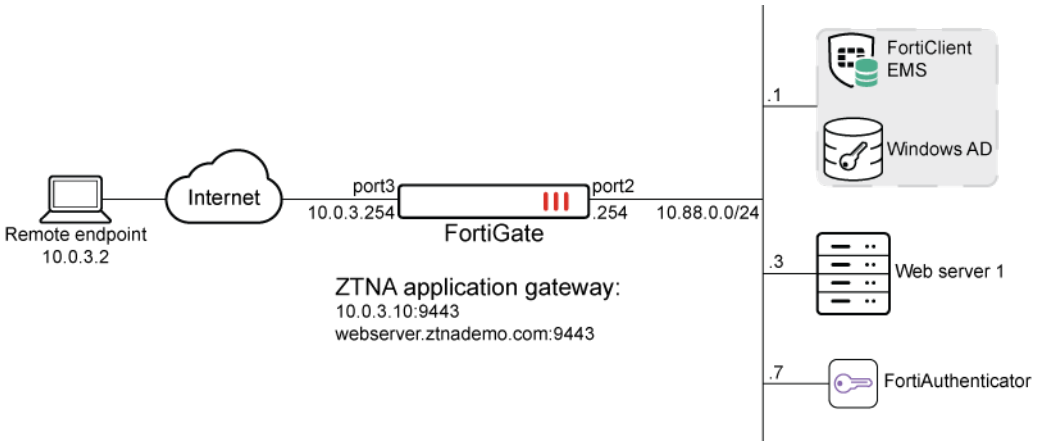
ZTNA application gateway with SAML and MFA using FortiAuthenticator example

ZTNA application gateway supports device verification using device certificates that are issued by EMS. To authenticate users, administrators can use either basic or SAML authentication. An advantage of SAML authentication is that multi-factor authentication (MFA) can be provided by the SAML Identity Provider (IdP).

In these examples, a FortiAuthenticator is used as the IdP, and MFA is applied to user authentication for remote users accessing the web, RDP, and SSH resources over the ZTNA application gateway. It is assumed that the FortiGate EMS fabric connector has already been successfully connected.

- Configuring FortiAuthenticator on page 1687
- Configuring the FortiGate SAML settings on page 1691
- Example 1 - Applying SAML and MFA to ZTNA HTTPS access proxy on page 1696
- Example 2 - Applying SAML and MFA to a ZTNA TCP forwarding access proxy for RDP connections on page 1703



DNS resolutions:

- webserver.ztnademo.com:9443 -> 10.0.3.10:9443
- fac.ztnademo.com -> 10.0.3.7

The FortiAuthenticator (FAC) integrates with Active Directory (AD) on the Windows Domain Controller, which is also acting as the EMS server. Users are synchronized from the AD to the FAC, and remote users are configured with token-based authentication. SAML authentication is configured on the FortiGate, pointing to the FAC as the SAML IdP. The SAML server is applied to the ZTNA application gateway authentication scheme and rule, to provide the foundation for applying user authentication on individual ZTNA policies.

Configuring FortiAuthenticator

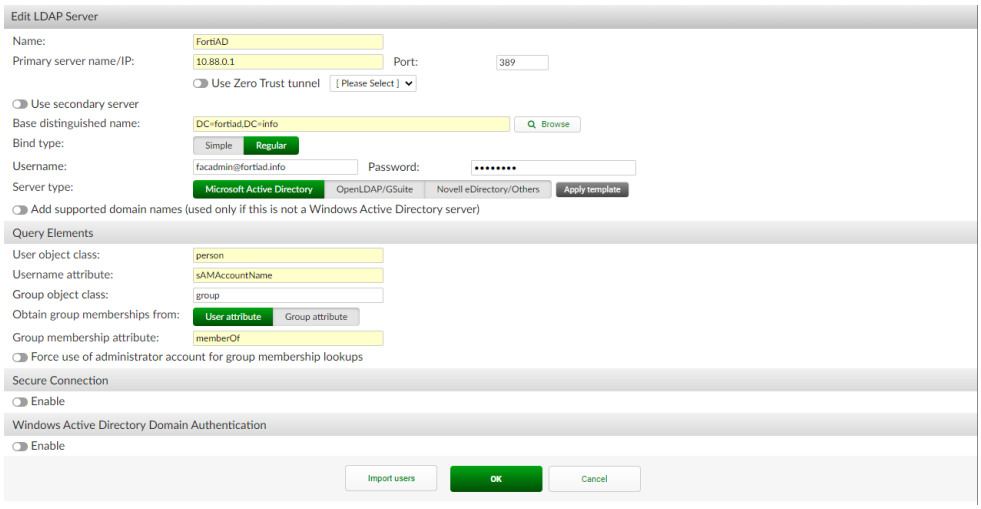
First configure FortiAuthenticator to synchronize users from AD using LDAP, apply MFA to individual remote users, and be the IdP.

To create a remote authentication server pointing to the Windows AD:

1. Go to *Authentication* > *Remote Auth. Servers* > *LDAP* and click *Create New*.
2. Configure the following:

Name	FortiAD
Primary server name / IP	10.88.0.1
Port	389 (or another port if using LDAPS)
Based distinguished name	DC=fortiad,DC=info
Bind type	Regular
Username	<user account used for LDAP bind>
Password	<password of user>
Server Type	Microsoft Active Directory
User object class	person (default)
Username attribute	sAMAccountName (default)
Group object class	group (default)
Obtain group membership from	User attribute
Group membership attribute	memberOf (default)
Secure connection	Enable if using LDAPS or STARTTLS

3. Click *OK*.
4. Edit the *FortiAD* entry.
5. At the bottom, click *Import users*.



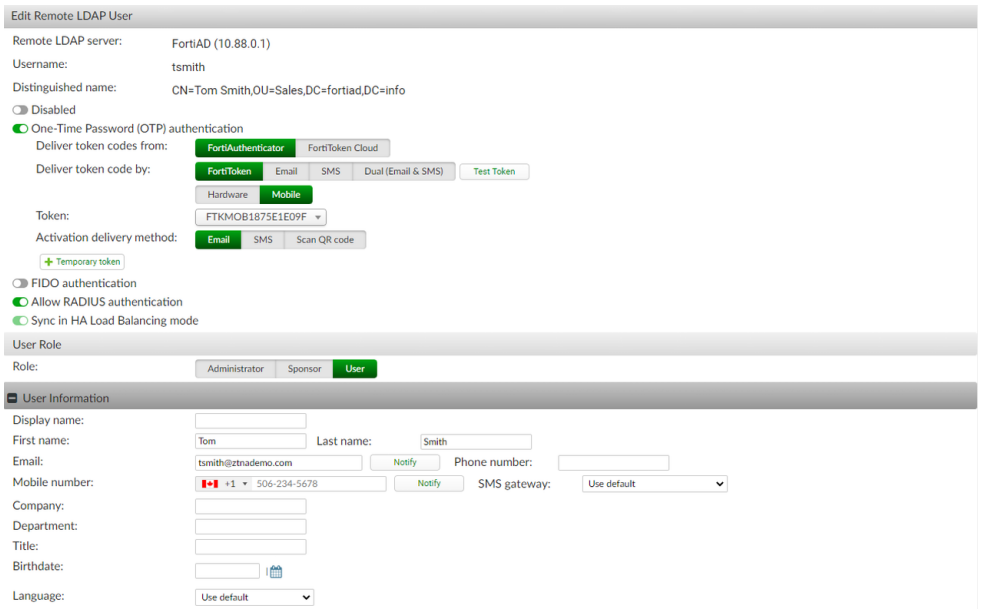
6. On the *Import Remote LDAP User* screen, configure the following settings:
   a. For *Remote LDAP Server*, select *FortiAD*.
   b. For *Action*, select *Import users*.
      i. Click *Go*.
      ii. Select the users to import.
      iii. Click *OK*.

   The screen displays the users that are imported.

   For more details, see LDAP in the FortiAuthenticator Administration Guide.

To configure a remote LDAP user to use MFA:

1. Go to *Authentication > User Management > Remote Users*, and edit a user.
2. Enable *One-Time Password (OTP) authentication*.
   a. Set *Deliver token codes from* to *FortiAuthenticator*.
   b. Set *Deliver token by*:
      i. Select *FortiToken > Mobile*.
      ii. Select *Token* from the drop-down list.
      iii. Set the *Activation delivery method* to email.
3. In the *User Information* section, add the email address that will be used for the FortiToken activation.



4. Click *OK*.

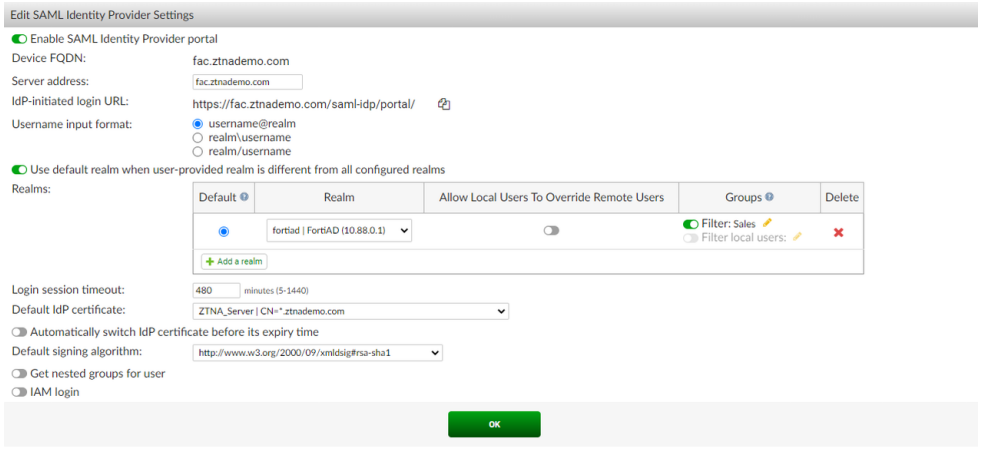
   An activation email is sent to the user that they can use to install the token to their FortiToken Mobile app.

   This guide assumes the token has been activated on a mobile device for user Tsmith.

   For more details, see Remote users in the FortiAuthenticator Administration Guide.

To configure SAML IdP:

1. Go to *Authentication > SAML IdP > General* and enable *Enable SAML Identity Provider portal*.
2. The *Server address* is the device FQDN or IP address (configured in the System Information widget at *System > Dashboard > Status*). In this example, it is *fac.ztnademo.com*.
3. Set *Username input format* to *username@realm*.
4. Click *Add a realm* in the *Realms* table:
   a. Set *Realm* to the just created LDAP realm (*FortiAD*).
   b. Optionally, enable *Filter* and select the required users groups. In this example, *Sales* is configured.
5. Set *Default IdP certificate* to the certificate that will be used in the HTTPS connection to the IdP portal.

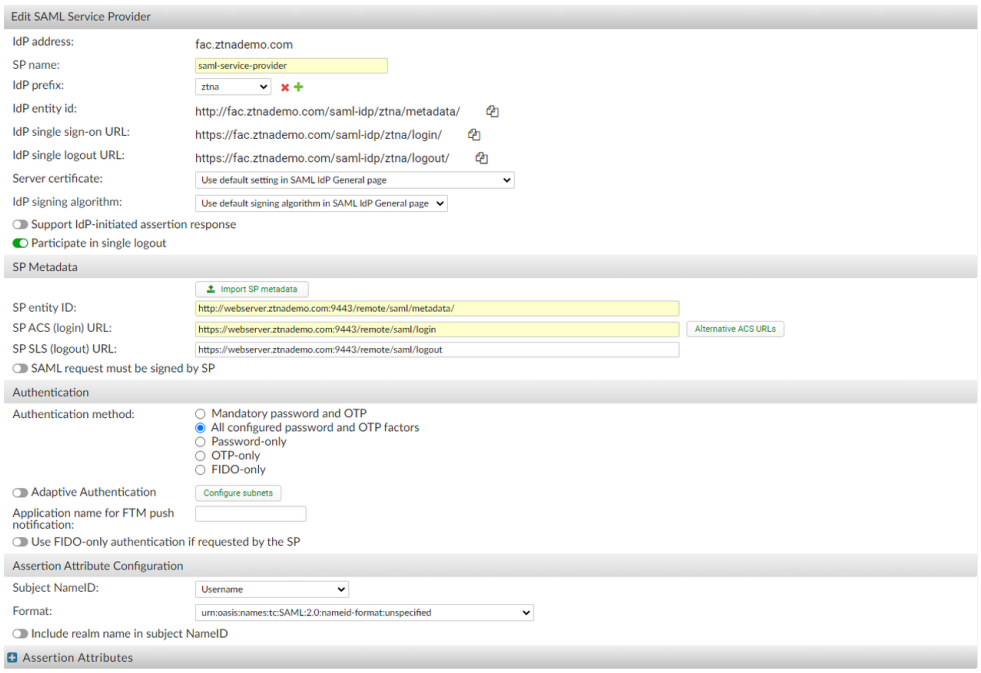


6. Click *OK*.
7. Go to *Authentication > SAML IdP > Service Providers*, and click *Create New* to create a service provider (SP) for the FortiGate SP.
8. Configure the following, which must match what will be configured on the FortiGate:

SP name	saml-service-provider
IdP prefix	ztna
Server certificate	Use default setting in *SAML IdP > General* page.
SP entity ID	http://webserver.ztnademo.com:9443/remote/saml/metadata/
SP ACS (login) URL	https://webserver.ztnademo.com:9443/remote/saml/login
SP SLS (logout) URL	https://webserver.ztnademo.com:9443/remote/saml/logout
Participate in single logout	Enable

Where the *SP entity ID*, *SP ACS (login) URL*, and *SP SLS (logout) URL* break down as follows:

- *webserver.ztnademo.com* - The FQDN that resolves to the FortiGate SP.
- *9443* - The port that is used to map to the FortiGate's SAML SP service.
- */remote/saml* - The custom, user defined fields.
- */metadata*, */login*, and */logout* - The standard convention used to identify the SP entity, log in portal, and log out portal.



9. Click *OK*.
10. Edit the just created SP object and, under *Assertion Attribute*, click *Add Assertion Attribute*.
11. Set *SAML attribute* to the username and set *User attribute* to *Username*, then click *OK*.
12. Click *OK*.

For more details, see Configuring SAML settings in the SAML Interoperability Guide.

Configuring the FortiGate SAML settings

On FortiGate, a SAML user is used to define the SAML SP and IdP settings. This user is then applied to the ZTNA proxy using an authentication scheme, rule, and settings. A ZTNA server is then created to allow access to the SAML SP server so that end users can reach the FortiGate SP's captive portal. The SAML user must then be added to a ZTNA policy to trigger authentication when accessing the ZTNA application gateway.

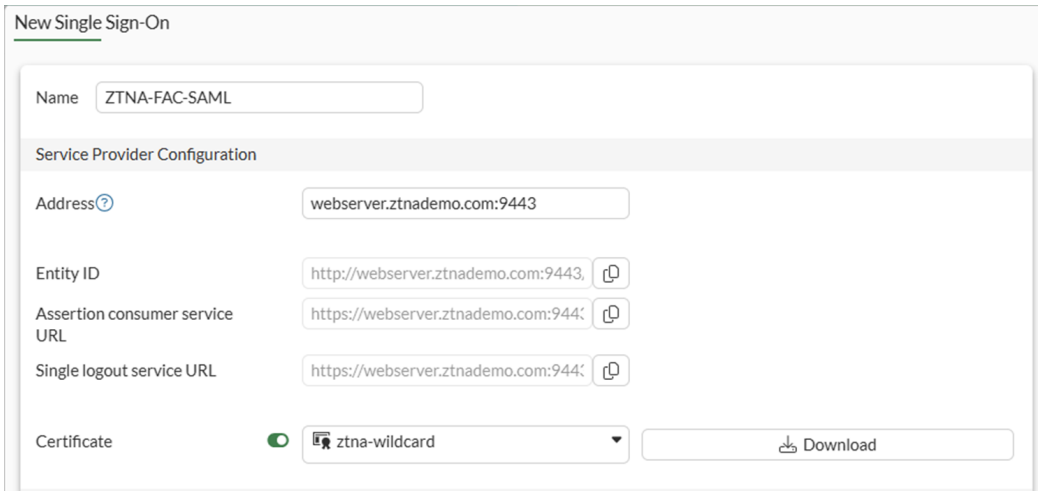
To create a new SAML user/server from the GUI:

1. On the FortiGate, go to *User & Authentication* > *Single Sign-On*.
2. Click *Create New*.
3. Set *Name* to *ZTNA-FAC-SAML*.
4. Set *Address* to *webserver.ztnademo.com:9443*.

   The *Entity ID*, *Assertion consumer service URL* and *Single logout service URL* will be updated. These should be the same URLs you configured on FortiAuthenticator.
5. Enable *Certificate*, then select the certificate used for the client.

   This example uses a wildcard certificate with a Common Name (CN):

   *.ztnademo.com to sign SAML messages that are exchanged between the client and the FortiGate SP.

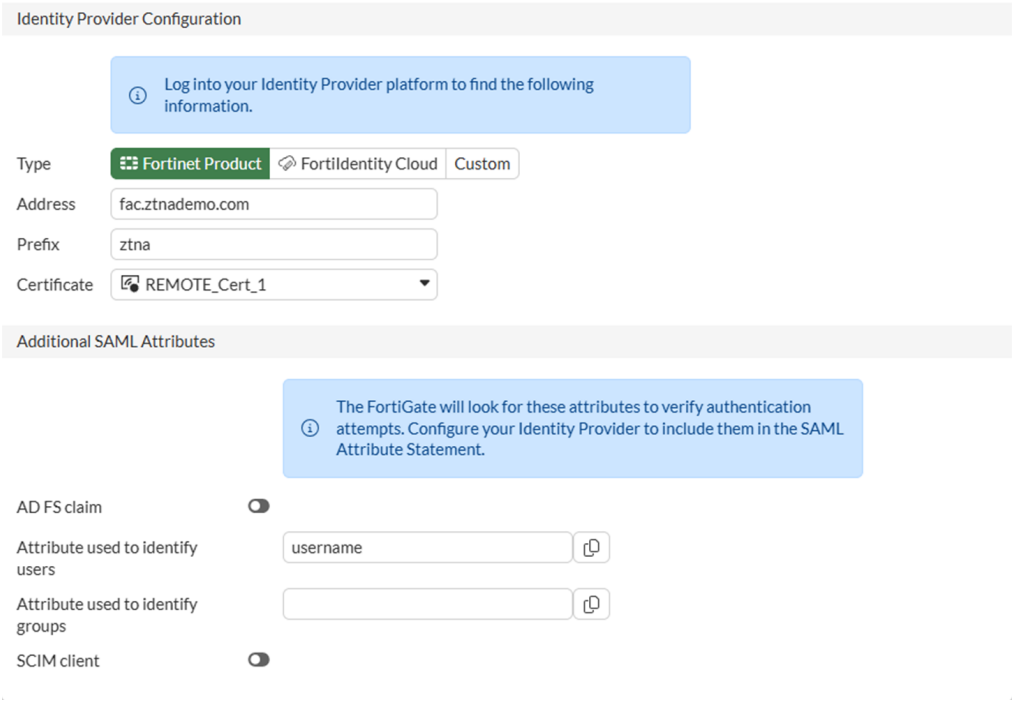


6. Use the settings from the Identity Provider to fill the custom *Identity Provider Details*. In this example, we select *Fortinet Product*, and fill in the fields as follows:

Address	fac.ztnademo.com
Prefix	ztna
IdP certificate	REMOTE_Cert_1

The certificate REMOTE_Cert_1 is the certificate used by the IdP (fac.ztnademo.com). In this example, a wildcard certificate is used.

7. Set *Attribute used to identify users* to *username*. Attributes to identify users and groups are case sensitive.



8. Click *OK* to save the settings.

To create a new SAML user/server from the CLI:

```
config user saml
    edit "ZTNA-FAC-SAML"
        set cert "ztna-wildcard"
        set idp-cert "REMOTE_Cert_1"
        set user-name "username"
        set digest-method sha256
        set entity-id "http://webserver.ztnademo.com:9443/remote/saml/metadata/"
        set single-sign-on-url "https://webserver.ztnademo.com:9443/remote/saml/login"
        set single-logout-url "https://webserver.ztnademo.com:9443/remote/saml/logout"
        set idp-entity-id "http://fac.ztnademo.com/saml-idp/ztna/metadata/"
        set idp-single-sign-on-url "https://fac.ztnademo.com/saml-idp/ztna/login/"
        set idp-single-logout-url "https://fac.ztnademo.com/saml-idp/ztna/logout/"
    next
end
```

To create a user group for the SAML user object:

1. Under *User & Authentication* > *User Groups*, click *Create New*.
2. Set *Name* to *ztna-saml-users*.
3. Under *Remote Groups*, click *Add*.
4. For *Remote Server*, select *ZTNA-FAC-SAML*.
5. Click *OK*.
6. Click *OK* again to save.

To apply the SAML server to proxy authentication from the GUI:

1. Go to *Policy & Objects > Authentication*.
2. Go to the *Authentication Schemes* tab and click *Create New*.
3. Set the name to *ZTNA-SAML-scheme*.
4. Set *Method* to *SAML*.
5. Set *SAML SSO server* to *ZTNA-FAC-SAML*.
6. Click *OK*.
7. Remaining in *Policy & Objects > Authentication*, select the *Authentication Rules* tab in the top menu.
8. Click *Create New*.
9. Set the *Name* to *ZTNA-SAML-rule*.
10. Set *Source Address* to *all*.
11. Set *Incoming interface* to *port3*.
12. Set *Protocol* to *HTTP*.
13. Enable *Authentication Scheme* and select *ZTNA-SAML-scheme*.
14. Set *IP-based Authentication* to *Disable*.
15. Click *OK*.

To apply the SAML server to proxy authentication from the CLI:

```
config authentication scheme
    edit "ZTNA-SAML-scheme"
        set method saml
        set saml-server "ZTNA-FAC-SAML"
    next
end
config authentication rule
    edit "ZTNA-SAML-rule"
        set srcintf "port3"
        set srcaddr "all"
        set ip-based disable
        set active-auth-method "ZTNA-SAML-scheme"
        set web-auth-cookie enable
    next
end
```

Assign an active authentication scheme and captive portal to serve the log in page for the SAML requests.

To configure the active authentication scheme and captive portal from the GUI:

1. Go to *User & Authentication > Authentication Settings*.
2. Enable *Authentication scheme*.
3. Select *ZTNA-SAML-scheme*.
4. Set *Captive portal type* to *FQDN*.
5. Enable *Captive portal*.
6. Select the firewall address *webserver.ztnademo.com*. If this has not be created, create this firewall address.

7. Click *Apply* to save.

To configure the active authentication scheme and captive portal from the CLI:

```
config firewall address
    edit "webserver.ztnademo.com"
        set type fqdn
        set fqdn "webserver.ztnademo.com"
    next
end
config authentication setting
    set active-auth-scheme "ZTNA-SAML-scheme"
    set captive-portal "webserver.ztnademo.com"
end
```

To configure a VIP and a firewall policy to forward IdP authentication traffic to the FortiAuthenticator:

Remote clients connect to the FortiAuthenticator IdP behind the FortiGate using a VIP. In this example, users connect to the FQDN fac.ztnademo.com that resolves to the VIP's external IP address.

1. Configure the VIP to forward traffic to the FortiAuthenticator:
   a. Go to *Policy & Objects* > *Virtual IPs* and navigate to the *Virtual IP* tab.
   b. Click *Create new* .
   c. Configure the following:

Name	FAC-VIP
Interface	Any
External IP address/range	10.0.3.7
Map to > IPv4 address/range	10.88.0.7

   d. Click *OK*.
2. Configure a firewall policy to allow VIP:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Configure the following:

Name	WAN_to_FAC
Schedule	Always
Action	Accept
Type	Standard
Incoming Interface	port3
Outgoing Interface	port2
Source	All

ZTNA server	FAC-VIP
Service	HTTP. HTTPS
NAT	disabled

c. Click *OK*.

To configure a VIP and firewall policy to forward IdP authentication traffic to the FortiAuthenticator in the CLI:

```
config firewall vip
    edit "FAC-VIP"
        set extip 10.0.3.7
        set mappedip "10.88.0.7"
        set extintf "any"
    next
end
```

```
config firewall policy
    edit 2
        set name "WAN_to_FAC"
        set srcintf "port3"
        set dstintf "port2"
        set action accept
        set srcaddr "all"
        set dstaddr "FAC-VIP"
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

Example 1 - Applying SAML and MFA to ZTNA HTTPS access proxy

In this HTTPS web proxy example, a web proxy is used to access a web server. The ZTNA rule verifies device identity and applies the SAML user group to enforce user authentication against the IdP (FortiAuthenticator).

To configure the ZTNA server for HTTPS access proxy:

1. Go to *Policy & Objects* > *ZTNA* and select the *Servers & Portals* tab.
2. Select *Create New*.
3. Set *Name* to *ZTNA-Webserver*.
4. Set *Host* to the IP address or FQDN that will be used to access the web server: webserver.ztnademo.com.

   Endpoints accessing the web server must resolve this FQDN to the ZTNA Application Gateway address (10.0.3.10 in this example).

5. Under *Connects on*, select *Create new for ZTNA port* to provide the following details:

a. Set *Interface* to *port3*.
b. Set *External IP* to *10.0.3.10*.
c. Set *External port* to *9443*.

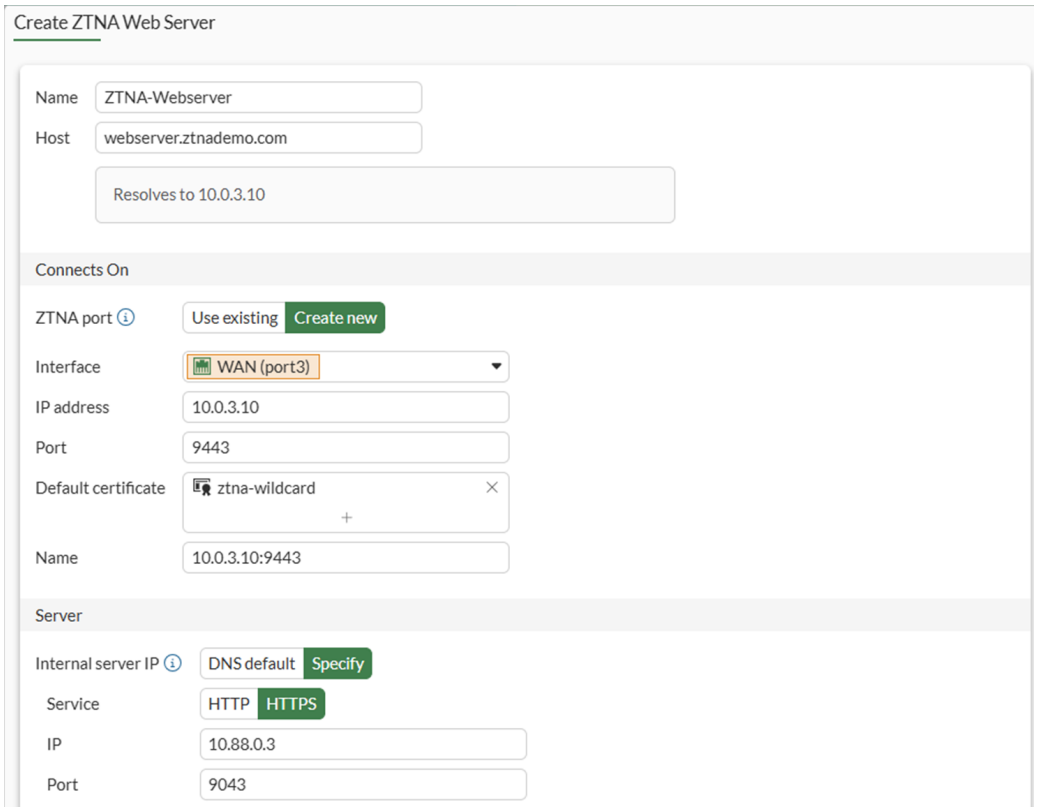
> Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.

6. Select a *certificate*. Clients will be presented with this certificate when they connect to the ZTNA port.

> This example uses a wildcard certificate with a Common Name (CN): *.ztnademo.com. This certificate is trusted by the endpoints which will access the ZTNA port.

7. Provide a name for the ZTNA port, such as 10.0.3.10:9443.
8. In the *Server* section, configure the internal server settings as follows:
   a. Switch the *Internal server IP* to *Specify*.
   b. Set *Service* to *HTTPS*.
   c. Set *IP to the internal IP for the web server: 10.88.0.3*.
   d. Set *Port* to *9443*.

> The WebServer service is running on port 9043. This configuration will translate clients accessing TCP/9443 to TCP/9043.



9. Click *OK* to save the ZTNA web server.

To configure ZTNA for the web server in the CLI:

```
config firewall vip
    edit "10.0.3.10:9443"
        set type access-proxy
        set server-type https
        set extip 10.0.3.10
        set extintf "port3"
        set extport 9443
        set ssl-certificate "ztna-wildcard"
    next
end
```

```
config firewall access-proxy-virtual-host
    edit "WebServer9443"
        set ssl-certificate "ztna-wildcard"
        set host "webserver.ztnademo.com"
    next
end
```

```
config ztna web-proxy
    edit "ZTNA-Webserver"
        set vip "10.0.3.10:9443"
        set host " WebServer9443"
        config api-gateway
            edit 1
                config realservers
                    edit 1
                        set ip 10.88.0.3
                        set port 9043
                    next
                end
            next
        end
    next
end
```

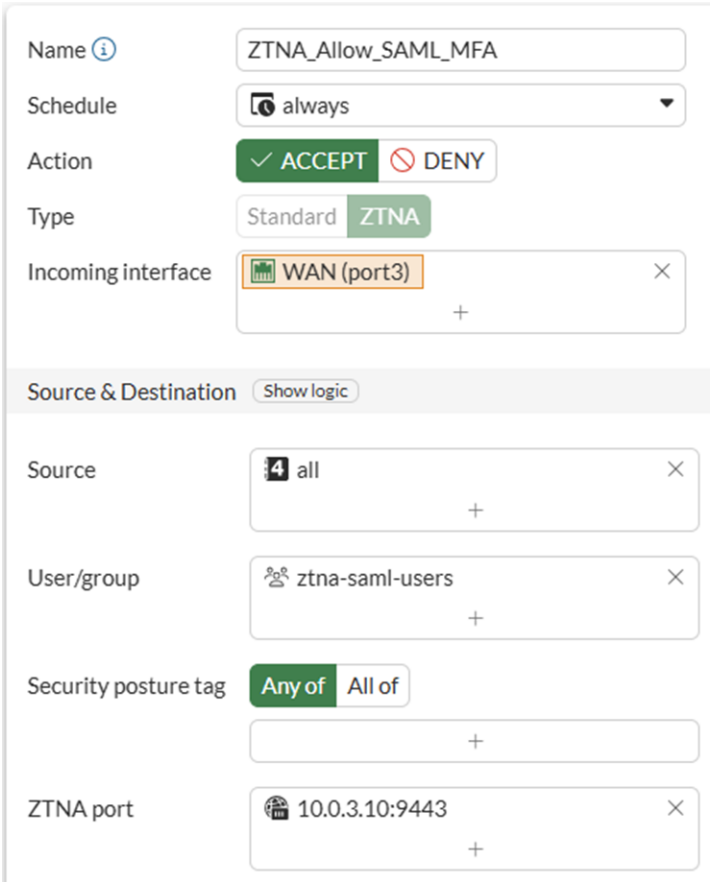
To enable user group authentication in a ZTNA firewall policy:

A simple ZTNA policy is created to apply the SAML authentication.

1. Go to *Policy & Objects > Firewall Policy* and select *Create New*.
2. Configure the following:

Name	ZTNA_Allow_SAML_MFA
Action	Accept
Type	ZTNA
Incoming Interface	port3

Source	All
User/group	ztna-saml-users
ZTNA port	10.0.3.10:9443
Log allowed traffic	All sessions



3. Click *OK* to save the policy.

To enable user group authentication in a ZTNA firewall policy in the CLI:

```
Config firewall policy
    edit 1
        set name "ZTNA_Allow_SAML_MFA"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "10.0.3.10:9443"
        set ztna-destination "Webserver:9043"
        set schedule "always"
        set logtraffic all
        set nat enable
        set groups "ztna-saml-users"
```

```
    next
end
```

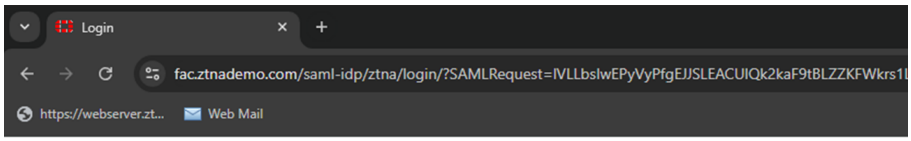
Testing and verification:

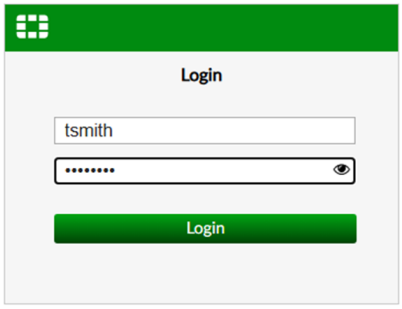
From the remote endpoint, user Tom Smith attempts to connect to the web server over ZTNA:

1. On the remote Windows computer, open FortiClient and register to the EMS server.

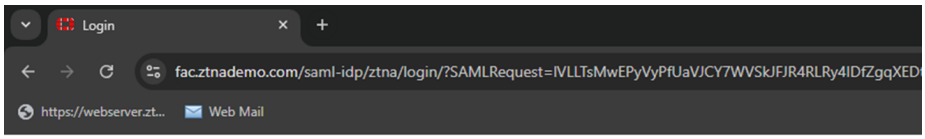
   > It is not necessary to configure a *ZTNA Destination* on the FortiClient for the HTTPS access proxy use case. In fact, configuring a *ZTNA Destination* rule for the website may interfere with its operation.

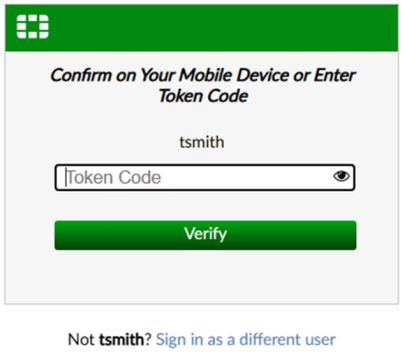
2. Open a browser and attempt to connect to the web server at *https://webserver.ztnademo.com:9443*.
3. Device authentication prompts the user for their device certificate. Select the certificate issued by EMS and click *OK*.
4. FortiGate receives the SAML request and redirects the user to the IdP login screen. Enter the username and password for Tom Smith and click *Login*.



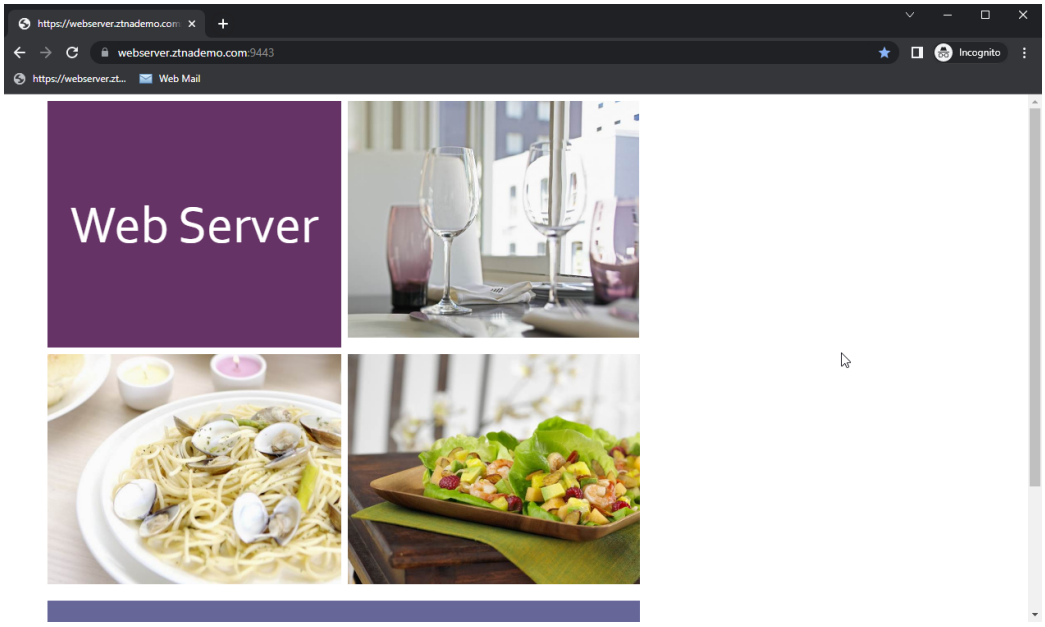


5. A second prompt opens asking for the *Token Code*. Enter the code then click *Verify*.





6. The FortiAuthenticator IdP verifies the login, then sends the SAML assertion back to the user.
7. The browser redirects the assertion to the FortiGate SP, which decides if the user is allowed access.
8. On a successful log in, FortiGate redirects the user to the web page that they are trying to access.



Logs and debugs:

On the FortiGate, a successful connection can be seen in *Log & Report > Forward Traffic* and *Log & Report > ZTNA Traffic*. The CLI can also be used:

```
# execute log filter category 0
# execute log filter field srcip 10.0.3.2
# execute log display

Allow_SAML_MFA" appcat="unscanned" duration=0 vip="10.0.3.10:9443" vipincomingip=10.0.3.10
clientdevicemanageable="unknown" clientcert="no" wanin=0 rcvdbyte=0 wanout=0 lanin=1828
sentbyte=1828 lanout=4141
```

Log number four shows that authentication first hits the ZTNA policy and has an action of **pending**.

Log number three shows that the ZTNA policy redirects the traffic to SAML authentication.

Log number two shows that the WAN_to_FAC policy is hit, indicating the remote user is sending traffic to the FortiAuthenticator.

Log number one shows that the ZTNA policy accepts the traffic and the remote user is permitted to access the ZTNA destination. Notice how the dstip and dstport both change from the application gateway (10.0.3.10:9443) to the real destination (10.88.0.3:9043).

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

```
# diagnose wad user list
ID: 5, VDOM: root, IPv4: 10.0.3.2
  user name   : tsmith
  worker      : 0
  duration    : 6
  auth_type   : Session
  auth_method : SAML
  pol_id      : 17
  g_id        : 8
  user_based  : 0
  expire      : no
  LAN:
    bytes_in=16414 bytes_out=308116
  WAN:
    bytes_in=303036 bytes_out=4474
```

Example 2 - Applying SAML and MFA to a ZTNA TCP forwarding access proxy for RDP connections

In this TCP forwarding access proxy example, RDP connections are allowed to be forwarded to the Windows/EMS server. Traffic to TCP/3389 is allowed through the ZTNA proxy. There are 2 steps to this example: Configure the ZTNA server and Configure the ZTNA policy.

To configure the ZTNA server for TCP forwarding on TCP/3389:

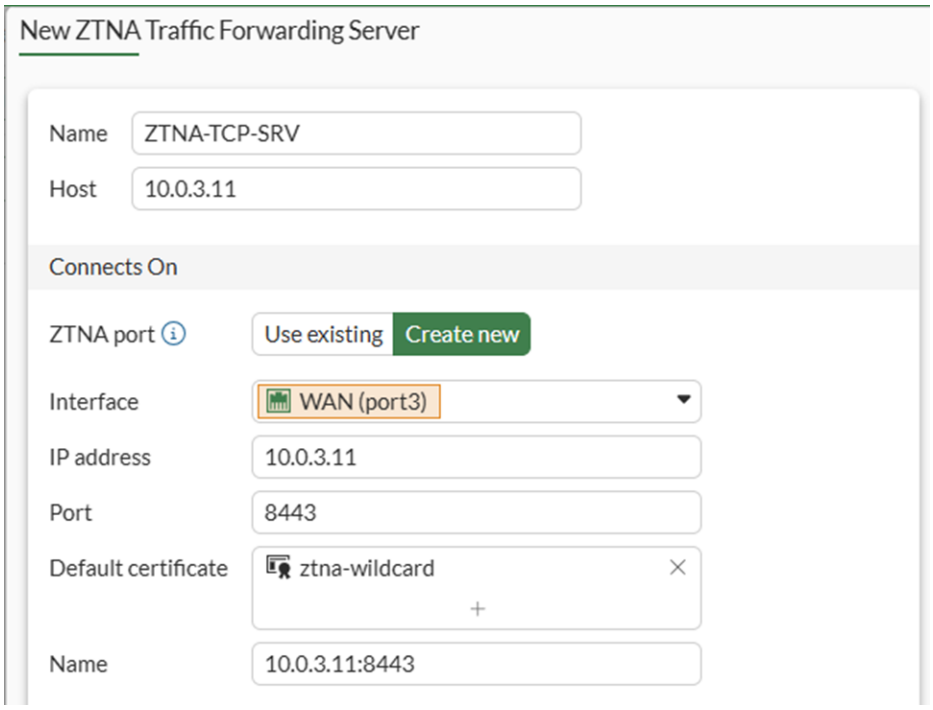
1. Create a firewall address for the Windows/EMS server:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. Configure the following:

Name	winserver
Interface	any
Type	Subnet
IP/Netmask	10.88.0.1/32

   d. Click *OK*.
2. Go to *Policy & Objects* > *ZTNA* and select the *Traffic Forwarding* tab. Traffic Forwarding Server is selected by default.
3. Select *Create New*.
4. Set *Name* to *ZTNA-TCP-SRV*.
5. Set *Host* to *10.0.3.11*.

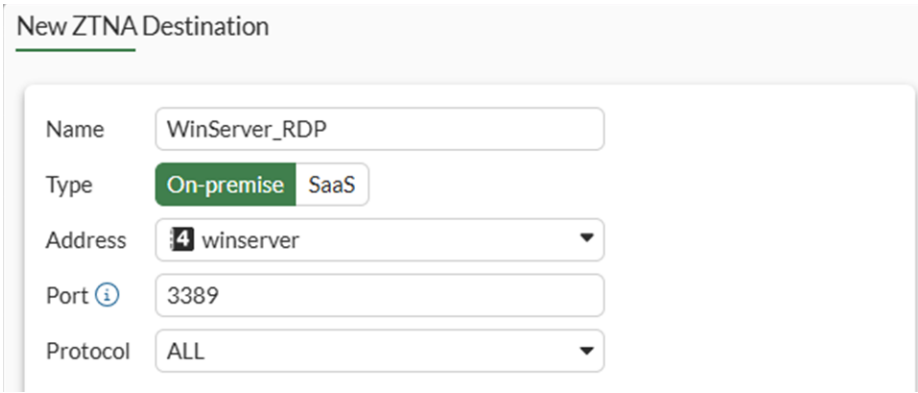
6. For *ZTNA port*, select *Create New* and enter the following details:

Interface	port3
IP address	10.0.3.11
Port	8443
Default certificate	This example uses a wildcard certificate with a Common Name (CN): *.ztnademo.com. This certificate is trusted by the endpoints which will access the ZTNA port.
Name	10.0.3.11:8443



7. Click *OK*.
8. Define a destination for the winserver:
   a. Remaining in the *Traffic Forwarding* section of ZTNA, select *Destination* from the top menu bar.
   b. Select *Create new* to define a new Destination for winserver access:

Name	WinServer_RDP
Type	On-premise
Address	Select the previously created winserver address object
Port	3389
Protocol	TCP[CK1]



c. Click *OK* to save the destination.

To configure the ZTNA server for TCP forwarding on TCP/3389 in the CLI:

1. Configure the access proxy VIP:

```
config firewall vip
    edit "10.0.3.11:8443"
        set type access-proxy
        set server-type https
        set extip 10.0.3.11
        set extintf "port3"
        set extport 8443
        set ssl-certificate "ztna-wildcard"
    next
end
```

2. Configure the destination:

```
config ztna destination
    edit "WinServer_RDP"
        set address "winserver"
        set mappedport 3389
    next
end
```

3. Configure the virtual host:

```
config firewall access-proxy-virtual-host
    edit "10.0.3.11_host"
        set ssl-certificate "ztna-wildcard"
        set host "10.0.3.11"
    next
end
```

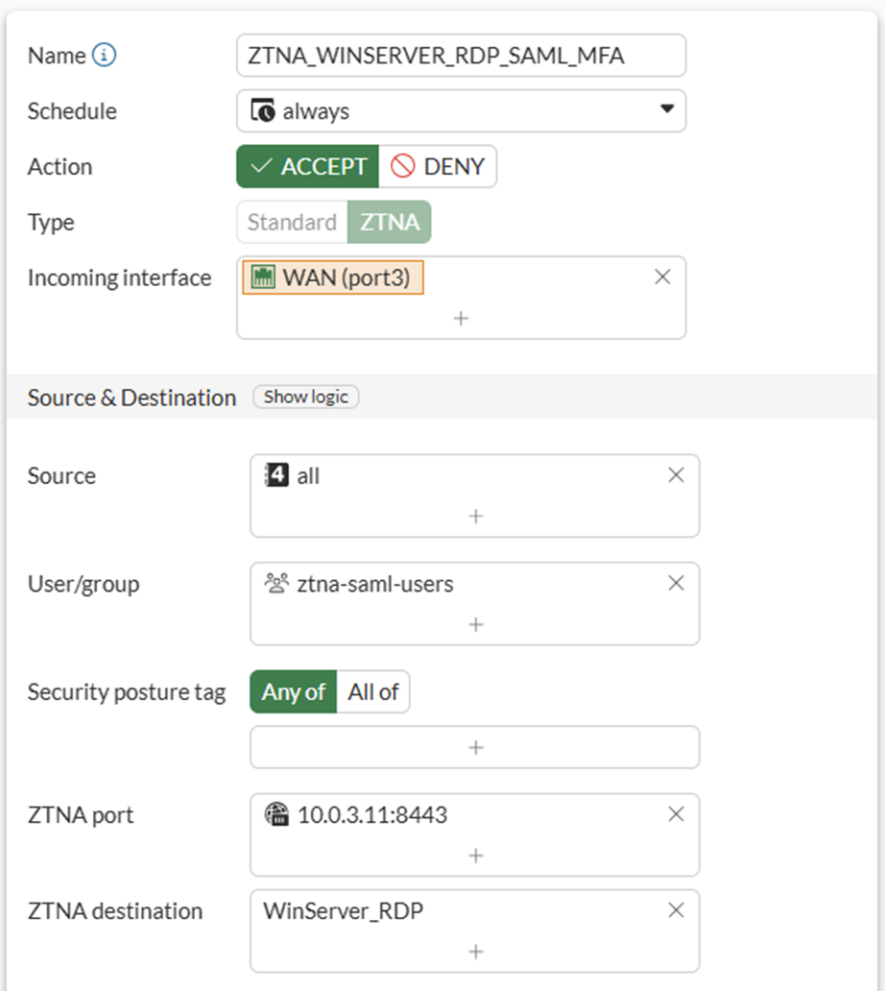
4. Configure the traffic forward proxy:

```
config ztna traffic-forward-proxy
    edit "ZTNA-TCP-SRV"
        set vip "10.0.3.11:8443"
```

```
        set host "10.0.3.11_host"
    next
end
```

To configure the ZTNA policy for TCP forwarding on TCP/3389:

1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*.
2. Set *Name* to ZTNA_WINSERVER_RDP_SAML_MFA.
3. Set *Type* to *ZTNA*.
4. Set *Incoming Interface* to *port3*.
5. Set *Source* to *all*.
6. Set the *User/group* to ztna-saml-users.
7. Set the *ZTNA port*: 10.0.3.11:8443.
8. Set the *ZTNA destination*: WinServer_RDP
9. Configure *Log allowed traffic* to log All sessions.
10. Configure the remaining settings as necessary.



11. Click *OK*.

To configure the ZTNA policy for TCP forwarding on TCP/3389 using the CLI:

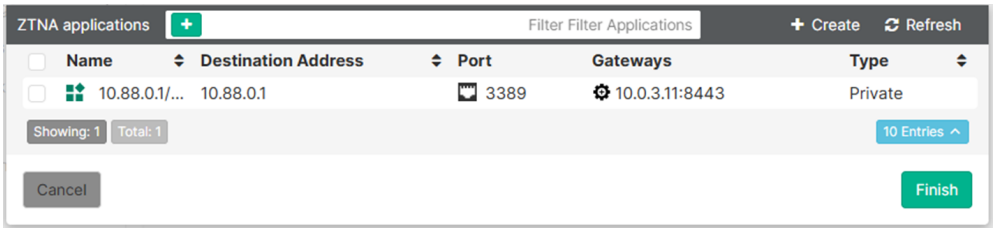
```
config firewall policy
    edit 1
        set name "ZTNA_WINSERVER_RDP_SAML_MFA"
        set srcintf "port3"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "10.0.3.11:8443"
        set ztna-destination "WinServer_RDP"
        set schedule "always"
        set logtraffic all
        set nat enable
        set groups "ztna-saml-users"
    next
end
```

Testing and verification:

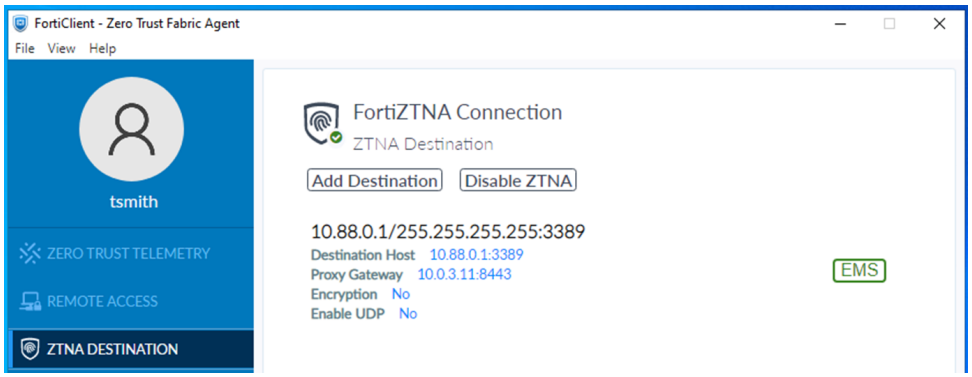
Before connecting, users must have a ZTNA connection rule in FortiClient. This will be configured using Enterprise Management Server (EMS).

To create a ZTNA Destination in EMS:

1. Go to *Endpoint Profiles > ZTNA Destinations*. Select the desired profile or create a new one.
2. In the *Name* field, enter the desired name.
3. In the *Rules* section, click *Add*.
4. The ZTNA applications is populated with the destination configured on the FortiGate.



5. Select the application, then click *Finish*.
6. The destination now appears as a rule entry.
7. Click *Save* to save the ZTNA Destinations profile.
8. Ensure this profile is applied to the endpoint policy assigned to the remote endpoint.
9. After some time, the FortiClient will receive the profile update and the configuration will appear under the *ZTNA DESTINATION* tab on FortiClient.

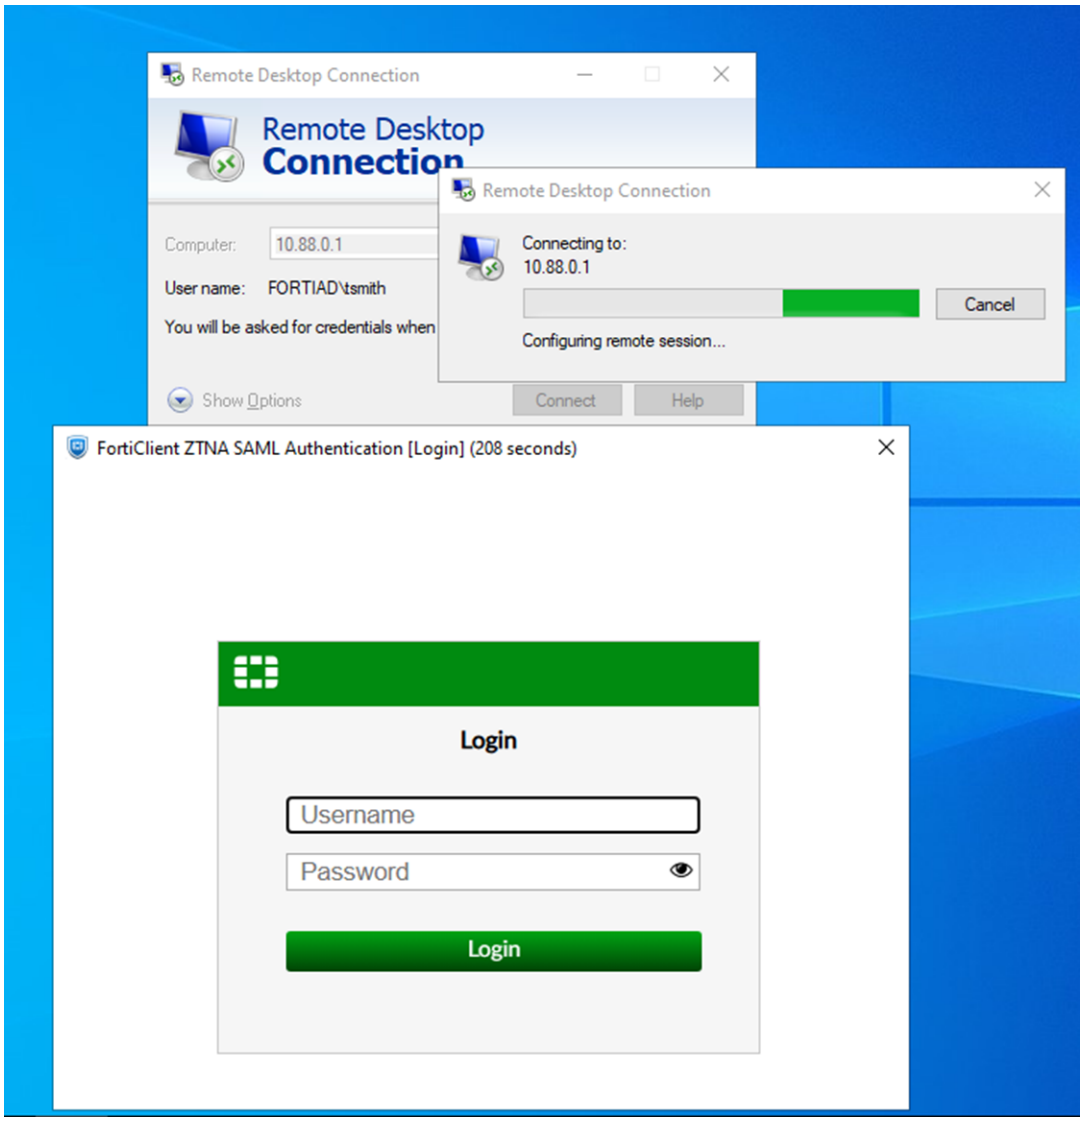


To test the RDP access:

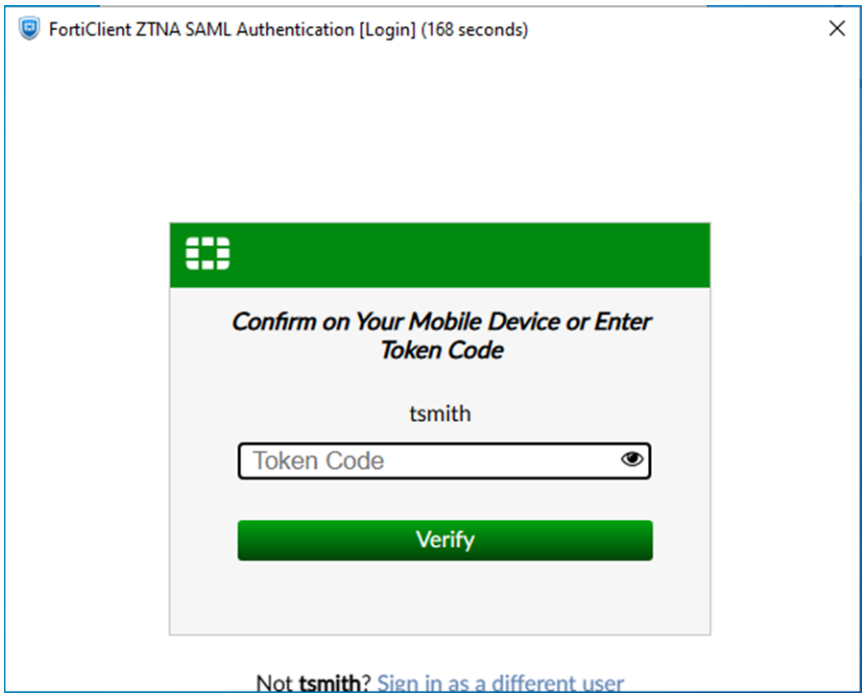
1. On the remote PC, open a new RDP connection.
2. Enter the IP address 10.88.0.1. By default, RDP session use port 3389.

   When the connection to the ZTNA application gateway is established, FortiGate will redirect the SAML login request to the FortiAuthenticator IdP.

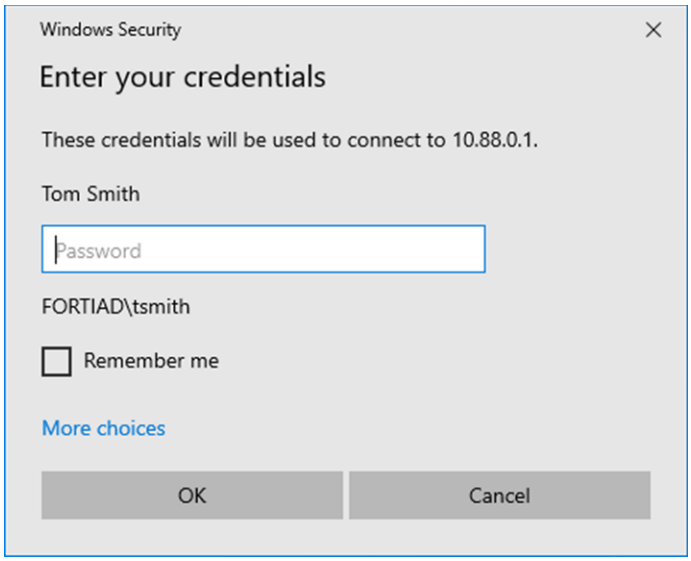
   A FortiClient prompt will open with the FortiAuthenticator login screen.



3. Enter the username and password then click *Login*.
4. A second prompt opens asking for the *Token Code*. Enter the code from your FortiToken app, then click *Verify*.



5. FortiAuthenticator verifies the token code, determines if the login is successful, then sends the SAML assertion back to the client.
6. The client redirects the response back to the FortiGate SP.
7. If the log in was successful, the user can now log on to the RDP session.



Logs and debugs:

On the FortiGate, a successful connection can be seen in *Log & Report* > *Forward Traffic* and *Log & Report* > *ZTNA Traffic*. The CLI can also be used:

```
# execute log filter category 0
# execute log filter field srcip 10.0.3.2
```

```
# execute log display

```

Log number four shows that authentication first hits the ZTNA policy and has an action of **pending**.

Log number three shows that the ZTNA policy redirects the traffic to SAML authentication.

Log number two shows that the WAN_to_FAC policy is hit, indicating the remote user is sending traffic to the FortiAuthenticator.

Log number one shows that the ZTNA policy accepts the traffic and the remote user is permitted to access the ZTNA destination. Notice how the dstip and dstport both change from the application gateway (10.0.3.11:8443) to the real destination (10.88.0.1:3389).

Use the following command to show if the FortiGate's WAD process has an active record of the SAML user login:

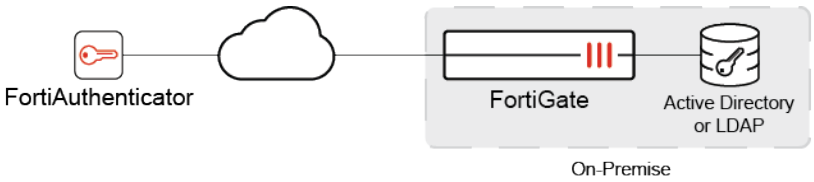
```
# diagnose wad user list

ID: 6, VDOM: root, IPv4: 10.0.3.2
  user name    : tsmith
  worker       : 0
  duration     : 192
  auth_type    : Session
  auth_method  : SAML
  pol_id       : 17
  g_id         : 8
  user_based   : 0
  expire       : no
  LAN:
    bytes_in=95081 bytes_out=317409
  WAN:
    bytes_in=303552 bytes_out=72039
```

Secure LDAP connection from FortiAuthenticator with zero trust tunnel example

When an on-premise Active Directory or LDAP server must be accessed remotely, a secure connection is important. LDAP without security should not be exposed on the internet, as user information and passwords are transferred in plain text.

This example describes how to configure a secure LDAP connection from a remote FortiAuthenticator to an on-premise AD server.



The on-premise FortiGate acts as a ZTNA application gateway to allow the FortiAuthenticator access to the AD using a TCP forwarding access proxy. Traditionally, this requires endpoints to have FortiClient installed with ZTNA destinations configured in order to connect and authenticate with a client certificate. In this scenario, the FortiAuthenticator will operate a local certificate authority, which generates a client certificate for the connection. The local root CA certificate is exported and installed on the FortiGate in order to authenticate and trust the client connection. This replaces the need for a FortiClient EMS server to manage the client certificate and act as the certificate authority.

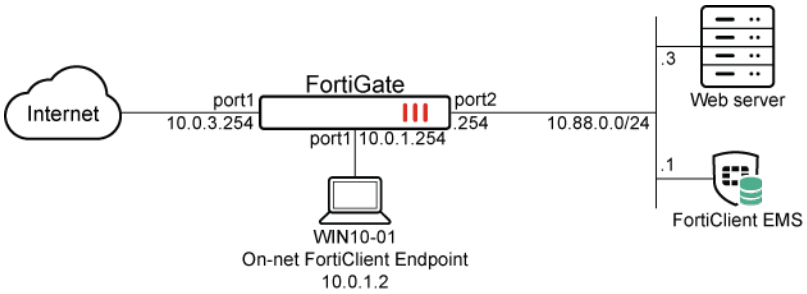
For detailed configuration steps, see Setting up a zero trust tunnel on the FortiAuthenticator page.

ZTNA IP MAC based access control example

In this example, firewall policies are configured that use security posture tags to control access between on-net devices and an internal web server. This mode does not require the use of the access proxy, and only uses security posture tags for access control. Traffic is passed when the FortiClient endpoint meets two conditions.

1. It is tagged with the *Domain-Users* security posture tag, identifying the device as logged on to the Domain.
2. It has the *High* importance classification tag indicating the device is High importance and low risk.

Traffic is denied when the FortiClient endpoint is tagged with *Malicious-File-Detected*.

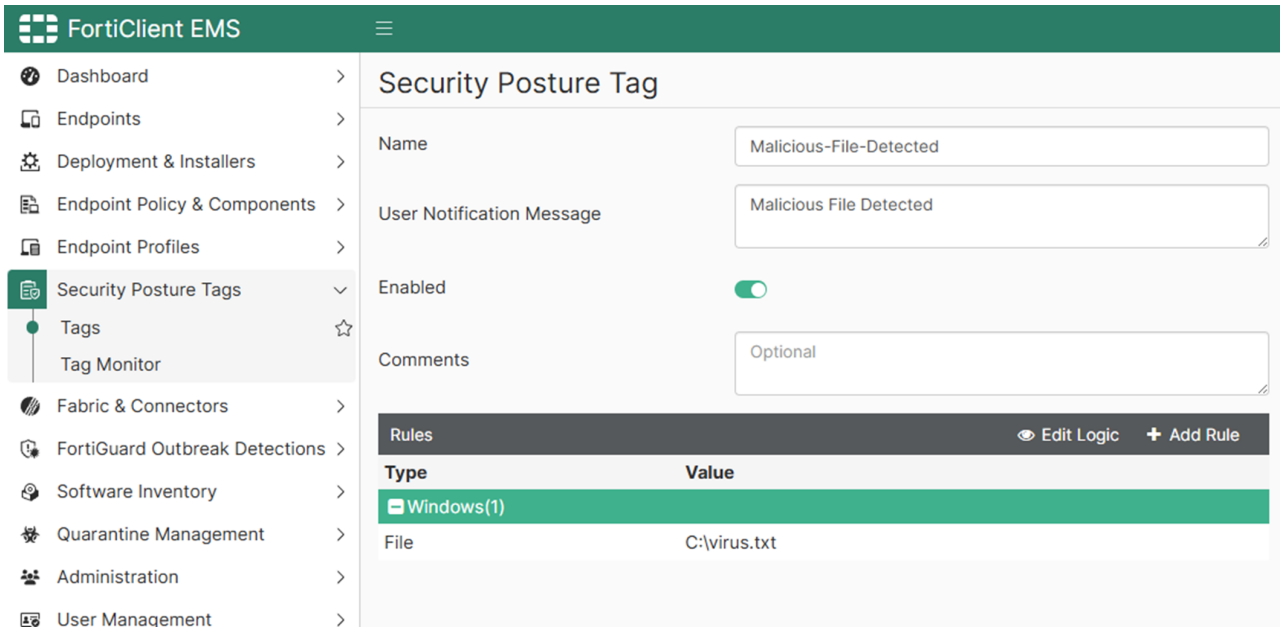


This example assumes that the FortiGate EMS fabric connector is already successfully connected, and a domain has been added to the FortiClient EMS. See Security Fabric connectors on page 4161 and Adding endpoints using an AD domain server

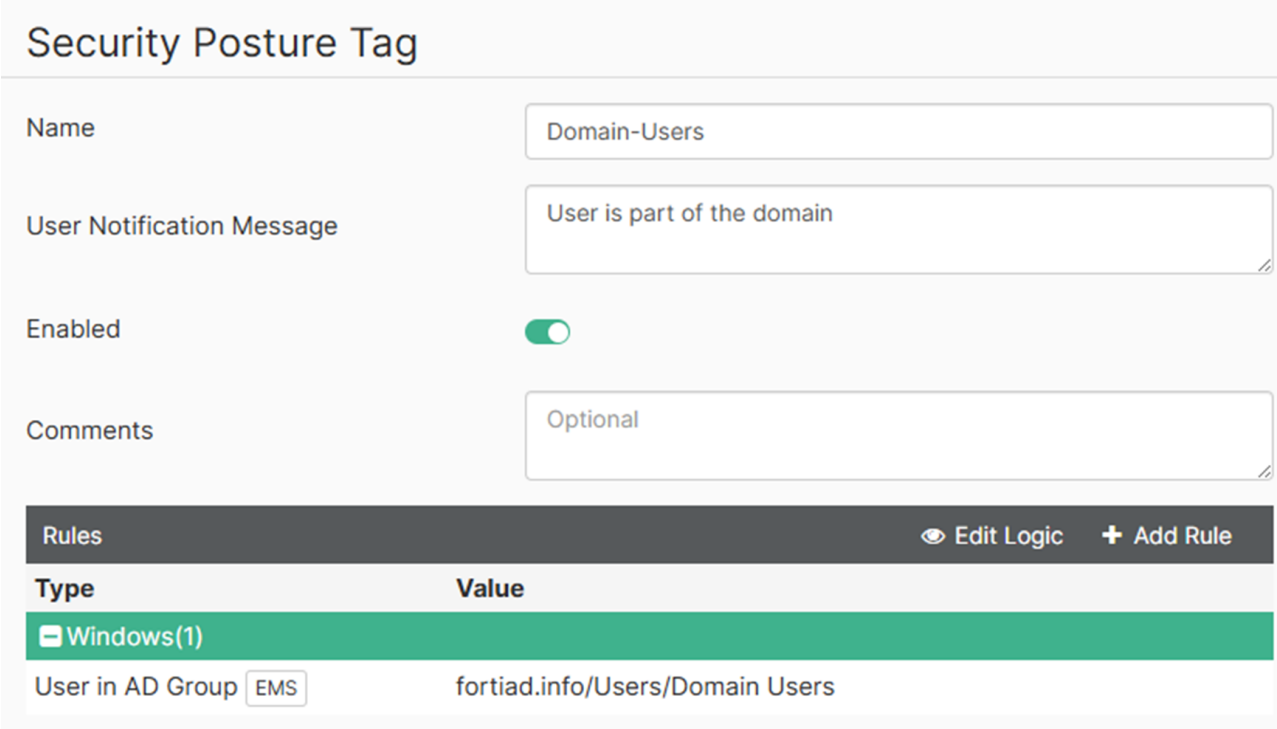
To configure ZTNA in the GUI, go to *System > Feature Visibility* and enable *Zero Trust Network Access*.

To configure Zero Trust tagging rules on the FortiClient EMS:

1. Log in to the FortiClient EMS.
2. Go to *Security Posture Tags > Tags*, and click *Create*.
3. In the *Name* field, enter *Malicious-File-Detected*.
4. Specify a *User Notification Message*, such as *Malicious File Detected*.
5. Click *Add Rule* then configure the rule:
   a. For *OS*, select *Windows*.
   b. From the *Rule Type* dropdown list, select *File*.
   c. Enter a file name, such as *C:\virus.txt*.
   d. Click *Save*.



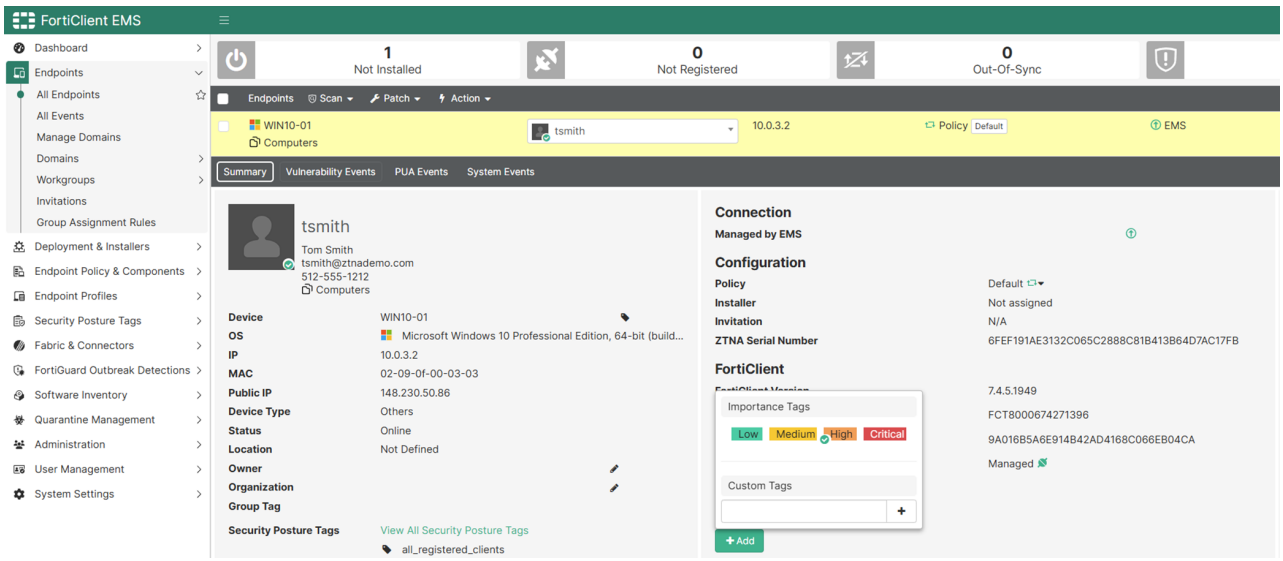
6. Click *Save*.
7. Click *Create* again.
8. In the *Name* field, enter *Domain-Users*.
9. Specify a *User Notification Message*, such as *User is part of the domain*.
10. Click *Add Rule* then configure the rule:
    a. For *OS*, select *Windows*.
    b. From the *Rule Type* dropdown list, select *User in AD Group*.
    c. For *AD Group*, select the *Domain-Users AD group*.
    d. Click *Save*.



11. Click *Save*.

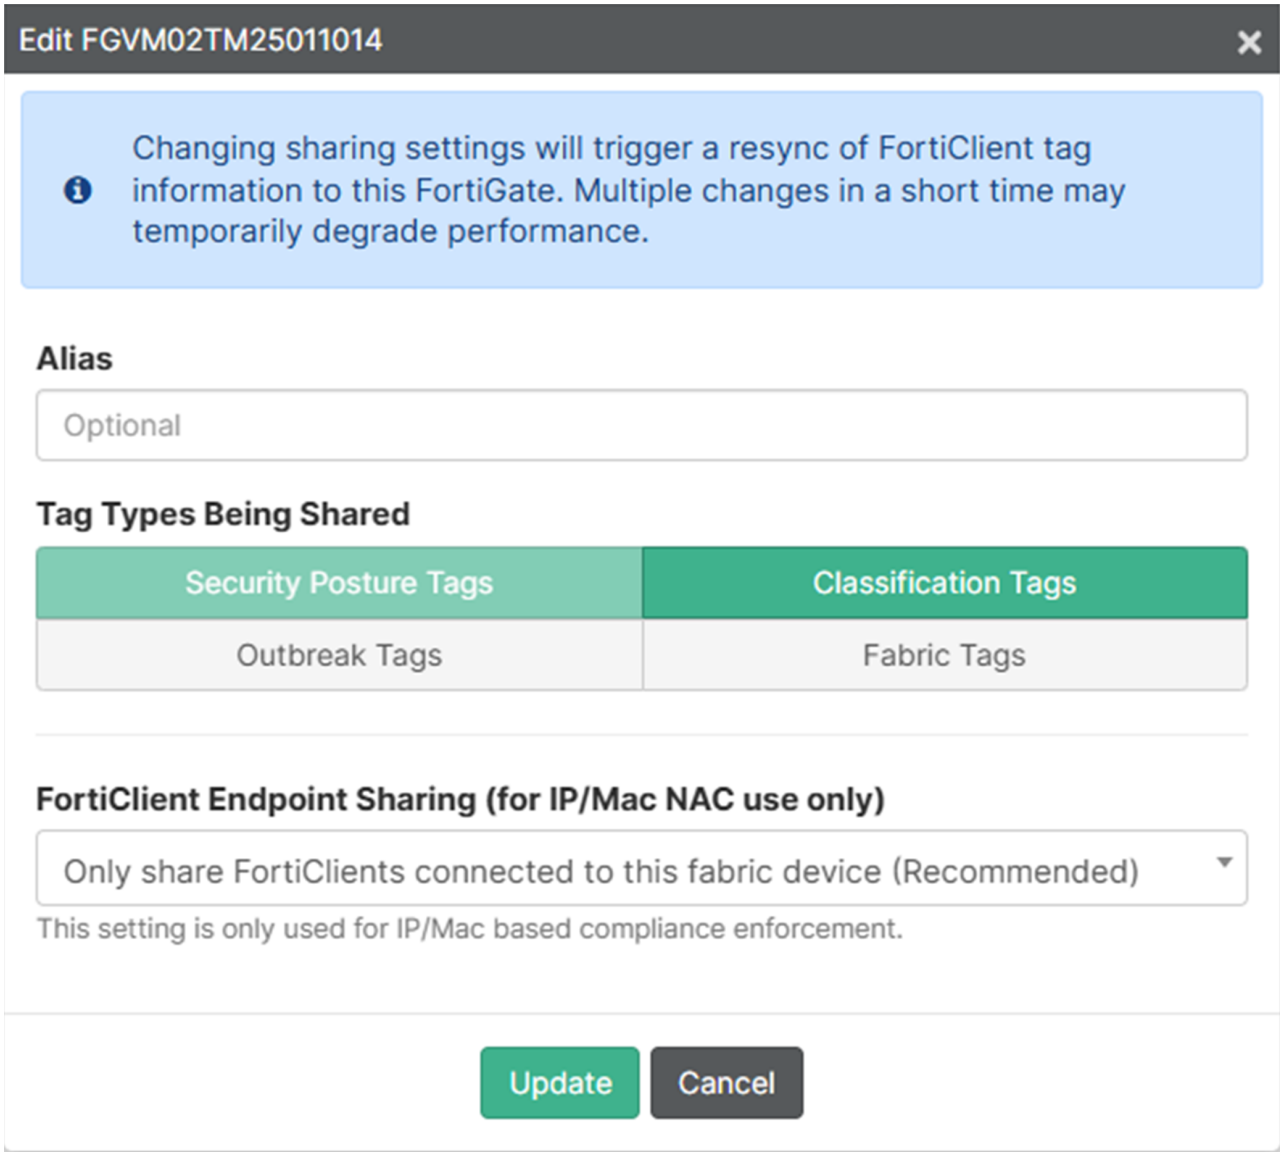
To configure a classification tag on the FortiClient EMS:

1. Go to *Endpoint* > *All Endpoints*.
2. Select the computer that will be granted access. This computer should be already registered to FortiClient EMS.
3. In the *Summary* tab, under *Classification Tags*, click *Add* and then set to High Importance.



4. Go to *Fabric & Connectors* > *Fabric Devices*.

5. Select the connecting FortiGate, then click the icon with the square and pencil to edit the FortiGate connector.
6. Under *Tag Types Being Shared*, add *Classification Tags*.

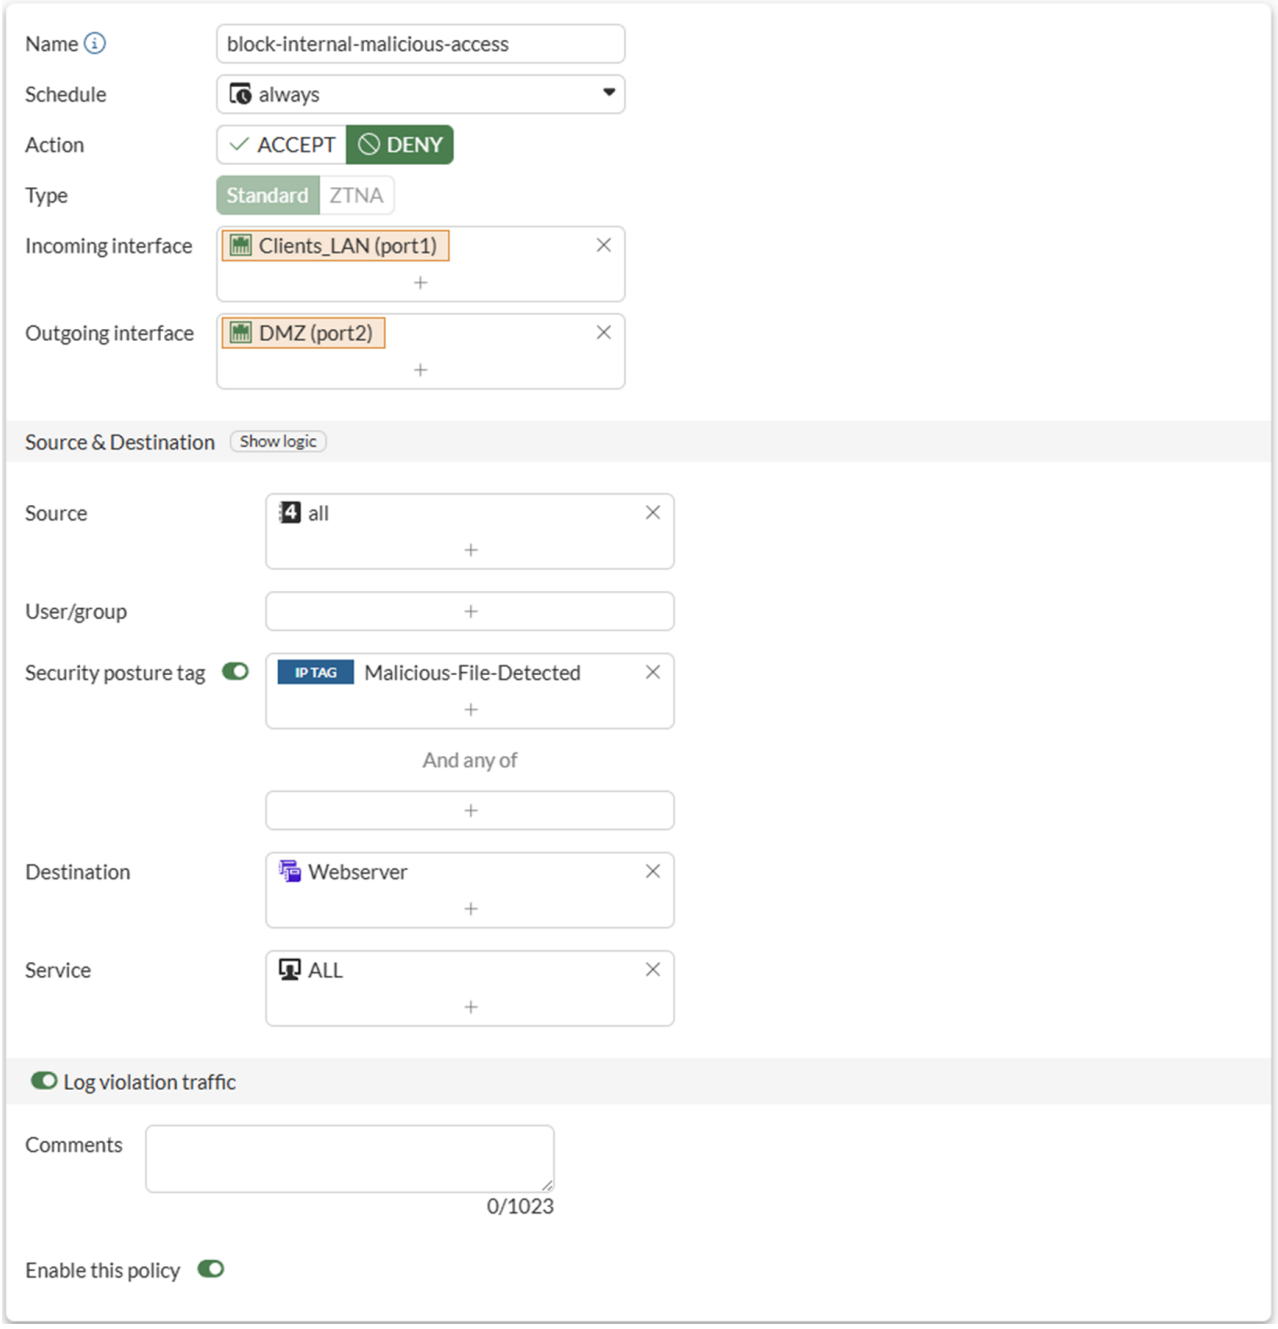


7. Click *Update*. The connector should reflect two black tags to indicate two tag types being shared.

To configure a firewall policy with IP/MAC based access control to deny traffic in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Set *Name* to *block-internal-malicious-access*.
3. Set *Action* to *DENY*.
4. Set *Type* to *Standard*.
5. Set *Incoming Interface* to *port1*.
6. Set *Outgoing Interface* to *port2*.
7. Set *Source* to *all*.

8. Enable *Security posture tag* and select *[IP TAG] Malicious-File-Detected*.
9. Set *Destination* to the address of the Web server. If no address is created, create a new address object for 10.88.0.3/32.
10. Set *Service* to *ALL*.
11. Enable *Log Violation Traffic*.
12. Configuring the remaining settings as needed.



13. Click *OK*.

To configure a firewall policy with IP/MAC based access control to allow access in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Set *Name* to *allow-internal-access*.
3. Set *Action* to *ACCEPT*.
4. Set *Type* to *Standard*.
5. Set *Incoming interface* to *port1*.
6. Set *Outgoing interface* to *port2*.
7. Set *Source* to *all*.
8. Enable *Security posture tag* and select *[MAC TAG] Domain-Users*, and set the *And any of* field to *[CLASS MAC] High*.

   The secondary group of tags is used with a logical And operator. The secondary group tags can be same or different types than the primary group.
9. Set *Destination* to the address of the Web server.
10. Set *Service* to *ALL*.
11. Enable *Log allowed traffic* and set it to *All Sessions*.
12. Configuring the remaining settings as needed.
13. Click *OK*.

To configure firewall policies with IP/MAC based access control to block and allow access in the CLI:

```
config firewall policy
    edit 17
        set name "block-internal-malicious-access"
        set srcintf "port1"
        set dstintf "port2"
        set ztna-status enable
        set srcaddr "all"
        set dstaddr "Webserver"
        set ztna-ems-tag "EMS1_ZTNA_Malicious-File-Detected"
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
    edit 19
        set name "allow-internal-access"
        set srcintf "port1"
        set dstintf "port2"
        set action accept
        set ztna-status enable
        set srcaddr "all"
        set dstaddr "Webserver"
        set ztna-ems-tag "MAC_EMS1_ZTNA_Domain-Users"
        set ztna-ems-tag-secondary "MAC_EMS1_CLASS_High"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
```

```
    next
end
```

When multiple tags are selected with `set ztna-ems-tag <tags>`, matching occurs using a logical OR operator. Any single tag that matches will return true.

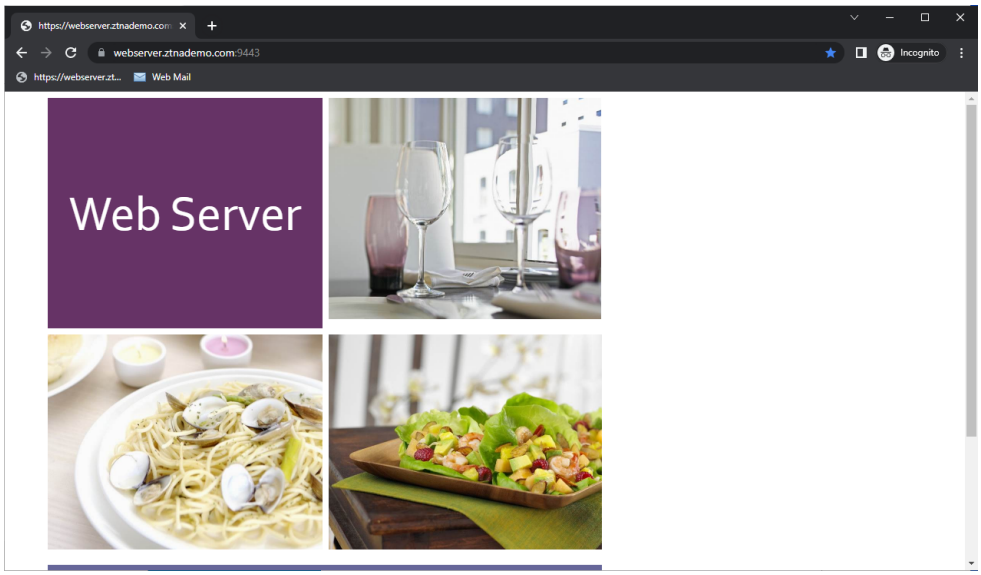
The `set ztna-ems-tag-secondary <tags>` command allows a second group of tags to be specified that is used with a logical And operator. The secondary group tags can be same or different types than the primary group.

The `set ztna-tags-match-logic {and | or}` command does not change the logical operator. It is applied by WAD to tags selected for ZTNA proxy-policy.

Testing the access to the web server from the on-net client endpoint

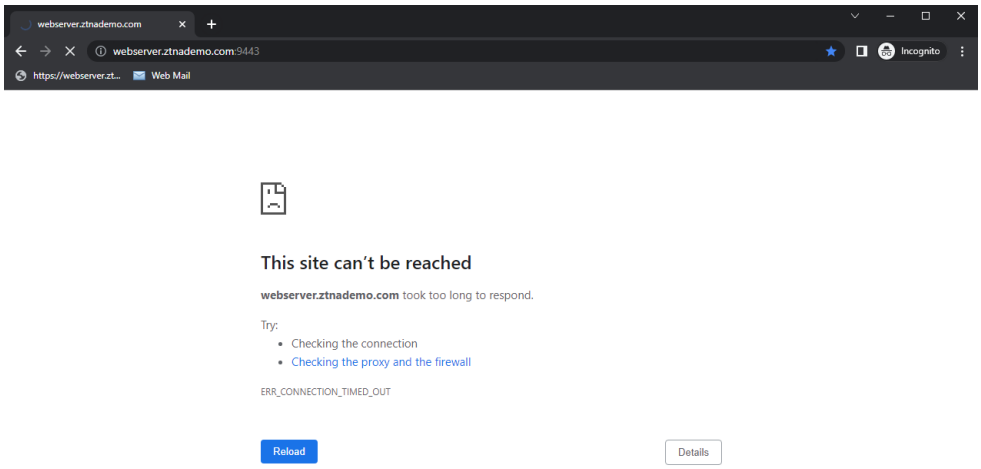
Access allowed:

1. On the internal PC, open FortiClient.
2. On the *Zero Trust Telemetry* tab, make sure that you are connected to the EMS server.
3. Open a browser and enter the address of the server.
4. The FortiGate matches your security posture by verifying your security posture tags and matching the corresponding `allow-internal-access` firewall policy, and you are allowed access to the web server.



Access denied:

1. On the internal PC, trigger the Zero Trust Tagging Rule by creating the file in C:\virus.txt.
2. Open a browser and enter the address of the server.
3. FortiGate checks your security posture. Because EMS has tagged the PC with the *Malicious-File-Detected* tag, it matches the *block-internal-malicious-access* firewall policy.
4. You are denied access to the web server.



Logs and debugs

Access allowed:

```

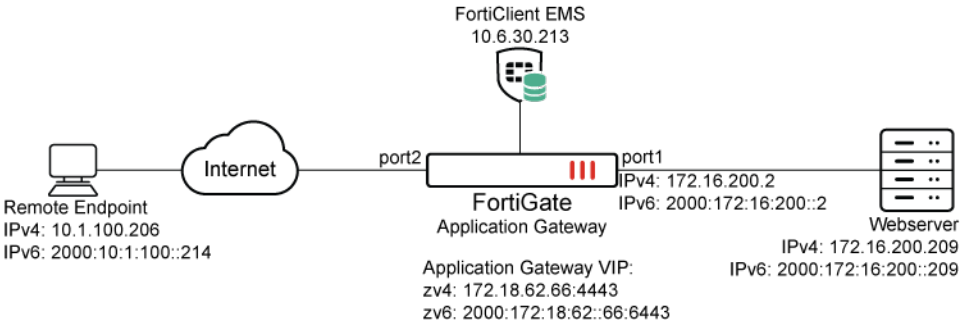
ZTNA IPv6 examples

IPv6 can be configured in ZTNA in several scenarios:

- IPv6 Client — IPv6 Access Proxy — IPv6 Server
- IPv6 Client — IPv6 Access Proxy — IPv4 Server
- IPv4 Client — IPv4 Access Proxy — IPv6 Server
- IPv6 EMS tags in dual stack firewall policies

These examples show the basic configuration for each scenario. It is assumed that the EMS fabric connector is already successfully connected.



Example 1: IPv6 Client — IPv6 Access Proxy — IPv6 Server

To configure the FortiGate:

1. Configure the IPv6 access proxy VIP:

```
config firewall vip6
    edit "zv6"
        set type access-proxy
        set extip 2000:172:18:62::66
        set server-type https
        set extport 6443
        set ssl-certificate "cert"
    next
end
```

2. Configure a virtual host:

```
config firewall access-proxy-virtual-host
    edit "vhost_ipv6"
        set ssl-certificate "cert"
        set host "webserver.test.com"
    next
end
```

The client uses this address to connect to the access proxy.

3. Configure an IPv6 web proxy and IPv6 api-gateway, apply the VIP6 and virtual host to it, and assign an IPv6 address to the realserver:

```
config ztna web-proxy
    edit "zs6"
        set vip "zv6"
        set host "vhost_ipv6"
        config api-gateway6
            edit 1
                config realservers
                    edit 1
                        set ip 2000:172:16:200::209
                    next
                end
            next
        end
    next
end
```

4. Configure a ZTNA policy:

```
config firewall policy
    edit 1
        set name "ztna_rule"
        set srcintf "port2"
        set dstintf "any"
        set action accept
        set srcaddr6 "all"
        set dstaddr6 "zs6"
        set schedule "always"
        set logtraffic all
    next
end
```

To test the configuration:

1. On an IPv6 client, ensure that the address webserver.test.com resolves to the IPv6 VIP address of 2000:172:18:62::66.
2. In a browser, connect to https://webserver.test.com:6443.
3. After device certificate verification, the browser will open up the webpage on the IPv6 real server.
4. In the Forward Traffic Log, the following log is available:

```
1: date=2026-03-03 time=14:46:14 eventtime=1772577974130406404 tz="-0800" logid="0005000024"

appcat="unscanned" duration=129 gatewayid=1 realserverid=1 vip="zv6"
vipincomingip=2000:172:18:62::66 accessproxy="zs6"
```

```
clientdeviceid="9A016B5A6E914B42AD4168C066EB04CA" clientdevicemanageable="manageable"
clientdeviceems="FCTEMS8825007166" clientdevicetags="CLASS_Low/ all_registered_clients"
clientcert="yes" emsconnection="online" wanin=303009 rcvdbyte=303009 wanout=4424 lanin=4220
sentbyte=4220 lanout=305716 fctuid="9A016B5A6E914B42AD4168C066EB04CA"
```

Example 2: IPv6 Client — IPv6 Access Proxy — IPv4 Server

To configure the FortiGate:

1. Configure the IPv6 access proxy VIP:

```
config firewall vip6
    edit "zv6"
        set type access-proxy
        set extip 2000:172:18:62::66
        set server-type https
        set extport 6443
        set ssl-certificate "cert"
    next
end
```

2. Configure a virtual host:

```
config firewall access-proxy-virtual-host
    edit "vhost_ipv6"
        set ssl-certificate "cert"
        set host "webserver.test.com"
    next
end
```

   The client uses this address to connect to the access proxy.

3. Configure an IPv6 web proxy and api-gateway, apply the VIP6 and virtual host to it, and assign an IPv4 address to the realserver:

```
config ztna web-proxy
    edit "zs6"
        set vip "zv6"
        set host "vhost_ipv6"
        config api-gateway
            edit 1
                config realservers
                    edit 1
                        set ip 172.16.200.209
                    next
                end
            next
        end
    next
end
```

4. Configure a ZTNA policy:

```
config firewall policy
    edit 1
        set name "ztna_rule"
        set srcintf "port2"
        set dstintf "any"
        set action accept
        set srcaddr6 "all"
        set dstaddr6 "zs6"
        set schedule "always"
        set logtraffic all
    next
end
```

To test the configuration:

1. On an IPv6 client, ensure that the address webserver.test.com resolves to the IPv6 VIP address of 2000:172:18:62::66.
2. In a browser, connect to https://webserver.test.com:6443.
3. After device certificate verification, the browser will open up the webpage on the IPv4 real server.
4. In the Forward Traffic Log, the following log is available:

```
1: date=2026-03-03 time=14:46:14 eventtime=1772577974130406404 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=2000:10:1:100::214 srcport=55957
srcintf="port2" srcintfrole="undefined" dstcountry="Reserved" srccountry="Reserved"
dstip=172.16.200.209 dstport=443 dstintf="port1" dstintfrole="undefined" sessionid=9174
srcuuid="b458a65a-f759-51ea-d7df-ef2e750026d1" dstuuid="01b612e6-174a-51f1-1a3d-b3293e8efa12"
service="HTTPS" proxyapptype="ztna-proxy" proto=6 action="accept" policyid=1
policytype="policy" poluuid="693c3e3e-174c-51f1-3e13-715130a1a107" policyname="ztna_rule"
appcat="unscanned" duration=129 gatewayid=1 realserverid=1 vip="zv6"
vipincomingip=2000:172:18:62::66 accessproxy="zs6"
clientdeviceid="9A016B5A6E914B42AD4168C066EB04CA" clientdevicemanageable="manageable"
clientdeviceems="FCTEMS8825007166" clientdevicetags="CLASS_Low/ all_registered_clients"
clientcert="yes" emsconnection="online" wanin=303009 rcvdbyte=303009 wanout=4424 lanin=4220
sentbyte=4220 lanout=305716 fctuid="9A016B5A6E914B42AD4168C066EB04CA"
```

Example 3: IPv4 Client — IPv4 Access Proxy — IPv6 Server

To configure the FortiGate:

1. Configure the IPv4 access proxy VIP:

```
config firewall vip
    edit "zv4"
        set type access-proxy
        set extip 172.18.62.66
        set extintf "port2"
        set server-type https
        set extport 4443
        set ssl-certificate "cert"
```

```
    next
end
```

2. Configure a virtual host:

```
config firewall access-proxy-virtual-host
    edit "vhost_ipv4"
        set ssl-certificate "cert"
        set host "qa.test.com"
    next
end
```

The client uses this address to connect to the access proxy.

3. Configure an IPv4 web proxy and IPv6 api-gateway, apply the VIP and virtual host to it, and assign an IPv6 address to the realserver:

```
config ztna web-proxy
    edit "zs4"
        set vip "zv4"
        set host "vhost_ipv4"
        config api-gateway6
            edit 1
                config realservers
                    edit 1
                        set ip 2000:172:16:200::209
                    next
                end
            next
        end
    next
end
```

4. Configure a ZTNA policy:

```
config firewall policy
    edit 1
        set name "ztna_rule"
        set srcintf "port2"
        set dstintf "any"
        set action accept
        set srcaddr "all"
        set dstaddr "zs4"
        set schedule "always"
        set logtraffic all
    next
end
```

To test the configuration:

1. On an IPv4 client, ensure that the address webserver.test.com resolves to the IPv4 VIP address of 172.18.62.66.
2. In a browser, connect to https://webserver.test.com:6443.

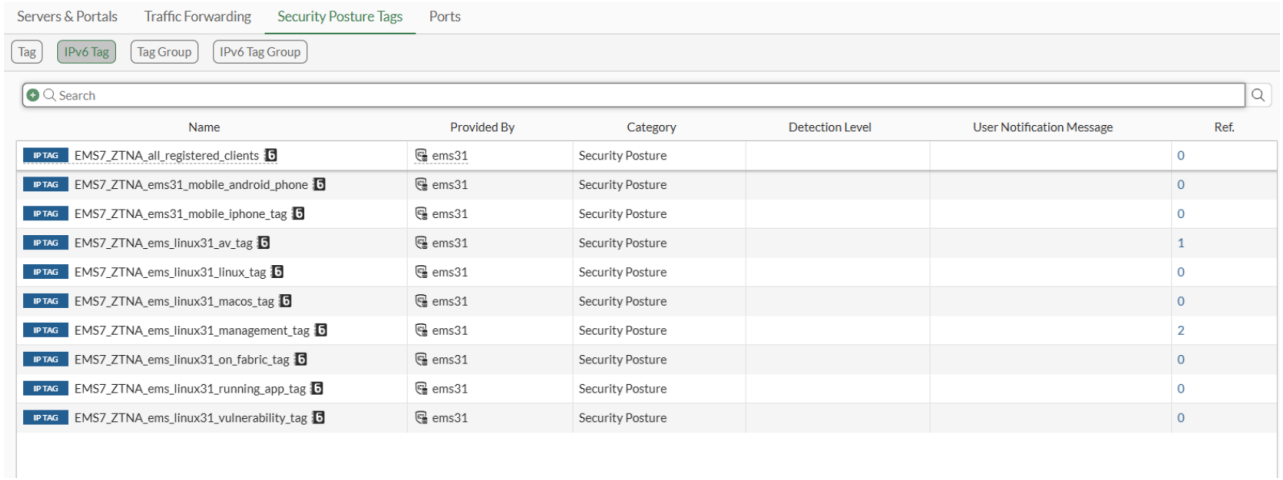
3. After device certificate verification, the browser will open up the webpage on the IPv6 real server.
4. In the Forward Traffic Log, the following log is available:

```
1: date=2026-03-03 time=14:46:14 eventtime=1772577974130406404 tz="-0800" logid="0005000024"
type="traffic" subtype="ztna" level="notice" vd="root" srcip=10.1.100.206 srcport=55957
srcintf="port2" srcintfrole="undefined" dstcountry="Reserved" srccountry="Reserved"
dstip=2000:172:16:200::209 dstport=443 dstintf="port1" dstintfrole="undefined" sessionid=9174
srcuuid="b458a65a-f759-51ea-d7df-ef2e750026d1" dstuuid="01b612e6-174a-51f1-1a3d-b3293e8efa12"
service="HTTPS" proxyapptype="ztna-proxy" proto=6 action="accept" policyid=1
policytype="policy" poluuid="693c3e3e-174c-51f1-3e13-715130a1a107" policyname="ztna_rule"
appcat="unscanned" duration=129 gatewayid=1 realserverid=1 vip="zv4"
vipincomingip=172.18.62.66 accessproxy="zs4" clientdeviceid="9A016B5A6E914B42AD4168C066EB04CA"
clientdevicemanageable="manageable" clientdeviceems="FCTEMS8825007166"
clientdevicetags="CLASS_Low/ all_registered_clients" clientcert="yes" emsconnection="online"
wanin=303009 rcvdbyte=303009 wanout=4424 lanin=4220 sentbyte=4220 lanout=305716
fctuid="9A016B5A6E914B42AD4168C066EB04CA"
```

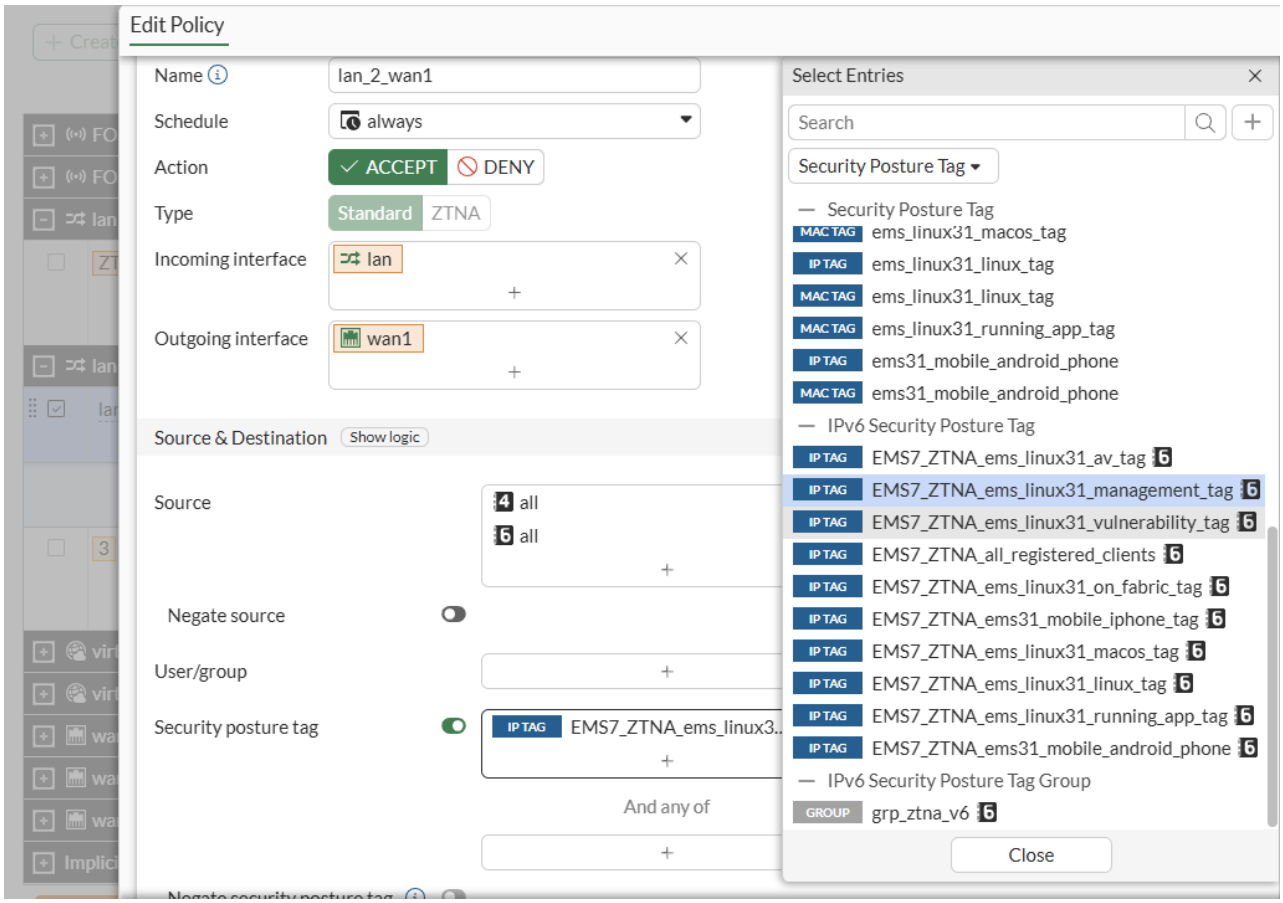
Example 4: IPv6 EMS tags in dual stack firewall policies

To configure the FortiGate:

1. Go to *Policy & Objects* > *ZTNA* > *Security Posture Tags* > *IPv6 Tag* to verify that FortiGate has IPv6 tags from FortiClient EMS:



2. Go to *Policy & Objects* > *Firewall Policy*, create or edit a firewall policy with IPv4 and IPv6 source addresses, and add IPv6 EMS security posture tag:



To configure the FortiGate in the CLI:

1. Verify the EMS tag in the CLI:

```
# show firewall address6
config firewall address6
    ...
    edit "EMS7_ZTNA_ems_linux31_management_tag"
        set uuid 880ef31c-fcba-51f0-e348-1f01acd82c22
        set type dynamic
        set sub-type ems-tag
        set dirty clean
        set obj-tag "ems_linux31_management_tag"
        set tag-type "zero_trust"
    next
    ...
end
```

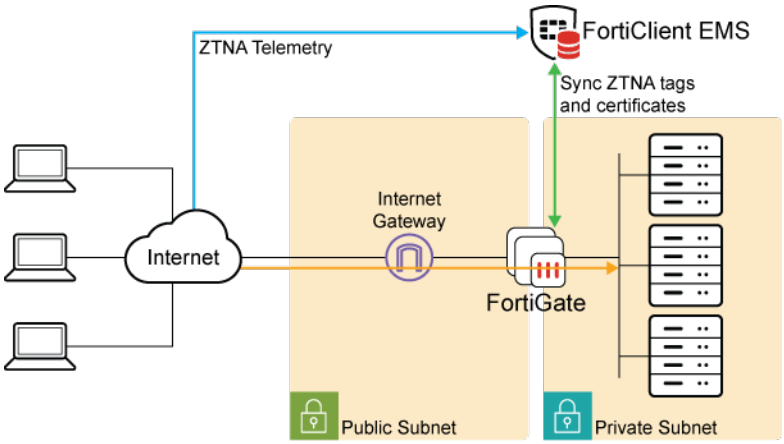
2. Apply the tag in a firewall policy:

```
config firewall policy
    edit 1
        set name "lan_2_wan1"
```

```
        set srcintf "lan"
        set dstintf "wan1"
        set action accept
        set ztna-status enable
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set ztna-ems-tag6 "EMS7_ZTNA_ems_linux31_management_tag"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

ZTNA Zero Trust application gateway example

The Zero Trust application gateway (ZTAG) for SaaS applications delivers Zero Trust Network Access (ZTNA) to companies that deploy SaaS applications and services in the cloud. A Zero Trust application gateway is deployed in the cloud, protecting resources on the private subnets by enforcing security and access control.



A Zero Trust application gateway can be deployed directly on AWS, Azure, and VMware. The deployment template can configure the necessary ZTNA settings to get the ZTNA configurations started.

For more information, see the Zero Trust Application Gateway Admin Guide.

ZTNA SaaS application access control with Inline CASB

The FortiGate ZTNA application gateway can be configured to act as an inline cloud access security broker (CASB) by providing access control to software-as-a-service (SaaS) traffic using ZTNA access control rules and an inline CASB profile. A CASB sits between users and their cloud service to enforce security policies as they access cloud-based resources.

The following components are required to use the ZTNA inline CASB feature:

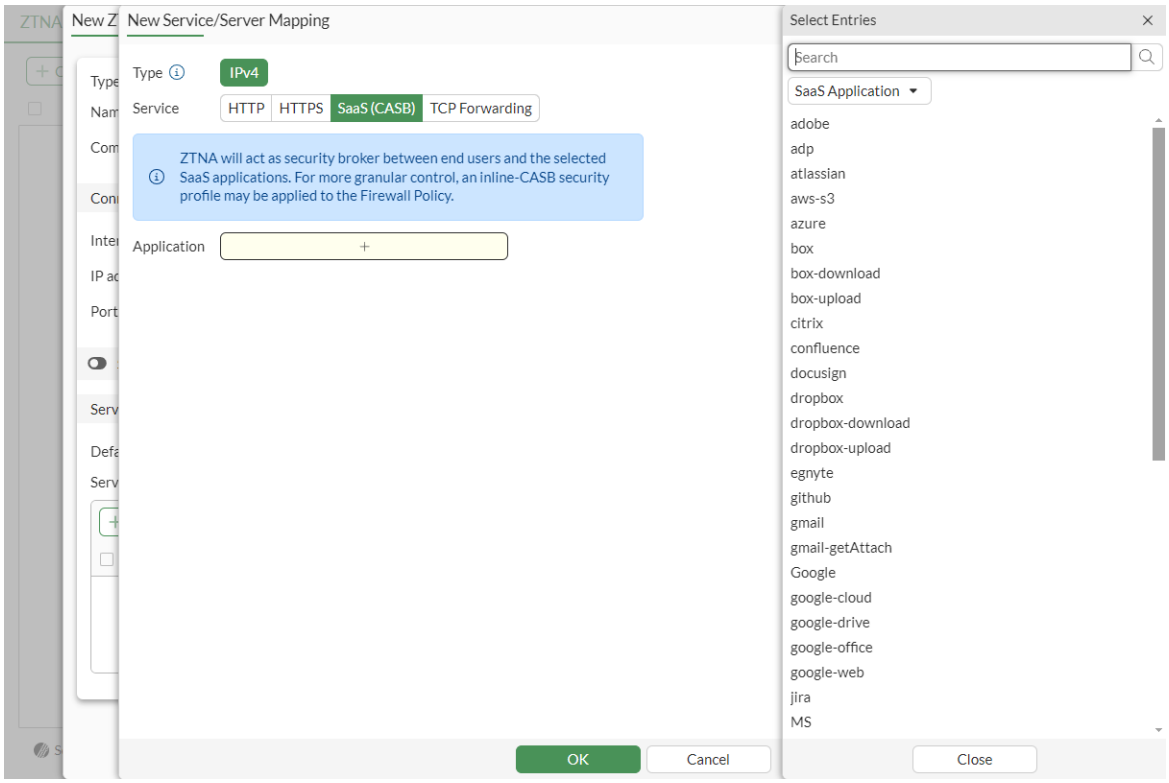
- The FortiGuard Inline CASB Database (ICDB) used by the FortiGate and FortiClient EMS.

  This database includes all FQDNs related to specific SaaS applications and corresponding FortiGuard packages for FortiOS and FortiClient.
- A FortiGate ZTNA TCP forwarding access proxy configuration that specifies SaaS application destinations using application names defined in the ICDB.
- ZTNA connection rules for SaaS traffic that are provisioned using FortiClient EMS (version 7.2.2 and later).
- FortiClient (version 7.2.0 and later) installed on the user's machine to receive the ZTNA connection rules for SaaS traffic from FortiClient EMS.

Syntax

Users can configure the ZTNA application gateway using the SaaS proxy access type and conveniently specify SaaS application destinations by application name or by application group name without needing to manually search for and enter FQDNs specific to each SaaS application. This can be configured in the GUI or in the CLI.

To configure a ZTNA service/server mapping to use SaaS in the GUI:



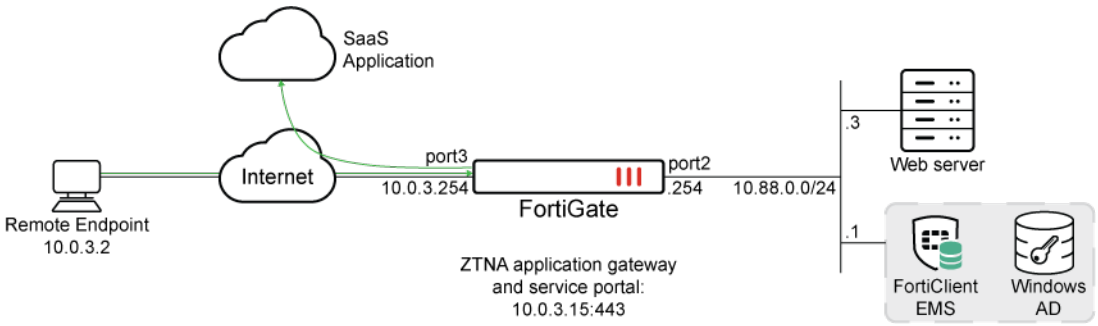
To configure a ZTNA application gateway to use SaaS in the CLI:

```
config firewall access-proxy
    edit <name>
        config api-gateway
            edit <ID>
                set url-map "/saas"
```

```
                set service saas
                set application <app 1> [app 2] ...
            next
        end
    next
end
```

Example

In this example, the FortiGate is configured as a ZTNA application gateway with a VIP of 10.0.3.15 and uses the SaaS access proxy type. SaaS application Gmail is allowed, but the action of uploading an attachment on Gmail is blocked.



To configure the ZTNA server object in the GUI:

1. Go to *Policy & Objects* > *ZTNA* > *Traffic Forwarding* > *Traffic Forwarding Server*.
2. Click *Create new*.
3. Set *Name* to *ZTNA-SaaS-Access*.
4. Set *Host* to *10.0.3.15*
5. Set *ZTNA port* to *Create new* and configure the following:

Option	Value
Interface	port3
IP Address	10.0.3.15
Port	443
Default Certificate	This example uses a wildcard certificate with a Common Name (CN): *.ztnademo.com. This certificate is trusted by the endpoints which will access the ZTNA port.
Name	SaaS:443

Verify that the IP address and port do not conflict with management access to the interface. Otherwise, change the IP address to another address on that subnet.

6. Click *OK*.

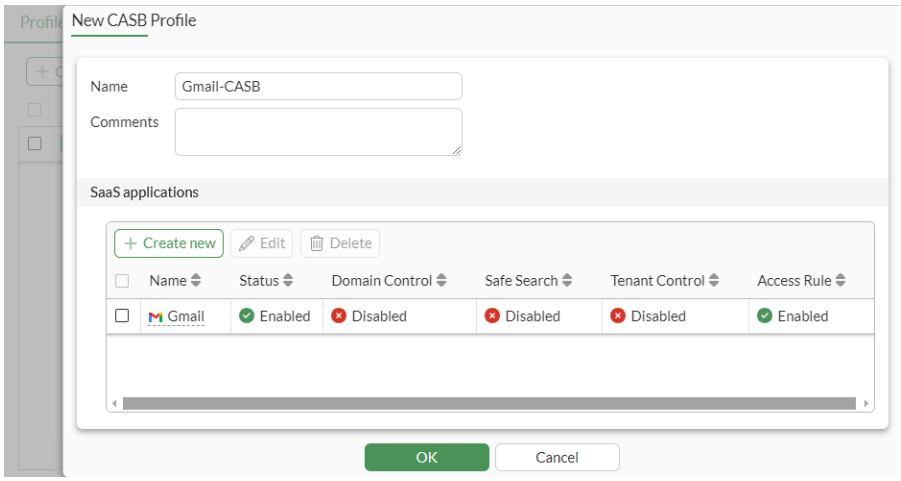
7. Go to *Policy & Objects* > *ZTNA* > *Traffic Forwarding* > *Destination*.
8. Click Create new and configure the following:

Option	Value
Name	SaaS
Type	SaaS
SaaS Application	gmail
Protocol	ALL

9. Click *OK*.

To configure the Inline CASB profile in the GUI:

1. Go to *System* > *Feature Visibility*.
2. Under *Security Features*, enable *Inline-CASB*.
3. Go to *Security Profiles* > *Inline-CASB* and click *Create new*.
4. Name the new profile *Gmail-CASB*.
5. In the *SaaS Applications* table, click *Create new*.
6. In *Select application*, select *Gmail*.
7. Click *Next*.
8. In *Privilege control*, right-click the entry and select *Block*.
9. Click *OK*.



10. Click *OK*.

To configure the ZTNA policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create new* and configure the following:

Option	Value
Name	ZTNA-SaaS-Access
Type	ZTNA
Incoming Interface	WAN (port3)
Source	All
User/group	<include, if needed>
Security posture tag	<include, if needed>
ZTNA port	SaaS:443
ZTNA destination	SaaS
Inline-CASB	Gmail-CASB
SSL inspection	custom-deep-inspection
Log allowed traffic	All sessions

3. Click *OK*.
4. Click *OK* to confirm the use of full SSL Inspection. Ensure that your clients trust the CA that is used in the SSL Inspection profile.

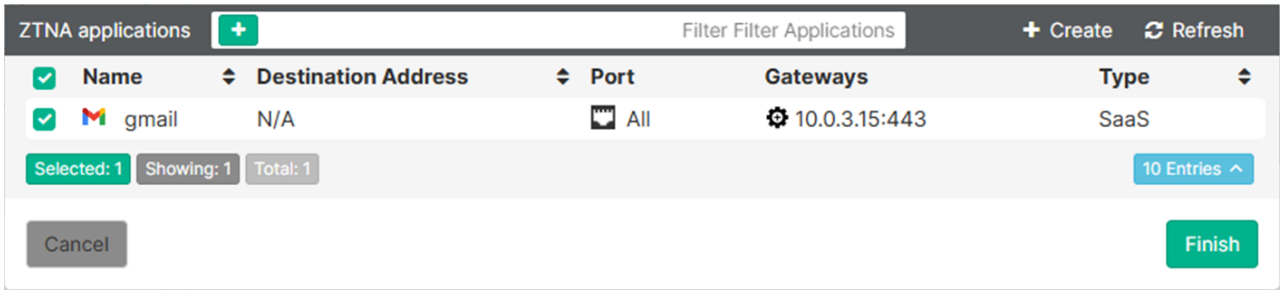
Optionally, if user authentication is configured, the ZTNA rule (`set users` or `set groups`), configure the authentication scheme and rule (see Applying user authentication in the ZTNA Deployment guide).

Before connecting, the users must have corresponding ZTNA Destinations in FortiClient. In FortiClient EMS, configure SaaS applications in *Endpoint Profiles > ZTNA Destinations* and push application destinations to FortiClient.

To configure the FortiClient EMS:

This step assumes the FortiGate and FortiClient EMS connector has been configured. See Fabric devices in the EMS Administration Guide and Configuring FortiClient EMS on page 4182.

1. On FortiClient EMS, go to *Endpoint Profiles > ZTNA Destinations*.
2. Edit the *Default* profile.
3. Next to *Name*, click *Advanced*.
4. Click the eye icon beside *ZTNA Destination Profile* to enable this profile to be viewed on the FortiClient.
5. Under *Rules*, click *Add* . The *ZTNA applications* dialog is displayed.
6. Select the gmail application as defined on the FortiGate.



7. Click *Finish*.

8. Click *Save*. The FortiClient endpoints will synchronize the destination from EMS.

Testing and results

Once connected, the FortiClient retrieves the list of hosted ZTNA services, including the SaaS service, and adds corresponding ZTNA connection rules for the configured SaaS applications.

Connect to Gmail from a browser. The traffic is allowed.

After closing the session, the corresponding traffic logs can be viewed from the FortiGate GUI or from the CLI.

```
# execute log filter field subtype ztna
# exec log display

ZTNA application gateway with KDC to access shared drives

Fortinet technical support cannot troubleshoot third-party applications involved in this solution.

Kerberos Key Distribution Center (KDC) proxy protocol can be used to remotely authenticate domain users and issue Kerberos tickets. A remote user can use the same Kerberos ticket to authenticate when remotely accessing shared drives through ZTNA application gateway.

The following options are available when setting up ZTNA application gateway on TCP 445 for remote access to mapped drives:

- Create the mapped drive using the server's IP address, which uses Windows NT LAN Manager (NTLM) to authenticate users.
- Create the mapped drive using the server's FQDN (or DNS name), which requires Kerberos authentication.

The preferred way to create mapped drives is using the server's DNS name. KDC proxy protocol can be a reliable way to initiate Kerberos authentication for remote users to seamlessly access mapped drives and requires the following steps:

1. Set up the KDC proxy service on a server.
2. Set up the ZTNA application gateway for mapped drives.

The KDC Proxy only works for domain-joined workstations.

Setting up the KDC proxy service

The following steps are required to set up the KDC proxy service on a server:

1. Deploy a server that is joined to the domain and create a trusted certificate.
2. Configure the KDC proxy service on the server.
3. Configure clients to use the KDC proxy.
4. If client machines cannot retrieve group policy updates, configure registry keys on the clients.

Deploying a server and creating a certificate

Deploy a server that is joined to the domain. At a minimum, the server must have a public network interface with a domain name pointed to it. Clients will connect to the server over the internet. For networking, you can forward port 443 if necessary.

Create a trusted certificate for the public domain name of the proxy endpoint:

- Domain: fortitest.net
- KDC proxy: kdcproxy.fortitest.net

The KDC proxy service is present on the server, but not configured.

Configuring the KDC proxy service on the server

The KDC proxy service must be configured before it can be started.

To configure the server:

1. Start an elevated command prompt, and configure a URL ACL for the endpoint:

```
netsh http add urlacl url=https://+:443/KdcProxy user="NT authority\Network Service"
```

2. Associate the certificate created previously with the endpoint:

```
netsh http add sslcert ipport=0.0.0.0:443 certhash=<thumbprint of your certificate> appid=
{generated Guid}
```

This association instructs `HTTP.SYS` to use the certificate when connections occur over HTTPS.

For example: `netsh http add sslcert ipport=0.0.0.0:443 certhash=aaaabbbbccccddddeeeeffff0000111122223333 appid={aaaaaaaa-bbbb-cccc-dddd-aaaabbbbcccc}`

> For `appid` you should generate a random GUID here. From PowerShell try `[Guid]::NewGuid()`. The `certhash` is the thumbprint of your certificate.
>
> If the certificate contains extensions for CRL or AIA, those URLs should be reachable from the remote client.

3. If not using smart card certificates (or Windows Hello) for authentication, disable the certificate authentication requirement:

```
REG ADD "HKLM\SYSTEM\CurrentControlSet\Services\KPSSVC\Settings" /v HttpsClientAuth /t REG_
DWORD /d 0x0 /f
```

4. Additionally if not using certificates, enable password authentication:

```
REG ADD "HKLM\SYSTEM\CurrentControlSet\Services\KPSSVC\Settings" /v
DisallowUnprotectedPasswordAuth /t REG_DWORD /d 0x0 /f
```

5. Configure the KDC Proxy Service (KPSSVC) to start automatically:

```
sc config kpssvc start=auto
```

6. Start the service:

```
net start kpssvc
```

Configuring clients to use a KDC proxy

Clients must be configured to use a KDC proxy. This can be done through GPO or through modifying the registry directly. The GPO path is:

```
Computer Configuration\Policies\Administrative Templates\System\Kerberos\Specify KDC proxy servers
for Kerberos clients
```

Enabling this policy requires setting a realm-to-value mapping. The realm is your domain name, starting with a period (for example ".fortitest.net"), or a "*" to include all domains in a wildcard format. The value is specially crafted:

```
<https kdcproxy.fortitest.net:kdcproxy />
```

Deploy the policy, and reboot the client. Wait a while for caching to complete, and then log in. You should find users are now authenticating over the KDC proxy endpoint.

To verify from a logged in session, launch a command prompt and try the following command:

```
klist get krbtgt
```

Configuring registry keys on clients

If you are trying to deploy these settings on a client machine that cannot retrieve group policy updates, manually configure the registry keys for the client:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\Kerberos]
"KdcProxyServer_Enabled"=dword:00000001
```

```
[HKEY_LOCAL_
MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\Kerberos\KdcProxy\ProxyServers]
"*"="<https kdcproxy.fortitest.net />" or ".fortitest.net"="<https kdcproxy.fortitest.net />"
```

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows\CurrentVersion\Policies\System\Kerberos\Parameters]
"NoRevocationCheck"=dword:00000000
```

Setting up the ZTNA application gateway for mapped drives

The following steps are required to set up ZTNA application gateway for mapped drives on the FortiGate:

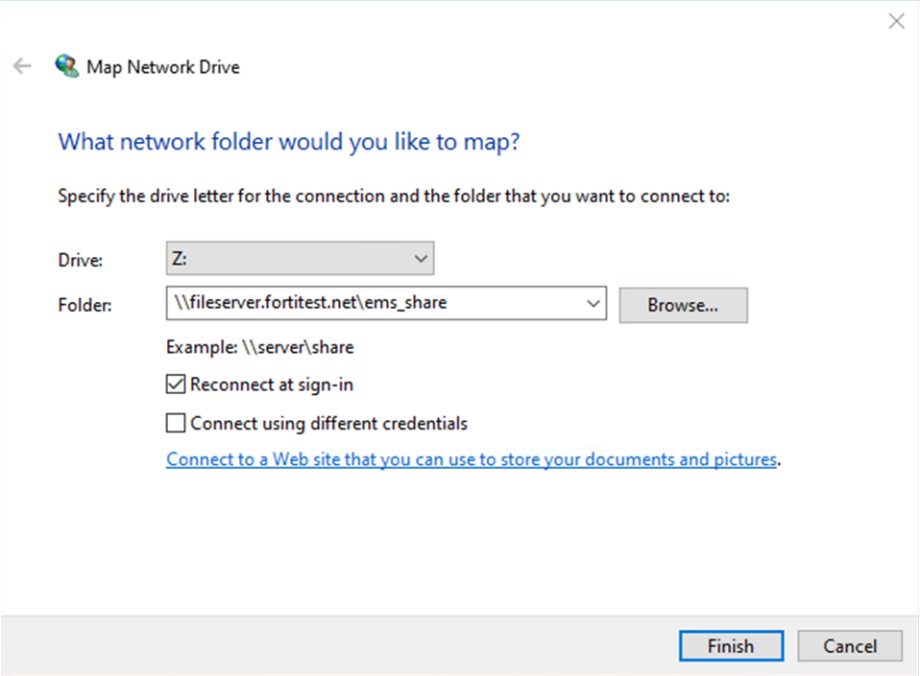
1. Configure FortiClient to have the ZTNA destination rule.
2. Configure a ZTNA server and proxy policy on FortiGate.

Configuring a ZTNA destination rule on FortiClient

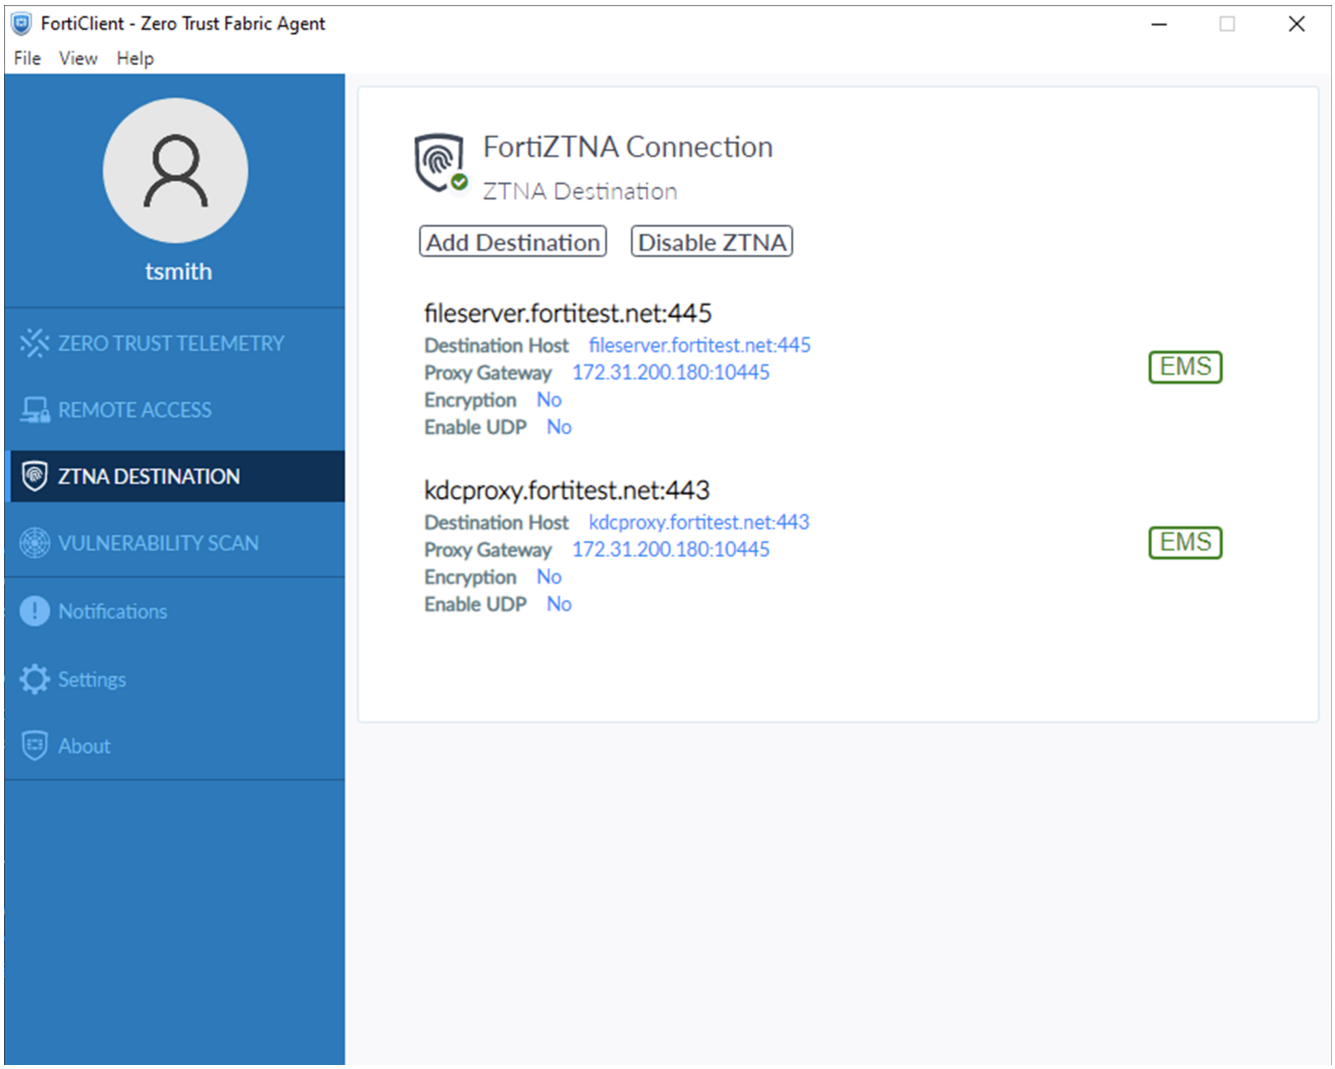
The ZTNA destination rule can be configured by using FortiClient EMS or by manually configuring FortiClient. The destination host matches the server's FQDN on port 445, and the proxy gateway should be the FortiGate WAN port on the chosen external port.

Another rule is required for the KDC proxy communication with the destination host defined as the FQDN of the KDC proxy server and port 443.

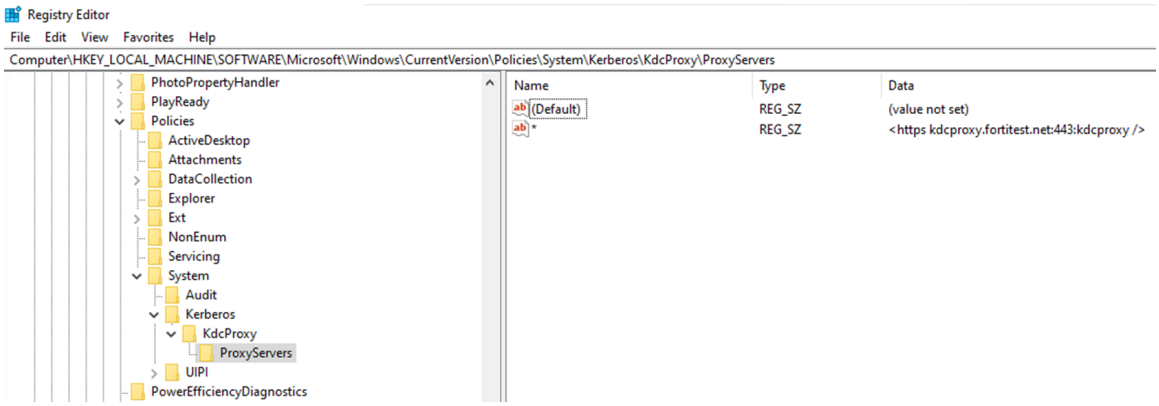
The map network drive configuration should be the last step after configuring the FortiGate. The following example shows the mapped drive:



The following example shows a ZTNA destination configured in FortiClient with the *Proxy Gateway*:



The following example shows the registry settings:



Configuring FortiGate

A ZTNA server and a proxy policy are required to verify and forward the incoming requests on port 10445 to the file server on port 445 as well as to the KDC proxy server on port 443.

To configure the ZTNA server:

1. Go to *Policy & Objects > ZTNA > Traffic Forwarding > Traffic Forwarding Server*.
2. Click *Create new*.
3. Set the *Name* to *Mapped Drive Using KDC*.
4. Set the *Host* to *172.31.200.180*.
5. In the ZTNA port table, click *Create New* and configure the following:

Option	Value
Interface	port3
IP address	172.31.200.180
Port	10445
Default certificate	Select the certificate which endpoints will be presented when accessing the ZTNA port.
Name	KDC:10445

6. Click *OK*.
7. Go to *Policy & Objects > ZTNA > Traffic Forwarding > Destination*.
8. Click *Create new* to define a new destination for the file server access:

Option	Value
Name	File-Server
Type	On-premise
Address	Use the dropdown and then the + button to define a new address object: • Name: fileserver • Type: FQDN • FQDN: fileserver.fortitest.net
Port	445
Protocol	TCP

9. Click *OK*.
10. Click *Create new* to define another new destination for the KDC proxy server:

Option	Value
Name	KDC_Proxy_Server
Type	On-premise

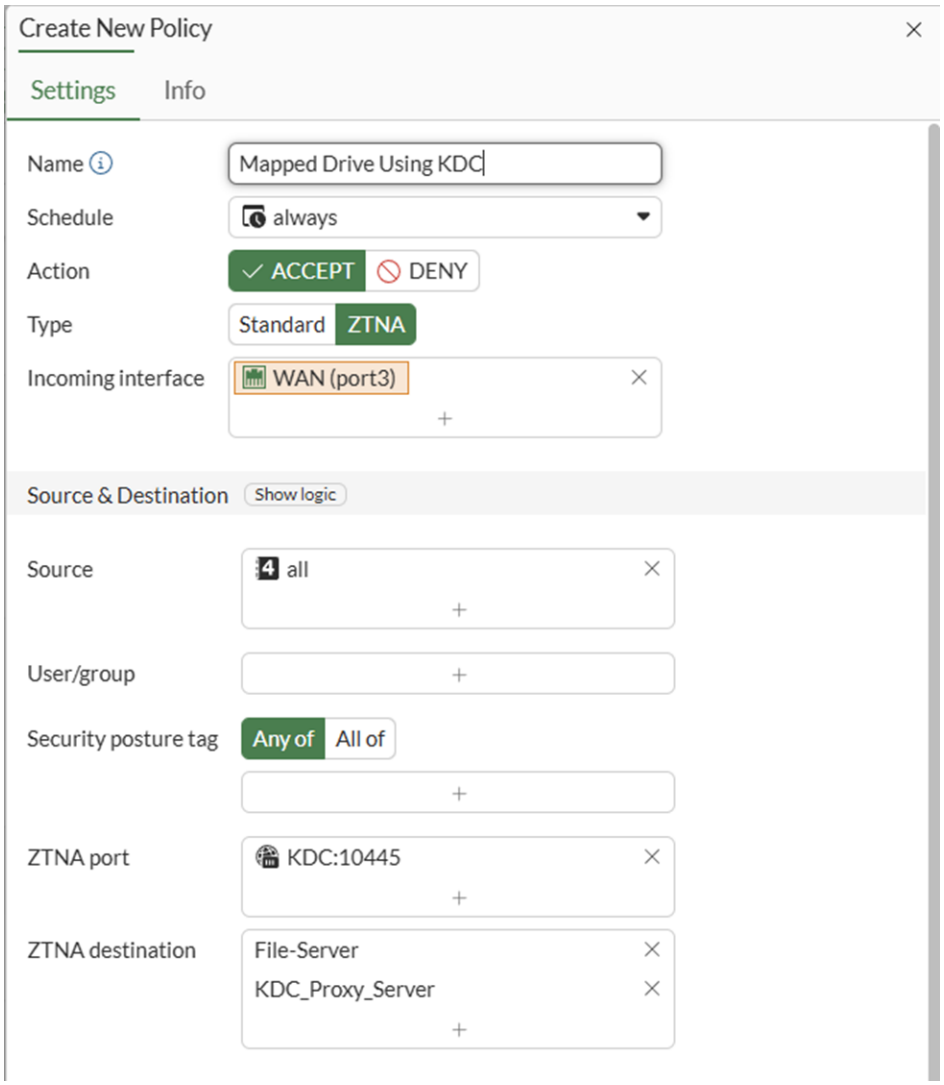
Option	Value
Address	Use the dropdown and then the + button to define a new address object: • Name: kdcproxy • Type: FQDN • FQDN: kdcproxy.fortitest.net
Port	443
Protocol	TCP

11. Click *OK*.

To configure the proxy policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create new*.
3. Configure the following:

Name	Mapped Drive Using KDC
Type	ZTNA
Incoming Interface	FGT-WAN (port1)
Source	all
Destination	FileServer KDC_Proxy_Server
ZTNA Port	KDC:10445
ZTNA Destination	File-Server KDC_Proxy_Server
Schedule	always
Action	Accept
Log Allowed Traffic	Enabled All Sessions
Enable this policy	Enabled



4. Click *OK*.

Custom replacement message for ZTNA virtual hosts

Each ZTNA virtual host can be configured to display messages from a custom replacement message group.

First create a replacement message group, and customize one ore more messages in the group. Then configure one or more ZTNA virtual hosts to use the replacement message group.

```
config firewall access-proxy-virtual-host
    edit <host name>
        set replacemsg-group <replacemsg group>
    next
end
```

When a client fails a ZTNA check with the virtual host, the replacement message is displayed.

Example

In this example, a ZTNA virtual host named *server1.ztna.local* is mapped to a replacement message group named *test-vhost*, and the group includes a customized *ZTNA Empty Certificate Error Page* message. The message is customized with a Company Y logo.

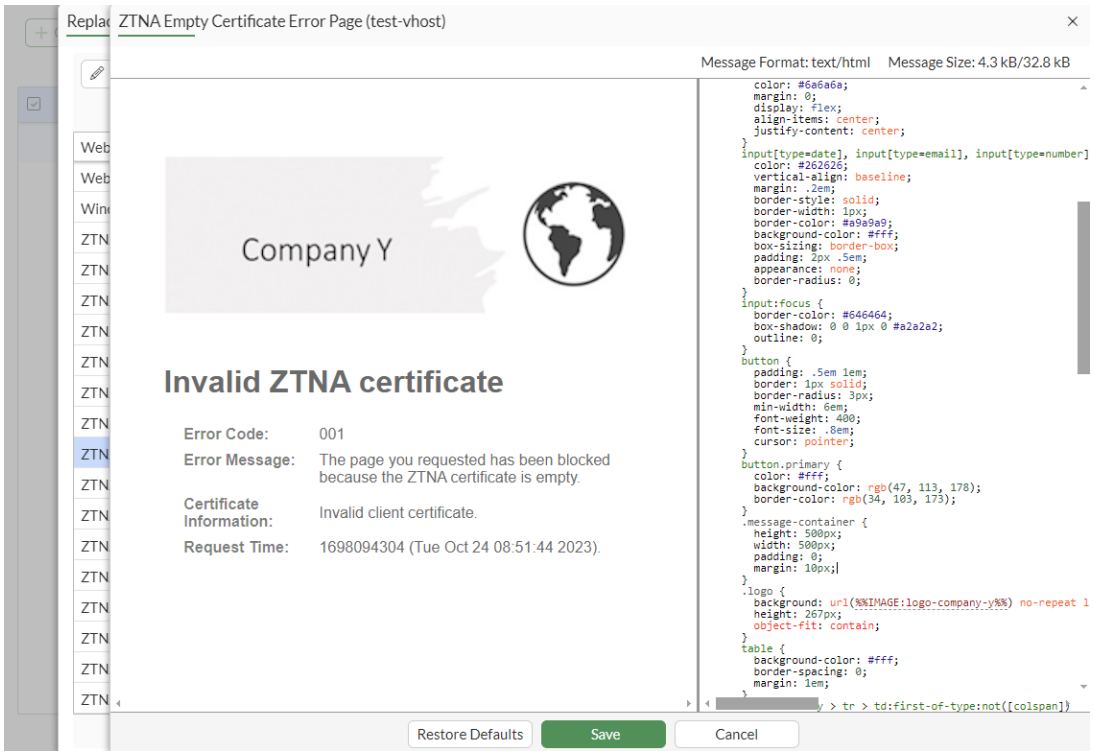
When clients fail a ZTNA check with the ZTNA virtual host (server1.ztna.local) because of an empty certificate, the custom replacement message is displayed.

Go to *System* > *Feature Visibility* and enable *Replacement Message Groups*. See Feature visibility on page 3820 for more information.

To customize replacement messages for ZTNA virtual hosts:

1. Upload a logo to the FortiGate to use in replacement messages:
   a. Go to *System* > *Replacement Messages* and click *Manage Images*.
   b. Click *Create New*.
   c. Name and upload an image file.
   d. Click *OK*. The logo is uploaded to the FortiGate.
2. Create a replacement message group named, for example, *test-vhost*:
   a. Go to *System* > *Replacement Message Groups* and click *Create New*.
   b. Specify a name for the group, such as *test-vhost*.
   c. Set *Group Type* to *Security*.
   d. Click *OK*.
3. Customize one or more messages in the *test-vhost* group:
   In this example, the *ZTNA Empty Certificate Error Page* message is edited to add a custom logo.
   a. Double-click the *test-vhost* replacement message group to open it for editing.
   b. Select the *ZTNA Empty Certificate Error Page* message and click *Edit*.
   c. In the right pane, edit the URL for the `.logo` section by typing the logo name to select the uploaded logo, for example, *logo-company-y*.

```
...
}
.logo {
  background: url(%%IMAGE:logo-company-y%%) no-repeat left center;
  height: 267px;
  object-fit: contain;
}
...
```



d. Click *Save*. A green checkmark is displayed in the *Modified* column to indicate a customized message.

4. Configure a ZTNA server with a ZTNA virtual host named *server1.ztna.local*. See Configure a ZTNA server on page 1550.

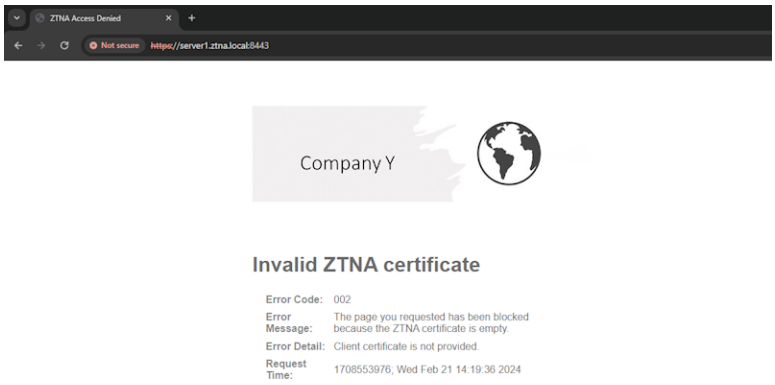
   In the *Service/server* mapping, be sure to set *Virtual Host* to *Specify*, and enter the name or IP address of the host that the request must match. For example, if server1.ztna.local is entered as the host, then only requests to server1.ztna.local will match.

5. Map the ZTNA virtual host to the replacement message group in the CLI.

   In this example, the ZTNA virtual host named `server1.ztna.local` is configured to use the `test-vhost` replacement message group.

```
config firewall access-proxy-virtual-host
    edit "server1.ztna.local"
        set replacemsg-group "test-vhost"
    next
end
```

6. Create a ZTNA policy to allow traffic to the ZTNA server. See Configure a ZTNA policy on page 1554.
7. When a client fails to access the ZTNA virtual host named *server1.ztna.local* because of an empty certificate error, the following custom replacement message with the Company Y logo is displayed.



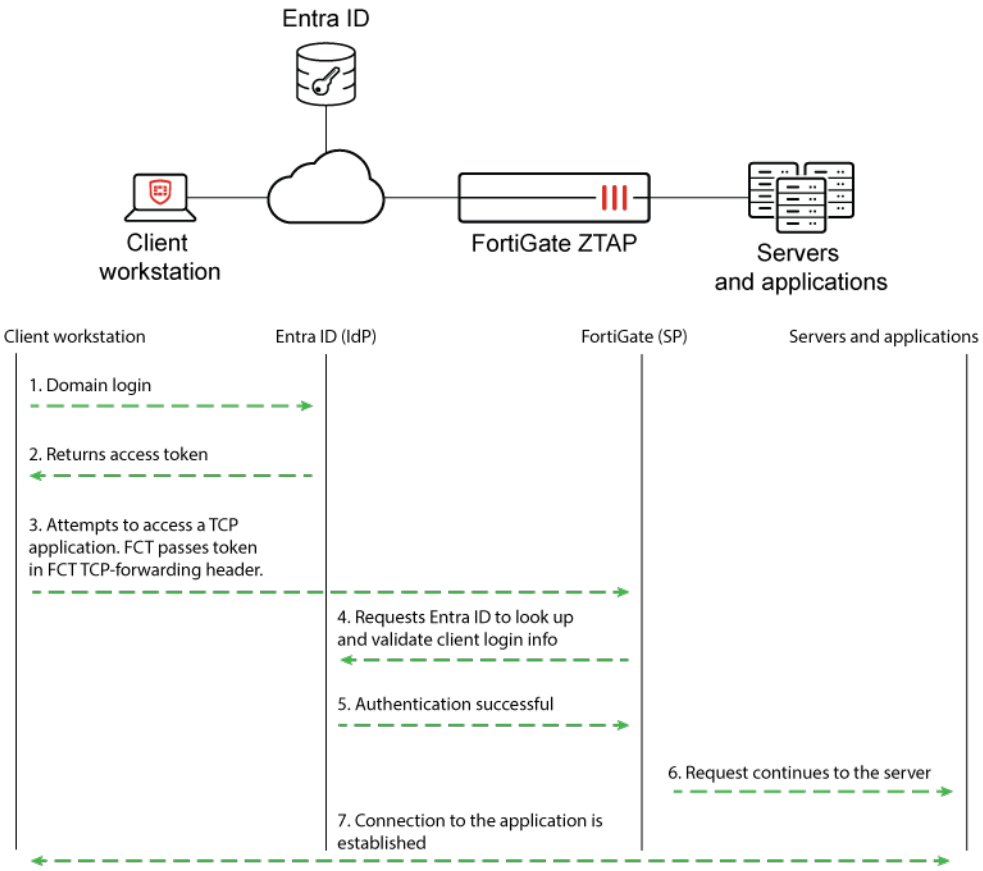
ZTNA single sign-on with Entra ID

In this enhancement, Windows users signed in to their workstations using Microsoft Entra ID domain are automatically allowed access to ZTNA-protected TCP resources by using the same IdP login information. FortiGate queries Entra ID using the client's login token to look up and validate the user. This allows single sign-on (SSO) and eliminates the extra step for each user to authenticate when they access a TCP application.

Prerequisites include:

- FortiClient 7.4.3 and later
- FortiOS 7.6.1 and later
- Domain configured on Microsoft Entra ID
- Enterprise application configured on Microsoft Entra ID
- Various permissions enabled in Microsoft Entra ID
- Windows clients that are able to join to the Entra ID domain

Topology and communications

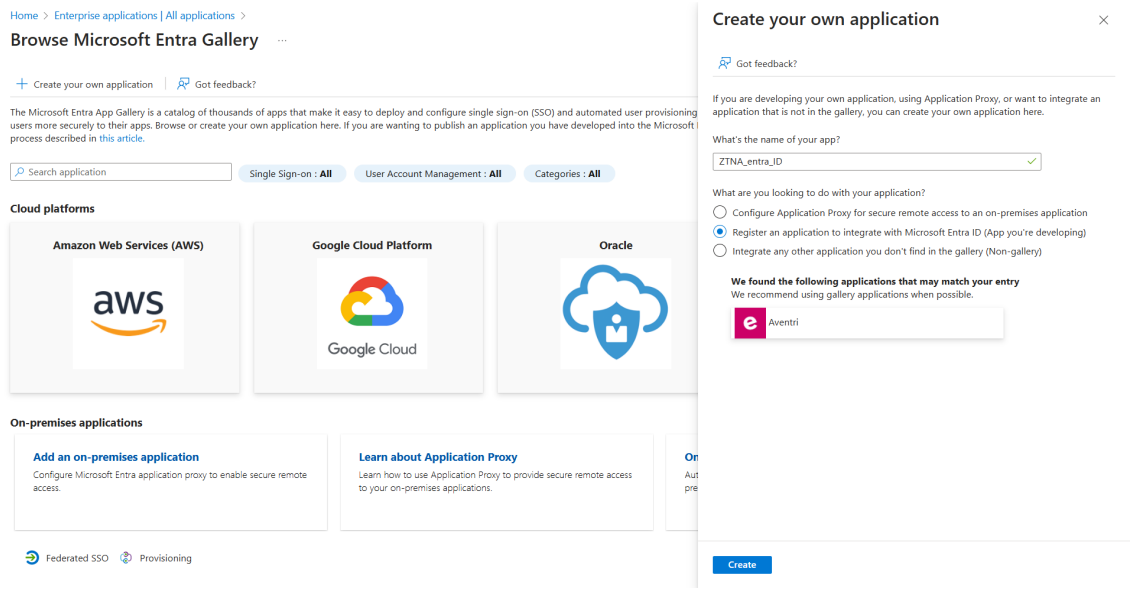


Entra ID configurations

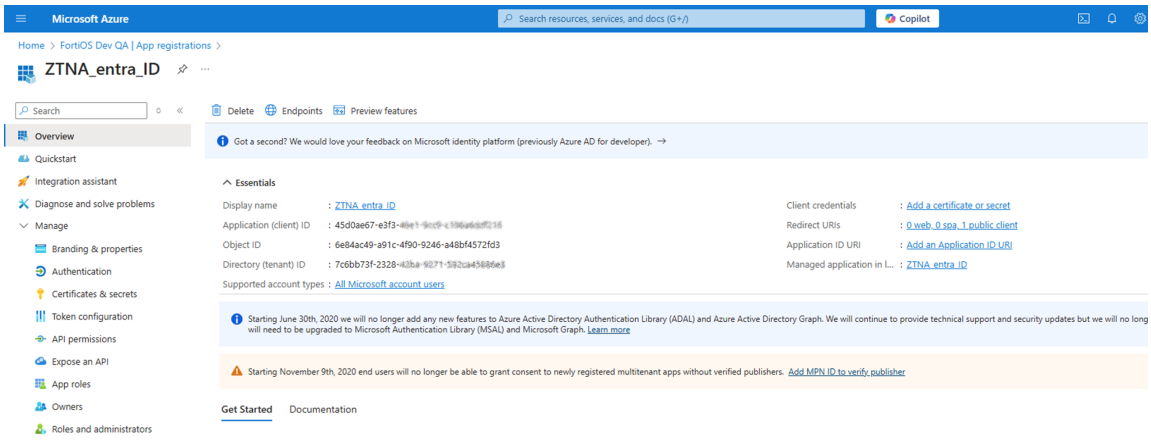
Create an Azure enterprise application to obtain Entra ID values.

To create an Azure enterprise application:

1. Click *Create your own application*, and select the *Register an application to integrate with Microsoft Entra ID (App you're developing)* option.



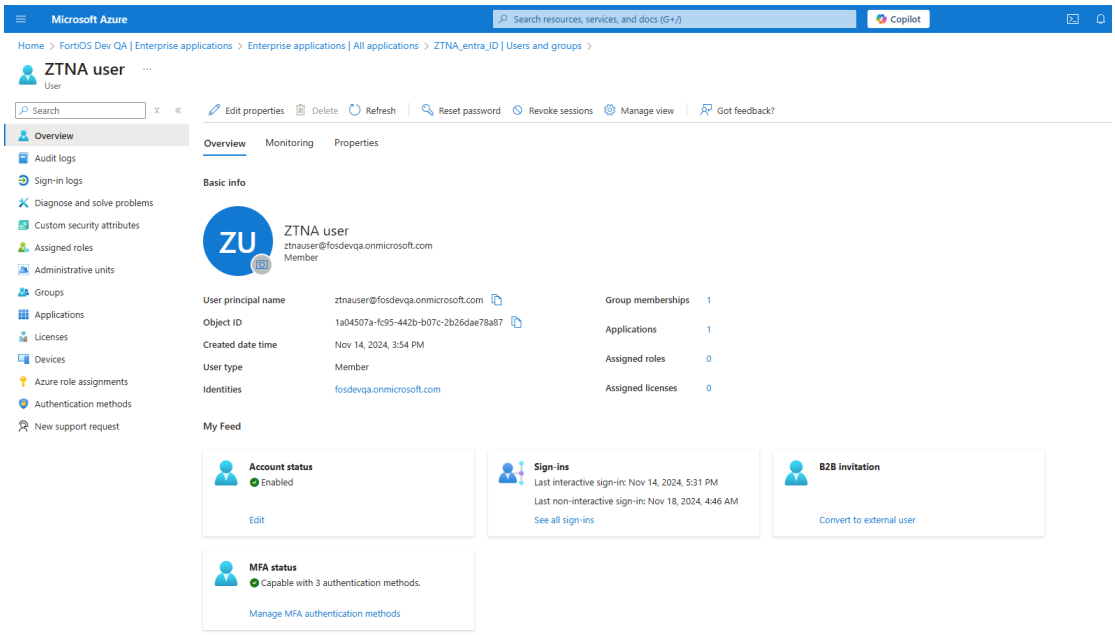
2. Open the *App registrations* page, and locate your app. On the *Overview* page, you can obtain the *Application (client) ID* and the *Directory (tenant) ID*.



In the this example, the values from the *ZTNA_entra_ID* app can be applied to the FortiClient EMS ZTNA Destinations profile in later steps:

Entra ID portal field	Corresponding FortiClient XML profile element	Value
Application (client) ID	<client_id>	45d0ae67-e3f3-xxxx-xxxx-xxxxxxxxxxxx
Directory (tenant) ID	<tenant_name>	7c6bb73f-2328-xxxx-xxxx-xxxxxxxxxxxx

Users and groups can be assigned to the enterprise application. In this example, the user ztnauser@fosdevqa.onmicrosoft.com belongs to a group assigned to the ZTNA_entra_ID app.



The user belongs to the Entra ID domain that is used by the user workstation to join the domain.

FortiClient EMS configurations

In FortiClient EMS 7.4.3 and later, the client ID and tenant ID can be specified in the `azure_app` attribute in XML.

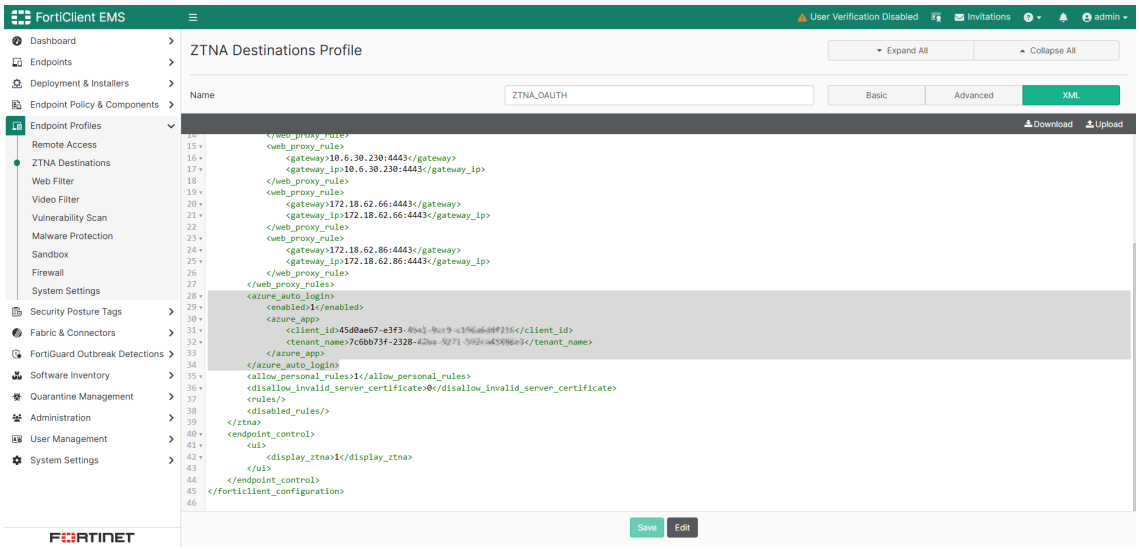
To configure FortiClient EMS:

1. Go to *Endpoint Profiles* > *ZTNA Destinations*.
2. Create a new profile or edit an existing one.
3. Click *XML*, and then click *Edit*.
4. Configure the profile as follows:

   Configure `<client_id>` and `<tenant_name>` with the Application (client) ID and Directory (tenant) ID values for the enterprise application in the Entra ID portal.

   Bold lines in the XML sample highlight key fields to support this feature:

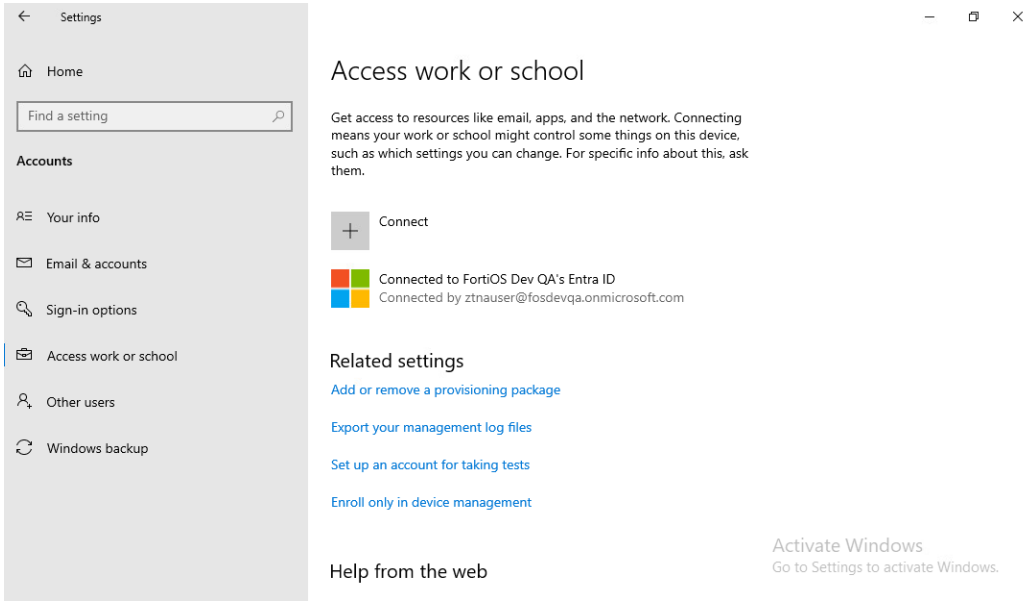
```
<forticlient_configuration>
    <ztna>
            …
        <azure_auto_login>
            <enabled>1</enabled>
            <azure_app>
                <client_id>45d0ae67-e3f3-xxxx-xxxx-xxxxxxxxxxxx</client_id>
                <tenant_name>7c6bb73f-2328-xxxx-xxxx-xxxxxxxxxxxx</tenant_name>
            </azure_app>
        </azure_auto_login>
        …
    </ztna>
<forticlient_configuration>
```



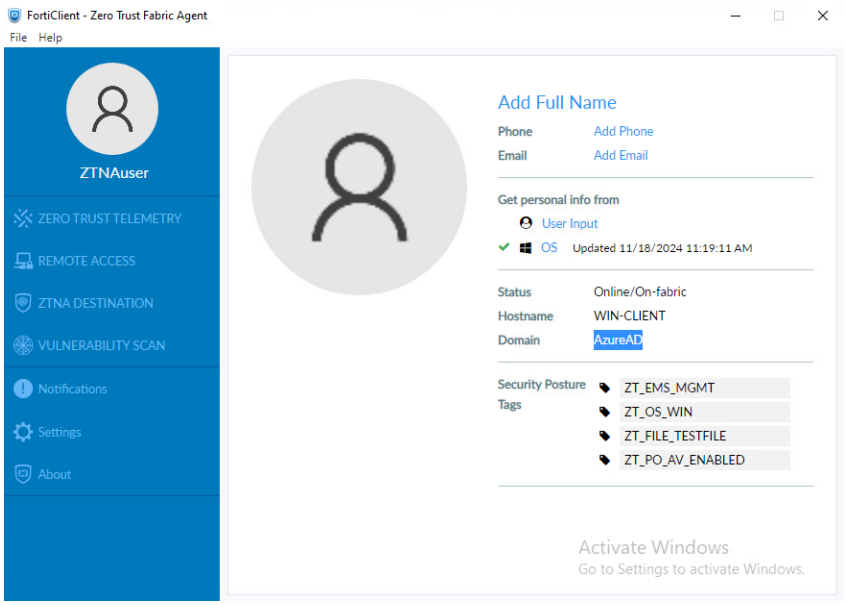
Not shown here, but TCP forwarding destinations are defined in the ZTNA destination profile.

Windows endpoint configuration

The endpoint client should already be joined to the Entra ID domain.



Once logged in and FortiClient is registered to EMS, click the user avatar to display information about the user, including the login domain name.

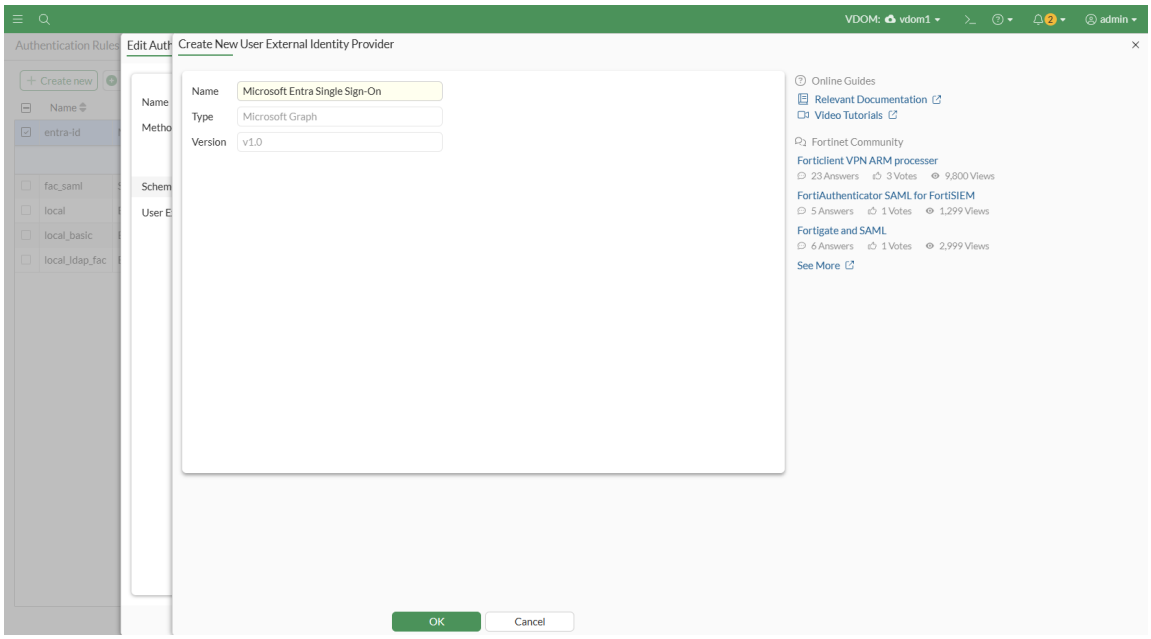


FortiGate configuration

FortiGate ZTNA server configurations remain the same. EMS connectivity and ZTNA server configurations are not explained in this topic. The major difference in FortiGate configurations is in the authentication scheme, rule, and user group. Therefore, the configuration process starts with authentication scheme and rule.

To configure the authentication scheme and rule:

1. Go to *Policy & Objects* > *Authentication*, and click the *Authentication Schemes* tab.
2. Click *Create new*.
3. Enter the name.
4. For method, click *+* and select the method *Microsoft Entra Single Sign-On*.
5. Create a new *User External Identity Provider*:
   a. Click the drop-down and click *Create*.
   b. Enter a name.
   c. Leave the default values of *Microsoft Graph* and *v1.0*, which are enabled by default.



d. Click *OK*.

6. Select the newly created External Identity Provider.
7. Click *OK* to save.
8. Click the *Authentication Rule* tab. Click *Create new*.
   a. Configure the following:

Field	Value
Name	Name of the rule
Source Address	*all* to apply this rule to all source traffic
Incoming Interface	*any* to apply this on any interface
Protocol	HTTP
Authentication Scheme	Disabled
IP-based Authentication	Enabled
SSO Authentication Scheme	Enabled. Set to the name of the new authentication scheme
Enable this rule	Enabled

   b. Click *OK* to save.

Next, you must configure the user group that is authorized to access the protected TCP application. The user group is queried against Entra ID using Microsoft Graph v1.0.

To configure the user group:

1. Go to *User & Authentication* > *User Groups*, and click *Create new*.
2. Enter a name.
3. Keep type as default (Firewall).

4. Under *Remote Groups*, click *Add*.
   a. For *Remote Server*, select the User External Identity Provider that was previously created.
   b. Optionally for *Groups*, specify the group name/ID corresponding to the user group object ID on Entra ID to filter by group.
   c. Click *OK*.
5. Click *OK* to save.

Finally, you must apply the user group to a ZTNA policy. In this example, a full ZTNA policy is configured.

To configure a full ZTNA policy:

1. Go to *Policy & Objects* > *Proxy Policy*, and click *Create new*.
2. Configure the following:

Field	Value
Name	Name of the policy
Type	ZTNA
Incoming Interface	Interface used by FortiGate to listen for the ZTNA connections.
Source	Address: Specify the source, or select *all* to allow all traffic sources. User: select the user group that was created in the previous step.
Security Posture Tag	Choose any tags that may be applicable.
Destination	Specify a destination server, or select *all* for all servers.
ZTNA Server	Specify the ZTNA server to allow access to.
Schedule	always
Action	ACCEPT

3. Configure other optional settings as needed.
4. Click *OK* to save.

Sample CLI configurations

```
config user external-identity-provider
    edit "entra_id"
        set type ms-graph
        set version v1.0
    next
end

config authentication scheme
    edit "entra_id"
        set method entra-sso
        set external-idp "entra_id"
    next
end
```

```
config authentication rule
    edit "entra_id"
        set srcaddr "all"
        set dstaddr "all"
        set ip-based disable
        set sso-auth-method "entra_id"
        set web-auth-cookie enable
    next
end

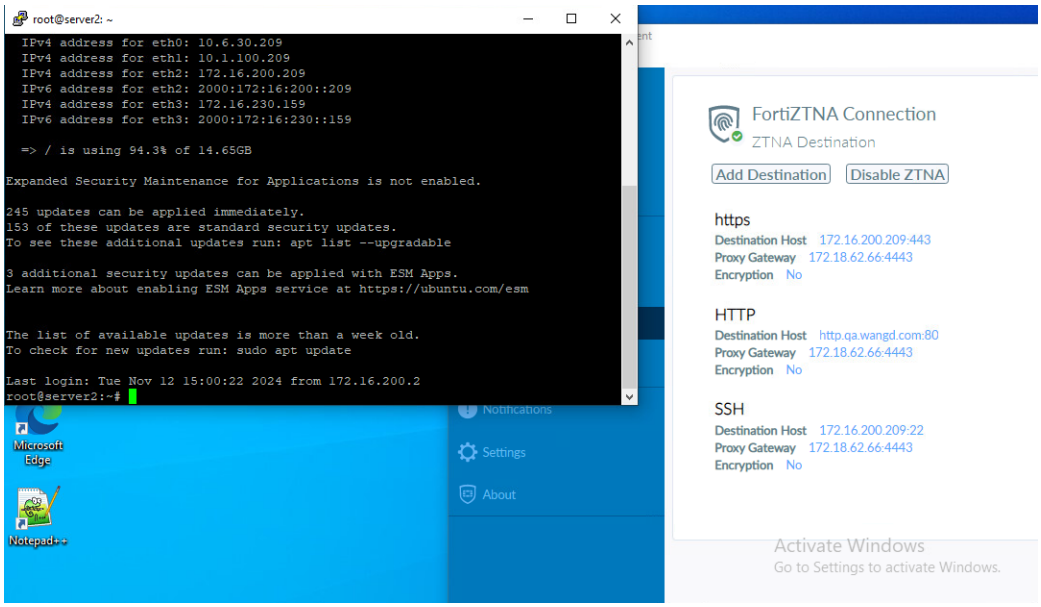
config user group
    edit "aad_group"
        set member "entra_id"
        config match
            edit 1
                set server-name "entra_id"
                set group-name "22e10685-49d3-4af8-b75b-57f22cb8aa32"
            next
        end
    next
end

config firewall proxy-policy
    edit 3
        set name "fzt"
        set proxy access-proxy
        set access-proxy "ztna_4"
        set srcintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set ztna-ems-tag "EMS7_ZTNA_ZT_OS_LINUX" "EMS7_ZTNA_ZT_OS_MAC" "EMS7_ZTNA_ZT_OS_WIN"
        set action accept
        set schedule "always"
        set logtraffic all
        set srcaddr6 "all"
        set dstaddr6 "all"
        set groups "aad_group"
        set ssl-ssh-profile "custom-deep-inspection"
    next
end
```

Testing and verification

In this example, a user logged in to Windows as ztnauser@fosdevqa.onmicrosoft.com in the AzureAD domain attempts to access a host 172.16.200.209:22 through SSH.

As the screenshot shows, the user can connect to the server through SSH without logging in again.



From the FortiGate, go to *Log & Report > ZTNA Traffic* to view corresponding traffic logs. Alternatively, use the CLI to run:

```
# execute log filter field subtype ztna
# execute log display
1: date=2024-11-18 time=14:46:53 eventtime=1731970013042933838 tz="-0800" logid="0005000024"

ZTNA troubleshooting and debugging commands

The following debug commands can be used to troubleshoot ZTNA issues:

Command	Description
`# diagnose endpoint fctems test-connectivity <EMS>`	Verify FortiGate to FortiClient EMS connectivity.

Command	Description
`# execute fctems verify <EMS>`	Verify the FortiClient EMS's certificate.
`# diagnose test application fcnacd 2`	Dump the EMS connectivity information.
`# diagnose debug app fcnacd -1` `# diagnose debug enable`	Run real-time FortiClient NAC daemon debugs.
`# diagnose endpoint ec-shm list <ip> <mac> <EMS_serial_number> <EMS_tenant_id>`	Show the endpoint record list. Optionally, add filters.
`# diagnose endpoint lls-comm send ztna find-uid <uid> <EMS_serial_number> <EMS_tenant_id>`	Query endpoints by client UID, EMS serial number, and EMS tenant ID.
`# diagnose endpoint lls-comm send ztna find-ip-vdom <ip> <vdom>`	Query endpoints by the client IP-VDOM pair.
`# diagnose wad dev query-by uid <uid> <EMS_serial_number> <EMS_tenant_id>`	Query from WAD diagnose command by UID, EMS serial number, and EMS tenant ID.
`# diagnose wad dev query-by ipv4 <ip>`	Query from WAD diagnose command by IP address.
`# diagnose firewall dynamic list`	List EMS security posture tags and all dynamic IP and MAC addresses.
`# diagnose test application fcnacd 7` `# diagnose test application fcnacd 8`	Check the FortiClient NAC daemon ZTNA and route cache.
`# diagnose wad worker policy list`	Display statistics associated with application gateway rules.

`# diagnose wad debug enable category all`
`# diagnose wad debug enable level verbose`
`# diagnose debug enable`
	Run real-time WAD debugs.

`# diagnose debug reset`	Reset debugs when completed.
`# diagnose wad user list`	List the ZTNA/proxy users.
`# diagnose wad user clear <id> <ip> <vdom>`	Clear a single ZTNA/proxy user.
`# diagnose wad user clear`	Clear all ZTNA/proxy users.

The WAD daemon handles proxy related processing. The FortiClient NAC daemon (fcnacd) handles FortiGate to EMS connectivity.

Troubleshooting usage and output

1. Verify the FortiGate to EMS connectivity and EMS certificate:

```
# diagnose endpoint fctems test-connectivity WIN10-EMS
Connection test was successful:
```

```
# execute fctems verify WIN10-EMS
Server certificate already verified.
```

```
# diagnose test application fcnacd 2
EMS context status:
FortiClient EMS number 1:
        name: WIN10-EMS confirmed: yes
        fetched-serial-number: FCTEMS0000109188
Websocket status: connected
```

2. If fcnacd does not report the proper status, run real-time fcnacd debugs:

```
# diagnose debug app fcnacd -1
# diagnose debug enable
```

3. Verify the following information about an endpoint:
   - Network information
   - Registration information
   - Client certificate information
   - Device information
   - Vulnerability status
   - Relative position with the FortiGate

```
# diagnose endpoint ec-shm list 10.6.30.214
Record 0:
                IP Address = 10.6.30.214
                MAC Address = 00:0c:29:ba:1e:61
                MAC list = 00:0c:29:ba:1e:61;00:0c:29:ba:1e:6b;
                VDOM = root (0)
                EMS serial number: FCTEMS8821001322
                EMS tenant id: 00000000000000000000000000000000
                Client cert SN: 17FF6595600A1AF53B87627AB4EBEDD032593E64
                Quarantined: no
                Online status: online
                Registration status: registered
                On-net status: on-net
                Gateway Interface: port2
                FortiClient version: 7.0.0
                AVDB version: 84.778
                FortiClient app signature version: 18.43
                FortiClient vulnerability scan engine version: 2.30
                FortiClient UID: 5FCFA3ECDE4D478C911D9232EC9299FD
                Host Name: ADPC
    …
                Number of Routes: (1)
                        Gateway Route #0:
                                - IP:10.1.100.214, MAC: 00:0c:29:ba:1e:6b, Indirect: no
                                - Interface:port2, VFID:0, SN: FG5H1E5819902474
online records: 1; offline records: 0; quarantined records: 0
```

4. Query the endpoint information, include security posture tags, by UID or IP address:

```
# diagnose endpoint lls-comm send ztna find-uid 5FCFA3ECDE4D478C911D9232EC9299FD
FCTEMS8821001322 00000000000000000000000000000000
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
EMS Fabric ID: FCTEMS8821001322:00000000000000000000000000000000
        status code:ok
        Domain: qa.wangd.com
        User: user1
        Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
        EMS SN: FCTEMS8821001322
        Routes(1):
         - route[0]: IP=10.1.100.214, VDom=root
        Tags(3):
         - tag[0]: name=ZT_OS_WIN
         - tag[1]: name=all_registered_clients
         - tag[2]: name=Medium
```

```
# diagnose endpoint lls-comm send ztna find-ip-vdom 10.1.100.214 root
UID: 5FCFA3ECDE4D478C911D9232EC9299FD
        status code:ok
        Domain: qa.wangd.com
        User: user1
        Cert SN:17FF6595600A1AF53B87627AB4EBEDD032593E64
        EMS SN: FCTEMS8821001322
        Routes(1):
         - route[0]: IP=10.1.100.214, VDom=root
        Tags(3):
         - tag[0]: name=ZT_OS_WIN
         - tag[1]: name=all_registered_clients
         - tag[2]: name=Medium
```

5. Query endpoint information from WAD by UID or IP address:

```
# diagnose wad dev query-by uid 5FCFA3ECDE4D478C911D9232EC9299FD FCTEMS8821001322
00000000000000000000000000000000
Attr of type=0, length=32, value(ascii)=5FCFA3ECDE4D478C911D9232EC9299FD
Attr of type=4, length=30, value(ascii)=MAC_FCTEMS8821001322_ZT_OS_WIN
Attr of type=4, length=26, value(ascii)=FCTEMS8821001322_ZT_OS_WIN
Attr of type=4, length=43, value(ascii)=MAC_FCTEMS8821001322_all_registered_clients
Attr of type=4, length=39, value(ascii)=FCTEMS8821001322_all_registered_clients
Attr of type=4, length=27, value(ascii)=MAC_FCTEMS8821001322_Medium
Attr of type=4, length=23, value(ascii)=FCTEMS8821001322_Medium
Attr of type=5, length=18, value(ascii)=FOSQA@qa.wangd.com
Attr of type=6, length=40, value(ascii)=17FF6595600A1AF53B87627AB4EBEDD032593E64
```

```
# diagnose wad dev query-by ipv4 10.1.100.214
Attr of type=0, length=32, value(ascii)=5FCFA3ECDE4D478C911D9232EC9299FD

Attr of type=4, length=39, value(ascii)=FCTEMS8821001322_all_registered_clients
Attr of type=4, length=27, value(ascii)=MAC_FCTEMS8821001322_Medium
Attr of type=4, length=23, value(ascii)=FCTEMS8821001322_Medium
```

```
Attr of type=5, length=18, value(ascii)=FOSQA@qa.wangd.com
Attr of type=6, length=40, value(ascii)=17FF6595600A1AF53B87627AB4EBEDD032593E64
```

6. List all the dynamic ZTNA IP and MAC addresses learned from EMS:

```
# diagnose firewall dynamic list
List all dynamic addresses:
FCTEMS0000109188_all_registered_clients: ID(51)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
FCTEMS0000109188_Low: ID(78)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
FCTEMS0000109188_Malicious-File-Detected: ID(190)
        ADDR(172.17.194.209)
        ADDR(192.168.40.8)
…
```

7. Check the FortiClient NAC daemon ZTNA and route cache:

```
# diagnose test application fcnacd 7
ZTNA Cache:
-uid 5FCFA3ECDE4D478C911D9232EC9299FD: { "tags": [ "ZT_OS_WIN", "all_registered_clients",
"Medium" ], "domain": "qa.wangd.com", "user_name": "user1", "client_cert_sn":
"17FF6595600A1AF53B87627AB4EBEDD032593E64", "owner": "FOSQA@qa.wangd.com", "gateway_route_
list": [ { "gateway_info": { "fgt_sn": "FG5H1E5819902474", "interface": "port2", "vdom":
"root" }, "route_info": [ { "ip": "10.1.100.214", "mac": "00-0c-29-ba-1e-6b", "route_type":
"direct" } ] } ], "ems_sn": "FCTEMS8821001322" }
```

```
# diagnose test application fcnacd 8
IP-VfID Cache:
IP: 10.1.100.206, vfid: 0, uid: 3DED29B54386416E9888F2DCBD2B9D21
IP: 10.1.100.214, vfid: 0, uid: 5FCFA3ECDE4D478C911D9232EC9299FD
```

8. Troubleshoot WAD with real-time debugs to understand how the proxy handled a client request:

```
# diagnose wad debug enable category all
# diagnose wad debug enable level verbose
# diagnose debug enable

[0x7fbd7a46bb60] Received request from client: 10.10.10.20:56312

```

Always reset the debugs after using them:

```
# diagnose debug reset
```

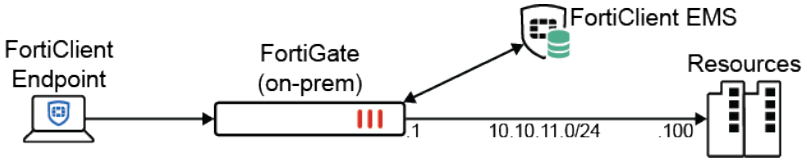
ZTNA troubleshooting scenarios

This topic describes how to troubleshoot common FortiClient endpoint IP/MAC access control issues for the following topologies:

- ZTNA access control on page 1762
- IP/MAC based access control on page 1764

ZTNA access control

In this topology, FortiClient endpoints use an SSL encrypted connection to the FortiGate application gateway to access protected resources. FortiGate works with FortiClient EMS to use a combination of IP/MAC addresses and security posture tags to control FortiClient endpoint access to resources.



This section describes how to handle the following errors:

- Invalid ZTNA certificate on page 1762
- ZTNA policy mismatch on page 1763

Invalid ZTNA certificate

When FortiClient attempts to access a server protected by ZTNA, an *Invalid ZTNA certificate* error is shown. This error often appears when the serial number for the ZTNA certificate differs between the endpoint and the FortiGate.

1. Check the serial number for the ZTNA certificate on the endpoint and the FortiGate:
   a. On the endpoint, check the serial number for the certificate.
   b. On the FortiGate, check the serial number for the client certificate by running the following command:

```
# diagnose endpoint ec-shm list
```

2. If the serial number for the ZTNA certificate differs between the endpoint and the FortiGate, and the serial number on the FortiGate is comprised of zeros, check the following:
   a. For FortiClient, make sure that the endpoint is running FortiClient 7.0 or later. FortiClient versions earlier than 7.0 do not support ZTNA.
   b. For FortiClient EMS, make sure that ZTNA is enabled. Check the profile on EMS and the endpoint's summary information.
   c. For licensing, make sure that you have a ZTNA agent license entitlement. Only some license types support ZTNA.
3. If the serial numbers still do not match, deregister FortiClient from EMS, and then connect FortiClient to EMS again to trigger a new certificate signing request.

ZTNA policy mismatch

In most cases, FortiGate denies incoming ZTNA requests because the endpoint FortiClient does not meet the tagging criteria configured in the ZTNA rule and is considered a policy mismatch.

1. On the FortiGate, look at the ZTNA event logs and the forwarded logs.
2. Run the following commands on the ZTNA server:

```
# diagnose wad debug enable category policy
```

```
# diagnose wad debug enable level verbose
```

```
# diagnose debug enable
```

   The command output contains incoming ZTNA requests and the FortiGate process for matching the connection to a ZTNA rule.
3. Verify the zero trust tags for the endpoint:
   - On FortiClient, verify the applied tags. Click the avatar to view the zero trust tags.
   - On FortiClient EMS, verify the endpoint's tags. Go to the endpoint list and click the endpoint.
   - On FortiGate, verify the tags using the following commands:
     - Display ZTNA cache data for all endpoints:

```
# diagnose test application fcnacd 7
```

     - Display ZTNA cache data for an individual endpoint:

```
# diagnose wad dev query-by uid <UID> <EMS S/N> <tenant ID>
```

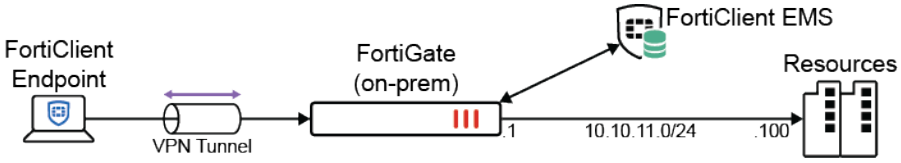
4. If the tagging information differs between FortiGate and EMS, examine the EMS tag exchange communication between FortiGate and EMS by looking at the cmNotify and python logs in the debug diagnostics for EMS.

   For more information about FortiClient EMS diagnostics, see Generate Diagnostic Log in the FortiClient EMS Administration Guide.

IP/MAC based access control

In the following ZTNA topology, FortiClient endpoints use VPN to access resources. FortiGate works with FortiClient EMS to use a combination of IP/MAC addresses and security posture tags to control FortiClient endpoint access to resources.

For more information, see ZTNA IP MAC based access control example on page 1712.



Security posture tag information missing on the FortiGate

If the IP address for the FortiClient endpoint is not associated with a security posture tag on the FortiGate, a firewall policy mismatch occurs, and the FortiGate denies network access to the FortiClient endpoint.

The following workflow summarizes how FortiGate retrieves the IP address and tags for the FortiClient endpoint to help you better understand how to troubleshoot the situation:

1. FortiClient establishes a VPN connection to the FortiGate.
2. FortiGate uses the API to pass FortiClient's UUID and VPN IP address to FortiClient EMS.
3. FortiGate requests system information and tags from FortiClient based on the response from EMS.

Based on the workflow, start troubleshooting before the FortiClient endpoint attempts to establish a VPN connection to FortiGate. On FortiGate, run the following commands:

```
# diagnose debug application fcnacd -1
```

```
# diagnose debug console timestamp enable
```

```
# diagnose endpoint filter show-large-data yes
```

```
# diagnose debug enable
```

The following outputs illustrate how to examine the command output. The output can differ between environments. The outputs help illustrate how to understand the communication between FortiGate and FortiClient EMS.

In the following output, FortiGate's VPN daemon sends FortiClient's UUID and the VPN IP address to FortiClient EMS using the API. The NAC daemon makes the API call to send the details to FortiClient EMS:

```
2022-10-17 08:50:41 [fcems_call_vpn_client_gateway_call:1147] VPN act connect (UID:
3358095CFDCB414B9EDA49ADE79AF428, Interface: port1, IP: 10.212.134.200, VDom: root,
 FortiGate-SN: FGVM02TM22018374) added to EMS FortiClientEMS
(FCTEMS8821003330:00000000000000000000000000000000)

```

FortiGate uses the information from FortiClient EMS to make a targeted API call to FortiClient EMS to retrieve both system information and tag information (with the means of uid_offset and updated_after parameters) for the endpoint. The following is the API call to retrieve the tags from FortiClient EMS:

```
https://172.31.200.182/api/v1/report/fct/uid_tags?sn_list[]=FGVM02TM22018374&updated_after=2022-
10-17 15:59:37.8227461&uid_offset=3358095CFDCB414B9EDA49ADE79AF428
```

The following in an example of the API call and subsequent communication between FortiGate and FortiClient EMS to retrieve tags for the FortiClient endpoint IP address:

```
2022-10-17 08:50:42 [ec_ez_worker_base_prep_resolver:373] Outgoing interface index 0 for 2
(FortiClientEMS).
2022-10-17 08:50:42 [ec_ez_worker_prep_data_url:98] request (26):
"""
```

```
sn_list[]=FGVM02TM22018374
"""

```

Other useful CLI commands

Output the JSON-formatted list of FortiGate interfaces (gateways) with IP and MAC addresses. This is the list that FortiGate sends to EMS so that EMS can identify the endpoints that are directly connected to the firewall:

```
# diagnose endpoint fctems json gateway-mac-request
```

Makes EMS execute API calls to the EMS API endpoints on demand:

```
# diagnose test application fcnacd 5
```

Send the gateway list to EMS on demand. It could be useful to execute `diagnose test application fcnacd 5` right after command during troubleshooting, as EMS will have an updated list of firewall interfaces:

```
# diagnose test application fcnacd 99
```

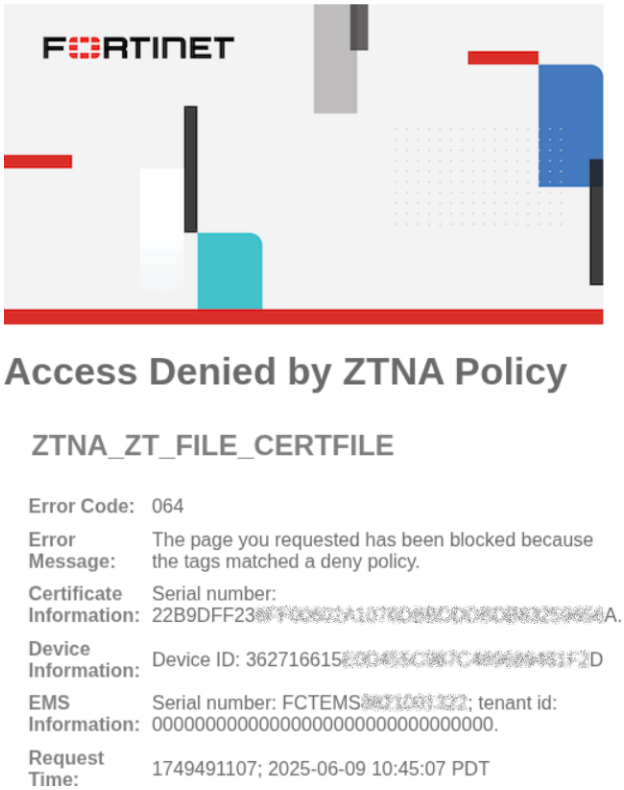
For more commands, see ZTNA troubleshooting and debugging commands on page 1756.

ZTNA troubleshooting with error messages

As part of the troubleshooting process, one essential step is to utilize the error messages displayed on the client endpoints to deduce the issue encountered. This is particularly important when accessing a resource from a web browser.

When a problem is encountered, the user is likely to see a replacement message.

For example, if a FortiGate is configured with a deny policy when matching a specific security posture tag called ZTNA_ZT_FILE_CERTFILE, and the endpoint client hit the deny policy because it matched this tag, an access denied message is would be shown.



The replacement message includes all or a subset of the following information:

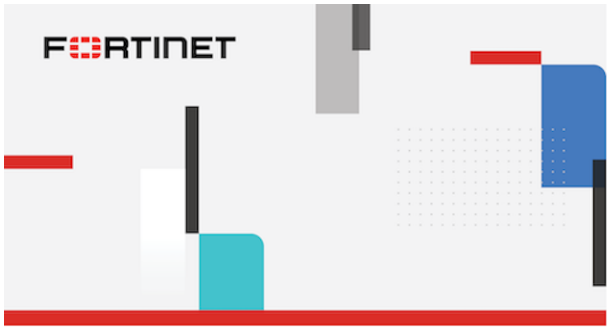
Field	Description
Title	Short summary of the issue
Subtitle	Additional details of the issue
Error Code	Code based on Error codes and replacement messages
Error Message	Specific error behavior encountered
User name	If the policy has user group defined, display the username
Certificate Information	The SN of the FortiClient endpoint certificate

Field	Description
Device Information	The Device ID of the FortiClient endpoint
Destination	The destination in which the client is trying to reach
EMS Information	Information about the EMS server including: • Server SN • Tenant ID
Request Time	When the request was made

Correlating with FortiGate ZTNA event logs

The replacement message information helps administrators correlate the event with the ZTNA event logs. If multiple EMS servers or tenants are used, the information helps pinpoint the relevant EMS server or tenant. Administrators can find the specific firewall policy that was matched to determine if the violation is legitimate, or if there is a misconfiguration.

For example, the following replacement message and log show that a user named mjohnson attempted to match a policy on the FortiGate against the ZTNA-webserver access proxy but was unable to match a policy that authorized its access due to no user group matched.



ZTNA Policy Denied

Error Code:	069
Error Message:	The page you requested has been blocked because authorization failed.
User Name:	mjohnson
Certificate Information:	Serial number: 230D5F9BF[redacted]46.

```

Additional Examples

Issue attempting to reach a destination

A client tries to access the destination 172.16.200.208:443, but the destination cannot be reached from the FortiGate. Before this enhancement, this resulted in a non-ZTNA replacement message, stating *504 Gateway Timeout: remote server did not respond to the proxy*.

After this enhancement, a *ZTNA Connection Error* replacement message with *Error Code 024* is displayed:

ZTNA Connection Error

Error Code:	024
Error Message:	There is a connection issue when attempting to reach the destination website.
Certificate Information:	Serial number: 22B9DFF23
Device Information:	Device ID: 362716615
Destination:	172.16.200.208:443
Request Time:	1749492345; 2025-06-09 11:05:45 PDT

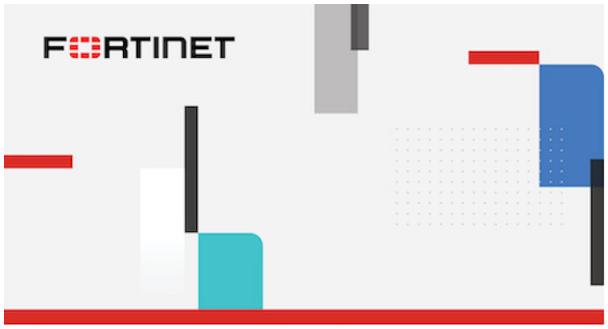
DNS resolution when matching a wildcard domain

A FortiGate has a real server definition for TCP forwarding using a wildcard domain match:

```
config firewall access-proxy
    edit "ztna"
        set vip "ztna"
            edit 2
```

```
                set url-map "/tcp"
                set service tcp-forwarding
                config realservers
                    edit 1
                        set address "ftnttest.com"
                        set domain "*.ftnttest.com"
                    next
                end
            next
        end
    next
end
```

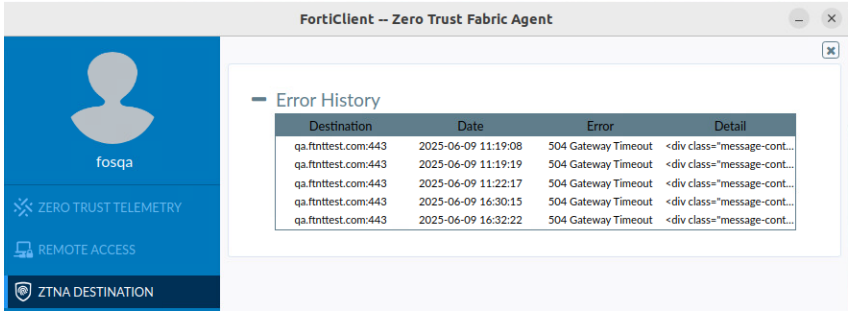
When the endpoint client requests the TCP forwarding resource that matches the wildcard domain, but this address cannot be resolved by the FortiGate, a *ZTNA Connection Error* replacement message with *Error Code 025* is displayed:



ZTNA Connection Error

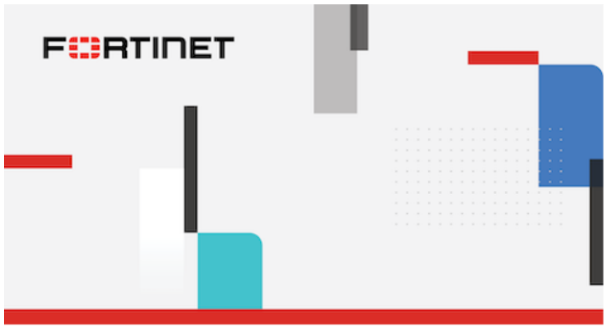
Error Code:	025
Error Message:	ZTNA connection failed due to a DNS issue.
Certificate Information:	Serial number: 22B9DFF23[redacted]A.
Device Information:	N/A.
Destination:	(N/A)
Request Time:	1749493337; 2025-06-09 11:22:17 PDT

Additionally, on FortiClient, the *Error History* indicates a *504 Gateway Timeout* when accessing the resource:



Tag(s) matched a deny policy

A FortiGate is configured with a deny policy when matching a specific security posture tag called ZTNA_ZT_FILE_CERTFILE. An *Access Denied by ZTNA policy* replacement message with *Error Code 064* is displayed:



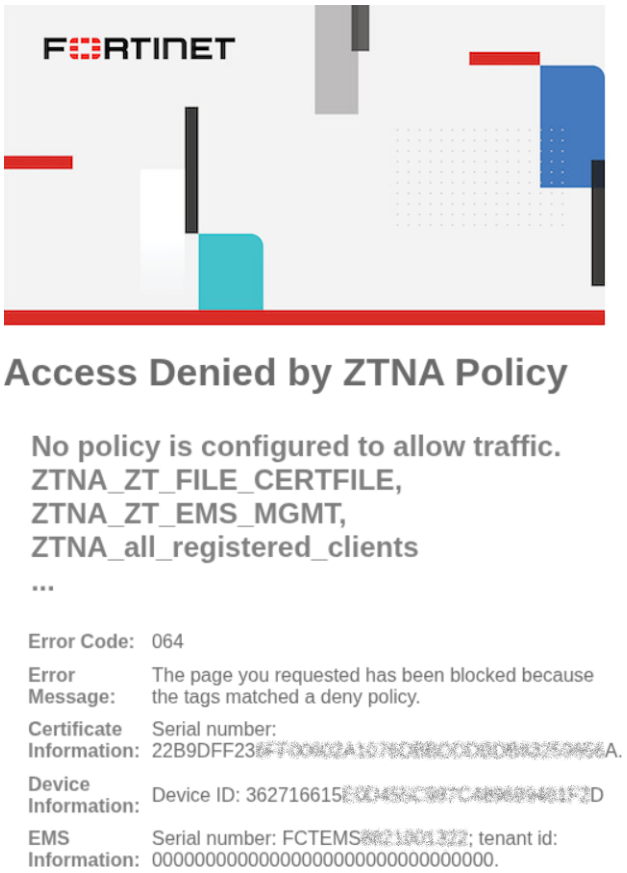
Access Denied by ZTNA Policy

ZTNA_ZT_FILE_CERTFILE

Error Code:	064
Error Message:	The page you requested has been blocked because the tags matched a deny policy.
Certificate Information:	Serial number: 22B9DFF23[redacted]A.
Device Information:	Device ID: 362716615[redacted]D
EMS Information:	Serial number: FCTEMS[redacted]; tenant id: 00000000000000000000000000000000.
Request Time:	1749491107; 2025-06-09 10:45:07 PDT

Tag(s) matched one or more deny policy

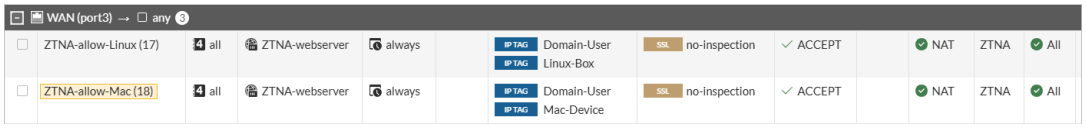
A FortiGate is configured with one or more deny policies, without any allow policies for ZTNA traffic. Client matches one of more of the deny policies based on its tags. An *Access Denied by ZTNA policy* replacement message with *Error Code 064* is displayed:



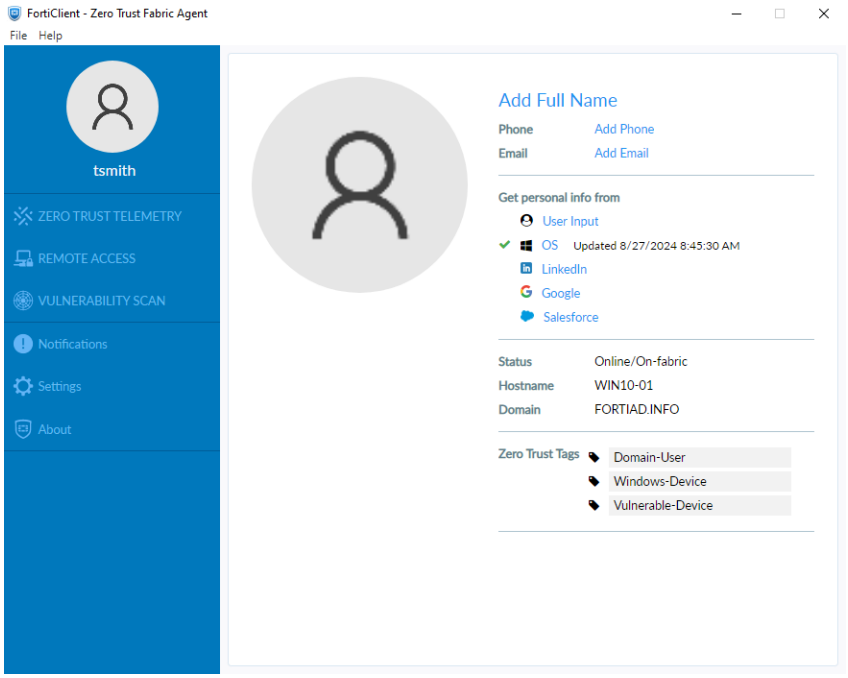
Client tags do not match any allowed ZTNA policy

One or more allow ZTNA policies are configured, with tags that are required for each policy. Client tags do not match the tag criteria in the allowed ZTNA policy, resulting in an implicit deny. An *Access Denied by ZTNA policy* replacement message with *Error Code 065* is displayed, along with the missing attributes/tags that would have matched a policy.

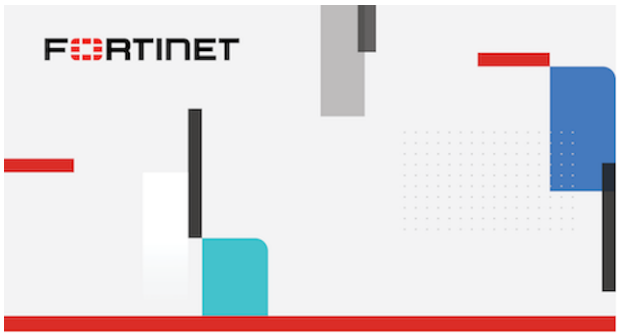
ZTNA policy configuration:



FortiClient tags:



Replacement Message:



Access Denied by ZTNA Policy

Missing attributes:
Detected Ubuntu Box,
Detected Mac Device

Error Code:	065
Error Message:	The page you requested has been blocked because the tags didn't match any policy.

Policy and Objects

This section contains topics on configuring policies and traffic shaping:

- Policies on page 1776
- Address objects on page 1963
- Custom tags NEW on page 2016
- Protocol options on page 2028
- Traffic shaping on page 2034
- Internet Services on page 2105

Policies

The firewall policy is the axis around which most features of the FortiGate revolve. Many firewall settings end up relating to or being associated with the firewall policies and the traffic they govern. Any traffic going through a FortiGate has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it is processed, if it is processed, and whether or not it is allowed to pass through the FortiGate.

When the firewall receives a connection packet, it analyzes the source address, destination address, and service (by port number). It also registers the incoming interface, the outgoing interface it needs to use, and the time of day. Using this information, the FortiGate firewall attempts to locate a security policy that matches the packet. If a policy matches the parameters, then the FortiGate takes the required action for that policy. If it is *Accept*, the traffic is allowed to proceed to the next step. If the action is *Deny* or a match cannot be found, the traffic is not allowed to proceed.

The two basic actions at the initial connection are either *Accept* or *Deny*:

- If the action is *Accept*, the policy permits communication sessions. There may be other packet processing instructions, such as requiring authentication to use the policy or restrictions on the source and destination of the traffic.
- If the action is *Deny*, the policy blocks communication sessions, and you can optionally log the denied traffic. If no security policy matches the traffic, the packets are dropped. A *Deny* security policy is needed when it is required to log the denied traffic, also called *violation traffic*.

One other action can be associated with the policy:

- *IPsec*: this is an *Accept* action that is specifically for IPsec VPNs.

Each field in a firewall policy that accepts multiple inputs, such as srcaddr and dstaddr, can accept as many inputs as there are unique objects created. The maximum number of objects depends on the model. See the Maximum Values Table for more details.

The following topics provide information on the available types of policies and configuration instructions:

- Firewall policy on page 1777
- NGFW policy on page 1803
- Local-in policy on page 1820
- DoS policy on page 1836
- Telemetry policy on page 1844
- Access control lists on page 1846
- Interface policies on page 1847

The following topics provide instructions on configuring policies:

- Source NAT on page 1848
- Destination NAT on page 1874
- Examples and policy actions on page 1900

Firewall policy

The firewall policy is the axis around which most of the other features of the FortiGate firewall revolve. A large portion of the settings in the firewall at some point will end up relating to or being associated with the firewall policies and the traffic that they govern. Any traffic going through a FortiGate unit has to be associated with a policy. These policies are essentially discrete compartmentalized sets of instructions that control the traffic flow going through the firewall. These instructions control where the traffic goes, how it's processed, if it's processed, and even whether or not it's allowed to pass through the FortiGate.

The following topics provide information on the firewall policy and configuration:

- Firewall policy parameters on page 1777
- Configurations in the GUI on page 1778
- Configurations in the CLI on page 1788
- Policy views on page 1793
- Policy match on page 1798
- Services on page 1798

Firewall policy parameters

For traffic to flow through the FortiGate firewall, there must be a policy that matches its parameters:

- Incoming interface(s)
- Outgoing interface(s)
- Source address(es)
- Destination address(es)
- User(s) identity
- Service(s)
- Schedule

Traffic parameters are checked against the configured policies for a match. If the parameters do not match any configured policies, the traffic is denied.

Traffic flow initiated from each direction requires a policy, that is, if sessions can be initiated from both directions, each direction requires a policy.

Just because packets can go from point A to point B on port X does not mean that the traffic can flow from point B to point A on port X. A policy must be configured for each direction.

When designing a policy, there is often reference to the traffic flow, but most communication is two-way so trying to determine the direction of the flow might be confusing. If traffic is HTTP web traffic, the user sends a request to the website, but most of the traffic flow will be coming from the website to the user or in both directions? For the purposes of determining the direction for a policy, the important factor is the direction of the initiating communication. The user is sending a request to the website, so this is the initial communication; the website is responding so the traffic is from the user's network to the Internet.

FortiOS does not perform a reverse-path check on reply traffic that matches an allowed session based on the IP tuple. The request traffic can be sent on one interface and the reply traffic could return on another interface.

Configurations in the GUI

Firewall policies can be created in the GUI by configuring the necessary parameters.

Schedule	The time frame that is applied to the policy. This can be something as simple as a time range that the sessions are allowed to start, such as between 8:00 AM and 5:00 PM. Something more complex like business hours that include a break for lunch and time of the session's initiation may need a schedule group because it will require multiple time ranges to make up the schedule.
Incoming interface (s)	This is the interface or interfaces by which the traffic is first connected to the FortiGate unit. The exception being traffic that the FortiGate generates itself. This is not limited to the physical Ethernet ports found on the device. The incoming interface can also be a logical or virtual interface such as a VPN tunnel, a Virtual WAN link, or a wireless interface. The FortiLink interface cannot be added into a firewall policy in the GUI. Instead, when you need to apply the FortiLink interface as a source, such as when you want to allow access to a syslog or SNMP server, create the firewall policy from the CLI.
Outgoing interface (s)	This is the interface or interfaces used by traffic leaving a port once it has been processed by the firewall. Similar to incoming interfaces, it is not limited to only physical interfaces.
Source address (es)	The addresses that a policy can receive traffic from can be wide open or tightly controlled. For a public web server that the world at large should be able to access, the best choice will be *all*. If the destination is a private web server that only the branch offices of a company should be able to access, or a list of internal computers that are the only ones allowed to access an external resource, then a group of preconfigured addresses is the better strategy

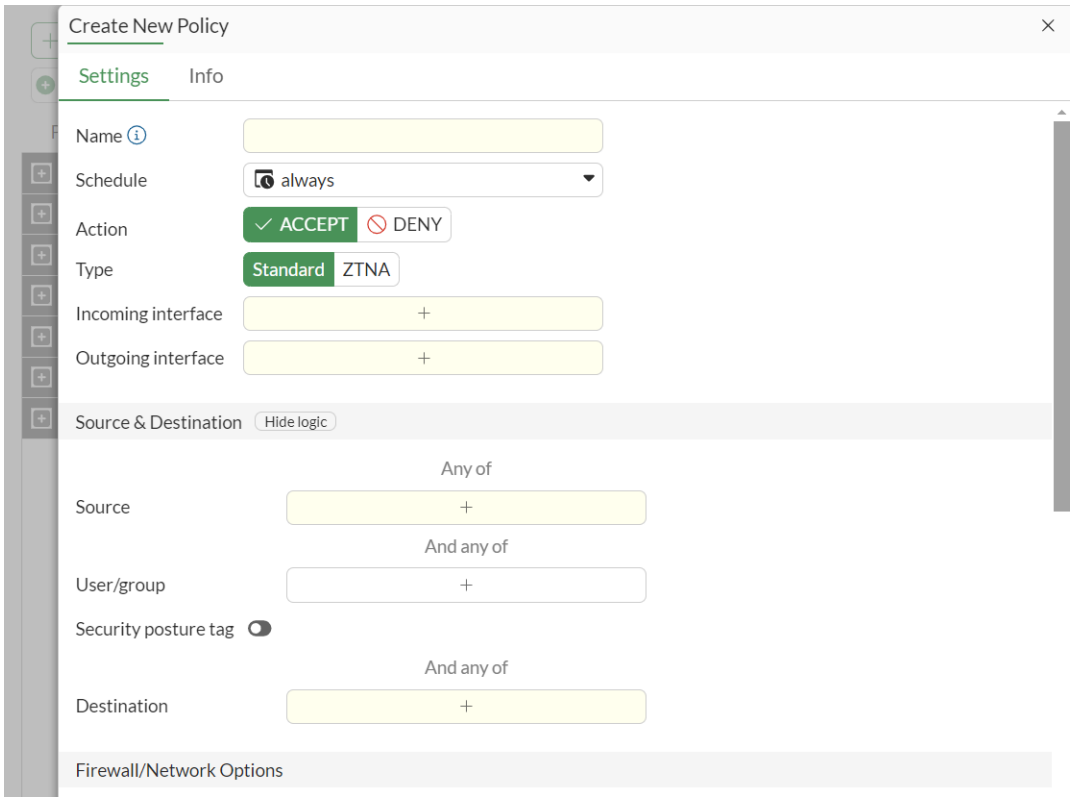
User/group	This parameter is based on a user identity that can be from a number of authentication authorities. It will be an account or group that has been set up in advance that can be selected from the drop down menu. The exception to this is the feature that allows the importing of LDAP Users. When the feature is used, a small wizard window will appear to guide the user through the setup. The caveat is that the LDAP server object in the *User & Authentication > LDAP Servers* section has to be already configured to allow the use of this import feature.
Destination address(es)	In the same way that the source address may need to be limited, the destination address can be used as a traffic filter. When the traffic is destined for internal resources, the specific address of the resource can be defined to better protect the other resources on the network. One of the specialized destination address options is to use a Virtual IP address. If the destination address doesn't need to be internal, you can define policies that are only for connecting to specific addresses on the Internet.
Internet service(s)	In this context, an Internet service is a combination of one or more addresses and one or more services associated with a service found on the Internet such as an update service for software.
Service	The services chosen represent the TCP/IP suite port numbers that will most commonly be used to transport the named protocols or groups of protocols. This is different than *Application Control* which looks more closely at the packets to determine the actual protocol used to create them. A case where either side can initiate the communication, like between two internal interfaces on the FortiGate unit, would be a more likely situation to require a policy for each direction.

Displaying logic between firewall policy objects in the GUI

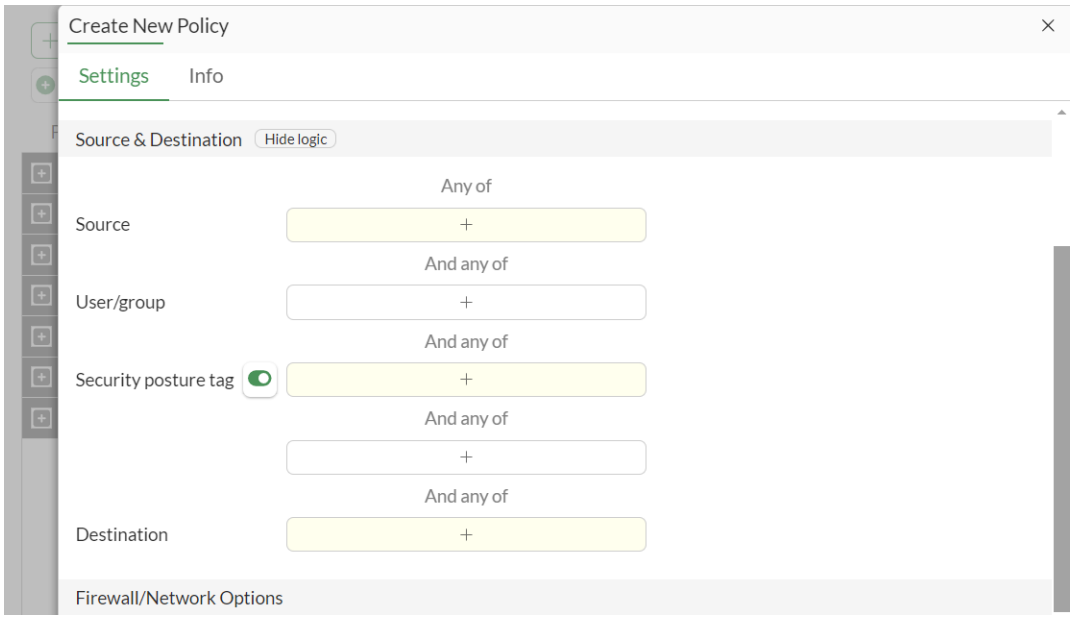
The FortiOS GUI can display the logical AND relationship in firewall policies between source and destination objects, including security posture tags when enabled, to help you configure firewall policies.

To display the logic in firewall policies in the GUI:

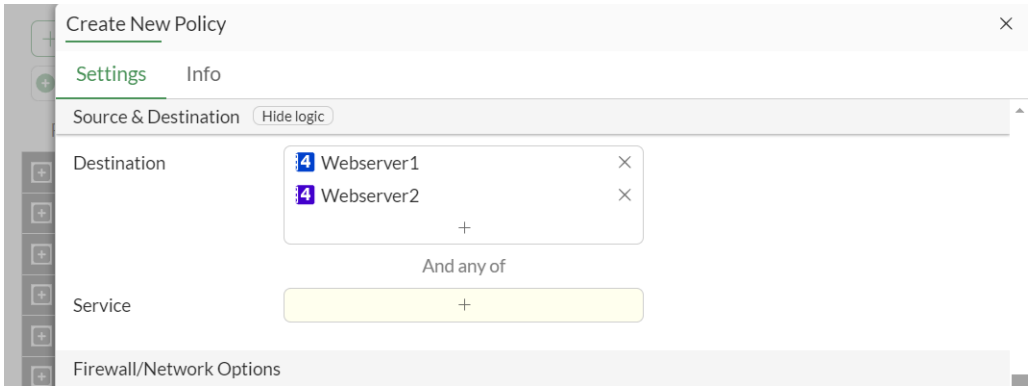
1. Go to *Policy & Objects > Firewall Policy*, and click *Create New*. The *Create New Policy* pane opens.
2. In the *Source & Destination* section, click *Show Logic*.
   - The labels *Any of* and *And any of* appear to clarify how the objects are used to match traffic. The *And any of* label indicates a logical AND relationship between the objects.



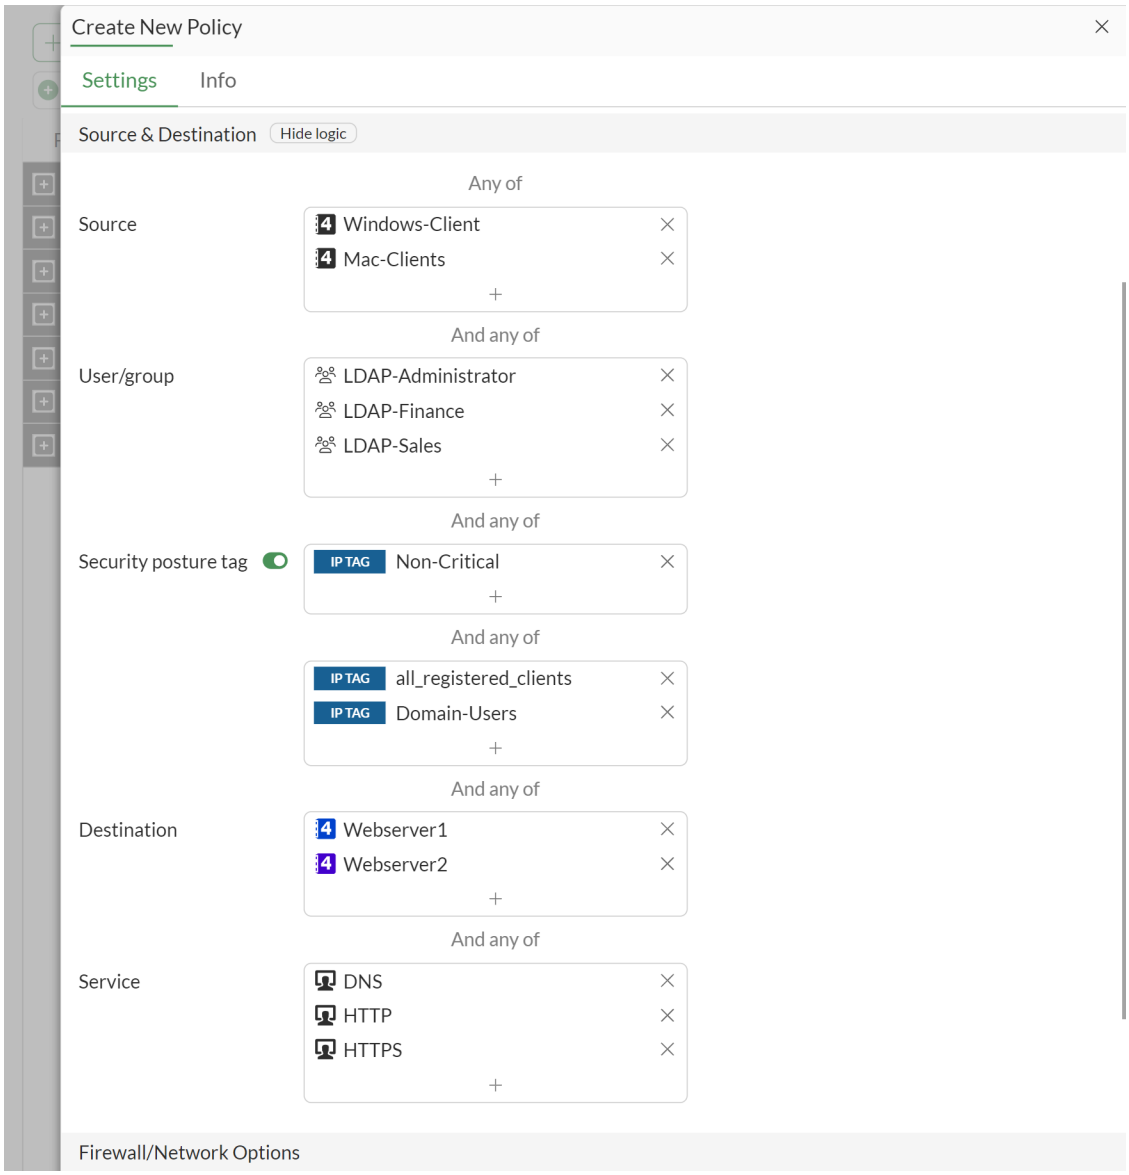
3. Enable *Security posture tag*:
   - The labels *And any of* appear, indicating a logical AND relationship between the two security posture tag objects.
   - The first security posture tag group is required when *Security posture tag* is enabled and is considered the primary tag group.
   - A second security posture tag group is optional when *Security posture tag* is enabled and is considered the secondary tag group.
   - Within each of the tag groups, there is a logical OR relationship between the tags when multiple tags are used.



4. In the *Destination* list, select one or more destinations to display *And any of* between the *Destination* and *Service* fields.



Following is the logic of using the mandatory and optional fields in the *Source & Destination* section, based on the following configurations:



Traffic must match all criteria below:

- Any *Source*: either *Windows-Client* OR *Mac-Clients*
- Any *User/group*: either *LDAP-Administrator*, *LDAP-Finance*, OR *LDAP-Sales*
- The primary *Security posture tag*: *Non-Critical*
- Any secondary security posture tags: either *all_registered_clients* OR *Domain-Users*
- Any *Destination*: either *Webserver1* OR *Webserver2*
- Any *Service*: Either *DNS*, *HTTP*, OR *HTTPS*

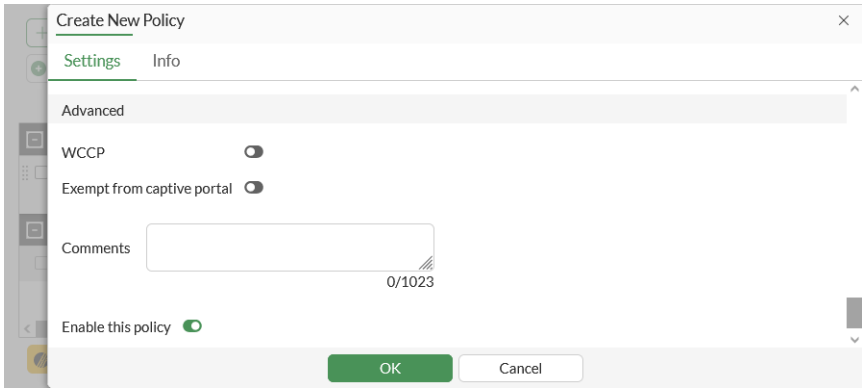
Enabling advanced policy options in the GUI

Advanced policy options can be enabled so that you can configure the options in the GUI.

To enable advanced policy options:

```
config system settings
    set gui-advanced-policy enable
end
```

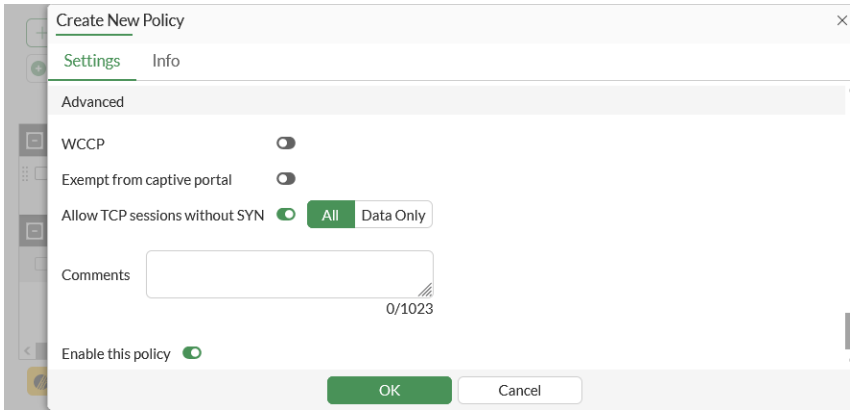
Advanced policy options are now available when creating or editing a policy in the GUI:



To enable configuring TCP sessions without SYN:

```
config system settings
    set tcp-session-without-syn enable
end
```

TCP sessions without SYN can now be configured when creating or editing a policy in the GUI:



Inspection mode per policy

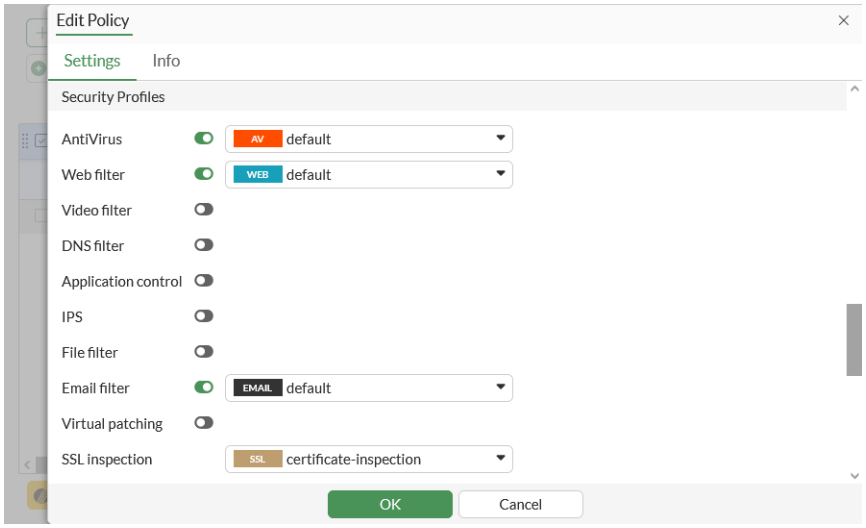
When configuring a firewall policy, you can select a *Flow-based* or *Proxy-basedInspection Mode*. The default setting is *Flow-based*.

To configure inspection mode in a policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy, or edit an existing policy.

3. Configure the policy as needed.
   a. If you change the *Inspection Mode* to *Proxy-based*, the *Proxy HTTP(S) traffic* option displays.

   b. In the *Security Profiles* section, if no security profiles are enabled, the default *SSL Inspection* is *no-inspection*. If you enable any security profile, the *SSL Inspection* should be changed *certificate-inspection*, *deep-inspection*, or a custom inspection profile.



To see the inspection mode changes using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
```

```
        set service "ALL"
        set inspection-mode proxy
        set nat enable
    next
end
```

To see the HTTP and SSH policy redirect settings when inspection mode is set to proxy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set http-policy-redirect enable
        set ssh-policy-redirect enable
        set nat enable
    next
end
```

To see the default SSL-SSH policy set to no inspection using the CLI:

```
config firewall policy
    edit 1
       show fu | grep ssl-ssh-profile
        set ssl-ssh-profile "no-inspection"
    next
end
```

Add Policy change summary and Policy expiration to Workflow Management

Two options, *Policy change summary* and *Policy expiration*, are included in *Workflow Management*. *Policy change summary* enforces an audit trail for changes to firewall policies. *Policy expiration* allows administrators to set a date for the firewall policy to be disabled.

There are three states for the *Policy change summary*:

- *Disable*: users will not be prompted to add a summary when editing a policy.
- *Required*: the *Policy change summary* will be enabled and will require users to add a summary when editing or creating a firewall policy.
- *Optional*: the *Policy change summary* will be enabled but users can leave the summary empty, if preferred, when editing or creating a firewall policy.

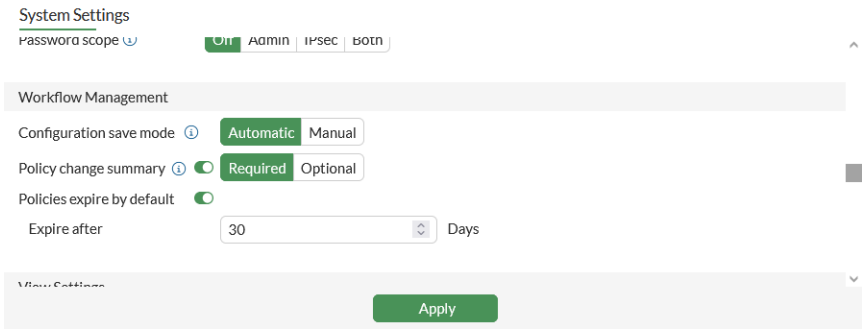
There are three states for *Policy expiration*:

- *Disable*: the firewall policy will not expire. This is the default setting for *Policy expiration*.
- *Default*: the firewall policy will expire after the default number of days.
- *Specify*: the firewall policy will expire at a set date and time.

The default value for *Policy expiration* is 30 days. This number can be changed in the CLI or in *System > Settings > Preference* in the GUI to any value between zero and 365 days. If the default value is set to zero, the *Default* state will disable the *Policy expiration*.

To configure the firewall policy change summary and default expiration in the GUI:

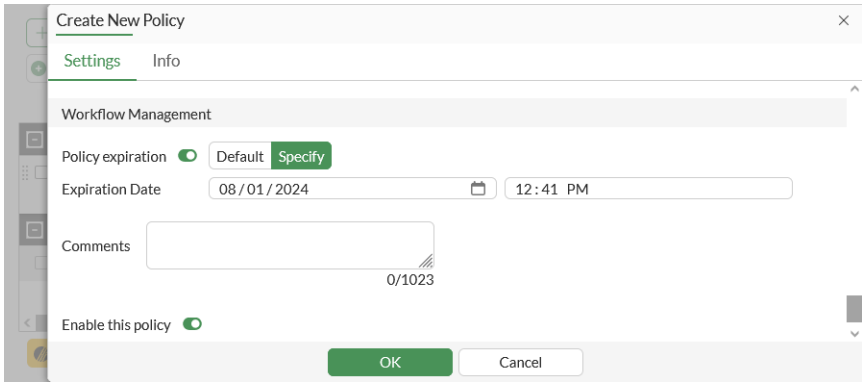
1. Go to *System > Feature Visibility*.
2. Enable *Workflow Management*.
3. Click *Apply*.
4. Go to *System > Settings > Preference*.
5. In the *Workflow Management* section, set *Policy change summary* to *Required*. *Policies expire by default* is enabled by default with an *Expire after* value of *30*.



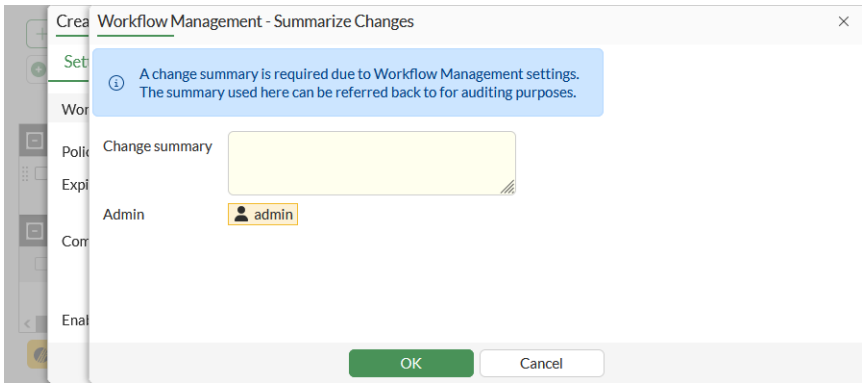
6. Click *Apply*.

To configure firewall policy expiration in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. Name the policy and configure the necessary parameters.
3. Set *Policy expiration* to *Specify*.



4. Select the date and time for the policy to expire from the *Expiration date* fields.
5. Click *OK*. The *Workflow Management - Summarize Changes* pane opens.



6. In the *Change summary* field, enter details about the changes made to the policy. These details can be referred to later for auditing purposes.
7. Click *OK*.

To configure the firewall policy change summary in the CLI:

```
config system settings
    set gui-enforce-change-summary {disable | require | optional}
end
```

To configure the policy expiration default value in the CLI:

```
config system settings
    set default-policy-expiry-days <integer>
end
```

To configure firewall policy expiration in the CLI:

```
config firewall policy
    edit <id>
        set policy-expiry {enable | disable}
        set policy-expiry-date <YYYY-MM-DD HH:MM:SS>
    next
end
```

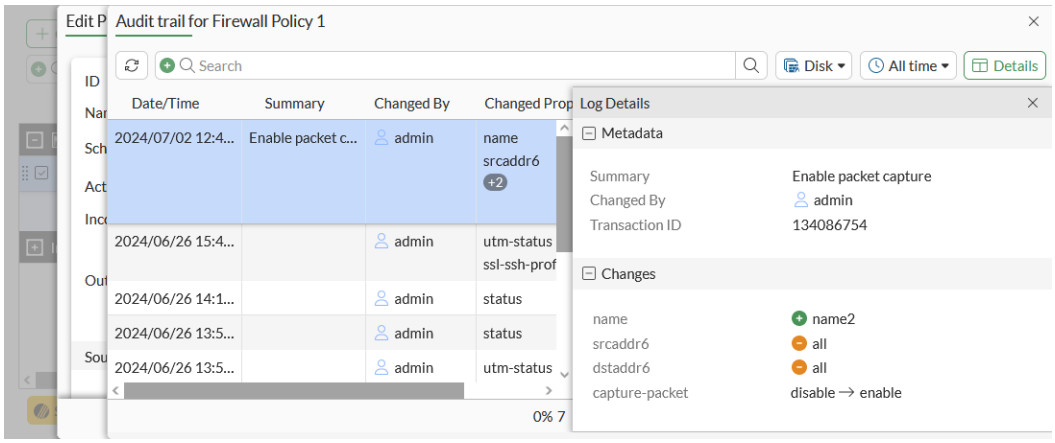
Policy change summaries are used to track changes made to a firewall policy. The *Audit Trail* allow users to review the policy change summaries, including the date and time of the change and which user made the change.

The *Audit Trail* is only supported by FortiGate models with disk logging.

To review the audit trail in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Select the policy you want to review and click *Edit*.

3. In the right-side banner (or on the *Info* tab if shown), click *Audit Trail*. The *Audit trail for Firewall Policy* pane opens and displays the policy change summaries for the selected policy.



4. Select an entry to review the details of the change made.
5. When you are done reviewing the *Audit Trail*, click *Close*.
6. Click *Cancel* to exit the *Edit Policy* page.

Configurations in the CLI

Firewall policies can be created in the CLI by configuring the necessary parameters. See Configurations in the GUI on page 1778 for more information on the various parameters.

Parameter	Definition
srcintf	Incoming (ingress) interface.
dstintf	Outgoing (egress) interface.
srcaddr	Source IPv4 address and address group names.
dstaddr	Destination IPv4 address and address group names.
internet-service	Enable/disable use of Internet Services for this policy. If enabled, destination address and service are not used.
schedule	Schedule name.
service	Service and service group names.
anti-replay	Enable/disable checking of TCP flags per policy.
match-vip	Enable/disable matching of VIPs when used in a policy with a deny action.
auto-asic-offload	Enable/disable hardware acceleration. Available on select FortiGate models with Secure Processing Unit (SPU) hardware only.
tcp-mss-sender	Sender TCP maximum segment size (MSS).
tcp-mss-receiver	Receiver TCP maximum segment size (MSS).
session-ttl	Time-to-live (TTL) in seconds for session accepted by this policy.

Firewall anti-replay option per policy

When the global anti-replay option is disabled, the FortiGate does not check TCP flags in packets. The per policy anti-replay option overrides the global setting. This allows you to control whether or not TCP flags are checked per policy.

To enable the anti-replay option so TCP flags are checked using the CLI:

```
config firewall policy
    edit 1
        set name "policyid-1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set anti-replay enable
        set logtraffic all
        set nat enable
    next
end
```

If the source IP address is either on the same network as or on a different subnet from the firewall's interface that will do the traffic redirection:

- If `allow-traffic-redirect` is enabled, then the traffic will be redirected without the need for a policy, based only on the routing decision.
- If `allow-traffic-redirect` is disabled, then the traffic must be matched by an IPv4 policy before being forwarded over the same interface that it entered on. If no IPv4 policy matches the traffic, then it will match the implicit deny policy and will be dropped.

```
config system global
    set allow-traffic-redirect {enable | disable}
end
```

When an IPv4 policy is needed to forward the traffic over the same interface that it came from, then `anti-replay` must be disabled for TCP traffic so that the traffic will not be dropped as replayed traffic.

Starting in FortiOS 7.6.5, `allow-traffic-redirect` is disabled by default. After upgrading, the setting will be disabled, even if it was enabled before the upgrade.

Deny matching with a policy with a virtual IP applied

Preventing hosts with specific source addresses from accessing a server behind the FortiGate may be required in some cases. For this scenario, you should have previously configured a firewall policy with a virtual IP (VIP) object applied to it to allow such access. See Destination NAT on page 1874 for details.

When denying traffic destined for a typical firewall policy without a VIP applied, you would simply configure a new firewall policy with an action of `deny` and with specific source addresses above the firewall policy that you

want to prevent these hosts from accessing. However, the FortiGate matches firewall policies with VIPs applied differently than typical firewall policies. Policies with VIPs applied have priority over typical firewall policies.

Therefore, to block specific source traffic destined for a firewall policy specified with an action of `accept` and with a VIP applied, you should configure `set match-vip enable` on the firewall policy with a `deny` action that has been configured to match traffic before the firewall policy with the VIP applied. By default, new `deny` action firewall policies have `match-vip` enabled.

If the policy action is set to `accept`, `match-vip` cannot be enabled.

To block VIP traffic in a deny policy:

```
config firewall policy
    edit 1
        set name "deny-policy-1"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "src-hosts-to-deny-access"
        set dstaddr "all"
        set action "deny"
        set schedule "always"
        set service "all"
        set match-vip enable
    next
    edit 2
        set name "vip-policy-1"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "all"
        set dstaddr "vip-object-1"
        set action "accept"
        set schedule "always"
        set service "ALL"
    next
end
```

Alternatively, to block access to a firewall policy with a VIP applied, you can configure a new VIP object configured with `set src-filter <range>`. Configure a new firewall policy with a `deny` action and with this new VIP applied, and then configure this policy to match traffic before the firewall policy with the same VIP applied with an action of `accept`. In this case, the firewall policy can simply have `set match-vip disable`.

To specify a VIP with source addresses specified with a deny policy:

```
config firewall vip
    edit “vip-with-srcaddr-to-deny”
        set extip "10.1.100.199"
        set extintf "wan1"
        set mappedip "172.16.200.55"
        set src-filter "1.1.1.1/24"
    next
end
```

```
config firewall policy
    edit 3
        set name "deny-policy-3"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "all"
        set dstaddr "vip-with-srcaddr-to-deny"
        set action "deny"
        set match-vip disable
        set schedule "always"
        set service "ALL"
    next
    edit 2
        set name "vip-policy-1"
        set srcintf "wan1"
        set dstintf "lan1"
        set srcaddr "all"
        set dstaddr "vip-object-1"
        set action "accept"
        set match-vip disable
        set schedule "always"
        set service "ALL"
    next
end
```

Hardware acceleration

Hardware acceleration is supported on select FortiGate devices and is enabled by default on all firewall policies to ensure optimal performance when processing network traffic traversing the FortiGate. See the Hardware Acceleration Reference Manual for details.

Typically, hardware acceleration on a specific firewall policy is disabled for one of two purposes:

- To allow CLI commands such as the packet sniffer and debug flow to display all traffic matching the policy since traffic offloaded by SPU hardware on a FortiGate device is not visible by those CLI tools.
- To troubleshoot any possible issues arising by using hardware acceleration.

To disable hardware acceleration in an IPv4 firewall policy:

```
config firewall policy
    edit 1
        set auto-asic-offload disable
    next
end
```

To disable hardware acceleration in an IPv6 firewall policy:

```
config firewall policy6
    edit 1
        set auto-asic-offload disable
```

```
    next
end
```

To disable hardware acceleration in a multicast firewall policy:

```
config firewall multicast-policy
    edit 1
        set auto-asic-offload disable
    next
end
```

TCP Maximum Segment Size (MSS)

The TCP maximum segment size (MSS) is the maximum amount of data that can be sent in a TCP segment. The MSS is the MTU size of the interface minus the 20 byte IP header and 20 byte TCP header. By reducing the TCP MSS, you can effectively reduce the MTU size of the packet.

The TCP MSS can be configured in a firewall policy, or directly on an interface. See Interface MTU packet size on page 232 for details on configuring TCP MSS directly on an interface.

To configure TCP MSS in a firewall policy:

```
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set tcp-mss-sender 1448
        set tcp-mss-receiver 1448
    next
end
```

Adjusting session time-to-live (TTL)

A session is a communication channel between two devices or applications across the network. Sessions allow FortiOS to inspect and act on a sequential group of packets in a session all at once instead of inspecting each packet individually. Each session has an entry in the session table that includes important information about the session.

The session time-to-live (TTL) parameter determines how long a session of a particular protocol such as TCP, UDP, or ICMP remains in the session table. To ensure proper operation of some devices or applications, the session TTL parameter may need to be increased or decreased to allow sessions to remain active in the session table for a longer or shorter duration, respectively.

To configure a modified session TTL in a firewall policy:

```
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set session-ttl 1800
    next
end
```

The session TTL can be set to zero or `never` to ensure a session never times out. See No session timeout on page 1927 for details.

Session TTL should only be set to zero or `never` after careful consideration of:

- The connected device's or application's requirements for sessions to always stay alive
- The expectation that a connected device or application will use the same session determined by traffic using a fixed source port, fixed destination port, fixed source IP address, and fixed destination IP address.

> ⚠ When session TTL is set to zero or `never`, then sessions will not be cleared from the session table or expire after a specified time unless the CLI commands `diagnose system session filter <filter>` and `diagnose system session clear` are used.
>
> If this setting is used in the case when traffic through a firewall policy can generate numerous unique sessions, then this may have unintended consequences to the FortiGate's memory usage and performance due to the session table constantly growing and not clearing out idle sessions.

To disable session TTL in a firewall policy:

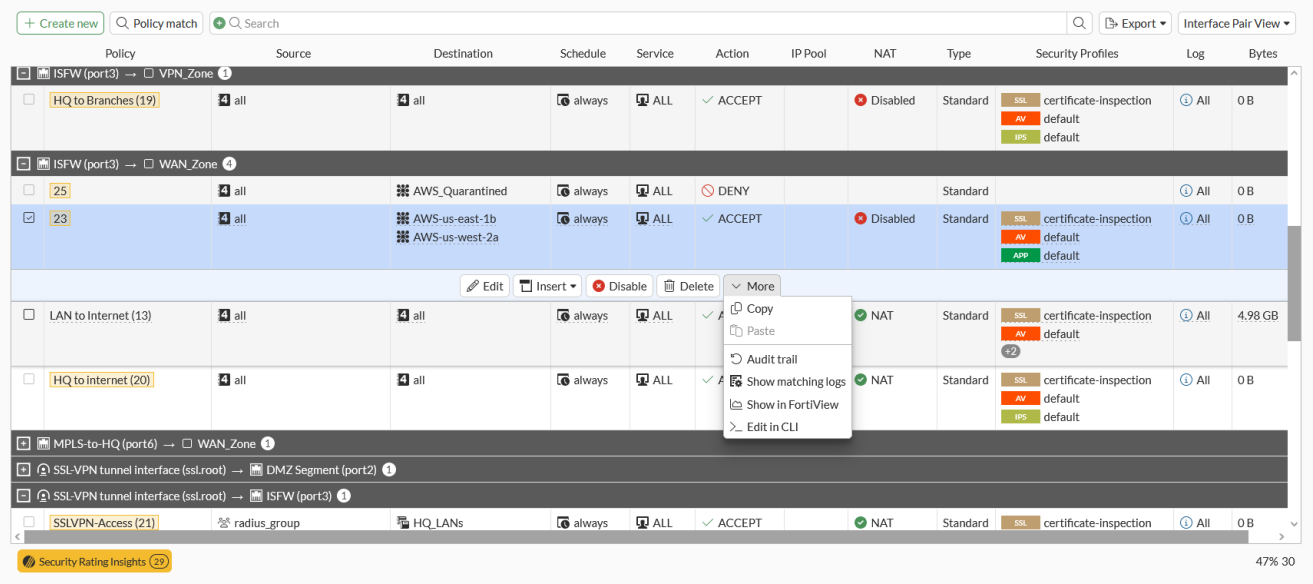
```
config firewall policy
    edit <policy ID>
        set srcintf "internal"
        set dstintf "wan1"
        set srcaddr "10.10.10.6"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set session-ttl never
    next
end
```

Policy views

In *Policy & Objects* policy list pages, there are three policy views: *Interface Pair View*, *Sequence Grouping View*, and *By Sequence*. For large policy tables (thousands of policies), the *By Sequence* view will load the fastest.

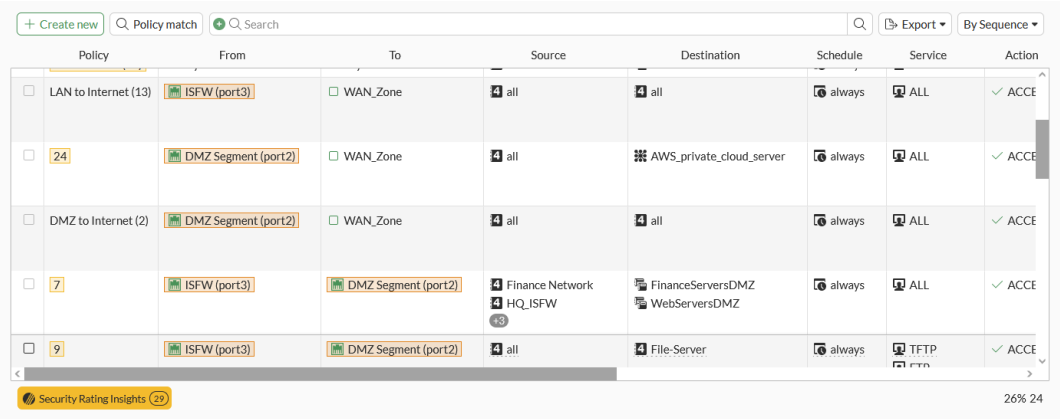
Interface Pair View displays the policies in the order that they are checked for matching traffic, grouped by the pairs of incoming and outgoing interfaces in collapsible sections. The *Interface Pair View* can be used when a policy is configured with multiple interfaces. Right-click on any pair name and click *Expand All* or *Collapse All* to expand or collapse all of the pairs.

When a policy is inserted, the Incoming and Outgoing interfaces are automatically filled in, and you can confirm the location of the new policy in the right-side gutter before clicking *OK* to insert the policy.



When a single policy is selected, an inline menu opens below the row. The *More* dropdown menu includes the same expanded list of options that are available in the right-click menu. When multiple policies are selected, the top menu bar changes to show buttons that are applicable to the multiple selections and you can click View selected to show only the selected policies on the page.

By Sequence displays policies in the order that they are checked for matching traffic without any grouping.

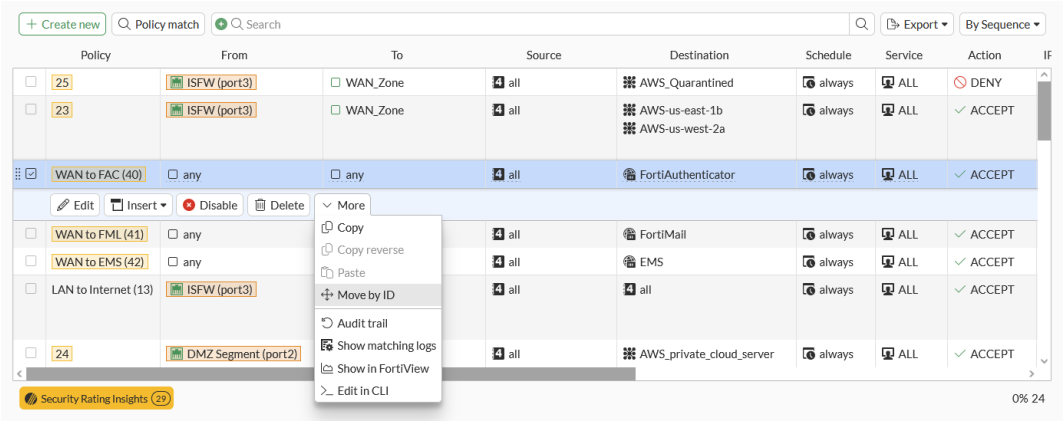


Policies can then be moved by their policy ID before or after another specified policy ID.

> Moving policies by ID is only available when viewing the *Firewall Policy* page in *By Sequence* or *Sequence Grouping View*.

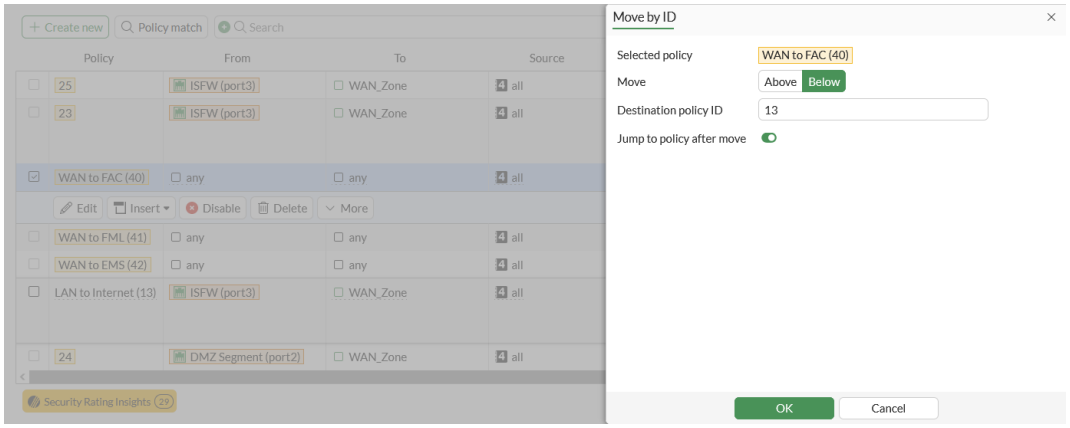
To move a policy by policy ID:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Select the policy you want to move.
3. Select *More* > *Move by ID*.



The *Move by ID* pane is displayed.

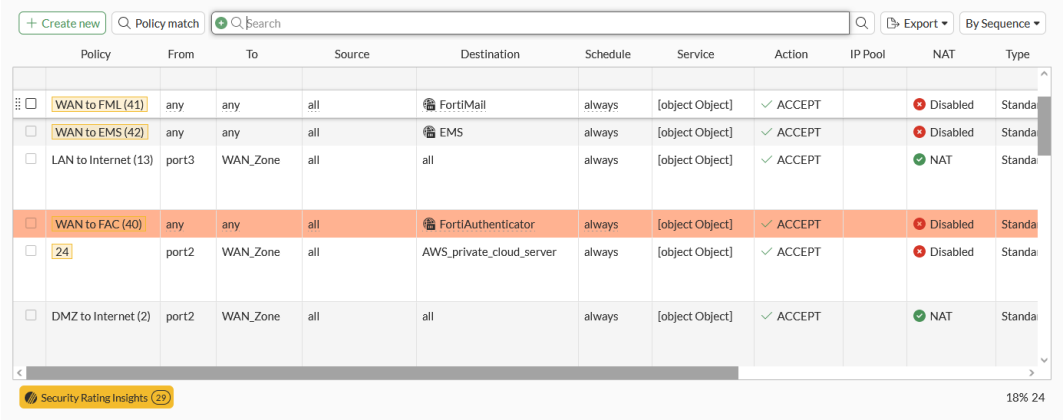
4. Define the new location of the policy:
   a. Select whether the policy should be moved *Above* or *Below* the policy ID you will define in the next step.
   b. In the *Destination policy ID* field, enter the ID of the destination policy or select it from the dropdown menu.



5. If you do not want to automatically view the new location of the policy, disable *Jump to policy after move*. This feature is enabled by default.
6. Click *OK*.

> If *Workflow Management* is enabled in *System* > *Feature Visibility*, the *Workflow Management - Summarize Changes* pane is displayed. Enter a *Change summary* then click *OK* to continue.

The policy will be moved to the new location.



Filtering on policy list statistics

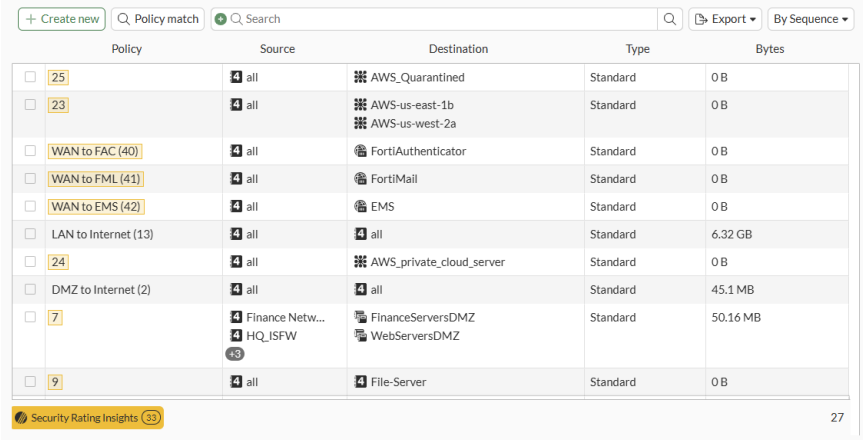
Statistics filtering on mutable policy lists allows users to refine policies based on key metrics such as *Bytes*, *Packets*, *Hit Count*, and *Last Used*. Statistics filters have been implemented in the *Firewall Policy*, *SSL Inspection & Authentication Policy*, and *Security Policy* pages. However, the available filters differ depending on the page.

This provides more precise control for identifying high-impact or frequently used policies, improving efficiency in policy management and troubleshooting.

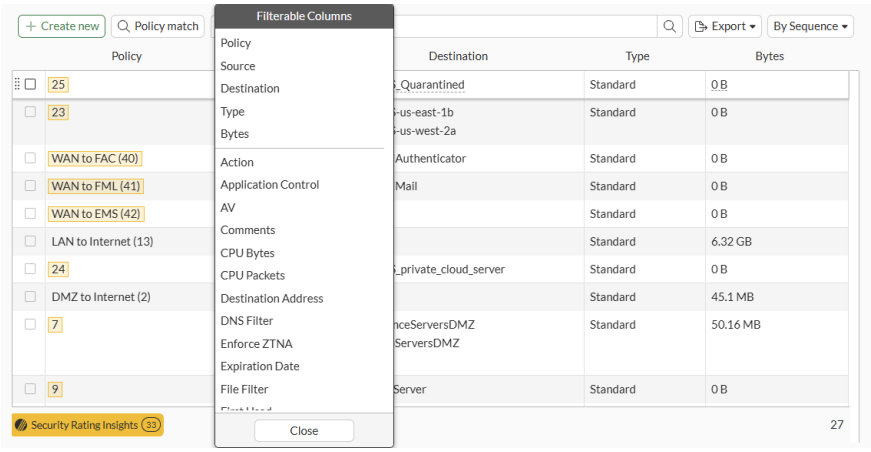
The following example demonstrates filtering the firewall policies table so that only policies with traffic greater than or equal to 40 MB are displayed.

To filter the policy list based on policy statistics:

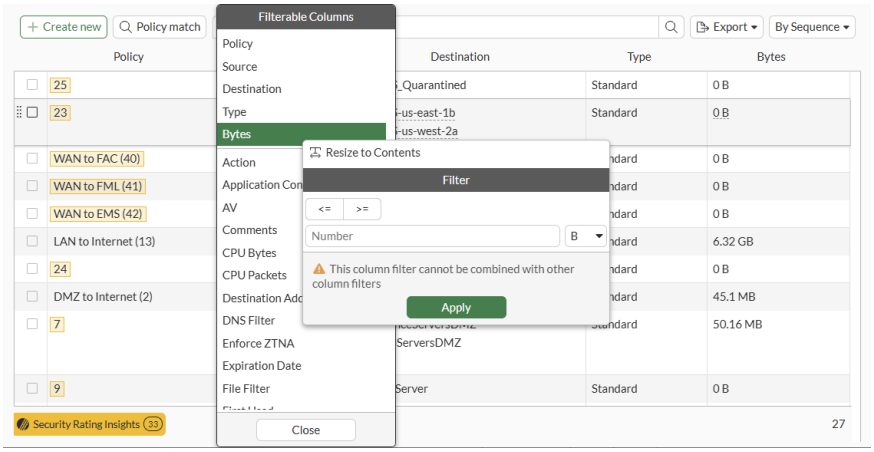
1. Go to *Policy & Objects* > *Firewall Policy*.



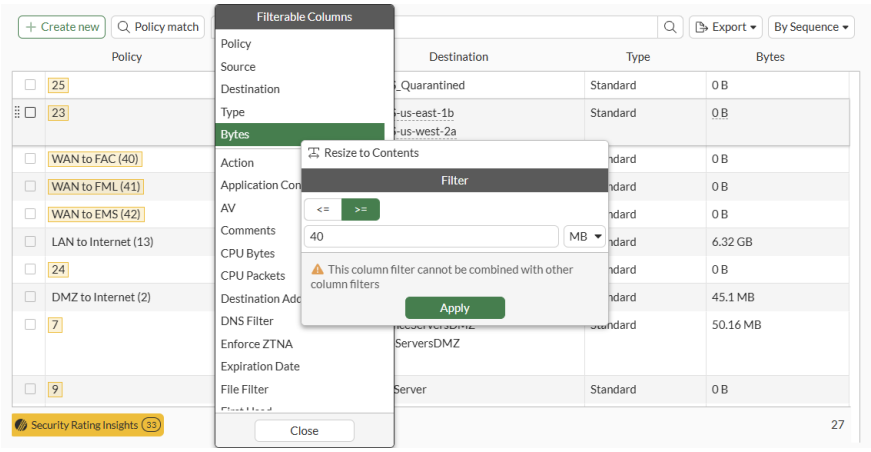
2. In the *Search* field, select the *+*. The *Filterable Columns* list is displayed.



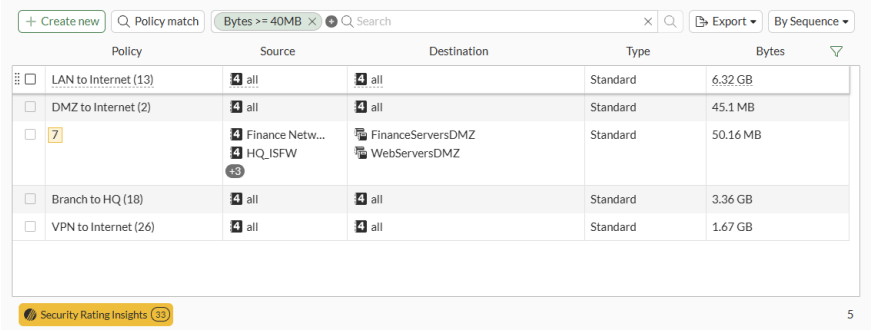
3. Select *Bytes*. A filter definitions dialog is displayed.



4. Define the filter parameters:
   a. Select >= to define the parameter range.
   b. Enter 40 into the value field.
   c. Select the unit dropdown list and select *MB*.



5. Click *Apply*. The filter parameters will be applied to the table.



Policy match

Firewall policy match is based on the `Source_interfaces/Protocol/Source_Address/Destination_Address` that matches the `source-port` and `dst-port` of the protocol. Use this tool to find out which policy matches specific traffic from a number of policies. After completing the match, the matching firewall policy is highlighted on the policy list page.

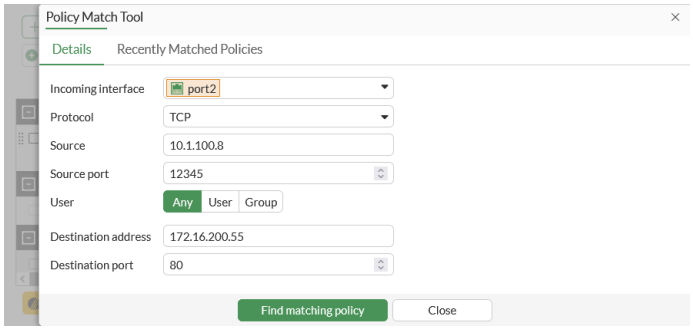
The *Policy match* tool has the following requirements:

- Transparent mode does not support policy match function.
- When executing the policy match, you need to confirm whether the relevant route required for the policy work already exists.

Sample configuration

This example uses the TCP protocol to show how policy match works:

1. On a *Policy & Objects* policy list page, click *Policy match* and enter the traffic parameters.



2. Click *Find matching policy* to display the policy match results.

Services

Services represent typical traffic types and application packets that pass through the FortiGate. Services include the service protocol type (TCP, UDP, ICMP, and so on), address, category, and logical destination port. Services can then be applied in a firewall policy to represent the TCP/IP suite port numbers that will most commonly be used to transport the named protocols or groups of protocols. Likewise, security profiles use service definitions to match session types.

The following services are available:

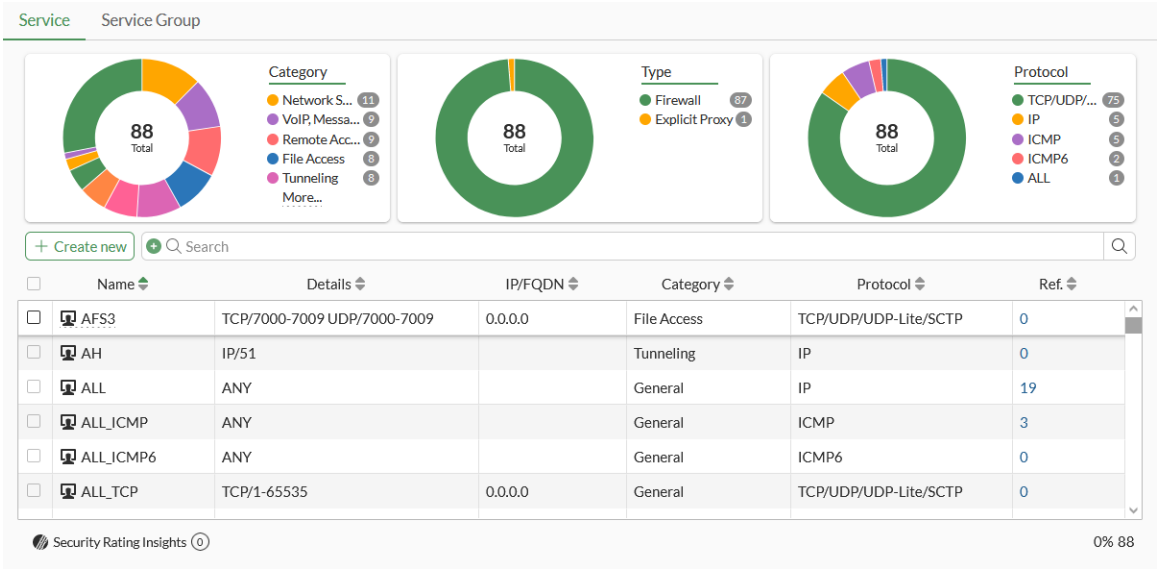
- Predefined services on page 1799
- Custom services on page 1801
- Service groups on page 1802

Predefined services

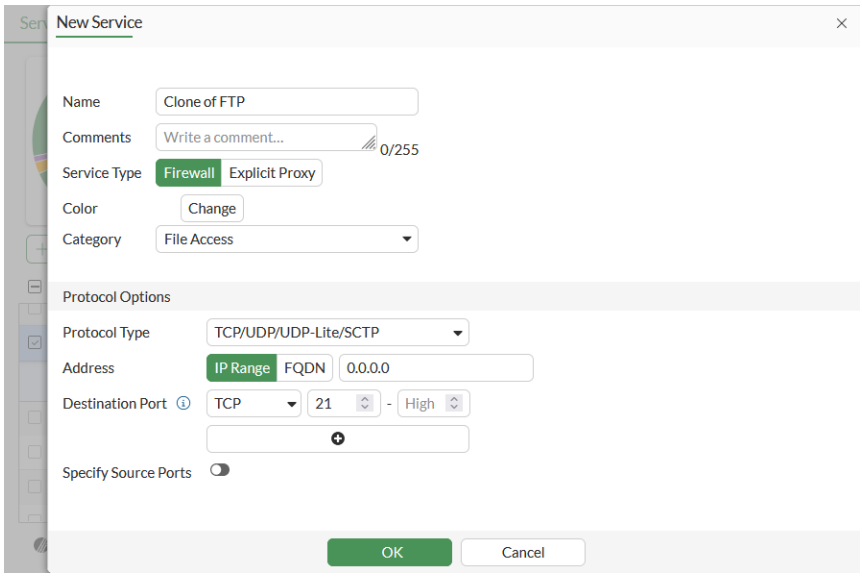
Firewall policies can be configured with default, predefined services that have been created for common traffic types. Predefined services can be edited, cloned, and deleted from the *Policy & Objects > Services* list. Cloning a services allows you to create a copy of the service parameters and edit it to create a similar service while still maintaining the existing service.

To clone a service:

1. Go to *Policy & Objects > Services*.
2. Go to the *Services* tab.



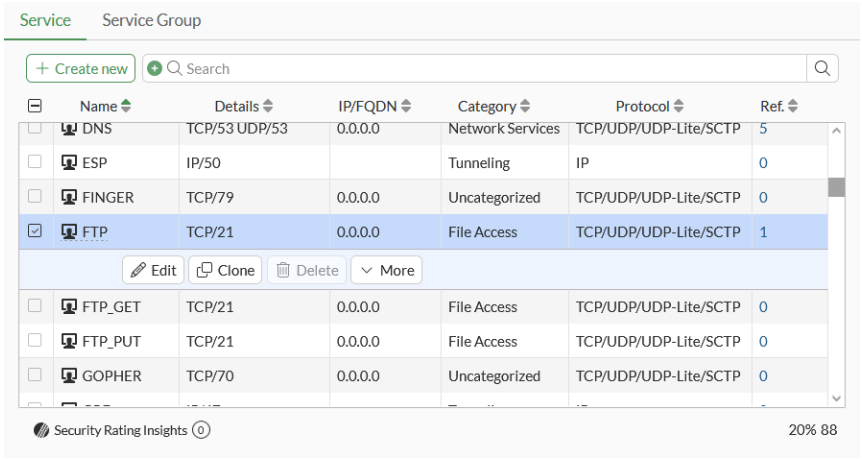
3. Select the service you want to clone.
4. Click *Clone*. The *New Service* page is displayed.



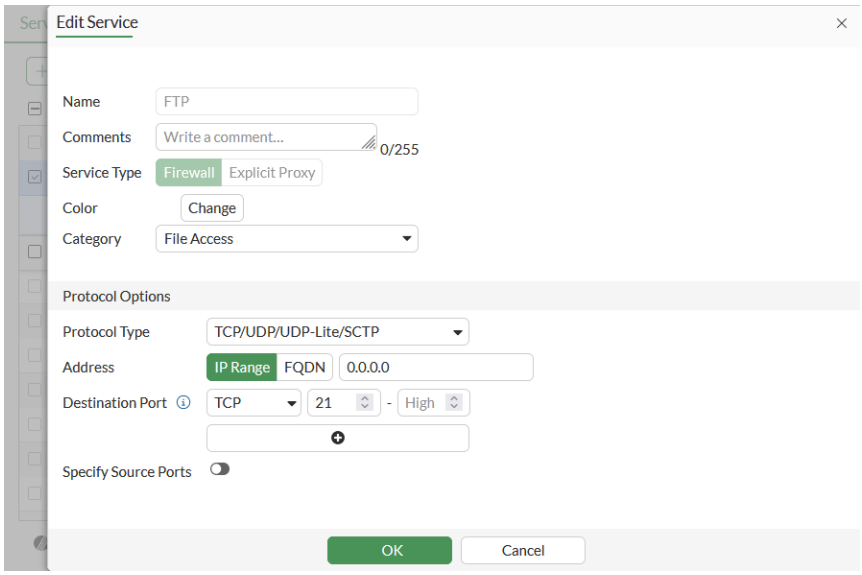
5. Edit the service details as needed.
6. Click *OK*.

To edit a service:

1. Go to *Policy & Objects* > *Services*.
2. Go to the *Services* tab and select the service that you need to edit.



3. Click *Edit*. The *Edit Service* page is displayed.



4. Edit the service details as needed.
5. Click *OK*.

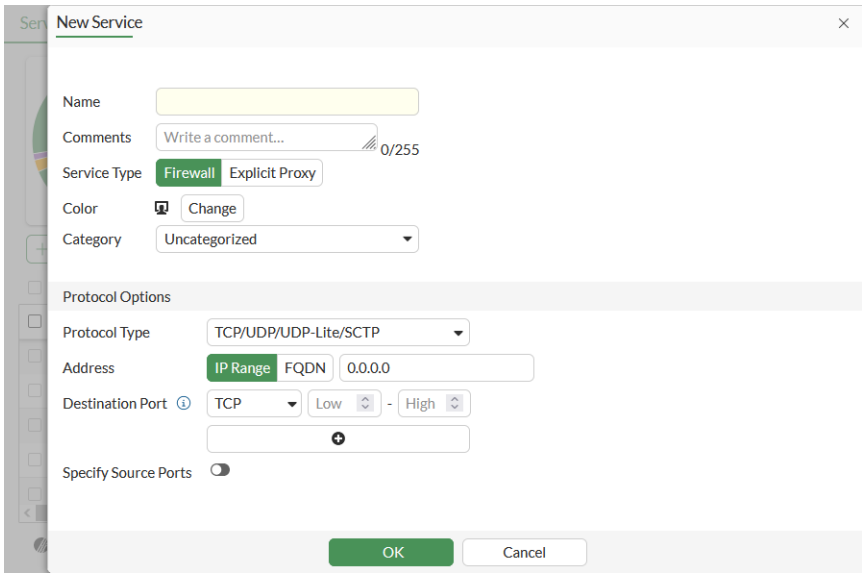
Custom services

You can create new, customized services in the *Policy & Objects > Services* page and the CLI. When creating a custom service, the ports, IP addresses, and protocols must be known for proper configuration. Once a service has been created, it must be applied to a firewall policy to take effect.

Custom services can also be created while configuring a new firewall policy.

To configure a custom service in the GUI:

1. Go to *Policy & Objects > Services*.
2. Go to the *Services* tab and click *Create new*.
3. Configure the service parameters as needed.



4. Click *OK*.

Custom services can be configured in the CLI for `TCP/UDP/UDP-Lite/SCTP`, `ICMP`, `ICMP6`, and `IP` protocols. Service parameters are dependent on the protocol type. See config firewall service custom in the CLI Reference guide for more information.

To configure a custom service in the CLI:

```
config firewall service custom
    edit <name>
        set protocol TCP/UDP/UDP-Lite/SCTP
        set tcp-portrange <destination port range>
        set udp-portrange <destination port range>
        set udplite-portrange <destination port range>
        set sctp-portrange <destination port range>
    next
end
```

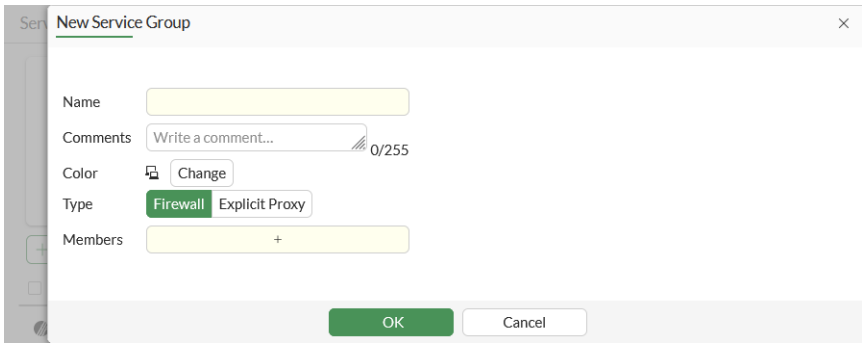
Service groups

Service groups are a collection of services and other service groups, allowing multiple services to be applied in a firewall policy at once.

Service groups can be cloned and edited in the *Service Groups* tab using the same process as services. See Predefined services on page 1799.

To configure a service group in the GUI:

1. Go to *Policy & Objects* > *Services*.
2. Go to the *Service Groups* tab and click *Create new*. The *New Service Group* page is displayed.



3. Enter the *Name* of the group.
4. (Optional) Enter a comment and select a color for the service group.
5. Select the group type.
6. Click the *Members* field and select the services and service groups to include in the group.
7. Click *OK*.

To configure a service group in the CLI:

```
config firewall service group
    edit <name>
        set fabric-object {enable | disable}
        set member <service name1>, <service name2>
        set proxy {enable | disable}
    next
end
```

NGFW policy

Profile-based next-generation firewall (NGFW) mode is the traditional mode where you create a profile (antivirus, web filter, and so on) and then apply the profile to a policy.

In policy-based NGFW mode, you allow applications and URL categories to be used directly in security policies, without requiring web filter or application control profiles. However, it is possible to select and apply web filter URL categories and groups.

In policy-based mode:

- Central NAT is always enabled. If no Central SNAT policy exists, you must create one. See Central SNAT on page 1859 for more information.
- Pre-match rules are defined separately from security policies, and define broader rules, such as SSL inspection and user authentication.
- The IPsec wizard is not supported.
- Only flow mode security profiles are supported; no proxy-based inspection.
- These profiles can be configured in the GUI:
  - AntiVirus
  - Web Filter
  - DNS Filter

    - Intrusion Prevention
    - File Filter
    - Email Filter
    - Virtual Patching
- These profiles can only be configured in the CLI:
    - DLP

If your FortiGate operates in NAT mode, rather than enabling source NAT in individual NGFW policies, go to *Policy & Objects* > *Central SNAT* and add source NAT policies that apply to all matching traffic. In many cases, you may only need one SNAT policy for each interface pair.

The NGFW mode is set per VDOM, and it is only available when the VDOM inspection mode is flow-based. You can operate your entire FortiGate or individual VDOMs in NGFW policy mode. The application default port can be set as a service port in the NGFW mode using the `default-app-port-as-service` option.

Inspection mode is configured on a per-policy basis in NGFW mode. This gives you more flexibility when setting up different policies.

In NGFW mode, administrators can configure a security policy in learn mode to monitor traffic. See Learn mode in security policies in NGFW mode on page 1815 for more information.

Other limitations

- When a change is made to a policy, existing sessions are not re-evaluated; only new sessions are re-evaluated.
- In the *Security Policy* view, there is no *Policy match* option.
- No *Application signature* page.
- Some application signatures requiring large scan-range are not supported.
- Webfilter FortiGuard Category based configurations are configured directly in the Security Policy. There are no options to configure the actions *Warning* or *Allow user to override block categories*.
- No *Web Profile* overrides.
- No *Workflow* mode.
- No support for HA session pickup upon HA failover.
- No support for configuring a static URL filter directly within the security policy.

Enabling policy-based NGFW mode

To enable policy-based NGFW mode without VDOMs in the GUI:

1. Go to *System* > *Settings* > *General*.
2. In *NGFW Mode*, select *Policy-based*.
3. Click *Apply*.

To enable policy-based NGFW mode with VDOMs in the GUI:

1. Go to *System* > *VDOM* .
2. Double-click a VDOM to edit the settings.

3. In *NGFW Mode*, select *Policy-based*.
4. Click *OK*.

To enable policy-based NGFW mode without VDOMs in the CLI:

```
config system settings
    set ngfw-mode policy-based
end
```

To enable policy-based NGFW mode with VDOMs in the CLI:

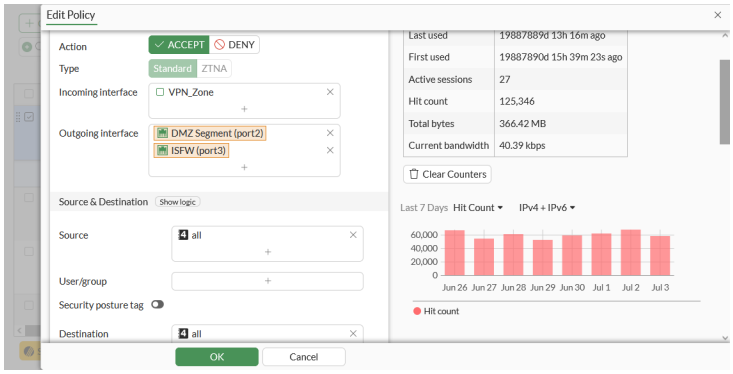
```
config vdom
    edit <vdom>
        config system settings
            set ngfw-mode policy-based
        end
    next
end
```

Hit count

When you edit a security policy, you can view the hit count for the last seven days. The hit count offers a rolling tally of how many times over the previous seven days a policy has been triggered, providing comprehensive, dynamic insight into policy usage patterns.

To view the hit count in the GUI:

1. Go to *Policy & Objects* > *Security Policy*.
2. Select a security policy, and click *Edit*. The *Last 7 Days* chart displays the hit count for the policy.



To view the hit count in the CLI:

1. Check the hit counter for a policy. The following example checks the hit count for the security policy with ID 1:

```
# diagnose ips pme policy stats
[  357] vdom:2 policy:1 ""
  first hit: 2024-06-26 10:22:56
  last hit:  2024-07-03 10:28:38
  hit count: 6 (1 0 0 1 1 1 1 1)

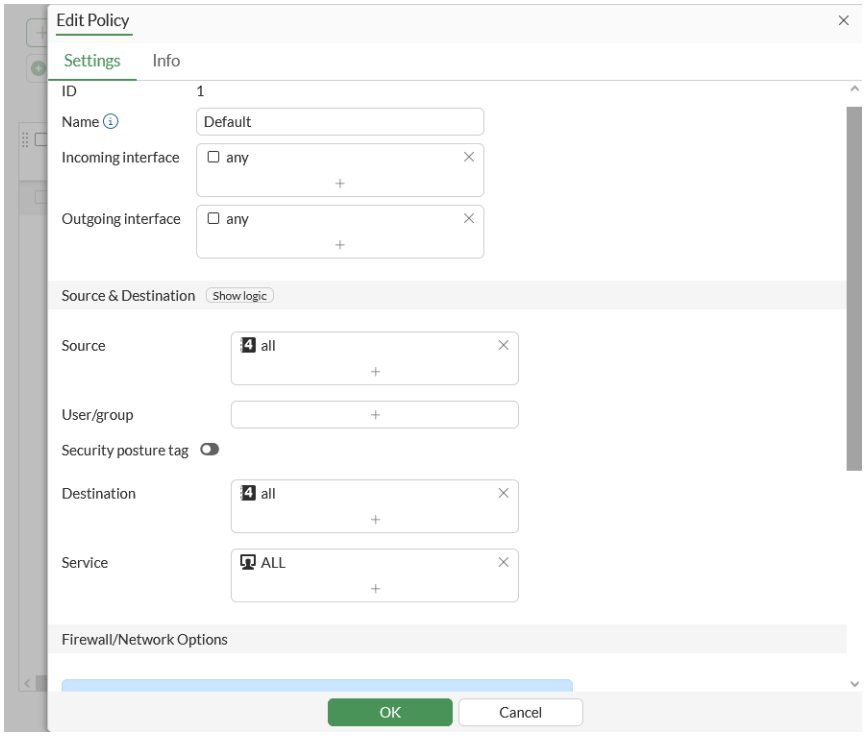
...
```

Security and SSL Inspection & Authentication policies

Security policies work with SSL Inspection & Authentication policies to inspect traffic. To allow traffic from a specific user or user group, both Security and SSL Inspection & Authentication policies must be configured. A default SSL Inspection & Authentication policy with the certificate-inspection SSL Inspection profile is preconfigured. Traffic will match the SSL Inspection & Authentication policy first. If the traffic is allowed, packets are sent to the IPS engine for application, URL category, user, and user group match, and then, if enabled, UTM inspection (antivirus, IPS, DLP, and email filter) is performed.

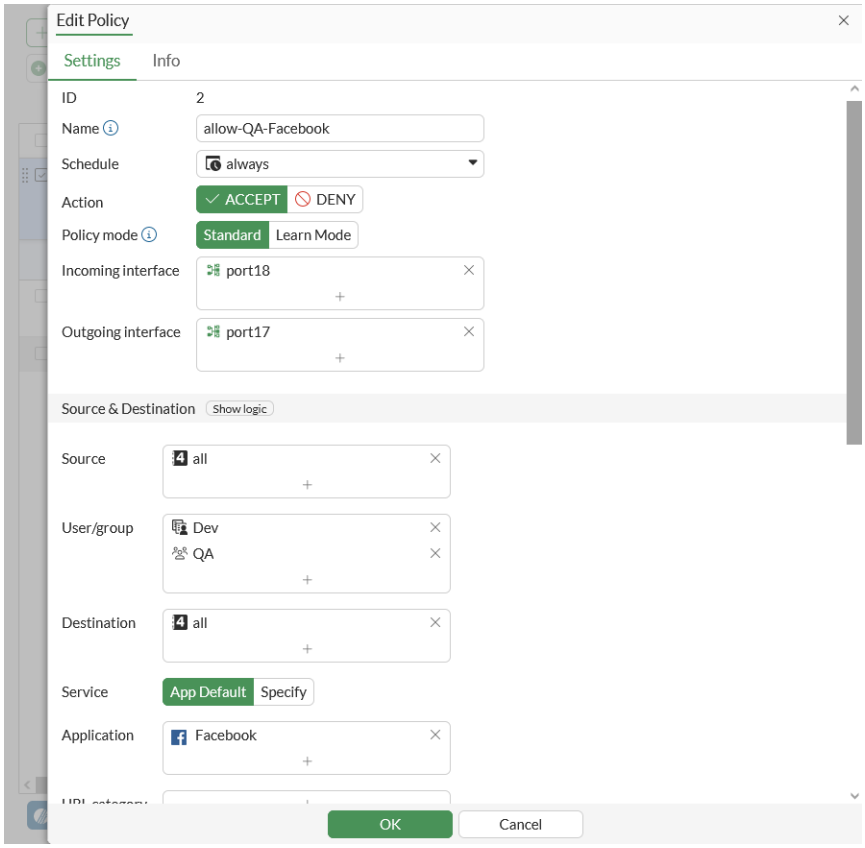
SSL Inspection & Authentication policies are used to pre-match traffic before sending the packets to the IPS engine:

- There are no schedule or action options; traffic matching the policy is always redirected to the IPS engine.
- SSL inspection, formerly configured in the VDOM settings, is configured in an SSL Inspection & Authentication policy.
- Users and user groups that require authentication must be configured in an SSL Inspection & Authentication policy.



Security policies work with SSL Inspection & Authentication policies to inspect traffic:

- Applications and URL categories can be configured directly in the policy.
- Users and user groups that require authentication must also be configured in a security policy.
- The available actions are *Accept* or *Deny*.
- The *Service* option can be used to enforce the standard port for the selected applications.
- UTM inspection is configured in a security policy.



To configure policies for Facebook and Gmail access in the CLI:

1. Configure an SSL Inspection & Authentication policy:

```
config firewall policy
    edit 1
        set name "Policy-1"
        set srcintf "port18"
        set dstintf "port17"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        set ssl-ssh-profile "new-deep-inspection"
        set groups "Dev" "HR" "QA" "SYS"
    next
end
```

2. Configure security policies:

```
config firewall security-policy
    edit 2
        set name "allow-QA-Facebook"
        set srcintf "port18"
        set dstintf "port17"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set application 15832
        set groups "Dev" "QA"
    next
    edit 4
        set name "allow-QA-Email"
        set srcintf "port18"
        set dstintf "port17"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set url-category 23
        set groups "QA"
    next
end
```

Logs

In the application control and web filter logs, `securityid` maps to the security policy ID.

Application control log:

```
date=2024-06-17 time=16:35:47 logid="1059028704" type="utm" subtype="app-ctrl"

```

Other NGFW policy-based mode options

You can combine *Application Control* and *Web Filter* in the same NGFW mode policy.

The following security profiles can be used in NGFW policy-based mode:

- AntiVirus
- Web Filter
- DNS Filter
- Intrusion Prevention
- File Filter
- Email Filter
- Virtual Patching
- DLP (CLI only)

Logging can also be enabled in security policies.

NGFW policy mode application default service

In NGFW policy-based mode, the application default service enforces applications running only on their default service port. The applications specified in the policy are monitored, and if traffic is detected from a nonstandard port, it is blocked, and a log entry is recorded with a *port-violation* event type.

If you are not using the default ports, and need to pick specific services, select *Specify* to select the required services.

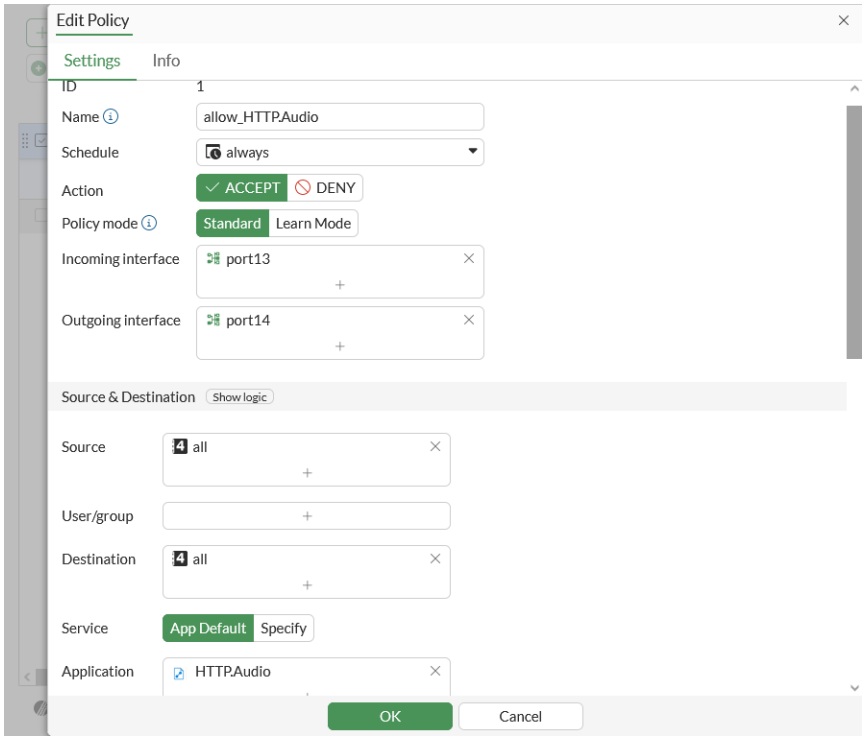
Example

In this example, the standard port is enforced for HTTPS traffic using the HTTP.Audio application.

First, an SSL Inspection & Authentication policy is created do to traffic pre-match, and then a security policy is created to allow the HTTP.Audio application when using the default port. Fetching an MP3 file from an HTTP server using port 443 is allowed, but is blocked when using a nonstandard port, such as 8443.

To enforce the HTTP.Audio application using the default port in the GUI:

1. Create a new SSL Inspection & Authentication policy, or use the default policy.
2. Go to *Policy & Objects* > *Security Policy*, and click *Create New*.
3. Enter a name for the policy, such as *allow_HTTP.Audio*.
4. Configure the ports as needed.
5. Set *Service* to *App Default*.
6. In the *Application* field, select *HTTP.Audio*.
7. Set the *Action* to *Accept*.



8. Click *OK*.

To enforce the HTTP.Audio application using the default port in the CLI:

1. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "consolidated_all"
        set srcintf "port13"
        set dstintf "port14"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
```

```
        set ssl-ssh-profile "new-deep-inspection"
    next
end
```

2. Create a security policy:

```
config firewall security-policy
    edit 1
        set name "allow_HTTP.Audio"
        set srcintf "port13"
        set dstintf "port14"
        set srcaddr "all"
        set dstaddr "all"
        set enforce-default-app-port enable
        set action accept
        set schedule "always"
        set logtraffic all
        set application 15879
    next
end
```

Logs

The application logs show logs with an event type of `port-violation` for traffic on port 8443 that is blocked, and an event type of `signature` for traffic on port 443 that is allowed.

Blocked:

```
2: date=2024-06-18 time=16:15:40 logid="1060028736" type="utm" subtype="app-ctrl" eventtype="port-
violation" level="warning" vd="vd1" eventtime=1560899740218875746 tz="-0700" appid=15879
srcip=10.1.100.22 dstip=172.16.200.216 srcport=52680 dstport=8443 srcintf="port13"
srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" proto=6 service="HTTPS"
direction="incoming" policyid=1 sessionid=5041 appcat="Video/Audio" app="HTTP.Audio"
action="block" hostname="172.16.200.216" incidentserialno=1906780850 url="/app_data/story.mp3"
securityid=2 msg="Video/Audio: HTTP.Audio," apprisk="elevated"
```

Allowed:

```
1: date=2024-06-18 time=16:15:49 logid="1059028704" type="utm" subtype="app-ctrl"
eventtype="signature" level="information" vd="vd1" eventtime=1560899749258579372 tz="-0700"
appid=15879 srcip=10.1.100.22 dstip=172.16.200.216 srcport=54527 dstport=443 srcintf="port13"
srcintfrole="undefined" dstintf="port14" dstintfrole="undefined" proto=6 service="HTTPS"
direction="incoming" policyid=1 sessionid=5064 appcat="Video/Audio" app="HTTP.Audio" action="pass"
hostname="172.16.200.216" incidentserialno=1139663486 url="/app_data/story.mp3" securityid=2
msg="Video/Audio: HTTP.Audio," apprisk="elevated"
```

Add option to set application default port as a service port

The `default-app-port-as-service` option can be used in NGFW mode to set the application default port as a service port. This allows applications to match the policy and be blocked immediately the first time that traffic

hits the firewall. When this option is enabled, the NGFW policy aggregates the ports used by the applications in the policy and performs a pre-match on the traffic.

```
config system settings
    set default-app-port-as-service {enable | disable}
end
```

This option can be configured on a per-VDOM level.

This setting is enabled by default on new installations. When upgrading, the setting is disabled to retain the previous behavior.

To configure the application default port as service port:

1. Configure the VDOM settings:

```
config system settings
    set vdom-type traffic
    set opmode nat
    set ngfw-mode policy-based
    set block-land-attack disable
    set default-app-port-as-service enable
    set application-bandwidth-tracking disable
end
```

2. Configure the NGFW policy:

```
config firewall security-policy
    edit 1
        set name "test"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set internet-service-src disable
        set enforce-default-app-port enable
        set action accept
    next
end
```

Sample logs

The following logging behavior occurs in NGFW mode with `default-app-port-as-service`:

- When `default-app-port-as-service` and `enforce-default-app-port` are enabled, traffic that does not match the default port is blocked immediately. Only a traffic log is generated.

Log with SSH and FTP traffic:

```
1: date=2024-06-24 time=11:16:36 eventtime=1645730197145603994 tz="-0800" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="vd1" srcip=10.1.100.12 srcport=40402
srcintf="port2" srcintfrole="undefined" dstip=172.16.200.55 dstport=21 dstintf="port1"

```

Application logging in NGFW policy mode

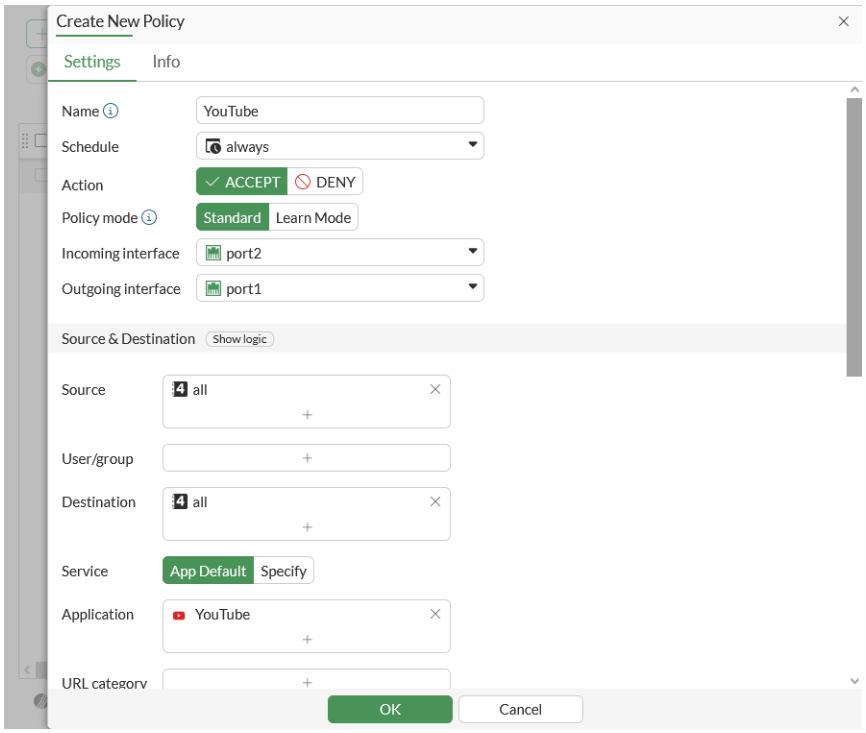
In NGFW policy mode, if an application, application category, or application group is selected on a security policy, and traffic logging is set to *UTM* or *All*, then application control logs will be generated. In addition, when a signature is set to the *ACCEPT* action under a security policy, all corresponding child signatures will be assessed and logged as well.

Under NGFW, with `default-app-port-as-service` enabled, enable APP Default. The traffic which doesn't match the default port will be blocked immediately, and there is only traffic log generated.

Under NGFW, with `default-app-port-as-service` disabled, enable APP Default. The traffic which doesn't match the default port will not be blocked immediately, and there is app and traffic logs generated.

To verify application logging:

1. Go to *Policy & Objects* > *Security Policy* and configure a new policy for YouTube.
2. Set *Application* to *YouTube*.
3. Set *Action* to *ACCEPT* and *Log Allowed Traffic* to *Security Events*.



4. Configure the remaining settings as required, then click *OK*.
5. On a client system, play some YouTube videos.
6. On FortiOS, go to *Log & Report* > *Security Events* and view the *Application Control* logs.

   There are logs not only for *YouTube*, but also for *YouTube_Video.Play*, *YouTube_Video.Access*, and so on, as verified from the *Application Name* column.

Learn mode in security policies in NGFW mode

In NGFW mode, administrators can configure a security policy in learn mode to monitor traffic that passes through the source and destination interfaces. The learn mode uses a special prefix in the `policymode` and `profile` fields in traffic and UTM logs for use by FortiAnalyzer and the Policy Analyzer Management Extension Application (MEA) that is available with FortiManager.

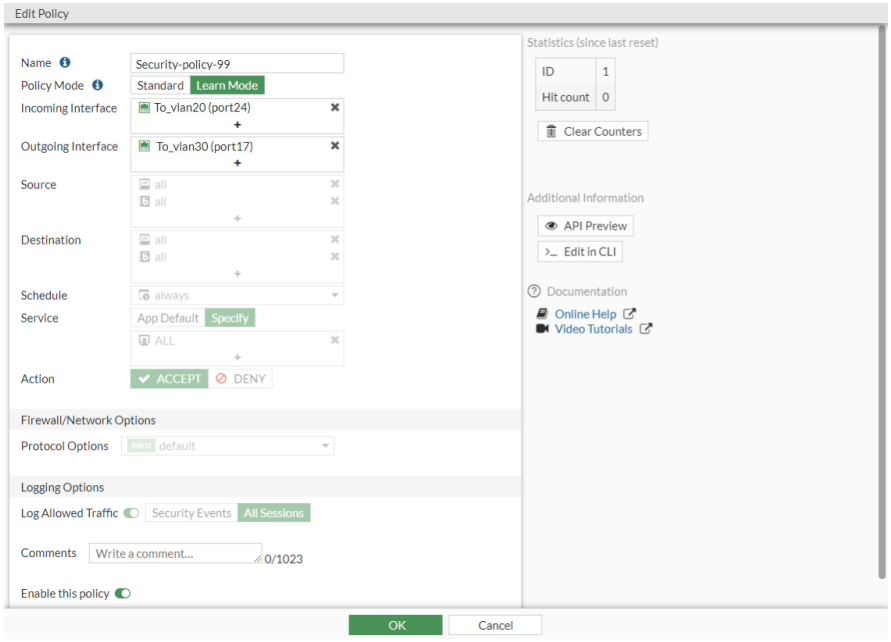
When enabled on FortiManager, Policy Analyzer MEA works with security policies in learning mode to analyze logs sent from a managed FortiGate to FortiAnalyzer. Based on the analyzed traffic, FortiManager administrators can choose to automatically create a policy in FortiManager for the managed FortiGate. For more information about Policy Analyzer MEA, see the Policy Analyzer Administration Guide.

The following limitations apply when learn mode is enabled in a security policy:

- Only interfaces with `device-identification enable` can be used as source interfaces in a security policy with learning mode enabled.
- Incoming and outgoing interfaces do not support any.
- Internet service is not supported.
- NAT46 and NAT64 are not supported.
- Users and groups are not supported.
- Some negate options are not supported.

To enable learn mode in the GUI:

1. Enable policy-based NGFW mode:
   a. Go to *System* > *Settings* > *General*.
   b. Set the *NGFW Mode* to *Policy-based* and click *Apply*.
2. Go to *Policy & Objects* > *Security Policy*, and open a security policy for editing.
3. Set the *Policy Mode* to *Learn Mode*.



4. Select an *Incoming Interface*.
5. Select an *Outgoing Interface*.
6. (Optional) Type a comment in the *Comments* box.
7. Toggle on *Enable this policy*.
8. Click *OK* to save the security policy.

To enable learn mode in the CLI:

1. Enable policy-based NGFW mode:

```
config system settings
    set ngfw-mode policy-based
end
```

2. Enable learn mode in a security policy:

```
config firewall security-policy
    edit <id>
        set learning-mode enable
    next
end
```

To view learn mode fields in logs in the CLI:

1. Filter and view fields in traffic logs:

```
# execute log filter category 0

# execute log display

1 logs found.

1 logs returned.

Dynamic address tags

Tags for dynamic addresses, including EMS (normal and local EMS tags), FortiVoice, and FortiNAC can be used as the source or destination address in security policies. Once these tags are used in security policies, run `diagnose ips pme dynamic-address list` to show the addresses that are used in the policy. The following example uses an EMS tag.

To apply an EMS tag object to a security policy in the GUI:

1. Go to *Policy & Objects* > *Security Policy*.
2. Click *Create new* or edit an existing policy.
3. In the *Source* field, click the *+* and select *EMS1_ZTNA_ZT_OS_WIN*.
4. Configure the other settings as needed.

5. Click *OK*.

To apply an EMS tag object to a security policy in the CLI:

1. Configure the policy:

```
config firewall security-policy
    edit 1
        set name "ddd"
        set srcintf "port8"
        set dstintf "port7"
        set srcaddr "EMS1_ZTNA_ZT_OS_WIN"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set logtraffic all
    next
end
```

2. Verify which IP addresses are used in the policy:

```
# diagnose ips pme dynamic-address list
EMS1_ZTNA_ZT_OS_WIN [vdom=0 type=IP]:
```

Local-in policy

While security profiles control traffic flowing through the FortiGate, local-in policies control inbound traffic that is going to a FortiGate interface.

Administrative access traffic (HTTPS, PING, SSH, and others) can be controlled by allowing or denying the service in the interface settings. Trusted hosts can be configured under an administrator to restrict the hosts that can access the administrative service.

Local-in policies allow administrators to granularly define the source and destination addresses, interface, and services. Traffic destined for the FortiGate interface specified in the policy that meets the other criteria is subject to the policies action.

Local-in policies can be used to restrict administrative access or other services, such as VPN, that can be specified as services. You can define source addresses or address groups to restrict access from. For example, by using a geographic type address you can restrict a certain geographic set of IP addresses from accessing the FortiGate. An IP Address external feed can also be used as either a source or destination address; see Applying an IP address external feed in a local-in policy on page 4574 for more information.

Local-in policies can also use virtual patching to mitigate known vulnerabilities targeted at the FortiGate. Vulnerability rules are scanned on local-in traffic on the specified interface, and all matched local-in traffic is dropped accordingly. See Virtual patching on the local-in management interface on page 1944 for more information.

This topic includes the following sections:

- Default local-in policy on page 1821
- Configuring the local-in policy on page 1821

- Implicit deny rule on page 1826
- Additional options on page 1828
- Logging local traffic per local-in policy on page 1830

Default local-in policy

The default local-in policy has internet service source enabled for Malicious-Malicious.Server, Tor-Exit.Node, and Tor-Relay.Node ISDB sources. This policy is designed to utilize these three sources to identify known malicious threat actors and prevent them from accessing any interface on the FortiGate on any service and port.

The default local-in policy is automatically added when a FortiGate is in factory default setting, or a new VDOM is created. Resetting your device to factory default settings is not recommended, so you can manually add the policy on FortiOS versions that support ISDB as a local-in policy source (7.4.4 and higher).

To manually add the policy:

```
config firewall local-in-policy
    edit 1
        set intf "any"
        set dstaddr "all"
        set internet-service-src enable
        set internet-service-src-name "Malicious-Malicious.Server" "Tor-Exit.Node" "Tor-
Relay.Node"
        set service "ALL"
        set schedule "always"
    next
end
```

To view the malicious sources that are blocked:

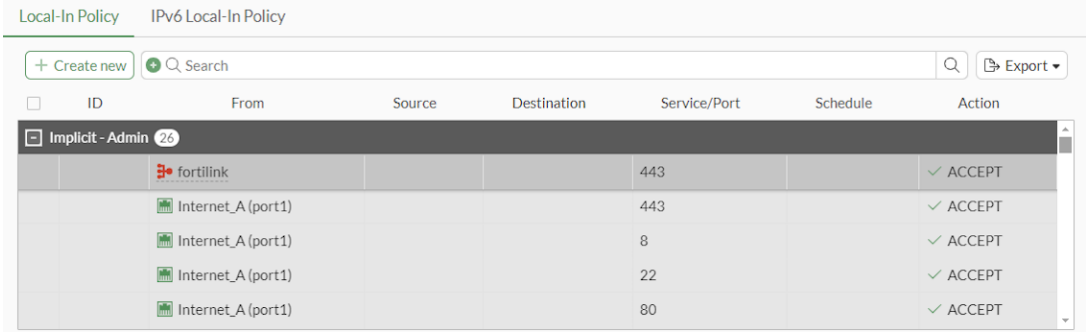
1. Go to *Policy & Objects* > *Internet Service Database* and select the *Internet Service* tab.
2. Search for *Malicious-Malicious.Server*, *Tor-Exit.Node*, or *Tor-Relay.Node*.
3. Hover over the entry and, in the pop-up, click *View/Edit Entries*.
   The listed addresses are the sources that will be blocked.

Configuring the local-in policy

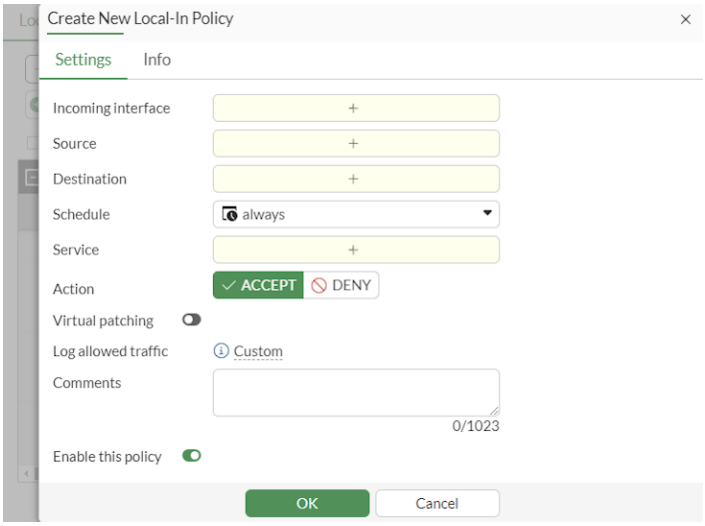
Local-in policies can be configured in the GUI and CLI.

To create an IPv4 local-in policy in the GUI:

1. Go to *Policy & Objects* > *Local-In Policy*.
2. Go to the *Local-In Policy* tab.



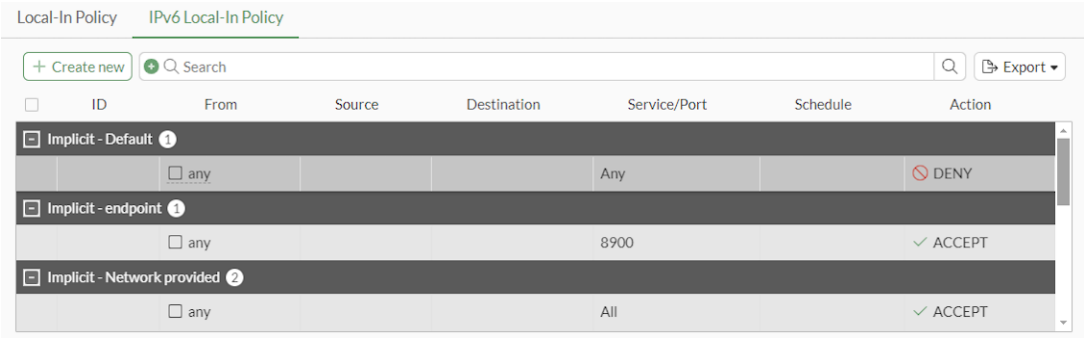
3. Click *Create new*. The *Create New Local-In Policy* pane is displayed.



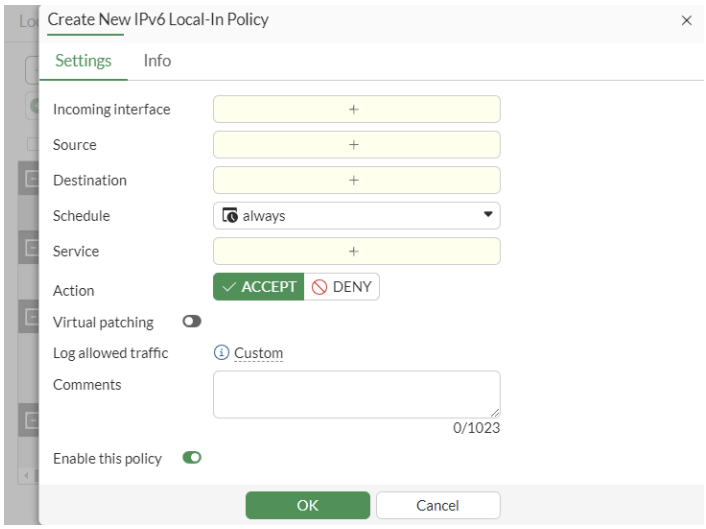
4. Configure the policy parameters.
5. Click *OK*.

To create an IPv6 local-in policy in the GUI:

1. Go to *Policy & Objects* > *Local-In Policy*.
2. Go to the *IPv6 Local-In Policy* tab.



3. Click *Create new*. The *Create New IPv6 Local-In Policy* pane is displayed.



4. Configure the policy parameters.
5. Click *OK*.

To configure a local-in policy using the CLI:

```
config firewall {local-in-policy | local-in-policy6}
    edit <policy_number>
        set intf <interface>
        set srcaddr <source_address> [source_address] ...
        set dstaddr <destination_address> [destination_address] ...
        set action {accept | deny}
        set service <service_name> [service_name] ...
        set schedule <schedule_name>
        set virtual-patch {enable | disable}
        set comments <string>
    next
end
```

Example 1

In this example, a local-in policy will be configured to prevent the source subnet 10.10.10.0/24 from pinging port1, but allow administrative access for PING on port1.

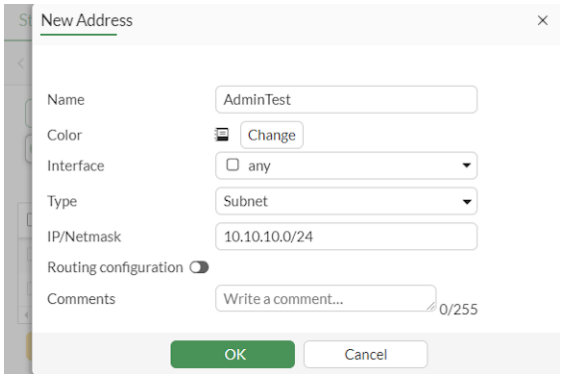
To configure the local-in policy for admin access in the CLI:

```
config firewall address
    edit "10.10.10.0"
        set subnet 10.10.10.0 255.255.255.0
    next
end
config firewall local-in-policy
    edit 1
        set intf "port1"
        set srcaddr "10.10.10.0"
```

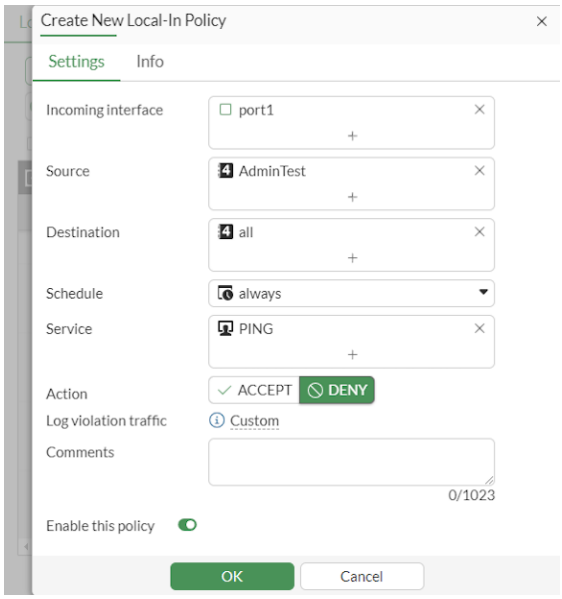
```
        set dstaddr "all"
        set service "PING"
        set schedule "always"
    next
end
```

To configure the local-in policy for admin access:

1. Configure the firewall address:
   a. Go to *Policy & Objects* > *Addresses*.
   b. Click *Create new*.
   c. Enter a name for the address.
   d. Set *Type* to *Subnet*.
   e. Set *IP/Netmask* to *10.10.10.0/24*.
   f. Click *OK*.



2. Configure the local-in policy:
   a. Go to *Policy & Objects* > *Local-In Policy*.
   b. Click *Create new*.
   c. Configure the following:
      i. Set *Interface* to *port1*.
      ii. Set *Source* to the address created previously.
      iii. Set *Destination* to *all*.
      iv. Set *Schedule* to *always*.
      v. Set *Service* to *PING*.
      vi. Set *Action* to *DENY*.



d. Click *OK*.

To test the configuration:

1. From the PC at 10.10.10.12, start a continuous ping to port1:

```
ping 192.168.2.5 -t
```

2. On the FortiGate, enable debug flow:

```
# diagnose debug flow filter addr 10.10.10.12
# diagnose debug flow filter proto 1
# diagnose debug enable
# diagnose debug flow trace start 10
```

3. The output of the debug flow shows that traffic is dropped by local-in policy 1:

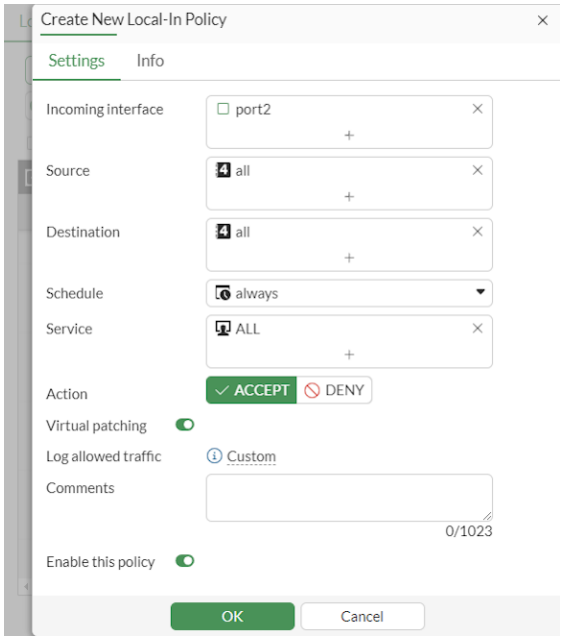
```
# id=20085 trace_id=1 func=print_pkt_detail line=5746 msg="vd-root:0 received a packet
(proto=1, 10.10.10.12:1->192.168.2.5:2048) from port1. type=8, code=0, id=1, seq=128."
id=20085 trace_id=1 func=init_ip_session_common line=5918 msg="allocate a new session-
0017c5ad"
id=20085 trace_id=1 func=vf_ip_route_input_common line=2615 msg="find a route: flag=80000000
gw-192.168.2.5 via root"
id=20085 trace_id=1 func=fw_local_in_handler line=474 msg="iprope_in_check() check failed on
policy 1, drop"
```

Example 2

The following example demonstrates how to enable virtual patching on the port2 interface using a local-in policy. For information on enabling virtual patching in the CLI and observing the outcomes, see Virtual patching on the local-in management interface on page 1944.

To enable virtual patching:

1. Go to *Policy & Objects* > *Local-In Policy*.
2. Click *Create new*.
3. Configure the following:
   a. Set *Interface* to *port2*.
   b. Set *Source* to *all*.
   c. Set *Destination* to *all*.
   d. Set *Schedule* to *always*.
   e. Set *Service* to *ALL*.
   f. Set *Action* to *ACCEPT*.
   g. Enable *Virtual patching*.



4. Click *OK*.

Implicit deny rule

If a local-in-policy is not functioning correctly and traffic that should be blocked is being allowed through, the issue may be that the implicit deny local-in-policy has not been created. Unlike IPv4 policies, there is no default implicit deny policy. The implicit deny policy should be placed at the bottom of the list of local-in-policies. Local-in-policies are created for each interface, but if you want to create a general implicit deny rule for all interfaces for a specific service, source, address, or destination address, use the any interface.

When you define a local-in policy, if no action is set manually, then the action will default to deny.

For example, to allow only the source subnet 172.16.200.0/24 to ping port1:

```
config firewall address
    edit "172.16.200.0"
        set subnet 172.16.200.0 255.255.255.0
    next
end
config firewall local-in-policy
    edit 2
        set intf "port1"
        set srcaddr "172.16.200.0"
        set dstaddr "all"
        set action accept
        set service "PING"
        set schedule "always"
    next
    edit 3
        set intf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "PING"
        set schedule "always"
    next
end
```

To test the configuration:

1. From the PC at 172.16.200.2, start a continuous ping to port1:

```
ping 172.16.200.1 –t
```

2. On the FortiGate, enable debug flow:

```
# diagnose debug flow filter proto 1
# diagnose debug enable
# diagnose debug flow trace start 10
```

3. The output of the debug flow shows that ping traffic coming from the 172.16.200.0 subnet is allowed:

```
# id=65308 trace_id=25 func=print_pkt_detail line=5939 msg="vd-root:0 received a packet
(proto=1, 172.16.200.2:5->172.16.200.1:2048) tun_id=0.0.0.0 from port1. type=8, code=0, id=5,
seq=0."

```

Additional options

To disable or re-enable the local-in policy, use the `set status {enable | disable}` command.

To dedicate the interface as an HA management interface, use the `set ha-mgmt-intf-only enable` command.

Example:

```
config firewall local-in-policy
    edit 1
        set ha-mgmt-intf-only enable
        set intf port4
        set srcaddr all
        set dstaddr all
        set service ALL
        set schedule always
        set action accept
        set status enable
    next
end
```

If a user tries to set the HA reserved management interface during the local-in policy an error is generated. Use the `set ha-mgmt-intf-only enable` command to avoid the error.

TTL policies

You can configure a time-to-live (TTL) policy to block attack traffic with high TTLs. This feature only applies to local-in traffic and does not apply to traffic passing through the FortiGate. You can use `srcintf` to set the interface that the local-in traffic hits. See config firewall ttl-policy.

To configure a TTL policy using the CLI:

```
config firewall ttl-policy
    edit <id>
        set status {enable | disable}
        set action {accept | deny}
        set srcintf <interface>
        set srcaddr <source_address> [source_address] ...
        set service <service_name> [service_name] ...
        set schedule <schedule_name>
        set ttl <value/range>
    next
end
```

Internet service as source addresses

An internet service can be used as the source address in a local-in policy. This allows for more flexibility and control when managing local traffic, enhancing network security and efficiency.

```
config firewall local-in-policy
    edit <id>
        set internet-service-src {enable | disable}
        set internet-service-src-name <string>
        set internet-service-src-group <string>
        set internet-service-src-custom <string>
        set internet-service-src-custom-group <string>
        set internet-service-src-negate {enable | disable}
    next
end
```

internet-service-src {enable | disable}	Enable/disable use of Internet Services in source for this local-in policy. If enabled, the source address is not used.
internet-service-src-name <string>	Internet Service source name.
internet-service-src-group <string>	Internet Service source group name.
internet-service-src-custom <string>	Custom Internet Service source name.
internet-service-src-custom-group <string>	Custom Internet Service source group name.
internet-service-src-negate {enable | disable}	When enabled, `internet-service-src` specifies what the service must NOT be.

Logging local traffic per local-in policy

Local traffic logging can be configured for each local-in policy. This enables more precise and targeted logging by focusing on specific local-in policies that are most relevant to your needs.

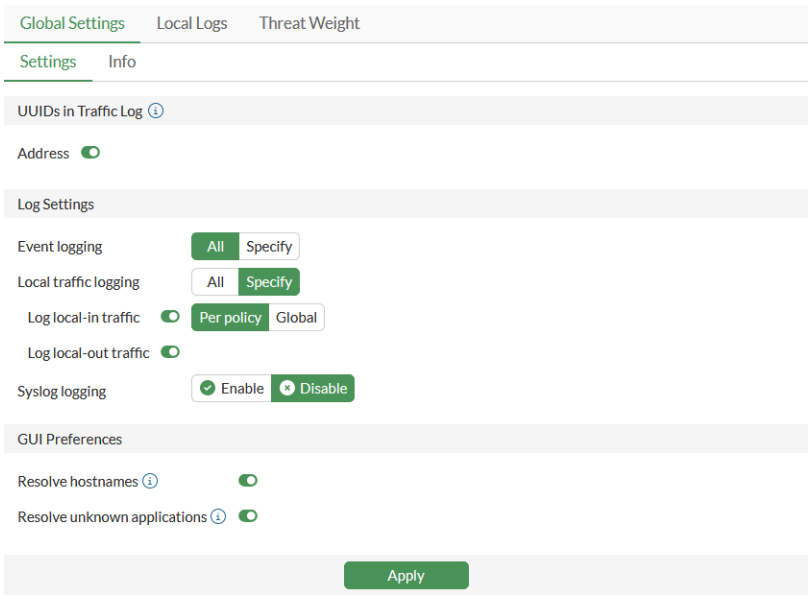
Logging can be configured per local-in policy in the *Log & Report > Log Settings* page or by using the following commands:

```
config log setting
    set local-in-policy-log {enable | disable}
end
config firewall local-in-policy
    edit <id>
        set logtraffic {enable | disable}
    next
end
config firewall local-in-policy6
    edit <id>
        set logtraffic {enable | disable}
    next
end
```

If per policy local-in traffic logging is enabled, the allowed traffic, denied unicast traffic, and denied broadcast traffic logging does not need to be configured for the log settings. When traffic logging is enabled for the local-in policy, the denied unicast traffic and denied broadcast traffic logs will be included.

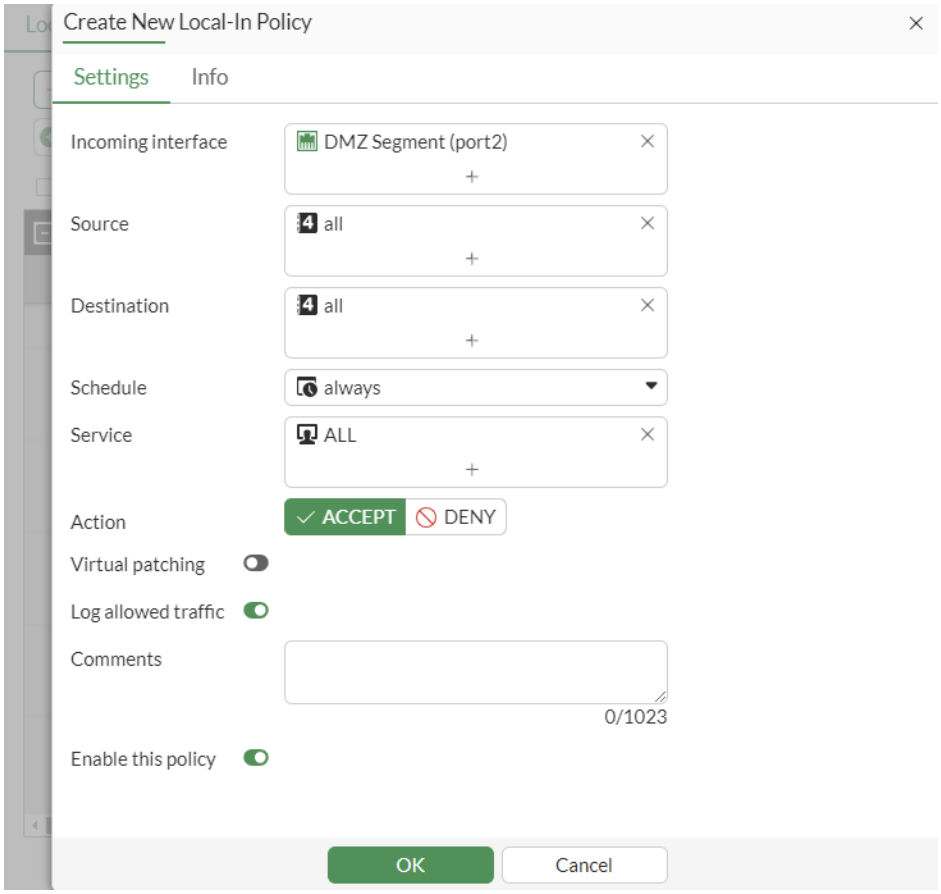
To log local traffic per local-in policy in the GUI:

1. Enable local-in traffic logging per policy:
   a. Go to *Log & Report > Log Settings*.
   b. Go to the *Global Settings* tab.
   c. Set *Local traffic logging* to *Specify*.
   d. Enable *Log local-in traffic* and set it to *Per policy*.

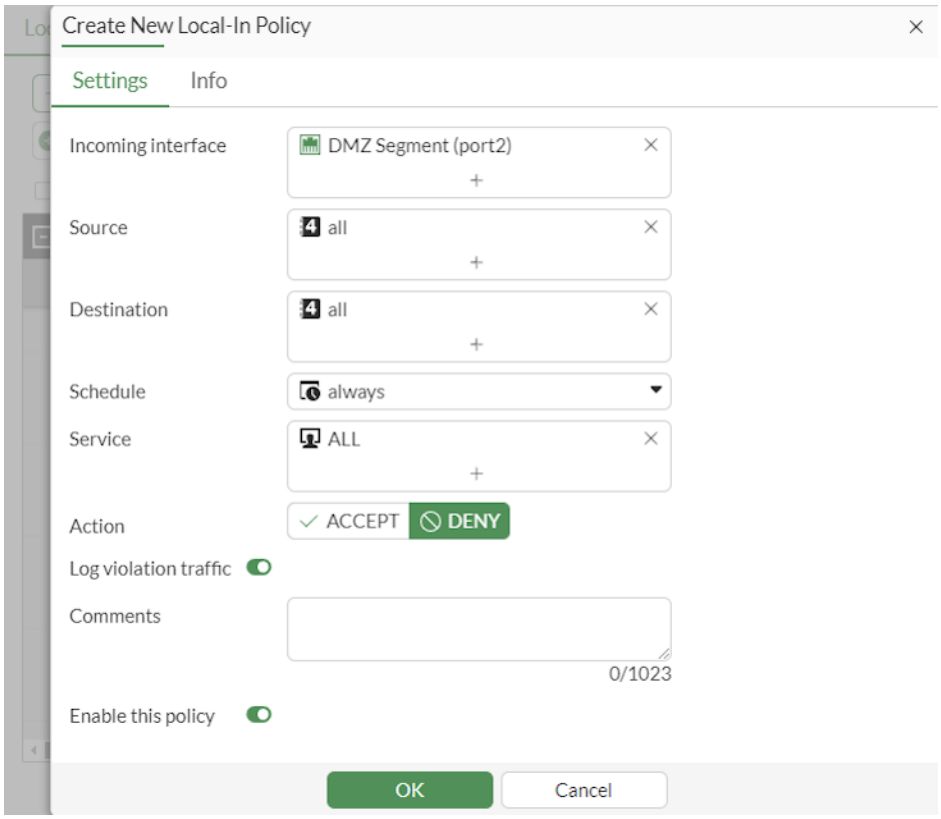


2. Log traffic in a local-in policy:
   a. Go to *Policy & Objects* > *Local-In Policy*.
   b. Select whether you want to configure a *Local-In Policy* or *IPv6 Local-In Policy*.
   c. Create a new policy or edit an existing policy.
   d. Enable traffic logging:

- For policies with the *Action* set to *ACCEPT*, enable *Log allowed traffic*.



- For policies with the *Action* set to *DENY*, enable *Log violation traffic*.



If traffic logging is enabled in the local-in policy, log denied unicast traffic and log denied broadcast traffic logs will display in *Log & Report > Local Traffic*.

To log local traffic per local-in policy in the CLI:

1. Enable logging local-in traffic per policy:

```
config log setting
    set local-in-policy-log enable
end
```

2. Enable local traffic logging in the policy:

```
config firewall local-in-policy
    edit 1
        set logtraffic enable
    next
end
config firewall local-in-policy6
    edit 2
        set logtraffic enable
    next
end
```

3. Review local logs. Traffic is logged for the local-in policies and denied unicast traffic and denied broadcast traffic logs are included.

```

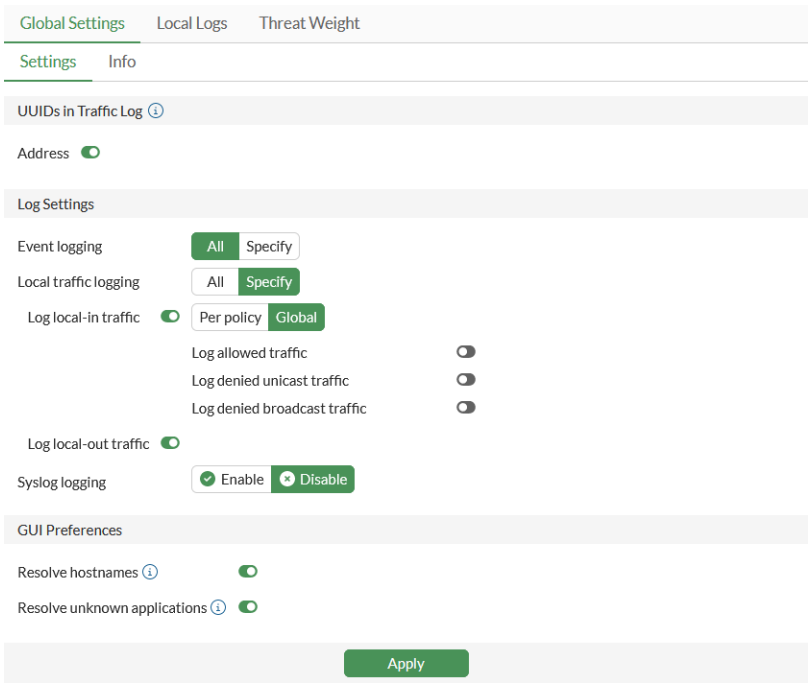
```

Global logging

Local-in traffic can also continue to be logged globally instead of per policy. To configure global local-in traffic logging in the CLI, disable `local-in-policy-log`.

To configure global local traffic logging in the GUI:

1. Enable local-in traffic logging per policy:
   a. Go to *Log & Report > Log Settings*.
   b. Go to the *Global Settings* tab.
   c. Set *Local traffic logging* to *Specify*.
   d. Enable *Log local-in traffic* and set it to *Global*.



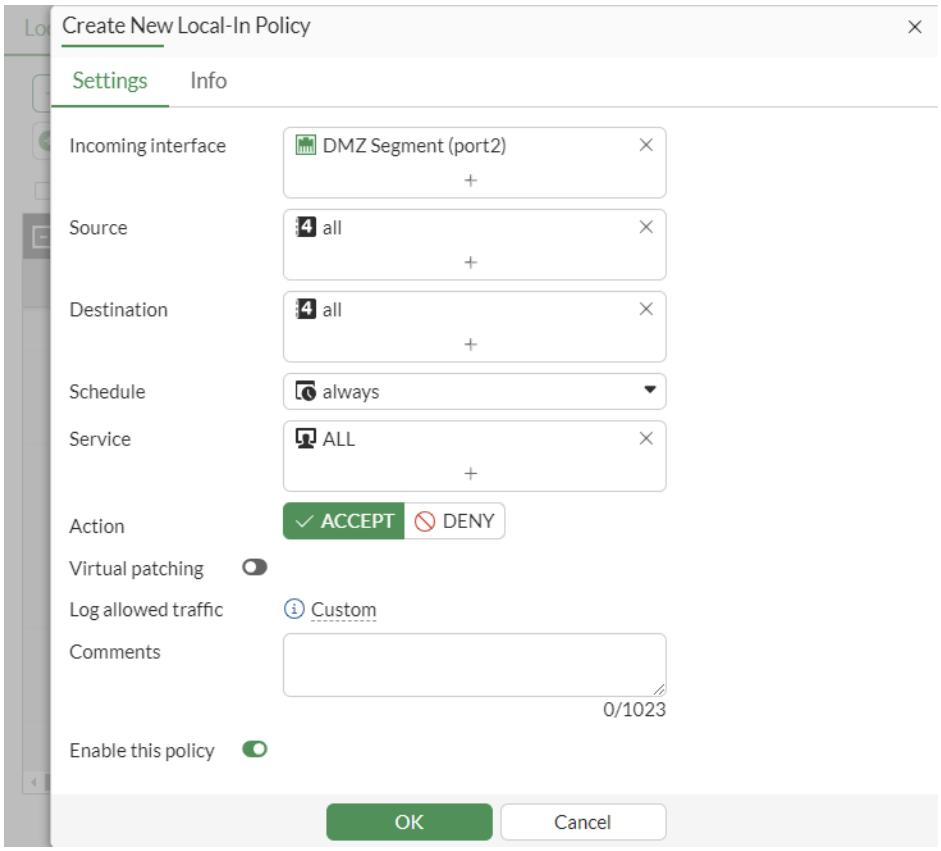
e. Enable the log events that should be globally logged.

2. Review logging in a local-in policy:

a. Go to *Policy & Objects* > *Local-In Policy*.

b. Select whether you want to configure a *Local-In Policy* or *IPv6 Local-In Policy*.

c. Create a new policy or edit an existing policy.



Log allowed traffic and *Log violation traffic* will be set to *Custom* and cannot be changed in the policy.

DoS policy

A Denial of Service (DoS) policy examines network traffic arriving at a FortiGate interface for anomalous patterns, which usually indicates an attack.

A denial of service occurs when an attacking system starts an abnormally large number of sessions with a target system. The large number of sessions slows down or disables the target system, preventing legitimate users from using it.

DoS policies are checked before security policies, preventing attacks from triggering more resource intensive security protection and slowing down the FortiGate.

DoS anomalies

Predefined sensors are setup for specific anomalous traffic patterns. New DoS anomalies cannot be added by the user.

The predefined anomalies that can be used in DoS policies are:

Anomaly	Description	Recommended Threshold
tcp_syn_flood	If the SYN packet rate of new TCP connections, including retransmission, to one destination IP address exceeds the configured threshold value, the action is executed. *	2000 packets per second.
tcp_port_scan	If the SYN packet rate of new TCP connections, including retransmission, from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second.
tcp_src_session	If the number of concurrent TCP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
tcp_dst_session	If the number of concurrent TCP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
udp_flood	If the UDP traffic to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second.
udp_scan	If the UDP sessions setup rate originating from one source IP address exceeds the configured threshold value, the action is executed.	2000 sessions per second.
udp_src_session	If the number of concurrent UDP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
udp_dst_session	If the number of concurrent UDP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
icmp_flood	If the number of ICMP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	250 packets per second.
icmp_sweep	If the ICMP sessions setup rate originating from one source IP address exceeds the configured threshold value, the action is executed.	100 sessions per second.
icmp_src_session	If the number of concurrent ICMP connections from one source IP address exceeds the configured threshold value, the action is executed.	300 concurrent sessions
icmp_dst_session	If the number of concurrent ICMP connections to one destination IP address exceeds the configured threshold value, the action is executed.	1000 concurrent sessions
ip_src_session	If the number of concurrent IP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.

Anomaly	Description	Recommended Threshold
ip_dst_session	If the number of concurrent IP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions.
sctp_flood	If the number of SCTP packets sent to one destination IP address exceeds the configured threshold value, the action is executed.	2000 packets per second
sctp_scan	If the number of SCTP sessions originating from one source IP address exceeds the configured threshold value, the action is executed.	1000 packets per second
sctp_src_session	If the number of concurrent SCTP connections from one source IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions
sctp_dst_session	If the number of concurrent SCTP connections to one destination IP address exceeds the configured threshold value, the action is executed.	5000 concurrent sessions

* The NP7 and NP6XLite have hardware modules that can provide tcp_syn-flood protection using the SYN cookies mechanism. The modules activate the mechanism by sending a reply in the hardware only after the tcp_syn_flood threshold is exceeded. DoS-offloading is required; see DoS policy hardware acceleration for more information.

For thresholds based on the number of concurrent sessions, blocking the anomaly will not allow more than the number of concurrent sessions to be set as the threshold.

For example, if the period for a particular anomaly is 60 seconds, such as those where the threshold is measured in concurrent sessions, after the 60 second timer has expired the number of allowed sessions that match the anomaly criteria is reset to zero. This means that, if you allow 10 sessions through before blocking, after the 60 seconds has elapsed, another 10 sessions will be allowed. The attrition of sessions from expiration should keep the allowed sessions from reaching the maximum.

For rate based thresholds, where the threshold is measured in packets per second, the *Block* action prevents anomalous traffic from overwhelming the firewall in two ways:

- continuous: Block packets once an anomaly is detected, and continue to block packets while the rate is above the threshold. This is the default setting.
- periodical: After an anomaly is detected, allow the configured number of packets per second.

For example, if a DoS policy is configured to block icmp_flood with a threshold of 10pps, and a continuous ping is started at a rate of 20pps for 1000 packets:

- In continuous mode, the first 10 packets are passed before the DoS sensor if triggered, and then the remaining 990 packets are blocked.
- In periodical mode, 10 packets are allowed to pass per second, so 500 packets are blocked in the 50 seconds during which the ping is occuring.

The actual numbers of passed and blocked packets may not be exact, as fluctuations in the rates can occur, but the numbers should be close to the defined threshold.

To configure the block action for rate based anomaly sensors:

```
config ips global
    set anomaly-mode {continuous | periodical}
end
```

DoS policies

A DoS policy can be configured to use one or more anomalies.

To configure a DoS policy in the GUI:

1. Go to *Policy & Objects* > *IPv4 DoS Policy* or *Policy & Objects* > *IPv6 DoS Policy* and click *Create New*.
   If the option is not visible, enable *DoS Policy* in *Feature Visibility*. See Feature visibility on page 3820 for details.
2. Configure the following:

Name	Enter a name for the policy.
Incoming Interface	Enter the interface that the policy applies to.
Source Address	Enter the source address.
Destination Address	Enter the destination address. This is the address that the traffic is addressed to. In this case, it must be an address that is associated with the firewall interface. For example, it could be an interface address, a secondary IP address, or the address assigned to a VIP address.
Service	Select the services or service groups. The ALL service can used or, to optimize the firewall resources, only the services that will be answered on an interface can be used.

L3 Anomalies
L4 Anomalies
	Configure the anomalies:
	• *Logging*: Enable/disable logging for specific anomalies or all of them. Anomalous traffic will be logged when the action is *Block* or *Monitor*.
	• *Action*: Select the action to take when the threshold is reached:
	  • *Disable*: Do not scan for the anomaly.
	  • *Block*: Block the anomalous traffic.
	  • *Monitor*: Allow the anomalous traffic, but record a log message if logging is enabled.
	• *Threshold*: The number of detected instances that triggers the anomaly action.

Comments	Optionally, enter a comment.

3. Enable the policy, then click *OK*.

The quarantine option is only available in the CLI. See Quarantine on page 1841 for information.

To configure a DoS policy in the GUI:

```
config firewall DoS-policy
    edit 1
        set name "Flood"
        set interface "port1"
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        config anomaly
            edit "icmp_flood"
                set status enable
                set log enable
                set action block
                set quarantine attacker
                set quarantine-expiry 1d1h1m
                set quarantine-log enable
                set threshold 100
            next
        end
    next
end
```

`name <string>`	Enter a name for the policy.
`interface <string>`	Enter the interface that the policy applies to.
`srcaddr <string>`	Enter the source address.
`dstaddr <string>`	Enter the destination address. This is the address that the traffic is addressed to. In this case, it must be an address that is associated with the firewall interface. For example, it could be an interface address, a secondary IP address, or the address assigned to a VIP address.
`service <string>`	Enter the services or service groups. The `ALL` service can used or, to optimize the firewall resources, only the services that will be answered on an interface can be used.
`status {enable | disable}`	Enable/disable this anomaly.
`log {enable | disable}`	Enable/disable anomaly logging. When enabled, a log is generated whenever the anomaly action is triggered, regardless of which action is configured.
`action {pass | block}`	Set the action to take when the threshold is reached: • `pass`: Allow traffic, but record a log message if logging is enabled. • `block`: Block traffic if this anomaly is found.

`quarantine {none | attacker}`	Set the quarantine method (see Quarantine on page 1841): • `none`: Disable quarantine. • `attacker`: Block all traffic from the attacker's IP address, and add the attacker's IP address to the banned user list.
`quarantine-expiry <###d##h##m>`	Set the duration of the quarantine, in days, hours, and minutes (###d##h##m) (1m - 364d23h59m, default = 5m). This option is available if `quarantine` is set `attacker`.
`quarantine-log {enable | disable}`	Enable/disable quarantine logging (default = disable). This option is available if `quarantine` is set `attacker`.
`threshold <integer>`	The number of detected instances - packets per second or concurrent session number - that triggers the anomaly action.

Quarantine

Quarantine is used to block any further traffic from a source IP address that is considered a malicious actor or a source of traffic that is dangerous to the network. Traffic from the source IP address is blocked for the duration of the quarantine, and the source IP address is added to the banned user list.

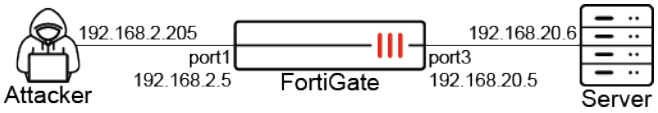
The banned user list is kept in the kernel, and used by Antivirus, Data Loss Prevention (DLP), DoS, and Intrusion Prevention System (IPS). Any policies that use any of these features will block traffic from the attacker's IP address.

To view the quarantined user list:

```
# diagnose user banned-ip list
src-ip-addr       created                  expires                  cause
192.168.2.205     Wed Nov 25 12:47:54 2020 Wed Nov 25 12:57:54 2020 DOS
```

Troubleshooting DoS attacks

The best way to troubleshoot DoS attacks is with Anomaly logs and IPS anomaly debug messages.



To test an icmp_flood attack:

1. From the Attacker, launch an icmp_flood with 50pps lasting for 3000 packets.
2. On the FortiGate, configure continuous mode and create a DoS policy with an icmp_flood threshold of 30pps:

```
config firewall DoS-policy
    edit 1
        set name icmpFlood
        set interface "port1"
```

```
        set srcaddr "all"
        set dstaddr "all"
        set service "ALL"
        config anomaly
            edit "icmp_flood"
                set status enable
                set log enable
                set action block
                set threshold 30
            next
        end
    next
end
```

3. Configure the debugging filter:

```
# diagnose ips anomaly config
DoS sensors in kernel vd 0:
DoS id 1 proxy 0
  0 tcp_syn_flood status 0 log 0 nac 0 action 0 threshold 2000
  ...
  7 udp_dst_session status 0 log 0 nac 0 action 0 threshold 5000
  8 icmp_flood status 1 log 1 nac 0 action 7 threshold 30
  9 icmp_sweep status 0 log 0 nac 0 action 0 threshold 100
  ...
total # DoS sensors: 1.
```

```
# diagnose ips anomaly filter id 8
```

4. Launch the icmp_flood from a Linux machine. This example uses Nmap:

```
$ sudo nping --icmp --rate 50 -c 3000 192.168.2.50
SENT (0.0522s) ICMP [192.168.2.205 > 192.168.2.50 Echo request (type=8/code=0) id=8597 seq=1]
IP [ttl=64 id=47459 iplen=28 ]
...
Max rtt: 11.096ms | Min rtt: 0.028ms | Avg rtt: 1.665ms
Raw packets sent: 3000 (84.000KB) | Rcvd: 30 (840B) | Lost: 2970 (99.00%)
Nping done: 1 IP address pinged in 60.35 seconds
```

5. During the attack, check the anomaly list on the FortiGate:

```
# diagnose ips anomaly list
list nids meter:
id=icmp_flood         ip=192.168.2.50 dos_id=1 exp=998 pps=46 freq=50

total # of nids meters: 1.
```

id=icmp_flood	The anomaly name.
ip=192.168.2.50	The IP address of the host that triggered the anomaly. It can be either the client or the server.

	For icmp_flood, the IP address is the destination IP address. For icmp_sweep, it would be the source IP address.
dos_id=1	The DoS policy ID.
exp=998	The time to be expired, in jiffies (one jiffy = 0.01 seconds).
pps=46	The number of packets that had been received when the diagnose command was executed.
freq=50	For session based anomalies, freq is the number of sessions. For packet rate based anomalies (flood, scan): • In continuous mode: freq is the greater of pps, or the number of packets received in the last second. • In periodic mode: freq is the pps.

6. Go to *Log & Report > Security Events* and download the *Anomaly* logs:

```
date=2020-11-20 time=14:38:39 eventtime=1605911919824184594 tz="-0800" logid="0720018433"
type="utm" subtype="anomaly" eventtype="anomaly" level="alert" vd="root" severity="critical"
srcip=192.168.2.205 srccountry="Reserved" dstip=192.168.2.50 srcintf="port1"
srcintfrole="undefined" sessionid=0 action="clear_session" proto=1 service="PING" count=1307
attack="icmp_flood" icmpid="0x2195" icmptype="0x08" icmpcode="0x00" attackid=16777316
policyid=1 policytype="DoS-policy" ref="http://www.fortinet.com/ids/VID16777316" msg="anomaly:
icmp_flood, 31 > threshold 30, repeats 28 times" crscore=50 craction=4096 crlevel="critical"
```

```
date=2020-11-20 time=14:39:09 eventtime=1605911949826224056 tz="-0800" logid="0720018433"
type="utm" subtype="anomaly" eventtype="anomaly" level="alert" vd="root" severity="critical"
srcip=192.168.2.205 srccountry="Reserved" dstip=192.168.2.50 srcintf="port1"
srcintfrole="undefined" sessionid=0 action="clear_session" proto=1 service="PING" count=1497
attack="icmp_flood" icmpid="0x2195" icmptype="0x08" icmpcode="0x00" attackid=16777316
policyid=1 policytype="DoS-policy" ref="http://www.fortinet.com/ids/VID16777316" msg="anomaly:
icmp_flood, 50 > threshold 30, repeats 1497 times" crscore=50 craction=4096 crlevel="critical"
```

Analysis

In the first log message:

msg="anomaly: icmp_flood, 31 > threshold 30	At the beginning of the attack, a log is recorded when the threshold of 30pps is broken.
repeats 28 times	The number of packets that has exceeded the threshold since the last time a log was recorded.
srcip=192.168.2.205 **dstip=192.168.2.50**	The source and destination IP addresses of the attack.
action="clear_session"	Equivalent to block. If `action` was set to `monitor` and logging was enabled, this would be `action="detected"`.

In the second log message:

- Because it is an ongoing attack, the FortiGate generates one log message for multiple packets every 30 seconds..
- It will not generate a log message if:
  - The same attack ID happened more than once in a five second period, or
  - The same attack ID happened more than once in a 30 second period and the actions are the same and have the same source and destination IP addresses.

msg="anomaly: icmp_flood, 50 > threshold 30	In the second before the log was recorded, 50 packets were detected, exceeding the configured threshold.
repeats 1497 times	The number of packets that has exceeded the threshold since the last time a log was recorded

Telemetry policy

This topic applies only to a FortiGate acting as a FortiTelemetry Controller with *FortiTelemetry* enabled on the *System > Feature Visibility* page. For a summary of FortiTelemetry-related tasks that you can do in FortiOS, see FortiTelemetry on page 138. See also *FortiTelemetry Administration Guide*.

A telemetry type of firewall policy must be created on the FortiTelemetry Controller to send monitoring tasks to the agents.

The telemetry firewall policy has type set to *Telemetry*, source set to telemetry addresses or telemetry address groups, and a telemetry profile selected. FortiTelemetry Controller uses the following firewall policy configuration elements to automatically create a monitor task for agents:

- FortiTelemetry agent from the policy source
- Applications to monitor from the telemetry profile

FortiOS automatically places the telemetry policy at the top of the policy table for you. This position allows the policy to function correctly.

You must also allow the monitor traffic from FortiGate.

To configure a telemetry policy in the GUI:

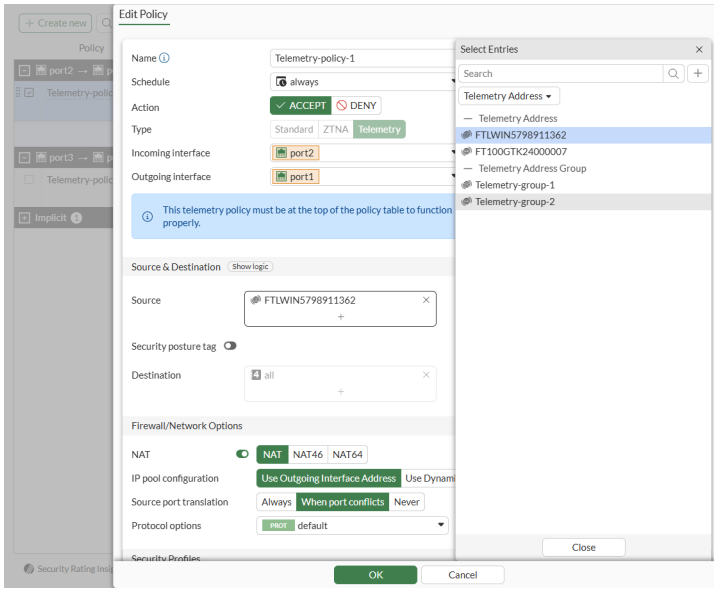
1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* to create a new firewall policy.
3. Configure the following settings:

Name	Enter a name for the policy.
Action	Set the action to *Accept* to send monitoring tasks to the agents.
Type	Select *Telemetry* as the policy type.
Incoming Interface	Choose the FortiGate port that is used to connect to the FortiTelemetry agent(s).
Outgoing Interface	Select the outgoing interface.

4. Set *Source* to one or more telemetry addresses or address groups.

See Telemetry addresses and address groups on page 2009 for more information.

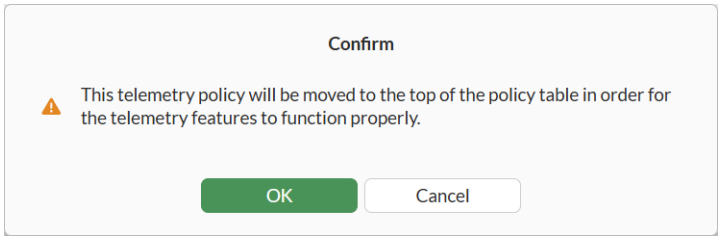
a. Click *Source*, and select *Telemetry Address* to display a list of telemetry addresses and telemetry address groups.



b. Select one or more addresses or address groups.

c. Click *Close* when done.

5. Set *Telemetry* to a telemetry security profile configured on the FortiGate.
   See Telemetry profile on page 2351 for more information.
6. Click *OK* to save the policy. A message is displayed:



7. Click *OK* to continue. The policy is saved and displayed at the top of the policy table.
   The *Type* column displays *Telemetry*.

To configure a FortiTelemetry policy in the CLI:

1. Use the following commands to configure a telemetry policy in the CLI:

```
config firewall policy
  edit "3"
    show
      config firewall policy
        edit 3
          set name "FTLPolicyWin136"
          set uuid 2a86e78c-d9c9-51ef-33d5-6ddd81cfcc63
          set srcintf "port3"
          set dstintf "port1"
```

```
            set action accept
            set srcaddr "FTLWIN4665500001"
            set dstaddr "all"
            set schedule "always"
            set service "ALL"
            set telemetry-profile "default"
            set logtraffic all
            set nat enable
            set comments "FTLPolicyWin136"
        next
    end
```

Access control lists

An access control list (ACL) is a granular, targeted blocklist that is used to block IPv4 and IPv6 packets on a specified interface based on the criteria configured in the ACL policy.

On FortiGate models with ports that are connected through an internal switch fabric with TCAM capabilities, ACL processing is offloaded to the switch fabric and does not use CPU resources. VLAN interfaces that are based on physical switch fabric interfaces are also supported. Interfaces that are connected through an internal switch fabric usually have names prefixed with *port* or *lan*, such as *port1* or *lan2*; other interfaces are not supported.

The packets will be processed by the CPU when offloading is disabled or not possible, such as when a port on a supported model does not connect to the internal fabric switch.

ACL is supported on the following FortiGate models:

- 100D, 100E, 100EF, 101E
- 140D, 140D-POE, 140E, 140E-POE
- 1500D, 1500DT
- 3000D, 3100D, 3200D, 3700D, 3800D
- All 300E and larger E-series models
- All 100F and larger F-series models

Example

To block all IPv4 and IPv6 telnet traffic from port2 to Company_Servers:

```
config firewall acl
    edit 1
       set interface "port2"
       set srcaddr "all"
       set dstaddr "Company_Servers"
       set service "TELNET"
    next
end
config firewall acl6
```

```
    edit 1
        set interface "port2"
        set srcaddr "all"
        set dstaddr "Company_Servers_v6"
        set service "TELNET"
    next
end
```

Diagnose commands

To check the number of packets dropped by an ACL:

```
# diagnose firewall acl counter
ACL id 1 dropped 0 packets
```

```
# diagnose firewall acl counter6
ACL id 2 dropped 0 packets
```

To clear the packet drop counters:

```
# diagnose firewall acl clearcounter
```

```
# diagnose firewall acl clearcounter6
```

Interface policies

Interface policies are implemented before the security policies and are only flow-based. They are configured in the CLI.

This feature allows you to attach a set of IPS policies with the interface instead of the forwarding path, so packets can be delivered to IPS before entering the firewall. This feature is used for following IPS deployments:

- One-Arm: By defining interface policies with IPS and DoS anomaly checks and enabling sniff-mode on the interface, the interface can be used for one-arm IDS.
- IPv6 IPS: IPS inspection can be enabled through interface IPv6 policy.
- Scan traffic that is destined to the FortiGate.
- Scan and log traffic that are silently dropped or flooded by Firewall or Multicast traffic.

IPS sensors can be assigned to an interface policy. Both incoming and outgoing packets are inspected by IPS sensor (signature).

To configure an interface policy:

```
config firewall interface-policy
    edit 1
        set status enable
        set comments 'test interface policy #1'
```

```
        set logtraffic utm
        set interface "port2"
        set srcaddr all
        set dstaddr all
        set service "ALL"
        set application-list-status disable
        set ips-sensor-status disable
        set dsri disable
        set av-profile-status enable
        set av-profile default
        set webfilter-profile-status disable
    next
end
```

Source NAT

Network Address Translation (NAT) is the process that enables a single device, such as a router or firewall, to act as an agent between the internet or public network and a local or private network. This agent acts in real-time to translate the source or destination IP address of a client or server on the network interface. Source IP translation enables a single, public address to represent a significantly larger number of private addresses. Destination IP translation enables the firewall to translate a public, destination address to a private address. So we don't have to configure a real public IP address for the server deployed in a private network.

NAT can be subdivided into two types:

- Source NAT (SNAT)
- Destination NAT (DNAT)

This section is about SNAT. Three NAT working modes are supported: static SNAT, dynamic SNAT, and central SNAT. For information about DNAT, see Destination NAT on page 1874.

The following topics provide instructions on configuring policies with source NAT:

- Static SNAT on page 1849
- Dynamic SNAT on page 1850
- Central SNAT on page 1859
- Configuring an IPv6 SNAT policy on page 1870
- SNAT policies with virtual wire pairs on page 1872
- Configuring PCP port mapping with SNAT and DNAT on page 1949

Static SNAT

In static SNAT all internal IP addresses are always mapped to the same public IP address. This is a port address translation, Since we have 60416 available port numbers, this one public IP address can handle the conversion of 60,416 internal IP addresses to the same service, where a service is defined by a specified protocol, destination IP address, and destination port.

Internal Source IP	Source Port	Translated Source IP	Translated Source Port
10.1.100.1	11110	172.16.200.1	5117
10.1.100.1	11111	172.16.200.1	5118
10.1.100.2	11112	172.16.200.1	5119
.....	.....	172.16.200.1	.....
.....	.....	172.16.200.1	65533

FortiGate firewall configurations commonly use the Outgoing Interface address.

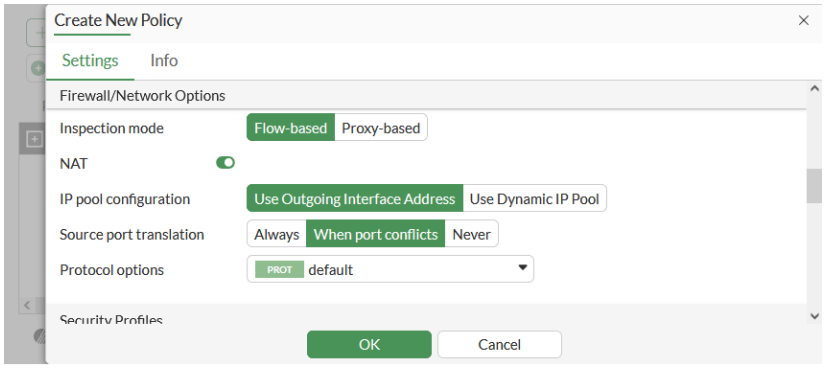
Sample configuration

The following example of static SNAT uses an internal network with subnet 10.1.100.0/24 (vlan20) and an external/ISP network with subnet 172.16.200.0/24 (vlan30).

When the clients in internal network need to access the servers in external network, We need to translate IP addresses from 10.1.100.0/24 to an IP address 172.16.200.0/24, In this example, we implement static SNAT by creating a firewall policy.

To configure static NAT:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the required policy parameters.
3. Enable *NAT* and select *Use Outgoing Interface Address*. For packets that match this policy, its source IP address is translated to the IP address of the outgoing interface.
4. The default setting for *Source Port Translation* is *When Port Conflicts*, which uses the original source port unless there is a conflict. If required, set it to *Always* to always change the source port for Source NAT, or *Never* to prevent Source NAT from changing a session's source port.



5. Click *OK*.

Dynamic SNAT

Dynamic SNAT maps the private IP addresses to the first available public address from a pool of addresses. In the FortiGate firewall, this can be done by using IP pools. IP pools is a mechanism that allows sessions leaving the FortiGate firewall to use NAT. An IP pool defines a single IP address or a range of IP addresses to be used as the source address for the duration of the session. These assigned addresses are used instead of the IP address assigned to that FortiGate interface.

IP pool types

FortiGate uses four types of IPv4 IP pools. This topic focuses on some of the differences between them.

Overload

This type of IP pool is similar to static SNAT mode. We need to define an external IP range that contains one or more IP addresses. When there is only one IP address it is almost the same as static SNAT, the outgoing interface address is used. When it contains multiple IP addresses, it is equivalent to an extended mode of static SNAT.

For instance, if we define an overload type IP pool with two external IP addresses (172.16.200.1—172.16.200.2), since there are 60,416 available port numbers per IP, this IP pool can handle 60,416*2 internal IP addresses to the same service, where a service is defined by a specific protocol, destination IP address, and destination port.

Original Source IP	Original Source Port	Translated Source IP	Translated Source Port
10.1.100.1	11110	172.16.200.1	5117
10.1.100.2	11111	172.16.200.1	5118
.....	.....	172.16.200.1	.....
.....	.....	172.16.200.1	65533
.....	.....	172.16.200.2	5117
.....	.....	.....	.....
.....	.....	172.16.200.2	65533

The mapped IP address can be calculated from the source IP address. The index number of the address in the pool is the remainder of the source IP address, in decimal, divided by the number addresses in the pool.

To calculate the decimal value of the source IP address, either use an online calculator, or use the following equation:

$$a.b.c.d = a * (256)^3 + b * (256)^2 + c * (256) + d$$

For example:

$$192.168.0.1 = 192 * (256)^3 + 168 * (256)^2 + 0 * (256) + 1 = 3232235521$$

If there is one IP pool, where:

- P_1 = the first address in the IP pool
- R_1 = the number of IP addresses in the IP pool
- X = the source IP address as a decimal number
- Y = the mapped IP address

Then the equation to determine the mapped address is:

$$Y = P_1 + X \bmod R_1$$

For example:

IP pool	Source IP address
172.26.73.20 to 172.26.73.90	192.168.1.200

1. Convert the source IP address to a decimal number:
$$192 * (256)^3 + 168 * (256)^2 + 1 * (256) + 200 = 3232235976$$
2. Determine the number of IP addresses in the pool:
$$172.26.73.90 - 172.26.73.20 = 71$$
3. Find the remainder of the source IP address divided by the number of addresses in the pool:
$$3232235976 \bmod 71 = 26$$
4. Add the remainder to the first IP address in the pool:
$$172.26.73.20 + 26 = 172.26.73.46$$
So, the mapped IP address is **172.26.73.46**.

If there are multiple IP pools, the calculation is similar to when there is only one pool.

If there are two IP pools, where:

- P_1 = the first address in the first IP pool
- P_2 = the first address in the second IP pool
- R_1 = the number of IP addresses in the first IP pool
- R_2 = the number of IP addresses in the second IP pool
- X = the source IP address as a decimal number
- Y = the mapped IP address

Then the equations to determine the mapped address are:

If $X \bmod (R_1 + R_2) >= R_1$, then $Y = P_2 + X \bmod R_2$

If $X \bmod (R_1 + R_2) < R_1$, then $Y = P_1 + X \bmod R_1$

For example:

IP pools	Source IP address
pool01: 172.26.73.20 to 172.26.73.90	192.168.1.200
pool02: 172.26.75.50 to 172.26.75.150	

1. Convert the source IP address to a decimal number:
$$192 * (256)^3 + 168 * (256)^2 + 1 * (256) + 200 = 3232235976$$
2. Determine the total number of IP addresses in the pools:
$$(172.26.73.90 - 172.26.73.20) + (172.26.75.50 - 172.26.75.150) = 71 + 101 = 172$$
3. Find the remainder of the source IP address divided by the number of addresses in the pools:
$$3232235976 \bmod 172 = 108$$
4. The remainder is greater than the number of addresses in pool01, so the address is selected from pool02 and the remainder is recalculated based only on pool02:
$$3232235976 \bmod 101 = 40$$

5. Add the new remainder to the first IP address in pool02:

   172.26.75.50 + 40 = 172.26.75.90

   So, the mapped IP address is **172.26.75.90**.

One-to-one

This type of IP pool means that the internal IP address and the external (translated) IP address match one-to-one. The port address translation (PAT) is disabled when using this type of IP pool. For example, if we define a one-to-one type IP pool with two external IP addresses (172.16.200.1 - 172.16.200.2), this IP pool only can handle two internal IP addresses.

Fixed port range

For the overload and one-to-one IP pool types, we do not need to define the internal IP range. For the fixed port range type of IP pool, we can define both internal IP range and external IP range. Since each external IP address and the number of available port numbers is a specific number, if the number of internal IP addresses is also determined, we can calculate the port range for each address translation combination. So we call this type fixed port range. This type of IP pool is a type of port address translation (PAT).

For instance, if we define one external IP address (172.16.200.1) and ten internal IP addresses (10.1.100.1-10.1.100.10), we have translation IP+Port combination like following table:

Original Source IP	Original Source Port	Translated Source IP	Translated Source Port Range
10.1.100.1	.....	172.16.200.1	5117~11157
10.1.100.2	.....	172.16.200.1	11158~17198
10.1.100.3	.....	172.16.200.1	.....
10.1.100.4	.....	172.16.200.1	.....
10.1.100.5	.....	172.16.200.1	.....
10.1.100.6	.....	172.16.200.1	.....
10.1.100.7	.....	172.16.200.1	.....
10.1.100.8	.....	172.16.200.1	.....
10.1.100.9	.....	172.16.200.1	53445~59485
10.1.100.10	.....	172.16.200.1	59486~65526

Custom port ranges, NAT64, and full cone NAT are supported. See Full cone NAT for fixed port range IP pools on page 1960 for more information about full cone NAT.

Port block allocation

This type of IP pool is also a type of port address translation (PAT). It gives users a more flexible way to control the way external IPs and ports are allocated. Users need to define *Block Size/Block Per User* and external IP range. *Block Size* means how many ports each Block contains. *Block per User* means how many blocks each user (internal IP) can use.

The following is a simple example:

- **External IP Range**: 172.16.200.1—172.16.200.1
- **Block Size**: 128
- **Block Per User**: 8

Result:

- **Total-PBAs**: 472 (60416/128)
- **Maximum ports can be used per User (Internal IP Address)**: 1024 (128*8)
- **How many Internal IP can be handled**: 59 (60416/1024 or 472/8)

Custom port ranges are supported.

A randomized port selection algorithm is also supported. The algorithm makes the port allocation process less predictable, which enhances security. The `port-random` option is available with:

- The `config firewall central-snat-map` command:

```
config firewall central-snat-map
    edit 1
        set port-preserve disable
        set port-random {enable | disable}
    next
end
```

- The `config firewall policy` command:

```
config firewall policy
    edit 1
        set port-preserve disable
        set port-random {enable | disable}
    next
end
```

`port-random {enable | disable}`	Enable/disable random source port selection for source NAT (default = disable). Available when `port-preserve` is disabled.

Interim logs can be configured for port block allocation (PBA) NAT logging. This enables continuous access to PBA event logs during an ongoing session, and provides comprehensive logging throughout a session's lifespan.

PBA event logs are generated periodically based on the configured time interval:

```
config firewall ippool
    edit pba-ippool
        set type port-block-allocation
        set pba-interim-log <integer>
    next
end
```

For example, when the PBA interim log interval is set to 600 seconds, event logs are obtained every ten minutes:

- Configure the PBA IP pool with a time interval:

```
config firewall ippool
    edit "pba-ippool"
        set type port-block-allocation
        set startip 172.16.200.151
        set endip 172.16.200.151
        set block-size 64
        set num-blocks-per-user 1
```

```
        set pba-interim-log 600
    next
end
```

- Check the event logs:

```
# execute log display

2 logs found.

2 logs returned.

1: date=2024-02-04 time=13:34:04 eventtime=1707082444264865326 tz="-0800" logid="0100022024"
type="event" subtype="system" level="notice" vd="vdom1" logdesc="IP pool PBA interim log"
action="ippool-interim" saddr="10.1.100.42" nat=172.16.200.151 portbegin=5117 portend=5180
poolname="pba-ippool" duration=1200 msg="IPpool interim"

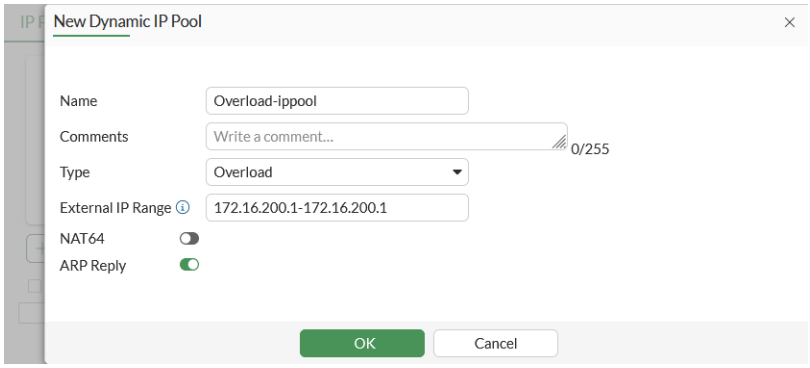
2: date=2024-02-04 time=13:24:03 eventtime=1707081844204865060 tz="-0800" logid="0100022024"
type="event" subtype="system" level="notice" vd="vdom1" logdesc="IP pool PBA interim log"
action="ippool-interim" saddr="10.1.100.42" nat=172.16.200.151 portbegin=5117 portend=5180
poolname="pba-ippool" duration=600 msg="IPpool interim"
```

Sample configuration

When an IP pool object is created with *ARP Reply* enabled, the object does not need to be referenced in any policies before a FortiGate interface starts responding to ARP requests for the addresses in the IP pool.

To configure overload IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *Overload*.
4. Enter the external IP range separated by a hyphen (*172.16.200.1-172.16.200.1*).



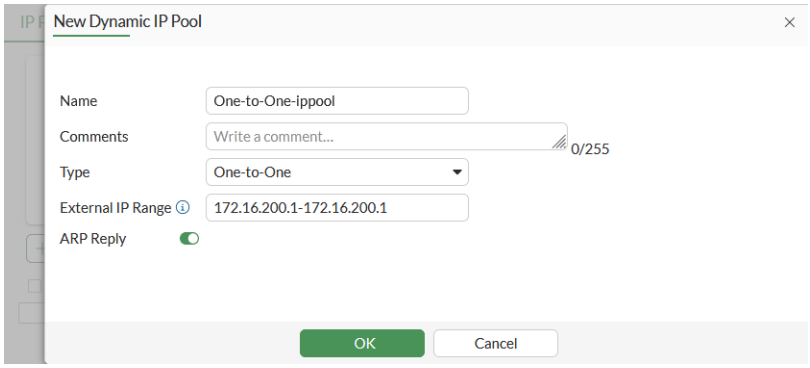
5. Click *OK*.

To configure overload IP pool in the CLI:

```
config firewall ippool
    edit "Overload-ippool"
        set startip 172.16.200.1
        set endip 172.16.200.1
    next
end
```

To configure one-to-one IP pool using the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *One-to-One*.
4. Enter the external IP range separated by a hyphen (*172.16.200.1-172.16.200.2*).



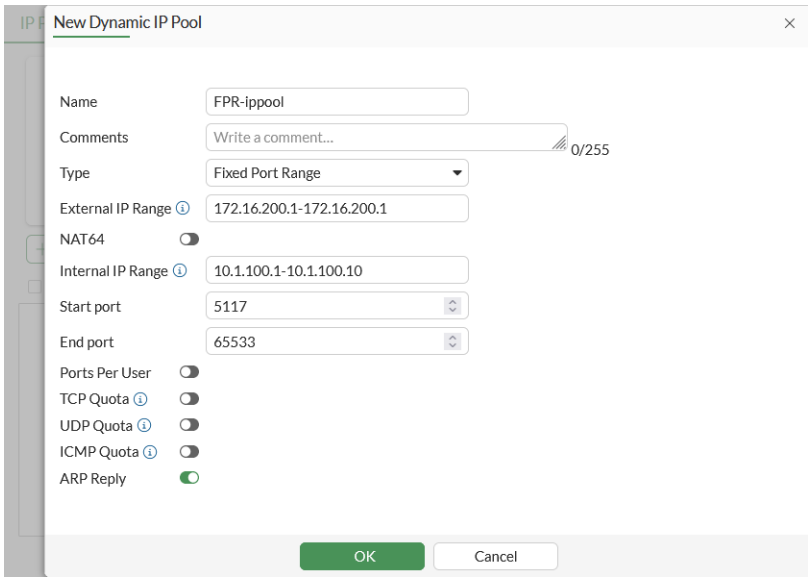
5. Click *OK*.

To configure one-to-one IP pool in the CLI:

```
config firewall ippool
    edit "One-to-One-ippool"
        set type one-to-one
        set startip 172.16.200.1
        set endip 172.16.200.2
    next
end
```

To configure fixed port range IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *Fixed Port Range*.
4. Enter the external IP range separated by a hyphen *172.16.200.1-172.16.200.1*).
5. Enter the internal IP range separated by a hyphen *10.1.100.1-10.1.100.10*).
6. (Optional) Enter the start port and end port numbers.



7. Click *OK*.

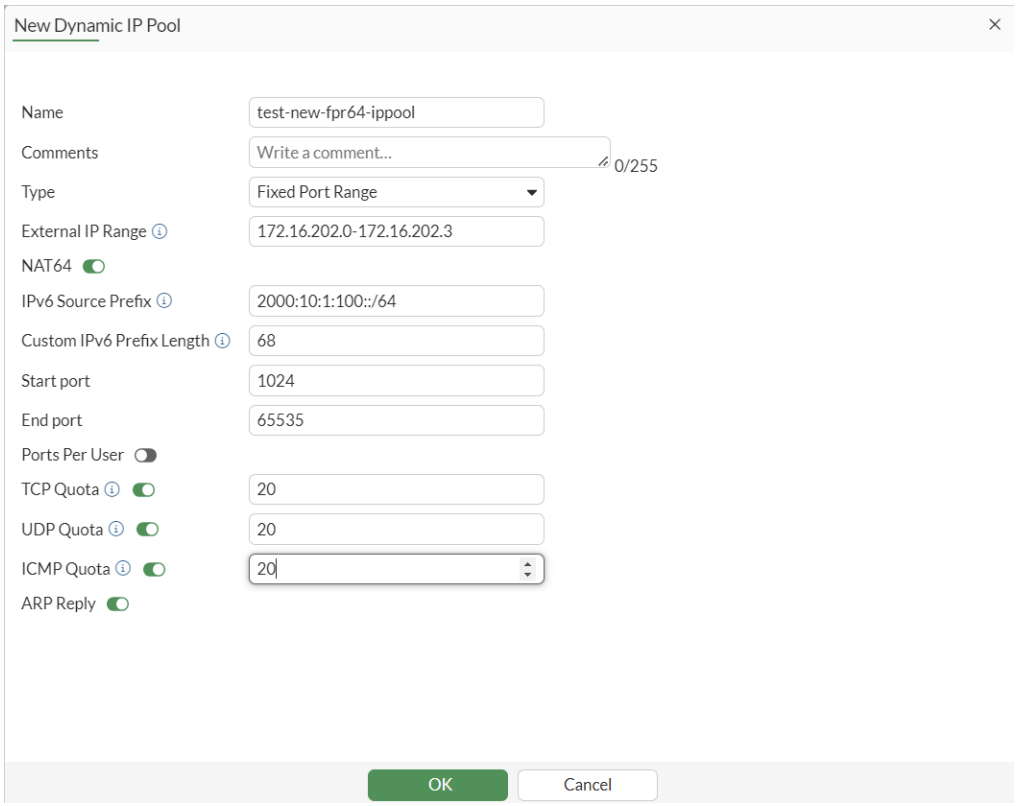
To configure fixed port range IP pool in the CLI:

```
config firewall ippool
    edit "FPR-ippool"
        set type fixed-port-range
        set startip 172.16.200.1
        set endip 172.16.200.1
        set startport 5117
        set endport 65533
        set source-startip 10.1.100.1
        set source-endip 10.1.100.10
   next
end
```

To configure NAT64 FPR IP pools in the GUI:

1. Go to *Policy & Objects* > *IP Pools*.
2. Select the *IP Pool* tab and click *Create New*.
3. Set the following options:

Name	Enter a name.
Type	Select *Fixed Port Range*.
External IP Range	Enter the IP address range.
NAT64	Enable.
IPv6 Source Prefix	Enter the source IPv6 network to be translated.
Custom IPv6 Prefix Length	Enter the subnet length of a single deterministic NAT64 client.



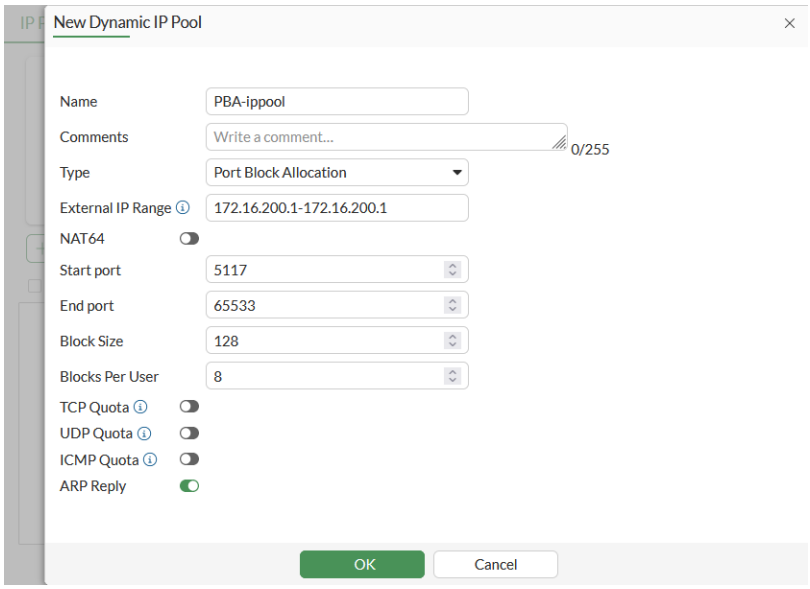
4. Set the remaining options as needed and click *OK*.

To configure NAT64 FPR IP pools in the CLI:

```
config firewall ippool
    edit "test-new-fpr64-ippool"
        set type fixed-port-range
        set startip 172.16.202.0
        set endip 172.16.202.3
        set startport 1024
        set endport 65535
        set nat64 enable
        set source-prefix6 2000:10:1:100::/64
        set client-prefix-length 68
        set tcp-session-quota 20
        set udp-session-quota 20
        set icmp-session-quota 10
    next
end
```

To configure port block allocation IP pool in the GUI:

1. In *Policy & Objects* > *IP Pools*, click *IP Pool*.
2. Click *Create new*.
3. Set *Type* to *Port Block Allocation*.
4. Enter the external IP range separated by a hyphen *172.16.200.1-172.16.200.1*).



5. Click *OK*.

To configure port block allocation IP pool in the CLI:

```
config firewall ippool
    edit PBA-ippool
        set type port-block-allocation
        set startip 172.16.200.1
        set endip 172.16.200.1
        set startport 5117
        set endport 65533
        set block-size 128
        set num-blocks-per-user 8
    next
end
```

IP pools and VIPs as local IP addresses

IP pools and VIPs are considered local IP addresses if responding to ARP requests on these external IP addresses is enabled (`set arp-reply enable`, by default). In this case, the FortiGate is considered a destination for those IP addresses and can receive reply traffic at the application layer successfully.

However, as a side-effect, once an IP pool or VIP has been configured, even if it is never used in a firewall policy, the FortiGate considers it as a local address and will not forward traffic based on the routing table. Therefore, any unused IP pools or VIPs should be deleted to prevent any unexpected behavior.

⚠ For a history of behavior changes related to IP pools and VIPs, see Technical Tip: IP pool and virtual IP behavior changes in FortiOS 6.4, 7.0, 7.2, and 7.4.

Central SNAT

The central SNAT table enables you to define and control (with more granularity) the address translation performed by FortiGate. With the NAT table, you can define the rules for the source address or address group, and which IP pool the destination address uses.

FortiGate reads the NAT rules from the top down until it hits a matching rule for the incoming address. This enables you to create multiple NAT policies that dictate which IP pool is used based on source address, destination address, and source port. NAT policies can be rearranged within the policy list. NAT policies are applied to network traffic after a security policy.

The central SNAT table allows you to create, edit, delete, and clone central SNAT entries.

Central SNAT notes

- The central NAT feature is not enabled by default.
- If central NAT is enabled, the NAT option under IPv4 policies is skipped and SNAT must be done via `central-snat-map`. The firewall policy list and dialog boxes have messages and redirection links to show this information.
- If NGFW mode is policy-based, then it is assumed that central NAT (specifically SNAT) is enabled implicitly.

Sample configuration

To enable central SNAT from the GUI:

1. In *System > Settings > General*, under *System Operations Settings*, enable *Central SNAT*.
2. Click *Apply*.

To enable or disable central SNAT using the CLI:

```
config system settings
   set central-nat {enable | disable}
end
```

When central NAT is enabled, *Policy & Objects* displays the Central SNAT section.

The Central SNAT policy has many options:

Field	Description
Type	Specify whether you are performing SNAT on IPv4 or IPv6. This option only appears when IPv6 is enabled under *Feature Visibility*.
Incoming Interface	Specify one or more interfaces for the ingress traffic.
Outgoing Interface	Specify one or more interfaces for the egress traffic.
Source Address	Specify the address or address group of the source.
Destination Address	Specify the address or address group of the destination.

Field	Description
NAT	Enable or disable to perform NAT. When disabled, no source address translation will occur.
IP Pool Configuration	Use outgoing interface address: • Use the address of the outgoing interfaces as source address. Use Dynamic IP Pool: • Choose an IP Pool to perform source NAT.
Protocol	Choose from any, TCP, UDP, SCTP, or specify the protocol number to match. For example, for ICMP, click *specify* with the protocol number 1.
Explicit port mapping	Enable in order to match this NAT policy only when the following ports are a match: • Choose an original source port from one to 65535. NAT'd port will be chosen by the FortiGate based on the IP Pool configuration. Explicit port mapping cannot apply to some protocols which do not use ports, such as ICMP. When enabling a NAT policy which uses Explicit port mapping, always consider that ICMP traffic will not match this policy. When using IP Pools, only the Overload type IP Pool allows Explicit port mapping. When Explicit port mapping is applied, you must define an original source port range and a translated sort port range. The source port will map one to one with the translated port. Refer to Dynamic SNAT to understand how each IP Pool type works.
Comments	Enter comments for this NAT policy.
Enable this policy	Enable or disable this policy.

To configure central SNAT using the CLI:

```
config firewall central-snat-map
    edit <policyID number>
        set status {enable | disable}
        set orig-addr <valid address object preconfigured on the FortiGate>
        set srcintf <name of interface on the FortiGate>
        set dst-addr <valid address object preconfigured on the FortiGate>
        set dstintf <name of interface on the FortiGate>
        set protocol <integer for protocol number>
        set dst-port <integer for destination port or port range>
        set orig-port <integer for original port number>
        set nat-port <integer for translated port number>
        set comments <string>
    next
end
```

Setting the destination port for traffic matching is available when the protocols are TCP, UDP, or SCTP.

The following examples demonstrate configuring central SNAT:

- Example one: Apply SNAT to all traffic on page 1861
- Example two: Apply an IP pool to all TCP traffic on page 1861
- Example three: Apply an IP pool to all traffic with a specific original port range on page 1863
- Example four: Create two central SNAT rules on page 1864
- Example five: Fine-tuning source port behavior on page 1866

IP address external feed objects can also be used as the source address of central SNAT policies. See Apply external feed connectors as source addresses in central SNAT on page 4591.

Example one: Apply SNAT to all traffic

Apply SNAT to all traffic from port2 to port3.

To configure from the CLI:

```
config firewall central-snat-map
    edit 1
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
    next
end
```

Example two: Apply an IP pool to all TCP traffic

Apply an IP pool to all traffic from port3 to port2 that are TCP. NAT all other traffic using the outgoing interface IP.

To configure from the CLI:

```
config firewall ippool
    edit "Overload-IPPOOL"
        set startip 192.168.2.201
        set endip 192.168.2.202
    next
end
config firewall central-snat-map
    edit 1
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
        set protocol 6
        set nat-ippool "Overload-IPPOOL"
    next
    edit 2
        set srcintf "port3"
```

```
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
    next
end
```

To collect session table output from the CLI:

```
diagnose sys session list
```

The TCP session (protocol 6) is NAT'd with Overload-IPPOOL to 192.168.2.201:

```
session info: proto=6 proto_state=05 duration=14 expire=0 timeout=3600 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=860/7/1 reply=555/8/1 tuples=2
tx speed(Bps/kbps): 60/0 rx speed(Bps/kbps): 38/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:49531->23.57.57.114:443(192.168.2.201:61776)
hook=pre dir=reply act=dnat 23.57.57.114:443->192.168.2.201:61776(192.168.0.10:49531)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011065 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

A UDP session (protocol 17) is NAT'd to the outgoing interface IP address 192.168.2.86:

```
session info: proto=17 proto_state=01 duration=16 expire=163 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ helper=dns-udp vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=59/1/1 reply=187/1/1 tuples=2
tx speed(Bps/kbps): 3/0 rx speed(Bps/kbps): 11/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:52177->4.2.2.1:53(192.168.2.86:61770)
hook=pre dir=reply act=dnat 4.2.2.1:53->192.168.2.86:61770(192.168.0.10:52177)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011061 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Example three: Apply an IP pool to all traffic with a specific original port range

Apply an IP Pool to all traffic from port3 to port2 that have a specific original port range, mapping the ports to the same NAT'd port range. Nat all other traffic using the outgoing interface IP.

To configure from the CLI:

```
config firewall central-snat-map
    edit 1
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
        set orig-port 50000-65535
        set nat-ippool "Overload-IPPOOL"
        set nat-port 50000-65535
    next
    edit 2
        set srcintf "port3"
        set dstintf "port2"
        set orig-addr "all"
        set dst-addr "all"
    next
end
```

To collect session table output from the CLI:

```
diagnose sys session list
```

Traffic with original port in the range between 50000-65535 will be NAT'd with the Overload type IP Pool. The mapped port is in the same port range:

```
session info: proto=17 proto_state=01 duration=3 expire=176 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ helper=dns-udp vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=71/1/1 reply=123/1/1 tuples=2
tx speed(Bps/kbps): 23/0 rx speed(Bps/kbps): 40/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:52540->4.2.2.1:53(192.168.2.201:52540)
hook=pre dir=reply act=dnat 4.2.2.1:53->192.168.2.201:52540(192.168.0.10:52540)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00011399 tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Traffic with original port outside the range of 50000-65535 will be NAT'd to the outgoing interface IP:

```
session info: proto=6 proto_state=01 duration=3 expire=3597 timeout=3600 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=2262/10/1 reply=2526/11/1 tuples=2
tx speed(Bps/kbps): 741/5 rx speed(Bps/kbps): 828/6
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:49805->142.250.68.66:443(192.168.2.86:62214)
hook=pre dir=reply act=dnat 142.250.68.66:443->192.168.2.86:62214(192.168.0.10:49805)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=0001139a tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Protocols which do not use ports, such as ICMP, will be NAT'd to the outgoing interface IP:

```
session info: proto=1 proto_state=00 duration=7 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=480/8/1 reply=480/8/1 tuples=2
tx speed(Bps/kbps): 66/0 rx speed(Bps/kbps): 66/0
orgin->sink: org pre->post, reply pre->post dev=9->6/6->9 gwy=192.168.2.1/192.168.0.10
hook=post dir=org act=snat 192.168.0.10:1->4.2.2.1:8(192.168.2.86:62209)
hook=pre dir=reply act=dnat 4.2.2.1:62209->192.168.2.86:0(192.168.0.10:1)
dst_mac=04:d5:90:5f:a2:2a
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=0001138b tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x040000
```

Example four: Create two central SNAT rules

In the following example, two central SNAT rules will be created:

- Rule 3 will have a destination port set and IP pool `test-ippool4-3` applied.
- Rule 5 will have IP pool `test-ippool4-1` applied but will not set the destination port.

Example traffic will then be passed to see how the rule is matched.

To test central SNAT rule destination port support:

1. Configure central SNAT rule 3 with the destination port range specified:

```
config firewall ippool
    edit "test-ippool4-3"
        set startip 172.16.200.150
        set endip 172.16.200.150
    next
end
config firewall central-snat-map
    edit 3
        set srcintf "port24"
        set dstintf "port17"
        set orig-addr "all"
        set dst-addr "all"
        set protocol 6
        set nat-ippool "test-ippool4-3"
        set dst-port 80-443
    next
end
```

2. Configure central SNAT rule 5:

```
config firewall ippool
    edit "test-ippool4-1"
        set startip 172.16.200.151
        set endip 172.16.200.151
    next
end
config firewall central-snat-map
    edit 5
        set srcintf "port24"
        set dstintf "port17"
        set orig-addr "all"
        set dst-addr "all"
        set nat-ippool "test-ippool4-1"
    next
end
```

3. Send HTTP traffic to pass through the FortiGate that is expected to match central SNAT rule 3. IP pool `test-ippool4-3` will perform source NAT.
4. Check the session to review for expected behavior:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=2 expire=3599 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=1800/31/1 reply=77304/60/1 tuples=2
```

```
tx speed(Bps/kbps): 602/4 rx speed(Bps/kbps): 25854/206
orgin->sink: org pre->post, reply pre->post dev=24->17/17->24 gwy=172.16.200.55/10.1.100.42
hook=post dir=org act=snat 10.1.100.42:46731->172.16.200.55:80(172.16.200.150:46731)
hook=pre dir=reply act=dnat 172.16.200.55:80->172.16.200.150:46731(10.1.100.42:46731)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=99 pol_uuid_idx=15864 auth_info=0 chk_client_info=0 vd=0
serial=00003c37 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

5. Send PING traffic to pass through the FortiGate that is expected to match central SNAT rule 5. IP pool `test-ippool4-1` will perform source NAT.
6. Check the session to review for expected behavior:

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=2 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=252/3/1 reply=252/3/1 tuples=2
tx speed(Bps/kbps): 99/0 rx speed(Bps/kbps): 99/0
orgin->sink: org pre->post, reply pre->post dev=24->17/17->24 gwy=172.16.200.55/10.1.100.42
hook=post dir=org act=snat 10.1.100.42:36732->172.16.200.55:8(172.16.200.151:36732)
hook=pre dir=reply act=dnat 172.16.200.55:36732->172.16.200.151:0(10.1.100.42:36732)
misc=0 policy_id=99 pol_uuid_idx=15864 auth_info=0 chk_client_info=0 vd=0
serial=00003f62 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

Example five: Fine-tuning source port behavior

FortiOS supports maintaining or altering the original source port in SNAT using the `port-preserve` command:

- When `port-preserve` is enabled, SNAT will use the original source port if it is not already in use. This is the default.
- When `port-preserve` is disabled, SNAT will always change the source port to use the next higher, available port in the range. When the highest available port is reached, the counter will roll back to the first available port in the range. This allows ports to remain free until the counter rolls back to them.

The `port-preserve` command is available for the central SNAT or for firewall policies when NAT is enabled.

Only ports within the source port range of 5117 to 65533 will be preserved. Anything below 5117 will be translated to a port higher than 5117 based on the internal SNAT source port algorithm. If your source port is less than 5117 and you want to preserve it, explicit port mapping must be used. For more information, see Explicit port mapping on page 1860.

To configure source port behavior for central SNAT:

```
config firewall central-snat-map
    edit 1
        set port-preserve {enable | disable}
    next
end
```

To preserve the original source port in a firewall policy:

1. Enable original source port preservation in the policy:

```
config firewall policy
    edit 2
        set srcintf "port7"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set port-preserve enable
    next
end
```

2. Check the session after the first traffic passes through the FortiGate:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=7 expire=3594 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty src-vis
statistic(bytes/packets/allow_err): org=165/3/1 reply=112/2/1 tuples=2
tx speed(Bps/kbps): 21/0 rx speed(Bps/kbps): 14/0
orgin->sink: org pre->post, reply pre->post dev=15->9/9->15 gwy=0.0.0.0/10.2.2.1
hook=post dir=org act=snat 10.1.100.42:20042->172.16.200.155:2156(172.16.200.199:5162)
hook=pre dir=reply act=dnat 172.16.200.155:2156->172.16.200.199:5162(10.1.100.42:20042)
po/(before,after) 0/(0,0), 0/(0,0)
src_mac=94:ff:3c:6e:d2:90  dst_mac=00:0c:29:3d:83:02
misc=0 policy_id=2 pol_uuid_idx=16000 auth_info=0 chk_client_info=0 vd=1
serial=0001cf04 tos=ff/ff app_list=0 app=0 url_cat=0
```

```
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  mac-host-check disabled-by-policy
total session: 1
```

SNAT uses source port 5162.

3. Clear the old session.
4. Send traffic again with the same source port from the client.
5. Check the new session:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=4 expire=3598 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty src-vis
statistic(bytes/packets/allow_err): org=165/3/1 reply=112/2/1 tuples=2
tx speed(Bps/kbps): 41/0 rx speed(Bps/kbps): 28/0
orgin->sink: org pre->post, reply pre->post dev=15->9/9->15 gwy=0.0.0.0/10.2.2.1
hook=post dir=org act=snat 10.1.100.42:20042->172.16.200.155:2156(172.16.200.199:5162)
hook=pre dir=reply act=dnat 172.16.200.155:2156->172.16.200.199:5162(10.1.100.42:20042)
pos/(before,after) 0/(0,0), 0/(0,0)
src_mac=94:ff:3c:6e:d2:90  dst_mac=00:0c:29:3d:83:02
misc=0 policy_id=2 pol_uuid_idx=16000 auth_info=0 chk_client_info=0 vd=1
serial=0001d0bf tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  mac-host-check disabled-by-policy
total session: 1
```

The same source port has been used.

To alter the original source port in a firewall policy:

1. Disable original source port preservation in the policy:

```
config firewall policy
    edit 2
        set srcintf "port7"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set nat enable
        set port-preserve disable
    next
end
```

2. Check the session after the first traffic passes through the FortiGate:

```
# diagnose sys session list
session info: proto=6 proto_state=05 duration=34 expire=113 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=269/5/1 reply=164/3/1 tuples=2
tx speed(Bps/kbps): 4/0 rx speed(Bps/kbps): 2/0
orgin->sink: org pre->post, reply pre->post dev=15->9/9->15 gwy=0.0.0.0/10.2.2.1
hook=post dir=org act=snat 10.1.100.42:20042->172.16.200.155:2156(172.16.200.199:5149)
hook=pre dir=reply act=dnat 172.16.200.155:2156->172.16.200.199:5149(10.1.100.42:20042)
pos/(before,after) 0/(0,0), 0/(0,0)
src_mac=94:ff:3c:6e:d2:90  dst_mac=00:0c:29:3d:83:02
misc=0 policy_id=2 pol_uuid_idx=16000 auth_info=0 chk_client_info=0 vd=1
serial=0004a004 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

   SNAT uses source port 5149.
3. Clear the old session.
4. Send traffic again with the same source port from the client.
5. Check the new session:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=3 expire=3597 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=165/3/1 reply=112/2/1 tuples=2
tx speed(Bps/kbps): 49/0 rx speed(Bps/kbps): 33/0
orgin->sink: org pre->post, reply pre->post dev=15->9/9->15 gwy=0.0.0.0/10.2.2.1
hook=post dir=org act=snat 10.1.100.42:20042->172.16.200.155:2156(172.16.200.199:5151)
hook=pre dir=reply act=dnat 172.16.200.155:2156->172.16.200.199:5151(10.1.100.42:20042)
pos/(before,after) 0/(0,0), 0/(0,0)
src_mac=94:ff:3c:6e:d2:90  dst_mac=00:0c:29:3d:83:02
misc=0 policy_id=2 pol_uuid_idx=16000 auth_info=0 chk_client_info=0 vd=1
serial=0004a1a5 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

   A new source port has been used.
6. Clear the old session again.

7. Send traffic again with the same source port from the client.
8. Check the new session:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=20 expire=3581 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=may_dirty
statistic(bytes/packets/allow_err): org=165/3/1 reply=112/2/1 tuples=2
tx speed(Bps/kbps): 8/0 rx speed(Bps/kbps): 5/0
orgin->sink: org pre->post, reply pre->post dev=15->9/9->15 gwy=0.0.0.0/10.2.2.1
hook=post dir=org act=snat 10.1.100.42:20042->172.16.200.155:2156(172.16.200.199:5153)
hook=pre dir=reply act=dnat 172.16.200.155:2156->172.16.200.199:5153(10.1.100.42:20042)
pos/(before,after) 0/(0,0), 0/(0,0)
src_mac=94:ff:3c:6e:d2:90  dst_mac=00:0c:29:3d:83:02
misc=0 policy_id=2 pol_uuid_idx=16000 auth_info=0 chk_client_info=0 vd=1
serial=0004a519 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

Another new source port has been used.

Configuring an IPv6 SNAT policy

IPv4 and IPv6 central SNAT maps are displayed in the same table.

To configure an IPv6 policy with central SNAT in the GUI:

1. Enable central SNAT:
   a. In the Global VDOM, go to *System* > *VDOM*.
   b. Select a VDOM and click *Edit*. The *Edit Virtual Domain Settings* pane opens.
   c. Enable *Central SNAT*.

   d. Click *OK*.

2. In the VDOM with central SNAT enabled (FG-traffic in this example), go to *Policy & Objects* > *Central SNAT* and click *Create New*.
3. Configure the policy settings:
   a. For *Type*, select *IPv6*.
   b. Enter the interface, address, and IP pool information.
   c. Configure the remaining settings as needed.

   d. Click *OK*.
   The matching SNAT traffic will be handled by the IPv6 central SNAT map.

To configure an IPv6 policy with central SNAT in the CLI:

1. Enable central SNAT:

```
config vdom
    edit FG-traffic
        config system settings
            set central-nat enable
        end
    next
end
```

2. Create an IPv6 central SNAT policy:

```
config vdom
    edit FG-traffic
        config firewall central-snat-map
            edit 2
                set type ipv6
```

```
                set srcintf "wan2"
                set dstintf "wan1"
                set orig-addr6 "all"
                set dst-addr6 "all"
                set nat-ippool6 "test-ippool6-1"
            next
        end
    next
end
```

3. Verify the SNAT traffic:

```
(FG-traffic) # diagnose sniffer packet any icmp6 4
interfaces=[any]
filters=[icmp6]
3.602891 wan2 in 2000:10:1:100::41 -> 2000:172:16:200::55: icmp6: echo request seq 0
3.602942 wan1 out 2000:172:16:200::199 -> 2000:172:16:200::55: icmp6: echo request seq 0
3.603236 wan1 in 2000:172:16:200::55 -> 2000:172:16:200::199: icmp6: echo reply seq 0
3.603249 wan2 out 2000:172:16:200::55 -> 2000:10:1:100::41: icmp6: echo reply seq 0
4.602559 wan2 in 2000:10:1:100::41 -> 2000:172:16:200::55: icmp6: echo request seq 1
4.602575 wan1 out 2000:172:16:200::199 -> 2000:172:16:200::55: icmp6: echo request seq 1
4.602956 wan1 in 2000:172:16:200::55 -> 2000:172:16:200::199: icmp6: echo reply seq 1
4.602964 wan2 out 2000:172:16:200::55 -> 2000:10:1:100::41: icmp6: echo reply seq 1
^C
8 packets received by filter
0 packets dropped by kernel
```

SNAT policies with virtual wire pairs

Source NAT (SNAT) can be configured in IPv4 and IPv6 policies with virtual wire pair (VWP) interfaces, and between VWP interfaces when central NAT is enabled.

To configure a policy using SNAT and a VWP interface when central NAT is disabled:

1. Create the VWP interface:

```
config system virtual-wire-pair
    edit "test-vw-1"
        set member "port1" "port4"
    next
end
```

2. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

```
config firewall ippool
    edit "vwp-pool-1"
        set startip 172.16.222.99
        set endip 172.16.222.100
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 88
        set srcintf "port4"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
        set ippool enable
        set poolname "vwp-pool-1"
    next
end
```

4. Verify the IP pool functions as expected and traffic passes through:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
23.438095 port4 in 172.16.200.11 -> 172.16.200.156: icmp: echo request
23.438126 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
23.438492 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
23.438501 port4 out 172.16.200.156 -> 172.16.200.11: icmp: echo reply
24.439305 port4 in 172.16.200.11 -> 172.16.200.156: icmp: echo request
24.439319 port1 out 172.16.222.100 -> 172.16.200.156: icmp: echo request
24.439684 port1 in 172.16.200.156 -> 172.16.222.100: icmp: echo reply
24.439692 port4 out 172.16.200.156 -> 172.16.200.11: icmp: echo reply

8 packets received by filter
0 packets dropped by kernel
```

To configure a SNAT between VWP interfaces when central NAT is enabled:

1. Enable central NAT:

```
config system settings
    set central-nat enable
end
```

2. Create the VWP interface:

```
config system virtual-wire-pair
    edit "test-vw-1"
        set member "port1" "port4"
    next
end
```

3. Create the IP pool. The IP pool must have a different subnet than the VWP peers.

```
config firewall ippool
    edit "vwp-pool-1"
        set startip 172.16.222.99
        set endip 172.16.222.100
    next
end
```

4. Configure the SNAT policy:

```
config firewall central-snat-map
    edit 2
        set srcintf "port4"
        set dstintf "port1"
        set orig-addr "all"
        set dst-addr "all"
        set nat-ippool "vwp-pool-1"
    next
end
```

5. Configure the firewall policy:

```
config firewall policy
    edit 90
        set srcintf "port4"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

Destination NAT

Network Address Translation (NAT) is the process that enables a single device, such as a router or firewall, to act as an agent between the internet or public network and a local or private network. This agent acts in real-time to translate the source or destination IP address of a client or server on the network interface. NAT can be subdivided into two types:

- Source NAT (SNAT)
- Destination NAT (DNAT)

This section is about DNAT. For information about SNAT, see Source NAT on page 1848.

A virtual IP (VIP) maps external IP addresses to internal IP addresses for DNAT. See Configuring VIPs on page 1875 and Configuring VIP groups on page 1878.

The following types of VIPs can be created:

Static VIP	A virtual IP that maps an IP address or range to another IP address or range. Custom settings can allow the VIP to be filtered by Source Address and/or services, so that the VIP only applies to the filtered traffic. See Static virtual IPs on page 1879.
Static VIP with services	A virtual IP that defines services for a single port number mapping. See Virtual IP with services on page 1880.
Static VIP with port forwarding	A virtual IP that hides the port number for an internal server or maps several internal servers to the same public IP address. See Virtual IPs with port forwarding on page 1882. See also .
FQDN-based VIP	A virtual IP mapped to an FQDN. See Configure FQDN-based VIPs on page 1896.
Virtual server load balancing	A special type of virtual IP used to implement server load balancing. See Virtual server load balance on page 1884. Virtual IPs can also be used for server load balance multiplexing. See Virtual server load balance multiplexing on page 1894.
Central DNAT	Where DNAT is configured by creating virtual IPs and selecting the VIPs in firewall policies, central NAT is not configured in the firewall policy. Central NAT is enabled in *System Settings*. When enabled, the *Policy & Objects* tree displays the *Central SNAT* policy option. Use the *Central SNAT* policy to configure VIPs as separate objects. During use, FortiGate reads the enabled NAT rules from the top down, until it locates a matching rule. See Central DNAT on page 1897.

See also Configuring PCP port mapping with SNAT and DNAT on page 1949.

Configuring VIPs

Virtual IPs can be configured for IPv4 and IPv6. After creating the VIP, add it to a firewall policy.

FortiOS does not check whether VIPs overlap. As a result, you can configure multiple VIPs with the same external interface and IP. However, you can view overlapping VIPs in the security rating report. See Viewing VIP overlap in security rating reports on page 1877.

To configure a VIP in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs*.
2. Select the *Virtual IP* tab, and click *Create New*.
3. Configure the following settings:

Name	Enter a name for the VIP.
Comments	Enter a description of the VIP.
Color	Click *Change* to select a color for the VIP.
Network	

	Interface (`extintf`)	The external interface that the firewall policy source interface must match. For example, if the external interface is port1, then the VIP can be used in a policy from port1 to port3, but not in a policy from port2 to port3. If the external interface is *any*, then the VIP can be used in any firewall policy.
	Type (`type`)	• Static NAT - Use an external IP address or address range. • FQDN - Use an external IP or FQDN address. • load-balance (CLI only) - Load balance traffic. • server-load-balance - Load balance traffic across multiple servers. SSL processing can be offloaded to the FortiGate. This type of VIP is configure from *Policy & Objects > Virtual Servers*. • dns-translation (CLI only) - DNS translation. • access-proxy - Used for ZTNA. See ZTNA web proxy example on page 1618 for details.
	External IP address/range (`extip`)	In a static NAT VIP, the external IP address is the IP address that the FortiGate listens for traffic on. When the external interface is not *any*, 0.0.0.0 can be used to make the external IP address equivalent to the external interface's IP address. The external IP address is also used to perform SNAT for the mapped server when the server outbound traffic with a destination interface that matches the external interface. The firewall policy must also have NAT enabled.
Map to		
	IPv4 address/range (`mappedip`)	The IPv4 address or range that the internal resource is being mapped to.
	IPv6 address/range (`ipv6-mappedip`)	The IPv6 address or range that the internal resource is being mapped to.
Optional Filters		Enable to access additional options.
	Source address (`src-filter`)	Restrict the source IP address, address range, or subnet that is allowed to access the VIP.
	Services (`service`)	Set the services that are allowed to be mapped.
Port Forwarding (`portforward`)		Enable port forwarding and display additional options. Enable port forwarding to specify the port (`mappedport`) to map to.
	Protocol (`protocol`)	Select the protocol to use when forwarding packets to the port.
	Port Mapping Type	• One to one - Each external service port is mapped to one port. A range is allowed, but the number of ports should be the same. • Many to Many - The port mapping can be one to one, one to many,

		or many to one. There are no restrictions on how many external ports must map to internal ports.
	External service port (`extport`)	Enter the external service port range to be mapped to a port range on the destination network.
	Map to IPv4 port (`mappedport`)	Enter the mapped IPv4 port range on the destination network.
	Map to IPv6 port (`ipv6-mappedport`)	Enter the mapped IPv6 port range on the destination network.

4. Click *OK* to save the VIP.

Viewing VIP overlap in security rating reports

There is no overlap check for VIPs, so there are no constraints when configuring multiple VIPs with the same external interface and IP. A new security rating report alerts users of any VIP overlaps.

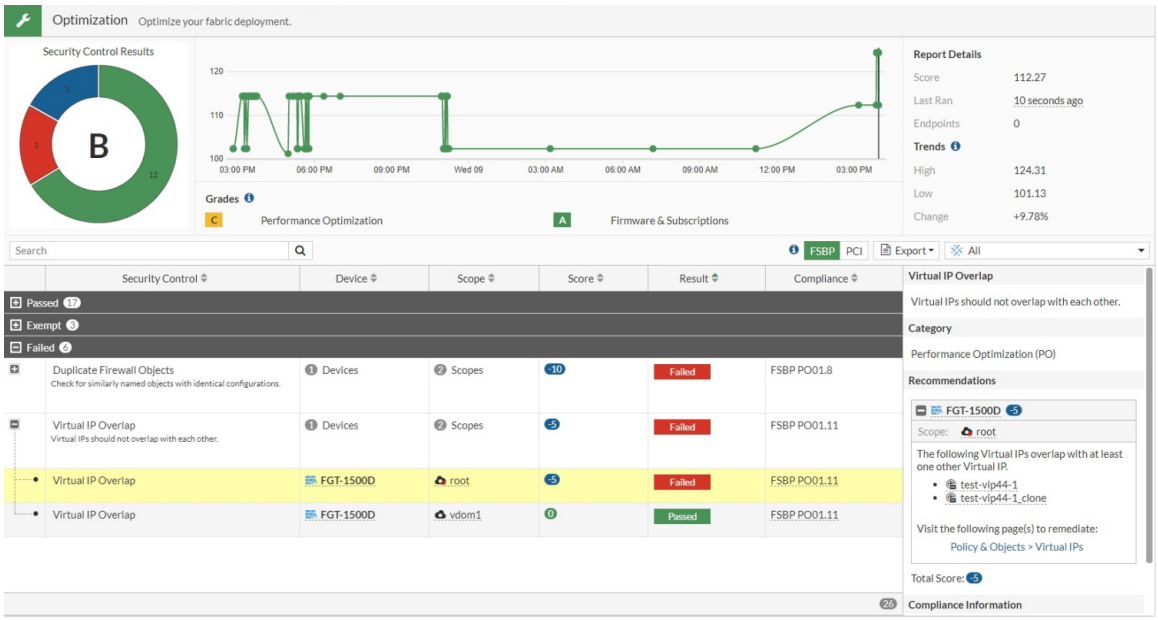
To configure two VIPs with the same external interface and IP:

```
config firewall vip
    edit "test-vip44-1"
        set extip 10.1.100.154
        set mappedip "172.16.200.156"
        set extintf "port24"
    next
    edit "test-vip44-1_clone"
        set extip 10.1.100.154
        set mappedip "172.16.200.156"
        set extintf "port24"
        set src-filter 10.1.100.11
    next
end
```

No error message appears regarding the overlapping VIPs.

To view the security rating report:

1. Go to *Security Fabric* > *Security Rating* and click the *Optimization* scorecard.
2. Expand the *Failed* section. The *Virtual IP Overlap* results show an overlap (*test-vip44-1* and *test-vip44-1_clone*) on the root FortiGate.



Configuring VIP groups

Virtual IP addresses (VIPs) can be organized into groups. After creating the VIP group, add it to a firewall policy.

VIP groups are useful when multiple VIPs are used together in firewall policies. If the VIP group members change, or a group member's settings change (such as the IP address, port, or port mapping type), then those changes are automatically updated in the corresponding firewall policies.

The following table summarizes which VIP types are allowed and not allowed to be members of a VIP group:

Group type	VIP types allowed as members	VIP types not allowed as members
IPv4	• Static NAT • Load balance • DNS translation • FQDN	• Access proxy • Server load balance
IPv6	• Static NAT	• Access proxy • Server load balance

Different VIP types can be added to the same group.

To configure a VIP group in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs*.
2. Navigate to the *Virtual IP Group* or *IPv6 Virtual IP Group* tab.
3. Click *Create new*.
4. Enter a name.
5. Optionally, enter additional information in the *Comments* field.

6. For IPv4 groups, select the *Interface*. Select a specific interface if all of the VIPs are on the same interface; otherwise, select *any*.
7. Click the *+* in the *Members* field and select the members to add to the group.
8. Click *OK*.

To configure an IPv4 VIP group in the CLI:

```
config firewall vipgrp
    edit <name>
        set interface <name>
        set member <vip1> <vip2> ...
    next
end
```

To configure an IPv6 VIP group in the CLI:

```
config firewall vipgrp6
    edit <name>
        set member <vip1> <vip2> ...
    next
end
```

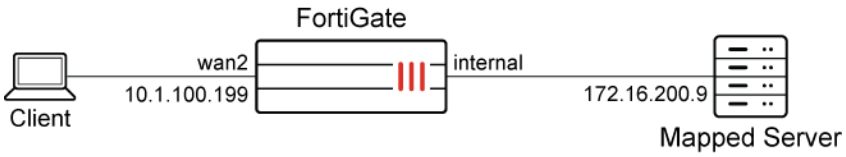
Static virtual IPs

Static Virtual IPs (VIP) are used to map external IP addresses to internal IP addresses. This is also called destination NAT, where a packet's destination is being NAT'd, or mapped, to a different address.

Static VIPs are commonly used to map public IP addresses to resources behind the FortiGate that use private IP addresses. A static one-to-one VIP is when the entire port range is mapped. A port forwarding VIP is when the mapping is configured on a specific port or port range.

When Central NAT is enabled, DNAT is no longer configured on the *Policy & Objects > Virtual IPs* page and is instead configured on the *Policy & Objects > DNAT & Virtual IPs* page. See Central DNAT on page 1897 for more information.

Sample configuration



To create a virtual IP in the GUI:

1. Go to *Policy & Objects > Virtual IPs* or, if Central NAT is enabled, *Policy & Objects > DNAT & Virtual IPs*.
2. Select the *Virtual IP* or *IPv6 Virtual IP* tab based on the IP versions used.
3. Click *Create new*.
4. Enter a unique name for the virtual IP.

5. Enter values for the external IP address/range and map to IPv4/IPv6 address/range fields.
6. Click *OK*.

To create a virtual IP in the CLI:

```
config firewall vip
    edit "Internal_WebServer"
        set extip 10.1.100.199
        set extintf "any"
        set mappedip "172.16.200.55"
    next
end
```

To apply a virtual IP to policy in the CLI:

```
config firewall policy
    edit 8
        set name "Example_Virtual_IP_in_Policy"
        set srcintf "wan2"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "Internal_WebServer"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

IP pools and VIPs as local IP addresses

IP pools and VIPs are considered local IP addresses if responding to ARP requests on these external IP addresses is enabled (`set arp-reply enable`, by default). In this case, the FortiGate is considered a destination for those IP addresses and can receive reply traffic at the application layer successfully.

However, as a side-effect, once an IP pool or VIP has been configured, even if it is never used in a firewall policy, the FortiGate considers it as a local address and will not forward traffic based on the routing table. Therefore, any unused IP pools or VIPs should be deleted to prevent any unexpected behavior.

> ⚠ For a history of behaviour changes related to IP pools and VIPs, see Technical Tip: IP pool and virtual IP behaviour changes in FortiOS 6.4, 7.0, 7.2, and 7.4.

Virtual IP with services

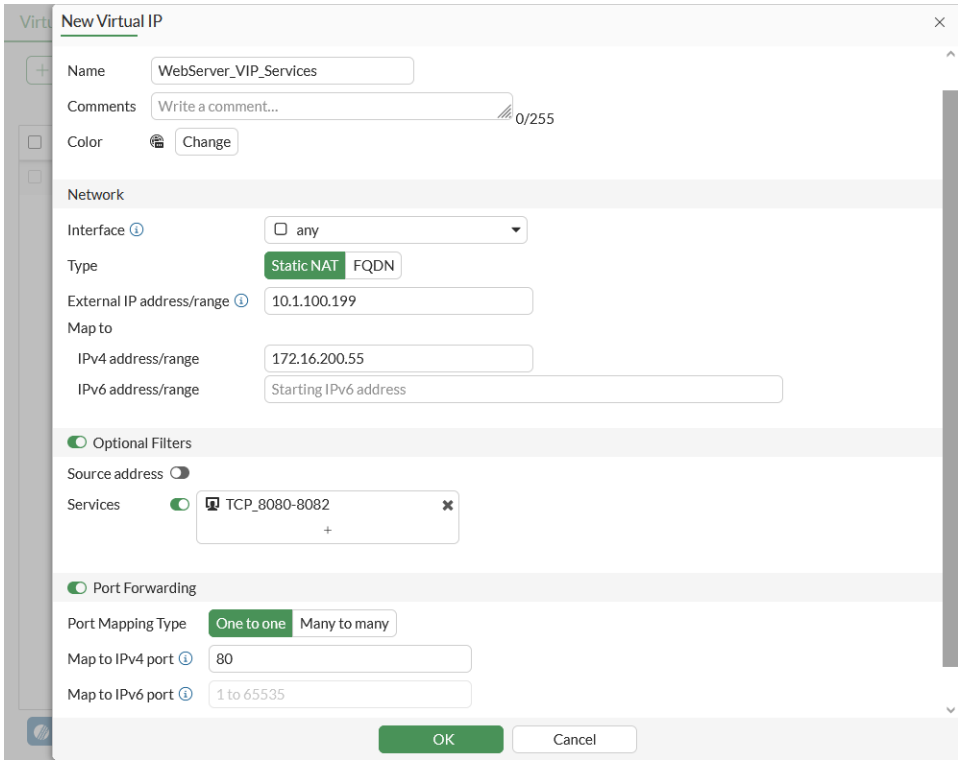
Virtual IP with services is a more flexible virtual IP mode. This mode allows users to define services to a single port number mapping.

This topic shows how to use virtual IP with services enabled. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to an internal WebServer TCP port 80. This allows remote connections to communicate with a server behind the firewall.

Sample configuration

To create a virtual IP with services in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Enter a unique name for the virtual IP.
4. Configure the fields in the *Network* section. For example:
   - Set *Interface* to *any*.
   - Set *External IP Address/Range* to *10.1.100.199*.
   - Set *Mapped IP Address/Range* to *172.16.200.55*.
5. Enable *Optional Filters* and then enable *Services*.
6. In the *Services* field, add TCP ports 8080, 8081, 8082. See Internet service customization on page 2127 for information about creating a custom port range service.
7. Enable *Port Forwarding* and set *Map to IPv4 port* to *80*.



8. Click *OK*.

To see the results:

1. Apply the above virtual IP to the firewall policy.
2. The results are:

- Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
- Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
- Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.55:80 in internal network.

To create a virtual IP with services in the CLI:

```
config firewall vip
    edit "WebServer_VIP_Services"
        set service "TCP_8080-8082"
        set extip 10.1.100.199
        set extintf "any"
        set portforward enable
        set mappedip "172.16.200.55"
        set mappedport 80
    next
end
```

Virtual IPs with port forwarding

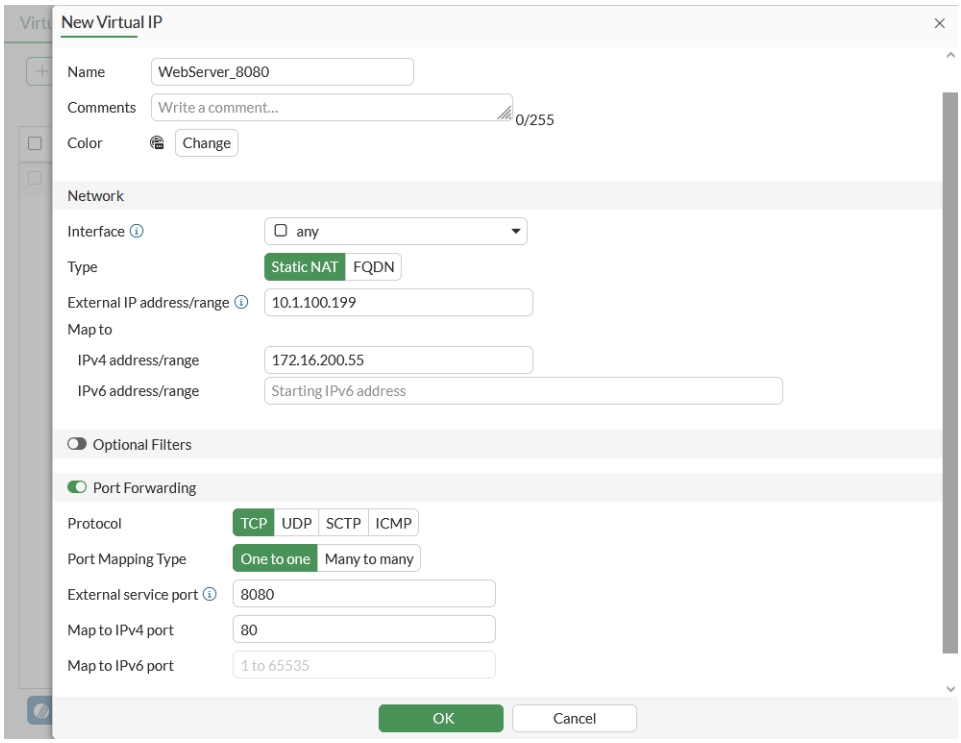
If you need to hide the internal server port number or need to map several internal servers to the same public IP address, enable port-forwarding for Virtual IP.

This topic shows how to use virtual IPs to configure port forwarding on a FortiGate unit. This example has one public external IP address. We map TCP ports 8080, 8081, and 8082 to different internal WebServers' TCP port 80. This allows remote connections to communicate with a server behind the firewall.

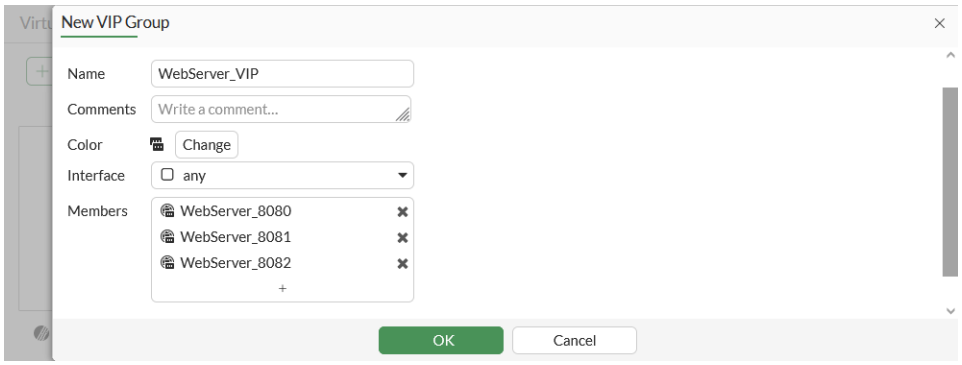
Sample configuration

To create a virtual IP with port forwarding in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Enter a unique name for the virtual IP.
4. Configure the fields in the *Network* section. For example:
   - Set *Interface* to *any*.
   - Set *External IP Address/Range* to *10.1.100.199*.
   - Set *Mapped IP Address/Range* to *172.16.200.55*.
5. Leave *Optional Filters* disabled.
6. Enable *Port Forwarding* and configure the fields. For example:
   - Set *Protocol* to *TCP*.
   - Set *External Service Port* to *8080*.
   - Set *Map to IPv4 port* to *80*.



7. Click *OK*.
8. Follow the above steps to create two additional virtual IPs.
   a. For one virtual IP:
      - Use a different *Mapped IP Address/Range*, for example *172.16.200.56*.
      - Set *External Service Port* to *8081*.
      - Use the same *Map to IPv4 port* number: *80*.
   b. For the other virtual IP:
      - Use a different *Mapped IP Address/Range*, for example *172.16.200.57*.
      - Set *External Service Port* to *8082*.
      - Use the same *Map to IPv4 port* number: *80*.
9. Create a *Virtual IP Group* and put the above three virtual IPs into that group:
   a. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP Group* tab.
   b. Click *Create new*.
   c. Enter a name for the group.
   d. Add the three previously created virtual IPs as members.



e. Click *OK*.

To see the results:

1. Apply the above virtual IP to the Firewall policy.
2. The results are:
   - Access 10.1.100.199:8080 from external network and FortiGate maps to 172.16.200.55:80 in internal network.
   - Access 10.1.100.199:8081 from external network and FortiGate maps to 172.16.200.56:80 in internal network.
   - Access 10.1.100.199:8082 from external network and FortiGate maps to 172.16.200.57:80 in internal network

Virtual server load balance

This topic shows a special virtual IP type: virtual server. Use this type of VIP to implement server load balancing.

The FortiOS server load balancing contains all the features of a server load balancing solution. You can balance traffic across multiple backend servers based on multiple load balancing schedules including:

- Static (failover)
- Round robin
- Weighted (to account for different sized servers or based on the health and performance of the server including round trip time and number of connections)

The load balancer supports HTTP, HTTPS, IMAPS, POP3S, SMTPS, SSL/TLS, and generic TCP/UDP and IP protocols. Session persistence is supported based on the SSL session ID based on an injected HTTP cookie, or based on the HTTP or HTTPS host. SSL/TLS load balancing includes protection from protocol downgrade attacks. Server load balancing is supported on most FortiGate devices and includes up to 10,000 virtual servers on high-end systems.

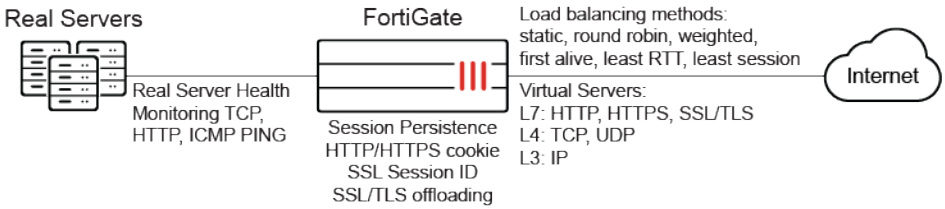
This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 for more information.

The following models do not support load balancing of Layer 7 protocols (HTTP, HTTPS, IMAPS, POP3S, SMTPS and SSL): FortiGate 40F, 60F and its variants.

FortiOS HTTP and HTTPS server load balancing does not support load balancing based on URL routing. You can use FortiWeb server pools or FortiADC server load balancing to load balance sessions to two or more URL based routes.

A policy with proxy-based inspection can accept all types of protocols configured in the Virtual Server object. However, a policy with flow-based inspection can only accept TCP/UDP/IP types in the Virtual Server object.

Sample topology



SSL/TLS offloading

FortiGate SSL/TLS offloading is designed for the proliferation of SSL/TLS applications. The key exchange and encryption/decryption tasks are offloaded to the FortiGate unit where they are accelerated using FortiASIC technology which provides significantly more performance than a standard server or load balancer. This frees up valuable resources on the server farm to give better response to business operations. Server load balancing offloads most SSL/TLS versions including SSL 3.0, TLS 1.0, TLS 1.2, and TLS 1.3, and supports full mode or half mode SSL offloading with DH key sizes up to 4096 bits.

FortiGate SSL offloading allows the application payload to be inspected before it reaches your servers. This prevents intrusion attempts, blocks viruses, stops unwanted applications, and prevents data loss. SSL/TLS content inspection supports TLS versions 1.0, 1.1, 1.2, and 1.3 and SSL versions 1.0, 1.1, 1.2, and 3.0.

The certificate used for SSL/TLS offloading by the virtual server configuration may contain multiple domain names, including wildcard domains. This certificate is returned to clients attempting to connect to the real server behind the FortiGate.

Virtual server requirements

When creating a new virtual server, you must configure the following options:

- Virtual Server Type.
- Load Balancing Methods.
- Health check monitoring (optional).
- Session persistence (optional).
- Virtual Server IP (External IP Address).
- Virtual Server Port (External Port).
- Real Servers (Mapped IP Address & Port).

Virtual server types

Select the protocol to be load balanced by the virtual server. If you select a general protocol such as IP, TCP, or UDP, the virtual server load balances all IP, TCP, or UDP sessions. If you select specific protocols such as HTTP, HTTPS, or SSL, you can apply additional server load balancing features such as *Persistence* and *HTTP Multiplexing*.

HTTP	Select *HTTP* to load balance only HTTP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 80 for HTTP sessions). You can enable *HTTP Multiplexing*. You can also set *Persistence* to *HTTP Cookie* to enable cookie-based persistence.
HTTPS	Select *HTTPS* to load balance only HTTPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 443 for HTTPS sessions). You can enable *HTTP Multiplexing*. You can also set *Persistence* to *HTTP Cookie* to enable cookie-based persistence, or you can set *Persistence* to *SSL Session ID*.
IMAPS	Select *IMAPS* to load balance only IMAPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 993 for IMAPS sessions). You can also set *Persistence* to *SSL Session ID*.
POP3S	Select *POP3S* to load balance only POP3S sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 995 for POP3S sessions). You can also set *Persistence* to *SSL Session ID*.
SMTPS	Select *SMTPS* to load balance only SMTPS sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced (usually port 465 for SMTPS sessions). You can also set *Persistence* to *SSL Session ID*.
SSL	Select *SSL* to load balance only SSL sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced. You can also set *Persistence* to *SSL Session ID*.
TCP	Select *TCP* to load balance only TCP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced.
UDP	Select *UDP* to load balance only UDP sessions with the destination port number that matches the *Virtual Server Port* setting. Change *Virtual Server Port* to match the destination port of the sessions to be load balanced.
IP	Select *IP* to load balance all sessions accepted by the security policy that contains this virtual server.

Load balancing methods

The load balancing method defines how sessions are load balanced to real servers.

All load balancing methods do not send traffic to real servers that are down or not responding. FortiGate can only determine if a real server is not responding by using a health check monitor. You should always add at least one health check monitor to a virtual server or to real servers; otherwise load balancing might try to distribute sessions to real servers that are not functioning.

Static	The traffic load is statically spread evenly across all real servers. Sessions are not assigned according to how busy individual real servers are. This load balancing method provides some persistence because all sessions from the same source address always go to the same real server. Because the distribution is stateless, so if a real server is added, removed, or goes up or down, the distribution is changed and persistence might be lost.
Round Robin	Directs new requests to the next real server. This method treats all real servers as equals regardless of response time or the number of connections. This method does not direct requests to real servers that down or non responsive.
Weighted	Real servers with a higher weight value receive a larger percentage of connections. Set the real server weight when adding a real server.
Least Session	Directs requests to the real server that has the least number of current connections. This method works best in environments where the real servers or other equipment you are load balancing all have similar capabilities. This load balancing method uses the FortiGate session table to track the number of sessions being processed by each real server. The FortiGate unit cannot detect the number of sessions actually being processed by a real server.
Least RTT	Directs sessions to the real server with the lowest round trip time. The round trip time is determined by a ping health check monitor. The default is 0 if no ping health check monitors are added to the virtual server.
First Alive	Directs sessions to the first live real server. This load balancing schedule provides real server failover protection by sending all sessions to the first live real server. If a real server fails, all sessions are sent to the next live real server. Sessions are not distributed to all real servers so all sessions are processed by the first real server only.
HTTP Host	Load balances HTTP host connections across multiple real servers using the host's HTTP header to guide the connection to the correct real server.

Health check monitoring

In the FortiGate GUI, you can configure health check monitoring so that the FortiGate unit can verify that real servers are able respond to network connection attempts. If a real server responds to connection attempts, the load balancer continues to send sessions to it. If a real server stops responding to connection attempts, the load balancer assumes that the server is down and does not send sessions to it. The health check monitor configuration determines how the load balancer tests real servers. You can use a single health check monitor for multiple load balancing configurations. You can configure TCP, HTTP, DNS, and ping health check monitors. You usually set the health check monitor to use the same protocol as the traffic being load balanced to it. For example, for an HTTP load balancing configuration, you would normally use an HTTP health check monitor.

Session persistence

Use persistence to ensure a user is connected to the same real server every time the user makes an HTTP, HTTPS, or SSL request that is part of the same user session. For example, if you are load balancing HTTP and HTTPS sessions to a collection of eCommerce web servers, when users make a purchase, they will be starting

multiple sessions as they navigate the eCommerce site. In most cases, all the sessions started by this user during one eCommerce session should be processed by the same real server. Typically, the HTTP protocol keeps track of these related sessions using cookies. HTTP cookie persistence ensure all sessions that are part of the same user session are processed by the same real server.

When you configure persistence, the FortiGate unit load balances a new session to a real server according to the load balance method. If the session has an HTTP cookie or an SSL session ID, the FortiGate unit sends all subsequent sessions with the same HTTP cookie or SSL session ID to the same real server.

Real servers

Starting in FortiOS 7.6.4, certificate verification of the real server is enabled by default. You can manually adjust the setting using the following CLI command:

```
config realservers
    edit <id>
        set verify-cert {enable | disable}
    next
end
```

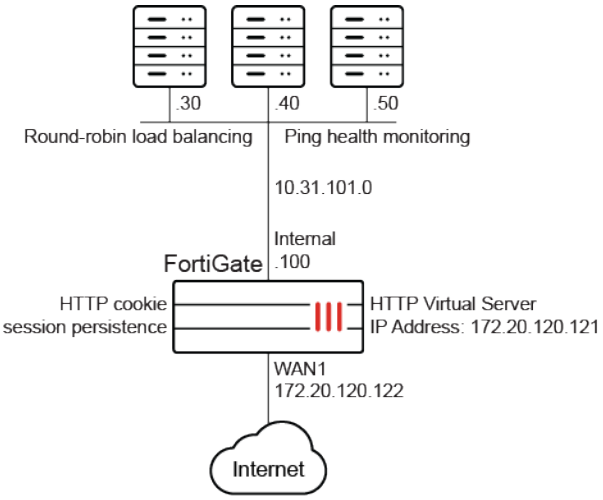
Add real servers to a load balancing virtual server to provide information the virtual server requires to send sessions to the server. A real server configuration includes the IP address of the real server and port number the real server receives sessions on. The FortiGate unit sends sessions to the real server's IP address using the destination port number in the real server configuration.

When configuring a real server, you can also specify the weight (if the load balance method is set to *Weighted*) and you can limit the maximum number of open connections between the FortiGate unit and the real server. If the maximum number of connections is reached for the real server, the FortiGate unit automatically switches all further connection requests to other real servers until the connection number drops below the limit. Setting *Maximum Connections* to 0 means that the FortiGate unit does not limit the number of connections to the real server.

Sample of HTTP load balancing to three real web servers

This example describes the steps to configure the load balancing configuration below. In this configuration, a FortiGate unit is load balancing HTTP traffic from the Internet to three HTTP servers on the internal network. HTTP sessions are accepted at the wan1 interface with destination IP address 172.20.120.121 on TCP port 8080, and forwarded from the internal interface to the web servers. When forwarded, the destination address of the session is translated to the IP address of one of the web servers.

This load balancing configuration also includes session persistence using HTTP cookies, round-robin load balancing, and TCP health monitoring for the real servers. Ping health monitoring consists of the FortiGate unit using ICMP ping to ensure the web servers can respond to network traffic.



General steps:

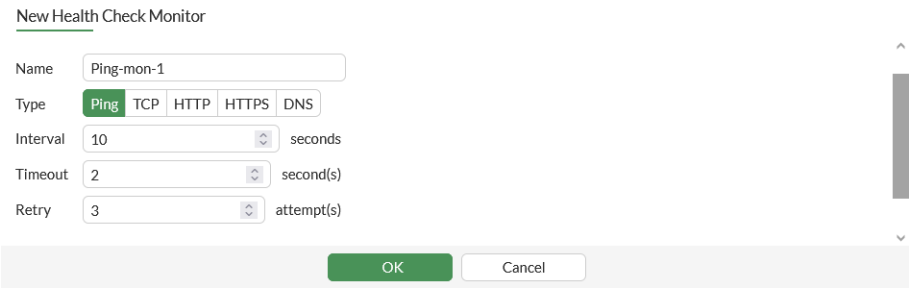
1. Create a health check monitor.
   A ping health check monitor causes the FortiGate to ping the real servers every 10 seconds. If one of the servers does not respond within 2 seconds, the FortiGate unit will retry the ping 3 times before assuming that the HTTP server is not responding.
2. Create a load balance virtual server with three real servers.
3. Add the load balancing virtual server to a policy as the destination address.

To see the virtual servers and health check monitors options in the GUI, *Load Balance* must be selected in *Feature Visibility > Additional Features*. See Feature visibility on page 3820 on page 1 for details.

Configure a load balancing virtual server in the GUI

To create a health check monitor:

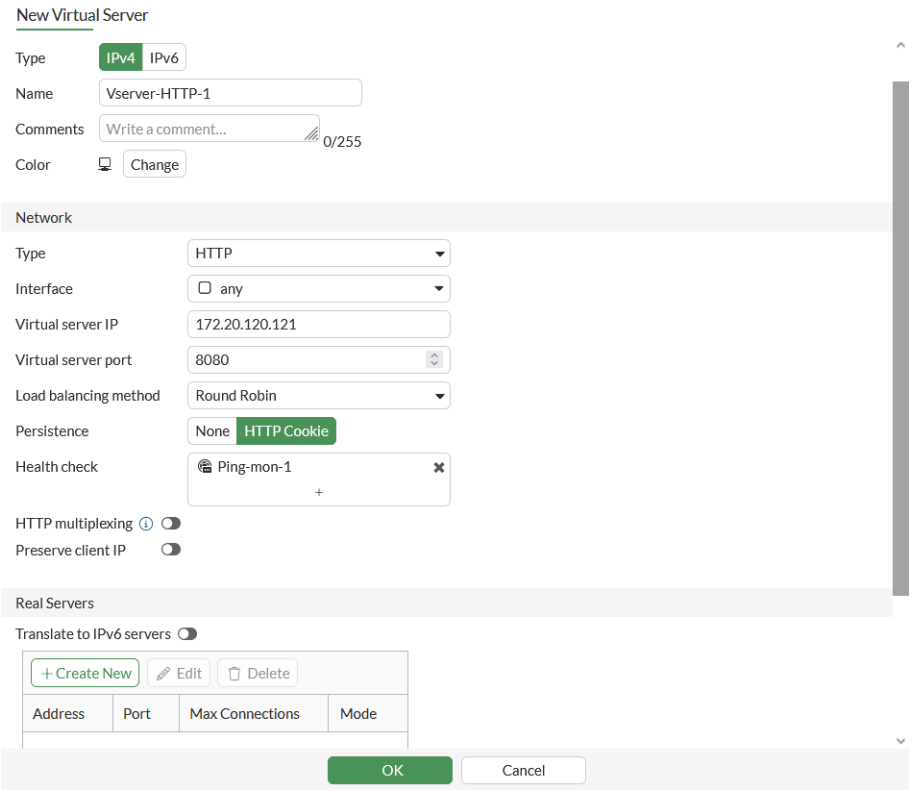
1. Go to *Policy & Objects > Health Check*.
2. Click *Create New*.
3. Set the following:
   - *Name* to *Ping-mon-1*
   - *Type* to *Ping*
   - *Interval* to *10* seconds
   - *Timeout* to *2* seconds
   - *Retry* to *3* attempt(s)



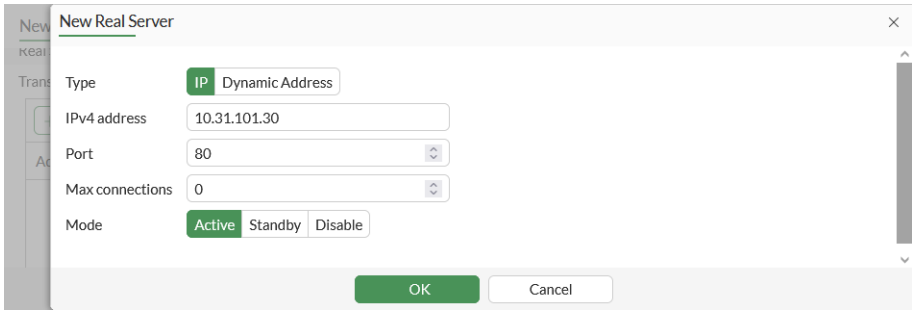
4. Click *OK*.

To create a virtual server:

1. Go to *Policy & Objects* > *Virtual Servers*.
2. Click *Create New*.
3. Set the following:
   - *Name* to *Vserver-HTTP-1*
   - *Type* to *HTTP*
   - *Interface* to *wan1*
   - *Virtual Server IP* to *172.20.120.121*
   - *Virtual Server Port* to *8080*
   - *Load Balance Method* to *Round Robin*
   - *Persistence* to *HTTP Cookie*
   - *Health Check* to *Ping-mon-1*



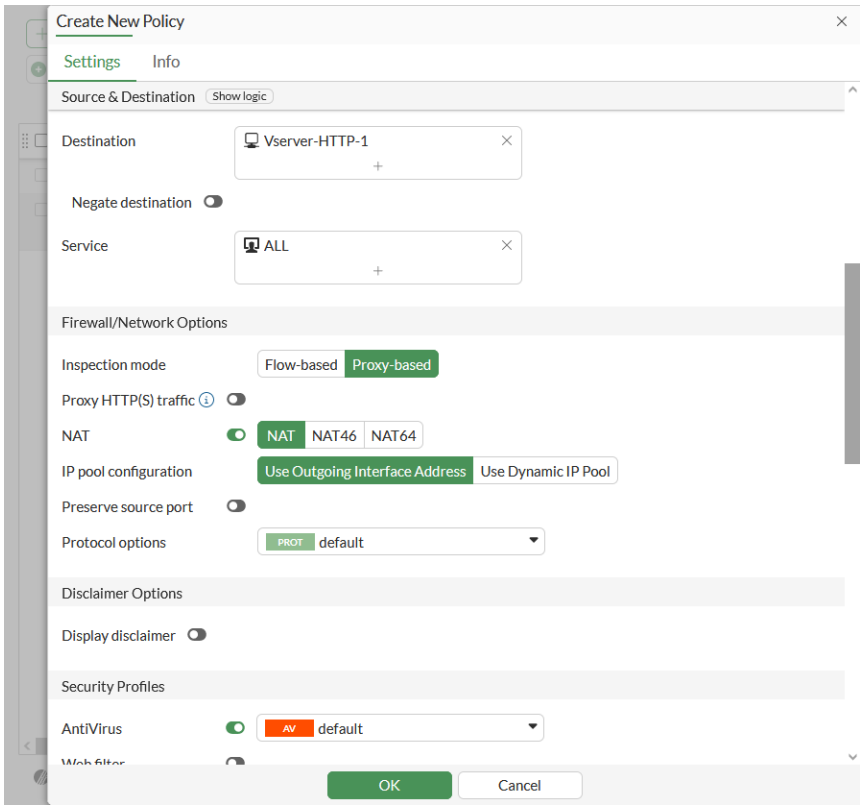
4. In the *Real Servers* table, click *Create New*.
5. Set the following for the first real server:
   - *Type* to *IP*
   - *IP Address* to *10.31.101.30*
   - *Port* to *80*
   - *Max Connections* to *0*
   - *Mode* to *Active*



6. Click *OK*. Configure two more real servers with IP addresses 10.31.101.40 and 10.31.101.50, and the same settings as the first real server.
7. Click *OK*.

To create a security policy that includes the load balance virtual server as the destination address:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Click *Create New*.
3. Set the *Inspection Mode* to *Proxy-based*. A flow-based firewall policy can only accept TCP/UDP/IP type virtual servers.
4. Set the following:
   - *Name* to *LB-policy*
   - *Incoming Interface* to *wan1*
   - *Outgoing Interface* to *internal*
   - *Source* to *all*
   - *Destination* to *Vserver-HTTP-1*
   - *Schedule* to *always*
   - *Service* to *ALL*
   - *Action* to *ACCEPT*
5. Enable *NAT* and set *IP Pool Configuration* to *Use Outgoing Interface Address*.
6. Enable *AntiVirus* and select an antivirus profile.



7. Click *OK*.

Configure a load balancing virtual server in the CLI

To configure HTTP load balancing to three real web servers in the CLI:

1. Create a health check monitor:

```
config firewall ldb-monitor
    edit "Ping-mon-1"
        set type ping
        set interval 10
        set timeout 2
        set retry 3
    next
end
```

2. Create a virtual server:

```
config firewall vip
    edit "Vserver-HTTP-1"
        set type server-load-balance
        set extip 172.20.120.121
        set extintf "any"
        set server-type http
        set monitor "Ping-mon-1"
        set ldb-method round-robin
```

```
        set persistence http-cookie
        set extport 8080
        config realservers
            edit 1
                set type ip
                set ip 10.31.101.30
                set port 80
            next
            edit 2
                set type ip
                set ip 10.31.101.40
                set port 80
            next
            edit 3
                set type ip
                set ip 10.31.101.50
                set port 80
            next
        end
    next
end
```

3. Add the load balancing virtual server to a policy as the destination address:

```
config firewall policy
    edit 2
        set name "LB-policy"
        set inspection-mode proxy
        set srcintf "wan1"
        set dstintf "internal"
        set srcaddr "all"
        set dstaddr "Vserver-HTTP-1"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set fsso disable
        set nat enable
    next
end
```

Results

Traffic accessing 172.20.120.121:8080 is forwarded in turn to the three real servers.

If the access request has an http-cookie, FortiGate forwards the access to the corresponding real server according to the cookie.

Virtual server load balance multiplexing

HTTP2 connection coalescing and concurrent multiplexing allows multiple HTTP2 requests to share the same TLS connection when the destination IP is the same.

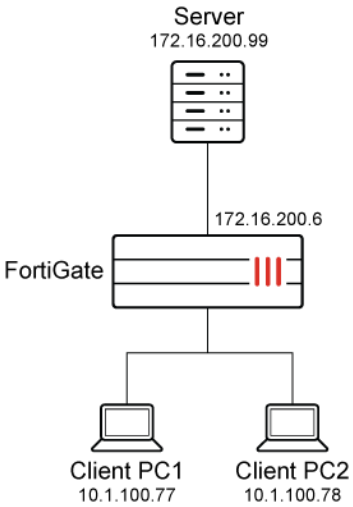
To configure the load balanced virtual server:

```
config firewall vip
    edit <name>
        set type server-load-balance
        set server-type {http | https}
        set http-multiplex {enable | disable}
        set http-multiplex-ttl <integer>
        set http-multiplex-max-request <integer>
        set h2-support {enable | disable}
    next
end
```

`http-multiplex {enable | disable}`	Enable/disable HTTP multiplexing.
`http-multiplex-ttl <integer>`	Set the time-to-live for idle connections to servers (in seconds, 0 - 2147483647, default = 15).
`http-multiplex-max-request <integer>`	Set the maximum number of requests that the multiplex server can handle before disconnecting (0 - 2147483647, default = 0).
`h2-support {enable | disable}`	Enable/disable HTTP2 support (default = enable).

Example

In this example, multiple clients submit requests in HTTP2. The requests hit the VIP address, and then FortiGate opens a session between itself (172.16.200.6) and the server (172.16.200.99). The coalescing occurs in this session as the multiple streams share the same TLS session to connect to the same destination server.



To configure connection coalescing and concurrent multiplexing with virtual server load balancing:

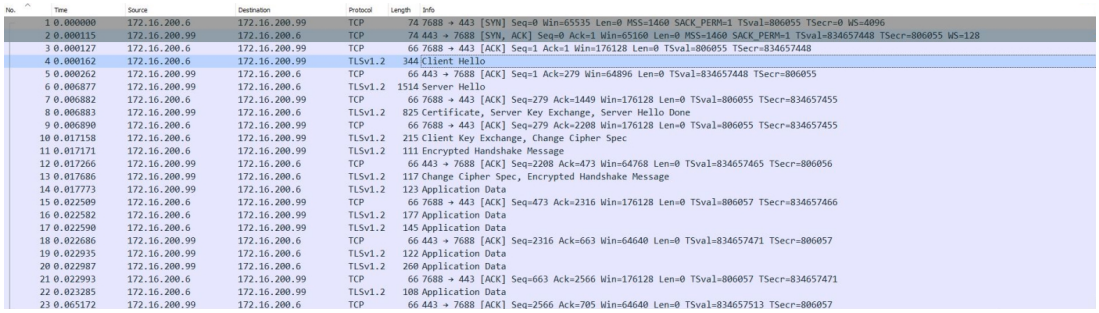
1. Configure the virtual server:

```
config firewall vip
    edit "vip-test"
        set type server-load-balance
        set extip 10.1.100.222
        set extintf "port2"
        set server-type https
        set extport 443
        config realservers
            edit 1
                set ip 172.16.200.99
                set port 443
            next
        end
        set http-multiplex enable
        set ssl-mode full
        set ssl-certificate "Fortinet_SSL"
    next
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "vip-test"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection-clone"
        set av-profile "av"
        set logtraffic all
        set nat enable
    next
end
```

3. Get the clients to access the VIP address (10.1.100.222). The FortiGate shares the first TLS connection with second TLS connection.
4. Verify the sniffer packet capture on the FortiGate server side. There is one client hello.



No.	Time	Source	Destination	Protocol	Length	Info
1	0.000000	172.16.200.6	172.16.200.99	TCP	74	7688 → 443 [SYN] Seq=0 Win=65535 Len=0 MSS=1460 SACK_PERM=1 TSval=806055 TSecr=0 WS=4096

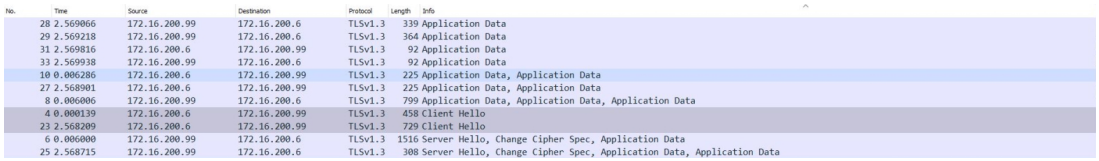
18	0.022686	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2316 Ack=663 Win=64640 Len=0 TSval=834657471 TSecr=806057
19	0.022935	172.16.200.99	172.16.200.6	TLSv1.2	122	Application Data
20	0.022987	172.16.200.99	172.16.200.6	TLSv1.2	260	Application Data
21	0.022993	172.16.200.6	172.16.200.99	TCP	66	7688 → 443 [ACK] Seq=663 Ack=2566 Win=176128 Len=0 TSval=806057 TSecr=834657471
22	0.023285	172.16.200.6	172.16.200.99	TLSv1.2	108	Application Data
23	0.065172	172.16.200.99	172.16.200.6	TCP	66	443 → 7688 [ACK] Seq=2566 Ack=705 Win=64640 Len=0 TSval=834657513 TSecr=806057

5. Disable HTTP multiplexing:

```
config firewall vip
    edit "vip-test"
        config realservers
            edit 1
                set type ip
                set ip 172.16.200.99
                set port 443
            next
        end
        set http-multiplex disable
    next
end
```

6. Verify the sniffer packet capture. This time, the FortiGate does reuse the TLS connection, so there are two client hellos sent to the real server.



No.	Time	Source	Destination	Protocol	Length	Info
28	2.569066	172.16.200.99	172.16.200.6	TLSv1.3	339	Application Data

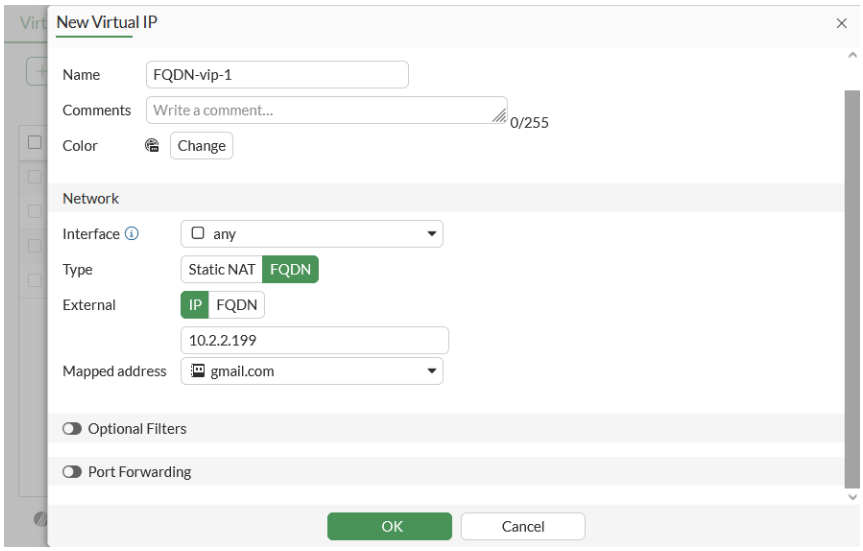
Configure FQDN-based VIPs

In public cloud environments, sometimes it is necessary to map a VIP to an FQDN address.

To configure an FQDN-based VIP in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
2. Click *Create new*.
3. Enter a name for the VIP.
4. Select an interface.
5. For *Type*, select *FQDN*.
6. For *External*, select *IP* and enter the external IP address.
7. For *Mapped address*, select an FQDN address.



8. Click *OK*.

To configure an FQDN-based VIP in the CLI:

```
config firewall vip
    edit "FQDN-vip-1"
        set type fqdn
        set extip 10.2.2.199
        set extintf "any"
        set mapped-addr "destination"
    next
end
```

Central DNAT

Central NAT allows for the central configuration of SNAT (source NAT) and DNAT (destination NAT).

To enable central NAT in the GUI:

1. Go to *System* > *Settings* > *General*.
2. In the *System Operation Settings*, enable *Central SNAT*.
3. Click *Apply*.

To enable central NAT in the CLI:

```
config system settings
    set central-nat {enable | disable}
end
```

When central NAT is enabled, virtual IPs (VIPs) are not configured in the firewall policy. The VIPs are configured as separate objects where their status must be enabled.

This option is only available for IPv4 VIP and VIP46 objects.

Configuring a DNAT and VIP object in central NAT mode is similar to configuring a VIP when central NAT is disabled. See Static virtual IPs on page 1879 for more information on each setting.

VIP objects can carry over when switching from non-central NAT mode to central NAT mode or vice-versa. However, if a VIP is assigned to a firewall policy in non-central NAT mode, it must be unassigned before switching to central NAT mode.

In this example, a DNAT and VIP are configured to forward traffic from 10.1.100.130 to 172.16.200.44. This example assumes that the firewall address, Addr_172.16.200.44/32, has already been configured.

To configure DNAT and a VIP in the GUI:

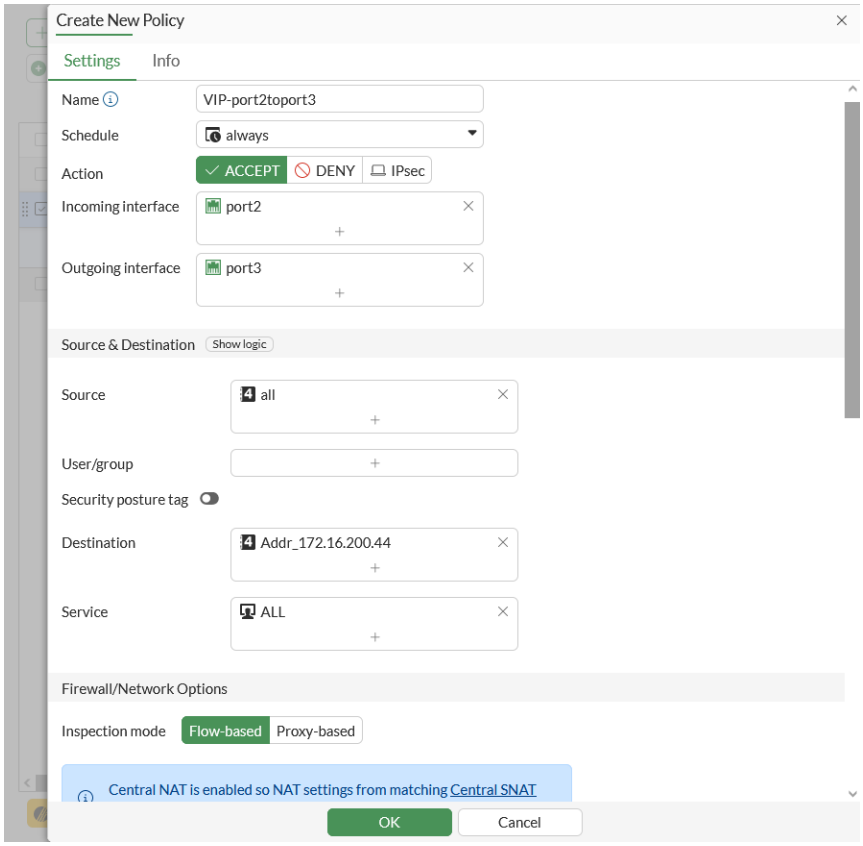
1. Configure the VIP:
   a. Go to *Policy & Objects* > *DNAT & Virtual IPs* and on the *Virtual IP* tab, click *Create New*.
   b. Enter a name (*test-vip44-1*).
   c. Set the *External IP address/range* to *10.1.100.130*.
   d. Set the *Map to IPv4 address/range* to *172.16.200.44*.

   e. Click *OK*.
2. Configure a firewall policy that allows traffic in the direction of the VIP:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Configure the following settings:

Name	*VIP-port2toport3*
Source	*all*
Destination	*Addr_172.16.200.44*
Schedule	*always*

Service	*ALL*
Action	*ACCEPT*

c. Configure the other settings as needed. There is no SNAT configuration section, so central SNAT policies will be applied.



d. Click *OK*.

To configure DNAT and a VIP in the CLI:

1. Configure the VIP:

```
config firewall vip
    edit "test-vip44-1"
        set extip 10.1.100.130
        set mappedip "172.16.200.44"
        set extintf "any"
        set status enable
    next
end
```

2. Configure a firewall policy that allows traffic in the direction of the VIP:

```
config firewall policy
    edit 3
        set name "VIP-port2toport3"
```

```
        set srcintf "port2"
        set dstintf "port3"
        set action accept
        set srcaddr "all"
        set dstaddr "Addr_172.16.200.44"
        set schedule "always"
        set service "ALL"
    next
end
```

To verify the DNAT and VIP:

If the VIP status is enabled, it will appear in the VIP table:

```
# diagnose firewall iprope list 100000
policy index=7 uuid_idx=625 action=accept
flag (8000104): f_p nat pol_stats
cos_fwd=0  cos_rev=0
group=00100000 av=00000000 au=00000000 split=00000000
host=0 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=0,
dest(1): 10.1.100.130-10.1.100.130, uuid_idx=625,
service(1):
        [0:0x0:0/(0,0)->(0,0)] helper:auto
nat(1): flag=0 base=10.1.100.130:0 172.16.200.44-172.16.200.44(0:0)
```

If the VIP status is disabled, it will not appear in the VIP table.

In this example, a one-to-one static NAT is enabled. Send a ping to 10.1.100.130, and the traffic will be forwarded to the destination 172.16.200.44.

Examples and policy actions

The following topics provide examples and instructions on policy actions:

- NAT46 and NAT64 policy and routing configurations on page 1901
- Hairpin NAT on page 1912
- Mirroring SSL traffic in policies on page 1916
- Recognize anycast addresses in geo-IP blocking on page 1918
- Matching GeoIP by registered and physical location on page 1919
- HTTP to HTTPS redirect for load balancing on page 1921
- Use Active Directory objects directly in policies on page 1923
- No session timeout on page 1927
- MAP-E support on page 1928
- DHCP-PD support for MAP-E on page 1933
- Seven-day rolling counter for policy hit counters on page 1939

- Cisco Security Group Tag as policy matching criteria on page 1941
- Virtual patching on the local-in management interface on page 1944
- Configuring PCP port mapping with SNAT and DNAT on page 1949
- Refreshing active sessions for specific protocols and port ranges per VDOM in a specified direction on page 1954
- Per-policy disclaimer messages on page 1957
- Full cone NAT for fixed port range IP pools on page 1960

NAT46 and NAT64 policy and routing configurations

Multiple NAT46 and NAT64 related objects are consolidated into regular objects. A per-VDOM virtual interface, naf.<vdom>, is automatically added to process NAT46/NAT64 traffic. The features include:

- `vip46` and `vip64` settings are consolidated in `vip` and `vip6` configurations.
- `policy46` and `policy64` settings are consolidated in `firewall policy` settings.
- `nat46`/`nat64` are included in `firewall policy` settings.
- `ippool` and `ippool6` support NAT46 and NAT64 (when enabled, the IP pool should match a subnet).
- Central SNAT supports NAT46 and NAT64.
- `add-nat46-route` in `ippool6` and `add-nat64-route` in `ippool` are enabled by default. The FortiGate generates a static route that matches the IP range in `ippool6` or `ippool` for the naf tunnel interface.

Automatic processing of the naf tunnel interface is not supported in security policies.

To configure NAT46/NAT64 translation, use the standard `vip`/`vip6` setting, apply it in a firewall policy, enable NAT46/NAT64, and enter the IP pool to complete the configuration.

The external IP address cannot be the same as the external interface IP address.

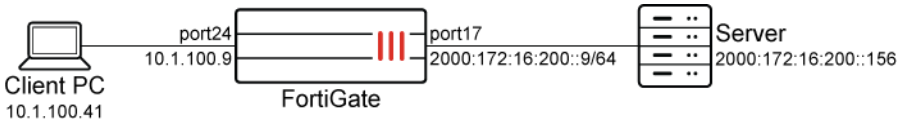
Examples

IPv6 must be enabled to configure these examples. In the GUI, so go to *System > Feature Visibility* and enable *IPv6*. In the CLI, enter the following:

```
config system global
    set gui-ipv6 enable
end
```

NAT46 policy

In this example, a client PC is using IPv4 and an IPv4 VIP to access a server that is using IPv6. The FortiGate uses NAT46 to translate the request from IPv4 to IPv6 using the virtual interface naf.root. An `ippool6` is applied so that the request is SNATed to the `ippool6` address (2000:172:16:101::1 - 2000:172:16:101::1).



To create a NAT46 policy in the GUI:

1. Configure the VIP:
   a. Go to *Policy & Objects* > *Virtual IPs* and select the *Virtual IP* tab.
   b. Click *Create new*.

Name	test-vip46-1
Interface	To_vlan20
Type	Static NAT
External IP address/range	10.1.100.150
Map to IPv6 address/range	2000:172:16:200::156

   Enter the following:

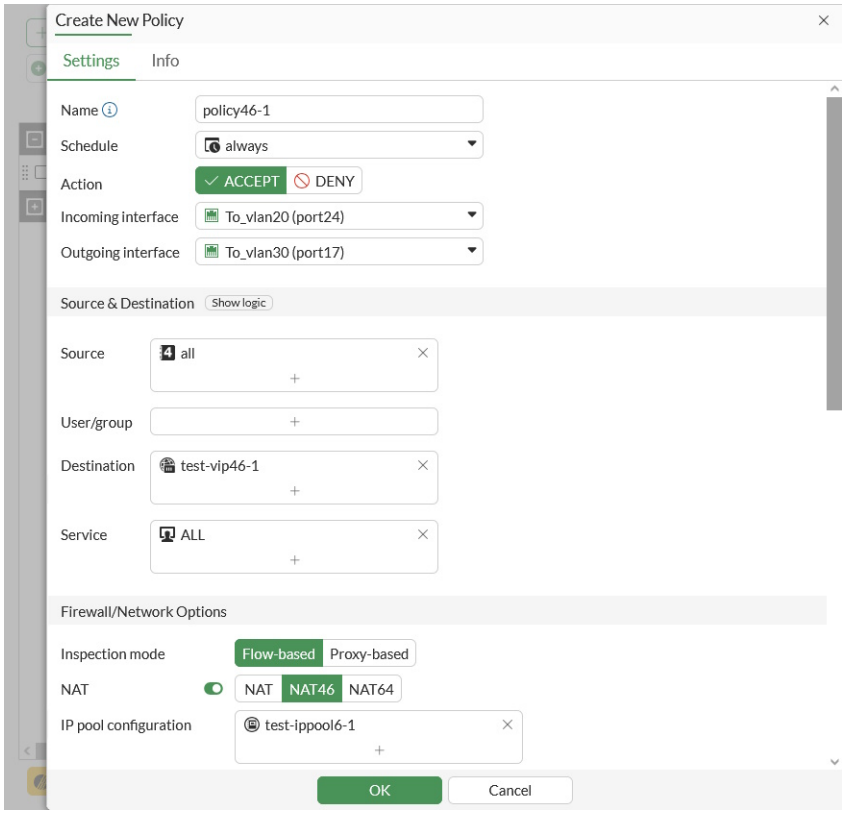
   c. Click *OK*.
2. Configure the IPv6 pool:
   a. Go to *Policy & Objects* > *IP Pools* and select the *IPv6 IP Pool* tab.
   b. Click *Create new*.
   c. Enter the following:

Name	test-ippool6-1
External IP address/range	2000:172:16:101::1-2000:172:16:101::1
NAT46	Enable

   d. Click *OK*.
3. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New* or edit an existing policy.
   b. Enter the following:

Name	policy46-1
Schedule	always
Action	ACCEPT
Incoming Interface	To_vlan20
Outgoing Interface	To_vlan30
Source	all
Destination	test-vip46-1
Service	ALL
NAT	NAT46
IP Pool Configuration	test-ippool6-1

c. Configure the other settings as needed.



d. Click *OK*.

To create a NAT46 policy in the CLI:

1. Configure the VIP:

```
config firewall vip
    edit "test-vip46-1"
```

```
        set extip 10.1.100.150
        set nat44 disable
        set nat46 enable
        set extintf "port24"
        set arp-reply enable
        set ipv6-mappedip 2000:172:16:200::156
    next
end
```

2. Configure the IPv6 pool:

```
config firewall ippool6
    edit "test-ippool6-1"
        set startip 2000:172:16:101::1
        set endip 2000:172:16:101::1
        set nat46 enable
        set add-nat46-route enable
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 2
        set name "policy46-1"
        set srcintf "port24"
        set dstintf "port17"
        set action accept
        set nat46 enable
        set srcaddr "all"
        set dstaddr "test-vip46-1"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname6 "test-ippool6-1"
    next
end
```

To verify the traffic and session tables:

1. Verify the traffic by the sniffer packets:

```
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
2.593302 port24 in 10.1.100.41 -> 10.1.100.150: icmp: echo request
2.593344 naf.root out 10.1.100.41 -> 10.1.100.150: icmp: echo request
2.593347 naf.root in 2000:172:16:101::1 -> 2000:172:16:200::156: icmp6: echo request seq 1
```

```
2.593383 port17 out 2000:172:16:101::1 -> 2000:172:16:200::156: icmp6: echo request seq 1
2.593772 port17 in 2000:172:16:200::156 -> 2000:172:16:101::1: icmp6: echo reply seq 1
2.593788 naf.root out 2000:172:16:200::156 -> 2000:172:16:101::1: icmp6: echo reply seq 1
2.593790 naf.root in 10.1.100.150 -> 10.1.100.41: icmp: echo reply
2.593804 port24 out 10.1.100.150 -> 10.1.100.41: icmp: echo reply
11 packets received by filter
0 packets dropped by kernel
```

2. Verify the session tables for IPv4 and IPv6:

```
(root) # diagnose sys session list
session info: proto=1 proto_state=00 duration=2 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00 netflow-origin netflow-reply
statistic(bytes/packets/allow_err): org=252/3/1 reply=252/3/1 tuples=2

hook=pre dir=org act=noop 10.1.100.41:29388->10.1.100.150:8(0.0.0.0:0)
hook=post dir=reply act=noop 10.1.100.150:29388->10.1.100.41:0(0.0.0.0:0)
misc=0 policy_id=2 auth_info=0 chk_client_info=0 vd=0
serial=00001bbc tos=ff/ff ips_view=1024 app_list=0 app=0 url_cat=0
```

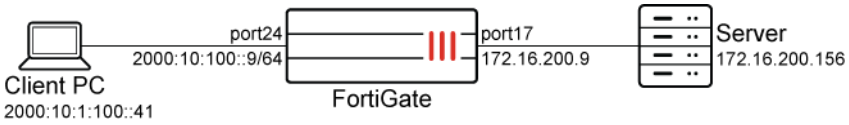
```
rpdb_link_id = 00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

The IPv4 session is between the incoming physical interface port24 and naf.root. The IPv6 session is between the naf.root and the outgoing physical interface port17.

NAT64 policy

In this example, a client PC is using IPv6 and an IPv6 VIP to access a server that is using IPv4. The FortiGate uses NAT64 to translate the request from IPv6 to IPv4 using the virtual interface naf.root. An `ippool` is applied so that the request is SNATed to the `ippool` address (172.16.101.2 - 172.16.101.3).

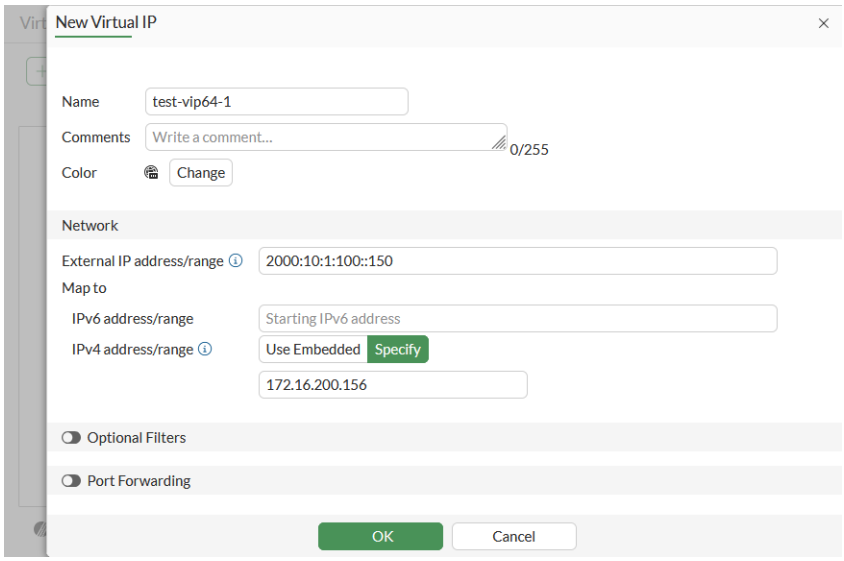
An embedded VIP64 object is used in this configuration so a specific IPv4 mapped IP does not need to be set. The lower 32 bits of the external IPv6 address are used to map to the IPv4 address. Only an IPv6 prefix is defined. In this example, the IPv6 prefix is 2001:10:1:100::, so the IPv6 address 2001:10:1:100::ac10:c89c will be translated to 172.16.200.156.



To create a NAT64 policy in the GUI:

1. Configure the VIP:
   a. Go to *Policy & Objects* > *Virtual IPs* and select the *IPv6 Virtual IP* tab.
   b. Click *Create new*.
   c. Enter the following:

Name	test-vip64-1
External IP address/range	2000:10:1:100::150
Map to IPv4 address/range	**Specify**: 172.16.200.156



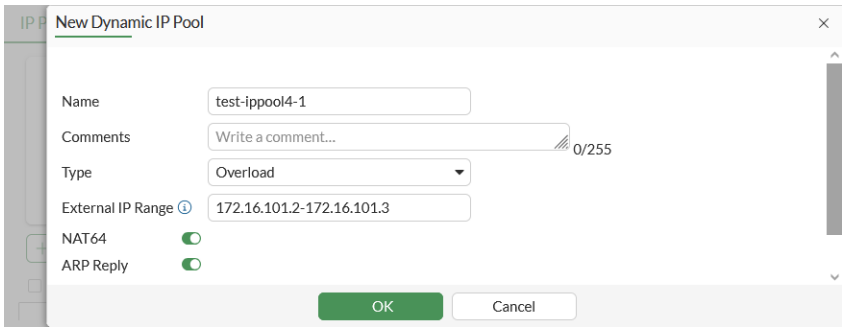
d. Click *OK*.

2. Configure the VIP with the embedded IPv4 address enabled:
   a. Go to *Policy & Objects* > *Virtual IPs* and select the *IPv6 Virtual IP* tab.
   b. Click *Create new*.
   c. Enter the following:

Name	test-vip64-2
External IP address/range	2001:10:1:100::-2001:10:1:100::ffff:ffff
Map to IPv4 address/range	Use Embedded

   d. Click *OK*.
3. Configure the IP pool:
   a. Go to *Policy & Objects* > *IP Pools* and select the *IP Pool* tab.
   b. Click *Create new*.
   c. Enter the following:

Name	test-ippool4-1
Type	Overload
External IP address/range	172.16.101.2-172.16.101.3
NAT64	Enable



d. Click *OK*.

4. Configure the firewall policy:

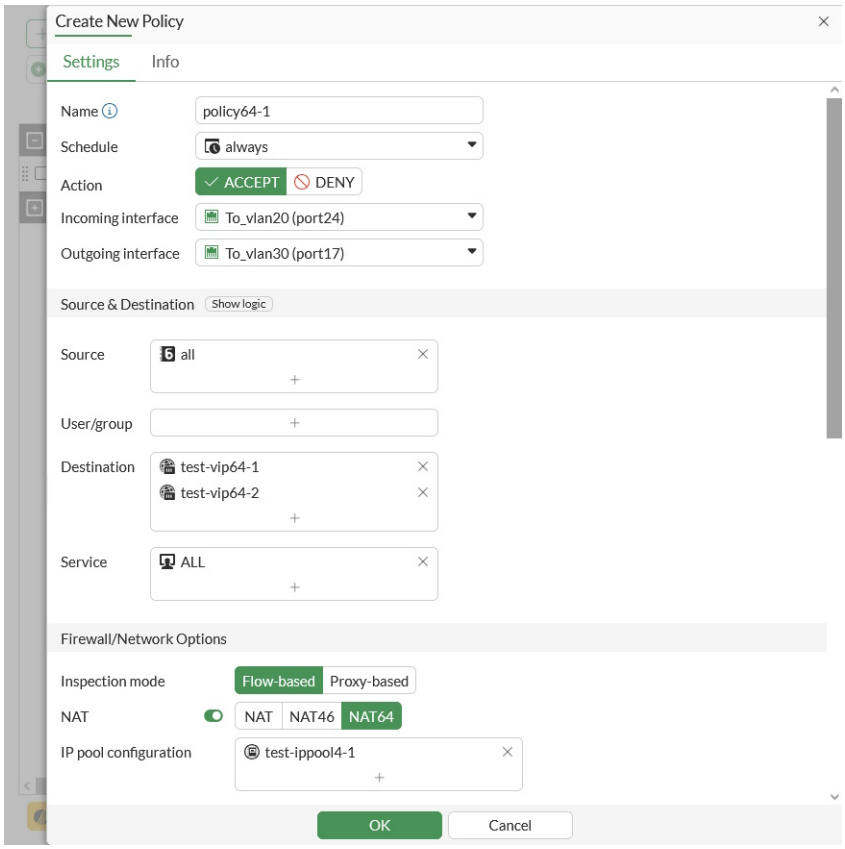
a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New* or edit an existing policy.

b. Enter the following:

c.

Name	policy64-1
Incoming Interface	To_vlan20
Outgoing Interface	To_vlan30
Source	all
Destination	test-vip64-1 test-vip64-2
Schedule	always
Service	ALL
Action	ACCEPT
NAT	NAT64
IP Pool Configuration	test-ippool4-1

d. Configure the other settings as needed.



e. Click *OK*.

To create a NAT64 policy in the CLI:

1. Configure the VIP:

```
config firewall vip6
    edit "test-vip64-1"
        set extip 2000:10:1:100::150
        set nat66 disable
        set nat64 enable
        set ipv4-mappedip 172.16.200.156
    next
end
```

2. Configure the VIP with the embedded IPv4 address enabled:

```
config firewall vip6
    edit "test-vip64-2"
        set extip 2001:10:1:100::-2001:10:1:100::ffff:ffff
        set nat66 disable
        set nat64 enable
        set embedded-ipv4-address enable
    next
end
```

3. Configure the IP pool:

```
config firewall ippool
    edit "test-ippool4-1"
        set startip 172.16.101.2
        set endip 172.16.101.3
        set nat64 enable
        set add-nat64-route enable
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "policy64-1"
        set srcintf "port24"
        set dstintf "port17"
        set action accept
        set nat64 enable
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "test-vip64-1" "test-vip64-2"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set ippool enable
        set poolname "test-ippool4-1"
    next
end
```

To verify the traffic and session tables:

1. Verify the VIP64 traffic by the sniffer packets:

```
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
20.578417 port24 in 2000:10:1:100::41 -> 2000:10:1:100::150: icmp6: echo request seq 1
20.578495 naf.root out 2000:10:1:100::41 -> 2000:10:1:100::150: icmp6: echo request seq 1
20.578497 naf.root in 172.16.101.2 -> 172.16.200.156: icmp: echo request
20.578854 port17 out 172.16.101.2 -> 172.16.200.156: icmp: echo request
20.579083 port17 in 172.16.200.156 -> 172.16.101.2: icmp: echo reply
20.579093 naf.root out 172.16.200.156 -> 172.16.101.2: icmp: echo reply
20.579095 naf.root in 2000:10:1:100::150 -> 2000:10:1:100::41: icmp6: echo reply seq 1
20.579377 port24 out 2000:10:1:100::150 -> 2000:10:1:100::41: icmp6: echo reply seq 1
11 packets received by filter
0 packets dropped by kernel
```

2. Verify the session tables for IPv6 and IPv4:

```
(root) # diagnose sys session6 list
session6 info: proto=58 proto_state=00 duration=5 expire=56 timeout=0 flags=00000000
sockport=0 socktype=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty
statistic(bytes/packets/allow_err): org=312/3/0 reply=312/3/0 tuples=2
tx speed(Bps/kbps): 55/0 rx speed(Bps/kbps): 55/0
orgin->sink: org pre->post, reply pre->post dev=24->53/53->24
hook=pre dir=org act=noop 2000:10:1:100::41:29949->2000:10:1:100::150:128(:::0)
hook=post dir=reply act=noop 2000:10:1:100::150:29949->2000:10:1:100::41:129(:::0)
peer=172.16.101.2:45392->172.16.200.156:8 naf=1
hook=pre dir=org act=noop 172.16.101.2:45392->172.16.200.156:8(0.0.0.0:0)
hook=post dir=reply act=noop 172.16.200.156:45392->172.16.101.2:0(0.0.0.0:0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=0
serial=000021ec tos=ff/ff ips_view=1024 app_list=0 app=0 url_cat=0
rpdb_link_id = 00000000 ngfwid=n/a
npu_state=0x040001 no_offload
no_ofld_reason:  disabled-by-policy non-npu-intf
total session 1
```

```
(root) # diagnose sys session list
session info: proto=1 proto_state=00 duration=7 expire=54 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=252/3/1 reply=252/3/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=53->17/17->53 gwy=172.16.200.156/172.16.101.2
hook=pre dir=org act=noop 172.16.101.2:45392->172.16.200.156:8(0.0.0.0:0)
hook=post dir=reply act=noop 172.16.200.156:45392->172.16.101.2:0(0.0.0.0:0)
peer=2000:10:1:100::150:29949->2000:10:1:100::41:129 naf=2
hook=pre dir=org act=noop 2000:10:1:100::41:29949->2000:10:1:100::150:128(:::0)
hook=post dir=reply act=noop 2000:10:1:100::150:29949->2000:10:1:100::41:129(:::0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=0
serial=0001347f tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

The IPv6 session is between the incoming physical interface port24 and naf.root. The IPv4 session is between the naf.root and the outgoing physical interface port17.

3. Verify the embedded VIP64 traffic by the sniffer packets:

```
(root) # diagnose sniffer packet any 'icmp or icmp6' 4
interfaces=[any]
filters=[icmp or icmp6]
7.696010 port24 in 2000:10:1:100::41 -> 2001:10:1:100::ac10:c89c: icmp6: echo request seq 1
7.696057 naf.root out 2000:10:1:100::41 -> 2001:10:1:100::ac10:c89c: icmp6: echo request seq 1
7.696060 naf.root in 172.16.101.2 -> 172.16.200.156: icmp: echo request
7.696544 port17 out 172.16.101.2 -> 172.16.200.156: icmp: echo request
7.696821 port17 in 172.16.200.156 -> 172.16.101.2: icmp: echo reply
7.696839 naf.root out 172.16.200.156 -> 172.16.101.2: icmp: echo reply
7.696841 naf.root in 2001:10:1:100::ac10:c89c -> 2000:10:1:100::41: icmp6: echo reply seq 1
7.697167 port24 out 2001:10:1:100::ac10:c89c -> 2000:10:1:100::41: icmp6: echo reply seq 1
11 packets received by filter
0 packets dropped by kernel
```

Hairpin NAT

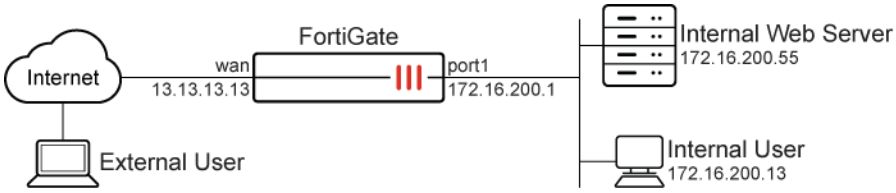
Hairpin NAT, also known as NAT loopback or U-turn NAT, allows devices on the same internal network to communicate using their external IP addresses. This simplifies network configurations and enhances connectivity.

How hairpin NAT works:

1. Request initiation: An employee within the office network attempts to access an internal resource using its external IP address.
2. NAT processing: The request is sent to the FortiGate, which recognizes that the destination IP address is its own external IP on the WAN interface.
3. Hairpin NAT: The FortiGate redirects the request back into the internal network, forwarding it to the web server's internal IP address and allowing the employee to access the internal web server using the external address.

Example

This configuration allows both internal and remote employees to use the same domain name to access the server. Hairpin NAT ensures consistency, avoiding confusion and complications in network configurations. This setup is particularly useful for companies that save bookmarks to internal web servers using public domain names in users' profiles, ensuring access whether connected to the internal LAN or the internet.



In this scenario, the user can access saved bookmarks containing public domain names from both their office computer on the internal network and their personal computer over the internet.

Before continuing, make sure that the port1 and wan interfaces have been configured with valid IP addresses and some publicly accessible domain names are saved as bookmarks in the user profile.

It is assumed that you have administrative access, the FortiGate is incorporated into your network, and the external IP address is the same as the FortiGate wan interface.

The configuration has four steps:

1. Create a VIP: Map the external IP address to the internal IP address.
2. Create a firewall policy for DNAT: Attach the VIP to a firewall policy, allowing external users to access the internal server using the external IP address. See Static virtual IPs on page 1879 for more information.
3. Create a firewall policy for SNAT: Allow internal users to access the external servers using the external IP address. See Static SNAT on page 1849 for more information.
4. Verify the result: Confirm that the employee can access the internal web server using the external address.

To create a VIP in the GUI:

1. Go to *Policy & Objects* > *Virtual IPs* or, if Central NAT is enabled, *Policy & Objects* > *DNAT & Virtual IPs*.
2. Select the *Virtual IP* and click *Create new*.
3. Configure the following:

Field	Value
Name	Internal_WebServer
Interface	any
Type	Static NAT
External IP address/range	13.13.13.13
IPv4 address/range	172.16.200.55

4. Click *OK*.

To create a firewall policy for DNAT in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*.
2. Configure the following:

Field	Value
Name	wan-lan
Schedule	always
Action	ACCEPT
Type	Standard
Incoming interface	wan
Outgoing interface	port1
Source	all
Destination	Internal_WebServer
Service	ALL

Field	Value
NAT	Enabled
IP pool configuration	Use Outgoing Interface Address
Log allowed traffic	All sessions

3. Click *OK*.

To create a firewall policy for SNAT in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*.
2. Configure the following:

Field	Value
Name	lan-wan
Schedule	always
Action	ACCEPT
Type	Standard
Incoming interface	port1
Outgoing interface	wan
Source	all
Destination	all
Service	ALL
NAT	Enabled
IP pool configuration	Use Outgoing Interface Address
Log allowed traffic	All sessions

3. Click *OK*.

To configure the VIP and policies in the CLI:

1. Create the VIP:

```
config firewall vip
    edit "Internal_WebServer "
        set extip 13.13.13.13
        set mappedip "172.16.200.55"
        set extintf "any"
    next
end
```

2. Create firewall policies for DNAT (`wan-lan`) and SNAT (`lan-wan`):

```
config firewall policy
    edit 2
        set name "wan-lan"
        set srcintf "wan"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "Internal_WebServer"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
    edit 3
        set name "lan-wan"
        set srcintf "port1"
        set dstintf "wan"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

To verify the results:

1. Access the internal machine and use the saved bookmark or the external IP address of the internal web server to access it. This should be successful, and the web server should load correctly. On the FortiGate, this can be verified using the logs and session list
2. On the FortiGate, go to *Log & Report > Forward Traffic* and double click the desired log entry to view its details, or use the CLI to view the logs:

```
#execute log filter category 0
#execute log display
1: date=2024-12-05 time=11:43:58 eventtime=1733427838055576829 tz="-0800" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="root" srcip=172.16.200.13 srcport=54134
srcintf="port1" srcintfrole="undefined" dstip=13.13.13.13 dstport=443 dstintf="wan"
dstintfrole="undefined" srccountry="Reserved" dstcountry="Reserved" sessionid=5797 proto=6
action="close" policyid=2 policytype="policy" poluuid="1dbc281e-b32c-51ef-f783-7b95542c1baf"
policyname="wan-lan" service="HTTPS" trandisp="snat+dnat" tranip=172.16.200.55 tranport=443
transip=172.16.200.1 transport=54134 appcat="unscanned" duration=2 sentbyte=2063 rcvdbyte=1748
sentpkt=8 rcvdpkt=5
```

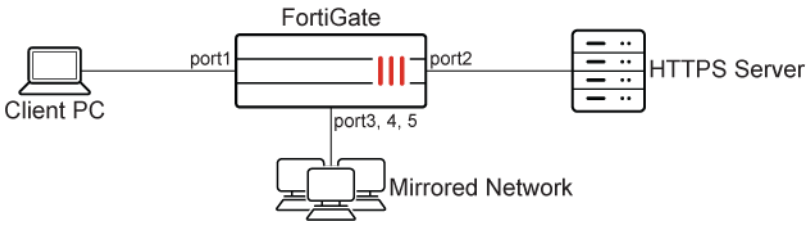
> If the logs are missing, go to *Log & Report > Forward Traffic* and increase the time frame to ensure that all pertinent log entries are available.

3. Check session list:

```
#get system session list | grep 13.13.13.13
PROTO   EXPIRE SOURCE           SOURCE-NAT       DESTINATION      DESTINATION-NAT
tcp     59     172.16.200.13:3  172.16.200.1:3   13.13.13.13:8    172.16.200.55:3
```

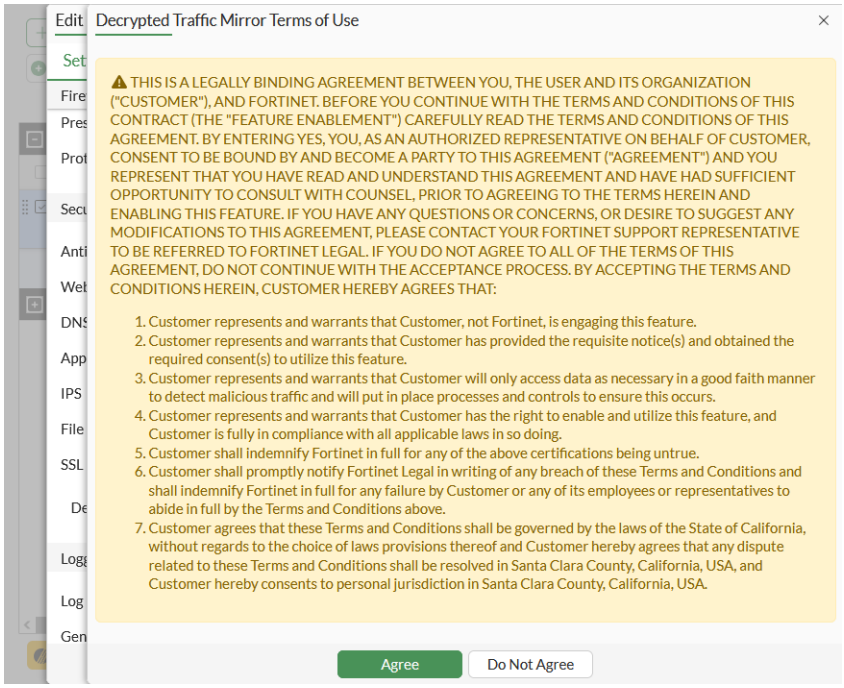
Mirroring SSL traffic in policies

SSL mirroring allows the FortiGate to decrypt and mirror traffic to a designated port. A new decrypted traffic mirror profile can be applied to IPv4, IPv6, and explicit proxy firewall policies in both flow and proxy mode. Full SSL inspection and in flow mode, a security profile, must be used in the policy for the traffic mirroring to occur. Proxy mode must be used if a security profile cannot be applied.

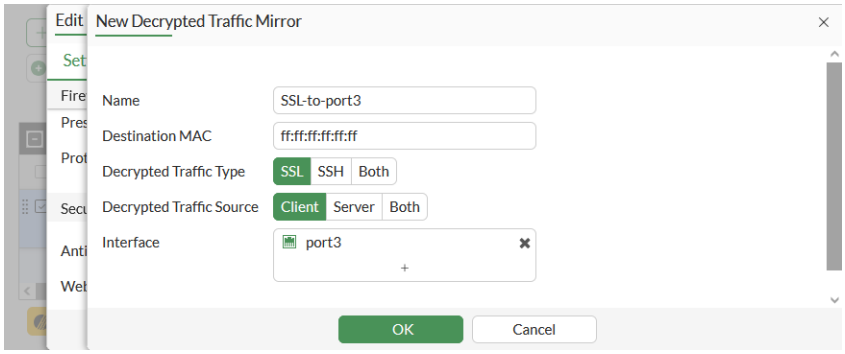


To configure SSL mirroring in a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy, or edit an existing one.
3. Configure the interfaces, sources, and other required information.
4. In the *Security Profiles* section, for *SSL Inspection*, select *deep-inspection*, or another profile that uses *Full SSL Inspection*.
5. If using flow mode, apply a security profile.
6. Enable *Decrypted Traffic Mirror* . The terms of use agreement opens.



7. Click *Agree* to accept the terms.
8. In the drop-down list, select a decrypted traffic mirror, or click *Create* to create a new one.
   In this example, a new decrypted traffic mirror is created using the port3 interface.



9. Click *OK* to save the policy.

To configure SSL mirroring in proxy mode in the CLI:

1. Create the decrypted traffic mirror profile:

```
config firewall decrypted-traffic-mirror
    edit SSL-to-port3
        set dstmac ff:ff:ff:ff:ff:ff
        set traffic-type ssl
        set traffic-source client
        set interface port3
    next
end
```

2. Configure the policy to enable SSL traffic mirroring. If using flow mode, a security profile must also be applied.

```
config firewall policy
    edit 1
        set name "mirror-policy"
        set srcintf "port1"
        set dstintf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
        set ssl-ssh-profile "deep-inspection"
        set decrypted-traffic-mirror "SSL-to-port3"

THIS IS A LEGALLY BINDING AGREEMENT BETWEEN YOU, THE USER AND ITS ORGANIZATION ("CUSTOMER"),
AND FORTINET. BEFORE YOU CONTINUE WITH THE TERMS AND CONDITIONS OF THIS CONTRACT (THE "FEATURE
ENABLEMENT") CAREFULLY READ THE TERMS AND CONDITIONS OF THIS AGREEMENT. BY ENTERING YES, YOU,
AS AN AUTHORIZED REPRESENTATIVE ON BEHALF OF CUSTOMER, CONSENT TO BE BOUND BY AND BECOME A
PARTY TO THIS AGREEMENT ("AGREEMENT") AND YOU REPRESENT THAT YOU HAVE READ AND UNDERSTAND THIS
```

```
AGREEMENT AND HAVE HAD SUFFICIENT OPPORTUNITY TO CONSULT WITH COUNSEL, PRIOR TO AGREEING TO
THE TERMS HEREIN AND ENABLING THIS FEATURE. IF YOU HAVE ANY QUESTIONS OR CONCERNS, OR DESIRE
TO SUGGEST ANY MODIFICATIONS TO THIS AGREEMENT, PLEASE CONTACT YOUR FORTINET SUPPORT
REPRESENTATIVE TO BE REFERRED TO FORTINET LEGAL. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF
THIS AGREEMENT, DO NOT CONTINUE WITH THE ACCEPTANCE PROCESS. BY ACCEPTING THE TERMS AND
CONDITIONS HEREIN, CUSTOMER HEREBY AGREES THAT:

1. Customer represents and warrants that Customer, not Fortinet, is engaging this feature.

2. Customer represents and warrants that Customer has provided the requisite notice(s) and
obtained the required consent(s) to utilize this feature.

3. Customer represents and warrants that Customer will only access data as necessary in a good
faith manner to detect malicious traffic and will put in place processes and controls to
ensure this occurs.

4. Customer represents and warrants that Customer has the right to enable and utilize this
feature, and Customer is fully in compliance with all applicable laws in so doing.

5. Customer shall indemnify Fortinet in full for any of the above certifications being untrue.

6. Customer shall promptly notify Fortinet Legal in writing of any breach of these Terms and
Conditions and shall indemnify Fortinet in full for any failure by Customer or any of its
employees or representatives to abide in full by the Terms and Conditions above.

7. Customer agrees that these Terms and Conditions shall be governed by the laws of the State
of California, without regards to the choice of laws provisions thereof and Customer hereby
agrees that any dispute related to these Terms and Conditions shall be resolved in Santa Clara
County, California, USA, and Customer hereby consents to personal jurisdiction in Santa Clara
County, California, USA.

Recognize anycast addresses in geo-IP blocking

An anycast IP can be advertised from multiple locations and the router selects a path based on latency, distance, cost, number of hops, and so on. This technique is widely used by providers to route users to the closest server. Since the IP is hosted in multiple geographic locations, there is no way to specify one single location to that IP.

Anycast IP address ranges can be bypassed in geo-IP blocking. The ISDB contains a list of confirmed anycast IP ranges that can be used for this purpose.

When the source or destination is set to `geoip`, you can enable the `geoip-anycast` option. Once enabled, IPs where the anycast option is set to `1` in `geoip_db` are bypassed in country matching and blocking.

You can only use the CLI to configure this feature.

To enable the geoip-anycast option using the CLI:

```
config firewall policy
    edit 1
        set name "policyid-1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "test-geoip-CA_1"
        set action accept
        set schedule "always"
        set service "ALL"
        set geoip-anycast enable
        set logtraffic all
        set nat enable
    next
end
```

To check the geoip-anycast option for an IP address using the CLI:

```
# diagnose geoip ip2country 1.0.0.1
    1.0.0.1 - Australia, is anycast ip
```

The anycast IP is `1.0.0.1`.

Matching GeoIP by registered and physical location

IP addresses have both a physical and registered location in the geography IP database. Sometimes these two locations are different. The `geoip-match` command allows users to match an IPv4 address in an firewall policy to its physical or registered location when a GeoIP is used as a source or destination address. IPv6 policies currently support geography address objects but do not support `geoip-match`.

In the following example, the physical location of 220.243.219.10 is CA (Canada), the registered location is CN (China), and it is not an anycast IP.

To configure GeoIP matching based on registered location:

1. Create a firewall policy to match the IP:

```
config firewall policy
    edit 1
        set name "policy_id_1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "test-geoip-CA"
        set action accept
        set schedule "always"
        set service "ALL"
        set geoip-match registered-location
```

```
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Since CA is applied as a destination address and registered location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will be blocked because the registered location is CN.

2. Verify that the policy is blocking traffic from the IP address:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.383798 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.381982 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
7.382608 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
^C
3 packets received by filter
0 packets dropped by kernel
```

To configure GeoIP matching based on physical location:

1. Create a firewall policy to match the IP:

```
config firewall policy
    edit 1
        set name "policy_id_1"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "test-geoip-CA"
        set action accept
        set schedule "always"
        set service "ALL"
        set geoip-match physical-location
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Since CA is applied as a destination address and physical location IP matching is enabled, if the destination IP of the traffic is 220.243.219.10, then the traffic will pass through.

2. Verify that the policy is allowing traffic from the IP address:

```
# diagnose sniffer packet any icmp 4
interfaces=[any]
filters=[icmp]
5.273985 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
5.274176 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
```

```
6.274426 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
6.274438 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
7.273978 wan2 in 10.1.100.41 -> 220.243.219.10: icmp: echo request
7.273987 wan1 out 172.16.200.10 -> 220.243.219.10: icmp: echo request
^C
6 packets received by filter
0 packets dropped by kernel
```

HTTP to HTTPS redirect for load balancing

You can configure a virtual server with HTTP to HTTPS redirect enabled. When enabled, a virtual server can convert a client's HTTP requests to HTTPS requests. Through this mandatory conversion, HTTP traffic is converted to HTTPS traffic. This conversion improves the security of the user network.

You can only enable this feature by using the CLI. After you enable this feature, traffic flows as follows:

- When FortiGate receives an HTTP request for an external IP, such as 10.1.100.201 in the following example, FortiGate sends an HTTP 303 response back to the original client and redirects HTTP to HTTPS, instead of forwarding the HTTP request to the real backend servers.
- The client browser restarts the TCP session to HTTPS.
- The HTTPS session comes to the FortiGate where a matching firewall policy allows the HTTPS traffic and establishes a secure SSL connection, and then forwards the request to the real backend servers.

To configure virtual server with HTTPS redirect enabled:

1. Create a virtual server with `server-type` set to `http`:

```
config firewall vip
    edit "virtual-server-http"
        set type server-load-balance
        set extip 10.1.100.201
        set extintf "wan2"
        set server-type http
        set ldb-method round-robin
        set extport 80
        config realservers
            edit 1
                set ip 172.16.200.44
                set port 80
            next
            edit 2
                set ip 172.16.200.55
                set port 80
            next
        end
    next
end
```

2. Create a virtual server with `server-type` set to `https` and with the same external IP address:

```
config firewall vip
    edit "virtual-server-https"
        set type server-load-balance
        set extip 10.1.100.201
        set extintf "wan2"
        set server-type https
        set ldb-method round-robin
        set extport 443
        config realservers
            edit 1
                set ip 172.16.200.44
                set port 443
            next
            edit 2
                set ip 172.16.200.55
                set port 443
            next
        end
        set ssl-certificate "Fortinet_SSL"
    next
end
```

3. Enable the `http-redirect` option for the virtual server with `server-type` set to `http`:

```
config firewall vip
    edit "virtual-server-http"
        <b>set http-redirect enable</b>
    next
end
```

4. Add the two virtual servers to a policy:

```
config firewall policy
    edit 9
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "virtual-server-http" "virtual-server-https"
        set action accept
        set schedule "always"
        set service "ALL"
        set inspection-mode proxy
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Use Active Directory objects directly in policies

Active Directory (AD) groups can be used directly in identity-based firewall policies. You do not need to add remote AD groups to local FSSO groups before using them in policies.

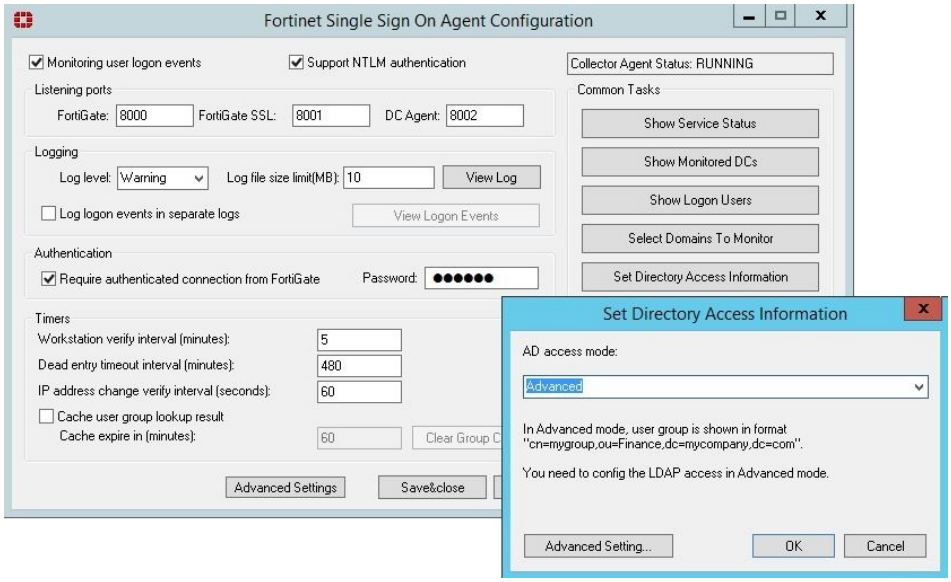
FortiGate administrators can define how often group information is updated from AD LDAP servers.

To retrieve and use AD user groups in policies:

1. Set the FSSO Collector Agent AD access mode on page 1923
2. Add an LDAP server on page 1924
3. Create the FSSO collector that updates the AD user groups list on page 1925
4. Use the AD user groups in a policy on page 1926

Set the FSSO Collector Agent AD access mode

To use this feature, you must set FSSO Collector Agent to *Advanced* AD access mode. If the FSSO Collector Agent is running in the default mode, FortiGate cannot correctly match user group memberships.



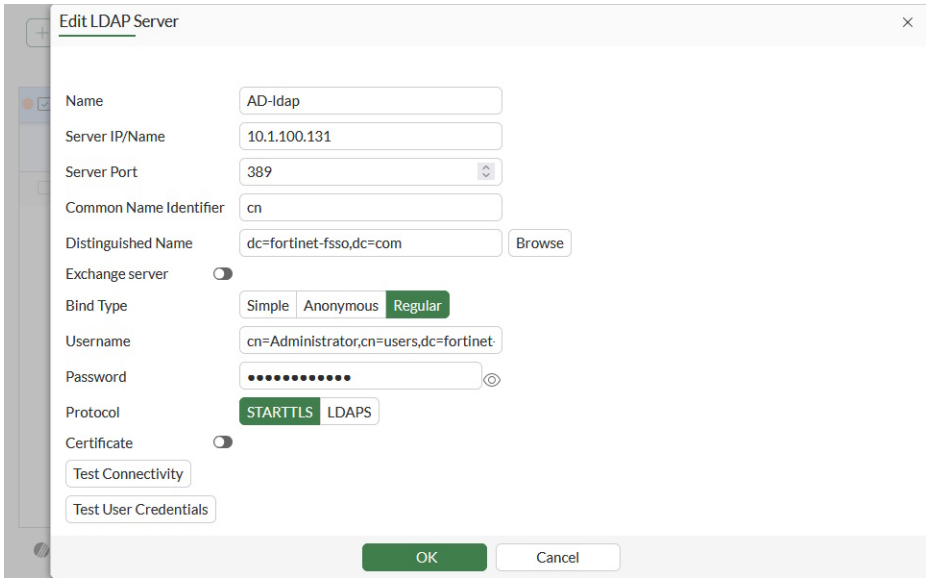
Add an LDAP server

When configuring an LDAP connection to an Active Directory server, an administrator must provide Active Directory user credentials.

- To secure this connection, use LDAPS on both the Active Directory server and FortiGate. See Configuring an LDAP server on page 3381 and Configuring client certificate authentication on the LDAP server on page 3396.
- Apply the principle of least privilege. For the LDAP regular bind operation, do not use credentials that provide full administrative access to the Windows server when using credentials. See Configuring least privileges for LDAP admin account authentication in Active Directory on page 3389.

To add an LDAP server in the GUI:

1. Go to *User & Authentication* > *LDAP Servers*.
2. Click *Create New*.
3. Configure the settings as needed.



4. If secure communication over TLS is not supported by the remote AD LDAP server, disable the secure connection in the CLI:

```
config user ldap
    edit "AD-ldap"
        set secure disable
    next
end
```

5. Click *OK*.

To add an LDAP server in the CLI:

```
config user ldap
    edit "AD-ldap"
        set server "10.1.100.131"
        set cnid "cn"
        set dn "dc=fortinet-fsso,dc=com"
        set type regular
        set username "cn=Administrator,cn=users,dc=fortinet-fsso,dc=com"
        set password XXXXXXXXXXXXXXXXXXXXXXX
    next
end
```

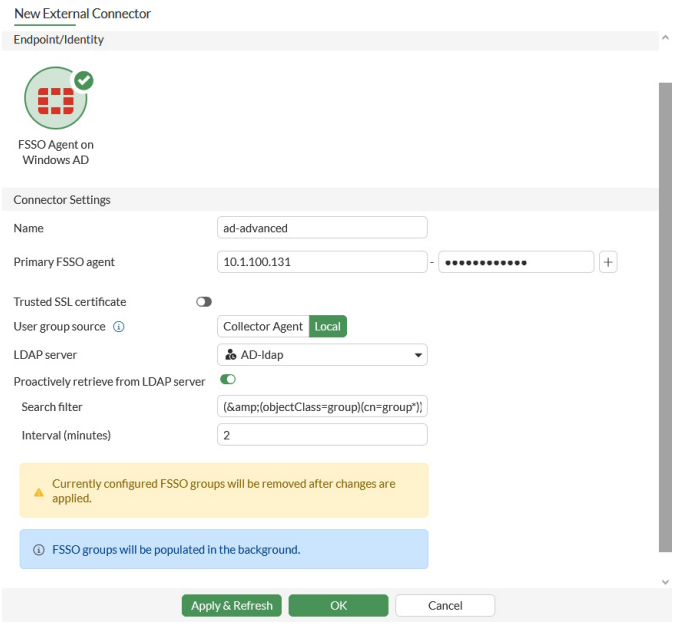
Create the FSSO collector that updates the AD user groups list

To create an FSSO agent connector in the GUI:

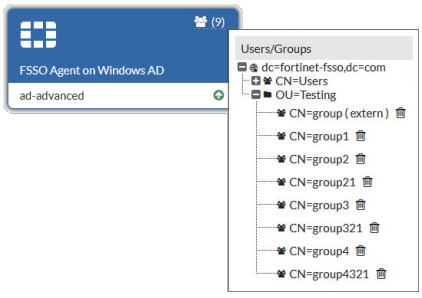
1. Go to *Security Fabric > External Connectors*.
2. Click *Create New*.
3. In the *Endpoint/Identity* section, click *FSSO Agent on Windows AD*.
4. Fill in the *Name*
5. Set the *Primary FSSO Agent* to the IP address of the FSSO Collector Agent, and enter its password.
6. Set the *User group source* to *Local*.
7. Set the *LDAP server* to the just created *AD-ldap* server.
8. Enable *Proactively retrieve from LDAP server*.
9. Set the *Search filter* to *(&(objectClass=group)(cn=group*))*.

   The default search filter retrieves all groups, including Microsoft system groups. In this example, the filter is configured to retrieve *group1*, *group2*, etc, and not groups like *grp199*.

   The filter syntax is not automatically checked; if it is incorrect, the FortiGate might not retrieve any groups.
10. Set the *Interval (minutes)* to configure how often the FortiGate contacts the remote AD LDAP server to update the group information.



11. Click *OK*.
12. To view the AD user groups that are retrieved by the FSSO agent, hover the cursor over the group icon on the fabric connector listing.



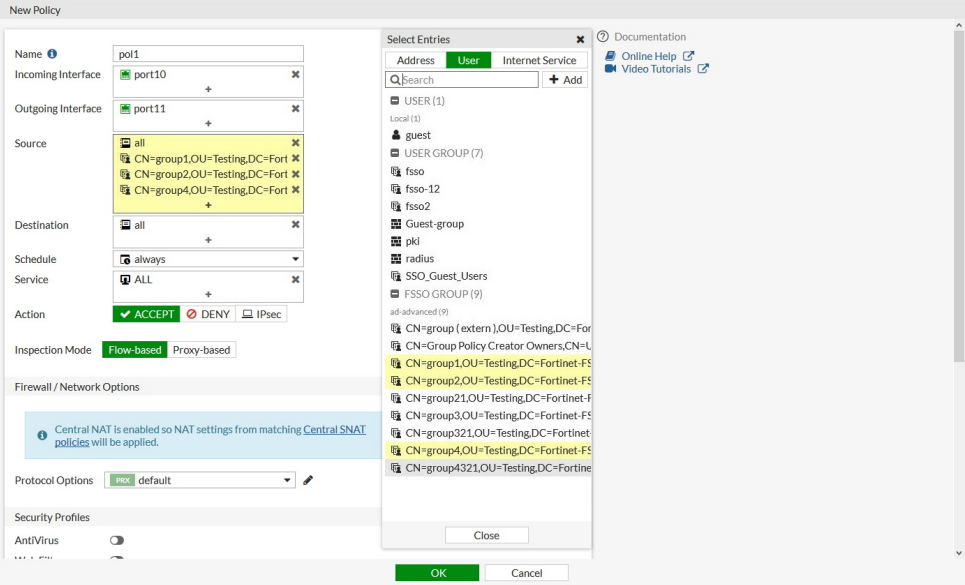
To create an FSSO agent connector in the CLI:

```
config user fsso
    edit "ad-advanced"
        set server "10.1.100.131"
        set password XXXXXXXXXXXXXX
        set ldap-server "AD-ldap"
        set ldap-poll enable
        set ldap-poll-interval 2
        set ldap-poll-filter "(&amp;(objectClass=group)(cn=group*))"
    next
end
```

You can view the retrieved AD user groups with the `show user adgrp` command.

Use the AD user groups in a policy

The AD user groups retrieved by the FortiGate can be used directly in firewall policies.



No session timeout

To allow clients to permanently connect with legacy medical applications and systems that do not have keepalive or auto-reconnect features, the session timeout can be set to never for firewall services, policies, and VDOMs.

The options to disable session timeout are hidden in the CLI.

To set the session TTL value of a custom service to never:

```
config firewall service custom
    edit "tcp_23"
        set tcp-portrange 23
        set session-ttl never
    next
end
```

To set the session TTL value of a policy to never:

```
config firewall policy
    edit 201
        set srcintf "wan1"
        set dstintf "wan2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "TCP_8080"
        set logtraffic disable
        set session-ttl never
        set nat enable
```

```
    next
end
```

To set the session TTL value of a VDOM to never:

```
config system session-ttl
    set default never
    config port
        edit 1
            set protocol 6
            set timeout never
            set start-port 8080
            set end-port 8080
        next
    end
end
```

To view a session list with the timeout set to never:

```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=9 expire=never timeout=never flags=00000000
sockflag=00000000 sockport=0 av_idx=0 use=3

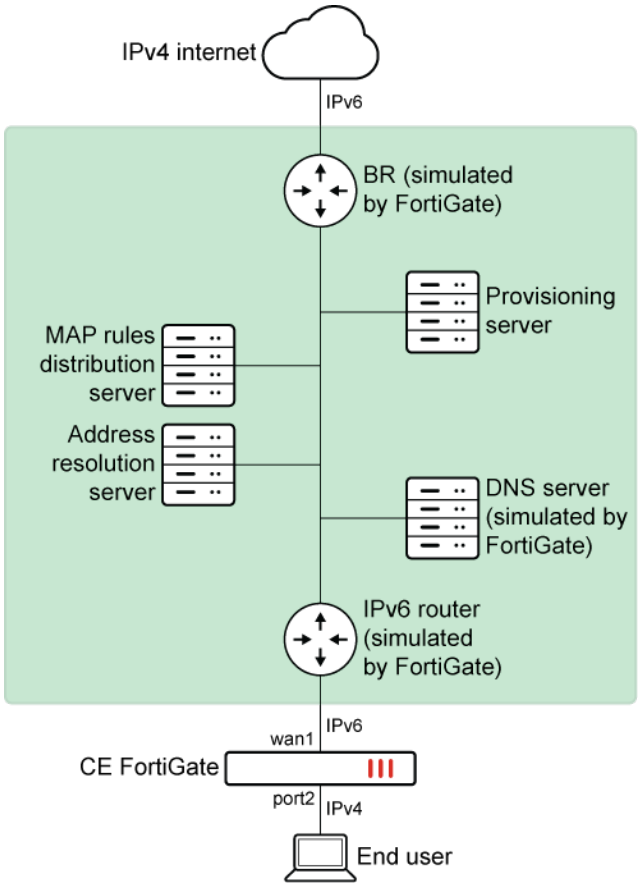
```

MAP-E support

On a customer edge (CE) FortiGate, an IPv4-over-IPv6 (MAP-E) tunnel can be created between the FortiGate and the border relay (BR) operating in an IPv6 network. A tunnel interface is created between the FortiGate and BR, which can be applied to firewall policies and IPsec VPN.



To configure a MAP-E tunnel between the FortiGate and the BR:

1. Configure fixed IP mode.
   a. Configure IPv6 on the interface:

```
config system interface
    edit "wan1"
        config ipv6
            set autoconf enable
            set unique-autoconf-addr enable
            set interface-identifier ::6f:6c1f:3400:0
        end
    next
end
```

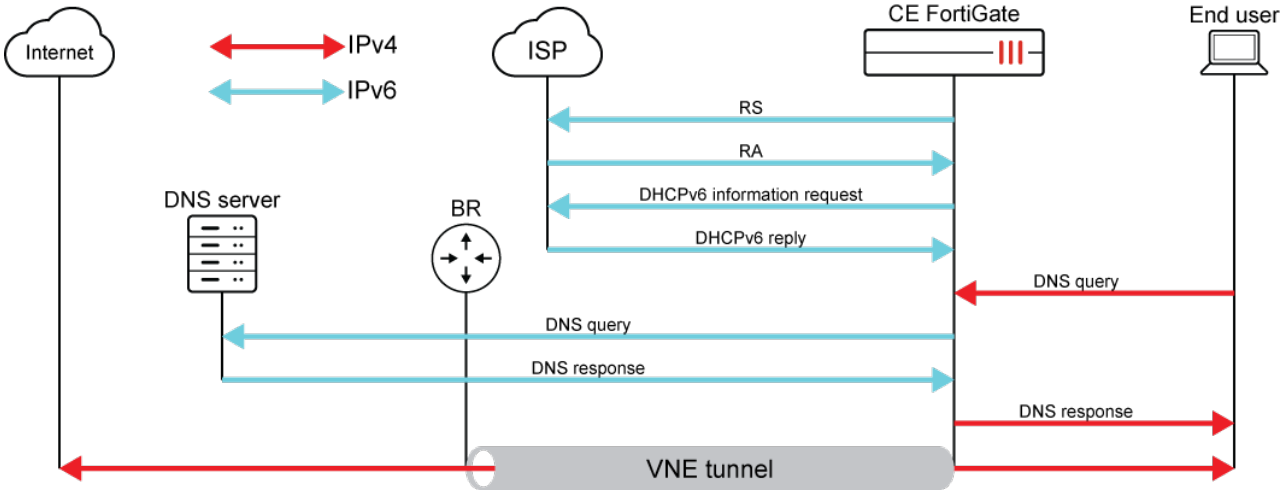
   The `interface-identifier` is an IPv6 address. Its last 64-bit will be kept and the rest will be cleared automatically. It will combine with the IPv6 prefix it gets from the IPv6 router to generate the IPv6 address of the interface.

   By default, `unique-autoconf-addr` is disabled. It must be enabled so it can handle IPv6 prefix changing.

   b. Configure the VNE tunnel:

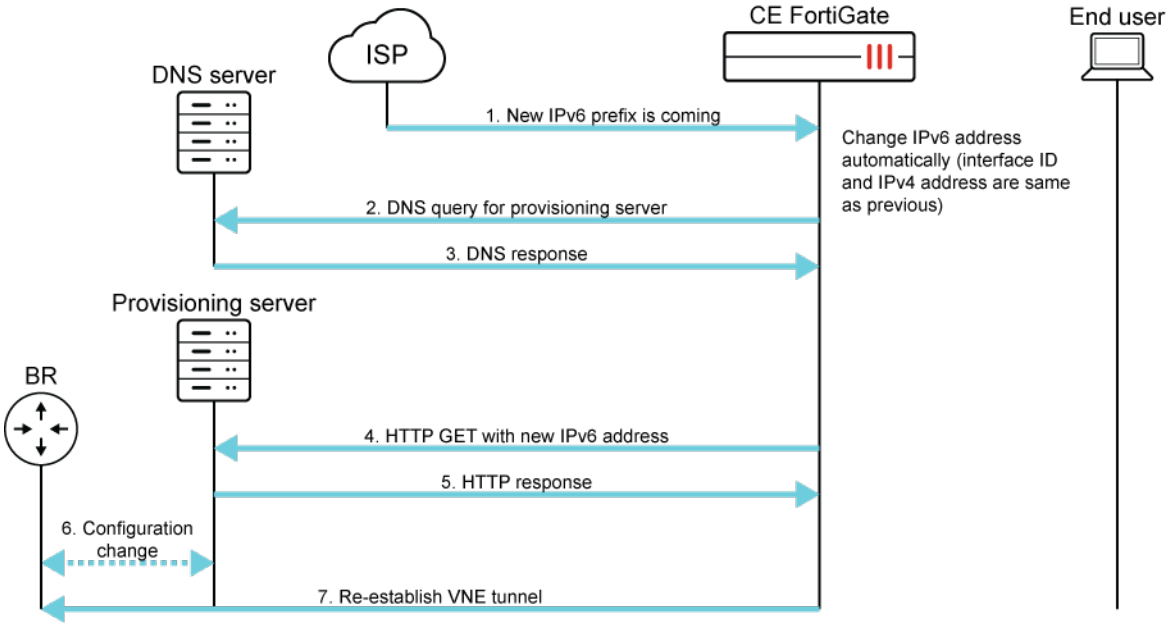
```
config system vne-interface
    edit vne1
        set interface "wan1"
        set mode fixed-ip
        set ipv4-address 10.10.81.81 255.255.255.255
        set br 2001:160::82
        set update-url http://qa.forosqa.com/update?user=xxxx&pass=yyyy
    next
end
```

Initial sequence overview of VNE tunnel under fixed IP mode:



Once the IPv6 address of the FortiGate changes, the tunnel will be down because the BR does not know the FortiGate's new IPv6 address. The FortiGate uses `update-url` to update the new IPv6 address to the provisioning server. The provisioning server updates the FortiGate's IPv6 address to the BR so the VNE tunnel can be re-established.

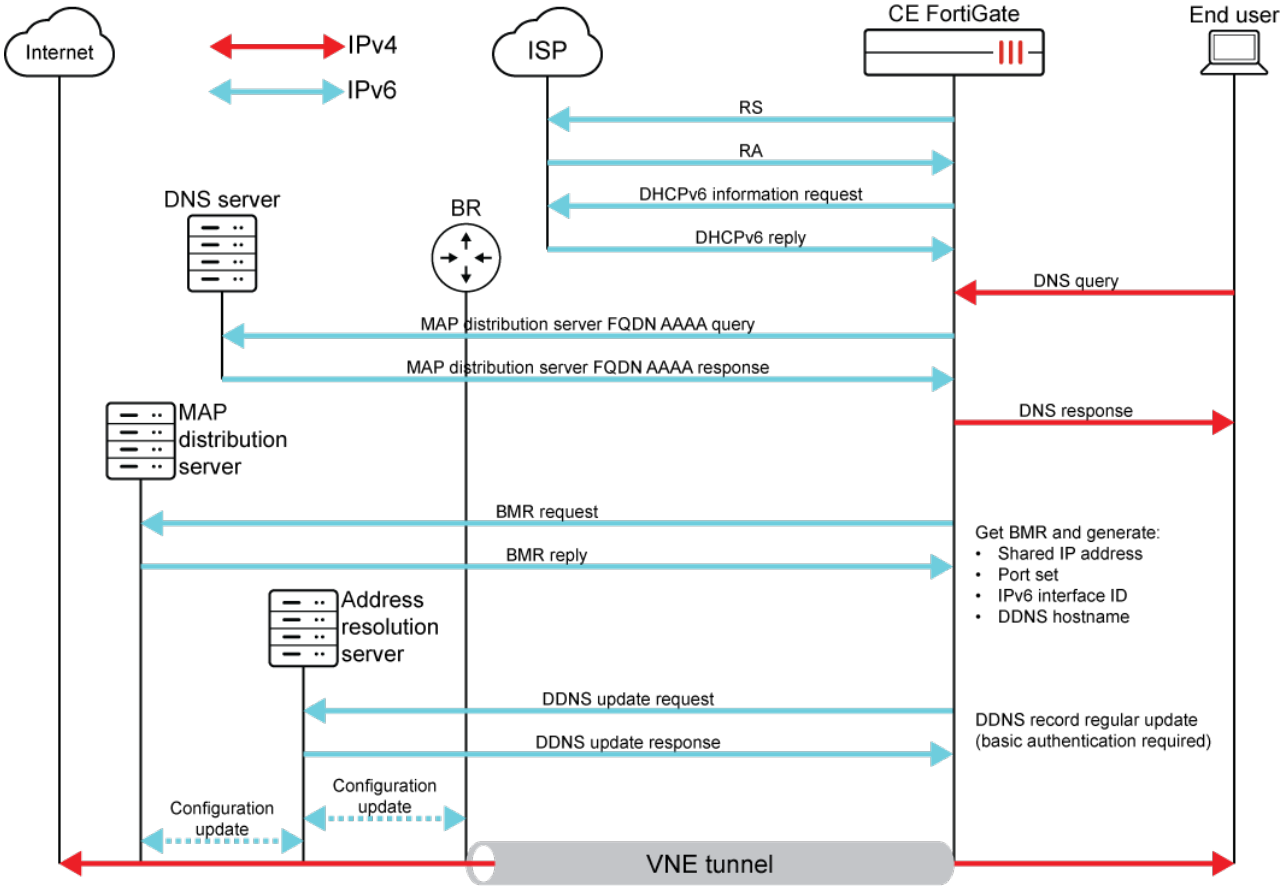
Communication sequence overview of re-establishing VNE tunnel:



2. Configure the VNE tunnel to use MAP-E mode:

```
config system vne-interface
    edit vne1
        set interface 'wan1'
        set ssl-certificate "Fortinet_Factory"
        set bmr-hostname ********
        set auto-asic-offload enable
        set mode map-e
    next
end
```

Initial sequence overview of VNE tunnel under MAP-E mode:



The FortiGate sends a MAP rule request to the MAP distribution server once the IPv6 address is configured on the FortiGate by RS/RA. Next, the FortiGate will send an AAAA query to get the IPv6 address of the MAP distribution server. After sending the BMR request to the MAP distribution server, the FortiGate will get the IPv4 address, port set, BR IPv6 address, and hostname of the address resolution server from the BMR reply. The VNE tunnel between the FortiGate and BR is now established.

The address resolution server is actually a dynamic DNS. The hostname is used for the FortiGate to maintain an IPv6 address when it changes.

The FortiGate updates the DDNS server with its IPv6 address whenever it updates, which in turn provides the update to the MAP distribution server and BR so they know how to resolve the FortiGate by hostname.

Once the VNE tunnel is established, an IPv4-over-IPv6 tunnel is set up between the FortiGate and BR. The route, firewall policy, and DNS server can now be configured to let the traffic go through the VNE tunnel and

protect the end-user. The VNE tunnel can also be used in IPsec phase 1.

3. Configure the route:

```
config router static
    edit 1
        set device "vne1"
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 111
        set name "ff"
        set srcintf "port2"
        set dstintf "vne1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set nat enable
    next
end
```

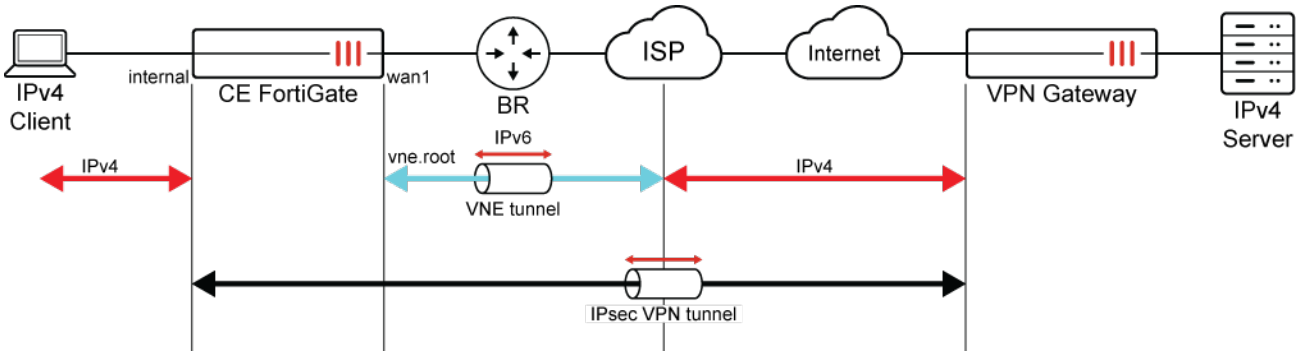
5. Configure the DNS server:

```
config system dns-server
    edit "port2"
    next
end
```

MAP-E can also operate in DHCPv6-PD environments; see DHCP-PD support for MAP-E on page 1933 for more information.

IPsec over VNE and offloading

In some scenarios, after the VNE tunnel is established, users might want to build IPsec tunnels over VNE for end-to-end encryption. This allows IPsec traffic to be encapsulated within the VNE tunnel to pass through the IPv6 ISP infrastructure and stay encrypted as it reaches the VPN Gateway and final destination.



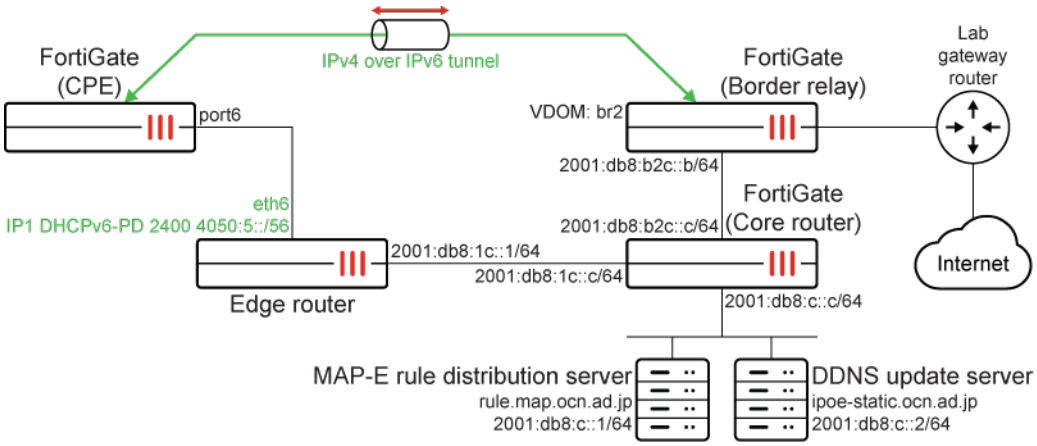
In these scenarios, NP-offloading (NP7 and NP7Lite) is supported over the IPsec tunnel when the following criteria are met:

1. The interface settings of the IPsec phase1-interface must be either a physical, trunk, or npu-vlink interface, or a VLAN on one of these interfaces.
2. The interface setting of the IPsec phase1-interface cannot be set to the VNE tunnel interface.
3. If the npu-vlink is used, the VNE and IPsec tunnels must be in different VDOMs.

DHCP-PD support for MAP-E

Mapping of address and port with encapsulation (MAP-E) can operate in DHCPv6 prefix delegation (DHCPv6-PD) environments, providing greater flexibility, improved automation, and scalability in network configurations. Previously, MAP-E utilized the RA IPv6 prefix for deployment; see MAP-E support on page 1928.

MAP-E mode



To configure MAP-E mode:

1. Configure the border relay FortiGate:

```
config system interface
    edit "core-br21"
        set vdom "br2"
        set type vdom-link
```

```
        set snmp-index 27
        config ipv6
            set ip6-address 2001:db8:b2c::b/64
            set ip6-allowaccess ping
        end
    next
end
config system ipv6-tunnel
    edit "6"
        set source 2001:db8:b2c::b
        set destination 2400:4050:6:0:c0:2:2200:0
    next
end
```

2. Configure the CPE FortiGate:
   a. Configure port6 to get an IPv6 address through the delegate:

```
config system interface
    edit "port6"
        set vdom "root"
        set type physical
        set snmp-index 6
        config ipv6
            set ip6-mode delegated
            set ip6-allowaccess ping
            set dhcp6-prefix-delegation enable
            set ip6-delegated-prefix-iaid 1
            set ip6-upstream-interface "port6"
            set ip6-subnet ::1/64
            config dhcp6-iapd-list
                edit 1
                    set prefix-hint ::/56
                next
            end
        end
    next
end
```

```
# dianose ipv ad list | grep port6
dev=7 devname=port6 flag= scope=0 prefix=64 addr=2400:4050:6::1 preferred=22 valid=45
cstamp=9913 tstamp=6047755
dev=7 devname=port6 flag=P scope=253 prefix=64 addr=fe80::20c:29ff:fe7b:d83b
preferred=4294967295 valid=4294967295 cstamp=6263 tstamp=6263
```

   b. Configure the virtual network enabler (VNE) tunnel:

```
config system vne-interface
    edit "vne.port6"
        set interface "port6"
    next
end
```

```
# diagnose test application vned 1
------------------------------------------------------------------------------
vdom: root/0, is master, devname=port6 link=1 tun=vne.port6 mode=map-e ssl_cert=Fortinet_
Factory
end user ipv6 perfix: 2400:4050:6::/56
interface ipv6 addr: 2400:4050:6::1
bmr rule ipv6 perfix: 2400:4050:6::/56
bmr rule ipv4 perfix: 192.0.2.34/32
bmr rule br: 2001:db8:b2c::b
bmr rule hostname: Testbed6_dhcpv6-pd-IP1
saved hostname: Testbed6_dhcpv6-pd-IP1
tunnel br: 2001:db8:b2c::b
tunnel ipv6 addr: 2400:4050:6:0:c0:2:2200:0
tunnel ipv4 addr: 192.0.2.34/255.255.255.255
update result: good

Map-e rule client: state=succeed retries=0 interval=60 expiry=23634 reply_code=200
fqdn=rule.map.ocn.ad.jp num=1 cur=0 ttl=86400 expiry=0
2001:db8:c::1
Map-e DDNS client: state=succeed retries=0 interval=120 expiry=61372 reply_code=200
fqdn=ipoe-static.ocn.ad.jp num=1 cur=0 ttl=86400 expiry=0
2001:db8:c::2
```

vne.port6 is automatically configured after the VNE tunnel is set up:

```
config system interface
    edit "vne.port6"
        set vdom "root"
        set ip 192.0.2.34 255.255.255.255
        set type tunnel
        set snmp-index 16
        set interface "port6"
    next
end
```

```
# diagnose ipv ad li | grep port6
dev=7 devname=port6 flag=Pn scope=0 prefix=128 addr=2400:4050:6:0:c0:2:2200:0
preferred=4294967295 valid=4294967295 cstamp=10620 tstamp=10620
dev=7 devname=port6 flag= scope=0 prefix=64 addr=2400:4050:6::1 preferred=37 valid=60
cstamp=9913 tstamp=6108593
dev=7 devname=port6 flag=P scope=253 prefix=64 addr=fe80::20c:29ff:fe7b:d83b
preferred=4294967295 valid=4294967295 cstamp=6263 tstamp=6263
```

c. Traffic can now pass through the VNE tunnel:

```
config router static
    edit 1
        set device "vne.port6"
    next
end
```

```
# execute ping 8.8.8.8
PING 8.8.8.8 (8.8.8.8): 56 data bytes
64 bytes from 8.8.8.8: icmp_seq=0 ttl=116 time=5.3 ms
64 bytes from 8.8.8.8: icmp_seq=1 ttl=116 time=4.1 ms

reply
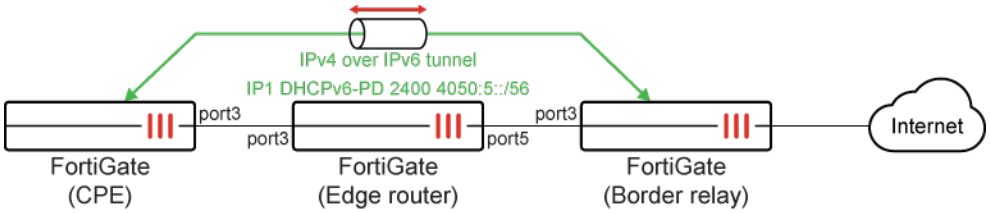
```

Fixed IP mode



To configure fixed IP mode:

1. Configure the border relay FortiGate:

```
config system ipv6-tunnel
    edit "VNE-IPV6-2"
        set source 2606:f900:8102:302::2
        set destination 2606:f900:8102:301:8000::
        set interface "port3"
    next
end
config system interface
    edit "port3"
        set vdom "root"
        set type physical
        set snmp-index 9
        config ipv6
            set ip6-address 2606:f900:8102:302::2/64
            set ip6-allowaccess ping
        end
    next
end
```

2. Configure the CPE FortiGate:
   a. Configure port3 to get an IPv6 address through the delegate:

```
config system interface
    edit "port3"
        set vdom "root"
        set type physical
        set snmp-index 9
        config ipv6
            set ip6-mode delegated
            set ip6-allowaccess ping
            set dhcp6-prefix-delegation enable
            set ip6-delegated-prefix-iaid 1
            set ip6-upstream-interface "port3"
            set ip6-subnet ::8000:0:0:0/64
            config dhcp6-iapd-list
                edit 1
                    set prefix-hint 2606:f900:8102:301::/64
                next
                edit 2
                    set prefix-hint 2606:f900:8102:303::/64
                next
            end
        end
    next
end
```

```
# diagnose ipv ad list | grep port3
dev=13 devname=port3 flag=P scope=0 prefix=64 addr=2606:f900:8102:301:8000::
```

```
preferred=4294967295 valid=4294967295 cstamp=61106 tstamp=61106

preferred=4294967295 valid=4294967295 cstamp=56882 tstamp=56882
```

b. Configure the VNE tunnel:

```
config system vne-interface
    edit "VNE"
        set interface "port3"
        set ipv4-address 10.100.100.1 255.255.255.255
        set br "2606:f900:8102:302::2"
        set update-url "http://test.com"
        set mode fixed-ip
    next
end
```

```
# diagnose test application vned 1
------------------------------------------------------------------------------
vdom: root/0, is master, devname=port3 link=1 tun=VNE mode=fixed-ip ssl_cert=Fortinet_
Factory
end user ipv6 perfix: 2606:f900:8102:301::/64
interface ipv6 addr: 2606:f900:8102:301:8000::
config ipv4 perfix: 10.100.100.1/255.255.255.0
config br: 2606:f900:8102:302::2
HTTP username:

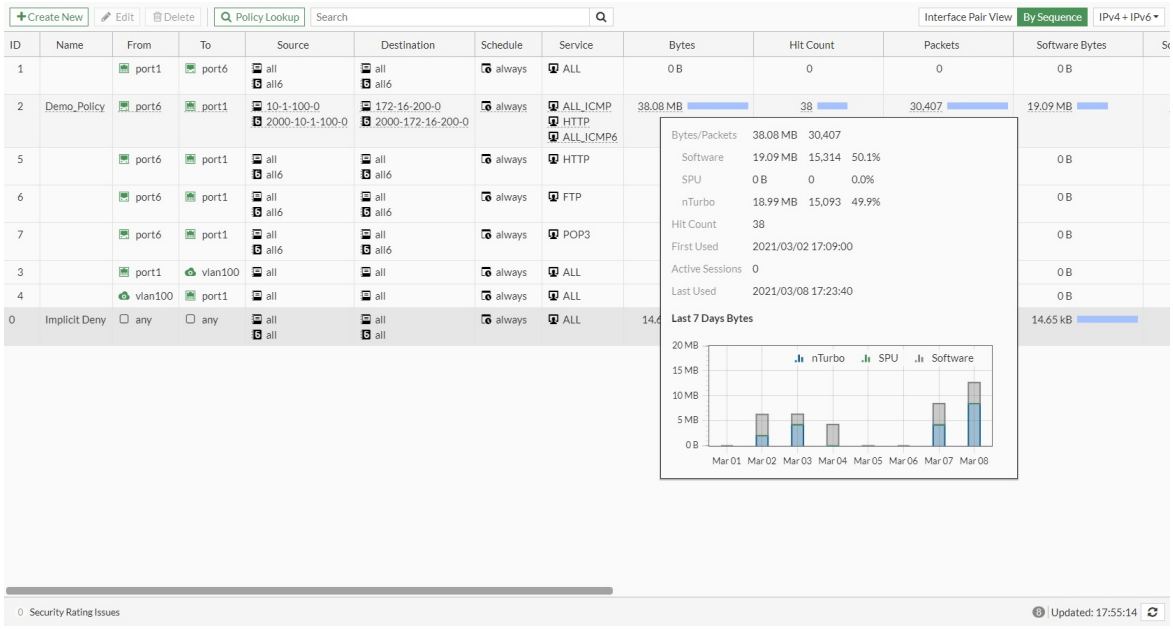
Seven-day rolling counter for policy hit counters

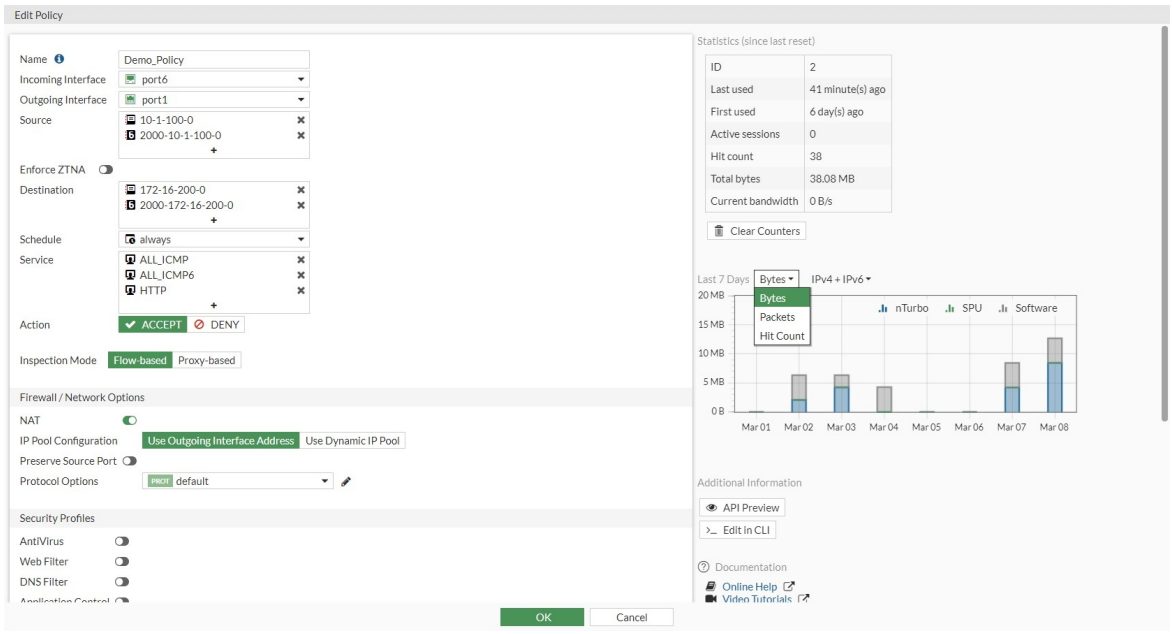
Instead of storing a single number for the hit count and byte count collected since the inception of each policy, seven numbers for the last seven days and an active counter for the current day are stored. The past seven-day hit count is displayed in the policy list and policy pages. A seven-day bar chart shows statistics on each policy page. This feature is currently supported in firewall and multicast policies, but not security policies.

To view the rolling counter information in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* or *Policy & Objects* > *Multicast Policy*.
2. Select a policy and hover over the *Bytes*, *Packets*, or *Hit Count* values to view the tooltip with the corresponding traffic statistics and bar graph (this example uses firewall policies).



3. Click *Edit*. The policy traffic statistics appear in the right-hand side of the page.
4. Use the dropdowns to filter the bar graph data by counter (*Bytes*, *Packets*, or *Hit Count*) and policy type (*IPv4*, *IPv6*, or *IPv4 + IPv6*).



5. Optionally, click *Clear Counters* to delete the traffic statistics for the policy.
6. Click *OK*.

To view the rolling counter information in the CLI:

```
# diagnose firewall iprope show 100004 2
idx=2 pkts/bytes=14709/18777329 asic_pkts/asic_bytes=8087/10413737 nturbo_pkts/nturbo_

```

Cisco Security Group Tag as policy matching criteria

The FortiGate can read the Cisco Security Group Tag (SGT) in Ethernet frames, and use them as matching criteria in firewall policies. A policy can match based on the presence of an SGT, or the detection of a specific ID or IDs.

When a packet with a SGT passes through and a session is established, the `ext_header_type=0xc5:0xc5` flag is included in the session table.

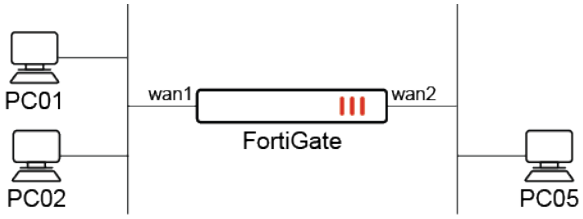
This feature is available in flow mode policies for virtual wire pair policies only.

To configure a firewall policy to detect SGTs in Ethernet frames:

```
config firewall policy
    edit 1
        set sgt-check {enable | disable}
        set sgt <ID numbers>
    next
end
```

Examples

In these examples, wan1 and wan2 are in a virtual wire pair. Firewall policies are created that pass traffic with SGTs with a specific ID number, any ID number, or either of two specific ID numbers.



To configure the virtual wire pair:

```
config system virtual-wire-pair
    edit "test-vwp-1"
        set member "wan1" "wan2"
        set wildcard-vlan enable
```

```
    next
end
```

To configure a firewall policy to match frames that have an SGT with ID 20 and allow them through:

```
config firewall policy
    edit 1
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set sgt-check enable
        set sgt 20
    next
end
```

To configure a firewall policy to match frames that have an SGT with any ID:

```
config firewall policy
    edit 1
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set sgt-check enable
    next
end
```

To configure a firewall policy to match frames that have the SGT with IDs 20 or 21:

```
config firewall policy
    edit 1
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set sgt-check enable
        set sgt 20 21
    next
end
```

Processing only Ethernet frames with a Cisco Security Group Tag

In this example, an Ethernet frame is sent from PC01 with an SGT tag (ID 20), which can pass through to PC05 based on any of the firewall policies in the previous examples.

To verify the configuration:

```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=10 expire=3593 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=

rpdb_link_id=00000000 rpdb_svc_id=0 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
ext_header_type=0xc5:0xc5
total session 1
```

Processing Ethernet frames with a Cisco Security Group Tag and VLAN tag

The FortiGate has the ability to process Ethernet frames with both the Cisco Security Group Tag and VLAN tag.

In this example, PC02 is connected to a switch port configured for VLAN 2. An Ethernet frame is sent from PC02 with an SGT tag (ID 20) and VLAN ID (2), which can pass through to PC05 based on any of the firewall policies in the previous examples.

To verify the configuration:

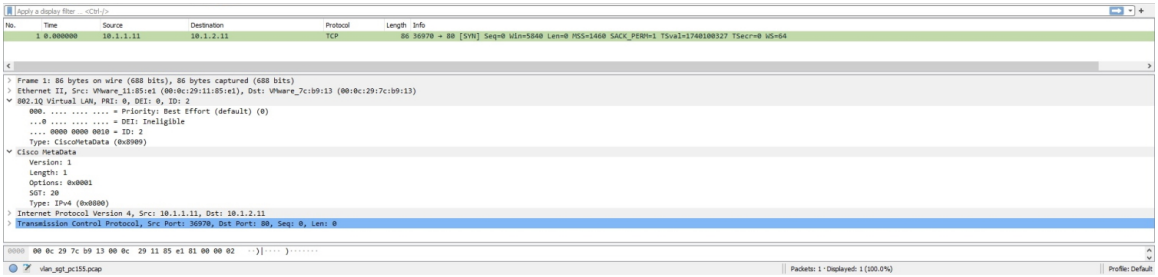
1. Check the session list:

```
# diagnose sys session list

session info: proto=6 proto_state=01 duration=2007 expire=3482 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
```

```
state=may_dirty br
statistic(bytes/packets/allow_err): org=164/3/1 reply=120/2/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 10.1.1.11:36970->10.1.2.11:80(0.0.0.0:0)
hook=post dir=reply act=noop 10.1.2.11:80->10.1.1.11:36970(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=1 pol_uuid_idx=572 auth_info=0 chk_client_info=0 vd=0
serial=0432fb8f tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
vlanid=2
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
           ext_header_type=0xc5:0xc5
```

2. Perform a packet capture on PC05 (Wireshark is used in this example) and check that the packet includes the VLAN ID and Cisco SGT fields.



Virtual patching on the local-in management interface

Virtual patching is a method of mitigating vulnerability exploits by using the FortiGate's IPS engine to block known vulnerabilities. Virtual patching can be applied to traffic destined to the FortiGate by applying the FMWP (Firmware Virtual Patch) database to the local-in interface using local-in policies. Attacks geared towards GUI and SSH management access, for example, can be mitigated using the FMWP database pushed from FortiGuard, thereby virtually patching these vulnerabilities.

When the `virtual-patch` option is enabled in a local-in policy, the IPS engine queries the FortiGuard API server to:

- Obtain a list of vulnerabilities targeting the FortiGate on a particular version
- Determine whether the session destined to the local-in interface on the FortiGate requires a scan by identifying and tagging services in the session. The session's port number and protocol are used to identify the services. Currently only Agentless VPN and web GUI services are tagged in a session.

If a tagged session lacks vulnerability signatures for the FortiOS version, then the IPS engine bypasses the session. This optimizes performance by only scanning and dropping sessions that are exploiting a vulnerability.

To configure virtual patching:

```
config firewall local-in-policy
    edit <id>
        set action accept
```

```
        set virtual-patch {enable | disable}
    next
end
```

The FortiGate must have a valid FMWR (Firmware) license to install the FMWP database. The FMWP database can be viewed by running the `diagnose autoupdate versions` command.

```
# diagnose autoupdate versions
FMWP Definitions
---------
Version: 23.00084 signed
Contract Expiry Date: Wed Jan  1 2031
Last Updated using manual update on Wed Sep  6 15:19:11 2023
Last Update Attempt: Wed Sep  6 15:40:08 2023
Result: No Updates
```

Once `virtual-patch` is enabled, the WAD process will periodically query vulnerability items from the FortiGuard API server at "productapi.corp.fortinet.com" and forward it to IPS.

> ⚠ For Agentless VPN and ZTNA connections that terminate on the FortiGate from a client that is using a client certificate, enabling `virtual-patch` will cause the connection to fail. Do not enable `virtual-patch` if you are using either of these configurations.

Sample vulnerability item found on the FortiGuard API server

```
{"ID":918630,"product":"fortios","vendor":"fortinet","max_version":"7.2.5","min_
version":"7.2.0","severity":"high","vuln_type":"Format String","refs":
["https://www.fortiguard.com/psirt/FG-IR-23-137"],"description":"This indicates detection of a
Zero-Day vulnerability protected by a signature from Fortinet's FortiGuard Labs. This signature
should help mitigate the threat proactively both prior to, and after an official statement is
available from the vendor. Once an official advisory or statement is available from the vendor,
the signature name and its description will be updated to provide more details regarding this
vulnerability. Further details may also be made available in an advisory on FortiGuard Center
(http://www.fortiguard.com).","patch_sig_id":10004065,"patch_sig_ids":[],"detection_sig_
ids":null,"date_added":"2023-08-22T13:09:11","date_updated":"2023-08-22T13:09:11"}
```

FortiGuard can be queried from the FortiOS CLI for a list of vulnerability rules while specifying parameters for the vendor, version, product, and model by running the `diagnose wad dev-vuln query` command. For example, to query Fortinet Inc.'s FortiOS 7.2.5:

```
# diagnose wad dev-vuln query vendor=fortinet&version=7.2.5&product=fortios
Dev-Vuln Lookup result: success, cache: found, fgd: unknown, item: 0x7fb474e0b4a0
Vulnerability details:
info entry (1):
        'vendor' = fortinet
       'product' = fortios
         'model' = N/A
   'version.min' = 7.2.0
   'version.max' = 7.2.5
      'firmware' = N/A
         'build' = N/A
```

```
    'date_added' = 2023-08-22T13:09:11
  'date_updated' = 2023-08-22T13:09:11
       'sig_id' = 10004065
      'vuln_id' = 918630
     'severity' = 3
...
```

After receiving the vulnerability rules from the WAD process, the IPS engine marks them as virtual patch rules mapped to each CVE vulnerability signature. For example:

FortiOS.NodeJS.Proxy.Authentication.Bypass(CVE-2022-40684)

FortiOS.SSL.VPN.Web.Portal.Password.Improper.Authentication(CVE-2018-13382)

FortiOS.SSL.VPN.Web.Protoal.Pathname.Information.Disclosure(CVE-2018-13379)

To show the list of available FMWP signatures from the FMWP database:

```
# get rule fmwp status
rule-name: "FortiOS.Fclicense.Daemon.Format.String."
rule-id: 10004067
rev: 23.082
date: 1697644800
action: block
status: enable
log: disable
log-packet: disable
severity: 3.high
service: TCP, HTTP
location: server
os: Linux
application: Other
rate-count: 0
rate-duration: 0
rate-track: none
rate-mode: continuous
vuln_type: Format String
cve: 202329181
fos_comp: Web-GUI
....
```

The following are the diagnose commands:

```
# diagnose ips vpatch {fmwp-status | fmwp-enable-all  | fmwp-reset}
```

`fmwp-status`	Shows the current status of enabled FMWP signatures.
`fmwp-enable-all`	Enable all FMWP signatures in FMWP database.
`fmwp-reset`	Revert the results of `fmwp-enable-all`.

Example

In this example, virtual patching is enabled for the local-in policy and the following scenarios are described:

- FortiGate with an Agentless VPN vulnerability
- FortiGate with a web GUI vulnerability
- FortiGate with both an Agentless VPN and web GUI vulnerability

To enable virtual patching:

1. Enable virtual patching in the local-in policy:

```
config firewall local-in-policy
    edit 1
        set intf "port2"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set service "ALL"
        set schedule "always"
        set virtual-patch enable
    next
end
```

For enabling virtual patching in a local-in policy in the GUI, see Local-in policy on page 1820.

Because the IPS engine can currently only tag services related to Agentless VPN and web GUI signatures, all other protocols are scanned when `service` is set to `ALL`. However, you can bypass scanning of other protocols, such as SSH and FTP, by setting `service` to only `HTTPS`.

2. Observe the outcome of the following scenarios:
   - In this example, FortiOS has an Agentless VPN vulnerability. The IPS engine drops Agentless VPN traffic to the local-in interface on the FortiGate and bypasses web GUI traffic. Traffic for other services is scanned and passed to the interface.

     Following is a log of the Agentless VPN traffic that was dropped because of the vulnerability. Bypassed web GUI traffic did not generate any logs.

```
# diagnose ips vpatch fmwp-status
Enabled FMWP signatures: 3

- In this example, FortiOS has an Agentless VPN and a web GUI vulnerability. The IPS engine drops both Agentless VPN and web GUI traffic to the local-in interface on the FortiGate. Traffic for other services is scanned and passed to the interface.

  Following is a log of the Agentless VPN and web GUI traffic that was dropped because of the vulnerability.

```
# diagnose ips vpatch fmwp-status
Enabled FMWP signatures: 3

  10002156 FortiOS.NodeJS.Proxy.Authentication.Bypass.
  10002887 FortiOS.SSL-VPN.Heap.Buffer.Overflow.
  10002890 FortiOS.HTTPD.Content-Length.Memory.Corruption.

Air-gapped and closed networks

In air-gapped and closed networks, it is possible to bypass direct queries to the FortiGuard server for vulnerability items by using a FortiManager as an override server. This defers the FortiGuard queries to the FortiManager, and FortiGate only talks to the FortiManager inside the closed network.

For information about how this is configured, see Using FortiManager as an override server for IoT query services on page 3781.

Configuring PCP port mapping with SNAT and DNAT

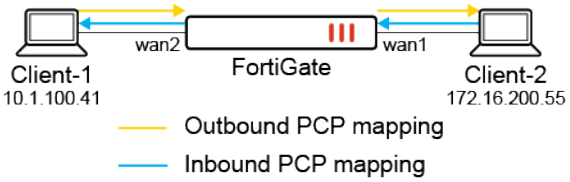
FortiOS supports the Port Control Protocol (PCP) by allowing the FortiGate to act as a PCP server, and dynamically manage network addresses and port translations for PCP clients. The PCP server must be enabled with a pool (`config system pcp-server`). In the firewall policy, enable either `pcp-outbound` or `pcp-inbound` mode and assign the pool.

```
config system pcp-server
    set status {enable | disable}
    config pools
        edit <name>
            set client-subnet <ip_address/subnet>
            set ext-intf <string>
            set extip ip>[-<ip>]
            set extport <port>[-<port>]
            set minimal-lifetime <integer>
            set maximal-lifetime <integer>
            set client-mapping-limit <integer>
            set mapping-filter-limit <integer>
            set allow-opcode {map peer announce}
            set third-party {allow | disallow}
            set multicast-announcement {enable | disable}
            set announcement-count <integer>
            set intl-intf <string>
            set recycle-delay <integer>
        next
    end
end
```

`client-subnet <ip_address/subnet>`	Enter the IP address with subnet from which PCP requests are accepted.
`ext-intf <string>`	Enter the external interface name.

`extip <ip>[-<ip>]`	Enter the IP address or address range on the external interface to map to an address on the internal network.
`extport <port>[-<port>]`	Enter the incoming port number or port range to map to a port number on the internal network.
`minimal-lifetime <integer>`	Set the minimal lifetime of a PCP mapping, in seconds (60 - 300, default = 120).
`maximal-lifetime <integer>`	Set the maximal lifetime of a PCP mapping, in seconds (3600 - 604800, default = 86400).
`client-mapping-limit <integer>`	Mapping limit per client (0 - 65535, default = 0, 0 = unlimited).
`mapping-filter-limit <integer>`	Filter limit per mapping (0 - 5, default = 1).
`allow-opcode {map peer announce}`	Set the allowed PCP OpCode: • `map`: allow MAP OpCode • `peer`: allow PEER OpCode • `announce`: allow ANNOUNCE OpCode
`third-party {allow | disallow}`	Allow/disallow the third-party option.
`multicast-announcement {enable | disable}`	Enable/disable multicast announcements.
`announcement-count <integer>`	Set the number of multicast announcements (3 - 10, default = 3).
`intl-intf <string>`	Enter the internal interface name.
`recycle-delay <integer>`	Set the minimum delay the PCP server will wait before recycling mappings that have expired, in seconds (0 - 3600, default = 0).

The following topology is used to demonstrate two use cases of PCP mapping: with SNAT and DNAT.



Example 1: PCP mapping with SNAT

This example demonstrates how PCP mapping works with SNAT. In the FortiGate PCP server settings, the pcp-pool1 pool is applied in the firewall policy with `pcp-outbound` mode. A PCP request is sent from Client-1 to the FortiGate to create PCP outbound mapping. When traffic is sent from Client-1 to Client-2, SNAT is performed by the PCP outbound mapping.

To configure the FortiGate as a PCP server:

1. Configure the PCP server settings:

```
config system pcp-server
    set status enable
    config pools
        edit "pcp-pool1"
            set client-subnet "10.1.100.41/32"
            set ext-intf "wan1"
            set extip 172.16.200.231
            set extport 50000-51000
            set intl-intf "wan2"
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 999
        set name "Outbound-pcp-policy999"
        set srcintf "wan2"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set pcp-outbound enable
        set pcp-poolname "pcp-pool1"
    next
end
```

To verify the configuration:

1. Generate a PCP peer request from Client-1 (10.1.100.41) to the FortiGate.
2. Verify the client's PCP request to the PCP server. In this example, an PCP client was installed on Ubuntu:

```
root@pc41:~# pcp -i 10.1.100.41:41111 -p 172.16.200.55:80 -s 10.1.100.8
```

3. On the FortiGate, verify the PCP outbound mappings list:

```
# diagnose firewall pcp-mapping list outbound
PCP outbound mappings (vdom=root):
pool:1 nonce:04307eb4037e0448317dc8b7 protocol:6 duration:8 lifetime:900 expiry:893
intl:10.1.100.41:41111 ext:172.16.200.231:50000 remote:172.16.200.55:80
```

4. Send HTTP traffic that passes through the FortiGate and access Client-2 (172.16.200.55:80) from Client-1.
5. On the FortiGate, verify the session list. The source IP address of Client-1 is translated to 172.16.200.231:50000, which follows the PCP outbound mapping:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=8 expire=3599 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00 pcp_outbound
statistic(bytes/packets/allow_err): org=1812/33/1 reply=124168/92/1 tuples=2
tx speed(Bps/kbps): 204/1 rx speed(Bps/kbps): 13998/111
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=172.16.200.55/10.1.100.41
hook=post dir=org act=snat 10.1.100.41:41111->172.16.200.55:80(172.16.200.231:50000)
hook=pre dir=reply act=dnat 172.16.200.55:80->172.16.200.231:50000(10.1.100.41:41111)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=999 pol_uuid_idx=677 auth_info=0 chk_client_info=0 vd=0
serial=0000b4f8 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

6. Send HTTP traffic that passes through the FortiGate and access another server from Client-1.
7. On the FortiGate, verify the session list. This time, the source IP address of Client-1 is not translated to 172.16.200.231:50000, since the traffic does not match the existing PCP outbound mapping:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=6 expire=3596 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=1449/26/1 reply=98808/72/1 tuples=2
tx speed(Bps/kbps): 215/1 rx speed(Bps/kbps): 14703/117
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=172.16.200.155/10.1.100.41
hook=post dir=org act=snat 10.1.100.41:41111->172.16.200.155:80(172.16.200.8:41111)
hook=pre dir=reply act=dnat 172.16.200.155:80->172.16.200.8:41111(10.1.100.41:41111)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=999 pol_uuid_idx=677 auth_info=0 chk_client_info=0 vd=0
serial=0000b596 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000001 no_offload
no_ofld_reason:  disabled-by-policy
total session 1
```

Example 2: PCP mapping with DNAT

This example demonstrates how PCP mapping works with DNAT. In the FortiGate PCP server settings, the pcp-pool1 pool is applied in the firewall policy with `pcp-inbound` mode. A PCP request is sent from Client-1 to the FortiGate to create PCP inbound mapping. When traffic is sent from Client-2 to access the external IP of Client-1 (172.16.200.231:50000), traffic passes by due to the PCP inbound mapping.

To configure the FortiGate as a PCP server:

1. Configure the PCP server settings:

```
config system pcp-server
    set status enable
    config pools
        edit "pcp-pool1"
            set client-subnet "10.1.100.41/32"
            set ext-intf "wan1"
            set extip 172.16.200.231
            set extport 50000-51000
            set intl-intf "wan2"
        next
    end
end
```

2. Configure the firewall policy:

```
config firewall policy
    edit 998
        set name "Inbound-pcp-policy998"
        set srcintf "wan1"
        set dstintf "wan2"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set pcp-inbound enable
        set pcp-poolname "pcp-pool1"
    next
end
```

To verify the configuration:

1. Generate a PCP peer request from Client-1 (10.1.100.41) to the FortiGate.
2. Verify the client's PCP request to the PCP server. In this example, an PCP client was installed on Ubuntu:

```
root@pc41:~# pcp -i 10.1.100.41:80 -s 10.1.100.8
```

3. On the FortiGate, verify the PCP inbound mappings list:

```
# diagnose firewall pcp-mapping list inbound
PCP inbound mappings (vdom=root):
pool:1 nonce:35e2ff035b959f7a4e669791 protocol:6 duration:3 lifetime:900 expiry:900
intl:10.1.100.41:80 ext:172.16.200.231:50000
```

4. From Client-2 (172.16.200.55:80), send traffic that passes through the FortiGate and access the external IP of Client-1 (172.16.200.231:50000).
5. On the FortiGate, run a sniffer trace. The traffic is allowed through policy 998, and the destination IP:port is translated from 172.16.200.231:50000 to 10.1.100.41:80, which follows the PCP inbound mapping:

```
# diagnose sniffer packet any 'tcp and port 50000 or port 80' 4
interfaces=[any]
filters=[tcp and port 50000 or port 80]
2.959915 wan1 in 172.16.200.55.43284 -> 172.16.200.231.50000: syn 3480016601

2.996230 wan1 in 172.16.200.55.43284 -> 172.16.200.231.50000: ack 2813145876
2.996245 wan2 out 10.1.100.8.43284 -> 10.1.100.41.80: ack 2813145876
```

Only traffic matching the PCP inbound mapping will be forwarded by policy 998. Any other traffic is dropped.

Refreshing active sessions for specific protocols and port ranges per VDOM in a specified direction

Active sessions can be refreshed for specific protocols and port ranges per VDOM in a specified direction. This option can help prevent potential denial of service (DoS) attacks by controlling the direction of traffic that refreshes existing sessions.

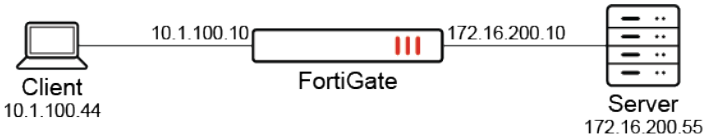
```
config system session-ttl
    config port
        edit <id>
            set protocol <integer>
            set timeout <timeout_value>
```

```
            set refresh-direction {both | outgoing | incoming}
        next
    end
end
```

Setting the `refresh-direction` to `outgoing` will use the original direction, while `incoming` will use the reply direction. To refresh in both directions, select `both`.

Example

In this example, active sessions for UDP port 5001 will be refreshed in the incoming direction.



To refresh active sessions for UDP port 5001 in the incoming direction:

1. Configure the global session TTL timer:

```
config system session-ttl
    set default 3600
    config port
        edit 5001
            set protocol 17
            set timeout 5001
            set refresh-direction incoming
            set start-port 5001
            set end-port 5001
        next
    end
end
```

2. Send UDP 5001 traffic from the client to the server.
3. Verify the session table:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=77 expire=4923 timeout=5001 refresh_dir=reply
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=58/2/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=18->17/17->18 gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.41:2041->172.16.200.55:5001(172.16.200.10:62458)
hook=pre dir=reply act=dnat 172.16.200.55:5001->172.16.200.10:62458(10.1.100.41:2041)
src_mac=00:0c:29:b6:e8:be  dst_mac=00:0c:29:92:89:96
```

```
misc=0 policy_id=99 pol_uuid_idx=1501 auth_info=0 chk_client_info=0 vd=0
serial=00005071 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

The timeout and refresh for the reply direction are attached to the session.

4. Send UDP 5001 traffic again from the client to the server.
5. Verify the diagnostics.
   a. Run the sniffer trace:

```
# diagnose sniffer packet any 'udp and port 5001' 4
interfaces=[any]
filters=[udp and port 5001]
3.387747 wan2 in 10.1.100.41.2041 -> 172.16.200.55.5001: udp 1
3.387757 wan1 out 172.16.200.10.62458 -> 172.16.200.55.5001: udp 1
^C
2 packets received by filter
0 packets dropped by kernel
```

   b. Verify the session table:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=119 expire=4881 timeout=5001 refresh_
dir=reply flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=116/4/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 1/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=18->17/17->18 gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.41:2041->172.16.200.55:5001(172.16.200.10:62458)
hook=pre dir=reply act=dnat 172.16.200.55:5001->172.16.200.10:62458(10.1.100.41:2041)
src_mac=00:0c:29:b6:e8:be  dst_mac=00:0c:29:92:89:96
misc=0 policy_id=99 pol_uuid_idx=1501 auth_info=0 chk_client_info=0 vd=0
serial=00005071 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

   As the traffic flows from the client to the server (outgoing), the expiration timer continues to count down and is not refreshed.
6. Send reverse UDP 5001 traffic from the server to the client.
7. Verify the diagnostics again.

a. Run the sniffer trace:

```
# diagnose sniffer packet any 'udp and port 62458 or port 2041' 4
interfaces=[any]
filters=[udp and port 62458 or port 2041]
3.237328 wan1 in 172.16.200.55.5001 -> 172.16.200.10.62458: udp 1
3.237339 wan2 out 172.16.200.55.5001 -> 10.1.100.41.2041: udp 1
^C
2 packets received by filter
0 packets dropped by kernel
```

b. Verify the session table:

```
# diagnose sys session list
session info: proto=17 proto_state=01 duration=1710 expire=4995 timeout=5001 refresh_
dir=reply flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=116/4/1 reply=116/4/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=18->17/17->18
gwy=172.16.200.55/10.1.100.41
hook=post dir=org act=snat 10.1.100.41:2041->172.16.200.55:5001(172.16.200.10:62458)
hook=pre dir=reply act=dnat 172.16.200.55:5001->172.16.200.10:62458(10.1.100.41:2041)
src_mac=00:0c:29:b6:e8:be  dst_mac=00:0c:29:92:89:96
misc=0 policy_id=99 pol_uuid_idx=1501 auth_info=0 chk_client_info=0 vd=0
serial=00005071 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

As the traffic flows from the server to the client (incoming), the expiration timer is refreshed.

Per-policy disclaimer messages

FortiOS supports a customizable captive portal to direct users to install or enable required software.

Per-policy custom disclaimers in each VDOM are supported. For example, you may want to configure three firewall policies, each of which matches traffic from endpoints with different FortiClient statuses:

Endpoint status	FortiOS behavior
Endpoint does not have FortiClient installed.	Traffic matches a firewall policy that displays an in-browser warning to install FortiClient from the provided link.
Endpoint has FortiClient installed, registered to EMS, and connected to the FortiGate.	Traffic matches a dynamic firewall policy which allows the endpoint to reach its destination via this policy.

Endpoint status	FortiOS behavior
Endpoint is deregistered from EMS and disconnected from the FortiGate.	Traffic matches another dynamic firewall policy that displays warning to register FortiClient to EMS.

The replacement message groups and policy disclaimer settings must be enabled.

To enable per-policy disclaimer messages in the GUI:

1. Go to *System* > *Feature Visibility*.
2. Enable *Replacement Message Groups* and *Policy Disclaimer*.
3. Click *Apply*.

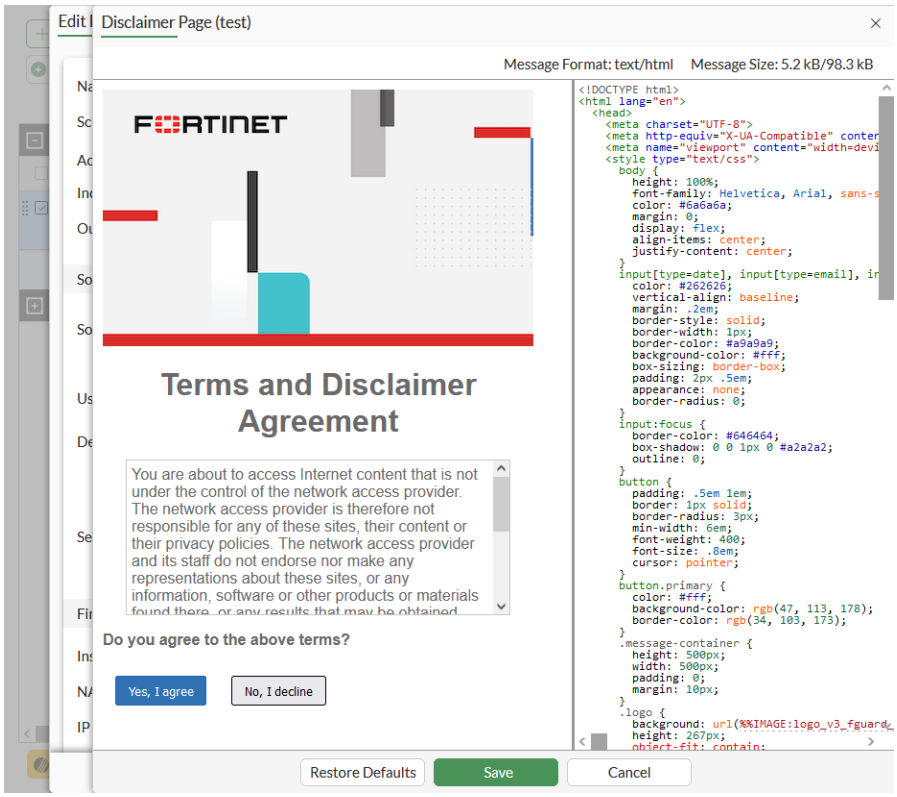
To enable per-policy disclaimer messages in the CLI:

```
config system global
    set gui-replacement-message-groups enable
end
```

```
config system settings
    set gui-policy-disclaimer enable
end
```

To configure per-policy disclaimers in the GUI:

1. Ensure the per-policy disclaimer messages option is enabled.
2. Go to *Policy & Objects* > *Firewall Policy*.
3. Edit the policy that applies when an endpoint does not have FortiClient installed.
4. Under *Disclaimer Options*, enable *Display Disclaimer* and *Customize Messages*.
5. Add a replacement message group:
   a. Select an existing replacement message group from the dropdown and click *Edit Disclaimer Message*.
   b. Click *Create*, enter a name, and click *OK*. Select the replacement message group and click *Edit Disclaimer Message*.



6. Edit the message to warn users to install FortiClient, and provide the FortiClient download link.
7. Click *Save*.
8. Repeat the above steps for each policy that requires a custom disclaimer message.

To configure per-policy disclaimers in the CLI:

```
config firewall policy
    edit 1
        set name "111"
        set srcintf "port12"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "pc155_address"
        set action accept
        set schedule "always"
        set service "ALL"
        set wsso disable
        set groups "ems_03_group"
        set disclaimer enable
        set replacemsg-override-group "test"
        set nat enable
    next
    edit 4
        set name "44"
        set srcintf "port12"
        set dstintf "port11"
```

```
        set srcaddr "all"
        set dstaddr "pc5-address"
        set action accept
        set schedule "always"
        set service "ALL"
        set wsso disable
        set groups "ems_03_group"
        set disclaimer enable
        set replacemsg-override-group "test2"
        set nat enable
    next
    edit 6
        set name "66"
        set srcintf "port12"
        set dstintf "port11"
        set srcaddr "all"
        set dstaddr "all"
        set status disable
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set fsso disable
        set block-notification enable
        set replacemsg-override-group "endpoint-override"
    next
end
```

Full cone NAT for fixed port range IP pools

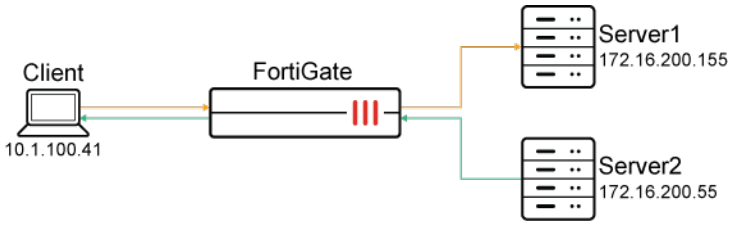
Full cone Network Address Translation (NAT) support is added for Fixed Port Range (FPR) IP pools. It allows all external hosts to send packets to internal hosts through a mapped external IP address and port, enhancing connectivity and communication efficiency. Full cone NAT is also known as Endpoint Independent Filtering (EIF).

To enable full cone NAT, enable the `permit-any-host` command when configuring the FPR IP pool.

```
config firewall ippool
    edit <name>
        set type fixed-port-range
        set permit-any-host {enable | disable}
    next
end
```

Only UDP is supported for full cone NAT.

To support HA session synchronization for full cone NAT, see FGCP and FGSP synchronizes full-cone expectation sessions when session-pickup-expectation enabled on page 3986.



In this example, a NAT44 FPR IP pool with `permit-any-host` enabled is created and applied to a policy. The packet is sent from Client1 to Server1 that hits the policy. The session list is checked for the NAT IP address and port, 172.16.201.3 and 1033. The expectation session list is checked to see that the session will be used to allow access to the NAT IP address and port from any other external host, such as Server2. The packet sent from Server2 to the NAT IP address and port is forwarded to Client1.

To configure and check the full cone IP pool:

1. Create an IP pool with full cone NAT:

```
config firewall ippool
    edit "test-new-fpr-ippool-1"
        set type fixed-port-range
        set startip 172.16.201.3
        set endip 172.16.201.4
        set startport 1024
        set endport 1087
        set source-startip 10.1.100.41
        set source-endip 10.1.100.42
        set port-per-user 64
        set permit-any-host enable
        set comments "test"
    next
end
```

2. Use the IP pool with full cone NAT in a policy:

```
config firewall policy
    edit 7
        set name "policy-fpr-ippool"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
        set ippool enable
        set poolname "test-new-fpr-ippool-1"
    next
end
```

3. Check the session list:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=65 expire=175 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=5
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=58/2/1 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=0.0.0.0/0.0.0.0
hook=post dir=org act=snat 10.1.100.41:20041->172.16.200.155:2156(172.16.201.3:1033)
hook=pre dir=reply act=dnat 172.16.200.155:2156->172.16.201.3:1033(10.1.100.41:20041)
misc=0 policy_id=7 pol_uuid_idx=8173 auth_info=0 chk_client_info=0 vd=0
serial=0001fb57 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
total session: 1
```

4. Check the expectation session list:

```
# diagnose sys session list expectation
session info: proto=17 proto_state=00 duration=74 expire=-44 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=2
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=255/255
state=new log f31
statistic(bytes/packets/allow_err): org=0/0/0 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=8->7/7->8 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=dnat 10.1.100.41:0->172.16.201.3:1033(10.1.100.41:0)
hook=pre dir=org act=noop 0.0.0.0:0->0.0.0.0:0(0.0.0.0:0)
misc=0 policy_id=7 pol_uuid_idx=8173 auth_info=0 chk_client_info=0 vd=0
serial=0001fb57 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  new disabled-by-policy

session info: proto=17 proto_state=00 duration=74 expire=-44 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=2
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=1 tunnel=/ vlan_cos=255/255
state=new log f31
statistic(bytes/packets/allow_err): org=0/0/0 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=0->8/8->0 gwy=0.0.0.0/0.0.0.0
```

```
hook=pre dir=org act=dnat 0.0.0.0:0->172.16.201.3:1033(10.1.100.41:20041)
hook=pre dir=org act=noop 0.0.0.0:0->0.0.0.0:0(0.0.0.0:0)
misc=0 policy_id=7 pol_uuid_idx=8173 auth_info=0 chk_client_info=0 vd=0
serial=0001fb57 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  new disabled-by-policy
```

5. Check that the packet sent from Server2 to the NAT IP address and port number is forwarded to Client1:

```
# diagnose sniffer packet any 'udp and port 1033 or 20041' 4
interfaces=[any]
filters=[udp and port 1033 or 20041]
12.001145 port1 in 172.16.200.55.4155 -> 172.16.201.3.1033: udp 4
12.001180 port2 out 172.16.200.55.4155 -> 10.1.100.41.20041: udp 4

2 packets received by filter
0 packets dropped by kernel
```

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=234 expire=1734 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=1 tunnel=/ vlan_cos=255/255
state=log intree
statistic(bytes/packets/allow_err): org=32/1/0 reply=0/0/0 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=7->8/8->7 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=dnat 172.16.200.55:4155->172.16.201.3:1033(10.1.100.41:20041)
hook=post dir=reply act=snat 10.1.100.41:20041->172.16.200.55:4155(172.16.201.3:1033)
misc=0 policy_id=7 pol_uuid_idx=8173 auth_info=0 chk_client_info=0 vd=0
serial=0001fb57 tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x000001 no_offload
no_ofld_reason:  disabled-by-policy
```

Address objects

Addresses define sources and destinations of network traffic and can be used in many functions such as firewall policies, ZTNA, etc.

To view the possible uses list of address object usage:

1. Go to *Policy & Objects* > *Addresses*.
2. Click the number under *Ref*. The *Usage of Address:<Predefined address>* pane opens, where *<Predefined address>* is one of the predefined addresses, such as SSLVPN_TUNNEL_ADDR1.

3. In the *Usage of Address:<Predefined address>* pane, click *Possible Uses* to view the list.

When properly set up, these address objects can be used with great flexibility to make the configuration of different functions simpler and more intuitive. When used in a firewall policy, the FortiGate compares the IP addresses contained in packet headers with a policy's source and destination addresses to determine if the policy matches the traffic. The matching of IP addresses in packet headers is also performed for other FortiGate functions configured with address objects.

Address types

When creating an IPv4 address, there are several different types of addresses that can be specified. Which one is chosen will depend on which method most easily yet accurately describes the addresses that you are trying to include with as few entries as possible based on the information that you have. For instance, if you are trying to describe the addresses of a specific company's web server but do not know how extensive their web server farm is, you would be more likely to use a Fully Qualified Domain Name (FQDN) rather than a specific IP address. On the other hand, some computers do not have FQDNs and a specific IP address must be used.

The following table provides a short description of the different types of addresses:

Address type	Description
Subnet	The subnet type of address is expressed using a host address and a subnet mask. This is the most flexible of the address types because the address can refer to as little as one individual address (x.x.x.x/32) or as many as all of the available addresses (0.0.0.0/0). See Subnet on page 1966 and Dynamic policy — Fabric devices on page 1967 for more information.
IP range	The IP range type can be used to define a continuous set of IP addresses between one specific IP address and another (inclusive). It is a flexible way to describe a continuous set of addresses while being specific and granular, without needing to fall within the boundaries of standard subnets. See IP range on page 1969 for more information.
FQDN	The Fully Qualified Domain Name (FQDN) address type accepts an address string and resolves it to one or more IP addresses. It relies on DNS to keep up with address changes without having to manually change the IP addresses on the FortiGate. See FQDN addresses on page 1970 for more information. FQDN can also be specified as wildcard addresses such as *.example.com. See Using wildcard FQDN addresses in firewall policies on page 1971 for more information.
Geography	Geography addresses are those determined by the country/region of origin. The IPs for the country/region is automatically determined from the Geography IP database. See Geography based addresses on page 1974 and IPv6 geography-based addresses on page 1977 for more information.

Address type	Description
Dynamic	Dynamic address objects are collections of addresses that are integrated from different external sources or other modules within the FortiGate. They can be used in policies that support the dynamic address type and come in different subtypes. • ClearPass: IP addresses gathered from the ClearPass Policy Manager. See ClearPass integration for dynamic address objects on page 1991 for more information. • Device & OS Identification: MAC addresses gathered from device detection that can be filtered by hardware vendor, model, OS, and OS version. See MAC address-based policies on page 1998 for more information. • Fabric Connector Address: IP addresses retrieved from SDN connectors, such as public and private cloud connectors. See Getting started with public and private SDN connectors on page 4458 for more information. • FortiNAC Tag: IP addresses collected from FortiNAC. See FortiNAC tag dynamic address on page 1995 for more information. • FortiVoice Tag: IP and MAC addresses collected from FortiVoice. See FortiVoice tag dynamic address on page 1995 for more information. • Fortinet Single Sign-On (FSSO): IP addresses of authenticated users from a FSSO collector agent, CPPM by FortiManager, or FortiNAC. See FSSO dynamic address subtype on page 1988 for more information. • RADIUS Single Sign-On (RSSO): IP address of the RADIUS single sign-on user matching the group value. See RSSO dynamic address subtype on page 2004 for more information. • Switch Controller NAC Policy Tag: MAC addresses collected from NAC policies.
Device (Mac address)	A MAC address is a link layer-based address type and it cannot be forwarded across different IP segments. In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range. See MAC address-based policies on page 1998, Adding MAC-based addresses to devices on page 153, ISDB well-known MAC address list on page 2001, and IPv6 MAC addresses and usage in firewall policies on page 2002 for more information.
Wildcard (CLI only)	Wildcard addresses are addresses that identify ranges of IP addresses, reducing the amount of firewall addresses and security policies required to match some of the traffic on your network. See Wildcard addressing on page 1979 for more information.
Interface subnet (CLI only)	For all interfaces set to a LAN or DMZ role, an option is available and enabled by default to automatically create an address object for the connected network. If the interface's subnet changes, the address object subnet changes too. See Interface subnet on page 1981 for more information.

Address group

Address groups are designed for ease of use in the administration of the device. If you have several addresses or address ranges that will commonly be treated the same or require the same security policies, you can put them into address groups, rather than entering multiple individual addresses in each policy that refers to them.

There are two different types of address groups and the following table provides a short description of each type:

Address group type	Description
Group	Members of an address group type group can belong to multiple address groups. See Address group on page 1983, Allow empty address groups on page 1986, and Address group exclusions on page 1986 for more information.
Folder	Members or an address group type folder can only belong to a single address folder. See Address folders on page 1984 for more information.

When an address group with no members is configured in a firewall policy, the policy will not match any traffic and will just match the implicit deny policy. See Allow empty address groups on page 1986 for more information.

Subnet

A subnet address object is usually used to refer internal networks or addresses which are defined by the network administrator.

A subnet address usually consists of a network address and a netmask, for example, 192.168.1.0 255.255.255.0. In this example, the network address is 192.168.1.0 and the netmask is 255.255.255.0. The network address defines the network to match and the netmask specify the IP address to match on the network.

In the above example, the subnet address 192.168.1.0 255.255.255.0 would match the following IP addresses:

```
192.168.1.1
192.168.1.2
192.168.1.3
...
192.168.1.255
```

For defining a subnet address object the valid format of IP address and netmask could be either:

`x.x.x.x/x.x.x.x`, such as 192.168.1.0/255.255.255.0

or

`x.x.x.x/x`, such as 192.168.1.0/24

To define a single address using subnet, use the netmask 255.255.255.255 or /32. A warning message will be shown if any other netmask is used and will not let the user save the address object.

To create a subnet address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *Subnet* from the dropdown menu.
5. In the *IP/Netmask* field, enter the address and subnet mask according to the format x.x.x.x/x.x.x.x or the short hand format of x.x.x.x/x
6. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
7. Enable/disable *Static route configuration*.
8. Enter any additional information in the *Comments* field.
9. Click *OK*.

Dynamic policy — Fabric devices

The dynamic address group represents the configured IP addresses of all Fortinet devices connected to the Security Fabric. It currently includes FortiManager, FortiAnalyzer, FortiClient EMS, FortiMail, FortiAP(s), and FortiSwitch(es). Like other dynamic address groups for fabric connectors, it can be used as an IPv4 address in firewall policies and objects.

The list of firewall addresses includes a default address object called `FABRIC_DEVICE`. You can apply the `FABRIC_DEVICE` object to the following types of policies:

- Firewall policy, including virtual wire pairs, NAT 46, and NAT 64 (IPv4 only)
- IPv4 shaping policy
- IPv4 ACL policy
- Security policy (NGFW mode)

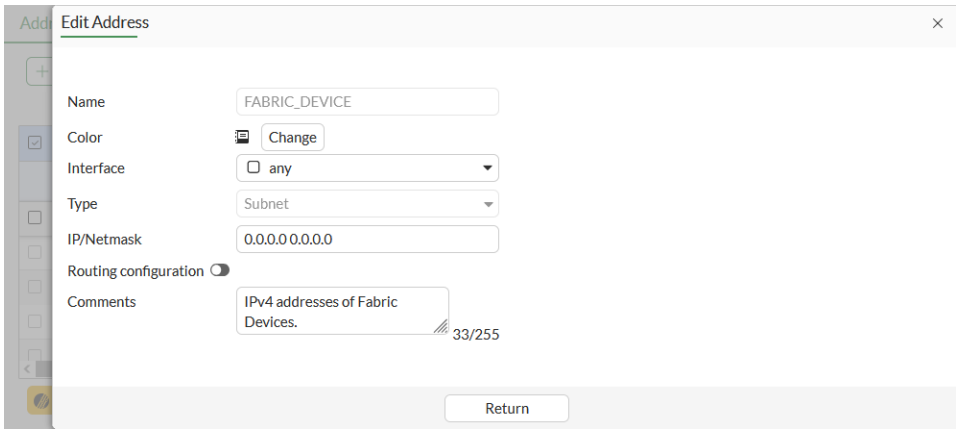
You cannot apply the `FABRIC_DEVICE` object to the following types of policies:

- IPv4 explicit proxy policy

You also cannot use the `FABRIC_DEVICE` object with the following settings:

- Custom extension on `internet-service`
- Exclusion of `addrgrp`

Initially the `FABRIC_DEVICE` object does not have an address value. The address value is populated dynamically as things change. As a result, you cannot edit the `FABRIC_DEVICE` object, add any addresses to the object, or remove any addresses from the object. The *Edit Address* pane in the GUI only has a *Return* button because the object is read-only:



The FABRIC_DEVICE object address values are populated based on:

- FortiAnalyzer IP (from the *Fabric Settings* pane)
- FortiManager IP (from the *Fabric Settings* pane)
- FortiMail IP (from the *Fabric Settings* pane)
- FortiClient EMS IP (from the *Fabric Settings* pane)
- FortiAP IPs (from the *FortiAP Setup* pane or DHCP)
- FortiSwitch IPs (from the *FortiSwitch Setup* page or DHCP)

To apply the FABRIC_DEVICE object to a firewall policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Create a new policy or edit an existing policy.
3. For the *Destination* field, select *FABRIC_DEVICE* from the list of address entries.
4. Configure the rest of the policy as needed.
5. Click *OK*.

To apply the FABRIC_DEVICE object to a firewall policy using the CLI:

```
config firewall address
    edit "FABRIC_DEVICE"
        set type ipmask
        set comment "IPv4 addresses of Fabric Devices."
        set visibility enable
        set associated-interface ''
        set color 0
        set allow-routing disable
        set subnet 0.0.0.0 0.0.0.0
    next
end
```

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
```

```
        set dstaddr "FABRIC_DEVICE"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set fsso disable
        set nat enable
    next
end
```

Diagnose commands

You can run diagnose commands to list IP addresses of Fortinet devices that are configured in the Security Fabric or used in a security policy.

To view the IP addresses of Fabric devices:

```
(root) # diagnose firewall sf-addresses list

FabricDevices: 172.18.64.48
FortiAnalyzer: 172.18.60.25
FortiSandbox: 172.18.52.154
FortiManager: 172.18.28.31
FortiClientEMS: 172.18.62.6
FortiAP:
FortiSwitch:
FortiAP/SW-DHCP:
```

To view which IP addresses are used in a security policy:

```
(root) # diagnose ips pme fabric-address list
VDOM 0:
- builtin [mask=0x1e]:
  - type=4: 172.18.62.213
  - type=4: 172.18.62.219
  - type=2: 172.18.70.82
- query:
  - 168.254.1.2
  - 0.0.0.0
  - 168.254.1.2
```

IP range

The IP range type of address can describe a group of addresses while being specific and granular. It does this by specifying a continuous set of IP addresses between one specific IP address and another.

The format would be:

`x.x.x.x-x.x.x.x`, such as 192.168.110.100-192.168.110.120

To create an IP range address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *IP Range* from the dropdown menu.
5. In the *IP Range* field, enter the range of addresses in the following format: x.x.x.x-x.x.x.x (no spaces)
6. In the *Interface* field, leave as the default any or select a specific interface from the drop down menu.
7. Enter any additional information in the *Comments* field.
8. Click *OK*.

FQDN addresses

By using Fully Qualified Domain Name (FQDN) addressing you can take advantage of the dynamic ability of DNS to keep up with address changes without having to manually change the addresses on the FortiGate. FQDN addresses are most often used with external web sites but they can be used for internal web sites as well if there is a trusted DNS server that can be accessed. FQDN addressing also comes in handy for large web sites that may use multiple addresses and load balancers for their web sites. The FortiGate firewall automatically maintains a cached record of all the addresses resolved by the DNS for the FQDN addresses used.

For example, if you were doing this manually and you wanted to have a security policy that involved Google, you could track down all of the IP addresses that they use across multiple countries. Using the FQDN address is simpler and more convenient.

When representing hosts by an FQDN, the domain name can also be a subdomain, such as mail.example.com.

Valid FQDN formats include:

- <host_name>.<top_level_domain_name>, such as example.com
- <host_name>.<second_level_domain_name>.<top_level_domain_name>, such as mail.example.com.

The FortiGate firewall keeps track of the DNS TTLs so as the entries change on the DNS servers the IP address will effectively be updated for the FortiGate. As long as the FQDN address is used in a security policy, it stores the address in the DNS cache.

To create a Fully Qualified Domain Name address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *FQDN* from the dropdown menu.
5. Enter the domain name in the *FQDN* field.
6. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
7. Enable/disable *Static route configuration*.
8. Enter any additional information in the *Comments* field.
9. Click *OK*.

Address learning

FQDN addresses are learned in one of two ways:

1. FortiGate periodically queries its DNS server to resolve the FQDNs.
2. FortiGate passively learns the IP addresses by sniffing DNS traffic from the clients.

Using the second method, there is a possible security downside to using FQDN addresses. Using a fully qualified domain name in a security policy means that your policies are relying on the DNS server of the client to be accurate and correct. Should the DNS server be compromised, security policies requiring domain name resolution may no longer function properly.

You can manually override and disable passive learning of FQDN addresses by disabling the following command on the firewall address object:

```
config firewall address
    edit <address>
        set passive-fqdn-learning {disable | enable}
    next
end
```

Option	Description
disable	Disable passive learning of FQDNs.
enable	Enable passive learning of FQDNs (default).

Troubleshooting and diagnosis

To view the address objects and IPs resolved:

```
# diagnose firewall fqdn list-ip
```

```
# diagnose firewall fqdn get-ip <fqdn address>
```

To dump the DNS FQDN and DNS cache:

```
# diagnose test application dnsproxy 6
```

```
# diagnose test application dnsproxy 7
```

Using wildcard FQDN addresses in firewall policies

You can use wildcard FQDN addresses in firewall policies. IPv4, IPv6, ACL, local, shaping, NAT64, NAT46, and NGFW policy types support wildcard FQDN addresses. Wildcard FQDN addresses can also be used in Web and FTP proxy policies for FortiGate firewalls.

For wildcard FQDN addresses to work, the FortiGate should allow DNS traffic to pass through.

Initially, the wildcard FQDN object is empty and contains no addresses. When the client tries to resolve a FQDN address, the FortiGate will analyze the DNS response. The IP address(es) contained in the answer section of the DNS response will be added to the corresponding wildcard FQDN object. It is therefore necessary to have the DNS session-helpers defined in the `config system session-helper` setting.

Since FortiGate must analyze the DNS response, it does not work with DNS over HTTPS.

In FortiOS 7.0 and later, FortiGate supports DNS over TLS. It is possible to analyze DNS responses sent over DoT, as long as there is a firewall policy that allows the DNS traffic from the client and is configured with a DNS filter that supports DoT. For information on configuring this, see DNS inspection with DoT and DoH on page 2339.

When the wildcard FQDN gets the resolved IP addresses, FortiOS loads the addresses into the firewall policy for traffic matching.

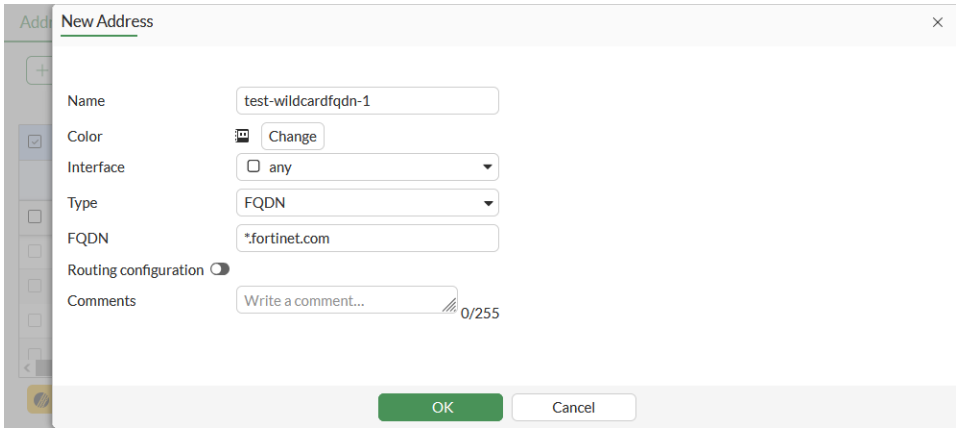
The FortiGate will keep the IP addresses in the FQDN object table as long as the DNS entry itself has not expired. Once it expires, the IP address is removed from the wildcard FQDN object until another query is made. At any given time, a single wildcard FQDN object may have up to 1000 IP addresses.

The DNS expiry TTL value is set by the authoritative name server for that DNS record. If the TTL for a specific DNS record is very short and you would like to cache the IP address longer, then you can extend it with the CLI. See To extend the TTL for a DNS record in the CLI: on page 1974

Wildcard FQDN IPs are synchronized to other autoscale members whenever a peer learns of a wildcard FQDN address.

To create a wildcard FQDN using the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Specify a *Name*.
4. For *Type*, select *FQDN*.
5. For *FQDN*, enter a wildcard FQDN address, for example, `*.fortinet.com`.



6. Click *OK*.

To use a wildcard FQDN in a firewall policy using the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*.
2. For *Destination*, select the wildcard FQDN.
3. Configure the rest of the policy as needed.
4. Click *OK*.

To create a wildcard FQDN using the CLI:

```
config firewall address
    edit "test-wildcardfqdn-1"
        set type fqdn
        set fqdn "*.fortinet.com"
    next
end
```

To use wildcard FQDN in a firewall policy using the CLI:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "test-wildcardfqdn-1"
        set action accept
        set schedule "always"
        set service "ALL"
        set auto-asic-offload disable
        set nat enable
    next
end
```

To use the diagnose command to list resolved IP addresses of wildcard FQDN objects:

```
# diagnose firewall fqdn list
List all FQDN:
*.fortinet.com: ID(48) ADDR(96.45.36.159) ADDR(192.168.100.161) ADDR(65.39.139.161)
```

Alternatively:

```
# diagnose test application dnsproxy 6
worker idx: 0
vfid=0 name=*.fortinet.com ver=IPv4  min_ttl=3266:0, cache_ttl=0 , slot=-1, num=3, wildcard=1
      96.45.36.159 (ttl=68862:68311:68311) 192.168.100.161 (ttl=3600:3146:3146) 65.39.139.161
(ttl=3600:3481:3481)
```

To use the diagnose command for firewall policies which use wildcard FQDN:

```
# diagnose firewall iprope list 100004
...
destination fqdn or dynamic address (1):*.fortinet.com ID(48) uuid_idx=57 ADDR(208.91.114.104)
ADDR(208.91.114.142) ADDR(173.243.137.143) ADDR(65.104.9.196) ADDR(96.45.36.210)
...
```

To extend the TTL for a DNS record in the CLI:

The TTL for DNS records can be configured globally, or for a specific FQDN address. If it is configured for an FQDN address, that setting will supersede the global setting for that address. See Important DNS CLI commands on page 340 for information about configuring a global TTL.

In this the example the `set cache-ttl` value has been extended to 3600 seconds.

```
config firewall address
    edit "fortinet.com"
        set type fqdn
        set fqdn "www.fortinet.com"
        set cache-ttl 3600
    next
end
```

Geography based addresses

Geography addresses are those determined by country of origin. The IP for the country or region is automatically determined from the Geography IP database. The `geoip-full-db` option controls whether the full geographic database is loaded into the kernel.

To view IP Geography database:

```
# diagnose autoupdate versions | grep -A 6 "IP Geography DB"
IP Geography DB
---------
Version: 3.00152
Contract Expiry Date: n/a
Last Updated using manual update on Thu Nov 17 17:52:00 2022
Last Update Attempt: Wed Nov 23 10:56:46 2022
Result: No Updates
```

Without a valid license, local IP geography database will continue to work. However the FortiGate will stop receiving geography IP updates from the FortiGuard servers and the geography IP database will no longer be updated. IP geolocation service is part of base services included with all FortiCare support contracts. See FortiGuard Security Services for more information.

To control if the full database is loaded:

```
config sys global
    set geoip-full-db {enable | disable}
end
```

Option	Description
`enable`	The full Geography IP database is downloaded, and geographic information is available in traffic logs. The FortiView Countries/Regions widget and monitor are available.
`disable`	The full Geography IP database is not downloaded, conserving memory. The FortiView Countries/Regions widget and monitor cannot be used.

By default, after upgrading to FortiOS 7.6.5:

- On devices with 4GB RAM or more, `geoip-full-db` is enabled.
- On devices with 2GB RAM, `geoip-full-db` is disabled. If required, it must be enabled manually after upgrading, but note that doing so will increase memory usage and may affect device performance.

To create a geography address:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Select *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *Geography* from the dropdown menu.
5. In the *Country/Region* field, select a single country from the dropdown menu.
6. In the *Interface* field, leave as the default *any* or select a specific interface from the dropdown menu.
7. Enter any additional information in the *Comments* field.
8. Click *OK*.

Overrides

It is possible to assign a specific IP address range to a customized country ID. Generally, geographic addressing is done at the VDOM level; it could be considered global if you are using the root VDOM, but the `geoip-override setting` is a global setting.

To configure a geography IP override:

1. Assign a specific IP address range to a customized country ID:

```
config system geoip-override
    edit "MyCustomCountry"
        config ip-range
            edit 1
                set start-ip 1.1.1.1
                set end-ip 1.1.1.2
            next
```

```
        end
    next
end
```

2. Use get sys geoip-country XX to determine the name corresponding to the custom 2-digit country code A0:

```
# get sys geoip-country A0
id                  : A0
name                : MyCustomCountry
```

3. Show the full configuration of the geography IP override just created to show that it corresponds to country code A0:

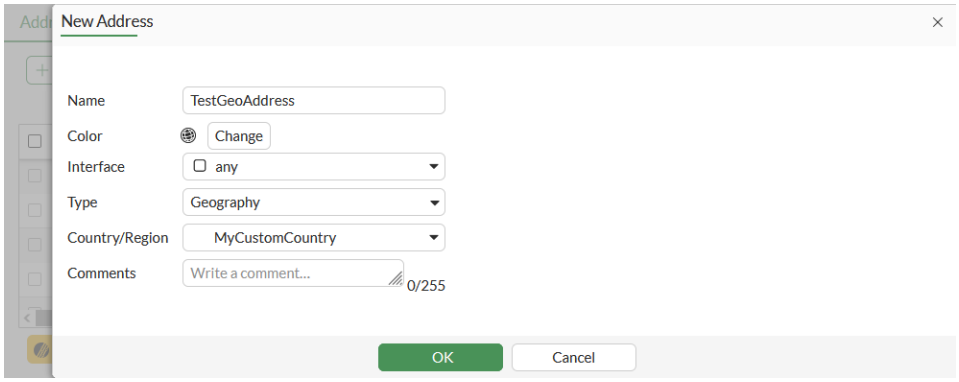
```
# show full sys geoip-override
config system geoip-override
    edit "MyCustomCountry"
        set description ''
        set country-id "A0"
        config ip-range
            edit 1
                set start-ip 1.1.1.1
                set end-ip 1.1.1.2
            next
        end
    next
end
```

To configure a geography address:

1. Enable debug to display the CLI commands running on the backend in response to certain GUI configuration:

```
# diagnose debug enable
# diagnose debug cli 7
Debug messages will be on for 30 minutes.
```

2. Go to *Policy & Objects* > *Addresses* and create a geography address using the previously created custom country code:



3. Observe the corresponding CLI commands run on the backend:

```
FGT # 0: config firewall address
0: edit "TestGeoAddress"
0: set type geography
0: set country "A0"
0: end
```

Diagnose commands

There are a few diagnose commands used with geographic addresses:

```
diagnose firewall ipgeo [country-list | ip-list | ip2country | override | copyright-notice]
```

Diagnose command	Description
country-list	List of all countries.
ip-list	List of the IP addresses associated with the country.
ip2country	Used to determine the physical and registered locations of the IP address as well and if the type is anycast.
override	List of user defined geography data; items configured with the `config system geoip-override` command.
copyright-notice	Shows the copyright notice.

```
diagnose geoip [geoip-query | ip2country | iprange]
```

Diagnose command	Description
geoip-query	Used to determine the complete geolocation of a specific IP address from the FortiGuard IP Geography DB.
ip2country	Used to determine which country a specific IP address is assigned to.
Iprange	List the IP addresses or IP ranges associated with the country.

For more details and examples using these diagnose commands, see the Fortinet Community article Technical Tip: Commands to verify GeoIP information and troubleshoot GeoIP database.

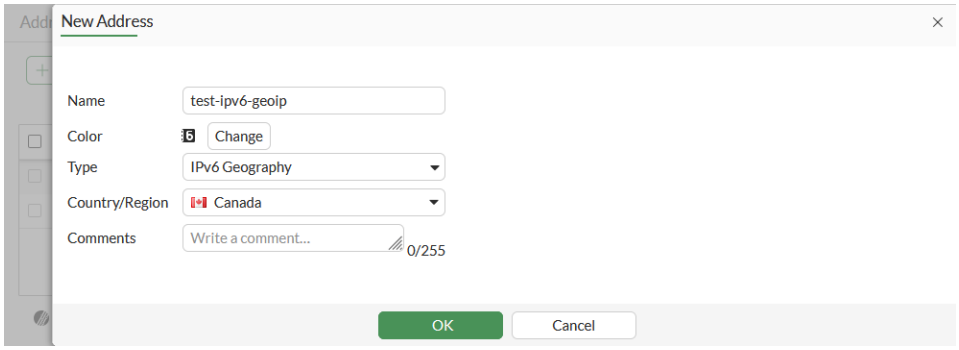
IPv6 geography-based addresses

Geography-based IPv6 addresses can be created and applied to IPv6 firewall policies.

IPv6 geography-based addresses do not support `geoip-override` or `geoip-anycast`.

To create an IPv6 geography-based address in the GUI:

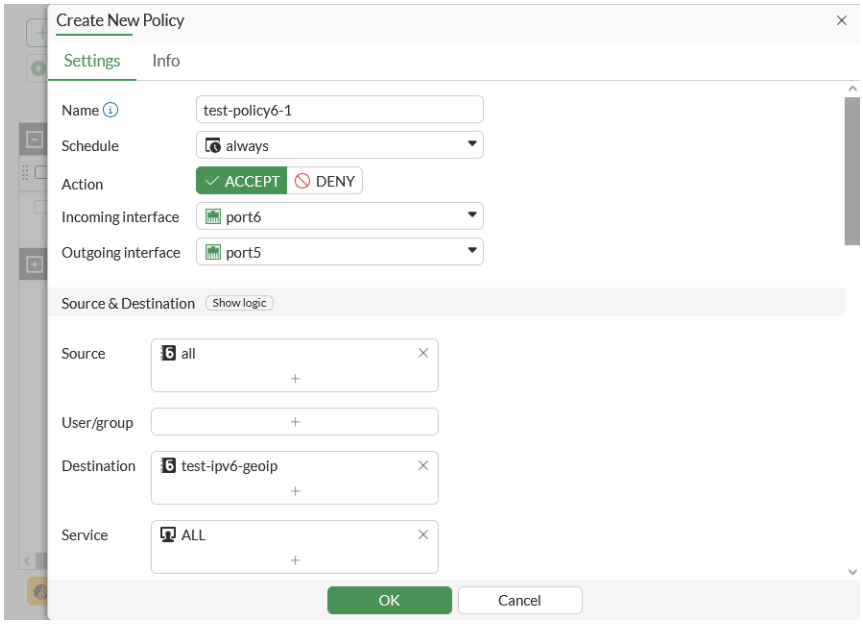
1. Go to *Policy and Objects* > *Addresses* and select *IPv6 Address*.
2. Click *Create new*.
3. Enter a name for the address.
4. Set *Type* to *IPv6 Geography*.
5. Select the *Country/Region* from the list.
6. Optionally, enter comments.



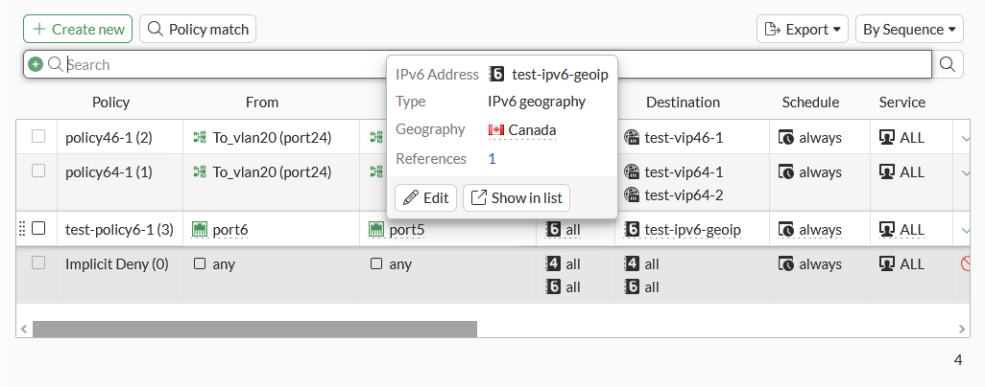
7. Click *OK*.

To use the IPv6 geography address in a policy:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit an existing policy, or create a new one, using the IPv6 geography address as the *Source* or *Destination Address*.



3. In the policy list, hover over the address to view details.



To configure an IPv6 geography-based address in the CLI:

1. Create an IPv6 geography-based address:

```
config firewall address6
    edit "test-ipv6-geoip"
        set type geography
        set color 6
        set comment "IPv6 Geography address"
        set country "CA"
    next
end
```

2. Use the IPv6 geography-based address in a policy:

```
config firewall policy
    edit 1
        set name "test-policy6-1"
        set srcintf "port6"
        set dstintf "port5"
        set srcaddr6 "all"
        set dstaddr6 "test-ipv6-geoip"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
```

Wildcard addressing

Wildcard addresses are addresses that identify ranges of IP addresses, reducing the amount of firewall addresses and security policies required to match some of the traffic on your network. Wildcard addresses are an advanced feature, usually required only for complex networks with complex firewall filtering requirements. By using these wildcard addresses in the firewall configuration, administrators can eliminate creating multiple, separate IP-based address objects and then grouping them to then apply to multiple security policies.

A wildcard address consists of an IP address and a wildcard netmask, for example, 192.168.0.56 255.255.0.255 or 2000:172:16:200::55 ffff:ffff:ffff:ffff::ffff. The IP address defines the networks to match and the wildcard netmask defines the specific addresses to match on these networks.

In a wildcard netmask, zero denotes ignoring the value of the octet in the IP address. This means that the wildcard firewall address matches any number in this address octet. This also means that the number included in this octet of IP address is ignored and can be any number. Usually, if the octet in the wildcard netmask is zero, the corresponding octet in the IP address is also zero.

In a wildcard netmask, a number denotes matching addresses according to how the numbers translate into binary addresses. For example, the wildcard netmask is 255; the wildcard address will only match addresses with the value for this octet that is in the IP address part of the wildcard address. So, if the first octet of the IP address is 192 and the first octet of the wildcard netmask is 255, the wildcard address will only match addresses with 192 in the first octet.

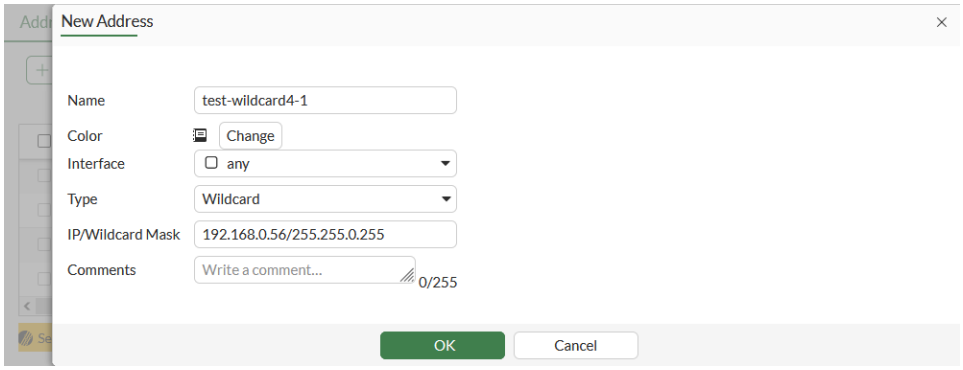
For example, if the IP address is 192.168.0.56 and the wildcard netmask is 255.255.0.255, then the wildcard address would match the following IP addresses:

```
192.168.0.56
192.168.1.56
192.168.2.56
...
192.168.255.56
```

The wildcard addresses 192.168.0.56 255.255.0.255 and 192.168.1.56 255.255.0.255 define the same thing since the 0 in the wildcard mask means to match any address in the third octet.

To configure an IPv4 wildcard address in the GUI:

1. Go to *Policy & Objects* > *Addresses* and, on the *Address* tab, click *Create New*.
2. Enter a name for the address.
3. Set *Type* to *Wildcard*.
4. Set *IP/Wildcard Mask* to the IPv4 address and wildcard netmask.



5. Click *OK*.

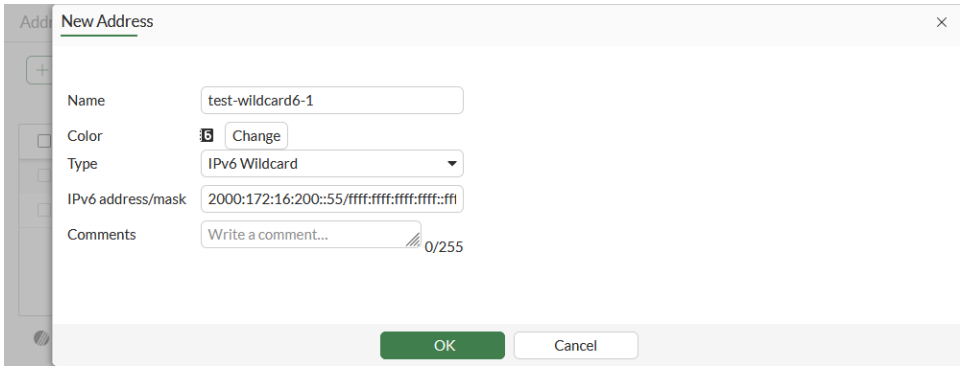
To configure an IPv4 wildcard address in the CLI:

```
config firewall address
    edit "test-wildcard4-1"
        set type wildcard
```

```
        set wildcard 192.168.0.56 255.255.0.255
    next
end
```

To configure an IPv6 wildcard address in the GUI:

1. Go to *Policy & Objects* > *Addresses* and, on the *IPv6 Address* tab, click *Create New*.
2. Enter a name for the address.
3. Set *Type* to *IPv6 Wildcard*.
4. Set *IPv6 address/mask* to the IPv6 address and wildcard netmask.



5. Click *OK*.

To configure an IPv6 wildcard address in the CLI:

```
config firewall address6
    edit "test-wildcard6-1"
        set type wildcard
        set wildcard 2000:172:16:200::55 ffff:ffff:ffff:ffff::ffff
    next
end
```

Interface subnet

Interface subnet address type enables an address object to be created automatically for the interface with which it is associated. Once created, the address object is updated when the interface IP/netmask changes on the associated interface.

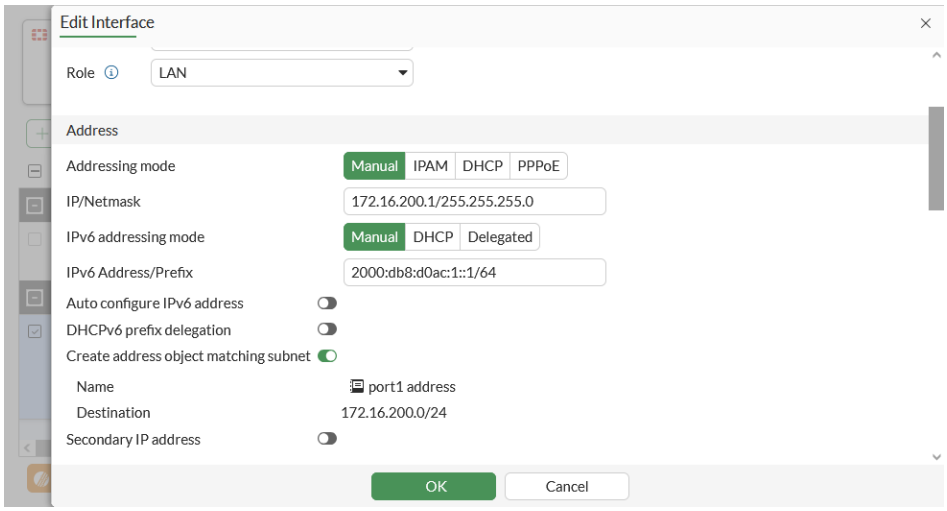
To create the interface subnet address type object, create or edit an interface under *Network* > *Interfaces*, and enable the *Create address object matching subnet* option.

The *Create address object matching subnet* option is automatically enabled and displayed in the GUI when *Role* is set to *LAN* or *DMZ*.

When you disable the *Create address object matching subnet* option, the feature is disabled, and the associated firewall address is deleted.

To create an interface subnet:

1. Go to *Network* > *Interfaces*.
2. Select *Create New* > *Interface* or select existing interface and *Edit*.
3. Set *Role* to either *LAN* or *DMZ*.
4. Verify that *Create address object matching subnet* is available and automatically enabled.



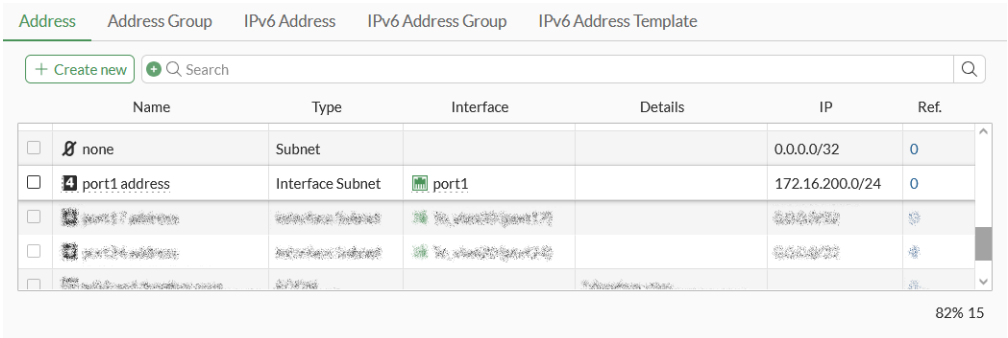
5. Click *OK*.

The following is an example of how to configure an interface subnet firewall address on the CLI:

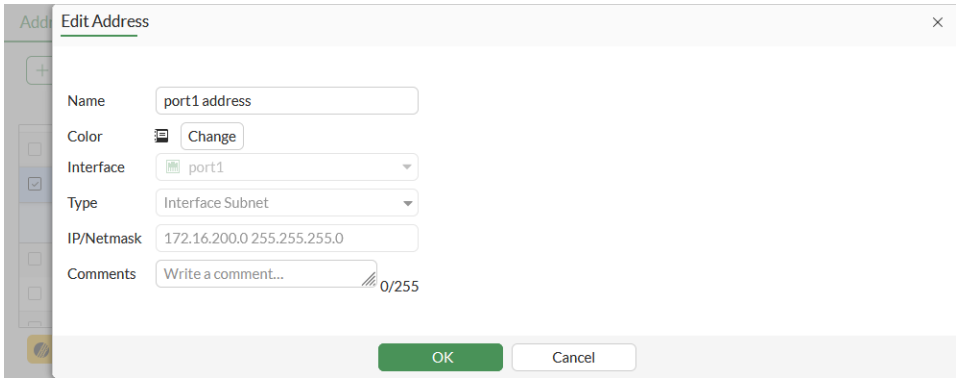
```
config firewall address
    edit "port1 address"
        set type interface-subnet
        set interface "port1"
    next
end
```

Interface subnet addresses are automatically created when *Role* is set to *LAN* or *DMZ* in the *Interface* page, or you can manually configure interface subnet addresses in the CLI. You cannot choose *Interface Subnet* in the GUI when creating the address, but after the address is created, *Interface Subnet* displays in the GUI. However, all the settings are grayed out, except *Name* and *Comments*, which can be edited.

When *Role* is set to *LAN* or *DMZ* in the *Interface* page, the new address object displays on the *Policy & Objects* > *Address* page.



After the address is created, the subnet is dynamically assigned to the address object, which can be seen in both GUI and CLI. If the interface address changes, the subnet will update dynamically.



```
config firewall address
    edit "port1 address"
        set type interface-subnet
        set subnet 172.16.200.0 255.255.255.0
        set interface "port1"
    next
end
```

Address group

The use of groups is not mandatory. However, adding individual addresses to a policy sometimes becomes tedious. If you use several different addresses with a given policy, these address objects can be grouped into an address group as it is much easier to add or subtract addresses from the group.

Security policies require addresses with homogenous network interfaces. Therefore, address groups should contain only addresses bound to the same network interface or Any.

For example, if address 1.1.1.1 is associated with port1, and address 2.2.2.2 is associated with port2, they cannot be in the same group. However, if 1.1.1.1 and 2.2.2.2 are configured with an interface of Any, they can be grouped, even if the addresses involve different networks.

To create an address group:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Go to *Create new*.
3. Enter a *Name* for the address object.
4. In the *Type* field, select *Group*.
5. Select the *+* in the *Members* field. The *Select Entries* pane opens.
6. Select members of the group. It is possible to select more than one entry. Select the *x* icon in the field to remove an entry.
7. Enable/disable *Static route configuration*.
8. Enter any additional information in the *Comments* field.
9. Click *OK*.

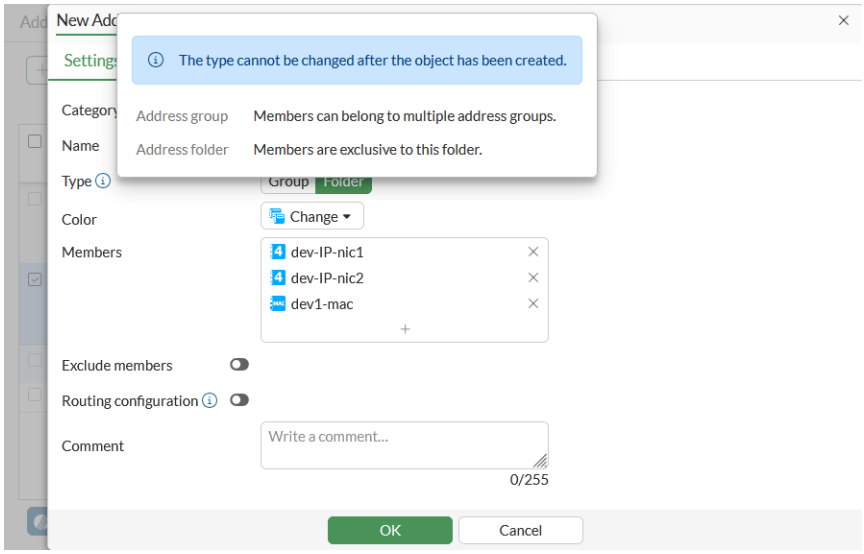
Address folders

Some address objects logically belong to the same device, such as two IPs from the same computer. These address objects can be grouped into an address folder, which is an exclusive list of address objects that do not appear in other address groups or folders.

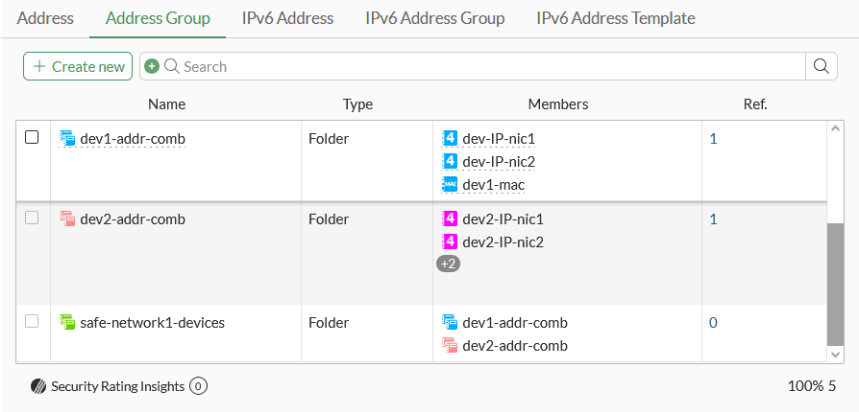
In the CLI, the folder type can be set after the member list is already populated. If the member list contains an incompatible entry, then the setting will be discarded when the `next`/`end` command is issued. If the folder type is set before the member list is populated, then the possible member entry list will be filtered according to the selected type.

To create an address folder in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Click *Create new* and enter a name.
3. For *Type*, select *Folder*.
4. For *Members*, click the *+* to add the addresses. Address folders and groups are exclusive, so the *Select Entries* window filters out address objects that are a member of an existing group or folder.



5. Click *OK*.
6. In the address group table, the folders' members are shown in the *Members* column:



To configure an address folder in the CLI:

```
config firewall addrgrp
    edit "dev1-addr-comb"
        set type folder
        set member "dev1-IP-nic1" "dev1-IP-nic2" "dev1-mac"
        set comment ''
        set exclude disable
        set color 18
    next
end
```

```
config firewall addrgrp
    edit "dev2-addr-comb"
        set type folder
        set member "dev2-IP-nic1" "dev2-IP-nic2" "dev2-IP-nic3" "dev2-mac"
        set comment ''
        set exclude disable
        set color 5
    next
end
```

```
config firewall addrgrp
    edit "safe-network1-devices"
        set type folder
        set member "dev1-addr-comb" "dev2-addr-comb"
        set comment ''
        set exclude disable
        set color 13
    next
end
```

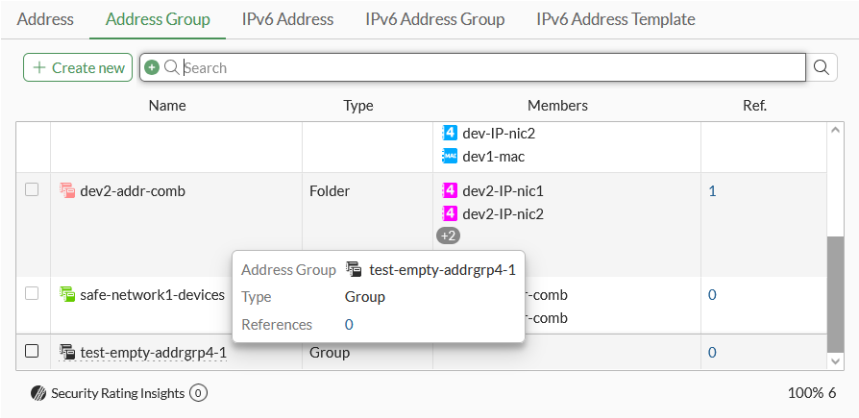
Allow empty address groups

Address groups with no members can be configured in the GUI, CLI, and through the API. In previous versions of FortiOS, error messages appear for empty address groups and they cannot be configured.

When an address group with no members is configured in a firewall policy, the policy will not match any traffic. In this case, policy matching logic will proceed down the list of firewall policies until matching the implicit deny policy.

To create an empty address group in the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Click *Create new* .
3. Enter a name.
4. Click *OK*. The *This field is required* error is not displayed under the *Members* field, and the group is listed in the *Address Group* list with no members:



To create an empty address group in the CLI:

```
config firewall addrgrp
    edit "test-empty-addrgrp4-1"
    next
end
```

No error message is returned in the console.

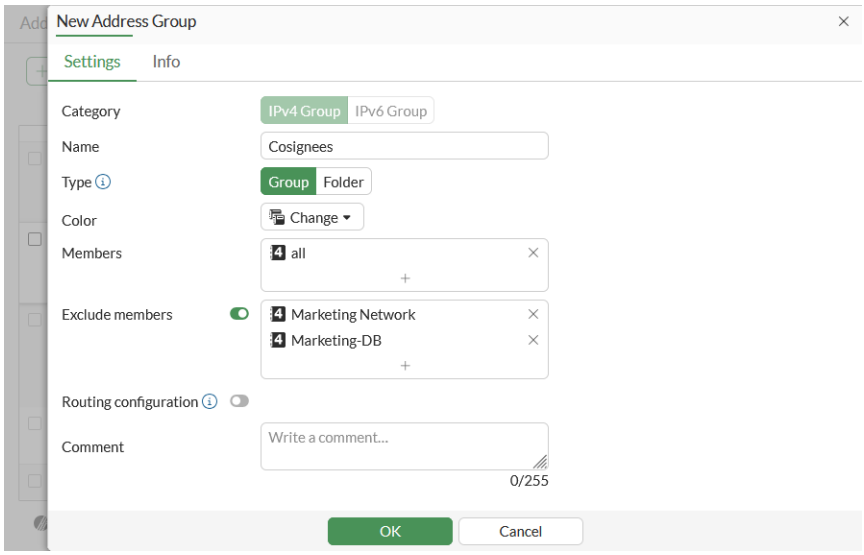
Address group exclusions

Specific IP addresses or ranges can be subtracted from the address group with the *Exclude Members* setting in IPv4 address groups.

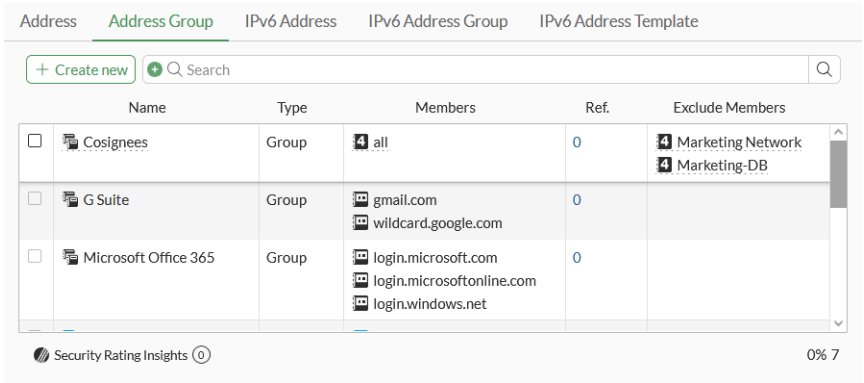
> This feature is only supported for IPv4 address groups, and only for addresses with a *Type* of *IP Range* or *Subnet*.

To exclude addresses from an address group using the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address Group*.
2. Create a new address group, or edit an existing address group.
3. Enable *Exclude Members* and click the *+* to add entries.
4. Configure the other settings as needed.
5. Click *OK*.



The excluded members are listed in the *Exclude Members* column. Note that the *Exclude Members* column is not shown by default, see Column settings on page 58.



To exclude addresses from an address group using the CLI:

```
config firewall addrgrp
    edit <address group>
        set exclude enable
        set exclude-member <address> <address> ... <address>
    next
end
```

FSSO dynamic address subtype

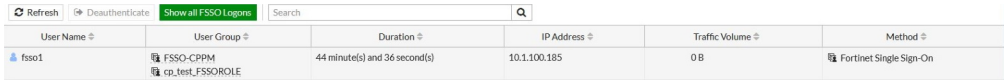
The Fortinet Single Sign-ON (FSSO) dynamic firewall address subtype can be used in policies that support dynamic address types. The FortiGate will update the dynamic address used in firewall policies based on the source IP information for the authenticated FSSO users.

It can also be used with FSSO group information that is forwarded by ClearPass Policy Manager (CPPM) via FortiManager, and other FSSO groups provided by the FSSO collector agent or FortiNAC. Up to 3000 dynamic FSSO IP addresses are supported per dynamic FSSO group.

To configure FSSO dynamic addresses with CPPM and FortiManager in the GUI:

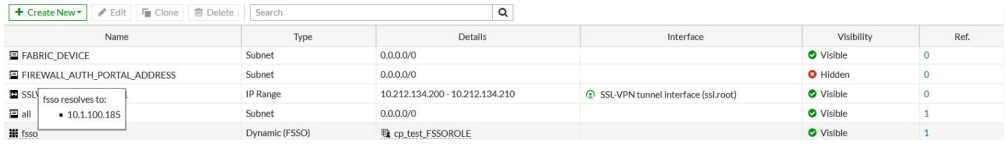
1. Create the dynamic address object:
   a. Go to *Policy & Objects* > *Addresses* and select *Address*.
   b. Click *Create new*.
   c. For *Type*, select *Dynamic*.
   d. For *Sub Type*, select *Fortinet Single Sign-On (FSSO)*.
   e. Select one or more groups.
   f. Click *OK* to save the configuration.

   In the address table, there will be an error message for the address you just created (*Unresolved dynamic address: fsso*). This is expected because there are currently no authenticated FSSO users (based on source IP) in the local FSSO user list.
2. Add the dynamic address object to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Create a new policy or edit an existing policy.
   c. For *Source*, select Address from the dropdown list and add the dynamic FSSO address object you just created.
   d. Configure the rest of the policy as needed.
   e. Click *OK* to save your changes.
3. Test the authentication to add a source IP address to the FSSO user list:
   a. Log in as user and use CPPM for user authentication to connect to an external web server. After successful authentication, CPPM forwards the user name, source IP address, and group membership to the FortiGate via FortiManager.
   b. Go to *Monitor* > *Firewall User Monitor* to view the user name (*fsso1*) and IP address.



c. Go to *Policy & Objects* > *Addresses* to view the updated address table. The error message no longer appears.

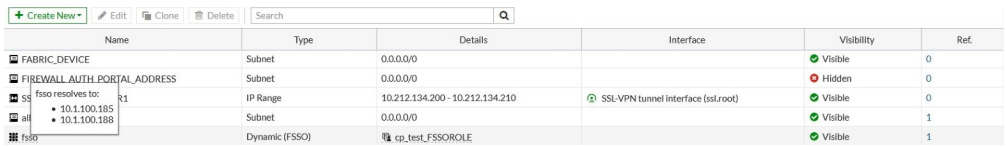
d. Hover over the dynamic FSSO address to view the IP address (*fsso resolves to: 10.1.100.185*).



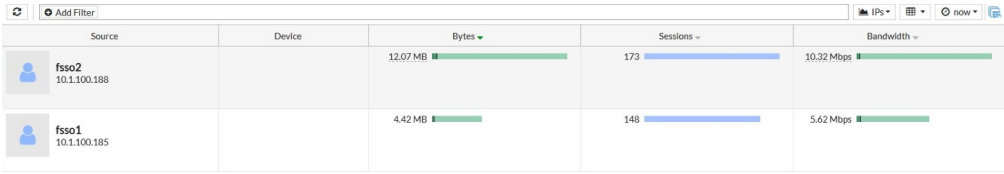
To verify user traffic in the GUI:

1. Go to *Log & Report* > *Forward Traffic*.
   Details for the user *fsso1* are visible in the traffic log:

   - If another user is authenticated by CPPM, then the dynamic address *fsso* entry in the address table will be updated. The IP address for user *fsso2* (*10.1.100.188*) is now visible:



2. Go to *FortiView* > *Sources* to verify that the users were able to successfully pass the firewall policy.



If a user logs off and CPPM receives log off confirmation, then CPPS updates the FortiGate FSSO user list via FortiManager. The user IP address is deleted from the dynamic FSSO address, and the user is no longer be able to pass the firewall policy.

To configure FSSO dynamic addresses with CPPM and FortiManager in the CLI:

1. Create the dynamic address object:

```
config firewall address
    edit "fsso"
        set type dynamic
        set sub-type fsso
        set fsso-group "cp_test_FSSOROLE"
    next
end
```

2. Add the dynamic address object to a policy:

```
config firewall policy
    edit 1
        set name "pol1"
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "fsso"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set fsso disable
        set nat enable
    next
end
```

To verify user traffic in the CLI:

1. Check the FSSO user list:

```
diagnose debug authd fsso list
----FSSO logons----
IP: 10.1.100.185  User: fsso1  Groups: cp_test_FSSOROLE  Workstation:  MemberOf: FSSO-CPPM cp_
test_FSSOROLE
Total number of logons listed: 1, filtered: 0
----end of FSSO logons----
```

2. Check the authenticated firewall users list:

```
diagnose firewall auth list
10.1.100.185, fsso1
type: fsso, id: 0, duration: 2928, idled: 2928
server: FortiManager
packets: in 0 out 0, bytes: in 0 out 0
group_id: 2 33554433
group_name: FSSO-CPPM cp_test_FSSOROLE
----- 1 listed, 0 filtered ------
```

After user traffic passes through the firewall, the nu

```
diagnose firewall auth list
10.1.100.185, fsso1
type: fsso, id: 0, duration: 3802, idled: 143
server: FortiManager
packets: in 1629 out 1817, bytes: in 2203319 out 133312
group_id: 2 33554433
group_name: FSSO-CPPM cp_test_FSSOROLE
----- 1 listed, 0 filtered ------
```

ClearPass integration for dynamic address objects

ClearPass Policy Manager (CPPM) can gather information about the statuses of network hosts, for example, the latest patches or virus infections. Based on this information, CPPM send the IP addresses and current states, such as Healthy or Infected, to the FortiGate.

On the FortiGate, the IP addresses received from CPPM are added to a dynamic firewall address with the *clearpass-spt* subtype. This address can be used in any policy that supports dynamic addresses, such as Firewall.

In this example, you create two dynamic IP addresses that are used in two firewall policies (deny and allow). One policy allows traffic (host state = Healthy), and the other denies traffic (host state = Infected). When CPPM sends the information, the IP addresses are assigned according to their host state: Healthy or Infected.

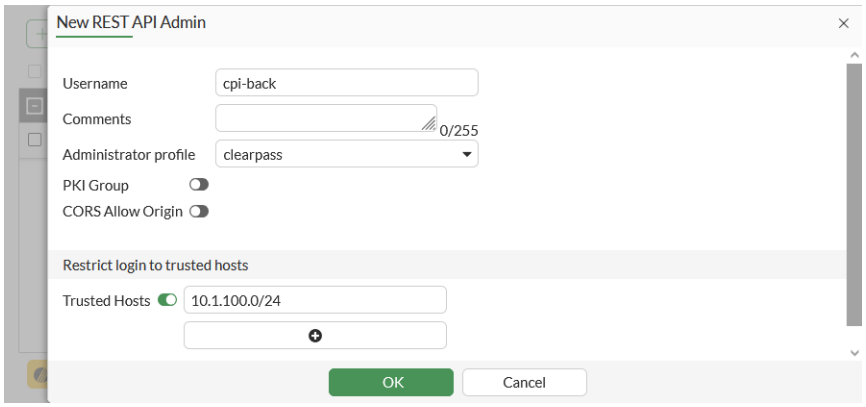
You can then verify that traffic from the Infected host is denied access by the deny policy, and traffic from the Healthy host is allowed access by the allow policy.

Create a REST API administrator

A REST API administrator is required to generate an authorization token for REST API messages, and to limit hosts that can send REST API messages to the FortiGate.

To create a REST API administrator in the GUI:

1. Go to *System* > *Administrators*.
2. Click *Create New* > *REST API Admin*.
3. Configure the *Username* and other information as needed.
4. Disable *PKI Group*.
5. In the *Trusted Hosts* field, enter *10.1.100.0/24*.



For this example, an administrator profile called *clearpass* was created with full read/write access. See Administrator profiles on page 3608 for details.

6. Click *OK*.

   The *New API key* pane opens.

   The API key is the REST API authorization token that is used in REST API messages sent by CPPM to the FortiGate.

7. Copy the API key to a secure location. A new key can be generated if this one is lost or compromised.
8. Click *Close*.

To create a REST API administrator in the CLI:

```
config system api-user
    edit "cpi-back"
        set accprofile "clearpass"
        config trusthost
            edit 1
                set ipv4-trusthost 10.1.100.0 255.255.255.0
            next
        end
    next
end
```

```
execute api-user generate-key cp-api
    New API key: 0f1HxGHh9r9p74k7qgfHNH40p51bjs
```

```
   NOTE: The bearer of this API key will be granted all access privileges assigned to the api-
user cp-api.
```

Create dynamic IP addresses with the clearpass subtype

Two dynamic IP addresses are required, one for the allow policy, and the other for the deny policy.

To create the dynamic IP addresses:

```
config firewall address
    edit "cppm"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt healthy
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
    edit "cppm-deny"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt infected
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
end
```

Create firewall policies

Two firewall policies are required, one to accept traffic (*cppm-allow*), and the other to deny traffic (*cppm-deny*).

To create the firewall policies in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Configure the allow policy:
   a. Click *Create New*.
   b. Enter a name for the policy.
   c. Set *Source* set to *cppm*.
   d. Set *Action* to *ACCEPT*.
   e. Configure the remaining settings as needed.
   f. Click *OK*.
3. Configure the deny policy:

a. Click *Create New*.
b. Enter a name for the policy.
c. Set *Source* set to *cppm-deny*.
d. Set *Action* to *DENY*.
e. Configure the remaining settings as needed.
f. Click *OK*.

To create the firewall policies in the CLI:

```
config firewall address
    edit "cppm"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt healthy
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
    edit "cppm-deny"
        set type dynamic
        set sub-type clearpass-spt
        set clearpass-spt infected
        set comment ''
        set visibility enable
        set associated-interface ''
        set color 0
    next
end
```

Verification

Go to *Log & Report* > *Forward Traffic* to review traffic logs and ensure that traffic is allowed or denied as expected.

To verify that FortiGate addresses are assigned correctly, enter the following:

```
# diagnose firewall dynamic list
List all dynamic addresses:
cppm-deny: ID(141)
        ADDR(10.1.100.188)

cppm: ID(176)
        ADDR(10.1.100.185)
        ADDR(10.1.100.186)
```

FortiNAC tag dynamic address

The FortiNAC tag dynamic firewall address type is used to store the device IP, FortiNAC firewall tags, and FortiNAC group information sent from FortiNAC by the REST API when user logon and logoff events are registered.

For more information see Dynamic Address Tag in the FortiNAC-F Security Fabric SSO guide.

FortiVoice tag dynamic address

When a FortiVoice-supplied MAC or IP address is used in a firewall policy, a FortiVoice tag (MAC/IP) dynamic address is automatically created on the FortiGate that contains all the provisioned FortiFones registered with FortiVoice. The dynamic address can be used in firewall policies to restrict rules to authorized FortiFones only. This is useful for large voice deployments that require security and efficiency. See Example of a firewall policy on page 1995.

FortiVoice tag dynamic addresses can also be applied to a NAC policy. See Example of a NAC policy on page 1996.

Example of a firewall policy

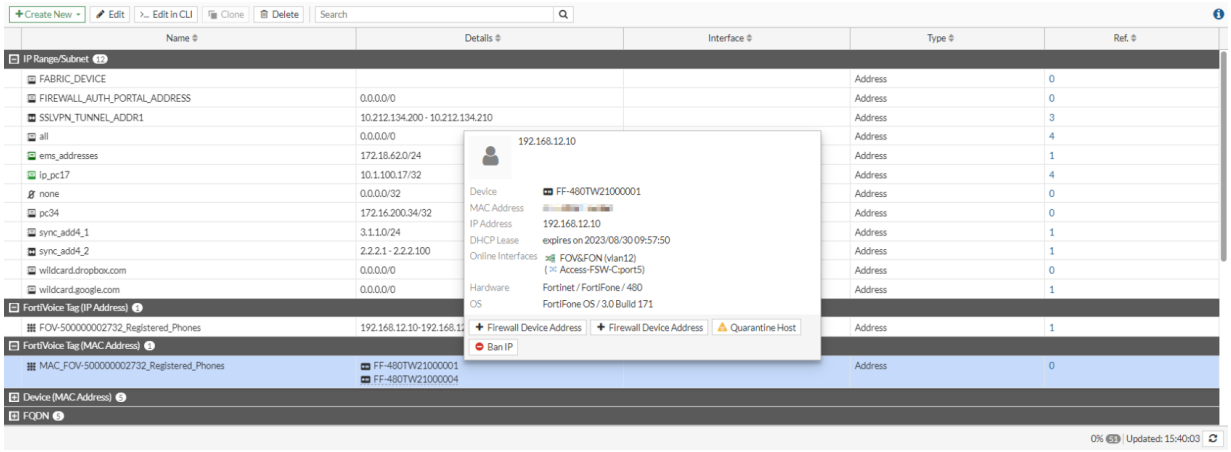
In this example, two FortiFones are registered to FortiVoice and are assigned names and extension numbers. A FortiVoice Fabric connector has been authorized to join the Security Fabric. The dynamic FortiVoice tags are applied to a firewall policy.

To use a FortiVoice tag dynamic firewall address in a policy:

1. Configure and authorize the FortiVoice Fabric connector (see Configuring FortiVoice on page 4248 for more information).
2. Go to *Policy & Objects* > *Addresses* to view the newly created dynamic firewall address objects:
   a. Expand the *FortiVoice Tag (IP Address)* section.

   There is one entry, *FOV-500000002732_Registered_Phones*, which matches 192.168.12.10 to 192.168.12.11.

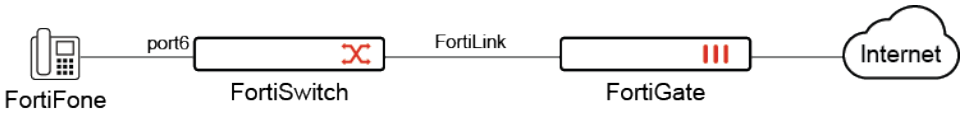
   b. Expand the *FortiVoice Tag (MAC Address)* section. There is one entry, *MAC_FOV-500000002732_Registered_Phones*, which matches two devices. Hover over the device serial number to view the tooltip that contains the MAC address and additional information.



3. Go to *Policy & Objects* > *Firewall Policy* and click *Create new* or edit an existing policy.
4. In the *Source* field, click the *+* and add the *FOV-500000002732_Registered_Phones* and *MAC_FOV-500000002732_Registered_Phones* addresses.
5. In the *Destination* field, click the *+* and add the *FOV-500000002732_Registered_Phones* address.
6. Configure the other settings as needed.
7. Click *OK*.

Example of a NAC policy

In this example, a dynamic FortiVoice tag MAC address (MAC_FOV-500000003139_Registered_Phones) is applied to a NAC policy on the FortiGate. Subsequently, the connected FortiSwitch port is moved to vlan12, where traffic can be controlled for registered FortiFones. For more information about NAC policies, see Defining a FortiSwitch NAC policy in the FortiLink Administration Guide. This example assumes that the FortiVoice Fabric connector is authorized to join the Security Fabric and vlan12 is already configured. See Configuring FortiVoice on page 4248 for more information.



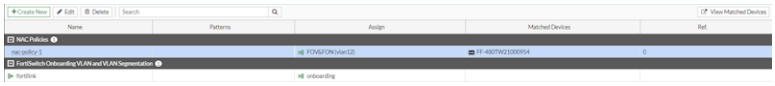
To configure FortiVoice Tag MAC address on NAC policies:

1. Configure the NAC policy:
   a. Go to *WiFi & Switch Controller* > *NAC Policies* and click *Create New*, or edit an existing policy.
   b. In the *Device Patterns* section:
      - Set *Category* to *FortiVoice tag*.
      - Set *FortiVoice tag* to *MAC_FOV-500000003139_Registered_Phones*.
   c. In the *Switch Controller Action* section, enable *Assign VLAN* and select *vlan12*.
   d. Configure the other settings as needed.
   e. Click *OK*.
2. Enable NAC mode on the desired FortiSwitch ports (port6 in this example):
   a. Go to *WiFi & Switch Controller* > *FortiSwitch Ports*.
   b. Select *port6*, then right-click and set the *Mode* to *NAC*.

3. Configure firewall policy that is used to control outbound internet access for FortiFones (vlan12 to wan1):
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Click *Create New*.
   c. Name the policy and configure the following parameters:

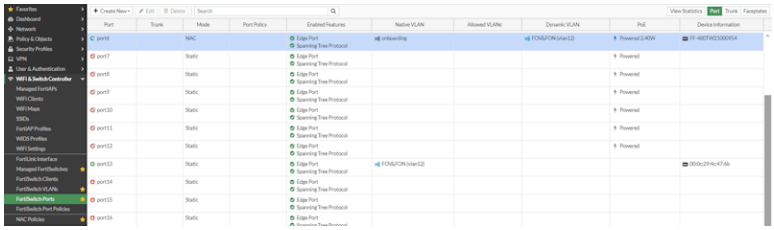
Incoming Interface	vlan12
Outgoing Interface	wan1
Source	all
Destination	all
Schedule	always
Service	ALL
Action	ACCEPT

   d. Configure the other settings as needed.
   e. Click *OK*.
4. Generate traffic from the FortiFone.
5. Once the NAC policy is matched, go to *WiFi & Switch Controller* > *NAC Policies* to view the device matched to the policy.



FortiFone is also shown on *Dashboards* > *Assets & Identities* in the *Matched NAC Devices* widget.

6. Go to *WiFi & Switch Controller* > *FortiSwitch Ports* and locate the port that the FortiFone is connected to. The port has been dynamically assigned vlan12.



To configure FortiVoice Tag MAC address on NAC policies in the CLI:

1. Configure the NAC policy:

```
config user nac-policy
    edit "nac-policy-1"
        set category fortivoice-tag
        set fortivoice-tag "MAC_FOV-500000003139_Registered_Phones"
        set switch-fortilink "fortilink"
```

```
        set switch-mac-policy "mac-policy-
    next
end
```

2. Configure the VLAN in the MAC policy:

```
config switch-controller mac-policy
    edit "mac-policy-1"
        set fortilink "fortilink"
        set vlan "vlan12"
    next
end
```

3. Enable NAC mode on the desired FortiSwitch ports:

```
config switch-controller managed-switch
    edit "Access-FSW-C”
        config ports
            edit "port6"
                set access-mode nac
            next
        end
    next
end
```

4. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "c_fov_fon"
        set srcintf "vlan12"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

MAC address-based policies

MAC addresses can be added to the following IPv4 policies:

- Firewall
- Virtual wire pair
- ACL
- Central SNAT

- DoS

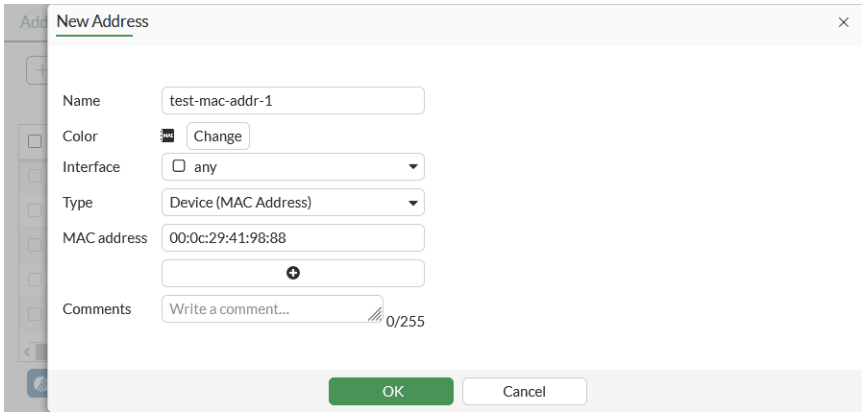
A MAC address is a link layer-based address type and it cannot be forwarded across different IP segments. In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range.

FortiOS only supports the MAC address type as source address for policies in NAT mode VDOM. When you use the MAC address type in a policy as source address in NAT mode VDOM, IP address translation (NAT) is still performed according to the rules defined in the policy. The MAC address type only works for source address matching. It does not have any association with NAT actions.

For policies in transparent mode or the virtual wire pair interface, you can use the MAC address type as source or destination address.

To configure a MAC address using the GUI:

1. Go to *Policy & Objects* > *Addresses* and select *Address*.
2. Click *Create new*.
3. Enter a name.
4. For *Category*, select *Address*.
5. For *Type*, select *Device (MAC Address)*.
6. Enter the MAC address.



7. Click *OK*.
8. Go to *Policy & Objects* > *Firewall Policy* to apply the address type to a policy in NAT mode VDOM:
   a. For *Source*, select the MAC address you just configured.
   b. For *Destination*, select an address.

      In NAT mode VDOM, this address type cannot be used as destination address.

   c. Configure the other settings as needed.
   d. Click *OK*.

To configure a MAC address using the CLI:

1. Create a new MAC address:

```
config firewall address
    edit "test-mac-addr-1"
        set type mac
        set macaddr 00:0c:29:41:98:88
    next
end
```

2. Apply the address type to a policy. In transparent mode or the virtual wire pair interface, this address type can be mixed with other address types in the policy:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "test-mac-addr-1" "10-1-100-42"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set nat enable
    next
end
```

Device & OS Identification dynamic address subtype

Another type of MAC address object is the dynamic *Device & OS identification* subtype. This firewall address subtype is an advanced feature that can be used in policies that support dynamic address subtypes, and it relies on device detection configured on the interface connected to user devices to determine device information.

The FortiGate will update the dynamic address used in firewall policies based on the MAC address and other device and OS information for devices matching configured criteria. The criteria could be hardware vendor, hardware model, software OS, software version, or a combination of these parameters.

Only existing devices whose device information has already been detected by the FortiGate and is known can be added to this dynamic address subtype.

Similar to MAC address-based objects, the dynamic address subtype can be used as a source address for firewall policies, proxy policies, and ZTNA rules. The dynamic address subtype can be used as a source or destination address for transparent mode policies or a virtual wire pair policy.

To use the dynamic *Device & OS Identification* subtype, go to *System* > *Feature Visibility* and enable *Dynamic Device & OS Identification*. Once enabled, the dynamic address subtype can be configured on the *Policy & Objects* > *Addresses* page.

ISDB well-known MAC address list

The Internet Service Database (ISDB) includes well-known vendor MAC address range lists. The lists can only be used for source MAC addresses in IPv4 policies, and include the vendor name and the MAC address ranges that the vendor belongs to.

To view the vendor list:

```
# diagnose vendor-mac id
Please input Vendor MAC ID.
ID: 1 name: "Asus"
ID: 2 name: "Acer"
ID: 3 name: "Amazon"
ID: 4 name: "Apple"
ID: 5 name: "Xiaomi"
ID: 6 name: "BlackBerry"
ID: 7 name: "Canon"
ID: 8 name: "Cisco"
ID: 9 name: "Linksys"
ID: 10 name: "D-Link"
ID: 11 name: "Dell"
ID: 12 name: "Ericsson"
ID: 13 name: "LG"
ID: 14 name: "Fujitsu"
ID: 15 name: "Fitbit"
ID: 16 name: "Fortinet"
ID: 17 name: "OPPO"
ID: 18 name: "Hitachi"
ID: 19 name: "HTC"
ID: 20 name: "Huawei"
ID: 21 name: "HP"
ID: 22 name: "IBM"
ID: 23 name: "Juniper"
ID: 24 name: "Lenovo"
ID: 25 name: "Microsoft"
ID: 26 name: "Motorola"
ID: 27 name: "Netgear"
ID: 28 name: "Nokia"
ID: 29 name: "Nintendo"
ID: 30 name: "PaloAltoNetworks"
ID: 31 name: "Polycom"
ID: 32 name: "Samsung"
ID: 33 name: "Sharp"
ID: 34 name: "Sony"
ID: 35 name: "Toshiba"
ID: 36 name: "VMware"
ID: 37 name: "Vivo"
ID: 38 name: "Zyxel"
ID: 39 name: "ZTE"
```

To view the MAC address ranges for a vendor:

```
# diagnose vendor-mac id 16
Vendor MAC: 16(Fortinet)
Version: 0000700021
Timestamp: 201908081432
Number of MAC ranges: 6
00:09:0f:00:00:00 - 00:09:0f:ff:ff:ff
04:d5:90:00:00:00 - 04:d5:90:ff:ff:ff
08:5b:0e:00:00:00 - 08:5b:0e:ff:ff:ff
70:4c:a5:00:00:00 - 70:4c:a5:ff:ff:ff
90:6c:ac:00:00:00 - 90:6c:ac:ff:ff:ff
e8:1c:ba:00:00:00 - e8:1c:ba:ff:ff:ff
```

To query the vendor of a specific MAC address or range:

```
# diagnose vendor-mac match 00:09:0f:ff:ff:ff 48
Vendor MAC: 16(Fortinet), matched num: 1
```

To use the vendor ID in a firewall policy:

```
config firewall policy
    edit 9
        set name "policy_id_9"
        set uuid 6150cf30-308d-51e9-a7a3-bcbd05d61f93
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set vendor-mac 36 16
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Only packets whose source MAC address belong to Fortinet or VMware are passed by the policy.

IPv6 MAC addresses and usage in firewall policies

Users can define IPv6 MAC addresses that can be applied to the following policies:

- Firewall
- Virtual wire pair
- ACL/DoS
- Central NAT

- NAT64
- Local-in

In FortiOS, you can configure a firewall address object with a singular MAC, wildcard MAC, multiple MACs, or a MAC range. In this example, a firewall policy is configured in a NAT mode VDOM with the IPv6 MAC address as a source address.

IPv6 MAC addresses cannot be used as destination addresses in VDOMs when in NAT operation mode.

To configure IPv6 MAC addresses in a policy in the GUI:

1. Create the MAC address:
   a. Go to *Policy & Objects* > *Addresses* and select *IPv6 Address*.
   b. Click *Create New*.
   c. Enter an address name.
   d. For *Type*, select *Device (MAC Address)*.
   e. Enter the the MAC address.

   f. Click *OK*.
2. Configure the policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. For *Source*, select the IPv6 MAC address object.
   c. Configure the other settings as needed.
   d. Click *OK*.

To configure IPv6 MAC addresses in a policy in the CLI:

1. Create the MAC address:

```
config firewall address6
    edit "test-ipv6-mac-addr-1"
        set type mac
        set macaddr 00:0c:29:b5:92:8d
    next
end
```

2. Configure the policy:

```
config firewall policy
    edit 2
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "test-ipv6-mac-addr-1" "2000-10-1-100-0"
        set dstaddr6 "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

RSSO dynamic address subtype

The RSSO dynamic address object subtype can be used in a firewall policy's source and destination fields. It allows for more granular and precise policies based on RSSO group membership, enhancing security and flexibility when managing network traffic and enforcing policies.

When the sub-type is `rsso`, the `sso-attribute-value` must be set. The IP address of the RADIUS single sign-on user matching the group value will be loaded to the address object.

To configure the RSSO dynamic address subtype:

```
config firewall address
    edit "test-rsso-addr-1"
        set type dynamic
        set sub-type rsso
        set sso-attribute-value <name(s)>
    next
end
```

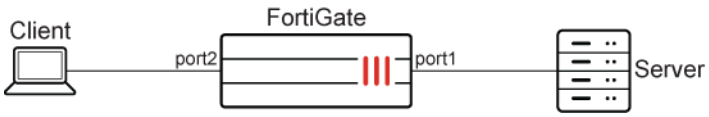
Variable	Description
`sub-type rsso`	RSSO address sub-type.
`sso-attribute-value <name (s)>`	RADIUS attributes value.

To check the RADIUS dynamic address database information :

```
# diagnose test application radiusd {6 | 66}
```

Test level	Description
6	Show RADIUS dynamic address database summary information.
66	Show RADIUS dynamic address database information.

Example



To configure and use an RSSO dynamic address object:

1. Enable RADIUS account access on port 1.
   When the RADIUS server sends an RSSO message to the FortiGate on port 1, which includes an IP address, the FortiGate will add it to the RSSO dynamic address list.

```
config system interface
    edit port1
        append allowaccess radius-acct
    next
end
```

2. Configure the RADIUS user and user group for the RSSO address:

```
config user radius
    edit "rsso_server"
        set rsso enable
        set rsso-radius-response enable
        set rsso-secret **************
        set rsso-flush-ip-session enable
    next
end
config user group
    edit "rsso_g1"
        set group-type rsso
        set sso-attribute-value "rsso_group_1"
    next
end
```

3. Configure a dynamic address with RSSO subtype:

```
config firewall address
    edit "test-rsso-addr-1"
        set type dynamic
        set sub-type rsso
        set sso-attribute-value "rsso_group_1"
    next
end
```

4. Apply the RSSO dynamic address as a destination in the firewall policy:

```
config firewall policy
    edit 44
        set name "nat44_policy"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "10-1-100-0"
        set dstaddr "test-rsso-addr-1"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

5. Check the RSSO dynamic address. In this case, 172.16.200.155 is loaded into the RSSO dynamic address:

```
# diagnose test application radiusd 6
dynamic addresses total[vd:root]:0.
dynamic addresses total[vd:vdom1]:1.
  name, ip_db-total
  test-rsso-addr-1, 1
```

```
# diagnose test application radiusd 66
dynamic addresses total[vd:root]:0.
dynamic addresses total[vd:vdom1]:1.
  name:test-rsso-addr-1, ip_db total:1.
        ip,     installed
        172.16.200.155, 1.
```

```
# diagnose firewall dynamic list test-rsso-addr-1
CMDB name: test-rsso-addr-1
test-rsso-addr-1: ID(90)
        ADDR(172.16.200.155)
Total IP dynamic range blocks: 0.
Total IP dynamic addresses: 1.
```

6. Send a packet that hits the policy, then check the session to see that the RSSO dynamic address works as a destination in the firewall policy:

```
# diagnose sys session list
session info: proto=6 proto_state=07 duration=6 expire=115 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3

```

ISDB record for SOCaaS

The *Fortinet-FortiGuard.SOCaaS* Internet service database (ISDB) entry for Fortinet SOCaaS enables policies to be configured for devices to forward data to SOCaaS collectors without relying on DNS. Eliminating the dependency on DNS reduces the risk of DNS mapping failures and helps ensure a more reliable and seamless data forwarding processing.

To check that the new entry is added to the ISDB:

1. Update the object versions:

```
# diagnose autoupdate versions

Internet-service Full Database
---------
Version: 7.03917 signed
Contract Expiry Date: n/a
Last Updated using manual update on Wed Oct 30 10:33:22 2024
Last Update Attempt: Wed Oct 30 10:33:22 2024
Result: Updates Installed
```

2. Check the Internet service database for the entry:

```
# diagnose internet-service id 1245514

Internet Service: 1245514(Fortinet-FortiGuard.SOCaaS)
Version: 00007.03917
Timestamp: 202410291605
Number of Entries: 14
66.35.19.120-66.35.19.120 country(840) region(283) city(23352) blocklist(0x0) reputation(5),
popularity(5) domain(5225) botnet(0) proto(6) port(514)

popularity(5) domain(0) botnet(0) proto(6) port(514)
```

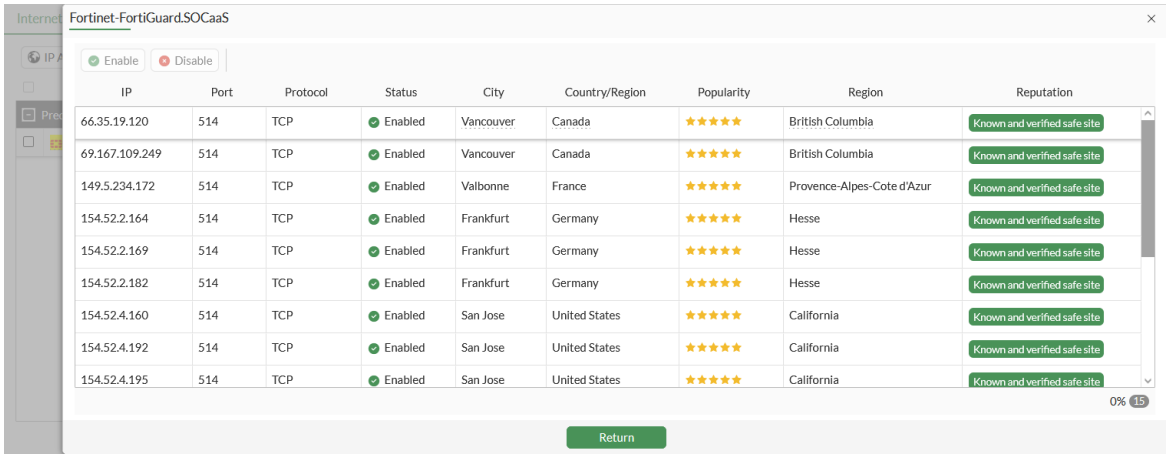
3. Check the entry in the GUI:
   a. Go to *Policy & Objects* > *Internet Service Database* and select the *Internet Service* tab.
   b. Search for *Fortinet-FortiGuard.SOCaaS*.
   c. Hover over the result, and click *View/Edit Entries*.



To use the new entry in a firewall policy:

1. Configure a firewall policy:

```
config firewall policy
    edit 99
        set name "ISDB_Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set internet-service enable
```

```
        set internet-service-name "Fortinet-FortiGuard.SOCaaS"
        set schedule "always"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

2. Generate and then check a log generated by traffic hitting the policy:

```
1: date=2024-10-29 time=17:52:49 eventtime=1730249569310005321 tz="-0700" logid="0000000013"

```

Telemetry addresses and address groups

This topic applies only to a FortiGate acting as a FortiTelemetry Controller with *FortiTelemetry* enabled on the *System > Feature Visibility* page. For a summary of FortiTelemetry-related tasks that you can do in FortiOS, see FortiTelemetry on page 138. See also *FortiTelemetry Administration Guide*.

After a FortiTelemetry agent is authorized in FortiOS, a dynamic telemetry address is automatically created. The name of the telemetry address is the serial number of the FortiTelemetry agent. See Connecting to FortiTelemetry agents on page 4223 for more information.

A static telemetry address group named TELEMETRY is also available. The telemetry address from each approved FortiTelemetry agent is automatically added to the TELEMETRY group.

You can view telemetry addresses and address groups in the GUI or CLI.

In the GUI, go to the *Policy & Objects > Addresses* pane, and click the *Telemetry* tab to view telemetry addresses and telemetry address groups.

In the CLI, use the `config firewall address` command for telemetry addresses:

```
config firewall address
    edit <FortiTelemetry agent serial number>
        set type dynamic
        set sub-type {telemetry}
        set agent-id <FortiTelemetry agent serial number>
    next
end
```

Option	Description
`sub-type {telemetry}`	Dynamic telemetry address.
`agent-id <FortiTelemetry agent serial number>`	Serial number of the FortiTelemetry agent, for example, FT100GTK24000001.

Use the `config firewall addrgrp` command for telemetry address groups:

```
config firewall addrgrp
    edit "telemetry-group"
        set category telemetry
        set member FT100GTK24000001
    next
end
```

Option	Description
`category {telemetry}`	Members must be telemetry groups or telemetry addresses. Can be used to determine telemetry policy.

Use the `config telemetry-controller global` command to control whether telemetry addresses are automatically added to the TELEMETRY address group:

```
config telemetry-controller global
    set auto-group-telemetry-addr {enable | disable}
end
```

Option	Description
`auto-group-telemetry-addr {enable | disable}`	Enable/disable automatically adding the telemetry address to the default address group named TELEMETRY (default = enable). • `enable`: Automatically add telemetry address to the default addrgrp TELEMETRY. • `disable`: Do not automatically add telemetry address to the default addrgrp TELEMETRY.

In FortiOS 7.6.3, FortiTelemetry agents were represented as firewall addresses of type `ipmask`. The firewall address name started with the reserved prefixes "FT100G" or "FTLWIN" and included the agent's serial number. The telemetry address could not be renamed, and the firewall addresses were dynamically updated by telemetryd.

When upgrading from FortiOS 7.6.3 to 7.6.4 or later:

- The `ipmask` firewall address is automatically migrated to the new address type. Starting in FortiOS 7.6.4, telemetry firewall objects no longer require the "FT100G" or "FTLWIN" prefixes. Although the telemetry firewall objects can be renamed in the CLI, it is not recommended to rename the objects.
- All existing telemetry addresses are added to the TELEMETRY address group.

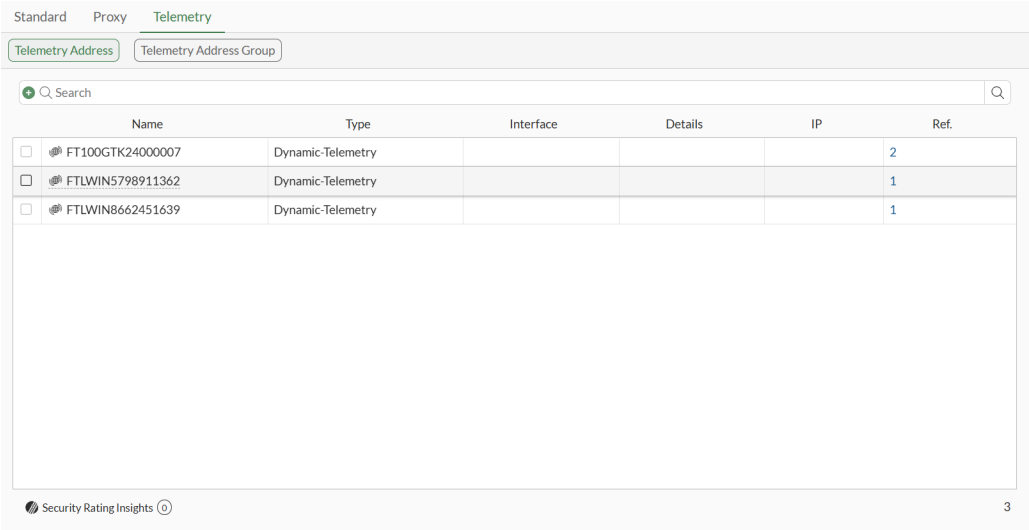
This topic includes the following examples:

- Viewing telemetry addresses on page 2011
- Adding telemetry addresses to TELEMETRY address group on page 2013
- Creating telemetry address groups on page 2013
- Viewing telemetry addresses before and after upgrade on page 2015

Viewing telemetry addresses

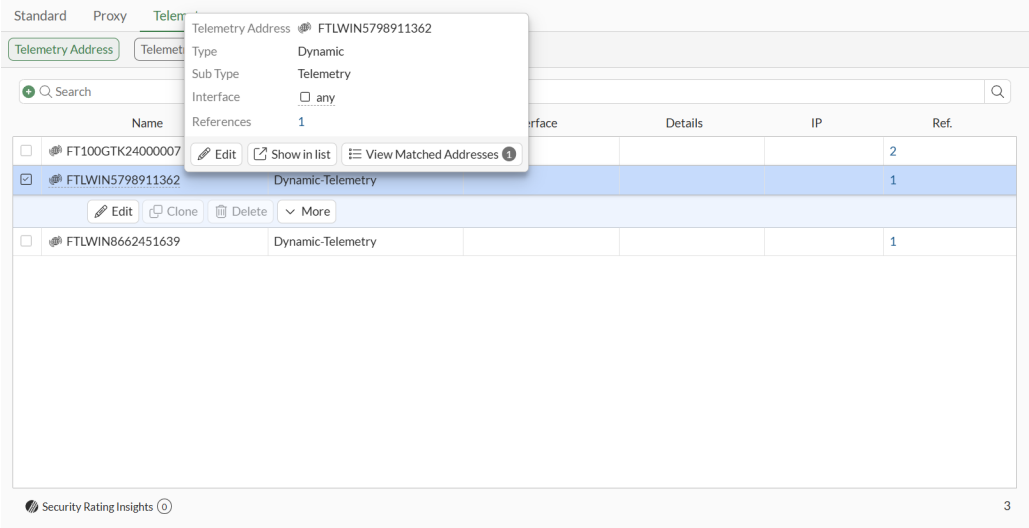
To view telemetry addresses in the GUI:

1. Go to *Policy & Objects* > *Addresses* > *Telemetry*. The *Telemetry Address* pane is displayed.
   This example lists three telemetry addresses.



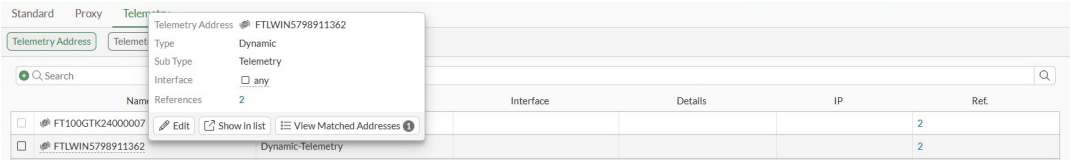
Name	Name of the address is the serial number of the FortiTelemetry agent. Hover over the name to display a tooltip of additional information and buttons, such as *Edit*, *Show in list*, and *View Matched Addresses*.
Type	Displays *Dynamic-Telemetry* to indicate a dynamic type of address with sub-type telemetry.
Ref.	Displays the number of references to the address. Click the number to view current usage details and possible uses.

2. Click a telemetry address to display a tooltip of additional information and more buttons.



Edit	Click to display the Edit Address pane and edit the address object.
More	Click to select *>_Edit in the CLI*.
View Matched Addresses	Click to view the resolved IP address for the FortiTelemetry agent.

3. Click the *View Matched Addresses* button to view the resolved IP address.



The *Resolved Addresses* pane is displayed and shows the IP address (*10.1.100.106*) of the FortiTelemetry agent.

To view a telemetry address in the CLI:

1. View the telemetry address.

   The `type` is `dynamic`, the `sub-type` is `telemetry`, and the `agent-id` is the serial number of the FortiTelemetry agent:

```
show full firewall address FTLWIN5798911362
config firewall address
    edit "FTLWIN5798911362"
        set uuid 8e6e691a-4ba6-51f0-5a93-9e03e58c5a19
        set type dynamic
        set sub-type telemetry
        set comment ''
        set associated-interface ''
```

```
        set color 0
        set fabric-object disable
        set agent-id "FTLWIN5798911362"
    next
end
```

2. View the IP address (`10.1.100.106`) of the FortiTelemetry agent.

```
# diagnose firewall dynamic address FTLWIN5798911362
CMDB name: FTLWIN5798911362
FTLWIN5798911362: ID(250)
        ADDR(10.1.100.106)
Total IP dynamic range blocks: 0.
Total IP dynamic addresses: 1.
```

Adding telemetry addresses to TELEMETRY address group

By default, FortiOS automatically adds the telemetry address from each approved FortiTelemetry agent to the default, static TELEMETRY group. Then you can select the TELEMETRY address group in a firewall policy to use all approved agents.

To automatically add telemetry addresses to the TELEMETRY address group:

```
config telemetry-controller global
    set auto-group-telemetry-addr enable
end
```

Creating telemetry address groups

You can create telemetry address groups in the GUI or CLI.

To create a telemetry address group in the GUI:

1. Go to *Policy & Objects* > *Addresses* > *Telemetry* > *Telemetry Address Group*.

Create new	Click to create a new telemetry address group.
Name	Name of the telemetry address group. A default TELEMETRY address group is provided. Hover over the name to display a tooltip of additional information and buttons, such as *Edit* and *Show in list*. By default, FortiOS adds the telemetry address for each approved FortiTelemetry agent to the TELEMETRY address group.

Type	Displays *Group* to indicate a group of telemetry addresses.
Members	Lists the members of the group. Members must be telemetry addresses or telemetry address groups.
Ref.	Displays the number of references to the address group. Click the number to view current usage details and possible uses.

2. Click the *Create new* button. The *New Address Group* pane is displayed.
3. Set the following options and click *OK*.
   - Set *Name* to a unique name.
   - Set *Type* to *Group*.
   - Click *Members*, select *Telemetry Address*, and select one or more telemetry addresses or telemetry address groups. Click *Close* when done.

   The telemetry group contains the selected telemetry addresses.
4. Click *OK* to save the new address group.

To create a telemetry address group in the CLI:

1. Create a telemetry address group.

   The example `Telemetry-group-1` is for a hardware agent. The `type` can be `default` or `folder`, and the `category` is `telemetry`. The member is the `FT100GTK24000007` telemetry address:

```
config firewall addrgrp
    edit "Telemetry-group-1"
        set type default
        set category telemetry
        set member "FT100GTK24000007"
        set comment ''
        set uuid 4f197cee-4d65-51f0-2942-8214af708a17
        set exclude disable
        set color 0
        set fabric-object disable
    next
end
```

2. Create a new telemetry address group.

   The example `Telemetry-group-2` is for a software agent. The `category` is `telemetry`, and the member is the `FTLWIN5798911362` telemetry address:

```
config firewall addrgrp
    edit Telemetry-group-2
        set category telemetry
```

```
        set member FTLWIN5798911362
    next
end
```

Viewing telemetry addresses before and after upgrade

During upgrade from FortiOS 7.6.3 to 7.6.4 or later, the `ipmask` telemetry address is migrated to the new telemetry type.

To view the telemetry address:

1. In FortiOS 7.6.3, view the configuration before upgrading to 7.6.4:

```
show firewall address
config firewall address
    edit "FTLWIN5798911362"
        set uuid adfe7cd2-4d6f-51f0-5f30-08450239a4e7
        set subnet 10.1.100.106 255.255.255.255
    next
    edit "FTLWIN8662451639"
        set uuid ae9083b6-4d6f-51f0-b13d-a61ffcd634e9
        set subnet 10.1.100.108 255.255.255.255
    next
    edit "FT100GTK24000007"
        set uuid cd9c80f2-4d6f-51f0-4d5a-b160e44881d1
        set subnet 192.168.14.8 255.255.255.255
    next
end
```

2. Upgrade FortiOS to 7.6.4 or later.
3. In FortiOS 7.6.4, view the configuration.

   For each address, the `type` is `dynamic`, the `sub-type` is `telemetry`, and the `agent-id` is the serial number for the FortiTelemetry agent.

```
show firewall address
config firewall address
    edit "FTLWIN5798911362"
        set uuid 8489a542-4d70-51f0-327e-e91bd439cf25
        set type dynamic
        set sub-type telemetry
        set agent-id "FTLWIN5798911362"
    next
    edit "FTLWIN8662451639"
        set uuid 8489a9d4-4d70-51f0-153f-e36cde5329d0
        set type dynamic
        set sub-type telemetry
        set agent-id "FTLWIN8662451639"
    next
    edit "FT100GTK24000007"
        set uuid 8489ae5c-4d70-51f0-1617-716c6bd9df2a
```

```
        set type dynamic
        set sub-type telemetry
        set agent-id "FT100GTK24000007"
    next
end
```

Custom tags NEW

Custom tags can be created and applied to various address types, address groups, and policy types. This helps administrators organize their addresses and policies, quickly visualize the category, and easily filter based on the assigned tags when many addresses and policies are configured.

The following objects can have custom tags assigned:

- Firewall address and address groups (IPv4 and IPv6)
- Proxy address and address groups
- Multicast addresses (IPv4 and IPv6)
- Firewall policy
- NGFW security policy
- Multicast policy
- DoS policy
- Local-in policy
- Central SNAT mapping
- Proxy policy

When address groups use custom tags as group members, they are called dynamic tag address groups. You can define more address objects for the tag associated with the address group for the firewall policy to automatically use the new address objects. No changes to the firewall policy are required.

Custom tags have tablesize limits. Refer to the Max Values table for exact size limits.

CLI syntax

Options are available to create custom tags:

```
config firewall custom-tag
    edit <tag name>
        set abbreviation <string>
        set comment <string>
        set color <integer>
    next
end
```

Command	Descriptions
`abbreviation <string>`	Custom tag name abbreviation. Maximum of four uppercase letters and numbers.
`comment <string>`	Comment.
`color <integer>`	Color of the custom tag on the GUI (0 to 32, default = 1).

To apply the tag to an address or policy:

```
config firewall address
    edit "taggedAddress"
        set custom-tags <tag> [tag]
    next
end
```

```
config firewall policy
    edit <ID>
        set custom-tags <tag> [tags]
    next
end
```

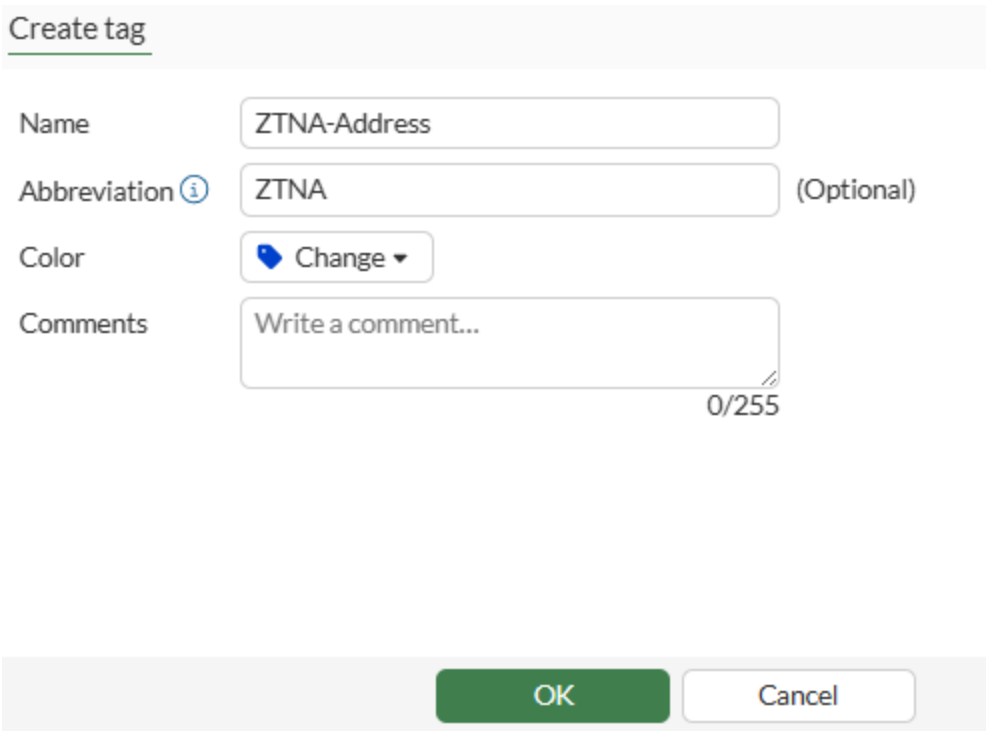
Options are available to create dynamic tag address groups with tags as group members:

```
config firewall addrgrp
    edit <name>
        set type {default | folder | dynamic-tag}
        set custom-tags <string>
    next
end
```

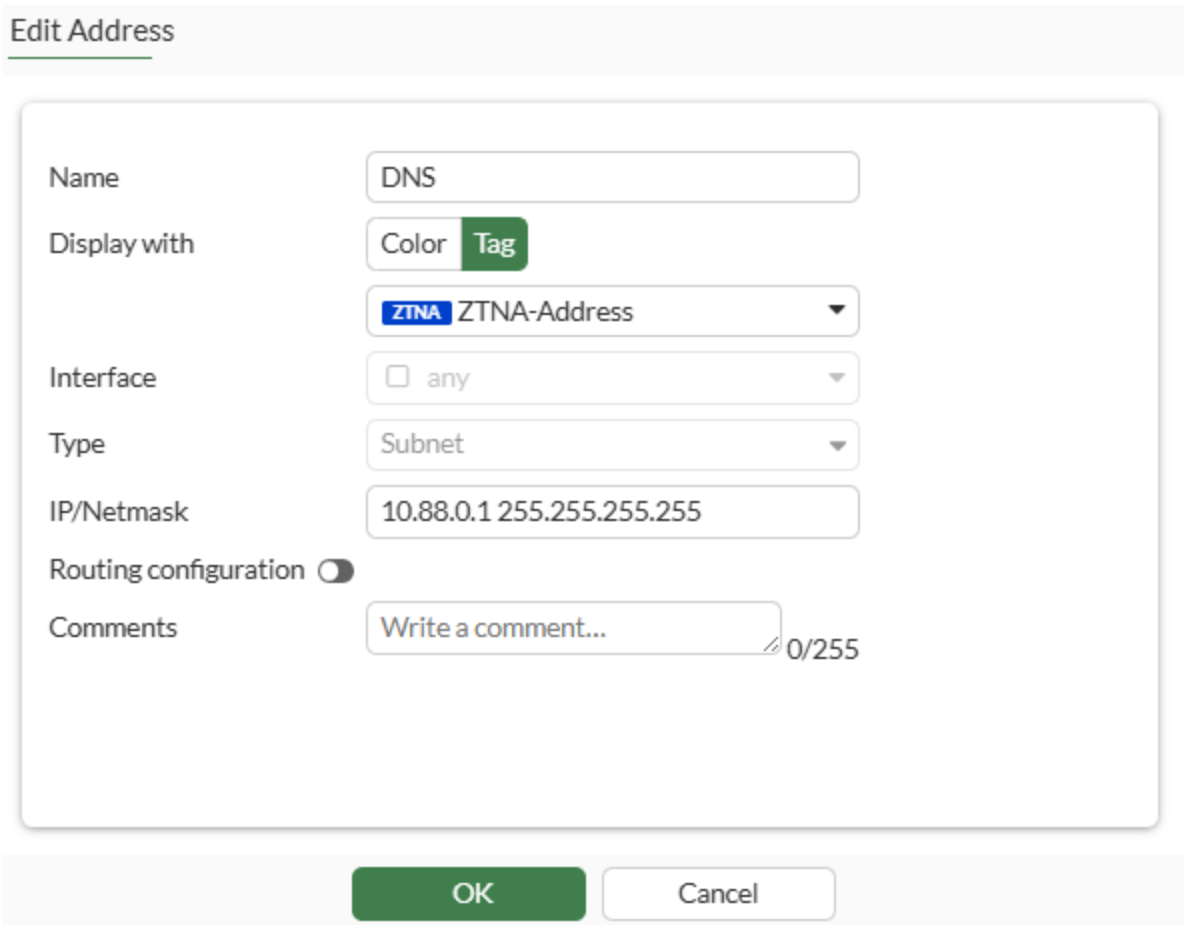
Command	Descriptions
`type {default | folder | dynamic-tag}`	Type of address group: • `default`: Default address group type (address may belong to multiple groups). • `folder`: Address folder group (members may not belong to any other group). • `dynamic-tag`: Dynamic tag group (members are addresses only if they have any one of the configured tags).
`custom-tags <string>`	Name of the custom tag. Available when `type` is set to `dynamic-tag`.

GUI

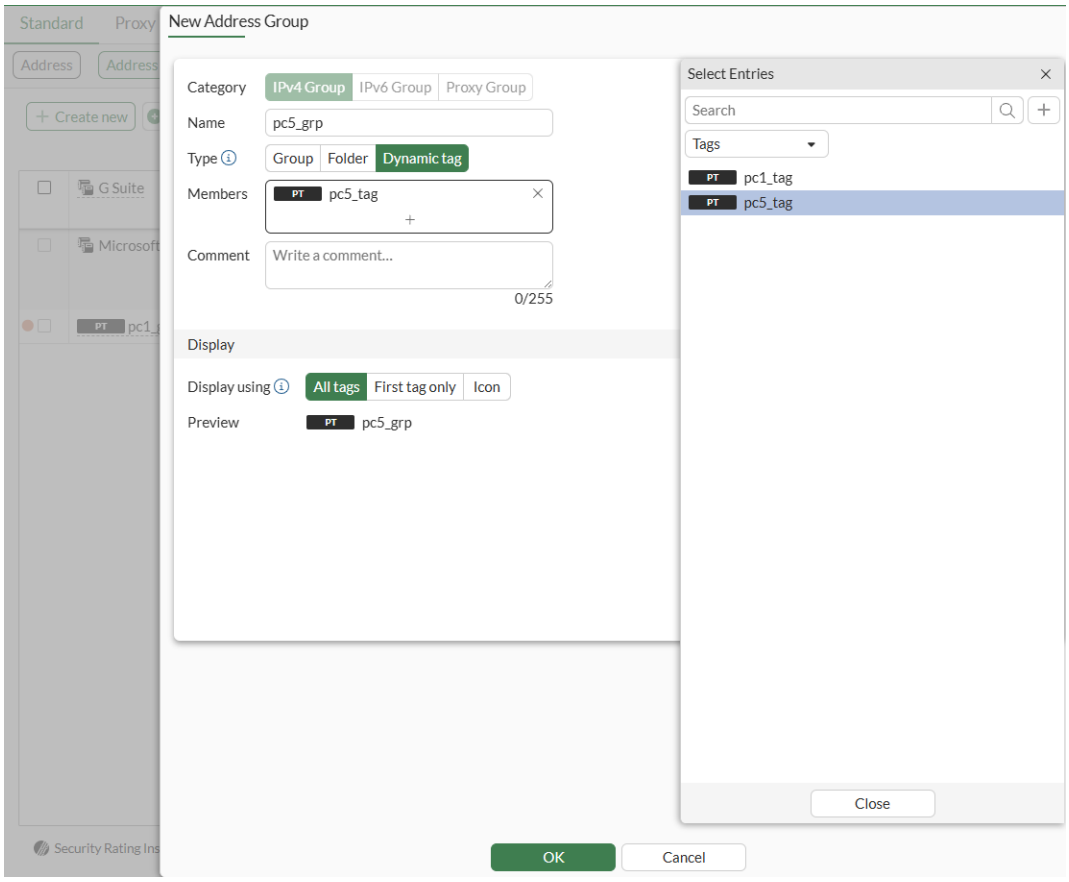
Custom tags can be configured from *Policy & Objects* > *Tags*.



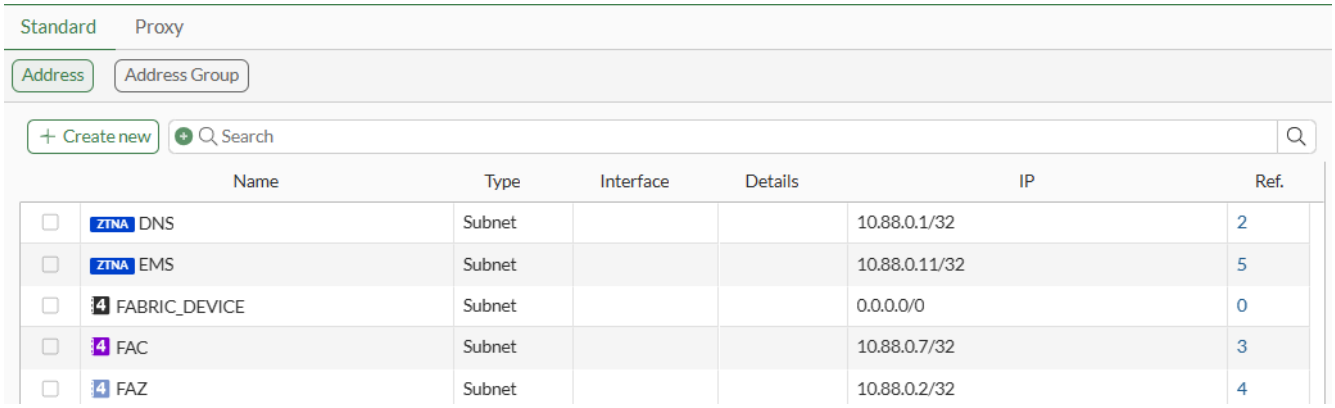
The abbreviation can be up to three uppercase letters and numbers.



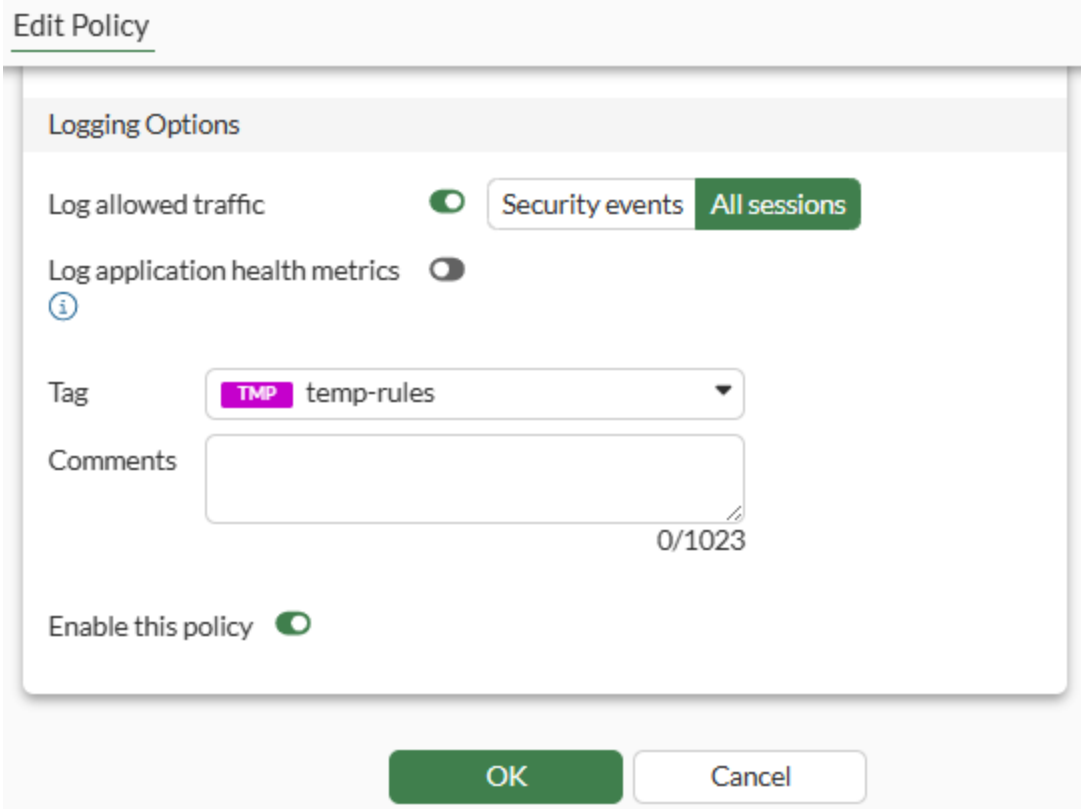
In address groups, set *Type* to *Dynamic* tag to select one or more tags:



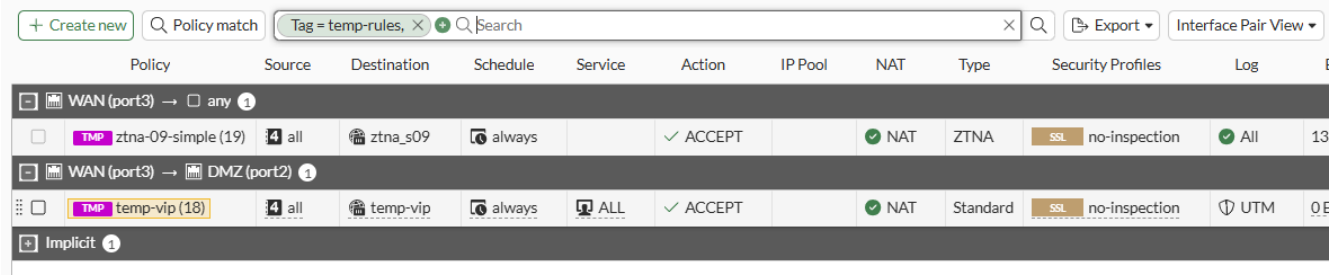
When *All tags* or *First tag only* is chosen as the display, the tag is shown as opposed to the default colored icon in the Address objects page for that particular object.



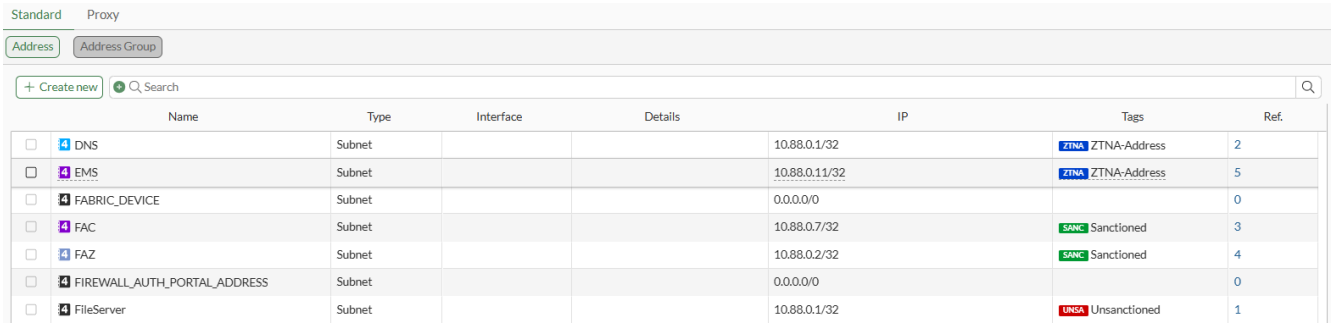
Policy Tagging is not enabled by default and must be enabled in *Feature Visibility*. Once enabled, a tag can be applied to the policy.



Tags are visible in the Policy list page and can be filtered in the Search bar.



Display changes slightly when multiple object tags are used. Use the *Tags* column to view the assigned tags.



Example

This example describes how to create two custom tags, associate the custom tags with address objects, and configure dynamic tag address groups. Dynamic tag address groups use tag names as group members instead of object names. The firewall policy is configured to use the dynamic tag address groups to allow traffic from PC1 to PC5.

The following items are created:

- Two custom tags:
  - pc1_tag
  - pc5_tag
- Two address objects:
  - pc1 assigned the pc1_tag
  - pc5 assigned the pc5_tag
- Two dynamic tag address groups:
  - pc1_grp assigned the pc1_tag
  - pc5_grp assigned the pc5_tag

The firewall policy is configured to use the dynamic tag address groups (pc1_grp and pc5_grp) to allow traffic from PC1 to PC5.

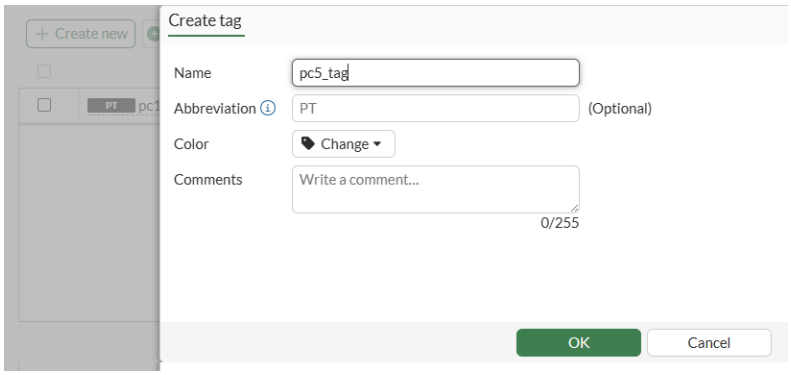
When you add more address objects with tags, the tags are used to automatically update the dynamic tag address group used by the firewall policy. No changes are required on the associated firewall policy.

For example, you could create more address objects assigned the pc1_tag for the firewall policy to automatically use the address objects for the pc1_grp, which is configured to use address objects assigned the pc1_tag.

To create dynamic tag address groups in the GUI:

1. Create two custom tags:
   a. Go to *Policy & Objects* > *Tags*.
   b. Click *Create new*.
   c. Enter a *Name*, such as pc1_tag.

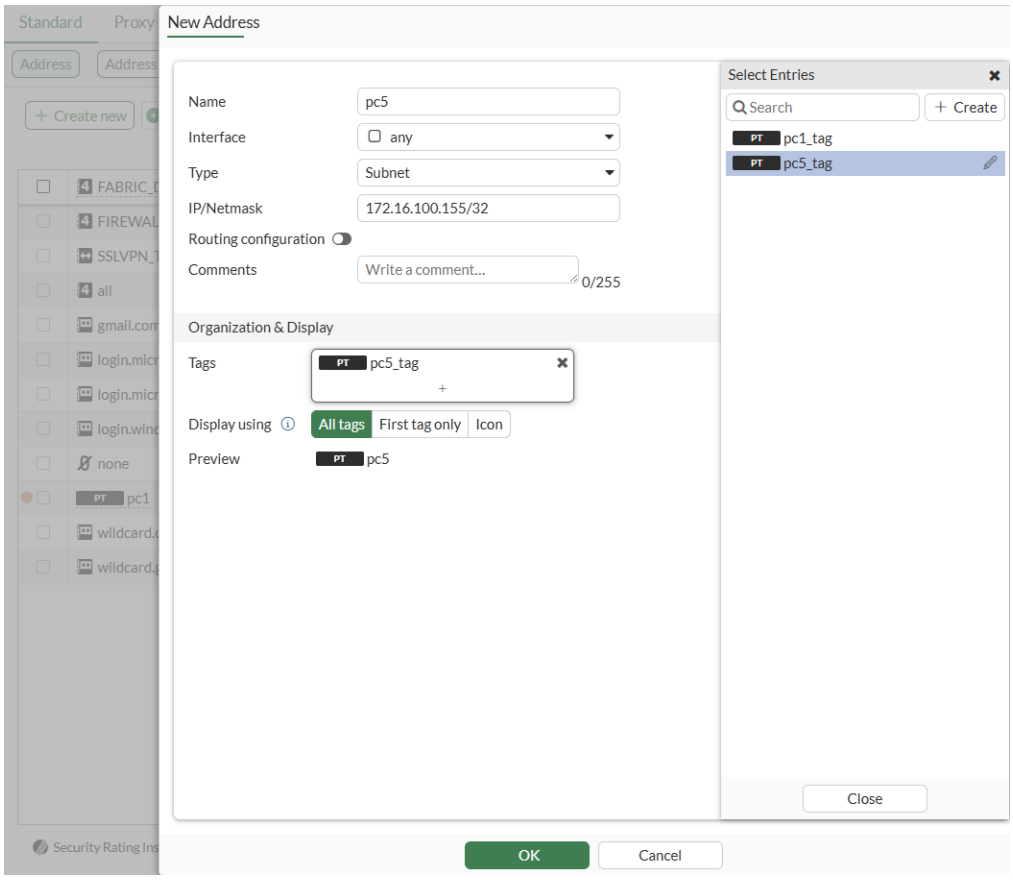
   d. Click *OK*.
   e. Repeat this procedure to create another custom tag named pc5_tag.



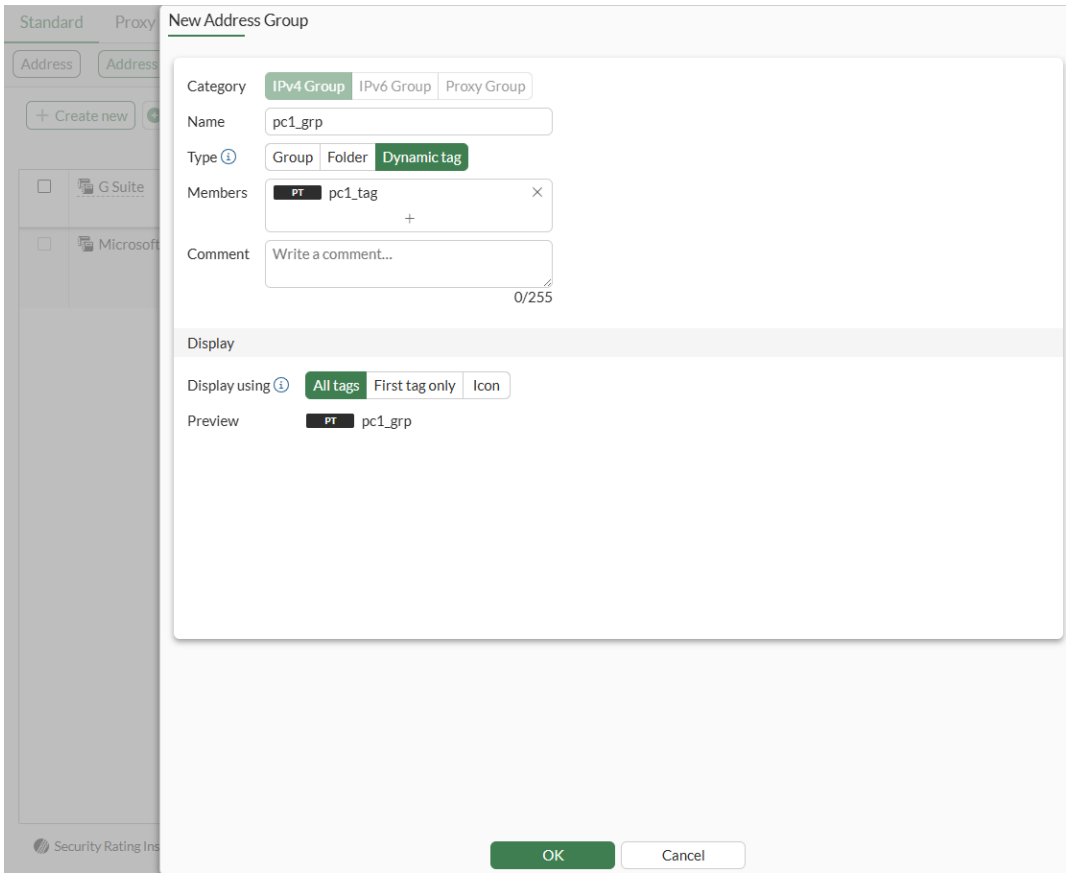
Two custom tags are available: pc1_tag and pc5.

2. Create two address objects for PC1 and PC5 and assign to them the tags you created:
   a. Go to *Policy & Objects* > *Addresses*.
   b. On the *Address* tab, click *Create new*.
   c. Enter a *Name*, such as pc1.
   d. Beside *Tags*, click *+*, and select the pc1_tag you created.

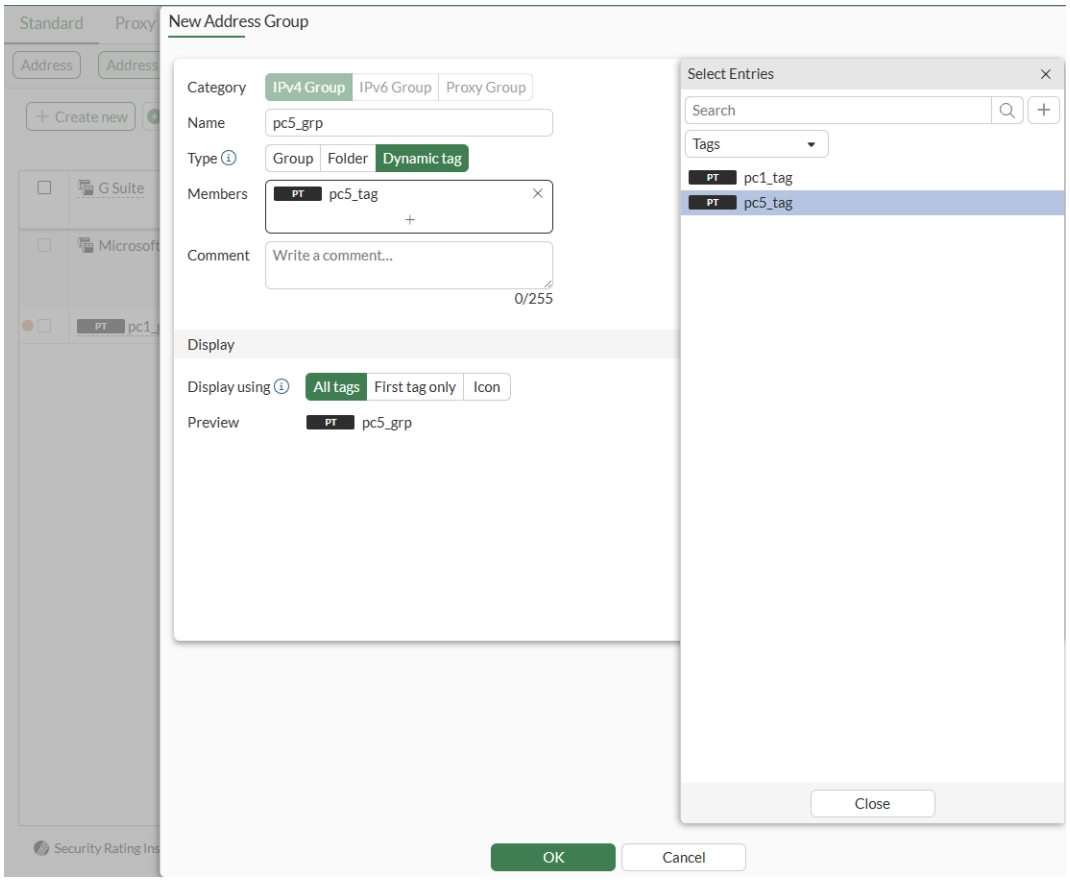
   e. Click *OK*.
   f. Repeat this procedure to create an address for pc5 and select the pc5_tag.



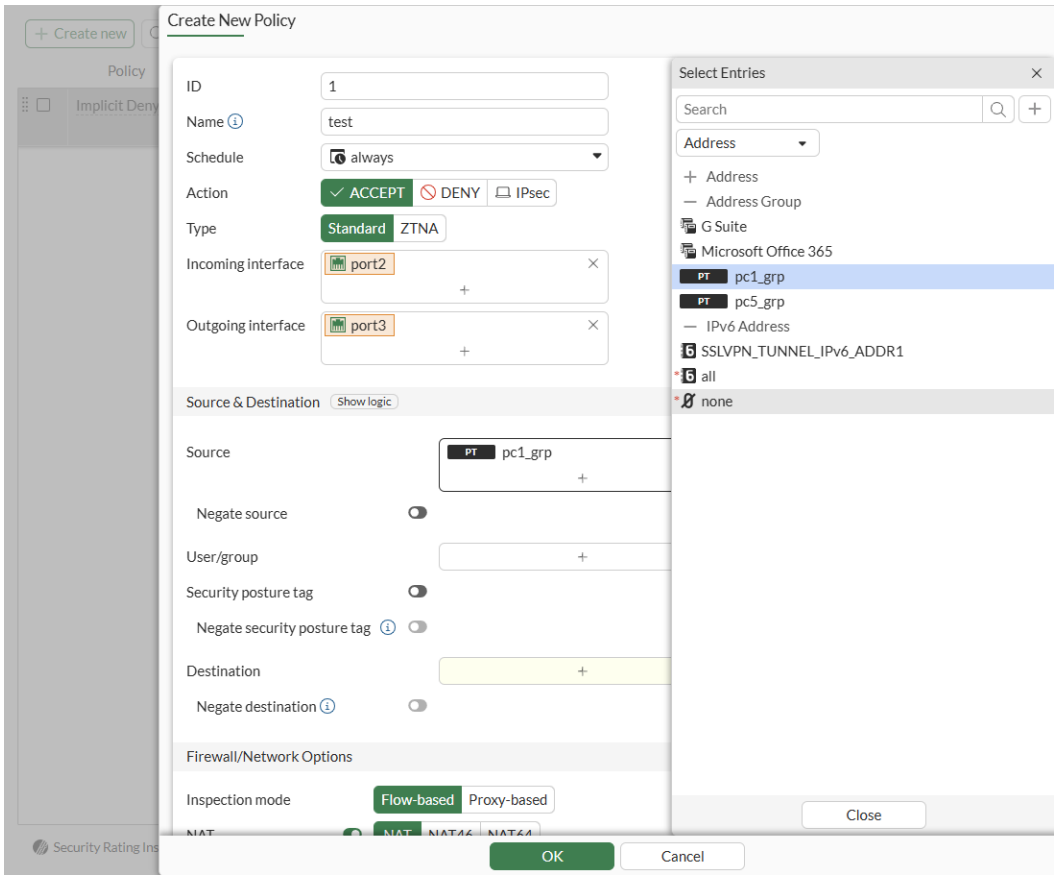
3. Create two dynamic tag address groups, with the tag names (pc1_tag and pc5_tag) as group members instead of the object names.
   a. In *Policy & Objects* > *Addresses*, click the *Address Group* tab.
   b. Click *Create new*.
   c. Enter a *Name*, such as pc1_grp.
   d. Set *Type* to *Dynamic tag*.
   e. Beside *Members*, click *+*, select the tag name (pc1_tag), and click *Close*.



f. Repeat this procedure to create an address group named pc5_grp and add custom tag pc5_tag as group member.



4. Enable policy tagging:
   a. Go to *System* > *Feature Visibility*.
   b. Under *Additional Features*, enable *Policy Tagging*.
   c. Click *Apply*.
5. Configure a firewall policy to allow traffic from PC1 to PC5.
   a. Go to *Policy & Objects* > *Firewall Policy*.
   b. Click *Create new*.
   c. Enter a *Name*.
   d. Beside *Source*, click *+*, select the address group named pc1_grp, and click *Close*.



e. Beside *Destination*, click *+*, select the address group named pc5_grp, and click *Close*

f. Set the remaining options as needed.

g. Click *OK*.

To create dynamic tag address groups in the CLI:

1. Create two custom tags:

```
config firewall custom-tag
    edit "pc1_tag"
    next
    edit "pc5_tag"
    next
end
```

2. Create two address objects named pc1 and pc5 with the pc1_tag and pc5_tag:

```
config firewall address
    edit "pc1"
        set custom-tags "pc1_tag"
        set subnet 10.1.100.111 255.255.255.255
    next

    edit "pc5"
```

```
        set custom-tags "pc5_tag"
        set subnet 172.16.200.155 255.255.255.255
    next
end
```

3. Create two dynamic tag address groups with the following tags as group members: pc1_tag and pc5_tag:

```
config firewall addrgrp
    edit "pc1_grp"
        set type dynamic-tag
        set custom-tags "pc1_tag"
    next
    edit "pc5_grp"
        set type dynamic-tag
        set custom-tags "pc5_tag"
    next
end
```

4. Configure a firewall policy to allow traffic from PC1 to PC5 using the address groups:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set action accept
        set srcaddr "pc1_grp"
        set dstaddr "pc5_grp"
        set schedule "always"
        set service "ALL"
        set auto-asic-offload disable
    next
end
```

Protocol options

Firewall policies contain a *Protocol Options* field that defines the parameters for handling protocol-specific traffic. Multiple protocol options profiles can be configured in FortiOS since the requirements may differ between policies. A single protocol options profile is applied per policy, but the profile can be used in multiple policies.

To create a protocol options profile, go to *Policy & Objects* > *Protocol Options*. The following settings can be configured.

Log oversized files

Enable this option to log the occurrence of oversized files being processed. This does not change how they are processed. It only allows the FortiGate to log that they were either blocked or allowed through.

It is common practice to allow larger files through without antivirus processing. Monitor the logs for the frequency of oversized file processing to determine whether or not to alter the settings for treating oversized files. The threshold setting for oversized files and emails is located in the *Common Options* section.

RPC over HTTP

This protocol is used by Microsoft Exchange Servers to perform virus scanning on emails that use RPC over HTTP.

Protocol port mapping

To optimize the FortiGate's resources, the mapping and inspection of the following protocols can be enabled or disabled:

- HTTP
- SMTP
- POP3
- IMAP
- FTP
- NNTP
- MAPI
- DNS
- CIFS

Each protocol has a default TCP port. The ports can be modified to inspect any port with flowing traffic. The packet headers indicate which protocol generated the packet.

Protocol port mapping only works with proxy-based inspection. Flow-based inspection inspects all ports regardless of the protocol port mapping configuration.

Common options

The *Comfort Clients* and *Block Oversized File/Email* options apply to multiple protocols.

Comfort clients

When proxy-based antivirus scanning is enabled, the FortiGate buffers files as they are downloaded. Once the entire file is captured, the FortiGate begins scanning the file. The user must wait during the buffering and scanning procedure. After the scan is completed and if no infection is found, the file is sent to the next step in the process flow. If the file is large, this part of the process can take some time. In some cases, enough time that some users may get impatient and cancel the download.

The *Comfort Clients* option mitigates this potential issue by feeding a trickle of data while waiting for the scan to complete. The user is aware that processing is taking place, and that there has not been a failure in the transmission. The slow transfer rate continues until the antivirus scan is complete. The transfer will proceed at full speed once the file is scanned successfully and does not contain any viruses.

If there is evidence of an infection, the FortiGate caches the URL and drops the connection. The client does not receive any notification of what happened because the download to the client has already started. Instead, the download stops and the user is left with a partially downloaded file. If the user tries to download the same file

again within a short period of time, the cached URL is matched and the download is blocked. A notification is displayed that the download was blocked. The number of URLs in the cache is limited by the size of the cache.

Client comforting is available for HTTP and FTP traffic. If the FortiGate supports SSL content scanning and inspection, client comforting can be configured for HTTPS and FTPS traffic.

> ⚠ Buffering the entire file allows the FortiGate to eliminate the danger of missing an infection due to fragmentation because the file is reassembled before examination. This buffering is performed whenever the *Comfort Clients* option is disabled.
>
> Client comforting can send unscanned and potentially infected content to the client, so only enable this option if you are prepared to accept this risk. Keeping the client comforting interval high and the amount low will reduce the amount of potentially infected data that is downloaded.

Block oversized files and emails

This option is related to antivirus scanning. The FortiGate has a finite amount of resources to buffer and scan a file. If a large file (such as an ISO image or video file) is downloaded, this could overwhelm or exceed the FortiGate's memory, especially if other large files are being downloaded at the same time.

A threshold is assigned to identify an oversize file or email. The default is 10 MB. The range varies per model, and the minimum is 1 MB. Any file or email over this threshold will not be processed by policies applying the antivirus security profile.

> 💡 If the FortiGate enters conserve mode on a regular basis, lowering the threshold can lessen the impact of processing the files on memory. This can increase risk, even though malware is more likely to be in smaller files.

Web options

The *Chunked Bypass* option applies to traffic containing web protocols.

Chunked bypass

Chunked bypass is a mechanism in HTTP 1.1 that allows a web server to start sending chunks of dynamically generated output in response to a request before actually knowing the actual size of the content. For dynamically generated content, enabling chunked bypass speeds up the initial response to HTTP requests, but the content is not held in the proxy as an entire file before proceeding.

Email options

The *Allow Fragmented Messages* and *Append Signature (SMTP)* options apply to email protocols.

Allow fragmented messages

The specifications of RFC 2046 allow for the breaking up of emails and sending the fragments in parallel to be rebuilt and read at the other end by the mail server. It was originally designed to increase the performance over slower connections where larger email messages were involved. Feasibility of using this function depends on the mail configuration. Outside of Microsoft Outlook, not many email clients are set up to break up messages like this. The drawback of this feature is that if malware is broken up between multiple fragments of the message, there is a risk that it will not be detected by some antivirus configurations because all the code may not be present at the same time to identify the malware.

Append signature

This option adds a plain text email signature to SMTP email messages as they pass through the FortiGate. The message maximum is 1023 characters.

This feature works best in an environment where there is some standardization of what goes into the senders' personal signatures so that there is no duplication or contradiction of information. For example:

- *This email should not be forwarded without prior approval.*
- *Please consider the environment before printing this email.*
- *For questions regarding purchasing our products, please call ...*

Stripping the X-Forwarded-For value in the HTTP header

The X-Forwarded-For value in the HTTP header can be stripped when the `strip-x-forwarded-for` option is enabled under `firewall profile-protocol-options`. This feature sets the value to empty using the IPS engine.

The following types of traffic support X-Forwarded-For stripping:

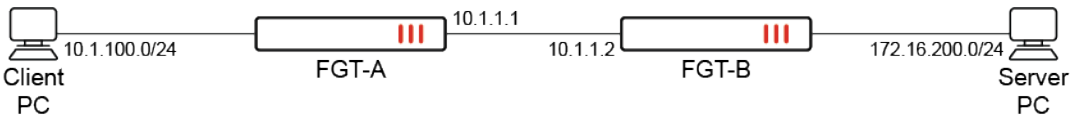
- HTTP/1.1, HTTP/2, and HTTP/3 traffic that matches an NGFW mode security policy with flow-based inspection.
- Plain HTTP/1.1 traffic that matches a firewall policy with proxy-based inspection.

The following types of traffic do not support X-Forwarded-For stripping:

- HTTPS traffic that matches a firewall policy with proxy-based inspection.
- HTTP and HTTPS traffic that matches an explicit web proxy policy.

Example

In this example, FGT-A is configured with `strip-x-forwarded-for` enabled for HTTP. On FGT-B, the IPS sensor is configured to monitor the Eicar.Virus.Test.File signature. The IPS logs on FGT-B are used to verify the traffic sent from FGT-A to FGT-B, namely the `forwardedfor` value in the `rawdata` field.



To configure X-Forwarded-For stripping:

1. Configure FGT-A:
   a. Configure the protocol options for HTTP:

```
config firewall profile-protocol-options
    edit "protocol-xff"
        config http
            set ports 80
            unset options
            set strip-x-forwarded-for enable
            unset post-lang
        end
    next
end
```

   b. Configure the firewall policy (ensure that an IPS sensor is applied):

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port5"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set profile-protocol-options "protocol-xff"
        set ssl-ssh-profile "ssl-deep"
        set ips-sensor "default"
        set nat enable
    next
end
```

2. Configure FGT-B:
   a. Configure the IPS sensor with extended logging:

```
config ips sensor
    edit "monitor-eicar"
        set extended-log enable
        config entries
            edit 1
                set rule 29844
                set status enable
                set action pass
            next
        end
    next
end
```

   b. Configure the firewall policy (ensure that an IPS sensor is applied):

```
config firewall policy
    edit 3
        set srcintf "port5"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "ssl-deep"
        set ips-sensor "monitor-eicar"
        set nat enable
    next
end
```

To verify the configuration:

1. Use a cURL request to send HTTPS traffic with HTTP header X-Forwarded-For from the Client PC to the Server PC:

   ```
   curl -vk -H "X-Forwarded-For: 10.22.22.22" https://172.16.200.52/eicar.com
   ```

2. On FGT-B, verify the corresponding IPS logs.
   a. For HTTP/1.1, the `X-Forwarded-For` value is removed from the `rawdata` field, and the `forwardedfor` value is not included:

      ```
      1: date=2023-09-21 time=14:05:34 eventtime=1695330334919589600 logid="0419016384"
      type="utm" subtype="ips" eventtype="signature" level="alert" vd="root" severity="info"
      srcip=10.1.1.1 srccountry="Reserved" dstip=172.16.200.42 dstcountry="Reserved"
      srcintf="port5" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined"
      sessionid=2471 action="detected" proto=6 service="HTTPS" policyid=3 poluuid="782b9e86-
      58a3-51ee-8e0f-79c7682223dd" policytype="policy" attack="Eicar.Virus.Test.File"
      srcport=36018 dstport=443 hostname="172.16.200.42" url="/eicar.com" agent="curl/7.61.1"
      httpmethod="GET" direction="incoming" attackid=29844 profile="monitor-eicar"
      ref="http://www.fortinet.com/ids/VID29844" incidentserialno=75497475 msg="file_transfer:
      Eicar.Virus.Test.File" rawdataid="1/1" rawdata="Response-Content-Type=application/x-msdos-
      program" crscore=5 craction=65536 crlevel="low"
      ```

   b. For HTTP/2 and HTTP/3, the `X-Forwarded-For` value is removed from the `rawdata` field, and `forwardedfor` is included:

      ```
      1: date=2023-09-21 time=14:05:56 eventtime=1695330356543624871 logid="0419016384"
      type="utm" subtype="ips" eventtype="signature" level="alert" vd="root" severity="info"
      srcip=10.1.1.1 srccountry="Reserved" dstip=172.16.200.52 dstcountry="Reserved"
      srcintf="port5" srcintfrole="undefined" dstintf="port1" dstintfrole="undefined"
      sessionid=2474 action="detected" proto=6 service="HTTPS" policyid=3 poluuid="782b9e86-
      58a3-51ee-8e0f-79c7682223dd" policytype="policy" attack="Eicar.Virus.Test.File"
      srcport=37786 dstport=443 hostname="172.16.200.52" url="/eicar.com" agent="curl/7.61.1"
      httpmethod="GET" direction="incoming" attackid=29844 profile="monitor-eicar"
      ref="http://www.fortinet.com/ids/VID29844" incidentserialno=75497476 msg="file_transfer:
      ```

```
Eicar.Virus.Test.File" rawdataid="1/1" forwardedfor="\r\n" rawdata="Response-Content-
Type=application/x-msdos-program" crscore=5 craction=65536 crlevel="low"
```

3. On FGT-A, disable `strip-x-forwarded-for` for HTTP:

```
config firewall profile-protocol-options
    edit "protocol-xff"
        config http
            set strip-x-forwarded-for disable
        end
    next
end
```

4. Send the same HTTPS traffic with HTTP header X-Forwarded-For from the Client PC to the Server PC.
5. On FGT-B, verify the corresponding IPS log, which includes `forwardedfor` and `X-Forwarded-For` values in the `rawdata` field:

```
1: date=2023-09-21 time=16:33:06 eventtime=1695339187144132034 logid="0419016384" type="utm"
subtype="ips" eventtype="signature" level="alert" vd="root" severity="info" srcip=10.1.1.1
srccountry="Reserved" dstip=172.16.200.52 dstcountry="Reserved" srcintf="port5"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" sessionid=3776
action="detected" proto=6 service="HTTPS" policyid=3 poluuid="782b9e86-58a3-51ee-8e0f-
79c7682223dd" policytype="policy" attack="Eicar.Virus.Test.File" srcport=37788 dstport=443
hostname="172.16.200.52" url="/eicar.com" agent="curl/7.61.1" httpmethod="GET"
direction="incoming" attackid=29844 profile="monitor-eicar"
ref="http://www.fortinet.com/ids/VID29844" incidentserialno=75497478 msg="file_transfer:
Eicar.Virus.Test.File" rawdataid="1/1" forwardedfor="10.22.22.22" rawdata="Response-Content-
Type=application/x-msdos-program|X-Forwarded-For=10.22.22.22" crscore=5 craction=65536
crlevel="low"
```

Traffic shaping

A FortiGate provides quality of service (QoS) by applying bandwidth limits and prioritization to network traffic. Traffic shaping is one technique used by the FortiGate to provide QoS. A basic approach to traffic shaping is to prioritize higher priority traffic over lower priority traffic during periods of traffic congestion. This provides a stabilizing effect for important traffic while throttling less important traffic.

The FortiGate can be configured to deliver traffic shaping with policing or traffic shaping with queuing. The general difference between the two is as follows:

Technique	Description
Traffic shaping with policing	When traffic exceeds the configured bandwidth limits, traffic is dropped.
Traffic shaping with queuing	When traffic exceeds the configured bandwidth limits, traffic is delayed for transport until bandwidth frees up. Traffic may be dropped if the queues are full.

Policing and queuing can both prioritize traffic and deliver guaranteed bandwidth and maximum bandwidth by setting bandwidth limits. The implementation differs though, since queuing uses queues, and policing does not. In queuing, before a packet egresses an interface, it is first enqueued to a queue using an algorithm such as RED or FIFO. The kernel dequeues the packet based on the HTB algorithm before sending it out. In policing, traffic simply drops if it is over the allocated bandwidth.

The following topics provide information about configuring traffic shaping:

- Traffic shaping policies on page 2037
- Traffic shaping profiles on page 2047
- Traffic shapers on page 2058
- Global traffic prioritization on page 2075
- DSCP matching and DSCP marking on page 2079
- Examples on page 2086

Configuration methods

There are different methods to configure traffic shaping on the FortiGate. The following table lists the methods and their capabilities in order of preference. If all three methods are configured, the first will be preferred over the second, which is preferred over the third.

Method	Policing		Queuing
	Traffic prioritization	Guaranteed and maximum bandwidth limits	Traffic queuing
Traffic shaping profile*	Yes	Yes, based on percentage of outbandwidth	Yes
Traffic shaper	Yes	Yes, based on rate	No
Global traffic prioritization	Yes	No	No

* Traffic shaping profiles are configured as either policing or queuing types. Queuing allows for additional options when configuring a shaping class entry.

The features of each method's implementation are slightly different. The following is a brief summary of the traffic policing features and the approach each method takes.

Traffic prioritization

The FortiGate can place packets into different priority levels in order to prioritize certain traffic over others.

Method	Description
Traffic shaping profile	Traffic is placed into classes. A total of 30 classes are available. For each class, traffic can be configured into five priority levels.
Traffic shaper	Traffic can be prioritized into the high (2), medium (3), or low (4) levels. When traffic is below the guaranteed bandwidth of the shaper, the traffic is automatically applied the critical level (1).
Global traffic prioritization	Traffic is prioritized into high (2), medium (3), or low (4) based on ToS (type of service) or DSCP.

Guaranteed and maximum bandwidth limits

The general purpose for configuring guaranteed bandwidth is to allocate a certain proportion of the total outbandwidth to guarantee transport for a certain type of traffic. This is configured and handled differently in each method.

A traffic shaping profile, when applied to an interface's egress shaping profile, can be configured to use up to 100% of the interface's configured bandwidth between all the classes. It does not matter what priority is configured in each class. The guaranteed bandwidth is always honored.

Traffic shapers, however, do not have a hard limit on the guaranteed bandwidth. Administrators need to be aware how much guaranteed bandwidth has been allocated to all their traffic shapers, so that they do not exceed the total outbandwidth of an interface. Traffic under the guaranteed bandwidth of a traffic shaper is given a priority of one. If the total traffic with priority one exceeds the total outbandwidth, traffic can be dropped.

The maximum bandwidth limit caps the maximum bandwidth that can be used. This is configured as a percentage of the outbandwidth in a traffic shaping profile. It is configured as a rate for traffic shapers.

Configuring outbandwidth

Traffic shaping is generally configured for egress traffic leaving the FortiGate. Therefore, it is necessary for the interface outbandwidth to be defined for traffic prioritization to take place in all of the traffic shaping configuration methods. Interface outbandwidth is also needed when defining the guaranteed and maximum bandwidth in a traffic shaping profile.

For traffic shapers, configuring outbandwidth is not necessary to apply maximum bandwidth limits; however, outbandwidth is necessary for guaranteed bandwidth. Traffic under the guaranteed bandwidth limit on a traffic shaper is given priority 1. If outbandwidth is not configured, traffic prioritization does not take place and the priority is meaningless.

Traffic shaping policy

Traffic shaping profiles and traffic shapers are methods of policing traffic. Traffic shaping policies are used to map traffic to a traffic shaper or assign them to a class.

A traffic shaping policy is a rule that matches traffic based on certain IP header fields and/or upper layer criteria. For example, it can match traffic based on source and destination IP, service, application, and URL category. One common use case is to match traffic based on the ToS or DS (differentiated services) field in the IP header. This allows Type of Service or Differentiated Services (DiffServ) tags to be read from traffic from a downstream device and prioritized accordingly on the FortiGate.

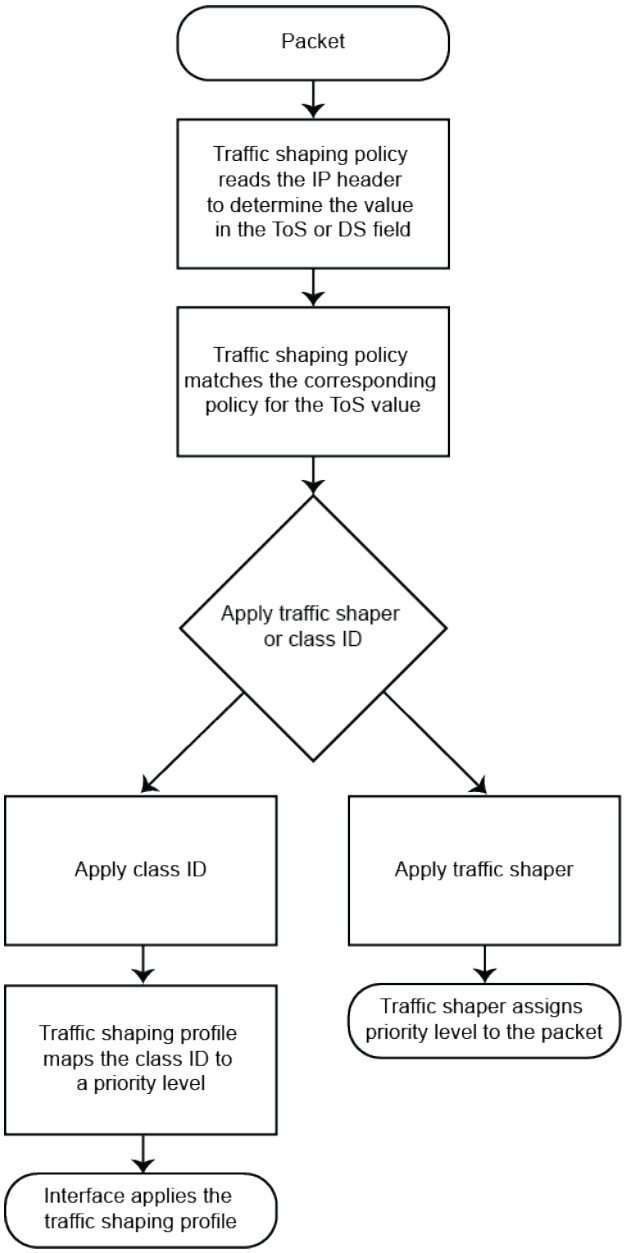
DSCP matching and DSCP marking

DSCP matching and DSCP marking can be performed on a firewall shaping policy and a regular firewall policy. DSCP matching is used to match DSCP tags from ingress traffic, and DSCP marking is used to change the DSCP tag on egress traffic.

In a firewall shaping policy and regular firewall policy, use the `tos` and `tos-mask` fields to perform DSCP matching. Use the `diffserv-forward` and `diffserv-reverse` fields to perform DSCP marking.

Traffic shaping policies

As mentioned in Traffic shaping on page 2034, traffic shaping starts with the traffic shaping policy. Traffic shaping policies are used to map traffic to a traffic shaper or assign them to a class. Traffic is then shaped by the shaper or the shaping profile that is applied on an interface.



Traffic can also be shaped by applying traffic shapers directly on a firewall policy. However, this legacy approach can only be configured from the CLI, and is not a preferred method for applying traffic shaping. As the number of firewall policies increases, managing shaping on each individual policy becomes increasingly difficult. For the same reason, it is also not recommended to mix the legacy approach with traffic shaping policies to avoid the added complexity.

Overview

A traffic shaping policy is a rule that matches traffic based on certain IP header fields and/or upper layer criteria. When traffic hits the firewall, the FortiGate will first look up a firewall policy, and then match a shaping policy. The matching traffic will apply a traffic shaper, class ID, or assign a DSCP DiffServ tag to the outgoing traffic.

The traffic shaping policies must be placed in the correct order in the traffic shaping policy list page to obtain the desired results. Policies are matched from top-down, so the traffic shaping policies should be arranged in a sequence that places the more granular policies above general policies.

The policy can be configured by going to *Policy & Objects* > *Traffic Shaping* and selecting the *Traffic Shaping Policy* tab. If the menu does not display the traffic shaping settings, go to *System* > *Feature Visibility* and enable *Traffic Shaping*.

Configuring traffic shaping policies

A traffic shaping policy can be split into two parts:

- Options used to match the traffic
- Options used to apply actions to the matched traffic

In the GUI, the options are configured in the *If Traffic Matches* and *Then* sections. In the CLI, all options are configured under `config firewall shaping-policy`. Some options can only be configured from the CLI.

The following options can be configured for traffic matching criteria:

GUI option		CLI option	Description
Source			
	Address	`set srcaddr <address_object>`	Select the address object to match the source IP.
	User	`set users <user_object>`	Select the user object to match the user authenticated for the session.

	Internet Service	`set internet-service-src enable`
		`set internet-service-src-name <name>`
		`set internet-service-src-group <group>`
		`set internet-service-src-custom <custom>`
		`set internet-service-src-custom-group <custom_group>`
			Select the internet service to match the source of the incoming traffic. Internet service currently cannot be used with source address.

Destination			
	Address	`set dstaddr <address_object>`	Select the address object to match the destination IP.

	Internet Service	`set internet-service enable`
		`set internet-service-name <name>`
		`set internet-service-group <group>`
		`set internet-service-custom <custom>`
		`set internet-service-custom-group <custom_group>`
			Select the internet service to match the destination of the incoming traffic. Internet service currently cannot be used with destination address and service.

GUI option	CLI option	Description
Schedule	`set schedule <schedule>`	Enable to select a schedule (one-time, recurring, or group).
Service	`set service <service>`	Select the service or service group for the traffic.
Application		Application control must be enabled in the related firewall policy to learn the application of the traffic.
Application	`set application <application>`	Select the application to match the application of the traffic.
Category	`set app-category <category>`	Select the application category to match the application of the traffic.
Group	`set app-group <groups>`	Select the application group to match the application of the traffic.
URL Category	`set url-category <category>`	Select the URL category to match the URL of the traffic. A web filter profile must be enabled in the related firewall policy to know the URL of the traffic (see Web filter on page 2238).

n/a	`set tos-mask <hexadecimal_mask>`
	`set tos <value>`
	`set tos-negate {enable | disable}`
		Specify the type of service (ToS) and mask to match.
		These options can only be configured in the CLI.

The following options can be configured for actions to apply to the matched traffic:

GUI option	CLI option	Description
Outgoing interface	`set dstintf <interface>`	Select the destination interface that the traffic shaping applies to (required).
Apply shaper		
Shared shaper	`set traffic-shaper <shaper>`	Select the shared shaper to be applied to traffic in the ingress-to-egress direction. For example, on traffic that egresses on the wan interface, the shaper is applied to upload or outbound traffic.
Reverse shaper	`set traffic-shaper-reverse <shaper>`	Select the reverse shaper to be applied to traffic in the egress-to-ingress direction. For example, on traffic that egresses on the wan interface, the shaper is applied to download or inbound traffic.

GUI option	CLI option	Description
Per-IP shaper	`set per-ip-shaper <shaper>`	Select the per-IP shaper. Per-IP shapers affect downloads and uploads. The allotted bandwidth applies to each individual IP. In a shared shaper, the allotted bandwidth applies to all IPs.
Assign shaping class ID		
Traffic shaping class ID	`set class-id <class>`	Set the class ID to apply the matching traffic. Class IDs are further prioritized within a traffic shaping profile and applied to an interface.

n/a	`set diffserv-forward {enable | disable}`
	`set diffservcode-forward <code>`
	`set diffserv-reverse {enable | disable}`
	`set diffservcode-reverse <code>`
		Specify the settings to apply a DSCP tag to the forward or reverse traffic. The DiffServ code is in 6-bit binary format.
		These options can only be configured in the CLI.

Traffic shapers and class IDs can be applied at the same time when configuring traffic shaping policies. However, to reduce the complexity, it is recommended to use one method over the other.

The following topics include examples with traffic shaping policies:

- Local-in and local-out traffic matching on page 2041
- VLAN CoS matching on a traffic shaping policy on page 2044
- Interface-based traffic shaping profile on page 2086
- Shared traffic shaper on page 2058
- Per-IP traffic shaper on page 2063

Local-in and local-out traffic matching

A FortiGate can apply shaping policies to local traffic entering or leaving the firewall interface based on source and destination IP addresses, ports, protocols, and applications.

```
config firewall shaping-policy
    edit <id>
        set traffic-type {forwarding | local-in | local-out}
    next
end
```

This topic contains the following examples:

- Example 1: local-in traffic shaping
- Example 2: local-out traffic shaping

Example 1: local-in traffic shaping

In this example, the traffic shaping policy applies to local-in traffic. The local-in traffic originates from the Linux client and is destined to port1 on the FortiGate.

To configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 2
        set traffic-type local-in
        set service "ALL"
        set schedule "always"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

To verify the configuration:

1. Check the shaping policy information for local-in traffic to verify that the correct class ID (3) is applied:

```
# diagnose firewall iprope list 100018
policy index=2 uuid_idx=1300 action=accept
flag (0):
schedule(always)
cos_fwd=0  cos_rev=0
group=00100018 av=00000000 au=00000000 split=00000000
host=1 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 3
```

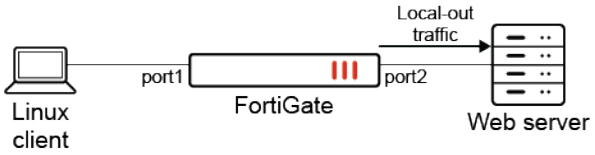
2. Check the session list to verify that the class ID (3) matches the shaping policy ID (2):

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=1195 expire=3574 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=3 shaping_policy_id=2 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
```

```
state=log local may_dirty
statistic(bytes/packets/allow_err): org=18274/350/1 reply=826037/603/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 1/0
orgin->sink: org pre->in, reply out->post dev=17->34/34->17 gwy=172.16.200.2/0.0.0.0
hook=pre dir=org act=noop 172.16.200.254:55432->172.16.200.2:443(0.0.0.0:0)
hook=post dir=reply act=noop 172.16.200.2:443->172.16.200.254:55432(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
src_mac=08:5b:0e:7d:42:db
misc=0 policy_id=4294967295 pol_uuid_idx=0 auth_info=0 chk_client_info=0 vd=1
serial=0000009d tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=00000000
no_ofld_reason:  local
```

Example 2: local-out traffic shaping

In this example, the traffic shaping policy applies to local-out traffic. The local-out traffic originates from port2 on the FortiGate and is destined to an external web server.



To configure the traffic shaping policy:

```
 config firewall shaping-policy
    edit 3
        set traffic-type local-out
        set service "ALL"
        set schedule "always"
        set class-id 2
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

To verify the configuration:

1. Check the shaping policy information for local-out traffic to verify that the correct class ID (2) is applied:

```
# diagnose firewall iprope list 100019
policy index=3 uuid_idx=1301 action=accept
flag (0):
schedule(always)
cos_fwd=0  cos_rev=0
group=00100019 av=00000000 au=00000000 split=00000000
host=1 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
```

```
source(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=1106,
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 2
```

2. Check the session list to verify that the class ID (2) matches the shaping policy ID (3):

```
# diagnose sys session list
session info: proto=6 proto_state=05 duration=40 expire=110 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=2 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=255/255
state=log local
statistic(bytes/packets/allow_err): org=3676/14/1 reply=3848/11/1 tuples=2

orgin->sink: org out->post, reply pre->in dev=34->17/17->34 gwy=0.0.0.0/172.16.200.2
hook=out dir=org act=noop 172.16.200.2:19178->140.174.22.68:443(0.0.0.0:0)
hook=in dir=reply act=noop 140.174.22.68:443->172.16.200.2:19178(0.0.0.0:0)
pos/(before,after) 0/(0,0), 0/(0,0)
dst_mac=08:5b:0e:7d:42:db
misc=0 policy_id=0 pol_uuid_idx=0 auth_info=0 chk_client_info=0 vd=1
serial=00000f1b tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=00000000
no_ofld_reason:  local
```

VLAN CoS matching on a traffic shaping policy

A FortiGate can use the class of service (CoS) value of VLAN packets as a matching criterion for shaping policies. This enables the FortiGate to prioritize traffic based on the CoS value assigned by the switch or router.

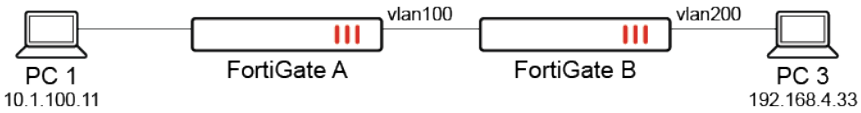
```
config firewall shaping-policy
    edit <id>
        set traffic-type {forwarding | local-in | local-out}
        set cos-mask <3-bit_binary>
        set cos <3-bit_binary>
    next
end
```

`traffic-type {forwarding | local-in | local-out}`	Set the traffic type. • `forwarding`: use forwarding traffic (default) • `local-in`: local-in traffic • `local-out`: local-out traffic
`cos-mask <3-bit_binary>`	Set the VLAN CoS evaluated bits, 3-bit binary (000 - 111). This setting is only available for forwarding traffic.

`cos <3-bit_binary>`	Set the VLAN CoS bit pattern, 3-bit binary (000 - 111). This setting is available once `cos-mask` is configured.

Example

In this example, FortiGate A forwards traffic to FortiGate B with VLAN CoS 3, which matches firewall policy 6. When FortiGate B receives traffic, it applies the traffic shaping policy and will prioritize based on the CoS value.



The VLAN CoS range is 000 to 111 (0 - 7), which includes the following values: 000, 001, 010, 011, 100, 101, 110, and 111. The `cos` and `cos-mask` settings can be used to match multiple `vlan_cos` values with a single shaping policy. The following matching logic is used: (`vlan_cos` AND `cos-mask`) == (`cos` AND `cos-mask`).

To match all possible `vlan_cos` values, set the `cos-mask` to `000`.

To configure VLAN CoS marking with traffic shaping:

1. Configure the firewall policy on FortiGate A with VLAN CoS forwarding:

```
config firewall policy
    edit 6
        set srcintf "port1"
        set dstintf "vlan100"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set vlan-cos-fwd 3
    next
end
```

   Traffic marked with CoS 3 will be forwarded to FortiGate B.

2. On FortiGate A, check the session list to verify that CoS 3 is marked:

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=1 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=0 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=3/255
state=log may_dirty npu f00
statistic(bytes/packets/allow_err): org=168/2/1 reply=168/2/1 tuples=2
```

```
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin->sink: org pre->post, reply pre->post dev=19->47/47->19 gwy=20.20.20.2/10.1.100.11
hook=pre dir=org act=noop 10.1.100.11:28489->192.168.4.33:8(0.0.0.0:0)
hook=post dir=reply act=noop 192.168.4.33:28489->10.1.100.11:0(0.0.0.0:0)
src_mac=00:0c:29:57:2a:01  dst_mac=70:4c:a5:7d:d4:95
misc=0 policy_id=6 pol_uuid_idx=1128 auth_info=0 chk_client_info=0 vd=2
serial=000717ca tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x4000c00 ofld-O ofld-R
npu info: flag=0x81/0x81, offload=8/8, ips_offload=0/0, epid=79/78, ipid=78/79,
vlan=0x0000/0x0064
vlifid=78/79, vtag_in=0x0000/0x0064 in_npu=2/2, out_npu=2/2, fwd_en=0/0, qid=0/1
```

3. Configure the traffic shaping policy to match VLAN CoS 3:

```
config firewall shaping-policy
    edit 1
        set traffic-type forwarding
        set name "vlan-cos-matching"
        set service "ALL"
        set srcintf "vlan100"
        set dstintf "vlan200"
        set class-id 2
        set cos-mask 111
        set cos 011
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Based on this shaping policy:

- `vlan_cos` = 3, which corresponds to `011`
  `cos-mask` = `111`
  AND both get `011`
- `cos-mask` = `111`
  `cos` = `011`
  AND both get `011`
- (`vlan_cos` AND `cos-mask`) == (`cos` AND `cos-mask`), so traffic will pass

The shaping policy will match `vlan_cos3`.

4. Configure the firewall policy on FortiGate B:

```
config firewall policy
    edit 3
        set srcintf "vlan100"
        set dstintf "vlan200"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
```

```
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

5. On FortiGate B, check the session list to verify that the class ID (2) matches the shaping policy ID (1):

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=672 expire=59 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=2 shaping_policy_id=1 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/0
state=log may_dirty f00
statistic(bytes/packets/allow_err): org=56532/673/1 reply=56532/673/1 tuples=2
tx speed(Bps/kbps): 82/0 rx speed(Bps/kbps): 82/0
orgin->sink: org pre->post, reply pre->post dev=59->61/61->59 gwy=20.20.200.3/20.20.20.1
hook=pre dir=org act=noop 10.1.100.11:28735->192.168.4.33:8(0.0.0.0:0)
hook=post dir=reply act=noop 192.168.4.33:28735->10.1.100.11:0(0.0.0.0:0)
src_mac=90:6c:ac:fb:bb:97  dst_mac=04:d5:90:36:73:3f
misc=0 policy_id=3 pol_uuid_idx=1245 auth_info=0 chk_client_info=0 vd=1
serial=0000160b tos=ff/ff app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=0x040000
no_ofld_reason:  non-npu-intf
```

If a particular session matches both the `firewall policy` and `firewall shaping-policy`, then anything configured in the `firewall shaping-policy` overrides whatever was configured in the `firewall policy`.

Traffic shaping profiles

As mentioned in Traffic shaping on page 2034, the three main methods of configuring traffic shaping are:

- Traffic shaping profiles
- Traffic shapers
- Global traffic prioritization

A traffic shaping profile allows traffic shaping to be configured with policing or queuing. Up to 30 classes can be defined, with prioritization and bandwidth limits configured for each class. When queuing is enabled, metrics can be configured for traffic queuing in each class.

Traffic shaping with policing

At the most basic level, policing involves traffic prioritization and bandwidth limits. Traffic prioritization helps categorize traffic into different priority levels: low, medium, high, critical, and top. When bandwidth is limited,

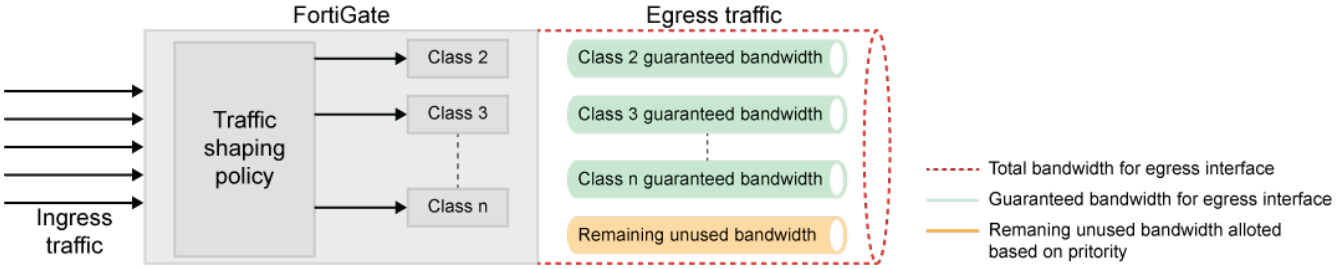
traffic with higher priority levels will take precedence over lower priority traffic. Traffic with lower priority levels that exceeds available bandwidth will be dropped. These levels are only applicable in the context of traffic shaping profiles and should not be confused with global traffic prioritization levels.

Bandwidth limits define the guaranteed and maximum bandwidth allotted to each traffic class. These limits are configured as a percentage of the outbandwidth, which is the outbound bandwidth configured on an interface.

Guaranteed bandwidth limits guarantee the minimum bandwidth that is allotted to a given class of traffic. The sum of all guaranteed bandwidth of all classes within a traffic shaping profile cannot exceed 100%. However, the sum of all guaranteed bandwidth does not need to add up to 100%. The guaranteed bandwidth is always respected, even if one class has lower priority than another.

Maximum bandwidth limits define the maximum percentage of the outbandwidth that a traffic class can use up. This value often will be 100%, given that when there is no other traffic going through other classes, you would want to fully utilize the bandwidth of the outbound link. Traffic throughput exceeding the maximum bandwidth will be dropped.

The following diagram illustrates ingress traffic and how the FortiGate assigns classes and bandwidth to each class.



When comparing traffic shaping profiles and traffic shapers, it is important to remember that guaranteed and maximum bandwidth in a traffic shaping profile is a percentage of the outbandwidth, while guaranteed and maximum bandwidth in a traffic shaper is a rate (Kbps, Mbps, and so on). As long as the outbandwidth is true to its measurement, the bandwidth usage should not exceed the available bandwidth of a link when using a traffic shaping profile.

Congestion occurs when actual traffic surpasses the outbandwidth limit. At this point, traffic prioritization helps determine which traffic will be prioritized over others. First, the guaranteed bandwidth limit is allocated for each class. The left over bandwidth is allocated to traffic classes based on priority. The traffic classes with the highest priority can use as much of the remaining bandwidth as needed. Then, the remaining bandwidth can be allocated to classes at the next priority level, and so forth.

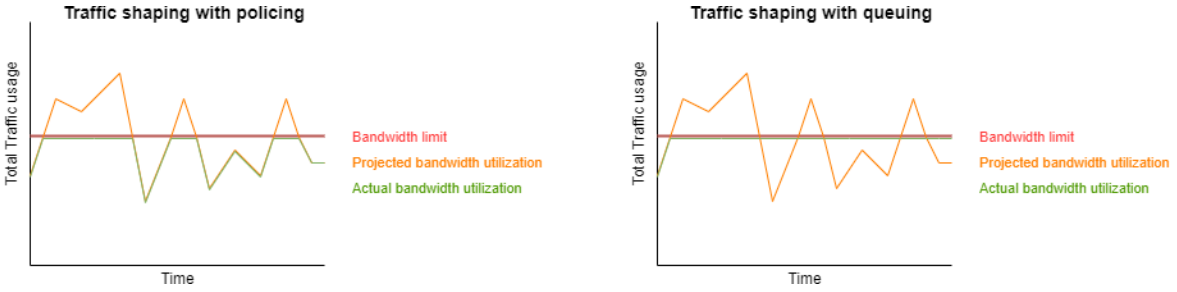
To see examples of applied traffic prioritization and bandwidth limits, see the debugs in Verifying that the traffic is being shaped on page 2052.

Traffic shaping with queuing

When traffic congestion occurs and if there is no queuing, then the excess packets are dropped. With queuing, when traffic exceeds the configured bandwidth limits, the traffic is delayed for transport until bandwidth frees up. Traffic may still be dropped if the queues are full.

In queuing, before a packet egresses an interface, it is first enqueued using an algorithm, such as random early detection (RED) or first in, first out (FIFO). The kernel then dequeues the packet based on the HTB algorithm before sending it out. Queuing can be configured per shaping profile, and it can be customized per class.

The following diagram shows how traffic policing differs from traffic queuing by comparing the bandwidth limit, projected bandwidth utilization, and actual bandwidth utilization.



For more information about traffic shaping with queuing, see Traffic shaping with queuing using a traffic shaping profile on page 2054.

Configuring traffic shaping profiles

The main steps to configure traffic shaping are:

1. Configure the traffic shaping policy, and assign matched traffic to a class (see Traffic shaping policies on page 2037).
2. Configure the traffic shaping profile and apply traffic bandwidth, prioritization and/or queuing per class.
3. Configure the interface outbandwidth and apply an egress shaping profile to the interface.

Configuring the traffic shaping profile

A traffic shaping profile consists of the class ID and the settings per class ID. It also defines the type of traffic shaping to apply (policing or queuing) and the default class ID for traffic that does not match any traffic shaping policies.

A class can be configured in the GUI as part of a traffic shaping profile or policy. In the CLI, a traffic class must be defined before it can be assigned within a traffic shaping profile. Class IDs range from 2 - 31, and they can be reused between different traffic shaping profiles.

- When NPU offloading is enabled on FortiGates with NP6, NP6Lite (SoC3), or NP6XLite (SoC4) processors, the class ID limit for egress traffic is 2 - 15.
- When NPU offloading is enabled on FortiGates with NP7 or NP7Lite (SoC5) processors, the class ID limit for egress traffic is 2–11.
- When NPU offloading is disabled, the class ID limit for egress traffic is 2–31.

Setting the egress traffic class ID outside of these limits can result in unexpected behavior.

When configuring a traffic shaping profile, the settings can be defined per class.

The following options can be configured for traffic shaping classes:

GUI option	CLI option	Description
Default	`set default-class-id <class-id>`	Set the default class ID.

GUI option	CLI option	Description
		Each profile must have one default class ID. The default class ID can be changed at any time.
Traffic shaping class ID	`set class-id <integer>`	Set the class ID (2 - 31).
Guaranteed bandwidth	`set guaranteed-bandwidth-percentage <integer>`	Set the percentage of the outbandwidth that will be guaranteed for the class ID.
Maximum bandwidth	`set maximum-bandwidth-percentage <integer>`	Set the percentage of the outbandwidth that will be the maximum bandwidth for the class ID.
Priority	`set priority {top | critical | high | medium | low}`	Select the priority level for the class ID.

To configure a traffic shaping profile in the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Profile* tab, and click *Create New*.
2. Enter the profile name, and optionally enter a comment.
3. In the *Traffic Shaping Classes* section, click *Create New*.
4. Configure the traffic shaping class ID settings (*Traffic shaping class ID*, *Guaranteed bandwidth*, *Maximum bandwidth*, and *Priority*).
5. Click *OK*.
6. Create more shaping classes as needed (the total guaranteed bandwidth of all classes cannot exceed 100%).
7. Click *OK*.

To configure a traffic shaping profile in the CLI:

1. Configure the shaping class:

```
config firewall traffic-class
    edit <integer>
        set class-name <string>
    next
end
```

2. Configure the shaping profile:

```
config firewall shaping-profile
    edit <name>
        set type {policing | queuing}
        set default-class-id <class-id>
        config shaping-entries
            edit <id>
                set class-id <integer>
                set priority {top | critical | high | medium | low}
                set guaranteed-bandwidth-percentage <integer>
                set maximum-bandwidth-percentage <integer>
```

```
            next
        end
    next
end
```

Configuring the interface outbandwidth

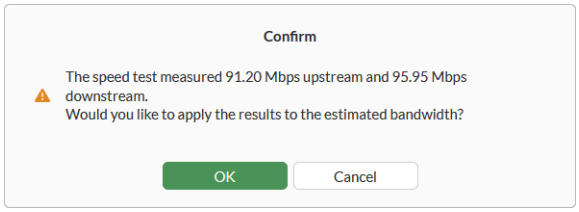
There are two settings that must be configured on an interface that has traffic shaping applied to egressing traffic: a traffic shaping profile must be assigned, and the outbound bandwidth must be configured.

Since traffic shaping is often configured on the WAN interface for egressing traffic, the outbound bandwidth is effectively the upstream bandwidth allowed by your ISP. On the FortiGate, it is possible to perform a speed test on interfaces are assigned a WAN role assigned (see GUI speed test on page 1187). The speed test performs measurements against public cloud servers, and provides an accurate measurement of the upstream bandwidth. After the test is complete, the results can be used to populate the *Outbound bandwidth* field.

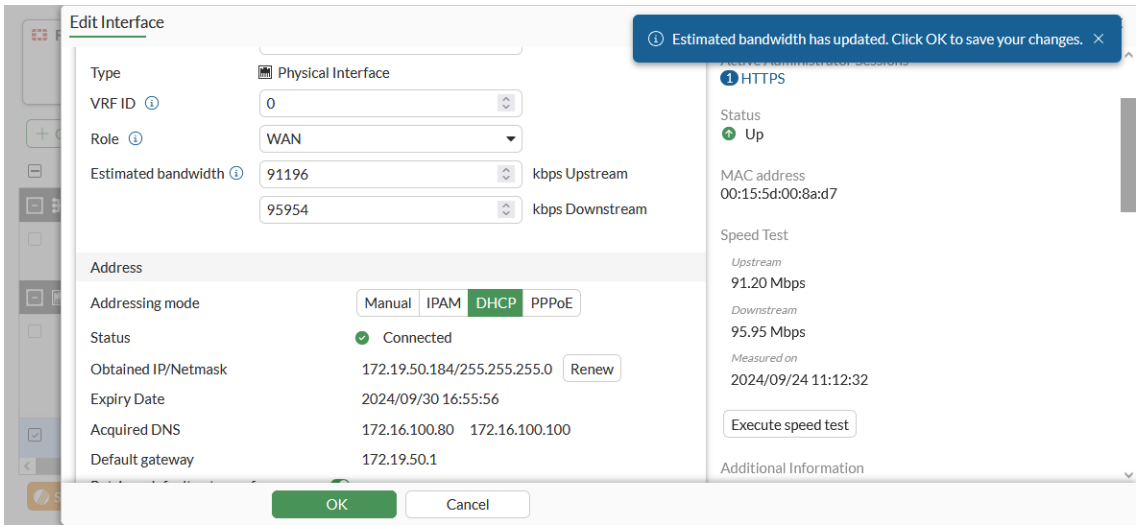
Changes to outbandwidth or egress shaping profiles on a physical or VLAN interface do not take effect for IPsec tunnels or sessions that are already established and offloaded by NP7 or NP7Lite (SoC5) processors. To apply the updated egress shaping settings, you must manually flush or reinstall the affected IPsec SAs and clear any offloaded sessions. Doing this rebuilds the IPsec tunnel and associated sessions using the new interface shaping configuration. You can configure FortiGates with NP7Lite (SoC5) processors to automatically flush or reinstall the affected IPsec SAs and clear any offloaded sessions after changing the configuration of an outbandwidth or egress shaping profile, see Automatic NP7Lite (SOC5) egress shaping profile refresh.

To configure traffic shaping on an interface:

1. Go to *Network* > *Interfaces* and double-click an interface to edit it.
2. For interfaces assigned a *WAN* role, in the right-side of the screen, click *Execute speed test*.
3. When the test completes, click *OK* in the *Confirm* pane to apply the results to the estimated bandwidth.



The speed test results are populated in the *Estimated bandwidth* fields for *kbps Upstream* and *kbps Downstream*.



4. In the *Traffic Shaping* section, enable *Outbound shaping profile* and select a profile.
5. Enable *Outbound bandwidth* and copy the *kbps Upstream* value from the speed test, or enter a custom value.
6. Click *OK*.

Verifying that the traffic is being shaped

In this example, three traffic classes are defined in the traffic shaping profile assigned to port1. The outbandwidth configured on port1 is 1000 Kbps. Each class has an `allocated-bandwidth`, `guaranteed-bandwidth`, `max-bandwidth`, and `current-bandwidth` value.

- The `guaranteed-bandwidth` and `max-bandwidth` are rates that are converted from the percentage of outbandwidth configured for each class. For example, `class-id` 2 has 10% `guaranteed-bandwidth`, equivalent to 100 Kbps, and 100% `max-bandwidth` equivalent to 1000 Kbps.
- The `allocated-bandwidth` displays the real-time bandwidth allocation for the traffic class based on all available factors. This value changes as traffic demand changes.
- The `current-bandwidth` displays the real-time bandwidth usage detected for the traffic class.

To verify that traffic is being shaped by the traffic shaping profile:

1. Enable debug flow to view the live traffic as it matches a traffic shaping policy:

```
# diagnose debug flow show function-name enable
# diagnose debug flow show iprope enable
# diagnose debug flow filter <filters>
# diagnose debug flow trace start <repeat_number>
# diagnose debug enable
```

The `iprope_shaping_check` function outputs the shaping policy matched for any given traffic:

```
...
id=20085 trace_id=21 func=iprope_shaping_check line=934 msg="in-[port3], out-[port1], skb_
flags-02000000, vid-0"
id=20085 trace_id=21 func=__iprope_check line=2277 msg="gnum-100015, check-ffffffffa002a8fe"
```

```
id=20085 trace_id=21 func=__iprope_check_one_policy line=2029 msg="checked gnum-100015 policy-
3, ret-matched, act-accept"
id=20085 trace_id=21 func=__iprope_check_one_policy line=2247 msg="policy-3 is matched, act-
accept"
id=20085 trace_id=21 func=__iprope_check line=2294 msg="gnum-100015 check result: ret-matched,
act-accept, flag-00000000, flag2-00000000"
```

2. Display the session list:

```
# diagnose sys session filter <filters>
# diagnose sys session list
```

Sessions that match a shaping policy will display `class_id` and `shaping_policy_id` fields:

```
...
session info: proto=6 proto_state=05 duration=32 expire=0 timeout=3600 flags=00000000
socktype=0 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=
class_id=4 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/255
```

3. Display the interface statistics:

```
# diagnose netlink interface list port1
if=port1 family=00 type=1 index=3 mtu=1500 link=0 master=0
ref=95 state=start present fw_flags=2001b800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:7e:af:a6 broadcast_addr=ff:ff:ff:ff:ff:ff
inbandwidth=10000(kbps)         total_bytes=2098887K    drop_bytes=7854K
egress traffic control:
        bandwidth=1000(kbps) lock_hit=241 default_class=3 n_active_class=3
        class-id=2      allocated-bandwidth=140(kbps)   guaranteed-bandwidth=100(kbps)
                        max-bandwidth=1000(kbps)        current-bandwidth=147(kbps)
                        priority=low    forwarded_bytes=8161K
                        dropped_packets=2032    dropped_bytes=3074K
        class-id=3      allocated-bandwidth=30(kbps)    guaranteed-bandwidth=300(kbps)
                        max-bandwidth=1000(kbps)        current-bandwidth=10(kbps)
                        priority=medium         forwarded_bytes=501K
                        dropped_packets=1       dropped_bytes=1195
        class-id=4      allocated-bandwidth=830(kbps)   guaranteed-bandwidth=500(kbps)
                        max-bandwidth=1000(kbps)        current-bandwidth=810(kbps)
                        priority=high   forwarded_bytes=1393K
                        dropped_packets=379     dropped_bytes=572K
stat: rxp=8349728 txp=11101735 rxb=2216101183 txb=1394077978 rxe=0 txe=0 rxd=0 txd=0 mc=0

```

If the debug output does not display egress traffic control by class and displays them by priority, it is likely that global traffic prioritization is configured. The global traffic prioritization settings must be disabled to view the preceding debug output (see Global traffic prioritization on page 2075).

Traffic shaping with queuing using a traffic shaping profile

You can use the weighted random early detection (WRED) queuing function within traffic shaping.

This topic includes two parts:

- Traffic shaping with queuing on page 2054
- Burst control in queuing mode on page 2055

You cannot configure or view WRED in the GUI; you must use the CLI.

WRED is not supported when traffic is offloaded to an NPU.

Traffic shaping with queuing

Traffic shaping has a queuing option. Use this option to fine-tune the queue by setting the profile queue size or performing random early drop (RED) according to queue usage.

This example shows setting the profile queue size limit to 5 so that the queue can contain a maximum of five packets and more packets are dropped.

To set the profile queue size limit:

```
config firewall shaping-profile
    edit "profile"
        set type queuing
        set default-class-id 31
        config shaping-entries
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 10
                set limit 5  <range from 5 to 10000; default: 1000>
            next
        end
    next
end
```

This example shows performing RED according to queue usage by setting `red-probability`, `min`, and `max`. Setting `red-probability` to `10` means start to drop packets when queue usage reaches the `min` setting. When queue usage reaches the `max` setting, drop 10% of the packets.

- Level 1: when queue is less than `min` packets, drop 0% of packets.
- Level 2: when queue reaches `min` packets, start to drop packets.
- Level 3: when queue usage is between `min` and `max` packets, drop 0–10% of packets by proportion.

- Level 4: when queue (average queue size) is more than `max` packets, drop 100% of packets.

To set RED according to queue usage:

```
config firewall shaping-profile
    edit "profile"
        set type queuing
        set default-class-id 31
        config shaping-entries
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 10
                set red-probability 10 <range from 0 to 20; default: 0 no drop>
                set min 100 <range from 3 to 3000>
                set max 300 <range from 3 to 3000>
            next
        end
    next
end
```

To troubleshoot this function, use the following diagnose commands:

```
diagnose netlink intf-class list <intf>
diagnose netlink intf-qdisc list <intf>
```

Burst control in queuing mode

In a hierarchical token bucket (HTB) algorithm, each traffic class has buckets to allow a burst of traffic. The maximum burst is determined by the bucket size `burst` (for guaranteed bandwidth) and `cburst` (for maximum bandwidth). The shaping profile has `burst-in-msec` and `cburst-in-msec` parameters for each shaping entry (`class id`) to control the bucket size.

This example uses the outbandwidth of the interface as 1 Mbps and the maximum bandwidth of class is 50%.

burst = burst-in-msec * guaranteed bandwidth = 100 ms × 1 Mbps x 50% = 50000 b = 6250 B

cburst = cburst-in-msec * maximum bandwidth = 200 ms × 1 Mbps x 50% = 100000 b = 12500 B

The following example sets `burst-in-msec` to 100 and `cburst-in-msec` to 200.

To set burst control in queuing mode:

```
config firewall shaping-profile
    edit "profile"
        set type queuing
        set default-class-id 31
        config shaping-entries
            edit 31
                set class-id 31
                set guaranteed-bandwidth-percentage 5
                set maximum-bandwidth-percentage 50
```

```
                set burst-in-msec 100 <range from 0 to 2000>
                set cburst-in-msec 200 <range from 0 to 2000>
            next
        end
    next
end
```

Example

Enabling RED for FTP traffic from QA

This example shows how to enable RED for FTP traffic from QA. This example sets a maximum of 10% of the packets to be dropped when queue usage reaches the maximum value.

To configure the firewall address:

```
config firewall address
    edit QA_team
        set subnet 10.1.100.0/24
    next
end
```

To set the shaping policy to classify traffic into different class IDs:

```
config firewall shaping-policy
    edit 1
        set service HTTPS HTTP
        set dstintf port1
        set srcaddr QA_team
        set dstaddr all
        set class-id 10
    next
    edit 2
        set service FTP
        set dstintf port1
        set srcaddr QA_team
        set dstaddr all
        set class-id 20
    next
end
```

To set the shaping policy to define the speed of each class ID:

```
config firewall shaping-profile
    edit QA_team_profile
       set type queuing
       set default-class-id 30
            config shaping-entries
                edit 1
```

```
                    set class-id 10
                    set guaranteed-bandwidth-percentage 50
                    set maximum-bandwidth-percentage 100
                next
                edit 2
                    set class-id 20
                    set guaranteed-bandwidth-percentage 30
                    set maximum-bandwidth-percentage 60
                    set red-probability 10
                next
                edit 3
                    set class-id 30
                    set guaranteed-bandwidth-percentage 20
                    set maximum-bandwidth-percentage 50
                next
            end
    next
end
```

To apply the shaping policy to the interface:

```
config sys interface
    edit port1
        set outbandwidth 10000
        set egress-shaping-profile QA_team_profile
    next
end
```

To use diagnose commands to troubleshoot:

```
# diagnose netlink intf-class list port1

Traffic shapers

The following topics provide more information about traffic shapers:

- Shared traffic shaper on page 2058
- Per-IP traffic shaper on page 2063
- Changing traffic shaper bandwidth unit of measurement on page 2067
- Multi-stage DSCP marking and class ID in traffic shapers on page 2068
- Multi-stage VLAN CoS marking on page 2070
- Adding traffic shapers to multicast policies on page 2074

Shared traffic shaper

Shared traffic shaper is used in a firewall shaping policy to indicate the priority and guaranteed and maximum bandwidth for a specified type of traffic use.

The maximum bandwidth indicates the largest amount of traffic allowed when using the policy. You can set the maximum bandwidth to a value between 1 and 16776000 Kbps. The GUI displays an error if any value outside this range is used. If you want to allow unlimited bandwidth, use the CLI to enter a value of 0.

The guaranteed bandwidth ensures that there is a consistent reserved bandwidth available. When setting the guaranteed bandwidth, ensure that the value is significantly less than the interface's bandwidth capacity.

Otherwise, the interface will allow very little or no other traffic to pass through, potentially causing unwanted latency.

In a shared traffic shaper, the administrator can prioritize certain traffic as high, medium, or low. FortiOS provides bandwidth to low priority connections only when high priority connections do not need the bandwidth. For example, you should assign a high traffic priority to a policy for connecting a secure web server that needs to support e-commerce traffic. You should assign less important services a low priority.

When you configure a shared traffic shaper, you can apply bandwidth shaping per policy or for all policies. By default, a shared traffic shaper applies traffic shaping evenly to all policies that use the shared traffic shaper.

When configuring a per-policy traffic shaper, FortiOS applies the traffic shaping rules defined for each security policy individually. For example, if a per-policy traffic shaper is configured with a maximum bandwidth of 1000 Kbps, any security policies that have that traffic shaper enabled get 1000 Kbps of bandwidth each.

If a traffic shaper for all policies is configured with a maximum bandwidth of 1000 Kbps, all policies share the 1000 Kbps on a first-come, first-served basis.

The configuration is as follows:

```
config firewall shaper traffic-shaper
    edit "traffic_shaper_name"
        set per-policy enable
    next
end
```

The shared traffic shaper selected in the traffic shaping policy affects traffic in the direction defined in the policy. For example, if the source port is LAN and the destination is WAN1, the traffic shaping affects the flow in this direction only, affecting the outbound traffic's upload speed. You can define the traffic shaper for the policy in the opposite direction (reverse shaper) to affect the inbound traffic's download speed. In this example, that would be from WAN1 to LAN.

Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.

Traffic shapers can be added to a multicast policy when multicast routing is enabled.

The following example shows how to apply different speeds to different types of service. The example configures two shared traffic shapers to use in two firewall shaping policies. One policy guarantees a speed of 10 Mbps for VoIP traffic. The other policy guarantees a speed of 1 Mbps for other traffic. In the example, FortiOS communicates with a PC using port10 and the Internet using port9.

To configure shared traffic shapers in the GUI:

1. Create a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Name* to *Internet Access*.
   c. Set the *Incoming Interface* to *port10*.
   d. Set the *Outgoing Interface* to *port9*.
   e. Set the *Source* and *Destination* to *all*.
   f. Set the *Schedule* to *always*.
   g. Set the *Service* to *ALL*.
   h. Click *OK*.

2. Create the shared traffic shapers:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaper* tab, then click *Create New*.
   b. Set the *Name* to *10Mbps*. This shaper is for VoIP traffic.
   c. Set the *Traffic Priority* to *High*.
   d. Enable *Max Bandwidth* and enter *20000*.
   e. Enable *Guaranteed Bandwidth* and enter *10000*.

   f. Click *OK*.
   g. Repeat the above steps to create another traffic shaper named *1Mbps* with the *Traffic Priority* set to *Low*, the *Max Bandwidth* set to *10000*, and the *Guaranteed Bandwidth* set to *1000*.
3. Create a firewall shaping policy:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
   b. Set the *Name* to *VoIP_10Mbps_High*. This policy is for VoIP traffic.
   c. Set the *Source* and *Destination* to *all*.
   d. Set the *Service* to all VoIP services.
   e. Set the *Outgoing Interface* to *port9*.
   f. Enable *Shared shaper* and select *10Mbps*.
   g. Enable *Reverse shaper* and select *10Mbps*.
   h. Click *OK*.
   i. Repeat the above steps to create another firewall shaping policy named *Other_1Mbps_Low* for other traffic, with the *Source* and *Destination* set to *all*, *Service* set to *ALL*, *Outgoing Interface* set to *port9*, and *Shared shaper* and *Reverse shaper* set to *1Mbps*.

To configure shared traffic shapers in the CLI:

1. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "Internet Access"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
```

```
        set schedule "always"
        set service "ALL"
        set fsso disable
        set nat enable
    next
end
```

2. Create the shared traffic shapers:

```
config firewall shaper traffic-shaper
    edit "10Mbps"
        set guaranteed-bandwidth 10000
        set maximum-bandwidth 20000
    next
    edit "1Mbps"
        set guaranteed-bandwidth 1000
        set maximum-bandwidth 10000
        set priority low
    next
end
```

3. Create a firewall shaping policy:

```
config firewall shaping-policy
    edit 1
        set name "VOIP_10Mbps_High"
        set service "H323" "IRC" "MS-SQL" "MYSQL" "RTSP" "SCCP" "SIP" "SIP-MSNmessenger"
        set dstintf "port9"
        set traffic-shaper "10Mbps"
        set traffic-shaper-reverse "10Mbps"
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 2
        set name "Other_1Mbps_Low"
        set service "ALL"
        set dstintf "port9"
        set traffic-shaper "1Mbps"
        set traffic-shaper-reverse "1Mbps"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

To troubleshoot shared traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the 10Mbps and 1Mbps shapers:

```
# diagnose firewall iprope list 100015
policy index=1 uuid_idx=0 action=accept
flag (0):
```

```
shapers: orig=10Mbps(2/1280000/2560000)
cos_fwd=0  cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000

3. Check the statuses of shared traffic shapers:

```
# diagnose firewall shaper traffic-shaper list
name 10Mbps
maximum-bandwidth 2500 KB/sec
guaranteed-bandwidth 1250 KB/sec
current-bandwidth 0 B/sec
priority 2
tos ff
packets dropped 0
bytes dropped 0

name 1Mbps
maximum-bandwidth 1250 KB/sec
guaranteed-bandwidth 125 KB/sec
current-bandwidth 0 B/sec
priority 4
tos ff
packets dropped 0
bytes dropped 0
```

Per-IP traffic shaper

With per-IP traffic shaping, you can limit each IP address's behavior to avoid a situation where one user uses all of the available bandwidth. In addition to controlling the maximum bandwidth used per IP address, you can also define the maximum number of concurrent sessions for an IP address. For example, if you apply a per-IP shaper of 1 Mbps to your entire network, FortiOS allocates each user/IP address 1 Mbps of bandwidth. Even if the network consists of a single user, FortiOS allocates them 1 Mbps. If there are ten users, each user gets 1 Mbps of bandwidth, totaling 10 Mbps of outgoing traffic.

For shared shapers, all users share the set guaranteed and maximum bandwidths. For example, if you set a shared shaper for all PCs using an FTP service to 10 Mbps, all users uploading to the FTP server share the 10 Mbps.

Shared shapers affect upload speed. If you want to limit the download speed from the FTP server in the example, you must configure the shared shaper as a reverse shaper. Per-IP shapers apply the speed limit on

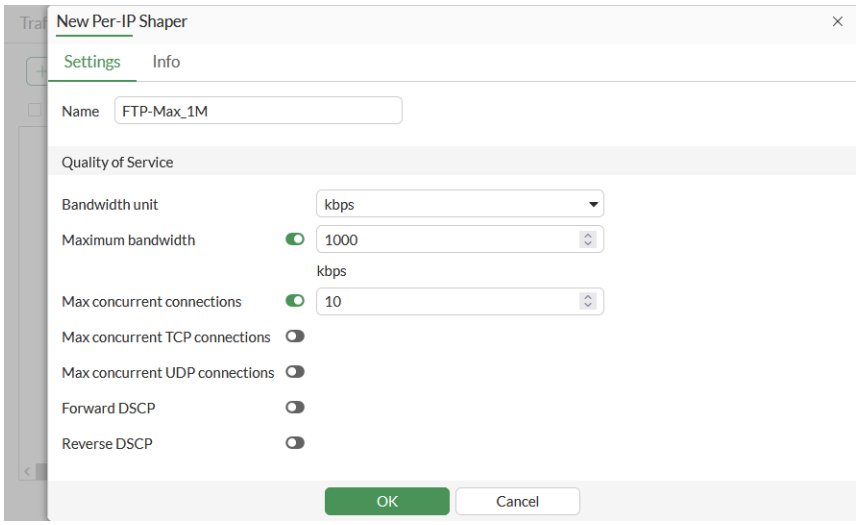
both upload and download operations. Only traffic through forward traffic shapers will be included in FortiView; reverse and per-IP shapers are not included.

The following example shows how to apply a per-IP shaper to a traffic shaping policy. This shaper assigns each user a maximum bandwidth of 1 Mbps and allows each user to have a maximum of ten concurrent connections to the FTP server. In the example, FortiOS communicates with users using port10 and the FTP server using port9.

To configure a per-IP traffic shaper in the GUI:

1. Create a firewall policy:
   a. Go to *Policy & Objects* > *IPv4 Policy* and click *Create New*.
   b. Set the *Name* to *FTP Access*.
   c. Set the *Incoming Interface* to *port10*.
   d. Set the *Outgoing Interface* to *port9*.
   e. Set the *Source* to *all*.
   f. Set the *Destination* to *FTP_Server*.
   g. Set the *Schedule* to *always*.
   h. Set the *Service* to *ALL*.
   i. Click *OK*.
2. Create the per-IP traffic shaper:
   a. Go to *Policy & Objects* > *Traffic Shaping* and select the *Traffic Shaper* tab.
   b. Select *Per-IP* in the type drop-down, then click *Create new*.

   c. Enter the *Name* (*FTP_Max_1M*). This shaper is for VoIP traffic.
   d. Enable *Max Bandwidth* and enter *1000*.
   e. Enable *Max Concurrent Connections* and enter *10*. This means that each user can have up to ten concurrent connections to the FTP server.



f. Click *OK*.

3. Create a firewall shaping policy:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
   b. Enter the *Name* (*FTP speed 1M*).
   c. Set the *Source* to the addresses and users that require access to the FTP server.
   d. Set the *Destination* to *FTP_Server*.
   e. Set the *Service* to *ALL*.
   f. Set the *Outgoing Interface* to *port9*.
   g. Enable *Per-IP shaper* and select *FTP_Max_1M*.
   h. Click *OK*.

To configure a per-IP traffic shaper in the CLI:

1. Create a firewall policy:

```
config firewall policy
    edit 1
        set name "FTP Access"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "FTP_Server"
        set action accept
        set schedule "always"
        set service "ALL"
        set fsso disable
        set nat enable
    next
end
```

2. Create the per-IP traffic shaper:

```
config firewall shaper per-ip-shaper
    edit "FTP_Max_1M"
```

```
        set max-bandwidth 1000
        set max-concurrent-session 10
    next
end
```

3. Create a firewall shaping policy:

```
config firewall shaping-policy
    edit 1
        set name "FTP speed 1M"
        set service "ALL"
        set dstintf "port9"
        set per-ip-shaper "FTP_Max_1M"
        set srcaddr "PC1" "WinPC" "PC2"
        set dstaddr "FTP_Server"
    next
end
```

To troubleshoot per-IP traffic shapers:

1. Check if specific traffic is attached to the correct traffic shaper. The example output shows the traffic attached to the FTP_Max_1M shaper:

```
# diagnose firewall iprope list 100015
policy index=3 uuid_idx=0 action=accept
flag (0):
shapers:  per-ip=FTP_Max_1M
cos_fwd=0  cos_rev=0
group=00100015 av=00000000 au=00000000 split=00000000
host=2 chk_client_info=0x0 app_list=0 ips_view=0
misc=0 dd_type=0 dd_mode=0
zone(1): 0 -&gt; zone(1): 38
source(3): 10.1.100.11-10.1.100.11, uuid_idx=30, 10.1.100.143-10.1.100.143, uuid_idx=32,
10.1.100.22-10.1.100.22, uuid_idx=31,
dest(1): 172.16.200.55-172.16.200.55, uuid_idx=89,
service(1):
    [0:0x0:0/(0,65535)-&gt;(0,65535)] helper:auto
```

2. Check if the correct traffic shaper is applied to the session. The example output shows that the FTP_Max_1M shaper is applied to the session:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=36 expire=3567 timeout=3600 flags=00000000
sockflag=00000000 sockport=0 av_idx=0 use=4
origin-shaper=
reply-shaper=
per_ip_shaper=FTP_Max_1M
class_id=0 shaping_policy_id=3 ha_id=0 policy_dir=0 tunnel=/ helper=ftp vlan_cos=0/255
state=may_dirty per_ip npu npd mif route_preserve
statistic(bytes/packets/allow_err): org=506/9/1 reply=416/6/1 tuples=2
tx speed(Bps/kbps): 0/0 rx speed(Bps/kbps): 0/0
orgin-&gt;sink: org pre-&gt;post, reply pre-&gt;post dev=39-&gt;38/38-&gt;39
```

```
gwy=172.16.200.55/0.0.0.0
hook=post dir=org act=snat 10.1.100.11:58275-&gt;172.16.200.55:21(172.16.200.1:58275)
hook=pre dir=reply act=dnat 172.16.200.55:21-&gt;172.16.200.1:58275(10.1.100.11:58275)
pos/(before,after) 0/(0,0), 0/(0,0)
misc=0 policy_id=1 auth_info=0 chk_client_info=0 vd=2
serial=0000211a tos=ff/ff app_list=0 app=0 url_cat=0
sdwan_mbr_seq=0 sdwan_service_id=0
rpdb_link_id = 00000000
dd_type=0 dd_mode=0
npu_state=0x100000
npu info: flag=0x00/0x00, offload=0/0, ips_offload=0/0, epid=0/0, ipid=0/0, vlan=0x0000/0x0000

no_ofld_reason:  offload-denied helper
```

3. Check the statuses of per-IP traffic shapers. The output should resemble the following:

```
# diagnose firewall shaper per-ip-shaper list
name FTP_Max_1M
maximum-bandwidth 125 KB/sec
maximum-concurrent-session 10
tos ff/ff
packets dropped 0
bytes dropped 0
addr=10.1.100.11 status: bps=0 ses=3
```

Changing traffic shaper bandwidth unit of measurement

Bandwidth speeds are measured in kilobits per second (Kbps), and bytes that are sent and received are measured in megabytes (MB). In some cases, this can cause confusion depending on whether your ISP uses kilobits per second (Kbps), kilobytes per second (KBps), megabits per second (Mbps), or gigabits per second (Gbps).

You can change the unit of measurement for traffic shapers in the CLI.

To change the bandwidth unit of measurement for a shared traffic shaper:

```
config firewall shaper traffic-shaper
    edit <traffic_shaper_name>
        set bandwidth-unit {kbps | mbps | gbps}
    next
end
```

To change the bandwidth unit of measurement for a per-IP traffic shaper:

```
config firewall shaper per-ip-shaper
    edit <traffic_shaper_name>
        set bandwidth-unit {kbps | mbps | gbps}
    next
end
```

Multi-stage DSCP marking and class ID in traffic shapers

Traffic shapers have a multi-stage method so that packets are marked with a different differentiated services code point (DSCP) and `class id` at different traffic speeds. Marking packets with a different DSCP code is for the next hop to classify the packets. The FortiGate benefits by marking packets with a different `class id`. Combined with the egress interface shaping profile, the FortiGate can handle the traffic differently according to its `class id`.

Rule	DSCP code	Class ID
speed < guarantee bandwidth	`diffservcode`	`class id` in shaping policy
guarantee bandwidth < speed < exceed bandwidth	`exceed-dscp`	`exceed-class-id`
exceed bandwidth < speed	`maximum-dscp`	`exceed-class-id`

This example sets the following parameters:

- When the current bandwidth is less than 50 Kbps, mark packets with `diffservcode` 100000 and set `class id` to 10.
- When the current bandwidth is between 50 Kbps and 100 Kbps, mark packets with `exceed-dscp` 111000 and set `exceed-class-id` to 20.
- When the current bandwidth is more than 100 Kbps, mark packets with `maximum-dscp` 111111 and set `exceed-class-id` to 20.

To set multi-stage DSCP marking and class ID in a traffic shaper:

```
config firewall shaper traffic-shaper
    edit "50k-100k-150k"
        set guaranteed-bandwidth 50
        set maximum-bandwidth 150
        set diffserv enable
        set dscp-marking-method multi-stage
        set exceed-bandwidth 100
        set exceed-dscp 111000
        set exceed-class-id 20
        set maximum-dscp 111111
        set diffservcode 100000
    next
end
```

```
config firewall shaping-policy
     edit 1
         set service "ALL"
         set dstintf PORT2
         set srcaddr "all"
         set dstaddr "all"
         set class-id 10
     next
end
```

Traffic shapers also have an overhead option that defines the per-packet size overhead used in rate computation.

To set the traffic shaper overhead option:

```
config firewall shaper traffic-shaper
    edit "testing"
        set guaranteed-bandwidth 50
        set maximum-bandwidth 150
        set overhead 14 <range from 0 to 100>
    next
end
```

Example

This example shows how to mark QA traffic with a different DSCP according to real-time traffic speed.

To configure the firewall address:

```
config firewall address
    edit QA_team
        set subnet 10.1.100.0/24
    next
end
```

To configure the firewall shaper traffic shaper:

```
config firewall shaper traffic-shaper
    edit "500k-1000k-1500k"
        set guaranteed-bandwidth 500
        set maximum-bandwidth 1500
        set diffserv enable
        set dscp-marking-method multi-stage
        set exceed-bandwidth 1000
        set exceed-dscp 111000
        set maximum-dscp 111111
        set diffservcode 100000
    next
end
```

```
config firewall shaping-policy
    edit QA_team
        set service "ALL"
        set dstintf port1
        set traffic-shaper "500k-1000k-1500k"
        set traffic-shaper-reverse "500k-1000k-1500k"
        set srcaddr "QA_team"
        set dstaddr "all"
    next
end
```

Multi-stage VLAN CoS marking

A FortiGate can configure the traffic shaper to dynamically change the CoS value of outgoing VLAN packets based on the shaper profile. This allows the FortiGate to mark traffic with different CoS values at different stages of the shaping process.

```
config firewall shaper traffic-shaper
    edit <name>
        set bandwidth-unit {kbps | mbps | gbps}
        set guaranteed-bandwidth <integer>
        set maximum-bandwidth <integer>
        set cos-marking {enable | disable}
        set cos-marking-method {static | multi-stage}
        set cos <3-bit_binary>
        set exceed-cos <3-bit_binary>
        set maximum-cos <3-bit_binary>
        set exceed-bandwidth <integer>
    next
end
```

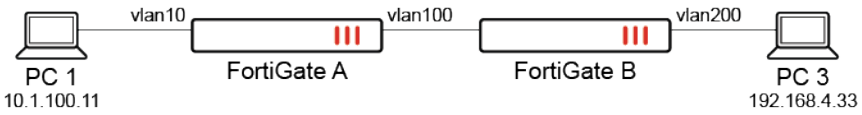
`cos-marking {enable | disable}`	Enable/disable VLAN CoS marking (default = `disable`).
`cos-marking-method {static | multi-stage}`	Set the VLAN CoS marking method. • `static`: use static VLAN CoS marking (default) • `multi-stage`: multi-stage VLAN CoS marking
`cos <3-bit_binary>`	Set the VLAN CoS mark, 3-bit binary (000 - 111).
`exceed-cos <3-bit_binary>`	Set the VLAN CoS mark for traffic in `guaranteed-bandwidth` and `exceed-bandwidth`, 3-bit binary (000 - 111).
`maximum-cos <3-bit_binary>`	Set the VLAN CoS mark for traffic in `exceed-bandwidth` and `maximum-bandwidth`, 3-bit binary (000 - 111).
`exceed-bandwidth <integer>`	Set the exceed bandwidth used for DSCP or VLAN CoS multi-stage marking. The integer value range depends on the `bandwidth-unit` setting. This setting is only available for CoS multi-stage marking.

Example

In this example, mutli-stage VLAN CoS marking is configured using traffic shapers on FortiGate A and FortiGate B. FortiGate A applies multi-stage CoS marking with the following traffic shaper settings:

- Traffic below the guaranteed bandwidth will apply CoS 6.
- Traffic greater than the guaranteed bandwidth will apply CoS 6 and 5.
- Traffic greater than the exceed bandwidth will apply CoS 6, 5, and 4.

A traffic shaper and shaping policy are configured on FortiGate B. When traffic comes from FortiGate A with CoS 6, the traffic shaping policy will be applied because the CoS matches.



Multi-stage VLAN CoS marking is not supported on NP models. Traffic is not offloaded when it is enabled.

To configure mutli-stage VLAN CoS marking on FortiGate A:

1. Configure the firewall policy:

```
config firewall policy
    edit 7
        set srcintf "port1"
        set dstintf "vlan100"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set traffic-shaper "multi-stage-cos-fgta"
        set traffic-shaper-reverse "multi-stage-cos-fgta"
    next
end
```

2. Configure the traffic shaper:

```
config firewall shaper traffic-shaper
    edit "multi-stage-cos-fgta"
        set guaranteed-bandwidth 1000
        set maximum-bandwidth 4000
        set per-policy enable
        set exceed-bandwidth 2000
        set cos-marking enable
        set cos-marking-method multi-stage
        set cos 110
        set exceed-cos 101
        set maximum-cos 100
    next
end
```

3. Check the session list to verify that CoS 6 is marked:

```
# diagnose sys session list
session info: proto=17 proto_state=00 duration=6 expire=180 timeout=0 flags=00000000
socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=multi-stage-cos-fgta prio=2 guarantee 125000Bps max 500000Bps traffic 504900Bps
drops 163905268B
```

```
reply-shaper=multi-stage-cos-fgta prio=2 guarantee 125000Bps max 500000Bps traffic 504900Bps
drops 0B
per_ip_shaper=

no_ofld_reason:  offload-denied
```

To configure mutli-stage VLAN CoS marking on FortiGate B:

1. Configure the firewall policy:

```
config firewall policy
    edit 4
        set srcintf "vlan100"
        set dstintf "vlan200"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
    next
end
```

2. Configure the traffic shaper:

```
config firewall shaper traffic-shaper
    edit "multi-stage-cos-fgtb"
        set guaranteed-bandwidth 250
        set maximum-bandwidth 1000
        set per-policy enable
        set cos-marking enable
        set cos-marking-method multi-stage
        set cos 100
        set exceed-cos 101
        set maximum-cos 110
        set exceed-bandwidth 500
```

```
    next
end
```

Based on this traffic shaper, the following CoS marking rules will be applied:

- If all traffic is less than the guaranteed bandwidth, then the traffic will be marked with CoS 4.
- If all traffic is greater than the guaranteed bandwidth but less than the exceed bandwidth, then 50% of the traffic will be marked as CoS 4 and 50% as CoS 5.
- If traffic is greater than the guaranteed bandwidth but less than the maximum bandwidth, then 50% of the traffic will be marked as CoS 6; CoS 4 and 5 will have another 50%.
- If traffic is greater than the maximum bandwidth, then 50% of the traffic will be marked as CoS 6, 25% will be marked as CoS 4, and 25% will be marked as CoS 5. Packet drops will be visible in the debug output.

3. Configure the traffic shaping policy:

```
config firewall shaping-policy
    edit 1
        set service "ALL"
        set srcintf "vlan100"
        set dstintf "vlan200"
        set traffic-shaper "multi-stage-cos-fgtb"
        set traffic-shaper-reverse "multi-stage-cos-fgtb"
        set class-id 2
        set cos-mask 111
        set cos 110
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

4. Check the session list to verify that the shaping ID (1) applied and CoS 4 is marked:

```
# diagnose sys session list
session info: proto=1 proto_state=00 duration=1 expire=59 timeout=0 flags=00000000 socktype=0
sockport=0 av_idx=0 use=3
origin-shaper=multi-stage-cos-fgtb prio=2 guarantee 31250Bps max 125000Bps traffic 236Bps
drops 0B
reply-shaper=multi-stage-cos-fgtb prio=2 guarantee 31250Bps max 125000Bps traffic 236Bps drops
0B
per_ip_shaper=
class_id=2 shaping_policy_id=1 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=4/4

```

Adding traffic shapers to multicast policies

When multicast routing is enabled, a traffic shaper can be added to a multicast policy.

Only a shared traffic shaper with the `per-policy` option disabled can be used. This is the default state of the `per-policy` option. The `auto-asic-offload` option must also be disabled on the multicast policy.

This feature is currently not supported on IPv6 multicast policies or on transparent mode VDOMs.

Example

In this example, a traffic shaper is applied to the multicast policy. A multicast flow sender sends the multicast data stream. The shaper attached to the multicast session is checked, and the shaping of the data stream is confirmed in the multicast session.

To apply traffic shaping to a multicast policy:

1. Enable multicast routing on the VDOM:

```
config router multicast
    set multicast-routing enable
    config pim-sm-global
        config rp-address
            edit 1
                set ip-address 10.1.100.10
            next
        end
    end
    config interface
        edit "wan2"
            set pim-mode sparse-mode
        next
        edit "wan1"
            set pim-mode sparse-mode
        next
    end
end
```

2. Create a traffic shaper:

```
config firewall shaper traffic-shaper
    edit "shaper128kbps-high"
```

```
        set guaranteed-bandwidth 128
        set maximum-bandwidth 128
        set per-policy disable
        set diffserv enable
        set diffservcode 010101
    next
end
```

3. Apply the traffic shaper to the multicast policy and disable NPU offloading:

```
config firewall multicast-policy
    edit 1
        set name "test_multicast-policy"
        set logtraffic enable
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set snat enable
        set auto-asic-offload disable
        set traffic-shaper "shaper128kbps-high"
    next
end
```

4. Check the shaper and DSCP in the multicast session:

```
# diagnose sys mcast-session list
    session info: id=26 vf=0 proto=17 10.1.100.41.35537->230.0.0.1.7878
    used=2 path=1 duration=118 expire=179 indev=18 pkts=119 bytes=64260
    state=00000000:
    session-npu-info: ipid/vlifid=0/0 vlanid/vtag_in=0/0 in_npuid=0 tae_index=0 qid=0 fwd_
map=0x00000000
    path: log snat npu-deny nsaddr=172.16.200.10 policy=1, outdev=17, tos=0x15
            origin-shaper=shaper128kbps-high prio=2 tos=0x15 guarantee 16000Bps max 16000Bps
traffic 620Bps drops 0pkt/0B
    Total 1 sessions
```

Global traffic prioritization

Global traffic prioritization allows your traffic to be prioritized as high (2), medium (3), or low (4) based on ToS (type of service) or DSCP. When using ToS-based priority, integers 0 to 15 can be used, which correspond to the definitions of the ToS field values in RFC 1349. When using DSCP, values 0 to 63 can be used, which correspond to the six bits in the DSCP value.

The outbandwidth must be defined in order for global prioritization to take effect. When the outbandwidth is defined on an interface without an applied `egress-shaping-profile`, the interface has a total of five priority levels:

Priority level	Description
0	Top
1	Critical
2	High
3	Medium
4	Low

Priority level 0 is reserved for administrative and local out traffic. Priority level 1 is used for traffic that is below guaranteed bandwidth when using a traffic shaper.

Traffic shaper and traffic shaping profile configurations take precedence over global traffic prioritization.

CLI commands

The following commands are used to configure the prioritization either by ToS or DSCP.

To configure the traffic prioritization type and level:

```
config system global
    set traffic-priority {tos | dscp}
    set traffic-priority-level {high | medium | low}
end
```

To configure the ToS-based priority table:

```
config system tos-based-priority
    edit <id>
        set tos <0-15>
        set priority (high | medium | low)
    next
end
```

To configure the DSCP-based priority table:

```
config system dscp-based-priority
    edit <id>
        set ds <0-63>
        set priority (high | medium | low)
    next
end
```

To configure the interface outbandwidth:

```
config system interface
    edit <name>
        set outbandwidth <bandwidth in kbps>
    next
end
```

Example

In the following configuration, packets with DSCP markings of 1 are prioritized as high, and packets with DSCP markings of 2 are prioritized as medium. All the other traffic is prioritized as low. The outbandwidth on interface port3 is set to 1000 kbps.

To configure DSCP-based traffic prioritization:

1. Configure DSCP-based prioritization in the global settings:

```
config system global
    set traffic-priority dscp
    set traffic-priority-level low
end
```

2. Configure the DSCP-based priority table:

```
config system dscp-based-priority
    edit 1
        set ds 1
        set priority high
    next
    edit 2
        set ds 2
        set priority medium
    next
end
```

3. Configure the outbandwidth on port3:

```
config system interface
    edit "port3"
        set outbandwidth 1000
    next
end
```

Verifying the traffic prioritization

When traffic exceeds the outbandwidth of 1000 kbps, traffic prioritization will take effect. Since the form of traffic shaping applied here is policing, excess packets above the outbandwidth are dropped.

In scenario 1, approximately 300 kbps of high priority traffic and 300 kbps of medium priority traffic passes through the FortiGate on port3.

To debug the bandwidth allocation:

```
# diagnose netlink interface list port3
if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
ref=35 state=start present fw_flags=3800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:fb:81:0c broadcast_addr=ff:ff:ff:ff:ff:ff
outbandwidth=1000(kbps)
        priority=0      allocated-bandwidth=0(kbps)     total_bytes=9311K       drop_bytes=197K
        priority=1      allocated-bandwidth=0(kbps)     total_bytes=0   drop_bytes=0
        priority=2      allocated-bandwidth=354(kbps)   total_bytes=20407K      drop_bytes=48K
        priority=3      allocated-bandwidth=354(kbps)   total_bytes=7093K       drop_bytes=1262K
        priority=4      allocated-bandwidth=290(kbps)   total_bytes=266018K     drop_bytes=7743K
stat: rxp=15450901 txp=25933756 rxb=5456860515 txb=17257309292 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1629439926
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=35
```

High priority (2) traffic is allocated 354 kbps of bandwidth. Medium priority (3) traffic is also allocated 354 kbps of bandwidth. The remaining bandwidth is allocated to low priority (4) traffic.

In scenario 2, approximately 400 kbps of high priority traffic and 800 kbps of medium priority traffic passes through the FortiGate on port3.

To debug the bandwidth allocation:

```
# diagnose netlink interface list port3
if=port3 family=00 type=1 index=5 mtu=1500 link=0 master=0
ref=36 state=start present fw_flags=3800 flags=up broadcast run allmulti multicast
Qdisc=pfifo_fast hw_addr=52:54:00:fb:81:0c broadcast_addr=ff:ff:ff:ff:ff:ff
outbandwidth=1000(kbps)
        priority=0      allocated-bandwidth=7(kbps)     total_bytes=9981K       drop_bytes=240K
        priority=1      allocated-bandwidth=0(kbps)     total_bytes=0   drop_bytes=0
        priority=2      allocated-bandwidth=425(kbps)   total_bytes=31478K      drop_bytes=101K
        priority=3      allocated-bandwidth=567(kbps)   total_bytes=12056K      drop_bytes=1984K
        priority=4      allocated-bandwidth=0(kbps)     total_bytes=266795K     drop_bytes=7771K
stat: rxp=15461740 txp=25950805 rxb=5459688950 txb=17273940560 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1629440553
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=36
```

High priority (2) traffic is allocated 425 kbps of bandwidth. Medium priority (3) traffic is allocated 567 kbps of bandwidth. Since the total bandwidth required exceeds 1000 kbps, the remaining medium priority (3) traffic is dropped. In comparing the successive debug outputs, the `drop_bytes` counter for medium priority (3) traffic gets bigger.

DSCP matching and DSCP marking

This section includes:

- DSCP matching in firewall policies
- DSCP matching in firewall shaping policies
- DSCP marking in firewall shaping policies
- DSCP marking for self-generated traffic on page 2083

DSCP matching in firewall policies

Traffic is allowed or blocked according to the Differentiated Services Code Point (DSCP) values in the incoming packets.

The following CLI variables are available in the `config firewall policy` command:

`tos-mask <mask_value>`	Non-zero bit positions are used for comparison. Zero bit positions are ignored (default = 0x00). This variable replaces the `dscp-match` variable.
`tos <tos_value>`	Type of Service (ToC) value that is used for comparison (default = 0x00). This variable is only available when `tos-mask` is not zero. This variable replaces the `dscp-value` variable.
`tos-negate {enable | disable}`	Enable/disable negated ToS match (default = disable). This variable is only available when `tos-mask` is not zero. This variable replaces the `dscp-negate` variable.

DSCP matching in firewall shaping policies

Shaping is applied to the session or not according to the DSCP values in the incoming packets. The same logic and commands as in firewall policies are used.

DSCP marking in firewall shaping policies

Traffic is allowed or blocked according to the DSCP values in the incoming packets. DSCP marking in firewall shaping policies uses the same logic and commands as in firewall policy and traffic-shaper.

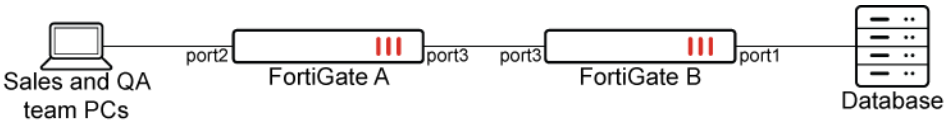
When DSCP marking on `firewall shaper traffic-shaper`, `firewall shaping-policy`, and `firewall policy` all apply to the same session, `shaping-policy` overrides `policy`, and `shaper traffic-shaper` overrides both `shaping-policy` and `policy`.

The following CLI variables in `config firewall policy` are used to mark the packets:

`diffserv-forward {enable | disable}`	Enable/disable changing a packet's DiffServ values to the value specified in `diffservcode-forward` (default = disable).

`diffservcode-forward <dscp_value>`	The value that packet's DiffServ is set to (default = 000000). This variable is only available when `diffserv-forward` is enabled.
`diffserv-reverse {enable | disable}`	Enable/disable changing a packet's reverse (reply) DiffServ values to the value specified in `diffservcode-rev` (default = disable).
`diffservcode-rev <dscp_value>`	The value that packet's reverse (reply) DiffServ is set to (default = 000000). This variable is only available when `diffserv-rev` is enabled.

The following topology is used in the examples:



Example 1

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B does DSCP matching, allowing only the sales team to access the database.

1. Configure FortiGate A:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "QA"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 110000
        set nat enable
    next
    edit 5
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "Sales"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 111011
        set nat enable
    next
end
```

2. Configure FortiGate B:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "Database"
        set action accept
        set schedule "always"
        set service "ALL"
        set tos-mask 0xf0
        set tos 0xe0
        set fsso disable
        set nat enable
    next
end
```

Example 2

FortiGate A marks traffic from the sales and QA teams with different DSCP values. FortiGate B uses a firewall shaping policy to do the DSCP matching, limiting the connection speed of the sales team to the database to 10MB/s.

1. Configure FortiGate A:

```
config firewall policy
    edit 1
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "QA"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 110000
        set nat enable
    next
    edit 5
        set srcintf "port2"
        set dstintf "port3"
        set srcaddr "Sales"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set diffserv-forward enable
        set diffservcode-forward 111011
        set nat enable
    next
end
```

2. Configure FortiGate B:

```
config firewall policy
    edit 2
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set nat enable
    next
end
config firewall shaper traffic-shaper
    edit "10MB/s"
        set guaranteed-bandwidth 60000
        set maximum-bandwidth 80000
    next
end
config firewall shaping-policy
    edit 1
        set service "ALL"
        set dstintf "port1"
        set tos-mask 0xf0
        set tos 0xe0
        set traffic-shaper "10MB/s"
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

Example 3

FortiGate A has a traffic shaping policy to mark traffic from the QA team with a DSCP value of 100000, while reverse traffic is marked with 000011.

1. Configure FortiGate A:

```
config firewall shaping-policy
    edit 1
        set name "QA Team 50MB"
        set service "ALL"
        set dstintf "port3"
        set traffic-shaper "50MB/s"
        set traffic-shaper-reverse "50MB/s"
        set diffserv-forward enable
        set diffserv-reverse enable
        set srcaddr "QA"
        set dstaddr "all"
        set diffservcode-forward 100000
        set diffservcode-rev 000011
    next
end
```

DSCP marking for self-generated traffic

FortiOS supports DSCP and VLAN CoS marking for both local-in and local-out traffic.

Most network providers often require that both application traffic and FortiGate self-generated traffic must be marked with specific DSCP values to ensure efficient traffic management and quality of service (QoS). FortiOS DSCP marking ensures that self-generated traffic complies with the network's standards. This enables the FortiGate to operate as a fully functional Customer Premises Equipment (CPE) that is capable of directly connecting to the provider's network without a CPE router.

This feature does not apply to self-generated traffic like DHCP requests that do not go through the kernel IP stack and therefore do not generate a kernel session to apply the traffic shaping to.

To configure DSCP and VLAN CoS for local-in traffic:

1. Configure the traffic shaper with bandwidth settings and the DSCP and VLAN CoS mark:

```
config firewall shaper traffic-shaper
    edit "test-shaper-300kbps"
        set guaranteed-bandwidth 30
        set maximum-bandwidth 300
        set per-policy enable
        set diffserv enable
        set cos-marking enable
        set cos 001
        set diffservcode 000001
    next
end
```

2. Configure the shaping policy for local-in traffic:

```
config firewall shaping-policy
    edit 2
        set traffic-type local-in
        set service "ALL"
        set traffic-shaper-reverse "test-shaper-300kbps"
        set class-id 2
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

3. Verify that the shaper was successfully applied to the shaping policy:

```
# diagnose firewall iprope list 100018
policy index=2 uuid_idx=926 action=accept
flag (0):
schedule(always)
shapers: reply=test-shaper-300kbps(2/3750/37500)
cos_fwd=255  cos_rev=255
```

```
group=00100018 av=00000000 au=00000000 split=00000000
host=2 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=799,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=799,
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 2
```

4. Test local-in traffic from the PC to the FortiGate.
   a. Check the session list:

```
# diagnose sys session list
session info: proto=17 proto_state=01 duration=9 expire=179 timeout=0 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
origin-shaper=
reply-shaper=test-shaper-300kbps prio=2 guarantee 3750Bps max 37500Bps traffic 7881Bps
drops 651B
per_ip_shaper=
class_id=2 shaping_policy_id=2 ha_id=0 policy_dir=0 tunnel=/ vlan_cos=0/1
state=local may_dirty rs
statistic(bytes/packets/allow_err): org=337599/4717/1 reply=342414/4708/1 tuples=2
tx speed(Bps/kbps): 34948/279 rx speed(Bps/kbps): 35446/283
orgin->sink: org pre->in, reply out->post dev=7->48/48->7 gwy=0.0.0.0/0.0.0.0
hook=pre dir=org act=noop 172.16.200.55:58382->172.16.200.2:161(0.0.0.0:0)
hook=post dir=reply act=noop 172.16.200.2:161->172.16.200.55:58382(0.0.0.0:0)
src_mac=00:0c:29:d6:12:20
misc=0 policy_id=4294967295 pol_uuid_idx=0 auth_info=0 chk_client_info=0 vd=2
serial=0000249b tos=ff/01 app_list=0 app=0 url_cat=0
rpdb_link_id=00000000 ngfwid=n/a
npu_state=00000000
no_ofld_reason:  local
```

   b. Check the shaper information to verify the DSCP mark and bandwidth limitation:

```
# diagnose firewall shaper traffic-shaper list | grep test- -A 10
name test-shaper-300kbps
maximum-bandwidth 37 KB/sec
guaranteed-bandwidth 3 KB/sec
current-bandwidth 37 KB/sec
priority 2
policy 2
overhead 0
tos 01
packets dropped 10
bytes dropped 725
```

To configure DSCP and VLAN CoS for local-out traffic:

1. Configure the traffic shaper with bandwidth settings and the DSCP and VLAN CoS mark:

```
config firewall shaper traffic-shaper
    edit "test-shaper-600kbps"
        set guaranteed-bandwidth 60
        set maximum-bandwidth 600
        set per-policy enable
        set diffserv enable
        set cos-marking enable
        set cos 110
        set diffservcode 110000
    next
end
```

2. Configure the shaping policy for local-out traffic:

```
config firewall shaping-policy
    edit 5
        set traffic-type local-out
        set service "ALL"
        set traffic-shaper "test-shaper-600kbps"
        set class-id 5
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

3. Verify that the shaper was successfully applied to the shaping policy:

```
# diagnose firewall iprope list 100019
policy index=5 uuid_idx=928 action=accept
flag (0):
schedule()
shapers: orig=test-shaper-600kbps(2/7500/75000)
cos_fwd=255  cos_rev=255
group=00100019 av=00000000 au=00000000 split=00000000
host=2 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
zone(1): 0 -> zone(1): 0
source(1): 0.0.0.0-255.255.255.255, uuid_idx=799,

service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
class_id: 5
```

4. Test local-in traffic from the FortiGate to the remote PC.
   a. Check the session list:

```
# diagnose sys session list
session info: proto=6 proto_state=01 duration=4 expire=3599 timeout=3600 refresh_dir=both
flags=00000000 socktype=0 sockport=0 av_idx=0 use=3
```

```
origin-shaper=test-shaper-600kbps prio=2 guarantee 7500Bps max 75000Bps traffic 73557Bps
drops 70500B

npu_state=00000000
no_ofld_reason:  local
```

b. Check the shaper information to verify the DSCP mark and bandwidth limitation:

```
#  diagnose firewall shaper traffic-shaper list | grep test- -A 10
name test-shaper-600kbps
maximum-bandwidth 75 KB/sec
guaranteed-bandwidth 7 KB/sec
current-bandwidth 65 KB/sec
priority 2
policy 5
overhead 0
tos 30
packets dropped 5086
bytes dropped 1148949
```

Examples

This section includes the following traffic shaping configuration examples:

- Interface-based traffic shaping profile on page 2086
- Interface-based traffic shaping with NP acceleration on page 2096
- QoS assignment and rate limiting for FortiSwitch quarantined VLANs on page 2098
- Ingress traffic shaping profile on page 2099

Interface-based traffic shaping profile

A traffic shaping policy can be used for interface-based traffic shaping by organizing traffic into 30 class IDs. The shaping profile defines the percentage of the interface bandwidth that is allocated to each class. Each traffic class ID is shaped to the assigned speed according to the outgoing bandwidth limit configured to the interface.

Traffic classification

A shaping policy classifies traffic and organizes it into different class IDs, based on matching criteria. For traffic matching a criteria, you can choose to put it into 30 different shaping classes, identified by class ID 2 - 31.

- When NPU offloading is enabled on FortiGates with NP6, NP6Lite (SoC3), or NP6XLite (SoC4) processors, the class ID limit for egress traffic is 2 - 15.
- When NPU offloading is enabled on FortiGates with NP7 or NP7Lite (SoC5) processors, the class ID limit for egress traffic is 2–11.
- When NPU offloading is disabled, the class ID limit for egress traffic is 2–31.

Setting the egress traffic class ID outside of these limits can result in unexpected behavior.

You must select an outgoing interface for the traffic. The shaping policy is only applied when the traffic goes to one of the selected outgoing interfaces.

Criterion	Description
Source	• Address: match the source address of the traffic to the selected address or address group. • User: use the user credentials of the traffic to match the selected user or user group. At least one address, address group, or internet service must also be selected. • Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.
Destination	• Address: match the destination address of the traffic to the selected address or address group. • Internet service: match the traffic to the selected internet service. Internet services cannot be used if addresses or address or groups are used.
Schedule	Match the current date and time to the selected schedule. You can select a one-time schedule, recurring schedule, or schedule group. This setting is optional.
Service	Match the service of the traffic to the selected service or service group.
Application	Match the application of the traffic to the selected application, application category, or application group. Application control must be enabled in the related firewall policy to know the application of the traffic. See Application control on page 2355 for more information.
URL category	Match the URL of the traffic to the selected URL category. Web filter must be enabled in the related firewall policy to know the URL of the traffic. See Web filter on page 2238 for more information.

When multiple items are selected in one criterion, it is considered a match when traffic matches any one of them.

Traffic prioritization

Shaping profiles define how different shaping classes of traffic are prioritized. For each class, you can define three prioritization strategies: guaranteed bandwidth, maximum bandwidth, and priority.

For each shaping profile, a default shaping class must be defined. Traffic is prioritized based on the default shaping group in the following two circumstances:

- All traffic to the outgoing interface that does not match to any shaping policy
- Traffic with a shaping group that is not defined in a shaping profile

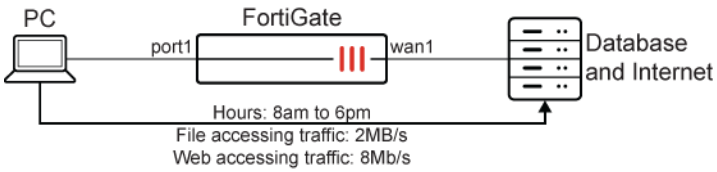
Prioritization strategy	Description
Guaranteed bandwidth	The percentage of the link speed that is reserved for the shaping group. The total guaranteed bandwidth for all shaping groups cannot exceed 100%.
Maximum bandwidth	The maximum percentage of the link speed that the shaping group can use.
Priority	The shaping class priority: top, critical, high, medium, or low. When groups are competing for bandwidth on the interface, the group with the higher priority wins.

Applying a shaping profile to an interface

Traffic shaping is accomplished by configuring the outgoing bandwidth and outgoing shaping profile on an interface. The shaping profile uses the outgoing bandwidth of the interface as the maximum link speed, and it only works when the outgoing bandwidth is configured.

This example shows how to apply interface-based traffic shaping to web and file accessing traffic according to a schedule:

- The link speed of the wan1 interface is 10 Mb/s.
- File access can use up to 2 Mb/s from 8:00 AM to 6:00 PM.
- Web access can use 8 Mb/s from 8:00 AM to 6:00 PM.



Putting the traffic into shaping classes

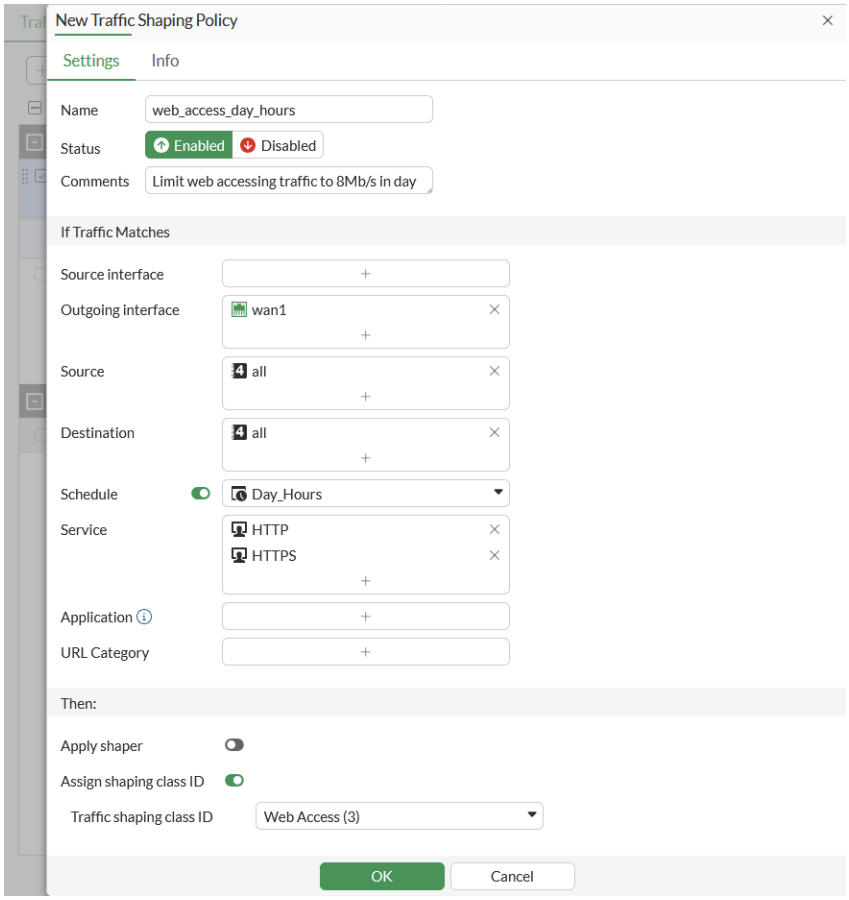
To create a recurring schedule in the GUI:

1. Go to *Policy & Objects* > *Schedules* and navigate to the *Recurring Schedule* tab.
2. Click *Create New*.

3. Configure a recurring schedule called *Day_Hours* for everyday from 8:00 AM to 6:00 PM.
4. Click *OK*.

To create a traffic shaping policy and class ID for the web accessing traffic in the GUI:

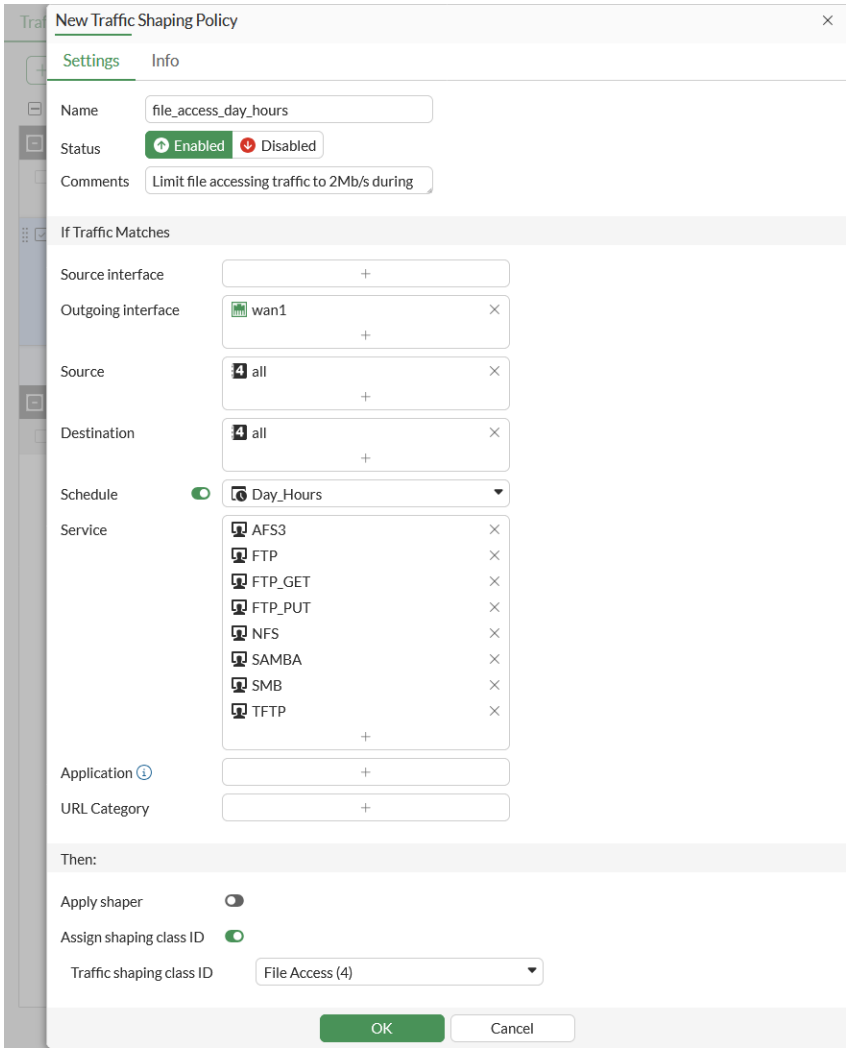
1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
2. Enter a name for the policy, such as *web_access_day_hours*.
3. Set *Outgoing interface* to *wan1*.
4. Enable *Schedule* and select the schedule you just created.
5. Set *Service* to web accessing services, such as *HTTP* and *HTTPS*.
6. Enable *Assign shaping class ID*.
7. Click the *Traffic shaping class ID* drop down then click *Create*.
8. Enter an integer value for the *ID* (*3*) and a description for the *Name*, such as *Web Access*.
9. Click *OK*.
10. Select the class ID you just created for *Traffic shaping class ID*.



11. Configure the remaining settings as required.
12. Click *OK*.

To create a traffic shaping policy and class ID for the file accessing traffic in the GUI:

1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
2. Enter a name for the policy, such as *file_access_day_hours*.
3. Set *Outgoing interface* to *wan1*.
4. Enable *Schedule* and select the schedule you just created.
5. Set *Service* to file accessing services, such as *ASF3*, *FTP* and *SMB*.
6. Enable *Assign shaping class ID*.
7. Click the *Traffic shaping class ID* drop down then click *Create*.
8. Enter an integer value for the *ID* (*4*) and a description for the *Name*, such as *File Access*.
9. Click *OK*.
10. Select the class ID you just created for *Traffic shaping class ID*.



11. Configure the remaining settings as required.
12. Click *OK*.

To put the traffic into shaping classes in the CLI:

1. Create a recurring schedule:

```
config firewall schedule recurring
    edit "Day_Hours"
        set start 08:00
        set end 18:00
        set day sunday monday tuesday wednesday thursday friday saturday
    next
end
```

2. Create the traffic class IDs:

```
config firewall traffic-class
    edit 3
        set class-name "Web Access"
    next
    edit 4
        set class-name "File Access"
    next
end
```

3. Create the web and file accessing traffic shaping policies:

```
config firewall shaping-policy
    edit 2
        set name "web_access_day_hours"
        set comment "Limit web accessing traffic to 8Mb/s in day time"
        set service "HTTP" "HTTPS"
        set schedule "Day_Hours"
        set dstintf "wan1"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
    edit 3
        set name "file_access_day_hours"
        set comment "Limit file accessing traffic to 2Mb/s during the day"
        set service "AFS3" "FTP" "FTP_GET" "FTP_PUT" "NFS" "SAMBA" "SMB" "TFTP"
        set schedule "Day_Hours"
        set dstintf "wan1"
        set class-id 4
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

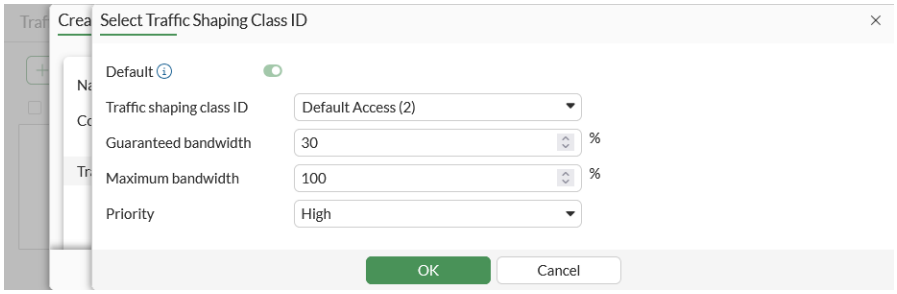
Allocating bandwidth to the shaping classes

A traffic shaping profile defines the guaranteed and maximum bandwidths each class receives. In this example, file access can use up to 2 Mb/s and web access can use 8 Mb/s from 8:00 AM to 6:00 PM.

To create a traffic shaping profile using the GUI:

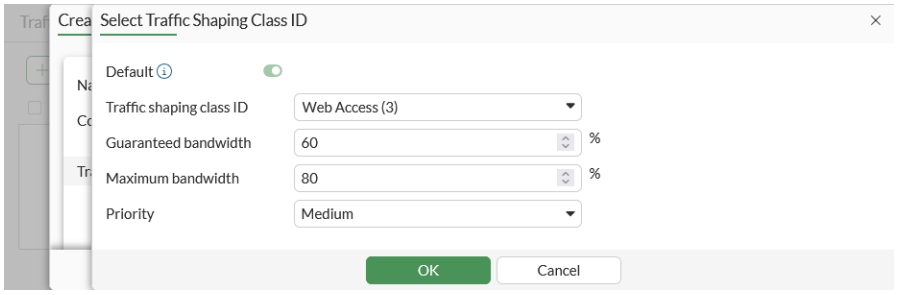
1. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Profile* tab, and click *Create New*.
2. Enter a name for the profile, such as *Day_Hours_Profile*.
3. Configure a default traffic shaping class:
   This class has a high priority, meaning that when the other classes have reached their guaranteed bandwidths, this default class will use the rest of the available bandwidth.
   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Click the *Traffic shaping class ID* drop down then click *Create*.
   c. Enter a name for the class, such as *Default Access*.
   d. Click *OK*.
   e. Select the class ID you just created for *Traffic shaping class ID*.
   f. Configure the following settings, then click *OK*:

Guaranteed bandwidth	30
Maximum bandwidth	100
Priority	High



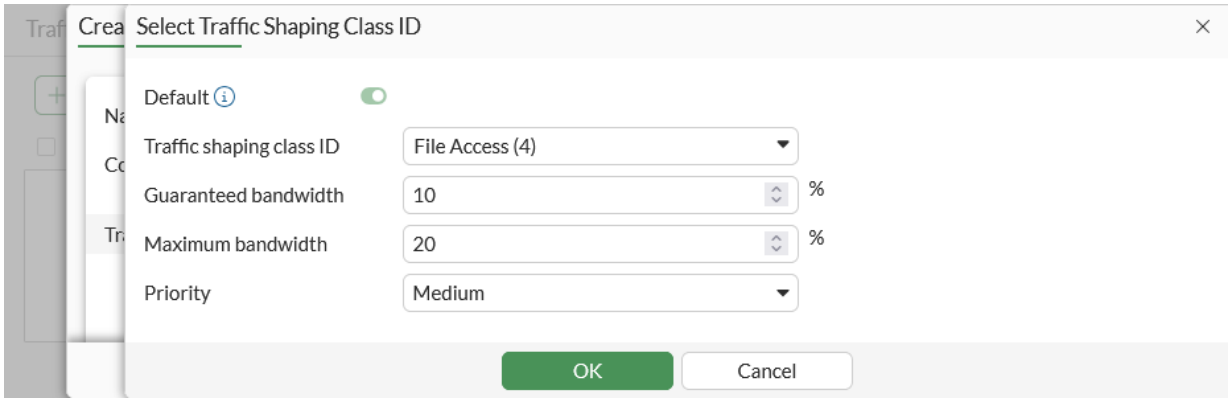
4. Configure a web accessing traffic shaping class:
   When other types of traffic are competing for bandwidth, this class is guaranteed to 6 Mb/s, or 60% of the bandwidth.
   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Configure the following settings, then click *OK*:

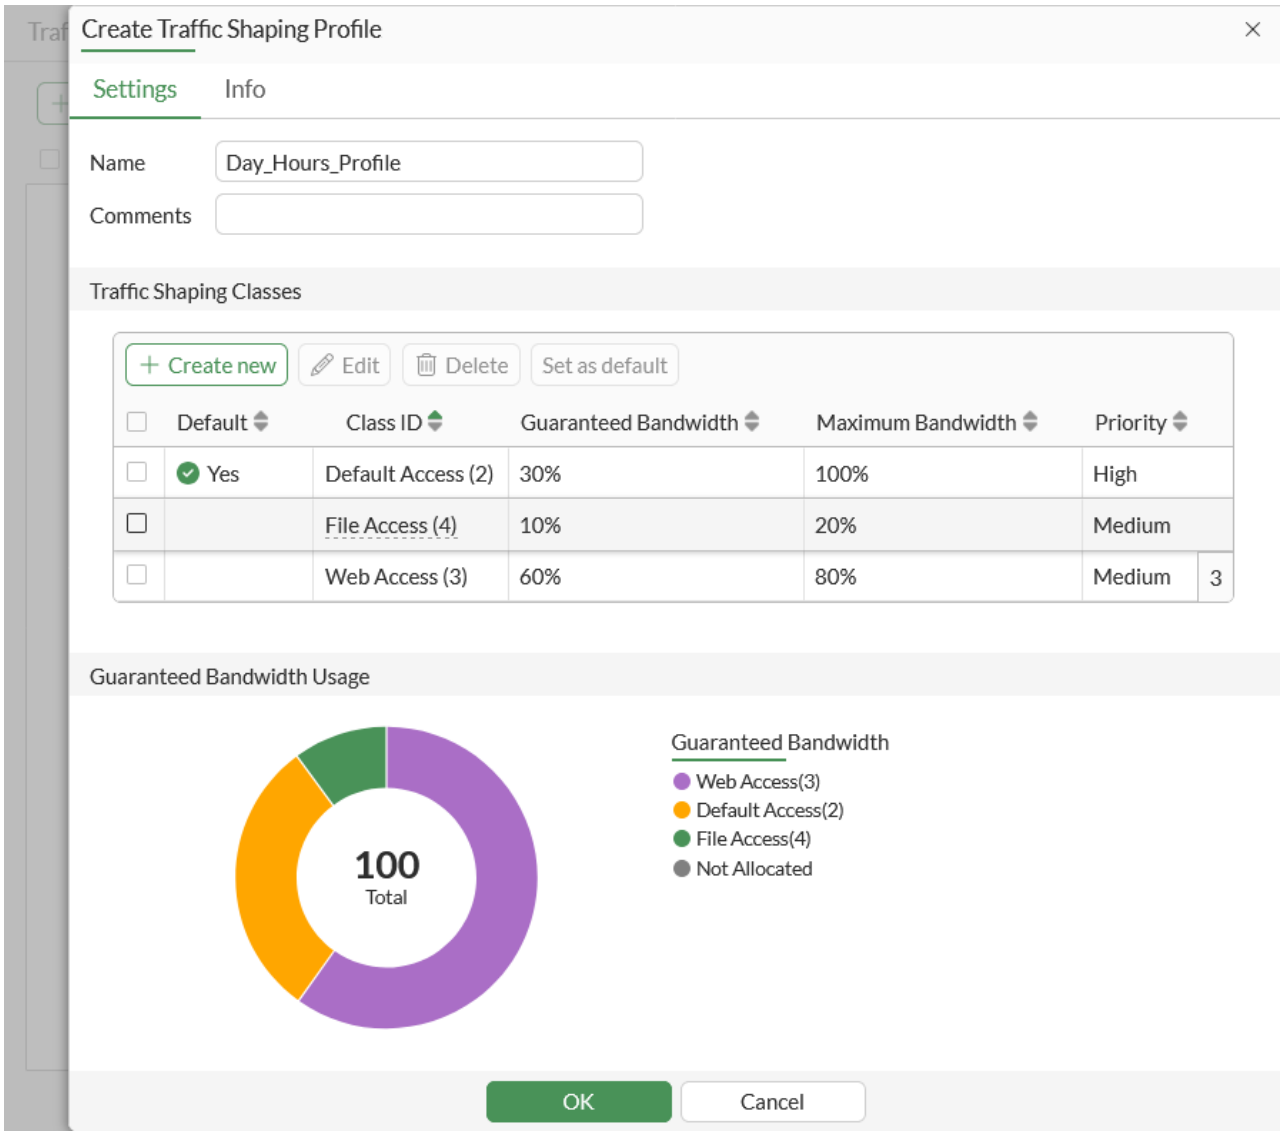
Traffic shaping class ID	Web Access
Guaranteed bandwidth	60
Maximum bandwidth	80
Priority	Medium



5. Configure a file accessing traffic shaping class:
   When other types of traffic are competing for bandwidth, this group is guaranteed to 1 Mb/s, or 10% of the bandwidth.
   a. In the *Traffic Shaping Classes* table click *Create New*.
   b. Configure the following settings, then click *OK*:

Traffic shaping class ID	File Access
Guaranteed bandwidth	10
Maximum bandwidth	20
Priority	Medium





6. Click *OK*.

To create a traffic shaping profile using the CLI:

```
config firewall shaping-profile
    edit "Day_Hours_Profile"
        set default-class-id 2
        config shaping-entries
            edit 1
                set class-id 2
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 100
            next
            edit 2
                set class-id 3
                set priority medium
```

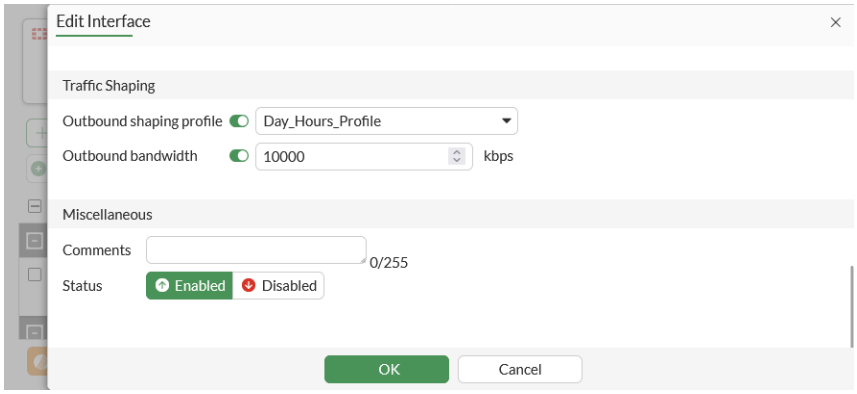
```
                set guaranteed-bandwidth-percentage 60
                set maximum-bandwidth-percentage 80
            next
            edit 3
                set class-id 4
                set priority medium
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 20
            next
        end
    next
end
```

Defining the available bandwidth on an interface

In this example, the link speed of the wan1 interface is 10 Mb/s.

To set the bandwidth of the wan1 interface in the GUI:

1. Go to *Network* > *Interfaces*.
2. Edit the wan1 interface.
3. Under Traffic Shaping, enable *Outbound shaping profile* and select the profile that you just created, *Day_Hours_Profile*.
4. Enable *Outbound Bandwidth* and set it to *10000* Kbps.



5. Click *OK*.

To set the bandwidth of the wan1 interface in the CLI:

```
config system interface
    edit "wan1"
        set egress-shaping-profile "Day_Hours_Profile"
        set outbandwidth 10000
    next
end
```

Diagnose commands

To check that the specific traffic is put into the correct shaping group or class ID:

```
# diagnose firewall iprope list 100015
```

To check the speed limit for each class ID on an interface:

```
# diagnose netlink interface list wan1
```

Interface-based traffic shaping with NP acceleration

Interface-based traffic shaping with NP acceleration is supported on some devices.

An administrator configures the WAN interface's maximum outbound bandwidth and, based on that, creates a traffic shaping profile with a percentage based shaper. This allows for proper QoS and traffic shaping. VLAN interfaces are not supported.

This feature is supported on FortiGate 600E, 500E, 400E, and 300E models.

To configure interface-based traffic shaping:

1. Enable NPU offloading when doing interface-based traffic shaping according to the egress-shaping-profile:

```
config system npu
    set intf-shaping-offload enable
end
```

2. Configure shaping profiles:

```
config firewall shaping-profile
    edit "sdwan"
        set default-class-id 4
        config shaping-entries
            edit 1
                set class-id 4
                set guaranteed-bandwidth-percentage 3
                set maximum-bandwidth-percentage 5
            next
            edit 2
                set class-id 3
                set priority medium
                set guaranteed-bandwidth-percentage 50
                set maximum-bandwidth-percentage 100
            next
            edit 3
                set class-id 2
                set priority low
```

```
                set guaranteed-bandwidth-percentage 1
                set maximum-bandwidth-percentage 5
            next
        end
    next
end
```

The class number is limited to 16.

3. Configure a traffic shaper and shaping policy:

```
config firewall shaper traffic-shaper
    edit "Transactional"
        set priority medium
    next
end
```

```
config firewall shaping-policy
    edit 1
        set service "ALL"
        set dstintf "any"
        set traffic-shaper "Transactional"
        set class-id 3
        set srcaddr "all"
        set dstaddr "all"
    next
end
```

4. Apply the egress shaping profile on the interface:

```
config system interface
    edit "port2"
        set vdom "root"
        set ip 10.1.100.23 255.255.255.0
        set allowaccess ping
        set type physical
        set outbandwidth 500
        set egress-shaping-profile "sdwan"
        set snmp-index 4
    next
end
```

5. Configure a firewall policy:

```
config firewall policy
    edit 3
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
```

```
        set logtraffic all
        set nat enable
    next
end
```

QoS assignment and rate limiting for FortiSwitch quarantined VLANs

When devices are quarantined, they are isolated from the rest of the network. However, they can still impact the network if not controlled beyond isolation. A quarantined host, which offers heavy traffic, could congest the network and create a DOS-style reduction in service to authorized hosts.

Within the quarantined VLAN, two restrictions are available within the network:

- Traffic policing (also known as rate limiting)
- QoS (Quality of Service) assignment (also known as priority assignment)

Each quarantined host's traffic can be subject to rate limiting and priority adjustment. This reduces the impact that any quarantined host can have on authorized traffic on the network.

To configure QoS assignment and rate limiting for quarantined VLANs:

1. Configure a traffic policy, or use the default "quarantine" policy:

```
config switch-controller traffic-policy
    edit "quarantine"
        set description "Rate control for quarantined traffic"
        set guaranteed-bandwidth 163840
        set guaranteed-burst 8192
        set maximum-burst 163840
        set cos-queue 0
    next
end
```

2. Configure an interface:

```
config system interface
    edit "qtn.aggr1"
        set vdom "root"
        set ip 10.254.254.254 255.255.255.0
        set description "Quarantine VLAN"
        set security-mode captive-portal
        set replacemsg-override-group "auth-intf-qtn.aggr1"
        set device-identification enable
        set snmp-index 30
        set switch-controller-access-vlan enable
        set switch-controller-traffic-policy "quarantine"
        set color 6
        set interface "aggr1"
        set vlanid 4093
```

```
    next
end
```

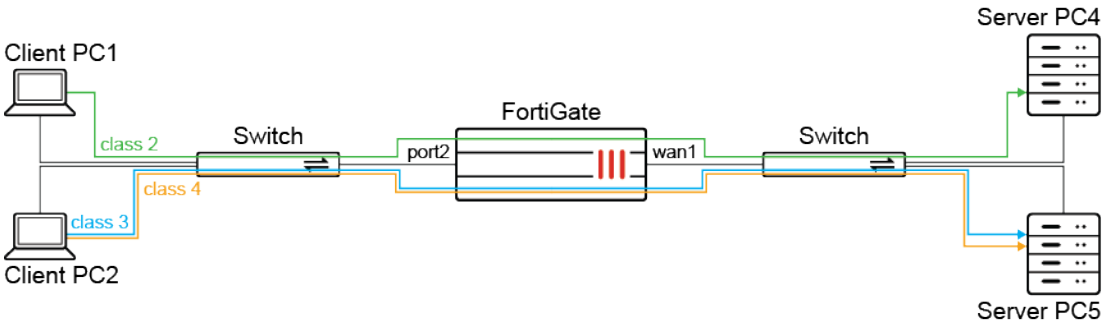
By default, `switch-controller-traffic-policy` is empty. You need to apply the necessary traffic policy (not only limited to "quarantine").

Ingress traffic shaping profile

A traffic shaping profile can be applied to an interface for traffic in the ingress direction. Similar to an egress traffic shaping profile, the guaranteed bandwidth and priority of the profile will be respected when an interface receives inbound traffic. When congestion occurs, any remaining bandwidth will be allotted to classes based on priority.

Example

In this example, the port2 interface has a total inbound bandwidth of 100 Mbps. Traffic from certain clients to certain servers are assigned different classes.



IPv6 traffic from any client PCs to server PCs is assigned class 5.

For each class, the priority, guaranteed bandwidth, and maximum bandwidth are as follows:

Class	Priority	Guaranteed bandwidth	Maximum bandwidth
2	Low	10%	60%
3	High	20%	100%
4	High	30%	100%
5	Medium	10%	50%

Bandwidth will first be allotted to each class according to its guaranteed bandwidth. Then remaining available bandwidth will be allotted to class 3 and 4 first based on their priority. The allocation will be proportional to their guaranteed bandwidth ratio.

To configure ingress traffic shaping:

1. Configure the client and server addresses:

```
config firewall address
    edit "pc1"
        set subnet 10.1.100.11 255.255.255.255
    next
    edit "pc2"
        set subnet 10.1.100.22 255.255.255.255
    next
    edit "pc4"
        set subnet 172.16.200.44 255.255.255.255
    next
    edit "pc5"
        set subnet 172.16.200.55 255.255.255.255
    next
end
```

2. Configure the class IDs:

```
config firewall traffic-class
    edit 2
        set class-name "class2"
    next
    edit 3
        set class-name "class3"
    next
    edit 4
        set class-name "class4"
    next
    edit 4
        set class-name "class5"
    next
end
```

3. Configure traffic shaping policies to assign classes to each group of traffic.
   a. Configure a policy to assign traffic from PC1 to PC4 in class 2:

```
config firewall shaping-policy
    edit 1
        set name "shaping policy 1"
        set service "ALL"
        set dstintf "wan1"
        set class-id 2
        set srcaddr "pc1"
        set dstaddr "pc4"
    next
end
```

   b. Configure a policy to assign traffic from PC2 to PC4 in class 3:

```
config firewall shaping-policy
    edit 2
        set name "shaping policy 2"
        set service "ALL"
        set dstintf "wan1"
        set class-id 3
        set srcaddr "pc2"
        set dstaddr "pc4"
    next
end
```

c. Configure a policy to assign traffic from PC2 to PC5 in class 4:

```
config firewall shaping-policy
    edit 3
        set name "shaping policy 3"
        set service "ALL"
        set dstintf "wan1"
        set class-id 4
        set srcaddr "pc2"
        set dstaddr "pc5"
    next
end
```

d. Configure a policy to assign all IPv6 traffic to class 5:

```
config firewall shaping-policy
    edit 4
        set name "shaping policy 4"
        set ip-version 6
        set service "ALL"
        set dstintf "wan1"
        set class-id 5
        set srcaddr6 "all"
        set dstaddr6 "all"
    next
end
```

4. Configure a shaping profile to set the priority, and the guaranteed and maximum bandwidth percentages for each class:

```
config firewall shaping-profile
    edit "ingShapeProfile"
        set default-class-id 2
        config shaping-entries
            edit 2
                set class-id 2
                set priority low
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 60
            next
            edit 3
```

```
                set class-id 3
                set guaranteed-bandwidth-percentage 20
                set maximum-bandwidth-percentage 100
            next
            edit 4
                set class-id 4
                set guaranteed-bandwidth-percentage 30
                set maximum-bandwidth-percentage 100
            next
            edit 5
                set class-id 5
                set priority medium
                set guaranteed-bandwidth-percentage 10
                set maximum-bandwidth-percentage 50
            next
        end
    next
end
```

5. Configure the inbandwidth and apply the ingress shaping profile on port2:

```
config system interface
    edit "port2"
        set ip 10.1.100.1 255.255.255.0
        set inbandwidth 100000
        set ingress-shaping-profile "ingShapeProfile"
        config ipv6
            set ip6-address 2000:10:1:100::1/64
        end
    next
end
```

Inbandwidth must be configured for traffic shaping to take effect.

6. Configure a firewall policy to allow traffic to go through. Since traffic shaping is for inbound traffic on port2, the policy is defined from port2 to wan1:

```
config firewall policy
    edit 2
        set srcintf "port2"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set srcaddr6 "all"
        set dstaddr6 "all"
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload enable
        set nat enable
    next
end
```

Ingress traffic shaping supports NPU offloading and it is enabled by default. Set `auto-asic-offload` to `disable` to disable it.

Verifying that the traffic is being shaped

In each of the following cases, the server PCs (PC4 and PC5) are configured as iPerf servers. The client PCs (PC1 and PC2) are configured as iPerf clients. The client sends traffic to the server from the client to server direction, triggering inbound traffic shaping on the port2 interface. The inbound bandwidth on port2 is 100 Mbps.

Case 1: single stream, PC1 to PC4

Traffic is sent from PC1 to PC4. There is no other traffic. Traffic is marked with class ID 2 and allocated the maximum bandwidth 60 Mbps (60%).

```
# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=25 state=start present fw_flags=3800 flags=up broadcast run multicast
Qdisc=mq hw_addr=70:4c:a5:7d:d4:95 broadcast_addr=ff:ff:ff:ff:ff:ff
ingress traffic control:
        bandwidth=100000(kbps) lock_hit=50 default_class=2 n_active_class=4
        class-id=2      allocated-bandwidth=60000(kbps)         guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=60000(kbps)       current-bandwidth=60002(kbps)
                        priority=low    forwarded_bytes=58157K
                        dropped_packets=94K     dropped_bytes=125385K
        class-id=5      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=50000(kbps)       current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=15000(kbps)         guaranteed-bandwidth=20000(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=4      allocated-bandwidth=24000(kbps)         guaranteed-bandwidth=30000(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0

misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=25
```

Case 2: dual stream, PC1 to PC4, PC2 to PC4

Traffic is sent from both PC1 and PC2 to PC4. PC1 to PC4 traffic is marked with class ID 2 and low priority, and PC2 to PC4 traffic is marked with class ID 3 and high priority. Both class 2 and 3 will be allocated their guaranteed bandwidth first, using up 10% and 20% respectively. The remaining available bandwidth is used by class 3 since it has a higher priority. Class 2 uses around 10 Mbps, and class 3 uses around 90 Mbps.

```
# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=36 state=start present fw_flags=3800 flags=up broadcast run multicast
Qdisc=mq hw_addr=70:4c:a5:7d:d4:95 broadcast_addr=ff:ff:ff:ff:ff:ff
ingress traffic control:
        bandwidth=100000(kbps) lock_hit=181 default_class=2 n_active_class=4
        class-id=2      allocated-bandwidth=10000(kbps)         guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=60000(kbps)       current-bandwidth=10001(kbps)
                        priority=low    forwarded_bytes=1799482K
                        dropped_packets=5998K   dropped_bytes=7965553K
        class-id=5      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=50000(kbps)       current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=88000(kbps)         guaranteed-bandwidth=20000(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=88000(kbps)
                        priority=high   forwarded_bytes=345039K
                        dropped_packets=324K    dropped_bytes=430862K
        class-id=4      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=30000(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=0(kbps)
                        priority=high   forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
stat: rxp=181269891 txp=2433428 rxb=205136511596 txb=2771214402 rxe=0 txe=0 rxd=0 txd=0 mc=0
collision=0 @ time=1628815849
re: rxl=0 rxo=0 rxc=0 rxf=0 rxfi=0 rxm=0
te: txa=0 txc=0 txfi=0 txh=0 txw=0
misc rxc=0 txc=0
input_type=0 state=3 arp_entry=0 refcnt=36
```

Case 3: multiple streams

Multiple streams of traffic are sent at the same time:

- PC1 to PC4 traffic is assigned class 2 with low priority, and a guaranteed bandwidth of 10 Mbps.
- PC2 to PC4 traffic is assigned class 3 with high priority, and a guaranteed bandwidth of 20 Mbps.
- PC2 to PC5 traffic is assigned class 4 with high priority, and a guaranteed bandwidth of 30 Mbps.

All classes will be allocated their guaranteed bandwidth first, using up 10 Mbps, 20 Mbps, and 30 Mbps respectively. The remaining available bandwidth (40 Mbps) is shared by class 3 and class 4 based on their guaranteed bandwidth ratio of 20:30.

- Class 3's share of the remaining 40 Mbps traffic = 40 × 20/(20 + 30) =16 Mpbs
- Class 4's share of the remaining 40 Mbps traffic = 40 × 30/(20 + 30) =24 Mpbs

Each class is allocated roughly the following bandwidth:

- Class 2: 10 Mbps
- Class 3: 20 Mbps + 16 Mbps = 36 Mbps
- Class 4: 30 Mbps + 24 Mbps = 54 Mbps

```
# diagnose netlink interface list port2
if=port2 family=00 type=1 index=20 mtu=1500 link=0 master=0
ref=27 state=start present fw_flags=3800 flags=up broadcast run multicast
```

```
Qdisc=mq hw_addr=70:4c:a5:7d:d4:95 broadcast_addr=ff:ff:ff:ff:ff:ff
ingress traffic control:
        bandwidth=100000(kbps) lock_hit=148731 default_class=2 n_active_class=4
        class-id=2      allocated-bandwidth=10000(kbps)         guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=60000(kbps)       current-bandwidth=10004(kbps)
                        priority=low    forwarded_bytes=2267956K
                        dropped_packets=10389K  dropped_bytes=13796469K
        class-id=5      allocated-bandwidth=1000(kbps)  guaranteed-bandwidth=10000(kbps)
                        max-bandwidth=50000(kbps)       current-bandwidth=0(kbps)
                        priority=medium         forwarded_bytes=0
                        dropped_packets=0       dropped_bytes=0
        class-id=3      allocated-bandwidth=35000(kbps)         guaranteed-bandwidth=20000(kbps)
                        max-bandwidth=100000(kbps)      current-bandwidth=35729(kbps)
                        priority=high   forwarded_bytes=2119502K

```

Internet Services

The Internet Service Database (ISDB) data comes from the FortiGuard service system. Information is regularly added to this database, for example, geographic location, IP reputation, popularity & DNS, and so on. All this information helps users define Internet security more effectively. You can use the contents of the database as criteria for inclusion or exclusion in a policy.

Internet Service can be applied both as source and destination objects in a policy. You can also apply Internet Services to shaping policy.

The Internet Service Database can be configured with different numbers of addresses:

```
config system global
    set internet-service-database {mini | standard | full | on-demand}
end
```

Value	Description
mini	Small sized Internet Service database with very limited IP addresses.
standard	Medium sized Internet Service database with most IP addresses.
full	Full sized Internet Service database with all IP addresses.
on-demand	Internet Service database with customer selected IP addresses.

The default value varies between model. For FortiGate models that have 2GB of memory, it is recommended that the on-demand database be used.

The following topics provide instructions on configuring policies with Internet Service:

- Using Internet Service in a policy on page 2106
- Using custom Internet Service in policy on page 2110
- Using extension Internet Service in policy on page 2112
- Global IP address information database on page 2115
- IP reputation filtering on page 2117
- Internet service groups in policies on page 2118
- Allow creation of ISDB objects with regional information on page 2125
- Internet service customization on page 2127
- Look up IP address information from the Internet Service Database page on page 2128
- Internet Service Database on-demand mode on page 2129
- Enabling the ISDB cache in the FortiOS kernel on page 2132
- ISDB FQDN groups on page 2133

Using Internet Service in a policy

This topic shows how to apply a predefined Internet Service entry into a policy.

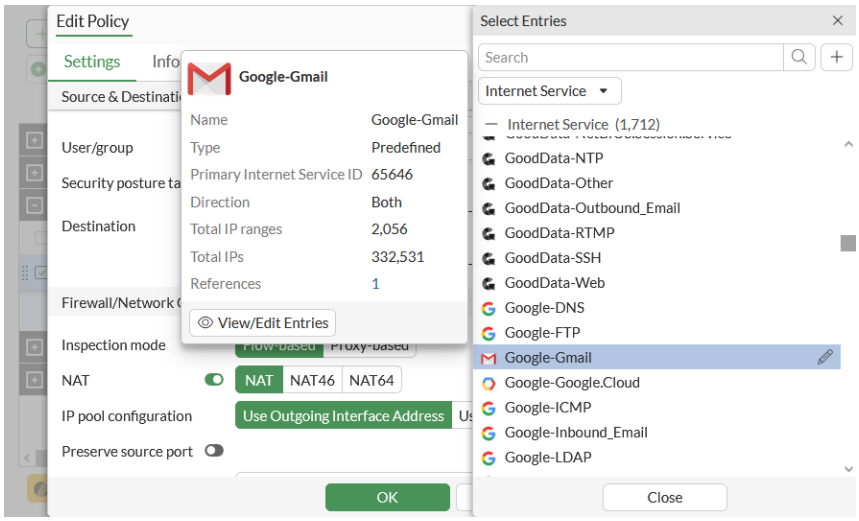
There are three types of Internet Services you can apply to a firewall policy:

- Predefined Internet Services
- Custom Internet Services
- Extension Internet Services

Sample IPv4 configuration

To apply a predefined Internet Service entry to a policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Click in the *Destination* field.
3. In the *Select Entries* pane, select *Internet Service* from the dropdown list and select *Google-Gmail*.



4. Configure the remaining fields as needed.
5. Click *OK*.

To apply a predefined Internet Service entry to a policy in the CLI:

In the CLI, enable the `internet-service` first and then use its ID to apply the policy.

This example uses Google Gmail and its ID is 65646. Each Internet Service has a unique ID.

```
config firewall policy
    edit 9
        set name "Internet Service in Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

To diagnose an Internet Service entry in the CLI:

```
# diagnose internet-service id-summary 65646
Version: 0000600096
Timestamp: 201902111802
Total number of IP ranges: 444727
Number of Groups: 7
Group(0), Singularity(20), Number of IP ranges(142740)
Group(1), Singularity(19), Number of IP ranges(1210)
```

```
Group(2), Singularity(16), Number of IP ranges(241)
Group(3), Singularity(15), Number of IP ranges(38723)
Group(4), Singularity(10), Number of IP ranges(142586)
Group(5), Singularity(8), Number of IP ranges(5336)
Group(6), Singularity(6), Number of IP ranges(113891)
Internet Service: 65646(Google.Gmail)
Number of IP range: 60
Number of IP numbers: 322845
Singularity: 15
Reputation: 5(Known and verified safe sites such as Gmail, Amazon, eBay, etc.)
Icon Id: 510
Second Level Domain: 53(gmail.com)
Direction: dst
Data source: isdb
```

Result

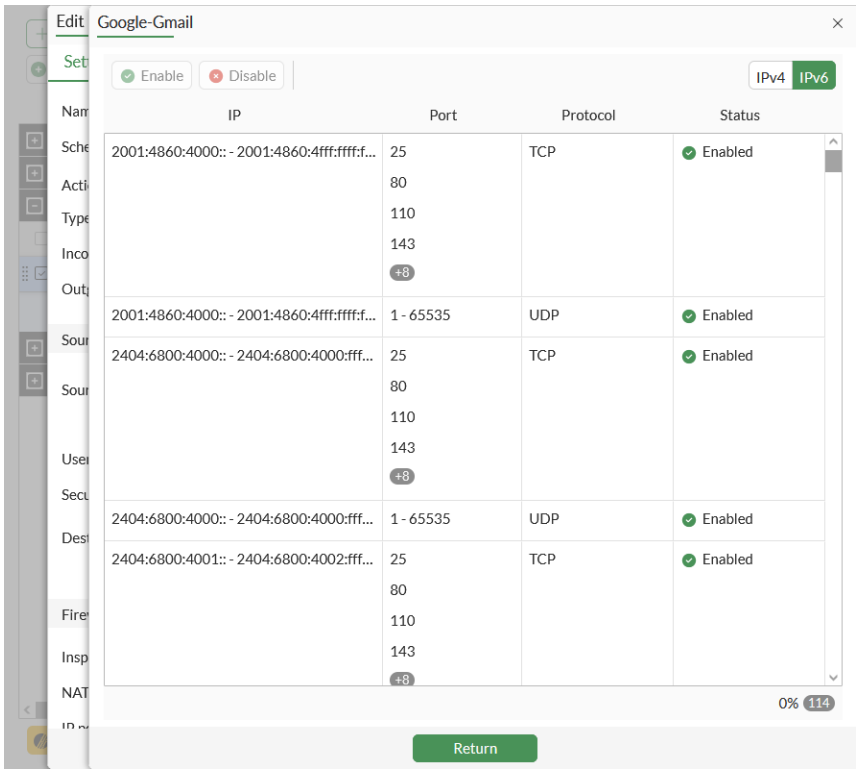
Because the IP and services related to Google Gmail on the Internet are included in this Internet Service (65646), all traffic to Google Gmail is forwarded by this policy.

Sample IPv6 configuration

In this example, the Google Gmail IPv6 ISDB address (ID 65646) is used as a destination in a firewall policy.

To apply a predefined IPv6 Internet Service entry to a policy using the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. In the *Destination* field, select *Internet Service* from the dropdown list.
3. In the *IPv6 Internet Service* section, select *Google-Gmail*.
4. Optionally, hover over the *Google Gmail* and click *View/Edit Entries*. A pane appears that displays the IPv6 address ranges for this Internet Service.



5. Click *Return* to close the pane.
6. Configure the other settings as needed.
7. Click *OK*.

To apply a predefined IPv6 Internet Service entry to a policy using the CLI:

```
config firewall policy
    edit 4
        set name "Internet Service6 policy"
        set srcintf "vlan100"
        set dstintf "wan1"
        set action accept
        set srcaddr6 "all"
        set internet-service6 enable
        set internet-service6-name "Google-Gmail"
        set schedule "always"
        set nat enable
    next
end
```

To diagnose an IPv6 Internet Service entry in the CLI:

```
# diagnose internet-service6 id-summary 65646

Version: 00007.02907
Timestamp: 202212161345
```

```
Total number of IP ranges: 36878
Number of Groups: 12
Group(0), Singularity(20), Number of IP ranges(60)
Group(1), Singularity(18), Number of IP ranges(12)
Group(2), Singularity(17), Number of IP ranges(2728)
Group(3), Singularity(16), Number of IP ranges(2812)
Group(4), Singularity(15), Number of IP ranges(4011)
Group(5), Singularity(10), Number of IP ranges(2345)
Group(6), Singularity(9), Number of IP ranges(14)
Group(7), Singularity(8), Number of IP ranges(1555)
Group(8), Singularity(7), Number of IP ranges(2704)
Group(9), Singularity(6), Number of IP ranges(7300)
Group(10), Singularity(5), Number of IP ranges(3154)
Group(11), Singularity(4), Number of IP ranges(10183)
Internet Service: 65646(Google-Gmail)
Number of IP ranges: 482
Singularity: 15
Icon Id: 510
Direction: both
Data source: isdb
Country: 32 36 56 76 124 152 158 203 208 246 250 276 344 348 356 372 376 380 392 404 458 484
        528 616 634 643 682 702 710 724 752 756 784 826 840
Region: 65535
City: 65535
```

Result

Because the IP and services related to Google Gmail on the Internet are included in this Internet Service (65646), all traffic to Google Gmail is forwarded by this policy.

Using custom Internet Service in policy

Custom Internet Services can be created and used in firewall policies.

When creating a custom Internet Service, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges
- Reputation

You must use CLI to create a custom Internet Service, except for geographic based services (see Allow creation of ISDB objects with regional information on page 2125).

CLI syntax

```
config firewall internet-service-custom
    edit <name>
```

```
        set comment <comment>
        set reputation {1 | 2 | 3 | 4 | 5}
        config entry
            edit <ID>
                set protocol <protocol #>
                set dst <object_name>
                config port-range
                    edit <ID>
                        set start-port <port #>
                        set end-port <port #>
                    next
                end
            next
        end
    end
end
```

Sample configuration

To configure a custom Internet Service:

```
config firewall internet-service-custom
   edit "test-isdb-1"
        set comment "Test Custom Internet Service"
        set reputation 4
        config entry
           edit 1
               set protocol 6
               config port-range
                   edit 1
                       set start-port 80
                       set end-port 443
                   next
               end
               set dst "10-1-100-0"
           next
           edit 2
               set protocol 6
               config port-range
                   edit 1
                       set start-port 80
                       set end-port 80
                   next
               end
               set dst "172-16-200-0"
           next
        end
   next
end
```

To apply a custom Internet Service into a policy:

```
config firewall policy
    edit 1
        set name "Internet Service in Policy"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set internet-service-custom "test-isdb-1"
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Result

In addition to the IP address, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which access to 10.1.100.0/24 and TCP/80-443 and 172.16.200.0/24 and TCP/80.

Using extension Internet Service in policy

Extension Internet Service lets you add custom or remove existing IP address and port ranges to an existing predefined Internet Service entries. Using an extension type Internet Service is actually editing a predefined type Internet Service entry and adding IP address and port ranges to it.

When creating an extension Internet Service and adding custom ranges, you must set following elements:

- IP or IP ranges
- Protocol number
- Port or port ranges

You must use CLI to add custom IP address and port entries into a predefined Internet Service.

You must use GUI to remove entries from a predefined Internet Service.

Custom extension Internet Service CLI syntax

```
config firewall internet-service-extension
    edit <ID #>
        set comment <comment>
        config entry
            edit <ID #>
                set protocol <number #>
```

```
                set dst <object_name>
                config port-range
                    edit <ID #>
                         set start-port <number #>
                         set end-port <number #>
                    next
                end
            next
        end
    end
end
```

Sample configuration

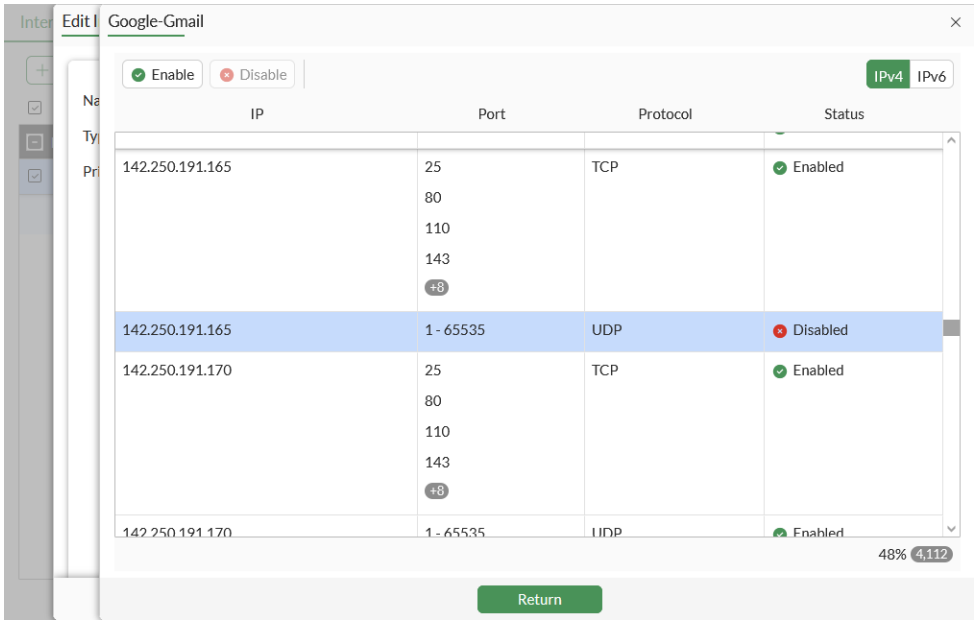
To configure an extension Internet Service in the CLI:

```
config firewall internet-service-extension
    edit 65646
        set comment "Test Extension Internet Service 65646"
        config entry
            edit 1
                set protocol 6
                config port-range
                    edit 1
                        set start-port 80
                        set end-port 443
                    next
                end
                set dst "172-16-200-0"
            next
            edit 2
                set protocol 17
                config port-range
                    edit 1
                        set start-port 53
                        set end-port 53
                    next
                end
                set dst "10-1-100-0"
            next
        end
    next
end
```

To remove IP address and port entries from an existing Internet Service in the GUI:

1. Go to *Policy & Objects > Internet Service Database*.
2. Search for *google-gmail*.
3. Select *Google-Gmail* and click *Edit*.
4. In the gutter, click *View/Edit Entries*.

5. Select the *IP* entry that you need to remove and click *Disable*.



6. Click *Return* twice.

To remove IP address and port entries from an existing Internet Service in the CLI:

```
config firewall internet-service-extension
    edit 65646
        config disable-entry
            edit 1
                set protocol 17
                config port-range
                    edit 1
                    next
                end
                config ip-range
                    edit 1
                        set start-ip 142.250.191.165
                        set end-ip 142.250.191.165
                    next
                end
            next
        end
    next
end
```

To apply an extension Internet Service into policy in the CLI:

```
config firewall policy
    edit 9
        set name "Internet Service in Policy"
        set srcintf "wan2"
```

```
        set dstintf "wan1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-id 65646
        set action accept
        set schedule "always"
        set utm-status enable
        set av-profile "g-default"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Result

In addition to the IP addresses, IP address ranges, and services allowed by Google.Gmail, this policy also allows the traffic which accesses 10.1.100.0/24 and UDP/53 and 172.16.200.0/24 and TCP/80-443. At the same time, the traffic that accesses 2.20.183.160 is dropped because this IP address and port is disabled from Google.Gmail.

Global IP address information database

The Internet Service and IP Reputation databases download details about public IP address, including: ownership, known services, geographic location, blocklisting information, and more. The details are available in drilldown information, tooltips, and other mechanisms in the FortiView and other pages.

The global IP address database is an integrated database containing all public IP addresses, and is implemented in the Internet Service Database.

To view the owner of the IP address:

```
(global) # get firewall internet-service-owner ?
    id    Internet Service owner ID.
    1  Google
    2  Facebook
    3  Apple
    4  Yahoo
    5  Microsoft
    ......
    115  Cybozu
    116  VNC
```

To check for any known service running on an IP address:

```
(global) # diagnose internet-service info FG-traffic 6 80 8.8.8.8
    Internet Service: 65537(Google.Web)
```

To check GeoIP location and blocklist information:

```
(global) # diagnose internet-service id 65537 | grep 8.8.8.8
    8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(6) port(80 443)
    8.8.8.8-8.8.8.8 geo_id(11337) block list(0x0) proto(17) port(443)
```

To check a known malicious server:

```
(global) # diagnose internet-service id-summary 3080383
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7
    Group(0), Singularity(20), Number of IP ranges(142740)
    Group(1), Singularity(19), Number of IP ranges(1210)
    Group(2), Singularity(16), Number of IP ranges(241)
    Group(3), Singularity(15), Number of IP ranges(38723)
    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 3080383(Botnet.C&C.Server)
    Number of IP range: 111486
    Number of IP numbers: 111486
    Singularity: 20
    Reputation: 1(Known malicious sites related to botnet servers, phishing sites, etc.)
    Icon Id: 591
    Second Level Domain: 1(other)
    Direction: dst
    Data source: irdb
```

To check questionable usage:

```
(global) # diagnose internet-service id-summary 2818238
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7
    Group(0), Singularity(20), Number of IP ranges(142740)
    Group(1), Singularity(19), Number of IP ranges(1210)
    Group(2), Singularity(16), Number of IP ranges(241)
    Group(3), Singularity(15), Number of IP ranges(38723)
    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 2818238(Tor.Relay.Node)
    Number of IP range: 13718
    Number of IP numbers: 13718
    Singularity: 20
    Reputation: 2(Sites providing high risk services such as TOR, proxy, P2P, etc.)
    Icon Id: 43
    Second Level Domain: 1(other)
```

```
    Direction: dst
    Data source: irdb

(global) # diagnose internet-service id-summary 2818243
    Version: 0000600096
    Timestamp: 201902111802
    Total number of IP ranges: 444727
    Number of Groups: 7
    Group(0), Singularity(20), Number of IP ranges(142740)

    Group(4), Singularity(10), Number of IP ranges(142586)
    Group(5), Singularity(8), Number of IP ranges(5336)
    Group(6), Singularity(6), Number of IP ranges(113891)
    Internet Service: 2818243(Tor.Exit.Node)
    Number of IP range: 1210
    Number of IP numbers: 1210
    Singularity: 19
    Reputation: 2(Sites providing high risk services such as TOR, proxy, P2P, etc.)
    Icon Id: 43
    Second Level Domain: 1(other)
    Direction: src
    Data source: irdb
```

IP reputation filtering

There are currently five reputation levels in the Internet Service Database (ISDB), and custom reputation levels can be defined in a custom internet service. You can configure firewall policies to filter traffic according to the desired reputation level. If the reputation level of either the source or destination IP address is equal to or greater than the level set in the policy, then the packet is forwarded, otherwise, the packet is dropped.

The five default reputation levels are:

1	Known malicious sites, such as phishing sites or sites related to botnet servers
2	High risk services sites, such as TOR, proxy, and P2P
3	Unverified sites
4	Reputable social media sites, such as Facebook and Twitter
5	Known and verified safe sites, such as Gmail, Amazon, and eBay

The default minimum reputation level in a policy is zero, meaning that the reputation filter is disabled.

For IP addresses that are not included in the ISDB, the default reputation level is three.

The default reputation direction is `destination`.

Example 1

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

To set the reputation level and direction in a policy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "wan2"
        set dstintf "port1"
        set srcaddr “all”
        set dstaddr "all"
        set reputation-minimum 3
        set reputation-direction source
        set action accept
        set schedule "always"
        set service "ALL"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Packets from the source IP address with reputation levels three, four, or five will be forwarded by this policy.

Example 2

This policy allows only outbound FTP traffic, if the destination server has a minimum reputation of 4.

To set the reputation level and direction in a policy using the CLI:

```
config firewall policy
    edit 1
        set srcintf "port1"
        set dstintf "wan2"
        set srcaddr “all”
        set dstaddr "all"
        set reputation-minimum 4
        set reputation-direction destination
        set action accept
        set schedule "always"
        set service "FTP"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

Internet service groups in policies

Groups of internet services can be created using the GUI or CLI. Once created, you can use the group with traffic shaping and firewall policies as criteria to match and shape traffic. The shaper is applied when the traffic matches.

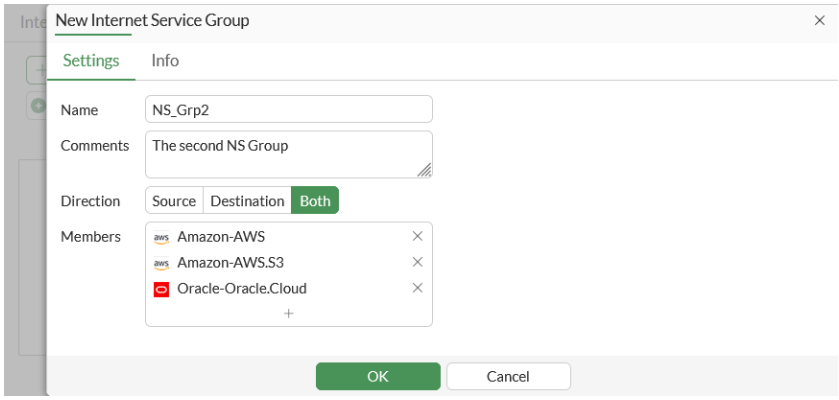
Internet service groups can be used as the source and destination of the policy. When using the CLI, `internet-service` must be enabled to use an internet service group as a destination, and `internet-service-src` must be enabled to use an internet service group as a source.

The following CLI variables are available in the `firewall policy` and `firewall shaping-policy` commands:

Variable	Description
`internet-service-group <string>`	Internet service group name.
`internet-service-custom-group <string>`	Custom internet service group name.
`internet-service-src-group <string>`	Source internet service group name.
`internet-service-src-custom-group <string>`	Custom source internet service group name.

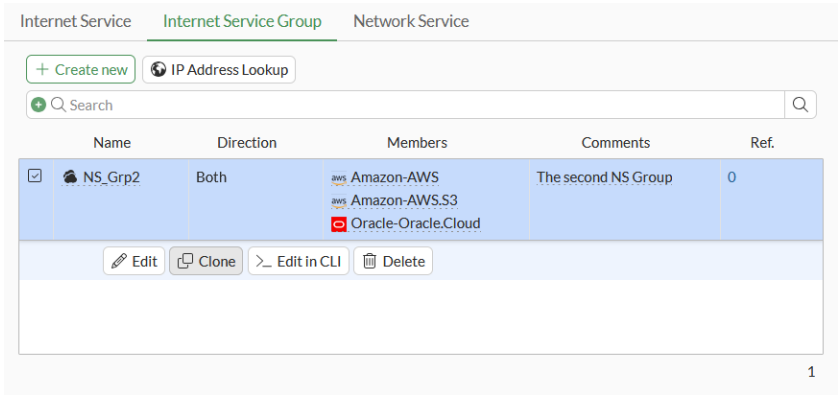
To create an internet service group in the GUI:

1. Go to *Policy & Objects* > *Internet Service Database*, select the *Internet Service Group* tab, and click *Create New*.
2. Configure the settings as needed, and click *OK*.



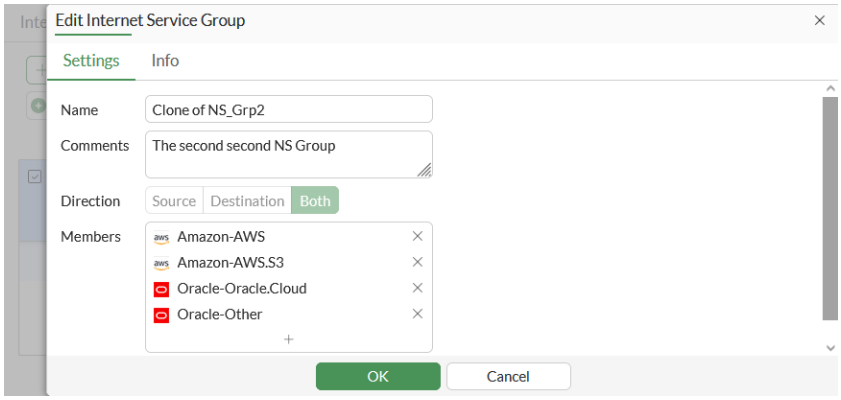
To clone an internet service group:

1. Go to *Policy & Objects* > *Internet Service Database*, and click the *Internet Service Group* tab.
2. Select an internet service group, and click *Clone*.



The *Edit Internet Service Group* pane opens.

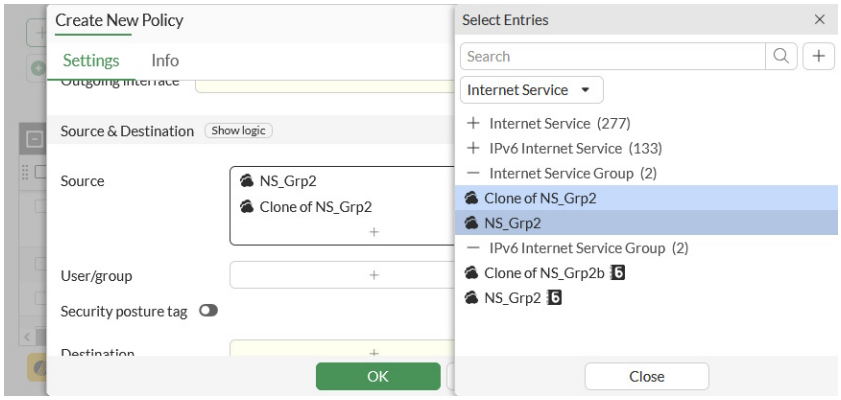
3. Edit the options.



4. Click *OK*. The clone is created.

To apply the internet service group to a firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*.
2. Select the internet service group:
   a. Click the *Source* or *Destination* field. The *Select Entries* pane opens.
   b. Select *Internet Service*, and select one or more internet service groups, such as *NS_Grp2*.
   c. Click *Close*.



3. Configure the remaining options as needed, then click *OK*.

Examples

The following examples use the below topology.

Example 1

In this example, the PC is allowed to access Google, so all Google services are put into an internet service group.

To configure access to Google services using an internet service group using the CLI:

1. Create an internet service group for Google services.
   In this example, the internet service group is named `Google_Group`.

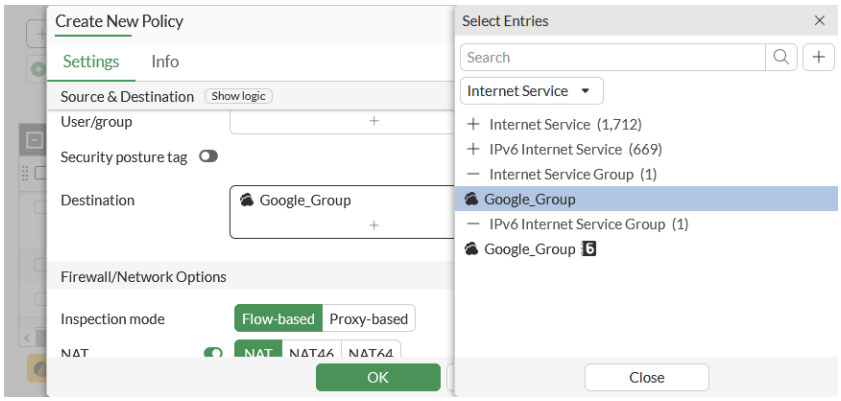
```
config firewall internet-service-group
    edit "Google_Group"
        set direction destination
        set member Google-Other Google-Web Google-ICMP Google-DNS Google-Outbound_Email
Google-SSH Google-FTP Google-NTP Google-Inbound_Email Google-LDAP Google-
NetBIOS.Session.Service Google-RTMP Google-NetBIOS.Name.Service Google-Google.Cloud Google-
Gmail
    next
end
```

2. Create a firewall policy and select the internet service group to allow access to all Google services from the PC.
   In this example, `internet-service` is `enabled`, and the internet service group named `Google_Group` is selected to allow access to all Google services from the PC.

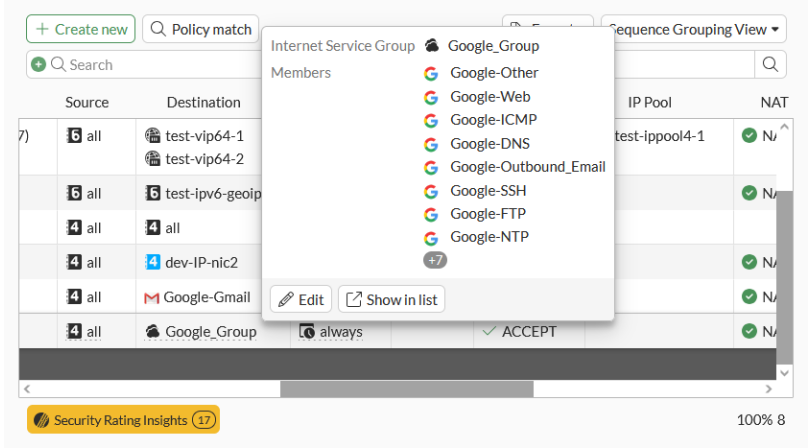
```
config firewall policy
    edit 1
        set name "PC to Google"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-group "Google_Group"
        set action accept
        set schedule "always"
        set fsso disable
        set nat enable
    next
end
```

To configure access to Google services using an internet service group in the GUI:

1. On the FortiGate, create an internet service group.
2. Go to *Policy & Objects > Firewall Policy*, and create a new policy.
3. Set the *Destination* to the internet service group.



4. Configure the remaining options, and click *OK*.
5. Go to *Policy & Objects* > *Firewall Policy* and hover over the group to view a list of its members.



Example 2

In this example, two office FTP servers are put into a custom internet service group, and the PC connection to the FTP servers is limited to 1Mbps.

To put two FTP servers into a custom internet service group and limit the PC connection speed to them in the CLI:

1. Create a custom internet service group for the internal FTP servers in the CLI:

```
config firewall internet-service-custom
    edit "FTP_PM"
        config entry
            edit 1
                config port-range
                    edit 1
                        set start-port 21
                        set end-port 21
                    next
                end
                set dst "PM_Server"
```

```
            next
        end
    next
    edit "FTP_QA"
        config entry
            edit 1
                config port-range
                    edit 1
                        set start-port 21
                        set end-port 21
                    next
                end
                set dst "QA_Server"
            next
        end
    next
end
```

2. Edit a firewall policy and add the custom internet service group to it:

```
config firewall internet-service-custom-group
    edit "Internal_FTP"
        set member "FTP_QA" "FTP_PM"
    next
end
```

3. Create a traffic shaper to limit the maximum bandwidth:

```
config firewall shaper traffic-shaper
    edit "Internal_FTP_Limit_1Mbps"
        set guaranteed-bandwidth 500
        set maximum-bandwidth 1000
        set priority medium
    next
end
```

4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:

```
config firewall shaping-policy
    edit 1
        set name "For Internal FTP"
        set internet-service enable
        set internet-service-custom-group "Internal_FTP"
        set dstintf "port1"
        set traffic-shaper "Internal_FTP_Limit_1Mbps"
        set traffic-shaper-reverse "Internal_FTP_Limit_1Mbps"
        set srcaddr "PC"
    next
end
```

To put two FTP servers into a custom service group and limit the PC connection speed to the in the GUI:

1. Create custom internet services for the internal FTP servers using the CLI.
2. Create a custom internet server group and add the just created custom internet services to it using the CLI.
3. Create a traffic shaper to limit the maximum bandwidth:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaper* tab, and click *Create New*.
   b. Enter a *Name* for the shaper, such as *Internal_FTP_Limit_1Mbps*.
   c. Set the *Traffic Priority* to *Medium*.
   d. Enable *Max Bandwidth* and set it to *1000*.
   e. Enable *Guaranteed Bandwidth* and set it to *500*.
   f. Click *OK*.
4. Create a firewall shaping policy to limit the speed from the PC to the internal FTP servers:
   a. Go to *Policy & Objects* > *Traffic Shaping*, select the *Traffic Shaping Policy* tab, and click *Create New*.
   b. Enter a name for the policy.
   c. Set *Source* to the address of the PC.
   d. Set the *Destination* to the just created custom internet service group.
   e. Enable *Apply shaper* and apply the just create traffic shaper to the *Shared shaper* and *Reverse shaper*.

   f. Configure the remaining options as required, then click *OK*.

Allow creation of ISDB objects with regional information

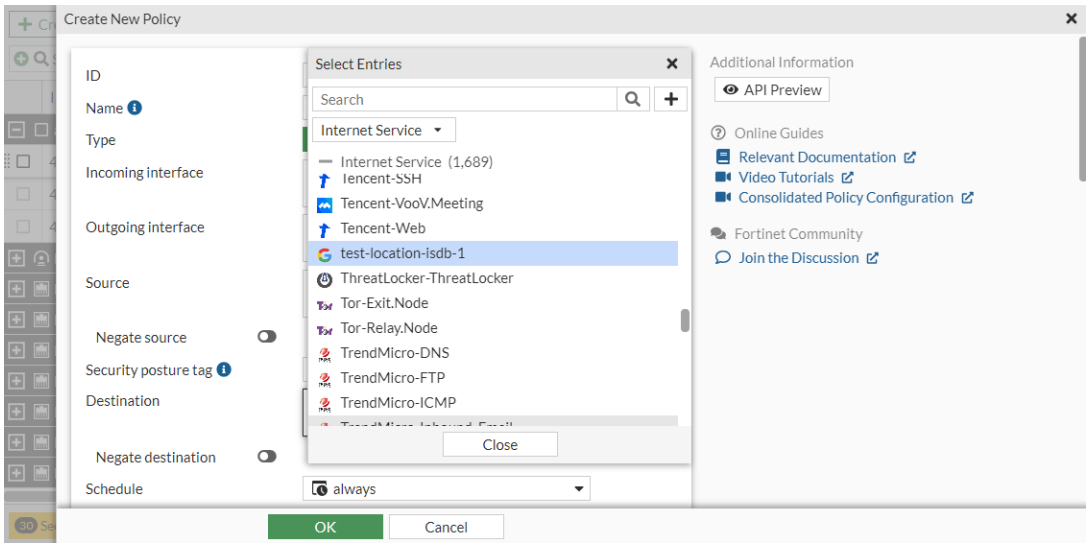
Geographic-based Internet Service Database (ISDB) objects allow users to define a country, region, and city. These objects can be used in firewall policies for more granular control over the location of the parent ISDB object. ISDB objects are now referenced in policies by name instead of ID.

To apply a location-based ISDB object to a policy in the GUI:

1. Create the ISDB object:
   a. Go to *Policy & Objects* > *Internet Service Database* and click *Create New* > *Geographic Based Internet Service*.
   b. Configure the settings as required.

   c. Click *OK*.
2. View the IP ranges in the location-based internet service:
   a. Go to *Policy & Objects* > *Internet Service Database* .
   b. In the table, hover over the object created in step 1 and click *View/Edit Entries*. The list of IPs is displayed:

   c. Click *Return*.
3. Add the ISDB object to a policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and create a new policy or edit an existing one.
   b. For *Destination*, select *Internet Service* from the dropdown list and select the ISDB object created in step 1.
   c. Configure the other settings as needed.



d. Click *OK*.

To apply a location-based ISDB object to a policy in the CLI:

1. Create the ISDB object:

```
config firewall internet-service-name
    edit "test-location-isdb-1"
        set type location
        set internet-service-id 65536
        set country-id 840
        set region-id 283
        set city-id 23352
    next
end
```

2. View the IP ranges in the location-based internet service:

```
# diagnose internet-service id 65536 | grep "country(840) region(283) city(23352)"
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation(4),
domain(5) popularity(0) botnet(0) proto(6) port(1-65535)
96.45.33.73-96.45.33.73 country(840) region(283) city(23352) blocklist(0x0) reputation(4),
domain(5) popularity(0) botnet(0) proto(17) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0) reputation(4),
domain(5) popularity(4) botnet(0) proto(6) port(1-65535)
198.94.221.56-198.94.221.56 country(840) region(283) city(23352) blocklist(0x0) reputation(4),
domain(5) popularity(4) botnet(0) proto(17) port(1-65535)
```

3. Add the ISDB object to a policy:

```
config firewall policy
    edit 3
        set name "PC to Google"
        set srcintf "port2"
        set dstintf "port1"
```

```
        set srcaddr "PC"
        set internet-service enable
        set internet-service-name "test-location-isdb-1"
        set action accept
        set schedule "always"
        set logtraffic all
        set logtraffic-start enable
        set auto-asic-offload disable
        set nat enable
    next
end
```

Internet service customization

Internet Service Database (ISDB) entries can be tuned for their environments by adding custom ports and port ranges, as well as port mapping.

If you are in multi-VDOM mode, Internet service customization can only occur at the Global level and not in a VDOM. See VDOM overview on page 3702 for more information.

To add a custom port range:

```
config firewall internet-service-addition
    edit 65646
        set comment "Add custom port-range:tcp/8080-8090 into 65646"
        config entry
            edit 1
                set protocol 6
                config port-range
                    edit 1
                        set start-port 8080
                        set end-port 8090
                    next
                end
            next
        end
    next
end
Warning: Configuration will only be applied after rebooting or using the 'execute internet-service
refresh' command.
```

To verify that the change was applied:

```
 # diagnose internet-service info FG-traffic 6 8080 2.20.183.160
 Internet Service: 65646(Google.Gmail)
```

To configure additional port mapping:

```
config firewall internet-service-append
    set match-port 10
    set append-port 20
end
Warning: Configuration will only be applied after rebooting or using the 'execute internet-service
refresh' command.
```

Look up IP address information from the Internet Service Database page

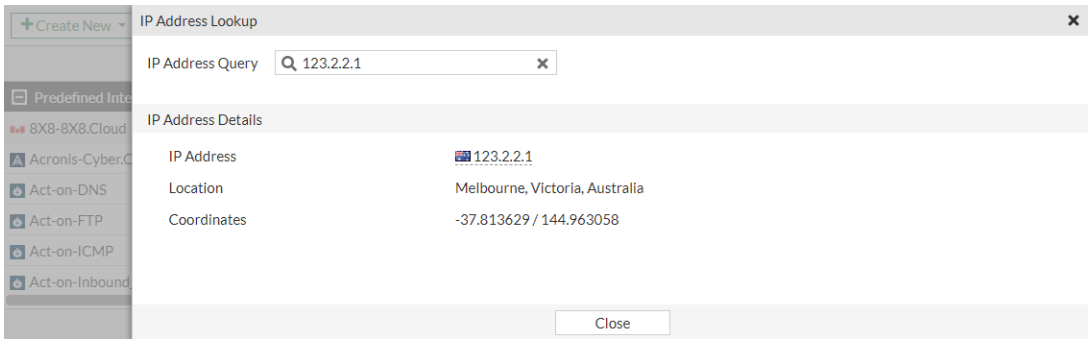
The *IP Address Lookup* button allows users to look up IP address information from the Internet Service Database and GeoIP Database. Returned IP address information includes the reverse IP address/domain lookup, location, reputation, and other internet service information.

To look up IP address information:

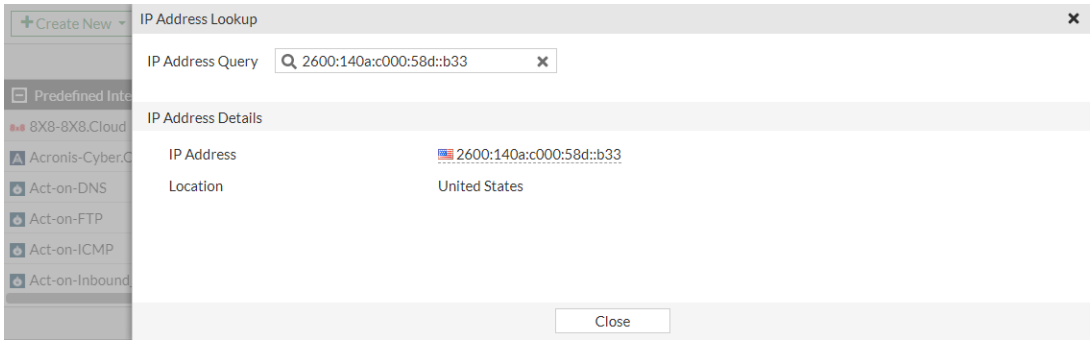
1. Go to *Policy & Objects* > *Internet Service Database*.
2. Click *IP Address Lookup*. The *IP Address Lookup* pane opens.
3. In the *IP Address Query* field, enter the IP address and press `Enter`.

   Results of an IP address from the Internet Service Database:

   Results of an IP address from the GeoIP Database:



Results of an IPv6 address from the GeoIP Database:



4. Click *Close*.

Internet Service Database on-demand mode

Internet Service Database (ISDB) on-demand mode replaces the full-sized ISDB file with a much smaller file that is downloaded onto the flash drive. This file contains only the essential entries for Internet Services. When a service is used in a firewall policy, the FortiGate queries FortiGuard to download the IP addresses and stores them on the flash drive. The FortiGate also queries the local MAC Database (MADB) for corresponding MAC information. The content of the ISDB entries used in firewall policies persists through reboots.

For FortiGate models that have 2GB of memory, it is recommended that the on-demand database be used.

To enable ISDB (FFDB) on-demand mode:

1. Configure the global setting:

```
config system global
    set internet-service-database on-demand
end
```

All FFDB files are erased.

2. Verify that there are no ISDB (FFDB) files:

```
# diagnose autoupdate versions | grep Internet -A 6
Internet-service On-Demand Database
---------
Version: 0.00000
```

```
Contract Expiry Date: n/a
Last Updated using manual update on Mon Jan  1 00:00:00 2001
Last Update Attempt: n/a
Result: Updates Installed
```

Shortly after, the ISDB (FFDB) data structure is downloaded on the FortiGate. The following message appears in the debug messages:

```
do_ffsr_update[1567]-Starting  Update FFDB ondemand:(not final retry)
```

3. Run diagnostics again to verify that the ISDB (FFDB) files are saved on the FortiGate flash drive:

```
# diagnose autoupdate versions | grep Internet -A 6
Internet-service On-Demand Database
---------
Version: 7.02950
Contract Expiry Date: n/a
Last Updated using manual update on Fri Jan  6 06:45:00 2023
Last Update Attempt: n/a
Result: Updates Installed
```

4. Since no services have been applied to a policy, the IP range and IP address values are blank in the the summary details. For example, check the summary details for ID 1245187, Fortinet DNS:

```
# diagnose internet-service id-summary 1245187
Version: 00007.02950
Timestamp: 202301060645
Total number of IP ranges: 3085
Number of Groups: 1
Group(0), Singularity(90), Number of IP ranges(3085)
Internet Service: 1245187(Fortinet-DNS)
Number of IP ranges: 0
Number of IP addresses: 0
Singularity: 0
Icon Id: 19
Direction: dst
Data source: isdb
Country:
Region:
City:
```

5. Apply the Fortinet DNS service in a firewall policy:

```
config firewall policy
    edit 1
        set name "FDNS"
        set srcintf "port1"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set internet-service enable
        set internet-service-name "Fortinet-DNS"
```

```
        set schedule "always"
        set nat enable
    next
end
```

6. Verify the summary details again for ID 1245187 (Fortinet DNS). There is now data for the IP range and IP address values:

```
# diagnose internet-service id-summary 1245187
Version: 00007.02951
Timestamp: 202301061144
Total number of IP ranges: 3558
Number of Groups: 2
Group(0), Singularity(90), Number of IP ranges(3078)
Group(1), Singularity(10), Number of IP ranges(480)
Internet Service: 1245187(Fortinet-DNS)
Number of IP ranges: 480
Number of IP addresses: 55242
Singularity: 10
Icon Id: 19
Direction: dst
Data source: isdb
Country: 12 32 36 40 56 124 158 170 203 222 250 276 320 332 344 356 360 372 380 392 458 484
        528 591 600 604 642 643 702 764 784 807 826 840

        5334 5549 5654 5827 6322 6325 6330 6355 6652 7844 9055 10199 10333 11420 12930 13426
13685 13769 14107 14813 15121
        15220 15507 15670 16347 16561 16564 16567 16631 17646 17746 17885 17975 17995 18071
18476 19066 19285 20784 21065 21092 21136
        21146 21266 21337 21779 21993 22292 22414 22912 23352 23367 23487 23574 23635 23871
23963 24076 24203 24298 24611 24955 25050
        25332 26854 27192 27350 28825 28866 65535
```

To verify MAC vendor information:

```
# diagnose vendor-mac id 1
Vendor MAC: 1(ASUS)
Version: 0000100146
Timestamp: 202301031100
Number of MAC ranges: 85
00:04:0f:00:00:00 - 00:04:0f:ff:ff:ff
00:0c:6e:00:00:00 - 00:0c:6e:ff:ff:ff
00:0e:a6:00:00:00 - 00:0e:a6:ff:ff:ff
...
```

Troubleshooting

In on-demand mode, the ISDB will be updated automatically on schedule after a service is used in a firewall policy. However, to trigger an explicit download, use the following command:

```
# execute update-ffdb-on-demand
```

To ensure ISDB can be updated, the following setting must be enabled:

```
config system fortiguard
    set update-ffdb enable
end
```

To debug ISDB update issues in real-time, use the following real-time debugs:

```
# diagnose debug application update -1
# diagnose debug enable
```

Enabling the ISDB cache in the FortiOS kernel

A software ISDB cache can be enabled in the FortiOS kernel. This ISDB cache can be used to enhance lookup performance by circumventing the ISDB lookup penalty when revisiting the same resources.

The ISDB cache can be enabled using the following command:

```
config system settings
    set internet-service-database-cache {enable | disable}
end
```

Example

In the following example, after enabling the software ISDB cache, traffic will be generated twice to the same resource. Since the ISDB cache is enabled, no new query will occur in the ISDB. Instead, the ISDB lookup in performed in the cache table.

To enable the software ISDB cache:

1. Enable the ISDB cache:

   ```
   config system settings
       set internet-service-database-cache enable
   end
   ```

2. Create an ISDB firewall policy:

   ```
   config firewall policy
       edit 1
           set internet-service enable
   ```

```
        set internet-service-name "Google-DNS" "Google-Other" "Google-Web"
        set internet-service6 enable
        set internet-service6-name "Google-DNS" "Google-Other" "Google-Web"
    next
end
```

3. Generate traffic to access the resource which matches the ISDB ID in the firewall policy.
4. Check the Internet Service cache lists:

```
# diagnose firewall internet-service-cache list
List Internet Service (IPV4) Cache in Kernel:
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=2 isdb_cache_hit_count=0 isdb_query_
count=2
proto=6 port=443 IP=10.151.118.105 id=1245185 country_id=840 region_id=283 city_id=21065
reputation=5 insert_timestamp=4302579542 cache_hit_count=0
proto=6 port=443 IP=10.8.8.8 id=65537 country_id=840 region_id=283 city_id=15905 reputation=5
insert_timestamp=4302579760 cache_hit_count=0

# diagnose firewall internet-service6-cache list
List Internet Service (IPV6) Cache in Kernel:
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=1 isdb_cache_hit_count=0 isdb_query_
count=1
proto=6 port=443 IP=2600:140a:1000:196::b33 id=7929993 country_id=124 region_id=65535 city_
id=65535 reputation=4 insert_timestamp=4302580009 cache_hit_count=0
```

5. Generate traffic to access the same resource again.
6. Check the Internet Service cache lists:

```
# diagnose firewall internet-service-cache list
List Internet Service (IPV4) Cache in Kernel:
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=2 isdb_cache_hit_count=1 isdb_query_
count=2
proto=6 port=443 IP=10.151.118.105 id=1245185 country_id=840 region_id=283 city_id=21065
reputation=5 insert_timestamp=4302579542 cache_hit_count=0
proto=6 port=443 IP=10.8.8.8 id=65537 country_id=840 region_id=283 city_id=15905 reputation=5
insert_timestamp=4302579760 cache_hit_count=1

# diagnose firewall internet-service6-cache list
List Internet Service (IPV6) Cache in Kernel:
MAX_ISDB_CACHE_ENTRY_SIZE=1024 num_isdb_cache_entry=1 isdb_cache_hit_count=1 isdb_query_
count=1
proto=6 port=443 IP=2600:140a:1000:196::b33 id=7929993 country_id=124 region_id=65535 city_
id=65535 reputation=4 insert_timestamp=4302580009 cache_hit_count=1
```

The ISDB lookup is performed in the cache table so there is no new query in the full ISDB.

ISDB FQDN groups

ISDB Fully Qualified Domain Name (FQDN) groups are groups of well-known services like Amazon-AWS, Cisco-Webex, Google-Gmail, Microsoft-Update, and others that are comprised of various FDQNs that make up the service.

For example, Microsoft-Microsoft.Update includes several FQDNs used for their updating service:

- *.dsp.mp.microsoft.com
- *.windowsupdate.com
- windowsupdate.microsoft.com
- *.update.microsoft.com
- and others

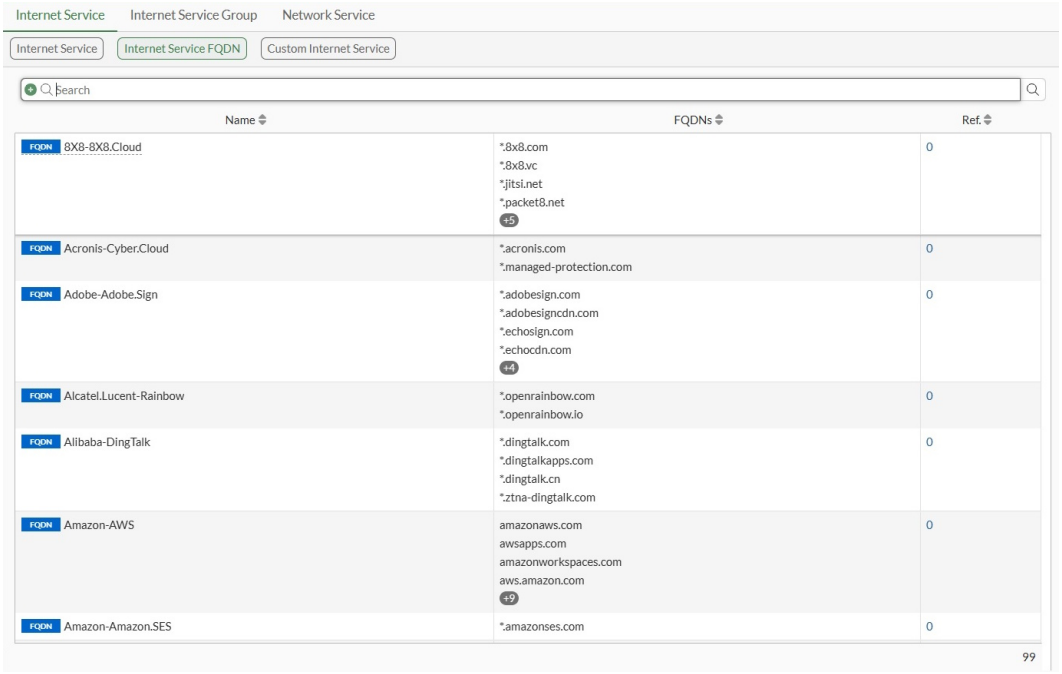
FortiGate can resolve these FDQN addresses to their respective IP addresses and groups.

ISDB FQDN groups allow users to select well-known services as an FQDN group, as opposed to individual ISDB addresses that map directly to IP address and port entries.

ISDB FQDN groups can be used in firewall policies and in security policies when FortiGate is in NGFW policy-based mode.

Applying FQDN address groups within the ISDB in the GUI

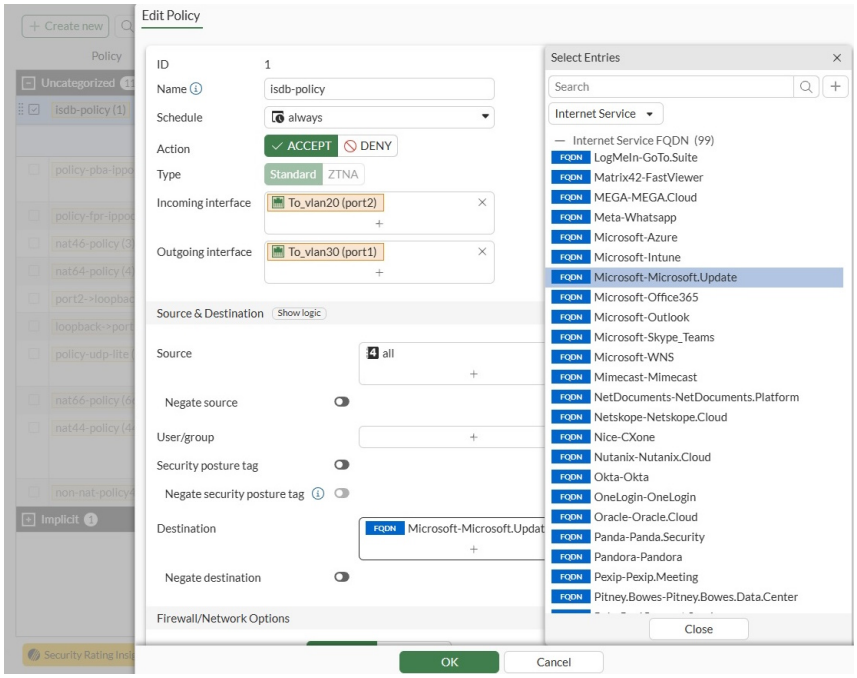
The option to filter ISDB entries by FQDN group is available in the *Policy & Objects > Internet Service Database* page. On the *Internet Service* tab, select *Internet Service FQDN* to view the list of FQDN entries. These address group entries can be applied to a policy in the GUI.



To apply an ISDB FQDN group to a firewall policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy*.
2. Click *Create New* or edit an existing policy.
3. Assign the FQDN address group:
   a. Select the *Source* or *Destination* field. The *Select Entries* pane is displayed.
   b. Select *Internet Service* from the dropdown list.

c. In the *Internet Service FQDN* section, select the FQDN address groups you would like to assign.



d. Click *Close*.

4. Configure the other fields, as needed.
5. Click *OK*.

To apply an ISDB FQDN group to an NGFW policy in the GUI:

1. Ensure policy-based NGFW mode is enabled. See NGFW policy on page 1803.
2. Go to *Policy & Objects* > *Security Policy*.
3. Click *Create New* or edit an existing policy.
4. Assign the FQDN address group:
   a. Select the *Source* or *Destination* field. The *Select Entries* pane is displayed.
   b. Select *Internet Service* from the dropdown list.
   c. In the *Internet Service FQDN* section, select the FQDN address groups you would like to assign.
   d. Click *Close*.
5. Configure the other fields, as needed.
6. Click *OK*.

Applying FQDN address groups within the ISDB in the CLI

FQDN address groups can be applied in the CLI. Likewise, the following `diagnose` commands identify predefined FQDNs:

```
# diagnose ffdb-fqdn group-list [<Built-in group name>]
# diagnose ffdb-fqdn group-get <Built-in FQDN name>
# diagnose ffdb-fqdn icon-get <Built-in FQDN group name>
```

Command	Description
`ffdb-fqdn group-list`	List all of the built-in ISDB FQDN groups. If the specific built-in FQDN name is appended to the end of the command, only that entry's information is displayed. If the specific built-in FQDN name name is not defined, all entries in the current database will be listed.
`ffdb-fqdn group-get`	Determine which built-in FQDN group the given FQDN name belongs to.
`ffdb-fqdn icon-get`	Determine which icon ID the given FQDN group name belongs to.

Example: firewall policy

In the following example, a predefined FQDN Internet service, `g-BuiltIn-Microsoft-Microsoft.Update`, is applied to a firewall policy. We will then review how the customer Internet service is loaded in the kernel and try to send packets to the FortiGate from the client to hit the policy. Finally, we will review the Internet service related fields in the traffic logs.

To apply an ISDB FQDN group to a firewall policy in the CLI:

1. Apply the built-in FQDN entry to the firewall policy:

```
config firewall policy
    edit 1
        set name "isdb-policy"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set internet-service enable
        set internet-service-fortiguard "FQDN-Microsoft-Microsoft.Update"
        set schedule "always"
        set logtraffic all
        set auto-asic-offload disable
        set nat enable
    next
end
```

2. Review how the built-in FQDN entry is loaded into the kernel:

```
# diagnose firewall iprope list 100004 | grep -A 16 index=1

policy index=1 uuid_idx=8207 action=accept
flag (8050109): log redir nat master use_src pol_stats
flag2 (6200): no_asic log_fail resolve_sso
flag3 (a0): link-local best-route
flag4 (200): port-preserve
schedule(always)
cos_fwd=255  cos_rev=255
group=00100004 av=00004e20 au=00000000 split=00000000
host=0 chk_client_info=0x0 app_list=0 ips_view=0
misc=0
```

```
zone(1): 8 -> zone(1): 7
source(1): 0.0.0.0-255.255.255.255, uuid_idx=8050,
dest(1): 0.0.0.0-255.255.255.255, uuid_idx=8050,
service(1):
        [0:0x0:0/(0,65535)->(0,65535)] flags:0 helper:auto
internet service(1): FQDN-Microsoft-Microsoft.Update(4278190087,0,0,0)
```

3. Review the FQDN domain name and corresponding IP address information contained in the built-in FQDN entry are listed. The resolution of these domain names comes from the DNS server set by the FortiGate.

```
# diagnose firewall internet-service-fortiguard list
List internet service in kernel(fortiguard):
name=FQDN-Microsoft-Microsoft.Update id=4278190087 reputation=3 Unverified site. singularity=0
flags=0x0 protocol=0
fqdn=(9):
        devicelistenerprod.microsoft.com ID(26) ADDR(4.255.252.37)
        *.download.microsoft.com ID(42)
        *.update.microsoft.com ID(79)
        *.dsp.mp.microsoft.com ID(83)
        ntservicepack.microsoft.com ID(147) ADDR(132.196.74.18)
        windowsupdate.microsoft.com ID(210) ADDR(20.72.235.82)
        wustat.windows.com ID(216)
        *.windowsupdate.com ID(241)
        *.delivery.mp.microsoft.com ID(339)
dynamic=(0):
```

4. Send packets from the client to the FQDN domain `windowsupdate.microsoft.com`, which is one of the FQDN domains included in `FQDN-Microsoft-Microsoft.Update`. The traffic will hit and be forwarded by the firewall policy.

```
1: date=2025-06-16 time=12:30:24 eventtime=1729107023938309279 tz="-0700" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="root" srcip=10.1.100.41
srcport=46900 srcintf="port2" srcintfrole="undefined" dstip=20.72.235.82 dstport=443
dstintf="port1" dstintfrole="undefined" srcuuid="5cfbeb4e-b05e-51ee-233c-5026f6bf6d00"

service="FQDN-Microsoft-Microsoft.Update" trandisp="snat" transip=172.16.200.6 transport=46900
appcat="unscanned" duration=2 sentbyte=1623 rcvdbyte=5268
sentpkt=16 rcvdpkt=13
```

Example: NGFW policy

To apply an ISDB FQDN group to an NGFW policy:

1. Ensure policy-based NGFW mode is enabled. See NGFW policy on page 1803.
2. Apply the built-in FQDN entry to a security policy in NGFW policy-based mode:

```
config firewall security-policy
    edit 100
        set uuid 4473436c-9b01-51f0-eea3-44af202bf3a1
```

```
        set srcintf "port3"
        set dstintf "port1"
        set srcaddr "all"
        set internet-service enable
        set internet-service-fortiguard "FQDN-Microsoft-Microsoft.Update"
        set action accept
        set schedule "always"
        set logtraffic all
    next
end
```

3. Send packets from the client to the FQDN domain `windowsupdate.microsoft.com` (IP address `128.85.102.70`), which is one of the FQDN domains included in `FQDN-Microsoft-Microsoft.Update`. The traffic is affected, and FortiGate forwards the traffic according to the security policy.

```
1: date=2025-09-26 time=10:54:25 eventtime=1758909265590012214 tz="-0700" logid="0000000013"

Security Profiles

This section contains information about configuring FortiGate security features, including:

- Inspection modes on page 2139
- AI protection on page 2151
- Antivirus on page 2167
- Web filter on page 2238
- Video filter on page 2299
- DNS filter on page 2313
- Application control on page 2355
- Inline CASB examples on page 2376
- Intrusion prevention on page 2402
- File filter on page 2442
- Email filter on page 2455
- VoIP solutions on page 2472
- ICAP on page 2506
- Web application firewall on page 2523
- Data loss prevention on page 2526
- Virtual patching on page 2599
- SSL & SSH Inspection on page 2614
- Custom signatures on page 2648
- Overrides on page 2660
- IP ban on page 2675
- Profile groups on page 2681

If you are unable to view a security profile feature, go to *System > Feature Visibility* to enable it.

Some profiles and features are not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 and Proxy-based inspection for email protocols supported on models with 2 GB RAM on page 2145 for details.

Inspection modes

FortiOS supports flow-based and proxy-based inspection in firewall policies. You can select the inspection mode when configuring a policy.

Flow-based inspection takes a snapshot of content packets and uses pattern matching to identify security threats in the content.

Proxy-based inspection reconstructs content that passes through the FortiGate and inspects the content for security threats.

Certain security profiles allows users to display flow-based or proxy-based feature sets.

This following topics provide information about inspection modes for various security profile features:

- Flow mode inspection (default mode) on page 2140
- Proxy mode inspection on page 2140
- Inspection mode feature comparison on page 2141

See also Proxy-based inspection for email protocols supported on models with 2 GB RAM on page 2145.

Flow mode inspection (default mode)

When a firewall policy's inspection mode is set to flow, traffic flowing through the policy will not be buffered by the FortiGate. Unlike proxy mode, the content payload passing through the policy will be inspected on a packet by packet basis with the very last packet held by the FortiGate until the scan returns a verdict. If a violation is detected in the traffic, a reset packet is issued to the receiver, which terminates the connection and prevents the payload from being sent successfully.

Flow-based inspection identifies and blocks security threats in real time as they are identified. All applicable flow-based security modules are applied simultaneously in one single pass, using Direct Filter Approach (DFA) pattern matching to identify possible attacks or threats. Pattern matching is offloaded and accelerated by CP8 or CP9 processors.

Flow-based inspection typically requires lower processing resources than proxy-based inspection and does not change packets, unless a threat is found and packets are blocked. Flow-based inspection is selected by default on new firewall policies. It is the recommended inspection mode, unless proxy-specific features are required. For more information, see Inspection mode feature comparison on page 2141.

Proxy mode inspection

When a firewall policy’s inspection mode is set to proxy, traffic flowing through the policy will be buffered by the FortiGate for inspection. This means that the packets for a file, email message, or web page will be held by the FortiGate until the entire payload is inspected for violations (virus, spam, or malicious web links). After FortiOS finishes the inspection, the payload is either released to the destination (if the traffic is clean) or dropped and replaced with a replacement message (if the traffic contains violations).

To optimize inspection, the policy can be configured to block or ignore files or messages that exceed a certain size. To prevent the receiving end user from timing out, you can apply client comforting. This allows small portions of the payload to be sent while it is undergoing inspection.

In proxy-based antivirus scanning, certain techniques are used to streamline scanning with either in-process or stream-based scanning. For more information, see Proxy mode stream-based scanning on page 2186.

Proxy mode provides some security profile capabilities that are not available to flow-based scanning:

- Video Filter
- Inline CASB
- Web Application Firewall (WAF)

- Content Disarm and Reconstruction (CDR)
- Web quota
- Sandbox Inline Scanning

For a complete list, see Inspection mode feature comparison on page 2141.

Some features are exclusively proxy-based:

- SSL Offloading
- Explicit Web Proxy
- ZTNA

Verify the capabilities that you need when deciding to use proxy-based or flow-based policy. Applying the same type of scan mode in all your policies also helps optimize your performance.

FortiOS supports the Zstandard (ZSTD) compression algorithm for web content. FortiOS can use proxy-based policies to decode ZSTD-encoded web content, scan it, and forward the web content to a browser. Then the web content can be passed to the user or blocked from the user based on UTM profile settings, ensuring a seamless and secure browsing experience.

Most proxy features are not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 and Proxy-based inspection for email protocols supported on models with 2 GB RAM on page 2145.

Inspection mode feature comparison

The following table shows which UTM profile can be configured on a flow mode or proxy mode inspection policy.

Some UTM profiles are hidden in the GUI and can only be configured using the CLI. To configure profiles in a firewall policy in CLI, enable the `utm-status` setting.

Some profiles might have feature differences between flow-based and proxy-based Inspection. From the GUI and CLI, you can set the *Feature set* option to be *Flow-based* or *Proxy-based* to display only the settings for that mode.

Some profiles and features are not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 for the list of models. See also Proxy-based inspection for email protocols supported on models with 2 GB RAM on page 2145.

	Flow Mode Inspection Policy		Proxy Mode Inspection Policy		Feature set option
UTM Profile	GUI	CLI	GUI	CLI	
AntiVirus**	Yes	Yes	Yes	Yes	GUI/CLI
Web Filter**	Yes	Yes	Yes	Yes	GUI/CLI
Video Filter*	No	No	Yes	Yes	N/A
DNS Filter***	Yes	Yes	Yes	Yes	N/A
Application Control	Yes	Yes	Yes	Yes	N/A

UTM Profile	Flow Mode Inspection Policy		Proxy Mode Inspection Policy		Feature set option
	GUI	CLI	GUI	CLI	
Inline CASB*	No	No	Yes	Yes	N/A
Intrusion Prevention System	Yes	Yes	Yes	Yes	N/A
File Filter**	Yes	Yes	Yes	Yes	GUI/CLI
Email Filter**	Yes	Yes	Yes	Yes	GUI/CLI
VoIP	Yes	Yes	Yes	Yes	N/A
ICAP*	No	No	Yes	Yes	N/A
Web Application Firewall*	No	No	Yes	Yes	N/A
Data Loss Prevention**	No	Yes	Yes	Yes	CLI
Virtual Patching	Yes	Yes	Yes	Yes	N/A
SSL/SSH Inspection	Yes	Yes	Yes	Yes	N/A
SSH Filter*	No	No	No	Yes	N/A

* Proxy-only UTM profiles are not supported on FortiGate models with 2 GB RAM or less.

** Feature set option is not available on FortiGate models with 2 GB RAM or less. Profile only supports flow mode.

*** The transparent conditional DNS forwarder feature only works with a proxy-based firewall policy. The feature uses DNS filters with `transparent-dns-database` enabled and is not available on FortiGate models with 2 GB RAM or less.

The following sections outline differences between flow-based and proxy-based inspection for a security profile.

Feature comparison between Antivirus inspection modes

The following table indicates which Antivirus features are supported by their designated scan modes.

Part1	Replacement Message	Content Disarm	Mobile Malware	Virus Outbreak	Sandbox Post-Transfer Scanning	Sandbox Inline Scanning	NAC Quarantine
Proxy (2)	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes (1)	No	Yes	Yes	Yes	Yes	Yes

1. IPS Engine caches the URL and a replacement message is presented after the second attempt.
2. Not available on FortiGate models with 2 GB RAM or less, except when the firewall policy inspects email protocols SMTP(s), POP3(s), IMAP(s), and NNTP.

Part 2	Archive Blocking	Emulator	Client Comforting	Infection Quarantine	Heuristics	Treat EXE as Virus
Proxy (3)	Yes	Yes	Yes	Yes (1)	Yes	Yes (2)
Flow	Yes	Yes	No	Yes (1)	Yes	Yes (2)

1. Only available on FortiGate models with HDD or when FortiAnalyzer or FortiGate Cloud is connected and enabled.
2. Only applies to inspection on IMAP, POP3, SMTP, and MAPI protocols.
3. Not available on FortiGate models with 2 GB RAM or less, except when the firewall policy inspects email protocols SMTP(s), POP3(s), IMAP(s), and NNTP.

Part 3	External Blocklist	EMS External Feed	AI/ML Based Detection	FortiNDR Inline Detection
Proxy (1)	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	No

1. Not available on FortiGate models with 2 GB RAM or less, except when the firewall policy inspects email protocols SMTP(s), POP3(s), IMAP(s), and NNTP.

Feature comparison between Web Filter inspection modes

The following table indicates which Web Filter features are supported by their designated inspection modes.

	FortiGuard Category-Based Filter	Category Usage Quota	Override Blocked Categories	Search Engines	Static URL Filter	Rating Option	Proxy Option	Web Profile Override
Proxy (4)	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes (1)	No	Yes (2)	Yes	Yes (5)	Yes	Limited (3)	No

1. Local Category and Remote Category filters do not support the warning and authenticate actions.
2. Local Category and Remote Category filters cannot be overridden.
3. Only HTTP POST Action and Remove Cookies are supported.
4. Not available on FortiGate models with 2 GB RAM or less.
5. File filter is not supported. See Configuring web filter to exempt URLs from other security profiles on page 2296.

Feature comparison between Email Filter inspection modes

The following tables indicate which Email Filters are supported by the specified inspection modes for local filtering and FortiGuard-assisted filtering.

Local Filtering	Banned Word Check	Block/Allow List	HELO/ EHLO DNS Check	Return Address DNS Check	DNSBL/ ORBL Check	MIME Header Check
Proxy	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	No	No	No	Yes

FortiGuard-Assisted Filtering	Phishing URL Check	Anti-Spam IP Check	Submit Spam to FortiGuard	Spam Email Checksum Check	Spam URL Check
Proxy	Yes	Yes	Yes	Yes	Yes
Flow	No	No	No	No	No

Feature comparison between DLP inspection modes

The following table indicates which DLP filters are supported by their designated inspection modes.

	Credit Card Filter	SSN Filter	Regex Filter	File-Type Filter	File-Pattern Filter	Fingerprint Filter	Watermark Filter	Encrypted Filter	File-Size Filter
Proxy (2)	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Flow	Yes	Yes	Yes	Yes	Yes	No	No	Yes	Yes (1)

1. File-size filtering only works if file size is present in the protocol exchange.
2. Not available on FortiGate models with 2 GB RAM or less, except when the firewall policy inspects email protocols SMTP(s), POP3(s), IMAP(s), and NNTP.

Inspection of SMBv3 multichannel is not supported. To inspect SMBv3 traffic, it is advisable to disable multichannel support first. See the vendor specific documentation for more information on disabling multichannel support.

Proxy-based inspection for email protocols supported on models with 2 GB RAM

Previously in FortiOS 7.4.4, proxy-related features were disabled on FortiGate models with 2 GB RAM or less. See Proxy-related features no longer supported on FortiGate 2 GB RAM models for more information.

FortiOS 7.6.5 and later supports proxy-based inspection for email protocols on FortiGate models with 2 GB RAM for the following services:

- SMTP(s)
- POP3(s)
- IMAP(s)
- NNTP

Firewall policies support proxy-based inspection mode when you select one or more of the supported services in a firewall policy.

When configuring a firewall policy in the GUI, a warning is displayed when the selected services, protocol options, and SSL inspection profile contain non-mail protocols. Therefore, at least one of the services, protocol options, and SSL inspection profile must contain strictly mail protocols.

Even if you select a non-mail protocol as a service and FortiOS allows the configuration, traffic hitting the policy for the non-mail protocol is dropped. Therefore, it is recommended to define only the mail protocols that you want to inspect in the proxy-based inspection policy under the services field.

Furthermore, the following proxy-based UTM profiles are not supported in either proxy-based or flow-based policies:

- casb-profile
- waf-profile
- videofilter-profile
- icap-profile
- ssh-filter-profile

The following profiles are not supported in proxy-based policies, but are supported in flow-based policies:

- dnsfilter-profile
- webfilter-profile
- voip-profile

Other UTM profiles, such as AV, IPS, application control, file filter, DLP, and so on have no restrictions.

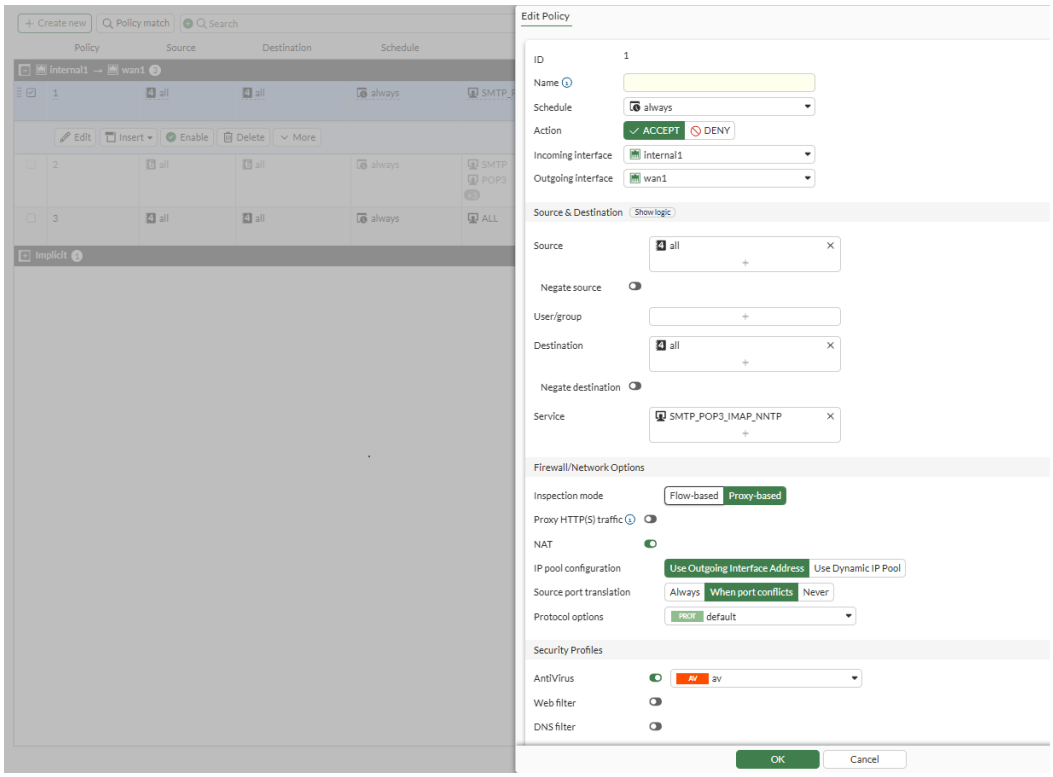
Finally, if `inspect-all` is enabled in an SSL inspection profile, then the profile cannot be used in a proxy-based firewall policy.

These changes impact the FortiGate/FortiWiFi 40F, 60E, 60F, 80E, and 90E series of devices and their variants and FortiGate-Rugged 60F (2 GB versions only).

The following screen shot shows a firewall policy correctly configured with email/NNTP services, proxy-based inspection mode, and a proxy UTM profile:

- *Service* is set to *SMTP_POP3_IMAP_NNTP*.
- *Inspection mode* is set to *Proxy-based*.
- *Protocol Options* is set to the *default* profile.
- Under *Security Profiles*, *AntiVirus* is enabled, and the *av* profile is selected.
- *SSL Inspection* is set to the *deep-inspection* profile.

Conclusion: Because the *Service* defined contains only mail protocols, this configuration is accepted.

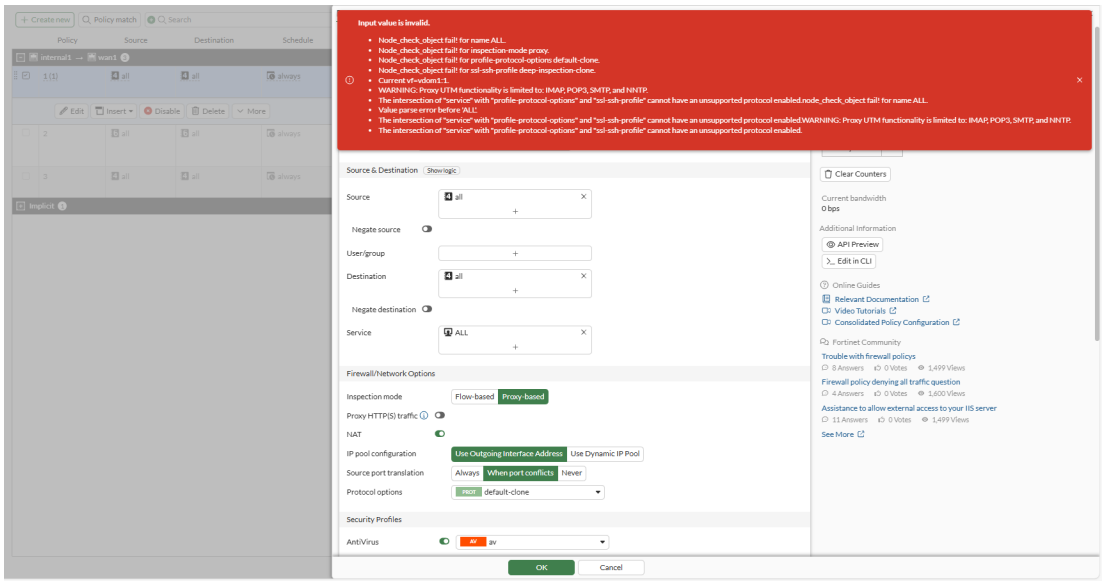


The following GUI example shows the warning message that displays with an unsupported firewall policy configuration:

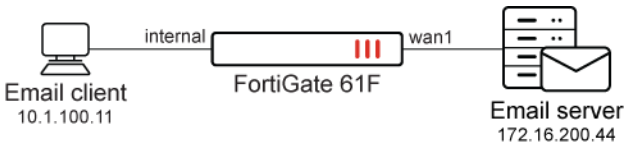
- *Service* is set to *ALL*.

  The *ALL* setting includes ports, such as 80 and 443, that are used for protocols other than the supported email protocols of SMTP, POP3, IMAP, and NNTP.
- *Inspection mode* is set to *Proxy-based*.
- *Protocol Options* is set to the *default-clone* profile, which inspects HTTP.
- Under *Security Profiles*, *AntiVirus* is enabled, and the *av* profile is selected.
- *SSL Inspection* is set to the *deep-inspection-clone* profile, which inspects HTTP.

Conclusion: Between the *Service* selected, the *Protocol Options*, and *SSL Inspection* profile, all three include inspection on non-mail protocols.



Example



In this example, a firewall policy is configured to scan email traffic sent from an email client through FortiGate to an email server. The firewall policy is configured with a proxy-based inspection mode and mail services and profiles. The FortiGate 61F has less than 2 GB RAM.

To configure a firewall policy:

1. Configure the service to include mail protocols in the TCP port range:

```
config firewall service custom
    edit "SMTP_POP3_IMAP_NNTP"
        set uuid 8fa0520e-afcd-51f0-ecf3-f5bc0e446b3b
        set category "General"
        set tcp-portrange 25 110 143 119 465 995 993
    next
end
```

2. Configure the protocol profile:

```
config firewall profile-protocol-options
    edit "default-clone"
        set comment "All default services."
        config http
            set ports 80 8080
            unset options
```

```
            unset post-lang
        end
        config ftp
            set ports 21
            set options splice
        end
        config imap
            set ports 143
            set options fragmail
        end
        config pop3
            set ports 110
            set options fragmail
        end
        config smtp
            set ports 25
            set options fragmail splice
        end
        config nntp
            set ports 119
            set options splice
        end
        config dns
            set ports 53
        end
        config cifs
            set ports 445
            unset options
        end
    next
end
```

3. Configure an SSL inspection profile:
   This example uses the default `deep-inspection-clone` profile.

```
config firewall ssl-ssh-profile
    edit "deep-inspection-clone"
        set comment "Read-only deep inspection profile."
        config https
            set ports 443
            set status deep-inspection
        end
        config ftps
            set ports 990
            set status deep-inspection
        end
        config imaps
            set ports 993
            set status deep-inspection
        end
        config pop3s
            set ports 995
```

```
            set status deep-inspection
        end
        config smtps
            set ports 465
            set status deep-inspection
        end
        config dot
            set status disable
        end
        set ssl-exemption-log enable
        set ssl-server-cert-log enable
        set ssl-handshake-log enable
    next
end
```

4. Configure an antivirus profile with proxy-only feature and content-disarm:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        config http
            set av-scan block
        end
        config ftp
            set av-scan block
        end
        config imap
            set av-scan block
        end
        config pop3
            set av-scan block
        end
        config smtp
            set av-scan block
        end
        config content-disarm
            set analytics-suspicious disable
        end
    next
end
```

5. Configure the firewall policy:

```
config firewall policy
    edit 1
        set name "1"
        set uuid a85736ea-79dd-51ef-103d-0791ae4d6152
        set srcintf "internal"
        set dstintf "wan1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
```

```
        set schedule "always"
        set service "SMTP_POP3_IMAP_NNTP"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "default-clone"
        set ssl-ssh-profile "deep-inspection-clone"
        set av-profile "av"
        set logtraffic all
        set nat enable
    next
end
```

When email traffic of SMTP(s), POP3(s), or IMAP(s) contains a virus and is sent through the firewall policy, the antivirus profile blocks the traffic. Following are examples of the generated utm-av logs for SMTP(s), POP3(s), and IMAP(s):

- SMTP(s):

```

AI protection

Artificial Intelligence (AI) is rapidly transforming business operations, cybersecurity, and digital infrastructure. Among its most prominent forms are Large Language Models (LLMs), such as GPT, which are a type of Generative AI (GenAI) widely used in chatbot applications, such as ChatGPT, DeepSeek, and others. As these chatbots become more common in corporate environments, new risks emerge. AI applications, including but not limited to chatbots, can inadvertently expose sensitive data. For instance, an employee might paste a confidential email into a chatbot to generate a customized reply, potentially exposing sensitive information.

Securing GenAI has become critical in this evolving landscape. FortiGate offers several methods to restrict or block access to GenAI tools, helping prevent data leaks and protect company information.

The following table outlines the techniques and highlights scenarios where each method may be most effective.

Technique	Description
Web filter	Using a web filter profile with the FortiGuard Artificial Intelligence Technology category enables users to monitor and block access to sites in this category by matching the requested URL against FortiGuard's classification. See Protecting GenAI access using web filter on page 2152 for more information.
Application control	Using an application control profile with the Generative AI category enables users to monitor and block access to sites in this category by matching traffic patterns against FortiGuard's Generative AI signatures. This approach goes beyond URL matching by employing deep packet inspection to identify and control application-level traffic, offering enhanced visibility and insight into AI-related activities. See Protecting GenAI access using application control on page 2154 for more information.

Technique	Description
Data Loss Prevention (DLP)	Using a DLP profile, administrators can block access to LLM applications when specific keywords are detected in user prompts. This technique uses keyword matching and FQDN filtering to prevent sensitive or restricted data from being sent to external AI services. This is particularly useful for enforcing compliance and protecting intellectual property. See Protecting GenAI Access using DLP on page 2159 for more information.

Protecting GenAI access using web filter

By leveraging FortiGuard's Artificial Intelligence Technology category within a web filter profile, organizations can proactively restrict access to sites offering AI-related solutions, insights, and resources. This capability is particularly valuable for enterprises aiming to mitigate risks associated with unauthorized AI tool usage.

To confirm that the URL of the LLM application that you need to block is in the Artificial Intelligence Technology category, the URL category can be verified using the FortiGuard Web Filter Lookup.

The `Artificial intelligence technology` FortiGuard category has been added as category `100` in the CLI.

This topic includes examples that incorporate several web filter use cases:

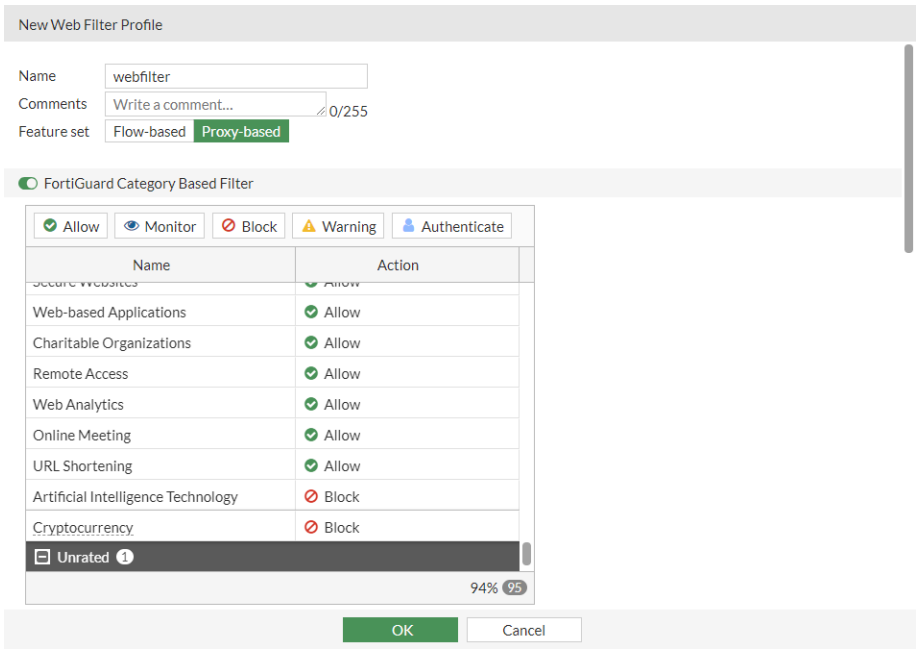
- Example 1: block access to Artificial Intelligence Technology category on page 2152

Example 1: block access to Artificial Intelligence Technology category

In this example, access to all websites classified under the Artificial Intelligence Technology category is blocked using a web filter profile

To configure a web filter profile to block the AI category in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a name for the web filter profile.
3. In the category table, locate the *General Interest - Business* section. Select the *Artificial Intelligence Technology*, and set the *Action* to *Block*.



4. Configure the remaining settings as needed.
5. Click *OK*.

To configure a web filter profile to block the AI category in the CLI:

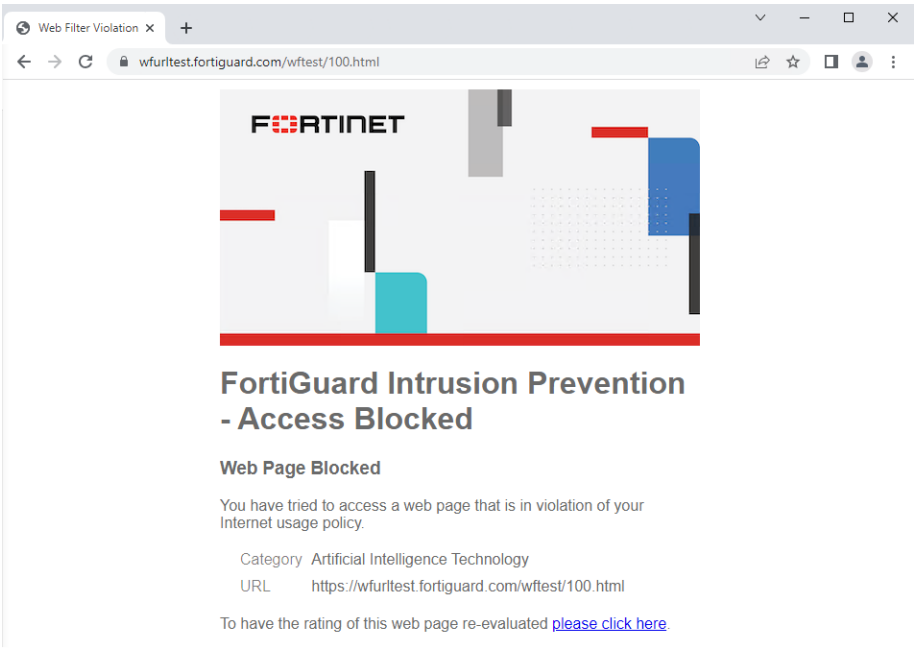
```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            config filters
                edit 100
                    set category 100
                    set action block
                next
            end
        end
        set log-all-url enable
    next
end
```

To verify that the categories are blocked:

1. Apply the web filter profile in a firewall policy.
2. On a device that is connected through the FortiGate and uses the policy, visit the following test URL for the category:
   a. `https://wfurltest.fortiguard.com/wftest/100.html`

      The browser displays a replacement message that the URL is blocked based on the FortiGuard category.

- Artificial intelligence technology:



To verify the web filter logs:

1. In the GUI, go to *Log & Report* > *Security Events* and click *Web Filter*.
2. In the CLI, enter the following:

```
2: date=2023-07-12 time=10:39:13 eventtime=1689183553021358734 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vdom1" policyid=1
poluuid="996b0a68-2055-51ee-b841-2b3f373c9b37" policytype="policy" sessionid=3255
srcip=10.1.100.31 srcport=35102 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="124f368a-2055-51ee-c7d6-857ab36dd6cb" dstip=154.52.5.202 dstport=443
dstcountry="United States" dstintf="port1" dstintfrole="undefined" dstuuid="124f368a-2055-
51ee-c7d6-857ab36dd6cb" proto=6 httpmethod="GET" service="HTTPS"
hostname="wfurltest.fortiguard.com" agent="curl/7.68.0" profile="webfilter" action="blocked"
reqtype="direct" url="https://wfurltest.fortiguard.com/wftest/100.html" sentbyte=849
rcvdbyte=3633 direction="outgoing" msg="URL belongs to a denied category in policy"
ratemethod="domain" cat=100 catdesc="Artificial Intelligence Technology"
```

Protecting GenAI access using application control

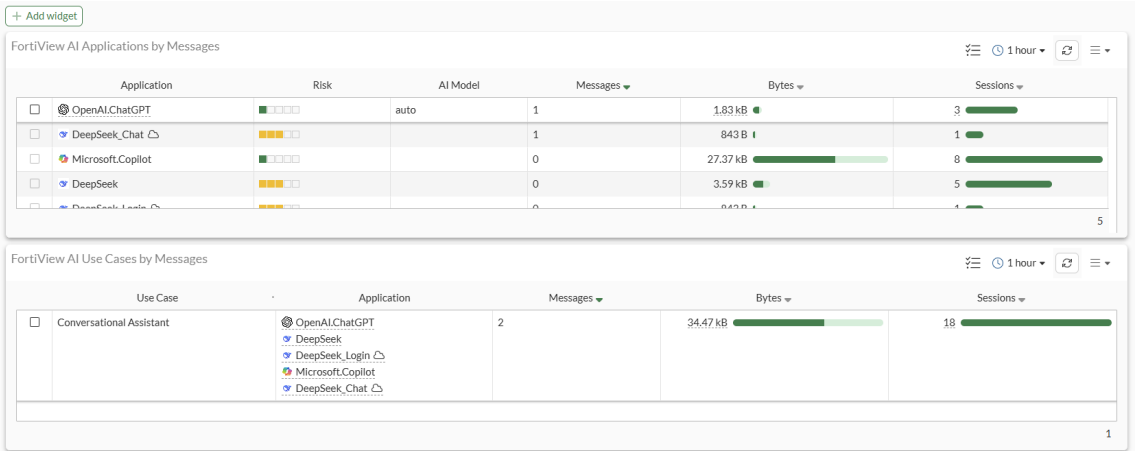
By leveraging FortiGuard's GenAI application category within security profiles, organizations can monitor and manage AI-related activities, such as ChatGPT usage, ensuring compliance and reducing risk.

This technique offers visibility and insight to AI-related activities with deep packet inspection enabled. Following is a table of log fields available in the CLI and GUI for generative AI monitoring:

CLI log field	GUI log field
`aiuser`	AI User
`model`	Model
`dcgeo`	Data Center's Geographical Location
`usecase`	Use Case
`prompt`	Prompt
`cloudgenai`	Generate AI Application

The following FortiView widgets are available to support real-time monitoring of AI traffic:

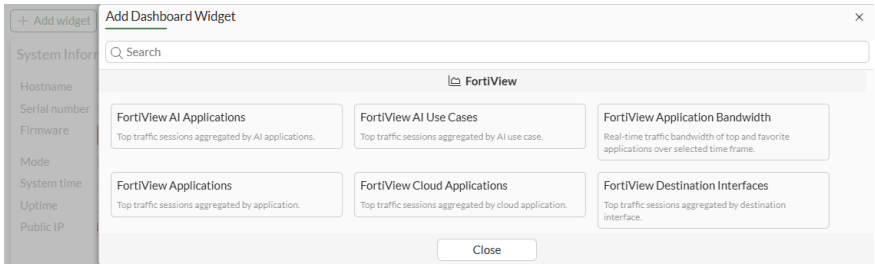
- *AI Applications*: Displays top traffic sessions aggregated by AI application, including details such as Risk, AI model, Sessions, and more. Selecting Drill Down on an application reveals specific insights like Users, Use Cases, and Data Center Locations.
- *AI Use Cases*: Categorizes AI activity based on business or operational context, showing top traffic sessions by use case along with related Application, Sessions, and other metrics. Drill Down provides further details such as Users, Applications, and Data Center Locations.



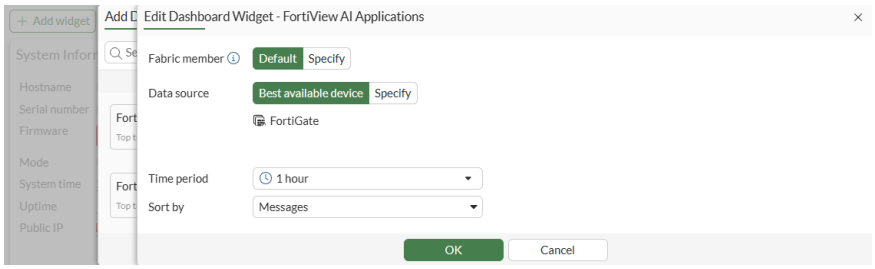
These widgets provide security teams with actionable insights and help enforce governance over AI usage within the network.

To add the FortiView AI widgets to the Dashboard:

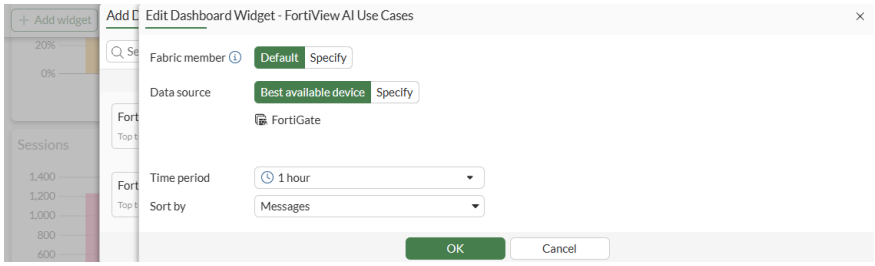
1. Go to *Dashboard* > *Status*.
2. Click *Add Widget*.



3. Select *FortiView AI Applications*.



4. Configure the widget.
5. Click *OK*. The widget will be added to the *Dashboard*.
6. Repeat the configuration steps for *FortiView AI Use Cases*.



7. Click *OK*. The widget will be added to the *Dashboard*.
8. Click *Close*.

To review the generative AI database:

```
# diagnose autoupdate versions | grep -A 6 GenAI
GenAI Application Definitions
---------
Version: 33.00033 signed
Contract Expiry Date: Thu Jan  3 2030
Last Updated using scheduled update on Tue Jun 24 20:59:43 2025
Last Update Attempt: Tue Jun 24 23:10:03 2025
Result: No Updates
```

If you see `Version: 0.00000`, this implies that the AIAP database is not updated yet. For AIAP database to be updated, ensure that at least one firewall policy is utilizing an application control profile. Database updates require FMWR contract.

The `GenAI` application category has been added as `category 36` in the CLI.

Limitations and advanced configurations

Keep the following limitations and advanced configurations in mind when using Generative AI application control:

- To work with proxy policies while using explicit proxy, for example, inline IPS must be disabled:

```
config ips settings
    set proxy-inline-ips disable
end
```

- Some signatures require deep inspection and some do not.
  To identify which signatures require deep inspection:
  a. Go to *Security Profiles* > *Application Signatures*, and locate the *Generative AI* signature.
  b. Hover over the signature to display the popup.

  c. Locate the *Requirements* field to see whether *SSL Deep Inspection* is required.
- Extended UTM log should be enabled to capture extra information in the log, such as model, message, GenAI user, DC location, and so on. This requires deep inspection.

This topic includes examples that incorporate several application control use cases:

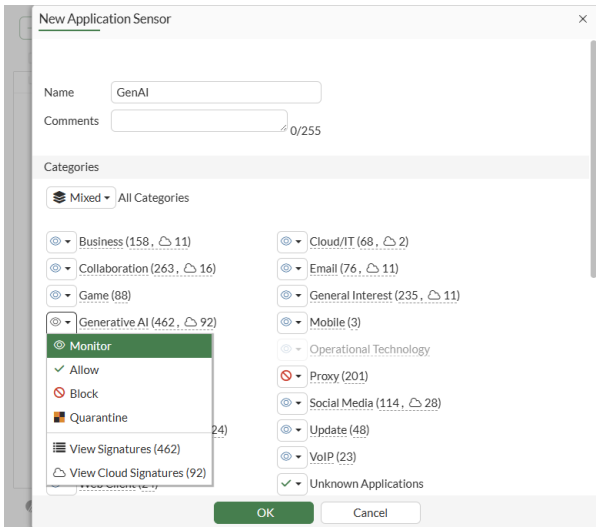
- Example 1: monitor access to Generative AI category on page 2157

Example 1: monitor access to Generative AI category

In this example, access to all signatures classified under the Generative AI category are monitored using an application control profile.

To create an application control sensor to monitor generative AI in the GUI:

1. Monitor generative AI in an application control sensor:
   a. Go to *Security Profiles* > *Application Control*.
   b. Click *Create New*.
   c. Enter a *Name*.
   d. Set the *Generative AI* category to *Monitor*.



e. Configure other fields, as needed.

f. Click *OK*.

2. Apply the sensor to a firewall policy with deep inspection:

a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.

b. In the *Security Profiles* section, enable *Application control* and select the profile that you previously created. In this example, the GenAI profile is selected.

c. Set *SSL Inspection* to a profile where deep-inspection is enabled. In this example *new-deep-inspection* is selected.

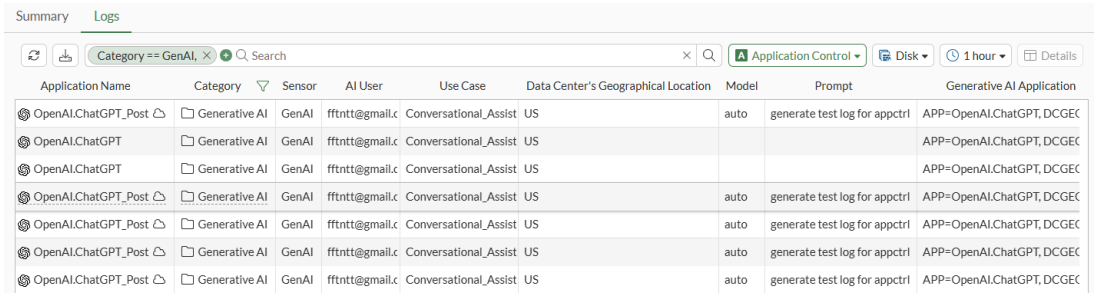
d. Configure the other settings as needed.

e. Click *OK*.

3. On a Client Windows PC, log in to www.chatgpt.com and enter a test prompt.

4. Review the application control UTM log for OpenAI.ChatGPT_Post:

Logs are listed in *Log & Report* > *Security Events*.



To implement generative AI application control in the CLI:

1. Monitor generative AI in an application control sensor:

```
config application list
    edit "GenAI"
        config entries
            edit 1
                set category 36
```

```
                set action pass
            next
        end
    next
end
```

2. Apply the sensor to a firewall policy with deep inspection:

```
config firewall policy
    edit 1
        set name "1"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set ssl-ssh-profile "new-deep-inspection"
        set application-list "GenAI"
        set nat enable
    next
end
```

3. On a Client Windows PC, log into www.chatgpt.com and enter a test prompt.
4. Review the application control UTM log for OpenAI.ChatGPT_Post:

```
# execute log display
1: date=2025-06-25 time=00:13:07 eventtime=1750810387445006017 logid="1059028704" type="utm"

```

Protecting GenAI Access using DLP

The FortiGate Data Loss Prevention (DLP) system helps safeguard your network by inspecting traffic for sensitive data patterns. It scans both inbound and outbound traffic, and based on predefined rules, it can block, log, allow, or quarantine data that matches these patterns.

To prevent the upload of sensitive information to Large Language Model (LLM) applications over HTTPS, FortiGate can block traffic containing specific keywords using the predefined "keyword" data type in the DLP dictionary.

Since web-based chatbot implementations are highly dynamic and can vary significantly, it is recommended to configure both message-based and file-based DLP rules to improve detection accuracy. While this approach enhances protection, it may not be completely foolproof.

For stronger security, it is advisable to restrict access to LLM applications entirely. This can be achieved by:

- Applying a web filter profile with the FortiGuard Artificial Intelligence Technology category set to block, or
- Using an application control profile with the Generative AI category

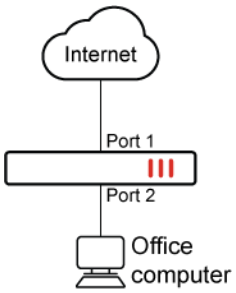
This topic includes examples that incorporate several DLP use cases:

- Example 1: prevent sensitive LLM searches in the browser on page 2160

Example 1: prevent sensitive LLM searches in the browser

In this example, a user is conducting a search on an LLM application in the Chrome browser on an office computer, using a sensitive keyword that has been configured in the DLP dictionary. The FortiGate intercepts this traffic using deep inspection and prevents the search that contains sensitive keywords because it matches the DLP profile that has been set up on this FortiGate.

When a sensitive keyword is included in HTTPS upload traffic, the request is blocked and a DLP log is generated.



To block HTTPS upload traffic that includes sensitive keywords in the GUI:

1. Configure the DLP dictionary:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Dictionary* tab, then click *Create New*.
   b. Set *Name* to *llmapps*.
   c. In the *Dictionary Entries* table click *Create New*:
      i. Set *Type* to *keyword*.
      ii. Set *Pattern* to *fortinet*.
      iii. Enable *Case sensitive*.
      iv. Click *OK*.
   d. Repeat step c and set *Pattern* to *source code*.
   e. Click *OK*.
2. Configure the DLP sensor:
   a. Go to *Security Profiles* > *Data Loss Prevention*, select the *Sensor* tab, then click *Create New*.
   b. Set *Name* to *llmapps*.
   c. In the *Sensor Entries* section, click *Add*. The *Select Entries* pane is displayed.
   d. Select *Managed Locally* from the dropdown menu.

e. Select *llmapps* and click *Apply*.
f. Click *OK*.

3. Configure the DLP profile:
   a. Go to *Security Profiles > Data Loss Prevention*, select the *Profile* tab, then click *Create New*.
   b. Set *Name* to *llmapps*.
   c. In the *Rules* section, click *Create New*:
      i. Configure the following settings:

Name	llmapps1
Sensors	llmapps
Severity	Critical
Action	Block
Type	File
File type	builtin-patterns
Protocol	HTTP-POST

      ii. Click *OK*.
   d. In the *Rules* section, click *Create New* again:
      i. Configure the following settings:

Name	llmapps2
Sensors	llmapps
Severity	Critical
Action	Block
Type	Message
Protocol	HTTP-POST

      ii. Click *OK*.
   e. Click *OK* to save the profile.
   f. Unset the file type option to enable filtering of all file types, including unknown ones:

```
config dlp profile
    edit "llmapps"
        config rule
            edit 1
                unset file-type
            next
        end
    next
end
```

4. Configure the firewall address for the LLM application:
   a. Go to *Policy & Objects > Addresses*, select the *Standard* tab, then click *Create New*.
   b. Set the following:

Name	<name>
Type	FQDN
FQDN	See FQDN on page 2164 for the FQDN on the specific LLM application.

c. Click *OK*.

5. Add the firewall address to a group:
   a. Go to *Policy & Objects* > *Addresses*, select the *Address Group* tab, then click *Create New*.
   b. Set the following:

Group name	llmapps
Members	ChatGpt, Gemini, DeepSeek

6. Add the DLP profile and the address group to a firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Set the *Inspection Mode* to *Proxy-based*.
   c. Set the *Destination* to *llmapps*.
   d. In the *Security Profiles* section:
      i. Enable *Application control* and select the profile that *QUIC* is blocked in. In this example, the *default* profile is selected.
      ii. Enable *DLP Profile* and select *llmapps*.
   e. Set *SSL Inspection* to *deep-inspection*.
   f. Configure the other settings as needed.
   g. Click *OK*.

To block HTTPS upload traffic that includes sensitive keywords in the CLI:

1. Configure the DLP dictionary:

```
config dlp dictionary
    edit "llmapps"
        config entries
            edit 1
                set type "keyword"
                set pattern "source code"
                set ignore-case enable
            next
            edit 2
                set type "keyword"
                set pattern "fortinet"
                set ignore-case enable
            next
        end
    next
end
```

2. Configure the DLP sensor:

```
config dlp sensor
    edit "llmapps"
        config entries
            edit 1
                set dictionary "llmapps"
            next
        end
    next
end
```

3. Configure the DLP profile:

```
config dlp profile
    edit "llmapps"
        set feature-set proxy
        config rule
            edit 1
                set name "llmapps1"
                set severity critical
                set proto http-post
                set filter-by sensor
                set sensor "llmapps"
                set action block
            next
            edit 2
                set name "llmapps2"
                set type message
                set proto http-post
                set filter-by sensor
                set sensor "llmapps"
                set action block
            next
        end
    next
end
```

4. Configure the firewall address for the LLM application:

```
config firewall address
    edit <name>
        set type fqdn
        set fqdn <string>
    next
end
```

See FQDN on page 2164 for the FQDN on the specific LLM application.

5. Add the firewall addresses to a group:

```
config firewall addrgrp
    edit "llmapps"
        set member "ChatGpt" "Gemini" "DeepSeek"
```

```
    next
end
```

6. Add the DLP profile and the FQDN address to a firewall policy:

```
config firewall policy
    edit 1
        set name "llmapps "
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "llmapps"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set dlp-profile "llmapps"
        set application-list "default"
        set nat enable
    next
end
```

FQDN

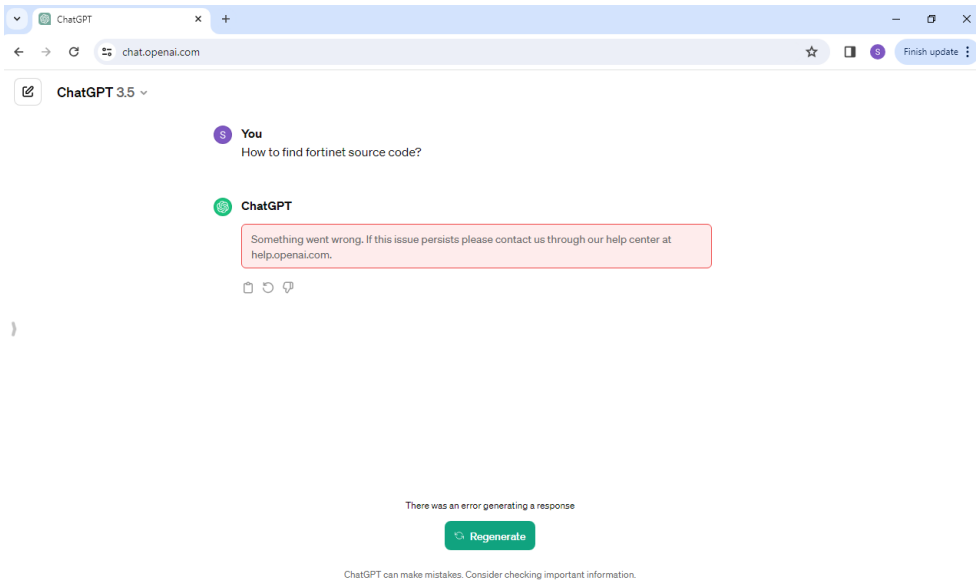
A firewall address should be created for each LLM application:

LLM application	FQDN
ChatGPT	*chat.openai.com*
Gemini	*gemini.google.com*
DeepSeek	*chat.deepseek.com*

Verification

ChatGPT:

1. Visit https://chat.openai.com.
2. Search for any phrase that includes keywords set up in the DLP dictionary.

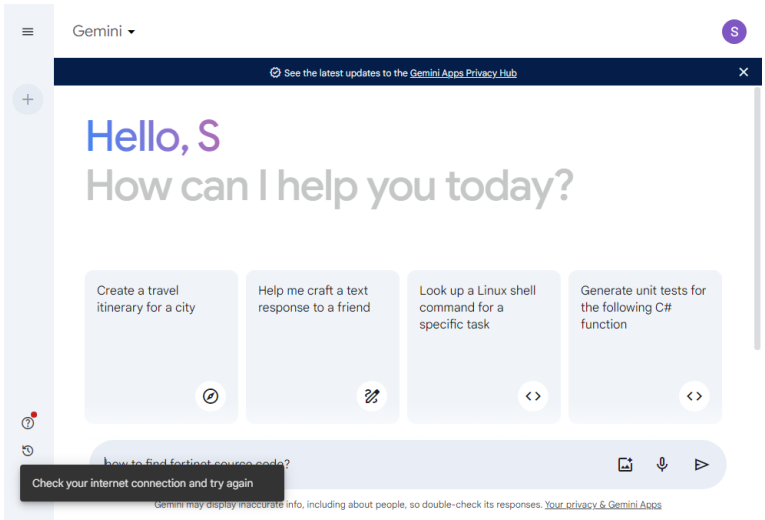


3. Verify that the request failed and an error was generated.
4. Review the log that was generated when the attempt was made to send an HTTP POST request containing sensitive keywords:

```
1: date=2024-03-15 time=09:59:35 eventtime=1710453575538415503 tz="+1200" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1
rulename="llmapps1" dlpextra="Sensor 'llmapps' matching any: ('llmapps'=1) >= 1; match."
filtertype="sensor" filtercat="file" severity="critical" policyid=1 poluuid="eea32b46-db4e-
51ee-92a9-b46e5580db33" policytype="policy" sessionid=69254 epoch=424445846 eventid=1
srcip=13.13.13.13 srcport=56747 srccountry="United States" srcintf="port2"
srcintfrole="undefined" srcuuid="d2f06fda-15e7-51ee-0d22-faaf5170dad2" dstip=104.18.37.228
dstport=443 dstcountry="United States" dstintf="port1" dstintfrole="undefined"
```

Gemini:

1. Visit https://gemini.google.com .
2. Search for any phrase that includes keywords set up in the DLP dictionary.



3. Verify that the request failed and an error was generated.
4. Review the log that was generated when the attempt was made to send an HTTP POST request containing sensitive keywords:

```
1: date=2024-03-15 time=12:46:08 eventtime=1710463568053453203 tz="+1200" logid="0954024576"
type="utm" subtype="dlp" eventtype="dlp" level="warning" vd="root" ruleid=1
rulename="llmapps1" dlpextra="Sensor 'llmapps' matching any: ('llmapps'=1) >= 1; match."
filtertype="sensor" filtercat="file" severity="critical" policyid=1 poluuid="eea32b46-db4e-

```

Antivirus

An antivirus software's primary function is to detect and stop viruses that could cause harm to your system or compromise the security of your connected devices. It can be installed on individual endpoints or it can operate as an antivirus engine (AV engine) to perform traffic inspection inside a Next Generation Firewall (NGFW).

The FortiGate's AV engine operates by leveraging the information stored in signature databases that is updated in real-time by the FortiGuard AV services. These databases are essentially vast repositories that contain detailed profiles of known and previously unknown viruses. The AV engine cross-references these profiles with the activities and files on your system to determine if any known or previously unknown viruses are active or attempting to infiltrate your network.

The scope of threats that the antivirus engine can neutralize extends beyond just viruses. It is equipped to deal with a wide array of malicious software, often called malware. This encompasses, but is not confined to, infected files that may carry harmful code, Trojans that disguise themselves as legitimate software, worms that can replicate themselves and spread across networks, and spyware that can collect and transmit your personal information without your consent. Furthermore, inline malware prevention powered by Sandboxing and AI extends protection to even new zero-day malware found in the wild.

This section includes information about antivirus techniques and configurations:

- Antivirus introduction on page 2167
- Advanced configurations on page 2194
- Configuration examples on page 2222

Antivirus introduction

FortiOS offers antivirus solutions in two modes: flow-based and proxy-based. Users can select the mode that best suits their needs. The default setting for a new antivirus profile is flow-based inspection, which is generally recommended unless there is a need for features specific to proxy. For more information, see Protocol comparison between antivirus inspection modes on page 2168.

FortiOS includes two preloaded antivirus profiles:

- *default*
- *wifi-default*

You can customize these profiles, or you can create your own to inspect certain protocols, remove viruses, analyze suspicious files with FortiSandbox, and apply botnet protection to network traffic. Once configured, you can add the antivirus profile to a firewall policy.

This functionality requires a subscription to FortiGuard Antivirus.

In order to download updated AV definitions, at least 1 policy with a security profile that has Antivirus scanning must be enabled.

Protocol comparison between antivirus inspection modes

The following table indicates which protocols can be inspected by the designated antivirus scan modes.

	HTTP	FTP	IMAP	POP3	SMTP	NNTP	MAPI	CIFS	SSH
Proxy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes*	Yes
Flow	Yes	Yes	Yes	Yes	Yes	Yes	No	Yes	No

* Proxy mode antivirus inspection on CIFS protocol has the following limitations:

- Cannot detect infections within some archive files.
- Cannot detect oversized files.

Other antivirus differences between inspection modes

Starting from 6.4.0, the scan mode option is no longer available for flow-based AV.

This means that AV no longer exclusively uses the default or legacy scan modes when handling traffic on flow-based firewall policies. Instead, AV in flow-based policies uses a hybrid of the two scan modes. Flow AV may use a pre-filtering database for malware detection in some circumstances as opposed to the full AV signature database in others. The scan method is determined by the IPS engine algorithm that is based on the type of file being scanned. When handling oversized files in flow-based AV, the action can either be pass (default) or block. When the action is pass, IPS appends to-be-scan data into the AV scan buffer. If the appended file size exceeds the oversize-limit that is defined in the protocol option profile, then the AV session is cleared and the file is bypassed from AV scanning.

In contrast, proxy mode maintains the scan mode option, which can be toggled between default or legacy mode. In default mode, the WAD daemon receives the file and then decides if it can do an in-process scan of the file in simple AV configuration scenarios. If the file is in an oversized archive that is supported by the stream-based decompressor, then it is sent to stream-based scan for best effort inspection. Stream-based scan decompresses and scans the entire archive without archiving the file. If the file is not supported by stream-based scan, then it is buffered and then sent to the scanunit daemon for inspection on content that is under the oversize limit.

In legacy mode, stream-based scanning is disabled, so oversized archive files and files that cannot be handled by WAD in-process scan are buffered and sent to the scanunit daemon for processing.

Antivirus techniques

The security of digital systems is a top priority for organizations. A range of techniques and tools are employed to ensure the integrity and reliability of these systems.

The following table describes some of the industry standard techniques that are used for Antivirus protection, and if they can be configured in the GUI or CLI.

Technique	Description	GUI	CLI
Signature-based detection	Antivirus scan detects and compares malicious file against virus signatures database. The FortiGuard Antivirus Service uses content pattern recognition language (CPRL), which is more efficient and accurate than traditional signature-based detection methods.	✓	✓
Content Disarm and Reconstruction (CDR)	CDR sanitizes Office, OpenOffice, PDF, RTF, and XLSB files by removing active content and active media, preserving only the text. See Content disarm and reconstruction on page 2170 for more information.	✓	✓
Virus Outbreak Prevention (VOS)	VOS enhances FortiGate's antivirus database with third-party malware hashes. It checks file hashes against FortiGuard's database. See Virus outbreak prevention on page 2170 for more information.	✓	✓
Zero-day malware stream scanning	Enables real-time delivery of malware IOCs (Indicators of Compromise) to FortiGate devices using the fortimq daemon and notifications, eliminating the need for frequent cloud polling and reducing server load. See Zero-day malware stream scanning on page 2226 for more information.	✓	✓
External Malware Block List	Users can add their own malware signatures to an external list. See External malware block list on page 2170 for more information.	✓	✓
EMS External Feed	FortiGate receives malware feeds from FortiClient EMS, which itself gathers detected malware hashes from FortiClients. See EMS external feed on page 2171 for more information.	✓	✓
Behavior-based detection	Submit suspected malicious files to FortiSandbox for inspection. See Using FortiSandbox post-transfer scanning with antivirus on page 2194 and Using FortiSandbox inline scanning with antivirus on page 2196 for more information.	✓	✓
CIFS Scanning	File filtering and antivirus scanning on Common Internet File System (CIFS) traffic is supported. See CIFS support on page 2216 for more information.	✓	✓
Heuristic Analysis	Identify malicious files such as Windows Portable Executables (PEs) to combat zero-day attacks. See AI-based malware detection on page 2171 for more information.		✓
AI/ML, behavioral, and human analysis	Helps identify, classify, and respond to threats. See Using FortiNDR inline scanning with antivirus on page 2211 for more information.	✓	✓

See Configuring an antivirus profile on page 2171 and Testing an antivirus profile on page 2174 for more information.

Content disarm and reconstruction

Content disarm and reconstruction (CDR) allows the FortiGate to sanitize Microsoft Office documents and PDF files (including those that are in ZIP archives) by removing active content, such as hyperlinks, embedded media, JavaScript, macros, and so on from the files (disarm) without affecting the integrity of its textual content (reconstruction).

CDR is supported on HTTP, SMTP, POP3, and IMAP.

HTTP GET is supported, but not HTTP POST.

SMTP splice and client-comfort mode are not supported.

CDR does not support flow-based inspection modes.

It allows network administrators to protect their users from malicious document files. See Content disarm and reconstruction on page 2222 for a configuration example.

Virus outbreak prevention

FortiGuard VOS allows the FortiGate antivirus database to be supplemented with third-party malware hash signatures curated by FortiGuard. This allows VOS to manage zero-day threats effectively. The hash signatures are obtained from FortiGuard's Global Threat Intelligence database. Any signature that is added to FortiGuard becomes immediately active, eliminating the need to wait for AVDB (antivirus database) update. The AVDB queries FortiGuard with the hash of a scanned file. If FortiGuard returns a match, the scanned file is deemed to be malicious. Enabling the AV engine scan is not required to use this feature.

FortiGuard VOS can be used in both proxy-based and flow-based policy inspections across all supported protocols.

The FortiGate must be registered with a valid FortiGuard outbreak prevention license.

See FortiGuard outbreak prevention on page 2224 for a configuration example.

External malware block list

The external malware block list allows users to add their own malware signatures in the form of MD5, SHA1, and SHA256 hashes. The FortiGate's antivirus database retrieves an external malware hash list from a remote server and polls the hash list every n minutes for updates. Enabling the AV engine scan is not required to use this feature.

The external malware block list can be used in both proxy-based and flow-based policy inspections, but it is not supported in AV quick scan mode.

Note that using different types of hashes simultaneously may slow down the performance of malware scanning. It is recommended to use one type of hash.

See External malware block list on page 2233 and Malware hash external feed on page 4579 for more details and configuration examples.

EMS external feed

A FortiGate can pull malware external feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. This feature is supported in proxy and flow mode.

If an external malware blocklist and the FortiGuard outbreak prevention database are also enabled in the antivirus profile, the checking order is: AV local database, EMS external feed, external malware blocklist, FortiGuard outbreak prevention database. If the EMS external feed and external malware blocklist contain the same hash value, then the EMS infection will be reported if both of them are blocked.

See Malware external feed from EMS on page 2214 for more details and configuration examples.

AI-based malware detection

The AV Engine AI malware detection model integrates into regular AV scanning to help detect potentially malicious files, such as malicious Windows Portable Executables or ELF files, in order to mitigate zero-day attacks. Previously, this type of detection was handled by heuristics that analyzed file behavior. With AV Engine AI, the module is trained by FortiGuard AV against many malware samples to identify file features that make up the malware. The AV Engine AI package can be downloaded by FortiOS via FortiGuard on devices with an active AV subscription. The machine-learning-detection setting is enabled by default at a per-VDOM level. Files detected by the AV Engine AI are identified with the W32/AI.Pallas.Suspicious virus signature.

To configure machine learning-based malware detection:

```
config antivirus settings
     set machine-learning-detection {enable| monitor | disable}
end
```

FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from https://www.fortiguard.com/sample-files. Test the AI-based malware detection feature by downloading *AI Sample* file. See Example 2: AI sample file on page 2179.

Configuring an antivirus profile

In an antivirus profile, the FortiGate can be configured to apply antivirus protection to HTTP, FTP, IMAP, POP3, SMTP, CIFS, and NNTP sessions. Proxy-based profiles also support MAPI and SSH. Antivirus inspection prevents potentially unwanted and malicious files from entering the network. Antivirus profiles include multiple different functions, such as scanning files for virus signatures, scanning for advanced persistent threats, checking external malware hash lists and external feeds, and others. Malicious files can be blocked or monitored, and can be quarantined. Some antivirus profile options require a license and/or other Fortinet products. Some antivirus profile options can only be configured in the CLI (refer to the FortiOS CLI Reference).

The feature set setting (proxy or flow) in the antivirus profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based antivirus profile must be used with a flow-based firewall policy.

To configure an antivirus profile:

1. Go to *Security Profiles* > *AntiVirus* and click *Create New*.
2. Configure the following settings:

Name	Enter a unique name for the profile.
Comments	Enter a comment (optional).
AntiVirus scan	Enable one or more protocols for inspection, then enable *AntiVirus scan* for the selected protocols with a specified action. • *Block*: block the malicious traffic. • *Monitor*: log malicious traffic and allow it to pass inspection.

Feature set	Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy.
	• *Flow-based*
	• *Proxy-based*
	Additional options are available in proxy-based mode and are identified in the GUI with a *P* icon. See Inspection mode feature comparison on page 2141 for more details.
	If the *Feature set* option is not visible, enter the following in the CLI:
	`config system settings`
	`  set gui-proxy-inspection enable`
	`end`

Inspected Protocols	Enable to inspect the protocol for session inspection: HTTP, SMTP, POP3, IMAP, FTP, and CIFS. Disabled protocols are not inspected. MAPI and SSH can be inspected in proxy-based mode.
APT Protection Options	This section includes options available with FortiGuard to mitigate advanced persistent threats (APT) in file-based attacks.
Content Disarm and Reconstruction	This option is available in proxy-based mode when at least one protocol is enabled for inspection and *AntiVirus scan* is enabled. See Content disarm and reconstruction on page 2170 for more details.
Allow transmission when an error occurs	Enable to allow traffic to pass when an inspection error occurs. Disable to block traffic when an inspection error occurs.
Original File Destination	Specify how to quarantine files processed by content disarm and reconstruction. • *FortiSandbox*: quarantine files on FortiSandbox. The FortiSandbox must be enabled. See Using FortiSandbox post-transfer scanning with antivirus on page 2194 for more details. • *File Quarantine*: quarantine files on FortiGate models with a hard disk. • *Discard*: discard suspicious files.

Treat Windows executables in email attachments as viruses	Enable to deem all Windows executable files located in email traffic as viruses.
Send Files to FortiSandbox for Inspection	Enable to send files to FortiSandbox for inspection. The FortiSandbox must be enabled.
Scan strategy	FortiSandbox scans files inline for flow-based mode (*Inline*) and after the file transfer is complete for proxy-based mode (*Post Transfer*). See Using FortiSandbox inline scanning with antivirus on page 2196 and Using FortiSandbox post-transfer scanning with antivirus on page 2194 for more details.
File types	Specify which files to FortiSandbox for inspection. • *Suspicious Files Only*: only send suspicious files to FortiSandbox for inspection. • *All Supported Files*: send all supported files to FortiSandbox for inspection.
Do not submit files matching types	Click the + to exclude certain file types from being sent to FortiSandbox.
Do not submit files matching file name patterns	Click the + to enter a wildcard pattern to exclude files from being sent to FortiSandbox.
Use FortiSandbox database	Enable to use the signature database from FortiSandbox. The FortiSandbox must be enabled.
Send files to FortiNDR for inspection	This option is available in proxy-based mode when at least one protocol is enabled for inspection, *AntiVirus scan* is enabled, and FortiNDR is enabled. See Using FortiNDR inline scanning with antivirus on page 2211 for more details.
Include mobile malware protection	Enable to use the mobile malware protection database from FortiGuard for content scanning.
Quarantine	This option is available when at least one protocol is enabled for inspection and *AntiVirus scan* is enabled. Enable to quarantine infected files. See also Downloading quarantined files in archive format on page 2237.
Virus Outbreak Prevention	This section includes options available with the FortiGuard Virus Outbreak Protection Service (VOS). See Virus outbreak prevention on page 2170 and FortiGuard outbreak prevention on page 2224 for more details.
Use FortiGuard outbreak prevention database	Enable to use the outbreak prevention database that is available with Advanced Malware Protection on FortiGuard. A license is required. • *Block*: block the malicious traffic. • *Monitor*: log malicious traffic and allow it to pass inspection.
Use 0-day malware stream scanning	Enable to use real-time delivery of malware IOCs to FortiGate devices using fortimq daemon.

	• *Block*: block the malicious traffic. • *Monitor*: log malicious traffic and allow it to pass inspection. See Zero-day malware stream scanning on page 2226 for more details.
Use external malware block list	Enable to use one or more external blocklist file hashes. • *Block*: block the malicious traffic. • *Monitor*: log malicious traffic and allow it to pass inspection. • *All*: use all malware block lists. • *Specify*: select specific malware block lists. See External malware block list on page 2170and Malware hash external feed on page 4579 for more details.
Use EMS external feed	This option is available when at least one protocol is enabled for inspection and *AntiVirus scan* is enabled. Enable to use malware external feeds from FortiClient EMS. A FortiClient EMS Fabric connector with EMS external feed enabled is required. See EMS external feed on page 2171 for more details.

3. Click *OK*.

Protocol options

When applying an antivirus profile to a firewall policy, the protocol options profile defines parameters for handling protocol-specific traffic. These parameters affect functions such as the port mapping for inspecting each protocol, whether to log or block oversized files when performing AV scanning, enabling comfort client, and more. Protocol options profiles are configured by going to *Policy & Objects* > *Protocol Options*, or in the CLI under `config firewall profile-protocol-options`. See Protocol options on page 2028 for more information.

Scan mode

In proxy-based antivirus profiles, the scan mode can be set to either default or legacy. This setting can only be configured in the CLI. See Proxy mode stream-based scanning on page 2186 for more information.

To configure the scan mode:

```
config antivirus profile
    edit <name>
        set feature-set proxy
        set scan-mode {default | legacy}
    next
end
```

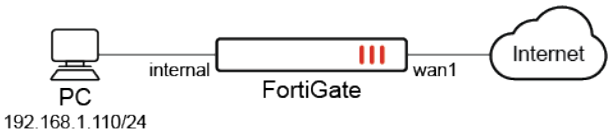
Testing an antivirus profile

Antivirus (AV) profiles can be tested using various file samples to confirm whether AV is correctly configured. In this topic, an AV profile is configured, applied to a firewall policy, and a user attempts to download sample virus test files hosted on eicar.org and fortiguard.com.

Different sample files are used to verify different features on the AV profile. The expectation is these files must be blocked by the AV profile, and the user should be presented with a block page.

File	Test case
EICAR test file	A plain text EICAR test file (hosted on eicar.org over a HTTPS connection) to test basic AV scanning on the FortiGate using deep inspection.
AI sample file	A machine learning sample file to test AI-based malware detection on the FortiGate.
Virus outbreak (VO) sample file	A zero-day sample virus file to test the outbreak prevention feature of the AV profile.
Behavioral-based samples	Files that are detected by a sandbox. This requires FortiSandbox integration with the FortiGate.

For the following AV test cases, the test PC has an IP of 192.168.1.110/24 and is connected to the internal1 interface. It accesses the internet through the wan1 interface.



Configuring the AV profile

The *default* AV profile is used, and the *Use FortiGuard outbreak prevention database* setting is enabled with the action set to block.

To configure the AV profile:

1. Go to *Security Profiles* > *AntiVirus* and edit the *default* profile.
2. In the *Virus Outbreak Prevention* section, enable *Use FortiGuard outbreak prevention database* and select *Block*. See FortiGuard outbreak prevention on page 2224 for more information about this setting.
3. Configure the other settings as needed (see Configuring an antivirus profile on page 2171).
4. Click *OK*.

By default, the FortiOS AV Engine has AI-based malware detection enabled (`set machine-learning-detection enable`) . The AV Engine AI malware detection model integrates into regular AV scanning to help detect potentially malicious Windows Portable Executables (PEs) in order to mitigate zero-day attacks. See AI-based malware detection on page 2171 for more information.

To verify the status of the AV Engine AI contract:

```
# diagnose autoupdate versions | grep AI -A6
AI/Machine Learning Malware Detection Model
---------
Version: 2.12588 signed
Contract Expiry Date: Tue Jul  9 2024
Last Updated using scheduled update on Tue Sep  5 08:23:15 2023
```

```
Last Update Attempt: Tue Sep  5 09:23:00 2023
Result: No Updates
```

Configuring the SSL SSH profile and firewall policy

The PC will be accessing and downloading the test files using HTTPS from the EICAR and the FortiGuard websites. Since HTTPS traffic is encrypted traffic, in order for the FortiGate to scan the encrypted traffic and inspect it for viruses and malware, it should act as the machine-in-the-middle to decrypt this communication and then re-encrypt it to send it to the website. Deep inspection must be enabled in the SSL SSH profile that will be applied to the firewall policy (see Deep inspection on page 2621). The *custom-deep-inspection* profile is modified to remove the *fortinet* FQDN address from the exemption list.

To configure the SSL SSH profile:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and edit the *custom-deep-inspection* profile.
2. In the *Exempt from SSL Inspection* section, locate the *fortinet* FQDN entry in the *Addresses* field, and click the *X* to delete it.
3. Click *OK*.

To configure the firewall policy:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
2. Configure the following settings:

Name	*To Internet*
Incoming Interface	*internal1*
Outgoing Interface	*wan1*
AntiVirus	Enable and select *default*.
SSL Inspection	Select *custom-deep-inspection*.

3. Configure the other settings as needed (see Firewall policy on page 1777).

   The feature set setting (proxy or flow) in the antivirus profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based antivirus profile must be used with a flow-based firewall policy.

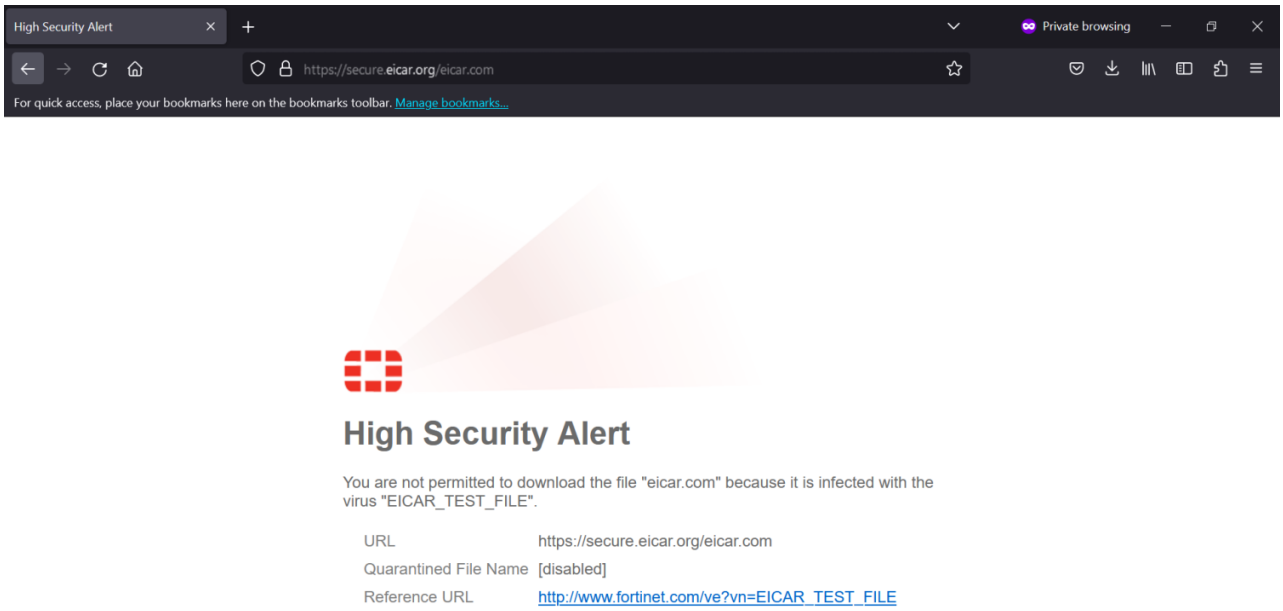
4. Click *OK*.

Example 1: EICAR test file

EICAR hosts anti-malware test files, which are available to download from https://www.eicar.org/download-anti-malware-testfile.

To test the AV profile with the EICAR test file:

1. On the PC, go to the EICAR website and download the *eicar.com* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.



3. Check the antivirus statistics on the FortiGate, `HTTP virus detected` increases by one:

```
# diagnose ips av stats show
 AV stats:
 HTTP virus detected: 1
 HTTP virus blocked: 0
 SMTP virus detected: 0
 SMTP virus blocked: 0
 POP3 virus detected: 0
 POP3 virus blocked: 0
 IMAP virus detected: 0
 IMAP virus blocked: 0
 NNTP virus detected: 0
 NNTP virus blocked: 0
 FTP virus detected: 0
 FTP virus blocked: 0
 SMB virus detected: 0
 SMB virus blocked: 0
```

4. Check the antivirus statistics using an SNMP walk:

```
root:~# snmpwalk -c public -v 1 10.1.100.6 1.3.6.1.4.1.12356.101.8.2.1.1
 iso.3.6.1.4.1.12356.101.8.2.1.1.1 = Counter32: 2  (fgAvVirusDetected)
 iso.3.6.1.4.1.12356.101.8.2.1.1.2 = Counter32: 1  (fgAvVirusBlocked)
 iso.3.6.1.4.1.12356.101.8.2.1.1.3 = Counter32: 1  (fgAvHTTPVirusDetected)
 iso.3.6.1.4.1.12356.101.8.2.1.1.4.1 = Counter32: 0
```

```
iso.3.6.1.4.1.12356.101.8.2.1.1.5.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.6.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.7.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.8.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.9.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.10.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.11.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.12.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.13.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.14.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.15.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.16.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.17.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.18.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.19.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.20.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.21.1 = Counter32: 0
iso.3.6.1.4.1.12356.101.8.2.1.1.22.1 = Counter32: 0
```

5. Verify the AV log.
   a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.

   b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-08-30 time=14:51:26 eventtime=1693432286598227820 tz="-0700" logid="0211008192"
type="utm" subtype="virus" eventtype="infected" level="warning" vd="root" policyid=1
poluuid="c65fa590-4758-51ee-4d28-f2cc75f14979" policytype="policy" msg="File is infected."
action="blocked" service="HTTPS" sessionid=15797 srcip=192.168.1.110 dstip=89.238.73.97
srcport=64641 dstport=443 srccountry="Reserved" dstcountry="Germany" srcintf="internal1"
```

```
srcintfrole="undefined" dstintf="wan1" dstintfrole="wan" srcuuid="ab8d1c24-30b1-51ee-138a-
f7be846c205d" dstuuid="ab8d1c24-30b1-51ee-138a-f7be846c205d" proto=6 direction="incoming"
filename="eicar.com" quarskip="Quarantine-disabled" virus="EICAR_TEST_FILE"
viruscat="Virus" dtype="av-engine" ref="http://www.fortinet.com/ve?vn=EICAR_TEST_FILE"
virusid=2172 url="https://secure.eicar.org/eicar.com" profile="default" agent="Mozilla/5.0

analyticssubmit="false" crscore=50 craction=2 crlevel="critical"
```

6. Optionally, reset the antivirus statistics to zero:

```
# diagnose ips av stats clear
```

See CLI troubleshooting cheat sheet for log gathering, analysis, and troubleshooting.

Example 2: AI sample file

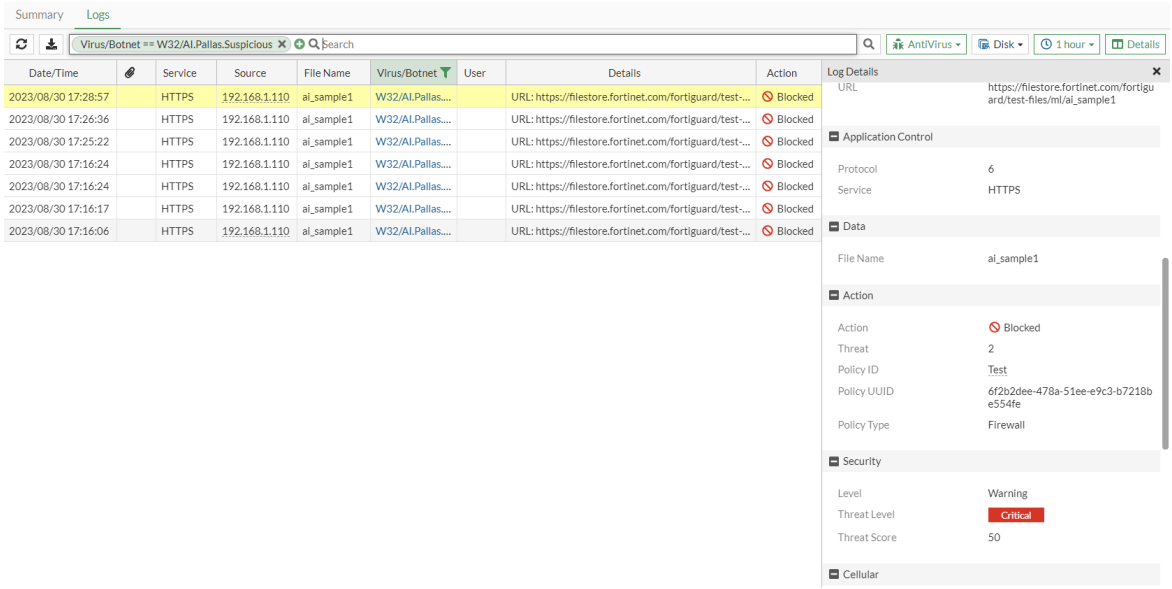
FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from https://www.fortiguard.com/sample-files.

To test the AV profile with the AI sample file:

1. On the PC, go to the FortiGuard website and download the *AI Sample* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.

   The file is blocked due to AI-based malware detection and will be logged. Files detected by the AV Engine AI are identified with the W32/AI.Pallas.Suspicious virus signature in the AV logs.
3. Verify the AV log.

a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.



b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-08-30 time=17:28:57 eventtime=1693441737721077640 tz="-0700" logid="0211008192"
type="utm" subtype="virus" eventtype="infected" level="warning" vd="root" policyid=1

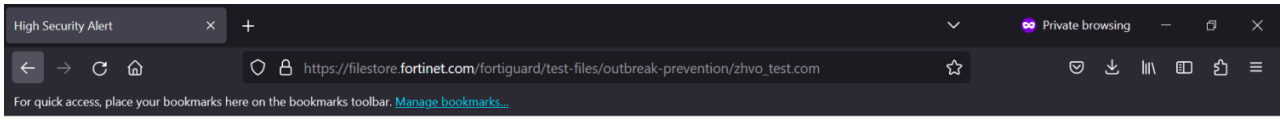
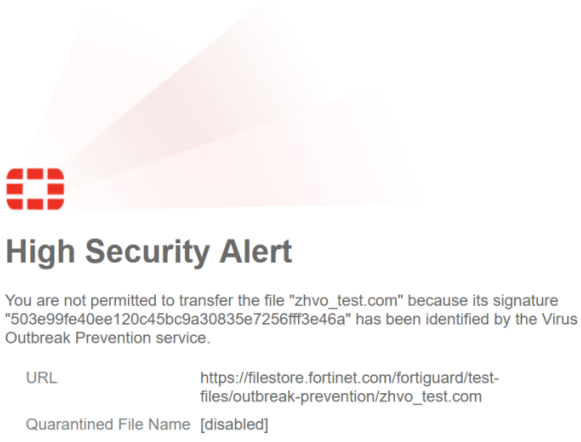
Example 3: VO sample file

To test the AV profile with the VO sample file:

1. On the PC, go to the FortiGuard website and download the *VO Sample* file.
2. The download attempt is blocked by the FortiGate's *default* AV profile, and a block page appears in the PC's browser.

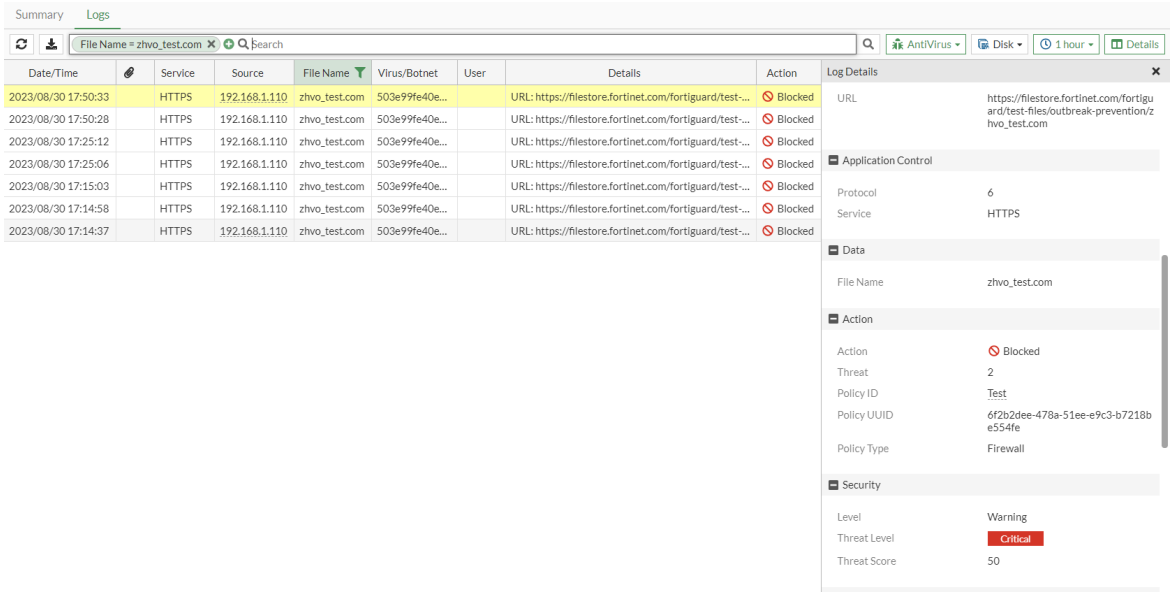




The file is blocked due to the virus outbreak protection service and database that is enabled in the *default* AV profile.

3. Verify the AV log.

a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.



b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-08-30 time=17:50:33 eventtime=1693443033509250120 tz="-0700" logid="0204008202"

analyticssubmit="false" crscore=50 craction=2 crlevel="critical"
```

Example 4: behavioral-based samples detected by a sandbox

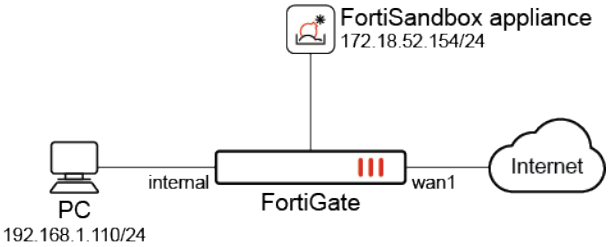
The FortiGate can be integrated with FortiSandbox appliance (used in this example), FortiSandbox Cloud, or FortiGate Cloud Sandbox. See Configuring sandboxing on page 4214 for more information about configuring the different FortiSandbox sandbox solutions.

There are two types of scan strategies that can be used in an AV profile.

- Inline: files are sent to the FortiSandbox, and the FortiGate waits for a verdict before completing the file transfer to the client (see Using FortiSandbox inline scanning with antivirus on page 2196).

- Post-transfer: files are sent to the FortiSandbox, but the FortiGate does not wait for a verdict and completes the file transfer to the client (see Using FortiSandbox post-transfer scanning with antivirus on page 2194).
  - After the FortiSandbox scans and presents a verdict, it updates its malware signature database and the FortiGate retrieves the malware signature database from FortiSandbox if the FortiSandbox database on page 2192 is enabled.
  - If a user attempts to download the file again, the FortiGate will either block or allow the download depending on the FortiSandbox verdict.

This example uses the inline AV scan strategy with a Windows executable sample file, and assumes that the scan profile has already been configured in FortiSandbox. See Verify the FortiSandbox Analysis in the FortiSandbox Administration Guide for more information.



To test the AV profile with a Windows executable sample file:

1. Integrate the FortiGate with the FortiSandbox appliance using the Security Fabric (see Configuring sandboxing on page 4214).
2. Update the AV profile to use inline scanning (see FortiSandbox appliance inline scanning).
3. On the PC, go to the FortiGuard website, hover over the *Windows Executable* link, right-click, and select the browser's option to copy the link.
4. Open another browser tab, paste the URL, and append the URL with `&s=<string>`, such as `https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt`.

   Every file download attempt from the FortiGuard website downloads a new file. Downloading a file with same `<string>` ensures that the downloaded file is the same, and not a new file. A file named windows.exe starts to download.

   Since inline AV scanning is in use, the client's file is held while it is sent to FortiSandbox for inspection. During this time, the FortiGate may apply client comforting (see Protocol options on page 2028) by leaking a certain amount of bytes at a certain time interval to the client.

   Once a verdict is returned from FortiSandbox, the appropriate action (allow or block) is performed on the held file. If there is an error connecting to the FortiSandbox or a timeout on the FortiSandbox scanning the file within the default 50 seconds, the file can be passed, logged, or blocked based on FortiGate's configuration. In this example, the action is set to the default (`log-only`), which allows the file to be downloaded if FortiSandbox takes more than 50 seconds to present a verdict.

   In the first attempt, the windows.exe file is downloaded on the client's PC if FortiSandbox takes more than 50 seconds for scanning the file, after which the FortiGate encounters a scan timeout.

   a. To change the FortiSandbox error and timeout settings in the AV profile, enter the following in the CLI:

```
config antivirus profile
   edit <name>
       set fortisandbox-error-action {ignore | log-only | block}
```

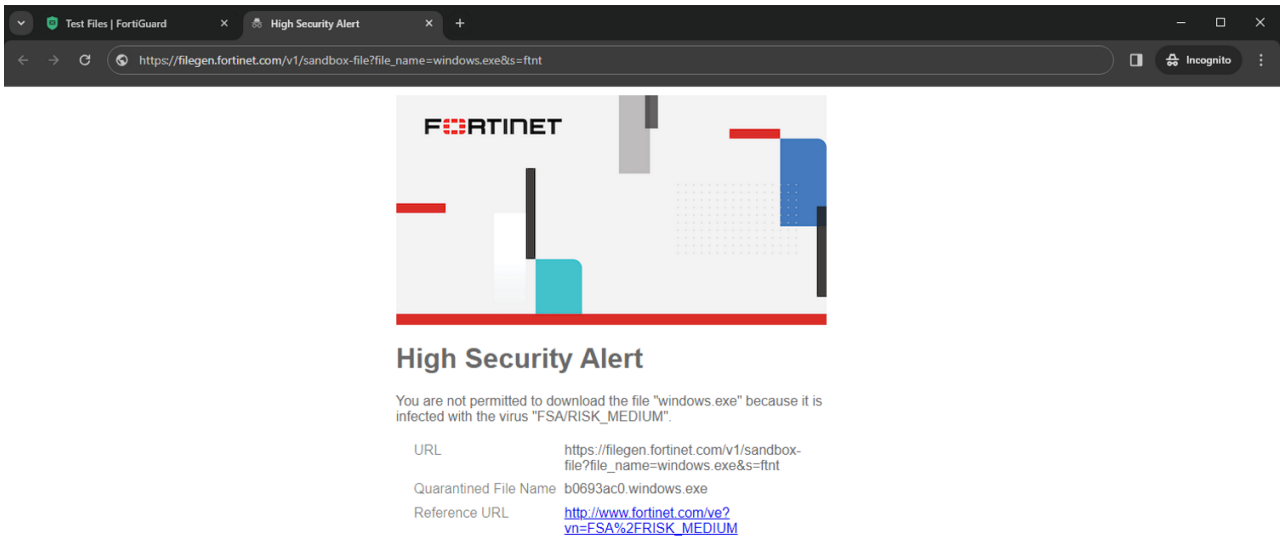
```
        set fortisandbox-timeout-action {ignore | log-only | block}
    next
end
```

`fortisandbox-error-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters an error reaching the FortiSandbox: • `ignore`: take no action • `log-only`: log the FortiSandbox inline scan error, but allow the file (default) • `block`: block the file upon FortiSandbox inline scan error
`fortisandbox-timeout-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters a scan timeout: • `ignore`: take no action • `log-only`: log the FortiSandbox inline scan timeout, but allow the file (default) • `block`: block the file upon FortiSandbox inline scan timeout

5. Verify the AV log:

```
# execute log filter category 2
# execute log display
date=2023-11-01 time=11:30:45 eventtime=1698863444363194189 tz="-0700" logid="0209008225"
type="utm" subtype="virus" eventtype="inline-block" level="notice" vd="root" policyid=1
poluuid="6f2b2dee-478a-51ee-e9c3-b7218be554fe" policytype="policy" msg="Inline Block scan
timeout." action="monitored" service="HTTPS" sessionid=946497 srcip=192.168.1.110
dstip=149.5.234.147 srcport=57497 dstport=443 srccountry="Reserved" dstcountry="France"
srcintf="internal1" srcintfrole="undefined" dstintf="wan1" dstintfrole="wan"
srcuuid="a051eeb2-5284-51ee-99d0-d8b19cb7439d" dstuuid="6c43f8d6-478a-51ee-95d8-31177232e869"
proto=6 direction="incoming" filename="windows.exe" quarskip="No-quarantine-for-inline-block-
error" url="https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt
profile="default" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KHTML,
like Gecko) Chrome/118.0.0.0 Safari/537.36" httpmethod="GET" analyticssubmit="false"
icbaction="timeout" crscore=50 craction=2 crlevel="critical"
```

6. After FortiSandbox finishes scanning the file (typically between one to three minutes), attempt to re-download the file using the same URL and separator (`https://filegen.fortinet.com/v1/sandbox-file?file_name=windows.exe&s=ftnt`).
7. The file is now blocked by the FortiGate, and a *High Security Alert* block page appears in the PC's browser.



8. Verify the AV log again.
   a. In the GUI, go to *Log & Report* > *Security Events* and select the *AntiVirus* card. Select the log entry and click *Details*.

   b. In the CLI, enter the following:

```
# execute log filter category 2
# execute log display
date=2023-11-01 time=11:46:34 eventtime=1698864393856143209 tz="-0700" logid="0211009234"
type="utm" subtype="virus" eventtype="infected" level="warning" vd="root" policyid=1
poluuid="6f2b2dee-478a-51ee-e9c3-b7218be554fe" policytype="policy" msg="File reported
infected by Sandbox." action="blocked" service="HTTPS" sessionid=946497

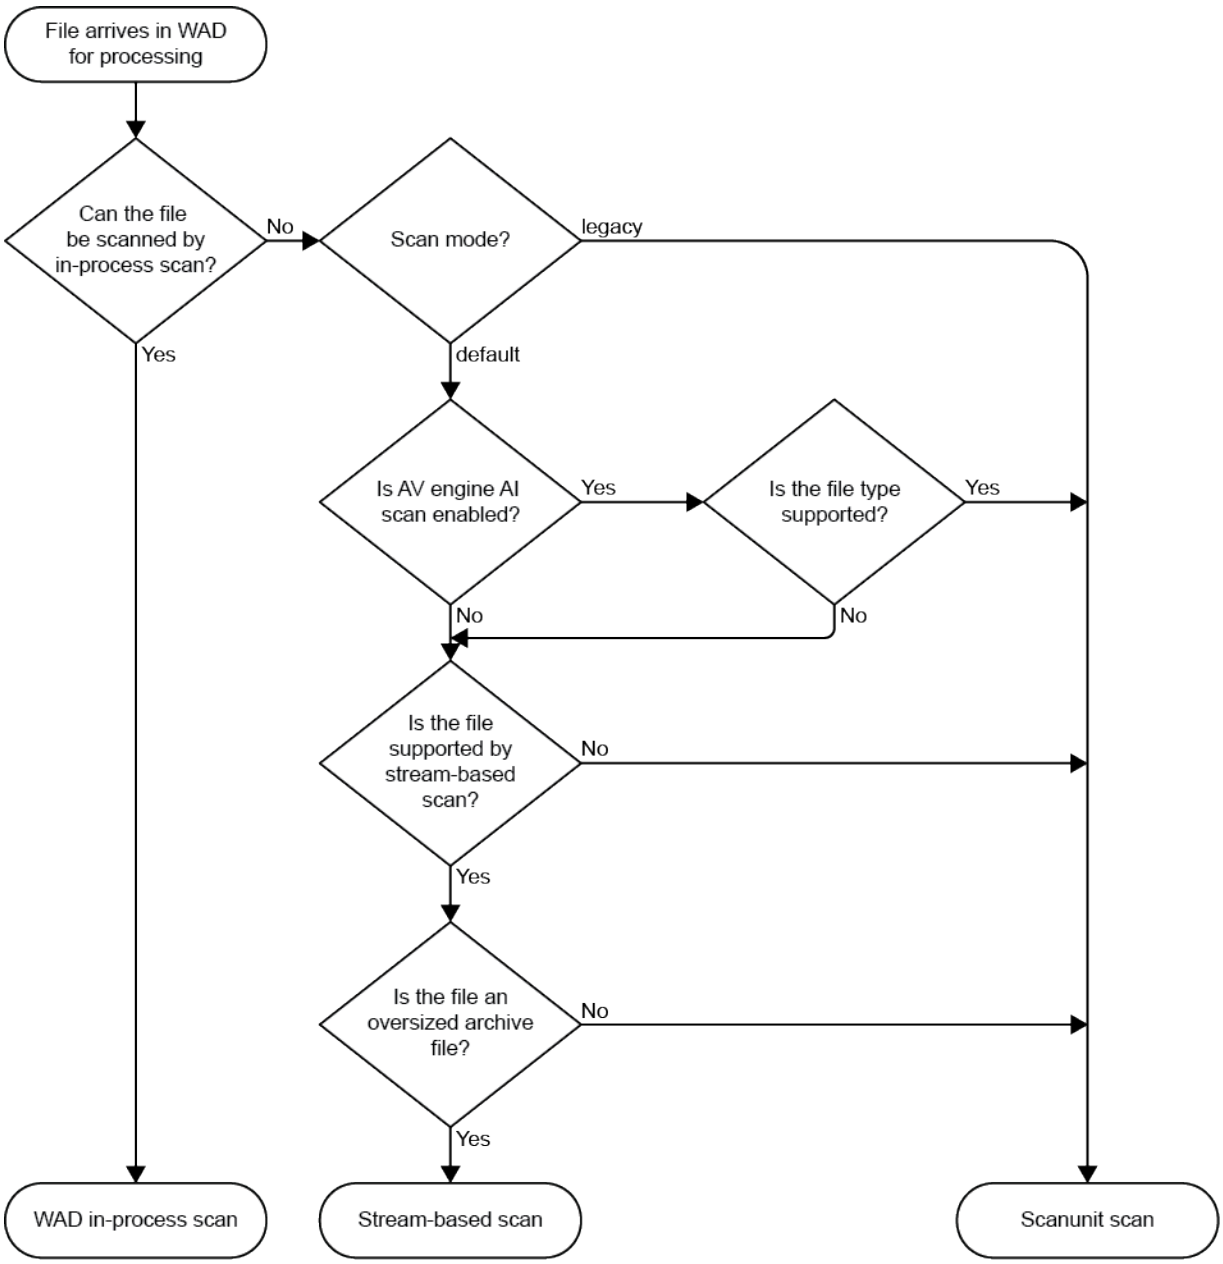
analyticssubmit="false" crscore=10 craction=2 crlevel="medium"
```

Proxy mode stream-based scanning

In proxy mode, AV scanning is processed as follows:



Can the file be scanned by in-process scan?

- This is determined by the WAD daemon.
- In-process scan can be used for simple AV configurations to quickly scan a file without handing it off to another process.
- The following, more complex feature sets cannot be processed by in-process scan:
  - AV engine AI scan
  - DLP
  - Quarantine
  - FortiGuard outbreak prevention, external block list, and EMS external feed
  - Content disarm

Scan mode?

- To configure the scan mode:

```
config antivirus profile
    edit <name>
        set feature-set proxy
        set scan-mode {default | legacy}
    next
end
```

`default`	Enable stream-based scanning (default).
`legacy`	Disable stream-based scanning.

Is AV engine AI scan enabled?

- When enabled, supported files (such as EXE, PDF, and MS Office) are forwarded to the scanunit scan.
- AV engine AI scan is enabled by default. To disable it:

```
config antivirus settings
    set machine-learning-detection disable
end
```

Is the file supported by stream-based scan?

- Stream-based scan supports the following archive file types: ZIP, GZIP, BZIP2, TAR, and ISO (ISO 9660).
- In FortiOS 7.0, stream-based scan is supported in HTTP(S), FTP(S), and SCP/SFTP.
- In FortiOS 6.4 and 6.2, stream-based scan is only supported in HTTP(S).
- Stream-based scan does not support HTTP POST.
- Stream-based scan is not supported when the following features are enabled:
  - DLP
  - Quarantine
  - FortiGuard outbreak prevention, external block list, and EMS external feed
  - Content Disarm
- If a file is not supported, it is buffered and sent to scanunit for scanning.

Is the file an oversized archive file?

- An oversized archive file is a compressed file that is oversized according to the following setting:

```
config firewall profile-protocol-options
    edit <profile>
        config <protocol>
            set oversize-limit <size>
        end
    next
end
```

- If the file is not oversized, it is buffered and sent to scanunit for scanning.

Notes

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 for more information.

Stream-based scans:

- Are performed with no oversize limits on a best effort basis.
- Can inspect the contents of large archive files without buffering the entire file.
- Decompress and scan the entire archive.
- Can cache infected scan results and clean the scan results (this is enabled by default):

```
config antivirus settings
    set cache-infection-result enable
    set cache-clean-result enable
end
```

Legacy scan mode:

- Used to disable stream-based scanning for troubleshooting purposes.
- Limited by the oversize and uncompressed-oversize limits:

```
config firewall profile-protocol-options
    edit <profile>
        config <protocol>
            set oversize-limit <size>
            set uncompressed-oversize-limit <size>
        end
    next
end
```

TCP windows

Some file transfer applications can negotiate large TCP windows. For example, WinSCP can negotiate an initial TCP window size of about 2 GB.

The TCP window options can be used to prevent overly large initial TCP window sizes, helping avoid channel flow control issues. It allows stream-based scan's flow control to limit peers from sending data that exceeds a policy's configured oversize limit.

To configure TCP window size options:

```
config firewall profile-protocol-options
    edit <string>
        config {http | ftp | ssh | cifs}
            set stream-based-uncompressed-limit <integer>
            set tcp-window-type {auto-tuning | system | static | dynamic}
            set tcp-window-size <integer>
            set tcp-window-minimum <integer>
            set tcp-window-maximum <integer>
        end
    next
end
```

{http | ftp | ssh | cifs}	• http: Configure HTTP protocol options. • ftp: Configure FTP protocol options. • ssh: Configure SFTP and SCP protocol options. • cifs: Configure CIFS protocol options.
stream-based-uncompressed-limit <integer>	The maximum stream-based uncompressed data size that will be scanned, in MB (default = 0 (unlimited)). Stream-based uncompression used only under certain conditions.).
tcp-window-type {auto-tuning | system | static | dynamic}	The TCP window type to use for this protocol. • auto-tuning: Allow the system to auto-tune TCP window size (default). • system: Use the system default TCP window size for this protocol. • static: Manually specify the TCP window size. • dynamic: Vary the TCP window size based on available memory within the limits configured in tcp-window-minimum and tcp-window-maximum.
tcp-window-size <integer>	The TCP static window size (65536 - 16777216, default = 262144). This option is only available when tcp-window-type is static.
tcp-window-minimum <integer>	The minimum TCP dynamic window size (65536 - 1048576, default = 131072). This option is only available when tcp-window-type is dynamic.
tcp-window-maximum <integer>	The maximum TCP dynamic window size (1048576 - 16777216, default = 8388608). This option is only available when tcp-window-type is dynamic.

Flow mode stream-based scanning

In flow mode with AV engine 7.0, FortiOS automatically uses stream-based antivirus scanning for HTML and Javascript files. The AV engine determines the necessary amount of file payload to buffer and scans the partial buffer in certain instances, eliminating the need to cache the entire file, and potentially improving memory usage.

Prior to AV engine 7.0, flow AV operates in a hybrid mode where the IPS engine will attempt an in-process AV scan by default. If the built-in AV engine in the IPS process indicates a full scan is required, the file is sent to the

`scanunit` process for a full scan. In this scenario, the whole file is cached before `scanunit` can begin scanning the file.

With this stream-based AV scanning enhancement, the built-in AV engine in the IPS process can attempt to scan HTML and Javascript files as it buffers the file. This provides better performance and potentially less memory usage overall compared to a full scan.

The full antivirus scanning method is retained for file types and configurations unsupported by stream-based scanning.

The following table summarizes the types of scans and when they are automatically used:

Default antivirus scan	• Automatically uses stream-based scanning in flow mode for HTML and Javascript files. • Automatically scans other supported files using the flow DB. • Triggers a legacy scan for unsupported configurations and file types.

Full antivirus scan	• Automatically used for files types unsupported by default antivirus scans.
	• Automatically used when any of the following antivirus scanning features are enabled:
	  • Machine learning-based malware detection (`set machine-learning-detection`)
	  • Extreme antivirus database (`set use-extreme-db`)
	  • Antivirus PUP/PUA grayware checks
	  • Mobile malware database (`set mobile-malware-db`)
	  • External block list (`set external-blocklist`)
	  • EMS external feed
	  • FortiGuard outbreak prevention
	• Automatically used when any of the following scanning features are used:
	  • Data loss prevention (DLP)
	  • File filter

Example

When the default antivirus scan is used, the AV engine uses stream-based scanning to partially buffer the file and scan it:

```
# diagnose debug application ipsengine 0x1000
diagnose sys scanunit debug all
diagnose debug enable
...
[flav-402] open file size: 68, ftype: 0
[flav-402] flowav config allows quickscan: yes
[flav-402] fsa_enabled=0 fsa_mode=2
[flav-402] heur=0 (0) bz2=1 fsa_ft=0 grayware=0 scantypes: 1
[flav-402] av_flow_write_0 flav_ctx=0x7f35a61a1000, buflen=68, rc = 2
[flav-402] file is infected or suspicious. Wait until file close due to av_exempt enabled
[flav-402] ips_avscan_file_close
[flav-402] [118]: quickscan_close() flav_ctx=0x7f35a61a1000, rc = 2
[flav-402] [118]: cached length 0, flow_bytes 68
```

```
[flav-402] [118]: virus EICAR_TEST_FILE detected!
[flav-402] quickscan_destroy(), flow_writes=1, flow_bytes=68, flav_ctx=0x7f35a61a1000
[flav-402] [118]: quickscan finalized with action 1
[flav-402] ips_avscan_file_close, action=1
[flav-402] ips_avscan_file_destroy
```

The above debug is taken while a user attempts to download an EICAR file. Partial buffering occurred and the file is scanned inside the IPS engine.

When the default antivirus scan (stream-based scanning) cannot be used for a file, the full antivirus scan is used, and the IPS engine buffers the entire file before sending it to `scanunit` for scanning:

```
# diagnose debug application ipsengine 0x1000
# diagnose sys scanunit debug all
# diagnose debug enable
...
[flav-496] [41]: quickscan_close() flav_ctx=0x7fdfc41a1000, rc = -7
[flav-496] [41]: file requires fullscan
[flav-496] attempting switch to fullscan
[flav-496] succesfully switched to fullscan
[flav-496] got FlowAV fullscan request: query_id=41 view_id=3 file_size=12939
[flav-496] quickscan_destroy(), flow_writes=10, flow_bytes=12939, flav_ctx=0x7fdfc41a1000
su 2388 open
```

The Flow AV statistics monitor can be used to view whether the default or full (legacy) scan method was used:

```
# diagnose test app ipsmonitor 24

pid: 23498 from 20240404-09:23:05 to 20240404-09:23:59
av_failopen: enabled
    FlowAV mmap                   : 0
    FlowAV file open              : 0
    FlowAV timeout                : 0
    FlowAV req success            : 0
    FlowAV req fail               : 0
    FlowAV req retry success      : 0
    FlowAV req retry fail         : 0
    FlowAV bypassed scan          : 0
    FlowAV buffer scan            : 0
    FlowAV file scan              : 0
    FlowAV interface file open    : 0
    FlowAV interface file close   : 0
    FlowAV interface file destroy : 0
    FlowAV ignored files          : 0
    FlowAV legacy scan            : 1
    FlowAV default scan           : 1
```

Databases

The antivirus scanning engine uses a virus signatures database to record the unique attributes of each infection. The antivirus scan searches for these signatures and when one is discovered, the FortiGate determines if the file is infected and takes action.

All FortiGates have the normal antivirus signature database. Some models have additional databases that you can use. The database you use depends on your network and security needs, and on your FortiGate model.

The extended virus definitions database is the default setting and provides comprehensive antivirus protection. Entry-level and some mid-range FortiGates cannot support the extreme database. The FortiGate 200G is the lowest model that supports the extreme database. All VMs support the extreme database. The `use-extreme-db` setting is only available on models that support the extreme database.

Extended	This is the default setting. This database includes currently spreading viruses, as determined by the FortiGuard Global Security Research Team, plus recent viruses that are no longer active. These viruses may have been spreading within the last year but have since nearly or completely disappeared.
Extreme	This includes the extended database, plus a large collection of zoo viruses. These are viruses that have not spread in a long time and are largely dormant. Some zoo viruses might rely on operating systems and hardware that are no longer widely used.

To change the antivirus database:

```
config antivirus settings
    set use-extreme-db {enable | disable}
end
```

FortiSandbox database

The *Use FortiSandbox database* setting in the Antivirus profile enables the FortiGate's antivirus engine to receive the latest malware signatures discovered by FortiSandbox that is stored inside FortiSandbox's malware database. By enabling *Use FortiSandbox database*, FortiGate uses these signatures from the malware database along with its existing antivirus signature database for scanning.The antivirus engine scan searches for the malware signature database and antivirus signature database in tandem to check for a match. Once a signature match is discovered, the FortiGate determines if the file is infected and takes action.

The malware signature database supplements the existing antivirus signature database on the FortiGate. This setting is useful if a FortiSandbox solution (either FortiGate Sandbox Cloud, FortiSandbox Cloud, or the FortiSandbox appliance) is deployed.

If you have multiple FortiGates deployed and FortiSandbox is in use, if *Use FortiSandbox database* is enabled in the Antivirus profile, it will enable all FortiGates to download the malware signature database from your FortiSandbox. This can prevent zero-day attacks discovered by the FortiSandbox. FortiSandbox can also be configured to submit its malware signature database with Fortinet Inc. Community by enabling the required *Contribute* settings under your scan profile. See Scan Profile Advanced Tab in the FortiSandbox Administration Guide for information on the scan profile.

FortiGuard labs later release the required submitted signatures in the form of Antivirus updates which can be downloaded by the FortiGates worldwide through FortiGuard updates. See Configuring FortiGuard updates on page 3793.

To enable using the FortiSandbox database in an antivirus profile in the GUI:

1. Go to *Security Profile* > *AntiVirus*.
2. Select the default profile and click *Edit*.
3. Under the *APT Protection Options*, enable *Use FortiSandbox database*.
4. Click *OK* to save the changes.
5. Apply this default profile to the respective firewall policy.

To enable using the FortiSandbox database in an antivirus profile in the CLI:

```
config antivirus profile
    edit “default”
        set analytics-db enable
    next
end
```

It is best practice to keep the `analytics-db` enabled.

To use the antivirus profile in a firewall policy:

```
config firewall policy
    edit 1
        set name "policyid-1"
        set srcintf "lan"
        set dstintf "wan"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set ssl-ssh-profile "certificate-inspection"
        set av-profile "default"
        set nat enable
    next
end
```

Once the Antivirus profile is configured to use the FortiSandbox database and submit files to FortiSandbox, and the antivirus profile is used in a firewall policy, the sharing of malware database from the FortiSandbox to the FortiGate needs to be configured. For information on submitting files to FortiSandbox, see Using FortiSandbox post-transfer scanning with antivirus on page 2194.

The configuration depends on the type of FortiSandbox in use. The table below shows key differences in configuration:

Type of FortiSandbox	Malware database sharing with the FortiGate
FortiSandbox Appliance/FortiSandbox VM (On-Premise)	Enabled using the Global network. See Global Network in the FortiSandbox Administration Guide.

Type of FortiSandbox	Malware database sharing with the FortiGate
FortiSandbox Cloud (PaaS)	Enabled by default.
FortiGate Cloud Sandbox (SaaS)	Enabled by default.

Advanced configurations

This section includes the following:

- Using FortiSandbox post-transfer scanning with antivirus on page 2194
- Using FortiSandbox inline scanning with antivirus on page 2196
- Using FortiNDR inline scanning with antivirus on page 2211
- Malware external feed from EMS on page 2214
- CIFS support on page 2216

Using FortiSandbox post-transfer scanning with antivirus

Antivirus profiles can submit potential zero-day viruses to FortiSandbox for inspection. Based on FortiSandbox's analysis, the FortiGate can supplement its own antivirus database with FortiSandbox's threat intelligence to detect files determined as malicious or suspicious. This augments the FortiGate antivirus with zero-day detection.

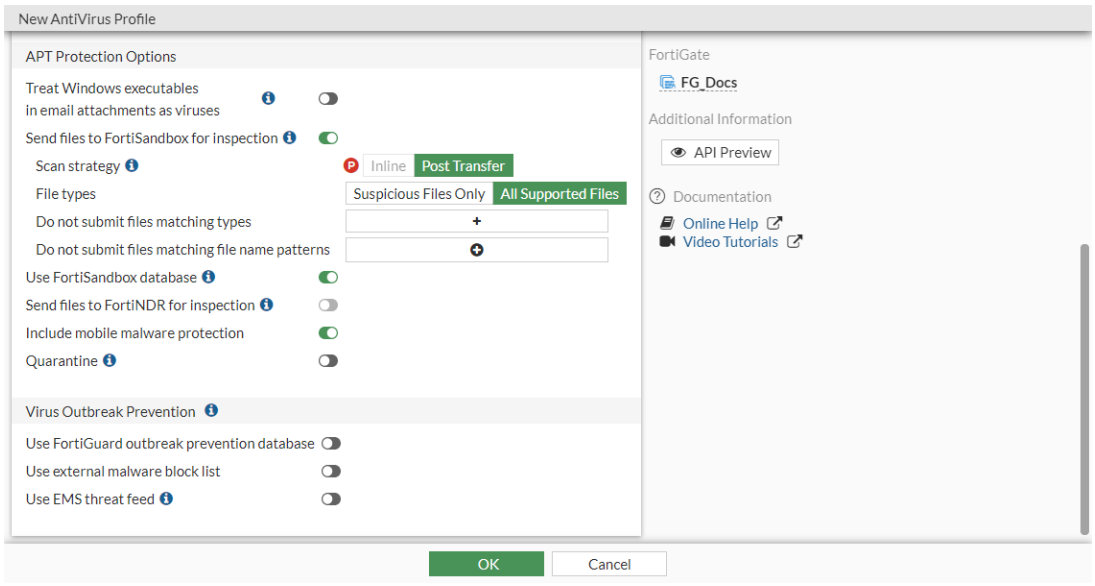
FortiSandbox can be used with antivirus in both proxy-based and flow-based inspection modes. The FortiGate first examines the file for any known viruses. When a match is found, the file is tagged as known malware. If no match is found, the files are forwarded to FortiSandbox using the following options:

- *All Supported Files*: all files matching the file types defined in the scan profile of the FortiSandbox are forwarded.
- *Suspicious Files Only*: files classified by the antivirus as having any possibility of active content are forwarded to FortiSandbox. When using FortiGate Cloud Sandbox, we recommend selecting this option due to its submission limits.
- *None*: files are not forwarded to FortiSandbox.

For more information, see Configuring sandboxing on page 4214.

To enable FortiSandbox inspection in an antivirus profile:

1. Go to *Security Profiles* > *AntiVirus*.
2. Create, edit, or clone an antivirus profile.
3. In the *APT Protection Options* section, set *Send Files to FortiSandbox for Inspection* to either *Suspicious Files Only* or *All Supported Files*.
4. Optionally, for *Do not submit files matching types*, click the *+* to exclude certain file types from being sent to FortiSandbox.
5. Optionally, for *Do not submit files matching file name patterns*, click the *+* to enter a wildcard pattern to exclude files from being sent to FortiSandbox.



6. Enable *Use FortiSandbox Database*.
7. Click *OK*.

FortiGate diagnostics

To view the detection count:

```
# diagnose test application quarantined 7
Total: 0

Statistics:
        vfid: 0, detected: 2, clean: 1252, risk_low: 6, risk_med: 2, risk_high: 1, limit_reached:0
```

To verify the address is configured correctly:

```
# diagnose test application quarantined 1
…
fortisandbox-fsb1 is enabled: analytics, realtime=yes, taskfull=no
addr=172.18.52.154/514, source-ip=0.0.0.0, keep-alive=no. ssl_opt=3, hmac_alg=0
…
```

To run the diagnostics for real-time debugging:

```
# diagnose debug application quarantined -1
# diagnose debug enable
```

To check the FortiGate Cloud server status:

```
# diagnose test application forticldd 3
…
```

```
    Active APTServer status:  up
```

To view FortiGate Cloud Sandbox submission statistics for advanced debugging:

```
# diagnose test application quarantined 2
```

FortiSandbox diagnostics

To run the OFTP debug for advanced debugging:

```
# diagnose-debug device <client serial number>
```

Using FortiSandbox inline scanning with antivirus

FortiSandbox inline scanning can be used in proxy and flow mode. When inline scanning is enabled, the client's file is held while it is sent to FortiSandbox for inspection. During this time, the FortiGate may apply client comforting (see Protocol options on page 2028). For example, leaking a certain amount of bytes at a certain time interval to the client. Once a verdict is returned, the appropriate action (allow or block) is performed on the held file. If there is an error connecting to the FortiSandbox or a timeout on the FortiSandbox scanning the file, the file can be passed, logged, or blocked based on FortiGate's configuration. For more information, see Configuring sandboxing on page 4214.

When using FortiSandbox inline scanning in flow mode, you can utilize sandboxing alongside other flow-mode features, such as IPS; streamlining security operations by improving threat detection capabilities without the need to switch to proxy mode.

This topic describes how to configure the FortiSandbox inline scanning as follows:

- FortiSandbox appliance inline scanning on page 2196
- Configuring proxy-mode FortiSandbox inline scanning on page 2198
- FortiGuard AI-based Inline Malware Prevention Service on page 2201
- FortiSandbox scanning error and timeout actions on page 2206
- Verifying flow-mode FortiSandbox inline scanning for HTTP actions on page 2206
- Verifying flow-mode FortiSandbox inline scanning for FTP actions on page 2208
- Verifying flow-mode FortiSandbox inline scanning for POP3 actions on page 2209

FortiSandbox appliance inline scanning

Inline scanning requires a FortiSandbox appliance running version 4.2 or later, and the FortiSandbox must be reachable by port 4443. See Understanding Inline Block feature in the FortiSandbox Best Practices for more information.

FortiSandbox inline scanning is disabled by default. FortiSandbox inline scanning is best used in conjunction with AV engine scanning since there is a higher rate of detection by using both at the same time.

To enable FortiSandbox inline scanning:

```
config system fortisandbox
    set status enable
    set inline-scan {enable | disable}
    set server <fortisandbox_server_ip>
end
```

To configure the FortiSandbox scanning options in an antivirus profile:

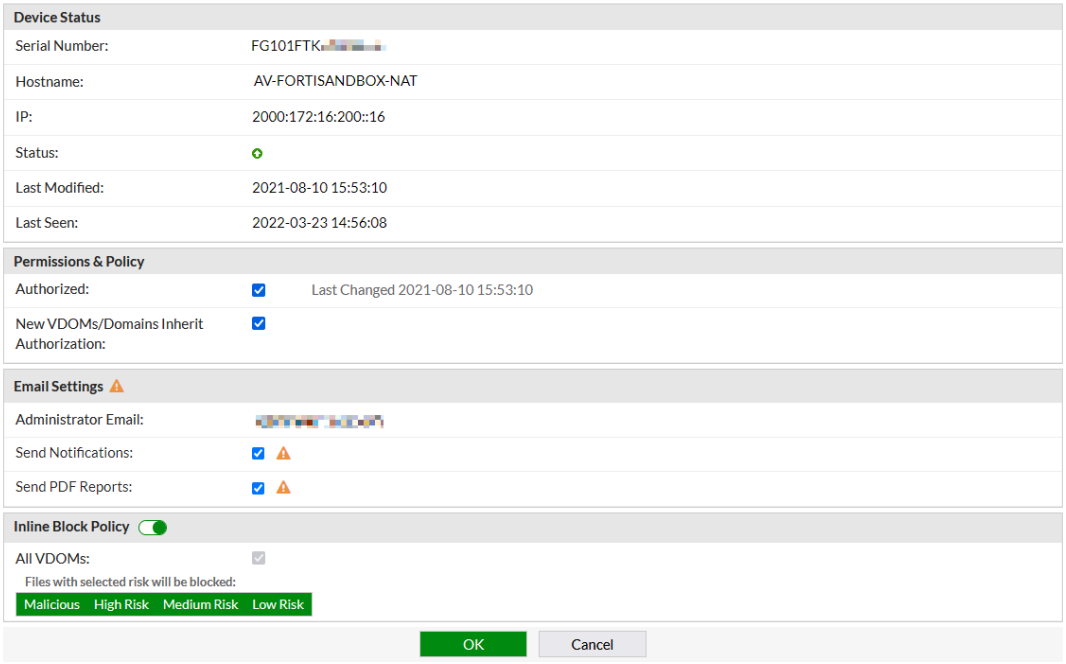
```
config antivirus profile
    edit <name>
        set feature-set {proxy | flow}
        set fortisandbox-mode {inline | analytics-suspicious | analytics-everything}
        set fortisandbox-error-action {ignore | log-only | block}
        set fortisandbox-timeout-action {ignore | log-only | block}
        set fortisandbox-max-upload <integer>
        set fortisandbox-scan-timeout <integer>
        config {http | ftp | imap | pop3 | smtp | mapi | cifs | ssh}
            set av-scan {disable | block | monitor}
            set fortisandbox {disable | block | monitor}
        end
    next
end
```

Command	Description
`feature-set {proxy | flow}`	Set the inline scanning mode type.
`fortisandbox-mode {inline | analytics-suspicious | analytics-everything}`	Set the FortiSandbox scan mode: • `inline`: FortiSandbox inline scanning • `analytics-suspicious`: FortiSandbox post-transfer scanning; submit supported files if heuristics or other methods determine they are suspicious • `analytics-everything`: FortiSandbox post-transfer scanning; submit supported files and known infected files (default)
`fortisandbox-error-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters an error reaching the FortiSandbox: • `ignore`: Allow the file to pass, do not log the error. • `log-only`: Allow the file to pass, but log the connection error. (Default) • `block`: Block the file if a sandboxing error occurs.
`fortisandbox-timeout-action {ignore | log-only | block}`	Set the action to take if FortiSandbox inline scanning encounters a scan timeout: • `ignore`: Allow the file to pass, do not log the timeout. • `log-only`: Allow the file to pass, but log the timeout event. (Default) • `block`: Block the file if the scan times out.
`fortisandbox-max-upload <integer>`	Set the maximum size of files that can be uploaded to FortiSandbox (1 - 396, default = 10).

Command	Description
`fortisandbox-scan-timeout <integer>`	FortiSandbox inline scan timeout, in seconds (30 - 180, default = 60).
`av-scan {disable | block | monitor}`	Enable the antivirus scan service. Set to `block` or `monitor` to work with FortiSandbox (default = `disable`).
`fortisandbox {disable | block | monitor}`	Set the protocol level parameter for FortiSandbox file scanning: • `disable` (default), `block`, and `monitor` are available for inline scanning • `disable` (default) and `monitor` are available for post-transfer scanning

Configuring proxy-mode FortiSandbox inline scanning

This example assumes that *Inline Block Policy* is already enabled in FortiSandbox for the FortiGate with selected risk levels (see FortiGate devices in the FortiSandbox Administration Guide for more information). The inline block policy in this example blocks all risk levels: malicious, high risk, medium risk, and low risk.



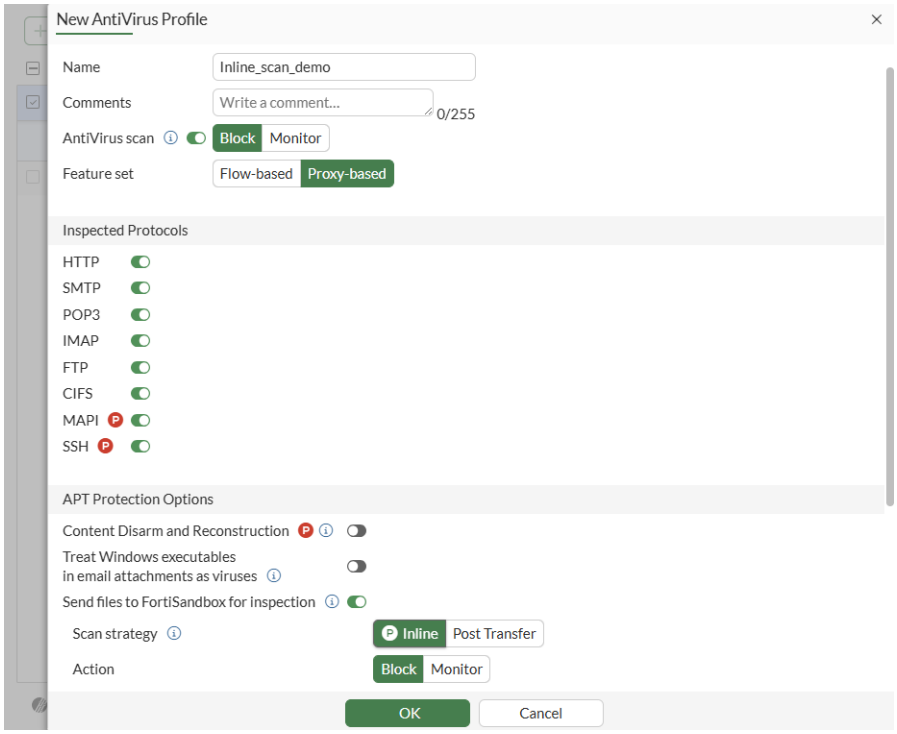
To configure proxy-mode FortiSandbox inline scanning in the GUI:

1. Enable FortiSandbox inline scanning globally:

```
config system fortisandbox
    set status enable
    set inline-scan enable
    set server "172.18.70.76"
end
```

2. Configure the antivirus profile:

a. Go to *Security Profiles* > *AntiVirus* and click *Create New*.
b. Set the *Feature set* to *Proxy-based*.
c. Enable the protocols to inspect.
d. Enable *AntiVirus scan* and set it to *Block*.
e. Enable *Send files to FortiSandbox* for inspection and set the *Action* to *Block*. The *Scan strategy* appears as *Inline* because it was configured in the CLI.



f. Click *OK*.

To configure proxy-mode FortiSandbox inline scanning in the CLI:

1. Enable FortiSandbox inline scanning globally:

```
config system fortisandbox
    set status enable
    set inline-scan enable
    set server "172.18.70.76"
end
```

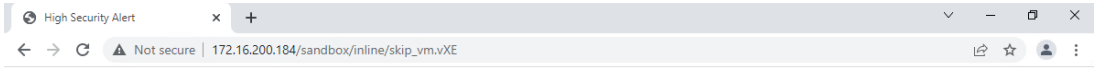
2. Configure the antivirus profile:

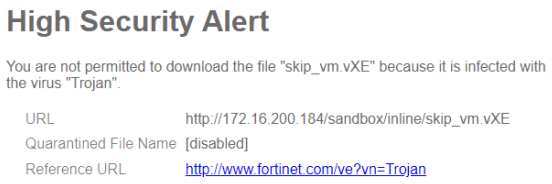
```
config antivirus profile
    edit "Inline_scan_demo"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set av-scan block
            set fortisandbox block
        end
```

```
        config ftp
            set av-scan block
            set fortisandbox block
        end
        config imap
            set av-scan block
            set fortisandbox block
        end
        config pop3
            set av-scan block
            set fortisandbox block
        end
        config smtp
            set av-scan block
            set fortisandbox block
        end
        config mapi
            set av-scan block
            set fortisandbox block
        end
        config cifs
            set av-scan block
            set fortisandbox block
        end
        config ssh
            set av-scan block
            set fortisandbox block
        end
    next
end
```

To verify that infected files are blocked inline:

1. On a client, open a web browser and download an infected file.
2. The file is held while being scanned by FortiSandbox. Once FortiSandbox determines that file's risk level is not tolerated by the inline block policy, the FortiGate drops the connection and displays a replacement message that the file cannot be downloaded.





3. In FortiOS, view the antivirus log.

- In the GUI, go to *Log & Report* > *Security Events* and click the *AntiVirus* card.
- In the CLI:

```
# execute log filter category 2
# execute log display
1 logs found.
1 logs returned.

FortiGuard AI-based Inline Malware Prevention Service

Inline scanning is supported when the FortiGate is licensed with the FortiGuard AI-based Inline Malware Prevention Service (IL MPS). It works similar to inline scanning for the FortiSandbox appliance, where the file that is being processed is first checked locally by the FortiGate. If it requires further analysis, the file is sent to the IL MPS for inspection. The file is submitted along with the following, additional information:

- Device configuration (VDOM, service)
- Username
- Device identifiers
- IP address
- Suspicious URL
- Suspicious files

The file and the above additional information remain in the FortiSandbox where they are evaluated by its multi-layered process leveraging its contained AI model. The information is not shared outside the FortiSandbox service with other large learning models. After the rating of either suspicious or clean is sent back to the FortiGate, the cloud-based service keeps the file, collected information, and derived information based on the retention period of 3 days and 60 days for files rated as Clean and Suspicious, respectively.

Inline scanning is supported for FortiSandbox appliances, FortiNDR, and IL MPS. On a FortiGate, only a single inline scanning type can be configured at one time.

To configure IL MPS scanning in the GUI:

1. Enable the FortiGate Cloud feature visibility:
   a. Go to *System* > *Feature Visibility*.
   b. In the *Additional Features* section, enable *FortiGate Cloud Sandbox*.
   c. Click *Apply*.
2. Configure the *Sandbox* Fabric connector:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *Sandbox* card.
   b. In the *Settings* tab, set the *Type* to *FortiGate Cloud*.
   c. Select a *Region*.
   d. Enable *Inline scan*.
   e. Click *OK*.
3. Configure the antivirus profile:
   a. Go to *Security Profiles* > *AntiVirus* and click *Create New*.
   b. Set the *Feature set* to *Proxy-based*.
   c. Enable the protocols to inspect.
   d. Enable *Send files to FortiSandbox* for inspection.
   e. Set the *Scan strategy* to *Inline*, and set the *Action* to *Block*.

   f. Click *OK*.

To configure IL MPS scanning in the CLI:

1. Disable FortiSandbox appliance and FortiSandbox Cloud:

```
config system fortisandbox
    set status disable
end
```

2. Configure FortiGate Cloud Sandbox:

```
# execute forticloud-sandbox region
0  Global
1  Europe
2  Japan
3  US
Please select cloud sandbox region[0-3]:0
Cloud sandbox region is selected: Global
```

3. Enable inline scanning for FortiGate Cloud:

```
config system fortiguard
    set sandbox-region "Global"
    set sandbox-inline-scan enable
end
```

4. Configure the antivirus profile:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set fortisandbox block
        end
        config ftp
            set fortisandbox block
        end
        config imap
            set fortisandbox block
        end
        config pop3
            set fortisandbox block
        end
        config smtp
            set fortisandbox block
        end
        config mapi
            set fortisandbox block
        end
        config cifs
            set fortisandbox block
        end
        config ssh
            set fortisandbox block
        end
        set scan-mode default
    next
end
```

To verify that infected files are blocked inline:

1. On a client, open a web browser and download an infected file using HTTP.
2. The file is held while being scanned by FortiGate Cloud Sandbox. Once FortiGate Cloud Sandbox determines that file's risk level is not tolerated, the FortiGate drops the connection and displays a replacement message that the file cannot be downloaded.
3. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

1: date=2022-07-12 time=16:31:26 eventtime=1657668686245018328 tz="-0700" logid="0210008232"
type="utm" subtype="virus" eventtype="fortisandbox" level="warning" vd="vdom1" policyid=1
poluuid="54c06312-01fd-51ed-0db5-10c9586a0c2e" policytype="policy" msg="Blocked by
FortiSandbox." action="blocked" service="HTTP" sessionid=19934 srcip=10.1.100.191
dstip=172.16.200.194 srcport=51688 dstport=80 srccountry="Reserved" dstcountry="Reserved"
srcintf="port1" srcintfrole="undefined" dstintf="port9" dstintfrole="undefined"
srcuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0" dstuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0"
proto=6 direction="incoming" filename="skip_vm.vXE" quarskip="Quarantine-disabled"

fsaseverity="high-risk" fsafileid=0 fsafiletype="exe" crscore=50 craction=2 crlevel="critical"
```

To verify that infected files are monitored:

1. Edit the antivirus profile to monitor files over HTTP:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set fortisandbox monitor
        end
    next
end
```

2. On a client, open a web browser and download an infected file using HTTP.
3. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

1: date=2022-07-12 time=16:34:25 eventtime=1657668865371976563 tz="-0700" logid="0210008233"
type="utm" subtype="virus" eventtype="fortisandbox" level="notice" vd="vdom1" policyid=1
poluuid="54c06312-01fd-51ed-0db5-10c9586a0c2e" policytype="policy" msg="Detected by
FortiSandbox." action="monitored" service="HTTP" sessionid=20002 srcip=10.1.100.191
```

```
dstip=172.16.200.194 srcport=51724 dstport=80 srccountry="Reserved" dstcountry="Reserved"
srcintf="port1" srcintfrole="undefined" dstintf="port9" dstintfrole="undefined"
srcuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0" dstuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0"
proto=6 direction="incoming" filename="skip_vm.vXE" quarskip="Quarantine-disabled"
virus="Unknown" viruscat="Trojan" dtype="fortisandbox"
ref="http://www.fortinet.com/ve?vn=Unknown" virusid=0
url="http://172.16.200.194/sandbox/inline/skip_vm.vXE" profile="av" agent="curl/7.68.0"
httpmethod="GET" analyticssubmit="false" fsaaction="deny" fsaverdict="block"
fsaseverity="high-risk" fsafileid=0 fsafiletype="exe" crscore=50 craction=2 crlevel="critical"
```

To verify that infected files are blocked inline if a scan timeout occurs:

1. Edit the antivirus profile to block files over HTTP and when there is a scan timeout:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set fortisandbox block
        end
        set fortisandbox-timeout-action block
    next
end
```

2. On a client, open a web browser and download a large ZIP file (clean file).
3. When the scan timeout occurs, a replacement message appears that *The file "zipfile.zip" is still being scanned and will be released once complete. Please try the transfer again in a few minutes.*
4. Verify the antivirus log:

```
# execute log display
1 logs found.
1 logs returned.

1: date=2022-07-12 time=16:44:51 eventtime=1657669491697816069 tz="-0700" logid="0210008236"
type="utm" subtype="virus" eventtype="fortisandbox" level="warning" vd="vdom1" policyid=1
poluuid="54c06312-01fd-51ed-0db5-10c9586a0c2e" policytype="policy" msg="FortiSandbox scan
timeout." action="blocked" service="HTTP" sessionid=20258 srcip=10.1.100.191
dstip=172.16.200.194 srcport=51830 dstport=80 srccountry="Reserved" dstcountry="Reserved"
srcintf="port1" srcintfrole="undefined" dstintf="port9" dstintfrole="undefined"
srcuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0" dstuuid="1cb467b6-01fd-51ed-8abf-72abd959c0d0"
proto=6 direction="incoming" filename="zipfile.zip" quarskip="Quarantine-disabled"
url="http://172.16.200.194/sandbox/zipfile.zip" profile="av" agent="curl/7.68.0"
httpmethod="GET" analyticssubmit="false" fsaaction="timeout" fsafileid=0 crscore=50 craction=2
crlevel="critical"
```

5. After a few minutes, download the ZIP file again.
6. When the scan is complete on the FortiSandbox side, the file is downloaded and no log is generated because the scan deemed that the file is clean.

FortiSandbox scanning error and timeout actions

In this example, the HTTP protocol settings for `av-scan` and `fortisandbox` in the AV profile are both set to `block`. All files traversing HTTP in this configuration are scanned by the AV engine first, and then by FortiSandbox inline scanning for further file analysis. Based on the FortiSandbox results, FortiOS will take the appropriate action.

Files can be blocked if they contain a scan error or timeout. The scan timeout is configured in FortiSandbox and set to 50 seconds. If the file scan takes longer than 50 seconds, FortiSandbox returns a timeout to the FortiGate, and file is dropped with the current configuration. If a user tries to download the same file again, the cached result is provided by FortiSandbox to the FortiGate based on the previous file scan.

This example assumes FortiSandbox inline scanning has been configured globally. The FortiGate will block the file if there is an inline scanning error or timeout.

To configure the antivirus profile to block files if there is an inline scanning error or timeout:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        set fortisandbox-mode inline
        config http
            set av-scan block
            set fortisandbox block
        end
        set fortisandbox-error-action block
        set fortisandbox-timeout-action block
    next
end
```

If the administrator decides to take more risk and scan all files traversing HTTP, but log or ignore an inline scanning error or timeout, the profile is modified as follows:

```
config antivirus profile
    edit "av"
        set fortisandbox-error-action {log-only | ignore}
        set fortisandbox-timeout-action {log-only | ignore}
    next
end
```

The AV engine is still used first, followed by FortiSandbox inline scanning. The FortiGate will log or ignore the file if there is an inline scanning error or timeout, and the file is allowed to pass through.

Verifying flow-mode FortiSandbox inline scanning for HTTP actions

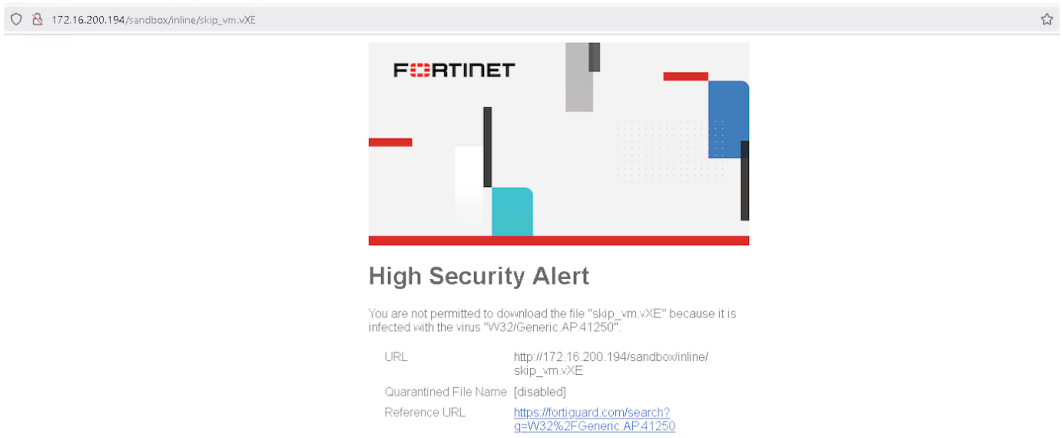
In the following example, FortiSandbox inline scanning in flow mode is set to block HTTP actions. Downloading a malicious file sample on HTTP is blocked.

To block HTTP actions through FortiSandbox inline scanning in flow mode:

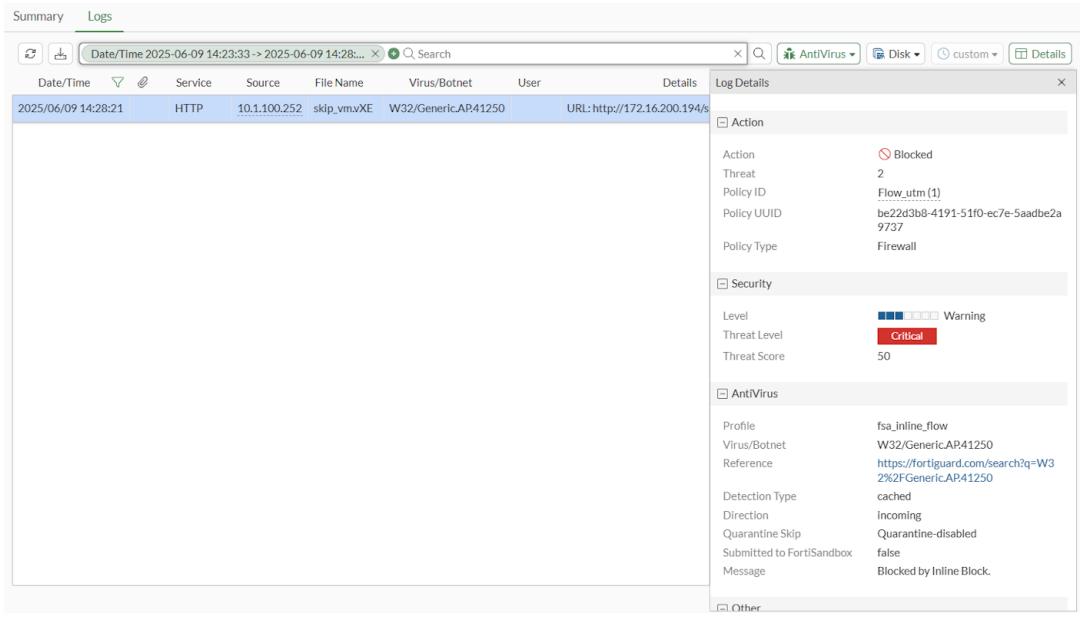
1. Configure FortiSandbox inline scanning in flow mode:

```
config antivirus profile
    edit "fsa_inline_flow"
        set fortisandbox-mode inline
        config http
            set fortisandbox block
        end
    next
end
```

2. Attempt to download a malicious file sample on HTTP. The action is blocked.



3. View the logs in the GUI:



4. View the logs in the CLI:

```
# execute log display

Verifying flow-mode FortiSandbox inline scanning for FTP actions

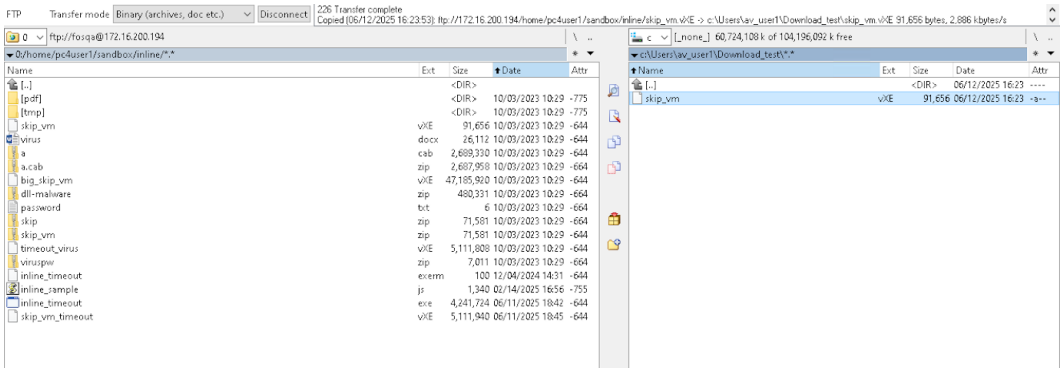
In the following example, FortiSandbox inline scanning in flow mode is set to monitor FTP actions. Uploading a malicious file sample on FTP is monitored.

To monitor FTP actions through FortiSandbox inline scanning in flow mode:

1. Configure FortiSandbox inline scanning in flow mode:

```
config antivirus profile
    edit "fsa_flow_inline"
        set fortisandbox-mode inline
        config ftp
            set fortisandbox monitor
        end
    next
end
```

2. Attempt to upload a malicious file sample on FTP. The action is monitored.



3. View the logs:

```
# execute log display

1: date=2025-06-12 time=16:19:56 eventtime=1749770396462744989 tz="-0700" logid="0209008221"

Verifying flow-mode FortiSandbox inline scanning for POP3 actions

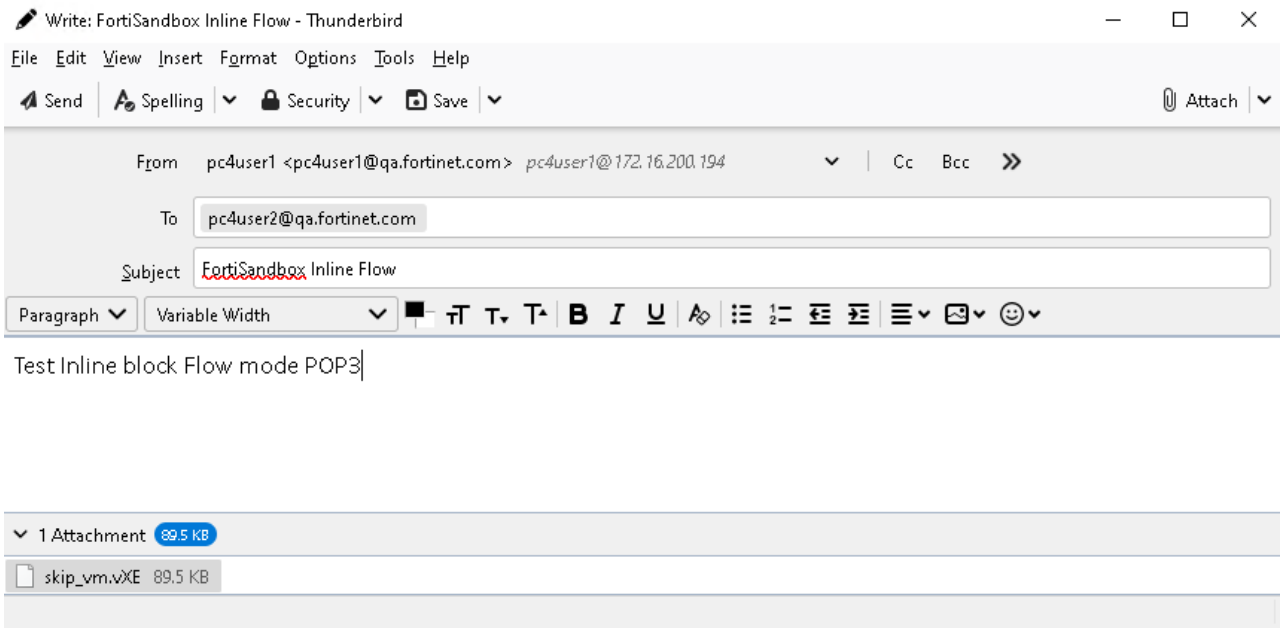
In the following example, FortiSandbox inline scanning in flow mode is set to block POP3 actions. Downloading a malicious file sample on POP3 is blocked.

To block POP3 actions through FortiSandbox inline scanning in flow mode:

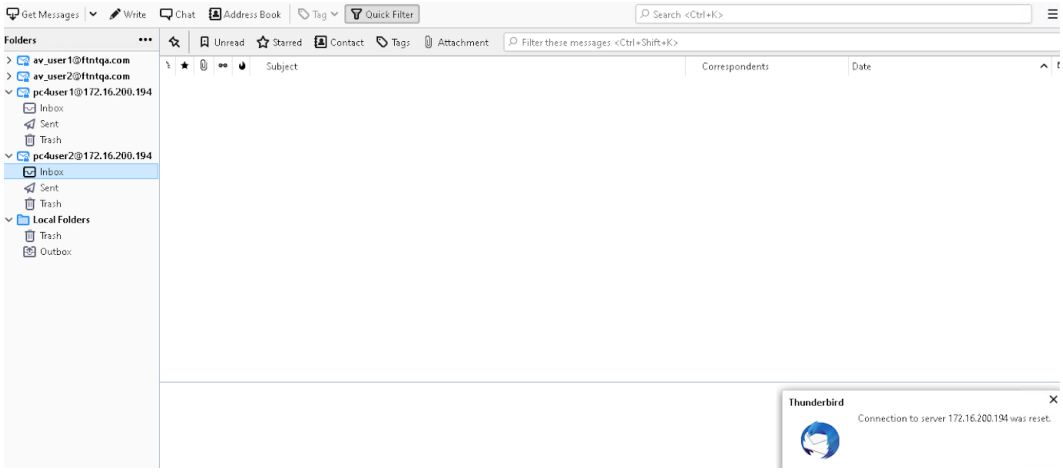
1. Configure FortiSandbox inline scanning in flow mode:

```
config antivirus profile
    edit "fsa_inline_flow"
        set fortisandbox-mode inline
        config pop3
            set fortisandbox block
        end
    next
end
```

2. A malicious file is emailed to the client on POP3.



The email is blocked.



3. View the logs:

```
# execute log display

1: date=2025-06-12 time=17:02:06 eventtime=1749772926320332178 tz="-0700" logid="0209008220"

```

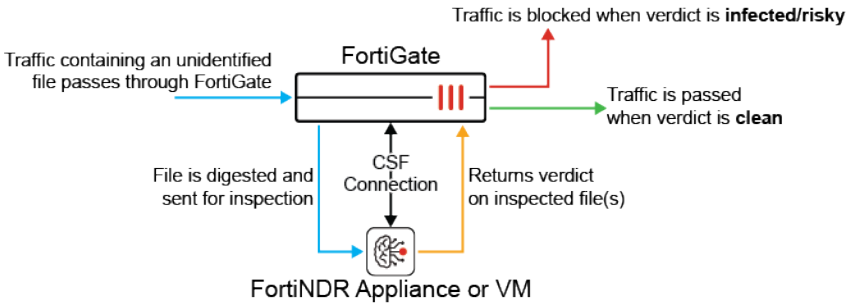
Using FortiNDR inline scanning with antivirus

FortiNDR can be used with antivirus profiles in proxy inspection mode (flow mode is currently not supported). FortiNDR inspects high-risk files and issues a verdict to the firewall based on how close the file features match those of malware. When enabled, FortiNDR can log, block, ignore, or monitor (allow) the file based on the verdict.



A licensed FortiNDR appliance is required to use this feature. Check the FortiNDR release notes for support information.

To configure FortiNDR inline inspection with an AV profile:

1. Configure FortiNDR to join a Security Fabric in FortiOS (see Configuring FortiNDR on page 4246).
2. On the FortiOS, enable inline inspection:

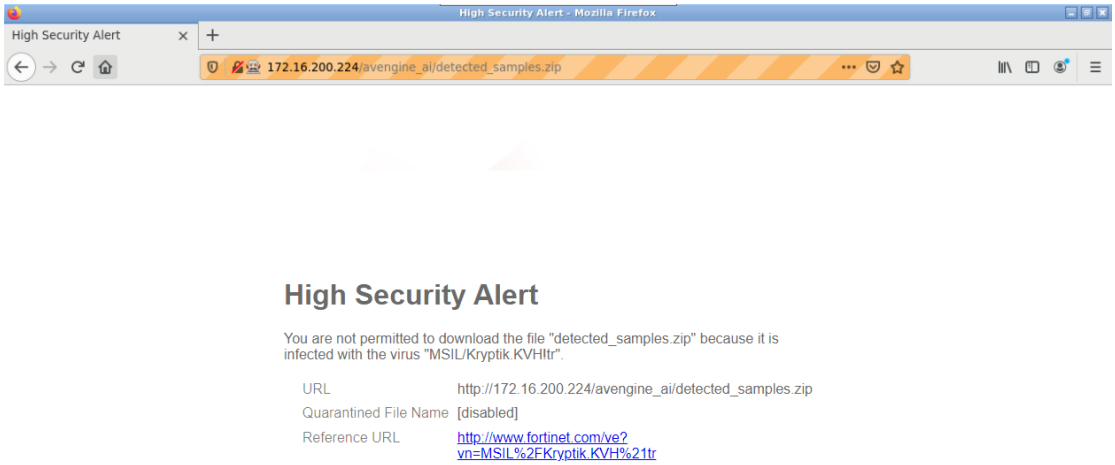
```
config system fortindr
    set status enable
end
```

3. Configure an antivirus profile to use inline inspection and block detected infections:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        config http
            set fortindr block
        end
        config ftp
            set fortindr block
        end
        config imap
            set fortindr block
        end
        config pop3
            set fortindr block
```

```
        end
        config smtp
            set fortindr block
        end
        config mapi
            set fortindr block
        end
        config nntp
            set fortindr block
        end
        config cifs
            set fortindr block
        end
        config ssh
            set fortindr block
        end
    next
end
```

4. Add the antivirus profile to a firewall policy. When potential infections are blocked by FortiNDR inline inspection, a replacement message appears (see Replacement messages on page 3766 for more information). An infection blocked over HTTP looks similar to the following:



Sample log

```
date=2021-04-29 time=15:12:07 eventtime=1619734327633022960 tz="-0700" logid="0209008221"
type="utm" subtype="virus" eventtype="fortindr" level="notice" vd="vdom1" policyid=1 msg="Detected
by FortiNDR." action="monitored" service="HTTP" sessionid=13312 srcip=10.1.100.221
dstip=172.16.200.224 srcport=50792 dstport=80 srcintf="wan2" srcintfrole="wan" dstintf="wan1"
dstintfrole="wan" proto=6 direction="incoming" filename="detected_samples.zip" quarskip="File-was-
not-quarantined" virus="MSIL/Kryptik.KVH!tr" dtype="fortindr"
ref="http://www.fortinet.com/ve?vn=MSIL%2FKryptik.KVH%21tr" virusid=0
url="http://172.16.200.224/avengine_ai/detected_samples.zip" profile="av" agent="curl/7.68.0"
analyticssubmit="false" crscore=50 craction=2 crlevel="critical"
```

FortiNDR inline inspection with other AV inspection methods

The following inspection logic applies when FortiNDR inline inspection is enabled simultaneously with other AV inspection methods. The AV engine inspection and its verdict always takes precedence because of performance. The actual behavior depends on which inspected protocol is used.

HTTP, FTP, SSH, and CIFS protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
   a. FortiNDR inline inspection occurs simultaneously.
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
   a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
   a. FortiNDR inline inspection occurs simultaneously.

If any AV inspection method returns an infected verdict, the FortiNDR inspection is aborted.

POP3, IMAP, SMTP, NNTP, and MAPI protocols:

1. AV engine scan; AV database and FortiSandbox database (if applicable).
2. AV engine machine learning detection for WinPE PUPs (potentially unwanted programs).
   a. FortiNDR inline inspection occurs simultaneously.
3. Outbreak prevention and external hash list resources.
   a. FortiNDR inline inspection occurs simultaneously.

In an AV profile, use `set fortindr-error-action {log-only | block | ignore}` to configure the action to take if FortiNDR encounters an error.

Accepted file types

The following file types are sent to FortiNDR for inline inspection:

7Z	HTML	RTF
ARJ	JS	TAR
BZIP	LZH	VBA
BZIP2	LZW	VBS
CAB	MS Office documents (XML and non-XML)	WinPE (EXE)
ELF	PDF	XZ
GZIP	RAR	ZIP

Malware external feed from EMS

A FortiGate can pull malware external feeds from FortiClient EMS, which in turn receives malware hashes detected by FortiClients. The malware hash can be used in an antivirus profile when AV scanning is enabled with block or monitor actions. This feature is supported in proxy and flow mode.

If an external malware blocklist and the FortiGuard outbreak prevention database are also enabled in the antivirus profile, the checking order is: AV local database, EMS external feed, external malware blocklist, FortiGuard outbreak prevention database. If the EMS external feed and external malware blocklist contain the same hash value, then the EMS infection will be reported if both of them are blocked.

To configure an EMS external feed in an antivirus profile in the GUI:

1. Enable the EMS external feed:
   a. Go to *Security Fabric* > *Fabric Connectors* and double-click the *FortiClient EMS* card.
   b. Enable *EMS external feed* for an EMS server.
   c. Configure the other settings if needed (see Configuring FortiClient EMS on page 4182 for more details).
   d. Click *OK*.
2. Create the antivirus profile:
   a. Go to *Security Profiles* > *AntiVirus* and click *Create New*.
   b. In the *Virus Outbreak Prevention* section, enable *Use EMS external feed*.
   c. Configure the other settings as needed.

   d. Click *OK*.

To configure an EMS external feed in an antivirus profile in the CLI:

1. Enable the EMS external feed:

```
config endpoint-control fctems
    edit 2
        set status enable
        set name "WIN10-EMS"
        set server "192.168.20.10"
        set https-port 443
        set source-ip 0.0.0.0
        set pull-sysinfo enable
        set pull-vulnerabilities enable
        set pull-tags enable
        set pull-malware-hash enable
        unset capabilities
        set call-timeout 30
        set websocket-override disable
    next
end
```

2. Create the antivirus profile:

```
config antivirus profile
    edit "av"
        config http
            set av-scan block
        end
        config ftp
            set av-scan block
        end
        config imap
            set av-scan block
        end
        config pop3
            set av-scan block
        end
        config smtp
            set av-scan block
        end
        config cifs
            set av-scan block
        end
        set external-blocklist-enable-all enable
        set ems-threat-feed enable
    next
end
```

Sample log

```
# execute log filter category utm-virus
# execute log display
```

```
1: date=2021-03-19 time=16:06:46 eventtime=1616195207055607417 tz="-0700" logid="0208008217"

CIFS support

Antivirus scanning on Common Internet File System (CIFS) traffic is supported in flow-based and proxy-based inspection. The file filter profile handles the configuration of file filtering on CIFS. The antivirus profile handles the antivirus configuration for CIFS scanning.

File filtering for CIFS is performed by inspecting the first 4 KB of the file to identify the file's magic number. If a match occurs, CIFS file filtering prevents the CIFS command that contains that file from running. The file filter functions differently for un-encrypted and encrypted CIFS traffic:

- For un-encrypted CIFS traffic, the standalone file filter works in flow and proxy mode.
- For encrypted CIFS traffic, the CIFS profile must be enabled in the firewall policy because the SMB server's credential settings are still be configured in CIFS profile. Using the standalone file filter only works in proxy mode.

For a CIFS profile to be available for assignment in a policy, the policy must use proxy inspection mode. See Proxy mode inspection on page 2140 for details. Note that in proxy inspection mode, special condition archive files (encrypted, corrupted, mailbomb, and so on) marked by the antivirus engine are blocked automatically.

Messages that are compressed with LZNT1, LZ77, and LZ77+Huffman algorithms can be scanned in proxy mode.

To configure file-type filtering and antivirus scanning on CIFS traffic:

1. Configure a CIFS domain controller on page 2217
2. Configure a CIFS profile on page 2217
3. Configure an antivirus profile on page 2219

Configure a CIFS domain controller

The domain controller must be configured when CIFS traffic is encrypted. The configuration tells the FortiGate the network location of the domain controller and the superuser credentials.

For FortiGate to retrieve the domain information, the user needs to grant Replicating Directory Changes permissions in the Domain Controller (DC). See How to grant the "Replicating Directory Changes" permission for the Microsoft Metadirectory Services ADMA service account for more information.

To configure the CIFS domain controller:

```
config user domain-controller
    edit "SERVER_NAME"
        set hostname "host"
        set domain-name "EXAMPLE.COM"
        set username "admin-super"
        set password *********
        set ip 172.16.201.40
    next
end
```

Configure a CIFS profile

To create a CIFS profile, configure the server credential type and create a file filter profile.

Set the CIFS server credential type

The CIFS server credential type can be none, `credential-replication`, or `credential-keytab`.

none

The CIFS profile assumes the CIFS traffic is unencrypted. This is the default value.

```
config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type none
        end
    next
end
```

credential-replication

To decrypt CIFS traffic, FortiOS obtains the session key from the domain controller by logging in to the superuser account. The domain controller must be configured.

```
config firewall profile-protocol-options
    edit "cifs"
```

```
        config cifs
            set server-credential-type credential-replication
            set domain-controller "SERVER_NAME"
        end
    next
end
```

Variable	Description
domain-controller <string>	The previously configured domain to decrypt CIFS traffic for.

credential-keytab

To decrypt CIFS traffic, FortiOS uses a series of keytab values. This method is used when the SMB connection is authenticated by Kerberos. Keytab entries must be configured, and are stored in FortiOS in plaintext.

```
config firewall profile-protocol-options
    edit "cifs"
        config cifs
            set server-credential-type credential-keytab
            config server-keytab
                edit "keytab1"
                    set keytab
"BQIAAABFAAEAC0VYQU1QTEUuQ09NAAdleGFtcGxlAAAAAVUmAlwBABIAILdV5P6NXT8RrTvapcMJQxDYCjRQiD0BzxhwS9h0V
gyM"
                next
            end
        end
    next
end
```

Variable	Description
keytab <keytab>	Base64 encoded keytab file containing the credentials of the server.

Configure CIFS file filtering

Multiple rules can be added to a file filter profile. See File filter on page 2442.

To configure a file filter for CIFS traffic:

```
config file-filter profile
    edit "cifs"
        set comment "block zip files on unencrypted cifs traffic"
        set feature-set flow
        set replacemsg-group ''
        set log enable
        config rules
            edit "rule1"
                set protocol cifs
                set action block
```

```
                set direction any
                set password-protected any
                set file-type zip
            next
        end
    next
end
```

Variable	Description
comment <string>	A brief comment describing the entry.
feature-set {flow | proxy}	Flow or proxy mode feature set (default = `flow`).
replacemsg-group <string>	Replacement message group.
log {enable | disable}	Enable/disable file filter logging (default = `enable`).
scan-archive-contents [enable | disable]	Enable/disable scanning of archive contents (default = `enable`).
protocol {http ftp smtp imap pop3 mapi cifs ssh}	Filter based on the specified protocol(s).
action {log-only | block}	The action to take for matched files: • `log-only`: Allow the content and write a log message (default). • `block`: Block the content and write a log message.
direction {incoming | outgoing | any}	Match files transmitted in the session's originating (`incoming`) and/or reply (`outgoing`) direction (default = `any`).
password-protected [yes | any]	Match only password-protected files (`yes`) or any file (default = `any`).
file-type <file_type>	The file types to be matched. See Supported file types on page 2444 for details.

Configure an antivirus profile

The antivirus profile handles the antivirus configuration for CIFS scanning.

To configure an antivirus profile:

```
config antivirus profile
    edit "av"
        ...
        config cifs
            set av-scan {disable | block | monitor}
            set outbreak-prevention {disable | block | monitor}
            set external-blocklist {disable | block | monitor}
            set quarantine {enable | disable}
            set archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb
fileslimit timeout unhandled}
            set archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb
```

```
fileslimit timeout unhandled}
            set emulator {enable | disable}
        end
    next
end
```

Variable	Description
av-scan	Enable antivirus scan service: • `disable`: Disable (default). • `block`: Block the virus infected files. • `monitor`: Log the virus infected files.
outbreak-prevention {disable | block | monitor}	Enable the virus outbreak prevention service: • `disable`: Disable (default). • `block`: Block the matched files. • `monitor`: Log the matched files.
external-blocklist {disable | block | monitor}	Enable the external blocklist: • `disable`: Disable (default). • `block`: Block the matched files. • `monitor`: Log the matched files.
quarantine {enable | disable}	Enable/disable quarantine for infected files (default = `disable`).
archive-block {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to block: • `encrypted`: Block encrypted archives. • `corrupted`: Block corrupted archives. • `partiallycorrupted`: Block partially corrupted archives. • `multipart`: Block multipart archives. • `nested`: Block nested archives. • `mailbomb`: Block mail bomb archives. • `fileslimit`: Block exceeded archive files limit. • `timeout`: Block scan timeout. • `unhandled`: Block archives that FortiOS cannot open.
archive-log {encrypted corrupted partiallycorrupted multipart nested mailbomb fileslimit timeout unhandled}	Select the archive types to log: • `encrypted`: Log encrypted archives. • `corrupted`: Log corrupted archives. • `partiallycorrupted`: Log partially corrupted archives. • `multipart`: Log multipart archives. • `nested`: Log nested archives. • `mailbomb`: Log mail bomb archives. • `fileslimit`: Log exceeded archive files limit. • `timeout`: Log scan timeout. • `unhandled`: Log archives that FortiOS cannot open.
emulator {enable | disable}	Enable/disable the virus emulator (default = `enable`).

Log samples

File-type detection events generated by CIFS profiles are logged in the `utm-file-filter` log category. Antivirus detection over the CIFS protocol generates logs in the `utm-virus` category. See the FortiOS Log Message Reference for more information.

Logs generated by CIFS profile file filter:

```

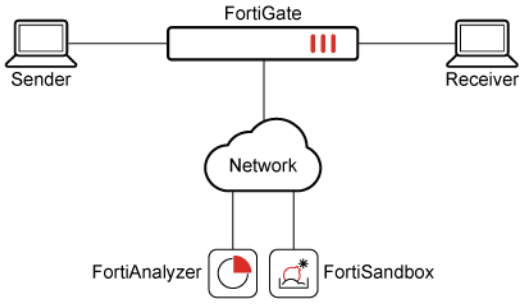
Configuration examples

This section includes the following examples:

- Content disarm and reconstruction on page 2222
- FortiGuard outbreak prevention on page 2224
- External malware block list on page 2233
- Exempt list for files based on individual hash on page 2236
- Downloading quarantined files in archive format on page 2237

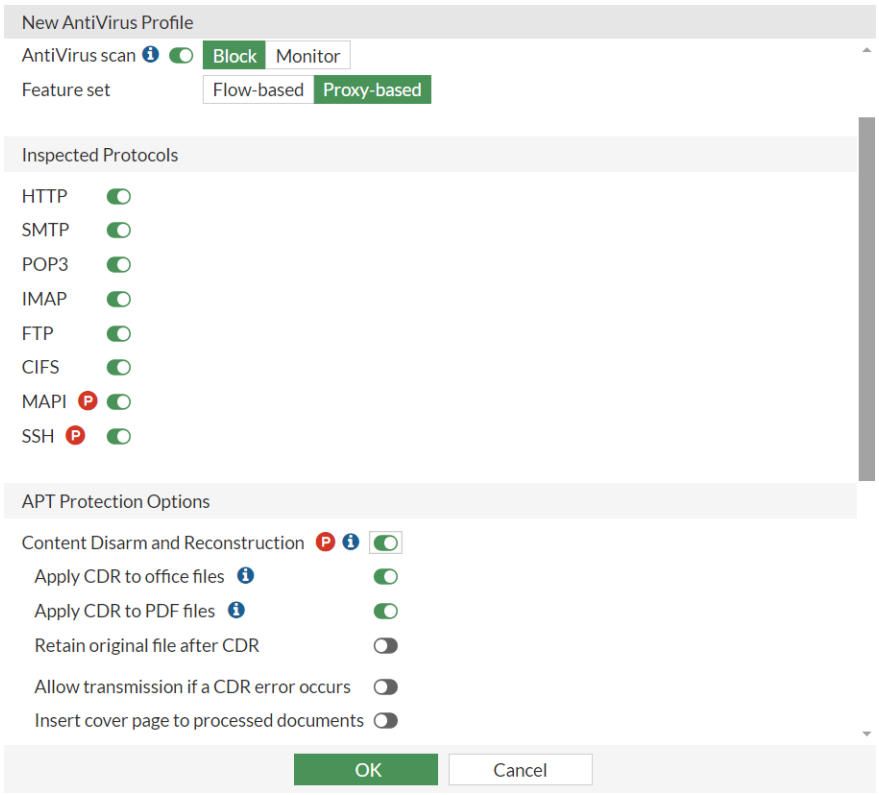
Content disarm and reconstruction

In this example, a Microsoft Office document, such as a Microsoft OneNote file, with an embedded hyperlink (that redirects to an external website) is sent to the receiver. When the user receives the file, the hyperlink in the document is deactivated. See Content disarm and reconstruction on page 2170 for more information.



To configure CDR:

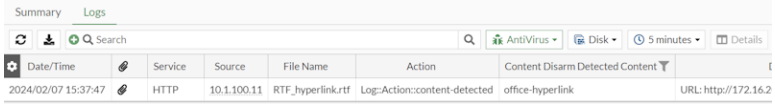
1. Go to *Security Profiles* > *AntiVirus*.
2. Edit an antivirus profile, or create a new one.
3. Set *Feature set* to *Proxy-based*.
4. Under *Inspected Protocols*, enable one or more protocols to inspect.
5. Enable *AntiVirus scan*.
6. Under *APT Protection Options*, enable *Content Disarm and Reconstruction*.



7. Enable *Retain original file after CDR*, and select a quarantine location from the available options:

Quarantine locally	Saves the original document file to disk (if possible) or a connected FortiAnalyzer based on the FortiGate log settings (`config log fortianalyzer setting`).
Send to FortiSandbox	Saves the original document file to a connected FortiSandbox.

   When *Retain original file after CDR* is disabled, the original document file is discarded.
8. Click *OK*.
9. Go to *Log & Report > Security Events* to view CDR events in Antivirus logs.
   In the following example, an AntiVirus log file includes a CDR event for an embedded hyperlink in an RTF file.



To edit the CDR detection parameters:

By default, stripping of all active Microsoft Office and PDF content types are enabled. In this example, stripping macros in Microsoft Office documents will be disabled.

```
config antivirus profile
    edit av
        config content-disarm
            set office-macro disable
            set detect-only {enable | disable}
```

```
            set cover-page {enable | disable}
        end
    next
end
```

Where:

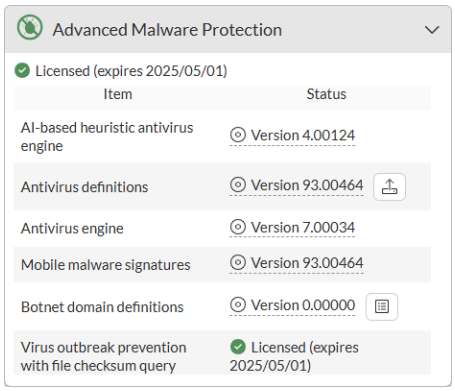
`detect-only`	Only detect disarmable files, do not alter content. Disabled by default.
`cover-page`	Attach a cover page to the file's content when the file has been processed by CDR. Enabled by default.

FortiGuard outbreak prevention

This example demonstrates how to enable FortiGuard Virus Outbreak Protection Service (VOS). See Virus outbreak prevention on page 2170 for more information.

To verify FortiGuard antivirus license information:

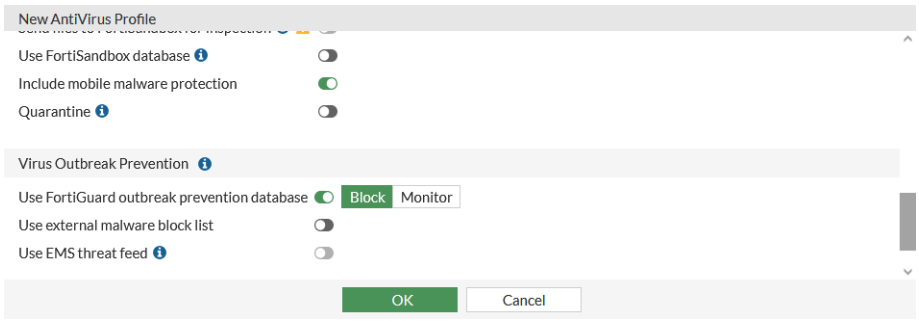
1. Go to *System* > *FortiGuard*.
2. In the *Subscriptions* > *Licensed* tab, expand the *Advanced Malware Protection* entitlement section and locate the *Virus outbreak prevention with file checksum query* entry.



3. See the instructions in the video How to Purchase or Renew FortiGuard Services, if required.

To enable FortiGuard outbreak prevention:

1. Go to *Security Profiles* > *AntiVirus*.
2. Edit an antivirus profile, or create a new one.
3. Under *Virus Outbreak Prevention*, enable *Use FortiGuard outbreak prevention database* and select *Block* or *Monitor*.



4. Click *OK*.

To verify FortiGuard antivirus license information:

```
# diagnose debug rating
Locale       : english

Service      : Web-filter
Status       : Enable
License      : Contract

Service      : Antispam
Status       : Disable

Service      : Virus Outbreak Prevention
Status       : Enable
License      : Contract

-=- Server List (Tue Feb 19 16:36:15 2019) -=-

su 4739 outbreak-prevention recv error
```

FortiGuard provides several sample files to test the AV configuration on the FortiGate, which are available to download from https://www.fortiguard.com/sample-files. Test the *Virus Outbreak Prevention* feature by downloading *VO Sample* file. See Example 3: VO sample file on page 2181.

Zero-day malware stream scanning

Zero-day malware stream scanning enables real-time delivery of malware IOCs (Indicators of Compromise) to FortiGate devices using the fortimq daemon and notifications.

FortiGate automatically maintains an up-to-date malware hash database, removing outdated entries and optimizing performance without manual intervention.

A FortiSandbox Advanced (FSAC) or FortiSandbox Advanced Plus (FSAP) license is required for FortiGate to receive malware hash updates.

This topic includes the following information:

- Enabling fortimq daemon and notifications on page 2226
- How FortiGate receives malware-hash updates on page 2227
- Example 1: blocking malicious files on HTTP protocol on page 2228
- Example 2: monitoring malicious files on MAPI protocol on page 2231
- Troubleshooting commands on page 2233

Enabling fortimq daemon and notifications

The fortimq deamon can be enabled in the CLI and requires the following configuration:

- FortiGuard Anycast must be enabled.
- Cloud communications must be enabled.
- Notifications must be enabled.

To enable fortimq daemon in the CLI:

1. Enable fortimq daemon:

```
config system fortiguard
   set fortiguard-anycast enable
end
config system global
    set cloud-communication enable
end
```

2. Enable notifications:

```
config system fortiguard
   set subscribe-update notification enable
end
```

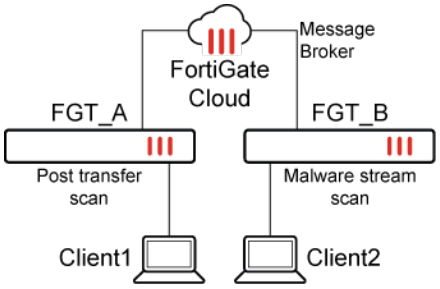
3. Confirm FortiGate is connected to fortimq daemon and able to receive messages:

```
# diagnose test application fortimq  1
connection status: connected
    acct: 901713
    fqdn: globalfortimq.fortinet.net
    port: 5671
    next-channel: 2
    msg count: 46266
    attempts: 0
```

How FortiGate receives malware-hash updates

In this example, FGT_A is configured to use post-transfer scanning to FortiGate Cloud Sandbox to monitor for malware. FGT_B is configured to use zero-day malware stream scanning and receive messages through fortimq daemon.

This example uses a sample malicious file with the hash value 71e4d6a0cc41d47e49ac0eeb45a26b2afefdd920538078eeda89b0c8f01bf622.



The user on Client1, downloads a malicious file, and FGT_A submits the file to FortiGate Cloud Sandbox for analysis. FortiGate Cloud Sandbox determines the file is malicious, and sends the verdict to FGT_A. FGT_B also receives the malware-hash update from fortimg daemon. Following is a summary of this process:

1. FGT_A generates a log for the submission to FortiGate Cloud Sandbox:

```
1: date=2025-03-25 time=14:06:39 eventtime=1742936798824763123 tz="-0700" logid="0201009233"
type="utm" subtype="virus" eventtype="analytics" level="information" vd="vdom1" policyid=1
poluuid="f820fc12-f07d-51ef-10a7-9ce92adafc22" policytype="policy" msg="File submitted to
Sandbox." action="analytics" service="HTTP" sessionid=2176 srcip=10.1.100.201

States" srcintf="port2" srcintfrole="lan" dstintf="port3" dstintfrole="lan" srcuuid="eb7a7402-
4489-51ef-4afd-ca286e50ca04" dstuuid="eb7a7402-4489-51ef-4afd-ca286e50ca04" proto=6
direction="incoming" filename="fsa_downloader_1bf622.exe" filetype="exe"
url="http://rb3.ftnt.io/downloader/0.21385215657678536" profile="fgt_a_analytics_submit"
agent="Wget/1.20.3 (linux-gnu)" httpmethod="GET"
analyticscksum="71e4d6a0cc41d47e49ac0eeb45a26b2afefdd920538078eeda89b0c8f01bf622"
analyticssubmit="true"
```

2. FGT_A receives the verdict from FortiGate Cloud Sandbox:

```
1: date=2025-03-25 time=14:12:13 eventtime=1742937133549596694 tz="-0700" logid="0201009238"
type="utm" subtype="virus" eventtype="analytics" level="notice" vd="vdom1" srcip=10.1.100.201
dstip=192.241.205.137 srcport=33454 dstport=80 action="monitored" service="HTTP"
filename="fsa_downloader_1bf622.exe" fsaverdict="high risk"
analyticscksum="71e4d6a0cc41d47e49ac0eeb45a26b2afefdd920538078eeda89b0c8f01bf622"
dtype="fortisandbox"
```

3. FGT_B receives the malware-hash update from fortimq daemon within one minute and adds the new value to the scanunit file-has list.

```
# diagnose sys scanunit file-hash query sha256
71e4d6a0cc41d47e49ac0eeb45a26b2afefdd920538078eeda89b0c8f01bf622
0-day malware-stream '71e4d6a0cc41d47e49ac0eeb45a26b2afefdd920538078eeda89b0c8f01bf622'
description 'FSA/RISK_HIGH|FSA3KET320000157|7609597837562012709'
```

Example 1: blocking malicious files on HTTP protocol

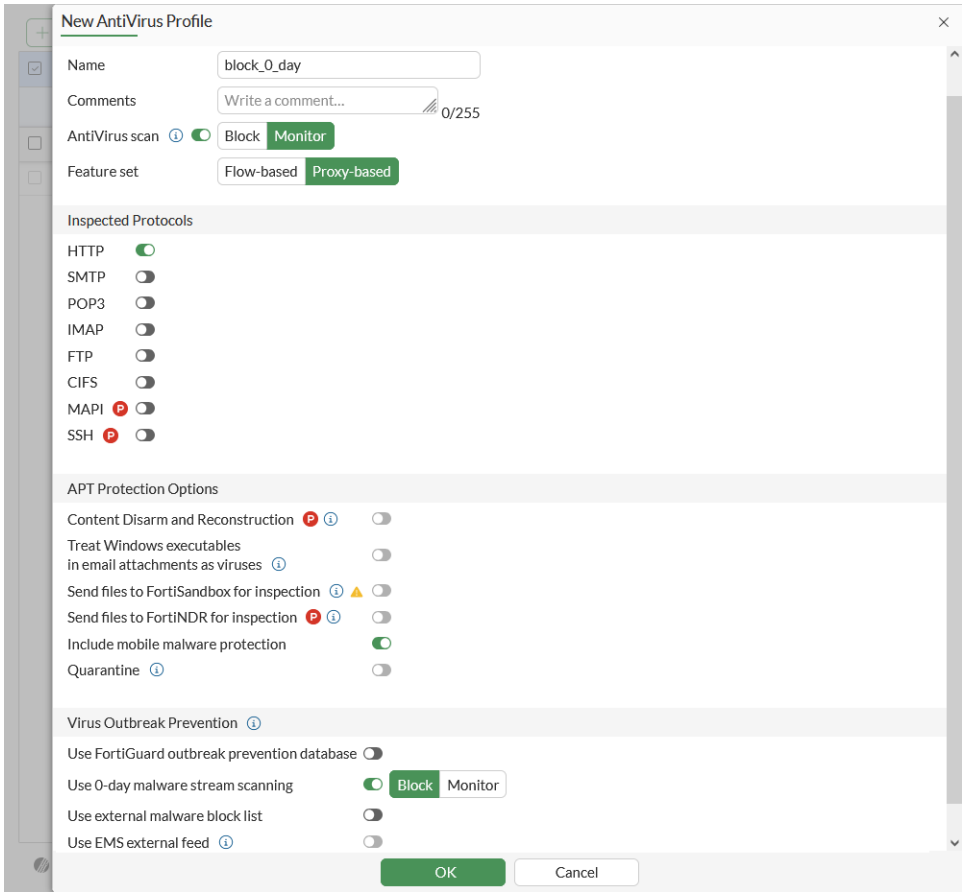
In this example, zero-day malware stream scanning is enabled on FGT_B and set to block and log malicious files on the HTTP protocol. The configuration includes:

- Enabling fortimq daemon and notifications. See Enabling fortimq daemon and notifications on page 2226.
- Configuring an AntiVirus profile to use zero-day malware stream scanning to block malicious files

To configure an AntiVirus profile in the GUI:

1. Go to *Security Profiles* > *AntiVirus*, and click *Create New*.
2. Set the following options:
   - Enter a name, such as block_0_day.
   - Enable *AntiVirus scan* and select *Monitor*.
   - Set *Feature set* to *Proxy-based*.
   - Enable *HTTP*.
   - Enable *Use 0-day malware stream scanning* and select *Block*.

- Set the other options as desired.

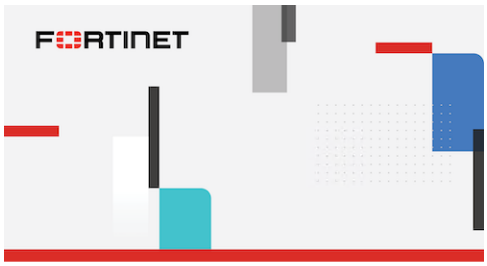


3. Click *OK* to save the profile.

To configure an AntiVirus profile in the CLI:

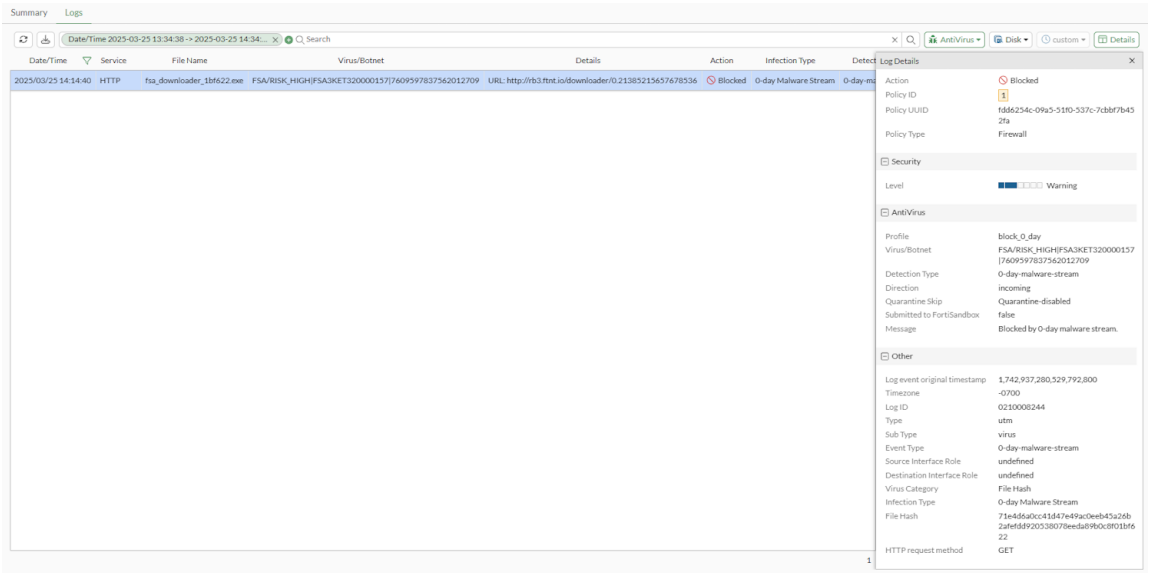
```
config antivirus profile
    edit "block_0_day"
        set feature-set proxy
        config http
            set av-scan monitor
            set malware-stream block
        end
    next
end
```

When the user on Client2 attempts to download a malicious file, FGT_B blocks the file and displays the HTTP block replacement message:



FGT_B adds the *block* action to the security event logs:

- In the GUI, go to *Log & Report* > *Security Events*:



- In the CLI:

```
1: date=2025-03-25 time=14:14:40 eventtime=1742937280529792875 tz="-0700" logid="0210008244"
type="utm" subtype="virus" eventtype="0-day-malware-stream" level="warning" vd="vdom1"
policyid=1 poluuid="fdd6254c-09a5-51f0-537c-7cbbf7b452fa" policytype="policy" msg="Blocked by
0-day malware stream." action="blocked" service="HTTP" sessionid=5921 srcip=10.1.100.252
dstip=192.241.205.137 srcport=50448 dstport=80 srccountry="Reserved" dstcountry="United

```

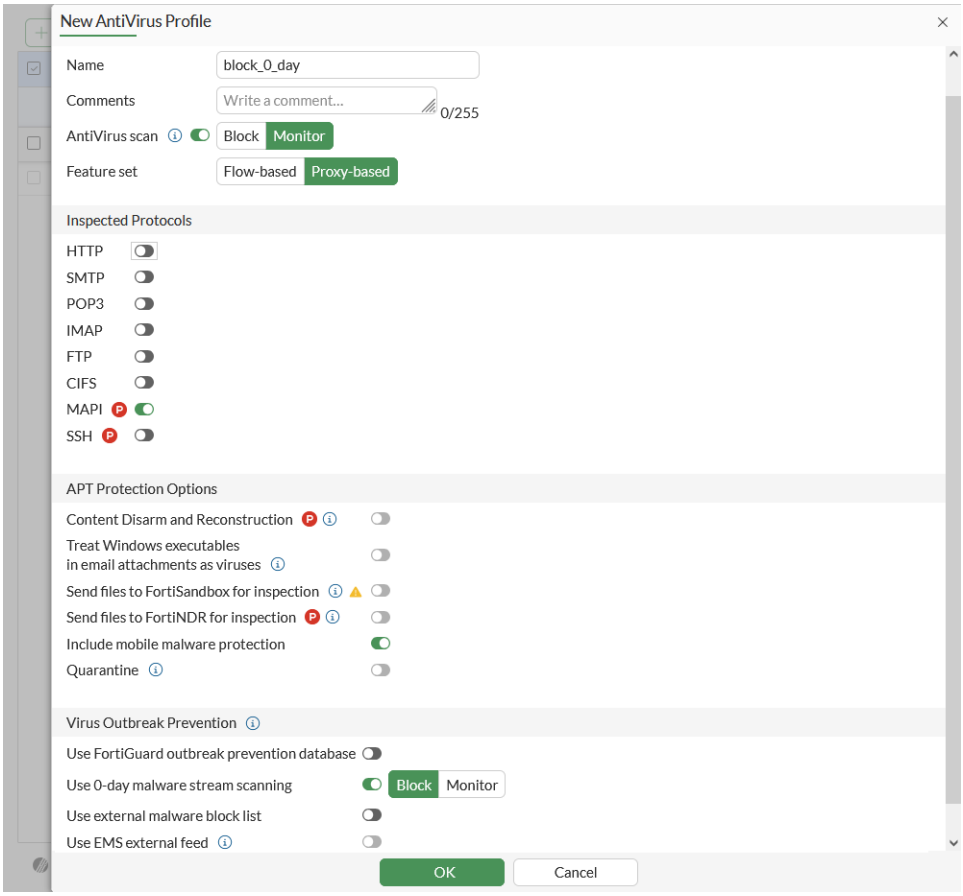
Example 2: monitoring malicious files on MAPI protocol

In this example, zero-day malware stream scanning is enabled on FGT_B and set to monitor and log malicious files on the MAPI protocol. The configuration includes:

- Enabling fortimq daemon and notifications. See Enabling fortimq daemon and notifications on page 2226.
- Configuring an AntiVirus profile to use zero-day malware stream scanning and monitor malicious files

To configure an AntiVirus profile in the GUI:

1. Go to *Security Profiles* > *AntiVirus*, and click *Create New*.
2. Set the following options:
   - Enter a name, such as monitor_0_day.
   - Enable *AntiVirus scan* and select *Monitor*.
   - Set *Feature set* to *Proxy-based*.
   - Enable *MAPI*.
   - Enable *Use 0-day malware stream scanning* and select *Monitor*.
   - Set the other options as desired.



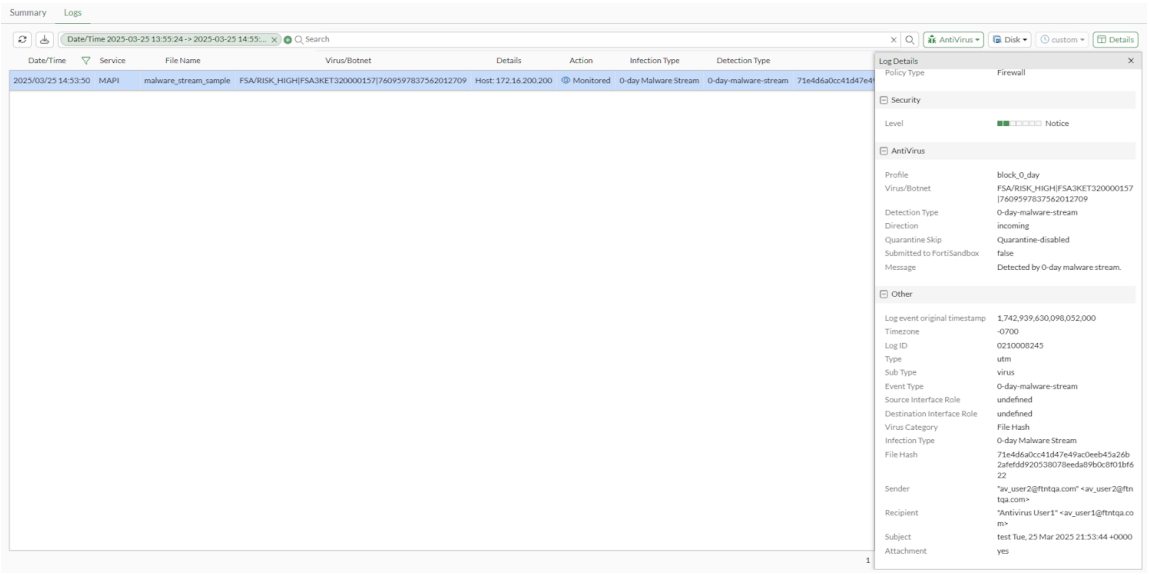
3. Click *OK* to save the profile.

To configure FGT_B in the CLI:

```
config antivirus profile
    edit "monitor_0_day"
        set feature-set proxy
        config mapi
            set av-scan monitor
            set malware-stream monitor
        end
    next
end
```

When the user on Client2 receives an email through MAPI protocol, FGT_B adds the *monitored* action to the security event logs:

- In the GUI, go to *Log & Report > Security Events*:



- In the CLI:

```
1: date=2025-03-25 time=14:53:50 eventtime=1742939630098052082 tz="-0700" logid="0210008245"
type="utm" subtype="virus" eventtype="0-day-malware-stream" level="notice" vd="vdom1"

```

Troubleshooting commands

The following diagnose commands can be used for troubleshooting:

```
# diagnose test application fortimq <level>
```

Level	Description
1	fortimq status
2	dump ipc links
3	dump bindings
4	dump queue info
5	dump dns info
6	dump state info
7	dump timer info
8	dump unbound payloads
9	dump amqp client errors
99	restart fortimq daemon

External malware block list

This example demonstrates creating and implementing an external malware block list. See External malware block list on page 2170 for more information.

To create the external block list:

1. Create the malware hash list.

   The malware hash list follows a strict format in order for its contents to be valid. Malware hash signature entries must be separated into each line. A valid signature needs to follow this format:

```
# MD5 Entry with hash description
aa67243f746e5d76f68ec809355ec234  md5_sample1

# SHA1 Entry with hash description
a57983cb39e25ab80d7d3dc05695dd0ee0e49766  sha1_sample2

# SHA256 Entry with hash description
ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379  sha256_sample1

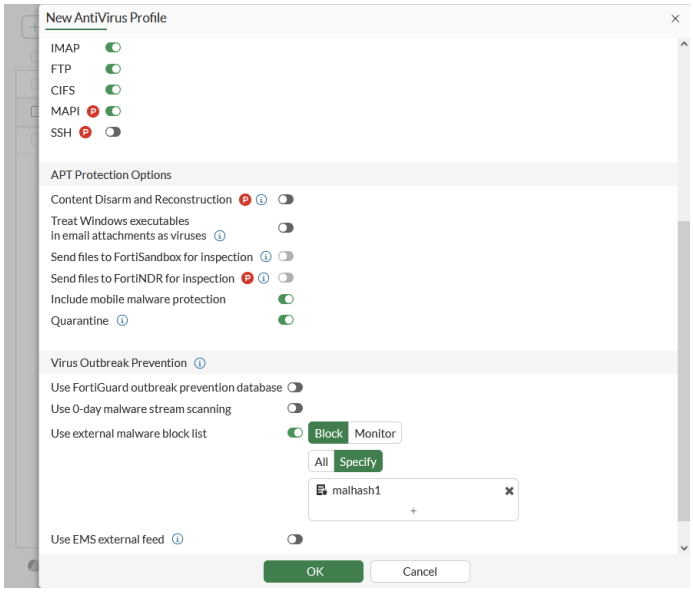
# Entry without hash description
0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521

# Invalid entries
7688499dc71b932feb126347289c0b8a_md5_sample2
7614e98badca10b5e2d08f8664c519b7a906fbd5180ea5d04a82fce9796a4b87sha256_sample3
```

2. Configure the external malware block list source:
   a. Go to *Security Fabric* > *External Connectors* and click *Create New*.
   b. Click *Malware Hash*.
   c. Configure the settings as needed. The URI must point to the malware hash list on the remote server.
   d. Click *OK*.
3. To view entries inside the malware block list on the *External Connectors* page, hover over the malware hash card and click *View Entries*.

To configure antivirus to use an external block list in the GUI:

1. Go to *Security Profiles* > *AntiVirus* and edit the antivirus profile.
2. In the *Virus Outbreak Prevention* section, enable *Use external malware block list* and click *Specify*.
3. Click the *+* in the field and select an external feed.
4. Optionally, enable *Quarantine*.



5. Configure the other settings as needed.
6. Click *OK*.

To configure antivirus to use an external block list in the CLI:

```
config antivirus profile
    edit "Demo"
        set feature-set proxy
        set mobile-malware-db enable
        config http
            set av-scan disable
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set content-disarm disable
        end
```

```
        config ftp
            set av-scan disable
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
        end
        config imap
            set av-scan monitor
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set executables default
            set content-disarm disable
        end
        config pop3
            set av-scan monitor
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set executables default
            set content-disarm disable
        end
        config smtp
            set av-scan monitor
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set executables default
            set content-disarm disable
        end
        config mapi
            set av-scan monitor
            set outbreak-prevention block
            set external-blocklist block
            set quarantine enable
            set emulator enable
            set executables default
        end
        config nntp
            set av-scan disable
            set outbreak-prevention disable
            set external-blocklist disable
            set quarantine disable
            set emulator enable
        end
        config cifs
            set av-scan monitor
            set outbreak-prevention block
```

```
            set external-blocklist block
            set quarantine enable
            set emulator enable
        end
        config ssh
            set av-scan disable
            set outbreak-prevention disable
            set external-blocklist disable
            set quarantine disable
            set emulator enable
        end
        set outbreak-prevention-archive-scan enable
        set external-blocklist-enable-all disable
        set external-blocklist "malhash1"
        set av-virus-log enable
        set av-block-log enable
        set extended-log disable
        set scan-mode default
    next
end
```

The quarantine setting is configured in each protocol (`set quarantine`). The malware external feed is also specified (`set external-blocklist-enable-all disable`) to the external connector, malhash1 (`set external-blocklist "malhash1"`).

To verify the scanunit daemon updated itself with the external hashes:

```
# diagnose sys scanunit malware-list list
md5 'aa67243f746e5d76f68ec809355ec234' profile 'malhash1' description 'md5_sample1'
sha1 'a57983cb39e25ab80d7d3dc05695dd0ee0e49766' profile 'malhash1' description 'sha1_sample2'
sha256 '0289b0d967cb7b1fb1451339c7b9818a621903090e0020366ab415c549212521' profile 'malhash1'
description ''
sha256 'ae9bc0b4c5639d977d720e4271da06b50f7c60d1e2070e9c75cc59ab30e49379' profile 'malhash1'
description 'sha256_sample1'
```

Exempt list for files based on individual hash

The antivirus exempt list allows users to exempt known safe files that happen to be incorrectly classified as malicious by the AV signature and AV engine scan. Users can specify file hashes in MD5, SHA1, or SHA256 for matching, which are applied at a per-VDOM level. When matched, the FortiGate ignores the AV scan verdict so that the corresponding UTM behavior defined in the AV profile is not performed.

```
config antivirus exempt-list
    edit <name>
        set hash-type {md5 | sha1 | sha256}
        set hash <string>
        set status {enable | disable}
    next
end
```

The exempt list does not apply to results from outbreak prevention, machine learning, FortiNDR, or FortiSandbox inline scans.

In this example, an antivirus exempt list is configured for the EICAR anti-malware test file. Although the antivirus profile is configured to block HTTP, the client is able to download the file.

To configure an antivirus exempt list:

1. Configure the antivirus profile:

```
config antivirus profile
    edit "av"
        set feature-set proxy
        config http
            set av-scan block
        end
    next
end
```

2. Configure the antivirus exempt list:

```
config antivirus exempt-list
    edit "test-hash"
        set comment "eicar.com"
        set hash-type md5
        set hash "44d88612fea8a8f36de82e1278abb02f"
        set status enable
    next
end
```

3. Get a client to access https://www.eicar.com/ and download the anti-malware test file.
   The FortiGate exempts the AV scan verdict and bypasses the file. The client can download the file and no replacement message is displayed.

Downloading quarantined files in archive format

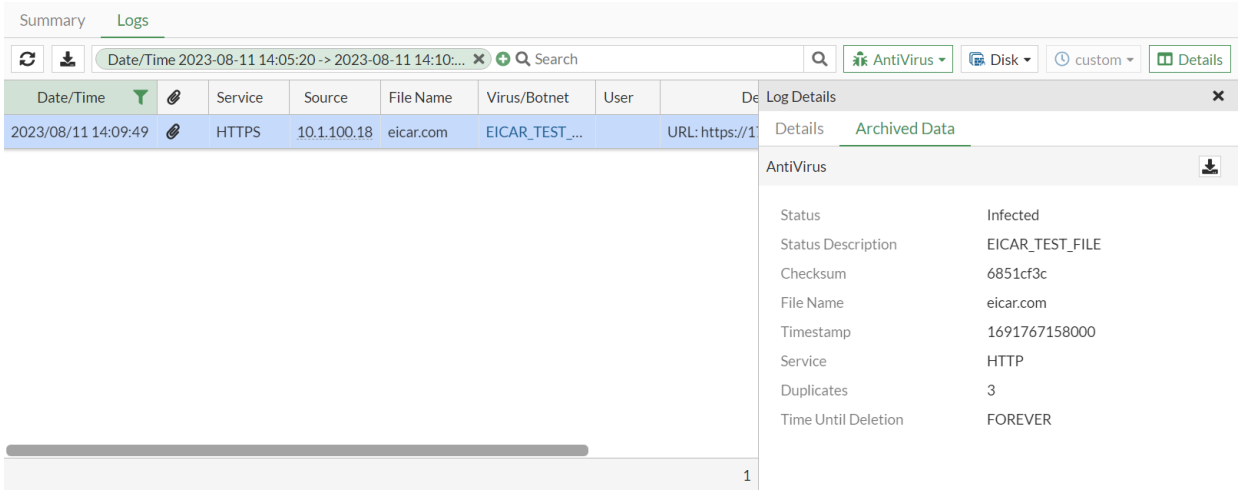
The FortiGate can download quarantined files in an archive format (.TGZ) instead of the original raw file. This allows for a more detailed analysis of the quarantined files and reduces the risk of malware infection.

The FortiGate must have a disk logging capacity or be connected to FortiAnalyzer for logging.

To download a quarantined archive file:

1. Ensure that quarantining files is enabled in the AV profile:
   a. Go to *Security Profiles* > *AntiVirus* and edit the AV profile.
   b. In the *APT Protection Options* section, verify that *Quarantine* is enabled. At least one protocol must be enabled in the AV profile for inspection, and *AntiVirus scan* must be enabled for the *Quarantine* option to work.
2. Go to *Log & Report* > *Security Events* and select the *AntiVirus* card.

3. Select a log entry and click *Details*. The *Log Details* pane opens.
4. Select the *Archived Data* tab and click the download icon (in the *AntiVirus* title bar).



Web filter

Web filtering feature offers a flexible and effective solution to control and manage internet usage within your organization, tailored to your specific requirements and objectives. It's a powerful tool for enhancing productivity and maintaining a secure digital environment. This feature has the ability to restrict users from accessing certain websites or Uniform Resource Locators (URLs) by inhibiting the users' browsers from loading the pages linked to these particular sites onto their devices.

Web filtering serves as the primary shield against attacks originating from the web. The FortiGuard URL Filtering Service provides comprehensive threat protection to address threats including ransomware, credential-theft, phishing, and other web-borne attacks. It uses AI-driven behavior analysis and correlation to block unknown malicious URLs almost immediately, with near-zero false negatives. The FortiGate's WAD daemon sends the URLs to FortiGuard in real-time for category determination.

This section includes information about web filter techniques and configurations:

- Web filter introduction on page 2238
- Advanced CLI configuration on page 2269
- Configuration examples on page 2289

Web filter introduction

Web filtering restricts or controls user access to web resources and can be applied to firewall policies using either policy-based or profile-based NGFW mode.

In FortiOS, there are three main components of web filtering:

- Web content filter: blocks web pages containing words or patterns that you specify.
- URL filter: uses URLs and URL patterns to block or exempt web pages from specific sources, or block malicious URLs discovered by FortiSandbox.
- FortiGuard Web Filtering service: provides many additional categories you can use to filter web traffic.

These components interact with each other to provide maximum control over what users on your network can view and protect your network from many internet content threats.

Web filters are applied in the following order:

1. URL filter
2. FortiGuard Web Filtering
3. Web content filter
4. Web script filter
5. Antivirus scanning

FortiOS includes three preloaded web filter profiles:

- *default*
- *monitor-all* (monitors and logs all URLs visited, flow-based)
- *wifi-default* (default configuration for offloading WiFi traffic)

You can customize these profiles, or you can create your own to manage network user access.

Some features of this functionality require a subscription to FortiGuard Web Filtering.

Web filter techniques

Web filtering is a crucial aspect of cybersecurity, helping organizations protect their digital systems from threats and ensure safe internet usage. A range of techniques and tools are employed to ensure a secure, reliable, and safe digital environment for organizations.

The following table describes some of the industry standard techniques that are used for Web filtering and if they can be configured in the GUI or CLI.

Technique	Description	GUI	CLI
URL filtering	Blocks access to websites based on their URLs. See for more information.	✓	✓
Category-based filtering	The FortiGuard URL Filtering Service provides comprehensive threat protection to address threats including ransomware, credential-theft, phishing, and other web-borne attacks. See FortiGuard filter on page 2242 for more information.	✓	✓
Image and video filtering	Remove explicit results, such as sexual content or graphic violence, that a user may encounter when conducting a search through a search engine. See Search engines on page 2253 for more information.	✓	✓
Content filtering	Block access based on specific keywords or patterns present on a	✓	✓

Technique	Description	GUI	CLI
	web page. See Web content filter on page 2263 for more information.		
Credential phishing preventing	Scans for corporate credentials submissions to external websites and cross-references those entries with legitimate corporate credentials. See Credential phishing prevention on page 2270 for more information.		✓
Blocklists and allowlists	Curate lists of prohibited and permitted websites. See FortiGuard category external feed on page 4568 for more information.	✓	✓
Web filter plugin	Extension that you can install on your web browser to enforce Web Filter rules. See Web browser plugin for HTTPS web filtering in the FortiClient Administration Guide for more information.	✓	✓
Endpoint filtering	Control and regulate access to websites at the level of individual devices in a network. See Web & Video Filter in the FortiClient Administration Guide for more information.	✓	✓
Websense web filtering service	Send traffic to the third-party web filtering service for rating and approval checking. See Websense Integrated Services Protocol on page 2278 for more information.		✓

See Configuring a web filter profile on page 2240 for more information.

Configuring a web filter profile

Web filtering restricts or controls user access to web resources and can be applied to firewall policies using either policy-based or profile-based NGFW mode.

> The feature set setting (proxy or flow) in the web filter profile must match the inspection mode setting (proxy or flow) in the associated firewall policy. For example, a flow-based web filter profile must be used with a flow-based firewall policy.
>
> An SSL inspection profile (such as the certificate-inspection profile) and a web filter profile must both be selected in the associated firewall policy. See SSL & SSH Inspection on page 2614.

Some web filter profile options can only be configured in the CLI. See Advanced CLI configuration on page 2269 and the FortiOS CLI Reference for more information.

To configure a web filter profile:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Configure the following settings:

Name	Enter a unique name for the profile.
Comments	(Optional) Enter a comment.

Feature set	Select the feature set for the profile. The feature set mode must match the inspection mode used in the associated firewall policy.
	• Flow-based
	• Proxy-based
	Additional options are available in proxy-based mode and are identified in the GUI with a P icon. See Inspection mode feature comparison on page 2141.
	If the *Feature set* option is not visible, enter the following in the CLI:
	`config system settings`
	`set gui-proxy-inspection enable`
	`end`

FortiGuard Category Based Filter	Enable to use the category-based filters from FortiGuard. A default action is assigned to each category, and you can change the action. See FortiGuard filter on page 2242.
Category Usage Quota	This option is available in proxy-based mode and can be applied to categories set to *Monitor*, *Warning*, and *Authenticate*. See Category usage quota on page 2250.
Allow users to override blocked categories	Enable to allow certain users or user groups to override websites blocked by web filtering profiles for a specified length of time. See Web profile override on page 2671.
Groups that can override	Select one or more user groups that can override blocked websites. The user group must be specified as the Source in the firewall policies using this profile.
Profile Name	Select what web filter profiles can be overridden.
Switch applies to	Specify whether the override applies to a User, User Group, or IP address. Alternately select Ask to prompt the user to log in to access the web page.
Switch duration	Select *Predefined* to specify how many days, hours, and minutes to allow the override. Select Ask to prompt the user to specify how long to allow the override.
Search Engines	
Enfore 'Safe Search' on Google, Yahoo!, Bing, Yandex	Enable to prevent explicit websites and images from appearing in search results. See Safe search on page 2253.
Restrict YouTube Access	Enable to filter out potentially mature videos. See Restrict Google account usage to specific domains on page 2268.
Log all search keywords	This option is available in proxy-based mode. Enable to log all search phrases. See Log all search keywords on page 2255.
Static URL Filter	

	Block invalid URLs	Enable to block websites when their SSL certificate CN field lacks a valid domain name. See Block invalid URLs on page 2256.
	URL Filter	Enable to specify URL patterns and an action for FortiGate to take when matching URL patterns are found in traffic. See URL filter on page 2256.
	Block malicious URLs discovered by FortiSandbox	Enable to block malicious URLs found by FortiSandbox. Requires FortiGate to be connected to a registered FortiSandbox. See Block malicious URLs discovered by FortiSandbox on page 2262.
	Content Filter	Enable to specify word or patterns to be used to identify and control access to web pages. See Web content filter on page 2263.
Rating Options		
	Allow websites when a rating error occurs	Enable to allow access to websites that return a rating error from the FortiGuard Web Filter service. See Allow websites when a rating error occurs on page 2266.
	Rate URLs by domain and IP address	Enable for FortiGate to always send both the URL domain name and the TCP/IP packet's IP address (except for private IP addresses) to FortiGuard for rating. See Rate URLs by domain and IP address on page 2267.
Proxy Options		
	Restrict Google account usage to specific domains	This option is available in proxy-based mode. Enable to block access to certain Google accounts and services. See Restrict Google account usage to specific domains on page 2268.
	HTTP POST Action	Enable to specify how to handle HTTP POST traffic. See HTTP POST action on page 2268.
	Remove Java Applets	This option is available in proxy-based mode. Enable to remove Java applets from web traffic. See Remove Java applets, ActiveX, and cookies on page 2269.
	Remove ActiveX	This option is available in proxy-based mode. Enable to remove ActiveX from web traffic. See Remove Java applets, ActiveX, and cookies on page 2269.
	Remove Cookies	Enable to remove cookies from web traffic. See Remove Java applets, ActiveX, and cookies on page 2269.

3. Click *OK*.

FortiGuard filter

The FortiGuard filter enhances the web filter features by sorting billions of web pages into a wide range of categories that users can allow or block.

The FortiGuard Web Filtering service includes over 45 million individual website ratings that apply to more than two billion pages. When the FortiGuard filter is enabled in a web filter profile and applied to firewall policies, if a request for a web page appears in traffic controlled by one of the firewall policies, the URL is sent to the nearest FortiGuard server. The URL category or rating is returned. If the category is blocked, the FortiGate shows a

replacement message in place of the requested page. If the category is not blocked, the page request is sent to the requested URL as normal.

To use this service, you must have a valid FortiGuard license.

The following actions are available:

FortiGuard web filter action	Description
Allow	Permit access to the sites in the category.
Monitor	Permit and log access to sites in the category. User quotas can be enabled for this option (see Category usage quota on page 2250).
Block	Prevent access to the sites in the category. Users trying to access a blocked site see a replacement message indicating the site is blocked.
Warning	Display a message to the user allowing them to continue if they choose.
Authenticate	Require the user to authenticate with the FortiGate before allowing access to the category or category group.
Disable	Remove the category from the from the web filter profile. This option is only available for local or remote categories from the right-click menu.

FortiGuard web filter categories

FortiGuard has many web filter categories, including two local categories and a special remote category. Refer to the following table for more information:

FortiGuard web filter category	Where to find more information
All URL categories	See Web Filter Categories.
Local categories	See Web rating override on page 2660.
Remote category	See External feeds on page 4554.

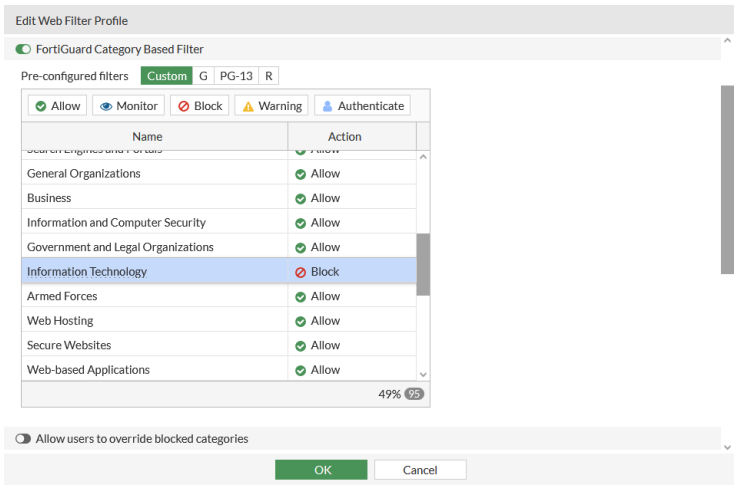
The priority of categories is local category > external category > FortiGuard built-in category. If a URL is configured as a local category, it only follows the behavior of the local category and not the external or FortiGuard built-in category.

Blocking a web category

The following example shows how to block a website based on its category. The Information Technology category (category 52) will be blocked.

To block a category in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Block*.



3. Configure the remaining settings as needed.
4. Click *OK*.

To block a category in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set category 52
                    set action block
                next
            end
        end
    next
end
```

You can use the `get webfilter categories` command to determine the web filtering category that corresponds to a given category ID.

To verify that the category is blocked:

1. Go to a website that belongs to the blocked category, such as www.fortinet.com.
   The page should be blocked and display a replacement message.

To view the log of a blocked website in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *Web Filter* card name.
3. Select an entry with *blocked* in the *Action* column and click *Details*.
4. 
To view the log of a blocked website in the CLI:

```
# execute log filter category utm-webfilter
# execute log display

4: date=2023-08-08 time=13:25:31 eventtime=1691526331836645153 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="root" policyid=1
poluuid="4a4b9d00-e471-51ed-71ec-c1a3bc8f773c" policytype="policy" sessionid=254529 srcip=1.1.1.2
srcport=60836 srccountry="Australia" srcintf="internal7" srcintfrole="lan" srcuuid="45eec070-e471-

dstintfrole="wan" dstuuid="45eec070-e471-51ed-4b1c-930f37c5d882" proto=6 service="HTTPS"
hostname="www.fortinet.com" profile="default" action="blocked" reqtype="direct"
```

```
url="https://www.fortinet.com/" sentbyte=517 rcvdbyte=0 direction="outgoing" msg="URL belongs to a
denied category in policy" ratemethod="domain" cat=52 catdesc="Information Technology"
```

Allowing users to override blocked categories

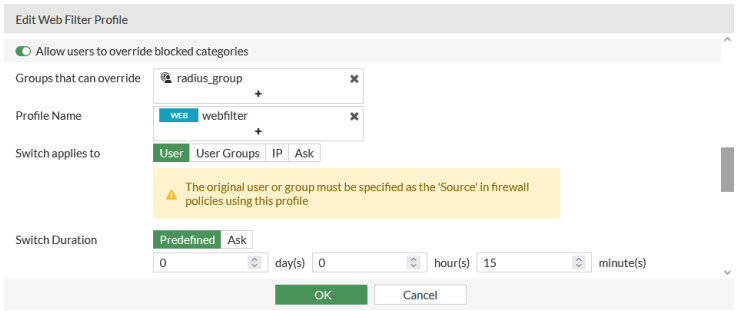
There is an option to allow users with valid credentials to override blocked categories.

To allow users to override blocked categories in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. Enable *Allow users to override blocked categories*.
3. Enter information in the following fields:

Groups that can override	Add the user group that will be allowed to override.
Profile Name	Add the web filter profile the overridden group will use. This cannot be the same profile as its own.
Switch applies to	Select *User*, *User Groups*, *IP*, or *Ask*.
Switch Duration	Select either *Predefined* to specify a duration, or *Ask* for user input.

4. Configure the other settings as needed.



5. Click *OK*.

To allow users to override blocked categories in the CLI:

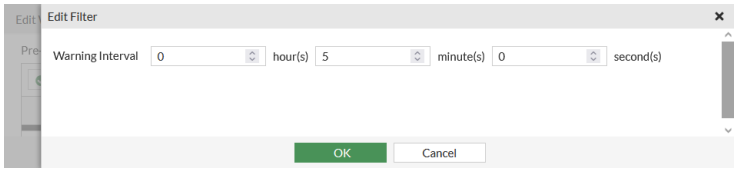
```
config webfilter profile
    edit "webfilter"
        set ovrd-perm bannedword-override urlfilter-override fortiguard-wf-override contenttype-
check-override
        config override
            set ovrd-user-group "radius_group"
            set profile "webfilter"
        end
        config ftgd-wf
            unset options
        end
    next
end
```

Issuing a warning on a web category

The following example shows how to issue a warning when a user visits a website in a specific category (Information Technology, category 52).

To configure a warning for a category in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Warning*.
3. Set the *Warning Interval*, then click *OK*.
   The warning interval is the amount of time until the warning appears again after the user proceeds past it.



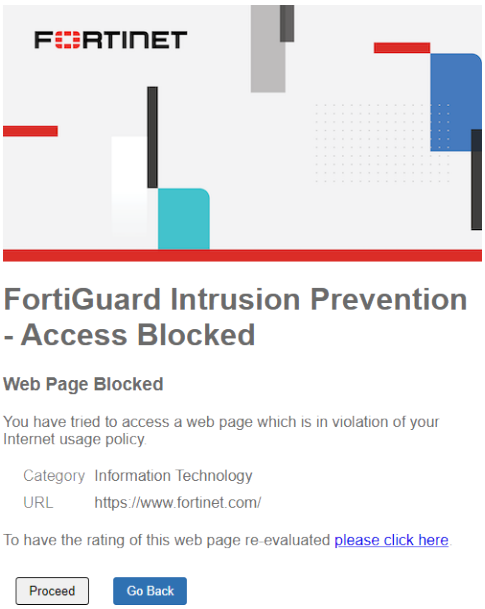
4. Configure the remaining settings as needed.
5. Click *OK*.

To configure a warning for a category in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set category 52
                    set action warning
                next
            end
        end
    next
end
```

To verify that the warning works:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed* or *Go Back*.



Authenticating a web category

The following example shows how to authenticate a website based on its category (Information Technology, category 52).

To authenticate a category in the GUI:

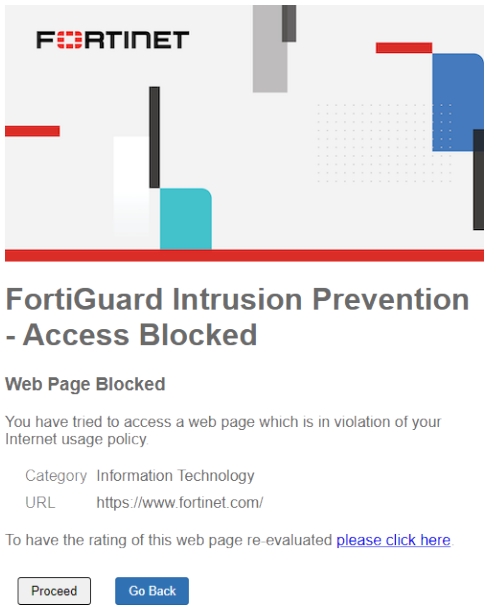
1. Go to *Security Profiles* > *Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, select *Information Technology*, then click *Authenticate*.
3. Set the *Warning Interval* and select one or more user groups, then click *OK*.
4. Configure the remaining settings as needed.
5. Click *OK*.

To authenticate a category in the CLI:

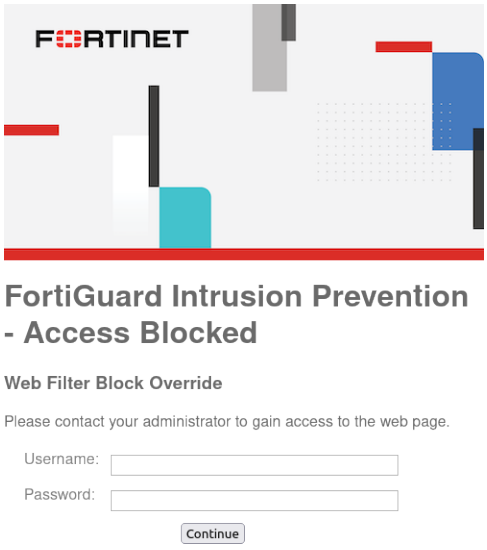
```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set category 52
                    set action authenticate
                    set auth-usr-grp "local_group"
                next
            end
        end
    next
end
```

To verify that you have configured authentication:

1. Go to a website that belongs to the category, such as www.fortinet.com.
2. On the warning page, click *Proceed*.



3. Enter the username and password for the configured user group, then click *Continue*.



Customizing the replacement message page

When the category action is *Block*, *Warning*, or *Authenticate*, you can customize the replacement message page that a user sees.

To customize the replacement message page:

1. Go to *Security Profiles* > *Web Filter* and edit or create a new web filter profile.
2. In the *FortiGuard category based filter* section, right-click on a category and select *Customize*.

3. Select a *Replacement Message Group*. See Replacement message groups on page 3770 for details.
4. Optionally, click *Edit FortiGuard Block Page* or *Edit FortiGuard Warning Page* to make modifications.
5. Click *Save*.
6. Configure the remaining settings as needed.
7. Click *OK*.

Customizing the CA certificate

When accessing a HTTPS webpage, in order to intercept the connection and perform an override, warning, or authentication, the connection must be proxied and the warning and/or authentication page must be signed with FortiGate's CA certificate. The client accessing the page must trust the CA in order to avoid certificate errors while browsing.

When applying the web filter profile to a firewall policy, an SSL inspection profile must also be selected.

To apply a custom certificate to the SSL inspection profile in the GUI:

1. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*, or edit an existing profile.
2. Under *SSL Inspection Options*, set *CA certificate* to the desired custom CA certificate.
3. Click *OK*.
4. On the client endpoints, ensure this custom CA is trusted.

To apply a custom certificate to the SSL inspection profile in the CLI:

```
config firewall ssl-ssh-profile
    edit <name>
        set caname <custom_CA_certificate>
    next
end
```

Category usage quota

In addition to using category and classification blocks and overrides to limit user access to URLs, you can set a daily quota by category, category group, or classification. Quotas allow access for a specified length of time or a specific bandwidth, and are calculated separately for each user. Quotas are reset daily at midnight.

Quotas can be set for the *Monitor*, *Warning*, or *Authenticate* actions. Once the quota is reached, the traffic is blocked and the replacement message page displays.

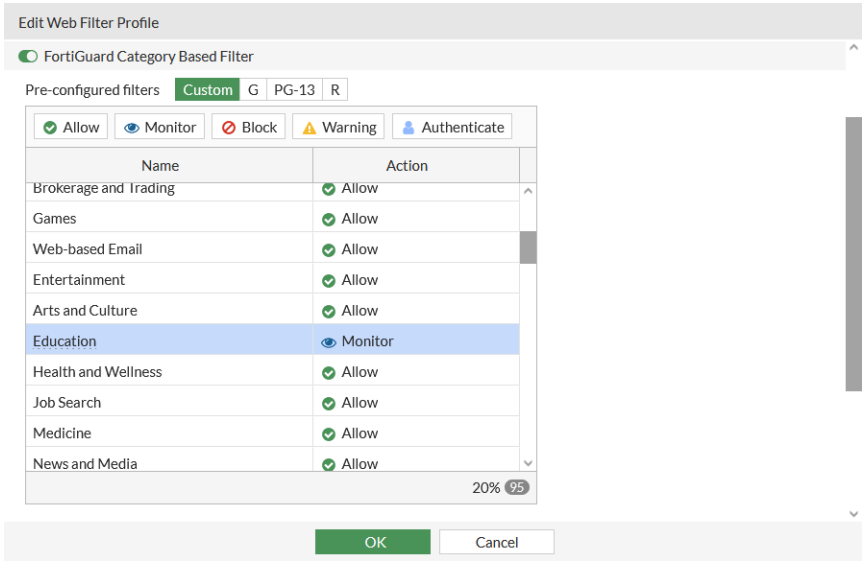
Quotas are only available in proxy-based inspection mode.

Configuring a quota

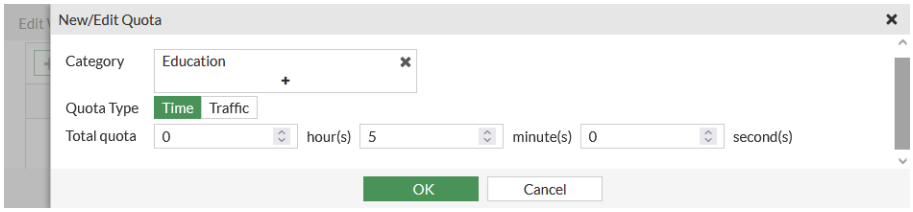
The following example shows how to set a time quota for the education category (category 30).

To configure a quota in the GUI:

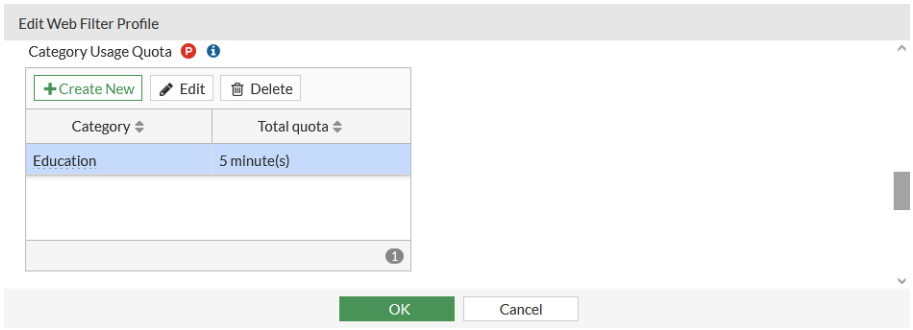
1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. For *Feature set*, select *Proxy-based*.
3. In the *FortiGuard category based filter* section, scroll to the *General Interest - Personal* and click the + to expand the section.
4. Select *Education*, then click *Monitor*.



5. In the *Category Usage Quota* section, click *Create New*.
   The *New/Edit Quota* pane opens.
6. In the *Category* field, select *Education*.
7. For the *Quota Type*, select *Time* and set the *Total quota* to 5 minutes.



8. Click *OK*. The entry appears in the table.



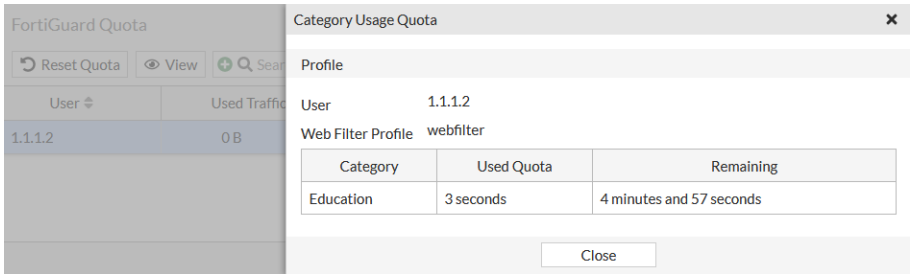
9. Configure the other settings as needed.
10. Click *OK*.

To configure a quota in the CLI:

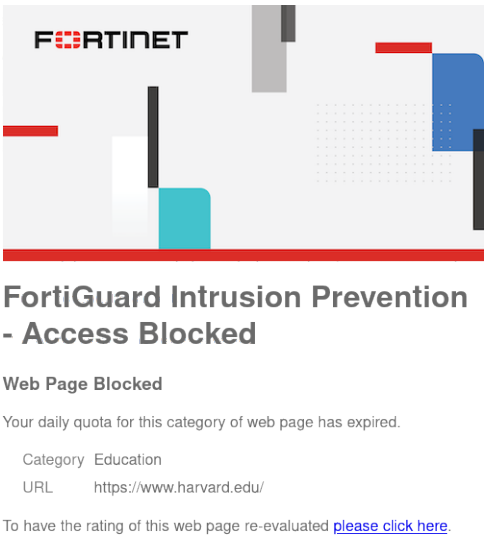
```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
           unset options
           config filters
              edit 1
                 set category 30
              next
           end
           config quota
              edit 1
                 set category 30
                 set type time
                 set duration 5m
              next
           end
        end
    next
end
```

To verify the quota usage:

1. Go to a website that belongs to the education category, such https://www.harvard.edu/. You can view websites in that category at the moment.
2. In FortiOS, go to *Dashboard* > *FortiGuard Quota Monitor* to check the used and remaining time.



3. When the quota reaches its limit, traffic is blocked and the replacement page displays.



Search engines

This topic gives examples of the following advanced filter features:

- Safe search on page 2253
- Restrict YouTube and Vimeo access on page 2254
- Log all search keywords on page 2255

Safe search

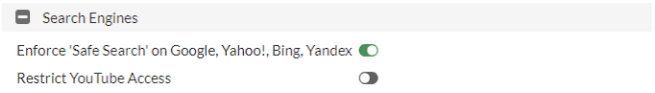
This setting applies to popular search sites and prevents explicit websites and images from appearing in search results.

The supported search sites are:

- Google
- Yahoo
- Bing
- Yandex

To enable safe search in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Enforce 'Safe Search' on Google, Yahoo!, Bing, Yandex*.



3. Click *OK*.

To enable safe search in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set safe-search url header
        end
    next
end
```

Restrict YouTube and Vimeo access

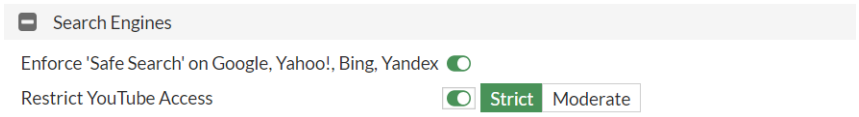
The *Restrict YouTube access* setting in the video filter profile adds the HTTP header `YouTube-Restrict: Strict` or `YouTube-Restrict: Moderate` into the HTTP request when enabled. When YouTube reads this header, it applies the appropriate content restriction based on the selected mode. YouTube Restricted Mode is an optional setting that filters out potentially mature videos while leaving a large number of videos still available (see Restrict YouTube content available to users and Manage your organization's YouTube settings for more information). Google defines the restricted YouTube access modes as follows:

- Strict Restricted YouTube access: this setting is the most restrictive. Strict Restricted Mode does not block all videos, but works as a filter to screen out many videos based on an automated system, while leaving some videos still available for viewing.
- Moderate Restricted YouTube access: this setting is similar to Strict Restricted Mode but makes a much larger collection of videos available.

To restrict YouTube access in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Enforce 'Safe Search' on Google, Yahoo!, Bing, Yandex* to display the *Restrict YouTube Access* option.

   When `safe-search` is set to `header` in the CLI, the *Restrict YouTube Access* option is visible in the GUI.
3. Enable *Restrict YouTube Access* and select either *Strict* or *Moderate*.



4. Click *OK*.

> It is recommended to set `safe-search` to `url` and `header` because some search engines, such as Google, use the URL, and other search engines, such as Bing, use the header.
>
> When you enable *Enforce 'Safe Search' on Google, Yahoo!, Bing, Yandex* in the GUI, `safe-search` is set to `url header` in the CLI.

To restrict YouTube access in the CLI:

```
config webfilter profile
    edit <name>
        config web
            set safe-search url header
            set youtube-restrict {none | strict | moderate}
        end
    next
end
```

The file filter profile includes a setting to restrict Vimeo access, which can only be configured in the CLI.

To restrict Vimeo access:

```
config webfilter profile
    edit <name>
        config web
            set safe-search url header
            set vimeo-restrict {7 | 134}
        end
    next
end
```

`vimeo-restrict {7 | 134}`	Set the Vimeo restriction: • 7: do not show mature content • 134: do not show unrated and mature content

Log all search keywords

Use this setting to log all search phrases.

This filter is only available in proxy-based inspection mode.

To enable logging search keywords in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Search Engines* section, enable *Log all search keywords*.
3. Click *OK*.

To enable logging search keywords in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set log-search enable
        end
```

```
    next
end
```

Static URL filter

This topic gives examples of the following advanced filter features:

- Block invalid URLs on page 2256
- URL filter on page 2256
- Disabling simple type URL filter from blocking subdomains on page 2262
- Block malicious URLs discovered by FortiSandbox on page 2262
- Web content filter on page 2263

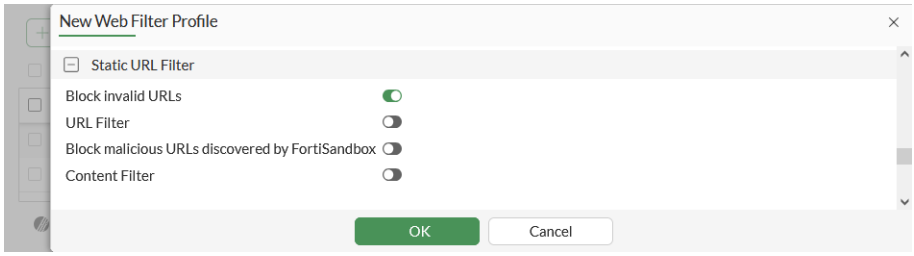
Block invalid URLs

Use this setting to block websites when their SSL certificate CN field does not contain a valid domain name.

This option also blocks URLs that contains spaces. If there is a space in the URL, it must be written as *%20* in the URL path.

To block invalid URLs in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block invalid URLs* .



3. Click *OK*.

To block invalid URLs in the CLI:

```
config webfilter profile
    edit "webfilter"
        set options block-invalid-url
    next
end
```

URL filter

The URL filter uses specific URLs with patterns containing text and regular expressions so the FortiGate can process the traffic based on the filter action (exempt, block, allow, monitor) and web pages that match the criteria. Once a URL filter is configured, it can be applied to a firewall policy.

The following filter types are available:

URL filter type	Description
Simple	The FortiGate tries to strictly match the full context. For example, if you enter *www.facebook.com* in the *URL* field, it only matches traffic with *www.facebook.com*. It won't match *facebook.com* or *message.facebook.com*. One exception is subdomains. For example, if you specify *slack.com* in the URL field, this will match *hooks.slack.com* as well. When the FortiGate finds a match, it performs the selected URL action.
Regular expression/ wildcard	The FortiGate tries to match the pattern based on the rules of regular expressions or wildcards. For example, if you enter **fa** in the *URL* field, it matches all the content that has *fa* such as *www.facebook.com*, *message.facebook.com*, *fast.com*, and so on. When the FortiGate finds a match, it performs the selected URL action.

For more information, see the URL Filter expressions technical tip in the Knowledge Base.

The following actions are available:

URL filter action	Description
Exempt	The traffic is allowed to bypass the remaining FortiGuard web filters, web content filters, web script filters, antivirus scanning, and DLP proxy operations.
Block	The FortiGate denies or blocks attempts to access any URL that matches the URL pattern. A replacement message is displayed.
Allow	The traffic is passed to the remaining FortiGuard web filters, web content filters, web script filters, antivirus proxy operations, and DLP proxy operations. If the URL does not appear in the URL list, the traffic is permitted.
Monitor	The traffic is processed the same way as the *Allow* action. For the *Monitor* action, a log message is generated each time a matching traffic pattern is established.

The exempt URL filter action can be configured to bypass all or certain scanning and filtering operations. This setting can only be configured in the CLI.

If the `action` is set to `exempt`, use `set exempt` to select the scanning and filtering operations that exempt URLs skip.

```
config webfilter urlfilter
    edit <id>
        config entries
            edit <id>
                set action exempt
                set exempt {av web-content activex-java-cookie dlp fortiguard range-block pass
antiphish all}
            next
        end
    next
end
```

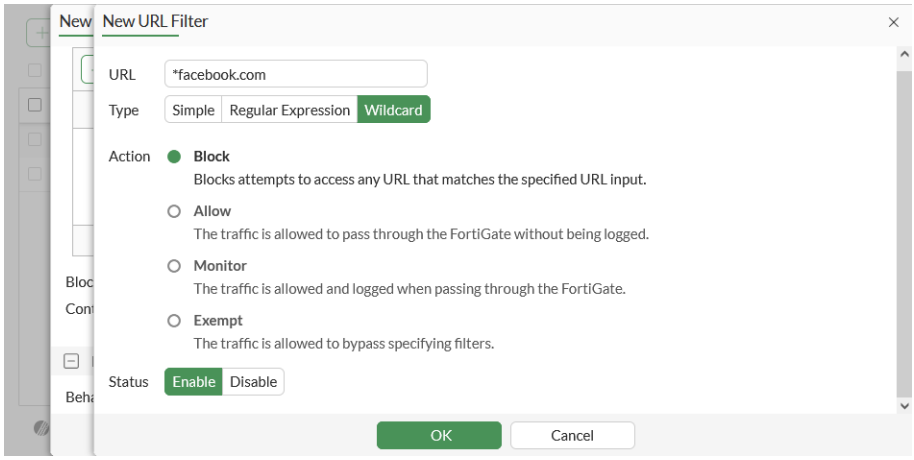
Option	Description
av	Antivirus scanning
web-content	Web filter content matching
activex-java-cookie	ActiveX, Java, and cookie filtering
dlp	DLP scanning
fortiguard	FortiGuard web filtering
range-block	Range block feature
pass	Pass single connection from all
antiphish	Antiphish credential checking
all	Exempt from all scanning and filtering operations listed above

These exempt options are not visible in the GUI. Setting the URL filter *Action* to *Exempt* will exempt URLs from all security profiles.

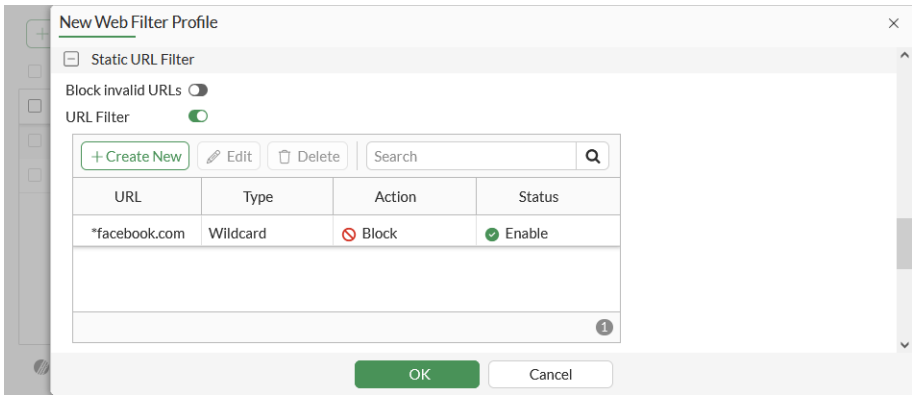
In the following example, a URL filter will be created to block the facebook.com URL using a wildcard.

To create a URL filter for Facebook in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *URL Filter*.
3. Click *Create New*. The *New URL Filter* pane opens.
4. For URL, enter **facebook.com*, for *Type*, select *Wildcard*, and for *Action*, select *Block*.



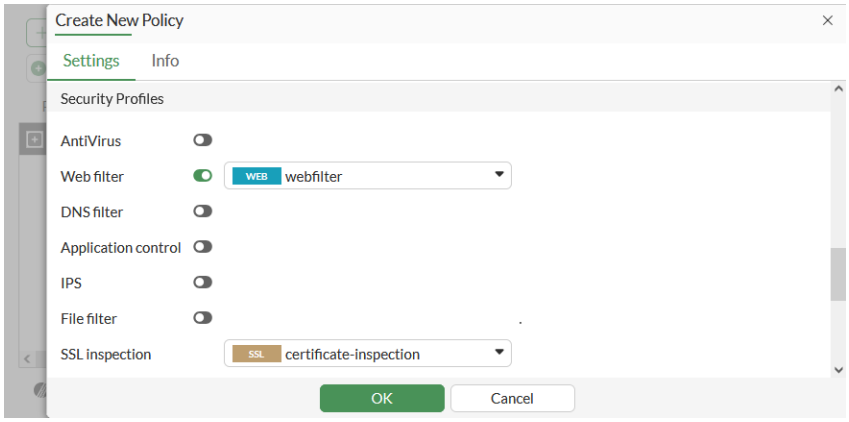
5. Click *OK*. The entry appears in the table.



6. Configure the other settings as needed.
7. Click *OK*.

To apply the web filter profile to a firewall policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*.
2. Edit a policy, or create a new one.
3. In the *Security Profiles* section, enable *Web Filter* and select the profile that you created.
4. Set *SSL Inspection* to *certificate-inspection*.



> The *no-inspection* profile does not perform SSL inspection, so it should not be selected with other UTM profiles.

5. Configure the other settings as needed.
6. Click *OK*.

To create a URL filter for Facebook in the CLI:

```
config webfilter urlfilter
    edit 1
        set name "webfilter"
        config entries
            edit 1
                set url "*facebook.com"
```

```
                set type wildcard
                set action block
            next
        end
    next
end
```

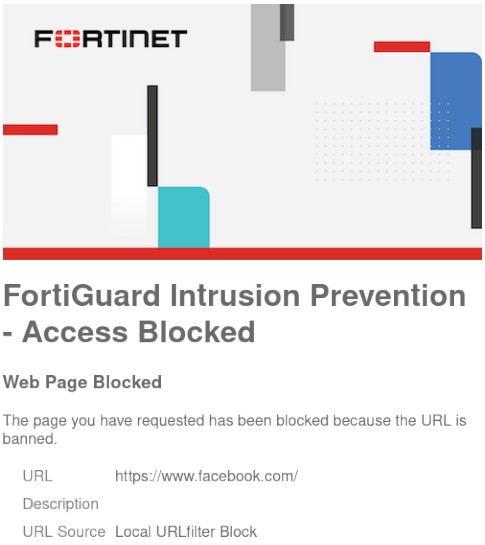
To apply the URL filter to a web filter profile in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set urlfilter-table 1
        end
        config ftgd-wf
            ...
        end
    next
end
```

To apply the web filter profile to a firewall policy in the CLI:

```
config firewall policy
    edit 1
        set name "WF"
        set srcintf "wan2"
        set dstintf "wan1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set webfilter-profile "webfilter"
        set ssl-ssh-profile "certificate-inspection"
        set nat enable
    next
end
```

Verify the URL filter results by going to a blocked website. For example, when you go to the Facebook website, the replacement message appears:

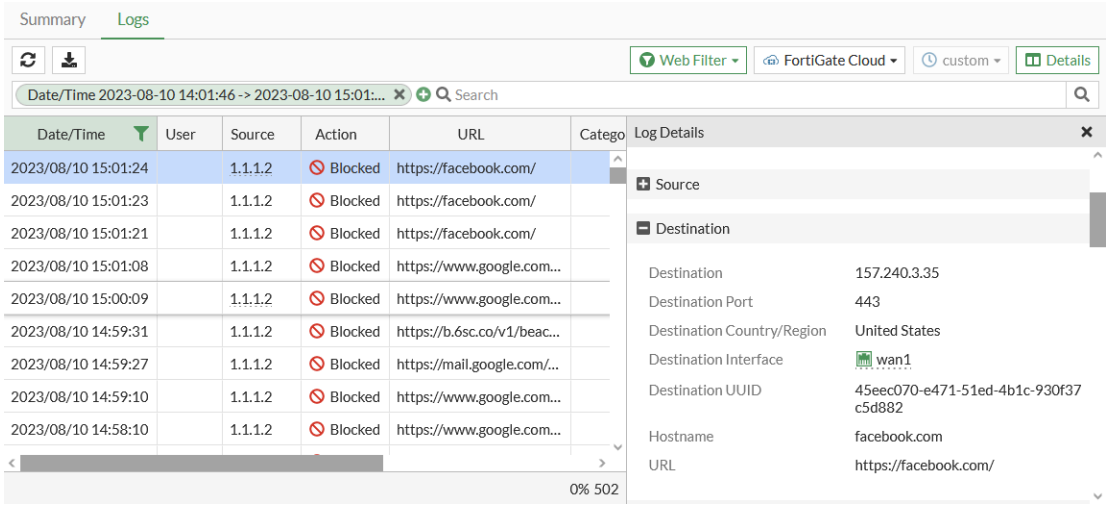


To customize the URL web page blocked message:

1. Go to *System* > *Replacement Messages*.
2. In the *HTTP* section, select *URL Block Page* and click *Edit*.
3. Edit the HTML to customize the message. See Replacement messages on page 3766 for more information.

To check web filter logs in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *Web Filter* card name.
3. If there are a lot of log entries, click *Add Filter* and select *Event Type* > *urlfilter* to display logs generated by the URL filter.



To check web filter logs in the CLI:

```
# execute log filter category utm-webfilter
# execute log display

2: date=2023-08-10 time=15:02:25 eventtime=1691704944982929658 tz="-0700" logid="0315012544"
type="utm" subtype="webfilter" eventtype="urlfilter" level="warning" vd="root" urlfilteridx=1
urlfilterlist="webfilter" policyid=1 poluuid="4a4b9d00-e471-51ed-71ec-c1a3bc8f773c"
policytype="policy" sessionid=4198 srcip=1.1.1.2 srcport=55044 srccountry="Australia"
srcintf="internal7" srcintfrole="lan" srcuuid="45eec070-e471-51ed-4b1c-930f37c5d882"
dstip=157.240.3.35 dstport=443 dstcountry="United States" dstintf="wan1" dstintfrole="wan"
dstuuid="45eec070-e471-51ed-4b1c-930f37c5d882" proto=6 service="HTTPS" hostname="www.facebook.com"
profile="webfilter" action="blocked" reqtype="direct" url="https://www.facebook.com/" sentbyte=812
rcvdbyte=0 direction="outgoing" urlsource="Local URLfilter Block" msg="URL was blocked because it
is in the URL filter list" crscore=30 craction=8 crlevel="high"
```

Disabling simple type URL filter from blocking subdomains

By default, a URL filter of type Simple will block subdomains. For example, specifying *slack.com* will match *hooks.slack.com* as well as *help.slack.com*.

To disable the inclusion of subdomains:

```
config webfilter urlfilter
    edit <id>
        set include-subdomains {enable | disable}
    next
end
```

The set `include-subdomain` option only applies to Simple type entries.

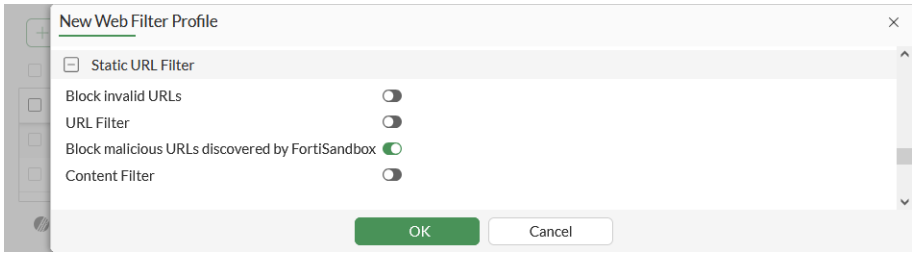
Block malicious URLs discovered by FortiSandbox

This setting blocks malicious URLs that FortiSandbox finds. Your FortiGate must be connected to a registered FortiSandbox.

For information on configuring FortiSandbox, see Using FortiSandbox post-transfer scanning with antivirus on page 2194 and Using FortiSandbox inline scanning with antivirus on page 2196.

To block malicious URLs discovered by FortiSandbox in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Block malicious URLs discovered by FortiSandbox*.



3. Click *OK*.

To block malicious URLs discovered by FortiSandbox in the CLI:

```
config webfilter profile
    edit "webfilter"
        config web
            set blocklist enable
        end
    next
end
```

Web content filter

You can control access to web content by blocking webpages containing specific words or patterns. This helps to prevent access to pages with questionable material. You can specify words, phrases, patterns, wildcards, and regular expressions to match content on webpages. You can use multiple web content filter lists and select the best one for each web filter profile.

The maximum number of web content patterns in a list depends on the model of the device. To find the maximum number of web content patterns allowed for a device, go to the Maximum Values Table (https://docs.fortinet.com/max-value-table). Select the software version and models, and click *Go*. Maximum values are displayed. In the *Search* box, enter *webfilter.content:entries* to find the maximum number.

When configuring a web content filter list, the following patterns are available:

Web content pattern type	Description
Wildcard	Use this setting to block or exempt one word or text strings of up to 80 characters. You can also use wildcard symbols such as *?* or * to represent one or more characters. For example, a wildcard expression *forti*.com* matches *fortinet.com* and *fortiguard.com*. The * represents any character appearing any number of times.
Regular expression	Use this setting to block or exempt patterns of regular expressions that use some of the same symbols as wildcard expressions, but for different purposes. In regular expressions, * represents the character before the symbol. For example, *forti*.com* matches *fortiii.com* but not *fortinet.com* or *fortiice.com*. In this case, the symbol * represents *i* appearing any number of times.

The web content filter scans the content of every webpage that is accepted by a firewall policy. The system administrator can specify banned words and phrases and attach a numerical value (or score) to the importance of those words and phrases. When the web content filter scan detects banned content, it adds the scores of banned words and phrases found on that page. If the sum is higher than a threshold set in the web filter profile, the FortiGate blocks the page.

The default score for web content filter is 10 and the default threshold is 10. This means that by default, a webpage is blocked by a single match. These settings can only be configured in the CLI.

Banned words or phrases are evaluated according to the following rules:

- The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.

- The score for any word in a phrase without quotation marks is counted.
- The score for a phrase in quotation marks is counted only if it appears exactly as written.

The following table is an example of how rules are applied to the webpage contents . For example, a webpage contains only this sentence:

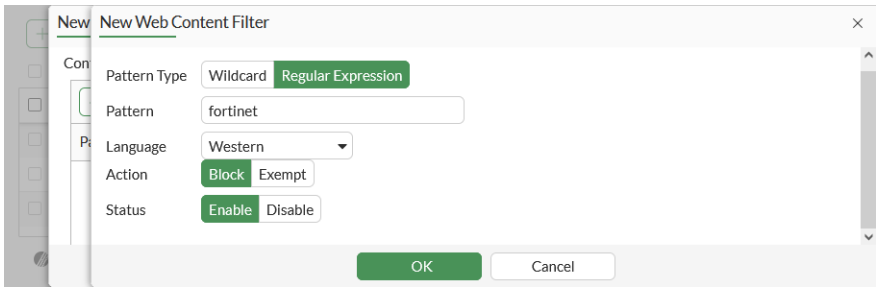
The score for each word or phrase is counted only once, even if that word or phrase appears many times in the webpage.

Banned pattern	Assigned score	Score added to the sum for the entire page	Threshold score	Comment
word	20	20	20	Appears twice but is only counted once. The webpage is blocked.
word phrase	20	40	20	Each word appears twice but is only counted once, giving a total score of 40. The webpage is blocked.
word sentence	20	20	20	*word* appears twice and *sentence* does not appear, but since any word in a phrase without quotation marks is counted, the score for this pattern is 20. The webpage is blocked.
"word sentence"	20	0	20	This phrase does not appear exactly as written. The webpage is allowed.
"word or phrase"	20	20	20	This phrase appears twice but is only counted once. The webpage is blocked.

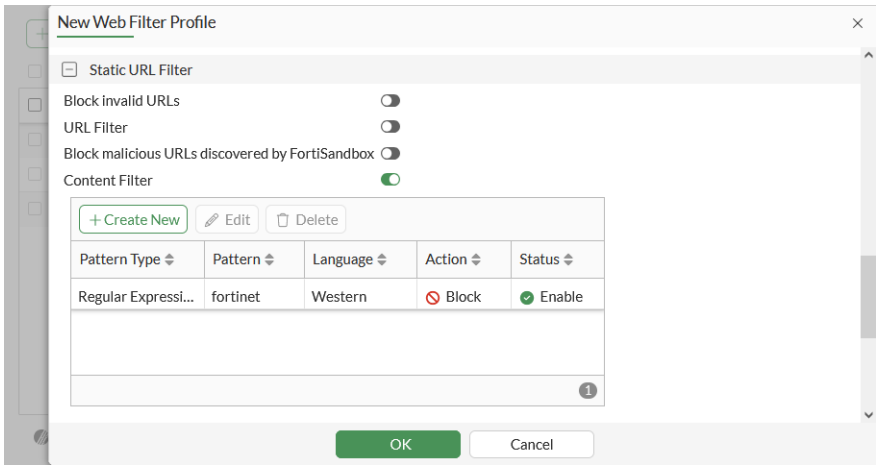
To configure a web content filter in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Static URL Filter* section, enable *Content Filter*.
3. In the table, click *Create New*. The *New Web Content Filter* pane opens.
4. Configure the following settings:

Pattern Type	Regular Expression
Pattern	fortinet
Language	Western
Action	Block
Status	Enable



5. Click *OK*. The entry appears in the table.



6. Configure the other settings as needed.
7. Click *OK*.

To configure a web content filter in the CLI:

1. Create the content (banned word) table:

```
config webfilter content
   edit 1
      set name "webfilter"
      config entries
         edit "fortinet"
           set pattern-type regexp
           set status enable
           set lang western
           set score 10
           set action block
         next
      end
   next
end
```

2. Apply the content table to the web filter profile:

```
config webfilter profile
   edit "webfilter"
      config web
```

```
            set bword-threshold 10
            set bword-table 1
        end
        config ftgd-wf
            unset options
        end
    next
end
```

To verify the content filter:

1. Go to a website with the word *fortinet*, such as www.fortinet.com.
   The website is blocked and a replacement page displays:

Rating options

This topic gives examples of the following advanced filter features:

- Allow websites when a rating error occurs on page 2266
- Rate URLs by domain and IP address on page 2267

Allow websites when a rating error occurs

If you do not have a FortiGuard license, but you have enabled services that need a FortiGuard license (such as FortiGuard filter), then you will get a rating error message.

Use this setting to allow access to websites that return a rating error from the FortiGuard Web Filter service.

To allow websites with rating errors in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Allow websites when a rating error occurs*.
3. Click *OK*.

To allow websites with rating errors in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            set options error-allow
        end
    next
end
```

Rate URLs by domain and IP address

If you enable this setting, in addition to only sending domain information to FortiGuard for rating, the FortiGate always sends both the URL domain name and the TCP/IP packet's IP address (except for private IP addresses) to FortiGuard for the rating.

The FortiGuard server might return a different category of IP address and URL domain. If they are different, the FortiGate uses the rating weight of the IP address or domain name to determine the rating result and decision. This rating weight is hard-coded in FortiOS.

For example, if we use a spoof IP of Google as www.irs.gov, the FortiGate will send both the IP address and domain name to FortiGuard to get the rating. We get two different ratings: one is the search engine and portals that belong to the Google IP, the second is the government and legal organizations that belongs to www.irs.gov. Because the search engine and portals rating has a higher weight than government and legal organizations, the traffic is rated as search engine and portals.

To rate URLs by domain and IP address in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Rating Options* section, enable *Rate URLs by domain and IP address*.
3. Click *OK*.

To rate URLs by domain and IP address in the CLI:

```
config webfilter profile
    edit "webfilter"
        config ftgd-wf
            set options rate-server-ip
        end
    next
end
```

Proxy options

This topic gives examples of the following advanced filter features:

- Restrict Google account usage to specific domains on page 2268
- HTTP POST action on page 2268
- Remove Java applets, ActiveX, and cookies on page 2269

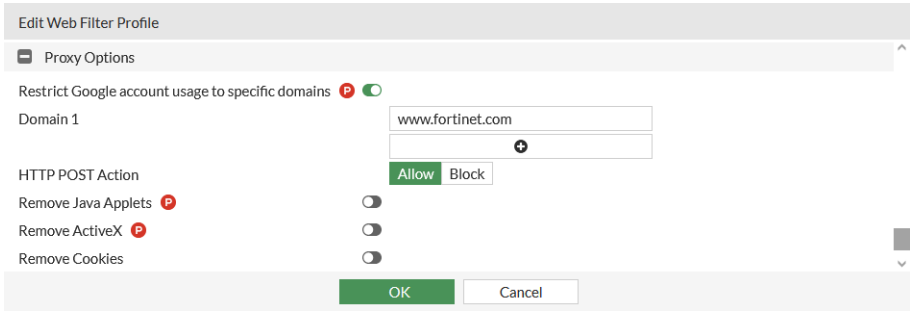
These advanced filters are only available in proxy-based inspection mode.

Restrict Google account usage to specific domains

Use this setting to block access to certain Google accounts and services, while allowing access to accounts with domains in the exception list.

To enable Google account restriction:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, enable *Restrict Google account usage to specific domains*.
3. Click the + and enter the domains that Google can access, such as www.fortinet.com.



4. Click *OK*.

When you try to use Google services like Gmail, only traffic from the domain of www.fortinet.com can go through. Traffic from other domains is blocked.

HTTP POST action

Use this setting to select the action to take with HTTP POST traffic. HTTP POST is the command used by the browser when you send information, such as a completed form or a file you are uploading to a web server. The action options are allow or block. The default is allow.

To configure HTTP POST in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile.
2. In the *Proxy Options* section, for *HTTP POST Action*, select *Allow* or *Block*.
3. Click *OK*.

To configure HTTP POST in the CLI:

```
config webfilter profile
    edit "webfilter"
        set post-action {normal | block}
        config ftgd-wf
            unset options
        end
```

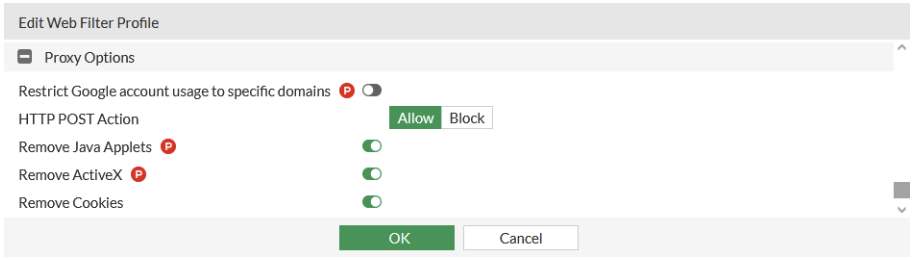
```
    next
end
```

Remove Java applets, ActiveX, and cookies

Web filter profiles have settings to filter Java applets, ActiveX, and cookies from web traffic. Note that if these filters are enabled, websites using Java applets, ActiveX, and cookies might not function properly.

To enable these filters in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*, or edit an existing profile. and go to the *Proxy Options* section.
2. In the *Proxy Options* section, enabled the filters you want to use: *Remove Java Applets*, *Remove ActiveX*, or *Remove Cookies*.



To enable these filters in the CLI:

```
config webfilter profile
   edit "webfilter"
      set options {activexfilter cookiefilter javafilter}
      config ftgd-wf
         unset options
      end
   next
end
```

Advanced CLI configuration

This section includes the following:

- Credential phishing prevention on page 2270
- Additional antiphishing settings on page 2272
- Web filter statistics on page 2276
- URL certificate blocklist on page 2277
- Websense Integrated Services Protocol on page 2278
- Inspecting HTTP3 traffic on page 2279
- Warning prompt per domain on page 2280
- Using URL risk-scores in determining policy action on page 2281

Credential phishing prevention

When credential phishing prevention is enabled, the FortiGate scans for corporate credentials submitted to external websites and compares them to sensitive credentials stored in the corporate domain controller. Based on the configured antiphishing rules in proxy mode web filter profiles, the FortiGate will block the URL or alert the user if the credentials match ones that are stored on the corporate domain controller.

- The corporate domain controller must be configured in the `domain controller`.
- For FortiGate to retrieve the domain information, the user needs to grant Replicating Directory Changes permissions in the Domain Controller (DC). See How to grant the "Replicating Directory Changes" permission for the Microsoft Metadirectory Services ADMA service account for more information.
- Credentials can be matched based on sAMAccountName, user principal name (UPN), or down-level logon name.
- The antiphishing profile defines the corporate domain controller, antiphishing check option, default action if no rules match, antiphishing status, and so on.
- Inspection entries in the profile define what action occurs when the submission request matches the specified FortiGuard categories.
- The profile scans for predefined and custom username and password fields in the HTTP request, such as `username`, `auth`, and `password`. You can evaluate custom fields by configuring custom patterns.
- The URL filter defines individual URLs that the antiphish action (block or log) is applied to when the URL submission request matches.

Web-based URL filter actions and FortiGuard category-based filtering have higher priority than antiphishing URL filter actions and FortiGuard filtering:

- If a request is blocked by the web-based URL filter or FortiGuard filter, there is no further antiphishing scanning. Antiphishing scanning only happens after the web-based URL filtes and FortiGuard filters allow the traffic.
- If a submission matches an entry in the URL filter table that has an antiphishing action, the defined action is taken. No further FortiGuard category-based rules are applied.
- Like firewall rules, the URL filter table and Fortiguard category-based antiphishing rules use a top-down priority. The rule that matches first is the one that is used.

In this example, URLs that match FortiGuard category 37 (social networking) will be blocked and other categories will be logged.

To configure credential phishing prevention:

1. Configure the corporate domain controller:

```
config user domain-controller
    edit "win2016"
        set hostname "win2016"
        set domain-name "corpserver.local"
        set username "Administrator"
        set password **********
        set ip <server_ip>
```

```
    next
end
```

The hostname and the domain-name are case sensitive.

2. Configure the antiphishing profile, which includes the FortiGuard category rule:

```
config webfilter profile
    edit <profile-name>
        set feature-set proxy
        ...
        config web
            ...
        end
        config antiphish
            set status enable
            set domain-controller "win2016"
            set default-action block
            set check-uri enable
            set check-basic-auth enable
            set max-body-len 65536
            config inspection-entries
                edit "inspect-37"
                    set fortiguard-category 37
                    set action block
                next
                edit "inspect-others"
                    set fortiguard-category all
                    set action log
                next
            end
            config custom-patterns
                edit "customer-name"
                    set category username
                next
                edit "customer-passwd"
                   set category password
                next
            end
        end
        ...
        set web-antiphishing-log enable
    next
end
```

- `check-uri` enables support for scanning HTTP GET URI parameters.
- `check-basic-auth` enables support for scanning the HTTP basic authentication field.

3. Configure the URL filter to scan specific URLs.

   The antiphish action is added to the URL filter table entry, and the URL filter is applied to the web filter profile:

```
config webfilter urlfilter
    edit 1
        set name "antiphish-table"
        config entries
            edit 1
                set url "www.example.com"
                set type simple
                set antiphish-action block
                set status enable
                set referrer-host ''
            next
        end
    next
end
config webfilter profile
    edit "<profile-name>"
        config web
            set urlfilter-table 1
        end
        ...
    next
end
```

4. Optionally, define custom patterns to scan fields other than the built-in username and password keywords:

```
config webfilter profile
    edit "<profile-name>"
        config custom-patterns
                edit "customer-name"
                    set category username
                next
                edit "customer-passwd"
                   set category password
                next
            end
        end
    next
end
```

Additional antiphishing settings

The following settings are available for antiphishing:

- Enable DNS service lookup in the domain controller so that the domain controller IP does not need to be configured. The DNS server will resolve the domain controller IP.
- Specify a source IP or port for the fetching domain controller.
- Use an LDAP server as a credential source (only the OpenLDAP server is supported).
- Block or log valid usernames regardless of password match.
- Use literal custom patterns type for username and password.
- Active Directory Lightweight Directory Services (AD LDS) support

Configuration examples

To enable DNS service lookup:

```
config user domain-controller
    edit "win2016"
        set ad-mode ds
        set dns-srv-lookup enable
        set hostname "win2016"
        set username "replicate"
        set password **********
        set domain-name "SMB2016.LAB"
    next
end
```

To specify the source IP and port for the fetching domain controller:

```
config user domain-controller
    edit "win2016"
        set ad-mode ds
        set hostname "win2016"
        set username "replicate"
        set password **********
        set ip-address 172.18.52.188
        set source-ip-address 172.16.100.1
        set source-port 2000
        set domain-name "SMB2016.LAB"

    next
end
```

To use an LDAP server as a credential store:

1. Configure the LDAP server:

```
config user ldap
    edit "openldap"
        set server "172.18.60.214"
        set cnid "cn"
        set dn "dc=qafsso,dc=com"
        set type regular
        set username "cn=Manager,dc=qafsso,dc=com"
        set password **********
        set antiphish enable
        set password-attr "userPassword"
    next
end
```

2. Configure the web filter profile:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            config filters
                edit 1
                    set action block
                next
            end
        end
        config antiphish
            set status enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            set authentication ldap
            set ldap "openldap"
        end
        set log-all-url enable
    next
end
```

To configure username-only credential matching:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            ...
        end
        config antiphish
            set status enable
            set check-username-only enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            set domain-controller "win2016"
        end
        set log-all-url enable
    next
end
```

To configure different custom pattern types for usernames and passwords:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            ...
        end
        config antiphish
            set status enable
            config inspection-entries
                edit "cat34"
                    set fortiguard-category 34
                    set action block
                next
            end
            config custom-patterns
                edit "qwer"
                    set type literal
                next
                edit "[0-6]Dat*"
                next
                edit "dauw9"
                    set category password
                    set type literal
                next
                edit "[0-5]foo[1-4]"
                    set category password
                next
            end
            set domain-controller "win2016"
        end
        set log-all-url enable
    next
end
```

In this example, the `qwer` and `dauw9` entries use the literal type, while `[0-6]Dat*` and `[0-5]foo[1-4]` use the default regex type.

To configure Active Directory in LDS mode:

```
config user domain-controller
    edit "win2016adlds"
        set hostname "win2016adlds"
        set username "foo"
        set password **********
        set ip-address 192.168.10.9
        set domain-name "adlds.local"
        set ad-mode lds
        set adlds-dn "CN=adlds1part1,DC=ADLDS,DC=COM"
        set adlds-ip-address 192.168.10.9
```

```
        set adlds-port 3890
    next
end
```

Web filter statistics

FortiOS provides diagnostics commands to view web filter statistics reports, which are either proxy-based or flow-based. The commands are available in both VDOM and global command lines.

Proxy-based web filter statistics report

Use the `diagnose wad filter vd {<VDOM> | global}` command to filter for per-VDOM or global statistics reports.

In the following example, there are two VDOMs (root and vdom1) using proxy-based policies that have web filter profiles enabled.

To view per-VDOM statistics reports:

```
(global) # diagnose wad filter vd root
Drop_unknown_session is enabled.
```

```
(global) # diagnose wad stats filter list
filtering of vdom root
  dlp          = 0
  content-type = 0
  urls:
    examined = 6
    allowed = 3
    blocked = 0
    logged = 0
    overridden = 0
```

```
(global) # diagnose wad filter vd vdom1
(global) # diagnose wad stats filter list
filtering of vdom vdom1
  dlp          = 0
  content-type = 0
  urls:
    examined = 13
    allowed = 2
    blocked = 9
    logged = 8
    overridden = 0
```

```
(global) # diagnose wad filter vd ALL
(global) # diagnose wad stats filter list
filtering of all accessible vdoms
  dlp          = 0
```

```
  content-type = 0
  urls:
    examined = 19
    allowed = 5
    blocked = 9
    logged = 8
    overridden = 0
```

Flow-based web filter statistics report

Use the `diagnose webfilter stats list {<VDOM> | global}` command to check the flow-based web filter statistics.

In the following example, the VDOM is using flow-based policies that have web filter profiles enabled.

To view web filter statistics:

```
# diagnose webfilter stats list root
Proxy/flow URL filter stats:
request:   9474
blocked:   8606
allowed:   868
overridden:0
logged:    8606
pending:   0
```

URL certificate blocklist

As increasing numbers of malware have started to use SSL to attempt to bypass IPS, maintaining a fingerprint-based certificate blocklist is useful to block botnet communication that relies on SSL.

This feature adds a dynamic package that is distributed by FortiGuard and is part of the Web Filtering service. It is enabled by default for SSL/SSH profiles, and can be configured using the following CLI commands:

```
config vdom
    edit <vdom>
        config firewall ssl-ssh-profile
            edit "certificate-inspection"
                set block-blocklisted-certificates enable
            next
            edit "deep-inspection"
                set block-blocklisted-certificates enable
            next
        end
    next
end
```

Websense Integrated Services Protocol

Websense Integrated Services Protocol (WISP) is supported on the FortGate, which allows the firewall to send traffic to the third-party web filtering service for rating and approval checking.

When WISP is enabled, the FortiGate maintains a pool of TCP connections to the WISP server. The TCP connections are used to forward HTTP request information and log information to the WISP server and receive policy decisions.

When a WISP server is used in a web filter profile, in flow or proxy mode, the following web filter scanning priority sequence is used:

1. Local URL filter
2. Websense web filtering service
3. FortiGuard web filtering service

The following example uses a WISP server configured in a flow mode web filter profile.

To use a WISP server in flow mode:

1. Configure the WISP servers:

```
config web-proxy wisp
    edit "wisp1"
        set server-ip 10.2.3.4
    next
    edit "wisp2"
        set server-ip 10.2.3.5
    next
    edit "wisp3"
        set server-ip 192.168.1.2
    next
    edit "wisp4"
        set server-ip 192.168.3.4
    next
end
```

2. Configure the web filter profile:

```
config webfilter profile
    edit "webfilter_flowbase"
        set feature-set flow
        config ftgd-wf
            unset options
            config filters
                edit 64
                    set category 64
                    set action block
                next
            end
        end
        set wisp enable
        set wisp-servers "wisp1" "wisp2"
```

```
        set wisp-algorithm {primary-secondary | round-robin | auto-learning}
        set log-all-url enable
    next
end
```

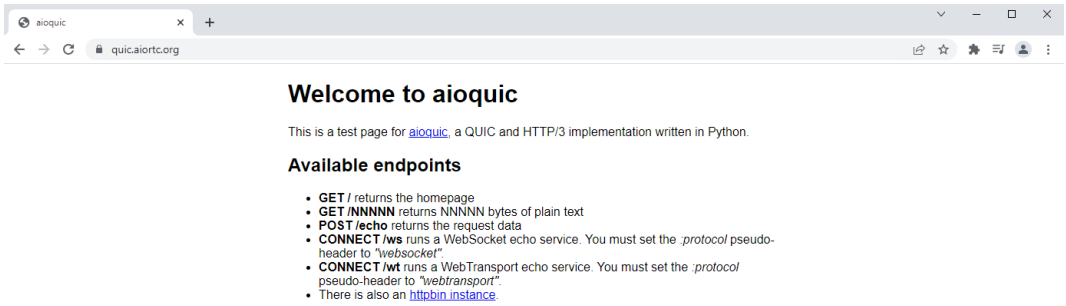
Inspecting HTTP3 traffic

HTTP/3 traffic can be inspected on the FortiGate in flow mode inspection.

When using Chrome, the browser may switch the HTTP/3 connection to HTTP/2 when deep inspection is applied, due to its sensitivity to delays caused by deep inspection.

Example

In this example, a web filter profile is created to block the words *Welcome to aioquic*, which appear in a website that uses HTTP/3.



To block content in HTTP/3 traffic:

1. Configure the web filter banned word table:

```
config webfilter content
    edit 1
        set name "aioquic"
        config entries
            edit "Welcome to aioquic"
                set status enable
            next
        end
    next
end
```

2. Apply the banned word table in the web filter profile:

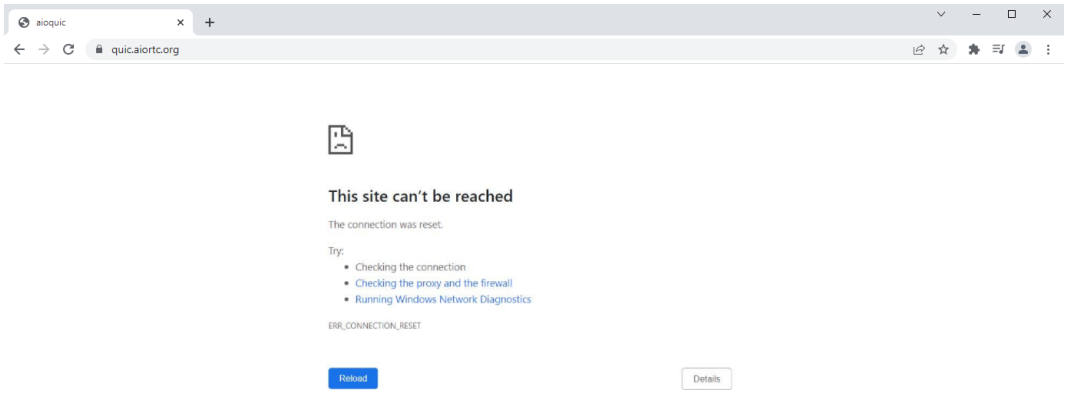
```
config webfilter profile
    edit "flow-webfilter"
        config web
            set bword-table 1
```

```
        end
        config ftgd-wf
            unset options
        end
    next
end
```

3. Configure the firewall policy:

```
config firewall policy
    edit 1
        set utm-status enable
        set ssl-ssh-profile "deep-inspection"
        set webfilter-profile "flow-webfilter"
        set logtraffic all
        set nat enable
    next
end
```

4. Access the website using a supported HTTP/3 client, such as Chrome or Firefox. The website is blocked by the FortiGate.



Warning prompt per domain

When you are configuring web filter profiles and setting the action to warn for a web filter category, the default action is to allow access to that category for the configured time. See Web profile override on page 2671.

Alternatively, the CLI may be used to set the presentation of a warning prompt for individual domains within a given category. By requiring users to acknowledge the desire to proceed on each domain within a category, subsequent visits to domains in the same category within the warn-duration provide the same experience as the initial domain. They are not transparently allowed and maintain a consistent experience for the category.

This feature requires deep inspection. Using certificate inspection is not supported and will provide inconsistent results and logs.

To configure a warning prompt:

```
config webfilter profile
    edit <web_filter_name>
        config ftgd-wf
            config filters
                edit <filter_id>
                    set category <category_id>
                    set action warning
                    set warning-prompt per-domain
                next
            end
        end
    next
end
```

Using URL risk-scores in determining policy action

Risk level ratings can be added to the FortiGuard URL rating service. A FortiGate can query the rating service to retrieve the risk score for a URL. This risk score rates the likelihood that a website has malicious intent. It combines the results of machine learning models and human analysis together to predict how likely a given URL is malicious.

The risk score returned from FortiGuard is a value from 0-100, where:

Risk Score	Risk Level	Description
91-100	High	Strong confidence of malicious intent.
71-90	Suspicious	Medium confidence of malicious intent.
51-70	Moderate	Generally benign with a potential risk of attack.
21-50	Low	Low predictive risk of attack.
1-20	Trustworthy	Very low predictive risk of attack.
0	Unrated	The URL does not exist in FortiGuard DB or the risk score of the URL is unknown.

The FortiGate can utilize this risk score and risk level in two different ways.

1. In a web filter profile, a risk level can be associated with the action *Block* or *Monitor*. When traffic hits a policy with the web filter profile applied, the URL will be used to query the FortiGuard URL rating service. If the risk score matches a level defined in the profile, the action is taken on that website.

   The firewall policy must use proxy-based inspection. Either certificate or deep inspection will work with this feature.

2. In an explicit or transparent web proxy, a proxy-policy can be configured with a risk level. The risk level becomes a matching criteria for the policy.

Furthermore, the risk score range associated with each predefined level above cannot be modified on the FortiGate. However, new risk levels can be created with a custom range. These risk levels can be used within a web filter profile or within a proxy-policy.

Tie-breaker

In a web filter profile, when both risk level and web filter category are used, the action for the matched risk level will be ranked against the action for the matched web category.

Actions have the following weight order:

1. Block
2. Warning (Authenticate)
3. Monitor
4. Allow

When the action resulting from the risk level query and web filter category query return different actions, the action higher in the weight order will be performed. For example, a block and a warning action will result in the page being blocked.

When the actions returned are the same, then that action will be applied, and the replacement message and UTM log will indicate the decision was made by web filter category check.

Finally, if multiple risk levels are matched within a web filter profile, the action that has the higher weight will be applied.

Risk score override

A risk score can be overridden by a local risk-score override value. This override applies to a single URL specified in the object name.

CLI Syntax

The follow CLI syntax are included for introducing URL risk-scores to determine policy action:

- Risk level configuration in a web filter profile:

```
config webfilter profile
    edit <name>
        set feature-set proxy
        config ftgd-wf
            unset options
            config risk
                edit <id>
                    set risk-level <pre-defined or custom level>
                    set action {block | monitor}
                    set log {enable | disable}
                next
            end
        end
    next
end
```

- Built-in read-only web filter local FortiGuard risk-level definition:

```
config webfilter ftgd-risk-level
    edit "high"
        set high 100
        set low 91
    next
    edit "suspicious"
        set high 90
        set low 71
    next
    edit "moderate"
        set high 70
        set low 51
    next
    edit "low"
        set high 50
        set low 21
    next
    edit "trustworthy"
        set high 20
        set low 1
    next
    edit "unrated"
        set high 0
        set low 0
    next
end
```

- Custom user-defined web filter local FortiGuard risk-level:

```
config webfilter ftgd-risk-level
    edit <name>
        set high <score>
        set low <score>
    next
end
```

- Web filter local FortiGuard risk-score override:

```
config webfilter ftgd-local-risk
    edit <url>
        set status {enable | disable}
        set comment <string>
        set risk-score <score>
    next
end
```

- Applying risk-level to proxy-policy match:

```
config firewall proxy-policy
    edit <id>
        set url-risk <pre-defined or custom level>
```

```
    next
end
```

Examples

The following examples demonstrate applying risk levels in different scenarios.

Two demo URLs are used for the examples:

Demo URL	Risk score	Default risk level
www.example.com	58	Moderate
www.httpbin.org	46	Low

In the web filter examples, the profile is applied to a firewall policy that utilizes proxy-based inspection and deep inspection.

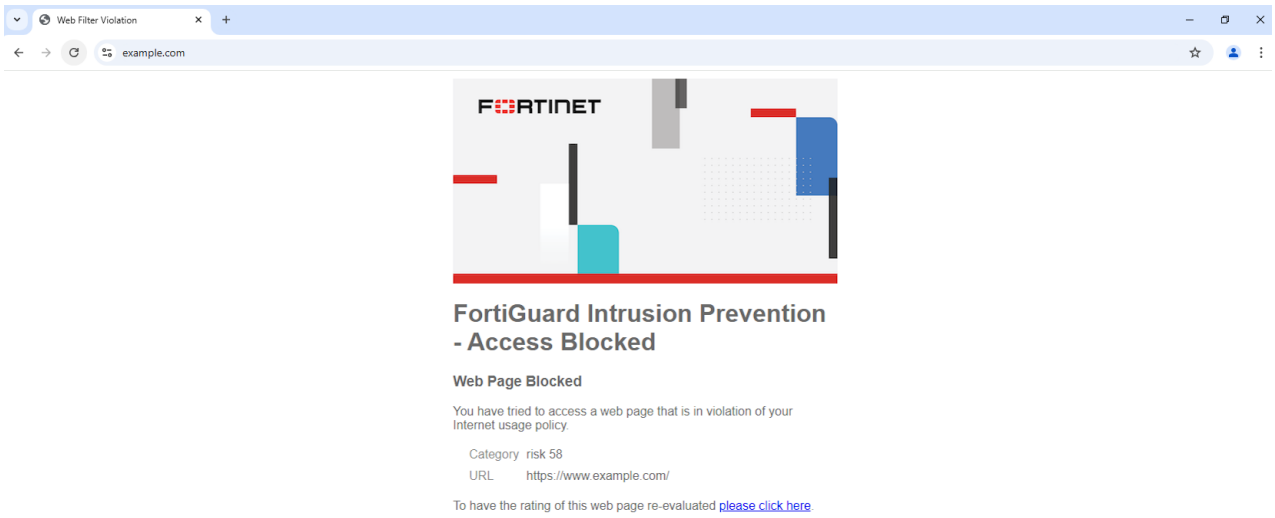
Example 1: Applying the action block to the moderate risk level

To apply the action block to the moderate risk level:

```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            config risk
                edit 1
                    set risk-level "moderate"
                    set action block
                next
            end
        end
    next
end
config firewall policy
    edit 1
        set name "WF"
        set srcintf "port2"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set profile-protocol-options "protocol"
        set ssl-ssh-profile "protocols"
        set webfilter-profile "webfilter"
        set logtraffic all
```

```
        set nat enable
    next
end
```

When a client accesses www.example.com, the URL is blocked.



The following UTM log can be observed from CLI:

```
# execute log filter category utm-webfilter
# execute log display
1: date=2024-11-20 time=09:45:19 eventtime=1732124719100876715 tz="-0800" logid="0316013058"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vdom1" policyid=1
poluuid="717176ae-97e7-51ef-2203-1f0b21e90462" policytype="policy" sessionid=6273
srcip=10.1.100.123 srcport=61545 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="8770b128-97cd-51ef-63d8-082966d66657" dstip=93.184.215.14 dstport=443
dstcountry="Belgium" dstintf="port1" dstintfrole="undefined" dstuuid="8770b128-97cd-51ef-63d8-
082966d66657" proto=6 httpmethod="GET" service="HTTPS" hostname="www.example.com"
agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KH" profile="webfilter"
action="blocked" reqtype="direct" url="https://www.example.com/" sentbyte=4559 rcvdbyte=6070
direction="outgoing" msg="URL belongs to a denied risk-level in policy" ratemethod="domain"
cat=255 urlrisk=58
```

Example 2: Overriding the URL's FortiGuard risk score with local risk score

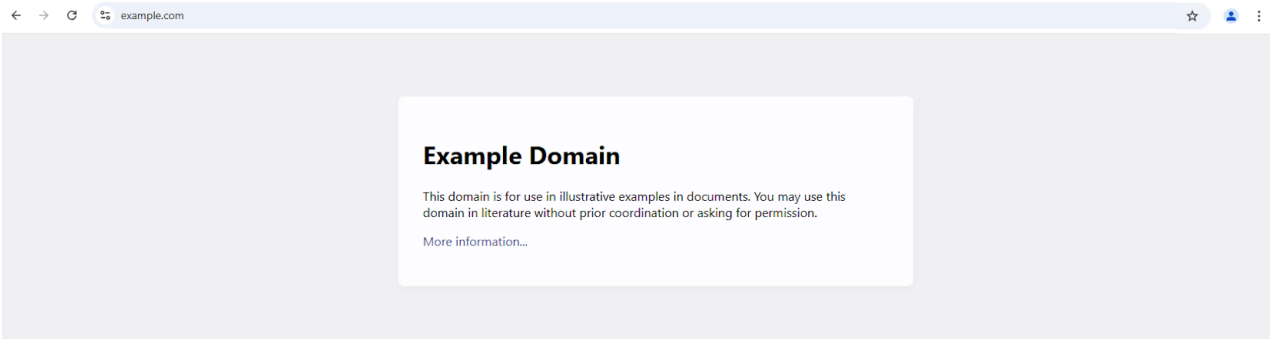
To override the URL's FortiGuard risk score with local risk score:

```
config webfilter ftgd-local-risk
    edit "www.example.com"
        set risk-score 30
    next
end
config webfilter profile
    edit "webfilter"
        set feature-set proxy
```

```
        config ftgd-wf
            unset options
            config risk
                edit 1
                    set risk-level "moderate"
                    set action block
                next
                edit 2
                    set risk-level "low"
                next
            end
        end
        set log-all-url enable
    next
end
```

The `low` risk-level is added to the web filter profile, with the action monitor.

When a client accesses www.example.com, the URL is allowed.



The following UTM log can be observed from CLI:

```
1: date=2024-11-20 time=11:25:55 eventtime=1732130754321650374 tz="-0800" logid="0317013313"
type="utm" subtype="webfilter" eventtype="ftgd_allow" level="notice" vd="vdom1" policyid=1
poluuid="717176ae-97e7-51ef-2203-1f0b21e90462" policytype="policy" sessionid=7648
srcip=10.1.100.123 srcport=61943 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="8770b128-97cd-51ef-63d8-082966d66657" dstip=93.184.215.14 dstport=443
dstcountry="Belgium" dstintf="port1" dstintfrole="undefined" dstuuid="8770b128-97cd-51ef-63d8-
082966d66657" proto=6 httpmethod="GET" service="HTTPS" hostname="www.example.com"
agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KH" profile="webfilter"
action="passthrough" reqtype="direct" url="https://www.example.com/" sentbyte=3118 rcvdbyte=4927
direction="outgoing" msg="URL belongs to an allowed risk-level in policy" ratemethod="domain"
cat=255 urlrisk=30
```

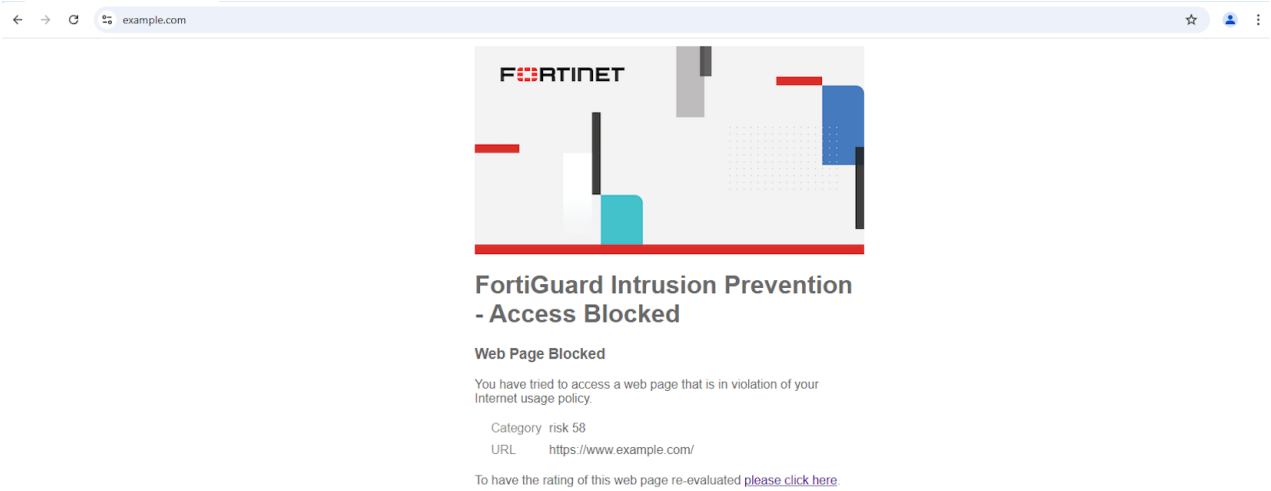
Example 3: Applying a user-defined risk level to the web filter profile

To apply a user-defined risk level to the web filter profile:

```
config webfilter ftgd-risk-level
    edit "medium-safety"
        set high 60
```

```
        set low 30
    next
end
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            config risk
                edit 1
                    set risk-level "medium-safety"
                    set action block
                next
            end
        end
        set log-all-url enable
    next
end
```

When a client accesses www.example.com, the URL is blocked.



The following UTM log can be observed from CLI:

```
1: date=2024-11-20 time=11:58:46 eventtime=1732132726031604734 tz="-0800" logid="0316013058"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vdom1" policyid=1
poluuid="717176ae-97e7-51ef-2203-1f0b21e90462" policytype="policy" sessionid=8028
srcip=10.1.100.123 srcport=62051 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="8770b128-97cd-51ef-63d8-082966d66657" dstip=93.184.215.14 dstport=443
dstcountry="Belgium" dstintf="port1" dstintfrole="undefined" dstuuid="8770b128-97cd-51ef-63d8-
082966d66657" proto=6 httpmethod="GET" service="HTTPS" hostname="www.example.com"
agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KH" profile="webfilter"
action="blocked" reqtype="direct" url="https://www.example.com/" sentbyte=2962 rcvdbyte=4927
direction="outgoing" msg="URL belongs to a denied risk-level in policy" ratemethod="domain"
cat=255 urlrisk=58
```

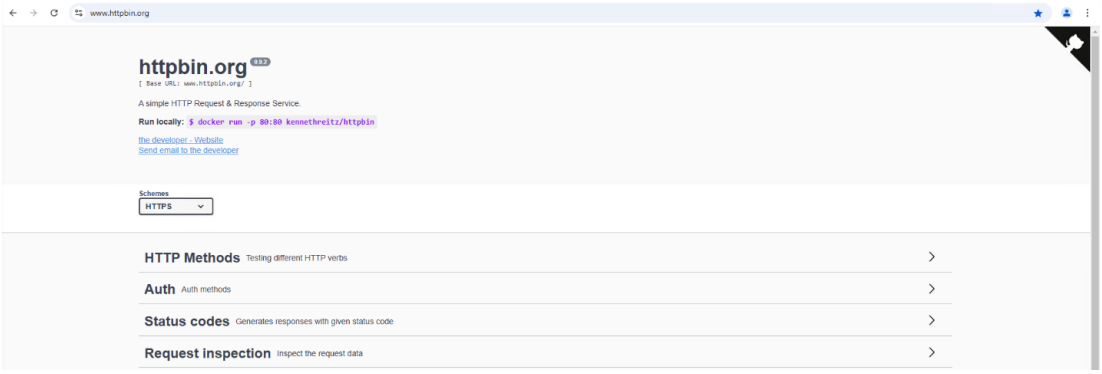
Example 4: Matching an explicit web proxy policy by the URL's risk level

A proxy-policy is configured to allow URLs that have low risk level.

To match an explicit web proxy policy by the URL's risk level:

```
config firewall proxy-policy
    edit 1
        set name "Test"
        set proxy explicit-web
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set url-risk "low"
        set service "webproxy"
        set action accept
        set schedule "always"
        set logtraffic all
        set ssl-ssh-profile "protocols"
        set log-http-transaction enable
    next
end
```

When a client accesses www.httpbin.org, the URL is allowed.



Traffic log indicates the traffic matched proxy-policy 1:

```
# execute log filter category traffic
# execute log display
2: date=2024-11-20 time=14:14:43 eventtime=1732140883609560183 tz="-0800" logid="0006000026"
type="traffic" subtype="http-transaction" level="notice" vd="vdom1" srcip=10.1.100.123
srcport=64445 dstip=52.20.148.183 dstport=443 sessionid=1798921931 transid=150995356
action="accept" policyid=1 policytype="proxy-policy" poluuid="7b6afd8e-a78b-51ef-0ae5-
5ddbd0defd25" url="https://www.httpbin.org/" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64)
AppleWebKit/537.36 (KHTML, like Gecko) Chrome/131.0.0.0 Safari/537.36" appcat="unscanned"
duration=1 reqlength=474 resplength=9751 rcvdbyte=15379 sentbyte=2809 scheme="https"
hostname="www.httpbin.org" resptype="normal" httpmethod="GET" statuscode="200" reqtime=1732140882
resptime=1732140883 respfinishtime=1732140883
```

When a client accesses www.example.com, no proxy policy is matched. The URL is blocked.

Traffic log indicates the traffic is denied:

```
2: date=2024-11-20 time=14:19:17 eventtime=1732141157742504064 tz="-0800" logid="0000000013"

```

Configuration examples

This section includes the following configuration examples:

- Configuring web filter profiles with Hebrew domain names on page 2289
- Configuring web filter profiles to block cryptocurrency on page 2294
- Configuring web filter to exempt URLs from other security profiles on page 2296

Configuring web filter profiles with Hebrew domain names

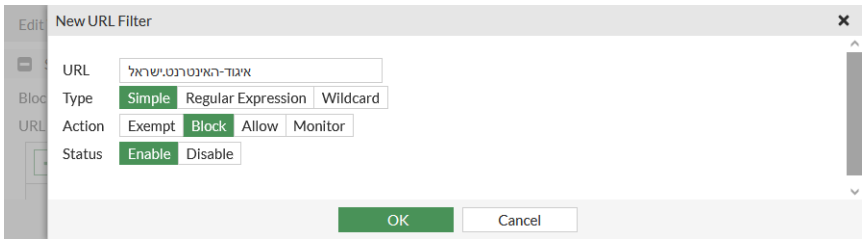
The domain name URLs in web filter profiles can be configured with non-ASCII characters, such as in Hebrew. Any configured domain name in non-ASCII characters is encoded into Punycode format, then the domain name in Punycode format is used to match the domain name in the HTTP request for URL filtering purposes.

In the following example, a Hebrew URL (`אינטרנט-אגוד.ישראל`) is blocked in by a static URL filter. The URL translates to:

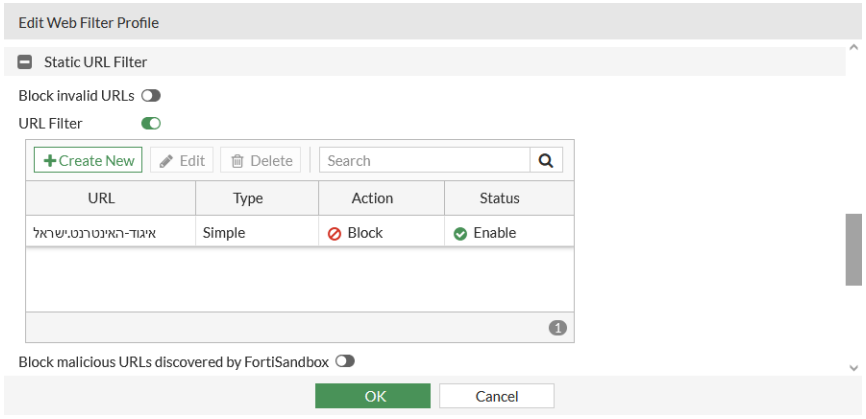
- `xn----zhcbgfhe2aacg8fb5i.xn--4dbrk0ce` in Punycode
- `en.isoc.org.il` in English

To configure the web filter profile in the GUI:

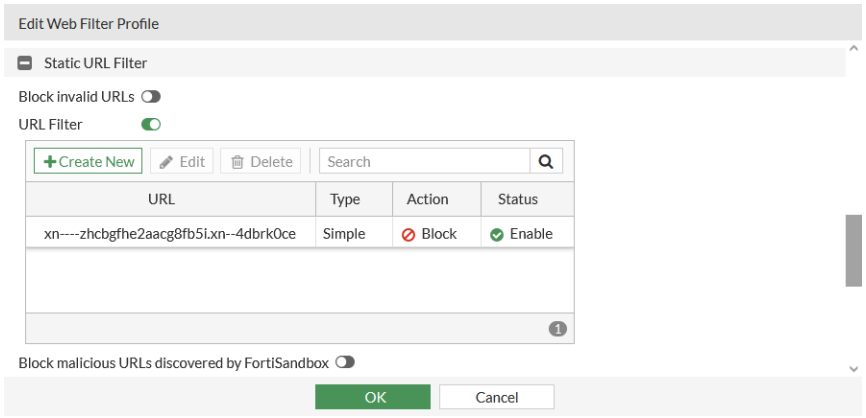
1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a profile *Name*.
3. In the *Static URL Filter* section, enable *URL Filter* and click *Create New*.
4. Enter the Hebrew URL and set the *Action* to *Block*. The URL can be entered in Hebrew.



5. Click *OK* to save the filter. The URL appears in Hebrew in the URL filter table.



6. Click *OK* to save the web filter profile.
7. Edit the web filter profile. The URL in the table has been converted by the FortiGate into Punycode.



In the CLI, Punycode must be used to configure the Hebrew URL.

To configure the web filter profile in the CLI:

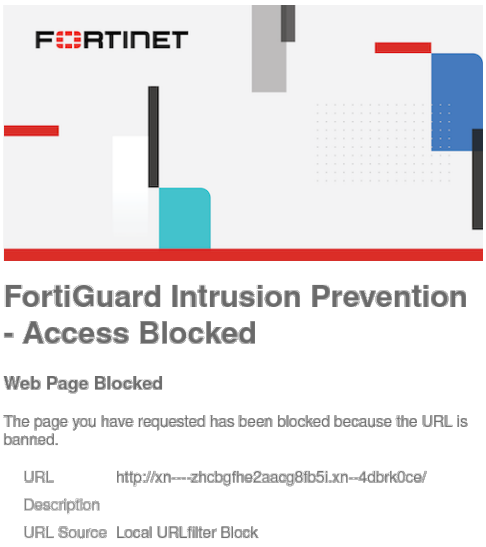
```
config webfilter urlfilter
    edit 1
        set name "Auto-webfilter-urlfilter_0wedo5f1c"
        config entries
            edit 1
                set url "xn----zhcbgfhe2aacg8fb5i.xn--4dbrk0ce"
                set action block
            next
```

```
        end
    next
end
```

To verify the configuration:

1. From a client, access the Hebrew URL over HTTPS. The website is blocked by the FortiGate.
2. The content of the replacement message displayed in the browser depends on the inspection mode.
   - In flow mode (current configuration), the URL is displayed in Hebrew.

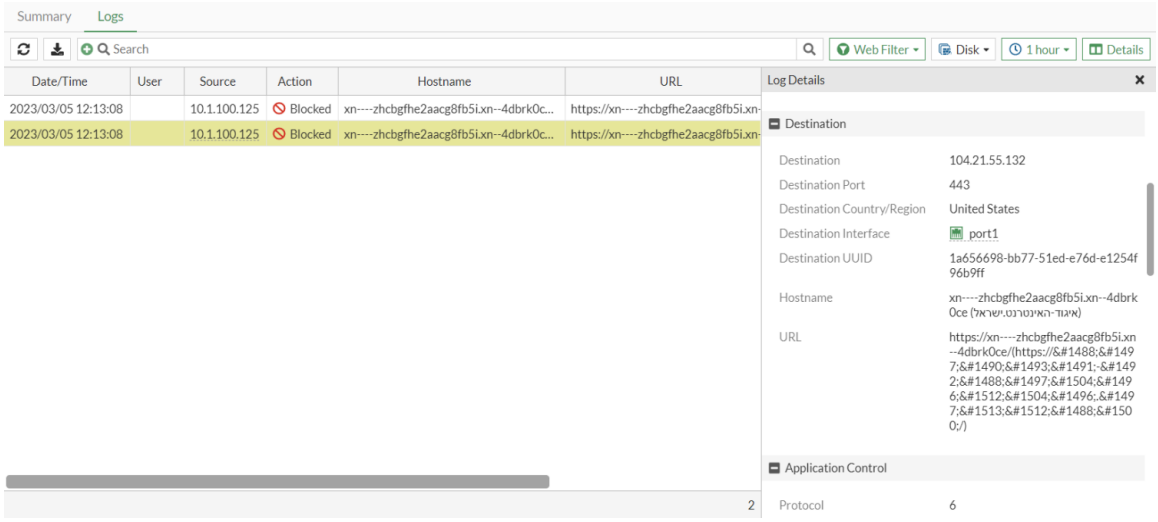
   - In proxy mode, the URL is displayed in Punycode.



To verify the logs:

1. Go to *Log & Report* > *Security Events* and select the *Web Filter* card.
2. Select a log and click *Details*. The format of the *Hostname* and *URL* fields depends on the inspection mode.

- In flow mode, the *Hostname* is displayed in Punycode with Hebrew in parentheses. The *URL* is displayed Punycode.



When the log file is downloaded, the hostname in the raw file cannot be displayed. Paste the log into a text editor (such as Word or Notepad) to view the URL in Hebrew.

```
# execute log display
2 logs found.
2 logs returned.

If a FortiGuard category-based filter is configured in a web filter profile, the same behavior for replacement messages and logs applies based on the inspection mode.

Configuring web filter profiles to block cryptocurrency

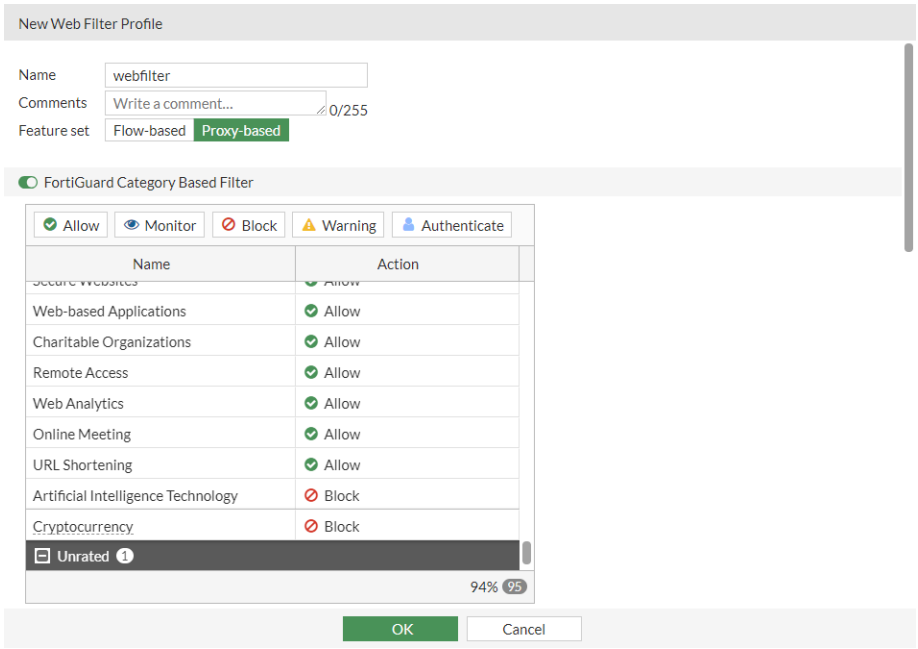
The following FortiGuard web filter category is available:

- Cryptocurrency (category 101): sites that specialize in digital or virtual currencies that are secured by cryptography and operate on decentralized networks.

See also Protecting GenAI access using web filter on page 2152.

To configure a web filter profile to block the cryptocurrency categories in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a name for the web filter profile.
3. In the category table, locate the *General Interest - Business* section. Select the *Cryptocurrency* category, and set the *Action* to *Block*.



4. Configure the remaining settings as needed.
5. Click *OK*.

To configure a web filter profile to block the cryptocurrency category in the CLI:

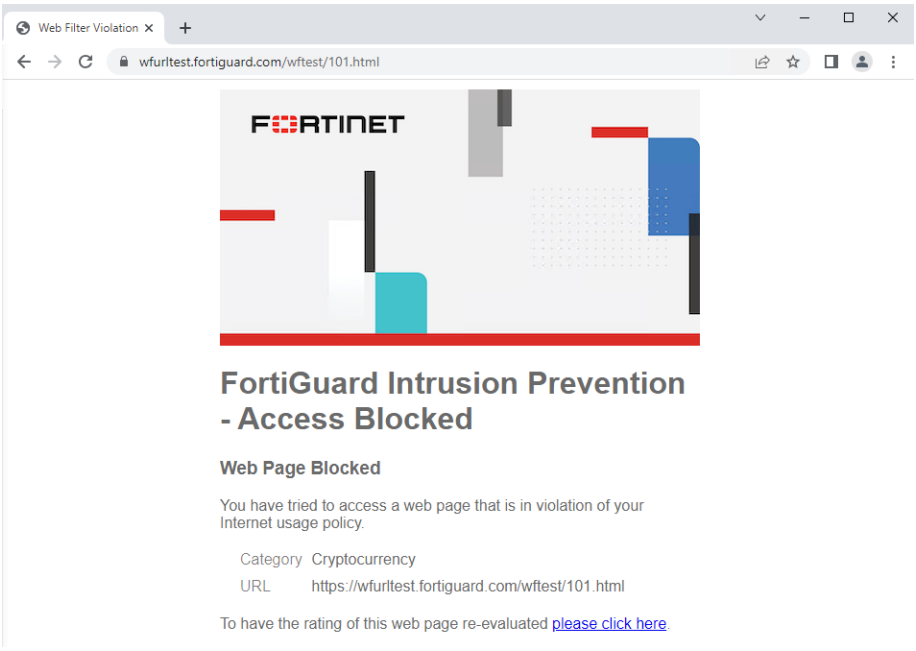
```
config webfilter profile
    edit "webfilter"
        set feature-set proxy
        config ftgd-wf
            unset options
            config filters
                edit 101
                    set category 101
                    set action block
                next
                edit 52
                    set category 52
                next
            end
        end
        set log-all-url enable
    next
end
```

To verify that the categories are blocked:

1. Apply the web filter profile in a firewall policy.
2. On a device that is connected through the FortiGate and uses the policy, visit the following test URL for the category:
   a. `https://wfurltest.fortiguard.com/wftest/101.html`

      The browser displays a replacement message that the URL is blocked based on the FortiGuard category.

- Cryptocurrency:



To verify the web filter logs:

1. In the GUI, go to *Log & Report* > *Security Events* and click *Web Filter*.
2. In the CLI, enter the following:

```
# execute log filter category utm-webfilter
# execute log display
1: date=2023-07-12 time=10:39:18 eventtime=1689183557968026063 tz="-0700" logid="0316013056"
type="utm" subtype="webfilter" eventtype="ftgd_blk" level="warning" vd="vdom1" policyid=1
poluuid="996b0a68-2055-51ee-b841-2b3f373c9b37" policytype="policy" sessionid=3258
srcip=10.1.100.31 srcport=35116 srccountry="Reserved" srcintf="port2" srcintfrole="undefined"
srcuuid="124f368a-2055-51ee-c7d6-857ab36dd6cb" dstip=154.52.5.202 dstport=443
dstcountry="United States" dstintf="port1" dstintfrole="undefined" dstuuid="124f368a-2055-
51ee-c7d6-857ab36dd6cb" proto=6 httpmethod="GET" service="HTTPS"
hostname="wfurltest.fortiguard.com" agent="curl/7.68.0" profile="webfilter" action="blocked"
reqtype="direct" url="https://wfurltest.fortiguard.com/wftest/101.html" sentbyte=849
rcvdbyte=3633 direction="outgoing" msg="URL belongs to a denied category in policy"
ratemethod="domain" cat=101 catdesc="Cryptocurrency"
```

Configuring web filter to exempt URLs from other security profiles

When configuring other security profiles, specific URLs sometimes need to be exempt from the defined rules.

For example, a rule might exist to block all executable files, but an executable file needs to be downloadable from a specific website. In this case, a web filter static URL filter can be used to exempt the specific URL from further processing by the other security profiles.

Static URL filters can be applied to other security profiles as follows:

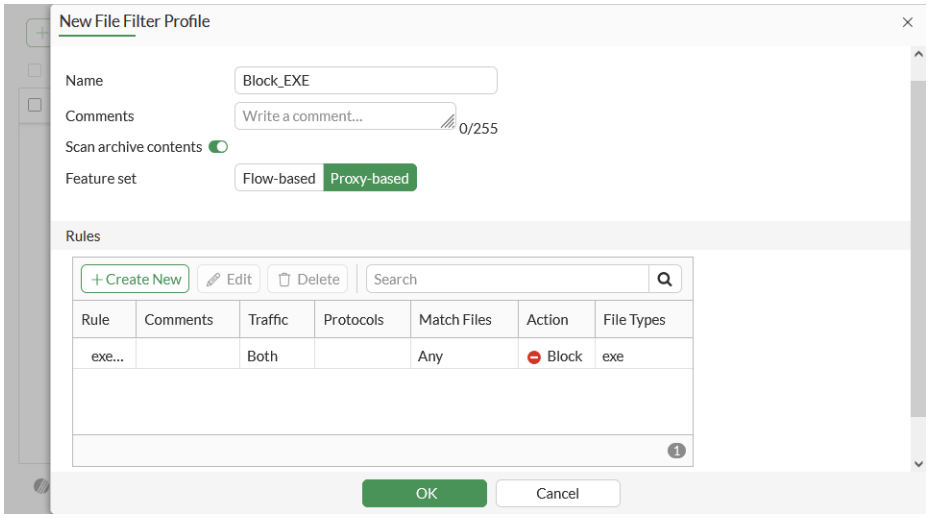
Security profile	Proxy support	Flow support
File filter	Yes	No
Antivirus	Yes	Yes
Data loss prevention	Yes	Yes
Video filter	No	(Proxy only security profile)

Example

In this example, a file filter has been configured to block downloads of .exe files and is applied to a firewall policy that has deep inspection enabled.

The file filter has the following settings:

Field	Value
Name	Block_EXE
Feature set	Proxy-based
Rule	exe_block
Traffic	Both
Match Files	Any
Action	Block
File Types	exe

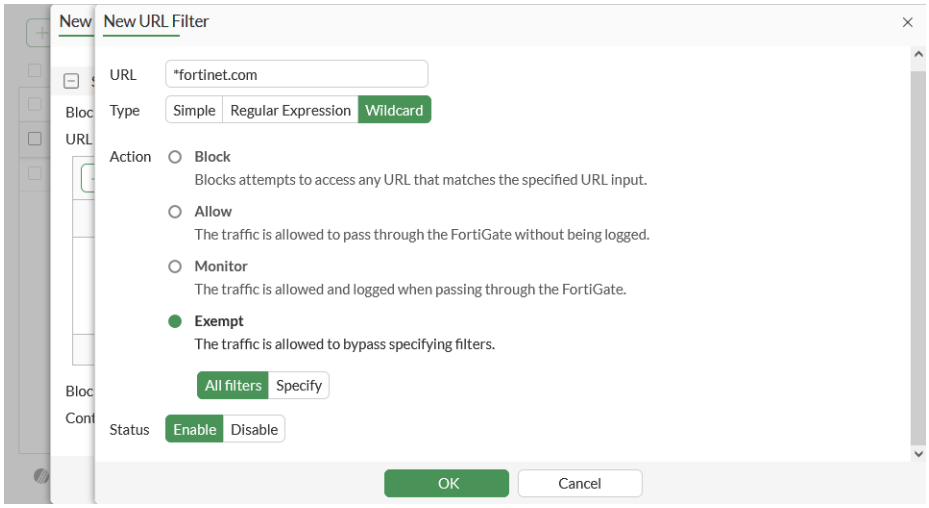


See File filter on page 2442 for more information about configuring file filters.

To configure the web filter exemption in the GUI:

1. Go to *Security Profiles* > *Web Filter* and click *Create New*.
2. Enter a profile *Name*.

3. In the *Static URL Filter* section, enable *URL Filter* and click *Create New* in the table.
4. Enter the URL you need to make an exception for. In this example the *Wildcard* type is used.
5. Set *Action* to *Exempt* and *Status* to *Enable*.



6. Click OK.
7. Click OK to save the web filter profile.
8. Enable the web filter profile in the firewall policy that includes the file filter that you need to add the exemption to. See Firewall policy on page 1777 for more information.

To configure the web filter exemption in the CLI:

1. Configure the URL filter:

```
config webfilter urlfilter
    edit 99
        set name "exempt_URL"
        config entries
            edit 1
                set url "*fortinet.com"
                set type wildcard
            next
        end
    next
end
```

2. Configure the web filter profile to use the URL filter:

```
config webfilter profile
    edit "exempt_exe"
        config web
            set urlfilter-table 99
        end
    next
end
```

3. Apply the web filter in the firewall policy:

```
config firewall policy
    edit 1
        set webfilter-profile "exempt_exe"
    next
end
```

Video filter

The video filter profile can be used to filter YouTube videos based on several criteria, including: FortiGuard categories, video titles, video descriptions, and channel IDs. These criteria provide a more granular override of a single channel, user, or video. The video filter profile is currently supported in proxy-based policies and requires SSL deep inspection. The FortiGuard Video filtering service is based on a valid FortiGuard web filter license.

This feature is not supported on FortiGate models with 2 GB RAM or less. See Proxy-related features not supported on FortiGate 2 GB RAM models on page 126 for more information.

Configuring a video filter profile

In the GUI (*Security Profiles* > *Video Filter* > *Video Filter Profile*), four types of filters can be created on the *New Video Filter Profile* page: *Category*, *Title*, *Description*, and *Channel*.

When adding a *Category* type filter, the various FortiGuard categories, including *Any*, can be set to allow, monitor, or block videos in those categories. See Filtering based on FortiGuard categories on page 2300 for a detailed example and explanation of how the WAD daemon inspects videos.

The *Title* and *Description* type filters can be used to filter video based on keywords. See Configuring a video filter keyword list on page 2309 for more information. When a video's title or description matches a defined keyword, the video filter will take the corresponding action of allow, monitor, or block. See Filtering based on title on page 2307 and Filtering based on description on page 2308 for detailed examples.

The *Channel* type filter can be used to filter all or specific YouTube channels. When a video matches a YouTube channel, the video filter will take the corresponding action of allow, monitor, or block. See Filtering based on YouTube channel on page 2305 for a detailed example.

Users can prioritize configured filters within the video filter profiles based on their sequence order. To change the sequence order, drag the selected filter to the desired position. An implicit rule within the video filter profile is set to *Allow*. If a video does not match any of the other filters, it will be subject to this implicit rule and allowed to pass through.

To configure a video filter profile:

```
config videofilter profile
    edit <name>
        config filters
            edit <id>
                set type {category* | channel | title | description}
                set log {enable* | disable}
```

```
                set action {allow | block | monitor*}
            next
        end
    next
end
```

The default values are marked with an asterisk (*).

YouTube API key

The YouTube API key is required when filtering by a:

- YouTube video title
- YouTube video description
- YouTube channel in conjunction with filtering based on FortiGuard categories

To configure the YouTube API key in the GUI:

1. Go to *Security Profiles* > *Video Filter* and select the *Video Filter Settings* tab.
2. Click the + to add an API key.
3. Click *OK*.

To configure the YouTube API key in the CLI:

```
config videofilter youtube-key
    edit <id>
        set key <string>
    next
end
```

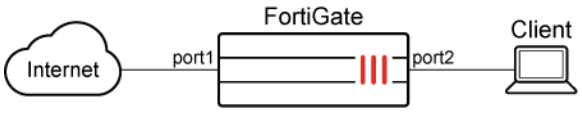
Filtering based on FortiGuard categories

Video filtering is only proxy-based and uses the WAD daemon to inspect the video in four phases:

1. When the WAD receives a video query from a client, it extracts the video ID (`vid`) and tries to check the category and channel from the local cache.
2. If there is no match from the local cache, it connects to the FortiGuard video rating server to query the video category.
3. If the FortiGuard rating fails, it uses the `videofilter.youtube-key` to communicate with the Google API server to get its category and channel ID. This is the API query setting and it requires the user's own YouTube API key string. This configuration is optional.
4. If all steps fail to match the video, the WAD calls on the IPS engine to match the video ID and channel ID from the application signature database.

The FortiGuard anycast service must be enabled to use this feature.

In this example, a new video filter profile is created to block the Knowledge category.



To configure a video filter based on FortiGuard categories in the GUI:

1. Create the video filter profile:
   a. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and click *Create new*.
   b. Enter a name (*category_filter*).
   c. Create the filter:
      i. In the *Filters* table, click *Create new*.
      ii. Set the *Type* to the *Category*.
      iii. Set the *Action* to *Block*.
      iv. Set the *Category* to *Knowledge*.
      v. Click *OK* to save the filter.
   d. Click *OK* to save the video filter profile.
2. Create the firewall policy:
   a. Enter the following:

Incoming Interface	port2
Outgoing Interface	port1
Source	All
Destination	All
Service	All
Inspection Mode	Proxy-based
NAT	Enable
Video Filter	Enable and select *category_filter*
Application Control	Enable and select *default*
SSL Inspection	deep-inspection
Log Allowed Traffic	All Sessions

   b. Configure the other settings as needed and click *OK*.

To configure a video filter based on FortiGuard categories in the CLI:

1. Create the video filter profile:

```
config videofilter profile
    edit "category_filter"
        config filters
            edit 1
```

```
                set type category
                set category "4"
                set action block
                set log enable
            next
        end
    next
end
```

2. Create the firewall policy:

```
config firewall policy
    edit 10
        set name "client_yt_v4"
        set srcintf "port2"
        set dstintf "port1"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "deep-inspection"
        set application-list "default"
        set videofilter-profile "category_filter"
        set logtraffic all
        set nat enable
    next
end
```

Verifying that the video is blocked

When a user browses to YouTube and selects a video based in the Knowledge category, a replacement message will appear (see Example 3: blocking the video based on FortiGuard category on YouTube for an example replacement message). On the FortiGate, verify the forward traffic and web filter logs.

Sample forward traffic log:

```
2: date=2023-12-05 time=09:05:32 eventtime=1701796727673178582 tz="-0800" logid="0000000013"
type="traffic" subtype="forward" level="notice" vd="root" srcip=10.1.100.11 srcport=50568
srcintf="port2" srcintfrole="undefined" dstip=142.251.179.93 dstport=443 dstintf="port1"
dstintfrole="undefined" srccountry="United States" dstcountry="United States" sessionid=480384
proto=6 action="client-rst" policyid=1 policytype="policy" poluuid="f4fe48a4-938c-51ee-8856-
3e84e3b24af4" policyname="client_yt_v4" service="HTTPS" trandisp="snat" transip=172.16.200.1

utmaction="block" countweb=2 countapp=3 sentdelta=0 rcvddelta=0 utmref=65514-4674
```

Sample web filter log:

```
1: date=2023-12-05 time=09:05:37 eventtime=1701795937361806440 tz="-0800" logid="0347013664"
type="utm" subtype="webfilter" eventtype="videofilter-category" level="warning" vd="root"
msg="Video category is blocked." policyid=1 poluuid="f4fe48a4-938c-51ee-8856-3e84e3b24af4"
sessionid=480384 srcip=10.1.100.11 dstip=142.251.179.93 srcport=50568 dstport=443 srcintf="port2"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6 httpmethod="POST"
service="HTTPS" action="blocked" videoinfosource="FortiGuard" profile="category_filter"
videoid="hG-rVFM62J4" videocategoryid=4 videocategoryname="Knowledge" hostname="www.youtube.com"
agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36 (KH"
referralurl="https://www.youtube.com/results?search_query=udemy"
url="https://www.youtube.com/youtubei/v1/player?key=AIzaSyAO_FJ2SlqU8Q4STEHLGCilw_Y9_
11qcW8&prettyPrint=false"
```

Troubleshooting and debugging

To verify if the FortiGuard video filtering license is valid:

```
# get system fortiguard

fortiguard-anycast  : enable
fortiguard-anycast-source: fortinet
protocol            : https
port                : 443
...
webfilter-license   : Contract
webfilter-expiration: Mon Oct 28 2024
...
```

To verify the WAD worker is running:

```
# diagnose test app wad 1000
Process [0]: WAD manager type=manager(0) pid=232 diagnosis=yes.
Process [1]: type=worker(2) index=0 pid=294 state=running
              diagnosis=no debug=enable valgrind=supported/disabled
...
Process [6]: type=YouTube-filter-cache-service(9) index=0 pid=290 state=running
              diagnosis=no debug=enable valgrind=unsupported/disabled
...
```

To display and debug video filter cache:

```
# diagnose test app wad ?
....
        321:  Display Video Filter Cache stats.
        322:  Reset Video Filter Cache stats.
        323:  Flush Video Filter Cache entries.
        324:  Display Video Filter module stats.
        325:  Request category list from Youtube API.
```

```
        326:  Display FTGD agent module stats.
        327:  Reset FTGD agent module stats.
        328:  Toggle Video Filter Cache Check.
        329:  Toggle Video Filter FTGD Query.
        330:  Toggle Video Filter API Check.
```

To enable real-time WAD debugs:

```
# diagnose wad debug enable level verbose
# diagnose wad debug enable category video
# diagnose debug enable
```

Sample output

```

Filtering based on YouTube channel

Video filtering can be configured to filter any or specific YouTube channels. When a video matches a YouTube channel, the video will take the corresponding action of allow, monitor, or block. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

The YouTube API key must be configured when using this feature in conjunction with filtering based on FortiGuard categories. See YouTube API key for more information.

Videos are filtered based on their sequence order, which could allow for specific categorization. A category can be blocked, but certain channels within that category can be allowed. If no match is found, then the video will be subjected to an implicit rule and allowed to pass through See Basic configuration for an example.

Identifying the YouTube channel ID

The following table lists how to identify the YouTube channel ID based on different YouTube video URLs formats:

Video URL	Channel ID
www.youtube.com/channel/<channel-id>	<channel-id> indicates the ID for the channel.
www.youtube.com/user/<user-id>	Open the page source and locate: `<meta itemprop="channelId" content="<channel-id>">` <channel-id> indicates the channel ID for the user page.
www.youtube.com/watch?v=<string>	Open the page source and locate: `<meta itemprop="channelId" content="<channel-id>">` <channel-id> indicates the channel ID for the video.

Basic configuration

In this example, the Knowledge category in the video filter is configured to be blocked. The YouTube channel filter list is configured with the action set to monitor, which effectively creates an allowlist. The Fortinet YouTube channel ID UCJHo4AuVomwMRzgkA5DQEOA is allowed. This example uses the category_filter video filter profile and client_yt_v4 firewall policy configured in Filtering based on FortiGuard categories on page 2300.

To configure a video filter based on a YouTube channel in the GUI:

1. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and edit *channel_filter*.
2. In the *Filters* table, click *Create new*.
3. Set the *Type* to the *Channel*.

4. Set the *Action* to *Monitor*.
5. Set the *Channel* to *Specify* and enter the *Channel ID*, *UCJHo4AuVomwMRzgkA5DQEOA*.
6. Click *OK* to save the filter.
7. Click *OK* to save the video filter profile.

To configure a video filter based on a YouTube channel in the CLI:

```
config videofilter profile
    edit "category_filter"
        config filters
            edit 2
                set type channel
                set channel "UCJHo4AuVomwMRzgkA5DQEOA"
                set action monitor
                set log enable
            next
        end
    next
end
```

Verifying the configuration

Perform a search from a client for a video on YouTube that falls under the Knowledge category, such as any video from the Udemy channel. The result is a blocked video. However, searching for a video from the Fortinet YouTube channel results in an accessible video.

Sample logs:

```
1: date=2023-12-13 time=09:33:20 eventtime=1702488800873289004 tz="-0800" logid="0347013664"

Filtering based on title

Video filtering can be configured to filter using keyword-based filters for video titles. When a video's title matches the configured keyword, the video filter will take the corresponding action of allow, monitor, or block. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

The YouTube API key must be configured to use this feature. Otherwise, the title filter will not retrieve the video information and bypass the traffic. See YouTube API key for more information.

Basic configuration

In this example, videos are blocked that contain the keyword, game. For information about configuring video filter keyword lists, see Example configuration.

To configure the video filter profile in the GUI:

1. Configure the video filter profile:
   a. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and click *Create new*.
   b. Enter a name (*title-filter-profile*).
   c. In the *Filters* table, click *Create new*.
   d. Configure the filter with the following settings:
      i. Set the *Type* to *Title*.
      ii. Set the *Action* to *Block*.
      iii. Set the *Keyword* to *test-keyword-match-or*.
      iv. Click *OK*.
   e. Click *OK* to save the video filter profile.
2. Apply the video filter in a firewall policy.

To configure the video filter profile in the CLI:

1. Configure the video filter profile:

```
config videofilter profile
    edit "title-filter-profile"
        config filters
            edit 1
                set type title
                set keyword 1
                set action block
                set log enable
            next
        end
```

```
    next
end
```

2. Apply the video filter in a firewall policy.

Verifying the configuration

From a client, search for a video in YouTube named "How To Use Python Steam API || Steam game API python". The video is blocked.

Sample log:

```
6: date=2023-11-24 time=09:51:30 eventtime=1700848289598975941 tz="-0800" logid="0350013712"
type="utm" subtype="webfilter" eventtype="unknown" level="warning" vd="vdom1" msg="Video title is
blocked." policyid=1 poluuid="19841eb8-841c-51ee-7047-6a6860eb3522" sessionid=384813810
srcip=10.1.100.141 dstip=142.251.33.110 srcport=21473 dstport=443 srcintf="port2"
srcintfrole="undefined" dstintf="port1" dstintfrole="undefined" proto=6 httpmethod="GET"
service="HTTPS" action="blocked" videoinfosource="API" profile="title-filter-profile"
videoid="LaRHkSVvDjI" videotitle="How To Use Python Steam API  || Steam game API python"
hostname="www.youtube.com" agent="Mozilla/5.0 (Windows NT 10.0; Win64; x64) AppleWebKit/537.36
(KH" url="https://www.youtube.com/watch?v=LaRHkSVvDjI"
```

Filtering based on description

Video filtering can be configured to filter using keyword-based filters for video descriptions. When a video's description matches the configured keyword, the video filter will take the corresponding action of allow, monitor, or block. The description filter supports the first 100 characters of the video description. Video filtering is only supported in proxy-based inspection mode, and deep inspection must be enabled in the firewall policy.

The YouTube API key must be configured to use this feature. Otherwise, the description filter will not retrieve the video information and bypass the traffic. See YouTube API key for more information.

Basic configuration

In this example, videos are blocked where the description contains the keyword, API. For information about configuring video filter keyword lists, see Example configuration.

To configure the video filter profile in the GUI:

1. Configure the video filter profile:
   a. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Profile* tab, and click *Create new*.
   b. Enter a name (*test-description-filter*).
   c. In the *Filters* table, click *Create new*.
   d. Configure the filter with the following settings:
      i. Set the *Type* to *Description*.
      ii. Set the *Action* to *Block*.

iii. Set the *Keyword* to *test-keyword-match-all*.
iv. Click *OK*.

e. Click *OK* to save the video filter profile.

2. Apply the video filter in a firewall policy.

To configure the video filter profile in the CLI:

1. Configure the video filter profile:

```
config videofilter profile
    edit "test-description-filter"
        config filters
            edit 1
                set type description
                set keyword 2
                set action block
                set log enable
            next
        end
    next
end
```

2. Apply the video filter in a firewall policy.

Verifying the configuration

From a client, search for a video in YouTube named "Postman Tutorial #7 - HTTP Methods GET and POST in Postman". The description contains the text, "POSTMAN TUTORIAL - Complete API Testing and API Test Automation Course using Postman Tool...", so the video is blocked.

Sample log:

```
4: date=2023-11-24 time=16:08:51 eventtime=1700870931146681788 tz="-0800" logid="0351013728"
type="utm" subtype="webfilter" eventtype="unknown" level="warning" vd="vdom1" msg="Video

```

Configuring a video filter keyword list

Users have the ability to filter videos based on the video titles and descriptions by defining a video filter keyword. Multiple keywords can be defined using a wildcard or regular expression, and can be used with AND/OR logic options.

Unicode emoji character code is currently not supported.

Configure the video filter keyword list in the GUI:

1. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Keyword* tab, and click *Create new*.
2. Configure the following:

Name	Enter a name.
Match operator	Select the match operator. • *Any*: match any keyword (OR logic) • *All*: match all keywords (AND logic)

3. Create the keywords:
   a. In the *Keywords* table, click *Create new*.
   b. Configure the following:

Pattern	Enter a regular expression or wildcard pattern string.
Pattern type	Select the pattern type. • *Wildcard*: suitable for basic search • *Regular Expression*: suitable for advanced search
Status	Set the status. • *Enable*: consider this keyword • *Disable*: ignore this keyword

   c. Click *OK*.
4. Click *OK* to save the keyword list.

Configure the video filter keyword list in the CLI:

```
config videofilter keyword
    edit <id>
        set name <string>
        set match {or | and}
        config word
           edit <name>
                set pattern-type {wildcard | regex}
                set status {enable | disable}
            next
        end
    next
end
```

Example configuration

In this example, two keywords, API and game, are created with the wildcard and regular expression types, respectively. The match operator is set to *Any*.

Configure the video filter keyword list in the GUI:

1. Go to *Security Profiles* > *Video Filter*, select the *Video Filter Keyword* tab, and click *Create new*.
2. Enter a name (*test-keyword-match-or*) and set *Match operator* to *Any*.
3. In the *Keywords* table, click *Create new*.
4. Configure the API keyword with the following settings:
   a. In the *Pattern* field, enter *API*.
   b. Set the *Pattern type* to *Wildcard*.
   c. Click *OK*.
5. Click *Create new*.
6. Configure the game keyword with the following settings:
   a. In the *Pattern* field, enter *Game*.
   b. Set the *Pattern type* to *Regular Expression*.
   c. Click *OK*.
7. Click *OK* to save the keyword list.

Configure the video filter keyword list in the CLI:

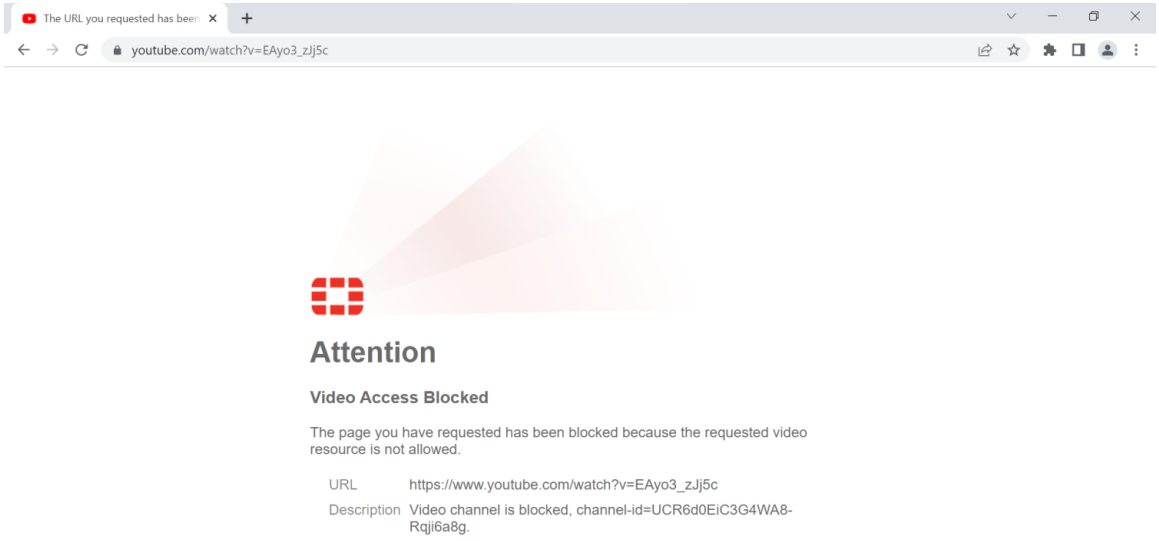
```
config videofilter keyword
    edit 1
        set name "test-keyword-match-or"
        set match or
        config word
           edit "API"
                set pattern-type wildcard
                set status enable
            next
            edit "Game"
                set pattern-type regex
                set status enable
            next
        end
    next
end
```

Replacement messages displayed in blocked videos

When a user visits a video directly by a URL, a full page replacement message is displayed. When a user loads a video from the YouTube website (homepage or recommended videos), the page loads and the replacement message is displayed in the video frame. For more information about configuring video filters, see Filtering based on FortiGuard categories on page 2300 and Filtering based on YouTube channel on page 2305.

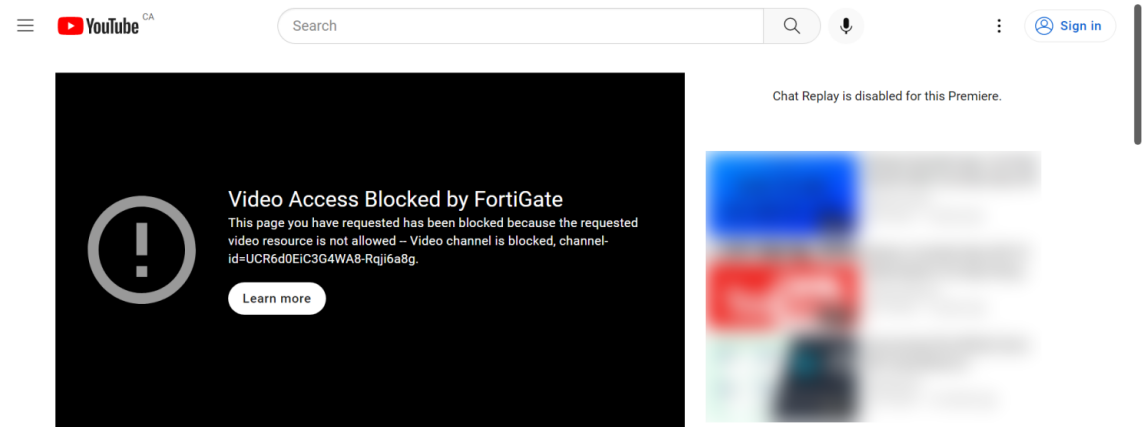
Example 1: blocking the video based on the URL

In this example, the user entered the URL of a blocked channel ID in their browser. The replacement message is displayed in the browser (full page).



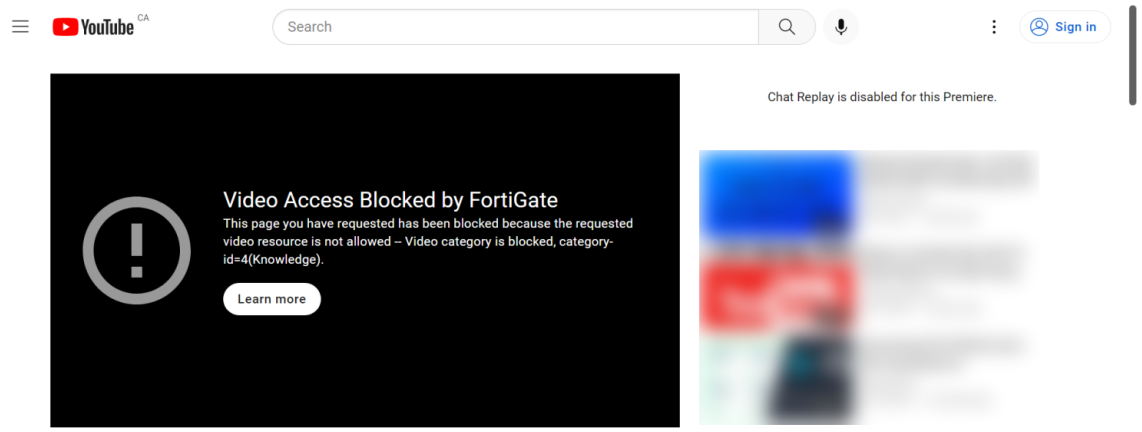
Example 2: blocking the video based on channel ID on YouTube

In this example, the user visited a blocked channel ID on the YouTube website. The replacement message is displayed in the video frame.



Example 3: blocking the video based on FortiGuard category on YouTube

In this example, the user visited a video on the YouTube website that belongs to a blocked FortiGuard category. The replacement message is displayed in the video frame.



DNS filter

You can apply DNS category filtering to control user access to web resources. You can customize the default profile, or create your own to manage network user access and apply it to a firewall policy, or you can add it to a DNS server on a FortiGate interface. For more information about configuring DNS, see DNS on page 340.

When both a DNS and a web filter are configured on a firewall policy, the DNS filter takes precedence. If certificate inspection is also used, the web filter replacement message might be shown instead of the SDNS block page. If both filters are set to block, SSL inspection is set to certificate inspection, and the destination web traffic is HTTPS, then the client receives a redirect to the SDNS server, which is then blocked by the web filter because the redirect URL cannot pass the certificate inspection.

DNS filtering has the following features:

- FortiGuard Filtering: filters the DNS request based on the FortiGuard domain rating.
- Botnet C&C domain blocking: blocks the DNS request for the known botnet C&C domains.
- External dynamic category domain filtering: allows you to define your own domain category.
- DNS safe search: enforces Google, Bing, and YouTube safe addresses for parental controls.
- Local domain filter: allows you to define your own domain list to block or allow.
- External IP block list: allows you to define an IP block list to block resolved IPs that match this list.
- DNS translation: maps the resolved result to another IP that you define.

Some DNS filter features require a subscription to FortiGuard Web Filtering.

DNS filtering connects to the FortiGuard secure DNS server over anycast by default. For more information about this configuration, see DNS over TLS and HTTPS on page 374.

The IPS engine handles the DNS filter in flow mode policies and queries the FortiGuard web filter server for FortiGuard categories. In proxy mode, the DNS proxy daemon handles the DNS filter and queries the FortiGuard SDNS server for FortiGuard categories. When a DNS filter profile is enabled in `config system dns-server`, the DNS proxy daemon handles the traffic.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2315), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2338).

DNS filter behavior in proxy mode

In cases where the DNS proxy daemon handles the DNS filter (described in the preceding section) and if DNS caching is enabled (this is the default setting), then the FortiGate will respond to subsequent DNS queries using the result in the DNS cache and will not forward these queries to a real DNS server.

There are two options to disable this behavior:

- Disable DNS caching globally.
- Remove the DNS filter profile from the proxy mode firewall policy or from the DNS server configured on a FortiGate interface.

To disable DNS caching globally:

```
config system dns
    set dns-cache-limit 0
end
```

There will be a performance impact to DNS queries since each query will not be cached, and will be forwarded to a real DNS server.

FortiGuard DNS rating service

DNS over TLS connections to the FortiGuard secure DNS server is supported. The CLI options are only available when `fortiguard-anycast` is enabled. DNS filtering connects to the FortiGuard secure DNS server over anycast by default.

To configure DoT to the secure DNS server in the CLI:

```
config system fortiguard
    set fortiguard-anycast enable
    set fortiguard-anycast-source fortinet
    set anycast-sdns-server-ip 0.0.0.0
    set anycast-sdns-server-port 853
end
```

The following topics provide information about DNS filters:

- Configuring a DNS filter profile on page 2315
- FortiGuard category-based DNS domain filtering on page 2320
- Botnet C&C domain blocking on page 2323

- DNS safe search on page 2327
- Local domain filter on page 2329
- DNS translation on page 2333
- Applying DNS filter to FortiGate DNS server on page 2338
- DNS inspection with DoT and DoH on page 2339
- DNS over QUIC and DNS over HTTP3 for transparent and local-in DNS modes on page 2343
- Troubleshooting for DNS filter on page 2348

Configuring a DNS filter profile

A DNS filter profile contains settings that enable or disable various forms of DNS filtering, including:

- FortiGuard filtering
- Botnet C&C domain blocking
- DNS safe search
- External dynamic category domain filtering
- Local domain filter
- External IP block list
- DNS translation

Once a DNS filter is configured, it can be applied to a firewall policy, or on a FortiGate DNS server if one is configured. In the following basic example, a DNS filter is created and applied to a firewall policy to scan DNS queries that pass through the FortiGate.

To configure a DNS filter profile in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Configure the settings as needed.

Name	Enter a unique name for the profile.
Comments	Enter a comment (optional).
Redirect botnet C&C requests to Block Portal	Enable to block botnet website access at the DNS name resolution stage. See Botnet C&C domain blocking on page 2323 for more details.
Enforce 'Safe Search' on Google, Bing, YouTube	Enable to avoid explicit and inappropriate results in the Google, Bing, and YouTube search engines. See DNS safe search on page 2327 for more details.
Restrict YouTube Access	When *Enforce 'Safe Search' on Google, Bing, YouTube* is enabled, select either *Strict* or *Moderate* to restrict YouTube access by responding to DNS resolutions with CNAME restrict.youtube.com and restrictmoderate.youtube.com respectively.
FortiGuard Category Based Filter	Enable to use the FortiGuard domain rating database to inspect DNS traffic. A FortiGuard Web Filter license is required to use this option.

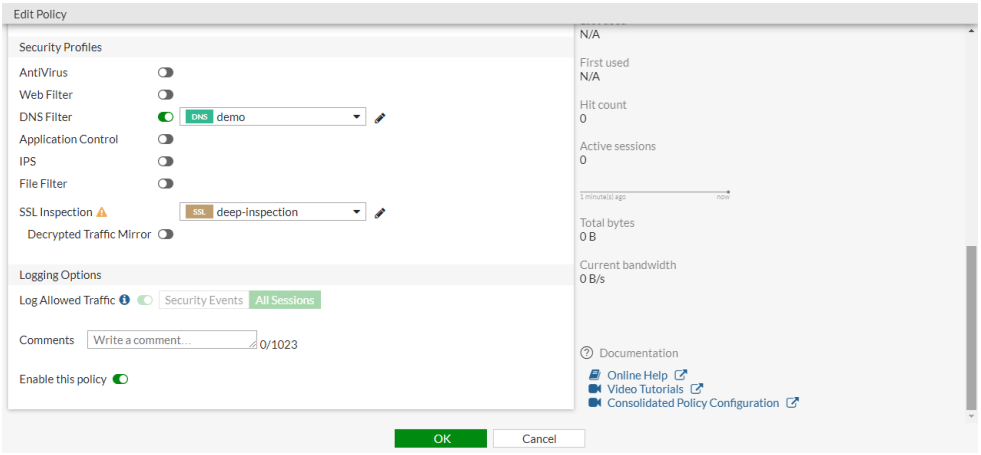
		Expand the category groups in the table to view and edit the FortiGuard category settings to *Allow*, *Monitor*, or *Redirect to Block Portal*. See FortiGuard category-based DNS domain filtering on page 2320 for more details.
Static Domain Filter		This section includes options related to the static domain filter.
	Domain Filter	Enable to define local static domain filters to allow or block specific domains. The local domain filter has a higher priority than the FortiGuard category-based domain filter. Click *Create New* in the table to add a domain filter and configure the following settings. • *Domain*: enter a domain. • *Type*: select *Simple*, *Reg. Expression*, or *Wildcard*. • *Action*: select *Redirect to Block Portal*, *Allow*, or *Monitor*. • *Status*: select *Enable* or *Disable*. See Local domain filter on page 2329 for more details.
	External IP Block Lists	Enable to add one or more external IP block lists. See IP address external feed on page 4571 for more details.
	DNS Translation	Enable to translate a DNS resolved IP address to another IP address specified on a per-policy basis. Click *Create New* in the table to add a DNS translation and configure the following settings. • *Type*: select *IPv4* or *IPv6*. • *Original Destination*: enter the address of a host or subnet that you want translated. When a resolved address in a DNS response matches this destination, the FortiGate will replace the address with the address in *Translated Destination*. • *Translated Destination*: enter the address of a host or subnet that you want the resolved address to be translated to. • *Network Mask*: enter the netmask for the original and translated destination. If a single host is used for the original and translated destination, set the netmask to *255.255.255.255*. • *Status*: select *Enable* or *Disable*. Enabling DNS translation will override matching DNS responses with translated IPs. See DNS translation on page 2333 for more details.
Options		This section includes other options related to the DNS filter.
	Redirect Portal IP	Set the IP address of the SDNS redirect portal. Select *Use FortiGuard Default*, or *Specify* and enter the IP address. When *FortiGuard Category Based Filter* categories are set to *Redirect to Block Portal*, the DNS response will use this IP address in its response to the client. If the client is accessing the domain on a web browser, they will be redirected to the block portal page on this address.

	Allow DNS requests when a rating error occurs	Enable to allow all domains when FortiGuard DNS servers fail, or they are unreachable from the FortiGate. When this happens, a log message is recorded in the DNS logs by default.
	Log all DNS queries and responses	Enable to log all domains visited (detailed DNS logging).
	Strip Encrypted Client Hello service parameters	Enable removal of the ECH service parameter from supporting DNS RRs. ECH information is stripped from DoH responses, forcing the browser to not use ECH for TLS connections.

3. Click *OK*.

To apply a DNS filter profile to a policy in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*, or edit an existing policy.
2. In the *Security Profiles* section, enable *DNS Filter* and select the DNS filter.



3. Configure the other settings as needed.
4. Click *OK*.

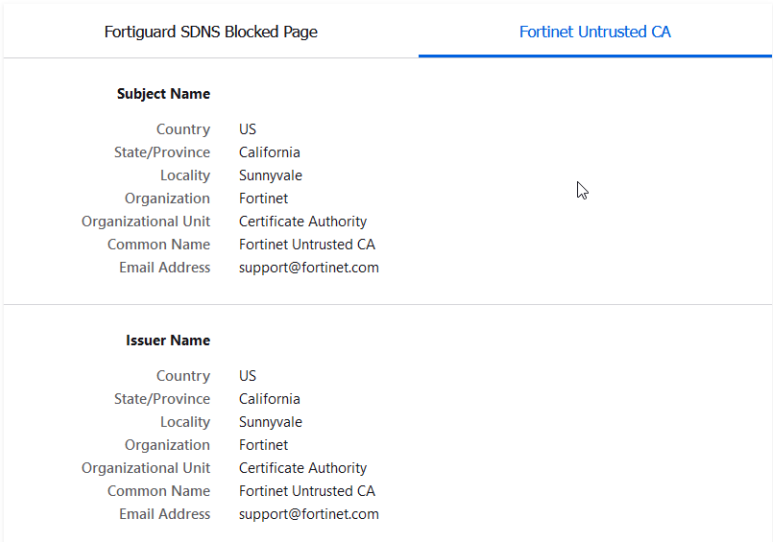
Redirecting to default Block Portal

By default, FortiGate redirects traffic to the FortiGuard SDNS block portal at 208.91.112.55, which is owned and hosted by Fortinet. When opening a blocked destination in the browser, two behaviors may occur:

- When opening a HTTP page, the blocked page is hosted on HTTP/80 and displays without errors.
- When opening a HTTPS page, the blocked page is hosted on HTTPS/443 and results in a warning.

  The warning is expected because the blocked page is redirected to the blocked portal on 208.91.112.55, but the page is served in HTTPS using the domain of the destination that the user is trying to reach. Therefore, a Fortinet CA must resign the SSL certificate in order to display the block page content. The Fortinet CA cannot be trusted natively because it is not a publicly trusted CA. As such, when you review the CA issuer, you find that the Common Name of the CA specifically indicates Fortinet Untrusted CA.

Certificate



CLI-only settings

The following DNS filter profile settings can only be configured in the CLI:

```
config dnsfilter profile
    edit <name>
        set block-action {block | redirect | block-servfail}
        set sdns-ftgd-err-log {enable | disable}
    next
end
```

`block-action {block | redirect | block-servfail}`	Set the action to take for blocked domains: • `block`: return NXDOMAIN for blocked domains. • `redirect`: redirect blocked domains to SDNS portal (default). • `block-servfail`: return SERVFAIL for blocked domains. When a FortiGuard or local domain filter category is set to *Redirect to Block Portal* in the GUI, the action is set to `block` in the CLI. By default, the `block-action` applied to a DNS profile is set to `redirect`.
`sdns-ftgd-err-log {enable | disable}`	Enable/disable FortiGuard SDNS rating error logging (default = enable).

To configure a DNS filter profile in the CLI:

```
config dnsfilter profile
    edit "demo"
        set comment ''
        config domain-filter
            unset domain-filter-table
        end
```

```
        config ftgd-dns
            set options error-allow
            config filters
                edit 2
                    set category 2
                    set action monitor
                next
                edit 7
                    set category 7
                    set action block
                next
                ...
                edit 22
                    set category 0
                    set action monitor
                next
            end
        end
        set log-all-domain enable
        set sdns-ftgd-err-log enable
        set sdns-domain-log enable
        set block-action redirect
        set block-botnet enable
        set safe-search enable
        set redirect-portal 93.184.216.34
        set youtube-restrict strict
        set strip-ech enable
    next
end
```

To apply a DNS filter profile to a policy in the CLI:

```
config firewall policy
    edit 1
        set name "Demo"
        set srcintf "port10"
        set dstintf "port9"
        set srcaddr "all"
        set dstaddr "all"
        set action accept
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set logtraffic all
        set fsso disable
        set dnsfilter-profile "demo"
        set profile-protocol-options "default"
        set ssl-ssh-profile "deep-inspection"
        set nat enable
    next
end
```

FortiGuard category-based DNS domain filtering

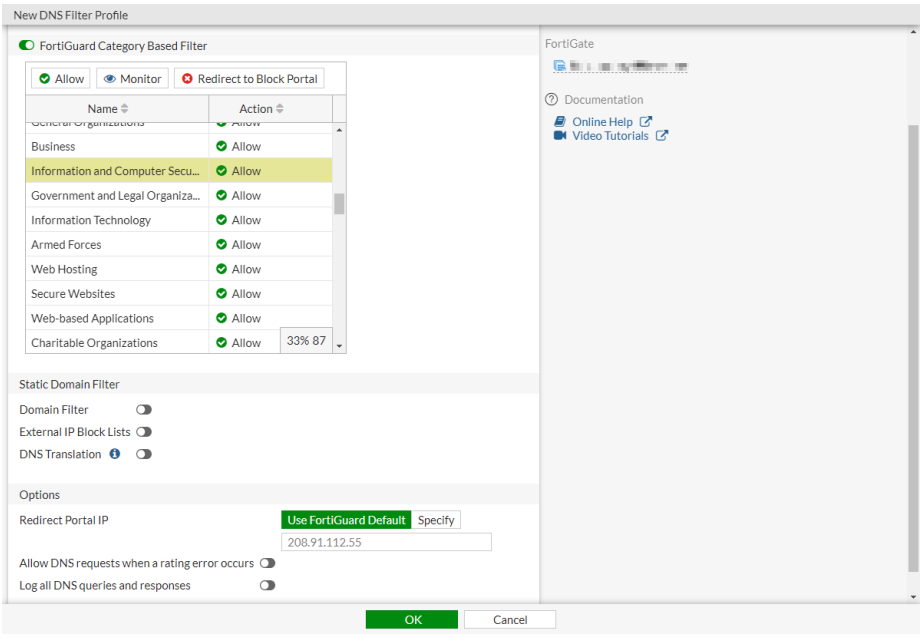
You can use the FortiGuard category-based DNS domain filter to inspect DNS traffic. This makes use of FortiGuard's continuously updated domain rating database for more reliable protection.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2315), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2338).

The FortiGate must have a FortiGuard Web Filter license to use the FortiGuard category-based filter.

To configure FortiGuard category-based DNS domain filtering in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *FortiGuard Category Based Filter*.
3. Select the category and then select *Allow*, *Monitor*, or *Redirect to Block Portal* for that category.
4. In the *Options* section, select a setting for *Redirect Portal IP*. Select either *Use FortiGuard Default* (208.91.112.55) or click *Specify* and enter another portal IP. The FortiGate will use the portal IP to replace the resolved IP in the DNS response packet.



5. Click *OK*.

To configure FortiGuard category-based DNS domain filtering in the CLI:

```
config dnsfilter profile
   edit "demo"
      set comment ''
      config domain-filter
         unset domain-filter-table
```

```
      end
      config ftgd-dns
         set options error-allow
         config filters
             edit 2
                 set category 2
                 set action monitor
             next
             edit 7
                 set category 7
                 set action monitor
             next
            ...
             edit 22
                 set category 0
                 set action monitor
             next
         end
      end
      set log-all-domain enable
      set sdns-ftgd-err-log enable
      set sdns-domain-log enable
      set block-action {redirect | block}
      set block-botnet enable
      set safe-search enable
      set redirect-portal 93.184.216.34
      set youtube-restrict strict
   next
end
```

You can use the `get webfilter categories` command to determine the web filtering category that corresponds to a given category ID.

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, to do a DNS query for some domains. For example:

```
#dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 61252
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 13; ADDITIONAL: 11

;; QUESTION SECTION:
;; www.example.com.             IN      A

;; ANSWER SECTION:
www.example.com.        17164   IN      A       93.184.216.34

;; AUTHORITY SECTION:
com.                    20027   IN      NS      h.gtld-servers.net.
com.                    20027   IN      NS      i.gtld-servers.net.
```

```
com.                    20027   IN      NS      f.gtld-servers.net.
com.                    20027   IN      NS      d.gtld-servers.net.
com.                    20027   IN      NS      j.gtld-servers.net.
com.                    20027   IN      NS      l.gtld-servers.net.
com.                    20027   IN      NS      e.gtld-servers.net.
com.                    20027   IN      NS      a.gtld-servers.net.
com.                    20027   IN      NS      k.gtld-servers.net.
com.                    20027   IN      NS      g.gtld-servers.net.
com.                    20027   IN      NS      m.gtld-servers.net.
com.                    20027   IN      NS      c.gtld-servers.net.
com.                    20027   IN      NS      b.gtld-servers.net.

;; ADDITIONAL SECTION:

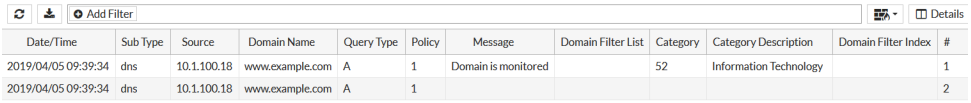
```

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *DNS Query* card name. There are logs for the DNS traffic that just passed through the FortiGate with the FortiGuard rating for the domain name.



Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description	Domain Filter Index	#
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1	Domain is monitored		52	Information Technology		1
2019/04/05 09:39:34	dns	10.1.100.18	www.example.com	A	1						2

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns

# execute log display
2 logs found.
2 logs returned.

1: date=2019-04-05 time=09:39:34 logid="1501054802" type="utm" subtype="dns" eventtype="dns-

```

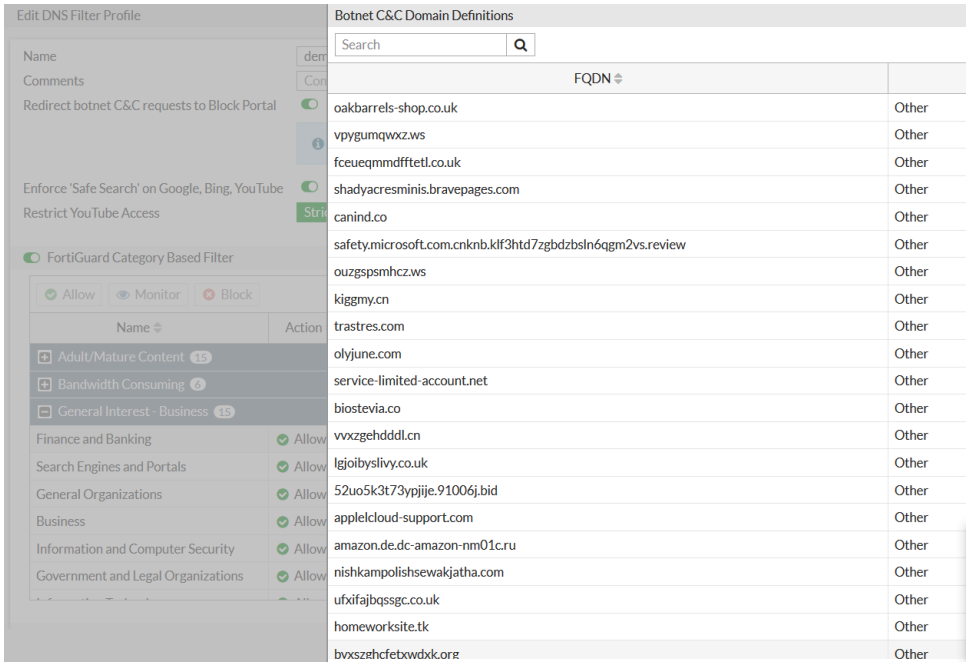
Botnet C&C domain blocking

FortiGuard Service continually updates the botnet C&C domain list. The botnet C&C domain blocking feature can block the botnet website access at the DNS name resolving stage. This provides additional protection for your network.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2315), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2338).

To configure botnet C&C domain blocking in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *Redirect botnet C&C requests to Block Portal*.
3. Optionally, click the *botnet package* link. The *Botnet C&C Domain Definitions* pane opens, which displays the latest list.



4. Configure the other settings as needed.
5. Click *OK*.

To configure botnet C&C domain blocking in the CLI:

```
config dnsfilter profile
   edit "demo"
      set comment ''
      config domain-filter
         unset domain-filter-table
      end
      config ftgd-dns
         set options error-allow
         config filters
            ...
         end
      end
      set log-all-domain enable
      set sdns-ftgd-err-log enable
      set sdns-domain-log enable
      set block-action block
      set block-botnet enable
      set safe-search enable
      set redirect-portal 208.91.112.55
      set youtube-restrict strict
   next
end
```

Verifying the logs

Select a botnet domain from that list. From your internal network PC, use a command line tool, such as dig or nslookup, to send a DNS query to traverse the FortiGate. For example:

```
#dig canind.co
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 997
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; canind.co.                   IN      A

;; ANSWER SECTION:
canind.co.              60      IN      A       208.91.112.55

;; Received 43 B
;; Time 2019-04-05 09:55:21 PDT
;; From 172.16.95.16@53(UDP) in 0.3 ms
```

The botnet domain query was blocked and redirected to the portal IP (208.91.112.55) .

To check the DNS filter log in the GUI:

1. Go to *Log & Report > Security Events*.
2. Click the *DNS Query* card name to view the DNS query blocked as a botnet domain.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1	Domain was blocked by dns botnet C&C			
2019/04/04 16:43:59	dns	10.1.100.18	canind.co	A	1				

To check the DNS filter log in the CLI:

```
(vdom1) # execute log filter category utm-dns

(vdom1) # execute log display
2 logs found.
2 logs returned.

1: date=2019-04-04 time=16:43:59 logid="1501054601" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1554421439 policyid=1 sessionid=14135

dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=24339 qname="canind.co"
qtype="A" qtypeval=1 qclass="IN"
```

Botnet C&C IPDB blocking

FortiOS also maintains a botnet C&C IP address database (IPDB). If a DNS query response IP address (resolved IP address) matches an entry inside the botnet IPDB, this DNS query is blocked by the DNS filter botnet C&C.

To view the botnet IPDB list in the CLI:

```
(global) # diagnose sys botnet list 9000 10
9000. proto=TCP ip=103.228.28.166, port=80, rule_id=7630075, name_id=3, hits=0
9001. proto=TCP ip=5.9.32.166, port=481, rule_id=4146631, name_id=7, hits=0
9002. proto=TCP ip=91.89.44.166, port=80, rule_id=48, name_id=96, hits=0
9003. proto=TCP ip=46.211.46.166, port=80, rule_id=48, name_id=96, hits=0
9004. proto=TCP ip=77.52.52.166, port=80, rule_id=48, name_id=96, hits=0
9005. proto=TCP ip=98.25.53.166, port=80, rule_id=48, name_id=96, hits=0
9006. proto=TCP ip=70.120.67.166, port=80, rule_id=48, name_id=96, hits=0
9007. proto=TCP ip=85.253.77.166, port=80, rule_id=48, name_id=96, hits=0
9008. proto=TCP ip=193.106.81.166, port=80, rule_id=48, name_id=96, hits=0
9009. proto=TCP ip=58.13.84.166, port=80, rule_id=48, name_id=96, hits=0
```

Select an IP address from the IPDB list and use a reverse lookup service to find its corresponding domain name. From your internal network PC, use a command line tool, such as dig or nslookup, to query this domain and verify that it is blocked by the DNS filter botnet C&C. For example:

```
# dig cpe-98-25-53-166.sc.res.rr.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 35135
```

```
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; cpe-98-25-53-166.sc.res.rr.com.              IN      A

;; ANSWER SECTION:
cpe-98-25-53-166.sc.res.rr.com. 60      IN      A       208.91.112.55

;; Received 64 B
;; Time 2019-04-05 11:06:47 PDT
;; From 172.16.95.16@53(UDP) in 0.6 ms
```

Since the resolved IP address matches the botnet IPDB, the query was blocked and redirected to the portal IP (208.91.112.55) .

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *DNS Query* to view the DNS query blocked by botnet C&C IPDB.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1	Domain was blocked by dns botnet C&C			
2019/04/05 11:06:48	dns	10.1.100.18	cpe-98-25-53-166.sc.res.rr.com	A	1				

To check the DNS filter log in the CLI:

```
(global) # execute log filter category utm-dns

(global) # execute log display
2 logs found.
2 logs returned.

1: date=2019-04-05 time=11:06:48 logid="1501054600" type="utm" subtype="dns" eventtype="dns-
response" level="warning" vd="vdom1" eventtime=1554487606 policyid=1 sessionid=55232
srcip=10.1.100.18 srcport=60510 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16

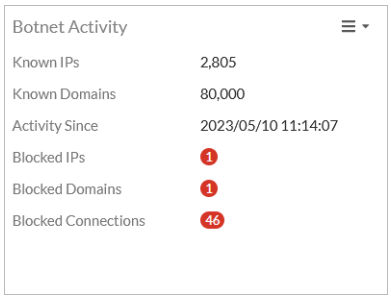
2: date=2019-04-05 time=11:06:48 logid="1500054000" type="utm" subtype="dns" eventtype="dns-query"
level="information" vd="vdom1" eventtime=1554487606 policyid=1 sessionid=55232 srcip=10.1.100.18
srcport=60510 srcintf="port10" srcintfrole="undefined" dstip=172.16.95.16 dstport=53
dstintf="port9" dstintfrole="undefined" proto=17 profile="demo" xid=16265 qname="cpe-98-25-53-
166.sc.res.rr.com" qtype="A" qtypeval=1 qclass="IN"
```

To check botnet activity:

1. Go to *Dashboard* > *Status* and locate the *Botnet Activity* widget.



2. If you do not see the widget, click *Add Widget*, and add the *Botnet Activity* widget.

DNS safe search

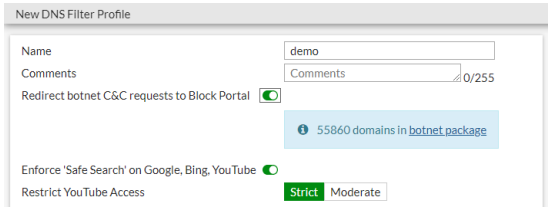
The DNS safe search option helps avoid explicit and inappropriate results in the Google, Bing, DuckDuckGo, Qwant, and YouTube search engines. The FortiGate responds with content filtered by the search engine.

For individual search engine safe search specifications, refer to the documentation for Google, Bing, DuckDuckGo, Qwant, and YouTube.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2315), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2338).

To configure safe search in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Enable *Enforce 'Safe search' on Google, Bing, YouTube* (this setting also applies safe search on DuckDuckGo and Qwant).
3. For *Restrict YouTube Access*, click *Strict* or *Moderate*.



4. Configure the other settings as needed.
5. Click *OK*.

To configure safe search in the CLI:

```
config dnsfilter profile
    edit "demo"
        config ftgd-dns
```

```
            set options error-allow
            config filters
                edit 2
                    set category 2
                next
               ...
            end
        end
        set log-all-domain enable
        set block-botnet enable
        set safe-search enable
        set youtube-restrict strict
    next
end
```

Verifying the logs

From your internal network PC, use a command line tool, such as dig or nslookup, and perform a DNS query on www.bing.com. For example:

```
# dig www.bing.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 46568
;; Flags: qr rd ra; QUERY: 1; ANSWER: 2; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.bing.com.                IN      A

;; ANSWER SECTION:
www.bing.com.           103     IN      CNAME   strict.bing.com
strict.bing.com.        103     IN      A       204.79.197.220

;; Received 67 B
;; Time 2019-04-05 14:34:52 PDT
;; From 172.16.95.16@53(UDP) in 196.0 ms
```

The DNS query for www.bing.com returns with a CNAME strict.bing.com, and an A record for the CNAME. The user's web browser then connects to this address with the same search engine UI, but any explicit content search is filtered out.

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *DNS Query* card name.

Date/Time	Sub Type	Source	Domain Name	Query Type	Policy	Message	Domain Filter List	Category	Category Description
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1	DNS Safe Search enforced		41	Search Engines and Portals
2019/04/05 14:34:53	dns	10.1.100.18	www.bing.com	A	1				

   The DNS filter log in FortiOS shows a message of *DNS Safe Search enforced*.

To check the DNS filter log in the CLI:

```
# execute log filter category utm-dns
# execute log display
2 logs found.
2 logs returned.

1: date=2019-04-05 time=14:34:53 logid="1501054804" type="utm" subtype="dns" eventtype="dns-
response" level="notice" vd="vdom1" eventtime=1554500093 policyid=1 sessionid=65955

```

Local domain filter

In addition to the FortiGuard category-based domain filter, you can define a local static domain filter to allow or block specific domains.

In a DNS filter profile, the local domain filter has a higher priority than FortiGuard category-based domain filter. DNS queries are scanned and matched first with the local domain filter.

- If the local domain filter list has no match, then the FortiGuard category-based domain filter is used. If a DNS query domain name rating belongs to the block category, the query is blocked and redirected. If the FortiGuard category-based filter has no match, then the original resolved IP address is returned to the client DNS resolver.
- If the local domain filter action is set to block and an entry matches, then that DNS query is blocked and redirected.
- If the local domain filter action is set to allow and an entry matches, it will skip the FortiGuard category-based domain filter and directly return to the client DNS resolver.
- If the local domain filter action is set to monitor and an entry matches, it will skip the FortiGuard category-based domain filter, directly return to the client DNS resolver, and log the resolution.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2315), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2338).

In this example, a DNS filter profile is configured and applied to a firewall policy running proxy-based inspection mode.

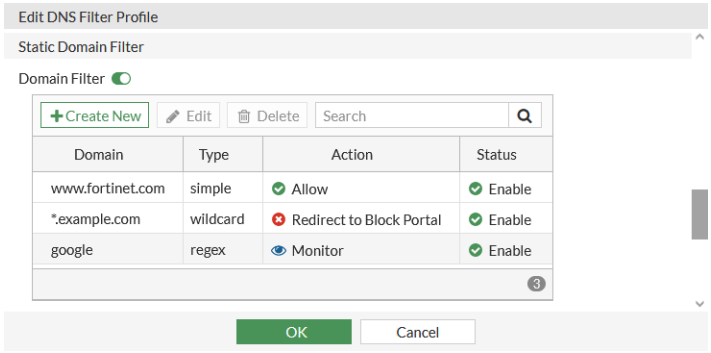
To configure the local domain filter in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*, or edit an existing profile.
2. Set *Name* to *demo*.

3. In the *Static Domain Filter* section, enable *Domain Filter*.
4. Click *Create New*. The *Create Domain Filter* pane opens.
5. Enter a domain, and select a *Type* and *Action*. This example has three filters:

Domain	Type	Action
www.fortinet.com	Simple	Allow
*.example.com	Wildcard	Redirect to Block Portal
google	Reg. Expression	Monitor

6. Click *OK*. The entry appears in the table.



7. In the *FortiGuard Category Based Filter* table, set *General Interest - Business > Search Engines and Portals* to *Redirect to Block Portal*.
8. Configure the remaining settings as required.
9. Click *OK*.

To apply the DNS filter to a policy-mode policy in the GUI:

1. Go to *Policy & Objects > Firewall Policy* and click *Create New*, or edit an existing policy.
2. Configure the *Incoming Interface*, *Outgoing Interface*, *Source*, *Destination*, and *Service* as required.
3. Set *Inspection Mode* to *Proxy-based*.
4. Enable *DNS Filter* and select the *demo* filter.
5. Set *SSL Inspection* to *certificate-inspection*.
6. Configure the remaining settings as required.
7. Click *OK*.

To configure the local domain filter in the CLI:

```
config dnsfilter domain-filter
    edit 1
        set name "demo"
        set comment ''
        config entries
            edit 1
                set domain "www.fortinet.com"
                set type simple
                set action allow
```

```
                set status enable
            next
            edit 2
                set domain "*.example.com"
                set type wildcard
                set action block
                set status enable
            next
            edit 3
                set domain "google"
                set type regex
                set action monitor
                set status enable
            next
        end
        config domain-filter
            set domain-filter-table 1
        end
        config ftgd-dns
            config filters
                edit 23
                    set category 41
                    set action block
                next
            end
        end
    next
end
```

Wildcard entries are converted to regular expressions by FortiOS. As a result, wildcards will match any suffix, as long as there is a word boundary following the search term.

For example:

```
config entries
    edit 1
        set domain "*.host"
        set type wildcard
    next
end
```

will match `wp36.host` and `wp36.host.pressdns.com`, but not `wp36.host123.pressdnds.com`.

To avoid this, use an explicit regular expression search string:

```
config entries
    edit 1
        set domain "^.*\\.host$"
        set type regexp
    next
end
```

To apply the DNS filter to a proxy-mode policy in the CLI:

```
config firewall policy
    edit 1
        set name "port3-port1"
        set srcintf "port3"
        set dstintf "port1"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set inspection-mode proxy
        set ssl-ssh-profile "certificate-inspection"
        set dnsfilter-profile "demo"
        set logtraffic all
        set nat enable
    next
end
```

Testing and Verification

On a client computer, perform DNS lookup on the three domains:

Domain	DNS query result	Log
www.fortinet.com	Allowed. Resolved to correct IP.	None
www.example.com	Blocked. Redirected to IP of block page.	Deny log
www.google.com	Allowed. Resolved to correct IP.	Allow log

To check the DNS filter log in the GUI:

1. Go to *Log & Report* > *Security Events*.
2. Click the *DNS Query* card name to show the logs.

To check the DNS filter log in the CLI:

```
# execute log display
71 logs found.
10 logs returned.

1: date=2022-08-17 time=18:16:50 eventtime=1660785410733825945 tz="-0700" logid="1501054401"

DNS translation

DNS translation is a technique that allows the translation of a DNS-resolved IP address to another specified IP address on a per-policy basis.

One of its use cases is as an alternative to hairpin NAT. By utilizing DNS translation, internal clients can access internal servers using external DNS names. This is achieved by translating DNS responses to internal IP addresses, which can streamline configurations and mitigate some of the complexities associated with Hairpin NAT. However, hairpin NAT can offer faster performance in certain scenarios by eliminating the need for DNS queries, thereby providing direct routing and potentially reducing overhead. The performance difference may not always be significant and largely depends on the specific network setup. For more information, see Hairpin NAT on page 1912.

How DNS translation works:

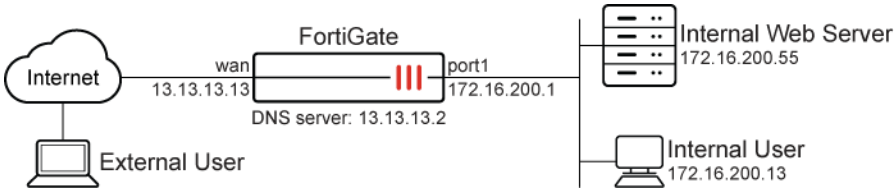
1. DNS Query Interception: When an internal client queries the DNS for the external IP address of an internal server the DNS server intercepts this request.
2. DNS Response Modification: Instead of returning the external IP address, the DNS server responds with the internal IP address of the server.
3. Direct Communication: The internal client then communicates directly with the internal server using its internal IP address, bypassing the need for NAT hairpinning.

DNS translation supports Service (SRV) records over the DNS filter profile for IPv4 and IPv6 and for flow and proxy inspection modes. The translation detects and logs DNS QTYP=SRV. You can view the records in the GUI by going to *Log & Report* > *Security Events* and filtering by *Query Type = SRV*.

A DNS filter profile can be applied in a policy to scan DNS traffic traversing the FortiGate (see Configuring a DNS filter profile on page 2315), or applied on the DNS server interface (see Applying DNS filter to FortiGate DNS server on page 2338).

Example

This configuration allows both internal and remote employees to use the same domain name to access the server, such as www.pochiya.com. DNS translation ensures consistency, avoiding confusion and complications in network configurations. This setup is particularly useful for companies that save bookmarks to internal web servers using public domain names in users' profiles, ensuring access whether connected to the internal LAN or the internet.



In this scenario, the user can access saved bookmarks containing public domain names from both their office computer on the internal network and their personal computer over the internet.

Before continuing, make sure that the port1 and wan interfaces have been configured with valid IP addresses and some publicly accessible domain names are saved as bookmarks in the user profile.

It is assumed that you have administrative access, the FortiGate is incorporated into your network, and the external IP address is the same as the FortiGate wan interface.

The configuration has three steps:

1. Create and attach DNS translation object: Map the external IP address to the internal IP address and attach the DNS translation object to a DNS filter profile, allowing internal clients to receive the internal IP address when querying the external DNS name.
2. Apply the DNS filter profile to a policy: DNS traffic is filtered through the DNS translation profile, allowing internal users to access the internal server using the external DNS name.
3. Verify the result: Confirm that the employee can access the internal web server using the external DNS name.

To create and attach a DNS translation object in the GUI:

1. Go to *Security Profiles* > *DNS Filter* and click *Create New*.
2. Set the *Name* of the filter, such as *Reflective DNS*.
3. Under *Static Domain Filter*, enable *DNS Translation*.
4. In the *DNS Translation* table, click *Create New* and configure the new translation:

Original Destination	13.13.13.13
Translated Destination	172.16.200.55

Network Mask	255.255.255.255
Status	Enable

5. Click *OK*.
6. Enable *Log all DNS queries and responses*.
7. Click *OK*.

To configure a firewall policy for DNS translation in the GUI:

1. Go to *Policy & Objects* > *Firewall Policy*, and click *Create New*.
2. Configure the following:

Field	Value
Name	lan-wan
Schedule	always
Action	ACCEPT
Type	Standard
Incoming interface	port1
Outgoing interface	wan
Source	all
Destination	all
Service	ALL
NAT	Enabled
IP pool configuration	Use Outgoing Interface Address
DNS Filter	Enable and select *Reflective DNS*
Log allowed traffic	All sessions

3. Click *OK*.

To configure DNS translation in the CLI:

1. Create and attach a DNS translation object :

```
config dnsfilter profile
    edit "Reflective DNS"
        set log-all-domain enable
        config dns-translation
            edit 1
                set src 13.13.13.13
                set dst 172.16.200.55
                set netmask 255.255.255.255
            next
```

```
        end
    next
end
```

2. Configure a firewall policy for DNS translation:

```
config firewall policy
    edit 1
        set name "lan-wan"
        set srcintf "port1"
        set dstintf "wan"
        set action accept
        set srcaddr "all"
        set dstaddr "all"
        set schedule "always"
        set service "ALL"
        set utm-status enable
        set dnsfilter-profile "Reflective DNS"
        set logtraffic all
        set nat enable
   next
end
```

To verify the results:

1. Access the internal machine and use the saved bookmarks that contain the public domain name of the internal web server to access it. This should be successful, and the web server should load correctly. On the FortiGate, this can be verified using the logs and session list
2. On the FortiGate, go to *Log & Report > Security Events*, expand the *DNS Query* widget, and double click the desired log entry to view its details, or use the CLI to view the logs:

```
#execute log filter category 15
#execute log display
1: date =2024-12-13 time=07:39:37 eventtime=1734032377518565638 tz="+1200" logid="1501054802"
type="utm" subtype="dns" eventtype="dns-response" level="notice" vd="root" policyid=1
poluuid="62063350-b324-51ef-75c1-7c13a319762c" policytype="policy" sessionid=5147
srcip=172.16.200.13 srcport=60866 srccountry="Reserved" srcintf="port1"
srcintfrole="undefined" dstip=13.13.13.2 dstport=53 dstcountry="United States" dstintf="wan"
dstintfrole="undefined" proto=17 profile="Reflective DNS" xid=64 qname="www.pochiya.com"
qtype="A" qtypeval=1 qclass="IN" ipaddr="172.16.200.55" msg="Domain is monitored"
action="pass" cat==49 catdesc="Business" translationid=1

2: date=2024-12-13 time=07:39:37 eventtime=1734032377517238918 tz="+1200" logid="1500054000"
type="utm" subtype="dns" eventtype="dns-query" level="information" vd="root" policyid=1
poluuid="62063350-b324-51ef-75c1-7c13a319762c" policytype="policy" sessionid=5147
srcip=172.16.200.13 srcport=60866 srccountry="Reserved" srcintf="port1"
srcintfrole="undefined" dstip=13.13.13.2 dstport=53 dstcountry="United States" dstintf="wan"
dstintfrole="undefined" proto=17 profile="Reflective DNS" xid=64 qname="www.pochiya.com"
qtype="A" qtypeval=1 qclass="IN"
```

If the logs are missing, go to *Log & Report > Forward Traffic* and increase the time frame to ensure that all pertinent log entries are available.

DNS translation network mask

The following is an example of DNS translation that uses a network mask other than /32 (255.255.255.255):

To configure DNS translation in the CLI:

```
config dns-translation
        edit 1
           set src 93.184.216.34
           set dst 1.2.3.4
           set netmask 255.255.224.0
        next
    end
```

To check DNS translation using a command line tool after DNS translation:

```
# dig www.example.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 6736
;; Flags: qr rd ra; QUERY: 1; ANSWER: 1; AUTHORITY: 2; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.example.com.             IN      A

;; ANSWER SECTION:
www.example.com.        29322   IN      A       1.2.24.34

;; AUTHORITY SECTION:
example.com.            13954   IN      NS      a.iana-servers.net.
example.com.            13954   IN      NS      b.iana-servers.net.

;; Received 97 B
;; Time 2019-04-08 12:04:30 PDT
;; From 172.16.95.16@53(UDP) in 2.0 ms
```

The binary arithmetic to convert 93.184.216.34 to 1.2.3.4 with the subnet mask is as follows:

1. AND src(Original IP) with negative netmask (93.184.216.34 & ~255.255.224.0):

   ```
   01011101.10111000.11011000.00100010 93.184.216.34
   00000000.00000000.00011111.11111111 ~255.255.224.0
   ----------------------------------------------------- &
   00000000.00000000.00011000.00100010 0.0.24.34
   ```

2. AND dst(Translated IP) with netmask:

```
00000001.00000010.00000011.00000100 1.2.3.4
11111111.11111111.11100000.00000000 255.255.224.0
--------------------------------------------------- &
00000001.00000010.00000000.00000000 1.2.0.0
```

3. Final step 2 bitwise-OR 3:

```
00000000.00000000.00011000.00100010 0.0.24.34
00000001.00000010.00000000.00000000 1.2.0.0
--------------------------------------------------- |
00000001.00000010.00011000.00100010 1.2.24.34
```

Applying DNS filter to FortiGate DNS server

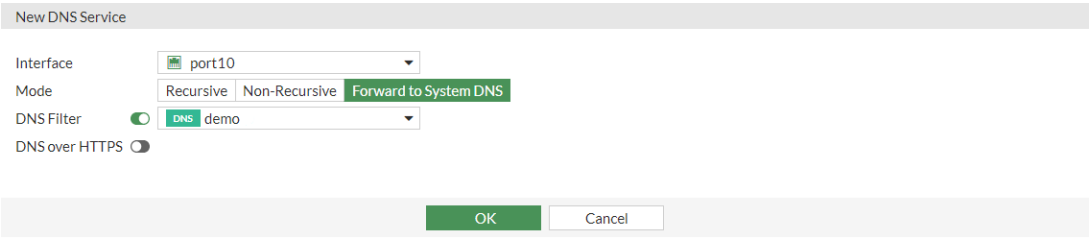
You can configure a FortiGate as a DNS server in your network. When you enable DNS service on a specific interface, the FortiGate will listen for DNS service on that interface.

Depending on the configuration, DNS service works in three modes: *Recursive*, *Non-Recursive*, or *Forward to System DNS* (server). For details on how to configure the FortiGate as a DNS server and configure the DNS database, see FortiGate DNS server on page 347.

You can apply a DNS filter profile to *Recursive* and *Forward to System DNS* mode. This is the same as the FortiGate working as a transparent DNS proxy for DNS relay traffic.

To configure DNS service in the GUI:

1. Go to *Network* > *DNS Servers* (if this option is not available, go to *System* > *Feature Visibility* and enable *DNS Database*).
2. In the *DNS Service on Interface* section, click *Create New* and select an *Interface* from the dropdown.
3. For *Mode*, select *Forward to System DNS*.
4. Enable *DNS Filter* and select a profile from the dropdown.



5. Click *OK*.

To configure DNS service in the CLI:

```
config system dns-server
    edit "port10"
        set mode forward-only
        set dnsfilter-profile "demo"
    next
end
```

To check DNS service with a DNS filter profile using a command line tool:

In this example, port10 is enabled as a DNS service with the DNS filter profile demo. The IP address of port10 is 10.1.100.5 , and the DNS filter profile is configured to block category 52 (information technology). From your internal network PC, use a command line tool, such as dig or nslookup, to perform a DNS query. For example:

```
# dig @10.1.100.5 www.fortinet.com
;; ->>HEADER<<- opcode: QUERY; status: NOERROR; id: 52809
;; Flags: qr rd; QUERY: 1; ANSWER: 1; AUTHORITY: 0; ADDITIONAL: 0

;; QUESTION SECTION:
;; www.fortinet.com.            IN      A

;; ANSWER SECTION:
www.fortinet.com.       60      IN      A       208.91.112.55

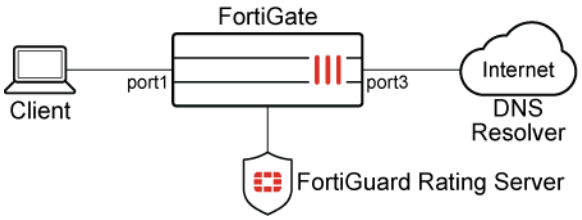
;; Received 50 B
;; Time 2019-04-08 14:36:34 PDT
;; From 10.1.100.5@53(UDP) in 13.6 ms
```

The relay DNS traffic was filtered based on the DNS filter profile configuration. It was blocked and redirected to the portal IP (208.91.112.55).

DNS inspection with DoT and DoH

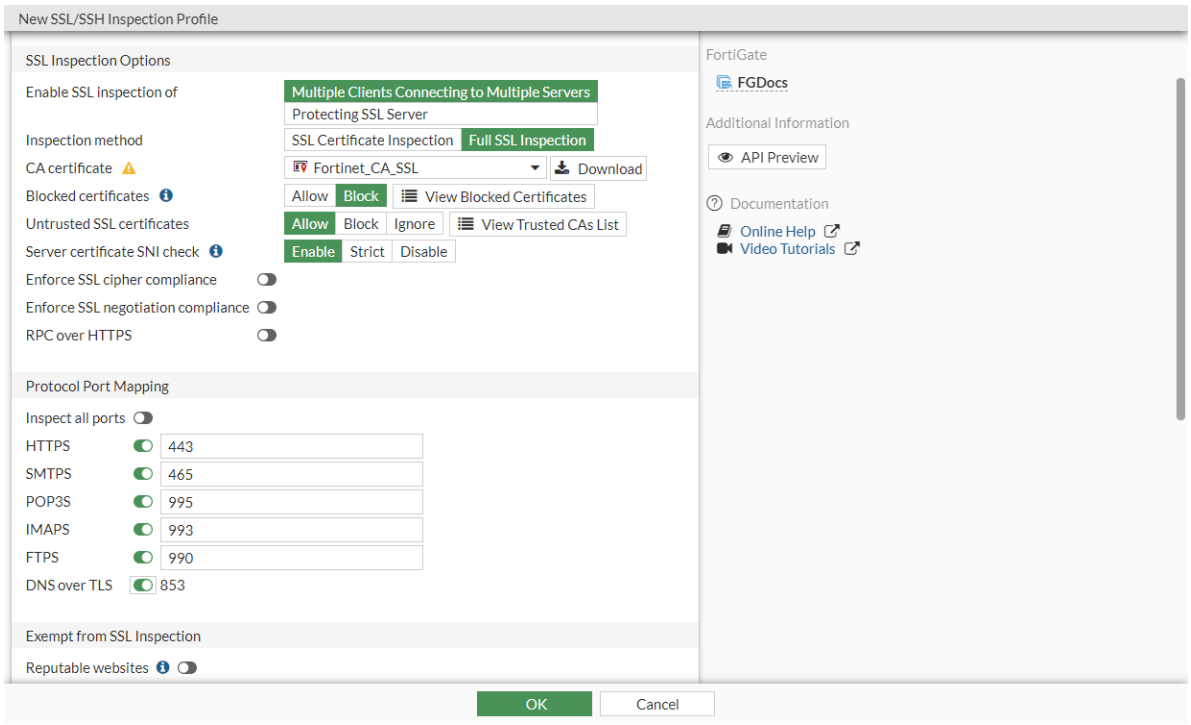
DNS over TLS (DoT) and DNS over HTTPS (DoH) are supported in DNS inspection. Prior to 7.6.0, DoT and DoH inspection can only be processed in proxy mode. Starting in 7.6.0, both proxy and flow inspection modes are able to handle DoT and DoH.

In the following examples, the FortiGate inspects DNS queries made over DoT and DoH to a Cloudflare DNS server. The DNS filter profile blocks the education category.



To configure DNS inspection of DoT and DoH queries in the GUI:

1. Configure the SSL-SSH profile:
   a. Go to *Security Profiles* > *SSL/SSH Inspection* and click *Create New*.
   b. Set *Inspection method* to *Full SSL Inspection*. DoT and DoH can only be inspected using doing deep inspection.
   c. In the *Protocol Port Mapping* section, enable *DNS over TLS*.



d. Configure the other settings as needed.

e. Click *OK*.

2. Configure the DNS filter profile:
   a. Go to *Security Profiles* > *DNS Filter* and click *Create New*.
   b. Enable *Redirect botnet C&C requests to Block Portal*.
   c. Enable *FortiGuard Category Based Filter* and set the *Action* for the *Education* category to *Redirect to Block Portal*.
   d. Configure the other settings as needed.
   e. Click *OK*.
3. Configure the firewall policy:
   a. Go to *Policy & Objects* > *Firewall Policy* and click *Create New*.
   b. Enable *DNS Filter* and select the profile you created.
   c. For *SSL Inspection*, select the profile you created.
   d. Configure the other settings as needed.
   e. Click *OK*.

To configure DNS inspection of DoT and DoH queries in the CLI:

1. Configure the SSL-SSH profile:

```
config firewall ssl-ssh-profile
    edit "ssl"
        config dot
            set status deep-inspection
